Only if the application uses Retain or Retain/Persistent variables the command generates an output file.

**Attention!**

It is recommended to execute the PLC shell command only while PLC is in state STOP, or it is ensured that there is no write access to the %M or the Retain/Persistent area.

**Import and export of retain/persistent variables by library functions**

It is also possible to import or export the Retain/Persistent variables and the %M markers via system function calls from the PLC Application. The required system functions are implemented in the IEC library **ABB_IntUtils_AC500.library**.

It provides the following Functions or Function Blocks:

- **SRAM_IMPORT**
- **SRAM_EXPORT**
- **SRAM_CLEARED**
SRAM_IMPORT

The Function Block SRAM_IMPORT is used to import the %M markers and the Retain/Persistent variables from the specified files in the userdisk.

- Import only those %M markers and/or Retain/Persistent variables that are compatible to the application running in the PLC.

- It is recommended to import only when the %M and/or the Retain/Persistent area is not accessed by the application.
  Otherwise inconsistencies are possible.

For a complete description of the Function Block see ABB_IntUtils_AC500.library.

---

SRAM_EXPORT

The Function Block SRAM_EXPORT is used to export the %M markers and the Retain/Persistent variables to the specified files in the userdisk.

- Export only those %M markers and/or Retain/Persistent variables that are compatible to the application running in the PLC.

- It is recommended to export only when the %M and/or the Retain/Persistent area is not accessed by the application.
  Otherwise inconsistencies are possible.

For a complete description of the Function Block see ABB_IntUtils_AC500.library.

---

SRAM_CLEARED

The Function SRAM_CLEARED is used to check if the SRAM was deleted.

For a complete description of the Function see ABB_IntUtils_AC500.library.

---

1.5.5.1.2 System processing

System start-up / Program processing

- AC500-eCo Processor Modules do not have an integrated display and keyboard. All functions related to keyboard and display are not applied for those devices.
Definitions: PLC system start-up

Cold start
- A cold start is performed by switching power OFF/ON if no battery is connected.
- All RAM memory modules are checked and erased (see Command 'Reset cold' Chapter 1.3.1.25.2.6.9 “Command ‘Reset Cold’” on page 931).
- If no user program is stored in the Flash EPROM, the default values (as set on delivery) are applied to the interfaces.
- If there is a user program stored in the Flash EPROM, it is loaded into RAM.
- The default operating modes set by the PLC configuration are applied.

Warm start
- A warm start is performed by switching power OFF/ON with a battery connected.
- All RAM memory modules are checked and erased except of the buffered operand areas and the RETAIN variables (see Command 'Reset warm' Command ‘Reset Warm’ on page 931).
- If there is a user program stored in the Flash EPROM, it is loaded into RAM.
- The default operating modes set by the PLC configuration are applied.

RUN -> STOP
- RUN -> STOP means pressing the RUN function key on the PLC while the PLC is in run mode (PLC display "run").
- If a user program is loaded into RAM, execution is stopped.
- All outputs are set to FALSE or 0.
- Variables keep their current values, i.e., they are not initialized.
- The PLC display changes from "run" to "StoP".

START -> STOP
- START -> STOP means stopping the execution of the user program in the PLC's RAM using the menu item "Online/Stop" in the programming system.
- All outputs are set to FALSE or 0.
- Variables keep their current values, i.e., they are not initialized.
- The PLC display changes from "run" to "StoP".

Reset
- Performs a START -> STOP process.
- Preparation for program restart, i.e., the variables (VAR) (exception: RETAIN variables) are set to their initialization values.
- Reset is performed using the menu item "Online/Reset" in the programming system or pressing the function key RUN for ≥ 5 s in STOP mode.

Reset (cold)
- Performs a START -> STOP process.
- Preparation for program restart, i.e., the variables (VAR) (also RETAIN variables) are set to their initialization values.
- Reset (cold) is performed using the menu item "Online/Reset (cold)" in the programming system.

Reset (original)
- Resets the controller to its original state (deletion of Flash, SRAM (%M, area, %R area, RETAIN, RETAIN PERSISTENT), Communication Module configurations and user program!).
- Reset (original) is performed using the menu item "Online/Reset (original)" in the programming system.

STOP -> RUN
- STOP -> RUN means short pressing the RUN function key on the PLC while the PLC is in STOP mode (PLC display "StoP").
- If a user program is loaded into RAM, execution is continued, i.e., variables will not be set to their initialization values.
- The PLC display changes from "StoP" to "run".
STOP -> START
- STOP -> START means continuing the execution of the user program in the PLC's RAM
  using the menu item "Online/Start" in the programming system.
- If a user program is loaded into RAM, execution is continued, i.e., variables will not be set to
  their initialization values.
- The PLC display changes from "StoP" to "run".

Download
- Download means loading the complete user program into the PLC's RAM. This process is
  started by selecting the menu item "Online/Download" in the programming system or after
  confirming a corresponding system message when switching to online mode (menu item
  "Online/Login").
- Execution of the user program is stopped.
- In order to store the user program to the Flash memory, the menu item "Online/Create boot
  project" must be called after downloading the program.
- Variables are set to their initialization values according to the initialization table.
- RETAIN variables can have wrong values as they can be allocated to other memory
  addresses in the new project!
- A download is forced by the following:
  - changed PLC configuration
  - changed task configuration
  - changed library management
  - changed compile-specific settings (segment sizes)
  - execution of the commands "Project/Clean all" and "Project/Rebuild All".

Online change
- After a project has changed, only these changes are compiled when pressing the key <F11>
  or calling the menu item "Project/Build". The changed program parts are marked with a blue
  arrow in the block list.
- The term Online Change means loading the changes made in the user program into the
  PLC's RAM using the programming system (after confirming a corresponding system mes-
  sage when switching to online mode, menu item "Online/Login").
- Execution of the user program is not stopped. After downloading the program changes, the
  program is re-organized. During re-organization, no further online change command is
  allowed. The storage of the user program to the Flash memory using the command "Online/
  Create boot project" cannot be initiated until re-organization is completed.
- Online Change is not possible after:
  - changes in the PLC configuration
  - changes in the task configuration
  - changes in the library management
  - changed compile-specific settings (segment sizes)
  - performing the commands "Project/Clean all" and "Project/Rebuild All".

Data buffering
- Data buffering, i.e., maintaining data after power ON/OFF, is only possible, if a battery is
  connected. The following data can be buffered completely or in parts:
  - Data in the addressable flag area (%M area)
  - RETAIN variable
  - PERSISTENT variable (number is limited, no structured variables)
  - PERSISTENT area (%R area)
- In order to buffer particular data, the data must be excluded from the initialization process
  (see Initialization of Variables).

Start of the user program
The user program (UP) is started according to the following table. It is assumed that a valid user
program is stored to the Flash memory.
See Storage Devices Chapter 1.5.7.1.4 “Storage device details” on page 3511.
<table>
<thead>
<tr>
<th>Action</th>
<th>No SD memory card with UP installed</th>
<th>No SD memory card with UP installed</th>
<th>SD memory card with UP installed</th>
<th>SD memory card with UP installed</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Auto run = ON</td>
<td>Auto run = OFF</td>
<td>Auto run = ON</td>
<td>Auto run = OFF</td>
</tr>
<tr>
<td>Voltage ON or Warm start or Cold start</td>
<td>UP is loaded from Flash into RAM and started from Flash.</td>
<td>No UP is loaded from Flash. When logging in, the message &quot;No program available in the controller ...&quot; is displayed.</td>
<td>UP is loaded from the SD memory card into Flash memory and RAM and then started from RAM.</td>
<td>UP is loaded from the SD memory card to the Flash memory. RAM remains empty. When logging in, the message &quot;No program available in the controller ...&quot; is displayed.</td>
</tr>
<tr>
<td>STOP -&gt; RUN</td>
<td>UP in RAM is started.</td>
<td>UP in RAM is started.</td>
<td>UP in RAM is started.</td>
<td>UP in RAM is started.</td>
</tr>
<tr>
<td>STOP -&gt; START</td>
<td>UP in RAM is started.</td>
<td>UP in RAM is started.</td>
<td>UP in RAM is started.</td>
<td>UP in RAM is started.</td>
</tr>
<tr>
<td>Download *1)</td>
<td>The UP currently stored in the CPU's RAM is stopped. The built UP is loaded from the PC into the PLC's RAM.</td>
<td>The built UP is loaded from the PC into the PLC's RAM.</td>
<td>The UP currently stored in the CPU's RAM is stopped. The built UP is loaded from the PC into the PLC's RAM.</td>
<td>The built UP is loaded from the PC into the PLC's RAM.</td>
</tr>
<tr>
<td>Online Change *2)</td>
<td>Processing of the UP currently stored in the CPU's RAM is continued. The changes made to the UP are loaded from the PC into the PLC's RAM. The UP is reorganized and processed.</td>
<td>The changes made to the UP are loaded from the PC into the PLC's RAM. The UP is reorganized.</td>
<td>Processing of the UP currently stored in the CPU's RAM is continued. The changes made to the UP are loaded from the PC into the PLC's RAM. The UP is reorganized and processed.</td>
<td>The changes made to the UP are loaded from the PC into the PLC's RAM. The UP is reorganized.</td>
</tr>
</tbody>
</table>

Remarks:

*1): After the download is completed, the program is not automatically stored to the Flash memory. To perform this, create a boot project `boot` from Chapter 1.3.1.11.6 “Generating boot applications” on page 305. If the UP is not stored to the Flash memory, the UP is reloaded from the Flash memory after voltage OFF/ON. Start the program either by pressing the RUN/STOP function key or using Automation Builder.

*2): After the online change process is completed, the program is not automatically stored to the Flash memory. For this, after reorganization is completed create a boot project `boot` from Chapter 1.3.1.11.6 “Generating boot applications” on page 305. During reorganization and flashing, no further online change command is allowed. If the UP is not stored to the Flash memory, the UP is reloaded from the Flash memory after voltage OFF/ON.

**Task configuration**

The task model processes the following kind of tasks:
- Non real time system tasks: system tasks with no real time property (e.g. file access, Ethernet Communication, OPC UA, …)
- Non real time IEC tasks: IEC tasks with no real time property
- Real time system tasks: system tasks with real time property
- Real time IEC tasks: IEC tasks with real time property

The possible number of tasks depends on the type of Processor Module. How to distribute the IEC tasks over multiple CPU cores and on how to use the IEC task configuration for Automation Builder is described in detail in the CODESYS task configuration section.

**Task configuration** Chapter 1.3.1.25.1.38.1 “Tab ‘Configuration’” on page 839

---

**PLC utilization**

The parameters cpuload and plcload represent the actual CPU load or PLC load of the system.

- **cpuload:** This value represents the time the PLC requires to calculate all processes running on the PLC. For a good system performance this value should be less than 80%. In case of a higher value, the degree of utilization should be reduced by using a more powerful PLC or by reducing the amount of processes.
- **plcload:** This value represents the time the PLC requires to calculate all real time processes. Real time processes are either high priority system tasks or IEC tasks with a priority between 0 and 15. For a good system performance this value should be less than 60%. In case of a higher value, the degree of utilization should be reduced by using a more powerful PLC.

During commissioning we recommend to monitor the CPU and PLC values online with one of the following methods:

<table>
<thead>
<tr>
<th>Automation Builder</th>
<th>Commissioning via <strong>PLC shell</strong> (command 'plcload' and 'cpuload') <strong>Chapter 1.5.6.4.4 &quot;PLC shell commands&quot;</strong> on page 3473.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Automation Builder</td>
<td>Commissioning via <strong>Device Trace</strong>. In order to display the load of the CPU or PLC, create a new Device Trace object in your PLC project. Then, <strong>Upload</strong> the data into the views <strong>Chapter 1.3.1.25.2.21.19 “Command 'Upload Trace’”</strong> on page 1034.</td>
</tr>
</tbody>
</table>
| IEC applications/IEC program | To access the parameters plcload and cpuload please use system functions as follows:  
  - **plcload:** SchedGetProcessorLoad() included in library ‘CmpSchedule’.  
  - **cpuload:** SysMCGetLoad() included in library ‘SysCpuMultiCore’. |

**Setting standard configuration**

If the target setting configuration is changed, standard configuration can be restored:
1. Open CODESYS.
2. In the “Resources” tab, double-click “PLC Configuration”.
3. Select “Menu Extras ➤ Standard Configuration”.

1.5.5.1.3 Real-time clock and battery

The real-time clock is an optional function for AC500-eCo Processor Modules.

The real-time clock operates as a PC clock. It saves date and time to a DWORD in DT format (DATE AND TIME FORMAT), i.e., in seconds passed since the start time: 1 January 1970 at 00:00.

If a battery is connected and full, the real-time clock continues to run even if the control voltage is switched off.

If no battery is inserted or the battery is empty, the real-time clocks starts with the value 0 (=1970-01-01, 00:00:00).

When switching on the control voltage, the system clock of the operating system is set to the value of the real-time clock.

Real-time clock

The PLC browser/PLC shell commands `date` and `time` are used to set the real-time clock.

The commands `date <ENTER>` or `time <ENTER>` display the current date and time of the real-time clock.

The command: `date yyyy-mm-dd<ENTER>` (year-month-day) sets the date.

The command: `time hh-mm-ss<ENTER>` (hours-minutes-seconds) sets the time.

Example:
The real-time clock should be set to 22 February 2005, 16:50.

1. Enter the date:
   ```
   date 2005-02-22<ENTER>
   
   Display: date 2005-02-22 Clock set to 2005-02-22 08:01:07
   
   The time remains unchanged.
   ```

2. Enter the time:
   ```
   time 16:50<ENTER>
   
   Display: time 16:50 Clock set to 2005-02-22 16:50:00
   ```

The following Function Blocks located in the folder "Realtime clock" of the system library `ABB_ExtUtils_AC500.lib` can be used to set and display the real-time clock (RTC) with help of the user program:
### Function Block

<table>
<thead>
<tr>
<th>Function Block</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLOCK (V3) “Library Manager  ABB-AC500 Use Cases  AC500 Utils PM&lt;Version&gt; (ABB) Function Blocks Realtime clock”</td>
<td>Sets and displays the real-time clock with values for year, month, day, hours, minutes and seconds. Also the day of week is indicated (Mo=1, Tue=2, Wed=3, Thu=4, Fr=5, Sa=6, Su=0). Note: The week of day cannot be set. It is given by the real-time clock. The input DAY_SET is ignored.</td>
</tr>
<tr>
<td>CLOCK_DT (V3) “Library Manager  ABB-AC500 Use Cases  AC500 Utils PM&lt;Version&gt; (ABB) Function Blocks Realtime clock”</td>
<td>Sets and displays the real-time clock in DT format, for example DT#2005-02-17-17:15:00.</td>
</tr>
</tbody>
</table>

The Function Blocks CLOCK and CLOCK_DT are documented in the “Library Manager” for the system library PM<Version>.lib (in AC500 Utils).

### AC500 battery

The AC500 battery buffers the following data in case of "control voltage off":

- Retentive variables in SRAM (VAR_RETAIN..END_VAR) · Chapter 1.5.5.1.1 “Handling of remanent variables for AC500 V3 products” on page 3105
- Date and time of the real-time clock

Further information:

- PLC diagnosis · Chapter 1.6.3 “Diagnosis messages” on page 3565

> To prevent data loss when using the AC500 battery, the battery status should be periodically monitored by the user program.

### Battery status

The battery status can be monitored either with the help of a user program on the PLC or in Automation Builder.

In the PLC shell of Automation Builder the command "batt" · Chapter 1.5.6.4.4 “PLC shell commands” on page 3473 “batt” can be used · Chapter 1.5.6.4.4 “PLC shell commands” on page 3473. The following is output:

<table>
<thead>
<tr>
<th></th>
<th>Battery status</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Battery empty</td>
</tr>
<tr>
<td>20</td>
<td>Remaining battery charge below 20 %</td>
</tr>
<tr>
<td>100</td>
<td>Battery charge OK</td>
</tr>
</tbody>
</table>

In the user program, the battery status can be checked with the function BATT which is available in the folder "Battery" of the system library ABB_ExtUtils_AC500.lib (“Library Manager  ABB-AC500  Use Cases”). The following is output:

<table>
<thead>
<tr>
<th></th>
<th>Battery status</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Battery empty</td>
</tr>
<tr>
<td>20</td>
<td>Remaining battery charge below 20 %, battery must be replaced</td>
</tr>
<tr>
<td>100</td>
<td>Battery charge OK</td>
</tr>
</tbody>
</table>

On the device, the battery status can be checked with the function keys of a Processor Module.
1.5.5.1.4 LEDs, display and function keys on the front panel

Overview

The display of a processor module is equipped with a background-lighted 7-segment display. This display consists of 6 digits for plain text or error codes.

Some functionalities may be not yet supported by the product. Please refer to the release notes of the product at time of release.

Display indicators

- A black square (■) denotes the state/working activity of the corresponding object on the left/right side of the display. The black square flashes according to the device's activity, e.g. during data exchange on ETH1, ETH2, COM1, etc.

**MC activity**

For the activity of the memory card the black square (■) is shown as long as a file is open on memory card.

- A black triangle (▲) points to the selected item/interface on the left/right side of the display to be configured or read. Further, it acts as a cursor for the count up/count down function keys.

A black triangle (▲) at the BATT item indicates a missing or uncharged battery.
The indicators point to the following items on the left side of the display:

<table>
<thead>
<tr>
<th>No.</th>
<th>On the left Side</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>MC (memory card)</td>
<td>Refers to the memory card status.</td>

### Reading out values

#### Reading out values CPU firmware SystemFW 3.1.x and DisplayFW 3.0

The following settings of the Processor Module can be read out by pressing the function key VAL repeatedly:

1. Displays time of the Processor Module (hh.mm.ss).
2. Displays date of the Processor Module (yy.mm.dd).
3. Displays state of battery (ub 100 = 100%, ub 020 = 20% or ub 000 = empty).
4. Displays version of display firmware (e.g. d 3.0 r (= display Version 3.0 release)).
5. Displays version of CPU firmware (e.g. C 3.1.0r (= CPU Version 3.1.0 release)).
6. Displays CPU type.
7. Displays default text (RUN/STOP).
# Reading out values CPU firmware SystemFW >=V3.2.0 and DisplayFW >=V4.1

Enable flashing of display

Blink functionality

As of SystemFW 3.1.0 and AB 2.1.0 the Blink functionality is implemented. “Blink” means – activate flashing of background light of AC500 display in Automation Builder via “IP-Configuration” tool (for details see Blink functionality Chapter 1.5.6.2.4.2.1 “Blink functionality” on page 3269).

Wink functionality

As of SystemFW 3.1.0 and AB 2.0.0 the Wink functionality is implemented. “Wink” means – activate flashing of background light of AC500 display in Automation Builder via communication settings (for details see Wink functionality).

Function blocks

PmErrLedSet

This Function Block switches the ERR-LED ON and OFF.

PmDispSetText

With this Function Block a text can be displayed on the CPU.

Further information is provided in the documentation of the AC500 Pm library. See the function blocks PmErrLedSet and PmDispSetText in the “Library Manager” of Automation Builder.

1.5.5.1.5 Onboard technologies

Ethernet

Default open Ethernet ports of PM56xx-2ETH

After startup without a PLC project the PM56xx-2ETH contains the following Ethernet ports and sockets:

<table>
<thead>
<tr>
<th>Protocol</th>
<th>Port</th>
<th>Sockets</th>
</tr>
</thead>
<tbody>
<tr>
<td>ABB NetConfig ¹)</td>
<td>UDP 24576</td>
<td>1 permanent socket per interface</td>
</tr>
<tr>
<td>Online access with driver 3S UDP BlkDrvUdp (with scan)</td>
<td>UDP 1740</td>
<td>1 socket per connection + 4 listen</td>
</tr>
<tr>
<td>Online access with driver 3S Tcp/Ip BlkDrvTcp (no scan)</td>
<td>TCP 11740</td>
<td>1 socket per connection + 1 listen</td>
</tr>
<tr>
<td>OPC UA server ²)</td>
<td>TCP 4840</td>
<td></td>
</tr>
</tbody>
</table>

Remarks:
¹): The port 24576 for ABB NetConfig protocol can be disabled via PLC configuration by deleting the protocol node from configuration tree of Ethernet interfaces ETH1 and ETH2.
²): The port 4840 for OPC UA server is closed by default as of SystemFW V3.1.0.

All other ports are closed by default.

</tr>
</thead>
<tbody>
<tr>
<td>PM56xx-2ETH</td>
<td>ETH1: 192.168.0.10&lt;br&gt;ETH2: 192.168.1.10</td>
<td>255.255.255.0</td>
<td>The Ethernet ports must be configured in different sub networks.</td>
</tr>
</tbody>
</table>

For changing the default addresses, see *IP-Configuration tool* Chapter 1.5.6.2.2.4.2 “Configuration of the IP settings with IP configuration tool” on page 3267, or description of function key Chapter 1.5.5.1.4.4 “Description of the function keys” on page 3121.
Online access

Preferred driver for online access: 3S UDP block driver BlkDrvUdp. This driver allows to scan and select the connected PLC’s.

Alternative: 3S TCP/IP block driver. This driver requires at least 2 sockets:
- 1x driver “BlkDrvTcp” on port 11740
- 1x listen on port 11740 if PLC has established online connection

Each established connection needs one socket. In addition one socket on port 11740 is listening.
1. Startup the PLC.
   - One socket on port 11740 (listen).
2. Login from Automation Builder via driver “BlkDrvTcp”.
   - 2 sockets on port 11740 (1x online, 1x listen)
3. Additional login out of OPC server with the same driver.
   - 3 sockets on port 11740 (2x online, 1x listen)
4. Additional connect CP600 via driver “BlkDrvTcp”.
   - 4 sockets on port 11740 (3x online, 1x listen)

SNTP client and server

As of version 3.1.0 the SystemFW provides a SNTP Protocol implementation which can be used for time synchronization of PLC clock. It can be used as SNTP Client or / and SNTP Server. But only one instance of each can be executed at the same time on one PLC.

See also, Configuration of SNTP Protocol V3

> Chapter 1.5.6.3.3.2 “Configuration of the SNTP protocol” on page 3425.

The SNTP server is listening only on the Ethernet interface, which the protocol is configured on. It is not possible to have an SNTP server on several Ethernet interfaces.

To read diagnosis information from the SNTP protocol within an IEC Application the Function Block PmSntpInfo can be used. This Function block is part of the library ABB_Pm_AC500.lib. It can also be used to determine the synchronization state of the PLC clock.

Using network variables in AC500 V3

When using network variables via UDP broadcast, the default broadcast address is set to 255.255.255.255.

This will not work on PLCs with multiple Ethernet interfaces, because of undecidable routing.

Set the broadcast address to a matching subnet broadcast address, depending on which interface should be used to send the variables into the network.
Example

- ETH1 with IP 192.168.0.10 netmask 255.255.255.0
- ETH2 with IP 192.168.1.10 netmask 255.255.255.0

If you want the network variables to be broadcast on ETH1, use broadcast address 192.168.0.255.

Onboard CAN configuration

Onboard CAN interface supports the following protocols

- CAN Open Manager: Connection of CI581 and CI582 without additional I/O modules
- CAN 2A/2B
- J1939

Configuration in Automation Builder is described in chapter “Chapter 1.5.6.2.7.1.1 “CM598-CAN - CANopen master communication module” on page 3286.

Further information can be found in chapter “Chapter 1.5.6.2.12 “CAN-based fieldbuses” on page 3332.

AC500 V3 PLCs provide the following methods for CAN integration:

- Onboard CAN interface
- Communication module CM598-CN

Differences in supported protocols can be seen in the table below.

<table>
<thead>
<tr>
<th></th>
<th>Onboard CAN</th>

</tr>
</tbody>
</table>
1.5.5.1.6 Hot swap

Preconditions for using hot swap

**Hot swap**

**WARNING!**
**Risk of explosion or fire in hazardous environments during hot swapping!**
Hot swap must not be performed in flammable environments to avoid life-threatening injury and property damage resulting from fire or explosion.

**WARNING!**
**Electric shock due to negligent behavior during hot swapping!**
To avoid electric shock:
- Make sure the following conditions apply:
  - Digital outputs are not under load.
  - Input/output voltages above safety extra low voltage/protective extra low voltage (SELV/PELV) are switched off.
  - Modules are fully interlocked with the terminal unit with both snap-fits engaged before switching on loads or input/output voltage.
  - Never touch exposed contacts (dangerous voltages).
  - Stay away from electrical contacts to avoid arc discharge.
  - Do not operate a mechanical installation improperly.

**NOTICE!**
**Risk of damage to I/O modules!**
Hot swapping is only allowed for I/O modules.
Processor modules and communication interface modules must not be removed or inserted during operation.

\[ H = \text{Hot swap} \]

**Hot swap**
System requirements for hot swapping of I/O modules:
- Types of terminal units that support hot swapping of I/O modules have the appendix TU5xx-H.
- I/O modules as of index F0.

The following I/O bus masters support hot swapping of attached I/O modules:
- Communication interface modules CI5xx as of index F0.
- Processor modules PM56xx-2ETH with firmware version as of V3.2.0.
The index of the module is in the right corner of the label.

**NOTICE!**
Risk of damage to I/O modules!
Modules with index below F0 can be damaged when inserted or removed from the terminal unit in a powered system.

**NOTICE!**
Risk of damage to I/O modules!
Do not perform hot swapping if any I/O module with firmware version lower than 3.0.14 is part of the I/O configuration.

For min. required device index see table below.

<table>
<thead>
<tr>

1.5.5.1.7 KNX IP integration

This document describes the system aspects of AC500 V3 PLCs interface to KNX and its integration into the engineering tools.

It assumes - beneath basic AC500 and Automation Builder know-how at least basic experience and expertise in use of KNX and ETS (engineering software for KNX).

Additional information can be found:
- In the example projects and their documentation (C:\Users\Public\Documents\Automation-Builder\Examples\PS5604-KNX).
- In ABB products and services.
Introduction

KNX is a bus system used more on the room and floor level in buildings (e.g. for lighting, shading and local HVAC devices).

The KNX as such doesn’t necessarily need a dedicated controller for simple connection of sensor/switch to receiving/actuator devices.

The signals exchanged via the protocol are so called “group addresses” (“objects”), which are downloaded via ETS to all the thereby linked (=grouped) devices.

On the room level it typically has a serial wiring called KNX TP (twisted pair), which then is linked to floor or central building or management level via IP routers. On Ethernet it is called KNXnet/IP abbreviated also as KNX IP.

![Diagram of KNX network](image)

The AC500 V3 PLC is after the Automation Builder engineering step and download a standard KNX device, in which KNX communication is done via the IP network interface. It is arranged topologically on the area / main line of the KNX IP routers and communicates with them via the KNXnet/IP protocol.

Engineering workflow

Both engineering software systems for AC500 V3 PLC (Automation Builder) and KNX (ETS) are directly linked.

A data exchange for the group objects (hereinafter also called communication objects) from the Automation Builder to ETS (via an XML file) and received by a DCA (Device configuration APP) for ETS is available.

The AC500 V3 PLC is integrated into the ETS via a certified KNX “device” with the transferred group objects as configured in Automation Builder and a physical KNX address (transferred via ETS and KNX IP to the AC500 V3 PLC).
Programming and commissioning of the AC500 V3 PLC starts with Automation Builder:
Configuration of the AC500 V3 PLC, its communications, here KNX, and I/O modules and all
necessary parameters.
1. Configure programmable KNX controller in CODESYS by adding group objects to the
device.
2. Use group objects as inputs and outputs in the IEC application.
3. Download of the above into the AC500 V3 PLC (via the engineering interface)
The subsequent linking of the AC500 V3 PLC and the other KNX devices takes place with
the vendor independent KNX commissioning software ETS:
5. Install DCA Plugin and the AC500 V3 PLC device description in ETS
6. Connect group objects in ETS and assign group addresses.
7. KNX IP download to AC500 V3 PLC.
8. The physical KNX address of the AC500 V3 PLC must be set before or during download
of the KNX configuration.

The programming of the AC500 V3 PLC and the KNX commissioning can be done also by dif-
ferent people at different times and with same or separate engineering PCs. Both projects carry
out their own download parts of their respective configurations to the AC500 V3 PLC.
The only data exchange between the two Engineering programs are the details about the KNX
group objects defined in the ABB Automation Builder. This is done flexibly via the XML configu-
ration file.

Prerequisites
- PC(s) with Windows 7 or higher with Administrator right(s)
- At least temporary network access to the internet for downloading and installing of:
  - Automation Builder as of version AB 2.1.2, (and e.g. example .project)
  - ETS5 and the necessary additional files (DCA .etsapp, device description .knxprod) plus
    possibly an matching example .knxproj) to above Automation Builder .project
- Network access to the local network, were the AC500 V3 PLC and KNX devices are connected.
- PS5604-KNX AC500 runtime license for each dedicated AC500 V3 PLC used in KNX networks (see Chapter 1.5.5.1.7.6.1 "KNX runtime license" on page 3164).
- The current IP address of the engineering PC(s) where Automation Builder and ETS are located in same Network / masked IP range, as the AC500 V3 PLC to be used.

General settings and system behavior

The KNX interface at the AC500 V3 PLC is only active during the PLC is in RUN.
1. Download Automation Builder program.
2. Run PLC.
3. Set physical address or download KNX application Programm via ETS.
   - The bus status can be viewed in Online View of Automation Builder.

KNX communication is only working after download the matching ETS application to the AC500 V3 PLC. Until then, the AC500 V3 PLC KNX communication is deactivated and marked with a warning symbol.

![Fig. 283: KNX Interface not ready](image)

However in this state the AC500 V3 PLC can still be switched to the KNX programming mode and the physical KNX address can be programmed. Also the device info can be read by ETS.

If the KNX interface is ready, this can be recognized by the green symbol on the KNX interface in the Automation Builder.

![Fig. 284: KNX Interface ready](image)

Start-up behavior

Start/Stop PLC

- KNX bus works only in "RUN" mode.
- If the PLC is in "STOP" mode the KNX bus and the outputs are reset.

To avoid this behavior in "STOP" mode set the following preferences at the PLC_AC500_CPU:
1. Double-click PLC_AC500_V3 <...> and click PLC Settings.
2. Enable checkbox **Update IO while in stop** and select in dropdown-menu **Behavior for Outputs in Stop** “Keep current values”.

**Warm start / Cold start**
If the PLC is reset also the connected objects will be reset on the KNX bus.

**Power ON/Off**
After Power ON the KNX Interface need approximately 1 s to start after the PLC program had started. During this period no inputs will be recognized by the PLC and no outputs will be send to the bus.

### Engineering of KNX in Automation Builder

#### Creation of KNX group objects

---

**Attention**
This information refers to Automation Builder as of version 2.2.0.
---

The data exchange with the KNX bus is done via KNX group objects.

1. Double-click node “KNX” in the device tree “click General ➔ click Add”.
   - The window **Communication object** appears.
2. Enter your properties:
   - **Group Object Number:**
     The number of the KNX Group Object must match within the controller. It is displayed in the ETS and influences the display order in the ETS and the Automation Builder.
   - **Type:**
     Selection of the communication direction.
     – Input means that the controller receives values from the KNX bus.
     – Output means that the controller sends values to the KNX bus.
   - **Data Point Type:**
     Specification of the KNX data point type (DPT) of the Group Object. This determines the memory size, scaling and unit. For further information see the KNX Standard.
   - **Group Object Name:**
     The name of the KNX Group Object. It is freely selectable and is displayed in the ETS under the field name.
   - **Group Object Function:**
     The name of the function of the Group Object. It is freely selectable and is displayed in the ETS under the field Function.

Based on this selection, the flags of the KNX Group Object are set accordingly in the ETS.

You can use the [Export CSV...] button in the “General” tab menu bar to display the list of KNX group objects in a spreadsheet program such as Excel and edit and extend it flexibly. Then you can import them again via [Import CSV].

After you have created all the required KNX group objects, export them using the [Export to ETS] button. This exported file contains the configuration of the KNX group objects of the AC500 V3 PLC and is imported by ETS for linking to other KNX devices. If you have not yet created project information under main menu “Project ➔ Project Information”, the default values will be used during the export.
To use these KNX group objects in your application program, you must assign them with IEC 61131-3 variables. This additional abstraction layer of an additional variable allows you to create modular automation programs that are independent of the used bus system or input / output modules.

The assignment is possible either via the parameter page “KNX I/O Mapping” or “I/O mapping list”. Both editors offer the same function in different representations.

On the KNX I/O Mapping page, the KNX variables are shown hierarchically. Each KNX Group Object consists of several channels with additional information. These differ depending on whether it is an input or an output.

The view is structured as follows:

- **Variable:** Enter the name of the IEC 61131-3 variable that you want to assign to this channel (KNX Group Object).
- **Mapping:** Shows if the channel is already linked
- **Channel:** Name of the Channel (Channel name)
- **Address:** The memory address under which the information is stored in the memory of the AC500 V3 PLC. Inputs start with %I and outputs start with %Q.
- **Type:** Specification of the IEC 61131-3 variable type
- **Default Value:** The value used after starting the controller.
  - At a KNX Group Object input, this value is used by the automation program until a value has been received from the KNX bus.
  - At a KNX Group Object output, this value is sent to the bus when the controller is started.
- **Unit:** Specification of the KNX data point type (DPT)
- **Description:** Note text

A KNX Group Object “input” consists of a status and a control part:

The Channel name of the status part consists of: Object Number + Object Name + Object Function and include the following informations:

- **UpdateFlag:**
  This status flag is set to the value “true” for one cycle as soon as a new KNX telegram has been received. Even if the value of the telegram does not differ from the previous one.
- **ValueChanged:**
  This status flag is set to the value “true” as soon as a new KNX telegram has been received and the value differs from the previous one.
- **ValueValid:**
  This status flag is set to the value “true” as soon as a KNX telegram has been received for the first time after the controller has been started.
- **WatchdogTimeout:**
  As of Automation Builder 2.2.1 it will be possible to define a Watchdog Timeout for each input object. If a timeout occur this flag will be set to the value “true” for one cycle.

The Channel name of the control part consists of: “Control” + Object Number + Object Name + Object Function and include the following control possibilities:
● Reset status flags:
When this flag is set from “false” to “true” by the automation program then the above-mentioned status flags of the KNX Group Object are reset to the value “false”.

● Send value read:
When this flag is set from “false” to “true” by the automation program, a ValueRead telegram is sent to the KNX bus. This causes the KNX remote device to send back its current value.

A KNX Group Object “output” is represented as follows:
The Channel name of the Group Object consists of: Object Number + Object Name + Object Function

● Trigger Output:
When this flag is set from “false” to “true” by the automation program, the current value is sent immediately to the KNX bus. The sending conditions that are may be activated in the ETS (send on change and cyclic sending) will be restarted

● Disable Output:
As long this flag is set to “true” by the automation program, the sending conditions send on change and cyclic sending in the ETS are deactivated.

● Value:
The current value of the KNX Group Object that is sent to the KNX bus.

The permanently defined Program LED Status represent the function as known in other KNX devices, showing the status of the programming LED.

Create an application program
The KNX variables defined on the KNX I/O Mapping page are available programwide under IoConfig_Globals_Mapping.

These you can see if you click in to the programming window and either via right-click select “Input Assistant” or press F2.
Export XML file

To exchange the configured KNX group objects the configuration has to be exported via XML File.

If later both projects (from Automation Builder and ETS) are loaded on the PLC, the PLC checks if the two projects have the same source and fit together. This will be done by an automatically calculated Checksum. For calculating the Checksum the following information's from the Project information will be used:

- Company
- Title
- Version
- Timestamp

This Information will also be shown in the ETS after loading the XML File. If the user has not entered any project information some default values will be set.

Integration of the PLC in KNX

Insert controller

1. Start the ETS and insert the PS5604-KNX AC500 as controller from the ETS device catalog into your ETS project.

2. Assign a physical KNX address to the controller.
   - The controller is placed topologically on the IP Main Area.
Import configuration

1. Select the “PS5604-KNX AC500” in the ETS explorer tree and click on “DCA” tab in the editor window.
2. Click on Load Configuration and select the configuration .xml file.
   - The KNX group objects defined in AC500 V3 PLC in Automation Builder are displayed in the ETS.

Connect controller with KNX Devices

1. Right-click on a “PS5604-KNX AC500” group object and assign a KNX group address or drag and drop from group address window.
2. Interlink group objects by assigning the same KNX Group Address.
Parameters of the device

The following settings are possible in the ETS parameters of the PS5604-KNX AC500.

Tab General settings

- Default Gateway:
  The used KNXnet/IP broadcast address. This must match the KNX system (KNX IP router). It is the default setting that is usually not changed.
  - The entry field Default Gateway can contain another IP address for the Multicast communication. The normal Multicast IP address for KNX is 224.0.23.12.
  - If another Multicast IP address is to be used, it can be chosen in the area from 239.0.0.0 to 239.255.255.255. This alternative Multicast IP address can be defined in the input field Default Gateway.

- Telegram rate:
  The maximum transmission rate of the AC500 V3 PLC can be limited in order to prevent an excessive bus load and thus to avoid malfunction of the KNX system.
  The KNX telegrams are buffered until they have been sent. New values which have been calculated by the automation program in the meantime are updating the cached values. The old cached value is discarded and not sent.

- Project Information:
  At this point, the project information of the Automation Builder project is displayed.
For each KNX Group Object of the AC500 V3 PLC an Object entry is displayed in the device parameters. This is named after the number of the KNX Group Object.

For outputs (controller sends to the KNX bus) the KNX transmission conditions can be set:

- **Communication direction:**
  Setting of the transmission direction of the object.
  - Input (KNX to PLC): The Controller receives values from the KNX bus.
  - Output (PLC to KNX): The Controller sends values to the KNX bus.

- **Send condition (only for outputs):**
  Setting whether the Controller sends a telegram to the KNX bus automatically when the object value is changed. The following options are available
  - No automatic sending:
    No automatic sending to the KNX bus. This must be done via the program code by the Trigger Output flag.
  - Send on change:
    Every time the object value changes, a telegram is sent to the KNX bus. No matter how minor this change is.
  - Send on difference (only for group objects which are not DPT 1.* Boolean): Every time the object value changes, this value is only sent to the KNX bus if it differs from the last sent value at least by the settable difference.

- **Sending difference (only if Send on difference is active):**
  Input of the difference by which the object value must change to be send. You can enter numbers with decimal places.

- **Cyclic sending (only for outputs):**
  Setting whether in addition the object value is sent cyclically repeatedly to the bus. This also happens if this object value has not changed. Two different value ranges for the cycle time can be specified.

- **Cycle time (only when Cyclic sending is active):**
  Specification of the cycle time for the cyclic transmission.
  Input format hour:minute:second

Regardless of the set transmission conditions, the program code can trigger by the flag **Trigger Output** a sending of the value to the KNX bus at any time.

By activating the flag **Read on Init** of the KNX group objects in the right ETS properties panel, the Controller sends a value read query to the connected KNX device at startup. This then responds with its current object value.
In this properties panel you can also select the appropriate subdata point type of the KNX Group Object. This defines the unit of the value in the KNX system. For example DPT 9.001 represents temperature in °C.

If for example the response of an actuator state is needed for an input "Aktor A Status", this feature can be enabled in the parameter of the Switch Actuator (e.g. 1.1.6 SA/S4.10.1).
The current IP address as well as further information of the AC500 V3 PLC can be read via the ETS Device Info function. For this the physical KNX address is necessary. You can determine the address by the ETS function Programming Mode.

With the ETS function Group Monitor you can analyze the telegrams on the KNX bus. You can also use it to write/read KNX telegrams.

Download ETS configuration to controller

The download of the ETS configuration to the AC500 V3 PLC is done via the ETS function “Download” in the menu bar. This download happens via the KNX interface directly to the AC500 V3 PLC.

Best you select in ETS the network interface of the computer as the bus interface. Thus, a fast data exchange is possible and the data is not routed via the KNX TP bus.

At the first download, the physical KNX address of the controller is programmed. To do this, set the AC500 V3 PLC to KNX programming mode.

This can be done either via the display or functions inside the application program of the controller (e.g. connected to a Webvisu like done in the example program).

![Table and Diagram](image)

The AC500 V3 PLC must be in RUN mode.

1. Press the CFG function key.
   ⇒ Switch is OFF (S OFF) is displayed.

2. Press the Arrow Down function key
   ⇒ Pbut 0 is displayed.
   
   (Pbut is standing for programming button, the 0 (or the 1) showing the status of the programming LED (0=Off; 1 =ON))

3. Press the CFG function key.
   ⇒ The display shows Pbut 1 flashing.

Attention!
The activation of the KNX programming mode via the display only works with Automation Builder as of version 2.2.0.

Chapter 1.5.5.1.4.4.3.2 “Configuration CPU firmware SystemFW >=V3.2.0 and DisplayFW >=V4.1” on page 3127
4. Confirm this with the **OK** function key.
   ⇒ The display permanently shows *Pbut 1*. The AC500 V3 PLC is in KNX programming mode.

The AC500 V3 PLC automatically terminates the KNX programming mode after the programming of the physical KNX address.

Alternatively you can terminate the programming mode with *Pbut 0* by pressing the **CFG** function key.

You can exit the menu at any time with the **ESC** function key.

**Via AC500 application**

Please use the following variable for setting the KNX Program Button:

\[AC500_IoDrvKNX.GVL.IoDrvKNXCopyChannels.ProgramButton\]

The controller automatically terminates the programming mode after programming the physical address with the ETS.

The AC500 V3 PLC has then besides the Automation Builder configuration also the appropriate ETS configuration and starts its KNX communication.

Download all other linked KNX devices as well as the KNX IP routers. The ETS automatically creates the filter tables of the KNX IP routers so that the KNX telegrams are routed from the KNX TP lines to the IP line of the AC500 Controller.

**Make changes**

Changes can be made in the Automation Builder as well as in the ETS without the need for a change in the other software or the need for a new data exchange.

Only if changes are made to the KNX group objects in the Automation Builder, a data exchange with the ETS is again necessary. Afterwards, a download is required both in the Automation Builder and in the ETS. Only when these two configurations have been downloaded again to the AC500 V3 PLC, the KNX communication is in operation again.

The DCA detects changes to names and numbers of the KNX group objects when importing the configuration file in the ETS and keeps the already made settings and linked Group Addresses of these changed group objects.

**Remarks**

**KNX runtime license**

The standard V3 AC500 CPUs are shipped from the factory without firmware and need an installed PS5604-KNX runtime license for KNX operation in each CPU. The PS5604-KNX is a license document with activation code and needs to be purchased separately. The license can after a first download to one CPU also be transferred to another CPU via Automation Builder.

**Data conversion**

The KNX standard defines a big-endian byte order while the IEC 61131-3 is based on the little-endian byte order. Therefore, the controller automatically converts the data point types.

However, if you access the bits of the structured KNX data point types (DPT) for time, date (DPT 10.*, DPT 16.*, DPT 19.*) in your program code, you have to note the reverse byte order. Therefore, as of Automation Builder version 2.2.0, corresponding function libraries are available that provide conversion functions for these data point types.

1.5.5.1.8 Communication with Modbus RTU

Protocol description

The Modbus RTU protocol is implemented in the AC500 Processor Modules.

Modbus is a master-slave (client-server) protocol. The client sends a request to the server(s) and receives the response(s).

The Modbus operating mode of a serial interface is set in the PLC configuration Chapter 1.5.6.2.10.1 “Configuring Modbus RTU on serial interface” on page 3325.

Modbus client

In this operating mode, the telegram traffic with the server(s) is handled via the Function Block ModRtuMast.

This Function Block sends Modbus request telegrams to the server(s) via the set interface and receives Modbus response telegrams from the server(s) via this interface.

The Modbus blocks transferred by the server contain the following information:

- Modbus address of the interrogated server (1 byte)
- Function code that defines the request of the client (1 byte)
- Data to be exchanged (n bytes)
- CRC16 control code (2 bytes)

Modbus server

In this operating mode, no Function Block is required for Modbus communication. Sending and receiving Modbus telegrams is performed automatically.

The AC500 CPUs process the following Modbus operation codes:

<table>
<thead>
<tr>
<th>Function code</th>
<th>DEC</th>
<th>HEX</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>01 or 02</td>
<td>01 or 02</td>

Calculation of the bit variable from the hexadecimal address:

**Formula:**

\[
\text{Bit variable (BOOL)} := \%\text{MX}_\text{BYTE}.\text{BIT}
\]

where:

<table>
<thead>
<tr>
<th>DEC</th>
<th>Decimal address</th>
</tr>
</thead>
<tbody>
<tr>
<td>BYTE</td>
<td>DEC / 8</td>
</tr>
<tr>
<td>BIT</td>
<td>DEC mod 8 (Modulo division)</td>
</tr>
</tbody>
</table>

**3ADR010583, 1, en_US**

2020/12/10
Examples:
- Address hexadecimal = 16#2002
  DEC := 8194
  BYTE := 8194 / 8 := 1024
  BIT := 8194 mod 8 := 2
  Bit variable: %MX1024.2
- Address hexadecimal = 16#3016
  DEC := 12310
  BYTE := 12310 / 8 := 1538,75 -> 1538
  BIT := 12310 mod 8 := 6
  Bit variable: %MX1538.6
- Address hexadecimal = 16#55AA
  DEC := 21930
  BYTE := 21930 / 8 := 2741,25 -> 2741
  BIT := 21930 mod 8 := 2
  Bit variable: %MX2741.2

Examples:
- Bit variable := %MX515.4
  DEC := 515 * 8 + 4 := 4124
  Address hex := 16#101C
- Bit variable := %MX3.3
  DEC := 3 * 8 + 3 := 27
  Address hex := 16#001B
- Bit variable := %MX6666.2
  DEC := 6666 * 8 + 2 := 53330
  Address hex := 16#D052

Peculiarities for accessing Modbus addresses

Peculiarities for bit access:
- A WORD in the %M area is assigned to each Modbus address 0000hex .. FFFFhex.
- Bit addresses 0000hex .. FFFFhex are contained in the word range %MW0 .. %MW4095

Areas protect from read/write access by Modbus client

As described in Configuration of Modbus TCP/IP Server - parameter disable, one write-protected and one read-protected area can be defined. As described in Chapter 1.5.6.3.2.1.1 “Configuration of Modbus TCP/IP server” on page 3422. If you try to write to a write-protected area or to read from a read-protected area, an exception response is generated.

Local data of the Modbus client

The address of the area from which data are to be read or to which data are to be written is specified in the Function Block ModRtuMast at input "Data", via the ADR operator.

For the AC500, the following areas can be accessed using the ADR operator:
- Inputs area (%I area)
- Outputs area (%Q area)
- Area of non-buffered variables (VAR .. END_VAR or VAR_GLOBAL END_VAR)
- Addressable flag area (also protected areas for %M area)
- Area of buffered variables (VAR RETAIN .. END_VAR or VAR_GLOBAL RETAIN .. END_VAR)

Modbus telegrams

The send and receive of telegrams shown in this section are not visible in the PLC. However, the complete telegrams can be made visible using a serial data analyzer connected to the connection line between server and client, if required.

The amount of user data depends on the capabilities of the server and the client.

For the following examples, it is assumed that one AC500 Modbus module is used as client and another one is used as server. There may be different properties if modules of other manufacturers are used.

**FCT 1 or 2: Read n bits**

Table 669: Client request

<table>

</tbody>
</table>

**FCT 3 or 4: Read n double words**

The function code "read double word" is not defined in the Modbus RTU standard. This is why the double word is composed of a low word and a high word (depending on the manufacturer)

Same tables as [Chapter 1.5.5.1.8.5.2 “FCT 3 or 4: Read n words” on page 3172](#).

**FCT 5: Write 1 bit**

For the function code "write 1 bit", the value of the bit to be written is encoded in one word.
BIT = TRUE -> Data word = FF 00 HEX  
BIT = FALSE -> Data word = 00 00 HEX

**Table 673: Client request**

Exception response by server

In operating mode Modbus client, the AC500 does only send requests, if the parameters at the ModRtuMast inputs are logically correct.

Nevertheless, it can happen that a server cannot process the request of the client or that the server cannot interpret the request due to transmission errors or in case it’s capabilities are exceeded in any way. In those cases, the server returns an exception response to the client. In order to identify this response as an exception response, the function code returned by the server is a logical OR interconnection of the function code received from the client and the value 80HEX.

Table 687: Server response

<td>Function code: 81HEX</td>
</tr>
<tr>
<td>Error code: 03</td>
</tr>
</tbody>
</table>

**Processing bits**

Some of the Modbus function codes are used to read or write bits (coils, discrete inputs). While a variable of data type WORD can be accessed easily, accessing a stream of bits is complex.

Data type BIT must not be mixed up with data type BOOL. Variables of both types may have values 'TRUE' or 'FALSE'. But while BIT means one single bit only, BOOL requires a byte (8 bit) of memory.

**Modbus client**

When accessing bits in a Server, the local data referred to at Client Function Blocks input data is always expected to be of format BOOL.
Modbus server

Using the bit offset

The simplest way to access a certain bit within a larger variable is to directly use the bit offset (0 based; see Bit Access to Variables © Chapter 1.3.1.24.4.11 “Bit access to variables” on page 565).
Defining symbolic names for the bit offsets

A more convenient way to access bits e.g. within a word is to define a symbolic name for each single offset (see Bit Access to a variable by using a global constant © Chapter 1.3.1.24.4.11 “Bit access to variables” on page 565).

```
VAR_GLOBAL_CONSTANT
("bit offsets in awWordVariable[0]*
NameBitOffset_0_00 : INT := 0;
NameBitOffset_0_01 : INT := 1;
(*...*)
NameBitOffset_0_15 : INT := 15;
("bit offsets in awWordVariable[7]*
NameBitOffset_7_00 : INT := 0;
NameBitOffset_7_01 : INT := 1;
(*...*)
NameBitOffset_7_15 : INT := 15;
END_VAR

VAR
awWordVariable AT %MW0 : ARRAY [0..7] OF WORD;
END_VAR

awWordVariable[0].NameBitOffset_0_00 := TRUE;
awWordVariable[7].NameBitOffset_7_15 := FALSE;
```
Defining a data type

A further alternative is to define your own data type according to the requirements of your particular application (see Chapter 1.3.1.25.1.14 "Object ‘DUT’" on page 735). Bit access to BIT data types (see Chapter 1.3.1.24.4.11 "Bit access to variables" on page 565).

```plaintext
TYPE ControlWordType :
  STRUCT
    NameBitOffset_00 : BIT;
    NameBitOffset_01 : BIT;
    NameBitOffset_02 : BIT;
    NameBitOffset_03 : BIT;
    NameBitOffset_04 : BIT;
    NameBitOffset_05 : BIT;
    NameBitOffset_06 : BIT;
    NameBitOffset_07 : BIT;
    NameBitOffset_08 : BIT;
    NameBitOffset_09 : BIT;
    NameBitOffset_10 : BIT;
    NameBitOffset_11 : BIT;
    NameBitOffset_12 : BIT;
    NameBitOffset_13 : BIT;
    NameBitOffset_14 : BIT;
    NameBitOffset_15 : BIT;
  END_STRUCT
END_TYPE

VAR
atTypeVariable AT §M60 : ARRAY [0..7] OF ControlWordType;
END_VAR

atTypeVariable[0].NameBitOffset_00 := TRUE;
atTypeVariable[7].NameBitOffset_15 := FALSE;
```
Defining a complex data type

In case your application requires some more complex data types you can combine data types (DUT; see Bit access to BIT data types Chapter 1.3.1.24.4.11 “Bit access to variables” on page 565).

```plaintext
TYPE ControlWord0Type :
  STRUCT
  NameBitOffset_0_00 : BIT;
  NameBitOffset_0_01 : BIT;
  NameBitOffset_0_02 : BIT;
  NameBitOffset_0_03 : BIT;
  NameBitOffset_0_04 : BIT;
  NameBitOffset_0_05 : BIT;
  NameBitOffset_0_06 : BIT;
  NameBitOffset_0_07 : BIT;
  NameBitOffset_0_08 : BIT;
  NameBitOffset_0_09 : BIT;
  NameBitOffset_0_10 : BIT;
  NameBitOffset_0_11 : BIT;
  NameBitOffset_0_12 : BIT;
  NameBitOffset_0_13 : BIT;
  NameBitOffset_0_14 : BIT;
  NameBitOffset_0_15 : BIT;
END_STRUCT
END_TYPE

TYPE ControlWord1Type :
  STRUCT
  NameBitOffset_1_00 : BIT;
  NameBitOffset_1_01 : BIT;
  NameBitOffset_1_02 : BIT;
  NameBitOffset_1_03 : BIT;
  NameBitOffset_1_04 : BIT;
  NameBitOffset_1_05 : BIT;
  NameBitOffset_1_06 : BIT;
  NameBitOffset_1_07 : BIT;
  NameBitOffset_1_08 : BIT;
  NameBitOffset_1_09 : BIT;
  NameBitOffset_1_10 : BIT;
  NameBitOffset_1_11 : BIT;
  NameBitOffset_1_12 : BIT;
  NameBitOffset_1_13 : BIT;
  NameBitOffset_1_14 : BIT;
  NameBitOffset_1_15 : BIT;
END_STRUCT
END_TYPE

TYPE ControlWordListType :
  STRUCT
  ControlWord0 : ControlWord0Type;
  ControlWord1 : ControlWord1Type;
END_STRUCT
END_TYPE

VAR
  atWordListType AT @MSW0 : ControlWordListType;
END_VAR

atWordListType.ControlWord0.NameBitOffset_0_00 := TRUE;
atWordListType.ControlWord1.NameBitOffset_1_15 := FALSE;
```
Pack/unpack BOOL variables

In case you prefer variables of type BOOL you can use the functions for **packing** and **unpacking**.

```plaintext
VAR
abBoolVariable : ARRAY [0..15] OF BOOL;
wWordVariable0 : AT WORD;
wWordVariable1 : AT WORD;
END_VAR

VAR
Unpack : Mem.UnpackWord;
END_VAR

abBoolVariable[0] := TRUE;
abBoolVariable[15] := FALSE;

wWordVariable0 := Mem.PackBitsToWord(abBoolVariable[0], abBoolVariable[1], abBoolVariable[2], abBoolVariable[3],
abBoolVariable[4], abBoolVariable[5], abBoolVariable[6], abBoolVariable[7],
abBoolVariable[8], abBoolVariable[9], abBoolVariable[10], abBoolVariable[11],
abBoolVariable[12], abBoolVariable[13], abBoolVariable[14], abBoolVariable[15]);

wWordVariable1 := 1;
Unpack(wValue:= wWordVariable1,
    xBit0 => abBoolVariable[0], xBit1 => abBoolVariable[1], xBit2 => abBoolVariable[2], xBit3 => abBoolVariable[3],
    xBit4 => abBoolVariable[4], xBit5 => abBoolVariable[5], xBit6 => abBoolVariable[6], xBit7 => abBoolVariable[7],
    xBit8 => abBoolVariable[8], xBit9 => abBoolVariable[9], xBit10 => abBoolVariable[10], xBit11 => abBoolVariable[11],
    xBit12 => abBoolVariable[12], xBit13 => abBoolVariable[13], xBit14 => abBoolVariable[14], xBit15 => abBoolVariable[15]);
```

Function block ModRtuMast

This Function Block is only required in the operating mode Modbus client. It handles the communication (transmission of telegrams to the servers and receipt of telegrams from the servers). The Function Block can be used for the local serial interfaces of the controller. A separate instance of the Function Block has to be used for each interface.

*ModRtuMast* is contained in the library *AC500_ModRtuMast*. 
1.5.5.1.9 Communication with Modbus TCP/IP

Protocol description

The Modbus TCP protocol is implemented in the AC500 Processor Modules.

Modbus is a master-slave (client-server) protocol. The client sends a request to the server(s) and receives the response(s).

Each Ethernet interface can work as Modbus client and server interface in parallel if required.

The Modbus operating mode of an Ethernet interface is set in Modbus on TCP/IP.

Modbus client

In this operating mode, the telegram traffic with the server(s) is handled via the Function Block ETHx_MOD_MAST. This Function Block sends Modbus request telegrams to the server(s) via the set interface and receives Modbus response telegrams from the server(s) via this interface.

The Modbus Function Blocks transferred by the client contain the following information:

- Transaction identifier for synchronization between messages of server and client (2 byte)
- Protocol identifier (0 for Modbus/TCP) (2 byte)
- Length field (Number of bytes in frame) (2 byte)
- Unit identifier (1 byte)
- Function code that defines the request of the client (1 byte)
- Data to be exchanged (n bytes)

In this operating mode, no Function Block is required for Modbus communication. Sending and receiving Modbus telegrams is performed automatically.

The AC500 CPUs process the following Modbus operation codes:

<table>
<thead>
<tr>
<th>Function code</th>
<th>HEX</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>01 or 02</td>
<td>01 or 02</td>
<td>Read n bits</td>
</tr>
<tr>
<td>03 or 04</td>
<td>03 or 04</td>
<td>Read n words</td>
</tr>
<tr>
<td>05</td>
<td>05</td>
<td>Write one bit (encoded in one word)</td>
</tr>
<tr>
<td>06</td>
<td>06</td>
<td>Write one word</td>
</tr>
<tr>
<td>15</td>
<td>0F</td>
<td>Write n bits (encoded in one byte)</td>
</tr>
<tr>
<td>16</td>
<td>10</td>
<td>Write n words</td>
</tr>
<tr>
<td>22</td>
<td>16</td>
<td>Mask write</td>
</tr>
<tr>
<td>23</td>
<td>17</td>
<td>Read/write multiple words in one telegram</td>
</tr>
</tbody>
</table>

The following restrictions apply to the length of the data to be sent:

<table>
<thead>
<tr>
<th>Function code</th>
<th>HEX</th>
<th>Max. length</th>
</tr>
</thead>
<tbody>
<tr>
<td>01 or 02</td>
<td>01 or 02</td>
<td>2000 bits</td>
</tr>
<tr>
<td>03 or 04</td>
<td>03 or 04</td>
<td>125 words / 62 double words</td>
</tr>
<tr>
<td>05</td>
<td>05</td>
<td>1 bit</td>
</tr>
<tr>
<td>Function code</td>
<td>DEC</td>
<td>HEX</td>
</tr>
<tr>
<td>---------------</td>
<td>-----</td>
<td>-----</td>
</tr>
<tr>
<td>06</td>
<td>06</td>
<td>06</td>
</tr>
<tr>
<td>15</td>
<td>0F</td>
<td>15</td>
</tr>
<tr>
<td>16</td>
<td>10</td>
<td>16</td>
</tr>
<tr>
<td>22</td>
<td>16</td>
<td>17</td>
</tr>
<tr>
<td>23</td>
<td>17</td>
<td>17</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Technical data**

Configuration of Modbus on TCP/IP is described in the chapter *Modbus on TCP/IP*.

**Modbus addresses for processor modules PM56xx**

</tbody>
</table>

Calculation of the bit variable from the hexadecimal address:

**Formula:**

\[
\text{Bit variable (BOOL)} := \%M\text{XBYTE}.\text{BIT}
\]

where:

<table>
<thead>
<tr>
<th>DEC</th>
<th>BYTE</th>
<th>BIT</th>
</tr>
</thead>
<tbody>
<tr>
<td>Decimal address</td>
<td>DEC / 8</td>
<td>DEC mod 8 (Modulo division)</td>
</tr>
</tbody>
</table>

**Examples:**

- Address hexadecimal = 16#2002
  
  
  DEC := 8194
  BYTE := 8194 / 8 := 1024
  BIT := 8194 mod 8 := 2
  Bit variable: %MX1024.2

- Address hexadecimal = 16#3016
  
  DEC := 12310
  BYTE := 12310 / 8 := 1538.75 -> 1538
  BIT := 12310 mod 8 := 6
  Bit variable: %MX1538.6

- Address hexadecimal = 16#55AA
  
  DEC := 21930
  BYTE := 21930 / 8 := 2741.25 -> 2741
  BIT := 21930 mod 8 := 2
  Bit variable: %MX2741.2

Calculation of the hexadecimal address from the bit variable:

**Examples:**

- Bit variable := %MX515.4
  
  DEC := 515 * 8 + 4 := 4124
  Address hex := 16#101C

- Bit variable := %MX3.3
  
  DEC := 3 * 8 + 3 := 27
  Address hex := 16#001B

- Bit variable := %MX6666.2
  
  DEC := 6666 * 8 + 2 := 53330
  Address hex := 16#D052
Peculiarities for accessing Modbus addresses

Peculiarities for bit access:
- A WORD in the %M area is assigned to each Modbus address 0000hex .. FFFFhex.
- Bit addresses 0000hex .. FFFFhex are contained in the word range %MW0 .. %MW4095

Areas protect from read/write access by Modbus client

As described in Configuration of Modbus TCP/IP Server - parameter disable, one write-protected and one read-protected area can be defined. If you try to write to a write-protected area or to read from a read-protected area, an exception response is generated.

Local data of the Modbus client

The address of the area from which data are to be read or to which data are to be written is specified in the Function Block ETHx_MOD_MAST or ModTcpMast at input "Data", via the ADR operator.

For the AC500, the following areas can be accessed using the ADR operator:
- Inputs area (%I area)
- Outputs area (%Q area)
- Area of non-buffered variables (VAR .. END_VAR or VAR_GLOBAL END_VAR)
- Addressable flag area (also protected areas for %M area)
- Area of buffered variables (VAR RETAIN .. END_VAR or VAR_GLOBAL RETAIN .. END_VAR)

Modbus telegrams

For a detailed description of the Modbus TCP telegrams and their elements please see the corresponding specifications on public websites.

Exception response by server

In operating mode Modbus client, the AC500 does only send requests, if the parameters at the MODMAST inputs are logically correct. Nevertheless, it can happen that a server cannot process the request of the client or that the server cannot interpret the request due to transmission errors or in case it's capabilities are exceeded in any way. In those cases, the server returns an exception response to the client. In order to identify this response as an exception response, the function code returned by the server is a logical OR interconnection of the function code received from the client and the value 80HEX.

Processing bits

Some of the Modbus function codes are used to read or write bits (coils, discrete inputs). While a variable of data type WORD can be accessed easily, accessing a stream of bits is complex.

Data type BIT must not be mixed up with data type BOOL. Variables of both types may have values ‘TRUE’ or ‘FALSE’. But while BIT means one single bit only, BOOL requires a byte (8 bit) of memory.

Modbus client

When accessing bits in a Server, the local data referred to at Client Function Blocks input data is always expected to be of format BOOL.

```plaintext
VAR
  abBoolArray : ARRAY [0..15] OF BOOL;
  ModMast : ModTcpMast;
END_VAR

abBoolArray[0] := TRUE;
```

Modbus server

Using the bit offset

The simplest way to access a certain bit within a larger variable is to directly use the bit offset (0 based; see Bit Access to Variables Chapter 1.3.1.24.4.11 “Bit access to variables” on page 565).
VAR
awWordVariable AT %M0 : ARRAY [0..7] OF WORD;
END_VAR

awWordVariable[0].0 := TRUE;
awWordVariable[7].15 := FALSE;
Defining symbolic names for the bit offsets

A more convenient way to access bits e.g. within a word is to define a symbolic name for each single offset (see Bit Access to a variable by using a global constant on page 565).

```plaintext
VAR_GLOBAL_CONSTANT
  (*bit offsets in awWordVariable[0]*)
  NameBitOffset_0_00 : INT := 0;
  NameBitOffset_0_01 : INT := 1;
  (*...*)
  NameBitOffset_0_15 : INT := 15;
  (*bit offsets in awWordVariable[7]*)
  NameBitOffset_7_00 : INT := 0;
  NameBitOffset_7_01 : INT := 1;
  (*...*)
  NameBitOffset_7_15 : INT := 15;
END_VAR

VAR
  awWordVariable AT %MW0 : ARRAY [0..7] OF WORD;
END_VAR

awWordVariable[0].NameBitOffset_0_00 := TRUE;
awWordVariable[7].NameBitOffset_7_15 := FALSE;
```
Defining a data type

A further alternative is to define your own data type according to the requirements of your particular application (see Chapter 1.3.1.25.1.14 “Object ‘DUT’” on page 735). Bit access to BIT data types (see Chapter 1.3.1.24.4.11 “Bit access to variables” on page 565).

```plaintext
TYPE ControlWordType:
  STRUCT
    NameBitOffset_00 : BIT;
    NameBitOffset_01 : BIT;
    NameBitOffset_02 : BIT;
    NameBitOffset_03 : BIT;
    NameBitOffset_04 : BIT;
    NameBitOffset_05 : BIT;
    NameBitOffset_06 : BIT;
    NameBitOffset_07 : BIT;
    NameBitOffset_08 : BIT;
    NameBitOffset_09 : BIT;
    NameBitOffset_10 : BIT;
    NameBitOffset_11 : BIT;
    NameBitOffset_12 : BIT;
    NameBitOffset_13 : BIT;
    NameBitOffset_14 : BIT;
    NameBitOffset_15 : BIT;
  END_STRUCT
END_TYPE

VAR
  atTypeVariable AT M80 : ARRAY [0..7] OF ControlWordType;
END_VAR

atTypeVariable[0].NameBitOffset_00 := TRUE;
atTypeVariable[7].NameBitOffset_15 := FALSE;
```
Defining a complex data type

In case your application requires some more complex data types you can combine data types (DUT; see Bit access to BIT data types Chapter 1.3.1.24.4.11 "Bit access to variables" on page 565).

```plaintext
TYPE ControlWord0Type :
  STRUCT
  NameBitOffset_0_00 : BIT;
  NameBitOffset_0_01 : BIT;
  NameBitOffset_0_02 : BIT;
  NameBitOffset_0_03 : BIT;
  NameBitOffset_0_04 : BIT;
  NameBitOffset_0_05 : BIT;
  NameBitOffset_0_06 : BIT;
  NameBitOffset_0_07 : BIT;
  NameBitOffset_0_08 : BIT;
  NameBitOffset_0_09 : BIT;
  NameBitOffset_0_10 : BIT;
  NameBitOffset_0_11 : BIT;
  NameBitOffset_0_12 : BIT;
  NameBitOffset_0_13 : BIT;
  NameBitOffset_0_14 : BIT;
  NameBitOffset_0_15 : BIT;
  END_STRUCT
END_TYPE

TYPE ControlWord1Type :
  STRUCT
  NameBitOffset_1_00 : BIT;
  NameBitOffset_1_01 : BIT;
  NameBitOffset_1_02 : BIT;
  NameBitOffset_1_03 : BIT;
  NameBitOffset_1_04 : BIT;
  NameBitOffset_1_05 : BIT;
  NameBitOffset_1_06 : BIT;
  NameBitOffset_1_07 : BIT;
  NameBitOffset_1_08 : BIT;
  NameBitOffset_1_09 : BIT;
  NameBitOffset_1_10 : BIT;
  NameBitOffset_1_11 : BIT;
  NameBitOffset_1_12 : BIT;
  NameBitOffset_1_13 : BIT;
  NameBitOffset_1_14 : BIT;
  NameBitOffset_1_15 : BIT;
  END_STRUCT
END_TYPE

TYPE ControlWordListType :
  STRUCT
  ControlWord0 : ControlWord0Type;
  ControlWord1 : ControlWord1Type;
  END_STRUCT
END_TYPE

VAR
  atWordListType AT &MW0 : ControlWordListType;
END_VAR

atWordListType.ControlWord0.NameBitOffset_0_00 := TRUE;
atWordListType.ControlWord1.NameBitOffset_1_15 := FALSE;
```
Pack/unpack BOOL variables

In case you prefer variables of type BOOL you can use the functions for packing and unpacking.

```plaintext
VAR
  aBooleanVariable : ARRAY [0..15] OF BOOL;
  wWordVariable0 : AT WORD WORD;
  wWordVariable1 : AT WORD WORD;
END_VAR

VAR
  Unpack : Mem.UnpackWord;
END_VAR

aBooleanVariable[0] := TRUE;

wWordVariable0 := Mem.PackBitsToWord(aBooleanVariable[0], aBooleanVariable[1], aBooleanVariable[2], aBooleanVariable[3],
                                      aBooleanVariable[4], aBooleanVariable[5], aBooleanVariable[6], aBooleanVariable[7],
                                      aBooleanVariable[8], aBooleanVariable[9], aBooleanVariable[10], aBooleanVariable[11],
                                      aBooleanVariable[12], aBooleanVariable[13], aBooleanVariable[14], aBooleanVariable[15]);

Unpack(Value := wWordVariable0,  
       xBit0 => aBooleanVariable[0], xBit1 => aBooleanVariable[1], xBit2 => aBooleanVariable[2], xBit3 => aBooleanVariable[3],
       xBit4 => aBooleanVariable[4], xBit5 => aBooleanVariable[5], xBit6 => aBooleanVariable[6], xBit7 => aBooleanVariable[7],
       xBit8 => aBooleanVariable[8], xBit9 => aBooleanVariable[9], xBit10 => aBooleanVariable[10], xBit11 => aBooleanVariable[11],
       xBit12 => aBooleanVariable[12], xBit13 => aBooleanVariable[13], xBit14 => aBooleanVariable[14], xBit15 => aBooleanVariable[15]);
```

Function block ETHx_MOD_MAST and ModTcpMast

These Function Blocks are only required for the operating mode Modbus client. It handles the communication (transmission of telegrams to the servers and receipt of telegrams from the servers). The Function Block can be used for the Ethernet interfaces of the controller.

ETHx_MOD_MAST is contained in the library Ethernet_AC500_V10.lib.

ModTcpMast is contained in the library ABB_ModbusTcp_AC500.

1.5.5.1.10 Fast counters

Fast counters in AC500 devices

For AC500 devices the function "fast counter" is available in S500 I/O modules as of firmware version V1.3.

For AC500-eCo devices the function "fast counter" is available in onboard I/Os of PM55x and PM56x.

Integrated fast counters are only available for digital I/O modules.
The digital I/O modules on the I/O bus contain two fast counters each.
If the counter is used, it needs up to 2 digital inputs and one digital output.
If the fast counter is deactivated, the inputs and outputs reserved for the counter can be used for other tasks.

See Configuration Chapter 1.5.6.2.9.8 “Fast counter” on page 3311.

A fast counter is available in the following constellations:

- In digital I/O modules, connected to an AC500 processor module.
- In AC500-eCo processor modules PM55x and PM56x with onboard I/Os.
- In CS31 and CANopen communication interface modules.
- In Modbus, PROFINET and PROFIBUS communication interface modules and in the connected digital I/O modules.
- In digital I/O modules, connected to an EtherCAT communication interface module.
The following table shows the S500 modules which contain a fast counter and which of the digital inputs and outputs are reserved for the counter.

¹) The two hardware inputs (channels A and B) are also and always available within the normal process image, irrespective of the operating mode of the counter.

²) The hardware output channel C is activated by the fast counter only in the operating modes 1 and 2.
The counter function of the CS31 communications interface module can only be activated if a bus address greater than 70 is set on the module by means of the address rotary switches. In this case, the effective bus address equals the set address minus 70, and the counter is ready for operation. Example: A set bus address of 83 means that the effective bus address = (83 - 70) = 13 and that the integrated fast counter can be used. In this case the parameter “Fast counter operating mode” may not be 0!

Especially for module DA502: The counter operating mode 101 is the same as mode 1, but the assigned output is DO0 instead of DC18. Also the counter operating mode 102 is the same as mode 2, but the assigned output is DO0 instead of DC18.

The counter function is performed within the communications interface module and, accordingly, in the digital I/O module(s). It works independently of the user program and is therefore able to respond quickly to external signals. A simultaneous counter operation of several digital I/O modules is possible.

Each module counter can be configured for one out of 10 possible modes. The desired operating mode is selected in the PLC configuration using module parameters. After that, it is activated during the initialization phase (power-on, cold start, warm start).

The data exchange to and from the user program is performed using input and output operands. While integrating a module containing a fast counter in the PLC configuration, the necessary operands are created and reserved immediately. Thus, a counter implementation carried out later on does not cause an address shift.

---

### Features independent of the fast counter operating mode

- The pulses at the fast counters' inputs or the evaluated signals of the traces A and B in case of incremental position sensors are counted.
- The counting frequencies of the communications interface modules of PROFINET, PROFIBUS and CANopen are max. 200 kHz (in modes 1 to 6), max. 50 kHz (in mode 7), max. 35 kHz (in mode 9), and max. 20 kHz (in mode 10).
- If the modules DA501, DC522, DC523, DC532, DC531-CS31, CI592-CS31 and CI590-CS31-HA are used, each counting input must be circuited externally in series with a resistor of 470 Ω / 1 W, in order to safely avoid influences from the deactivated module outputs to the connected sensors.
- The positive signal edges are counted, if not noted differently.
- By setting the operating mode 0, the counting function is switched off. In this case, the reserved inputs and outputs can be used for other tasks. Simultaneous use of these terminals for the fast counter and other signals must be avoided.
- The fast counter's actual value is provided as a double word (32 bits).
- The fast counter can count upwards in all operating modes. It counts beginning at the start value (set value) up to the end value (max. from 0 to 4,294,967,295 or hexadecimal from 00 00 00 00 to FF FF FF FF. After reaching 4,294,967,295, the counter jumps with the next pulse to 0. When the counter reaches the programmed end value, the counter output is stored permanently as CF = TRUE (end value reached). Only when the fast counter is set again (set value), CF is reset to FALSE.

---

1.5.5.2 System technology of the AC500 communication modules

1.5.5.2.1 CANopen communication modules

Triggering of event tasks with CAN-IDs

For CM598-CAN module the execution of a PLC application task can be triggered automatically by a certain event, i.e. by incoming CAN 2.0 A or CAN 2.0 B frames. For this, the PLC application task is to be configured as external event task.

**Prerequisites**

- PLC firmware version 3.2.5 and Automation Builder as of version 2.2.5.
- Only one PLC application task can be assigned to a communication module.
- Triggering of event tasks is only supported for the communication module CM598-CAN.

Every incoming CAN frame on a CM598-CAN module processes an event in the AC500 PLC. If the parameter "Trigger PLC Task" is set to TRUE, the CAN protocol task checks via the receive buffer configuration and the corresponding CAN-ID of the CAN frame whether a CAN frame is to be executed or not. Only those CAN-IDs that are configured in the protocol configuration will be processed. All other CAN frames will be rejected. If a CAN frame is to be processed, the CAN frame data is copied to the receive buffer and an event on the IEC event task is triggered.

The IEC event task will be executed for one cycle.

The IEC event task will be triggered continuously until all associated receive buffers have been emptied. Hence, ensure that the buffers are emptied by the task, otherwise the task will run into a loop.

Within the task the function block Cm598CanMsgRecEvt must be used to read the CAN frames from the receive buffers. The function block Cm598CanMsgRec is not suitable as it requires several task cycles for execution.

**CAN frame processing**

The following picture shows the sequence CAN frames processing when the triggering of event task is used.
– Only one external event task can be assigned to a CM598-CAN.
– There is only one common event for an external event task and all selected CAN-IDs. It must be evaluated which CAN-IDs have been received.
– It is possible that CAN frames are lost when necessary system resources are in use or when the CAN frames could not be processed in time due to high system load. So, the PLC application must monitor the task which consumes the events of the CAN protocol with a watchdog mechanism or something similar.
– Received CAN frames of the same CAN-ID are internally stored in FIFO buffers. Reading and writing of the FIFO buffers is not possible at the same time.
– Within an external event task the function block Cm598CanMsgRecEvt must be used to read the received CAN frames. The function block Cm598CanMsgRec is not suitable since its execution needs more than one task cycle.
– The CAN-IDs that are enabled to trigger an external event task must be read by the associated task. Otherwise the task is triggered again and again, and the CPU load will be high.

**Event task configuration**

Add the external event task that should be executed to the task configuration of the PLC application:
1. Right-click on “Task Configuration”. Enter a name for the task and click “Add object”.

2. Right-click on the new task and append a “Program Call”. This contains the program code that is executed by the task.

3. Double-click on the task and setup the task parameters.

A parameter description is given in the CODESYS task configuration § Chapter 1.3.1.25.1.38.1 “Tab ’Configuration”’ on page 839. Deviations are described in the following:

<table>
<thead>
<tr>
<th>Parameter</th>

Configuration of a CM598-CAN module is described in the configuration chapter CM598-CAN § Chapter 1.5.6.2.7 “Communication modules” on page 3286.
1.5.5.3 System technology of the communication interface modules

1.5.5.3.1 Modbus communication interface module

Overview

The Modbus TCP bus module CI52x-MODTCP is used as decentralized I/O module in Modbus TCP networks. The network connection is performed via 2 RJ45 connectors which are integrated in the terminal unit.

CI521-MODTCP I/O channels properties:

- 4 analog inputs (1.0...1.3)
- 2 analog outputs (1.5...1.6)
- 8 digital inputs 24 VDC in 1 group (2.0...2.7)
- 8 digital outputs 24 VDC in 1 group (3.0...3.7)

Functionality

</table>

CI522-MODTCP I/O channels properties:

- 8 digital configurable inputs/outputs in 1 group (1.0...1.7)
- 8 digital inputs 24 VDC in 1 group (2.0...2.7)
- 8 digital outputs 24 VDC in 1 group (3.0...3.7)
### Functionality

</tr>
</tbody>
</table>

The inputs/outputs are electrically isolated from the Ethernet network. There is no potential separation between the channels.

The configuration of the inputs/outputs is performed by software.

For usage in enhanced ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

### Modbus TCP registers

**Register layout for CI52x-MODTCP**

The registers can be divided in 4 sections:

- Information data section 0x0000 to 0x0D50 (for acyclic use)
- I/O data and diagnosis section 0x0FFA to 0x2B00 (for cyclic use)
- Parameter data section 0x3000 to 0x3B00 (for acyclic use)
- Special functionality section 0x5A00 to 0x6A00 (for acyclic use)
Information data section (Acyclic data)

The information data section can be used to read out common and module specific information. This section is read only.

*) supported from CI52x firmware version V3.2.0 (device index F0)

This section can be divided again in two sections:

- The module specific section (containing information for each module CI52x-MODTCP and expansion modules and hot swap terminal units)
- The common device information block

Module specific information registers

For each module (CI52x device, expansion modules and hot swap terminal units) the following data can be read out:

- Device and FW information
  This section consists of 20 WORDs per module and contains information on each module using the following structure:

<table>
<thead>
<tr>
<th>Data</th>
<th>DATA TYPE</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Module ID</td>
<td>WORD</td>

</tbody>
</table>

1) supported from CI52x firmware version V3.2.0 (device index F0)

2) from CI52x firmware version V3.2.0 (device index F0) “Reserved” is ARRAY [1..4] OF BYTE

- **Production / Traceability data:**
  - This section consists of 25 WORDs per module and contains the traceability data for each module using following structure:
    - Article number: Byte 01..15
    - Index: Byte 16..17
    - Name: Byte 18..29
    - Production date: Byte 30..33
    - Key number: Byte 34..38
    - Site: Byte 39..40
    - Year: Byte 41..42
    - Serial number: Byte 41..50 (The serial number implies the year)

- **Production / Traceability data from CI5x2 firmware version V3.2.0 (device index F0):**
  - This section consists of 26 WORDs per module and contains the traceability data for each module using following structure:
    - Article number: Byte 01..15
    - Index: Byte 16..17
    - Name: Byte 18..31
    - Production date: Byte 32..35
    - Key number: Byte 36..40
    - Site: Byte 41..42
    - Year: Byte 43..44
    - Serial number: Byte 42..52 (The serial number implies the year)

---

**Common device information registers**

**Common device information block**

This section consists of 80 WORDs (90 WORDs from CI52x firmware version V3.2.0 (device index F0)) and contains cluster wide information (CI52x device and connected expansion modules using the following structure:
<table>

This section can be divided again in three sections:

- Module state (containing the state of connected expansion modules and hot swap terminal units)
- Diagnosis data (containing diagnosis data in AC500 specific format)
- Process data (containing I/O data)
### Module state

The module state section consists of 44 WORDs and contains the module state of connected expansion modules and hot swap terminal units using the following structure:

<table>
<thead>
<tr>
<th>Data</th>
<th>DATA TYPE</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Module ID</td>
<td>WORD</td>
<td>Module ID of the CI52x</td>
</tr>
<tr>
<td>Expected module ID</td>
<td>WORD</td>
<td>Expected (configured) module ID of the CI52x</td>
</tr>
</tbody>
</table>
| Module state        | BYTE      | The current module state of the CI52x:  
0: NO_MOD (no module detected)  
1: MOD_INIT (module detected, module is in initialization phase)  
2: MOD_RUN (module detected and running or in failsafe state, input data are valid)  
3: WRONG_MOD (wrong module detected, module ID doesn’t match expected module ID)  
4: MOD_REMOVED (module removed or defective on hot swap terminal unit, no communication to module possible)  
5: MOD_ERROR (module defective on hot swap terminal unit, no communication to module possible)  
6: MOD_LOST (lost communication to module on not hot swap capable terminal unit)  
7: UNKNOWN (module detected but not configured) |
| Diagnosis flag      | BYTE      | Diagnosis flag for the CI52x:  
0: NO_DIAG (no diagnosis available from CI52x I/O cards)  
1: DIAGAVAILABLE (diagnosis available for CI52x I/O cards) |
| Terminal unit state | BYTE      | Terminal unit state for the CI52x:  
0: NO_HOTSWAP_TU (not hot swap terminal unit detected)  
1: HOTSWAP_TU_RUNNING (hot swap terminal unit detected and working)  
2: HOTSWAP_TU_ERROR (hot swap terminal unit detected, but communication errors for hot swap terminal unit detected) |
| Parameter state     | BYTE      | Parameter state of the CI52x:  
0: NO_PARA (module is in initialization phase and not ready for parameterization)  
1: WAIT_PARA (module awaits parameterization)  
2: PARA_RUN (parameterization running)  
3: LEN_ERR (length of parameters not correct)  
4: ID_ERR (module ID inside parameters not correct)  
5: PARA_DONE (parameterization finished without errors) |
<p>| Module ID           | WORD      | Module ID of the 1st connected expansion module |</p>
<table>
<thead>
<tr>
<th>Data</th>
<th>DATA TYPE</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td>Parameter state</td>
<td>BYTE</td>
<td>Parameter state of the 10&lt;sup&gt;th&lt;/sup&gt; connected expansion module</td>
</tr>
</tbody>
</table>
Diagnosis data

The diagnosis data section contains one diagnostic message with the following structure (according to AC500 diagnosis):

<table>
<thead>
<tr>
<th>Byte Number</th>
<th>Description</th>
<th>Possible Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Diagnosis Byte, slot number</td>
<td>31 = CI52x-MODTCP (e. g. error at integrated 8 DI / 8 DO)</td>
</tr>
<tr>
<td></td>
<td></td>
<td>1 = 1st connected S500 I/O Module</td>
</tr>
<tr>
<td></td>
<td></td>
<td>...</td>
</tr>
<tr>
<td></td>
<td></td>
<td>10 = 10th connected S500 I/O Module</td>
</tr>
<tr>
<td>2</td>
<td>Diagnosis Byte, module number</td>
<td>According to the I/O bus specification passed on by modules to the fieldbus master</td>
</tr>
<tr>
<td>3</td>
<td>Diagnosis Byte, channel</td>
<td>According to the I/O bus specification passed on by modules to the fieldbus master</td>
</tr>
<tr>
<td>4</td>
<td>Diagnosis Byte, error code</td>
<td>According to the I/O bus specification Bit 7 and Bit 6, coded error class</td>
</tr>
<tr>
<td></td>
<td></td>
<td>0 = E1</td>
</tr>
<tr>
<td></td>
<td></td>
<td>1 = E2</td>
</tr>
<tr>
<td></td>
<td></td>
<td>2 = E3</td>
</tr>
<tr>
<td></td>
<td></td>
<td>3 = E4</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Bit 0 to Bit 5, coded error description</td>
</tr>
<tr>
<td>5</td>
<td>Diagnosis Byte, flags</td>
<td>According to the I/O bus specification</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Bit 7: 1 = coming error</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Bit 6: 1 = leaving error</td>
</tr>
<tr>
<td>6</td>
<td>Reserved</td>
<td>0</td>
</tr>
</tbody>
</table>

If a diagnosis message is read out, the next one will be automatically filled in.
If no more diagnosis messages are available the buffer will be reset to zero.
This ensures that each diagnosis message can be delivered to the Modbus TCP client/slave and no diagnosis will be lost.

I/O data

The I/O data section can use two different formats according to the module parameter “I/O Mapping Structure” (see hardware description Chapter 1.5.3 “Device specifications” on page 2265 for details).

- Fixed I/O mapping
  In case of fixed I/O mapping each module has a predefined register range for each Inputs and Outputs.

- Dynamic I/O mapping
  In case of dynamic I/O mapping the mapping is build according to the actual configuration.

The dummy output at the end of the I/O data section can be used to retrigger the bus supervision and has no effect on the HW outputs.
In case of fixed I/O mapping the following predefined register table is used:

<table>
<thead>
<tr>
<th>Register (hex)</th>
<th>Description</th>
<th>Readable by Modbus function code</th>
<th>Writeable by Modbus function code</th>
</tr>
</thead>
<tbody>
<tr>
<td>1000</td>
<td>Inputs CI</td>
<td>3, 4, 23</td>
<td>x</td>
</tr>
<tr>
<td>1100</td>
<td>Inputs 1.EXP</td>
<td>3, 4, 23</td>
<td>x</td>
</tr>
<tr>
<td>...</td>
<td>...</td>
<td></td>
<td></td>
</tr>
<tr>
<td>1A00</td>
<td>Inputs 10.EXP</td>
<td>3, 4, 23</td>
<td>x</td>
</tr>
<tr>
<td>2000</td>
<td>Outputs CI</td>
<td>3, 23</td>
<td>6, 16, 23</td>
</tr>
<tr>
<td>2100</td>
<td>Outputs 1.EXP</td>
<td>3, 23</td>
<td>6, 16, 23</td>
</tr>
<tr>
<td>...</td>
<td>...</td>
<td></td>
<td></td>
</tr>
<tr>
<td>2A00</td>
<td>Outputs 10.EXP</td>
<td>3, 23</td>
<td>6, 16, 23</td>
</tr>
<tr>
<td>2B00</td>
<td>Dummy output</td>
<td>3, 23</td>
<td>6, 16, 23</td>
</tr>
</tbody>
</table>

If a certain expansion module has no inputs or outputs the corresponding registers remain empty.

In case of dynamic mapping only the start addresses of inputs and outputs are predefined:

<table>
<thead>
<tr>
<th>Register (hex)</th>
<th>Description</th>
<th>Readable by Modbus function code</th>
<th>Writeable by Modbus function code</th>
</tr>
</thead>
<tbody>
<tr>
<td>1000</td>
<td>Inputs CI</td>
<td>3, 4, 23</td>
<td>x</td>
</tr>
<tr>
<td>...</td>
<td>...</td>
<td></td>
<td></td>
</tr>
<tr>
<td>2000</td>
<td>Outputs CI</td>
<td>3, 23</td>
<td>6, 16, 23</td>
</tr>
<tr>
<td>...</td>
<td>...</td>
<td></td>
<td></td>
</tr>
<tr>
<td>2B00</td>
<td>Dummy output</td>
<td>3, 23</td>
<td>6, 16, 23</td>
</tr>
</tbody>
</table>

The register addresses of the connected expansion modules are calculated dynamically based on the number of inputs and outputs of the previous modules (each module starts directly on the next register after the previous module).

The register addresses of each module can be read out via the common device register (see Chapter 1.5.5.3.1.2.2.2 “Common device information registers” on page 3203).
The difference between fixed I/O mapping and dynamic I/O mapping is shown in the following table.

For this comparison a cluster with CI522, AX522, DC532, AX521, DC523, AO523, AI523, DI524, AX522 and DC523 is used.

<table>

</tbody>
</table>
For each connected module the following parameter data are defined (the parameters are represented as ARRAY OF BYTE):

- **Actual used parameter for each module**
  In these sections the actual parameters are stored. This section is also used to write parameters to the module (For a description on how to parameterize see Chapter 1.5.5.3.1.3.2 “Parameterization” on page 3220).

- **Stored parameters for each module**
  If the module has stored nonvolatile parameters these can be read out using the corresponding registers.

The controlword/statusword is used to trigger a parameterization process. The single bits have the following meaning:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>End of parameterization use parameters</td>
</tr>
<tr>
<td>1</td>

</tbody>
</table>

The direction of the first 8 bits is client to server (master to slave).

The direction of the second 8 bits is server to client (slave to master). A description of the bits can be found in chapter behavior Chapter 1.5.5.3.1.3.2 “Parameterization” on page 3220.

The parameter register sections (actual and stored parameters) have the structure as explained in the hardware description of the corresponding module Chapter 1.5.3 “Device specifications” on page 2265.

Parameters of connected expansion modules

The parameters of the connected expansion modules are represented as byte array (the parameters valid for "CPU" in the hardware description of the corresponding module are used $\forall$ Chapter 1.5.3 “Device specifications” on page 2265):

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Additional Info</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Module ID (high byte)</td>
<td>Fixed, see hardware description of corresponding module (the module ID of FBP is used) $\forall$ Chapter 1.5.3 “Device specifications” on page 2265</td>
</tr>
<tr>
<td>1</td>
<td>Module ID (low byte)</td>
<td>Fixed, see hardware description of corresponding module (the module ID of FBP is used) $\forall$ Chapter 1.5.3 “Device specifications” on page 2265</td>
</tr>
<tr>
<td>2</td>
<td>Ignore module</td>
<td>Reserved must be 0</td>
</tr>
<tr>
<td>3</td>
<td>Length of following parameter block</td>
<td>Fixed, see hardware description of corresponding module $\forall$ Chapter 1.5.3 “Device specifications” on page 2265</td>
</tr>
<tr>
<td>4...</td>
<td>The rest of the parameter are described in the corresponding module</td>
<td></td>
</tr>
</tbody>
</table>

Special functionality

This section contains special services like firmware update or single parameterization.

<table>

Behavior

IP address assignment

The delivery IP address of the CI52x-MODTCP is 192.168.0.xx (xx is the hardware address switch position of the device.

The devices support BOOTP, DHCP and fixed IP address setting (these can be set individual or together). If BOOTP and DHCP are enabled the following priority takes place:

- If DHCP configuration fails, the device will fall back to BOOTP.
- In case of a BOOTP failure, the fixed IP address will be used.

A new IP address (or changing of BOOTP and DHCP) can be set in two different ways:

- With the address switches of the corresponding module
- With the IP Configuration Tool

Using the address switches

With the address switches only the last byte of the IP address can be changed. The IP address can only be set via the address switches in case of factory default or in case of the last byte of the IP address is set to zero with the IP Configuration Tool. The not allowed IP addresses are mapped as followed:

- Address switch position 255 is mapped to fixed IP 192.168.0.254 independent of other stored settings (by IP Configuration Tool). This is a backup so the module can always get a valid IP address and can be configured by the IP Configuration Tool.
- Address switch position 0 is mapped to last byte equal 1 and DHCP enabled.

Using the IP configuration tool

With the IP Configuration Tool a network scan can be executed, and the found devices can be assigned with new settings, e.g. enable BOOTP or DHCP and set a new fixed IP. If the last byte of the IP address of the CI52x-MODTCP devices is set to 0 with the IP Configuration Tool the address switch position is used instead (see Chapter 1.5.5.3.1.3.1.1 “Using the address switches” on page 3219).
Parameterization

The parameterization is done via the corresponding registers explained in the Modbus TCP registers “Parameter data (Acyclic data)” on page 3212.

In addition to that the parameters can be directly transferred via Automation Builder (see documentation of Automation Builder for that).

There are two different parameter sections with different behaviour.

**Actual used parameters**

After startup this section contains the following data:

- Default parameters (only module id and parameter length set all others zero) if no valid stored parameters are available (no or invalid parameters stored).
- Actual used / stored parameters if valid parameters are stored nonvolatile.

These parameters can be read out and changed by reading or writing of the corresponding registers, but will not be used automatically after writing them, the use of new written parameters has to be triggered by writing the parameter control word with the corresponding bits set (see below).

**Stored parameters**

This section always contains a copy of the nonvolatile stored parameters, if no parameters are stored nonvolatile this sections will be 0.

**Controlword/statusword parameter**

This parameter can be used to trigger and save new parameters.

The direction of the first 8 bit is client to server (master to slave). The direction of the second 8 bits is server to client (slave to master).

**Cyclic I/O data exchange**

The I/O data can be exchanged cyclic by the master by reading, writing the corresponding registers.

I/O data exchange is only possible after successful parameterization of the device.

For writing of outputs **bus failure detection** can be activated by setting the corresponding parameter. This bus failure detection is described in the following chapter.

**Bus failure detection**

If the parameter "*timeout*" in the module parameters of the CI52x-MODTCP is set, the module will supervise the Modbus TCP "write telegrams".

After the first "write telegram" the bus will be supervised. If no new "write telegram" arrives at the CI52x-MODTCP within the configured time, the module will detect a bus failure and switch off its outputs or switch them to the configured failsafe state (see module parameter "Failsafe CI521" and "Failsafe CI522" for details § Chapter 1.5.3.7.4.1.7 “Parameterization” on page 2918 § Chapter 1.5.3.7.4.2.7 “Parameterization” on page 2947).
With the module parameters “Master IP”- “Master IP 7” it is possible to set write restrictions on the CI52x-MODTCP device. If none of the parameters is set, all masters / clients in the network have read and write rights on the CI52x-MODTCP device and its connected expansion modules. If at least one parameter is set only the configured masters / clients have write rights on the CI52x-MODTCP device. All other masters / clients still have read access to the CI52x-MODTCP device.

Diagnosis behavior

Each diagnosis message signals if this error is coming or going, so it is possible to create a list in the master of actual pending diagnosis. Diagnosis messages will be transferred again after a bus failure detection and reconnection. Diagnosis messages can be read out with function code 3,4,23. Function codes 3 and 4 can always read out diagnosis messages, function code 23 can only read out after successful parameterization of the device. See also table “Chapter 1.5.5.3.1.2.3.2 “Diagnosis data” on page 3208.

Single parameterization

The single parameterization services can be used to read or write parameters during runtime of device without the need of triggering a new parameterization process. For indexes used for single parameterization services see parameter lists in section Modbus TCP registers of this document. The read and write parameterization services are explained below, for each module (CI52x-MODTCP and connected expansion modules) a different section for read and write is defined (see chapter Modbus TCP registers in this document). Both services are using the following data structure:

The length of the read / write service depends on the count of parameters that should be transferred (length = 4+ count*8).

Reading of single parameters

The read single parameterization works in two steps:

- Writing of a request list containing the indexes that should be read using the structure explained above.
  Only CNT and PARA_IDX has to be set.
  Up to 5 parameters can be requested with one telegram.
  The length of the write service depends on the count of parameters that should be transferred (length = 4+ count*8).
- Reading of the parameters list with the same length then the previous write request.
  If the internal reading process inside the CI52x-MODTCP device is done the data will be read out.
  If the internal reading process inside the CI52x-MODTCP device is not yet finished the read service will be rejected with Modbus TCP exception code 6 (device busy).
Writing of single parameters

For writing of single parameters only one step is necessary, the parameters are transferred with one write request using the structure described above.

The length of the write service depends on the count of parameters that should be transferred (length = 4 + count*8).

In case of write of single parameters the following values have to be set:

- CNT: number of parameters to be set
- And for each parameter:
  - Parameter index
  - Parameter length
  - New parameter value

Written single parameters are not stored volatile and not stored nonvolatile. That means after a bus reconnection or power cycle the written parameters will be discarded.

Commissioning example

Set IP Address:

- The setting of the IP address is the first step to integrate the CI52x-MODTCP devices into a running system.
- The setting of the IP address of the CI52x-MODTCP devices is described in the chapter "Chapter 1.5.5.3.1.3.1 "IP address assignment" on page 3219 in this document.

Set Parameters (optional read parameters):

- The second step in configuring the CI52x-MODTCP devices is to set the module and channel parameters.
- A read of parameters is optional but can be used to get the module IDs and the parameter length.
- The reading and or writing of parameters is described in chapter "Chapter 1.5.5.3.1.3.2 "Parameterization" on page 3220.

Set Control Word:

- After setting the parameter data these have to be activated by writing the control word.
- The meaning and usage of the control word is described in chapter "Chapter 1.5.5.3.1.3.2 "Parameterization" on page 3220.

Exchange data:

- After setting and activating the parameters the CI52x-MODTCP device is ready for data exchange.
- The registers for data exchange are described in chapter "Chapter 1.5.5.3.1.2.3 "I/O / Process data and diagnosis section (Cyclic data)" on page 3205.

Hot swap

With hot swap for AC500 and S500 it is possible to exchange expansion modules (with same type) during runtime.

Preconditions for using hot swap

Information about preconditions for using hot swap see "Hot swap" on page 2312.
## Compatibility of hot swap

<table>
<thead>
<tr>

</tr>
<tr>
<td>Diagnosis of hot swap capability of I/O module mounted on hot swap terminal unit</td>
<td>Information can be obtained by reading Modbus registers in the communication interface module. Those Modbus registers contain: ● Diagnosis in case that a not hot-swap-pable I/O module is plugged on a hot swap terminal unit ● Diagnosis In case that in a mixed configuration with at least one hot swap terminal unit an I/O module, that must not be used in a hot swap configuration, is mounted on any terminal unit of the configuration ● Production data and version index of the modules</td>
</tr>
<tr>
<td>Diagnosis while hot swap module is pulled or module (mounted on hot swap terminal unit) has stopped working</td>
<td>Diagnosis is available in Modbus registers in the communication interface module</td>
</tr>
<tr>
<td>Input state in process image of controller while module is pulled or module is not operational</td>
<td>Input = ZERO</td>
</tr>
<tr>
<td>Diagnosis after plugging the I/O module on the hot swap terminal unit</td>
<td>Diagnose &quot;diagnosis gone&quot; is available in Modbus registers in the communication interface module</td>
</tr>
</tbody>
</table>
System behavior

If an expansion module is removed or defective during run time, the input data of this module will be set to “0” and the module state will be set to the corresponding value (see Chapter 1.5.5.3.1.3 “I/O / Process data and diagnosis section (Cyclic data)” on page 3205). A diagnosis message will be created in that case (see hardware description of CI521-MODTCP / CI522-MODTCP for diagnosis messages Chapter 1.5.3.7.4.1 “CI521-MODTCP” on page 2898 Chapter 1.5.3.7.4.2 “CI522-MODTCP” on page 2938).

In case a module is replaced, the new module will automatically be parameterized with the last parameters of the removed module (if single parameters were written to the previously removed module, this parameters will be ignored).

During pulling or plugging of a certain module, all other module will continue to operate with one limitation: The reaction time of modules connected to the right of the affected module will be bigger in that case (up to 50 ms).

If the bus failure detection is active for CI52x and failsafe is configured (see Chapter 1.5.5.3.1.3.3 “Cyclic I/O data exchange” on page 3221) the following behavior applies if a module is removed and replugged during failsafe condition:

- Last value configured for output:
  - After a bus failure is detected, failsafe will be activated and the output will remain at its last value.
  - If the module is removed and plugged again, the output will remain off, and not be kept its last value, as the last value of the new module is “0” in that case.

- Substitute value configured for output:
  - After a bus failure is detected, failsafe will be activated and the output will be according to the configured substitute value.
  - If the module is removed and plugged again now, the output will be set according to the configured substitute value again.

- Substitute value for x seconds configured for output:
  - After a bus failure is detected, failsafe will be activated and the output will be according to the configured substitute value for the configured time.
  - If the module is removed and plugged again now, the output will be set according to the configured substitute value again, and the configured time starts again.

Mandatory rules for hot swapping

Mandatory rules for hot swapping:

- Between two pull and / or plug operations of I/O modules a pause of at least 1 second must be observed.
  - That means if a module is pulled or plugged there has to be at least a break of 1 second before the next module is pulled or plugged.

- At boot up of CI52x all configured expansion modules have to be physically available.
  - Start up with missing modules is not supported.

- In the application program it is possible to detect if a hot swap terminal unit is mounted in a specific position on the I/O bus. The information is available in the common device information registers. These can be accessed when the version of the communication interface module supports hot swap.
  - This has to be checked by application:
    Best way for checking if a hot swap terminal unit is available or not, is reading out the common device information registers (see Chapter 1.5.5.3.1.2.2 “Information data section (Acyclic data)” on page 3202). If the CI52x rejects this read out the CI52x doesn’t support hot swap at all.
1.5.5.3.2 PROFINET communication interface module

Hot swap

With hot swap for AC500 and S500 it is possible to exchange expansion modules (with same type) during runtime.

Preconditions for using hot swap

Information about preconditions for using hot swap see “Hot swap” on page 2312.

<td>Input = ZERO</td>
</tr>
<tr>
<td>Diagnosis after plugging of the I/O module on the hot swap terminal unit</td>
<td>PROFINET channel diagnosis is generated together with standard &quot;plug alarm&quot; which must be acknowledged</td>
</tr>
</tbody>
</table>

System behavior

If an expansion module is removed or defective during run time, the input data of this module will be set to “0” and the module state will be set to the corresponding value. A diagnosis message will be created in that case (see hardware description of CI501-PNIO / CI502-PNIO for diagnosis messages Chapter 1.5.3.7.5.2 “CI501-PNIO” on page 2965).

In case a module is replaced, the new module will automatically be parameterized with the last parameters of the removed module (if single parameters were written to the previously removed module, this parameters will be ignored).

During pulling or plugging of a certain module, all other module will continue to operate with one limitation: The reaction time of modules connected to the right of the affected module will be bigger in that case (up to 50 ms).

If the bus failure detection is active for CI50x and failsafe is configured the following behavior applies if a module is removed and replugged during failsafe condition:
● Last value configured for output:
  – After a bus failure is detected, failsafe will be activated and the output will remain at its last value.
  – If the module is removed and plugged again, the output will remain off, and not be kept its last value, as the last value of the new module is “0” in that case.
● Substitute value configured for output:
  – After a bus failure is detected, failsafe will be activated and the output will be according to the configured substitute value.
  – If the module is removed and plugged again now, the output will be set according to the configured substitute value again.
● Substitute value for x seconds configured for output:
  – After a bus failure is detected, failsafe will be activated and the output will be according to the configured substitute value for the configured time.
  – If the module is removed and plugged again now, the output will be set according to the configured substitute value again, and the configured time starts again.

Mandatory rules for hot swapping

Mandatory rules for hot swapping:
● Between two pull and / or plug operations of I/O modules a pause of at least 1 second must be observed.
  – That means if a module is pulled or plugged there has to be at least a break of 1 second before the next module is pulled or plugged.
● At boot up of CI50x all configured expansion modules have to be physically available.
  – Start up with missing modules is not supported.
● In the application program it is possible to detect if a hot swap terminal unit is mounted in a specific position on the I/O bus. The information is available in the process data area or can be read out via acyclic read. These can be accessed when the version of the communication interface module supports hot swap.
  – This has to be checked by application:

Best way for checking if a hot swap terminal unit is available or not, is checking the corresponding information inside the process image.

1.5.6 Configuration in Automation Builder for AC500 V3 products

1.5.6.1 General settings

This chapter describes the device configuration of AC500 product family with Automation Builder. Basic information on Automation Builder handling can be found in the Getting Started § Chapter 1.1 “Getting started” on page 14.

1.5.6.1.1 Project handling

What is a project?
● A project contains the objects that are necessary for the creation of a control program (‘application’):
  – Pure POU's, for example programs, function blocks, functions, GVLs.
  – Objects that are additionally required in order to be able to execute the application on a PLC. For example, task configuration, library manager, symbol configuration, device configuration, visualizations, external files.
● You can program several applications and connect several control devices in a project.
● CODESYS manages device-specific and application-specific POU’s in the “Devices” view (‘Device tree’), project-wide available POU’s in the “POU’s” view.
● For the creation of projects there are templates that already contain certain objects.
Basic configurations and information for the project are defined in the “Project Settings” and the “Project Information”. For example:

- Compiler settings
- User management
- Author
- Data for the project file.

There are settings for the version compatibility of the project in the configuration dialog boxes for the “Project Environment”.

- You save a project as a file in the file system. Optionally you can pack it together with project-relevant files and information in a project archive. Saving in a source control system such as SVN is also possible.

- Each project contains the information regarding the CODESYS version with which it was created. If you open it in another version, CODESYS will draw your attention to possible or necessary updates with regard to file format, library versions, etc.

- You can compare, export or import projects and create documentation for them.

- You can protect a project against change and completely, i.e. also against reading. By using a user management system you can purposefully control access to the project and even to individual objects in the project.

Creating a new project

1. Select “File → New Project”.
   - If the used Automation Builder version is not the latest version, an information is displayed.

2. • Select “Change to newest installed version” to create a project with the latest installed version of Automation Builder.
   • Select “Continue to work with version: XXX” to create a project in the current software version.

3. Select “AC500 project”, enter a project name and specify the storage location for the new project.

   With “Empty project” a project without a PLC is created.
4. Select the device type for the new project and click [Add device].

The new project is created and can be configured.

Opening and updating an existing project

**NOTICE!**
Risk of damaging Automation Builder projects!
Projects created with Automation Builder are incompatible with CODESYS V2.3.9.x. Do not open projects with CODESYS V2.3.9.x as this can cause corrupted Automation Builder projects.

Automation Builder performs an integrity check for the PLC configuration before generating the configuration.

Opening an existing project

1. Select “File ➔ Open Project”.
   ⇒ The “Open Project” dialog appears.
2. Select the existing project from the file system.
   ⇒ Automation Builder switches to the version of the project and opens the project.

**Updating an existing project**

With opening an existing project Automation Builder automatically detects the project version. In case of an outdated project version you are asked, whether the project shall be updated.

- If you confirm the update, the project is automatically updated to the latest Automation Builder version.
- If you decline the update, the outdated version is kept. To update the project at a later date, select “Project ⇒ Update Project”.
  Automation Builder updates the complete project (complete device tree) to the latest version. Success messages, warnings and errors are described in the section “All messages”.

> To keep an older project, it must be opened with the same Control Builder Plus/Automation Builder version the project has been created. For this, the appropriate Control Builder Plus/Automation Builder profil must be selected.

> In this mode, new Automation Builder features cannot be used.

> It is not possible to downgrade a project to an earlier Automation Builder version.

> Automation Builder performs an integrity check for the PLC configuration before generating the configuration.

To update all devices of an existing PLC project, right-click the PLC node and select “Update objects”. In the dialog enable “update subtree” option to update all sub-objects. Otherwise only the Processor Module object is updated.

To update a specific device only, the command “Update objects” can be executed individually at the specific node.

**Exporting and importing project**

Configuration of a complete PLC or single devices can be reused within the same project by copy-and-paste the desired nodes in the device tree.

> Imported project parts can only be imported in the same Automation Builder version.

> Automation Builder performs an integrity check for the PLC configuration before generating the configuration.

**Project export**

From the menu, select “Project ⇒ Export ⇒ Project”. Select the objects that should be added to the export file.
“One file per subtree”: If this option is activated, all objects belonging to the same subtree will be exported into the same export file, otherwise a separate file will be created for each particular object.

Project import

In order to compare projects, check differences and only adapt the necessary changes, a command for importing and comparing projects has been introduced in Automation Builder.

The project comparison is a premium feature. Users with a basic or standard licence see no comparison.

Project import without comparison function

From the menu, select “Project ➔ Import ➔ Project”.

In the dialog, select the *.export file from the file system and press [Open] to import the project file.

If the version of the export file is not identically to the version of the project an import is not possible. An error message appears.

Project import with comparison function

Below are scenarios/behavior of the command providing a project is already exported using Automation Builder export command.
1. Import already exported (*.export) file using import command.

2. Once file is imported, a compare view is shown. If current project is same as imported then projects are equal message is shown to the user. Left pane is for current project and right pane is for imported.

3. If current project is empty, then imported project is compared with empty project only. Left pane would be blank in this case.
4. If there is a difference between current and imported projects, then difference is highlighted in red.

5. If anything is added in current project (/not available in imported) is highlighted in green.

6. If imported project is having any extra module which is highlighted in blue (other way indicates that extra module is deleted from current project).
7. If user wants to adapt only changed nodes from imported project then the user can select only that node and accept it (“Accept Block”/“Accept Single”) and this operation updates left pane project (which is current project). The “Project Comparison - Differences” is completed and the changes are accepted when the dialog is closed with the small yellow marked “x”. The changes will be saved and reflected in device tree.
8. If any safety modules are present in imported project then, a login dialog box is appeared, and user has to enter credentials.

If correct credentials are entered and click “OK”, safety modules are added. On click of “Cancel”, safety modules are omitted.

I/O mapping export and import

Export I/O mapping
To exchange information on I/O mapping only, data can be exported as .csv file. This allows maintenance of I/O data outside Automation Builder, e.g. in MS Excel.

Right-click the “Processor Module” node or “I/O Bus” node in the device tree and select “Export -> I/O mapping”. To export the I/O Mapping for the complete project, e.g. with more than one configured Processor Modules, I/O data of the complete project can be exported “Project -> Export -> I/O mapping”.

Import I/O mapping
A previously exported .csv file can be imported to the project: “Project -> Import -> I/O mapping”.

Comparing projects

You can compare the currently open project with another project – a reference project. The differences in contents, properties, or access rights are detected and shown in a comparison view.

Clicking “Project ➤ Compare” opens the “Project Compare” dialog for you to configure and run the comparison. Then the result is shown in the comparison view “Project Compare - Differences” where the objects are aligned in a tree structure. Objects that indicate differences from the respective reference object are identified by colors and symbols. This is how you detect whether or not the contents, properties, or access rights are different.

For differences in the contents, you can also open the detailed compare view “Project Compare - <object name> Differences” in order to zoom into the object. In the detailed compare view, the contents of the object and reference object are displayed or their source code aligned. The detected differences are marked. Previously opened views are not closed. In this way, you can have any number of comparison views open and read them, in addition to the project compare view.

You can accept the detected differences from the reference project into the current project. This is possible only from the reference project into the open project. To do this, you activate differences (for example in the code) that should be accepted in the current project with the commands ✅, ✗, or ☐ in the active comparison view for accepting. These positions are highlighted in yellow. Make sure that any other open compare views are inactive (write-protected, read-only), therefore, you can activate differences to be accepted in exactly one comparison view only. When exiting the active compare view, if you confirm that the differences that are activated for acceptance are actually accepted into the current project, then the current project is modified.

In order to exit the project comparison completely, close the project compare view.

Creating a comparison view

Requirement: You have made changes in your current project and wish, for example, to compare it with the last-saved version. In the meantime, for example, you have added further POU’s, removed a POU, changed single lines of code or the object properties in function blocks.

1. Select the command “Project ➤ Compare”.
   ⇒ The “Project Comparison” dialog box opens.
2. Enter the path to the reference project, for example the path to the last-saved version of your current project.
3. Leave the activation of the comparison option “Ignore Spaces” as it is.
4. Click on “OK”.
   ⇒ CODESYS opens the comparison view. Title: “Project Comparison – Differences”.
   The Device trees of the current project and the reference project are displayed alongside each other and the changed objects are marked in color.
5. Select an object marked in blue in the tree of the reference project (right). The current project no longer contains this object.
   Click on ✅“Accept Single”
   ⇒ CODESYS adds the object to the tree of the current project (left). The line has a yellow background. ✗ appears in the middle column.
6. Select an object marked in green in the tree of the current project (left). The reference project does not contain this object.
   Click on ✗“Accept Single”
   ⇒ CODESYS removes the object again from the tree of the current project (left). The line has a yellow background. ☐ appears in the middle column.
7. If CODESYS detects changes in the content of an object that is contained in both the current project and the reference project, this is indicated by red lettering. You can then switch to the detailed comparison view for the object by double-clicking on the object.
8. Close the comparison view and answer the query whether the changes made are to be saved with “Yes”.
   ⇒ The changes become effective in the project.

Opening the Detailed Compare View

Requirement: For example, a user modified the code in a POU of the current project. You have performed the project comparison by clicking “Project ➤ Compare”. The project compare view shows this POU highlighted in red in the aligned in the project tree.

1. Double-click the line of the aligned POU versions.
   ⇒ The compare view switches to the detailed compare view of the POU. The modified code lines are highlighted in gray and written in red.

2. Click .
   ⇒ Code lines with changes (red) are extended by two lines: an line with insert (left, green) and a line with delete (right, blue).

3. Click again.
   ⇒ The code line is marked again as modified.

4. Move the mouse pointer to the code line marked as modified and click ✓ “Accept Single”.
   ⇒ The code line from the reference project is activated for acceptance into the current project.

5. Click .
   ⇒ The project compare view opens for the entire project. It is write-protected (read-only) to prevent you from activating differences for acceptance. The link highlighted in yellow above the tree view also indicates this.

6. Click the link: “Project compare view is read only because there are uncommitted changes in another view. Click here to switch to the modified view.”
   ⇒ The detailed compare view opens again. The unconfirmed changes are highlighted in yellow.

7. Click × in the tab of the view and confirm that the changes should be saved.
   ⇒ The detail project view is closed and the POU is overwritten. Now it corresponds to the POU of the reference project. The project view is active again so that you can continue working with project compare.

If you do not click the link, but click × instead to close the editor of the project compare view, then you will also confirm the acceptance of changes into the current project. The detail changes are accepted and then the project compare is closed completely.

Project archive

Automation Builder supports the creation and the import of project archive files. Archive files contain all relevant project data including the PLC configuration, the project files of the CODESYS and all device descriptions. This allows exchanging Automation Builder projects without taking care of the target environment.
Creation of an archive

☐ The following steps describe the creation archive file from an Automation Builder project:
1. Select "File ➔ Project Archive ➔ Save/Send Archive".
2. Select the information which should be included in the archive file from the list box.

<table>
<thead>
<tr>
<th>Section/Control</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Information</td>
<td>Options</td>
<td>Not supported</td>
</tr>
<tr>
<td>selection list box</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Referenced devices</td>
<td></td>
<td>The referenced devices can be selected by expanding the &quot;Referenced devices&quot; item of the list box. It is strongly recommended to include all devices in the project archive to maintain consistency.</td>
</tr>
<tr>
<td>Additional files</td>
<td>-</td>
<td>Not supported</td>
</tr>
<tr>
<td>Comment</td>
<td>-</td>
<td>Opening a control window which allows the input of a comment to the project archive.</td>
</tr>
<tr>
<td>Save</td>
<td>-</td>
<td>Opening a dialog window to determine the path and the file name of the project archive and storing it to the file system.</td>
</tr>
<tr>
<td>Send</td>
<td>-</td>
<td>Not supported</td>
</tr>
<tr>
<td>Cancel</td>
<td>-</td>
<td>Canceling the operation and closing the dialog window.</td>
</tr>
</tbody>
</table>

With [Comment] additional information can be added to the project archive, for example to add a brief description or some information concerning the project.

3. Proceed with [Save...].

It is strongly recommended to keep the default settings.

Section “Options” of the list box is not support. Do not enable this option.

Extraction of an archive

The currently loaded project will be closed automatically when extracting the selected project archive. It is recommended to open a new instance of Automation Builder before starting the extraction process.
The following steps describe the extraction of an archive file and the import to Automation Builder.

1. Select “File ➔ Project Archive ➔ Extract Archive”.
2. Select the desired project file and click [Open].

<table>
<thead>
<tr>
<th>Section/Control</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Locations</td>
<td>Extract into the same folder where the archive is located</td>
<td>The project archive will be extracted to the same path where the archive is located.</td>
</tr>
<tr>
<td></td>
<td>Extract into the following folder</td>
<td>Path to which the project archive should be extracted.</td>
</tr>
<tr>

<td>Displaying comments included inside the Project archive file.</td>
</tr>
<tr>
<td>Extract</td>
<td></td>
<td>Triggering the extraction process. Automation Builder extracts the archive and creates a project from out the archive. After creating the project Automation Builder checks the version of the project. If the project version and the activated Automation Builder version is not identical the workflow is the same as described in &quot;Opening an Existing Project&quot;.</td>
</tr>
<tr>
<td>Cancel</td>
<td></td>
<td>Closing the “Extract Project Archive” dialog and canceling the extraction process.</td>
</tr>
</tbody>
</table>

### 1.5.6.1.2 User and access rights management

#### User and access rights

The 'User Management' provide functions for defining user accounts and configure the access rights within a project. The rights to access project objects via specified actions are assigned only to user groups, not to a single user account. So each user must be member of a group.

#### User management

Before setting up users and user groups, notice the following: The configuration of users and groups is done in the Project Settings dialog > Chapter 1.5.6.1.2.3 “Project Settings - Users and groups” on page 3243.

- Automatically there is always a group "Everyone" and by default primarily each defined user or other groups are members of this group. Thus each user account at least automatically is provided with defined default settings. Group "Everyone" cannot be deleted, just renamed, and no members can be removed from this group.
- Also automatically there is always a group "Owner" containing one user "Owner". Users can be added to or removed from this group, but at least one user must remain. This group also cannot be deleted and always has all access rights. Thus it is not possible to make a project unusable by denying the respective rights to all groups. Both group and user "owner" might be renamed.
- When starting the programming system resp. a project, primarily no user is logged on the project. But then the user optionally might log on via a defined user account with user name and password in order to have a special set of access rights.
Notice that each project has its own user management!

So, for example to get a special set of access rights for a library included in a project, the user must separately log on to this library. Also users and groups, set up in different projects, are not identical even if they have identical names.

CAUTION!

The user passwords are stored irreversibly!

If a password gets lost, the respective user account gets unusable. If the "Owner"-password gets lost, the entire project might get unusable!

Access right management

User management in a project is only useful in combination with the access right management. Notice the following:

- In a new project basically all rights are not yet defined explicitly but set to a default value. This default value usually is: "granted".
- In the further run of working on the project each right can be explicitly granted or denied resp. set back to default. The access right management of a project is done in the Permissions dialog “Permissions” on page 3242.
- Access rights on objects get "inherited". If an object has a "father" object (example: if an action is assigned to a program object, that is inserted in the structure tree below the program, then the program is the "father" of the action object), the current rights of the father automatically will become the default settings of the child. Father-child relations of objects concerning the access rights usually correspond with the relations shown in the POUs or Devices tree and are indicated in the Permissions dialog by the syntax "<father object>.<child object>".

Example

Action ACT is assigned to POU object PLC_PRG. So in the POUs window ACT is shown in the objects tree indented below PLC_PRG. In the Permissions dialog ACT is represented by "PLC_PRG.ACT" indicating that PLC_PRG is the "father" of ACT. If the "modify" right would be denied explicitly for PLC_PRG and a certain user group, the default value of the "modify" right for ACT automatically also would be "denied".

User management commands

The 'User Management UI' plug-in provides commands for command category 'User Management'.

These are used for:

- Configuration of access rights on the project objects
- Logging on or off to/from the project via a defined user account in order to get the access rights which are associated to this account

The configuration of user accounts and groups is done in the Project Settings subdialog User Management “Chapter 1.5.6.1.2.3 “Project Settings - Users and groups” on page 3243.

By default the following commands are part of submenu 'User Management' in the 'Project' menu: Logon, Logoff, Permissions.

Logon

Symbol: 

This command opens the Logon dialog for logging on to a project or library via a defined user account.
Logging on with a certain user account means to log on with those object access rights which are granted to the group which the user belongs to. The configuration of user accounts and groups is done in the Project Settings subdialog User Management.

To log on select the project or an included library from the selection list in the Project/Library field. Enter User name and Password of a valid user account, noticing that each project or library has an own user and access rights management. Log on with OK.

If already another user is logged on the project, this one will be logged out automatically by the new log-on action.

When you are logged on to a project or library and try to perform an action for which you have no right, automatically a Logon dialog will be opened, giving the possibility to log on with another user account provided with the appropriate rights.

The status bar always displays which user currently is logged on the project.

Logoff

Symbol: 

This command logs off the currently logged on user. If no user had been logged on to the currently opened project or to a referenced library an appropriate message will appear when trying to log off.

If the user currently is logged on to more than one project or referenced library (not necessarily with the same user account) a Logoff dialog will appear when trying to log off.

From the Project/Library selection list choose those project/library for which you want to log off.

The name of the Current user is displayed just for information.

The status bar always displays which user currently is logged on the project.

Permissions

This command opens the Permissions dialog, where the rights to work on objects or to perform commands in the current project can be configured.

Any changes made in this dialog will be applied immediately.
The Actions window displays all possible rights, that is, all actions which might be performed on any object of the current project.

The tree is structured in the following way:

- **Top-level** see the names of some categories, which have been set up just for the purpose of optical structuring the rights management. They are grouping concerning the execution of Commands, the configuration of User accounts and Groups, the creation of Object Types, the viewing, editing, removing and handling of child objects of Project Objects.

- **Below each category node** there are nodes for the particular actions which might be performed on the command, user account, group, object type or project object. These nodes also only have optical function. Possible Actions:
  - execute (execution of a menu command)
  - create (creating a new object in the current project)
  - add or remove children (adding or removing of "child" objects to an existing object)
  - modify (editing an object in an editor)
  - remove (deleting or cutting an object)
  - view (viewing an object in an editor)

Below each action node find the possible targets, that is project objects, of the respective action.

The Permissions window provides a list of all currently available user groups (except the "Owner" group) and a toolbar for configuring rights to a group.

Select the group and configure it’s permissions.

Left to each group name one of the following icons indicates the currently assigned permission concerning the target which is currently selected in the Actions window:

- The action(s) for the target(s) currently selected in the Actions window are granted for the selected group.
- The action(s) for the target(s) currently selected in the Actions window are denied for the selected group.
- The right to perform the action(s) which are currently selected for the selected target(s) in the Actions window, has not been granted explicitly, but is granted by default, for example because the corresponding right has been granted to the "father" object. (Example: The group has got the right for object "myplc", thus it by default also has got it for object "myplc.pb_1".) Basically this is the default setting for all rights which not explicitly have been configured.
- The right to perform the action(s) which are currently selected for the selected target(s) in the Actions window, has not been denied explicitly, but is denied by default, for example in case because the corresponding right has been assigned to the "father" object.

If currently multiple actions are selected in the Actions window, which do not have unique settings referring to the currently selected group, no icon will be displayed.

To configure the rights for a group select the desired action(s) and target in the Actions window and the desired group in the Permissions window. Then use the appropriate button in the toolbar of the Permissions window:

- Grant: Explicit granting.
- Deny: Explicit denying.
- Clear: The currently granted right for the action(s) currently selected in the Actions window will be deleted, that is set back to the default.

**Project Settings - Users and groups**

The Project Settings dialog in category 'Users and Groups' provides three subdialogs for the user management for the current project: Users, Groups, Settings. For a general description on users and access rights management see help page "Chapter 1.5.6.1.2.1 “User and access rights” on page 3240."
Users dialog

The currently registered users are listed in a tree structure. The ownerships of each user is displayed and each user is a member of a group by default. Chapter 1.5.6.1.2.1 "User and access rights" on page 3240.

Define a new user account

1. Click “Add” to open the “Add User” dialog.
2. Define the user credentials and click OK to set up the new user. If there are incorrect entries (no login name, password mismatch, user already existing) you will get an appropriate error message.

Modify a user account

Click “Edit” to open the “Edit User” dialog. The entry fields are the same as in the “Add User” dialog. The password fields however - for security reasons - will show 32 * characters. After having modified the desired entries close the dialog with OK to get applied the new settings.

Remove user accounts

Enable the entries to be removed in the Users list and click “Remove”. Note that you will get no further inquiry! An error message appears if you try to delete all users from a group. At least one entry must remain.

Groups dialog

Add a group

The currently available groups are displayed in a tree structure. A member also might be a group.

1. Click “Add” to open the “Add Group” dialog.
2. Define a name for the new group and enable all entries (single users or groups) which should be members of the new group.
3. Click OK to set up the new group. If there are incorrect entries (no name defined, group already existing, in Members having selected a group which would cause a "group cycle", you will get an appropriate error message.

Modify a group

Click “Edit” to open the “Edit User” dialog. The entry fields are the same as in the ‘Add Group’ dialog (see above). After having modified the desired entries close the dialog with OK to get applied the new settings.

Remove groups

Enable the entries to be removed in the groups tree and click “Remove”. Note that you will get no further inquiry! The members of the deleted groups will remain unmodified. An error message appears if you try to delete the groups “Everyone” and/or "Owner”.

Settings dialog

The following basic options and settings concerning the user accounts can be made:

- Maximum number of authentication trials: If activated, the user account will be set invalid after the specified number of trials to log in with a wrong password. If not activated, the number of erroneous trials is unlimited. Default: option activated, number of trials: 3; permissible values: 1-10.
- Automatically log out after time of inactivity: If activated, the user account will be logged out automatically after the specified number of minutes of inactivity (no user actions via mouse or keyboard registered in the programming system). Default: option activated, time: 10 minutes; permissible time values: 1-180 minutes.
1.5.6.1.3 Later change-over of target system

Target change from AC500 V2 to AC500 V3

Customer libraries

CODESYS for AC500 V2 products contains different types of libraries:

- Standard CODESYS libraries
- Specific AC500 libraries
- Customer libraries

The Standard CODESYS libraries and the AC500 libraries are automatically converted during a target change from AC500 V2 to AC500 V3. The customer libraries have to be converted manually using the Library Converter integrated into the Automation Builder installation:

1. In Automation Builder click “File” ➔ “Open project”.
2. Select the CODESYS library for AC500 V2 products which has to be converted.
3. After conversion of the library, open the view POU in the device navigator and double-click “Project Information”.
4. In the dialog enter “Company”, “Title” and “Version” in the specific fields, then, open the “Properties” tab. For the target change the new “Key” “CoDeSysV2Library” has to be added. Under “value”, enter the name of the CODESYS library and click the “Add” button.

Click “File” ➔ “Save project” and install into the library repository.

1.5.6.1.4 Firmware identification and update

Version information

Information on the firmware versions of the processor modules or communication modules, is provided on the “Version information” tab.
Remarks:

- The “Version information” tab displays the version identified on the device and the version provided with Automation Builder.
- The firmware on the devices must match to the Automation Builder version. Upgrade or downgrade to version supplied with Automation Builder is recommended (especially for CPUs) to ensure correct functionality.
- The firmware type can be changed to the type required by the hardware configuration for devices that support changing the firmware type. E.g., the onboard field bus communication modules of PM959 that may be used as PROFINET, Ethernet or EtherCAT communication module.

### State icons

<table>
<thead>
<tr>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Green" /></td>
<td>Firmware version on device matches version supplied with Automation Builder.</td>
</tr>
<tr>
<td><img src="image" alt="Yellow" /></td>
<td>Firmware version (or type) on device is different from version supplied with Automation Builder. Upgrade/downgrade to version supplied with Automation Builder is recommended.</td>
</tr>
<tr>
<td><img src="image" alt="Yellow" /></td>
<td>Only for communication modules if CPU firmware must be updated first. This happens when CPU firmware has version below 2.5.0.0. Firmware version (or type) on device is different from version supplied with Automation Builder. Upgrade/downgrade to version supplied with Automation Builder is recommended.</td>
</tr>
<tr>
<td><img src="image" alt="Red" /></td>
<td>Identified device is different from configured device, thus no firmware update is possible. Happens only for Communication Modules.</td>
</tr>
<tr>
<td><img src="image" alt="No icon" /></td>
<td>Firmware of device is not updateable or no newer firmware than the initial version is available.</td>
</tr>
</tbody>
</table>

The [Update Firmware] button to download the new firmware is only enabled if there is updateable firmware.

### AC500 V3 firmware installation and update

The PLC firmware can be updated via Automation Builder.
This is also necessary for commissioning V3 CPUs.

A very new CPU has no pre-installed firmware. To guarantee the authenticity of delivered AC500 firmware, V3 CPUs are delivered with a boot loader only. You need to download a valid firmware to the CPU. After download, the functionality of the CPU is given.

- An Automation Builder project with an AC500 V3 CPU is open.
- CPU is in "stop" mode or shows uPdAtE (update) on the display.
- After update the CPU shows either donE or StoP on the display
- For new modules: IP address is set. (The default IP address is 192.168.0.10)

1. Double-click CPU “PLC_AC500_V3”.
2. Select “Version information”.

3. Select [Update Firmware].
   - While the update process is running, the RUN and ERR LEDs are toggling, i.e., they are flashing alternating.
4. Wait for the PLC to finish the update.
   A completed update is indicated by a message on the display. Either donE, or StoP.

**NOTICE!**
Do not disconnect the power supply during the update process! The PLC could be damaged.

- StoP indicates a restart has been performed by the CPU. When donE is displayed sometimes it is necessary to re-boot the CPU manually, e.g., by powering-off. Manual re-boot might be, e.g., for some older CPU versions or if downgrading to an older firmware version according to application settings.

The CPU display shows "stop" after re-boot. The update process is finished.
5. If necessary, refresh the version information by switching to another tab and back.

⇒ Successful firmware update:

![Firmware Update Status](image)

**Behavior of LEDs during firmware update**

<table>
<thead>
<tr>
<th>LED</th>
<th>LED flashes</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>

<tr>
<td>RUN</td>
<td>Flashing slow</td>
<td>Done successful</td>
</tr>
<tr>
<td>ERR</td>
<td>Flashing slow</td>
<td>Done failed</td>
</tr>
</tbody>
</table>

**Update CI52x-modbus firmware**

Requirement: A firmware update file is available, e.g. AC500_CI52x_Firmware_V3.2.8.bin.

*The CI52x Modbus firmware update is only available in the Automation Builder IP Configuration Tool.*
Installation of the IP configuration tool

1. In Automation Builder click “Tools ➤ Installation Manager” to start the Installation Manager.
2. Close any other running instances of Automation Builder. Then, click “Modify” in the Installation Manager.
3. Select the option “IP Configuration Tool” from the list and start the installation of the IP Configuration Tool.

Firmware update procedure

1. In the IP Configuration Tool click “Scan” to initialize a device scan.
2. From the list select the CI52x-MODTCP device(s) which shall be updated and click “FW Update”.
3. Select the firmware update file (e.g. AC500_CI52x_Firmware_V3.2.8.bin) to initialize a signature check and start the update procedure.
4. After the update, click “Scan” again to retrieve the firmware version of the device.

Troubleshooting

After the IP Configuration Tool has been installed, the firmware update of the CI devices can be initialized. If the CI firmware update fails, check the troubleshooting hints and follow the instructions.

General hints

- Close all unused applications on the update PC and do not open Automation Builder or any other applications during the firmware update.
- Stop the communication between AC500 PLC and the CI52x devices and disconnect the Ethernet connection of the update PC and the CI Modbus device(s).
- Do not close the IP Configuration Tool during a firmware update and do not switch off a CI Modbus device during the firmware update.

During a firmware update the operation of the device(s) is stopped. After the update, all outputs are set to zero.

Erroneous firmware update

<table>
<thead>
<tr>
<th>Error</th>
<th>Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Error 1: Package Timeout</strong></td>
<td>Locate the PC on which the update is performed as near as possible to the stationed CI Modbus devices. Avoid network switches.</td>
</tr>
<tr>
<td>Due to a primitive firmware update protocol a fast and stable network connection is required. Otherwise the update packages cannot be transferred within the requested time and a timeout occurs.</td>
<td></td>
</tr>
<tr>
<td><strong>Error 2: Unable to read device status</strong></td>
<td>Rescan and repeat the update. If this doesn’t work, power cycle the device and retry the update.</td>
</tr>
<tr>
<td>After the firmware update the IP Configuration Tool reads out the status of the updated device in order to check if the update was successful.</td>
<td></td>
</tr>
</tbody>
</table>
### Error 3: IP is not unique
If more than one device holds the same IP address, a firmware update is not possible as the update command is IP based. Correct the IP address, rescan and repeat the update. If this doesn't work, power cycle the device and retry the update.

### Error 4: Internal Error
An internal error on the CI52x Modbus device occurred during the firmware update. Rescan and repeat the update. If this doesn't work, power cycle the device and retry the update.

### Error 5: Cannot connect to device
The TCP communication is not sufficient for a connection. Increase the connection quality. See Error 1: Package Timeout.

---

### Signature check failed
After the selection of the firmware file (*.bin) a signature check is performed. If either the firmware file or the signature file is corrupt, the signature check fails. In the event of an erroneous signature check, perform the following steps:

- Ensure the signature file is stored in the same directory as the firmware file.
- Check the file names. The name of the signature file must be the same as the firmware file + attached ".sig".

#### File names
- Name of the firmware file: c:\AC500\AC500_CI52x_Firmware_V3.2.8.bin
- Correct name of the signature file: c:\AC500\AC500_CI52x_Firmware_V3.2.8.bin.sig
- Wrong name of the signature file: c:\AC500\AC500_CI52x_Firmware_V3.2.8.sig

### Indeterminate device firmware version
If the firmware version of the device cannot be determined, an error occurs. In this case, check that the device and the update PC are located in the same subnet and ping the device. If the ping is successful you can use the IP Configuration Tool to retrieve the device firmware version.

<table>
<thead>
<tr>
<th>PC</th>
<th>Device</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>192.168.10.71 / 255.255.255.0</td>
<td>192.168.14.10 / 255.255.255.0</td>
<td>ERROR</td>
</tr>
<tr>
<td>192.168.10.71 / 255.255.0.0</td>
<td>192.168.14.10 / 255.255.0.0</td>
<td>OK</td>
</tr>
</tbody>
</table>

---

### Migration of third party devices
After an update of Automation Builder the device repository contains only ABB devices. The third party devices which were installed into previous versions of Automation Builder are not automatically installed in the newest version profile. This has to be triggered by the user.

*The feature "Migrate third party devices" is available as of Automation Builder 2.1.1.*
1. Click “Tools” in the main menu of Automation Builder.
2. Click “Migrate third party devices” in the drop-down list.
   ⇒ The window Version profile selection appears.
3. Select a version profile in the drop-down list containing previous Automation Builder / Control Builder Plus profiles. The active profile does not appear in the list.

After selection of a previous version profile, all the third party devices which have been installed inside this version profile are listed.

![Version profile selection window](image)

It is not possible to select or deselect some third party devices. Importing will affect all the third party devices which are listed in the list view.

- Click [Import].
During the migration the message window displays success or failure of device migration.

In case of failure during the migration the affected third party device description has to be installed manually via main menu “Tools ➔ Device Repository ➔ Install”.

In the status bar, the third party device which is on Migrating: <...> is displayed on the left side. The import operation can be cancelled by clicking the “Click here to CANCEL this operation” link on the right side of the status bar. This becomes effective when the migration of the just migrating third party device is finished.

- Click [Close] button of the Version profile selection dialog to close the dialog.

### 1.5.6.1.6 Advanced IO device handling

Automation Builder provides the Advanced IO Device Handling feature for configuring identical IO device types at multiple instances.

This feature is supported by the following commands that works with IO devices only.

- Generate DUT
- Map to Existing DUT
- Release DUT mapping

These commands work on individual nodes and on CI (communication interface) level nodes.

**Generating DUT**

Each device generates two DUTs. One for the input and one for the output. Some devices contain only input or output type. In such cases, the device generates only one DUT of the relevant type.
- Right-click on the desired IO device and select “Generate DUT” to generate a DUT for an IO device.

The following example shows how to generate DUTs at CI level node.

- In the device tree, right-click on a master node such as PNIO_Controller and select “Generate DUT” to create DUTs for the child nodes.
- The DUTs of child nodes are generated in “Applicationressing DUT Generated Items” folder.
- Generated DUT considers channels with BYTE datatype as members. If channels with BYTE datatype are not present in the given hierarchy, it adds the members with another higher datatype.
- Channels with BOOL datatype are not considered.

Mapping to existing DUT

This command is enabled for the IO device when the IO device is not mapped and when DUTs of matching size (calculated based on device channel list) are available in “Applicationressing DUT Generated Items” folder.

1. Right-click on an IO device and select “Map to Existing DUT”.
   ➜ Enter Instance Name dialog is displayed.
2. Enter the instance name which satisfies IEC naming validations and unique name in global scope.
3. Click “OK” to create a global variable associated with the mappings in DI (PRG).
   If you want to view mapped instances, double-click “DI (PRG)”.

With the ‘Map to Existing DUT’ command:

- Any device can be mapped only to one input DUT and one output DUT. If you have already mapped an input DUT, only the output DUT is shown in the options list and vice-versa.
- Mapping is also supported at CI level nodes. To create global variables for CI level nodes, the address of the first child is considered.

Releasing DUT mapping

This command is enabled on an IO device only when an IO device is mapped either to input, output or both DUTs. You can use this command to release (or revert) mappings and to delete global variables created during ‘Map to Existing DUT’.

Right-click on an IO device and select “Release DUT Mapping”. The mapped DUT instance is deleted.

Using DUT variables in CODESYS application

1. In the Automation Builder project, double-click “Application” to launch CODESYS application.
   ➜ CODESYS application is launched. CODESYS application contains mapped DUT instances.
2. Double-click “PLC_PRG” to create DUT variables.
3. Add DUT variables based on mapped DUTs.

For further information on mapping DUTs, see section Chapter 1.5.6.1.6.2 “Mapping to existing DUT” on page 3253.
For example, in the PLC_PRG, add analog I/O and digital I/O. If you insert a dot at a position where an identifier should be inserted, then a selection list is open, offering all the input and output variables which are found in the project.

After adding DUT variables, rebuild the program in CODESYS application using “Project ➔ Rebuild”.

**Support for CI level node**

The user can create DUTs for the entire hierarchy of CI level node (for example, IO_BUS), by right-clicking on the desired CI level node and by selecting “Generate DUT”. Further, all the DUTs are generated in “Application ➔ App ➔ IO_Device_Generated_Items” folder.

- The command generates DUT for the node itself and also for all child nodes.
- The DUT generated for the CI level node contains generated DUTs for the child nodes as their members.
- For every execution, the command checks, if any new child node is added and generates DUT.

If you delete child nodes in CI level node (for example, IO_BUS), the DUTs generated for these child nodes are not deleted automatically. You should delete the DUTs manually in the “Application ➔ App ➔ IO_Device_Generated_Items” folder if desired.

**Configuration check**

Configuration check for size is enabled to ensure that all devices are mapped with DUTs of the correct size. In case of any changes in the mapped DUT, configuration check verifies the size of the DUT. If it fails, an error message is displayed in Automation Builder messages window and does not allow to launch the application. This check can be performed in “Create configuration data”.

**1.5.6.2 PLC devices and components**

**1.5.6.2.1 Device repository**

The Device Repository of Automation Builder manages the pool of devices that can be used in the PLC configuration.

You install or uninstall devices in the “Device Repository” dialog box. The system installs a device by reading the device description files, which define the device properties for configurability, programmability, and possible connections to other devices.

You can use the devices provided in the device repository by adding them to the device tree of your project.
1. Click “Tools ➔ Device Repository”.
   ⇒ The “Device Repository” dialog box opens.

![Device Repository dialog box]

- **[Edit Locations]**: Changes the default repository location. The devices can be managed at different locations.
- **[Install]** / **[Uninstall]**: Installs or uninstalls devices.
- **[Renew device repository]**: Updates the device list, e.g. after uninstallation of a device.
- **[Details]**: Provides technical details on the selected device.

2. Select the install location. “System Repository” is set by default.

**Installing devices**

The device repository cannot be changed manually, e.g. by copying or deleting files. Use always the Device Repository dialog to add or remove devices.
1. Click [Install] and select the appropriate file format.  
⇒ The “Install Device Description” dialog box opens.

2. Select the file path of the device description.

3. Select the file type filter of the required device description.  
⇒ All device descriptions of the selected file type are listed.

4. Select the required device description and click “Open”.  
⇒ Automation Builder adds the device description to the matching category of your device repository.

   If errors occur during installation (for example, missing files that are referenced by the device description), then Automation Builder displays them in the lower part of the device repository dialog box.

   During the installation the device description files and all additional files referenced by that description will be copied to an internal location. Altering the original files will have no further effects to an internal location.

   The changes take only effect after reinstalling the corresponding device(s). The version number shown in the information section of the device should be verified.

Uninstalling devices

Select the device you want to remove and click [Uninstall].

The device is removed from the list.

Uninstalled devices which are used in existing projects are indicated by the symbol 🛑. The device will not be configured properly.
1.5.6.2.2 PLC start-up

A fast online program modification of the user program is possible without interrupting the run-
ing operation. If data areas should be saved during power OFF/ON, they can be stored in the
Flash EPROM. An optional battery saves data in the RAM.

Initialization of AC500 V3 CPU

To initialize an AC500 V3 CPU, you need to download the firmware in advance.

A very new CPU has no pre-installed firmware. To guarantee the authenticity of delivered
AC500 firmware, V3 CPUs are delivered with a boot loader only. You need to download a valid
firmware to the CPU. After download, the functionality of the CPU is given.

An Automation Builder project with an AC500 V3 CPU is open.

1. Switch on the CPU.
   ⇒ On the CPU display "Init" is shown.

   In Automation Builder the activated PLC is not displayed under “Tools ➔ IP-Configuration”.

2. Automation Builder: Double-click the node “PLC_AC500_V3” and select the IP address
   "192.168.0.10":

3. Click “Execute update”.
   ⇒ Device: The Run and Error LEDs are still blinking.
   
   Wait until only the Run LED is blinking and the device display shows "Stop".
   Then, reboot the PLC.
   After Power Cycle the PLC ends in Stop mode.

4. Automation Builder: Click “Tools ➔ IP-Configuration” and click “Scan”.

5. Double-click the node “PLC_AC500_V3” and enter the IP address:

- Click “Enter” to start the scan process.
- After a successful scan, the IP address is enhanced to "192.168.0.10 (active)".

6. Login to the PLC: “Online ➔ Login”.

7. To read out firmware information, double-click the node “PLC_AC500_V3”. In the tab PLC Shell navigate to the command line and type "rtsinfo".

**PLC runtime licensing**

The use of some libraries and devices require the PLC to have a runtime license. If you purchased such a license, activate the license in Chapter 1.5.6.2.2.2.1 “Activating a runtime license via license key” on page 3258.

If you want to test device functionality or library features in advance, you can activate a demo license in advance in Chapter 1.5.6.2.2.2.2 “Activating a demo license” on page 3262.

The license status of a PLC can be displayed at any time in Chapter 1.5.6.2.2.2.5 “View license information” on page 3265.

**NOTICE!**

After removing a Wibu SD memory card (which holds the AC500 runtime license), the PLC system moves into 'Stop' mode after 24 h.

Ensure to insert the Wibu SD memory card at the time.

**Activating a runtime license via license key**

The use of some libraries and devices require the PLC to have a runtime license.

- PC and PLC are connected. In case of no connection, perform the activation via SD memory card in Chapter 1.5.6.2.2.2.3 “Licensing via SD memory card” on page 3262.
There is a connection to the Internet. In case of no connection, perform the activation on another PC with internet connection. Chapter 1.5.6.2.2.1.1 “Activation without internet connection” on page 3259.

1. Right-click on the PLC and select “PLC runtime licensing” from the “Runtime Licensing” menu.
   ⇨ A wizard starts. Follow the instructions.

2. Enter the license activation key and select “Next” to finish the licensing procedure.
   ⇨ The license is activated on the PLC device.

   If the license shall be used on another PLC device, the installed license can be returned. Chapter 1.5.6.2.2.2.4 “Returning a license” on page 3263.

Activation without internet connection

1. If an error occurs when communicating with the ABB license server, or if Automation Builder is running on a PC without internet connection, then it is possible to manually complete the ABB license server interaction by using another PC (with internet connection).

2. In the error dialog select “Next” and save the license activation request file to a storage location the other PC can access, e.g. a file share.
3. In the dialog the web address of the ABB license server is displayed ([http://lc.codemeter.com/32838/depot/index.php](http://lc.codemeter.com/32838/depot/index.php)). From the PC with internet connection, upload the license activation request file.

4. After the upload, download and save the license activation file from the ABB license server. Transfer this file to the PC without Internet connection.

5. Select “Next” to continue the license activation process. Click “Cancel” to continue the license activation process at a later time (see Offline activation [Further information on page 3261](#)).
6. Select “Browse” and select the license activation file (*.WibuCmRaU) from the defined storage location.
   ⇒ The license is validated by the ABB license server and afterwards activated on the PLC device.
   
   If the license shall be used on another PLC device, the installed license can be returned © Chapter 1.5.6.2.2.2.4 “Returning a license” on page 3263.

7. To complete the licensing process, a license receipt file must be uploaded to the ABB license server.
   
   Save the license receipt file and upload it manually from a PC with internet connection to
   ⇒ A license confirmation is returned.

---

**Offline activation**

If the runtime licensing process was closed between saving the license activation request file and obtaining the license activation file from the ABB license server, perform an offline activation:

1. Right-click on the PLC node and select “PLC runtime licensing” from the “Runtime Licensing” menu.
   ⇒ A wizard starts. Follow the instructions.

2. Select the option “Complete offline licensing process”.

3. Select “Browse” and select the license activation file (*.WibuCmRaU) from the defined storage location.
   ⇒ The license is activated on the PLC device.
   
   If the license shall be used on another PLC device, the installed license can be returned © Chapter 1.5.6.2.2.2.4 “Returning a license” on page 3263.

4. To complete the licensing process, a license receipt file must be uploaded to the ABB license server.
   
   Save the license receipt file and upload it manually from a PC with internet connection to
   ⇒ A license confirmation is returned.
Activating a demo license

It is possible to try out device features or library features by using a Demo license on the PLC. With this, you can use the features for a limited time period.

☐ PC and PLC device are connected. In case of no connection, perform the activation via SD memory card ➔ Chapter 1.5.6.2.2.2.3 “Licensing via SD memory card” on page 3262.

☐ There is a connection to the Internet. In case of no connection, perform the activation on another PC with Internet connection ➔ Chapter 1.5.6.2.2.2.1.1 “Activation without internet connection” on page 3259.

1. Right-click on the PLC node and select “PLC runtime licensing” from the “Runtime Licensing” menu.
   ➔ A wizard is started. Follow the instructions.

2. Select the option “Create a demo license” and click “Next” to finish the licensing procedure.
   ➔ The demo license is validated by the ABB license server and afterwards activated on the PLC device.

Licensing via SD memory card

When you have no connection between your PC and the PLC device the licensing procedure can be effected via an SD memory card.

On the PC:
Create a license request

☐ There is a connection to the internet.

☐ The SD memory card can be used with AC500 V3 products.

![NOTICE!]

If an SDCard.ini file is stored on the SD memory card, the file will be overwritten.

1. Place the SD memory card in the PC.
2. Right-click on the PLC node and select “Prepare PLC license SD memory card” from the “Runtime Licensing” menu.
3. From the filesystem select the root folder of the SD memory card.
   ➔ A success message is displayed when the creation of the SD memory card files is completed.
   
   The license request files are stored to the selected folder.

On the PLC:
Transfer the license data

1. Insert the SD memory card into the PLC device and reboot the PLC.
   ➔ When the license request file is successfully created by the PLC, “done” is shown on the display of the PLC.
2. Remove the SD memory card from the PLC.
For this action, internet connection is required.

1. Place the SD memory card into the PC.
2. Open the PLC project in Automation Builder. Ensure the PLC is logged out.
3. Right-click on the PLC node and select “PLC runtime licensing” from the “Runtime Licensing” menu.
   - A wizard is started. Follow the instructions.
4. Enter the license activation key.
5. From the filesystem, select the root folder of the SD memory card.
   - The previously created license request files are sent to the ABB license server. A license activation is created on the SD memory card.
6. Remove the SD memory card from the PC.

On the PLC: Complete license activation for the PLC

1. Insert the SD memory card into the PLC device and reboot the PLC.
   - done is displayed on the PLC if license activation was successful.
2. Remove the SD memory card from the PLC

On the PC: Complete license activation on the license server

To complete the licensing process, the license receipt file must be uploaded to the ABB license server.
1. Place the SD memory card into the PC.

The license receipt on the SD memory card is located in the subfolder license

- A license confirmation is returned.

Returning a license

NOTICE!
After returning a AC500 runtime license, the PLC system moves into ‘Stop’ mode after 24 h.
A license which has been installed on a PLC device can be returned and installed on another PLC device.

PC and PLC device are connected. In case of no connection, perform the activation via SD memory card “Returning a license via SD memory card” on page 3264.

1. Right-click on the PLC node and select “Return active license” from the “Runtime Licensing” menu.
   ⇒ A wizard is started. Follow the instructions.
2. Enter the license activation key and click “Return license”.
   ⇒ The results of the return process will be displayed in the dialog.

The license from the PLC device is removed and can be used now for another PLC device.

When the PLC is not connected to the PC (PLC logged out) it is possible to return a license via SD memory card.

1. Place the SD memory card into the PC.
2. Right-click on the PLC node and select “Return active license” from the “Runtime Licensing” menu.
   ⇒ A wizard is started. Follow the instructions.
3. Enter the license activation key and click “Return license”.
4. Click “Browse” and select the root folder of the SD memory card.
   ⇒ Returning of the license is started.
5. Place the SD memory card in the PLC device and reboot the PLC.
   ⇒ The license from the PLC device is removed and can be used now for another PLC device.

6. To complete the licensing process, a license receipt file must be uploaded to the ABB license server.
   
   Save the license receipt file and upload it manually from a PC with internet connection to
   ⇒ A license confirmation is returned.

View license information

To view the license information of AC500 V3 products, right-click on the PLC node and select “Show license information” from the “Runtime Licensing” menu. The project is scanned for required licenses. If you are logged in to a PLC, then the licenses available on the PLC are displayed. A missing required license is highlighted.

![License Information](image)

Connection of devices

All installed devices that are available in Automation Builder are listed in the Device Repository Chapter 1.1.9 “Device repository” on page 31.

Configuring devices

Modify your Automation Builder project by adding device objects. Preset items can be replaced in the same way.
1. In the device tree, right-click an item node. Select “Add object”.

![Image of Add object dialog]

2. Select the desired object and click [Add object].

3. Double-click the new object in the device tree to configure the device settings. Depending on the selected item different configuration tabs are available.

![Image of A523 Parameters]

**Update of AC500 devices**

Perform a firmware update to update AC500 V3 devices. § Chapter 1.17.2.6 “AC500 V3 firmware installation and update” on page 59.

**Comparing objects**

To compare similar objects within a project (such as the project configuration) select both objects. Right-click and select Compare Objects to see the differences.
IP settings

Configuration of the IP settings with the LED display

The IP settings for the PLC can be set directly on the processor module via keypad and LED display.

See LED Display % Chapter 1.5.5.1.4.4.3 “Configuration” on page 3123

Configuration of the IP settings with IP configuration tool

With the IP configuration tool a network scan can be executed.

Further, the IP settings of found PLC devices can be changed if required.
IP Configuration Tool
1. From the menu, select “Tools → IP-Configuration”.
2. Click [Scan] to trigger the scan process for devices in the network.
   ⇒ A progress bar shows the progress.
3. To change the configured IP settings, select a connected device from the list.
   ⇒ The IP settings are displayed below the list and can be edited.
4. Click [Send Configuration] to transmit the IP settings to the corresponding device.

Processor modules with 2 onboard Ethernet interfaces:
- Configure only 1 interface as default gateway.
- In case of 2 configured interfaces only the latter will be executed.

**Blink functionality**
Activates flashing of background light of AC500 LED display in Automation Builder via IP configuration tool.
1. From the menu, select “Tools → IP-Configuration”.
2. Click [Scan] to trigger the scan process for devices in the network.
   ⇒ A progress bar shows the progress. The IP settings of a selected device is displayed below the list and can be edited.
3. Adjust your desired time and click [Blink] to activate flashing.
4. Click “Save Configuration” to transmit the IP settings to the corresponding device.
Configuration of communication via Ethernet (TCP/IP)

Programming via Ethernet is only possible on a PC with Ethernet board and installed network. Programming can be done via the internal Ethernet communication module.

Programming via internal (onboard) Ethernet communication module:

1. Right-click the top node “PLC_AC500 <...>” and select “Communication Settings” from the context menu.
   ⇒ Dialog box Communication Settings <...> appears.

2. Enter your PLC IP Address and click [OK].
Enter PLC IP address by scanning devices

1. Right-click the top node “PLC_AC500 <...>” and select “Communication Settings” from the context menu.
   ⇒ Dialog box Communication Settings <...> appears.

2. Click [...].
   ⇒ Dialog box Pick IP Address <...> appears.

3. Click [Scan], select your desired PLC and click [OK].
   ⇒ Entry is transferred to the dialog box Communication Settings <...>.
   
   Click [OK].

4. Click to log in the “PLC_AC500_V3” project.

Enter PLC IP address by [Advanced Settings...]

If a remote gateway instead of a local one has to be used it can be configured in the [Advanced Settings...].
1. Right-click the top node “PLC_AC500 <...>” and select “Communication Settings” from the context menu.
   ⇒ Dialog box Communication Settings <...> appears.

2. Enable checkbox Use advanced settings and click [Advanced Settings...].
   ⇒ Tab “Communication Settings” opens.

3. Check gateway or change if required.
   ⇒ Successful connection is indicated by green dot on the gateway icon.

4. **Manual entry of the IP address.**
   Check IP address or change if required.

5. Press ENTER to confirm changed IP address.
   ⇒ Successful communication is indicated by green dot on the PLC icon.
6. Or instead of the last two steps:

Set the IP address via a scan.

Click [Scan Network], select your desired PLC and click [OK].

Successful connection is indicated by green dot on the gateway icon.

7. Click to log in the “PLC_AC500_V3” project.

Troubleshooting Hints for IP Configuration Tool/Plugin

On a standard Windows 7 installation without third party firewall or security tools installed the IP Configuration Tool/Plugin should work as designed.

The Automation Builder setup installs rules or exceptions for the built-in Windows firewall to allow IPConfig to receive the responses for the IPConfig scan.

To check the Windows firewall is set correctly check the firewall settings in the control panel.

Windows 7 On the network that is used for communication with the PLC, set “Incoming connections” to “Block all connections to programs that are not on the list of allowed programs”.

2020/12/10 3ADR010583, 1, en_US 3273
If a third party firewall is used these exceptions must be configured manually.

Either exceptions for applications can be entered: Automation Builder and IP Configuration Tool must be added as application.

Or the protocol and the port number must be given (for IPConfig: UDP protocol and port number 24576).

### 1.5.6.2.3 Processor modules

**Configure a processor module in the device tree**

1. Add a Processor Module to your project.
2. In the device tree, double-click the “PLC_AC500_V3 <...>” node.
3. Select the “PM56xx Parameters” tab to configure the parameters for the Processor Module (see Chapter 1.5.6.2.3.4.1 “Floating point values” on page 3276).

Use the “PM56xx Hardware” tab for later on changes of “Terminal Base Type” or “Processor Module Type” (see Chapter 1.5.6.2.3.2 “Changing the processor module type” on page 3274).

### Changing the processor module type

If it is required, to change the type of Processor Module after the configuration has been finished already, it is possible to change the type of Processor Module later on. By this, all configurations of fieldbusses and interfaces that are identical on the new Processor Module are kept.
1. Close CODESYS.

2. Double-click the PLC_AC500_V3 <...> node.

2. Open the “PM56xx Hardware” tab and select the new PM5xx Type from the drop-down list.

3. Click [Change PM / TB type].

Changing the terminal base type

1. Open the “PM56xx Hardware” tab and select the new Terminal Base Type from the drop-down list.

2. Click [Change PM / TB type].

Diagnosis History

The 'Diagnosis History' view provides an overview of the current and past system events that resulted in a diagnosis event.

- Incoming diagnosis events are indicated with +.
  After the problem that causes a diagnosis event has been resolved, this diagnosis event is indicated automatically with -. 
- Alarm events, e.g. PROFINET alarms are indicated with ⚠. 
  In the 'Diagnosis' view the user can acknowledge an alarm. Note that an alarm event can be acknowledged though the problem that causes the alarm still persists. 
  The acknowledge action is indicated with ✔ on the concerning event entry. If the icon changes to ✔, the acknowledge action has been completed by the PLC.

The following buttons are available in the 'Diagnosis History' view:

- Start/Stop refresh: Enables or disables the automatic refresh mode. In refresh mode new diagnosis events will be displayed automatically. Only the last 100 entries are shown in this view, the latest events on top of the list.
- Get next entries: Adds the previous (older) 100 diagnosis events at the bottom of the list.
- Export complete history: Creates a csv file with all events from the diagnosis history (not only the visible ones).
Parameters of the processor module

Floating point values

A calculation with floating points can lead to the following values:

0 (zero)

If a calculation results in an underrun, the value is set to 0 (result near 0, but not presentable). Depending on the sign bit, it can be a positive zero or a negative zero. The operator "=" of -0 and 0 returns TRUE.

Infinity

If a calculation results in an overrun, the value is set to Infinity (the result is not presentable). Depending on the sign bit, it can be a positive infinity (Infinity) or negative infinity (-Infinity).

If Infinity is converted into another data type it results in the maximum value of the other data type (e.g., conversion into DWORD with REAL_TO_DWORD: 16#FFFFFFFF, into DINT with REAL_TO_DINT: 16#7FFFFFFF).

If -Infinity is converted into another data type it results in the maximum value of the other data type (e.g., conversion into DWORD with REAL_TO_DWORD: 16#00000000, into DINT with REAL_TO_DINT: 16#80000000).

Except for:

TRUE := REAL_TO_BOOL(Infinity);

'#Inf' := REAL_TO_STRING(Infinity);

'-#Inf' := REAL_TO_STRING(-Infinity);
Examples:

<table>
<thead>
<tr>
<th>Infinity</th>
<th>-Infinity</th>
</tr>
</thead>
<tbody>
<tr>
<td>Infinity := 1.0 / 0.0</td>
<td>-Infinity := -1.0 / 0.0</td>
</tr>
<tr>
<td>Infinity := Infinity + Infinity</td>
<td>-Infinity := -Infinity -Infinity</td>
</tr>
<tr>
<td>Infinity := Infinity + 1.0</td>
<td>-Infinity := -Infinity + 1.0</td>
</tr>
<tr>
<td>Infinity := LREAL_TO_REAL(Infinity)</td>
<td>-Infinity := LREAL_TO_REAL(-Infinity)</td>
</tr>
</tbody>
</table>

**NaN**

If a calculation results in an undefined value the result is set to NaN (Not a Number). The result of each calculation with NaN is NaN. The operators "<", "<=", ">" and ">=" return FALSE if either or both operands are NaN.

Operator "=" returns FALSE if one operand is NaN.

Operator "<>" returns TRUE if one operand is NaN.

If NaN is converted into another data type the result is 0.

Except for:

- TRUE := REAL_TO_BOOL(NaN);
- '#NaN' := REAL_TO_STRING(NaN);

Examples:

NaN := SQRT(-2.0)
NaN := 0.0 / 0.0
NaN := Infinity -Infinity
NaN := 0.0 * Infinity
NaN := Infinity / Infinity

The result of an operation can be checked with the following program parts:

**Check for NaN (REAL):**

```plaintext
rX: REAL;
IF (rX <> rX) THEN (* rX is a NaN *)
   ...
END_IF;
```

**Check for NaN (LREAL):**

```plaintext
lrX: LREAL;
IF (lrX <> lrX) THEN (* lrX is a NaN *)
   ...
END_IF;
```
Check for Infinity (REAL):

<table>
<thead>
<tr>
<th>Infinity is represented with sign bit 0, exponent of all 1s and a fraction of all 0s.</th>
</tr>
</thead>
<tbody>
<tr>
<td>-Infinity is represented with sign bit 1, exponent of all 1s and a fraction of all 0s.</td>
</tr>
</tbody>
</table>

```
rX: REAL;
prX: POINTER TO REAL;
pdX: POINTER TO DWORD;
prX := ADR(rX);
pdX := prX;
IF (pdX^ = 16#7F800000) THEN (* rX is Infinity *)
  ...;
END_IF;
IF (pdX^ = 16#FF800000) THEN (* rX is -Infinity *)
  ...;
END_IF;
```

Check for Infinity (LREAL):

```
lrX: LREAL;
plrX: POINTER TO LREAL;
plwX: POINTER TO LWORD;
plrX := ADR(lrX);
plwX := plrX;
IF (plwX^ = 16#7FF0000000000000) THEN (* lrX is Infinity *)
  ...;
END_IF;
IF (plwX^ = 16#FFF0000000000000) THEN (* lrX is -Infinity *)
  ...;
END_IF;
```

1.5.6.2.4 Terminal bases

Change terminal base type

☞ “Changing the terminal base type” on page 3275

1.5.6.2.5 Onboard Ethernet configuration

Onboard Ethernet is provided for device types with -ETH extension.

Configuration of the IP settings with IP configuration tool

With the IP configuration tool a network scan can be executed.
Further, the IP settings of found PLC devices can be changed if required.
IP Configuration Tool
1. From the menu, select “Tools ➤ IP-Configuration”.
2. Click [Scan] to trigger the scan process for devices in the network.
   ➞ A progress bar shows the progress.
3. To change the configured IP settings, select a connected device from the list.
   ➞ The IP settings are displayed below the list and can be edited.
4. Click [Send Configuration] to transmit the IP settings to the corresponding device.

**Processor modules with 2 onboard Ethernet interfaces:**
- Configure only 1 interface as default gateway.
- In case of 2 configured interfaces only the latter will be executed.

**Blink functionality**
Activates flashing of background light of AC500 LED display in Automation Builder via IP configuration tool.

1. From the menu, select “Tools ➤ IP-Configuration”.
2. Click [Scan] to trigger the scan process for devices in the network.
   ➞ A progress bar shows the progress. The IP settings of a selected device is displayed below the list and can be edited.
3. Adjust your desired time and click [Blink] to activate flashing.
4. Click “Save Configuration” to transmit the IP settings to the corresponding device.
Configuration of communication via Ethernet (TCP/IP)

Programming via Ethernet is only possible on a PC with Ethernet board and installed network. Programming can be done via the internal Ethernet communication module.

Programming via internal (onboard) Ethernet communication module:

1. Right-click the top node “PLC_AC500 <...>” and select “Communication Settings” from the context menu.

   ⇒ Dialog box Communication Settings <...> appears.

2. Enter your PLC IP Address and click [OK].
Enter PLC IP address by scanning devices

1. Right-click the top node “PLC_AC500 <...>” and select “Communication Settings” from the context menu.
   ⇒ Dialog box Communication Settings <...> appears.

2. Click [...].
   ⇒ Dialog box Pick IP Address <...> appears.
3. Click [Scan], select your desired PLC and click [OK].
   ⇒ Entry is transferred to the dialog box Communication Settings <...>.
   Click [OK].

4. Click to log in the “PLC_AC500_V3” project.

Enter PLC IP address by [Advanced Settings...]

If a remote gateway instead of a local one has to be used it can be configured in the [Advanced Settings...].
1. Right-click the top node “PLC_AC500 <...>” and select “Communication Settings” from the context menu.
   ⇒ Dialog box Communication Settings <...> appears.

2. Enable checkbox Use advanced settings and click [Advanced Settings...].
   ⇒ Tab “Communication Settings” opens.

3. Check gateway or change if required.
   ⇒ Successful connection is indicated by green dot on the gateway icon.

4. **Manual entry of the IP address.**
   Check IP address or change if required.

5. Press ENTER to confirm changed IP address.
   ⇒ Successful communication is indicated by green dot on the PLC icon.
6. Or instead of the last two steps:

Set the IP address via a scan.

Click [Scan Network], select your desired PLC and click [OK].

![Communication Settings](image)

⇒ Successful connection is indicated by green dot on the gateway icon.

7. Click to log in the “PLC_AC500_V3” project.
Switch functionality of Ethernet interfaces ETH1/ETH2

As of SystemFW 3.1.0 the Ethernet interfaces ETH1/ETH2 can be configured as an Ethernet switch.

The default setting is "Two separate interfaces".

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETH1 / ETH2 mode</td>
<td>&quot;Two separate interfaces&quot;</td>
<td>Two separate Ethernet interfaces ETH1 and ETH2</td>
</tr>
<tr>
<td></td>
<td>&quot;Switch functionality ETH1-ETH2&quot;</td>
<td>Switch between ETH1 and ETH2</td>
</tr>
</tbody>
</table>

If the Switch functionality ETH1-ETH2 is active, only the Ethernet interface ETH1 is available (see ETH1 / ETH2 mode) Chapter 1.5.5.1.4.4.3 “Configuration” on page 3123. Any protocols configured under Ethernet interface ETH2 must be deleted. Otherwise a compile error will be created.

The setting of ETH1 / ETH2 mode can be checked on LED display with soft key <CFG> (see ETH1 / ETH2 mode) Chapter 1.5.5.1.4.4.3 “Configuration” on page 3123.

1.5.6.2.6 Onboard CAN configuration

Onboard CAN interface supports the following protocols

- CAN Open Manager: Connection of CI581 and CI582 without additional I/O modules
- CAN 2A/2B
- J1939

Configuration in Automation Builder is described in chapter Chapter 1.5.6.2.7.1.1 “CM598-CAN - CANopen master communication module” on page 3286.

Further information can be found in chapter Chapter 1.5.6.2.12 “CAN-based fieldbuses” on page 3332.
AC500 V3 PLCs provide the following methods for CAN integration:

- Onboard CAN interface
- Communication module CM598-CN

Differences in supported protocols can be seen in the table below.

<table>
<thead>
<tr>
<th></th>
<th>Onboard CAN</th>
<th>CM598-CN</th>
</tr>
</thead>
<tbody>
<tr>
<td>CANopen Manager</td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>CAN 2A/2B</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>J1939</td>
<td>X</td>
<td></td>
</tr>
</tbody>
</table>

### 1.5.6.2.7 Communication modules

**CANopen**

**CM598-CAN - CANopen master communication module**

#### Configuration of the communication module

- Click menu “Tools ➔ Options” and select “Device editor” in the Options window.
- Enable first checkbox Show generic device configuration views and click [OK].

#### Append a CM598-CAN

1. Right-click on your desired Slot below node “Extension_Bus” and click “Add object”.
2. Click CM598_CAN in the list and click [Replace object].
3. Double-click “CM598_CAN (CM598-CAN)” to get the “CM598-CAN Parameters” in the editor window.

The following parameters are available:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default value</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Run on config fault</td>
<td>No</td>
<td>No</td>
<td>In case of a configuration error, the user program is not started.</td>
</tr>
<tr>
<td></td>
<td>Yes</td>
<td></td>
<td>The user program is started independent of a faulty configuration of the CM598-CAN communication module.</td>
</tr>
<tr>
<td>Bus behavior</td>
<td>Asynchronous (IEC bus cycle)</td>
<td>Asynchronous (IEC bus cycle)</td>
<td>Not yet supported.</td>
</tr>
<tr>
<td></td>
<td>Synchronous (start of bus cycle)</td>
<td>Synchronous (start of bus cycle)</td>
<td>Not yet supported.</td>
</tr>
<tr>
<td>Node ID</td>
<td>1</td>
<td>1 - 127</td>
<td>Identifier of the device within CANopen.</td>
</tr>
</tbody>
</table>
The tab “CAN Bus” contains the basic settings of the CAN bus and special settings for the CAN 2.0 B protocol.

The settings at “29 Bit COB-ID” are only valid for CAN 2.0 B protocol. Ensure the option “Enable 29 Bit COB-ID” is enabled. Otherwise no CAN 2.0 B frames can be received. With the other parameters at “Enable 29 Bit COB-ID” the receive filter is configured.

29 Bit COB-ID
### Configuration of the protocols CAN 2.0 A / CAN 2.0 B

The Communication Module CM598-CAN can be used to realize CAN bus based networks in combination with library ABB_CM598Can_AC500.library.

To enable the support for the desired protocol it must be appended to CM598-CAN.

1. Right-click “CM598_CAN (CM598-CAN)” in the device tree and select “Add device” in the context menu.
   
   ⇒ Window Add object below: CM598_CAN_1 appears.

2. Select “CAN 2.0 A” or “CAN 2.0 B” from the list.

### Parameterization

The CAN data transmission requires a buffer for the incoming data that can be read with function blocks of library ABB_CM598Can_AC500.library.
1. Right-click “CAN_2_0A_11_bit_identifier_ (CAN 2.0A)” or “CAN_2_0B_29_bit_identifier_ (CAN 2.0B)” and select “Add object”.

2. Select “Buffer for CAN 2A” for CAN 2.0A. Or select “Buffer for CAN 2B” for CAN 2.0B from the list.

3. Double-click on “Buffer_for_CAN_2A (Buffer for CAN2A)” or “Buffer_for_CAN_2B (Buffer for CAN2B)” in the device tree to open the Buffer configuration in the editor window.

The following parameters are available:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default value</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Identifier</td>
<td>0</td>
<td>CAN 2A: 0 ... 2047 CAN 2B: 0 ... 536870911</td>
<td>The value of the CAN identifier that is compared with the identifier of the incoming telegrams. The telegrams will be added to the buffer if the identifier matches.</td>
</tr>
<tr>
<td>Number of receive buffers</td>
<td>1</td>
<td>1 ... 16</td>
<td>The size of the buffer in number of telegrams.</td>
</tr>
<tr>
<td>Behaviour on receive buffer overflow</td>
<td>Overwrite</td>
<td>Overwrite</td>
<td>The oldest telegram in the buffer is overwritten by the incoming telegram. Discard</td>
</tr>
<tr>
<td>Enable triggering of IEC task</td>
<td>No</td>
<td>No</td>
<td>Disables the triggering of the execution of the related IEC task. Yes</td>
</tr>
</tbody>
</table>

Configuration of the CANopen master

☞ Chapter 1.5.6.2.12.1.1 “CANopen manager (master)” on page 3332

PROFINET
CM579-PNIO - PROFINET IO controller
For Automation Builder < 2.2.0

Configuration in Automation Builder is described in the PROFINET IO configuration.
For Automation Builder >= 2.2.0

PROFINET IO

CM579-PNIO – PROFINET IO communication module

Configuration of the communication module

Configuration is valid as of CPU FW 3.2.0.

Append a CM579-PNIO

1. Right-click on your desired Slot below node “Extension_Bus” and click “Add object”.
   ⇨ Dialog Replace object: appears.
2. Click CM579_PNIO in the list and click [Replace object].
3. Double-click “CM579_PNIO (CM579-PNIO)” to get the “CM579-PNIO Parameters” in the editor window.

The following parameters are available:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default value</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Run on config fault</td>
<td>No</td>
<td>No</td>
<td>In case of a configuration error, the user program is not started.</td>
</tr>
<tr>
<td></td>
<td>Yes</td>
<td></td>
<td>The user program is started independent of a faulty configuration of the CM579-PNIO communication module.</td>
</tr>
<tr>
<td>Bus behavior</td>
<td>Asynchronous (IEC bus cycle)</td>
<td>Asynchronous (IEC bus cycle)</td>
<td>The bus cycle and the IEC Application are running asynchronously. The IO update rate between the Profinet IO Controller and the IEC Application is defined with the bus cycle task.</td>
</tr>
</tbody>
</table>

Configuration of the PROFINET IO controller

The PROFINET IO Controller node appears automatically below the added Communication Module CM579-PNIO.

PROFINET IO controller - Configuration

Double-click on “PNIO_Controller” and open the tab “General” in the editor window.

The following parameters are available:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Value</th>
<th>Description</th>
<th>Parameter</th>
</tr>
</thead>
<tbody>
<tr>
<td>Station name</td>
<td>CM579</td>
<td>Up to 240 characters</td>
<td>Network name of the PROFINET IO controller station. Must be a valid hostname.</td>
<td>Station name</td>
</tr>
<tr>
<td>IP parameters</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>IP-Address</td>
<td>192.168.0.1</td>
<td>Valid IP address</td>
<td>IP address of the PROFINET IO controller station.</td>
<td>IP address</td>
</tr>
</tbody>
</table>
### PROFINET IO controller - Parameters

The tab “PROFINET-IO-Controller Parameters” is a generic view of all PROFINET IO controller parameters. It is normally hidden and is normally not needed for configuration.

- **Use tab “PROFINET-IO-Controller Parameters” only, if you need to change a parameter, which is not visible in other dialogs.**

#### Activating tab

1. Click “Tools  Options” and select “Device editor”.
   - The Device editor dialog opens.
2. Enable checkbox Show generic device configuration views and click [OK]
   - The tab is now available.

### PROFINET IO controller - I/O mapping

In this tab the bus cycle task can be specified. It is possible to select a particular task of the IEC application by its name or to use the option “Use the parent bus cycle setting”. In the latter case the setting of the Bus cycle options in “PLC_AC500_V3  PLC settings” are used.
Configuration of PROFINET IO devices

Add PROFINET IO device

1. Right-click on node “PNIO_Controller (PROFINET-IO-controller)” and click “Add object.”
   ⇒ A list with all installed PROFINET IO Devices appears.
2. Select the desired device and click [Add object].
   ⇒ The device is added to the Profinet IO Controller in the device tree.

PROFINET IO device - Configuration

Double-click on “PNIO-Device” to open the device configuration in the editor window.

The following parameters are available:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Value</th>
<th>Description</th>
<th>Parameter</th>
</tr>
</thead>
<tbody>
<tr>
<td>Identification</td>
<td></td>

</tbody>
</table>

**PROFINET IO device – Timing parameters**

In the current implementation are 2 Communication Relations (CR) between the controller and the device defined.

One describes the I/O telegram from the controller to the device (outputs), the other the I/O telegram from the device to the controller (inputs).

The timing of the corresponding I/O telegrams can be defined separately for each device.

Editable timing parameters are:

- Send clock
- Reduction ratio
- Phase

The relation between these parameters is shown in the following drawing.
For each device a SendCycle must be configured, which determines the sending interval of I/O frames. It is based on a time base of 31.25 µs and is calculated as:

\[ \text{SendClock [ms]} = \text{SendClockFactor} \times 31.25 \mu\text{s} / 1000. \]

The cycle time of an I/O telegram is defined by the SendCycle. It's calculated as:

\[ \text{SendCycle [ms]} = \text{SendClock [ms]} \times \text{Reduction Ratio}. \]

The values of the individual parameters are limited by the maximum value 512 ms of the SendCycle. The following table summarizes the relation of the timing parameters.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Relation</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>SendCycle</td>
<td>Is the cycle time of a RT telegram.</td>
<td>SendCycle = SendClock \times \text{Reduction ratio}.</td>
<td>1ms..512 ms</td>
</tr>
<tr>
<td>SendClock</td>
<td>The SendCycle is divided into several time slots. The SendClock defines the size of a time slot within the SendCycle.</td>
<td>SendClock = SendClock factor \times 31.25 \mu\text{s};</td>
<td>SendClock \times \text{Reduction ratio} \leq 512 ms</td>
</tr>
<tr>
<td>SendClock factor</td>
<td>Is multiplied with the time base 31.25 \mu\text{s to calculate the SendClock.}</td>
<td>SendClock factor = SendClock / 31.25 \mu\text{s}</td>
<td>1..128</td>
</tr>
<tr>
<td>Reduction ratio</td>
<td>The reduction ratio defines the number of time slots within the SendCycle.</td>
<td>SendClock \times \text{Reduction factor} \leq 512 ms</td>
<td>1..16384</td>
</tr>
<tr>
<td>Phase</td>
<td>The time slot in which the IO frame is sent.</td>
<td>A integer value of the range 1 ... Reduction ratio</td>
<td>1..16384</td>
</tr>
</tbody>
</table>
PROFINET IO device – PNIO parameters

The tab “PNIO Parameters” is a generic view of all PROFINET IO device parameters. It is normally hidden and is normally not needed for configuration.

Use tab “PNIO Parameters” only, if you need to change a parameter, which is not visible in other dialogs.

Activating tab

1. Click “Tools ➔ Options” and select “Device editor”.
   ⇒ The Device editor dialog opens.
2. Enable checkbox Show generic device configuration views and click [OK]
   ⇒ The tab is now available.

Configuration of non-ABB PROFINET IO devices

Before a Non-ABB PROFINET IO device can be used, the provided GSDML file has to be installed in the Device Repository.

Installation

Go to “Tools ➔ Device Repository ➔ Install”.

Configuration

See Chapter 1.5.6.2.7.2.1.2.1.1.3 “Configuration of PROFINET IO devices” on page 3292.

I/O mapping of the PROFINET IO devices

Open I/O mapping list

1. Double-click on the “PNIO_Controller” or below on the “<...>PNIO-Device” or below on the “I/O-Module” in the device tree.
2. Select tab “I/O mapping list” to show the list of I/O channels.

The content of the list depends on the selected node.

For instance:
- When the “PNIO_Controller” node is selected all I/O channels of all configured devices are shown.
- When a “PNIO-Device” is selected all I/O channels of the configured modules are shown.

An IEC variable for an I/O channel that is available in the Application can be defined by double-clicking in column Variable.
CM589-PNIO - PROFINET IO slave

Configuration in Automation Builder is described in the PROFINET IO Slave configuration.

EtherCAT
CM579-ETHCAT - EtherCAT IO master

Configuration in Automation Builder is described in the EtherCAT Master configuration.

EtherCAT-Master - ABB functionality for sync units

With the EtherCAT sync units, several slaves are configured into groups and subdivided into smaller units. For each group, the working counter can be monitored for granular input data validation. As soon as a slave is missing in a sync unit group, the input data of all other slaves in the same group becomes invalid.

Detection occurs immediately in the next bus cycle, as the working counter is continuously checked. Unaffected groups remain operable without any interference.

Right click on the “Application” node and press “Create configuration data”.

Automation Builder creates a set of global variables defining the working counter state of a SyncUnit command.

The variables use the following naming scheme:

"SLOT_" + "CouplerSlot_ " + "SyncUnitName" + "_CMD_" + "LogicalAccess" + "_FRAME_" + "FrameID CouplerSlot".

CouplerSlot
The coupler slot is the ID of the slot where the coupler is plugged in.

SyncUnitName
The sync unit name is as defined in the “Sync Unit Assignment” tab.

LogicalAccess
The logical access defines the command List of logical access commands:

- Read = 10;
- Write = 11
- Read/Write = 12

FrameID
The frame ID starts with 1 and increments if the cyclic exchanged data is larger than the maximum Ethernet frame boundary.

Values
- FALSE : Working counter is as expected (data from slaves is valid)
- TRUE : Working counter is different to expected value (data from slaves is invalid)

The variables can be used by conditional consumption of slave data in the application:

```c
IF NOT SLOT_1_default_CMD_10_FRAME_1 THEN
    (* Consume SyncUnit default slave data *)
END_IF;
```

See also 3S Sync Unit Assignment % Chapter 1.5.6.2.13.1.2 “Tab 'EtherCAT Master - Sync Unit Assignment' ” on page 3349.

EtherCAT diagnosis (V2 PLC and V3 PLC)

Automation Builder 2.3 provides an enhanced diagnosis interface for the EtherCAT fieldbus. The user can get EtherCAT diagnosis information from four different editor views. All these views are accessible within the EtherCAT master device editor and provide information about the master and all configured or connected slaves. The main diagnosis overview is given in the EtherCAT master view “Diagnostics main”.

“Diagnostics main” shows EtherCAT state “Operate”.

“Diagnostics main” shows EtherCAT state “Topology error”.

If the EtherCAT bus state shows “Operate”, the user does not need to check for any more information.

If the “Diagnostics main” shows any error, like “Topology mismatch detected”, the user can continue to the next level of information by opening editor view “Master State Control”.
“Master State Control” shows EtherCAT state “Operate”.

In editor view “Master State Control” the user can request a master state change or get information about configured parameters as well as events and latest communication errors. In case of any topology error (e.g. slaves are configured in a different order than they exist in hardware) the Automation Builder shows a hint to the user that it might be helpful to execute a bus scan in editor view “Diagnostics live list” to compare the scan result of the real hardware with the configurations slaves in the Automation Builder project.

Bus scan result in editor view “Diagnostics live list” shows the connected hardware.
The bus scan result list shows the following information for each connected slave:

<table>
<thead>
<tr>
<th>“ID”</th>
<th>Position of the found slave device</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Type”</td>
<td>Slave identification (name or Vendor/Device ID number)</td>
</tr>
<tr>
<td>“State”</td>
<td>The connection/link state of all ports (0-3) of the given slave</td>
</tr>
<tr>
<td></td>
<td>Connected =&gt; Cable is plugged in</td>
</tr>
<tr>
<td></td>
<td>+ Link =&gt; Physically connected to another slave</td>
</tr>
<tr>
<td></td>
<td>+ Communication =&gt; Communication works fine</td>
</tr>
<tr>
<td>“Name”</td>
<td>Not used for EtherCAT</td>
</tr>
<tr>
<td>“Address”</td>
<td>Not used for EtherCAT</td>
</tr>
<tr>
<td>“Details”</td>
<td>E.g. revision number of the slave device</td>
</tr>
</tbody>
</table>

The bus scan shows information about the real connected hardware.

Note that a bus scan will always restart the EtherCAT bus.

This should not be a problem during commissioning but it might not be applicable in a running system.

For runtime diagnosis the Automation Builder provides cyclic information of all configured slaves and their states in the editor view “Slave diagnosis”.

Slave diagnosis information shows that configured slaves are ok.

“Slave diagnosis” view shows wrong slave at position 1.

The editor view “Slave diagnosis” shows information about the configured slaves. If these slaves are found in hardware, the states of all slaves are ok. If there is a mismatch between hardware and configuration the view shows at which position that mismatch was detected.
The “Slave diagnosis” shows the following information for each configured slave:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Topology Position”</td>
<td>Position of the configured slave device.</td>
</tr>
<tr>
<td>“Configured Station Address”</td>
<td>Address that is defined by configuration. This address is not topology dependent.</td>
</tr>
<tr>
<td>“Slave Name”</td>
<td>Configured name of the slave device.</td>
</tr>
<tr>
<td>“Slave State”</td>
<td>The state of the slave. Possible slave states are:</td>
</tr>
<tr>
<td></td>
<td>NOT CONNECTED</td>
</tr>
<tr>
<td></td>
<td>INIT</td>
</tr>
<tr>
<td></td>
<td>PREOP</td>
</tr>
<tr>
<td></td>
<td>SAFEOP</td>
</tr>
<tr>
<td></td>
<td>OP</td>
</tr>
<tr>
<td></td>
<td>INIT ERR</td>
</tr>
<tr>
<td></td>
<td>PREOP ERR</td>
</tr>
<tr>
<td></td>
<td>SAFEOP ERR</td>
</tr>
<tr>
<td>“Port State”</td>
<td>The state of all ports (0-3) of the given slave. Shows how many connections this slave has to other slaves and if the connections are working fine:</td>
</tr>
<tr>
<td>Connected</td>
<td>=&gt; Cable is plugged in</td>
</tr>
<tr>
<td>+ Link</td>
<td>=&gt; Physically connected to another slave</td>
</tr>
<tr>
<td>+ Communication</td>
<td>=&gt; Communication works fine</td>
</tr>
<tr>
<td>“Last Error”</td>
<td>The last error that occurred in this slave. As text, if available, and error number. If this is any topology error, the editor view will show a hint to perform a bus scan.</td>
</tr>
<tr>
<td>“Emergency” [CAN application protocol over EtherCAT (CoE)]</td>
<td>This column contains up to 5 CoE emergency entries. Each entry has</td>
</tr>
<tr>
<td>Error code</td>
<td></td>
</tr>
<tr>
<td>Address of the error register</td>
<td></td>
</tr>
<tr>
<td>Error data (1 byte)</td>
<td>If there are more than five emergencies reported by the slave, the columns show a hint that some emergency entries have been lost. The column is empty, if no CoE emergencies exist.</td>
</tr>
<tr>
<td>“Frame Error Counters”</td>
<td>Counts transmission errors on frame layer, detected by CRC check of frames. Fast growing values show a serious problem. Possible root causes include damaged cables, high electromagnetic noise or misbehavior of EtherCAT slave devices. Four counter values are shown, one for each port 0-3. Column has red background in case of any value other than 0.</td>
</tr>
<tr>
<td>“Physical Layer Error Counters”</td>
<td>Counts transmission errors on physical layer. Possible root causes include electromagnetic disturbance or faulty devices. Four counter values are shown, one for each port 0-3. Column has red background in case of any value other than 0.</td>
</tr>
</tbody>
</table>
“Link Lost Counters" 2) Optional feature of EtherCAT slave devices, not supported by every device.

Counts loss of physical connection (no link, LED off). Even short interruptions can be detected. Possible root causes include power dips, device reset, poor cables or connectors, loose contact. Four counter values are shown, one for each port 0-3. Column has red background in case of any value other than 0.

1) Note that columns “Port State”, “Frame Error Counters”, “Physical Layer Error Counters” and “Link Lost Counters” show “LLD: Timeout”, if this state is NOT CONNECTED, because this information is not accessible.

2) Note that this column contains “LLD: Timeout", if slave state is NOT CONNECTED.

General note on the counters
Please note that this kind of errors will be detected by devices when power state changes, e.g. when the device itself or a neighboring device is powered on, caused by switching artifacts on the cable. This does not signal an issue, only counters increasing during normal operation should trigger deeper analysis. Counters can be reset by the PLC program using corresponding function blocks.

1.5.6.2.8 Communication interface modules

Configuration of communication interface modules
Automation Builder can be used to configure the parameters of CI5xx devices.

Adding CI5xx device to the device tree

1. Right click in the device tree on the node “Slot1” or “Slot2” of the “Extension_Bus” and click “Add object”.
   ⇨ The window Replace object : Slot <...> opens.
2. Select your CM5xx master module and click [Add object].
   ⇨ The CM5xx master appears in the Slot.
3. Right click on the CM5xx master module and click “Add object”.
   ⇨ The window Add object below : <...>_Master opens.
4. Select your “CI5xx” device and click [Add object].
   ⇨ The “CI5xx” device appears in your device tree.

Adding S500 I/O modules

1. Right click on your “CI5xx” device and click [Add object].
   ⇨ The window Add object below: opens.
2. Select your I/O module and click [Add object].
   ⇒ The I/O module is added.

Configure parameters

⇒ Double-click the “CI5xx” device to open editors and select the “CI5xx_IO Parameters” tab.

This editor shows the parameters that can be set for each device. For more information see Parameters of the Communication Interface Modules Chapter 1.5.3.7 “Communication interface modules (S500)” on page 2785, and Parameters of the I/O Modules Chapter 1.5.3.6 “I/O modules” on page 2327.

CI521-MODTCP/CI522-MODTCP

Unbundled CI52x-MODTCP configuration

Automation Builder can be used to configure the parameters of CI52x-MODTCP devices.

A direct Ethernet connection is required between the PC running Automation Builder and the CI52x-MODTCP module.

Configuration of S500 I/O modules can be performed without CI52x-MODTCPs modules connected.

Start a project from template

1. Select “New Project” in menu item “File”.
   ⇒ The window “New Project” appears.

2. Select the “CI52x-MODTCP Configuration Project” and click “OK”.
   ⇒ The window “Select PLC” opens.

3. Select a “CI52x-MODTCP” device and click “Add device”.
   ⇒ A project is created. More modules can be added.

Add CI52x-MODTCP to a project

1. Right click in the device tree on the root of the “Project” and click “Add object”.
   ⇒ The window “Add object below” opens.

2. Select “Modbus devices” and click “Add object”.
   ⇒ The node “Modbus_devices” appears in your device tree.

3. Right click on the node “Modbus_devices” and click “Add object”.
   ⇒ The window “Select PLC” opens.
4. Select your “CI52x-MODTCP” device and click “Add device”.
   ⇨ The “CI52x-MODTCP” device appears in your device tree.

Add S500 I/O modules

1. “Add object” to your “CI52x-MODTCP” device.
   ⇨ The window “Add object below: CI52x-MODTCP” opens.

2. Select your I/O module and click “Add object”.
   ⇨ The I/O module is added.

Configure parameters

▷ Double-click the device to open editors and select the “CI52x-MODTCP Parameters” tab.

This editor shows the parameters that can be set for each device. For more information see
Parameters of the Module CI521 % Chapter 1.5.3.7.4.1.7.1 “Parameters of the module”
on page 2918, Parameters of the Module CI522 % Chapter 1.5.3.7.4.2.7.1 “Parameters of the module”
on page 2947 and Parameters of the I/O Modules % Chapter 1.5.3.6 “I/O modules”
on page 2327.

Connect to device

To read or write parameters, the CI52x-MODTCP module must be connected to the PC with an
Ethernet connection.

See Addressing CI521 % Chapter 1.5.3.7.4.1.5 “Addressing” on page 2917 and
Addressing CI522 % Chapter 1.5.3.7.4.2.5 “Addressing” on page 2947 of the CI52x-MODTCP
hardware documentation for information on configuring the IP address of the device.

On the CI52x-MODTCP device editor, the “Connection Settings” tab allows the IP address of
the device to be entered.
Read  Reads the parameters from the CI52x-MODTCP and also for the attached S500 I/O modules.

Write  Sends the parameters from the editors to the CI52x-MODTCP and also the S500 I/O modules.

Device checking  The CI52x-MODTCP module knows which I/O modules are attached. While reading and writing parameters, the project must match the physical hardware. Otherwise an error will be given. Communication errors will also result in error messages. When the parameters have been read or written correctly, a message is seen in the “All messages” window:

```
All messages

<table>
<thead>
<tr>
<th>Description</th>
<th>0 error(s)</th>
<th>0 warning(s)</th>
<th>2 message(s)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameters read successfully</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Parameters stored successfully</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
```

Attached S500 modules  It is possible to read and write parameters when the S500 I/O modules are not attached to the CI52x-MODTCP module.

To perform a read, the project structure must still match the configuration of CI52x-MODTCP.

A warning will be shown if an I/O module is not detected:

```
All messages

<table>
<thead>
<tr>
<th>Description</th>
<th>0 error(s)</th>
<th>1 warning(s)</th>
<th>1 message(s)</th>
</tr>
</thead>
<tbody>
<tr>
<td>I/O module A562 not detected</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Parameters read successfully</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
```

When writing parameters, the CI52x-MODTCP configuration is overwritten so the current configuration of missing (unplugged) modules does not matter. If the I/O modules are attached, then the project must match the hardware, otherwise an error will be given.

Firmware update  As of Automation Builder 2.2.1, the IP Configuration Tool can be used to perform firmware updates for CI52x-MODTCP devices.
IP Configuration Tool
1.5.6.2.9 I/O-bus and I/O modules

Parameterization of the I/O bus

Double-click the “IO_Bus” node in the device tree to open the I/O-Bus configuration.

The following parameters are available:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Run on config fault</td>
<td>No</td>
<td>No</td>
<td>In case of configuration fault the user program will not be launched.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Yes</td>
<td>The user program will be also launched in case of configuration error on the I/O Bus.</td>
</tr>
<tr>
<td>Max wait run</td>
<td>3000</td>
<td>0...120000</td>
<td>Maximum waiting time for valid inputs.</td>
</tr>
</tbody>
</table>

In case of a digital I/O Module, the channels are provided as WORD, BYTE and BOOL. Because the analog inputs can also be configured as digital inputs, bit 0 of each channel is also available as BOOL.

The symbolic name of a channel can be entered in front of the string "AT" in the channel declaration.

All channels should have a symbolic name and only symbolic names should be used in the program code. If the hardware configuration has changed or if you want to download the project to a PLC with another hardware configuration and thus the PLC configuration has to be changed, the addresses of the inputs and outputs can change. In case of symbolic programming (i.e., symbolic names are used), the program code does not have to be changed.

Parameter 'Ignore module'

All I/O devices provide the parameter "Ignore module". This parameter can be used for simulation purposes and determines whether an I/O device is considered or ignored during a PLC configuration check.

This allows to use an existing Automation Builder project/PLC configuration though some hardware devices are not physically available in a hardware installation.

Example

The Automation Builder project for machine A shall be used for machine B. However, the second DC523 device is missing in the hardware installation of machine B. Hence, for machine B the value for 'Ignore module' is set to 'YES'.

2020/12/10

3306
I/O-bus - Bus cycle task

As a rule, for each IEC task the used input data is read at the start of each task (1) and the written output data is transferred to the I/O driver at the end of the task (3). The implementation in the I/O driver is decisive for further transfer of the I/O data. The implementation is therefore responsible for the timeframe and the specific time when the actual transmission occurs on the respective bus system.

The bus cycle task of the PLC can be defined globally for all fieldbuses in the PLC settings. For some fieldbuses, however, you can change this independent of the global setting. The task with the shortest cycle time is used as the bus cycle task (setting: "unspecified" in the PLC settings). In this task, the messages are normally transferred on the bus.

Other tasks copy only the I/O data from an internal buffer that is exchanged only with the physical hardware in the bus cycle task.

(1) Read inputs from input buffer       (2) IEC task
(3) Write outputs to output buffer      (4) Bus cycle
(5) Input buffer                        (6) Output buffer
(7) Copy data to/from bus               (4) Bus cycle
(9) Bus cycle task, priority 1, 1 ms
(10) Bus cycle task, priority 5
(11) Bus cycle task, priority 10, interrupted by task 5

Using tasks

The “Task Deployment” provides an overview of used I/O channels, the set bus cycle task, and the usage of channels.

WARNING!
If an output is written in various tasks, then the status is undefined, as this can be overwritten in each case.

When the same inputs are used in various tasks, the input could change when a task is processed. This happens if the task is interrupted by a task with a higher priority and causes the process map to be read again. Solution: At the beginning of the IEC task, copy the input variables to variables and then work only with the local variables in the rest of the code.

Conclusion: Using the same inputs and outputs in several tasks does not make any sense and can lead to unexpected reactions in some cases.
Insertion of S500 I/O devices

1. Right-click “IO_Bus” in device tree and select [Add object].
   - The Add Device dialog window where all available S500 I/O Devices are listed will open.
2. Append the S500 I/O Devices in the same order as they are mounted on the hardware.
   - Input and output modules connected to the I/O bus occupy the I/O following area: %IB0 .. %IB999 or %QB0 .. %QB999.

AC500 (Standard): PM56xx support up to 10 S500 I/O Devices.

Configuring the input and output modules and channels

The I/O channel configuration depends on the corresponding S500 I/O Device. See hardware documentation of the I/O Device for more information.

The individual configuration parameters can be opened in the editor window via double-click on the corresponding module and are listed in tab [S500 I/O device name] Configuration.

Symbolic names for variables, inputs and outputs

The IEC naming rules are not checked during input in Automation Builder.

Input and output mapping

Devices with I/Os provide an I/O Mapping tab in their configuration editor where the available I/O channels can directly be mapped to a global variable.

The corresponding variable declarations are automatically available in the project.

All available I/O channels can easily be assigned to a variable.

</tbody>
</table>
AC500 uses Intel Byte Order (Little Endian).

Only entries with a data type set in column "Type" can be mapped. These entries can be expanded to show the available I/O channels.

If the project has been imported from a previous Automation Builder version, all variables should be checked to avoid inconsistencies concerning the I/O mapping.

I/O mapping list

Automation Builder contains an I/O mapping list feature for creating mapping variables with better usability support compared to the tree structured view. Details on the tree structured view is provided in the CODESYS Development System Configuring I/O Links Chapter 1.3.1.8.3 “Configuring devices and I/O mapping” on page 162

![Image of I/O mapping list]

Functionalities of the I/O mapping list:

- Displays I/O mappings for current node and all valid subsequent child nodes.
- Displays channel information with additional columns.
- Supports keyboard functions such as cut, copy, paste, delete, and select all within the editor and within Excel spreadsheet (for bulk editing).
- Contains a toolbar for various actions, e.g. filtering, undo/redo and clear mappings.
- Supports single click edit and easy navigation using arrow keys.
- Improvised error handling:
  - Allows to enter invalid mapping variables. This provides flexibility in bulk editing. Only when saving the project, the errors - according to IEC 61131 standard - are displayed.
  - In the message window, the error log is visible. The user can track the errors to their corresponding channel in the editor.
- Allows multi-selection of rows and columns. (Random selection is not allowed.)
Configuring I/O mapping list

Automation Builder supports tree and list based editors for creating I/O mapping variables.

1. From the Tools menu, select Options.
2. Under Automation Builder, select the Editors tab.
3. Choose your desired mapping dialog and click OK.
   - Choose tree based to display the I/O mapping in tree structure.
   - Choose list based to display the I/O mapping as list with the functionalities of the ToolBar.
   - Choose both to display both the tree structure (I/O Mapping tab) and the list view (I/O mapping list tab).

Available channel information

The I/O mapping list displays the channel information in offline and online mode. In online mode, all columns are read-only. In offline mode, some columns are editable.

The order of the devices in I/O mapping list is synchronized with the order in the device tree.

The channels of a device are ordered by the device description file. If channels have a section, the channel information is represented in a specific format.

Example: Fast counter: Actual value 1. These channels are listed at last position of a device.

Editing I/O mapping list

1. In the device tree, double-click IO_Bus to configure entire I/O mapping list of different I/O devices.
2. Enter the variables and descriptions to map the I/O devices.
   - Do not start variable names with a number or a special character. When saving the project, this generates an error. Example: 12input3, @input4.
3. Click Save Project to save the I/O mapping changes.

Toolbar

Filtering

Especially in case of long I/O mapping lists, it might be helpful to filter the I/O mappings. For this, click the “Filter” icon to display all available criteria for filter options.

Undo, redo and clear

- **Undo**: Cancels the last change.
- **Redo**: Repeats the last change.
- **Clear mappings**: Deletes all variables and descriptions.
Fast counter

Configuration for S500 I/O devices

1. In the device tree, add a digital I/O Module to the “IO-Bus” node.
2. Double-click the node for the I/O Module, open the “Parameters” tab and set the counting mode.  
   See Chapter 1.5.6.2.9.8.2.1 “Counting modes” on page 3318 of the “Fast counter” parameter.
3. In the “I/O Mapping” tab channel configuration is displayed.  
   See Chapter 1.5.6.2.9.8.3 “Control of the fast counter” on page 3322.

<td>-------</td>
</tr>
</tbody>
</table>
| 2              | One up-counter with enable input via terminal | A = Counting input  
B = Enable input  
C = End value reached | The enable input enables the counting input and the output "end value reached". The counter is only enabled if the enable input = TRUE (signal 1) AND the bit EN = TRUE within the control byte. |
| 3              | Two up/down counters | A = Counting input 0  
B = Counting input 1 | With this operating mode, two counters exist, which are independent of each other. The state "End value reached" is only readable from the two status bytes. It is not readable from output terminals. The counting direction is defined by the bit UP/DWN within the control byte. |
| 4              | Two up/down counters (1 counting input inverted) | A = Counting input 0  
B = Counting input 1 | This operating mode equals operating mode 3 with one exception: The counting input B (of counter 1) is inverted. It counts the TRUE/FALSE edges at input B. |
| 5              | One up/down counter with a dynamic set input via terminal | A = Counting input  
B = Dynamic set input | With this operating mode, one up/down counter is available which has a dynamic set input. Dynamic means that the set operation is performed at the FALSE/TRUE signal edge (0/1 edge) of the set input and not while the signal is TRUE. The state "End value reached" is only readable from the status byte, not from an output terminal. |
| 6              | One up/down counter with a dynamic set input via terminal | A = Counting input  
B = Dynamic set input | This operating mode equals operating mode 5 with one exception: The dynamic set input operates at the TRUE/FALSE edge (1-0 edge). |
<table>
<thead>
<tr>
<th>Operating mode</th>
<th>Function</th>
<th>Used inputs and outputs</th>
<th>Notes</th>
</tr>
</thead>
</table>
| 7             | One up/down counter for position sensors | A = Trace A of the position sensor
B = Trace B of the position sensor                                                 | With this operating mode, incremental position sensors can be used which interchange their counting signals on tracks A and B in a 90° phase sequence. Depending on the sequence of the signals at A and B, the counter counts up or down. There is no pulse-multiplier function (e.g. x2 or x4). The position sensor must provide 24 V signals. Signals of 5 V sensors must be converted. Zero traces are not processed. The state "End value reached" is only readable from the state byte 0, not from an output terminal. The bit UP/DWN within the control byte must be FALSE. Otherwise, a parameter error occurs. In this operating mode, the maximum counting frequency is: I/O modules 35 kHz. Communication interface modules 50 kHz. |
| 8             | Reserved                       |                                                                                         |                                                                                                                                                                                                     |

PLC Automation with V3 CPUs
PLC integration > Configuration in Automation Builder for AC500 V3 products
<table>
<thead>
<tr>
<th>Operating mode</th>
<th>Function</th>
<th>Used inputs and outputs</th>
<th>Notes</th>
</tr>
</thead>
</table>
| 9              | One up/down counter for position sensors (pulse multiplier x2) | A = Trace A of the position sensor  
B = Trace B of the position sensor | This operating mode equals operating mode 7 with one exception: There is a pulse multiplication x2 with the evaluation of the counting inputs. This means, that the counter counts both the positive edges and the negative edges of trace A. This results in the double number of counting pulses. The precision increases correspondingly.  
In this operating mode, the maximum counting frequency is:  
I/O modules 30 kHz.  
Communication interface modules 35 kHz. |
| 10             | One up/down counter for position sensors (pulse multiplier x4) | A = Trace A of the position sensor  
B = Trace B of the position sensor | This operating mode equals operating mode 7 with one exception: There is a pulse multiplication x4 with the evaluation of the counting inputs. This means, that the counter counts the positive and negative edges of the traces A and B. This results in the fourfold number of counting pulses. The precision increases correspondingly.  
In this operating mode, the maximum counting frequency is:  
I/O modules 15 kHz.  
Communication interface modules 20 kHz. |
Configuration for onboard I/Os

1. In the device tree, double-click the “Onboard I/O” node (OBIO).

2. In the “Parameters” tab set the counting mode (Chapter 1.5.6.2.9.8.2.1 “Counting modes” on page 3318) for the fast counter.

3. In the “I/O Mapping” tab channel configuration is displayed. (Chapter 1.5.6.2.9.8.3 “Control of the fast counter” on page 3322)

Configuring the fast counter

The parameter of the Fast Counter channels of the Onboard I/O must be configured before they can be used. User should take these steps to configure the fast counter:

<table>
<thead>
<tr>
<th>Channel</th>
<th>Direction</th>
<th>Width</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Actual value X</td>
<td>Input</td>
<td>DWORD</td>
<td>Current value of the Fast Counter.</td>
</tr>
</tbody>
</table>
| State byte X  | Input     | BYTE  | Bit 0 = CF
If the counter reaches the programmed end value, the counter output is stored permanently as CF = TRUE (end value reached). Only, if the counter is set again (set value), CF is reset to FALSE. **Bit 1 to Bit 7 free** |
<p>| Start value X | Output    | DWORD | Each counter can be set to a start value. Start values are loaded into the counter by the user program. Using the set signal (dependent on the operating mode either via a terminal or the bit SET within the control byte X), the values of the double word variables are loaded into the counter X. |
| End value X   | Output    | DWORD | The end values for the two counters are stored as comparison values into the module by the user program. Both counters compare continuously, whether or not their programmed end value is equal to their actual value. If the counter (actual value) reaches its programmed end value, the binary output CF of the status byte is set permanently. |</p>

**Counting modes**

The fast counter can be configured as one mode out of 10 possible modes. The desired operating mode is selected in the PLC configuration using configuration parameters. Inputs and outputs which are not used by the counter are available for other tasks. In the following table, A means input channel A, B means input channel B and C means output channel C.
<table>

### 1.5.6.2.10 Serial interface

**Configuring Modbus RTU on serial interface**

To enable Modbus RTU on a serial interface the protocol setup per default has to be replaced by either Modbus RTU Client or Server, depending on required operation mode.

A serial interface supports only one protocol/operation mode at once.

![Configuration screen](image)

**Replace object “CAA_SerialCom”**

1. Right-click node “CAA_SerialCom” and click “Add object”.
2. Select “Modbus RTU Client” or “Modbus RTU Server” and click “Add object”.
   ⇒ “CAA_SerialCom” is replaced by your selection.

**Parameters**

**Serial**

Serial parameters to be set selecting the interfaces node “COM_1”. They are common for both operating modes client and server.
The parameter “Data bits” always has to be set to “8” for Modbus.

Modbus RTU server

Server specific parameters to be set selecting the protocol’s node “Modbus_RTU_Server”.

Address
Bus address of the PLC as Modbus RTU Server on that interface

Byte Order
Format/Endianess for the transmission of WORD values (register) within the request/response telegram (default: Big Endian)

Disable

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Disable write to %MB from</td>
<td>0</td>
<td>0 ... 65535</td>
<td>Disable write access starting at %MBx</td>
</tr>
<tr>
<td>Disable write to %MB to</td>
<td>0</td>
<td>0 ... 65535</td>
<td>Disable write access up to %MBx</td>
</tr>
<tr>
<td>Disable read from %MB from</td>
<td>0</td>
<td>0 ... 65535</td>
<td>Disable read access starting at %MBx</td>
</tr>
<tr>
<td>Disable read from %MBx to</td>
<td>0</td>
<td>0 ... 65535</td>
<td>Disable read access up at %MBx</td>
</tr>
</tbody>
</table>

It is possible to disable read and/or write access to individual segments. Reading/writing is disabled beginning at the set start address and is valid up to the set end address (inclusive).

Modbus RTU client

“Modbus RTU Client” does not have any protocol parameters.

Configuring CAA SerialCom on serial interface

The protocol CAA SerialCom represents the standard serial protocol provided by 3S and allows the users to implement their own custom protocol.

For details on CAA SerialCom, refer to standard 3S V3 documentation (see, CAA SerialCom library).
When creating a new project, the protocol “CAA SerialCom” is automatically attached to the “COM_1” port of a V3 PLC.

Right-click on the node attached to “COM_1” node in the device tree and click “Delete”. The node is switched back to the “CAA SerialCom” protocol.

Since CAA SerialCom doesn’t represent a “real” protocol, there are no specific parameters required. All common settings can be found at the Tab “COM_1” after double-click on the “COM_1” node (see also Chapter 1.5.6.2.10.3 “Setting up a serial interface” on page 3330).

Activate particular configuration parameters

The parameters set up in the Automation Builder device tree are NOT automatically taken over in the PLC.
It is still required to use the 3S IEC POUs to activate the particular configuration parameters.

ABB provides the library AC500_Com ("ABB - AC500 / Use Cases / Serial Communication") which contains a POU called “ComGetCaaSerialComConfig”.

The Function Block can be used to obtain the configuration data which is set up in Automation Builder to directly pass it to CAA SerialCom-POU Open. This avoids manual creation of a parameter list.

The following code snippet shows, how the COM port is identified by its node name and how the parameter list for the Function Block is read from the configuration data of the currently loaded IEC application:

FUNCTION_BLOCK GET_CAA_COM_CFG
VAR_INPUT
END_VAR
VAR_OUTPUT
END_VAR
VAR

  ComGetCaaSerialComConfig:    ComGetCaaSerialComConfig;

    bError := TRUE;
END_IF
Setting up a serial interface

General

The configuration for serial interfaces and their protocols is done via two nodes:

- One node represents the common serial parameters related to the hardware port.
- The node below represents the parameterization for the particularly attached protocol.

Protocols supported by AC500 V3 PLCs

- 3S CAA SerialCom (common serial communication, send/receive data  Chapter 1.5.6.2.10.2 “Configuring CAA SerialCom on serial interface” on page 3326)
- Modbus RTU (client & server  Chapter 1.5.6.2.10.1 “Configuring Modbus RTU on serial interface” on page 3325)

How to switch between the protocols, see “Default setting” on page 3327.

Configuration

The following parameters are available in the configuration view of the COM port node:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value ranges</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Run on config fault</td>
<td>No, Yes</td>
<td>If this parameter is set to “Yes” the IEC application will not be prevented from switching to RUN state, independent from possibly existing configuration errors of the particular COM port.</td>
</tr>
<tr>
<td>Transmission rate</td>
<td>9600 baud/sec, 19200, 38400, 57600, 115200</td>
<td>Sets up the transmission rate to use for the COM port.</td>
</tr>
<tr>
<td>Parity</td>
<td>None, Odd, Even</td>
<td>Sets up the parity to use for the COM port.</td>
</tr>
<tr>
<td>Data bits</td>
<td>5 data bits, 6 data bits, 7 data bits, 8 data bits</td>
<td>Sets up the number of data bits to use for the COM port.</td>
</tr>
<tr>
<td>Stop bits</td>
<td>1 stop bits, 2 stop bits</td>
<td>Sets up the number of stop bits to use for the COM port.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Value ranges</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>-------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Flow control</td>
<td>No flow control</td>
<td>Allows to switch between different flow control modes (either RTS/CTS hardware or Xon/Xoff software or none). This setting is only valid for RS-232 serial interface mode. In case RS-485 is used for parameter “Serial interface”, flow control must set to “No flow control”. Otherwise a configuration error is triggered.</td>
</tr>
<tr>
<td></td>
<td>Hardware RTS/CTS</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Software Xon/Xoff</td>
<td></td>
</tr>
<tr>
<td>Boot parameter</td>
<td>RS-232</td>
<td>Allows to switch between RS-232 and RS-485. Due to technical reasons, it’s not possible to dynamically switch between the modes. This means, a reboot (or power cycle) of the PLC is required to activate the particular setting once changed.</td>
</tr>
<tr>
<td>Serial interface</td>
<td>RS-485</td>
<td></td>
</tr>
</tbody>
</table>

Comparison to V2

The following table shows the differences between V2 and V3 PLCs regarding the parameter set for serial interfaces:

<table>
<thead>
<tr>
<th>V2 Parameter</th>
<th>Representation in V3</th>
<th>Remark</th>
</tr>
</thead>
<tbody>
<tr>
<td>Run on config fault</td>
<td>Run on config fault</td>
<td>Exactly the same</td>
</tr>
<tr>
<td>RTS control</td>
<td>Flow control (partially)</td>
<td>Special modes which allow to use PLC as modem and mode implicitly setting RS-485 will not be taken over. Flow control settings will be limited and only support hardware, software or none.</td>
</tr>
<tr>
<td>Transmission rate</td>
<td>Transmission rate</td>
<td>For V3, the transmission rate range will be 9600 to 115200. Low modes will not be supported due to lack of support in Linux. High rates were only realized in V2 to support field bus plug as well as CS31 field bus. Both protocols are not supported anymore in V3, so these transmission rates won’t be available in V3. Approach: Only support most common transmission rates</td>
</tr>
<tr>
<td>Parity</td>
<td>Parity (subset)</td>
<td>A500 V3 doesn’t allow to configure parity modes “mark” and “space”. This means, only “none”, “odd” and “even” are configurable.</td>
</tr>
<tr>
<td>Data Bits</td>
<td>Data Bits</td>
<td>Exactly the same</td>
</tr>
<tr>
<td>Stop Bits</td>
<td>Stop Bits</td>
<td>Exactly the same</td>
</tr>
</tbody>
</table>

1.5.6.2.11 Gateway configuration

1. In the Automation Builder project, right-click the topmost PLC tree node and select “Communication Settings”.
   ➤ The dialog window Communication Settings appears.

2. Click “Advanced Settings” to open the Communication Parameters ➤ Chapter 1.3.1.25.1.19.2 “Tab ‘Communication Settings’” on page 741 dialog.
   ➤ This information will be stored in the project file.
3. Click “Gateway” and select the desired action from the Gateway menu either to change the local gateway (see Configure the local gateway Chapter 1.3.1.25.2.18.2 “Command ‘Configure the local gateway’” on page 1013) or to add a new gateway channel (see Add new gateway Chapter 1.3.1.25.2.18.1 “Command ‘Add gateway’” on page 1012).

Confirm your settings with “OK”.

Gateway settings on windows server 2012

Gateway as a service

To allow multiple concurrent users from different user sessions on the server to connect to PLCs, the user has to run CODESYS gateway as a system service. This is managed by a service called "CoDeSys V2.3 Gateway Service Wrapper". The service starts on system start-up and launch the gateway.

If you want to restart the gateway, use "Services management console" to restart "CoDeSys V2.3 Gateway Service Wrapper".

Gateway settings

You can set the communication settings in the Automation Builder project for every PLC. Otherwise, an error message is displayed while trying to open CODESYS.

See the description for Chapter 1.5.6.2.11 “Gateway configuration” on page 3331 and select “TCP/IP” under “Connection”.

</table>
| “Autostart CANopen Manager” | ✔: The CANopen manager starts automatically (switches to OPERATIONAL mode) after all required slaves are ready.  
☐: You have to start the CANopen manager from the application. Use the CiA405 NMT function block to do this.  
Hint: As long as the CANopen manager is not in OPERATIONAL mode, no PDOs are sent (outputs refreshed). |
| “Polling of optional slaves” | ✔: When a slave does not respond during the boot sequence, the CANopen manager interrogates it every second until it does respond.  
Constantly polling the slave increases the bus cycle time, which can interfere with the application (especially motion applications). You can deactivate polling to avoid this behavior. If polling is deactivated, then a slave is detected again when it sends a bootup message. |
| “Start Slaves” | ✔: The CANopen manager is responsible for starting the slaves.  
☐: You have to start the slaves from the application. Use the CiA405 NMT function block to do this. |
**NMT start all (if possible)**: If the “Start slaves” option is activated, then the CANopen manager starts all slaves with an "NMT Start All" command. The "NMT Start All" command is not executed as long as optional slaves are not yet ready to be started. In this case, the CANopen manager starts each slave individually. The "NMT Start All" command can be guaranteed only in a project without optional slaves.

**NMT error behavior**:
- "Restart Slave". If an error occurs during slave monitoring (NMT Error Event), then the slave is restarted automatically by the stack (NMT Reset + SDO Configuration + NMT Start).
- "Stop Slave". If an error occurs during slave monitoring (NMT Error Event), then the slave is stopped. Then you must reset the slave from the application, using the CiA405 NMT function block.

---

**Table 701: “Guarding”**

Working with heartbeat messages is an alternative method of monitoring. It can be executed from both master and slave nodes, as opposed to node-guarding. Normally the master sends heartbeat messages to the slaves.

<table>
<thead>
<tr>
<th><strong>Enable heartbeat producing</strong></th>
<th>The master sends heartbeat messages that define the time interval in the “Producer Time”. When the slaves are provided with the heartbeat function, a heartbeat consuming entry from the slave is created for the master. Then the node ID and the 1.5x heartbeat interval of the master are applied.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Node ID</strong></td>
<td>Unique identification (1-127) of the heartbeat producer on the bus.</td>
</tr>
<tr>
<td><strong>Producer time (ms)</strong></td>
<td>Interval length between successive heartbeats (in milliseconds).</td>
</tr>
<tr>
<td><strong>Redundancy node ID</strong></td>
<td>Requirement: A “Redundancy Configuration” object is inserted below the application. Unique identification (1-127) of the redundant heartbeat producer on the bus.</td>
</tr>
<tr>
<td><strong>Redundancy wait time (µs)</strong></td>
<td>Requirement: A “Redundancy Configuration” object is inserted below the application. Duration of how long the passive controller waits for the heartbeat of the active controller. If this time is exceeded, then the passive controller takes on the active role.</td>
</tr>
</tbody>
</table>

---

**Table 702: “SYNC”**

<table>
<thead>
<tr>
<th><strong>Enable SYNC producing</strong></th>
<th>(disabled by default) The CANopen manager sends SYNC telegrams. The synchronous PDOs are sent directly after the SYNC telegram.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>COB ID (Hex)</strong></td>
<td>CAN ID of the SYNC telegram. Range of possible values: [1...2047].</td>
</tr>
<tr>
<td><strong>Cycle period (µs)</strong></td>
<td>Interval length (in microseconds) after which the SYNC telegram is sent.</td>
</tr>
<tr>
<td><strong>Window length (µs)</strong></td>
<td>Length of the time frame for synchronous PDOs (in microseconds).</td>
</tr>
<tr>
<td><strong>Enable SYNC consuming</strong></td>
<td>(disabled by default) Another device must produce the SYNC telegrams that are received by the CANopen manager.</td>
</tr>
</tbody>
</table>

---

**NOTICE!**

If SYNC producing is enabled for the CANopen manager, then you are not permitted to activate the “Enable Sync Producing” option for all other bus devices.
Table 703: “TIME”

<table>
<thead>
<tr>
<th>“Enable TIME producing”</th>
<th>[✓] (disabled by default) The CANopen manager sends TIME messages.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“COB ID (Hex)”</td>
<td>(Communication Object Identifier): identifies the time stamp of the message. Default values: [0...2047], preset 16#100.</td>
</tr>
<tr>
<td>“Producer time (ms)”</td>
<td>Interval (in milliseconds) when the time stamp is sent. This value must be a multiple of the task cycle time. Possible values [0...65535].</td>
</tr>
</tbody>
</table>

The runtime system must support high resolution timestamps. If not, then an error message is displayed.

Dialog ‘Check and Fix Configuration’

If you insert several devices below the CANopen manager, then error messages may report multiple assigned node IDs or invalid COB IDs. The “Check and Fix Configuration” button opens a dialog for solving these conflicts.

For conflicts with node IDs or PDO COB IDs, you can click “Edit Conflicts” to open a dialog with detailed information.

Table 704: “Node ID and COB ID conflicts”

<table>
<thead>
<tr>
<th>“Doubled node number”</th>
<th>List of all devices with identical IDs. In the field of the “Node ID” column, you can enter new node numbers for the affected devices.</th>
</tr>
</thead>
</table>
| “Incorrect and double assignment of PDO COB IDs” | The COB IDs that are generated automatically from the device description files may not be permitted. All incorrect entries are listed with the respective device names, node IDs, and indexes. There are three options for correcting invalid COB IDs:  
  - Correct the displayed formula for calculating the COB IDs so that a valid COB ID results. You can change the formula in the respective table element.  
  - Accept the automatic suggestion for the COB ID by clicking the respective button.  
  - Accept all automatic suggestions by clicking the “Used suggested COB ID” button. |

Corrected entries are removed from the displayed list automatically.

You can solve timing problems automatically by using the “Automatic Repair”. The command adjusts all timing values to compatible values. (The time should be a multiple of the task time.)

CANopen remote device (Slave)

In CODESYS, a CANopen remote device is a slave device that you insert below a CANopen manager in the device tree of a project. A distinction is made between modular and non-modular slaves:

- **Modular slaves**: You can insert CANopen modules (submodules) below a modular slave. These modules provide a dialog for mapping their inputs and outputs. Modular slaves can also have fixed I/Os. Then these devices also provide the “I/O Mapping” dialog. Modular devices provide the “Configure PDO mapping automatically” option, which we recommend for standard applications. You find this option in the “CANopen Remote Device” dialog in the “General” section.
- **Non-modular slaves**: You cannot insert additional modules below a non-modular device. The inputs and outputs of these devices are mapped in the “I/O Mapping” dialog. Automatic mapping is not possible here.

Tab 'CANopen Remote Device - General'

The general settings of the CANopen slave are defined in this dialog box of a CANopen remote device (slave).

Table 705: “General”

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Node ID</strong></td>
<td>The node number identifies the CAN module as unique and it corresponds to the number set on the module (value between 1 and 127). You provide the node ID as a decimal.</td>
</tr>
<tr>
<td><strong>Enable expert settings</strong></td>
<td>☑ All settings are displayed that are predefined by the device description (EDS file) for the device.</td>
</tr>
<tr>
<td><strong>SDO channels</strong></td>
<td>Click this button to open a dialog for activating the SDO channels that are predefined in the EDS file. Service data objects (SDOs) allow access to all entries in the CANopen object directory. An SDO creates a peer-to-peer communication channel between two devices (SDO server and client channel).</td>
</tr>
<tr>
<td><strong>Optional device</strong></td>
<td>☑ The slave is optional and not required for starting the CAN network.</td>
</tr>
<tr>
<td><strong>Sync producing</strong></td>
<td>Available only when the “Enable sync producing” option is cleared in the CANopen manager.</td>
</tr>
<tr>
<td><strong>No initialization</strong></td>
<td>☑ The I/O transmission is synchronized on the bus. The slave works as a sync producer. The parameters of the sync interval are defined in the settings of the CANopen manager.</td>
</tr>
<tr>
<td><strong>Presettings</strong></td>
<td>The availability of this option depends on the content of the device description file.</td>
</tr>
<tr>
<td></td>
<td>☑ Selected by default. The slave nodes are reset to the default parameters before the configuration is loaded to the device or always when the slave is configured. Which parameters can be set is device-specific. The concrete task is performed from the subindex of the drop-down list.</td>
</tr>
<tr>
<td></td>
<td>- “Sub:001”: All parameters are reset.</td>
</tr>
<tr>
<td></td>
<td>- “Sub:002”: Communication parameters (index 1000h - 1FFFh manufacturer-specific communication parameters) are reset.</td>
</tr>
<tr>
<td></td>
<td>- “Sub:003”: Application parameters (index 6000h - 9FFFh manufacturer-specific application parameters) are reset.</td>
</tr>
<tr>
<td></td>
<td>- “Sub:004” - “Sub:127”: Manufacturer-specific, individual selection of parameters is reset.</td>
</tr>
<tr>
<td></td>
<td>- “Sub:128” - “Sub254”: Reserved for future purposes</td>
</tr>
<tr>
<td><strong>Autoconfig PDO mapping</strong></td>
<td>This option is available for modular devices only.</td>
</tr>
<tr>
<td></td>
<td>☑ PDO mapping is generated automatically from the definitions in the device description and then cannot be changed in the two mapping dialogs. If the automatically generated mapping does not match your application, then you can deactivate the option and configure the mapping manually. We recommend that this option is activated for standard applications.</td>
</tr>
</tbody>
</table>
Node guarding is an outdated monitoring method and should not be used anymore because it uses RTR frames. You should always use heartbeats when possible. In some exceptions, such as for older slaves, you can use only node guarding.

**“Enable node guarding”**

- The CANopen manager sends a message to the slave in the “Guard time (ms)” interval. If the slave does not respond with the given “Guard COB ID” (Communication Object Identifier), then the CANopen manager resends this message as many times as defined in “Life time factor” or until the slave responds.
- If the slave does not respond, then it is marked as "unavailable".

**“Guard time (ms)”**

Interval for sending messages (default: 200 ms)

**“Life time factor”**

When the slave does not respond, a node-guarding error is established according to the “Life time Factor” time multiplied by the “Guard Time”.

**“Enable heartbeat producing”**

- The module sends heartbeats in the time intervals as given in “Producer time (ms)”.

**“Producer time (ms)”**

The default setting is 200 as long as there is no special entry or the entry in the device description file is 0.

**“Heartbeat consuming”**

Opens the “Heartbeat Consuming Properties” dialog box where you activate the slaves that you will monitor.

The number of possible slaves to be monitored is defined in the EDS file. To do this, you must select the “Enable” check box and enter the node ID of the slave and the required values in the “Heartbeat time” field (in milliseconds). Then the slave monitors the heartbeats that are sent from the affected slaves (defined by the node ID). When no more heartbeats are received, the slave switches off the I/Os.

While a slave is monitoring, a green check mark is shown on the “Heartbeat consuming” switch.

**Note:** When you insert a device with the heartbeat function, its heartbeat settings are harmonized automatically with the master (CANopen manager).

**“Enable emergency”**

- When internal errors occur, the slave sends emergency messages with a unique COB ID. You can read these messages by using the function block from the CiA405 library. (RECV_EMCY_DEF, RECV_EMCY).

**“COB ID”**

CAN ID of the EMCY message. Range of possible values: [1...2047].

**“Enable TIME producing”**

- The device sends TIME messages.

**“COB ID (Hex)”**

(Communication Object Identifier): identifies the time stamp of the message.

**“Enable TIME consuming”**

- The device processes TIME messages.

**“Checks at Startup”**

The respective information is read from the firmware of the CANopen slave (0x1018 identity object) and compared to the information from the EDS file. In case of disparities, the configuration is stopped and the slaves are not started.

**“Vendor code”**

- Check of the vendor ID at startup

**“Product number”**

- Check of the product number at startup

**“Revision number”**

- Check of the revision number at startup

Tab 'CANopen Remote Device - PDOs'

Object: CANopen Remote Device, CANopen Local Device

This dialog is available only in the device editor of a CANopen slave of version V3.5.6.0 or later. It shows all PDOs and their default settings. In this dialog, you can add new objects and delete or edit existing objects.

On the left side, there are the PDOs that the slave receives from the master. On the right side, there are the PDOs that the slave sends to the master.

<table>
<thead>
<tr>
<th>“Add PDO”</th>
<th>Opens the “Select PDO” dialog box where all available PDOs are displayed. In this dialog, you select the PDOs to be added to the “Receive PDOs” or “Transmit PDOs”.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Add Mapping”</td>
<td>Opens the “Select Item from Object Directory” dialog box. Objects are listed there that you can add to the PDO mapping.</td>
</tr>
<tr>
<td>“Edit”</td>
<td>Opens the “PDO Properties” (when a PDO is selected). When a PDO mapping is selected, the “Select Item from Object Directory” dialog box opens.</td>
</tr>
<tr>
<td>“Delete”</td>
<td>Deletes the selected objects from the list</td>
</tr>
<tr>
<td>“Move Up”</td>
<td>Moves the selected object upwards by one entry.</td>
</tr>
<tr>
<td>“Move Down”</td>
<td>Moves the selected object downwards by one entry.</td>
</tr>
</tbody>
</table>

Dialog 'PDO Properties'

| “COB ID” | Every PDO message must have a COB ID (Communication Object Identifier). You can input explicit values (example: 16#201) or formulas (example: $NODEID+16#200). |
| “RTR” | Remote Transmission Request. This option is available for transmit PDOs only. You can use an RTR frame for interrogating the PDO externally. |
| “Inhibit time (x 100µs)” | You can edit this field only if the device supports this functionality. The inhibit time is the minimum time between two messages of a specific PDO. You can use this setting for preventing PDOs from being sent too often when their values are edited. Default: “0”. Possible values: 0...65535. |
| “Transmission type” | - “acyclic - synchronous”: When a change is made, the PDO is transmitted synchronously, but not periodically. (default) - “cyclic - synchronous”: The PDO is transmitted every nth sync. - “synchronous – RTR only”: Available for transmit PDOs only. After a synchronization message, the PDO is updated, but not transmitted. Transmission is by explicit request only (Remote Transmission Request). - “asynchronous – RTR only”: Available for transmit PDOs only. The PDO is updated and transmitted by explicit request only (Remote Transmission Request). - “asynchronous – manufacturer-specific”: The PDO is transmitted after specific events. - “asynchronous – device profile”: The PDO is transmitted according to the CiA device profile. |
"Number of syncs"  
For transmission type “cyclic - synchronous” only.  
Indicate the interval for transmitting the PDOs. The value is a multiple of the "Cycle period (µs)" of the CANopen manager. Default: 1. Possible values: 1...240.  
Example: Number of syncs = 4; cycle period = 1000 µs → transmission interval = 4000 µs.

"Event time (x 1ms)"  
Only for transmission types “asynchronous - manufacturer-specific” and “asynchronous - device profile”.  
You can edit this field only if the device supports this functionality. Indicate the time frame that should be between two PDO transmissions PDOs (in milliseconds). Default: "0". Possible values: 0...65535.

"Processing by CANopen Manager"  
☑: Default.  
☐: The CANopen manager does not process the PDO any longer. It is no longer transmitted or received.

Dialog 'Select Item from Object Directory'  
For modular slave, you must deactivate the “Autoconfig PDO mapping” option to be able to configure the mapping manually.

The table shows all object directory entries from the EDS file of the device. For receive PDOs, CODESYS provides only the objects here with write permission (flag = w); for transmit PDOs, read permission.

<table>
<thead>
<tr>
<th>&quot;Name&quot;</th>
<th>COB ID of the PDO or the name of the mapped object as it is used in the device description and in the object directory.</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Index&quot;</td>
<td>Index of the object</td>
</tr>
<tr>
<td>&quot;Subindex&quot;</td>
<td>Subindex of the object</td>
</tr>
<tr>
<td>&quot;Access type&quot;</td>
<td></td>
</tr>
</tbody>
</table>
  ● “RW”: read-write  
  ● “RO”: read only  
  ● “WO”: write only  
  ● “RWW”: Read/write per SDO; write permission per PDO (==> RPDO, output from the master viewpoint, input from the slave viewpoint).  
  ● “RWR”: Read/write per SDO; read permission per PDO (==> TPDO, input from the master viewpoint, output from the slave viewpoint).  
  ● CONST=constant |
| "Data type"       | Data type of the object                                                                                     |
| "Default value"   | Default value of the object                                                                                  |
| "Bit length"      | Length of the object                                                                                        |

Tab 'CANopen Remote Device - SDOs'  
When initializing the CANbus, CODESYS transmits the current configuration settings by using SDOs (Service Data Objects).

In this tab, you configure the necessary SDOs and determine the transmission order of the objects and the actions taken in case of a transmission error.

The object order in this list corresponds to the transmission order of SDOs to the module.

NOTICE!  
If the “Expert settings” option is not activated for the current device, then only the user-defined SDOs are shown here.
“Add SDO”  Opens the “Select Item from Object Directory” dialog box where all available SDOs are displayed. The chosen object is inserted after the selected object.

“Edit”  Opens the “Select Item from Object Directory” dialog box and highlights the respective object. You can modify the object parameters or replace the object with another one.

“Delete”  Deletes the selected objects from the list.

“Move Up”  Moves the selected object upwards by one entry.

“Move Down”  Moves the selected object downwards by one entry.

“Abort If Error”  If an error is detected for this SDO, then the stack stops the configuration phase of the current slave. The slave remains in PREOPERATIONAL mode.

“Jump to Line If Error”  The transmission is continued with the SDO that you indicated in the “Next Line” column.

“Next Line”  Line number where processing continues if there an error is detected

“SDO Timeout (ms)”  Timeout for the SDO transmission. If the slave does not respond to the SDO request within this time, then the transmission is canceled with a timeout.

“Create all SDOs”  Creates an SDO for all writeable objects starting at index 16#2000 for which a default value is given in the EDS. Only experts should use this option. It should be deactivated for standard use.

“Write complete PDO configuration”  This option forces the writing of all PDO configuration objects. In this way, you make sure that the settings in the project correspond to those of the slave. PDOs are not deactivated explicitly. The requirement is that the “Default settings” option is activated in the common settings of the slave and the PDOs are also deactivated in the EDS. If the default values in the EDS do not match the default settings of the slave firmware, then this procedure may cause problems. In this case, you should activate this option.

Dialog ‘Select Item from Object Directory’

This table shows all object directory entries from the device EDS file for each SDO that are writeable and not larger than 4 bytes. Before you add an SDO for selection in the SDO dialog, you can modify its parameters in the fields below the table. In this way, you can also created an SDO that is not writeable in the EDS file by entering a new index/subindex value.

| “Name” | COB ID of the PDO or the name of the mapped object as it is used in the device description and in the object directory. |
| “Index” | Index of the object |
| “Subindex” | Subindex of the object |
| “Access type” | “RW”: Read and write  “WO”: Write only  “RWW”: Read/write per SDO; write permission per PDO (==> RPDO, output from the master viewpoint, input from the slave viewpoint).  “RWR”: Read/write per SDO; read permission per PDO (==> TPDO, input from the master viewpoint, output from the slave viewpoint). |
| “Data type” | Data type of the object |
| “Default value” | Default value of the object |
| “Bit length” | Length of the object |
| “Value” | Value of the object |
CANopen module

CANopen modules are components that you insert below a CANopen remote device.

J1939

J1939 is a CAN-based protocol (CAN stands for "Controller Area Network"). It was developed for serial data transmission between electronic control units (ECU) in heavy goods vehicles. The CODESYS plug-in 'DeviceEditorJ1939' provides dialogs for configuring J1939 devices according to SAE J1939 standards.

J1939 - Bus cycle task

(1) Receive single package PG             (4) Receive multi-packages
P GS, Transmit PGs

See also

- Tab '<device name> I/O Mapping'® Chapter 1.3.1.25.1.19.11 “Tab '<device name> I/O Mapping’” on page 755

J1939 manager

You add the J1939 manager below the CANbus node in the device tree. It supports the CANbus J1939 configuration by means of internal functions. You insert the ECUs below the J1939 manager. You add the devices by means of the "Add Device” command.

The “Scan Devices” command is not available for J1939.
Tab 'J1939 Manager - General'

The J1939 manager provides a database that contains all global J1939 standard signals and parameter groups (PG).

The CODESYS installation includes a standard database with default settings. This database is write-protected to prevent losing this catalog due to unintended changes. You should make a writeable copy that you can extend or modify.

All J1939 databases are located in "C:\ProgramData\CODESYS\J1939 Databases".

This database is a SQLite database that can be opened and modified with an appropriate database tool.

Table 710

<table>
<thead>
<tr>
<th>&quot;Database&quot; : Name of the database (extension *.db)</th>
<th>Name of the database (extension *.db)</th>
</tr>

</tr>
</tbody>
</table>

Tab 'J1939 ECU - General'

In this dialog box of the J1939 ECU editor, the general parameters of a J1939 ECU can be displayed and modified.
### Table 711: “General”

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Preferred address”</td>
<td>Address of the ECU. If more than one ECU with the same address is present in the network, then all ECUs that permit an address change (“Arbitrary address capable” activated), receive a new address.</td>
</tr>
<tr>
<td>“Local device”</td>
<td>CODESYS is also an ECU in the J1939 network. For local devices, an additional “RX Signals (P2P)” dialog is provided for configuring received signals. In CODESYS, you can configure any number of local devices.</td>
</tr>
</tbody>
</table>

### Table 712: “ECU NAME”

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“NAME (64 bit): 16#”</td>
<td>Hexadecimal 64-bit code that contains complete information about the parameter settings. Each time this code is modified, the respective parameter is also modified. The same is true for the other direction.</td>
</tr>
<tr>
<td>“Arbitrary address capable”</td>
<td>If an address conflict occurs, then an address change can be performed for the ECU.</td>
</tr>
<tr>
<td>“Industry group”</td>
<td>List of industry groups according to the definition from SAE J1939.</td>
</tr>
<tr>
<td>“Vehicle system instance”</td>
<td>The parameter depends on the “Vehicle system”. The 4-bit value assigns a number to each instance of the “Vehicle system”.</td>
</tr>
<tr>
<td>“Vehicle system”</td>
<td>The value is defined in the SAE J1939 standard.</td>
</tr>
<tr>
<td>“Reserved”</td>
<td>Always deactivated and reserved for future SAE definitions.</td>
</tr>
<tr>
<td>“Function”</td>
<td>The parameter is defined and assigned by SAE. The value range is 0...255, however not all values are assigned.</td>
</tr>
<tr>
<td></td>
<td>The interpretation of values that are greater than or equal to 127 depends on the “Industry” selection. For example, the value “133” means “Product Flow” in the “Agricultural and Forestry Equipment” industry. If “Construction Equipment” is selected for “Industry”, then the same value means “Land Leveling System Display”.</td>
</tr>
<tr>
<td></td>
<td>If the value is less than 128 (0 - 127), then there is no dependency to other parameters.</td>
</tr>
<tr>
<td>“Function instance”</td>
<td>The parameter is related to the “Function” field. A J1939 network can consist of several ECUs with the same “Function”. The 5-bit “Function instance” assigns a number to each instance of the “Function”, where 0 is assigned to the first instance.</td>
</tr>
<tr>
<td>“ECU instance”</td>
<td>A J1939 network can include several ECUs that have the same task. For example, a vehicle can have two identical ECUs, where one measures vehicle speed and the other measures the trailer speed.</td>
</tr>
<tr>
<td>“Manufacturer code”</td>
<td>The 11-bit manufacturer code is assigned by SAE and indicates the company that manufactured the ECU. This code is defined in the SAE J1939 document.</td>
</tr>
<tr>
<td>“Identity number”</td>
<td>The 21-bit identity number is assigned by the manufacturer and should be used for assuring unique names in a product line. The manufacturer can also add more information to the identity number, such as serial number and date of manufacture.</td>
</tr>
</tbody>
</table>

### Table 713: “Communication Watchdog”

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Enable communication watchdog”</td>
<td>The stack checks whether the ECU transmits data within the given “Watchdog time”. If this does not happen, then the device is classified as “not available” and highlighted in red in the device tree.</td>
</tr>
</tbody>
</table>
Tab 'J1939 ECU - TX Signals'

This dialog shows the parameter groups that you defined for transmitting them to all other ECUs (broadcast) or to a specific ECU (P2P). In this dialog box, you can activate and deactivate individual groups and modify their parameters. You can also add new groups or signals to the list.

| “Enable” | ☑: The parameter group is transmitted. ☐: The parameter group is not transmitted for a local device. For a remote device, the PLC does not process this group. |
| “Type” | • “Broadcast”: The parameter group is transmitted to all ECUs. • “Peer-to-Peer (P2P)”: The parameter group is transmitted to a specific ECU. |
| “Add PG” | Opens the “Add Parameter Groups” dialog box. |
| “Add Signal” | Opens the “Add Signal” dialog box. The button is enabled only if you have selected a parameter group. |

Parameter group properties

Table 714: “General”

| “PGN” | The “parameter group number” is a unique number for addressing a parameter group. |
| “Name” | Name of the parameter group |
| “Description” | Description of the parameter group |
| “Length” | The length of the message data (0…1785 bytes). Due to the maximum data field length of 8 bytes, messages with over 8 bytes are transmitted as multipackages. |

Table 715: “Transmission settings”

These settings are provided only for the TX parameter groups of local devices.

| “Priority” | Priority of the parameter group (0..7). Priority 0 is the highest and 7 is the lowest. |
| “Destination address” | The target address is needed for P2P parameter groups only. |
| “Transmission mode” | Determines the time when a parameter group is transmitted (for local devices). • “Mode change”: The PG is transmitted when the value of the signal changes. • “Cyclic” The PG is transmitted after a specified number of PLC cycles (see cycle time factor). • “On request”: The PG is transmitted on request of another device. • “Application-controlled”: The PG is transmitted when triggered by the application. |
| “Cycle time factor” | Number of PLC cycles after which the parameter group is transmitted. Only applies for cyclic transmission. |

Signal parameters

Table 716: “General”

| “SPN” | (Suspect Parameter Number) One of the numbers assigned by the SAE for a specific parameter in a parameter group. |
| “Name” | Name of the parameter |
| “Description” | Description of the parameter |

Tab 'J1939-ECU - P2P RX Signals'

This dialog is available for local ECUs only. It shows all PGs (parameter groups) that should be received by other ECUs. In this dialog, individual groups can be activated or deactivated, and their parameters can be modified. In addition, new groups or signals can be added to the list.

The commands and parameters of this dialog are the same as those in the “TX Signals” tab.

Command 'Scan for Devices'

**Function:** This command establishes a brief connection to the hardware and determines the devices in the network. You can then adopt the devices found into the device tree of your project.

**Call:** Main menu “Project”, context menu of a device object in the device tree.

**Requirement:** The settings for communication with the control device are correct. The gateway and the PLC are running. The device supports the scan function.

To use the scan functionality, you must log in once in order to load the library to the controller.

The command refers to the master controller selected in the device tree. For example, an already inserted PROFINET IO controller can be selected and the command used to determine the I/O devices and I/O modules assigned to it.

After scanning, the dialog box “Scan for Devices” appears with the results.

</table>

| “Show differences to project”                                               | The table in the dialog also shows additional configured devices (in the    |
|                                                                             | device tree of the project).                                               |
|                                                                             | The table shows all scanned devices. The configured devices are not shown.  |

| “Scan Devices”                                                              | Starts a new search.                                                       |
| “Copy all devices to project”                                               | The device that is selected in the table is inserted into the device tree in |
|                                                                             | the project. If nothing is selected, then all scanned devices are shown.    |

NOTICE!
If you insert devices, which are available in the device tree, to the device tree with “Copy All Devices to Project”, then the following should be noted. The data of the “Process Data” and “<...> I/O Mapping” tabs of the existing devices can be overwritten with the data of the recently inserted devices.

Table 723: “Configured Devices”

This part of the dialog is visible only when you select the “Show differences to project” option.

Differences between the scanned and configured devices are color-coded. Devices in green are identical on both sides. Device in red are available only in the view of the scanned or configured devices.

- ![Up Arrow] If you have selected a device in both views, then the scanned devices are inserted above the selected configured device.
- ![Down Arrow] If you have selected a device in both views, then the scanned devices are inserted below the selected configured device.
- ![Refresh] If you have selected a device in both views, then the configured devices are replaced by the selected scanned device.
- ![Copy Icon] All scanned devices are copied to the project.
- ![Delete Icon] Deletes the selected configure device.
Tab 'CANbus - General'

<td>Baud rate (in bits per second) for transmitting data on the bus. The default value is used from the device description file (*.devdesc) of the CANbus device. You can select the baud rate from the drop-down list or type it directly into the input field.</td>
</tr>
</tbody>
</table>

1.5.6.2.13 EtherCAT configurator

Refer to the general description for information about the following tabs of the device editor.

- Tab '<device name> I/O Mapping' \(\%\) Chapter 1.3.1.25.1.19.11 "Tab '<device name> I/O Mapping'" on page 755
- Tab '<device name> IEC Objects' \(\%\) Chapter 1.3.1.25.1.19.12 "Tab '<device name> IEC Objects'" on page 759
- Tab '<device name> Parameters' \(\%\) Chapter 1.3.1.25.1.19.3 "Tab 'Parameters'" on page 746
- Tab '<device name> Status' \(\%\) Chapter 1.3.1.25.1.19.17 "Tab 'Status'" on page 768
- Tab '<device name> Information' \(\%\) Chapter 1.3.1.25.1.19.18 "Tab 'Information'" on page 768

Only in the case of special features is there an additional help page for the specific device editor.

If the "<device name> Parameters" tab is not shown, then select the "Show generic device configuration editors" option in the CODESYS options ("Device Editor" category).

The configuration of EtherCAT modules is based on the device description files for the master and slave devices employed and can be adapted in the project in configuration dialogs. In order to ensure the simplest and most error-free use possible, we recommend for standard applications that you activate the option for the "Automatic Configuration" of the master, so that the majority of the configuration settings are performed automatically.

Requirements

The requirement for the combination of EtherCAT devices with a CODESYS Control Win V3 is the installation of the program library WinPCap (freely downloadable, e.g. from winpcap.org). Furthermore, add the following entries to the CODESYS configuration file (\..\GatewayPLC\CODESYS\CODESYSSP.cfg):

- component.<subsequent number>=CmpEt100Drv
  Required only with the RTE. The RTE requires special network drivers. Available for Realtek RTL81x9/RTL8169, Intel Pro 100 / 1000
- component.<subsequent number>=CmpRTL81x9Mpd
  Required only with the RTE. Available for RTL8139.
- component.<subsequent number>=8169Mpd
  Required only with the RTE. Available for Realtek RTL8169 or RTL8168 (PCIe version))
The bus cycle task is set in the general PLC settings.

Access to the EtherCAT configuration by the application takes place via instances of the EtherCAT master and EtherCAT slave. If the EtherCAT master or EtherCAT slaves are inserted as objects into a project, instances are automatically created for master and slaves that can be addressed in the application program. For example a restart, a stop or a status check of the EtherCAT device can be performed from the application.

Furthermore, the EtherCAT library offers function blocks for the reading and writing of individual parameters, even during bus operation.

EtherCAT master

1.5.6.2.13.1.1 Tab 'EtherCAT Master - General'............................................. 3348
1.5.6.2.13.1.2 Tab 'EtherCAT Master - Sync Unit Assignment' ..................... 3349
1.5.6.2.13.1.3 Tab 'EtherCAT Master - Parameter'......................................... 3350

Tab 'EtherCAT Master - General'

Object: “EtherCAT Master”

This tab is for the configuration of the basic settings for the EtherCAT master. The preset basic settings originate from the device description file.

Settings of the configuration parameters

| “Autoconfig Master/Slaves” | The greater part of the master and slave configuration is accomplished automatically, based on the device description file and implicit calculations. The dialog for the FMMU/Sync settings is not available. Even if this option of the master is activated, an expert mode can be activated explicitly for each individual slave that permits the manual editing of the automatically generated process data configuration. |

**NOTICE!**
The auto-configuration mode ("Autoconfig Master/Slaves" option) is activated by default and is adequate for standard applications. If the mode is not activated, all configuration settings for master and slave(s) must be made manually, for which expert knowledge is required! The auto-configuration mode option must be switched off for the configuration of slave-to-slave communication.
### Table 725: “EtherCAT NIC setting”

| “Destination address” | MAC address of the device in the EtherCAT network that is to receive the telegrams. Options:  
| “Broadcast:” | no “destination address (MAC)” need be specified. |

| “Source address” | MAC address of the controller (target system) or network name (name of the card, i.e. PLC (target system)) |

| “Network name” | Name or MAC of the network, depending on which of the following options is activated:  
| “Select network by MAC” | □: Network is specified by the MAC-ID. The project then cannot be used on another device, since each network adaptor has a unique MAC-ID.  
| “Select network by Name” | □: Network is identified by the network name and the project is device-independent.  
| “Browse” | Scans the network for the MAC-IDs or names of the target devices that are presently available. |

### Table 726: “Distributed Clocks”

| “Cycle time (μs)” | Time interval after which a new data telegram is dispatched on the bus. If the “Distributed clocks” function is activated in the slave, the master cycle time specified here is transferred to the slave clocks. In this way a precise synchronization of the data exchange can be achieved, which is important in particular if spatially distributed processes require simultaneous actions. Simultaneous actions are, for example, applications in which several axes must execute coordinated movements at the same time. A very precise, network-wide timebase with a jitter of substantially less than 1 microsecond can be achieved in this way. |

### Table 727: “Options”

| “Use LRW instead of LWR/LRD” | □: Direct communication from slave to slave is possible. In place of separate read (LRD) and write commands (LWR), combined read/write commands (LRW) are used. |

| “Send/Receive per task” | □: Read and write commands, i.e. the handling of the input and output messages, can be controlled with various tasks. |

| “Automatically restart slaves” | □: In the event of a communication breakdown the master immediately attempts to restart the slaves. |

### Table 728: “Master setting”

These settings can be edited only if the “Automatic Configuration” option is deactivated, otherwise this takes place automatically and they are not visible here.

| “Image in address” | First logical address of the first slave for input data |

| “Image out address” | First logical address of the first slave for output data |

- ☞ Chapter 1.5.6.2.13.2.1 “Tab ‘EtherCAT Slave - General’” on page 3350

### Tab 'EtherCAT Master - Sync Unit Assignment'

Object: “EtherCAT Master”

This tab shows all slaves that are inserted below a particular master with an assignment to the sync units.
With the EtherCAT sync units, several slaves are configured into groups and subdivided into smaller units. For each group, the working counter can be monitored for an improved and more precise error detection. As soon as a slave is missing in a sync unit group, the other slaves in the group are also shown as missing. Detection occurs immediately in the next bus cycle, as the working counter is continuously checked. With the device diagnostics, the missing group can be remedied as quickly as possible.

Unaffected groups remain operable without any interference.

Sync unit support is defined by the device description of the EtherCAT master and can be deactivated for OEM-specific device descriptions. By default, it is provided with a device description of version 3.5.8.0 and later.

<table>
<thead>
<tr>
<th>“Device Name”</th>
<th>Name of the slave</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Sync Unit”</td>
<td>Name of the selected sync unit. You can combine individual devices or whole groups (multiple selection) into one sync unit group.</td>
</tr>
<tr>
<td>“Add”</td>
<td>When you type a name in the text field, you can create a new sync unit.</td>
</tr>
<tr>
<td>“Delete”</td>
<td>Removes the selected sync unit. If slaves are assigned to the group to be deleted, then a warning is displayed. If you confirm the dialog prompt by clicking “Yes”, then these devices are reassigned to the default group.</td>
</tr>
</tbody>
</table>

Tab 'EtherCAT Master - Parameter'

Object: "EtherCAT master"

This tab contains the master parameters that are defined in the device description file.

If the auto-configuration mode is activated in the "Master" dialog, then the parameters are set automatically here in accordance with the specifications from the device description file and the network topology. Nothing should be changed in the generic editor, since an invalid configuration can be set here.

| “Value” | Editable, change is only effective if auto-configuration mode is deactivated. Whether or not the change becomes effective depends on the respective parameter. |

EtherCAT slave

Tab 'EtherCAT Slave - General’

Object: “EtherCAT Slave”

The basic settings for the EtherCAT slave are configured in this tab. The basic settings are preset from the device description file.
Table 729: “Address”

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“AutoInc address”</td>
<td>Self-incrementing address (16-bit) that results from the position of the slave in the network. The address is used only during the system boot when the master assigns the EtherCAT addresses to its slaves. When the first message runs through the slaves for this purpose, each slave increments its “AutoInc address” by 1. The slave with address 0 receives the data. A possible input here is “-8”.</td>
</tr>
<tr>
<td>“EtherCAT address”</td>
<td>Final address of the slaves, assigned by the master during bootup. The address is independent of the position of the slave in the network.</td>
</tr>
</tbody>
</table>

Table 730: “Additional”

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Expert settings”</td>
<td>Additional settings are possible for the start-up check and time monitoring (see below). The “Expert Process Data” tab is also available in the device editor. However, expert settings are not required for standard applications. The auto-configuration mode is recommended and sufficient for standard applications.</td>
</tr>
</tbody>
</table>

Table 731: “Distributed Clocks”

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Select distributed clocks”</td>
<td>Drop-down list with all settings for distributed clocks in the device description file</td>
</tr>
<tr>
<td>“Activate”</td>
<td>Cycle time for the data exchange, displayed in the “Sync unit cycle (µs)” input field, is determined by the cycle time of the master. The master clock can thus synchronize the data exchange in the network.</td>
</tr>
</tbody>
</table>

The “Sync0” and “Sync1” settings described below are slave-dependent:

Table 732: “Sync0”

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Activate sync 0”</td>
<td>Synchronization unit “Sync0” is used. A synchronization unit describes a set of process data that is exchanged synchronously.</td>
</tr>
<tr>
<td>“Sync unit cycle”</td>
<td>The master cycle time (multiplied by the factor selected from the drop-down list) is used as the synchronization cycle time for the slave. “Cycle time (µs)” displays the cycle time currently set.</td>
</tr>
<tr>
<td>“User defined”</td>
<td>A user-defined cycle time (in microseconds) can be specified in the “Cycle time (µs)” field.</td>
</tr>
</tbody>
</table>

Table 733: “Sync1”

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Activate sync 1”</td>
<td>Synchronization unit “Sync1” is used. A synchronization unit describes a set of process data that is exchanged synchronously.</td>
</tr>
<tr>
<td>“Sync unit cycle”</td>
<td>The master cycle time (multiplied by the factor selected from the drop-down list) is used as the synchronization cycle time for the slave. The “Cycle time (µs)” field displays the cycle time currently set.</td>
</tr>
<tr>
<td>“User defined”</td>
<td>A user-defined cycle time (in microseconds) can be specified in the “Cycle time (µs)” field.</td>
</tr>
</tbody>
</table>

Table 734: “Startup Checking”

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Check vendor ID”</td>
<td>By default the vendor ID and product ID of the device are checked against the current configuration settings when the system boots up. If they do not agree, then the bus is stopped and no further actions are executed. This is done to prevent an incorrect configuration from being loaded onto the bus system. Options to deactivate the corresponding check.</td>
</tr>
<tr>
<td><strong>Check revision number</strong></td>
<td>☑: The revision number is checked during the system bootup according to your selection in the drop-down list.</td>
</tr>
<tr>
<td><strong>Download of the expected module configuration</strong></td>
<td>☑: For the online check of the configured and actual module configuration. If the configurations conflict with each other, then the device still switches to “Run” and an entry is recorded in the device log.</td>
</tr>
</tbody>
</table>

**Table 735: “Timeouts”**

By default, time monitoring is not defined for the following actions. If necessary, an appropriate “timeout” time can be specified here (in milliseconds):

| **SDO access** | Transmits the SDO list at system start. Specified in milliseconds. |
| **I -> P** | Switch from “Init” mode to “Preoperational” mode. Specified in milliseconds. |
| **P -> S / S -> O** | Switch from “Preoperational” mode to “Safe Operational” mode or from “Safe Operational” mode to “Operational” mode. Specified in milliseconds. |

**Table 736: “DC Cyclic Unit Control: Assign to Local \( \mu \)C”**

One or more options for the “Distributed clocks” function can be activated here that should be used on the local microprocessor. The check is performed in the registry at 0x980 in the EtherCAT slave. Possible settings:

| **Cycle unit** |
| **Latch unit 0** |
| **Latch unit 1** |

**Table 737: “Watchdog”**

| **Set multiplier** | Watchdogs PDI and SM receive their signals from the local terminal clock, divided by the watchdog multiplier |
| **Set PDI watchdog** | This watchdog triggers if there is no PDI communication with the EtherCAT slave controller for longer than the PDI (Process Data Interface) watchdog time that has been set and activated. |
| **Set SM watchdog** | This watchdog triggers if there is no EtherCAT process data communication with the terminal for longer than the SM (SyncManager) watchdog time that has been set and activated |

**Table 738: “Identification”**

In this section, you set the device identification of the slave. In this way, you can make the address of the slave independent of its position in the bus.

The following options are visible only if the “Enable expert settings” option or “Optional” option is activated.

| **Deactivated** | The identification of the slave is not checked. |
| **Configured station alias (ADO 0x0012)** | Address that is stored in the EEPROM of the device. You can change this value in online mode. |
| **Write EEPROM** | Visible in online mode only for “Configured station alias”. Writes the defined address for “Value” to the EEPROM of the slave. |
| **Explicit device identification (ADO 0x0134)** | The device identification is hard set on the hardware (for example, by DIP switches). It is displayed in “Actual address”. |
| **Data word (2 bytes)** | A 2-byte value for the identification is saved in the slave. |
| **Value** | Expected value for the check. If the actual value does not match this setting, then an error is issued. |
**Tab 'EtherCAT Slave - FMMU/Sync'**

Object: "EtherCAT Slave"

The tab shows the FMMUs and Sync Manager of the EtherCAT slave as they are defined in the device description file. There is a possibility to edit the FMMUs and Sync Manager, e.g. for the configuration of slave-to-slave communication.

Requirement: The auto-configuration mode in the EtherCAT master is deactivated.

Table 739: "FMMU"

Table shows the Fieldbus Memory Management Units of the slave, which are used for handling the process data. In each case the allocation of the logical address ("GlobalStartAdr") to a physical address ("Ph. Start Address") is defined. Mapping bit by bit is possible.

<table>
<thead>

Tab 'EtherCAT Slave - Expert Process Data'

Object: “EtherCAT Slave”

This tab provides a different and more detailed view of the process data that is also displayed in the “Process Data” dialog box. Downloads are also selected here for PDO assignment and PDO configuration.

Requirement: The check box for the expert settings of the slave is selected.

- ☞ Chapter 1.5.6.2.13.2.1 “Tab 'EtherCAT Slave - General' ” on page 3350
“Direction”
- “TxPDO (Input)”: The PDO is transmitted from the master to the slave.
- “RxPDO (Output)”: The PDO is transmitted from the slave to the master.

“Flags”
- “Mandatory”: The PDO is required and cannot be deactivated in the “PDO Assignment”.
- “Fixed Content”: The PDO contents are fixed and cannot be changed. Therefore, it is also not possible to add entries to the “PDO Content”.
- “Virtual PDO”: Reserved for future use.

“Exclude PDOs”
It is possible to define an exclusion list. When one PDO is active in the “PDO Assignment”, other PDOs are inactive and cannot be activated.

“Sync unit”
ID of the sync manager where the PDO should be assigned.

Table 747: “PDO Content”
Displays the contents of the PDOs that are selected in the “PDO List”. You can add new entries or edit or delete existing entries by executing the respective commands (“Add”, “Delete”, “Edit”) in the command bar or shortcut menu. You can change the PDO order by clicking “Move Up” and “Move Down”.

Table 748: “Download”

| “PDO assignment”              | Specific CoE commands for initializing the 0x1cxx objects are generated and written to the slave. |
| “PDO configuration”           | The CoE commands for 0x16xx or 0x1axx are generated, loading the PDO mapping to the slave. As a rule, the default values originate from the ESI file and the device must support this functionality. For example, if a device has a fixed configuration, then these commands are seen as flawed. |

Tab 'EtherCAT Slave - Startup Parameters'

Object: "EtherCAT Slave"

The SDOs (Service Data Objects) or IDNs that transmit specified parameters to the device at the system start are defined for the current slave in this tab.

The object directory with the required data objects is described in the EtherCAT-ML description file or in an EDS file which is referenced in the XML file.

Requirement: The device supports CAN over EtherCAT or Servodrive over EtherCAT.

Some modules that are inserted below a slave have their own start parameters. These parameters are then also shown in this list but cannot be edited here. The parameters are changed in the editor of the corresponding module.

### Tab 'EtherCAT Slave - Parameters'

Object: "EtherCAT slave"

This tab contains the slave parameters that are defined in the device description file.

If the auto-configuration mode of the master is activated, then the parameters are set automatically here in accordance with the specifications from the device description file and the network topology. For standard applications it is also normally not required to edit them.
"Value"  Only a few parameters are editable. Change is only effective if auto-configuration mode is deactivated.
In principle the user should not change anything here, since in doing so an invalid configuration could be created, thus preventing the slave from entering the operational state.

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Column “Idn”</td>
<td></td>
</tr>
<tr>
<td>Column “Base value”</td>
<td>Basic value of the IDN, Editable, (open with double click)</td>
</tr>
</tbody>
</table>

Input fields
"IDN"  ● “S”
     ● “P”

"PSet"  By specifying new “PSet/Offset” entries, a new object can be added to the IDN that is not yet described in the XML file. This is useful if only an incomplete object directory or none at all is present.

"Offset"  By specifying new PSet/Offset entries, a new object can be added to the IDN that is not yet described in the XML file. This is useful if only an incomplete object directory or none at all is present.

"Bit Length"  Drop-down list for the selection of the bit length

"Value"  Drop-down list for the selection of the value

"Channel"  This drop-down list is automatically displayed if the object has several sub-objects.

"As List"  Parameters are loaded as a list. The first four bytes indicate the length.  
   : The length is calculated automatically.

---

**“CAN over EtherCAT”**

Table 758: “Select an Entry from the Object Directory”

| Column “Flags” | Display of access flags: RW (read/write), RO (read only), WO (write only) |
| Column “Base value” | Editable (open with double click) |

| “Name” | Input field for displaying and changing the name |
| “Index: 16#” | By specifying new index/subindex entries, a new object can be added to the SDO that is not yet described in the EDS file. |
| “Subindex: 16#” | Value range of the object |
| “Bit length” | The size of each value can be maximum one byte (0-255). It can also be a hexadecimal in IEC syntax (for example, 16#ad). If the “Byte array” option is enabled, then the values have to be specified as a comma-separated list (for example, 1,2,3,4). |
| “Value” | The complete object is written with one access and all subindexes are set at the same time. The time needed for the transfer is reduced because not every sub-index has to be transferred individually. |
| “Full access” | Values can be specified as a comma-separated byte array. |

- Chapter 1.5.6.2.13.2.1 “Tab ’EtherCAT Slave - General’ ” on page 3350

**Bus cycle task - EtherCAT**

**General information**  As a rule, for each IEC task the used input data is read at the start of each task (1) and the written output data is transferred to the I/O driver at the end of the task (3). The implementation in the I/O driver is decisive for further transfer of the I/O data. The implementation is therefore responsible for the timeframe and the specific time when the actual transmission occurs on the respective bus system.
The bus cycle task of the PLC can be defined globally for all fieldbuses in the PLC settings. For some fieldbuses, however, you can change this independent of the global setting. The task with the shortest cycle time is used as the bus cycle task (setting: "unspecified" in the PLC settings). In this task, the messages are normally transferred on the bus.

Other tasks copy only the I/O data from an internal buffer that is exchanged only with the physical hardware in the bus cycle task.

(1) Read inputs from input buffer       (2) IEC task
(3) Write outputs to output buffer      (4) Bus cycle
(5) Input buffer                        (6) Output buffer
(7) Copy data to/from bus              (8) Bus cycle task, priority 1, 1 ms
(9) Bus cycle task, priority 5         (10) Bus cycle task, priority 10, interrupted by task 5
(11) Bus cycle task, priority 10, interrupted by task 5

Using tasks
The "Task Deployment" provides an overview of used I/O channels, the set bus cycle task, and the usage of channels.

**WARNING!**
If an output is written in various tasks, then the status is undefined, as this can be overwritten in each case.

When the same inputs are used in various tasks, the input could change when a task is processed. This happens if the task is interrupted by a task with a higher priority and causes the process map to be read again. Solution: At the beginning of the IEC task, copy the input variables to variables and then work only with the local variables in the rest of the code.

Conclusion: Using the same inputs and outputs in several tasks does not make any sense and can lead to unexpected reactions in some cases.

**Behavior of the bus cycle with EtherCAT**
The pending network messages of the last cycle are read before the IEC inputs are copied.
If the “Send/Receive per Task” option is activated in the settings of the EtherCAT master, additional telegrams are transmitted to the devices employed per task and input or output employed. Channels that are used in a slow task are also transmitted less frequently. The bus load can thus be reduced.

PROFINET IO configurator

Refer to the general description for information about the following tabs of the device editor.

- Tab '<device name> I/O Mapping' % Chapter 1.3.1.25.1.19.11 “Tab '<device name> I/O Mapping'” on page 755
- Tab '<device name> IEC Objects' % Chapter 1.3.1.25.1.19.12 “Tab '<device name> IEC Objects'” on page 759
- Tab '<device name> Parameters' % Chapter 1.3.1.25.1.19.3 “Tab 'Parameters'' on page 746
- Tab '<device name> Status' % Chapter 1.3.1.25.1.19.17 “Tab 'Status'' on page 768
- Tab '<device name> Information' % Chapter 1.3.1.25.1.19.18 “Tab 'Information'' on page 768

Only in the case of special features is there an additional help page for the specific device editor.

If the "<device name> Parameters" tab is not shown, then select the “Show generic device configuration editors” option in the CODESYS options (“Device Editor” category).

PROFINET IO is based on the working model of PROFIBUS DP, but it uses Ethernet TCP/IP for cyclic communication between the central PLC and the distributed field devices. It is appropriate for fast transmission of I/O data, as well as required data, IT functions, and parameters.

Even though the PROFIBUS master-slave method is replaced in principle by a provider-consumer model for PROFINET IO, the PROFINET IO real-time communication for cyclic transmission of user data requires a defined master-slave configuration. Therefore, there is a master (PROFINET IO controller), slaves (PROFINET IO devices), and I/O modules below the slaves.

In order for you to insert and configure PROFINET IO devices as objects in the device tree, you must first install the I/O controller, I/O devices, and I/O modules on the local system. If this does not happen automatically with the installation of the current development system, then you have to do it explicitly by means of the device repository dialog. The GSDML device description files that are supplied with the hardware are used as a basis for this.

You insert a PROFINET IO controller into the device tree below a device that has a PLC logic node. The device description file of the PROFINET IO controller defines which PROFINET IO devices you can insert below it. Similarly, the description of an I/O device defines which PROFINET IO modules you can insert below the I/O devices. For I/O modules that have a fixed position, CODESYS automatically provides slots in the device tree. The "Insert Device" command is used for inserting devices. Please note that it is also possible to deactivate a device temporarily for network operation.

See also
- Command 'Insert device' % Chapter 1.3.1.25.2.4.3 “Command 'Insert Device'” on page 898

PROFINET IO - Controller

The configuration of the PROFINET IO controller consists of the controller and the PROFINET IO devices (slaves) inserted below it. The devices are configured by the controller and exchange data with it.

CODESYS provides two different PROFINET IO controllers: A variant especially for Hilscher CIFX adapters and a variant that runs on any Ethernet adapter.
When inserting the Ethernet-based controller, two tasks are created implicitly that are required by the PROFINET IO communication stack.

- **“Profinet_CommunicationTask”**: This task includes the acyclic communication services, such as establishing connections and diagnostics. These services are not time-critical due to very weak real-time demands. Therefore the task is low priority.
- **“Profinet_IOTask”**: This is where the actual PROFINET IO real-time data exchange takes place. Pending I/O data packets are processed in each cycle (see Slave Configurator: “Send Clock”). Therefore, a cycle time of 1ms is required (for 1ms send clock).

If the smallest selected sender interval for the slaves of this controller is 2ms, 4ms, or greater, then also a cycle time of 2ms or 4 ms can be selected. However, the priority of the task should be selected as high as possible.

For maximum I/O performance with minimum delay when reading/writing, I/O data can be updated in this task (→ insert own POU that updates I/Os in this task). No blocking or persisting operations should be executed in the I/O task, such as visualization or file access. If the task is blocked too long, then the watchdog cancels the connection for communicating with the slave (see Slave Configurator: “Watchdog”).

**NOTICE!**

We recommend that you activate the “Refresh I/Os in Stop” option in the PLC settings. Otherwise the communication is canceled when the application stops at a breakpoint.

---

**With the scan functionality, you can easily ascertain the present hardware structure and transmit to the device tree.**

The connection is terminated and the slaves switch to their substitute values. The defaults for the watchdog originate from the device description.</td>
</tr>
</tbody>
</table>

### CODESYS default values - PROFINET IO substitute values

PROFINET IO devices set their inputs and outputs to predefined substitute values when there is an interruption. These values are defined in the field device in contrast with default values. These values are usually zero, but specific substitute values can also be configured depending on the device.

The substitute values are set in the following cases:

- The connection is interrupted.
- The controller sets the provider state for the incoming data to "BAD".
- Other interruptions occur (for example, exception in host application, incorrect parameterization)

If the "Application Stop --> Substitute Values" option is enabled, then the controller sets the provider states to "BAD" at application stop. In this case, the slaves set their substitute values. All incoming data from the controller is ignored (including default values).

If the default values defined in the application should be set for an application stop, then you have to disable this option. Moreover, you should enabled the "Update IO while stop" option (in the "PLC Settings"). Otherwise, the CODESYS PROFINET IO controller is stopped.

### PROFINET IO Controller - Overview

Object: PROFINET IO controller

This tab shows an overview of all devices with their communication settings. The station name, the IP configuration, and the transmission speed can all be modified directly in the list. For the other parameters, the "Communication Settings" dialog opens.

These settings are overwritten by the settings of the device.
Table 759

PROFINET IO Controller - Bus Cycle Task

General information

As a rule, for each IEC task the used input data is read at the start of each task (1) and the written output data is transferred to the I/O driver at the end of the task (3). The implementation in the I/O driver is decisive for further transfer of the I/O data. The implementation is therefore responsible for the timeframe and the specific time when the actual transmission occurs on the respective bus system.

The bus cycle task of the PLC can be defined globally for all fieldbuses in the PLC settings. For some fieldbuses, however, you can change this independent of the global setting. The task with the shortest cycle time is used as the bus cycle task (setting: "unspecified" in the PLC settings). In this task, the messages are normally transferred on the bus.

Other tasks copy only the I/O data from an internal buffer that is exchanged only with the physical hardware in the bus cycle task.
Using tasks

The "Task Deployment" provides an overview of used I/O channels, the set bus cycle task, and the usage of channels.

WARNING!

If an output is written in various tasks, then the status is undefined, as this can be overwritten in each case.

When the same inputs are used in various tasks, the input could change when a task is processed. This happens if the task is interrupted by a task with a higher priority and causes the process map to be read again. Solution: At the beginning of the IEC task, copy the input variables to variables and then work only with the local variables in the rest of the code.

Conclusion: Using the same inputs and outputs in several tasks does not make any sense and can lead to unexpected reactions in some cases.

PROFINET IO - Device

PROFINET IO does not provide any additional settings. Its functionality corresponds to the general description.

PROFINET IO - Device

PROFINET IO-Device - General

Object: PROFINET IO Device
In this dialog, you configure a communication link (PROFINET IO: application relation) to a PROFINET IO field device.

For all settings in the present dialog, the device description determines if the values here are editable and the values that are predefined or possible.

<table>
<thead>
<tr>
<th><strong>“Station name”</strong></th>
<th>The station name of the device. It is used for unique identification of the device in the network.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Station status”</strong></td>
<td>32-bit error code compliant with the PROFINET IO specification. In case of error, the status is provided here, for example, when establishing a connection fails or a link is interrupted. For some errors, an additional description is provided.</td>
</tr>
</tbody>
</table>

**“IP Parameters”**

- **“IP address”**
- **“Subnet mask”**
- **“Default gateway”**

**“Communication”**

- **“Send clock (ms)”** Send clock time (in milliseconds).
- **“Reduction ratio”** Scaling factor
  
The transmission interval results from the “Send clock” multiplied by the “Reduction ratio”. Therefore, a “Send clock” of 1ms and a “Reduction Ratio” of 4 means that I/O data is sent every 4ms.

- **“Phase”** With a “Reduction ratio” of n, the transmission interval is subdivided into phases 1 to n (where transmission is in one phase only). You can determine the phase for transmission for the purpose of load distribution.
  
  If “Send clock” = 1 and “Reduction ratio” = 4 (as in the example above), then you could configure phases 1 - 4. For four slaves with this send clock and reduction ratio settings, you could assign one of the four phases to each of the four slaves. In this way, only one data package is sent in each of the four phases of the clock time and the load is distributed equally.

- **“Watchdog (ms)”** Monitoring time. Possible values: 3 ms to 1920 ms. (in steps, depends on “Send clock” * “Reduction ratio”)
  
  A connection is canceled when the controller or the PROFINET IO device does not receive I/O data from the communication peer within this time period. The device enters error mode and switches the outputs to default values.

- **“VLAN ID”** VLAN identifier: Number between 0 and 4095 for VLAN type 802.1Q.
  
  Please note: For newer devices compliant with PROFINET IO specification V2.3, only "0" is still permitted.

- **“RT class”** if available, you can select the required RT class from the list (real-time communication).

**“User Parameters”**

- **“Set All Default Values”** CODESYS resets all settings to default values (see default value column) from the GSDML file.
- **“Read All Values”** CODESYS reads the current values from the device and updates them in the editor.
- **“Write All Values”** CODESYS writes the current values from the editor to the I/O device. Not all I/O devices support parameter updates in run mode. If not, then an error message is displayed.
PROFINET IO Device - Options

Object: PROFINET IO Device

On this tab, you define whether the device is configured by another controller and therefore is operated as a shared device.

In addition, you can define the neighboring devices and connection cable.

| “Shared device” | ✔️: This device is configured by another controller. Modules that are used by the other controller must be deactivated by setting this option. |
| “Peer station/port” | Neighboring device with port that is connected to this port. You can accept this setting in the “PROFINET IO Controller Topology” tab. |
| “Cable length” | Length of the network cable (in meters)  
- < 10  
- < 25  
- < 50  
- < 100  
When a cable length is specified, it is checked when the controller is powered up. An incorrect cable length causes an error message. |
| “MAU type” | Type of network cable  
- Copper  
- Optical fiber  
When a cable type is specified, it is checked when the controller is powered up. An incorrect cable type causes an error message. |

- PROFINET IO Device - IOxS

Object: PROFINET IO device

In this dialog, you can access I/O provider data and I/O consumer data.

In addition to the actual input and output data, PROFINET sends status information (provider states). These indicate whether or not the values are valid (PS == 0x80). For example, the input values of a slave could be invalid if a hardware failure is present. Likewise, you could explicitly declare the outputs sent by the controller as invalid if an error occurs somewhere in the application. Then the slaves activate the default values if they are configured.

Submodules without their own I/Os also provide a provider state for inputs.

“Show I/O channels” | Note: The channels are deactivated when the option “Add I/O mapping” is activated in the “PROFINET IO Controller - General” tab.  
- ✔️: The associated module provides additional I/Os with the provider state in the I/O mapping dialog. The corresponding module can be opened by double-clicking the address field. |
"Submodule"  
"Variable"  
"Address"

The I/O variable that is mapped to the input/output.

IEC address where this variable is mapped (I/O mapping dialog).

The value "hex 80" (bit 7) from the provider state bytes display the status "OK". For detailed information about the definition of this byte, refer to the technical specification for PROFINET IO.

In the case of an I/O provider state that is mapped for output data, the output PS must be set to "GOOD" (=0x80) explicitly. Otherwise, the device will not accept the data. Then the slaves activate the default values if they are configured.

If the application is stopped, then the unmapped I/O provider states for outputs are set to "bad". Mapped I/O provider states are set to their configured values.

PROFINET IO Device - Status
Object: PROFINET IO Device
This tab shows the diagnostics data and the alarms of the device.

"Diagnostics Data"  
"Alarms"  
"Acknowledge"

The diagnostics currently located in the device. The current diagnostics data is reloaded from the status display as long as a link can be established to the device.

All alarms of this device that have been reported by this device since the start of the application. The alarms are stored in a ring buffer on the controller.

Deletes the alarms from the ring buffer.

PROFINET IO - Module

1.5.6.2.14.1.5.1  PROFINET IO Module - General.......................................... 3370
1.5.6.2.14.1.5.2  PROFINET IO Module - Status............................................ 3371

PROFINET IO Module - General
Object: PROFINET IO Module

Table 761: “Module Information”

| “ID number” | Identification of the module (from the device description). |
| "Slot number" | Position of the I/O module below the I/O device, starting at “1” for the first module and incremented for each additional module. This results automatically from the current structure in the device tree. |
Table 762: “User Parameters”

<td>Deletes the alarms from the ring buffer.</td>
</tr>
</tbody>
</table>

PROFINET IO - Slave device

The configuration of the PROFINET IO slave device consists of the device itself as well as the modules inserted below.

CODESYS provides two different PROFINET IO slave devices: A variant especially for Hilscher CIFX adapters and a variant that runs on any Ethernet adapter.

When inserting the Ethernet-based slave devices, two tasks are created implicitly that are required by the PROFINET IO communication stack.

- “Profinet_CommunicationTask”: This task includes the acyclic communication services, such as establishing connections and diagnostics. These services are not time-critical due to very weak real-time demands. Therefore the task is low priority.
- “Profinet_IOTask”: This is where the actual PROFINET IO real-time data exchange takes place. Pending I/O data packets are processed in each cycle (see Slave Configurator: “Send clock”). Therefore, a cycle time of 1ms is required (for 1ms send clock).

For maximum I/O performance with minimum delay when reading/writing, I/O data can be updated in this task (insert own POU that updates I/Os in this task). No blocking or persisting operations should be executed in the I/O task, such as visualization or file access. If the task is blocked too long, then the watchdog cancels the connection for communicating with the slave (see Slave Configurator: “Watchdog”).

NOTICE!

We recommend that you activate the “Refresh I/Os in Stop” option in the PLC settings. Otherwise the communication is canceled when the application stops at a breakpoint.

PROFINET IO Slave device - General

Object: PROFINET IO Slave Device

The tab shows the basic communication preferences.

According to the Profinet standard, the PROFINET IO slave device is responsible for the IP settings of the used adapter. It must save remanent IP settings and be able to reset or modify at the request of the controller (IP=0.0.0.0). Initial state (Reset to factory) is with deactivated IP suite (IP=0.0.0.0).

However, if the PROFINET IO device is a programmable logic controller and connected with the (CODESYS) programming environment via one and the same Ethernet adapter, then modifying and resetting the IP address is interruptive (connection interruption between IDE and PLC). Therefore, one of the modes is provided that deviates from the standard ("Use project parameters"). You must also use this option for Windows and VxWorks systems.

Table 763: “IP and Name Assignment”

<table>
<thead>
<tr>
<th>“Use remanent data”</th>
<th>The IP settings and the station name of the file are used. The file is stored in the file system. The data is set by the controller and saved to a file by the device.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Use project parameters”</td>
<td>The IP settings and the station name of the project are used (settings of the Ethernet adapter). This option must be selected for Windows, VxWorks, and WinCE, because changing the IP address is not possible for these systems.</td>
</tr>
<tr>
<td>“Station name”</td>
<td>Station name of the PROFINET IO device</td>
</tr>
</tbody>
</table>

Table 764: “IO Provider / Consumer Status”

<table>
<thead>
<tr>
<th>“Use incoming”</th>
<th>✓: The I/O data for the provider and consumer states is generated which is received by the controller.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Use outgoing”</td>
<td>✓: The I/O data for the provider and consumer states is generated which is sent to the controller.</td>
</tr>
</tbody>
</table>
| “Substitute values”          | The substitute values for the output data become active when the corresponding provider status (Output Data PS) is set to Bad. The output data is sent by the controller and copied to the %I area of the Profinet modules.  
  The following options are available for the substitute values:
  - “Inactive”: The outputs are set to "inactive" (example: 0).
  - “Last value”: The output data retains the last valid value (provider status = Good). The value is retained even if the connection to the controller has been interrupted. |

In online mode, the station name and the IP settings are displayed “Status” tab.
PROFINET IO Slave device – Configuration

Linux configuration

The following configuration steps are necessary in Linux for a standard-compliant behavior (example here for Debian/Raspi):

- Select the option “Use operating system settings” for the Ethernet adapter.
- Deactivate the protocol filters and set the IP address in the config file of the CODESYS runtime:
  - [SysEthernet]
    Linux.ProtocolFilter=3
  - [SysSocket]
    Adapter.0.Name="eth0"
    Adapter.0.EnableSetIpAndMask=1
- Configure the operating system so that the Ethernet adapter starts without the IP address in "promiscuous mode". In /etc/network/interfaces:
  - auto eth0
    iface eth0 inet manual
    pre-up ifconfig $IFACE promisc up
    post-down ifconfig $IFACE promisc down
    If necessary, deactivate the “Zero Conf” services, such as the avahi daemon:
    update-rc.d -f avahi-daemon remove

See also

- § Chapter 1.5.6.2.14.2.1 “PROFINET IO Slave device - General” on page 3372

VxWorks configuration

The following configuration steps are necessary for standard-compliant behavior in VxWorks:

- Select the option “Use operating system settings” for the Ethernet adapter.
- Setting the IP address in the config file of the CODESYS runtime is permitted. At first, do not set any IP address for this adapter:
  - [SysSocket]
    Adapter.0.Name="eth0"
    Adapter.0.EnableSetIpAndMask=1
    Adapter.0.ipaddress=
    Adapter.0.subnetmask=
- Configure the operating system so that the Ethernet adapter starts without the IP address in "promiscuous mode". To do this, you have to add these entries to the startup script (for the desired adapter):
  - ifconfig ("gei0 promisc")
    ipAttach 1,"gei0"

See also

- § Chapter 1.5.6.2.14.2.1 “PROFINET IO Slave device - General” on page 3372

Windows configuration

The following configuration steps are necessary for standard-compliant behavior in Windows:

1. For CODESYS Control Win V3: Install WinPCap (for example, included in the setup of Wireshark).
   When using CODESYS Control RTE V3, WinPCap is not necessary.
2. Set a fixed IP address for the Ethernet adapter to be used in the Windows control panel.
   Caution: Any IP address from the auto-config (169.254.x.y) range must not be used. Instead, use an address for the local subnet (for example, 192.168.0.x / 255.255.255.0).
3. Setting the IP address in the config file of the CODESYS runtime is permitted:
   - [SysSocket]
   - Adapter.0.Name="Profinet Adapter"
   - Adapter.0.EnableSetIpAndMask=1
   - Adapter.0.ipaddress=
   - Adapter.0.subnetmask=

4. Start WinPLC.
   At the initial start, some settings for the adapter specified in step 3 are applied in the Windows Registry. These are effective after the system has restarted.

5. After the system is restarted, check the control panel whether an auto-config address has been used for the adapter (--> remove).

7. In the CODESYS project, set the option "Use operating system settings" on the Ethernet adapter device.

- Chapter 1.5.6.2.14.2.1 “PROFINET IO Slave device - General” on page 3372
- Chapter 1.5.6.2.14.5.1 “Runtime system configuration” on page 3378

Windows CE configuration
When using Windows CE, the following should be taken into account:
- Select the option “Use operating system settings” for the Ethernet adapter.
- Setting the IP address in the *.cfg file is not permitted.
- Select the option “Use project parameters” from the “General” tab.

See also
- Chapter 1.5.6.2.14.2.1 “PROFINET IO Slave device - General” on page 3372

PROFINET IO Slave device - General
Object: PROFINET IO slave device
This tab shows the basic communication preferences.

<table>
<thead>
<tr>
<th>&quot;Use remanent data&quot;</th>
<th>The IP settings and the station name of the file are used. Initially, the IP address is 0.0.0.0 according to the standard and the station name is blank. When a controller sets these values with the &quot;store remanent&quot; option, then they are stored here.</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Use project parameters&quot;</td>
<td>When starting the device, the values defined in the project for IP configuration and station name are always used initially. This option must be selected for Windows, VxWorks, and WinCE, because changing the IP address is not possible for these systems.</td>
</tr>
<tr>
<td>&quot;Station name&quot;</td>
<td>The name of the device in the network. Note: The station name and the IP settings can deviate from the (default) settings configured in the project. They can be set by the controller in online mode and in some cases stored persistently (this means when this is specified for the controller in the Set IP or Set station name commands). After a restart, the device is configured with these values as long as the &quot;Use remanent data&quot; option is set.</td>
</tr>
</tbody>
</table>
Initial settings for identification in the network.

Caution: This data can be modified by the PROFINET IO controller. The data is stored remanent on the file system of the controller. After the controller is restarted, this stored data goes into effect. The settings here are then ignored.

In online mode, the station name and the IP settings are displayed “Status” tab.

Command 'Scan For Devices'

Function: This command establishes a brief connection to the hardware and determines the devices in the network. You can then adopt the devices found into the device tree of your project.

Call: Main menu “Project”, context menu of a device object in the device tree.

Requirement: The settings for communication with the control device are correct. The gateway and the PLC are running. The device supports the scan function.

To use the scan functionality, you must log in once in order to load the library to the controller.

The command refers to the master controller selected in the device tree. For example, an already inserted PROFINET IO controller can be selected and the command used to determine the I/O devices and I/O modules assigned to it.

After scanning, the dialog box “Scan for Devices” appears with the results.

Dialog 'Scan Devices'

Table 765: “Scanned Devices”

Data about the scanned device depending on network type.

When you change a value in the list of scanned devices, the value is shown in italics. This indicates that the new value has been changed in the editor in CODESYS, but not in the device. When you download the value to the device, it is shown normally.

Value that indicate differences between the project and the scanned device are shown in orange.

If several device descriptions are available for the scanned device, then the name is displayed in bold. The selection of the matching device description is resolved differently for different fieldbuses. Details can be found in the corresponding fieldbus sections.

If a device description cannot be found, then the following message is shown: "Attention! The device was not found in the repository." Depending on the bus system, additional information is displayed, such as manufacturer number and product number. The device cannot be inserted into the project without the installed device description.

“Show differences to project”

☑: The table in the dialog also shows additional configured devices (in the device tree of the project).

☐: The table shows all scanned devices. The configured devices are not shown.
Table 766: "Configured Devices"

This part of the dialog is visible only when you select the “Show differences to project” option.

Differences between the scanned and configured devices are color-coded. Devices in green are identical on both sides. Device in red are available only in the view of the scanned or configured devices.

<table>
<thead>
<tr>
<th>Difference Description</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>If you have selected a device in both views, then the scanned devices are</td>
<td>inserted above the selected configured device.</td>
</tr>
<tr>
<td>inserted below the selected configured device.</td>
<td></td>
</tr>
<tr>
<td>If you have selected a device in both views, then the configured devices are</td>
<td>replaced by the selected scanned device.</td>
</tr>
<tr>
<td>All scanned devices are copied to the project.</td>
<td></td>
</tr>
<tr>
<td>Deletes the selected configured device.</td>
<td></td>
</tr>
</tbody>
</table>

**NOTICE!**

If you insert devices, which are available in the device tree, to the device tree with “Copy All Devices to Project”, then the following should be noted. The data of the “Process Data” and “<..> I/O Mapping” tabs of the existing devices can be overwritten with the data of the recently inserted devices.

---

**Special settings for PROFINET**

**“ID No.”**

Display only when
- I/O device and controller are part of the same logical network
- IP address and network mask of the I/O device are set correctly

**“Station name”**

You can modify these entries or create them again before you accept the device and its settings into the configuration of the project. If you do not define an address, then the presets are used. The presets are defined in “PNIO Controller Parameter”.

**“IP address”**

To determine the module structure of the station, it must possess a valid IP address (see setting the IP address with “Set IP” or “Denominate”).

**NOTICE:** Each device must have received a station name because the name is required in network operation for certain functionalities.

To declare the new name in the bus system, you must click the “Denominate” button for the selected device entry.
"I&M" Use this command for retrieving the I&M data (identification and maintenance) of the device. The data is shown in the dialog “I&M data”.

"Auto IP" With this command, you automatically set a valid IP address within the network (network settings of the master) if the address scanned by the device is invalid.

"<--> " Use this command for assigning the settings (“Station name”, “IP address”) from the configured device to the scanned device.

"--> " Use this command for assigning the settings (“Station name”, “IP address”) from the scanned device to the configured device.

"Reset" Resets the device settings to default values.

"Blink LED" In the “Found Devices” view, you can identify a device by its hardware by selecting the entry in the dialog and clicking “Blink LED”. The device should respond with a flashing signal.

"Set Name+IP" CODESYS attempts to set the station name and IP address that were specified for the selected slave.

“Show only unnamed stations” Only devices are listed that do not have an assigned station name.

Please note the option of aligning the configuration settings of a PROFINET IO device with the settings of the corresponding hardware device © Chapter 1.3.1.8.2 “Mapping a hardware structure in the device tree” on page 159.

Dialog I&M data

| “I&M version” | Implemented version of I&M functions |
| "Vendor ID" | ID of the manufacturer of the submodule |
| "Order ID" | Order number |
| "Serial Number" | Serial number of the submodule (unique production number) |
| "Hardware Revision" | Hardware version of the submodule |
| "Software Revision" | Software version of the submodule |
| "Location" | Location where the device is installed (for example, in a plant or production hall) |
| "Function" | Function or task of the submodule |
| "Date" | Day of installation or commissioning of the device or module |
| "Description" | Any individual information |

For some devices, the parameters “Function”, “Location”, “Date”, and “Description” can be modified.

Command 'Profinet Topology'

Function: The command displays the network topology of the PROFINET IO network as a tree structure. For each port of the PROFINET IO device, the neighboring device connected here and its port are displayed (if available).

Call: Context menu of a PROFINET IO controller.

Requirement: The communication settings to the controller are correct. The gateway and the PLC are running. The device supports the scan function.
refreshes the view

“I&M“ Gets the I&M data (identification and maintenance) of the device and view in a dialog.

“Auto IP“ Automatic setting of a valid IP address for the selected device in case the address scanned by the device is invalid.

“Port State“ Possible states:
- ● : Unknown or not connected
- ● : OK
- ● : Error

“Neighbour“ Name of the neighboring device in the network.
In the case that the device does not support the function or does not have a valid IP configuration, "No data!" is displayed. Details about the error cause are shown as a tooltip.

“Neighbour-Port“ Name of the neighboring port in the network.

Troubleshooting

This section describes the troubleshooting for CODESYS PROFINET IO drivers (PLC and slave device). In particular, it covers problems that can occur in connection with the different runtime variants. This section does not provide an introduction to PROFINET diagnosis.

NOTICE!
Please note the configuration steps for each platform.

Runtime system configuration

When problems of any kind occur, first check the configuration of the operating system and the CODESYS runtime system, as described below.

Firewall and package filter

The PROFINET stacks do not use the configured Ethernet adapters of the PLC exclusively. The PROFINET protocols run parallel with the network protocols (for example, UDP), as well as building on these. In this way, these Ethernet adapters can also be used for CODESYS communication. However, the firewall configuration (if active) must be modified to the PROFINET requirements.

Network protocols used
- ● PROFINET RT (Ethtype = 0x8892)
- ● UDP, Port 0x8894, as well as free ports in the range of 0xC000 – 0xFFFF ( – 0xC0FF is usually sufficient).
  Also for incoming packages.
- ● LLDP (Ethtype 0x88CC)
- ● ARP (Ethtype 0x0806)

It is usually sufficient to unblock the UDP ports at the firewall.

The PROFINET-RT protocol is not an IP protocol. It cannot be routed and is restricted to the local network.

If you suspect that the firewall is the cause of the communication problems, then deactivate it temporarily in an isolated environment.
Runtime system configuration

For communication with the PROFINET RT protocol, the PROFINET IEC stacks use a special runtime system interface (SysEthernet) that allows the transmission of RAW Ethernet frames. This runtime system component must be activated in the configuration file of PLC.

```
[ComponentManager]
Component.1=CmpSysEthernet
```

For Linux systems, the protocol filter must also be deactivated.

```
[SysEthernet]
Linux.ProtocolFilter=3
[SysSocket]
```

For some platforms, a package filter is also active on the operating system level, and the Ethernet adapter must be switched explicitly to promiscuous mode (for example for Linux).

For example, in `/etc/network/interfaces`:

```
auto eth0
pre-up ifconfig $IFACE promisc up
post-down ifconfig $IFACE promisc down
```

CODESYS Control Win V3

For the operation of PROFINET, WinPCap must be installed on the system (for example, included in the setup of Wireshark).

If an Ethernet adapter is added again to the system, then the system has to be restarted. Otherwise, the adapter may not be detected. In this case, the driver displays the ErrorFindEthernet error in the "Status" tab.

Diagnosis methods

For more information about troubleshooting, refer to the following views in CODESYS or external software, each depending on the case:

Status dialog in the device configurator

If the object of the PROFINET controller or sPROFINET device has a red symbol in the device tree, or if no communication is taking place at all, then take a look at the "Status" tab in the device configuration dialog.

![Status dialog](image)

Here we are looking at the controller only. The same basically applies to the device.

The most important fields in the diagnosis structure displayed here are as follows:

"Controller status":

Current status of the controller; the individual values correspond to the enumeration `Profinet.ControllerState`:
Specific conclusions about problem sources can often be drawn from these values, for example for license issues or doubled station names.

The status value is also available in the PLC application:

**“Received frames” / “Received RT frames”:**

Under specific conditions, the controller status switches to “Run”, but communication is still not possible. The values “Received frames” / “Received RT frames” can provide more information:

“Received frames” shows the number of all Ethernet frames that were received over the Ethernet interface. “Received RT frames” shows the subset of the PROFINET RT frames.

If both counters remain at 0 after starting the controller although the device is in a network, then this indicates basic problems with the runtime system component `SysEthernet`.

If only “Received frames” increments but not “Received RT frames” although PROFINET devices are in the network, then this indicates a problem with the runtime system configuration (firewall, packet filter, etc.).

**“Recv time” / “Send time”:**

The maximum value and the average value are displayed here for both sending and receiving of the Ethernet frame. A performance indicator for the link to the Ethernet adapter (runtime system interface `SysEthernet`).

**PROFINET IO slave configurator**

In the case of a failed connection (slave symbol is red), the cause is displayed in the “General” tab of the device configuration dialog. (PNIOStatus according to PI Specification: Application Layer protocol for decentralized periphery Technical Specification for PROFINET IO, Version 2.3Ed2MU2, Date: February 2015, Order No.: 2.722)
On weak systems or systems with a poor link to the Ethernet component (SysEthernet), connection disruptions can be caused by jitter or high cycle times. The controller is affected above all, the device is not critical in this case. The "Monitoring" tab in the "Task configuration" helps to detect these problems.

The "Profinet_IOTask" is important because the PROFINET RT data packets are transmitted at a constant transmission speed. If this transmission speed cannot be maintained, then the connection is terminated by the communication watchdog "DataHoldTimer" of the PROFINET devices.

As recommended values, the average cycle time should not exceed 250 µs and the maximum cycle time should not exceed 1 ms.

The "Profinet_IOTask" should therefore run as high priority, and they should not block other IEC tasks (same or higher priority). In the context of this task, no blocking or long-lasting calls should occur.

In case of error in the configuration or an interruption of the connection, the PROFINET driver may provide more information in the log view of the device configurator of the PLC:

An established tool for network diagnostics in general is the free software Wireshark (www.wireshark.org). This can be used for recording all network traffic on the port of the controller/device. Wireshark can also be installed on another device (for example, a Windows PC) as long as it is in the same network as the PROFINET device. In this case, however, a switch must be used with a mirror port.

Performance

The PROFINET RT data packets are transmitted to both the controller and device at a constant transmission speed. If this transmission speed cannot be maintained, then the connection is terminated by the communication watchdog "DataHoldTimer" of the PROFINET devices, even during the phase of establishing a connection.

On weak systems or systems with a poor link to the Ethernet component (SysEthernet), unstable data transmission can occur.

Then either the transmission speed has to be reduced in the Reduction ratio setting, or the communication watchdog has to be intensified. The performance of the CPU is less important than the performance of the PROFINET driver. The link of the Ethernet interface is decisive. In addition to the hardware, the software-specific link (operating system and Ethernet drivers) also plays an important role.

Examples of a possible number of connections and transmission speed:
<table>
<thead>
<tr>
<th>OS</th>
<th>CPU</th>
<th>Connections * transmission speed</th>
</tr>
</thead>
<tbody>
<tr>
<td>Windows (RTE)</td>
<td>Atom</td>
<td>50 * 1 ms</td>
</tr>
<tr>
<td>VxWorks</td>
<td>Power-PC</td>
<td>30 * 4 ms</td>
</tr>
<tr>
<td>Linux</td>
<td>Raspi V3</td>
<td>6 * 1 ms</td>
</tr>
</tbody>
</table>

PROFINET and other drivers

The PROFINET controller and device can run on one and the same Ethernet adapter with other drivers, such as Modbus/TCP or Ethernet-IP. However, they require exclusive access to the low-level Ethernet component (SysEthernet). Therefore, for example, they cannot run parallel with EtherCAT on one adapter. If multiple Ethernet adapters are available, then one PROFINET driver each (controller or device) can be operated there.

PROFINET IO and older runtime system versions

PROFINET drivers require at least one runtime system V3.5.7.0.

Important: PROFINET drivers in version 3.5.10.0 and later also function on older runtime systems, but they require the UDP library also in version 3.5.10.0 and later.

For RTS Windows RTE, at least V3.5.10.0 is recommended (problems regarding reserved UDP ports from the PROFINET area).

Hardware requirements

- PROFINET IO requires an Ethernet adapter that supports at least 100 mbps with full duplex.
- All applied network components (switches) also have to support this transmission mode.
- MAC addresses
  - For some controllers with multiple Ethernet adapters, unique MAC addresses are not assigned. This can lead to serious malfunctions. In this case, the user can usually set a MAC address.

Effects and causes

PLC - Device object displays red symbol

It is imperative that you check the “Controller status” in the “Status” tab of the device.

Causes

- IP or station name of the controller are doubled
- Driver does not have a license
- Internal error

See also

- “Status dialog in the device configurator” on page 3379
In order for the scan dialog to show the PROFINET devices currently located in the PROFINET network, the data is read in two stages:

- Then all devices are recorded in the PROFINET RT protocol.
- In UDP/IP, the module configuration is read for each device.

Possible problems:

<table>
<thead>
<tr>
<th>Effect</th>
<th>Cause</th>
</tr>
</thead>
<tbody>
<tr>
<td>PROFINET devices are displayed in the scan dialog, but not the modules of the devices.</td>
<td>The PROFINET device does not have an IP address, or it is located in another subnet than the controller and therefore it is unreachable via UDP. The firewall is configured incorrectly. Another clue for this are error messages in the “Log” of the PLC.</td>
</tr>
<tr>
<td>Scan dialog displays nothing.</td>
<td>The driver is not started, and the application is stopped. No PROFINET RT packets can be received.</td>
</tr>
</tbody>
</table>

1.5.6.3 Protocols and special servers
1.5.6.3.1 IEC60870-5-104 (Telecontrol)

General information IEC60870

Introduction

The implemented IEC60870-5-104 protocol allows link-ups between AC500 CPUs with onboard Ethernet and external systems. The link-up takes place via the onboard Ethernet interface of the CPU. The telecontrol protocol according to IEC60870-5 is used.

The CPU can work as both control station and substation. In control direction, setpoints and commands can be set; in monitoring direction the control station sends status values, real values and discrete values to the substation. Via general inquiry, the substation requests the control station to send all status values, real values and discrete values. Otherwise, these values are sent by the control station on a change-driven basis, cyclically or when triggered by an application. Status values, real values and discrete values may contain timestamps. These are filled in with the time of the process station when sent. The CPU can time-synchronize the telecontrol link.

A module accepts the configuration of the physical interface (link layer) and the general protocol parts (application layer).

Send and receive blocks are available for data exchange. These blocks exist for the IEC60870-5 data types setpoint value, command value, double command value, status value, double status value, real value and discrete value. The inputs/outputs of the send and receive blocks are combined with the signals to be communicated. See documentation of IEC60870 library for more information.

Limits of supported devices

AC500 V3 (Standard):
- PM5630: Support of 5 control stations and/or substations with 1.000 information objects overall on ETH1 and ETH2.
- PM5650: Support of 10 control stations and/or substations with 5.000 information objects overall on ETH1 and ETH2.
- PM5670: Support of 20 control stations and/or substations with 10.000 information objects overall on ETH1 and ETH2.

Data flow control

Each send or receive block can only process one data message. Ideally, new data are available at each user task run-through or new data can be sent.
If the output OV (send block only) indicates TRUE, the Function Block computes more quickly than the data can be sent. This can happen if the receive block is not computed quickly enough and has thus not collected all the data.

Alternatively, this block sends either cyclically or if the input value is changed. Ideally, the topical data can be sent via the telecontrol link in connection with every user task run-through.

Data integrity

With IEC60870-5 protocol, a distinction is made between data transmission in the monitoring direction (status values, real values, discrete values) and in the control direction (commands and setpoints).

All data transmissions are acknowledged from the link communication level by the receiver. This acknowledgement is not sent to the sender of the data in every telecontrol link.

For data transmission in control direction, additional acknowledgement (e.g. ACTTERM) is possible. These acknowledgements are not sent by every telecontrol link either. For safe data transmission, it is necessary, in such cases, to configure data readback. The receiver then sends the data received back to the sender via the corresponding send blocks.

Information in the monitoring direction is acknowledged by the receiver on the lowest communication level (link level) when received. This acknowledgement is generated by the telecontrol head itself with some telecontrol heads. In the event of overload/overrun, a data message may be lost. For data in the control direction, so-called ACTTERM acknowledgement can be used. This additional acknowledgement is sent back to the sender when the data have been executed in the process. If data are to be sent in the monitoring direction with guaranteed transmission, it is necessary to read back the sent value via another variable and, after observing a monitoring time, resend in the event of an error.

Data transmission

Send blocks

On the basis of the communication protocol, it is sensible to restrict the data types at one send block to one type. Therefore, there are 5 types of send blocks: send of status values, commands, real values, setpoints and discrete values. These types are mapped to the IEC1131 data types BOOL, REAL and DINT. See documentation of IEC60870 Library for more information.

Operating modes of the send blocks

The send blocks know three operating modes to send their data:

● Caused by request pin (SEND)
● Send in connection with a change of data (AUTO)
● Cyclic send of data (CYCLE)

Send via request pin

The SEND signal is evaluated on the rising edge, the RDY signal remains applied for one computation cycle. If a rising edge is generated again at the SEND signal although no acknowledgement has yet been received from the receiver, the OV pin is set in order to indicate that an overrun has happened. The evaluation of the receive acknowledgement is carried out before the evaluation of whether transmission is to take place. This means, assuming that there is an appropriately fast telecontrol link, that in connection with change-driven and cyclic transmission, a transmission job can be sent in connection with every computation of the block. In connection with send via the request pin it is possible to send only in connection with every second computation (send takes place only with a rising edge).
Change-driven send of data

Data are always sent when the value of the input variables changes. When changes take place, there is an internal simulation that the SEND pin changed from 0 to 1.

In order to prevent unnecessarily frequent send in the event of mild fluctuations in the input value, a threshold value can be configured for real values and setpoints. The input value is not sent until it differs positively or negatively from the value last sent by more than the threshold value.

If the input value changes again although no acknowledgement has yet been received from the receiver, the OV pin is set in exactly the same way as in connection with send via the request pin. If an error occurs during send, the job is automatically retried until the value has been sent without error.

Cyclic send

The data are automatically sent after expiration of a configurable cycle time (SCANDOWN). This cycle time is indicated in multiples of the task cycle time in which the block is computed. In this operating mode, an overrun error can occur if the transmission is faster than the response time of the receiver. For setpoints, it is necessary to ensure that an acknowledgement is generated by the receiver which is not sent until the setpoint is accepted. The send block is not ready for transmission again until after this acknowledgement has been received.

Receive blocks

In receive direction, the jobs enter the device module via the interface. The device module selects the correct receive block using the telecontrol address. To this end, during installation the receive blocks pass their parameterized telecontrol addresses to the device module. The device module stores the data received and the receive blocks make the data available at their output pins in connection with the next computation of the user task.

Configuration changes >= Automation Builder 1.1/CBP 2.4

The IEC 60870 protocol allows link-ups between AC500 CPUs with onboard Ethernet (e.g. PM595-4ETH and PM591-2ETH) and external systems.

The link-up takes place via the onboard Ethernet interface of the CPU. As of Automation Builder Version 1.1 telecontrol is also supported for CPUs that provide more than one Ethernet interface (e.g. PM595-4ETH and PM591-2ETH). This allows to use different Ethernet interfaces for IEC 60870 connections, hence, telecontrol configuration is changed. Further, as of this version terminology is aligned with IEC 60870 standard and provides additional features that are described in this chapter. For a description on principle telecontrol configuration.
Control and Substations ≥ CBP 2.4 > Chapter 1.5.6.3.1.2.2 “Control station and substation configuration” on page 3387

Import Export ≥ CBP 2.4 > Chapter 1.5.6.3.1.2.1 “Configuration changes >= Automation Builder 1.1/CBP 2.4” on page 3386

Validity Check of Configuration ≥ CBP 2.4 > Chapter 1.5.6.3.1.2.4 “Validity check of configuration” on page 3407

Control station and substation configuration

The CPU can work as both, control station and substation.

<table>
<thead>
<tr>
<th>Control station</th>
<th>Client, master, controlling station: Synonyms for a higher-level station (central station, monitors other stations)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Control direction</td>
<td>Data transfer direction from the control station to the substation</td>
</tr>
<tr>
<td>Substation</td>
<td>Server, slave, controlled station: synonyms for a subordinate IEC 60870-5-104 telecontrol station (which is monitored)</td>
</tr>
<tr>
<td>Monitoring direction</td>
<td>Data transfer direction from the substation to the controlling station</td>
</tr>
</tbody>
</table>

Configure a control station in the device tree PLC -> Interfaces -> Ethernet -> ETHx:

1. Right-click “ETHx ➔ Add objects”.
2. Select the control station from the list and click “Add object”. Configure substations and further control stations in the same way. As of Automation Builder 1.1 any combination of control stations and substations can be configured, in due consideration of a total number of 10 stations.
3. Double-click the new control station node to open parameter configuration. In the Link Layer tab access to the Ethernet interface is configured.
As of Automation Builder 2.2.1 the V3 PLC telecontrol station objects from GVL IEC60870_5_104_Connection_GVL can only be used in structured text by adding the namespace of the GVL as prefix.

Example:

```
byteValue := IEC60870_5_104_Connection_GVL.IEC_60870_5_104_Control-station.Con;
```

Tab link layer

In order to provide flexible usage of control stations and substations as of Automation Builder 1.1 configuration of substations has been changed. As several substations can be operated with several Ethernet interfaces, select the Ethernet interface to be used from the pull-down menu. Enter the IP address to the control station and if required to another control station (redundant connection). If no IP address is defined, the substation accepts connection to any control station.

This field is not available in the Link Layer tab of control stations. Selection of ETH interface is only possible for substations. The control station is always configured on both interfaces by default.

Timeout settings

T1, T2, T3: The values for the connection control and message replication; timeout1/2/3.

Buffer settings

This parameter gives the maximum number of outstanding messages and acknowledgement behaviour.

Send buffer (k): Maximum difference receive sequence number to send state variable.

Rec buffer (w): Latest acknowledge after receiving w I format APDUs.
Network settings

Network settings are available for control stations and for substations. The IP address of the control station and if available the IP address of another control station (redundant IP address) can be selected by the user.

For an overview on the configured Ethernet interfaces for the control stations and substations, double-click the “Protocols” node.

Tab application layer

Settings

The application layer is the communication layer with which the send and receive blocks work.

![Application layer settings](image)

**Use ACTTERM**

This parameter concerns only setpoints and commands. If this parameter is checked, an acknowledgement with set ‘actterm’ is generated as reason for transmission at the time at which the receive block is computed and outputs its telecontrol data at its output pins. On transmission side, the data block awaits the reception of this ACTTERM acknowledgement and reacts with its corresponding output (see IEC60870 Library) to the reception of this acknowledgement. For commands with execution time, the acknowledgement is generated when the command is terminated, for commands with continuous execution time and for setpoints, the acknowledgement is generated when the data are output to the output pins.

**ForeignAcknowledgement**

If this option is not enabled (default), a message that was sent is considered as ok as soon as transmission was successful. If you enable this option, a message that was sent is not considered as ok until a success message (foreign acknowledge) is returned from the receiver.

**Application timeout**

This time indicates how long an acknowledgement will be awaited on the application level. An acknowledgement is generated only for commands and setpoints on the application level.

**Station address**

The station address defines which station will be subject to a count query. The values define the 2 bytes for the common telecontrol address (Common addr.). The values concerned are as follows:
0: The station address is not used.
1...254: The count is queried on the station defined by the station address.
255: The count is queried on all accessible stations.

**Timesync**

After each new establishment of a link and once per hour, a ‘coarse time synchronisation’ message is generated. This time synchronisation is only supported from AC500 to external systems. Time synchronisation from an external system to AC500 is not provided! Incoming time synchronisation messages are confirmed by the process station but not executed. Greenwich Mean Time (GMT) is used as the time for the synchronisation.

**Send 'Init end' after reconnection**

After each establishment of a link or only in connection with the first establishment of a link and after reconfiguration, an init end message is generated. After the init end message, there is a general inquiry, if configured.

**General inquiry**

**Activated**

This parameter concerns only real values, discrete values and status values. The device module generates a general inquiry message after each new establishment of a link. The other side then generates a message with the reason for transmission ‘general inquiry’ for every data point and subsequently an init end message. This procedure ensures that, in the event of a new establishment of a link, all data are available on the reception side in topical form.

**With parameters**

If general inquiry is activated the parameter values are sent.

**Without integrated totals**

With a general inquiry no integrated total values are sent.

**Counter interrogation**

**Group**

General, 1 .. 4: The count inquiry is executed for a specific group of counters (1 .. 4). The count inquiry is executed for all groups of counters.

**With reset**

The reset quality bit is sent along with the count inquiry.

**With relocate**

The relocate quality bit is sent along with the count inquiry.

**Tab information objects**

Open the ‘Information object’ tab to configure so called Information objects and a Common address (known as 'data points' and 'Global address' in former Automation Builder versions). In this tab different information objects and their services for transmission are defined. A data point or information object is identified via a system-wide unambiguous address containing a maximum 5 bytes.

1. Right-click in the empty view and select ‘Add Information Object with ASDU’ to add a data group. Select the desired object from the list (e.g. M_SP_NA_1).

⇒ An information object with a corresponding ASDU (Application Service Data Unit) is created.
2. Configure the settings in the “Information Object” tab to your convenience.

3. Double-click a table cell to modify pre-set values. For some ASDUs additional sub information objects can be configured. For this, right-click the already existing ASDU and select “Add Information Object” to selected ASDU option. This allows configuration of 16 data points at the most (depending on the ASDU type). With “Remove Information Object” the selected ASDU is deleted.

**Description of the columns**
- **ASDU name**: node name of the information object (name of the ASDU).
- **Data type**: Data type of the ASDU.
- **ASDU type**: Type of ASDU.
- **Common addr**: Common address of the ASDU (known as ‘Global Address’ in former AB Versions). Byte 1/2 of the common telecontrol address of the block (range: 0...255).
- **Info obj addr**: Together with common address Info obj addr defines the endpoint (range: 0...255).
- **Norm start**: Low limit (0 %) of the normalized range for real values and setpoints.
- **Norm end**: High limit (100 %) of the normalized range for real values and setpoints.
- **Threshold**: Threshold limit beyond which a change of the input value referred to.
- **Description**: Table cell for free text. Use this field to describe your configuration settings e.g. differences between configuration variants.

**Format of common addr and info obj addr**

The following address formats of your entries in the columns **Common addr** and **Info obj addr** of the Tab **Information Objects** are possible:
- 1.2 and 3.4.5 (Default format)
- 1-2 and 3-4-5
- 258 or hex 0x102 and 197637 or hex 0x30405
- 513 or hex 0x201 and 328707 or hex 0x50403

Previously you have to choose your preferred address format:
1. Click “Tools” and then “Options...”
   ⇒ The Window Options appears

2. Select IEC 60870-5-104, make your choice and click OK.

Import options of information objects

The User can accept the imported IEC60870 Information Objects as single change or change as block.
IEC60870-5-104 Multiple connections

An AC500 with more than one substation connection must be able to identify the corresponding control station clearly. This identification takes place exclusively via the control station’s IP address. In order to make it possible for a non-redundant control station to have redundant access to a substation with 2 Ethernet connections. The local substation address is ignored during connection establishment.

In the following descriptions, the term station must not be confused with the individual connection. One station can have several connections. An IEC60870-5-104 communication always takes place between a control station and a substation. A control station can manage several substations and also simultaneously be a substation for one or several control stations. However, these must then be realized using different stations.

A PLC may not be configured for another PLC repeatedly as a substation or a control station unless a disjunctive Ethernet infrastructure is used for this.

Redundant connections must be specified as such in the configuration.

An AC500 can be used only once as control station for another AC500, it makes no sense to use the same AC500 repeatedly as a control station for the same substation. Such a structure is configured as a redundant control station as long as only one AC500 exists as a control station per substation. However, this control station may have 2 IP addresses. Therefore, this configuration must either have the IP address 0.0.0.0 entered on the substation for the control station, meaning that all IP addresses are accepted and no other control station can access this AC500 or alternatively the possible control station addresses must be specified (ETH1 and ETH2).
Tree constellation

PM57x/- PM58x/- PM59x-ETH, PM5650-2ETH:

If you plan to control several substations with the AC500, they can be cascaded. This results in a tree structure.

In the following, the notation 192.168.1.0/24 is used for TCP/IP networks. Here, the figure /24 specifies the network mask with 255.255.255.0 and 192.168.1.0 describes the network. The valid addresses for this Class C network are 192.168.1.1 to 192.168.1.254! Only the last byte of the address is provided on the respective devices, with e.g. .10. This means that the respective device has the address 192.168.1.10.
Minimal structure

A control station with an Ethernet interface is connected to a substation with an Ethernet interface.

Configuration at control station

PM57x-/ PM58x-/ PM59x-ETH, PM5650-2ETH:
The respective substation IP address must be specified at the control station. For this, in the network settings of the control station (1) enter the IP address of the substation (in the example: 192.168.1.25). Option "Enable redundant connection" must be disabled.

Configuration at substation

PM57x-/ PM58x-/ PM59x-ETH, PM5650-2ETH:
Either the control station IP address or the general address 0.0.0.0 must be specified at the substation (2). For this, in the network settings of the substation enter the IP address of the control station (in the example: 192.168.1.10). Option "Enable redundant connection" must be disabled.

If the general address 0.0.0.0 is used at the substation, no further control station can be configured on this controller for a further substation.
**Minimal redundancy structure**

The most simple redundant structure with an AC500 consists of a redundant control station (not AC500) which is connected to the AC500 substation with 2 different IP addresses. These redundant control stations must synchronize which control station is active.

Only one control station can be active at any given time.

![Diagram of redundant structure](image)

**Configuration at control stations**  The respective substation IP address must be specified at the control stations 1 and 2 (not AC500). For this, in the network settings of both control stations enter the IP address of the substation (in the example: 192.168.1.25).

**Configuration at substation**  PM57x-/ PM58x-/ PM59x-ETH, PM5650-2ETH:

Either the control station IP addresses or the general address 0.0.0.0 must be specified at the substation (3). For this, in the network settings of the substation enter the IP addresses of the control station (in the example: 192.168.1.10 and 192.168.1.11). Option "Enable redundant connection" must be enabled.
If the general address 0.0.0.0 is used at the substation, no further control station can be configured on this controller for a further substation.

Network redundancy
For network redundancy a control station can reach a substation via 2 paths.
Both the control station and the substation can have 2 different IP addresses. Without special network routing, 2 separate networks should exist, within which both the substation and the control station each have 2 interfaces.
Possible variants of network redundancy are described in the following.

Network redundancy with 2 separate networks

| (1) | Control station with 2 redundant paths |
| (2) | 1 Substation with 2 Ethernet interfaces |

Configuration at control stations
PM591-2ETH, PM595-4ETH, PM5650-2ETH:
The substation’s IP addresses must be specified at the control stations (1). For this, in the network settings of the control station enter the IP addresses of the substation (in the example: 192.168.1.25 and 192.168.2.26). Option “Enable redundant connection” must be enabled.
PM591-2ETH, PM595-4ETH, PM5650-2ETH:
Either the control station's IP addresses or the general address 0.0.0.0 must be specified at the substation (2). For this, in the network settings of the substation enter the IP addresses of the control station (in the example: 192.168.1.10 and 192.168.2.11). Option “Enable redundant connection” must be enabled.

If the general address 0.0.0.0 is used at the substation, no further control station on another substation can be configured on this controller. Equally, the substation connection must be activated for both interfaces.

Network redundancy with 1 network and 2 Ethernet ports in substation

(1) Control station with 2 paths to reach substation
(2) 1 Substation with 2 Ethernet interfaces

PM591-2ETH, PM595-4ETH, PM5650-2ETH:
The substation’s IP addresses must be specified at the control stations (1). For this, in the network settings of the control station enter the IP addresses of the substation (in the example: 192.168.1.25 and 192.168.1.26). Option “Enable redundant connection” must be enabled.
Configuration at substation

PM591-2ETH, PM595-4ETH, PM5650-2ETH:

Either the control station's IP addresses or the general address 0.0.0.0 must be specified at the substation (2). For this, in the network settings of the substation enter the IP addresses of the control station (in the example: 192.168.1.10 and 192.168.2.11). Option “Enable redundant connection” must be enabled.

If the general address 0.0.0.0 is used at the substation, no further control station on another substation can be configured on this controller. Equally, the substation connection must be activated for both interfaces.

Network redundancy with 1 network and 1 Ethernet port in substation

No online redundancy.

Only one connection will be established.

Configuration at control stations

PM591-2ETH, PM595-4ETH, PM5650-2ETH:

The substation's IP addresses must be specified at the control stations (1). For this, in the network settings of the control station enter the IP addresses of the substation (in the example: 192.168.1.25 and 0.0.0.0). Option “Enable redundant connection” must be disabled.
Configuration at substation

PM591-2ETH, PM595-4ETH, PM5650-2ETH:

Either the control station's IP addresses or the general address 0.0.0.0 must be specified at the substation (2). For this, in the network settings of the substation enter the IP addresses of the control station (in the example: 192.168.1.10 and 192.168.2.11). Option "Enable redundant connection" must be enabled.

If the general address 0.0.0.0 is used at the substation, no further control station on another substation can be configured on this controller. Equally, the substation connection must be activated for both interfaces.

Network redundancy with 2 Ethernet ports in substation

![Network redundancy diagram]

(2) 1 Substation with 2 Ethernet interfaces

Configuration at control stations

PM591-2ETH, PM595-4ETH, PM5650-2ETH:

The substation's IP addresses must be specified at the control stations (1). For this, in the network settings of the control station enter the IP addresses of the substation (in the example: 192.168.1.25 and 192.168.1.26). Option "Enable redundant connection" must be enabled.

Configuration at substation

PM591-2ETH, PM595-4ETH, PM5650-2ETH:
Either the control station's IP addresses or the general address 0.0.0.0 must be specified at the substation (2). For this, in the network settings of the substation enter the IP addresses of the control station (in the example: 192.168.1.11 and 0.0.0.0). Option “Enable redundant connection” must be disabled.

If the general address 0.0.0.0 is used at the substation, no further control station on another substation can be configured on this controller. Equally, the substation connection must be activated for both interfaces.

**Full control station redundancy**

A control station can consist of two fully redundant units (not AC500s), which are connected via a redundancy link. These control stations must ensure that only one of them at a time is actively connected to the substation and communicates with it. The inactive control station, however, can establish non-active connection with a substation and monitor it with keep alive packages.

Configuration at control stations

The substation’s IP address must be specified at the control stations (1) (not AC500). For this, in the network settings of the control station enter the IP addresses of the substation (in the example: 192.168.1.25 and 192.168.2.26).

**Configuration at substation**

PM591-2ETH, PM595-4ETH, PM5650-2ETH: Either the control station's IP addresses or the general address 0.0.0.0 must be specified at the substation (2). For this, in the network settings of the substation enter the IP addresses of the control station (in the example: 192.168.1.10 and 192.168.2.11). Option “Enable redundant connection” must be enabled.
If the general address 0.0.0.0 is used at the substation, no further control station on another substation can be configured on this controller. Equally, the substation connection must be activated for both interfaces.

Multiple control stations on the same network

As of firmware version 2.4, an AC500 can be used as a substation for several control stations. For this, the control stations must be distinguished by their IP addresses. Should a control station have more than one IP address (redundancy), both possible IP addresses should also be entered for the allocated substation connection. As a result, even despite being equipped with several Ethernet interfaces, a device can only be one allocated control station at a time for a determined substation. Thus, several substations can be configured for different control stations on a AC500.

PM57x/- PM58x/- PM59x-ETH, PM5650-2ETH:
The substation’s IP address must be specified at the control stations. For this, in the network settings of the control station (1 and 2) enter the IP addresses of the substation (in the example: 192.168.1.25). Option “Enable redundant connection” must be disabled.

PM57x/- PM58x/- PM59x-ETH, PM5650-2ETH:
Both control station's IP addresses must be specified at the substation (3). For this, in the network settings of the substation enter the IP addresses of the control stations (in the example: 192.168.1.10 and 192.168.1.11). Option “Enable redundant connection” must be disabled.

Multiple control stations on different networks

As of firmware version 2.4, an AC500 can have several local Ethernet interfaces which can be used for separate control station connections. For this, a control station must be identified via its IP address. The substation address used locally is not used to distinguish a connection in order to enable a network and therefore route redundancy. On AC500, the acceptance of IEC60870-5-104 connections on an interface can only be prevented.

<table>
<thead>
<tr>
<th>(1) Control station 1</th>
<th>(2) Control station 2</th>
<th>(3) 2 Substations with 2 Ethernet interfaces (2nd port and 2nd connection)</th>
</tr>
</thead>
</table>

Configuration at control stations

PM57x-/ PM58x-/ PM59x-ETH, PM5650-2ETH:
The substation's IP addresses must be specified at the control stations (1 and 2). For this, in the network settings of the control station enter the IP addresses of the substation (in the example: 192.168.1.25 and 192.168.2.26). Option “Enable redundant connection” must be disabled.

Configuration at substations

PM591-ETH, PM595-ETH, PM5650-2ETH:
Both control station's IP addresses must be specified at the substation (3) under both substation connections. For this, in the network settings of the substation enter the IP addresses of the control stations (in the example: 192.168.1.10 and 192.168.2.11). Option “Enable redundant connection” must be disabled.
Double connection

This configuration does work. But it is senseless!

It is possible to configure a double connection between 2 stations using 2 separate networks (at least logically separated sub-networks).

However, such a setup has no advantages via-à-vis the minimal structure right at the start of Chapter 1.5.6.3.1.2.6.1.1 “Minimal structure” on page 3395.

For this setup, connection data must be double configured and double resources are also required at the stations, not providing any advantages whatsoever.

Rather the opposite is true, because such configurations are highly prone to errors.

(1) 2 Control stations with 2 Ethernet interfaces
(2) 2 Substations with 2 Ethernet interfaces
Faulty configuration

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>This configuration does not work!</td>
</tr>
</tbody>
</table>

If an AC500 is configured as a control station, the interface which is used to reach the substation is not defined.

The decision as to which interface is used for this is taken by TCP/IP when running.

It is also dependent on the current network configuration.

Here, the current link status and the order of link recognition may be decisive for the interface to be used.

Such a scenario would not result in stable communication as both substations cannot clearly distinguish the control stations.

Instead, the connection management for a substation will assume that the control station has lost the connection and then establishes a connection.

Export a CSV file

As an alternative many values can be modified at a time by exporting the configuration to a CSV file. After modifying the file data, import the CSV file \( \Rightarrow \) Chapter 1.5.6.3.1.2.3 “Import/Export functionality” on page 3406.
Import/Export functionality

As of Automation Builder 1.1 (CBP >= 2.4) configuration of control stations and substations can be exported/imported via CSV file. Open the CSV file with a spreadsheet software (e.g. Microsoft Excel) and modify the values within the file to your convenience:

1. Export configuration data: right-click the node of the control station or substation to be exported.

2. Click “Export ➔ IEC 60870-5-104 information objects (CSV)” and store the CSV file to a desired directory.

3. Open the CSV file with a spreadsheet software (e.g. Microsoft Excel) and change the values to your convenience. Added table columns are only accepted after the last column.

4. Import configuration data: right-click the node of the control station or substation that has been exported previously.

5. Click “Import ➔ IEC 60870-5-104 information objects (CSV)” and select the CSV file from the file system. Configuration data is imported.

As of Automation Builder 1.1.1 during file import the project data is compared with the project data that is already available. In order to prevent data from being overwritten inadvertently, you can select the data that shall be imported in the “Project Compare - Differences” window:

Data on the left side of the window refers to already available project data. This data is displayed under “Control station ➔ Information objects” tab. Data on the right side of the window refers to new data that can be imported after your confirmation. Decide whether to import (and overwrite) the data or not.
Data in black color means the existing data and the data to be imported is identical.
Data in red color means the existing data and the data to be imported differ. Decide whether to import the new data (and to overwrite the existing data) or not.
Data in blue color means, the data to be imported is new and will be added to the existing data.
Data that has been confirmed for the import already is displayed in green color (after clicking the [Accept Single] button).

In order to move data from one side of the window to another, select the data and click the [Accept Single] button. Data is highlighted in yellow.

To confirm the import of all new data, click the top entry (here: All: ASDU name - ASDU type - Common addr - ...). Then, click the [Accept Single] button.

Close the "Project Compare - Differences" tab, save your project and confirm the message. The changes are displayed in the “Information objects" tab.

Validity check of configuration

We recommend you to verify the IEC configuration of control stations and substations: Right-click a control station or substation -> Check configuration.
The check will look for the following topics:

- Duplicate addresses.
- Stations without any Information objects.
- ASDU names, which are not unique.

When a check finds errors or incompatibilities this will be reported in a separate messages view at the bottom of the window:

With a double-click on the error line, the part of the configuration with the violation will be opened. Now, you can correct the error.

IEC60870 compatibility list
AC500 V2.4 IEC60870-5-104 Compatibility List

9 Interoperability

This companion standard presents sets of parameters and alternatives from which subsets must be selected to implement particular telecontrol systems. Certain parameter values, such as the choice of "structured" or "unstructured" fields of the INFORMATION OBJECT ADDRESS of ASDUs represent mutually exclusive alternatives. This means that only one value of the defined parameters is admitted per system. Other parameters, such as the listed set of different process information in command and in monitor direction allow the specification of the complete set or subsets, as appropriate for given applications. This clause summarizes the parameters of the previous clauses to facilitate a suitable selection for a specific application. If a system is composed of equipment stemming from different manufacturers, it is necessary that all partners agree on the selected parameters.

The interoperability list is defined as in IEC 60870-5-101 and extended with parameters used in this standard. The text descriptions of parameters which are not applicable to this companion standard are strike-through (corresponding check box is marked black).

NOTE In addition, the full specification of a system may require individual selection of certain parameters for certain parts of the system, such as the individual selection of scaling factors for individually addressable measured values.

The selected parameters should be marked in the white boxes as follows:

- Function or ASDU is not used
- Function or ASDU is used as standardized (default)
- Function or ASDU is used in reverse mode
- Function or ASDU is used in standard and reverse mode

The possible selection (blank, X, R, or B) is specified for each specific clause or parameter.

A black check box indicates that the option cannot be selected in this companion standard.

9.1 System or device
(system-specific parameter, indicate definition of a system or a device by marking one of the following with "X")

- System definition
- Controlling station definition (Master)
- Controlled station definition (Slave)

9.4 Link layer
(network-specific parameter, all options that are used are to be marked "X". Specify the maximum frame length. If a non-standard assignment of class 2 messages is implemented for unbalanced transmission, indicate the Type ID and COT of all messages assigned to class 2.)

Frame format FT 1.2, single character 1 and the fixed time out interval are used exclusively in this companion standard.

Link transmission

- Balanced transmission
- Unbalanced transmission

Frame length

- Maximum length L (number of octets)

Address field of the link

- not present (balanced transmission only)
- One octet
- Two-octets
- Structured
- Unstructured

- 2 -
AC500 V2.4 IEC60870-5-104 Compatibility List

When using an unbalanced link layer, the following ASDU types are returned in class 2 messages (low priority) with the indicated causes of transmission:

- The standard assignment of ASDUs to class 2 messages is used as follows:

<table>
<thead>
<tr>
<th>Type identification</th>
<th>Cause of transmission</th>
</tr>
</thead>
<tbody>
<tr>
<td>9, 11, 13, 21</td>
<td>&lt;1&gt;</td>
</tr>
</tbody>
</table>

- A special assignment of ASDUs to class 2 messages is used as follows:

<table>
<thead>
<tr>
<th>Type identification</th>
<th>Cause of transmission</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Note: (In response to a class 2 poll, a controlled station may respond with class 1 data when there is no class 2 data available).

9.5 Application layer

Transmission mode for application data

Mode 1 (Least significant octet first), as defined in 4.10 of IEC 60870-5-4, is used exclusively in this companion standard.

Common address of ASDU

(system-specific parameter, all configurations that are used are to be marked "X")

- One octet  
  X Two octets

Information object address

(system-specific parameter, all configurations that are used are to be marked "X")

- One octet  
  Structured

- Two octets  
  Unstructured

X Three octets

Cause of transmission

(system-specific parameter, all configurations that are used are to be marked "X")

- One octet  
  Two octets (with originator address). Originator address is set to zero if not used

X Two octets

Length of APDU

(system-specific parameter, specify the maximum length of the APDU per system)

The maximum length of APDU for both directions is 253. It is a fixed system parameter.

X Maximum length of APDU per system in control direction

AC500 V2.4 IEC60870-5-104 Compatibility List

Parameter in control direction
(station-specific parameter, mark each Type ID "X" if it is only used in the standard direction, "R" if only used in the reverse direction, and "B" if used in both directions).

[X] <110>: Parameter of measured value, normalized value P_ME_NA_1
[X] <111>: Parameter of measured value, scaled value P_ME_NB_1
[X] <112>: Parameter of measured value, short floating point value P_ME_NC_1
[X] <113>: Parameter activation P_AC_NA_1

File transfer
(station-specific parameter, mark each Type ID "X" if it is only used in the standard direction, "R" if only used in the reverse direction, and "B" if used in both directions).

[X] <120>: File ready F_FR_NA_1
[X] <121>: Section ready F_SR_NA_1
[X] <122>: Call directory, select file, call file, call section F_SC_NA_1
[X] <123>: Last section, last segment F_LS_NA_1
[X] <124>: Ack file, ack section F_AF_NA_1
[X] <125>: Segment F_SG_NA_1
[X] <126>: Directory (blank or X, only available in monitor (standard) direction) F_DR_TA_1
[X] <127>: Query Log – Request archive file F_SC_NB_1

Type identifier and cause of transmission assignments
(station-specific parameters)

Shaded boxes: option not required.
Black boxes: option not permitted in this companion standard
Blank: functions or ASDU not used.
Mark Type Identification/Cause of transmission combinations:
"X" if only used in the standard direction;
"R" if only used in the reverse direction;
"B" if used in both directions.

* Blank or X only
9.6 Basic application functions

Station initialization
(station-specific parameter, mark “X” if function is used)

Remote initialization

Cyclic data transmission
(station-specific parameter, mark “X” if function is only used in the standard direction, “R” if only used in the reverse direction, and “B” if used in both directions)

Cyclic data transmission

Read procedure
(station-specific parameter, mark “X” if function is only used in the standard direction, “R” if only used in the reverse direction, and “B” if used in both directions)

Read procedure

Spontaneous transmission
(station-specific parameter, mark “X” if function is only used in the standard direction, “R” if only used in the reverse direction, and “B” if used in both directions)

Spontaneous transmission

Double transmission of information objects with cause of transmission spontaneous
(station-specific parameter, mark each information type “X” where both a Type ID without time and corresponding Type ID with time are issued in response to a single spontaneous change of a monitored object)

The following type identifications may be transmitted in succession caused by a single status change of an information object. The particular information object addresses for which double transmission is enabled are defined in a project-specific list.

- Single-point information M_SP_NA_1, M_SP_TA_1, M_SP_TB_1 and M_PS_NA_1
- Double-point information M_DP_NA_1, M_DP_TA_1 and M_DP_TB_1
- Step position information M_ST_NA_1, M_ST_TA_1 and M_ST_TB_1
- Bitstring of 32 bit M_BO_NA_1, M_BO_TA_1 and M_BO_TB_1 (if defined for a specific project)
- Measured value, normalized value M_ME_NA_1, M_ME_TA_1, M_ME_ND_1 and M_ME_TD_1
- Measured value, scaled value M_ME_NB_1, M_ME_TB_1 and M_ME_TE_1
- Measured value, short floating point number M_ME_NC_1, M_ME_TC_1 and M_ME_TF_1
AC500 V2.4 IEC60870-5-104 Compatibility List

**Station interrogation**
(station-specific parameter, mark "X" if function is only used in the standard direction, "R" if only used in the reverse direction, and "B" if used in both directions).

- X global
- group 1
- group 2
- group 3
- group 4
- group 5
- group 6
- group 7
- group 8
- group 9
- group 10
- group 11
- group 12
- group 13
- group 14
- group 15
- group 16

Information object addresses assigned to each group must be shown in a separate table.

**Clock synchronization**
(station-specific parameter, mark "X" if function is only used in the standard direction, "R" if only used in the reverse direction, and "B" if used in both directions).

- X Clock synchronization
- Day of week used
- RES1, GEN (time tag substituted/ not substituted) used
- SU-bit (summertime) used

optional, see 7.6

**Command transmission**
(object-specific parameter, mark "X" if function is only used in the standard direction, "R" if only used in the reverse direction, and "B" if used in both directions).

- X Direct command transmission
- X Direct set point command transmission
- Select and execute command
- Select and execute set point command
- C_SE ACTTERM used

- No additional definition

- X Short-pulse duration (duration determined by a system parameter in the outstation)

- X Long-pulse duration (duration determined by a system parameter in the outstation)

- X Persistent output

- Supervision of maximum delay in command direction of commands and set point commands

- Maximum allowable delay of commands and set point commands
Transmission of integrated totals
(station- or object-specific parameter, mark "X" if function is only used in the standard direction, "R" if only used in the reverse direction, and "B" if used in both directions).

- Mode A: Local freeze with spontaneous transmission
- Mode B: Local freeze with counter interrogation
- Mode C: Freeze and transmit by counter-interrogation commands
- Mode D: Freeze by counter-interrogation command, frozen values reported

- Counter read
- Counter freeze without reset
- Counter freeze with reset
- Counter reset

- General request
- Request counter group 1
- Request counter group
- Request counter group 3
- Request counter group 4

Parameter loading
(object-specific parameter, mark "X" if function is only used in the standard direction, "R" if only used in the reverse direction, and "B" if used in both directions).

- Threshold value
- Smoothing factor
- Low limit for transmission of measured values
- High limit for transmission of measured values

Parameter activation
(object-specific parameter, mark "X" if function is only used in the standard direction, "R" if only used in the reverse direction, and "B" if used in both directions).

- Act/deact of persistent cyclic or periodic transmission of the addressed object

Test procedure
(station-specific parameter, mark "X" if function is only used in the standard direction, "R" if only used in the reverse direction, and "B" if used in both directions).

- Test procedure
AC500 V2.4 IEC60870-5-104 Compatibility List

File transfer
(station-specific parameter, mark "X" if function is used).
File transfer in monitor direction

☐ Transparent file
☐ Transmission of disturbance data of protection equipment
☐ Transmission of sequences of events
☐ Transmission of sequences of recorded analogue values

File transfer in control direction

☐ Transparent file

Background scan
(station-specific parameter, mark "X" if function is only used in the standard direction, "R" if only used in the reverse direction, and "B" if used in both directions).

X Background scan

Acquisition of transmission delay
(station-specific parameter, mark "X" if function is only used in the standard direction, "R" if only used in the reverse direction, and "B" if used in both directions).

☐ Acquisition of transmission delay

Definition of time outs

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default value</th>
<th>Remarks</th>
<th>Selected value</th>
</tr>
</thead>
<tbody>
<tr>
<td>t₀</td>
<td>30 s</td>
<td>Time-out of connection establishment</td>
<td></td>
</tr>
<tr>
<td>t₁</td>
<td>15 s</td>
<td>Time-out of send or test APDUs</td>
<td></td>
</tr>
<tr>
<td>t₂</td>
<td>10 s</td>
<td>Time-out for acknowledges in case of no data messages t₂ &lt; t₁</td>
<td></td>
</tr>
<tr>
<td>t₃</td>
<td>20 s</td>
<td>Time-out for sending test frames in case of a long idle state</td>
<td></td>
</tr>
</tbody>
</table>

Maximum range for timeouts t₀ to t₂: 1 s to 255 s, accuracy 1 s.
Recommended range for timeout t₃: 1 s to 48 h, resolution 1 s.
Long timeouts for t₃ may be needed in special cases where satellite links or dialup connections are used (for instance to establish connection and collect values only once per day or week).

Maximum number of outstanding I format APDUs k and latest acknowledge APDUs (w)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default value</th>
<th>Remarks</th>
<th>Selected value</th>
</tr>
</thead>
<tbody>
<tr>
<td>k</td>
<td>12 APDUs</td>
<td>Maximum difference receive sequence number to send state variable</td>
<td></td>
</tr>
<tr>
<td>w</td>
<td>8 APDUs</td>
<td>Latest acknowledge after receiving w I format APDUs</td>
<td></td>
</tr>
</tbody>
</table>

Maximum range of values k: 1 to 32767 \(2^{15}-1\) APDUs, accuracy 1 APDU
AC500 V2.4 IEC60870-5-104 Compatibility List

Maximum range of values $w$: 1 to 32767 APDUs, accuracy 1 APDU (Recommendation: $w$ should not exceed two-thirds of $k$).

- 2 Number N of redundancy group connections used

RFC 2200 suite

RFC 2200 is an official Internet Standard which describes the state of standardization of protocols used in the Internet as determined by the Internet Architecture Board (IAB). It offers a broad spectrum of actual standards used in the Internet. The suitable selection of documents from RFC 2200 defined in this standard for given projects has to be chosen by the user of this standard.

- Ethernet 802.3
- Serial X.21 interface
- Other selection from RFC 2200:

  List of valid documents from RFC 2200

1.5.6.3.2 Modbus protocol

Modbus on TCP/IP protocol

Configuration of Modbus TCP/IP server

Adding a Modbus TCP/IP server to device tree

A Modbus TCP/IP Server instance can be added to any specific Ethernet interface / IP address. Each interface supports max. one instance of “Modbus TCP/IP Server”. Other protocols can be added in parallel.

1. Right click on ETH interface and click “Add object”.
   ⇒ The window “Add object below: ETH” appears.
2. Select “Modbus TCP/IP Server” and click “Add object”.
   ⇒ The node “Modbus_TCP_IP_Server” is added.

Setting the parameters of Modbus_TCP_IP_Server

Byte Order
Format/Endianness for the transmission of WORD values (register) within the request/response telegram (default: “Big Endian”).

Port
TCP Port on which the Server listens.

Startup Behaviour
This parameter specifies how the Server behaves when configuration data is loaded (e.g. on
download). It's default value is “Active”. This means the Server is immediately addressable after
configuration has been performed. In case the Server should be activated later on during run-
time by means of Function Block ModTcpServOnOff this parameter value has to be set to “No
activity”. Parameter Behaviour in state inactive then specifies the Server's behaviour during the
inactive phase.

**Behaviour in state inactive**

This parameter specifies how the Server behaves in inactive state. This state may be set at the
very beginning (parameter Startup Behaviour = “No activity”) and/or requested during runtime
calling Function Block ModTcpServOnOff. It's default value is “No activity”. This means the
Server is not addressable at all (no listening socket on TCP/IP) when it is inactive. Using this
setting, any requests by Modbus TCP Clients lead to the result *Failed to connect to Server or
Timeout*. All other parameter values make the Server respond with an exception code to any
requests by Modbus TCP Clients.

The presentation of the icon next to the Modbus TCP Server in the device tree depends on the
state of the Server:

<table>
<thead>
<tr>
<th>Active</th>
<th>Inactive</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image1" alt="Active Icon" /></td>
<td><img src="image2" alt="Inactive Icon" /></td>
</tr>
</tbody>
</table>

**Attention:**

*Exception code 9 is actually not defined by Modbus specification. This may
cause problems using a different Modbus TCP Client than AC500 V3.*

**Disable**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Disable write to %MB from</td>
<td>0</td>
<td>0 ... 65535</td>
<td>Disable write access starting at %MBx</td>
</tr>
<tr>
<td>Disable write to %MB to</td>
<td>0</td>
<td>0 ... 65535</td>
<td>Disable write access up to %MBx</td>
</tr>
<tr>
<td>Disable read from %MB from</td>
<td>0</td>
<td>0 ... 65535</td>
<td>Disable read access starting at %MBx</td>
</tr>
<tr>
<td>Disable read from %MBx to</td>
<td>0</td>
<td>0 ... 65535</td>
<td>Disable read access up at %MBx</td>
</tr>
</tbody>
</table>

It is possible to disable read and/or write access to individual segments. Reading/writing is disa-
bled beginning at the set start address and is valid up to the set end address (inclusive).
Configuration of Modbus TCP/IP client

Adding a Modbus TCP/IP client to the device tree

The “Modbus_TCP_IP_Client” instance has to be added to the common Ethernet Client protocols’ node. This node supports max. one instance of Modbus TCP/IP Client. Other protocols can be added in parallel.

1. Right click on the node “Protocols” and click “Add object”.
   ≫ The window “Add object below: Protocols” appears.
2. Select “Modbus TCP/IP Client” and click “Add object”.
   ≫ Node “Modbus_TCP_IP_Client” is added.

Depending on a Server’s IP-Address the Client sends its requests via the Ethernet interfaces available.

Setting the parameters of Modbus_TCP_IP_Client

Modbus TCP/IP Client does not have any parameters.

Modbus on RTU protocol

Protocol description can be found in the chapter for Serial interfaces "Configuring Modbus RTU on serial interface" on page 3325.

1.5.6.3 SNTP protocol

Introduction of the SNTP protocol

The Protocol SNTP (Simple Network Time Protocol) provides the functionality to synchronize the clock of a PLC to an external time source. For further information and specification of the protocol please refer to the document RFC4330.

The following modes are supported by the implementation of the AC500 PLC:

- SNTP Client
- SNTP Server
- SNTP Client and Server

The Function Block PmSntpInfo can be used to read diagnosis information of the protocol.

Refer to the documentation of the library ABB_Pm_AC500.lib for further information.
If a high precision of system time is wanted, use a fully functional NTP server or at least a SNTP server with a high-precision time-source (e.g. DCF-77 receiver). Avoid cascading several levels of SNTP server / SNTP clients.

Client requests are normally sent at intervals depending on the frequency tolerance of the client clock and the required accuracy. However, under no conditions requests should be sent at less than one minute intervals (see RFC 4330). Keep that in mind when setting polling-interval of the SNTP client, especially if a huge amount of clients use one single server.

Be sure not to use broadcast or multicast addresses as server or backup-server since current SNTP implementation does not support manycast mode.

Configuration of the SNTP protocol

SNTP client configuration

Implementation of SNTP client and SNTP server is based on protocol version 4.

For SNTP client configuration add a new object “SNTP Client” under “Protocols (Client Protocols)”. Only one instance of the SNTP Client is possible per PLC.

The following parameters are available:

Not all parameters are shown in the user interface.

It should not be necessary to change the default values of the other parameters for the most applications.

But there is the possibility to edit them in the generic parameter editor.
### Server 1

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP address</td>
<td>0.0.0.0</td>
<td>Valid IP address</td>
<td>IP address of a server which is used as external time source.</td>
</tr>
<tr>
<td>Minimum polling rate</td>
<td>6</td>
<td>2^6 = 64 s</td>
<td>Specifies the lower limit of the polling rate. It is calculated as power of 2 and has the unit [s]. The actual polling rate is determined by the protocol itself but it will not be lower than this limit.</td>
</tr>
<tr>
<td>Maximum polling rate</td>
<td>10</td>
<td>2^10 = 1024 s</td>
<td>Specifies the upper limit of the polling rate. It is calculated as power of 2 and has the unit [s]. The actual polling rate is determined by the protocol itself but it will not be higher than this limit.</td>
</tr>
</tbody>
</table>

### Server 2

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable</td>
<td>FALSE</td>
<td>TRUE or FALSE</td>
<td>Enable server</td>
</tr>
<tr>
<td>IP address</td>
<td>0.0.0.0</td>
<td>Valid IP address</td>
<td>IP address of a server which is used as external time source.</td>
</tr>
<tr>
<td>Minimum polling rate</td>
<td>6</td>
<td>2^6 = 64 s</td>
<td>Specifies the lower limit of the polling rate. It is calculated as power of 2 and has the unit [s]. The actual polling rate is determined by the protocol itself but it will not be lower than this limit.</td>
</tr>
<tr>
<td>Maximum polling rate</td>
<td>10</td>
<td>2^10 = 1024 s</td>
<td>Specifies the upper limit of the polling rate. It is calculated as power of 2 and has the unit [s]. The actual polling rate is determined by the protocol itself but it will not be higher than this limit.</td>
</tr>
</tbody>
</table>

### Time Jumps

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable</td>
<td>TRUE</td>
<td>TRUE or FALSE</td>
<td>Enables the option “Time jumps”</td>
</tr>
<tr>
<td>Time jump threshold</td>
<td>1.0 s</td>
<td>0 ... 3.403e+38</td>
<td>Specifies the threshold value for time steps in seconds</td>
</tr>
<tr>
<td>Limit</td>
<td>-1</td>
<td>-1 ... 2147483647</td>
<td>Number of first clock updates after that this option is deactivated, a negative value activates this option permanently.</td>
</tr>
</tbody>
</table>
Max change

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable</td>
<td>TRUE</td>
<td>TRUE or FALSE</td>
<td>Enables the option “Max change”</td>
</tr>
<tr>
<td>Maximum change offset</td>
<td>3600 s</td>
<td>0 … 4294967295</td>
<td>Maximum allowed clock offset in seconds</td>
</tr>
<tr>
<td>Start after</td>
<td>3</td>
<td>0 … 4294967295</td>
<td>Specifies the number of first clock updates after that this option is activated</td>
</tr>
<tr>
<td>Ignore after</td>
<td>-1</td>
<td>-1 … 2147483647</td>
<td>Specifies the number of ignored clock updates which exceed the maximum offset. The protocol will be stopped when this value will be exceed. It is never stopped when a negative value is set.</td>
</tr>
</tbody>
</table>

SNTP server configuration

Implementation of SNTP client and SNTP server is based on protocol version 4.

For SNTP server configuration add a new object “SNTP Server” under of the available “Ethernet interfaces (ETH1-ETHn)”. Only one instance of the SNTP Server is possible per PLC.

The following parameters are available:

Not all parameters are shown in the user interface.
It should not be necessary to change the default values of the other parameters for the most applications.
But there is the possibility to edit them in the generic parameter editor.
### Access control

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable</td>
<td>FALSE</td>
<td>TRUE or FALSE</td>
<td>Enables Access Control</td>
</tr>
<tr>
<td>Network address</td>
<td>0.0.0.0</td>
<td>Valid IP address</td>
<td>Network address of allowed clients</td>
</tr>
<tr>
<td>Subnet mask</td>
<td>24</td>
<td>8 ... 32</td>
<td>Subnet mask of the network address</td>
</tr>
</tbody>
</table>

### Local server

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable</td>
<td>FALSE</td>
<td>TRUE or FALSE</td>
<td>This option enables the protocol to run as local server. That means without synchronization to an external time source.</td>
</tr>
<tr>
<td>Stratum</td>
<td>10</td>
<td>1 ... 15</td>
<td>Stratum of the server when it is used as local server</td>
</tr>
<tr>
<td>Distance</td>
<td>1 s</td>
<td>0 ... 3.403e+38</td>
<td>Distances in seconds of the server when it is used as local server</td>
</tr>
<tr>
<td>Orphan</td>
<td>FALSE</td>
<td>TRUE or FALSE</td>
<td>Enables or disables the orphan mode</td>
</tr>
</tbody>
</table>

### 1.5.6.3.4 FTP server

#### Configuration of FTP server

As of SystemFW 3.1.0 the FTP server is listening only on the Ethernet interface, which the protocol is configured on. It is not possible to have an FTP server on both Ethernet interfaces.

1. Under “Ethernet -> ETH [1,2,...]” add a new object and select “FTP Server” from the list.
2. Double-click the “FTP_Server” item to open FTP server configuration and change the default settings of the parameters, if required.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FTP Server</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Port</td>
<td>21</td>
<td>21</td>
<td>Do not change the default setting. The parameter specifies the port which is used to connect to the FTP server on the PLC.</td>
</tr>
<tr>
<td>Sessions</td>
<td>1</td>
<td>1...4</td>
<td>Enter the max. number of allowed simultaneous and parallel connections to the FTP server. Each session uses one socket. Note: Some FTP clients require several connections to work.</td>
</tr>
<tr>
<td>Passwords</td>
<td></td>
<td></td>
<td>Set each user's passwords for login. No entry = no password.</td>
</tr>
<tr>
<td>system</td>
<td></td>
<td></td>
<td>System RAM disk</td>
</tr>

</tbody>
</table>
1.5.6.3.5 MQTT client protocol

System technology

The MQTT protocol is a lightweight communication protocol which is widely used on the internet to connect embedded devices to the cloud.

The MQTT (Message Queuing Telemetry Transport) Client library allows to integrate an AC500 Processor Module to act as a client in the MQTT protocol. Thus, it is possible to exchange data between the AC500 and other devices connected to the MQTT network.

In the figure below, there is an MQTT network with one broker (MQTT broker in the middle) and five clients. The figure shows the main functions of MQTT to send and receive data: publish and subscribe. The clients can publish messages with a specific topic to send data (e.g., the temperature of a connected sensor with a timestamp) to the MQTT broker. For example, the client “AC500_1” publishes a message to topic “topic/2”. On the other hand, sides clients can also subscribe to topics to receive data. For example, the client “Laptop” has subscribed topic “topic/2”. So all messages with the topic “topic/2” which has been published to the MQTT broker will be sent immediately to the client “Laptop”. This creates a message flow from the client “AC500_1” to the laptop.

To realize the MQTT behavior, there are several function blocks implemented in the MQTT Client Library & Chapter 1.4.2.7 “MQTT client library” on page 2196.

Table 767: Function blocks overview

<table>
<thead>
<tr>
<th>Function Block</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MqttConnectWithCertBuffer</td>
<td>Every MQTT use case starts with establishing a connection to an MQTT broker. Therefore, a connection structure needs to be created. The connection structure is used to identify the connection for subsequent operations like publish or subscribe. It is possible to establish an SSL connection. Using an SSL connection, at least a certificate for the server is needed. Certificates can be loaded from a buffer (program variable) or a file which is stored on the PLC.</td>
</tr>
<tr>
<td>MqttConnectWithCertFile</td>
<td>These function blocks can be used on an established MQTT connection to realize the desired use case.</td>
</tr>
<tr>
<td>MqttGetReceivedPacket</td>
<td></td>
</tr>
<tr>
<td>MqttPing</td>
<td></td>
</tr>
<tr>
<td>MqttPublish</td>
<td></td>
</tr>
<tr>
<td>MqttSubscribe</td>
<td></td>
</tr>
<tr>
<td>MqttUnsubscribe</td>
<td></td>
</tr>
<tr>
<td>MqttDisconnect</td>
<td>This function block is the end of each use case.</td>
</tr>
</tbody>
</table>

One MQTT send use case could look like this:
It makes sense for several publish messages in a row (e.g., one message per second) not always open a new connection.

One MQTT receive use case could look like this:

---

### TLS version

The MQTT client uses the TLS version 1.2.

### Configuration in Automation Builder

For the MQTT client no configuration is needed.

### Configuration in CODESYS

All function blocks have to be called in tasks with cyclically processing.

You can use the function blocks with:

- PLC_PRG with automatic task configuration or manual task configuration.
- One single program or different programs.
- One single task or different tasks.

With different programs assigned to different tasks you can define different cycle times and priorities.

### Limitations

- No persistent session. After an interrupted connection, the client needs to subscribe on topics again in case of reconnect.
- One connection (MQTT_CONNECTION) cannot be shared between multiple tasks. Different connections can be used by different tasks or even within the same task.
- Only one FB can operate on a single connection at the same time. Always wait for the FB to complete before calling the next FB. To use two different FB's in parallel (like publish and receive) it is necessary to have two different connections, otherwise they must be called one after the other.

### Hardware

The MQTT protocol requires AC500 devices with integrated Ethernet.

### Examples

Example projects for the libraries can be found in the folder: `\Users\Public\Documents\AutomationBuilder\Examples`.
1.5.6.3.6 AC500 V3 secure protocols

Introduction

The following protocols can be secured using certificates:

- Communication between Automation Builder and the PLC (e.g. Programming, Monitoring)
- Communication between the PLC’s webserver and visualization clients (browsers)
- Communication between the PLC’s FTP server and FTP clients
- Communication between the OPC UA server and OPC UA clients

As a prerequisite to enable secure communication on one or more protocols, the required certificates need to be present on the PLC.

For security reasons ABB does not encourage the use of self-signed certificates. ABB shall not be held liable for any damage or loss that arises due to the use of self-signed certificates on AC500 PLCs.

Self-signed certificates protect against eavesdropping if used correctly. They do not offer any secure means of authentication.

Certificate handling

Automation Builder offers a convenient “Security Screen” to manage certificates on connected PLCs.

It can be accessed through the shield icon on the lower right corner of the main window:

Use the tab “Devices” to manage certificates on the PLC.

It offers to:

- show certificates available on the PLC
- import and export certificates
- create new (self-signed) certificates
- trust or untrust certificates
Configuring secure protocols

Encrypted communication between Automation Builder and the PLC

Via tab “Communication Settings”

Via “Security Screen” in Automation Builder
Install a trusted certificate

Ensure the PLC clock is set to the current time and date when using certificates on the PLC. Otherwise the certificate cannot be used to secure a protocol (see also AC500_Battery Chapter 1.5.5.1.3.2 “AC500 battery” on page 3116 and Chapter 1.5.6.3.3.2.1 “SNTP client configuration” on page 3425).

When trying to log in or when you set the PLC as active path, there will be a one-time pop-up asking you to add the PLC’s certificate to the trusted certificates:

After trusting the PLC’s certificate, the communication between the Automation Builder and the PLC is now encrypted. This is shown by additional yellow lines around the communication path on the “Communication Settings” page.

Secure web server

1. Generate or import a certificate for the web server

2. Attach a web server node to either ETH1 or ETH2 or both and configure security mode.

   This will automatically insert a visualization into the project.

   The available modes of operation are:
   - http only
   - https only
   - Both (http and https)
   - Redirect http to https
3. Download and set the PLC to RUN.
4. Connect to the web server using the configured method: https://<your PLC’s IP address>/webvisu.htm.

In case you are using a self-signed certificate, your browser will show some warnings.
If you are aware of the risks of self-signed certificates, this can be ignored.
☞ Further information on page 3431

Secure FTP

1. Import a certificate to the PLC for FTP or create a self-signed certificate.

Ensure the PLC clock is set to the current time and date when using certificates on the PLC. Otherwise the certificate cannot be used to secure a protocol (see also AC500_Battery Chapter 1.5.5.1.3.2 “AC500 battery” on page 3116 and Chapter 1.5.6.3.3.2.1 “SNTP client configuration” on page 3425).

2. Add an FTP server to either ETH1 or ETH2
3. Set the parameter “Security Mode” to either “BOTH” or “FTPS only”.
☞ You can use any FTP client that supports FTPS explicit mode (FTPES).

In case you are using a self-signed certificate, the FTP client will show some warnings or notice that it does not know the certificate and wants you to check it.
☞ Further information on page 3431

OPC UA secure

OPC UA uses mutual authentication, which means that both partners must have their own certificate and know the other’s certificate, before being able to establish a connection!
1. Create a new certificate in your OPC UA client.

   **Ensure the PLC clock is set to the current time and date when using certificates on the PLC. Otherwise the certificate cannot be used to secure a protocol (see also AC500_Battery Chapter 1.5.5.1.3.2 “AC500 battery” on page 3116 and Chapter 1.5.6.3.3.2.1 “SNTP client configuration” on page 3425).**

2. Import that certificate to the “Trusted Certificates” in your PLC using the “Security Screen”.

3. Import a certificate for the OPC UA server on the PLC or create a self-signed certificate.

4. Export that cert to the PC and provide it as a trusted certificate to your OPC UA client.

5. Reboot the PLC and check that it is in RUN and both certificates are on the PLC (via the “Security Screen”).

6. Add the PLC as OPC UA server in your OPC UA client.

7. Connect to the OPC UA Server.
   - You can interact normal with the UA server.

   **In case you are using a self-signed certificate, you will see some warning message (depending on the OPC UA client).**

   **If you are aware of the risks of self-signed certificates, this can be ignored.**

   ☞ Further information on page 3431

The certificate warnings will only go away when using a certificate from a trusted certification authority or a certificate derived from this by an intermediate certification authority (e.g. a company CA).

That process is done via PLCShell command “cert-createcsr”, then getting the file from the PLC via the filebrowser tab in “cert/export” and getting that signing request turned into a real certificate by a certification authority.

Import the certificate generated by your certification authority using the security screen.
1.5.6.3.7 KNX configurator

Refer to the general description for information about the following tabs of the device editor.

- **Tab `<device name> I/O Mapping`** % Chapter 1.3.1.25.1.19.11 “Tab `<device name> I/O Mapping” on page 755
- **Tab `<device name> IEC Objects`** % Chapter 1.3.1.25.1.19.12 “Tab `<device name> IEC Objects” on page 759
- **Tab `<device name> Parameters`** % Chapter 1.3.1.25.1.19.3 “Tab 'Parameters’” on page 746
- **Tab `<device name> Status`** % Chapter 1.3.1.25.1.19.17 “Tab 'Status” on page 768
- **Tab `<device name> Information`** % Chapter 1.3.1.25.1.19.18 “Tab 'Information’” on page 768

Only in the case of special features is there an additional help page for the specific device editor.

*If the "<device name> Parameters" tab is not shown, then select the “Show generic device configuration editors” option in the CODESYS options (“Device Editor” category).*

With the KNX editor from CODESYS, you define the communication objects of your building automation. The communication objects are exported and made available to the ETS5 program. Linking the communication objects to the different KNX devices is performed exclusively in the ETS5 program. Therefore, only the objects are generated in CODESYS. The objects are linked to variables from the PLC program by means of “I/O mapping”.

You add an Ethernet adapter below the controller. Then you add the KNX device below the adapter. You can insert only one KNX device per controller.

See also

- **Device Editor Options** % Chapter 1.3.1.25.3.13.9 “Dialog ‘Options’ - ‘Device Editor’” on page 1081
ETS5 Software - 'DCA' Plug-In

Linking the communication objects of the different KNX devices is performed exclusively in the ETS5 program. To do this, you need the ETS5 software (light or professional version). You also need the KNX product file available from KNX.

**Programming steps**

1. Create a project in CODESYS.
2. Download the CODESYS project to the controller.
   - The CRC is also downloaded to the controller.
3. Create an export file in CODESYS.
   - The CRC is also saved in the export file.
4. Read the export file into the configuration of ETS5.
5. Parameterize the objects in ETS5.
6. Start the program on the controller.
7. Transfer the KNX configuration to the controller.
   - The CRC is also transferred. The runtime system checks whether or not both CRCs match. When they match, the KNX device is identified as functional by the green arrow. If not, then an error is issued in the logger. In case of error, the process data (inputs/outputs) is not updated.

**Tab 'KNX - General'**

Object: KNX

The tab in the configurator of the KNX editor shows an overview of all communication objects. The I/Os of the communication objects are applied automatically to the I/O mapping.

Entries can be edited directly in the table or in the “Communication object” dialog. Existing entries can be copied via copy&paste. The next free channel number is used automatically in this case.

<table>
<thead>
<tr>

<tr>
<td><strong>“Export to ETS”</strong></td>
</tr>
<tr>
<td><strong>“Import CSV”</strong></td>
</tr>
<tr>
<td><strong>“Identification”</strong></td>
</tr>
</tbody>
</table>

**Dialog 'Communication object'**

| **“Number of group object”** | Unique channel number. Gaps in the numbering is permitted. If the channel number is already assigned, then an error text is displayed and the “OK” button is disabled. |
| **“Type”** | Determines whether or not the object in CODESYS is used as “Input” or “Output”. |
**Data point type**
The data types (DPT = Data Point Types) are specified in the KNX standard. In CODESYS, a selection of the most common data types is available. Only the basic data type can be selected, without units (for example, DPT9.*).

**Name of group object**
Any object name. Depending on the data type, a predefined text is automatically added.

**Function of group object**
Any function name. Depending on the data type, a predefined text is automatically added.

**Watchdog Timeout**
If no new message has been received after this time has elapsed, then the status bit Timeout is set.

---

Tab 'I/O Mapping'
Object: KNX
The I/O channels are generated for each communication object:

<table>
<thead>
<tr>
<th>Table 769: General I/Os</th>
</tr>
</thead>

1.5.6.3.8 CODESYS BACnet

Overview

BACnet is a standardized data communication protocol for Building Automation and Control networks as defined in the ANSI/ASHRAE Standard 135 and ISO 16484-5.

The BACnet protocol defines "Services" to allow communication between devices. Examples include Who-Is, I-Am, Who-Has, and I-Have for device and object search and identification, as well as Read-Property and Write-Property for the exchange of data.
The BACnet protocol defines a number of "Object" types on which the services operate. Each object is characterized by its "Properties".

The BACnet objects are combined in a BACnet "Device". A BACnet device represents the functionality of a physical device.

BACnet integration into CODESYS implements the ANSI/ASHRAE Standard 135-2012 "protocol revision 14" and is based on the AMEV AS-A and AS-B standards. Integration allows access to the properties of BACnet objects and the configuration parameters of a BACnet device by means of an IEC application. You can program a dynamic BACnet configuration and have access to the BACnet functions in the BACnet network by reading and writing BACnet object properties.

The installation of the packages contains the following parts:

- **Package: CODESYS BACnet**
  - BACnet plug-in component
  - Device descriptions for BACnet servers, BACnet objects, and BACnet clients
  - Libraries: CmpBACnet, BACnet, and BACnetDefaultImpl
- **BACnet runtime component**

Documentation for the BACnet library and the CmpBACnet library is provided in the Library Manager.

**Architecture, Components, and their Tasks**

CODESYS BACnet includes three IEC libraries:

- CmpBACnet
- BACnet
- BACnetDefaultImpl

It also includes the BACnet plugin for the CODESYS development environment, which performs consistency checks on library versions and BACnet object IDs, as well as providing EDE export/import.

The BACnet stack (BACstack) is an optional component of the CODESYS runtime (CmpBACnet component).

The IEC library CmpBACnet represents the integration of the BACnet stack into a CODESYS IEC environment and provides the BACnet data types as well as the BACstack methods. The sole use of the IEC library CmpBACnet (without the BACnet and BACnetDefaultImpl libraries) would result in complex and lengthy IEC application code.

The BACnet library simplifies BACnet application development considerably as compared to the sole use of CmpBACnet, especially in the following areas:

- Starting and stopping the BACnet stack
- Using BACnet server objects and their properties
- Triggering asynchronous requests (mainly client service requests) and processing the request transaction
- Processing of callbacks from the BACnet stack (see IBACnetEventConsumer) and distributing the callbacks to multiple receivers in the application
Furthermore, the BACnet library provides a plug-in mechanism (BACnetServerPlugin) for extending certain aspects of the BACnet library. BACnetServerPlugin is the basis for the BACnetDefaultImpl library.

The BACnetDefaultImpl library is used for the additional simplification of BACnet application development. The BACnet standard ASHRAE 135 leaves some aspects of the practical use of BACnet open. The most notable examples include the following:

- Persistence of server objects
- Storage and persistence of Trend Log, Trend Log Multiple, and Event Log entries
- Update of the date/time information of the device object

CODESYS implementations for these aspects are necessarily based on some assumptions about the PLC and the application, for example:

- The PLC has a file system
- The PLC file system does not have excessively strict limitations regarding data volume, speed, or number of write cycles

Due to these assumptions, such implementations cannot be fixed in the BACnet library, because this would prevent the actualization of other use cases and the compliance with other constraints.

The BACnetDefaultImpl library is the place for these kinds of default implementations. In the best case, when the assumptions are correct, these standard implementations can be used easily. If not, then a standard implementation of a particular aspect can be used very well as an example and a basis for a PLC/application-specific implementation.

- % Chapter 1.5.6.3.8.5 “BACnet Configuration in the Runtime” on page 3444
- % Chapter 1.5.6.3.8.3 “When to Use the BACnet Library or the CmpBACnet Library” on page 3441

When to Use the BACnet Library or the CmpBACnet Library

The IEC library BACnet is intended as a layer over the IEC library CmpBACnet. However, the layer does not hide the library because this would require the BACnet library to have “facade” functions for CmpBACnet functions. These facade functions would result in larger application code and increased runtime requirements. This is difficult for the PLC to accept. For this reason, it is necessary to know when elements from the BACnet library or CmpBACnet library are to be used.

General rules:

- Starting and stopping the BACnet stack
  Always use BACnetServer.StartBACnetStack and BACnetServer.StopBACnetStack or AutoStart. Never directly use the corresponding functions of the CmpBACnet library, such as CmpBACnet.BACnetServerInit.

- Using BACnet server objects and their properties
  Always use the specified function blocks in IEC-lib-BACnet, such as BACnetAnalogValue. Never directly use the corresponding functions of the BACnet library, such as CmpBACnet.BACnetStorePropertyInstance.
● Triggering of asynchronous requests
  Always use the specified client function blocks of the BACnet library, such as 
  BACnetClientReadProperty. Never directly use the corresponding functions of the 
  CmpBACnet library, such as CmpBACnet.BACnetReadProperty. All functions of the 
  CmpBACnet library that require a BACnetAsyncTransactionToken belong to this cate-
  gory and should never be used directly.

● Processing of callbacks from the BACnet stack and distributing the callbacks to multiple 
  receivers in the application
  Always use IBACnetEventConsumer and BACnetServer.RegisterHook/
  UnregisterHook/RegisterCallback/UnregisterCallback. Never directly use the 
  corresponding functions of the CmpBACnet library, such as CmpBACnet.BACnetSetHook 
  or CmpBACnet.BACnetSetCallback.

When is it appropriate and safe to directly call the functions of the CmpBACnet library?

Basically, it is only necessary to call functions of CmpBACnet directly when a corresponding 
functionality is not provided in the BACnet library. Check the BACnet library first before trying to 
use CmpBACnet directly. It is possible to use blocking functions in CmpBACnet, such as 
BACnet*CbCompletion, BACnetIam(Ex), or BACnetIHave(Ex), BACnetUnconf*.

Most often, you will use BACnet*CbCompletion to implement your specific 
IBACnetEventConsumer.BACnetEventCallbacks. But first check whether or not the 
BACnetDefaultImpl library already contains an appropriate standard implementation.

- § Chapter 1.5.6.3.8.2 “Architecture, Components, and their Tasks” on page 3440

Getting Started

The following instruction guide you to a simple application that uses two BACnet objects in 
order to 1) write an analog BACnet value at runtime and 2) sound an alarm according to a 
BACnet notification class when the current BACnet value is outside of a specific range.

Requirements:

- The CODESYS BACnet package is installed.
- The runtime supports BACnet. For this to work, the component CmpBACnet has to be 
  entered and configured in the configuration file of the runtime.

1. Create a standard project in CODESYS with a PLC device that supports BACnet.
2. Select the PLC object in the device tree and click “Insert Device” to insert a “BACnet 
   Server”.
3. Select the BACnet server object and click “Insert Device” to insert a “BACnet_Analog_Value” object and a “BACnet_Notification_Class” object below it.
   The inserted BACnet objects are displayed in the “Devices” view.

4. Double-click the “BACnet_Analog_Value” object to open its configuration editor.
   On the “BACnet Parameter” tab, you see the initial configuration of the BACnet AnalogValue object.

5. Modify the object properties in the “Value” column as follows:
   - AckedTransitions: '111'
   - NotificationClass: 1
   - HighLimit: 10
   - LimitEnable: '11'
   - LowLimit: 0
   Now your application provides a BACnet AnalogValue and a BACnet NotificationClass. Now the configuration is set so that the BACnet AnalogValue will generate alarms as soon as its Present_Value property reaches a value outside of [0; 10].

6. In the PLC_PRG program of your application, define a variable lrVal of the type LREAL and insert the following code: Hint: You can also press the [F2] key to get the function block instances of the BACnet objects from the Input assistant ("Instance Calls" category).
   
   ```
   BACnet_Analog_Value.PresentValue :=
   BACnet_Analog_Value.PresentValue + 0.0001;
   lrVal := BACnet_Analog_Value.PresentValue;
   ```

7. Build ([F11]), download the error-free application to the controller, and start it.
   The BACnet property Present_Value of the BACnet Analog Value object is incremented.
8. Start an external BACnet client (for example, Innea BACnet Explorer Free) that runs at a different network address than the runtime (for example, using a virtual machine). Use it to monitor the values of BACnet property `Present_Value` and variable `lrVal` in the BACnet network.

   ⇒ You can see how the BACnet property `Present_Value` is incremented and as a consequence the value of the variable `lrVal` increases. As soon as `Present_Value` exceeds the value of 10, an alarm of the type `BACnet-NotificationClass` inserted in the application is generated on the BACnet server device.

This is an example of how you can access the BACnet properties of a BACnet object at runtime. If no explicit property is provided by the BACnet object function block, then at least it provides auxiliary functions for accessing certain or all BACnet properties.

See also
- Chapter 1.5.6.3.8.1 “Overview” on page 3439
- Chapter 1.5.6.3.8.5 “BACnet Configuration in the Runtime” on page 3444
- Chapter 1.5.6.3.8.6 “BACnet Configuration in the CODESYS Project” on page 3445
- Chapter 1.5.6.3.8.7 “Access to BACnet Objects and Their Properties” on page 3447

**BACnet Configuration in the Runtime**

CODESYS BACnet uses the component `CmpBACnet` for communication. This component has to be entered and configured in the configuration file of the runtime as follows.

```plaintext
[ComponentManager]
Component.1=CmpBACnet
[CmpBACnet]
; configuration file of the BACnet stack
IniFile=bacstac.ini
; task priority of the BACstack process task, default: TASKPRIO_NORMAL_END (159)
TaskPrio=128
; name of the named pipe for the communication with the BACstack
AppName=/tmp/BACnetServer
```

In general, CODESYS separates access to the file system within the IEC application and access from the program code of the runtime components. Different root directories can be specified in the configuration file of the runtime.

```plaintext
[SysFile]
; root file path for runtime components
FilePath=D:/Temp/Default
; root file path for IEC applications
IecFilePath=D:/Temp/IEC
```

An IEC application with CODESYS BACnet writes the configuration file of the BACnet stack (using information from `BACnet.BACnetIPdatalink`) when starting the BACnet server and then reads the file within the runtime component `CmpBACnet`. Therefore, shared read and write access of the IEC application and the runtime component have to be enabled for this configuration file. This is done either by using an absolute path or by using placeholders (for CODESYS Control V3.5.16.0 and later).

**Absolute path:**

```plaintext
...
[CmpBACnet]
IniFile=D:/Temp/bacstac.ini
...
```

**Placeholder (example: $BACnet$:)**
Furthermore, CODESYS allows for the "sandboxing" of various aspects of the runtime, including access to the file system. In this case, access to the file system within the IEC application and access from the program code of the runtime components are restricted to the configured paths. For more information, see the configuration of [SysFile]:

...  
[SysFile]  
; ForceFilePath=1  
; ForceIecFilePath=1  
...  

For more information about this, see the help for CODESYS Control V3 Runtime System, "CODESYS Control FilePath & Placeholders". This help is available in the 3S-Smart Software Solutions GmbH Customer Portal.

When configuring the "sandboxing" of the file system, you should note that it is possible to access the configuration file of the BACnet stack as described above. Therefore, the alternative using placeholders is mandatory in this case when the path to `bacstac.ini` is not already configured elsewhere.

### BACnet Configuration in the CODESYS Project

#### BACnet configuration in the device tree and device editor

In CODESYS, you can insert a BACnet server and BACnet objects as devices below a PLC device in the project tree. The BACnet server represents the BACnet device and handles the communication with the runtime system.

One server device is possible per application, including the object devices as children. You can also insert BACnet clients below the server.

Requirement: The CODESYS BACnet package is installed. A project with a BACnet-capable PLC device has been created.

1. Select the PLC device in the project tree and add a "BACnet Server" by clicking "Project ➔ Add Device".
2. Select the BACnet server in the tree and insert the required BACnet objects below it.
   - Servers and objects are provided with an initial configuration that conforms with the AMEV AS-A and AS-B standard. This is illustrated in the generic device editor.
3. Double-click the BACnet server or a BACnet object to open its device editor.
   - On the "BACnet Interface Parameters" tab, you can modify the initial configuration in the "Value" column.

A complete configuration of server and object properties by means of this device configuration editor is not possible. This is possible by means of IEC program code. See below.
You can import and export the current BACnet configuration (located in the device tree of the project) to and from CSV files in EDE format (Engineering Data Exchange).

The functionality is based on the "Template for the Exchange of Engineering Data for BACnet Systems" as an Excel file. The export writes the required as well as optional information about the BACnet configuration to the base export file *_EDE.csv. In doing so, other CSV files with information about the "State Texts", "Unit Texts", and "Object Types" are created automatically: *_ObjTypes.csv, *_StateTexts.csv, and *_Units.csv.

**Export:**

The command **"BACnet ➔ Export to EDE File"** opens the “EDE Export” dialog for the following input:

<table>
<thead>
<tr>
<th>“Project name”</th>
<th>Name of the project that is currently being exported from. Found in the &lt;project name&gt;.csv file at PROJECT_NAME</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Version of the reference file”</td>
<td>Version of the export file. Example: 1.0.0.0 Found in the CSV file at VERSION_OF_REFERENCE_FILE</td>
</tr>
<tr>
<td>“Author of last change”</td>
<td>Found in the CSV file at AUTHOR_OF_LAST_CHANGE</td>
</tr>
<tr>
<td>“EDE file to export”</td>
<td>Path of the location of the export file in the local file system. Note: The name of the CSV file has to correspond to the following syntax: &lt;name&gt;_EDE.csv. Example: proj1_EDE.csv</td>
</tr>
<tr>
<td>“Separator”</td>
<td>Character that should be used to separate the text in the export file. Selection: comma, semicolon, space, or tab</td>
</tr>
<tr>
<td>“Quoting”</td>
<td>Specifies whether the exported texts in the EDE file should be placed in single quotation marks, double quotation marks, or no quotation marks.</td>
</tr>
</tbody>
</table>

**Import:**

The **“BACnet ➔ Import from EDE File”** opens the “EDE Import” dialog. Here you specify the following information for the import:

| “EDE file to import”             | In the file system, select an EDE file (*_EDE.csv) that contains the desired BACnet configuration. Any other CSV files (*_ObjTypes.csv, *_StateTexts.csv, *_Units.csv) that may be found are also read automatically. Note: Only CSV files that correspond to the usual EDE file naming convention are included. See above: “EDE file to export” |
| “Separator”                      | The separator used in the selected CSV file is identified and set here automatically.                          |
| “Quoting”                        | The quotation mark used in the selected CSV file is identified and set here automatically.                    |
| “EDE file to export”             | Path of the export file in the local file system.                                                            |
| “Separator”                      | Character that should be used to separate the text in the export file. Selection: comma, semicolon, space, or tab |
| “Quoting”                        | Specifies whether the exported texts in the EDE file should be placed in single quotation marks, double quotation marks, or no quotation marks. |
**Import EDE Information**

- **Project name**
  Not editable. `PROJECT_NAME` from the EDE file.
- **Version of the reference file**
  Not editable. `VERSION_OF_REFERENCEFILE` from the EDE file.
- **Author of last change**
  Not editable. `AUTHOR_OF_LAST_CHANGE` from the EDE file.
- **Timestamp of last change**
  Not editable. `TIMESTAMP_OF_LAST_CHANGE` from the EDE file.
- **Version of layout**
  Not editable. `VERSION_OF_LAYOUT` from the EDE file.

**Import Selection**

- **BACnet device to import**
  The BACnet devices defined in the EDE file are available for selection. The import operation inserts the selected device into the device tree below the “PLC to import to” set below.

- **PLC to import to**
  The devices available in the project are available for selection. The imported BACnet configuration is inserted below the selected device.

---

**Note the following during import:**

The EDE import ignores the following information which may be included in the EDE file:

- Non-standardized BACnet object types (entry in the "Object Types" sheet of the data exchange template, and in the EDE file *_ObjTypes.csv)
- Non-standardized BACnetEngineeringUnits, meaning unit codes (entry in the "Unit Texts" sheet of the data exchange template, and in the EDE file *_Units.csv)
- The optional information "settable" (entry in the "EDE" sheet of the data exchange template, and in the EDE file *_EDE.csv)
- The optional information "supports COV" (entry in the "EDE" sheet of the data exchange template, and in the EDE file *_EDE.csv)

Acceptance of EDE file entries into the BACnet device object:

- The entry "keyname" is stored in the parameter "EDEkey".
- The entry "vendor-specific-address" is stored in the parameter "EDEVendorSpecificAddress".
- The "Unit Text" that belongs to the unit code is stored in the parameter "EDEunitText".

**BACnet configuration using application code**

So that you can access all configuration parameters and BACnet object properties with IEC program code, the library `BACnet` provides a function block for BACnet servers and another function block for BACnet objects. This is mapped to an instance variable on the "I/O Mapping" tab of the respective device configuration editor. Example: The function block `BACnetAnalogValue` is provided for the BACnet object `BACnet Analog Value`. This is automatically instantiated in the project by means of the variable `BACnet_Analog_Value`.

In this way, you can dynamically configure all BACnet properties of an object with your application.

See also

- Chapter 1.5.6.3.8.7 "Access to BACnet Objects and Their Properties" on page 3447

**Access to BACnet Objects and Their Properties**

Each function block of an BACnet object inserted as a device in the project tree is derived from the `BACnetStaticObjectBase` function block (`BACnet` library) and therefore from `BACnetObjectBase`. 
BACnetObjectBase provides the capability of changing any BACnet property for any BACnet object function block by means of the general function SetPropertyInstance.

The data for the BACnet properties to be set are transferred to SetPropertyInstance in the form of the IEC_BACNET_PROPERTY_CONTENTS structure. Besides an enumeration that describes the data type, this structure also contains a buffer that has a POINTER TO BYTE to the actual BACnet property data. This makes it possible to transfer any BACnet property data structures within the IEC_BACNET_PROPERTY_CONTENTS structure. The specified data type defines the structures or data to which the buffer points.

The data and the data type must correspond to each other in accordance with the following table.

<table>

The basic function block BACnetObjectBase provides auxiliary functions (for example, SetBACnetRealProperty, SetBACnetBooleanProperty) for some of the frequently used data types.

#### Example of the correct usage of IEC_BACNET_PROPERTY_CONTENTS

```plaintext
METHOD SetBACnetRealProperty
VAR_INPUT
    propID: CmpBACnet.IEC_BACNET_PROPERTY_ID;
    rVal : REAL;
END_VAR
VAR
    BACreal : CmpBACnet.IEC_BACNET_REAL := 0.0;
    conts : CmpBACnet.IEC_BACNET_PROPERTY_CONTENTS := ( tag :=
        CmbBACnet.IEC_BACNET_DATA_TYPE.DATA_TYPE_REAL,
        nElements := 1,
        buffer :=
            ( nBufferSize := SIZEOF(LREAL), pBuffer := ADR(BACreal) ),
        rawBuffer := ( nBufferSize := 0, pBuffer :=0 ) );
END_VAR
BACreal := rVal;
SetPropertyInstance(propID, -1, conts);
```

This code sets a BACnet property of the type REAL to the value 0.0.

Accordingly, in order to read BACnet properties in the most general case, the BACnetObjectBase function block provides the GetPropertyInstance function. Within the IEC_BACNET_PROPERTY_CONTENTS structure, you can transfer either 1) a buffer pre-initialized with the correct data type, which is then filled, or 2) a buffer of size 0, which is initialized automatically, but which you release again by means of the FreeStackAllocatedMemory function.

Regardless of this general case, auxiliary functions are provided for the most frequent cases. For the most frequently used BACnet properties, there is also a selection of function block properties for each BACnet object function block that allow direct access.
Use of BACnet client function blocks

In addition to BACnet objects, BACnet clients can also be inserted as “devices” under a BACnet server.

Like the objects and the server, each client device also brings along a function block that is instantiated under the same name as the client device.

Unlike BACnet objects, a BACnet client does not require a complex (static) configuration, thus a client function block can be used without creating a BACnet client as "device". In this case however it must be "connected" to its BACnetServer in IEC-code via RegisterToServer(), and thus get activated. This "activation" takes place automatically, when a BACnet client is inserted as “device”.

The BACnet client function blocks implement the "Common Behaviour Model", and so they provide inputs and outputs for flow control.

- Inputs xExecute and xAbort
- Outputs xBusy, xDone, xError and xAborted
- Inputs and outputs for the client request parameters and results
The following code uses the function module BACnetClientReadProperty from the BACnet library to send a client read property request to a specific BACnet client device in the BACnet network. The received response is read out into a local variable:

```plaintext
PROGRAM PLC_PRG
VAR
  initDone : BOOL := FALSE;
  readProp : BACnet.BACnetClientReadProperty;
  readPropCnt : INT := 0;
  readPropErrorCnt : INT := 0;
  readPropCancelCnt : INT := 0;
  readPropVal : REAL;
END_VAR

IF NOT initDone THEN
  readProp:RegisterToServer(BACnet_Server);
  readProp(
    dwTargetDeviceNumber:= 43,
    objType:=
      BACnet.CmpBACnet.IEC_BACNET_OBJECT_TYPE.OBJ_ANALOG_VALUE,
    objInst:= 1,
    propID:=
      BACnet.CmpBACnet.IEC_BACNET_PROPERTY_ID.PROP_PRESENT_VALUE,
    nIndex:= -1);
END_IF

IF readProp.xExecute AND readProp.xBusy AND readProp.iState = 3 THEN
  IF readPropCnt MOD 2 = 0 THEN // cancel every second request
    readProp.xAbort := TRUE;
    readPropCancelCnt := readPropCancelCnt + 1;
  END_IF
END_IF

IF NOT readProp.xExecute AND NOT readProp.xAborted AND NOT readProp.xDone THEN
  readProp.xExecute := TRUE;
  readPropCnt := readPropCnt + 1;
END_IF

IF readProp.xExecute THEN
  IF readProp.xDone THEN
    END_IF
    readProp.xExecute := FALSE;
  END_IF
  IF readProp.xError THEN
    END_IF
    readProp.xExecute := FALSE;
    readPropErrorCnt := readPropErrorCnt + 1;
  END_IF
  IF readProp.xAborted THEN
    END_IF
    readProp.xExecute := FALSE;
    readProp.xAbort := FALSE;
  END_IF
END_IF

readProp();

IF readProp.xDone OR readProp.xError THEN
  IF readProp.xError THEN
    // handle error
  ;
```

Example of IEC code for a client action
If a client request provides a response, the response content is provided in the form of one or
more output variables, as in the above example. However, this may vary depending on the
client action. The example additionally uses the auxiliary function `GetRealFromContents()`
to read the output variable `readProp.result` of type `IEC_BACNET_PROPERTY_CONTENTS`.

**BACnet data types**

The BACnet library mostly uses BACnet data types - defined in CmpBACnet library - at their
interface (method arguments, method return values, function block properties)

If other data types are used on the interface - in this case mostly IEC basic data types - the cor-
responding methods and properties perform an implicit conversion to / from the corresponding
internally used BACnet data types.

Examples of this:

<table>
<thead>
<tr>
<th>Conversion</th>
<th>Using BOOL (TRUE/FALSE) instead of CmpBACnet.IEC_BACNET_BOOLEAN improves the readability of the IEC code.</th>
</tr>
</thead>
<tbody>
<tr>
<td>IEC BOOL &lt;-&gt; CmpBACnet.IEC_BACNET_BOOLEAN</td>
<td>Using BOOL (TRUE/FALSE) instead of CmpBACnet.IEC_BACNET_BOOLEAN improves the readability of the IEC code.</td>
</tr>
<tr>
<td>IEC WSTRING &lt;-&gt; CmpBACnet.IEC_BACNET_STRING</td>
<td>The use of WSTRING is necessary, since a conversion to/from the internally used BAC data types CmpBACnet.IEC_BACNET_STRING_TYPE.BACNET_STRING_UTF_8 or CmpBACnet.IEC_BACNET_STRING_TYPE.BACNET_STRING_ISO_8859_1 takes place.</td>
</tr>
<tr>
<td>IEC DATE/TIME / BACnetDateTime &lt;-&gt; CmpBACnet.IEC_BACNET_DATE/ CmpBACnet.IEC_BACNET_TIME</td>
<td>The use of IEC DATE/TIME is more common for the IEC programmer and is therefore preferred on the interface.</td>
</tr>
</tbody>
</table>

At the BACnet library interface, BACnet data types other than the BACnet data types are only
used in well-founded exceptions to simplify the application IEC code. The usually minimal over-
head coming with a conversion is negligible.

**Implementation Requirements when Using the Current BACnet API/Stack**

In the implementation of a BACnet API/stack described here, a large part of the object behavior
specified in the BACnet standard is already pre-implemented. However, there are specific object
actions that have to be implemented by each specific application (the user application, or in
other words your application) in order to fully comply with the BACnet standard (for example, to
obtain BTL certification).
This description lists all object actions and object behavior that are already implemented or not implemented in the current BACnet API/stack (see § Chapter 1.5.6.3.8.10.1 “Implemented Standard Object Actions and Behavior in the Current BACnet API/Stack” on page 3454 and § Chapter 1.5.6.3.8.10.2 “Objects with Implementation of Standard Actions” on page 3460). Moreover, you will find descriptions and an example of how missing object behavior is implemented when using the current BACnet API/stack (see § Chapter 1.5.6.3.8.10.3 “Example and Explanations for the Implementation of Service Hooks” on page 3462).

</table>

Many service requests are already handled in this API so that an application does not have to register all service hooks to run as a BACnet device. Service hooks describe the BACnet network requests that have to be resolved in the manner defined in the BACnet standard.

### Service indication hooks with default action implementation

Here is a list of hooks that already have some default action implemented and normally do not need any implementation in the user application:

- **AcknowledgeAlarm service hook**
  After verifying the validity of the request, the API will attempt to locate the specified object. If the object exists and if the Time Stamp parameter matches the most recent time for the event being acknowledged, then the following will happen: The bit in the Acked_Transitions property of the object that corresponds to the value of the Event State Acknowledged parameter will be set to 1, a result(+) primitive will be issued, and an event notification with a Notify Type parameter equal to ACK_NOTIFICATION will be issued. Otherwise, a result(-) primitive will be issued. An acknowledgment notification will use the same type of service (confirmed or unconfirmed) directed to the same recipients to which the original confirmed or unconfirmed event notification was sent. The Time Stamp conveyed in the acknowledgment notification will not be derived from the Time Stamp of the original event notification, but rather the time at which the acknowledgment notification is generated.

- **GetAlarmSummary service hook**
  After verifying the validity of the request, the API will search all event-initiating objects that have an Event State property not equal to NORMAL and a Notify Type property whose value is ALARM. A positive response containing the alarm summaries for objects found in this search will be constructed. If no objects are found that meet these criteria, then a list of length zero will be returned.

- **GetEnrollmentSummary service hook**
  After verifying the validity of the request, the API will search for all event-initiating objects that meet the search criteria specified in the request primitive. The search criteria are the logical conjunctions of all of the explicitly stated filters and the default values for any filters that were omitted in the request primitive. A positive response containing the enrollment summaries for objects found in this search will be constructed. If no objects are found that meet these criteria, then a list of length zero will be returned.
SubscribeCOV service hook

If neither Lifetime nor Issue Confirmed Notifications are present, then the request will be considered to be a cancellation. Any COV context that already exists for the same BACnet address contained in the PDU that carries the SubscribeCOV request and has the same Subscriber Process Identifier and Monitored Object Identifier will be disabled and a SimpleAck is returned. Cancellations that are issued for which no matching COV context can be found will succeed as if a context had existed, returning SimpleAck. If the Lifetime parameter is not present but the Issue Confirmed Notifications parameter is present, then a value of zero (indefinite lifetime) will be assumed for the lifetime. If the Issue Confirmed Notifications parameter is present but the object to be monitored does not support COV reporting, then an error will be returned. If the object to be monitored does support COV reporting, then a check will be made to locate an existing COV context for the same BACnet address contained in the PDU that carries the SubscribeCOV request and has the same Subscriber Process Identifier and Monitored Object Identifier. If an existing COV context is found, then the request will be considered a re-subscription and will succeed as if the subscription had been newly created. If no COV context can be found that matches the request, then a new COV context will be established that contains the BACnet address from the PDU that carries the SubscribeCOV request and the same Subscriber Process Identifier and Monitored Object Identifier. If no context can be created, then an error will be returned. If a new context is created, or a re-subscription is received, then the COV context will be initialized and given a lifetime as specified by the Lifetime parameter if present, or zero if the Lifetime parameter is not present. The subscription will be automatically cancelled after that many seconds have elapsed unless a re-subscription is received. A lifetime of zero will indicate that the subscription is indefinite and no automatic cancellation will occur. In either case, a SimpleAck will be returned. A ConfirmedCOVNotification or UnconfirmedCOVNotification will be issued as soon as possible after the successful completion of a subscription or re-subscription request, as specified by the Issue Confirmed Notifications parameter.

AddListElement service hook

After verifying the validity of the request, the API will attempt to modify the object identified in the Object Identifier parameter. If the identified object exists and has the property specified in the Property Identifier parameter, an attempt will be made to add all of the elements specified in the List of Elements parameter to the specified property. If this attempt is successful, a SimpleAck primitive will be issued. If one or more of the elements is already present in the list, it will be ignored, that is, will not be added to the list. Ignoring an element that already exists will not cause the service to fail. If the specified object does not exist, the specified property does not exist, or the specified property is not a list, then the service will fail and an error response primitive will be issued. If one or more elements cannot be added to the list and they are not already members, an error response primitive will be issued and no elements will be added to the list. The effect of this service will be to add to the list all of the specified elements that are not already present or to add no elements to the list at all.

RemoveListElement service hook

After verifying the validity of the request, the API will attempt to modify the object identified in the Object Identifier parameter. If the identified object exists and it has the property specified in the Property Identifier parameter, an attempt will be made to remove the elements in the List of Elements from the property of the object. If one or more of the elements does not exist or cannot be removed because of insufficient authority or other problems, none of the elements will be removed and an error response primitive will be issued.

ReadProperty service hook

After verifying the validity of the request, the API will attempt to access the specified property of the specified object. If the access is successful, a ComplexAck primitive, which returns the accessed value, will be generated. If the access fails, an error primitive will be generated, indicating the reason for the failure. When the object-type in the Object Identifier parameter contains the value Device Object and the instance in the Object Identifier parameter contains the value 4194303, the API will treat the Object Identifier as if it correctly matched the local Device object. This allows the device instance of a device that does not generate I-Am messages to be determined.
**ReadPropertyMultiple service hook**

After verifying the validity of the request, the API will attempt to access the specified properties of the specified objects and will construct a List of Read Access Results in the order specified in the request. If the List of Property References portion of the List of Read Access Specifications parameter contains the property identifier ALL, REQUIRED, or OPTIONAL, then the List of Read Access Results will be constructed as if each property being returned had been explicitly referenced. While there is no requirement that the request be carried out “automatically” nonetheless the API will ensure that all readings are taken in the shortest possible time subject only to higher priority processing. The request will continue to be executed until an attempt has been made to access all specified properties. If none of the specified objects is found or if none of the specified properties of the specified objects can be accessed, either an error primitive or a ComplexAck primitive that returns error codes for all properties that could not be accessed. When the object-type in the Object Identifier portion of the Read Access Specification parameter contains the value Device Object and the instance of that Object Identifier parameter contains the value 4194303, the API will treat the Object Identifier as if it correctly matched the local Device object. This allows the device instance of a device that does not generate I-Am messages to be determined.

For BACnet server user applications, which can't use the internal database and thus have to implement support for the ReadPropertyMultiple service, they only need to implement the ReadProperty service hook because ReadPropertyMultiple requests are split into single ReadProperty requests internally and completions are collected to build the response.

**WriteProperty service hook**

After verifying the validity of the request, the API will attempt to modify the specified property of the specified object using the value provided in the Property Value parameter. If the modification attempt is successful, a SimpleAck primitive will be issued. If the modification attempt fails, an error primitive will be issued indicating the reason for the failure.

**WriteProperty Multiple service hook**

For each Write Access Specification contained in the List of Write Access Specifications, the value of each specified property will be replaced by the property value provided in the Write Access Specification and a SimpleAck primitive will be issued, indicating that the service request was carried out in its entirety. If, in the process of carrying out the modification of the indicated properties in the order specified in the List of Write Access Specifications, a property is encountered that cannot be modified, the PI will issue an error response primitive indicating the reason for the failure. The result of this service will be either that all of the specified properties or only the properties up to, but not including, the property specified in the First Failed Write Attempt parameter were successfully modified. A BACnet-Reject-PDU will be issued only if no write operations have been successfully executed, indicating that the service request was rejected in its entirety. If any of the write operations contained in the List of Write Access Specifications could not be successfully executed, an error response indicating the reason for the failure will be issued as described above.

**ReadRange service hook**

The API will first verify the validity of the Object Identifier, Property Identifier and Property Array Index parameters and will return an error response with the appropriate error class and code if the object or property is unknown, if the referenced data is not a list or array, or if it is currently inaccessible for another reason. If the Range parameter is not present, then the API will read and attempt to return all of the available items in the list or array. If the Range parameter is present and specifies the By Position parameters, then the API will read and attempt to return all of the items specified. The items specified include the item at the index specified by Reference Index plus up to Count - 1 items following if Count is positive, or up to -1 - Count items preceding if Count is negative. The first element of a list will be associated with index 1. If the Range parameter is present and specifies the By Time parameter or the By Sequence Number parameters, then the API will reject the request by returning an error response with the appropriate error class and code. The returned response will convey the number of items read and returned using the Item Count parameter. The actual items will be returned in the Item Data parameter. If the returned response includes the first positional
index, then the Result Flags parameter will contain the FIRST_ITEM flag set to TRUE; otherwise it will be FALSE. If the returned response includes the last positional index, then the Result Flags will contain the LAST_ITEM flag set to TRUE; otherwise it will be FALSE. If there are no items in the list that match the Range parameter criteria, then a ComplexAck will be returned with an Item Count of 0 and no First Sequence Number parameter.

The default implementation of this service will NOT support the access to the log-buffer property of the trend- and event-logging objects. If a user application needs to support logging objects, the storage and the access to those data has to be implemented by the user application.

**SubscribeCOVProperty service hook**

If neither Lifetime nor Issue Confirmed Notifications are present, then the request will be considered to be a cancellation. Any COV context that already exists for the same BACnet address contained in the PDU that carries the SubscribeCOVProperty request and has the same Subscriber Process Identifier, Monitored Object Identifier and Monitored Property Identifier will be disabled and a SimpleAck is returned. Cancellations that are issued for which no matching COV context can be found will succeed as if a context had existed, returning SimpleAck. If an existing COV context is found, it will be removed from the Active_COV_Subscriptions property in the Device object. If the Issue Confirmed Notifications parameter is present but the property to be monitored does not support COV reporting, then an error will be returned. If the property to be monitored does support COV reporting, then a check will be made to locate an existing COV context for the same BACnet address contained in the PDU that carries the SubscribeCOVProperty request and has the same Subscriber Process Identifier, Monitored Object Identifier and Monitored Property Identifier. If an existing COV context is found, then the request will be considered a re-subscription and will succeed as if the subscription had been newly created. If no COV context can be found that matches the request, then a new COV context will be established that contains the BACnet address from the PDU that carries the SubscribeCOVProperty request and the same Subscriber Process Identifier, Monitored Object Identifier and Monitored Property Identifier. The new context will be included in the Active_COV_Subscriptions property of the Device object. If no context can be created, then an error will be returned. If a new context is created, or a re-subscription is received, then the COV context will be initialized and given a lifetime as specified by the Lifetime parameter. The subscription will be automatically cancelled after that many seconds have elapsed unless a re-subscription is received. A SimpleAck will be returned and a ConfirmedCOVNotification or UnconfirmedCOVNotification will be issued as soon as possible after the successful completion of a subscription or resubscription request, as specified by the Issue Confirmed Notifications parameter.

**GetEventInformation service hook**

After verifying the validity of the request, the API will search for all event-initiating objects that meet the following conditions, beginning with the object following (in ascending internal ordering of object instances) the object specified by the Last Received Object Identifier parameter, if present have an Event_State property whose value is not equal to NORMAL, or have an Acked_Transitions property that has at least one of the following bits (TO-OFFNORMAL, TO-FAULT, TO-NORMAL) set to FALSE. A positive response containing the event summaries for objects found in this search shall be constructed. If no objects are found that meet these criteria, then a list of length zero will be returned. As many of the included objects as can be returned within the APDU will be returned. If more objects exist that meet the criteria but cannot be returned in the APDU, the More Events parameter will be set to TRUE, otherwise it will be set to FALSE.

**I-Am service hook**

After verifying the validity of the request, the API will add the received information to the device object property Address_Binding which is used to resolve device instance numbers into BACnet MAC addresses which are needed for communication with that device.

**I-Have service hook**

After verifying the validity of the request, the API will add the received information to an internal sorted list which is used to resolve object names into object identifiers which are needed for accessing those objects.
Who-Has service hook

The API will transmit the Who-Has unconfirmed request, normally using a broadcast address. If the Device Instance Range Low Limit and Device Instance Range High Limit parameters are present, then the API whose Device Object-Identifier instance number falls in the range Device Instance Range Low Limit <= Device Object-Identifier Instance Number <= Device Instance Range High Limit will be qualified to respond. If the Object Name parameter is present, then the API receiving that contain an object with an Object Name property value matching the Object Name parameter will respond with an I-Have service request. If the Object Identifier parameter is present, then the API receiving that contain an object with an Object Identifier property value matching the Object Identifier parameter will respond with an I-Have service request.

Who-Is service hook

The API will transmit the Who-Is unconfirmed request, normally using a broadcast address. If the Device Instance Range Low Limit and Device Instance Range High Limit parameters are omitted, then the API will return their Device Object-Identifier in individual responses using the I-Am service. If the Device Instance Range Low Limit and Device Instance Range High Limit parameters are present, then the API whose Device Object-Identifier instance number falls within the range Device Instance Range Low Limit <= Device Object-Identifier Instance Number <= Device Instance Range High Limit will return their Device Object-Identifier using the I-Am service.

AtomicReadFile service hook

The API will first verify the validity of the Object Identifier and will return an error response result(-) with the appropriate error class and code if the object is unknown. This service hook only supports STREAM accessed files. After that the validity of the local file access on the local hard drive is checked and an error response result(-) with the appropriate error class and code will be returned if the file start position is invalid or if the file is not accessible for some reason. If the validity check is successful the specified number Request Record Count of octets is read from the local file. If the actual number of read octets is less than the specified one, the Returned Record Count of the returned result(+) indicates the number of read octets and if the end of the file was reached the End Of File Parameter of the returned result(+) is set to TRUE.

This service hook is implemented using the SysFile-Interface of CODESYS only supporting STREAM access. Consequently the user application may want to change especially this service hook for the file access.

AtomicWriteFile service hook

The API will first verify the validity of the Object Identifier and will return an error response result(-) with the appropriate error class and code if the object is unknown. This service hook only supports STREAM accessed files. After that the validity of the local file access on the local hard drive is checked and an error response result(-) with the appropriate error class and code will be returned if the file start position is invalid or if the file is not accessible for some reason. If the File Start Position parameter of the service request exceeds the local file size, the file will be extended for writing the incoming octets. If the File Start Position parameter has the value -1, the local file will get appended by the incoming octets. If the writing of the local file failed, an appropriate result(-) response will be issued. If the writing of the local file succeeded, a result(+) will be issued containing the appropriate File Start Position.

This service hook is implemented using the SysFile-Interface of CODESYS only supporting STREAM access. Consequently the user application may want to change especially this service hook for the file access.

CreateObject service hook

The API will first verify the validity of the request by checking if the Object Specifier of the request specifies a creatable object type (according to the intern rule $\text{IsBACnetObjectAMVECreatable}$) and will return an appropriate error result(-) if that is not the case. If specified by the Object Specifier the validity of the object instance number is checked and an appropriate error result(-) is returned if the instance number is not available anymore. If no List of Initial Values is given, all properties of the created object
are created using default values as it is done for properties not specified in a given List of Initial Values. If the creation of the object fails an appropriate error result(-) is issued, whereas the First Failed Element Number of the response is set to 0. If the creation succeeded an result(+) response is issued, which carries the object identifier of the created object.

This implementation of this service hook has to be accounted for to be only a comprehensive proposal for its implementation. As it is a purely local matter of the user application how this service request is treated it is very likely, that the user application wants to supply its own service hook for another treatment of the request.

DeleteObject service hook

The API will first verify the validity of the Object Identifier and will return an error response result(-) with the appropriate error class and code if the object is unknown. If the specified object can be deleted a result(+) response is issued, if the deletion of the objects fails, i.e. the object can not be dynamically deleted (according to the intern rule BACnet.IsBACnetObjectAMEVCreatable), or for any other reason a result(-) is issued.

This implementation of this service hook has to be accounted for to be only a comprehensive proposal for its implementation. As it is a purely local matter of the user application how this service request is treated it is very likely, that the user application wants to supply its own service hook for another treatment of the request.

- § Chapter 1.5.6.3.8.1 “Overview” on page 3439

Service indication hooks with internal used implementation

The following listed hooks do not have any default action implemented, but the advanced client API uses this set of functions to acquire the data from remote devices:

- ConfirmedCOVNotification service hook
- ConfirmedEventNotification service hook
- UnconfirmedCOVNotification service hook
- UnconfirmedEventNotification service hook

These hooks for example can be used, to receive the answered information after a SubscribeCOVProperty request, i.e. after a subscription of a certain Property of an Object of a Device the ConfirmedCOVNotification hook will be called whenever the latter Device send a COVNotification to inform about a change of the Property.

- § Chapter 1.5.6.3.8.10 “Implementation Requirements when Using the Current BACnet API/Stack” on page 3453
- § Chapter 1.5.6.3.8.1 “Overview” on page 3439

Service indication hooks without default action implementation

The following listed hooks do not have any default action implemented. The application needs to implement its own request handling routine if the service has to be supported:

- DeviceCommunicationControl service hook
- ReinitializeDevice service hook
- TimeSynchronization service hook
- UtcTimeSynchronization service hook
The hooks listed here may need to be implemented by the user application (depending on the user application and its specifications concerning the BACnet standard), since no pre-implementation can be done due to the hardware correlation of this hooks.

- Chapter 1.5.6.3.8.10 “Implementation Requirements when Using the Current BACnet API/Stack” on page 3453
- Chapter 1.5.6.3.8.1 “Overview” on page 3439

Objects with Implementation of Standard Actions

1.5.6.3.8.10.2.1 Common object property actions.................................................. 3460
1.5.6.3.8.10.2.2 Objects without default action implementation.............................. 3462

Common object property actions

Following common object property actions are implemented for all objects which have those listed properties.

Property Status_Flags

The Status_Flags property has a bit-string value which has 4 bits. The values of 3 of those bits are related to the values of other properties in the same object. This following relationship is defined in the BACnet standard and is implemented as actions in this API: Bit IN_ALARM is logical FALSE if the Event_State property has a value of NORMAL, otherwise logical TRUE. Bit FAULT is logical TRUE if the Reliability property is present and does not have a value of NO_FAULT_DETECTED, otherwise logical FALSE. Bit OUT_OF_SERVICE is logical TRUE if the Out_Of_Service property is present and has a value of TRUE, otherwise logical FALSE.

Property Out_Of_Service

The Out_Of_Service property, of type BOOL, is an indication whether (TRUE) or not (FALSE) the physical point that the object represents is not in service. In case that it is not in service, different other properties need to be writable. For e.g. the Present_value and Reliability property need to be writable to simulate different events and states an object supports which will not occur during normal operation. So if the Out_Of_Service property is set to TRUE those properties will be writable, even if the user application had specified NO access rights to them.

Properties related to intrinsic reporting

Objects which have defined intrinsic reporting procedures in the standard and which are also supported by this API, will have updated their properties related to intrinsic reporting automatically by internal actions in the API. For e.g. the property Event_State will be set to the appropriate enumerated value for the intrinsic state that the object is in. The property Event_Time_Stamp is updated when the event notification is sent. Bits in the property Acked_Transitions are modified accordingly too.

Properties related to change of value reporting

Objects which have defined COV reporting procedures in the standard and which are also supported by this API, will have updated their properties related to COV reporting automatically by internal actions in the API. Also sending change of value notifications to registered subscribers to objects or object properties is done by the API.

Properties related to command prioritization

For BACnet objects, commands are prioritized based upon a fixed number of priorities that are assigned to command-issuing entities. A prioritized command (one that is directed at a commandable property of an object) is performed via a WriteProperty service request or a WritePropertyMultiple service request. The request primitive includes a conditional Priority parameter that ranges from 1 to 16. Each commandable property of an object has an associated priority table that is represented by the Priority_Array property. The Priority_Array consists of an array of commanded values in order of decreasing priority. The first value in the array corresponds to priority 1 (highest), the second value corresponds to
priority 2, and so on, to the sixteenth value that corresponds to priority 16 (lowest). If such a prioritized command is received by the API all necessary actions described in clause 19 in the BACnet standard will take place by internal actions to handle the prioritized command correctly. If the user application has registered callbacks for the properties Present_value and Priority_Array it will get informed about the current command state in the object.

**Accumulator object**

The Accumulator object type defines a standardized object whose properties represent the externally visible characteristics of a device that indicates measurements made by counting pulses. The pulse injection to this object can be done either by adding the proprietary property Prop_Pulse_Value_Source and filling it with a reference to a BINARY or BOOLEAN value source or by calling the BACnet.BACnetServer.UpdateAccumulatorDataSourceValue function, which is available for every inserted BACnet server in the CODESYS device tree. In any case toggling values will be counted by the object and all property actions defined in the BACnet standard will be done by the API. The intrinsic reporting procedure is also handled by internal actions in this API for this object.

**Analog-Input object**

The Analog-Input object type defines a standardized object whose properties represent the externally visible characteristics of a physical analog input. The properties Min_Pres_Val and Max_preset_Val which indicate the lowest and highest number in engineering units that can be reliably obtained for the Present_Value property of this object, will generate value out of range errors, if the Present_Value is set out of that range. Also the values of properties High_Limit, Low_Limit and Deadband are observed if they get outside this range. The optional present property Resolution, which specifies the smallest recognizable change in Present_Value in engineering unit, influences the setting of the Present_Value property directly and will adjust its value automatically. The Change-Of-value reporting procedure and the intrinsic reporting procedure are fully implemented by internal actions of this API for this object type.

**Analog-Output object**

The Analog-Output object type defines a standardized object whose properties represent the externally visible characteristics of a physical analog output. All actions implemented for the Analog-Input object are also implemented for this object type.

**Analog-Value object**

The Analog-Value object type defines a standardized object whose properties represent the externally visible characteristics of a analog value. An "analog value" is a control system parameter residing in the memory of the BACnet Device and has no physical device. All actions implemented for the Analog-Input object are also implemented for this object type.

**Averaging object**

The Averaging object type defines a standardized object whose properties represent the externally visible characteristics of a value that is sampled periodically over a specified time interval. The Averaging object records the minimum, maximum and average value over the interval, and makes these values visible as properties of the Averaging object. The sampled value may be the value of any BOOLEAN, INTEGER, UNSIGNED, ENUMERATED or REAL property value. The value of the over Object_Property_Reference referenced object is acquired and all depending property values such as Minimum_Value, Maximum_Value, Average_Value and others will be updated by internal actions in the API.

The common property actions implemented by this API also apply for further objects.

- % Chapter 1.5.6.3.8.1 “Overview” on page 3439
Objects without default action implementation

In the present version of this API there is no internal action implemented to any to this object type related properties: Notification-Class object, Program object, Structured-View object.

The object types listed here correspond to the object types available in the CODESYS device tree as devices. Other object types may be creatable using the CmpBACnet library. For those object the general property actions described beforehand hold also, but no additional property actions of not listed objects and not listed properties are pre-implemented by this API.

Example and Explanations for the Implementation of Service Hooks

1.5.6.3.8.10.3.1 CreateObject service hook implementation example........... 3462
1.5.6.3.8.10.3.2 Implementation of logging objects (Event-Log, Trend-Log, Trend-Log-Multiple).............................................................. 3467

This part provides a detailed description of the implementation of a service hook using the CreateObject hook as an example. Furthermore, the special behavior of the logging objects (event log object, trend log object, and trend log multiple object) is described and explained how their missing object actions can be implemented.

CreateObject service hook implementation example

The following example code shows how to implement a CreateObject service hook using the BACnet Stack/API.

First thing to do is to register the corresponding hook within any place in your program code. This is done by registering an FB CallbackFB implementing the Interface IBACnetEventConsumer using the function RegisterHook of the BACnetServer-FB meaning the FB inserted for the local BACnetServer-Device in the CODESYS device tree:

BACnetServer.RegisterHook(CmpBACnet.IEC_BACNET_CB_TYPE.CB_CREATE_OBJEC T, CallbackFB);

Having done so, this FBs function BACnetEventCallback (defined by the interface IBACnetEventConsumer) will be called whenever a CreateObject service request is collected by the BACnetServer (in other words the BACnet device). The following sample code demonstrates an implementation of the BACnetEventCallback function of the CallbackFB. It has the following declaration:

METHOD BACnetEventCallback : BOOL
VAR_INPUT
  /*If only one event is possibly called, the following Ids can be ignored. If there are
   * more at least the EventId should be checked, to get the
   * right type of pParameter. ID of the occured Event. Contains the
   * class and the event.*)
  EventId : DWORD;
  /*Id of the parameter structure (see pParameter)*/
usParamId : WORD;
  /*Version of the parameter structure (see pParameter)*/
usVersion : WORD;
  /*Pointer to the event specific parameter, that is specified by
  * Id (see GVL EVENTID in
  * CmpBACnet)*/
Id (see GVL EVENTID in
  CmpBACnet)*/
Notice the `pCreateObj` variable which will carry the essential information of the `CreateObject` request. The code the `BACnetEventCallback` function of the `CallbackFB` could be implemented like this:

```pascal
BACnetEventCallback := FALSE;

//Check if the issued service event is the one we are interested in
//meaning the create object event
IF EventId = CmpBACnet.EVT_CreateObject AND
   usParamId = CmpBACnet.EVTPARAMID_CmpBACnet_CreateObject AND
   usVersion = CmpBACnet.EVTVERSION_CmpBACnet_CreateObject THEN

   //Get the service information using the proper
   //event structure CmpBACnet.EVT_BACNET_CREATEOBJECT
   pCreateObj := pParameter;

   //The pCBStatus property of the event structure allows to define
   //the result of this service hook. Choosing the default action
   //will advice the API to use its default implementations if available
   //see also documentation of CB_STATUS_DEFAULT)
   pCreateObj^.pCBStatus^ := CmpBACnet.IEC_BACNET_CB_STATUS.CB_STATUS_DEFAULT;

   //Get the device instance number for the service request and
   //check if it is
   //our device that the request is for (only important for the case
   //of multiple
   //devices in one PLC)
   bacResult := CmpBACnet.BACnetDeviceAddressToInstNumber(pCreateObj^.destinationAddress);
   ADR(destInstNumber);
   IF bacResult = CmpBACnet.IEC_BACNET_STATUS.BACNET_STATUS_OK AND
      destInstNumber = m_Device.DeviceInstNumber THEN

      //Get the object specifier defining what to create
      objSpec := pCreateObj^.pServiceInfo^.objectSpecifier;
      //Check if the
      object type specified is creatable
      IF IsBACnetObjectAMEVCreatable(objSpec.objectSpec.typ) THEN
```
no object ID is given find a free one
objSpec.tag =

    CmpBACnet.IEC_BACNET_CREATE_OBJECT_TYPE.CREATE_OBJECT_TYPE
THEN

    objID.typ := objSpec.objectSpec.typ;
    objID.instNumber := 1;
    objCount := GetObjectCount();
    i := 1;

    WHILE i <= objCount DO
        GetObject(i, bacObj);
        runObjID := bacObj.ObjectID;
        IF runObjID.typ = objID.typ AND
            runObjID.instNumber = objID.instNumber THEN
            objID.instNumber := objID.instNumber + 1;
            i := 1;
        END_IF
        i := i + 1;
    END WHILE

    BACnetEventCallback := TRUE;

//If the object ID is given check if it is a valid/free object ID
ELSIF objSpec.tag =

    CmpBACnet.IEC_BACNET_CREATE_OBJECT_TYPE.CREATE_OBJECT_ID THEN

    objID := objSpec.objectSpec.objectID;
    objCount := GetObjectCount();
    i := 1;

    BACnetEventCallback := TRUE;

    WHILE i <= objCount DO
        GetObject(i, bacObj);
        runObjID := bacObj.ObjectID;
        IF runObjID.typ = objID.typ AND
            runObjID.instNumber = objID.instNumber THEN
            errorCode := ERR_CODE_OBJ_ID_ALREADY_EXISTS;
        END_IF
    END WHILE

2020/12/10 3ADR010583, 1, en_US 3464
BACnetEventCallback := FALSE;
EXIT;
END_IF
i := i + 1;
END_WHILE
ELSE
// No object specification given which can be interpreted, so
issue a standard error
BACnetEventCallback := FALSE;
END_IF
ELSE
// If the object type is not supported to be created issue the
// appropriate error
errCode := ERR_CODE_DYN_CREATION_NOT_SUPP;
BACnetEventCallback := FALSE;
END_IF

// If everything is all right till now (BACnetEventCallback is TRUE) try to
// create the object
IF BACnetEventCallback
THEN
IF pCreateObj^.pServiceInfo^.fValuesPresent > 0 THEN
// If property values are given by the service request use them
bacResult := CmpBACnet.BACnetConstructObject(destInstNumber,
ADR(objID),
pCreateObj^.pServiceInfo^.pValues,
pCreateObj^.pServiceInfo^.nValuesCount,
m_SupportUnsolicitedCOV, 1,
m_HideToOutside);
ELSE
// If no property values are given by the service request just
// create the object using the default implementation
bacResult := ConstructDefaultObject(objID.typ, objID.instNumber,
STRING_TO_WSTRING(CONCAT('CreatedObject',
DWORD_TO_STRING(objID.instNumber))),
bacObj, strBuffer);
END_IF
END_IF

// Check if everything went well
IF BACnetEventCallback AND bacResult = BACNET_STATUS_OK THEN
everything succeeded issue an result(+) response containing the
//object ID
CmpBACnet.BACnetCreateObjectResponseCbCompletion(pCreateObj^.phTransaction, ADR(objID));
//We treated
the service request, so no default API actions are
//necessary anymore
pCreateObj^.pCBStatus^ := CmpBACnet.IEC_BACNET_CB_STATUS.CB_STATUS_OK;
ELSE
//If something went wrong issue an error
BACnetEventCallback := FALSE;
//If no explicit error code was given till now, issue an internal error
IF errCode = 0 THEN
errCode := ERR_CODE_INTERNAL_ERROR;
END_IF
//Issue the result(-) response with the appropriate error code
CmpBACnet.BACnetCreateObjectErrorCbCompletion(pCreateObj^.phTransaction,
ERR_CLASS_OBJECT, errCode, 0);
//We treated
the service request, so no default API actions are
//necessary anymore
pCreateObj^.pCBStatus^ := CmpBACnet.IEC_BACNET_CB_STATUS.CB_STATUS_OK;
END_IF
END_IF
END_IF
END_IF

The main feature of this code example is to get the service request information by casting pCreateObj (EVT_BACNET_CREATEOBJECT) to the pParameter, to get access to the information in pParameter. pCreateObj is a typical hook request structure (found and declared in the library CmpBACnet). Most of them contain a variable pCBStatus which is the return value to the API. The latter return value decides whether the API further treats the service request (Default) or not (OK). The rest of the code mainly check the properties of the service request and then tries to create the object, whereas occurring errors are saved within the variable errCode. Finally result(+) or result(-) responses are issued using the functions CmpBACnet.BACnetCreateObjectResponseCbCompletion or CmpBACnet.BACnetCreateObjectErrorCbCompletion.

This is a typical example of an implemented service hook using the event mechanisms of the BACnet Stack/API: there is an event/callback you can register to in order to get a call whenever a service request was received. The implementation of the service hook then has to follow the specifications of the BACnet standard in order to provide a compliant service.

See also

- Chapter 1.5.6.3.8.10 “Implementation Requirements when Using the Current BACnet API/Stack” on page 3453
- Chapter 1.5.6.3.8.1 “Overview” on page 3439
Implementation of logging objects (Event-Log, Trend-Log, Trend-Log-Multiple)

For the Event-Log, Trend-Log and Trend-Log-Multiple object types no complete implementation of their functionality is provided by the BACnet Stack/API, because the saving of logged data is possibly very hardware specific and therefore very likely to be implemented by the specific user application. Nevertheless all property behaviour of the logging objects is pre-implemented in this API, so that basically only the recording and reading of the trended data has to be implemented by the user application.

A. Implementation of data recording for logging objects

Every logging object shall use its Log_Buffer property for storing the logged data. Since this property is only accessible (and therefore testable for BACnet standard compliance) via the ReadRange service, it is not necessary to care for its (user application) internal representation. Therefore the BACnet Stack/API handles the Log_Buffer as being only one record long and writes the incoming records to this single record whenever needed (i.e. the logged object produces new data). Therefore, for implementing a proper recording of the logged data, it is sufficient to just catch the write events to the Log_Buffer property and consequently saving the incoming single records.

For doing so, one can use the Write-Callback of the BACnet Stack/API. The latter callback is always called whenever a property of an object is written (assuming that the callback of the object was activated using the function BACnet.BACnetObjectBase.SetPropertyCallbackAttachment, which is part of any BACnet object FB in CODESYS). Registering such a Write-Callback is done very similar to registering a service hook with the only difference of the used register function. Again a CallbackFB (or two) implementing the Interface IBACnetEventConsumer can be registered using the function RegisterCallback function of the BACnetServer-FB:

```c
BACnetServer.RegisterCallback(CmpBACnet.IEC_BACNET_CALLBACK_TYPE.BACNET_CALLBACK_WRITE, CallbackFB, 0);
```

The corresponding function BACnetEventCallback in the CallbackFB now can be implemented to save the record coming along with the callback data (EVT_BACNET_WRITEPROPERTYCALLBACK), whenever called. For implementation be sure to filter for the correct object ID and the correct property ID for the callback data, so that you can be sure to only record data written to the Log_Buffer of a logging object.

B. Implementation of data reading for logging objects

As mentioned beforehand the Log_Buffer property of a logging object can only be read out using the ReadRange service. Consequently it is sufficient to implement the ReadRange service hook for implementing the data reading for the logging objects.

The ReadRange service hook may be implemented the same way as described for the CreateObject, see Chapter 1.5.6.3.8.10.3.1 "CreateObject service hook implementation example" on page 3462. That means registering a CallbackFB to the corresponding hook (RegisterHook). Within the BACnetEventCallback function of this CallbackFB you then have to filter for the correct object ID and property ID and get the correct service data (EVT_BACNET_READRANGE).

Within this ReadRange hook exactly that data has to be retuned (depending on the specified object ID), which was recorded beforehand in the Write-Callback (see A.). Thereby the ReadRange hook has to take care of the sorting out of data depending on the requested record numbers or record time stamps.

C. Comments

The procedure described in A. and B. holds for all logging objects meaning the Event-Log object, the Trend-Log object and the Trend-Log-Multiple object. Thereby it is not necessary to care about any object actions concerning properties, but only to implement the Write-Callback hook for saving the data and the ReadRange hook for reading this data out again.

1.5.6.4.1 Source download/upload

**Prerequisites**

- Communication settings are correct
- Project is saved on PC
- PLC is connected

1. Click “Online ➔ Source download to connected device”.
   - Project archive will be downloaded to PLC.

2. To verify download double-click node “PLC_AC500_V3”, select view “Files” and double-click folder “PlcLogic” of the Runtime view (if necessary click refresh button of Runtime view).
   - File Archive.prj will appear if download was successful.
Source upload

Prerequisite

● Project archive on PLC available (from previous source download)
● PLC is connected

1. Open Automation Builder.
2. Click “File ➔ Source upload...”.
   ⇒ Window Pick the device from where you want to upload the source archive... appears.
   
   ![Pick the device from where you want to upload the source archive...]

3. Select your PLC with the archive and click [OK].
   ⇒ Dialog Extract Project Archive appears.
4. Select your preferred folder and click [Extract].
   ⇒ Then you are prompted to open the project archive.
5. Click [Yes].
   ⇒ The project opens.
   
   Upload was successful.

1.5.6.4.2 Programming and testing

For information on programming see

● Programming Applications ➤ Chapter 1.3.1.9 “Programming of applications” on page 171
● Programming via Ethernet (TCP/IP) ➤ Chapter 1.3.1.11.1 “Configuring the connection to the PLC” on page 295

● Transferring Applications to the PLC ➤ Chapter 1.3.1.11 “Transferring an application to the PLC” on page 295

For information on testing/debugging see Testing and Debugging ➤ Chapter 1.3.1.12 “Testing and debugging” on page 309
1.5.6.4.3 Configuration of communication via Ethernet (TCP/IP)

Programming via Ethernet is only possible on a PC with Ethernet board and installed network. Programming can be done via the internal Ethernet communication module.

Programming via internal (onboard) Ethernet communication module:

Enter a known PLC IP address

1. Right-click the top node “PLC_AC500 <...>” and select “Communication Settings” from the context menu.
   ⇒ Dialog box Communication Settings <...> appears.

2. Enter your PLC IP Address and click [OK].
Enter PLC IP address by scanning devices

1. Right-click the top node “PLC_AC500 <...>” and select “Communication Settings” from the context menu.

   ⇒ Dialog box Communication Settings <...> appears.

2. Click ....

   ⇒ Dialog box Pick IP Address <...> appears.

3. Click [Scan], select your desired PLC and click [OK].

   ⇒ Entry is transferred to the dialog box Communication Settings <...>.

   Click [OK].

4. Click to log in the “PLC_AC500_V3” project.

Enter PLC IP address by [Advanced Settings…]

If a remote gateway instead of a local one has to be used it can be configured in the [Advanced Settings…].
1. Right-click the top node “PLC_AC500 <...>” and select “Communication Settings” from the context menu.
   ⇒ Dialog box Communication Settings <...> appears.

2. Enable checkbox Use advanced settings and click [Advanced Settings...].
   ⇒ Tab “Communication Settings” opens.

3. Check gateway or change if required.
   ⇒ Successful connection is indicated by green dot on the gateway icon.

4. **Manual entry of the IP address.**

   Check IP address or change if required.

5. Press ENTER to confirm changed IP address.
   ⇒ Successful communication is indicated by green dot on the PLC icon.
6. Or instead of the last two steps:

   Set the IP address via a scan.

Click [Scan Network], select your desired PLC and click [OK].

   ⇤ Successful connection is indicated by green dot on the gateway icon.

7. Click to log in the “PLC_AC500_V3” project.

1.5.6.4.4 PLC shell commands

   The PLC shell is used for requesting specific information from the controller. By entering a device-specific command the response is returned in a result window. The PLC shell can be issued without login.

   Proceed as follows:

1. Ensure the gateway is configured properly and a connection to the controller can be established.
2. In Automation Builder double-click the PLC node and open the tab “PLC Shell”.
3. Enter “?” in the command line of the tab window. All available PLC commands are listed.

If the gateway is able to establish a connection to the controller, an online connection to the PLC is opened automatically.

   The commands listed in online mode can differ from the commands shown when pressing the button […] as Automation Builder version and firmware version can differ ⇤ Chapter 1.1.5 “Information on the installed version” on page 27 ⇤ Chapter 1.5.6.1.4 “Firmware identification and update” on page 3245.

1.5.6.4.5 Watchlists

   Using Watchlists ⇤ Chapter 1.3.1.13.1.2 “Using watch lists” on page 330

Installation of OPC server

**Prerequisites**

*The following applications are closed:*
- All OPC clients
- ABB OPC tunnel
- CODESYS gateway server

*Ensure termination of the following processes:*
- Gateway.exe
- CoDeSysOPC.exe
- WinCoDeSysOPC.exe
- OCTsvc.exe

**Installing with Automation Builder**

2. Click button of *Latest Automation Builder version (recommended)* and run the installer.

3. Open “Installer Options and Additional Tools” and click [Install Additional Tools].
4. Agree to the “License Terms”.

![Automation Builder installation interface](image-url)
5. Select “Version 2 and/or 3” and install.
   ⇒ All required files are installed for OPC and the OPC server is registered automatically as user application.
Manual registration and unregistration

It is possible to register or to uninstall the OPC server manually either as COM server (user application) or as a service.

Register the OPC server as interactive software in the Windows registry:

**Command for OPC 3:** `WinCoDeSysOPC/RegServer`

Register the OPC server as system service:

**Command for OPC 3:** `WinCoDeSysOPC/Service`

Unregister the OPC server from the Windows registry and from the service entry:

**Command for OPC 3:** `WinCoDeSysOPC/UnRegServer`

Please see REF1 chapter 3 (OPC 3) Table on page 3475 for details.
Register OPC server V3 as a system service

Prerequisites
- All programs, processes and services which connect to the OPC server are closed.
  1. Start the “Command Prompt” with command “cmd” in the “Start ➔ Run...” window.
  2. Go to the CoDeSysOPC V2 installation folder.
  3. Unregister the OPC server with WinCoDeSysOPC/UnRegServer.
  4. Register the OPC server as system service with WinCoDeSysOPC/Service.

OPC clients for tests

Free of charge test clients can be found in the web:

Symbol file

Define symbols

1. Right-click on “Application” in CODESYS V3 project and click “Add Object”.

2. Choose “Symbol Configuration” and click [Add object].
3. Select your programs and/or single symbols and click [Build].
   ⇒ A symbol file will be automatically downloaded to the PLC with Project Download.

With double-click in the device tree to “Symbol Configuration” you can change the “Symbol Configuration” settings.

   To restrict traffic and load, choose only symbols you need.

Configure OPC server

Configure OPC Server V3

2. If the configuration is needed furthermore, save the configuration.

The actual configuration at start of OPC server will always be read from `OPCServer.ini`.

![OPC Server Configuration](image)

**Update rate**

- The Update Rate may not be 0 (ms)!
- The default value of 200 ms is a suitable value of many applications.
- The adjustment for the Update Rate depends on the number of symbols (variables).
- For a big number of symbols it can be better to increase the Update Rate.

The checkboxes **Sync Init** and **Enable logging (Default events)** must be enabled.
3. Select “PLC_FW3”.

- If the *.sdb files should be loaded from the “Gateway Files” directory on PC, the project name must be identical with project name in CODESYS. The extension is not necessary.
- If the symbol information should be loaded from AC500 V2.x, the project name is not required and can also be empty.
- The parameters displayed in the screenshot above are recommended default settings.
- The checkbox Active must be enabled.
- Enabled checkbox “Enable logging” allows a later diagnosis.
4. Select “Connection” and click [Edit].

5. Enter the TCP/IP address of the target PLC at *PLC name or address* and enable *Use Tcp/Ip blockdriver*.

6. Enter the TCP/IP address of the target PLC at *IP Address of PLC* and click [OK].

7. Click “File ➔ Save” OPCserver.ini and “File ➔ Exit” OPCConfig.

**Check OPC function with AC500**

It is urgently recommended to check the function of the previous configuration steps.

In order to check the OPC function without AC500, see .
Check OPC server V3

1. Start OPCExplorer.exe and connect “CoDeSys.OPC.DA”.

2. Add Group, add Items, select available Items in Server “CoDeSys.OPC.DA”. Add to Tag List, close the Item browser.

   ⇒ If anything is right, then “CoDeSys.OPC.DA” is connected, is running and the “Quality” of the items is good.

Check processes with windows task manager

Correct configuration: All processes run with the same “User Name” and with the same “Session ID”.
Configure AlarmEvents

Refer to REF2 AeConfigurator_UserGuide.pdf for details. Table on page 3475.

Check AlarmEvents

The function of the “AlarmEvents” can be checked with “MatrikonOPC Explorer”.

The “AlarmEvents” can be simulated by writing the value of the Items.

Configure user account for OPC server

Please refer to REF3 ReadMe.rtf and REF4 ReleaseNotes OPCV3 AE for HA. Table on page 3475.

OPC server V3 on windows server 2003 / 2008 / 2012

When running the OPC Server V3 on Windows Server 2003 / 2008 / 2012 multiple sessions need to be supported. Therefore the installation of the OPC server as service running with a dedicated user account is recommended.
Configuration steps

- Create specific user, no administrator account is required
- Register V3 OPC Server as service
- Configure V3 OPC Server as service

Create specific user

Register the OPC Server executable as service from the command line.

With command “WinCoDeSysOPC /Service” WinCoDeSysOPC.exe gets installed as system service.

Started once, the service will stay “started” until the system gets terminated.
The communication to the configured PLCs survives.

Also here the service gets installed in the current position of WinCoDeSysOPC.exe.
At “Computer Management ➔ Services and Applications ➔ Services” open the “Properties” of the “CoDeSysOPCDAService”.

Complete the Service Configuration
Testing

Check Users and Session during Test Cases

Check the “Session ID” and “User Name” of
● Gateway.exe,
● WinCoDeSysOPC.exe and
● OPC Client

on different test cases like multi session with terminal service sessions.

Potential issues

Session isolation

Situation
With Windows Server 2003, Windows Server 2008, Windows 7 services are alone in session 0. User applications run in session 1 (2 and so on).

Services:
A Windows service is a computer program that operates in the background.

Windows services can be configured to start when the operating system is started or can be started manually and run in the background as long as Windows is running. They can operate when a user is not logged on.

Services are:
Windows operating systems include numerous services. OPC client like S+ OPC scanner PGIM, Aspen CIM-IO Manager, ICONICS, .. can also installed as service.

User applications are:
Microsoft Word, Notepad, MatrikonExplorer, ControlBuilderPlus.exe and Codesys.exe

Problem
Service and user application are isolated in their session. They can not communicate with each other directly.

OPC Server uses, like the CBP and CODESYS, the gateway server from CODESYS (gateway.exe) for the communication with the AC500 and starts the gateway in their session. That creates undefined behavior, if the OPC Server runs as a service. The gateway server is not able to run in multi sessions.

Resolutions
● Install all OPC clients and OPC Server, which use the gateway server, in the same session.
● The OPC Server as a service (session 0) may not be connected at the same time (in parallel) with an OPC server as a user application or CBP or CODESYS (all in session 1) with the AC500. If this function is necessary, different PC or virtual machines must be used.
● Use tools like OPC tunnel. In a DigiVis 500 setup context the OPC server must not be registered as service. The OPC tunnel itself starts the OPC server within its service.

1.5.6.5.2 OPC UA server for AC500 V3 products

General
OPC UA server can be added as an Object below the Ethernet Interfaces ETH1 or ETH2.

The user can access the variable interface of the PLC via a client. At the same time, communication can be protected by means of encryption.

The CODESYS OPC UA server supports the following features:
● Browsing of data types and variables
● Standard read/write services
Creating a project for OPC UA access

1. Click “File ➔ New Project ➔ AC500 project” in Automation Builder 2.1 or newer.
2. Choose a PLC - AC500 V3 and click [Add object].
3. Right-click on node ETH1 or ETH2 and “Add object”.
4. Choose OPC UA Server in the dialog and click [Add object].
5. Declare some variables of different types in the program.
6. Right-click “Application ➔ Add object”. Choose Symbol configuration and click [Add object].
7. Enable checkbox Support OPC UA Features in the dialog Add symbol configuration.
8. Double-click “Symbol configuration” in the Devices tree to open the editor Symbol configuration.
9. Click [Build].

The variables are displayed in a tree structure.
10. Activate the variables that you want to publish to an OPC UA client. Specify the access rights.
11. Download the project to the PLC.

Use node name

1. Double-click node “OPC_UA_Server”.
2. Set parameter Use node name to TRUE.
3. Double-click node “PLC_AC500_V3 <...>”.
4. Click “Device” and “Rename active device...”
5. Enter new device name in the following dialog and click [OK].

Use UaExpert client

The OPC UA client UaExpert is available for download from the Unified Automation website and can be used free of charge (freeware license).

Using this client, you can connect to the AC500 OPC UA server.

The following description refers to this program. Other OPC UA clients work in a similar way.
1. Start the *UaExpert* program.

2. Click on the “blue cross symbol”.

3. Double-click on the “blue cross symbol” in the *Add Server* dialog.

4. Enter URL and click [OK].
   - The URL appears in the *Add Server* dialog.

5. Select “Advanced” tab and click [OK].

6. Click [Connect] button.
7. Expand the project tree in the Address Space window.

![Address Space window](image)

8. Drag and drop the needed symbols to Data Access View.

Working with encryption

Creating a certificate

2. Select the “Devices” tab.
   - The certificate information opens.
3. Select the PLC in the left Information view.
   - All services of the PLC that require a certificate are displayed in the right Information view.
4. Select the service “OPC UA Server”.
5. Click the icon ![Certificate Settings](image) to create a new certificate for the device.
   - Certificate Settings dialog appears.
6. Define the certificate parameters according to the image above and click “[OK].
   ⇒ The certificate is created on the PLC.

7. Upload the certificate to your PC.
8. Restart the runtime system.

For further information see Chapter 1.5.6.3.6.3.4 “OPC UA secure” on page 3434.

Encrypted connection with UaExpert client

1. Start the UaExpert program.

2. Click on the “blue cross symbol”.
4. Enter URL and click [OK].
   ⇒ The URL appears in the Add Server dialog.
5. Select “Advanced” tab.

6. Choose option “Basic256sha256” of drop-down list Security Policy and “Sign & Encrypt” of drop-down list Message Security Mode and click [OK].
7. Click menu “Settings” and “Manage Certificates”

8. Click [Create new Application Certificate...].
   ⇒ Dialog New Application Instance Certificate opens.
9. Enter the required informations and click [OK].
   
   Dialog “Manage Certificates” opens

10. Click [Copy Application Certificate To...] your PC.

11. Download the certificate to AC500 via the Security Screen view.

12. Click [Connect] button in the UaExpert client.
Dialog Certificate Validation opens.

Working with a trusted certificate will avoid this error message.

14. Enable checkbox Accept the server certificate temporarily for this session and click [Continue].

Dialog Connect Error opens
15. Click [Ignore]

16. Check settings in dialog *Manage Certificates.*

**Changing variables via UaExpert client**

1. Expand in view *Address Space “Objects → DeviceSet → PM5670 → Resources → Application → PLC_PRG”.*
   
   The variables of the global variable list are visible.
2. Drag and drop the variables to the Data Access View.
3. Change values in the column Value.

Configuring OPC UA client

Operating modes

Polling
- Objects will be continuously updated in a defined interval
- Create higher load then Subscription
- Is recommended only for a few Symbols

Pub/Sub Not yet supported

Subscription (recommended mode)
- Updated objects depending on the publishing interval and filters
- Method to reduce load
- Different intervals
- Filter possible (coming in AC500)

<table>
<thead>
<tr>
<th>Client defines a group of symbols with</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Publishing interval</td>
<td>Interval, in which server publish data to client</td>
</tr>
<tr>
<td>Sampling interval</td>
<td>Interval for sampling and storing data at server and send in each publishing interval</td>
</tr>
<tr>
<td>Queue size</td>
<td>Array of data to save data if sampling Interval is faster than publishing Interval (At AC500 in the moment only 1)</td>
</tr>
<tr>

<tr>
<td></td>
<td>● Change of time stamp</td>
</tr>
<tr>
<td></td>
<td>AC500 is fix configured for change of data and change of status.</td>
</tr>
</tbody>
</table>
Using OPC UA with subscription mode

Recommendations:

- Define only variables you need as symbols
- Do not configure publishing intervals to short (increase load)
- Use different subscriptions with different publishing intervals in order to decrease load
- Do not use sampling intervals faster then publishing intervals as long as AC500 OPC UA Server don't support Queue Size different from 1
- Be careful: Setting „0“ at sampling Interval at client will be interpreted in server as „as fast as possible“, which is 100ms at AC500 and create a high load.

Publishing and sampling intervals in UaExpert
1. Right-Click on an Item in Data Access View and click “Subscription Settings”.

![Subscription Settings window](image)

2. Set the recommended values.

   **Life Time Count:** Number of publishing intervals in which client has to send publish requests to the server. After this period without request from client, subscription in server will be deleted.

   **Max Keep Alive Count:** If there are no new data to send, Server can skip a publishing interval. After the alive count, server has to send, even if there are no new data.

   Click **[OK]**.

3. Right-Click on an Item in Data Access View and click “Monitored Item Settings”.

![Monitored Item Settings window](image)

4. Set the recommended values.

1.5.6.6 **Convert an AC500 V2 project to an AC500 V3 project**

*Instructions on how to convert a V2 project to a V3 project and differences between V2 and V3.*

1.5.7 Storage devices for AC500 V3 products
1.5.7.1 Introduction of AC500 storage devices for AC500 Products
1.5.7.1.1 Overview

AC500 PLCs offer a variety of storage devices. The following table gives a short overview and a description on these storage devices:

IEC access means that the storage device can be accessed by Function Blocks of an IEC program.

FTP access means that the device can be accessed via FTP server on the PLC (if available).

</tbody>
</table>

*) Examples for the filename with path (sFileName for FILE.Open) specified by the user ('mydir' is optional, but must be an existing directory):

- 'userdisk/myfile.txt'
- 'sdcard/mydir/myfile.txt'
- 'flashdisk/myfile.txt'
The maximum number of files opened at the same time is limited to 1007.

The max. length of the user string (path and filename) is 241 characters.

Unlike the PLC's memory areas like %M or Retain, where 1 byte actually consumes 1 byte, all storage device utilize a file system.

That means there is a difference between a files size and its size on the disk.

On disks the files are stored in so-called clusters which are a group of disk sectors. "Size on disk" refers to the amount of cluster(s) a file is taking up, while "file size" is an actual byte count of the file data. So you will usually find that the size on disk is larger than the file size. This is not an error, but a result of the disk organization via a file system. Since sector and cluster sizes vary depending on a disk's size and the used file system, the ratios between the size on disk and the file size also vary between the various storage devices.

### 1.5.7.1.3 Memory sizes

<table>

<td></td>
</tr>
</tbody>
</table>

It is not possible to use 100% of a device's memory space. About 10% of the total available space must remain unused at any time to maintain normal device operation.

### 1.5.7.1.4 Storage device details

This section contains some details on each storage device. For further details on specific topics please also refer to the following chapters:

- **Storage device sizes**
  - see Chapter 1.5.7.1.3 “Memory sizes” on page 3510
- **IEC access**
  - see CAA File Library
  - see SysInt Library
- **FTP access**
  - see FTP server
- **PLC shell commands**
  - see PLC shell commands § Chapter 1.5.6.4.4 “PLC shell commands” on page 3473

### SRAM

The SRAM is a battery-buffered, nonvolatile RAM and is used for the retain/persistent and the ProzM variables. If a battery is inserted into the Processor Module, the data stored in the SRAM will not get lost during a power-down cycle.

During PLC startup, the SRAM will be deleted automatically if no or an empty battery is inserted into the Processor Module. In this case the information

```
ABBInitSram_SetupMemory : SRAM cleared
```
and the warning
Retain size in config changed, or retain area got corrupted
are written into the log file.
Further information see Handling of Remanent Variables_V3 © Chapter 1.5.5.1.1 “Handling of remanent variables for AC500 V3 products” on page 3105.

SD memory card

The SD memory card is a removable persistent mass storage device and can be used for any application purpose. Both firmware updates and boot project updates can be run from the SD memory card © Chapter 1.5.7.2 “SD memory card in AC500” on page 3513.

<table>
<thead>
<tr>
<th>Size</th>

</tr>
</thead>
<tbody>
<tr>
<td>IEC access</td>
<td>CAA File Library</td>
</tr>
<tr>
<td></td>
<td>SysInt_Library</td>
</tr>
</tbody>
</table>

Flash disk

The flash disk is an internal persistent mass storage device and can be used for any application purpose.
It has a memory capacity of 8 GB (preformatted).
The flash disk is capable of high data throughput, however, the actual values to be achieved depend on the use cases. If the performance seems to get insufficient, check the following:
- If the PLCs CPU load is high, reduce overall CPU load of the PLC to have more performance for file operations.
- If the device has low free space, cleanup the disk.
Please consider the cluster size of 4 kB in your application design to achieve optimal usage of the flash disks space and access performance. For example, 10 files with 10 byte each require 10*4 kB disk space, while 1 file with 100 byte requires only 4 kB.

Number of max. write cycles

Technically, the flash chip used in V3 flash disk has 20000 Erase-Cycles (Write cycles).
Due to the produced write overhead, the optimum achievable number of write cycles is 10000 (for typical payload sizes of 256 kB).

Example

The write overhead is indicated by the write amplification factor (WAF).

\[ WAF = \frac{\text{Flash Write (in Bytes)}}{\text{Host Write (in Bytes)}} \]

Table 773: Rule of thumb for assessing the flash lifetime for an application:

<table>
<thead>
<tr>

## 1.5.7.2 SD memory card in AC500

The SD memory card is a removable persistent mass storage device and can be used for any application purpose. Both firmware updates and boot project updates can be run from the SD memory card.

### NOTICE!

**Removal of the SD memory card**

Do not remove the SD memory card during access. For MC activity the black square (■) is shown on display as long as a file is open on Memory card. Remove only when the black square for MC activity does not blink. Otherwise the SD memory card and/or files on it might get corrupted and/or normal PLC operation might be disturbed.

### 1.5.7.2.1 Firmware update with SD memory card

**File content:** Firmware version V3.x

**General update process**

Information on the firmware: *Firmware identification and update* § Chapter 1.1.17.2.6 “AC500 V3 firmware installation and update” on page 59

The main components of the V3 CPU firmware are:

- BootFW (boot firmware): responsible for the starting of the UpdateFW or the SystemFW
- UpdateFW (update firmware): responsible for the update of BootFW, UpdateFW, SystemFW, UpdateHook and boot project
- SystemFW (system firmware, CPUFW): Runtime system of the PLC, additionally responsible for the update of the DisplayFW (display firmware) and the firmware of the coupler
- DisplayFW (display firmware): firmware of the display

Additionally the update process includes the following parts:

- Coupler (coupler firmware): firmware of the different couplers
- UpdateHook: Specific patches for the PLC
- UserProgram: boot project of the application
- License features: Import and export of license files. The license file for the "ImportLicense" is a Wbb or a WibuCmRaU file. The license file of the "ExportLicense" is a WibuCmRaC file.
The firmware updates are triggered by the command file `SDCARD.INI`. In addition a result file of the firmware update is generated (`SDCARD.RDY`, identical path as `SDCARD.INI`). For the group [FirmwareUpdate] the parameters 0, 11, 12 and 13 are defined. For each firmware update two files are necessary. The firmware file and the corresponding signature file.

For example:

AC500_V3_SystemFirmware_V3.0.1.73.tar.bz2
AC500_V3_SystemFirmware_V3.0.1.73.tar.bz2.sig
AC500_V3_DisplayFirmware_V3.0.0.0.app
AC500_V3_DisplayFirmware_V3.0.0.0.app.sig

For the user program the application file and the application CRC are necessary. For example:

`Application.app`
`Application.crc`

If the signature file and the firmware file do not match, no update is performed and the correspondent error result is written to the file `SDCARD.RDY`.

If the update firmware is running the display shows the text `update`. The blinking of the RUN and the ERR LED's indicates the update process.

At the end of the update process a “reboot” is executed and the system firmware is started for the finishing of the update process. The positive result of the update process is signaled by the blinking of the RUN LED (ERR LED is off) and the display shows `done`. A negative result is signaled by the blinking of the ERR LED (RUN LED is off) and the display shows `FAIL`. The file “SDCARD.RDY” includes the results of the different updates. After an update of a coupler CODESYS Control is started in safe mode (no download or starting of the application is possible) and the PLC needs a reboot (power down/up; the display shows `please` and `reboot` alternately).

As of system firmware 3.2 the compatibility file "Version.txt" (with the corresponding signature file "Version.txt.sig", identical path as "SDCARD.INI") is necessary for the update process. The update firmware checked the compatibility of the following parts:

- CPUFW (system firmware)
- BootFW (boot firmware)
- UpdateFW (update firmware)
- DisplayFW (display firmware)

A missing "Version.txt" or a missing/corrupt "Version.txt.sig" file is signalled at the component "CPUFW" (file "SDCARD.RDY").

If the update process would result in incompatible parts of firmware no update is performed in the update firmware. After starting of the system firmware the compatibility of the coupler firmware is checked additionally. The check of the compatibility of the firmware is executed always (independent of the parameter for the component). Incompatibility is signalled at the corresponding component (file SDCARD.RDY).
<table>
<thead>
<tr>
<th>Configuration</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BootFW=x</td>
<td>See description CPUFW. The component's path key for the boot firmware in module's section [CPU] is “BootFW”.</td>

Example SDCARD.INI for SD Card PM5650-2ETH for update only the system firmware (SystemFW):
[FirmwareUpdate]
CPUPFW=11
[CPU]
CPUFW=/SystemFirmware/ AC500_V3_SystemFirmware_V3.1.3.zzz.tar.bz2

Initializing an SD memory card using a PC

It is possible to create the above described file structure on the hard disk of a PC with SD memory card interface. To do this, create the required directories and an ASCII file named SDCARD.INI with Notepad, for example.

1.5.7.3 Flash memory for AC500 V3 products

AC500 Processor Modules for V3 products (PM56xx) are equipped with non-removable and non-volatile onboard user flash memory for program and data storage. The integrated flash management, including a wear levelling algorithm and a power-fail protected file system, is designed for robustness and operation in industrial environments and applications. The user flash memory can be accessed from the user program using the CAA_File_Library.

NOTICE!
The User Flash Memory has a finite number of write cycles.

Important: Programmers should keep the amount of cyclic written data low to ensure long availability.

1.5.7.4 Health monitoring

AC500 V3 products are equipped with non-removable and non-volatile onboard user flash memory for program and data storage. The integrated flash management, including a wear levelling algorithm and a power-fail protected file system, is designed for robustness and operation in industrial environments and applications.
Keep the amount of cyclic written data low to assure long availability of the flash memory. The spent/remaining lifetime information of the flash memory can be acquired with the Function Blocks PmDiskStatus and PmDiskLifetimeUsed in the “Library Manager” of Automation Builder.

Further information is provided in the documentation of the AC500_Pm library. See the function blocks PmDiskLifetimeUsed and PmDiskStatus in the “Library Manager” of Automation Builder.

1.6 Diagnosis and debugging for AC500 V3 products

1.6.1 The diagnosis system

The diagnosis system enables uniform diagnosis of the CPU and its local interfaces, of the local I/O bus with the connected S500 I/O devices and of the fieldbuses connected via communication modules, considering the special features of the various fieldbuses. The safety CPU is also integrated into the diagnosis system.

Diagnosis data of the devices can be accessed by
- CPU display
- Automation Builder
- IEC application

To forward the information to notify them by, e.g., webserver or OPC UA server, the data retrieved in IEC application can be stored in variables.

Fig. 285: Overview of the diagnosis system

All diagnosis data is assigned to a device. System diagnosis (e.g., battery low) is coming from the CPU device or one of the child objects (e.g., watchdog diagnosis of a task object).

Diagnosis is available for devices with representation in the Automation Builder device tree.

Diagnosis messages include the severity of an error. Error severity can be used for defining system behavior, e.g., activating the error LED or stop the PLC.

CPU parameters

Chapter 1.6.1.5.1 “Error severity” on page 3550.
Types of diagnosis messages

- An event describes the current state of the device. It does not have to be acknowledged.
- An alarm describes that at a certain point of time, there was a diagnosis message. It does not say anything about the current state of the device. Alarms must be acknowledged by the user. After acknowledging, the alarm disappears for all consumers.

Every diagnosis message has a come time.

Device state

With reference to diagnosis, there are different device states:

- Device without events and without unacknowledged alarms.
- Device with events or unacknowledged alarms.
- Device does not respond and is not available for online connection.

Diagnosis descriptions

Diagnosis messages are always available for all consumers.

- ABB AC500 V3 devices:
  - Events and unacknowledged alarms.
  - Every diagnosis message with come time, location, error number and text.
- 3rd party devices:
  - Events and unacknowledged alarms.
  - Every diagnosis message with come time, location and error number.
  - Clear text information if available either from a standard or from the device description.
  - If available: Extended diagnosis: Additional data coming from the device for manual analysis.

Extended diagnosis

Some devices are able to provide extended diagnosis. This additional device-dependant diagnosis will only be collected on request and will be device type specific (e.g. bus scan request on PROFINET I/O controller). Main intention is to cover commissioning use cases, when very specific information is required that typically cannot be stored in error numbers in a reasonable way.

1.6.1.1 Access to diagnosis data

Access to device state

- Error LED on CPU © Chapter 1.6.1.2 “Diagnosis in CPU display” on page 3520
- Automation Builder device tree © Chapter 1.6.1.3 “Diagnosis in Automation Builder” on page 3524
- IEC application via device name © Chapter 1.6.1.4.3 “Device diagnosis” on page 3540
- IEC application via list of all available diagnosis © Chapter 1.6.1.4.2 “System diagnosis” on page 3531
- External access via global IEC variables Fig. 285

Access to diagnosis descriptions

- CPU display © Chapter 1.6.1.2.2 “Diagnosis descriptions” on page 3520 (for CPU, local I/O bus and connected S500 I/O modules, not for communication modules and field buses)
- Automation Builder via “All messages” window © Chapter 1.6.1.3.2 “Diagnosis descriptions” on page 3525:
  - Support for (bulk) acknowledgement of alarm
  - Access to extended diagnosis data of 3rd party devices devices (if available), without any interpretation
- IEC application via a list of all current diagnosis either of a device (device object from the Automation Builder tree) \( \Leftrightarrow \) Chapter 1.6.1.4.3 “Device diagnosis” on page 3540 or of the complete PLC \( \Leftrightarrow \) Chapter 1.6.1.4.2 “System diagnosis” on page 3531:
  - Navigation chronologically in both directions (starting either from the oldest or newest diagnosis)
  - Access to the diagnosis numerically (evaluation by IEC application), textual (use on HMI) or to extended diagnosis data of 3rd party devices (if available)
  - Acknowledgement of alarms
- External access via global IEC variables by using the IEC application features for getting all relevant information

**Access to extended diagnosis**

Extended diagnosis data will be displayed in Automation Builder via “All messages” window. The data is displayed as it is provided from the device without any interpretation. Refer to, e.g., the manual of the device to get information about the extended diagnosis data.

### 1.6.1.2 Diagnosis in CPU display

#### 1.6.1.2.1 Device state

If there is at least one active diagnosis message, the error LED ERR is on.

The behavior of the error LED depends on the setting of CPU parameter “Error LED” \( \Leftrightarrow \) Chapter 1.5.6.2.3.4 “Parameters of the processor module” on page 3276.

**Diagnosis of AC500-eCo CPUs can only be shown by LED ERR at CPU. No display is available.**

#### 1.6.1.2.2 Diagnosis descriptions

\( \Leftrightarrow \) Chapter 1.5.5.1.4.4.5 “Reading out diagnosis messages on the CPU” on page 3138.

<table>
<thead>
<tr>
<th>Entry</th>
<th>Length [byte]</th>
<th>Values</th>
<th>Description</th>
<th>Display</th>
</tr>
</thead>
<tbody>
<tr>

</tbody>
</table>
CPU display does not show any communication modules or fieldbus diagnosis. To view these diagnosis messages use Automation Builder > Chapter 1.6.1.3 “Diagnosis in Automation Builder” on page 3524 or IEC application > Chapter 1.6.1.4 “Diagnosis in IEC application” on page 3526.

This is valid for:
- all external communication modules incl. safety CPUs, CM574-RS, FM502-CMS
- CANopen on onboard CAN interface
- fieldbuses on Ethernet interfaces ETH1/ETH2 like PROFINET IO controller, EtherCAT master, etc.

For identification of the location of a diagnosis the hardware ID and in addition for CPU diagnosis the SubSysteminfo byte 1 is used.

The location is displayed with 3 characters.

### 1.6.1.3 Diagnosis in Automation Builder

#### 1.6.1.3.1 Device state

In Automation Builder, colored icons next to the devices’ nodes in the device tree indicate the device state of each single device. 

*Chapter 1.6.2.3 “Project tree in online mode” on page 3553.*
1.6.1.3.2 Diagnosis descriptions

Displayed text

For output of diagnosis messages in textual format Automation Builder and IEC application use text lists. Both application use the same text lists. The text lists are part of the device description. When inserting a new device in device tree of project, the corresponding text list is loaded. This text lists are part of PLC program and will be downloaded into the PLC.

It is necessary to include a visualization, even if visualization will not be used. Without visualization the text lists will not be included.

The text lists are generated automatically. We recommend that you do not change them manually because the changes can be overwritten automatically and without prompting.

The text lists for 3rd party devices are created during reading of the device description sheets, e.g., GSDML files for PROFINET I/O devices.

The name of a text list for a PROFINET I/O device is: Diag_PNIO_Vendor ID_Device ID

Example

CI501-PNIO: Diag_PNIO_26_22
26 = vendor ID ABB, 22 = device ID CI501-PNIO

The text list for the AC500 PROFINET I/O modules contains all text needed for PROFINET standard diagnosis and AC500 process alarm handling.

Which texts are used, depends on parameter "Selection of diagnosis method". Double-click on a PROFINET I/O module and open tab “General”.

2020/12/10 3ADR010583, 1, en_US 3525
1.6.1.3.3 System diagnosis

In Automation Builder the system diagnosis is activated by default and can be deactivated in:
“Tools ➔ Options ➔ Diagnosis ➔ Enable subtree diagnosis”

![System diagnosis](image)

1.6.1.3.4 Device diagnosis

Each node in the device tree has a diagnosis view, which displays the diagnosis messages for this device only.

1. Double-click on a device.
2. Select the tab “Diagnosis”.

Example

Battery empty or missing.

Example

Wrong module configured on I/O bus.

1.6.1.4 Diagnosis in IEC application

There are two possibilities for accessing the diagnosis messages in the IEC application:

- System diagnosis: Access to diagnosis messages of the whole PLC
- Device diagnosis: Access to the diagnosis messages of a device

For both possibilities common data types (structures and enumerations) are defined in the library AC500_DiagTypes ➔ Chapter 1.6.1.4.1 “Data types in library AC500_DiagTypes” on page 3527. The library is automatically included in PLC project.
For output of diagnosis messages in textual format Automation Builder and IEC application use text lists. Both application use the same text lists. The text lists are part of the device description. When inserting a new device in device tree of project, the corresponding text list is loaded. This text lists are part of PLC program and will be downloaded into the PLC.

It is necessary to include a visualization, even if visualization will not be used. Visualization

Without visualization the text lists will not be included.

The text lists are generated automatically. We recommend that you do not change them manually because the changes can be overwritten automatically and without prompting.

The text lists for 3rd party devices are created during reading of the device description sheets, e.g., GSDML files for PROFINET I/O devices.

The name of a text list for a PROFINET I/O device is: Diag_PNIO_Vendor ID_Device ID

Example

CI501-PNIO: Diag_PNIO_26_22
26 = vendor ID ABB, 22 = device ID CI501-PNIO

The text list for the AC500 PROFINET I/O modules contains all text needed for PROFINET standard diagnosis and AC500 process alarm handling.

Which texts are used, depends on parameter "Selection of diagnosis method": Double-click on a PROFINET I/O module and open tab “General”.

1.6.1.4.1 Data types in library AC500_DiagTypes

All data types regarding diagnosis are defined in the library AC500_DiagTypes.
Structure DIAG_VAL_TYPE

This data type specifies the format of all kinds of diagnosis messages in numeric format. It consists of one element for each detail of a diagnosis message.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Initial</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>diTimestamp</td>
<td>DT</td>
<td>DATE_AND_TIME#1970-1-1-0:0</td>
<td>RTC time of eDiagEvent_Occurred</td>
</tr>
<tr>
<td>uiMs</td>
<td>UINT</td>
<td>0</td>
<td>Milliseconds of event</td>
</tr>
<tr>
<td>eClass</td>
<td>teClass</td>
<td>teClass.eDiagClass_4_Warning</td>
<td>Error severity of diagnosis message</td>
</tr>
<tr>
<td>szDevice</td>
<td>STRING(80)</td>
<td>&quot;&quot;</td>
<td>Name of device, max. 80 characters</td>
</tr>
<tr>
<td>eHwInterfaceId</td>
<td>teHwId</td>
<td>teHwId_CPU</td>
<td>Identifier of hardware interface</td>
</tr>
<tr>
<td>dwSubSysteminfo</td>
<td>DWORD</td>
<td>0</td>
<td>Any number describing details or location within device, device-specific</td>
</tr>
<tr>
<td>dwAdditional</td>
<td>DWORD</td>
<td>0</td>
<td>Additional number describing details or location within device, optional, device-specific</td>
</tr>
<tr>
<td>dwErrorCode</td>
<td>DWORD</td>
<td>0</td>
<td>Error code</td>
</tr>
<tr>
<td>wSizeExtDiag</td>
<td>DWORD</td>
<td>0</td>
<td>Number of bytes of extended diagnosis data</td>
</tr>
</tbody>
</table>

Structure DIAG_TXT_TYPE

This data type specifies the format of all kinds of diagnosis messages in textual format. It consists of a single string containing all details of a diagnosis message.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Initial</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>szDiag</td>
<td>STRING(512)</td>
<td>&quot;&quot;</td>
<td>Diagnosis message as text, max. 512 characters</td>
</tr>
</tbody>
</table>

The text consists of the following data, separated by semicolon:
- Timestamp in Date_And_Time (DT) format of eDiagEvent_Occurred and added milliseconds
- Error severity
- Device name (max. 80 characters) as defined in Automation Builder device tree
- The error text itself, composed of the interpretation of dwSubSysteminfo and dwAdditional and the error text plus remedy (if available) from Automation Builder text list according dwErrorCode. Displayed as: error text -> remedy.

Example

Battery empty or missing.

Enumeration ERROR_ID

Type of the return values of all methods and functions to request information on diagnosis.
### Name

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Comment</th>
<th>Remedy</th>
</tr>
</thead>
<tbody>
<tr>
<td>NO_ERROR</td>
<td>16#0</td>
<td>Execution successfully completed</td>
<td></td>
</tr>
<tr>
<td>ERR_PARAMETER</td>
<td>16#1</td>
<td>Invalid parameter value in function call</td>
<td>Correct parameter</td>
</tr>
<tr>
<td>ERR_NO_SINK</td>
<td>16#2</td>
<td>Failed to register as sink</td>
<td></td>
</tr>
<tr>
<td>ERR_NO_TEXT_LIST</td>
<td>16#3</td>
<td>Failed to get a device text list</td>
<td>Check text lists</td>
</tr>
<tr>
<td>ERR_NO_TEXT_CONTENT</td>
<td>16#4</td>
<td>Failed to get at least one content from text list</td>
<td></td>
</tr>
<tr>
<td>ERR_COMPETING</td>
<td>16#5</td>
<td>Failed due to competing access of other method</td>
<td>Try again</td>
</tr>
<tr>
<td>ERR_ASYNC</td>
<td>16#6</td>
<td>Failed to create async process</td>
<td></td>
</tr>
<tr>
<td>ERR_INTERNAL</td>
<td>16#7</td>
<td>Any internal error during execution</td>
<td></td>
</tr>
<tr>
<td>BUSY</td>
<td>16#FFF</td>
<td>Busy</td>
<td></td>
</tr>
<tr>
<td>NO_ERROR_NO_DATA</td>
<td>16#FFFF</td>
<td>Execution successfully completed, no more</td>
<td></td>
</tr>
</tbody>
</table>

All values except "BUSY" are final results. In case "NO_ERROR" is returned, the requested action has been successfully performed. "NO_ERROR_NO_DATA" also indicates a successful completion. The only difference to "NO_ERROR" is the fact, that there is one (more) data to be provided. All other return values (except "BUSY") are final error states. In case a method or function returns "BUSY", it has to be called again in the following cycles until it returns a final result.

### Enumeration teClass

Specifies the error severity of diagnosis messages \(\&\) Chapter 1.6.1.5.1 “Error severity” on page 3550.

<table>
<thead>
<tr>
<th>Name</th>
<th>Error severity</th>
</tr>
</thead>
<tbody>
<tr>
<td>eDiagClass_2_SeriousError</td>
<td>2</td>
</tr>
<tr>
<td>eDiagClass_3_Error</td>
<td>3</td>
</tr>
<tr>
<td>eDiagClass_4_Warning</td>
<td>4</td>
</tr>
<tr>
<td>eDiagClass_Parameter</td>
<td>11</td>
</tr>
</tbody>
</table>

### Enumeration teEvent

The enumeration teEvent specifies the severity of diagnosis messages.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Initial</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>eDiagEvent_Occurred</td>
<td>DINT</td>
<td>1</td>
<td>Error occurred, remains &quot;active&quot; until eDiagEvent_Disappeared</td>
</tr>
<tr>
<td>eDiagEvent_Disappeared</td>
<td>DINT</td>
<td>2</td>
<td>Error disappeared, became &quot;active&quot; due to eDiagEvent_Occurred earlier on</td>
</tr>
<tr>
<td>eDiagEvent_Received</td>
<td>DINT</td>
<td>4</td>
<td>Received a diagnosis message which cannot be analyzed in detail, cannot disappear, needs to be acknowledged</td>
</tr>
<tr>
<td>eDiagEvent_Acknowledged</td>
<td>DINT</td>
<td>8</td>
<td>Acknowledge a diagnosis message which has been received by eDiagEvent_Received, removes diagnosis message from diagnosis system although error may still be present</td>
</tr>
</tbody>
</table>
The enumeration teHwId is only used for diagnosis output in CPU display to identify the location of a diagnosis message.

<table>
<thead>
<tr>
<th>Name</th>
<th>Initial</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>eDiagHwId_CPU</td>
<td>0</td>
<td>Any diagnosis message regarding CPU itself, like &quot;battery&quot;, &quot;sd card&quot;, etc.</td>
</tr>
<tr>
<td>eDiagHwId_Coupler1</td>
<td>1</td>
<td>Any diagnosis message regarding communication module at slot 1. May be indicated by any corresponding communication module driver (instance) or a protocol driver (instance)</td>
</tr>
<tr>
<td>eDiagHwId_Coupler2</td>
<td>2</td>
<td>Any diagnosis message regarding communication module at slot 2. May be indicated by any corresponding communication module driver (instance) or a protocol driver (instance)</td>
</tr>
<tr>
<td>eDiagHwId_Coupler3</td>
<td>3</td>
<td>Any diagnosis message regarding communication module at slot 3. May be indicated by any corresponding communication module driver (instance) or a protocol driver (instance)</td>
</tr>
<tr>
<td>eDiagHwId_Coupler4</td>
<td>4</td>
<td>Any diagnosis message regarding communication module at slot 4. May be indicated by any corresponding communication module driver (instance) or a protocol driver (instance)</td>
</tr>
<tr>
<td>eDiagHwId_Coupler5</td>
<td>5</td>
<td>Any diagnosis message regarding communication module at slot 5. May be indicated by any corresponding communication module driver (instance) or a protocol driver (instance)</td>
</tr>
<tr>
<td>eDiagHwId_Coupler6</td>
<td>6</td>
<td>Any diagnosis message regarding communication module at slot 6. May be indicated by any corresponding communication module driver (instance) or a protocol driver (instance)</td>
</tr>
<tr>
<td>eDiagHwId_COM1</td>
<td>7</td>
<td>Any diagnosis message regarding COM1. May be indicated by any corresponding interface driver (instance) or a protocol driver (instance)</td>
</tr>
<tr>
<td>eDiagHwId_COM2</td>
<td>8</td>
<td>Any diagnosis message regarding COM2. May be indicated by any corresponding interface driver (instance) or a protocol driver (instance)</td>
</tr>
<tr>
<td>eDiagHwId_CAN</td>
<td>9</td>
<td>Any diagnosis message regarding CAN interface. May be indicated by any corresponding interface driver (instance) or a protocol driver (instance)</td>
</tr>
<tr>
<td>eDiagHwId_OnboardIO</td>
<td>10</td>
<td>Onboard I/O, AC500-eCo only</td>
</tr>
<tr>
<td>eDiagHwId_OptionBoard1</td>
<td>11</td>
<td>Option board 1, AC500-eCo only</td>
</tr>
<tr>
<td>eDiagHwId_OptionBoard2</td>
<td>12</td>
<td>Option board 2, AC500-eCo only</td>
</tr>
<tr>
<td>eDiagHwId_OptionBoard3</td>
<td>13</td>
<td>Option board 3, AC500-eCo only</td>
</tr>
<tr>
<td>eDiagHwId_IOBus</td>
<td>14</td>
<td>I/O bus</td>
</tr>
<tr>
<td>eDiagHwId_ETH1</td>
<td>15</td>
<td>Any diagnosis message regarding ETH1. May be indicated by any corresponding interface driver (instance) or a protocol driver (instance)</td>
</tr>
<tr>
<td>eDiagHwId_ETH2</td>
<td>16</td>
<td>Any diagnosis message regarding ETH2. May be indicated by any corresponding interface driver (instance) or a protocol driver (instance)</td>
</tr>
</tbody>
</table>
1.6.1.4.2 System diagnosis

Library AC500_Diag provides several methods and functions to access the diagnosis messages on all devices in the PLC application. It contains also a function to convert numeric diagnosis into a textual format.

The variables and their assigned values can be referred to within the IEC application as well as they can be used to transfer diagnosis messages to any visualization client.

Device state

The library contains a single function block named “Diag”, providing several methods to process the device state.

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NumTotal</td>
<td>Provides the total number of currently active diagnosis messages</td>
</tr>
<tr>
<td>NumClass</td>
<td>Provides the number of currently active diagnosis messages related to the error severity</td>
</tr>
</tbody>
</table>

Method NumTotal

This method provides the total number of currently active diagnosis messages (including parameter errors, etc.).

<table>
<thead>
<tr>
<th>Scope</th>
<th>Name</th>
<th>Type</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Return</td>
<td>NumTotal</td>
<td>DWORD</td>
<td>Number of diagnosis messages</td>
</tr>
</tbody>
</table>

Example

```plaintext
VAR
    fbDiag : AC500_Diag.Diag; (* Instance of FB Diag *)
    dwNumTotal : DWORD;
END_VAR

dwNumTotal := fbDiag.NumTotal();
```

Method NumClass

This method provides the number of currently active diagnosis messages related to the error severity.

<table>
<thead>
<tr>
<th>Scope</th>
<th>Name</th>
<th>Type</th>
<th>Initial</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Return</td>
<td>NumClass</td>
<td>DWORD</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Input</td>
<td>DataInVal</td>
<td>AC500_DiagTypes.teClass</td>
<td>eClass.eDiagClass_2_SeriousError</td>
<td>Error severity of diagnosis message</td>
</tr>
</tbody>
</table>
Example

VAR

fbDiag : AC500_Diag.Diag;
eDiagClass_4: AC500_DiagTypes.teClass := AC500_DiagTypes.teClass.eDiagClass_4.Warning; (* 4 *)
eDiagClass_3: AC500_DiagTypes.teClass := AC500_DiagTypes.teClass.eDiagClass_3.Error; (* 3 *)
eDiagClass_11: AC500_DiagTypes.teClass := AC500_DiagTypes.teClass.eDiagClass_Parameter; (* 11 *)
dwNumClass_4 : DWORD;
dwNumClass_3 : DWORD;
dwNumClass_11 : DWORD;
END_VAR

dwNumClass_4 := fbDiag.NumClass(eDiagClass := eDiagClass_4);
dwNumClass_3 := fbDiag.NumClass(eDiagClass := eDiagClass_3);
dwNumClass_11 := fbDiag.NumClass(eDiagClass := eDiagClass_11);
Diagnosis descriptions

The library contains a single function block "Diag", providing several methods to process diagnosis descriptions.

All methods for system diagnosis start with "Get...". For device diagnosis the prefix "Diag" is added: "DiagGet...". For better readability, only the method names for system diagnosis is used in the descriptions of the methods.

<table>
<thead>
<tr>
<th>Method for system diagnosis</th>

</tr>
</tbody>
</table>
Method Ack / DiagAck: acknowledgement

This method can be used to acknowledge a diagnosis alarm previously requested by using any Get... / DiagGet... method. Alternatively, you can acknowledge an alarm in Automation Builder.

After acknowledgement, the alarm is deleted from the diagnosis system.

<table>
<thead>
<tr>
<th>Scope</th>
<th>Name for device diagnosis</th>
<th>Name for device diagnosis</th>
<th>Type</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Return</td>
<td>Ack</td>
<td>DiagAck</td>
<td>AC500_DiagTypes.ERROR_ID</td>
<td>Variable containing details of diagnosis alarm to be acknowledged</td>
</tr>
<tr>
<td>Input</td>
<td>Data</td>
<td>Data</td>
<td>AC500_DiagTypes.DIAG_VAL_TYPE</td>
<td></td>
</tr>
</tbody>
</table>

Example

System diagnosis: acknowledge first diagnosis message

```var
 VAR
 fbDiag : AC500_Diag.Diag;
 eErrorId_First : AC500_DiagTypes.ERROR_ID; (* instance of FB Diag *)
 sFirstVal : AC500_DiagTypes.DIAG_VAL_TYPE; (* return value *)
 END_VAR

 eErrorId_First := fbDiag.Ack(Data := sFirstVal);
```

Methods Get... / DiagGet...: get and sort diagnosis messages

All these methods can be used to get the first (oldest), next, last (newest) or previous diagnosis message stored in diagnosis system. The only difference are the details the methods provide. While, e.g., Get-xxx-Val just provides the basic information in numeric format, Get-xxx-ValExt additionally provides this information by the extended diagnosis data of the entry.

The numeric format provided by these methods can be converted into textual format later on if required \(\%\) Chapter 1.6.1.4.2.2.7 “Function DiagValToTxt” on page 3539. Alternatively, the methods Get-xxx-ValAndTxt and Get-xxx-ValAndTxtExt can be used for numeric and textual format in parallel \(\%\) Chapter 1.6.1.4.2.2.5 “Method Get-xxx-ValAndTxt / DiagGet-xxx-ValAndTxt: numeric values and text” on page 3537 \(\%\) Chapter 1.6.1.4.2.2.6 “Method Get-xxx-ValAndTxtExt / DiagGet-xxx-ValAndTxtExt: numeric values, extended numeric values and text” on page 3538.

All methods may need multiple cycles to process the request. Therefore, they must be called in successive cycles until they return a final result \(\%\) Chapter 1.6.1.4.1.3 “Enumeration ERROR_ID” on page 3528.

**All diagnosis messages sorted by time, ascending**

1. Call any GetFirst... method until it indicates a final result.
2. If the result is not "NO_ERROR_NO_DATA": Call any GetNext... method as long as its final result is "NO_ERROR".

**All diagnosis messages sorted by time, descending**

1. Call any GetLast... method until it indicates a final result.
2. If the result is not "NO_ERROR_NO_DATA": Call any GetPrev... method as long as its final result is "NO_ERROR".

-xxx- = First, Next, Last, Prev. Example: GetFirstVal, DiagGetLastVal.

<table>

#### Library CAA Device Diagnosis (namespace DED)

Library CAA Device Diagnosis (namespace DED) is automatically included in the project. This library is needed for displaying and processing the device state.

In case the functionality of diagnosis is no longer needed in IEC application, we recommend to disable this setting.

---

### 1.6.1.4.3 Device diagnosis

#### Activate device diagnosis

While the notification of diagnosis messages at the display and the Automation Builder is enabled by default, the functionality to access diagnosis messages from within the IEC application needs to be explicitly enabled.

1. Double-click on the CPU in the device tree.
2. Select tab “PLC Settings”.
3. Under “Additional Settings” select “Enable Diagnosis for devices”.

Library CAA Device Diagnosis (namespace DED) is automatically included in the project. This library is needed for displaying and processing the device state.

In case the functionality of diagnosis is no longer needed in IEC application, we recommend to disable this setting.
Device state

1. Open one of the IEC application code editors.
2. Type the device's name as it is written in the device tree, followed by a dot (".").
3. Select the method `GetDeviceState` from the context menu or type the name of the method on yourself.

![Image of GetDeviceState method]

4. Assign the function's parameters.

```
eError : DED.ERROR; (* return value of call *)
bDiagAvailable : BOOL; (* at least one diagnosis available for this device *)
DeviceState_DC532 : DED.DEVICE_STATE; (* general device state *)
```

```DeviceState_DC532 := DC532.GetDeviceState(xDiagnosisInfoAvailable => bDiagAvailable, eError => eError);```

Diagnosis descriptions

The library contains a single function block "Diag", providing several methods to process diagnosis descriptions.

All methods for system diagnosis start with "Get...". For device diagnosis the prefix "Diag" is added: "DiagGet...". For better readability, only the method names for system diagnosis is used in the descriptions of the methods.

</tr>
</tbody>
</table>
**Method Ack / DiagAck: acknowledgement**

This method can be used to acknowledge a diagnosis alarm previously requested by using any Get... / DiagGet... method. Alternatively, you can acknowledge an alarm in Automation Builder.

After acknowledgement, the alarm is deleted from the diagnosis system.

<table>
<thead>
<tr>
<th>Scope</th>
<th>Name for device diagnosis</th>
<th>Name for device diagnosis</th>
<th>Type</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Return</td>
<td>Ack</td>
<td>DiagAck</td>
<td>AC500_DiagTypes.ERROR_ID</td>
<td>Variable containing details of diagnosis alarm to be acknowledged</td>
</tr>
<tr>
<td>Input</td>
<td>Data</td>
<td>Data</td>
<td>AC500_DiagTypes.DIAG_VAL_TYPE</td>
<td></td>
</tr>
</tbody>
</table>

**Example**

System diagnosis: acknowledge first diagnosis message

```vb
VAR
    fbDiag : AC500_Diag.Diag;
    eErrorID_First : AC500_DiagTypes.ERROR_ID; (* return value *)
    sFirstVal : AC500_DiagTypes.DIAG_VAL_TYPE; (* structure of returned values *)
END_VAR

eErrorID_First := fbDiag.Ack(Data := sFirstVal);
```

**Methods Get... / DiagGet...: get and sort diagnosis messages**

All these methods can be used to get the first (oldest), next, last (newest) or previous diagnosis message stored in diagnosis system. The only difference are the details the methods provide. While, e.g., Get-xxx-Val just provides the basic information in numeric format, Get-xxx-ValExt additionally provides this information by the extended diagnosis data of the entry.

The numeric format provided by these methods can be converted into textual format later on if required. The methods Get-xxx-ValAndTxt and Get-xxx-ValAndTxtExt can be used for numeric and textual format in parallel.

All methods may need multiple cycles to process the request. Therefore, they must be called in successive cycles until they return a final result.

1. Call any GetFirst... method until it indicates a final result.
2. If the result is not "NO_ERROR_NO_DATA": Call any GetNext... method as long as its final result is "NO_ERROR".

All diagnosis messages sorted by time, ascending

1. Call any GetLast... method until it indicates a final result.
2. If the result is not "NO_ERROR_NO_DATA": Call any GetPrev... method as long as its final result is "NO_ERROR".

-xxx- = First, Next, Last, Prev. Example: GetFirstVal, DiagGetLastVal.

<tr>
<td>----------------</td>
<td>------------------</td>
<td>----------------------------------------------------------------------------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>4</td>
<td>Warnings</td>
<td>Errors that occur on peripheral devices or that will have an effect only in the future. The user decides which reactions are to be done.</td>
<td>Short circuit in an I/O module, battery empty/not installed</td>
</tr>
<tr>
<td>11</td>
<td>Parameter error</td>
<td>Error occurred during parameter setting</td>
<td>Different I/O devices in PLC configuration and hardware installation</td>
</tr>
</tbody>
</table>

**Errors with error severity 1 - fatal errors**

Errors with error severity 1 are not entered in the diagnosis system. These errors do not allow normal operation of the PLC. These errors are detected during PLC start-up and stop the PLC immediately.

Examples are RAM errors or checksum errors when starting the firmware.

Such errors are indicated by rapid flashing of the ERR LED.

1.6.1.6 Diagnosis history

As of Automation Builder 2.4.0 / System FW 3.4.0 the diagnosis system has been extended with diagnosis history.

Diagnosis history is the entry of all diagnoses into a file according to their time of occurrence.

The diagnosis history file is in the root directory of the user disk and has the name "DiagHistory.csv". The max. number of entries is 5000. When 5000 entries are reached, the oldest entry is overwritten. The max. size of the extended data is 32 bytes.

An entry consists of following data:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Comment</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>timestamp</td>
<td>ARRAYDT OF BYTE</td>
<td>RTC time of event in milliseconds consists of diTimestamp in DT format and uiMs milliseconds – see % Chapter 1.6.1.4.1.1 “Structure DIAG_VAL_TYPE” on page 35288STRUCT</td>

As shown in the example data of the diagnosis history file is not easily readable. The entries must be interpreted according to device and/or fieldbus. Therefore the Automation Builder consists a special view for diagnosis history "Chapter 1.5.6.2.3.3 “Diagnosis History” on page 3275.

With the entries CompID, conn and connID, the device generating the event is clearly identified in the device tree.

If the PLC configuration is changed, the values of this entries may be changed also. Therefore, the diagnosis history will be deleted during each download.

1.6.2 Online diagnosis in Automation Builder
1.6.2.1 Short description and overview
To use the diagnosis system in Automation Builder, login to the online mode is required "Chapter 1.6.2.2 “Entering/leaving the online mode” on page 3552. The online diagnosis in Automation Builder consists of a set of partly animated, mostly read only views. They can be invoked by a double-click on a project tree element which shows a circle indicating that this element is able to show diagnosis messages "Chapter 1.6.2.3 “Project tree in online mode” on page 3553.

Available online diagnosis and statistics:
- **Diagnosis messages**
  When the Automation Builder is switched to online mode, incoming diagnosis messages are displayed as plain-text "Chapter 1.6.1.3 “ Diagnosis in Automation Builder” on page 3524.
- **CPU/PLC diagnosis**
- **I/O module diagnosis**
  "Chapter 1.6.2.5 “Live values in views with I/O components” on page 3559.
- **Communication module and fieldbus diagnosis**
  "Chapter 1.6.2.6 “Communication module and fieldbus diagnosis” on page 3560
- **Diagnosis in IEC application**
  "Chapter 1.6.1.4 “Diagnosis in IEC application” on page 3526

For information on the disk status, diagnosis information can be read out with the Function Blocks PmDiskStatus and PmDiskLifetimeUsed "Chapter 1.5.7.4 “Health monitoring” on page 3517. PmDiskStatus PmDiskLifetimeUsed

1.6.2.2 Entering/leaving the online mode
Prerequisite: Set the gateway before entering the online mode "Chapter 1.5.6.2.11 “Gateway configuration” on page 3331. Gateway configuration
Enter the online mode

Right-click the “Application” node and select “Login”.

The Automation Builder project login to online mode updates the latest changes of the project.

![The online mode can be entered or left for each PLC in the project separately.]

Leave the online mode

Right-click the “Application” node and select “Logout”.

When online mode is active, a thread is running on Automation Builder project which sends cyclically a message to the PLC and expects a response. If the PLC does not respond, the online mode is left programmatically.

1.6.2.3 Project tree in online mode

When Automation Builder enters the online mode internally, it shows the state of all configured communication modules.

The connection status can be recognized by a symbol in the device tree:

- Device without diagnosis messages
- Device with diagnosis messages
- Device without diagnosis messages, but with diagnosis messages on at least one device in the branch below
- Device with diagnosis messages and with diagnosis messages on at least one device in the branch below
- Device does not respond to identification message and is not available for online connection
The identification is done in online mode.

- Double-click an element of the device-tree and select “Status” tab. Diagnosis information will be available.
The user will be notified in the device tree with an exclamation mark beside the device having diagnosis messages. The diagnosis messages are provided in the "Diagnosis" tab.

Alarms will be presented with a thunderbolt in the first column of the diagnosis grid.

Acknowledging an alarm

1. Stop diagnosis refreshment by clicking [Stop refresh].
2. Select one or more alarms and click [Acknowledge selected alarms].
Some diagnosis messages contain additional data. Click [View] button to see the additional diagnosis (in hex) for further analysis. If [View] button is not available, no additional data is available for this diagnosis message.

You can copy the additional data to the clipboard with [CTRL] + [C].

When building an IEC application in Automation Builder, diagnosis text lists will be generated and added to the device tree below the diagnosis folder. These text lists contain the device type specific diagnosis texts which are used by the diagnosis functions in the PLC application to show corresponding texts for error numbers.

The text lists will be downloaded automatically to the PLC with the visualization.

If there is a problem with downloading the text lists, make sure that the settings are correct:
1. Right-click on a text list and select “Properties”.
2. Open the “Text List” tab. The check box “Download by visualization” has to be selected.

1.6.2.4 CPU diagnosis views

1.6.2.4.1 Version information

Information on the firmware versions of the processor modules or communication modules, is provided on the “Version information” tab.

Remarks:

- The “Version information” tab displays the version identified on the device and the version provided with Automation Builder.
- The firmware on the devices must match to the Automation Builder version. Upgrade or downgrade to version supplied with Automation Builder is recommended (especially for CPUs) to ensure correct functionality.
- The firmware type can be changed to the type required by the hardware configuration for devices that support changing the firmware type. E.g., the onboard field bus communication modules of PM595 that may be used as PROFINET, Ethernet or EtherCAT communication module.
Firmware version on device matches version supplied with Automation Builder.

Firmware version (or type) on device is different from version supplied with Automation Builder. Upgrade/downgrade to version supplied with Automation Builder is recommended.

Only for communication modules if CPU firmware must be updated first. This happens when CPU firmware has version below 2.5.0.0. Firmware version (or type) on device is different from version supplied with Automation Builder. Upgrade/downgrade to version supplied with Automation Builder is recommended.

Identified device is different from configured device, thus no firmware update is possible. Happens only for Communication Modules.

Firmware of device is not updateable or no newer firmware than the initial version is available.

The [Update Firmware] button to download the new firmware is only enabled if there is updateable firmware.

1.6.2.4.2 PLC shell commands

The PLC shell is used for requesting specific information from the controller. By entering a device-specific command the response is returned in a result window. The PLC shell can be issued without login.

Proceed as follows:

1. Ensure the gateway is configured properly and a connection to the controller can be established.
2. In Automation Builder double-click the PLC node and open the tab “PLC Shell”.
3. Enter “?” in the command line of the tab window. All available PLC commands are listed.

If the gateway is able to establish a connection to the controller, an online connection to the PLC is opened automatically.
1.6.2.4.3 Statistics

**Setting the CPU time**

The PLC always uses “UTC time”.

It can be shown either in UTC or converted to the local time according to the date and time settings of the PC.

1.6.2.5 Live values in views with I/O components

“I/O mapping list” tab: In online mode, all Automation Builder views, which contain I/O component mapping tables, show animated live values which are updated every second.
1.6.2.6 Communication module and fieldbus diagnosis

1.6.2.6.1 Fieldbus commissioning

Common online diagnosis views for all netX-based coupler modules (e.g. CM579-ETHCAT, CM579-PNIO) can be accessed whenever the related PLC is in online mode "Entering/leaving the online mode" on page 3552.

Master/controller modules

Master/controller modules like CM579-ETHCAT or CM579-PNIO, provide the following diagnosis views:

- "Diagnostics main": provides diagnosis messages which are common for all protocols (e.g., protocol state and error)
- "Diagnostics live list": provides a list of connected slaves/devices and their state "PROFINET scan and comparison view" on page 3561
- "Diagnostics eventlog": provides diagnosis messages from the master/controller and its connected slaves/devices
PROFINET scan and comparison view

PNIO_Controller

1. After going online, double-click on “PNIO_Controller (PROFINET-IO-Controller)” in the device tree.
   ➔ The editor “PNIO_Controller” is displayed.

2. Select tab “Diagnostics live list” and click [Scan] to find all hardware devices that exist.
   ➔ The found devices are listed in a table.

3. Click [Compare] to compare the found hardware I/O devices with the current project configuration.

Unknown hardware

If any I/O hardware device is unknown:

● The devices will be marked with a red exclamation mark.
● A message box will be appear for each unknown device.
● Automation Builder generates a message with information about its vendor ID and device ID.
Comparison view

1. To display the comparison view, install the device description for the unknown device.
2. After installing the device description, click [Scan] and click [Compare].

   [Image]

   ⇨ The message box informs you, that the application will go offline to display the comparison view.

3. Click [Yes].
   ⇨ The “Project Comparison - Differences” tab displays the difference between the PROFINET configuration in Automation Builder (left side) and the real hardware configuration (right side).

4. Click [Accept Single] to accept only a part of the differences or [Accept Block] to accept all differences.
   ⇨ After clicking on the Button [Accept Single] or [Accept Block] the found devices will be moved from the right side to the left side.
5. Close tab “Project Comparison - Differences”.
   A message will be displayed to ask if you want to commit the new changes into project.

6. Click [Yes].
   The changes will be saved and the devices will be added to the project.
Slave/device coupler modules

Diagnosis views for slave/device coupler modules like CM589-PNIO:

- "Diagnostics main": provides diagnosis messages which are common for all protocols
- "Diagnostics details": provides protocol specific diagnosis messages

1.6.2.6.2 CI52x Modbus diagnosis

1. Double-click node “CI52x_MODTCP” in the device tree.
2. Select “CI52x Diagnosis” tab.
   - The button [Get Diagnosis] appears in the tab view.
3. Click on the button [Get Diagnosis].
   - One of the following use cases will be displayed:
     - Device not connected
     - No Errors on the device
     - Diagnosis list

Device not connected

If there is no device connected to the project, the following dialog will be displayed:

1. Select tab “Connection Settings” and enter the IP address for the device.
2. Click again button [Get Diagnosis].
No errors on the device  If there are no errors on the device the following dialog will be displayed:

![Error message dialog](image)

Diagnosis list  If the device is not correctly configured the errors will be displayed with “Error Code” and “Code Description”.

![Error code list](image)

### 16.3.4.2 CM579-PNIO – PROFINET I/O controller diagnosis

Diagnosis data for CM579-PNIO is not displayed in PLC display. In Automation Builder, we recommend to use methods with text output to get diagnosis messages in clear text format. E.g., DiagGetFirstValAndTxt.

Output string:

```
<timestamp>; <error severity>; <device name>; <error location>; error ID <id>: <error text>
```

If you need to access the diagnosis data directly, you have to interpret them manually. Refer to the example to learn how to interpret them correctly "Chapter 16.3.4.2.1 "Manual interpretation of CM579-PNIO diagnosis" on page 3586.

#### For experts: manual interpretation

If you need to access the diagnosis data directly, you have to interpret them manually. Refer to the example to learn how to interpret them correctly "Chapter 16.3.4.2.1 "Manual interpretation of CM579-PNIO diagnosis" on page 3586.

Manual interpretation of CM579-PNIO diagnosis

For better understanding, we show the manual interpretation of CM579-PNIO diagnosis with an example.

System: AC500 CM579-PNIO + CI501-PNIO + optional S500 I/O inserted as PROFINET standard device

Error: discrepancy time expired (class 3, error ID 3) at channel 4 of first attached S500 I/O device on CI501-PNIO

For comparison: If a method with text output is used, e.g. DiagGetFirstValAndTxt the text output will be the string: Timestamp; E3; device name; subslot 1, channel 4, extended channel diagnosis; error ID 3: discrepancy time expired (class 3, error ID 3)

In Automation Builder the following error entry data is displayed:

Analyze the data in the following order: Element “dwAdditional” for the type of diagnosis, element “Error Code”, element “SubSysteminfo”.

Type of diagnosis

   Convert the given value from decimal to hexadecimal format.
   “dwAdditional” = 131076 = 16#20004

2. Interpretation:
   Word 2 = 2
   Word 1 = 4

3. Generate error text Add_Word 1_Word 2 = Add_4_2

4. Look up which error type it is.
   Add_4_2 = extended channel diagnosis

Data analysis

1. Analyze element “Error Code”:
   “dwErrorCode” = 196867 = 16#30103 →
   Word 2 (extended error type) = 16#0003
   Word 1 (error type) = 16#0103
   ➔ Error text: Err_Word 1 (hex)_Word 2 (hex)
   ➔ Err_0103_0003 →
   Error ID 3 – discrepancy time expired (class 3, error ID 3)

2. Analyze “SubSysteminfo”
   “dwSubSysteminfo” = 65540 = 16#10004 →
   Word 2 (subslot index) = 1
   Word 1 (channel index) = 4
### 1.7 Engineering interfaces and tools

#### 1.7.1 Export and import interfaces

**1.7.1.1 Exporting and importing ECAD data (PBF)**

Automation Builder provides an ECAD interface for exchanging the PLC configuration data with EPLAN Electric P8 and Zuken E3. This feature removes double data entry between electrical engineering in the ECAD tool and the control logic programming in Automation Builder by synchronizing the PLC hardware including topology and I/O signals between these tools.

Automation Builder - ECAD interface supports various flexible workflows:

- Enables PLC hardware planning and configuration in the ECAD tool and allows importing the exported data from the ECAD tool through the PBF file (process integration bus interchange format) into the Automation Builder project with diff and merge functionality, providing full control on selective import/merge.
- Enables PLC hardware configuration in Automation Builder and allows exporting the configuration to the ECAD tool through a PBF file.
- Supports bi-directional roundtrip engineering with loss less data exchange between Automation Builder and the ECAD tool.

Automation Builder uses the rack information to identify the relations between:

- PLC and devices plugged to IO bus or extension bus.
- Fieldbus slave and attached IO devices.

It is recommended to assign the PLC, IO devices, communication modules and fieldbus slaves properly to the rack in the ECAD project. If the rack information is missing, devices will be imported to the device pool and must be arranged manually in the Automation Builder project or mapped to already existing devices.
1.7.1.1 Requirements on EPLAN electric P8

- EPLAN Electric P8 with PLC and Bus Extension. It is recommended to use version 2.3 or later.
- Use of appropriate part data and macros for ABB devices. This can be achieved by getting the part data and macros from the EPLAN data portal.

1.7.1.2 Importing PLC data from the ECAD tool

You can create a new Automation Builder PLC project from the existing PLC hardware configuration in your ECAD tool, by importing the exported PBF file to Automation Builder.

1. From the main menu, select "Project ➔ Import ➔ ECAD (PBF)".
2. From the file system, select the PBF file.
   Automation Builder starts importing the devices and its associated signals from the PBF file. After a successful import, the result is displayed in the Project Compare – Differences view. You can now decide and selectively merge the differences. See 'Compare' Command in Chapter 1.3.1.25.2.4.18 "Command 'Compare'" on page 905
3. Select the DevicePool node and click “Accept Block” to accept the complete PLC structure in the ECAD tool.
4. Select the PLC node and click “Accept Block” to accept all child device nodes.
   The DevicePool node holds all devices coming from the ECAD tool without any hierarchy information. The missing hierarchy information can be defined after closing the editor.
5. Close the Project Compare – Differences view to accept the changes.

The I/O signals assigned to I/O devices in the PBF file are imported and allocated to IO devices. I/O signals can be viewed in I/O mapping editor of the I/O devices.
1.7.1.1.3 Importing third party devices

Prerequisite: To import third party devices from ECAD to Automation Builder, install third party fieldbus devices (for example, GSD, GSDML and EDS files) using “Tools ➔ Device repository” in Automation Builder.

1. From the main menu, select “Project ➔ Import ➔ ECAD (PBF)”.
2. From the file system, select the ECAD pbf file which consists of third party devices.

.existsSync(). When the device identifier of the third party device installed in Automation Builder does not match with the device identifier of the device imported from ECAD, an error window is shown with the devices which are failed to import with error ID 14.

To import third party devices, it is required to assign ECAD identifier (PLC type designation/order number) in Automation Builder in “Tools ➔ Device ECAD data”. Click the link in the Import window to see the error messages in a text file.

3. Click “Continue” in the Import window to import valid devices to the project that are imported successfully or click “Cancel” to cancel the import process.
4. In Automation Builder, click “Tools ➔ Device ECAD data”.
5. In the Device ECAD data editor, add the ECAD identifier for the devices shown in the import errors window with error ID 14, to enable these devices for export and import.

SuccessListener(). Also, add the ECAD identifiers for all devices which need to support export/import in ECAD.

6. Reimport the pbf file to import the third party devices.

1.7.1.1.4 Exporting PLC data to ECAD tool

1. Open the existing PLC project.
2. In the device tree, right-click “PLC ➔ Export ➔ ECAD (PBF)”.
3. Select the desired location in the file system to save the PBF file.

The ECAD user can import the exported PBF file from Automation Builder and can use the imported PLC data for electrical engineering purpose. If the user modifies imported PLC data in the ECAD project, the data can be imported back to the Automation Builder project which supports the round trip engineering efficiently with loss less synchronization of the data.
1.7.1.1.5 Exporting third party devices

1. Right-click on a PLC device, click “Export” and select “ECAD (PBF)”.
2. Save the file to the desired location in the file system.
   
   If the third party devices does not contain assigned ECAD identifiers, a message is displayed showing which devices cannot be exported.
   
   To add ECAD identifiers to the devices, see Importing third party devices Chapter 1.7.1.1.3 “Importing third party devices” on page 3589.
   
   After adding ECAD identifiers to the third party devices, execute “Export” to export the devices including third party devices.

1.7.1.1.6 Importing ECAD PLC data to existing AB project

Automation Builder ECAD interface supports concurrent engineering by importing the ECAD data to the existing Automation Builder PLC project.

1. From the main menu, select “Project ➔ Import ➔ ECAD (PBF)”.
2. Select the PBF file which has been created during the export from the ECAD tool.
3. Select the PLC from the list and click “OK”.
   
   A dialog window is displayed if the Automation Builder project provides PLCs of the identical type as defined in the PBF file.
   
   By selecting “None” in the dialog window a new PLC is defined in the ECAD tool.
4. In the Project Compare – Differences view, click [ ] to merge device signals.
   
   The differences between the current PLC hardware configuration in Automation Builder and the ECAD PLC data are displayed.
5. Select the differences as desired and click “Accept Single” to accept the selected difference block.
6. Close the Project Compare – Differences view to accept the changes.

1.7.1.1.7 Arrange or map devices imported to the device pool

Devices that are imported to the device pool because of missing hierarchy information (mainly rack information) must be arranged manually in the Automation Builder project or mapped to already existing devices.

Arrange devices imported to the device pool

Arrange the unassigned devices in the DevicePool to the PLC hardware structure by drag-and-drop.

Map devices imported to the device pool

If the devices are already added to the Automation Builder project prior to the import, you have to map the instances of the same type manually (one instance in the Automation Builder project tree and one instance in the DevicePool).

After mapping the devices, you can selectively merge the device parameter or signal in the difference view.

To map pool devices, proceed as follows:
1. In the device tree, select the Device Pool node, click “Project” and select “Map pool devices”.

2. Map the device pool instances of identical types in the project from the drop-down list and click “OK”.

   Pool devices which are mapped are removed from the device pool and mapped to the corresponding Automation Builder device. Differences between the signals of the mapped I/O devices are displayed. e.g. AI523_1 device:

1.7.1.8 Limitations

The following limitations are considered when working with the Automation Builder ECAD interface:

- The scope of a PBF file is limited to one single PLC including all connected devices.
- There is no representation of XC variants of devices in Automation Builder. Therefore, always use the standard variant for export. This might lead to part data mismatch when importing into the ECAD tool.
- In reimport or round trip import cases, if any changes are made in ECAD by adding a new communication module with connecting to one of the PLC slot or replacing existing communication module, then those device changes to the communication modules are not displayed as connected to PLC slots during the import in Automation Builder diff and import, instead those CM modules are added under the device pool. After merging and importing is completed, to work with device pool devices ⇒ Chapter 1.7.1.1.7 “Arrange or map devices imported to the device pool” on page 3590.
- IO mapping data cannot be imported for IO devices plugged to an EtherCAT slave when they are imported individually to the device pool because of missing hierarchy information. After arranging the devices properly in the device tree, the import can be done again to import also the IO mapping data.

1.7.1.2 Exporting and importing I/O mapping (CSV)

The I/O module mappings of an Automation Builder project can be exported to CSV for bulk editing in MS Excel or other documentation purposes. I/O mappings can be exported at single I/O module level or at PLC level.
Further, the I/O module mappings can be imported with the option of displaying differences and merging each single changed or import all signals at once by overwriting existing I/O module signals.

1.7.1.2.1 Exporting IO mapping data to CSV

To export I/O mappings to a CSV signal list, proceed as follows:

1. In the device tree, right-click “PLC ➔ Export ➔ IO mapping (CSV)”.
2. Save the **IO mappings CSV** to the desired location in the file system.

   If the CSV signal list has been exported successfully, a success message is displayed. The status of the export is shown in the dialog.

3. In the export dialog, click the link to open the exported **IO mapping CSV** file in MS Excel.

   ![Excel Template]

   *The template can only be opened if MS Excel is installed and configured to open .csv files.*

4. In the IO mapping (CSV) file, change **Variable** and **Description** fields to edit I/O mappings.

   ![Excel File]

   *Do not modify other field’s data in IO mapping (CSV) file.*
1.7.1.2 Importing I/O mapping data from CSV

To import an edited I/O mapping (CSV) file, proceed as follows:

1. From the main menu, select “Project ➔ Import ➔ I/O mapping (CSV) ➔ Open”.
2. A CSV signal list import dialog is displayed.
   - With “YES”, all I/O mappings will be imported without difference view. With “NO”, the difference view is displayed with the I/O mapping differences.
3. In the Project Compare – Differences view, click [ ] to merge I/O mappings.
4. Select the signal row for which the difference is to be accepted. Select the Variable field and click “Accept Single” to merge the I/O mappings.
5. Close the Project compare – Differences view to accept the changes and merge the I/O mappings with the Automation Builder project.

1.7.1.3 Exporting and importing device list (CSV)

The Automation Builder project devices can be exported to CSV for bulk device renaming or adding device tag labels to devices in MS Excel or other documentation purposes. A devices export is only possible at PLC level.

Automation Builder provides importing devices in bulk based on device type, instance and hierarchy information provided in the CSV file.

1.7.1.3.1 Exporting device list to CSV

To export a CSV device list, proceed as follows:

1. In the device tree, right-click “PLC ➔ Export ➔ Device list (CSV)”.
2. Select the desired location in the file system to save the Device list (CSV).
   - If the CSV device list is exported successfully, a success message is displayed.
3. In the Export dialog, click the link to open the exported CSV device list. The exported CSV device list consists of all devices connected to the PLC that is exported. Each row represents a device with its device type and hierarchy information.

1.7.1.3.2 Creating CSV device list

To create the devices in CSV, use the device list template provided in Automation Builder.

- In the main menu, click “Tools ➔ Create CSV Device list”.
- The device list template is opened in the MS Excel.

The template can only be opened if MS Excel is installed and configured to open .csv files.

In this file, add each device in a separate row with device information like Device Type (Order Num or Device Type Name) and instance details (name, tag) and hierarchy information (parent Device name, parent Device Tag, position). The mandatory information required to import CSV is only Device Type. All other fields are optional. After editing the device list CSV file, save it in the file system and close.
1.7.1.3.3 Importing a device list from CSV

To import devices from CSV in bulk, proceed as follows:

1. From the main menu, click “Project ➔ Import ➔ Device list (CSV)”.
2. Select the device list CSV file from the file system and click “Open” in the Import dialog. All devices that are defined in the CSV are imported. The Project Compare – Differences view displays the current project and the project that has been updated by the import file.
3. Select the desired devices and click “Accept Block” to accept all the devices and its child device nodes or “Accept Single” to accept only a single device.
4. After closing the Project Compare – Differences view, the devices are imported to the Automation Builder project.

⇒ The devices (except PLC) are placed under the device pool if the valid device hierarchy information is not provided in the CSV device list file. By drag-and-drop devices can be assigned to the desired PLC hardware structure ⇒ Chapter 1.7.1.1.7 “Arrange or map devices imported to the device pool” on page 3590.

If a device tag is provided for a device in CSV, it appears next to each device node in the device tree.

1.7.1.3.4 Renaming devices

To rename the devices, proceed as follows:

1. In the device tree, right-click “PLC ➔ Export ➔ Device list (CSV)”.
2. Select the desired location from the file system to save the CSV device list.
3. Rename the device names in the column **Device Name**:

4. Click "Project ➔ Import ➔ Device list (CSV)".

5. Select the updated CSV file from the file system.

Open the **Project Compare – Differences** view. If only the device names have been changed in the CSV file, the difference view does not show the changes.

6. Close the **Project Compare – Differences** view. The Renamed Devices dialog is displayed with the current name and the new name provided in the CSV file.

7. In the Rename Devices window, select the desired devices and click “OK”. The device names are updated in the Automation Builder project.
1.7.2 CODESYS Security Agent

1.7.2.1 Integration in CODESYS Development System

The CODESYS Security Agent is an add-on product for CODESYS. It simplifies the configuration and control of security-relevant aspects in the development system.

At this time, you can configure and create certificates of the controlling device with the CODESYS Security Agent. After installation, a new "Device" tab is added to the “Security-Screen” view in the development system. You can then configure encrypted communication with the controller, as well as encrypt the boot application, download, and online change.

A description of the standard security functions in CODESYS Development System are located in the standard CODESYS online help under the keywords "security", "encryption", and "security screen".

See also

● Chapter 1.7.2.2 “Encrypted communication with devices via controller certificates” on page 3597
● Chapter 1.7.2.3 “Encrypting boot applications with certificates” on page 3598

1.7.2.2 Encrypted communication with devices via controller certificates

Requirement: A digital signature for certificate exchange is configured. Refer to the standard CODESYS online help “Encryption and Signing with Certificates”.

We assume that the controller still has not certificate that is intended for encrypted communication. With the following steps, you generate this kind of certificate and encrypt communication:

1. Configure the active path to the controlling device.
2. Open the “Security-Screen” view by double-clicking the symbol in the status bar or by clicking “View ➔ Security-Screen”.
3. Click the button to update the list of available devices and their certificate store.
4. Select the corresponding device entry on the left side.
   ➤ On the right side, there is still no license entry for the “Encrypted Communication” use case.
5. Select “Encrypted Communication” on the right side and click the button to generate a new certificate on the device.
   Change the default key length to 4096. Otherwise an error occurs that is only visible in the log of the PLC.
   ➤ The certificate is generated and displayed in the table with its properties. The symbol before “Encrypted Communication” appears now as follows: 🛡.
6. In this step, you activate encrypted communication with the controller:

Open the “Security-Screen” view from CODESYS (“Users” tab). Activate the option “Force encrypted communication” (“Security level”).

➤ As of now, communication with all controllers is possible only as long as the certificate is valid on the controller and you have a key for it.

The connecting line between the development system, the gateway, and the controller is displayed in yellow in the “Communication” tab of the device editor of the controller.

As an alternative to the option “Force encrypted communication” that was just described and applies to all controllers, you can also encrypt communication with a specific controller only. To do this, open the “Communication” tab in the device editor of the controller. In the drop-down list “Device”, click “Encrypted communication”. 
7. Then log in again to the controller.
   A dialog opens, prompting that the certificate of the controller is not signed by a trusted source. In addition, the dialog displays information about the certificate and prompts whether to install it as a trustworthy certificate in the local store in the "Controller certificates" folder.

8. Confirm the dialog.
   The certificate is installed in the local store and you log in to the controller.
   In the future, the communication with the controller is encrypted automatically with this control certificate.

1.7.2.3 Encrypting boot applications with certificates

Aim: You want to encrypt the boot application with a certificate from the controller in order to make sure that it cannot be exchanged. To do this, a corresponding certificate must be created on the controller and installed in the Windows Certificate Store of your computer.

Requirement: The active path to the controller is configured. A digital signature for certificate exchange is configured. Refer to the standard CODESYS online help “Encryption and Signing with Certificates”.

1. Open the “Security-Screen” view by double-clicking the symbol in the status bar or by clicking “View → Security-Screen”.
2. Click the button “Refresh the list of available devices and their certificate store”.
3. Select the device entry on the left side.
4. Select “Encrypted Application” on the right side and click the button “Generate a new certificate on the device”.
   The certificate is created and listed in the table with the symbol.
5. Change the default key length to 4096. Otherwise an error occurs that is only visible in the log of the PLC.
   Double-click the certificate entry.
   The default Windows “Certificate” dialog opens.
6. Click the “Install certificate” button in the “General” tab.
   The “Certificate import assistant” opens.
7. In the “Certificate memory” dialog, select the option “Save all certificates in the following memory location”, and then select the folder “Controller Certificates” as the “Certificate memory”.
   The controller certificate is imported to the directory “Controller certificates” and is now available for encryption of download, online change, and boot application.
8. Follow the steps below if you want the boot application of your project, as well as downloads and online changes, to always be encrypted.
9. Open the “Users” tab in the “Security-Screen”. Activate the option “Force encryption of downloads, online changes, and boot applications” in the “Security-Level” area.
10. Open the “Project” tab and double-click the application entry in the area “Encryption of boot application, download, and online change”.
    The “Properties” dialog of the application opens.
11. Select the “Encryption” tab and select “Encryption with certificates” as the “Encryption technology”. Then click [ ]. Note: If the option “Force encryption of downloads, online changes, and boot applications” is activated in the “Security screen”, then “Encryption with certificates” is already preselected.

12. In the “Certificate selection” dialog, select the corresponding certificate from the “Controller certificates” folder and click [ ].

13. Click “OK” to confirm the dialog.

→ The certificate is displayed in the properties dialog.

14. Confirm the “Properties” dialog of the application.

→ The certificate is displayed in the “Security screen” view (“Project ” tab, “Encryption of boot application, download, and online change”): The boot application, download, and online change are encrypted.

15. Now transferring the boot application, download, and online change are possible, as long as the certificate configured for it and the signature are valid.

### 1.7.2.4 Reference User Interface

#### 1.7.2.4.1 View 'Security-Screen' - 'Devices'

**Symbol:** 🚀

**Function:** This tab allows for the configuration and the transfer of controller certificates for encrypted communication with the controller.

**Call:** Menu bar: “View”.

**Requirement:** The CODESYS Security Agent add-on product is installed.

The “Devices” tab shows all PLC devices configured in the project and their certificate store. If the communication path to the controller is configured, then you see the certificates stored in the memory. Here you can create and configure new certificates on the controller.

<table>
<thead>
<tr>
<th>Left side: “Information”</th>
<th>Devices and certificate store</th>
</tr>
</thead>
<tbody>
<tr>
<td>Shows the individual devices 🎨 as expandable nodes, each with the controller-specific 🛡️ certificate store below it.</td>
<td>For example, there are the following categories for the CODESYS Control Win V3:</td>
</tr>
<tr>
<td>For example, there are the following categories for the CODESYS Control Win V3:</td>
<td>• Individual certificates: Certificates with the associated, private key to which you have access.</td>
</tr>
<tr>
<td>• Trusted certificates: Certificates that have been created by a trusted certificate source.</td>
<td>• Untrustworthy certificates: Certificates that you have defined specifically as not trusted.</td>
</tr>
</tbody>
</table>
| • Certificates in quarantine: Certificates that do not fulfill the criteria of the categories above. | Toolbar (left side): 🔄: Refresh the display

Download: Transfer the selected certificate to the PLC
If the active path to the controller is set and a device node is selected, then every use case for controller certificates are displayed on the right side.

- **“OPC UA Server”:** Encrypted communication over an OPC UA server
- **“Encrypted Communication”:** Encrypted communication between the development system and the controller
- **“Encrypted Application”:** Encryption of the boot application
- **“Web Server”:** Encrypted communication with the web server

As long as a certificate is not available for one of these use cases, it is displayed with the icon & and as “(not available)”.

When a certificate store is selected on the left side, all certificates in it are displayed on the right side with the following information:

- **“Information”:** Use case (Currently the affected controller component is displayed: for example, “CmpSecureChannel”)
- **“Created for”:** Name of the computer for which the certificate was created (for example, “MyLocalPC”)
- **“Created by”:** Name of the computer on which the certificate was created (for example, “MyLocalPC”)
- **“Valid as of”:** Date (for example, “20-07-2017 15:09:29”)
- **“Valid until”:** Date (for example, “20-07-2022 00:00:00”)
- **“Thumbprint”:** Checksum from specific properties of the certificate for purposes of identification (for example, “279e1a46b86bd636c8e6f19fd51c222469ec49a8”) Double-clicking a certificate entry opens the default Windows “Certificate” dialog. In this way, you can import a controller certificate in the Windows Certificate Store to the directory “Controller certificates” so that it is available for encryption of download, online change, and boot application.

If multiple certificates are available for one use case, then the system follows the steps below to determine the certificate that is used:

- Certificate that was created directly by the user (currently not supported)
- Filtering of existing certificates by:
  - 1. Subject (user of the certificate)
  - 2. Key usage
  - 3. Extended key usage
  - 4. Valid time stamp
- Dividing of detected, valid certificates as "signed" and "self-signed"
- Filtering of signed certificates, and the self-signed certificates by the following criteria:
  - 1. Longest validity period
  - 2. Strongest key

**Drag&Drop:** Moving of the certificate to another certificate store of the same device

Double-clicking a certificate entry opens the default Windows dialog for displaying all certificate information.

**Toolbar (right side)**

- **Creation of a new certificate for a specific use case**
  The dialog “Certificate settings” opens for configuring the “Validity period” of the certificate and the “Key length” for the private key. “OK” saves the specified values in the CODESYS options. The values are set again at the next operation.

As long as the certificate is being created, ”(computing)” is shown after the use case. You cannot cancel the creation operation, but you can close and continue working with the “Security-Screen”.

- **Upload and save the selected certificate to the local file system.**
- **Delete the selected certificate.**
1.7.3 CODESYS Static Analysis

CODESYS Static Analysis already helps to write more readable code when programming in CODESYS and to detect contradictory or unsupported settings. In particular, potential sources of error can be identified, such as test code or pointers that have not been checked for 0 before dereferencing. With specific checks, you can make sure that the code is portable. Example: The analysis should report the use of language resources for object orientation because the code is to run on platforms that do not support object orientation.

The analysis checks the source code of the CODESYS project and reports any deviations from certain coding rules, naming conventions, or permitted keywords and identifiers. CODESYS Static Analysis is based on the rule set defined in the PLCopen Coding Guidelines and extends it with additional test options.

You can display the detected deviations as errors or warnings in the message view before the project is downloaded to the target system.

You activate static analysis either explicitly by clicking “Build ➤ Run static analysis”, or you let it execute automatically at each code generation. You activate the automatic execution in the “Static Analysis” dialog of the project settings. In this dialog, you also configure what is to be checked in detail. You can use pragma statements to exclude individual parts of the code from the check.

To evaluate the code quality, you can also display selected metrics that CODESYS Static Analysis detects in your code in a separate view. An example of this is the McCabe metric, which measures the cyclomatic complexity and indicates the number of execution paths that can be processed during code execution.

NOTICE!
The analysis is performed only for the code of the applications in the current project. Libraries are not taken into consideration.

The CODESYS development system contains a light version of static analysis that is extended by CODESYS Static Analysis.

1.7.3.1 Configuring and Running Static Analysis

Using a basic sample project below, you will find the most important steps and options for configuring and running a static analysis.

Requirements: CODESYS Static Analysis is installed.

Sample project

If you want to reproduce the example project, create a standard project and insert the POU below the application in the device tree. Then configure the communication settings for the connection to your local CODESYS Control Win V3.

FUNCTION_BLOCK fb1
VAR_INPUT
    iVar_fb1in1 : INT;
    iVar_fb1in2 : INT;
    rVar_fb1in3 : REAL;
END_VAR
VAR_OUTPUT
    iVar_fb1out:INT;
Checking for compliance to rules

1. Click “Project ➔ Project Settings” and select the “Static Analysis” category. Click the “Rules” tab.
   ⇧ A list is displayed containing all possible rule checks. They are organized in a tree structure by topical category. The rule number is added in parentheses (for example, “Unused variables (33)” in category “Unused objects”).

2. Click the check box of the first line a few times (“Rules” node).
   ⇧ Clicking toggles the activation status. The check boxes in the entire tree have a red or orange check mark, or no check mark at all.

3. In this way, activate all entries with a red check mark. This means that CODESYS Static Analysis should report any detected rule violations as errors.

4. Click “Build ➔ Static analysis ➔ Run static analysis”.
   ⇧ Errors are reported in the message view. The message texts are tagged with a § and begin with the error number "SA<rule number>".

5. Double-click the first message SA0033: Unused variables 'iVar_fb2out'.
   ⇧ The focus moves to the declaration part of function block fb2 and the relevant variable is selected. The variable is declared, but not used. This is checked in Rule 33 (“Unused variables”). In the code, the relevant locations are underlined with a wavy line.

6. Now test how to perform static analysis automatically. Click “Project ➔ Project Settings”, “Static Analysis” category. On the “Settings” tab, select the “Perform static analysis automatically” option. Click “OK” to close the dialog.

7. Click “Online ➔ Login”.
   ⇧ A dialog prompt indicates that compile errors exist. The errors reported by the code analysis are displayed again in the message view.
8. Now deactivate all rules for static analysis in the project settings. In the "Unused objects" category, explicitly activate Rule SA0035 ("Unused input variables (35)") with an orange-colored check mark to report a warning. See the tooltip for the rule text: "This rule corresponds to the following PLCopen rules: CP24"). Click "OK" to close the project settings.

9. Click "Build ➔ Generate code".
   The analysis is performed automatically. Two errors are reported in the message view:
   $ SA0035: Unused input variable 'iVar_fb1in2' and $ SA0035: Unused input variable 'iVar_fb1in3'.

10. Double-click the message and comment or remove the declaration. Perform the code analysis again.
   No error messages are displayed.

- § Chapter 1.7.3.2.2.2 “Dialog 'Static Analysis' - 'Rules'” on page 3607

Checking for compliance to defined naming conventions

1. Click “Project ➔ Project Settings” and select the “Static Analysis” category. Click the “Naming Conventions” tab.
   You see a table in a tree structure that is divided into expandable categories of variables and program blocks.

2. Expand the “Prefixes for variables” - “Prefixes for types” category: In the “Prefix” column, specify I for “INT (14)”.
   Expand the “Prefixes for POUss” - “Prefixes for POU type” category: In the “Prefix” column, specify the prog for “PROGRAM (122)” and fb for “FUNCTIONBLOCK (103)”. 

3. Click the “Naming conventions (2)” tab. Select the “First character after prefix should be an upper case letter” option. Clear all other options.

4. Click “Build ➔ Static analysis ➔ Run static analysis”.
   Error messages:
   - NC0102: Invalid name 'PLC_PRG': Expect prefix 'prog' because PLC_PRG does not have the required prefix
   - First character after prefix should be uppercase: 'ivar_fb1in2' because iVar_fb1in2 : INT; in fb1
   - NC0014: Invalid variable name P_fSampleProperty: Expect prefix 'i' because this integer variable does not have the required prefix

See also
- § Chapter 1.7.3.2.2.3 “Dialog 'Static Analysis' - 'Naming Conventions'” on page 3608
- § Chapter 1.7.3.2.2.6 “Dialog 'Static Analysis' - 'Naming conventions (2)'” on page 3610
Checking for forbidden symbols

1. Click “Project ➔ Project Settings” and select the “Static Analysis” category. Click the “Forbidden symbols” tab.
   - A line editor allows for specifying character strings that should not to be used in the code.
2. As an example, double-click the blank line and type in the invalid character string PRO directly. Double-click the next blank line and click to open the input assistance. From “Standard Types”, select “REAL”. Click “OK” to close the dialog.
3. Click “Build ➔ Static analysis ➔ Run static analysis”.
   - The error message Forbidden symbol 'REAL' and Forbidden symbol 'PRO' are displayed in the message view. Double-click the message text to jump to the relevant line of code.

See also
- Chapter 1.7.3.2.2.5 “Dialog ‘Static Analysis’ - ‘Forbidden symbols’” on page 3609

Displaying metrics

CODESYS Static Analysis performs selected tests on the code, and you can display the results in a view.

1. Click “Project ➔ Project Settings” and select the “Static Analysis” category. Click the “Metrics” tab.
   - The metrics that CODESYS Static Analysis applies to the code are listed in a table.
2. For this example, activate the “Number of inputs variables” metric and specify the permitted value range: lower limit 1 and upper limit 2. Activate some more metrics, for example “Code size” and “Number of calls”.
3. Click “Build ➔ Static analysis ➔ View standard metrics”.
   - The view includes a table with a line for each “Program unit” of the sample program. For each activated metric, there is a column showing the measured values. Values that are outside of the value range defined in the settings are highlighted in red. In the case of this specific example, this is at least the “PLC_PRG/Inputs” field because the number of input variables in this POU is greater than the defined upper limit of 2.

- Chapter 1.7.3.2.1 “Menu Commands” on page 3605

1.7.3.2 Reference, User Interface

1.7.3.2.1 Menu Commands......................................................................................... 3605
1.7.3.2.2 Dialogs........................................................................................................ 3606
1.7.3.2.1 Menu Commands

1.7.3.2.1.1 Command 'Run Static Analysis'.................................................... 3605
1.7.3.2.1.2 Command 'View Standard-Metrics'.............................................. 3605

Command 'Run Static Analysis'

Symbol: §

Function: The command starts the static analysis for the active application and displays the results in the message view.

Call: Menu bar: “Build ➔ Static Analysis”

During the code analysis, CODESYS generates code just like the “Build ➔ Generate Code” command. The results of the analysis are displayed as errors § and warnings § in the message view (“Build” category). The numbers refer to the corresponding rules as they are defined in the project settings. The syntax for the displayed messages is “SA<rule number:<rule text>”.

See also
● Chapter 1.7.3.2.2 “Rules” on page 3616

Command 'View Standard-Metrics'

Symbol: 

Function: The command starts the static analysis for the active application and displays the metrics for all POUs in a table.

Call: Menu bar: “Build ➔ View Standard Metrics”

The metrics (code numbers) to be displayed are activated in the project settings. You can access the configuration by clicking “Configure” in the context menu of the displayed table. If a value is outside of the configured upper and lower limits, then the field in the table is highlighted in red.

See also
● Chapter 1.7.3.2.2.4 “Dialog 'Static Analysis’ - 'Metrics’” on page 3609

Commands in the context menu

The following commands are provided in the context menu of the table:

● “Calculate”: The values are refreshed.
● “Copy Table”: The table is copied to the clipboard. The separators are tabs.
● “Print Table”: The default dialog for setting up a print job opens.
● “Export Table”: The table is exported as a CSV file. The separators are semicolons.
● “Kiviat Diagram”: Requirement: At least three metrics have defined upper and lower limits. A radar chart is created for the selected POU. This visualizes the quality of POU code with respect to a given standard.

Each metric is depicted as an axis with its origin at the center (value 0) which radiates outward into three concentric ring zones. The inner ring zone represents the value range below the lower limit defined for the metric. The outer ring represents the value range above the upper limit. The axes of the metrics are distributed uniformly around the circle.

The current values of the individual metrics on the axes are connected by a line. In the ideal case, the complete line is located in the middle zone.

● “Configure”: The table for selecting the desired metrics opens. This corresponds to the table in the project settings.
● “Open POU”: The POU opens in the editor.
The name of the metric is displayed at the end of the respective axis and the name of the POU is displayed in the upper right corner of the diagram.

### 1.7.3.2 Dialogs

| 1.7.3.2.2.1 | Dialog 'Static Analysis' - 'Settings' | 3606 |
| 1.7.3.2.2.2 | Dialog 'Static Analysis' - 'Rules' | 3607 |
| 1.7.3.2.2.3 | Dialog 'Static Analysis' - 'Naming Conventions' | 3608 |
| 1.7.3.2.2.4 | Dialog 'Static Analysis' - 'Metrics' | 3609 |
| 1.7.3.2.2.5 | Dialog 'Static Analysis' - 'Forbidden symbols' | 3609 |
| 1.7.3.2.2.6 | Dialog 'Static Analysis' - 'Naming conventions (2)' | 3610 |

The dialogs for the configuration of static code analysis are located in "Project -> Project Settings", in the "Static Analysis" category. The requirement is that a CODESYS project has to be open.

### Dialog 'Static Analysis' - 'Settings'

**Function:** In the dialog, you select automatic static analysis, and save or load the project settings for static analysis as a CSA file.

**Call:** Menu bar: “Project ➔ Project Settings”, “Static Analysis” category, “Settings” tab

**Requirement:**
- The CODESYS Static Analysis package is installed.
- A project is open.
Table 784

<table>
<thead>
<tr>
<th>“Perform static analysis automatically”</th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>☑: CODESYS performs the code check automatically at each code generation (for example, when the “Build ➔ Generate code” command is executed or before a download.</td>
<td>☐: The code check is not performed automatically, but it can be performed explicitly by means of the “Build ➔ Static analysis ➔ Run static analysis” command.</td>
<td></td>
</tr>
</tbody>
</table>

“Load”

Opens the “Load Static Analysis Configuration” dialog for selecting the project settings for the static analysis as a CSA file in the file system. When you click the “Open” button, the selected CSA file is loaded.

“Save”

Open the “Save Static Analysis Configuration” dialog for saving all project settings in the “Static Analysis” category as a CSA file in the file system.

See also

- ☇ Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601

Dialog ‘Static Analysis’ - ‘Rules’

**Function:** In the dialog, you select the rules that are checked during the static analysis of the source code of a project.

**Call:** Menu bar: “Project ➔ Project Settings”, “Static Analysis” category, “Rules” tab

**Requirement:** A project is open.

This tab shows a tree structure of all rules that can be checked during static analysis. By default, every rule is activated, with the exception of SA0016, SA0024, SA0073, SA0101, SA0105, SA0106, SA0133, SA0134, SA0150, SA0162, and all strict IEC rules.

Each rule has a unique number. When the rule is checked and a violation is detected, the rule number and an error description are shown in the message view in the “Build” category in the following format: SA<rule number>, where SA stands for ”Static Analysis” (example: "SA003" for rule 3).

- The list of available rules can be extended by specific plug-ins.

Table 785

<table>
<thead>
<tr>
<th>Some rules that are activated in the dialog can be deactivated temporarily in the application by applying a pragma.</th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>When you click the check box, the setting toggles between ☐, ☑, and ☑</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

When you activate or deactivate a parent node, all child rules are also activated or deactivated, respectively.

- The rule is not checked.

- If the result of the check is positive, then an error ( § ) for the static analysis is displayed in the message view.

- If the result of the check is positive, then a warning ( § ) for the static analysis is displayed in the message view.

See also

- ☇ Chapter 1.7.3.2.2 “Rules” on page 3616
- ☇ Chapter 1.7.3.3.1 “Pragmas and Attributes” on page 3611
- ☇ “Checking for compliance to rules” on page 3602
Dialog 'Static Analysis' - 'Naming Conventions'

**Function:** In the dialog, you define the prefixes for the data types and scopes of variables, as well as prefixes for POUs and user-defined data types (DUTs). Static analysis checks compliance with the naming conventions. When a convention is not observed, the static analysis reports an error message in the “Messages” view.

**Call:** Menu bar: “Project ➔ Project Settings”, “Static Analysis” category, “Naming Conventions” tab

**Requirement:**
- The CODESYS Static Analysis package is installed.
- A project is open.

The error messages are displayed in the following format: § NC<prefix-convention number><message text>. NC stands for "Naming Convention".

For example, the error message "§NC0102: Invalid name..." means a violation of naming convention 102 for POUs of type PROGRAM.

| **Names** | Nodes and elements for which a prefix can be defined.  
The number in parentheses after each element (for example, “PROGRAM (102)”) is the prefix convention number that is reported in the case of noncompliance with a naming convention. |
| **Prefix** | Input field of the prefix  
Multiple prefixes can be specified by means of comma separation.  
Examples of prefixes: prog, func, fu  
Regular expressions (RegEx) are also possible for prefixes. To do this, an @ must be prepended.  
Example: @x[a-zA-Z]: The name must begin with x and may contain one character from the scope a-zA-Z. |
| **Prefixes for variables** | Organizational node for all data types and scopes of variables for which a prefix can be defined |
| **Prefixes for POUs** | Organizational node for all POU types and method scopes for which a prefix can be defined |
| **Prefixes for DUTs** | Organizational node for all DUT data types for which a prefix can be defined |
For variables of type “Alias” and POUs of type “Property”, \{\text{datatype}\} can be defined as a prefix. Then the code analysis reports errors for all variables that do not have the prefix \{\text{datatype}\} for the data type of the alias or property. In the definition, \{\text{datatype}\} can also be combined with other prefixes.

Dialog ‘Static Analysis’ - ‘Metrics’

Function: In the dialog, you select the metrics to be displayed for each POU in the “Standard metrics” view by means of the “Build ➔ Static Analysis ➔ View standard-metrics” command.

Call: Menu bar: “Project ➔ Project Settings”, “Static Analysis” category, “Metrics” tab

Requirement:
● The CODESYS Static Analysis package is installed.
● A project is open.

The “Code size”, “Variable size”, “Stack size”, and “Calls” metrics are reported only for POUs from libraries which are integrated in the project.

Violations of the upper and lower limits of the activated metrics can be reported as build errors by means of static analysis rule SA0150.

<table>
<thead>
<tr>
<th>“Metrics”</th>
<th>All selectable metrics are displayed in the column.</th>
</tr>
</thead>
</table>
| “Active”  | ☑: The metric is displayed for each POU in the “Standard metrics” view following the “Build ➔ Static Analysis ➔ View standard metrics” command.  
☐: The metric is not displayed in the “Standard metrics” view following the “Build ➔ Static Analysis ➔ View standard metrics” command. |
| “Lower limit” | Lower value from which the “Metric” is displayed |
| “Upper Limit” | Upper value to which the “Metric” is displayed |

Dialog ‘Static Analysis’ - ‘Forbidden symbols’

Function: In the dialog, you define the keywords and symbols that must not be used in the project code.

Call: Menu bar: “Project ➔ Project Settings”, “Static Analysis” category, “Forbidden symbols” tab
Requirement:
- The CODESYS Static Analysis package is installed.
- A project is open.

<table>
<thead>
<tr>
<th>Input line</th>
<th>Double-clicking the line opens the line editor for specifying a keyword or symbol.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>: The Input Assistant opens for selecting the keyword or symbol.</td>
</tr>
</tbody>
</table>

See also
- “Checking for forbidden symbols” on page 3604

Dialog 'Static Analysis' - 'Naming conventions (2)'

Function: In the dialog, you define the check options for using prefixes. The dialog is an extension of the “Naming Conventions” tab.

Call: Menu bar: “Project ➔ Project Settings”, “Static Analysis” category, “Naming conventions (2)” tab

Requirement:
- The CODESYS Static Analysis package is installed.
- A project is open.

<table>
<thead>
<tr>
<th>“First character after prefix should be an upper case letter”</th>
<th>Static analysis reports an error for a variable when the first character of the variable name after the defined prefix is not an uppercase letter.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Recursive prefixes for combinable data types”</td>
<td>Variables of combined data types (for example, POINTER OF POINTER TO INT or REFERENCE TO ARRAY) necessarily have to be combined prefixes that correspond to the naming conventions defined on the “Naming Conventions” tab.</td>
</tr>
<tr>
<td></td>
<td>Example: On the “Naming Conventions” tab, the prefix p was defined for the data type POINTER and the prefix i was defined for the data type INT. Static analysis reports errors for all variables of type POINTER OF POINTER TO INT which do not have the prefix ppi.</td>
</tr>
<tr>
<td>“Combine scope prefix with data type prefix”</td>
<td>As its namespace, a variable must have the prefix defined on the “Naming Conventions” tab followed by the defined prefix for its data type.</td>
</tr>
<tr>
<td></td>
<td>Example 1: On the “Naming Conventions” tab, the following prefixes were defined: g for “VAR_GLOBAL” and r for data type “REAL”. The code analysis reports errors for global REAL variables that do not have the prefix gr_.</td>
</tr>
<tr>
<td></td>
<td>Example 2: In the application, there exists an alias s_StringAlias and a variable sMyAlias.</td>
</tr>
<tr>
<td></td>
<td>TYPE s_StringAlias : STRING;</td>
</tr>
<tr>

1.7.3.3 Reference, Programming

1.7.3.3.1 Pragmas and Attributes

CODESYS Static Analysis provides pragmas for activating or deactivating individual rules or naming conventions for static code analysis.

Requirement: The rules or conventions are activated or defined in the project settings.

Rules that are deactivated in the project settings cannot be activated by means of pragmas or attributes.

Rule SA0004 cannot be deactivated by means of a pragma.

See also

- Chapter 1.7.3 “CODESYS Static Analysis” on page 3601

Pragma ‘analysis’

This pragma is used to deactivate the code rules for individual code lines of a POU. You deactivate code rules by specifying the rule numbers with a prepended minus sign (“-”). A prepended plus sign (“+”) activates the rule. You can specify any number of rules in the pragma.

Insert location: Deactivation: With \{analysis - ...\} before the first code line where the code analysis is deactivated. Activation: With \{analysis + ...\} after the last line of the deactivation.

Syntax:

Deactivation of rules:

\{analysis -<rule number> ( , -<additional rule number> )* \}  
* : optional none, one or more additional rule numbers

Activation of rules:

\{analysis +<rule number> ( , +<additional rule number> )* \}  
* : none, one or more additional rule numbers

Example

Rule 24 is deactivated for two lines and then reactivated. As a result, rule 24 is not checked in these lines so that nTest:=DINT#99 is allowed for example.

\{analysis -24\}
nTest := 99;
iVar := INT#2;
{analysis +24}

Deactivating multiple rules:

\{analysis -10, -24, -18\}

See also

- Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601
Attribute 'analysis'

The pragma deactivates specific rules for an entire programming object. You deactivate the code rules by specifying the rule numbers with a prepended minus sign ("-".) You can specify any number of rules in the pragma.

**Insert location:** In the declaration part of a POU, in the first line.

**Syntax:**

```
{attribute 'analysis' := '-<rule number> ( , -<additional rule number> )* '}
```

* : none, one or more additional rule numbers

**Example**

Rules 33 and 31 are deactivated for the entire structure:

```plaintext
{attribute 'analysis' := '-33, -31'}
```

```
TYPE My_Structure :
STRUCT
  iLocal : INT;
  uiLocal : UINT;
  udiLocal : UDINT;
END_STRUCT
END_TYPE
```

Rule 100 is deactivated for the array:

```plaintext
{attribute 'analysis' := '-100'}
```

```
PROGRAM PLC_PGR
VAR
  aBigData: ARRAY[1..10000] OF DWORD;
  aBigDATA_2: ARRAY[1..10000] OF DWORD;
END_VAR
```

See also
- Chapter 1.7.3.1 "Configuring and Running Static Analysis" on page 3601

Attribute 'naming'

The pragma marks the code lines that are excluded from the analysis of naming convention. An off is assigned to the pragma attribute before the first code line where the code analysis is deactivated. An on is assigned after the last line. When an omit is assigned, only the next code line is ignored.

**Insert location:** Deactivation: In the declaration part of POUs and DUTs, above the affected lines. Activation: Below the affected lines.

**Syntax:**

```
{attribute 'naming' := '<switch state>'}
```

*switch state*: on | off | omit

- on : naming is switched on
- off : naming is switched off
- omit : only next code line is switched off
Defined naming conventions: 1) INT variable names must be prepended with "int" as the identifier prefix, for example "intVar1". 2) Program names must begin with "prog".

For the code presented below, the static analysis issues messages only for the following variables: cccVar, aVariable, and bVariable.

```plaintext
VAR
{attribute 'naming' := 'off'}
iVarA : INT;
iVarB : INT;
{attribute 'naming' := 'on'}
iVarC : INT;
END_VAR

VAR
...
{attribute 'naming' := 'omit'}
iVarC : INT;
...
END_VAR

{attribute 'naming' := 'omit'}
PROGRAM PLC_PRG
VAR
...
END_VAR

{attribute 'naming' := 'omit'}
PROGRAM DoSomethingA
VAR
{attribute 'naming' := 'on'}
iVarA : INT;
iVarB : INT;
...
VAR_END
```

See also
- [Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601](#)

**Attribute 'nameprefix'**

The attribute defines a prefix for variables of a structured data type. The prefix must be prepended to the identifier of variables that are declared by this type.

**Insert location:** In the line before the declaration of a structured data type

**Syntax:**

```plaintext
{attribute 'nameprefix' := '<prefix>'}
```
Example

In the following example, Static Analysis issues a message for pB because the variable name does not begin with "point".

```plaintext
{attribute 'nameprefix' := 'point'}
TYPE DATAPoint :
  STRUCT
    iX: INT;
    iY: INT;
  END_STRUCT
END_TYPE

PROGRAM PLC_PRG
VAR
  pointA : DATAPoint;
  pB : DATAPoint;
END_VAR
pointA.iX := 1;
pointA.iY := 10;
pB.iX := 2;
pB.iY := 20;

Error message after static analysis: "Invalid variable name 'pB'. Expect prefix 'point'"
```

See also

- Chapter 1.7.3.1 "Configuring and Running Static Analysis" on page 3601

Attribute 'analysis:report-multiple-instance-calls'

The pragma marks a function block for checking for rule 105: Only function blocks with this pragma are checked whether the function block instances are called more than one time. If rule 105 is deactivated in the project settings, then the pragma does not have any effect.

Insert location: First line in the declaration part of a function block.

Syntax:

```plaintext
{attribute 'analysis:report-multiple-instance-calls'}
```
FUNCTION_BLOCK FB_DoA
VAR_INPUT
END_VAR
VAR_OUTPUT
END_VAR
VAR
  iA : INT;
END_VAR
  iA := iA + 1;
FUNCTION_BLOCK FB_DoB
VAR_INPUT
END_VAR
VAR_OUTPUT
END_VAR
VAR
  iB : INT;
END_VAR
  iB := iB + 1;
PROGRAM PLC_PRG
VAR
  fbA : FB_DoA;
  fbB : FB_DoB;
ND_VAR
  fbA();
  fbB();  // SA0105
  fbA();
  fbB();  // SA0105
--> SA0105: Instance 'fbB' called more than once

1.7.3.2.60 SA0167: Temporary function block instances........................... 3687

SA0001: Unreachable code

Detects lines of code that are not executed, for example due to a RETURN or CONTINUE statement

Justification: Unreachable code should always be avoided. The test often indicates that test code still exists which should be removed.

Importance: High

PLCopen rule: CP2

Example

PROGRAM PLC_PRG
VAR
  xReturn_Before_End: BOOL;
  xContinue_In_Loop_FUN: BOOL;
  iCounter: INT;
END_VAR

xContinue_In_Loop_FUN := FALSE;
FOR iCounter := INT#0 TO INT#5 BY INT#1 DO
  CONTINUE;
  xContinue_In_Loop_FUN := FALSE;
END_FOR

--> SA0001: Unreachable code detected in 'PLC_PRG'

See also

● ⇐ Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601

SA0002: Empty objects

Detects POUs, GVLs, data type declarations, or interfaces that do not contain any code

Justification: Empty objects should be avoided. They are often a sign that an object has not been implemented completely. Exception: In some cases, no code is specified in the body of a function block when it should be used by interfaces only. In other cases, a method is created only because it is required by an interface without a sensible implementation being possible for the method. No matter the case, this kind of situation should be commented.

Importance: Medium

See also

● ⇐ Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601
SA0003: Empty statements

Detects lines of code that have a semicolon (;) but not a statement

Justification: An empty statement can be a sign for missing code. Exceptions: There are good reasons for using empty statements. For example, in a CASE statement it could make sense to explicitly program out all cases, even those where there is nothing to do. This would simply be to document that the case was not forgotten.

Importance: Low

Examples

```plaintext
CASE value OF
1: DoSomething();
2:; // nothing to do
3: DoSomethingElse();
END_CASE
```

See also

- § Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601

SA0004: Multiple write access on output

Detects outputs that are written to more than one location

Justification: The maintainability is degraded when an output is written in different locations in the code. Then it is uncertain which write access is the one that actually has an effect in the process. Good practice is to calculate the output variables in auxiliary variables and assign the calculated value at one location at the end of the cycle.

Importance: High

PLCopen rule: CP12

An error is not issued when an output variable (VAR_IN_OUT) is written in different branches of IF and CASE statements.

A pragma cannot deactivate this rule.
Example

VAR_GLOBAL
  g_xVar AT %QX0.0 : BOOL ;
  g_iTest AT %QW0 : INT ;
END_VAR

PROGRAM PLC_PRG
  IF g_iCondition < INT#0 THEN
    g_xVar := TRUE;
    g_iTest := INT#12;
  END_IF
  CASE g_iCondition OF
    INT#1:
      g_xVar := FALSE;
    INT#2:
      g_iTest := INT#11;
    ELSE
      g_xVar := TRUE;
      g_iTest := INT#9;
  END_CASE
  --> SA0004: Multiple write access on output '%QX0.0'
  --> SA0004: Multiple write access on output '%QW0'

See also

● § Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601

SA0006: Write access from several tasks

Detects variables that are written by more than one task

Justification: A variable that is written in multiple tasks may change its value unexpectedly. This can lead to confusing situations. String variables (and on some 32-bit systems also 64-bit integer variables) can even reach an inconsistent state if the variable is written to two tasks simultaneously.

Exception: In specific cases, it may be necessary for several tasks to write a variable. For example, use semaphores to make sure that access does not lead to an inconsistent state.

Importance: High

PLCopen rule: CP10

Example

VAR_GLOBAL
  g_iTemp1: INT;
END_VAR

PROGRAM PLC_PRG    // Controlled by MainTask
  g_iTemp1 := g_iTemp1 + INT#2;
END_PROGRAM

PROGRAM PLC_PRG_1  // Controlled by SubTask
  g_iTemp1 := g_iTemp1 - INT#3;
END_PROGRAM

  --> SA0006: Concurrent write access to 'g_iTemp1' in Tasks MainTask, SubTask

See also

● § Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601
SA0007: Address operator on constants

Detects lines of code where the operator ADR is applied for a constant

Justification: Using a pointer to a constant variables overrides the CONSTANT property of the variable. The variable can be changed by means of the pointer without any notification from the compiler.

Exception: In rare cases, it might be useful to pass a pointer to a constant to a function. However, you have to make sure that this function does not change the transferred value. Whenever possible, use VAR_IN_OUT CONSTANT.

Importance: High

When the “replace constants” option is selected in the “Compiler options” of the project settings, the address operator is not permitted for scalar constants (integer, BOOL, REAL) and a compile error is issued. (Constant strings, structures, and arrays always have an address.)

Example

PROGRAM PLC_PRG
VAR CONSTANT
  c_iValue : INT := INT#15;
END_VAR
VAR
  poiValue : POINTER TO INT;
END_VAR
poiValue := ADR(c_iValue); // SA0007
--> SA0007: Address to constant variable 'c_iValue'

See also
● Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601

SA0008: Check subrange types

Detects out-of-range violations of subrange types. Assigned literals are already checked by the compiler. When constants are assigned, then the values must be within the defined range. When variables are assigned, then the data types must be identical.

Justification: If subrange types are used, then make sure that this subrange is not exited. The compiler checks for these kinds of subrange violations only for assignments of constants.

Importance: Low

The check is not performed for CFC objects because the code structure does not allow for it.
Example

VAR_GLOBAL
   iVarGlob:INT;
END_VAR

PROGRAM PLC_PRG
VAR
   iSubr1: INT (INT#1..INT#10);
   iSubr2: INT (INT#1..INT#1000);
   iCount: INT;
   by_SubType : BYTE (BYTE#0..BYTE#11);
   iVar : INT (-4095..4095);
END_VAR

iSubr1 := nCount;              // SA0008
iSubr1 := subr2;               // SA0008
iSubr1 := gvl.iVarGlob;        // SA0008
//byBYTE_SubType := BYTE#123;  //already detected by compiler,
error "Cannot convert type..."

--> SA0008: Subrange variable 'iSubr1' maybe out of allowed range

See also

● 溘 Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601

SA0009: Unused return values

Detects function, method and property calls in which the return value is not used

Justification: When a function or method returns a return value, it should also be evaluated. The return value often indicates whether or not the function was executed successfully. If not, then you will not be able to identify later whether the return value was forgotten or if it is actually not needed.

Exception: If a return value is irrelevant to the call, then you can document this and omit the assignment. Error returns should never be ignored.

Importance: Medium

PLCopen rule: CP7 / CP17

Example

FUNCTION Return_BOOL : BOOL
VAR_INPUT
END_VAR
VAR
   xTest : BOOL;
END_VAR
xTest := FALSE;
Return_BOOL := xTest;

PROGRAM PLC_PRG
Return_BOOL ();  // SA0009

--> SA0009: Ignoring return value of 'Return_Bool'

See also

● 溘 Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601
SA0010: Arrays with only one component

Detects arrays with only one element

Justification: An array with one element can be replaced by a base-type variable. Access to this variable is considerably faster than access by index to the variable.

Exception: The length of an array is often determined by a constant and is a parameter for a program. Then the program can work with arrays of different lengths and does not have to be changed if the length is only 1. This kind of situation should be documented accordingly.

Importance: Low

Example

```pascal
PROGRAM PLC_PRG
VAR
  aoiEmpty : ARRAY [22..22] OF INT;
  aorEmpty : ARRAY [1..1] OF REAL;
END_VAR

aoiEmpty;
aorEmpty;

--> SA0010: Vacuous array element in variable 'aoiEmpty'
--> SA0010: Vacuous array element in variable 'aorEmpty'
```

See also

- Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601

SA0011: Useless declarations

Detects structures or enumerations with only one component

Justification: This kind of declaration can be confusing for the reader. A structure with only one element can be replaced by an alias type. An enumeration with only one element can be replaced by a constant.

PLCopen rule: CP22 / CP24

Importance: Low

Example

```pascal
TYPE SingleStruct : STRUCT
  iPart : INT;
END_STRUCT
END_TYPE

TYPE myUnion :
  UNION
    lrValue : LREAL;
END_UNION
END_TYPE

TYPE SingleEnum :
  (
    OnlyOne := 1
  );
END_TYPE

--> Useless declaration 'SingleStruct'
--> Useless declaration 'myUnion'
--> Useless declaration 'SingleEnum'
```
See also

- § Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601

SA0012: Variable which could be declared as constants

Detects variables that are not accessed with write permission and therefore could be declared as constants

Justification: If a variable is written only at the declaration point and is otherwise used only for reading, then the static analysis assumes that the variable should also not be changed. Firstly, a declaration as a constant results in checking that the variable is not changed when the program is changed. Secondly, the declaration as a constant may result in faster code.

NOTICE!

If multiple applications exist in one project, then only the objects below the currently active application are affected. If there is only one application, then the objects in the common POU pool are also affected.

Importance: Low

Example

PROGRAM PLC_PRG
VAR
  iVar : INT := INT#17;
  iTest : INT;
END_VAR
iTest := iTest + iVar;   // SA0012: iVar could be declared as constant

--> SA0012: Variable 'iVar' could be declared as constant

See also

- § Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601

SA0013: Declarations with the same variable name

Detects variables with names that are already used by other variables (for example, global and local variables with the same name). Also detects variables with names of functions, actions, methods, or properties which are used in the same access scope. Variables are also detected that are declared in a GVL in the “Devices” view or in the POU pool. For this, however, the GVL of the “POUs” view have to be used in the application program.

Justification: The same names can be confusing when reading the code, and they can cause errors if the wrong object is accessed unintentionally. We recommend that you use naming conventions to avoid these situations.

PLCopen rule: N5 / N9

Importance: Medium
Example

```plaintext
VAR_GLOBAL
   xVar1 : BOOL;
   iVar3 : INT;
END_VAR

PROGRAM PLC_PRG
VAR
   xVar1 : BOOL;  // SA0013
   iVar3 : INT;   // SA0013
END_VAR

xVar1 := NOT GVL.xVar1;
iVar3 := iVar3 + INT#2;
iVar3 := GVL.iVar3;

--> SA0013: Declaration of 'iVar1' hides symbol 'GVL.iVar1'
--> SA0013: Declaration of 'xVar3' hides symbol 'GVL.xVar3'
```

Example

The function block **POU** has the action **ACT** and the method **METH**.

```plaintext
FUNCTION_BLOCK POU
VAR
   ACT : UINT;  // SA0013
   METH : BYTE; // SA0013
END_VAR

--> SA0013: Declaration of 'ACT' hides symbol 'POT.ACT'
--> SA0013: Declaration of 'METH' hides symbol 'POT.METH'
```

See also

- % Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601

**SA0014: Assignment of instances**

Detects assignments to function block instances. In the case of instances with pointer or reference variables, these assignments are potentially risky.

**Justification:** This is a performance warning. When an instance is assigned to another instance, all elements and subelements are copied from the one instance to the other instance. Pointers to data are also copied, but not their referenced data, so that the target instance and the source instance contain the same data after the assignment. Depending on the size of the instances, this kind of assignment could last a long time. For example, if an instance should be passed to a function for processing, then it is much more efficient to pass a pointer to the instance. If you want to selectively copy values from one instance to another, then a copy method is useful: `inst_First.Copy_From(inst_Second)`.

**Importance:** Medium
PROGRAM PLC_PRG
VAR
    inst_First : My_FB;
    inst_Second : My_FB;
END_VAR
inst_First();
inst_Second := inst_First;  // SA0014

--> SA0014: Assignment of instances

See also
- ☑ Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601

SA0015: Access to global data via FB_Init

Detects the access of a function block to global variables by means of the method FB_Init.
The value of this variable depends on the order of initializations.

Justification: Depending on the declaration location of the POU instance, an uninitialized variable could be accessed if the rule is violated.

Importance: High

Example

VAR_GLOBAL
    g_xTest1 : BOOL;
    g_iTest3 : INT;
END_VAR

METHOD PUBLIC fb_init : BOOL
VAR_INPUT
    bInitRetains : BOOL; // If TRUE, the retain variables are initialized (warm start / cold start)
    bInCopyCode : BOOL; // If TRUE, the instance afterwards gets moved into the copy code (online change)
END_VAR

g_xTest1 := NOT g_xTest1;       // SA0015
g_iTest3 := g_iTest3 + INT#1;   // SA0015

--> SA0015: FB_Init method of function block 'POU' accesses global data

- ☑ Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601

SA0016: Gaps in structures

Detects gaps in structures or function blocks that are caused by the alignment requirements of the currently set target system. If possible, you should remove the gaps by resorting the structure elements or filling them with a dummy element. If this is not possible, then you can deactivate the rule for the affected structures by means of the analysis pragma.

Justification: Due to different alignment requirements on different platforms, there may be a different layout in the memory for these kinds of structures. Then the code can perform differently, depending on the platform.

Importance: Low
Example

PROGRAM PLC_PRG
VAR
  myStruct : Unpadded_Structure;
END_VAR
myStruct.iTest := 0;

TYPE Unpadded_Structure :
  STRUCT
    xTest : BOOL;
    iTest : INT; // SA0016
    byTest : BYTE;
    wTest : WORD;
  END_STRUCT
END_TYPE

--> SA0016: Structure 'Unpadded_Structure' must be padded (pack-mode=8)

See also
  ● § Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601

SA0017: Non-regular assignments

Detects assignments to pointers that are neither addresses (ADR operator, pointer variables) nor constants 0

Justification: If a pointer contains a value that is not a valid address, then an access violation exception occurs when dereferencing the pointer.

Importance: High

Example

PROGRAM PLC_PRG
VAR
  pInt : POINTER TO INT;
  dwAddress : DWORD;
END_VAR

dwAddress := dwAddress + DWORD#1;
pInt := dwAddress; // SA0017

--> SA0017: Non-regular assignment

See also
  ● § Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601

SA0018: Unusual bit access

Detects bit access to signed variables. However, the IEC 61131-3 standard permits only bit access and bit shift operations on bit fields. See also the strict rules SA0147 and SA0148.

Justification: Signed data types should not be used as bit fields and the other way around. The IEC 61131-3 standard does not provide for this kind of access, and therefore you should comply with this rule when you write portable code.

Importance: Medium
Exception for flag enumerations: When an enumeration is declared as a flag by means of the {attribute 'flags'} pragma attribute, the SA0018 error is not issued for bit access with the OR, AND or NOT operators.

Example

PROGRAM PLC_PRG
VAR
    iTemp1 : INT;
    diTemp3 : DINT;
    uliTemp4 : UUINT;
    siTemp5 : SINT;
    usiTemp6 : USINT;
    byTemp2 : BYTE;
END_VAR
iTemp1.3 := TRUE;     // SA0018
diTemp3.4 := TRUE;    // SA0018
uliTemp4.18 := FALSE; // no error because this is an unsigned data type
siTemp5.2 := FALSE;   // SA0018
usiTemp6.3 := TRUE;   // no error because this is an unsigned data type
byTemp2.5 := FALSE;   // no error because the byte is a bitfield
--> SA0018: Unusual bit access

See also
- % Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601
- % Chapter 1.7.3.2.49.12 “SA0147: Unusual shift operation - strict” on page 3676
- % Chapter 1.7.3.2.49.13 “SA0148: Unusual bit access - strict” on page 3677

SA0020: Possibly assignment of truncated value to REAL variable

Detects operations on integer variables for which a truncated value could be assigned to a REAL data type variable

Justification: Static analysis issues an error when the result of an integer calculation is assigned to a REAL or LREAL variable. The programmer should be alerted to a possible incorrect interpretation of this kind of assignment: lrealvar := dintvar1 * dintvar2. Because the value range of LREAL is greater than that of DINT, one could assume that the result of the calculation could always be represented in LREAL. But that is not the case. The processor calculates the result of the multiplication as an integer and then casts the result to LREAL. An overflow in the integer calculation would be lost. To work around the problem, the calculation has to be done as a REAL operation: lreal_var := TO_LREAL(dintvar1) * TO_LREAL(dintvar2).

Importance: High

Example

PROGRAM PLC_PRG
VAR
    rx : LREAL;
    di : DINT;
END_VAR
rx := di * di                              // SA0020
rx := TO_LREAL(di) * TO_LREAL(di) // No message
--> SA0020: Possibly assignment of truncated value to REAL variable
See also

● § Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601

SA0021: Transporting the address of a temporary variable

Detects address assignments of temporary variables (on the stack) to non-temporary variables

Justification: Local variables of a function or method are created on the stack and they exist only while the function or method is being processed. If a pointer points to this kind of variable after processing the method or function, then you can use this pointer to access undefined memory, or to access an incorrect variable in another function. This situation should be avoided at all costs.

Importance: High

Example

FUNCTION TempVarInFUNC : DWORD
VAR
  uiTemp : UINT;
END_VAR
TempVarInFUNC := ADR(uiTemp);  // SA0021

PROGRAM PLC_PRG
VAR
  dwTest : DWORD;
END_VAR
dwTest := TempVarInFUNC();

--> SA0021: Transporting address of temporary variable to outer scope symbol

See also

● § Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601

SA0022: (Possibly) unassigned return value

Detects all functions and methods that include an execution thread without an assignment to the return value

Justification: An unassigned return value in a function or method is an indication of missing code. Even if the return value always has a default value, it is always useful to assign it again explicitly to avoid confusion.

Importance: Medium

Example

FUNCTION FUN : DINT
VAR_INPUT
  bTest : BOOL;
END_VAR

IF bTest THEN
  RETURN;
ENDIF
FUN := 99;

--> SA0022: (Possibly) unassigned return value
SA0023: Too big return values

Detects structured return values that fill more than 4 bytes of memory and therefore are too large. Moreover, return values of type `STRING` are identified (regardless of the size of the used memory).

Justification: This is a performance warning. If large values are returned as the result of a function, method, or property, then the processor copies them multiple times when executing the code. This can lead to runtime problems and should be avoided whenever possible. Performance can be improved by passing a structured value as `VAR_IN_OUT` to a function or method and filling it in the function or method.

Importance: Medium

Example

```plaintext
TYPE LargeStructure :
  STRUCT
    a : LINT;
    b : BOOL;
  END_STRUCT
END_TYPE

TYPE SmallStructure :
  STRUCT
    a : INT;
    b : BYTE;
  END_STRUCT
END_TYPE

FUNCTION Large_Return_Value_FUNC : LargeStructure   // SA0023
FUNCTION Small_Return_Value_FUNC : SmallStructure   // OK

--> SA0023: Structured return value
```

SA0024: Untyped literals / constants

Detects untyped literals and constants.

Justification: CODESYS assigns types for literals depending on their use. In some cases, this can cause unexpected problems, which should be resolved better with a typed literal. For example: `dw := ROL(DWORD#1, i)`

Importance: Low
Example

PROGRAM PLC_PRG
VAR
  iTemp1 : INT = 10; // SA0024
diTemp2 : DINT;
liTemp3 : LINT;
rTemp4 : REAL;
lrTemp5 : LREAL;
END_VAR
iTemp1 := iTemp1 + INT#34;
diTemp2 := diTemp2 + 23; // SA0024
liTemp3 := liTemp3 + 124; // SA0024
rTemp4 := rTemp4 + 1.1; // SA0024
lrTemp5 := lrTemp5 + 3.4; // SA0024
---> SA0024: Untyped literal found

See also

- Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601

SA0025: Unqualified enumeration constants

Detects enumeration constants for which a qualified name does not prepend the enumeration
Justification: Qualified access makes the code more readable and easier to maintain. Without
forcing qualified variable names, an additional enumeration could be inserted when the program
is extended. This enumeration contains a constant with the same name as an existing enumera-
tion (see the example below: "red"). This would result in ambiguous access to this piece of
code. We recommend to always use only enumerations with the {attribute 'qualified-only'}.
Importance: Medium

Example

TYPE COLOR
  (red, green, blue);
END_TYPE

PROGRAM PLC_PRG
enumVar : COLOR;
enumVar := COLOR.red; // SA0025
enumVar := red; // SA0025
---> SA0025: Enumeration constant 'red' not qualified

See also

- Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601

SA0026: Possible truncated strings

Detects string assignments and string initializations that do not use sufficient string length
Justification: When strings of different lengths are assigned, a string could be truncated. This
can have unexpected results.
Importance: Medium
Example

PROGRAM PLC_PRG
VAR
    strVar1 : STRING[10];
    strVar2 : STRING[6];
END_VAR

strVar2 := strVar1; // SA0026

--> SA0026: Truncation of string 'abcdefghi'
--> SA0026: Possible truncation of string 'strVar1'

See also

●  § Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601

SA0027: Multiple uses of identifiers

Detects multiple uses of a name/identifier for a variable or an object (POU) within the scope of a project

Justification: Same names can be confusing when reading the code. They can cause errors if the wrong object is accessed accidentally. Define and follow naming conventions to avoid any situation like this.

The following cases are detected:

● The name of an enumeration is identical to the name of another enumeration in the application or in an integrated library.
● The name of a variable is identical to the name of another object in the application or in an integrated library.
● The name of a variable is identical to the name of an enumeration constant in an enumeration in the application or in an integrated library.
● The name of an object is identical to the name of another object in the application or in an integrated library.

Importance: Medium

Example

The Standard library is integrated in the project and provides the TON function.

PROGRAM PLC_PRG
VAR
    ton : INT;
END_VAR

--> Variable name 'ton' in 'PLC_PRG' already used for an object in library 'standard,...'

See also

●  § Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601

SA0028: Overlapping memory areas

Detects the lines of code where two or more variables reserve the same memory

Justification: When two variables reserve the same memory, the code may behave with unexpected results. This situation should be avoided at all costs. If you cannot avoid using a value in different interpretations (for example, one time as DINT and another time as REAL), then you should define a UNION. You can also use a pointer to access a value with a different type without the value being converted.
Importance: High

**Example**

```
PROGRAM PLC_PRG
VAR
 iVar AT %QB21: INT;
 dwVar2 AT %QD5: DWORD;
END_VAR

--> The following variables access the same memory:
--> SA0028: iVar AT %QB21
--> SA0028: dwVar2 AT %QD5
```

See also
- § Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601

**SA0029: Notation in code different to declaration**

Detects the code locations where the notation of an identifier is different from the notation in its declaration

Justification: The IEC 61131-3 standard defines identifiers as not case-sensitive. This means that a variable declared as "varx" can also be used as "VaRx" in the code. However, this is confusing and misleading and should be avoided.

Importance: Medium

**Example**

```
A POU PLC_PRG and a POU fnc (function) exist in the device tree.

PROGRAM PLC_PRG
VAR
 iVar: INT;
 _123test_var_: INT;
END_VAR

ivar := iVar + 1;                   // SA0029
_123TEST_var_ := _123test_var_;        // SA0029
Fnc();                              // SA0029

--> SA0029: Notation in code (ivar) must equal declaration (iVar)
--> SA0029: Notation in code (_123TEST_var_) must equal declaration (_123test_var_)
--> SA0029: Notation in code (Fnc) must equal declaration (fnc)
```

**Unused Objects**

- 1.7.3.2.28.1 SA0031: Unused signatures.......................................................... 3633
- 1.7.3.2.28.2 SA0032: Unused enumeration constants................................. 3633
- 1.7.3.2.28.3 SA0033: Unused variables......................................................... 3633
- 1.7.3.2.28.4 SA0035: Unused input variables............................................... 3634
- 1.7.3.2.28.5 SA0036: Unused output variables............................................. 3634
SA0031: Unused signatures
Detects programs, function blocks, functions, data types, interfaces, methods, properties, and actions that are not called within the compiled program code

Justification: Unused objects unnecessarily increase the size of the project and can be confusing when reading the code.

Importance: Low

PLCopen rule: CP2

If multiple applications exist in a project, then only the objects below the currently active applications are affected. If there is only one application, then the objects in the POU pool are also affected.

See also
● § Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601

SA0032: Unused enumeration constants
Detects enumeration constants that are not used in the compiled program code

Justification: Unused enumeration constants unnecessarily increase the size of the enumeration definition and can be confusing when reading the program.

PLCopen rule: CP24

Importance: Low

If multiple applications exist in a project, then only the objects below the currently active applications are affected. If there is only one application, then the objects in the common POU pool are also affected.

Example

TYPE My_Enum :
  (one := 1, two := 2);
END_TYPE

--> SA0032: Unused enumeration constant 'one'
--> SA0032: Unused enumeration constant 'two'

See also
● § Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601

SA0033: Unused variables
Detects variables that are declared but not used within the compiled program code

Justification: Unused variables make a program less readable and maintainable. Unused variables unnecessarily fill memory and unnecessarily waste runtime during initialization.

Importance: Medium

PLCopen rule: CP22 / CP24
For GVL variables: If multiple applications exist in a project, then only the objects below the currently active applications are affected. If there is only one application, then the objects in the common POU pool are also affected.

**Example**

```plaintext
PROGRAM PLC_PRG
VAR
    iCounter1 : INT;
    iCounter2 : INT; // SA0035
END_VAR

iCounter1 := 100;
--> SA0035: Unused Variable 'iCounter2'
```

See also

- ⇢ *Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601*

**SA0035: Unused input variables**

Detects input variables that are not used by any function block instance

Justification: Unused variables make a program less readable and maintainable. Unused variables unnecessarily fill memory and unnecessarily waste runtime during initialization.

Importance: Medium

PLCopen rule: CP24

**Example**

```plaintext
FUNCTION_BLOCK AFB
VAR_INPUT
    iIn1: INT;
    iIn2: INT;
END_VAR

VAR_OUTPUT
    iOut1: INT;
END_VAR

PROGRAM PLC_PRG
VAR
    Fb1: AFB;
END_VAR

Fb1(iIn1 := 99)
--> SA0035: Unused input 'iIn2'
```

See also

- ⇢ *Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601*

**SA0036: Unused output variables**

Detects output variables that are not used by any function block instance

Justification: Unused variables make a program less readable and maintainable. Unused variables unnecessarily fill memory and unnecessarily waste runtime during initialization.
Example

```plaintext
FUNCTION_BLOCK AFB
VAR_INPUT
  iIn1: INT;
  iIn2: INT;
END_VAR
VAR_OUTPUT
  iOut1: INT;
END_VAR
PROGRAM PLC_PRG
VAR
  Fb1: AFB;
END_VAR
Fb1(iIn1 := 99)
--> SA0036: Unused output 'iOut1'
```

See also
- § Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601

**SA0034: Enumerations with incorrect assignment**

Detects values that are assigned to an enumeration variable. Only defined enumeration constants of an enumeration variable are permitted to be assigned.

Justification: A variable of the enumeration type should have only the intended values, otherwise the code that uses this variable may not work correctly. We recommend to always use enumerations with the `{attribute 'strict'}`. Then the compiler already checks the correct use of the enumeration components.

Importance: High

Example

```plaintext
TYPE COLOR :
  (  
    Red := 0,
    Green,
    Yellow
  );
END_TYPE

PROGRAM PLC_PRG
VAR
  eColor1: COLOR;
END_VAR

eColor1 := COLOR.Red;
eColor1 := 1;     // SA0034
--> SA0034: Use enumeration value instead of 'INT#1'
```

See also
- § Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601
SA0037: Write access to input variable

Detects input variables (VAR_INPUT) that are accessed with write permission within the POU

Justification: According to the IEC 61131-3 standard, an input variable must not be changed within a POU. This kind of access is also a cause for errors and makes the code poorly maintainable. This is an indication that a variable is used as both an input variable and an auxiliary variable. This kind of dual use should be avoided.

Importance: Medium

Example

```plaintext
VAR_GLOBAL
  g_xGlob AT %QX0.0 : BOOL;
END_VAR

PROGRAM PLC_PRG
VAR_INPUT
  xVarIn1:BOOL;
  xVarIn2:BOOL;
END_VAR
VAR
  iCondition : INT;
END_VAR

iCondition := iCondition + INT#1;
CASE iCondition OF
  INT#1:
    g_xGlob := xVarIn1;
  INT#2:
    g_xGlob := xVarIn2;
ELSE
  g_xGlob := FALSE;
  xVarIn1 := FALSE;  // SA0037
END_CASE

--> SA0037: Write access to input variable 'xVarIn1'
```

See also

- Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601

SA0038: Read access to output variable

Detects output variables (VAR_OUTPUT) that are accessed with read permission within the POU

Justification: According to the IEC 61131-3 standard, it is prohibited to read an output within a POU. This is an indication that the output is not only used as an output but also as a temporary variable for intermediate results. This kind of dual use should be avoided.

Importance: Low
Example

```plaintext
VAR_GLOBAL
    g_xGlob AT %QX0.0 : BOOL ;
    g_iGlob AT %QW1 : INT ;
END_VAR

PROGRAM PLC_PRG
VAR_OUTPUT
    xVarOut1:BOOL;
    xVarOut2:INT;
    xVarOut3:INT;
END_VAR
VAR
    iCondition : INT;
END_VAR

iCondition := iCondition + INT#1;
CASE iCondition OF
    INT#1:
        xVarOut1 := g_xGlob;
        xVarOut2 := g_iGlob;
    INT#2:
        xVarOut3 := xVarOut2; // SA0038
    ELSE
        xVarOut1 := FALSE;
        g_xGlob := xVarOut1; // SA0038
        xVarOut2 := INT#0;
        xVarOut3 := INT#-1;
END_CASE

--> SA0038: Read access to output variable 'xVarOUT2'
--> SA0038: Read access to output variable 'xVarOUT1'
```

See also

- ¶ Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601

SA0040: Possible division by zero

Detecets code locations where there is possible division by zero

Justification: Division by zero should never occur, and a variable denominator should always be checked for 0 first.

Importance: High
**Example**

```plaintext
VAR_GLOBAL
    g_iVar AT %QW1 : INT;
END_VAR

PROGRAM PLC_PRG
VAR
    iCounter : INT;
    iSumme : INT;
    iMid : INT;
    iVal1 : INT := INT#2;
    iVal2 : INT;
    iVal3 : INT := INT#3;
    iVal4 : INT := INT#4;
    iVal5 : INT;
END_VAR

IF iVal2 <> 0 THEN
    iVal1 := iVal1 / iVal2;  // no error
END_IF;

iMid := iSumme / iCounter;  // SA0040
iCounter := iCounter + INT#1;
iSumme := g_iVar + iSumme;
IF iMid < INT#100 THEN
    iVal1 := iVal1 / iVal2;  // SA0040
END_IF

--> SA0040: Possible division by zero
--> SA0040: Possible division by zero
```

See also

- ☀ Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601

**SA0041: Detect possible loop invariant code**

Detects assignments in loops that calculate the same value for each loop cycle. These lines of
code could possibly be inserted outside of the loop.

Justification: This is a performance warning. Code that is executed in a loop, but does the same
thing in each loop cycle, can be executed outside of the loop.

Importance: Medium

**Example**

```plaintext
PROGRAM PLC_PRG
VAR
    iCounter, iVar1, iVar2: INT;
END_VAR

FOR iCounter := 0 TO 10 DO
    iVar1 := 100;        // SA0041
    iVar2 := iVar2 + iVar1;
END_FOR

--> SAN0041: Possible loop invariant code 'iVar1 := 100'
```

See also

- ☀ Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601
SA0042: Usage of different access paths

Detects the usage of different access paths for the same variable

Justification: Different access to the same element decreases the readability and maintainability of a program. We recommend the consistent usage of `{attribute 'qualified-only'}` for libraries, global variable lists, and enumerations. This forces a fully qualified access.

Importance: Low

Example

```plaintext
VAR_GLOBAL
    iTemp:INT;
    instPOU:POU;
END_VAR

FUNCTION_BLOCK POU
VAR
    a:INT;
END_VAR
    a := INT#1;

PROGRAM SA0042
VAR
    ptiTemp:POINTER TO INT;
    sTemp:STRING;
END_VAR
    ptiTemp := ADR(iTemp);
    ptiTemp^:= INT#1;
    iTemp:= INT#2;                       // SA0042 - direct access
    on variable
    GVL.iTemp := INT#2;                  // SA0042 - access on
    variable via GVL
    sTemp := CONCAT( 'ab', 'cd');        // SA0042 - direct access on
    function
    sTemp := Standard.CONCAT( 'ab', 'cd'); // SA0042 - access on
    function via Standard
    instPOU();                           // SA0042 - direct access
    on POU instance
    GVL.instPOU();                       // SA0042 - access via GVL

--> SA0042: Different access paths for 'CONCAT'
--> SA0042: Different access paths for 'Standard.CONCAT'
--> SA0042: Different access paths for 'instPOU'
--> SA0042: Different access paths for 'GVL.instPOU'
--> SA0042: Different access paths for 'iTemp'
--> SA0042: Different access paths for 'GVL.iTemp'
```

See also

- Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601

SA0043: Use of a global variable in only one POU

Detects the use of a global variable in only a single POU

Justification: A global variable that is used in only one location should also only be declared at this location.

Importance: Medium
PLCopen rule: CP26

**Example**

```plaintext
VAR_GLOBAL
  g_xVar AT %QX0.0 : BOOL;
  g_iTest AT %QW1 : INT;
  g_wTest AT %QW2 : WORD;
END_VAR

PROGRAM prog1
VAR
  iCondition : INT;
  bTemp :BOOL;
END_VAR

  IF iCondition < INT#0 THEN
    bTemp := g_xVar; // SA0043 - g_xVar only read in this POU
  ELSEIF iCondition = INT#0 THEN
    bTemp := g_xVar; // SA0043 - g_xVar only read in this POU
  ELSE
    bTemp := g_xVar; // SA0043 - g_xVar only read in this POU
    g_wTest := WORD#4; // g_wTest used also in prog2 -> OK
  END_IF

PROGRAM prog2
VAR
  iCondition : INT;
END_VAR

  CASE iCondition OF
    INT#1:
      g_iTest := WORD_TO_INT(g_wTest); // SA0043 - g_iTest only written in this POU
    INT#2:
      g_iTest := INT#2;                 // SA0043 - g_iTest only written in this POU
    ELSE
      g_iTest := INT#3;                 // SA0043 - g_iTest only written in this POU
  END_CASE

--> SA0043: Global variable 'g_xVar' only used in 'prog1'
--> SA0043: Global variable 'g_iTest' only used in 'prog2'
```

- Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601

**SA0044: Declarations with reference to interface**

Detects declarations with `REFERENCE TO` interfaces and declarations of `VAR_IN_OUT` variables with interfaces (implicitly implemented by means of `REFERENCE TO`)

Justification: An interface type is always implicitly a reference to an instance of a function block that implements this interface. A reference to an interface is therefore a reference to a reference and can result in unwanted behavior.

Importance: High
**Example**  

ITF is an interface that is defined in the project.

```plaintext
PROGRAM PLC_PRG
VAR
    inst:POU;
    itf_inst1 : ITF;
    itf_ref : REFERENCE TO ITF; // SA0044
END_VAR FUNCTION_BLOCK POU
VAR_INPUT
    inst_itf2 : ITF;
END_VAR
VAR_OUTPUT
    inst_itf3 : ITF;
END_VAR
VAR_IN_OUT
    inst_itf4 : ITF;           // SA0044
END_VAR

--> SA0044: Reference to interface 'itf_ref'
--> SA0044: Reference to interface 'itf4_ref'
```

**Conversions**

1.7.3.2.37.1 SA0019: Implicit pointer conversions........................................ 3641
1.7.3.2.37.2 SA0130: Implicit expanding conversions.................................... 3642
1.7.3.2.37.3 SA0131: Implicit narrowing conversions.................................. 3643
1.7.3.2.37.4 SA0132: Implicit signed/unsigned conversions........................... 3644
1.7.3.2.37.5 SA0133: Explicit narrowing conversions.................................. 3644
1.7.3.2.37.6 SA0134: Explicit signed/unsigned conversions........................... 3645

**SA0019: Implicit pointer conversions**

Detects implicitly generated pointer conversions

Justification: In CODESYS, pointers are not strictly typed and they can be assigned to each other in any way. This is often used and therefore not reported by the compiler. However, it can also accidentally cause unexpected access. If you assign a POINTER TO BYTE to a POINTER TO DWORD, then you can unintentionally overwrite memory using the latter pointer. Therefore, always check this rule and block the message for cases in which you intentionally want to access a value with a different type.

Implicit data type conversions are reported with a different message.

Importance: High

PLCopen rule: CP25

Exception: BOOL <-> BIT
Example

PROGRAM PLC_PRG
VAR
  pINT : POINTER TO INT;
  byteVar : BYTE;
END_VAR

pINT := ADR(byteVar);

--> SA0019: Implicit conversion from pointer to 'POINTER TO BYTE'
to pointer to 'POINTER TO INT'

See also

● Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601

SA0130: Implicit expanding conversions

Detects implicit conversions from smaller data types to larger data types

Justification: The compiler permits any assignments of different types when the value range of the source type is completely contained within the value range of the target type. However, the compiler will build a conversion into the code as late as possible. For an assignment of type lint := dint * dint, the compiler performs the implicit conversion only after multiplication: lint := TO_LINT(dint * dint). An overflow is therefore truncated. To prevent this, you can already convert the elements: lint := TO_LINT(dint) * TO_LINT(dint). Therefore, it may be useful to report locations where the compiler implements implicit conversions in order to check whether these are exactly what is intended. Furthermore, explicit conversions can be used to improve portability to other systems when those systems have more restrictive type checks.

Importance: Low
Example

PROGRAM PLC_PRG
VAR
  byTemp : BYTE;
  usiTemp : USINT;
    uiTemp : UINT;
    iTemp : INT;
    udiTemp : UDINT;
  diTemp : DINT;
  uliTemp : ULINT;
    liTemp : LINT;
    lwTemp : LWORD;
    lrTemp : LREAL;
END_VAR

liTemp := iTemp;       // SA0130
uliTemp := usiTemp;    // SA0130
lwTemp := udiTemp;     // SA0130
lrTemp := byTemp;      // SA0130
diTemp := uiTemp;      // SA0130

byTemp.5 := FALSE;     // OK (BIT_BOOL conversion)

--> SA0130: Implicit widening conversion from type 'INT' to type 'LINT'
--> SA0130: Implicit widening conversion from type 'USINT' to type 'ULINT'
--> SA0130: Implicit widening conversion from type 'UDINT' to type 'LWORD'
--> SA0130: Implicit widening conversion from type 'BYTE' to type 'LREAL'
--> SA0130: Implicit widening conversion from type 'UINT' to type 'DINT'

See also

● "Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601"

SA0131: Implicit narrowing conversions

Detects implicit conversions from larger data types to smaller data types

Justification: This message is obsolete now because it is already reported as a warning by the compiler.

Importance: Low

Example

PROGRAM PLC_PRG
VAR
  rTemp : REAL;
  lrTemp : LREAL;
END_VAR
rTemp := lrTemp;    // SA0131

--> SA0131: Implicit narrowing conversion from type 'LREAL' to type 'REAL'

See also

● "Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601"
SA0132: Implicit signed/unsigned conversions

Detects implicit conversions from signed data types to unsigned data types or the other way around.

This message is obsolete now because it is already reported as a warning by the compiler.

Importance: Low

Example

```plaintext
PROGRAM PLC_PRG
VAR
  byTest : BYTE;
  udiTest: UDINT;
  ulktest: ULIINT;
  wTest : WORD;
  lwTest : LWORD;
  siTest : SINT;
  iTest : INT;
  diTest : DINT;
  liTest : LINT;
END_VAR
liTest := ulktest;    // SA0132
udiTest:= diTest;     // SA0132
siTest := byTest;     // SA0132
wTest := iTest;       // SA0132
lwTest := siTest;     // SA0132
---> SA0132: Implicit signed/unsigned conversion from type 'ULINT' to type 'LINT'
---> SA0132: Implicit signed/unsigned conversion from type 'DINT' to type 'UDINT'
---> SA0132: Implicit signed/unsigned conversion from type 'BYTE' to type 'SINT'
---> SA0132: Implicit signed/unsigned conversion from type 'INT' to type 'WORD'
---> SA0132: Implicit signed/unsigned conversion from type 'SINT' to type 'LWORD'
```

See also

- § Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601

SA0133: Explicit narrowing conversions

Detects explicit conversions from a larger data type to a smaller data type

Justification: A large number of type conversions may indicate that you have chosen the wrong data types for variables. For this reason, there are programming guidelines that require an explicit justification for data type conversions.

Importance: Low
Example

PROGRAM SA0133
VAR
    siVar:SINT;
    diVar:DINT;
    liVar:LINT;
    byVar:BYTE;
    uiVar:UINT;
    dwVar:DWORD;
    lwVar:LWORD;
    rVar:REAL;
    lrVar:LREAL;
END_VAR
siVar := LINT_TO_SINT(liVar);     // SA0133
byVar := DINT_TO_BYTE(diVar);     // SA0133
siVar := DWORD_TO_SINT(dwVar);    // SA0133
uiVar := LREAL_TO_UINT(lrVar);    // SA0133
rVar := LWORD_TO_REAL(lwVar);     // SA0133

--> SA0133: Explicit narrowing conversion from type 'LINT' to type 'SINT'
--> SA0133: Explicit narrowing conversion from type 'DINT' to type 'BYTE'
--> SA0133: Explicit narrowing conversion from type 'DWORD' to type 'SINT'
--> SA0133: Explicit narrowing conversion from type 'LREAL' to type 'UINT'
--> SA0133: Explicit narrowing conversion from type 'LWORD' to type 'REAL'

See also

- § Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601

SA0134: Explicit signed/unsigned conversions

Detects explicit conversions from signed data types to unsigned data types and the other way around.

Justification: Excessive use of type conversions may indicate that you have chosen the wrong data types for variables. For this reason, there are programming guidelines that require an explicit justification for data type conversions.

Importance: Low
Example

```plaintext
PROGRAM PLC_PRG
VAR
  byVar : BYTE;
  udiVar : UDINT;
  uliVar : ULLINT;
  lwVar : LWORD;
  wVar : WORD;
  siVar : SINT;
  iVar : INT;
  diVar : DINT;
  liVar : LINT;
END_VAR
liVar := ULLINT_TO_LINT(uliVar);
udiVar := DINT_TO_UDINT(diVar);
siVar := BYTE_TO_SINT(byVar);
wVar := INT_TO_WORD(iVar);
lwVar := SINT_TO_LWORD(siVar);

--> SA0134: Explicit signed/unsigned conversion from type 'ULLINT'
to type 'LINT'
--> SA0134: Explicit signed/unsigned conversion from type 'DINT' to
type 'UDINT'
--> SA0134: Explicit signed/unsigned conversion from type 'BYTE' to
type 'SINT'
--> SA0134: Explicit signed/unsigned conversion from type 'INT' to
type 'WORD'
--> SA0134: Explicit signed/unsigned conversion from type 'SINT' to
type 'LWORD'
```

Use of Direct Addresses

1.7.3.2.38.1 SA0005: Invalid addresses and data types............................. 3646
1.7.3.2.38.2 SA0047: Accesses to direct address....................................... 3647
1.7.3.2.38.3 SA0048: AT-declarations on direct addresses......................... 3647

SA0005: Invalid addresses and data types

Detects invalid addresses and data type specifications. Valid size prefixes in addresses: X for
BOOL B for 1-byte data types, W for 2-byte data types, and D for 4-byte data types.

Justification: Variables located on direct addresses should preferably be associated with an
address that corresponds to their data type width. It can be confusing for the reader of the code,
for example, if a DWORD is assigned to a BYTE address.

Importance: Low
Example

PROGRAM Check_Address_Type_PRG
VAR
  iVar AT %QB0 : INT ;   // OK e. g.: %QW0
  xTest AT %QW1 : BOOL ; // OK e. g.: %QX1.0
END_VAR

iVar := iVar + INT#1;
xTest := NOT xTest;

--> SA0005: Invalid address for data type 'iVar'

See also

● % Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601

SA0047: Accesses to direct address

Detects direct address access in the implementation code

Justification: Symbolic programming is always preferable. A variable has a name that can also have a meaning. An address cannot indicate what it is used for.

Importance: High
PLCopen rule: N1 / CP1

Example

PROGRAM PLC_PRG
VAR
  xVar : BOOL;
  byVar : BYTE;
END_VAR

xVar := %IX0.0;
%QX0.0 := xVar;
%MX0.1 := xVar;
%MB1 := byVar;

--> Access to direct address '%IX0.0'
--> Access to direct address '%QX0.0'
--> Access to direct address '%MX0.1'
--> Access to direct address '%MB1'

See also

● % Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601

SA0048: AT-declarations on direct addresses

Detects AT declarations on direct addresses

Justification: The use of direct addresses in the code is problematic because the address then appears in multiple locations: first in the controller configuration where the assignment of a physical object to an address is defined, and second in the program where variables are assigned to these addresses. If the addresses are relocated because the configuration is changed, then you have to reassign variables to addresses at a completely different location in the program. This is a cause of error and results in poorer readability and maintainability of the code. Therefore, it is best to perform all assignments in the I/O mapping of the device editor.

Importance: High
PLCopen rule: N1 / CP1

Note: We recommend that you use direct addresses ONLY in the “I/O Mapping” tab of the device editor.

Example

```plaintext
PROGRAM PLC_PRG
VAR
  xVar1 AT %IX0.0 : BOOL;
  byVar1 AT %IB1 : BYTE;
  xVar2 AT %QX0.0 : BOOL;
END_VAR

--> SA0048: Declaration uses direct address '%IX0.0'
--> SA0048: Declaration uses direct address '%IB1'
--> SA0048: Declaration uses direct address '%QX0.0'
```

**SA0051: Comparison operations on BOOL variables**

Detects comparison operations on variables of type **BOOL**

Justification: CODESYS permits these kinds of comparison, but they are very unusual and can be confusing. The IEC 61131-3 standard does not provide for these comparisons. By avoiding them, you increase the portability of the code to other development systems.

Importance: Medium
Example

PROGRAM PLC_PRG
VAR
    xBool1, xBool2 : BOOL;
    xResult : BOOL;
END_VAR

xResult := xBool1 > xBool2;  // SA0051
xBool1 := NOT xBool1;           // OK!
xBool2 := xBool2 XOR xBool1;    // OK!

--> SA0051: Comparison operations on BOOL variables

See also

● % Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601

SA0052: Unusual shift operation

Detects shift operations (bit shift) on signed variables. In the case of shift operations on bit field data types (Byte, DWORD, LWORD, WORD), an error is not reported.

Justification: CODESYS permits shift operations on signed data types. However, these operations are unusual and can be confusing. The IEC 61131-3 standard does not provide for these kinds of operations. Therefore, they should be avoided in order to increase the portability of the code to other development systems.

Importance: Medium

Example

PROGRAM PLC_PRG
VAR
    iTemp : INT;
    dwTemp1 : DWORD;
    byTemp2 : BYTE;
    diTemp3 : DINT;
    siTemp4 : SINT;
    liTemp5 : LINT;
END_VAR

//the following lines each will cause an  SA0052:
iTemp := SHL(iTemp, BYTE#2);
diTemp3 := SHR(diTemp3, BYTE#4);
siTemp4 := ROL(siTemp4, BYTE#2);
liTemp5 := ROR(liTemp5, BYTE#2);

//no error SA0052 because DWORD and BYTE are bit field data types:
dwTemp1 := SHL(dwTemp1, BYTE#3);
byTemp2 := SHR(byTemp2, BYTE#1);

---> SA0052: Unusual shift operation

See also

● % Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601

SA0053: Too big bitwise shift

Detects whether or not the data type width of the operand has been exceeded in the case of a bitwise shift (bit shift) of operands
Justification: If a shift operation exceeds the data type width, then a constant 0 is generated. If a rotation shift exceeds the data type width, then it is difficult to read. Therefore, the rotation value should be shortened.

Importance: High

Example

```plaintext
PROGRAM PLC_PRG
VAR
  byTemp1 : BYTE;
  wTemp2 : WORD;
  dwTemp3 : DWORD;
  lwTemp4 : LWORD;
END_VAR
byTemp1 := SHR(byTemp1, BYTE#25);
wTemp2 := SHL(wTemp2, BYTE#45);
dwTemp3 := ROR(dwTemp3, BYTE#78);
lwTemp4 := ROL(lwTemp4, BYTE#111);
--> SA0053: Too big bitwise shift
```

See also

- Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601

SA0054: Comparisons of REAL/LREAL for equality / inequality

Detects whether or not the comparison operators = (equality) and <> (inequality) compare the operands of type REAL or LREAL

Justification: REAL/LREAL values are implemented as floating-point numbers according to the IEEE 754 standard. This standard implies that specific, apparently simple decimal numbers cannot be represented with precision. As a result, there may be different representations as LREAL for the same decimal number.

Consider the following lines of code:

```plaintext
lr11 := 1.1;
lr33 := 3.3;
lrVar1 := lr11 + lr11;
lrVar2 := lr33 - lr11;
botest := lrVar1 = lrVar2;
```

In this case, `botest` returns FALSE, even if the variables `lrVar1` and `lrVar2` both return the monitoring value of 2.2. This is not an error of the compiler, but a property of the floating point units of all conventional processors. You can avoid this by specifying a minimum value by which the values may differ: `botest := ABS(lrVar1 - lrVar2) < 0.1;`

Exception: A comparison with 0.0 is not reported by this analysis. For the 0, there is an exact representation in the IEEE 754 standard, and therefore the comparison functions normally as expected. Therefore, for better performance, it makes sense to permit a direct comparison here.

Importance: High

PLCopen rule: CP54
Example

PROGRAM PLC_PRG
VAR
    rTest1 : REAL;
    rTest2 : REAL;
    lrTest3 : LREAL;
    lrTest4 : LREAL;
    xResult : BOOL;
END_VAR

//the following lines each will cause an SA0054:
    xResult := rTest1 = rTest1;
    xResult := rTest1 = rTest2;
    xResult := rTest1 <> rTest2;
    xResult := lrTest3 = lrTest3;
    xResult := lrTest3 = lrTest4;
    xResult := lrTest3 <> lrTest4;
//the following lines each will not cause an SA0054:
    xResult := rTest1 > rTest2;
    xResult := lrTest3 < lrTest4;

--> SA0054: Comparisons of REAL/LREAL for equality / inequality

See also
● Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601

SA0055: Unnecessary comparisons of unsigned operands

Detects unnecessary comparisons with unsigned operands. An unsigned data type is never less than zero. This can be used as a sign check.

Justification: A comparison detected with this check yields a constant result and is an indication of an error in the code.

Importance: High

Example

PROGRAM PLC_PRG
VAR
    byTest: BYTE;
END_VAR

WHILE byTest >= 0 DO
    byTest := byTest - 1;
END_WHILE;

--> SA0055: Unnecessary comparisons of unsigned operands

See also
● Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601

SA0056: Constant out of valid range

Detects literals (constants) outside of the valid range of the operator

Justification: The message is issued for an operation that returns the constant TRUE or FALSE. This is an indication of a programming error.

Importance: High
Example

PROGRAM PLC_PRG
VAR
  byTestVar: BYTE;
END_VAR

WHILE byTestVar >= 0 DO
  byTestVar := byTestVar + 1;
END_WHILE

--> SA0056: Constant out of valid range

See also

- Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601

SA0057: Possible loss of decimal places

Detects statements with possible loss of decimal places

Justification: A piece of code of the following type (diTemp2 := 1 rTemp1 := 
TO_REAL(diTemp2 / DINT#2)) can cause a misinterpretation. The author or reader of this line of code can assume that the division would be performed as a REAL operation, and in this case the result would be REAL#0.5. However, this is not true. It is an integer operation. The result is cast to REAL and rTemp1 gets the value REAL#0. To avoid this, use a cast to make sure that the operation is performed as a REAL operation: rTemp1 := TO_REAL(diTemp2) / REAL#2.

Importance: Medium

Example

PROGRAM PLC_PRG
VAR
  rTemp1 : REAL;
  diTemp2 : DINT;
  liTemp3 : LINT;
END_VAR

diTemp2 := diTemp2 + DINT#11;
rTemp1 := DINT_TO_REAL(diTemp2 / DINT#3); // SA0057
rTemp1 := DINT_TO_REAL(diTemp2) / REAL#3.0;
liTemp3 := liTemp3 + LINT#13;
rTemp1 := LINT_TO_REAL(liTemp3 / LINT#7); // SA0057
rTemp1 := LINT_TO_REAL(liTemp3) / REAL#7.0;

--> SA0057: Possible loss of decimal places

See also

- Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601

SA0058: Operations on enumeration variables

Detects operations on variables of the enumeration data type Assignments are permitted.

Justification: Enumerations should not be used as ordinary integer values. You can also define an alias data type or use a subrange type.

Importance: Medium
Exception: If an enumeration is tagged with the pragma \{attribute 'strict'\}, then the compiler already reports this kind of operation.

If an enumeration is declared as a flag by the pragma \{attribute 'flags'\}, then an error is not issued for \texttt{AND}, \texttt{OR}, \texttt{NOT}, or \texttt{XOR} operations.

**Example**

```plaintext
TYPE My_Enum :
 (   red := 1, blue := 2, green := 3, black := 4
 );
END_TYPE

PROGRAM PLC_PRG
VAR
   iTemp1 : INT;
   abc : My_Enum;
END_VAR

iTemp1 := iTemp1 + INT#1;
abc := My_Enum.red; // OK
iTemp1 := My_Enum.black / My_Enum.blue; // SA0058
iTemp1 := My_Enum.green / My_Enum.red; // SA0058

--> SA0058: Operations on enumeration variables
```

**Example with a pragma \{attribute 'flags'\}**

```plaintext
{attribute 'flags'} // declaring the enumeration as a "flag"
TYPE Flags :
 (   Unknown := 16#00000001,
      Stopped := 16#00000002,
      Running := 16#00000004
 ) DWORD;
END_TYPE

PROGRAM PLC_PRG
VAR
   iTemp1 : INT;
   abc : Flags;
   batate : BYTE;
   dwFlags : DWORD;
   dwState : DWORD;
END_VAR

// OK for the following
IF (dwFlags AND Flags.Unknown) <> DWORD#0 THEN
   dwState := dwState AND Flags.Unknown;
ELSIF (dwFlags OR Flags.Stopped) <> DWORD#0 THEN
   dwState := dwState OR Flags.Running;
END_IF
```

See also

- ≫ Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601
SA0059: Comparison operations always returning TRUE or FALSE

Detects comparisons with literals that always have the result TRUE or FALSE, and can already be processed during the compile.

Justification: An operation that consistently yields TRUE or FALSE is an indication of a programming error.

Importance: High

Example

PROGRAM PLC_PRG
VAR
  byTemp1 : BYTE;
END_VAR

WHILE byTemp1 <= 255 DO
  byTemp1 := byTemp1 + 1;
END_WHILE;

--> SA0059: Relational operator '<=' always evaluates 'TRUE'

See also

● Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601

SA0060: Zero used as invalid operand

Detects operations where an operand with the value "0" causes an invalid or a nonsense operation.

Justification: This kind of expression could be an indication of a programming error. In any case, it unnecessarily wastes runtime.

Importance: Medium

Example

PROGRAM PLC_PRG
VAR
  byTemp1 : BYTE;
  wTemp2 : WORD;
  dwTemp3 : DWORD;
END_VAR

byTemp1 := byTemp1 + 0;
wTemp2 := wTemp2 - WORD#0;
dwTemp3 := dwTemp3 * DWORD#0;

--> SA0060: Zero used as invalid operand

See also

● Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601

SA0061: Unusual operation on pointer

Detects operations one variables of type POINTER TO which are not = (equality), <> (inequality), + (addition), or ADR.
In CODESYS, pointer arithmetic is generally permitted and can also be used appropriately. Therefore, the addition of a pointer with an integer value is considered a common operation on pointers. This makes it possible to use a pointer to process an array of variable length. All other (unusual) operations with pointers are reported with SA0061.

Importance: High
PLCopen rule: E2 / E3

**Example**

```plaintext
PROGRAM PLC_PRG
VAR
  piTemp : POINTER TO INT;
  iTemp : INT;
END_VAR

iTemp := iTemp + INT#1;
piTemp := ADR(iTemp);
piTemp := piTemp * DWORD#5; // SA0061
piTemp := piTemp / DWORD#2; // SA0061
piTemp := piTemp MOD DWORD#3; // SA0061
piTemp := piTemp + DWORD#1;
piTemp := piTemp - DWORD#1; // SA0061

--> SA0061: Unusual operation on pointer
```

See also

- Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601

**SA0062: Uses of TRUE or FALSE in expressions**

Detects the use of the literals TRUE or FALSE in expressions

Justification: This kind of expression is obviously unnecessary and may indicate an error. In any case, the expression unnecessarily affects the runtime.

Importance: Medium

**Example**

```plaintext
PROGRAM PLC_PRG
VAR
  xTemp1, xTemp2 : BOOL;
END_VAR
xTemp1 := xTemp1 AND NOT TRUE;
xTemp2 := xTemp1 OR TRUE;
xTemp2 := xTemp1 OR NOT FALSE;
xTemp2 := xTemp1 AND FALSE;

--> Uses of TRUE or FALSE in expressions
```

See also

- Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601

**SA0063: Possibly not 16-bit-compatible operations**

Detects 16-bit operations with temporary results. Background: On 16-bit systems, 32-bit temporary results can be truncated. Example: (int+10) can exceed 16 bits.

Justification: In the very rare case that you have to write code which should run on a 16-bit processor as well as on a 32-bit processor, this message should help to prevent any problems.
Importance: Low

Example

PROGRAM PLC_PRG
VAR
    iVar : INT;
END_VAR
iVar := (iVar + 10) / 2;

--> SA0063: Compatibility for 16 Bit - Possible truncated intermediate result

See also
- Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601

SA0064: Addition of pointer

Detects the addition of pointers

Justification: In CODESYS, pointer arithmetic is generally permitted and can also be used appropriately. However, it is also a source of errors. Therefore, programming rules exist that generally prohibit pointer arithmetic. This test can check such a requirement.

Importance: Medium

Example

PROGRAM PLC_PRG
VAR
    iTest:INT;
    ariTest:ARRAY[0..10] OF INT;
    {attribute 'analysis':='-111'}
    piTest:POINTER TO INT;
    i:INT;
END_VAR

piTest := ADR(ariTest[0]);            // OK
piTest^:= 0;
piTest := ADR(ariTest) + SIZEOF(INT); // SA0064
piTest^:= 1;
piTest := ADR(ariTest) + 6;           // SA0064
piTest^:= 3;
piTest := ADR(ariTest[10]);
FOR i:=0 TO 10 DO
    piTest^ := i;
    piTest := piTest + 2;               // SA0064
END_FOR

--> SA0064: Addition of pointer

See also
- Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601

SA0065: Incorrect pointer addition to base size

Detects pointer additions for which the value to be added does not match the base size of the pointer. Only literals of the base size can be added. Also multiplication products of the base size cannot be added.
Justification: In CODESYS (in contrast to C and C++), when adding a pointer with an integer value, only this integer value is added as the number of bytes, and not the integer value multiplied by the base size. Example in ST:

```plaintext
pINT := ADR(array_of_int[0])
pINT := pINT + 2 ;  // In CODESYS, pINT then points to array_of_int[1]
```

This code would function differently in C:

```plaintext
short* pShort
pShort = &(array_of_short[0])
pShort = pShort + 2;  // In C, pShort then points to array_of_short[2]
```

Therefore, in CODESYS, you should always add a multiple of the base size of the pointer to a pointer. Otherwise, the pointer may point to non-aligned memory which (depending on the processor) can lead to an alignment exception when accessing it.

Importance: High

### Example

```plaintext
VAR
  pudiTest:POINTER TO UDINT;
  udiTest:UDINT;
  prTest:POINTER TO REAL;
  rTest:REAL;
END_VAR

pudiTest := ADR(udiTest) + 4;                  // OK
pudiTest := ADR(udiTest) + ( 2 + 2 );          // OK
pudiTest := ADR(udiTest) + SIZEOF(UDINT);      // OK
pudiTest := ADR(udiTest) + 3;                   // SA0065
pudiTest := ADR(udiTest) + 2*SIZEOF(UDINT);    // SA0065
pudiTest := ADR(udiTest) + ( 3 + 2 );          // SA0065
prTest := ADR(rTest);
prTest := prTest + 4;                          // OK
prTest := prTest + ( 2 + 2 );                  // OK
prTest := prTest + SIZEOF(REAL);               // OK
prTest := prTest + 1;                          // SA0065
prTest := prTest + 2;                          // SA0065
prTest := prTest + 3;                          // SA0065
prTest := prTest + ( SIZEOF(REAL) - 1 );       // SA0065
prTest := prTest + ( 1 + 4 );                  // SA0065
```

```plaintext
 --> SA0065: Incorrect pointer addition to base size
```

- “Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601

### SA0066: Uses of temporary results

Detects the use of temporary results in statements with a data type that is less than the registry size. The implicit cast in this case may lead to unwanted results.

Justification: For performance reasons, CODESYS performs operations on the register width of the processor. Intermediate results are not truncated. This can lead to misinterpretations as in the following case:

```plaintext
usintTest := 0; xError := usintTest - 1 <> 255;
```

In CODESYS, `xError` is TRUE in this case because the operation `usintTest - 1` is typically executed as a 32-bit operation and the result is not cast to the byte size. Then the value `16#ffffffff` (not equal to 255) is located in the registry. To avoid this, you have to cast the intermediate result explicitly:

```plaintext
xError := TO_USINT(usintTest - 1) <> 255;
```
NOTICE!

If this message is activated, then many less problematic locations in the code will be reported. Although a problem can only occur when the operation produces an overflow or underflow in the data type, the static analysis cannot differentiate between the individual locations.

If you include an explicit typecast in all reported locations, then the code will be much slower and less readable.

Importance: Low

Example

PROGRAM PLC_PRG
VAR
  byTest:BYTE;
  liTest:LINT;
  xError:BOOL;
END_VAR

//type size smaller than register size;
byTest := 0;
IF (byTest - 1) <> 255 THEN //use of temporary result + implicit casting -> SA0066
  xError := TRUE;
ELSE
  xError := FALSE;
END_IF

//type size equal to or bigger than register size;
liTest := 0;
IF (liTest - 1) <> -1 THEN // use of temporary result and no implicit casting -> OK
  xError := TRUE;
ELSE
  xError := FALSE;
END_IF

--> SA0066: Use of temporary result: (byTest - USINT #1)

Rules for Statements

1.7.3.2.40.1  SA0072: Invalid uses of counter variable........................................ 3659
1.7.3.2.40.2  SA0073: Uses of inadequate counter variable.............................. 3659
1.7.3.2.40.3  SA0080: Loop index variable for array index exeeds array range.............................. 3659
1.7.3.2.40.4  SA0081: Upper border is not a constant........................................ 3660
1.7.3.2.40.5  SA0075: Missing ELSE................................................ 3661
1.7.3.2.40.6  SA0076: Missing enumeration constant................................... 3662
1.7.3.2.40.7  SA0077: Type mismatches with CASE expression....................... 3663
1.7.3.2.40.8  SA0078: Missing CASE branches......................................... 3663
1.7.3.2.40.9  SA0090: Return statement before end of function.................... 3664
SA0072: Invalid uses of counter variable

Detects the use of a counter variable in a **FOR** loop

Justification: Manipulation of the counter variable in a **FOR** loop can easily result in an infinite loop. To prevent the execution of the loop for specific values of the counter variable, use **CONTINUE** or simply an **IF**.

Importance: High

PLCopen rule: L12

**Example**

```plaintext
PROGRAM PLC_PRG
VAR_TEMP
  iIndex : INT;
END_VAR
FOR iIndex := INT#0 TO INT#20 BY INT#1 DO
  iIndex := iIndex - INT#1;
END_FOR
--> SA0072: Invalid use of counter variable 'iIndex'
```

See also
- Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601

SA0073: Uses of inadequate counter variable

Detects the use of non-temporary variables in **FOR** loops.

Justification: This is a performance warning. A counter variable is always initialized each time a POU is called. You can create this variable as a temporary variable (**VAR_TEMP**). Access to it may be faster and the variable does not take up any permanent memory.

Importance: Medium

PLCopen rule: CP21 / L13

**Example**

```plaintext
PROGRAM PLC_PRG
VAR
  nIndex : INT;
  iVar : INT;
END_VAR
FOR nIndex := INT#0 TO INT#20 BY INT#1 DO
  iVar := iVar + nIndex;
END_FOR
--> SA0073: Inadequate counter variable
```

See also
- Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601

SA0080: Loop index variable for array index exceeds array range

Detects the **FOR** statements where the index variable is used to access an array index and exceeds the range of the array index.
Justification: Arrays are typically processed in **FOR** loops. The start and end value of the counter variable should typically match (or at least not exceed) the upper and lower bounds of the array. A typical cause of error is detected here when array bounds are changed and constants are not carefully used; or when a different value is used accidentally in the **FOR** loop than in the array declaration.

Importance: High

**Example**

```plaintext
PROGRAM PLC_PRG
VAR
  iIndex1, iIndex2, iIndex3 : INT;
  arWord : ARRAY[1..100] OF WORD;
  arararINT : ARRAY[1..9, 1..9, 1..9] OF INT;
  arUSINT : ARRAY[0..99] OF USINT;
END_VAR

//1 violation of the rule (lower range is exceeded): SA0080
FOR iIndex1 := INT#0 TO INT#100 DO
  arWord[iIndex1] := INT_TO_WORD(iIndex1);
END_FOR

//6 violations (lower and upper range is exceeded for each array dimension): 3SA0080
FOR iIndex2 := INT#0 TO INT#10 DO
  arararINT[iIndex2, iIndex2, iIndex2] := iIndex2;
END_FOR

//1 violation (upper range is exceeded by the end result of the index), previous expressions on index are not evaluated -> OK
FOR iIndex3 := INT#0 TO INT#50 DO
  arUSINT[iIndex3 * INT#2] := INT_TO_USINT(iIndex3);
END_FOR

--> SA0080: Loop index range of 'Index1' exceeds array range
--> SA0080: Loop index range of 'Index2' exceeds array range
```

See also

- Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601

**SA0081: Upper border is not a constant**

Detects the **FOR** statements where the upper bound is not defined with a constant value

Justification: If the upper bound of a loop is a variable value, then it is no longer possible to see how often a loop is executed. This can result in serious problems at runtime. The worst case is an infinite loop.

Importance: High
Example

PROGRAM PLC_PRG
VAR
  i:INT;
  iBorder1: INT := 10;
  iBorder2: INT := 10;
  iCounter: INT;
END_VAR
VAR CONSTANT
  ciBorder:INT := 10;
END_VAR
FOR i:=0 TO 10 DO    //OK
  iCounter := i;
END_FOR
FOR i:=0 TO ciBorder DO // OK
  iCounter := i;
END_FOR
FOR i:=0 TO iBorder1 DO    // SA0081
  iCounter := i;
END_FOR
FOR i:=0 TO iBorder2 DO    // SA0081
  iCounter := i;
  IF iCounter = 10 THEN
    iBorder2 := 50;
  END_IF
END_FOR
--> SA0081: Upper border of a for loop must be a constant value

See also

- Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601

SA0075: Missing ELSE

Detects CASE statements without an ELSE branch

Justification: Defensive programming requires the inclusion of an ELSE branch in every CASE statement. If there is nothing to do in the ELSE branch, then include a comment to indicate this. It is then clear to the reader of the code that the case was not simply forgotten.

Importance: Low

PLCopen rule: L17
Example

PROGRAM PLC_PRG
VAR
  iVar : INT;
  xTemp : BOOL;
END_VAR

iVar := iVar + INT#1;
CASE iVar OF
  INT#1:
  xTemp := FALSE;
  INT#2:
  xTemp := TRUE;
END_CASE

--> SA0075: Missing ELSE in CASE statement

See also

● § Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601

SA0076: Missing enumeration constant

Detects whether or not an enumeration variable is used as a condition and not all enumeration values are treated as CASE branches.

Justification: Defensive programming requires the processing of all possible values of an enumeration. If an action is not required for a particular enumeration value, then you should add a comment to indicate this explicitly. It is then clear to the reader of the code that the value was not simply forgotten.

Importance: Low

Example

TYPE My_Enum :
  (red := 1, blue := 2, green := 3, black := 4);
END_TYPE

PROGRAM PLC_PRG
VAR
  iVar : My_Enum;
  xTemp : BOOL;
END_VAR

iVar := My_Enum.black;
CASE iVar OF
  My_Enum.red:
  xTemp := FALSE;
  My_Enum.blue, My_Enum.green:
  xTemp := TRUE;
  ELSE
  xTemp := NOT xTemp;
END_CASE

--> SA0076: Missing enumeration constant 'black' in CASE statement

See also

● § Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601
SA0077: Type mismatches with CASE expression

Detects code locations where the data type of a condition does not match that of the CASE branch.

Justification: If the data types between the CASE variable and the CASE itself do not match, then this could indicate an error.

Importance: Low

Example

```
TYPE My_Enum :
   (eins := 1, zwei := 2, drei := 3, vier := 4);
END_TYPE

PROGRAM PLC_PRG
VAR
diVar : DINT;
xTemp : BOOL;
END_VAR
diVar := diVar + DINT#1;
CASE diVar OF
   DINT#1:
      xTemp := FALSE;
      My_Enum.zwei, DINT#3: //SA0077
      xTemp := TRUE;
      ELSE
      xTemp := NOT xTemp;
   END_CASE
```

See also

- *Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601*

SA0078: Missing CASE branches

Detects CASE statements without CASE branches and only one ELSE statement.

Justification: A CASE statement without cases wastes execution time and it is difficult to read.

Importance: Medium

Example

```
PROGRAM PLC_PRG
VAR
   iVar : INT;
xTemp : BOOL;
END_VAR
iVar := iVar + INT#1;
//in the following the case descriptions are missing:
CASE iVar OF
   ELSE
      xTemp := NOT xTemp;
END_CASE
```

--> SA0077: Type mismatches with CASE expression

--> SA0078: CASE-Missing CASE branches
SA0090: Return statement before end of function

Detects whether or not the `RETURN` statement is not the last statement in a function, method, property, or program.

Justification: A `RETURN` in the code results in worse maintainability, testability, and readability of the code. A `RETURN` in the code is easily overlooked. Before each `RETURN`, it is often forgotten to insert code that should always be executed when exiting a function.

Importance: Medium

PLCopen rule: CP14

Example

```plaintext
FUNCTION FUN : DINT
VAR_INPUT
  bTest : BOOL;
END_VAR

IF bTest THEN
  RETURN;
END_IF
FUN := 99;

--> SA0090: Return statement before end of function
```

See also

● § Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601

SA0095: Assignments in conditions

Detects assignments in conditions of `IF`, `CASE`, or `REPEAT` constructs

Justification: An assignment (:=) and a comparison (=) can easily be mistaken. As a result, an assignment in a condition can easily be unintentional, and it is therefore reported. This can also confuse the reader of the code.

Importance: High
Example

```plaintext
PROGRAM PLC_PRG
VAR
  iCond1:INT := INT#1;
iCond2:INT := INT#2;
xCond:BOOL := FALSE;
iVar : INT;
END_VAR

IF INT_TO_BOOL(iCond1 := iCond2) THEN                      // SA0095
  iCond1 := INT#1;
iCond2 := INT#2;
ELSIF (iCond1 := 11) = 11 THEN                             // SA0095
  iCond1 := INT#1;
iCond2 := INT#2;
END_IF

IF xCond := TRUE THEN                                      // SA0095
  xCond := FALSE;
END_IF

IF (xCond := FALSE) OR (iCond1 := iCond2) = 12 THEN        // SA0095
  xCond := FALSE;
iCond1 := INT#1;
iCond2 := INT#2;
END_IF

IF (iVar := iVar + 1) = 120 THEN                           // SA0095 (can be valid, but is not reparable very well
  iVar := 0;
END_IF

WHILE (xCond = TRUE) OR (iCond1 := iCond2) = 12 DO         // SA0095
  xCond := FALSE;
END_WHILE

// Error: assignment in repeat loop
REPEAT
  xCond := FALSE;
UNTIL
  (xCond = TRUE) OR (iCond1 := iCond2) = 12              // SA0095
END_REPEAT

--> SA0095: Assignment in condition: '...'
```

See also

- § Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601

SA0100: Variables greater than <n> bytes...

Detects variables that use more than n bytes, where n is defined by the current configuration.
Default value: 1024 bytes. The value can be changed by double-clicking the line.

Justification: Some programming guidelines specify a maximum size for a single variable. This can be checked with this.

Importance: Low
**Example**

```plaintext
PROGRAM PLC_PRG
VAR
   aobyTest : ARRAY [0..1024] OF BYTE;
END_VAR

aobyTest[INT#0] := aobyTest[INT#0] + BYTE#1;
--> SA0100: Variable 'aobyTest' greater 1024 bytes
```

See also

- "Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601"

**SA0101: Names with invalid length**

Detects names with invalid lengths. In the “Project Settings”, double-click the rule entry to open a dialog where you can define the length of the name and define any exception.

Justification: Some programming guidelines specify a minimum length for variable names. This analysis can be used to check compliance.

Importance: Low

PLCopen rule: N6

```plaintext
Example

PROGRAM PLC1               // SA0101
VAR
   iVar1: INT;            // SA0101
END_VAR

--> SA0101: Incorrect length of name 'PLC1'
```

See also

- "Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601"

**SA0102: Access to program/fb variables from the outside**

Detects external access to local variables of programs or function blocks

Justification: CODESYS permits external read access to local variables of programs or function blocks. This contradicts the principle of data encapsulation (hiding data) and does not comply with the IEC 61131-3 standard.

Importance: Medium
Example

PROGRAM PLC_PRG
VAR
  iCounter : INT;
  afb_Instance : AFB;
  bfb_Instance : BFB;
END_VAR
iCounter := A_PRG.iLocal;                // SA0102
iCounter := bfb_Instance.iLocal;         // SA0102
A_PRG();

FUNCTION_BLOCK AFB
VAR_INPUT
END_VAR
VAR_OUTPUT
END_VAR
VAR
  iLocal: INT;
END_VAR
METHOD METH : INT
VAR_INPUT
END_VAR
iLocal := iLocal + 1;

FUNCTION_BLOCK BFB EXTENDS AFB
VAR_INPUT
END_VAR
VAR_OUTPUT
END_VAR
VAR
END_VAR
METHOD METH : INT
VAR_INPUT
END_VAR
iLocal := iLocal + 1;

PROGRAM A_PRG
VAR
  iLocal: INT;
END_VAR
iLocal := iLocal + 1;

--> SA0102: Access to program/fb variable 'iLocal' from the outside

See also
● “Chapter 1.7.3.1 “Configuring and Running Static Analysis” on page 3601

SA0103: Concurrent access on not atomic data

Detects whether or not non-atomic variables (for example, with data type STRING, WSTRING, ARRAY, STRUCT, FB instances, 64-bit data types) are used in more than one task

Justification: When there is no synchronization during access, inconsistent values can be read when reading in one task and writing in another task at the same time.

Importance: Medium
For some data types, especially 64-bit integers, it depends on the platform whether or not access is atomic. Static analysis reports a problem only when the controller does not support atomic access to 64-bit integer data types.

This rule does not apply in the following cases:

- If the target system has a floating point unit (FPU), then access of multiple tasks to LREAL variables is not detected.
- If the target system is a 64-bit processor or the corresponding target setting is set for the target device, then the rule does not apply to 64-bit data types.

**Example**

The project contains both programs, PRG1 and PRG2: The program PRG1 is called by the task MainTask_1. The program PRG2 is called by the task MainTask_2.

```
GVL
VAR_GLOBAL
   lrTest : LREAL;   // Since the target system has an FPU, SA0103 does apply.
   lint1 : LINT;
   sTest : STRING;   // SA0103
   wsTest : WSTRING; // SA0103
END_VAR

PROGRAM PRG1
GVL.lrTest := 5.0;
GVL.sTest := 'welt';
GVL.wsTest := "welt";
GVL.lint1 := 99;

PROGRAM PRG2
GVL.lrTest := 5.0;
GVL.sTest := 'hallo';
GVL.wsTest := "hallo";
GVL.lint1 := 88;

--> SA0103: Concurrent access on not atomic data 'sTest'
--> SA0103: Concurrent access on not atomic data 'wsTest'
```

See also

- § Chapter 1.7.3.1 "Configuring and Running Static Analysis" on page 3601

**SA0105: Multiple instance calls**

Detects the instances of function blocks that are called multiple times. To do this, the function blocks have to be marked with the pragma `attribute 'analysis:report-multiple-instance-calls'`.

Justification: Some function blocks are designed in such a way that they can be called only one time in the cycle. This test checks whether or not a call is made in multiple locations.

Importance: Low

PLCopen rule: CP16 / CP20
Example

```plaintext
// {attribute 'analysis:report-multiple-instance-calls'} Deactivated
FUNCTION_BLOCK FB_DoA
  VAR_INPUT
  END_VAR
  VAR_OUTPUT
  END_VAR
  VAR
    iA : INT;
  END_VAR
  iA := iA + 1;

{attribute 'analysis:report-multiple-instance-calls'}
FUNCTION_BLOCK FB_DoB
  VAR_INPUT
  END_VAR
  VAR_OUTPUT
  END_VAR
  VAR
    iB : INT;
  END_VAR
  iB := iB + 1;

PROGRAM PLC_PRG
  VAR
    fbA : FB_DoA;
    fbB : FB_DoB;
    ND_VAR
    fbA();
    fbB();    // SA0105
    fbA();
    fbB();    // SA0105
    --> SA0105: Instance 'fbB' called more than once
```

See also

- Chapter 1.7.3.3.1.5 “Attribute 'analysis:report-multiple-instance-calls’” on page 3614

SA0106: Virtual method calls in FB_INIT

Detects method calls in the FB_Init method of a base function block, which are overwritten by a function block derived from a base function block.

Justification: In these cases, it could be that the variables in the overwritten methods are not initialized in the base FB.

Importance: High
The function block FB_A includes the methods `FB_Init` and `Meth_MyInit`. FB_Init calls Meth_MyInit for initialization. The function block FB_B is derived from FB_A. PLC_PRG calls FB_B's Meth_MyInit and therefore uses its mbMyDintB variable before it has been initialized. FB_B's Meth_MyInit overwrites FB_A's Meth_MyInit.

```plaintext
FUNCTION_BLOCK FB_A
  VAR
    mbMyDintA : DINT;
  END_VAR
FUNCTION_BLOCK FB_B EXTENDS FB_A
  VAR
    mbMyDintB : DINT;
  END_VAR
  METHOD FB_Init : BOOL
    VAR_INPUT
    bInitRetains:BOOL;
    bInCopyCode:BOOL;
    END_VAR
    mbMyDintA := 123;
    diDummy := Meth_MyInit();
  METHOD Meth_MyInit : DINT
    VAR_INPUT
    END_VAR
    mbMyDintB := 123; // access to member of FB_B
  PROGRAM PLC_PRG
    VAR
      g_BInst : FB_B;
      xVar : BOOL;
    END_VAR
    xVar := g_BInst.fb_init(TRUE, TRUE);
    // this instruction causes the following order of initializations:
    // FB_A.fb_init
    // FB_B.Meth_MyInit
    // FB_B.fb_init
    // FB_B.Meth_MyInit
    --> SA0106: Virtual method call 'Meth_MyInit' in FB_INIT
```

- "Chapter 1.7.3.3.1.5 “Attribute 'analysis:report-multiple-instance-calls'” on page 3614"

### SA0107: Missing formal parameters

Detects whether or not formal parameters are missing.

Justification: Code becomes more readable when formal parameters are specified in the call.

Importance: Low
FUNCTION FUNA : BOOL
VAR_INPUT
    bDo: BOOL;
    bInit: BOOL;
    bManual : BOOL;
END_VAR
VAR
    iInit: INT;
    iLocal: INT;
    iManual: INT;
END_VAR
IF bInit = TRUE THEN
    iInit := iInit + 1;
END_IF
IF bDo = TRUE THEN
    iLocal := iLocal + 1;
END_IF
IF bManual = TRUE THEN
    iManual:= iManual + 1;
END_IF
FUNA := TRUE;
PROGRAM PLC_PRG
VAR
END_VAR
FUNA(bInit := TRUE, bDo := TRUE, bManual := FALSE); // OK
FUNA(TRUE, TRUE, bManual:= FALSE);                      // SA0107
--> SA0107: Missing formal parameter for input 'TRUE'

1.7.3.3.2.49.8 SA0120: Program calls................................................................. 3674
1.7.3.3.2.49.9 SA0121: Missing VAR_EXTERNAL declarations..................................... 3675
1.7.3.3.2.49.10 SA0122: Array index defined as expression................................. 3676
1.7.3.3.2.49.11 SA0123: Usages of INI, ADR or BITADR........................................... 3676
1.7.3.3.2.49.12 SA0147: Unusual shift operation - strict........................................ 3676
1.7.3.3.2.49.13 SA0148: Unusual bit access - strict............................................... 3677
1.7.3.3.2.49.14 SA0118: Initialisations not using constants..................................... 3678
1.7.3.3.2.49.15 SA0124: Pointer dereferences in declarations.............................. 3678
1.7.3.3.2.49.16 SA0125: References in initializations............................................ 3678
SA0111: Pointer variables

Detects variables of type `POINTER TO`

Justification: The IEC 61131-3 standard does not permit pointers.

Importance: Low

Example

```plaintext
VAR
    piTemp : POINTER TO INT;
    pbyTemp : POINTER TO BYTE;
END_VAR

--> SA0111: Data type POINTER not allowed
```

See also

- Chapter 1.7.3.3.1.5 “Attribute 'analysis:report-multiple-instance-calls’” on page 3614

SA0112: Reference variables

Detects variables of type `REFERENCE TO`

Justification: The IEC 61131-3 standard does not permit references.

Importance: Low

Example

```plaintext
VAR
    ref_int : REFERENCE TO INT;
    ref_dw : REFERENCE TO DWORD;
END_VAR

--> Data type REFERENCE not allowed
```

See also

- Chapter 1.7.3.3.1.5 “Attribute 'analysis:report-multiple-instance-calls’” on page 3614

SA0113: Variables with data type `WSTRING`

Detects variables of type `WSTRING`

Justification: Not all systems support `WSTRING`. The code is more easily portable without `WSTRING`.

Example

```plaintext
VAR
    wstrTemp : WSTRING;
END_VAR

--> SA0113: Data type WSTRING not allowed
```

See also

- Chapter 1.7.3.3.1.5 “Attribute 'analysis:report-multiple-instance-calls’” on page 3614
SA0114: Variables with data type LTIME

Detects variables of type LTIME.

Justification: Not all systems support LTIME. The code is more easily portable without LTIME.

Importance: Low

Example

```
VAR
  ltVar : LTIME; // SA0114
END_VAR
```

--> SA0114: Data type LTIME not allowed

See also

- Chapter 1.7.3.3.1.5 “Attribute ‘analysis:report-multiple-instance-calls’” on page 3614

SA0115: Variables with data type UNION

Detects declarations of a UNION data type and variable declarations of the UNION type.

Justification: The IEC 61131-3 standard does not include unions. The code is more easily portable without unions.

Importance: Low

Example

```
TYPE u1: UNION
  lrTemp : LREAL;
  liTemp : LINT;
END_UNION
END_TYPE

PROGRAM PLC_PRG
VAR
  uVar: u1;
END_VAR
```

--> SA0115: Unions not allowed

See also

- Chapter 1.7.3.3.1.5 “Attribute ‘analysis:report-multiple-instance-calls’” on page 3614

SA0117: Variables with data type BIT

Detects variable declarations of data type BIT (possible within structure definitions).

Justification: The IEC 61131-3 standard does not include the data type BIT. The code is more easily portable without BIT.

Importance: Low
Example

```plaintext
TYPE Struct1 :
  STRUCT
    bitVar : BIT;
    iVar : INT;
    bVar : BOOL;
  END_STRUCT
END_TYPE

--> SA0117: Variables with data type BIT
```

See also

- Chapter 1.7.3.3.1.5 “Attribute 'analysis:report-multiple-instance-calls’” on page 3614

SA0119: Object-oriented features

Detects the use of object-oriented features, such as function block declarations with `EXTENDS` and `IMPLEMENTS`, or property and interface declarations. This rule is useful when you write code that is intended to be ported to other IEC 61131-3-compliant systems.

Justification: Not all systems support object-oriented programming. The code is more easily portable without object-orientation.

Importance: Low

Example

```plaintext
//Function block extended by another and implementing an interface:
FUNCTION_BLOCK POU EXTENDS CTD IMPLEMENTS ITF        //SA0119
...

// Declaration parts of property methods assigned to a function block:
POU.Prop.Get        //SA0119
POU.Prop.Set        //SA0119

--> SA0119: Object-oriented features not allowed
```

See also

- Chapter 1.7.3.3.1.5 “Attribute 'analysis:report-multiple-instance-calls’” on page 3614

SA0120: Program calls

Detects program calls

Justification: According to the IEC 61131-3 standard, programs can be called in the task configuration only. The code is more easily portable when you do not call programs from other locations.

Importance: Low
Example

PROGRAM prog_control
VAR
END_VAR

PROGRAM PLC_PRG
VAR
END_VAR

prog_control();
--> SA0120: Program call to 'prg_control' not allowed

See also

- Chapter 1.7.3.3.1.5 “Attribute 'analysis:report-multiple-instance-calls'” on page 3614

SA0121: Missing VAR_EXTERNAL declarations

Detects the use of a global variable in function blocks without them being declared there as “VAR_EXTERNAL”

Justification: According to the IEC 61131-3 standard, access to global variables is permitted only by an explicit import by means of a VAR_EXTERNAL declaration.

Importance: Low
PLCopen rule: CP18

Example

VAR_GLOBAL
  iGlob1:INT;
END_VAR

PROGRAM PLC_PRG
VAR
ivar:INT;
END_VAR
ivar:=iGlob1;       // SA0121

--> SA0121: EXTERNAL declaration required for variable 'iGlob1'

Example: Avoid error

VAR_GLOBAL
  iGlob1:INT;
END_VAR

PROGRAM PLC_PRG
VAR
ivar:INT;
END_VAR
VAR_EXTERNAL
  iGlob1:INT;
END_VAR
ivar:=iGlob1;       // OK
SA0122: Array index defined as expression

Detects the use of expressions in the declaration of array indexes

Justification: Not all systems permit expressions as array limits.

Importance: Low

Example

```plaintext
PROGRAM PLC_PRG
VAR CONSTANT
c_iValue : INT := INT#15;
END_VAR
VAR
arr: ARRAY[0..c_iValue + 1] OF INT;
END_VAR

--> SA0122: Only constants allowed for array definition 'arr'
```

SA0123: Usages of INI, ADR or BITADR

Detects the use of the CODESYS-specific operators INI, ADR, and BITADR

Justification: CODESYS-specific operators prevent the portability of code.

Importance: Low

Example

```plaintext
PROGRAM PLC_PRG
VAR
  uiTemp: UINT;
  TempVarInFUNC: DWORD;
END_VAR

TempVarInFUNC := ADR(uiTemp);        //SA0123

--> SA0123: Operator 'ADR' not allowed
```

SA0147: Unusual shift operation - strict

Detects bit shift operations that are not made to bit field data types (BYTE, WORD, DWORD, LWORD)

Justification: The IEC 61131-3 standard permits bit access only to bit field data types. However, the CODESYS compiler also permits bit shift operations with unsigned data types.

Importance: Low
See also the strict rule SA0018.

**Example**

```plaintext
PROGRAM PLC_PRG
VAR
  in_byte : BYTE := 16#45;   // 2#01000101
  in_word : WORD := 16#0045; // 2#0000000001000101
  in_uint : UINT;
  in_dint : DINT;
  erg_byte : BYTE;
  erg_word : WORD;
  erg_uint : UINT;
  erg_dint : DINT;
  n: BYTE := 2;
END_VAR

  erg_byte := SHL(in_byte,n);  // no error because BYTE is a bit field
  erg_word := SHL(in_word,n);  // no error because WORD is a bit field
  erg_uint := SHL(in_uint,n);  // SA0147
  erg_dint := SHL(in_dint,n);  // SA0147

  --> SA0147: Unusual shift operation - strict
```

See also

- % Chapter 1.7.3.3.1.5 “Attribute ‘analysis:report-multiple-instance-calls’” on page 3614
- % Chapter 1.7.3.3.2.17 “SA0018: Unusual bit access” on page 3626

**SA0148: Unusual bit access - strict**

Detects bit access that is not made to bit field data types (BYTE, WORD, DWORD, and LWORD). The IEC 61131-3 standard permits only bit access to bit field data types. However, the CODESYS compiler also permits bit access to unsigned data types.

**Example**

```plaintext
PROGRAM PLC_PRG
VAR
  iTemp1 : INT;
  diTemp3 : DINT;
  uliTemp4 : ULINT;
  siTemp5 : SINT;
  usiTemp6 : USINT;
  byTemp2 : BYTE;
END_VAR

  iTemp1.3 := TRUE;     // SA0148
  diTemp3.4 := TRUE;    // SA0148
  uliTemp4.18 := FALSE; // SA0148
  siTemp5.2 := FALSE;   // SA0148
  usiTemp6.3 := TRUE;   // SA0148
  byTemp2.5 := FALSE;   // no error because BYTE is a bit field

  --> SA0148: Unusual bit access - strict
```
SA0118: Initialisations not using constants

Detects initializations that do not assign constants

Justification: Initializations should be constant if possible and should not refer to other variables. In particular, you should avoid function calls during initialization because this can allow access to uninitialized data.

Importance: Medium

Example

```plaintext
PROGRAM PLC_PRG
VAR
 dwTemp : DWORD := 22;
dwTest : DWORD := dwTemp;       // SA0118
dwVar : DWORD := TempVarInFUNC(); // SA0118
END_VAR

--> SA0118: Initialisations not using constants
```

See also

● “Chapter 1.7.3.3.1.5 “Attribute ‘analysis:report-multiple-instance-calls’” on page 3614

SA0124: Pointer dereferences in declarations

Detects pointer dereferences that are used for initialization in the declaration part

Justification: Pointers and references should not be used for initializations because this can lead to access violations if the pointer has not been initialized.

Importance: Medium

Example

```plaintext
FUNCTION_BLOCK FB_Test
VAR_INPUT
 refStruct: REFERENCES TO ST_Test;
END_VAR
VAR
 xPointer : BOOL := refStruct.a; // SA0124
 iCount : INT;
END_VAR

--> SA0124: Dereference access in initialisation
```

See also

● “Chapter 1.7.3.3.1.5 “Attribute ‘analysis:report-multiple-instance-calls’” on page 3614

SA0125: References in initializations

Detects reference variables that are used for initialization in the declaration part

Justification: Pointers and references should not be used for initializations because this can lead to access violations if the pointer has not been initialized.

Importance: Medium
Example

PROGRAM PLC_PRG
VAR
  xRef: REFERENCE TO INT;
  iCount: INT := xRef;
END_VAR

--> SA0125: Reference used in initializations

See also

● § Chapter 1.7.3.3.1.5 “Attribute 'analysis:report-multiple-instance-calls’” on page 3614

SA0140: Statements commented out

Detects commented-out statements

Justification: Code is often commented out for debugging purposes. When this kind of comment is released, it is not always clear at a later time whether the code should be deleted, or whether it has been commented out for debugging purposes and unintentionally not uncommented.

Importance: High

PLCopen rule: C4

Example

PROGRAM PLC_PRG
VAR
  iValue1: INT;
  iValue2: INT;
END_VAR

iValue1 := 100;
iValue2 := 200;
// iValue2 := 300;

--> SA0140: Statement commented out:: iValue2 := 300

See also

● § Chapter 1.7.3.3.1.5 “Attribute 'analysis:report-multiple-instance-calls’” on page 3614

Possible Use of Uninitialized Variables

1.7.3.3.2.51.1 SA0039: Possible null-pointer deferences.............................. 3679
1.7.3.3.2.51.2 SA0046: Possible use of not initialised interface..................... 3680
1.7.3.3.2.51.3 SA0145: Possible use of not initialised reference................... 3681

SA0039: Possible null-pointer deferences

Detects code locations where a null pointer is possibly dereferenced

Justification: A pointer should be checked before each dereferencing to make sure it is not equal to zero. Otherwise an access violation may occur at runtime.

Importance: High
Example

PROGRAM PLC_PRG
VAR
  ptiVar1:POINTER TO INT;
  ptiVar2:POINTER TO INT;
  ptiVar3:POINTER TO INT;
  iVar:INT;
  iCount :INT;
  iCondition: INT;
END_VAR

iCount := iCount + INT#1;
ptiVar1 := ADR(iVar);
ptiVar1^ := iCondition;  // OK - valid reference
ptiVar2^ := iCondition;  // SA0039 - null pointer dereferenciation
iVar := ptiVar3^;        // SA0039 - null pointer dereferenciation

--> SA0039: Possible null pointer dereference 'ptiVar2^'
--> SA0039: Possible null pointer dereference 'ptiVar3^'

See also

- Chapter 1.7.3.3.1.5 "Attribute 'analysis:report-multiple-instance-calls" on page 3614

SA0046: Possible use of not initialised interface

Detected the use of interfaces that were not initialized before being used

Justification: An interface reference should be checked for <> 0 before it is used. Otherwise an access violation may occur during access.

Importance: High
Example

// declaration of INTERFACE ITF and assigned METH2:
METHOD METH2 : BOOL
VAR_INPUT
  iInput2:INT;
END_VAR

// declaration of INTERFACE Master_ITF1 and assigned METH:
METHOD METH : BOOL
VAR_INPUT
  iInput:INT;
END_VAR

PROGRAM PLC_PRG
VAR
  instPOU:POU;
  instITF:ITF;
  instMasterITF1:Master_ITF1;
  instMasterITF2:Master_ITF2;
  iDummy:INT;
  xDummy:BOOL;
  instNoInitITF:ITF;
  instNoInitITF2:ITF;
  instNoInitMasterITF1:Master_ITF1;
  instNoInitMasterITF2:Master_ITF2;
END_VAR

instITF := instPOU;
xDummy := instITF.METH(iInput := iDummy);             // OK
instMasterITF1 := instPOU;
xDummy := instMasterITF1.METH(iInput := iDummy);        // OK

xDummy := instNoInitITF.METH(iInput := INT#1);        // SA0046
xDummy := instNoInitITF2.METH(iInput2 := INT#2);       // SA0046
xDummy := instNoInitMasterITF1.METH(iInput := INT#3);  // SA0046
iDummy := instNoInitMasterITF2.Prop;                  // SA0046

IF instNoInitITF <> 0 THEN
  instNoInitITF.Prop;          // OK, weil das Interface nicht 0
  sein kann
END_IF

--> SA0046: Possible use of not initialised interface
  'instNoInitITF'

See also

- Chapter 1.7.3.3.1.5 “Attribute 'analysis:report-multiple-instance-calls'” on page 3614

SA0145: Possible use of not initialised reference

Detects any reference variables that may not be initialized before use and are not checked by
the operator __ISVALIDREF. This rule is applied in the implementation part of POUs. Rule
SA0124 applies to the declaration.
Justification: A reference should be checked for its validity before access because an access violation may occur during access.

Importance: High

Example

PROGRAM PLC_PRG
VAR_INPUT
  ref_iTest : REFERENCE TO INT;
END_VAR

ref_iTest := 99;         // SA0145
IF __ISVALIDREF(ref_iTest) THEN
  ref_iTest := 88;
END_IF

--> SA0145: Possible use of not initialised reference 'ref_iTest'

See also

- § Chapter 1.7.3.3.1.5 “Attribute ‘analysis:report-multiple-instance-calls’” on page 3614
- § Chapter 1.7.3.3.2.49.15 “SA0124: Pointer dereferences in declarations” on page 3678

SA0150: Violations of lower or upper limits or the metrics

Detects the POUs that violate the activated metrics at the lower or upper limits

Justification: Code that complies with certain metrics is easier to read, easier to maintain, and easier to test.

Importance: High

PLCopen rule: CP9

Example

Initial situation: The “Number of calls” metric is selected in “Project Settings ➔ Static Analysis ➔ Metrics”. Lower limit: 0; upper limit: 3. Prog_1 is called five times.

When running the static analysis, the “SA0150: Metric violation for Prog_1. Report for metric calls (5) > 2” error is issued in the message view, in the “Build” category.

See also

- § Chapter 1.7.3.3.1.5 “Attribute ‘analysis:report-multiple-instance-calls’” on page 3614

SA0160: Recursive calls

Detects recursive calls in actions, methods, and properties of function blocks. Also detects possible recursions from virtual function calls and interface calls.

Justification: Recursions lead to non-deterministic behavior and are therefore a source of errors.

Importance: Medium

PLCopen rule: CP13
Example

The following method Call is assigned to the function block FB_Test:

```plaintext
FUNCTION_BLOCK FB_Test
VAR
  bParameter: BOOL;
END_VAR

METHOD Call : BOOL
VAR_INPUT
END_VAR
Call := THIS^.Call();  //SA0160
```

The program PLC_PRG calls FB_Test:

```plaintext
PROGRAM PLC_PRG
VAR
  fbTest : FB_Test;
  bValue : BOOL;
END_VAR
bValue := fbTest.bParameter;
fbTest.Call();
--> SA0160: Recursive call detected: 'PLC_PRG -> FB_Test.Call -> FB_Test.Call
```

See also

- Chapter 1.7.3.3.1.5 “Attribute ’analysis:report-multiple-instance-calls’” on page 3614

SA0161: Unpacked structure in packed structure

Detects unpacked structures that are used in packed structures

Justification: The compiler typically sets an unpacked structure to an address that allows aligned access to all elements within the structure. If you create this structure in a packed structure, then aligned access is no longer possible. Furthermore, access to an element in the unpacked structure can lead to a misalignment exception.

Importance: High
The structure `structSingleDataRecord` is packed, but it contains the unpacked structures `struct4Byte` and `struct9Byte`.

```plaintext
{attribute 'pack_mode' := '1'}
TYPE structSingleDataRecord :
  STRUCT
    str9ByteData: struct9Byte;    (* 9 BYTE *)
    str4ByteData: struct4Byte;    (* 4 BYTE *)
    udi1: UDINT;
    udi2: UDINT;
    udi3: UDINT;
    usi4: USINT;
  END_STRUCT
END_TYPE (* 9 BYTE *)
TYPE struct9Byte :
  STRUCT
    usiRotorSlots: USINT;        (* 1 BYTE *)
    uiMaxCurrent: UINT;            (* 2 BYTE *)
    usiVelocity: USINT;            (* 1 BYTE *)
    uiAcceleration: UINT;        (* 2 BYTE *)
    uiDeceleration: UINT;        (* 2 BYTE *)
    usiDirectionChange: USINT;    (* 1 BYTE *)
  END_STRUCT
END_TYPE TYPE struct4Byte :
  STRUCT
    //udiDummy : UDINT;
    rRealDummy : REAL;
  END_STRUCT
END_TYPE
```

--> SA0161: Declaration of an unpacked struct 'struct9ByteData'
inside a packed struct 'structSingleDataRecord'

--> SA0161: Declaration of an unpacked struct 'struct4ByteData'
inside a packed struct 'structSingleDataRecord'

See also

- ☞ Chapter 1.7.3.3.1.5 “Attribute 'analysis:report-multiple-instance-calls'” on page 3614

**SA0162: Missing comments**

Detects uncommented locations in the program

Justification: Complete commenting is required by many programming guidelines, and it increases the readability and maintainability of the code.

Importance: Low

PLCopen rule: C2

Comments are required in the following cases:

- Declaration of variables (Comments are located either above the declaration or to the right of the declaration.)
- Declaration of programs, function blocks, or methods (Comments are located above the declaration in the first line.)
Example

```plaintext
PROGRAM PLC_PRG
VAR
   iVar: INTEGER;
END_VAR

---> SA0162: Missing comment for 'PLC_PRG'
---> SA0162: Missing comment for 'iVar'
```

See also

- Chapter 1.7.3.3.1.5 “Attribute 'analysis:report-multiple-instance-calls” on page 3614

**SA0163: Nested comments**

Detects nested comments

Justification: Nested comments should be avoided because they are difficult to read.

Importance: Low

PLCopen rule: C3

Example

```plaintext
{attribute 'do-analysis'}
(* That is
(* nested comment 1 *)
*)
PROGRAM PLC_PRG
VAR
(* That is
// nested comment 2
comment *)
   iVar: INTEGER;
   iVar2: INTEGER;

(* That is
(* nested comment 3 *) *)
   iVar3: POINTER TO DWORD;
   hugo: INTEGER;
END_VAR

(* That is
// nested comment 4
comment *)

iVar := iVar + 1;

(* That is
(* nested comment 5 *)
*)

(* Not that one *)

---> SA0163: Nested comment 'nested comment 1'
---> SA0163: Nested comment 'nested comment 2'
---> SA0163: Nested comment 'nested comment 3'
---> SA0163: Nested comment 'nested comment 4'
---> SA0163: Nested comment 'nested comment 5'
```
SA0164: Multiline comments

Detects multiline comments that are coded as (* comment *). Only single-line comments that are coded as // comment are permitted.

Justification: Some programming guidelines prohibit multiline comments in code because the beginning and end of a comment could get lost and the closing comment bracket could be deleted by accident.

Importance: Low

PLCopen rule: C5

Example

```plaintext
{attribute 'do-analysis'}
(*
  This is a multi-line comment     // SA0164
*)
PROGRAM PLC_PRG
VAR
  // This is a single line comment
  a: DINT;
END_VAR
(* This is not a single line comment *)     // SA0164
a := a + 1;
```

SA0165: Tasks calling other POUs than programs

Detects tasks that call function blocks or functions instead of a program

Justification: This rule is part of the PLCopen Coding Guidelines. Therefore, compliance is also checked in CODESYS. We do not see any problems with data consistency in CODESYS if tasks would call POUs other than programs. However, problems can occur if the code is to be ported to other platforms.

Importance: Low

PLCopen rule: CP16

Tasks are inserted below the task configuration. The POUs to be called are configured in the tasks. The POUs must be the “Program” type. The “Function block” and “Function” types are not permitted.
Example

SA0166: Max. number of input/output/in-out variables...

Detects whether or not a defined number of input variables (VAR_INPUT), output variables (VAR_OUTPUT) or VAR_IN_OUT variables is exceeded in a POU. In the “Project Settings”, double-click the rule entry to open a dialog where you define the maximum number.

Justification: This is about checking individual programming guidelines. Many programming guidelines provide for a maximum number of POU parameters. Too many parameters make the code unreadable and the POUs difficult to test.

Importance: Medium

PLCopen rule: CP23

Example

FUNCTION_BLOCK FB1
    VAR_INPUT
        xIn    : BOOL;
    END_VAR
    VAR_IN_OUT
        xInOut1 : BOOL;
        xInOut2 : BOOL;
    END_VAR
    --> SA0166: Too many VAR_IN_OUT variables in POU 'FB1'

See also

● § Chapter 1.7.3.1.5 “Attribute 'analysis:report-multiple-instance-calls’’ on page 3614

SA0167: Temporary function block instances

Detects function block instances that are declared as temporary variables. This affects instances that are declared in a method or function or as VAR_TEMP, and therefore are reinitialized in each processing cycle or for each POU call.

Justification: Function blocks have a state that is usually maintained over multiple PLC cycles. An instance on the stack exists only for the duration of the function call. Therefore, it rarely makes sense to create an instance as a temporary variable. Secondly, function block instances are often large and need a lot of space on the stack (which is usually restricted to controllers). Thirdly, the initialization and often also the scheduling of a function block can take a long time.

See also

● § Chapter 1.7.3.1.5 “Attribute 'analysis:report-multiple-instance-calls’’ on page 3614
Importance: Medium

Examples

PROGRAM PLC_PRG
VAR
END_VAR
VAR_TEMP
  _yafb: AFB;
END_VAR

FUNCTION Fun : INT
VAR_INPUT
END_VAR
VAR
  funafb: AFB;
END_VAR

METHOD METH : INT
VAR_INPUT
END_VAR
VAR
  methafb: AFB; // SA0167
END_VAR

--> SA0167: Temporary function block instance: 'methafb'

See also
● % Chapter 1.7.3.3.1.5 “Attribute 'analysis:report-multiple-instance-calls'” on page 3614

1.7.4 CODESYS Profiler
1.7.4.1 Overview

CODESYS Profiler is a program analysis tool which is integrated in CODESYS for detecting inefficient programming in your application source code.

The term profiling means taking measurements for the runtime behavior of POUs of the application. This is possible by means of the instrumentation of the code, or on multicore systems by means of sampling.

The "Sampling" method of measurement is not supported yet in V1.3.0.0.

In addition to profiling, CODESYS Profiler also supports a measurement of code coverage, which detects the number of processed statements per POU. This method also works by instrumenting the code.

The measurements for profiling and code coverage have to be activated explicitly.

You can use the measurement data to help plan a course of action for optimizing the source code on both a structural and algorithmic level.

Overview of the integration of CODESYS Profiler in CODESYS:

Insert a “Profiler” object below the application. In the editor of this object, configure the desired measurement method and view the measurement results in online mode. Moreover, in the "Online ➔ Profiler" menu, the "Profiler Watch List" is provided for configuring and displaying the POUs to be measured.
1.7.4.2 Executing the Profiling Measurements

NOTICE!
The implicitly added IEC code for a Profiler measurement method results in a change which slows down the evaluated program.

When a profiling or code coverage measurement is active, an online is generally not possible. Moreover, some online features are not available, such as flow control and breakpoints.

Enabling or disabling a Profiler measurement method, or changing any settings in the Profiler editor each requires a download. Then an online change is no longer possible.

NOTICE!
POUs from uncompiled libraries are also displayed on the “Online” tab of the Profiler editor and in the “Profiler Watch List”.

CODESYS Profiler provides different profiling methods for measuring the processing times of programs for various kinds of problems.

- **Instrumentation**
  Profiler measures the times by using additional code which is generated into the program. The recording and processing of the measured values takes place on the controller and therefore can also be performed without connecting the development system to the controller (in contrast to the other measuring methods).

- **Sampling (for multicore systems only)**
  This method is not supported yet in V1.3.0.0. Profiler pauses a task at random times and evaluates the call stack of the task. The Profiler sampling measures the frequency of the POU execution, not durations of time. The recorded call stacks are transferred in cycles to the development system for processing. Therefore, this method only works when the development system is in online mode.

- **Profiler Watch List**
  Profiler measures the execution time of individual POUs by means of execution points which are set in the POUs while the program is running.

See the help pages for each method to find the right one for your application.

- Chapter 1.7.4.2.2 “Using the Profiler Watch List” on page 3692
1.7.4.2.1 Profiling by Code Instrumentation

NOTICE!
The implicitly added IEC code for a Profiler measurement method, as well as the breakpoints for POUIs in the watch list, result in a change and slows down the evaluated program.

When a profiling or code coverage measurement is active, an online is generally not possible. Moreover, some online features are not available, such as flow control and breakpoints. There are no restrictions for the watch list in this respect.

Enabling or disabling a Profiler measurement method, or changing any settings in the Profiler editor each requires a download. Then an online change is no longer possible. There are no restrictions for the watch list in this respect.

The recording and processing of the measured values takes place on the controller and therefore can also be performed without connecting the development system to the controller (in contrast to the other measuring methods).

With this profiling method, CODESYS Profiler inserts additional code into the entry and exit of each function in the program. The runtimes of a entire task cycle are measured and stored.

The method is useful for detecting individual outliers in the task runtimes. To do this, select the “Record max cycle” recording mode.

When the entire project is instrumented, this can have a considerable impact on task runtimes and memory consumption. Therefore, select only a part of the application POUIs for instrumentation whenever possible. One recommended approach is to first select only those POUIs that are called directly by the task. Determine the hot spots of the runtime for these POUIs and then based on these select the called POUIs for measurement.

NOTICE!
- POUIs which are not selected for measurement are not shown on the measurement list, the call tree, or the backtrace tabs. Therefore, it is possible that a call tree “POU1 -> POU3” is displayed, although there is no direct call of POU3 by POU1. This is because there are POU calls which are not selected for measurement between POU1 and POU3.
- The "own time" output in the measurement for a POU can also contain times of called POUIs which are not selected for measurement.

Requirement:
- A CODESYS project application with multiple POUIs is open in offline mode.
- A task is defined to control POU calls.
- The application is the active application and can be compiled without errors.
- A connection to the standard controller is configured in the communication settings, and the controller is running.

1. To activate and deactivate profiling programmatically, you define a Boolean variable in the application. (This is optional for the example described here. Activation can also be performed by a menu command.)
2. Click “Add Object” to add a “Profiler” object below the application in the device tree.
3. Double-click the object.
   - The object editor opens. The 🔎 “Settings” tab is in focus.
4. Set the “Method” to “Instrumentation”. Select the “Task” with the POU calls that you want to perform time measurements on.

5. Under “Recording”, select the task for controlling the POUs to be instrumented.
   For “Condition”, click and select the Boolean variable from your application that you want to use to switch the value recording on and off. Note: Using this kind of variable is optional. If you leave the field blank, then every cycle is recorded.

6. Under “Instrumentation parameters”, set the “Recording mode” to “Record next cycle”. Leave the required “Buffer size” (the maximum number of POU calls that are recorded per task cycle) as the default “10000”.
   Under “Snapshot appearance”, select the “Time format” for displaying the recording.

7. In “POU selection”, select the POUs that should be instrumented. Note that you could also select “Instrument whole application”, which would include all POUs of the project as well as the POUs of the integrated libraries.

8. Click “Online ➔ Login” to download the application to the controller.
   ➔ CODESYS displays in the status bar.

9. Click “Debug ➔ Start” to start the application.
   ➔ The project runs and you see the current variables values in the usual monitoring view.

10. If you have configured a Boolean variable as a condition to start profiling, then now set this variable to TRUE.

   Background information about recording: Because you selected the “Record next cycle” option in this example, only the first cycle is recorded when the application is started and the profiling. No additional cycle is recorded. An additional measurement is performed only when a recording is uploaded from the controller. This uploading is done either by opening the “Online” tab for the first time or by clicking the “Refresh this snapshot” button. For information about the alternative “Record max cycle” option, see the "Tab 'Settings’” chapter in the reference part of the help.

   Now look at the measurement results. Open the editor of the Profiler object and its “Online” tab.
   ➔ The “Online” tab includes four subtabs which can be selected from the menu on the left side. In addition, you see an area with buttons and settings for the profiling that is currently running. A description of the tabs is located in the “Tab 'Online’” chapter in the reference part of the help.

Detailed information about a POU call in the “Properties” dialog

1. On the “Online” tab, click the “Call Tree” subtab.
   ➔ You see the hierarchy of all calls that have originated from the task specified in the “Settings” dialog.

2. Select one of the calls and click “Properties” in the context menu.
   ➔ The “Properties” dialog for the called POU opens with detailed information, such as “Own time” and “Standard deviation”.

### 1.7.4.2.2 Using the Profiler Watch List

**NOTICE!**

The implicitly added IEC code for a Profiler measurement method, as well as the breakpoints for POUs in the watch list, result in a change and slows down the evaluated program.

When a profiling or code coverage measurement is active, an online is generally not possible. Moreover, some online features are not available, such as flow control and breakpoints. There are no restrictions for the watch list in this respect.

Enabling or disabling a Profiler measurement method, or changing any settings in the Profiler editor each requires a download. Then an online change is no longer possible. There are no restrictions for the watch list in this respect.

In CODESYS, the Profiler Watch List is provided with CODESYS Profiler. In this view, you can combine a selection of POUs or POU instances whose runtimes and calls that you want Profiler to measure. The configuration is possible in both online mode and offline mode.

When you select a POU for the Profiler Watch List, a watch point is set implicitly at the first and last break point position of the POU. The time difference between the two watch points on the controller is measured. In the case of a function block, the measurement is also performed and displayed for all POU instances.

**NOTICE!**

The Profiler Watch List can have a very different impact on the task runtime, depending on how often the implicitly set execution points are started.

When a function block instance is entered in the watch list, the execution points for all instances of the corresponding function block are reached. However, time is measured only for the specified instance.

The Profiler Watch List is suitable for measuring the runtime of individual POUs in runtime mode. The major advantage of this method is that it does not require any special code and it is always available.

**Requirement:** A project exists with an application which calls different program and function blocks as well as function block instances.

- In this example, you configure the list in offline mode.

1. Open the project and click “Online ➔ Profiler ➔ Profiler Watch List”.
   - The empty “Profiler Watch List” opens.

2. Drag one of the application POUs from the device tree to the watch list.
   - The POU is inserted into the first line of the list. The “POU” column contains the POU name, and the “Application” column contains the name of the respective application.

3. Add all additional required POUs, either by dragging them to the list or by double-clicking a field in the “POU” column to open the Input Assistant.

Now view the list in online mode:

1. Download the project to the controller and start it. Open the “Profiler Watch List”.
   - You see measurement results about the call durations and number of calls for each POU. See the help page for the “Profiler Watch List”.

---

**Configuring watch lists**

- Requirement: A project exists with an application which calls different program and function blocks as well as function block instances.

- In this example, you configure the list in offline mode.

1. Open the project and click “Online ➔ Profiler ➔ Profiler Watch List”.
   - The empty “Profiler Watch List” opens.

2. Drag one of the application POUs from the device tree to the watch list.
   - The POU is inserted into the first line of the list. The “POU” column contains the POU name, and the “Application” column contains the name of the respective application.

3. Add all additional required POUs, either by dragging them to the list or by double-clicking a field in the “POU” column to open the Input Assistant.

Now view the list in online mode:

1. Download the project to the controller and start it. Open the “Profiler Watch List”.
   - You see measurement results about the call durations and number of calls for each POU. See the help page for the “Profiler Watch List”.

---

3692 3ADR010583, 1, en_US 2020/12/10
2. Click “Display Mode” in the context menu of the watch list and change to another data type or unit.
   ⇒ All current results in the list are displayed continuously in the selected format, as is the case for monitoring.

3. Click “Open POU” in the context menu of the watch list.
   ⇒ The POU currently in focus in the list is opened in the editor. You see the solid green circle of the watch point at the beginning and end of the implementation code that is implicitly set to enable the Profiler measurement.

4. Drag another POU to the watch list.
   ⇒ The POU is included immediately in the measurement.

1.7.4.2.3 Profiling by Sampling

This method is not supported yet in V1.3.0.0.

1.7.4.3 Measuring Code Coverage

NOTICE!

The implicitly added IEC code for a Profiler measurement method results in a change which slows down the evaluated program.

Enabling or disabling a Profiler measurement method, or changing any settings in the Profiler editor each requires a download. Then an online change is no longer possible.

In addition to profiling, CODESYS Profiler also supports the measurement of code coverage. This determines which of the statements in a POU are executed when processing. The part of the total number of executed instructions is termed as "coverage". Coverage is expressed as a percentage.

In the “Code Coverage” view, select the POUs in offline mode that should be used to perform the measurement. In online mode, you will continuously see the current values of the code coverage.

Requirements
● A CODESYS project application with multiple POUs is open in offline mode.
● A task is defined to control POU calls.
● The application is the active application and can be compiled without errors.
● A connection to the standard controller is configured in the communication settings, and the controller is running. The project is in offline mode.

Settings in offline mode
1. In the device tree, double-click the “Profiler” object to open the editor. Set the method to “Code Coverage”.
   ⇒ The POUs of the application are displayed in the editor in a tree structure under "POU selection".
2. Select the POUs that should be measured by code coverage.

Viewing measurement results in online mode

1. In the device tree, double-click the “Profiler” object to open the editor.

   ⊳ The view opens with the measurement results for each of the instrumented POUs, including the total number of statements and the number of statements not executed. The code coverage is displayed as a percentage with a gray bar in the “Coverage” column.

   You can sort the table according to this column either ascending or descending by clicking a column heading.

2. Note the menu bar above the results table.

   ● “Open POU” for opening the POU selected in the results table in its own editor
   ● “Reset” for restarting the measurement
   ● “Save Snapshot” for creating a snapshot

   ⊳ If the open POU is programmed in ST, then the processed code is displayed in green and the unprocessed code is displayed in red.

● ☞ Chapter 1.7.4.5.2.1 “Command ‘Open POU’” on page 3702

1.7.4.4 Creating Snapshots

In online mode, a snapshot of all current measurement results can be created on the tab during a Profiler measurement. All created snapshots are managed on the “Snapshots” tab of the Profiler editor.

1. For example: Configure a profiling measurement for your application using the instrumentation method.

2. Start the application to the controller, and start the measurement.

   ⊳ The measurement results are displayed in the Profiler editor on the various tabs.

3. Click “Save snapshot”. For the instrumentation and sampling methods, the command button for this is located on the left side of the “Online” tab. For the code coverage method, the command button is located on the toolbar of the tab.

   ⊳ The “Save Snapshot” dialog opens.

4. Type in the name for the snapshot and include an optional description. Click “OK” to confirm.

5. Open the “Snapshots” tab. Note that this tab is available only after the first snapshot has been created.

   ⊳ The recently created snapshot is listed with the “Name” which you assigned to it and the “Timestamp”. It is listed below the node of the name of the applied Profiler method (“Sampling” in the current example).

6. Click the line of the snapshot.

   ⊳ The snapshot opens on the right side of the tab. In this view, the same functionalities (for example, open POU, copy table, and export) are available as on the “Online” tab.

7. On the left side of the tab, right-click the created snapshot.

   ⊳ Here you see the commands for deleting and editing the snapshot.
8. On the “Profiler” - “Snapshots” tab, double-click the line of the snapshot.

   ➔ The snapshot opens in a new tab named <name, time stamp> on the same level as the Profiler editor. The usual functionalities are available here as well. However, if a POU has been modified after the snapshot, then you cannot open it in the red/green view.

- % Chapter 1.7.4.5.1.4 “Tab ‘Snapshots’” on page 3701
Tab 'Settings'

The “Settings” tab in the editor of the Profiler object is used to configure the profiling in online mode. It contains the setting options that correspond to the set method.

Table 786: Recording

<table>
<thead>
<tr>
<th>“Task”</th>
<th>In online mode, CODESYS Profiler records the runtime behavior for the POUs that are called by this task.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Condition”</td>
<td>(Boolean expression) The value TRUE is a requirement for recording. For example, you can use the Input Assistant to set a Boolean variable for this. If the field is blank, then every cycle is recorded.</td>
</tr>
<tr>
<td>“Instrumentation parameters”</td>
<td>Available only when the profiling method is set to “Instrumentation”</td>
</tr>
<tr>
<td>● “Instrument whole application”: All POUs of the application are instrumented, including the POUs from the referenced, compiled libraries. In this case, the “POU selection” is not available in the lower part of the tab.</td>
<td></td>
</tr>
<tr>
<td>● “Recording mode”</td>
<td>– “Record next cycle”: When the application starts, the first PLC cycle is recorded. No additional cycle is recorded. An additional measurement is performed only after a recording is uploaded from the controller either by opening the “Online” tab for the first time, or by clicking “Refresh this snapshot”.</td>
</tr>
<tr>
<td></td>
<td>– “Record max cycle”: Every cycle is recorded. The result of a recording is saved when the cycle has lasted longer than the last saved recording. When a recording is uploaded from the controller, the longest recording to date is deleted and the recording starts all over again.</td>
</tr>
<tr>
<td>● “Buffer size”: Maximum number of individual recordable run times per cycle. These are the runtimes of all POU calls for the task specified above. For a correct configuration of the buffer size, also note the selected “Recording mode”.</td>
<td></td>
</tr>
<tr>
<td>“Sampling parameters”</td>
<td>Available only when the profiling method is set to “Sampling”</td>
</tr>
<tr>
<td>● “Profiler task group”: The available task groups in their multicore system can be selected.</td>
<td></td>
</tr>
<tr>
<td>● “Sampling interval”: Time period when a random measurement should be taken</td>
<td></td>
</tr>
<tr>

<td></td>
</tr>
</tbody>
</table>
Table 787: Snapshot appearance

| "Time format"     | 
|-------------------|----------------------------------|
| "tick"            | Time unit defined by the processor |
| "ms"              | Milliseconds                      |
| "µs"              | Microseconds                      |
| "ms/µs"           | Milliseconds or microseconds (depending on size) |

Note: Implicit code calculates the approximate assignment of the time formats "ms" and "µs" to system ticks. On the "Online" tab, on the "Overview" subtab, you can see the calculated value displayed in the "Time" entry. Example: 1 ms = 3398810 Ticks.

Determining critical limits

- "Critical limit total time"
- "Critical limit end of call chain"
- "Critical limit high own time"

Critical upper limits for the times measured in the current cycle. If the time of a call in the cycle exceeds the percentage defined here for the total cycle time, then this is indicated in the Profiler results with a symbol at the beginning of the respective lines.

- Total time: Time spent by the POU call, including all calls from this POU
- End of the call chain: Last call in the call tree. In this case: total time = "Own time"
- Own time: Time spent by the POU call, excluding the time spent on all POU calls made by this POU itself

Table 788: POU selection

<table>
<thead>
<tr>
<th>In tree structure:</th>
<th>Available only when the &quot;Instrumentation&quot; or &quot;Code coverage&quot; profiling method is set and the &quot;Instrument whole application&quot; option is not selected</th>

**Table 790: Tab 'Online' - 'Call Tree'**

This hierarchical tree structure shows all calls that have been made to the selected task during the measurement period. The top node is the task, and all call chains are displayed below it.

Calls in libraries are not displayed.

Each node corresponds to a specific POU call and provides the following information about the current and previous measured times and number of calls.

- Percentage of time that has elapsed in this call to the time that has elapsed in all calls (example: 34.05%)
- Name and type of POU (example: PLC_PRG (PRG))
- Total time elapsed in the call (example: 85.531 µs)
- Number of calls of this POU in this cycle in this call tree (example: 22 Calls)
- Average, minimum, and maximum execution time of this call (example: Avg: 0.254 µs Min: 0.194 µs Max: 0.3µs)

Example:
Table 791: Tab 'Online' - 'List'

All instrumented POUs are listed. For each POU, you see the number of “Samples” and the “Time (ms/µs)” of all recorded calls.

The “Functions called by <POU name>” list in the lower part of the view always shows the POU calls of the POU currently selected in the list above. Double-clicking a line in the lower list selects the corresponding entry in the upper list.

<table>
<thead>
<tr>
<th>“POU Name”</th>
<th>Name and type of POU (example: PLC_PRG (PRG))</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Time (ms/µs)”</td>
<td>Total time elapsed in the call (example: 85.53 µs)</td>
</tr>
<tr>
<td>“Average time”</td>
<td>Average, minimum, and maximum execution time of this call in &quot;ms&quot; or &quot;µs&quot; (example: Avg: 0.254 µs, Min: 0.194 µs Max: 0.3µs)</td>
</tr>
<tr>
<td>“Min. time (ms/µs)”</td>
<td></td>
</tr>
<tr>
<td>“Max. Time”</td>
<td></td>
</tr>
<tr>
<td>“Own time (ms/µs)”</td>
<td>Time that the POU call has spent, excluding the time spent by all POU calls from this POU</td>
</tr>
<tr>
<td>“Own Time (%)”</td>
<td>Percentage of the own time to the total time</td>
</tr>
<tr>
<td>“Calls”</td>
<td>Number of calls of this POU in this cycle in this call tree (example: 22 Calls)</td>
</tr>
<tr>
<td>“Standard deviation”</td>
<td>Standard deviation of the average execution time (example: 0.128 µs)</td>
</tr>
</tbody>
</table>

Example:
Table 792: Tab 'Online' - 'Back Traces'

This is a reverse view of the call tree. This means that you can trace all calls from a POU call to the beginning of the call chain.

- Percentage of own time to total time (example: 19.35%)
- Name and type of POU (example: MID (FUN))
- Own time, or portion of the own time of the call to the own time of the node (example: 9.466μs of 9.752μs)
- Number of calls in this call tree in this cycle, and the percentage of calls to the total number of calls (example: 4 Calls of 5)

Example:

![Call Tree Example]

Table 793: Actions for the current measurement

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Refresh this snapshot&quot;</td>
<td>The current measurements are done and displayed. The display is not refreshed automatically.</td>
</tr>
<tr>
<td>&quot;Save snapshot&quot;</td>
<td>The “Save Snapshot” dialog opens for typing in a name and description for the snapshot. After you click “OK”, the current measurement results are saved and can be called again in the “Snapshots” tab.</td>
</tr>
<tr>
<td>For the “Sampling” method only (not supported at this time): “Reset”</td>
<td>The current measurement is reset and can be restarted.</td>
</tr>
<tr>
<td>For the “Sampling” method only (not supported at this time): “Stop”, “Pause”</td>
<td>Button for starting, pausing, and stopping, the measurement process</td>
</tr>
</tbody>
</table>
| For the “Sampling” method only (not supported at this time): “Sampling interval” | Time period between measurements  
A random value is generated in the range between 0 and the specified time span. After this time, the task to be measured is paused and recorded. The remaining time until the specified time span elapses until the next random value is generated. This means that it is measured within the time span, but not before the full time span has been reached.  
At a sampling interval of 1 ms, 100 measurements should be performed in 100 ms. |
Measurement of code coverage

When code coverage is used, the “Online” tab shows which of the statements are executed in the selected POUs and which are not. In contrast to the profiling methods, explicit refreshing of the measured values is not necessary here. However, the measurement can be repeated.

Table 794: Table with measurement results

| “Name” | The names of the POUs selected for the measurement are shown in the tree structure. The parent objects act as nodes (for example, the name of the application to which they belong). |
| “Number of statements” | Total number of statements contained in the POU |
| “Statements not executed” | Number of statements contained in the POU but not executed |
| “Coverage (%)*” | Percentage of statements in the POU that are executed (example: 75 for 75%) |

Table 795: Buttons above the measurement value table

| “Open POU” | The POU selected in the view is opened in its editor. Statements that have been processed are displayed in green. Statements that have not been processed are displayed in red. The POU editor also opens when you double-click a row in the table. |
| “Reset” | The measurement results are reset to 0 and the measurement is repeated in the next cycle. |
| “Save Snapshot” | The “Save Snapshot” dialog opens for typing in a name and description for the snapshot. After you click “OK”, the current measurement results are saved and can be called again in the “Snapshots” tab. |

Context menu

The following commands are available in the context menu depending on the selected location in the various displays of the measurement results:

- “Open POU”
- “Export”
- “Copy Table”
- “Properties” (in the call tree only)

Tab ‘Snapshots’

This tab is displayed only after a measurement has already been recorded as a snapshot. The “Save snapshot” button on the “Online” tab of the Profiler editor is used to record snapshots.

The recorded snapshots are displayed in a tree structure. The nodes correspond to the profiling method in which they were created.
The recorded measurement results are displayed on the right for the time recording selected in the tree. Double-click the time recording in the tree to display it in a separate window. You can work with the same functionalities and commands as in online mode of the measurement. However, if a POU has been modified after the snapshot, then you cannot open it in the red/green view. If a POU has been deleted, then it cannot be opened ever again.

Commands for deleting and editing (name, description) are available in the context menu of a selected time recording.

## 1.7.4.5.2 Menu Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Symbol</th>
<th>Function</th>
<th>Call</th>
</tr>
</thead>
<tbody>
<tr>
<td>'Open POU'</td>
<td>![Symbol]</td>
<td>The command opens the selected POU in its editor.</td>
<td>On the “Online” tab, the context menu of a selected line on the “Call Tree” subtab, on the “List” subtab, or on the “Back Traces” subtab</td>
</tr>
<tr>
<td>'Properties'</td>
<td>![Symbol]</td>
<td>The “Properties” dialog is opened for the selected POU.</td>
<td>On the “Online” tab, the context menu of a selected line on the “Call Tree” subtab</td>
</tr>
</tbody>
</table>

**Dialog ‘Properties for ‘<POU>’**

The dialog shows recording results for the call of the POU that is currently selected in the call tree.

- **‘This call’**: Call of the POU by the POU or task located above in the tree
- **‘All calls’**: All calls of the POU by the task
<table>
<thead>
<tr>
<th><strong>POU Type</strong></th>
<th>Type of POU (examples: function, program)</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Code Size</strong></td>
<td>Code size of selected POU</td>
</tr>
<tr>
<td><strong>Location</strong></td>
<td>Name of the project that contains the active application</td>
</tr>
<tr>
<td><strong>Task</strong></td>
<td>Name of the responsible task</td>
</tr>
<tr>
<td><strong>Number of calls</strong></td>
<td>Number of calls of the POU in the current cycle</td>
</tr>
<tr>
<td><strong>Total time</strong></td>
<td>Total time for the POU call, including the time for all calls that the POU and its called POUs have performed</td>
</tr>
<tr>
<td><strong>Own time</strong></td>
<td>Total time for the POU call, excluding the time for all calls that the POU and its called POUs have performed</td>
</tr>
<tr>
<td><strong>Average time</strong></td>
<td>Average total time measured in the current cycle for the call of the selected POU</td>
</tr>
<tr>
<td><strong>Min. time</strong></td>
<td>Minimum total time measured in the current cycle for the call of the selected POU</td>
</tr>
<tr>
<td><strong>Max. Time</strong></td>
<td>Maximum total time measured in the current cycle for the call of the selected POU</td>
</tr>
<tr>
<td><strong>Standard deviation</strong></td>
<td>Standard deviation of the call time in the current cycle from the average time</td>
</tr>
</tbody>
</table>

**Command 'Delete Snapshot’**

Symbol: ✗

**Function:** The selected snapshot is deleted.

**Call:** Context menu of a selected snapshot entry on the “Snapshots” tab

The deleted snapshot cannot be restored.

See also

- Chapter 1.7.4.5.1.4 “Tab ‘Snapshots’” on page 3701

**Command 'Edit Snapshot’**

Symbol: 📝

**Function:** The name and description of the selected snapshot can be modified.

**Call:** Context menu of a selected snapshot entry on the “Snapshots” tab

The command opens the “Edit Snapshot” dialog for changing the name and description. The dialog corresponds to the “Save Snapshot” dialog.

See also

- Chapter 1.7.4.5.1.4 “Tab ‘Snapshots’” on page 3701
- Chapter 1.7.4.5.1.3 “Tab ‘Online’” on page 3697

**Command 'Print Table’**

Symbol: 📈

**Function:** The command opens the default dialog for configuring a print job. You can print the table with the current measurement results of the code coverage.

**Call:** Context menu of a code coverage measurement on the “Online” tab
See also
● § Chapter 1.7.4.5.1.3 “Tab ‘Online’” on page 3697

Command 'Times'

**Function:** The command opens the dialog "Times for <POU>". The measured time is displayed for each POU call.

**Call:** On the “Online” tab, the context menu of a selected line of a POU which is called multiple times on the “Call Tree” subtab

Dialog 'Times for <POU>

The dialog shows the measured duration for each individual POU call at the selected position in the call tree.

Additional information includes the following:

- **“POU Type”:** For example, Function
- **“Code Size”:** POU size (in bytes), for example, 360 Bytes
- **“Location”:** Location where the POU is defined (application, library, etc.), for example, standard, 3.5.5.0 (system)

See also
● § Chapter 1.7.4.5.1.3 “Tab ‘Online’” on page 3697

Command 'Export'

**Function:** The command opens the standard dialog for saving a file to the local file system. You can save the current list of Profiler results as a CSV file.

**Call:** On the “Online” tab, the context menu on the “List” subtab

See also
● § Chapter 1.7.4.5.1.3 “Tab ‘Online’” on page 3697

Command 'Copy Table'

**Symbol:** ⌘

**Function:** The command saves the current list of profiler results to the clipboard.

**Call:** On the “Online” tab, the context menu on the “List” subtab

See also
● § Chapter 1.7.4.5.1.3 “Tab ‘Online’” on page 3697
NOTICE!
The implicitly added IEC code for a Profiler measurement method, as well as
the breakpoints for POU's in the watch list, result in a change and slows down
the evaluated program.

When a profiling or code coverage measurement is active, an online is gener-
ally not possible. Moreover, some online features are not available, such as flow
control and breakpoints. There are no restrictions for the watch list in this
respect.

Enabling or disabling a Profiler measurement method, or changing any settings
in the Profiler editor each requires a download. Then an online change is no
longer possible. There are no restrictions for the watch list in this respect.

For each POU and each POU instance of an application in this watch list, CODESYS Profiler
detects at runtime the frequency and duration that it is called.

You can fill the list with the required POUs and instances in offline mode or online mode:
- By dragging a POU from the device tree or editor to the list
- By specify an entry manually (supported by the Input Assistant)
- By clicking “Add to Profiler Watch List” in the context menu of a POU in the “Devices” or
“POUs” view

<table>
<thead>
<tr>
<th>“Call”</th>
<th>Name of the POU whose calls are analyzed (example: PLC_PRG). For input options, see above.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Instance”</td>
<td>Name POU instance</td>
</tr>
<tr>
<td>“Application”</td>
<td>Path of the application for which the analysis should be performed (example: Device_XY.Application)</td>
</tr>
<tr>
<td>“Count”</td>
<td>Number of calls since the measurement was started (example: “24”)</td>
</tr>
<tr>
<td>“Duration &lt;unit&gt;”</td>
<td>Total duration of all calls in the current cycle (example: 51 µs)</td>
</tr>
<tr>
<td>“Max. Duration &lt;unit&gt;”</td>
<td>Maximum duration of calls in a cycle since beginning the measurement (example: 764 µs)</td>
</tr>
<tr>
<td>“Min. Duration &lt;unit&gt;”</td>
<td>Minimum duration of calls in a cycle since beginning the measurement (example: 200 µs)</td>
</tr>
<tr>
<td>“Sum Duration &lt;unit&gt;”</td>
<td>Total duration of all calls since beginning the measurement (example: 204876 µs)</td>
</tr>
<tr>
<td>“Avg. Duration &lt;unit&gt;”</td>
<td>Average duration of calls in a cycle since beginning the measurement (example: 48 µs)</td>
</tr>
</tbody>
</table>

Context menu in online mode or offline mode when the focus is in a table cell:
- “Reset” Resets the measured times of the selected lines to zero
- “Delete” Deletes the selected lines
“Open POU” | Opens the POU of the selected lines in the editor
---|---
Submenu “Display Mode” | For setting the time data type or the unit directly for displaying the duration:
- “LTIME” (example: LTIME#43ms13µs44ns)
- “TIME” (example: T#201ms)
- “ms” (example: 201)
- “µs” (example: 1347)
- “ns” (example: 597811)

- Chapter 1.7.4.2.2 “Using the Profiler Watch List” on page 3692

1.7.5 Drive composer pro integration

Drive Composer Pro is a start-up and maintenance tool for ABB’s common architecture drives. The tool is used to view and set drive parameters, and to monitor and tune process performance.

Drive Composer Pro provides:
- Setting parameters,
- taking local control of the drive from the PC,
- event logger handling
- control diagrams,
- fast monitoring,
- working with multiple drives on the PC tool network,
- macro script editing for parameters and much more.

1. Add “Drive Composer Pro” object into the tree via add object dialog.
2. Open the “Drive Composer Pro” with double-click on the object.

In the following section important functions are described.
1. Import of FSO backup files (*.dcsafety) and Drive Parameters backup files (*.dcparamsbak) into Automation Builder project via the Drive Composer Pro object in the device tree.

2. View of integrated FSO backup files and Drive Parameters backup files in Automation Builder project - refer to image below.

Drive Composer Pro can't be launched directly with integrated “FSO backup files” but they have to be loaded manually via context menu on the drive in Drive Composer Pro → “Safety Settings”.
1. Select the FSO and Drive Parameters backup files.
2. Export the selected file by clicking [Export].
   ➞ Select the desired storage path.
Remove of backup files

1. Select the FSO and Drive Parameter backup files from Automation Builder project.
2. Remove the selected files by clicking [Remove].
1. Open the “Crane_follower12.dcparsmbak” with double-click.

2. The “Drive Composer Pro” starts automatically.

Standard Drive Parameter backup files (*.dcparsmbak) are automatically displayed under “File Drives”.

3. Saved changes in the standard drive parameter backup file are automatically updated in the Automation Builder project.

### 1.7.6 CODESYS SVN

SVN integration in CODESYS

CODESYS SVN allows for the development of CODESYS projects under version control by Apache™ Subversion®. CODESYS SVN provides an SVN client integrated in CODESYS. The objects of your project are versioned in a central SVN repository.

As a rule, the SVN repository should be created in a server configuration and located on a server. For testing purposes, you can create a local SVN repository where you can access per file://.

Professional Version Control requires a valid license and can be installed using the Automation Builder Installer or the Automation Builder Installation Manager.
1.7.6.1 Getting Started

The following steps are required in order to develop your CODESYS project with CODESYS SVN with version control by Apache™ Subversion®:

1. Install the CODESYS SVN package in CODESYS.
2. Install an SVN server.
3. Create an SVN repository.
4. Open your CODESYS project in CODESYS.
5. Import the CODESYS project into the SVN project archive.
   ➔ The CODESYS project is saved in the SVN repository.
6. To edit and further develop the project with SVN version control, the project is edited in CODESYS and then committed to the SVN repository.

A detailed description of these individual steps is located in the following sections.
See also
● § Chapter 1.7.6.3 “Using an SVN Repository” on page 3711
● § Chapter 1.7.6.4 “Using Working Copies” on page 3713

1.7.6.2 Version control

What is version control? Apache™ Subversion® (SVN) is a tool for version and revision management of current and previous versions of files, such as source code, websites, and documentation. Apache™ Subversion® is a registered trademark of the Apache Software Foundation.

Revision management (also known as version control, version management, and source code management) is the management of changes to documents, programs, and other information that is stored as computer files. Version control is employed frequently in software development when a team of employees works on the same files.

Tasks
● Co-writing of changes in revisions: At any time, you can show who made which changes at which time.
● Restoring of old revisions of individual files: At any time, you can reverse accidental changes to files.
● Archiving of special revisions of a project: At any time, you can revert to older versions.
● Coordination of common access of developers to data
● Development of a project simultaneously in multiple branches

Script Engine SVN Add-on API
CODESYS SVN provides a scripting-interface for SVN.
See also
● Script Engine SVN AddOn API Reference

1.7.6.3 Using an SVN Repository

An SVN repository usually saves information as a file system tree, a hierarchy of files, and directories. Any number of clients connects to the SVN repository and reads or writes changes to the files in revisions.
Creating an SVN repository

**NOTICE!**
Consult with your IT specialists for more information, for example how to create an SVN repository. For production purposes, we recommend a strictly dedicated administrative SVN server.

We recommend that you create the suggested default directory structure in the SVN repository.

See also

---

Creating an SVN repository for testing purposes

**NOTICE!**
Use the file:// access method for testing purposes only.

For testing purposes, you can create a local SVN repository without installing your own server. The SVN repository is accessed via file:// and provides the same functionality as a server.

Requirement: The SVN client TortoiseSVN 1.9 is installed on the development system.

1. Create a new, empty folder on your local file system. The test repository will be created there.
   - **Example:** D:\SVN repository
2. Click **“TortoiseSVN ➔ Create repository here”**.
   - The dialog “Create repository” opens.
3. Click “Create directory tree”.
   - The SVN repository is created.

- Documentation TortoiseSVN
  [Documentation TortoiseSVN](#)

---

Creating a test repository with TortoiseSVN

Accessing the SVN repository

<table>
<thead>
<tr>
<th><strong>Table 797: SVN repository URLs</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>file:///</td>
</tr>
<tr>
<td>http://</td>
</tr>
<tr>
<td>https://</td>
</tr>
<tr>
<td>svn://</td>
</tr>
<tr>
<td>svn+ssh://</td>
</tr>
</tbody>
</table>
Import the project into the SVN repository.

1. Open the CODESYS project that you want to save in the SVN repository.
   
   ⇒ Example: A.project is open.

2. Click “Project ➔ SVN ➔ Import project to SVN”.
   
   ⇒ The “Browse SVN repository” dialog opens.

3. Select the directory file:///D:/SVN repository/trunk in the directory tree.

4. Select the command.
   
   ⇒ The “Create remote directory” dialog opens.

5. Specify the URL for the new directory.
   
   Note: Because the new directory should contain the CODESYS project, specify the project name with extension here.
   
   ⇒ file:///D:/SVN20repository/trunk/A.project

6. Click “OK” to close the dialog.

7. Select the new project and click “OK” to exit the “Browse SVN repository” dialog.
   
   ⇒ The “Import Project to SVN” dialog opens. The directory file:///D:/SVN repository/trunk/A.project is specified in “URL of SVN repository”.

● § Chapter 1.7.6.5.1 “Overlay Icons” on page 3714

1.7.6.4 Using Working Copies

Checking out a project

You can copy CODESYS projects to your development system that are saved in the SVN repository.

1. Open CODESYS.

2. Click “Project ➔ SVN ➔ Checkout”.
   
   ⇒ The “Checkout” dialog opens.

3. Specify the URL of the SVN repository and select a project in the SVN repository tree.
   
   If a CODESYS project has the extension .project or _project, then it is recognized automatically as a project at checkout. If it has the extension .library or _library, then it is recognized as a library project.

4. In “Checkout to”, specify the name and location of the working copy on your development system.

5. Click “OK” to close the dialog.
   
   ⇒ The project opens in CODESYS. In the object tree of the project, the SVN link is shown with overlaid icons. Now the project is saved as a working copy on your development system.

See also

● § Chapter 1.7.6.5.1 “Overlay Icons” on page 3714
Update the working copy before you start editing, especially if the project is revised by a team. This is how you avoid conflicts.

1. Open the working copy.
2. Click “Project ➔ SVN ➔ Update project” (symbol: 🔄).  
   ⇒ You working copy is current.
3. Revise your project.
4. Click “Project ➔ SVN ➔ Edit SVN working copy”.  
   ⇒ The dialog opens. There you can browse your changes.
5. Close the dialog.
6. If necessary, you can click “SVN ➔ Revert” in the context menu.  
   ⇒ The file is reverted back to the base revision and your changes are discarded.
7. If necessary, you can click “Compare” in the context menu of an edited object.  
   ⇒ The compare dialog opens. You can resolve any conflicts here.
8. Close the compare dialog.
9. Click “Project ➔ SVN ➔ Commit project” (symbol: ✨).  
   ⇒ The “Commit” dialog opens.
    ⇒ Your changes are saved in the SVN repository as a revision with a revision number.

See also
- Chapter 1.7.6.5.2.1 “Command ‘SVN Repository Browser’” on page 3716

For projects in version CODESYS SVN V4.1.0.0 and later, the working directory (working copy) has a new format.

If you open a project that was created with V4.0.4.0 or earlier, then the project is updated automatically to the new format when it is opened.

If you open a project that was created with V4.0.4.0 or earlier and the project is based on an older SVN version of 1.7.x or earlier, then you are prompted whether or not CODESYS should update the format. If you decline the update, then the SVN link of the project is deactivated. You can still load and edit the project.

The update does not have an effect on saving to the SVN server. You can also checkout projects with earlier versions of the client. The new format affects only the local working directory.

Command 'SVN Repository Browser'

Symbol: 

Function: This command opens the SVN repository browser. The contents of an SVN repository is shown in a tree structure here. You can search through the repository in the browser.

Call: Menu bar: “Project ➔ SVN”.

Depending on the selected object, the following commands are available in the context menu:

- “Show log”
- “Checkout”
- “Create folder”
- “Copy to”
- “Rename”
- “Delete”

Double-clicking the object with the right mouse button opens the log dialog.
**Dialog 'SVN Repository Browser'**

**Command 'Edit SVN working copy'**

**Symbol:** ![icon](image)

**Function:** This command opens the dialog “Edit SVN working copy” and displays the working copy in a browser from the SVN view.

**Call:** Menu bar: “Project ➔ SVN”. 
The functionality of the browser allows for:

- Access to and actions on objects that are not displayed in the “Devices” view.
- Actions on objects that can lead to exceptions in the “Devices” view.
- Editing of global objects that are modified, in conflict, or blocked.

**Dialog ‘Edit SVN working copy’**

**Command 'Import project to SVN'**

**Symbol:** 🔄

**Function:** This command opens the dialog “Import project to SVN” in order to import a CODESYS project to the SVN repository.

**Call:** Menu bar: “Project ➔ SVN”.

**Requirement**

- You have access to an SVN repository and you know its URL.
- You have read access to the entire project.

See also

- User and access management in Protect and save project

**Dialog 'Import Project to SVN'**

<table>
<thead>
<tr>
<th>“URL of SVN repository”</th>
<th>URL of the SVN repository with the new project folder where the files are imported. Example: <a href="https://svnserver/repository/trunk/ControlABC.project">https://svnserver/repository/trunk/ControlABC.project</a></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Tip: When importing libraries, specify the extension .library or _library. For projects, specify the extension .project or _project. Then the project type is recognized automatically at checkout and the options are set accordingly in the “Checkout” dialog.</td>
</tr>
<tr>
<td>“Import message”</td>
<td>Text for use as log message Example: Control project for customer A</td>
</tr>
<tr>
<td>“Recent Messages”</td>
<td>Opens the “Recent Messages” dialog. There you can reuse the last log messages.</td>
</tr>
<tr>
<td>“Generate SVN_VERSION_INFO”</td>
<td>If the object SVN_VERSION_INFO is not created automatically during the import operation. Therefore, the project does not obtain any global constants or variables for the project metadata.</td>
</tr>
<tr>
<td>“OK”</td>
<td>Creates the current project in the SVN repository and imports the project objects. The local project in CODESYS Development System is linked to the SVN repository. Overlay icons show this in the object trees.</td>
</tr>
</tbody>
</table>
Command 'Checkout'

Symbol: 

**Function:** This command opens the “Checkout” dialog. Here you can checkout a project stored in the SVN repository as a working copy.

**Call:** Menu bar: “Project ➔ SVN”.

**Dialog 'Checkout'**

<table>
<thead>
<tr>

</tbody>
</table>
Table 805: “Revision”

For a description, refer to the section “Dialog ‘Select revision’”.

Note: The group provides the same options as the “Revision” dialog.

| “OK”          | Checks out the project from the SVN repository, saves it locally to the specified location, and opens it in CODESYS as the primary project. |

If files were encrypted when imported to the SVN repository, or if they have been committed, then note the following:

When committing to the SVN repository, the information about an encrypted project file is included. However, the type of encryption is not included (password, Wibu security key, X509 certificate). Therefore, it may be necessary to encrypt the working copy again in the project settings. In this case, a dialog opens when exiting the command to notify you of this. Then you are able to switch directly to the project settings.

Command ‘Commit’, Command ‘Commit project’

Symbol: ✅

Function: This command commits changes that were made in CODESYS to the SVN repository. The “Commit” dialog opens for this purpose.

Call:
- Context menu: “SVN” to commit this object exactly.
- Menu bar: “Project ➔ SVN ➔ Commit project” to commit all changes in the project at the same time.

Requirement: At least one object was edited. The edited object is overlaid in the object tree with the icon.

When you execute the command, the block on the objects to be committed is lifted automatically.

Dialog ‘Commit’

Table 806: “Commit to: <URL project/object>”

<table>
<thead>
<tr>
<th>URL in SVN repository</th>
<th>Example: file://D:/SVN repository/trunk/ControlABC.project</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Log message”</td>
<td>Comment the change in a log message.</td>
</tr>
<tr>
<td></td>
<td>Example: Bug fix error 123</td>
</tr>
<tr>
<td>“Recent Messages”</td>
<td>Opens the dialog “Recent Messages” to display the last log messages. You can click a log message to accept it.</td>
</tr>
</tbody>
</table>
### Table 807: “Changes made (double-click on object for compare, right-click on object for more operations)”

| **Object** | List of objects that were changed and can therefore be committed. The SVN URLs mirror the hierarchy of the object in the SVN repository. The objects are highlighted in color according to the object status:  
  - Blue: Modified  
  - Green: Added  
  - Dark red: Deleted  
  - Red: Conflicted  
  - Black: Non-versioned (not in SVN repository)  
  - Gray: Excluded from commit  
  - Note: These objects are displayed when the option “Show non-versioned objects” is activated.  
  - Note: This is the case when the option “Ignore during commit” is activated.  
  - Double-click an object in order to open the compare dialog. The revision of the working copy is compared with the base revision. The compare dialog also opens when you click “Compare” in the context menu.  
  - Right-click an object in order to open the context menu.  
  - Note: This opens a list of objects when “Commit project” was clicked. For the “Commit” command applied to a specific object, only this object is listed (if modified) and its modified children.  
  - “Object”: The object is activated for the commit.  
  - Example: ![Device|Plc Logic|Application|PLC_PRG](image)  |
| **Text status** | Object status in CODESYS  
  - “Modified”  
  - “Added”  
  - “Deleted”  
  - “Non-versioned”  
  - “Conflicted”  |
| **Property status** | Status of the metadata of the object  
  - “Modified”  
  - “Added”  
  - “Deleted”  
  - “Conflicted”  
  - “Normal”  |
| **Lock** | If the object has a lock, then it is shown here the user who applied the lock.  
  - Example: b.mayer  |
| **Description** | Display of the log message  |
| **Select/deselect all** | ☑: All objects in the list are activated.  |

- “Keep locks”: ☑: Your locked object keeps remains in lock status after the commit.
- “Keep change lists”: ☑: The change list also remains after the commit.
- ☓: The change list is not deleted after the commit.
- “Update after commit (recommended)”: ☑: The object/project is updated after the commit. Select this check box to ensure that the project is up-to-date and to prevent conflicts resulting from mixed revisions of working copies.

See also: SVN help
| Button “Update project” | Updates the project.  
| Tip: Prevent conflicts by committing a previously updated project/object. |
| **“OK”** | Checks the working copy first. Starts the commit of changes when the working copy is current.  
| Keyboard shortcut [Ctrl]+[Enter] | Opens a dialog when the working copy is outdated. You can then select the following:  
| ● “Abort the commit, I want to investigate the issue.”  
| ● “Yes, I want to update this project now.”  
| ● “Continue with the commit, I know what I do.”  
| Note: The history of the commit is displayed in the “Messages” view.  
| The messages are highlighted in color:  
| ● Blue: Commit a change  
| ● Green: Add an object  
| ● Dark red: Delete/replace an object  
| ● Black: Other messages (summary) |

### Handling external objects

*If the external object is in the same SVN repository, then changes in this external object are listed in the commit dialog and committed together with the internal project. If an external object is in another SVN repository, then you are notified about changes in the external project and you have to commit these separately.*

*An external object has the “externals” property.*

### Context menu

*(right-click on object)*

| “Compare” | Opens the compare dialog to compare the working copy with the top-level revision. |
| “Compare with HEAD version” | Opens the compare dialog to compare the working copy with the HEAD revision. |
| “Compare with revision” | The list entries are highlighted in color according to the object status:  
| ● Blue: Modified  
| ● Green: Added  
| ● Dark red: Deleted  
| ● Red: Conflicted  
| ● Black: Non-versioned (not in SVN repository)  
| Note: These objects are displayed when the option “Show non-versioned objects” is activated.  
| ● Gray: Excluded from commit  
| Note: This is the case when the option “Ignore during commit” is activated for the object. |
| “Revert” | Discards your changes to the working copy. Then the object corresponds to the revision in the SVN repository. |
| “Show log” | Shows the version history of the selected object. |
“Properties” | Opens the “SVN Properties” dialog. The properties are displayed there and you can edit them.
---|---
Move to change list | Note: This command has not been implemented yet.

Command 'Compare'

Symbol: 

**Function:** This command opens a tab that shows the result of the comparison of your working copy and the BASE revision. The base revision is the top-level revision in the SVN repository.

**Call:**
- Menu bar: “Project ➔ SVN”.
- Context menu

**Requirement:** The object is versioned, it was modified locally, and it does not contain any conflicts.

Multiple tabs can be open at the same time with the comparison of different objects.

**Comparison by object type**

The comparison dialog makes use of the functionality of the CODESYS command “Project ➔ Compare”. In this way, objects are compared according to their object type.

See also
- Project compare with the 'Compare' command

Command 'Compare with HEAD revision'

Symbol: 

**Function:** This command opens a tab that shows the result of the comparison of your working copy and the HEAD revision. The HEAD revision is the top-level revision in the branch. You can revert specific changes that were committed to the HEAD revision.

**Call:** Context menu: “SVN”

**Requirement:** The object is versioned and not conflicted.

Multiple tabs can be open at the same time with the comparison of different objects.

**Comparison by object type**

The comparison dialog makes use of the functionality of the CODESYS command “Project ➔ Compare”. In this way, objects are compared according to their object type.

See also
- Project compare with the 'Compare' command

Command 'Compare with revision'

Symbol: 

---
**Function:** This command opens the “Project log” dialog or “Log - <object>” where the version history is displayed from the project or an object of the CODESYS project. Here you can select a revision. A tab opens and shows the result of the comparison of your working copy and the revision.

**Call:** Context menu: “SVN”

**Requirement:** The object is versioned and not conflicted.

Multiple tabs can be open at the same time with the comparison of different objects.

<table>

</tbody>
</table>

See also
- Chapter 1.7.6.5.2.1 “Command ‘SVN Repository Browser’” on page 3716
- Dialog 'Properties'

Command 'Include externals to project', Command 'Include externals'

Symbol: ➔

Function: These commands open the dialog “Include externals”.

Call:
- Menu bar: “Project ➔ SVN”.
- Context menu: “SVN”

Requirement: An object is selected in the object tree. The external objects are linked below that. If you have selected nothing or the project root directory, then the command “Include externals to project” is available. If you have selected an object, then the command “Include externals” is available.

The same external objects cannot be linked multiple times at different locations in the same project. This leads to problems in CODESYS because of conflicts with the internal identification of the object.

Dialog 'Include externals'
Table 812: “URL of SVN repository”

| **URL of the external object that is linked. The object to be linked is versioned and can have sub-objects.** |
| External objects are located at another location in the SVN repository than the project. It can even be in another SVN repository. |
| **Example:** file:///D:/SVN repo A/trunk/DSTest.project/GlobalTextList |
| **Note:** The objects that should be linked below the selected object must have a matching object type. For example, only a task can be linked below the “Task configuration” object. |

| **Opens the dialog “Select revision”** |
| Here you can select a revision. |
| The button is labeled with the currently selected revision: |
| ● **“HEAD”**: Top revision (latest). Preset |
| ● **“15”**: Revision number of the selected revision |
| ● **“23.12.2016 11:59:59 (UTC)”**: Change date of the selected revision (UTC) |
| **Note:** The dialog provides the same options as the “Revision” group. |

| **Opens the “SVN repository browser” dialog** |
| Here you can browse the SVN repository. |

Table 813: “Revision”

| Options for selecting a revision |
| Note: the current valid selection is also displayed in the buttons next to the SVN repository URL. |
| **“HEAD”** | ● Latest revision (top revision) selected in a branch. |
| **“Revision”** | ● A specific revision by the revision number. |
| Example: 3 |
| **“Date”** | ● A specific revision by the modification date. |
| Example: 12/23/2016 11:59:59 |
| **“Use UTC Time”**: | [✓]: Modification date in universal time. |

| **“OK”** |
| Adds the external object and its sub-objects with the property `svn:externals` to your project (below the selected object). The working copy is updated and the external object is overlaid with the symbol. |
| Example: [Source](external device Source) |
| **Note:** If the linking fails (for example when adding a device below a task configuration), then the complete operation fails and reverts back. |
| **Note:** Renaming or moving individual external objects is permitted only within an external tree, whereby it is not permitted to move the top object. |
| To move a complete tree, you have to remove it and link it to another location. |
“... You should seriously consider using explicit revision numbers in all of your externals definitions. Doing so means that you get to decide when to pull down a different snapshot of external information, and exactly which snapshot to pull. Besides avoiding the surprise of getting changes to third-party repositories that you might not have any control over, using explicit revision numbers also means that as you backdate your working copy to a previous revision, your externals definitions will also revert to the way they looked in that previous revision, which in turn means that the external working copies will be updated to match the way they looked back when your repository was at that previous revision. For software projects, this could be the difference between a successful and a failed build of an older snapshot of your complex codebase. ...”

This is a quote from: http://svnbook.red-bean.com/nightly/en/svn.advanced.externals.html.

Command 'Ignore on commit'

**Function:** This command identifies an object and adds it to the "ignore-on-commit" list. Then it is deactivated in the commit dialog by default.

**Call:** Menu bar: “SVN”

**Requirement:** At least one object is available that is not in the change list ignore-on-commit.

Objects of the "ignore-on-commit" list are overlaid with the symbol in the object tree. By default, they are not selected in the commit dialog, unless a dependency of a selected object requires it. These objects can always be selected manually in the dialog.

See also

- Chapter 1.7.6.5.2.25 “Command 'Un-Ignore on commit'” on page 3737

Command 'SVN Info'

**Function:** This command provides information about the selected object in the SVN repository. The "SVN Information" dialog opens for this purpose.

**Call:** Context menu: “SVN”

**Requirement:** A versioned object (with SVN link) is selected in the object tree.

Dialog 'SVN Information'

**Example**

Name: Device_4\Plc Logic\Application\PLC_PRG
URL: file:///D:/SVN repository/trunk/ControlABC.project/Device/Plc Logic/Application/PLC_PRG/svnobj

<th>“Recursive”</th>
<th>☑: The lock is stolen by the object and all subordinate child objects.</th>
</tr>
</thead>
</table>

| “OK” | Steals the lock. When the stolen lock is successful, the object (in the object tree) is overlaid with the ⚒ symbol. |

Command 'Release lock'

Symbol: ⚒

**Function:** This command releases the lock of an object.

**Call:** “Context menu ➔ SVN”

**Requirement:** The object is locked.

Command 'Release locks recursively'

Symbol: ⚒

**Function:** This command releases the lock of an object explicitly with all of its subordinate objects.

**Call:** “Context menu ➔ SVN”

**Requirement:** The object is locked.

Command 'Show log', Command 'Show project log'

Symbol: ⚒

**Function:** These commands open the tab “Project log” or “Log - <object>”. The version history of the project or an object of the CODESYS project is displayed in the tab.

**Call:**
- Menu bar: “Project ➔ SVN”.
- “Context menu ➔ SVN”

If you select nothing or the base node in the object tree, then the history of the entire project is displayed (“Show project log”). If you select one or more objects, then the history of these elements is displayed (“Show log”).

Multiple tabs can be open at the same time with the version history of different objects.
Tab 'Project log', Dialog 'Log - <object>'

Upper area
- "Revision": Revision number
- "Author"
- "Date"
- "Message": Message entered at commit

List of all revisions of the project or the selected objects in the information. The first 100 revisions are displayed by default. The "Next 100" and "All" buttons are provided for displaying more or all revisions.

Several commands are available in the context menu of each revision. These context menu commands are described below.

Middle area
Display of the "Message" of the revision that is selected in the upper area.

Lower area
- "Action"
- "Path": Object path in SVN
- "Copy from path"
- "Copy from revision"

List of actions that were performed on the objects of the project in the selected revision:

"Hide unrelated changed paths" ☑: All changes of this revision are hidden that do not have any relevance to the object.

"Stop on copy/rename" ☑: If the object was copied from another location in the SVN repository, then no more log messages are retrieved. This is especially beneficial when branches or tags are monitored and only changes within the branch are relevant.

"Filter/Range" Opens the "Filter" dialog

"All" All revisions are listed.

"Next 100" The next 100 revisions are listed.

Table 815: Dialog "Filter"

- "Revision range" The displayed revisions can be filtered by "Head", "Revision", or "Date". ☑: The option fields for "Start revision" and "End revision" are editable. "Use UTC time": Date display in universal time.
  For more detailed information, refer to the description "Dialog 'Select revision'".

- "Message contains" Display of revision logs that contain a special text in the "Message"

- "Author contains" Display of revision logs of the specified author

- "Path contains" Display of revision logs of the specified path

Table 816: Context menu commands of the revisions

- "Compare with base working copy" Compares the selected revision of the object with the base working copy (without local changes).

- "Com with working copy" Compares the selected revision of the object with the working copy.

- "Compare with HEAD revision" Compares the selected revision of the object with the HEAD revision.

- "Compare with previous revision" Compares the selected revision of the object with the previous revision.

- "Update item to revision" Updates the object to the selected revision.
  Note: Changes of the project by this command cannot be committed.
  For VSS users: This is comparable to loading an older version without checkout. To revert a previous commit, the command "Revert to this revision" has to be used.
Revert to this revision

Reverts the object to the selected revision. This command does not have an effect on the SVN repository as long as the changes are not committed. Internally, SVN reverts the merges for all changes that were made after the selected revision in order to revert the changes of the preceding commits.

Edit author

Opens a dialog for changing the author of the revision.

Edit log message

Opens a dialog for changing the log message of the revision.

Revision properties

Opens the dialog “Revision properties” where the properties are displayed. In the dialog, you can activate the “Add” and “Remove” properties and the option “Show binary properties”.

Create branch/tag from this revision

Creates a branch or tag from the selected revision.

Browse SVN repository

Opens the “SVN repository browser” dialog.

Copy to clipboard

Copies log details of the selected revision to the clipboard. This is the revision number, author, date of revision, log message, and the list of changes objects for each revision.

- % Chapter 1.7.6.5.2.1 “Command 'SVN Repository Browser'” on page 3716
- % Chapter 1.7.6.5.3.3 “Dialog 'Select revision'” on page 3745

Command 'Revert', Command 'Revert project'

Symbol: 

Function: This command opens the “Revert” dialog. In the dialog, select the objects whose local changes should be reverted, and those that are reverted to the state of the base revision of the working copy.

Call:

- Menu bar: “Project ➔ SVN”.
- “Context menu ➔ SVN”

If you select nothing or the main node in the device tree, then all modified objects are listed in this dialog (“Revert project”). If you selected one or more objects, then only the changes to this object are listed and recursively their sub-objects (“Revert”).

Dialog ‘Revert’

- Group externals
  - The external definitions are grouped by their external storage locations.
- Keep locks
  - The lock is retained for all files that are modified by the revert command.
- Select/deselect all

When external objects are deleted, CODESYS SVN cannot restore this data in SVN offline mode. The user is prompted how to proceed:

- Switch back to SVN online mode and call the external objects.
- Connect now to the SVN server one time in order to complete the current operation, but afterwards switch back to SVN offline mode.
- Skip the retrieval of the external objects. They can be fetched later by updating the project.
See also
- Chapter 1.7.6.5.2.20 “Command ‘Revert to revision’, Command ‘Revert project to revision’” on page 3734

Command ‘Revert to revision’, Command ‘Revert project to revision’

Symbol:  ⚫

Function: This command opens the “Select revision” dialog. In this dialog, you select the revision to which the project or the selected objects revert.

Call:
- “Project ➔ SVN”
- “Context menu ➔ SVN”

If nothing or the base node is marked in the object tree, then the entire project is reverted to a specific revision (“Revert project to revision”). If one or more objects are selected, then these objects and their sub-objects are reverted (“Revert to revision”).

Dialog 'Select revision'

For a description of the dialog, refer to the section "Select revision".

See also
- Chapter 1.7.6.5.3.3 “Dialog ‘Select revision”” on page 3745
- Chapter 1.7.6.5.2.19 ‘Command ‘Revert’, Command ‘Revert project’” on page 3733
- Chapter 1.7.6.5.2.18 ‘Command ‘Show log’, Command ‘Show project log’” on page 3731

Command 'Update', Command 'Update project'

Symbol:  ⚫

Function: This command commits changes in the SVN repository to the project. The update is performed with the HEAD revision.

Call:
- Menu bar: “Project ➔ SVN”.
- “Context menu ➔ SVN”

If nothing or the main node is selected, then the entire project is updated (“Update project”). If one or more objects are selected, then these objects and their sub-objects are updated (“Update SVN”).
The following cases are possible:

- Projects are added to the project that are present in the SVN repository, but not in the project. In this case, the message "Added <object>" is issued to the message view.
- Objects that no longer exist in the SVN repository, but are present in the project locally (and not marked as "added"), are treated according to the Subversion standard procedure: If local changes are present, then the object remains in the project as unversioned. If there are no local changes, then the object is also deleted locally because the user can retrieve the object from an older version at any time. In this case, "Deleted object" is issued to the message view.
- Versioned objects that exist in both the SVN repository and the project are updated if they are different. Three cases to observe:
  - No local changes have been made since the last update: In this case, the local object is overwritten by the contents from the SVN repository. The message "Object updated" is issued to the message view.
  - Local changes have been made since the last update and the corresponding object type can be merged. When versions have been merged successfully, the message "Objects merged" is issued to the message view. If the command is not executed successfully, then the object is marked as "Conflicted object" in the object tree and the message "Conflicted object" is issued.
  - Local changes have been made since the last update and the corresponding object type cannot be merged. In this case, the object is marked as "Conflicted object" in the object tree and the message "Conflicted object" is issued.

If only some of the objects are updated, it may be that objects with the same name already exist. For example, this situation can come from moving objects to a folder.

For this conflict, you can react in the following ways:

- Do nothing and leave the conflict-causing objects as they are.
- Update (and remove) the conflicting objects in order to correct the conflict.
- Update the entire project in order to remove all conflicting objects and correct the conflict.

See also

- Chapter 1.7.6.5.2.22 “Command 'Update to revision'” on page 3735

Command 'Update to revision'

Symbol: 

SFunction: This command opens the “Update” dialog. In the dialog, the revision is defined for updating the project.

Call:

- "Project ➔ SVN"
- “Context menu ➔ SVN"

If you select nothing or the base node in the object tree, then the entire project is updated to a revision (“Update project to revision”). If you select one or more objects, then these objects are updated and their sub-objects are updated recursively (“Update to revision”). As an option, you can define that the sub-objects are not updated.

The behavior of the updating process (for example merging of conflicts) is similar to the “Update project” and “Update” commands.

Dialog 'Update'

| “HEAD” | : This command behaves the same as the “Update” and “Update project” commands. |
| “Revision” | : The revision to which was last updated is selected by the revision number. |
| | : Opens the dialog “Log” for selecting the revision. |
“Date”  • The revision to which was last updated is selected by the modification date.
  “Use UTC time”:  • The date is displayed in universal time.

“Recursive”  • Default setting. The selected part is updated recursively. This means that all elements below the selected object are also updated.

“Omit external objects”  • External objects are not updated.

- † Chapter 1.7.6.5.3.3 “Dialog 'Select revision’” on page 3745

Command 'Disconnect project from SVN'

Symbol:  

Function: This command deletes all connections of the current project to SVN by converting the project into a non-versioned project.

Call: Menu bar: “Project ➔ SVN”.

Because this operation cannot be reversed, the operation must be confirmed before the command is executed.

Use the command "Connect to existing project" to connect to the SVN repository again at a later time.

See also
- † Chapter 1.7.6.5.2.29 “Command ‘Connect to existing project’” on page 3739

Command 'Switch'

Symbol:  

Function: This command opens the “SVN switch” dialog. In this dialog, you specify a URL in the SVN repository to which the current working copy of the project is updated. The command switches a project from a branch or tag to another.

Call: Menu bar: “Project ➔ SVN”.

Requirement: The project is versioned.

Dialog 'SVN switch'

<table>
<thead>
<tr>
<th>“From”</th>
<th>Current SVN URL of the project</th>
</tr>
</thead>
<tbody>
<tr>
<td>“To”</td>
<td>Input field for the target URL in SVN</td>
</tr>
</tbody>
</table>

- ”HEAD”: The “Select revision” dialog opens.
-  The “SVN Repository Browser” dialog opens. There you select the target URL in the SVN repository.

See also
- † Chapter 1.7.6.5.2.1 “Command ‘SVN Repository Browser’” on page 3716
Command 'Un-Ignore on commit'

**Function:** This command removes an unversioned object from the ignore list so that the object is checked by default on commit.

**Call:** Context menu: “SVN”

**Requirement:** The command “Ignore on commit” was executed for the object. The object is marked with the © symbol.

See also

- © Chapter 1.7.6.5.2.11 “Command 'Ignore on commit'” on page 3729

Command 'SVN Cleanup'

**Function:** This command opens the “SVN Cleanup” dialog. In the dialog, you define actions that are performed when cleaning up the SVN working copy.

**Call:** Menu bar: “Project ➔ SVN”.

Dialog 'SVN Cleanup'

### Table 817

<table>
<thead>
<tr>
<th>“Internal SVN working copy”</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Update time stamps (speeds up SVN status display)”</strong></td>
</tr>
<tr>
<td><strong>“Vacuum cached pristine copies (may reduce the size of your project file)”</strong></td>
</tr>
<tr>
<td><strong>“Clear work queue and force unlock of SVN internal data structures (emergency only)!”</strong></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Project contents”</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Revert all local changes (use with care!)”</strong></td>
</tr>
<tr>
<td><strong>“Release all locks”</strong></td>
</tr>
<tr>
<td><strong>“Revalidate all locks against the repository (they could have been stolen)”</strong></td>
</tr>
<tr>
<td><strong>“Status caches”</strong></td>
</tr>
</tbody>
</table>
Command 'Clear authentication data'

**Function**: This command opens the “CODESYS” dialog. In this dialog, define the caches that will be deleted.

**Call**: Menu bar: “Project ➔ SVN”.

Dialog 'CODESYS'

The authentication memory contains the authentication data of all SVN repositories for which the user has selected for saving the authorization data. This memory is deleted completely by this command.

<table>
<thead>
<tr>
<th>“Clear the shared on-disk cache.”</th>
<th>The data saved on the computer is deleted.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Clear the RAM cache of this instance.”</td>
<td>The data saved in the RAM is deleted.</td>
</tr>
</tbody>
</table>

The authentication data saved on the computer is stored in %APPDATA%\Subversion\auth. This memory path is also used for most other Subversion client applications (for example, TortoiseSVN and AnkhSVN). Therefore, deleting the authentication data affects these applications as well.

Command 'Merge changes'

**Symbol**: ⌘

**Function**: This command opens the “Merge” dialog. In this dialog, you determine the revisions with the changes to be merged with the working copy of the project.

**Call**: Menu bar: “Project ➔ SVN”.

**Requirement**: The project is linked to SVN.

Dialog 'Merge’“”

| “Kind of merge” | ● “Sync/Reintegrate/Symmetric merge”: Synchronizes all missing changes from trunk (or a different branch) into this branch.  
● “Cherry pick”: Integrates specifically selected revisions from one branch to another branch. This is necessary, for example, if any error trapping has to be ported back to an older version. |
|-----------------|--------------------------------------------------------------------------------------------------|
| “Merge source” | SVN URL of the SVN repository  
● Input field  
● “HEAD”: HEAD revision  
● [ ] Dialog “SVN Repository Browser” opens for selecting the SVN repository. |
| “Define start and end revision” | Select this option to merge a cohesive range of revisions with the working copy. |
| “Start revision” | Defines the range of revisions that are merged with the working copy:  
● “HEAD”: HEAD revision  
● “Revision”: Start and end revision of the range  
● “Date”: Date of the start and end revisions |

3ADR010583, 1, en_US 2020/12/10
"Define revision range" | Select this option to merge individual revisions with the working copy. You can also highlight the individual revisions in the "Log" dialog.
Note: When defining ranges, CODESYS SVN behaves like other graphical clients, such as Tortoise SVN), and not like the command-line client. Example: For a range of 4–7, revisions 4, 5, 6, and 7 are merged.
See also: Merging a Range of Revisions

"Dry run (simulation)" | ☑: This command is executed without changing the working copy. Files that are changed during an actual merge are displayed, as well as ranges where conflicts occur.

"Record only" | ☑: The revision is marked as "merged" without actually performing the merge.

"Ignore ancestry " | ☑: SVN uses path-based differences only, not history-based differences.

See also
- % Chapter 1.7.6.5.3.3 “Dialog ‘Select revision’” on page 3745
- % Chapter 1.7.6.5.2.1 “Command ‘SVN Repository Browser’” on page 3716

Command ‘Connect to existing project’

Symbol: ➔

Function: This command opens the “Connect to SVN repository” dialog. In the dialog, you define the URL and the revision of the SVN repository with which the unversioned project is connected.

Call: Menu bar: “Project ➔ SVN”.

Requirement: The project is disconnected from SVN.

NOTICE!
Only users who have read access to the entire project (see the CODESYS user and access management) can import the project into the SVN repository or can link to an existing database project.

NOTICE!
This command functions reliably only when the project has already been imported into SVN and then disconnected with the command “Disconnect project from SVN”.

Dialog ‘Connect to SVN repository’

"URL of existing project" | URL of the SVN repository
  "HEAD": Selection of the revision in the “Select revision” dialog
  ☑: Selection of the SVN repository in the “SVN Repository Browser”

"Checkout options" | “Omit externals”: External objects are not checked out.

"Revision" | ● “HEAD”: HEAD revision
    ● “Revision”: Number of the revision
    ● “Date”: Date of the revision
    “Use UTC time”: ☑: Date display in universal time.
Command 'Resolve conflict'

Symbol:  

**Function:** This command opens the "<object>" dialog. In the dialog, the conflicts are displayed and functions for resolving conflicts are prepared in order to merge changes.

**Call:** Context menu of the object.

**Requirement:** The object has a conflict that has occurred by updating the object with local changes.

**Dialog '<object>**'

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Compare&quot;</td>
<td>The local objects are displayed on the left side, and the version from the SVN repository is displayed on the right side.</td>
</tr>
<tr>
<td>&quot;Use mine&quot;</td>
<td>A local change is used.</td>
</tr>
<tr>
<td>&quot;Use yours&quot;</td>
<td>A change of the version from the SVN repository is changed.</td>
</tr>
<tr>
<td>&quot;Apply&quot;</td>
<td>All changes are accepted that you made in this dialog. The status of the object is changed.</td>
</tr>
<tr>
<td>&quot;Cancel&quot;</td>
<td>Cancels all changes that you made in this dialog. But the object keeps the conflicted status.</td>
</tr>
</tbody>
</table>

Command 'Work in offline mode'

**Function:** This command switches to SVN offline mode. In SVN offline mode, the implicit locking and all commands that access the SVN repository are not possible.

**Call:**
- Menu bar: "Project ➔ SVN".
- Context menu: "SVN"

**Requirement:** The project is linked to SVN.

When switching back to SVN online mode, all present locks on the working copy are checked against the server. If this locking is invalid, then it is released.

**Uses case**

The user on a machine wants to make changes to the project without disconnecting the connection. At the moment, there is no connection to the server. Despite this, when automatic locking is activated, work is possible because the SVN offline mode deactivates the automatic lock temporarily.

Command 'Copy (Branch/Tag)'

Symbol:  

**Function:** This command opens the "SVN Copy Branch/Tag" dialog. There you can "Branch" or "Tag" a revision of your project. A specific revision of your project is saved there at this position. A branch is normally used in order to save changes isolated in one version. A tag is used for marking a specific state, for example a shipping version. Internally, it is copied not in the actual sense, but more refers to the revision.

**Call:** Menu bar: "Project ➔ SVN".
**Requirement:** The project is versioned.

**Dialog 'SVN Copy (Branch/Tag)'**

Table 818: “SVN repository”

<table>
<thead>
<tr>
<th>“From”</th>
<th>SVN path of the current project</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td><a href="https://svnserver/repository/trunk/ControlABC.project">https://svnserver/repository/trunk/ControlABC.project</a></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“To”</th>
<th>Target path in the SVN repository for the copy operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example of tag:</td>
<td><a href="https://svnserver/repository/tags/V4.4.4.4/ControlABC.project">https://svnserver/repository/tags/V4.4.4.4/ControlABC.project</a></td>
</tr>
</tbody>
</table>

: Dialog “SVN Repository Browser” opens for selecting the target path.

Table 819: “Log message”

<table>
<thead>
<tr>
<th>Input field</th>
<th>Comment the change in a log message.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Tag for version 4.4.4.4 created.</td>
</tr>
</tbody>
</table>

| “Recent Messages”                 | Opens the dialog “Recent Messages” to display the last log messages. You can click a log message to accept it. |

Table 820: “Create copy from”

<table>
<thead>
<tr>
<th>“Working copy (including local changes)”</th>
<th>The new branch/tag refers to the working copy including all local changes. The local changes are committed to the SVN repository for this purpose.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Base revision of working copy (&lt;revision number&gt;)”</td>
<td>The new branch/tag refers to the base revision of your working copy whose revision number is displayed in the parentheses. If the working copy already contains local changes, then these are not committed to the SVN repository.</td>
</tr>
<tr>
<td>“HEAD revision of the repository”</td>
<td>The new branch/tag refers to the HEAD revision of your project.</td>
</tr>
<tr>
<td>“Specific revision in SVN repository”</td>
<td>The new branch/tag refers to a revision that is displayed on the adjacent button. Click the button to change the revision. The “dialog opens.”.</td>
</tr>
</tbody>
</table>

| “Switch to new location ” | [ ] After the dialog is confirmed, the working copy switches to the new branch/tag. |

| “OK”                         | The target path is created (as a new tag ../repository/tags/V4.4.4.4 or as a new branch ../repository/branches/new_feature). Then the revision specified in “Create copy from” is copied there. |

**Dialog 'SVN Settings'**

**Tab ’General’**

Symbol:  

**Function:** This tab includes the basic settings for CODESYS SVN.

**Call:** Menu bar: “Tools ➔ Options”.

---

**Double-clicking the object opens the project comparison.**

---
Table 821: “Automatic locking and merging”

<table>
<thead>
<tr>
<th>“Merge”</th>
<th>Behavior for the commands “Update”, “Merge”, or “Switch”, when both sides (working copy and SVN repository) have changed from the base version.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>● “Mark all colliding changes as conflicts”: The objects are not merged automatically. All changes with a conflict are marked as &quot;With conflict&quot;, even if some of them can be merged automatically.</td>
</tr>
<tr>
<td></td>
<td>● “Merge mergeable changes, mark the others as conflicts”: Changes that can be merged are merged automatically. All others are marked as &quot;With conflict&quot;.</td>
</tr>
<tr>
<td></td>
<td>● “Merge mergeable changes, ask the user for the others”: Changes that can be merged are merged automatically. The user is prompted for all others.</td>
</tr>
<tr>
<td></td>
<td>● “Always ask the user, even for mergeable changes”: For all changed objects, the user is prompted, even if some of them can be merged automatically.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Locks”</th>
<th>Behavior such as CODESYS SVN objects when they are changed locally.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>● “Always try to lock before modification”: All objects are locked before they are changed, even if they can be merged.</td>
</tr>
<tr>
<td></td>
<td>● “Only lock the objects which don’t support merging”: Only those objects are locked that cannot be merged automatically.</td>
</tr>
<tr>
<td></td>
<td>● “Never acquire a lock automatically”: No objects are locked, not even if they can be merged automatically.</td>
</tr>
</tbody>
</table>

| “Marker” | ● “Use conflict markers when merging objects”: If objects with conflicts exist that cannot be merged, then these conflicts are marked in the source code with conflict markers. In addition, the object itself is marked as being merged successfully (no conflict). |
|          | ● “Leave non-mergeable objects as conflicted”: No conflict marker is set. Objects that cannot be merged remain in the status "With conflict". |

| “Prompt the user when automatic locking fails.” | ☑: If it is not possible, to lock the object, then the dialog “Automatic locking failed” opens (see dialog description). |

**Example of conflict markers**

```plaintext
Foo();

>>>>>>>>>>>>>>>>>
I := I + 1;

=============
I := I + 2;

<<<<<<<<<<<
```

Table 822: “Server check”

<table>
<thead>
<tr>

**Dialog 'Select revision'**

**Function:** This dialog shows the currently selected revision. You can edit the selection there.

<table>
<thead>
<tr>
<th>“Revision”</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>“HEAD”</td>
<td>☑: The latest revision (top revision) within a branch is displayed.</td>
</tr>
<tr>
<td>“Revision”</td>
<td>☑: A specific revision is displayed by the revision number.</td>
</tr>
</tbody>
</table>

Example: 3

Tip: Click to show the revisions. Then the “Log” dialog opens to display the revisions and the associated actions. The revision that you select there is applied.

<table>
<thead>
<tr>
<th>“Date”</th>
<th>☑: A specific revision is checked out by the modification date. This is the highest revision at the given time (the last revision before that time).</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Example: 12/23/2016 11:59:59</td>
</tr>
</tbody>
</table>

Tip: See section "Revision identifiers" in "Version control with Subversion"

<table>
<thead>
<tr>
<th>“Use UTC Time”</th>
<th>☑: Modification date in universal time is used.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Reset recursively”</td>
<td>☑: All objects below the selected object are also reset.</td>
</tr>
</tbody>
</table>

The action fails if
- Objects have been moved in or out of the hierarchy below
- Objects outside of the hierarchy would be changed by implicit dependencies

**Dialog 'Subversion Authentication'**

The dialogs are used for authenticating the server/client connection. A server or client authentication is performed depending on the initial situation and protocol.
Overview of possible protocols and dialogs

- **svn://**: The SVN protocol; either unencrypted or SSL/TLS encrypted
  - Can prompt for user name and password (even for an unencrypted connection)
  - Can prompt for a server certificate from the dialog for authentication in order to confirm the server if a certificate is unknown, defective, or invalid (for TLS/SSL encryption)
  - As an alternative or in addition to the user name and password prompt, the client can also be authenticated with client certificates (for TLS/SSL encryption). The dialogs for authentication open with the client certificate.

- **http://**: SVN via http, unencrypted
  - Can prompt for user name and password

- **https://**: SVN via http, SSL/TLS encrypted.
  - Can prompt for user name and password
  - Can prompt for a server certificate from the dialog for authentication in order to confirm the server if a certificate is unknown, defective, or invalid.
  - As an alternative or in addition to the user name and password, the client can also be authenticated with client certificates. The dialogs for authentication open with the client certificate.

- **svn+ssh://**: The SVN protocol, encrypted through an SSH tunnel. SSH (Secure Shell) is the usual networking tool in Linux/Unix for accessing other computers.
  - Can prompt for user name and password
  - Prompts for server certificate in the dialog for authentication if the server is still unknown in order to be sure that it is the correct server.

### Initial situation
CODESYS (as a client) receives an unknown or defective server certificate.

This dialog shows information about the certificate. There you can confirm the identity of the server.

<table>
<thead>
<tr>
<th>&quot;Authentication area&quot;</th>
<th>Connection that is secured</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Example: <a href="https://svn">https://svn</a> repository:443</td>
</tr>
</tbody>
</table>

#### Table 827: “Certificate information” (for SSL/TLS connections)

<td></td>
</tr>
</tbody>
</table>

#### Table 828: “SSH server key information” (for SSH connections)

| "Key type" |
| "Key size (bits)" |
| "Key thumbprint" |
### "Save information to RAM"
- The certificate is saved to the working memory. Then the client recognizes in the current CODESYS session for future connections.
- If you restart CODESYS, then you have to accept the certificate again.

### "Save to disk"
- The certificate is saved on the computer and it is available for future connections.
- If you restart CODESYS, then the saved certificate is used.

### "OK"
- Authenticates and established the connection.

---

The certificate memory is secured cryptographically and distributed with other SVN clients.

1.7.6.4 Objects

1.7.6.4.1 Object ‘SVN_VERSION_INFO’ ................................................................. 3749

Object ‘SVN_VERSION_INFO’

Symbol: 

The object contains the SVN metadata of the project as global constants or variables in a variable list. It is located in the “POUs” view. You can specifically retrieve the data of the global constants or variables by the application. By calling specific data, you can also reduce the memory usage on the controller.

The SVN metadata is provided for this purpose, subdivided over multiple global variable lists (GVLs):

- “SVN_VERSION_INFO”
- “SVN_Info_Summary”
- “SVN_Info_SummaryW”
- “SVN_Info_URI”
- “SVN_Info_Revisions”
- “SVN_Info_Flags”
- “SVN_info_LastChange”

The SVN_VERSION_INFO object is created automatically when a project is imported to a SVN repository. To do so the option “Create SVN_VERSION_INFO” in the dialog “Import project to SVN” must be activated.

Furthermore you can create the object or remove it from the project with the option “Generate SVN_VERSION_INFO constants for IEC Access” (Dialog “Project ➔ Project Settings”, category “SVN Settings”).
Table 832: Global Constants

<table>
<thead>
<tr>
<th>Name</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MINREVISION</td>
<td>LINT</td>
<td>Lowest revision number of the working copy</td>
</tr>
<tr>
<td>MAXREVISION</td>
<td>LINT</td>
<td>Highest revision number of the working copy</td>
</tr>
<tr>
<td>PARTIAL</td>
<td>BOOL</td>
<td>TRUE: The working copy is incomplete. Example: Cancellation during the last update due to a network error or a checkout.</td>
</tr>
<tr>
<td>MODIFIED</td>
<td>BOOL</td>
<td>TRUE: Local changes were made.</td>
</tr>
<tr>
<td>SWITCHED</td>
<td>BOOL</td>
<td>TRUE: Parts of the project were branched (with the “Switch” command).</td>
</tr>
<tr>
<td>VERSION</td>
<td>STRING</td>
<td>Version identification, similar to Apache™ Subversion® (subversion.exe)</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Example: 12:34M, means MINREVISION = 12, MAXREVISION = 34, MODIFIED = TRUE</td>
</tr>
<tr>
<td></td>
<td></td>
<td>For more information, refer to the documentation for Apache™ Subversion®.</td>
</tr>
<tr>
<td>CLEAN</td>
<td>BOOL</td>
<td>TRUE: The version is clean. This is the case when MINREVISION is equal to MAXREVISION, the working copy is complete, and non-versioned, and is was not switched.</td>
</tr>
<tr>
<td>URL</td>
<td>WSTRING</td>
<td>SVN-URL of the project</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Example: <a href="https://svnserver/repository/trunk/ControlABC.project">https://svnserver/repository/trunk/ControlABC.project</a></td>
</tr>
</tbody>
</table>

If a controller does not support the data type WSTRING, then a compiler error is issued when accessing the object SVN_VERSION_INFO.

1.7.7 Subversion

1.7.7.1 Project Version Control with Subversion

Introduction
Automation Builder projects can be stored in Subversion (SVN) repositories by using the Project Version Control. The Project Version Control can be used to track changes on a project and to have access to historic versions of the whole project or objects in the project. It is possible to hold different versions of a project in branches and to compare these versions. The Project Version Control enables multiple engineers to work collaboratively on the same project.

Basic knowledge
Make yourself familiar with the concepts of SVN.
This manual about Project Version Control is additionally to the following information and describes mainly the specific behavior of Subversion in Automation Builder.
● Homepage of Subversion: http://subversion.apache.org/
● Online user manual for Subversion: http://svnbook.red-bean.com/
● Documentation on SVN integration in Automation Builder: Refer to subfolder CODESYS SVN.

1.7.7.1 Preconditions

**Automation Builder**

- In Automation Builder, the Project Version Control must be installed.
- A valid license for the Project Version Control must be activated.
- All collaborating users working on the same project need:
  - Automation Builder installed in the same version with the same features.
  - License for same edition.
  - Same set of optional third party device descriptions.
  - Same set of optional customer specific packages.

**SVN server**

The Project Version Control can be used in combination with an SVN server in version 1.6 or newer, the repository format should be 1.5, 1.6 or 1.7. Newer repository formats are not yet supported.

The usage of local repositories in the local file system or even on a network share is strongly discouraged.

1.7.7.2 Working with Project Version Control

- All objects in the device tree or POU tree are represented by an object in the SVN repository, there might be hidden objects that are not visible in the tree but that exist in SVN.
- The smallest unit in the SVN repository is one object including all its data like name, parameters, device identification.
- Objects are identified in the SVN repository by their name. Renaming one object in Automation Builder means to delete it from the SVN repository and add a new one to the SVN repository. Renaming an object causes a break in the history of that object.
- By default objects are locked before they are changed to prevent other users from changing the object. The locking strategy can be changed in the user options.
- Objects can be compared to other versions of the same object, many differences/changes between the current object in the Automation Builder project and the compared object can be merged into the object in the Automation Builder project. Merging changes could be used to resolve conflicts in case concurrent changed can not be avoided.

- To ensure consistency it is required and also enforced that some changes can be committed or reverted only together.
  - All changes to device objects in the hardware tree that are sub-nodes to the same top level device. Note: Objects that are not devices are excluded, e.g. the application node.
  - All changes below the AC500 PLC application node.
- Most SVN operations can not be performed while other external applications like CODESYS or Panel Builder work on files that are embedded in Automation Builder project.
- Some operations like changing the target or updating the project to the latest device (description) versions do a recursive lock of the whole AC500 PLC. If the lock can’t be obtained the operation is aborted.
- Some objects contain internal data that has no meaning to the end user but is also important. Changes on such data are not shown in the compare dialog or are summarized by a placeholder like "There are hidden changes".
- Including externals is not supported.
1.7.7.1.3 Recommendations on Working with Project Version Control

Be collaborative
- Multiple users that work collaboratively on the same project should agree on their responsibility for certain parts of the project where they do changes to avoid conflicts and tree conflicts.
- Agree on locking strategy used by all users working on the same project.
- Distribute the work between multiple users meaningfully.
  - It is suggested to setup the hardware structure at first before other users checkout a project to work on it and limit structure changes in the hardware tree to the minimum.
  - Before adding objects, especially top level objects, users should agree that only one user adds objects at top level or below the same parent, or agree on unique names for the objects to add. The default naming scheme for new objects bears the risk of name conflicts. These conflicts could be resolved only by reverting the changes of the user who later tried to commit the changes.

Be careful
- The SVN integration (and also project compare) gives lot of power to the user, users should be sure to do only things they fully understand. Especially by merging changes incomplete it is possible to create inconsistent data.
- Adding devices, removing devices or even changing parameters can have side effects to other devices, do not change objects/parameters to their original state by merging that were not done explicitly.
- Commit changes frequently to SVN.
  - To release locks that you don’t longer need.
  - To reduce the risk of conflict with co-workers.
  - To keep the sets of changes to commit small.
- Do frequent updates when collaborating in a team.
  - To be up-to date.
  - To keep the sets of changes to get from SVN small.
  - To reduce the risk of losing work results in case of conflicts.
- To avoid conflicts, it is suggested to stay with the default setting to automatically lock objects before doing changes. Consider explicit recursive locks of sub-trees where you plan bigger changes.
- Prefer a clean checkout over using the switch command to change between different branches.
- Do not use the switch command to change between unrelated projects, this could corrupt the Automation Builder project (local copy, not in SVN) easily.
- Commit local changes to the SVN repository before creating a branch.

Be effective
- Give objects good/correct names after adding them and use renaming of objects already committed to SVN sparely to maintain a continuous history in the SVN repository.
- The goal to revert only single changes of all changes done that must be committed/reverted together, could be achieved by using project compare or the object compare dialog.
- If changes can’t be committed to the SVN repository because of locks hold by other users, it is possible to create a branch, use the switch command to change to this branch and commit the changes there. The branch and base line could be merged together later.

1.7.7.1.4 Known Issues and Troubleshooting

Not all changes are shown for all objects, but hidden changes are also important. The device pool may be changed as side effect of several operations, including opening the project.

When a project was corrupted (by performing an update that tried to add an AC500 Communication Module) it is possible to save this project and merge changes to a project that has been cleanly checked out by project compare.
1.7.7.2 SVN Support Examples

1.7.7.2.1 Importing Automation Builder Project to SVN Repository

1. In the Automation Builder main menu, go to “Project ➔ SVN ➔ Import Project to Subversion”.
2. Enter user credentials and click “OK”.
3. Select SVN server repository to import Automation Builder project and click “OK”.

⇒ The Automation Builder project is imported into the selected repository and connected automatically to the repository. The imported project nodes are identified with green indicators.

1.7.7.2.2 Logging in User2

1. In the Automation Builder main menu, go to “Project ➔ SVN ➔ Checkout”.
2. Enter user credentials and click OK.
3. Select the repository location, project folder and revision if any and click “OK”.

⇒ The project will checked out of the repository, saved in the selected location and opened as a primary project.

The tables below provide the descriptions of the options available in the check-out dialog.

<table>
<thead>
<tr>
<th>Checkout options</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Omit externals</td>
<td>Do not checkout external objects.</td>
</tr>
<tr>
<td>As library project</td>
<td>Saves the project as a CODESYS library file.</td>
</tr>
</tbody>
</table>
## 1.7.7.2.3 Examples

**Example 1**

If User1 modifies Panel_CP600 project, then the node indicator turns to orange with lock symbols. If User2 need to modify the same Panel_CP600 project, the Panel_CP600 project appears with a lock symbol.

To steal the lock of an affected object, proceed as follows:

1. Double-click “Panel_CP600” project.
   - Automatic lock failed dialog is displayed.
2. Enable “Try to steal the lock for the affected objects” and click “OK” to steal the lock.
3. In the Lock Message window, enter the reason to steal the lock and click “OK”.
4. User2 can modify and commit the project.

**Example 2**

If User1 adds a new object to the project and commit the changes, then User2 can update the project to see the latest modifications.
The user can revert to any of the available project revisions.
1. Right-click on object node and select “SVN ➔ Revert to Revision”.
2. Select or enter the revision number and click “OK”.
   ⇒ The revision command reverts local changes of this object back to the specific revision of the working copy.
3. Right-click on the object node and select “SVN ➔ Commit”.
4. In the commit window, enter the reason to change the project and click “OK” to make the changes.
   ⇒ The project node is updated with the latest changes.

SVN server allows to select the required revisions of Automation Builder project. You can checkout the project using “Project ➔ SVN ➔ Checkout” and then enter the credentials and click “OK”.

In the check-out dialog, do the following:
1. Select the project repository.
2. Activate “Revision” and select or enter the revision number and click “OK”.

The user can work on the selected revision. To commit the changes to the project, right-click on project and select “SVN ➔ Commit Project”.

1.7.8 Python

Further information on how to use Python can be found in the Python script examples: %Public %\Documents\AutomationBuilder\Examples\Python scripts.
1.8 Human machine interface
1.8.1 Panel Builder interface

This document describes HMI CP600 Control Panel configuration in Automation Builder and starting HMI configuration and programming software Panel Builder 600 from Automation Builder. The Panel Builder project created for the HMI CP600 is stored within the Automation Builder project.

1.8.1.1 Adding desired AC500 PLC to the project

Configuring the Symbol File

1. In the Automation Builder device tree, right-click the “Application” node and click “Add object”

2. Click on “Symbol Configuration” and click “Add object”
   ⇒ A “Symbol Configuration” object is added to the “Application” node.
3. Double-click on the “Symbol Configuration” object, then click on “Build”

![Symbol Configuration](image)

⇒ A list of all variables in the project is generated. Single variables or groups of variables can be selected by checking the corresponding item in the list.

4. After the symbols have been configured, download the project or click “Build Generate code” in the Automation Builder to create an .xml file containing all the variables read to be imported in the Tag Editor.

1.8.1.2 Creating a Panel Builder project

Adding a panel object

1. Right-click in the Automation Builder device tree and click “Add object → Panel-CP600”
2. Click on “CP600 Control Panel” and click “Add object”

⇒ A Control Panel object is added to the Automation Builder device tree.

Starting a Panel Builder project

1. In the device tree, double-click “Panel CP600” object to start Panel CP600 screen.

![Panel Builder](image)

2. Select the required PLC and enable the checkbox in the ‘Use Standard Connection Settings’ column to use it as a standard gateway connection.

You can set communication settings using the application program or by creating custom communication settings. Custom communication settings can be configured by clicking the button in the ‘Details’ column.
3. Enable the “Update Panel Builder project on launch” checkbox and click [Launch Panel Builder Editor].

If you update Automation Builder project with new variables and data types or if there are changes in existing Automation Builder project variables and data types (new, modified, deleted), recompile CODESYS application to refresh the symbol file, then launch Panel Builder editor.

4. Select “New” and click “Open” to create a new HMI project.
   ⇒ A project wizard is displayed.

If you want to import an already existing Panel Builder project file from the file system, select “Import existing project file” and proceed.

5. Select the required panel type and orientation and click “Finish”.
   ⇒ A new project wizard starts only if the Panel project is empty.

The panel projects can be compared in Automation Builder using the “Compare Objects” option.
Changing panel type

1. In the Panel project, double-click “Project properties” to change the panel type to the panel which is used.
   ⇒ The Properties dialog is displayed.

   ![Properties dialog]

2. In the Properties dialog, expand “Project” and click “Project Type”.
   ⇒ A project wizard dialog is displayed.

3. Select the desired panel type and click “Finish”.

Project information

The project information view provides an overview of the Panel Builder project without opening the project. To open the project information, double-click the “Panel_CP600” object.

The project information is updated every time the Panel Builder project is edited. You can rename the Panel Builder project via context menu.

The project name is internally used as a base for the Panel Builder project file name. Therefore, the project name has to comply with general file name restrictions.

---

Changing panel type

1. In the Panel project, double-click “Project properties” to change the panel type to the panel which is used.
   ⇒ The Properties dialog is displayed.

   ![Properties dialog]

2. In the Properties dialog, expand “Project” and click “Project Type”.
   ⇒ A project wizard dialog is displayed.

3. Select the desired panel type and click “Finish”.

Project information

The project information view provides an overview of the Panel Builder project without opening the project. To open the project information, double-click the “Panel_CP600” object.

The project information is updated every time the Panel Builder project is edited. You can rename the Panel Builder project via context menu.

The project name is internally used as a base for the Panel Builder project file name. Therefore, the project name has to comply with general file name restrictions.
The Panel Builder project information shows the list of PLCs added to the project.

1.8.1.3 Configuring Panel Builder

The user can configure a panel project manually in Panel Builder editor when there is a need to create individual panel projects. Otherwise, the configuration is updated in the panel project while launching Panel Builder editor in Automation Builder.

1. In the Panel Builder project structure, click “Config ➔ Protocols”.

2. Click to add the desired protocol.

3. Select the desired protocol and set the IP address, port, protocol type and PLC models. Click [OK].
**Importing tags**

1. In the Panel project view, click “Config ➔ Tags”.
2. Select the protocol from the drop-down list and click to import tags.
   
   *If the Panel Builder contains multiple tag importers, a dialog is displayed to select the required importer type.*

3. Select the symbol file which was exported to the file system.
4. In the lower part of the tag editor, mark the desired tags and click “Import Tag(s)” to import the tags to the Panel Builder project.

**Attaching tags to widgets**

1. In the project view, expand “Pages” and double-click Page1.
2. In the Panel Builder 600 main menu, select “View ➔ Toolbars and Docking Windows ➔ Widget Gallery”.
3. Drag-and-drop the desired widget to the page editor.
4. Right-click on the widget value and select “Attach To” to attach a tag to the widget.

5. Select the desired tag and select the desired option for the authorization “Read Only” or “Read/Write” or “Write Only”. Then, click [OK].

Downloading a project to panel

1. In the Panel Builder main menu, click “Run ➔ Download To Target”.
2. Select the CP600 project from the drop-down list and click “Download”.

Importing an existing Panel Builder project

1. In the Automation Builder device tree, right-click the Panel project and click “Import ➔ Panel Builder Project”.
   System prompts to overwrite the exiting project object data.
2. Click “Yes” to confirm.
3. Select the existing Panel Builder 600 project from the file system and click “Open”.
   The imported project is displayed.
1. In the Automation Builder device tree, right-click the Panel Builder 600 project and click “Export ➔ Panel Builder Project”.
2. Click “Browse” and select the desired location in the file system and save the project file.
   ⇨ A success message is displayed, if the project file exports successfully.

When you double-click the Panel Builder project node, the compressed information of the node is extracted into a temporary folder and then the external Panel Builder program is started. After the external Panel Builder program is closed, the corresponding Panel Builder files can be compressed back into the node and saved in the Automation Builder project.

We recommend to edit the Panel Builder project by starting Panel Builder through the Automation Builder. You can also export a Panel Builder project to the file system to edit the project by using the external Panel Builder. Then, reimport it to Automation Builder.

1.8.2 SCADA Integration

Overview
This document describes SCADA integration configuration in Automation Builder using zenon editor. The configured device network address information and variables are synchronized with zenon editor to avoid double entry.

The Automation Builder supports both standard and multi-user functionality.

1.8.2.1 Creating Workspace and Project
1. In the device tree, double-click “zenon_Project”.

⇨ To launch the zenon editor, click [Launch Zenon Editor].
To update the zenon project with latest changes of application program, click [Update zenon project].
2. Select the required PLC and select the “Use Standard Conn. Settings” option to use as a standard gateway connection. This enables the user to use the same communication settings that Automation Builder uses to communicate to the PLC.

![The configured gateway communication settings made in Automation Builder are displayed in the column 'Connection Type'.]

As an alternative you can create custom communication settings: Deselect the “Use Standard Conn. Settings” option and click the button in the 'Details' column.

3. Click [Launch Zenon Editor] to create a new workspace and project.

![Fig. 286: Connect to zenon project](image)

If Zenon Editor is already running, then select the “Use current workspace” option.

4. Select the “Create a new workspace” option and select the file location to create a new workspace.
5. Select the “Create new project” option to create a project.

⇒ ABB zenon editor is displayed.

![If you update or change an Automation Builder project with new variables or data types (new, modified, deleted), recompile the application to refresh the symbol file and click [Update zenon project].]

PLC Automation with V3 CPUs
Human machine interface > SCADA Integration

2020/12/10
After creating the project and workspace in Automation Builder, it is not required to set it again for the zenon object. A double-clicking on the zenon project shows the previously configured zenon project and the workspace.

### 1.8.2.2 Loading existing Workspace and Project

You can load an existing workspace and project to ABB zenon supervisor.

1. In the zenon_Project screen, click **Update zenon project**.
   - Connection to the zenon project dialog is displayed.
2. In the workspace area, enable “Load existing workspace” and select the location.
3. In the project area, enable “Select loaded project” and click **OK**.
   - Zenon editor loads the selected existing workspace and the project.

### 1.8.2.3 Checking the Gateway Settings in a Zenon Project

The gateway settings configured in Automation Builder can be checked in a zenon project. The IP address configured in Automation Builder are displayed in the zenon driver configuration.

In the Project Manager structure of the zenon editor, click “Variables ➔ Drivers” to configure the driver configuration.

The “Settings” tab shows all gateway settings based on the number of configured PLCs in Automation Builder. The IP address should be similar to the project gateway settings in Automation Builder.

---

*In the zenon project window, the Connect column should be checked to transfer the desired number of PLC connection settings to the zenon editor.*
1.8.2.4 Generating a Symbol File

Before generating the symbol file, define the variables in the CODESYS application.

1. In the CODESYS application main menu, click “Project ➔ Options”.
2. In the “Options” dialog, click “Symbol configuration”. Enable “Dump symbol entries” and “Dump XML symbol table” and click “Configure symbol file”.
   Set object attributes dialog is displayed.
3. Enable “Export variables of object”. If this option has a gray background, double-click on it to activate.
4. In the CODESYS application window, click at the bottom of the window and click “Resources ➔ Tools ➔ Target settings”.
5. In the target settings dialog, open the “General” tab and enable “Download symbol file”.
6. From the CODESYS application main menu, select “Project ➔ Build” to compile the project.

Precondition to generate a symbol file is to create the application and perform a PLC program build in CODESYS application.

The symbol file is generated after the build. The data exchange can be transferred to the zenon project by clicking [Update zenon project] in Automation Builder.

1.8.2.5 Updating Standard Data Types

The standard data types created in CODESYS application can be updated to the zenon project by clicking on “Update zenon project”.

Data types and variables can be updated from the desired number of PLCs configured in the zenon project of Automation Builder.

In the zenon project, double-click “Variables” and check the updated standard data type.
1.8.2.6 Creating Data Types

1. In the CODESYS application open the “Data types” tab. Right-click “Data types ➔ Add object” to create a new data type.
2. Enter the user defined data type name.
3. In “POUs” tab, add the user defined variable data type and compile.
   ⇒ The user defined data type is created and can be imported in the zenon editor.

   If you modify or delete the data types in CODESYS application, compile with “Rebuild all option”.

1.8.2.7 Importing Data Types in zenon Editor

1. In the zenon project, click [Update zenon project] to update the data types.
2. Click “Update” to update the variables and data types to the zenon project.
   ⇒ The user defined variables and data types are imported to the zenon project.

Fig. 287: User defined variables

1.9 Contact ABB

If you have questions on any ABB product you receive further contact information for your specific device in the ABB Global Contact Directory: [http://www.abb.com/contacts](http://www.abb.com/contacts).
If you have questions on Automation Builder software you receive further information on [http://www.abb.com/automationbuilder](http://www.abb.com/automationbuilder).

### 1.9.1 ABB contact for PLC and panel builder products

If you have questions on a PLC product you receive further information on [http://www.abb.com/plc](http://www.abb.com/plc).

#### Service - Control engineering

ABB operates a Technical Support Center to assist in the case of problems.

- Consultation by phone (Helpline)
- Failure analysis and removal at the machine/installation

In order to provide the customer with qualified assistance, customers are requested to provide the following:

- All required application documentation and information.
- Access (if required) to the system being examined.
- Assign key individuals to assist as required.

For inquiries and orders, please contact:

**ABB Automation Products GmbH**

Wallstader Straße 59
68526 Ladenburg
Germany

Phone sales: +49 6203 717-717
Phone Technical Support: +49 6221 701-1444
E-Mail: plc.support@de.abb.com

#### Repair services and replacement devices

The following services are covered by our activities:

- Delivery of replacement devices
- Repair of defective devices and systems

Please contact your responsible sales office for your inquiry.

#### Seminars/Workshops

ABB also offers seminars and workshops to support you in planning, commissioning and operation of AC500 devices. If desired, we offer seminars at the customer’s facility.

If necessary, it is also possible to arrange the seminar contents according to the customer’s wishes. Depending on the special requirements, the training can be held in Heidelberg or at any other location favored by the customer. We are pleased to prepare an individual offer for you according to your special requirements.
