<th>Note: Container and interface libraries are created automatically with library references with version constraint. As far as possible, do not create libraries that include library references with version constraint. Otherwise, you reference the libraries by placeholders. Edit a placeholder resolution in the “Placeholders” dialog box.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Specific version”</strong></td>
<td>☑️: (selected from drop-down list) Version is integrated into the project. Note: This option is strongly recommended for container libraries, and it is usually preset for this library type.</td>
</tr>
<tr>
<td><strong>“Newest version always”</strong></td>
<td>☑️: The library repository is scanned and the latest detected version is integrated. Note: If a newer library version is available, then the library modules that are actually used can change. This option is strongly recommended for interface libraries, and it is usually preset for this library type.</td>
</tr>
</tbody>
</table>

Table 171: “Visibility”

| “Only allow qualified access to all identifiers.” | ☑️: Library modules (and variables) are called in the project only with prepended namespace paths. |
| “If the current project is referenced as a library by another project.” | Note: Changing the following settings makes sense only if you created a library with your project and therefore opened a library project. In this way, the selected library is referenced in the new library. |
| “Publish all IEC symbols to that project as if this reference would have been included there directly.” | ☑️: As a container library, the selected library makes the content of the referenced library visible at the top level (later in a project). Requirement: A container project is created with a library project. A container library does not implement its own modules, but references other libraries exclusively. It bundles libraries. A container library can be employed sensibly to bundle multiple libraries (in a reference) in a project. This option must be activated for each library reference. Symbolic access to library modules: <namespace of container library>.<module name> ☐️: The contents of the referenced library is accessed uniquely by means of the namespace. The path name consists of the library name and the unique name (library reference), and it is prepended to the module name. Requirement: No container project is created with a library project. Unique symbolic access to the library module: <namespace of library>.<namespace of sublibrary>.<module name>. |
| “Do not show this reference in the dependency tree.” | ☑️: The selected library is not displayed in the library manager as a library reference (later in a project). The library is a hidden reference. Warning: If there are compile errors resulting from hidden library errors, then detecting the errors may be difficult. ☐️: The selected library is displayed as a library reference (later in a project). |
| “Optional (if the library is missing, no error will be reported).” | ☑️: The selected library is treated as optional. When downloading the project that references the library, no error is reported, even if the library is not available in the library repository. |

Command 'Placeholders'

**Function:** This command opens the “Placeholders” dialog box. The dialog shows information on the currently selected placeholder library and allows to assign a project-specific resolution.

**Call:**
- Menu “Libraries”
- Symbol placeholders in the symbol bar in the upper part of the Library Manager window.

**Requirement:** A placeholder library is selected in the Library Manager.

A placeholder library, which is included in the “Devices” view, will be resolved as follows:
- If you have assigned a specific resolution to the placeholder library via the dialog “Placeholder”, this will be applied.
- If no specific resolution is defined, it will be checked, whether there is one specified in the device description of the application.
- Afterwards the library profile will be checked for a resolution definition.
- The result is displayed in the Library Manager below the “Effective Version”.

A placeholder library, which is included in the “POUs” view, gets resolved as follows:
- A specific resolution defined in the dialog “Placeholder” will be ignored.
- For the application it will be checked whether there is a resolution defined in the device description.
- Afterwards the library profile will be checked.
- The result is displayed in the tooltip of the symbol.

<td>• Resolved by &lt;specific library&gt;</td>
</tr>
</tbody>
</table>

Command 'Export Library'

**Function:** This command is used for saving the library file to the hard disk.

**Call:** Context menu of the Library Manager

**Requirement:** A library is selected in the Library Manager.

The command opens the standard dialog for saving a file in the local file system. The library file can have the file type Library files (*.library), Compiled library files (*.compiled-library), or Compiled library files (*.compiled-library-v3).
Menu 'Image Pool'

1.3.1.25.2.15.1 Command 'Insert Image'.......................................................... 1009

Menu 'Declarations'

1.3.1.25.2.16.1 Command 'Insert'................................................................. 1009
1.3.1.25.2.16.2 Command 'Edit Declaration Header'..................................... 1009
1.3.1.25.2.16.3 Command 'Move Down'..................................................... 1010
1.3.1.25.2.16.4 Command 'Move Up'......................................................... 1010

Command 'Insert Image'

Symbol: 

Function: This command inserts a new line into an image pool.

Call: Main menu "Imagepool", or right-click.

Requirements: An image pool is active and a line is selected in the image pool.

See also

● Chapter 1.3.1.25.1.24 “Object 'Image Pool'” on page 770

Command 'Insert'

Symbol: 

Function: This command inserts a new line for a variable declaration in the declaration editor and the input field for the variable name opens.

Call: Context menu in the tabular declaration editor; button in the declaration heading.

To edit the other fields of the declaration lines, double-click the fields and select the data from the drop-down lists or by means of the respective dialogs.

See also

● Chapter 1.3.1.9.2.1 “Using the declaration editor” on page 173

Command 'Edit Declaration Header'

Function: The command opens the dialog "Edit Declaration Header", which serves in the declaration editor for the configuration of a POU header.

Call: Context menu of the tabular declaration editor

Requirements: The tabular declaration editor is the active editor.

See also

● “Declaring in the tabular declaration editor” on page 174

Dialog 'Edit Declaration Header'

Function: The dialog is for configuring the declaration part of a POU.

Call: Click on the header bar of the tabular declaration editor, or context menu in the tabular declaration editor.
"Declaration"

Selection list for changing the POU type

- "PROGRAM"
- "FUNCTION_BLOCK"
  - "EXTENDS": Input field for a basic function block
  - "IMPLEMENTES": Input field for an interface
- "FUNCTION"
  - "Return type"

Input field with current POU name: you can change the name of the POU

"Automatically adapt all references on rename"

☑: Dialog box “Refactoring” opens.
☐: Renaming is only effective in the declaration header of the POU.

"Attributes"

The dialog box “Attribute” opens for the input of attributes and pragmas.

</tr>
<tr>
<td>1.3.1.25.2.17.4</td>
<td>Command 'Add all instance paths'</td>
</tr>
</tbody>
</table>
Command 'Reorder List and Clean Gaps'

**Function:** This command cleans the gaps that can result when you make changes to the declaration of persistent variables. The memory requirement is reduced by this cleaning. When the command is executed, CODESYS displays a warning informing the user about the possible loss of data.

**Call:** Main menu “Declarations”, context menu

**Requirement:** The persistence editor (persistent variable list) is active.

Before cleaning you should consider saving the current values of the persistent variables to a recipe (command “Save Current Values to Recipe”). Then you can load the values to the controller again after the next download.

See also

- § Chapter 1.3.1.9.20 “Data persistence” on page 249
- § Chapter 1.3.1.25.2.17.3 “Command ‘Restore Values from Recipe’” on page 1011
- § Chapter 1.3.1.25.2.17.2 “Command ‘Save Current Values to Recipe’” on page 1011

Command 'Save Current Values to Recipe'

**Function:** This command creates a new recipe definition in the recipe manager and stores the current values of the persistent variables in it. You should execute this command before the command “Reorder List and Clean Gaps” in order to avoid a possible loss of data. You can subsequently restore the data with the command “Restore Values from Recipe”.

**Call:** Main menu “Deklarationen”

**Requirement:** The application is in online mode and the persistence editor (persistent variable list) is active.

If a list already exists in the recipe manager with the corresponding names when saving a persistent variable list, then the current persistent variables are sorted into the list:

- New persistent variables are added to the list
- Variables, that are not in the list, will be deleted

Therefore, it is possible to add more recipes to the list in the recipe manager and these will be retained. However, if new variables are added to the list, then these are deleted the next time the command “Save Current Values to Recipe” is executed.

See also

- § Chapter 1.3.1.9.20 “Data persistence” on page 249

- § Chapter 1.3.1.25.1.23 “Object ‘Persistent variable list’” on page 770

Command 'Restore Values from Recipe'

**Function:** This command restores the values of the persistent variables that you have stored in a recipe using the command “Save Current Values to Recipe”. You would normally select this command after executing the command “Reorder List and Clean Gaps”.

**Call:** Main menu “Declarations”

**Requirement:** The persistence editor (persistent variable list) is active, the application is in online mode
Command 'Add all instance paths'  

**Function:**  
- When you execute the command in the persistence editor, the application is searched for declarations of persistent variables with the `PERSISTENT` keyword which are outside of the persistence editor. For each declaration found, an instance path of this variable is added in the persistence editor.  
- When you execute the command in a variable configuration, an instance path is added for each variable with an incomplete address. All function blocks of the application are considered in this case.  

**Call:** Menu bar: “Declarations”, right-click.  

**Requirement**  
- the persistence editor (global persistent variable list) is active or a variable configuration (global variable list with `VAR_CONFIG` declarations) is opened.  
- The application was compiled successfully.

Menu 'Device Communication', Gateway  

| 1.3.1.25.2.18.1 | Command 'Add gateway'........................................................................ 1012  
| 1.3.1.25.2.18.2 | Command 'Configure the local gateway'............................................... 1013  

Command 'Add gateway'  

**Function:** This command opens the “Gateway” dialog where you can define a gateway channel and add it to the current device configuration.  

**Call:** Menu bar: “Gateway” in the “Communication” dialog of the device editor.  

**Dialog 'Gateway'**  

| “Name” | Name of the gateway. |  
| “Drivers” | Driver type from a drop-down list. |  
| Driver-specific settings, for example: IP address, port | Editable after double-clicking the predefined value. A short description for each parameter is displayed in the lower part of the dialog. Note: You can also specify the address of a DNS domain. This has to begin with `dns:` (example: `dns:MyDynDNSAdress`). |  

The dialog is also used for later editing of the gateway entries of your project.  

See also  
- ☐ Chapter 1.3.1.25.1.19.2 “Tab 'Communication Settings'” on page 741
Command 'Configure the local gateway'

**Function:** The command opens the dialog “Gateway Configuration”, where you can set up the block driver configuration for the local gateway. This is an alternative to manually editing of the configuration file `Gateway.cfg`.

**Call:** Context menu of a gateway entry in the “Communication Settings” dialog.

---

**NOTICE!**

A correct gateway configuration requires detailed knowledge. In case of any doubts do not change the standard configuration settings!

---

**Dialog 'Gateway Configuration'**

The configuration tree shown in the dialog corresponds to the currently valid configuration file `gateway.cfg`. For the concerned interfaces it shows the parameters and current settings. Changes of the configuration in the dialog, confirmed with “OK” effect an direct update of the configuration file.

After having changed the gateway configuration file `gateway.cfg`, the gateway must be stopped and restarted in order to get the changes applied.

1.3.1.25.2.19.12 Command 'Update Structured Variables'................................ 1019

Command 'Insert Variable'

Symbol: 

Function: This command inserts a variable into the currently opened recipe definition before the selected position.

Call: Main menu “Recipes”.

Requirement: You have opened a recipe definition in the editor and selected the normal view.

CODESYS inserts the default text "NewVariable" in the column “Variable”. You must replace this name with the respective variable name. To do this, open the input assistant by clicking ⨁ or enter the variable name directly into the table element.

● § Chapter 1.3.1.25.2.19 “Menu ‘Recipes’” on page 1015

Command 'Add a New Recipe'

Symbol: 

Function: This command opens a dialog box for adding a new recipe (new column) to the recipe definition.
Call: Main menu “Recipes”.

Requirement: You have opened a recipe definition in the editor.

After choosing the command, a dialog box opens for you to define the name of the new recipe. The dialog box also provides the capability of copying existing recipes into the new recipe.

See also
- ≈ Chapter 1.3.1.13.2 “Changing values with recipes” on page 331
- ≈ Chapter 1.3.1.25.2.19 “Menu ‘Recipes’” on page 1015

Command ‘Remove Recipe’

Symbol: 🗑

Function: This command removes a recipe from the currently opened recipe definition.

Call: Main menu “Recipes”.

Requirement: You have selected a field in the recipe column of a recipe definition.

See also
- ≈ Chapter 1.3.1.13.2 “Changing values with recipes” on page 331
- ≈ Chapter 1.3.1.25.2.19 “Menu ‘Recipes’” on page 1015

Command ‘Load Recipe’

Symbol: 📄

Function: The command loads a recipe from a file.

Call: Menu bar: “Recipes”.

Requirement: You have selected a field in the recipe column of a recipe definition.

This command overwrites the values of the selected recipe of the recipe definition.

If you want to overwrite only individual recipe variables with new values, then remove the values for the other variables before loading to the recipe file. Entries without value definitions are not read, and therefore updating leaves these variables unchanged on the PLC and in the project.

For values of the data type REAL/LREAL, the hexadecimal value is also written to the recipe file in some cases. This is necessary so that the exact identical value is restored when converting back. In this case, change the decimal value and delete the hexadecimal value.

See also
- ≈ Chapter 1.3.1.13.2 “Changing values with recipes” on page 331
- ≈ Chapter 1.3.1.25.2.19 “Menu ‘Recipes’” on page 1015

Command 'Save Recipe'

Symbol: 🔄
**Function:** This command saves the variable values of a recipe to a file.

**Call:** Main menu “Recipes”.

**Requirement:** You have selected the value of a recipe in the recipe definition.

When you choose this command, CODESYS saves the values of the selected recipe to a file. You can define the format in the settings for the recipe manager in the tab “Storage”.

See also

- Chapter 1.3.1.13.2 “Changing values with recipes” on page 331
- Chapter 1.3.1.25.2.19 “Menu ‘Recipes’” on page 1015

---

**Command 'Read Recipe’**

**Function:** This command reads the variable values of a recipe from the controller.

**Call:** Main menu “Recipes”.

**Requirement:** The application is in online mode and you have selected the value of a recipe in the recipe definition.

When you choose this command, CODESYS overwrites the values of the selected recipe with the read values from the controller.

*If you have selected the option “Recipe Management in the PLC”, please note the following.*

*If you change recipes in the project by choosing the command “Load Recipe” or “Read Recipe”, then an online change is required when logging in again.*

---

**Command 'Write Recipe’**

**Function:** This command writes the values of a recipe to the variables in the controller.

**Call:** Main menu “Recipes”.

**Requirement:** The application is in online mode and you have selected the value of a recipe in the recipe definition.

When you choose this command, CODESYS overwrites the values in the controller with the values of the selected recipe.

See also

- Chapter 1.3.1.13.2 “Changing values with recipes” on page 331
- Chapter 1.3.1.25.2.19 “Menu ‘Recipes’” on page 1015

---

**Command 'Load and Write Recipe’**

**Function:** This command loads a recipe from a file and writes the values to the variables in the PLC.

**Call:** Menu bar: “Recipes”.

---
**Requirement:** The application is in online mode. You have selected the value of a recipe in the recipe definition.

After choosing the command, you are prompted either to write the variable values also to the recipe in the project or only to write them to the PLC. Updating the values in the recipe could require an online change when logging in again.

When you choose this command, CODESYS overwrites the values of the selected recipe of the recipe definition. In addition, these recipe values overwrite the variable values in the PLC.

> **If you want to overwrite only individual recipe variables with new values, then remove the values for the other variables before loading to the recipe file. Entries without value definitions are not read, and therefore updating leaves these variables unchanged on the PLC and in the project.**

*For values of the data type REAL/LREAL, the hexadecimal value is also written to the recipe file in some cases. This is necessary so that the exact identical value is restored when converting back. In this case, change the decimal value and delete the hexadecimal value.*

Command 'Load Recipes from Device'

Symbol: 📁

Function: This command initiates the synchronization of the recipes from the open recipe definition in the project and the recipes located on the device in the form of recipe files.

Call: Menu bar: “Recipes”.

Requirement: The application is in online mode and a recipe definition is open in the editor.

In detail, the synchronization is described as follows:

● The current values for the recipe variables located in the project are overwritten by the values from the recipes on the controller. As a result, there is likely an online change at the next login.

● If recipe variables are defined in the recipe files on the controller, and the recipe variables are missing in the recipe definition of the project, then these variables are ignored when at the time of download. Before that, a message appears for each recipe file regarding the variables in question.

● If recipe variables are missing in the recipe files on the controller, and these recipe variables are included in the recipe definition of the project, then a message appears for each recipe file with the variables in question.

● If more recipes for these variables have been created on the controller, then they are added to the recipe definition in the project.

Command 'Update Structured Variables'

Symbol: ➗

Function: This command opens the “Update Structured Variables” dialog box.

Call: Main menu “Recipes”.

In this dialog box, you can update recipe definitions if the declaration of a structured variable or a block has changed. For example, if the dimension of an array is changed, then you can automatically add or remove the entries in the recipe definition.

Table 173: Dialog Box 'Update Structured Variables'

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Remove not existing variables&quot;</td>
<td>Variables are removed from the recipe definition when they no longer exist in the project due to a change to a structured element.</td>
</tr>
<tr>
<td>&quot;Update instances of structures and function blocks&quot;</td>
<td>If the declaration of a structure or function block is extended and available in the recipe definition with an instance, then the respective variables are added to the recipe definition.</td>
</tr>
<tr>
<td>&quot;Update array dimensions of array instances&quot;</td>
<td>If the dimension of an array is extended and available in the recipe definition with an instance, then the respective variables are added to the recipe definition.</td>
</tr>
<tr>
<td>&quot;Update contained global variable lists&quot;</td>
<td>If the declaration of a global variable list is extended and available in the recipe definition with an instance, then the respective variables are added to the recipe definition.</td>
</tr>
<tr>
<td>&quot;Update contained programs&quot;</td>
<td>If the declaration of a program is extended and instanced in the recipe definition, then the respective variables are added to the recipe definition.</td>
</tr>
</tbody>
</table>

1.3.1.25.2.20.13 Command 'Remove Text List Support'.................................... 1024

Command 'Add Language'

Symbol: 📑

Function: This command adds a further language column to the text list.
Call: Main menu “Textlist”, context menu
Requirement: A text list or a global text list is open and active.
In the dialog box “Enter Language”, enter a code for the new language, for example “en-US”. CODESYS inserts the code as column header.

Command 'Create Global Text List'

Symbol: 📑

Function: This command creates the global text list in the “POUs” view.
Call: “Visualization”, context menu.
Requirements: A visualization is open.
See also
● Chapter 1.3.1.25.1.20 “Object ‘GlobalTextList’” on page 768
● Chapter 1.3.1.9.9.1 “Managing static text in global text lists” on page 217

Command 'Export Everything as Text'

Symbol: 💾

Function: This command exports all the text lists of the project.
Call: Main menu “Textlist”, context menu
Requirement
● A text list or a global text list is open and active.
● The visualization does not code the characters of the texts in Unicode.
CODESYS creates a file as plain text in the format .txt for each text list. The name of the text list becomes the name of the file. The directory into which the files are exported is set in “Project ➤ Project Settings ➤ Visualization”, category “General” in “Text list files”.
A controller can read and use this format. For example, you can copy the file to a controller and, by means of a configuration in the visualization manager, prevent the text lists from being transmitted again when loading the application.
Command 'Export All Unicode .txt Text List Files'
Symbol:  

**Function:** This command exports all the text lists of the project.

**Call:** Main menu “Textlist”, context menu

**Requirement**
- A text list or a global text list is open and active.
- The visualization codes the characters of the texts in Unicode.
  - The option “Use Unicode strings” in the visualization manager is activated.
  - The compiler instruction VISU_USEWSTRING in the application is set. Check this by selecting the command “Properties” in the context menu of the application. Then select the “Compile” tab. VISU_USEWSTRING must be entered in the input field for “Compiler defines.”

CODESYS creates a file as plain text in the format .txt for each text list. The name of the text list becomes the name of the file. The directory into which the files are exported is set in “Project ➔ Project Settings ➔ Visualization”, category “General” in “Text list files”.

A controller can read and use this format. For example, you can copy the file to a controller and, by means of a configuration in the visualization manager, prevent the text lists from being transmitted again when loading the application.

- Chapter 1.3.1.9.9 “Managing text in text lists” on page 213

Command 'Insert Text'
Symbol:  

**Function:** This command inserts a new line into the text list above the selected line. An input field under “Standard” opens, in which you input the source text.

**Call:** Main menu “Textlist ➔ Insert Text”, context menu

**Requirement:** A text list, not a “GlobalTextList”, is open and active. A field in the table is selected.

See also
- Chapter 1.3.1.9.9 “Managing text in text lists” on page 213

Command 'Import/Export Text Lists'
Symbol:  

**Function:** This command exports an active text list, imports a file, or matches a text list with a file. The file has the CSV format. The “Import/Export” dialog provides options for this.

**Call:** Menu bar: “Text List ➔ Import/Export Text Lists”; context menu

**Requirement:** A text list or global text list is active.

Dialog 'Import/Export'

<table>
<thead>
<tr>
<th>“Select File for Import”</th>
<th>File that CODESYS reads.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>opens the dialog “Select Text List File” for you to select a file.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Select export file”</th>
<th>File that CODESYS writes to.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>opens the dialog “Select Text List File” for you to select a file and directory.</td>
</tr>
</tbody>
</table>
Table 174: “Import/Export Type”

| “Import”          | Requirement: A file is selected in “Select file for compare or import”. The file can contain text list entries for both the global text list and text lists.  
|                  | Global text list  
|                  | • CODESYS reads the file, compares the text list entries for the same source text, and accepts differences in the translations. CODESYS overwrites any translations in the project.  
|                  | Text lists  
|                  | • CODESYS reads the file, compares the text list entries for the same ID, and accepts differences in the source text and translations into the project. CODESYS overwrites any text list entries in the project.  
|                  | • If the file contains a new ID, then the text list entry is imported into the text list of the project and the text list is added.  
| “Import replacement file” | Requirement: A replacement file is selected in “Select file for compare or import”. The replacement file contains replacements for the global text list. CODESYS processes the replacement file row by row and performs the specified replacements in the global text list. The structure of the replacement file is described in the section "Managing static text in a global text list".  
| “Export”         | Requirement: The file that CODESYS writes to is selected in “Select export file”. CODESYS exports all texts from all text lists of the current project. All languages available in the project are inserted as columns in the export file. The file can be used for the external translation of the language-dependent texts.  
| “Export text differences only” | Requirement: An import file is selected for the comparison in “Select file for compare or export”, and an export file that CODESYS writes to is selected in “Select export file”. CODESYS reads the import file and then uses that information to compare the rows of the active text list. CODESYS ignores the rows that match. If rows differ, then CODESYS writes the row to the export file and, if necessary, copies translations from the text list. CODESYS accepts the translations from the import file and overwrites them if necessary.

- “Updating the global text list with a replacement file” on page 218  

Command 'Remove Language'

Symbol: 🍀  
**Function**: Removes the selected language column from the text list.  
**Call**: Main menu “Textlist”, context menu  
**Requirement**: A text list or a global text list is open and active. A field is selected in the column of the language that you wish to remove.  

See also
- Chapter 1.3.1.9.9 “Managing text in text lists” on page 213  

Command 'Rename Language'

Symbol: 🍀
Function: Opens a dialog for specifying a new name for a language that is displayed in the text list as a column heading.

Call: Menu bar: “Text List”, context menu.

Requirement: A text list or global text list is active. A field in the language column to be renamed is selected.

See also
- © Chapter 1.3.1.9.9 “Managing text in text lists” on page 213

Command 'Remove Unused Text List Entries'

Symbol: 

Function: This command checks whether a text list entry in the project is used as static text. If not, CODESYS removes it from the text list.

Call: Main menu “Textlist”, context menu

Requirement: The “GlobalTextList” is open and active. A field in the table is selected.

See also
- © Chapter 1.3.1.9.9 “Managing text in text lists” on page 213

Command 'Check Visualization Text IDs'

Symbol: 

Function: This command checks whether the ID of a text list entry in the project is correct and reports the result.

Call: Main menu “Textlist”, context menu

Requirement: The “GlobalTextList” is open and active. A field in the table is selected.

If CODESYS finds during checking that the global text list and the static texts of the visualizations do not correspond, this could be because the global text list is or was write protected. The requirement for this is that you have set up a user management system in the project.

See also
- © Chapter 1.3.1.9.9 “Managing text in text lists” on page 213

Command 'Update Visualization Text IDs'

Symbol: 

Function: This command updates all inconsistent IDs in a static text list.

Call: Main menu “Textlist ➔ Paste Text”, context menu

Requirement: The “GlobalTextList” is open and active. A field in the table is selected. The object is write protected.

If CODESYS finds during checking that the global text list and the static texts of the visualizations do not correspond, this could be because the global text list is or was write protected. The requirement for this is that you have set up a user management system in the project.

**Command 'Add Text List Support'**

**Symbol:** 📑

**Function:** This command adds text list support to the selected DUT object (type: enumeration).

**Call:** Context menu of a standard DUT object (type: enumeration 📑).

Text list support allows the localization of the enumeration component identifier and the display of the symbolic component value in a text output of a visualization.

**Command 'Remove Text List Support'**

**Symbol:** 📑

**Function:** This command removes text list support from the selected enumeration object.

**Call:** Context menu of an object of an enumeration with text list support 📑.

Text list support allows the localization of the enumeration component identifier and the display of the symbolic component value in a text output of a visualization.

**Command 'Add Variable'**

**Function:** This command adds a trace variable to the configuration.
**Call**: Main menu “Trace”.

A new variable is displayed in the tree view of the trace configuration. The associated variables configuration appears to the right in “Variable Settings”.

See also

- Chapter 1.3.1.25.3.15.2 “Dialog ‘Trace Configuration’” on page 1092
- Chapter 1.3.1.13.3.2 “Creating trace configuration” on page 338

**Command ’AutoFit’**

Symbol: 

**Function**: This command scales the y-axis of the trace diagram for optimum display of all graphs, making sure that the y-values fit in the visible region of the diagrams. The command works with both single-channel and multi-channel displays.

**Call**: Menu bar: “Trace”; context menu.

**Trace in a single-channel display**

When all trace variables are displayed in one diagram, the trace is in single-channel display.

**Trace in a multi-channel display**

When the trace variables are displayed in multiple diagrams, the trace is in multi-channel display.

- Chapter 1.3.1.25.3.15.2 “Dialog ‘Trace Configuration’” on page 1092
- Chapter 1.3.1.13.3.5 “Navigating into trace data” on page 343

**Command ’Compress’**

Symbol: 

**Function**: This command compresses the trace graph by zooming into the displayed time range by a fixed percentage.

**Call**: Main menu “Trace”, or context menu.

See also

- Chapter 1.3.1.25.2.21.18 “Command ’Stretch’” on page 1034
- Chapter 1.3.1.13.3.5 “Navigating into trace data” on page 343

**Command ’Configuration’**

**Function**: This command opens the “Trace Configuration” dialog box for enabling the configuration of the data recording.

**Call**: Main menu “Trace”, or context menu.

See also

- Chapter 1.3.1.25.3.15.2 “Dialog ‘Trace Configuration’” on page 1092

**Command ’Cursor’**

Symbol: 

---

2020/12/10

3ADR010583, 1, en_US 1025
**Function:** This function
- inserts a trace cursor into the trace diagram when no trace cursor is available
- inserts a second trace cursor into the trace diagram when 1 trace cursor is available
- removes the trace cursors when 2 trace cursors are available

**Call:** Menu bar: “Trace”; context menu.

A trace cursor is a small black triangle with a vertical black line running parallel to the y-axis.

**Trace diagram without trace cursors**
In this mode, you can process the trace diagram with the mouse pointer. The x-value that focuses on with the cursor is displayed in the status bar with normal style. Example: “Time: 1m23s456ms; Value: 1”

**Trace diagram with one trace cursor**
In the status bar and y-value, CODESYS prints the time that was marked by the trace cursor. Example: “Time: 1m23s456ms”

**Trace diagram with two trace cursors**
In the status bar, CODESYS prints the two times and the time interval that are marked by the two trace cursors. Example: “Time: 1m23s456ms - Time: 1m24s456ms (Δ 1s)”.

**User input in the trace diagram**
If one or two trace cursors are available, then you can move them along the x-axis.

</tr>
</tbody>
</table>

See also
- *Chapter 1.3.1.13.3.5 “Navigating into trace data” on page 343*

**Command ’Download Trace’**

**Symbol:** ![Download Trace]

**Function:** This command transfers the trace configuration on the controller to the associated application, and starts the data recording. The recorded data is transferred back to the development system. The trace diagram shows the current samples and continues.

**Call:** Menu bar: “Trace”; context menu.

**Requirement:** The command is available when the assigned application is in online mode.

See also
- *Chapter 1.3.1.13.3.3 “Operating the data recording” on page 341*
Command 'Export Symbolic Trace Config'

**Function:** This command exports a trace configuration to a `traceconfig` file.

**Call:** Main menu “Trace”, or context menu.

**Requirement:** The origin application includes a symbol configuration that defines the configured trace variables as symbols. Access to the IEC variables where data was recorded is therefore symbolic. Then you can use the trace configuration for various similar applications.

Using the configuration file

You can transfer this file to any runtime system. At runtime, its `CmpTraceMgr` runtime system component can access and perform data recording. The configuration file also includes information about the application context in addition to the configuration data.

The configuration file defines the following context:

- Application name
- Trace name
- Task name

The application that is executed at runtime must fulfill the following conditions:

- The application has the same name as the origin application.
- The trace that is configured in the application has the same as the trace that is configured in the origin application.
- The task that is running in the data recording has the same name as the task that is configured in the origin application.

**NOTICE!**

The configuration is not loaded automatically. You must execute the command explicitly.

You can proceed as follows:

- Access the trace manager programmatically via IEC code by using library interfaces.
- Register the configuration file with the trace manager. Then the trace manager loads the configuration file when the application is started.

For more information about the functionality of the trace manager, refer to "Trace Manager Runtime System Component Description".
Sample configuration file

Command 'Load Trace'

**Function:** This command makes it possible to load a file, which contains the configuration and data, and was saved to the file system of the development system. The "Load Trace" dialog box opens.

**Call:** Main menu “Trace”, or context menu.

### Dialog box “Load Trace”

<table>

Command 'Mouse Zooming'

**Symbol:**  (command disabled),  (command enabled)

**Function:** This command enables and disables mouse zooming in the trace diagram.

**Call:** Menu bar: “Trace”; context menu.

**User input in the trace diagram**

If the command is enabled, then you can stretch a box with the mouse. When you release the mouse button, the display zooms in on the box and the data is enlarged.

See also

- Chapter 1.3.1.13.3.5 “Navigating into trace data” on page 343

Command 'Convert to Multi-Channel'

**Function:** This command switches the display in the trace editor from single-channel to multi-channel.

**Call:** Menu bar: “Trace”; context menu.

**Multi-channel display**

Multi-channel display means that the trace variables are displayed in multiple diagrams.
Command 'Convert to Single-Channel'

**Function:** This command switches the display in the trace editor from multi-channel to single-channel.

**Call:** Menu bar: “Trace”; context menu.

**Single-channel display**
If a trace is displayed as single-channel, then all trace variables are included in one diagram.
See also

- § Chapter 1.3.1.25.3.15.2 “Dialog 'Trace Configuration'” on page 1092
- § Chapter 1.3.1.13.3.5 “Navigating into trace data” on page 343

**Command 'Online List'**

**Function:** This command opens the “Online List” dialog. If the trace editor of a DeviceTrace object is active, then all traces that are running on the controller are displayed in a tree view. If the trace editor of an application-specific trace object is active, then only this trace is displayed if it is running on the controller.

**Call:** Menu bar: “Trace”; context menu of the trace editor.

**Requirement:** The runtime system uses the CmpTraceMgr components. An application belonging to the device is in online mode.
NOTICE!
Closing the DeviceTrace editor terminates the connection to the controller.

Please note that the connections to the controller is also terminated when the last open "DeviceTrace" editor is closed. In order for device traces to be displayed again in the project, you have to reload them into the "DeviceTrace" objects.

At this time, closing the editor is also the recommended procedure for deliberately terminating the connection to the controller. Logging out is not enough for this.

**Dialog 'Online List'**

<table>
<thead>
<tr>
<th>“Delete from runtime”</th>
<th>Stops and removes the selected trace from the running application.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Upload”</td>
<td>This command is visible when a DeviceTrace is loaded in the trace editor. A DeviceTrace is a trace that runs on the controller: In the device tree, it can be represented with a DeviceTrace object directly below a device. When you execute this command, the trace that is selected in the tree view is loaded from the runtime system into the trace editor. Any existing configuration in the project is overwritten. For example, the device can provide traces for data of the processor load (cpuload, plcload), which then you can track in the trace editor in CODESYS. An individual &quot;DeviceTrace&quot; object is necessary in the device tree for each trace of the device that should be displayed in the project.</td>
</tr>
</tbody>
</table>

**Command 'Reset Trigger'**

Symbol: 

**Function:** This command resets the trace configuration after a triggered data recording. Then the application can record new data and react to a trigger again.

**Call:** Main menu “Trace”, or context menu.

**Requirement:** After triggering, the complete data is in the buffer of the development system.

See also
- Chapter 1.3.1.13.3.3 “Operating the data recording” on page 341

**Command 'Reset View'**

Symbol: 

**Function:** This command resets the trace diagram to the default view.

**Call:** Main menu “Trace”, or context menu.
**Requirement:** The display in the trace diagram has been changed by zooming, scrolling, or “AutoFit”.

See also
- % Chapter 1.3.1.25.2.21.2 “Command ‘AutoFit’” on page 1025
- % Chapter 1.3.1.13.3.5 “Navigating into trace data” on page 343

**Command ‘Save Trace’**

**Function:** This command saves the data to a file on the development system. Depending on the file format, the configuration may also be saved. The “Save Trace” dialog box opens.

**Call:** Main menu “Trace”, or right-click.

**Dialog Box ‘Save Trace’**

<table>
<thead>
<tr>
<th>“File name”</th>
<th>Name and location of the trace file</th>
</tr>
</thead>
<tbody>
<tr>
<td>“File type”</td>
<td>File format</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>● *.trace:</td>
</tr>
<tr>
<td></td>
<td>“Trace file” contains the data and configuration. You can run the “Load Trace” command to load the file to the trace editor when offline.</td>
</tr>
<tr>
<td></td>
<td>● *.txt:</td>
</tr>
<tr>
<td></td>
<td>“Text file” contains the recorded data. You can load this file type and edit it with tools that support CSV format. It cannot be loaded to the trace editor when offline because the trace editor cannot read this format.</td>
</tr>
<tr>
<td></td>
<td>● *.trace.csv</td>
</tr>
<tr>
<td></td>
<td>“Trace CSV file (data only)” contains the recorded data. Address information is provided for each trace variable. The created file can be read in the runtime system. The data is imported but the trace cannot be started because the variable addresses are not saved.</td>
</tr>
</tbody>
</table>

See also
- % Chapter 1.3.1.25.2.21.8 “Command ‘Load Trace’” on page 1029
- % Chapter 1.3.1.13.3.6 “Managing trace” on page 344

**Command ‘Start Trace’**

Symbol: ➤

**Function:** This command starts the data recording on the controller when it is stopped.

**Call:** Main menu “Trace”, or context menu.

**Requirement:** The assigned application on the runtime system is running and a trace configuration is loaded.

See also
- % Chapter 1.3.1.13.3.3 “Operating the data recording” on page 341

**Command ‘Stop Trace’**

Symbol: ⊹
**Function**: This command stops the data recording of a trace.

**Call**: Main menu “Trace”, or context menu.

**Requirement**: The assigned application on the runtime system is running and executes a trace.

See also

- Chapter 1.3.1.13.3.3 “Operating the data recording” on page 341

---

**Command 'Stretch’**

Symbol: \[\text{\un 11}\]

**Function**: This command stretches the trace graph by zooming out of the displayed time range by a fixed percentage.

**Call**: Main menu “Trace”, or context menu.

See also

- Chapter 1.3.1.25.2.21.3 “Command 'Compress'” on page 1025
- Chapter 1.3.1.13.3.5 “Navigating into trace data” on page 343

---

**Command 'Upload Trace’**

**Function**: This command establishes the connection to the PLC device, if not already connected. Then it opens the “Online List” dialog listing the traces running on the controller. Then the selected trace is loaded to the trace editor by means of the “Upload” command in the dialog.

**Call**: Menu bar: “Trace”; context menu of the trace editor.

**Requirement**: The editor of a “DeviceTrace” object is open. The runtime system uses the CmpTraceMgr components (trace manager). At least one application in the runtime system in running. The communication settings for the PLC are configured correctly in the CODESYS project.

**NOTICE!**

Closing the DeviceTrace editor terminates the connection to the controller.

Please note that the connections to the controller is also terminated when the last open “DeviceTrace” editor is closed. In order for device traces to be displayed again in the project, you have to reload them into the “DeviceTrace” objects.

At this time, closing the editor is also the recommended procedure for deliberately terminating the connection to the controller. Logging out is not enough for this.

See also

---

**Command 'Statistics’**

**Function**: This command opens the “Trace Statistics” dialog box, which shows statistics about each trace variable.

**Call**: Main menu “Trace”, or right-click.

**Requirement**: The trace editor contains samples.
Dialog Box 'Trace Statistics' 

The analyzed time range and duration are shown in the caption. The table contains one line per signal.

<table>
<thead>
<tr>
<th>“Signal”</th>
<th>Name pf the trace variable (for example, PLC_PRG.S1)</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Index”</td>
<td>0-based index of the signal order</td>
</tr>
<tr>
<td>“N”</td>
<td>Number of measurements for the calculations</td>
</tr>
<tr>
<td>“Min”</td>
<td>Smallest value</td>
</tr>
<tr>
<td>“Avg”</td>
<td>Average</td>
</tr>
<tr>
<td>“Median”</td>
<td>Middle value when the values are ordered by size</td>
</tr>
<tr>
<td>“RMS”</td>
<td>Root mean square</td>
</tr>
<tr>
<td>“StdDev”</td>
<td>Standard deviation</td>
</tr>
<tr>
<td>“Max”</td>
<td>Largest value</td>
</tr>
<tr>
<td>“Integral”</td>
<td>Integral</td>
</tr>
<tr>
<td>“Min Δt [s]”</td>
<td>Smallest change of time intervals for successive values</td>
</tr>
<tr>
<td>“Avg Δt [s]”</td>
<td>Average change of time intervals for successive values</td>
</tr>
<tr>
<td>“Median Δt [s]”</td>
<td>Median change of time intervals for successive values</td>
</tr>
<tr>
<td>“StdDev Δt [s]”</td>
<td>Standard deviation of change of time intervals for successive values</td>
</tr>
<tr>
<td>“Max Δt [s]”</td>
<td>Largest change of time intervals for successive values</td>
</tr>
</tbody>
</table>

Click a column head in the table. CODESYS sorts the table by that column, changing the order from ascending to descending and back. Default: The table is sorted ascending by the “Index” column. The signals are then sorted in the same order as in the signal tree.

Click in the line. The line is selected. You can select or clear other lines by pressing [Shift]+[arrow] up or down.

[Ctrl]+[C] CODESYS copies the selected lines as text to the clipboard. The values of the individual columns are tab-separated, and the lines are delimited with the control character [CR] or [LF]. Requirement: At least one line is selected.

Menu 'Device Application'

1.3.1.25.2.22.1 Command 'Login to All Applications' ........................................ 1036
1.3.1.25.2.22.2 Command 'Logout All Applications' ........................................... 1036
1.3.1.25.2.22.3 Command 'Delete Applications from Device' .............................. 1036
1.3.1.25.2.22.4 Command 'Reset Cold All Applications' .................................... 1036
1.3.1.25.2.22.5 Command 'Reset Warm All Applications' .................................. 1037
1.3.1.25.2.22.6 Command 'Start All Applications' ............................................ 1037
1.3.1.25.2.22.7 Command 'Stop All Applications' ............................................. 1037
Command 'Login to All Applications'

**Function:** This command has the same effect on all applications of the device as the command "Login" for a single application. Therefore, it calls the usual login dialog box, or if no changes were made to the applications, it logs into all applications of the device without any dialog prompt. The applications go into online mode.

**Call:** Context menu of the device object in the device tree.

**Requirement:** The device has a device application. At least one of the applications of the device is not in online mode.

> If you login with a single application of a device for which a device application is configured, then you also login automatically with the device application.

See also
- ☞ Chapter 1.3.1.16 “Using device applications” on page 358
- ☞ Chapter 1.3.1.25.2.6.2 “Command 'Login'” on page 923

Command 'Logout All Applications'

**Function:** This command has the same effect on all applications of the device as the command "Logout" for a single application. The applications go into offline mode.

**Call:** Context menu of the device object in the device tree.

**Requirement:** The device has a device application. At least one of the applications of the device is in online mode.

See also
- ☞ Chapter 1.3.1.16 “Using device applications” on page 358
- ☞ Chapter 1.3.1.25.2.6.3 “Command 'Logout'” on page 926

Command 'Delete Applications from Device'

**Function:** This command deletes the application of the device selected in the device tree.

**Call:** Context menu of the application object in the device tree.

See also
- ☞ Chapter 1.3.1.25.1.19.4 “Tab 'Applications'” on page 747
- ☞ Chapter 1.3.1.25.1.1 “Object 'Application'” on page 710

Command 'Reset Cold All Applications'

**Function:** This command resets all applications of the device. This behavior is as for the use of the “Reset Cold” command for a single application.

**Call:** Context menu of the device object in the device tree.

**Requirement:** The device has a device application. All applications are in online mode.

See also
- ☞ Chapter 1.3.1.16 “Using device applications” on page 358
- ☞ Chapter 1.3.1.25.2.6.9 “Command 'Reset Cold'” on page 931
Command 'Reset Warm All Applications'

**Function:** This command resets all applications of the device. This behavior is as for the use of the “Reset Warm” command for a single application.

**Call:** Context menu of the device object in the device tree.

**Requirement:** The device has a device application. All applications are in online mode.

See also
- Chapter 1.3.1.16 “Using device applications” on page 358
- Chapter 1.3.1.25.2.6.10 “Command ‘Reset Warm’” on page 931

Command 'Start All Applications'

**Function:** This command starts all applications that belong to the device configuration.

**Call:** Context menu of the device object in the device tree.

**Requirement:** The device has a device application and is in online mode.

See also
- Chapter 1.3.1.16 “Using device applications” on page 358

Command 'Stop All Applications'

**Function:** This command stops all applications that belong to the device configuration, but not the device application itself.

**Call:** Context menu of the device object in the device tree.

**Requirement:** The device has a device application and is in online mode.

See also
- Chapter 1.3.1.16 “Using device applications” on page 358

Other

<table>
<thead>
<tr>
<th>Command</th>
<th>Location</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.3.1.25.2.23.1</td>
<td>Command 'Add Watch'</td>
</tr>
<tr>
<td>1.3.1.25.2.23.2</td>
<td>Command 'Implement Interfaces'</td>
</tr>
<tr>
<td>1.3.1.25.2.23.3</td>
<td>Command 'Limit Results to Current Declaration'</td>
</tr>
</tbody>
</table>

Command 'Add Watch'

**Symbol:**  

**Function:** This command adds the variable of the current location of the cursor to a watchlist for the purpose of online monitoring.

**Call:** Right-click a variable in an editor when the application is in online mode.

This command adds the variable to the currently opened watchlist. If a watchlist is not open, then the variable is added to the “Watch 1” list and that view opens.

See also
- Chapter 1.3.1.13.1.2 “Using watch lists” on page 330
- Chapter 1.3.1.13.1 “Monitoring of values” on page 323
Command 'Implement Interfaces'

**Function:** This command updates the implemented interfaces for a function block.

**Call:** Context menu of the selected function block (FB) in the device tree.

**Requirement:** The function block implements an interface that you have modified. For example, an additional method was added to the interface.

In object-oriented programming, if you derive a function block (FB) from a base function block, which implements one or more interfaces, for the purpose of inheritance, then the following applies:

When you execute the “Implement Interfaces” command for the derived FB, all interface methods and interface attributes of the base FB are accepted into the derived FB in the form of stubs (without implementation). Then you are responsible for making sure that an "empty" method/attribute in the derived FB does not conflict with an implemented one in the base FB. The following actions are taken to support you in this case: If there es a base implementation for a method/attribute, then CODESYS adds a pragma attribute {error..} in the first line of the affected derived interface method or interface attribute that will generate the error message. If there is no base implementation for the method/attribute, then there is a pragma attribute entry for a warning. After editing the block, you must remove the error pragma attribute entry explicitly.

See also
- § Chapter 1.3.1.25.1.28.4 “Object 'Interface'” on page 783

Command 'Limit Results to Current Declaration'

**Function:** When multiple declarations have been found, this command collapses the display in the cross-reference list. It shows only the results for the declaration that you selected explicitly in the list.

**Call:** Right-click.

**Requirement:** The cross-reference list is active. Multiple declarations for the searched symbol are listed as cross-references.

See also
- § Chapter 1.3.1.9.14.1 “Using the cross-reference list to find occurrences” on page 232
The dialogs of the CODESYS user interface basically are described on the help pages for the CODESYS menu commands or CODESYS objects. The help book “Dialogs” contains only descriptions of dialogs, which

- appear only after multi-step calls after a certain menu command call or within an object editor,
- or which are not placed on a help page for a command or for an object because of their complexity (multiple subdialogs).

### Dialog 'Import Assistant'

**Function:** The dialog allows for the transfer of CODESYS options and package installations from an older CODESYS installation that was found in the local computer.

**Call:** The dialog opens when a recently installed CODESYS version is started for the first time and an older version is installed on the computer.

<table>
<thead>
<tr>
<th>“Program settings”</th>
<th>□: The user-specific CODESYS options are transferred from the older installation to the new installation.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Packages”</td>
<td>□: The packages installed with the older CODESYS version are transferred to the Package Manager of the new version. See the list of discovered package installations with the “Name”, “Version”, and “Installation date”.</td>
</tr>
<tr>
<td>“Import”</td>
<td>The program settings and/or options are transferred to the current CODESYS version.</td>
</tr>
<tr>
<td>“Skip”</td>
<td>The program settings and/or options are not transferred to the current CODESYS version.</td>
</tr>
</tbody>
</table>

See also

- % Chapter 1.3.1.1.1 “Setting CODESYS options” on page 102
- % “Package manager” on page 376
Dialog 'Library Reference Conversion'

Function: The dialog defines how references to libraries that are no longer available are to be handled. Note: The undefined library references can be found in the Global Library Manager located in the "POUs" view.

Call: When opening a CoDeSys V2.3 project in V3, the dialog opens when the converter detects a library which cannot be used anymore in the current CODESYS version.

---

Table 175: “What do you want to do?”

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Convert and install the library as well.”</td>
<td>The converter also converts the library file into the new format. It remains referenced in the project. It is installed automatically in the library repository in the &quot;Other&quot; category. If the library does not provide the necessary project information for an installation, then the “Enter Project Information” dialog opens for the information to be added.</td>
</tr>
<tr>
<td>“Use the following library that has already been installed”</td>
<td>The previously used library is replaced by another library. The “Browse” button opens a dialog for selecting from the local library repository.</td>
</tr>
<tr>
<td>“Ignore the library. The reference will not appear in the converted project”</td>
<td>The library reference is removed from the project.</td>
</tr>
</tbody>
</table>

Dialog 'Select Function Block'

Function: The dialog is used for selecting a function block for I/O mapping. The function block should be mapped to the I/O channel selected in the “<device name> I/O Mapping” tab or to the object selected in the “<device name> IEC Objects” tab.

Call:
- Tab “<device name> I/O Mapping”, command button “Add FB for I/O channel”
- Tab “<device name> IEC Objects”, command button “Add”

The dialog provides all function blocks from the active application and the libraries included in the project which fulfill the following:
- The function block has the \{attribute 'io_function_block'\} attribute.
- The function block contains input or output parameters that match the channel type (input, output, data type) and has the \{attribute 'io_function_block_mapping'\} attribute.

When a function block is selected that provides multiple matching parameters, only the first one is mapped automatically to the channel. The others can only be assigned manually in the “<device name> I/O Mapping” tab.

After the function block is assigned, the parameter of the function block instance is entered in the “Variable” column of the mapping table. Then the path is composed as follows:
Example: App1.Out_4_Int_myScale_Output_Int_1.iOutput for the parameter iOutput of the first inserted instance of the function block myScale_Output.

<table>
<thead>
<tr>
<th>“Find”</th>
<th>Input field for searching for function block names</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Type”</td>
<td>Function blocks in the tree structure that match the channel type. Nodes: application, library name(s)</td>
</tr>
<tr>
<td>“Documentation”</td>
<td>Shows the available documentation for the library selected in the tree or the library block.</td>
</tr>
</tbody>
</table>

See also
- % Chapter 1.3.1.25.1.19.11 “Tab '<device name> I/O Mapping'” on page 755
- % Chapter 1.3.1.24.6.2.19 “Attribute 'io_function_block', 'io_function_block_mapping'” on page 617

Dialog 'Device Conversion'

Function: The dialog defines how references to devices that are no longer available are to be handled.

Call: When opening a CoDeSys V2.3 project in V3, the dialog opens when the converter detects a device reference which cannot be used anymore.

A CoDeSys V2.3 project can be converted into a CODESYS V3 project only if the CODESYS V2.3 Converter package is installed in CODESYS V3. The package is available in the CODESYS Store.

Table 176: “What do you want to do?”

<table>
<thead>
<tr>
<th>“Use the following device that has already been installed”</th>
<th>CODESYS replaces the previously used device in the device tree with another device. The “Browse” button opens a dialog for selecting from the local device repository.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Ignore the device. All device specific objects will not be available in the new project”</td>
<td>The device entry with all objects inserted below it is removed from the device tree.</td>
</tr>
</tbody>
</table>

| “Remember this mapping for all future occurrences of that device” | The settings made here in the dialog are saved in the CODESYS Options, in the “CODESYS V2.3 Converter” category. As a result, they are also valid for future project conversions. |

See also
- % Chapter 1.3.1.3.5 “Opening a V2.3 project” on page 128

- % Chapter 1.3.1.25.2.8.5 “Command 'Device Repository'” on page 957

Dialog 'Breakpoint Properties'

Function: The dialog is used to display or change the properties of the selected breakpoint in the “Breakpoints” view.

Call:
● “Breakpoints” view, “Properties” button
● “Breakpoints” view, “New” button, “New Breakpoint” command or “New Data Breakpoint” command

**Requirement:** An entry is selected in the list of breakpoints.

The dialog is identical to the “New Breakpoint” dialog which is opened in the “Debug” menu by means of the respective commands. Therefore, see the description in the help for the “New Breakpoint” dialog.

See also
● Chapter 1.3.1.25.3.8 “Dialog 'New Breakpoint'” on page 1044

**Dialog 'Permissions'**

**Function:** Definition of the permissions for user groups to perform certain actions on certain objects in the project.

**Call:** Menu “Project ➔ User Management”.

Each modification in the dialog will be applied immediately.

**Actions** Below “Actions” you find all possible actions on objects of the project. The actions are divided in 4 categories and below each action you see the assignments to the current objects. For each assignment action->object you can define the permission for each existing user group.

**Action categories:**

<table>
<thead>
<tr>
<th>Categories</th>
<th>Actions</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Commands”</td>
<td>Actions concerning the execution of commands</td>
</tr>
<tr>
<td>“Users, groups and permissions”</td>
<td>Actions concerning the configuration of user accounts, user groups and their permissions</td>
</tr>
<tr>
<td>“Object types”</td>
<td>Actions concerning the creation of object types</td>
</tr>
<tr>
<td>“Project objects”</td>
<td>Actions concerning the viewing, the editing, the removing and the child object handling of project objects</td>
</tr>
</tbody>
</table>

**Actions in detail:**

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“execute”</td>
<td>Executing a menu command</td>
</tr>
<tr>
<td>“create”</td>
<td>Creating a new object in the project</td>
</tr>
<tr>
<td>“add or remove children”</td>
<td>Adding or removing a child object below an existing object</td>
</tr>
<tr>
<td>“modify”</td>
<td>Modifying an object in the editor; modifying the users, groups or permission settings in the respective editor/dialog</td>
</tr>
<tr>
<td>“remove”</td>
<td>Deleting or cutting an object</td>
</tr>
<tr>
<td>“view”</td>
<td>Viewing the object in its editor</td>
</tr>
</tbody>
</table>

**Permissions** Below “Permissions” you find a list of all currently defined user groups (except group "Owner") and a symbol bar for configuring the permissions for a group.
The actions currently selected in the “Actions” window, on the currently selected targets are granted for the currently selected group.

The actions currently selected in the “Actions” window, on the currently selected targets are denied for the currently selected group.

The permission to perform the actions currently selected in the “Actions” window, on the currently selected targets, is not granted explicitly, however the actions are granted by default. For example because the respective permission is assigned to the "parent object". Example: The group has got the respective permission for object "mylec", and for this reason it has this permission also for object "mylec.pb_1".

The action currently expanded in the “Actions” window, on the currently selected targets, has not been denied explicitly, however the actions are denied by default. For example because the respective permission is assigned to the "parent object".

No symbol: Currently in the “Actions” window several actions are selected, for which the group has got different permissions.

Symbol bar:

**“Grant”**
The currently selected action on the currently selected target is explicitly granted for the currently selected group.

**“Deny”**
The currently selected action on the currently selected target is explicitly denied for the currently selected group.

**“Clear”**
The permission to perform the currently selected action on the currently selected target will be set back to the default for the currently selected group.

See also

- § Chapter 1.3.1.6.5 “Protecting objects in the project by access rights” on page 146

**Dialog Box 'Prepare Value’**

**Function:** This dialog box is used for preparing a value for a forced variable. CODESYS executes the prepared action with the next forcing.

CODESYS opens the dialog box in the following situations:

- When clicking in the field “Prepared value” of a forced variable in the declaration section
- When clicking in the inline monitoring field of a forced variable
- When clicking in the field “Prepared value” of a forced variable in the monitoring window

<table>
<thead>
<tr>
<th>“Prepare a new value for the next write or force operation”</th>
<th>Value that CODESYS writes to the variable with the next force operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Remove a preparation with a value”</td>
<td>CODESYS deletes the prepared value.</td>
</tr>
<tr>
<td>“Release the force, without modifying the value”</td>
<td>CODESYS retains the forced value and ends forcing. CODESYS marks the variable &lt;Unforce&gt;.</td>
</tr>
<tr>
<td>“Release the force and restore the variable to the value it had before forcing it”</td>
<td>CODESYS resets the forced value and ends forcing. The variable is marked with &lt;Unforce and restore&gt;.</td>
</tr>
</tbody>
</table>

See also

- § Chapter 1.3.1.25.2.7.16 “Command ‘Force Values’” on page 943
**Dialog 'New Breakpoint'**

**Function:** In the dialog, you define the settings for a new breakpoint or data breakpoint. It is identical to the "Breakpoint Properties" dialog which is used in the "Breakpoints" view.

**Call:**
- "Debug ➔ New Breakpoint"
- "Debug ➔ New Data Breakpoint"

**Requirement:** The application is in online mode.

**Tab 'Condition'**
The dialog defines the requirements for which program processing should halt at a breakpoint.

!NOTICE!
Using conditional breakpoints slows down code execution, even when the condition does not yield TRUE.

Conditional breakpoints required a CODESYS runtime >= V3.5.4.0.

---

**Table 177: "Tasks"**

<table>
<thead>
<tr>
<th>&quot;Only break if the breakpoint is hit in one of the following tasks&quot;</th>
</tr>
</thead>
<tbody>
<tr>
<td>CODESYS evaluates the breakpoint only if it is reached by specific tasks. The required tasks must be activated.</td>
</tr>
<tr>
<td>For example, you can define a single debug task and also prevent other tasks that use the same block from being affected when debugging.</td>
</tr>
</tbody>
</table>

---

**Table 178: "Hit Count"**

<table>
<thead>
<tr>
<th>&quot;Hit Count&quot;</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Break always&quot;: The program always halts at this breakpoint.</td>
</tr>
<tr>
<td>Alternative: The program halts at the breakpoint when the breakpoint has been hit as often as defined in the following (type in the required hit count or select it from the number list):</td>
</tr>
<tr>
<td>- &quot;Break when the hit count is equal to&quot;</td>
</tr>
<tr>
<td>- &quot;Break when the hit count is a multiple of&quot;</td>
</tr>
<tr>
<td>- &quot;Break when the hit count is greater than or equal to&quot;</td>
</tr>
</tbody>
</table>

---

**Table 179: "Condition"**

<table>
<thead>
<tr>
<th>&quot;Break, if true&quot;</th>
</tr>
</thead>
<tbody>
<tr>
<td>CODESYS evaluates the specified condition and halts the program at the breakpoint only when the result yields TRUE. You can define a condition as a valid Boolean expression. Examples: x&gt;100, x[y]=z, a AND b, boolVar.</td>
</tr>
</tbody>
</table>

---

**Tab 'Data'**

Requirement: This is used for the properties of a data breakpoint.
On the tab, the variable or memory address is specified for which the data breakpoint is set or will be set.

| “Break execution when the value of the variable or address changes” | ● Input of a qualified variable name  
| | ● Selection of a variable in the “Input Assistant” dialog, in the “Watch Variables” category  
| Examples: Variable: PLC_PRG.fb_DoSth.dwVariable, address: 16#12A, 0x12A, 129 |

| “Size” | Number of bytes of the specified variable or memory address above which should be monitored for changes. When a new variable or memory address is specified, a value that matches the data type or memory is set automatically at first. |
| Example: 4 for data type DWORD |

Tab 'Execution Point Settings'  Here, an existing breakpoint or data breakpoint can be converted into an execution point.

| “Execution point (Execution does not stop at breakpoint)” | [✓]: The breakpoint becomes an execution point. Processing does not halt at this point and the given code is executed.  
| | ● Execution point of a breakpoint: activated: [✓]; deactivated:  
| | ● Execution point of a data breakpoint: activated: [✓]; deactivated: |

| “Execute the following code” | Code that is executed when the execution point is reached.  
| Looping structures (For, While) and IF or CASE expressions are not possible. |

| “Print a message in the device log” | This option is available only when you select the “Enable logging in breakpoints” option in “Project Settings ➔ Compile Options”.  
| CODESYS can print variables with the placeholder {variable name} in the message text. |

Tab 'Location'  Requirement: The command “New breakpoint” was selected.

| “POU” | POU of the active application where the breakpoint is placed. |
| “Position” | Position of the breakpoint in the POU. Entry as row and column numbers (text editor) or as network or element numbers. |

| “Instances” | In the case of function blocks, you must define whether the breakpoint should be set in the implementation or in an instance.  
| [✓] CODESYS sets the breakpoint in the instance. For this option, select “Instance Path”.  
| [ ] CODESYS sets the breakpoint in the implementation. |

| “Enable breakpoint immediately” | [✓]: The breakpoint is activated.  
| [ ]: The breakpoint is not activated. To activate later, click the button in the “Breakpoints” view. |

Dialog 'Monitoring Range'

Function: This dialog restricts the range of array elements whose values are displayed during monitoring.

Call: Click in the column field “Data Type” that belongs to the array variable.

Requirement: A POU is in online mode and is being monitored. In addition, a variable of the POU has the data type “ARRAY”.

| “Valid range” | The validity range of the array elements that are monitored. Example of a three-dimensional array: [1..10][-3..3][-10..10] |
| “Maximum number of array elements” | Number of elements of the array variables Example: 1470 |

When you edit one of the settings “Start”, “End”, or “Scroll range of 1000 elements”, both of the other settings are adapted automatically.

“Start” | Index of the first array element whose value is displayed.
“End” | Index of the last array element whose value is displayed.
“Scroll range of 1000 elements” | Scrollbar for selecting a range from the set of array elements.

This dialog box is for the configuration of the properties of an object in CODESYS. In addition, depending on the object, it contains different tabs that each handle a category of properties.

Call: Menu “View”, context menu of the object in the “Devices”, “POUs” or “Modules” view.
Dialog Box 'Properties' - 'Common'

**Function:** This dialog box shows common information about the selected object.

**Call:** Main menu “View ➔ Properties”, or context menu of the object (“Common”).

**Requirement:** An object is selected in the device tree or POUs view.

| “Name” | Object name as shown in the device tree or POUs view |
| “Object type” | Type of object (for example, POU, application, or interface) |
| “Open with” | Type of editor to display or edit the object |

Dialog 'Properties' - 'Boot Application'

**Function:** The settings in this tab define when and how a boot application is created from the application.

**Requirement:** The device supports the settings.

**Call:** Right-click application object and select “Properties”; main menu “View ➔ Properties” (“Boot Application” tab).

| “Create implicit boot application on download” | A boot application is created automatically when downloading the application. |
| “Create implicit boot application on Online Change” | A boot application is created automatically when for an online change. |
| “Remind boot application on project close” | Before closing the project, CODESYS prompts to create the boot application. |

Regardless of the presets defined here, you are always able to create a boot application explicitly when you log in.

Dialog 'Properties' - 'Encryption'

**Function:** The dialog contains the properties of the application for encryption. If the CODESYS Security Agent is installed, then you can start a wizard for the encryption of downloads, online changes, and boot applications.

**Call:**

- Menu bar: “View ➔ Properties”
- Context menu of an application object
Table 182: “Encryption Technology”

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“No Encryption”</td>
<td>You can download the boot application to the controller only when the defined dongle (license key) is connected to the computer. The dongle is provided by 3S-Smart Software Solutions GmbH or by the respective hardware manufacturer. The firmcode is displayed. Type in the delivered product code.</td>
</tr>
<tr>
<td>“Simple Encryption”</td>
<td>You can download the boot application to the controller only after you have specified the product code and firmcode, and the respective dongle is connected to both the development computer and the controller. You receive the codes from the vendor that manages the licenses.</td>
</tr>
<tr>
<td>“Encryption with license management”</td>
<td>You can download the boot application to the controller only when a valid certificate exists for it. The “Certificates” group is enabled. See the description below.</td>
</tr>
<tr>
<td>“Encryption with certificates”</td>
<td>The option is already selected if the “Enforce signing of downloads, online changes and boot applications” option is selected on the “User” tab of the “Security Screen” view.</td>
</tr>
</tbody>
</table>

Table 183: “Certificates”

Note: If the “Enforce encryption of downloads, online changes and boot applications” option is selected in the “Security Screen” view in the “Security level” group, then the encryption technology is set to “Encryption with certificates” and cannot be changed in the “Properties” dialog.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Certificate Selection”</td>
<td>The “Certificate Selection” dialog opens. Here you can select previously installed certificates of devices for which the encryption of download, online change, and boot application is enabled. The list can contain several entries if several devices are authorized to run this application.</td>
</tr>
<tr>
<td>“Digitally sign application code”</td>
<td>The application is signed with a digital signature. The certificate for the digital signature is specified in the “Security Screen” view on the “User” tab.</td>
</tr>
</tbody>
</table>

Area for the display of the selected certificates with corresponding information

Information per certificate:
- “Issued for”
- “Issued by”
- “Valid from”
- “Valid until”
- “Thumbprint”

“Encryption Wizard” This button is available only if the CODESYS Security Agent is installed. It starts the wizard with the same name. See the help for CODESYS Security Agent in this case.

Dialog 'Properties' - 'Build'

Symbol: 📋

Function: This dialog includes options for compiling the object.

Call: Menu bar: “View ➤ Properties”; context menu of the object in the device tree.
**Name** | **Description**
---|---
"Exclude from build" | ☑: This object and inherently its child objects are not considered for the next compile process. The object entry is displayed in green fonts in the “Devices” or “POUs” view.

"External implementation"  
"(Late link in the runtime system) " | ☑: CODESYS does not generate any code for this object when compiling the project. The object is linked as soon as the project is running on the target system, provided it is available there (for example, in a library). The object name is postfixed with (EXT) in “Devices” or “POUs” view.

"Enable system call" | ☑: A system call (runtime system) for functions is possible. Background: As opposed to CoDeSys V2.3, the ADR operator in V3 can be used with function names, program names, function block names, and method names. It replaces the INSTANCE_OF operator. BUT: It is not possible to call function pointers from within CODESYS.

"Link Always" | ☑: The object is marked by the compiler and therefore always included in the compile information. This means that it is always compiled and downloaded to the PLC.

"Compiler defines" | Here you can specify defines or conditions for compiling the object (conditional compile). You can also type in the expression expr, which is used in these kinds of pragmas. Multiple entries are possible as a comma-separated list (see {define} statements). Example: hello, test:='1'

"Additional compiler definitions from the device description"  
"Defined in device" | List of compiler definitions that originate from the device description. These compiler definitions are used in the build if they are not listed in the “Ignored definitions” field.

"Ignored definitions" | List of compiler definitions from the device description that are not used in the build.

> | Copies the selected compiler definition from the “Defined in device” field to the “Ignored definitions” field.

< | Moves the selected compiler definition from the “Ignored definitions” field to the “Defined in device” field. The compiler definition is used in the build.

See also

- Chapter 1.3.1.24.6.3 “Conditional pragmas” on page 637

**Dialog 'Properties' – 'Build' (C-integration)**

**Function:** In this dialog, you configure the build environment and the necessary data for the integration of the C development environment.

**Call:** Main menu “View”, context menu of the object “C Code Module”

**Requirement:** The object “C Code Module” is selected in the device tree.

**NOTICE!**

The dialog in this form is valid only for CODESYS Control Win V3 and Visual Studio. For other environments, the dialog can look different or may not even be available at all.
### Visual Studio location
Installation path of Visual Studio on the hard disk
You can also select the path with the input assistant or search for it with the magnifying glass.

### Windows SDK location
Installation path of Windows SDK on the hard disk
You can also select the path with the input assistant or search for it with the magnifying glass.

### Temporary build folder Location
Path on the hard disk for the temporary build files

See also
- § Chapter 1.3.1.25.1.16 “Object 'C Code Module’” on page 737
- § Chapter 1.3.1.9.11 “Integrating C Modules’” on page 222

### Dialog 'Properties' - 'Access Control'

**Function:** The dialog defines the access rights of user groups for objects.  
**Call:** Main menu “View ➨ Properties”, context menu of an object in the view “Device” or “POUs”.

**Requirement:** An object is selected in the view “Device” or in the view “POUs”.

### Groups, actions and permissions
A table which displays the following user groups access rights on objects:
- “View”
- “Modify”
- “Remove”
- “Add/remove children”

Perform a double click on the access right symbol to open the drop down list with the available rights.

See also
- § Chapter 1.3.1.6.5 “Protecting objects in the project by access rights” on page 146
- § Chapter 1.3.1.25.3.6 “Dialog 'Permissions’” on page 1042

### Dialog 'Properties' - 'External file'

**Function:** The dialog is used to view and edit the properties of the external file. The properties were defined when the object was created. Changed properties are saved by pressing the “OK” button.

**Call:** “View ➨ Properties”, context menu of the object

**Requirement:** The object of the external file is selected in the “Devices” view or “POUs” view.

### What do you want to do with the external file?

<table>
<thead>
<tr>
<th>Remember the link</th>
<th>The file is available in the project only as long as it exists in the defined file path.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remember the link and embed into project</td>
<td>CODESYS saves an internal copy of the file in the project, as well as the link to the defined file path. The update option selected below applies as long as the external file exists there. Otherwise CODESYS uses the version saved in the project.</td>
</tr>
<tr>
<td>Embed into project</td>
<td>CODESYS saves only one copy of the file in the project. There is no longer a link to the external file.</td>
</tr>
</tbody>
</table>
Table 184: “When the external file changes, then”

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“reload the file automatically”</td>
<td>If the external file changes, then CODESYS updates the file in the project.</td>
</tr>
<tr>
<td>“prompt whether to reload the file”</td>
<td>If the external file changes, then a dialog prompt opens whether CODESYS should also update the file in the project.</td>
</tr>
<tr>
<td>“do nothing”</td>
<td>The file remains unchanged in the project, even if the external file changes.</td>
</tr>
</tbody>
</table>

Table 185: “Linked file”

- Requirement: Either the “Remember the link” option or “Remember the link and embed into project” option is selected.
- The following information about the linked file is shown: “Name”, “Location”, “Size”, “Changed”.
- “Display file properties” Clicking this button opens the default “Properties of <file name>” dialog, which you can also open in the Windows file system by right-clicking the file.

Table 186: “Embedded file”

- Shows the “Size” and “Changed” properties of the embedded file.

See also
- § Chapter 1.3.1.25.1.15 “Object 'External File’” on page 736

Dialog Box 'Properties' - 'Bitmap'

- **Function**: The dialog is for assigning a bitmap file to the object. The image will be used in the graphic view of the Library Manager and in the Toolbox view of the FBD/LD/IL editor.
- **Call**: Main menu “View ➔ Properties”, context menu of the object
- **Requirement**: The object is selected in the view “Devices” or in the view “POUs”

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Render pixels of this color transparently: ”</td>
<td>The selected color will be displayed transparently.</td>
</tr>
</tbody>
</table>

Dialog 'Properties' - 'Application Build Options'

- **Function**: This dialog includes settings that CODESYS uses for creating a boot application for the controller.
- **Call**: Menu bar: “View ➔ Properties”, context menu of an application object.
**Download Application Info**

This feature requires compiler version >=3.5.0.0, runtime system version >= 3.5.0.0.

The information about the application contents is also downloaded to the PLC. We recommend that you keep this option activated because it enables a difference check between the current application and the application on the PLC. This compares the number of blocks, data, and memory locations.

To receive information about the differences, click “Details” in the “Applications” tab of the device editor. This is also in the message view that opens when you are downloading an application to the PLC when it is different from the one already on the PLC.

**Stop parent application in case of exception**

Available for applications with a parent application. The option is activated by default for device applications.

[✓] An exception in this application also leads to stopping the device application and therefore stopping all other applications.

**Dynamic memory settings**

Memory is allocated dynamically for the application, for example when using the __NEW operator. In this case, define the "Maximum size of memory (bytes)".

Caution: The entire memory is not available for creating objects dynamically. Instead, the system always uses part of it for management information.

- ☰ Chapter 1.3.1.16 “Using device applications” on page 358

**Dialog 'Properties' - 'Network Variables'**

**Symbol:** [ ]

**Function:** In this dialog, you define network properties for the variable list that is selected in the device tree. Furthermore, any variables in it that are declared as network variables are also available.

**Call:** “Context menu of variable list in device tree ➔ Properties”, “Network Variables” tab

<table>
<thead>
<tr>
<th><strong>“Network type”</strong></th>
<th>UDP</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Task”</strong></td>
<td>Task of the current application that controls the variables to be sent. CODESYS always sends the variables at the end of a task cycle.</td>
</tr>
<tr>
<td><strong>“List identifier”</strong></td>
<td>Used to identify the network variable list. Must be unique</td>
</tr>
<tr>
<td><strong>“Pack variables”</strong></td>
<td>The size of the packages (telegrams) that are transmitted depends on the network type. In the case of “UDP”, a package is 256 bytes.</td>
</tr>
<tr>
<td>[✓] CODESYS bundles the variables for sending in packages in order to reduce as much as possible the number of packages to send. In the case of variables of type array or structured data types, this can lead to the splitting of the variables into multiple telegrams. As a result, data inconsistencies are possible within these variables, even if the variable size is smaller than the package size.</td>
<td></td>
</tr>
<tr>
<td>[☐] CODESYS generates one package per variable.</td>
<td></td>
</tr>
</tbody>
</table>
“Transmit checksum”
- A checksum is provided for each variable package. The receiver checks the checksum to make sure that the variable definitions match from the sender and receiver. A package with non-matching checksums is not accepted.

“Acknowledgement”
- CODESYS sends an acknowledgement message for each received data package. If the sender does not receive a confirmation before it sends again, then an error is written to the diagnostic structure.

Note: For the NetVarUdp library version 3.5.7.0 and later, a receiver channel is no longer assigned when confirmed transfer is not selected. In this way, network variable exchange is also possible between two controllers on one hardware device.

“Cyclic transmission”, “Interval”
- CODESYS sends the variables within the defined interval. Example for time definition: "T#70ms".

“Transmit on change”, “Minimum gap”
- CODESYS sends the variables only if their values have changed. You can use "minimum gap" to define the least amount of time between two transmissions.

“Transmit on event”, “Variable”
- CODESYS sends the variables as soon as the defined variable yields \texttt{TRUE}.

“Settings”
- Protocol-specific settings; possible entries depend on the network library.
  - “Port”: Number of the port that CODESYS uses for data exchange with other network units. The "Default value" is "1202". You can change the current value in the "Value" field at any time. Select the field, press the \texttt{[Space Bar]}, and type the value.
  - Caution: The other nodes in the network must define the same port. If more than one UDP connection is defined in the project, then the port numbers in all configurations are adapted to this value.
  - “Broadcast Adr.”: The "Default value" is 255.255.255.255, which means that data exchange will take place with all network units. You can change the current value in the "Value": select the field, press the \texttt{[space bar]}, and type the address or address range of a subnet-work (for example, 197.200.100.x when communication should be with all nodes that have an IP address in the range 197.200.100.x.

See also
- Chapter 1.3.1.10.3 “Network variables” on page 277
- Chapter 1.3.1.10.3.1 “Configuring a network variable exchange” on page 278
- Chapter 1.3.1.25.1.27 “Object ‘Network Variable List (Receiver)’” on page 775
- Chapter 1.3.1.25.1.26 “Object ‘Network Variable List (Sender)’” on page 774

Dialog 'Properties' - 'Network Settings'
If the device supports the network functionality, then the current network settings for a GNVL (global network variable list) can be displayed and changed in the ‘Properties’ dialog of the object. These are the settings that were used when adding the GNVL in the “Add Network Variable List (Receiver)” dialog.

See also
- Dialog Box ‘Add Network Variable List (Receiver)” on page 775
- Chapter 1.3.1.10.3.1 “Configuring a network variable exchange” on page 278
Dialog 'Properties' - 'CFC Execution Order'

**Function:** The tab switches the mode of the execution order for CFC objects.

**Call:** Context menu: “Properties” of a CFC object in the “Devices” view or “POUs” view

### Tab 'CFC Execution Order'

<table>
<thead>
<tr>
<th><strong>“Execution order”</strong></th>
<th>In the CFC editor, you position the elements and therefore also the networks freely. Two modes are available to prevent the execution order in the CFC POU from being undefined.</th>
</tr>
</thead>
</table>
| **“Auto Data Flow Mode”** | In this mode, the execution order is determined automatically by data flow, or in case of ambiguity, by network topology. The POUs and the outputs are numbered internally. The networks are executed from top to bottom and left to right. Advantage: The automatically defined execution order is optimized by time and by cycle. You do not need any information about the internally managed execution order during the development process. The following commands are provided afterwards in the “CFC Execution Order” menu:  
  ● “Display Execution Order”  
  ● “Set Start of Feedback”  
  The elements in the CFC editor are displayed without markers and without numbering. It is not possible to change the execution order manually. For networks with feedback, you can also set a starting point. |
| **“Explicit Execution Order Mode”** | In this mode, you can define the execution order explicitly. To do this, the elements are displayed in the CFC editor with markers and numbering, and menu commands are provided for defining the order. The following commands are provided in the “CFC Execution Order” menu:  
  ● “Send to Front”  
  ● “Send to Back”  
  ● “Move Up”  
  ● “Move Down”  
  ● “Set Execution Order”  
  ● “Order by Data Flow”  
  ● “Order by Topology”  
  Note: Up to CODESYS V3.5 SP1, this was the usual behavior of CFC POUs. Pay attention that it is your responsibility to adapt the execution order and assess the consequences and impacts. This is another reason why the execution order is always displayed. |
| **“Apply to All CFCs”** | Changes the mode for all other CFC objects in the project to the mode selected in the list |

Dialog 'Properties' - 'SFC Settings'

**Function:** The dialog defines the default settings for all POUs used in the project, which are programmed in SFC.

**Call:** Main menu “View ➔ Properties”, context menu of a SFC POU in the view “Device” or “POUs”.

**Flag**

<table>
<thead>
<tr>
<th>List of all possible SFC flags</th>
<th>“Use”✓: The SFC flag is activated and will be considered in the program execution.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>“Declare”✓: The SFC flag is declared automatically.</td>
</tr>
<tr>
<td></td>
<td>If “Declare” is activated, but “Use” is not activated, the variable will be declared but the flag has no effect in the program execution.</td>
</tr>
<tr>
<td></td>
<td>Hint: If you have manually declared a SFC variable you have to disable the declaration of this flag in the “SFC Settings”. Otherwise the automatically generated flag will overwrite the manually declared flag.</td>
</tr>
<tr>
<td></td>
<td>Hint: A automatically declared flag variable is only visible in the online mode in the declaration part of the SFC editor.</td>
</tr>
</tbody>
</table>

“Use defaults”✓: The settings of this dialog overwrites the “SFC settings” of the single POUs.

See also
- ⇧ Chapter 1.3.1.24.1.4.6 “SFC flags” on page 447

**Build**

**Table 187: “Code generation”**

| “Calculate active transitions only” | ✓: CODESYS generates code for the currently active transition only. |

Dialog 'Properties' - 'Link to File'

**Function:** The dialog defines the link of an external file with the content of the global variable list (GVL). You can either export the GVL to an external file or import it from an external file.

**Call:** Main menu “View ➔ Properties”, context menu of a GVL.

| “Import before compile” | ✓: With each compile of the project (for example with F11) CODESYS saves a file with extension gvl in the directory defined in “File name”. |
| “Export before compile” | ✓: An existing export file is read automatically with each project compile. Thus you can import a GVL exported from a different project, for example to setup a communication via network variables. |

See also
- ⇧ Chapter 1.3.1.25.1.21 “Object ‘GVL’ - Global Variable List” on page 769
- ⇧ Chapter 1.3.1.10.3.1 “Configuring a network variable exchange” on page 278

Dialog 'Properties' - 'Cam'

**Function:** Use this dialog to define the global variables of the cam.
### Table 188: “Dimensions”

<table>
<thead>
<tr>
<th>“Master start/end position”</th>
<th>The start and end positions of the master define the range of the master values and therefore the scale of the horizontal axis of the cam. The default settings are given in angular degrees with 0 and 360 as limiting values.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Slave start/end position”</td>
<td>The associated slave positions are determined by the graph type that is defined for the cam. However, the segment depicted by the curves (this is also the scale of the vertical axis) can be defined by the slave start and end positions given here.</td>
</tr>
</tbody>
</table>

### Table 189: “Period”

| “Smooth transition” | The values for position, velocity, and acceleration are adjusted automatically. |
| “Slave period” | Indicates when the slave period is repeated mechanically. The slave position at the start and end of the master period may then be in an interval of a whole number multiple of this value. This value is effective only if the “Smooth transition” check box is selected. |

### Table 190: “Continuity Requirements”

Activation of these options for the continuity of the curve does not have any effect when editing the cam. It does, however, prompt a continuity check, which reports any violations to the message view (CAM). It is not possible to edit jumps in the position curve. The default setting also requires the continuity of velocity and acceleration. You can clear these options, for example in the special case of a curve that consists of only linear segments. However, this will lead to kinks in the position curve. By default, the jerk (3rd derivative) is not tested for jumps.

| “Position” | |
| “Velocity” | ✓: The entire curve is tested for jumps. |
| “Acceleration” | |
| “Jerk” | |

### Table 191: “Compile Format”

When compiling, `MC_CAM_REF` structure variables are generated. A cam is described according to the following options:

| “polynomial (XYVA)” | Polynomial description of the individual points consisting of the master position, slave position, slave velocity, and slave acceleration. |
| “one dimensional point array” | 1D table of slave positions |
| “two dimensional point array” | 2D table of composite master/slave positions |
| “Elements” | Number of elements in the arrays. This array has already been created in SM3 Basic for the default cases “128” and “256”. If you type in another value, you must create the structure in your application (see the following example). |
Example of an array with 720 elements

```plaintext
TYPE SMC_CAMTable_LREAL_720_2 : STRUCT
  Table: ARRAY[0..719] OF ARRAY[0..1] OF LREAL;
  fEditorMasterMin, fEditorMasterMax: REAL;
  fEditorSlaveMin, fEditorSlaveMax: REAL;
  fTableMasterMin, fTableMasterMax: REAL;
  fTableSlaveMin, fTableSlaveMax: REAL;
END_STRUCT
END_TYPE
```

Dialog 'Properties' - 'Image Pool'

**Function:** The dialog allows for setting the basic properties of the selected image pool.

**Call:** “View ➔ Properties” of an “Image Pool” object type; context menu of an “Image Pool” object type.

| “Download only used images” | Yes: Instead of loading all images from the image pool, CODESYS loads only the images that are actually used in the application on the PLC. |
| "Download by visualization" | Yes: The image pool is downloaded with the visualization to the controller. |
| “Internal” | Yes: CODESYS does not provide the image pool in the “ToolBox” view. You cannot drag these images to the visualization. |

**Table 192: “Symbol library settings”**

| “Mark library as symbol library” | Marks the image pool as a symbol library for use in a visualization. The symbol library receives the key VisuSymbolLibrary = TRUE as file property in the project information. The VisuElements library is inserted automatically as a placeholder library in the “POUs” pool of the Library Manager. |
| “Internal” | Requirement: A library project is open. CODESYS displays symbol libraries that are installed in the repository in the “Project Settings” (“Visualization” category, “Symbol Libraries” tab). |
| “Textlist for symbol translation” | Select the text list from the drop-down list that contains the translated texts for the image pool. |

Dialog 'Properties' - 'TextList'

**Function:** The dialog allows for setting the basic properties of the selected text list.

**Call:** “View ➔ Properties” of an “Text List” object type; context menu of an “Image List” object type.
"Download by visualization"

The text list is downloaded with the visualization to the controller.

"Internal"

The text list can be used only in a library. It is not available in an ordinary CODESYS project.

- Chapter 1.3.1.25.1.35 “Object 'TextList’” on page 823
- Using Text Lists

Dialog 'Properties' - 'Options'

Options (Controller)

Function: This dialog provides the settings for monitoring an login for objects of type device. The availability of the options depends on the device description.

Call: Context menu of the device, or main menu "View ➔ Properties", if the device is selected.

| "Monitoring interval (ms)" | Interval of the monitoring (10 ms - 1000 ms) |

Table 193: “Interactive Login Mode”

This mode is used to prevent an accidentally login to a different controller.

| "None" | No interaction with the user during login. Corresponds to the behavior of previous versions. |
| "Enter ID" | During login CODESYS asks to enter an ID. The ID is stored in the controller. Without a valid ID no login is possible. When login a second time, CODESYS does not ask again for the ID if the computer name, the user name, the device name and the device address have not changed. The information is saved in the project options. |
| "Press key" | During login a dialog prompts and requests the user to press a key on the controller. The timeout for this action is saved in the device description. |
| "Wink (= blink an LED)" | During login a led blinks on the connected controller. |

Table 194: “Symbol Configuration”

| "Access variables in sync with IEC tasks" | Default setting, consistent access is not permitted |
| | Consistent access is permitted |

The setting only will take effect when all applications and boot applications are re-downloaded to the controller.

Note: If the option is activated, then the jitter for all IEC applications may increase on this device! The consistent access can disturb the real-time capability.

Dialog 'Properties' - 'Monitoring'

Function: The tab contains options for the monitoring of transitions in SFC.

Call: Select transition object, click “Properties”; menu bar: “View ➔ Properties”.

Table 192: "Function"
**“Enable monitoring”**

☑️ An implicit variable is created for the transition, which is then always given the current property value when the application calls the Transition method. The value stored last in this variable is displayed in the monitoring.

**“Monitoring using call”**

☑️ The transition to be monitored is read by directly calling the transition.

Note: When you activate this option, you have to consider possible side effects. These kinds of side effects can occur if additional operations are implemented in the transition.

---

**Dialog 'Project Settings'**

| 1.3.1.25.3.11.1 | Dialog ‘Project Settings’ - 'SFC' | 1059 |
| 1.3.1.25.3.11.2 | Dialog Box 'Project Settings' - 'Users and Groups' | 1060 |
| 1.3.1.25.3.11.3 | Dialog Box 'Project Settings' - ‘Compileoptions’ | 1062 |
| 1.3.1.25.3.11.4 | Dialog Box 'Project Settings' - 'Compiler Warnings' | 1062 |
| 1.3.1.25.3.11.5 | Dialog 'Project Settings' – 'Source Download' | 1063 |
| 1.3.1.25.3.11.6 | Dialog 'Project Settings' - 'Page Setup' | 1064 |
| 1.3.1.25.3.11.7 | Dialog 'Project Settings' - 'Security' | 1064 |
| 1.3.1.25.3.11.8 | Dialog 'Project Settings' - 'Static Analysis Light' | 1066 |
| 1.3.1.25.3.11.9 | Dialog 'Project settings' - 'Visualization' | 1068 |
| 1.3.1.25.3.11.10 | Dialog 'Project Settings' - 'Visualization Profile' | 1069 |

**Symbol:** 📜

**Function:** The object contains the basic configuration of the project. In the “Project Settings” dialogs the configuration can be adjusted.

**Call:** Double click on the “Project Settings” object in the device tree, or main menu “Project ➔ Project Settings”.

CODESYS saves the project settings directly in the project. If a project is transferred to another system for example the “Project Settings” object is transferred as well without the need of a project archive.

The project settings are valid project wide. Dependent on the installed packages the dialogs provide settings for several categories, as for example “SFC” or “User and Groups”.

See also

- Chapter 1.3.1.25.2.8.1 “Command ‘Package Manager’ ” on page 949

---

**Dialog 'Project Settings' - 'SFC'**

**Symbol:** 📜

**Function:** This dialog is used for configuring the settings of SFC objects. The properties of each new SFC object automatically have the configured settings.

**Call:** Menu bar: “Project ➔ Project Settings” (“SFC”).

**Requirement:** A project is open.

---

**Tab 'Flags'**
Implicitly generated variables for checking and monitoring the processing in an SFC diagram

| “Active” | ✅: The corresponding variable is used. |
| “Declare” | ✅: The corresponding variable is created automatically. Otherwise, you have to declare the variable explicitly if you intend to use it (“Use” is selected). |

| “Apply to all” | In this dialog, CODESYS applies changes to existing SFC objects. CODESYS selects the “Use defaults” check box in the properties of the SFC POUs. |

NOTICE!
Automatically declared variables are visible in the declaration part of the SFC editor only in online mode.

Tab 'Build'

Table 195: “Code Generation”

| “Calculate active transitions only” | ✅: CODESYS generates code only for currently active transitions. |

Table 196: “SFC Library”

This part of the dialog is available only for compiler versions < 3.4.1.0.

| “Company” | Defines the SFC library that CODESYS uses by default. |
| “Title” | |
| “Version” | |
| “Namespace” | Enables unique references to libraries. Required when various versions of the library are available on the system. Please make sure that there are no discrepancies between the namespace defined in the library manager and the namespace defined for the individual object. The SfcIec.library data is used for the default settings that CODESYS provides with the default profile. |

Each SFC block stores the information via the library version that applied when you added the block. This can cause you to use multiple library versions within the same project. In order to prevent this, you are prevented from defining specific versions of IecSfc.library (as of compiler version 3.4.1.0). The library version, which you use for all SFC blocks in the project, is defined with a placeholder. CODESYS resolves the placeholder depending on the compiler version in use. The allocation of the library version to the compiler version is defined in the library profile.

Dialog Box 'Project Settings' - 'Users and Groups'

Symbol: 🔄

Function: This dialog box is for the configuration of the user management for the current project.

Call: Menu “Project ➔ Project Settings”, category “Users and Groups”
Tab 'User'

Displays the users and their memberships in groups

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Add&quot;</td>
<td>Opens the dialog box “Add User”.</td>
</tr>
<tr>
<td>&quot;Edit&quot;</td>
<td>Opens the dialog box “Edit User”.</td>
</tr>
<tr>
<td>&quot;Delete&quot;</td>
<td>An error message appears if you attempt to delete the last user of a group, since a group must have at least one member.</td>
</tr>
</tbody>
</table>

Table 197: “Add User / Edit User”

Input fields for setting up a new user account or changing an existing one

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Active&quot;</td>
<td>☑: You may use the user account, default ☐: The user cannot log in. If he attempts to login again with incorrect login data, this can result in automatic deactivation of the account; see below: Settings.</td>
</tr>
<tr>
<td>&quot;Memberships&quot;</td>
<td>List of all user groups that you have defined in addition to the group “Everyone” (to which each new user automatically belongs). &lt;group name&gt;: the new user belongs to the group.</td>
</tr>
</tbody>
</table>

Table 198: “Export/Import”

<table>

Dialog Box 'Project Settings' - 'Compileoptions'

Symbol: 

Function: This dialog box is for configuring the compiler options.

Call: Main menu “Project ➜ Project Settings” (“Compileoptions” category).

Requirement: A project is open.

Table 199: “Compilerversion”

| “Fix Version” | Defines the compiler version that CODESYS uses when compiling and downloading for compile (for example, “3.5.6.0” for version 3.5 SP6). |

Table 200: “Settings”

| “Allow unicode characters for identifiers” | Cleared by default because using Unicode characters in identifier names is not permitted in the IEC standard. May be required for some foreign languages (for example, Asian languages). |
| “Replace constants” | (default): CODESYS loads the value directly for every scalar constant (not for strings, arrays, and structures). In online mode, CODESYS marks the constants with a symbol that is prepended to the value in the declaration editor or monitoring view. In this case, access is not possible, for example by means of an ADR operator, forcing, and writing. |
| “Enable logging in breakpoints” | For breakpoints that are defined as execution points, you can create a message text in the “Execution point settings” dialog box. CODESYS prints this text to the device log when the application halts at the execution point. |

Table 201: “Compiler Warnings”

| “Maximum number of warnings” | Refers to the warnings that CODESYS prints to the messages view. You define the selection of displayed compiler warnings in the “Project Settings” dialog box in the “Compiler Warnings” category. |

See also

- Chapter 1.3.1.25.3.11.4 “Dialog Box 'Project Settings' - 'Compiler Warnings’” on page 1062
- Chapter 1.3.1.25.1.19.8 “Tab 'Log’” on page 750

Dialog Box 'Project Settings' - 'Compiler Warnings'

Symbol: 

Function: This dialog box is used for selecting the compiler warnings that CODESYS displays in the messages view during a compile process.

Call: Call: Main menu “Project ➜ Project Settings” (“Compiler Warnings” category).

Requirement: A project is open.

You define the maximum number of listed warnings in the “Compileoptions” dialog box.
Dialog 'Project Settings' – 'Source Download'

Symbol: 

Function: This dialog defines the compilation and the storage of the source code as a source-code download archive on one or more controllers.

Call: “Project ➔ Project settings” menu, “Download source code” category

A source-code download archive is a project archive with the name Archiv.prj.

Table 202: “Destination device”

<table>
<thead>
<tr>
<th>Options</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;name of controller&gt;</code></td>
<td>Selected controller. CODESYS loads the project archive to this controller. Requirement: the project contains several controllers.</td>
</tr>
<tr>
<td><code>&lt;all devices in project&gt;</code></td>
<td>CODESYS loads the project archive to all controllers in the project.</td>
</tr>
</tbody>
</table>

Table 203: “Content”

<table>
<thead>
<tr>
<th>Options</th>
<th>Description</th>
</tr>
</thead>
</table>
| “Use compact download” | ☑: The project archive contains only that device in the project that contains the active application.  
  ☐: The project archive contains all the devices in the project |
| “Additional Files” | Opens the “Additional files” dialog where you can select additional files for downloading. |

Table 204: “Timing”

<table>
<thead>
<tr>
<th>Options</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Implicitly at program download and online change”</td>
<td>Each time an application is loaded or an online change is made, CODESYS additionally loads the project archive to the target device(s) with no further prompt.</td>
</tr>
<tr>
<td>“Implicitly at creating boot project”</td>
<td>Each time a boot application is created, CODESYS additionally loads the project archive to the target device(s) with no further prompt.</td>
</tr>
<tr>
<td>“Implicitly at creating boot project, download and online change”</td>
<td>Each time a boot application is created, an application is loaded or an online change is made, CODESYS additionally loads the project archive to the target device(s) with no further prompt.</td>
</tr>
</tbody>
</table>
Each time an application is loaded or an online change is made, CODESYS opens a prompt, where you can select whether CODESYS should load the project archive to the controller.

A prompt opens only if the command “Online ➔ Load source code to connected controller” is called. There you can select whether CODESYS should load the project archive to the controller.

Dialog 'Project Settings' - 'Page Setup'

Symbol: ✎

Function: This dialog defines the layout for the print version of the project contents. This layout is used for the printout of the project information by clicking “File ➔ Print” and the printout of the project documentation by clicking “Project ➔ Document”.

Call: Main menu “Project ➔ Project Settings” (“Page Setup”)

You can change settings the following:
- “Paper”
- “Margins”
- “Header and Footer”
- “Document”
- “Title Page”

Table 205: “Edit Header, Edit Footer”

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Row spanning”</td>
<td>Number of rows that CODESYS should merge into a single column.</td>
</tr>
<tr>
<td>“Column spanning”</td>
<td>Number of columns that CODESYS should merge into a single row.</td>
</tr>
<tr>
<td></td>
<td>Opens the list of available placeholders for the “Text” field. When printing the page, CODESYS provides the placeholders with the current values.</td>
</tr>
</tbody>
</table>

Dialog 'Project Settings' - 'Security'

Symbol: ✎

Function: this dialog is for the configuration of the project protection by a password, a dongle, or a certificate.

Call: Menu bar: “Project ➔ Project Settings” (category “Security”).
NOTICE!

If the encryption password is lost you can no longer open the project. You can also no longer restore it.

"No protection"  ● The project file is not protected from unauthorized access and data manipulation.

Note: We strongly recommend that you use security functionality.

● The “Password”, “Dongle”, and “Certificates” options cannot be selected.

"Integrity check"  ● When you create a new project, this option is enabled by default.

● The project file is stored in a proprietary format and its integrity is checked each time the project is loaded. The file may be incompatible with older versions of the development system.

Please note that the project file is not encrypted. To better protect your data, activate one of the encryption functions.

"Encryption"  ● The “Password”, “Dongle”, and “Certificates” encryption functions can be selected.

"Password"  ● Entering, changing and confirming the encryption password.

If you save the project with these settings you must enter the password later in order to open the project again, even if it is to be loaded as a library reference.

"Dongle"  ● Requirement: you have connected the CODESYS security key (dongle) to the computer.

“Add”: The dialog “Add Registered Dongle” opens.

"Registered dongles"  ● Drop-down list of the registered dongles.

"Certificates"  ● Certificates are used for the encryption of contents of the open project file.

Requirement: The certificates for all users who share the project must be installed in the local memory.

● The “Certificate selection” dialog opens.

Table 206: Adding a registered dongle

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Dongle&quot;</td>
<td>Drop-down list of all connected dongles.</td>
</tr>
<tr>
<td>&quot;Update&quot;</td>
<td>CODESYS refreshes the drop-down list.</td>
</tr>
<tr>
<td>&quot;Flash&quot;</td>
<td>The LEDs of the currently selected dongle flash for two seconds (if it supports this function).</td>
</tr>
</tbody>
</table>

The dongle must be connected to the computer when CODESYS loads the project, even if it is loaded as a library reference.

Dialog 'Project Settings' - 'Static Analysis Light'

Symbol: §

**Function:** This dialog activates the tests that the light version of CODESYS Static Analysis performs each time code is generated.

**Call:** Menu bar: “Project ➔ Project Settings” (“Static Analysis Light” category).

You can exclude lines of code from the static code analysis by marking the code with the pragma `{analysis ...}` or the pragma `{attribute 'analysis' := '...'}.`

### Additional compile tests

<table>
<thead>
<tr>
<th>Test Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“SA0033: Unused variables”</strong></td>
<td>Finds variables that are declared, but not used within the compiled program code. For GVL variables: If there are multiple applications in one project, then only the objects under the currently active application are affected. If there is only one application, then the objects in the POU view are also affected.</td>
</tr>
<tr>
<td><strong>“SA0028: Overlapping memory areas”</strong></td>
<td>Detects the locations where two or more variables reserve the same storage space. For example, this occurs for the following declarations: <code>var1 AT %QB21: INT</code> and <code>var2 AT %QD5: DWORD</code>. In this case, both variables use byte 21, which means that the memory range of the variables overlap.</td>
</tr>
<tr>
<td><strong>“SA0006: Write access from multiple tasks”</strong></td>
<td>Detects variables that are written by more than one task.</td>
</tr>
<tr>
<td><strong>SA0004 “Multiple write access on output”</strong></td>
<td>Detects outputs that are written to more than one location. Note: No error is reported when an output variable (<code>VAR_IN_OUT</code>) is written in different branches of IF and CASE statements. Note: A pragma cannot deactivate this rule.</td>
</tr>
</tbody>
</table>
| **“SA0027: Multiple use of identifiers”** | Detects multiple uses of a name/identifier for a variable or an object (POU) within the scope of a project. The following cases are detected:  
  - The name of an enumeration constant is the same as in another enumeration in the application or used in an included library.  
  - The name of a variable is the same as an object in the application or an included library.  
  - The name of a variable is the same as for an enumeration constant in and enumeration in the application or an included library.  
  - The name of an object is the same as another object in the application.  
  - The name of a variable is the same as the name of a method.  
  - The name of an object is the same as the name of a superordinate object ("parent object"). |
| **“SA0167: Temporary function block instances”** | The test detects function block instances that are declared as temporary variables. This concerns instances that are declared in a method or in a function or as `VAR_TEMP`, and therefore are reinitialized in each processing cycle and for each POU call. |
Examples

SA0003: Empty statements

;  (* Comment *);
iVar;

SA0006: Concurrent access

FUNCTION_BLOCK ADD_FB
  g_iTemp1 := g_iTemp1 + INT#1;
PROGRAM PLC_PRG  //controlled by MainTask
  g_iTemp1 := g_iTemp1 + INT#2;
  g_xTemp2 := g_iTemp1 > INT#10;
PROGRAM PLC_PRG_1  //controlled by SubTask
  g_iTemp1 := g_iTemp1 - INT#3;
  g_xTemp2 := g_iTemp1 < INT#-10;

SA0004 Multiple write access on output

VAR_GLOBAL
  g_xVar AT %QX0.0 : BOOL;
  g_iTest AT %QW0 : INT;
END_VAR

PROGRAM PLC_PRG

</table>

**Function:** You use this dialog for checking the actuality of the software and of the files, which are included in the project. CODESYS checks for example the selected compiler and finds out if there is a newer version. In such a case you can update the affected components.

**Call:** Main menu “Project”

**Dialog 'Project Environment’ – ‘Library Versions’**

**Function:** This dialog displays the libraries of the opened project for which newer versions are available.

**Call:** Main menu “Project ➔ Project Environment”, tab “Library Version”

This dialog opens automatically when you open a project containing outdated libraries.

**Table 211**

<table>
<thead>
<tr>
<th>“Action”</th>
<th>Double-click inside the field to select the desired actions.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Check for updates when loading this project”</td>
<td>☑: Checking takes place each time the project is opened.</td>
</tr>
<tr>
<td></td>
<td>☐: Checking takes place once only.</td>
</tr>
<tr>
<td>“Set all to newest”</td>
<td>CODESYS uses the newest available version of the library.</td>
</tr>
<tr>
<td>“OK”</td>
<td>CODESYS performs the selected action(s).</td>
</tr>
</tbody>
</table>

**Dialog 'Project Environment’ - ‘Compiler Version’**

**Function:** This dialog shows the current compiler version of the project and provides the capability of updating.

**Call:** Main menu “Project ➔ Project Environment” (“Compiler Version” tab).
Table 212

<table>
<thead>
<tr>
<th>“Current compiler version in project”</th>

<td>2-100</td>
</tr>
<tr>
<td>“Qualifier width”</td>
<td>2-100</td>
</tr>
<tr>
<td>“Property width”</td>
<td>2-100</td>
</tr>
</tbody>
</table>

---

**Table 217: “Font”**

The example text shows the current font. Click it to change the font.

---

**Table 218: “Step Actions”**

- “Copy reference”: The reference to the action objects that call the step are also copied when the step is copied. The copied step and new step call the same action.
- “Duplicate implementation”: The reference to the action objects that call the step are linked to this step. When copying the step element, new action objects are created for the new step, and the implementation is duplicated.
- “Always ask”: When inserting a step action, you are always prompted whether the actions of a step element should be duplicated when it is copied, or whether the reference to the existing action should be applied.

Note: If a step already contains an embedded action, then new inserted actions of this step are also embedded. Likewise, new inserted actions are not embedded when the step already contains a non-embedded action. In these cases, you are no longer prompted for a duplication mode.

---

**Table 219: “Embedded Objects”**

- “Show action and transition objects in the navigator”

  - : Action and transition objects that are embedded in the SFC box by a step are displayed in the “Devices” or “POUs” tree view.

---

Tab 'View'

**Table 220: “Property Visibility”**

List of element properties for the categories “Common” and “Specific” with definitions of the display options.

<table>
<thead>
<tr>
<th>Property</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Property”</td>
<td>Defines the element properties displayed next to the element in the SFC diagram.</td>
</tr>
</tbody>
</table>
Dialog 'Options' – 'Libraries'

Symbol: 📚

**Function:** This dialog helps you to manage the mappings of library references that CODESYS uses during the conversion of an old project. If you have not yet stored any mapping for a certain library, you must redefine the mapping each time when opening an old project in which this library is integrated.

**Call:** Menu bar: “Tools ➔ Options”; category: “Libraries”.

A mapping defines what a library reference looks like following the conversion of the project to the current format. There are three possibilities:

- You retain the reference. This means that CODESYS similarly converts the library into the current format (*.library) and installs it in the local library repository.
- You replace a reference with another reference. This means that one of the installed libraries replaces the library that was integrated until now.
- You delete the reference. This means that the converted project no longer integrates the library.

CODESYS applies all the listed mappings to the library references of an old project the next time it is converted. Hence, you must repeat the mapping definition if the same library is integrated again in a project that is to be converted. You can enter a new mapping in the last line.

<table>
<thead>
<tr>
<th>“Source Library”</th>
<th>Path of the library that is integrated in the project before the conversion. A double-click an entry makes the field editable and the button for the input assistance appears.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Target Library”</td>
<td>Name and location of the library that is to be integrated in the project after the conversion. A double-click an entry opens the dialog “Set target system library”.</td>
</tr>
</tbody>
</table>

**Table 222: “Set target system library”**

<table>
<thead>
<tr>
<th>“Scan”</th>
<th>The “Select Library” dialog opens. You can select a library from the library repository here. The dialog corresponds to the dialog in the library repository.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Ignore”</td>
<td>When CODESYS converts the project, CODESYS always removes the existing source library from the project.</td>
</tr>
</tbody>
</table>

Dialog 'Options' – 'Library Download'

Symbol 🌐

**Function:** This dialog is for the setting of download servers.

**Call:** menu “Tools ➔ Options”, “Library Download” category
If you click on the button “Download Missing Libraries” in the library manager, CODESYS browses these download servers for libraries marked as missing in the library manager and uses the set login details for the proxy server.

<table>
<thead>
<tr>
<th>“Download servers”</th>
<th>URL of a server containing library files</th>
</tr>
</thead>
<tbody>
<tr>
<td>Double-click on “(Enter new download server here)”</td>
<td>An input field opens in which you can enter the URL address of a server.</td>
</tr>
</tbody>
</table>

Dialog ‘Options’ - ‘CFC Editor’

Symbol: 🗞

Function: This dialog is for the configuration of the settings for editing and printing in the CFC editor.

Call: menu “Tools ➔ Options”, category “CFC Editor”

Tab 'General'

| “Enable AutoConnect” | ☑: If you drag a CFC element onto the work area of the editor and insert it, CODESYS automatically connects together unconnected pins that ‘touch’ one another. Make sure that you do not create unwanted connections when shifting elements! |
| “Prepare values in implementation part” | ☑: In online mode you can also prepare variable values for writing and forcing in the implementation part of the CFC module. In addition, CODESYS displays the values you have just prepared in the inline monitoring box of the variable in angle brackets. |

Tab 'View'

| “Display grid points” | ☑: Grid points at which you can position the elements are visible in the editor. |
| “Show box icon” | ☑: Existing function blocks that are linked with a bitmap are displayed by CODESYS in the CFC editor as symbols. 
Requirement: You have either created the link for a function block or a function in the object properties or loaded it via a library. |
| “Edit Line Colors” | Opens the “Edit Line Colors” dialog for the definition of the colors of the connecting lines, depending on the data type applied. The lines appear in offline and online mode in these colors, unless CODESYS paints over them with the thick black and blue lines used to display the boolean data flow.
- “Add Type:” Adds a data type to the list.
- “Delete Type” |
| “Font” | Display of the font and button for changing the font. |

### Dialog 'Options' - 'CoDeSys V2.3 Converter'

**Symbol:** 🌐

**Function:** The dialog is used to define the mapping when converting a CoDeSys V2.3 project.

**Call:** Menu bar: “Tools ➔ Options”, “CoDeSys V2.3 Converter” category

> A CoDeSys V2.3 project can be converted into a CODESYS V3 project only if the CODESYS V2.3 Converter package is installed in CODESYS V3. The package is available in the CODESYS Store.

### Table 223: “Devices”

List and definition of the device mappings for a conversion.

All device mappings of this list are also in effect the next time a CoDeSys V2.3 project is converted. This eliminates the need to recreate the image definition when the same device is used in multiple projects.

<table>
<thead>
<tr>
<th>“Source Device”</th>
<th>Double-clicking an entry or an empty field opens the “Select Source Device” dialog. CODESYS lists all devices that converter can process.</th>
</tr>
</thead>
</table>
| “Target Device” | Double-clicking an entry or an empty field opens the “Select Target Device” dialog.  
  - “Select a target device from the list of installed devices below”: Confirm the selection by clicking “OK”.  
  - “None”: The source device will not be available in the new project. This also means that application-specific objects, such as the task configuration, are not imported. |
Table 224: “Visualizations”

<table>
<thead>
<tr>
<th>“Import of Targetvisualizations”</th>
<th>“Import of Webvisualizations”</th>
</tr>
</thead>
<tbody>
<tr>
<td>Defines the handling of the CODESYS TargetVisu and CODESYS WebVisu display variants when a CoDeSys V2.3 project is opened.</td>
<td></td>
</tr>
</tbody>
</table>

List box

- **“Try to imitate old behaviour”**: The option is available if the currently used device supports the option. The effect of this option is that the new target or web visualization settings correspond as accurately as possible to the settings in the old project.
- **“Ask the user once”**: CODESYS asks the user to define the settings only when an "old" visualization project is imported for the first time. After that, CODESYS applies the automatically settings in all other visualization imports.
- **“Ask the user”**: CODESYS asks the user to define the settings every time an "old" visualization project is opened.
- **“Setting from Device Description”**: CODESYS sets the settings according to the entries in the device description of the installed target device.
- **“Try to imitate old behaviour”**: The option is available only if the currently used device supports the option. The effect of this option is that the new display variant settings for the target or web visualization correspond as accurately as possible to the settings in the old project.

**NOTICE!**

CODESYS TargetVisu does not support the access to VAR_IN_OUT variables, because the compiler does not support this. This behavior corresponds to the behavior of CoDeSys V2.3 target visualizations.

Dialog 'Options' - 'SmartCoding'

**Symbol:** 🛠

**Function:** This dialog is for configuring the settings for easier coding.

**Call:** Menu bar: “Tools ➤ Options”, “SmartCoding” category

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Declare unknown variables automatically (AutoDeclare)</strong></td>
<td>The “Declare Variable” dialog opens when you type an undeclared identifier into an implementation language editor and then click away from the input line. In order for the AutoDeclare function to be available in the ST editor as well, the “Enable for ST editor” option also has to be selected.</td>
</tr>
</tbody>
</table>
| **Enable for ST editor** | Requirement: The “Declare unknown variables automatically (AutoDeclare)” option is selected.  
☑: The AutoDeclare function is also available in the ST editor.  
☐: The AutoDeclare function is not available in the ST editor. |
| **Show all instance variables in Input Assistant** | ☑: The "List components" function also lets you select the local variables of a function block instance.  
☐: The "List components" function lets select only the input variables and output variables of a function block instance. |
| **Show symbols from system libraries in Input Assistant** | System libraries are inserted in the library manager automatically and displayed in light gray.  
☑: Symbols, such as global variables, data types, and function blocks, are offered in the Input Assistant.  
☐: The symbols of the system libraries are not available in the Input Assistant. |
| **List components after typing a dot (.)** | ☑: Activates the "List components" function. When you type a dot (.) at a location where CODESYS expects an identifier, a list box appears with possible code. |
| **List components immediately when typing** | Requirement: The “List components after typing a dot (.)” check box is selected.  
☑: While you type code, a list box appears with possible identifiers and operators. |
| **Insert with namespace** | ☑: CODESYS adds the namespace before the identifier. |
| **Convert keywords to uppercase automatically (AutoFormat)** | ☑: CODESYS displays all keywords in uppercase. |
| **Automatically list selection in cross-reference view** | ☑: The cross-reference list automatically shows the references of variables, POU, and DUTs that are currently selected or where the cursor is waiting. |
| **Underline errors in the editor** | ☑: Incorrect or unknown program code is underlined. |
| **Highlight symbols** | ☑: All occurrences of a symbol where the cursor is positioned are highlighted in color within the editor. In this way, cross-references within the editor are quickly detected. |
| **Max. degree of parallelism** | List box for the number of parallel threads that can be used for the precompile processing.  
CODESYS detects the displayed number of threads from the number of CPU cores. This default number should be changed only in exceptional cases. |

Dialog 'Options' – 'International Settings'

Symbol: 🌍

Function: This dialog is for the setting of the language in the user interface and in the help.

Call: Menu bar: “Tools ➔ Options”, category “International Settings”.

Dialog 'Options' – 'Load and Save'

Symbol: 📄

Function: This dialog contains settings for the behavior of CODESYS when loading and saving a project.

Call: Menu “Tools ➔ Options”, category “Load and Save ”

| “Create backup copy”     | : Each time the project is saved, CODESYS also saves the project as the file <projectname>.backup in addition to the file <projectname>.project. You can rename the backup file and open it in the programming system. |
| “Automatically save every … minutes” | : CODESYS automatically saves the project at the specified time intervals in a file <projectname>.autosave, which you can reload following non-regular closing of the programming system. In case of regular closing or saving of the project, CODESYS deletes the .autosave file. In the case of a non-regular abort, CODESYS keeps the .autosave file. If you open a project for which there is an associated auto-save file, the “Auto Save Backup” dialog opens. In this dialog, you select whether the .autosave file or the version of the project last saved by the user should be opened. |
| “Save before build”     | CODESYS saves the project automatically before any build run. |
| “Advanced Settings”     | The “Advanced Settings” dialog opens. “Loading Behavior”: The loading of libraries and compilation information takes place in the background while you are already editing the project. |

Dialog 'Options' - 'Proxy Settings'

Symbol: 💻

Function: You use this dialog for storing the authentication data for the proxy server which is currently used for accessing the internet from CODESYS.

Call: Main menu “Tools ➔ Options”, category “Proxy Settings”
Requirement: Internet access of the network via proxy server

|“Enter proxy credentials”| A double click opens the input request for the user name and the password for the proxy server.
CODESYS uses the access data for the establishment of the connection to the download server for libraries and the device description, for the establishment of the connection to the CODESYS Store and for the command “View ➔ Start Page”.
Requirement: If the internet access of your computer or of the network takes place via a proxy server, then the button is available.

Dialog 'Options' - 'Refactoring'
Symbol: 🇧 🇪 🇪 🇫 🇫

Function: This dialog is used for defining the operations in the project for which the automatic refactoring is suggested. The refactoring functionality helps you in your improvement endeavors.

Call: Menu bar: “Tools ➔ Options” (“Refactoring”).

'Suggest Refactoring for the Following Operations’

|“Auto declare”| When you change the name of a variable in a declaration by calling auto-declare ([(Shift]+[F2]), the activated option “Apply changes by means of refactoring” appears. Then the “Refactoring” dialog opens and you can change the variable throughout the project.

☑: “On renaming variables” ☐: You specify the names in the auto-declare (dialog “Declare Variable”) and click “OK” to close the dialog. Then the “Refactoring” dialog opens for renaming the variable throughout the project.
See the section: “Refactoring”, “Changing a variable declaration and applying refactoring automatically”.

☑: “On adding or removing variables, or for changing the namespace” ☐: You delete the names in the auto-declare (dialog “Declare Variable”) and click “OK” to close the dialog. Then the “Refactoring” dialog opens for removing the variable throughout the project.

“Unit conversion editor” ☑: When you change the name of a conversion in the unit conversion editor, you are prompted whether CODESYS should perform “Automatic Refactoring” when renaming.

“Mapping editor” ☑: When you change a variable name in the device editor (“I/O Mapping” tab), you are prompted whether CODESYS should perform "Automatic Refactoring" when renaming.

“Navigator” ☑: When you change the name of an object in the device tree or in the POUs view, you are prompted whether CODESYS should perform "Automatic Refactoring” when renaming.

“Tabular declaration editor” ☑: When you change the name of a variable in the tabular declaration editor, you are prompted whether CODESYS should perform "Automatic Refactoring" when renaming.

Dialog Box 'Options' - 'Syntax Highlighting'

Symbol: 📜

Function: This dialog box is used for configuring the color and font settings for the text elements of an editor (for example, operands and pragmas).

Call: Main menu “Tools ➔ Options”, category “Syntax Highlighting”

Dialog 'Options' - 'Text Editor'

Symbol: 🖋

Function: The dialog contains settings for working in a text editor.

Tab 'Theme'

In this tab, you set the theme for the ST editor.

| “Theme” | Color theme for the text editor. The set theme is shown in the “Preview” window. The available themes are stored in the Themes folder of the installation directory. |
Tab 'Editing'

<table>
<thead>
<tr>
<th><strong>“Number of undos”</strong></th>
<th>Maximum number of editing steps to which you can apply the command “Edit → Undo”.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Folding”</strong></td>
<td>Defines the structuring of the code by means of indentation. When you select an indentation, you can expand or collapse the indentation section with the help of a plus or a minus sign respectively before the first line of the respective section.</td>
</tr>
<tr>
<td></td>
<td>● “Indent”: CODESYS collects all lines that are indented in comparison with the preceding line in an indentation unit.</td>
</tr>
<tr>
<td></td>
<td>● “Explicit”: You mark explicitly the code section to be summarized in an indentation unit with comments. Before the section, there must be a comment containing 3 opening braces “{{{”. After the section, there must be a comment containing 3 closing braces “}}}}”. The comments can contain additional text. Example:</td>
</tr>
<tr>
<td></td>
<td><img src="image" alt="Example Code" /></td>
</tr>
<tr>
<td><strong>“Word wrap”</strong></td>
<td>● “Soft”: The word wrap takes place at the edge of the editor window if 0 is entered for “Wrap margin”.</td>
</tr>
<tr>
<td></td>
<td>● “Hard”: The word wrap takes place after the number of characters specified for the “Wrap margin”.</td>
</tr>
<tr>
<td><strong>“Tab width”</strong></td>
<td>Number of characters</td>
</tr>
<tr>
<td><strong>“Keep tabs”</strong></td>
<td>The empty space that you inserted with the [Tab] key is not resolved into spaces afterwards by CODESYS.</td>
</tr>
<tr>
<td><strong>“Indent width”</strong></td>
<td>If you have selected the “AutoIndent” option “Smart” or “Smart with code completion”, then CODESYS inserts the number of spaces at the beginning of the line.</td>
</tr>
<tr>
<td><strong>“AutoIndent”</strong></td>
<td>● “None”</td>
</tr>
<tr>
<td></td>
<td>● “Block”: A new line automatically applies the indentation of the preceding line.</td>
</tr>
<tr>
<td></td>
<td>● “Smart”: Lines that follow a line containing a keyword (for example <code>VAR</code>) are automatically indented by the specified indentation size.</td>
</tr>
<tr>
<td></td>
<td>● “Smart with code completion”: Indentation as with the “Smart” option, but CODESYS additionally inserts the concluding keyword (for example <code>END_VAR</code>).</td>
</tr>
</tbody>
</table>

Tab 'Text Area'
### “Matching brackets”
If the cursor is positioned before or after a bracket within a code line, CODESYS marks the matching closing or opening bracket with a frame in the set color.

### “End of line markers”
CODESYS marks the end of each editor line with a small dash in the set color behind the last character (including spaces) of the line.

### “Wrap guide”
If a soft or hard word wrap is activated, the defined word wrap point is indicated by a vertical line in the selected color.

### “Caret color”
Color of the cursor character

### “Selection color”
Color of the selected text area

### “Inactive”
Color of a selection when the corresponding window is not active (focus on another window).

### “Foreground reduced line”
Color of the header of a closed, indented section in the code

### “Background reduced line”
The header of a closed, indented section in the code is given a colored background.

### “Font”
Clicking the field opens the common dialog for the configuration of the font.

---

#### Tab 'Margin'

Settings for the left margin of the text editor window, which is separated from the input area by a vertical line:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Line numbering”</td>
<td>Display of the line numbers in the declaration and implementation part, in each case starting with 1</td>
</tr>
<tr>
<td>“Foreground color”</td>
<td>Color of the line numbers</td>
</tr>
<tr>
<td>“Background color”</td>
<td>Color of the margin</td>
</tr>
<tr>
<td>“Bracketing”</td>
<td>Bracketing encompasses the lines between the keywords that open and close a construct, for example <strong>IF</strong> and <strong>END_IF</strong>.</td>
</tr>
<tr>
<td></td>
<td>If this option is enabled and the cursor is located before, after or in one of the keywords of a construct, the bracketed area is indicated by a square bracket in the border. You can select the color of the bracket from the drop-down list of this option.</td>
</tr>
<tr>
<td>“Active border color”</td>
<td>Color of the dividing line between the border and input area</td>
</tr>
<tr>
<td>“Inactive border color”</td>
<td>Color of the dividing line between the border and input area of the part of the window that is currently inactive</td>
</tr>
</tbody>
</table>

| “Mouse actions”                | |<br>You can assign one of the following actions to each of the specified mouse actions or mouse button combinations. CODESYS executes the actions when you execute the mouse action on the plus or minus sign before the header of a parenthesized area: |
| “Select fold”                  | CODESYS selects all lines of the bracketed area.                           |
| “Toggle fold”                  | CODESYS opens or closes the bracketed area or, if there are nested brackets, the first level of the bracketed area. |
| “Toggle fold fully”            | CODESYS opens or closes all levels of a nested bracketed area.             |

---

#### Tab 'Monitoring'

Settings for the display of the monitoring fields:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Enable inline monitoring”</td>
<td>Display of the monitoring fields behind the variables in online mode</td>
</tr>
<tr>
<td>“Monitoring foreground color”</td>
<td>Display of the value in the monitoring field</td>
</tr>
<tr>
<td>“Monitoring background color”</td>
<td>Display of the background in the monitoring field</td>
</tr>
<tr>
<td>“Flow control foreground color”</td>
<td>Display of the value in the monitoring fields at the flow control positions</td>
</tr>
</tbody>
</table>
"Flow control background color"  Display of the background in the monitoring fields at the flow control positions

"Number of displayed digits"  Number of decimal places in the monitoring field

"String length"  Maximum length of string variable values in the monitoring field

Dialog 'Customize'

1.3.1.25.3.14.1  Dialog ‘Customize’ - 'Menu'................................................... 1089
1.3.1.25.3.14.2  Dialog ‘Customize’ - 'Command Icons' ................................. 1090
1.3.1.25.3.14.3  Dialog ‘Customize’ - 'Toolbars'............................................... 1090
1.3.1.25.3.14.4  Dialog Box ‘Customize’ - 'Keyboard' .................................... 1091

The dialog contains the tabs to configure the user interface.

You can reset the CODESYS settings to default by use of the “Reset” button.

Dialog 'Customize' - 'Menu'

Function: With this dialog, you define the structure and contents of the user interface.

Call: Main menu “Tools → Customize” (“Menu”).

When you click “OK” to close the dialog, the changes are visible in the menu bar of the CODESYS user interface.

Table 242: “Menu”

Display of currently defined menus, submenus, and included commands. In CODESYS, a menu or submenu caption is identified by the caption symbol (≡). The layout from top to bottom corresponds to the layout displayed later in the CODESYS menu.

| “Add Command” | Enabled when a command is selected.
|               | Adds a command above the selected command. Opens the “Add Command” dialog. Use the “Add Command” dialog for selecting one or more commands. Left part: List of categories. Right part: List of commands in the selected category. |
| “Add Separator” | Adds a separator above the selected command. |
| “Add Popup Menu” | Adds a popup menu above the selected menu, submenu, or command. Opens the “Add Popup Menu” dialog. |
| “Edit Popup Menu” | Opens the “Edit Popup Menu” dialog. |
| “Reset” | Resets the default settings of the entire menu. |
| “Load” | Loads the settings from a stored file (<file name>.opt.menu). |

Table 243: “Add Popup Menu”

In CODESYS, a new menu is shown in the menu bar only when the menu contains at least one command.

| “Default text” | Select this check box when localization is available. |
Localized Texts

List: Languages and localized texts.

Add Language

Opens a drop-down list of available languages.
In CODESYS, the selected language is displayed in the area “Localized Texts”.
Use the “Text” column for typing the localized texts.

Dialog ‘Customize’ - ‘Toolbars’

Function: Use this dialog for generating new toolbars or customizing existing toolbars.
Call: Main menu “Tools ➔ Customize” (“Toolbars”).
When you click “OK” to close the dialog, the changes are visible in the menu bar of the CODESYS user interface.

Table 245: “Toolbars”

Display of currently defined toolbars. In CODESYS, the associated commands are listed below each toolbar in the order they will appear in the toolbar.
Double-clicking a toolbar in the list switches to editing mode.

<table>
<thead>
<tr>
<th>“Add Toolbar”</th>
<th>Enabled when a toolbar is selected. In CODESYS, this adds a toolbar above the selected toolbar and places the cursor in the name field of the new toolbar.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Add Command”</td>
<td>Enabled when you select a command or blank command entry below a toolbar. Adds a command above the selected command. Opens the “Add Command” dialog. Use the “Add Command” dialog to select one or more commands. Left part: List of categories. Right part: List of commands in the selected category.</td>
</tr>
<tr>
<td>“Add Separator”</td>
<td>Adds a separator above the selected command.</td>
</tr>
<tr>
<td>“Hide”</td>
<td>Hide the selected toolbar from the user interface.</td>
</tr>
<tr>
<td>“Show”</td>
<td>Shows the selected hidden toolbar in the CODESYS user interface.</td>
</tr>
</tbody>
</table>
Dialog Box 'Customize' - 'Keyboard'

**Function:** This dialog box is used for defining keyboard shortcuts (quick access keys or keyboard combinations) for commands.

**Call:** Main menu "Tools ➔ Customize" ("Keyboard").

<table>
<thead>
<tr>
<th>Table 246: “Keyboard”</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Shortcuts for selected command”</strong></td>
</tr>
<tr>
<td><strong>“Press shortcut keys”</strong></td>
</tr>
<tr>
<td><strong>“Shortcut keys currently used by”</strong></td>
</tr>
<tr>
<td><strong>“Reset”</strong></td>
</tr>
<tr>
<td><strong>“Load”</strong></td>
</tr>
</tbody>
</table>

Dialog 'Trace Configuration'

Function: This dialog provides extended settings for recording data.

Call: "Advanced" button in "Trace Configuration" dialog, "Record Settings" subdialog

Requirement: The trace editor is open and active. The dialog "Trace configuration" is open and the top node of the trace record tree is selected so that the subdialog "Record settings" is available.

For the calculation of the values, you have to select a task in the "Trace Configuration" dialog.

The buffer size is defined as "number of samples". CODESYS calculates the time intervals that corresponds to this number and displays the result in normal fonts on the right outside the table (for example, "1h1m1s1ms"). The calculation is possible only with the help of the task configuration settings and when the task cycle time is known.

<table>
<thead>
<tr>
<th>&quot;Measurement in every nth cycle&quot;</th>
<th>Data recording in every n task cycle</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Preset:</strong> 1; then the application performs the data recording in each task cycle.</td>
<td></td>
</tr>
<tr>
<td><strong>Scanning interval of the data recording</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong> 100ms</td>
<td></td>
</tr>
</tbody>
</table>
"Recommended runtime buffer size (samples)"

Requirement: "Override runtime buffer size" is deactivated.
The maximum number of samples that CODESYS calculates and recommends, which the application stores at runtime per trace variable. CODESYS calculates the number in the task cycle time from the value in "Measure in every n-th cycle" and the value in Measure in every n-th cycle.

Maximum length of the time interval during which the application collects data on the runtime system.

Example: 2s

"Override runtime buffer size"

Maximum number of samples per trace variable that saves the application per trace variable in runtime mode.

Example: 100

Value range: starting at 10

☑: The application uses this value, not the value calculated by CODESYS from "Recommended runtime buffer size (samples)".

Maximum length of the time interval during which the application collects data on the runtime system.

Example: 6s

"Trace editor buffer size per variable (samples)"

Number of values that can be stored per variable in the trace editor.

Example: 10000

The maximum time period for the display in the trace editor results from the maximum number and the scanning interval of the data recording. You can scroll back a maximum of this time in the trace editor.

</table>

**Tree view 'Presentation (Diagrams)'** The tree view lists the diagrams that are displayed in the trace editor and allows for access to their display mode.

<table>
<thead>
<tr>
<th>Selected node “Time axis”</th>
<th>The subdialog “Display Mode” for the time axis is displayed on the right. You can specify the time axis display. See below.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Selected diagram name</td>
<td>The settings for the coordinate system of the diagram and a preview are displayed on the right. See below.</td>
</tr>
<tr>
<td>Selected node “Y-axis”</td>
<td>The subdialog “Display Mode” is displayed on the right. You can specify the axis display. See below.</td>
</tr>
<tr>
<td>“Show variables”</td>
<td></td>
</tr>
<tr>
<td>Selected trace variable</td>
<td>The subdialog “Variable Settings” is displayed on the right. You can configure the trace variable. See below. Note: These are the same settings that can be accessed in the tree view “Trace Record”.</td>
</tr>
</tbody>
</table>

**Table 248: Context menu commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>+ “Add Diagram”</td>
<td>Adds a new diagram below and displays it in the tree view “Presentation (Diagrams)”.</td>
</tr>
<tr>
<td>+ “Add New Variable”</td>
<td>Adds a new trace variable. The subdialog “Variable Settings” opens on the right and it is partially configured. Select a variable in the input field of the “Variable” setting to trace its value graph. Specify its display. In addition, the variable is assigned to the selected diagram.</td>
</tr>
<tr>
<td>“Add Existing Variable”</td>
<td>Lists all trace variables (in the submenu on the right) where the selected diagram is not currently displayed. Select a variable in order to display it in the selected diagram. Tip: When the command is deactivated, all trace variables are already displayed in the selected diagram.</td>
</tr>
</tbody>
</table>

**Subdialog 'Record Settings'** Requirement: The top node is selected in the “Trace record” tree view.
**Enable trigger**

- Triggers are activated. The trace data is buffered in runtime mode only when a trigger signal has been sent. You determine how the trigger signal is sent in the settings “Trigger variable”, “Trigger parameter”, “Trigger edge”, “Post trigger (Samples)”, and “Trigger level”.

- Continuous display of current records

**Trigger variable**

- Signal that is used as a trigger. A complete instance path is required.
- A valid trigger signal is an IEC variable, a property, a reference, an array element of the application, or an expression. Permitted types are all IEC-based types except STRING, WSTRING, and ARRAY. Enumerations are permitted when the base type is not STRING, WSTRING, or ARRAY. The contents of a pointer are not a valid signal.
- When the runtime system uses the CmpTraceMgr component, a property that is linked to the 'monitoring' attribute can then be recorded as a variable.

**Trigger parameter**

- System parameter that is used as a trigger.
- The “Input Assistant” dialog lists all valid system parameters in the “Parameters” category of the “Categories” tab.

**Trigger edge**

- Defined the edge detection for triggering:
  - **“positive”**
    - For Boolean trigger variables, triggering occurs when the values change from FALSE to TRUE.
    - For analog trigger variables, triggering occurs when the value as defined in “Trigger level” is reached from below.
  - **“negative”**
    - For Boolean trigger variables, triggering occurs when the values change from TRUE to FALSE.
    - For analog trigger variables, triggering occurs when the value as defined in “Trigger level” is reached from above.
  - **“both”**
    - For Boolean trigger variables, triggering occurs when the values change.
    - For analog trigger variables, triggering occurs when the value as defined in “Trigger level” is reached.

**Post trigger (samples)**

- Number of records per trace variable that are buffered after triggering. Preset: 50. Value range: 0 to \((2^{32} - 1)\)

**Trigger level**

- Value that is reached for triggering

**Task**

- Task where data was recorded

**Recording condition**

- In runtime mode, the application checks the recording condition. If it is fulfilled, then the trace data is buffered.
- Record condition for data recording with CmpTraceMgr runtime system component:
  - As an expression that includes only permitted operators and operands.
    - Permitted operators that can also be nested: (logical) AND, NOT, OR, comparison operators <, <=, >, >=, =, <>
    - Permitted operands: Variables that are valid for trace.
  - As a variable.
    - Permitted type: BOOL, bit access, property. The condition is fulfilled for TRUE or 1. The contents of a pointer are not permitted.
- Recording condition for a data recording with IEC code.
  - As an expression that returns a Boolean value.

**Comment**

- Comment (for example, from the recording condition)
**“Resolution”**  Measure for the time stamp that is recorded per data set  
- **“ms”**: Time stamp (in milliseconds).  
- **“µs”**: Time stamp (in microseconds) for a task cycle time of 1 ms or less

**“Automatic restart”**  Persistently saves the trace configuration and the last contents of the RTS buffer to the target device. After the device is restarted, the trace is started automatically if the trigger has not occurred yet.

**“Advanced”**  Opens the “Advanced Trace Settings” dialog.

Link “Preview”  
Displays the preview of the diagram.

**Diagram preview**  
Requirement: A diagram is selected in the tree view “Presentation (Diagrams)”
**Dialog Box 'Trend storage'

**Function:** This dialog box includes the configuration for buffering the trend data of a trend recording.

**Call:** “Trend Storage” button in the editor of a trend recording.

<table>
<thead>
<tr>
<th><strong>Maximum number of variables</strong></th>
<th>Maximum number of trend variables that can be managed in the database. If you increase this value afterwards, then will CODESYS perform a download and reconfigure the database.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Store every N milliseconds</strong></td>
<td>Time interval (in ms) when the CmpTraceMgr runtime system component buffers the recorded data before storing it persistently in the database. The application calculates internally the number of task cycles from the time interval. The duration of a task cycle is defined in the task configuration.</td>
</tr>
<tr>
<td></td>
<td>A high value results in better runtime performance. The disadvantage is the increased risk of losing data if the controller crashes or shuts down. A low value reduces this risk. The disadvantage is the slower control over a trend visualization with large amounts of data.</td>
</tr>
</tbody>
</table>
| **Limit**                       | ☰: Limit the recording  
  ◆ “No Limit”: Unlimited number of data records (not recommended)  
  ◆ “Maximum number of records”: Maximum number of data records that are stored in the database. A data record consists of time stamp and the values of the trend variables at this time.  
  ◆ “Maximum storage size”: Maximum size of the trend storage. The application calculates internally the number of data records. Clicking the “down” symbol (▼) of the drop-down list will set the units to kilobytes (KB), megabytes (MB), or gigabytes (GB). |

**Dialog Box 'Advanced Trend Settings'

**Function:** This dialog box provides more settings for configuring trend recording.
Call: Click “Advanced” in the editor of a “TrendRecording” object.

| “Measure in every n-th cycle” | Frequency that the runtime system records data, depending on the number of processed task cycles. Select a value from the drop-down list or type a value into the input field. Using the settings from the task configuration, CODESYS calculates the time interval according to the frequency. Therefore, the calculation is possible only if at least the task cycle time is set. The result is shown on the right of the input field in normal syntax (for example, “1h1m1s1ms”). Default: 1 means that data is recorded in each task cycle. |
| “Additional Runtime Buffer for” | Length of the time interval when the runtime system can record more data (for example, 1000 ms). If a delay occurs when writing data in the runtime system component, then there is a risk of data loss due to overwriting. In this case, the runtime system uses the addition buffer. |

Dialog ‘Certificate Selection’

Symbol: 

Function: This dialog is used for selecting the certificates for encryption, decryption, and digital signatures.

Call:
- “Security Screen” view, “User” tab
- Main menu: “View ➔ Properties”, “Encryption” tab when the “Application” is selected in the device tree.
- Main menu: “Project ➔ Project Settings”, category “Security”
The purpose of the certificate that is selected in the dialog depends on the call location:

- Call location: “Security screen” view, “User” tab
  - Certificate for digital signatures
  - Certificate for the decryption of project files
  - Certificate for encrypted communication
- Call: “View ➔ Properties” of the application
  - “Certificates of devices that share the encrypted download and the boot application”
- Call location: “Project ➔ Project settings”, category “Security”
  - “Certificate for project encryption”

<table>
<thead>
<tr>
<th>Listing of the selected certificates in a table</th>
<th>The following properties are displayed for each selected X.509 certificate:</th>
</tr>
</thead>
<tbody>
<tr>
<td>• “Created for”</td>
<td>• “Created by ”</td>
</tr>
<tr>
<td>• “Valid as of”</td>
<td>• “Valid until”</td>
</tr>
<tr>
<td>• “Thumbprint”: SHA1 fingerprint</td>
<td></td>
</tr>
</tbody>
</table>

Double-clicking an entry opens the “Certificate” dialog with the “General” tab, “Details” tab, and “Certification Path” tab. In that tab, you will find a reference to Windows help with more information about the dialog.

- Adds the selected available certificate to the list of selected certificates.
- Deletes the certificate selected in the list.

“Available certificates in the local Windows Certificate Store” Double-clicking an entry opens the “Certificate” dialog with the “General” tab, “Details” tab, and “Certification Path” tab. In that tab, you will find a reference to Windows help with more information about the dialog.

<table>
<thead>
<tr>
<th>Certificate icons</th>
<th>● ![Certificate with private key] Certificate with private key</th>
</tr>
</thead>
<tbody>
<tr>

1.3.2 Fieldbus Support

1.3.2.1 Device diagnostics

CODESYS supports the linking to the common fieldbus types.

For general information about using devices in a project, see chapter “�� Chapter 1.3.1.8.1 “Device tree and device editor” on page 155”.

For specific information about using devices for a certain fieldbus type, see the corresponding chapter here.

1.3.2.1 Device diagnostics

CODESYS provides general and fieldbus-specific function blocks for performing diagnostics on connected devices.

General diagnostics You can perform diagnostics on devices regardless of the fieldbus. The function blocks from the CAA Device Diagnosis library are provided for this purpose.
Before you can work with these function blocks, you must activate the option "Enable diagnosis for devices" in the PLC settings. This causes CODESYS to create instances of the diagnostics functions blocks automatically. These function blocks can be used for your diagnostics.

Please work exclusively with the automatically generated instances of the diagnostics function blocks. Do not create your own instances.

1.3.3 Runtime Systems, OPC UA Server

1.3.3.1 OPC UA server

The standard installation of CODESYS includes an OPC UA server. You can use it to access the variable interface of the controller via a client. The OPC UA server communicates with connected OPC UA clients over a separate TCP connection. Therefore, these connections have to be examined again separately with regard to security.

The OPC UA server can now be safeguarded by using encrypted communication to the client and OPC UA user management. See the following sections for these settings.

The CODESYS OPC UA server supports the following features:
- Browsing of data types and variables
- Standard read/write services
- Notification for value changes: subscription and monitored item services
- Encrypted communication according to "OPC UA standard (profile: Basic256SHA256)"
- Imaging of the IEC application according to "OPC UA Information Model for IEC 61131-3"
- Supported profile: Micro Embedded Device Server Profile
- By default, there is no restriction in the number of sessions, monitored items, and subscriptions. The number depends on the performance of the respective platform.
- Sending of Events according to the OPC UA standard.

Creating a project for OPC UA access

1. Create a new project with a CODESYS Control Win V3 controller.
2. Declare some variables of different types in the PLC_PRG program.
3. Add a “Symbol Configuration” object below the application.
4. In the “Add Symbol Configuration” dialog, select the “Support OPC UA Features” option.
5. Open the symbol configuration in the editor.
6. Click “Build”.
   ⇒ The variables are shown in a tree structure.
7. Select the variables that you want to change with an OPC UA client. Specify the access rights.
8. Download the project to the controller.
In order to encrypt data and exchange it with the client safely, the server needs a certificate that the client must classify as trusted when a connection is established for the first time. Requirement: The active path to the controller is set.

1. Install the CODESYS Security Agent add-on.
2. Click “View ➔ Security Screen”.
3. Select the “Devices” tab.
4. Select the controller in the left view.
   ⇒ All services of the controller that require a certificate are displayed in the right view.
5. Select the service “OPC UA Server”.
6. Create a new certificate for the device. Click the icon 🌐.
   ⇒ The “Certificate Settings” dialog opens.
7. Define the certificate parameters and click “OK” to close the dialog.
   ⇒ The certificate is created on the controller.
8. Restart the runtime system.

The OPC UA client "UaExpert" is freely accessible software that you can download from the Internet. Using this client, you can connect to the CODESYS OPC UA server. The following description refers to this program. Other OPC UA clients work in a similar way.

1. Start the "UaExpert" program.
2. Click “Server ➔ Add”.
   ⇒ The “Add Server” dialog opens.
3. Expand “Local ➔ OPCUAServer@...” in the tree view.
4. Select the connection type "Basic256Sha256 - Sign & Encrypt (uatcp-uasc-uabinary)" and click "OK" to close the dialog.

5. Click "Server ➔ Connect".
   - The "Certificate Validation" dialog opens with an error message.

6. Activate the option "Accept the server certificate temporarily for this session" and click "Continue".

7. In CODESYS Development System, click the symbol.
   - The view is refreshed.

8. Select the certificate folder "Quarantined Certificates".
   - The client certificate "UaExpert@..." is displayed in the right view.

9. Drag the certificate to the certificate folder "Trusted Certificates".
   - Now the client certificate is classified by the server as trusted.

    - The "Certificate Validation" dialog opens with an error message.

11. Activate the option "Accept the server certificate temporarily for this session" and click "Continue".
    - The connection is established and objects are displayed in the "Address Space" view.

**User management in OPC UA**

The CODESYS OPC UA server supports the CODESYS user management. You set the access rights on the server from the "Access Rights" tab on the controller. To do this, select the object "RuntimeSystemObjects ➔ RemoteConnections ➔ OPCUAServer".

Access rights can be checked at both the service and objects levels. This means that a variable cannot be written by a user, although this user is generally allowed to write to the OPC UA server.
### OPC UA service

- § Chapter 1.3.1.25.1.19.14 “Tab 'Access Rights'” on page 762

### Changing a variable via the OPC UA client

1. Expand the object “Objects ➔ DeviceSet ➔ CODESYS OPC UA ➔ Application ➔ Global Vars ➔ GVL” in the ”UaExpert“ client of the view “Address Space”.  
   - The variables of the global variable list are visible.
2. Select the variables and drag them to the “Data Access View”.  
   - The variables and their current values are shown.
3. Change the variable values by double-clicking the “Value” field.
Creating events in the CODESYS project

The CODESYS OPC UA server provides the capability of sending standard OPC UA events.

1. Create a new project with a CODESYS Control Win V3 controller.
2. Add an “Alarm configuration” object below the application.
3. Add an “Alarm class” object below the “Alarm Configuration”. Specify a name, for example Event. 
   ⇨ The new alarm group opens in the editor.
4. Select the acknowledgement method “REP”.
5. Add an “Alarm group” object below the “Alarm Configuration”. Specify a name, for example ApplicationEvent. 
   ⇨ The new alarm group opens in the editor.
6. Change the following parameters:
   ● “Observation type”: “Event”
   ● “Class”: “Event”
   ● “Message”: ”Message 1”
7. Add an “Visualization” object below the “Application”.
8. Add a “Symbol configuration” object below the application.
9. In the Program (for example, POU PLC_PRG), add a program call for triggering the event alarm.

   ```
   AlarmManager.AlarmGlobals.g_AlarmHandler.RaiseEvent(Alm_AlarmConfiguration_Alarmgroup_IDs.ID_ApplicationEvent, 
   Alm_ApplicationEvent_Alarm_IDs.ID_0);
   ```
10. Add the library CmpOPCUAProviderAlarmConfiguration to the Library Manager. 
    When the library is added, it connects automatically as a client to the alarm configuration 
    and sends the events to the OPC UA server.
11. Send the project to the controller and start it.

See also
   ● § Chapter 1.3.1.25.1.7 “Object ‘Alarm Group’” on page 718
   ● § Chapter 1.3.1.9.21.3 “Calling event alarms in the program ” on page 261

Monitoring an event via the OPC UA client "UaExpert"

1. Start the "UaExpert" program.
2. Click “Server ➔ Add”. 
   ⇨ The “Add Server” dialog opens.
3. Expand “Local ➔ OPCUAServer@...” in the tree view.
4. Select the connection type “None” and click “OK” to close the dialog.
5. Click “Server ➔ Connect”. 
   ⇨ An object tree is shown in the “Address Space” view.
6. Click “Documents ➔ Add”. 
   ⇨ The “Add Document” dialog opens.
7. Select the "Document Type" “Event View”.
  ⇒ The “Event View” tab opens.
8. Expand the object “Objects ➔ DeviceSet ➔ CODESYS Control Win V3” in the “Address Space” view.
9. Select the object CODESYS Control Win V3 in “Address Space” and drag it to the “Event View”.
  ⇒ The events are displayed.

1.3.4 Libraries

Libraries are used for preparing POUs and functions for use in CODESYS applications. In addition to the descriptions presented here in the help, always see the documentation included in the library as well.

For using libraries in your CODESYS project, see the "Managing Libraries" chapter.
To create your own CODESYS libraries, follow the guidelines for library developers.

See also
●  Chapter 1.3.1.19 “Using libraries” on page 371

1.3.4.1 Guidelines for creating libraries

Libraries must be created according to specific rules to avoid compatibility issues.
The main items include the following:
● Select a meaningful library name (required)
● Use templates to ensure consistency (optional)
● Use a familiar and uniform project structure, when possible (optional)
● Register a unique library namespace (required)
● Enter all project information (required)
● Apply the correct method for referencing other libraries correctly (required)
● Design smart external and internal interfaces (required)
● Implement a user-friendly error handling (required)
● Apply the correct method (protection) for deployment (required)
● Apply a consistent naming convention to get clean code (optional)
● When revising an existing library, consider the interface compatibility with previous versions.
Please follow these guidelines when developing libraries in CODESYS: "Library Development Summary". You will find this document as a CHM file (LibDevSummary.chm) in the installation directory of CODESYS, or in the online help.

- Chapter 1.3.1.19 “Using libraries” on page 371

1.3.5 CODESYS Visualization

Everything in one project
In the same CODESYS project, you use CODESYS Visualization to create the suitable user interface for your application. You link the visualization to the application variables and in this way they can animate and display data. When creating a visualization and an application, you use common functions, for example, as library and source code management or find/replace throughout the project.

Overview of functionality
- Display variant depending on the target platform
  You can execute the same visualization on various target platforms. Possible display variants are CODESYS WebVisu, CODESYS TargetVisu. In addition, there is a display integrated in the development system.
- Visualization editor
  In the graphic editor you design the desired user interface from visualization elements. The visualization elements are provided via libraries in a "ToolBox". You drag them into the editor area and adapt them with the help of a property configurator.
- Referenceable visualizations
  A visualization can be referenced in other visualizations. This enables the creation of user interfaces with a complex structure. For this purpose CODESYS Visualization also provides predefined visualizations, e.g. for dialogs.
- Simple design change
  The simple change of the look & feel of a visualization is possible in one place by creating a different visualization style.
- Multilingualism
  You can conveniently prepare visualization texts in several languages with the help of text lists. You can configure a user input element for switching to a different language in online mode.
- User management
  You can set up the visualization's own user management for access control up to individual element level.
- Other useful features
  Function block instances of visualizations, array accesses to the visualization, real-time data logging, extendability of the pool of visualization elements, provision of graphic objects via symbol libraries, calls of PLC functions from the visualization, reusability of visualizations by depositing them in libraries.
| **Table 250: Overview of the objects, editors, repositories, etc. relevant for the visualization in the CODESYS Development System** |
|--------------------|---------------------------------------------------------------------------------------------------------|
| **Visualization** | Object below an application in the device tree or in the POUs pool that contains a visualization image. A visualization can reference other visualizations. |
| **Visualization editor and additional views** | In this IEC 61131-3-compliant editor you can create the desired graphical user interfaces, panels, dialogs, etc. from visualization elements. The editor is made up of the following components:  
  - Graphic editor area for arranging the elements  
  - “Interface Editor”: for the parameterization of the visualization  
  - “Hotkey Configuration”: editor for defining keys for online operation  
  - “Elementlist”: overview of all visualization elements used, editor for the position of the elements on the z-axis  
  The following views are also available:  
  - “ToolBox”: view for the provision of visualization elements  
  - “Properties”: view with editor for the configuration of the element that currently has the focus in the graphic editor |
| **Visualization element** | Ready-to-use elements from the visualization libraries are available in the Tools view of the visualization editor for insertion. |
| **Visualization profile** | The profile defines which visualization elements are available. Each project that contains a visualization is based on such a profile (project settings). |
| **Visualization Styles** | The selected style determines the "look & feel" of the elements. It is set application-wide in the visualization manager. Ready-to-use styles are provided and you can also create your own. |
| **Visualization Manager** | Each application has a visualization manager of its own for its visualizations with various settings such as user management, style, language, input type, etc. The “Visualization Manager” object is suspended in the device tree below the application. |
| **Display variant** | A visualization can be displayed in online mode in the following variants, which are created as objects under the visualization manager:  
  - CODESYS TargetVisu (target visualization and remote target visualization on PLC devices)  
  - CODESYS WebVisu (web visualization via a web browser)  
  - Visualization integrated in the development system |
| **Visualization library** | Collection of visualization elements that are provided in the toolbox. |
| **Symbol library** | Collection of images and graphics that you can use in visualizations. When inserting a visualization object you can choose whether the installed system libraries should be available in the project. |
| **Visualization Element Repository** | Repository for the management of the visualization profiles and the visualization element libraries. |
The user interfaces created in CODESYS can be used in different display variants, depending on which ones the controller employed supports.

The display variants

- **Visualization ("diagnostic visualization") integrated in the CODESYS Development System:** The integrated visualization in the development system is ideal for application tests, for service or diagnostic purposes and for the commissioning of a system. As soon as a connection to the controller has been established, the visualization editor switches over and animates the elements displayed. This variant is part of the free CODESYS Development System and can always be used, irrespective of the controller employed.

- **CODESYS WebVisu:**
  This variant means web-based display of the user interface in a standard browser (PCs, tablets, smartphones), enabling remote access, remote monitoring and service and diagnosis of a system via the Internet. A standard web browser communicates by Java Script (optionally with SSL encryption) with the web server in the controller and displays the visualization by means of HTML5. This technology is supported by virtually all browsers and is thus also available on terminal devices with iOS or Android.

- **CODESYS TargetVisu:**
  This variant runs independent of the platform on control systems with an integrated display. Logic application and user interface run on the same device; the user interface is displayed directly on the controller. This variant is suitable for the operation and monitoring of machines and plants. An optional extension of the runtime system is required for the use of CODESYS TargetVisu.

### 1.3.5.1 Preparing CODESYS and projects

The following provides details of the presets that exist for visualizations and the steps that are necessary for creating a visualization in a project.

#### Presets

When you create a visualization in a project, you should know that the following presets apply:
### Scope

**Location**

- Throughout the application

**Setting**

- Unicode, CurrentVisu variable, multitouch, semi-transparency, memory size, data transmission, number of clients
- Visualization styles
- Language setting, language-specific font
- Default keyboard configuration
- Visualizations and visualization references
- Font for each language
- User management

<table>
<thead>
<tr>
<th>Single visualization</th>
<th>“Properties” of the visualization object</th>
</tr>
</thead>
<tbody>
<tr>
<td>Category</td>
<td>“Visualization”</td>
</tr>
<tr>
<td></td>
<td>• Purpose and scope of use</td>
</tr>
<tr>
<td></td>
<td>• Size definition</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Display variant of a single visualization</th>
<th>Editor of the WebVisu or TargetVisu object</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Start visualization, refresh rate, buffer size, html file name</td>
<td></td>
</tr>
<tr>
<td>• Scaling options</td>
<td></td>
</tr>
<tr>
<td>• Display options</td>
<td></td>
</tr>
<tr>
<td>• Default text input</td>
<td></td>
</tr>
</tbody>
</table>

### Creating visualization objects in the project

For each visualization, you insert a “Visualization” object into your project like any other object. This also applies to visualizations that should be used later only within other visualizations. You can insert the new visualization object directly below an application, or below the root node of the “Devices” view (for availability throughout the entire project).

The required base libraries and other objects, such as the Visualization Manager, are inserted automatically. When you insert the visualization object below an application, the subordinate objects for the display variants supported by the device are also displayed.

Every visualization object can be edited separately in the visualization editor.

The following steps describe a simply example for creating an object for an application-specific visualization.

**Requirement:** A project is open. An application is created in the device tree.

1. Select the application in the device tree. Click “Add object ➔ Visualization” in the context menu.

   The “Add visualization” dialog box opens. In the “Symbol libraries” table, there is at least the standard entry “VisuSymbols Vx.x.x. (System)”, and possibly other installed symbol libraries.

---

### Project-specific updates

Project-specific updates of the visualization profile, the visualization styles, and the visualization symbol libraries are possible in “Project ➔ Project environment” of the respective tabs.

Customization of the visualization menu is performed in “Tools ➔ Customize”.

- ☞ Chapter 1.3.5.19.3.13 “Dialog ‘Project Settings’ - ‘Visualization’” on page 1602
- ☞ Chapter 1.3.5.19.3.14 “Dialog ‘Project Settings’ - ‘Visualization Profile’” on page 1603
- ☞ Chapter 1.3.5.19.3.10 “Dialog ‘Project Environment’ - ‘Visualization Profile’” on page 1601
- ☞ Chapter 1.3.5.19.3.11 “Dialog ‘Project Environment’ - ‘Visualization Styles’” on page 1601
- ☞ Chapter 1.3.5.19.3.12 “Dialog ‘Project environment’ - ‘Visualization Symbols’” on page 1601
- ☞ Chapter 1.3.5.19.3.15 “Dialog ‘Properties’ of Visualization Objects” on page 1603
2. Accept the default name Visualization. Activate the “VisuSymbols” option. Then the visualization symbols (graphical objects) are contained in the library in the visualization project. Click “Add” to close the dialog box.

In the device tree, the “Visualization manager” and “Visualization” objects are inserted below the application. Depending on the device in use, the “TargetVisu” and/or “WebVisu” objects are also created below the visualization manager.

If a “TargetVisu” object or “WebVisu” object is created, then a “VISU_TASK” object is also created below the task configuration with an implicit program call.

The required visualization libraries are added automatically in the “Library Manager” of the application.

The visualization editor opens with the “Visualization” editor window and the “ToolBox” and “Properties” views.

In the “ToolBox” view, there is a “Symbols” button for viewing the symbols from the library VisuSymbols.library.

3. Now you can create the required visualization in the visualization editor.

4. Note: You can create structured visualizations by using a frame element to reference one visualization in another visualization. Dialog visualizations are a special option for this. In this case, the input configuration of a visualization element is used for referencing.

---

For creating an application-dependent visualization, insert the visualization object directly below the root node of the device tree. This corresponds to insertion in the “POUs” view. In this case, the visualization manager is not created with objects for the display variants.

- § Chapter 1.3.5.19.3.13 “Dialog ’Project Settings’ - ’Visualization’” on page 1602
- § Chapter 1.3.5.19.3.15 “Dialog ’Properties’ of Visualization Objects” on page 1603

1.3.5.2 Limitation of the number of usable web pages on AC500 V3 PLCs

Automation Builder will get all the available visualizations in the project and count those reachable from the visualization client objects (WebVisu and RemoteTargetVisualization).

In case the predefined number of visualizations is exceeded an error is shown in the message window, preventing the user from compiling the project.

The error will be shown under “Build” category when the user executes the build command. The PLC program won’t download to the PLC until this error is solved (like with any other build errors). In the image below, there are 5 visualizations being used (3 of them added directly into the Automation Builder project and the other 2 referenced from a library that was added to the project).
The error will look like this when build command is executed:

```
Messages - Total 3 error(s), 2 warning(s), 2 message(s)
Build       - 1 error(s)  1 warning(s)  0 message(s)
```

If the visualizations are in the project but not being referenced (e.g. not reachable from the “Start Visualization” in the WebVisu) they are not taken into account for this limitation. If the error condition is solved, the error will disappear when the user executes the build command again.

1.3.5.3 Designing a visualization with elements

The visualization editor provides the visualization elements for the design of a user interface in the view “Tools”.

Drag the desired element into the editor window and adapt it in the view “Properties”: purely visual design, labelling, display of data, reaction to user inputs, possibility to input values, etc. Static or dynamic configuration of the properties is possible, i.e. the assignment of fixed values or application variables. A dynamic configuration allows an animation that is executed at runtime.

See also

- Chapter 1.3.5.19.4.1.1 “Visualization editor” on page 1608
1.3.5.3.1 Selecting an element

The view “Toolbox” provides the following elements for selection:

- All visualization elements that define the set visualization profile.
- Image elements for all images in the project from the integrated libraries or the symbol libraries.
- Frame elements for all visualizations in the project or from the libraries.

The currently set visualization profile and the symbol libraries currently in use can be seen in the “Project Settings”.

The elements are summarized into certain categories, for each of which there is a button in “Toolbox”. These categories are created by providing each element with a certain "identifier", which appears as the button label.

The elements of all "pressed" identifiers appear in “Toolbox” as thumbnails for selection. It is also possible to search by element name.

Simply drag the element thumbnail with the mouse to the desired position in the editor window. The configurable properties of the element then automatically appear in the view “Properties” of the visualization editor.

- Chapter 1.3.5.19.4.1.1 “Visualization editor” on page 1608
- Chapter 1.3.5.19.4.1.2 “View ’Toolbox’” on page 1609
- Chapter 1.3.5.18.1.5 “Visualization element 'Image'” on page 1272
- Chapter 1.3.5.18.1.6 “Visualization element 'Frame'” on page 1287

Creating or removing an identifier for element categories

Requirement: the visualization editor is opened.

1. Click on the button in the view “Toolbox”.

   - The dialog “Configure Tags and Items” appears.

2. In the dialog, open the “Add Tag” dialog by clicking on . Please note: you can delete the definition of an identifier with – or [Del].

3. Enter a name in the “Name” input field, for example tagA, and exit the dialog with “OK”.

   - The new user-defined identifier tagA is inserted at the bottom in the tree view in the dialog “Configure Tags and Items”. It is provided with the symbol .

4. Click on the option “Activate” for the new identifier and exit the dialog with “OK”.

   - CODESYS adds a button "tagA" to the view "Toolbox". By clicking on the button you can filter according to the new identifier.

See also

- Chapter 1.3.5.19.3.4 “Dialog ‘Configure Tags and Items’” on page 1585

Marking a visualization element

Requirement: the visualization editor is opened. You have already created a user-defined identifier tagA. A button labelled with tagA is visible in the view “Tools”.

1. Click on an element in the view “Toolbox” and open the context menu.

   - A context menu appears. It contains the commands “Add Entry to Identifier 'tagA'” and “Add to Identifier".
2. Select the command “Add Entry to Identifier "tagA"” and close the dialog with “OK”.
   ⇒ The element is marked with 'tagA'.
3. Click on the button “tagA”.
   ⇒ All elements assigned to this identifier appear, including the element that has just been assigned.

   ● ❝ Chapter 1.3.5.19.4.1.2 “View 'Toolbox'” on page 1609

1.3.5.3.2 Positioning elements, adapting size and layer

A visualization is a raster image in pixels. The pixel position is specified in x/y-coordinates. The origin (0,0) is located at the upper left corner of the window. The positive x-axis runs to the right, and the positive y-axis runs downwards. The position of an element on the z-axis of the visualization is controlled by the position in the element list (see below).

Configuring the size and position in the editor

The size and position of an element are specified as pixel coordinates in the “Properties” view. These settings are displayed graphically in the editor view at the same time.

When you drag a visualization element from the “Toolbox” view to the editor view, it is shown as selected, as in the following example of a rectangle element:

The possible positions depend on the set grid. You can change its settings CODESYS options. Commands in the context menu are available for alignment and grouping.

You can now move or resize the element directly in the editor. As an alternative, you configure the “Position” property in the properties editor, which opens automatically for the selected element. Refer to the description for this, for example in the help page for the button element. The changes are also updated in the other editor.

1. Focus the element so that the shape of the mouse pointer indicates movement (example: 🔄).
2. Drag the element to any position.
   ⇒ The position of the element is also updated in the properties “Position ➔ X” and “Position ➔ Y”.
3. Focus on a blue box.
   ⇒ The shape of the mouse pointer is a double arrow that indicates the direction you can drag the box in order to resize the box 🔄.
4. Drag the blue box to resize the element.
   ⇒ The position of the element is also updated in the properties “Position ➔ X” and “Position ➔ Y”.

In addition, you can rotate the rectangle, line, polygon, and pie elements.
1. Select the element for static rotation. Example: Rectangle
   ⇒ The rectangle is displayed with a handle next to the movable position boxes.

   (1) Handle

2. Drag the mouse pointer over the handle.
   ⇒ The cursor is displayed as a rotating arrow 🔄.

3. Rotate the element to any position.
   ⇒ In the property “Position ➔ Angle”, the set angle is displayed in degrees.

See also

●

Moving the visualization element forward and back

Each visualization element is in its own layer of the visualization (z-axis). It can be hidden by other elements in the foreground and hide other elements in the background. The order of layers is visible in the “Element List” tab above the editor view. The order of elements from front to back specifies the order of visualization layers from back to front.

Use the commands from the “Order” context menu to move a selected element.

Example of an element list (1):
1.3.5.3.3 Assigning a color

You configure the color of a visualization element either statically by means of the “Color” property, or dynamically by assigning an application variable by means of the “Color variables” property. Depending on the element, color assignments are also available in other properties. For example, for the font color, this is provided in the “Text” property of a labeled element.

For the static assignment of a color value, you can always use the color dialog in the properties editor, which provides color palettes to choose from.

You can specify the color as a style color. Style colors are color names for color definitions from the actively applied style. When configuring an corresponding property, you are provided with a list of available style colors. **We recommend that you use style colors** because then you can change colors centrally by means of a style selection or a style customization. You can also open the “Color” dialog to select a value from color palettes.

In addition, you can define the fill color of an element as a “Gradient”. Then the color changes linearly, radially, or axially from the initial color to the final color. You configure the “Gradient setting” in the “Gradient Editor” dialog.
Designing a visualization element with a style color or a fixed color value

- Requirement: The visualization editor is open.
  1. Insert some Rectangle elements.
  2. Select an element.
     - The “Properties” view is active.
  3. Click in the “Colors ➔ Normal state ➔ Fill color” property.
     - A list box and the button appear.
  4. Assign a style color to the rectangle. For example, select “Elementfillcolor” from the list box.
  5. Define the degree of transparency in the “Colors ➔ Normal state ➔ Fill color ➔ Transparency” property. Use the slider to select the value “136”.
  6. Select another rectangle. Click in the “Colors ➔ Normal state ➔ Fill color” property.
     - A list box and the button appear.
  7. Assign a fixed color value to the rectangle. Click to do this.
     - The “Color” dialog opens.
  8. Select a standard color or “Define Custom Colors” to fine-tune your selection. Then click “OK”.
     - The color is set as a fixed value. The color is displayed as a small rectangle. The RGB values are also indicated next to it.
  9. Click in the “Colors ➔ Normal state ➔ Fill color ➔ Transparency” property.
  10. Use the slider to select the value “136”.
     - The color is semitransparent.

See also
- “Chapter 1.3.5.17 “Applying visualization styles” on page 1216

Designing a visualization element with a color gradient

- Requirement: The visualization editor is open.
  1. Drag a “Rectangle” element to the visualization.
  2. Select the “Colors ➔ Use gradient color” property.
  3. Click in the “Colors ➔ Gradient setting” property.
     - The “Gradient Editor” dialog opens.
4. Define the color gradient for the element:
   - “Gradient type”: “Radial”
   - “Standard radial”: “Center”
   ⇐ The fill color of the element changes radially from white to black.

See also
- ⇐ Chapter 1.3.5.19.3.5 “Dialog ‘Gradient Editor’” on page 1586

**Configuring a visualization element for color animation**

The “Color variables” property, which certain elements may have, is used for the color animation of the element. If you assign a variable there, then you can program color changes in the application code or configure a user input that results in a color change.

You can see an example in the "Animating Visualization Elements" chapter.

- ⇐ Chapter 1.3.5.8.3 “Animating a color display” on page 1152

### 1.3.5.3.4 Using texts

You can get displayed text in an element by assigning a string in the element property “Texts ➔ Text”. For example all base elements have this property. Also, you can get displayed a text as a tooltip (element property “Texts ➔ Tooltip”). Texts assigned in this way are static. They are managed in the object “GlobalTextList” in view “POUs” and they cannot be modified during runtime, neither programmatically nor via an user input.

However, you can extend a static text by (exactly) 1 placeholder containing a formatting specification, in order to output the content of a variable at this place. At runtime the current value of the variable, which you have assigned to the element via property “Textvariable”, will be output.

```
On the possible formatting specifications please see: ⇐ Chapter 1.3.5.18.2
“Placeholders with format definition in the output text” on page 1546
```

By dynamic configuration you can animate the optical representation of the text.

You can localize the static texts, if you have set up multilingualism in your project.

See some examples for the text configuration of visualization elements in the following chapters.

See also
- ⇐ Chapter 1.3.5.18.2 “Placeholders with format definition in the output text” on page 1546
- ⇐ Chapter 1.3.5.6 “Setting up multiple languages” on page 1143
Labeling an image element with a static text

Precondition: A project containing a visualization is opened. You have an image file representing a stop symbol.

1. Below the Application object insert an object “Image Pool” named ImagePool_A.
2. In the image pool ImagePool_A add your stop symbol image file with ID Stop.
3. Open the visualization and from the ToolBox draw an element “Image” into the editor.
   ➔ The input assistant opens. In tab Category you see the image pool ImagePool_A.
4. Select the image Stop and close the dialog with “OK”.
5. Configure the property “Text” of the image: ImagePool_A, Stop
6. Configure the property “Text properties ➔ Horizontal alignment”: Left.
7. Configure the property “Text properties ➔ Vertical alignment”: Bottom.

Text output: Element outputs the result of ST code which is executed on a mouse-click

Precondition: A project containing a visualization is opened.

1. Open the visualization and insert a “Button” element.
   ➔ The “Properties” view opens for the new element.
2. Configure property “Text”: Number of clicks: %I
   ➔ The string contains the placeholder %I.
3. In POU PLC_PRG of the application declare a type-conform variable: iClicks : INT;
4. Configure the property “Text variable” of the button element with PLC_PRG.iClicks.
   ➔ At runtime the variable value will be output instead of the placeholder.
5. Below property “Inputconfiguration”, in the cell containing the input event OnMouseClick, click on “Configure”.
6. From the list of possible actions choose Execute ST-Code.
7. Enter the code for the action in the editor “Execute ST-Code”:
   PLC_PRG.iClicks := PLC_PRG.iClicks + 1;
8. Close the dialog with “OK”.
   ➔ The user input is configured.
9. Build, download and start the application.
   ➔ The application is running. The visualization opens. The element is labeled and the number of clicks will be output. If you as user click on the button, the number will be increased.

   ![Image of a button with the label 'Number of clicks: 4']

**Text output:**

**Dynamic output using a textlist**

Using the “Text field” element you can produce a dynamic text output. The text output can be effected via an user input or via the application program.

☐ Precondition: A project containing a visualization is opened.
1. Open the visualization and insert a “Text field” element.
   ➔ The “Properties” view shows the configuration of the element.
2. Below the application add a Text List with the following entries: Textlist_A.

   ![Image of a text list with entries]

3. In POU PLC_PRG of the application declare the text variable: strTextID : STRING := '0';
4. Also declare the variable strTooltipID : STRING := '0';
5. Also declare the variable iText : INT;
6. Configure the property “Dynamic texts ➔ Text List” with 'Textlist_A'.
7. Configure the property “Dynamic texts ➔ Text index” with PLC_PRG.strTextID.
8. Configure the property “Dynamic texts ➔ Tooltip index” with PLC_PRG.strTooltipID.
9. In POU PLC_PRG implement the CASE instruction as shown below.
   ➔ The variables in property “Dynamic Texts” are programmed.
10. Configure the property “Inputconfiguration ➔ OnMouseclick” for Execute ST-Code with PLC_PRG.iText := (PLC_PRG.iText + 1) MOD 4;

⇒ For element “Text field” an user input is configured.

11. Build, download and start the application.

⇒ The application is running. The visualization opens. In the text field the text None is output. When you as user click on the element, the text changes to Dynamic_File_A. And the matching tooltip is available: Information A. With each click the text changes according to the CASE instruction.

```plaintext
CASE iText OF
  0:    strTextID := '0';
        strToolTipID := '0';

  1:    strTextID := '1';
        strToolTipID := '4';

  2:    strTextID := '2';
        strToolTipID := '5';

  3:    strTextID := '3';
        strToolTipID := '6';
ELSE
  strTextID := '0';
  strToolTipID := '0';
END_CASE;
```

In property “Text ➔ Text” you can define a text in order to get a static text output. A text in “Text ➔ Tooltip” will be displayed as tooltip. You can configure the text in a way, that the content of a variable is additionally output.

You can extend a static text by (exactly) 1 placeholder including a formatting definition, in order to output the content of a variable at this place at runtime. The variable must be assigned in property “Text variable”. When the variable value changes in the application code, then at the same time the output in the visualization changes.

☑ Precondition: A project containing a visualization is opened.

1. Open the visualization and insert an element “Text field”.

⇒ The “Properties” view shows the element configuration.

2. Configure the property “Texte ➔ Text”: File name: %s

⇒ The text contains the placeholder %s.

3. In POU PLC_PRG of the application declare a type-conform variable strFileName : STRING := 'File_A';

4. Configure the property “Text variable” of the text field with PLC_PRG.strFileName.

⇒ At runtime the variable value will be output instead of the placeholder.

5. Build, download and start the application.

⇒ The application is running. The visualization opens. The text field element displays the text: File name: File_A
Configuring text input in a text field

You can use the “Text field” element in order to output the text given by a variable, or to provide a place, where the user can give input on the variable.

Additionally you can configure a text input. In this case on an user input an input field in the element “Text field” will appear. As a precondition you must have configured an user input action in the property “Inputconfiguration”.

See also

- Chapter 1.3.5.6 “Setting up multiple languages” on page 1143

Showing text as a tooltip

1. Open the visualization and insert an element “Text field”.
   - The “Properties” view shows the element configuration.
2. Configure the property “Texts ➔ Text”: File name: %s
   - The text contains the placeholder %s
3. Configure the property “Texts ➔ Tooltip”: Storage location: %s
4. In POU PLC_PRG of the application declare a type-conform variable strFileName : STRING := 'File_A';
5. In POU PLC_PRG of the application declare also the variable strFileDir : STRING := 'D:/Data';
6. Configure the property “Text variable” of the text field with PLC_PRG.strFileName.
   - At runtime the variable value will be output instead of the placeholder.
7. Configure the property “Tooltip” of the text field with PLC_PRG.strFileDir.
8. Build, download and start the application.
   - The application is running. The visualization opens. The text field element shows the text File name: File_A. When the mouse cursor is moved above the text field, the tooltip will be displayed: Storage location : D:/Data.

Configuring element “Text field” for text input

The user should be able to enter text in a text field. For this configure an input of type “Write variable” on a text output variable. This text output variable will store the text input of the user and will display this text instead of the placeholder (this is %s in the example below). You specify the text output variable in the property “Text variables ➔ Text variable”.

See also

- Chapter 1.3.5.18.2 “Placeholders with format definition in the output text” on page 1546
Precondition: A project containing a visualization is opened.

1. In POU PLC_PRG of the application declare a string variable: strInput : STRING;
2. Open the visualization and insert an element “Text field”.
    ☀ The “Properties” view shows the configuration of the element.
3. In property “Text” enter Input: %s.
4. In property “Inputconfiguration” for mouse action “OnMouseClicked” click on “Configure” to open the “Input Configuration” dialog box. There choose action “Write a Variable” and activate option “Use text output variable”. Close with “OK”.
5. In the element property “Text variables ➔ Text variable” assign the text output variable PLC_PRG.strInput.
6. Build, download and start the application.
    ☀ The application is running. The visualization opens. The element outputs the text: Input:. Click in the element to open an input field, where you can enter a string. After having terminated the input by [Enter], the text will be adopted.

Animating the text display
Configure the property “Font variables” in order to animate the display of a text. All base elements have this property, additionally the table, scrollbar and text field element.

See also
● ¶ Chapter 1.3.5.8.2 “Animating a text display” on page 1152

Configuring the ’Label’ element
Precondition: A project containing a visualization is opened.
1. Open a visualization and insert an element “Label”.
    ☀ The “Properties” view with the pre-set property configuration opens.
2. Configure the property “Text ➔ Text” Visualization A.

Making an element invisible
You can configure the property “State variables ➔ Invisible” in order to hide an element in the visualization.

Precondition: In the visualization you have configured a text field, which gets visible only, if a certain application variable gets TRUE. For example in order to show certain instructions or descriptions only in a certain state of the machine.

1. For the text field element configure the property “Text ➔ Text” with Error detected: Do the following....
    Configure the property “Text properties ➔ Font color” with “dark red”.
2. In PLC_PRG declare the variable bIsInvisible : BOOL : TRUE; (this is the initialization for the current example; normally the variable should be set to TRUE by the application program under certain conditions.
3. Configure the property “State variables ➔ Invisible” with PLC_PRG.bIsInvisible.
4. Build, download and start the application.
    ☀ The application is running. The visualization opens and the text field is not visible. When you set bIsInvisible to TRUE, the textfield will be displayed.
1.3.5.3.5 How to display variable values in the visualization

There are simple to very specialized visualization elements for displaying data from a running application.

Examples:

- Simple output of variable values: For example, you can configure a purely formatting specification for a “Rectangle” element in the “Text” property and the variable whose value is to be displayed in the element in the “Text variable” property.
- Display of structured variable values (structure, array, function block): You use the “Table” element and specify an array variable in its configuration in the “Data array” property whose values are to be displayed in the table. One-dimensional arrays can also be displayed in a “Histogram”.
- Display of values by image switching. Example: A specific screen is displayed depending on the error message that occurs. You do this by configuring an “Image” element with a variable for the “Bitmap ID variable” property.
- Display a variable value as a bar or with a pointer on a scale: You specify a variable in the “Value” property of the “Bar Display” element or “Meter” element to display its value as a bar on a horizontal or circular scale.
- Display of alarms: The alarms configured in the alarm management of the application can be made visible by means of the “Alarm Table” and “Alarm Banner” elements in the user interface.
- “Trace” and “Trend”: For graphical recording of variable values over a period of time.

For details, see the descriptions of the element properties.

- Chapter 1.3.5.18.1 “Visualization elements” on page 1223
- Chapter 1.3.5.21.2 “Displaying array data in histograms” on page 1958

1.3.5.3.6 How to change variable values via the visualization

In addition to displaying values from the controller, a user interface is also used to enter and change values.

In general, you can configure user input for each element in its “Input configuration” properties. Moreover, elements have been developed especially for specific input.

Examples:

- A “Button” element (or “Rectangle” element, and so on) that is clicked to open a predefined dialog visualization for easily specifying a value.
- A “Slider” element for changing the value of a variable by moving visual element parts, for example with the mouse. In the case of the slider: The element adjusts the value of a variable, depending on the position of the slider within the slider. You define the value range of the slider bar by means of the scale start and scale end.
- A switch element (example; “Power Switch”) for setting a Boolean value.
- A “SpinControl” element for incrementing or decrementing the value of a variable in defined intervals.
- A “Button” element for writing a recipe, executing a specific ST code, writing a specific variable, and so on (definition in the input configuration).

See also

- Chapter 1.3.5.18.1 “Visualization elements” on page 1223
1.3.5.3.7 Designing a background

You can design the background of your visualization in color or with an image. To do this, use the command “Visualization ➔ Background”.

See also
- Chapter 1.3.5.19.2.10 “Command 'Background'” on page 1565
- Chapter 1.3.5.19.3.15 “Dialog 'Properties' of Visualization Objects” on page 1603

In addition, you can use the property “Integrate background” in the dialog “Properties” of a visualization object to specify whether the background image should always be displayed in its entirety or whether it should be truncated.

Requirement: A project with a visualization is open.

1. Open the visualization and select the command “Visualization ➔ Background”.
2. Activate the option “Image” and open the input assistant.
3. Select an image in the dialog “Input Assistant”.
   - The image serves as a background image.

See also
- Chapter 1.3.5.19.3.15 “Dialog 'Properties' of Visualization Objects” on page 1603

1.3.5.4 Configuring user inputs

User inputs for a visualization are configured in order to operate the visualization.

For this purpose, you configure input events on visualization elements where follow-up actions are triggered. The combination of user inputs and follow-up actions are defined in the “Input configuration” of an element. For example, you can select a mouse click on an element as the input event and opening a dialog box as the input action.

Keyboard events can also be configured that trigger actions in a specific visualization window when the events occur. You program this kind of input configuration for a visualization in its “Keyboard configuration” editor.

In addition, keyboard events can be configured that occur in all visualizations programmed in the application. You configure this kind of input configuration per application below the visualization manager in the “Standard keyboard shortcuts” tab.

Input is usually performed with the mouse and keyboard as controlling device. You can also configure a user operation by means of gestures.

If a visualization device is not equipped with a mouse, then you can activate default keyboard usage. Then a user can operate the visualization with the keyboard only by navigating with the arrow keys and triggering events by pressing the [Enter] key.

Configuring an image as a background

☐ Requirement: A project with a visualization is open.
1. Open the visualization and select the command “Visualization ➔ Background”.
2. Activate the option “Image” and open the input assistant.
3. Select an image in the dialog “Input Assistant”.
   - The image serves as a background image.

See also
- Chapter 1.3.5.19.3.15 “Dialog 'Properties' of Visualization Objects” on page 1603

Configuring a colored background

☐ Requirement: A project with a visualization is open.
1. Open the visualization and select the command “Visualization ➔ Background”.
2. Activate the option “Color”.
3. Select a style color such as “Element background color” from the selection list.
   - The background of the visualization is colored.
If a visualization device is not equipped with a keyboard, then you can call a virtual keyboard or a virtual numeric keypad.

**NOTICE!**
Configure keyboard events only for keys that the visualization device supports.

- Chapter 1.3.5.19.4.3 “Tab ‘Visualization Manager’ - ‘Default Hotkeys’” on page 1617

**Processing order of keyboard events**

1. Event handler of the application. Requirement: The event handler is activated.
2. Events of the default keyboard usage
3. Events of the keyboard usage are configured in the tab “Visualization manager” - “Default hotkeys”.
4. Events of keyboard usage are configured in the tab “Keyboard configuration” for the currently visible visualization.

See also
- Chapter 1.3.5.19.1 “Keyboard Shortcuts for Default Keyboard Action” on page 1555
- “Tab ‘Keyboard configuration’” on page 1558 ➔ Chapter 1.3.5.19.2.2 “Command ‘Keyboard Configuration’” on page 1558
- Chapter 1.3.5.19.4.3 “Tab ‘Visualization Manager’ - ‘Default Hotkeys’” on page 1617
- Chapter 1.3.5.19.4.3 “Tab ‘Visualization Manager’ - ‘Default Hotkeys’” on page 1617

**1.3.5.4.1 Configuring user inputs for visualization elements**

All base elements and some common control elements have the “Input configuration” property. This is where you can configure a user input for an element. For this purpose, you select an input event and an input action.

**Configuring user inputs**

- **Requirement:** A project is open with a visualization.
- 1. Open the visualization and added a “Button” element.
   ➔ The “Properties” view opens for the new button.
- 2. Configure the property “Text” with **Number of clicks: %i**.
- 3. Declare a variable **iClicks : INT;** in the application in the PLC_PRG POU.
- 4. Configure the “Text variable” property of the button as **PLC_PRG.iClicks**.
   ➔ At runtime, its variable value will replace the placeholder in the “Text” property.
- 5. In the “Input configuration” property, click the “Configure” button in the **OnMouseClick** line.
6. Select the **Execute ST code** action from the list of possible actions and click the symbol.

   ⇨ The action appears in the list of actions to be executed. The blank implementation of the action appears in the window area to the right of the list.

7. Program the action in the editor at “**Execute ST code**”:

   ```
   PLC_PRG.iClicks := PLC_PRG.iClicks + 1;
   ```

8. Click “**OK**” to close the dialog box.

   ⇨ The user input is configured.

9. Compile, download, and start the application.

   ⇨ The application runs. The visualization opens. If the user clicks the button, then the action is executed, the variable `PLC_PRG.iClicks` is incremented, and the number of clicks is printed.

---

**1.3.5.4.2 Configuring gesture recognition**

You can execute a visualization on a device that is operated by means of gestures. The visualization retains its user input configuration for mouse and keyboard operation and also recognizes gestures and multi-touch events. Gesture events are recognized and interpreted as mouse events.

For this purpose, activate the “**Activate multi-touch**” setting in the visualization manager.

Elements of the type “**Frame**” or “**Tab control element**” display contents that a user should be able to move. Therefore, configure their “**Scaling type**” property with “**Fixed and scrollable**”. 
Gesture recognition for:

- **Tapping**  
  A quick tap on the element is interpreted as a mouse click.

- **Panning**  
  Pressing, moving, and releasing with one finger in a frame or with a tab control element (in the window area of the element) will move the contents.

- **Multi-finger touch detection**  
  Touching several elements at the same time will input for all elements. These touch events are interpreted as the respective mouse events.

  **Example:**  
  Two-hand operation in order to trigger an action with two simultaneous inputs on two different elements.
  Virtual mixing console where multiple sliders can be operated at the same time.

In addition, the `IGestureEventHandler` interface is available in the `VisuElems.VisuElemBase` library. You can use this to implement application code that recognizes gestures and executes follow-up actions.

The following display variants can execute a visualization on a multi-touch device

- CODESYS WebVisu

See also

- “Implementing event handling with multi-touch” on page 1128

### Using gestures to control visualizations

1. Requirement: A project is open with a visualization and a user input configuration. It contains one button. The visualization device is a display with multi-touch support.
   1. Double-click the “Visualization manager” object.
      🔗 The editor opens.
   2. Click the “Settings” tab.
   3. In the “Additional settings” group, activate the “Activate multi-touch” option.
   4. Compile, download, and start the application.
      🔗 The application runs. The visualization opens. When a user touches the display of the visualization device, the visualization responds. Elements that respond to mouse events also respond to touch events. Several buttons can be pressed at the same time. Scrollable frames or tab control elements are displayed without scrollbars and can be moved by panning.

Note: The “Scaling type” property of elements type “Frame” or “Tab control element” must be set to “Fixed and scrollable”.

- “Chapter 1.3.5.18.1.10 “Visualization element ‘Tab control’” on page 1316
Implementing event handling with multi-touch

- Requirement: The device is multi-touch capable
  1. Implement and register a function block that receives the gesture events.
     ⇒ FUNCTION_BLOCK GesturesHandler IMPLEMENTS VisuElems.VisuElemBase.IGestureEventHandler2
        VisuElems.g_VisuEventManager.SetGestureEventHandler(THIS^);
  2. Implement and register a function block that sets the touch areas.
     ⇒ FUNCTION_BLOCK RectProvider IMPLEMENTS VisuElems.VisuElemBase.IApplicationRectangleProvider
        VisuElems.g_VisuRectangleProvider := THIS^;
  3. Implement actions as application code that are executed when a gesture event occurs

1.3.5.4.3 Configuring text input with the virtual keyboard

A visualization is usually configured so that it calls a virtual keyboard for a text input event when an input device is not available. For this purpose, the follow-up action “Write variable” is preset accordingly in the user input: The value “Standard” is selected for the “Input type” setting.

However, you can also configure especially how text is input. For this purpose, more input types are available in the user input, such as Text input or the listed visualizations. These visualizations have the visualization type “Numpad/Keypad” and display virtual keyboards or numeric keypads.

In the “Settings for default text input” setting of the visualization manager you can preset a keyboard visualization that is called from all visualizations in the application when required. This is possible without having to customize the user inputs of the visualizations.

See also
- Chapter 1.3.5.19.3.6 “Dialog ‘Input Configuration’” on page 1586

Configuring text input especially for virtual keyboards

- Requirement: A project is open with a visualization.
  1. Declare an input variable in the PLC_PRG program.
     ⇒ VAR_INPUT stInput : STRING; VAR_END
  2. Add a button to the visualization and select the element.
  3. Configure the property “Texts ➤ Text” with Text input: %s.
  4. Configure the property “Text variables ➤ Text variable” with PLC_PRG.stInput.
  5. Click auf “Configure” in the property “Input configuration ➤ OnMouseClick”.
     ⇒ The “Input Configuration” dialog box opens. The selected input event is printed below the caption.
  6. Select the “Write variable” action.
  7. Select the visualization Visudialogs.Keypad in “Input type” of the implementation of the action.
     ⇒ The virtual keyboard Visudialogs.Keypad is selected as the input device.
8. Compile, download, and start the application.
   ⇒ The visualization opens.
9. Click the button as a visualization user.
   ⇒ The virtual keyboard appears and allows text input by means of the mouse.

Configuring numeric input especially for virtual numeric keypads

- Requirement: A project is open with a visualization.
- Declare an input variable in the PLC_PRG program.
  ⇒ VAR_INPUT iInput : INT; VAR_END
- Open the visualization and added a “Rectangle” element.
- Select the element in the editor.
  ⇒ The properties are visible in the “Properties” view.
- Configure the property “Texts ➔ Text” with Number input: %i.
- Configure the property “Text variables ➔ Text variable” with PLC_PRG.iInput.
- In the “Input configuration” property, click the “Configure” button in the OnMouseClick line.
  ⇒ The “Input Configuration” dialog box opens. The selected input event is printed below the caption.
- Select the Write variable action from the list of possible actions and click the symbol.
  ⇒ The action appears in the list of actions to be executed. The blank implementation of the action appears in the window area to the right of the list.
8. Select the following settings:
   “Input type” set to VisuDialogs.Numpad.
   “Choose variable to edit” set to “Use text output variable”.
   “Dialog title” set to 'My virtual numpad'.
9. Click “OK” to close the dialog box.
   ⇒ The user input is configured.
10. Compile, download, and start the application.
    ⇒ The application runs. The visualization opens. When a user clicks the rectangle, the numeric keypad opens.
Defining standard text input

- Requirement: A project is open with a visualization and a user input configuration. For all "Write variable" follow-up actions, the value "Default" is selected for the "Input type" setting.
  1. Double-click the visualization manager.
  2. Click in the default text input in the "Settings" tab ("Default text input" group) and assign visualizations.
     - These visualizations are defined as default text input. If a display variant does not have a keyboard, then these visualizations are called without you having to adapt the user input.

1.3.5.4.4 Configuring keyboard shortcuts

You can define keyboard shortcuts and assign specific actions to them. At runtime, a visualization detects the keyboard input event and executes the action.

There are different locations where you can configure a keyboard input event.

The options include the following:
- Configure keyboard input for a specific element.
- Configure keyboard input for a specific visualization.
- Configure keyboard input that is valid for all visualizations.
- Activate the preset default keyboard shortcuts.

If the visualization integrated in CODESYS is executed, then you can deactivate the keyboard input of the visualization in order to use the keyboard shortcut from CODESYS in this state.

Configuring keyboard shortcuts for elements

You can define a keyboard shortcut that triggers an action for an element. The element must be visible and operable. For this purpose, the property "Input configuration ➔ Keyboard shortcuts" is available in the "Properties" view of the visualization editor.

- Requirement: A CODESYS project is open with the existing visualizations visEllipse and visRectangle.
  1. Select the application in the device tree and add a visualization named visMain.
     - The visualization editor opens.
  2. Select the "Frame" element from the "Toolbox" view and drag it to the editor.
     - The "Configuration of Frame Visualizations" dialog box opens.
  3. Double-click in succession the visEllipse and visRectangle visualizations in "Available Visualizations".
     - The visualizations appear in "Selected Visualizations".
  4. Click "OK" to close the dialog box.
     - The visualization contains a new element type "Frame". The two selected visualizations appear in the "Referenced visualizations" property.
       In the editor, the frame shows the visualization with the index 0.
5. Add a button and configure its properties:
   Select Rectangle in the property “Texts ➔ Text”.
   In the “Input configuration ➔ OnMouseDown” property, select “Switch frame visualization” for the visualization visRectangle.
   Specify the value R in the property “Input configuration ➔ Keyboard shortcuts ➔ Key”.
   ✳️ The button has a user input and a keyboard shortcut.

6. Add a button and configure its properties:
   Select Ellipse in the property “Texts ➔ Text”.
   In the “Input configuration ➔ OnMouseDown” property, select “Switch frame visualization” for the visualization visEllipse.
   Specify the value E in the property “Input configuration ➔ Keyboard shortcuts ➔ Key”.
   ✳️ The button has a user input and a keyboard shortcut.

7. Click “Online ➔ Login” for the device and start the application.
   ✳️ The visualization starts. It has a frame where one of the referenced visualizations runs. Focus on the visEllipse visualization and press [E]. The visualization switches the contents in the frame to the visEllipse visualization. When you press [R], the visualization switches the contents in the frame to the visRectangle visualization.

- ☢️ “Input action ‘Switch frame visualization’” on page 1593

Configuring keyboard shortcuts for a specific visualization

You can define keyboard shortcuts that trigger an input action on a specific visualization. The “Keyboard configuration” tab in the editor of the visualization is used for this purpose.

☐ Requirement: A CODESYS project is open with the visualizations visEllipse and visRectangle.
   1. Open the CODESYS TargetVisu object and select visEllipse as the start visualization.
   2. Open the visEllipse visualization and click the “Keyboard Configuration” tab.
3. Click “Visualizations ➔ Keyboard configuration”.
   - The “Keyboard configuration” opens.
4. Select the value C in the “Key” column.
5. Activate the “Press key” option.
6. Select the value “Change shown visualization” in the “Action type” column.
7. Select visRectangle in the “Action” column.
   - The user input is configured for [C].
8. Open the visRectangle visualization and click the “Keyboard Configuration” tab.
9. Select the value C in the “Key” column.
10. Activate the “Press key” option.
11. Select the value “Change shown visualization” in the “Action Type” column.
12. Select visEllipse in the “Action” column.
   - The user input for [C] is also configured for this visualization.
13. Build the application.
14. Click “Online ➔ Login” for the device and start the application.
   - The visualization starts and displays an ellipse. Focus on the visEllipse visualization and press [C]. The visRectangle visualization is displayed. Focus on the visualization and press [C] again. Now the visualization is switched again to visRectangle.

- “Tab ‘Keyboard configuration’” on page 1558
- “Input action ‘Change shown visualization’” on page 1589

Configuring keyboard shortcuts for all visualizations in the application

You can define keyboard shortcuts that trigger the same input action for all visualizations of the application. The “Default Keyboard Shortcuts” tab in the visualization manager is available for this purpose.

- ✔ Requirement: A project is open with a visualization.
- 1. Open the visualization.
- 2. Add a rectangle.
- 3. Configure the property “Texts ➔ Text” with Keyboard shortcut.
- 4. Double-click the “GlobalTextList” object.
- 5. Click in the table, “Add Language”, and then specify de.
   - The language de is configured.
- 6. Click in the table, “Add Language”, and then specify en.
   - The language en is configured.
7. Configure translations for **de** and **en** for the text *Keyboard shortcut.*
   
    🔄 Hotkey Tastaturkürzel Hotkey

8. Open the visualization manager and select the “Default Keyboard Shortcuts” tab.

9. Specify **D** in the “Key” column.

10. Activate the “Press key” option.

11. Select the value “Change language” in the “Action Type” column.

12. Select the language **de** in the “Action” column.
   
    🔄 The keyboard event for [D] is configured.

13. Specify **D** in the “Key” column.

15. Activate the “Alt” option.

16. Select the value “Change language” in the “Action Type” column.

17. Select the language **en** in the “Action” column.
   
    🔄 The keyboard event for [Alt]+[D] is configured.

18. Compile, download, and start the application.
   
    🔄 The visualization opens.

19. As visualization user, press [D].
   
    🔄 The text is displayed in the language **de**.

- ☢️ Chapter 1.3.5.19.4.3 “Tab ‘Visualization Manager’ - ‘Default Hotkeys’” on page 1617
- ☢️ “Input action ‘Change the language’” on page 1589

---

**Activating default keyboard usage**

When you activate the universal keyboard shortcuts for default keyboard usage, the user can operate the visualization without a mouse. Elements that respond to user input can process a keyboard event instead of a mouse event without you adapting its input configuration.

- ✔️ Requirement: A project is open with a visualization.
- 1. Click the “Visualization Manager” object.
- 2. Activate the “Activate default keyboard usage” option.
   
    🔄 The universal keyboard shortcuts are activated.
- 3. Load the application to the device and start the application.
   
    🔄 The visualization starts. Now operation can continue without the mouse. You can navigate in the window by means of the [arrow] and [tab] keys and press [Enter] instead of the mouse button.

See also

- ✔️
-  - ☢️ Chapter 1.3.5.19.1 “Keyboard Shortcuts for Default Keyboard Action” on page 1555
**Activating and deactivating keyboard shortcuts for integrated visualizations**

If you execute the visualization as an integrated visualization, then the command “Visualization → Activate Keyboard Usage” is available in order to deactivate the capturing of keyboard events. It is actually possible for the same keyboard shortcuts to be defined in the visualization and in CODESYS.

When you activate the command, the visualization executes the configured keyboard events. When you deactivate the command, CODESYS executes the keyboard events. Capturing keyboard events is then deactivated for the visualization.

See also

- Chapter 1.3.5.19.2.4 “Command ’Activate Keyboard Usage’” on page 1560

**1.3.5.4.5 Capturing user input events**

You can capture user input events in the application. For this purpose, you can implement a function block that is executed when user events occur.

**Capturing the writing of variables**

When the user completes the input of a value (in an input field), an edit control event is closed. You can capture this event in the application as follows.

1. Create a function block that implements the VisuElems.IEditBoxInputHandler interface from the VisuElemBase library.

2. Pass the instance to the global event manager VisuElems.Visu_Globals.g_VisuEventManager by calling the SetEditBoxEventHandler method.
A visualization has two input fields for \texttt{iInput\_A} and \texttt{rInput\_B} and one text output element. The input fields are rectangles that the user is prompted to click in order to input text. The text output element is a rectangle where the contents of the text variable \texttt{PLC\_PRG.stInfo} are printed. The text variable contains the last input by a user in one of the input fields and the additional information that was added.

\begin{verbatim}
PROGRAM PLC\_PRG
VAR_INPUT
  iInput\_A:INT; (* Used in the visualization as user input variable*)
  rInput\_B:REAL; (* Used in the visualization as user input variable*)
  stInfo : STRING; (* Informs about the user input via the edit
\end{verbatim}
control field;
   String gets composed by method 'VariableWritten;
   Result is displayed in the lower rectangle of the
visualization *)
END_VAR
VAR
   inst : POU;
   bFirst : BOOL := TRUE;
END_VAR

IF bFirst THEN
   bFirst := FALSE;
   VisuElems.Visu_Globals.g_VisuEventManager.SetEditBoxEventHandler(ins
   t);
   (* Call of method VariableWritten *)
END_IF

FUNCTION_BLOCK POU IMPLEMENTS VisuElems.IEditBoxInputHandler
  (* no further declarations, no implementation code *)
METHOD VariableWritten : BOOL
  (* provides some information always when an edit control field is
  closed in the visualization, that is a variable gets written by
  user input in one of the upper rectangles *)
  VAR_INPUT
     pVar : POINTER TO BYTE;
     varType : VisuElems.Visu_Types;
     iMaxSize : INT;
     pClient : POINTER TO VisuElems.VisuStructClientData;
  END_VAR

  // String stInfo, which will be displayed in the lower rectangle,
  is composed here
  PLC_PRG.stInfo := 'Variable written; type: ';
  PLC_PRG.stInfo := CONCAT(PLC_PRG.stInfo, INT_TO_STRING(varType));
  PLC_PRG.stInfo := CONCAT(PLC_PRG.stInfo, ', adr: ');
  PLC_PRG.stInfo := CONCAT(PLC_PRG.stInfo, DWORD_TO_STRING(pVar));
  PLC_PRG.stInfo := CONCAT(PLC_PRG.stInfo, ', by: ');
  PLC_PRG.stInfo := CONCAT(PLC_PRG.stInfo,
      SEL(pClient^.globaldata.clienttype =
      VisuElems.Visu_ClientType.Targetvisualization,'other visu',
      'targetvisu'));
END_VAR

Capturing keyboard events

When the user presses and releases the key, a keyboard event is triggered in the visualization.
You can capture this event in the application as follows.

1. Create a function block that implements VisuElems.IVisuUserEventManager from the VisuElemBase library.

2. Pass the instance to the global event manager VisuElems.Visu_Globals.g_VisuEventManager by calling the SetKeyEventHandler method.
Example

A visualization has one text output element. The text output element is a rectangle where the contents of the text variable `PLC_PRG.stInfo` are printed. The text variable contains information about the last key pressed by the user.

<table>
<thead>
<tr>
<th>Properties of the rectangle for the text output</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Texts ➔ Text&quot;</td>
</tr>
<tr>
<td>&quot;Text variables ➔ Text variable&quot;</td>
</tr>
<tr>
<td><code>%s</code></td>
</tr>
<tr>
<td>PLC_PRG.stInfo</td>
</tr>
</tbody>
</table>

Implementation of the PLC_PRG program

```plaintext
PROGRAM PLC_PRG
VAR_INPUT
  stInfo : STRING;
END_VAR
VAR
  inst : POU;
  bFirst : BOOL := TRUE;
END_VAR
IF bFirst THEN
  bFirst := FALSE;
  VisuElems.VisuGlobals.g_VisuEventManager.SetKeyEventHandler(inst);
END_IF
```

Implementation of the POU function block

```plaintext
FUNCTION_BLOCK POU IMPLEMENTS VisuElems.IKeyEventHandler
(* no further declarations, no implementation code *)
/// This method will be called after a key event is released.
/// RETURN:
/// TRUE - When the handler has handled this event and it should not be handled by someone else
/// FALSE - When the event is not handled by this handler
METHOD HandleKeyEvent : BOOL
VAR_INPUT
  /// Event type. The value is true if a key-up event was released.
  bKeyUpEvent : BOOL;
  /// Key code
  dwKey : DWORD;
  /// Modifier. Possible values:
  /// VISU_KEYMOD_SHIFT : DWORD := 1;
  /// VISU_KEYMOD_ALT : DWORD := 2;
  /// VISU_KEYMOD_CTRL : DWORD := 4;
  dwModifiers : DWORD;
  /// Pointer to the client structure were the event was released
  pClient : POINTER TO VisuStructClientData;
END_VAR
VAR
END_VAR
PLC_PRG.stInfo := 'KeyEvent up: ';
PLC_PRG.stInfo := CONCAT(PLC_PRG.stInfo, BOOL_TO_STRING(bKeyUpEvent));
PLC_PRG.stInfo := CONCAT(PLC_PRG.stInfo, ', key: ');
PLC_PRG.stInfo := CONCAT(PLC_PRG.stInfo, DWORD_TO_STRING(dwKey));
PLC_PRG.stInfo := CONCAT(PLC_PRG.stInfo, ', modifier: ');
PLC_PRG.stInfo := CONCAT(PLC_PRG.stInfo, DWORD_TO_STRING(dwModifiers));
PLC_PRG.stInfo := CONCAT(PLC_PRG.stInfo, ', by: ');
PLC_PRG.stInfo := CONCAT(PLC_PRG.stInfo, ');
```
Recording variable value changes triggered by input events

All visualization elements that change the value of a variable by user input call the IValueChangedListener interface. With this interface, the value changes can be recorded and then processed programmatically.

1. Implement a function block (example: POU) that implements the IValueChangedListener interface.

   ```
   FUNCTION_BLOCK POU IMPLEMENTS VisuElems.IValueChangedListener
   In the device tree, the “ValueChanged” method is inserted below the function block.
   ```

2. In a program (example: “PLC_PRG”), implement the IEC code that registers the interface.

   ```
   VisuElems.g_itfValueChangedListenerManager.AddValueChangedListener(itfValueChangedListener)
   “PLC_PRG” receives all value changes by means of the “ValueChanged” method.
   Now you can record and process the value changes.
   ```

1.3.5.5 Setting up user management

1.3.5.5.1 Setting up user management for visualizations

   Setting up user management for visualizations.................................. 1139

   1.3.5.5.2 Configuring users and groups............................................. 1140

   1.3.5.5.3 Editing and selecting user management dialogs....................... 1141

   1.3.5.5.4 Configuring permissions for groups...................................... 1142

In the visualization user management, you define users and user groups and assign access rights to user groups for individual visualization elements. In the user management dialogs, users can be registered and unregistered in runtime mode and passwords and user management can be changed.

In a project with several applications, you can configure user management for each application.

**NOTICE!**

When a visualization user management exists, an unregistered user automatically receives the access rights from the None group.

1.3.5.5.1 Setting up user management for visualizations

When you set up user management for your visualization, the following variants are possible:

- **Empty user management**
  An empty user management contains the None user group. You configure all users and groups yourself.

- **User management with default users and groups**
  This user management contains the Admin, Service, Operator, and None groups. The first three groups each contain one user with the same name as the group.
Create new user management

☐ Requirement: A user management does not exist yet for your visualization.

1. Click the “Visualization Manager” object in the device tree.
2. Select the “User Management” tab.
3. Click “Create Empty User Management” or “Create User Management with Default Groups and Users” depending on which variant you need.
   ⇒ The “Groups”, “Users”, and “Settings” tabs are displayed.
   The “Group” tab opens.
4. If you have created an empty user management, then you configure the new groups and users.
   If you have created a user management with default groups and users, then you can grant permissions for elements in your visualization. You can also select the user management dialogs and assign them to the buttons of the visualization.

● ☰ Chapter 1.3.5.5.3 “Editing and selecting user management dialogs” on page 1141

1.3.5.5.2 Configuring users and groups

Groups and their users for the basis for user management. A group has one or more users; a user can belong to multiple groups. The permissions of the visualization elements are always assigned to a group.

Adding groups

☐ Requirement: You have already created a user management by clicking “Create Empty User Management” or “Create User Management with Default Groups and Users” in the “Visualization Manager” (“User Management” tab).

1. Click the “Visualization Manager” object in the device tree.
2. Select the “User Management” tab.
3. Click in the last line of the list.
   In this line, the field of the “Group Name” column is still empty.
4. Click in the field of the “Group Game” column and specify the name for the new group.
5. If necessary, activate the options “Automatic Logout” and “Permission to Change User Data”.

Adding users and assigning groups

☐ Requirement: A user management exists with at least on group. The “Visualization Manager” is open.

1. Select the tab “User Management ➔ User”.
2. Click in the last empty line of the list.
3. Specify the "Login Name".
   CODESYS applies the "Login Name" as "Password".

4. If you want to change the password, click in the "Password" field of the user.
   The "Change Password" dialog box opens.

5. Click the "User Group" field.
   The "User Groups the User Belongs to" dialog box opens.

6. Activate the "Assigned" option for the groups that the user should be long to and click "OK" to confirm.
   In the "User Group" field, all groups are listed that the new user belongs to.

- Chapter 1.3.5.5.1 “Setting up user management for visualizations” on page 1139
- 1.3.5.5.3 Editing and selecting user management dialogs

1.3.5.5.3 Editing and selecting user management dialogs

In the user management dialogs, you define the login, logout, changing of the user password, and editing of the user management in the visualization at runtime.

**NOTICE!**
If you create your own dialog as a user management dialog, then you should use the visualizations from the included library project VisuUserMgmtDialogs.library as the basis, because it uses the required interfaces. Your own user management dialog is listed then in “Visualization Manager ➔ Settings”, “Settings for User Management dialogs”.

Editing user management dialogs

Requirement: The library project VisuUserMgmtDialogs.library exists in the installation directory.

1. Click “File ➔ Open Project”.
2. Select the project VisuUserMgmtDialogs.library from the Projects folder of the installation directory.
3. Click “View ➔ POU’s”.
   In the "POUs" view, the project is displayed with the visualizations "UserMgmtChangePassword", "UserMgmtConfig", and "UserMgmtChangePassword".
4. Double-click a visualization (example: "UserMgmtLogin").
5. Change the visualization as you like and save the project.
6. Then, reinstall the library and add it to the “Library Manager” of your application.

Selecting user management dialogs

A user management already exists in your application in the “Visualization Manager” object (“User Management” tab).
The “VisuUserManagement” library is in the library manager.

1. Click the “Visualization Manager” object in the device tree.
2. Click the “Settings” tab.
3. In “Settings for User Management Dialogs”, select the dialogs for “Login dialog”, “Change password dialog”, and “Change configuration dialog”.

If no entries can be seen in “Settings for User Management Dialogs” in the dialog lists, then close the “Visualization Manager” and reopen it.

Configuring visualization buttons for the login, logout, change password, and user management dialogs

Requirement: A visualization is open.

1. Drag a “Button” element from the “Toolbox” view (“Common controls”) to the visualization.
2. Click the “Input configuration” node in the “Properties” view.
3. Click “Configure” in the property “Input configuration ➔ OnMouseClick”.
4. Click “User management” and ➔ in the “Input Configuration” dialog.
   ➔ The following “Dialogs and actions” are listed on the right: “Login”, “Logout”, “Change user password”, and “Open user management”.
5. Select the dialog or action to assign to the button and click “OK”.
   ➔ When the button is clicked at runtime, the selected dialog opens or the selected action is executed.

If you want to open and edit the user management in the visualization at runtime, you must be a member of a group that has the “Permission to Change User Data”.

1.3.5.4 Configuring permissions for groups

Configuring permissions for an element of the visualization

Permissions for visualization-elements are not granted to individual users, but to groups with assigned users.
Requirement: A “Visualization” object is open with at least one inserted visualization element.

1. Click a visualization element in the editor.
2. Click the “Value” field of the “Permissions” element property in the “Properties” view.
   - The “Permissions” dialog box opens.
3. Select the permissions that the respective user group should have for the visualization element.
   
   Note: If the option “Group hierarchy is used” is activated, the groups lower in the hierarchy cannot be granted more permissions than groups higher in the hierarchy.

In the “Element List” of the visualization, the “Permissions” column shows the element permissions granted to groups.

- § Chapter 1.3.5.19.4.1.1 “Visualization editor” on page 1608

1.3.5.6 Setting up multiple languages

Texts and tooltip texts for visualizations are managed in text lists and can be displayed in different languages. To switch a visualization between the available languages, configure a visualization element with the corresponding input configuration for changing the language.

There are static texts that are managed in “GlobalTextList” (generated automatically) and dynamic texts from created text lists. A dynamic text can be changed at runtime with a variable that defines the index of the text list entry. Static texts are fixed labels within a visualization; dynamic texts are often used for displaying variable values or error messages.

For creating and using text lists, see: Managing Text in a Text list.

You can modify the appearance and formatting of texts and tooltips with the element properties “Text properties” and “Font variables”.

See also
- § Chapter 1.3.5.18.2 “Placeholders with format definition in the output text” on page 1546
- § Chapter 1.3.5.19.3.6 “Dialog ‘Input Configuration’” on page 1586

Configuring the language switcher for texts from text lists

Requirement: An empty visualization object is inserted into the project and it is open for editing in the visualization editor. There is also a “Visualization Manager” object. User management is not created for the visualization.

The following instructions provide a simplified example:
By means of two buttons, the user should be able to toggle the visualization texts between English and German.

Static texts in the visualization include the labels "State, Machine 01", "State, Machine 02", "English", and "German". These texts are located in the “GlobalTextList” in English and German.

Dynamic texts will describe the state of both machines. The texts are provided in the text list “Status_Texts” in English (en) and German (de).

1. Drag a “Text field” from the “Toolbox” view (category “Common Controls”) to the editor view. Specify the value State, Machine M01 in the properties editor for the element property “Texts ➔ Text”.
2. Copy the element and change the copy label to State, Machine M02.
3. See also the figure in step 14 for the following steps.

Insert two elements of type “Button” from the “Toolbox” view (category “Common Controls”) in the visualization editor. With these elements, the user should be able to toggle the language of the visualization. Specify the text German or English in the properties editor for element property “Texts ➔ Text” (4).

4. Double-click and open “GlobalTextList” in the “POUs” view.
   
   - The texts are entered in the “Standard” (1) column, and the “ID”’s 0 and 1 are assigned automatically as additional information.

5. Add the languages “de” and “en” with the texts shown in the following figure.

![GlobalTextList](image)

6. Close the “GlobalTextList”.
7. Add two elements of type “Rectangle” from the “Toolbox” view (category “Basic”) in the visualization editor. The current state of each machine should be displayed.
8. For managing the texts for describing the states, add an object of type “Text List” below the application. Name the list Status_Texts.
9. Specify the texts shown in the figure for the standard language (1) and the target languages “en” and “de” in the editor of “Status_Texts”.

![Status_Texts](image)

10. Close the text list “Status_Texts”.

11. Select the rectangle element for displaying the state of machine M01. Select the text list Status_Texts from the combo box in the properties editor (2) for the element property “Dynamic texts” (5). Specify an application variable for “Text index” that shows the appropriate text index for the state of the machine at runtime. Example:
    
    PLC_PRG.ivar_status_m01.
12. Now configure the user input for both buttons for toggling the language in the visualization.

Select the button "German". Double-click “Configure” of the property “Input configuration” (6), “OnMouseClick”.

⇒ The “Input configuration / OnMouseClick” dialog opens.

13. Select “Change the language” on the left. Click the arrows to accept the setting to the right. Select “de” in “Language” to the right of the dialog in the input assistance. Click “OK” to confirm.

⇒ The following figure shows the performed properties configurations for the four visualization elements.

15. When the application is compiled without errors, you can test the visualization in simulation mode. Activate the option “Online ➔ Simulation”. Click “Online ➔ Login”.

⇒ The visualization appears in the visualization editor view in online mode:
16. Click the “German” button.

⇒ The language changes to German:

●  Chapter 1.3.5.19.3.6 “Dialog ‘Input Configuration’” on page 1586

Setting up fonts for a language

The font for a visualization element is defined in the properties editor. If a language switch is provided, you can overwrite this basic font with another font for each language in the visualization manager.

Requirement: A visualization is set up with at least one language in addition to the default language. For an example, see “Configuring the language switcher for texts from text lists” on page 1143

1. Double-click and open the “Visualization Manager” object and select the “Font” tab.
2. Double-click the field in the “Font” line for a particular language. Select a font from the combo box.
3. In the “Font size” line, replace the value 1 with a value greater than 1 (example: 2) in order to increase the size of the font as defined by the visualization style; or replace it with a value less than 1 in order to decrease it (example: 0.5).

⇒ In online mode, the font changes depending on the set language.

1.3.5.7 Visualizing alarm management

In CODESYS, the alarm management is a powerful object for creating and managing alarms. You can group alarms and set the acknowledgement behavior individually. The alarm display in the visualization can also be customized.

The “Alarm Table” and “Alarm Banner” visualization elements are available for displaying and processing alarms. The alarm table lists the alarm texts. The alarm banner is a simplified version of the alarm table. It visualizes a single alarm only. However, by adding scroll elements you can allow for switching the display from one active alarm to another active alarm.

See also
●  Alarm Management

Creating an alarm table

Requirement: In your project, alarms are defined in alarm groups and they are assigned to an alarm class. The following instructions are based on the example that is described in the "Configuring alarm management" chapter.
1. Open the visualization editor.
2. Drag the “Alarm Table” element from the “Alarm Manager” group to the visualization editor.
   ⇐ The “Alarm Table” visualization element is visible in the editor.
3. In the “Alarm configuration” / “Alarm groups” property, define the alarm groups that you want to visualize. Click into the value field.
   ⇐ The “Select Alarm Group” dialog opens.
4. Clear the “All” check box and select the “PartsDeficit” alarm group. Add the group to the selected alarm groups by clicking the button.
5. In the “Alarm configuration” / “Alarm classes” property, define the alarm classes that you want to visualize. Click into the value field.
   ⇐ The “Select Alarm Class” dialog opens.
6. Clear the “All” check box and select the “PartsDeficit” alarm class. Add the alarm class to the selected alarm classes by clicking the button.
7. Add an additional column. Click the “Columns” / “Create New” button.
   ⇐ CODESYS adds the column “[2]” to the properties. The “Symbol” column is added to the table.
8. Select data type “State” for column [2].
   ⇐ The default column heading “State” is shown in the table.
9. Name the “Column heading” column “Status”.
10. Specify the appearance of the selected table cell. Set the “Selection” / “Selection color” to “Green”.
11. In the “Control variables” / “Confirm selection” property, specify the variable bQuitAlarm for confirming messages.
12. Adjust the other properties to your requirements. See the “Alarm table” visualization element for a complete description of the properties.

- Configuring Alarm Management
- Chapter 1.3.5.18.1.22 “Visualization element ‘Alarm table’” on page 1395

Inserting elements for acknowledging alarms

In CODESYS, predefined buttons are available for controlling the alarms in an alarm table.

Requirement: An “Alarm table” element exists in the visualization.

1. Select the visualization element in the editor.
2. Click “Visualization ➔ Insert elements for acknowledging alarms”.
   ⇐ The “Alarm Table Wizard” dialog opens.
3. Click “OK” to accept all settings.
   - Four buttons are added for controlling the alarm table.

![Alarm table]

- Chapter 1.3.5.18.1.22 “Visualization element 'Alarm table'” on page 1395

Creating an alarm banner

Requirement: In your project, alarms are defined in alarm groups and they are assigned to an alarm class. The following statement is based on the example that is described in the "Configuring alarm management" chapter.

The alarm banner displays an active alarm in online mode. If there are multiple active alarms, filtering takes place by means of the filter criteria set in the alarm banner (newest for filter criterion "Priority" and most important for filter criterion "Newest"). See the instructions below for adding scroll elements in order to switch the display between multiple alarms.

1. Open the visualization editor.
2. Drag the “Alarm banner” element from the “Alarm manager” group to the visualization editor.
   - The “Alarm banner” visualization element is visible in the editor.
3. In the “Alarm configuration” / “Alarm groups” property, define the alarm groups that you want to visualize. Click into the value field.
   - The “Select Alarm Group” dialog opens.
4. Clear the “All” check box and select the “PartsDeficit” alarm group. Add the group to the selected alarm groups by clicking the button.
5. In the “Alarm configuration” / “Alarm classes” property, define the alarm classes that you want to visualize. Click into the value field.
   - The “Select Alarm Class” dialog opens.
6. Clear the “All” check box and select the “PartsDeficit” alarm class. Add the alarm class to the selected alarm classes by clicking the button.
7. Set the “Alarm configuration” / “Filter criterion” property to “Newest”.
   - In online mode, the newest alarm message is always shown.
8. Add an additional column. Click the “Columns” / “Create new” button.
   - CODESYS adds the column “[2]” to the properties. The “Symbol” column is added to the table.
9. Select data type “State” for column [2].
   - The default column heading “State” is shown in the table.
10. In the “Confirmation variable” property, specify the variable bQuitAlarm for confirming messages.
Adding elements for scrolling the active alarms

Elements can be added to an alarm banner for switching the display between the individual active alarms. You can control the scrolling with visu-local variables or application variables.

1. Select the added "Alarm banner" visualization element. Click "Insert Elements for Scrolling Alarms" in the context menu.
   ⇒ The “Alarm Banner Wizard” opens.
2. Select the element type for the scroll elements: “Button” or “Rectangle”.
3. Activate the action(s) for which a control should be inserted: “Scroll to next alarm”, “Scroll to previous alarm”.
4. Specify a Boolean variable that gets the value TRUE when multiple active alarms are present. If you have already configured a project variable in the element properties, then it is also specified here in the wizard. Otherwise CODESYS automatically creates the visu-local variable “xMultipleAlarmsActive”.
5. In the next step, check the configuration of the element properties of the extended alarm banner.
6. Select the alarm banner element and look at the section “Handling of multiple active alarms” in the “Properties” view. You have two options:
   7. Option 1: The display should switch automatically. Activate the “Switch automatically” property.
      ⇒ Now, in “Every N seconds” you define the time interval after which the display in the alarm banner in online mode should switch to the next alarm.
   8. Option 2: The display should be controlled by means of the application. Deactivate the “Switch automatically” property.
      ⇒ Switching between the active alarms can be controlled by two variables. By default, xNext and xPrev are created for scrolling to the next or previous alarm. You can replace these variables with custom your own defined application variables.

Filtering by the contents of a latch variable can be useful when there are a lot of alarm events displayed. If the latch variable assigned to an alarm in the alarm group definition contains, for example, the error number or the name of a device instance, then you can filter the alarms in the visualization by it.

For this purpose, you configure an input option in the alarm visualization for the contents of the latch variable to be filtered by. For example, insert an input field which writes to the variable that is specified in the “Alarm configuration” - “Filter by latch 1” - “Filter variable” property of the configuration of the “Alarm table” element or “Alarm banner” element.

In addition, you configure an input option for the type of filtering. The type determines whether a numeric value (typed literal, LINT literal) or the string value of the latch variable is used for filtering. Filtering can also be switched off by means of type setting 0. For example, in the visualization, insert another input field which writes to the variable that is specified in the “Filter type” property of the configuration of the alarm table or alarm banner.

For more information, see the "Alarm Filter Latch Example" sample project in the CODESYS Store.

See also

- Configuring Alarm Management
The animation of a visualization element at runtime can serve to visualize value curves in addition to serving purely visual purposes. Animation is possible through a dynamic configuration of certain element properties, i.e. by controlling these properties with a variable. See the following examples of possible animations.

### 1.3.5.8.1 Configuring rotations and offsets

You can animate a visualization element and have it shifted or rotated at runtime. To do this you assign variables in its property “Absolute movement” and then program the animation in the application code.

**Configuring an offset**

- **Requirement:** A project with a visualization is open.
- 1. Open the visualization and add an element “Rectangle”.
  - The view “Properties” displays the configuration of the element.
- 2. In the application in the POU PLC_PRG, declare type-compliant variables: diOffsetX : DINT; and diOffsetY : DINT;
- 3. Configure the property “Absolute movement ➔ Movement ➔ X” with PLC_PRG.diOffsetX and “Y” with PLC_PRG.diOffsetY.
- 4. Implement a shift of the element, for example by means of a modulo division of the value:
  diOffsetX := diOffsetX MOD 100;
  diOffsetY := diOffsetY MOD 100;
- 5. Compile, load and start the application.
  - The application runs. The visualization opens. The rectangle moves.

**Configuring a rotating element**

When an element rotates, then the center point of the element rotates precisely around its center. The center is defined in the property “Center”. The center point of an element is calculated internally. If the center point and center coincide, then there is no rotation.

You can configure a clockwise rotation of the element by increasing the value of the variable “Absolute movement ➔ Rotation”.

- **Requirement:** A project with a visualization is open.
- 1. Open the visualization and add an element “Rectangle”.
  - The view “Properties” displays the configuration of the element.
- 2. In the application in the POU PLC_PRG, declare a type-compliant variable: rValue : REAL;
- 3. Configure the property “Absolute movement ➔ Rotation” with PLC_PRG.rValue.
- 4. Implement the clockwise rotation of the element by increasing the value of the variable:
  rValue := rValue + 0.1;
5. Compile, load and start the application.
   ⇒ The application runs. The visualization opens. The rectangle rotates about the center. The alignment of the element with respect to the coordinate system is fixed.

Configuring a rotating element

When an element performs an inner rotation and rotates, then the center point of the element rotates precisely around its center. This is the point defined in the property "Center". The alignment of the element also rotates relative to the coordinate system. If the center point of the element and the center coincide, this produces a rotation on the spot.

You can configure a clockwise rotation of the element by increasing the value of the variable "Absolute movement ➔ Inner rotation".

If the visualization is In runtime, you can see that the element rotates (also relative to the coordinate system of the visualization).

☐ Requirement: A project with a visualization is open.
1. Open the visualization and add an element “Polygon”, which you form into a pointer.
   ⇒ The view “Properties” displays the configuration of the element.
2. Drag the center point of the element to the base of the pointer.
3. In the application in the POU PLC_PRG, declare a type-compliant variable:

   rValue : REAL;

4. Configure the property “Absolute movement ➔ Inner rotation” with PLC_PRG.rValue.
5. Implement the clockwise rotation of the element by increasing the value of the variable:

   rValue := rValue + 0.1;
6. Compile, load and start the application.
   ⇒ The application runs. The visualization opens. The pointer rotates about its base.
1.3.5.8.2 Animating a text display

An animation of the text display can be configured in the property “Font variables”. All basic elements have this property as well as tables, scrollbars and text fields.

Example: animating the font size

☐ Requirement: A project with a visualization is open.
1. Open the visualization and add an element “Rectangle”.
   ⇒ The view “Properties” displays the configuration of the element.
2. Configure the property “Texts ➔ Text” with Important:
3. In the application in the POU PLC_PRG, declare a type-compliant variable:
   ⇒ iFontHeight : INT;
4. Configure the property “Font variables ➔ Size” with PLC_PRG.iFontHeight.
5. Implement a change of the font size.
   ⇒ iFontHeight := iFontHeight + 1) MOD 20;
6. Compile, load and start the application.
   ⇒ The application runs. The visualization opens. The rectangle is labelled with Important. The font size grows from 1 to 20.

See also
- Chapter 1.3.5.18.1.1 “Visualization element ‘Rectangle’, ‘Round rectangle’, ‘Ellipse’” on page 1224

1.3.5.8.3 Animating a color display

The colors of an element are specified in the “Colors” properties of the element properties. There you can select either a predefined style color from the selection list or a color in the color dialog.

The “Color variables” element property is used for the color animation of the element. If you pass variables to the properties, then you can program color changes in the application code or configure a user input that results in a color change. A color constant or color variable in the code has the data type DWORD and is encoded according to the RGB color space or RGBA extension.

NOTICE!

The “Activate semi-transparent drawing” option is provided in the Visualization Manager. This option is enabled by default so that the “Transparency” property is available for all color definitions. With programmatic color definition, the leading byte is interpreted as an alpha channel and therefore used as the transparency value of the color. When the option is cleared, the “Transparency” property is not available and the leading byte is ignored in color literals.

Color information in the code is specified as DWORD literals. The value is in the RGBA color space and is usually shown as a hexadecimal number. The value is coded with additive portions of red, green, and blue. It is appended with the alpha channel which determines the transparency of the color.
Byte order of a color literal

16#<TT><RR><GG><BB>

<TT> : 00 - FF     // Transparency in 256 levels
<RR> : 00 - FF     // Red in 256 levels
<GG> : 00 - FF     // Green in 256 levels
<BB> : 00 - FF     // Blue in 256 levels

The graduation value for transparency is 16#FF for opaque and 16#00 for transparent. For each color portion, one byte is reserved for 256 color graduations (16#FF to 16#00). 16#FF means 100% color portion and 16#00 means 0% color portion.

| <TT> | Byte for the transparent graduation of 00-FF |
| <RR> | Byte for the red portion of 00-FF          |
| <GG> | Byte for the green portion of 00-FF        |
| <BB> | Byte for the blue portion of 00-FF         |

Table 251: Color literal

<table>
<thead>
<tr>
<th>Color Literal</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>16#FF0000FF</td>
<td>Blue, opaque</td>
</tr>
<tr>
<td>16#FF00FF00</td>
<td>Green, opaque</td>
</tr>
<tr>
<td>16#FFFFFF00</td>
<td>Yellow, opaque</td>
</tr>
<tr>
<td>16#88888888</td>
<td>Gray, semitransparent</td>
</tr>
<tr>
<td>16#88000000</td>
<td>Black, semitransparent</td>
</tr>
<tr>
<td>16#FFFF0000</td>
<td>Red, opaque</td>
</tr>
</tbody>
</table>

Example

Global declaration of color constants

```plaintext
VAR_GLOBAL CONSTANT
c_dwBLUE : DWORD := 16#FF0000FF;         // Highly opaque
c_dwGREEN : DWORD := 16#FF00FF00;         // Highly opaque
c_dwYELLOW : DWORD := 16#FFFFFF00;        // Highly opaque
c_dwGREY : DWORD := 16#88888888;          // Semitransparent
c_dwBLACK : DWORD := 16#88000000;         // Semitransparent
c_dwRED : DWORD := 16#FFFF0000;           // Highly opaque
END_VAR
```

Example

Global declaration of color constants

```plaintext
VAR_GLOBAL CONSTANT
c_dwRED : DWORD := 16#FFFF0000;           // Highly opaque
c_dwGREEN : DWORD := 16#FF00FF00;         // Highly opaque
c_dwYELLOW : DWORD := 16#FFFFFF00;        // Highly opaque
c_dwGREY : DWORD := 16#88888888;          // Semitransparent
c_dwBLACK : DWORD := 16#88000000;         // Semitransparent
END_VAR
```

Animating a visualization element in color

1. Create a standard project in CODESYS.
2. Declare global color constants in the POU tree.

```plaintext
{attribute 'qualified_only'}
VAR_GLOBAL CONSTANT
  gc_dwRed : DWORD := 16#FFFF0000;           // Highly opaque
  gc_dwGreen : DWORD := 16#FF00FF00;         // Highly opaque
  gc_dwYellow : DWORD := 16#FFFFFF00;        // Highly opaque
  gc_dwGrey : DWORD := 16#88888888;          // Semitransparent
  gc_dwBlack : DWORD := 16#88000000;         // Semitransparent
END_VAR
```
3. In the device tree, declare local color variables in PLC_PRG.

```
VAR
  dwFillColor: DWORD := GVL.gc_dwGreen;
  dwFrameColor : DWORD := GVL.gc_dwBlack;
  dwAlarmColor : DWORD := GVL.gc_dwRed;
END_VAR
```

4. Declare a control variable.

```
  bChangeColor : BOOL;
```

5. Declare an input variable in PLC_PRG.

```
  bInput : BOOL;
```

6. Enable the visualization editor.

7. Drag a “Rectangle” element to the visualization editor.

```
The “Properties” view of the element opens.
```

8. Configure the properties of the rectangle as follows:

- Property “Color variables”, “Normal state”, “Filling color”: PLC_PRG.dwFillColor
- Property “Color variables”, “Normal state”, “Frame color”: PLC_PRG.dwFrameColor
- Property “Color variables”, “Alarm state”, “Filling color”: PLC_PRG.dwAlarmColor
- Property “Color variables”, “Toggle color”: <toggle/tap variable>
- Property “Input configuration”, “Toggle”, “Variable”: PLC_PRG.bInput

9. Program the variables as follows:

```
PROGRAM PLC_PRG
VAR
  dwFillColor: DWORD := GVL.gc_dwGreen;
  dwFrameColor : DWORD := GVL.gc_dwBlack;
  dwAlarmColor : DWORD := GVL.gc_dwRed;
  bChangeColor : BOOL;
  bInput : BOOL;
END_VAR

IF bChangeColor = TRUE THEN
  dwFillColor := GVL.gc_dwYellow;
  dwFrameColor := GVL.gc_dwBlue;
ELSE
  dwFillColor:= GVL.gc_dwGreen;
  dwFrameColor := GVL.gc_dwBlack;
END_IF
```

```
The colors are initialized at runtime. If the variable bChangeColor is then forced to
TRUE, the color display of the rectangle changes. When the rectangle is clicked in the
visualization, the rectangle is displayed in alarm colors.
```

- § Chapter 1.3.5.8.2 “Animating a text display” on page 1152
A frequently required function of a user interface is the display of data arrays. CODESYS Visualization provides the element "Table" for this.

In the configuration of the element "Table", enter an array variable in the property "Data array". The array components are displayed in the rows and columns of the table.

A table for displaying data arrays can also be created in the following way. You duplicate a single element having at least one property that is described by a structured variable. The single element is configured as a "template" for this and duplicated with a command.

1.3.5.9.1 Displaying structured variable values in tables

Subsequent instructions describe an example of how an array of a structure is displayed in a table. As a preparation, create the MyStruct DUT and the declarations in the PLC_PRG program.

```plaintext
TYPE MyStruct :
    STRUCT
        iNo : INT;
        bOnStock : BOOL;
        strPartNumber : STRING;
    END_STRUCT
END_TYPE

PROGRAM PLC_PRG
VAR
    arrStruct : ARRAY[0..6] OF MyStruct;
    iSelectedColumn : INT;
END_VAR
```

1. Drag the "Table" visualization element to the visualization editor.
2. Assign the array variable arrStruct to the "Data array" property.
   ⇒ The structure members are displayed as column headings and the array index as row headings.
3. Change the "Columns ➔ Column ➔ [0] ➔ Column header" property to an informative heading (example: Number).
5. Assign a color to the "Selection ➔ Selection color" property.
6. Define the "Selection ➔ Selection type" property as Row selection.
7. In the “Selection ➔ Variable for selected row” property, define the PLC_PRG.iSelectedColumn variable. The following display results in online mode:

<table>
<thead>
<tr>
<th>Number</th>
<th>in Stock</th>
<th>Part Number</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>FALSE</td>
<td></td>
</tr>
<tr>
<td>1</td>
<td>FALSE</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>FALSE</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>FALSE</td>
<td></td>
</tr>
</tbody>
</table>

1.3.5.9.2 Configuring and multiplying visualization elements as templates

You can use the “Visualization ➔ Multiply Visu Element” command to display array data. The command multiplies a template element to create an element of the same type for each array component. The layout of the new elements in the visualization is one-dimensional as a row or column, or two-dimensional as a table.

To do this, drag an applicable element into the visualization editor. Then configure the properties of the element with array variables and specify the index access placeholder $FIRSTDIM$ as component access. If you have declared a multidimensional array, then you can use the second index access placeholder $SECONDDIM$ for the additional dimension. Configure the remaining properties as usual with the typical values. The purpose is to create a valid template element. Then execute the “Multiply Visu Element” command on the template element. Now the dialog with the same name opens. There you define in detail how many elements should be created and where they should be located.

After multiplying, the visualization contains as many of the same elements as are indexed using placeholders. In doing so, the settings in the “Multiply Visu Element” dialog are taken into consideration. All new elements in the properties that were preset with placeholders have these replaced with precise indexes. The remaining properties have been applied and copied without changes.

For example, you can have a layout of nine buttons as 3x3 tables, which are all the same size or the same color, but vary in the labeling. The labels are declared as a string array (nine components) and are passed as a value to the “Texts”->”Text” property.

Valid template element:
● Declaration of array variables
  Example: asText: ARRAY[1..3, 1..3] OF STRING;
● Element with applicable element type
● Configuration of at least one property of the applicable element with array variables with index access placeholders
  Example: “Texts”, “Text” property = PLC_PRG.asText[$FIRSTDIM$, $SECONDDIM$]
  This is possible for all properties that permit a variable as a value (for example, also properties from the "Animation" or "Input" categories. To configure multiple properties for an element with arrays and index access placeholders, all arrays must have the same structure with the same dimension. The declarations have to be compatible.
● Configuration of properties that do not vary (and are therefore the same for all generated elements) with the usual values without index access placeholders
  Example:
  sButtonTip : STRING := 'This element is created by multiplication'
  “Texts”, “Tooltip” property = %s
  “Text variables”, “Tooltip variable” property = sButtonTip
Applicable visualization elements

Visualization elements that can be multiplied:

- Rectangle
- Round rectangle
- Ellipse
- Line
- Polygon
- Polyline
- Bézier curve
- Image
- Frame
- Button
- Pie
- SpinControl
- Text field
- Checkbox
- Image switcher
- Lamp
- Dip switch
- Power switch
- Push switch
- Push switch LED
- Rocker switch
- Rotary switch

Configuring and multiplying lamps and buttons as templates

1. Create a new standard project.
   ⇒ A CODESYS Control Win V3 is configured as the device. The MainTask calls PLC_PRG. The implementation language is ST.

2. In PLC_PRG in the program code, declare array variables with basic data type STRING.
   ⇒
   
   ```
   PROGRAM PLC_PRG
   VAR
   axLampIsOn: ARRAY[1..2,1..3] OF BOOL;  // For lamp, property 'variable' and button, user input
   asButtonText: ARRAY[1..2,1..3] OF STRING := // Output text for button, property 'text variables''text variable'
   [
   '1A Lamp', '2A Lamp',
   '1B Lamp', '2B Lamp',
   '1C Lamp', '2C Lamp'
   ];
   END_VAR
   ```

3. Select the application in the device tree and click “Add Object ➤ Visualization”.

You can still use the placeholder % as usual for the text display of variable values in the properties in “Texts”.
4. In the “Add Visualization” dialog, specify the name VisuMain and click “Add” to close the dialog.
5. Drag a “Lamp” element from the “Toolbox” view to the visualization.
6. Configure the fixed property values.
7. Double-click the value field of the “Variable” property.
   ▶ The line editor opens.
8. Click .
   ▶ The Input Assistant opens.
9. Select the array variable PLC_PRG.axLampIsOn from the variable tree.
10. Extend the string at the end, for example with “[i].”
   ▶ If you have activated SmartCoding (“Options” dialog, “SmartCoding” category, “List components immediately when typing” option), then the current variable list appears with the placeholders:

   ![Variable List Screen](image)

11. Select the placeholder $FIRSTDIM$ for the first dimension and confirm the selection.
12. Extend the string at the end, for example with “, s”.
   ▶ The variable list appears again.
13. Select the placeholder $SECONDDIM$ for the second dimension and confirm the selection.
14. Complete the string with a closing bracket.
   ▶ PLC_PRG.axLampIsOn[$FIRSTDIM$, $SECONDDIM$]
   The lamp is configured as a template.
15. Click “Visualization ➔ Multiply Visu Element”.
   ⇒ The “Multiply Visu Element” dialog opens. The default values are derived from the array declarations.
   “Total number of elements”, “Horizontal” = 2
   “Total number of elements”, “Vertical” = 3
16. Declare the distance between the new elements.
   ⇒ “Offset between elements”, “Horizontal” = 3
   “Offset between elements”, “Vertical” = 3
17. Check the advanced settings.
18. Click “OK” to confirm the selection.
   ⇒ The new elements appear in the visualization editor. All properties are configured with a precise index and the array variables are indexed.
19. In the “Visualization Toolbox”, in the “Common Controls” category, select and drag the “Button” element to the visualization editor.
   ⇒ The “Properties” view of the element opens.
20. Configure the fixed property values.
   \( \Rightarrow \) PLC_PRG.asButtonText[$FIRSTDIM$, $SECONDDIM$]

   \( \Rightarrow \) PLC_PRG.axLampIsOn[$FIRSTDIM$, $SECONDDIM$]

   The button is configured as a template.

23. Click “Visualization ➔ Multiply Visu Element”.
   \( \Rightarrow \) The “Multiply visu element” dialog opens. The default values are derived from the array declarations.
   “Total number of elements”, “Horizontal” = 2
   “Total number of elements”, “Vertical” = 3

24. Declare the distance between the new elements.
   \( \Rightarrow \) “Offset between elements”, “Horizontal” = 3
   “Offset between elements”, “Vertical” = 3

25. Check the advanced settings.

26. Click “OK” to confirm the selection.
   \( \Rightarrow \) The new elements appear in the visualization editor. All properties are configured with a precise index and the array variables are indexed.

![Visualization editor with configured elements]
27. Build, start, and download the application.

Visualization at runtime:

You can also configure the template element with array variables that have more than two dimensions, but you can only assign placeholders to a maximum of two of the dimensions. In the additional dimensions, the indexes are fixed.

**Example**

Declaration

```
PROGRAM PLC_PRG
VAR
  asText: ARRAY[1..2, 1..3, 1..6, 1..2] OF STRING;
END_VAR
```

Configure the “Text variables”, “Tooltip variable” property for the template element:

```
PLC_PRG.asText[2, $FIRSTDIM$, $SECONDDIM$, 2]
```
You can configure the template element with a one-dimensional array by means of the index access placeholder $FIRSTDIM$. If the number of new elements to be created is greater than five, then a tabular layout is preset in the "Multiply Visu Element" dialog. The layout of the new elements is as quadratic as possible.

Example

```plaintext
PROGRAM PLC_PRG
VAR
  asText: ARRAY[1..100] OF STRING;
END_VAR
```

The default setting in the "Multiply Visu Element" dialog allows for a layout of 100 new elements in a 10x10 field.

1.3.5.10 Displaying data curve with trace

With this element, you can integrate a trace graph in the visualization that monitors and displays variable values permanently. You configure the displayed trace graph in the element properties. In addition, you can add control elements that control the trace functionality. This is done manually or by using the "Insert Elements for Controlling Trace" command.

Configurations for the 'Trace' visualization element can be taken from the 'Trace' object.
1.3.5.10.1 Getting started with trace

Create a project with the following program PLC_PRG:

PROGRAM PLC_PRG
VAR
   iVar : INT;
   rSin : REAL;
   rVar : REAL;
END_VAR

   iVar := iVar + 1;
   iVar := iVar MOD 33;
   rVar := rVar + 0.1;
   rSin := 30 * SIN(rVar);

1. In the device tree, select the application and add a new visualization by clicking “Project ➔ Add Object ➔ Visualization”.
   ⇨ The respective visualization editor opens.
2. Add the “Visualization” object to the device tree below “Application”.
   ⇨ An empty visualization appears.
3. Open “Toolbox ➔ Special Controls”.
4. Drag the “Trace” element to the visualization editor.
   ⇨ The element properties are displayed on the right side.
5. Click the symbol in the “Trace” property.
   ⇒ The “Trace Configuration” dialog opens.

6. Click “Add Variable” to add an entry to the tree view of the trace configuration and select a project variable (for example, PLC_PRG.rSin).

7. Click the top node of the trace configuration.
   ⇒ The group “Record Settings” is shown on the right.

8. Select the MainTask option for the “Task” setting.
   Tip: The trace recording and the corresponding program should be executed in the same task.

9. Click “OK”.
   ⇒ The task configuration is applied.

10. Select the trace element and click “Visualization ➔ Add Elements for Trace Control”
    ⇒ The “Trace Wizard” dialog opens. By default, all control elements are activated there.

11. Click “OK” to close the dialog.
    ⇒ The control elements are added to the visualization and the control variables are declared. Then the control elements and the trace element are configured with the control variables.

12. Download the application to the controller and start it.

Example

The PLC_PRG program is running on the PLC. When you follow the "Getting Started" instructions, the following interface is displayed:

You can control the trace recording by clicking the buttons.
1.3.5.11 Displaying data curve with trend

A trend visualizes data that is used in the database of a trend recording. In contrast to the trace element, the trend element is particularly appropriate for long-term data recording.

The visualization of a trend encompasses the Trend element and the control elements. The three possible control elements can be seen in the illustration.

- Legend ①: Outputs the trend variables with values.
- Time range picker ②: Provides buttons for selecting predefined time ranges.
- Date range picker ③: encompasses control elements for navigation and zooming in the historical and current data on basis of the set date range.

A cursor is optionally available that enables the reading of a value at a certain time.

You can execute a trend visualization in the following clients:

- Target visualization
- Integrated visualization

See also

- Trend recording
- Chapter 1.3.5.11.1 “Getting started with trend visualization” on page 1165
- Chapter 1.3.5.18.1.35 “Visualization element 'Trend'” on page 1471
- Chapter 1.3.5.18.1.45 “Visualization element 'Date range picker'” on page 1521
- Chapter 1.3.5.18.1.46 “Visualization element 'Time range picker'” on page 1525

1.3.5.11.1 Getting started with trend visualization

When you execute a trend, it is best to proceed with user guidance and the help of the trend wizard.
Development of a visualization with trend

1. Create an empty standard project and program at least one variable into PLC_PRG.
   ⇒ PLC_PRG is declared and implemented
2. Add the “Visualization” object to the device tree below “Application”.
   ⇒ An empty visualization appears.
3. Open “Toolbox ➔ Special control elements”.
4. Drag the “Trend” element to the visualization
   ⇒ The “Trend Recording” dialog opens with the “Recording Settings”.
5. Select the task in which the trend recording will be executed.
   In general the trend recording runs in the same task as the main program, i.e. PLC_PRG.
   Therefore, select MainTask.
6. Add a trend variable with “Add Variable” and assign an IEC variable from PLC_PRG to the trend variable.
7. Click “OK” to close “Trend Configuration”.
   ⇒ There is a newly created object of the type Trend recording under “Trend Recording Manager”. The active visualization contains a trend element that is selected.
8. Click “Visualization ➔ Insert Elements for Controlling Trend Elements”.
   ⇒ The “Trend Wizard” dialog box opens.
9. By default, all three control elements are activated in the dialog. Click “OK” to close the dialog box.
   ⇒ The active visualization contains a trend with control elements.
10. Set the application containing the trend objects to active.
11. Compile the application with [F11].
12. Click “Online ➔ Login”.
13. Start the application with [F5].
   ⇒ The target visualization appears. The visualization contains the trend diagram with the value curve of the variable. The control elements enable user inputs.

See also
- Trend recording
- Chapter 1.3.5.11.2 “Programming a trend” on page 1168
- Chapter 1.3.5.19.2.18 “Command ‘Insert Elements for Controlling the Trend’” on page 1577

Example: Visualization of the sinusoidal trend of an IEC variable.
The following objects are implemented in the project:
- PLC_PRG
- Visualization_Trend1
- VisuWithTrend
PLC_PRG runs as part of the application on the controller.

```plaintext
PROGRAM PLC_PRG
VAR
  iVar : INT;
  rSin : REAL;
  rVar : REAL;
END_VAR

iVar := iVar + 1;
iVar := iVar MOD 33;

rVar := rVar + 0.1;
rSin := 30 * SIN(rVar);
```

Visualization_Trend1 is the object that contains the configuration of the trend recording.
**VisuWithTrend**  

VisuWithTrend is the object that visualizes the trend. The visualization contains four elements: one trend and three control elements. The properties of the trend are defined as follows.

<table>
<thead>
<tr>
<th>Properties</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Trend recording”</td>
<td>Visualization_Trend1</td>
</tr>
<tr>
<td>“Display cursor”</td>
<td>✅</td>
</tr>
<tr>
<td>“Display tool tip”</td>
<td>✅</td>
</tr>
<tr>
<td>“Show frame”</td>
<td>✅</td>
</tr>
<tr>
<td>“Date range picker”</td>
<td>Trend1DateRangeSelector</td>
</tr>
<tr>
<td>“Time picker”</td>
<td>Trend1TimeSelector</td>
</tr>
<tr>
<td>“Legend”</td>
<td>Trend1Legend</td>
</tr>
</tbody>
</table>

**VisuWithTrend at runtime**

**1.3.5.11.2 Programming a trend**

If you edit the properties of the trend you can modify the display of the trend recording. The trend wizard, which also edits the properties of the trend, additionally accesses the properties of the control elements.
The visualization task and the trend recording task generally run under the same application. If this is not the case, then the application containing the visualization task requires a data sources manager.

1. Select a trend in the active visualization editor.
   ⇒ The properties of the trend element are displayed on the right side.
2. Double-click the value field “Properties ➔ Application”.
3. Use the input assistant (… ) to select the application. You can also specify the name of the application directly.

See also

- Trend recording
- Data sources manager

Editing control elements

1. Select a trend in the active visualization editor.
2. Click “Visualization ➔ Insert Elements for Controlling Trend”.
   ⇒ The “Trend Wizard” dialog box opens.
3. Double-click in the configuration table on the “Element Type” of the element
   ⇒ A drop-down list appears.
4. Select an element type.
5. Click in the configuration table on the “Instance Name” of an element
6. Enter the new name.
   ⇒ The name is accepted by clicking “OK” to closed the dialog box.
7. Double-click in the configuration table on the “Position” of the element.
   ⇒ A drop-down list appears.
8. Select a position. You must select the position so that there is no overlap with other elements. Overlapping is indicated by an error message.

After closing the dialog box by clicking “OK”, the control element is moved to the new position.

See also

- Chapter 1.3.5.19.2.18 “Command ‘Insert Elements for Controlling the Trend’” on page 1577

Editing the trend recording

1. Select a trend in the active visualization editor.
   ⇒ The properties of the trend element are displayed on the right side.
2. Click the value field of “Properties ➔ Trend recording”
   ⇒ “Select trend recording” appears. The trend recordings available application-wide are listed under “Available trend recordings”.
3. Select a trend recording under “Available trend recordings”.
4. Click …
   ⇒ The trend recording is located under “Selected trend recording”.

2020/12/10
5. Click “OK” to confirm the entry.
   ⇨ The selected trend recording appears in “Values” in “Properties ➔ Trend recording”.

See also
- Trend recording

### Deleting a control element

A control element that was added with the help of the “Trend wizard” cannot be deleted via the Trend wizard dialog.

1. Select the control element of a trend in the active visualization editor.
2. Delete the element with [Del] or “Delete”.
3. Select the trend in the active visualization editor.
4. Delete the assigned value in “Properties ➔ Assigned control elements ➔ <control element>”.

**NOTICE!**
It is absolutely necessary to delete this reference manually. The property is not deleted automatically by deleting the control element.

### Add a further control element

1. Select a trend in the active visualization editor.
2. Click “Visualization ➔ Insert Elements for Controlling Trend”.
   ⇨ The “Trend Wizard” dialog box opens.
3. By default, all three control elements are activated in the dialog.
4. Determine the position of the control element.
5. Select an element type.
6. Edit the instance of the control element.
7. Click “OK” to close the dialog box.
   ⇨ The configured control element is added.

See also
- Chapter 1.3.5.19.2.18 “Command ‘Insert Elements for Controlling the Trend’” on page 1577

### Configuring the coordinate system of the trend diagram

1. Select a trend in the active visualization editor.
2. Use the command “Visualization ➔ Configure Appearance of Trend”.
   ⇨ The “Edit Appearance” dialog box opens.
3. Change the settings.
Reads a trend value at runtime

1. Open “View ➔ Element Properties”.
2. Select a trend element in your visualization.
   ➔ The properties of the trend element are displayed on the right side.
3. Activate the option “Properties ➔ Show cursor” and “Show tooltip”.
   ➔ A cursor is drawn in the coordinate system.
4. Activate the option “Properties ➔ Show tooltip”.
5. Load the application to the controller and start it.
6. If the diagram “runs”, then the date range has been placed in such a way that its end time is the current time.

Select the date range such that the diagram does **not** run. If necessary, drag the scrollbar to an earlier date range.

   ➔ A cursor is available. The tool tip of the cursor informs you of the trend values. For each trend variable, the legend displays the value at the point in time at which the cursor is positioned.

1.3.5.12 Displaying and editing text files

1.3.5.12.1 Configuring the display of a text file

In order to display a text file that is located on the controller, you need not only the element “Text Editor”, but also control elements for selecting, opening and closing the file. Optionally a text search function can be set up in the file with further control elements.

Example:
1. Drag an element “Text Editor” into the visualization editor.

2. Declare the control variables for the element, for example as global variables in the GVL object.
   
   Refer to the declaration of the control variables for this.

3. For the text editor, configure the property “Editing mode” with “Read only”.

4. Also configure the property “Control variables”.

Assign the following variables there:

- “Control variables ➔ File ➔ Variable” with \texttt{g\_sFileName}
- “Control variables ➔ File ➔ Open” with \texttt{g\_bFileOpen}
- “Control variables ➔ File ➔ Close” with \texttt{g\_bFileClose}
- “Control variables ➔ File ➔ New ➔ Variable” with \texttt{g\_bFileNew}
- “Control variables ➔ File ➔ Save ➔ Variable” with \texttt{g\_bFileSave}
- “Control variables ➔ Edit ➔ Variable” with \texttt{g\_sEditSearchFor}
- “Control variables ➔ Edit ➔ Find” with \texttt{g\_bEditFind}
- “Control variables ➔ Edit ➔ Find next occurrence” with \texttt{g\_bEditFindNext}
Declaring the control variables

VAR_GLOBAL

  g_sFileName: STRING := 'Readme.txt';
  g_bFileOpen : BOOL;
  g_bFileClose: BOOL;
  g_bFileNew: BOOL;
  g_bFileSave: BOOL;
  g_sEditSearchFor : STRING;
  g_bEditFind : BOOL;
  g_bEditFindNext : BOOL;
  g_usiErrorHandlingVarForErrorCode: USINT;
  g_bVarForContentChanged : BOOL;
  g_bVarForReadWriteMode: BOOL;
END_VAR

Configuring control elements for the file selection

1. Add an element “Label”.
2. Configure the property “Texts ➔ Text” with File:
3. Add an element “Rectangle” next to it, in which the user can then enter the file name:
4. Configure the property “Texts ➔ Text” with %s:
5. Configure the property “Texts ➔ Text variable” with g_sFileName.
6. Configure the property “Input configuration ➔ OnMouseclick” with “Write a variable”.
   In the dialog “Input Configuration”, select “Text input” as the “Input type”.
   Activate the option “Use text output variable”.
   ➔ The rectangle for the input of the file name is configured.
7. Add an element “Button” for opening the file.
8. Configure the property “Texts ➔ Text” with Open:
9. Configure the property “Input configuration ➔ OnMouseclick” with “Toggle a variable”.
    Assign g_bFileOpen as a variable.
   ➔ The button Open is configured.
10. Add a further element “Button” for closing the file.
11. Configure the property “Texts ➔ Text” with Close:
12. Configure the property “Input configuration ➔ OnMouseclick” with “Toggle a variable”.
    Assign g_bEditFile as a variable.
   ➔ The button Close is configured.

Control elements for searching for a text.

1. Add an element “Label”.
2. Configure the property “Texts ➔ Text” with Text:
3. Alongside it, add an element “Rectangle” for the input of the text to be found.
4. Configure the property “Texts ➔ Text” with %s:
5. Configure the property “Texts ➔ Text variable” with g_sEditSearchFor.
6. Configure the property “Input configuration ➔ OnMouseclick” with “Write a variable”.
   In the dialog “Input Configuration”, select “Text input” as the “Input type”.
   Activate the option “Use text output variable”.
   ➔ The rectangle is configured.
7. Add an element “Button” for starting the search.
8. Configure its property “Texts ➔ Text” with Find.
9. Configure the property “Input configuration ➔ OnMouseclick” with “Toggle a variable”.
   Assign g_bEditFind as a variable.
10. Also add the action “Execute ST-Code”.
    Program the action with: g_bEditFindNext := FALSE;
    ➔ The button is configured.
11. Add a further element “Button”.
12. Configure the property “Texts ➔ Text” with Find next.
13. Configure the property “Input Configuration ➔ OnMouseclick” with “Toggle a variable”.
    Assign g_bEditFind as a variable.
14. Also add the action “Execute ST code”.
    Program: g_bEditFindNext := TRUE;
    ➔ The button is configured.

   ● § Chapter 1.3.5.18.1.41 “Visualization element 'Text editor'' on page 1494

1.3.5.12.2 Configuring the editing of a text file

In order to be able to create a new text file or edit an existing one on the controller with the text editor in the user interface, you need not only the element “Text Editor”, but also control elements for selecting, opening, closing, saving and creating a file.

Example:

Configuring the element “Text editor”, example:

1. Drag an element “Text Editor” into the visualization editor.
2. Declare the control variables for the element, for example as global variables in the GVL object.
   ➔ Refer below to the declaration of the control variables for this.
3. For the text editor, configure the property “Editing mode” with “Read/Write”.

![Image of text editor interface with file changed message]
4. Also configure the property “Control variables”.

Assign the following variables there:

- “Control variables ➔ File ➔ Variable” with g_sFileName
- “Control variables ➔ File ➔ Open” with g_bFileOpen
- “Control variables ➔ File ➔ Close” with g_bFileClose
- “Control variables ➔ File ➔ Save” with g_bFileSave
- “Control variables ➔ File ➔ New” with g_FileNew

```plaintext
VAR_GLOBAL

g_sFileName: STRING := 'Readme.txt';
g_bFileOpen : BOOL;
g_bFileClose: BOOL;
g_bFileSave: BOOL;
g_FileNew: BOOL;
g_usiErrorHandlingVarForErrorCode: USINT;
g_bVarForContentChanged : BOOL;
g_bVarForReadWriteMode: BOOL;
END_VAR
```

1. Add an element “Label”.

2. Configure it in the property “Texts ➔ Text” with File:

3. Add an element “Rectangle” next to it.

4. Configure its property “Texts ➔ Text” with %s.

5. Configure its property “Texts ➔ Text variable” with g_sFileName.

6. Configure the property “Input configuration ➔ OnMouseclick” with “Write a variable”.
   In the dialog “Input Configuration”, select “Text input” as the “Input type”.
   Activate the option “Use text output variable”.
   ⇧ The rectangle for the input of the file name is configured.

7. Add an element “Button”.

9. Configure the property “Input configuration ➔ OnMouseclick” with “Toggle a variable”.
   Assign g_bFileNew as a variable.
   ⇧ The button New is configured.

10. Add a further element “Button”.

11. Configure the property “Texts ➔ Text” with Open:

12. Configure the property “Input configuration ➔ OnMouseclick” with “Toggle a variable”.
    Assign g_bFileOpen as a variable.
    ⇧ The button Open is configured.

13. Add a further element “Button”.

15. Configure the property “Input configuration ➔ OnMouseclick” with “Toggle a variable”.
    Assign g_bFileSave as a variable.
    ⇧ The button Save is configured.

16. Add a further element “Button”.

17. Configure its property “Texts ➔ Text” with Close.
18. Configure the property “Input configuration ➔ OnMouseclick” with “Toggle a variable”.
Assign g_bEditFile as a variable.
⇒ The button Close is configured.

See also
● Chapter 1.3.5.18.1.41 “Visualization element ‘Text editor’” on page 1494

1.3.5.13 Configuring a variable assignment with unit conversion

A variable that was assigned in a visualization can be linked with a unit conversion. This causes the variable value to be converted according to a predefined rule and the result is edited in the visualization.

You have already configured the conversion rules in the editor of an object of the type “Unit Conversion”.

See also
● Using unit conversion

1.3.5.14 Using recipes in visualization elements

You can manage and use the recipes created in CODESYS by means of a visualization. For this purpose, the input configuration of a visualization element provides the following commands:

● “Read Recipe”
● “Write Recipe”
● “Load Recipe from File”
● “Save Recipe to File”
● “Create Recipe”
● “Delete Recipe”

See also
● Changing Values with Recipes
● Chapter 1.3.5.19.3.6 “Dialog ‘Input Configuration’” on page 1586
Requirement: The “Visualization” object is added to the project.

1. Create a recipe according to the instructions in the section "Changing Values with Recipes - Creating Recipes".
   Assign the following names:
   ● Recipe definition: “Recipes”
   ● Recipes: “Recipe1” and “Recipe2”
   ● Variables: iValue1 and iValue2
   Type in different variable values of both recipes.
2. Open the “Visualization” object in the editor.
3. Drag a “Button” element to the visualization. Label it "Load Recipe 1". You can specify the text by double-clicking the element or in the “Texts ➔ Text” property.
4. Click the value field of the “Input configuration”: “OnMouseDown” property.
   ➔ The “Input Configuration” dialog box opens.
5. Select “Execute command” in the left of the left side and click the button ➔ The configuration of the “Internal command” opens on the right side of the dialog.
6. Select the “Write Recipe” command from the drop-down list.
7. Click the button.
   ➔ The “WriteRecipe” command is added to the list.
8. Specify the first parameter as Recipes and the second parameter as Recipe1.
9. Click “OK” to close the dialog box.
10. Drag a second button to the visualization, name it "Load Recipe 2", and repeat steps 4 to 8. For step 7, specify Recipe2 as the second parameter.
11. Load the program to the controller and start it. Click the “Load Recipe 1” and “Load Recipe 2”, and monitor the variables iValue1 and iValue2.

The other recipe commands are assigned to visualization elements as described in this example. Refer to the help page of the input configuration for a description of the internal commands.

1.3.5.15 Creating a structured user interface

You can reference visualizations that are available or exist in the project in another visualization and thus reuse them. You obtain a structured user interface that consists of several visualizations. In principle you have the following possibilities to reference visualizations.

On the one hand you can display visualizations within a main visualization and toggle between them. The element “Frame” or “Tab control” serves here as a window area element that defines the display area for the referenced visualizations.

On the other hand you can configure a user input for a visualization that causes another visualization to open as a dialog. The requirements for this is that it has the visualization type “Dialog”. A dialog is used to collect inputs from the user.

In addition, you can declare an interface for a visualization that is to be referenced in order to vary the display of the visualization at runtime. A visualization is thereby instanced with different data and executed.
1.3.5.15.1 Displaying multiple visualizations in one visualization

You can reference other visualizations within a main visualization either in a frame or a tab control and then display them in the window pane of the element.

In the case of the “Frame” element, you can freely program which of the visualizations is displayed at which time. One option is to use the switch frame variable of the frame element, which automatically triggers a switch according to its value. You can also program additional controls which, after user input, trigger input actions that result in switching a visualization.

NOTICE!

Visualizations can be nested at any depth by means of frame elements. In order to use the “Switch to any visualization” frame selection type without any problems, a frame must not contain more than 21 referenced visualizations.

For more information, see also the description for the “Input configuration” of an element: Action “Switch frame visualization”.

Moreover, you can use the “Tab control” to reference visualizations. It is easy and advantageous that the tab element provides preconfigured control of the visualization switch.

In CODESYS Store, you will find the sample project “Visualization Switching”. There you will see a visualization that displays other visualizations in a frame area one after another at runtime. The visualization switch is controlled either by the user, programmatically, or via the FrameManager.

Switching frame visualizations by means of a variable

Connecting frame visualizations with a radio button

In the main visualization, the “Frame” element displays one of the referenced frame visualizations at runtime. The user can select the “Radio Button” element which is displayed in the frame.

1. Create a new standard project in CODESYS.
2. Select the application in the device tree and click “Add Object ➔ Visualization”.
3. In the “Add Visualization” dialog, specify the name VisuMain and click “Add” to close the dialog.
4. Select the application in the device tree and click “Add Object ➔ Visualization”.
5. In the “Add Visualization” dialog, specify the name Visu1 and click “Add” to close the dialog.
6. Select the application in the device tree and click “Add Object ➔ Visualization”.
7. In the “Add Visualization” dialog, specify the name Visu2 and click “Add” to close the dialog.
8. Select the application in the device tree and click “Add Object ➔ Visualization”.
9. In the “Add Visualization” dialog, specify the name Visu3 and click “Add” to close the dialog.
   In addition to the main visualization, there are three more visualization objects.
10. Open the Visu1 object.
11. In the “Visualization ToolBox”, in the “Basic” category, select and drag the “Radio Button”
element to the visualization editor.
   ➔ The “Properties” view of the element opens.

12. Configure the properties of the rectangle as follows:
   ● Property “Texts”, “Text” = Visu1
   ● Property “Text properties”, “Font” = “Title”
   ● Property “Colors”, “Normal state”, “Fill color” = “Light gray”

13. Program the object Visu2 accordingly.
    Properties of the rectangle:
    ● Property “Texts”, “Text” = Visu2
    ● Property “Text properties”, “Font” = “Title”
    ● Property “Colors”, “Normal state”, “Fill color” = “Gray”

14. Program the object Visu3 accordingly.
    Properties of the rectangle:
    ● Property “Texts”, “Text” = Visu3
    ● Property “Text properties”, “Font” = “Title”
    ● Property “Colors”, “Normal state”, “Fill color” = “Dark gray”

15. Open the VisuMain object.

16. In the “Visualization ToolBox”, in the “Basic” category, select and drag the “Frame” ele-
    ment to the visualization editor.
   ➔ The “Frame Configuration” dialog opens.

17. In the “Available Visualizations” window area, on the “By Visualization Name” tab, select
    the object Visu1. In “Selected Visualizations”, click “Add”.

18. Then select the object Visu2 and click “Add” in “Selected Visualizations”.

19. Then select the object Visu3 and click “Add” in “Selected Visualizations”.
20. Click “OK” to exit the dialog.

⇒ Now the frame element references the three selected visualizations. In the element properties of the frame element, the references (1) are listed in the “References” property. In addition to the visualization name, the corresponding index value (2) is also displayed.

Note: You can open the dialog when you click the “Configure” button in the value field of the “References” property. See (3). You can influence the index by means of the visualization order in the “Selected Visualizations” list.

21. In the “Visualization ToolBox”, in the “Common Controls” category, select and drag the “Radio Button” element to the visualization editor.

⇒ The “Properties” view of the element opens.

22. In the “Radio button settings”, “Radio Button”, click the “Create new” button.

⇒ This element has three switches to select from.
23. Configure the properties of the radio button as follows:
   - Property “Radio button settings”, “Areas”, “[0]”, “Text” = Visu1
   - Property “Radio button settings”, “Areas”, “[1]”, “Text” = Visu2
   - Property “Radio button settings”, “Areas”, “[2]”, “Text” = Visu3

24. In the PLC_PRG program, declare a local variable for the number of the visualization that is active.
   
   ```
   VAR
   iActiveVisu : INT; // Index of visu activated by the user END_VAR
   ```

25. Select the “Radio Button” element. In the value field of the “Variable” property, click [ ].

26. In the “Input Assistant” dialog, select the recently declared variable. Then exit the dialog.
   - Property of the radio button element:
     - Property “Variable” = PLC_PRG.iActiveVisu

27. Select the “Frame” element. Click in the value field of the “Switch frame variable”, “Variable” property. Specify the recently declared variable here as well.
   - Property of the frame element:
     - Property “Switch frame variable”, “Variable” = PLC_PRG.iActiveVisu

   The control variable of the radio button element is also the switch frame variable of the frame element. User input for the radio button switches the frame visualization.

28. Click “Build ➔ Build”.
29. Click “Online ➔ Login” and start the application.

- The visualization starts. One of the referenced visualizations is running in the frame. When you click an unselected option of the radio button, the visualization switches the contents in the frame to the desired visualization.

In the example, the switch frame variable is connected to an input variable. Instead, you can also set the switch frame variable programmatically in the IEC code.

In the main visualization, the “Frame” element displays one of the frame visualizations at runtime. The user can use buttons to control the display in the frame. The user input triggers the “Switch frame visualization” input action.

Switching frame visualizations by means of a follow-up action

Programming a visualization

1. Create a new standard project in CODESYS.
2. Select the application in the device tree and click “Add Object ➔ Visualization”.
3. In the “Add Visualization” dialog, specify the name VisuMain and click “Add” to close the dialog.
4. Select the application in the device tree and click “Add Object ➔ Visualization”.
5. In the “Add Visualization” dialog, specify the name Visu1 and click “Add” to close the dialog.
6. Select the application in the device tree and click “Add Object ➔ Visualization”.

PLC Automation with V3 CPUs
Programming with IEC 61131-3 editor > CODESYS Visualization
7. In the “Add Visualization” dialog, specify the name Visu2 and click “Add” to close the dialog.
8. Select the application in the device tree and click “Add Object ➔ Visualization”.
9. In the “Add Visualization” dialog, specify the name Visu3 and click “Add” to close the dialog.
   ⇒ In addition to the main visualization, there are three more visualization objects.
10. Open the Visu1 object.
11. In the “Visualization ToolBox”, in the “Basic” category, select and drag the “Rectangle” element to the visualization editor.
   ⇒ The “Properties” view of the element opens.
12. Configure the properties of the rectangle as follows:
   ● Property “Texts”, “Text” = Visu1
   ● Property “Text properties”, “Font” = “Title”
   ● Property “Colors”, “Normal state”, “Fill color” = “Light gray”

![Image of Visu1 rectangle configuration]

13. Program the object Visu2 accordingly.
   ⇒ Properties of the rectangle:
   ● Property “Texts”, “Text” = Visu2
   ● Property “Text properties”, “Font” = “Title”
   ● Property “Colors”, “Normal state”, “Fill color” = “Gray”
14. Program the object Visu3 accordingly.
   ⇒ Properties of the rectangle:
   ● Property “Texts”, “Text” = Visu3
   ● Property “Text properties”, “Font” = “Title”
   ● Property “Colors”, “Normal state”, “Fill color” = “Dark gray”
15. Open the VisuMain object.
16. In the “Visualization ToolBox”, in the “Basic” category, select and drag the “Frame” element to the visualization editor.
   ⇒ The “Frame Configuration” dialog opens.
17. In the “Available Visualizations” window area, on the “By Visualization Name” tab, select the object Visu1. In “Selected Visualizations”, click “Add”.
18. Then select the object Visu2 and click “Add” in “Selected Visualizations”.
19. Then select the object Visu3 and click “Add” in “Selected Visualizations”.

20. Click “OK” to exit the dialog.

⇒ Now the frame element references the three selected visualizations. In the element properties of the frame element, the references (1) are listed in the “References” property. In addition to the visualization name, the corresponding index value (2) is also displayed.

Note: You can open the dialog independently when you click the “Configure” button in the value field of the “References” property. See (3). You can influence the index by means of the visualization order in the “Selected Visualizations” list.

21. In the “Visualization ToolBox”, in the “Common Controls” category, select and drag the “Button” element to the visualization editor.

⇒ The element is selected and its properties are visible in the “Properties” view.

23. In the “Input configuration” “OnMouseDown” property, click “Configure”.

⇒ The “Input Configuration” dialog opens.

24. Select the “Switch frame visualization” action and click .

⇒ The action is displayed in the window on the right.

25. Configure the action:

- Select the “Switch local visualization” option.
- Set the “Visualization selection” to Visu1.
- Click “OK” to exit the dialog.

⇒ The follow-up action is configured in the “Input configuration” property.

Property “Input configuration”, “OnMouseDown”, “Switch frame visualization” = 0
26. Drag another “Button” element to the visualization editor. Configure the button accordingly.
   - Properties of the button:
     - Property “Texts”, “Text” = Visu2
     - Property “Input configuration”, “OnMouseDown”, “Switch frame visualization” = 1

27. Drag another “Button” element to the visualization editor. Configure the button accordingly.
   - Properties of the button:
     - Property “Texts”, “Text” = Visu3
     - Property “Input configuration”, “OnMouseDown”, “Switch frame visualization” = 2

28. Click “Build ➔ Build”.
29. Click “Online ➔ Login” for the device and start the application.
   - The visualization starts. One of the referenced visualizations is running in the frame. When you click one of the buttons, the visualization switches the contents in the frame to the respective visualization.

Displaying visualizations in a tab control
For the “Tab control”, the navigation of the referenced visualizations is provided automatically. The first of the referenced visualizations is in the foreground, while the others are hidden behind it. The user can navigate between them by means of the tabs which are provided automatically.

Configuring a tab control
1. Create a new standard project in CODESYS.
2. Select the application in the device tree and click “Add Object ➔ Visualization”.

2020/12/10
3. In the “Add Visualization” dialog, specify the name VisuMain and click “Add” to close the dialog.

4. Select the application in the device tree and click “Add Object ➔ Visualization”.

5. In the “Add Visualization” dialog, specify the name Visu1 and click “Add” to close the dialog.

6. Select the application in the device tree and click “Add Object ➔ Visualization”.

7. In the “Add Visualization” dialog, specify the name Visu2 and click “Add” to close the dialog.

8. Select the application in the device tree and click “Add Object ➔ Visualization”.

9. In the “Add Visualization” dialog, specify the name Visu3 and click “Add” to close the dialog.

⇒ In addition to the main visualization, there are three more visualization objects.

10. Open the Visu1 object.

11. Drag a “Rectangle” element to the visualization editor.

⇒ The “Properties” view of the element opens.

12. Configure the properties of the rectangle as follows:

- Property “Texts”, “Text” = Visu1
- Property “Text properties”, “Font” = “Title”
- Property “Colors”, “Normal state”, “Fill color” = “Light gray”

13. Program the object Visu2 accordingly.

⇒ Properties of the rectangle:

- Property “Texts”, “Text” = Visu2
- Property “Text properties”, “Font” = “Title”
- Property “Colors”, “Normal state”, “Fill color” = “Gray”

14. Program the object Visu3 accordingly.

⇒ Properties of the rectangle:

- Property “Texts”, “Text” = Visu3
- Property “Text properties”, “Font” = “Title”
- Property “Colors”, “Normal state”, “Fill color” = “Dark gray”

15. Open the VisuMain object.

16. In the “Visualization ToolBox”, in the “Basic” category, select and drag the “Frame” element to the visualization editor.

⇒ The “Frame Configuration” dialog opens.
17. In the “Available Visualizations” window area, on the “By Visualization Name” tab, select the object Visu1. In “Selected Visualizations”, click “Add”.

18. Then select the object Visu2 and click “Add” in “Selected Visualizations”.

19. Then select the object Visu3 and click “Add” in “Selected Visualizations”.

20. Click “OK” to exit the dialog.

➤ Now the frame element references the three selected visualizations. In the element properties of the frame element, the references (1) are listed in the “References” property. In addition to the visualization name, the corresponding index value (2) is also displayed.

Note: You can open the dialog “Frame Configuration” dialog independently when you click the “Configure” button in the value field of the “References” property. See (3). You can influence the index by means of the visualization order in the “Selected Visualizations” list.

21. In the “Visualization ToolBox”, in the “Common controls” category, select and drag the “Tab control” element to the visualization editor.

➤ The “Properties” view of the element opens.
22. Configure the properties of the tab as follows:
   - Property “Tab width”: 40
   - Property “References”, Visu1, “Header” = Visu1
   - Property “References”, Visu2, “Header” = Visu2
   - Property “References”, Visu3, “Header” = Visu3

23. Click “Build ➔ Build”.
24. Click “Online ➔ Login” for the device and start the application.
   ➔ The visualization starts. One of the referenced visualizations is running in the tab control. Click the tab to switch to the respective visualization.

1.3.5.15.2 Calling a visualization with an interface

You can declare an interface for parameters for a visualization that is to be referenced. The actual parameters are passed to the interface (similar as in the case of a function block) when the visualization is called at runtime.
First of all, declare the interface variables in the visualization interface editor. Then configure the parameters that are transferred to the interface by assigning a data-type-compliant application variable to each interface variable. The assignment is configured in the “References” property in the case of a frame or a tab control.

Depending on the display variant, the parameter transfer of local variables (with the VAR scope) is limited. If you execute the visualization as an integrated visualization, you can only transfer local variables having a basic data type as parameters. If the visualization is called as CODESYS TargetVisu or CODESYS WebVisu, then you can also transfer parameters with a user-defined data type.

If you have configured visualization references and then save a change to the variable declaration for one of these visualizations in an interface editor, then the “Updating the Frame Parameters” dialog appears automatically. The dialog prompts you to edit the references. A list of all the visualizations affected is displayed there, so that the parameter transfers can be reassigned at the changed interface.

When the dialog is closed, the changes are accepted and the elements affected are displayed in the “References” property.

User-controlled update of the transfer parameters

If you have configured visualization references and then save a change to the variable declaration for one of these visualizations in an interface editor, then the “Updating the Frame Parameters” dialog appears automatically. The dialog prompts you to edit the references. A list of all the visualizations affected is displayed there, so that the parameter transfers can be reassigned at the changed interface.

When the dialog is closed, the changes are accepted and the elements affected are displayed in the “References” property.

Calling visualization with interface (VAR_IN_OUT)

- Requirement: The project contains a visualization and a main visualization. The main visualization contains an element that the visualization references.
  1. Open the visualization.
  2. Click “Visualization ➔ Interface Editor”.
  3. Declare a variable in the interface editor.
     - The visualization has an interface and the “Updating the Frame Parameters” dialog appears.
  4. Assign a type-compliant transfer parameter to the interface variables in all calls by entering an application variable in “Value”. Close the dialog.
     - A transfer parameter is assigned at the points where the visualization is to be referenced. These now appear in the main visualization in the “References” property.
The visPie visualization contains an animated, colored pie. The visMain main visualization calls the visPie visualization multiple times in a tab control. Color information, angle information, and label are transferred via the pieToDisplay interface variable. The pies vary at runtime.

Visualization visPie:

```
VAR_IN_OUT
  pieToDisplay : DATAPIE;
END_VAR
```

Main visualization visMain:

```

  iDegree : INT; // Variable center angle for the pie element
  used for animation
END_VAR

IF iInit = TRUE THEN
  pieA.dwColor := GVL.c_dwBLUE;
  pieA.iStart := 0;
  pieA.sLabel := 'Blue';

  pieB.dwColor := GVL.c_dwGREEN;
  pieB.iStart := 22;
  pieB.sLabel := 'Green';

  pieC.dwColor := GVL.c_dwYELLOW;
  pieC.iStart := 45;
  pieC.sLabel := 'Yellow';

  iInit := FALSE;
END_IF

iDegree := (iDegree + 1) MOD 360;

pieA.iEnd := iDegree;
pieB.iEnd := iDegree;
pieC.iEnd := iDegree;

Main visualization visMain at runtime:
In order to obtain and output the instance name of a transfer parameter, you can implement an interface variable (data type STRING) with the pragma \{attribute 'parameterstringof'} in the VAR_INPUT scope.

The project contains a visualization and a main visualization. The main visualization contains elements that the visualization references.

1. Open the visualization.
2. Click “Visualization ➔ Interface Editor”.
3. Declare an interface variable (VAR_IN_OUT).
   \(\text{pieToDisplay} : \text{DATAPIE}\);
4. In the interface editor, declare a variable (VAR_INPUT) with attribute \{attribute 'parameterstringof'}.
   \(\{\text{attribute 'parameterstringof'} := \text{pieToDisplay}\}\)
   \(\text{sNameToDisplay} : \text{STRING}\);
5. Save the changes.
   \(\text{The “Updating the Frame Parameters” dialog does not open.}\)
6. Insert a “Text Field” element.
7. In the “Texts”, “Text” property, assign an output text to the text field.
   \(\text{Visualization of %s}\)
8. In the “Text variables” “Text variable” property, assign the interface variable to the text field.
   \(\text{sNameToDisplay visPie has a heading.}\)
The `visPie` visualization consists of one pie until now. The `visMain` main visualization calls `visPie` in a tab control three times with different transfer parameters.

The `visPie` is extended with a text field that outputs the name of the parameters actually passed to the visualization. For this, the interface of `visPie` is extended with a string variable that contains the instance name of the specified transfer parameter. At runtime, each pie is overwritten.

### Table 254: Properties of the “Text field” element:

<table>
<thead>
<tr>
<th>“Texts”, “Text”</th>
<th>Visualization of <code>%s</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>“Text variables”, “Text variable”</td>
<td>sNameToDisplay</td>
</tr>
</tbody>
</table>

### Interface of the ‘visPie’ visualization:

```plaintext
VAR_INPUT
  {attribute 'parameterstringof' := 'pieToDisplay'}
  sNameToDisplay : STRING;
END_VAR
VAR_IN_OUT
  pieToDisplay : DATAPIE;
END_VAR
```

### Main visualization `visMain` at runtime:

The visualization is displayed in three tabs, each with its own color: blue, green, and yellow. The text field outputs the name of the parameter associated with each pie.
1.3.5.15.3 Calling a dialog in a visualization

You can configure a user input for a visualization that causes a referenced visualization to open as a dialog. For example, a user clicks on a button, whereupon a dialog opens requesting the input of values. A dialog is used to collect user inputs and, if it is modal, it can lead to inputs outside the dialog being blocked.

Only visualizations with the visualization type “Dialog” can be opened as dialog. The visualization type is configured in the dialog “Properties” of a visualization object.

Basic procedure:

☑ Requirement: The project contains a main visualization and a dialog.

1. Configure a user input for the main visualization with the action “OpenDialog” for the dialog.
   ➔ The opening of the dialog is configured.

2. Configure a user input for an element of the dialog with the action “CloseDialog”.
   Hint: in the case of non-modal dialogs you can also configure the user input for closing outside the dialog.
   ➔ The closing of the dialog is configured.

You can also use dialogs from the library instead of self-made dialogs. For example, if the library VisuDialogs is integrated in the project, you can use the dialogs VisuDialogs>Login or VisuDialogs.FileOpenSave contained in it.

- Chapter 1.3.5.19.3.3 “Dialog ‘Updating the Frame Parameters’” on page 1584

Configuring a visualization object as a dialog

1. Select the object in the view “Devices”, open the context menu and select the command “Properties”.
2. Select the tab “Visualization”.
3. Activate the option “Dialog” and close the dialog with “OK”.
   ➔ The visualization has the visualization type “Dialog” and can be called as such.

Configuring a dialog call

When calling a dialog, a user normally clicks on a button, whereupon a dialog opens requesting an input.

In the following example, a dialog representing a calendar enables a date to be entered.
Requirement: The project contains the visualizations `visMain` and `dlgCalender`.

1. Set the visualization type of `dlgCalender` to Dialog.
2. Drag a rectangle into the visualization `visMain`.
3. Configure the property “Texts ➔ Text” with the text `Due Date: %t[yyyy-MM-dd]`.
   Configure the property “Text variables ➔ Text variable” with `PLC_PRG.dateDue`.
4. Drag a button into the visualization.
5. Configure the property “Texts ➔ Text” with the text `Open dialog`.
   Configure the property “Input configuration ➔ OnMouseClick” for the action “Open Dialog” with `dlgCalender`.
   ➔ The user input for the opening of the dialog is configured.
6. Double-click on the dialog `dlgCalender`.
7. Drag the element “Date picker” into the visualization editor.
8. Configure the property “Texts ➔ Text” with `Due Date: %t[yyyy-MM-dd]`.
   Configure the property “Variable” with `PLC_PRG.dateCalender`.
   ➔ The element is configured.
9. Drag a button into the visualization editor.
10. Configure the property “Texts ➔ Text” with `OK`.
11. Configure the property “Input configuration ➔ OnMouseClick” for the action “Close Dialog” with `dlgCalender`, Result: OK.
12. Configure a further property “Input configuration ➔ OnMouseClick” for the action “Execute ST-Code” with `PLC_PRG.dateDue := PLC_PRG.dateCalendar;`.
   ➔ The user input for the closing of the dialog is configured.
13. Drag a further button into the visualization editor.
14. Configure the property “Texts ➔ Text” with `Cancel`.
15. Configure the property “Input configuration ➔ OnMouseClick” for the action “Close Dialog” with `dlgCalender`, Result: Cancel.
   ➔ The user input for the cancellation of the dialog is configured.
17. Compile, load and start the application.

**Variable declaration:**

```plaintext
PROGRAM PLC_PRG
VAR
  dateDue : DATE := DATE#2000-01-01;
  dateCalendar : DATE;
END_VAR
```

**Opening a dialog globally**

Normally a dialog appears only on the display variant on which the user has executed the triggering event.

However, you can configure the opening of the dialog in such a way that the dialog appears simultaneously on all active display variants configured under the visualization manager. This way, for example, an input request can appear simultaneously on all display variants although a user only entered something on the CODESYS TargetVisu.

If a user closes the dialog on a CODESYS TargetVisu display variant, it will be closed on all display variants.
You can open and close a global dialog with the functions `OpenDialog3` and `CloseDialog2` from the library `VisuElems`.

In the application code you can implement the access to a dialog that is managed in the dialog manager. The dialog manager automatically instances and manages all visualizations of the type “Dialog”. The access takes place via the internal visualization manager.

First of all, implement the access to the dialog manager by calling the `GetDialogManager()` method of the internal visualization manager. You can then use the methods of the dialog manager to program the program sequence of a dialog.

In the following example a button is configured so that it opens the preconfigured dialog `Login` when clicked on. The user can enter a name and a password in the dialog. The dialog `Login` is contained in the library `VisuDialogs`. You can also call a self-made dialog in the same way.

**Requirement:** The library `VisuDialogs` is integrated in the project.

1. Insert a new visualization `visMain` under the application.

2. Drag a button into the visualization editor. The visualization editor opens.

3. Enter in its property “Text” `Login`. The button is labelled.

4. Click on “Configure” in the property “Input configuration OnMouseDown”.

5. Select the input action “Execute ST-Code” and click on .

6. Enter the following function call in the ST editor: `OpenLoginDialog(pClientData)`; The main visualization contains a button. If a user clicks on the button, the dialog `Login` opens and the function `OpenLoginDialog()` is called.

7. Click on “Configure” in the property “Input configuration OnDialogClosed”.

8. Select the input action “Execute ST-Code” and click on .

9. Enter the following function call in the ST editor: `OnLoginDialogClosed(pClientData)`; If a user closes the dialog, the function `OnLoginDialogClosed()` is called.

```st
FUNCTION OpenLoginDialog : BOOL
VAR_INPUT
    pClientData : POINTER TO VisuStructClientData;
END_VAR

VAR
    dialogMan : IDialogManager;
```

2020/12/10
dialogMan := g_VisuManager.GetDialogManager(); // The DialogManager is provided via the implicitly available VisuManager IF dialogMan <> 0 AND pVisuClient <> 0 THEN loginDialog :=
dialogMan.GetDialog('VisuDialogs.Login'); // Dialog to be opened is specified
END_IF

FUNCTION OnLoginDialogClosed : BOOL
VAR_INPUT
    pClientData : POINTER TO VisuStructClientData;
END_VAR

VAR
    dialogMan : IDialogManager;
    loginDialog : IVisualisationDialog;
    pLoginInfo : POINTER TO Login_VISU_STRUCT;
    result : Visu_DialogResult;
    stPassword : STRING;
    stUsername : STRING;
END_VAR

dialogMan := g_VisuManager.GetDialogManager(); // The DialogManager is provided via the implicitly available VisuManager IF dialogMan <> 0 AND pVisuClient <> 0 THEN
    loginDialog :=
dialogMan.GetDialog('VisuDialogs/Login'); // Gets the login dialog
    IF loginDialog <> 0 THEN
        result := loginDialog.GetResult(); // Gets the result (OK, Cancel) of the dialog
        IF result = Visu_DialogResult.OK THEN
            loginDialog.SetResult(Visu_DialogResult.None); // Reset to default (none)
            pLoginInfo :=
dialogMan.GetClientInterface(loginDialog, pVisuClient); // Structure Login_VISU_STRUCT gets read;
            // In the following the structure parameters can be set
            IF pLoginInfo <> 0 THEN
                stPassword :=
            END_IF
        END_IF
    ELSE
        stPassword :=
    END_IF
END_FUNCTION

OnLoginDialogClosed() defines the reaction to the closing of a dialog.
pLoginInfo^.stPassword := ''; // Reset the password
stUsername := pLoginInfo^.stUsername;
END_IF
ELSIF result = Visu_DialogResult.Cancel THEN
loginDialog.SetResult(Visu_DialogResult.None); // React on 'Cancel'
ELSE
// nothing to do
END_IF
END_IF
END_IF
END_IF

1.3.5.15.4 Call dialog with interfaces

You can define an interface for a visualization that is called as a dialog.

Create a visualization for this with visualization type “Dialog” and declare an interface for the dialog. The reference the visualization in a primary visualization by means of a user input and transfer the parameters to the interface.

If you call the visualization as an integrated visualization, then the parameter that are transferred must be variables of a basic data type. If the visualization is called as CODESYS Target-Visu or CODESYS WebVisu, then the parameters can have user-defined data types as well.

See also
● Chapter 1.3.5.19.2.1 “Command 'Interface Editor’” on page 1556
● Chapter 1.3.5.19.3.15 “Dialog 'Properties’ of Visualization Objects” on page 1603

Main procedure

1. Set the visualization types of the visualization to dialog.
2. Declare variables in the interface editor of the dialog.
   ⇒ The dialog has an interface. You can transfer parameters when calling the dialog.
3. Configure the elements of the dialog and use the interface variables.
4. Select an element in another visualization (usually the main visualization) for configuring how the dialog opens.
5. Click “Configure” in the property “Input configuration ⇒ OnMouseDown”.
   ⇒ The “Input Configuration” dialog box opens.
6. Select “Open dialog” in the list of selected input actions.
7. Select one from the “Dialog” drop-down list.
   ⇒ If the selected dialog has an interface, then the interface variables are listed below.
8. Assign a transfer parameter to the interface variables in the “Value” column.
9. Select the result for which the parameters were updated in the list “Update” ⇒ “and” ⇒ “Parameter in case of results”.
10. Activate the option “Open dialog modal”. Click “OK” to close the dialog box.
    ⇒ The dialog opening is configured.
Executing a dialog several times at the same time requires multiple instances of the dialog. These must have already been downloaded to the visualization device when downloading the application. For this purpose, set the number of instances to download in the visualization manager ("Visualizations" tab).

Example

the following application calls the “Change User Level” dialog and prompts the user to select a level and specify a password. If the password agrees, then the “OK” button is enabled. Then the user can close the dialog. The input of the level is also applied.
Dialog visChangeUserLevel:

Declaration of the interface of dialog visChangeUserLevel:

</tbody>
</table>

Table 258: List “Update” and “Parameter in case of result”

<table>
<thead>
<tr>
<th>“Value”</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“OK”</td>
<td>activated</td>
</tr>
</tbody>
</table>

“Open in dialog mode” activated input outside of the dialog is not possible.

**Application code PLC_PRG:**

```plaintext
PROGRAM PLC_PRG
VAR
iLevel: INT;
sPwd : STRING;
END_VAR
```
After clicking the button, the dialog opens and permits input. If the specified text agrees with the stored text, then “OK” is enabled:

After clicking “OK”, the selection is applied.

The example shows the procedure for multiple return values. However, the password can be returned more easily with a local variable in the dialog.
The variables declared in the interface of a visualization are available automatically as structure variables. They are identified by `<Name of visualization>_VISU_STRUCT`. Therefore, you can access the interface variables of visualizations that appear as a dialog. Normally you use the structure in the application code of a function that is called by a user input.

To pass a complex data structure, you can flag an interface variable of type `VAR_IN_OUT` with the pragma attribute `VAR_IN_OUT_AS_POINTER` and pass a pointer or reference to it as a parameter.

1. Declare the user data object (`DUT`).
2. In the interface editor of a dialog, declare an interface variable (`VAR_IN_OUT`) as a reference to the data object by assigning the attribute `VAR_IN_OUT_AS_POINTER` to the variable.
3. Program the user interface: use the dialog in a visualization or assign the dialog in the input configuration of a visualization element. Then access to the referenced data is possible.
Example:
Using an interface with the pragma "VAR_IN_OUT_AS_POINTER"

```
FUNCTION_BLOCK ControlFB
VAR_INPUT
END_VAR
VAR_OUTPUT
END_VAR
VAR
  bOk : BOOL := TRUE;
  nCounter : INT;
  nValue : INT;
END_VAR
nCounter := nCounter + 1;
```

Declaration of an interface variable with VAR_IN_OUT_AS_POINTER
User interface: dialog opens:

```
VAR_INPUT
  nValueIn : INT;
END_VAR
VAR_IN_OUT
  {attribute 'VAR_IN_OUT_AS_POINTER'}
    controller : ControlFB;
END_VAR
VAR_OUTPUT
  nValueOut : INT;
END_VAR
```
1.3.5.16 Configuring and executing display variants

You can execute the visualization created in CODESYS as a display variant. You can execute just one or also several display variants at the same time. The content of the visualization is thereby always the same in all variants, even if several variants are executed at the same time. If CODESYS is opened in addition, the same content of visualization is also displayed in the visualization editor at runtime (with the same content).

For the configuration of each display variant of your visualization, you use an corresponding object under the visualization manager. If no object is inserted under the visualization manager, the visualization is automatically displayed as an integrated visualization when the application is started.

The following object types are available to you:

- WebVisu

You can execute a display as CODESYS TargetVisu, but you can also execute your visualization any number of times as CODESYS WebVisu and thus also insert any number of objects with the object type WebVisu.

As soon as an object exists under the visualization manager, the visualization task VISU_TASK is automatically inserted under the task configuration. The task is automatically deleted if no more objects exist under the visualization manager or if the objects under it are excluded from compilation. You can configure an individual object accordingly in its dialog "Properties" on the tab "Compile".

See also

- "Chapter 1.3.5.18.4 “Attribute 'VAR_IN_OUT_AS_POINTER'” on page 1554"
If an error or an exception occurs in a visualization at runtime, the execution of the visualization is stopped without stopping the execution of the application. An error screen appears informing you of this. In addition, the error screen (usually) enables you to restart the visualization. This exception handling takes place from visualization profile CODESYS V3.5 SP7, compiler version 3.5.7.0 and a runtime system from version 3.5.7.0.

Select the command “Stop Execution at Handled Exceptions” in order to investigate the cause of the occurrence of exceptions and the error position.

See also
- ‘Stop execution on handled exceptions’

In order to programmatically identify a display variant, the VisuFbClientTagDataHelper library module from the VisuElemBase library is available to you. The library itself is referenced in VisuElems. The library module is typically called with VisuElems.VisuFbClientTagDataHelper.

Further information on this library module can be found in its documentation in the library manager.

See also
- Using library modules

### Executing as CODESYS WebVisu

**NOTICE!**

**Recommendations for data security**

In order to minimize the risk of breaches of data security, we recommend the following organizational and technical measures for the system on which your applications run:

As far as possible, avoid exposing the PLC and control networks to open networks and the Internet. For protection, use additional data link layers such as a VPN for remote access and install firewall mechanisms. Limit access to authorized persons, change any existing standard passwords during the initial commissioning and continue to change them regularly.

If you nevertheless wish to publish your web visualization, it is urgently recommended that you provide it at least with simple password protection in order to prevent anyone accessing your control functionality over the Internet. (See an example in the project SimpleWebvisuLogin.project, which is provided with the standard installation of the development system).

**Use the latest versions of the gateway server and the web server.**

You can execute a visualization as CODESYS WebVisu.

The requirement for this is that the runtime system contains a web server with WebVisu support. This enables communication between target system and web browser. The web server on the target system is started as soon as an application with WebVisu configuration is started and runs until all applications with WebVisu are ended. The device can then display visualizations in connected HTML5-capable web browsers.

The web-based display variant of the CODESYS Visualization enables remote access to a plant as well as its remote monitoring, service and diagnosis over the Internet. A web browser communicates by Java Script (optionally with SSL encryption) with the web server in the controller and displays the visualization by means of HTML5. This technology is supported by virtually all browsers and is thus also available on terminal devices with iOS or Android.
Configuring and starting display variants

- An executable visualization `visMain` exists in the project.
1. Select the object “Visualization manager” and select the command “Add object”.
2. Select the object “WebVisu” and enter the name `WebVisu_A`.
   - There is a new object in the device tree underneath the object “Visualization Manager”. The associated editor opens.
   - The visualization task `VISU_TASK` is automatically added under the task configuration.
3. Select the visualization `visMain` in the “Start Visualization”.
4. In “Name of .htm file”, enter the name `webvisuA`.
5. Click on “Show used visualizations” and check whether the selected visualization is activated for a download to the associated device.
   - The visualization is configured. The settings under “Scaling options” determine the window size and the scaling.
6. Start a suitable runtime system with web server and WebVisu support.
   - Configure the communication settings for your system.
   - The runtime system runs.
7. Compile, load and start the application.
   - The application and the web server run.
8. Start a web browser with the following address: `http://localhost:8080/webvisuA.htm`
   - The page is displayed and you can see the data of the application and operate the application.

See also
- Chapter 1.3.5.19.4.7 “Object ‘TargetVisu’” on page 1623

Calling a page in the web server

- Requirement: A visualization with WebVisu is started.
1. Start a current browser with JavaScript and support of HTML5-Canvas, e.g. Firefox, Chrome, IE>=9.
2. Enter the following address in the web browser:
   - `http://localhost:8080/webvisu.htm`
   - The page is displayed and you can see the data of the application and operate the application.
Identifying WebVisu

In order to be able to identify a WebVisu with the help of the library block `VisuFbClientTagDataHelper`, the WebVisu needs a name. In order to be able to specifically address it in the application, expand the URL call by the parameter `ClientName=<Name>`.

See also
- Chapter 1.3.5.19.4.8 “Object ‘WebVisu’” on page 1624

1.3.5.16.2 Executing as an Integrated Visualization

You can execute the visualization as an integrated visualization. In this case a display variant of the visualization runs on the development system **without** the visualization code being loaded to the controller.

Use the integrated visualization for the testing and diagnosis of your application, or for the service and commissioning of a plant.

The requirement for this is that there are no objects under the visualization manager. Alternatively, any objects located there can be excluded from compilation. You can configure an individual object accordingly in its dialog “Properties” on the tab “Compile”.

See also
- Chapter 1.3.5.19.3.15 “Dialog ‘Properties’ of Visualization Objects” on page 1603

Configuring and starting display variants

- A visualization project is open.
- Remove all objects from underneath the visualization manager or exclude the objects from compilation.
  - The VISU_TASK has been removed from under the task configuration.
- Load the application to the controller.
  - Now no visualization code will be transferred on loading the application.
- Start the application.
  - The visualization in the visualization editor is being executed. You can operate your application.

Use the command “Activate keyboard usage” in order to toggle between the keyboard usage of the integrated visualization and the keyboard usage of CODESYS.

See also
- Chapter 1.3.5.19.2.4 “Command ’Activate Keyboard Usage’” on page 1560
- Chapter 1.3.5.19.1 “Keyboard Shortcuts for Default Keyboard Action” on page 1555

Restrictions in the variable output

Numerical variable values, which are output within a text in an integrated visualization, are displayed according to the current display format. You can select the display format with the command “Debug ➔ Display”.
See also

- Command 'Display' – 'Binary', 'Decimal', 'Hexadecimal'

Data server restrictions
A variable value that is transferred via the data server is not output. The integrated visualization only outputs the initialization or the last transferred value.

The integrated visualization thus only enables a passive observation of the application.

Restrictions in variable types
VAR_INPUT variables behave like integrated visualizations such as VAR_IN_OUT variables during execution.

Restrictions in expressions and monitoring
Only the following expressions, which are also used in the monitoring mechanism of the development system, are supported in an integrated visualization.

Variable access:
- Example: PLC_PRG.myPou.nCounter

Array access:
- Access to an array of scalar data types, where a variable is used as an index
  Example: a[i]
- Access to an array of complex data types (structure, function block, array), where a variable is used as an index
  Example: a[i].x
- Access to a multidimensional array of all kinds of data types with one or more variable indices
  Example: a[i, 1, j].x
- Access to an array with constant index
  Example: a[3]
- Accesses like those described above in which simple operators are used for the calculations inside the index brackets.
  Example: a[i+3]
- Nested combinations of the complex expressions listed above
  Example: a[i + 4 * j].aInner[j * 3].x

Operators in index calculations:
- +, -, *, /, MOD

Pointer monitoring:
- Example: p^.x

Methods and function calls are not supported with the exception of the following:
- Standard string functions
- Type conversion functions
  Example: INT_TO_DWORD
- Operators such as SEL, MIN, etc.

Restrictions in the input action “Execute ST-Code”
When the input action “Execute ST-Code” is called, only a list of assignments is supported. If a list of assignments is used, the value of the left-hand side is not assigned until the next cycle. Processing in the next row immediately afterwards is not possible.
Example

```plaintext
PLC_PRG.n := 20 * PLC_PRG.m; // Don't use this!
IF PLC_PRG.n < MAX_COUNT THEN
  PLC_PRG.n := PLC_PRG.n + 1;
END_IF
//Use the following!
PLC_PRG.n := MIN(MAX_COUNT, PLC_PRG.n + 1);
```

Restrictions in the interface of a visualization

No interface (INTERFACE) may be declared in the interface editor of a visualization.

1.3.5.16.3 Configure File Transfer Mode

When downloading, usually files required by the visualization for displaying, are transmitted to the respective display unit. These are especially image files or text list files.

Alternatively, you can configure, that the visualization accesses local files. So no files are transferred with a download.

The following configuration is required to allow the visualization access to local files:

- The file paths for image files or text files lists are relative.
- The link type for image files is “Link to file”.

### Using local visualization files

- **Requirement:** You have opened a visualization project with an image pool.
  1. Open the image pool.
  2. Select for each image under “Link Type” the setting “Link to file”.
     - The image is linked.
  3. Select the command “Project ➔ Project Setting” and select the category “Visualization”.
  4. Insert in tab “General” in “Image files” the local paths of the image files with relative path names.
     - Example: `.\\images\`
     - Note: When no path is specified, the setting in dialog box “Options”, category “Visualization”, tab “File Options” setting “Image files” is used.
  5. Open the visualization manager.
  6. Activate under “Extended settings” the option “Visible”.
  7. Activate under “File Transfer Mode” the option “Use local visualization files”.
     - When downloading, no files are transferred. When displaying the visualization, the local files are used.

- `Object 'Image pool'`
  - Chapter 1.3.5.19.3.13 “Dialog ‘Project Settings’ - ‘Visualization’” on page 1602
1.3.5.17 Applying visualization styles

A visualization style is a collection of colors, fonts, images, and any values that are defined as style properties. When designing a visualization element, you can use these style properties only. The you have a uniform, style-dependent appearance.

An element that applies style colors and style fonts behaves according to the selected style design in each selected style. In this way, a style property, such as Element basic color, can be blue in one style and gray in another style. In contrast, if the color of an element has a fixed value, this color is fixed even when the style is switched.

All applicable styles are consistent because they define a fixed set of style properties. Therefore, you can switch smoothly between styles in order to customize your visualization. You can preview a style to get an impression of how it behaves.

CODESYS provides different styles, for example the styles Flat style and White Style. These provided styles are installed in the visualization style repository.

The selected style that applies to all visualizations in the application is set in the “Visualization Manager” object (“Settings” tab, “Style Settings” group, “Selected style”). In addition, the “Properties” view provides its style properties when designing an element. For each element, you can assign these styles instead of fixed values.

The style is applied to all visualizations that are below an application. The settings of the “Options - Visualization Styles” dialog are also considered for a library visualization or a visualization in the POUs view.

See also
- Chapter 1.3.5.19.3.11 “Dialog 'Project Environment' - 'Visualization Styles’” on page 1601
- Chapter 1.3.5.19.3.7 “Dialog 'Options' - 'Visualization Styles'” on page 1597

Designing visualization elements with style properties

The set style includes style properties. These are provided in the “Properties” view of an element in the drop-down list of the “Value” column. It is checked which style properties are appropriate for which property. For example, only style properties with color definitions are available for a color assignment.

A style can have directly defined visualization element properties. If this style is used in the project, then these properties are not configurable anymore.

Requirement: A project is open with a visualization.

1. Double-click the visualization.
2. Select an element.
3. Choose “View ➔ Element Properties”.
4. Click in the input field of a color in the window “Properties” (category “Colors”).
   - The list box opens with style properties. The style colors are based on the currently selected style.
5. Select a style property.
   - The visualization shows the element according to the style.

Example

A visualization uses the style CompanyStyle8, which defines the colors CompanyRed, CompanyBlue, and CompanyGreen. An element is selected in the visualization. You can configure the element in the “Properties” view. By clicking into the value field of the “Color” property, you receive a drop-down list with the entries CompanyRed, CompanyBlue, and CompanyGreen.
Switching visualization styles

When setting a style in the visualization manager, all complete styles in the repository are available for selection. It does not matter and it is not evident if a style have been derived from another style.

You can preview a style to get an impression of how it behaves.

How a visualization implements a style at runtime also depends on the display variant. For example, if a font that is defined in the style is not available, the display variant shows the visualization with a preset font.

☐ Requirement: A project is open with a visualization.

1. Double-click the “Visualization Manager” object in the device tree.
   ⇒ The editor opens.

2. Click in the input field of “Selected style” (“Settings” tab, “Style Settings” group).
   ⇒ All styles that are installed in the repository are listed.

3. Mouse over a style.
   ⇒ A preview of how the style is displayed appears in a new window.

4. Select a style.
   ⇒ The style is applied. The preview in “Style Settings” shows the new setting.

5. Double-click a visualization.
   ⇒ The visualization appears in the new style.

Updating versions

☐ Requirement: A project is open with a visualization.

1. Click “Project ➔ Project Environment”, “Visualization Styles” tab.
   ⇒ CODESYS lists all new versions of the currently used styles.

2. Click “Set All to Newest”.
   ⇒ The style is updated. Visualizations and their elements apply the new style.

1.3.5.17.1 Editing visualization styles in the visualization style editor

A style is an XML file with the file extension *.visustyle.xml. It contains a specific set of style properties. CODESYS checks the style properties in the consistency check.

You can create a new style or customize an existing style. The visualization style editor is available for this.

If you customize a style, then a new style is created as a hierarchy of styles. A hierarchy consists of at least two styles based on each other. The nesting depth is unrestricted. A hierarchy is identified simply with its top derived style. You can derive multiple different styles from one base style by extending the styles by differing style properties. This save memory and therefore should be your preferred method.

A base style does not have to be consistent for itself. Instead, you must identify it as an incomplete style. Only the top derived style must be consistent.
Example of a style hierarchy

In a partial style, you can combine any style properties to form efficient hierarchies without having to worry about consistency. For example, you can collect all image references into one partial style. Then you derive the style and define more style properties for colors. This style is also incomplete. You derive the style again and define more style properties for its fonts. The top style is now completely.

- **(1):** CompanyImg is a partial style defining image references.
- **(2):** CompanyColor is a partial, derived style based on CompanyImg and also defines colors.
- **(3):** PetrolStyle is a complete, derived style based on CompanyColor and also defines a special color.
- **(4):** The hierarchy of styles comprises PetrolStyle, CompanyColor, and CompanyImg.
In the visualization style editor, you can open a style, define its style properties, and localize its name. If the style is consistent, then you can install it in the visualization style repository. The editor is not integrated in CODESYS. However, you can start the editor in CODESYS.

**Names for style properties**

A style property is an entry for a specific color, a specific font, or a specific image reference. If this name contains a dash, then the Visualization Style Editor can sort the style properties by the prefixed terms before the dash and display them in a hierarchy. Otherwise the names can be sorted in alphabetical order or sequential order or in sequential order (as saved in the XML file). CODESYS displays the style properties in the order of names actually saved in the XML file for the style.

Example: `Element-Alarm-Fill-Color`

See also

- ☑ Chapter 1.3.5.20.3 “Editor ‘Visualization Style Editor’” on page 1947

**Starting the editor in CODESYS**

1. Double-click the “Visualization Manager” object.
   ⇒ The editor opens.
2. Click the symbol ☑ (“Settings” tab, “Style Settings” group).
3. Click “Open Style Editor” from the drop-down list.
   ⇒ The “Visualization Style Editor” opens.

**Starting the editor independent of CODESYS**

[Link]

Choose “Visualization Styles Editor” from the CODESYS install folder in the Start menu. If you have a standard installation, then this link is located in CODESYS (the program folder for CODESYS).

⇒ The visualization style editor opens.

**Deriving visualization styles**

![Info]

This is the recommended way to create a style that combines existing style properties with new ones.

**Starting the editor in CODESYS and deriving styles**

☑ Requirement: CODESYS is open with a project containing a visualization.

1. Double-click the “Visualization Manager” object in the device tree.
   ⇒ The editor opens.
2. Click the symbol ☑ (“Settings” tab, “Style Settings” group).
   ⇒ A list of commands opens.
3. Choose “Create and Edit Derived Style”.
   ⇒ The visualization style editor starts and the “Create a New Visualization Style” dialog box opens.
4. Type a name.
5. Select a directory.
6. Select a base style. The default style is set in CODESYS. You can also select a style from the repository.
   ⇒ The new style appears in the visualization style editor. The style properties from the base style are displayed yellow.
7. Add a new style property or modify an existing value.
8. Provide a version for the style and click “File ➔ Save and Install”.
   ⇒ The style is installed in the repository. The memory requirement is low because only the style property added in step 7 is saved.

Copying visualization styles

☑ Requirement: CODESYS is open with a project containing a visualization.
1. Double-click the “Visualization Manager” object in the device tree.
   ⇒ The editor opens.
2. Click the symbol ☰ (“Settings” tab, “Style Settings” group).
   ⇒ A list of commands opens.
3. Choose “Copy and Edit Style”.
   ⇒ The visualization style editor starts and the “Open Existing Style as a Copy” dialog box opens.
4. Select which style should be copied (“Style”).
5. Type a directory in “Destination” and click “OK”.
   ⇒ The new style appears in the visualization style editor. All style properties are identical to those in the copied style.
6. Type a name.
7. Add a new style property or modify the value of an existing style property.
8. Provide a version for the style and click “File ➔ Save and Install”.
   ⇒ The style is installed in the repository and the style properties are identical to the added style property, except for the style property added in step 8. The memory requirement is high because the common style properties are defined in both styles.

Creating new visualization styles

☑ Requirement: CODESYS is open with a project containing a visualization.
1. Double-click the “Visualization Manager” object in the device tree.
   ⇒ The editor opens.
2. Click the symbol ☰ (“Settings” tab, “Style Settings” group).
   ⇒ A list of commands opens.
3. Click “Open Style Editor”.
   ⇒ The visualization style editor opens.
4. Click “File ➔ New Style”.
   ⇒ The “Create a New Visualization Style” dialog box opens.
5. Type a name. Specify a base style.
6. Specify a directory and click “OK” to close the dialog box.
   ⇒ The new style appears in the visualization style editor.
7. Add a new style property.
8. Provide a version for the style and click “File ➔ Save and Install”.
   ⇒ The style is installed in the Visualization Styles Repository with the version number.

**Adding a style property**

Using the visualization style editor, you can edit a style to save and install as a new version.

☑  Requirement: The visualization style editor is open with a style.
1. Select a style property and click “Styles ➔ New Style (Afterwards)” in the “Style Properties” tab.
   ⇒ A new style property is added.
2. In the “General” tab, type a new version number in the “Version” setting.
3. Choose “File ➔ Save and Install”.
   ⇒ The changes are saved and the style is installed in the repository as the new version.

**Localizing style properties**

You can assign a language-dependent name to a style property. CODESYS displays a style property by its localized name, depending on the language settings in category “International Settings” (menu “Tools ➔ Options”).

☑  Requirement: The visualization style editor is open with a style.
1. Translate the name of the style property into the localized language in the “Localization” tab.
2. Provide a version for the file in the “General” tab.
3. Choose “Save and Install”.
   ⇒ The edited style is installed in the repository currently selected in CODESYS.
4. Update the style.
5. Set the language settings in CODESYS to the localized language.
6. Open a visualization and select an element. The style settings in its properties are displayed in the localized language.

**1.3.5.17.2 Managing visualization styles in repositories**

The styles that are listed in CODESYS in the drop-down lists of different dialogs and editors are all checked for consistency and installed in the visualization style repository. For derived styles, the hierarchy is checked completely and all styles of the hierarchy are installed. The repository is a version control system within the development system.

You can open a style as write-protected from the visualization style repository in the visualization style editor. The “Save” and “Save and Install” commands are not available there for read-only files. However, you can derive it as the basis for a new style or as a copy.

See also
- ☰ Chapter 1.3.5.19.2.20 “Command 'Visualization Style Repository’’ on page 1580
- ☰ Chapter 1.3.5.20.3 “Editor ‘Visualization Style Editor’” on page 1947
Installing styles to repositories

1. Click “Tools ➔ Visualization Style Repository”.
   ⇒ The “Visualization Styles” dialog box opens.

2. Select the “System” repository in the drop-down list of “Storage location”.
   ⇒ All versions of the installed styles are listed in “Installed Visualization Styles”.

3. Click on the “Install” button.
   ⇒ The “Select Visualization style(s)” dialog box opens.

4. Select a style file and click “Open” to close the dialog box.
   ⇒ The style is installed in the “System” repository. It appears now in the tree view below “Installed Visualization Styles”.

Uninstalling styles

1. Click “Tools ➔ Visualization Style Repository”.
   ⇒ The “Visualization Styles” dialog box opens.

2. Select a repository in the drop-down list of “Storage location”.
   ⇒ All versions of the installed styles are listed in “Installed Visualization Styles”.

3. Select a style there.

4. Click the “Uninstall” button.
   ⇒ The “Select Visualization Style(s)” dialog box opens.

Managing repositories

1. Click “Tools ➔ Visualization Style Repository”.
   ⇒ The “Visualization Styles” dialog box opens.

2. Click on the “Edit Locations” button.
   ⇒ The dialog makes it possible to manage other repositories.

44. **1.3.5.18.1.44** Visualization element 'Cartesian XY Chart'
45. **1.3.5.18.1.45** Visualization element 'Date range picker'
46. **1.3.5.18.1.46** Visualization element 'Time range picker'
Visualization element 'Rectangle', 'Round rectangle', 'Ellipse'

Symbol:

Tag: "Basic"

The rectangle, round rectangle, and ellipse are the same element type. They can be converted into another element type by changing the "Element type" property.

Element properties

<table>
<thead>
<tr>
<th>&quot;Element name&quot;</th>
<th>Optional</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: Werkstueck_3</td>
<td></td>
</tr>
<tr>
<td>Hint: Assign individual names for elements so that they are found faster in the element list.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>&quot;Type of element&quot;</th>
<th>&quot;Rectangle&quot;, &quot;Round rectangle&quot;, &quot;Ellipse&quot;</th>
</tr>
</thead>
</table>

Element property 'Position' The position defines the location and size of the element in the visualization window. This is based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

<table>
<thead>
<tr>
<th>&quot;X&quot;</th>
<th>The x-coordinate of the upper left corner of the element</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Specified in pixels</td>
</tr>
<tr>
<td></td>
<td>Example: 10</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>&quot;Y&quot;</th>
<th>The y-coordinate of the upper left corner of the element</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Specified in pixels</td>
</tr>
<tr>
<td></td>
<td>Example: 10</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>&quot;Width&quot;</th>
<th>Specified in pixels</th>
</tr>
</thead>
<tbody>
<tr>

<td>Example: 150</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>&quot;Height&quot;</th>
<th>Specified in pixels</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Example: 30</td>
</tr>
</tbody>
</table>

Tip: You can change the values in "X", "Y", "Width", and "Height" by dragging the corresponding symbols to another position in the editor.
**“Angle”**

Static angle of rotation (in degrees)

Example: 35

The element is displayed rotated in the editor. The point of rotation is the center of the element. A positive value rotates clockwise.

Tip: You can change the value in the editor by focusing the element to the handle. When the cursor is displayed as a rotating arrow (🪂), you can rotate the element about its center as a handle.

(1): Handle

Note: If a dynamic angle of rotation is also configured in the property “Absolute movement ➔ Internal rotation”, then the static and dynamic angles of rotation are added in runtime mode. The static angle of rotation acts as an offset.

- ¶ Chapter 1.3.5.3.2 “Positioning elements, adapting size and layer” on page 1113

**Radius setting**

Visible only when “Round rectangle” is selected in the “Type of element” property.

**“Radius”**

How the corners are rounded.

“From style”

“Relative to the element size”

“Explicit”: Allows for specifying a custom value in the “Value” setting.

**“Value”**

Radius of the rounded corners (in pixels)

Example: 5

Requirement: “Explicit” is selected in the “Radius” setting.

**Element property ‘Center’**

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the 🔄 symbol. The point is used as the center for rotating and scaling.

<table>
<thead>
<tr>
<th>“X”</th>
<th>X-coordinate of the point of rotation</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Y”</td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the symbols ( ري) to other positions in the editor.

**Element property ‘Colors’**
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Normal state</td>
<td>The normal state is in effect if the variable in “Color variables ➔ Toggle color” is not defined or it has the value <strong>FALSE</strong>.</td>
</tr>
<tr>
<td>Frame color</td>
<td>Frame and fill color for the corresponding state of the variable.</td>
</tr>
<tr>
<td>Fill color</td>
<td></td>
</tr>
<tr>
<td>Transparency</td>
<td>Transparency value (0 to 255) for defining the transparency of the selected color. Example: 255: The color is opaque. 0: The color is completely transparent.</td>
</tr>
<tr>
<td>Alarm state</td>
<td>The alarm state is in effect if the variable in “Color variables ➔ Toggle color” has the value <strong>TRUE</strong>.</td>
</tr>
<tr>
<td>Use gradient color</td>
<td>✅: The element is displayed with a gradient of two colors.</td>
</tr>
<tr>
<td>Gradient setting</td>
<td>The “Gradient editor” dialog box opens.</td>
</tr>
</tbody>
</table>

<td></td>
<td>✷ “Dashes”</td>
</tr>
<tr>
<td></td>
<td>✷ “Dots”</td>
</tr>
<tr>
<td></td>
<td>✷ “Dash Dot”</td>
</tr>
<tr>
<td></td>
<td>✷ “Dash Dot Dot”</td>
</tr>
<tr>
<td></td>
<td>✷ “not visible”</td>
</tr>
</tbody>
</table>

You can assign variables in the “Appearance variables” property for controlling the appearance dynamically. The fixed values here are overwritten.

See also
- ❖ “Element property ‘Appearance variables’” on page 1285

**Element property ‘Texts’**

The properties contain character strings for labeling the element. The character string can also contain a placeholder with a format definition. In runtime mode, the placeholder is replaced by the current value in the specified format.

CODESYS accepts the specified texts automatically into the “GlobalTextList” text list. Therefore, these texts can be localized.
### “Text”
Character string (without single straight quotation marks) for the labeling the element. Add a line break by pressing the keyboard shortcut [Ctrl] + [Enter].

**Example:** `Accesses: %i`  
The variable that contains the current value for the placeholder is specified in the property “Text variable ➔ Text”.

### “Tooltip”
Character string (without single straight quotation marks) that is displayed as the tooltip of an element.

**Example:** `Number of valid accesses`  
The variable that contains the current value for the placeholder is specified in the property “Text variable ➔ Tooltip”.

### See also
- “Element property ‘Text variables’” on page 1229
- Chapter 1.3.5.18.2 “Placeholders with format definition in the output text” on page 1546

### Element property ‘Text properties’
The properties contain fixed values for the text properties.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Horizontal alignment”</td>
<td>Horizontal alignment of the text within the element.</td>
</tr>
<tr>
<td>“Vertical alignment”</td>
<td>Vertical alignment of the text within the element.</td>
</tr>
<tr>
<td>“Text format”</td>
<td>Definition for displaying texts that are too long</td>
</tr>
<tr>
<td></td>
<td>- “Default”: The long text is truncated.</td>
</tr>
<tr>
<td></td>
<td>- “Line break”: The text is split into parts.</td>
</tr>
<tr>
<td></td>
<td>- “Ellipsis”: The visible text ends with “...” indicating that it is not complete.</td>
</tr>
<tr>
<td>“Font”</td>
<td>Example: “Default”</td>
</tr>
<tr>
<td></td>
<td><img src="image" alt="Font dialog box" /> The “Font” dialog box opens.</td>
</tr>
<tr>
<td></td>
<td><img src="image" alt="Drop-down list" />: Drop-down list with style fonts.</td>
</tr>
<tr>
<td>“Font color”</td>
<td>Example: “Black”</td>
</tr>
<tr>
<td></td>
<td><img src="image" alt="Font color dialog box" />: The “Color” dialog box opens.</td>
</tr>
<tr>
<td></td>
<td><img src="image" alt="Drop-down list" />: Drop-down list with style colors.</td>
</tr>
<tr>
<td>“Transparency”</td>
<td>Whole number (value range from 0 to 255). This determines the transparency of the respective color.</td>
</tr>
<tr>
<td></td>
<td>Example: 255: The color is opaque.</td>
</tr>
<tr>
<td></td>
<td>0: The color is completely transparent.</td>
</tr>
<tr>
<td></td>
<td>Please note: If the color is a style color and already has a transparency value, then this property is write-protected.</td>
</tr>
</tbody>
</table>

### Element property ‘Absolute movement’
The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Movement”</td>
<td></td>
</tr>
<tr>
<td>“X”</td>
<td>Variable (numeric data type). Defines the X position (in pixels).</td>
</tr>
<tr>
<td></td>
<td>Example: PLC_PRG.iPos_X.</td>
</tr>
<tr>
<td></td>
<td>Increasing this value in runtime mode moves the element to the right.</td>
</tr>
<tr>
<td>Variable</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>&quot;Y&quot;</td>
<td>Variable (numeric data type). Defines the Y position (in pixels).</td>
</tr>
<tr>
<td>&quot;Rotation&quot;</td>
<td>Variable (numeric data type). Defines the angle of rotation (in degrees).</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>&quot;Scaling&quot;</td>
<td>Variable (integer data type). Causes centric stretching.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>&quot;Interior rotation&quot;</td>
<td>Variable (numeric data type). Defines the angle of rotation (in degrees).</td>
</tr>
<tr>
<td>&quot;Use REAL values&quot;</td>
<td>Note: Only available if the device supports the use of REAL coordinates.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

You can link the variables to a unit conversion.
The properties “X”, “Y”, “Rotation”, and “Interior rotation” are supported by the “Client Animation” functionality.

See also
- "Unit conversion"

Element property 'Relative movement'

The properties contains variables for moving the element. The reference point is the position of the element ("Position" property). The shape of the element can change.

<table>
<thead>
<tr>
<th>&quot;Movement top-left&quot;</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>“X”</td>
<td>Variable (integer data type). It contains the number (in pixels) that the left edge is moved horizontally. Incrementing the value moves the element to the right. Example: PLC_PRG.iDeltaX</td>
</tr>
<tr>
<td>“Y”</td>
<td>Variable (integer data type). It contains the number (in pixels) that the top edge is moved vertically. Incrementing the value moves the element to the down. Example: PLC_PRG.iDeltaY</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>&quot;Movement bottom-right&quot;</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>“X”</td>
<td>Variable (integer data type). It contains the number (in pixels) that the right edge is moved horizontally. Incrementing the value moves the element to the right. Example: PLC_PRG.iDeltaWidth</td>
</tr>
<tr>
<td>“Y”</td>
<td>Variable (integer data type). It contains the number (in pixels) that the bottom edge is moved vertically. Incrementing the value moves the element to the down. Example: PLC_PRG.iDeltaHeight</td>
</tr>
</tbody>
</table>

See also
- "Element property 'Absolute movement'" on page 1227

Element property 'Text variables'

These properties are variables with contents that replace a format definition.

<table>
<thead>
<tr>
<th>“Text variable&quot;</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. Example: PLC_PRG.iAccesses</td>
<td></td>
</tr>
<tr>
<td>Note: The format definition is part of the text in the property “Texts ➔ Text”. Note: If you specify a variable of type enumeration with text list support, then the name of the enumeration data type is added automatically in angle brackets after the variable name. Example: PLC_PRG.enVar &lt;enumeration name&gt;. Then the symbolic value of the enumeration component is printed instead of the numeric value when text is printed. Refer to the help page for the enumerations.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Tooltip variable”</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. Example: PLC_PRG.iAccessesInTooltip</td>
<td></td>
</tr>
<tr>
<td>Note: The format definition is part of the text in the property “Texts ➔ Tooltip&quot;</td>
<td></td>
</tr>
</tbody>
</table>
Element property 'Dynamic texts'

Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.

<table>
<thead>
<tr>
<th>“Text list”</th>
<th>Variable (string) or name of the text list as a fixed string in single straight quotation marks.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Example: 'Errorlist' * Drop-down list with the dialogs available in the text lists.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Text index”</th>
<th>Text list ID. This refers to the desired output text.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• As fixed string with the ID in single straight quotation marks.</td>
</tr>
<tr>
<td></td>
<td>Example: '1'</td>
</tr>
<tr>
<td></td>
<td>• As a variable (STRING) for dynamically controlling the text output.</td>
</tr>
<tr>
<td></td>
<td>Example: strTextID * Sample assignment: PLC_PRG.strTextID := '1';</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Tooltip index”</th>
<th>Text list ID. This refers to the desired output text.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• As fixed string with the ID in single straight quotation marks.</td>
</tr>
<tr>
<td></td>
<td>Example: '2'</td>
</tr>
<tr>
<td></td>
<td>• As a variable (STRING) for dynamically controlling the text output.</td>
</tr>
<tr>
<td></td>
<td>Example: strToolTipID * Sample assignment: PLC_PRG.strToolTipID := '2';</td>
</tr>
</tbody>
</table>

- Text list

Element property 'Font variables'

The variables allow for dynamic control of the text display.

See also

- Chapter 1.3.5.18.2 “Placeholders with format definition in the output text” on page 1546
- “Element property ‘Texts’” on page 1226
- Enumerations
### “Font name”
Variable (STRING). Includes the font of the text.
Example: PLC_PRG.stFontVar := 'Arial';
The selection of fonts corresponds to the default “Font” dialog.

### “Size”
Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name.
- <pt>: Points (default)
  Example: PLC_PRG.iFontHeight <pt>
  Code: iFontHeight : INT := 12;
- <px>: Pixels
  Example: PLC_PRG.iFontHeight <px>
  Code: iFontHeight : INT := 19;

If you click in the value field, a drop-down list opens on the right for setting the unit.

Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property “Text property ⇒ Font”.

### “Flags”
Variable (DWORD). Contains the flags for displaying fonts.
Flags:
- 1: Italics
- 2: Bold
- 4: Underline
- 8: Strikethrough

Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: PLC_PRG.dwFontType := 6;

### “Character set”
Variable (DWORD). Contains a character set number for the font.
The selection of character set numbers corresponds to the “Script” setting of the standard “Font” dialog.

### “Color”
Variable (DWORD). Includes the color of the text.
Example: PLC_PRG.dwColorFont := 16#FF000000;

### “Flags for text alignment”
Variable (integer data type). Contains the coding for text alignment.
Example: PLC_PRG.dwTextAlignment.
Coding:
- 0: Top left
- 1: Horizontal center
- 2: Right
- 4: Vertical center
- 8: Bottom

Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: PLC_PRG.dwFontType := 5;
Fixed values for displaying texts are set in “Text properties”.

- "Element property 'Text properties'" on page 1227

Element property 'Colorvariables'

The Element property is used as an interface for project variables to dynamically control colors at runtime.

<table>
<thead>
<tr>
<th>“Toggle color”</th>
<th>The property controls the toggled color at runtime.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Value assignment:</td>
<td></td>
</tr>
<tr>
<td>● FALSE:</td>
<td>The element is displayed with the color specified in the “Color” property.</td>
</tr>
<tr>
<td>● TRUE:</td>
<td>The element is displayed with the color specified in the “Alarm color” property.</td>
</tr>
<tr>
<td>Assignment options:</td>
<td></td>
</tr>
<tr>
<td>● Placeholder for the user input variable</td>
<td>&lt;toggle/tap variable&gt;”</td>
</tr>
<tr>
<td></td>
<td>&lt;NOT toggle/tap variable&gt;”</td>
</tr>
<tr>
<td>Note: Specify a variable for the mouse events “Tap” or “Toggle” in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both “Toggle” and “Tap”, then the variable specified in “Tap” is used.</td>
<td></td>
</tr>
<tr>
<td>Hint: Click the symbol to insert the placeholder “&lt;toggle/tap variable&gt;”. When you activate the “Inputconfiguration”, “Tap FALSE” property, then the “&lt;NOT toggle/tap variable&gt;” placeholder is displayed.</td>
<td></td>
</tr>
<tr>
<td>● Instance path of a project variable (BOOL)</td>
<td>Example: PLC_PRG.xColorIsToggled</td>
</tr>
<tr>
<td>Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.</td>
<td></td>
</tr>
</tbody>
</table>

| “Normal state”       | The properties listed below control the color depending on the state. The normal state is in effect if the variable in “Color variables”, “Toggle color” is not defined or it has the value FALSE. The alarm state is in effect if the variable in “Colorvariables”, “Toggle color” has the value TRUE. |
| “Alarm state”        |                                                      |

<table>
<thead>
<tr>
<th>“Frame color”</th>
<th>Assignment options:</th>
</tr>
</thead>
<tbody>
<tr>
<td>● Variable (DWORD)</td>
<td>for the frame color</td>
</tr>
<tr>
<td>Example: PLC_PRG.dwBorderColor</td>
<td></td>
</tr>
<tr>
<td>● Color literal</td>
<td>Example of green and opaque: 16#FF00FF00</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Filling color”</th>
<th>Assignment options:</th>
</tr>
</thead>
<tbody>
<tr>
<td>● Variable (DWORD)</td>
<td>for the fill color</td>
</tr>
<tr>
<td>Example: PLC_PRG.dwFillColor</td>
<td></td>
</tr>
<tr>
<td>● Color literal</td>
<td>Example of gray and opaque: 16#FF888888</td>
</tr>
</tbody>
</table>
The transparency part of the color value is evaluated only if the “Activate semi-transparent drawing” option of the visualization manager is selected.

Select the “Advanced” option in the toolbar of the properties view. Then all element properties are visible.

See also
- Chapter 1.3.5.8.3 “Animating a color display” on page 1152

Element property 'Appearance variables'

| “Line width” | Variable (integer data type). Contains the line weight (in pixels). |
| “Fill attributes” | Variable (DWORD). Controls whether the fill color of the element is visible. |
| - Variable value = 0: Filled |
| - Variable value > 0: Invisible; no fill color |
| “Line style” | Variable (DWORD). Controls the line style. |
| - Coding: |
| - 0: Solid line |
| - 1: Dashed line |
| - 2: Dotted line |
| - 3: Line type "Dash Dot" |
| - 3: Line type "Dash Dot Dot" |
| - 8: Invisible; no line |

Fixed values can be set in the “Appearance” property. These values can be overwritten by dynamic variables at runtime.

See also
- “Element property ‘Appearance’” on page 1238

Element property 'State variables'

| “Invisible” | Variable (BOOL). Toggles the visibility of the element. |
| - TRUE: The element is not visible at runtime. |
| “Deactivate inputs” | Variable (BOOL). Toggles the operability of the element. |
| - TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated. |
The “Invisible” property is supported by the “Client Animation” functionality.

See also

These properties are available only when you select the “Preview: Support client animations and overlay of native elements” option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Animation duration”</td>
<td>Time that the element executes an animation (in milliseconds)</td>
</tr>
<tr>
<td>Example: 500</td>
<td></td>
</tr>
<tr>
<td>“Move to the foreground”</td>
<td>Property value (BOOL)</td>
</tr>
<tr>
<td>TRUE: At runtime, the element is displayed in the foreground.</td>
<td></td>
</tr>
<tr>
<td>FALSE: At runtime, the element is displayed in the layer where it was inserted in the visualization editor.</td>
<td></td>
</tr>
</tbody>
</table>

See also

- Chapter 1.3.5.21.5 “Using client animation” on page 1962

Element property 'Input configuration'

The properties contain the configurations for the user input when using the mouse or keyboard. A user input defines an event and one or more actions that are executed when an event occurs.

The “Configure” button opens the “Input configuration” dialog box for creating or modifying a user input.

Configured user inputs are briefly listed below the events. They each include the action that is triggered and the setting in short form.

Example: “Execute ST code”: #PLC_PRG.i_x := 0;

<table>
<thead>
<tr>
<th>Event</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“OnDialogClosed”</td>
<td>Input event: The user closes the dialog box.</td>
</tr>
<tr>
<td>“OnMouseClick”</td>
<td>Input event: The user clicks the mouse button completely. The mouse button is clicked and released.</td>
</tr>
<tr>
<td>“OnMouseDown”</td>
<td>Input event: The user clicks down on the mouse button.</td>
</tr>
<tr>
<td>“OnMouseEnter”</td>
<td>Input event: The user drags the mouse pointer to the element.</td>
</tr>
<tr>
<td>“OnMouseLeave”</td>
<td>Input event: The user drags the mouse pointer away from the element.</td>
</tr>
<tr>
<td>“OnMouseMove”</td>
<td>Input event: The user moves the mouse pointer over the element area.</td>
</tr>
<tr>
<td>“OnMouseUp”</td>
<td>Input event: The user releases the mouse button over the element area.</td>
</tr>
</tbody>
</table>
When a mouse click event occurs, the variable defined in "Variable" is described in the application. The coding depends on the options "Tap FALSE" and "Tap on enter if captured".

<table>
<thead>
<tr>
<th>&quot;Variable&quot;</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable (BOOL) that is set on mouse click.</td>
</tr>
<tr>
<td>Example: PLC_PRG.bIsTapped</td>
</tr>
<tr>
<td>TRUE: A mouse click event exists. It lasts while the user presses the mouse button over the element. It ends when the button is released.</td>
</tr>
<tr>
<td>FALSE: A mouse click event does not exist.</td>
</tr>
<tr>
<td>Requirement: The &quot;Tap FALSE&quot; option is not activated.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>&quot;Tap FALSE&quot;</th>
</tr>
</thead>
<tbody>
<tr>
<td>☑: The mouse click event leads to a complementary value in &quot;Variable&quot;.</td>
</tr>
<tr>
<td>TRUE: A mouse click event does not exist.</td>
</tr>
<tr>
<td>FALSE: While the mouse click event exists.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>&quot;Tap on enter if captured&quot;</th>
</tr>
</thead>
<tbody>
<tr>
<td>☑: During user input, it is also taken into consideration whether the mouse pointer is dragged within the element area or not while the mouse button is pressed.</td>
</tr>
<tr>
<td>TRUE: While the mouse click event exists and the mouse pointer is moved over the element area.</td>
</tr>
<tr>
<td>FALSE: A mouse click event does not exist. Or the user moves the mouse pointer outside of the element area while the mouse button is pressed.</td>
</tr>
<tr>
<td>The value is TRUE again as soon as the user moves the pointer back to the element area. The mouse is then captured.</td>
</tr>
</tbody>
</table>

With the onset of a mouse click event, the variable is set; when the mouse click event is completed, the variable is reset.

<table>
<thead>
<tr>
<th>&quot;Variable&quot;</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable (BOOL). Its value toggled when the mouse click event is ended. This is when the user releases the mouse button while the mouse pointer is over the element area.</td>
</tr>
<tr>
<td>If the user releases the mouse button while the mouse pointer is outside of the element area, then the mouse click event is not ended and the value is not toggled.</td>
</tr>
<tr>
<td>Tip: The user can cancel a started toggle input by dragging the mouse pointer out of the element area.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>&quot;Toggle on up if captured&quot;</th>
</tr>
</thead>
<tbody>
<tr>
<td>☑: The value toggles regardless of where the mouse pointer is when the mouse button is released. The mouse is then captured.</td>
</tr>
</tbody>
</table>

Keyboard shortcut on the element for triggering specific input actions.

When the keyboard shortcut event occurs, the input actions in the "Event(s)" property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.

<table>
<thead>
<tr>
<th>&quot;Key&quot;</th>
</tr>
</thead>
<tbody>
<tr>
<td>Key pressed for input action.</td>
</tr>
<tr>
<td>Example: [T]</td>
</tr>
<tr>
<td>Note: The following properties appear when a key is selected.</td>
</tr>
</tbody>
</table>
**“Event(s)”**

- “None”
- “Mouse down”: Pressing the key triggers the input actions that are configured in the “OnMouseDown” property.
- “Mouse up”: Releasing the key triggers the input actions that are configured in the “OnMouseUp” property.
- “Mouse down/up”: Pressing and releasing the key triggers the input actions that are configured in the “OnMouseDown” property and the “OnMouseUp” property.

**“Shift”**  
✔: Combination with the Shift key  
Example: [Shift]+[T].

**“Control”**  
✔: Combination with the Ctrl key  
Example: [Ctrl]+[T].

**“Alt”**  
✔: Combination with the Alt key  
Example: [Alt]+[T].

---

All keyboard shortcuts and their actions that are configured in the visualization are listed in the “Keyboard configuration” tab.

---

- § Chapter 1.3.5.19.3.1 “Dialog ‘Access Rights’” on page 1583

---

Visualization element 'Line'

Symbol:

Tag: “Basic”

The element draws a single line.
### Element properties

<table>
<thead>
<tr>
<th>&quot;Element name&quot;</th>
<th>Optional.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: Separator_Header</td>
<td></td>
</tr>
<tr>
<td>Hint: Assign individual names for elements so that they are found faster in the element list.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>&quot;Type of element&quot;</th>
<th>Line</th>
</tr>
</thead>
</table>

#### Element property 'Position'

The following properties define the position and length of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

<table>
<thead>
<tr>
<th>&quot;Dots&quot;</th>
<th>&quot;[0]&quot;: Coordinates of the starting point</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>&quot;[1]&quot;: Coordinate of the end point</td>
</tr>
<tr>
<td></td>
<td>You can also change the values by dragging the box symbols (□) to other positions in the editor.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>&quot;Angle&quot;</th>
<th>Static angle of rotation (in degrees).</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Example: 35</td>
</tr>
<tr>
<td></td>
<td>The element is displayed rotated in the editor. The point of rotation is the center of the element. A positive value rotates clockwise.</td>
</tr>
<tr>
<td></td>
<td>Tip: You can change the value in the editor by focusing the element to the handle. When the cursor is displayed as a rotating arrow (↻), you can rotate the element about its center as a handle.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
</tr>
<tr>
<td><img src="image.png" alt="Diag_1" /></td>
<td></td>
</tr>
<tr>
<td>(1): Handle</td>
<td></td>
</tr>
<tr>
<td>Note: If a dynamic angle of rotation is also configured in the property &quot;Absolute movement ➔ Internal rotation&quot;, then the static and dynamic angles of rotation are added in runtime mode. The static angle of rotation acts as an offset.</td>
<td></td>
</tr>
</tbody>
</table>

#### See also

- 

#### Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

<table>
<thead>
<tr>
<th>&quot;X&quot;</th>
<th>X-coordinate of the point of rotation</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Y&quot;</td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>
You can also change the values by dragging the symbols (intéractor) to other positions in the editor.

### Element property 'Colors'

The properties contain fixed values for setting colors.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Color”</td>
<td>Color of the line in normal state. Please note that the normal state is in effect if the expression in the “Color variables ➔ Toggle color” property is not defined or it has the value FALSE.</td>
</tr>
<tr>
<td>“Alarm color”</td>
<td>Color of the line in alarm state. Please note that the alarm state is in effect if the expression in the “Color variables ➔ Toggle color” property has the value TRUE.</td>
</tr>
<tr>
<td>“Transparency”</td>
<td>Value (0 to 255) for defining the transparency of the selected color. Example 255: The color is opaque. 0: The color is completely transparent.</td>
</tr>
</tbody>
</table>

See also
- 

### Element property 'Appearance'

The properties contain fixed values for setting the look of the element.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Line width”</td>
<td>Value in pixels</td>
</tr>
<tr>
<td></td>
<td>Example: 2</td>
</tr>
<tr>
<td></td>
<td>Note: The values 0 and 1 both result in a line weight of one pixel. If no line should be displayed, then the “Line style” property must be set to the option “Invisible”.</td>
</tr>
<tr>
<td>“Line style”</td>
<td>Type of line representation</td>
</tr>
<tr>
<td></td>
<td>“Solid”</td>
</tr>
<tr>
<td></td>
<td>“Dashes”</td>
</tr>
<tr>
<td></td>
<td>“Dots”</td>
</tr>
<tr>
<td></td>
<td>“Dash Dot”</td>
</tr>
<tr>
<td></td>
<td>“Dash Dot Dot”</td>
</tr>
<tr>
<td></td>
<td>“not visible”</td>
</tr>
</tbody>
</table>

You can assign variables in the “Appearance variables” property for controlling the appearance dynamically. The fixed values are defined here.

See also
- Element property 'Appearance variables’ on page 1285

### Element property 'Texts'

The properties contains character strings for labeling the element. The character string can also contain a placeholder with a format definition. In runtime mode, the placeholder is replaced by the current value in the specified format.

CODESYS accepts the specified texts automatically into the “GlobalTextList” text list. Therefore, these texts can be localized.
| **“Text”** | Character string (without single straight quotation marks) for the labeling the element. Add a line break by pressing the keyboard shortcut [Ctrl] + [Enter].  
Example: `Accesses: %i`  
The variable that contains the current value for the placeholder is specified in the property **“Text variable”**. |
| **“Tooltip”** | Character string (without single straight quotation marks) that is displayed as the tooltip of an element.  
Example: `Number of valid accesses`  
The variable that contains the current value for the placeholder is specified in the property **“Text variable”**. |

See also
- “Element property ‘Text variables’” on page 1229
- “Chapter 1.3.5.18.2 “Placeholders with format definition in the output text” on page 1546

### Element property ‘Text properties’

The properties contain fixed values for the text properties.

| **“Horizontal alignment”** | Horizontal alignment of the text within the element. |
| **“Vertical alignment”** | Vertical alignment of the text within the element. |
| **“Text format”** | Definition for displaying texts that are too long  
- **“Default”**: The long text is truncated.  
- **“Line break”**: The text is split into parts.  
- **“Ellipsis”**: The visible text ends with "..." indicating that it is not complete. |
| **“Font”** | Example: **“Default”**  
[▼]: The “Font” dialog box opens.  
[▼]: Drop-down list with style fonts. |
| **“Font color”** | Example: **“Black”**  
[▼]: The “Color” dialog box opens.  
[▼]: Drop-down list with style colors. |
| **“Transparency”** | Whole number (value range from 0 to 255). This determines the transparency of the respective color.  
Example: **255**: The color is opaque.  
0: The color is completely transparent.  
Please note: If the color is a style color and already has a transparency value, then this property is write-protected. |

### Element property ‘Absolute movement’

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

| **“Movement”** |  |
| **“X”** | Variable (numeric data type). Defines the X position (in pixels).  
Example: `PLC_PRG.iPos_X`.  
Increasing this value in runtime mode moves the element to the right. |
### “Y”
Variable (numeric data type). Defines the Y position (in pixels).

**Example:** PLC_PRG.iPos_Y.

Increasing this value in runtime mode moves the element downwards.

### “Rotation”
Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle1.

The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.

In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

### “Scaling”
Variable (integer data type). Causes centric stretching.

**Example:** PLC_PRG.iScaling.

The reference point is the “Center” property.

The value 1 shrinks the element by a factor of 0.001. The value 1000 returns the element to its original size.

### “Interior rotation”
Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol.

Note: If a static angle of rotation is specified in the property “Position ➔ Angle”, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

### “Use REAL values”
Note: Only available if the device supports the use of REAL coordinates.

- The properties of the absolute movement are interpreted as REAL values. The values are not rounded.

- The option allows for the individual fine-tuning of drawing the element, for example for the visualization of a smoother rotation.

- Hint: If a horizontal or vertical line is drawn blurry on a specific visualization platform, then this can be corrected by an offset of 0.5px in the direction of the line thickness.

---

You can link the variables to a unit conversion.
The properties “X”, “Y”, “Rotation”, and “Interior rotation” are supported by the “Client Animation” functionality.

See also
- Unit conversion

Element property 'Relative movement'
The properties contains variables for moving the element. The reference point is the position of the element (“Position” property). The shape of the element can change.

<table>
<thead>
<tr>
<th>“Movement point[0]”</th>
<th>Variable (numeric data type). It contains the number (in pixels) that the starting point of the line is moved. Incrementing the X value moves the element to the right. Incrementing the Y value moves the element to the down.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“X”</td>
<td></td>
</tr>
<tr>
<td>“Y”</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Movement point[1]”</th>
<th>Variable (numeric data type). It contains the number (in pixels) that the end point of the line is moved. Incrementing the X value moves the element to the right. Incrementing the Y value moves the element to the down.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“X”</td>
<td></td>
</tr>
<tr>
<td>“Y”</td>
<td></td>
</tr>
</tbody>
</table>

See also
- “Element property ‘Absolute movement’” on page 1227

Element property 'Text variables'
These properties are variables with contents that replace a format definition.

| “Text variable” | Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. Example: PLC_PRG.iAccesses
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Note: The format definition is part of the text in the property “Texts ➔ Text”. Note: If you specify a variable of type enumeration with text list support, then the name of the enumeration data type is added automatically in angle brackets after the variable name. Example: PLC_PRG.enVar &lt;enumeration name&gt;. Then the symbolic value of the enumeration component is printed instead of the numeric value when text is printed. Refer to the help page for the enumerations.</td>
</tr>
</tbody>
</table>

| “Tooltip variable” | Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. Example: PLC_PRG.iAccessesInTooltip
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Note: The format definition is part of the text in the property “Texts ➔ Tooltip”.</td>
</tr>
</tbody>
</table>

- “Element property ‘Texts’” on page 1226
- Enumerations

Element property 'Dynamic texts'
Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.
| **Text list** | Variable (string) or name of the text list as a fixed string in single straight quotation marks.  
Example: 'Errorlist'  
▼: Drop-down list with the dialogs available in the text lists. |
| **Text index** | Text list ID. This refers to the desired output text.  
● As fixed string with the ID in single straight quotation marks.  
Example: '1'  
● As a variable (STRING) for dynamically controlling the text output.  
Example: strTextID  
Sample assignment: PLC_PRG.strTextID := '1'; |
| **Tooltip index** | Text list ID. This refers to the desired output text.  
● As fixed string with the ID in single straight quotation marks.  
Example: '2'  
● As a variable (STRING) for dynamically controlling the text output.  
Example: strToolTipID  
Sample assignment: PLC_PRG.strToolTipID := '2'; |

See also  
● Text list

### Element property 'Font variables'

| **Font name** | Variable (STRING). Includes the font of the text.  
Example: PLC_PRG.stFontVar := 'Arial';  
The selection of fonts corresponds to the default “Font” dialog. |
| **Size** | Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name.  
● <pt>: Points (default)  
Example: PLC_PRG.iFontHeight <pt>  
Code: iFontHeight : INT := 12;  
● <px>: Pixels  
Example: PLC_PRG.iFontHeight <px>  
Code: iFontHeight : INT := 19;  
If you click in the value field, a drop-down list opens on the right for setting the unit.  
Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property “Text property ➔ Font”.

### Flags
Variable (DWORD). Contains the flags for displaying fonts.

#### Flags:
- 1: Italics
- 2: Bold
- 4: Underline
- 8: Strikethrough

Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: `PLC_PRG.dwFontType := 6;`

### Character set
Variable (DWORD). Contains a character set number for the font.

The selection of character set numbers corresponds to the “Script” setting of the standard “Font” dialog.

### Color
Variable (DWORD). Includes the color of the text.

Example: `PLC_PRG.dwColorFont := 16#FF000000;`

### Flags for text alignment
Variable (integer data type). Contains the coding for text alignment.

#### Coding:
- 0: Top left
- 1: Horizontal center
- 2: Right
- 4: Vertical center
- 8: Bottom

Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: `PLC_PRG.dwFontType := 5;`

---

Fixed values for displaying texts are set in "Text properties".

See also
- "Element property 'Text properties'" on page 1227

**Element property 'Color variables'**
The Element property is used as an interface for project variables to dynamically control colors at runtime.
The property controls the toggled color at runtime.

Value assignment:

- **FALSE**: The element is displayed with the color specified in the “Color” property.
- **TRUE**: The element is displayed with the color specified in the “Alarm color” property.

Assigning the property:

- Placeholder for the user input variable
  - “<toggle/tap variable>”
  - “<NOT toggle/tap variable>”

  The color change is not controlled by its own variable, but by a user input variable.
  
  Note: Specify a variable for the mouse events “Tap” or “Toggle” in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both “Toggle” and “Tap”, then the variable specified in “Tap” is used.

  Hint: Click the symbol to insert the placeholder “<toggle/tap variable>”. When you activate the “Input configuration”, “Tap FALSE” property, then the “<NOT toggle/tap variable>” placeholder is displayed.

- Instance path of a project variable (BOOL)
  Example: PLC_PRG.xColorIsToggled

  Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.

---

**“Color”**

- Variable (DWORD) for the color
  Example: PLC_PRG.dwColor

- Color literal
  Example of gray and opaque: `16#FF888888`

  Please note that the normal state is in effect if the expression in the “Colorvariables ➔ Toggle color” property is not defined or it has the value FALSE.

---

**“Alarm color”**

Color variable in the alarm state

- Variable (DWORD) for the alarm color
  Example: PLC_PRG.dwAlarmColor

- Color literal
  Example of red and opaque: `16#FFFF0000`

  Please note that the alarm state is in effect if the expression in the “Colorvariables ➔ Toggle color” property has the value TRUE.

---

The transparency part of the color value is evaluated only if the “Activate semi-transparent drawing” option of the visualization manager is selected.

Select the “Advanced” option in the toolbar of the properties view. Then all element properties are visible.

- Chapter 1.3.5.8.3 “Animating a color display” on page 1152
### Element property 'State variables'

The variables control the element behavior dynamically.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Invisible”</strong></td>
<td>Variable (BOOL). Toggles the visibility of the element. TRUE: The element is not visible at runtime.</td>
</tr>
<tr>
<td><strong>“Deactivate inputs”</strong></td>
<td>Variable (BOOL). Toggles the operability of the element. TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated.</td>
</tr>
</tbody>
</table>

> The “Invisible” property is supported by the “Client Animation” functionality.

See also
- 

### Element property 'Line width variable'

Dynamic definition of the weight of a line element using a variable.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Integer value”</strong></td>
<td>Variable (integer data type). Defines the line weight of the element (in pixels). This overwrites the fixed value that is defined in “Appearance ➔ Line weight”. Note: The value 0 codes the same as 1 and sets the line weight to one pixel.</td>
</tr>
</tbody>
</table>

### Element property 'Line style variable'

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
</table>
| **“Integer value”** | Variable (integer data type). Defines the appearance of the line at runtime.  
  - 1: Solid  
  - 2: Dashes  
  - 3: Dots  
  - 4: Dash Dot  
  - 5: Dash Dot Dot  
  - 6: Invisible: The line is not drawn. |

These properties are available only when you select the “Preview: Support client animations and overlay of native elements” option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
</table>
| **“Animation duration”** | Time that the element executes an animation (in milliseconds)  
  Example: 500                                                                                         |
| **“Move to the foreground”** | Property value (BOOL)  
  TRUE: At runtime, the element is displayed in the foreground.  
  FALSE: At runtime, the element is displayed in the layer where it was inserted in the visualization editor. |

See also
- [Chapter 1.3.5.21.5 “Using client animation” on page 1962](#)
The properties contain the configurations for the user input when using the mouse or keyboard. A user input defines an event and one or more actions that are executed when an event occurs.

The "Configure" button opens the "Input configuration" dialog box for creating or modifying a user input. Configured user inputs are briefly listed below the events. They each include the action that is triggered and the setting in short form.

**Example:** "Execute ST code": `PLC_PRG.i_x := 0;`

<table>
<thead>
<tr>
<th>Event</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;OnDialogClosed&quot;</td>
<td>Input event: The user closes the dialog box.</td>
</tr>
<tr>
<td>&quot;OnMouseClick&quot;</td>
<td>Input event: The user clicks the mouse button completely. The mouse button is clicked and released.</td>
</tr>
<tr>
<td>&quot;OnMouseDown&quot;</td>
<td>Input event: The user clicks down on the mouse button.</td>
</tr>
<tr>
<td>&quot;OnMouseEnter&quot;</td>
<td>Input event: The user drags the mouse pointer to the element.</td>
</tr>
<tr>
<td>&quot;OnMouseLeave&quot;</td>
<td>Input event: The user drags the mouse pointer away from the element.</td>
</tr>
<tr>
<td>&quot;OnMouseMove&quot;</td>
<td>Input event: The user moves the mouse pointer over the element area.</td>
</tr>
<tr>
<td>&quot;OnMouseUp&quot;</td>
<td>Input event: The user releases the mouse button over the element area.</td>
</tr>
</tbody>
</table>

| "Tap"                  | When a mouse click event occurs, the variable defined in "Variable" is described in the application. The coding depends on the options "Tap FALSE" and "Tap on enter if captured". |
| "Variable"             | Variable (BOOL) that is set on mouse click.                                 |
| Example: PLC_PRG.bIsTapped | TRUE: A mouse click event exists. It lasts while the user presses the mouse button over the element. It ends when the button is released. |
|                        | FALSE: A mouse click event does not exist.                                 |
| Requirement:           | The "Tap FALSE" option is not activated.                                   |

| "Tap FALSE"            | ☑: The mouse click event leads to a complementary value in "Variable".      |
|                        | TRUE: A mouse click event does not exist.                                  |
|                        | FALSE: While the mouse click event exists.                                 |

| "Tap on enter if captured" | ☑: During user input, it is also taken into consideration whether the mouse pointer is dragged within the element area or not while the mouse button is pressed. |
|                           | TRUE: While the mouse click event exists and the mouse pointer is moved over the element area. |
|                           | FALSE: A mouse click event does not exist. Or the user moves the mouse pointer outside of the element area while the mouse button is pressed. |
|                           | The value is TRUE again as soon as the user moves the pointer back to the element area. The mouse is then captured. |
### "Shift"
With the onset of a mouse click event, the variable is set; when the mouse click event is completed, the variable is reset.

### "Variable"
Variable (BOOL). Its value toggled when the mouse click event is ended. This is when the user releases the mouse button while the mouse pointer is over the element area.

If the user releases the mouse button while the mouse pointer is outside of the element area, then the mouse click event is not ended and the value is not toggled.

Tip: The user can cancel a started toggle input by dragging the mouse pointer out of the element area.

### "Toggle on up if captured"
- The value toggles regardless of where the mouse pointer is when the mouse button is released. The mouse is then captured.

### "Keyboard shortcuts"
Keyboard shortcut on the element for triggering specific input actions.

When the keyboard shortcut event occurs, the input actions in the "Event(s)" property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.

#### "Key"
Key pressed for input action.

Example: [T]

Note: The following properties appear when a key is selected.

#### "Event(s)"
- "None"
- "Mouse down": Pressing the key triggers the input actions that are configured in the "OnMouseDown" property.
- "Mouse up": Releasing the key triggers the input actions that are configured in the "OnMouseUp" property.
- "Mouse down/up": Pressing and releasing the key triggers the input actions that are configured in the "OnMouseDown" property and the "OnMouseUp" property.

#### "Shift"
- Combination with the Shift key
  - Example: [Shift]+[T].

#### "Control"
- Combination with the Ctrl key
  - Example: [Ctrl]+[T].

#### "Alt"
- Combination with the Alt key
  - Example: [Alt]+[T].

All keyboard shortcuts and their actions that are configured in the visualization are listed in the "Keyboard configuration" tab.

See also
- Chapter 1.3.5.19.2.2 “Command ‘Keyboard Configuration’” on page 1558
- Chapter 1.3.5.19.3.6 “Dialog ‘Input Configuration’” on page 1586

Requirement: User management is set up for the visualization.
“Access rights” Opens the “Access rights” dialog. There you can edit the access privileges for the element.

Status messages:
- “Not set. Full rights.”: Access rights for all user groups: “operable”
- “Rights are set: Limited rights”: Access is restricted for at least one group.

See also:
- § Chapter 1.3.5.19.3.1 “Dialog ‘Access Rights’” on page 1583

Visualisation element ‘Polygon’, ‘Polyline’, ‘Bézier curve’

Symbol:

Tag: “Basic”

The polygon, polyline, and Bézier curve are the same element type. They can be converted into another type by changing the “Element type” property.

Elements can be dragged and dropped to the editor. The element is then drawn with five points: [0] to [4].

Other positions are added as follows: Move the mouse pointer over a corner point; the mouse pointer changes shape. Now if you press and hold [Ctrl] and click the left mouse button, another point is created. You can delete a point by pressing and holding [Shift]+[Ctrl] and click the selected point.

As an alternative, you can select the element in the toolbox area and in the editor click multiple times. At the same time, a connecting line is drawn from one point to the other. End by double-clicking the element or right-clicking it one time.

Element properties

<table>
<thead>
<tr>
<th>“Element name”</th>
<th>Optional.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hint: Assign individual names for elements so that they are found faster in the element list.</td>
<td></td>
</tr>
<tr>
<td>Example: Werkstueck_1</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Type of element”</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>“Polygon”</td>
<td></td>
</tr>
<tr>
<td>“Polyline”</td>
<td></td>
</tr>
<tr>
<td>“Bézier curve”</td>
<td></td>
</tr>
</tbody>
</table>

Element property ‘Position’

The following properties define the position of the corner points in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.
### “Dots”

[0..n]: Coordinates of the corner points

Specified in pixels

You can also change the values by dragging the box symbols (✓) to other positions in the editor.

### “Angle”

Static angle of rotation (in degrees).

Example: 35

The element is displayed rotated in the editor. The point of rotation is the center of the element. A positive value rotates clockwise.

Tip: You can change the value in the editor by focusing the element to the handle. When the cursor is displayed as a rotating arrow (✓), you can rotate the element about its center as a handle.

(1): Handle

Note: If a dynamic angle of rotation is also configured in the property “Absolute movement ➔ Internal rotation”, then the static and dynamic angles of rotation are added in runtime mode. The static angle of rotation acts as an offset.

### Element property ‘Center’

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

<table>
<thead>
<tr>
<th>“X”</th>
<th>X-coordinate of the point of rotation</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Y”</td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the symbols (✓) to other positions in the editor.

### Element property ‘Colors’

<table>
<thead>
<tr>
<th>“Normal state”</th>
<th>The normal state is in effect if the variable in “Color variables ➔ Toggle color” is not defined or it has the value FALSE.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Frame color”</td>
<td>Frame and fill color for the corresponding state of the variable.</td>
</tr>
<tr>
<td>“Fill color”</td>
<td></td>
</tr>
<tr>
<td>“Transparency”</td>
<td>Transparency value (0 to 255) for defining the transparency of the selected color. Example: 255: The color is opaque. 0: The color is completely transparent.</td>
</tr>
<tr>
<td>“Alarm state”</td>
<td>The alarm state is in effect if the variable in “Color variables ➔ Toggle color” has the value TRUE.</td>
</tr>
<tr>
<td>“Use gradient color”</td>
<td>[✓]: The element is displayed with a gradient of two colors.</td>
</tr>
<tr>
<td>“Gradient setting”</td>
<td>The “Gradient editor” dialog box opens.</td>
</tr>
</tbody>
</table>
Element property 'Appearance'
The properties contain fixed values for setting the look of the element.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Line width</td>
<td>Value in pixels&lt;br&gt;Note: The values 0 and 1 both result in a line weight of 1 pixel. If no line should be displayed, then the “Line style” property must be set to the option “Invisible”.</td>
</tr>
<tr>
<td>Fill attributes</td>
<td>The way in which the element is filled.&lt;br&gt;● “Filled”: The element is filled with the color from property “Colors ➔ Fill color”.&lt;br&gt;● “Invisible”: The fill color is invisible.</td>
</tr>
<tr>
<td>Line style</td>
<td>Type of line representation&lt;br&gt;● “Solid”&lt;br&gt;● “Dashes”&lt;br&gt;● “Dots”&lt;br&gt;● “Dash Dot”&lt;br&gt;● “Dash Dot Dot”&lt;br&gt;● “not visible”</td>
</tr>
</tbody>
</table>

You can assign variables in the “Appearance variables” property for controlling the appearance dynamically. The fixed values here are overwritten.

See also
● § Chapter 1.3.5.19.3.5 “Dialog ‘Gradient Editor’” on page 1586

Element property 'Texts'
The properties contains character strings for labeling the element. The character string can also contain a placeholder with a format definition. In runtime mode, the placeholder is replaced by the current value in the specified format.

CODESYS accepts the specified texts automatically into the “GlobalTextList” text list. Therefore, these texts can be localized.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Text</td>
<td>Character string (without single straight quotation marks) for the labeling the element. Add a line break by pressing the keyboard shortcut [Ctrl] + [Enter].&lt;br&gt;Example: Accesses: %i&lt;br&gt;The variable that contains the current value for the placeholder is specified in the property “Text variable ➔ Text”.</td>
</tr>
<tr>
<td>Tooltip</td>
<td>Character string (without single straight quotation marks) that is displayed as the tooltip of an element.&lt;br&gt;Example: Number of valid accesses.&lt;br&gt;The variable that contains the current value for the placeholder is specified in the property “Text variable ➔ Tooltip”.</td>
</tr>
</tbody>
</table>
See also
- “Element property ‘Text variables’” on page 1229
- Chapter 1.3.5.18.2 “Placeholders with format definition in the output text” on page 1546

**Element property ‘Text properties’**
The properties contain fixed values for the text properties.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Horizontal alignment”</td>
<td>Horizontal alignment of the text within the element.</td>
</tr>
<tr>
<td>“Vertical alignment”</td>
<td>Vertical alignment of the text within the element.</td>
</tr>
<tr>
<td>“Text format”</td>
<td>Definition for displaying texts that are too long</td>
</tr>
<tr>
<td></td>
<td>- “Default”: The long text is truncated.</td>
</tr>
<tr>
<td></td>
<td>- “Line break”: The text is split into parts.</td>
</tr>
<tr>
<td></td>
<td>- “Ellipsis”: The visible text ends with ”...” indicating that it is not complete.</td>
</tr>
<tr>
<td>“Font”</td>
<td>Example: “Default”</td>
</tr>
<tr>
<td></td>
<td>- The “Font” dialog box opens.</td>
</tr>
<tr>
<td></td>
<td>- Drop-down list with style fonts.</td>
</tr>
<tr>
<td>“Font color”</td>
<td>Example: “Black”</td>
</tr>
<tr>
<td></td>
<td>- The “Color” dialog box opens.</td>
</tr>
<tr>
<td></td>
<td>- Drop-down list with style colors.</td>
</tr>
<tr>
<td>“Transparency”</td>
<td>Whole number (value range from 0 to 255). This determines the transparency of the respective color.</td>
</tr>
<tr>
<td></td>
<td>Example: 255: The color is opaque.</td>
</tr>
<tr>
<td></td>
<td>0: The color is completely transparent.</td>
</tr>
<tr>
<td></td>
<td>Please note: If the color is a style color and already has a transparency value, then this property is write-protected.</td>
</tr>
</tbody>
</table>

**Element property ‘Absolute movement’**
The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Movement”</td>
<td></td>
</tr>
<tr>
<td>“X”</td>
<td>Variable (numeric data type). Defines the X position (in pixels).</td>
</tr>
<tr>
<td></td>
<td>Example: PLC_PRG.iPos_X.</td>
</tr>
<tr>
<td></td>
<td>Increasing this value in runtime mode moves the element to the right.</td>
</tr>
<tr>
<td>“Y”</td>
<td>Variable (numeric data type). Defines the Y position (in pixels).</td>
</tr>
<tr>
<td></td>
<td>Example: PLC_PRG.iPos_Y.</td>
</tr>
<tr>
<td></td>
<td>Increasing this value in runtime mode moves the element downwards.</td>
</tr>
</tbody>
</table>
**“Rotation”**  
Variable (numeric data type). Defines the angle of rotation (in degrees).

Example: PLC_PRG.iAngle1.

The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.

In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

---

**“Scaling”**  
Variable (integer data type). Causes centric stretching.

Example: PLC_PRG.iScaling.

The reference point is the “Center” property.

The value 1 shrinks the element by a factor of 0.001. The value 1000 returns the element to its original size.

---

**“Interior rotation”**  
Variable (numeric data type). Defines the angle of rotation (in degrees).

Example: PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol.

Note: If a static angle of rotation is specified in the property “Position → Angle”, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

---

**“Use REAL values”**  
Note: Only available if the device supports the use of REAL coordinates.

- The properties of the absolute movement are interpreted as REAL values. The values are not rounded.

The option allows for the individual fine-tuning of drawing the element, for example for the visualization of a smoother rotation.

Hint: If a horizontal or vertical line is drawn blurry on a specific visualization platform, then this can be corrected by an offset of 0.5px in the direction of the line thickness.
The properties “X”, “Y”, “Rotation”, and “Interior rotation” are supported by the “Client Animation” functionality.

### Element property ‘Dynamic points’

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| **“Array of points”** variable (POINTER TO) | Points to an array of the structure VisuElems.VisuStructPoint. The elements iX and iY of VisuStructPoint contain the xy-coordinates of a point. The current number of array elements implicitly contains the variable in the property “Number of points”. The variable that is assigned to the property “Number of points” contains the number of array elements and therefore the number of corner points.

Example:
```plaintext
pPoints : POINTER TO ARRAY[0..100] OF VisuElems.VisuStructPoint;
```

| **“Number of points”** variable (integer data type) | Contains the number of array elements and therefore the number of corner points for displaying the element.

Example:
```plaintext
PLC_PRG.iNumberOfPoints := 24;
```

In the example, the element has 24 points. This definition is necessary because the individual points are defined by a pointer and this does not allow control over the number of points.

Note: In this way, it is possible to adapt the display of the element dynamically by updating the number of corner points.

### Element property ‘Text variables’

These properties are variables with contents that replace a format definition.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| **“Text variable”** variable (data type compliant with the format definition) | It contains what is printed instead of the format definition.

Example:
```plaintext
PLC_PRG.iAccesses
```

Note: The format definition is part of the text in the property “Texts ➔ Text”.

Note: If you specify a variable of type enumeration with text list support, then the name of the enumeration data type is added automatically in angle brackets after the variable name. Example: PLC_PRG.enVar <enumeration name>. Then the symbolic value of the enumeration component is printed instead of the numeric value when text is printed. Refer to the help page for the enumerations.

| **“Tooltip variable”** variable (data type compliant with the format definition) | It contains what is printed instead of the format definition.

Example:
```plaintext
PLC_PRG.iAccessesInTooltip
```

Note: The format definition is part of the text in the property “Texts ➔ Tooltip”.

See also

- “Chapter 1.3.5.18.2 “Placeholders with format definition in the output text” on page 1546
- “Element property ‘Texts’” on page 1226
- Enumerations
**Element property 'Dynamic texts'**

Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.

| “Text list” | Variable (string) or name of the text list as a fixed string in single straight quotation marks.  
| | Example: 'Errorlist'  
| | ◀: Drop-down list with the dialogs available in the text lists. |

| “Text index” | Text list ID. This refers to the desired output text.  
| | ● As fixed string with the ID in single straight quotation marks.  
| | Example: '1'  
| | ● As a variable (STRING) for dynamically controlling the text output.  
| | Example: strTextID  
| | Sample assignment: PLC_PRG.strTextID := '1'; |

| “Tooltip index” | Text list ID. This refers to the desired output text.  
| | ● As fixed string with the ID in single straight quotation marks.  
| | Example: '2'  
| | ● As a variable (STRING) for dynamically controlling the text output.  
| | Example: strToolTipID  
| | Sample assignment: PLC_PRG.strToolTipID := '2'; |

**See also**

- "Text list"

**Element property 'Font variables'**

The variables allow for dynamic control of the text display.

| “Font name” | Variable (STRING). Includes the font of the text.  
| | Example: PLC_PRG.stFontVar := 'Arial';  
| | The selection of fonts corresponds to the default “Font” dialog. |

| “Size” | Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name.  
| | ● <pt>: Points (default)  
| | Example: PLC_PRG.iFontHeight <pt>  
| | Code: iFontHeight : INT := 12;  
| | ● <px>: Pixels  
| | Example: PLC_PRG.iFontHeight <px>  
| | Code: iFontHeight : INT := 19; |

If you click in the value field, a drop-down list opens on the right for setting the unit.

**Hint:** The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property “Text property ➔ Font”.

---

[Image of a drop-down list with options 'pt' and 'px']
### "Flags"
Variable (DWORD). Contains the flags for displaying fonts.

Flags:
- 1: Italics
- 2: Bold
- 4: Underline
- 8: Strikethrough

Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: `PLC_PRG.dwFontType := 6;`

### "Character set"
Variable (DWORD). Contains a character set number for the font.
The selection of character set numbers corresponds to the “Script” setting of the standard “Font” dialog.

### "Color"
Variable (DWORD). Includes the color of the text.
Example: `PLC_PRG.dwColorFont := #FF000000;`

### "Flags for text alignment"
Variable (integer data type). Contains the coding for text alignment.
Example: `PLC_PRG.dwTextAlignment;
Coding:
- 0: Top left
- 1: Horizontal center
- 2: Right
- 4: Vertical center
- 8: Bottom

Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: `PLC_PRG.dwFontType := 5;`

---

**Fixed values for displaying texts are set in "Text properties".**

See also
- § “Element property 'Text properties’” on page 1227

**Element property 'Colorvariables’**
The Element property is used as an interface for project variables to dynamically control colors at runtime.
### "Toggle color"

The property controls the toggled color at runtime.

**Value assignment:**
- **FALSE:** The element is displayed with the color specified in the "Color" property.
- **TRUE:** The element is displayed with the color specified in the "Alarm color" property.

**Assignment options:**
- Placeholder for the user input variable
  - "<toggle/tap variable>"
  - "<NOT toggle/tap variable>"

The color change is not controlled by its own variable, but by a user input variable.

Note: Specify a variable for the mouse events "Tap" or "Toggle" in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both "Toggle" and "Tap", then the variable specified in "Tap" is used.

Hint: Click the symbol to insert the placeholder "<toggle/tap variable>". When you activate the "Inputconfiguration", "Tap FALSE" property, then the "<NOT toggle/tap variable>" placeholder is displayed.

- **Instance path of a project variable** (BOOL)
  
  Example: PLC_PRG.xColorIsToggled

  Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.

---

### "Normal state"

### "Alarm state"

The properties listed below control the color depending on the state. The normal state is in effect if the variable in "Color variables", "Toggle color" is not defined or it has the value FALSE. The alarm state is in effect if the variable in "Colorvariables", "Toggle color" has the value TRUE.

---

### "Frame color"

**Assignment options:**
- **Variable (DWORD) for the frame color**
  
  Example: PLC_PRG.dwBorderColor

- **Color literal**
  
  Example of green and opaque: 16#FF00FF00

---

### "Filling color"

**Assignment options:**
- **Variable (DWORD) for the fill color**
  
  Example: PLC_PRG.dwFillColor

- **Color literal**
  
  Example of gray and opaque: 16#FF888888

---

The transparency part of the color value is evaluated only if the "Activate semi-transparent drawing" option of the visualization manager is selected.

Select the "Advanced" option in the toolbar of the properties view. Then all element properties are visible.

See also
- Chapter 1.3.5.8.3 “Animating a color display” on page 1152
The properties contain IEC variables for controlling the appearance of the element dynamically.

**Element property 'Appearance variables'**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Line width&quot;</td>
<td>Variable (integer data type). Contains the line weight (in pixels).</td>
</tr>
<tr>
<td>&quot;Fill attributes&quot;</td>
<td>Variable (DWORD). Controls whether the fill color of the element is visible.</td>
</tr>
<tr>
<td>Variable value = 0: Filled</td>
<td></td>
</tr>
<tr>
<td>Variable value &gt; 0: Invisible; no fill color</td>
<td></td>
</tr>
<tr>
<td>&quot;Line style&quot;</td>
<td>Variable (DWORD). Controls the line style.</td>
</tr>
<tr>
<td>Coding:</td>
<td></td>
</tr>
<tr>
<td>0: Solid line</td>
<td></td>
</tr>
<tr>
<td>1: Dashed line</td>
<td></td>
</tr>
<tr>
<td>2: Dotted line</td>
<td></td>
</tr>
<tr>
<td>3: Line type &quot;Dash Dot&quot;</td>
<td></td>
</tr>
<tr>
<td>3: Line type &quot;Dash Dot Dot&quot;</td>
<td></td>
</tr>
<tr>
<td>8: Invisible; no line</td>
<td></td>
</tr>
</tbody>
</table>

Fixed values can be set in the "Appearance" property. These values can be overwritten by dynamic variables at runtime.

See also

- § “Element property ‘Appearance’” on page 1238

**Element property 'State variables'**

The variables control the element behavior dynamically.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Invisible&quot;</td>
<td>Variable (BOOL). Toggles the visibility of the element.</td>
</tr>
<tr>
<td>TRUE: The element is not visible at runtime.</td>
<td></td>
</tr>
<tr>
<td>&quot;Deactivate inputs&quot;</td>
<td>Variable (BOOL). Toggles the operability of the element.</td>
</tr>
<tr>
<td>TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated.</td>
<td></td>
</tr>
</tbody>
</table>

The “Invisible” property is supported by the "Client Animation" functionality.

See also

- 

These properties are available only when you select the “Preview: Support client animations and overlay of native elements” option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.
<table>
<thead>
<tr>
<th><strong>Animation duration</strong></th>
<th>Time that the element executes an animation (in milliseconds)</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td>500</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Move to the foreground</strong></th>
<th>Property value (BOOL)</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>TRUE:</strong></td>
<td>At runtime, the element is displayed in the foreground.</td>
</tr>
<tr>
<td><strong>FALSE:</strong></td>
<td>At runtime, the element is displayed in the layer where it was inserted in the visualization editor.</td>
</tr>
</tbody>
</table>

**See also**
- Chapter 1.3.5.21.5 “Using client animation” on page 1962

**Element property 'Input configuration'**
The properties contain the configurations for the user input when using the mouse or keyboard. A user input defines an event and one or more actions that are executed when an event occurs.

The “Configure” button opens the “Input configuration” dialog box for creating or modifying a user input. Configured user inputs are briefly listed below the events. They each include the action that is triggered and the setting in short form.

**Example:** "Execute ST code": # PLC_PRG.i_x := 0;

<table>
<thead>
<tr>
<th><strong>OnDialogClosed</strong></th>
<th>Input event: The user closes the dialog box.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>OnMouseClick</strong></td>
<td>Input event: The user clicks the mouse button completely. The mouse button is clicked and released.</td>
</tr>
<tr>
<td><strong>OnMouseDown</strong></td>
<td>Input event: The user clicks down on the mouse button.</td>
</tr>
<tr>
<td><strong>OnMouseEnter</strong></td>
<td>Input event: The user drags the mouse pointer to the element.</td>
</tr>
<tr>
<td><strong>OnMouseLeave</strong></td>
<td>Input event: The user drags the mouse pointer away from the element.</td>
</tr>
<tr>
<td><strong>OnMouseMove</strong></td>
<td>Input event: The user moves the mouse pointer over the element area.</td>
</tr>
<tr>
<td><strong>OnMouseUp</strong></td>
<td>Input event: The user releases the mouse button over the element area.</td>
</tr>
</tbody>
</table>

**Tap**
When a mouse click event occurs, the variable defined in “Variable” is described in the application. The coding depends on the options “Tap FALSE” and “Tap on enter if captured”.

<table>
<thead>
<tr>
<th><strong>Variable</strong></th>
<th>Variable (BOOL) that is set on mouse click.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td>PLC_PRG.bIsTapped</td>
</tr>
<tr>
<td><strong>TRUE:</strong></td>
<td>A mouse click event exists. It lasts while the user presses the mouse button over the element. It ends when the button is released.</td>
</tr>
<tr>
<td><strong>FALSE:</strong></td>
<td>A mouse click event does not exist.</td>
</tr>
</tbody>
</table>

Requirement: The “Tap FALSE” option is not activated.
### "Tap FALSE"

- **True**: The mouse click event leads to a complementary value in "Variable".
- **False**: A mouse click event does not exist.
- **False**: While the mouse click event exists.

### "Tap on enter if captured"

- **True**: During user input, it is also taken into consideration whether the mouse pointer is dragged within the element area or not while the mouse button is pressed.
- **False**: While the mouse click event exists and the mouse pointer is moved over the element area.
- **False**: A mouse click event does not exist. Or the user moves the mouse pointer outside of the element area while the mouse button is pressed.

The value is **True** again as soon as the user moves the pointer back to the element area. The mouse is then captured.

### "Shift"

With the onset of a mouse click event, the variable is set; when the mouse click event is completed, the variable is reset.

### "Variable"

Variable (BOOL). Its value toggled when the mouse click event is ended. This is when the user releases the mouse button while the mouse pointer is over the element area.

If the user releases the mouse button while the mouse pointer is outside of the element area, then the mouse click event is not ended and the value is not toggled.

Tip: The user can cancel a started toggle input by dragging the mouse pointer out of the element area.

### "Toggle on up if captured"

- **True**: The value toggles regardless of where the mouse pointer is when the mouse button is released. The mouse is then captured.

### "Keyboard shortcuts"

Keyboard shortcut on the element for triggering specific input actions.

When the keyboard shortcut event occurs, the input actions in the "Event(s)" property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.

### "Key"

Key pressed for input action.

Example: [T]

Note: The following properties appear when a key is selected.

### "Event(s)"

- "None"
- "Mouse down": Pressing the key triggers the input actions that are configured in the "OnMouseDown" property.
- "Mouse up": Releasing the key triggers the input actions that are configured in the "OnMouseUp" property.
- "Mouse down/up": Pressing and releasing the key triggers the input actions that are configured in the "OnMouseDown" property and the "OnMouseUp" property.

### "Shift"

- **True**: Combination with the Shift key

Example: [Shift]+[T].

### "Control"

- **True**: Combination with the Ctrl key

Example: [Ctrl]+[T].

### "Alt"

- **True**: Combination with the Alt key

Example: [Alt]+[T].
All keyboard shortcuts and their actions that are configured in the visualization are listed in the “Keyboard configuration” tab.

Element property 'Access rights'

| "Access rights" | Opens the “Access rights” dialog. There you can edit the access privileges for the element. Status messages:  
| "Not set. Full rights.": Access rights for all user groups: "operable"  
| "Rights are set: Limited rights": Access is restricted for at least one group. |

See also
- % Chapter 1.3.5.19.3.1 “Dialog 'Access Rights’” on page 1583

See also
- 

Visualization element 'Pie'

Symbol:

Tag: “Basic”
The element draws a pie of any angle.

Element properties

| "Element name" | Example: Error_rate_part_1 |
| "Type of element" | Pie |

The position defines the location and size of the element in the visualization window. This is based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.
<table>
<thead>
<tr>
<th><strong>“X”</strong></th>
<th>The x-coordinate of the upper left corner of the element</th>
<th>Specified in pixels</th>
<th>Example: 10</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Y”</strong></td>
<td>The y-coordinate of the upper left corner of the element</td>
<td>Specified in pixels</td>
<td>Example: 10</td>
</tr>
<tr>
<td><strong>“Width”</strong></td>
<td>Specified in pixels</td>
<td>Example: 150</td>
<td></td>
</tr>
<tr>
<td><strong>“Height”</strong></td>
<td>Specified in pixels</td>
<td>Example: 30</td>
<td></td>
</tr>
</tbody>
</table>

Tip: You can change the values in “X”, “Y”, “Width”, and “Height” by dragging the corresponding symbols to another position in the editor.

<table>
<thead>
<tr>
<th><strong>“Angle”</strong></th>
<th>Static angle of rotation (in degrees).</th>
<th>Example: 35</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>The element is displayed rotated in the editor. The point of rotation is the center of the element. A positive value rotates clockwise.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Tip: You can change the value in the editor by focusing the element to the handle. When the cursor is displayed as a rotating arrow, you can rotate the element about its center as a handle.</td>
<td></td>
</tr>
</tbody>
</table>

(1): Handle

Note: If a dynamic angle of rotation is also configured in the property “Absolute movement ➔ Internal rotation”, then the static and dynamic angles of rotation are added in runtime mode. The static angle of rotation acts as an offset.

See also

- Chapter 1.3.5.3.2 “Positioning elements, adapting size and layer” on page 1113
### Property "Begin"

Start angle of the pie. If you also define a variable for the start, then the start angle is calculated from the sum of the values for "Begin" and "Variable for begin".

**Example:**
- "Begin": 330
- "End": 90

### Property "End"

End angle of the pie. If you also define a variable for the end, then the end angle is calculated from the sum of the values for "End" and "Variable for end".

The pie is drawn clockwise from the start angle to the end angle.

### Property "Variable for begin"

The start of the sector is defined dynamically by a variable.

### Property "Variable for end"

The end of the sector is defined dynamically by a variable.

### Property "Only show circle line"

The pie is drawn without the radius line or filling color.

### Element property 'Center'

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;X&quot;</td>
<td>Display of the center coordinates. You cannot modify these values here in the properties.</td>
</tr>
<tr>
<td>&quot;Y&quot;</td>
<td>If the pie is selected in the editor, then the center of the pie (as well as the center of the enveloping box) is visualized with the symbol 📑. Moreover, the element is decorated with a position, begin, and end boxes that you can move.</td>
</tr>
</tbody>
</table>

The center coordinates change when you move the center symbol 📑 in the editor. This also changes the size of the pie so that the position box 🖍 retains its position and the center remains in the middle of the element.

### Element property 'Colors'

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Normal state&quot;</td>
<td>The normal state is in effect if the variable in &quot;Color variables ➔ Toggle color&quot; is not defined or it has the value FALSE.</td>
</tr>
<tr>
<td>&quot;Frame color&quot;</td>
<td>Frame and fill color for the corresponding state of the variable.</td>
</tr>
<tr>
<td>&quot;Fill color&quot;</td>
<td></td>
</tr>
<tr>
<td>&quot;Transparency&quot;</td>
<td>Transparency value (0 to 255) for defining the transparency of the selected color. Example: 255: The color is opaque. 0: The color is completely transparent.</td>
</tr>
</tbody>
</table>
### “Alarm state”
The alarm state is in effect if the variable in “Color variables → Toggle color” has the value TRUE.

### “Use gradient color”
- The element is displayed with a gradient of two colors.

### “Gradient setting”
The “Gradient editor” dialog box opens.

See also
- ☀ Chapter 1.3.5.19.3.5 “Dialog ‘Gradient Editor’” on page 1586

### Element property ‘Appearance’
The properties contain fixed values for setting the look of the element.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| **“Line width”** | Value in pixels
| Example: 2       | Note: The values 0 and 1 both result in a line weight of 1 pixel. If no line should be displayed, then the “Line style” property must be set to the option "Invisible". |
| **“Fill attributes”** | The way in which the element is filled.
| “Filled”         | The element is filled with the color from property “Colors → Fill color”.
| “Invisible”      | The fill color is invisible. |
| **“Line style”** | Type of line representation
| “Solid”          | |
| “Dashes”         | |
| “Dots”           | |
| “Dash Dot”       | |
| “Dash Dot Dot”   | |
| “not visible”    | |

You can assign variables in the “Appearance variables” property for controlling the appearance dynamically. The fixed values here are overwritten.

See also
- ☀ “Element property ‘Appearance variables’” on page 1285

### Element property ‘Texts’
The properties contains character strings for labeling the element. The character string can also contain a placeholder with a format definition. In runtime mode, the placeholder is replaced by the current value in the specified format.

CODESYS accepts the specified texts automatically into the “GlobalTextList” text list. Therefore, these texts can be localized.
**“Text”**
Character string (without single straight quotation marks) for the labeling the element. Add a line break by pressing the keyboard shortcut [Ctrl] + [Enter].

Example: Accesses: %i

The variable that contains the current value for the placeholder is specified in the property “Text variable ➔ Text”.

**“Tooltip”**
Character string (without single straight quotation marks) that is displayed as the tooltip of an element.

Example: Number of valid accesses.

The variable that contains the current value for the placeholder is specified in the property “Text variable ➔ Tooltip”.

</tr>
<tr>
<td></td>
<td>▼: Drop-down list with style fonts.</td>
</tr>
<tr>
<td>“Font color”</td>
<td>Example: “Black”</td>
</tr>
<tr>
<td></td>
<td>▶: The “Color” dialog box opens.</td>
</tr>
<tr>
<td></td>
<td>▼: Drop-down list with style colors.</td>
</tr>
<tr>
<td>“Transparency”</td>
<td>Whole number (value range from 0 to 255). This determines the transparency of the respective color.</td>
</tr>
<tr>
<td></td>
<td>Example: 255: The color is opaque.</td>
</tr>
<tr>
<td></td>
<td>0: The color is completely transparent.</td>
</tr>
<tr>
<td></td>
<td>Please note: If the color is a style color and already has a transparency value, then this property is write-protected.</td>
</tr>
</tbody>
</table>

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

<table>
<thead>
<tr>
<th>“Movement”</th>
</tr>
</thead>
<tbody>
<tr>
<td>“X”</td>
</tr>
<tr>
<td>Variable (integer data type). Defines the X position (in pixels).</td>
</tr>
<tr>
<td>Example: PLC_PRG.iPos_X.</td>
</tr>
<tr>
<td>Increasing this value in runtime mode moves the element to the right.</td>
</tr>
<tr>
<td>Property</td>
</tr>
<tr>
<td>--------------</td>
</tr>
<tr>
<td>“Y”</td>
</tr>
<tr>
<td>“Scaling”</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td>“Interior rotation”</td>
</tr>
</tbody>
</table>

---

You can link the variables to a unit conversion.

The “X”, “Y”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

See also
- **Unit conversion**

Element property 'Text variables'

These properties are variables with contents that replace a format definition.
### "Text variable"

Variable (data type compliant with the format definition). It contains what is printed instead of the format definition.

**Example:** PLC_PRG.iAccesses

Note: The format definition is part of the text in the property "Texts ➤ Text".

Note: If you specify a variable of type enumeration with text list support, then the name of the enumeration data type is added automatically in angle brackets after the variable name. Example: PLC_PRG.enVar <enumeration name>. Then the symbolic value of the enumeration component is printed instead of the numeric value when text is printed. Refer to the help page for the enumerations.

### "Tooltip variable"

Variable (data type compliant with the format definition). It contains what is printed instead of the format definition.

**Example:** PLC_PRG.iAccessesInTooltip

Note: The format definition is part of the text in the property "Texts ➤ Tooltip".

- ¶ Enumerations

#### Element property 'Dynamic texts'

Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.

<table>
<thead>
<tr>
<th>&quot;Text list&quot;</th>
<th>Variable (string) or name of the text list as a fixed string in single straight quotation marks.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td>'Errorlist'</td>
</tr>
<tr>
<td>‣: Drop-down list with the dialogs available in the text lists.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>&quot;Text index&quot;</th>
<th>Text list ID. This refers to the desired output text.</th>
</tr>
</thead>
</table>
| ‣ As fixed string with the ID in single straight quotation marks. | Example: '1'
| ‣ As a variable (STRING) for dynamically controlling the text output. | Example: strTextID
| Sample assignment: PLC_PRG.strTextID := '1'; |

<table>
<thead>
<tr>
<th>&quot;Tooltip index&quot;</th>
<th>Text list ID. This refers to the desired output text.</th>
</tr>
</thead>
</table>
| ‣ As fixed string with the ID in single straight quotation marks. | Example: '2'
| ‣ As a variable (STRING) for dynamically controlling the text output. | Example: strToolTipID
| Sample assignment: PLC_PRG.strToolTipID := '2'; |

- ¶ Text list

#### Element property 'Font variables'

The variables allow for dynamic control of the text display.
<table>
<thead>
<tr>
<th><strong>“Font name”</strong></th>
<th>Variable (STRING). Includes the font of the text.</th>
<th>Example: PLC_PRG.stFontVar := 'Arial';</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>The selection of fonts corresponds to the default “Font” dialog.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>“Size”</strong></th>
<th>Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name.</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• &lt;pt&gt;: Points (default)</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Example: PLC_PRG.iFontHeight &lt;pt&gt;</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Code: iFontHeight : INT := 12;</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• &lt;px&gt;: Pixels</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Example: PLC_PRG.iFontHeight &lt;px&gt;</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Code: iFontHeight : INT := 19;</td>
<td></td>
</tr>
</tbody>
</table>

If you click in the value field, a drop-down list opens on the right for setting the unit.

Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property “Text property ➔ Font”.

<table>
<thead>
<tr>
<th><strong>“Flags”</strong></th>
<th>Variable (DWORD). Contains the flags for displaying fonts.</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Flags:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• 1: Italics</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• 2: Bold</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• 4: Underline</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• 8: Strikethrough</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: PLC_PRG.dwFontType := 6;</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>“Character set”</strong></th>
<th>Variable (DWORD). Contains a character set number for the font.</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>The selection of character set numbers corresponds to the “Script” setting of the standard “Font” dialog.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>“Color”</strong></th>
<th>Variable (DWORD). Includes the color of the text.</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Example: PLC_PRG.dwColorFont := 16#FF000000;</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>“Flags for text alignment”</strong></th>
<th>Variable (integer data type). Contains the coding for text alignment.</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Example: PLC_PRG.dwTextAlignment.</td>
<td></td>
</tr>
<tr>
<td>Coding:</td>
<td>• 0: Top left</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• 1: Horizontal center</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• 2: Right</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• 4: Vertical center</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• 8: Bottom</td>
<td></td>
</tr>
<tr>
<td>Note:</td>
<td>You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: PLC_PRG.dwFontType := 5;</td>
<td></td>
</tr>
</tbody>
</table>
Fixed values for displaying texts are set in “Text properties”.

See also
- "Element property 'Text properties'“ on page 1227

**Element property 'Color variables'**

The Element property is used as an interface for project variables to dynamically control colors at runtime.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Toggle color&quot;</td>
<td>The property controls the toggled color at runtime.</td>
</tr>
<tr>
<td>Value assignment:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• FALSE: The element is displayed with the color specified in the “Color” property.</td>
</tr>
<tr>
<td></td>
<td>• TRUE: The element is displayed with the color specified in the “Alarm color” property.</td>
</tr>
<tr>
<td>Assignment options:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Placeholder for the user input variable</td>
</tr>
<tr>
<td></td>
<td>– &quot;&lt;toggle/tap variable&gt;&quot;</td>
</tr>
<tr>
<td></td>
<td>– &quot;&lt;NOT toggle/tap variable&gt;&quot;</td>
</tr>
<tr>
<td></td>
<td>The color change is not controlled by its own variable, but by a user input variable.</td>
</tr>
<tr>
<td></td>
<td>Note: Specify a variable for the mouse events “Tap” or “Toggle” in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both “Toggle” and “Tap”, then the variable specified in “Tap” is used.</td>
</tr>
<tr>
<td></td>
<td>Hint: Click the symbol to insert the placeholder “&lt;toggle/tap variable&gt;”. When you activate the “Inputconfiguration”, “Tap FALSE” property, then the “&lt;NOT toggle/tap variable&gt;” placeholder is displayed.</td>
</tr>
<tr>
<td></td>
<td>• Instance path of a project variable (BOOL)</td>
</tr>
<tr>
<td></td>
<td>Example: PLC_PRG.xColorIsToggeled</td>
</tr>
<tr>
<td></td>
<td>Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Normal state&quot;</td>
<td>The properties listed below control the color depending on the state. The normal state is in effect if the variable in “Color variables”, “Toggle color” is not defined or it has the value FALSE.</td>
</tr>
<tr>
<td>&quot;Alarm state&quot;</td>
<td>The alarm state is in effect if the variable in “Color variables”, “Toggle color” has the value TRUE.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Property</th>
<th>Assignment options:</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Frame color&quot;</td>
<td>• Variable (DWORD) for the frame color</td>
</tr>
<tr>
<td></td>
<td>Example: PLC_PRG.dwBorderColor</td>
</tr>
<tr>
<td></td>
<td>• Color literal</td>
</tr>
<tr>
<td></td>
<td>Example of green and opaque: 16#FF00FF00</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Property</th>
<th>Assignment options:</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Filling color&quot;</td>
<td>• Variable (DWORD) for the fill color</td>
</tr>
<tr>
<td></td>
<td>Example: PLC_PRG.dwFillColor</td>
</tr>
<tr>
<td></td>
<td>• Color literal</td>
</tr>
<tr>
<td></td>
<td>Example of gray and opaque: 16#FF888888</td>
</tr>
</tbody>
</table>
The transparency part of the color value is evaluated only if the "Activate semi-transparent drawing" option of the visualization manager is selected.

Select the "Advanced" option in the toolbar of the properties view. Then all element properties are visible.

See also
- ¶ Chapter 1.3.5.8.3 “Animating a color display” on page 1152
- ¶

Element property 'Appearance variables'

The properties contain IEC variables for controlling the appearance of the element dynamically.

| "Line width" | Variable (integer data type). Contains the line weight (in pixels). |
| "Fill attributes" | Variable (DWORD). Controls whether the fill color of the element is visible. |
| - Variable value = 0: Filled |
| - Variable value > 0: Invisible; no fill color |
| "Line style" | Variable (DWORD). Controls the line style. |
| - Coding: |
| - 0: Solid line |
| - 1: Dashed line |
| - 2: Dotted line |
| - 3: Line type "Dash Dot" |
| - 3: Line type "Dash Dot Dot" |
| - 8: Invisible; no line |

Fixed values can be set in the “Appearance” property. These values can be overwritten by dynamic variables at runtime.

See also
- ¶ “Element property ‘Appearance’” on page 1238

Element property 'State variables'

The variables control the element behavior dynamically.

| "Invisible" | Variable (BOOL). Toggles the visibility of the element. |
| TRUE: The element is not visible at runtime. |
| "Deactivate inputs" | Variable (BOOL). Toggles the operability of the element. |
| TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated. |
The “Invisible” property is supported by the “Client Animation” functionality.

See also

These properties are available only when you select the “Preview: Support client animations and overlay of native elements” option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.

<table>
<thead>
<tr>
<th>“Animation duration”</th>
<th>Time that the element executes an animation (in milliseconds)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Example: 500</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Move to the foreground”</th>
<th>Property value (BOOL)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>TRUE: At runtime, the element is displayed in the foreground.</td>
</tr>
<tr>
<td></td>
<td>FALSE: At runtime, the element is displayed in the layer where it was inserted in the visualization editor.</td>
</tr>
</tbody>
</table>

See also

- Chapter 1.3.5.21.5 “Using client animation” on page 1962

**Element property 'Input configuration'**

The properties contain the configurations for the user input when using the mouse or keyboard. A user input defines an event and one or more actions that are executed when an event occurs.

The “Configure” button opens the “Input configuration” dialog box for creating or modifying a user input.

Configured user inputs are briefly listed below the events. They each include the action that is triggered and the setting in short form.

Example: “Execute ST code”: #PLC_PRG.i_x := 0;

<table>
<thead>
<tr>
<th>“OnDialogClosed”</th>
<th>Input event: The user closes the dialog box.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“OnMouseClick”</td>
<td>Input event: The user clicks the mouse button completely. The mouse button is clicked and released.</td>
</tr>
<tr>
<td>“OnMouseDown”</td>
<td>Input event: The user clicks down on the mouse button.</td>
</tr>
<tr>
<td>“OnMouseEnter”</td>
<td>Input event: The user drags the mouse pointer to the element.</td>
</tr>
<tr>
<td>“OnMouseLeave”</td>
<td>Input event: The user drags the mouse pointer away from the element.</td>
</tr>
<tr>
<td>“OnMouseMove”</td>
<td>Input event: The user moves the mouse pointer over the element area.</td>
</tr>
<tr>
<td>“OnMouseUp”</td>
<td>Input event: The user releases the mouse button over the element area.</td>
</tr>
</tbody>
</table>
### “Tap”
When a mouse click event occurs, the variable defined in “Variable” is described in the application. The coding depends on the options “Tap FALSE” and “Tap on enter if captured”.

### “Variable”
Variable (BOOL) that is set on mouse click.
- **Example**: PLC_PRG.bIsTapped
  - TRUE: A mouse click event exists. It lasts while the user presses the mouse button over the element. It ends when the button is released.
  - FALSE: A mouse click event does not exist.
- **Requirement**: The “Tap FALSE” option is not activated.

### “Tap FALSE”
- **☑️**: The mouse click event leads to a complementary value in “Variable”.
- **TRUE**: A mouse click event does not exist.
- **FALSE**: While the mouse click event exists.

### “Tap on enter if captured”
- **☑️**: During user input, it is also taken into consideration whether the mouse pointer is dragged within the element area or not while the mouse button is pressed.
- **TRUE**: While the mouse click event exists and the mouse pointer is moved over the element area.
- **FALSE**: A mouse click event does not exist. Or the user moves the mouse pointer outside of the element area while the mouse button is pressed.
  - The value is **TRUE** again as soon as the user moves the pointer back to the element area. The mouse is then captured.

### “Shift”
With the onset of a mouse click event, the variable is set; when the mouse click event is completed, the variable is reset.

### “Variable”
Variable (BOOL). Its value toggled when the mouse click event is ended. This is when the user releases the mouse button while the mouse pointer is over the element area.
- If the user releases the mouse button while the mouse pointer is outside of the element area, then the mouse click event is not ended and the value is not toggled.
- **Tip**: The user can cancel a started toggle input by dragging the mouse pointer out of the element area.

### “Toggle on up if captured”
- **☑️**: The value toggles regardless of where the mouse pointer is when the mouse button is released. The mouse is then captured.

### “Keyboard shortcuts”
Keyboard shortcut on the element for triggering specific input actions.
When the keyboard shortcut event occurs, the input actions in the “Event(s)” property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.

### “Key”
Key pressed for input action.
- **Example**: [T]
- **Note**: The following properties appear when a key is selected.
**"Event(s)"**

- **"None"**
- **"Mouse down"**: Pressing the key triggers the input actions that are configured in the "OnMouseDown" property.
- **"Mouse up"**: Releasing the key triggers the input actions that are configured in the "OnMouseUp" property.
- **"Mouse down/up"**: Pressing and releasing the key triggers the input actions that are configured in the "OnMouseDown" property and the "OnMouseUp" property.

**"Shift"**
- Combination with the Shift key
- Example: [Shift]+[T].

**"Control"**
- Combination with the Ctrl key
- Example: [Ctrl]+[T].

**"Alt"**
- Combination with the Alt key
- Example: [Alt]+[T].

---

> All keyboard shortcuts and their actions that are configured in the visualization are listed in the "Keyboard configuration" tab.

- [Chapter 1.3.5.19.2.2 “Command 'Keyboard Configuration’” on page 1558](#)
- [Chapter 1.3.5.19.3.6 “Dialog 'Input Configuration’” on page 1586](#)

**Element property 'Access rights'**

Requirement: User management is set up for the visualization.

**"Access rights"**

Opens the "Access rights" dialog. There you can edit the access privileges for the element.

Status messages:

- **"Not set. Full rights."**: Access rights for all user groups : “operable”
- **"Rights are set: Limited rights."**: Access is restricted for at least one group.

See also

- [Chapter 1.3.5.19.3.1 “Dialog 'Access Rights’” on page 1583](#)

---

**Visualization element 'Image'**

Symbol:

Tag: "Basic"

The element adds an image to the visualization. The displayed image is managed in the image pool and referenced in the visualization element by means of a static ID. In addition, you can change the displayed image dynamically by using a variable instead of the static ID.
With the “Background” command, you can define a background for the entire visualization.

Directories that contain the images for use in visualizations can be defined in the project settings (category “Visualization”).

Element properties

<table>
<thead>
<tr>
<th>“Element name”</th>
<th>Example: Status bar</th>
</tr>
</thead>
<tbody>
<tr>
<td>Optional</td>
<td>Hint: Assign individual names for elements so that they are found faster in the element list.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Type of element”</th>
<th>“Image”</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Identifier for static assignment</td>
</tr>
<tr>
<td></td>
<td>ID of the image file on, as it is defined in the corresponding image pool. If the image is not included in the global image pool in the POU view, then the instance path must be specified. Then the name of the image pool is preceded to make the entry unique. Example: imagepool2.button_image.</td>
</tr>
<tr>
<td></td>
<td>When entering a new ID, a file selection opens. The selected file is saved to the “GlobalImagePool”.</td>
</tr>
<tr>
<td></td>
<td>See also: Help for the “Image pool” object.</td>
</tr>
</tbody>
</table>

| “Show frame” | [✓] The image file is displayed with a frame. |
| “Clipping” | Requirement: “Scaling type” is “Fixed”. |
| [✓] Only part of the visualization is displayed that fits in the element frame. |

| “Transparent” | [✓] The image pixels that have the “Transparent color” are displayed as transparent. |

| “Transparent color” | Effective only if the “Transparent” option is activated. |
|                     | The button opens the color selection dialog. This is where you select the transparent color. |

<table>
<thead>
<tr>
<th>“Scaling type”</th>
<th>Definition how an image fits in the element frame.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• “Isotropic”: The entire image is shown in the element frame, either larger or smaller. As a result, the proportion of height and width are retained.</td>
</tr>
<tr>
<td></td>
<td>If the alignment of the elements to each other should also be retained within a scaled frame element, then note the following. Unwanted horizontal or vertical offsets can be prevented by setting the properties “Horizontal alignment” and “Vertical alignment” to “Centered”. The alignment of the elements is retained and there are no resulting horizontal or vertical offsets. Example: A lamp is centered above a switch. The lamp should remain in the horizontally centered position, even if the frame is resized.</td>
</tr>
<tr>
<td></td>
<td>• “Anisotropic”: The image resizes automatically to the dimensions of the element frame, filling the entire element frame. As a result, the proportions are not retained.</td>
</tr>
<tr>
<td></td>
<td>• “Fixed”: The image retains its original size, even if the element frame is resized. Please note also that the “Clipping” option is selected. For each reassignment of an image ID, the element size is adapted automatically to the image size.</td>

<tr>
<td>Note</td>
<td>The property “Variable” is shown below.</td>
</tr>
</tbody>
</table>

| “Variable”             | Enumeration variable (ENUM VisuElemBase.VisuEnumHorizontalAlignment). Contains the horizontal alignment. |   |
|                       | Enumeration:                                                 |   |
|                       | TYPE VisuElemBase.VisuEnumHorizontalAlignment                  |   |
|                       | LEFT                                                        |   |
|                       | HCENTER                                                     |   |
|                       | RIGHT                                                       |   |
|                       | END_TYPE                                                    |   |
| Example                | PLC_PRG.eHorizontalAlignment                                |   |
| Declaration            | PROGRAM PLC_PRG                                              |   |
|                       | VAR                                                         |   |
|                       | eHorizontalAlignment :                                       |   |
|                       | VisuElemBase.VisuEnumHorizontalAlignment :=                  |   |
|                       | VisuElemBase.VisuEnumHorizontalAlignment.HCENTER;            |   |
|                       | END_VAR                                                     |   |
**Vertical alignment**

Vertical alignment of the element within the element frame:
- "Top"
- "Centered"
- "Bottom"

Requirement: The scaling type of the image is "Isotropic" or "Fixed".

Note: If the visualization is referenced, then the horizontal alignment takes effect within the frame position.

* The "Variable" property is shown below.

**Variable**

Enumeration variable (ENUM VisuElemBase.VisuEnumVerticalAlignment). Contains the vertical alignment.

**Enumeration:**

```
TYPE VisuElemBase.VisuEnumVerticalAlignment
  DOWN
  VCENTER
  BOTTOM
END_TYPE
```

Example: PLC_PRG.eHorizontalAlignment

**Declaration:**

```
PROGRAM PLC_PRG
VAR
  eVerticalAlignment :
    VisuElemBase.VisuEnumVerticalAlignment :=
    VisuElemBase.VisuEnumVerticalAlignment.VCENTER;
END_VAR
```

See also

- *Object 'Image Pool'*

**Element property 'Position'**

The position defines the location and size of the element in the visualization window. This is based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

**"X"**

The x-coordinate of the upper left corner of the element

Specified in pixels

Example: 10

**"Y"**

The y-coordinate of the upper left corner of the element

Specified in pixels

Example: 10

**"Width"**

Specified in pixels

Example: 150

**"Height"**

Specified in pixels

Example: 30

Tip: You can change the values in "X", "Y", "Width", and "Height" by dragging the corresponding symbols to another position in the editor.
**“Angle”**

Static angle of rotation (in degrees).

Example: 35

The element is displayed rotated in the editor. The point of rotation is the center of the element. A positive value rotates clockwise.

Tip: You can change the value in the editor by focusing the element to the handle. When the cursor is displayed as a rotating arrow, you can rotate the element about its center as a handle.

![Image of handle](image)

(1): Handle

Note: If a dynamic angle of rotation is also configured in the property “Absolute movement ➔ Internal rotation”, then the static and dynamic angles of rotation are added in runtime mode. The static angle of rotation acts as an offset.

See also

- § Chapter 1.3.5.3.2 “Positioning elements, adapting size and layer” on page 1113

**Element property 'Center’**

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

| **“X”** | X-coordinate of the point of rotation |
| **“Y”** | Y-coordinate of the point of rotation |

You can also change the values by dragging the symbols (aleza) to other positions in the editor.

**Element property 'Colors’**

The properties contain fixed values for setting colors.

| **“Color”** | Color for the frame |
| **Requirement**: “Show frame” property is activated. |
| Please note that the normal state is in effect if the expression in the “Color variables ➔ Toggle color” property is not defined or it has the value FALSE. |

| **“Alarm color”** | Color for the frame in alarm state |
| **Requirement**: “Show frame” property is activated. |
| Please note that the alarm state is in effect if the expression in the “Color variables ➔ Toggle color” property has the value TRUE. |

| **“Transparency”** | Value (0 to 255) for defining the transparency of the selected color. |
| Example 255: The color is opaque. 0: The color is completely transparent. |
The properties contain fixed values for setting the look of the element.

**Element property 'Appearance'**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Line width&quot;</td>
<td>Value in pixels&lt;br&gt;Note: The values 0 and 1 both result in a line weight of one pixel. If no line should be displayed, then the &quot;Line style&quot; property must be set to the option &quot;Invisible&quot;.</td>
</tr>
</tbody>
</table>
| "Line style"  | Type of line representation<br>- "Solid"
  - "Dashes"
  - "Dots"
  - "Dash Dot"
  - "Dash Dot Dot"
  - "not visible" |

You can assign variables in the "Appearance variables" property for controlling the appearance dynamically. The fixed values are defined here.

See also

- “Element property ‘Appearance variables’” on page 1285

**Element property 'Texts'**

The properties contain character strings for labeling the element. The character string can also contain a placeholder with a format definition. In runtime mode, the placeholder is replaced by the current value in the specified format.

CODESYS accepts the specified texts automatically into the “GlobalTextList” text list. Therefore, these texts can be localized.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Text&quot;</td>
<td>Character string (without single straight quotation marks) for the labeling of the element. Add a line break by pressing the keyboard shortcut [Ctrl] + [Enter].&lt;br&gt;Example: Accesses: %i&lt;br&gt;The variable that contains the current value for the placeholder is specified in the property &quot;Text variable ➔ Text&quot;.</td>
</tr>
<tr>
<td>&quot;Tooltip&quot;</td>
<td>Character string (without single straight quotation marks) that is displayed as the tooltip of an element.&lt;br&gt;Example: Number of valid accesses.&lt;br&gt;The variable that contains the current value for the placeholder is specified in the property &quot;Text variable ➔ Tooltip&quot;.</td>
</tr>
</tbody>
</table>

<tr>
<td>&quot;Transparency&quot;</td>
<td>Whole number (value range from 0 to 255). This determines the transparency of the respective color.</td>
</tr>
<tr>
<td></td>
<td>Example: 255: The color is opaque.</td>
</tr>
<tr>
<td></td>
<td>0: The color is completely transparent.</td>
</tr>
<tr>
<td></td>
<td>Please note: If the color is a style color and already has a transparency value, then this property is write-protected.</td>
</tr>
</tbody>
</table>

Variable (STRING). Contains the image ID. The contents of the string correspond to the description of the "Static ID" property.

Example: PLC_PRG.stImageID := 'ImagePool_A.Image3';

See also
- Chapter 1.3.5.18.1.5 "Visualization element 'Image'" on page 1272
- Object 'Image Pool'

You can use this element property for animating a series of image files.

Variable (integer data type). Contains the version of the image.

If the variable changes, then the visualization re-reads the image referenced in the "Image ID" property and displays it.

The visualization displays animations when the image file on the controller is updated continuously, thus incrementing the version variable. The application must be programmed for this.

Possible applications
- Displaying graphics that are generated by the application
- Displaying images that are refreshed by a camera
The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

### "Movement"

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>X</td>
<td>Variable (numeric data type). Defines the X position (in pixels).</td>
<td>PLC_PRG.iPos_X. Increasing this value in runtime mode moves the element to the right.</td>
</tr>
<tr>
<td>Y</td>
<td>Variable (numeric data type). Defines the Y position (in pixels).</td>
<td>PLC_PRG.iPos_Y. Increasing this value in runtime mode moves the element downwards.</td>
</tr>
</tbody>
</table>

### "Rotation"

Variable (numeric data type). Defines the angle of rotation (in degrees).

Example: PLC_PRG.iAngle1.

The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.

In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

### "Scaling"

Variable (integer data type). Causes centric stretching.

Example: PLC_PRG.iScaling.

The reference point is the “Center” property.

The value 1 shrinks the element by a factor of 0.001. The value 1000 returns the element to its original size.

### "Interior rotation"

Variable (numeric data type). Defines the angle of rotation (in degrees).

Example: PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol.

Note: If a static angle of rotation is specified in the property “Position → Angle”, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

You can link the variables to a unit conversion.
The properties “X”, “Y”, “Rotation”, and “Interior rotation” are supported by the "Client Animation" functionality.

See also
- Unit conversion

Element property ‘Relative movement’

The properties contains variables for moving the element. The reference point is the position of the element (‘Position’ property). The shape of the element can change.

<table>
<thead>
<tr>
<th>“Movement top-left”</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>“X”</td>
<td>Variable (integer data type). It contains the number (in pixels) that the left edge is moved horizontally. Incrementing the value moves the element to the right. Example: PLC_PRG.iDeltaX</td>
</tr>
<tr>
<td>“Y”</td>
<td>Variable (integer data type). It contains the number (in pixels) that the top edge is moved vertically. Incrementing the value moves the element to the down. Example: PLC_PRG.iDeltaY</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Movement bottom-right”</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>“X”</td>
<td>Variable (integer data type). It contains the number (in pixels) that the right edge is moved horizontally. Incrementing the value moves the element to the right. Example: PLC_PRG.iDeltaWidth</td>
</tr>
<tr>
<td>“Y”</td>
<td>Variable (integer data type). It contains the number (in pixels) that the bottom edge is moved vertically. Incrementing the value moves the element to the down. Example: PLC_PRG.iDeltaHeight</td>
</tr>
</tbody>
</table>

See also
- “Element property ‘Absolute movement”’ on page 1227

Element property 'Text variables'

These properties are variables with contents that replace a format definition.

<table>
<thead>
<tr>
<th>“Text variable”</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. Example: PLC_PRG.iAccesses</td>
<td></td>
</tr>
<tr>
<td>Note: The format definition is part of the text in the property “Texts ➔ Text”. Note: If you specify a variable of type enumeration with text list support, then the name of the enumeration data type is added automatically in angle brackets after the variable name. Example: PLC_PRG.enVar &lt;enumeration name&gt;. Then the symbolic value of the enumeration component is printed instead of the numeric value when text is printed. Refer to the help page for the enumerations.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Tooltip variable”</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. Example: PLC_PRG.iAccessesInTooltip</td>
<td></td>
</tr>
<tr>
<td>Note: The format definition is part of the text in the property “Texts ➔ Tooltip”.</td>
<td></td>
</tr>
</tbody>
</table>
Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.

<table>
<thead>
<tr>
<th><strong>“Text list”</strong></th>
<th>Variable (string) or name of the text list as a fixed string in single straight quotation marks.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>'Errorlist'</td>
</tr>
<tr>
<td></td>
<td>Drop-down list with the dialogs available in the text lists.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>“Text index”</strong></th>
<th>Text list ID. This refers to the desired output text.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• As fixed string with the ID in single straight quotation marks.</td>
</tr>
<tr>
<td></td>
<td>Example: '1'</td>
</tr>
<tr>
<td></td>
<td>• As a variable (STRING) for dynamically controlling the text output.</td>
</tr>
<tr>
<td></td>
<td>Example: strTextID</td>
</tr>
<tr>
<td></td>
<td>Sample assignment: PLC_PRG.strTextID := '1';</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>“Tooltip index”</strong></th>
<th>Text list ID. This refers to the desired output text.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• As fixed string with the ID in single straight quotation marks.</td>
</tr>
<tr>
<td></td>
<td>Example: '2'</td>
</tr>
<tr>
<td></td>
<td>• As a variable (STRING) for dynamically controlling the text output.</td>
</tr>
<tr>
<td></td>
<td>Example: strToolTipID</td>
</tr>
<tr>
<td></td>
<td>Sample assignment: PLC_PRG.strToolTipID := '2';</td>
</tr>
</tbody>
</table>

See also

- **Text list**

The variables allow for dynamic control of the text display.

Element property 'Font variables'

- **See also**
  - Chapter 1.3.5.18.2 “Placeholders with format definition in the output text” on page 1546
  - “Element property ‘Texts’” on page 1226
  - Enumerations
| **Font name** | Variable (STRING). Includes the font of the text.  
Example: PLC_PRG.stFontVar := 'Arial';  
The selection of fonts corresponds to the default “Font” dialog. |
| **Size** | Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name.  
- `<pt>`: Points (default)  
  Example: PLC_PRG.iFontHeight <pt>  
  Code: iFontHeight : INT := 12;  
- `<px>`: Pixels  
  Example: PLC_PRG.iFontHeight <px>  
  Code: iFontHeight : INT := 19;  
  If you click in the value field, a drop-down list opens on the right for setting the unit.  
  Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property “Text property → Font”. |
| **Flags** | Variable (DWORD). Contains the flags for displaying fonts.  
Flags:  
- 1: Italics  
- 2: Bold  
- 4: Underline  
- 8: Strikethrough  
Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: PLC_PRG.dwFontType := 6; |
| **Character set** | Variable (DWORD). Contains a character set number for the font.  
The selection of character set numbers corresponds to the “Script” setting of the standard “Font” dialog. |
| **Color** | Variable (DWORD). Includes the color of the text.  
Example: PLC_PRG.dwColorFont := 16#FF000000; |
| **Flags for text alignment** | Variable (integer data type). Contains the coding for text alignment.  
Example: PLC_PRG.dwTextAlignment.  
Coding:  
- 0: Top left  
- 1: Horizontal center  
- 2: Right  
- 4: Vertical center  
- 8: Bottom  
Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: PLC_PRG.dwFontType := 5; |
Fixed values for displaying texts are set in “Text properties”.

See also

- “Element property 'Text properties'” on page 1227

**Element property 'Colorvariables'**

The Element property is used as an interface for project variables to dynamically control colors at runtime.
"Toggle color"  
The property controls the toggled color at runtime. 

Value assignment: 
- **FALSE**: The element is displayed with the color specified in the "Color" property. 
- **TRUE**: The element is displayed with the color specified in the "Alarm color" property. 

Assigning the property: 
- Placeholder for the user input variable 
  - "<toggle/tap variable>" 
  - "<NOT toggle/tap variable>" 

The color change is not controlled by its own variable, but by a user input variable.  

Note: Specify a variable for the mouse events "Tap" or "Toggle" in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both "Toggle" and "Tap", then the variable specified in "Tap" is used. 

Hint: Click the symbol ✈ to insert the placeholder "<toggle/tap variable>". When you activate the "Input configuration", "Tap FALSE" property, then the "<NOT toggle/tap variable>" placeholder is displayed. 

- Instance path of a project variable (BOOL) 
  Example: PLC_PRG.xColorIsToggeled 

Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes. 

"Color"  
Color variable for the frame 

- Variable (DWORD) for the color 
  Example: PLC_PRG.dwColor 

- Color literal 
  Example of gray and opaque: 16#FF888888 

Requirement: "Show frame" property is activated. 

Please note that the normal state is in effect if the expression in the "Colorvariables ➜ Toggle color" property is not defined or it has the value FALSE. 

"Alarm color"  
Color variable for the frame in alarm state 

- Variable (DWORD) for the alarm color 
  Example: PLC_PRG.dwAlarmColor 

- Color literal 
  Example of red and opaque: 16#FFFF0000 

Please note that the alarm state is in effect if the expression in the "Colorvariables ➜ Toggle color" property has the value TRUE. 

The transparency part of the color value is evaluated only if the "Activate semi-transparent drawing" option of the visualization manager is selected. 

Select the "Advanced" option in the toolbar of the properties view. Then all element properties are visible.
Element property 'Appearance variables'
The properties contain variables for controlling the appearance of the element dynamically.

| “Line width” | Variable (integer data type). Contains the line weight (in pixels).
|              | Note: The values 0 and 1 both result in a line weight of one pixel. If no line should be displayed, then the “Line style” property must be set to the option “Invisible”.

| “Line style” | Variable (DWORD). Controls the line style.
|             | Coding:
|             | ● 0: Solid line
|             | ● 1: Dashed line
|             | ● 2: Dotted line
|             | ● 3: Line type "Dash Dot"
|             | ● 3: Line type "Dash Dot Dot"
|             | ● 8: Invisible: The line is not drawn.

Fixed values can be set in the “Appearance” property. These values can be overwritten by dynamic variables at runtime.

Element property 'State variables'
The variables control the element behavior dynamically.

| “Invisible” | Variable (BOOL). Toggles the visibility of the element.
|            | TRUE: The element is not visible at runtime.

| “Deactivate inputs” | Variable (BOOL). Toggles the operability of the element.
|                     | TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated.

The “Invisible” property is supported by the “Client Animation” functionality.

These properties are available only when you select the “Preview: Support client animations and overlay of native elements” option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.
**“Animation duration”**
Time that the element executes an animation (in milliseconds)
Example: 500

**“Move to the foreground”**
Property value (BOOL)
TRUE: At runtime, the element is displayed in the foreground.
FALSE: At runtime, the element is displayed in the layer where it was inserted in the visualization editor.

See also
- § Chapter 1.3.5.21.5 “Using client animation” on page 1962

**Element property 'Input configuration’**
The properties contain the configurations for the user input when using the mouse or keyboard.
User input is a user event from the perspective of the element.

The “Configure” button opens the “Input configuration” dialog box for creating or modifying a user input configuration.
A configuration contains one or more input actions for the respective input event. Existing input actions are displayed below it.
Example: “Execute ST code”: #PLC_PRG.i_x := 0;

<table>
<thead>
<tr>
<th>Input event</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;OnDialogClosed&quot;</td>
<td>Input event: The user closes the dialog box.</td>
</tr>
<tr>
<td>&quot;OnMouseClick&quot;</td>
<td>Input event: A user clicks the element completely. The mouse button is clicked and released.</td>
</tr>
<tr>
<td>&quot;OnMouseDown&quot;</td>
<td>Input event: A user clicks down on the element only.</td>
</tr>
<tr>
<td>&quot;OnMouseEnter&quot;</td>
<td>Input event: A user drags the mouse pointer to the element.</td>
</tr>
<tr>
<td>&quot;OnMouseLeave&quot;</td>
<td>Input event: A user drags the mouse pointer away from the element.</td>
</tr>
<tr>
<td>&quot;OnMouseMove&quot;</td>
<td>Input event: A user moves the mouse pointer over the element area.</td>
</tr>
<tr>
<td>&quot;OnMouseUp&quot;</td>
<td>Input event: The user releases the mouse button over the element area.</td>
</tr>
</tbody>
</table>

See also
- § Chapter 1.3.5.19.3.6 “Dialog ‘Input Configuration’” on page 1586

**“Hotkeys”**
Keyboard shortcut on the element for triggering specific input actions.
When the keyboard shortcut event occurs, the input actions in the “Event(s)” property are triggered.

<table>
<thead>
<tr>
<th>Key pressed for input action</th>
<th>Example: [T]</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| “Event(s)”                | • “None”  
  • “Mouse down”: Pressing the key triggers the input actions that are configured in the “OnMouseDown” property.  
  • “Mouse up”: Releasing the key triggers the input actions that are configured in the “OnMouseUp” property.  
  • “Mouse down/up”: Pressing and releasing the key triggers the input actions that are configured in the “OnMouseDown” property and the “OnMouseUp” property.  |

**“Shift”**
☑: Combination with the Shift key
Example: [Shift]+[T].
“Control”  
☑ Combination with the Ctrl key  
Example: [Ctrl]+[T].

“Alt”  
☑ Combination with the Alt key  
Example: [Alt]+[T].

All keyboard shortcuts and their actions that are configured in the visualization are listed in the “Keyboard configuration” tab.

See also  
● ☞ Chapter 1.3.5.19.2.2 “Command 'Keyboard Configuration'' on page 1558

Element property 'Access rights'

Requirement: User management is set up for the visualization.

“Access rights”  
Opens the “Access rights” dialog. There you can edit the access privileges for the element.  
Status messages:  
● “Not set. Full rights.”: Access rights for all user groups: “operable”  
● “Rights are set: Limited rights”: Access is restricted for at least one group.

See also  
● ☞ Chapter 1.3.5.19.3.1 “Dialog 'Access Rights’” on page 1583

● Project Settings - Visualization  
● ☞ Chapter 1.3.5.19.2.10 “Command 'Background'” on page 1565

Visualization element 'Frame'

Symbol:

Tag: “Basic”

The element serves as a frame in which to display one or more already existing visualizations. You get a structured user interface. The size of the frame can be fixed or scaled. The display area of the referenced visualization then adapts itself to the frame size.

Element properties

<table>
<thead>
<tr>
<th>“Element name”</th>
<th>Example: refVisUserInfo</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Type of element”</td>
<td>“Frame”</td>
</tr>
</tbody>
</table>

2020/12/10 3ADR010583, 1, en_US 1287
| “Clipping” | Fixed size. Only that part of the referenced visualization that fits inside the frame is displayed. Requirement: “Scaling type” property is “Fixed”. |
| “Show frame” | Displays the frame |
| ● “No frame”: The displayed area of the frame does not have borders. |
| ● “Frame”: The displayed area of the frame has borders. |
| ● “No frame with offset”: The displayed area of the frame does not have a border and the displayed area of the referenced visualization is reduced inwards by one pixel as compared to the frame area. The gap prevents the referenced visualization from touching any adjacent elements. |

| “Scaling type” | The method with which the height and width of the referenced visualization are scaled. |
| ● “Isotropic”: The visualization is scaled to the size of the element. The visualization retains its proportions with a fixed height/width ratio. |
| ● “Anisotropic”: The visualization is scaled to the size of the element. The height and width are adapted to the element independently of each other. |
| ● “Fixed”: the visualization is displayed in its original size without taking into account the size of the element. |
| ● “Fixed and scrollable”: The visualization is displayed fixed in the element. If it is larger than the element, the element will be provided with scrollbars. Please note: assign variables to the properties “Scroll position variable horizontal” or “Scroll position variable vertical”. You can then edit the data of the scrollbar position in the application. |

Element properties ‘Scrollbar settings’ The properties contain variables for the position of the scrollboxes in the scrollbars. You can then edit the data of the scrollbox position in the application.

| Requirement: the property “Scaling type” is “fixed and scrollable”. |
| “Scroll position variable horizontal” | Variable (integer data type, also as array). Contains the position of the horizontal or vertical scrollbox. The array contains the position for every display variant. If the visualization runs on several display variants, then the position changes are decoupled from each other. |
| “Scroll position variable vertical” | Example: |
| PLC_FRG.iScrollHor[CURRENTCLIENTID] PLC_FRG.iScrollVer[CURRENTCLIENTID] The variable is declared as an array in the example. |
| iScrollHor: ARRAY[0..20] OF INT; iScrollVer: ARRAY[0..20] OF INT; CURRENTCLIENTID indexes the current display variant. You can combine the variables with a unit conversion. |

See also
- Unit conversion
**Deactivation of the background character**

The background is drawn. The non-animated element of the referenced visualization is drawn as a background bitmap in order to optimize the performance of the visualization.

Consequence: Elements can be displayed in an unexpected order at runtime. For example, an animated element can push itself behind the frame at runtime.

☑️ Background character is deactivated in order to avoid the behaviour described above.

---

### Element property 'References'

Contains the currently configured visualization references as a subnode

#### "References"

Clicking “Configure” opens the “Frame Configuration” dialog. This is used to manage the referenced visualizations.

Caution: Visualizations can be nested at any depth by means of frame elements. In order to use the “Switch to any visualization” frame selection type without any problems, a frame must not contain more than 21 referenced visualizations. For more information, see also the description for the “Input configuration” of an element: Action “Switch frame visualization”.

List of the currently referenced visualizations

Visualizations that have a button also have this displayed as a subnode. Each interface variable is listed with the currently assigned transfer parameters.

Example:

```plaintext
vis_FormA
```

- `iDataToDisplay_1:PLC_PRG.iVar1`
- `iDataToDisplay_2:PLC_PRG.iVar2`

Hint: You can change the assignment of the variables to an interface variable here and edit the value field. Or click the “Configure” button instead.

---

- ☑️ Chapter 1.3.5.19.2.1 “Command ‘Interface Editor’” on page 1556
- ☑️ Chapter 1.3.5.19.3.6 “Dialog ‘Input Configuration’” on page 1586

---

### Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>&quot;X&quot;</strong></td>
<td>X coordinate of the upper left corner of the element Specified in pixels. Example: 10.</td>
</tr>
<tr>
<td><strong>&quot;Y&quot;</strong></td>
<td>Y coordinate of the upper left corner of the element Specified in pixels. Example: 10.</td>
</tr>
<tr>
<td><strong>&quot;Width&quot;</strong></td>
<td>Specified in pixels. Example: 150</td>
</tr>
<tr>
<td><strong>&quot;Height&quot;</strong></td>
<td>Specified in pixels. Example: 30</td>
</tr>
</tbody>
</table>
The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

### Element property 'Center'

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>X</td>
<td>X-coordinate of the point of rotation</td>
</tr>
<tr>
<td>Y</td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>

The properties contain fixed values for the colors.

### Element property 'Colors'

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Color</td>
<td>Color of the frame&lt;br&gt;▼: Selection list with style colors appears&lt;br&gt;: Standard dialog “Color” opens for selecting a color.</td>
</tr>
<tr>
<td>Alarm color</td>
<td>Color with which the element is filled during the alarm state. Please note: Alarm state is when the value of the boolean variable in the property “Color variables  Toggle color” is not defined or its value is FALSE.</td>
</tr>
<tr>
<td>Transparency</td>
<td>Integer number (value range from 255 to 0). Specifies the transparency of the associated color.&lt;br&gt;255: The color is opaque.&lt;br&gt;0: The color is fully transparent. Please note: If the color is a style color and already contains a transparency value, then this property is write-protected.</td>
</tr>
</tbody>
</table>

The properties contain fixed values for setting the look of the element.

### Element property 'Appearance'

See also
- Chapter 1.3.5.3.2 “Positioning elements, adapting size and layer” on page 1113
- Chapter 1.3.5.3.3 “Assigning a color” on page 1115
<table>
<thead>
<tr>
<th><strong>“Line width”</strong></th>
<th>Value in pixels</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: 2</td>
<td></td>
</tr>
</tbody>
</table>

Note: The values 0 and 1 both result in a line weight of one pixel. If no line should be displayed, then the “Line style” property must be set to the option “Invisible”.

<table>
<thead>
<tr>
<th><strong>“Line style”</strong></th>
<th>Type of line representation</th>
</tr>
</thead>
<tbody>
<tr>
<td>● “Solid”</td>
<td></td>
</tr>
<tr>
<td>● “Dashes”</td>
<td></td>
</tr>
<tr>
<td>● “Dots”</td>
<td></td>
</tr>
<tr>
<td>● “Dash Dot”</td>
<td></td>
</tr>
<tr>
<td>● “Dash Dot Dot”</td>
<td></td>
</tr>
<tr>
<td>● “not visible”</td>
<td></td>
</tr>
</tbody>
</table>

You can assign variables in the “Appearance variables” property for controlling the appearance dynamically. The fixed values are defined here.

See also
- § “Element property ‘Appearance variables’” on page 1285

**Element property 'Texts’**

The properties contain character strings for labeling the element. The character string can also contain a placeholder with a format definition. In runtime mode, the placeholder is replaced by the current value in the specified format.

CODESYS accepts the specified texts automatically into the “GlobalTextList” text list. Therefore, these texts can be localized.

<table>
<thead>
<tr>
<th><strong>“Text”</strong></th>
<th>Character string (without single straight quotation marks) for the labeling the element. Add a line break by pressing the keyboard shortcut [Ctrl] + [Enter].</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Accesses: %i</td>
</tr>
<tr>
<td></td>
<td>The variable that contains the current value for the placeholder is specified in the property “Text variable” ➔ “Text”.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>“Tooltip”</strong></th>
<th>Character string (without single straight quotation marks) that is displayed as the tooltip of an element.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Number of valid accesses.</td>
</tr>
<tr>
<td></td>
<td>The variable that contains the current value for the placeholder is specified in the property “Text variable” ➔ “Tooltip”.</td>
</tr>
</tbody>
</table>

</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Font color</strong></th>
<th>Example: &quot;Black&quot;</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>▲: The &quot;Color&quot; dialog box opens.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Transparency</strong></th>
<th>Whole number (value range from 0 to 255). This determines the transparency of the respective color.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: 255</td>
<td>The color is opaque.</td>
</tr>
<tr>
<td>0</td>
<td>The color is completely transparent.</td>
</tr>
</tbody>
</table>

Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

### Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

<table>
<thead>
<tr>
<th><strong>Movement</strong></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>X</strong></td>
<td>Variable (numeric data type). Defines the X position (in pixels).</td>
</tr>
<tr>
<td>Example:</td>
<td>PLC_PRG.iPos_X.</td>
</tr>
<tr>
<td>Increasing this value in runtime mode moves the element to the right.</td>
<td></td>
</tr>
</tbody>
</table>

| **Y**        | Variable (numeric data type). Defines the Y position (in pixels). |
| Example:     | PLC_PRG.iPos_Y. |
| Increasing this value in runtime mode moves the element downwards. |

| **Rotation** | Variable (numeric data type). Defines the angle of rotation (in degrees). |
| Example:     | PLC_PRG.iAngle1. |
| The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol. |
| In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right. |

| **Scaling** | Variable (integer data type). Causes centric stretching. |
| Example:    | PLC_PRG.iScaling. |
| The reference point is the “Center” property. |
| The value 1 shrinks the element by a factor of 0.001. The value 1000 returns the element to its original size. |
"Interior rotation"  
Variable (numeric data type). Defines the angle of rotation (in degrees).

Example: PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in "Center" according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the ‼ symbol.

Note: If a static angle of rotation is specified in the property “Position → Angle”, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

You can link the variables to a unit conversion.

The properties “X”, “Y”, “Rotation”, and “Interior rotation” are supported by the "Client Animation" functionality.

- Unit conversion
- "Element property ‘Absolute movement’" on page 1227

---

Element property ‘Relative movement’

The properties contains variables for moving the element. The reference point is the position of the element (“Position” property). The shape of the element can change.

| “Movement top-left” |  
| "X"      | Variable (integer data type). It contains the number (in pixels) that the left edge is moved horizontally. Incrementing the value moves the element to the right. Example: PLC_PRG.iDeltaX |
| "Y"      | Variable (integer data type). It contains the number (in pixels) that the top edge is moved vertically. Incrementing the value moves the element to the down. Example: PLC_PRG.iDeltaY |

| “Movement bottom-right” |  
| "X"      | Variable (integer data type). It contains the number (in pixels) that the right edge is moved horizontally. Incrementing the value moves the element to the right. Example: PLC_PRG.iDeltaWidth |
| "Y"      | Variable (integer data type). It contains the number (in pixels) that the bottom edge is moved vertically. Incrementing the value moves the element to the down. Example: PLC_PRG.iDeltaHeight |

### Element property 'Text variables'

These properties are variables with contents that replace a format definition.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Text variable&quot;</td>
<td>Variable (data type compliant with the format definition). It contains what is printed instead of the format definition.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Example: PLC_PRG.iAccesses</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Note: The format definition is part of the text in the property “Texts ➔ Text”.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Note: If you specify a variable of type enumeration with text list support, then the name of the enumeration data type is added automatically in angle brackets after the variable name. Example: PLC_PRG.enVar &lt;enumeration name&gt;. Then the symbolic value of the enumeration component is printed instead of the numeric value when text is printed. Refer to the help page for the enumerations.</td>
<td></td>
</tr>
<tr>
<td>&quot;Tooltip variable&quot;</td>
<td>Variable (data type compliant with the format definition). It contains what is printed instead of the format definition.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Example: PLC_PRG.iAccessesInTooltip</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Note: The format definition is part of the text in the property “Texts ➔ Tooltip”.</td>
<td></td>
</tr>
</tbody>
</table>

### Element property 'Dynamic texts'

Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Text list&quot;</td>
<td>Variable (string) or name of the text list as a fixed string in single straight quotation marks.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Example: 'Errorlist'</td>
<td></td>
</tr>
<tr>
<td></td>
<td>◄: Drop-down list with the dialogs available in the text lists.</td>
<td></td>
</tr>
<tr>
<td>&quot;Text index&quot;</td>
<td>Text list ID. This refers to the desired output text.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- As fixed string with the ID in single straight quotation marks.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Example: '1'</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- As a variable (STRING) for dynamically controlling the text output.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Example: strTextID</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Sample assignment: PLC_PRG.strTextID := '1';</td>
<td></td>
</tr>
<tr>
<td>&quot;Tooltip index&quot;</td>
<td>Text list ID. This refers to the desired output text.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- As fixed string with the ID in single straight quotation marks.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Example: '2'</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- As a variable (STRING) for dynamically controlling the text output.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Example: strToolTipID</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Sample assignment: PLC_PRG.strToolTipID := '2';</td>
<td></td>
</tr>
</tbody>
</table>

See also
- Text list

### Element property 'Font variables'

The variables allow for dynamic control of the text display.
### “Font name”
Variable (STRING). Includes the font of the text.
Example: `PLC_PRG.stFontVar := 'Arial';`

The selection of fonts corresponds to the default “Font” dialog.

### “Size”
Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name.
- **<pt>:** Points (default)
  Example: `PLC_PRG.iFontHeight <pt>`
  Code: `iFontHeight : INT := 12;`
- **<px>:** Pixels
  Example: `PLC_PRG.iFontHeight <px>`
  Code: `iFontHeight : INT := 19;`

If you click in the value field, a drop-down list opens on the right for setting the unit.

Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property “Text property → Font”.

### “Flags”
Variable (DWORD). Contains the flags for displaying fonts.
Flags:
- **1**: Italics
- **2**: Bold
- **4**: Underline
- **8**: Strikethrough

Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: `PLC_PRG.dwFontType := 6;`

### “Character set”
Variable (DWORD). Contains a character set number for the font.
The selection of character set numbers corresponds to the “Script” setting of the standard “Font” dialog.

### “Color”
Variable (DWORD). Includes the color of the text.
Example: `PLC_PRG.dwColorFont:= 16#FF000000;`

### “Flags for text alignment”
Variable (integer data type). Contains the coding for text alignment.
Example: `PLC_PRG.dwTextAlignment.`
Coding:
- **0**: Top left
- **1**: Horizontal center
- **2**: Right
- **4**: Vertical center
- **8**: Bottom

Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: `PLC_PRG.dwFontType := 5;`
Fixed values for displaying texts are set in “Text properties”.

See also

- “Element property 'Text properties'” on page 1227

**Element property 'Colorvariables'**

The Element property is used as an interface for project variables to dynamically control colors at runtime.
"Toggle color"  

The property controls the toggled color at runtime.

Value assignment:
- **FALSE**: The element is displayed with the color specified in the "Color" property.
- **TRUE**: The element is displayed with the color specified in the "Alarm color" property.

Assigning the property:
- Placeholder for the user input variable
  - "<toggle/tap variable>"
  - "<NOT toggle/tap variable>"

The color change is not controlled by its own variable, but by a user input variable.

Note: Specify a variable for the mouse events "Tap" or "Toggle" in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both "Toggle" and "Tap", then the variable specified in "Tap" is used.

Hint: Click the symbol to insert the placeholder "<toggle/tap variable>". When you activate the "Input configuration", "Tap FALSE" property, then the "<NOT toggle/tap variable>" placeholder is displayed.

- Instance path of a project variable (BOOL)
  Example: PLC_PRG.xColorIsToggled

Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.

"Color"  

Color variable for the frame

- Variable (DWORD) for the color
  Example: PLC_PRG.dwColor
- Color literal
  Example of gray and opaque: 16#FF888888

Requirement: "Show frame" property is activated.

Please note that the normal state is in effect if the expression in the "Colorvariables Toggle color" property is not defined or it has the value FALSE.

"Alarm color"  

Color variable for the frame in alarm state

- Variable (DWORD) for the alarm color
  Example: PLC_PRG.dwAlarmColor
- Color literal
  Example of red and opaque: 16#FFFF0000

Please note that the alarm state is in effect if the expression in the "Colorvariables Toggle color" property has the value TRUE.

The transparency part of the color value is evaluated only if the "Activate semi-transparent drawing" option of the visualization manager is selected.

Select the "Advanced" option in the toolbar of the properties view. Then all element properties are visible.
The properties contain variables for controlling the appearance of the element dynamically.

### Element property 'Appearance variables'

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Line width&quot;</td>
<td>Variable (integer data type). Contains the line weight (in pixels). Note: The values 0 and 1 both result in a line weight of one pixel. If no line should be displayed, then the &quot;Line style&quot; property must be set to the option &quot;Invisible&quot;.</td>
</tr>
</tbody>
</table>

**Fixed values can be set in the “Appearance” property. These values can be overwritten by dynamic variables at runtime.**

### Element property 'Switch frame variable'

The variable controls the switching of the referenced visualizations. This variable indexes one of the referenced frame visualizations and this is displayed in the frame. When the value of the variable changes, it switches to the recently indexed visualization.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Variable&quot;</td>
<td>Variable (integer data type) that contains the index of the active visualization Example: PLC_PRG.uiIndexVisu Hint: The &quot;Frame Configuration&quot; dialog includes a list of referenced visualizations. The visualizations are automatically numerically indexed via the order in the list. Note: This variant of switching usually affects all connected display variants. Array element (integer data type) for index access via CURRENTCLIENTID Example: PLC_PRG.aIndexVisu[CURRENTCLIENTID] Note: This variant of switching applies to the current client only, and therefore only on one display variant. That is the display variant where the value change was triggered (for example, by means of user input).</td>
</tr>
</tbody>
</table>

### Element property 'State variables'

The variables control the element behavior dynamically.
“Invisible” Variable (BOOL). Toggles the visibility of the element.
TRUE: The element is not visible at runtime.

“Deactivate inputs” Variable (BOOL). Toggles the operability of the element.
TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated.

The “Invisible” property is supported by the “Client Animation” functionality.

See also

●

These properties are available only when you select the “Preview: Support client animations and overlay of native elements” option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.

“Animation duration” Time that the element executes an animation (in milliseconds)
Example: 500

“Move to the foreground” Property value (BOOL)
TRUE: At runtime, the element is displayed in the foreground.
FALSE: At runtime, the element is displayed in the layer where it was inserted in the visualization editor.

See also

●  Chapter 1.3.5.21.5 “Using client animation” on page 1962

Element property 'Input configuration'
The properties contain the configurations for the user input when using the mouse or keyboard. A user input defines an event and one or more actions that are executed when an event occurs.

The “Configure” button opens the “Input configuration” dialog box for creating or modifying a user input. Configured user inputs are briefly listed below the events. They each include the action that is triggered and the setting in short form.

Example: “Execute ST code”:

```
PLC_PRG.i_x := 0;
```

“OnDialogClosed” Input event: The user closes the dialog box.

“OnMouseClick” Input event: The user clicks the mouse button completely. The mouse button is clicked and released.

“OnMouseDown” Input event: The user clicks down on the mouse button.

“OnMouseEnter” Input event: The user drags the mouse pointer to the element.

“OnMouseLeave” Input event: The user drags the mouse pointer away from the element.

“OnMouseMove” Input event: The user moves the mouse pointer over the element area.

“OnMouseUp” Input event: The user releases the mouse button over the element area.
### "Tap"

When a mouse click event occurs, the variable defined in "Variable" is described in the application. The coding depends on the options "Tap FALSE" and "Tap on enter if captured".

### "Variable"

Variable (BOOL) that is set on mouse click.

**Example:** PLC_PRG.bIsTapped

**TRUE:** A mouse click event exists. It lasts while the user presses the mouse button over the element. It ends when the button is released.

**FALSE:** A mouse click event does not exist.

**Requirement:** The "Tap FALSE" option is not activated.

### "Tap FALSE"

<select>
- **TRUE:** The mouse click event leads to a complementary value in "Variable".
- **FALSE:** A mouse click event does not exist.

### "Tap on enter if captured"

<select>
- **TRUE:** While the mouse click event exists and the mouse pointer is moved over the element area.
- **FALSE:** A mouse click event does not exist. Or the user moves the mouse pointer outside of the element area while the mouse button is pressed.

The value is **TRUE** again as soon as the user moves the pointer back to the element area. The mouse is then captured.

### "Shift"

With the onset of a mouse click event, the variable is set; when the mouse click event is completed, the variable is reset.

### "Variable"

Variable (BOOL). Its value toggled when the mouse click event is ended. This is when the user releases the mouse button while the mouse pointer is over the element area.

If the user releases the mouse button while the mouse pointer is outside of the element area, then the mouse click event is not ended and the value is not toggled.

**Tip:** The user can cancel a started toggle input by dragging the mouse pointer out of the element area.

### "Toggle on up if captured"

<select>
- **TRUE:** The value toggles regardless of where the mouse pointer is when the mouse button is released. The mouse is then captured.

### "Keyboard shortcuts"

Keyboard shortcut on the element for triggering specific input actions.

When the keyboard shortcut event occurs, the input actions in the "Event(s)" property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.

### "Key"

Key pressed for input action.

**Example:** [T]

**Note:** The following properties appear when a key is selected.
“Event(s)”
- “None”
- “Mouse down”: Pressing the key triggers the input actions that are configured in the “OnMouseDown” property.
- “Mouse up”: Releasing the key triggers the input actions that are configured in the “OnMouseUp” property.
- “Mouse down/up”: Pressing and releasing the key triggers the input actions that are configured in the “OnMouseDown” property and the “OnMouseUp” property.

“Shift”
- ✔ Combination with the Shift key
  Example: [Shift]+[T].

“Control”
- ✔ Combination with the Ctrl key
  Example: [Ctrl]+[T].

“Alt”
- ✔ Combination with the Alt key
  Example: [Alt]+[T].

---

All keyboard shortcuts and their actions that are configured in the visualization are listed in the “Keyboard configuration” tab.

Element property 'Access rights'
Requirement: User management is set up for the visualization.

“Access rights”
- Opens the “Access rights” dialog. There you can edit the access privileges for the element.
  Status messages:
  - “Not set, Full rights.”: Access rights for all user groups: “operable”
  - “Rights are set: Limited rights”: Access is restricted for at least one group.

See also
- ☰
  - ☰ Chapter 1.3.5.19.3.6 “Dialog 'Input Configuration’” on page 1586

Visualization element 'Label'
Symbol:

Tag: “Common controls”
The element is used to label visualizations.
**Element properties**

<table>
<thead>
<tr>
<th>“Element name”</th>
<th>Optional</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hint: Assign individual names for elements so that they are found faster in the element list.</td>
<td></td>
</tr>
<tr>
<td>Example: Header_Parameter</td>
<td></td>
</tr>
</tbody>
</table>

| “Type of element” | “Label” |

**Element property 'Texts'**

The property requires a string that can contain a placeholder with a format definition. At runtime, the placeholder is replaced by the current value. Specify the actual value in the “Text variables” property.

This text is entered automatically into the GlobalTextList text list and can be localized there.

<table>
<thead>
<tr>
<th>“Text”</th>
<th>Character string (without single straight quotation marks)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: Main page %s</td>
<td></td>
</tr>
</tbody>
</table>

See also

- Chapter 1.3.5.18.2 “Placeholders with format definition in the output text” on page 1546

**Element property 'Position'**

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

<table>
<thead>
<tr>
<th>“X”</th>
<th>X coordinate of the upper left corner of the element</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specified in pixels.</td>
<td></td>
</tr>
<tr>
<td>Example: 10.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Y”</th>
<th>Y coordinate of the upper left corner of the element</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specified in pixels.</td>
<td></td>
</tr>
<tr>
<td>Example: 10.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Width”</th>
<th>Specified in pixels.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: 150</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Height”</th>
<th>Specified in pixels.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: 30</td>
<td></td>
</tr>
</tbody>
</table>

You can also change the values by dragging the box symbols (_drag_) to other positions in the editor.

See also

- Chapter 1.3.5.3.2 “Positioning elements, adapting size and layer” on page 1113

**Element property 'Center'**

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the _rotate_ symbol. The point is used as the center for rotating and scaling.
"X"  X-coordinate of the point of rotation

"Y"  Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (🔗) to other positions in the editor.

Element property 'Text properties'

The properties contain fixed values for the text properties.

<table>
<thead>
<tr>

</tbody>
</table>

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Movement&quot;</td>
<td></td>
</tr>
<tr>
<td>&quot;X&quot;</td>
<td>Variable (numeric data type). Defines the X position (in pixels).</td>
</tr>
<tr>
<td></td>
<td>Example: PLC_PRG.iPos_X.</td>
</tr>
<tr>
<td></td>
<td>Increasing this value in runtime mode moves the element to the right.</td>
</tr>
<tr>
<td>&quot;Y&quot;</td>
<td>Variable (numeric data type). Defines the Y position (in pixels).</td>
</tr>
<tr>
<td></td>
<td>Example: PLC_PRG.iPos_Y.</td>
</tr>
<tr>
<td></td>
<td>Increasing this value in runtime mode moves the element downwards.</td>
</tr>
</tbody>
</table>
### Rotation

Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle1.

The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

### Interior rotation

Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol.

Note: If a static angle of rotation is specified in the “Position ➔ Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

---

You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.

See also

- **Unit conversion**

---

**Element property 'State variables'**

The variables control the element behavior dynamically.

<table>
<thead>
<tr>
<th><strong>Invisible</strong></th>
<th>Variable (BOOL). Toggles the visibility of the element.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>TRUE</strong></td>
<td>The element is not visible at runtime.</td>
</tr>
</tbody>
</table>

The “Invisible” property is supported by the “Client Animation” functionality.
These properties are available only when you select the “Preview: Support client animations and overlay of native elements” option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.

<table>
<thead>
<tr>
<th><strong>Property</strong></th>
<th>Description</th>
</tr>
</thead>
</table>
| **Animation duration** | Time that the element executes an animation (in milliseconds)  
Example: 500 |
| **Move to the foreground** | Property value (BOOL)  
TRUE: At runtime, the element is displayed in the foreground.  
FALSE: At runtime, the element is displayed in the layer where it was inserted in the visualization editor. |

Visualization element ‘Combo box integer’

Symbol:

Tag: “Common controls”

The element shows values as a drop-down list. When the user clicks an entry, the ID of the entry is written to an integer variable. The entries in the drop-down list can be from a list and contain images from an image pool.

Element properties
<table>
<thead>
<tr>
<th>&quot;Element name&quot;</th>
<th>Example: List of product numbers</th>

- Chapter 1.3.5.3.2 “Positioning elements, adapting size and layer” on page 1113

Element property ‘Center’ The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

<table>
<thead>
<tr>
<th>“X”</th>
<th>X-coordinate of the point of rotation</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Y”</td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the symbols (Drag) to other positions in the editor.
### “Variable”

At runtime, saves the text list ID of the list entry that the user clicks. If only one image pool is displayed, then the image ID is saved.

**Property value**

- **Variable (integer data type)**
  
  *Example:* `PLC_PRG.iIDComboboxEntry`

- **Enumeration variable with text list support**
  
  *Example:* `PLC_PRG.eMyCombobox<COMBO>`

### “Text list”

Displayed as combo box. Every text list entry becomes a combo box entry.

**Transfer value**

- **Text list identifier as string**
  
  *Example:* `'TextList_A'`

**Note:** The IDs of the text list must be lie within the value range of DWORD or DINT.

- **Empty**
  
  - When an enumeration variable with text list support is specified in the “Variable” property
  
  - When only one image pool is visualized

### “Image pool”

Displayed as combo box. Every image in the image pool becomes a combo box entry.

*Example:* `'ImagePool_A'`

---

**Element property ‘Settings of the list’**

Displayed list that expands when a visualization user clicks into the element.

<table>
<thead>
<tr>
<th><strong>Number of rows setting</strong></th>
<th><strong>From style</strong>: “Explicit”. Then the “Number of visible rows” property appears below it.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Number of visible rows</strong></td>
<td>Number of visible lines of the combo box drop-down list defined here</td>
</tr>
<tr>
<td></td>
<td>- Integer literal</td>
</tr>
<tr>
<td></td>
<td><em>Example:</em> 5</td>
</tr>
<tr>
<td></td>
<td>- Variable (integer data type)</td>
</tr>
<tr>
<td></td>
<td><em>Example:</em> <code>PLC_PRG.iNumberOfVisibleRows</code></td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The property is available when the “Number of rows setting” property is set to “Explicit”.</td>
</tr>
<tr>
<td><strong>Row height</strong></td>
<td><strong>From style</strong>:</td>
</tr>
<tr>
<td></td>
<td>- Literal</td>
</tr>
<tr>
<td></td>
<td><em>Example:</em> 20</td>
</tr>
<tr>
<td><strong>Height of image</strong></td>
<td>Image height (in pixels) of the image displayed in the drop-down list entry</td>
</tr>
<tr>
<td></td>
<td>- “From style”:</td>
</tr>
<tr>
<td></td>
<td>- Integer literal</td>
</tr>
<tr>
<td></td>
<td><em>Example:</em> 30</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Images are displayed only when a value is specified in the “Image pool” property.</td>
</tr>
</tbody>
</table>
### "Width of image"

Image width (in pixels) of the image displayed in the drop-down list entry

- **"From style"**:
  - Literal
    - Example: 30

Note: Images are displayed only when a value is specified in the “Image pool” property.

### "Offset of image"

Makes the images in the selection list appear offset (in pixels) from the left margin. An offset of 0 means that the images are displayed directly on the margin.

- **"From style"**:
  - Literal
    - Example: 4

Note: Images are displayed only when a value is specified in the “Image pool” property.

### "Scrollbar size"

Size of the scrollbar (in pixels). The scrollbar is displayed when more entries are specified in the drop-down list than in “Number of visible rows”.

Default: 20

---

**Element property 'Texts'**

### "Tooltip"

Character string (without single straight quotation marks) that is displayed as the tooltip of an element in runtime mode

Example: Products of customer A

Hint: The text is accepted automatically into the “GlobalTextList” text list and can be localized there.

---

**Element property 'Value range'**

### "Limit valuerange"

Limits the text list to one subrange. This subrange is displayed by the combobox.

Requirement: A value is specified in the “Text list” property.

- : Only the subrange that is defined by the “Minimum value” “Maximum value” properties is displayed as a drop-down list.

### "Minimum value"

ID of the text list entry from which a combobox entry is displayed

- Literal ($ANY_NUM$)
  - Example: 5
- Variable (integer data type)
  - Example: PLC_PRG.iFirstEntry
### Maximum value
ID of the text list entry up to which combo box entries are displayed

- **Literal (ANY_NUM)**
  - Example: 10
- **Variable (integer data type)**
  - Example: PLC_PRG.iLastEntry

### Filter missing text entries
☑: Text list is refreshed and any unused texts (IDs) are removed.

**Requirement:** A value is specified in the “Text list” property.

---

**Element property 'Text properties'**

The properties contain fixed values for the text properties.

| “Usage of” | “Default style values”: The values of the visualization style are used.  
|            | “Individual settings”: The "Individual text properties" property group is shown  
|            | The values can be customized here. |
| "Individual text properties" | Requirement: The “Individual settings” text property is defined. |
| “Horizontal alignment” | Horizontal alignment of the text within the element. |
| “Vertical alignment” | Vertical alignment of the text within the element. |
| “Font” | Example: “Default”  
|        | ☐: The “Font” dialog box opens.  
|        | ▼: Drop-down list with style fonts. |
| “Font color” | Example: “Black”  
|        | ☐: The “Color” dialog box opens.  
|        | ▼: Drop-down list with style colors. |
| “Transparency” | Whole number (value range from 0 to 255). This determines the transparency of the respective color.  
|      | Example: 255: The color is opaque.  
|      | 0: The color is completely transparent.  
|      | Please note: If the color is a style color and already has a transparency value, then this property is write-protected. |

---

**Element property 'Absolute movement'**

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

| “Movement” |  |
| "X" | Variable (numeric data type). Defines the X position (in pixels).  
|      | Example: PLC_PRG.iPos_X.  
|      | Increasing this value in runtime mode moves the element to the right. |
| "Y" | Variable (numeric data type). Defines the Y position (in pixels).  
|      | Example: PLC_PRG.iPos_Y.  
|      | Increasing this value in runtime mode moves the element downwards. |
### "Rotation"
Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle1.

The midpoint of the element rotates at the "Center" point. This rotation point is shown as the symbol.

In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

### "Interior rotation"
Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in "Center" according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol.

Note: If a static angle of rotation is specified in the "Position Angle" property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

---

You can link the variables to a unit conversion.

The "X", "Y", "Rotation", and "Interior rotation" properties are supported by the "Client Animation" functionality.

See also
- Unit conversion

---

**Element property 'State variables'**

The variables control the element behavior dynamically.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Invisible&quot;</td>
<td>Variable (BOOL). Toggles the visibility of the element. TRUE: The element is not visible at runtime.</td>
</tr>
<tr>
<td>&quot;Deactivate inputs&quot;</td>
<td>Variable (BOOL). Toggles the operability of the element. TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated.</td>
</tr>
</tbody>
</table>
The “Invisible” property is supported by the “Client Animation” functionality.

See also

- These properties are available only when you select the “Preview: Support client animations and overlay of native elements” option in the Visualization Manager. You can animate a movement, a rotation, and the visibility of a visualization element.

<table>
<thead>
<tr>
<th>“Animation duration”</th>

Visualization element ‘Combo box array’

Symbol:

Tag: “Common controls”

The element shows values of an array as a drop-down list. When the visualization user clicks an entry, the array index of the entry is written to an integer variable.
Element properties

<table>
<thead>
<tr>
<th>“Element name”</th>
<th>Optional</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hint: Assign individual names for elements so that they are found faster in the element list.</td>
<td></td>
</tr>
<tr>
<td>Example: List_Product_Number</td>
<td></td>
</tr>
</tbody>
</table>

| “Type of element” | “Combo box array” |

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

| “X” | X coordinate of the upper left corner of the element |
| Specified in pixels. |
| Example: 10 |

| “Y” | Y coordinate of the upper left corner of the element |
| Specified in pixels. |
| Example: 10 |

| “Width” | Specified in pixels. |
| Example: 150 |

| “Height” | Specified in pixels. |
| Example: 30 |

You can also change the values by dragging the box symbols (строенное) to other positions in the editor.

See also
● § Chapter 1.3.5.3.2 “Positioning elements, adapting size and layer” on page 1113

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

| “X” | X-coordinate of the point of rotation |
| “Y” | Y-coordinate of the point of rotation |

You can also change the values by dragging the symbols (строено) to other positions in the editor.
**Variable**

At runtime, saves the array index of the list entry that the user clicks.

**Property value**

- Variable (integer data type)
  
  Example: PLC_PRG.iIndexComboBoxEntry

- Enumeration variable with text list support
  
  Example: PLC_PRG.eMyComboBox<COMBO>

  Note: Value range of the enumeration value that lies within the DWORD or DINT value range

**Data array**

Displayed as combo box. Every array component becomes a combo box entry.

**Property value**

- Array variable (ARRAY[...] OF)
  
  Example: PLC_PRG.astrComboBox

See also

- Enumerations
- Chapter 1.3.5.6 “Setting up multiple languages” on page 1143

**Element property 'Columns'**

The "ComboBox – Array" element visualizes an array variable or structure variable in a tabular view. The index of array elements or structure members is shown in a column or row. Two-dimensional arrays or structure arrays are shown in several columns. You specify the visualized variable in the "Data array" property. If a variable is assigned there, then you can specify the display of the table columns where the array elements are shown. You can customize each column that is assigned to an index [<n>].

**Columns**

- [<n>]

  Due to the structure of the variable that is defined in "Data array", CODESYS determines the number of columns and defines them with the index <n>.

  Example: StringTable : ARRAY [0..2, 0..4] OF STRING := ['BMW', 'Audi', 'Mercedes', 'VW', 'Fiat', '150', '150', '150', '150', '100', 'blue', 'gray', 'silver', 'blue', 'red'];: three columns are formed [0], [1] and [2].

**Max. array index**

Optional. Variable (integer data type) or value. Defines up to which array index the data is displayed.

**Row height**

Height of the rows (in pixels).

**Number visible rows**

Optional. If the array is larger than the number of visible rows, then a scrollbar is included.

**Scrollbar size**

Width of the vertical scrollbar (in pixels).

Table 259: “Element property 'Columns: Column [<n>]’”

<table>
<thead>
<tr>
<th>“Width”</th>
<th>Column width (in pixels).</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Image column”</td>
<td>Images can be displayed in the column. Images are used from the global image pool or user-defined image pools. The image IDs are shown in the cells of the table as defined in the image pool.</td>
</tr>
<tr>
<td>“Image configuration”</td>
<td></td>
</tr>
</tbody>
</table>
### “Fill mode”
- **“Fill cell”**
  The image resizes to the dimensions of the cell without fixing the height/width ratio.
- **“Centered”**
  The image is centered in the cell and retains its proportions (height-width ratio).

### “Transparency”
[✔]: The color that is specified in “Transparent color” is displayed as transparent.

### “Transparent color”
When the “Transparent” property is enabled, the color specified here is not displayed. Pixels with this color are transparent.

### “Text alignment in column”
- **“Left”**
- **“Centered”**
- **“Right”**

## Element property ‘Texts’

### “Tooltip”
Character string (without single straight quotation marks) that is displayed as the tooltip of an element in runtime mode

**Example:** Products of customer A

**Hint:** The text is accepted automatically into the “GlobalTextList” text list and can be localized there.

### See also

## Element property 'Text properties'

The properties contain fixed values for the text properties.

### “Usage of”
- **“Default style values”**: The values of the visualization style are used.
- **“Individual settings”**: The “Individual text properties” property group is shown
  The values can be customized here.

### “Individual text properties”
Requirement: The “Individual settings” text property is defined.

### “Font”
**Example:** “Default”

![Font dialog box opens.](image)

- Drop-down list with style fonts.

### “Font color”
**Example:** “Black”

![Color dialog box opens.](image)

- Drop-down list with style colors.

### “Transparency”
Whole number (value range from 0 to 255). This determines the transparency of the respective color.

**Example:** 255: The color is opaque.

0: The color is completely transparent.

Please note: If the color is a style color and already has a transparency value, then this property is write-protected.
Element property 'Absolute movement'  
The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

## "Movement"

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Example</th>

<td></td>
</tr>
<tr>
<td></td>
<td>In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.</td>
<td></td>
</tr>
</tbody>
</table>

## "Interior rotation"

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Interior rotation</strong></td>
<td>Variable (numeric data type). Defines the angle of rotation (in degrees).</td>
<td>PLC_PRG.iAngle2.</td>
</tr>
<tr>
<td></td>
<td>In runtime mode, the element rotates about the point of rotation specified in &quot;Center&quot; according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>The rotation point is shown as the symbol.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Note: If a static angle of rotation is specified in the &quot;Position ➔ Angle&quot; property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.</td>
<td></td>
</tr>
</tbody>
</table>

You can link the variables to a unit conversion.

The "X", "Y", "Rotation", and "Interior rotation" properties are supported by the "Client Animation" functionality.

<td>&quot;Tab height&quot;</td>
<td>Height of the tab (in pixels)</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Integer literal</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• &quot;From style&quot;</td>
</tr>
<tr>
<td>&quot;Scaling type&quot;</td>
<td>The method with which the height and width of the referenced visualization are scaled.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• &quot;Isotropic&quot;: The visualization is scaled to the size of the element. The visualization retains its proportions with a fixed height/width ratio.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• &quot;Anisotropic&quot;: The visualization is scaled to the size of the element. The height and width are adapted to the element independently of each other.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• &quot;Fixed&quot;: The visualization is displayed in its original size without taking into account the size of the element.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• &quot;Fixed and scrollable&quot;: The visualization is displayed fixed in the element. If it is larger than the element, the element will be provided with scrollbars.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Please note: assign variables to the properties &quot;Scroll position variable horizontal&quot; or &quot;Scroll position variable vertical&quot;. You can then edit the data of the scrollbar position in the application.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>&quot;Deactivate background drawing&quot;</th>
<th>The non-animated elements of the referenced visualization are displayed as background images in order to optimize the performance of the visualization. Result: At runtime, the elements can be displayed in any order, for example when an element moves behind the frame at runtime.</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Deactivate background drawing&quot;</td>
<td>□: Deactivates the background display in order to prevent the behavior described above The property is not available for the following settings:</td>
</tr>
<tr>
<td></td>
<td>• The &quot;Scaling type&quot; property is set to &quot;Fixed and scrollable&quot;</td>
</tr>
<tr>
<td></td>
<td>• The client animation functionality is enabled.</td>
</tr>
</tbody>
</table>

See also

- The properties include variables for the position of the scroll boxes in the scrollbars. You can process the data for the scroll box position in the application.
**Requirement:** The “Scaling type” property is “Fixed and scrollable”.

<table>
<thead>
<tr>
<th>Scaling type property</th>
<th>Description</th>
</tr>
</thead>
</table>
| “Scroll position variable horizontal”                      | Variable (integer data type, also array). Includes the position of the horizontal or vertical scroll box. The array contains the position for each display variant. If the visualization is running on multiple display variants, then the position changes are disconnected from each other. Example:   
  PLC_PRG.iScrollHor[CURRENTCLIENTID]  
  PLC_PRG.iScrollVer[CURRENTCLIENTID]  
  In this example, the variable is declared as an array:  
  iScrollHor: ARRAY[0..20] OF INT;  
  iScrollVer: ARRAY[0..20] OF INT;  
  CURRENTCLIENTID indicates the current display variant. |
| “Scroll position variable, vertical”                       |                                                                                                  |

- Chapter 1.3.5.19.2.9 “Command ‘Frame Selection’” on page 1564

### Element property ‘Absolute movement’

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
**“Movement”**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Example</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“X”</strong></td>
<td>Variable (numeric data type). Defines the X position (in pixels).</td>
<td>PLC_PRG.iPos_X</td>
<td>Increasing this value in runtime mode moves the element to the right.</td>
</tr>
<tr>
<td><strong>“Y”</strong></td>
<td>Variable (numeric data type). Defines the Y position (in pixels).</td>
<td>PLC_PRG.iPos_Y</td>
<td>Increasing this value in runtime mode moves the element downwards.</td>
</tr>
<tr>
<td><strong>“Rotation”</strong></td>
<td>Variable (numeric data type). Defines the angle of rotation (in degrees).</td>
<td>PLC_PRG.iAngle1</td>
<td>The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.</td>
</tr>
<tr>
<td><strong>“Interior rotation”</strong></td>
<td>Variable (numeric data type). Defines the angle of rotation (in degrees).</td>
<td>PLC_PRG.iAngle2</td>
<td>In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the symbol. Note: If a static angle of rotation is specified in the “Position ➔ Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.</td>
</tr>
</tbody>
</table>

You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.

See also
- Unit conversion
**Element properties 'State variables'**

The variables control the element behavior dynamically.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Invisible&quot;</td>
<td>Variable (BOOL). Toggles the visibility of the element. TRUE: The element is not visible at runtime.</td>
</tr>
<tr>
<td>&quot;Deactivate inputs&quot;</td>
<td>Variable (BOOL). Toggles the operability of the element. TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated.</td>
</tr>
</tbody>
</table>

The "Invisible" property is supported by the "Client Animation" functionality.

See also

- 

These properties are available only when you select the “Preview: Support client animations and overlay of native elements” option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Animation duration&quot;</td>
<td>Time that the element executes an animation (in milliseconds)</td>
</tr>
<tr>
<td>Example: 500</td>
<td></td>
</tr>
<tr>
<td>&quot;Move to the foreground&quot;</td>
<td>Property value (BOOL)</td>
</tr>
<tr>
<td>TRUE: At runtime, the element is displayed in the foreground.</td>
<td></td>
</tr>
<tr>
<td>FALSE: At runtime, the element is displayed in the layer where it was inserted in the visualization editor.</td>
<td></td>
</tr>
</tbody>
</table>

See also

- 

**Visualization element 'Button'**

Symbol:

![Symbol](image)

Tag: “Common controls”

This element triggers an action, such as setting a variable.

**Element properties**
**Element property 'Position'**

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

| “X” | X coordinate of the upper left corner of the element  
Specified in pixels.  
Example: 10. |
| “Y” | Y coordinate of the upper left corner of the element  
Specified in pixels.  
Example: 10. |
| “Width” | Specified in pixels.  
Example: 150 |
| “Height” | Specified in pixels.  
Example: 30 |

You can also change the values by dragging the box symbols (_drag_box_) to other positions in the editor.

See also

- Chapter 1.3.5.3.2 “Positioning elements, adapting size and layer” on page 1113

**Element property 'Center'**

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the _circle_ symbol. The point is used as the center for rotating and scaling.

| “X” | X-coordinate of the point of rotation |
| “Y” | Y-coordinate of the point of rotation |

You can also change the values by dragging the symbols ( _circle_ ) to other positions in the editor.

**Element property 'Colors'**

The properties contain fixed values for setting colors.
**“Color”**

Color for the element in its normal state.

Please note that the normal state is in effect if the expression in the “Color variables ➔ Toggle color” property is not defined or it has the value `FALSE`.

**“Alarm color”**

Color for the element in alarm state.

Please note that the alarm state is in effect if the expression in the “Color variables ➔ Toggle color” property has the value `TRUE`.

**“Transparency”**

Value (0 to 255) for defining the transparency of the selected color.

Example: 255: The color is opaque. 0: The color is completely transparent.

**“Use gradient color”**

The element is displayed with a color gradient.

**“Gradient setting”**

The “Color gradient editor” dialog box opens.

See also

- ☝️ Chapter 1.3.5.19.3.5 “Dialog ‘Gradient Editor’” on page 1586

---

**Element property ’Image’**

**“Static ID”**

Reference to an image in an image pool of the format `<name of image pool>.<image ID>` (example: `image_pool.GreenButton`).

If the image is from the “GlobalImagePool”, then you can omit the name of the image pool because CODESYS always searches this pool first.

[...]: The “Input Assistant” dialog box opens and lists all available image pools and images in the entire project.

**“Scale type”**

Behavior of the image when resizing the button.

- **“Isotropic”**: The image retains its proportions. The ratio of height to width is retained, even if you change the height or width of the button separately.
- **“Anisotropic”**: The image resizes to the dimensions of the button.
- **“Fixed”**: The image retains its original size, even if you change the size of the button.

**“Transparency”**

The visualization displays the image with the transparency color that is selected in “Transparency color”.

**“Transparency color”**

Color that is transparent in the image (example: “White”). If the image background that is referenced by “Static ID” is white, then this background is displayed transparent.

Clicking [...] opens a color selection dialog.

Requirement: The “Transparency” option is activated.

**“Horizontal alignment”**

Horizontal alignment of the image

- **“Left”**
- **“Centered”**
- **“Right”**

**“Vertical alignment”**

Vertical alignment of the image

- **“Top”**
- **“Centered”**
- **“Bottom”**

---

**Element property ’Texts’**

The properties contain character strings for labeling the element. The character string can also contain a placeholder with a format definition. In runtime mode, the placeholder is replaced by the current value in the specified format.
CODESYS accepts the specified texts automatically into the “GlobalTextList” text list. Therefore, these texts can be localized.

|“Text”| Character string (without single straight quotation marks) for the labeling the element. Add a line break by pressing the keyboard shortcut [Ctrl] + [Enter]. | Example: Accesses: %i
The variable that contains the current value for the placeholder is specified in the property “Text variable ⇒ Text”. |
|“Tooltip”| Character string (without single straight quotation marks) that is displayed as the tooltip of an element. | Example: Number of valid accesses.
The variable that contains the current value for the placeholder is specified in the property “Text variable ⇒ Tooltip”.

See also
- “Element property ‘Text variables’” on page 1229
- Chapter 1.3.5.18.2 “Placeholders with format definition in the output text” on page 1546

The properties contain fixed values for the text properties.

|“Horizontal alignment”| Horizontal alignment of the text within the element. |
|“Vertical alignment”| Vertical alignment of the text within the element. |
|“Text format”| Definition for displaying texts that are too long | “Default”: The long text is truncated. 
“Line break”: The text is split into parts. 
“Ellipsis”: The visible text ends with “...” indicating that it is not complete. |
▼: Drop-down list with style fonts. |
|“Font color”| Example: “Black” | The “Color” dialog box opens. 
▼: Drop-down list with style colors. |
|“Transparency”| Whole number (value range from 0 to 255). This determines the transparency of the respective color. | Example: 255: The color is opaque. 
0: The color is completely transparent. 
Please note: If the color is a style color and already has a transparency value, then this property is write-protected. |

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
### "Movement"

| **X** | Variable (numeric data type). Defines the X position (in pixels).  
**Example:** PLC_PRG.iPos_X.  
Increasing this value in runtime mode moves the element to the right. |
| **Y** | Variable (numeric data type). Defines the Y position (in pixels).  
**Example:** PLC_PRG.iPos_Y.  
Increasing this value in runtime mode moves the element downwards. |
| **Rotation** | Variable (numeric data type). Defines the angle of rotation (in degrees).  
**Example:** PLC_PRG.iAngle1.  
The midpoint of the element rotates at the "Center" point. This rotation point is shown as the + symbol.  
In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right. |
| **Scaling** | Variable (integer data type). Causes centric stretching.  
**Example:** PLC_PRG.iScaling.  
The reference point is the "Center" property.  
The value 1 shrinks the element by a factor of 0.001. The value 1000 returns the element to its original size. |

---

**You can link the variables to a unit conversion.**

**The properties "X", "Y", "Rotation", and "Interior rotation" are supported by the "Client Animation" functionality.**

---

**Element property 'Relative movement'**

The properties contains variables for moving the element. The reference point is the position of the element ("Position" property). The shape of the element can change.

### "Movement top-left"

| **X** | Variable (integer data type). It contains the number (in pixels) that the left edge is moved horizontally. Incrementing the value moves the element to the right.  
**Example:** PLC_PRG.iDeltaX |
<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
</table>
| \(Y\) Variable (integer data type). It contains the number (in pixels) that the top edge is moved vertically. Incrementing the value moves the element to the down.  
Example: PLC_PRG.iDeltaY |
| \(Movement \text{ bottom-right}\) Variable (integer data type). It contains the number (in pixels) that the \(right\) edge is moved horizontally. Incrementing the value moves the element to the right.  
Example: PLC_PRG.iDeltaWidth|
| \(Y\) Variable (integer data type). It contains the number (in pixels) that the bottom edge is moved vertically. Incrementing the value moves the element to the down.  
Example: PLC_PRG.iDeltaHeight |

See also
- “Element property ‘Absolute movement’” on page 1227

**Element property ‘Text variables’**
These properties are variables with contents that replace a format definition.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
</table>
| \(\text{Text variable}\) Variable (data type compliant with the format definition). It contains what is printed instead of the format definition.  
Example: PLC_PRG.iAccesses |

Note: The format definition is part of the text in the property “Texts \(\rightarrow\) Text”.
Note: If you specify a variable of type enumeration with text list support, then the name of the enumeration data type is added automatically in angle brackets after the variable name. Example: PLC_PRG.enVar <enumeration name>. Then the symbolic value of the enumeration component is printed instead of the numeric value when text is printed. Refer to the help page for the enumerations. |

| \(\text{Tooltip variable}\) Variable (data type compliant with the format definition). It contains what is printed instead of the format definition.  
Example: PLC_PRG.iAccessesInTooltip |

Note: The format definition is part of the text in the property “Texts \(\rightarrow\) Tooltip”. |

See also
- Chapter 1.3.5.18.2 “Placeholders with format definition in the output text” on page 1546
- “Element property ‘Texts’” on page 1226
- Enumerations

**Element property ‘Dynamic texts’**
Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.
| **Text list** | Variable (string) or name of the text list as a fixed string in single straight quotation marks.  
Example: 'Errorlist'  
▼: Drop-down list with the dialogs available in the text lists. |
| **Text index** | Text list ID. This refers to the desired output text.  
- As fixed string with the ID in single straight quotation marks.  
  Example: '1'  
- As a variable (STRING) for dynamically controlling the text output.  
  Example: strTextID  
  Sample assignment: PLC_PRG.strTextID := '1'; |
| **Tooltip index** | Text list ID. This refers to the desired output text.  
- As fixed string with the ID in single straight quotation marks.  
  Example: '2'  
- As a variable (STRING) for dynamically controlling the text output.  
  Example: strToolTipID  
  Sample assignment: PLC_PRG.strToolTipID := '2'; |

**See also**  
- Text list

**Element property 'Font variables'**  
The variables allow for dynamic control of the text display.

| **Font name** | Variable (STRING). Includes the font of the text.  
Example: PLC_PRG.stFontVar := 'Arial';  
The selection of fonts corresponds to the default “Font” dialog. |
| **Size** | Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name.  
- <pt>: Points (default)  
  Example: PLC_PRG.iFontHeight <pt>  
  Code: iFontHeight : INT := 12;  
- <px>: Pixels  
  Example: PLC_PRG.iFontHeight <px>  
  Code: iFontHeight : INT := 19;  

If you click in the value field, a drop-down list opens on the right for setting the unit.  

Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property “Text property ➔ Font”.

---

2020/12/10  
3ADR010583, 1, en_US  
1327
**"Flags"**

Variable (DWORD). Contains the flags for displaying fonts.

Flags:
- 1: Italics
- 2: Bold
- 4: Underline
- 8: Strikethrough

Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: `PLC_PRG.dwFontType := 6;`

---

**"Character set"**

Variable (DWORD). Contains a character set number for the font.

The selection of character set numbers corresponds to the “Script” setting of the standard “Font” dialog.

---

**"Color"**

Variable (DWORD). Includes the color of the text.

Example: `PLC_PRG.dwColorFont := 16#FF000000;`

---

**"Flags for text alignment"**

Variable (integer data type). Contains the coding for text alignment.

Example: `PLC_PRG.dwTextAlignment.`

Coding:
- 0: Top left
- 1: Horizontal center
- 2: Right
- 4: Vertical center
- 8: Bottom

Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: `PLC_PRG.dwFontType := 5;`

---

*Fixed values for displaying texts are set in "Text properties".*

---

**See also**
- § "Element property 'Text properties'" on page 1227

---

**Element property 'Colorvariables'**

The Element property is used as an interface for project variables to dynamically control colors at runtime.
**“Toggle color”**

The property controls the toggled color at runtime.

**Value assignment:**
- **FALSE:** The element is displayed with the color specified in the “Color” property.
- **TRUE:** The element is displayed with the color specified in the “Alarm color” property.

**Assigning the property:**
- Placeholder for the user input variable
  - `<toggle/tap variable>`
  - `<NOT toggle/tap variable>`

  The color change is not controlled by its own variable, but by a user input variable.

  Note: Specify a variable for the mouse events “Tap” or “Toggle” in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both “Toggle” and “Tap”, then the variable specified in “Tap” is used.

  Hint: Click the symbol to insert the placeholder “<toggle/tap variable>”. When you activate the “Inputconfiguration”, “Tap FALSE” property, then the “<NOT toggle/tap variable>” placeholder is displayed.

  - Instance path of a project variable (BOOL)
    Example: PLC_PRG.xColorIsToggeled

    Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.

**“Color”**

Color variable for the frame

- **Variable (DWORD) for the color**
  Example: PLC_PRG.dwColor

- **Color literal**
  Example of gray and opaque: 16#FF888888

**Requirement:** “Show frame” property is activated.

Please note that the normal state is in effect if the expression in the “Colorvariables ➔ Toggle color” property is not defined or it has the value FALSE.

**“Alarm color”**

Color variable for the frame in alarm state

- **Variable (DWORD) for the alarm color**
  Example: PLC_PRG.dwAlarmColor

- **Color literal**
  Example of red and opaque: 16#FFFF0000

Please note that the alarm state is in effect if the expression in the “Colorvariables ➔ Toggle color” property has the value TRUE.

---

The transparency part of the color value is evaluated only if the “Activate semi-transparent drawing” option of the visualization manager is selected.

Select the “Advanced” option in the toolbar of the properties view. Then all element properties are visible.
See also
- Chapter 1.3.5.8.3 “Animating a color display” on page 1152

**Element property 'State variables'**

The variables control the element behavior dynamically.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Invisible”</strong></td>
<td>Variable (BOOL). Toggles the visibility of the element. TRUE: The element is not visible at runtime.</td>
</tr>
<tr>
<td><strong>“Deactivate inputs”</strong></td>
<td>Variable (BOOL). Toggles the operability of the element. TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated.</td>
</tr>
</tbody>
</table>

The “Invisible” property is supported by the "Client Animation" functionality.

See also
- 

**Element property 'Button state variable'**

At runtime, the property controls whether the button is displayed as pressed or not.

Values:
- FALSE: The button is displayed as not pressed.
- TRUE: The button is displayed as pressed.

Argument passed to the property:
- Placeholder for the user input variable to couple the representation of the button with the input variable.
  - “<toggle/tap variable>”
  - “<NOT toggle/tap variable>”

Note: Specify a variable for the mouse events “Tap” or “Toggle” in the input configuration of the button. Only then is the placeholder set. If you configure a variable in both “Toggle” and “Tap”, then the variable specified in “Tap” is used.

Hint: Click the symbol 🖼 to insert the placeholder “<toggle/tap variable>”.

When you activate the “Inputconfiguration”, “Tap FALSE” property, then the “<NOT toggle/tap variable>” placeholder is displayed.
- Instance path of a project variable (BOOL)
  Example: prgA.xButtonState

Note: Implement a value assignment in the code for the variable specified here.

- 

**Element property 'Image ID variable'**

<table>
<thead>
<tr>
<th>“Image ID”</th>
<th>Variable (STRING). Contains the image ID. The contents of the string corresponds to the description of the “Static ID” property.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>PLC_PRG.stImageID := 'ImagePool_A.Image3';</td>
</tr>
</tbody>
</table>

See also

- "Chapter 1.3.5.18.1.5 “Visualization element 'Image'” on page 1272"
- "Object 'Image Pool'"

These properties are available only when you select the “Preview: Support client animations and overlay of native elements” option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.

<table>
<thead>
<tr>
<th>“Animation duration”</th>
<th>Time that the element executes an animation (in milliseconds)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>500</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Move to the foreground”</th>
<th>Property value (BOOL)</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRUE</td>
<td>At runtime, the element is displayed in the foreground.</td>
</tr>
<tr>
<td>FALSE</td>
<td>At runtime, the element is displayed in the layer where it was inserted in the visualization editor.</td>
</tr>
</tbody>
</table>

See also

- "Chapter 1.3.5.21.5 “Using client animation” on page 1962"

**Element property 'Input configuration'**

The properties contain the configurations for the user input when using the mouse or keyboard. A user input defines an event and one or more actions that are executed when an event occurs.

The “Configure” button opens the “Input configuration” dialog box for creating or modifying a user input.

Configured user inputs are briefly listed below the events. They each include the action that is triggered and the setting in short form.

**Example:** "Execute ST code":  # PLC_PRG.i_x := 0;

<table>
<thead>
<tr>
<th>“OnDialogClosed”</th>
<th>Input event: The user closes the dialog box.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“OnMouseClicked”</td>
<td>Input event: The user clicks the mouse button completely. The mouse button is clicked and released.</td>
</tr>
<tr>
<td>“OnMouseDown”</td>
<td>Input event: The user clicks down on the mouse button.</td>
</tr>
<tr>
<td>“OnMouseEnter”</td>
<td>Input event: The user drags the mouse pointer to the element.</td>
</tr>
<tr>
<td>“OnMouseLeave”</td>
<td>Input event: The user drags the mouse pointer away from the element.</td>
</tr>
<tr>
<td>“OnMouseMove”</td>
<td>Input event: The user moves the mouse pointer over the element area.</td>
</tr>
<tr>
<td>“OnMouseUp”</td>
<td>Input event: The user releases the mouse button over the element area.</td>
</tr>
</tbody>
</table>
**“Tap”**

When a mouse click event occurs, the variable defined in “Variable” is described in the application. The coding depends on the options “Tap FALSE” and “Tap on enter if captured”.

**“Variable”**

Variable (BOOL) that is set on mouse click.

Example: PLC_PRG.bIsTapped

TRUE: A mouse click event exists. It lasts while the user presses the mouse button over the element. It ends when the button is released.

FALSE: A mouse click event does not exist.

Requirement: The “Tap FALSE” option is not activated.

**“Tap FALSE”**

☑: The mouse click event leads to a complementary value in “Variable”.

TRUE: A mouse click event does not exist.

FALSE: While the mouse click event exists.

**“Tap on enter if captured”**

☑: During user input, it is also taken into consideration whether the mouse pointer is dragged within the element area or not while the mouse button is pressed.

TRUE: While the mouse click event exists and the mouse pointer is moved over the element area.

FALSE: A mouse click event does not exist. Or the user moves the mouse pointer outside of the element area while the mouse button is pressed.

The value is TRUE again as soon as the user moves the pointer back to the element area. The mouse is then captured.

**“Shift”**

With the onset of a mouse click event, the variable is set; when the mouse click event is completed, the variable is reset.

**“Variable”**

Variable (BOOL). Its value toggled when the mouse click event is ended. This is when the user releases the mouse button while the mouse pointer is over the element area.

If the user releases the mouse button while the mouse pointer is outside of the element area, then the mouse click event is not ended and the value is not toggled.

Tip: The user can cancel a started toggle input by dragging the mouse pointer out of the element area.

**“Toggle on up if captured”**

☑: The value toggles regardless of where the mouse pointer is when the mouse button is released. The mouse is then captured.

**“Keyboard shortcuts”**

Keyboard shortcut on the element for triggering specific input actions.

When the keyboard shortcut event occurs, the input actions in the “Event(s)” property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.

**“Key”**

Key pressed for input action.

Example: [T]

Note: The following properties appear when a key is selected.
<table>
<thead>
<tr>
<th><strong>Event(s)</strong></th>
<th><strong>None</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>&quot;Mouse down&quot;: Pressing the key triggers the input actions that are configured in the &quot;OnMouseDown&quot; property.</td>
</tr>
<tr>
<td></td>
<td>&quot;Mouse up&quot;: Releasing the key triggers the input actions that are configured in the &quot;OnMouseUp&quot; property.</td>
</tr>
<tr>
<td></td>
<td>&quot;Mouse down/up&quot;: Pressing and releasing the key triggers the input actions that are configured in the &quot;OnMouseDown&quot; property and the &quot;OnMouseUp&quot; property.</td>
</tr>
<tr>
<td><strong>Shift</strong></td>
<td>![Checkmark] Combination with the Shift key</td>
</tr>
<tr>
<td></td>
<td>Example: [Shift]+[T].</td>
</tr>
<tr>
<td><strong>Control</strong></td>
<td>![Checkmark] Combination with the Ctrl key</td>
</tr>
<tr>
<td></td>
<td>Example: [Ctrl]+[T].</td>
</tr>
<tr>
<td><strong>Alt</strong></td>
<td>![Checkmark] Combination with the Alt key</td>
</tr>
<tr>
<td></td>
<td>Example: [Alt]+[T].</td>
</tr>
</tbody>
</table>

All keyboard shortcuts and their actions that are configured in the visualization are listed in the "Keyboard configuration" tab.

- Chapter 1.3.5.19.2.2 “Command ‘Keyboard Configuration’” on page 1558
- Chapter 1.3.5.19.3.6 “Dialog ‘Input Configuration’” on page 1586

**Element property 'Access rights'**

Requirement: User management is set up for the visualization.

<table>
<thead>
<tr>
<th><strong>Access rights</strong></th>
<th>Opens the “Access rights” dialog. There you can edit the access privileges for the element.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Status messages:</td>
</tr>
<tr>
<td></td>
<td>- “Not set. Full rights.”: Access rights for all user groups: “operable”</td>
</tr>
<tr>
<td></td>
<td>- “Rights are set: Limited rights.”: Access is restricted for at least one group.</td>
</tr>
</tbody>
</table>

See also
- Chapter 1.3.5.19.3.1 “Dialog ‘Access Rights’” on page 1583

**Visualization element 'Group box’**

Symbol:

Tag: "Common controls"

The element provides visual grouping of visualization elements. The group box can be nested many times.
You can also use drag&drop to add elements to a group box. To do this, simply drag the element to the group box. The appearance of the cursor changes (a small plus sign is shown). When you click the [Shift] key at the same time, the element is not added.

You can remove elements from the group box by dragging them out of the group box.

---

</table>

<table>
<thead>
<tr>
<th>“Height”</th>
<th>Specified in pixels.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Example: 30</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the box symbols (¶) to other positions in the editor.

See also

- § Chapter 1.3.5.3.2 “Positioning elements, adapting size and layer” on page 1113

**Element property 'Center'**

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ± symbol. The point is used as the center for rotating and scaling.
"X"  X-coordinate of the point of rotation

"Y"  Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (_drag) to other positions in the editor.

Element property 'Texts'
The properties contain character strings for labeling the element. CODESYS accepts the specified texts automatically into the "GlobalTextList" text list. Therefore, these texts can be localized.

| "Text" | Character string (without single straight quotation marks) for the labeling the element.  
Example: Axis 1. |
| "Tooltip" | Character string (without single straight quotation marks) that is displayed as the tooltip of an element.  
Example: Parameters of Axis 1. |

See also

Element property 'Text properties'
The properties contain fixed values for the text properties.

| "Font" | Example: "Default"  
_text: The "Font" dialog box opens.  
▼: Drop-down list with style fonts. |
| "Font color" | Example: "Black"  
_text: The "Color" dialog box opens.  
▼: Drop-down list with style colors. |
| "Transparency" | Whole number (value range from 0 to 255). This determines the transparency of the respective color.  
Example: 255: The color is opaque.  
0: The color is completely transparent.  
Please note: If the color is a style color and already has a transparency value, then this property is write-protected. |

Element property 'Absolute movement'
The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
### Movement

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>X</strong></td>
<td>Variable (numeric data type). Defines the X position (in pixels).</td>
<td><code>PLC_PRG.iPos_X</code></td>
</tr>
<tr>
<td></td>
<td>Increasing this value in runtime mode moves the element to the right.</td>
<td></td>
</tr>
<tr>
<td><strong>Y</strong></td>
<td>Variable (numeric data type). Defines the Y position (in pixels).</td>
<td><code>PLC_PRG.iPos_Y</code></td>
</tr>
<tr>
<td></td>
<td>Increasing this value in runtime mode moves the element downwards.</td>
<td></td>
</tr>
</tbody>
</table>

### Rotation

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Rotation</strong></td>
<td>Variable (numeric data type). Defines the angle of rotation (in degrees).</td>
<td><code>PLC_PRG.iAngle1</code></td>
</tr>
<tr>
<td></td>
<td>The midpoint of the element rotates at the “Center” point. This rotation point is shown as the <code>+</code> symbol.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.</td>
<td></td>
</tr>
</tbody>
</table>

### Scaling

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Scaling</strong></td>
<td>Variable (integer data type). Causes centric stretching.</td>
<td><code>PLC_PRG.iScaling</code></td>
</tr>
<tr>
<td></td>
<td>The reference point is the “Center” property.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>The value 1 shrinks the element by a factor of 0.001. The value 1000 returns the element to its original size.</td>
<td></td>
</tr>
</tbody>
</table>

### Interior rotation

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Interior rotation</strong></td>
<td>Variable (numeric data type). Defines the angle of rotation (in degrees).</td>
<td><code>PLC_PRG.iAngle2</code></td>
</tr>
<tr>
<td></td>
<td>In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>The rotation point is shown as the <code>+</code> symbol.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Note: If a static angle of rotation is specified in the property “Position ➔ Angle”, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.</td>
<td></td>
</tr>
</tbody>
</table>

You can link the variables to a unit conversion.

The properties “X”, “Y”, “Rotation”, and “Interior rotation” are supported by the “Client Animation” functionality.
Element property 'State variables'
The variables control the element behavior dynamically.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Invisible&quot;</td>
<td>Variable (BOOL). Toggles the visibility of the element. TRUE: The element is not visible at runtime.</td>
</tr>
<tr>
<td>&quot;Deactivate inputs&quot;</td>
<td>Variable (BOOL). Toggles the operability of the element. TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated.</td>
</tr>
</tbody>
</table>

The "Invisible" property is supported by the "Client Animation" functionality.

These properties are available only when you select the "Preview: Support client animations and overlay of native elements" option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Animation duration&quot;</td>
<td>Time that the element executes an animation (in milliseconds) Example: 500</td>
</tr>
</tbody>
</table>
| "Move to the foreground" | Property value (BOOL)  
TRUE: At runtime, the element is displayed in the foreground.  
FALSE: At runtime, the element is displayed in the layer where it was inserted in the visualization editor. |

Visualization element 'Table'
Symbol:

Tag: “Common controls”
The element displays data that can be represented as an array in a table. Therefore, the data type of the visualizing variable can be 1) a one-dimensional array, 2) a maximum two-dimensional array, 3) an array of an array, 4) an array of structures, or 5) an array of a function block.

### Element properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Element name”</strong></td>
<td>Example: Data set component 1</td>
</tr>
<tr>
<td>Optional</td>
<td>Hint: Assign individual names for elements so that they are found faster in the element list.</td>
</tr>
<tr>
<td><strong>“Type of element”</strong></td>
<td>Table</td>
</tr>
<tr>
<td><strong>“Data array”</strong></td>
<td>Array whose data is visualized as a table. Variable (ARRAY) whose data type determines the number of columns and rows in the table. Array types</td>
</tr>
<tr>
<td></td>
<td>● One-dimensional array: The table has one column.</td>
</tr>
<tr>
<td></td>
<td>● Two-dimensional array: The second dimension determines the number of columns.</td>
</tr>
<tr>
<td></td>
<td>● Array of an array: The number of array elements of the back array determines the number of columns.</td>
</tr>
<tr>
<td></td>
<td>● Array of a structure: The number of structure members determines the number of columns.</td>
</tr>
<tr>
<td></td>
<td>● Array of a function block: The number of local variables determines the number of columns.</td>
</tr>
<tr>
<td>Example:</td>
<td>PLC_PRG.aiTable</td>
</tr>
<tr>
<td>Declaration:</td>
<td>aiTable : ARRAY[0..3, 0..4] OF INT := [4(1, 2, 3, 4, 5)];</td>
</tr>
<tr>
<td></td>
<td>Hint: If the declaration of the array changes, then the table can be refreshed by placing the cursor in the data array value field and pressing the [Enter] key.</td>
</tr>
<tr>
<td><strong>“Max. array index”</strong></td>
<td>Top index limit for the displayed table. Limits the number of displayed rows. The index begins at 0.</td>
</tr>
<tr>
<td></td>
<td>● Variable (integer data type)</td>
</tr>
<tr>
<td></td>
<td>Example: PLC_PRG.iUpperIndexBoundToDisplay</td>
</tr>
<tr>
<td></td>
<td>● Integer literal</td>
</tr>
<tr>
<td></td>
<td>Example: 4 is displayed as 5 in the row of the table.</td>
</tr>
</tbody>
</table>

- Data Type ‘ARRAY’

### Element property ‘Columns’

The table element shows the values of a variable in a tabular view. The array elements of structure members are shown in a column or in a row. Two-dimensional arrays or arrays of a structure are shown in multiple columns. The visualized variable is defined in the “Data array” property. When a variable is assigned there, you can specify the display of the table columns where the array elements are shown. An individual configuration is possible for each column that is assigned to an index [<n>].

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Show row header”</strong></td>
<td>☑: The row header is visible.</td>
</tr>
<tr>
<td>Example:</td>
<td>For an array, the index of the array element is displayed in the header.</td>
</tr>
<tr>
<td><strong>“Show column header”</strong></td>
<td>☑: The column label is visible.</td>
</tr>
</tbody>
</table>
Table 260: “Element property ‘Columns: Column [<n>]’”

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Row height”</td>
<td>Height of the rows (in pixels)</td>
</tr>
<tr>
<td>“Row header width”</td>
<td>Width of the row label</td>
</tr>
<tr>
<td>“Scrollbar size”</td>
<td>Size of the scrollbar (in pixels)</td>
</tr>
<tr>
<td>“Column header”</td>
<td>By default, the name of the array or structure is applied as the heading with the index or structure member for the column. If an array of a function block has been selected for “Data array”, then the name of the array is applied to the column header with the local variables of the function block that belong to the column. The column label can be changed here by specifying a new title.</td>
</tr>
<tr>
<td>“Width”</td>
<td>Column width (in pixels)</td>
</tr>
<tr>
<td>“Image column”</td>
<td>Images can be displayed in the column. Images are used from the global image pool or custom image pools. The image IDs are shown in the cells of the table as they are defined in the image pool.</td>
</tr>
<tr>
<td>“Image configuration”</td>
<td></td>
</tr>
<tr>
<td>“Fill mode”</td>
<td>● Fill cell: The image resizes to the dimensions of the cell without fixing the height/width ratio. ● Centered: The image is centered in the cell and retains its proportions (height/width ratio).</td>
</tr>
<tr>
<td>“Transparency”</td>
<td>[✓]: The color which is specified in “Transparent color” is displayed as transparent.</td>
</tr>
<tr>
<td>“Transparent color”</td>
<td>This color is displayed as transparent. Requirement: The “Transparency” property is activated.</td>
</tr>
<tr>
<td>“Text alignment of header”</td>
<td>Alignment of the column header:</td>
</tr>
<tr>
<td></td>
<td>● Left</td>
</tr>
<tr>
<td></td>
<td>● Centered</td>
</tr>
<tr>
<td></td>
<td>● Right</td>
</tr>
<tr>
<td>“Use template”</td>
<td>[✓]: Another visualization element (type “Rectangle”, “Round rectangle”, or “Ellipse”) is inserted into each line of this table column. The properties list is extended automatically with the properties of this element in “Template”.</td>
</tr>
<tr>
<td>“Text alignment of the headline from the template”</td>
<td>Requirement: The “Use template” property is activated. [✓]: When activated, the settings for font (size) and alignment in the inserted template are also applied to the column header.</td>
</tr>
<tr>
<td>“Template”</td>
<td>Requirement: The “Use template” property is activated. The properties of all elements assigned to the column are listed in “Template”. They can be modified there as described in &quot;Rectangle, Round rectangle and Ellipse&quot;</td>
</tr>
</tbody>
</table>

See also
- Chapter 1.3.5.18.1.1 “Visualization element 'Rectangle', 'Round rectangle', 'Ellipse'” on page 1224

Element property ‘Position’
The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“X”</td>
<td>X coordinate of the upper left corner of the element. Specified in pixels. Example: 10.</td>
</tr>
<tr>
<td>“Width”</td>
<td>Specified in pixels. Example: 150</td>
</tr>
<tr>
<td>“Height”</td>
<td>Specified in pixels. Example: 30</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the box symbols (_) to other positions in the editor.

See also

● Chapter 1.3.5.3.2 “Positioning elements, adapting size and layer” on page 1113

**Element property ‘Center’**

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ◆ symbol. The point is used as the center for rotating and scaling.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“X”</td>
<td>X-coordinate of the point of rotation</td>
</tr>
<tr>
<td>“Y”</td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the symbols (◆) to other positions in the editor.

**Element property ‘Text properties’**

The properties contain fixed values for the text properties.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Horizontal alignment”</td>
<td>Horizontal alignment of the text within the element.</td>
</tr>
<tr>
<td>“Vertical alignment”</td>
<td>Vertical alignment of the text within the element.</td>
</tr>
<tr>
<td>“Font”</td>
<td>Example: “Default”</td>
</tr>
<tr>
<td></td>
<td><img src="icon" alt="The “Font” dialog box opens." /></td>
</tr>
<tr>
<td></td>
<td><img src="icon" alt="Drop-down list with style fonts." /></td>
</tr>
</tbody>
</table>
**Font color**

Example: "Black"

- The "Color" dialog box opens.
- Drop-down list with style colors.

**Transparency**

Whole number (value range from 0 to 255). This determines the transparency of the respective color.

Example: 255: The color is opaque.
0: The color is completely transparent.

Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

---

**Element property 'Dynamic texts'**

Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.

**Text list**

Variable (string) or name of the text list as a fixed string in single straight quotation marks.

Example: 'Errorlist'

- Drop-down list with the dialogs available in the text lists.

**Text index**

Text list ID. This refers to the desired output text.

- As fixed string with the ID in single straight quotation marks.
  Example: '1'
- As a variable (STRING) for dynamically controlling the text output.
  Example: strTextID
  Sample assignment: PLC_PRG.strTextID := '1';

**Tooltip index**

Text list ID. This refers to the desired output text.

- As fixed string with the ID in single straight quotation marks.
  Example: '2'
- As a variable (STRING) for dynamically controlling the text output.
  Example: strToolTipID
  Sample assignment: PLC_PRG.strToolTipID := '2';

---

See also

- Text list

---

**Element property 'Font variables'**

The variables enable dynamic control of the text display.

**Font name**

Variable (STRING). Includes the font of the text.

Example: PLC_PRG.stFontVar := 'Arial';

The selection of fonts corresponds to the default "Font" dialog box.

**Size**

Variable (integer data type). Contains the font size (in pixels).

Example: PLC_PRG.iFontHeight := 16;

The selection of font sizes corresponds to the default "Font" dialog box.
**Flags**

Variable (DWORD). Contains the flags for displaying fonts.

Flags:
- 1: Italics
- 2: Bold
- 4: Underline
- 8: Strikethrough

Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text:

```plaintext
PLC_PRG.dwFontType := 6;
```

**Charset**

Variable (DWORD). Contains a character set number for the font.

The selection of character set numbers corresponds to the “Script” setting of the standard “Font” dialog box.

**Color**

Variable (DWORD). Includes the color of the text.

Example:

```plaintext
PLC_PRG.dwColorFont := 16#FF000000;
```

**Flags for text alignment**

Variable (integer data type). Contains the coding for text alignment.

Example:

```plaintext
PLC_PRG.dwTextAlignment := 5;
```

Coding:
- 0: Top left
- 1: Horizontal center
- 2: Right
- 4: Vertical center
- 8: Bottom

Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text:

```plaintext
PLC_PRG.dwFontType := 5;
```

### Fixed values for displaying texts are set in “Text properties”.

See also

- “Element property ‘Text properties’” on page 1227

**Element property 'Absolute movement'**

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

<table>
<thead>
<tr>
<th><strong>“Movement”</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“X”</strong></td>
</tr>
<tr>
<td>Variable (numeric data type). Defines the X position (in pixels).</td>
</tr>
<tr>
<td>Example: PLC_PRG.iPos_X.</td>
</tr>
<tr>
<td>Increasing this value in runtime mode moves the element to the right.</td>
</tr>
</tbody>
</table>

| **“Y”** |
| Variable (numeric data type). Defines the Y position (in pixels). |
| Example: PLC_PRG.iPos_Y. |
| Increasing this value in runtime mode moves the element downwards. |
### “Rotation”

Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle1.

The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.

In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

### “Interior rotation”

Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol.

Note: If a static angle of rotation is specified in the “Position » Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

---

**You can link the variables to a unit conversion.**

---

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.

---

**Element property ‘State variables’**

The variables control the element behavior dynamically.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Invisible”</td>
<td>Variable (BOOL). Toggles the visibility of the element. TRUE: The element is not visible at runtime.</td>
</tr>
<tr>
<td>“Deactivate inputs”</td>
<td>Variable (BOOL). Toggles the operability of the element. TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated.</td>
</tr>
</tbody>
</table>
The “Invisible” property is supported by the “Client Animation” functionality.

<tr>
<td>“Selection type”</td>
<td>Selection when clicking the table row.</td>
</tr>
<tr>
<td></td>
<td>• No selection: No selection</td>
</tr>
<tr>
<td></td>
<td>• Cell selection: The clicked cell only.</td>
</tr>
<tr>
<td></td>
<td>• Row selection: Row of the clicked cell.</td>
</tr>
<tr>
<td></td>
<td>• Column selection: Column of the clicked cell.</td>
</tr>
<tr>
<td></td>
<td>• Row and column selection: Row and column of the clicked cell.</td>
</tr>
<tr>
<td>“Frame around selected cells”</td>
<td>☑️: A frame is drawn around the selected cells.</td>
</tr>
<tr>
<td>“Variable for selected column”</td>
<td>Variable (INT). Contains the array index of the “Column” of the selected cell.</td>
</tr>
<tr>
<td></td>
<td>Warning: This index represents the correct position in the array only if no columns have been removed from the table in the display.</td>
</tr>
<tr>
<td>“Variable for selected row”</td>
<td>Variable (INT). Contains the array index of the “Row” of the selected cell.</td>
</tr>
<tr>
<td>“Variable for valid column selection”</td>
<td>Variable (BOOL). TRUE: The “Variable for selected column” variable contains a valid value.</td>
</tr>
</tbody>
</table>

These properties are available only when you select the “Preview: Support client animations and overlay of native elements” option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Animation duration”</td>
<td>Time that the element executes an animation (in milliseconds)</td>

● § Chapter 1.3.5.9.1 “Displaying structured variable values in tables” on page 1155

● Data Type ‘ARRAY’

Visualization element 'Text field'  

Symbol: 

Tag: “Common controls”

The element is used for the following:

● Static output of text. The contents of a variable can be part of the text.
● Showing a tooltip. The text is managed as static text and can also be defined so that the contents of a variable are also displayed.
● Dynamic output of text. Texts of a text list are displayed dynamically.
● Input of text. For example, a user can input a number or a text literal.

- Chapter 1.3.5.3.2 “Positioning elements, adapting size and layer” on page 1113

---

**Element property 'Colors'**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Normal state&quot;</td>
<td>The normal state is in effect if the variable in “Color variables ➔ Toggle color” is not defined or it has the value FALSE.</td>
</tr>
<tr>
<td>&quot;Frame color&quot;</td>
<td>Frame and fill color for the corresponding state of the variable.</td>
</tr>
<tr>
<td>&quot;Fill color&quot;</td>
<td></td>
</tr>
<tr>
<td>&quot;Transparency&quot;</td>
<td>Transparency value (0 to 255) for defining the transparency of the selected color. Example: 255: The color is opaque. 0: The color is completely transparent.</td>
</tr>
<tr>
<td>&quot;Alarm state&quot;</td>
<td>The alarm state is in effect if the variable in “Color variables ➔ Toggle color” has the value TRUE.</td>
</tr>
</tbody>
</table>

See also
- Chapter 1.3.5.19.3.5 “Dialog ‘Gradient Editor’” on page 1586

---

**Element property 'Appearance'**
The properties contain fixed values for setting the look of the element.
"Line width" Value in pixels
Example: 2
Note: The values 0 and 1 both result in a line weight of 1 pixel. If no line should be displayed, then the “Line style” property must be set to the option “Invisible”.

"Fill attributes" The way in which the element is filled.
- “Filled”: The element is filled with the color from property “Colors ➔ Fill color”.
- “Invisible”: The fill color is invisible.

"Line style" Type of line representation
- “Solid”
- “Dashes”
- “Dots”
- “Dash Dot”
- “Dash Dot Dot”
- “not visible”

You can assign variables in the “Appearance variables” property for controlling the appearance dynamically. The fixed values here are overwritten.

See also
- § “Element property 'Appearance variables” on page 1285

Element property 'Texts'
The properties contains character strings for labeling the element. The character string can also contain a placeholder with a format definition. In runtime mode, the placeholder is replaced by the current value in the specified format.
CODESYS accepts the specified texts automatically into the “GlobalTextList” text list. Therefore, these texts can be localized.

"Text" Character string (without single straight quotation marks) for the labeling the element. Add a line break by pressing the keyboard shortcut [Ctrl] + [Enter].
Example: Accesses: %i
The variable that contains the current value for the placeholder is specified in the property “Text variable ➔ Text”.

"Tooltip" Character string (without single straight quotation marks) that is displayed as the tooltip of an element.
Example: Number of valid accesses.
The variable that contains the current value for the placeholder is specified in the property “Text variable ➔ Tooltip”.

See also
- § “Element property 'Text variables” on page 1229
- § Chapter 1.3.5.18.2 “Placeholders with format definition in the output text” on page 1546

Element property 'Text properties'
The properties contain fixed values for the text properties.
**“Horizontal alignment”**
Horizontal alignment of the text within the element.

**“Vertical alignment”**
Vertical alignment of the text within the element.

**“Text format”**
Definition for displaying texts that are too long
- **“Default”**: The long text is truncated.
- **“Line break”**: The text is split into parts.
- **“Ellipsis”**: The visible text ends with "..." indicating that it is not complete.

**“Font”**
Example: **“Default”**
- The “Font” dialog box opens.
- Drop-down list with style fonts.

**“Font color”**
Example: **“Black”**
- The “Color” dialog box opens.
- Drop-down list with style colors.

**“Transparency”**
Whole number (value range from 0 to 255). This determines the transparency of the respective color.
Example: **255**: The color is opaque.
Example: **0**: The color is completely transparent.

Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

---

**Element property ’Text variables’**
These properties are variables with contents that replace a format definition.

<table>
<thead>
<tr>
<th>“Text variable”</th>
<th>Variable (data type compliant with the format definition). It contains what is printed instead of the format definition.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: <strong>PLC_PRG.iAccesses</strong></td>
<td>Note: The format definition is part of the text in the property “Texts ➔ Text”. Note: If you specify a variable of type enumeration with text list support, then the name of the enumeration data type is added automatically in angle brackets after the variable name. Example: <strong>PLC_PRG.enVar &lt;enumeration name&gt;</strong>. Then the symbolic value of the enumeration component is printed instead of the numeric value when text is printed. Refer to the help page for the enumerations.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Tooltip variable”</th>
<th>Variable (data type compliant with the format definition). It contains what is printed instead of the format definition.</th>

- Enumerations

**Element property ’Dynamic texts’**
Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.
| **Text list** | Variable (string) or name of the text list as a fixed string in single straight quotation marks.  
Example: 'Errorlist'  
▼: Drop-down list with the dialogs available in the text lists. |
|------------------|--------------------------------------------------|
| **Text index** | Text list ID. This refers to the desired output text.  
- As fixed string with the ID in single straight quotation marks.  
  Example: '1'  
- As a variable (STRING) for dynamically controlling the text output.  
  Example: strTextID  
  Sample assignment: PLC_PRG.strTextID := '1'; |
| **Tooltip index** | Text list ID. This refers to the desired output text.  
- As fixed string with the ID in single straight quotation marks.  
  Example: '2'  
- As a variable (STRING) for dynamically controlling the text output.  
  Example: strToolTipID  
  Sample assignment: PLC_PRG.strToolTipID := '2'; |

See also  
- **Text list**

**Element property 'Font variables'**  
The variables allow for dynamic control of the text display.

| **Font name** | Variable (STRING). Includes the font of the text.  
Example: PLC_PRG.stFontVar := 'Arial';  
The selection of fonts corresponds to the default "Font" dialog. |
|------------------|--------------------------------------------------|
| **Size** | Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name.  
- <pt>: Points (default)  
  Example: PLC_PRG.iFontHeight <pt>  
  Code: iFontHeight : INT := 12;  
- <px>: Pixels  
  Example: PLC_PRG.iFontHeight <px>  
  Code: iFontHeight : INT := 19;  
If you click in the value field, a drop-down list opens on the right for setting the unit.  
Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property "Text property ➤ Font". |
### Flags

Variable (DWORD). Contains the flags for displaying fonts.

Flags:
- 1: Italics
- 2: Bold
- 4: Underline
- 8: Strikethrough

Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: `PLC_PRG.dwFontType := 6;` 

### Character set

Variable (DWORD). Contains a character set number for the font.

The selection of character set numbers corresponds to the "Script" setting of the standard "Font" dialog.

### Color

Variable (DWORD). Includes the color of the text.

Example: `PLC_PRG.dwColorFont := 16#FF000000;` 

### Flags for text alignment

Variable (integer data type). Contains the coding for text alignment.

Example: `PLC_PRG.dwTextAlignment := 5;` 

Coding:
- 0: Top left
- 1: Horizontal center
- 2: Right
- 4: Vertical center
- 8: Bottom

Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: `PLC_PRG.dwFontType := 5;` 

---

**Fixed values for displaying texts are set in "Text properties".**

See also

- "Element property 'Text properties'" on page 1227

**Element property 'Colorvariables'**

The Element property is used as an interface for project variables to dynamically control colors at runtime.
### “Toggle color”

The property controls the toggled color at runtime.

**Value assignment:**
- **FALSE:** The element is displayed with the color specified in the “Color” property.
- **TRUE:** The element is displayed with the color specified in the “Alarm color” property.

**Assignment options:**
- Placeholder for the user input variable
  - `<toggle/tap variable>`
  - `<NOT toggle/tap variable>`

The color change is not controlled by its own variable, but by a user input variable.

Note: Specify a variable for the mouse events “Tap” or “Toggle” in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both “Toggle” and “Tap”, then the variable specified in “Tap” is used.

Hint: Click the symbol to insert the placeholder “<toggle/tap variable>”. When you activate the “Input configuration”, “Tap FALSE” property, then the “<NOT toggle/tap variable>” placeholder is displayed.

- Instance path of a project variable (BOOL)
  - Example: PLC_PRG.xColorIsToggeled

Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.

### “Normal state”

### “Alarm state”

The properties listed below control the color depending on the state. The normal state is in effect if the variable in “Color variables”, “Toggle color” is not defined or it has the value FALSE. The alarm state is in effect if the variable in “Color variables”, “Toggle color” has the value TRUE.

### “Frame color”

**Assignment options:**
- Variable (DWORD) for the frame color
  - Example: PLC_PRG.dwBorderColor
- Color literal
  - Example of green and opaque: 16#FF00FF00

### “Filling color”

**Assignment options:**
- Variable (DWORD) for the fill color
  - Example: PLC_PRG.dwFillColor
- Color literal
  - Example of gray and opaque: 16#FF888888

---

The transparency part of the color value is evaluated only if the “Activate semi-transparent drawing” option of the visualization manager is selected.

Select the “Advanced” option in the toolbar of the properties view. Then all element properties are visible.

- Chapter 1.3.5.8.3 “Animating a color display” on page 1152
**Element property 'Absolute movement'**
The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Example</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Movement”</strong></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>“X”</strong></td>
<td>Variable (numeric data type). Defines the X position (in pixels).</td>
<td>PLC_PRG.iPos_X</td>
<td>Increasing this value in runtime mode moves the element to the right.</td>
</tr>
<tr>
<td><strong>“Y”</strong></td>
<td>Variable (numeric data type). Defines the Y position (in pixels).</td>
<td>PLC_PRG.iPos_Y</td>
<td>Increasing this value in runtime mode moves the element downwards.</td>
</tr>
<tr>
<td><strong>“Rotation”</strong></td>
<td>Variable (numeric data type). Defines the angle of rotation (in degrees).</td>
<td>PLC_PRG.iAngle1</td>
<td>The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.</td>
</tr>
<tr>
<td><strong>“Interior rotation”</strong></td>
<td>Variable (numeric data type). Defines the angle of rotation (in degrees).</td>
<td>PLC_PRG.iAngle2</td>
<td>In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>The rotation point is shown as the symbol. Note: If a static angle of rotation is specified in the &quot;Position Angle&quot; property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.</td>
</tr>
</tbody>
</table>

You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.
See also
- [Unit conversion](#)

### Element property 'State variables'

The variables control the element behavior dynamically.

<table>
<thead>
<tr>
<th>Variable (BOOL)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Invisible&quot;</td>
<td>Toggles the visibility of the element. TRUE: The element is not visible at runtime.</td>
</tr>
<tr>
<td>&quot;Deactivate inputs&quot;</td>
<td>Toggles the operability of the element. TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated.</td>
</tr>
</tbody>
</table>

The "Invisible" property is supported by the "Client Animation" functionality.

See also
- [Unit conversion](#)

### Element property 'Selection and caret configuration'

The variables allow for controlling the caret position and the selection of the text.

<table>
<thead>
<tr>
<th>Variable (integer data type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Caret position&quot;</td>
<td>Contains the position of the caret.</td>
</tr>
<tr>
<td>&quot;Selection start&quot;</td>
<td>Contains the position of the first selected character. Example: PLC_PRG.iSelStart</td>
</tr>
<tr>
<td>&quot;Selection end&quot;</td>
<td>Contains the position of the last selected character. Example: PLC_PRG.iSelEnd</td>
</tr>
<tr>
<td>&quot;All selected&quot;</td>
<td>Toggles the selection of the entered text. TRUE: The text in the text field is selected. FALSE: The selection starts with the value in “Selection start” and ends with “Selection end”.</td>
</tr>
</tbody>
</table>

These properties are available only when you select the “Preview: Support client animations and overlay of native elements” option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.

<table>
<thead>
<tr>
<th>Variable (BOOL)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Animation duration&quot;</td>
<td>Time that the element executes an animation (in milliseconds). Example: 500</td>
</tr>
<tr>
<td>&quot;Move to the foreground&quot;</td>
<td>Property value (BOOL). TRUE: At runtime, the element is displayed in the foreground. FALSE: At runtime, the element is displayed in the layer where it was inserted in the visualization editor.</td>
</tr>
</tbody>
</table>
The properties contain the configurations for the user input when using the mouse or keyboard. A user input defines an event and one or more actions that are executed when an event occurs.

The “Configure” button opens the “Input configuration” dialog box for creating or modifying a user input. Configured user inputs are briefly listed below the events. They each include the action that is triggered and the setting in short form.

### Example: “Execute ST code”

```plc
PLC_PRG.i_x := 0;
```

<table>
<thead>
<tr>
<th>Event</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“OnDialogClosed”</td>
<td>Input event: The user closes the dialog box.</td>
</tr>
<tr>
<td>“OnMouseClick”</td>
<td>Input event: The user clicks the mouse button completely. The mouse button is clicked and released.</td>
</tr>
<tr>
<td>“OnMouseDown”</td>
<td>Input event: The user clicks down on the mouse button.</td>
</tr>
<tr>
<td>“OnMouseEnter”</td>
<td>Input event: The user drags the mouse pointer to the element.</td>
</tr>
<tr>
<td>“OnMouseMove”</td>
<td>Input event: The user moves the mouse pointer over the element area.</td>
</tr>
<tr>
<td>“OnMouseLeave”</td>
<td>Input event: The user drags the mouse pointer away from the element.</td>
</tr>
<tr>
<td>“OnMouseUp”</td>
<td>Input event: The user releases the mouse button over the element area.</td>
</tr>
</tbody>
</table>

### “Tap”

When a mouse click event occurs, the variable defined in “Variable” is described in the application. The coding depends on the options “Tap FALSE” and “Tap on enter if captured”.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Tap FALSE”</td>
<td>✔️: The mouse click event leads to a complementary value in “Variable”.</td>
</tr>
<tr>
<td></td>
<td>TRUE: A mouse click event does not exist.</td>
</tr>
<tr>
<td></td>
<td>FALSE: While the mouse click event exists.</td>
</tr>
</tbody>
</table>

### “Tap on enter if captured”

✔️: During user input, it is also taken into consideration whether the mouse pointer is dragged within the element area or not while the mouse button is pressed.

TRUE: While the mouse click event exists and the mouse pointer is moved over the element area.

FALSE: A mouse click event does not exist. Or the user moves the mouse pointer outside of the element area while the mouse button is pressed. The value is TRUE again as soon as the user moves the pointer back to the element area. The mouse is then captured.
**“Shift”**  
With the onset of a mouse click event, the variable is set; when the mouse click event is completed, the variable is reset.

**“Variable”**  
Variable (BOOL). Its value toggled when the mouse click event is ended. This is when the user releases the mouse button while the mouse pointer is over the element area.

If the user releases the mouse button while the mouse pointer is outside of the element area, then the mouse click event is not ended and the value is not toggled.

Tip: The user can cancel a started toggle input by dragging the mouse pointer out of the element area.

**“Toggle on up if captured”**  
☑: The value toggles regardless of where the mouse pointer is when the mouse button is released. The mouse is then captured.

**“Keyboard shortcuts”**  
Keyboard shortcut on the element for triggering specific input actions.

When the keyboard shortcut event occurs, the input actions in the “Event(s)” property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.

**“Key”**  
Key pressed for input action.

Example: [T]

Note: The following properties appear when a key is selected.

**“Event(s)”**
- “None”
- “Mouse down”: Pressing the key triggers the input actions that are configured in the “OnMouseDown” property.
- “Mouse up”: Releasing the key triggers the input actions that are configured in the “OnMouseUp” property.
- “Mouse down/up”: Pressing and releasing the key triggers the input actions that are configured in the “OnMouseDown” property and the “OnMouseUp” property.

**“Shift”**
☑: Combination with the Shift key

Example: [Shift]+[T].

**“Control”**
☑: Combination with the Ctrl key

Example: [Ctrl]+[T].

**“Alt”**
☑: Combination with the Alt key

Example: [Alt]+[T].

---

All keyboard shortcuts and their actions that are configured in the visualization are listed in the “Keyboard configuration” tab.

**Element property ‘Access rights’**

Requirement: User management is set up for the visualization.
“Access rights” Opens the “Access rights” dialog. There you can edit the access privileges for the element.
Status messages:
- “Not set. Full rights.”: Access rights for all user groups: “operable”
- “Rights are set: Limited rights”: Access is restricted for at least one group.

See also
- ☞ Chapter 1.3.5.19.3.1 “Dialog ‘Access Rights’” on page 1583

Visualization element ‘Scrollbar’
Symbol:

Tag: “Common controls”
The element sets the value of a variable, depending on the position of the scrollbar.

Element properties

<table>
<thead>
<tr>
<th>“Element name”</th>
<th>Example: Speed Conveyor Belt 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Optional</td>
<td>Hint: Assign individual names for elements so that they are found faster in the element list.</td>
</tr>
<tr>
<td>“Type of element”</td>
<td>“Scrollbar”</td>
</tr>
</tbody>
</table>

Element property ‘Center’
The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

<table>
<thead>
<tr>
<th>“X”</th>
<th>X-coordinate of the point of rotation</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Y”</td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the symbols (④) to other positions in the editor.

<table>
<thead>
<tr>
<th>“Value”</th>
<th>Variable as type integer that includes the position of the scrollbar.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Minimum value”</td>
<td>Smallest value of the scrollbar (fixed value or variable).</td>
</tr>
<tr>
<td>“Maximum value”</td>
<td>Largest value of the scrollbar (fixed value or variable).</td>
</tr>
</tbody>
</table>
"Page size"  Page size
  ● As a fixed value, for example 10
  ● As a variable of data type integer
  Requirement: Visible when the "Move to click" property is not selected.

"Move to click"  Behavior of the scrollbar at visualization runtime when it is clicked:
  ☑: The scrollbar moves to the clicked position.
  ☐: The scrollbar moves to one "Page size" in the direction of the click.

Element property 'Position'  The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;X&quot;</td>
<td>X coordinate of the upper left corner of the element Specified in pixels. Example: 10.</td>
</tr>
<tr>
<td>&quot;Y&quot;</td>
<td>Y coordinate of the upper left corner of the element Specified in pixels. Example: 10.</td>
</tr>
<tr>
<td>&quot;Width&quot;</td>
<td>Specified in pixels. Example: 150</td>
</tr>
<tr>
<td>&quot;Height&quot;</td>
<td>Specified in pixels. Example: 30</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the box symbols (tracked) to other positions in the editor.

See also
  ● Chapter 1.3.5.3.2 “Positioning elements, adapting size and layer” on page 1113

Element property 'Bar'  The property defines the representation of scaling and direction of travel.
**Orientation**  
Alignment of the slider; defined by the ratio of width to height.  
- **“Horizontal”**  
- **“Vertical”**  
You can modify the alignment in the visualization editor by using the pointing device to adjust the width and height of the scrollbar.

**Running direction**  
The drop-down list varies depending on the alignment of the slider.  
**Horizontal**  
- **“Left to right”: Scale starts at the left.**  
- **“Right to left”: Scale starts at the right.**  
**Vertical**  
- **“Bottom to top”: Scale starts at the bottom.**  
- **“Top to bottom”: Scale starts at the top.**

**Element property ‘Colors’**  
The properties contain fixed values for setting colors.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Color</strong></td>
<td>Color for the element in its normal state. Please note that the normal state is in effect if the expression in the “Color variables ➔ Toggle color” property is not defined or it has the value FALSE.</td>
</tr>
<tr>
<td><strong>Alarm color</strong></td>
<td>Color for the element in alarm state. Please note that the alarm state is in effect if the expression in the “Color variables ➔ Toggle color” property has the value TRUE.</td>
</tr>
<tr>
<td><strong>Transparency</strong></td>
<td>Value (0 to 255) for defining the transparency of the selected color. Example 255: The color is opaque. 0: The color is completely transparent.</td>
</tr>
</tbody>
</table>

**Element property ‘Texts’**  
The properties contains character strings for labeling the element. The character string can also contain a placeholder with a format definition. In runtime mode, the placeholder is replaced by the current value in the specified format.  
CODESYS accepts the specified texts automatically into the “GlobalTextList” text list. Therefore, these texts can be localized.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Text**       | Character string (without single straight quotation marks) for the labeling the element. Add a line break by pressing the keyboard shortcut [Ctrl] + [Enter]. Example: Accesses: %i  
The variable that contains the current value for the placeholder is specified in the property “Text variable ➔ Text”. |
| **Tooltip**    | Character string (without single straight quotation marks) that is displayed as the tooltip of an element. Example: Number of valid accesses.  
The variable that contains the current value for the placeholder is specified in the property “Text variable ➔ Tooltip” |
Element property 'Text properties'
The properties contain fixed values for the text properties.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Horizontal alignment&quot;</td>
<td>Horizontal alignment of the text within the element.</td>
</tr>
<tr>

### Element property 'Dynamic texts'

Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.

| **“Text list”** | Variable (string) or name of the text list as a fixed string in single straight quotation marks.  
Example: 'Errorlist'  
▼: Drop-down list with the dialogs available in the text lists. |
| --- | --- |
| **“Text index”** | Text list ID. This refers to the desired output text.  
- As fixed string with the ID in single straight quotation marks.  
  Example: '1'  
- As a variable (STRING) for dynamically controlling the text output.  
  Example: strTextID  
  Sample assignment: PLC_PRG.strTextID := '1'; |
| **“Tooltip index”** | Text list ID. This refers to the desired output text.  
- As fixed string with the ID in single straight quotation marks.  
  Example: '2'  
- As a variable (STRING) for dynamically controlling the text output.  
  Example: strToolTipID  
  Sample assignment: PLC_PRG.strToolTipID := '2'; |

See also
- **Text list**

### Element property 'Font variables'

The variables allow for dynamic control of the text display.

| **“Font name”** | Variable (STRING). Includes the font of the text.  
Example: PLC_PRG.stFontVar := 'Arial';  
The selection of fonts corresponds to the default “Font” dialog. |
| --- | --- |
| **“Size”** | Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name.  
- <pt>: Points (default)  
  Example: PLC_PRG.iFontHeight <pt>  
  Code: iFontHeight : INT := 12;  
- <px>: Pixels  
  Example: PLC_PRG.iFontHeight <px>  
  Code: iFontHeight : INT := 19; |

If you click in the value field, a drop-down list opens on the right for setting the unit.

Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property “Text property ➔ Font”.

---

---
“Flags” Variable (DWORD). Contains the flags for displaying fonts.
Flags:
● 1: Italics
● 2: Bold
● 4: Underline
● 8: Strikethrough
Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: PLC_PRG.dwFontType := 6;

“Character set” Variable (DWORD). Contains a character set number for the font.
The selection of character set numbers corresponds to the “Script” setting of the standard “Font” dialog.

“Color” Variable (DWORD). Includes the color of the text.
Example: PLC_PRG.dwColorFont := 16#FF000000;

“Flags for text alignment” Variable (integer data type). Contains the coding for text alignment.
Example: PLC_PRG.dwTextAlignment.
Coding:
● 0: Top left
● 1: Horizontal center
● 2: Right
● 4: Vertical center
● 8: Bottom
Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: PLC_PRG.dwFontType := 5;

Fixed values for displaying texts are set in “Text properties”.

See also
● § “Element property ‘Text properties’” on page 1227

Element property ‘Colorvariables’ The Element property is used as an interface for project variables to dynamically control colors at runtime.
<table>
<thead>
<tr>
<th><strong>“Toggle color”</strong></th>
<th>The property controls the toggled color at runtime.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Value assignment:</strong></td>
<td></td>
</tr>
<tr>
<td>● <strong>FALSE</strong>: The element is displayed with the color specified in the “Color” property.</td>
<td></td>
</tr>
<tr>
<td>● <strong>TRUE</strong>: The element is displayed with the color specified in the “Alarm color” property.</td>
<td></td>
</tr>
<tr>
<td><strong>Assignment options:</strong></td>
<td></td>
</tr>
<tr>
<td>● Placeholder for the user input variable</td>
<td></td>
</tr>
<tr>
<td>– “&lt;toggle/tap variable&gt;”</td>
<td></td>
</tr>
<tr>
<td>– “&lt;NOT toggle/tap variable&gt;”</td>
<td></td>
</tr>
</tbody>
</table>

The color change is not controlled by its own variable, but by a user input variable.

Note: Specify a variable for the mouse events “Tap” or “Toggle” in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both “Toggle” and “Tap”, then the variable specified in “Tap” is used.

Hint: Click the symbol to insert the placeholder “<toggle/tap variable>”. When you activate the “Inputconfiguration”, “Tap FALSE” property, then the “<NOT toggle/tap variable>” placeholder is displayed.

● Instance path of a project variable (BOOL)
  Example: PLC_PRG.xColorIsToggled

Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.

| **“Normal state”** | The properties listed below control the color depending on the state. The normal state is in effect if the variable in “Color variables”, “Toggle color” is not defined or it has the value FALSE. |
| **“Alarm state”** | The alarm state is in effect if the variable in “Color variables”, “Toggle color” has the value TRUE. |

<table>
<thead>
<tr>
<th><strong>“Frame color”</strong></th>
<th>Assignment options:</th>
</tr>
</thead>
<tbody>
<tr>

● Chapter 1.3.5.8.3 “Animating a color display” on page 1152
The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

<table>
<thead>
<tr>
<th>“Movement”</th>
</tr>
</thead>
</table>
| **“X”** | Variable (numeric data type). Defines the X position (in pixels).  
**Example:** PLC_PRG.iPos_X.  
Increasing this value in runtime mode moves the element to the right. |
| **“Y”** | Variable (numeric data type). Defines the Y position (in pixels).  
**Example:** PLC_PRG.iPos_Y.  
Increasing this value in runtime mode moves the element downwards. |
| **“Rotation”** | Variable (numeric data type). Defines the angle of rotation (in degrees).  
**Example:** PLC_PRG.iAngle1.  
The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.  
In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right. |
| **“Interior rotation”** | Variable (numeric data type). Defines the angle of rotation (in degrees).  
**Example:** PLC_PRG.iAngle2.  
In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.  
The rotation point is shown as the symbol.  
Note: If a static angle of rotation is specified in the “Position ➔ Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed. |

You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.
The variables control the element behavior dynamically.

**Element property 'State variables'**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Invisible&quot;</td>
<td>Variable (BOOL). Toggles the visibility of the element. TRUE: The element is not visible at runtime.</td>
</tr>
<tr>
<td>&quot;Deactivate inputs&quot;</td>
<td>Variable (BOOL). Toggles the operability of the element. TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated.</td>
</tr>
</tbody>
</table>

The "Invisible" property is supported by the "Client Animation" functionality.

These properties are available only when you select the "Preview: Support client animations and overlay of native elements" option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Animation duration&quot;</td>
<td>Time that the element executes an animation (in milliseconds) Example: 500</td>
</tr>
<tr>
<td>&quot;Move to the foreground&quot;</td>
<td>Property value (BOOL) TRUE: At runtime, the element is displayed in the foreground. FALSE: At runtime, the element is displayed in the layer where it was inserted in the visualization editor.</td>
</tr>
</tbody>
</table>

Requirement: User management is set up for the visualization.

**Element property 'Access rights'**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Access rights&quot;</td>
<td>Opens the &quot;Access rights&quot; dialog. There you can edit the access privileges for the element. Status messages: &quot;Not set. Full rights.&quot;: Access rights for all user groups: &quot;operable&quot; &quot;Rights are set: Limited rights&quot;: Access is restricted for at least one group.</td>
</tr>
</tbody>
</table>

Visualization element ‘Slider’

Symbol:

Tag: “Common controls”

The element adjusts the value of a variable, depending on the position of the slider within the slider bar. You define the value range of the slider bar by means of the scale start and scale end.

**Element properties**

<table>
<thead>
<tr>
<th>“Element name”</th>
<th>Example: Speed controller conveyor belt 1</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Optional</td>
</tr>
<tr>
<td></td>
<td>Hint: Assign individual names for elements so that they are found faster in the element list.</td>
</tr>
</tbody>
</table>

| “Type of element”       | “Slider”                                   |

**Element property ‘Position’**

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

<table>
<thead>
<tr>
<th>“X”</th>
<th>X coordinate of the upper left corner of the element</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Specified in pixels.</td>
</tr>

</tr>
</tbody>
</table>

You can also change the values by dragging the box symbols (¶) to other positions in the editor.

See also

- Chapter 1.3.5.3.2 “Positioning elements, adapting size and layer” on page 1113
Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>X</td>
<td>X-coordinate of the point of rotation</td>
</tr>
<tr>
<td>Y</td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

---

Element property 'Variable'

Variable (numeric data type)

Example: PLC_PRG.rSlider

When executed, the variable assigns a value that corresponds to the position of the slider in the bar.

---

Element property 'Page size'

Page size

- As a fixed value, for example 10
- As an IEC variable of data type integer

Requirement: The "Move to click" element property is not activated.

---

Element property 'Move to click'

Function of the slider at visualization runtime when it is clicked:

- The slider moves to the clicked position.
- The slider moves to the value (defined in the "Page size" element property) in the direction of the click.

---

Element property 'Scale'

- "Show scale": The element has a visible scale.
  
  Note: This option is available for the slider only.

- "Scale start": Least value of the scale and the lower limit of the value range for the element.
  
  Example: 0

  The property "Variable" is shown below.

- "Variable": Variable (integer data type). Contains the scale start.
  
  Example: PLC_PRG.iScaleStart

  Declaration:

  ```
  PROGRAM PLC_PRG
  VAR
    iScaleStart : INT := 0;
  END_VAR
  ```

- "Scale end": Greatest value of the scale and the upper limit of the value range for the element.
  
  Example: 100

  The property "Variable" is shown below.
<table>
<thead>
<tr>
<th><strong>Variable</strong></th>
<th>Variable (integer data type). Contains the scale end.</th>
</tr>
</thead>
<tbody>

<tbody>
<tr>
<td>Note: This property is available for the slider only.</td>
<td></td>
</tr>
</tbody>
</table>

| **Scale proportion** | Size of the scale (in %) of the total size |

**Element property 'Bar'**
The property defines the representation of scaling and direction of travel.
"Diagram type" | The drop-down list varies depending on the alignment of the diagram.  
Horizontal  
- "Top": Scale is above the slider.  
- "Bottom": Scale is below the slider.  
- "Top and bottom": Two scales frame the slider above and below.  
Vertical  
- Left: Scale is left of the slider.  
- Right: Scale is right of the slider.  
- Left and right: Two scales frame the slider on the left and the right.

"Orientation" | Alignment of the slider; defined by the ratio of width to height.  
- "Horizontal"  
- "Vertical"  
You can modify the alignment in the visualization editor by using the pointing device to adjust the width and height of the scrollbar.

"Running direction" | The drop-down list varies depending on the alignment of the slider.  
Horizontal  
- "Left to right": Scale starts at the left.  
- "Right to left": Scale starts at the right.  
Vertical  
- "Bottom to top": Scale starts at the bottom.  
- "Top to bottom": Scale starts at the top.

Element property 'Absolute movement' | The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement" |  
"X" | Variable (numeric data type). Defines the X position (in pixels).  
Example: PLC_PRG.iPos_X.  
Increasing this value in runtime mode moves the element to the right.

"Y" | Variable (numeric data type). Defines the Y position (in pixels).  
Example: PLC_PRG.iPos_Y.  
Increasing this value in runtime mode moves the element downwards.

"Rotation" | Variable (numeric data type). Defines the angle of rotation (in degrees).  
Example: PLC_PRG.iAngle1.  
The midpoint of the element rotates at the "Center" point. This rotation point is shown as the symbol.  
In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.
"Interior rotation"

Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in "Center" according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol.

Note: If a static angle of rotation is specified in the "Position ➔ Angle" property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

See also

- Unit conversion
- 

**Element property 'State variables'**

The variables control the element behavior dynamically.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Invisible&quot;</td>
<td>Variable (BOOL). Toggles the visibility of the element. TRUE: The element is not visible at runtime.</td>
</tr>
<tr>
<td>&quot;Deactivate inputs&quot;</td>
<td>Variable (BOOL). Toggles the operability of the element. TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated.</td>
</tr>
</tbody>
</table>

The "Invisible" property is supported by the "Client Animation" functionality.

See also

- 

These properties are available only when you select the “Preview: Support client animations and overlay of native elements” option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.
**"Animation duration"**

Time that the element executes an animation (in milliseconds)

**Example:** 500

---

**"Move to the foreground"**

Property value (BOOL)

**TRUE:** At runtime, the element is displayed in the foreground.

**FALSE:** At runtime, the element is displayed in the layer where it was inserted in the visualization editor.

See also

- § Chapter 1.3.5.21.5 “Using client animation” on page 1962

---

**Element property 'Access rights'**

Requirement: User management is set up for the visualization.

**"Access rights"**

Opens the “Access rights” dialog. There you can edit the access privileges for the element.

Status messages:

- “Not set. Full rights.”: Access rights for all user groups: “operable”
- “Rights are set: Limited rights”: Access is restricted for at least one group.

---

**Visualization element 'SpinControl'**

Symbol:

![Symbol](Image)

Tag: “Common controls”

The element increments or decrements the value of a variable in defined intervals.

---

**Element properties**

**"Element name"**

**Example:** Speed controller conveyor belt

Optional

Hint: Assign individual names for elements so that they are found faster in the element list.

**"Type of element"**

“SpinControl”

---

**Element property 'Position'**

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.
"X"  
X coordinate of the upper left corner of the element  
Specified in pixels.  
Example: 10.

"Y"  
Y coordinate of the upper left corner of the element  
Specified in pixels.  
Example: 10.

"Width"  
Specified in pixels.  
Example: 150

"Height"  
Specified in pixels.  
Example: 30

---

You can also change the values by dragging the box symbols (ドラッグ) to other positions in the editor.

See also
- Chapter 1.3.5.3.2 “Positioning elements, adapting size and layer” on page 1113

Element property 'Center'  
The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

"X"  
X-coordinate of the point of rotation

"Y"  
Y-coordinate of the point of rotation

---

You can also change the values by dragging the symbols (ドラッグ) to other positions in the editor.

"Variable"  
Variable (numeric data type)  
Beispiel PLC_PRG.iTemp

"Number format"  
Format of the value in printf syntax  
Example: %d, %.2f

"Interval"  
Interval used for modification of the value
**Element property 'Text properties'**

- **Minimum value**
  - Lower limit of the output value
  - fixed value
  - Variable (INT)

- **Maximum value**
  - Upper limit of the output value
  - fixed value
  - Variable (INT)

The properties contain fixed values for the text properties.

**Usage of**

- “Default style values”: The values of the visualization style are used.
- “Individual settings”: The "Individual text properties" property group is shown. The values can be customized here.

**“Individual text properties”**
Requirement: The “Individual settings” text property is defined.

- **Horizontal alignment**
  - Horizontal alignment of the text within the element.

- **Vertical alignment**
  - Vertical alignment of the text within the element.

- **Font**
  - Example: “Default”
  - The “Font” dialog box opens.
  - †: Drop-down list with style fonts.

- **Font color**
  - Example: “Black”
  - †: The “Color” dialog box opens.
  - †: Drop-down list with style colors.

- **Transparency**
  - Whole number (value range from 0 to 255). This determines the transparency of the respective color.
  - Example: 255: The color is opaque.
  - 0: The color is completely transparent.
  - Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

**Element property 'Colorvariables'**

The Element property is used as an interface for project variables to dynamically control colors at runtime.
**“Toggle color”**

The property controls the toggled color at runtime.

**Value assignment:**
- **FALSE:** The element is displayed with the color specified in the “Color” property.
- **TRUE:** The element is displayed with the color specified in the “Alarm color” property.

**Assigning the property:**
- Placeholder for the user input variable
  - `<toggle/tap variable>`
  - `<NOT toggle/tap variable>`

The color change is not controlled by its own variable, but by a user input variable.

*Note:* Specify a variable for the mouse events “Tap” or “Toggle” in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both “Toggle” and “Tap”, then the variable specified in “Tap” is used.

*Hint:* Click the symbol to insert the placeholder “<toggle/tap variable>”. When you activate the “Input configuration”, “Tap FALSE” property, then the “<NOT toggle/tap variable>” placeholder is displayed.

- **Instance path of a project variable (BOOL)**
  - Example: PLC_PRG.xColorIsToggled

*Note:* In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.

---

**The transparency part of the color value is evaluated only if the “Activate semi-transparent drawing” option of the visualization manager is selected.**

**Select the “Advanced” option in the toolbar of the properties view. Then all element properties are visible.**

Element property 'Input configuration'

The properties contain the configurations for the user input when using the mouse or keyboard. User input is a user event from the perspective of the element.

The input configuration refers to the text area of the element only, not the two buttons.

The “Configure” button opens the “Input configuration” dialog box for creating or modifying a user input configuration.

A configuration contains one or more input actions for the respective input event. Existing input actions are displayed below it.

Example: “Execute ST code”: \[ PLC\_PRG\_.i\_x := 0; \]

<table>
<thead>
<tr>
<th>“OnDialogClosed”</th>
<th>Input event: The user closes the dialog box.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“OnMouseClick”</td>
<td>Input event: The user clicks the element completely. The mouse button is clicked and released.</td>
</tr>
<tr>
<td>“OnMouseDown”</td>
<td>Input event: The user clicks down on the element only.</td>
</tr>
<tr>
<td>“OnMouseEnter”</td>
<td>Input event: The user drags the mouse pointer to the element.</td>
</tr>
<tr>
<td>“OnMouseLeave”</td>
<td>Input event: The user drags the mouse pointer away from the element.</td>
</tr>
<tr>
<td>“OnMouseMove”</td>
<td>Input event: The user moves the mouse pointer over the element area.</td>
</tr>
<tr>
<td>“OnMouseUp”</td>
<td>Input event: The user releases the mouse button over the element area.</td>
</tr>
</tbody>
</table>

- "Mouse down/up": Pressing and releasing the key triggers the input actions that are configured in the "OnMouseDown" property and the "OnMouseUp" property.

"Shift"

☑ Combination with the Shift key
Example: [Shift]+[T].

"Control"

☑ Combination with the Ctrl key
Example: [Ctrl]+[T].

"Alt"

☑ Combination with the Alt key
Example: [Alt]+[T].

All keyboard shortcuts and their actions that are configured in the visualization are listed in the “Keyboard configuration” tab.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

"Access rights"

Opens the “Access rights” dialog. There you can edit the access privileges for the element.
Status messages:
- "Not set. Full rights.": Access rights for all user groups: “operable”
- "Rights are set: Limited rights": Access is restricted for at least one group.

- % Chapter 1.3.5.19.3.1 “Dialog ‘Access Rights’” on page 1583

See also
- "Visibility" (Common controls)

Visualization element 'Invisible input'

Symbol:

Tag: “Common controls”

This element is displayed in the editor with a dashed line and is not visible in online mode. You define the behavior of the el in the input configuration.
Element properties

<table>
<thead>
<tr>
<th>“Element name”</th>
<th>Optional</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hint: Assign individual names for elements so that they are found faster in the element list.</td>
<td></td>
</tr>
<tr>
<td>Example: invisible_input_1</td>
<td></td>
</tr>
</tbody>
</table>

| “Type of element”     | “Invisible input”                             |

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

<table>
<thead>
<tr>
<th>“X”</th>
<th>X coordinate of the upper left corner of the element</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specified in pixels.</td>
<td></td>
</tr>
<tr>
<td>Example: 10.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Y”</th>
<th>Y coordinate of the upper left corner of the element</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specified in pixels.</td>
<td></td>
</tr>
<tr>
<td>Example: 10.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Width”</th>
<th>Specified in pixels.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: 150</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Height”</th>
<th>Specified in pixels.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: 30</td>
<td></td>
</tr>
</tbody>
</table>

You can also change the values by dragging the box symbols (_drag) to other positions in the editor.

See also

- Chapter 1.3.5.3.2 “Positioning elements, adapting size and layer” on page 1113

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

<table>
<thead>
<tr>
<th>“X”</th>
<th>X-coordinate of the point of rotation</th>
</tr>
</thead>
</table>

| “Y”                  | Y-coordinate of the point of rotation                |

You can also change the values by dragging the symbols (drag) to other positions in the editor.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
### “Movement”

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Example</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>“X”</td>
<td>Variable (numeric data type). Defines the X position (in pixels).</td>
<td>PLC_PRG.iPos_X.</td>
<td>Increasing this value in runtime mode moves the element to the right.</td>
</tr>
<tr>
<td>“Y”</td>
<td>Variable (numeric data type). Defines the Y position (in pixels).</td>
<td>PLC_PRG.iPos_Y.</td>
<td>Increasing this value in runtime mode moves the element downwards.</td>
</tr>
<tr>
<td>“Rotation”</td>
<td>Variable (numeric data type). Defines the angle of rotation (in degrees).</td>
<td>PLC_PRG.iAngle1.</td>
<td>The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.</td>
</tr>
<tr>
<td>“Interior rotation”</td>
<td>Variable (numeric data type). Defines the angle of rotation (in degrees).</td>
<td>PLC_PRG.iAngle2.</td>
<td>In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the symbol. Note: If a static angle of rotation is specified in the “Position ➔ Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.</td>
</tr>
</tbody>
</table>

You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.

See also
- [Unit conversion](#)
The variables control the element behavior dynamically.

<table>
<thead>
<tr>
<th><strong>&quot;Deactivate inputs&quot;</strong></th>
<th>Variable (BOOL). Toggles the operability of the element. TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated.</th>
</tr>
</thead>
</table>

These properties are available only when you select the “Preview: Support client animations and overlay of native elements” option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.

| **"Animation duration"** | Time that the element executes an animation (in milliseconds)  
Example: 500 |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| **"Move to the foreground"** | Property value (BOOL)  
TRUE: At runtime, the element is displayed in the foreground.  
FALSE: At runtime, the element is displayed in the layer where it was inserted in the visualization editor. |
**“Tap”**

When a mouse click event occurs, the variable defined in “Variable” is described in the application. The coding depends on the options “Tap FALSE” and “Tap on enter if captured”.

**“Variable”**

Variable (BOOL) that is set on mouse click.

**Example:** PLC_PRG.bIsTapped

- **TRUE**: A mouse click event exists. It lasts while the user presses the mouse button over the element. It ends when the button is released.
- **FALSE**: A mouse click event does not exist.

**Requirement:** The “Tap FALSE” option is not activated.

**“Tap FALSE”**

- **☑**: The mouse click event leads to a complementary value in “Variable”.
  - **TRUE**: A mouse click event does not exist.
  - **FALSE**: While the mouse click event exists.

**“Tap on enter if captured”**

- **☑**: During user input, it is also taken into consideration whether the mouse pointer is dragged within the element area or not while the mouse button is pressed.
  - **TRUE**: While the mouse click event exists and the mouse pointer is moved over the element area.
  - **FALSE**: A mouse click event does not exist. Or the user moves the mouse pointer outside of the element area while the mouse button is pressed.

The value is **TRUE** again as soon as the user moves the pointer back to the element area. The mouse is then captured.

**“Shift”**

With the onset of a mouse click event, the variable is set; when the mouse click event is completed, the variable is reset.

**“Variable”**

Variable (BOOL). Its value toggled when the mouse click event is ended. This is when the user releases the mouse button while the mouse pointer is over the element area.

If the user releases the mouse button while the mouse pointer is outside of the element area, then the mouse click event is not ended and the value is not toggled.

**Tip:** The user can cancel a started toggle input by dragging the mouse pointer out of the element area.

**“Toggle on up if captured”**

- **☑**: The value toggles regardless of where the mouse pointer is when the mouse button is released. The mouse is then captured.

**“Keyboard shortcuts”**

Keyboard shortcut on the element for triggering specific input actions.

When the keyboard shortcut event occurs, the input actions in the “Event(s)” property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.

**“Key”**

Key pressed for input action.

**Example:** [T]

**Note:** The following properties appear when a key is selected.
“Event(s)”

- “None”
- “Mouse down”: Pressing the key triggers the input actions that are configured in the “OnMouseDown” property.
- “Mouse up”: Releasing the key triggers the input actions that are configured in the “OnMouseUp” property.
- “Mouse down/up”: Pressing and releasing the key triggers the input actions that are configured in the “OnMouseDown” property and the “OnMouseUp” property.

“Shift”

- Combination with the Shift key
  Example: [Shift]+[T].

“Control”

- Combination with the Ctrl key
  Example: [Ctrl]+[T].

“Alt”

- Combination with the Alt key
  Example: [Alt]+[T].

All keyboard shortcuts and their actions that are configured in the visualization are listed in the “Keyboard configuration” tab.

</tr>
</tbody>
</table>

"Interior rotation"

<table>
<thead>
<tr>
<th>&quot;Interior rotation&quot;</th>
<th>Variable (numeric data type). Defines the angle of rotation (in degrees).</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: PLC_PRG.iAngle2.</td>
<td>In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.</td>
</tr>
<tr>
<td></td>
<td>The rotation point is shown as the symbol.</td>
</tr>
<tr>
<td></td>
<td>Note: If a static angle of rotation is specified in the “Position Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.</td>
</tr>
</tbody>
</table>
You can link the variables to a unit conversion.

The "X", "Y", "Rotation", and "Interior rotation" properties are supported by the "Client Animation" functionality.

See also
- Unit conversion

Element property 'State variables'

The variables control the element behavior dynamically.

<table>
<thead>
<tr>
<th><strong>&quot;Invisible&quot;</strong></th>
<th>Variable (BOOL). Toggles the visibility of the element.</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRUE: The element is not visible at runtime.</td>
<td></td>
</tr>
</tbody>
</table>

The "Invisible" property is supported by the "Client Animation" functionality.

See also
- 

These properties are available only when you select the "Preview: Support client animations and overlay of native elements" option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.

<table>
<thead>
<tr>
<th><strong>&quot;Animation duration&quot;</strong></th>
<th>Time that the element executes an animation (in milliseconds)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: 500</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>&quot;Move to the foreground&quot;</strong></th>
<th>Property value (BOOL)</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRUE: At runtime, the element is displayed in the foreground.</td>
<td></td>
</tr>
<tr>
<td>FALSE: At runtime, the element is displayed in the layer where it was inserted in the visualization editor.</td>
<td></td>
</tr>
</tbody>
</table>

See also
- Chapter 1.3.5.21.5 “Using client animation” on page 1962

Element property 'Access rights'

Requirement: User management is set up for the visualization.
“Access rights” Opens the “Access rights” dialog. There you can edit the access privileges for the element.

Status messages:
- “Not set. Full rights.”: Access rights for all user groups: “operable”
- “Rights are set: Limited rights”: Access is restricted for at least one group.

See also
- Chapter 1.3.5.19.3.1 “Dialog ‘Access Rights’” on page 1583

Visualization element ‘Checkbox’

Symbol:

<table>
<thead>
<tr>
<th>Tag: “Common controls”</th>
</tr>
</thead>
</table>

The element is used for setting and resetting a Boolean variable. The set state is represented by a check mark.

Element properties

<table>
<thead>
<tr>
<th>“Element name”</th>
<th>Example: signal_tone_for_parts_deficit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Optional</td>
<td></td>
</tr>
</tbody>
</table>
| Hint: Assign individual names for elements so that they are found faster in the element list.

<table>
<thead>
<tr>
<th>“Type of element”</th>
<th>“Checkbox”</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>“Text ID”</th>
<th>ID for the text in the “GlobalTextList”</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: 22</td>
<td></td>
</tr>
</tbody>
</table>

The text ID cannot be modified. As soon as you specify and save a text in “Texts” - “Text”, CODESYS automatically creates an entry in the “GlobalTextList” and displays the ID here.

Element property ‘Position’

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

<table>
<thead>
<tr>
<th>“X”</th>
<th>X coordinate of the upper left corner of the element</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Specified in pixels. Example: 10.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Y”</th>
<th>Y coordinate of the upper left corner of the element</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Specified in pixels. Example: 10.</td>
</tr>
</tbody>
</table>
### "Width"
Specified in pixels.
Example: 150

### "Height"
Specified in pixels.
Example: 30

You can also change the values by dragging the box symbols (quito) to other positions in the editor.

See also
-  Chapter 1.3.5.3.2 “Positioning elements, adapting size and layer” on page 1113

#### Element property 'Center'
The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the (quito) symbol. The point is used as the center for rotating and scaling.

<table>
<thead>
<tr>
<th>“X”</th>
<th>X-coordinate of the point of rotation</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Y”</td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the symbols (quito) to other positions in the editor.

#### "Variable"
Variable of type BOOL.
Example: "PLC_PRG.xIsTrue"

#### "Frame size"
Distance of the element to the edge
Example: “From style”

#### Element property 'Texts'
The properties contains character strings for labeling the element.
CODESYS accepts the specified texts automatically into the “GlobalTextList” text list. Therefore, these texts can be localized.

<table>
<thead>
<tr>
<th>“Text”</th>
<th>Character string (without single straight quotation marks) for the labeling the element.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Tooltip”</td>
<td>Character string (without single straight quotation marks) that is displayed as the tooltip of an element.</td>
</tr>
</tbody>
</table>

Example:
- Text: Axis 1.
- Tooltip: Parameters of Axis 1.

See also
-  

#### Element property 'Text properties'
The properties contain fixed values for the text properties.
<table>
<thead>
<tr>
<th>“Usage of”</th>
<th>“Default style values”: The values of the visualization style are used.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>“Individual settings”: The “Individual text properties” property group is shown</td>
</tr>
<tr>
<td></td>
<td>The values can be customized here.</td>
</tr>
<tr>
<td>“Individual text properties”</td>
<td>Requirement: The “Individual settings” text property is defined.</td>
</tr>
<tr>
<td>“Horizontal alignment”</td>
<td>Horizontal alignment of the text within the element.</td>
</tr>
<tr>
<td>“Vertical alignment”</td>
<td>Vertical alignment of the text within the element.</td>
</tr>
<tr>
<td>“Text format”</td>
<td>Definition for displaying texts that are too long</td>
</tr>
<tr>
<td></td>
<td>“Default”: The long text is truncated.</td>
</tr>
<tr>
<td></td>
<td>“Line break”: The text is split into parts.</td>
</tr>
<tr>
<td></td>
<td>“Ellipsis”: The visible text ends with “…”, indicating that it is not complete.</td>
</tr>
<tr>
<td>“Font”</td>
<td>Example: “Default”</td>
</tr>
<tr>
<td></td>
<td>📔: The “Font” dialog box opens.</td>
</tr>
<tr>
<td></td>
<td>✶: Drop-down list with style fonts.</td>
</tr>
<tr>
<td>“Font color”</td>
<td>Example: “Black”</td>
</tr>
<tr>
<td></td>
<td>📔: The “Color” dialog box opens.</td>
</tr>
<tr>
<td></td>
<td>✶: Drop-down list with style colors.</td>
</tr>
<tr>
<td>“Transparency”</td>
<td>Whole number (value range from 0 to 255). This determines the transparency of the respective color.</td>
</tr>
<tr>
<td></td>
<td>Example: 255: The color is opaque.</td>
</tr>
<tr>
<td></td>
<td>0: The color is completely transparent.</td>
</tr>
<tr>
<td></td>
<td>Please note: If the color is a style color and already has a transparency value, then this property is write-protected.</td>
</tr>
</tbody>
</table>

**Element property 'Absolute movement'**

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

<table>
<thead>
<tr>
<th>“Movement”</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“X”</strong></td>
<td>Variable (numeric data type). Defines the X position (in pixels).</td>
</tr>
<tr>
<td></td>
<td>Example: PLC_PRG.iPos_X.</td>
</tr>
<tr>
<td></td>
<td>Increasing this value in runtime mode moves the element to the right.</td>
</tr>
<tr>
<td><strong>“Y”</strong></td>
<td>Variable (numeric data type). Defines the Y position (in pixels).</td>
</tr>
<tr>
<td></td>
<td>Example: PLC_PRG.iPos_Y.</td>
</tr>
<tr>
<td></td>
<td>Increasing this value in runtime mode moves the element downwards.</td>
</tr>
</tbody>
</table>
"Rotation" Variable (numeric data type). Defines the angle of rotation (in degrees).
Example: PLC_PRG.iAngle1.
The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.
In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

"Interior rotation" Variable (numeric data type). Defines the angle of rotation (in degrees).
Example: PLC_PRG.iAngle2.
In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.
The rotation point is shown as the symbol.
Note: If a static angle of rotation is specified in the "Position Angle" property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

See also
- Unit conversion

Element property ‘State variables’ The variables control the element behavior dynamically.

<table>
<thead>
<tr>
<th>“Invisible”</th>
<th>Variable (BOOL). Toggles the visibility of the element. TRUE: The element is not visible at runtime.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Deactivate inputs”</td>
<td>Variable (BOOL). Toggles the operability of the element. TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated.</td>
</tr>
</tbody>
</table>
The “Invisible” property is supported by the “Client Animation” functionality.

See also

These properties are available only when you select the “Preview: Support client animations and overlay of native elements” option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.

<table>
<thead>
<tr>
<th>“Animation duration”</th>
<th>Time that the element executes an animation (in milliseconds)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: 500</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Move to the foreground”</th>
<th>Property value (BOOL)</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRUE:</td>
<td>At runtime, the element is displayed in the foreground.</td>
</tr>
<tr>
<td>FALSE:</td>
<td>At runtime, the element is displayed in the layer where it was inserted in the visualization editor.</td>
</tr>
</tbody>
</table>

</tbody>
</table>
Element property 'Text properties'  
The properties contain fixed values for the text properties.

| “Usage of”                      | ● “Default style values”: The values of the visualization style are used.  
|                                | ● “Individual settings”: The “Individual text properties” property group is shown  
|                                | The values can be customized here.  

“Individual text properties”  
Requirement: The “Individual settings” text property is defined.

<table>
<thead>
<tr>
<th>“Horizontal alignment”</th>
<th>Horizontal alignment of the text within the element.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Vertical alignment”</td>
<td>Vertical alignment of the text within the element.</td>
</tr>
</tbody>
</table>

| “Text format”          | Definition for displaying texts that are too long  
|                        | ● “Default”: The long text is truncated.  
|                        | ● “Line break”: The text is split into parts.  
|                        | ● “Ellipsis”: The visible text ends with “...” indicating that it is not complete.  

| “Font”                 | Example: “Default”  
|                        | : The “Font” dialog box opens.  
|                        | : Drop-down list with style fonts.  

| “Font color”           | Example: “Black”  
|                        | : The “Color” dialog box opens.  
|                        | : Drop-down list with style colors.  

| “Transparency”         | Whole number (value range from 0 to 255). This determines the transparency of the respective color.  
|                        | Example: 255: The color is opaque.  
|                        | 0: The color is completely transparent.  
|                        | Please note: If the color is a style color and already has a transparency value, then this property is write-protected.  

Element property 'Absolute movement'  
The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

| “Movement”             |  
|                       |  
| “X”                   | Variable (numeric data type). Defines the X position (in pixels).  
|                        | Example: PLC_PRG.iPos_X.  
|                        | Increasing this value in runtime mode moves the element to the right.  
| “Y”                   | Variable (numeric data type). Defines the Y position (in pixels).  
|                        | Example: PLC_PRG.iPos_Y.  
|                        | Increasing this value in runtime mode moves the element downwards.  

### "Rotation"

Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle1.

The midpoint of the element rotates at the "Center" point. This rotation point is shown as the symbol.

In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

### "Interior rotation"

Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in "Center" according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol.

Note: If a static angle of rotation is specified in the "Position Angle" property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

---

You can link the variables to a unit conversion.

The "X", "Y", "Rotation", and "Interior rotation" properties are supported by the "Client Animation" functionality.

---

**Element property 'State variables'**

The variables control the element behavior dynamically.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Invisible&quot;</td>
<td>Variable (BOOL). Toggles the visibility of the element. TRUE: The element is not visible at runtime.</td>
</tr>
<tr>
<td>&quot;Deactivate inputs&quot;</td>
<td>Variable (BOOL). Toggles the operability of the element. TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated.</td>
</tr>
</tbody>
</table>
The “Invisible” property is supported by the “Client Animation” functionality.

Visualization element 'Alarm table'

Symbol:

Tag: “Alarm manager”

The element displays alarms in a list. In the element properties, you specify which information is shown. You define the appearance of the element and the variables that control the element behavior.

In online mode, you can sort an alarm table by a specific column – even in the classic view. Click into the column header. A small triangle indicates the current sort order (ascending, descending). Clicking the symbol reverses the order.

Sorting inside the column depends on the type of the contained information. The "Priority" column is sorted numerically, and the "Message" and "Class" columns alphabetically. The "Value" and "Latch" columns may contain different value types. In this case, sorting is first by type (blank, Boolean, numeric value, character string) and then either numerically or alphabetically depending on the type.

Element properties

<table>
<thead>

See also

- **Object 'Data source'**
## “Alarm groups”
Opens the “Select Alarm Group” dialog where you define the alarm groups that you want to display.

## “Priority from”
Lowest priority for alarm display. (0 to 255).

## “Priority to”
Highest priority for alarm display. (0 to 255).

## “Alarm classes”
Opens the “Select Class Group” dialog where you define the alarm classes that you want to display.

## “Filter criterion”
For the alarm banner element only
- **“Most important”**: The alarm with the highest priority (lowest value) is displayed.
- **“Newest”**: The most recent alarm is displayed.

## “Filter by latch 1”
The generated alarms (previous and current) can be filtered by the contents of “Latch variable 1”, which is specified in the configuration of the alarm group. In “Filter type”, you define whether or not the filtering is performed by a string value or a numerical value.

- **“Filter variable”**: Indicates what the alarms are filtered by. Possible entries: Application variable of data type STRING or WSTRING, or a literal value directly. Examples: `PLC_PRG.strFilterVariable`, `'STRING'`.
- **“Filter type”**: Integer value that determines by which criteria the latch variable value is used for filtering. Possible entries: Numerical variable from the application (example: `PLC_PRG.diFilterType`), or a value directly (example: 2).

Possible values:
- 0: No filtering
- 1: Filter by alarms whose latch variable 1 contains the string specified in “Filter variable”. Example: The filter variable contains ‘Error 1’ which is the latch variable 1 of different alarms of type STRING and has the value 'Error 1' ->. Only these alarms are displayed.
- 2: Filter by alarms whose latch variable 1 contains the typed literal specified in “Filter variable” according to IEC 61131-3. Examples: `T#1h2s`, `DINT#15`, `REAL#1.5`, `FALSE`
- 3: Filter by alarms whose latch variable 1 contains the LINT literal value specified in “Filter variable”. Therefore, the value of the latch variables has to be in the range of 9,223,372,036,854,775,808 to 9,223,372,036,854,775,807.
- All other values: The behavior is not defined and can change in the future.

### Element property ‘General table configuration’

- **“Show row header”**: Display of the row number at the beginning of the row.
- **“Show column header”**: Display of the column heading as defined in “Column heading”.
- **“Row height”**: Height of the table rows (in pixels).
- **“Row header width”**: Width of the line header (in pixels).
Scrollbar size

Width of the scrollbar when it runs vertically. Width of the scrollbar when it runs horizontally. Specified in pixels.

Automatic line break for alarm message

☑️ The message text is truncated at the end of the line.
☐☐ The message text is truncated at the end of the column, if the text is too long.

Element property 'Columns: Column [<>]'

By default, columns [0] and [1] are configured: “Time stamp” and “Message text”. You can create more columns by clicking the “Create new”, and remove columns by clicking “Delete”.

Animations (dynamic text, font variables), text, and tooltip are not supported.

Column header

The standard header is set and changed here by specifying a new text.

Use text alignment in title

☑️ The text in the column header is aligned according to the current definition in “Text alignment”.
☐☐ The text in the column header is centered.

Width

Width of the column (in pixels).

Data type

Notice about time stamps: For use in a TargetVisu or WebVisu, you can control the date and time format with the help of the global string variables from the library Alarmmanager.library:AlarmGlobals.g_sDateFormat (example: AlarmGlobals.g_sDateFormat := 'MM.yyyy') and AlarmGlobals.g_sTimeFormat (example: AlarmGlobals.g_sTimeFormat := 'HH:mm').

Define the information to be displayed in the column.

- “Symbol”
- “Time stamp”: Date and time of the last status change of the alarm.
- “Time stamp active”: Date and time of the last activation of the alarm.
- “Time stamp inactive”: Date and time of the last deactivation of the alarm.
- “Time stamp acknowledge”: Date and time of the last acknowledgment.
- “Value”: Current value of the printout
- “Message text”: Output of the message text
- “Priority”: Alarm priority
- “Class”: Alarm class
- “State”: Alarm state
- “Latch Variable <n>”: Value of the selected latch variables

Text alignment

Alignment of the text in this column

- “Left”
- “Centered”
- “Right”

Color settings

- “Activate color settings”: Boolean variable for activating and deactivating the color settings defined here. Example: PLC_PRG.bColorSettings
- “Cell fill color”:
  - “Color variable”: Variable for the cell fill color, example: dwCellColor (hexadecimal color definition: 16#TTTRGGGBB)
  - “Use color also for column header”: ☑️ The color defined via “Color variable” is used in the column header as well.
- “Text color”:
  - “Color variable”: Variable for the definition of the text color in the column, example: dwTextColor (hexadecimal color definition: 16#TTTRGGGBB)
  - “Use color also for column header”: ☐☐ The color defined via “Color variable” is used in the column header as well.

See also

- ☸ Chapter 1.3.5.8.3 “Animating a color display” on page 1152
The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

### Element property 'Position'

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;X&quot;</td>
<td>X coordinate of the upper left corner of the element</td>
<td>10</td>
</tr>
<tr>
<td>&quot;Y&quot;</td>
<td>Y coordinate of the upper left corner of the element</td>
<td>10</td>
</tr>
<tr>
<td>&quot;Width&quot;</td>
<td>Specified in pixels.</td>
<td>150</td>
</tr>
<tr>
<td>&quot;Height&quot;</td>
<td>Specified in pixels.</td>
<td>30</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the box symbols ( realloc ) to other positions in the editor.

See also
- " Chapter 1.3.5.2 “Positioning elements, adapting size and layer” on page 1113

### Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;X&quot;</td>
<td>X-coordinate of the point of rotation</td>
</tr>
<tr>
<td>&quot;Y&quot;</td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the symbols ( realloc ) to other positions in the editor.

### Element property 'Text properties'

The properties contain fixed values for the text properties.
### “Font”
Example: “Default”
- The “Font” dialog box opens.
- Drop-down list with style fonts.

### “Font color”
Example: “Black”
- The “Color” dialog box opens.
- Drop-down list with style colors.

### “Transparency”
Whole number (value range from 0 to 255). This determines the transparency of the respective color.
- Example: 255: The color is opaque.
- 0: The color is completely transparent.
Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

### Element property ‘Selection’

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Background color on selection”</td>
<td>Fill color of the selected row.</td>
</tr>
<tr>
<td>“Selection font color”</td>
<td>Font color of the selected row.</td>
</tr>
<tr>
<td>“Frame around selected cells”</td>
<td>A frame is drawn around the selected cells at runtime.</td>
</tr>
<tr>
<td>“Variable for selected alarm group”</td>
<td>Name of the affected alarm group; type: STRING, WSTRING.</td>
</tr>
<tr>
<td>“Variable for selected alarm ID”</td>
<td>Alarm ID of the affected alarm group; type: STRING, WSTRING.</td>
</tr>
<tr>
<td>“Variable for selected line”</td>
<td>Index of the selected alarm line (0-based). The index can be read and written; integer data type</td>
</tr>
<tr>
<td>“Variable for valid selection”</td>
<td>TRUE: An alarm line is selected. FALSE: The selection is invalid. For example, for an empty alarm table or when an alarm is not selected yet.</td>
</tr>
</tbody>
</table>

### Element property ‘Control variables’

Boolean variables are defined here for executing specific actions in the table can be executed at runtime.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Acknowledge selected”</td>
<td>Variable (BOOL)</td>
</tr>
<tr>
<td>Example: PLC_PRG.bAckSelectedAlarms</td>
<td>If the assigned variable is TRUE, then the selected alarm is acknowledged.</td>
</tr>
<tr>
<td>“Acknowledge all visible”</td>
<td>Variable (BOOL)</td>
</tr>
<tr>
<td>Example: PLC_PRG.bAckVisibleAlarms</td>
<td>If the assigned variable is TRUE, then all alarms are acknowledged that are visible in the alarm table.</td>
</tr>
<tr>
<td>“History”</td>
<td>Variable (BOOL)</td>
</tr>
<tr>
<td>Example: PLC_PRG.bShowHistory</td>
<td>If the assigned variable is TRUE, then the history alarms are displayed in addition to the active alarms. In the classic view, the same sort options apply as in normal mode. Note: Acknowledgment is not possible in this view.</td>
</tr>
</tbody>
</table>
### “Freeze scroll position”

Variable (BOOL)

**Example:** PLC_PRG.bFreezeScrollPosition

If the assigned variable is TRUE, then the scroll position set in the “History” view is retained, even if a new alarm is active. If not, then the scroll position jumps to the first table row (the newest alarm).

### “Count alarms”

Variable (integer data type)

**Example:** PLC_PRG.iNumberOfAlarms.

Number of alarms that are currently displayed in the alarm table. Defined by the alarm table.

### “Count visible rows”

Variable (integer data type)

**Example:** PLC_PRG.iNumberVisibleLines

Number of alarms that can be displayed on one page of the alarm table. Defined by the alarm table.

### “Current scroll index”

Variable (integer data type)

**Example:** PLC_PRG.iScrollIndex

The index of the first visible row if the alarm table (0-based). The variable can be read and written.

### “Current column sorting”

Variable (integer data type)

**Example:** PLC_PRG.iColSort

The variable contains a value of the enumeration "VisuElemsAlarm.VisuEnumAlarmDataType". This value determines the column that sorts the alarm table.

### “Variable for sorting direction”

Variable (BOOL)

**Example:** PLC_PRG.xSortAscending

The variable determines the sort order for the entries in the alarm table (TRUE: ascending; FALSE: descending).

---

You can also use the “Insert elements for acknowledging alarms” command to define buttons with predefined control variables.

See also

- ☞ Chapter 1.3.5.19.2.23 “Command ‘Add Elements for Alarm Acknowledgement’” on page 1582

---

### Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

<table>
<thead>
<tr>
<th>“Movement”</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“X”</strong></td>
</tr>
<tr>
<td>Variable (numeric data type). Defines the X position (in pixels).</td>
</tr>
<tr>
<td><strong>Example:</strong> PLC_PRG.iPos_X.</td>
</tr>
<tr>
<td>Increasing this value in runtime mode moves the element to the right.</td>
</tr>
<tr>
<td><strong>“Y”</strong></td>
</tr>
<tr>
<td>Variable (numeric data type). Defines the Y position (in pixels).</td>
</tr>
<tr>
<td><strong>Example:</strong> PLC_PRG.iPos_Y.</td>
</tr>
<tr>
<td>Increasing this value in runtime mode moves the element downwards.</td>
</tr>
</tbody>
</table>
### “Rotation”
Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle1.

The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.

In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

![Diagram of rotation](image)

### “Interior rotation”
Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol.

**Note:** If a static angle of rotation is specified in the “Position Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

![Diagram of interior rotation](image)

You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.

**See also**
- Unit conversion

### Element property ‘State variables’
The variables control the element behavior dynamically.

<table>
<thead>
<tr>
<th>“Invisible”</th>
<th>Variable (BOOL). Toggles the visibility of the element.</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRUE: The element is not visible at runtime.</td>
<td></td>
</tr>
</tbody>
</table>

The “Invisible” property is supported by the “Client Animation” functionality.
See also

These properties are available only when you select the “Preview: Support client animations and overlay of native elements” option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.

<table>
<thead>
<tr>
<th>“Animation duration”</th>
<th>Time that the element executes an animation (in milliseconds)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Example: 500</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Move to the foreground”</th>
<th>Property value (BOOL)</th>

Visualization element ‘Alarm banner’

Symbol:

Tag: “Alarm manager”

The element is a simplified version of the alarm table. It visualizes a single alarm only. In the element properties, you specify which information is shown. You define the appearance of the element and the variables that control the element behavior.
The alarm banner displays active alarms only. If the alarm is acknowledged, then it disappears from the alarm banner.

### Element properties

<table>
<thead>
<tr>
<th><strong>“Element name”</strong></th>
<th><strong>Example:</strong> GenElemInst_1</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Type of element”</strong></td>
<td><strong>“Alarm banner”</strong></td>
</tr>
<tr>
<td><strong>“Data source”</strong></td>
<td>If you intend to use a remote alarm configuration, then you have to specify the name of the remote application here. If you do not specify anything, the alarm configuration will be located locally.</td>
</tr>
</tbody>
</table>

### Element property ‘Alarm configuration’

<table>
<thead>
<tr>
<th><strong>“Alarm groups”</strong></th>
<th>Opens the “Select Alarm Group” dialog where you define the alarm groups that you want to display.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Priority from”</strong></td>
<td>Lowest priority for alarm display. (0 to 255).</td>
</tr>
<tr>
<td><strong>“Priority to”</strong></td>
<td>Highest priority for alarm display. (0 to 255).</td>
</tr>
<tr>
<td><strong>“Alarm classes”</strong></td>
<td>Opens the “Select Class Group” dialog where you define the alarm classes that you want to display.</td>
</tr>
</tbody>
</table>
### “Filter criterion”

For the alarm banner element only

- **“Most important”**: The alarm with the highest priority (lowest value) is displayed.
- **“Newest”**: The most recent alarm is displayed.

### “Filter by latch 1”

The generated alarms (previous and current) can be filtered by the contents of “Latch variable 1”, which is specified in the configuration of the alarm group. In “Filter type”, you define whether or not the filtering is performed by a string value or a numerical value.

- **“Filter variable”**: Indicates what the alarms are filtered by. Possible entries: Application variable of data type STRING or WSTRING, or a literal value directly. Examples: PLC_PRG.strFilterVariable, 'STRING'.
- **“Filter type”**: Integer value that determines by which criteria the latch variable value is used for filtering. Possible entries: Numerical variable from the application (example: PLC_PRG.diFilterType, or a value directly (example: 2).

Possible values:
- 0: No filtering
- 1: Filter by alarms whose latch variable 1 contains the string specified in “Filter variable”. Example: The filter variable contains ‘Error 1’ which is the latch variable 1 of different alarms of type STRING and has the value ‘Error 1’ ->. Only these alarms are displayed.
- 2: Filter by alarms whose latch variable 1 contains the typed literal specified in “Filter variable” according to IEC 61131-3. Examples: T#1h2s, DINT#15, REAL#1.5, FALSE
- 3: Filter by alarms whose latch variable 1 contains the LINT literal value specified in “Filter variable”. Therefore, the value of the latch variables has to be in the range of 9,223,372,036,854,775,808 to 9,223,372,036,854,775,807.
- All other values: The behavior is not defined and can change in the future.

<td>&quot;Every N second&quot;</td>
<td>Time period until the next switching. Available only if &quot;Automatic switch&quot; is selected.</td>
</tr>
<tr>
<td>&quot;Next alarm&quot;</td>
<td>Variable for switching to the next alarm. Available only if &quot;Automatic switch&quot; is not selected.</td>
</tr>
<tr>
<td>&quot;Previous alarm&quot;</td>
<td>Variable for switching to the previous alarm. Available only if &quot;Automatic switch&quot; is not selected.</td>
</tr>
<tr>
<td>&quot;Multiple alarms active&quot;</td>
<td>Variable that has the value TRUE if multiple alarms are active.</td>
</tr>
</tbody>
</table>

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

| Element property 'Absolute movement' | The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved. |
**“Movement”**

| **“X”** | Variable (numeric data type). Defines the X position (in pixels).  
Example: PLC_PRG.iPos_X.  
Increasing this value in runtime mode moves the element to the right. |
| **“Y”** | Variable (numeric data type). Defines the Y position (in pixels).  
Example: PLC_PRG.iPos_Y.  
Increasing this value in runtime mode moves the element downwards. |
| **“Rotation”** | Variable (numeric data type). Defines the angle of rotation (in degrees).  
Example: PLC_PRG.iAngle1.  
The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.  
In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right. |
| **“Interior rotation”** | Variable (numeric data type). Defines the angle of rotation (in degrees).  
Example: PLC_PRG.iAngle2.  
In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.  
The rotation point is shown as the symbol.  
Note: If a static angle of rotation is specified in the “Position ➔ Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed. |

---

You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.

- [Unit conversion](#)
Element property 'State variables'

The variables control the element behavior dynamically.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Invisible&quot;</td>
<td>Variable (BOOL). Toggles the visibility of the element. TRUE: The element is not visible at runtime.</td>
</tr>
</tbody>
</table>

The "Invisible" property is supported by the "Client Animation" functionality.

See also

These properties are available only when you select the “Preview: Support client animations and overlay of native elements” option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Animation duration&quot;</td>
<td>Time that the element executes an animation (in milliseconds) Example: 500</td>
</tr>
<tr>
<td>&quot;Move to the foreground&quot;</td>
<td>Property value (BOOL) TRUE: At runtime, the element is displayed in the foreground. FALSE: At runtime, the element is displayed in the layer where it was inserted in the visualization editor.</td>
</tr>
</tbody>
</table>

Element property ‘Position’
The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.
### Element property 'Background'

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Background color”</strong></td>
<td>Drop-down list with background colors</td>
</tr>
<tr>
<td></td>
<td>Note: This property depends on the style. For example, there are no heterochromatic background images for “FlatStyle” and “Whitestyle”.</td>
</tr>
<tr>
<td><strong>“Own image”</strong></td>
<td>• “image”: Image ID of the background image. You select the background image from an image pool by clicking the symbol. Info: If you specify the “&lt;default&gt;” value or select the image from the “Default” category in the input assistant, then the original element background image is used.</td>
</tr>
<tr>
<td></td>
<td>• “Transparent color”: Color of pixels that are displayed as transparent. Selection from drop-down list or input assistant.</td>
</tr>
<tr>
<td><strong>“Optimized drawing”</strong></td>
<td>✔️: The background image is drawn one time. If there is a change in the foreground, then only the affected part of the image is redrawn.</td>
</tr>
<tr>
<td></td>
<td>☐: The background image is redrawn in cycles. Note: Deactivating this option is sensible only in certain exceptional cases.</td>
</tr>
</tbody>
</table>

### Element property 'Bar'

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Diagram type”</strong></td>
<td>Position of the scale</td>
</tr>
<tr>
<td></td>
<td>• “Scale besides bar”</td>
</tr>
<tr>
<td></td>
<td>• “Scale in bar”</td>
</tr>
<tr>
<td></td>
<td>• “Bar in scale”</td>
</tr>
<tr>
<td></td>
<td>• “No scale”</td>
</tr>
<tr>
<td><strong>“Orientation”</strong></td>
<td>Orientation depending on the ratio of width to height of the bar display:</td>
</tr>
<tr>
<td></td>
<td>• “Horizontal”</td>
</tr>
<tr>
<td></td>
<td>• “Vertical”</td>
</tr>
</tbody>
</table>
"Running direction" | Direction the values are increased.  
| Drop-down list for "Orientation Horizontal":  
| ● "Left to right"  
| ● "Right to left"  
| Drop-down list for "Orientation Vertical":  
| ● "Bottom to top"  
| ● "Top to bottom"

"Optimum size for bar" | ✓ The bar width requires the majority of the element surface.  
| Note: This property depends on the style. It is not provided for "FlatStyle" or "WhiteStyle".

### Element property 'Scale'

| "Scale start" | Least value of the scale and the lower limit of the value range for the element.  
| Example: 0  
| Note: The property “Variable” is shown below.

| "Variable" | Variable (integer data type). Contains the scale start.  
| Example: PLC_PRG.iScaleStart  
| Declaration:  
| PROGRAM PLC_PRG  
| VAR   
| iScaleStart : INT := 0;  
| END_VAR

| "Scale end" | Greatest value of the scale and the upper limit of the value range for the element.  
| Example: 100  
| Note: The property “Variable” is shown below.

| "Variable" | Variable (integer data type). Contains the scale end.  
| Example: PLC_PRG.iScaleEnd  
| Declaration:  
| PROGRAM PLC_PRG  
| VAR   
| iScaleEnd : INT := 120;  
| END_VAR

| "Main scale" | Distance between 2 values on the rough scale.  
| Example: 10  
| Note: The property “Variable” is shown below.

| "Variable" | Variable (integer data type). Contains the distance.  
| Example: PLC_PRG.iMainScale  
| Declaration:  
| PROGRAM PLC_PRG  
| VAR   
| iMainScale : INT := 20;  
| END_VAR
### "Subscale"

Distance between 2 values on the fine scale.
You can hide the fine scale by setting the value to 0.

**Example:** 2

*: The property "Variable" is shown below.

### "Variable"

Variable (integer data type). Contains the spacing.

**Example:** PLC_PRG.iSubScale

**Declaration:**

```plaintext
PROGRAM PLC_PRG
VAR
  iSubScale : INT := 5;
END_VAR
```

### "Scale line width"

Specified in pixels.

**Example:** 3

### "Scale color"

Color of scale lines

- ★★★: The "Color" dialog box opens.
- ▼▼▼: A drop-down list with color names opens.

### "Scale in 3D"

* ✓: Tick marks are displayed with slight 3D shadowing.
  Note: This property depends on the style. Not available for "FlatStyle".

### "Element frame"

* ✓: A frame is drawn around the element.

---

#### Element property 'Label'

### "Unit"

Text that is displayed in the element.

**Example:** Units displayed in m/s.

### "Font"

Font for labels (example: scale numbering).

Selection from the drop-down list or by clicking the "" button.

### "Scale format (C Syntax)"

Values scaled in "printf" syntax

**Examples:** %d, %5.2f

### "Max. text width of labels"

(optional) Value that redefines the maximum width of the scale label. The correct value is normally set automatically.

**Note:** Change this value only if the automatic adjustment does not yield the expected result.

### "Text height of labels"

(optional) Value that redefines the maximum height of the scale label. The correct value is normally set automatically.

**Note:** Change this value only if the automatic adjustment does not yield the expected result.

### "Font color"

Selection from the drop-down list or by clicking the "" button.

### Element property 'Absolute movement'###

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
### Movement

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Example</th>
<th>Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>X</strong></td>
<td>Variable (numeric data type). Defines the X position (in pixels).</td>
<td>PLC_PRG.iPos_X</td>
<td>Increasing this value in runtime mode moves the element to the right.</td>
</tr>
<tr>
<td><strong>Y</strong></td>
<td>Variable (numeric data type). Defines the Y position (in pixels).</td>
<td>PLC_PRG.iPos_Y</td>
<td>Increasing this value in runtime mode moves the element downwards.</td>
</tr>
<tr>
<td><strong>Rotation</strong></td>
<td>Variable (numeric data type). Defines the angle of rotation (in degrees).</td>
<td>PLC_PRG.iAngle1</td>
<td>The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.</td>
</tr>
<tr>
<td><strong>Interior rotation</strong></td>
<td>Variable (numeric data type). Defines the angle of rotation (in degrees).</td>
<td>PLC_PRG.iAngle2</td>
<td>In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the symbol. Note: If a static angle of rotation is specified in the “Position ➔ Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.</td>
</tr>
</tbody>
</table>

You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.

See also
- Unit conversion
The variables control the element behavior dynamically.

| "Deactivate inputs" | Variable (BOOL). Toggles the operability of the element. TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated. |

Element property 'Access rights'

Requirement: User management is set up for the visualization.

| "Access rights" | Opens the "Access rights" dialog. There you can edit the access privileges for the element. Status messages: ● "Not set. Full rights.": Access rights for all user groups: "operable" ● "Rights are set: Limited rights": Access is restricted for at least one group. |

Visualization element 'Meter 90°'

Symbol:

Tag: “Measurement controls”

The element displays the value of a variable. The needle is positioned according to the value of the assigned variable. A meter is used to represent a tachometer, for example.

Element properties

| "Element name" | Example: GenElemInst_1 |
| "Type of element" | "Meter 90°" |
| "Value" | Variable (numeric data type) The variable value determines the pointer movement of the element. |

These properties are available only when you select the “Preview: Support client animations and overlay of native elements” option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.
<table>
<thead>
<tr>
<th><strong>“Animation duration”</strong></th>

<tr>
<td>Example:</td>
<td>%d, %5.2f</td>
</tr>
</tbody>
</table>
**Max. text width of labels**  
(optional) Value that redefines the maximum width of the scale label. The correct value is normally set automatically.  
Note: Change this value only if the automatic adjustment does not yield the expected result.

**Text height of labels**  
(optional) Value that redefines the maximum height of the scale label. The correct value is normally set automatically.  
Note: Change this value only if the automatic adjustment does not yield the expected result.

**Font color**  
Selection from the drop-down list or by clicking the button.

---

### Element property ‘Positioning’

| Usage of          | "Preset style values": Values from the current style  
| "User-defined settings": The subnode “Positioning” appears. |

**Positioning**  
Requirement: “User-defined settings” is selected as “Usage of”.  
The displayed positioning settings depend on the type of needle instrument and potentiometer, and partially on whether a custom background image is selected. The following settings are used for achieving the exact position relative to the background image.

| Needle movement | Length of the needle (in pixels) |
| Scale movement  | Distance from the tick marks to the center (in pixels)  
| Requirement: A customer image is selected as “Background”. |
| Scale length    | Length of the tick marks (in pixels)  
| Requirement: A customer image is selected as “Background”. |
| Label offset    | Distance from the labels to the tick marks (in pixels) |
| Unit offset     | Distance of the unit text “Label ➔ Unit” from the upper scale edge (in pixels) |
| Origin offset   | Offset of the element (in pixels)  
| Requirement: For the elements “Meter 180°” and “Meter 90°”, this property is displayed only if a custom image is selected as “Background”. |

---

### Element property ‘Colors’

| Durable color areas | □: All color areas are visible, regardless of the current value.  
| ▮: Only the color area is visible that includes the current value. |

| Use colors for scale | ▮: Colors in the color area are used only for the scale and frame. |

| Create new | A new color area is added to the “Elements” view. |

| Delete | The color area is removed from the list and the list is refreshed. |

| Begin of area | Start value of the color area  
<p>| Example: 20 | ▮: The property “Variable” is shown below. |</p>
<table>
<thead>
<tr>
<th><strong>“Variable”</strong></th>
<th>Variable (integer data type). Contains the start value. Example: PLC_PRG.iColorAreaStart0</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Declaration</strong></td>
<td>PROGRAM PLC_PRG&lt;br&gt;VAR&lt;br&gt;   icolorAreaStart0 : INT := 80; END_VAR</td>
</tr>
<tr>
<td><strong>“End of area”</strong></td>
<td>End value of the color area Example: 120</td>
</tr>
<tr>
<td><strong>Variable</strong></td>
<td>Variable (integer data type). Contains the end value. Example: iColorAreaEnd0</td>
</tr>
<tr>
<td><strong>Declaration</strong></td>
<td>PROGRAM PLC_PRG&lt;br&gt;VAR&lt;br&gt;   icolorAreaEnd0 : INT := 100; END_VAR</td>
</tr>
<tr>
<td><strong>“Color”</strong></td>
<td>Color that is used for displaying the area.</td>
</tr>
</tbody>
</table>

**Element property 'Absolute movement'**

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

<table>
<thead>
<tr>
<th><strong>“Movement”</strong></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“X”</strong></td>
<td>Variable (numeric data type). Defines the X position (in pixels). Example: PLC_PRG.iPos_X. Increasing this value in runtime mode moves the element to the right.</td>
</tr>
<tr>
<td><strong>“Y”</strong></td>
<td>Variable (numeric data type). Defines the Y position (in pixels). Example: PLC_PRG.iPos_Y. Increasing this value in runtime mode moves the element downwards.</td>
</tr>
<tr>
<td><strong>“Rotation”</strong></td>
<td>Variable (numeric data type). Defines the angle of rotation (in degrees). Example: PLC_PRG.iAngle1. The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.</td>
</tr>
</tbody>
</table>
“Interior rotation” Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol.

Note: If a static angle of rotation is specified in the “Position ➔ Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

---

You can link the variables to a unit conversion.

---

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

See also
- Unit conversion

---

**Element property 'Access rights'**

Requirement: User management is set up for the visualization.

“Access rights” Opens the “Access rights” dialog. There you can edit the access privileges for the element.

Status messages:
- “Not set. Full rights.”: Access rights for all user groups: “operable”
- “Rights are set: Limited rights”: Access is restricted for at least one group.

See also
- § Chapter 1.3.5.19.3.1 “Dialog 'Access Rights'” on page 1583

---

**Visualization element 'Meter 180°’**

Symbol:

Tag: “Measurement controls”
The element displays the value of a variable. The needle is positioned according to the value of the assigned variable on a scale. A meter is used to represent a tachometer, for example.

### Element properties

<table>
<thead>
<tr>
<th>“Element name”</th>
<th>Example: GenElemInst_1</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Type of element”</td>
<td>“Meter 180°”</td>
</tr>
</tbody>
</table>
| “Value” | Variable (numeric data type)  
The variable value determines the pointer movement of the element. |

### Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

| “X” | X-coordinate of the point of rotation |
| “Y” | Y-coordinate of the point of rotation |

You can also change the values by dragging the symbols to other positions in the editor.

These properties are available only when you select the “Preview: Support client animations and overlay of native elements” option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.

| “Animation duration” | Time that the element executes an animation (in milliseconds)  
Example: 500 |
| “Move to the foreground” | Property value (BOOL)  
TRUE: At runtime, the element is displayed in the foreground.  
FALSE: At runtime, the element is displayed in the layer where it was inserted in the visualization editor. |

See also

- ☞ Chapter 1.3.5.21.5 “Using client animation” on page 1962

### Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.
“X”   
X coordinate of the upper left corner of the element
Specified in pixels.
Example: 10.

“Y”   
Y coordinate of the upper left corner of the element
Specified in pixels.
Example: 10.

“Width”   
Specified in pixels.
Example: 150

“Height”   
Specified in pixels.
Example: 30

You can also change the values by dragging the box symbols ( Freel) to other positions in the editor.

See also
●  § Chapter 1.3.5.3.2 “Positioning elements, adapting size and layer” on page 1113

Element property ‘Background’

“Image color”   
List box containing background colors

“Own image”   
●  “Image”: ID of the background image.
    You select the background image from an image pool by clicking .
    Info: If you specify the value “<default>” or select the image from the “Default” category in the Input Assistant, then the original element background image is used.

●  “Transparency color”: Selection from list box or Input Assistant.

Element property ‘Arrow’

“Hand style”   
Drop-down list with different arrow types

“Color”   
●  ▼: The “Color” dialog box opens.
●  ▼: Drop-down list with color names

“Angle range”   
Drop-down list for the alignment of the element

“Additional arrow”   
☑: An additional arrow is shown inside the scale.

Element property ‘Scale’
| **Sub scale position** | ● **Outside**: The subscale is displayed on the outer scale ring. ("Frame outside")
  ● **Inside**: The subscale is displayed on the inner scale ring. ("Frame inside") |
<table>

|                        | VAR
|                        | iScaleEnd : INT := 120;                                                                                                          |
|                        | ```                                                                                                                             |
| **Main scale**         | Distance between two values on the main scale                                                                                   |
|                        | Example: 10.  
  🌟: The "Variable" property is shown below.                                                                                     |
| **Variable**           | Variable (integer data type) Contains the distance between two values on the main scale                                         |
|                        | Example: PLC_PRG.iMainScale                                                                                                      |
|                        | Declaration:                                                                                                                     |
|                        | ```                                                                                                                             |
|                        | PROGRAM PLC_PRG
|                        | VAR
|                        | iMainScale : INT := 20;                                                                                                          |
|                        | ```                                                                                                                             |
| **Sub scale**          | Distance between two values on the fine scale                                                                                   |
|                        | You can hide the fine scale by setting the value to 0.                                                                             |
|                        | Example: 2.  
  🌟: The "Variable" property is shown below this.                                                                                     |
| **“Variable”** | Variable (integer data type) Contains the distance between two values on the fine scale  
Example: PLC_PRG.iSubScale  
Declaration:  
PROGRAM PLC_PRG  
VAR  
iSubScale : INT := 5;  
END_VAR |
|---|---|
| **“Scale line width”** | Specified in pixels  
Example: 3 |
| **“Scale color”** | Color of scale lines  
- [ ]: The “Color” dialog opens.  
- ▼: A list box with style colors opens. |
| **“Scale in 3D”** | [ ]: Scale lines are displayed with soft 3D shadowing.  
Note: This property is not displayed in “FlatStyle”. |
| **“Show scale”** | [ ]: The scale is displayed. |
| **“Frame inside”** | [ ]: A frame is drawn at the inner end of the scale. |
| **“Frame outside”** | [ ]: A frame is drawn at the outer end of the scale. |

**Element property 'Label'**

| **“Label”** | Selection list  
- “Outside”: Scale values are placed outside of the scale.  
- “Inside”: Scale values are placed inside of the scale. |
| **“Unit”** | Text that is displayed in the element.  
Example: Units displayed in m/s. |
| **“Font”** | Font for labels (example: scale numbering).  
Selection from the drop-down list or by clicking the “” button. |
| **“Scale format (C Syntax)”** | Values scaled in “printf” syntax  
Examples: %d, %5.2f |
| **“Max. text width of labels”** | (optional) Value that redefines the maximum width of the scale label. The correct value is normally set automatically.  
Note: Change this value only if the automatic adjustment does not yield the expected result. |
| **“Text height of labels”** | (optional) Value that redefines the maximum height of the scale label. The correct value is normally set automatically.  
Note: Change this value only if the automatic adjustment does not yield the expected result. |
| **“Font color”** | Selection from the drop-down list or by clicking the “” button. |
“Usage of”
- “Preset style values”: Values from the current style
- “User-defined settings”: The subnode “Positioning” appears.

“Positioning”
Requirement: “User-defined settings” is selected as “Usage of”.

The displayed positioning settings depend on the type of needle instrument and potentiometer, and partially on whether a custom background image is selected. The following settings are used for achieving the exact position relative to the background image.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Needle movement”</td>
<td>Length of the needle (in pixels)</td>
</tr>
<tr>
<td>“Scale movement”</td>
<td>Distance from the tick marks to the center (in pixels)</td>
</tr>
<tr>
<td>Requirement: A customer image is selected as “Background”.</td>
<td></td>
</tr>
<tr>
<td>“Scale length”</td>
<td>Length of the tick marks (in pixels)</td>
</tr>
<tr>
<td>Requirement: A customer image is selected as “Background”.</td>
<td></td>
</tr>
<tr>
<td>“Label offset”</td>
<td>Distance from the labels to the tick marks (in pixels)</td>
</tr>
<tr>
<td>“Unit offset”</td>
<td>Distance of the unit text “Label ➔ Unit” from the upper scale edge (in pixels)</td>
</tr>
<tr>
<td>“Origin offset”</td>
<td>Offset of the element (in pixels)</td>
</tr>
<tr>
<td>Requirement: For the elements “Meter 180°” and “Meter 90°”, this property is displayed only if a custom image is selected as “Background”.</td>
<td></td>
</tr>
</tbody>
</table>

“Color areas”

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Durable color areas”</td>
<td>☐: All color areas are visible, regardless of the current value.</td>
</tr>
<tr>
<td></td>
<td>☑: Only the color area is visible that includes the current value.</td>
</tr>
<tr>
<td>“Use colors for scale”</td>
<td>☑: Colors in the color area are used only for the scale and frame.</td>
</tr>
</tbody>
</table>

“Color areas”

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Create new”</td>
<td>A new color area is added to the “Elements” view.</td>
</tr>
<tr>
<td>“Delete”</td>
<td>The color area is removed from the list and the list is refreshed.</td>
</tr>
</tbody>
</table>

“Begin of area”
Start value of the color area
Example: 20

嵎: The property “Variable” is shown below.

“Variable”
Variable (integer data type). Contains the start value.
Example: PLC_PRG.iColorAreaStart0

Declaration:

```plaintext
PROGRAM PLC_PRG
VAR
   iColorAreaStart0 : INT := 80;
END_VAR
```

“End of area”
End value of the color area
Example: 120

嵎: The property “Variable” is shown below.
### Variable

Variable (integer data type). Contains the end value.

**Example:** iColorAreaEnd0

**Declaration:**

```plaintext
PROGRAM PLC_PRG
VAR
  iColorAreaEnd0 : INT := 100;
END_VAR
```

### Color

Color that is used for displaying the area.

**Element property 'Absolute movement'**

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

### Movement

#### X

Variable (numeric data type). Defines the X position (in pixels).

**Example:** PLC_PRG.iPos_X.

Increasing this value in runtime mode moves the element to the right.

#### Y

Variable (numeric data type). Defines the Y position (in pixels).

**Example:** PLC_PRG.iPos_Y.

Increasing this value in runtime mode moves the element downwards.

#### Rotation

Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle1.

The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.

In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

#### Interior rotation

Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol.

Note: If a static angle of rotation is specified in the “Position Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.
You can link the variables to a unit conversion.

The "X", "Y", "Rotation", and "Interior rotation" properties are supported by the "Client Animation" functionality.

See also
- Unit conversion
- ...

**Element property 'State variables'**

The variables control the element behavior dynamically.

| "Invisible" | Variable (BOOL). Toggles the visibility of the element. 
| TRUE: The element is not visible at runtime. |

The "Invisible" property is supported by the "Client Animation" functionality.

See also
- ...

**Element property 'Access rights'**

Requirement: User management is set up for the visualization.

| "Access rights" | Opens the "Access rights" dialog. There you can edit the access privileges for the element. 
| Status messages: 
| - "Not set. Full rights.": Access rights for all user groups: "operable" 
| - "Rights are set: Limited rights": Access is restricted for at least one group. |

**Visualization element 'Meter'**

Symbol:
Tag: “Measurement controls”

The element displays the value of a variable. The needle is positioned according to the value of the assigned variable. A meter is used to represent a tachometer, for example.

**Element properties**

<table>
<thead>
<tr>
<th>“Element name”</th>
<th>Example: GenElemInst_1</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Type of element”</td>
<td>“Meter”</td>
</tr>
<tr>
<td>“Value”</td>
<td>Variable (numeric data type). The variable value determines the pointer movement of the element.</td>
</tr>
</tbody>
</table>

**Element property 'Center’**

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

| “X” | X-coordinate of the point of rotation |
| “Y” | Y-coordinate of the point of rotation |

You can also change the values by dragging the symbols to other positions in the editor.

These properties are available only when you select the “Preview: Support client animations and overlay of native elements” option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.

<table>
<thead>
<tr>
<th>“Animation duration”</th>
<th>Time that the element executes an animation (in milliseconds)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: 500</td>
<td></td>
</tr>
<tr>
<td>“Move to the foreground”</td>
<td>Property value (BOOL)</td>
</tr>
<tr>
<td>TRUE: At runtime, the element is displayed in the foreground.</td>
<td></td>
</tr>
<tr>
<td>FALSE: At runtime, the element is displayed in the layer where it was inserted in the visualization editor.</td>
<td></td>
</tr>
</tbody>
</table>

**Element property ‘Position’**

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.
| **“X”**  | X coordinate of the upper left corner of the element  
Specified in pixels.  
Example: 10. |
|**“Y”**  | Y coordinate of the upper left corner of the element  
Specified in pixels.  
Example: 10. |
|**“Width”**  | Specified in pixels.  
Example: 150 |
|**“Height”**  | Specified in pixels.  
Example: 30 |

You can also change the values by dragging the box symbols ((formatter-icons) to other positions in the editor.

### Element property 'Background'

| **“Image color”**  | List box containing background colors |
|**“Own image”**  |  
- **“Image”**: ID of the background image.  
You select the background image from an image pool by clicking [formatter-icons].  
Info: If you specify the value “<default>” or select the image from the “Default” category in the Input Assistant, then the original element background image is used.  
- **“Transparency color”**: Selection from list box or Input Assistant. |

### Element property 'Arrow'

| **“Hand style”**  | Drop-down list with different arrow types |
|**“Color”**  |  
- [formatter-icons]: The “Color” dialog box opens.  
- [formatter-icons]: Drop-down list with color names |
|**“Arrow start”**  | Angle (in degrees) between the scale start and the horizontal axis |
|**“Arrow end”**  | Angle (in degrees) between the right edge of the pointer instrument and the horizontal axis |
|**“Additional arrow”**  | [formatter-icons]: An additional arrow is shown inside the scale. |
### “Sub scale position”
- **“Outside”**: The subscale is displayed on the outer scale ring. ("Frame outside")
- **“Inside”**: The subscale is displayed on the inner scale ring. ("Frame inside")

### “Scale type”
Type of scale
- **“Lines”**
- **“Dots”**
- **“Squares”**

### “Scale start”
Least value of the scale and the lower limit of the value range for the element
Example: 0
⇒ The “Variable” property is displayed in the line below this.

### “Variable”
Variable (integer data type). Contains the scale start
Example: PLC_PRG.iScaleStart
Declaration:

```plaintext
PROGRAM PLC_PRG
VAR
  iScaleStart : INT := 0;
END_VAR
```

### “Scale end”
Greatest value of the scale and the upper limit of the value range for the element
Example: 100
⇒ The “Variable” property is shown below this.

### “Variable”
Variable (integer data type). Contains the scale end
Example: PLC_PRG.iScaleEnd
Declaration:

```plaintext
PROGRAM PLC_PRG
VAR
  iScaleEnd : INT := 120;
END_VAR
```

### “Main scale”
Distance between two values on the main scale
Example: 10
⇒ The “Variable” property is shown below.

### “Variable”
Variable (integer data type) Contains the distance between two values on the main scale
Example: PLC_PRG.iMainScale
Declaration:

```plaintext
PROGRAM PLC_PRG
VAR
  iMainScale : INT := 20;
END_VAR
```

### “Sub scale”
Distance between two values on the fine scale
You can hide the fine scale by setting the value to 0.
Example: 2
⇒ The “Variable” property is shown below this.
### “Variable”

Variable (integer data type) Contains the distance between two values on the fine scale  
**Example:** PLC_PRG.iSubScale  
**Declaration:**

```plaintext
PROGRAM PLC_PRG  
VAR  
iSubScale : INT := 5;  
END_VAR
```

### “Scale line width”

Specified in pixels  
**Example:** 3

### “Scale color”

Color of scale lines  
- ▶️: The “Color” dialog opens.  
- ▼️: A list box with style colors opens.

### “Scale in 3D”

☑️: Scale lines are displayed with soft 3D shadowing.  
**Note:** This property is not displayed in “FlatStyle”.

### “Show scale”

☑️: The scale is displayed.

### “Frame inside”

☑️: A frame is drawn at the inner end of the scale.

### “Frame outside”

☑️: A frame is drawn at the outer end of the scale.

---

**Element property 'Label'**

### “Label”

Selection list  
- “Outside”: Scale values are placed outside of the scale.  
- “Inside”: Scale values are placed inside of the scale.

### “Unit”

Text that is displayed in the element.  
**Example:** Units displayed in m/s.

### “Font”

Font for labels (example: scale numbering).  
Selection from the drop-down list or by clicking the “” button.

### “Scale format (C Syntax)”

Values scaled in "printf" syntax  
**Examples:** %d, %5.2f

### “Max. text width of labels”

(optional) Value that redefines the maximum width of the scale label. The correct value is normally set automatically.  
**Note:** Change this value only if the automatic adjustment does not yield the expected result.

### “Text height of labels”

(optional) Value that redefines the maximum height of the scale label. The correct value is normally set automatically.  
**Note:** Change this value only if the automatic adjustment does not yield the expected result.

### “Font color”

Selection from the drop-down list or by clicking the “” button.
**Usage of**

- “Preset style values”: Values from the current style
- “User-defined settings”: The subnode “Positioning” appears.

**Positioning**

Requirement: “User-defined settings” is selected as “Usage of”.

The displayed positioning settings depend on the type of needle instrument and potentiometer, and partially on whether a custom background image is selected. The following settings are used for achieving the exact position relative to the background image.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Needle movement”</td>
<td>Length of the needle (in pixels)</td>
</tr>
<tr>
<td>“Scale movement”</td>

<td></td>
<td>Requirement: A customer image is selected as “Background”.</td>
</tr>
<tr>
<td>“Scale length”</td>
<td>Length of the tick marks (in pixels)</td>
</tr>
<tr>
<td></td>
<td>Requirement: A customer image is selected as “Background”.</td>
</tr>
<tr>
<td>“Label offset”:</td>
<td>Distance from the labels to the tick marks (in pixels)</td>
</tr>
<tr>
<td>“Unit offset”:</td>
<td>Distance of the unit text “Label Unit” from the upper scale edge (in pixels)</td>
</tr>
<tr>
<td>“Origin offset”</td>
<td>Offset of the element (in pixels)</td>
</tr>
<tr>
<td></td>
<td>Requirement: For the elements “Meter 180°” and “Meter 90°”, this property is displayed only if a custom image is selected as “Background”.</td>
</tr>
</tbody>
</table>

**Element property ‘Colors’**

**“Color areas”**

- **“Durable color areas”**: □: All color areas are visible, regardless of the current value. □: Only the color area is visible that includes the current value.
- **“Use colors for scale”**: □: Colors in the color area are used only for the scale and frame.
- **“Color areas”**

  - **Create new**: A new color area is added to the “Elements” view.
  - **Delete**: The color area is removed from the list and the list is refreshed.

**“Begin of area”**

Start value of the color area

Example: 20

- The property “Variable” is shown below.

**“Variable”**

Variable (integer data type). Contains the start value.

Example: PLC_PRG.iColorAreaStart0

Declaration:

```plaintext
PROGRAM PLC_PRG
VAR
  iColorAreaStart0 : INT := 80;
END_VAR
```

**“End of area”**

End value of the color area

Example: 120

- The property “Variable” is shown below.
**“Variable”**

Variable (integer data type). Contains the end value.

**Example:** `IColorAreaEnd0`

**Declaration:**

```plaintext
PROGRAM PLC_PRG
VAR
  iColorAreaEnd0 : INT := 100;
END_VAR
```

**“Color”**

Color that is used for displaying the area.

---

**Element property ‘Absolute movement’**

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

---

**“Movement”**

**“X”**

Variable (numeric data type). Defines the X position (in pixels).

**Example:** `PLC_PRG.iPos_X`

Increasing this value in runtime mode moves the element to the right.

**“Y”**

Variable (numeric data type). Defines the Y position (in pixels).

**Example:** `PLC_PRG.iPos_Y`

Increasing this value in runtime mode moves the element downwards.

**“Rotation”**

Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** `PLC_PRG.iAngle1`

The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.

In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

**“Interior rotation”**

Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** `PLC_PRG.iAngle2`

In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol.

Note: If a static angle of rotation is specified in the “Position ➔ Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.
You can link the variables to a unit conversion.

The "X", "Y", "Rotation", and "Interior rotation" properties are supported by the "Client Animation" functionality.

Element property 'Scale'
### Sub scale position
- **Outside**: The subscale is displayed on the outer scale ring. ("Frame outside")
- **Inside**: The subscale is displayed on the inner scale ring. ("Frame inside")

### Scale type
Type of scale
- **Lines**
- **Dots**
- **Squares**

### Scale start
Least value of the scale and the lower limit of the value range for the element
Example: 0
*: The "Variable" property is displayed in the line below this.

### Variable
Variable (integer data type). Contains the scale start
Example: PLC_PRG.iScaleStart
Declaration:

```
PROGRAM PLC_PRG
VAR
  iScaleStart : INT := 0;
END_VAR
```

### Scale end
Greatest value of the scale and the upper limit of the value range for the element
Example: 100
*: The "Variable" property is shown below this.

### Main scale
Distance between two values on the main scale
Example: 10
*: The "Variable" property is shown below.

### Variable
Variable (integer data type) Contains the distance between two values on the main scale
Example: PLC_PRG.iMainScale
Declaration:

```
PROGRAM PLC_PRG
VAR
  iMainScale : INT := 20;
END_VAR
```

### Sub scale
Distance between two values on the fine scale
You can hide the fine scale by setting the value to 0.
Example: 2
*: The "Variable" property is shown below this.
"Variable" Variable (integer data type) Contains the distance between two values on the fine scale
Example: PLC_PRG.iSubScale
Declaration:

PROGRAM PLC_PRG
VAR
  iSubScale : INT := 5;
END_VAR

"Scale line width" Specified in pixels
Example: 3

"Scale color" Color of scale lines
- ▉: The "Color" dialog opens.
- ▼: A list box with style colors opens.

"Scale in 3D" ▽: Scale lines are displayed with soft 3D shadowing.
Note: This property is not displayed in "FlatStyle".

"Show scale" ▽: The scale is displayed.

"Frame inside" ▽: A frame is drawn at the inner end of the scale.

"Frame outside" ▽: A frame is drawn at the outer end of the scale.

Element property 'Label'

"Label" Selection list
- "Outside": Scale values are placed outside of the scale.
- "Inside": Scale values are placed inside of the scale.

"Unit" Text that is displayed in the element.
Example: Units displayed in m/s.

"Font" Font for labels (example: scale numbering).
Selection from the drop-down list or by clicking the " " button.

"Scale format (C Syntax)" Values scaled in "printf" syntax
Examples: %d, %5.2f

"Max. text width of labels" (optional) Value that redefines the maximum width of the scale label. The correct value is normally set automatically.
Note: Change this value only if the automatic adjustment does not yield the expected result.

"Text height of labels" (optional) Value that redefines the maximum height of the scale label. The correct value is normally set automatically.
Note: Change this value only if the automatic adjustment does not yield the expected result.

"Font color" Selection from the drop-down list or by clicking the " " button.

Element property 'Positioning'
“Usage of”
- “Preset style values”: Values from the current style
- “User-defined settings”: The subnode “Positioning” appears.

“Positioning”
Requirement: “User-defined settings” is selected as “Usage of”.

The displayed positioning settings depend on the type of needle instrument and potentiometer, and partially on whether a custom background image is selected. The following settings are used for achieving the exact position relative to the background image.

| “Needle movement”               | Length of the needle (in pixels) |
| “Scale movement”               | Distance from the tick marks to the center (in pixels) |
|                               | Requirement: A customer image is selected as “Background” |
| “Scale length”                 | Length of the tick marks (in pixels) |
|                               | Requirement: A customer image is selected as “Background” |
| “Label offset”                 | Distance from the labels to the tick marks (in pixels) |
| “Unit offset”                  | Distance of the unit text “Label ➔ Unit” from the upper scale edge (in pixels) |
| “Origin offset”                | Offset of the element (in pixels) |
|                               | Requirement: For the elements “Meter 180°” and “Meter 90°”, this property is displayed only if a custom image is selected as “Background” |

Element property ‘Colors’

“Color areas”

“Durable color areas”
- ☐: All color areas are visible, regardless of the current value.
- ☑: Only the color area is visible that includes the current value.

“Use colors for scale”
- ☑: Colors in the color area are used only for the scale and frame.

“Color areas”

“Create new”
A new color area is added to the “Elements” view.

“Delete”
The color area is removed from the list and the list is refreshed.

“Begin of area”
Start value of the color area
Example: 20
- The property “Variable” is shown below.

“Variable”
Variable (integer data type). Contains the start value.
Example: PLC_PRG.iColorAreaStart0
Declaration:

```
PROGRAM PLC_PRG
VAR
  iColorAreaStart0 : INT := 80;
END_VAR
```

“End of area”
End value of the color area
Example: 120
- The property “Variable” is shown below.
**“Variable”**

Variable (integer data type). Contains the end value.

**Example:** `iColorAreaEnd0`  
**Declaration:**

```plaintext
PROGRAM PLC_PRG
VAR
  iColorAreaEnd0 : INT := 100;
END_VAR
```

**“Color”**

Color that is used for displaying the area.

---

**Element property ‘State variables’**

The variables control the element behavior dynamically.

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
</table>
| **“Invisible”** | Variable (BOOL). Toggles the visibility of the element.  
TRUE: The element is not visible at runtime. |
| **“Deactivate inputs”** | Variable (BOOL). Toggles the operability of the element.  
TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated. |

-  

**Element property ‘Absolute movement’**

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Movement”</strong></td>
<td></td>
</tr>
</tbody>
</table>
| **“X”** | Variable (numeric data type). Defines the X position (in pixels).  
**Example:** `PLC_PRG.iPos_X`.  
Increasing this value in runtime mode moves the element to the right. |
| **“Y”** | Variable (numeric data type). Defines the Y position (in pixels).  
**Example:** `PLC_PRG.iPos_Y`.  
Increasing this value in runtime mode moves the element downwards. |
**"Rotation"**

Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle1.

The midpoint of the element rotates at the "Center" point. This rotation point is shown as the symbol.

In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

---

**"Interior rotation"**

Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in "Center" according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol.

Note: If a static angle of rotation is specified in the "Position Angle" property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

---

You can link the variables to a unit conversion.

---

The "X", "Y", "Rotation", and "Interior rotation" properties are supported by the "Client Animation" functionality.

---

See also

- Unit conversion

---

**Element property 'Access rights'**

Requirement: User management is set up for the visualization.

**"Access rights"**

Opens the "Access rights" dialog. There you can edit the access privileges for the element.

Status messages:

- "Not set. Full rights.": Access rights for all user groups : "operable"
- "Rights are set: Limited rights": Access is restricted for at least one group.

See also

- Chapter 1.3.5.19.3.1 “Dialog ‘Access Rights’” on page 1583
Visualization element 'Histogram'

Symbol:

Tag: “Measurement controls”

The element displays the data of a one-dimensional array as a histogram. You can define specific colors for certain value ranges.

See also

● Chapter 1.3.5.21.2 “Displaying array data in histograms” on page 1958

Element properties

<table>
<thead>
<tr>
<th>&quot;Element name&quot;</th>
<th>Example: GenElemInst_35</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Type of element&quot;</td>
<td>“Histogram”</td>
</tr>
<tr>
<td>&quot;Data array&quot;</td>
<td>One-dimensional array with data displayed in this histogram. Example: PLC_PRG.arr1</td>
</tr>
</tbody>
</table>

Element property 'Subrange of array'

| "Use subrange" | ✔: Only part of the array is displayed in the histogram. |
| "Start index" | First array index with a displayed value. Requirement: "Use subrange" is activated. |
| "End index" | Last array index with a displayed value. Requirement: "Use subrange" is activated. |

| "Display type" | ● "Bars": Data is displayed as bars. ● "Lines": Data is displayed as lines. ● "Curve": Interpolation of data into a curve. |
| "Line width" | Specified in pixels Requirement: "Curve" is selected as the "Display type". |
| "Show horizontal lines" | ✔: Horizontal lines are drawn on the main scale. Note: Not all visualization styles have this property. This element property is not available for visualization styles that have striped backgrounds (example: “Flat style”). |
| "Relative bar width" | Integer value between 1 and 100 ● 1: The bars are drawn as lines. ● 100: The complete width of the histogram is filled with the bars. |

Element property ‘Position’

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;X&quot;</td>
<td>X coordinate of the upper left corner of the element. Specified in pixels. Example: 10.</td>
</tr>
<tr>
<td>&quot;Y&quot;</td>
<td>Y coordinate of the upper left corner of the element. Specified in pixels. Example: 10.</td>
</tr>
<tr>
<td>&quot;Width&quot;</td>
<td>Specified in pixels. Example: 150</td>
</tr>
<tr>
<td>&quot;Height&quot;</td>
<td>Specified in pixels. Example: 30</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the box symbols ( draggable) to other positions in the editor.

See also
- Chapter 1.3.5.3.2 “Positioning elements, adapting size and layer” on page 1113

Element property 'Center'
The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;X&quot;</td>
<td>X-coordinate of the point of rotation</td>
</tr>
<tr>
<td>&quot;Y&quot;</td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the symbols ( draggable) to other positions in the editor.

Element property 'Scale'

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Scale start&quot;</td>
<td>Least value of the scale and the lower limit of the value range for the element. Example: 0</td>
</tr>
<tr>
<td>&quot;Variable&quot;</td>
<td>Variable (integer data type). Contains the scale start. Example: PLC_PRG.iScaleStart Declaration:</td>
</tr>
</tbody>
</table>

```plaintext
PROGRAM PLC_PRG
VAR
   iScaleStart : INT := 0;
END_VAR
```
<table>
<thead>
<tr>
<th><strong>Property</strong></th>
<th>Description</th>
</tr>
</thead>
</table>
| **“Scale end”** | Greatest value of the scale and the upper limit of the value range for the element.  
Example: 100 |
| **“Variable”** | Variable (integer data type). Contains the scale end.  
Example: PLC_PRG.iScaleEnd |
| Declaration: |  
PROGRAM PLC_PRG  
VAR  
iScaleEnd : INT := 120;  
END_VAR |
| **“Main scale”** | Distance between 2 values on the rough scale.  
Example: 10 |
| **“Variable”** | Variable (integer data type). Contains the distance.  
Example: PLC_PRG.iMainScale |
| Declaration: |  
PROGRAM PLC_PRG  
VAR  
iMainScale : INT := 20;  
END_VAR |
| **“Subscale”** | Distance between 2 values on the fine scale.  
You can hide the fine scale by setting the value to 0.  
Example: 2 |
| **“Variable”** | Variable (integer data type). Contains the spacing.  
Example: PLC_PRG.iSubScale |
| Declaration: |  
PROGRAM PLC_PRG  
VAR  
iSubScale : INT := 5;  
END_VAR |
| **“Scale color”** | Color of scale lines  
- ▲: The “Color” dialog box opens.  
- ▼: A drop-down list with color names opens. |
| **“Base line”** | Value of the main scale where the horizontal base line of the histogram is located.  
The drawing of the bar starts at the base line. |

**Element property ‘Label’**
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Unit&quot;</td>
<td>Text that is displayed in the element. Example: Units displayed in m/s.</td>
</tr>
<tr>
<td>&quot;Font&quot;</td>
<td>Font for labels (example: scale numbering). Selection from the drop-down list or by clicking the &quot;...&quot; button.</td>
</tr>
<tr>
<td>&quot;Scale format (C Syntax)&quot;</td>
<td>Values scaled in &quot;printf&quot; syntax. Examples: %d, %5.2f.</td>
</tr>
<tr>
<td>&quot;Max. text width of labels&quot;</td>
<td>Optional value that defines the maximum width of the scale label. Note: Change this value only if the automatic adjustment does not yield the expected result.</td>
</tr>
<tr>
<td>&quot;Text height of labels&quot;</td>
<td>Optional value that defines the maximum height of the scale label. Note: Change this value only if the automatic adjustment does not yield the expected result.</td>
</tr>
<tr>
<td>&quot;Font color&quot;</td>
<td>Selection from the drop-down list or by clicking the &quot;...&quot; button.</td>
</tr>
</tbody>
</table>

**Element property 'Colors'**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Graph color&quot;</td>
<td>Color of the bar in normal state. Note: The normal state is in effect when the current value of the array component does not fulfill the alarm condition.</td>
</tr>
<tr>
<td>&quot;Alarm value&quot;</td>
<td>Threshold for the alarm</td>
</tr>
<tr>
<td>&quot;Alarm condition&quot;</td>
<td>If the current value of the array component fulfills the alarm condition, then the alarm condition is set.</td>
</tr>
<tr>
<td></td>
<td>● &quot;Less&quot;: The current value is less than the “Alarm value”</td>
</tr>
<tr>
<td></td>
<td>● &quot;More&quot;: The current value is greater than the “Alarm value”</td>
</tr>
<tr>
<td>&quot;Alarm color&quot;</td>
<td>Color of the bar in alarm state.</td>
</tr>
<tr>
<td>&quot;Use color areas&quot;</td>
<td>☑: The color areas defined in this element are used.</td>
</tr>
<tr>
<td>&quot;Color areas&quot;</td>
<td></td>
</tr>
<tr>
<td>&quot;Create new&quot;</td>
<td>A new color area is added.</td>
</tr>
<tr>
<td>&quot;Delete&quot;</td>
<td>The color area is removed from the list.</td>
</tr>
<tr>
<td>&quot;Begin of area&quot;</td>
<td>The start value on the “Scale” of the histogram where the color area begins.</td>
</tr>
<tr>
<td>&quot;End of area&quot;</td>
<td>The end value on the “Scale” of the histogram where the color area ends.</td>
</tr>
<tr>
<td>&quot;Color&quot;</td>
<td>Color that is used for displaying the area.</td>
</tr>
</tbody>
</table>

**Element property 'Absolute movement'**

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Movement&quot;</td>
<td></td>
</tr>
<tr>
<td>&quot;X&quot;</td>
<td>Variable (numeric data type). Defines the X position (in pixels). Example: PLC_PRG.iPos_X. Increase this value in runtime mode moves the element to the right.</td>
</tr>
</tbody>
</table>
**“Y”**

Variable (numeric data type). Defines the Y position (in pixels).

**Example:** PLC_PRG.iPos_Y.

Increasing this value in runtime mode moves the element downwards.

**“Rotation”**

Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle1.

The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.

In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

**“Interior rotation”**

Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol.

Note: If a static angle of rotation is specified in the “Position ➔ Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

---

You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.

See also

- [Unit conversion](#)

These properties are available only when you select the “Preview: Support client animations and overlay of native elements” option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.
“Animation duration” | Time that the element executes an animation (in milliseconds)
---|---
Example: | 500

“Move to the foreground” | Property value (BOOL)
---|---
Property value | TRUE: At runtime, the element is displayed in the foreground.
FALSE: At runtime, the element is displayed in the layer where it was inserted in the visualization editor.

See also
- Chapter 1.3.5.21.5 “Using client animation” on page 1962

Element property ‘Access rights’

Requirement: User management is set up for the visualization.

“Access rights” | Opens the “Access rights” dialog. There you can edit the access privileges for the element.
---|---
Status messages:
- “Not set. Full rights.”: Access rights for all user groups: “operable”
- “Rights are set: Limited rights”: Access is restricted for at least one group.

See also
- Chapter 1.3.5.19.3.1 “Dialog ‘Access Rights’” on page 1583

Visualization element ‘Image switcher’

Symbol:

Tag: “Lamps/Switches/Bitmaps”
The element displays one of three referenced images. Mouse actions change the displayed image. The images are defined in the “Image settings” element properties. The effects of mouse clicks are defined in the “Element behavior” property.

Element properties

“Element name” | Optional
---|---
Hint: Assign individual names for elements so that they are found faster in the element list.
Example: ImageSwitcher_1

“Type of element” | “Image switcher”

Element property ‘Position’
The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.
### Positioning Elements

**“X”**  
X coordinate of the upper left corner of the element  
Specified in pixels.  
Example: 10.

**“Y”**  
Y coordinate of the upper left corner of the element  
Specified in pixels.  
Example: 10.

**“Width”**  
Specified in pixels.  
Example: 150

**“Height”**  
Specified in pixels.  
Example: 30

You can also change the values by dragging the box symbols (낭) to other positions in the editor.

See also
- ☞ Chapter 1.3.5.3.2 “Positioning elements, adapting size and layer” on page 1113

### Variable

**“Variable”**  
Variable (BOOL).  
The value of the variable changes according to user input and it is independent of the “Element behavior” element property.

### Image Settings

**“Image “on””**  
Image ID from an image pool. The image can be selected using the input assistant.  
The image is used if the variable of the “Variable” property has the value TRUE.

**“Image “off””**  
Image ID from an image pool. The image can be selected using the input assistant.  
The image is used if the variable of the “Variable” property has the value FALSE.

**“Image “clicked””**  
Image ID from an image pool. The image is selected using the input assistant.  
In runtime mode, the visualization displays the referenced image when the element is clicked (and the mouse button is held down).  
Requirement: The “Element behavior” is “Image toggler”.

**“Transparency”**  
☑️ The “Transparent color” is selected.

**“Transparent color”**  
The image pixels that have the transparent color are displayed as transparent.  
Requirement: “Transparency” is activated.  
- ➕ The “Color” dialog box opens.  
- ⤴ A drop-down list with color names opens.
### “Scaling type”

Defines how an image fits in the element frame.

- **“Fixed”**: The original size of the image is retained, regardless of the dimensions of the element.
- **“Isotropic”**: The entire image is shown in the element frame, either larger or smaller. As a result, the proportion of height and width are retained.
- **“Anisotropic”**: The image resizes automatically to the dimensions of the element frame, filling the entire element frame. As a result, the proportions are not retained.

### “Horizontal alignment”

Horizontal alignment of the image within the element frame or element

- Left
- Centered
- Right

Requirement: “Scaling type” is “Isotropic”.

### “Vertical alignment”

Vertical alignment of the image within the element frame or element

- Top
- Centered
- Bottom

Requirement: “Scaling type” is “Isotropic”.

### “Element behavior”

- **“Image toggler”**: Every mouse click switches the image.
- **“Image tapper”**: While a visualization user holds down the mouse button, the image of the “Image on” property is displayed. At the same time, the value TRUE is assigned to the “Variable” property.

### “Tap FALSE”

✅: While the mouse button is pressed, the image of the “Image” property is displayed and the “Variable” property gets the value FALSE instead of the value TRUE, and back.

Requirement: “Image tapper” is selected in the “Element behavior” property.

### Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>X</td>
<td>X-coordinate of the point of rotation</td>
</tr>
<tr>
<td>Y</td>
<td>Y-coordinate of the point of rotation</td>

</tr>
</tbody>
</table>

You can also change the values by dragging the box symbols (_drag-) to other positions in the editor.

See also

- ☮ Chapter 1.3.5.3.2 “Positioning elements, adapting size and layer” on page 1113
“Variable”

Variable (BOOL).
The variable value is displayed as a lamp that goes on (TRUE) or off (FALSE).

Image settings

“Transparency” ☑: The “Transparent color” property is selected.

“Transparent color”

Pixels in this color are displayed as transparent.
Requirement: “Transparency” is activated.
- The “Color” dialog box opens.
- A drop-down list with style colors opens.

“Scaling type”

Reaction of the element when the dimension of the “Frame” element is changed:
- “Isotropic”: The height and width of the image are resized proportionally to the “Frame”.
  Please note: To retain the alignment of elements also within a scaled “Frame” element, define the “Horizontal alignment” or “Vertical alignment” explicitly with “Centered”.
- “Anisotropic”: The image fills the entire “Frame” regardless of its proportions.

“Horizontal alignment”

Horizontal alignment of the image within the element frame or element
- Left
- Centered
- Right
Requirement: “Scaling type” is “Isotropic”.

“Vertical alignment”

Vertical alignment of the image within the element frame or element
- Top
- Centered
- Bottom
Requirement: “Scaling type” is “Isotropic”.

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

“X”

X-coordinate of the point of rotation

“Y”

Y-coordinate of the point of rotation

You can also change the values by dragging the symbols to other positions in the editor.

Element property 'Texts'

“Tooltip”

String display as tooltip for the element
Example: Valid access.
The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

**“Movement”**

| “X”   | Variable (numeric data type). Defines the X position (in pixels).  
Example: PLC_PRG.iPos_X.  
Increasing this value in runtime mode moves the element to the right. |
|-------|------------------------------------------------------------------|
| “Y”   | Variable (numeric data type). Defines the Y position (in pixels).  
Example: PLC_PRG.iPos_Y.  
Increasing this value in runtime mode moves the element downwards. |

**“Rotation”**

Variable (numeric data type). Defines the angle of rotation (in degrees).  
Example: PLC_PRG.iAngle1.

The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.

In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

**“Interior rotation”**

Variable (numeric data type). Defines the angle of rotation (in degrees).  
Example: PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol.

Note: If a static angle of rotation is specified in the “Position ➔ Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.
The variables control the element behavior dynamically.

| **“Invisible”** | Variable (BOOL). Toggles the visibility of the element. 
| **TRUE** | The element is not visible at runtime. |

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you select the “Preview: Support client animations and overlay of native elements” option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.

| **“Animation duration”** | Time that the element executes an animation (in milliseconds) 
| **Example: 500** |

| **“Move to the foreground”** | Property value (BOOL) 
| **TRUE** | At runtime, the element is displayed in the foreground. 
| **FALSE** | At runtime, the element is displayed in the layer where it was inserted in the visualization editor. |

| **“Image”** | Drop-down list with background colors 
| Depends on the visualization style |

| **“Access rights”** | Opens the “Access rights” dialog. There you can edit the access privileges for the element. 
| Status messages: 
| **“Not set. Full rights.”**: Access rights for all user groups: “operable” 
| **“Rights are set: Limited rights”**: Access is restricted for at least one group. |
Visualization element 'Dip switch', 'Power switch', 'Push switch', 'Push switch LED', 'Rocker switch'

Symbols:

Tag: “Lamps/Switches/Bitmaps”

The element assigns a value to a Boolean variable. The switch position "on" the value TRUE to the variable, and the switch position "off" assigns the value FALSE. Use the mouse to change the switch position.

Element properties

<table>
<thead>
<tr>
<th>&quot;Element name&quot;</th>
<th>Example: Operating_Switch</th>
</tr>
</thead>
<tbody>
<tr>
<td>Optional</td>
<td></td>
</tr>
<tr>
<td>Hint: Assign individual names for elements so that they are found faster in the element list.</td>

</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>&quot;Type of element&quot;</th>
<th>Depending on the element: “Dip switch”, “Power switch”, “Push switch”, “Push switch LED”, or “Rocker switch”</th>
</tr>
</thead>
</table>

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

| "X" | X coordinate of the upper left corner of the element  
Specified in pixels.  
Example: 10. |
|-----|---------------------------------------------------|
| "Y" | Y coordinate of the upper left corner of the element  
Specified in pixels.  
Example: 10. |
| "Width" | Specified in pixels.  
Example: 150 |
| "Height" | Specified in pixels.  
Example: 30 |
You can also change the values by dragging the box symbols (_drag_•) to other positions in the editor.

### Image settings

| “Transparency” | [☐]: The “Transparent color” property is selected. |
| “Transparent color” | Pixels in this color are displayed as transparent. |
| Requirement: “Transparency” is activated. |
| ● [☐]: The “Color” dialog box opens. |
| ● [☐]: A drop-down list with style colors opens. |

| “Scaling type” | Reaction of the element when the dimension of the “Frame” element is changed: |
| “Isotropic”: The height and width of the image are resized proportionally to the “Frame”. |
| Please note: To retain the alignment of elements also within a scaled “Frame” element, define the “Horizontal alignment” or “Vertical alignment” explicitly with “Centered”. |
| “Anisotropic”: The image fills the entire “Frame” regardless of its proportions. |

| “Horizontal alignment” | Horizontal alignment of the image within the element frame or element |
| ● Left |
| ● Centered |
| ● Right |
| Requirement: “Scaling type” is “Isotropic”. |

| “Vertical alignment” | Vertical alignment of the image within the element frame or element |
| ● Top |
| ● Centered |
| ● Bottom |
| Requirement: “Scaling type” is “Isotropic”. |

| “Element behavior” | ● “Image toggler”: Every mouse click changes the switch and the “Variable” value. |
| ● “Image tapper”: The switch is "on" and the “Variable” value is TRUE while the mouse button is pressed. |

| “Tap FALSE” | [☑]: The value TRUE is assigned to the “Variable” property instead of the value FALSE, and back. |
| Requirement: “Image tapper” is selected in the “Element behavior” property. |

**Element property ‘Center’** The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⬇️ symbol. The point is used as the center for rotating and scaling.
Element property 'Texts'

| "Tooltip" | String display as tooltip for the element  
Example: Valid access.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

| "Movement"        | Variable (numeric data type). Defines the X position (in pixels).  
Example: PLC_PRG.iPos_X.  
Increasing this value in runtime mode moves the element to the right.

| "X"                | Variable (numeric data type). Defines the Y position (in pixels).  
Example: PLC_PRG.iPos_Y.  
Increasing this value in runtime mode moves the element downwards.

| "Rotation"        | Variable (numeric data type). Defines the angle of rotation (in degrees).  
Example: PLC_PRG.iAngle1.  
The midpoint of the element rotates at the "Center" point. This rotation point is shown as the symbol.  
In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.  

You can also change the values by dragging the symbols (♀) to other positions in the editor.
**“Interior rotation”**

Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol.

Note: If a static angle of rotation is specified in the “Position ➔ Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

---

You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.

See also
- Unit conversion

Element property 'State variables'

The variables control the element behavior dynamically.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Invisible”</strong></td>
<td>Variable (BOOL). Toggles the visibility of the element. <strong>TRUE:</strong> The element is not visible at runtime.</td>
</tr>
<tr>
<td><strong>“Deactivate inputs”</strong></td>
<td>Variable (BOOL). Toggles the operability of the element. <strong>TRUE:</strong> User inputs do not have any effect in runtime more. The element is shown as deactivated.</td>
</tr>
</tbody>
</table>

The “Invisible” property is supported by the "Client Animation" functionality.

See also
- 

These properties are available only when you select the “Preview: Support client animations and overlay of native elements” option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.
| “Animation duration” | Time that the element executes an animation (in milliseconds)  
Example: 500 |
|-----------------------|---------------------------------------------------------------|
| “Move to the foreground” | Property value (BOOL)  
**TRUE**: At runtime, the element is displayed in the foreground.  
**FALSE**: At runtime, the element is displayed in the layer where it was inserted in the visualization editor. |

See also
- Chapter 1.3.5.21.5 “Using client animation” on page 1962

### Element property 'Background'

| “Image” | Drop-down list with background colors  
Depends on the visualization style |

### Element property 'Access rights'

Requirement: User management is set up for the visualization.

| “Access rights” | Opens the “Access rights” dialog. There you can edit the access privileges for the element.  
Status messages:  
- “Not set. Full rights.”: Access rights for all user groups: “operable”  
- “Rights are set: Limited rights”: Access is restricted for at least one group. |

### Visualization element ‘Rotary switch’

Symbol:

Tag: “Lamps/Switches/Bitmaps”

The element assigns a value to a Boolean variable. The switch position "on" the value **TRUE** to the variable, and the switch position "off" assigns the value **FALSE**. Use the mouse to change the switch position.

### Element properties
<table>

“Scaling type”

Reaction of the element when the dimension of the “Frame” element is changed:

- **“Isotropic”**: The height and width of the image are resized proportionally to the “Frame”.

  Please note: To retain the alignment of elements also within a scaled “Frame” element, define the “Horizontal alignment” or “Vertical alignment” explicitly with “Centered”.

- **“Anisotropic”**: The image fills the entire “Frame” regardless of its proportions.

“Horizontal alignment”

Horizontal alignment of the image within the element frame or element

- Left
- Centered
- Right

Requirement: “Scaling type” is “Isotropic”.

“Vertical alignment”

Vertical alignment of the image within the element frame or element

- Top
- Centered
- Bottom

Requirement: “Scaling type” is “Isotropic”.

“Element behavior”

- **“Image toggler”**: Every mouse click changes the switch and the “Variable” value.

- **“Image tapper”**: The switch is “on” and the “Variable” value is TRUE while the mouse button is pressed.

“Orientation”

- **“At top”**: The rotary switch turns from the top right to the top left.

- **“At side”**: The rotary switch turns from the top right to the bottom right.

“Color change”

☑: The element changes in color when “Variable” is TRUE.

Element property ‘Center’

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

“X”

X-coordinate of the point of rotation

“Y”

Y-coordinate of the point of rotation

You can also change the values by dragging the symbols to other positions in the editor.

Element property ‘Texts’

“Tooltip”

String display as tooltip for the element

Example: Valid access.

Element property ‘Absolute movement’

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
### Movement

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Show cursor”</td>
<td>☐: A cursor (vertical line) is displayed at the mouse position. The trigger</td>
</tr>
<tr>
<td></td>
<td>and variable values where the cursor points are displayed as a tooltip.</td>
</tr>
<tr>
<td>“Overwrite existing trace on PLC”</td>
<td>☑: If a trace with the same name is on the PLC, then it is overwritten at down-</td>
</tr>
<tr>
<td></td>
<td>load with the configuration that is defined here.</td>
</tr>
<tr>
<td>“Number format”</td>
<td>Number format of values in the tooltip in printf syntax (example: %d, %5.2f).</td>
</tr>
</tbody>
</table>

The control variables are assigned automatically when you click “Insert elements for controlling trace”.

2020/12/10
| **“Reset Trigger”** | Variable (BOOL). | Standard control variable: bResetTrigger | TRUE: Resets the triggering. After the action is executed, the variable is set automatically to FALSE. |
| **“Start Trace”** | Variable (BOOL). | Standard control variable: bStart | TRUE: Starts the trace. After the action is executed, the variable is set automatically to FALSE. |
| **“Stop Trace”** | Variable (BOOL). | Standard control variable: bStop | TRUE: Stops the trace. After the action is executed, the variable is set automatically to FALSE. |
| **“Save trace to a file”** | Variable (BOOL). | Standard control variable: bStore | TRUE: Saves the current trace configuration and the data that is stored in the development system to a file. When the action is ended, the variable is set automatically to FALSE. |
| **“File name”** | Variable (STRING) that contains the file name of the file to be saved. | Standard control variable: sStoreFilename |
| **“Load trace from file”** | Variable (BOOL). | Standard control variable: bRestore | TRUE: Reads the file specified below and loads its contents into the trace editor. The file contains a trace configuration and possibly also trace data. To do this, the stored trace configuration must match the application where the trace configuration is located. When the action is ended, the variable is set automatically to FALSE. Note: A trace configuration can be loaded from a file only under special circumstances. The file must have been created with exactly the same (running) application with which it will then be loaded. The consequence of changing the running application (for example by downloading again) is that a file which was previously created from the application cannot no longer be read into the application. Even external manual changes to the file can cause this. You should edit only those configuration settings that have an effect on displaying the variables. If you change variable definitions directly in the file (for example by replacing variable x with v y), then the file cannot be loaded. |
| **“File name”** | Variable (STRING) that contains the file name of the file to be read. | Standard control variable: sRestoreFilename |

<td>Example: 30</td>
</tr>
</tbody>
</table>

Tip: You can change the values in “X”, “Y”, “Width”, and “Height” by dragging the corresponding symbols to another position in the editor.

Static angle of rotation (in degrees)

<table>
<thead>
<tr>
<th>Angle</th>
<th>Static angle of rotation (in degrees)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Example: 35</td>
</tr>
</tbody>
</table>

The element is displayed rotated in the editor. The point of rotation is the center of the element. A positive value rotates clockwise.

Tip: You can change the value in the editor by focusing the element to the handle. When the cursor is displayed as a rotating arrow, you can rotate the element about its center as a handle.

Note: If a dynamic angle of rotation is also configured in the property “Absolute movement ➔ Internal rotation”, then the static and dynamic angles of rotation are added in runtime mode. The static angle of rotation acts as an offset.

</table>

Element property 'Tick mark labels'
### “Time stamp”

The values of the time stamps are displayed in absolute time. Example: 18.03.2016, 14:05:30:000

The display formatting can be adjusted in the property “Internationalization (format strings)”.

### “Two-line labelling”

- ☑: The time stamps are displayed in two lines. The date is displayed in the first line and the time is displayed in the second line.
- ☐: Time stamp is displayed in one line. The date and time can also be displayed in one line depending on the formatting.

### “Omit irrelevant information in time stamp”

- ☑: The time stamp has a shorter form. For example, the date is displayed only for the first tick mark, and only the time for the following tick marks. The settings in “Internationalization (format strings)” are ignored for this setting.
- ☐: All information is displayed for each time stamp.

### “Internationalization (format strings)”

Only active when the parameter “Omit irrelevant information in timestamps” is deactivated.

### “Date”

Definition of the date format. The default setting is taken from the Windows control panel.

### “Time”

Definition of the time format. The default setting is taken from the Windows control panel.

---

**Element property ‘Assigned control elements’**

These elements are created automatically when the control elements are added with the command “Insert elements for controlling trend”.

### “Date range picker”

Control element for changing the date and time of the displayed data sets. With all elements are provided that have implemented the interface IDateRangeSelector. By default, instances of the “Date range picker” visualization element are available.

### “Time picker”

Control element for changing the time of the displayed data sets. With all elements are provided that have implemented the interface ITimeSelector. By default, instances of the “Time range picker” visualization element are available.

### “Legend”

Control element for displaying a legend for the graphs. With all elements are provided that have implemented the interface ILegendDisplayer.

---

**See also**

- § Chapter 1.3.5.19.2.18 “Command ‘Insert Elements for Controlling the Trend’” on page 1577

---

**Element property ‘Center’**

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

### “X”

X-coordinate of the point of rotation

### “Y”

Y-coordinate of the point of rotation

---

You can also change the values by dragging the symbols ( 중심) to other positions in the editor.
Element property 'Absolute movement'
The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

### “Movement”

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>“X”</td>
<td>Variable (numeric data type). Defines the X position (in pixels). Increasing this value in runtime mode moves the element to the right.</td>
<td>PLC_PRG.iPos_X.</td>
</tr>
<tr>
<td>“Y”</td>
<td>Variable (numeric data type). Defines the Y position (in pixels). Increasing this value in runtime mode moves the element downwards.</td>
<td>PLC_PRG.iPos_Y.</td>
</tr>
</tbody>
</table>

### “Rotation”

- The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.
- In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

### “Interior rotation”

- In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.
- The rotation point is shown as the symbol.
- Note: If a static angle of rotation is specified in the “Position ➔ Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

---

**You can link the variables to a unit conversion.**

**The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.**
The variables control the element behavior dynamically.

**Element property 'State variables'**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Invisible&quot;</td>
<td>Variable (BOOL). Toggles the visibility of the element. TRUE: The element is not visible at runtime.</td>
</tr>
</tbody>
</table>

The "Invisible" property is supported by the "Client Animation" functionality.

See also

- **Unit conversion**

These properties are available only when you select the "Preview: Support client animations and overlay of native elements" option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Animation duration&quot;</td>
<td>Time that the element executes an animation (in milliseconds) Example: 500</td>

<tr>
<td>“Max. number of columns”</td>
<td>2</td>
</tr>
</tbody>
</table>

### Element Property 'Text properties'

The property affects the text configured in the associated element.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Text format”</td>
<td>“Default”: The text will be cut and displayed in only the part that fits into the visualization element.</td>
</tr>
<tr>
<td></td>
<td>“Linebreak”: The text will be wrapped in rows.</td>
</tr>
<tr>
<td></td>
<td>“Ellipsis”: The text is cut and ellipsis . . . are added to indicate that something is missing.</td>
</tr>
<tr>
<td>“Font”</td>
<td>Font of the text. The entries of the selection list are defined in the visualization style.</td>
</tr>
<tr>
<td>“Font color”</td>
<td>Text color, for example Grey. The entries of the selection list are defined in the visualization style.</td>
</tr>
<tr>
<td>“Transparency”</td>
<td>Transparency value (255 to 0), which defines the transparency of the corresponding color.</td>
</tr>
<tr>
<td></td>
<td>Example: 255: The color is opaque. 0: The color is fully transparent.</td>
</tr>
</tbody>
</table>

### Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Movement”</td>
<td>“X” Variable (numeric data type). Defines the X position (in pixels).</td>
</tr>
<tr>
<td></td>
<td>Example: PLC_PRG.iPos.X.</td>
</tr>
<tr>
<td></td>
<td>Increasing this value in runtime mode moves the element to the right.</td>
</tr>
<tr>
<td>Variable</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>----------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>“Y”</td>
<td>Variable (numeric data type). Defines the Y position (in pixels).</td>
</tr>
<tr>
<td>“Rotation”</td>
<td>Variable (numeric data type). Defines the angle of rotation (in degrees).</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>“Interior rotation”</td>
<td>Variable (numeric data type). Defines the angle of rotation (in degrees).</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.

See also
- **Unit conversion**

These properties are available only when you select the “Preview: Support client animations and overlay of native elements” option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.
**“Animation duration”**

Time that the element executes an animation (in milliseconds)

Example: 500

**“Move to the foreground”**

Property value (**BOOL**)

TRUE: At runtime, the element is displayed in the foreground.
FALSE: At runtime, the element is displayed in the layer where it was inserted in the visualization editor.

See also

- § Chapter 1.3.5.21.5 “Using client animation” on page 1962

**Element property 'Access rights’**

Requirement: User management is set up for the visualization.

**“Access rights”**

Opens the “Access rights” dialog. There you can edit the access privileges for the element.

Status messages:

- “Not set. Full rights.”: Access rights for all user groups: “operable”
- “Rights are set: Limited rights”: Access is restricted for at least one group.

See also

- § Chapter 1.3.5.19.3.1 “Dialog ‘Access Rights’” on page 1583

**Visualization element 'ActiveX’**

Symbol: ![Visual Element]

Tag: “Special controls”

The element is used for linking an existing ActiveX element in the visualization. In the element properties of the ActiveX element, you can configure the method calls and their parameters.

*In the CODESYS Store, you will find a sample project for using ActiveX components in visualizations.*

See also

- CODESYS Store

</tbody>
</table>

You can also change the values by dragging the symbols (●) to other positions in the editor.

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
### "Movement"

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>&quot;X&quot;</strong></td>
<td>X position (in pixels). Increasing this value in runtime mode moves the element to the right.</td>
<td><code>PLC_PRG.iPos_X</code></td>
</tr>
<tr>
<td><strong>&quot;Y&quot;</strong></td>
<td>Y position (in pixels). Increasing this value in runtime mode moves the element downwards.</td>
<td><code>PLC_PRG.iPos_Y</code></td>
</tr>
<tr>
<td><strong>&quot;Rotation&quot;</strong></td>
<td>Angle of rotation (in degrees). In runtime mode, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value rotates the element to the right.</td>
<td><code>PLC_PRG.iAngle1</code></td>
</tr>
<tr>
<td><strong>&quot;Scaling&quot;</strong></td>
<td>Causes centric stretching. The value 1 shrinks the element by a factor of 0.001. The value 1000 returns the element to its original size.</td>
<td><code>PLC_PRG.iScaling</code></td>
</tr>
<tr>
<td><strong>&quot;Interior rotation&quot;</strong></td>
<td>Angle of rotation (in degrees). In runtime mode, the element rotates about the point of rotation specified in &quot;Center&quot; according to the value of the variable. Increasing the value rotates the element clockwise.</td>
<td><code>PLC_PRG.iAngle2</code></td>
</tr>
</tbody>
</table>

Note: If a static angle of rotation is specified in the property "Position ➔ Angle", then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

---

*You can link the variables to a unit conversion.*

*The properties "X", "Y", "Rotation", and "Interior rotation" are supported by the "Client Animation" functionality.*
Element property 'State variables'

| “Invisible” | Variable (BOOL). Toggles the visibility of the element.  
| TRUE: The element is not visible at runtime. |

The “Invisible” property is supported by the "Client Animation" functionality.

See also

Element property 'Control variables'

| “URL” | URL of the web page that is displayed in the visualization.  
| Variable (STRING or WSTRING)  
| Example: PLC_PRG.stURL  
| Literal in single straight quotation marks  
| Example: ‘http://de.wikipedia.org’ |

| “Show” | Variable (BOOL).  
| Example: PLC_PRG.bSetURL  
| Controls the display of the “Web browser” element.  
| If the variable contains a rising edge, then the visualization calls the web page given in “URL” and displays its contents in the 'Web browser' visualization element. |

| “Back” | Variable (BOOL).  
| Example: PLC_PRG.bGoBack  
| Controls the back navigation in the “Web browser”. If the variable has a rising edge, then the visualization displays the contents of the previously displayed page. |

| “Forward” | Variable (BOOL).  
| Example: PLC_PRG.bGoForward  
| Controls the forward navigation in the “Web browser”. If the variable has a rising edge, then the visualization displays the contents of the previously displayed page. |

These properties are available only when you select the “Preview: Support client animations and overlay of native elements” option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.

See also

- Unit conversion
| "Animation duration" | Time that the element executes an animation (in milliseconds)  
| Example: 500 |
| "Move to the foreground" | Property value (BOOL)  
| TRUE: At runtime, the element is displayed in the foreground.  
| FALSE: At runtime, the element is displayed in the layer where it was inserted in the visualization editor. |

See also  
- § Chapter 1.3.5.21.5 “Using client animation” on page 1962

Element property 'Access rights'  
Requirement: User management is set up for the visualization.

| "Access rights" | Opens the “Access rights“ dialog. There you can edit the access privileges for the element.  
| Status messages:  
| "Not set. Full rights." : Access rights for all user groups : “operable”  
| "Rights are set: Limited rights" : Access is restricted for at least one group. |

- § Chapter 1.3.5.19.3.1 “Dialog ‘Access Rights’” on page 1583

Visualization element ‘Waiting symbol cube’

Symbol:

Tag: “Special controls”

In runtime mode, this element indicates automatically that the runtime system is busy or waiting for data.

Element properties

| "Element name" | Example: Data_Transfer  
| Optional  
| Hint: Assign individual names for elements so that they are found faster in the element list. |
| "Type of element" | Waiting symbol cube

Element property 'Position'  
The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.
### X

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>X</td>
<td>X coordinate of the upper left corner of the element</td>
<td>Specified in pixels. Example: 10.</td>
</tr>
</tbody>
</table>

### Y

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Y</td>
<td>Y coordinate of the upper left corner of the element</td>
<td>Specified in pixels. Example: 10.</td>
</tr>
</tbody>
</table>

### Width

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Width</td>
<td>Specified in pixels.</td>
<td>Example: 150</td>
</tr>
</tbody>
</table>

### Height

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Height</td>
<td>Specified in pixels.</td>
<td>Example: 30</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the box symbols ((Constructor) to other positions in the editor.

See also

- Chapter 1.3.5.3.2 “Positioning elements, adapting size and layer” on page 1113

### Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>X</td>
<td>X-coordinate of the point of rotation</td>
</tr>
<tr>
<td>Y</td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the symbols (Constructor) to other positions in the editor.

### Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Movement</td>
<td>Variable (numeric data type). Defines the X position (in pixels). Example: PLC_PRG.iPos_X. Increasing this value in runtime mode moves the element to the right.</td>
</tr>
<tr>
<td></td>
<td>Variable (numeric data type). Defines the Y position (in pixels). Example: PLC_PRG.iPos_Y. Increasing this value in runtime mode moves the element downwards.</td>
</tr>
</tbody>
</table>
"Rotation" Variable (numeric data type). Defines the angle of rotation (in degrees).

Example: PLC_PRG.iAngle1.

The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.

In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

"Interior rotation" Variable (numeric data type). Defines the angle of rotation (in degrees).

Example: PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol.

Note: If a static angle of rotation is specified in the “Position Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

See also
- Unit conversion
- 

Element property 'State variables'
The variables control the element behavior dynamically.

"Invisible" Variable (BOOL). Toggles the visibility of the element.

TRUE: The element is not visible at runtime.

The “Invisible” property is supported by the "Client Animation" functionality.
These properties are available only when you select the “Preview: Support client animations and overlay of native elements” option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.

<table>
<thead>
<tr>
<th>“Animation duration”</th>
<th>Time that the element executes an animation (in milliseconds)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Example: 500</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Move to the foreground”</th>
<th>Property value (BOOL)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>TRUE: At runtime, the element is displayed in the foreground.</td>
</tr>
<tr>
<td></td>
<td>FALSE: At runtime, the element is displayed in the layer where it was inserted in the visualization editor.</td>
</tr>
</tbody>
</table>

Visualization element 'Waiting symbol flower'

Symbol:

Tag: “Special controls”

The element indicates that the system is busy or waiting for data.
### Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;X&quot;</td>
<td>X coordinate of the upper left corner of the element</td>
</tr>
<tr>
<td></td>
<td>Specified in pixels.</td>
</tr>
<tr>
<td>Example:</td>
<td>10.</td>
</tr>
<tr>
<td>&quot;Y&quot;</td>
<td>Y coordinate of the upper left corner of the element</td>
</tr>
<tr>
<td></td>
<td>Specified in pixels.</td>
</tr>
<tr>
<td>Example:</td>
<td>10.</td>
</tr>
<tr>
<td>&quot;Width&quot;</td>
<td>Specified in pixels.</td>
</tr>
<tr>
<td>Example:</td>
<td>150</td>
</tr>
<tr>
<td>&quot;Height&quot;</td>
<td>Specified in pixels.</td>
</tr>
<tr>
<td>Example:</td>
<td>30</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the box symbols (_drag_box) to other positions in the editor.

See also
- Chapter 1.3.5.3.2 “Positioning elements, adapting size and layer” on page 1113

### Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the _rotate_ symbol. The point is used as the center for rotating and scaling.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;X&quot;</td>
<td>X-coordinate of the point of rotation</td>
</tr>
<tr>
<td>&quot;Y&quot;</td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the symbols (_rotate) to other positions in the editor.

### Element property 'Colors'

The properties contain fixed values for setting colors.
### “Frame color”

### “Fill color”

### “Transparency”
Value (0 to 255) for defining the transparency of the selected color.
Example 255: The color is opaque. 0: The color is completely transparent.

See also
- Chapter 1.3.5.19.3.5 “Dialog ‘Gradient Editor’” on page 1586

### Element property ‘Appearance’

The properties contain fixed values for setting the look of the element.

<table>
<thead>
<tr>
<th>“Line width”</th>
<th>Value in pixels</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: 2</td>
<td></td>
</tr>
</tbody>
</table>

Note: The values 0 and 1 both result in a line weight of 1 pixel. If no line should be displayed, then the “Line style” property must be set to the option “Invisible”.

### “Fill attributes”
The way in which the element is filled.
- “Filled”: The element is filled with the color from property “Colors ➔ Fill color”.
- “Invisible”: The fill color is invisible.

### “Line style”
Type of line representation
- “Solid”
- “Dashes”
- “Dots”
- “Dash Dot”
- “Dash Dot Dot”
- “not visible”

You can assign variables in the “Appearance variables” property for controlling the appearance dynamically. The fixed values here are overwritten.

See also
- “Element property ‘Appearance variables’” on page 1285

### “Symbol color”
Selection of a color for the flower symbol.

### “Line”
Stroke width of the lines (in pixels).

### Element property ‘Absolute movement’
The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

<table>
<thead>
<tr>
<th>“Movement”</th>
<th></th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>“X”</th>
<th>Variable (numeric data type). Defines the X position (in pixels).</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Example: PLC_PRG.iPos_X.</td>
</tr>
<tr>
<td></td>
<td>Increasing this value in runtime mode moves the element to the right.</td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-------------</td>
</tr>
<tr>
<td>“Y”</td>
<td>Variable (numeric data type). Defines the Y position (in pixels).</td>
</tr>
<tr>
<td>“Rotation”</td>
<td>Variable (numeric data type). Defines the angle of rotation (in degrees).</td>
</tr>
<tr>
<td>“Interior rotation”</td>
<td>Variable (numeric data type). Defines the angle of rotation (in degrees).</td>
</tr>
</tbody>
</table>

You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.

**Visualization element ‘Text editor’**

Symbol:

Tag: “Special controls”

The element shows the contents of text files that are saved on the controller. Files can be encoded in ASCII or Unicode formats.

A visualization user can also edit the text.
Element properties

<table>
<thead>
<tr>
<th>“Element name”</th>
<th>Example: GenElemInst_1</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Type of element”</td>
<td>“Text editor”</td>
</tr>
</tbody>
</table>

**Element property 'Position'**

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

| “X” | X coordinate of the upper left corner of the element  
Specified in pixels.  
Example: 10. |
| “Y” | Y coordinate of the upper left corner of the element  
Specified in pixels.  
Example: 10. |
| “Width” | Specified in pixels.  
Example: 150 |
| “Height” | Specified in pixels.  
Example: 30 |

You can also change the values by dragging the box symbols (_drag_ ) to other positions in the editor.

**Element property 'Font'**

| “Font name” | Non-proportional font used by the visualization to display the contents of the file  
Example: “Courier New” |
| “Size” | Font size  
Example: 12 |

**Element property 'Control variables'**
### Table 261: Element property “Control variables --> File”

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Variable** | Variable (STRING). Contains the file names and optionally the location of the file. It is located in the file system of the controller.  
Example: FLC_PRG.strFile: STRING := '/Documentation/Info.txt'; |
| **Open** | Variable (BOOL). Controls opening the file which is defined in the “Variable” property  
Example: bOpen: BOOL;  
TRUE: The file is opened. |
| **Close** | Variable (BOOL). Controls closing the file which is defined in the “Variable” property  
Example: bClose: BOOL;  
TRUE: The file is closed. |
| **Save** | Variable (BOOL). Controls saving the file which is defined in the “Variable” property  
Example: bStore: BOOL;  
TRUE: The file is saved. |
| **New** | Variable (BOOL). Controls creating a new file. The name is defined in the “Variable” property.  
Example: bCreate: BOOL;  
TRUE: A file is created and opened. |

### Table 262: Element property “Control variables --> Edit”

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Variable** | Variable (STRING). Contains the string to search for in the file  
Example: strFind: STRING := 'abc'; |
| **Find** | Variable (BOOL). Controls executing the search for the string in the “Variable” property  
Example: bFind: BOOL;  
TRUE: The search is performed. The variable is automatically reset to FALSE. |
| **Find next** | Variable (BOOL). Controls the location to begin the search in the file  
Example: bFindNext: BOOL;  
TRUE: The search begins at the last search result location.  
FALSE: The search begins at the beginning of the file. |

### Table 263: Element property “Control variables --> Cursor position”

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Line** | Variable (integer data type). Contains the line of the cursor  
Example: iRowCursor: INT; |
| **Column** | Variable (integer data type). Contains the column of the cursor  
Example: iColumnCursor: INT; |
**“Position”**
Output variable (integer data type). Shows the absolute cursor position in the text.
Example: iPosCursor: INT;

**“Set cursor”**
Variable (BOOL). Controls the setting of the cursor at a specific location
Example: iSetCursor: INT;
TRUE: The cursor is moved. The new position is defined in the “Line” and “Column” properties.
FALSE: The “Line”, “Column”, and “Position” properties contain the actual values.
Note: The variable is used as the control variable for an input event triggered by a visualization user.

**Table 264: Element property “Control variables --> Selection”**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Start position”</td>
<td>Output variable (integer data type). Shows the absolute position for starting the text selection</td>
<td>iPosSelection: INT;</td>
</tr>
<tr>
<td>“End position”</td>
<td>Output variable (integer data type). Shows the absolute position for ending the text selection</td>
<td>iPosEndSelection: INT;</td>
</tr>
<tr>
<td>“Start line number”</td>
<td>Output variable (integer data type). Shows the line where the text selection begins</td>
<td>iRowSelection: INT;</td>
</tr>
<tr>
<td>“Start column index”</td>
<td>Output variable (integer data type). Shows the column where the text selection begins</td>
<td>iColumnSelection: INT;</td>
</tr>
<tr>
<td>“End line number”</td>
<td>Output variable (integer data type). Shows the line where the text selection ends</td>
<td>iRowEndSelection: INT;</td>
</tr>
<tr>
<td>“End column index”</td>
<td>Output variable (integer data type). Shows the column where the text selection ends</td>
<td>iColumnEndSelection: INT;</td>
</tr>
<tr>
<td>“Line to select”</td>
<td>Variable (integer data type). Contains the line number that is selected</td>
<td>bSetSelection: BOOL;</td>
</tr>
<tr>
<td></td>
<td>Note: The selection is controlled by the variables in the “Trigger selection” property.</td>
<td></td>
</tr>
<tr>
<td>“Set selection”</td>
<td>Variable (BOOL). Controls the selection of a line.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Example: bSetSelection: BOOL;</td>
<td></td>
</tr>
<tr>
<td></td>
<td>TRUE: The line from the “Line to select” property is selected and highlighted in the text editor.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>if the line is not in the current text segment of the text editor, then the text segment is moved to this line.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Note: The variable is used as the control variable for an input event triggered by a visualization user. The control variable is not reset automatically. You are responsible for this to occur in the visualization.</td>
<td></td>
</tr>
</tbody>
</table>
### Table 265: Element property “Control variables --> Error handling”

<table>
<thead>
<tr>
<th>Variable for error code</th>
<th>Variable (integer data type). Contains the error code when an error occurs.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Example: <code>iError: INT;</code></td>
</tr>
<tr>
<td></td>
<td>The error codes are declared in <code>GVL_ErrorCodes</code> in the <code>VisuElemTextEditor</code> library. To display the error text, the <code>VisuFctTextEditorGetErrorText()</code> function of the library must be called.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Variable for content changed</th>
<th>Variable (BOOL). Shows whether the contents have changed</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Example: <code>bIsContentEdited: BOOL;</code></td>
</tr>
<tr>
<td></td>
<td><code>TRUE</code>: The contents of the text editor have changed.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Variable for access mode</th>
<th>Variable (BOOL). Controls the access privileges to the file</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Example: <code>bIsReadOnly: BOOL;</code></td>
</tr>
<tr>
<td></td>
<td><code>TRUE</code>: A visualization user has read-only permission. At runtime, the file contents are highlighted in gray in the text editor.</td>
</tr>
<tr>
<td></td>
<td><code>FALSE</code>: A visualization user has read/write permission.</td>
</tr>
<tr>
<td></td>
<td>Note: The variable overwrites the setting in the “Editor mode” property.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Maximum line length</th>
<th>Maximum number of characters per line</th>

</thead>
</table>

<table>
<thead>
<tr>
<th>Editor mode</th>
<th>“Read-only”: A visualization user has read-only permissions to the file. At runtime, the file contents are highlighted in gray in the text editor.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>“Read/write”: A visualization user has read-write permissions.</td>
</tr>
</tbody>
</table>

### Element property ‘New files’

<table>
<thead>
<tr>
<th>Encoding</th>
<th>Character encoding of the new file:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>“ASCII”</td>
</tr>
<tr>
<td></td>
<td>“Unicode (Little endian)”</td>
</tr>
<tr>
<td></td>
<td>“Unicode (Big endian)”</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>New line character sequence</th>
<th>End of line character of the new file:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>“CR/LF”: Normal for Windows systems</td>
</tr>
<tr>
<td></td>
<td>“LF”: Normal for UNIX systems</td>
</tr>
<tr>
<td></td>
<td>Please note: When a visualization user opens an existing file, the end-of-line character of the file is detected and used automatically.</td>
</tr>
</tbody>
</table>

These properties are available only when you select the “Preview: Support client animations and overlay of native elements” option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.
### Animation duration

Time that the element executes an animation (in milliseconds)

**Example:** 500

### Move to the foreground

**Property value** *(BOOL)*

- **TRUE:** At runtime, the element is displayed in the foreground.
- **FALSE:** At runtime, the element is displayed in the layer where it was inserted in the visualization editor.

**See also**

- Chapter 1.3.5.21.5 “Using client animation” on page 1962

#### Requirement: User management is set up for the visualization.

### Access rights

Opens the “Access rights” dialog. There you can edit the access privileges for the element.

**Status messages:**

- **“Not set. Full rights.”**: Access rights for all user groups: “operable”
- **“Rights are set: Limited rights.”**: Access is restricted for at least one group.

**See also**

- Chapter 1.3.5.19.3.1 “Dialog ‘Access Rights’” on page 1583

**See also**

- [Visualization element ‘Path3D’](#)

#### Symbol:

![Path3D Symbol](image)

**Tag:** “Special controls”

The visualization element “Path3D” graphically displays the curves of two independent records as a 3D path. It is specially designed for use with CODESYS SoftMotion CNC in order to display the trajectory of a machine tool or a robot. The programmed path (path) and the path actually traveled (track) is visualized.

Although the visualization element is designed for use with CODESYS SoftMotion CNC, it can also be used to display any other record. In this case the application must provide the path data. The sample application 3D Path Generator, which is available in the CODESYS Store, shows how these data can be generated.

If the element is used together with SoftMotion CNC, then function blocks from the library SM3_CNC_Visu help to generate the data from the path and track. These function blocks are used by the sample project CNC_File_3DPath, which is stored in the installation directory of CODESYS.

- SMC_PathCopier
- SMC_PathCopierCompleteQueue
- SMC_PathCopierFile
- SMC_PositionTracker
A description of the function blocks can be found in the Library Manager in the SM3_CNC_Visu library.

The element does not work with the CODESYS HMI display variant.

- CNC Example 6: Using Path3D with SoftMotion CNC

Element properties

<table>
<thead>
<tr>
<th>&quot;Element name&quot;</th>
<th>Example: GenElemInst_1</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Type of element&quot;</td>
<td>&quot;Path3D&quot;</td>
</tr>
</tbody>
</table>

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

<table>
<thead>
<tr>
<th>&quot;X&quot;</th>
<th>X coordinate of the upper left corner of the element Specified in pixels. Example: 10.</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Y&quot;</td>
<td>Y coordinate of the upper left corner of the element Specified in pixels. Example: 10.</td>
</tr>
<tr>
<td>&quot;Width&quot;</td>
<td>Specified in pixels. Example: 150</td>
</tr>
<tr>
<td>&quot;Height&quot;</td>
<td>Specified in pixels. Example: 30</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the box symbols (_drag-) to other positions in the editor.

See also
- Chapter 1.3.5.3.2 “Positioning elements, adapting size and layer” on page 1113

Path description
### Path data (VisuStruct3DTrack)
Variable of the type VisuStruct3DTrack, which is declared in the IEC code. Example: PLC_PRG.pc.vs3dt. A description of the structure can be found in the library manager in the library VisuElem3DPath.library.

The data structure describes a path or track through a certain number of points. The points are determined and buffered by the application. The track typically displays the last n positions, so that only a certain part of them is ever displayed at any one time. VisuStruct3DTrack.pProjection is a variable that is set by the visualization element and contains information about the path/track projection. It can be read (only) by the application. In addition, the methods Projection.Apply or .ApplyV can be used in order to see whether the transformed position lies inside or outside the visualization display area, which is defined by Projection.ElementRect.

#### Path color
Color of the path drawn

#### Path line width
Path line width in pixels, e.g.: "2"

#### Style of boundary points
Display of the points between two successive objects in the path
- End points are not displayed
- End points are marked with a circle
- End points are marked with a cross
- End points are marked with a plus

### Track description
The track data are structured in exactly the same way as the path data: VisuStruct3DTrack

#### Track data (VisuStruct3DTrack)
Variable of the type VisuStruct3DTrack, which is declared in the IEC code. Example: PLC_PRG.pc.vs3dt. A description of the structure can be found in the library manager in the library VisuElem3DPath.library.

#### Track color
Color of the track drawn

#### Track line width
Track line width in pixels, e.g.: "2"

### Camera control
The camera position for the 3D mode is controlled with a reference to the external data structure. This structure allows the following operations:
- Shifting to the left/to the right/upwards/downwards
- Rotation around the X/Y/Z axis
- Resetting of the view at X/Y, Y/Z or Z/X level, so that the path and the track are completely visible.

#### Control data (VisuStruct3DControl)
Variable of the type VisuStruct3DControl, which is declared in the IEC code. Example: PLC_PRG.pc.vs3dc. A description of the structure can be found in the library manager in the library VisuElem3DPath library.

The values can be set via the application itself or via the visualization element “ControlPanel”. The library VisuElem3DPath contains ready-to-use visualization frames that provide a possible user interface for these data.
Highlighting

Individual parts of the path can be visually highlighted. This is typically used to mark the already processed part of a track with a different color. Each point in the path is given a unique ID, which in the case of a CNC editor is linked with the object ID on which the point lies. This ID ("highlight ID") can be specified via the application so that dynamic elements/parts of the track can be highlighted.

<thead>
<tr>
<th>&quot;Highlight mode&quot;</th>
<th>Select one of the following highlight modes:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Only the element whose ID corresponds to the value of the variable is highlighted.</td>
<td></td>
</tr>
<tr>
<td>All elements whose ID (linked with the object ID in the case of a CNC editor) is smaller than or equal to the value in &quot;Variable&quot; are highlighted.</td>
<td></td>
</tr>
</tbody>
</table>

| "Variable" | Project variable that specifies the ID of an element. Example: PLC_PRG.iVarElementID. This "highlight ID" is taken into account for the setting of the "highlight mode". The variable must be set in the IEC application. |

| "Highlight color" | Color of the grid lines |

Element look

| "Frame line width" | Width of the frame around the element, in pixels, for example: "1" |
| "Frame line style" | Select one of these style types for the frame line: |
| Solid | Dashes | Dots | Dash Dot | Dash Dot Dot | Hollow |

| "Transparent background" | The background of the element is displayed transparently. |
| "Background color" | The background of the element is displayed in the defined background color. |

These properties are available only when you select the "Preview: Support client animations and overlay of native elements" option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.

<table>
<thead>
<tr>
<th>&quot;Animation duration&quot;</th>
<th>Time that the element executes an animation (in milliseconds)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: 500</td>
<td></td>
</tr>
</tbody>
</table>

| "Move to the foreground" | Property value (BOOL) |
| TRUE: At runtime, the element is displayed in the foreground. |
| FALSE: At runtime, the element is displayed in the layer where it was inserted in the visualization editor. |
Element property 'Access rights'

<table>
<thead>
<tr>
<th>“Access rights”</th>
<th>Opens the “Access rights” dialog. There you can edit the access privileges for the element.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Status messages:</td>
</tr>
<tr>
<td></td>
<td>● “Not set. Full rights.”: Access rights for all user groups: “operable”</td>
</tr>
<tr>
<td></td>
<td>● “Rights are set: Limited rights”: Access is restricted for at least one group.</td>
</tr>
</tbody>
</table>

See also

● § Chapter 1.3.5.19.3.1 “Dialog ‘Access Rights’” on page 1583

Visualization element 'Control Panel'

Symbol:

Tag: “Special controls”

This visualization element is used in connection with the “Path3D” visualization element. It is used for changing the position and orientation to the CNC path shown with “Path3D”.

See also

● § Chapter 1.3.5.18.1.42 “Visualization element ‘Path3D’” on page 1499

Element properties

<table>
<thead>
<tr>
<th>“Element name”</th>
<th>Optional.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Hint: Assign individual names for elements so that they are found faster in the element list.</td>
</tr>
<tr>
<td></td>
<td>Example: Camera_Path_1</td>
</tr>
<tr>
<td>“Type of element”</td>
<td>“Frame”</td>
</tr>
<tr>
<td>“Clipping”</td>
<td>☑️ If you have set the “Scaling type” to “Fixed”, then only that part of the visualization is displayed that fits in the frame.</td>
</tr>
<tr>
<td>“Show frame”</td>
<td>Displays the frame</td>
</tr>
<tr>
<td></td>
<td>● “No frame”: The displayed area of the frame does not have borders.</td>
</tr>
<tr>
<td></td>
<td>● “Frame”: The displayed area of the frame has borders.</td>
</tr>
<tr>
<td></td>
<td>● “No frame with offset”: The displayed area of the frame does not have a border and the displayed area of the referenced visualization is reduced downwards by one pixel as compared to the frame area. The resulting gap prevents the referenced visualization from touching any adjacent elements.</td>
</tr>
</tbody>
</table>
"Scaling type" Describes how the frame reacts when the visualization is resized:

- "Isotropic": The frame retains its proportions. This allows the ratio of height to width to be preserved, even if the height and width of the visualization have been changed separately.
- "Anisotropic": The frame depends on the size of the visualization, so that height and width of the referenced visualization can be changed separately.
- "Fixed": The original size of the frame is retained, regardless of the visualization size. If you have also selected the "Clipping" option, then only the fitting part is displayed.
- "Fixed and scrollable": The referenced visualization is displayed without scaling. If it is larger than the window area of the frame, then scrollbars are included on the frame. To set the position of the scrollbar with a variable, use the "Scroll position variable horizontal" or "Scroll position variable vertical" property.

"Deactivation of the background drawing" To optimize the performance of the visualization, the non-animated elements of the frame element are drawn as a background bitmap. This could result in the elements not being displayed in the expected order.

- Deactivation of the background drawing. This can prevent the behavior described above.

Element property 'References'
Contains the currently configured visualization references as a subnode

"References" Clicking “Configure” opens the “Frame Configuration” dialog. This is used to manage the referenced visualizations.

Caution: Visualizations can be nested at any depth by means of frame elements. In order to use the “Switch to any visualization” frame selection type without any problems, a frame must not contain more than 21 referenced visualizations. For more information, see also the description for the “Input configuration” of an element: Action “Switch frame visualization”.

List of the currently referenced visualizations Visualizations that have a button also have this displayed as a subnode. Each interface variable is listed with the currently assigned transfer parameters.

Example:
vis_FormA
- iDataToDisplay_1: PLC_PRG.iVar1
- iDataToDisplay_2: PLC_PRG.iVar2

Hint: You can change the assignment of the variables to an interface variable here and edit the value field. Or click the “Configure” button instead.

See also
- Chapter 1.3.5.19.2.1 “Command 'Interface Editor'” on page 1556
- Chapter 1.3.5.19.3.6 “Dialog 'Input Configuration'” on page 1586

Element property 'Position'
The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“X”</td>
<td>X coordinate of the upper left corner of the element&lt;br&gt;Specified in pixels.&lt;br&gt;Example: 10.</td>
</tr>
<tr>
<td>“Y”</td>
<td>Y coordinate of the upper left corner of the element&lt;br&gt;Specified in pixels.&lt;br&gt;Example: 10.</td>
</tr>
<tr>
<td>“Width”</td>
<td>Specified in pixels.&lt;br&gt;Example: 150</td>
</tr>
<tr>
<td>“Height”</td>
<td>Specified in pixels.&lt;br&gt;Example: 30</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the box symbols (_drag) to other positions in the editor.

See also
- Chapter 1.3.5.3.2 “Positioning elements, adapting size and layer” on page 1113

**Element property ‘Center’**

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“X”</td>
<td>X-coordinate of the point of rotation</td>
</tr>
<tr>
<td>“Y”</td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the symbols (drag) to other positions in the editor.

**Element property ‘Colors’**

The properties contain fixed values for setting colors.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Color”</td>
<td>Color for the element in its normal state.&lt;br&gt;Please note that the normal state is in effect if the expression in the “Color variables ➔ Toggle color” property is not defined or it has the value FALSE.</td>
</tr>
<tr>
<td>“Alarm color”</td>
<td>Color for the element in alarm state.&lt;br&gt;Please note that the alarm state is in effect if the expression in the “Color variables ➔ Toggle color” property has the value TRUE.</td>
</tr>
<tr>
<td>“Transparency”</td>
<td>Value (0 to 255) for defining the transparency of the selected color.&lt;br&gt;Example 255: The color is opaque. 0: The color is completely transparent.</td>
</tr>
<tr>
<td>“Use gradient color”</td>
<td>: The element is displayed with a color gradient.</td>
</tr>
<tr>
<td>“Gradient setting”</td>
<td>The “Color gradient editor” dialog box opens.</td>
</tr>
<tr>
<td>“Frame color”</td>
<td>Example: “Black”</td>
</tr>
<tr>
<td>“Fill color”</td>
<td>Example: “Light gray”</td>
</tr>
</tbody>
</table>
The properties contain fixed values for setting the look of the element.

**Element property ‘Appearance’**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Line width”</strong></td>
<td>Value in pixels</td>
</tr>
<tr>
<td></td>
<td>Example: 2</td>
</tr>
<tr>
<td></td>
<td>Note: The values 0 and 1 both result in a line weight of one pixel. If no line</td>
</tr>
<tr>
<td></td>
<td>should be displayed, then the “Line style” property must be set to the option</td>
</tr>
<tr>
<td></td>
<td>“Invisible”.</td>
</tr>
<tr>
<td><strong>“Line style”</strong></td>
<td>Type of line representation</td>
</tr>
<tr>
<td></td>
<td>● “Solid”</td>
</tr>
<tr>
<td></td>
<td>● “Dashes”</td>
</tr>
<tr>
<td></td>
<td>● “Dots”</td>
</tr>
<tr>
<td></td>
<td>● “Dash Dot”</td>
</tr>
<tr>
<td></td>
<td>● “Dash Dot Dot”</td>
</tr>
<tr>
<td></td>
<td>● “not visible”</td>
</tr>
</tbody>
</table>

You can assign variables in the “Appearance variables” property for controlling the appearance dynamically. The fixed values are defined here.

**Element property ‘Texts’**

The properties contains character strings for labeling the element. The character string can also contain a placeholder with a format definition. In runtime mode, the placeholder is replaced by the current value in the specified format.

CODESYS accepts the specified texts automatically into the “GlobalTextList” text list. Therefore, these texts can be localized.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Text”</strong></td>
<td>Character string (without single straight quotation marks) for the labeling the element. Add a line break by pressing the keyboard shortcut [Ctrl] + [Enter].</td>
</tr>
<tr>
<td></td>
<td>Example: Accesses: %i</td>
</tr>
<tr>
<td></td>
<td>The variable that contains the current value for the placeholder is specified in the property “Text variable ➔ Text”.</td>
</tr>
<tr>
<td><strong>“Tooltip”</strong></td>
<td>Character string (without single straight quotation marks) that is displayed as the tooltip of an element.</td>
</tr>
<tr>
<td></td>
<td>Example: Number of valid accesses.</td>
</tr>
<tr>
<td></td>
<td>The variable that contains the current value for the placeholder is specified in the property “Text variable ➔ Tooltip”.</td>
</tr>
</tbody>
</table>

See also

- “Element property ‘Appearance variables’” on page 1285
- “Element property ‘Text variables’” on page 1229
The properties contain fixed values for the text properties.

<table>
<thead>
<tr>
<th><strong>Horizontal alignment</strong></th>
<th>Horizontal alignment of the text within the element.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Vertical alignment</strong></td>
<td>Vertical alignment of the text within the element.</td>
</tr>
</tbody>
</table>

**Text format**
- **Default**: The long text is truncated.
- **Line break**: The text is split into parts.
- **Ellipsis**: The visible text ends with "..." indicating that it is not complete.

**Font**
Example: **Default**
- The “Font” dialog box opens.
- DROP-DOWN LIST WITH STYLE FONTS.

**Font color**
Example: **Black**
- The “Color” dialog box opens.
- DROP-DOWN LIST WITH STYLE COLORS.

**Transparency**
Whole number (value range from 0 to 255). This determines the transparency of the respective color.
Example: 255: The color is opaque.
0: The color is completely transparent.
Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

**Movement**

**X**
Variable (numeric data type). Defines the X position (in pixels).
Example: PLC_PRG.iPos_X.
Increasing this value in runtime mode moves the element to the right.

**Y**
Variable (numeric data type). Defines the Y position (in pixels).
Example: PLC_PRG.iPos_Y.
Increasing this value in runtime mode moves the element downwards.

**Rotation**
Variable (numeric data type). Defines the angle of rotation (in degrees).
Example: PLC_PRG.iAngle1.
The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.
In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.
**“Scaling”**

Variable (integer data type). Causes centric stretching.

Example: PLC_PRG.iScaling.

The reference point is the “Center” property.

The value 1 shrinks the element by a factor of 0.001. The value 1000 returns the element to its original size.

**“Interior rotation”**

Variable (numeric data type). Defines the angle of rotation (in degrees).

Example: PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol.

Note: If a static angle of rotation is specified in the property “Position ➔ Angle”, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

---

You can link the variables to a unit conversion.

The properties “X”, “Y”, “Rotation”, and “Interior rotation” are supported by the “Client Animation” functionality.

---

See also

- *Unit conversion*

---

**Element property 'Relative movement'**

The properties contains variables for moving the element. The reference point is the position of the element (“Position” property). The shape of the element can change.

<table>
<thead>
<tr>
<th>“Movement top-left”</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“X”</strong></td>
<td>Variable (integer data type). It contains the number (in pixels) that the left edge is moved horizontally. Incrementing the value moves the element to the right.</td>
</tr>
<tr>
<td>Example: PLC_PRG.iDeltaX</td>
<td></td>
</tr>
<tr>
<td><strong>“Y”</strong></td>
<td>Variable (integer data type). It contains the number (in pixels) that the top edge is moved vertically. Incrementing the value moves the element to the down.</td>
</tr>
<tr>
<td>Example: PLC_PRG.iDeltaY</td>
<td></td>
</tr>
<tr>
<td><strong>“Movement bottom-right”</strong></td>
<td></td>
</tr>
<tr>
<td><strong>X</strong></td>
<td>Variable (integer data type). It contains the number (in pixels) that the right edge is moved horizontally. Incrementing the value moves the element to the right. <strong>Example:</strong> PLC_PRG.iDeltaWidth</td>
</tr>
<tr>
<td><strong>Y</strong></td>
<td>Variable (integer data type). It contains the number (in pixels) that the bottom edge is moved vertically. Incrementing the value moves the element to the down. <strong>Example:</strong> PLC_PRG.iDeltaHeight</td>
</tr>
</tbody>
</table>

See also

- “Element property ‘Absolute movement’” on page 1227

**Element property ‘Text variables’**

These properties are variables with contents that replace a format definition.

| “Text variable” | Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. **Example:** PLC_PRG.iAccesses |
| “Tooltip variable” | Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. **Example:** PLC_PRG.iAccessesInTooltip |

See also

- Chapter 1.3.5.18.2 “Placeholders with format definition in the output text” on page 1546
- “Element property ‘Texts’” on page 1226
- Enumerations

**Element property ‘Dynamic texts’**

Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.
| **“Text list”** | Variable (string) or name of the text list as a fixed string in single straight quotation marks.  
Example: 'Errorlist'  
▼: Drop-down list with the dialogs available in the text lists. |
| **“Text index”** | Text list ID. This refers to the desired output text.  
- As fixed string with the ID in single straight quotation marks.  
  Example: '1'  
- As a variable (STRING) for dynamically controlling the text output.  
  Example: strTextID  
  Sample assignment: PLC_PRG.strTextID := '1'; |
| **“Tooltip index”** | Text list ID. This refers to the desired output text.  
- As fixed string with the ID in single straight quotation marks.  
  Example: '2'  
- As a variable (STRING) for dynamically controlling the text output.  
  Example: strToolTipID  
  Sample assignment: PLC_PRG.strToolTipID := '2'; |

See also  
- Text list

**Element property ’Font variables’**  
The variables allow for dynamic control of the text display.

| **“Font name”** | Variable (STRING). Includes the font of the text.  
Example: PLC_PRG.stFontVar := 'Arial';  
The selection of fonts corresponds to the default “Font” dialog. |
| **“Size”** | Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name.  
- <pt>: Points (default)  
  Example: PLC_PRG.iFontHeight <pt>  
  Code: iFontHeight : INT := 12;  
- <px>: Pixels  
  Example: PLC_PRG.iFontHeight <px>  
  Code: iFontHeight : INT := 19;  

If you click in the value field, a drop-down list opens on the right for setting the unit.  

Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property “Text property ➔ Font”.

| pt | px |
### Flags

Variable (DWORD). Contains the flags for displaying fonts.

**Flags:**
- 1: Italics
- 2: Bold
- 4: Underline
- 8: Strikethrough

Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text:

```plaintext
PLC_PRG.dwFontType := 6;
```

### Character set

Variable (DWORD). Contains a character set number for the font.

The selection of character set numbers corresponds to the “Script” setting of the standard “Font” dialog.

### Color

Variable (DWORD). Includes the color of the text.

Example:

```plaintext
PLC_PRG.dwColorFont := 16#FF000000;
```

### Flags for text alignment

Variable (integer data type). Contains the coding for text alignment.

**Coding:**
- 0: Top left
- 1: Horizontal center
- 2: Right
- 4: Vertical center
- 8: Bottom

Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text:

```plaintext
PLC_PRG.dwFontType := 5;
```

---

*Fixed values for displaying texts are set in “Text properties”.*

See also
- § “Element property ‘Text properties’” on page 1227

**Element property ‘Colorvariables’**

The Element property is used as an interface for project variables to dynamically control colors at runtime.
### “Toggle color”

The property controls the toggled color at runtime.

**Value assignment:**
- **FALSE**: The element is displayed with the color specified in the “Color” property.
- **TRUE**: The element is displayed with the color specified in the “Alarm color” property.

**Assignment options:**
- Placeholder for the user input variable
  - “<toggle/tap variable>”
  - “<NOT toggle/tap variable>”

  The color change is not controlled by its own variable, but by a user input variable.

  Note: Specify a variable for the mouse events “Tap” or “Toggle” in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both “Toggle” and “Tap”, then the variable specified in “Tap” is used.

  Hint: Click the symbol to insert the placeholder “<toggle/tap variable>”. When you activate the “Inputconfiguration”, “Tap FALSE” property, then the “<NOT toggle/tap variable>” placeholder is displayed.

- Instance path of a project variable (BOOL)
  Example: PLC_PRG.xColorIsToggeled

  Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.

---

### “Normal state”

**“Alarm state”**

The properties listed below control the color depending on the state. The normal state is in effect if the variable in “Color variables”, “Toggle color” is not defined or it has the value FALSE. The alarm state is in effect if the variable in “Colorvariables”, “Toggle color” has the value TRUE.

---

### “Frame color”

**Assignment options:**
- Variable (DWORD) for the frame color
  Example: PLC_PRG.dwBorderColor
- Color literal
  Example of green and opaque: 16#FF00FF00

---

### “Filling color”

**Assignment options:**
- Variable (DWORD) for the fill color
  Example: PLC_PRG.dwFillColor
- Color literal
  Example of gray and opaque: 16#FF888888

---

*The transparency part of the color value is evaluated only if the “Activate semi-transparent drawing” option of the visualization manager is selected.*

---

*Select the “Advanced” option in the toolbar of the properties view. Then all element properties are visible.*

---

**See also**
- [Chapter 1.3.5.8.3 “Animating a color display” on page 1152](#)
**Element property 'Appearance variables'**

The properties contain variables for controlling the appearance of the element dynamically.

| “Line width” | Variable (integer data type). Contains the line weight (in pixels).  
|              | Note: The values 0 and 1 both result in a line weight of one pixel. If no line should be displayed, then the “Line style” property must be set to the option “Invisible”. |

| “Line style” | Variable (DWORD). Controls the line style.  
|             | Coding:  
|             | ● 0: Solid line  
|             | ● 1: Dashed line  
|             | ● 2: Dotted line  
|             | ● 3: Line type "Dash Dot"  
|             | ● 3: Line type "Dash Dot Dot"  
|             | ● 8: Invisible: The line is not drawn. |

*Fixed values can be set in the “Appearance” property. These values can be overwritten by dynamic variables at runtime.*

See also

- ® “Element property ‘Appearance’” on page 1238

**Element property 'Switch frame variable'**

The variable controls the switching of the referenced visualizations. This variable indexes one of the referenced frame visualizations and this is displayed in the frame. When the value of the variable changes, it switches to the recently indexed visualization.

| “Variable” | Variable (integer data type) that contains the index of the active visualization  
|           | Example: PLC_PRG.uiIndexVisu  
|           | Hint: The “Frame Configuration” dialog includes a list of referenced visualizations. The visualizations are automatically numerically indexed via the order in the list.  
|           | Note: This variant of switching usually affects all connected display variants.  
|           | ● Array element (integer data type) for index access via CURRENTCLIENTID  
|           | Example: PLC_PRG.aIndexVisu[CURRENTCLIENTID]  
|           | Note: This variant of switching applies to the current client only, and therefore only on one display variant. That is the display variant where the value change was triggered (for example, by means of user input). |

See also

- ® Chapter 1.3.5.19.2.9 “Command ‘Frame Selection’” on page 1564

**Element property 'State variables'**

The variables control the element behavior dynamically.
"Invisible" Variable (BOOL). Toggles the visibility of the element.
TRUE: The element is not visible at runtime.

"Deactivate inputs" Variable (BOOL). Toggles the operability of the element.
TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated.

The "Invisible" property is supported by the "Client Animation" functionality.

See also

These properties are available only when you select the "Preview: Support client animations and overlay of native elements" option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.

"Animation duration" Time that the element executes an animation (in milliseconds)
Example: 500

"Move to the foreground" Property value (BOOL)
TRUE: At runtime, the element is displayed in the foreground.
FALSE: At runtime, the element is displayed in the layer where it was inserted in the visualization editor.

See also

- Chapter 1.3.5.21.5 “Using client animation” on page 1962

Element property 'Input configuration'
The properties contain the configurations for the user input when using the mouse or keyboard. A user input defines an event and one or more actions that are executed when an event occurs.

The "Configure" button opens the "Input configuration" dialog box for creating or modifying a user input.

Configured user inputs are briefly listed below the events. They each include the action that is triggered and the setting in short form.

Example: "Execute ST code": # PLC_PRG.i_x := 0;

"OnDialogClosed" Input event: The user closes the dialog box.
"OnMouseClick" Input event: The user clicks the mouse button completely. The mouse button is clicked and released.
"OnMouseDown" Input event: The user clicks down on the mouse button.
"OnMouseEnter" Input event: The user drags the mouse pointer to the element.
"OnMouseLeave" Input event: The user drags the mouse pointer away from the element.
"OnMouseMove" Input event: The user moves the mouse pointer over the element area.
"OnMouseUp" Input event: The user releases the mouse button over the element area.
### "Tap"

When a mouse click event occurs, the variable defined in "Variable" is described in the application. The coding depends on the options "Tap FALSE" and "Tap on enter if captured".

### "Variable"

Variable (BOOL) that is set on mouse click.

**Example:** PLC_PRG.bIsTapped

- **TRUE:** A mouse click event exists. It lasts while the user presses the mouse button over the element. It ends when the button is released.
- **FALSE:** A mouse click event does not exist.

**Requirement:** The "Tap FALSE" option is not activated.

### "Tap FALSE"

- ✔️: The mouse click event leads to a complementary value in "Variable".
- **TRUE:** A mouse click event does not exist.
- **FALSE:** While the mouse click event exists.

### "Tap on enter if captured"

- ✔️: During user input, it is also taken into consideration whether the mouse pointer is dragged within the element area or not while the mouse button is pressed.
- **TRUE:** While the mouse click event exists and the mouse pointer is moved over the element area.
- **FALSE:** A mouse click event does not exist. Or the user moves the mouse pointer outside of the element area while the mouse button is pressed.

The value is **TRUE** again as soon as the user moves the pointer back to the element area. The mouse is then captured.

### "Shift"

With the onset of a mouse click event, the variable is set; when the mouse click event is completed, the variable is reset.

### "Variable"

Variable (BOOL). Its value toggled when the mouse click event is ended. This is when the user releases the mouse button while the mouse pointer is over the element area.

- If the user releases the mouse button while the mouse pointer is outside of the element area, then the mouse click event is not ended and the value is not toggled.

**Tip:** The user can cancel a started toggle input by dragging the mouse pointer out of the element area.

### "Toggle on up if captured"

- ✔️: The value toggles regardless of where the mouse pointer is when the mouse button is released. The mouse is then captured.

### "Keyboard shortcuts"

Keyboard shortcut on the element for triggering specific input actions.

When the keyboard shortcut event occurs, the input actions in the "Event(s)" property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.

### "Key"

Key pressed for input action.

**Example:** [T]

**Note:** The following properties appear when a key is selected.
### Event(s)
- **None**: 
- **Mouse down**: Pressing the key triggers the input actions that are configured in the “OnMouseDown” property.
- **Mouse up**: Releasing the key triggers the input actions that are configured in the “OnMouseUp” property.
- **Mouse down/up**: Pressing and releasing the key triggers the input actions that are configured in the “OnMouseDown” property and the “OnMouseUp” property.

### Shift
- **Shift**: Combination with the Shift key
- Example: [Shift]+[T].

### Control
- **Control**: Combination with the Ctrl key
- Example: [Ctrl]+[T].

### Alt
- **Alt**: Combination with the Alt key
- Example: [Alt]+[T].

All keyboard shortcuts and their actions that are configured in the visualization are listed in the “Keyboard configuration” tab.

See also

- Chapter 1.3.5.19.3.6 “Dialog ‘Input Configuration’” on page 1586

### Visualization element ‘Cartesian XY Chart’

#### Symbol:

![Cartesian XY Chart Symbol](image)

#### Tag: “Special controls”

The element displays the curve of array values graphically as a line or bar chart in the Cartesian coordinate system. The chart can display multiple curves at one time.

---

**NOTICE!**

**Restriction**
The element can be used with controller with V3.5 SP11 and later.

---

In the CODESYS Store, you will find a sample project for using XY chart elements in visualizations.
Element properties

| “Element name”               | Example: Velocity chart |
| “Type of element”            | “XY Chart”              |
| “Cartesian XY Chart”         | XYChart: Opens the “XY Chart Configuration” dialog. This is where the chart is configured. |

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

| “X”                          | X coordinate of the upper left corner of the element Specified in pixels. Example: 10. |
| “Y”                          | Y coordinate of the upper left corner of the element Specified in pixels. Example: 10. |
| “Width”                      | Specified in pixels. Example: 150 |
| “Height”                     | Specified in pixels. Example: 30 |

You can also change the values by dragging the box symbols ( ) to other positions in the editor.

See also

- § Chapter 1.3.5.3.2 “Positioning elements, adapting size and layer” on page 1113

Element property 'Element look'

The properties contain fixed values for defining the look of the element.

| “Border line width”          | Value in pixels Example: 2 Note: The values 0 and 1 both result in a line weight of one pixel. If no line should be displayed, then the “Border line style” property must be set to the option “Invisible”. |
| “Frame line color”           | Style color from the drop-down list. Example: Black Fixed value that is selected in the color dialog. Example: 0; 0; 0 |
### Element property 'Axis font'

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Font</strong></td>
<td>Example: “Default”</td>
</tr>
</tbody>
</table>

- ![opens button]: Opens the “Font” dialog.
- 📦: Drop-down list with style fonts

### Element property 'Control variables'

#### Table 266: “Zoom”

- Zooming the displayed curve is done by means of the mouse, or the pinch gesture on a multitouch device. It also applies to all axes.

  - At runtime when “Enable” is TRUE, you can draw a box with the mouse by holding down the left mouse button. When you release the mouse button, the display zooms in on the box and the curve is magnified. To zoom in and out on a multitouch device, move two fingers together or away from each other, respectively.

  - Zooming and panning can work together.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Enable</strong></td>
<td>Variable (BOOL) that enables or disables zooming.</td>
</tr>
</tbody>
</table>

  - TRUE: Enables zooming

  - Example: PLC_PRG.xZoomEnable

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Home</strong></td>
<td>Variable (BOOL).</td>
</tr>
</tbody>
</table>

  - Rising edge: Reset the displayed curve to the initial state after the display has changed due to zooming.

  - Example: PLC_PRG.xZoomHome

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Undo</strong></td>
<td>Variable (BOOL).</td>
</tr>
</tbody>
</table>

  - Rising edge: Reset the displayed curve to the previous position after the display has changed due to zooming.

  - Example: PLC_PRG.xZoomUndo

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Is zoomed</strong></td>
<td>Variable (BOOL) that indicates whether or not the displayed curve was modified due to zooming.</td>
</tr>
</tbody>
</table>

  - TRUE: Curve setting was zoomed.

  - Example: PLC_PRG.xIsZoomed

#### Table 267: “Pan”

- Panning the displayed curve is done by means of the mouse or the pinch gesture on a multitouch device. It also applies to all axes.

  - At runtime if “Enable” is TRUE, then you can drag the displayed curve to another position by holding down the left mouse button. To pan the displayed curve on a multitouch device, drag it with one finger to another position.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Enable</strong></td>
<td>Variable (BOOL) to enable or disable panning.</td>
</tr>
</tbody>
</table>

  - TRUE: Enables panning

  - Example: PLC_PRG.xPanEnable
### "Home"

**Variable (BOOL).**
Rising edge: Reset the displayed curve to the initial position after the display has changed due to panning.

**Example:** PLC_PRG.xPanHome

### "Is panned"

**Variable (BOOL) whose state indicates whether or not the displayed curve was modified due to zooming.**

**TRUE:** Curve setting was panned.

**Example:** PLC_PRG.xIsPanned

---

**Element property 'Absolute movement'**

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

---

### "Movement"

| **"X"**   | Variable (numeric data type). Defines the X position (in pixels).
|-----------|--------------------------------------------------------------------------
| Example:  | PLC_PRG.iPos_X.                                                           |
|           | Increasing this value in runtime mode moves the element to the right.     |
| **"Y"**   | Variable (numeric data type). Defines the Y position (in pixels).
| Example:  | PLC_PRG.iPos_Y.                                                           |
|           | Increasing this value in runtime mode moves the element downwards.         |

### "Rotation"

**Variable (numeric data type). Defines the angle of rotation (in degrees).**

**Example:** PLC_PRG.iAngle1.

The midpoint of the element rotates at the "Center" point. This rotation point is shown as the symbol.

In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

### "Interior rotation"

**Variable (numeric data type). Defines the angle of rotation (in degrees).**

**Example:** PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in "Center" according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol.

**Note:** If a static angle of rotation is specified in the "Position ➔ Angle" property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.

See also
- Unit conversion

## Element property 'State variables'

The variables control the element behavior dynamically.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Invisible”</strong></td>
<td>Variable (BOOL). Toggles the visibility of the element.</td>
</tr>
<tr>
<td></td>
<td>TRUE: The element is not visible at runtime.</td>
</tr>
<tr>
<td><strong>“Deactivate inputs”</strong></td>
<td>Variable (BOOL). Toggles the operability of the element.</td>
</tr>
<tr>
<td></td>
<td>TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated.</td>
</tr>
</tbody>
</table>

The “Invisible” property is supported by the "Client Animation" functionality.

See also
- 

These properties are available only when you select the “Preview: Support client animations and overlay of native elements” option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Animation duration”</strong></td>
<td>Time that the element executes an animation (in milliseconds)</td>
</tr>
<tr>
<td>Example: 500</td>
<td></td>
</tr>
<tr>
<td><strong>“Move to the foreground”</strong></td>
<td>Property value (BOOL)</td>
</tr>
<tr>
<td></td>
<td>TRUE: At runtime, the element is displayed in the foreground.</td>
</tr>
<tr>
<td></td>
<td>FALSE: At runtime, the element is displayed in the layer where it was inserted in the visualization editor.</td>
</tr>
</tbody>
</table>

## Element property 'Access rights'

Requirement: User management is set up for the visualization.
“Access rights” opens the “Access rights” dialog. There you can edit the access privileges for the element.

Status messages:
- “Not set. Full rights.”: Access rights for all user groups: “operable”
- “Rights are set: Limited rights”: Access is restricted for at least one group.

See also
- Chapter 1.3.5.19.3.1 “Dialog ‘Access Rights’” on page 1583

Visualisation element ‘Date range picker’

Symbol:

Tag: “Date/time controls”

The element provides the capability of selecting the date and time range of a saved data set. The element is used with the “Trend” visualization element.

Element properties

<table>
<thead>
<tr>
<th>“Element name”</th>
<th>Example: DateTrend1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Option</td>
<td></td>
</tr>
<tr>
<td>Hint: Assign individual names for elements so that they are found faster in the element list.</td>
<td></td>
</tr>
</tbody>
</table>

| “Type of element” | “Date range picker” |

Element property ‘Position’

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

<table>
<thead>
<tr>
<th>“X”</th>
<th>X coordinate of the upper left corner of the element</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specified in pixels</td>
<td>Example: 10.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Y”</th>
<th>Y coordinate of the upper left corner of the element</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specified in pixels</td>
<td>Example: 10.</td>
</tr>
</tbody>
</table>
"Width"  Specified in pixels.
Example: 150

"Height"  Specified in pixels.
Example: 30

You can also change the values by dragging the box symbols (_drag) to other positions in the editor.

See also
●  Chapter 1.3.5.3.2 “Positioning elements, adapting size and layer” on page 1113

Element property 'Center'
The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

"X"  X-coordinate of the point of rotation

"Y"  Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (drag) to other positions in the editor.

"Show frame"  : The visualization element is displayed with a frame.

"Resolution"  Resolution saved for the time stamp: "Millisecond" or "Microsecond"

"Attached element instance"  The element can be assigned to a "Trend" visualization element. In this way, the time range of the trend element can be changed. The available visual elements are selected with the help of the input assistant (select).

Element property 'Tick mark labels'

"Two-line labelling"  : The time stamps are displayed in two lines. The date is displayed in the first line and the time is displayed in the second line.
☐: Time stamp is displayed in one line. The date and time can also be displayed in one line depending on the formatting.

"Omit irrelevant information in time stamp"  : The time stamp has a shorter form. For example, the date is displayed only for the first tick mark, and only the time for the following tick marks. The settings in "Internationalization (format strings)" are ignored for this setting.
☐: All information is displayed for all time stamps.

"Internationalization (format strings)"  Only active when the parameter "Omit irrelevant information in timestamps" is deactivated.

"Date"  Definition of the date format. The default setting is taken from the Windows control panel.

"Time"  Definition of the time format. The default setting is taken from the Windows control panel.
Element property 'Text properties'  The properties contain fixed values for the text properties.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Horizontal alignment&quot;</td>
<td>Horizontal alignment of the text within the element.</td>
</tr>
<tr>
<td>&quot;Vertical alignment&quot;</td>
<td>Vertical alignment of the text within the element.</td>
</tr>
<tr>
<td>&quot;Font&quot;</td>
<td>Example: &quot;Default&quot;&lt;br&gt;촉: The “Font” dialog box opens.</td>
</tr>
<tr>
<td>&quot;Font color&quot;</td>
<td>Example: &quot;Black&quot;&lt;br&gt;촉: The “Color” dialog box opens.</td>
</tr>
<tr>
<td>&quot;Transparency&quot;</td>
<td>Whole number (value range from 0 to 255). This determines the transparency of the respective color. Example: 255: The color is opaque. 0: The color is completely transparent. Please note: If the color is a style color and already has a transparency value, then this property is write-protected.</td>
</tr>
</tbody>
</table>

Element property 'Additional buttons'  The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Jump to the largest possible time stamp&quot;</td>
<td>총: An additional button ( sensit) is displayed for jumping to the last time stamp.</td>
</tr>
<tr>
<td>&quot;Jump to the smallest possible time stamp&quot;</td>
<td>총: An additional button ( sensit) is displayed for jumping to the first time stamp.</td>
</tr>
<tr>
<td>&quot;Zoom out&quot;</td>
<td>총: An additional button ( sensit) is displayed for setting the current min./max. range to the maximum range. The selected range is left.</td>
</tr>
</tbody>
</table>

Element property 'Absolute movement'  The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Movement&quot;</td>
<td>Variable (numeric data type). Defines the X position (in pixels). Example: PLC_PRG.iPos_X. Increasing this value in runtime mode moves the element to the right.</td>
</tr>
<tr>
<td>&quot;Y&quot;</td>
<td>Variable (numeric data type). Defines the Y position (in pixels). Example: PLC_PRG.iPos_Y. Increasing this value in runtime mode moves the element downwards.</td>
</tr>
</tbody>
</table>
### Rotation

Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle1.

The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.

In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

### Interior rotation

Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol.

Note: If a static angle of rotation is specified in the “Position Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

---

You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.

Visualization element 'Time range picker'

Symbol: 🕒

Tag: “Date/time controls”

The element provides configurable buttons for setting the time range of a trend display to a defined time. In the process the end time of the previous display is left unchanged and the start time is adapted.
**Element property 'Position'**

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>X</td>
<td>X coordinate of the upper left corner of the element. Specified in pixels. Example: 10.</td>
</tr>
<tr>
<td>Y</td>
<td>Y coordinate of the upper left corner of the element. Specified in pixels. Example: 10.</td>
</tr>
<tr>
<td>Width</td>
<td>Specified in pixels. Example: 150</td>
</tr>
<tr>
<td>Height</td>
<td>Specified in pixels. Example: 30</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the box symbols (_drag_•_•_•_) to other positions in the editor.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Orientation</td>
<td>Specifies whether the time picker element is aligned horizontally or vertically in the editor. Hint: Change the width to height ratio of the element in the editor.</td>
</tr>
<tr>
<td>Show frame</td>
<td><em>✓</em>: The visualization element is drawn with a frame.</td>
</tr>
<tr>
<td>Resolution</td>
<td>Resolution saved for the time stamp: “Millisecond” or “Microsecond”</td>
</tr>
<tr>
<td>Attached element instance</td>
<td>Assignment to the element that processes the time picker. The element can be assigned for example to a “Trend” visualization element. Then the time range of the trend element can be changed. The available visual elements are selected with the help of the input assistance (input assistance). Example: GenElemInst_1</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Element property 'Texts'</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Text</td>
<td>String label for the element. Example: Zoom</td>
</tr>
</tbody>
</table>

**Element property 'Text properties'**

The properties contain fixed values for the text properties.
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| **“Font”** | Example: “Default”  
- The “Font” dialog box opens.  
- Drop-down list with style fonts. |
| **“Font color”** | Example: “Black”  
- The “Color” dialog box opens.  
- Drop-down list with style colors. |
| **“Transparency”** | Whole number (value range from 0 to 255). This determines the transparency of the respective color.  
Example: 255: The color is opaque.  
0: The color is completely transparent.  
Please note: If the color is a style color and already has a transparency value, then this property is write-protected. |

**Property ’Times’**  
In “Times”, the buttons that the element provides at runtime are defined and configured in an array.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Provide &quot;All&quot; selection”</strong></td>
<td>☑: Time selector bar extended by &quot;All&quot; button. The diagram represents a time interval that covers all time stamps.</td>
</tr>
<tr>
<td><strong>“Times”</strong></td>
<td>☑: Adds another button to the time selection bar and increases the array by one entry. An additional index is present in the property “Times Æ Times Æ [&lt;new&gt;]”. “Time” is located under this index. The configuration of the button is to be entered there.</td>
</tr>
</tbody>
</table>
| **“Times”** | Array of all buttons in the time selection bar. Index corresponds to the number of buttons.  
- “[Index]”  
- with index € {0, 1, 2,...}  
- The associated button is removed from the time picker bar. The configuration entry is deleted from the “Times” property list. |
| **“[Index]”** | ☑: Time interval in standardized notation. Example: 3M for 3 months; 30m for 30 minutes. If a time interval is indicated in the field, then the button is labelled with it. If a user clicks on the button at runtime, the command is executed to switch the diagram to this time interval. The default is empty. |

**Element property ’Control variables’**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| **“Time”** | Displays which time is currently selected.  
Variable (STRING)  
Example: PLC_PRG.strSelectedTime |
| **“‘All’ selected”** | Displays the state of the “All” button  
Variable (BOOL)  
Example: PLC_PRG.AllTimesAreSelected |

**Element property ’Absolute movement’**  
The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
### Movement

<table>
<thead>
<tr>
<th>Variable</th>
<th>Definition</th>
<th>Example</th>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>X</strong></td>
<td>Variable (numeric data type). Defines the X position (in pixels).&lt;br&gt;Example: PLC_PRG.iPos_X. Increasing this value in runtime mode moves the element to the right.</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Y</strong></td>
<td>Variable (numeric data type). Defines the Y position (in pixels).&lt;br&gt;Example: PLC_PRG.iPos_Y. Increasing this value in runtime mode moves the element downwards.</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Rotation</strong></td>
<td>Variable (numeric data type). Defines the angle of rotation (in degrees).&lt;br&gt;Example: PLC_PRG.iAngle1. The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Interior rotation</strong></td>
<td>Variable (numeric data type). Defines the angle of rotation (in degrees).&lt;br&gt;Example: PLC_PRG.iAngle2. In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the symbol. Note: If a static angle of rotation is specified in the “Position Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.

See also
- [Unit conversion](#)
Element property 'State variables'

The variables control the element behavior dynamically.

<table>
<thead>
<tr>
<th>Variable (BOOL)</th>
<th>Toggles the visibility of the element.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>&quot;Invisible&quot;</strong></td>
<td>TRUE: The element is not visible at runtime.</td>
</tr>
</tbody>
</table>

The "Invisible" property is supported by the "Client Animation" functionality.

See also

* These properties are available only when you select the “Preview: Support client animations and overlay of native elements” option in the Visualization Manager.
You can animate a movement, a rotation, and the visibility of a visualization element.

<table>
<thead>
<tr>
<th>Time that the element executes an animation (in milliseconds)</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>&quot;Animation duration&quot;</strong></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Property value (BOOL)</th>
<th>At runtime, the element is displayed in the foreground.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>&quot;Move to the foreground&quot;</strong></td>
<td>FALSE: At runtime, the element is displayed in the layer where it was inserted in the visualization editor.</td>
</tr>
</tbody>
</table>

Element property 'Access rights'

Requirement: User management is set up for the visualization.

<table>
<thead>
<tr>
<th>Opens the “Access rights” dialog. There you can edit the access privileges for the element.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>&quot;Access rights&quot;</strong></td>
</tr>
</tbody>
</table>

Status messages:

* "Not set. Full rights.": Access rights for all user groups: "operable"
* "Rights are set: Limited rights": Access is restricted for at least one group.

See also

* Chapter 1.3.5.19.3.1 “Dialog 'Access Rights'” on page 1583

Visualization element 'Date picker'

Symbol:

Tag: “Date/time controls”
The element is a calendar that displays the current date. A user can click a tag to select a date, which is saved to a variable. In addition, it can customize the time interval that the calendar displays. Clicking the calendar header changes the year. Clicking the arrows in the calendar header changes the month.

The element contains language-dependent texts that are managed in the System text list. This deals with the names of the month and the days of the week written out completely or abbreviated. When the date picker is added to a visualization, CODESYS generates the text list automatically below the POU view. The IDs correspond to the default text and therefore English terms. The text list makes it possible to translate these texts.

### System text list

<table>
<thead>
<tr>

### Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

<table>
<thead>
<tr>
<th>“X”</th>
<th>X coordinate of the upper left corner of the element</th>

- Chapter 1.3.5.3.2 “Positioning elements, adapting size and layer” on page 1113

**Element property 'Center'**

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

| “X” | X-coordinate of the point of rotation |
| “Y” | Y-coordinate of the point of rotation |

You can also change the values by dragging the symbols (_symbol) to other positions in the editor.

| “Variable” | Input variable (DATE). Contains the date that a user selects in the calendar. Example: PLC_PRG.dtDueDate |
| “Design” | - “From style”: All settings are preconfigured according to the style.  
- “Explicit”: The “Design settings” property appears. Here you can customize the calendar. |

**Design settings**

Requirement: This property is visible only if the “Design” property is set to “Explicit”.

The values of the property can be predefined in the style. Then they are available in the drop-down list.

### Draw background
*From style*: The style defines whether and how a background is drawn.  
*Yes*: The background is filled with the color in the “Background color” property.  
*No*: The background is not filled with a color.

### Background color

### Show frame
*From style*: The style defines whether and how a frame is drawn.  
*Yes*: The frame is displayed with the following properties.  
*No*: A frame is not displayed.

### Frame color
Used if “Yes” is selected in “Show frame”.

### Rectangle type

### Line width

### Day of week heading
Design of the heading with the days of the week

### Font
Style font or user-defined font

### Font color
Style color or user-defined color

### Draw background
*From style*: The style defines whether and how a background is drawn.  
*Yes*: The background is filled with the style color “From style”. The style defines whether and how a background is drawn.  
*No*: The background is not filled with a color.

### Background color

### Show frame
*From style*: The style defines whether and how a frame is drawn.  
*Yes*: The frame is displayed with the following properties.  
*No*: A frame is not displayed.

### Frame color
Used if “Yes” is selected in “Show frame”.

### Rectangle type

### Line width

### Display separator line
*From style*: The style defines whether and how a separator line is drawn.  
*Yes*: Display with the following properties.  
*No*: A separator line is not displayed.

### Color of the separator line
Used if “Yes” is selected in “Display separator line”.

### Width of separator line

### Background
Design of the calendar days

### Draw background
*From style*: The style defines whether and how a background is drawn.  
*Yes*: The background is filled with the color in the “Fill color” property and framed in the “Frame color”.  
*No*: The background is not filled with a color.

</tbody>
</table>

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;X&quot;</td>
<td>Variable (numeric data type). Defines the X position (in pixels).</td>
</tr>
<tr>
<td></td>
<td>Example: PLC_PRG.iPos_X</td>
</tr>
<tr>
<td></td>
<td>Increasing this value in runtime mode moves the element to the right.</td>
</tr>
<tr>
<td>&quot;Y&quot;</td>
<td>Variable (numeric data type). Defines the Y position (in pixels).</td>
</tr>
<tr>
<td></td>
<td>Example: PLC_PRG.iPos_Y</td>
</tr>
<tr>
<td></td>
<td>Increasing this value in runtime mode moves the element downwards.</td>
</tr>
<tr>
<td>&quot;Rotation&quot;</td>
<td>Variable (numeric data type). Defines the angle of rotation (in degrees).</td>
</tr>
<tr>
<td></td>
<td>Example: PLC_PRG.iAngle1</td>
</tr>
<tr>
<td></td>
<td>The midpoint of the element rotates at the &quot;Center&quot; point. This rotation point is shown as the symbol.</td>
</tr>
<tr>
<td></td>
<td>In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.</td>
</tr>
<tr>
<td>&quot;Interior rotation&quot;</td>
<td>Variable (numeric data type). Defines the angle of rotation (in degrees).</td>
</tr>
<tr>
<td></td>
<td>Example: PLC_PRG.iAngle2</td>
</tr>
<tr>
<td></td>
<td>In runtime mode, the element rotates about the point of rotation specified in &quot;Center&quot; according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.</td>
</tr>
<tr>
<td></td>
<td>The rotation point is shown as the symbol.</td>
</tr>
<tr>
<td></td>
<td>Note: If a static angle of rotation is specified in the &quot;Position ➔ Angle&quot; property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.</td>
</tr>
</tbody>
</table>
You can link the variables to a unit conversion.

The "X", "Y", "Rotation", and "Interior rotation" properties are supported by the "Client Animation" functionality.

See also
- Unit conversion

Element property ‘State variables’

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Invisible”</td>
<td>Variable (BOOL). Toggles the visibility of the element. TRUE: The element is not visible at runtime.</td>
</tr>
<tr>
<td>“Deactivate inputs”</td>
<td>Variable (BOOL). Toggles the operability of the element. TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated.</td>
</tr>
</tbody>
</table>

The “Invisible” property is supported by the "Client Animation" functionality.

See also
- 

These properties are available only when you select the “Preview: Support client animations and overlay of native elements” option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Animation duration”</td>
<td>Time that the element executes an animation (in milliseconds) Example: 500</td>
</tr>
<tr>
<td>“Move to the foreground”</td>
<td>Property value (BOOL) TRUE: At runtime, the element is displayed in the foreground. FALSE: At runtime, the element is displayed in the layer where it was inserted in the visualization editor.</td>
</tr>
</tbody>
</table>

See also
- Chapter 1.3.5.21.5 “Using client animation” on page 1962

Element property ‘Access rights’

Requirement: User management is set up for the visualization.
“Access rights” Opens the “Access rights” dialog. There you can edit the access privileges for the element.

Status messages:
- “Not set. Full rights.”: Access rights for all user groups: “operable”
- “Rights are set: Limited rights”: Access is restricted for at least one group.

See also
- Chapter 1.3.5.19.3.1 “Dialog ‘Access Rights’” on page 1583

Visualization Element ‘Analog clock’

Symbol:

Tag: “Date/time controls”
The element is a clock that displays the current time of day. The clock can also display any time.

Element properties

<table>
<thead>
<tr>
<th>“Element name”</th>
<th>Example: GenElemInst_1</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Type of element”</td>
<td>“Analog clock”</td>
</tr>
</tbody>
</table>

Element property 'Position' The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

<table>
<thead>
<tr>
<th>“X”</th>
<th>X coordinate of the upper left corner of the element</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Specified in pixels.</td>
</tr>
<tr>
<td>Example: 10</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Y”</th>
<th>Y coordinate of the upper left corner of the element</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Specified in pixels.</td>
</tr>
<tr>
<td>Example: 10</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Width”</th>
<th>Specified in pixels.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: 150</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Height”</th>
<th>Specified in pixels.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: 30</td>
<td></td>
</tr>
</tbody>
</table>
You can also change the values by dragging the box symbols (ற) to other positions in the editor.

See also
- Chapter 1.3.5.3.2 “Positioning elements, adapting size and layer” on page 1113

**Element property 'Center'**
The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

<table>
<thead>
<tr>
<th>“X”</th>
<th>X-coordinate of the point of rotation</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Y”</td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the symbols (❑) to other positions in the editor.

**Element property 'Time Display'**

| “Use system time” | ☑: The system time of the PLC is displayed. |
| “Variable” | Variable (time data type TOD, TIME_OF_DAY). This receives the time of day that is not the system time. Example: PLC_PRG.todTimeTokio |

Requirement: The "Use system time" property is not activated.

See also
- Time/date type TOD

| “Design” | ● “From style”: All settings are preconfigured according to the style. ● “Explicit”: The “Settings” property appears. Here you can customize the analog clock. |

**Element property 'Absolute movement'**
The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

| “Movement” | | |
| “X” | Variable (numeric data type). Defines the X position (in pixels). Example: PLC_PRG.iPos_X. Increasing this value in runtime mode moves the element to the right. |
| “Y” | Variable (numeric data type). Defines the Y position (in pixels). Example: PLC_PRG.iPos_Y. Increasing this value in runtime mode moves the element downwards. |
### "Rotation"

Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle1.

The midpoint of the element rotates at the "Center" point. This rotation point is shown as the symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

### "Scaling"

Variable (integer data type). Causes centric stretching.

**Example:** PLC_PRG.iScaling.

The reference point is the "Center" property.

The value 1 shrinks the element by a factor of 0.001. The value 1000 returns the element to its original size.

### "Interior rotation"

Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in "Center" according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol.

Note: If a static angle of rotation is specified in the property "Position ➝ Angle", then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

### "Use REAL values"

Note: Only available if the device supports the use of REAL coordinates.

- The properties of the absolute movement are interpreted as REAL values. The values are not rounded.

- The option allows for the individual fine-tuning of drawing the element, for example for the visualization of a smoother rotation.

- Hint: If a horizontal or vertical line is drawn blurry on a specific visualization platform, then this can be corrected by an offset of 0.5px in the direction of the line thickness.

---

You can link the variables to a unit conversion.
The properties “X”, “Y”, “Rotation”, and “Interior rotation” are supported by the "Client Animation" functionality.

</tbody>
</table>

### Table 274: “Center point”

| “Color” | Color of the center of the clock |

### Table 275: “Positioning”

| “Usage of” | ● “Default style values”: Presetting of the style values  
| “Positioning” | Requirement: Visible when the “Usage or” property is set to “Individual settings”. |
| “Numerics movement” | Value (in pixels) for shifting the digits.  
Example: 80 |
| “Line movement” | Value (in pixels) for shifting the hour lines.  
Example: 100 |
| “Hands scaling” | Factor for scaling the length of the hour hand. You can customize the exact position of the hour hand relative to the background image.  
Example: 100 |

### “Scaling type”

| Defines the scaling of the height and width of the element. |
| ● “Anisotropic”: The background image is scaled to the size of the element The height and width are scaled independently of each other. |
| ● “Isotropic”: The background image is scaled to the size of the element, retaining its proportion. The proportion of height and width is fixed. |

### “Optimized drawing”

| ☑: The background image is drawn one time. When the hour hand moves, only the affected part of the image is redrawn. |
| ☐: The background image is redrawn in cycles.  
Hint: Deactivate this option only for extreme exceptions. |

**Element property 'Absolute movement'**

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

### “Movement”

| “X” | Variable (numeric data type). Defines the X position (in pixels).  
Example: PLC_PRG.iPos_X. |

Increasing this value in runtime mode moves the element to the right.
### “Y”
Variable (numeric data type). Defines the Y position (in pixels).

**Example:** PLC_PRG.iPos_Y.

Increasing this value in runtime mode moves the element downwards.

### “Rotation”
Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle1.

The midpoint of the element rotates at the “Center” point. This rotation point is shown as the ◆ symbol.

In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

### “Interior rotation”
Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the ◆ symbol.

Note: If a static angle of rotation is specified in the “Position ➔ Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

---

**You can link the variables to a unit conversion.**

**The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.**

See also
- Unit conversion
- 

---

**Element property ‘State variables’**

The variables control the element behavior dynamically.

### “Invisible”
Variable (BOOL). Toggles the visibility of the element.

TRUE: The element is not visible at runtime.
The “Invisible” property is supported by the “Client Animation” functionality.

See also

These properties are available only when you select the “Preview: Support client animations and overlay of native elements” option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.

<table>
<thead>
<tr>
<th>“Animation duration”</th>
<th>Time that the element executes an animation (in milliseconds)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Example: 500</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Move to the foreground”</th>
<th>Property value (BOOL)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>TRUE: At runtime, the element is displayed in the foreground.</td>
</tr>
<tr>
<td></td>
<td>FALSE: At runtime, the element is displayed in the layer where it was inserted in the visualization editor.</td>
</tr>
</tbody>
</table>

Symbol:

Tag: “Date/time controls”

The element provides the capability of selecting the date or time. The value can be changed by means of the keyboard or arrow keys. The date can be selected from a calendar.

Element properties

<table>
<thead>
<tr>
<th>“Element name”</th>
<th>Optional</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hint: Assign individual names for elements so that they are found faster in the element list.</td>
<td></td>
</tr>
<tr>
<td>Example: StartDateAndTime</td>
<td></td>
</tr>
</tbody>
</table>

| “Type of element” | “Date and time picker” |
Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

<table>
<thead>
<tr>
<th>“X”</th>
<th>X coordinate of the upper left corner of the element</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Specified in pixels.</td>
</tr>
<tr>
<td></td>
<td>Example: 10.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Y”</th>
<th>Y coordinate of the upper left corner of the element</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Specified in pixels.</td>
</tr>
<tr>
<td></td>
<td>Example: 10.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Width”</th>
<th>Specified in pixels.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Example: 150</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Height”</th>
<th>Specified in pixels.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Example: 30</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the box symbols to other positions in the editor.

See also

- Chapter 1.3.5.3.2 “Positioning elements, adapting size and layer” on page 1113

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

<table>
<thead>
<tr>
<th>“X”</th>
<th>X-coordinate of the point of rotation</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>“Y”</th>
<th>Y-coordinate of the point of rotation</th>
</tr>
</thead>
</table>

You can also change the values by dragging the symbols to other positions in the editor.
"Variable"  
Variable (DATE, DT, TIME, LTIME, TOD)  
The value of the value of the variable is shown by the element and can be modified by the element.

The data type automatically determines the displayed value units:
- **TIME**: Day, hour, minute, second (by default, milliseconds are not shown)
- **DATE**: Year, month, day
- **DT**: Year, month, day, hour, minute, second
- **TOD**: Hour, minute, second (by default, milliseconds are not shown)
- **LTIME**: Day, hour, minute, second (by default, milliseconds, microseconds, and nanoseconds are not shown)

"Format string"  
The format can restrict the output to individual values.

Example for **LTIME**: Format: HH:mm:ss.ms.us.ns --> displayed: 08:15:12.780.150.360

Basically, all usual formats available for %t are also supported.

"Design date time picker"  
- "From style": All settings are preconfigured according to the style.
- "Explicit": The property "Designsettings" appears. Here you can customize the calendar.

"Design date picker"  
- "From style": All settings are preconfigured according to the style.
- "Explicit": The property "Designsettings" appears. Here you can customize the calendar.

"Positioning date picker"  
- "Dynamic": The calendar is adapted and positioned automatically.
- "Manual": The "Position settings" property appears. Here you can customize the calendar.

See also  
- § Chapter 1.3.5.18.2 “Placeholders with format definition in the output text” on page 1546

Element property 'Absolute movement'  
The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"  
**X**  
Variable (numeric data type). Defines the X position (in pixels).
Example: PLC_PRG.iPos_X.
Increasing this value in runtime mode moves the element to the right.

**Y**  
Variable (numeric data type). Defines the Y position (in pixels).
Example: PLC_PRG.iPos_Y.
Increasing this value in runtime mode moves the element downwards.
### “Rotation”

Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle1.

The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.

In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

### “Scaling”

Variable (integer data type). Causes centric stretching.

**Example:** PLC_PRG.iScaling.

The reference point is the “Center” property.

The value 1 shrinks the element by a factor of 0.001. The value 1000 returns the element to its original size.

### “Interior rotation”

Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol.

Note: If a static angle of rotation is specified in the property “Position ➔ Angle”, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

---

You can link the variables to a unit conversion.

---

The properties “X”, “Y”, “Rotation”, and “Interior rotation” are supported by the “Client Animation” functionality.

---

**Element property 'State variables’**

The variables control the element behavior dynamically.

---

---

---
"Invisible" Variable (BOOL). Toggles the visibility of the element.
  TRUE: The element is not visible at runtime.

"Deactivate inputs" Variable (BOOL). Toggles the operability of the element.
  TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated.

The "Invisible" property is supported by the "Client Animation" functionality.

See also

- These properties are available only when you select the "Preview: Support client animations and overlay of native elements" option in the Visualization Manager.
  You can animate a movement, a rotation, and the visibility of a visualization element.

"Animation duration" Time that the element executes an animation (in milliseconds)
  Example: 500

"Move to the foreground" Property value (BOOL)
  TRUE: At runtime, the element is displayed in the foreground.
  FALSE: At runtime, the element is displayed in the layer where it was inserted in the visualization editor.

See also

- Chapter 1.3.5.21.5 “Using client animation” on page 1962

Element property 'Access rights'

Requirement: User management is set up for the visualization.

"Access rights" Opens the "Access rights" dialog. There you can edit the access privileges for the element.
  Status messages:
  - "Not set. Full rights.": Access rights for all user groups: "operable"
  - "Rights are set: Limited rights": Access is restricted for at least one group.

See also

- Chapter 1.3.5.19.3.1 “Dialog 'Access Rights'” on page 1583

1.3.5.18.2 Placeholders with format definition in the output text

A character string that is output in the visualization can include the placeholder % for a variable.
At runtime, the placeholder is replaced by the actual value of the variable in the defined format.
The data type in the format definition and of the variable must be identical. A character string can contain a maximum of one placeholder.

Character strings for output are listed in the "Text" property. The associated variable is listed in the "Text variable" property.
### Printing integers

<table>
<thead>
<tr>
<th>%d</th>
<th>Printing a variable (integer data type) as a decimal number</th>
<th>Code: iCounter : INT := 12; Property “Text”: Value: %i Property “Text variable”: PLC_PRG.iCounter Output: Value: 12</th>
</tr>
</thead>
<tbody>
<tr>
<td>%i</td>
<td>Printing a variable (integer data type) as a binary number</td>
<td>Code: byCode : BYTE := 255; Property “Text”: Coding: %b Property “Text variable”: PLC_PRG.byCode Output: Coding: 11111111</td>
</tr>
<tr>
<td>%b</td>
<td>Printing a variable (integer data type) as an unsigned octal number without a preceding zero</td>
<td>Code: byCode : BYTE := 8#377; Property “Text”: Coding: %o Property “Text variable”: PLC_PRG.byCode Output: Coding: 377</td>
</tr>
<tr>
<td>%o</td>
<td>Printing a variable (integer data type) as an unsigned hexadecimal number without a preceding &quot;0x&quot;</td>
<td>Code: dwCode : INT := 16#FFFFFFF; Property “Text”: Coding: %x Property “Text variable”: PLC_PRG.dwCode Output: Coding: ffffffff</td>
</tr>
<tr>
<td>%x</td>
<td>Printing a variable (integer data type with maximum 32 bits) as an unsigned hexadecimal number without a preceding &quot;0x&quot;</td>
<td>Code: lwCode : LWORD := 16#4FFF_3FFF_2FFF_1FFF; Property “Text”: Coding: %llx Property “Text variable”: PLC_PRG.lwCode Output: Coding: 4fffff2ff1ff</td>
</tr>
<tr>
<td>%llX</td>
<td>Output of a 64-bit variable (LWORD, LINT, ULLINT) as a hexadecimal number. Note: llx means “long long hexadecimal”</td>
<td>Code: uiNumber : UINT := 1234; Property “Text”: Number: %u Property “Text variable”: PLC_PRG.uiNumber Output: Number: 1234</td>
</tr>
</tbody>
</table>

### Floating-point numbers

Floating-point numbers have the data type **REAL** or **LREAL**.
### Printing text

<table>
<thead>
<tr>
<th>Short format</th>
<th>Description</th>
<th>Code</th>
<th>Property “Text”</th>
<th>Property “Text variable”</th>
<th>Output</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>%f</code></td>
<td>In decimal form with decimal point in format 1.6</td>
<td><code>rWeight : REAL := 1.123456789;</code></td>
<td>Weight: %f</td>
<td>PLC_PRG.rWeight</td>
<td>Weight: 1.123456</td>
</tr>
</tbody>
</table>
| `<alignment><minimum width>.<accuracy>f` | As decimal number in user-defined format  
  ● `<alignment>`: - or +, optional  
  - Left-aligned  
  + Right-aligned  
  ● `<minimum width>`: Number of places to the left of the decimal point  
  ● `<accuracy>`: Number of places to the right of the decimal point | `rWeight : REAL := 12.1` | Weight: %2.3f | Output: Weight: 12,100 |
| `%e`         | Printing a floating-point number (REAL or LREAL) in exponential notation of base 10 | `rValue : REAL := 1.234567e-003;` | Value: %E | PLC_PRG.rValue | Value: 1.23E-6 |
| `%E`         | | `rValue : REAL := 1.234567e-003;` | Value: %e | PLC_PRG.rValue | Value: 1.23e-6 |
| `%c`         | Printing a single character in ASCII | `bChar := 16#41;` | Key: %c | PLC_PRG.bChar | Key: A |
| `%s`         | Printing a character string | `strName := 'Paul Smith';` | Name: %s | PLC_PRG.strName | Name: Paul Smith |
Printing the percent sign

<table>
<thead>
<tr>
<th>%%</th>
<th>Printing the percent sign in a character string</th>
<th>Property “Text”: Valid until 90%</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Output: Valid until 90%</td>
<td>Code: iPercentage : INT := 80;</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Property “Text”: Valid until %d%.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Property “Text variable”:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>PLC_PRG.iPercentage := 80;</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Output: Valid until 80%</td>
</tr>
</tbody>
</table>

Printing the date and time

If the output text in the element property “Text” contains the placeholder “%t”, then a date and/or time is printed. If a variable is not specified in the property “Text variable”, then the system time is printed; otherwise it is the value of the variable.

The names of the days and months are displayed in English by default. If localized texts are used, then the text list System has to be supplemented. This text list is created automatically in the “POUs” view when the placeholder %t is used. The English terms have to be used as the ID here. The localization can be done for both the abbreviated and full names.

The localization can be done for both the abbreviated and full names.

Time data types include LTIME, TIME, TIME_OF_DAY, TOD, DATE, DATE_AND_TIME, and DT.

### Date and time formats

<table>
<thead>
<tr>
<th>%t[yyyy]</th>
<th>Years with century (4 digits)</th>
<th>Code: dateBy : DATE := DATE#2020-1-1;</th>

Output: Month: 1 |
| `%t[ddddd]` | Days of week as a number (1=Monday to 7=Sunday) | Code: `iDay : INT := 7;`  
Property “Text”: Day: `%t[ddddd]`  
Property “Text variable”: PLC_PRG.iDay  
Output: Day: 7 |
| `%t[dddd]` | Days of week as a full name | Code: `iDay : INT := 7;`  
Property “Text”: Day: `%t[dddd]`  
Property “Text variable”: PLC_PRG.iDay  
Output: Day: Sunday |
| `%t[ddd]` | Days of week as an abbreviated name | Code: `iDay : INT := 7;`  
Property “Text”: Day: `%t[ddd]`  
Property “Text variable”: PLC_PRG.iDay  
Output: Day: Sun |
| `%t[dd]` | Days in month as a number (01 – 31) | Code: `iDay : INT := 1;`  
Property “Text”: Day: `%t[dd]`  
Property “Text variable”: PLC_PRG.iDay  
Output: Day: 01 |
| `%t[d]` | Days in month as a number (1 – 31) | Code: `iDay : INT := 1;`  
Property “Text”: Day: `%t[d]`  
Property “Text variable”: PLC_PRG.iDay  
Output: Day: 1 |
| %t[jjj] | Days in year as a number (001-366) | Code: dateOfNoReturn : DATE := DATE#2016-09-01;
Property “Text”: Day of no return: %t[jjj]
Property “Text variable”: PLC_PRG.dateOfNoReturn
Output: Day of no return: 245 |
| %t[HH] | Hours in 24-hour format (00-23) | Code: todEnd : TOD := TIME_OF_DAY#17:0:0;
Property “Text”: Ends at: %t[HH]:00
Property “Text variable”: PLC_PRG.todEnd
Output: Ends at 17:00 |
| %t[hh] | Hours in 12-hour format (01-12) | Code: todEnd : TOD := TIME_OF_DAY#17:0:0;
Property “Text”: Ends at: %t[hh]:00 o'clock
Property “Text variable”: PLC_PRG.todEnd
Output: Ends at 17:00 o'clock |
| %t[mm] | Minutes with leading zeros (00-59) | Code: tPeriod : TIME := T#5M;
Property “Text”: Period: %t[mm]m
Property “Text variable”: PLC_PRG.tPeriod
Output: Period: 05m |
| %t[m] | Minutes without leading zeros (0-59) | Code: tPeriod : TIME := T#5m;
Property “Text”: Period: %t[m 'm']
Property “Text variable”: PLC_PRG.tPeriod
Output: Period: 5 m |
| %t[ss] | Seconds with leading zeros (00-59) | Code: tPeriod : TIME := T#5m3s;
Property “Text”: Period: %t[mm'm's's's']
Property “Text variable”: PLC_PRG.tPeriod
Output: Period: 05m03s |
| %t[s] | Seconds without leading zeros (0-59) | Code: tPeriod : TIME := T#5m3s;
Property “Text”: Period: %t[m'm's's']
Property “Text variable”: PLC_PRG.tPeriod
Output: Period: 5m3s |
| %t[ms] | Milliseconds without leading zeros (0-999) | Code: tPeriod : TIME := T#500ms;
Property “Text”: Period: %t[ms'm's']
Property “Text variable”: PLC_PRG.tPeriod
Output: Period: 500ms |
For LTIME variables only: microsecond definition (0-999)

Code:
```plaintext
ltPeriod : LTIME := LTIME#1000D23H44M12S34MS2US44NS;
```

Property “Text”: Period: %t[dd.HH.m.s.ms.us.ns]

Property “Text variable”: PLC_PRG.ltPeriod

Output: Period: 1000.23.44.12.34.2.44

Hint: Overflow is permitted in the greatest time unit of a definition.

For LTIME variables only: nanosecond definition (0-999)

Code:
```plaintext
tClosed : TOD := TOD#17:17:17.17;
```

Property “Text”: Closed at %t[hht]

Property “Text variable”: PLC_PRG.tClosed

Output: Closed at 5P

If the value is a time < 12h, then AM is printed; otherwise PM is printed.

Code:
```plaintext
tClosed : TOD := TOD#17:17:17.17;
```

Property “Text”: Closed at %t[hh tt]

Property “Text variable”: PLC_PRG.tClosed

Output: Closed at 5 PM

If character strings should be printed that correspond to a format definition, then these must be represented in single straight quotation marks.

The format definitions can be represented in a series.

Printing the complete time

Code:
```plaintext
dwTime : DWORD := 4294967295;
```

Property “Text”: Time: %t[HH:mm:ss:ms]

Property “Text variable”: PLC_PRG.dwTime

Printing the date and day of the week

Code:
```plaintext
dateSet : DATE := DATE#2016-02-12;
```

Property “Text”: Date: %t[yyyy-MM-dd dddd]

Property “Text variable”: PLC_PRG.dateSet

Output: Date: 2016-02-12 Friday

### 1.3.5.18.3 Methods of the dialog manager

Visualizations that have the visualization type “Dialog” and serve as input requests are automatically instanced and managed by the internal dialog manager.
The dialog manager can be accessed in the application via the similarly internal visualization manager by calling the method `GetDialogManager`.

The dialog manager has the following methods for handling a dialog.

**NOTICE!**

You can program the method calls in function blocks or functions that are themselves called from the visualization or via the action `Execute ST code`.

In addition, you can program the method calls in the application code. Make sure that the call runs in the VISU_TASK. The behavior is undefined if this is not the case.

See also

- Method 'GetDialog'

  Supplies the instance (IVisualisationDialog) of the dialog whose name is transferred.

  **Table 276: Inputs (VAR_INPUT)**

<table>
<thead>
<tr>
<th>Name</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

1.3.5.18.4 Attribute 'VAR_IN_OUT_AS_POINTER'

Function: The pragma (attribute 'VAR_IN_OUT_AS_POINTER') allows for the passing of a reference to a data object to the interface variable of a visualization.

Requirement: The referenced visualization must be used as a dialog.

Syntax: (attribute 'VAR_IN_OUT_AS_POINTER')
1.3.5.18.5 Attribute 'parameterstringof'

The pragma \{attribute 'parameterstringof'\} allows that the instance name of the specified parameter is made accessible for the referenced visualization. An interface variable (STRING) will contain the instance name of the specified parameter. The interface variable is visible within the referenced visualization and can for example be used in a text output.

Syntax:

\{attribute 'parameterstringof' := '<variable>'\}

Example: declaration of an interface

```plaintext
VAR_IN_OUT
  \{attribute 'VAR_IN_OUT_AS_POINTER'\}
  iftController : ControlFB;
END_VAR

- § Chapter 1.3.5.19.2.1 “Command 'Interface Editor’” on page 1556
```

1.3.5.19 Reference, user interface

1.3.5.19.1 Keyboard Shortcuts for Default Keyboard Action

Requirement: The “Activate default keyboard handling” option is activated in the “Visualization Manager” object.

The keyboard shortcuts for default keyboard action make it possible for users to operate the visualization with the keyboard only. Elements that respond to user input can process a keyboard event instead of a mouse event. You do not have to change their input configuration for this purpose. The universal keyboard shortcuts are supported by all devices and are available on all display variants when needed.

```
Example: declaration of an interface

VAR_INPUT
  \{attribute 'parameterstringof' := 'iftDut_A'\}
  sItfNameDut_A: STRING;
END_VAR
VAR_IN_OUT
  iftDut_A : DUT_A;
END_VAR

See also
- § Chapter 1.3.5.15.2 “Calling a visualization with an interface” on page 1188
- § Chapter 1.3.5.19.2.1 “Command 'Interface Editor’” on page 1556
```
### Keyboard shortcuts

**[Tab]**  
Focus jumps to the next element.  
The next element that responds to a configured or preconfigured user input receives the focus. The order of elements corresponds to the order that the elements were added to the editor.  
If the focused element is a table, then the upper left cell in the table is the next focus. After that, each next cell until all cells have been focused. It also applies here that only cells that require input are focused.  
If the focused element is a frame, then an element of the referenced visualization is set next in focus in the frame. After that, each next element until all elements have been focused. It also applies here that only elements that require input are focused.

**[Shift]+[Tab]**  
Focus jumps to the previous element.  
The element is focused that is before the currently focused element in the added order. Therefore, the order is the opposite as for “Tab”.

**[Arrow]**  
The focus jumps to the element that is in the direction as indicated by the arrow.

**[Input]**  
The visualization detects the input at the focused element and triggers the input action.

### 1.3.5.19.2 Commands

**Command 'Interface Editor'**

Symbol: 🔄; keyboard shortcut: `[Alt]+[F6]`.

**Function:** The command opens and closes the “Interface Editor” tab above the visualization editor.

**Call:** Menu bar: “Visualization ➔ Interface Editor” Also by clicking on the small down arrow at the top of the visualization editor.
Tab 'Interface Editor'

The tab contains an editor for the declaration of interface variables. The editor behaves in a similar way to the declaration editor of a function block, however interface variables are not initialized.

Syntax

```plaintext
<scope>
    {attribute '<attribute name>' ( := '<expression>' )? }?
    <identifier> : <data type>;
END_VAR
```

```plaintext
<scope> : VAR_INPUT | VAR_OUTPUT | VAR_IN_OUT // (...)? : Optional
```

Example

Declaration in the interface editor

```plaintext
VAR_INPUT
    {attribute 'parameterstringof'}
    sIdentifier : STRING; // String for instance name
    iCounter : INT;
END_VAR

VAR_IN_OUT
    {attribute 'VAR_IN_OUT_AS_POINTER'}
    fbController: FB_Controller;
END_VAR
```

Scopes

Possible scopes for interfaces of visualizations or dialogs

<table>
<thead>
<tr>
<th>Scope</th>

Command 'Keyboard Configuration'  

Symbol: ; keyboard shortcut: [Alt]+[F6].

Function: This command opens and closes the “Keyboard Configuration” tab above the visualization editor.

Call: Menu bar: “Visualization”.

Requirement: A visualization is open and active in the visualization editor.

See also

Tab 'Keyboard configuration'

This tab contains a list of keyboard shortcuts with an editing option.

A keyboard shortcut can refer specifically to an element. Then the configuration appears here and in the “Input configuration” property of the associated element.

A keyboard shortcut can also have several configurations. If a keyboard shortcut has multiple keyboard configurations, then its input actions are executed in the order listed here.

Keyboard shortcuts of the default keyboard action are not listed here.

| “Key” | Key that a keyboard configuration is defined. Example: [M] 
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Note:</td>
<td>You can combine the key with [Ctrl], [Alt], and/or [Shift].</td>
</tr>
</tbody>
</table>

| “Key down” | ☑: The input action is executed when the user presses the key. 
|------------|------------------------------------------------------------------|
|            | ☐: The input action is executed when the user releases the key.  
|            | Double-click: Drop-down list of all keys.                       |
| Note:      | If the input action should be executed for both pressing the key (KeyDown) and releasing the key (KeyUp), then you must define a keyboard configuration for both input actions. |

<table>
<thead>
<tr>
<th>“Shift”</th>
<th>☑: The input event is triggered for [Shift]+[key].</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Ctrl”</td>
<td>☑: The input event is triggered for [Ctrl]+[key].</td>
</tr>
<tr>
<td>“Alt”</td>
<td>☑: The input event is triggered for [Alt]+[key].</td>
</tr>
</tbody>
</table>

| “Action type” | input action 
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Double-click: Drop-down list of input actions.</td>
</tr>
<tr>
<td></td>
<td>Tip: For a description of input actions, refer to the “Input configuration” dialog box.</td>
</tr>
</tbody>
</table>

| “Action” | Configuration of the input action that was selected next. 
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Double-click</td>
<td>A dialog box opens that varies according to the input action. It allows the user-prompted customization of the settings.</td>
</tr>
<tr>
<td>Tip: For a description of dialog boxes, refer to the “Input configuration” dialog box. The input action is configured in the same way here.</td>
<td></td>
</tr>
</tbody>
</table>
"Element ID" | ID of the visualization element where the user can execute the key event. The ID is relevant only if the event is also assigned to an element.
---|---
| Tip: The assignment of ID to element name is listed in the “Element list”.

"Access rights" | Access privileges of the action per user group.
---|---
| Requirement: The visualization has a user management.

↓ | Clicking the symbol on the right of the list moves the selected row one line down.
↑ | Clicking the symbol on the right of the list moves the selected row one line up.
Blank line | Allows adding a new keyboard configuration.

Command 'Element List'
Symbol: ![element_list]

**Function:** The command opens the “Element List” tab for the current visualization. It is displayed in the upper part of the visualization editor.

**Call:** Menu “Visualization”

**Requirement:** A visualization is open in the editor.

Tab 'Elementlist'
This view provides a list of the visualization elements in the currently opened visualization. The selection is always synchronized with the selection in the main window of the visualization editor. Grouped elements are displayed in a tree structure. The order of the elements in this list from top to bottom is the same as the order of their positions in the display levels of the visualization from back to front. If an element is shifted forwards or backwards in the editor window with the commands from the menu “Visualization ➔ Order”, the element list is automatically updated.

<table>
<thead>
<tr>
<th>&quot;Type&quot;</th>
<th>Element type and symbol as used in the view “Tools”, as well as the element number that initially arises from the order of insertion.</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;X&quot;, &quot;Y&quot;</td>
<td>Position of the top left corner of the element (0,0 = top left corner of the visualization area).</td>
</tr>
<tr>
<td>&quot;Width&quot;</td>
<td>Dimensions of the element in pixels.</td>
</tr>
<tr>
<td>&quot;Height&quot;</td>
<td></td>
</tr>
<tr>
<td>&quot;ID&quot;</td>
<td>Internally assigned element identifier</td>
</tr>
<tr>
<td>&quot;Name&quot;</td>
<td>Element name as defined in “Properties ➔ Element name”.</td>
</tr>
<tr>
<td>&quot;Access rights&quot;</td>
<td>If the behavior of an element is restricted for some user groups, this is marked by a padlock symbol 🗝️.</td>
</tr>
</tbody>
</table>

- ☞ Chapter 1.3.5.3.2 “Positioning elements, adapting size and layer” on page 1113
Command 'Activate Keyboard Usage'

Symbol: 

**Function:** This command activates and deactivates the keyboard usage when a visualization is executed in online mode (integrated in CODESYS).

**Call:** Menu bar: “Visualization”, context menu.

**Requirement:** A visualization is open.

When this command is active, the visualization executes the keyboard events that you specified as a visualization user.

When the command is inactive, CODESYS executes the keyboard events that you specify.

See also

- § Chapter 1.3.5.4.4 “Configuring keyboard shortcuts” on page 1131

Command 'Order'

**Function:** The command makes further commands available. They are for specifying the order of the elements in levels, since elements in the rear levels are concealed by those in the front levels.

**Call:** Menu “Visualization”, context menu

**Requirement:** The visualization elements are positioned behind one another.

See also

- § Chapter 1.3.5.3.2 “Positioning elements, adapting size and layer” on page 1113

Command 'Bring to Front'

Symbol: 

**Function:** The command positions the selected visualization element in the front level. The element becomes completely visible.

**Call:** Menu “Visualization ➔ Order”, context menu

Command 'Bring One to Front'

**Function:** The command positions the selected visualization element one level further forwards.

**Call:** Menu “Visualization ➔ Order”, context menu

Command 'Send to Back'

Symbol: 

**Function:** The command positions the selected visualization element in the back level.

**Call:** Menu “Visualization ➔ Order”, context menu

Command 'Send One to Back'

Symbol: 

**Function:** The command positions the selected visualization element one level further backwards.

**Call:** Menu “Visualization ➔ Order”, context menu

Command 'Alignment'

**Function:** The command makes further commands available. It is used for the alignment of visualization elements in the window area of the visualization.

**Call:** Menu “Visualization”, context menu
See also

- Chapter 1.3.5.3.2 “Positioning elements, adapting size and layer” on page 1113

**Command 'Align Left'**

Symbol: 

Function: the command aligns the selected visualization elements along a line through the left-hand edge of the element that is positioned furthest left.

Call: Menu “Visualization → Alignment”, context menu

Requirement: Several elements are selected.

**Command 'Align Top'**

Symbol: 

Function: the command aligns the selected visualization elements along a line through the upper edge of the element that is positioned highest.

Call: Menu “Visualization → Alignment”, context menu

Requirement: Several elements are selected.

**Command 'Align Right'**

Symbol: 

Function: the command aligns the selected visualization elements along a line through the right-hand edge of the element that is positioned furthest right.

Call: Menu “Visualization → Alignment”, context menu

Requirement: Several elements are selected.

**Command 'Align Bottom'**

Symbol: 

Function: the command aligns the selected visualization elements along a line through the lower edge of the element that is positioned lowest.

Call: Menu “Visualization → Alignment”, context menu

Requirement: Several elements are selected.

**Command 'Align Vertical Center'**

Symbol: 

Function: the command aligns the selected visualization elements to their common vertical center.

Call: Menu “Visualization → Alignment”, context menu

Requirement: Several elements are selected.

**Command 'Align Horizontal Center'**

Symbol: 

Function: The command aligns the selected visualization elements to their common horizontal center.

Call: Menu “Visualization → Alignment”, context menu

Requirement: Several elements are selected.

**Command 'Make Horizontal Spacing Equal'**

Symbol: 

Function: The command aligns the selected visualization elements so that the elements positioned furthest left and furthest right retain their position and the elements between them are positioned with the same horizontal spacing.

Call: Menu “Visualization → Alignment”, context menu
Requirement: 3 or more elements are selected. The first element is blue, while the other elements are displayed in grey.

**Command 'Increase Horizontal Spacing'**

Symbol: ⬆️

Function: The command aligns the selected visualization elements so that the blue element retains its position and the other elements are positioned with a larger horizontal spacing. The spacing increases by 1 pixel each time.

Call: Menu “Visualization ➔ Alignment”, context menu

Requirement: Several elements are selected.

**Command 'Decrease Horizontal Spacing'**

Symbol: ⬅️

Function: The command aligns the selected visualization elements so that the blue element retains its position and the other elements are positioned with a smaller horizontal spacing. The spacing decreases by 1 pixel each time.

Call: Menu “Visualization ➔ Alignment”, context menu

Requirement: Several elements are selected.

**Command 'Remove Horizontal Spacing'**

Symbol: ❌

Function: The command aligns the selected visualization elements so that the blue element retains its position and the other elements are positioned with no horizontal spacing between them.

Call: Menu “Visualization ➔ Alignment”, context menu

Requirement: Several elements are selected.

**Command 'Make Vertical Spacing Equal'**

Symbol: ⬇️

Function: The command aligns the selected visualization elements so that the uppermost and lowermost elements retain their position and the elements between them are positioned with the same vertical spacing.

Call: Menu “Visualization”, context menu

Requirement: 3 or more elements are selected. The first element is blue, while the other elements are displayed in grey.

**Command 'Increase Vertical Spacing'**

Symbol: ⬆️

Function: The command aligns the selected visualization elements so that the blue element retains its position and the other elements are positioned with a larger vertical spacing. The spacing increases by 1 pixel each time.

Call: Menu “Visualization ➔ Alignment”, context menu

Requirement: Several elements are selected.

**Command 'Decrease Vertical Spacing'**

Symbol: ⬅️

Function: The command aligns the selected visualization elements so that the blue element retains its position and the other elements are positioned with a smaller vertical spacing. The spacing decreases by 1 pixel each time.

Call: Menu “Visualization ➔ Alignment”, context menu

Requirement: Several elements are selected.
**Command 'Remove Vertical Spacing'**

Symbol: 

**Function:** The command aligns the selected visualization elements so that the blue element retains its position and the other elements are positioned with no horizontal spacing between them.

**Call:** Menu “Visualization ➔ Alignment”, context menu

**Requirement:** Several elements are selected.

---

**Command 'Make Same Width'**

Symbol: 

**Function:** The command makes the width of the selected visualization elements the same as the width of the blue selected element.

**Call:** Menu “Visualization ➔ Alignment”, context menu

**Requirement:** Several elements are selected. The first element is blue, while the other elements are displayed in grey.

```
The command does not work with lines or polygons.
```

---

**Command 'Make Same Height'**

Symbol: 

**Function:** The command makes the height of the selected visualization elements the same as the height of the blue selected element.

**Call:** Menu “Visualization ➔ Alignment”, context menu

**Requirement:** Several elements are selected. The first element is blue, while the other elements are displayed in grey.

```
The command does not work with lines or polygons.
```

---

**Command 'Make Same Size'**

Symbol: 

**Function:** The command makes the size of the selected visualization elements the same as the size of the blue selected element.

**Call:** Menu “Visualization ➔ Alignment”, context menu

**Requirement:** Several elements are selected. The first element is blue, while the other elements are displayed in grey.

```
The command does not work with lines or polygons.
```

---

**Command 'Size to Grid'**

Symbol: 

**Function:** The command aligns the size and position of the selected visualization elements to the grid.

**Call:** Menu “Visualization ➔ Alignment”, context menu

**Requirement:** Several elements are selected.
Command 'Group'

Symbol: 🎨

**Function:** The command groups the selected visualization elements and displays them as one.

**Call:** Menu “Visualization”, context menu

**Requirement:** At least 2 elements are selected.

To select more elements you can drag a window around the desired elements with the mouse. Alternatively you can click on the desired elements while keeping the [Shift] key pressed.

To select all elements you can open the context menu of the visualization editor and choose the “Select All” command.

You can also drag and drop elements to a group. For that, press the [Shift] key while dragging the element to the group. Meanwhile the cursor changes its appearance (display a small plus sign).

- ✉ Chapter 1.3.5.19.2.8 “Command ‘Ungroup’” on page 1564
- ✉ Chapter 1.3.5.19.2.22 “Command ‘Select None’” on page 1581

Command 'Ungroup'

Symbol: 🎨

**Function:** The command ungroups elements again.

**Call:** Menu “Visualization”, context menu

**Requirement:** A grouping is selected.

See also
- ✉ Chapter 1.3.5.19.2.7 “Command ‘Group’” on page 1564

Command 'Frame Selection'

**Function:** The command opens the “Frame Configuration” dialog.

**Call:**
- Menu bar: “Visualization”
- Click the “Configure” button in the “References” property.

**Requirement:** A “Frame” element or “Tab control” element is selected in the editor. The “Element Properties” view is open.

Dialog 'Frame Configuration'

The dialog allows you to select one or more of all available visualizations. The selected visualizations are displayed at runtime in the window area of the frame element or tab control element.
**NOTICE!**
Visualizations can be nested at any depth by means of frame elements. In order to use the “Switch to any visualization” frame selection type without any problems, a frame must not contain more than 21 referenced visualizations.

For more information, see also the description for the “Input configuration” of an element: Action “Switch frame visualization”.

---

### Table 284: “Available Visualizations”

<table>
<thead>
<tr>
<th>“By Visualization Name”</th>
<th>The list of available visualizations of the project and libraries is sorted alphabetically.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“By Type or Instance”</td>
<td>The list of available visualizations of the project and libraries is sorted by type or instance.</td>
</tr>
<tr>
<td>Input field for a filter</td>
<td>If a filter text is specified, then only those visualizations whose names contain the filter text are listed.</td>
</tr>
<tr>
<td>()</td>
<td>Project with project visualizations below it</td>
</tr>
<tr>
<td>()</td>
<td>Library with project visualizations below it</td>
</tr>
</tbody>
</table>

### Table 285: “Selected Visualizations”

<table>
<thead>
<tr>
<th>“Add”</th>
<th>Click the symbol to add a visualization to the list of selected visualizations.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Requirement: This is selected in “Available Visualizations”.</td>
</tr>
<tr>
<td></td>
<td>Hint: To add a visualization, double-click a visualization in “Available Visualizations”.</td>
</tr>
<tr>
<td>“Delete”</td>
<td>Click the symbol to delete a visualization from the list.</td>
</tr>
<tr>
<td></td>
<td>Requirement: This is selected in “Selected Visualizations”.</td>
</tr>
</tbody>
</table>

The visualizations are automatically numerically indexed via the order in the list. The top visualization has the index 0. The next visualization has the index 1 and so on.

Note: A frame and a tab control element use the variables specified in the index of the “Switch frame variable” property.

| “Move Up” | Click the symbol to move a visualization up in the list. |
|           | Requirement: This is selected in “Selected Visualizations”. |
| “Move Down” | Click the symbol to move a visualization down in the list. |
|           | Requirement: This is selected in “Selected Visualizations”. |

---

---

**Command ‘Background’**

**Symbol:** 🎨

**Function:** The dialog “Background” opens. You can define here whether the background of the visualization is colored or displayed with an image.

**Call:** Menu “Visualization”, context menu
See also

- §Chapter 1.3.5.3.7 “Designing a background” on page 1124

**Dialog 'Background'**

**Table 286: “Color Settings”**

| “Use Color” | ☑: Background in color | Color defined as a style color or as a fixed value.

**Table 287: “Image Setting”**

| “Use Image” | ☑: Display of a background image | Reference to an image from an image pool in the project, formally specified as an instance path: <Name of the image pool>..<ID>

Example:
- ImagePool_A.Factory
- ImagePool_B.ID_B

**Command 'Multiply Visu Element’**

Symbol: 🠌

**Function:** The command opens the “Multiply Visu Element” dialog, which contains a configuration derived from the template element and the array declaration. You can rearrange the elements here, as well as their quantity and the index access to the array data. When you exit the dialog, a field of similar elements is created from the template element. In the properties of the new elements, array variables are now configured with precise array indexes. These new elements are those in which you have configured an array variable with index access placeholders in the template.

**Call:** Menu bar: “Visualization”; context menu

**Requirement:** The visualization is active and a configured template element is selected.

**Dialog 'Multiply Visu Element’**

**Table 288: Tab “Basic Settings”**

| “Total number of elements” | The total number is determined by the index range of the placeholders, including the setting on the “Advanced Settings” tab. The layout of the elements can be one-dimensional (as a column or row) or two-dimensional (as a table field).

| “Horizontal” | Number of elements per row |

Default: Number of array components (index range) of the placeholder $\text{FIRSTDIM}$

**Example for array:** axLampIsOn: ARRAY[0..4] OF BOOL; = 5
### “Vertical”

Number of rows required for the layout of all elements

Default

- When using index access placeholder \$FIRSTDIM\$:
  - If the index range of the placeholder is less than five, then the layout of elements is horizontal. If the index range is greater than five, then the layout the elements is quadratic whenever possible.
- When using index access placeholders \$FIRSTDIM\$ and \$SECONDDIM\$:
  - The number of horizontal elements is equal to the number of index ranges specified by the placeholder \$FIRSTDIM\$. The number of vertical elements is equal to the number of index ranges specified by the placeholder \$SECONDDIM\$.

### “Offset between elements”

Distance between the new elements; affects the positions of the new elements

- “0”: The frames of the elements overlap by one pixel.
- “1”: The elements touch.
- “<n>”: A distance of \(n-1\) pixel is visible between the elements.

### “Horizontal”

Distance between the elements within a row (in pixels)

Example: 2 for a distance of one pixel

### “Vertical”

Distance between the elements within the columns (in pixels)

Example for a distance of three pixels: 4

### “Arrangement of elements”

Origin from which the new elements are positioned and arranged

If “Vertical” or “Horizontal” <> 1

- “From top left”
- “From top right”
- “From bottom left”
- “From bottom right”

If “Horizontal” or “Vertical” = 1

- “From top”
- “From bottom”

### “Orientation”

Determines the layout of the elements in the field (row by row, or column by column)

- “Line by line”
- “Column by column”

### “Preview”

Displays the set layout and orientation of the elements as an arrow
Based on the template element, the precise index for accessing the array variable is calculated for each new element. The calculation is based on the array index limits as specified in the array declaration. The settings are also taken into account here.

**“1st dimension”** Calculation guideline for the index of the first dimension that replaces $FIRSTDIM$

The first new element gets the value specified below in “Start index” in the first dimension. The other elements each get an index incremented by “Increment” until an index is calculated for all elements.

Example
- “Start index”: 1
- “Increment”: 1

**“2nd dimension”** Calculation guideline for the index of the second dimension that replaces $SECONDDIM$

The first new element gets the value specified below in “Start index” in the second dimension. The other elements each get an index incremented by “Increment”.

Example
- “Start index”: 1
- “Increment”: 1

“OK” First, it is validated whether the calculated indices are in the index range of the array variable. If so, then the elements that match the template element are created and arranged as a field (row, column, or table). The placeholder indexes are replaced by the calculated indexes.
Example

Declaration of array variables

```plaintext
VAR
  asTexts_Example: ARRAY[1..2,1..2] OF STRING :=
    ['1A Text', '2A Text',
     '1B Text', '2B Text'];
  asToolTips_Example: ARRAY[1..2,1..2] OF STRING :=
    ['1A Tooltip', '2A Tooltip',
     '1B Tooltip', '2B Tooltip'];
  axUserInput_Example: ARRAY[1..2,1..2] OF BOOL;
END_VAR
```

Visualization with template element and its property configuration

Command 'Configure Display Settings of the Trend'

Symbol: 

**Function:** When you execute this command in “Visualization” or in the context menu, the “Edit Display Settings” dialog box opens.
Call:
- Menu bar: “Visualization”
- Context menu of a “Trend” element in the visualization editor
- Property “Display Settings”

**Requirement:** A trend is selected in the active visualization editor.

### Tab “X-Axis”

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Grid”</td>
<td>✓: Trend diagram with grid lines in the x-direction in the selected color</td>
</tr>
<tr>
<td>“Font”</td>
<td>Font for the axis label</td>
</tr>
</tbody>
</table>

### Tab “Y-Axis”

**Table 291: “Display mode”**

<table>
<thead>
<tr>
<th>Property</th>

</tbody>
</table>
### Add y-axis
Extends the trend diagram by one y-axis.

Result: The “Trend recording” editor contains an extended selection of y-axes in the “Additional axes” option of the “Variable Settings”.

### Delete y-axis
Deletes the y-axis of the visible tab.

- Editor ‘Trend recording’

### Command ‘Configure Trace’

**Symbol:**

**Function:** This command opens the “Trace Configuration” dialog box.

**Call:** Context menu of the visualization element; “Trace” property of the visualization element.

**Requirement:** An element of type “Trace” is open in the editor.

### Dialog box 'Trace Configuration'

The tree view shows the trace configuration and allows navigation.

The top entry contains the trace name. When this entry is selected, the “Record Settings” group appears in the adjacent view.

An entry is located here for each variable that data was recorded continuously. When a variable is selected, the “Variable Settings” group appears in the adjacent view.

### Add variable
Adds a new entry to the trace configuration.

Result: A blank configuration appears next to the new variable under “Variable Settings”. You configure the variable there.

### Delete variable
Removes the selected variable.

### 'Recording Settings'

A trigger can be configured in the trace only.

<table>
<thead>
<tr>
<th><strong>“Task”</strong></th>
<th>Task where data was recorded.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Record condition”</strong></td>
<td>Recording condition for which the application records data in runtime mode: Variable (BOOL)</td>
</tr>
<tr>

<tr>
<td><strong>“Resolution”</strong></td>
<td>Measure for the time stamp that is recorded per data set.</td>
</tr>
<tr>
<td></td>
<td>- “ms”: Time stamp (in milliseconds).</td>
</tr>
<tr>
<td></td>
<td>- “µs”: Time stamp (in microseconds) for a task cycle time of 1 ms or less</td>
</tr>
<tr>
<td><strong>“Automatic restart”</strong></td>
<td>[✓]: Recording starts automatically as soon as the trace has been started one time and then the controller was restarted. The trace configuration and the contents of the trace buffer are saved persistently to a file on the target system. Format: .trace.csv</td>
</tr>
<tr>
<td><strong>“Display”</strong></td>
<td>The “Edit Appearance” dialog box opens.</td>
</tr>
</tbody>
</table>
The “Advanced Trace Settings” dialog box opens.

The “Copy Settings from Trace Instance” dialog box opens. If you have already created an existing trace configuration from a trace object, then you can copy the configuration data to the visualization element. To do this, select the respective object.

| **"Parameters"** | Parameter whose value is acquired. |
|                  | ☑: Input assistance lists are valid parameters of the PLC. |

| **"Attached axis"** | Y-axis of the trace diagram for the "Variable". |
|                    | ☑: Selection of the standard y-axis and the additional configured y-axes |
| Note: The additional configured y-axes are configured in the "Edit Display Settings" dialog box. |

| **"Display variable name"** | ✅: The trace graphs are displayed in tooltip with their variable names. |
|                            | If a text is also specified in "Description", then the text is displayed first with the variable names in parentheses. |
| Example: Sensor A (PLC_PRG.iSensor_A) |
| If "Description" does not contain any text, then the "Display Variable Name" property is activated automatically. Then only the name is displayed (example: PLC_PRG.iSensor_A). |
| ☑: The trace graphs are displayed in tooltip without their variable names. Only the text in "Description" is displayed. |

| **"Description"** | Text for the tooltip. It is displayed when a visualization user moves the cursor in the trace diagram. |
|                  | Example: Sensor A |
|                  | The text is also entered into the “GlobalTextList” object and can be translated there. |

| **"Color"** | Color of the graph in the diagram. |

<p>| <strong>&quot;Line type&quot;</strong> | Representation of the graph as a line chart |
|                | ● &quot;Line&quot;: Values are linked to form a line. |
|                | ● &quot;Step&quot;: Values are linked in the form of steps. |
|                | ● &quot;None&quot;: Values are not linked. |</p>
<table>
<thead>
<tr>
<th><strong>“Line width”</strong></th>
<th>In pixels</th>
<th>Example: 1</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Line style”</strong></td>
<td>The display of the line is solid, dash, dot, dash-dot, or dash-dot-dot.</td>
<td></td>
</tr>
</tbody>
</table>
| **“Dot type”** | Representation of the graph as a scatter chart. This configuration entry with the “Line type” determines the appearance of the graph.  
  ● “Dot”: Each value as a dot.  
  ● “Cross”: Each value as a cross.  
  ● “None”  
  Note: For “Dot” or “Cross”, a paint buffer overflow can result from many recorded variables. |
| **“Warning at minimum”** | [ ] When below the lower limit, the visualization shows the trace graphs in the alert color. |
| **“Critical lower limit”** | Minimum Value | Example: 10. |
| **“Color”** | Warning color on falling below the limit |
| **“Warning at maximum”** | [ ] When above the upper limit, the visualization shows the trace graphs in the alert color. |
| **“Critical upper limit”** | Maximum value | Example: 90 |
| **“Color”** | Warning color on exceeding the limit |
| **“Dynamic appearance options”** | |
| **“Variable for visibility”** | Variable (BOOL) or as bit access. This controls the visibility of the variables in the trace diagram.  
  ● TRUE: Visible  
  ● FALSE: Invisible |

**Command ‘Export Trace Configuration’**

**Function:** This command opens the “Export Trace Configuration” dialog box.

**Call:** context menu (right-click) the upper node in the tree view of the trace configuration.

**Requirement:** The dialog box “Trace Configuration” is active and the name of the trace configuration is selected in the tree view (example: Visu_Trace1).

**Dialog box 'Export Trace Configuration’**

This dialog is used for saving the trace configuration to a text file that can be read by the run-time system.

<table>
<thead>
<tr>
<th><strong>“File name”</strong></th>
<th>Name of text file to be created.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“File type”</strong></td>
<td>“Trace file (*.trace)”: Format that the runtime system component CmpTraceMgr expects for reading.</td>
</tr>
</tbody>
</table>
Command 'Insert Elements for Controlling Trace'

Symbol:  

**Function:** The command opens the “Trace Wizard” dialog. In this dialog, you select predefined visualization elements for controlling the trace recording. These elements are then inserted as configured into the visualization editor.

**Call:** Menu bar: “Visualization”; context menu of the trace element.

**Requirement:** The view is active and a trace element is selected.

---

**Dialog 'Trace Wizard'**

<table>
<thead>
<tr>
<th>“Control variable”</th>
<th>Corresponds to the “Control variables” property that is available in the element properties of the trace element.</th>
</tr>
</thead>
<tbody>
<tr>
<td>✓</td>
<td>The control element for this trace control variable is created in the visualization editor.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Variable”</th>
<th>Project variables that are assigned to the control element below the “Input configuration” property. In addition, the project variables are declared as local variables in the visualization when needed (in the interface editor).</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>This list corresponds to the assignments that are defined in the element properties of the trace element. If nothing is configured in the properties of the trace element (no project variables assigned as control variables), then a pre-allocation is offered with default variable names.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Type of element to insert”</th>
<th>For a Boolean variable, this element can be inserted as a button or rectangle. For a string variable, a rectangle or a text field is provided.</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>“OK”</th>
<th>At the closing of the dialog, the selected control elements are inserted into the visualization editor and (when needed) its control variables are created as local variables of the visualization. They are declared in the interface editor and they are used by the control element (property “Input configuration” ➤ Toggle ➤ Variable”) and by the trace element (“Control variables” property). The control element writes to the variable and the trace element reads the variable.</th>
</tr>
</thead>
</table>

---

**Example**

**Standard control variables:**

```plaintext
VAR
  bResetTrigger : BOOL;
  bStart : BOOL;
  bStop : BOOL;
  bStore : BOOL;
  sStoreFilename : STRING;
  bRestore : BOOL;
  sRestoreFilename : STRING;
END_VAR
```

Command 'Configure Display Settings of the Trend'

Symbol: ☐

Function: When you execute this command in "Visualization" or in the context menu, the “Edit Display Settings” dialog box opens.

Call:
- Menu bar: “Visualization”
- Context menu of a “Trend” element in the visualization editor
- Property “Display Settings”

Requirement: A trend is selected in the active visualization editor.

Tab “X-Axis”

| “Grid”         | Trend diagram with grid lines in the x-direction in the selected color |
| “Font”         | Font for the axis label |

Tab “Y-Axis”

Table 294: “Display mode”

| “Auto” | ☐: The visualization scales automatically. |
| “Fixed” | ☐: Fixed range from “Minimum” to “Maximum” |
| “Minimum” | Start value of the range |
| “Maximum” | End value of the range |
| “Grid” | ☐: Trend diagram with grid lines in the y-direction in the selected color |
| “Description” | ☐: Text for labeling the y-axis (for example, DC/mA) |

Table 295: “Tick marks”

| “Fixed spacing” | ☐: Axis scale with tick marks for “Distance” and “Subdivisions” |
| “Distance” | Distance between tick marks (example: 2) |
| “Subdivisions” | Number of subdivisions between tick marks (example: 4) |

| “Font” | Font for the axis label |

Table 296: “Background”

| “From visualization style” | Background color as defined in the visualization style |
| “Draw background” | Background color that is selected in the lower input field |
| “No background” | Trend diagram with transparent background |
| Background color of the trend diagram | Requirement: “Draw background” is activated. |

| “Reset” | Resets the settings to the default settings |
| “Use as default” | Stores settings as default |
“Add y-axis” | Extends the trend diagram by one y-axis
---|---
Result: The “Trend recording” editor contains an extended selection of y-axes in the “Additional axes” option of the “Variable Settings”.

“Delete y-axis” | Deletes the y-axis of the visible tab.

Command 'Visualization Element Repository'

Symbol: 

**Function:** This command opens the “Visualization Element Repository” dialog box opens for editing the storage location and visualization profile.

**Call:** Menu bar: “Tools”.

**Requirement:** No project is open.

---

The visualization element repository is used for creating a visualization profile or visualization extension. This is necessary when developing your own visualization elements with the CODESYS VisuElement Toolkit. The CODESYS VisuElement Toolkit is required for this with a valid license. End users who do not wish to create their own visualization elements can use this dialog to find out which elements are included in which visualization profile. A reconfiguration of the storage location for a repository is also important only for element developers.

---

**NOTICE!**

1. Only an empty directory can be selected as a new storage location for a repository.

2. The "System" repository cannot be modified. This is indicated by the entry in italics in the repository list.

---

Currently only a single version of an element can be installed.

---

**Dialog box 'Visualization Element Repository'**

**Table 297: Editing the repository**

<table>
<thead>
<tr>
<th>“Location”</th>
<th>Storage location for the repository in the file system. The drop-down list contains the configured repositories for visualization elements.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Edit locations”</td>
<td>Opens the “Edit Repositories” dialog box for modifying the repository currently selected in “Location” or for creating a new repository.</td>
</tr>
</tbody>
</table>

**Table 298: “Profile or extension selection”**

A profile is a collection of visualization elements in a specific version. These elements originate from one or more libraries. They are available in the toolbox of the visualization editor when the profile is used in the project. You can use an extension to add a specific selection of elements to an existing profile.

Creating and editing a profile is possible only if the CODESYS VisuElement Toolkit is installed. In this case, the buttons on the right side of the dialog box can be used.

| “Create or update profile” | You can configure a new profile in the dialog or modify an existing one. Then, the “New”, “Copy”, and “Delete” buttons are operable, as well as the “Installed Elements” and “Available Elements” views. |
"Create or update extension" In the dialog, you can configure an extension for the selected profile. Another drop-down list “Extension” appears with all currently available extensions. To configure a new extension, use the “New” or “Copy” buttons (see below). In both cases, the “Specify Visualization Extension” dialog box opens for you to define a new extension. In this dialog box, the “Name”, “Company”, and “Version” of the extension are displayed. Version syntax: Sequence of numbers and points with a number at the end.

“Profile” Currently selected profile. The drop-down list provides all profiles available in the repository set above.

“Extension” The extension that is currently selected for the specified profile. The drop-down list provides all extensions available for the profile.

“New” Pressing the button opens the “Specify Name of Visualization Profile” dialog or the “Specify Visualization Extension” dialog. Specify a unique name for the new profile, or for an extension also the company name and the version. CODESYS automatically enters the previously used name, appended with “_0”.

The “Installed elements” list is empty.

“Copy” Pressing the button opens the “Specify Name of Visualization Profile” dialog or the “Specify Visualization Extension” dialog (see above: “New”).

The elements of the selected profile are accepted and they appear in the “Installed elements” view.

“Delete” The currently set profile or the extension is deleted, and then the drop-down list is removed.

Table 299: “Installed Elements”

<table>
<thead>
<tr>
<th>Name, Vendor, Library</th>
<th>Elements that are assigned to the selected profile.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Uninstall”</td>
<td>All elements currently selected in the list are uninstalled and removed from the “Available Elements” list.</td>
</tr>
<tr>
<td>“Update code”</td>
<td>The list is refreshed with any changes in the implementation code of the library POU.</td>
</tr>
<tr>
<td>“Update all”</td>
<td>The list is refreshed with any changes in the implementation code and in the interfaces (declaration part) of the library POU.</td>
</tr>
</tbody>
</table>

Table 300: “Available Elements”

<table>
<thead>
<tr>
<th>Name</th>
<th>Elements that are available in the system and can be installed into the current profile or extension. The selection depends on the installed element libraries and element packages.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Library”</td>
<td>The tree structure displays the libraries with the contained elements below them. Elements display in green are already installed for the specified profile or extension. “Profiles” shows the elements installed for the profiles.</td>
</tr>
<tr>
<td>“Vendor”</td>
<td></td>
</tr>
<tr>
<td>“Version”</td>
<td></td>
</tr>
<tr>
<td>“Repositories”</td>
<td></td>
</tr>
<tr>
<td>“Profiles”</td>
<td></td>
</tr>
<tr>
<td>“Install element”</td>
<td>The elements selected in the list are added to the “Installed Elements” view. Existing elements are overwritten.</td>
</tr>
<tr>
<td>“Install library”</td>
<td>The “Library Repository” dialog box opens where another library can be installed in order to accept its elements in the “Available Elements” view.</td>
</tr>
</tbody>
</table>
**Table 301**

| “Note current library versions only” | :yellow: When refreshing the list, only the most current version of the library is searched, not all libraries. |
| “Overwrite profiles without prompting” | :yellow: For actions that change the profile, the usual prompt does not appear for confirming the change. |

**Dialog box 'Edit Repositories'**

| “Storage location, Name” | For managing the visualization elements, one or more repositories can be used. All currently defined storage locations are listed here with file path and name. The order from top to bottom is also the search order for the visualization elements. File path and name of the storage location selected previously in the “Repository for Visualization Elements” dialog. Note: A storage location "System" is always defined automatically, which cannot be modified or deleted. |
| “Add” | Opens the “Storage Location for Repository” dialog for creating a new storage location or for editing the current storage location. Specify: “Storage location” (file path of an empty directory) and “Name”. The name is symbolic (example: “Elements category 1”). |
| “Edit” | | |
| “Remove” | Deletes the repository currently selected in the repository list. |
| “Move Up, Move Down” | Moves the entries within the list. Note: The repositories are searched from top to bottom. |

**Command 'Visualization Style Repository'**

Symbol: ![visor](image)

**Function:** This command opens the “Visualization Styles” dialog box. It makes it possible to edit visualization style repositories.

**Call:** Menu bar: “Tools”.

See also
- Chapter 1.3.5.17.2 “Managing visualization styles in repositories” on page 1221

**Dialog Box 'Visualization Styles'**

| “Storage location” | Name of the currently selected repository Preset: “System” ![visor](image): Lists the repositories installed in the development system. |
| “(...)” | Storage location of the repository Example: (C:\ProgramData\CODESYS\Visualization Styles) |
| “Edit locations” | The “Edit Repository Locations” dialog box opens. |
Table 302: “Installed Visualization Styles”

| “Company” | When a company name is specified here, the tree view is filtered and only the styles of the selected company are listed.\n| Preset: “(All companies)” It is not filtered.\n| ❖: Lists all companies that are specified in the styles. |

Windows with styles | Tree view of all versions of the installed visualization styles in the selected repository |

“Display localized names” | ☑: The style name is localized and displayed in the language that is set in CODESYS.\n| ☐: The style is display as the source name. |

“Install” | The “Select Visualization Style(s)” dialog box opens. |

“Uninstall” | The selected style version is removed from the repository. |

“Preview” | The windows closes. A preview is displayed of the selected style in the selected version. Specific elements are displayed in the style. |

Dialog box ‘Edit Repository Locations’

Table 303: “Repositories (elements are searched in that order)”

| “Location” | Storage location of the configured repository on the development system\n| Example: C:\ProgramData\CODESYS\Visualization Styles |

| “Name” | Preset: System |

| “Add” | The “Repository Locations” dialog box opens. It makes it possible to manage other repositories. |

| “Edit” | |

| “Remove” | |

| “Move Up” | The order in the list of repositories is adapted. It defines the processing order when searching for elements. |

| “Move Down” | |

Command ‘Add Visual Element’

Function: The command opens a menu containing all available visualization elements as menu items.

Requirement: You have configured the command in the dialog box “Customize” in a way that you have a call in a (any) menu.

When you select an element in the menu, the element is added in the visualization editor in the upper left corner.

See also
\n● Chapter 1.3.5.3.1 “Selecting an element” on page 1112
\n● Dialog box ‘Customize’

Command ‘Select None’

Function: The command cancels at once any selection in the current visualization editor.

Requirement: You have configured the command in the dialog box “Customize” in a way that you have a call in a (any) menu.
Command 'Add Elements for Alarm Acknowledgement'

Symbol: 🔴

Function: This command adds buttons automatically to the visualization for acknowledging alarms. It opens an assistant for inserting controls below the table.

Call: Menu bar: “Visualization”; context menu of visualization element "Alarm table"

Requirement: An "Alarm table" visualization element is selected.

Dialog box 'Alarm Table Wizard'

| "Type of element(s) to insert" | ● “Button”  
|                               | ● “Rectangle” |
| "Action"                      | 🔄 A button or a rectangle with the selected function is added to the visualization. |
| "Variable"                    | If you have already specified a variable for an action, then this is displayed here in the "Variable" column. If you have not defined a variable yet, then a local visualization variable is created automatically. |

See also
- % Chapter 1.3.5.18.1.22 “Visualization element ‘Alarm table’” on page 1395
Dialog 'Access Rights'

**Function:** This dialog defines the permissions of user groups for a visualization element.

**Call:** Click in the “Value” field of the “Access Rights” element property of a visualization element.

**Requirement:** A visualization element is selected in a visualization element and the “Properties” is open.

<table>
<thead>
<tr>
<th>“User Groups”</th>
<th>Groups that were configured in the “Visualization Manager” (tab “User Management ➔ Groups”).</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Operable”</td>
<td>☑: The visualization element is available with full functionality.</td>
</tr>
<tr>
<td>“Only Visible”</td>
<td>☑: The visualization element is visible only and does not provide any functionality.</td>
</tr>
<tr>
<td>“Invisible”</td>
<td>☑: The visualization element is not displayed.</td>
</tr>
<tr>
<td>“Group hierarchy is used”</td>
<td>Display whether the option “Use group hierarchy” is activated in the “Visualization Manager” (tab “User Management ➔ Settings”).</td>
</tr>
</tbody>
</table>

A group of a higher hierarchy cannot have fewer permissions for an element than an element of a lower hierarchy.

If no user is logged in, then the permissions apply for the visualization elements that are configured for the user group “None”. If the permissions for a visualization element is restricted, then the group “None” should be granted the lowest permissions.

●

Dialog 'Add Visualization'

**Function:** This dialog is used for creating a new object of type “Visualization”.

**Call:** “Project ➔ Add Object ➔ Visualization”; context menu of an application

**Requirement:** An application is selected in the device tree.

| “Name” | Name of the visualization  
Example: Visu_A |
|--------|-------------------------------------------------------------------|

The following settings are displayed only when you add an object of type “Visualization” to the project for the first time.

<table>
<thead>
<tr>
<th>“Symbol library”</th>
<th>List of all installed symbol libraries</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Assigned”</td>
<td>☑: Symbol library is selected</td>
</tr>
</tbody>
</table>

Tip: CODESYS manages this setting in the project settings.

<table>
<thead>
<tr>
<th>“Add”</th>
<th>CODESYS creates a new visualization, assigns the selected symbol libraries to the project, and provides them in the “ToolBox” view.</th>
</tr>
</thead>

- Dialog ‘Project Settings’ - ‘Visualization’
- Command ‘Add Object’

Dialog ‘Updating the Frame Parameters’

**Function:** The dialog requests you, after changing an interface in the visualization references concerned, to re-assign the variables for the parameter transfer.

**Call:** The dialog appears automatically.

**Requirement:** You have changed the interface of a visualization, for example by adding an additional variable. After that you have selected either the menu command “File ➔ Save Project” or “Build ➔ Build” or opened a visualization.

<table>
<thead>
<tr>
<th>“Parameter”</th>
<th>Hierarchical structure of the interface parameters as a tree view</th>
</tr>
</thead>
<tbody>
<tr>
<td>![Image]</td>
<td>Top node of the visualization hierarchy with the name of the visualization. This contains a frame or a tab control.</td>
</tr>
<tr>
<td>![Image]</td>
<td>Name of the frame or the tab control</td>
</tr>
<tr>
<td>![Image]</td>
<td>Name of the referenced visualization</td>
</tr>
<tr>
<td>![Image]</td>
<td>Interface of the referenced visualization with the new parameters You can edit the parameter transfer here.</td>
</tr>
<tr>
<td>![Image]</td>
<td>Interface of the referenced visualization with the previously valid parameters You cannot edit the parameter transfer, but you can use it as a template.</td>
</tr>
<tr>
<td>![Image]</td>
<td>Variable for the parameter transfer (VAR_INPUT scope)</td>
</tr>
<tr>
<td>![Image]</td>
<td>Variable for the parameter transfer (VAR_IN_OUT scope)</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Type”</th>
<th>Data type of the variable</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><strong>Example:</strong> INT</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Value”</th>
<th>Variable that is transferred as a parameter and with whose value the visualization is initialized during instantiation.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><strong>Example:</strong> PLC_PRG.iVisNr</td>
</tr>
</tbody>
</table>

If the variable lies under the current interface, which is marked in the tree view with ![Image] “(Current)”, then you can edit the parameter transfer.

- Click inside an input field to open it
- Double-click inside the field to open the input assistant
- Adopt the settings by copying assignments in the column “Value” and inserting them in another cell. Use the “Copy” and “Paste” links to do this

<table>
<thead>
<tr>
<th>“Copy”</th>
<th>Link to copy an assignment from the “Value” column.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Requirement: An assignment is selected.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Paste”</th>
<th>Link to insert an assignment</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Requirement: You have copied an assignment.</td>
</tr>
</tbody>
</table>
"OK"

Click on the button to close the dialog and confirm the changes made under "(Recent)".

Result: The assignment is entered in the "References" property and on the "Interface Editor" tab.

  ●  "Chapter 1.3.5.19.2.1 "Command 'Interface Editor'" on page 1556

Dialog 'Configure Tags and Items'

**Function:** The dialog is for the management of the identifiers in a tree view. The assigned elements are listed underneath an identifier. User-defined identifiers can be created and their assignment to the visualization elements edited. The name of the identifier appears in the "ToolBox" view as a label on the button for opening the element selection.

**Call:** Click on symbol in the view "Tools"

See also

●  "Chapter 1.3.5.3.1 “Selecting an element” on page 1112
  ●  "Chapter 1.3.5.19.4.1.2 “View 'Toolbox'” on page 1609

**Tree view**

<table>
<thead>
<tr>
<th>&quot;Tags&quot;</th>
<th>Tree view</th>
</tr>
</thead>
</table>
| ●  "<Name>": preset identifier  
  ●  "<Name>": user-defined identifier |
  Example: "Favorite"

| + | Lists the assigned visualization elements. A selected visualization element can be removed by clicking on [Del].  
  Hint: the assignment is created in the view “ToolBox” with the help of the context menu of a selected element. |

| "Active" | a button for the identifier is visible in the "ToolBox" view. |

**Toolbar**

| + | The dialog "Add Tag" opens. |
| − or [Del] | The tag selected in the tree view is removed. If you close the dialog with "OK", the button is also removed from the view "ToolBox". |

**Dialog 'Add Tag**

**Call:** Click on the + symbol in the dialog “Configure Tags and Items”

| "Name" | Name of the tag  
  Example: tagA |
| "Description" | Example: Tagged with A |
**Dialog 'Gradient Editor'**

**Function:** The dialog is for setting the color gradient of visualization elements. If you define two colors, the color graduates between them. If you only select 1 color, the color graduates within this color through its brightness. The detailed settings are for a special specification of the initial position and the angle of the color gradient.

**Call:** Click in the value field of the property "Gradient settings"

**Requirement:** You have selected a visualization element in the editor that has the property “Gradient settings”.

| "Gradient type" | ● “Linear”  
| ● “Radial”  
| ● “Axial”: The color gradient runs along an axis, with the colors extending perpendicular to the axis on both sides. |
| "Color 1” | First color of the gradient. |
| "Color 2” | Second color of the gradient. |
| “Transparency” | Transparency of the associated color. Permissible values: Integers in the value range from 255 to 0. 255: The color is opaque. 0: The color is fully transparent. |
| “Angle (degrees)” | Requirement: “Linear” or “Axial” color gradient. |
| “Center X (%):” | Requirement: “Radial” color gradient. X-position of the center point (0 – 100%) |
| “Center Y (%):” | Requirement: “Radial” color gradient. Y-position of the center point (0 – 100%) |
| “Use one color” | Color gradient between “Color 1” and the same color with a different brightness. |
| “Brightness” | Requirement: The option “Use one color” is selected. Setting from 0 (black) to 100 (white) |
| “Use two colors” | Color gradient between the two selected colors “Color 1” and “Color 2”. |

**Dialog 'Input Configuration'**

**Symbol:** 📅

**Function:** The dialog is used to assign input actions to specific input events. It also includes specific settings for the selected input action.

**Call:** Click “Configure” in the “Input configuration” property.

**Requirement:** An element is selected in the editor.

### Input action 'Close Dialog'

| Dialog | The visualization of type "Dialog" that will be closed.  
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Examples</td>
<td></td>
</tr>
</tbody>
</table>
| Default dialogs of the VisuDialogs library, which is usually integrated in the project.  
| - FileOpenSave |  
| - Keypad |  
| - Login |  
| - Numpad |  
| - NumpadExtended |  
| - TextInputWithLimits |  
| Note | The setting in the object property ("Visualization" tab) of a visualization determines whether or not a visualization can be used as a dialog.  
| Result | Return value for closing the dialog.  
| Note | If there are more input actions after closing, then they configured in the "Input configuration ➔ OnDialogClosed" property of the element.  
| None | ☑ No return value
“OK”  ⚫ The set return value is returned. The return value refers to the button in the dialog. The value OK is returned for the OK button. The value Cancel is returned for the cancel button.

“Cancel”

“Abort”

“Retry”

“Ignore”

“Yes”

“No”

See also

●  
- Chapter 1.3.5.19.3.15 “Dialog 'Properties' of Visualization Objects” on page 1603

Input action 'Open Dialog'

“Dialog”  Visualization (type “Dialog”). The dialog opens.

List box with all dialogs available in the project.

Note: The “VisuDialogs” library provides visualizations (type “Dialog”).

- VisuDialogs.FileOpenSave
- VisuDialogs.Login

Transfer parameters of the dialog

“Parameter”  Interface parameter as declared in the interface editor of the visualization

Example: filelistProvider

“Type”  Data type of the parameter as declared in the interface editor of the visualization.

Example: VISU_FBFILELISTPROVIDER

“Value”  Variable (data type corresponds to the data type of the parameter). The value of the variable is read when the dialog opens and passed to the parameter.

Example: PLC_PRG.fileListProvider // Instance of function block VisuDialogs.Visu_FbFileListProvider

�� The input assistance offers all variables available in the entire project.

Here the return value of the dialog is activated for which the Var_OUTPUT variable and VAR_IN_OUT variable are written. The dialog closes afterwards.

“Update”  “and”  “parameter in case of result”  Note: The parameters are updated before the dialog is closed. Until then, the values are stored temporarily. They are stored as a copy, not as a reference.

“None”  ⚫ No return value

“OK”  ⚫ Defines the return value for which the transfer parameter is written

“Cancel”

“Abort”

“Retry”

“Ignore”

“Yes”

“No”
“Open dialog modal”  
☑️ Only the dialog processes user inputs. The remaining visualizations are blocked to user input.

“Position to open”

“Centered”  
The dialog opens in the center of the visualization.

“Position”  
The dialog opens at the position defined by “X” and “Y”.

“X”  
Position (in pixels) or variable (integer data type)

“Y”  
Position (in pixels) or variable (integer data type)

See also

Input action 'Change the language'

“Language”  
Language to be switched

Example: en

ари: The input assistance offers all languages available in the project.

Input action 'Change shown visualization'

Table 304: “Zoom to visualization”

<table>
<thead>
<tr>
<th>Visualization that is shown at the user input</th>
<th>Visualization that is selected from all available visualizations in the project or libraries.</th>
</tr>
</thead>
<tbody>
<tr>

<th>Variable (STRING) that contains the name of the visualization</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: PLC_PRG.strVisu</td>
<td>for the following application code: strVisu: STRING := 'visMain';</td>
</tr>
</tbody>
</table>

The order in which visualizations are displayed by user inputs is saved internally. The following options use this information.

“Previous shown visualization”  
☑️: Visualization that has already been shown before the current one

Requirement: A visualization switch has already occurred.

“Next shown visualization”  
☑️: Visualization that is next in the call order after the current one.

Requirement: A visualization switch has already occurred which was called by “Previous shown visualization”.

Input action ”Execute command”  
Commands are listed here with transfer parameters that the visualization processes when an input event occurs.
“Configure commands”

Command from the list box. Click + to add the command to the list.

- “Execute program on the plc”
- “Execute program on client”
- “Print”
- “Navigate to URL (Webvisu)”
- “Create recipe”
- “Read Recipe”
- “Write Recipe”
- “Save a recipe in a file”
- “Load a recipe from a file”
- “Delete recipe”

+ The command in “Configure commands” is added to the list.

− The command is removed.

Requirement: A command is selected.

The order in the list defines the order of execution.

▼ The selected command is moved down one position in the list.

▲ The selected command is moved up one position in the list.

Table 305: Command “Execute program on the plc”

<table>
<thead>
<tr>
<th>“Command”</th>
<th>“1st parameter”</th>
<th>“2nd parameter”</th>
</tr>
</thead>
<tbody>
<tr>
<td>ExecutePlcProgram</td>
<td>'C:\programs\notepad.exe'</td>
<td>'Notes_A.txt'</td>
</tr>
<tr>
<td></td>
<td>EXE file that is executed on the controller</td>
<td></td>
</tr>
<tr>
<td></td>
<td>The program is executed on the PLC and therefore it must not be interactive or have any user interfaces.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>It is possible, for example, for a program to copy a file.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Program name with directory as STRING in single straight quotation marks</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Arguments of the program as STRING in single straight quotation marks</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Example: Name of the file that the program opens</td>
<td></td>
</tr>
</tbody>
</table>

Table 306: Command “Execute program on client”

<table>
<thead>
<tr>
<th>“Command”</th>
<th>“1st parameter”</th>
<th>“2nd parameter”</th>
</tr>
</thead>
<tbody>
<tr>
<td>ExecuteClientProgram</td>
<td>'C:\programs\notepad.exe'</td>
<td>'Notes_A.txt'</td>
</tr>
<tr>
<td></td>
<td>EXE file that is executed on the display variant (exception: WebVisu)</td>
<td></td>
</tr>
<tr>
<td></td>
<td>The program is executed within the context of the display variant. After this, the program may be interactive and have a user interface.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Program name with directory as STRING in single straight quotation marks</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Arguments of the program as STRING in single straight quotation marks</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Example: Name of the file that the program opens</td>
<td></td>
</tr>
</tbody>
</table>

NOTICE!

If the visualization is displayed as a CODESYS WebVisu, then no program (EXE file) can be started.
Table 307: Command “Navigate to URL (Webvisu) ”

<table>
<thead>
<tr>
<th>“Command”</th>
<th>“1st parameter”</th>
<th>“2nd parameter”</th>
</tr>
</thead>
<tbody>
<tr>
<td>NavigateURL</td>
<td>'<a href="http://en.wikipedia.org">http://en.wikipedia.org</a>'</td>
<td>'replace'</td>
</tr>
<tr>
<td></td>
<td>PLC_PRG.stURL</td>
<td></td>
</tr>
</tbody>
</table>

The visualization navigates to the web page of the URL.

Requirement: The visualization is executed as a CODESYS WebVisu.

URL
- As a literal in single straight quotation marks
- As a variable (STRING)

If a parameter is not specified, then the web page is displayed in a new window or a new tab.

If 'replace' is specified, then the CODESYS WebVisu is replaced by the web page.

Table 308: Command “Read Recipe”

<table>
<thead>
<tr>
<th>“Command”</th>
<th>“1st parameter”</th>
<th>“2nd parameter”</th>
</tr>
</thead>
<tbody>
<tr>
<td>ReadRecipe</td>
<td>'RecipeDefinitionForModules'</td>
<td>'RecipeModuleA'</td>
</tr>
<tr>
<td></td>
<td>Name of the recipe definition</td>
<td>Name of the recipe</td>
</tr>
<tr>
<td></td>
<td>- As a literal</td>
<td>- As a literal</td>
</tr>
<tr>
<td></td>
<td>- As a variable (STRING)</td>
<td>- As a variable (STRING)</td>
</tr>
</tbody>
</table>

At visualization runtime, the controller reads the actual values from the variables of the recipe definition and writes them to the specified recipe. The values are saved implicitly (to a file on the controller) and shown in the recipe definition in the Recipe Manager of CODESYS. In other words, the recipe that is managed in CODESYS is updated with values from the controller.

Table 309: Command “Write Recipe”

<table>
<thead>
<tr>
<th>“Command”</th>
<th>“1st parameter”</th>
<th>“2nd parameter”</th>
</tr>
</thead>
<tbody>
<tr>
<td>WriteRecipe</td>
<td>PLC_PRG.stRecipeDef</td>
<td>PLC_PRG.stRecipe</td>
</tr>
<tr>
<td></td>
<td>Name of the affected recipe definition</td>
<td>Name of the recipe (from the recipe definition)</td>
</tr>
<tr>
<td></td>
<td>- As a literal</td>
<td>- As a literal</td>
</tr>
<tr>
<td></td>
<td>- As a variable (STRING)</td>
<td>- As a variable (STRING)</td>
</tr>
</tbody>
</table>

At visualization runtime, the values of the recipe are written to the variables on the controller as they are in the Recipe Manager.

Table 310: Command “Save a recipe in a file”

<table>
<thead>
<tr>
<th>“Command”</th>
<th>“1st parameter”</th>
<th>“2nd parameter”</th>
</tr>
</thead>
<tbody>
<tr>
<td>SaveRecipeAs</td>
<td>PLC_PRG.stRecipeDef</td>
<td>PLC_PRG.stRecipe</td>
</tr>
</tbody>
</table>
At visualization runtime, the “Save Recipe as” dialog opens and prompts the user for a file name and a storage location on the controller. The file name must not be `<recipe>.<recipe definition>`. The file extension is `.txtrecipe`.

The user can then save the file that includes the actual values from the recipe variables. If a transfer parameter is not specified in the 2nd parameter, then the file is saved without changing an implicit recipe file. If a transfer parameter is given in the 2nd parameter, then the implicit recipe file is also updated.

Note: If the “Save recipe changes to recipe files automatically” option is selected in the “Recipe Manager - General” tab, then the recipe definition in CODESYS and the implicit recipe files are kept the same automatically.

Note: Implicit (automatically generated) recipe files exist on the controller with names in the following syntax: `<recipe>.<recipe definition>.txtrecipe`. These are typically used in the application as a buffer when reading and writing recipe variables.

---

Table 311: Command “Load a recipe from a file”

<table>
<thead>
<tr>
<th>“Command”</th>
<th>“1st parameter”</th>
<th>“2nd parameter”</th>
</tr>
</thead>
<tbody>
<tr>
<td>LoadRecipeFrom</td>
<td>PLC_PRG.stRecipeDef</td>
<td>PLC_PRG.stRecipe</td>
</tr>
<tr>
<td></td>
<td>Name of the affected recipe definition</td>
<td>Name of the affected recipe definition</td>
</tr>
<tr>
<td></td>
<td>● As a literal</td>
<td>● As a literal</td>
</tr>
<tr>
<td></td>
<td>● As a variable (STRING)</td>
<td>● As a variable (STRING)</td>
</tr>
</tbody>
</table>

At visualization runtime, the “Load Recipe” dialog opens. It provides the visualization user with a file list that is located in the file system of the controller and filters by the extension `.txtrecipe`. The selected file can be downloaded. Then the recipes from the file are written to the implicit files and read to the given recipe in the recipe definition of the Recipe Manager.

Requirement: The file was created with the `SaveRecipeAs` command.

---

Table 312: Command “Create recipe”

<table>
<thead>
<tr>
<th>“Command”</th>
<th>“1st parameter”</th>
<th>“2nd parameter”</th>
</tr>
</thead>
<tbody>
<tr>
<td>CreateRecipe</td>
<td>PLC_PRG.stRecipeDef</td>
<td>PLC_PRG.stRecipe_New</td>
</tr>
<tr>
<td></td>
<td>Name of the affected recipe definition</td>
<td>Name of the new recipe</td>
</tr>
<tr>
<td></td>
<td>● As a literal</td>
<td>● As a literal</td>
</tr>
<tr>
<td></td>
<td>● As a variable (STRING)</td>
<td>● As a variable (STRING)</td>
</tr>
</tbody>
</table>

At visualization runtime, a new recipe is created in the given recipe definition.
Table 313: Command “Delete recipe”

<table>
<thead>
<tr>
<th>“Command”</th>
<th>“1st parameter”</th>
<th>“2nd parameter”</th>
</tr>
</thead>
<tbody>
<tr>
<td>DeleteRecipe</td>
<td>PLC_PRG.stRecipeDef</td>
<td>PLC_PRG.stRecipe</td>
</tr>
<tr>
<td>Name of the affected recipe definition</td>
<td>• As a literal</td>
<td>Name of the recipe</td>
</tr>
<tr>
<td></td>
<td>• As a variable (STRING)</td>
<td>• As a literal</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• As a variable (STRING)</td>
</tr>
</tbody>
</table>

At visualization runtime, the specified recipe is deleted from the recipe definition.

Table 314: Command “Print”

<table>
<thead>
<tr>
<th>“Command”</th>
<th>“1st parameter”</th>
<th>“2nd parameter”</th>
</tr>
</thead>
<tbody>
<tr>
<td>Print</td>
<td>Optional: File name for the visualization screen to be printed (example: ‘Startup image’)</td>
<td>A second parameter cannot be specified for the Print command.</td>
</tr>
</tbody>
</table>

The default “Printer” dialog opens while the visualization is running. In the dialog, you select a printer and configure additional print settings. When you confirm the dialog, the currently displayed visualization screen is printed.

Note: The command cannot be executed in the WebVisu.

- Changing Values with Recipes
- Object ‘Recipe Definition’

Input action 'Switch frame visualization'

When the input event occurs, the display switches to another visualization within one frame.

<table>
<thead>
<tr>
<th>“Frame selection type”</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Switch local visualization”</td>
</tr>
<tr>
<td>“Switch to any visualization”</td>
</tr>
</tbody>
</table>

Requirement: “Switch local visualization” is selected.

<table>
<thead>
<tr>
<th>“Frame selection”</th>
<th>List of all frames that contain the active visualization. The referenced visualizations are listed below each frame, as determined in the “References” property of the respective frame.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Example:</td>
</tr>
<tr>
<td></td>
<td><img src="image.png" alt="Diagram" /></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Assign selection”</th>
<th>The selection in the “Frame selection” input field is accepted. Then it appears in the “Selected frame” and “Selected visualization” settings.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Requirement: A visualization is selected in the “Frame selection” input field.</td>
</tr>
</tbody>
</table>
**Selected Frame**

Name of the frame to be switched to

Example: MainArea

Hint: Use the "Assign selection" command for changing the setting here.

**Selected Visu**

Name of the switched visualization.

Example: visMainArea

Hint: Use the "Assign selection" command for changing the setting here.

---

**Frame and visualization selection**

Contains the frame to be switched to

**Assign**

Frame to be switched to (with complete path). The index determines the visualization.

Example: visMain.frameA.visB.frameB

The path is specified in the following syntax:

```
<visualization name>.<frame name> { <visualization name>.<frame name> }
```

Caution: Visualizations can be nested at any depth by means of frame elements. In order to use the "Switch to any visualization" frame selection type without any problems, a frame must not contain more than 21 referenced visualizations.

**Assign expression**

Variable (STRING). Contains the path of the frame to be switched to

Example: strFrame: STRING := 'visMain.frameA.visB.frameB';

**Index to select**

Index that determines which of the referenced visualizations is displayed

- As an integer
- As a variable (integer data type)
  
  Example: PLC_PRG.iIndex

Note: The referenced visualizations of a frame are indexed automatically according to their order.

---

Requirement: The project contains visualizations that form a structure.

See also

- "Dialog 'Frame Configuration'" on page 1564

---

**Input action**

The configuration of the input action defines how a visualization user specifies a value and to which variable the value is written.

**Input type**

How the input is prompted.

**Standard**

An input field also opens, or if necessary a virtual keyboard (when the display variant does not have a physical keyboard).

Note: The default option for text input at runtime is set in the Visualization Manager: "Dialog settings" tab, "Settings for default text input".

**Text input**

An input field appears. You use the keyboard to specify a number or a text.

Requirement: The display variant has a keyboard as input device.
<table>
<thead>
<tr>
<th>“Text input with limits”</th>
<th>An input field appears. You use the keyboard to specify a number or a text. The field also shows the value range for the input. When a limit is passed, the input value is displayed in red. Requirement: The display variant has a keyboard as input device.</th>

| “File name” | Requirement: The transfer type is “File”.
|-------------|--------------------------------------------------------------------------------------------------|
| | Name of the file in the file system of the controller. The file name can be specified as a variable of type STRING or it can be specified directly in single straight quotation marks.
| | An absolute or relative path with directory information can also be specified as the file name.
| | Examples:
| | 'E:\temp\test.txt' -> absolute path.
| | 'MyData/test.txt' -> relative path. The file is stored in the PlcLogic/MyData subdirectory. "PlcLogic" is the default resolution for the directory placeholder $PLCLOGIC$. This placeholder does not also have to be specified, but it can: '$$PLCLOGIC$$/MyData/test.txt').
| | '$$VISU$$/test.txt' -> relative path. The file is stored in the PlcLogic/visu subdirectory. "visu" is the default resolution for the placeholder $VISU$). It can also be specified explicitly 'visu/test.txt'.
| | '$$PLCLOGIC$$/test.txt' -> relative path. The file is stored in the PlcLogic subdirectory. Note: If the path in the visualization is edited by means of a "Text field" element, then the masking character $ does not have to be specified: $VISU$/dummy.txt
“Streaming instance name” | Instance name of the object that yields the data for the transfer in streaming mode. The object has to implement the interface IVisuStreamReader (PLC --> visualization) or IVisuStreamWriter (visualization --> PLC). Requirement: The transfer type is “Streaming”.

“Control flags” | Variable of type DWORD. These flags control the options for data transfer. This variable can be a combination of the following flags:
- VisuElems.VisuEnumFileTransferControlFlags.UseOriginalFileName: Defines whether or not the selected file name is also used in the controller.
- VisuEnumFileTransferControlFlags.ConfirmFileOverwriteInPlc: Defines whether or not the user has to confirm when overwriting an existing file.

Table 317: “Status Variables”

| “Transfer active” | Boolean variable (optional)  
| TRUE: The transfer is in progress. |
| “Transfer successful” | Boolean variable (optional)  
| TRUE: The transfer has completed successfully. |
| “Error code” |  
| 0: No errors  
| 1: Unspecified error  
| 2: Cancellation of file dialog  
| 3: Other file transfer in progress  
| 4: Error during file transfer  
| 5: Cancellation by timeout  
| 6: File read error – The file is not available or cannot be read.  
| 7: No device support for file transfer  
| Possible causes:  
| CODESYS WebVisu: By default, file transfer is not possible.  
| Communication with a controller of a version < 3.5.11: Functionality not implemented.  
| Communication with a controller of a version >= 3.5.11: File transfer not activated (device description).  
| Note: In this case, contact the CODESYS support team. |

Behavior in online mode (type “File”)
- Transfer from the controller to the visualization (operating panel): The “Save File” dialog opens. A file name and storage location can be defined on the operating panel for the file that is specified in “File name” in the input configuration. Then the file is stored there.
- Transfer from the visualization (operating panel) to the controller: The “Open file” dialog opens. Any file can be selected here which is stored as specified in “File name” on the controller.

Dialog 'Options' - 'Visualization Styles'

Symbol: 🎨

Function: This dialog is used for configuring the display of library visualizations and visualizations in the POU’s view in the visualization editor. In addition, it is used for configuring the tab “Visualization Manager” - “Settings” (group “Style Settings”).

Call: Menu bar: “Tools ➔ Options” (‘Visualization Styles’ category).

These settings are not applied at visualization runtime. In runtime mode, only the settings of the visualization manager are available in the “Settings” tab.

'Style Configuration for Libraries and Global Visualizations'

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Use no visualization style&quot;</td>
<td>Display without using style properties. Elements are displayed as defined by presets.</td>
</tr>
<tr>
<td>&quot;Use the following visualization style&quot;</td>
<td>Style with style properties used for displaying visualizations.</td>
</tr>
<tr>
<td>&quot;Derive visualization style automatically&quot;</td>
<td>Display with the style that was selected in the application in the visualization manager (when possible). Therefore, the display is derived from this style. It is actually possible for this to cause an incorrect display. Then the fallback solution is used.</td>
</tr>
<tr>
<td>&quot;Fallback if no visualization style could be derived &quot;</td>
<td>Another style that is applied after the selected style. Then a style property is assigned from the style specified here. This is done for element properties that could not be assigned style properties. Requirement: The selected style causes a device-specific, deficient display on the display variant.</td>
</tr>
</tbody>
</table>

'Preference Selection'

The drop-down list of “Selected style” can be configured in the visualization manager ("Settings" tab, "Style settings" group).

- "Display all versions" | All other styles of the repository, including the selected style, are listed for selection, but only in the latest version. If newer versions are installed for the selected style, then these are also listed.                                                                                  |
| □: All installed styles in all installed versions are available for selection. |

'Style for New Visualization Managers'

- "Last used: <style, version, vendor>" | Style that is selected automatically when you add a new visualization application. Note: It is actually possible that a display variant is displayed another way depending on the device despite this setting. |
- "Preset: <style, version, vendor>" |
- "<style, version, vendor>" |

Dialog 'Options' - 'Visualization User Management'

Symbol: 🌐

Function: The options define the use of visualization user management for global visualizations in the "POUs" view and for visualizations that are linked from libraries.

Call: Menu bar: “Tools”.

Requirement: A visualization user management exists.
Table 318: “User Management Configuration for Libraries and Global Visualizations”

| “Do not use visualization user management” | The affected visualizations behave as when no user management is configured. |
| “Use the following visualization user group list” | • You can edit the list.  
• The list is created in the “Visualization manager” (“User management Groups”) by clicking “Export groups for global visualizations”. |
| “Derive visualization user management automatically” | The affected visualizations use the user management configuration of the visualization manager selected here.  
The drop-down list shows all visualization managers of the project.  
If this is not possible, then the user groups are used from the option “Use the following user group list for the visualization”. |

See also

Dialog Box 'Options' - 'Visualization'

Symbol: 📖

Function: The dialog serves for the configuration of the visualization editor and during runtime it serves the configuration of the Integrated Visualization.

Call: Main menu “Tools ➔ Options”, category “Visualization”

Tab 'General'

These settings will not be applied for the following visualization clients: CODESYS TargetVisu, CODESYS WebVisu.

Table 319: “Presentation options (visualization editor in the programming system)”

| “Fixed” | The visualization maintains its original size |
| “Isotropic” | The visualization maintains its proportions |
| “Anisotropic” | The visualization adapts to the size of the visualization window |
| “Antialiased Drawing” | ☑: The visualization is drawn with the help of antialiasing methods. This applies while you are editing and also when the visualization is running as Diagnosis Visualization. |

Table 320: “Editing options”

| “Link to toggle/tap variable when appropriate” | ☑: The placeholder “<toggle/tap variable>” in the visualization element properties is enabled.  
Effect: If you drag an element having the property “Color variable ➔ Toggle color” in the visualization editor, this property will be configured with the placeholder “<toggle/tap variable>”.

**Tab 'Grid'**

| **Visible** | ☑: The visualization editor contains a grid. The spacing of the grid lines is defined by “Size”. |
| **Active** | ☑: The visualization elements get aligned to the grid, defined by “Size”, even if the grid lines are not visible. When you insert or move an element, its center will be positioned on the grid. When you modify the size of an element, you can move the position markers onto grid lines only. Elements already available in a visualization, will not be aligned automatically, until you change their position. |
| **Size** | Spacing of the grid lines in pixel. |

**Tab 'File options'**

| **Text list files for textual "IntelliSense"** | File name and path of a file of type .csv. The file contains texts in the format of a text list. The file entries will be available when using the function "List Components" as input assistance. Note: You can create this file as an export file of the global text list. For this purpose use the command “Import/Export Text Lists”. |
| **Visualization Directories** | |
| **Text list files** | Storage path for text lists. Note: This setting will be used in CODESYS only if no storage path for “Text list files” is defined in the “Project Settings”, category “Visualization”. |
| **Image files** | Storage path for image files. Multiple paths get separated by semicolons. CODESYS uses this path for example when exporting or importing image files. Note: This setting will be used in CODESYS only if no storage path for “Image files” is defined in the “Project Settings”, category “Visualization”. |

Dialog 'Project Environment' - 'Visualization Profile'

**Function:** The dialog displays the current visualization profile of the project. The profile can be updated here.

**Call:** Main menu “Project ➔ Project Environment”, Tab “Visualization Profile”.

<table>
<thead>
<tr>
<th>“Current visualization profile in project”</th>
<th>The currently set visualization profile of the opened project.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Recommended, newest profile”</td>
<td>The newest profile</td>
</tr>
<tr>
<td>“Action”</td>
<td></td>
</tr>
<tr>
<td>“Do not update”</td>
<td>The visualization profile of the project remains unchanged.</td>
</tr>
<tr>
<td>“Update to x.x.x.x”</td>
<td>CODESYS updates the project to the chosen visualization profile.</td>
</tr>
</tbody>
</table>
| “Check for updates when loading this project” | ☑: CODESYS checks for new profiles when the project is opened. If there are updates available an update dialog opens automatically.  
  ☐: No check of the profile when loading the project. The update dialogs do not open automatically any longer. |
| “Set All to Newest”                      | CODESYS updates the profile.                                  |

Dialog 'Project Environment' - 'Visualization Styles'

**Function:** The dialog displays the currently used visualization style of the project. The visualization style can be updated here.

**Call:** Main menu “Project ➔ Project Environment”, tab “Visualization Styles”

<table>
<thead>
<tr>
<th>“For the following visualization styles currently in use, newer versions are available:”</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>“Visualization Styles”</td>
<td>Version of the currently set visualization style of the opened project.</td>
</tr>
<tr>
<td>“Current”</td>
<td>Current version of the visualization style, for example 3.5.6.0</td>
</tr>
<tr>
<td>“Recommended”</td>
<td>Recommend version of the visualization style, for example 3.5.7.0</td>
</tr>
<tr>
<td>“Action”</td>
<td></td>
</tr>
<tr>
<td>“Do not update”</td>
<td>The visualization style of the project remains unchanged.</td>
</tr>
<tr>
<td>“Update to x.x.x.x”</td>

Tab ‘Visualization’

This tab assigns a visualization type to a visualization.

In addition, it includes settings for window size that are used at runtime.
Table 326: “Use visualization as”

<table>
<thead>
<tr>
<th>“Visualization”</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Dialog”</td>
<td>Visualization type for a visualization that opens as a dialog in its own window for an input event. The input action for this is “Open dialog”. The “Close dialog” input action closes the window.</td>
</tr>
<tr>
<td></td>
<td>Tip: A dialog usually includes an “OK” button or “Cancel” button at the bottom edge for confirming or rejecting user input, and for closing the dialog. A simple dialog or a dialog prompt includes only a question or information and buttons for closing the dialog with either “Yes” or “No”. A dialog is part of a user interface. While a dialog is open, the rest of the user interface is usually disabled.</td>
</tr>
<tr>
<td>“Numpad / keypad / dialog for input configuration”</td>
<td>Visualization type for a visualization that displays a virtual numeric keypad or a virtual keyboard. It appears when the user is prompted to specify text. The input action for this is “Write variable”.</td>
</tr>
<tr>
<td></td>
<td>Note: The interface of this visualization must also conform with the interfaces for the standard visualizations for the numeric keypad or that keyboard that provides the VisuDialogs library: Numpad, Keypad, NumpadExtended, or TextinputwithLimits.</td>
</tr>
<tr>
<td></td>
<td>Tip: The VisuDialogs library contains templates for virtual keyboards or numeric keypads.</td>
</tr>
<tr>
<td>“Dialog is opaque”</td>
<td>☑: The screen area that is covered by the dialog is not refreshed. This has a positive effect on the character and input performance.</td>
</tr>
<tr>
<td></td>
<td>Use this option when your drawn dialog is rectangular and opaque, containing no transparent parts.</td>
</tr>
<tr>
<td>“Use automatic detected visualization size”</td>
<td>☐: The size is determined so that all visualization elements are enclosed.</td>
</tr>
<tr>
<td>“Include background image”</td>
<td>☑: All elements and the background image are completely visible.</td>
</tr>
<tr>
<td></td>
<td>☐: All elements are visible, but a larger background image is truncated.</td>
</tr>
<tr>
<td>“Use specified visualization size”</td>
<td>☑: The values “Height” and “Width” define the window size of the visualization (in pixels).</td>
</tr>
<tr>
<td>“Internal”</td>
<td>☑: The visualization is internal. It is used exclusively as an internal module of a complete visualization in a library.</td>
</tr>
<tr>
<td></td>
<td>When editing as a library project while the project is open in CODESYS, an internal visualization is handled like all visualizations. The internal visualization appears in drop-down lists. Or in the visualization manager (“Visualizations” tab).</td>
</tr>
<tr>
<td></td>
<td>The internal visualizations that include a linked library are not visible to you.</td>
</tr>
</tbody>

Dialog 'Display Settings'

**Function:** This dialog box includes the configuration for the display settings of the trace diagram (for both the x-axis and y-axis) and provides a preview in the trace diagram.

**Call:** “Display Settings” button in “Trace Configuration” dialog box.

<table>
<thead>
<tr>
<th>Table 328: “Tick Marks”</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Fixed spacing”</strong></td>
</tr>
<tr>
<td><strong>“Distance”</strong></td>
</tr>
<tr>
<td><strong>“Subdivisions”</strong></td>
</tr>
</tbody>
</table>

**Tab ‘X-Axis’**

**“Display Mode”**
- “Auto”: CODESYS Scales automatically.
- “Fixed length”: CODESYS displays a segment of constant “Length”.
- “Fixed”: CODESYS displays a segment from “Minimum” to “Maximum”.

**“Minimum”**
Initial value of the segment. Requirement: “Display mode” is “Fixed”.

**“Maximum”**
End value of the segment. Requirement: “Display mode” is “Fixed”.

**“Length”**
Constant length of the segment.

**“Grid”**
- Diagram with vertical grid lines. Select the line color from the dropdown list of colors.
"Font" Font for the x-axis

Tab 'Y-Axis'

"Display Mode" Scaling
- "Auto": CODESYS Scales automatically.
- "Fixed": CODESYS displays a segment from "Minimum" to "Maximum".

"Minimum" Initial value of the displayed segment. Requirement: "Display mode" is "Fixed".

"Maximum" End value of the displayed segment. Requirement: "Display mode" is "Fixed".

"Grid" Diagram with a grid line. Select the line color from the dropdown list of colors.

"Label" The description is displayed on the axis.

Table 329: “Tick Marks”

"Fixed spacing" CODESYS draws tick marks with “Distance” and “Subdivisions”.

"Distance" Distance between tick marks

"Subdivisions" Number of subdivisions between two tick marks

"Font" Font for the y-axis

Preview of the trace diagram

"Background color"  
- "No background": Transparent display without background color.
- "Draw background": Background color according to selection below.
- "From visualization style": Background color as defined in the visualization style.

"Reset" CODESYS resets all settings to the presets.

"Use as Default" CODESYS saves the settings as presets.

Object 'Visualization' and visualization editor

Symbol: 🎨

The object represents a single visualization. You can insert a visualization under an application or, so that it is available project-wide, under the root node of the view “Devices” or directly in the view “POUs”. You can open the visualization editor for editing by double-clicking on the object entry in the device tree or in the view POUs.

See also
- Chapter 1.3.5.19.3.15 “Dialog ‘Properties’ of Visualization Objects” on page 1603
- Chapter 1.3.5.19.4.1.1 “Visualization editor” on page 1608

Visualization editor

The visualization editor opens after a double-click on a visualization object.

![Visualization editor interface]

- (1) Graphical editor: this is where you create a visualization from the visualization elements that are provided in the view Tools.
- (2) View “Tools”: available visualization elements
- (3) View “Properties”: configuration editor for the visualization element currently selected in the editor area
- (4) Menu “Visualization”: commands for working in the visualization editor
Amongst other things, the menu “Visualization” contains commands for opening additional editors:

- (5) “Interface Editor”: declaration of variables via which the references of the visualization can be parameterized.
- (6) “Hotkeys Configuration”: definition of shortcuts for inputs on the visualization in online mode.
- (7) “Elementlist”: List of all elements used in the visualization, possibility to change their position on the z-axis.

- Chapter 1.3.5.19.2.3 “Command ‘Element List’” on page 1559

View ‘Toolbox’

Symbol: 🏗

**Function:** This view provides the elements that are usable in the editor. The individual elements are provided with certain identifiers in order to be able to group them. There is a button for each identifier. The elements of selected identifiers are displayed with thumbnails and can be dragged into the editor. Apart from the standard identifier, you can also define your own. You can change the size of the thumbnails with the sliders and a full-text search for element names is possible.

**Call:** Menu bar: “View ➤ Toolbox”

**Requirement:** A visualization is active.
● (1) “Toolbox” view
● (2) Toolbar with commands
● (3) Buttons with the name of the underlying identifier for selecting element categories
● (4) Selection of an individual visualization element
● (5) Control elements

<td>A style selected in the visualization manager can include single, predefined element properties. As a result, these do not appear in this view because a fixed value is already assigned to them. They do not have to be configured anymore.</td>
</tr>
</tbody>
</table>

A style selected in the visualization manager can include single, predefined element properties. As a result, these do not appear in this view because a fixed value is already assigned to them. They do not have to be configured anymore.
Visualizations can be configured with device-specific restrictions that block the availability of element properties.

Device-specific restrictions:
- Elements with restricted availability
- Fonts with restricted availability
- Colors with restricted display
- Image formats with restricted display
- Maximum number of visualization elements
- Maximum number of visualizations below the device

Object 'Visualization manager'

Symbol: 📖

The visualization manager manages the configuration settings for all display variants of the visualizations of the current application.

The object is automatically inserted when a visualization object is inserted below the application. On a double-click the configuration dialog opens with several tabs.

If the device employed supports display variants of the visualization, the visualization manager automatically brings along the corresponding objects (CODESYS WebVisu, CODESYS TargetVisu).

If the device employed supports CODESYS TargetVisu, the visualization manager automatically brings along the corresponding object CODESYS TargetVisu.

- § Chapter 1.3.5.19.4.8 “Object ‘WebVisu’” on page 1624

Tab 'Visualization manager' – 'Settings'

Symbol: 📖

Function: the tab contains settings for all visualizations that are available application-wide.

'General settings'

| "Use unicode strings" | ✅: The visualization codes character strings as Unicode. |
| "Use CurrentVisu variable" | ✅: the application knows and uses the global variable VisuElems.CurrentVisu of the type STRING. It contains the name of the currently active visualization at the runtime of the application. The application can read from the variable in order to obtain the name of the currently active visualization. The application can cause a visualization change by a write access. Requirement: the application contains a visualization that calls further visualizations. Example
  - Variable assignment: VisuElems.CurrentVisu:=strVisuName;
  - Visualization name assignment: VisuElems.CurrentVisu:='visu1'; |
The “Visualization Style Editor” enables new styles to be generated, checked and installed in the visualization styles repository.

**“Selected style”**
- Style from the visualization styles repository that every visualization in the application uses, for example “Flat Style”.
- “<None>”: The visualization displays its elements without style or according to the internal default. A standard dialog appears instead of a selection list for selection in the element properties “Color” und “Font”.

Open a selection list with styles that are installed in the visualization styles repository.

**“Display all versions (for experts only)”**
- The selection list contains only the latest version of each selected style and all other styles. If a newer version of the selected style is installed it is also displayed.
- The selection list contains all versions of all installed styles.

**Button ➔**
Opens a selection list with commands for the use of the “Visualization Styles Editor”.

**“Open Style Editor”**
The “Visualization Styles Editor” opens.

**“Create and edit derived style”**
The “Visualization Styles Editor” opens with the dialog “Create a new visualization style”. The dialog contains the settings for the first configuration step.

Requirement: a style is selected in “Selected style”.

**“Copy and edit the selected style”**
The “Visualization Style Editor” opens with the dialog “Open existing style as a copy”. The dialog contains the settings for the first configuration step.

Requirement: a style is selected in “Selected style”.

**“Preview”**
The elements displayed represent the style specified in “Selected style”.

- Chapter 1.3.5.19.3.7 “Dialog ‘Options’ - ‘Visualization Styles’” on page 1597

**'Language settings'**

**“Selected language”**
Language used by the display variants at the start of a visualization.

**'Settings for default text input'**
For an element with standard text input, a dialog that supports the input appears at runtime. You can specify which dialog appears.
<table>
<thead>
<tr>
<th>Dialog Name</th>
<th>Description</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Numpad”</td>
<td>Dialog that calls the visualization if a user activates the input field for a number at runtime. The dialog represents a numeric keypad. Default: “VisuDialogs.Numpad”</td>
<td></td>
</tr>
<tr>
<td>“Keypad”</td>
<td>Dialog that calls the visualization if a user activates the input field for a text at runtime. The dialog represents a keyboard. Preset: “VisuDialogs.Keypad”</td>
<td></td>
</tr>
</tbody>
</table>
| “Use text input with limits” | Requirement: CODESYS TargetVisu or CODESYS WebVisu are configured as display variants and the “standard text input” is “keyboard”. The visualization then supports input via keyboard at runtime. The input thus generally takes place via an input field.  
☑️ Instead of the input field you can call a dialog that displays the value range for inputs with a limited value range.  
Default: “VisuDialogs.TextinputWithLimits”. This dialog displays the value range and doesn't accept any value outside these limits. |                              |

'Settings for user management dialogs'

You can configure your visualization with a user management. To do this, configure an input to an element that causes a user management dialog to appear. The VisuUserManagement library contains ready-to-use dialog visualizations for this purpose. The library is located in the installation directory, for example in C:\Program Files (x86)\3S CODESYS\CODESYS\Projects\Visu\Dialogs\VisuUserMgmtDialogs.library.

You can also use other visualizations as user management dialogs. To do that you have to change the defaults here.

<table>
<thead>
<tr>
<th>Dialog Name</th>
<th>Description</th>
<th>Default</th>
</tr>
</thead>
</table>
| “Login dialog”           | User management dialog that enables logging in; typically a request to enter a user name and a password. It appears upon an input event on an element that executes as a consequential action “User management”, action “Login”.  
Preset: VisuUserManagement.VUM_Login |                              |
| “Change password dialog” | User management dialog that enables a password to be changed; typically a request to enter the current password and a new one. It appears upon an input event on an element that executes as a consequential action “User management”, action “Change user password”.  
Preset: VisuUserManagement.ChangePassword |                              |
| “Change configuration dialog” | User management dialog that enables a configuration change of the user management, i.e. typically a display of the current user configuration and a possibility to change it. It appears upon an input event on an element that executes as a consequential action “User management”, action “Open user configuration”.  
Preset: VisuUserManagement.VUM_UserManagement |                              |

'Additional settings'

"Activate multitouch handling"  
☑️ At runtime the visualization expects user inputs via gestures and touch events.  
Elements concerned  
- Elements with input configuration  
- Element of the type “Frame”  
- Component of the type “Tab control”

"Activate semi-transparent drawing"  
☑️ The visualization draws the elements in a semi-transparent color.  
To do this you can additionally specify a graduation value for the transparency when defining a color. The transparency is defined in the “Transparency” property.  
The leading byte is evaluated in color variables.  
Preset: Activated. Requirement: you create a new visualization and the display variants can paint semi-transparently.

"Activate standard keyboard handling"  
☑️  
- [Tab]  
- [Shift] + [Tab]  
- [Input]  
- [Up arrow]  
- [Down arrow]  
- [Right arrow]  
- [Left arrow]

Table 334: “Memory settings”

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Size of memory for visualization</td>
<td>Memory size in bytes allocated by the visualization at runtime. Preset: “400000”</td>
</tr>
<tr>
<td>Size of the paintbuffer (per client)</td>
<td>Memory size in bytes allocated by the visualization per display variant and used for painting actions. Preset: “50000”</td>
</tr>
</tbody>
</table>

Table 335: “File transfer mode”

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Transfer visualization files to the PLC</td>
<td>☑️: When downloading the application from the visualization directories to the controller, CODESYS copies image files and text list files that the visualization references. A CODESYS TargetVisu needs the files on the PLC and similarly the dialogs that support a numerical input or a keyboard input.</td>
</tr>
<tr>
<td>Use local visualization files</td>
<td>☑️: The visualization uses image files and text list files from local directories</td>
</tr>
<tr>
<td>Note:</td>
<td>In order to achieve that the visualization can access the files stored locally, it is necessary that the file paths are relative. The paths are given in dialog box “Project ➔ Project settings” in tab “Visualization”.</td>
</tr>
<tr>
<td>Note:</td>
<td>It is also necessary that the link type of a image is “Link to file”. The link type is specified in the image pool.</td>
</tr>
</tbody>
</table>

Object 'Image pool'

Display variant denotes the type of visualization, for example WebVisu, TargetVisu. A visualization client is a currently connected display medium. Thus, several browsers (clients) can be connected in parallel for the display variant WebVisu.

Table 336: “Client settings”

<table>
<thead>
<tr>
<th>“Maximum number of visualization clients”</th>
<th>Limits the number of visualization clients that are executed at the same time. If you configure the elements so that they vary depending on the display variant, then you have to limit the number of display variants. A visualization is given an ID at runtime that identifies the display variant and then processes data accordingly. CODESYS can query the ID using the system variable CURRENTCLIENTID and thus obtains the information as to which of the running variants is concerned. Example: arr[CURRENTCLIENTID].dwColor</th>
</tr>
</thead>
<tbody>
<tr>
<td>Requirement: VisuGlobalClientManager library is integrated in the project. Tip: You can find in the CODESYS store. example &quot;Global Client Manager&quot;</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Transfer both svg images and converted images”</th>
<th>This option is visible only if both a WebVisu and a TargetVisu exist. It concerns images in svg format only. The option is available if the device description for the controller of the TargetVisu does not support the svg (full) format.</th>
<th>✓: The images are transmitted in the png or bmp formats (for TargetVisu) and additionally in svg format (for WebVisu).</th>
</tr>
</thead>
<tbody>
<tr>
<td>Not all settings are available with an integrated CODESYS visualization.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Tab 'Visualization Manager’ - ‘Default Hotkeys’

Symbol: □

The tab includes a list of configured keyboard shortcuts that are valid for all visualizations available throughout the application. Therefore, the tab is the central location for defining keyboard shortcuts for all visualizations that are below an application.

Keyboard shortcuts of the default keyboard action are not listed here.

The tab is similar to the “Keyboard Configuration” tab and provides the same editing options.

See also
- “Tab 'Keyboard configuration’” on page 1558

Tab 'Visualization manager’ – ‘Visualizations’

Symbol: 🎨
**Function:** The tab lists all visualizations that are available project-wide and enables an assignment of the visualizations for the loading behaviour, depending on the display variants.

**Tab 'Flags'**

<table>
<thead>
<tr>
<th>“Standard behaviour”</th>
<th>The visualizations of the application and the actually referenced visualizations are automatically loaded to the target system. The activated checkboxes show which one that is.</th>
</tr>
</thead>
</table>
|                      | ☑: The loading behaviour is explicitly defined for each visualization. Hint: use the explicit selection if you reference visualizations indirectly via IEC variables.                                                                 |}

<table>
<thead>
<tr>
<th>“Visualizations”</th>
<th>The list contains all created visualizations from the device tree and the POU view.</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>“Dialogs”</th>
<th>The list contains all the referenceable visualizations that are available via the libraries of the library management.</th>
</tr>
</thead>
</table>

Only those visualizations selected here using checkboxes are loaded.

<table>
<thead>
<tr>
<th>“Remote target visualization, target visualization, web visualization,”</th>
<th>The column settings affect the loading behaviour for the display variants “remote target visualization”, “target visualization” and “web visualization”.</th>
</tr>
</thead>
</table>

**Tab 'Visualization manager' - 'User management’**

Symbol: 🌐

The “User management” tab is used for creating and configuring the user management for visualizations and their users and groups.

If a user management has not been configured yet, then the following buttons are available:

<table>
<thead>
<tr>
<th>“Create empty user management”</th>
<th>The user management opens. The “None” group is created.</th>
</tr>
</thead>
</table>

| “Create user management with default groups and users” | The user management opens. The following groups and users are created:  
- “Admin” group with “Admin” user  
- “Service” group with “Service” user  
- “Operator” group “Operator” user  
- “None” group |
|--------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Project with multiple visualization user managements**

**Table 337: “Choose between local and remote user management”**

<table>
<thead>
<tr>
<th>Requirement: The project includes several devices with a visualization user management.</th>
<th>The user management of this visualization manager is used for the visualization.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Use local user management”</td>
<td>Drop-down list with all devices of the project that have their own visualization user management.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Use remote user management”</th>
<th>Drop-down list with all devices of the project that have their own visualization user management.</th>
</tr>
</thead>
</table>
Even if there are no display variants of the visualization in the application, it may be required that the visualization user management is located on the controller. This is the case, for example, when HMIs connect to the controller.

| Requirement: The visualization does not have any display variants. This means that the objects “Web visualization”, “Target visualization”, or “Remote target visualization” are inserted below the visualization manager. |

See also
● Chapter 1.3.5.5.2 “Configuring users and groups” on page 1140

**Tab 'Groups'**

| “Group name” | When you click the node, all users are listed that belong to the group. |
| “Automatic logout” | ☑: The “Logout time” input field is active and editable. |
| “Logout time” | Input field for integer value |
| | Drop-down list for time unit “Min”, “Sec”, or “Hr” |
| “Permission to change user data” | ☑: The group is granted permission to edit user data when the visualization is in online mode. |
| “Description” | The text is visible in the development system only. It is not downloaded to the controller. |
| “ID” | Unique ID for each group. Assigned automatically by the system. |

Add a new group
In the last row of the table, click in the “Group name” field and specify the name for the new group.

Delete a group
Select a group and press [Del]. The “None” group cannot be deleted.

**Table 338: Buttons**

| “Update visualizations / hotkeys” | Opens the “Update visualizations and hotkeys” dialog box. |
| | Update, if groups were changed at a time when visualizations or keyboard shortcuts already had restricted permissions. |
| “List usage of groups” | List of visualizations and keyboard shortcuts with restricted permissions. |
| | The list is displayed in the “Messages” view. |
| “Export groups for global visualizations” | The defined group names are transmitted to “Tools ➔ Options ➔ Visualization user management”. They are then listed in “Use the following user group list for the visualization”. The list can be changed there as well. |
| “Delete complete user management” | The user management is deleted and the start view is shown with the following buttons: |
| | “Create empty user management” and |
| | “Create user management with default groups and users”. |
| “Export user management” | The drop-down list opens. |
| | ● “Before V3.5 SP6” |
| | ● “V3.5 SP6 and later” |
| | A standard dialog opens for saving the user management as a CSV file with any name in any directory. |
“Import user management”  A standard dialog opens for importing a user management. The user management must be a CSV file.

↑, ↓  Moves the selected group one line up/down, thus changing the hierarchy of the group. A group of a higher hierarchy cannot have fewer permissions for an element than a group of a lower hierarchy.

Table 339: Dialog box “Update visualizations and hotkeys”

<table>
<thead>
<tr>
<th>Table 339: Dialog box “Update visualizations and hotkeys”</th>
</tr>
</thead>
<tbody>
<tr>
<td>This dialog updates only visualization elements and keyboard shortcuts with configured permissions.</td>
</tr>
<tr>
<td>“Add new group”  Drop-down list with all new created groups of this user management. Requirement: A new user group was created.</td>
</tr>
</tbody>
</table>
| “Setting for new group”  ● “new group in visualization / hotkey will get the right like group”: Drop-down list with all existing groups of this user management
  ● “new group should get the following right”
    – “for visualization elements”: Drop-down list with the permissions: “Operable”, “Only visible”, and “Invisible”.
    – “for hotkeys”: Drop-down list with the permissions: “Operable”, “Not operable”. |
| “Delete not existing groups”  If no affected visualization elements or keyboard shortcuts are found for updating, then this is displayed as a message in the “Messages” view (“Visualization” category). |
| “Rename groups”  Updates the permissions of the affected visualization elements and keyboard shortcuts |

Tab ‘User’

| “Login name”  Name for the user to log in to the visualization at runtime. This name is unique. |
| “Full name”  This name may exist more than one time in the user management. |
| “Password”  Encrypted by CODESYS. By default, the “Login name” is displayed here. If you click the “Password” field of a selected line, then the “Change password” dialog box opens. |
| “User group”  Group(s) that the user belongs to. Clicking the “User group” field of a selected user opens the dialog box “User groups the user belongs to”.
  ● “Groups”
  ● “Assigned”: The user is assigned to this group. |
| “Deactivate”  The user is deactivated. |
| “Description”  Descriptive text is available in the development system only and is not downloaded to the controller. |

Table 340: Buttons

| “Upload user from device”  The data of the user management is uploaded from the controller. If user data is already configured, then it is overwritten. |
| “Download user to device”  The data of the user management is downloaded to the controller. The existing user management on the controller is overwritten. |
“Export user management” The drop-down list opens.
- “Before V3.5 SP6”
- “V3.5 SP6 and later”
A standard dialog opens for saving the user management as a CSV file with any name in any directory.

“Import user management” A standard dialog opens for selecting the user management (in CSV format) from the file system.

Tab 'Settings'

“Settings for download of user data”

“Download user data on every login” The data of the user management is downloaded to the controller at login. Existing data is overwritten.

“Never download user data on login” The data of the user management is never downloaded to the controller, even if it changes.

“Allow decision on every download” A “Warning” dialog box opens for you to accept or refuse the download.

“Access rights for elements”

“Use group hierarchy” [✓]: The permissions can be granted to the group hierarchy of the “Groups” tab only.
The group in the first line of the “Group” list is the highest in the hierarchy.
A group of a higher hierarchy cannot have fewer permissions for an element than a group of a lower hierarchy.

“Logout behavior”

“Change to start visualization at logout” [✓]: Switches at logout to the visualization that is configured as the “Start visualization” in the respective display variant.

CSV file with the data for user management The data for user management is saved to a CSV file in the following format:
- **User groups**: ID;group name; automatic logoff TRUE/FALSE; logoff time; unit logoff time; permission to change user date TRUE/FALSE
- **Users**: login name; full name; password encrypt TRUE/FALSE; password; group ID; user deactivated TRUE/FALSE

Use this format when you want to edit data for user management by means of any tool. If you set password encrypt to FALSE, then an unencrypted password can be used. In the example, the unencrypted password Yellow was specified for the user Hugo. If you import the CSV file with the command "Import user management", then the password is encrypted automatically.
Example

V1.0.0.1
Usergroups:
1;Admin;TRUE;1;Minute;TRUE
3;Operator;FALSE;1;Minute;FALSE
7;Service;FALSE;1;Minute;FALSE
0;None;FALSE;1;Minute;FALSE
4;Early and late shift;FALSE;1;Minute;FALSE
2;Early shift;TRUE;1;Minute;FALSE
6;Late shift;FALSE;1;Minute;FALSE
User:
Service;Service;TRUE;C08298D42A35732CFFB7DF43771B7607;2;FALSE
Operator;Operator;TRUE;3D94AB9540B025B07773DE7037F19B37;3;FALSE
John;Blue;TRUE;62ED5DE29E5DD4164A01F3AF1B81EFA0;4;FALSE
Paul;White;TRUE;01E2CBD4AE5442D9EACE33669549A3CC;2;FALSE
Hugo;Green;FALSE;Yellow;6;FALSE

Tab 'Visualization Manager' - 'Font'

Symbol: 📐

Function: This tab provides settings for adapting the font and font size in the visualization according to the language. The settings apply to all visualizations of the application, including the visualization manager.

Table 341: “Language Specific Font Settings”

<table>
<thead>
<tr>
<th>“Language”</th>
<th>Language used in the project. A column is created for each language. All text lists, including those from integrated libraries, are scanned for this.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Font”</td>
<td>Font used by the visualization depending on the language.</td>
</tr>
</tbody>
</table>
| “Size factor” | The factor affects the type size of all texts in the visualization.  
    Preset: 1  
    If the factor is smaller than 1, this leads to a reduction of the type size. If the factor is 1, all texts are displayed unchanged as defined in “Properties”. |

Red highlighting of a cell
The highlighted language is no longer present in the text lists of the project or the libraries.  
This highlighting is not available in runtime mode.

Context menu of a selected table row

| “Delete Language” | The associated column is removed. This is advisable above all if settings in the column are highlighted in red. |
| “Copy Language Settings” | All settings in the column are copied to the clipboard. |
| “Paste Language Settings” | All settings in the column are overwritten with the values from the clipboard. |
Table 342: “General Font Settings”

| “Automatic decrease of font size” | ❑: If the text to be displayed does not fit in the text field in the set format, then the font size is decreased automatically until the text fits completely in the text field. 
Tip: This prevents a text from being truncated when changing to a language that needs more space. The requirement is that a font is available which has a sufficiently small font. |

Object ‘TargetVisu’

Symbol: 📚

**Function:** The object is used for configuring CODESYS TargetVisu in order to display the visualization directly on the controller of an integrated or connected panel.

**Requirement:** The CODESYS control runtime environment is equipped with the CODESYS TargetVisu component. The object itself is inserted below the visualization manager.

CODESYS TargetVisu can be executed on different platforms, from embedded controllers to powerful PC-based systems on different operating systems. Therefore, it can be run on Windows, Windows Embedded CE, Linux, QNX, or VxWorks. A ready-made adaptation to the graphics interface of the systems is available on these operating systems. An adaptation is required for embedded controllers or other operating systems. In addition, there are device manufacturers that integrate visualizations into external applications by means of ActiveX controls.

Table 343: “Scaling Options”

| “Fixed” | ❑: Fixed size of the visualization (original size). |
| “Isotropic” | ❑: The size of the visualization is adapted to the dimensions of the display device, retaining the proportions of the visualization. |
| “Anisotropic” | ❑: The size of the visualization is adjusted to the size of the display device, for example a screen. |
| “Use scaling options for dialogs” | ❑ The dialogs, also for keypad and numpad, are scaled like the visualization (drawn with the same scaling factor). This is an advantage when a dialog was created to match the visualization because then they are scaled together. |
“Use automatically detected client size”

- The visualization fills the screen of the display device completely.

“Use specified client size”

- The values in “Client height” and “Client width” are used for the size of the visualization. The visualization fills this screen area only.

“Client height”

- Height of the visualization (in pixels).

“Client width”

- Width of the visualization (in pixels).

<table>
<thead>
<tr>
<th>Table 344: “Presentation Options”</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Antialiased drawing”</td>
</tr>
<tr>
<td>- Antialiasing is used in the visualization editor for drawing a visualization as a TargetVisu and a TargetVisu variant.</td>
</tr>
<tr>
<td>Hint: If a horizontal or vertical line is drawn blurry on a specific visualization platform, then this can be corrected by an offset of 0.5px in the direction of the line thickness (see element property “Absolute movement”, option “Use REAL values”). Requirement: The platform in use supports using REAL coordinates.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Table 345: “Default Text Input”</th>

</tr>
</tbody>
</table>

Effect:

When you configure a user input for default text input, select an input configuration for input action “Write variable”, and configure the “Input type” as “Default”, then the settings are used here.

See also

- “Input action ‘Write a Variable’” on page 1594

Object ‘WebVisu’

Symbol: 🌐

Function: This object is used for configuring the web-based display variant for remote display of the visualization of the controller in a web browser. This allows for remote access, remote monitoring, as well as service and diagnostics of an application over the Internet.

Requirement: The object is inserted below the visualization manager, and the target system has a web server with CODESYS WebVisu support. The web server allows for the communication between the target system and the web browser.

See also

-
“Start Visualization” | Name of the visualization where the start is displayed as CODESYS WebVisu. Hint: Use input assistance for selecting another visualization.

“Name of the .htm file” | Base URL of the web page. The URL is also specified as the address in the web browser.
Example: http://localhost:8080/webvisu.htm

Note: If you use a BeagleBone Black as a visualization device, then you must note that a BeagleBone Black uses port 9090 for its web server. A valid IP address is as follows: http://192.168.7.2:9090/webvisu.htm

“Use as default page” | ☑: The page specified in “Name of .htm file” is preset as the default page. Now this page will always open when a user specified in the web browser the IP address and port of the web server that is running on the controller: http://<IP address web server>:<port web server>.
Example: http://localhost:8080

Notice: Even if you have created multiple web visualizations, you can activate this option for exactly one web page only and therefore preset only one page as the default page.

“Update rate (ms)” | Refresh rate (in milliseconds) in the web browser

“Default communication buffer size” | Default size for communication buffer (in bytes). Defines the maximum available memory for data transfer between the web client and the web server.
Example: 50000

“Show used visualizations” | The link opens the “Visualizations” tab in the “Visualization Manager” editor.
The tab provides information of the visualizations loaded on the display variants.

| 1.3.5.19.5.46 | Visualization element 'Date picker'
| 1.3.5.19.5.47 | Visualization Element 'Analog clock'
**Visualization element 'Rectangle', 'Round rectangle', 'Ellipse'**

Symbol:

![Rectangle Symbol](image)

Tag: "Basic"

The rectangle, round rectangle, and ellipse are the same element type. They can be converted into another element type by changing the "Element type" property.

**Element properties**

<table>
<thead>
<tr>
<th>&quot;Element name&quot;</th>
<th>Optional</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: Werkstueck_3</td>
<td></td>
</tr>
</tbody>
</table>

Hint: Assign individual names for elements so that they are found faster in the element list.

<table>
<thead>
<tr>
<th>&quot;Type of element&quot;</th>
<th>&quot;Rectangle&quot;, &quot;Round rectangle&quot;, &quot;Ellipse&quot;</th>
</tr>
</thead>
</table>

**Element property 'Position'**

The position defines the location and size of the element in the visualization window. This is based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

<table>
<thead>
<tr>
<th>&quot;X&quot;</th>
<th>The x-coordinate of the upper left corner of the element</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specified in pixels</td>
<td></td>
</tr>
<tr>
<td>Example: 10</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>&quot;Y&quot;</th>
<th>The y-coordinate of the upper left corner of the element</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specified in pixels</td>
<td></td>
</tr>
<tr>
<td>Example: 10</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>&quot;Width&quot;</th>
<th>Specified in pixels</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: 150</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>&quot;Height&quot;</th>
<th>Specified in pixels</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: 30</td>
<td></td>
</tr>
</tbody>
</table>

Tip: You can change the values in "X", "Y", "Width", and "Height" by dragging the corresponding symbols to another position in the editor.
**“Angle”**

Static angle of rotation (in degrees)

Example: 35

The element is displayed rotated in the editor. The point of rotation is the center of the element. A positive value rotates clockwise.

Tip: You can change the value in the editor by focusing the element to the handle. When the cursor is displayed as a rotating arrow, you can rotate the element about its center as a handle.

(1): Handle

Note: If a dynamic angle of rotation is also configured in the property “Absolute movement ➔ Internal rotation”, then the static and dynamic angles of rotation are added in runtime mode. The static angle of rotation acts as an offset.

See also

- § Chapter 1.3.5.3.2 “Positioning elements, adapting size and layer” on page 1113

**Radius setting**

Visible only when “Round rectangle” is selected in the “Type of element” property.

| “Radius” | How the corners are rounded.
| ——— | ——— |
| “From style” | &gt;&gt; |
| “Relative to the element size” | |
| “Explicit” | Allows for specifying a custom value in the “Value” setting. |

| “Value” | Radius of the rounded corners (in pixels)
| ——— | ——— |
| Example: 5 | |
| Requirement: “Explicit” is selected in the “Radius” setting. | |

**Element property ‘Center’**

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

| “X” | X-coordinate of the point of rotation |
| “Y” | Y-coordinate of the point of rotation |

You can also change the values by dragging the symbols (4) to other positions in the editor.

**Element property ‘Colors’**
**“Normal state”**
The normal state is in effect if the variable in “Color variables ➔ Toggle color” is not defined or it has the value FALSE.

**“Frame color”**
Frame and fill color for the corresponding state of the variable.

**“Fill color”**

**“Transparency”**
Transparency value (0 to 255) for defining the transparency of the selected color. Example: 255: The color is opaque. 0: The color is completely transparent.

**“Alarm state”**
The alarm state is in effect if the variable in “Color variables ➔ Toggle color” has the value TRUE.

**“Use gradient color”**
☑: The element is displayed with a gradient of two colors.

**“Gradient setting”**
The “Gradient editor” dialog box opens.

See also
- ☀ Chapter 1.3.5.19.3.5 “Dialog ‘Gradient Editor’” on page 1586

**Element property ‘Appearance’**
The properties contain fixed values for setting the look of the element.

<table>
<thead>
<tr>
<th>“Line width”</th>
<th>Value in pixels</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: 2</td>
<td></td>
</tr>
</tbody>
</table>

Note: The values 0 and 1 both result in a line weight of 1 pixel. If no line should be displayed, then the “Line style” property must be set to the option “Invisible”.

<table>
<thead>
<tr>
<th>“Fill attributes”</th>
<th>The way in which the element is filled.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>☐ “Filled”: The element is filled with the color from property “Colors ➔ Fill color”.</td>
</tr>
<tr>
<td></td>
<td>☐ “Invisible”: The fill color is invisible.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Line style”</th>
<th>Type of line representation</th>
</tr>
</thead>
<tbody>
<tr>
<td>☐ “Solid”</td>
<td></td>
</tr>
<tr>
<td>☐ “Dashes”</td>
<td></td>
</tr>
<tr>
<td>☐ “Dots”</td>
<td></td>
</tr>
<tr>
<td>☐ “Dash Dot”</td>
<td></td>
</tr>
<tr>
<td>☐ “Dash Dot Dot”</td>
<td></td>
</tr>
<tr>
<td>☐ “not visible”</td>
<td></td>
</tr>
</tbody>
</table>

You can assign variables in the “Appearance variables” property for controlling the appearance dynamically. The fixed values here are overwritten.

See also
- ☀ “Element property ‘Appearance variables’” on page 1285

**Element property ‘Texts’**
The properties contain character strings for labeling the element. The character string can also contain a placeholder with a format definition. In runtime mode, the placeholder is replaced by the current value in the specified format.

CODESYS accepts the specified texts automatically into the “GlobalTextList” text list. Therefore, these texts can be localized.
### “Text”

Character string (without single straight quotation marks) for the labeling the element. Add a line break by pressing the keyboard shortcut [Ctrl] + [Enter].

**Example:** `Accesses: %i`

The variable that contains the current value for the placeholder is specified in the property “Text variable ➔ Text”.

### “Tooltip”

Character string (without single straight quotation marks) that is displayed as the tooltip of an element.

**Example:** `Number of valid accesses`.

The variable that contains the current value for the placeholder is specified in the property “Text variable ➔ Tooltip”.

See also
- “Element property ‘Text variables’” on page 1229
- Chapter 1.3.5.18.2 “Placeholders with format definition in the output text” on page 1546

### Element property ‘Text properties’

The properties contain fixed values for the text properties.

<table>
<thead>
<tr>
<th><strong>“Horizontal alignment”</strong></th>
<th>Horizontal alignment of the text within the element.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Vertical alignment”</strong></td>
<td>Vertical alignment of the text within the element.</td>
</tr>
<tr>
<td><strong>“Text format”</strong></td>
<td>Definition for displaying texts that are too long</td>
</tr>
<tr>
<td></td>
<td>- “Default”: The long text is truncated.</td>
</tr>
<tr>
<td></td>
<td>- “Line break”: The text is split into parts.</td>
</tr>
<tr>
<td></td>
<td>- “Ellipsis”: The visible text ends with “...” indicating that it is not complete.</td>
</tr>
</tbody>
</table>

**“Font”**

**Example:** “Default”

➡️ The “Font” dialog box opens.

▶: Drop-down list with style fonts.

**“Font color”**

**Example:** “Black”

➡️ The “Color” dialog box opens.

▶: Drop-down list with style colors.

**“Transparency”**

Whole number (value range from 0 to 255). This determines the transparency of the respective color.

**Example:** 255: The color is opaque.

0: The color is completely transparent.

Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

### Element property ‘Absolute movement’

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

**“Movement”**

<table>
<thead>
<tr>
<th><strong>“X”</strong></th>
<th>Variable (numeric data type). Defines the X position (in pixels).</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td>PLC_PRG.iPos_X.</td>
</tr>
<tr>
<td></td>
<td>Increasing this value in runtime mode moves the element to the right.</td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>“Y”</td>
<td>Variable (numeric data type). Defines the Y position (in pixels).</td>
</tr>
<tr>
<td>“Rotation”</td>
<td>Variable (numeric data type). Defines the angle of rotation (in degrees).</td>
</tr>
<tr>
<td>“Scaling”</td>
<td>Variable (integer data type). Causes centric stretching.</td>
</tr>
<tr>
<td>“Interior rotation”</td>
<td>Variable (numeric data type). Defines the angle of rotation (in degrees).</td>
</tr>
<tr>
<td>“Use REAL values”</td>
<td>Note: Only available if the device supports the use of REAL coordinates. The properties of the absolute movement are interpreted as REAL values. The values are not rounded. The option allows for the individual fine-tuning of drawing the element, for example for the visualization of a smoother rotation. If a horizontal or vertical line is drawn blurry on a specific visualization platform, then this can be corrected by an offset of 0.5px in the direction of the line thickness.</td>
</tr>
</tbody>
</table>

You can link the variables to a unit conversion.
The properties “X”, “Y”, “Rotation”, and “Interior rotation” are supported by the "Client Animation" functionality.

See also
- Unit conversion

Element property 'Relative movement'

The properties contains variables for moving the element. The reference point is the position of the element ("Position" property). The shape of the element can change.

<table>
<thead>
<tr>
<th>“Movement top-left”</th>
</tr>
</thead>
<tbody>
<tr>
<td>“X” Variable (integer data type). It contains the number (in pixels) that the left edge is moved horizontally. Incrementing the value moves the element to the right. Example: PLC_PRG.iDeltaX</td>
</tr>
<tr>
<td>“Y” Variable (integer data type). It contains the number (in pixels) that the top edge is moved vertically. Incrementing the value moves the element to the down. Example: PLC_PRG.iDeltaY</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Movement bottom-right”</th>
</tr>
</thead>
<tbody>
<tr>
<td>“X” Variable (integer data type). It contains the number (in pixels) that the right edge is moved horizontally. Incrementing the value moves the element to the right. Example: PLC_PRG.iDeltaWidth</td>
</tr>
<tr>
<td>“Y” Variable (integer data type). It contains the number (in pixels) that the bottom edge is moved vertically. Incrementing the value moves the element to the down. Example: PLC_PRG.iDeltaHeight</td>
</tr>
</tbody>
</table>

See also
- “Element property ‘Absolute movement’” on page 1227

Element property 'Text variables'

These properties are variables with contents that replace a format definition.

<table>
<thead>
<tr>
<th>“Text variable”</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. Example: PLC_PRG.iAccesses</td>
</tr>
<tr>
<td>Note: The format definition is part of the text in the property “Texts ➔ Text”. Note: If you specify a variable of type enumeration with text list support, then the name of the enumeration data type is added automatically in angle brackets after the variable name. Example: PLC_PRG.enVar &lt;enumeration name&gt;. Then the symbolic value of the enumeration component is printed instead of the numeric value when text is printed. Refer to the help page for the enumerations.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Tooltip variable”</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. Example: PLC_PRG.iAccessesInTooltip</td>
</tr>
<tr>
<td>Note: The format definition is part of the text in the property “Texts ➔ Tooltip”.</td>
</tr>
</tbody>
</table>
See also

- % Chapter 1.3.5.18.2 “Placeholders with format definition in the output text” on page 1546
- % “Element property ‘Texts’” on page 1226
- Enumerations

**Element property ‘Dynamic texts’**

Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.

<table>
<thead>
<tr>
<th><strong>“Text list”</strong></th>
<th>Variable (string) or name of the text list as a fixed string in single straight quotation marks.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: 'Errorlist'</td>
<td>▼: Drop-down list with the dialogs available in the text lists.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>“Text index”</strong></th>
<th>Text list ID. This refers to the desired output text.</th>
</tr>
</thead>
<tbody>
<tr>
<td>- As fixed string with the ID in single straight quotation marks.</td>
<td>Example: '1'</td>
</tr>
<tr>
<td>- As a variable (STRING) for dynamically controlling the text output.</td>
<td>Example: strTextID Sample assignment: PLC_PRG.strTextID := '1';</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>“Tooltip index”</strong></th>
<th>Text list ID. This refers to the desired output text.</th>
</tr>
</thead>
<tbody>
<tr>
<td>- As fixed string with the ID in single straight quotation marks.</td>
<td>Example: '2'</td>
</tr>
<tr>
<td>- As a variable (STRING) for dynamically controlling the text output.</td>
<td>Example: strToolTipID Sample assignment: PLC_PRG.strToolTipID := '2';</td>
</tr>
</tbody>
</table>

See also

- Text list

**Element property ‘Font variables’**

The variables allow for dynamic control of the text display.
| “Font name” | Variable (STRING). Includes the font of the text.  
Example: PLC_PRG.stFontVar := 'Arial';  
The selection of fonts corresponds to the default “Font” dialog. |
| “Size” | Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name.  
- <pt>: Points (default)  
  Example: PLC_PRG.iFontHeight <pt>  
  Code: iFontHeight : INT := 12;  
- <px>: Pixels  
  Example: PLC_PRG.iFontHeight <px>  
  Code: iFontHeight : INT := 19;  
  If you click in the value field, a drop-down list opens on the right for setting the unit.  
  Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property “Text property ➔ Font”. |
| “Flags” | Variable (DWORD). Contains the flags for displaying fonts.  
Flags:  
- 1: Italics  
- 2: Bold  
- 4: Underline  
- 8: Strikethrough  
  Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: PLC_PRG.dwFontType := 6; |
| “Character set” | Variable (DWORD). Contains a character set number for the font.  
The selection of character set numbers corresponds to the “Script” setting of the standard “Font” dialog. |
| “Color” | Variable (DWORD). Includes the color of the text.  
Example: PLC_PRG.dwColorFont := 16#FF000000; |
| “Flags for text alignment” | Variable (integer data type). Contains the coding for text alignment.  
Example: PLC_PRG.dwTextAlignment.  
Coding:  
- 0: Top left  
- 1: Horizontal center  
- 2: Right  
- 4: Vertical center  
- 8: Bottom  
  Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: PLC_PRG.dwFontType := 5; |
Fixed values for displaying texts are set in “Text properties”.

- "Element property 'Text properties'” on page 1227

---

**Element property 'Color variables'**

The Element property is used as an interface for project variables to dynamically control colors at runtime.

<table>
<thead>
<tr>
<th><strong>“Toggle color”</strong></th>
<th>The property controls the toggled color at runtime.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Value assignment:</strong></td>
<td><strong>FALSE:</strong> The element is displayed with the color specified in the “Color” property.</td>
</tr>
<tr>
<td></td>
<td><strong>TRUE:</strong> The element is displayed with the color specified in the “Alarm color” property.</td>
</tr>
<tr>
<td><strong>Assignment options:</strong></td>
<td><strong>Placeholder for the user input variable</strong></td>
</tr>
<tr>
<td></td>
<td>– “&lt;toggle/tap variable&gt;”</td>
</tr>
<tr>
<td></td>
<td>– “&lt;NOT toggle/tap variable&gt;”</td>
</tr>
<tr>
<td></td>
<td>The color change is not controlled by its own variable, but by a user input variable.</td>
</tr>
<tr>
<td></td>
<td>Note: Specify a variable for the mouse events “Tap” or “Toggle” in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both “Toggle” and “Tap”, then the variable specified in “Tap” is used.</td>
</tr>
<tr>
<td></td>
<td>Hint: Click the symbol to insert the placeholder “&lt;toggle/tap variable&gt;”. When you activate the “Input configuration”, “Tap FALSE” property, then the “&lt;NOT toggle/tap variable&gt;” placeholder is displayed.</td>
</tr>
<tr>
<td></td>
<td><strong>Instance path of a project variable (BOOL)</strong></td>
</tr>
<tr>
<td></td>
<td>Example: PLC_PRG.xColorIsToggeled</td>
</tr>
<tr>
<td></td>
<td>Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>“Normal state”</strong></th>
<th>The properties listed below control the color depending on the state. The normal state is in effect if the variable in “Color variables”, “Toggle color” is not defined or it has the value FALSE. ### Element property 'Input configuration'

The properties contain the configurations for the user input when using the mouse or keyboard. A user input defines an event and one or more actions that are executed when an event occurs.

The “Configure” button opens the “Input configuration” dialog box for creating or modifying a user input.

Configured user inputs are briefly listed below the events. They each include the action that is triggered and the setting in short form.

Example: “Execute ST code”: \#PLC_PRG.i.x := 0;

<table>
<thead>
<tr>
<th>“OnDialogClosed”</th>
<th>Input event: The user closes the dialog box.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“OnMouseClicked”</td>
<td>Input event: The user clicks the mouse button completely. The mouse button is clicked and released.</td>
</tr>
<tr>
<td>“OnMouseDown”</td>
<td>Input event: The user clicks down on the mouse button.</td>
</tr>
<tr>
<td>“OnMouseEnter”</td>
<td>Input event: The user drags the mouse pointer to the element.</td>
</tr>
<tr>
<td>“OnMouseLeave”</td>
<td>Input event: The user drags the mouse pointer away from the element.</td>
</tr>
<tr>
<td>“OnMouseMove”</td>
<td>Input event: The user moves the mouse pointer over the element area.</td>
</tr>
<tr>
<td>“OnMouseUp”</td>
<td>Input event: The user releases the mouse button over the element area.</td>
</tr>
<tr>
<td><strong>“Tap”</strong></td>
<td>When a mouse click event occurs, the variable defined in “Variable” is described in the application. The coding depends on the options “Tap FALSE” and “Tap on enter if captured”.</td>
</tr>
<tr>
<td>---------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>“Variable”</strong></td>
<td>Variable <code>(BOOL)</code> that is set on mouse click.</td>
</tr>
<tr>
<td>Example</td>
<td>PLC_PRG.bIsTapped</td>
</tr>
<tr>
<td>TRUE:</td>
<td>A mouse click event exists. It lasts while the user presses the mouse button over the element. It ends when the button is released.</td>
</tr>
<tr>
<td>FALSE:</td>
<td>A mouse click event does not exist.</td>
</tr>
<tr>
<td>Requirement:</td>
<td>The “Tap FALSE” option is not activated.</td>
</tr>
<tr>
<td><strong>“Tap FALSE”</strong></td>
<td>☑: The mouse click event leads to a complementary value in “Variable”.</td>
</tr>
<tr>
<td>TRUE:</td>
<td>A mouse click event does not exist.</td>
</tr>
<tr>
<td>FALSE:</td>
<td>While the mouse click event exists.</td>
</tr>
<tr>
<td><strong>“Tap on enter if captured”</strong></td>
<td>☑: During user input, it is also taken into consideration whether the mouse pointer is dragged within the element area or not while the mouse button is pressed.</td>
</tr>
<tr>
<td>TRUE:</td>
<td>While the mouse click event exists and the mouse pointer is moved over the element area.</td>
</tr>
<tr>
<td>FALSE:</td>
<td>A mouse click event does not exist. Or the user moves the mouse pointer outside of the element area while the mouse button is pressed.</td>
</tr>
<tr>
<td></td>
<td>The value is TRUE again as soon as the user moves the pointer back to the element area. The mouse is then captured.</td>
</tr>
<tr>
<td><strong>“Shift”</strong></td>
<td>With the onset of a mouse click event, the variable is set; when the mouse click event is completed, the variable is reset.</td>
</tr>
<tr>
<td><strong>“Variable”</strong></td>
<td>Variable <code>(BOOL)</code>. Its value toggled when the mouse click event is ended. This is when the user releases the mouse button while the mouse pointer is over the element area.</td>
</tr>
<tr>
<td></td>
<td>If the user releases the mouse button while the mouse pointer is outside of the element area, then the mouse click event is not ended and the value is not toggled.</td>
</tr>
<tr>
<td></td>
<td>Tip: The user can cancel a started toggle input by dragging the mouse pointer out of the element area.</td>
</tr>
<tr>
<td><strong>“Toggle on up if captured”</strong></td>
<td>☑: The value toggles regardless of where the mouse pointer is when the mouse button is released. The mouse is then captured.</td>
</tr>
<tr>
<td><strong>“Keyboard shortcuts”</strong></td>
<td>Keyboard shortcut on the element for triggering specific input actions.</td>
</tr>
<tr>
<td></td>
<td>When the keyboard shortcut event occurs, the input actions in the “Event(s)” property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.</td>
</tr>
<tr>
<td><strong>“Key”</strong></td>
<td>Key pressed for input action.</td>
</tr>
<tr>
<td>Example</td>
<td><code>[T]</code></td>
</tr>
<tr>
<td>Note:</td>
<td>The following properties appear when a key is selected.</td>
</tr>
</tbody>
</table>
### Event(s)
- "None"
- "Mouse down": Pressing the key triggers the input actions that are configured in the "OnMouseDown" property.
- "Mouse up": Releasing the key triggers the input actions that are configured in the "OnMouseUp" property.
- "Mouse down/up": Pressing and releasing the key triggers the input actions that are configured in the "OnMouseDown" property and the "OnMouseUp" property.

### Shift
- Combination with the Shift key
- Example: [Shift]+[T].

### Control
- Combination with the Ctrl key
- Example: [Ctrl]+[T].

### Alt
- Combination with the Alt key
- Example: [Alt]+[T].

---

> All keyboard shortcuts and their actions that are configured in the visualization are listed in the “Keyboard configuration” tab.

---

### Element property 'Access rights'

<table>
<thead>
<tr>
<th>&quot;Access rights&quot;</th>
</tr>
</thead>
<tbody>
<tr>
<td>Opens the “Access rights” dialog. There you can edit the access privileges for the element.</td>
</tr>
<tr>
<td>Status messages:</td>
</tr>
<tr>
<td>- &quot;Not set. Full rights.&quot;: Access rights for all user groups: “operable”</td>
</tr>
<tr>
<td>- &quot;Rights are set: Limited rights&quot;: Access is restricted for at least one group.</td>
</tr>
</tbody>
</table>

**See also**
- § Chapter 1.3.5.19.3.1 “Dialog ‘Access Rights’” on page 1583

---

### Visualization element 'Line'

**Symbol:**

Tag: "Basic"

The element draws a single line.
Element properties

"Element name" | Optional.
Example: Separator_Header
Hint: Assign individual names for elements so that they are found faster in the element list.

"Type of element" | Line

Element property 'Position'
The following properties define the position and length of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

"Dots" | "[0]": Coordinates of the starting point
"[1]": Coordinate of the end point
You can also change the values by dragging the box symbols (_drag_to_other_positions_) to other positions in the editor.

"Angle" | Static angle of rotation (in degrees).
Example: 35
The element is displayed rotated in the editor. The point of rotation is the center of the element. A positive value rotates clockwise.
Tip: You can change the value in the editor by focusing the element to the handle. When the cursor is displayed as a rotating arrow (rotate_handle_), you can rotate the element about its center as a handle.
Example:

(1): Handle
Note: If a dynamic angle of rotation is also configured in the property "Absolute movement ➔ Internal rotation", then the static and dynamic angles of rotation are added in runtime mode. The static angle of rotation acts as an offset.

See also

Element property 'Center'
The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

"X" | X-coordinate of the point of rotation
"Y" | Y-coordinate of the point of rotation
Element property 'Colors'

The properties contain fixed values for setting colors.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Color”</td>
<td>Color of the line in normal state.</td>

- "Element property 'Appearance variables'"

Element property 'Appearance'

The properties contain fixed values for setting the look of the element.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Line width”</td>
<td>Value in pixels</td>
</tr>
<tr>
<td></td>
<td>Example: 2</td>
</tr>
<tr>
<td></td>
<td>Note: The values 0 and 1 both result in a line weight of one pixel. If no line</td>
</tr>
<tr>
<td></td>
<td>should be displayed, then the “Line style” property must be set to the option</td>
</tr>
<tr>
<td></td>
<td>“Invisible”.</td>
</tr>
<tr>
<td>“Line style”</td>
<td>Type of line representation</td>
</tr>
<tr>
<td></td>
<td>• &quot;Solid&quot;</td>
</tr>
<tr>
<td></td>
<td>• &quot;Dashes&quot;</td>
</tr>
<tr>
<td></td>
<td>• “Dots”</td>
</tr>
<tr>
<td></td>
<td>• “Dash Dot”</td>
</tr>
<tr>
<td></td>
<td>• “Dash Dot Dot”</td>
</tr>
<tr>
<td></td>
<td>• “not visible”</td>
</tr>
</tbody>
</table>

You can assign variables in the “Appearance variables” property for controlling the appearance dynamically. The fixed values are defined here.

See also
- "Element property 'Appearance variables'" on page 1285

Element property 'Texts'

The properties contain character strings for labeling the element. The character string can also contain a placeholder with a format definition. In runtime mode, the placeholder is replaced by the current value in the specified format.

CODESYS accepts the specified texts automatically into the “GlobalTextList” text list. Therefore, these texts can be localized.
### Text

Character string (without single straight quotation marks) for the labeling the element. Add a line break by pressing the keyboard shortcut [Ctrl] + [Enter].

**Example:** Accesses: %i

The variable that contains the current value for the placeholder is specified in the property “Text variable ➔ Text”.

### Tooltip

Character string (without single straight quotation marks) that is displayed as the tooltip of an element.

**Example:** Number of valid accesses.

The variable that contains the current value for the placeholder is specified in the property “Text variable ➔ Tooltip”.

### See also

- “Element property ’Text variables’” on page 1229
- Chapter 1.3.5.18.2 “Placeholders with format definition in the output text” on page 1546

### Horizontal alignment

Horizonal alignment of the text within the element.

### Vertical alignment

Vertical alignment of the text within the element.

### Text format

Definition for displaying texts that are too long

- **Default**: The long text is truncated.
- **Line break**: The text is split into parts.
- **Ellipsis**: The visible text ends with “...” indicating that it is not complete.

### Font

**Example:** “Default”

- The “Font” dialog box opens.
- : Drop-down list with style fonts.

### Font color

**Example:** “Black”

- The “Color” dialog box opens.
- : Drop-down list with style colors.

### Transparency

Whole number (value range from 0 to 255). This determines the transparency of the respective color.

**Example:** 255: The color is opaque.

0: The color is completely transparent.

Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

### Movement

**X**

Variable (numeric data type). Defines the X position (in pixels).

**Example:** PLC_PRG.iPos_X.

Increasing this value in runtime mode moves the element to the right.
| **“Y”** | Variable (numeric data type). Defines the Y position (in pixels).  
Example: PLC_PRG.iPos_Y.  
Increasing this value in runtime mode moves the element downwards. |
| **“Rotation”** | Variable (numeric data type). Defines the angle of rotation (in degrees).  
Example: PLC_PRG.iAngle1.  
The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.  
In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right. |
| **“Scaling”** | Variable (integer data type). Causes centric stretching.  
Example: PLC_PRG.iScaling.  
The reference point is the “Center” property.  
The value 1 shrinks the element by a factor of 0.001. The value 1000 returns the element to its original size. |
| **“Interior rotation”** | Variable (numeric data type). Defines the angle of rotation (in degrees).  
Example: PLC_PRG.iAngle2.  
In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.  
The rotation point is shown as the symbol.  
Note: If a static angle of rotation is specified in the property “Position ➔ Angle”, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed. |
| **“Use REAL values”** | Note: Only available if the device supports the use of REAL coordinates.  
The properties of the absolute movement are interpreted as REAL values. The values are not rounded.  
The option allows for the individual fine-tuning of drawing the element, for example for the visualization of a smoother rotation.  
Hint: If a horizontal or vertical line is drawn blurry on a specific visualization platform, then this can be corrected by an offset of 0.5px in the direction of the line thickness. |
The properties “X”, “Y”, “Rotation”, and “Interior rotation” are supported by the “Client Animation” functionality.

See also
- Unit conversion

Element property ‘Relative movement’
The properties contain variables for moving the element. The reference point is the position of the element (‘Position’ property). The shape of the element can change.

<table>
<thead>
<tr>
<th>“Movement point[0]”</th>
<th>Variable (numeric data type). It contains the number (in pixels) that the starting point of the line is moved.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“X”</td>
<td>Incrementing the X value moves the element to the right.</td>
</tr>
<tr>
<td>“Y”</td>
<td>Incrementing the Y value moves the element to the down.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Movement point[1]”</th>
<th>Variable (numeric data type). It contains the number (in pixels) that the end point of the line is moved.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“X”</td>
<td>Incrementing the X value moves the element to the right.</td>
</tr>
<tr>
<td>“Y”</td>
<td>Incrementing the Y value moves the element to the down.</td>
</tr>
</tbody>
</table>

See also
- “Element property ‘Absolute movement’” on page 1227

Element property ‘Text variables’
These properties are variables with contents that replace a format definition.

<table>
<thead>
<tr>
<th>“Text variable”</th>
<th>Variable (data type compliant with the format definition). It contains what is printed instead of the format definition.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: PLC_PRG.iAccesses</td>
<td></td>
</tr>
<tr>
<td>Note: The format definition is part of the text in the property “Texts ➔ Text”.</td>
<td></td>
</tr>
<tr>
<td>Note: If you specify a variable of type enumeration with text list support, then the name of the enumeration data type is added automatically in angle brackets after the variable name. Example: PLC_PRG.enVar &lt;enumeration name&gt;. Then the symbolic value of the enumeration component is printed instead of the numeric value when text is printed. Refer to the help page for the enumerations.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Tooltip variable”</th>
<th>Variable (data type compliant with the format definition). It contains what is printed instead of the format definition.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: PLC_PRG.iAccessesInTooltip</td>
<td></td>
</tr>
</tbody>
</table>
| Note: The format definition is part of the text in the property “Texts ➔ Tooltip”.

- “Element property ‘Texts’” on page 1226
- Enumerations

Element property ‘Dynamic texts’
Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.
| **“Text list”** | Variable (string) or name of the text list as a fixed string in single straight quotation marks.  
Example: 'Errorlist'  
▼: Drop-down list with the dialogs available in the text lists. |
| **“Text index”** | Text list ID. This refers to the desired output text.  
- As fixed string with the ID in single straight quotation marks.  
  Example: '1'  
- As a variable (STRING) for dynamically controlling the text output.  
  Example: strTextID  
  Sample assignment: PLC_PRG.strTextID := '1'; |
| **“Tooltip index”** | Text list ID. This refers to the desired output text.  
- As fixed string with the ID in single straight quotation marks.  
  Example: '2'  
- As a variable (STRING) for dynamically controlling the text output.  
  Example: strToolTipID  
  Sample assignment: PLC_PRG.strToolTipID := '2'; |

See also
- **Text list**

**Element property “Font variables”**

The variables allow for dynamic control of the text display.

| **“Font name”** | Variable (STRING). Includes the font of the text.  
Example: PLC_PRG.stFontVar := 'Arial';  
The selection of fonts corresponds to the default “Font” dialog. |
| **“Size”** | Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name.  
- <pt>: Points (default)  
  Example: PLC_PRG.iFontHeight <pt>  
  Code: iFontHeight : INT := 12;  
- <px>: Pixels  
  Example: PLC_PRG.iFontHeight <px>  
  Code: iFontHeight : INT := 19; |

If you click in the value field, a drop-down list opens on the right for setting the unit.

Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property “Text property ➔ Font”.

### “Flags”

Variable (DWORD). Contains the flags for displaying fonts.

Flags:
- 1: Italics
- 2: Bold
- 4: Underline
- 8: Strikethrough

Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: ```PLC_PRG.dwFontType := 6;``` 

### “Character set”

Variable (DWORD). Contains a character set number for the font.

The selection of character set numbers corresponds to the “Script” setting of the standard “Font” dialog.

### “Color”

Variable (DWORD). Includes the color of the text.

Example: ```PLC_PRG.dwColorFont := 16#FF000000;``` 

### “Flags for text alignment”

Variable (integer data type). Contains the coding for text alignment.

Example: ```PLC_PRG.dwTextAlignment := 5;``` 

- 0: Top left
- 1: Horizontal center
- 2: Right
- 4: Vertical center
- 8: Bottom

Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: ```PLC_PRG.dwFontType := 5;``` 

---

*Fixed values for displaying texts are set in “Text properties”.*

See also
- ₍ “Element property ‘Text properties’” on page 1227

---

**Element property ‘Colorvariables’**

The Element property is used as an interface for project variables to dynamically control colors at runtime.
"Toggle color"  The property controls the toggled color at runtime.

Value assignment:
- **FALSE:** The element is displayed with the color specified in the "Color" property.
- **TRUE:** The element is displayed with the color specified in the "Alarm color" property.

Assigning the property:
- Placeholder for the user input variable
  - "<toggle/tap variable>"
  - "<NOT toggle/tap variable>"

The color change is not controlled by its own variable, but by a user input variable.

Note: Specify a variable for the mouse events "Tap" or "Toggle" in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both "Toggle" and "Tap", then the variable specified in "Tap" is used.

Hint: Click the symbol to insert the placeholder "<toggle/tap variable>". When you activate the "Inputconfiguration", "Tap FALSE" property, then the "<NOT toggle/tap variable>" placeholder is displayed.

- Instance path of a project variable (BOOL)
  Example: PLC_PRG.xColorIsToggeled

Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.

"Color"

- Variable (DWORD) for the color
  Example: PLC_PRG.dwColor
- Color literal
  Example of gray and opaque: 16#FF888888

Please note that the normal state is in effect if the expression in the "Colorvariables ➔ Toggle color" property is not defined or it has the value FALSE.

"Alarm color"

- Color variable in the alarm state
- Variable (DWORD) for the alarm color
  Example: PLC_PRG.dwAlarmColor
- Color literal
  Example of red and opaque: 16#FFFF0000

Please note that the alarm state is in effect if the expression in the "Colorvariables ➔ Toggle color" property has the value TRUE.

The transparency part of the color value is evaluated only if the “Activate semi-transparent drawing” option of the visualization manager is selected.

Select the “Advanced” option in the toolbar of the properties view. Then all element properties are visible.

The “Invisible” property is supported by the “Client Animation” functionality.

See also

- Addition

Element property 'Line width variable

Dynamic definition of the weight of a line element using a variable.

| “Integer value” | Variable (integer data type). Defines the line weight of the element (in pixels). This overwrites the fixed value that is defined in “Appearance → Line weight”. Note: The value 0 codes the same as 1 and sets the line weight to one pixel. |

Element property 'Line style variable

<table>
<thead>
<tr>
<th>“Integer value”</th>
<th>Variable (integer data type). Defines the appearance of the line at runtime.</th>
</tr>
</thead>
<tbody>
<tr>

The properties contain the configurations for the user input when using the mouse or keyboard. A user input defines an event and one or more actions that are executed when an event occurs.

The “Configure” button opens the “Input configuration” dialog box for creating or modifying a user input. Configured user inputs are briefly listed below the events. They each include the action that is triggered and the setting in short form.

Example: “Execute ST code”:  \$PLC_PRG.i_x := 0;

<table>
<thead>
<tr>
<th>Event</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“OnDialogClosed”</td>
<td>Input event: The user closes the dialog box.</td>
</tr>
<tr>
<td>“OnMouseClick”</td>
<td>Input event: The user clicks the mouse button completely. The mouse button is clicked and released.</td>
</tr>
<tr>
<td>“OnMouseDown”</td>
<td>Input event: The user clicks down on the mouse button.</td>
</tr>
<tr>
<td>“OnMouseEnter”</td>
<td>Input event: The user drags the mouse pointer to the element.</td>
</tr>
<tr>
<td>“OnMouseLeave”</td>
<td>Input event: The user drags the mouse pointer away from the element.</td>
</tr>
<tr>
<td>“OnMouseMove”</td>
<td>Input event: The user moves the mouse pointer over the element area.</td>
</tr>
<tr>
<td>“OnMouseUp”</td>
<td>Input event: The user releases the mouse button over the element area.</td>
</tr>
</tbody>
</table>

“Tap”
When a mouse click event occurs, the variable defined in “Variable” is described in the application. The coding depends on the options “Tap FALSE” and “Tap on enter if captured”.

“Variable”
Variable (BOOL) that is set on mouse click.

Example: PLC_PRG.bIsTapped

TRUE: A mouse click event exists. It lasts while the user presses the mouse button over the element. It ends when the button is released.
FALSE: A mouse click event does not exist.

Requirement: The “Tap FALSE” option is not activated.

“Tap FALSE”

<table>
<thead>
<tr>
<th>boolean</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRUE</td>
<td>The mouse click event leads to a complementary value in “Variable”.</td>
</tr>
<tr>
<td>FALSE</td>
<td>A mouse click event does not exist.</td>
</tr>
<tr>
<td>FALSE</td>
<td>While the mouse click event exists.</td>
</tr>
</tbody>
</table>

“Tap on enter if captured”

<table>
<thead>
<tr>
<th>boolean</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRUE</td>
<td>During user input, it is also taken into consideration whether the mouse pointer is dragged within the element area or not while the mouse button is pressed.</td>
</tr>
<tr>
<td>TRUE</td>
<td>While the mouse click event exists and the mouse pointer is moved over the element area.</td>
</tr>
<tr>
<td>FALSE</td>
<td>A mouse click event does not exist. Or the user moves the mouse pointer outside of the element area while the mouse button is pressed. The value is TRUE again as soon as the user moves the pointer back to the element area. The mouse is then captured.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRUE</td>
<td>The mouse is then captured.</td>
</tr>
<tr>
<td>FALSE</td>
<td>The mouse is not captured.</td>
</tr>
</tbody>
</table>
**“Shift”**

With the onset of a mouse click event, the variable is set; when the mouse click event is completed, the variable is reset.

**“Variable”**

Variable (BOOL). Its value toggled when the mouse click event is ended. This is when the user releases the mouse button while the mouse pointer is over the element area.

If the user releases the mouse button while the mouse pointer is outside of the element area, then the mouse click event is not ended and the value is not toggled.

Tip: The user can cancel a started toggle input by dragging the mouse pointer out of the element area.

**“Toggle on up if captured”**

☑: The value toggles regardless of where the mouse pointer is when the mouse button is released. The mouse is then captured.

**“Keyboard shortcuts”**

Keyboard shortcut on the element for triggering specific input actions.

When the keyboard shortcut event occurs, the input actions in the “Event(s)” property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.

**“Key”**

Key pressed for input action.

Example: [T]

Note: The following properties appear when a key is selected.

**“Event(s)”**

- “None”
- “Mouse down”: Pressing the key triggers the input actions that are configured in the “OnMouseDown” property.
- “Mouse up”: Releasing the key triggers the input actions that are configured in the “OnMouseUp” property.
- “Mouse down/up”: Pressing and releasing the key triggers the input actions that are configured in the “OnMouseDown” property and the “OnMouseUp” property.

**“Shift”**

☑: Combination with the Shift key

Example: [Shift]+[T].

**“Control”**

☑: Combination with the Ctrl key

Example: [Ctrl]+[T].

**“Alt”**

☑: Combination with the Alt key

Example: [Alt]+[T].

---

**All keyboard shortcuts and their actions that are configured in the visualization are listed in the “Keyboard configuration” tab.**

- ☰ Chapter 1.3.5.19.3.6 “Dialog ‘Input Configuration’” on page 1586

**Requirement:** User management is set up for the visualization.
“Access rights”

Opens the “Access rights” dialog. There you can edit the access privileges for the element.

Status messages:

- “Not set. Full rights.”: Access rights for all user groups: “operable”
- “Rights are set: Limited rights”: Access is restricted for at least one group.

Visualization element 'Polygon', 'Polyline', 'Bézier curve'

Symbol:

Tag: “Basic”

The polygon, polyline, and Bézier curve are the same element type. They can be converted into another type by changing the “Element type” property.

Elements can be dragged and dropped to the editor. The element is then drawn with five points: [0] to [4].

Other positions are added as follows: Move the mouse pointer over a corner point; the mouse pointer changes shape. Now if you press and hold [Ctrl] and click the left mouse button, another point is created. You can delete a point by pressing and holding [Shift]+[Ctrl] and click the selected point.

As an alternative, you can select the element in the toolbox area and in the editor click multiple times. At the same time, a connecting line is drawn from one point to the other. End by double-clicking the element or right-clicking it one time.

Element properties

<table>
<thead>
<tr>
<th>&quot;Element name&quot;</th>
<th>Optional.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Hint: Assign individual names for elements so that they are found faster in the element list.</td>
</tr>
<tr>
<td>Example: Werkstück_1</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>&quot;Type of element&quot;</th>
<th>● “Polygon”</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>● “Polyline”</td>
</tr>
<tr>
<td></td>
<td>● “Bézier curve”</td>
</tr>
</tbody>
</table>

Element property 'Position'

The following properties define the position of the corner points in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.
### "Dots"

[0...n]: Coordinates of the corner points

Specified in pixels

You can also change the values by dragging the box symbols (ogene) to other positions in the editor.

### "Angle"

Static angle of rotation (in degrees).

Example: 35

The element is displayed rotated in the editor. The point of rotation is the center of the element. A positive value rotates clockwise.

Tip: You can change the value in the editor by focusing the element to the handle. When the cursor is displayed as a rotating arrow (ogene), you can rotate the element about its center as a handle.

(1): Handle

Note: If a dynamic angle of rotation is also configured in the property "Absolute movement ➜ Internal rotation", then the static and dynamic angles of rotation are added in runtime mode. The static angle of rotation acts as an offset.

See also

- 

### Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

<table>
<thead>
<tr>
<th>&quot;X&quot;</th>
<th>X-coordinate of the point of rotation</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Y&quot;</td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the symbols (ogene) to other positions in the editor.

### Element property 'Colors'

| "Normal state" | The normal state is in effect if the variable in "Color variables ➜ Toggle color" is not defined or it has the value FALSE. |
| "Frame color"  | Frame and fill color for the corresponding state of the variable. |
| "Fill color"   | |
| "Transparency" | Transparency value (0 to 255) for defining the transparency of the selected color. Example: 255: The color is opaque. 0: The color is completely transparent. |
| "Alarm state"  | The alarm state is in effect if the variable in "Color variables ➜ Toggle color" has the value TRUE. |
| "Use gradient color" | : The element is displayed with a gradient of two colors. |
| "Gradient setting" | The "Gradient editor" dialog box opens. |
The properties contain fixed values for setting the look of the element.

**Element property 'Appearance'**

<table>
<thead>
<tr>
<th><strong>“Line width”</strong></th>
<th>Value in pixels</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: 2</td>
<td></td>
</tr>
<tr>
<td>Note: The values 0 and 1 both result in a line weight of 1 pixel. If no line should be displayed, then the “Line style” property must be set to the option “Invisible”.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>“Fill attributes”</strong></th>
<th>The way in which the element is filled.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Filled”: The element is filled with the color from property “Colors ➔ Fill color”.</td>
<td></td>
</tr>
<tr>
<td>“Invisible”: The fill color is invisible.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>“Line style”</strong></th>
<th>Type of line representation</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Solid”</td>
<td></td>
</tr>
<tr>
<td>“Dashes”</td>
<td></td>
</tr>
<tr>
<td>“Dots”</td>
<td></td>
</tr>
<tr>
<td>“Dash Dot”</td>
<td></td>
</tr>
<tr>
<td>“Dash Dot Dot”</td>
<td></td>
</tr>
<tr>
<td>“not visible”</td>
<td></td>
</tr>
</tbody>
</table>

You can assign variables in the “Appearance variables” property for controlling the appearance dynamically. The fixed values here are overwritten.

**Element property 'Texts'**

The properties contains character strings for labeling the element. The character string can also contain a placeholder with a format definition. In runtime mode, the placeholder is replaced by the current value in the specified format.

CODESYS accepts the specified texts automatically into the “GlobalTextList” text list. Therefore, these texts can be localized.

<table>
<thead>
<tr>
<th><strong>“Text”</strong></th>
<th>Character string (without single straight quotation marks) for the labeling the element. Add a line break by pressing the keyboard shortcut [Ctrl] + [Enter].</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Accesses: %i</td>
</tr>
<tr>
<td>The variable that contains the current value for the placeholder is specified in the property “Text variable ➔ Text”.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>“Tooltip”</strong></th>
<th>Character string (without single straight quotation marks) that is displayed as the tooltip of an element.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Number of valid accesses.</td>
</tr>
<tr>
<td>The variable that contains the current value for the placeholder is specified in the property “Text variable ➔ Tooltip”.</td>
<td></td>
</tr>
</tbody>
</table>

### Element property ‘Text properties’

The properties contain fixed values for the text properties.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Horizontal alignment&quot;</td>
<td>Horizontal alignment of the text within the element.</td>
</tr>
<tr>
<td>&quot;Vertical alignment&quot;</td>
<td>Vertical alignment of the text within the element.</td>
</tr>
<tr>
<td>&quot;Text format&quot;</td>
<td>Definition for displaying texts that are too long</td>
</tr>
<tr>
<td>- &quot;Default&quot;: The long text is truncated.</td>
<td></td>
</tr>
<tr>
<td>- &quot;Line break&quot;: The text is split into parts.</td>
<td></td>
</tr>
<tr>
<td>- &quot;Ellipsis&quot;: The visible text ends with &quot;...&quot; indicating that it is not complete.</td>
<td></td>
</tr>
<tr>
<td>&quot;Font&quot;</td>
<td>Example: &quot;Default&quot;</td>
</tr>
<tr>
<td></td>
<td>☰: The “Font” dialog box opens.</td>
</tr>
<tr>
<td></td>
<td>☰: Drop-down list with style fonts.</td>
</tr>
<tr>
<td>&quot;Font color&quot;</td>
<td>Example: “Black”</td>
</tr>
<tr>
<td></td>
<td>☰: The “Color” dialog box opens.</td>
</tr>
<tr>
<td></td>
<td>☰: Drop-down list with style colors.</td>
</tr>
<tr>
<td>&quot;Transparency&quot;</td>
<td>Whole number (value range from 0 to 255). This determines the transparency of the respective color.</td>
</tr>
<tr>
<td></td>
<td>Example: 255: The color is opaque.</td>
</tr>
<tr>
<td></td>
<td>0: The color is completely transparent.</td>
</tr>
<tr>
<td></td>
<td>Please note: If the color is a style color and already has a transparency value, then this property is write-protected.</td>
</tr>
</tbody>
</table>

### Element property ‘Absolute movement’

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Movement&quot;</td>
<td></td>
</tr>
<tr>
<td>&quot;X&quot;</td>
<td>Variable (numeric data type). Defines the X position (in pixels).</td>
</tr>
<tr>
<td></td>
<td>Example: PLC_PRG.iPos_X.</td>
</tr>
<tr>
<td></td>
<td>Increasing this value in runtime mode moves the element to the right.</td>
</tr>
<tr>
<td>&quot;Y&quot;</td>
<td>Variable (numeric data type). Defines the Y position (in pixels).</td>
</tr>
<tr>
<td></td>
<td>Example: PLC_PRG.iPos_Y.</td>
</tr>
<tr>
<td></td>
<td>Increasing this value in runtime mode moves the element downwards.</td>
</tr>
</tbody>
</table>
### "Rotation"

Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle1.

The midpoint of the element rotates at the "Center" point. This rotation point is shown as the symbol.

In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

### "Scaling"

Variable (integer data type). Causes centric stretching.

**Example:** PLC_PRG.iScaling.

The reference point is the "Center" property.

The value 1 shrinks the element by a factor of 0.001. The value 1000 returns the element to its original size.

### "Interior rotation"

Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in "Center" according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol.

Note: If a static angle of rotation is specified in the property "Position → Angle", then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

### "Use REAL values"

Note: Only available if the device supports the use of REAL coordinates.

- The properties of the absolute movement are interpreted as REAL values. The values are not rounded.

The option allows for the individual fine-tuning of drawing the element, for example for the visualization of a smoother rotation.

**Hint:** If a horizontal or vertical line is drawn blurry on a specific visualization platform, then this can be corrected by an offset of 0.5px in the direction of the line thickness.

>You can link the variables to a unit conversion.
The properties “X”, “Y”, “Rotation”, and “Interior rotation” are supported by the “Client Animation” functionality.

See also
- Unit conversion

Element property 'Dynamic points'

| “Array of points” | Variable (POINTER TO). Points to an array of the structure VisuElems.VisuStructPoint. The elements iX and iY of VisuStructPoint contain the xy-coordinates of a point. The current number of array elements implicitly contains the variable in the property “Number of points”.

The variable that is assigned to the property “Number of points” contains the number of array elements and therefore the number of corner points.

Example:
```c
pPoints : POINTER TO ARRAY[0..100] OF VisuElems.VisuStructPoint;
```

| “Number of points” | Variable (integer data type): Contains the number of array elements and therefore the number of corner points for displaying the element.

Example:
```c
PLC_PRG.iNumberOfPoints := 24;
```

In the example, the element has 24 points. This definition is necessary because the individual points are defined by a pointer and this does not allow control over the number of points.

Note: In this way, it is possible to adapt the display of the element dynamically by updating the number of corner points.

Element property 'Text variables'

These properties are variables with contents that replace a format definition.

| “Text variable” | Variable (data type compliant with the format definition). It contains what is printed instead of the format definition.

Example:
```c
PLC_PRG.iAccesses
```

Note: The format definition is part of the text in the property “Texts ➔ Text”.

Note: If you specify a variable of type enumeration with text list support, then the name of the enumeration data type is added automatically in angle brackets after the variable name. Example: `PLC_PRG.enVar <enumeration name>`. Then the symbolic value of the enumeration component is printed instead of the numeric value when text is printed. Refer to the help page for the enumerations.

| “Tooltip variable” | Variable (data type compliant with the format definition). It contains what is printed instead of the format definition.

Example:
```c
PLC_PRG.iAccessesInTooltip
```

Note: The format definition is part of the text in the property “Texts ➔ Tooltip”.

See also
- § Chapter 1.3.5.1.8.2 “Placeholders with format definition in the output text” on page 1546
- § “Element property ‘Texts’” on page 1226
- Enumerations
Element property 'Dynamic texts'

Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.

| “Text list” | Variable (string) or name of the text list as a fixed string in single straight quotation marks.  
Example: 'Errorlist'  
▼: Drop-down list with the dialogs available in the text lists. |
|———|———|
| “Text index” | Text list ID. This refers to the desired output text.  
● As fixed string with the ID in single straight quotation marks.  
Example: '1'  
● As a variable (STRING) for dynamically controlling the text output.  
Example: strTextID  
Sample assignment: PLC_PRG.strTextID := '1'; |
|———|———|
| “Tooltip index” | Text list ID. This refers to the desired output text.  
● As fixed string with the ID in single straight quotation marks.  
Example: '2'  
● As a variable (STRING) for dynamically controlling the text output.  
Example: strToolTipID  
Sample assignment: PLC_PRG.strToolTipID := '2'; |

See also

● Text list

Element property 'Font variables'

The variables allow for dynamic control of the text display.

| “Font name” | Variable (STRING). Includes the font of the text.  
Example: PLC_PRG.stFontVar := 'Arial';  
The selection of fonts corresponds to the default “Font” dialog. |
|———|———|
| “Size” | Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name.  
● <pt>: Points (default)  
Example: PLC_PRG.iFontHeight <pt>  
Code: iFontHeight : INT := 12;  
● <px>: Pixels  
Example: PLC_PRG.iFontHeight <px>  
Code: iFontHeight : INT := 19; |

If you click in the value field, a drop-down list opens on the right for setting the unit.

Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property “Text property ➔ Font.”
**“Flags”**

Variable (DWORD). Contains the flags for displaying fonts.

Flags:
- 1: Italics
- 2: Bold
- 4: Underline
- 8: Strikethrough

Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: PLC_PRG.dwFontType := 6;

---

**“Character set”**

Variable (DWORD). Contains a character set number for the font.

The selection of character set numbers corresponds to the “Script” setting of the standard “Font” dialog.

---

**“Color”**

Variable (DWORD). Includes the color of the text.

Example: PLC_PRG.dwColorFont := 16#FF000000;

---

**“Flags for text alignment”**

Variable (integer data type). Contains the coding for text alignment.

Example: PLC_PRG.dwTextAlignment

Coding:
- 0: Top left
- 1: Horizontal center
- 2: Right
- 4: Vertical center
- 8: Bottom

Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: PLC_PRG.dwFontType := 5;

---

**Fixed values for displaying texts are set in “Text properties”**

---

See also

- “Element property ‘Text properties’” on page 1227

---

**Element property ‘Colorvariables’**

The Element property is used as an interface for project variables to dynamically control colors at runtime.
"Toggle color"  The property controls the toggled color at runtime.

Value assignment:
- **FALSE**: The element is displayed with the color specified in the “Color” property.
- **TRUE**: The element is displayed with the color specified in the “Alarm color” property.

Assignment options:
- Placeholder for the user input variable
  - "<toggle/tap variable>"
  - "<NOT toggle/tap variable>"

  The color change is not controlled by its own variable, but by a user input variable.

  Note: Specify a variable for the mouse events “Tap” or “Toggle” in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both “Toggle” and “Tap”, then the variable specified in “Tap” is used.

  Hint: Click the symbol to insert the placeholder “<toggle/tap variable>". When you activate the “Input configuration” “Tap FALSE” property, then the “<NOT toggle/tap variable>” placeholder is displayed.

- Instance path of a project variable (BOOL)
  - Example: PLC_PRG.xColorIsToggeled

  Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.

"Normal state"

"Alarm state"

The properties listed below control the color depending on the state. The normal state is in effect if the variable in “Color variables”, “Toggle color” is not defined or it has the value FALSE. The alarm state is in effect if the variable in “Colorvariables”, “Toggle color” has the value TRUE.

"Frame color"  Assignment options:
- Variable (DWORD) for the frame color
  - Example: PLC_PRG.dwBorderColor
- Color literal
  - Example of green and opaque: 16#FF00FF00

"Filling color"  Assignment options:
- Variable (DWORD) for the fill color
  - Example: PLC_PRG.dwFillColor
- Color literal
  - Example of gray and opaque: 16#FF888888

The transparency part of the color value is evaluated only if the “Activate semi-transparent drawing” option of the visualization manager is selected.

Select the “Advanced” option in the toolbar of the properties view. Then all element properties are visible.

See also
- Chapter 1.3.5.8.3 “Animating a color display” on page 1152
The properties contain IEC variables for controlling the appearance of the element dynamically.

### Element property 'Appearance variables'

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Line width&quot;</td>
<td>Variable (integer data type). Contains the line weight (in pixels).</td>
</tr>
</tbody>
</table>
| "Fill attributes" | Variable (DWORD). Controls whether the fill color of the element is visible.  
|                  | ● Variable value = 0: Filled                                                                                                                |
|                  | ● Variable value > 0: Invisible; no fill color                                                                                              |
| "Line style"      | Variable (DWORD). Controls the line style. Coding:  
|                  | ● 0: Solid line                                                                                                                             |
|                  | ● 1: Dashed line                                                                                                                            |
|                  | ● 2: Dotted line                                                                                                                             |
|                  | ● 3: Line type "Dash Dot"                                                                                                                   |
|                  | ● 3: Line type "Dash Dot Dot"                                                                                                                |
|                  | ● 8: Invisible; no line                                                                                                                     |

Fixed values can be set in the "Appearance" property. These values can be overwritten by dynamic variables at runtime.

- ¶ "Element property 'Appearance'" on page 1238

### Element property 'State variables'

The variables control the element behavior dynamically.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| "Invisible"        | Variable (BOOL). Toggles the visibility of the element.  
|                    | TRUE: The element is not visible at runtime.                                                                                               |
| "Deactivate inputs"| Variable (BOOL). Toggles the operability of the element.  
|                    | TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated.                                              |

The "Invisible" property is supported by the "Client Animation" functionality.

See also
- ¶

These properties are available only when you select the "Preview: Support client animations and overlay of native elements" option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.
“Animation duration”
Time that the element executes an animation (in milliseconds)
Example: 500

“Move to the foreground”
Property value (BOOL)
TRUE: At runtime, the element is displayed in the foreground.
FALSE: At runtime, the element is displayed in the layer where it was inserted in the visualization editor.

See also
- Chapter 1.3.5.21.5 “Using client animation” on page 1962

Element property 'Input configuration'
The properties contain the configurations for the user input when using the mouse or keyboard.
A user input defines an event and one or more actions that are executed when an event occurs.

The “Configure” button opens the “Input configuration” dialog box for creating or modifying a user input.
Configured user inputs are briefly listed below the events. They each include the action that is triggered and the setting in short form.
Example: “Execute ST code”:

```
PLC_PRG.i_x := 0;
```

<table>
<thead>
<tr>
<th>Event</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OnDialogClosed</td>
<td>Input event: The user closes the dialog box.</td>
</tr>
<tr>
<td>OnMouseClick</td>
<td>Input event: The user clicks the mouse button completely. The mouse button is clicked and released.</td>
</tr>
<tr>
<td>OnMouseDown</td>
<td>Input event: The user clicks down on the mouse button.</td>
</tr>
<tr>
<td>OnMouseEnter</td>
<td>Input event: The user drags the mouse pointer to the element.</td>
</tr>
<tr>
<td>OnMouseLeave</td>
<td>Input event: The user drags the mouse pointer away from the element.</td>
</tr>
<tr>
<td>OnMouseMove</td>
<td>Input event: The user moves the mouse pointer over the element area.</td>
</tr>
<tr>
<td>OnMouseUp</td>
<td>Input event: The user releases the mouse button over the element area.</td>
</tr>
</tbody>
</table>

“Tap”
When a mouse click event occurs, the variable defined in “Variable” is described in the application. The coding depends on the options “Tap FALSE” and “Tap on enter if captured”.

“Variable”
Variable (BOOL) that is set on mouse click.
Example: PLC_PRG.bIsTapped
TRUE: A mouse click event exists. It lasts while the user presses the mouse button over the element. It ends when the button is released.
FALSE: A mouse click event does not exist.
Requirement: The “Tap FALSE” option is not activated.
| **“Tap FALSE”** | ![Checkmark] The mouse click event leads to a complementary value in “Variable”.  
**TRUE**: A mouse click event does not exist.  
**FALSE**: While the mouse click event exists. |

| **“Tap on enter if captured”** | ![Checkmark] During user input, it is also taken into consideration whether the mouse pointer is dragged within the element area or not while the mouse button is pressed.  
**TRUE**: While the mouse click event exists and the mouse pointer is moved over the element area.  
**FALSE**: A mouse click event does not exist. Or the user moves the mouse pointer outside of the element area while the mouse button is pressed.  
The value is **TRUE** again as soon as the user moves the pointer back to the element area. The mouse is then captured. |

| **“Shift”** | With the onset of a mouse click event, the variable is set; when the mouse click event is completed, the variable is reset. |

| **“Variable”** | Variable (BOOL). Its value toggled when the mouse click event is ended. This is when the user releases the mouse button while the mouse pointer is over the element area.  
If the user releases the mouse button while the mouse pointer is outside of the element area, then the mouse click event is not ended and the value is not toggled.  
Tip: The user can cancel a started toggle input by dragging the mouse pointer out of the element area. |

| **“Toggle on up if captured”** | ![Checkmark] The value toggles regardless of where the mouse pointer is when the mouse button is released. The mouse is then captured. |

| **“Keyboard shortcuts”** | Keyboard shortcut on the element for triggering specific input actions.  
When the keyboard shortcut event occurs, the input actions in the “Event(s)” property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action. |

| **“Key”** | Key pressed for input action.  
Example: [T]  
Note: The following properties appear when a key is selected. |

| **“Event(s)”** |  
- “None”  
- “Mouse down”: Pressing the key triggers the input actions that are configured in the “OnMouseDown” property.  
- “Mouse up”: Releasing the key triggers the input actions that are configured in the “OnMouseUp” property.  
- “Mouse down/up”: Pressing and releasing the key triggers the input actions that are configured in the “OnMouseDown” property and the “OnMouseUp” property. |

| **“Shift”** | ![Checkmark] Combination with the Shift key  
Example: [Shift]+[T]. |

| **“Control”** | ![Checkmark] Combination with the Ctrl key  
Example: [Ctrl]+[T]. |

| **“Alt”** | ![Checkmark] Combination with the Alt key  
Example: [Alt]+[T]. |
All keyboard shortcuts and their actions that are configured in the visualization are listed in the “Keyboard configuration” tab.

See also
- Chapter 1.3.5.19.2.2 “Command 'Keyboard Configuration'” on page 1558
- Chapter 1.3.5.19.3.6 “Dialog 'Input Configuration'” on page 1586

Requirement: User management is set up for the visualization.

<table>
<thead>
<tr>
<th>“Access rights”</th>
<th>Opens the “Access rights” dialog. There you can edit the access privileges for the element.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status messages:</td>
<td>- “Not set. Full rights.”: Access rights for all user groups: “operable”</td>
</tr>
<tr>
<td></td>
<td>- “Rights are set: Limited rights”: Access is restricted for at least one group.</td>
</tr>
</tbody>
</table>

See also
- Chapter 1.3.5.19.3.1 “Dialog ‘Access Rights’” on page 1583

Visualization element 'Pie'

Symbol:

Tag: “Basic”
The element draws a pie of any angle.

Element properties

<table>
<thead>
<tr>
<th>“Element name”</th>
<th>Example: Error_rate_part_1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Optional</td>
<td>Hint: Assign individual names for elements so that they are found faster in the element list.</td>
</tr>
</tbody>
</table>

| “Type of element” | Pie |

Element property 'Position'
The position defines the location and size of the element in the visualization window. This is based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.
“X”
The x-coordinate of the upper left corner of the element
Specified in pixels
Example: 10

“Y”
The y-coordinate of the upper left corner of the element
Specified in pixels
Example: 10

“Width”
Specified in pixels
Example: 150

“Height”
Specified in pixels
Example: 30

Tip: You can change the values in “X”, “Y”, “Width”, and “Height” by dragging the corresponding symbols to another position in the editor.

“Angle”
Static angle of rotation (in degrees).
Example: 35

The element is displayed rotated in the editor. The point of rotation is the center of the element. A positive value rotates clockwise.

Tip: You can change the value in the editor by focusing the element to the handle. When the cursor is displayed as a rotating arrow, you can rotate the element about its center as a handle.

(1): Handle

Note: If a dynamic angle of rotation is also configured in the property “Absolute movement ➔ Internal rotation”, then the static and dynamic angles of rotation are added in runtime mode. The static angle of rotation acts as an offset.

See also

- ☰ Chapter 1.3.5.3.2 “Positioning elements, adapting size and layer” on page 1113
**“Begin”**
Start angle of the pie. If you also define a variable for the start, then the start angle is calculated from the sum of the values for “Begin” and “Variable for begin”.

**Example:**
- “Begin”: 330
- “End”: 90

**“End”**
End angle of the pie. If you also define a variable for the end, then the end angle is calculated from the sum of the values for “End” and “Variable for end”.

The pie is drawn clockwise from the start angle to the end angle.

**“Variable for begin”**
The start of the sector is defined dynamically by a variable.

**“Variable for end”**
The end of the sector is defined dynamically by a variable.

**“Only show circle line”**
☑: The pie is drawn without the radius line or filling color.

---

**Element property ‘Center’**

<table>
<thead>
<tr>
<th><strong>“X”</strong></th>
<th>Display of the center coordinates. You cannot modify these values here in the properties.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Y”</strong></td>
<td>If the pie is selected in the editor, then the center of the pie (as well as the center of the enveloping box) is visualized with the symbol  dàng. Moreover, the element is decorated with a position, begin, and end boxes that you can move.</td>
</tr>
</tbody>
</table>

The center coordinates change when you move the center symbol  dàng in the editor. This also changes the size of the pie so that the position box retains its position and the center remains in the middle of the element.

---

**Element property ‘Colors’**

| **“Normal state”** | The normal state is in effect if the variable in “Color variables ➔ Toggle color” is not defined or it has the value FALSE. |
| **“Frame color”** | Frame and fill color for the corresponding state of the variable. |
| **“Fill color”** | Transparency value (0 to 255) for defining the transparency of the selected color. Example: 255: The color is opaque. 0: The color is completely transparent. |
The alarm state is in effect if the variable in “Color variables ➔ Toggle color” has the value TRUE.

“Use gradient color”  
☑: The element is displayed with a gradient of two colors.

“Gradient setting”  
The “Gradient editor” dialog box opens.

See also
●  Chapter 1.3.5.19.3.5 “Dialog ‘Gradient Editor’” on page 1586

Element property ‘Appearance’  
The properties contain fixed values for setting the look of the element.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Line width”</td>
<td>Value in pixels&lt;br&gt;Note: The values 0 and 1 both result in a line weight of 1 pixel. If no line should be displayed, then the “Line style” property must be set to the option “Invisible”.</td>
</tr>
<tr>
<td>“Fill attributes”</td>
<td>The way in which the element is filled.&lt;br&gt;• “Filled”: The element is filled with the color from property “Colors ➔ Fill color”.&lt;br&gt;• “Invisible”: The fill color is invisible.</td>
</tr>
<tr>
<td>“Line style”</td>
<td>Type of line representation&lt;br&gt;• “Solid”&lt;br&gt;• “Dashes”&lt;br&gt;• “Dots”&lt;br&gt;• “Dash Dot”&lt;br&gt;• “Dash Dot Dot”&lt;br&gt;• “not visible”</td>
</tr>
</tbody>
</table>

You can assign variables in the “Appearance variables” property for controlling the appearance dynamically. The fixed values here are overwritten.

See also
●  “Element property ‘Appearance variables’” on page 1285

Element property ‘Texts’  
The properties contains character strings for labeling the element. The character string can also contain a placeholder with a format definition. In runtime mode, the placeholder is replaced by the current value in the specified format.

CODESYS accepts the specified texts automatically into the “GlobalTextList” text list. Therefore, these texts can be localized.
**“Text”**
Character string (without single straight quotation marks) for the labeling the element. Add a line break by pressing the keyboard shortcut [Ctrl] + [Enter].

**Example:** Accesses: %i
The variable that contains the current value for the placeholder is specified in the property “Text variable ➔ Text”.

**“Tooltip”**
Character string (without single straight quotation marks) that is displayed as the tooltip of an element.

**Example:** Number of valid accesses.
The variable that contains the current value for the placeholder is specified in the property “Text variable ➔ Tooltip”.

See also
- § “Element property ’Text variables’” on page 1229
- § Chapter 1.3.5.18.2 “Placeholders with format definition in the output text” on page 1546

---

**Element property ’Text properties’**
The properties contain fixed values for the text properties.

<table>
<thead>
<tr>
<th>“Horizontal alignment”</th>
<th>Horizontal alignment of the text within the element.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Vertical alignment”</td>
<td>Vertical alignment of the text within the element.</td>
</tr>
<tr>
<td><strong>“Text format”</strong></td>
<td>Definition for displaying texts that are too long</td>
</tr>
<tr>
<td></td>
<td>● “Default”: The long text is truncated.</td>
</tr>
<tr>
<td></td>
<td>● “Line break”: The text is split into parts.</td>
</tr>
<tr>
<td></td>
<td>● “Ellipsis”: The visible text ends with “...” indicating that it is not complete.</td>
</tr>
</tbody>
</table>

| **“Font”**            | Example: “Default”                                   |
|                       | ![The “Font” dialog box opens.]                      |
|                       | ![▼: Drop-down list with style fonts.]              |

| **“Font color”**      | Example: “Black”                                     |
|                       | ![The “Color” dialog box opens.]                    |
|                       | ![▼: Drop-down list with style colors.]             |

| **“Transparency”**    | Whole number (value range from 0 to 255). This determines the transparency of the respective color. |
|                       | Example: 255: The color is opaque.                   |
|                       | 0: The color is completely transparent.              |
|                       | Please note: If the color is a style color and already has a transparency value, then this property is write-protected. |

---

**Element property ’Absolute movement’**
The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

| **“Movement”**        | Variable (integer data type). Defines the X position (in pixels). |
|                      | Example: PLC_PRG.iPos_X.                                   |
|                      | Increasing this value in runtime mode moves the element to the right. |
### “Y”

Variable (integer data type). Defines the Y position (in pixels).

**Example:** PLC_PRG.iPos_Y.

Increasing this value in runtime mode moves the element downwards.

### “Scaling”

Variable (integer data type). Causes centric stretching.

**Example:** PLC_PRG.iScaling.

The reference point is the “Center” property.

The value 1 shrinks the element by a factor of 0.001. The value 1000 returns the element to its original size.

### “Interior rotation”

Variable (integer data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol.

If a static angle of rotation is specified in “Position ➔ Angle”, then the static angle of rotation and the angle of rotation are added.

---

**You can link the variables to a unit conversion.**

**The “X”, “Y”, and “Interior rotation” properties are supported by the "Client Animation" functionality.**

See also

- **Unit conversion**
- **"Client Animation" functionality.**

---

**Element property 'Text variables'**

These properties are variables with contents that replace a format definition.
**“Text variable”**

Variable (data type compliant with the format definition). It contains what is printed instead of the format definition.

**Example:** PLC_PRG.iAccesses

Note: The format definition is part of the text in the property “Texts ➔ Text”.

Note: If you specify a variable of type enumeration with text list support, then the name of the enumeration data type is added automatically in angle brackets after the variable name. Example: PLC_PRG.enVar <enumeration name>. Then the symbolic value of the enumeration component is printed instead of the numeric value when text is printed. Refer to the help page for the enumerations.

**“Tooltip variable”**

Variable (data type compliant with the format definition). It contains what is printed instead of the format definition.

**Example:** PLC_PRG.iAccessesInTooltip

Note: The format definition is part of the text in the property “Texts ➔ Tooltip”.

See also

- § Chapter 1.3.5.18.2 “Placeholders with format definition in the output text” on page 1546
- § “Element property ‘Texts’” on page 1226
- Enumerations

**Element property 'Dynamic texts'**

Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.

**“Text list”**

Variable (string) or name of the text list as a fixed string in single straight quotation marks.

**Example:** 'Errorlist'

확: Drop-down list with the dialogs available in the text lists.

**“Text index”**

Text list ID. This refers to the desired output text.

- As fixed string with the ID in single straight quotation marks.
  
  **Example:** '1'

- As a variable (STRING) for dynamically controlling the text output.
  
  **Example:** strTextID
  
  Sample assignment: PLC_PRG.strTextID := '1';

**“Tooltip index”**

Text list ID. This refers to the desired output text.

- As fixed string with the ID in single straight quotation marks.
  
  **Example:** '2'

- As a variable (STRING) for dynamically controlling the text output.
  
  **Example:** strToolTipID
  
  Sample assignment: PLC_PRG.strToolTipID := '2';

See also

- Text list

**Element property 'Font variables'**

The variables allow for dynamic control of the text display.
### “Font name”

Variable (STRING). Includes the font of the text.

Example: `PLC_PRG.stFontVar := 'Arial';`

The selection of fonts corresponds to the default “Font” dialog.

### “Size”

Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name.

- `<pt>`: Points (default)
  
  Example: `PLC_PRG.iFontHeight <pt>`
  
  Code: `iFontHeight : INT := 12;`

- `<px>`: Pixels
  
  Example: `PLC_PRG.iFontHeight <px>`
  
  Code: `iFontHeight : INT := 19;`

If you click in the value field, a drop-down list opens on the right for setting the unit.

Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property “Text property → Font”.

### “Flags”

Variable (DWORD). Contains the flags for displaying fonts.

Flags:

- 1: Italics
- 2: Bold
- 4: Underline
- 8: Strikethrough

Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: `PLC_PRG.dwFontType := 6;`

### “Character set”

Variable (DWORD). Contains a character set number for the font.

The selection of character set numbers corresponds to the “Script” setting of the standard “Font” dialog.

### “Color”

Variable (DWORD). Includes the color of the text.

Example: `PLC_PRG.dwColorFont := 16#FF000000;`

### “Flags for text alignment”

Variable (integer data type). Contains the coding for text alignment.

Example: `PLC_PRG.dwTextAlignment`

Coding:

- 0: Top left
- 1: Horizontal center
- 2: Right
- 4: Vertical center
- 8: Bottom

Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: `PLC_PRG.dwFontType := 5;`
Fixed values for displaying texts are set in “Text properties”.

See also
- “Element property ‘Text properties’” on page 1227

Element property ‘Colorvariables’
The Element property is used as an interface for project variables to dynamically control colors at runtime.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Toggle color”</td>
<td>The property controls the toggled color at runtime.</td>
</tr>
<tr>
<td>Value assignment:</td>
<td></td>

</tbody>
</table>
The transparency part of the color value is evaluated only if the "Activate semi-transparent drawing" option of the visualization manager is selected.

Select the "Advanced" option in the toolbar of the properties view. Then all element properties are visible.

See also
- Chapter 1.3.5.8.3 “Animating a color display” on page 1152

The properties contain IEC variables for controlling the appearance of the element dynamically.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Line width&quot;</td>
<td>Variable (integer data type). Contains the line weight (in pixels).</td>
</tr>
</tbody>
</table>
| "Fill attributes"| Variable (DWORD). Controls whether the fill color of the element is visible.  
  ● Variable value = 0: Filled  
  ● Variable value > 0: Invisible; no fill color |
| "Line style"     | Variable (DWORD). Controls the line style.  
  Coding:  
  ● 0: Solid line  
  ● 1: Dashed line  
  ● 2: Dotted line  
  ● 3: Line type "Dash Dot"  
  ● 3: Line type "Dash Dot Dot"  
  ● 8: Invisible; no line |

Fixed values can be set in the "Appearance" property. These values can be overwritten by dynamic variables at runtime.

See also
- “Element property ‘Appearance’” on page 1238

The variables control the element behavior dynamically.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
</table>
| "Invisible"       | Variable (BOOL). Toggles the visibility of the element.  
  TRUE: The element is not visible at runtime. |
| "Deactivate inputs" | Variable (BOOL). Toggles the operability of the element.  
  TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated. |
The “Invisible” property is supported by the “Client Animation” functionality.

See also

These properties are available only when you select the “Preview: Support client animations and overlay of native elements” option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>

**Element property 'Input configuration'**

The properties contain the configurations for the user input when using the mouse or keyboard. A user input defines an event and one or more actions that are executed when an event occurs.

The "Configure" button opens the “Input configuration” dialog box for creating or modifying a user input.

Configured user inputs are briefly listed below the events. They each include the action that is triggered and the setting in short form.

**Example:**

```
Execute ST code": PLC_PRG.i_x := 0;
```

<table>
<thead>
<tr>
<th>Event</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;OnDialogClosed&quot;</td>
<td>Input event: The user closes the dialog box.</td>
</tr>
<tr>
<td>&quot;OnMouseClick&quot;</td>
<td>Input event: The user clicks the mouse button completely. The mouse button is clicked and released.</td>
</tr>
<tr>
<td>&quot;OnMouseDown&quot;</td>
<td>Input event: The user clicks down on the mouse button.</td>
</tr>
<tr>
<td>&quot;OnMouseEnter&quot;</td>
<td>Input event: The user drags the mouse pointer to the element.</td>
</tr>
<tr>
<td>&quot;OnMouseLeave&quot;</td>
<td>Input event: The user drags the mouse pointer away from the element.</td>
</tr>
<tr>
<td>&quot;OnMouseMove&quot;</td>
<td>Input event: The user moves the mouse pointer over the element area.</td>
</tr>
<tr>
<td>&quot;OnMouseUp&quot;</td>
<td>Input event: The user releases the mouse button over the element area.</td>
</tr>
</tbody>
</table>
### “Tap”
When a mouse click event occurs, the variable defined in “Variable” is described in the application. The coding depends on the options “Tap FALSE” and “Tap on enter if captured”.

### “Variable”
Variable (BOOL) that is set on mouse click.

- **TRUE**: A mouse click event exists. It lasts while the user presses the mouse button over the element. It ends when the button is released.
- **FALSE**: A mouse click event does not exist.

#### Example:
```
PLC_PRG.bIsTapped
```

**Requirement**: The “Tap FALSE” option is not activated.

### “Tap FALSE”
- **TRUE**: The mouse click event leads to a complementary value in “Variable”.
- **FALSE**: A mouse click event does not exist.

### “Tap on enter if captured”
- **TRUE**: During user input, it is also taken into consideration whether the mouse pointer is dragged within the element area or not while the mouse button is pressed.
- **FALSE**: While the mouse click event exists and the mouse pointer is moved over the element area.
- **FALSE**: A mouse click event does not exist. Or the user moves the mouse pointer outside of the element area while the mouse button is pressed.

The value is **TRUE** again as soon as the user moves the pointer back to the element area. The mouse is then captured.

### “Shift”
With the onset of a mouse click event, the variable is set; when the mouse click event is completed, the variable is reset.

### “Variable”
Variable (BOOL). Its value toggled when the mouse click event is ended. This is when the user releases the mouse button while the mouse pointer is over the element area.

- If the user releases the mouse button while the mouse pointer is outside of the element area, then the mouse click event is not ended and the value is not toggled.
- **Tip**: The user can cancel a started toggle input by dragging the mouse pointer out of the element area.

### “Toggle on up if captured”
- **TRUE**: The value toggles regardless of where the mouse pointer is when the mouse button is released. The mouse is then captured.

### “Keyboard shortcuts”
Keyboard shortcut on the element for triggering specific input actions.

When the keyboard shortcut event occurs, the input actions in the “Event(s)” property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.

### “Key”
Key pressed for input action.

#### Example: 
```
[T]
```

**Note**: The following properties appear when a key is selected.
**“Event(s)”**

- **“None”**
- **“Mouse down”**: Pressing the key triggers the input actions that are configured in the “OnMouseDown” property.
- **“Mouse up”**: Releasing the key triggers the input actions that are configured in the “OnMouseUp” property.
- **“Mouse down/up”**: Pressing and releasing the key triggers the input actions that are configured in the “OnMouseDown” property and the “OnMouseUp” property.

**“Shift”**

☑️ Combination with the Shift key
Example: [Shift]+[T].

**“Control”**

☑️ Combination with the Ctrl key
Example: [Ctrl]+[T].

**“Alt”**

☑️ Combination with the Alt key
Example: [Alt]+[T].

---

All keyboard shortcuts and their actions that are configured in the visualization are listed in the “Keyboard configuration” tab.

---

**Element property 'Access rights'**

Requirement: User management is set up for the visualization.

**“Access rights”**

Opens the “Access rights” dialog. There you can edit the access privileges for the element.
Status messages:
- **“Not set. Full rights.”**: Access rights for all user groups: “operable”
- **“Rights are set: Limited rights”**: Access is restricted for at least one group.

See also
- ☮ Chapter 1.3.5.19.3.1 “Dialog ‘Access Rights’” on page 1583

---

**Visualization element 'Image'**

Symbol:

Tag: “Basic”

The element adds an image to the visualization. The displayed image is managed in the image pool and referenced in the visualization element by means of a static ID. In addition, you can change the displayed image dynamically by using a variable instead of the static ID.
With the “Background” command, you can define a background for the entire visualization.

Directories that contain the images for use in visualizations can be defined in the project settings (category “Visualization”).

# Element properties

<table>
<thead>
<tr>
<th>“Element name”</th>
<th>Example: Status bar</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Optional</td>
</tr>
<tr>
<td></td>
<td>Hint: Assign individual names for elements so that they are found faster in the element list.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Type of element”</th>
<th>“Image”</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>“Static ID”</th>
<th>Identifier for static assignment</th>
</tr>
</thead>
<tbody>
<tr>
<td>ID of the image file on, as it is defined in the corresponding image pool. If the image is not included in the global image pool in the POU view, then the instance path must be specified. Then the name of the image pool is preceded to make the entry unique. Example: <code>imagepool2.button_image</code>.</td>
<td></td>
</tr>
</tbody>
</table>

When entering a new ID, a file selection opens. The selected file is saved to the “GlobalImagePool”.

See also: Help for the “Image pool” object.

<table>
<thead>
<tr>
<th>“Show frame”</th>
<th>☑ The image file is displayed with a frame.</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>“Clipping”</th>
<th>Requirement: “Scaling type” is “Fixed”.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>☑ Only part of the visualization is displayed that fits in the element frame.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Transparent”</th>
<th>☑ The image pixels that have the “Transparent color” are displayed as transparent.</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>“Transparent color”</th>
<th>Effective only if the “Transparent” option is activated.</th>
</tr>
</thead>
<tbody>
<tr>
<td>The button opens the color selection dialog. This is where you select the transparent color.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Scaling type”</th>
<th>Definition how an image fits in the element frame.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>“Isotropic”: The entire image is shown in the element frame, either larger or smaller. As a result, the proportion of height and width are retained. If the alignment of the elements to each other should also be retained within a scaled frame element, then note the following. Unwanted horizontal or vertical offsets can be prevented by setting the properties “Horizontal alignment” and “Vertical alignment” to “Centered”. The alignment of the elements is retained and there are no resulting horizontal or vertical offsets. Example: A lamp is centered above a switch. The lamp should remain in the horizontally centered position, even if the frame is resized.</td>
</tr>
<tr>
<td></td>
<td>“Anisotropic”: The image resizes automatically to the dimensions of the element frame, filling the entire element frame. As a result, the proportions are not retained.</td>
</tr>
<tr>
<td></td>
<td>“Fixed”: The image retains its original size, even if the element frame is resized. Please note also that the “Clipping” option is selected. For each reassignment of an image ID, the element size is adapted automatically to the image size.</td>
</tr>
</tbody>
</table>
**“Horizontal alignment”**

Horizontal alignment of the element within the element frame:
- “Left”
- “Centered”
- “Right”

Requirement: The scaling type of the image is “Isotropic” or “Fixed”.

Note: If the visualization is referenced, then the horizontal alignment takes effect within the frame position.

- The property “Variable” is shown below.

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Enumeration:</td>
</tr>
<tr>
<td></td>
<td>TYPE VisuElemBase.VisuEnumHorizontalAlignment</td>
</tr>
<tr>
<td></td>
<td>LEFT                                                                  HCENTER                                                                  RIGHT</td>
</tr>
<tr>
<td></td>
<td>END_TYPE</td>
</tr>
<tr>
<td>Example:</td>
<td>PLC_PRG.eHorizontalAlignment</td>
</tr>
</tbody>
</table>

Declaration:

```plaintext
PROGRAM PLC_PRG
VAR
  eHorizontalAlignment :
  VisuElemBase.VisuEnumHorizontalAlignment :=
  VisuElemBase.VisuEnumHorizontalAlignment.HCENTER;
END_VAR
```
**Vertical alignment**

Vertical alignment of the element within the element frame:

- **“Top”**
- **“Centered”**
- **“Bottom”**

Requirement: The scaling type of the image is “Isotropic” or “Fixed”.

Note: If the visualization is referenced, then the horizontal alignment takes effect within the frame position.

**: The “Variable” property is shown below.

**Variable**

Enumeration variable (ENUM VisuElemBase.VisuEnumVerticalAlignment). Contains the vertical alignment.

Enumeration:

```
TYPE VisuElemBase.VisuEnumVerticalAlignment
  DOWN
  VCENTER
  BOTTOM
END_TYPE
```

**Example:** PLC_PRG.eHorizontalAlignment

**Declaration:**

```
PROGRAM PLC_PRG
VAR
  eVerticalAlignment :
    VisuElemBase.VisuEnumVerticalAlignment :=
    VisuElemBase.VisuEnumVerticalAlignment.VCENTER;
END_VAR
```

See also

- **Object ‘Image Pool’**

**Element property ‘Position’**

The position defines the location and size of the element in the visualization window. This is based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

<table>
<thead>
<tr>
<th><strong>X</strong></th>
<th>The x-coordinate of the upper left corner of the element</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Specified in pixels</td>
</tr>
<tr>
<td></td>
<td>Example: 10</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Y</strong></th>
<th>The y-coordinate of the upper left corner of the element</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Specified in pixels</td>
</tr>
<tr>
<td></td>
<td>Example: 10</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Width</strong></th>
<th>Specified in pixels</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Example: 150</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Height</strong></th>
<th>Specified in pixels</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Example: 30</td>
</tr>
</tbody>
</table>

Tip: You can change the values in “X”, “Y”, “Width”, and “Height” by dragging the corresponding symbols to another position in the editor.
"Angle"

Static angle of rotation (in degrees).

Example: 35

The element is displayed rotated in the editor. The point of rotation is the center of the element. A positive value rotates clockwise.

Tip: You can change the value in the editor by focusing the element to the handle. When the cursor is displayed as a rotating arrow, you can rotate the element about its center as a handle.

(1): Handle

Note: If a dynamic angle of rotation is also configured in the property "Absolute movement ➔ Internal rotation", then the static and dynamic angles of rotation are added in runtime mode. The static angle of rotation acts as an offset.

See also

- § Chapter 1.3.5.3.2 “Positioning elements, adapting size and layer” on page 1113

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“X”</td>
<td>X-coordinate of the point of rotation</td>
</tr>
<tr>
<td>“Y”</td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

Element property 'Colors'

The properties contain fixed values for setting colors.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Color”</td>
<td>Color for the frame</td>
</tr>
<tr>
<td>Requirement: “Show frame” property is activated.</td>
<td></td>
</tr>
<tr>
<td>Please note that the normal state is in effect if the expression in the “Color variables ➔ Toggle color” property is not defined or it has the value FALSE.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Alarm color”</td>
<td>Color for the frame in alarm state</td>
</tr>
<tr>
<td>Requirement: “Show frame” property is activated.</td>
<td></td>
</tr>
<tr>
<td>Please note that the alarm state is in effect if the expression in the “Color variables ➔ Toggle color” property has the value TRUE.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Transparency”</td>
<td>Value (0 to 255) for defining the transparency of the selected color.</td>
</tr>
<tr>
<td>Example 255: The color is opaque. 0: The color is completely transparent.</td>
<td></td>
</tr>
</tbody>
</table>
See also

- The properties contain fixed values for setting the look of the element.

### Element property 'Appearance'

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Line width&quot;</td>
<td>Value in pixels. Example: 2. Note: The values 0 and 1 both result in a line weight of one pixel. If no line should be displayed, then the &quot;Line style&quot; property must be set to the option &quot;Invisible&quot;.</td>
</tr>
<tr>
<td>&quot;Line style&quot;</td>
<td>Type of line representation. Type of line representation.</td>
</tr>
<tr>
<td></td>
<td>● &quot;Solid&quot;</td>
</tr>
<tr>
<td></td>
<td>● &quot;Dashes&quot;</td>
</tr>
<tr>
<td></td>
<td>● &quot;Dots&quot;</td>
</tr>
<tr>
<td></td>
<td>● &quot;Dash Dot&quot;</td>
</tr>
<tr>
<td></td>
<td>● &quot;Dash Dot Dot&quot;</td>
</tr>
<tr>
<td></td>
<td>● &quot;not visible&quot;</td>
</tr>
</tbody>
</table>

You can assign variables in the "Appearance variables" property for controlling the appearance dynamically. The fixed values are defined here.

See also

- “Element property ‘Appearance variables’” on page 1285

### Element property 'Texts'

The properties contain character strings for labeling the element. The character string can also contain a placeholder with a format definition. In runtime mode, the placeholder is replaced by the current value in the specified format.

CODESYS accepts the specified texts automatically into the "GlobalTextList" text list. Therefore, these texts can be localized.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Text&quot;</td>
<td>Character string (without single straight quotation marks) for the labeling of the element. Add a line break by pressing the keyboard shortcut [Ctrl] + [Enter]. Example: Accesses: %i The variable that contains the current value for the placeholder is specified in the property &quot;Text variable ➔ Text&quot;.</td>
</tr>
<tr>
<td>&quot;Tooltip&quot;</td>
<td>Character string (without single straight quotation marks) that is displayed as the tooltip of an element. Example: Number of valid accesses. The variable that contains the current value for the placeholder is specified in the property &quot;Text variable ➔ Tooltip&quot;.</td>
</tr>
</tbody>
</table>

- “Element property ‘Text variables’” on page 1229
- Chapter 1.3.5.18.2 “Placeholders with format definition in the output text” on page 1546
The properties contain fixed values for the text properties.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Horizontal alignment</td>
<td>Horizontal alignment of the text within the element.</td>
</tr>
<tr>
<td>Vertical alignment</td>
<td>Vertical alignment of the text within the element.</td>
</tr>
<tr>
<td>Text format</td>
<td>Definition for displaying texts that are too long</td>
</tr>
<tr>
<td></td>
<td>- &quot;Default&quot;: The long text is truncated.</td>
</tr>
<tr>
<td></td>
<td>- &quot;Line break&quot;: The text is split into parts.</td>
</tr>
<tr>
<td></td>
<td>- &quot;Ellipsis&quot;: The visible text ends with &quot;...&quot; indicating that it is not complete.</td>
</tr>
<tr>
<td>Font</td>
<td>Example: &quot;Default&quot;</td>
</tr>
<tr>
<td></td>
<td>📦: The &quot;Font&quot; dialog box opens.</td>
</tr>
<tr>
<td></td>
<td>◀️: Drop-down list with style fonts.</td>
</tr>
<tr>
<td>Font color</td>
<td>Example: &quot;Black&quot;</td>
</tr>
<tr>
<td></td>
<td>📦: The &quot;Color&quot; dialog box opens.</td>
</tr>
<tr>
<td></td>
<td>◀️: Drop-down list with style colors.</td>
</tr>
<tr>
<td>Transparency</td>
<td>Whole number (value range from 0 to 255). This determines the transparency of the respective color.</td>
</tr>
<tr>
<td></td>
<td>Example: 255: The color is opaque.</td>
</tr>
<tr>
<td></td>
<td>0: The color is completely transparent.</td>
</tr>
<tr>
<td></td>
<td>Please note: If the color is a style color and already has a transparency value, then this property is write-protected.</td>
</tr>
</tbody>
</table>

**Element property 'Image ID variable'**

| Image ID               | Variable (STRING). Contains the image ID. The contents of the string corresponds to the description of the "Static ID" property. Example: PLC_PRG.stImageID := 'ImagePool_A.Image3'; |

See also

- ☞ Chapter 1.3.5.18.1.5 "Visualization element 'Image'" on page 1272
- Object 'Image Pool'

You can use this element property for animating a series of image files.

**Element property 'Dynamic image'**

| Bitmap version         | Variable (integer data type). Contains the version of the image. If the variable changes, then the visualization re-reads the image referenced in the "Image ID" property and displays it. The visualization displays animations when the image file on the controller is updated continuously, thus incrementing the version variable. The application must be programmed for this. Possible applications |
|                       | - Displaying graphics that are generated by the application                                      |
|                       | - Displaying images that are refreshed by a camera                                               |
The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

**“Movement”**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>“X”</td>
<td>Variable (numeric data type). Defines the X position (in pixels). Increasing this value in runtime mode moves the element to the right.</td>
<td>PLC_PRG.iPos_X</td>
</tr>
<tr>
<td>“Y”</td>
<td>Variable (numeric data type). Defines the Y position (in pixels). Increasing this value in runtime mode moves the element downwards.</td>
<td>PLC_PRG.iPos_Y</td>
</tr>
</tbody>
</table>

**“Rotation”**

Variable (numeric data type). Defines the angle of rotation (in degrees).

Example: PLC_PRG.iAngle1.

The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.

In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

**“Scaling”**

Variable (integer data type). Causes centric stretching.

Example: PLC_PRG.iScaling.

The reference point is the “Center” property.

The value 1 shrinks the element by a factor of 0.001. The value 1000 returns the element to its original size.

**“Interior rotation”**

Variable (numeric data type). Defines the angle of rotation (in degrees).

Example: PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol.

Note: If a static angle of rotation is specified in the property “Position ➔ Angle”, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

---

You can link the variables to a unit conversion.
The properties “X”, “Y”, “Rotation”, and “Interior rotation” are supported by the “Client Animation” functionality.

See also
- Unit conversion

Element property 'Relative movement'
The properties contains variables for moving the element. The reference point is the position of the element ("Position" property). The shape of the element can change.

<table>
<thead>
<tr>
<th>“Movement top-left”</th>
</tr>
</thead>
<tbody>
<tr>
<td>“X” Variable (integer data type). It contains the number (in pixels) that the left edge is moved horizontally. Incrementing the value moves the element to the right. Example: PLC_PRG.iDeltaX</td>
</tr>
<tr>
<td>“Y” Variable (integer data type). It contains the number (in pixels) that the top edge is moved vertically. Incrementing the value moves the element to the down. Example: PLC_PRG.iDeltaY</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Movement bottom-right”</th>
</tr>
</thead>
<tbody>
<tr>
<td>“X” Variable (integer data type). It contains the number (in pixels) that the right edge is moved horizontally. Incrementing the value moves the element to the right. Example: PLC_PRG.iDeltaWidth</td>
</tr>
<tr>
<td>“Y” Variable (integer data type). It contains the number (in pixels) that the bottom edge is moved vertically. Incrementing the value moves the element to the down. Example: PLC_PRG.iDeltaHeight</td>
</tr>
</tbody>
</table>

See also
- “Element property ‘Absolute movement’” on page 1227

Element property 'Text variables'
These properties are variables with contents that replace a format definition.

<table>
<thead>
<tr>
<th>“Text variable”</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. Example: PLC_PRG.iAccesses</td>
</tr>
<tr>
<td>Note: The format definition is part of the text in the property “Texts ➔ Text”. Note: If you specify a variable of type enumeration with text list support, then the name of the enumeration data type is added automatically in angle brackets after the variable name. Example: PLC_PRG.enVar &lt;enumeration name&gt;. Then the symbolic value of the enumeration component is printed instead of the numeric value when text is printed. Refer to the help page for the enumerations.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Tooltip variable”</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. Example: PLC_PRG.iAccessesInTooltip</td>
</tr>
<tr>
<td>Note: The format definition is part of the text in the property “Texts ➔ Tooltip”.</td>
</tr>
</tbody>
</table>
Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.

<table>
<thead>
<tr>
<th><strong>Text list</strong></th>
<th>Variable (string) or name of the text list as a fixed string in single straight quotation marks.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: 'Errorlist'</td>
<td></td>
</tr>
<tr>
<td>▼: Drop-down list with the dialogs available in the text lists.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Text index</strong></th>
<th>Text list ID. This refers to the desired output text.</th>
</tr>
</thead>
<tbody>
<tr>
<td>▪ As fixed string with the ID in single straight quotation marks.</td>
<td></td>
</tr>
<tr>
<td>Example: '1'</td>
<td></td>
</tr>
<tr>
<td>▪ As a variable (STRING) for dynamically controlling the text output.</td>
<td></td>
</tr>
<tr>
<td>Example: strTextID</td>
<td></td>
</tr>
<tr>
<td>Sample assignment: PLC_PRG.strTextID := '1';</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Tooltip index</strong></th>
<th>Text list ID. This refers to the desired output text.</th>
</tr>
</thead>
<tbody>
<tr>
<td>▪ As fixed string with the ID in single straight quotation marks.</td>
<td></td>
</tr>
<tr>
<td>Example: '2'</td>
<td></td>
</tr>
<tr>
<td>▪ As a variable (STRING) for dynamically controlling the text output.</td>
<td></td>
</tr>
<tr>
<td>Example: strToolTipID</td>
<td></td>
</tr>
<tr>
<td>Sample assignment: PLC_PRG.strToolTipID := '2';</td>
<td></td>
</tr>
</tbody>
</table>

The variables allow for dynamic control of the text display.

See also

- [Chapter 1.3.5.18.2 “Placeholders with format definition in the output text” on page 1546](#)
- [“Element property ‘Texts’” on page 1226](#)
- [Enumerations](#)
### “Font name”

Variable (STRING). Includes the font of the text.

Example: `PLC_PRG.stFontVar := 'Arial';`

The selection of fonts corresponds to the default “Font” dialog.

### “Size”

Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name.

- `<pt>`: Points (default)
  
  Example: `PLC_PRG.iFontHeight <pt>`
  
  Code:
  ```
  iFontHeight : INT := 12;
  ```

- `<px>`: Pixels
  
  Example: `PLC_PRG.iFontHeight <px>`
  
  Code:
  ```
  iFontHeight : INT := 19;
  ```

If you click in the value field, a drop-down list opens on the right for setting the unit.

Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property “Text property ➔ Font”.

### “Flags”

Variable (DWORD). Contains the flags for displaying fonts.

Flags:

- **1**: Italics
- **2**: Bold
- **4**: Underline
- **8**: Strikethrough

Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: `PLC_PRG.dwFontType := 6;`

### “Character set”

Variable (DWORD). Contains a character set number for the font.

The selection of character set numbers corresponds to the “Script” setting of the standard “Font” dialog.

### “Color”

Variable (DWORD). Includes the color of the text.

Example: `PLC_PRG.dwColorFont := 16#FF000000;`

### “Flags for text alignment”

Variable (integer data type). Contains the coding for text alignment.

Example: `PLC_PRG.dwTextAlignment;`

Coding:

- **0**: Top left
- **1**: Horizontal center
- **2**: Right
- **4**: Vertical center
- **8**: Bottom

Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: `PLC_PRG.dwFontType := 5;`
Fixed values for displaying texts are set in “Text properties”.

See also

- “Element property 'Text properties’” on page 1227

**Element property 'Colorvariables'**

The Element property is used as an interface for project variables to dynamically control colors at runtime.
| **Toggle color** | The property controls the toggled color at runtime. Value assignment:  
  ● **FALSE**: The element is displayed with the color specified in the “Color” property.  
  ● **TRUE**: The element is displayed with the color specified in the “Alarm color” property.  
  Assigning the property:  
  ● Placeholder for the user input variable  
    – “<toggle/tap variable>”  
    – “<NOT toggle/tap variable>”  
  The color change is not controlled by its own variable, but by a user input variable.  
  Note: Specify a variable for the mouse events “Tap” or “Toggle” in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both “Toggle” and “Tap”, then the variable specified in “Tap” is used.  
  Hint: Click the symbol to insert the placeholder “<toggle/tap variable>”. When you activate the “Inputconfiguration”, “Tap FALSE” property, then the “<NOT toggle/tap variable>” placeholder is displayed.  
  ● Instance path of a project variable (BOOL)  
    Example: PLC_PRG.xColorIsToggeled  
    Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes. |
| **Color** | Color variable for the frame  
  ● Variable (DWORD) for the color  
    Example: PLC_PRG.dwColor  
  ● Color literal  
    Example of gray and opaque: 16#FF888888  
  Requirement: “Show frame” property is activated.  
  Please note that the normal state is in effect if the expression in the “Colorvariables” → “Toggle color” property is not defined or it has the value FALSE. |
| **Alarm color** | Color variable for the frame in alarm state  
  ● Variable (DWORD) for the alarm color  
    Example: PLC_PRG.dwAlarmColor  
  ● Color literal  
    Example of red and opaque: 16#FFFF0000  
  Please note that the alarm state is in effect if the expression in the “Colorvariables” → “Toggle color” property has the value TRUE. |

The transparency part of the color value is evaluated only if the “Activate semi-transparent drawing” option of the visualization manager is selected.

Select the “Advanced” option in the toolbar of the properties view. Then all element properties are visible.
Element property 'Appearance variables'

The properties contain variables for controlling the appearance of the element dynamically.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Line width&quot;</td>
<td>Variable (integer data type). Contains the line weight (in pixels). Note: The values 0 and 1 both result in a line weight of one pixel. If no line should be displayed, then the &quot;Line style&quot; property must be set to the option &quot;Invisible&quot;.</td>
</tr>
</tbody>
</table>

Fixed values can be set in the "Appearance" property. These values can be overwritten by dynamic variables at runtime.

See also
- § "Element property 'Appearance'" on page 1238

Element property 'State variables'

The variables control the element behavior dynamically.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Invisible&quot;</td>
<td>Variable (BOOL). Toggles the visibility of the element. TRUE: The element is not visible at runtime.</td>
</tr>
<tr>
<td>&quot;Deactivate inputs&quot;</td>
<td>Variable (BOOL). Toggles the operability of the element. TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated.</td>
</tr>
</tbody>
</table>

The "Invisible" property is supported by the "Client Animation" functionality.

See also
- §

These properties are available only when you select the "Preview: Support client animations and overlay of native elements" option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.
### Animation duration
Time that the element executes an animation (in milliseconds)

**Example:** 500

### Move to the foreground
Property value (BOOL)

- **TRUE:** At runtime, the element is displayed in the foreground.
- **FALSE:** At runtime, the element is displayed in the layer where it was inserted in the visualization editor.

See also
- Chapter 1.3.5.21.5 “Using client animation” on page 1962

### Element property 'Input configuration'
The properties contain the configurations for the user input when using the mouse or keyboard.

User input is a user event from the perspective of the element.

The “Configure” button opens the “Input configuration” dialog box for creating or modifying a user input configuration.

A configuration contains one or more input actions for the respective input event. Existing input actions are displayed below it.

**Example:** “Execute ST code”:

```
PLC_PRG.i_x := 0;
```

<table>
<thead>
<tr>
<th>Event(s)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>OnDialogClosed</strong></td>
<td>Input event: The user closes the dialog box.</td>
</tr>
<tr>
<td><strong>OnMouseClick</strong></td>
<td>Input event: A user clicks the element completely. The mouse button is clicked and released.</td>
</tr>
<tr>
<td><strong>OnMouseDown</strong></td>
<td>Input event: A user clicks down on the element only.</td>
</tr>
<tr>
<td><strong>OnMouseEnter</strong></td>
<td>Input event: A user drags the mouse pointer to the element.</td>
</tr>
<tr>
<td><strong>OnMouseLeave</strong></td>
<td>Input event: A user drags the mouse pointer away from the element.</td>
</tr>
<tr>
<td><strong>OnMouseMove</strong></td>
<td>Input event: A user moves the mouse pointer over the element area.</td>
</tr>
<tr>
<td><strong>OnMouseUp</strong></td>
<td>Input event: The user releases the mouse button over the element area.</td>
</tr>
</tbody>
</table>

See also
- Chapter 1.3.5.19.3.6 “Dialog ‘Input Configuration’” on page 1586

<table>
<thead>
<tr>
<th>Hotkeys</th>
<th>Keyboard shortcut on the element for triggering specific input actions.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Key</strong></td>
<td>Key pressed for input action.</td>
</tr>
<tr>
<td><strong>Event(s)</strong></td>
<td>When the keyboard shortcut event occurs, the input actions in the “Event(s)” property are triggered.</td>
</tr>
</tbody>
</table>

- **“None”**
- **“Mouse down”**: Pressing the key triggers the input actions that are configured in the “OnMouseDown” property.
- **“Mouse up”**: Releasing the key triggers the input actions that are configured in the “OnMouseUp” property.
- **“Mouse down/up”**: Pressing and releasing the key triggers the input actions that are configured in the “OnMouseDown” property and the “OnMouseUp” property.

<table>
<thead>
<tr>
<th>Shift</th>
<th>Combination with the Shift key</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong> [Shift]+[T].</td>
<td></td>
</tr>
</tbody>
</table>
“Control”  ✔ Combination with the Ctrl key
Example: [Ctrl]+[T].

“Alt”  ✔ Combination with the Alt key
Example: [Alt]+[T].

All keyboard shortcuts and their actions that are configured in the visualization are listed in the “Keyboard configuration” tab.

See also
- § Chapter 1.3.5.19.2.2 “Command 'Keyboard Configuration’” on page 1558

Element property 'Access rights'

Requirement: User management is set up for the visualization.

“Access rights”  Opens the “Access rights” dialog. There you can edit the access privileges for the element.
Status messages:
- “Not set. Full rights.”: Access rights for all user groups : “operable”
- “Rights are set: Limited rights”: Access is restricted for at least one group.

See also
- § Chapter 1.3.5.19.3.1 “Dialog 'Access Rights’” on page 1583

See also
-  Project Settings - Visualization
- § Chapter 1.3.5.19.2.10 “Command 'Background’” on page 1565

Visualization element 'Frame'

Symbol:

Tag: “Basic”
The element serves as a frame in which to display one or more already existing visualizations. You get a structured user interface. The size of the frame can be fixed or scaled. The display area of the referenced visualization then adapts itself to the frame size.

Element properties

<table>
<thead>
<tr>
<th>“Element name”</th>
<th>Example: refVisUserInfo</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Type of element”</td>
<td>“Frame”</td>
</tr>
</tbody>
</table>
**“Clipping”**

- **Fixed size.** Only that part of the referenced visualization that fits inside the frame is displayed.

  Requirement: “Scaling type” property is “Fixed”.

**“Show frame”**

- Displays the frame
  - **“No frame”**: The displayed area of the frame does not have borders.
  - **“Frame”**: The displayed area of the frame has borders.
  - **“No frame with offset”**: The displayed area of the frame does not have a border and the displayed area of the referenced visualization is reduced inwards by one pixel as compared to the frame area. The gap prevents the referenced visualization from touching any adjacent elements.

**“Scaling type”**

- The method with which the height and width of the referenced visualization are scaled.
  - **“Isotropic”**: The visualization is scaled to the size of the element. The visualization retains its proportions with a fixed height/width ratio.
  - **“Anisotropic”**: The visualization is scaled to the size of the element. The height and width are adapted to the element independently of each other.
  - **“Fixed”**: the visualization is displayed in its original size without taking into account the size of the element.
  - **“Fixed and scrollable”**: The visualization is displayed fixed in the element. If it is larger than the element, the element will be provided with scrollbars.

  Please note: assign variables to the properties “Scroll position variable horizontal” or “Scroll position variable vertical”. You can then edit the data of the scrollbar position in the application.

**Element properties ‘Scrollbar settings’**

- The properties contain variables for the position of the scrollboxes in the scrollbars. You can then edit the data of the scrollbar position in the application.

  Requirement: the property “Scaling type” is “fixed and scrollable”.

**“Scroll position variable horizontal”**

- Variable (integer data type, also as array). Contains the position of the horizontal or vertical scrollbox. The array contains the position for every display variant. If the visualization runs on several display variants, then the position changes are decoupled from each other.

  Example:

  ```
  PLC_PRG.iScrollHor[CURRENTCLIENTID]
  PLC_PRG.iScrollVer[CURRENTCLIENTID]
  ```

  The variable is declared as an array in the example.

  ```
  iScrollHor: ARRAY[0..20] OF INT;
  iScrollVer: ARRAY[0..20] OF INT;
  CURRENTCLIENTID indexes the current display variant.
  ```

  You can combine the variables with a unit conversion.

**See also**

- **Unit conversion**
"Deactivation of the background character": The background is drawn. The non-animated element of the referenced visualization is drawn as a background bitmap in order to optimize the performance of the visualization.

Consequence: Elements can be displayed in an unexpected order at runtime. For example, an animated element can push itself behind the frame at runtime.

☑️ Background character is deactivated in order to avoid the behaviour described above.

Element property 'References'

Contains the currently configured visualization references as a subnode

"References": Clicking "Configure" opens the "Frame Configuration" dialog. This is used to manage the referenced visualizations.

Caution: Visualizations can be nested at any depth by means of frame elements. In order to use the "Switch to any visualization" frame selection type without any problems, a frame must not contain more than 21 referenced visualizations. For more information, see also the description for the "Input configuration" of an element: Action "Switch frame visualization".

List of the currently referenced visualizations

Visualizations that have a button also have this displayed as a subnode. Each interface variable is listed with the currently assigned transfer parameters.

Example:

```plaintext
vis_FormA
  ● iDataToDisplay_1: PLC_PRG.iVar1
  ● iDataToDisplay_2: PLC_PRG.iVar2
```

Hint: You can change the assignment of the variables to an interface variable here and edit the value field. Or click the "Configure" button instead.

• ☸ Chapter 1.3.5.19.3.6 “Dialog ‘Input Configuration’” on page 1586

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;X&quot;</td>
<td>X coordinate of the upper left corner of the element. Specified in pixels. Example: 10.</td>
</tr>
<tr>
<td>&quot;Y&quot;</td>
<td>Y coordinate of the upper left corner of the element. Specified in pixels. Example: 10.</td>
</tr>
<tr>
<td>&quot;Width&quot;</td>
<td>Specified in pixels. Example: 150</td>
</tr>
<tr>
<td>&quot;Height&quot;</td>
<td>Specified in pixels. Example: 30</td>
</tr>
</tbody>
</table>
You can also change the values by dragging the box symbols (⊃) to other positions in the editor.

See also
- ☰ Chapter 1.3.5.2 “Positioning elements, adapting size and layer” on page 1113

**Element property 'Center'**

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the △ symbol. The point is used as the center for rotating and scaling.

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>“X”</td>
<td>X-coordinate of the point of rotation</td>
</tr>
<tr>
<td>“Y”</td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the symbols (⊃) to other positions in the editor.

**Element property 'Colors'**

The properties contain fixed values for the colors.

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>“Color”</td>
<td>Color of the frame</td>
</tr>
<tr>
<td></td>
<td>▼: Selection list with style colors appears</td>
</tr>
<tr>
<td></td>
<td>□: Standard dialog &quot;Color&quot; opens for selecting a color.</td>
</tr>
<tr>
<td></td>
<td>Please note: the normal state is when the boolean variable in the property “Color variables ▶ Toggle color” is not defined or its value is FALSE.</td>
</tr>
<tr>
<td>“Alarm color”</td>
<td>Color with which the element is filled during the alarm state.</td>
</tr>
<tr>
<td></td>
<td>Please note: Alarm state is when the value of the boolean variable in the property “Color variables ▶ Toggle color” is FALSE.</td>
</tr>
<tr>
<td>“Transparency”</td>
<td>Integer number (value range from 255 to 0). Specifies the transparency of the associated color.</td>
</tr>
<tr>
<td></td>
<td>255: The color is opaque.</td>
</tr>
<tr>
<td></td>
<td>0: The color is fully transparent.</td>
</tr>
<tr>
<td></td>
<td>Please note: If the color is a style color and already contains a transparency value, then this property is write-protected.</td>
</tr>
</tbody>
</table>

See also
- ☰ Chapter 1.3.5.3.3 “Assigning a color” on page 1115

**Element property 'Appearance'**

The properties contain fixed values for setting the look of the element.
### “Line width”
Value in pixels

Example: 2

Note: The values 0 and 1 both result in a line weight of one pixel. If no line should be displayed, then the “Line style” property must be set to the option “Invisible”.

### “Line style”
Type of line representation

- “Solid”
- “Dashes”
- “Dots”
- “Dash Dot”
- “Dash Dot Dot”
- “not visible”

You can assign variables in the “Appearance variables” property for controlling the appearance dynamically. The fixed values are defined here.

See also
- “Element property ‘Appearance variables’” on page 1285

---

**Element property ‘Texts’**

The properties contain character strings for labeling the element. The character string can also contain a placeholder with a format definition. In runtime mode, the placeholder is replaced by the current value in the specified format.

CODESYS accepts the specified texts automatically into the “GlobalTextList” text list. Therefore, these texts can be localized.

### “Text”
Character string (without single straight quotation marks) for the labeling the element. Add a line break by pressing the keyboard shortcut [Ctrl] + [Enter].

Example: Accesses: %i

The variable that contains the current value for the placeholder is specified in the property “Text variable Text”.

### “Tooltip”
Character string (without single straight quotation marks) that is displayed as the tooltip of an element.

Example: Number of valid accesses.

The variable that contains the current value for the placeholder is specified in the property “Text variable Tooltip”.

See also
- “Element property ‘Text variables’” on page 1229
- “Chapter 1.3.5.18.2 “Placeholders with format definition in the output text” on page 1546

---

**Element property ‘Text properties’**

The properties contain fixed values for the text properties.

<table>
<thead>
<tr>
<th>“Horizontal alignment”</th>
<th>Horizontal alignment of the text within the element.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Vertical alignment”</td>
<td>Vertical alignment of the text within the element.</td>
</tr>
</tbody>
</table>
### "Text format"

Definition for displaying texts that are too long

- **"Default"**: The long text is truncated.
- **"Line break"**: The text is split into parts.
- **"Ellipsis"**: The visible text ends with "..." indicating that it is not complete.

### "Font"

Example: "Default"

- The "Font" dialog box opens.
- ➤: Drop-down list with style fonts.

### "Font color"

Example: "Black"

- The "Color" dialog box opens.
- ➤: Drop-down list with style colors.

### "Transparency"

Whole number (value range from 0 to 255). This determines the transparency of the respective color.

- Example: 255: The color is opaque.
- 0: The color is completely transparent.

Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

### Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

### "Movement"

#### "X"

Variable (numeric data type). Defines the X position (in pixels).

- Example: PLC_PRG.iPos_X.
- Increasing this value in runtime mode moves the element to the right.

#### "Y"

Variable (numeric data type). Defines the Y position (in pixels).

- Example: PLC_PRG.iPos_Y.
- Increasing this value in runtime mode moves the element downwards.

#### "Rotation"

Variable (numeric data type). Defines the angle of rotation (in degrees).

- Example: PLC_PRG.iAngle1.
- The midpoint of the element rotates at the "Center" point. This rotation point is shown as the symbol.
- In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

#### "Scaling"

Variable (integer data type). Causes centric stretching.

- Example: PLC_PRG.iScaling.
- The reference point is the "Center" property.
- The value 1 shrinks the element by a factor of 0.001. The value 1000 returns the element to its original size.
"Interior rotation" Variable (numeric data type). Defines the angle of rotation (in degrees).

Example: PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in "Center" according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the \( \mathbb{R} \) symbol.

Note: If a static angle of rotation is specified in the property "Position \( \rightarrow \) Angle", then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

You can link the variables to a unit conversion.

The properties "X", "Y", "Rotation", and "Interior rotation" are supported by the "Client Animation" functionality.

See also
- Unit conversion

Element property 'Relative movement'

The properties contain variables for moving the element. The reference point is the position of the element ("Position" property). The shape of the element can change.

"Movement top-left"

| "X" | Variable (integer data type). It contains the number (in pixels) that the left edge is moved horizontally. Incrementing the value moves the element to the right. Example: PLC_PRG.iDeltaX |
| "Y" | Variable (integer data type). It contains the number (in pixels) that the top edge is moved vertically. Incrementing the value moves the element to the down. Example: PLC_PRG.iDeltaY |

"Movement bottom-right"

| "X" | Variable (integer data type). It contains the number (in pixels) that the right edge is moved horizontally. Incrementing the value moves the element to the right. Example: PLC_PRG.iDeltaWidth |
| "Y" | Variable (integer data type). It contains the number (in pixels) that the bottom edge is moved vertically. Incrementing the value moves the element to the down. Example: PLC_PRG.iDeltaHeight |

See also
- “Element property ‘Absolute movement’” on page 1227
Element property 'Text variables'

These properties are variables with contents that replace a format definition.

<table>
<thead>
<tr>
<th>&quot;Text variable&quot;</th>
<th>Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. Example: PLC_PRG.iAccesses</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Note: The format definition is part of the text in the property “Texts ➔ Text”. Note: If you specify a variable of type enumeration with text list support, then the name of the enumeration data type is added automatically in angle brackets after the variable name. Example: PLC_PRG.enVar &lt;enumeration name&gt;. Then the symbolic value of the enumeration component is printed instead of the numeric value when text is printed. Refer to the help page for the enumerations.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>&quot;Tooltip variable&quot;</th>
<th>Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. Example: PLC_PRG.iAccessesInTooltip</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Note: The format definition is part of the text in the property “Texts ➔ Tooltip”.</td>
</tr>
</tbody>
</table>

See also
- § Chapter 1.3.5.18.2 “Placeholders with format definition in the output text” on page 1546
- § “Element property 'Texts’” on page 1226
- Enumerations

Element property 'Dynamic texts'

Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.

<table>
<thead>
<tr>
<th>&quot;Text list&quot;</th>
<th>Variable (string) or name of the text list as a fixed string in single straight quotation marks. Example: 'Errorlist'</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>➔: Drop-down list with the dialogs available in the text lists.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>&quot;Text index&quot;</th>
<th>Text list ID. This refers to the desired output text. As fixed string with the ID in single straight quotation marks. Example: '1' As a variable (STRING) for dynamically controlling the text output. Example: strTextID Sample assignment: PLC_PRG.strTextID := '1';</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>&quot;Tooltip index&quot;</th>
<th>Text list ID. This refers to the desired output text. As fixed string with the ID in single straight quotation marks. Example: '2' As a variable (STRING) for dynamically controlling the text output. Example: strToolTipID Sample assignment: PLC_PRG.strToolTipID := '2';</th>
</tr>
</thead>
</table>

See also
- Text list

Element property 'Font variables'

The variables allow for dynamic control of the text display.
### “Font name”

Variable *(STRING)*. Includes the font of the text.

Example: `PLC_PRG.stFontVar := 'Arial';`

The selection of fonts corresponds to the default “Font” dialog.

### “Size”

Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name.

- **<pt>: Points (default)**
  
  Example: `PLC_PRG.iFontHeight <pt>`
  
  Code: `iFontHeight : INT := 12;`

- **<px>: Pixels**
  
  Example: `PLC_PRG.iFontHeight <px>`
  
  Code: `iFontHeight : INT := 19;`

If you click in the value field, a drop-down list opens on the right for setting the unit.

Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property “Text property → Font”.

### “Flags”

Variable *(DWORD)*. Contains the flags for displaying fonts.

Flags:

- 1: Italics
- 2: Bold
- 4: Underline
- 8: Strikethrough

Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: `PLC_PRG.dwFontType := 6;`

### “Character set”

Variable *(DWORD)*. Contains a character set number for the font.

The selection of character set numbers corresponds to the “Script” setting of the standard “Font” dialog.

### “Color”

Variable *(DWORD)*. Includes the color of the text.

Example: `PLC_PRG.dwColorFont := 16#FF000000;`

### “Flags for text alignment”

Variable (integer data type). Contains the coding for text alignment.

Example: `PLC_PRG.dwTextAlignment.`

Coding:

- 0: Top left
- 1: Horizontal center
- 2: Right
- 4: Vertical center
- 8: Bottom

Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: `PLC_PRG.dwFontType := 5;`
Fixed values for displaying texts are set in “Text properties”.

See also

- “Element property ‘Text properties’” on page 1227

**Element property ‘Colorvariables’**

The Element property is used as an interface for project variables to dynamically control colors at runtime.
### "Toggle color"

The property controls the toggled color at runtime.

**Value assignment:**
- **FALSE:** The element is displayed with the color specified in the "Color" property.
- **TRUE:** The element is displayed with the color specified in the "Alarm color" property.

**Assigning the property:**
- Placeholder for the user input variable
  - "<toggle/tap variable>"
  - "<NOT toggle/tap variable>"

The color change is not controlled by its own variable, but by a user input variable.

Note: Specify a variable for the mouse events "Tap" or "Toggle" in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both "Toggle" and "Tap", then the variable specified in "Tap" is used.

Hint: Click the symbol to insert the placeholder "<toggle/tap variable>". When you activate the "Inputconfiguration", "Tap FALSE" property, then the "<NOT toggle/tap variable>" placeholder is displayed.

- Instance path of a project variable (BOOL)
  Example: PLC_PRG.xColorIsToggeled

Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.

### "Color"

Color variable for the frame

- Variable (DWORD) for the color
  Example: PLC_PRG.dwColor
- Color literal
  Example of gray and opaque: `16#FF888888`

Requirement: "Show frame" property is activated.

Please note that the normal state is in effect if the expression in the "Colorvariables ➔ Toggle color" property is not defined or it has the value FALSE.

### "Alarm color"

Color variable for the frame in alarm state

- Variable (DWORD) for the alarm color
  Example: PLC_PRG.dwAlarmColor
- Color literal
  Example of red and opaque: `16#FFFF0000`

Please note that the alarm state is in effect if the expression in the "Colorvariables ➔ Toggle color" property has the value TRUE.

---

The transparency part of the color value is evaluated only if the "Activate semi-transparent drawing" option of the visualization manager is selected.

Select the "Advanced" option in the toolbar of the properties view. Then all element properties are visible.
Element property 'Appearance variables'

The properties contain variables for controlling the appearance of the element dynamically.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>&quot;Line width&quot;</strong></td>
<td>Variable (integer data type). Contains the line weight (in pixels). Note: The values 0 and 1 both result in a line weight of one pixel. If no line should be displayed, then the &quot;Line style&quot; property must be set to the option &quot;Invisible&quot;.</td>
</tr>
<tr>
<td><strong>&quot;Line style&quot;</strong></td>
<td>Variable (DWORD). Controls the line style. Coding:</td>
</tr>
<tr>
<td></td>
<td>● 0: Solid line</td>
</tr>
<tr>
<td></td>
<td>● 1: Dashed line</td>
</tr>
<tr>
<td></td>
<td>● 2: Dotted line</td>
</tr>
<tr>
<td></td>
<td>● 3: Line type &quot;Dash Dot&quot;</td>
</tr>
<tr>
<td></td>
<td>● 3: Line type &quot;Dash Dot Dot&quot;</td>
</tr>
<tr>
<td></td>
<td>● 8: Invisible: The line is not drawn.</td>
</tr>
</tbody>
</table>

Fixed values can be set in the "Appearance" property. These values can be overwritten by dynamic variables at runtime.

See also
- “Element property ‘Appearance” on page 1238

Element property 'Switch frame variable'

The variable controls the switching of the referenced visualizations. This variable indexes one of the referenced frame visualizations and this is displayed in the frame. When the value of the variable changes, it switches to the recently indexed visualization.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>&quot;Variable&quot;</strong></td>
<td>Variable (integer data type) that contains the index of the active visualization Example: PLC_PRG.uiIndexVisu</td>
</tr>
<tr>
<td></td>
<td>Hint: The “Frame Configuration” dialog includes a list of referenced visualizations. The visualizations are automatically numerically indexed via the order in the list. Note: This variant of switching usually affects all connected display variants.</td>
</tr>
<tr>
<td></td>
<td>● Array element (integer data type) for index access via CURRENTCLIENTID Example: PLC_PRG.aIndexVisu[CURRENTCLIENTID]</td>
</tr>
<tr>
<td></td>
<td>Note: This variant of switching applies to the current client only, and therefore only on one display variant. That is the display variant where the value change was triggered (for example, by means of user input).</td>
</tr>
</tbody>

Element property 'State variables'

The variables control the element behavior dynamically.
"Invisible" Variable (BOOL). Toggles the visibility of the element.
TRUE: The element is not visible at runtime.

"Deactivate inputs" Variable (BOOL). Toggles the operability of the element.
TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated.

The "Invisible" property is supported by the "Client Animation" functionality.

See also

These properties are available only when you select the "Preview: Support client animations and overlay of native elements" option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.

"Animation duration" Time that the element executes an animation (in milliseconds)
Example: 500

"Move to the foreground" Property value (BOOL)
TRUE: At runtime, the element is displayed in the foreground.
FALSE: At runtime, the element is displayed in the layer where it was inserted in the visualization editor.

See also

- Chapter 1.3.5.21.5 “Using client animation” on page 1962

Element property ’Input configuration’ The properties contain the configurations for the user input when using the mouse or keyboard. A user input defines an event and one or more actions that are executed when an event occurs.

Configured user inputs are briefly listed below the events. They each include the action that is triggered and the setting in short form.

Example: "Execute ST code": PLC_PRG.i_x := 0;

"OnDialogClosed" Input event: The user closes the dialog box.

"OnMouseClick" Input event: The user clicks the mouse button completely. The mouse button is clicked and released.

"OnMouseDown" Input event: The user clicks down on the mouse button.

"OnMouseEnter" Input event: The user drags the mouse pointer to the element.

"OnMouseLeave" Input event: The user drags the mouse pointer away from the element.

"OnMouseMove" Input event: The user moves the mouse pointer over the element area.

"OnMouseUp" Input event: The user releases the mouse button over the element area.
### “Tap”
When a mouse click event occurs, the variable defined in “Variable” is described in the application. The coding depends on the options “Tap FALSE” and “Tap on enter if captured”.

### “Variable”
Variable (BOOL) that is set on mouse click.

**Example:** PLC_PRG.bIsTapped
- **TRUE:** A mouse click event exists. It lasts while the user presses the mouse button over the element. It ends when the button is released.
- **FALSE:** A mouse click event does not exist.

**Requirement:** The “Tap FALSE” option is not activated.

### “Tap FALSE”
- **☑:** The mouse click event leads to a complementary value in “Variable”.
- **TRUE:** A mouse click event does not exist.
- **FALSE:** While the mouse click event exists.

### “Tap on enter if captured”
- **☑:** During user input, it is also taken into consideration whether the mouse pointer is dragged within the element area or not while the mouse button is pressed.
- **TRUE:** While the mouse click event exists and the mouse pointer is moved over the element area.
- **FALSE:** A mouse click event does not exist. Or the user moves the mouse pointer outside of the element area while the mouse button is pressed.

The value is **TRUE** again as soon as the user moves the pointer back to the element area. The mouse is then captured.

### “Shift”
With the onset of a mouse click event, the variable is set; when the mouse click event is completed, the variable is reset.

### “Variable”
Variable (BOOL). Its value toggled when the mouse click event is ended. This is when the user releases the mouse button while the mouse pointer is over the element area.

If the user releases the mouse button while the mouse pointer is outside of the element area, then the mouse click event is not ended and the value is not toggled.

**Tip:** The user can cancel a started toggle input by dragging the mouse pointer out of the element area.

### “Toggle on up if captured”
- **☑:** The value toggles regardless of where the mouse pointer is when the mouse button is released. The mouse is then captured.

### “Keyboard shortcuts”
Keyboard shortcut on the element for triggering specific input actions.

When the keyboard shortcut event occurs, the input actions in the “Event(s)” property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.

### “Key”
Key pressed for input action.

**Example:** [T]

**Note:** The following properties appear when a key is selected.
"Event(s)"

- "None"
- "Mouse down": Pressing the key triggers the input actions that are configured in the "OnMouseDown" property.
- "Mouse up": Releasing the key triggers the input actions that are configured in the "OnMouseUp" property.
- "Mouse down/up": Pressing and releasing the key triggers the input actions that are configured in the "OnMouseDown" property and the "OnMouseUp" property.

"Shift"

☑: Combination with the Shift key
Example: [Shift]+[T].

"Control"

☑: Combination with the Ctrl key
Example: [Ctrl]+[T].

"Alt"

☑: Combination with the Alt key
Example: [Alt]+[T].

All keyboard shortcuts and their actions that are configured in the visualization are listed in the "Keyboard configuration" tab.

See also
- § Chapter 1.3.5.19.2.2 “Command 'Keyboard Configuration’” on page 1558
- § Chapter 1.3.5.19.3.6 “Dialog 'Input Configuration’” on page 1586

Requirement: User management is set up for the visualization.

Element property 'Access rights'

"Access rights"

Opens the "Access rights" dialog. There you can edit the access privileges for the element.
Status messages:
- "Not set. Full rights.": Access rights for all user groups: "operable"
- "Rights are set: Limited rights": Access is restricted for at least one group.

See also
- § Chapter 1.3.5.19.3.1 “Dialog 'Access Rights’” on page 1583

Visualization element 'Label'

Symbol:

Tag: "Common controls"
The element is used to label visualizations.
### Element properties

<table>
<thead>
<tr>
<th>“Element name”</th>
<th>Optional</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hint: Assign individual names for elements so that they are found faster in the element list.</td>
<td></td>
</tr>
<tr>
<td>Example: Header_Parameter</td>
<td></td>
</tr>
</tbody>
</table>

| “Type of element” | “Label” |

### Element property 'Texts'

The property requires a string that can contain a placeholder with a format definition. At runtime, the placeholder is replaced by the current value. Specify the actual value in the “Text variables” property.

This text is entered automatically into the `GlobalTextList` text list and can be localized there.

<table>
<thead>
<tr>
<th>“Text”</th>
<th>Character string (without single straight quotation marks)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: Main page %s</td>
<td></td>
</tr>
</tbody>
</table>

See also
- Chapter 1.3.5.18.2 “Placeholders with format definition in the output text” on page 1546

### Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

<table>
<thead>
<tr>
<th>“X”</th>
<th>X coordinate of the upper left corner of the element</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specified in pixels.</td>
<td></td>
</tr>
<tr>
<td>Example: 10.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Y”</th>
<th>Y coordinate of the upper left corner of the element</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specified in pixels.</td>
<td></td>
</tr>
<tr>
<td>Example: 10.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Width”</th>
<th>Specified in pixels.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: 150</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Height”</th>
<th>Specified in pixels.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: 30</td>
<td></td>
</tr>
</tbody>
</table>

You can also change the values by dragging the box symbols (_draging_box_symbol_ ) to other positions in the editor.

See also
- Chapter 1.3.5.3.2 “Positioning elements, adapting size and layer” on page 1113

### Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the __rotation_center_symbol_ symbol. The point is used as the center for rotating and scaling.
<table>
<thead>
<tr>
<th><strong>X</strong></th>
<th>X-coordinate of the point of rotation</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Y</strong></td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the symbols (_drag_ ) to other positions in the editor.

**Element property 'Text properties'**

<table>
<thead>
<tr>
<th><strong>Horizontal alignment</strong></th>
<th>Horizontal alignment of the text within the element.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Vertical alignment</strong></td>
<td>Vertical alignment of the text within the element.</td>
</tr>
<tr>
<td><strong>Text format</strong></td>
<td>Definition for displaying texts that are too long</td>
</tr>
<tr>
<td></td>
<td>● &quot;Default&quot;: The long text is truncated.</td>
</tr>
<tr>
<td></td>
<td>● &quot;Line break&quot;: The text is split into parts.</td>
</tr>
<tr>
<td></td>
<td>● &quot;Ellipsis&quot;: The visible text ends with &quot;...&quot; indicating that it is not complete.</td>
</tr>
</tbody>
</table>

**Font**

Example: "Default"

_drag_. The "Font" dialog box opens.  

▼: Drop-down list with style fonts.

**Font color**

Example: "Black"

_drag_. The "Color" dialog box opens.  

▼: Drop-down list with style colors.

**Transparency**

Whole number (value range from 0 to 255). This determines the transparency of the respective color.

Example: 255: The color is opaque.  
0: The color is completely transparent.  

Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

**Element property 'Absolute movement'**

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

<table>
<thead>
<tr>
<th><strong>Movement</strong></th>
<th></th>
</tr>
</thead>
</table>
| **X**        | Variable (numeric data type). Defines the X position (in pixels).  
|              | Example: PLC_PRG.iPos_X.  
|              | Increasing this value in runtime mode moves the element to the right. |
| **Y**        | Variable (numeric data type). Defines the Y position (in pixels).  
|              | Example: PLC_PRG.iPos_Y.  
|              | Increasing this value in runtime mode moves the element downwards. |
### "Rotation"

Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle1.

The midpoint of the element rotates at the "Center" point. This rotation point is shown as the symbol.

In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

### "Interior rotation"

Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in "Center" according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol.

Note: If a static angle of rotation is specified in the "Position Angle" property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

---

**You can link the variables to a unit conversion.**

**The "X", "Y", "Rotation", and "Interior rotation" properties are supported by the "Client Animation" functionality.**

---

**See also**

- **Unit conversion**

---

**Element property 'State variables'**

The variables control the element behavior dynamically.

<table>
<thead>
<tr>
<th>&quot;Invisible&quot;</th>
<th>Variable (BOOL). Toggles the visibility of the element.</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRUE: The element is not visible at runtime.</td>
<td></td>
</tr>
</tbody>
</table>

**The "Invisible" property is supported by the "Client Animation" functionality.**
These properties are available only when you select the “Preview: Support client animations and overlay of native elements” option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.

<table>
<thead>
<tr>
<th>“Animation duration”</th>
<th>Time that the element executes an animation (in milliseconds)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: 500</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Move to the foreground”</th>
<th>Property value (BOOL)</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRUE:</td>
<td>At runtime, the element is displayed in the foreground.</td>
</tr>
<tr>
<td>FALSE:</td>
<td>At runtime, the element is displayed in the layer where it was inserted in the visualization editor.</td>
</tr>
</tbody>
</table>

Visualization element ‘Combo box array’

Symbol:

Tag: “Common controls”

The element shows values of an array as a drop-down list. When the visualization user clicks an entry, the array index of the entry is written to an integer variable.
**Element name**

Optional

Hint: Assign individual names for elements so that they are found faster in the element list.

Example: `List_Product_Number`

**Type of element**

“Combo box array”

---

**Element property ’Position’**

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

| **“X”** | X coordinate of the upper left corner of the element
| Specified in pixels.
| Example: 10. |
| **“Y”** | Y coordinate of the upper left corner of the element
| Specified in pixels.
| Example: 10. |
| **“Width”** | Specified in pixels.
| Example: 150 |
| **“Height”** | Specified in pixels.
| Example: 30 |

You can also change the values by dragging the box symbols (redicate) to other positions in the editor.

See also

- [Chapter 1.3.5.3.2 “Positioning elements, adapting size and layer” on page 1113](#)

---

**Element property ’Center’**

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the (predicate) symbol. The point is used as the center for rotating and scaling.

| **“X”** | X-coordinate of the point of rotation |
| **“Y”** | Y-coordinate of the point of rotation |

You can also change the values by dragging the symbols (predicate) to other positions in the editor.
**“Variable”**

At runtime, saves the array index of the list entry that the user clicks.

Property value
- Variable (integer data type)
  
  **Example:** `PLC_PRG.iIndexComboboxEntry`

- Enumeration variable with text list support
  
  **Example:** `PLC_PRG.eMyCombobox<COMBO>`

  **Note:** Value range of the enumeration value that lies within the DWORD or DINT value range.

**“Data array”**

Displayed as combo box. Every array component becomes a combo box entry.

Property value
- Array variable (ARRAY[... ] OF)
  
  **Example:** `PLC_PRG.astrCombobox`

  **Declaration:**
  ```plaintext```
  ```plaintext```

See also
- Enumerations
- Chapter 1.3.5.6 “Setting up multiple languages” on page 1143

**Element property 'Columns'**

The “Combo box – Array” element visualizes an array variable or structure variable in a tabular view. The index of array elements or structure members is shown in a column or row. Two-dimensional arrays or structure arrays are shown in several columns. You specify the visualized variable in the “Data array” property. If a variable is assigned there, then you can specify the display of the table columns where the array elements are shown. You can customize each column that is assigned to an index [<n>].

**“Columns”**

- [<n>]

  **Due to the structure of the variable that is defined in “Data array”, CODESYS determines the number of columns and defines them with the index <n>.**

  **Example:**
  ```plaintext```
  StringTable : ARRAY [0..2, 0..4] OF STRING :=
  ['BMW','Audi','Mercedes','VW','Fiat',
   '150','150','150','150','100','blue','gray','silver','blue',
   'red'];: three columns are formed [0],[1] and [2].
  ```plaintext```

**“Max. array index”**

Optional. Variable (integer data type) or value. Defines up to which array index the data is displayed.

**“Row height”**

Height of the rows (in pixels).

**“Number visible rows”**

Optional. If the array is larger than the number of visible rows, then a scrollbar is included.

**“Scrollbar size”**

Width of the vertical scrollbar (in pixels).

**Table 349: “Element property 'Columns: Column [<n>]’”**

<table>
<thead>
<tr>
<th>“Width”</th>
<th>Column width (in pixels).</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Image column”</td>
<td>Images can be displayed in the column. Images are used from the global image pool or user-defined image pools. The image IDs are shown in the cells of the table as defined in the image pool.</td>
</tr>
<tr>
<td>“Image configuration”</td>
<td></td>
</tr>
</tbody>
</table>
### "Fill mode"
- **"Fill cell"**
  The image resizes to the dimensions of the cell without fixing the height/width ratio.
- **"Centered"**
  The image is centered in the cell and retains its proportions (height-width ratio).

### "Transparency"
- : The color that is specified in "Transparent color" is displayed as transparent.

### "Transparent color"
When the "Transparent" property is enabled, the color specified here is not displayed. Pixels with this color are transparent.

### "Text alignment in column"
- **"Left"**
- **"Centered"**
- **"Right"**

### Element property 'Texts'  

<table>
<thead>
<tr>
<th>&quot;Tooltip&quot;</th>
<th>Character string (without single straight quotation marks) that is displayed as the tooltip of an element in runtime mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Products of customer A</td>
</tr>
<tr>
<td>Hint:</td>
<td>The text is accepted automatically into the &quot;GlobalTextList&quot; text list and can be localized there.</td>
</tr>
</tbody>
</table>

See also
- 

### Element property 'Text properties'  

The properties contain fixed values for the text properties.

| "Usage of" |  
|-------------|------------------------------------------------------------------------------------------------------------------|
| - **"Default style values"**: The values of the visualization style are used.  
- **"Individual settings"**: The "Individual text properties" property group is shown |
| The values can be customized here. |

<table>
<thead>
<tr>
<th>&quot;Individual text properties&quot;</th>
</tr>
</thead>
<tbody>
<tr>
<td>Requirement: The &quot;Individual settings&quot; text property is defined.</td>
</tr>
</tbody>
</table>

| "Font" | 
|--------|--------------------------------------------------|
| Example: "Default" |
| : The "Font" dialog box opens. |
| : Drop-down list with style fonts. |

| "Font color" | 
|-------------|--------------------------------------------------|
| Example: "Black" |
| : The "Color" dialog box opens. |
| : Drop-down list with style colors. |

| "Transparency" | 
|----------------|--------------------------------------------------|
| Whole number (value range from 0 to 255). This determines the transparency of the respective color. |
| Example: 255: The color is opaque. |
| 0: The color is completely transparent. |
| Please note: If the color is a style color and already has a transparency value, then this property is write-protected. |
The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

### "Movement"

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>X</strong></td>
<td>Variable (numeric data type). Defines the X position (in pixels). Increasing this value in runtime mode moves the element to the right.</td>
<td>PLC_PRG.iPos_X</td>
</tr>
<tr>
<td><strong>Y</strong></td>
<td>Variable (numeric data type). Defines the Y position (in pixels). Increasing this value in runtime mode moves the element downwards.</td>
<td>PLC_PRG.iPos_Y</td>
</tr>
</tbody>
</table>

### "Rotation" Variable (numeric data type). Defines the angle of rotation (in degrees). The midpoint of the element rotates at the "Center" point. This rotation point is shown as the symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

### "Interior rotation" Variable (numeric data type). Defines the angle of rotation (in degrees). In runtime mode, the element rotates about the point of rotation specified in "Center" according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the symbol.

Note: If a static angle of rotation is specified in the "Position ➔ Angle" property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

You can link the variables to a unit conversion.

The "X", "Y", "Rotation", and "Interior rotation" properties are supported by the "Client Animation" functionality.
The variables control the element behavior dynamically.

<table>
<thead>
<tr>
<th><strong>“Invisible”</strong></th>
<th>Variable (BOOL). Toggles the visibility of the element. TRUE: The element is not visible at runtime.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Deactivate inputs”</strong></td>
<td>Variable (BOOL). Toggles the operability of the element. TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated.</td>
</tr>
</tbody>
</table>

The “Invisible” property is supported by the “Client Animation” functionality.

These properties are available only when you select the “Preview: Support client animations and overlay of native elements” option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.

<table>
<thead>
<tr>
<th><strong>“Animation duration”</strong></th>
<th>Time that the element executes an animation (in milliseconds) Example: 500</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Move to the foreground”</strong></td>
<td>Property value (BOOL) TRUE: At runtime, the element is displayed in the foreground. FALSE: At runtime, the element is displayed in the layer where it was inserted in the visualization editor.</td>
</tr>
</tbody>
</table>

Visualization element ‘Combo box integer’

Symbol:

Tag: “Common controls”
The element shows values as a drop-down list. When the user clicks an entry, the ID of the entry is written to an integer variable. The entries in the drop-down list can be from a list and contain images from an image pool.

**Element properties**

<table>
<thead>
<tr>
<th>“Element name”</th>
<th>Example: List of product numbers</th>
</tr>
</thead>
<tbody>
<tr>
<td>Optional</td>
<td>Hint: Assign individual names for elements so that they are found faster in the element list.</td>
</tr>
</tbody>
</table>

| “Type of element” | “Combo box integer” |

**Element property 'Position'**

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

<table>
<thead>
<tr>
<th>“X”</th>
<th>X coordinate of the upper left corner of the element</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Specified in pixels.</td>
</tr>
<tr>
<td></td>
<td>Example: 10.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Y”</th>
<th>Y coordinate of the upper left corner of the element</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Specified in pixels.</td>
</tr>
<tr>
<td></td>
<td>Example: 10.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Width”</th>
<th>Specified in pixels.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Example: 150</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Height”</th>
<th>Specified in pixels.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Example: 30</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the box symbols ((strcmp)) to other positions in the editor.

See also

- Chapter 1.3.5.3.2 “Positioning elements, adapting size and layer” on page 1113

**Element property 'Center’**

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

<table>
<thead>
<tr>
<th>“X”</th>
<th>X-coordinate of the point of rotation</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Y”</th>
<th>Y-coordinate of the point of rotation</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

You can also change the values by dragging the symbols (strcmp) to other positions in the editor.
At runtime, saves the text list ID of the list entry that the user clicks if only one image pool is displayed, then the image ID is saved.

**Property value**
- Variable (integer data type)
  - Example: `PLC_PRG.iIDComboboxEntry`
- Enumeration variable with text list support
  - Example: `PLC_PRG.eMyCombobox<COMBO>`

**Text list**
Displayed as combo box. Every text list entry becomes a combo box entry.

**Transfer value**
- Text list identifier as string
  - Example: 'TextList_A'
  - Note: The IDs of the text list must be lie within the value range of DWORD or DINT.
- Empty
  - When an enumeration variable with text list support is specified in the "Variable" property
  - When only one image pool is visualized

**Image pool**
Displayed as combo box. Every image in the image pool becomes a combo box entry.

Example: 'ImagePool_A'

<td>• &quot;From style&quot;:&lt;br&gt;• Literal&lt;br&gt;Example: 20</td>
</tr>
<tr>
<td>&quot;Height of image&quot;</td>
<td>Image height (in pixels) of the image displayed in the drop-down list entry</td>
</tr>
<tr>
<td></td>
<td>• &quot;From style&quot;:&lt;br&gt;• Integer literal&lt;br&gt;Example: 30</td>
</tr>
<tr>
<td></td>
<td>Note: Images are displayed only when a value is specified in the &quot;Image pool&quot; property.</td>
</tr>
</tbody>
</table>
### "Width of image"

Image width (in pixels) of the image displayed in the drop-down list entry

- **From style**:  
  - Literal  
    - Example: 30

Note: Images are displayed only when a value is specified in the "Image pool" property.

### "Offset of image"

Makes the images in the selection list appear offset (in pixels) from the left margin. An offset of 0 means that the images are displayed directly on the margin.

- **From style**:  
  - Literal  
    - Example: 4

Note: Images are displayed only when a value is specified in the "Image pool" property.

### "Scrollbar size"

Size of the scrollbar (in pixels). The scrollbar is displayed when more entries are specified in the drop-down list than in "Number of visible rows".

Default: 20

### Element property 'Texts'

#### "Tooltip"

Character string (without single straight quotation marks) that is displayed as the tooltip of an element in runtime mode

**Example**: Products of customer A

**Hint**: The text is accepted automatically into the "GlobalTextList" text list and can be localized there.

### Element property 'Value range'

#### "Limit valuerange"

Limits the text list to one subrange. This subrange is displayed by the combo box.

Requirement: A value is specified in the "Text list" property.

☑: Only the subrange that is defined by the "Minimum value" and "Maximum value" properties is displayed as a drop-down list.

#### "Minimum value"

ID of the text list entry from which a combo box entry is displayed

- **Literal** (ANY_NUM)  
  - Example: 5
- **Variable** (integer data type)  
  - Example: PLC_PRG.iFirstEntry
<table>
<thead>
<tr>

</tr>
</thead>
<tbody>
<tr>
<td><strong>Usage of</strong></td>
<td>• <strong>Default style values</strong>: The values of the visualization style are used.&lt;br&gt;• <strong>Individual settings</strong>: The &quot;Individual text properties&quot; property group is shown&lt;br&gt;The values can be customized here.</td>
</tr>
<tr>
<td><strong>Individual text properties</strong></td>
<td>Requirement: The &quot;Individual settings&quot; text property is defined.</td>
</tr>
<tr>
<td><strong>Horizontal alignment</strong></td>
<td>Horizontal alignment of the text within the element.</td>
</tr>
<tr>
<td><strong>Vertical alignment</strong></td>
<td>Vertical alignment of the text within the element.</td>
</tr>
<tr>
<td><strong>Font</strong></td>
<td>Example: &quot;Default&quot;&lt;br&gt;➡️: The &quot;Font&quot; dialog box opens.&lt;br&gt;▼: Drop-down list with style fonts.</td>
</tr>
<tr>
<td><strong>Font color</strong></td>
<td>Example: &quot;Black&quot;&lt;br&gt;➡️: The &quot;Color&quot; dialog box opens.&lt;br&gt;▼: Drop-down list with style colors.</td>
</tr>
<tr>
<td><strong>Transparency</strong></td>
<td>Whole number (value range from 0 to 255). This determines the transparency of the respective color.&lt;br&gt;Example: 255: The color is opaque.&lt;br&gt;0: The color is completely transparent.&lt;br&gt;Please note: If the color is a style color and already has a transparency value, then this property is write-protected.</td>
</tr>
</tbody>
</table>

**Element property 'Absolute movement'**<br>The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Movement</strong></td>
<td></td>
</tr>
<tr>
<td><strong>X</strong></td>
<td>Variable (numeric data type). Defines the X position (in pixels).&lt;br&gt;Example: PLC_PRG.iPos_X.&lt;br&gt;Increasing this value in runtime mode moves the element to the right.</td>
</tr>
<tr>
<td><strong>Y</strong></td>
<td>Variable (numeric data type). Defines the Y position (in pixels).&lt;br&gt;Example: PLC_PRG.iPos_Y.&lt;br&gt;Increasing this value in runtime mode moves the element downwards.</td>
</tr>
</tbody>
</table>
### “Rotation”

Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle1.

The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.

In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

### “Interior rotation”

Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol.

Note: If a static angle of rotation is specified in the “Position → Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

---

**You can link the variables to a unit conversion.**

**The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.**

---

### “Invisible”

Variable (BOOL). Toggles the visibility of the element.

**TRUE:** The element is not visible at runtime.

### “Deactivate inputs”

Variable (BOOL). Toggles the operability of the element.

**TRUE:** User inputs do not have any effect in runtime more. The element is shown as deactivated.

---

Element property ‘State variables’

The variables control the element behavior dynamically.
The “Invisible” property is supported by the “Client Animation” functionality.

●

Element property 'Scrollbar settings'

The properties include variables for the position of the scroll boxes in the scrollbars. You can process the data for the scroll box position in the application.
Requirement: The “Scaling type” property is “Fixed and scrollable”.

| “Scroll position variable horizontal” | Variable (integer data type, also array). Includes the position of the horizontal or vertical scroll box. The array contains the position for each display variant. If the visualization is running on multiple display variants, then the position changes are disconnected from each other. Example: 
PLC_PRG.iScrollHor[CURRENTCLIENTID] 
PLC_PRG.iScrollVer[CURRENTCLIENTID] 
In this example, the variable is declared as an array: 
iScrollHor: ARRAY[0..20] OF INT; 
iScrollVer: ARRAY[0..20] OF INT; 
CURRENTCLIENTID indicates the current display variant. |
| “Scroll position variable, vertical” |

Element property 'References’

| “References” | Clicking “Configure” opens the “Frame Configuration” dialog. You can select an existing visualization there. Selected visualization references are shown in the properties. Selected visualization references are listed here as subordinate properties. |
| Name pf the visualization reference (example: PLC_PRG.S1) |
| “Heading” | Tab caption (example: Panel) |
| “Image ID” | Image ID in the theme <image pool name>.<ID> Example: Imagepool_A.1 for the image with ID 1 in Imagepool_A |

Interface parameter of the visualization reference Example: iX If the visualization has an interface, then their parameters are displayed here as subordinate properties. Variable (data type conforms to data type of the interface parameter). Includes the initialization value for the instantiation of the visualization.

Element property 'Position’ The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.
**"X"** | X coordinate of the upper left corner of the element  
Specified in pixels.  
Example: 10.

| **"Y"** | Y coordinate of the upper left corner of the element  
Specified in pixels.  
Example: 10.

| **"Width"** | Specified in pixels.  
Example: 150

| **"Height"** | Specified in pixels.  
Example: 30

---

General Information: You can also change the values by dragging the box symbols (_drag_ ) to other positions in the editor.

See also
- Chapter 1.3.5.3.2 “Positioning elements, adapting size and layer” on page 1113

**Element property 'Center'**

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the _rotation_ symbol. The point is used as the center for rotating and scaling.

| **"X"** | X-coordinate of the point of rotation

| **"Y"** | Y-coordinate of the point of rotation

---

General Information: You can also change the values by dragging the symbols (_rotation_ ) to other positions in the editor.

**Element property 'Switch frame variable'**

| **"Variable"** | Variable (integer data type). Specifies the index of the active visualization.  
Example: PLC_PRG.uiActiveVisuID.  
Tip: The “Frame Configuration” dialog box includes a list of selected visualizations. The visualizations are ordered automatically in numeric order in the list.

**Element property 'Image’**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Static ID”</td>
<td>Reference to an image in an image pool of the format &lt;name of image pool&gt; &lt;image ID&gt; (example: image_pool.GreenButton). If the image is from the “GlobalImagePool”, then you can omit the name of the image pool because CODESYS always searches this pool first. ![ ]: The “Input Assistant” dialog box opens and lists all available image pools and images in the entire project.</td>
</tr>
<tr>
<td>“Scale type”</td>
<td>Behavior of the image when resizing the button.</td>
</tr>
</tbody>
</table>
|             | - “Isotropic”: The image retains its proportions. The ratio of height to width is retained, even if you change the height or width of the button separately.  
|             | - “Anisotropic”: The image resizes to the dimensions of the button.                                                                        
|             | - “Fixed”: The image retains its original size, even if you change the size of the button.                                                |
| “Transparency”| The visualization displays the image with the transparency color that is selected in “Transparency color”.                                           |
| “Transparency color”| Color that is transparent in the image (example: “White”). If the image background that is reference by “Static ID” is white, then this background is displayed transparent. Clicking ![ ] opens a color selection dialog. Requirement: The “Transparency” option is activated. |
| “Horizontal alignment”| Horizontal alignment of the image                                                                                                        |
|             | - “Left”  
|             | - “Centered”  
|             | - “Right” |
| “Vertical alignment”| Vertical alignment of the image                                                                                                           |
|             | - “Top”  
|             | - “Centered”  
|             | - “Bottom” |

**Element property 'Texts’**

The properties contains character strings for labeling the element. The character string can also contain a placeholder with a format definition. In runtime mode, the placeholder is replaced by the current value in the specified format.
CODESYS accepts the specified texts automatically into the “GlobalTextList” text list. Therefore, these texts can be localized.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Text”</td>
<td>Character string (without single straight quotation marks) for the labeling the element. Add a line break by pressing the keyboard shortcut [Ctrl] + [Enter]. Example: Accesses: %i The variable that contains the current value for the placeholder is specified in the property “Text variable ➤ Text”.</td>
</tr>
<tr>
<td>“Tooltip”</td>
<td>Character string (without single straight quotation marks) that is displayed as the tooltip of an element. Example: Number of valid accesses. The variable that contains the current value for the placeholder is specified in the property “Text variable ➤ Tooltip”.</td>
</tr>
</tbody>
</table>

See also
- “Element property Text variables” on page 1229

**Element property ‘Text variables’**

These properties are variables with contents that replace a format definition.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Text variable”</td>
<td>Variable (data type compliant with the format definition). It contains what is printed instead of the format definition.</td>
<td>PLC_PRG.iAccesses</td>
</tr>
<tr>
<td></td>
<td>Note: The format definition is part of the text in the property “Texts ➔ Text”.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Note: If you specify a variable of type enumeration with text list support, then the name of the enumeration data type is added automatically in angle brackets after the variable name. Example: PLC_PRG.enVar &lt;enumeration name&gt;. Then the symbolic value of the enumeration component is printed instead of the numeric value when text is printed. Refer to the help page for the enumerations.</td>
<td></td>
</tr>
<tr>
<td>“Tooltip variable”</td>
<td>Variable (data type compliant with the format definition). It contains what is printed instead of the format definition.</td>
<td>PLC_PRG.iAccessesInTooltip</td>
</tr>
<tr>
<td></td>
<td>Note: The format definition is part of the text in the property “Texts ➔ Tooltip”.</td>
<td></td>
</tr>
</tbody>
</table>

- Enumerations

**Element property ‘Dynamic texts’**

Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.
| **“Text list”** | Variable (string) or name of the text list as a fixed string in single straight quotation marks.  
Example: 'Errorlist'  
▼: Drop-down list with the dialogs available in the text lists. |
| **“Text index”** | Text list ID. This refers to the desired output text.  
- As fixed string with the ID in single straight quotation marks.  
  Example: '1'  
- As a variable (STRING) for dynamically controlling the text output.  
  Example: strTextID  
  Sample assignment: PLC_PRG.strTextID := '1'; |
| **“Tooltip index”** | Text list ID. This refers to the desired output text.  
- As fixed string with the ID in single straight quotation marks.  
  Example: '2'  
- As a variable (STRING) for dynamically controlling the text output.  
  Example: strToolTipID  
  Sample assignment: PLC_PRG.strToolTipID := '2'; |

See also  
- *Text list*

**Element property "Font variables"**  
The variables allow for dynamic control of the text display.

| **“Font name”** | Variable (STRING). Includes the font of the text.  
Example: PLC_PRG.stFontVar := 'Arial';  
The selection of fonts corresponds to the default “Font” dialog. |
| **“Size”** | Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name.  
- <pt>: Points (default)  
  Example: PLC_PRG.iFontHeight <pt>  
  Code: iFontHeight : INT := 12;  
- <px>: Pixels  
  Example: PLC_PRG.iFontHeight <px>  
  Code: iFontHeight : INT := 19; |

If you click in the value field, a drop-down list opens on the right for setting the unit.  

Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property “Text property ➔ Font”.

---

2020/12/10

3ADR010583, 1, en_US
### Flags
Variable (DWORD). Contains the flags for displaying fonts.

Flags:
- 1: Italics
- 2: Bold
- 4: Underline
- 8: Strikethrough

Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: `PLC_PRG.dwFontType := 6;`  

### Character set
Variable (DWORD). Contains a character set number for the font.

The selection of character set numbers corresponds to the “Script” setting of the standard “Font” dialog.

### Color
Variable (DWORD). Includes the color of the text.

Example: `PLC_PRG.dwColorFont := 16#FF000000;`

### Flags for text alignment
Variable (integer data type). Contains the coding for text alignment.

Example: `PLC_PRG.dwTextAlignment.`  

Coding:
- 0: Top left
- 1: Horizontal center
- 2: Right
- 4: Vertical center
- 8: Bottom

Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: `PLC_PRG.dwFontType := 5;`  

---

Fixed values for displaying texts are set in “Text properties”.

See also
- ☰ “Element property ‘Text properties’” on page 1227

**Element property ‘Colorvariables’**
The Element property is used as an interface for project variables to dynamically control colors at runtime.
### “Toggle color”

The property controls the toggled color at runtime.

#### Value assignment:
- **FALSE**: The element is displayed with the color specified in the “Color” property.
- **TRUE**: The element is displayed with the color specified in the “Alarm color” property.

#### Assigning the property:
- Placeholder for the user input variable
  - “<toggle/tap variable>”
  - “<NOT toggle/tap variable>”

  The color change is not controlled by its own variable, but by a user input variable.
  
  Note: Specify a variable for the mouse events “Tap” or “Toggle” in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both “Toggle” and “Tap”, then the variable specified in “Tap” is used.

  Hint: Click the symbol to insert the placeholder “<toggle/tap variable>”. When you activate the “Inputconfiguration”, “Tap FALSE” property, then the “<NOT toggle/tap variable>” placeholder is displayed.

- Instance path of a project variable (BOOL)
  
  Example: PLC_PRG.xColorIsToggeled
  
  Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.

### “Color”

Color variable for the frame

- **Variable (DWORD)** for the color
  
  Example: PLC_PRG.dwColor

- Color literal
  
  Example of gray and opaque: 16#FF888888

**Requirement:** “Show frame” property is activated.

Please note that the normal state is in effect if the expression in the “Colorvariables ➔ Toggle color” property is not defined or it has the value FALSE.

### “Alarm color”

Color variable for the frame in alarm state

- **Variable (DWORD)** for the alarm color
  
  Example: PLC_PRG.dwAlarmColor

- Color literal
  
  Example of red and opaque: 16#FFFF0000

Please note that the alarm state is in effect if the expression in the “Colorvariables ➔ Toggle color” property has the value TRUE.

---

**The transparency part of the color value is evaluated only if the “Activate semi-transparent drawing” option of the visualization manager is selected.**

**Select the “Advanced” option in the toolbar of the properties view. Then all element properties are visible.**
**Element property 'State variables'**

The variables control the element behavior dynamically.

<table>
<thead>
<tr>
<th>“Invisible”</th>
<th>Variable (BOOL). Toggles the visibility of the element.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>TRUE: The element is not visible at runtime.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Deactivate inputs”</th>
<th>Variable (BOOL). Toggles the operability of the element.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated.</td>
</tr>
</tbody>
</table>

The “Invisible” property is supported by the "Client Animation" functionality.

**Element property 'Button state variable'**

At runtime, the property controls whether the button is displayed as pressed or not.

**Values:**

- FALSE: The button is displayed as not pressed.
- TRUE: The button is displayed as pressed.

**Argument passed to the property:**

- Placeholder for the user input variable to couple the representation of the button with the input variable.
  - "<toggle/tap variable>"
  - "<NOT toggle/tap variable>"

  Note: Specify a variable for the mouse events “Tap” or “Toggle” in the input configuration of the button. Only then is the placeholder set. If you configure a variable in both “Toggle” and “Tap”, then the variable specified in “Tap” is used.

  Hint: Click the symbol ![insert symbol] to insert the placeholder “<toggle/tap variable>”. When you activate the “Inputconfiguration”, “Tap FALSE” property, then the “<NOT toggle/tap variable>” placeholder is displayed.

- Instance path of a project variable (BOOL) Example: prgA.xButtonState

  Note: Implement a value assignment in the code for the variable specified here.
Element property 'Image ID variable'

<table>
<thead>
<tr>
<th>&quot;Image ID&quot;</th>
<th>Variable (STRING). Contains the image ID. The contents of the string correspond to the description of the &quot;Static ID&quot; property.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Example: PLC_PRG.stImageID := 'ImagePool_A.Image3';</td>
</tr>
</tbody>
</table>

See also

- § Object 'Image Pool'

These properties are available only when you select the “Preview: Support client animations and overlay of native elements” option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.

<table>
<thead>
<tr>
<th>&quot;Animation duration&quot;</th>
<th>Time that the element executes an animation (in milliseconds)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Example: 500</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>&quot;Move to the foreground&quot;</th>
<th>Property value (BOOL)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>TRUE: At runtime, the element is displayed in the foreground.</td>
</tr>
<tr>
<td></td>
<td>FALSE: At runtime, the element is displayed in the layer where it was inserted in the visualization editor.</td>
</tr>
</tbody>
</table>

See also

- § Chapter 1.3.5.21.5 “Using client animation” on page 1962

Element property 'Input configuration'

The properties contain the configurations for the user input when using the mouse or keyboard. A user input defines an event and one or more actions that are executed when an event occurs.

The “Configure” button opens the “Input configuration” dialog box for creating or modifying a user input.

Configured user inputs are briefly listed below the events. They each include the action that is triggered and the setting in short form.

Example: "Execute ST code": PLC_PRG.i_x := 0;

| "OnDialogClosed" | Input event: The user closes the dialog box. |
| "OnMouseClick"   | Input event: The user clicks the mouse button completely. The mouse button is clicked and released. |
| "OnMouseDown"    | Input event: The user clicks down on the mouse button. |
| "OnMouseEnter"   | Input event: The user drags the mouse pointer to the element. |
| "OnMouseLeave"   | Input event: The user drags the mouse pointer away from the element. |
| "OnMouseMove"    | Input event: The user moves the mouse pointer over the element area. |
| "OnMouseUp"      | Input event: The user releases the mouse button over the element area. |
**“Tap”**

When a mouse click event occurs, the variable defined in “Variable” is described in the application. The coding depends on the options “Tap FALSE” and “Tap on enter if captured”.

**“Variable”**

Variable (BOOL) that is set on mouse click.

Example: PLC_PRG.bIsTapped

TRUE: A mouse click event exists. It lasts while the user presses the mouse button over the element. It ends when the button is released.

FALSE: A mouse click event does not exist.

Requirement: The “Tap FALSE” option is not activated.

**“Tap FALSE”**

☑️: The mouse click event leads to a complementary value in “Variable”.

TRUE: A mouse click event does not exist.

FALSE: While the mouse click event exists.

**“Tap on enter if captured”**

☑️: During user input, it is also taken into consideration whether the mouse pointer is dragged within the element area or not while the mouse button is pressed.

TRUE: While the mouse click event exists and the mouse pointer is moved over the element area.

FALSE: A mouse click event does not exist. Or the user moves the mouse pointer outside of the element area while the mouse button is pressed.

The value is TRUE again as soon as the user moves the pointer back to the element area. The mouse is then captured.

**“Shift”**

With the onset of a mouse click event, the variable is set; when the mouse click event is completed, the variable is reset.

**“Variable”**

Variable (BOOL). Its value toggled when the mouse click event is ended. This is when the user releases the mouse button while the mouse pointer is over the element area.

If the user releases the mouse button while the mouse pointer is outside of the element area, then the mouse click event is not ended and the value is not toggled.

Tip: The user can cancel a started toggle input by dragging the mouse pointer out of the element area.

**“Toggle on up if captured”**

☑️: The value toggles regardless of where the mouse pointer is when the mouse button is released. The mouse is then captured.

**“Keyboard shortcuts”**

Keyboard shortcut on the element for triggering specific input actions.

When the keyboard shortcut event occurs, the input actions in the “Event(s)” property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.

**“Key”**

Key pressed for input action.

Example: [T]

Note: The following properties appear when a key is selected.
### Event(s)
- "None"
- "Mouse down": Pressing the key triggers the input actions that are configured in the "OnMouseDown" property.
- "Mouse up": Releasing the key triggers the input actions that are configured in the "OnMouseUp" property.
- "Mouse down/up": Pressing and releasing the key triggers the input actions that are configured in the "OnMouseDown" property and the "OnMouseUp" property.

### Shift
- Combination with the Shift key
- Example: [Shift]+[T].

### Control
- Combination with the Ctrl key
- Example: [Ctrl]+[T].

### Alt
- Combination with the Alt key
- Example: [Alt]+[T].

All keyboard shortcuts and their actions that are configured in the visualization are listed in the "Keyboard configuration" tab.

### Access rights
Requirement: User management is set up for the visualization.

- Opens the "Access rights" dialog. There you can edit the access privileges for the element.

<table>
<thead>
<tr>
<th>Access rights</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status messages:</td>
</tr>
<tr>
<td>- &quot;Not set. Full rights.&quot;: Access rights for all user groups: &quot;operable&quot;</td>
</tr>
<tr>
<td>- &quot;Rights are set: Limited rights&quot;: Access is restricted for at least one group.</td>
</tr>
</tbody>
</table>

- Chapter 1.3.5.19.3.6 “Dialog ‘Input Configuration’” on page 1586

### Visualization element ‘Group box’
Symbol:

Tag: “Common controls”
The element provides visual grouping of visualization elements. The group box can be nested many times.
You can also use drag & drop to add elements to a group box. To do this, simply drag the element to the group box. The appearance of the cursor changes (a small plus sign is shown). When you click the [Shift] key at the same time, the element is not added.

You can remove elements from the group box by dragging them out of the group box.

Element properties

<table>
<thead>
<tr>
<th>“Element name”</th>
<th>Example: Parameter axis 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Optional</td>
<td></td>
</tr>
<tr>
<td>Hint: Assign individual names for elements so that they are found faster in the element list.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Type of element”</th>
<th>“Group box”</th>
</tr>
</thead>
</table>

| “Clipping” | Elements are clipped that protrude beyond the size of the group box. |

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

<table>
<thead>
<tr>
<th>“X”</th>
<th>X coordinate of the upper left corner of the element</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Specified in pixels.</td>
</tr>
<tr>
<td></td>
<td>Example: 10.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Y”</th>
<th>Y coordinate of the upper left corner of the element</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Specified in pixels.</td>
</tr>
<tr>
<td></td>
<td>Example: 10.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Width”</th>
<th>Specified in pixels.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Example: 150</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Height”</th>
<th>Specified in pixels.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Example: 30</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the box symbols (_drag_ ) to other positions in the editor.

See also

- Chapter 1.3.5.3.2 “Positioning elements, adapting size and layer” on page 1113

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the _center_ symbol. The point is used as the center for rotating and scaling.
The properties contain character strings for labeling the element.

CODESYS accepts the specified texts automatically into the "GlobalTextList" text list. Therefore, these texts can be localized.

<table>
<thead>
<tr>
<th>Text</th>
<th>Character string (without single straight quotation marks) for the labeling the element. Example: Axis 1.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tooltip</td>
<td>Character string (without single straight quotation marks) that is displayed as the tooltip of an element. Example: Parameters of Axis 1.</td>
</tr>
</tbody>
</table>

See also

The properties contain fixed values for the text properties.

<table>
<thead>
<tr>
<th>Font</th>
<th>Example: &quot;Default&quot;</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>☐: The &quot;Font&quot; dialog box opens.</td>
</tr>
<tr>
<td></td>
<td>▼: Drop-down list with style fonts.</td>
</tr>
<tr>
<td>Font color</td>
<td>Example: &quot;Black&quot;</td>
</tr>
<tr>
<td></td>
<td>☐: The &quot;Color&quot; dialog box opens.</td>
</tr>
<tr>
<td></td>
<td>▼: Drop-down list with style colors.</td>
</tr>
<tr>
<td>Transparency</td>
<td>Whole number (value range from 0 to 255). This determines the transparency of the respective color. Example: 255: The color is opaque. 0: The color is completely transparent. Please note: If the color is a style color and already has a transparency value, then this property is write-protected.</td>
</tr>
</tbody>
</table>

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
### Movement

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
<th>Example</th>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>X</strong></td>
<td>Variable (numeric data type). Defines the X position (in pixels).</td>
<td>PLC_PRG.iPos_X</td>
<td>Increasing this value in runtime mode moves the element to the right.</td>
</tr>
<tr>
<td><strong>Y</strong></td>
<td>Variable (numeric data type). Defines the Y position (in pixels).</td>
<td>PLC_PRG.iPos_Y</td>
<td>Increasing this value in runtime mode moves the element downwards.</td>
</tr>
</tbody>
</table>

### Rotation

Variable (numeric data type). Defines the angle of rotation (in degrees).

Example: PLC_PRG.iAngle1.

The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.

In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

### Scaling

Variable (integer data type). Causes centric stretching.

Example: PLC_PRG.iScaling.

The reference point is the “Center” property.

The value 1 shrinks the element by a factor of 0.001. The value 1000 returns the element to its original size.

### Interior rotation

Variable (numeric data type). Defines the angle of rotation (in degrees).

Example: PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol.

Note: If a static angle of rotation is specified in the property “Position ➔ Angle”, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

You can link the variables to a unit conversion.

The properties “X”, “Y”, “Rotation”, and “Interior rotation” are supported by the “Client Animation” functionality.
### Element property 'State variables'

The variables control the element behavior dynamically.

<table>
<thead>
<tr>
<th>Variable Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Invisible”</td>
<td>Variable (BOOL). Toggles the visibility of the element. TRUE: The element is not visible at runtime.</td>
</tr>
<tr>
<td>“Deactivate inputs”</td>
<td>Variable (BOOL). Toggles the operability of the element. TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated.</td>
</tr>
</tbody>
</table>

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you select the “Preview: Support client animations and overlay of native elements” option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Animation duration”</td>
<td>Time that the element executes an animation (in milliseconds) Example: 500</td>
</tr>
<tr>
<td>“Move to the foreground”</td>
<td>Property value (BOOL) TRUE: At runtime, the element is displayed in the foreground. FALSE: At runtime, the element is displayed in the layer where it was inserted in the visualization editor.</td>
</tr>
</tbody>
</table>

See also
- Chapter 1.3.5.21.5 “Using client animation” on page 1962

### Visualization element 'Table'

Symbol:

Tag: “Common controls”
The element displays data that can be represented as an array in a table. Therefore, the data type of the visualizing variable can be 1) a one-dimensional array, 2) a maximum two-dimensional array, 3) an array of an array, 4) an array of structures, or 5) an array of a function block.

**Element properties**

<table>
<thead>
<tr>
<th>“Element name”</th>
<th>Example: Data set component 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Optional</td>
<td>Hint: Assign individual names for elements so that they are found faster in the element list.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Type of element”</th>
<th>Table</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>“Data array”</th>
<th>Array whose data is visualized as a table</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable (ARRAY) whose data type determines the number of columns and rows in the table</td>
<td></td>
</tr>
<tr>
<td>Array types</td>
<td></td>
</tr>
<tr>
<td>● One-dimensional array: The table has one column.</td>
<td></td>
</tr>
<tr>
<td>● Two-dimensional array: The second dimension determines the number of columns.</td>
<td></td>
</tr>
<tr>
<td>● Array of an array: The number of array elements of the back array determines the number of columns.</td>
<td></td>
</tr>
<tr>
<td>● Array of a structure: The number of structure members determines the number of columns.</td>
<td></td>
</tr>
<tr>
<td>● Array of a function block: The number of local variables determines the number of columns.</td>
<td></td>
</tr>
<tr>
<td>Example: PLC_PRG.aiTable</td>
<td></td>
</tr>
<tr>
<td>Declaration: aiTable : ARRAY[0..3, 0..4] OF INT := [4(1, 2, 3, 4, 5)];</td>
<td></td>
</tr>
<tr>
<td>Hint: If the declaration of the array changes, then the table can be refreshed by placing the cursor in the data array value field and pressing the [Enter] key.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Max. array index”</th>
<th>Top index limit for the displayed table. Limits the number of displayed rows. The index begins at 0.</th>
</tr>
</thead>
<tbody>
<tr>
<td>● Variable (integer data type)</td>
<td></td>
</tr>
<tr>
<td>Example: PLC_PRG.iUpperIndexBoundToDisplay</td>
<td></td>
</tr>
<tr>
<td>● Integer literal</td>
<td></td>
</tr>
<tr>
<td>Example: 4 is displayed as 5 in the row of the table.</td>
<td></td>
</tr>
</tbody>
</table>

See also

- Data Type ‘ARRAY’

**Element property 'Columns'**
The table element shows the values of a variable in a tabular view. The array elements of structure members are shown in a column or in a row. Two-dimensional arrays or arrays of a structure are shown in multiple columns. The visualized variable is defined in the “Data array” property. When a variable is assigned there, you can specify the display of the table columns where the array elements are shown. An individual configuration is possible for each column that is assigned to an index [<n>].

<table>
<thead>
<tr>
<th>“Show row header”</th>
<th>☑: The row header is visible.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: For an array, the index of the array element is displayed in the header.</td>
<td></td>
</tr>
</tbody>
</table>

| “Show column header” | ☑: The column label is visible. |
Table 350: “Element property 'Columns: Column [<n>]’”

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Column header”</td>
<td>By default, the name of the array or structure is applied as the heading with the index or structure member for the column. If an array of a function block has been selected for “Data array”, then the name of the array is applied to the column header with the local variables of the function block that belong to the column. The column label can be changed here by specifying a new title.</td>
</tr>
<tr>
<td>“Width”</td>
<td>Column width (in pixels)</td>
</tr>
<tr>
<td>“Image column”</td>
<td>Images can be displayed in the column. Images are used from the global image pool or custom image pools. The image IDs are shown in the cells of the table as they are defined in the image pool.</td>
</tr>
<tr>
<td>“Image configuration”</td>
<td></td>
</tr>
</tbody>
</table>
| “Fill mode”                    |  ● Fill cell: The image resizes to the dimensions of the cell without fixing the height/width ratio.  
  ● Centered: The image is centered in the cell and retains its proportions (height/width ratio).                                      |
| “Transparency”                 |  [✓]: The color which is specified in “Transparent color” is displayed as transparent.                                                           |
| “Transparent color”            | This color is displayed as transparent. Requirement: The “Transparency” property is activated.                                                |
| “Text alignment of header”     | Alignment of the column header:  
  ● Left  
  ● Centered  
  ● Right                                                                                                                                  |
| “Use template”                 |  [✓]: Another visualization element (type “Rectangle”, “Round rectangle”, or “Ellipse”) is inserted into each line of this table column. The properties list is extended automatically with the properties of this element in “Template”. |
| “Text alignment of the headline from the template” | Requirement: The “Use template” property is activated.  
  [✓]: When activated, the settings for font (size) and alignment in the inserted template are also applied to the column header. |
| “Template”                     | Requirement: The “Use template” property is activated.  
  The properties of all elements assigned to the column are listed in “Template”. They can be modified there as described in "Rectangle, Round rectangle and Ellipse” |

See also

- § Chapter 1.3.5.18.1.1 “Visualization element 'Rectangle', 'Round rectangle', 'Ellipse’” on page 1224

**Element property 'Position'**

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.
### Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>X</strong></td>
<td>X-coordinate of the point of rotation</td>
</tr>
<tr>
<td><strong>Y</strong></td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the symbols (-symbol) to other positions in the editor.

### Element property 'Text properties'

The properties contain fixed values for the text properties.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Horizontal alignment</strong></td>
<td>Horizontal alignment of the text within the element.</td>
</tr>
<tr>
<td><strong>Vertical alignment</strong></td>
<td>Vertical alignment of the text within the element.</td>
</tr>
<tr>
<td><strong>Font</strong></td>
<td>Example: “Default”&lt;br&gt; elevate: The “Font” dialog box opens. &lt;br&gt; ▼: Drop-down list with style fonts.</td>
</tr>
</tbody>
</table>
### Font color

Example: “Black”

- The “Color” dialog box opens.
- Drop-down list with style colors.

### Transparency

Whole number (value range from 0 to 255). This determines the transparency of the respective color.

Example: 255: The color is opaque.
0: The color is completely transparent.

Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

---

**Element property 'Dynamic texts'**

Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.

<table>
<thead>
<tr>
<th><strong>Text list</strong></th>
<th>Variable (string) or name of the text list as a fixed string in single straight quotation marks.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: 'Errorlist'</td>
<td>➣: Drop-down list with the dialogs available in the text lists.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Text index</strong></th>
<th>Text list ID. This refers to the desired output text.</th>
</tr>
</thead>
<tbody>
<tr>
<td>● As fixed string with the ID in single straight quotation marks.</td>
<td>Example: '1'</td>
</tr>
<tr>
<td>● As a variable (STRING) for dynamically controlling the text output.</td>
<td>Example: strTextID</td>
</tr>
<tr>
<td>Sample assignment: PLC_PRG.strTextID := '1';</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Tooltip index</strong></th>
<th>Text list ID. This refers to the desired output text.</th>
</tr>
</thead>
<tbody>
<tr>
<td>● As fixed string with the ID in single straight quotation marks.</td>
<td>Example: '2'</td>
</tr>
<tr>
<td>● As a variable (STRING) for dynamically controlling the text output.</td>
<td>Example: strToolTipID</td>
</tr>
<tr>
<td>Sample assignment: PLC_PRG.strToolTipID := '2';</td>
<td></td>
</tr>
</tbody>
</table>

See also

- **Text list**

---

**Element property 'Font variables'**

The variables enable dynamic control of the text display.

<table>
<thead>
<tr>
<th><strong>Font name</strong></th>
<th>Variable (STRING). Includes the font of the text.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: PLC_PRG.stFontVar := 'Arial';</td>
<td>The selection of fonts corresponds to the default “Font” dialog box.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Size</strong></th>
<th>Variable (integer data type). Contains the font size (in pixels).</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: PLC_PRG.iFontHeight := 16;</td>
<td>The selection of font sizes corresponds to the default “Font” dialog box.</td>
</tr>
</tbody>
</table>
**"Flags"**
Variable (DWORD). Contains the flags for displaying fonts.

Flags:
- 1: Italic
- 2: Bold
- 4: Underline
- 8: Strikethrough

Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text:
```
PLC_PRG.dwFontType := 6;
```

**"Charset"**
Variable (DWORD). Contains a character set number for the font.
The selection of character set numbers corresponds to the "Script" setting of the standard "Font" dialog box.

**"Color"**
Variable (DWORD). Includes the color of the text.
Example: 
```
PLC_PRG.dwColorFont := 16#FF000000;
```

**"Flags for text alignment"**
Variable (integer data type). Contains the coding for text alignment.

Coding:
- 0: Top left
- 1: Horizontal center
- 2: Right
- 4: Vertical center
- 8: Bottom

Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text:
```
PLC_PRG.dwFontType := 5;
```

---

**Fixed values for displaying texts are set in "Text properties".**

See also
- "Element property 'Text properties'" on page 1227

---

**Element property 'Absolute movement'**
The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

**"Movement"**

**"X"**
Variable (numeric data type). Defines the X position (in pixels).
Example: 
```
PLC_PRG.iPos_X.
```
Increasing this value in runtime mode moves the element to the right.

**"Y"**
Variable (numeric data type). Defines the Y position (in pixels).
Example: 
```
PLC_PRG.iPos_Y.
```
Increasing this value in runtime mode moves the element downwards.
**“Rotation”**
Variable (numeric data type). Defines the angle of rotation (in degrees).

Example: PLC_PRG.iAngle1.

The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.

In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

**“Interior rotation”**
Variable (numeric data type). Defines the angle of rotation (in degrees).

Example: PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol.

Note: If a static angle of rotation is specified in the “Position Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

---

You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.

See also
- Unit conversion
- 

---

**Element property ‘State variables’**
The variables control the element behavior dynamically.

<table>
<thead>
<tr>
<th>“Invisible”</th>
<th>Variable (BOOL). Toggles the visibility of the element. TRUE: The element is not visible at runtime.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Deactivate inputs”</td>
<td>Variable (BOOL). Toggles the operability of the element. TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated.</td>
</tr>
</tbody>
</table>
The "Invisible" property is supported by the "Client Animation" functionality.

See also

- "Background color on selection" Fill color of the selected row.
- "Selection font color" Font color of the selected row.
- "Selection type" Selection when clicking the table row.
  - No selection: No selection
  - Cell selection: The clicked cell only.
  - Row selection: Row of the clicked cell.
  - Column selection: Column of the clicked cell.
  - Row and column selection: Row and column of the clicked cell.
- "Frame around selected cells" A frame is drawn around the selected cells.
- "Variable for selected column" Variable (INT). Contains the array index of the "Column" of the selected cell. If the data array points to a structure, then the structure components are indexed, starting at 0.
  Warning: This index represents the correct position in the array only if no columns have been removed from the table in the display.
- "Variable for selected row" Variable (INT). Contains the array index of the "Row" of the selected cell.
- "Variable for valid column selection" Variable (BOOL).
  TRUE: The "Variable for selected column" variable contains a valid value.
- "Variable for valid row selection" Variable (BOOL).
  TRUE: The "Variable for selected row" variable contains a valid value.

These properties are available only when you select the "Preview: Support client animations and overlay of native elements" option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.

- "Animation duration" Time that the element executes an animation (in milliseconds)
  Example: 500
- "Move to the foreground" Property value (BOOL)
  TRUE: At runtime, the element is displayed in the foreground.
  FALSE: At runtime, the element is displayed in the layer where it was inserted in the visualization editor.

Visualization element 'Text field'

Symbol:

Tag: "Common controls"
The element is used for the following:
● Static output of text. The contents of a variable can be part of the text.
● Showing a tooltip. The text is managed as static text and can also be defined so that the contents of a variable are also displayed.
● Dynamic output of text. Texts of a text list are displayed dynamically.
● Input of text. For example, a user can input a number or a text literal.

</table>

You can also change the values by dragging the box symbols (_drag_ ) to other positions in the editor.

See also

- Chapter 1.3.5.3.2 “Positioning elements, adapting size and layer” on page 1113

**Element property 'Colors'**

<table>
<thead>
<tr>
<th><strong>Normal state</strong></th>
<th>The normal state is in effect if the variable in “Color variables ➔ Toggle color” is not defined or it has the value FALSE.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Frame color</strong></td>
<td>Frame and fill color for the corresponding state of the variable.</td>
</tr>
<tr>
<td><strong>Fill color</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Transparency</strong></td>
<td>Transparency value (0 to 255) for defining the transparency of the selected color. Example: 255: The color is opaque. 0: The color is completely transparent.</td>
</tr>
<tr>
<td><strong>Alarm state</strong></td>
<td>The alarm state is in effect if the variable in “Color variables ➔ Toggle color” has the value TRUE.</td>
</tr>
</tbody>
</table>

See also

- Chapter 1.3.5.19.3.5 “Dialog ‘Gradient Editor’” on page 1586

**Element property 'Appearance'**

The properties contain fixed values for setting the look of the element.
**“Line width”**  
Value in pixels  
Example: 2  
Note: The values 0 and 1 both result in a line weight of 1 pixel. If no line should be displayed, then the “Line style” property must be set to the option “Invisible”.

**“Fill attributes”**  
The way in which the element is filled.  
- “Filled”: The element is filled with the color from property “Colors ➔ Fill color”.  
- “Invisible”: The fill color is invisible.

**“Line style”**  
The type of line representation  
- “Solid”  
- “Dashes”  
- “Dots”  
- “Dash Dot”  
- “Dash Dot Dot”  
- “not visible”

You can assign variables in the “Appearance variables” property for controlling the appearance dynamically. The fixed values here are overwritten.

See also  
- “Element property ‘Appearance variables’” on page 1285

**Element property 'Texts’**  
The properties contain character strings for labeling the element. The character string can also contain a placeholder with a format definition. In runtime mode, the placeholder is replaced by the current value in the specified format.  
CODESYS accepts the specified texts automatically into the “GlobalTextList” text list. Therefore, these texts can be localized.

**“Text”**  
Character string (without single straight quotation marks) for the labeling the element. Add a line break by pressing the keyboard shortcut [Ctrl] + [Enter].  
Example: Accesses: %i  
The variable that contains the current value for the placeholder is specified in the property “Text variable ➔ Text”.

**“Tooltip”**  
Character string (without single straight quotation marks) that is displayed as the tooltip of an element.  
Example: Number of valid accesses.  
The variable that contains the current value for the placeholder is specified in the property “Text variable ➔ Tooltip”.

See also  
- “Element property ‘Text variables’” on page 1229
- Chapter 1.3.5.18.2 “Placeholders with format definition in the output text” on page 1546

**Element property 'Text properties’**  
The properties contain fixed values for the text properties.
### Element property 'Text variables'

These properties are variables with contents that replace a format definition.

<table>
<thead>
<tr>
<th><strong>Text variable</strong></th>
<th>Variable (data type compliant with the format definition). It contains what is printed instead of the format definition.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: PLC_PRG.iAccesses</td>
<td>Note: The format definition is part of the text in the property “Texts ➔ Text”. Note: If you specify a variable of type enumeration with text list support, then the name of the enumeration data type is added automatically in angle brackets after the variable name. Example: PLC_PRG.enVar &lt;enumeration name&gt;. Then the symbolic value of the enumeration component is printed instead of the numeric value when text is printed. Refer to the help page for the enumerations.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Tooltip variable</strong></th>
<th>Variable (data type compliant with the format definition). It contains what is printed instead of the format definition.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: PLC_PRG.iAccessesTooltip</td>
<td>Note: The format definition is part of the text in the property “Texts ➔ Tooltip”.</td>
</tr>
</tbody>
</table>

See also

- % Chapter 1.3.5.18.2 “Placeholders with format definition in the output text” on page 1546
- % “Element property ‘Texts’” on page 1226
- Enumerations

### Element property 'Dynamic texts'

Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.
### "Text list"

Variable (string) or name of the text list as a fixed string in single straight quotation marks.

Example: 'Errorlist'

- Drop-down list with the dialogs available in the text lists.

### "Text index"

Text list ID. This refers to the desired output text.

- As fixed string with the ID in single straight quotation marks.
  - Example: '1'
- As a variable (STRING) for dynamically controlling the text output.
  - Example: \(\text{strTextID}\)
  - Sample assignment: \(\text{PLC_PRG.strTextID} := '1';\)

### "Tooltip index"

Text list ID. This refers to the desired output text.

- As fixed string with the ID in single straight quotation marks.
  - Example: '2'
- As a variable (STRING) for dynamically controlling the text output.
  - Example: \(\text{strToolTipID}\)
  - Sample assignment: \(\text{PLC_PRG.strToolTipID} := '2';\)

#### See also
- "Text list"

---

### Element property 'Font variables'

The variables allow for dynamic control of the text display.

#### "Font name"

Variable (STRING). Includes the font of the text.

- Example: \(\text{PLC_PRG.stFontVar} := 'Arial';\)

The selection of fonts corresponds to the default "Font" dialog.

#### "Size"

Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name.

- \(<\text{pt}>\) Points (default)
  - Example: \(\text{PLC_PRG.iFontHeight} <\text{pt}>\)
  - Code: \(\text{iFontHeight} : \text{INT} := 12;\)
- \(<\text{px}>\) Pixels
  - Example: \(\text{PLC_PRG.iFontHeight} <\text{px}>\)
  - Code: \(\text{iFontHeight} : \text{INT} := 19;\)

If you click in the value field, a drop-down list opens on the right for setting the unit.

Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property "Text property ➔ Font".
### "Flags"

Variable (DWORD). Contains the flags for displaying fonts.

Flags:
- 1: Italics
- 2: Bold
- 4: Underline
- 8: Strikethrough

Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: PLC_PRG.dwFontType := 6;

### "Character set"

Variable (DWORD). Contains a character set number for the font.

The selection of character set numbers corresponds to the “Script” setting of the standard “Font” dialog.

### "Color"

Variable (DWORD). Includes the color of the text.

Example: PLC_PRG.dwColorFont := 16#FF000000;

### "Flags for text alignment"

Variable (integer data type). Contains the coding for text alignment.

Example: PLC_PRG.dwTextAlignment.

Coding:
- 0: Top left
- 1: Horizontal center
- 2: Right
- 4: Vertical center
- 8: Bottom

Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: PLC_PRG.dwFontType := 5;

---

**Fixed values for displaying texts are set in "Text properties".**

See also
- "Element property 'Text properties'" on page 1227

**Element property 'Colorvariables'**

The Element property is used as an interface for project variables to dynamically control colors at runtime.
"Toggle color"  The property controls the toggled color at runtime.  
**Value assignment:**  
- **FALSE**: The element is displayed with the color specified in the “Color” property.  
- **TRUE**: The element is displayed with the color specified in the “Alarm color” property.  

**Assignment options:**  
- Placeholder for the user input variable  
  – “<toggle/tap variable>”  
  – “<NOT toggle/tap variable>”  

The color change is not controlled by its own variable, but by a user input variable.  

Note: Specify a variable for the mouse events “Tap” or “Toggle” in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both “Toggle” and “Tap”, then the variable specified in “Tap” is used.  

Hint: Click the symbol to insert the placeholder “<toggle/tap variable>”. When you activate the “Input configuration”, “Tap FALSE” property, then the “<NOT toggle/tap variable>” placeholder is displayed.  

- Instance path of a project variable (BOOL)  
  Example: PLC_PRG.xColorIsToggled  

Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.

"Normal state"  "Alarm state"  The properties listed below control the color depending on the state. The normal state is in effect if the variable in "Color variables", "Toggle color" is not defined or it has the value FALSE. The alarm state is in effect if the variable in "Color variables", "Toggle color" has the value TRUE.

"Frame color"  **Assignment options:**  
- Variable (DWORD) for the frame color  
  Example: PLC_PRG.dwBorderColor  
- Color literal  
  Example of green and opaque: 16#FF00FF00

"Filling color"  **Assignment options:**  
- Variable (DWORD) for the fill color  
  Example: PLC_PRG.dwFillColor  
- Color literal  
  Example of gray and opaque: 16#FF888888

The transparency part of the color value is evaluated only if the “Activate semi-transparent drawing” option of the visualization manager is selected.

Select the “Advanced” option in the toolbar of the properties view. Then all element properties are visible.

See also  
- Chapter 1.3.5.8.3 “Animating a color display” on page 1152
**Element property 'Absolute movement'**

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

### "Movement"

| **"X"** | Variable (numeric data type). Defines the X position (in pixels).  
Example: PLC_PRG.iPos_X.  
Increasing this value in runtime mode moves the element to the right. |
| **"Y"** | Variable (numeric data type). Defines the Y position (in pixels).  
Example: PLC_PRG.iPos_Y.  
Increasing this value in runtime mode moves the element downwards. |

| **"Rotation"** | Variable (numeric data type). Defines the angle of rotation (in degrees).  
Example: PLC_PRG.iAngle1.  
The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.  
In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right. |
| **"Interior rotation"** | Variable (numeric data type). Defines the angle of rotation (in degrees).  
Example: PLC_PRG.iAngle2.  
In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.  
The rotation point is shown as the symbol.  
Note: If a static angle of rotation is specified in the "Position ➔ Angle" property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed. |

---

*You can link the variables to a unit conversion.*

*The "X", "Y", "Rotation", and "Interior rotation" properties are supported by the "Client Animation" functionality.*
The variables control the element behavior dynamically.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Invisible”</td>
<td>Variable (BOOL). Toggles the visibility of the element. TRUE: The element is not visible at runtime.</td>
</tr>
<tr>
<td>“Deactivate inputs”</td>
<td>Variable (BOOL). Toggles the operability of the element. TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated.</td>
</tr>
</tbody>
</table>

The “Invisible” property is supported by the “Client Animation” functionality.

The variables control the element behavior dynamically.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Caret position”</td>
<td>Variable (integer data type). Contains the position of the caret.</td>
</tr>
<tr>
<td>“Selection start”</td>
<td>Variable (integer data type). Contains the position of the first selected character. Example: PLC_PRG.iSelStart</td>
</tr>
<tr>
<td>“Selection end”</td>
<td>Variable (integer data type). Contains the position of the last selected character. Example: PLC_PRG.iSelEnd</td>
</tr>
<tr>
<td>“All selected”</td>
<td>Variable (BOOL). Toggles the selection of the entered text. TRUE: The text in the text field is selected. FALSE: The selection starts with the value in “Selection start” and ends with “Selection end”.</td>
</tr>
</tbody>
</table>

These properties are available only when you select the “Preview: Support client animations and overlay of native elements” option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Animation duration”</td>
<td>Time that the element executes an animation (in milliseconds) Example: 500</td>
</tr>
<tr>
<td>“Move to the foreground”</td>
<td>Property value (BOOL) TRUE: At runtime, the element is displayed in the foreground. FALSE: At runtime, the element is displayed in the layer where it was inserted in the visualization editor.</td>
</tr>
</tbody>
</table>
The properties contain the configurations for the user input when using the mouse or keyboard. A user input defines an event and one or more actions that are executed when an event occurs.

Example: "Execute ST code": \$ PLC_PRG.i_x := 0;

<table>
<thead>
<tr>
<th>Input event</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;OnDialogClosed&quot;</td>
<td>Input event: The user closes the dialog box.</td>
</tr>
<tr>
<td>&quot;OnMouseClick&quot;</td>
<td>Input event: The user clicks the mouse button completely. The mouse button is clicked and released.</td>
</tr>
<tr>
<td>&quot;OnMouseDown&quot;</td>
<td>Input event: The user clicks down on the mouse button.</td>
</tr>
<tr>
<td>&quot;OnMouseEnter&quot;</td>
<td>Input event: The user drags the mouse pointer to the element.</td>
</tr>
<tr>
<td>&quot;OnMouseLeave&quot;</td>
<td>Input event: The user drags the mouse pointer away from the element.</td>
</tr>
<tr>
<td>&quot;OnMouseMove&quot;</td>
<td>Input event: The user moves the mouse pointer over the element area.</td>
</tr>
<tr>
<td>&quot;OnMouseUp&quot;</td>
<td>Input event: The user releases the mouse button over the element area.</td>
</tr>
</tbody>
</table>

"Tap" When a mouse click event occurs, the variable defined in "Variable" is described in the application. The coding depends on the options "Tap FALSE" and "Tap on enter if captured".

"Variable" Variable (BOOL) that is set on mouse click.
Example: PLC_PRG.bIsTapped
TRUE: A mouse click event exists. It lasts while the user presses the mouse button over the element. It ends when the button is released.
FALSE: A mouse click event does not exist.

Requirement: The "Tap FALSE" option is not activated.

"Tap FALSE" ☑: The mouse click event leads to a complementary value in "Variable".
TRUE: A mouse click event does not exist.
FALSE: While the mouse click event exists.

"Tap on enter if captured" ☑: During user input, it is also taken into consideration whether the mouse pointer is dragged within the element area or not while the mouse button is pressed.
TRUE: While the mouse click event exists and the mouse pointer is moved over the element area.
FALSE: A mouse click event does not exist. Or the user moves the mouse pointer outside of the element area while the mouse button is pressed.
The value is TRUE again as soon as the user moves the pointer back to the element area. The mouse is then captured.
### “Shift”
With the onset of a mouse click event, the variable is set; when the mouse click event is completed, the variable is reset.

### “Variable”
Variable (BOOL). Its value toggled when the mouse click event is ended. This is when the user releases the mouse button while the mouse pointer is over the element area.

If the user releases the mouse button while the mouse pointer is outside of the element area, then the mouse click event is not ended and the value is not toggled.

Tip: The user can cancel a started toggle input by dragging the mouse pointer out of the element area.

### “Toggle on up if captured”
☑️: The value toggles regardless of where the mouse pointer is when the mouse button is released. The mouse is then captured.

### “Keyboard shortcuts”
Keyboard shortcut on the element for triggering specific input actions.

When the keyboard shortcut event occurs, the input actions in the “Event(s)” property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.

### “Key”
Key pressed for input action.

Example: [T]

Note: The following properties appear when a key is selected.

### “Event(s)”
- “None”
- “Mouse down”: Pressing the key triggers the input actions that are configured in the “OnMouseDown” property.
- “Mouse up”: Releasing the key triggers the input actions that are configured in the “OnMouseUp” property.
- “Mouse down/up”: Pressing and releasing the key triggers the input actions that are configured in the “OnMouseDown” property and the “OnMouseUp” property.

### “Shift”
☑️: Combination with the Shift key

Example: [Shift]+[T].

### “Control”
☑️: Combination with the Ctrl key

Example: [Ctrl]+[T].

### “Alt”
☑️: Combination with the Alt key

Example: [Alt]+[T].

---

All keyboard shortcuts and their actions that are configured in the visualization are listed in the “Keyboard configuration” tab.

- Chapter 1.3.5.19.3.6 “Dialog ‘Input Configuration’” on page 1586

---

Element property 'Access rights'

Requirement: User management is set up for the visualization.
“Access rights” Opens the “Access rights” dialog. There you can edit the access privileges for the element.

Status messages:
- “Not set. Full rights.”: Access rights for all user groups: “operable”
- “Rights are set: Limited rights”: Access is restricted for at least one group.

See also
- Chapter 1.3.5.19.3.1 “Dialog ‘Access Rights’” on page 1583

Visualization element ‘Scrollbar’

Symbol:

Tag: “Common controls”
The element sets the value of a variable, depending on the position of the scrollbar.

Element properties

<table>
<thead>
<tr>
<th>“Element name”</th>
<th>Example: Speed Conveyor Belt 1</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Optional</td>
</tr>
<tr>
<td></td>
<td>Hint: Assign individual names for elements so that they are found faster in the element list.</td>
</tr>
</tbody>
</table>

| “Type of element” | “Scrollbar” |

Element property ‘Center’
The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

<table>
<thead>
<tr>
<th>“X”</th>
<th>X-coordinate of the point of rotation</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Y”</td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

<table>
<thead>
<tr>
<th>“Value”</th>
<th>Variable as type integer that includes the position of the scrollbar.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Minimum value”</td>
<td>Smallest value of the scrollbar (fixed value or variable).</td>
</tr>
<tr>
<td>“Maximum value”</td>
<td>Largest value of the scrollbar (fixed value or variable).</td>
</tr>
<tr>
<td><strong>“Page size”</strong></td>
<td>Page size</td>
</tr>
<tr>
<td>----------------</td>
<td>-----------</td>
</tr>
<tr>
<td>● As a fixed value, for example 10</td>
<td></td>
</tr>
<tr>
<td>● As a variable of data type integer</td>
<td></td>
</tr>
<tr>
<td>Requirement: Visible when the “Move to click” property is <strong>not</strong> selected.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>“Move to click”</strong></th>
<th>Behavior of the scrollbar at visualization runtime when it is clicked:</th>
</tr>
</thead>
<tbody>
<tr>
<td>✓: The scrollbar moves to the clicked position.</td>
<td></td>
</tr>
<tr>
<td>□: The scrollbar moves to one “Page size” in the direction of the click.</td>
<td></td>
</tr>
</tbody>
</table>

**Element property ‘Position’**

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

<table>
<thead>
<tr>
<th><strong>“X”</strong></th>
<th>X coordinate of the upper left corner of the element</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specified in pixels.</td>
<td></td>
</tr>
<tr>
<td>Example: 10.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>“Y”</strong></th>
<th>Y coordinate of the upper left corner of the element</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specified in pixels.</td>
<td></td>
</tr>
<tr>
<td>Example: 10.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>“Width”</strong></th>
<th>Specified in pixels.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: 150</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>“Height”</strong></th>
<th>Specified in pixels.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: 30</td>
<td></td>
</tr>
</tbody>
</table>

You can also change the values by dragging the box symbols (▲) to other positions in the editor.

See also

- Chapter 1.3.5.3.2 “Positioning elements, adapting size and layer” on page 1113

**Element property ‘Bar’**

The property defines the representation of scaling and direction of travel.
| **Orientation** | Alignment of the slider; defined by the ratio of width to height.  
  ● “Horizontal”  
  ● “Vertical”  
  You can modify the alignment in the visualization editor by using the pointing device to adjust the width and height of the scrollbar. |
| **Running direction** | The drop-down list varies depending on the alignment of the slider.  
  Horizontal  
  ● “Left to right”: Scale starts at the left.  
  ● “Right to left”: Scale starts at the right.  
  Vertical  
  ● “Bottom to top”: Scale starts at the bottom.  
  ● “Top to bottom”: Scale starts at the top. |

**Element property 'Colors'**  
The properties contain fixed values for setting colors.

| **Color** | Color for the element in its normal state.  
  Please note that the normal state is in effect if the expression in the “Color variables ➔ Toggle color” property is not defined or it has the value FALSE. |
| **Alarm color** | Color for the element in alarm state.  
  Please note that the alarm state is in effect if the expression in the “Color variables ➔ Toggle color” property has the value TRUE. |
| **Transparency** | Value (0 to 255) for defining the transparency of the selected color.  
  Example 255: The color is opaque. 0: The color is completely transparent. |

**Element property 'Texts'**  
The properties contains character strings for labeling the element. The character string can also contain a placeholder with a format definition. In runtime mode, the placeholder is replaced by the current value in the specified format.

CODESYS accepts the specified texts automatically into the “GlobalTextList” text list. Therefore, these texts can be localized.

| **Text** | Character string (without single straight quotation marks) for the labeling the element. Add a line break by pressing the keyboard shortcut [Ctrl] + [Enter].  
  Example: Accesses: %i  
  The variable that contains the current value for the placeholder is specified in the property “Text variable ➔ Text”. |
| **Tooltip** | Character string (without single straight quotation marks) that is displayed as the tooltip of an element.  
  Example: Number of valid accesses.  
  The variable that contains the current value for the placeholder is specified in the property “Text variable ➔ Tooltip” |
The properties contain fixed values for the text properties.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Horizontal alignment”</strong></td>
<td>Horizontal alignment of the text within the element.</td>
</tr>
<tr>
<td><strong>“Vertical alignment”</strong></td>
<td>Vertical alignment of the text within the element.</td>
</tr>
<tr>
<td><strong>“Font”</strong></td>
<td>Example: “Default”&lt;br&gt;The “Font” dialog box opens.&lt;br&gt;▼: Drop-down list with style fonts.</td>
</tr>
<tr>
<td><strong>“Font color”</strong></td>
<td>Example: “Black”&lt;br&gt;The “Color” dialog box opens.&lt;br&gt;▼: Drop-down list with style colors.</td>
</tr>
<tr>
<td><strong>“Transparency”</strong></td>
<td>Whole number (value range from 0 to 255). This determines the transparency of the respective color. Example: 255: The color is opaque. 0: The color is completely transparent. Please note: If the color is a style color and already has a transparency value, then this property is write-protected.</td>
</tr>
</tbody>
</table>

These properties are variables with contents that replace a format definition.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Text variable”</strong></td>
<td>Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. Example: PLC_PRG.iAccesses</td>
</tr>
<tr>
<td></td>
<td>Note: The format definition is part of the text in the property “Texts ➔ Text”. Note: If you specify a variable of type enumeration with text list support, then the name of the enumeration data type is added automatically in angle brackets after the variable name. Example: PLC_PRG.enVar &lt;enumeration name&gt;. Then the symbolic value of the enumeration component is printed instead of the numeric value when text is printed. Refer to the help page for the enumerations.</td>
</tr>
<tr>
<td><strong>“Tooltip variable”</strong></td>
<td>Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. Example: PLC_PRG.iAccessesInTooltip</td>
</tr>
<tr>
<td></td>
<td>Note: The format definition is part of the text in the property “Texts ➔ Tooltip”.</td>
</tr>
</tbody>
</table>

See also
- "Element property ‘Text variables’" on page 1229
- Chapter 1.3.5.18.2 “Placeholders with format definition in the output text” on page 1546
- "Element property ‘Texts’" on page 1226
- Enumerations
Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.

**Text list**
Variable (string) or name of the text list as a fixed string in single straight quotation marks.
Example: 'Errorlist'
↓: Drop-down list with the dialogs available in the text lists.

**Text index**
Text list ID. This refers to the desired output text.
- As fixed string with the ID in single straight quotation marks.
  Example: '1'
- As a variable (STRING) for dynamically controlling the text output.
  Example: strTextID
  Sample assignment: PLC_PRG.strTextID := '1';

**Tooltip index**
Text list ID. This refers to the desired output text.
- As fixed string with the ID in single straight quotation marks.
  Example: '2'
- As a variable (STRING) for dynamically controlling the text output.
  Example: strToolTipID
  Sample assignment: PLC_PRG.strToolTipID := '2';

See also
- Text list

The variables allow for dynamic control of the text display.

**Font name**
Variable (STRING). Includes the font of the text.
Example: PLC_PRG.stFontVar := 'Arial';
The selection of fonts corresponds to the default “Font” dialog.

**Size**
Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name.
- <pt>: Points (default)
  Example: PLC_PRG.iFontHeight <pt>
  Code: iFontHeight : INT := 12;
- <px>: Pixels
  Example: PLC_PRG.iFontHeight <px>
  Code: iFontHeight : INT := 19;

If you click in the value field, a drop-down list opens on the right for setting the unit.

Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property “Text property ➔ Font”.

Element property 'Dynamic texts'

Element property 'Font variables'
"Flags" Variable (DWORD). Contains the flags for displaying fonts.

Flags:
- 1: Italics
- 2: Bold
- 4: Underline
- 8: Strikethrough

Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: PLC_PRG.dwFontType := 6;

"Character set" Variable (DWORD). Contains a character set number for the font.

The selection of character set numbers corresponds to the "Script" setting of the standard "Font" dialog.

"Color" Variable (DWORD). Includes the color of the text.

Example: PLC_PRG.dwColorFont := 16#FF000000;

"Flags for text alignment" Variable (integer data type). Contains the coding for text alignment.

Example: PLC_PRG.dwTextAlignment.

Coding:
- 0: Top left
- 1: Horizontal center
- 2: Right
- 4: Vertical center
- 8: Bottom

Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: PLC_PRG.dwFontType := 5;

Fixed values for displaying texts are set in "Text properties".

See also
- § "Element property 'Text properties'" on page 1227

Element property 'Color variables'

The Element property is used as an interface for project variables to dynamically control colors at runtime.
**“Toggle color”**

The property controls the toggled color at runtime.

**Value assignment:**
- **FALSE**: The element is displayed with the color specified in the “Color” property.
- **TRUE**: The element is displayed with the color specified in the “Alarm color” property.

**Assignment options:**
- Placeholder for the user input variable
  - `<toggle/tap variable>`
  - `<NOT toggle/tap variable>`

The color change is not controlled by its own variable, but by a user input variable.

Note: Specify a variable for the mouse events “Tap” or “Toggle” in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both “Toggle” and “Tap”, then the variable specified in “Tap” is used.

Hint: Click the symbol to insert the placeholder “<toggle/tap variable>”. When you activate the “Input configuration”, “Tap FALSE” property, then the “<NOT toggle/tap variable>” placeholder is displayed.

- Instance path of a project variable (BOOL)
  Example: PLC_PRG.xColorIsToggeled

Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.

---

**“Normal state”**

**“Alarm state”**

The properties listed below control the color depending on the state. The normal state is in effect if the variable in “Color variables”, “Toggle color” is not defined or it has the value FALSE. The alarm state is in effect if the variable in “Color variables”, “Toggle color” has the value TRUE.

---

**“Frame color”**

**Assignment options:**
- Variable (DWORD) for the frame color
  Example: PLC_PRG.dwBorderColor
- Color literal
  Example of green and opaque: 16#FF00FF00

---

**“Filling color”**

**Assignment options:**
- Variable (DWORD) for the fill color
  Example: PLC_PRG.dwFillColor
- Color literal
  Example of gray and opaque: 16#FF888888

---

The transparency part of the color value is evaluated only if the “Activate semi-transparent drawing” option of the visualization manager is selected.

Select the “Advanced” option in the toolbar of the properties view. Then all element properties are visible.

### Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

#### "Movement"

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>X</strong></td>
<td>Variable (numeric data type). Defines the X position (in pixels).</td>
<td>PLC_PRG.iPos_X.</td>
</tr>
<tr>
<td></td>
<td>Increasing this value in runtime mode moves the element to the right.</td>
<td></td>
</tr>
<tr>
<td><strong>Y</strong></td>
<td>Variable (numeric data type). Defines the Y position (in pixels).</td>
<td>PLC_PRG.iPos_Y.</td>
</tr>
<tr>
<td></td>
<td>Increasing this value in runtime mode moves the element downwards.</td>
<td></td>
</tr>
</tbody>
</table>

#### "Rotation"

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Rotation</strong></td>
<td>Variable (numeric data type). Defines the angle of rotation (in degrees).</td>
<td>PLC_PRG.iAngle1.</td>
</tr>
<tr>
<td></td>
<td>The midpoint of the element rotates at the &quot;Center&quot; point. This rotation point is shown as the symbol.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.</td>
<td><img src="image1" alt="Diagram" /></td>
</tr>
</tbody>
</table>

#### "Interior rotation"

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Interior rotation</strong></td>
<td>Variable (numeric data type). Defines the angle of rotation (in degrees).</td>
<td>PLC_PRG.iAngle2.</td>
</tr>
<tr>
<td></td>
<td>In runtime mode, the element rotates about the point of rotation specified in &quot;Center&quot; according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.</td>
<td><img src="image2" alt="Diagram" /></td>
</tr>
<tr>
<td></td>
<td>The rotation point is shown as the symbol.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Note: If a static angle of rotation is specified in the &quot;Position ➔ Angle&quot; property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.</td>
<td></td>
</tr>
</tbody>
</table>

You can link the variables to a unit conversion.

The "X", "Y", "Rotation", and "Interior rotation" properties are supported by the "Client Animation" functionality.
The variables control the element behavior dynamically.

### Element property 'State variables'

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Invisible&quot;</td>
<td>Variable (BOOL). Toggles the visibility of the element. TRUE: The element is not visible at runtime.</td>
</tr>
<tr>
<td>&quot;Deactivate inputs&quot;</td>
<td>Variable (BOOL). Toggles the operability of the element. TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated.</td>
</tr>
</tbody>
</table>

The "Invisible" property is supported by the "Client Animation" functionality.

See also

- Unit conversion

---

These properties are available only when you select the "Preview: Support client animations and overlay of native elements" option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.

### Element property 'Access rights'

**Requirement:** User management is set up for the visualization.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| "Access rights"          | Opens the "Access rights" dialog. There you can edit the access privileges for the element. Status messages:  
  - "Not set. Full rights.": Access rights for all user groups : "operable"  
  - "Rights are set. Limited rights": Access is restricted for at least one group. |

See also

- ☞ Chapter 1.3.5.21.5 “Using client animation” on page 1962
- ☞ Chapter 1.3.5.19.3.1 “Dialog ‘Access Rights’” on page 1583
Visualization element 'Slider'
Symbol:

Tag: “Common controls”
The element adjusts the value of a variable, depending on the position of the slider within the slider bar. You define the value range of the slider bar by means of the scale start and scale end.

Element properties

<table>
<thead>
<tr>
<th>“Element name”</th>
<th>Example: Speed controller conveyor belt 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Optional</td>
<td>Hint: Assign individual names for elements so that they are found faster in the element list.</td>
</tr>
<tr>
<td>“Type of element”</td>
<td>“Slider”</td>
</tr>
</tbody>
</table>

Element property 'Position'
The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

<table>
<thead>
<tr>
<th>“X”</th>
<th>X coordinate of the upper left corner of the element Specified in pixels. Example: 10.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Y”</td>
<td>Y coordinate of the upper left corner of the element Specified in pixels. Example: 10.</td>
</tr>
<tr>
<td>“Width”</td>
<td>Specified in pixels. Example: 150</td>
</tr>
<tr>
<td>“Height”</td>
<td>Specified in pixels. Example: 30</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the box symbols (_drag_box_1_) to other positions in the editor.

See also

- Chapter 1.3.5.3.2 “Positioning elements, adapting size and layer” on page 1113
**Element property 'Center'**

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“X”</td>
<td>X-coordinate of the point of rotation</td>
</tr>
<tr>
<td>“Y”</td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the symbols (.isDirectory) to other positions in the editor.

**"Variable"**

Variable (numeric data type)

Example: PLC_PRG.rSlider

When executed, the variable assigns a value that corresponds to the position of the slider in the bar.

**"Page size"**

Page size

- As a fixed value, for example 10
- As an IEC variable of data type integer

Requirement: The "Move to click" element property is not activated.

**"Move to click"**

Function of the slider at visualization runtime when it is clicked:

- The slider moves to the clicked position.
- The slider moves to the value (defined in the "Page size" element property) in the direction of the click.

**Element property 'Scale'**

**"Show scale"**

☑: The element has a visible scale.

Note: This option is available for the slider only.

**"Scale start"**

Least value of the scale and the lower limit of the value range for the element.

Example: 0

☑: The property "Variable" is shown below.

**"Variable"**

Variable (integer data type). Contains the scale start.

Example: PLC_PRG.iScaleStart

Declaration:

```plaintext```
PROGRAM PLC_PRG
VAR
    iScaleStart : INT := 0;
END_VAR
```plaintext```

**"Scale end"**

Greatest value of the scale and the upper limit of the value range for the element.

Example: 100

☑: The property "Variable" is shown below.
| **“Variable”** | Variable (integer data type). Contains the scale end.  
**Example:** PLC_PRG.iScaleEnd  
**Declaration:** |
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
PROGRAM PLC_PRG  
VAR  
iScaleEnd : INT := 120;  
END_VAR  
| |
| **“Main scale”** | Distance between two tick marks on the rough scale.  
**Example:** 10  
★: The property “Variable” is shown below. |
| **“Variable”** | Variable (integer data type). Contains the distance.  
**Example:** PLC_PRG.iMainScale  
**Declaration:** |
|  
PROGRAM PLC_PRG  
VAR  
iMainScale : INT := 20;  
END_VAR  
| |
| **“Subscale”** | Distance between two dashes on the fine scale. You can hide the fine scale by setting the value to 0.  
**Example:** 2  
★: The property “Variable” is shown below. |
| **“Variable”** | Variable (integer data type). Contains the distance.  
**Example:** PLC_PRG.iSubScale  
**Declaration:** |
|  
PROGRAM PLC_PRG  
VAR  
iMainScale : INT := 5;  
END_VAR  
| |
| **“Scale format (C Syntax)”** | Formatting of the scale label (example: %d %s)  
Note: This property is available for the slider only. |
| **“Scale proportion”** | Size of the scale (in %) of the total size |

**Element property ‘Bar’**  
The property defines the representation of scaling and direction of travel.
### Diagram type
The drop-down list varies depending on the alignment of the diagram.

**Horizontal**
- **"Top":** Scale is above the slider.
- **"Bottom":** Scale is below the slider.
- **"Top and bottom":** Two scales frame the slider above and below.

**Vertical**
- **Left:** Scale is left of the slider.
- **Right:** Scale is right of the slider.
- **Left and right:** Two scales frame the slider on the left and the right.

### Orientation
Alignment of the slider; defined by the ratio of width to height.
- **"Horizontal"**
- **"Vertical"**

You can modify the alignment in the visualization editor by using the pointing device to adjust the width and height of the scrollbar.

### Running direction
The drop-down list varies depending on the alignment of the slider.

**Horizontal**
- **"Left to right":** Scale starts at the left.
- **"Right to left":** Scale starts at the right.

**Vertical**
- **"Bottom to top":** Scale starts at the bottom.
- **"Top to bottom":** Scale starts at the top.

### Movement
The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

**X**
Variable (numeric data type). Defines the X position (in pixels).

Example: `PLC_PRG.iPos_X`.

Increasing this value in runtime mode moves the element to the right.

**Y**
Variable (numeric data type). Defines the Y position (in pixels).

Example: `PLC_PRG.iPos_Y`.

Increasing this value in runtime mode moves the element downwards.

**Rotation**
Variable (numeric data type). Defines the angle of rotation (in degrees).

Example: `PLC_PRG.iAngle1`.

The midpoint of the element rotates at the "Center" point. This rotation point is shown as the 📡 symbol.

In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.
**"Interior rotation"**

Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in "Center" according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the ✡ symbol.

Note: If a static angle of rotation is specified in the "Position ➔ Angle" property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

---

**You can link the variables to a unit conversion.**

---

**The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the ”Client Animation“ functionality.**

**See also**

- Unit conversion

---

**Element property ‘State variables’**

The variables control the element behavior dynamically.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>&quot;Invisible&quot;</strong></td>
<td>Variable (BOOL). Toggles the visibility of the element. TRUE: The element is not visible at runtime.</td>
</tr>
<tr>
<td><strong>&quot;Deactivate inputs&quot;</strong></td>
<td>Variable (BOOL). Toggles the operability of the element. TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated.</td>
</tr>
</tbody>
</table>

**The "Invisible" property is supported by the "Client Animation" functionality.**

**See also**

- 

These properties are available only when you select the "Preview: Support client animations and overlay of native elements" option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.
**“Animation duration”**
Time that the element executes an animation (in milliseconds)
Example: 500

**“Move to the foreground”**
Property value (BOOL)
TRUE: At runtime, the element is displayed in the foreground.
FALSE: At runtime, the element is displayed in the layer where it was inserted in the visualization editor.

See also
- *Chapter 1.3.5.21.5 “Using client animation” on page 1962*

**Element property 'Access rights'**
Requirement: User management is set up for the visualization.

**“Access rights”**
Opens the “Access rights” dialog. There you can edit the access privileges for the element.
Status messages:
- “Not set. Full rights.”: Access rights for all user groups: “operable”
- “Rights are set: Limited rights”: Access is restricted for at least one group.

See also
- *Chapter 1.3.5.19.3.1 “Dialog ‘Access Rights’” on page 1583*

**Visualization element 'SpinControl'**
Symbol:

Tag: “Common controls”
The element increments or decrements the value of a variable in defined intervals.

**Element properties**

<table>
<thead>
<tr>
<th><strong>“Element name”</strong></th>
<th>Example: Speed controller conveyor belt</th>
</tr>
</thead>
<tbody>
<tr>
<td>Optional</td>
<td>Hint: Assign individual names for elements so that they are found faster in the element list.</td>
</tr>
</tbody>
</table>

| **“Type of element”** | “SpinControl” |

**Element property ‘Position’**
The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| **“X”** | X coordinate of the upper left corner of the element | Specified in pixels.  
Example: 10. |
| **“Y”** | Y coordinate of the upper left corner of the element | Specified in pixels.  
Example: 10. |
| **“Width”** | Specified in pixels. | Example: 150 |
| **“Height”** | Specified in pixels. | Example: 30 |

You can also change the values by dragging the box symbols (_drag-) to other positions in the editor.

See also

- Chapter 1.3.5.3.2 “Positioning elements, adapting size and layer” on page 1113

**Element property ‘Center’**

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“X”</strong></td>
<td>X-coordinate of the point of rotation</td>
</tr>
<tr>
<td><strong>“Y”</strong></td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the symbols (drag) to other positions in the editor.

**“Variable”**

Variable (numeric data type)  
Beispiel PLC_PRG.iTemp

**“Number format”**

Format of the value in printf syntax  
Example: %d, %5.2f

**“Interval”**

Interval used for modification of the value

**Element property ‘Value range’**
### Minimum value
Lower limit of the output value
- fixed value
- Variable (INT)

### Maximum value
Upper limit of the output value
- fixed value
- Variable (INT)

**Element property 'Text properties'**

<table>
<thead>
<tr>
<th>Usage of</th>
<th>The properties contain fixed values for the text properties.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Usage of</strong></td>
<td></td>
</tr>
<tr>
<td>“Default style values”</td>
<td>The values of the visualization style are used.</td>
</tr>
<tr>
<td>“Individual settings”</td>
<td>The &quot;Individual settings&quot; property group is shown</td>
</tr>
<tr>
<td></td>
<td>The values can be customized here.</td>
</tr>
</tbody>
</table>

**Requirement:**

The “Individual settings” text property is defined.

<table>
<thead>
<tr>
<th>Horizontal alignment</th>
<th>Horizontal alignment of the text within the element.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Horizontal alignment</strong></td>
<td></td>
</tr>
<tr>
<td>Vertical alignment</td>
<td>Vertical alignment of the text within the element.</td>
</tr>
<tr>
<td><strong>Vertical alignment</strong></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Font</th>
<th>Example: “Default”</th>
</tr>
</thead>
<tbody>
<tr>

<td>▼: Drop-down list with style colors.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Transparency</th>
<th>Whole number (value range from 0 to 255). This determines the transparency of the respective color.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Example: 255: The color is opaque.</td>
</tr>
<tr>
<td></td>
<td>0: The color is completely transparent.</td>
</tr>
<tr>
<td></td>
<td>Please note: If the color is a style color and already has a transparency value, then this property is write-protected.</td>
</tr>
</tbody>
</table>

**Element property 'Colorvariables'**

The Element property is used as an interface for project variables to dynamically control colors at runtime.
"Toggle color"
The property controls the toggled color at runtime.
Value assignment:
- **FALSE**: The element is displayed with the color specified in the "Color" property.
- **TRUE**: The element is displayed with the color specified in the "Alarm color" property.
Assigning the property:
- Placeholder for the user input variable
  - "<toggle/tap variable>"
  - "<NOT toggle/tap variable>"
  
  The color change is not controlled by its own variable, but by a user input variable.
Note: Specify a variable for the mouse events "Tap" or "Toggle" in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both "Toggle" and "Tap", then the variable specified in "Tap" is used.
Hint: Click the symbol to insert the placeholder "<toggle/tap variable>". When you activate the "Inputconfiguration", "Tap FALSE" property, then the "<NOT toggle/tap variable>" placeholder is displayed.
- Instance path of a project variable (BOOL)
  
  Example: PLC_PRG.xColorIsToggeled
  
  Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.

The transparency part of the color value is evaluated only if the "Activate semi-transparent drawing" option of the visualization manager is selected.

Select the "Advanced" option in the toolbar of the properties view. Then all element properties are visible.

- § Chapter 1.3.5.8.3 “Animating a color display” on page 1152

Element property 'Absolute movement'
The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;X&quot;</td>
<td>Variable (numeric data type). Defines the X position (in pixels). Example: PLC_PRG.iPos_X. Increasing this value in runtime mode moves the element to the right.</td>
</tr>
<tr>
<td>&quot;Y&quot;</td>
<td>Variable (numeric data type). Defines the Y position (in pixels). Example: PLC_PRG.iPos_Y. Increasing this value in runtime mode moves the element downwards.</td>
</tr>
</tbody>
</table>
**“Rotation”**

Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle1.

The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.

In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

**“Interior rotation”**

Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol.

Note: If a static angle of rotation is specified in the “Position Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

---

You can link the variables to a unit conversion.

---

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.

See also

- Unit conversion

---

### Element property ‘State variables’

The variables control the element behavior dynamically.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Invisible”</strong></td>
<td>Variable (BOOL). Toggles the visibility of the element. TRUE: The element is not visible at runtime.</td>
</tr>
<tr>
<td><strong>“Deactivate inputs”</strong></td>
<td>Variable (BOOL). Toggles the operability of the element. TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated.</td>
</tr>
</tbody>
</table>
The “Invisible” property is supported by the “Client Animation” functionality.

See also

These properties are available only when you select the “Preview: Support client animations and overlay of native elements” option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.

<table>
<thead>
<tr>
<th><strong>&quot;Animation duration&quot;</strong></th>
<th>Time that the element executes an animation (in milliseconds)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: 500</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>&quot;Move to the foreground&quot;</strong></th>
<th>Property value (BOOL)</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRUE: At runtime, the element is displayed in the foreground.</td>
<td></td>
</tr>
<tr>
<td>FALSE: At runtime, the element is displayed in the layer where it was inserted in the visualization editor.</td>
<td></td>
</tr>
</tbody>
</table>

Element property 'Input configuration'
The properties contain the configurations for the user input when using the mouse or keyboard. User input is a user event from the perspective of the element.

The input configuration refers to the text area of the element only, not the two buttons.

The “Configure” button opens the “Input configuration” dialog box for creating or modifying a user input configuration.

A configuration contains one or more input actions for the respective input event. Existing input actions are displayed below it.

Example: “Execute ST code”: # PLC_PRG.i_x := 0;

<table>
<thead>
<tr>
<th><strong>&quot;OnDialogClosed&quot;</strong></th>
<th>Input event: The user closes the dialog box.</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;OnMouseClick&quot;</td>
<td>Input event: The user clicks the element completely. The mouse button is clicked and released.</td>
</tr>
<tr>
<td>&quot;OnMouseDown&quot;</td>
<td>Input event: The user clicks down on the element only.</td>
</tr>
<tr>
<td>&quot;OnMouseEnter&quot;</td>
<td>Input event: The user drags the mouse pointer to the element.</td>
</tr>
<tr>
<td>&quot;OnMouseLeave&quot;</td>
<td>Input event: The user drags the mouse pointer away from the element.</td>
</tr>
<tr>
<td>&quot;OnMouseMove&quot;</td>
<td>Input event: The user moves the mouse pointer over the element area.</td>
</tr>
<tr>
<td>&quot;OnMouseUp&quot;</td>
<td>Input event: The user releases the mouse button over the element area.</td>
</tr>
</tbody>
</table>

### “Tap”
When a mouse click event occurs, the variable defined in “Variable” is described in the application. The coding depends on the options “Tap FALSE” and “Tap on enter if captured”.

### “Variable”
Variable (BOOL). Contains the information whether a mouse click event exists.
- **Example:** PLC_PRG.bIsTapped
  - **TRUE:** A mouse click event exists. It lasts while the user presses the mouse button over the element. It ends when the button is released.
  - **FALSE:** A mouse click event does not exist.
- **Requirement:** The “Tap FALSE” option is not activated.

### “Tap FALSE”
- **✔️:** The mouse click event leads to a complementary value in “Variable”.
- **TRUE:** A mouse click event does not exist.
- **FALSE:** While the mouse click event exists.

### “Tap on enter if captured”
- **✔️:** During user input, it is also taken into consideration whether the mouse pointer is dragged within the element area or not while the mouse button is pressed.
  - **TRUE:** While the mouse click event exists and the mouse pointer is moved over the element area.
  - **FALSE:** A mouse click event does not exist. Or the user moves the mouse pointer outside of the element area while the mouse button is pressed.
  - The value is **TRUE** again as soon as the user moves the pointer back to the element area. The mouse is then captured.

### “Shift”
When a mouse click event occurs, the variable here is described in the application. When the mouse click event ends, its value is toggled with the “Toggle on up if captured” option.

### “Variable”
Variable (BOOL). Its value toggled when the mouse click event is ended. This is when the user releases the mouse button while the mouse pointer is over the element area.
- If the user releases the mouse button while the mouse pointer is outside of the element area, then the mouse click event is not ended and the value is not toggled.
- **Tip:** The user can cancel a started toggle input by dragging the mouse pointer out of the element area.

### “Toggle on up if captured”
- **✔️:** The value toggles regardless of where the mouse pointer is when the mouse button is released. The mouse is then captured.

### “Hotkeys”
Keyboard shortcut on the element for triggering specific input actions.
- When the keyboard shortcut event occurs, the input actions in the “Event(s)” property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.

### “Key”
Key pressed for input action.
- **Example:** [T]
- **Note:** The following properties appear when a key is selected.
“Event(s)”
- “None”
- “Mouse down”: Pressing the key triggers the input actions that are configured in the “OnMouseDown” property.
- “Mouse up”: Releasing the key triggers the input actions that are configured in the “OnMouseUp” property.
- “Mouse down/up”: Pressing and releasing the key triggers the input actions that are configured in the “OnMouseDown” property and the “OnMouseUp” property.

“Shift”
☑: Combination with the Shift key
Example: [Shift]+[T].

“Control”
☑: Combination with the Ctrl key
Example: [Ctrl]+[T].

“Alt”
☑: Combination with the Alt key
Example: [Alt]+[T].

All keyboard shortcuts and their actions that are configured in the visualization are listed in the “Keyboard configuration” tab.

</tbody>
</table>

You can also change the values by dragging the symbols (♣) to other positions in the editor.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
### Movement

**“X”**  
Variable (numeric data type). Defines the X position (in pixels).  
Example: PLC_PRG.iPos_X.  
Increasing this value in runtime mode moves the element to the right.

**“Y”**  
Variable (numeric data type). Defines the Y position (in pixels).  
Example: PLC_PRG.iPos_Y.  
Increasing this value in runtime mode moves the element downwards.

**“Rotation”**  
Variable (numeric data type). Defines the angle of rotation (in degrees).  
Example: PLC_PRG.iAngle1.  
The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.  
In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

**“Interior rotation”**  
Variable (numeric data type). Defines the angle of rotation (in degrees).  
Example: PLC_PRG.iAngle2.  
In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.  
The rotation point is shown as the symbol.  
Note: If a static angle of rotation is specified in the “Position ➔ Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

---

You can link the variables to a unit conversion.

---

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.

See also
- Unit conversion
The variables control the element behavior dynamically.

| “Deactivate inputs” | Variable (BOOL). Toggles the operability of the element.  
| TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated. |

These properties are available only when you select the “Preview: Support client animations and overlay of native elements” option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.

| “Animation duration” | Time that the element executes an animation (in milliseconds)  
| Example: 500 |
| “Move to the foreground” | Property value (BOOL)  
| TRUE: At runtime, the element is displayed in the foreground.  
| FALSE: At runtime, the element is displayed in the layer where it was inserted in the visualization editor. |

- © Chapter 1.3.5.21.5 “Using client animation” on page 1962

The properties contain the configurations for the user input when using the mouse or keyboard. A user input defines an event and one or more actions that are executed when an event occurs.

The “Configure” button opens the “Input configuration” dialog box for creating or modifying a user input.

Configured user inputs are briefly listed below the events. They each include the action that is triggered and the setting in short form.

Example: “Execute ST code”: # PLC_PRG.i_x := 0;

| “OnDialogClosed” | Input event: The user closes the dialog box. |
| “OnMouseClick” | Input event: The user clicks the mouse button completely. The mouse button is clicked and released. |
| “OnMouseDown” | Input event: The user clicks down on the mouse button. |
| “OnMouseEnter” | Input event: The user drags the mouse pointer to the element. |
| “OnMouseLeave” | Input event: The user drags the mouse pointer away from the element. |
| “OnMouseMove” | Input event: The user moves the mouse pointer over the element area. |
| “OnMouseUp” | Input event: The user releases the mouse button over the element area. |
### "Tap"

When a mouse click event occurs, the variable defined in "Variable" is described in the application. The coding depends on the options "Tap FALSE" and "Tap on enter if captured".

#### "Variable"
Variable (BOOL) that is set on mouse click.

**Example:** PLC_PRG.bIsTapped
- **TRUE**: A mouse click event exists. It lasts while the user presses the mouse button over the element. It ends when the button is released.
- **FALSE**: A mouse click event does not exist.

**Requirement:** The "Tap FALSE" option is not activated.

#### "Tap FALSE"
- **☑**: The mouse click event leads to a complementary value in "Variable".
- **TRUE**: A mouse click event does not exist.
- **FALSE**: While the mouse click event exists.

#### "Tap on enter if captured"
- **☑**: During user input, it is also taken into consideration whether the mouse pointer is dragged within the element area or not while the mouse button is pressed.
- **TRUE**: While the mouse click event exists and the mouse pointer is moved over the element area.
- **FALSE**: A mouse click event does not exist. Or the user moves the mouse pointer outside of the element area while the mouse button is pressed.

The value is **TRUE** again as soon as the user moves the pointer back to the element area. The mouse is then captured.

### "Shift"

With the onset of a mouse click event, the variable is set; when the mouse click event is completed, the variable is reset.

#### "Variable"
Variable (BOOL). Its value toggled when the mouse click event is ended. This is when the user releases the mouse button while the mouse pointer is over the element area.

If the user releases the mouse button while the mouse pointer is outside of the element area, the mouse click event is not ended and the value is not toggled.

**Tip:** The user can cancel a started toggle input by dragging the mouse pointer out of the element area.

#### "Toggle on up if captured"
- **☑**: The value toggles regardless of where the mouse pointer is when the mouse button is released. The mouse is then captured.

### "Keyboard shortcuts"
Keyboard shortcut on the element for triggering specific input actions.

When the keyboard shortcut event occurs, the input actions in the "Event(s)" property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.

#### "Key"
Key pressed for input action.

**Example:** [T]

**Note:** The following properties appear when a key is selected.
**“Event(s)”**

- **“None”**
- **“Mouse down”**: Pressing the key triggers the input actions that are configured in the “OnMouseDown” property.
- **“Mouse up”**: Releasing the key triggers the input actions that are configured in the “OnMouseUp” property.
- **“Mouse down/up”**: Pressing and releasing the key triggers the input actions that are configured in the “OnMouseDown” property and the “OnMouseUp” property.

**“Shift”**

- ✅: Combination with the Shift key
- Example: [Shift]+[T].

**“Control”**

- ✅: Combination with the Ctrl key
- Example: [Ctrl]+[T].

**“Alt”**

- ✅: Combination with the Alt key
- Example: [Alt]+[T].

---

All keyboard shortcuts and their actions that are configured in the visualization are listed in the “Keyboard configuration” tab.

<th>ID for the text in the &quot;GlobalTextList&quot;</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: 22</td>
<td></td>
</tr>
<tr>
<td>The text ID cannot be modified. As soon as you specify and save a text in &quot;Texts&quot; - &quot;Text&quot;, CODESYS automatically creates an entry in the &quot;GlobalTextList&quot; and displays the ID here.</td>
<td></td>
</tr>
</tbody>
</table>

**Element property 'Position'**

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

<table>
<thead>
<tr>
<th>&quot;X&quot;</th>
<th>X coordinate of the upper left corner of the element</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Specified in pixels.</td>
</tr>
<tr>
<td></td>
<td>Example: 10.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>&quot;Y&quot;</th>
<th>Y coordinate of the upper left corner of the element</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Specified in pixels.</td>
</tr>
<tr>
<td></td>
<td>Example: 10.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>&quot;Width&quot;</th>
<th>Specified in pixels.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Example: 150</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>&quot;Height&quot;</th>
<th>Specified in pixels.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Example: 30</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the box symbols (□) to other positions in the editor.

**“Font color”**

Example: “Black”

![The “Color” dialog box opens.](image)

![Drop-down list with style colors.](image)

**“Transparency”**

Whole number (value range from 0 to 255). This determines the transparency of the respective color.

Example: 255: The color is opaque.

0: The color is completely transparent.

Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

---

**Element properties 'Absolute movement’**

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

---

**“Movement”**

**“X”**

Variable (numeric data type). Defines the X position (in pixels).

Example: PLC_PRG.iPos_X.

Increasing this value in runtime mode moves the element to the right.

**“Y”**

Variable (numeric data type). Defines the Y position (in pixels).

Example: PLC_PRG.iPos_Y.

Increasing this value in runtime mode moves the element downwards.

**“Rotation”**

Variable (numeric data type). Defines the angle of rotation (in degrees).

Example: PLC_PRG.iAngle1.

The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.

In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

**“Interior rotation”**

Variable (numeric data type). Defines the angle of rotation (in degrees).

Example: PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol.

Note: If a static angle of rotation is specified in the “Position ➔ Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.
You can link the variables to a unit conversion.

The "X", "Y", "Rotation", and "Interior rotation" properties are supported by the "Client Animation" functionality.

</tbody>
</table>

<table>
<thead>
<tr>
<th>“Type of element”</th>
<th>“Progress bar”</th>
</tr>
</thead>
</table>

| “Text ID” | Identification of the global text list
| Requirement: Text is configured in the property “Texts ➔ Text”. |

| “Variable” | Variable (numeric data type). Represents the length of the progress bar. |

| “Minimum value” | Value range of the variable |

| “Maximum value” | |

| “Style” | ● “Blocks”
| ● “Bar” |

**Element property 'Position'**
The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.
“X”  X coordinate of the upper left corner of the element
specified in pixels.
Example: 10.

“Y”  Y coordinate of the upper left corner of the element
specified in pixels.
Example: 10.

“Width”  Specified in pixels.
Example: 150

“Height”  Specified in pixels.
Example: 30

You can also change the values by dragging the box symbols (_dragArrow_) to other positions in the editor.

Element property ‘Center’

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

“X”  X-coordinate of the point of rotation

“Y”  Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (_dragArrow_) to other positions in the editor.

Element property ‘Texts’

“Text”  String label for the element.
Example: Zoom

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

“Movement”

“X”  Variable (numeric data type). Defines the X position (in pixels).
Example: PLC_PRG.iPos_X.
Increasing this value in runtime mode moves the element to the right.
"Y" Variable (numeric data type). Defines the Y position (in pixels).
Example: PLC_PRG.iPos_Y.
Increasing this value in runtime mode moves the element downwards.

"Rotation" Variable (numeric data type). Defines the angle of rotation (in degrees).
Example: PLC_PRG.iAngle1.
The midpoint of the element rotates at the "Center" point. This rotation point is shown as the symbol.
In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

"Interior rotation" Variable (numeric data type). Defines the angle of rotation (in degrees).
Example: PLC_PRG.iAngle2.
In runtime mode, the element rotates about the point of rotation specified in "Center" according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.
The rotation point is shown as the symbol.
Note: If a static angle of rotation is specified in the "Position Angle" property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

You can link the variables to a unit conversion.

The "X", "Y", "Rotation", and "Interior rotation" properties are supported by the "Client Animation" functionality.

- Chapter 1.3.5.3.2 “Positioning elements, adapting size and layer” on page 1113

| Variable | Variable (integer data type) that gives the index of the radio button that the visualization user has activated
Example: PLC_PRG.iNrOfActivatedRadioButton |
| Number of columns | Definition of the number of list boxes displayed in a row
Example: 2 |
| Radio button order | “Left to right”: The radio buttons are aligned by rows until the number of columns is reached.
“Top to bottom”: The radio buttons are aligned row by columns until the number of columns is reached. |
| Frame size | Defines the distance from the list boxes to the edge (in pixels). |
| Row height | Height of the row (in pixels). Modifying the height of the row also changes the size of the list box. |
Element property 'Text properties'

The properties contain fixed values for the text properties.

| “Usage of”                  | • “Default style values”: The values of the visualization style are used.  
|                            | • “Individual settings”: The “Individual text properties” property group is shown  
|                            | The values can be customized here. |

| “Individual text properties”                 |
| Requirement: The “Individual settings” text property is defined. |

| “Horizontal alignment”    | Horizontal alignment of the text within the element. |
| “Vertical alignment”      | Vertical alignment of the text within the element. |

| “Text format”             | Definition for displaying texts that are too long  
|                            | • “Default”: The long text is truncated.  
|                            | • “Line break”: The text is split into parts.  
|                            | • “Ellipsis”: The visible text ends with ”...” indicating that it is not complete. |

| “Font”                    | Example: “Default”  
|                          | 🔗: The “Font” dialog box opens.  
|                          | ▼: Drop-down list with style fonts. |

| “Font color”              | Example: “Black”  
|                          | 🔗: The “Color” dialog box opens.  
|                          | ▼: Drop-down list with style colors. |

| “Transparency”            | Whole number (value range from 0 to 255). This determines the transparency of the respective color.  
| Example: 255: The color is opaque.  
| 0: The color is completely transparent. |
| Please note: If the color is a style color and already has a transparency value, then this property is write-protected. |

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

| “Movement”                |
| “X”                       | Variable (numeric data type). Defines the X position (in pixels).  
| Example: PLC_PRG.iPos_X.  
| Increasing this value in runtime mode moves the element to the right. |

| “Y”                       | Variable (numeric data type). Defines the Y position (in pixels).  
| Example: PLC_PRG.iPos_Y.  
| Increasing this value in runtime mode moves the element downwards. |
“Rotation” Variable (numeric data type). Defines the angle of rotation (in degrees).

Example: PLC_PRG.iAngle1.

The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.

In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

“Interior rotation” Variable (numeric data type). Defines the angle of rotation (in degrees).

Example: PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol.

Note: If a static angle of rotation is specified in the “Position Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.

Visualization element 'Alarm table'

Symbol:

Tag: “Alarm manager”

The element displays alarms in a list. In the element properties, you specify which information is shown. You define the appearance of the element and the variables that control the element behavior.

In online mode, you can sort an alarm table by a specific column – even in the classic view. Click into the column header. A small triangle indicates the current sort order (ascending, descending). Clicking the symbol reverses the order.

Sorting inside the column depends on the type of the contained information. The "Priority" column is sorted numerically, and the "Message" and "Class" columns alphabetically. The "Value" and "Latch" columns may contain different value types. In this case, sorting is first by type (blank, Boolean, numeric value, character string) and then either numerically or alphabetically depending on the type.

<table>
<thead>

</tr>
</tbody>
</table>

See also

• Object 'Data source'
**“Alarm groups”**
Opens the “Select Alarm Group” dialog where you define the alarm groups that you want to display.

**“Priority from”**
Lowest priority for alarm display. (0 to 255).

**“Priority to”**
Highest priority for alarm display. (0 to 255).

**“Alarm classes”**
Opens the “Select Class Group” dialog where you define the alarm classes that you want to display.

**“Filter criterion”**
For the alarm banner element only
- **“Most important”**: The alarm with the highest priority (lowest value) is displayed.
- **“Newest”**: The most recent alarm is displayed.

**“Filter by latch 1”**
The generated alarms (previous and current) can be filtered by the contents of “Latch variable 1”, which is specified in the configuration of the alarm group. In “Filter type”, you define whether or not the filtering is performed by a string value or a numerical value.
- **“Filter variable”**: Indicates what the alarms are filtered by. Possible entries: Application variable of data type STRING or WSTRING, or a literal value directly. Examples: PLC_PRG.strFilterVariable, 'STRING'.
- **“Filter type”**: Integer value that determines by which criteria the latch variable value is used for filtering. Possible entries: Numerical variable from the application (example: PLC_PRG.diFilterType, or a value directly (example: 2).

Possible values:
- 0: No filtering
- 1: Filter by alarms whose latch variable 1 contains the string specified in “Filter variable”. Example: The filter variable contains 'Error 1' which is the latch variable 1 of different alarms of type STRING and has the value 'Error 1' ->. Only these alarms are displayed.
- 2: Filter by alarms whose latch variable 1 contains the typed literal specified in “Filter variable” according to IEC 61131-3. Examples: T#1h2s, DINT#15, REAL#1.5, FALSE
- 3: Filter by alarms whose latch variable 1 contains the LINT literal value specified in “Filter variable”. Therefore, the value of the latch variables has to be in the range of 9,223,372,036,854,775,808 to 9,223,372,036,854,775,807.
- All other values: The behavior is not defined and can change in the future.

**Element property ‘General table configuration’**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Show row header”</td>
<td>Display of the row number at the beginning of the row.</td>
</tr>
<tr>
<td>“Show column header”</td>
<td>Display of the column heading as defined in “Column heading”.</td>
</tr>
<tr>
<td>“Row height”</td>
<td>Height of the table rows (in pixels).</td>
</tr>
<tr>
<td>“Row header width”</td>
<td>Width of the line header (in pixels).</td>
</tr>
</tbody>
</table>
**Scrollbar size**

Width of the scrollbar when it runs vertically. Width of the scrollbar when it runs horizontally. Specified in pixels.

**Automatic line break for alarm message**

☑: The message text is truncated at the end of the line.

☐: The message text is truncated at the end of the column, if the text is too long.

By default, columns [0] and [1] are configured: “Time stamp” and “Message text”. You can create more columns by clicking the “Create new”, and remove columns by clicking “Delete”.

Animations (dynamic text, font variables), text, and tooltip are not supported.

**Column header**

The standard header is set and changed here by specifying a new text.

**Use text alignment in title**

☑: The text in the column header is aligned according to the current definition in “Text alignment”.

☐: The text in the column header is centered.

**Width**

Width of the column (in pixels).

**Data type**

Notice about time stamps: For use in a TargetVisu or WebVisu, you can control the date and time format with the help of the global string variables from the library Alarmmanager.library: AlarmGlobals.g_sDateFormat (example: AlarmGlobals.g_sDateFormat := 'MM.yyyy') and AlarmGlobals.g_sTimeFormat (example: AlarmGlobals.g_sTimeFormat := 'HH:mm').

Define the information to be displayed in the column.

- “Symbol”
- “Time stamp”: Date and time of the last status change of the alarm.
- “Time stamp active”: Date and time of the last activation of the alarm.
- “Time stamp inactive”: Date and time of the last deactivation of the alarm.
- “Time stamp acknowledge”: Date and time of the last acknowledgment.
- “Value”: Current value of the printout
- “Message text”: Output of the message text
- “Priority”: Alarm priority
- “Class”: Alarm class
- “State”: Alarm state
- “Latch Variable <n>”: Value of the selected latch variables

**Text alignment**

Alignment of the text in this column

- “Left”
- “Centered”
- “Right”

**Color settings**

- “Activate color settings”: Boolean variable for activating and deactivating the color settings defined here. Example: PLC_PRG.bColorSettings
- “Cell fill color”:
  - “Color variable”: Variable for the cell fill color, example: dwCellColor (hexadecimal color definition: 16#TTRRGGBB)
  - “Use color also for column header”: ☑: The color defined via “Color variable” is used in the column header as well.
- “Text color”:
  - “Color variable”: Variable for the definition of the text color in the column, example: dwTextColor (hexadecimal color definition: 16#TTRRGGBB)
  - “Use color also for column header”: ☐: The color defined via “Color variable” is used in the column header as well.

</tbody>
</table>

You can also change the values by dragging the symbols (_draged_circle_ to other positions in the editor.

Element property 'Text properties'
The properties contain fixed values for the text properties.
### “Font”

Example: “Default”

- The “Font” dialog box opens.
- Drop-down list with style fonts.

### “Font color”

Example: “Black”

- The “Color” dialog box opens.
- Drop-down list with style colors.

### “Transparency”

Whole number (value range from 0 to 255). This determines the transparency of the respective color.

Example: 255: The color is opaque.
0: The color is completely transparent.

Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

---

#### Element property 'Selection'

<table>
<thead>
<tr>
<th>“Background color on selection”</th>
<th>Fill color of the selected row.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Selection font color”</td>
<td>Font color of the selected row.</td>
</tr>
<tr>
<td>“Frame around selected cells”</td>
<td>A frame is drawn around the selected cells at runtime.</td>
</tr>
<tr>
<td>“Variable for selected alarm group”</td>
<td>Name of the affected alarm group; type: STRING, WSTRING.</td>
</tr>
<tr>
<td>“Variable for selected alarm ID”</td>
<td>Alarm ID of the affected alarm group; type: STRING, WSTRING.</td>
</tr>
<tr>
<td>“Variable for selected line”</td>
<td>Index of the selected alarm line (0-based). The index can be read and written; integer data type</td>
</tr>
<tr>
<td>“Variable for valid selection”</td>
<td>TRUE: An alarm line is selected. FALSE: The selection is invalid. For example, for an empty alarm table or when an alarm is not selected yet.</td>
</tr>
</tbody>
</table>

---

#### Element property 'Control variables'

Boolean variables are defined here for executing specific actions in the table can be executed at runtime.

<table>
<thead>
<tr>
<th>“Acknowledge selected”</th>
<th>Variable (BOOL)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: PLC_PRG.bAckSelectedAlarms</td>
<td></td>
</tr>
<tr>
<td>If the assigned variable is TRUE, then the selected alarm is acknowledged.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Acknowledge all visible”</th>
<th>Variable (BOOL)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: PLC_PRG.bAckVisibleAlarms</td>
<td></td>
</tr>
<tr>
<td>If the assigned variable is TRUE, then all alarms are acknowledged that are visible in the alarm table.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“History”</th>
<th>Variable (BOOL)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: PLC_PRG.bShowHistory</td>
<td></td>
</tr>
<tr>
<td>If the assigned variable is TRUE, then the history alarms are displayed in addition to the active alarms. In the classic view, the same sort options apply as in normal mode. Note: Acknowledgment is not possible in this view.</td>
<td></td>
</tr>
</tbody>
</table>
### “Freeze scroll position” Variable (BOOL)

**Example:** PLC_PRG.bFreezeScrollPosition

If the assigned variable is TRUE, then the scroll position set in the “History” view is retained, even if a new alarm is active. If not, then the scroll position jumps to the first table row (the newest alarm).

### “Count alarms” Variable (integer data type)

**Example:** PLC_PRG.iNumberOfAlarms.

Number of alarms that are currently displayed in the alarm table. Defined by the alarm table.

### “Count visible rows” Variable (integer data type)

**Example:** PLC_PRG.iNumberOfVisibleLines

Number of alarms that can be displayed on one page of the alarm table. Defined by the alarm table.

### “Current scroll index” Variable (integer data type)

**Example:** PLC_PRG.iScrollIndex

The index of the first visible row if the alarm table (0-based). The variable can be read and written.

### “Current column sorting” Variable (integer data type)

**Example:** PLC_PRG.iColSort

The variable contains a value of the enumeration "VisuElemsAlarm.VisuEnumAlarmDataType". This value determines the column that sorts the alarm table.

### “Variable for sorting direction” Variable (BOOL)

**Example:** PLC_PRG.xSortAscending

The variable determines the sort order for the entries in the alarm table (TRUE: ascending; FALSE: descending).

---

You can also use the “Insert elements for acknowledging alarms” command to define buttons with predefined control variables.

---

**Element property 'Absolute movement'**

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

#### “Movement”

**“X”** Variable (numeric data type). Defines the X position (in pixels).

**Example:** PLC_PRG.iPos_X.

Increasing this value in runtime mode moves the element to the right.

**“Y”** Variable (numeric data type). Defines the Y position (in pixels).

**Example:** PLC_PRG.iPos_Y.

Increasing this value in runtime mode moves the element downwards.
**“Rotation”**  Variable (numeric data type). Defines the angle of rotation (in degrees).

Example: PLC_PRG.iAngle1.

The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.

In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

**“Interior rotation”**  Variable (numeric data type). Defines the angle of rotation (in degrees).

Example: PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol.

Note: If a static angle of rotation is specified in the “Position” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.

See also

- Unit conversion

Element property ‘State variables’

The variables control the element behavior dynamically.

**“Invisible”**  Variable (BOOL). Toggles the visibility of the element.

TRUE: The element is not visible at runtime.

The “Invisible” property is supported by the “Client Animation” functionality.
These properties are available only when you select the “Preview: Support client animations and overlay of native elements” option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.

<table>
<thead>
<tr>
<th>“Animation duration”</th>
<th>Time that the element executes an animation (in milliseconds)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: 500</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Move to the foreground”</th>
<th>Property value (BOOL)</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRUE: At runtime, the element is displayed in the foreground.</td>
<td></td>
</tr>
<tr>
<td>FALSE: At runtime, the element is displayed in the layer where it was inserted in the visualization editor.</td>
<td></td>
</tr>
</tbody>
</table>

Requirement: User management is set up for the visualization.

<table>
<thead>
<tr>
<th>“Access rights”</th>
<th>Opens the “Access rights” dialog. There you can edit the access privileges for the element.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status messages:</td>
<td></td>
</tr>
<tr>
<td>“Not set. Full rights.”</td>
<td>Access rights for all user groups : “operable”</td>
</tr>
<tr>
<td>“Rights are set: Limited rights”</td>
<td>Access is restricted for at least one group.</td>
</tr>
</tbody>
</table>

- Chapter 1.3.5.21.5 “Using client animation” on page 1962

Visualization element ‘Alarm banner’

Symbol:

Tag: “Alarm manager”

The element is a simplified version of the alarm table. It visualizes a single alarm only. In the element properties, you specify which information is shown. You define the appearance of the element and the variables that control the element behavior.
The alarm banner displays active alarms only. If the alarm is acknowledged, then it disappears from the alarm banner.

### Element properties

<table>
<thead>
<tr>
<th>“Element name”</th>
<th>Example: GenElemInst_1</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Type of element”</td>
<td>“Alarm banner”</td>
</tr>
<tr>
<td>“Data source”</td>
<td>If you intend to use a remote alarm configuration, then you have to specify the name of the remote application here. If you do not specify anything, the alarm configuration will be located locally.</td>
</tr>
</tbody>
</table>

### Element property 'Alarm configuration’

| “Alarm groups” | Opens the “Select Alarm Group” dialog where you define the alarm groups that you want to display. |
| “Priority from” | Lowest priority for alarm display. (0 to 255). |
| “Priority to” | Highest priority for alarm display. (0 to 255). |
| “Alarm classes” | Opens the “Select Class Group” dialog where you define the alarm classes that you want to display. |
### Filter criterion

For the alarm banner element only
- **“Most important”:** The alarm with the highest priority (lowest value) is displayed.
- **“Newest”:** The most recent alarm is displayed.

### Filter by latch 1

The generated alarms (previous and current) can be filtered by the contents of “Latch variable 1”, which is specified in the configuration of the alarm group. In “Filter type”, you define whether or not the filtering is performed by a string value or a numerical value.

- **“Filter variable”:** Indicates what the alarms are filtered by. Possible entries: Application variable of data type STRING or WSTRING, or a literal value directly. Examples: PLC_PRG.strFilterVariable, 'STRING'.
- **“Filter type”:** Integer value that determines by which criteria the latch variable value is used for filtering. Possible entries: Numerical variable from the application (example: PLC_PRG.diFilterType, or a value directly (example: 2).

Possible values:
- 0: No filtering
- 1: Filter by alarms whose latch variable 1 contains the string specified in “Filter variable”. Example: The filter variable contains ‘Error 1’ which is the latch variable 1 of different alarms of type STRING and has the value ‘Error 1’ ->. Only these alarms are displayed.
- 2: Filter by alarms whose latch variable 1 contains the typed literal specified in “Filter variable” according to IEC 61131-3. Examples: T#1h2s, DINT#15, REAL#1.5, FALSE
- 3: Filter by alarms whose latch variable 1 contains the LINT literal value specified in “Filter variable”. Therefore, the value of the latch variables has to be in the range of 9,223,372,036,854,775,808 to 9,223,372,036,854,775,807.
- All other values: The behavior is not defined and can change in the future.

### See also

- % Chapter 1.3.5.19.3.17 “Dialog ‘Selected Alarm Group’” on page 1605

- % Chapter 1.3.5.7 “Visualizing alarm management” on page 1146

### Element property ‘Columns: Column [<n>]

By default, columns [0] and [1] are preconfigured: “Time stamp” and “Message text”. You create more columns by clicking “Create new”. You remove columns by clicking “Delete”.

Animations (dynamic text, font variables), texts, and tooltips are not supported.
### “Width”

Width of the column (in pixels)

### “Type of data”

About time stamps: When used in a TargetVisu or WebVisu, you can control the date and time format by means of the global string variables from the library Alarmmanager.library: AlarmGlobals.g_sDateFormat (example: AlarmGlobals.g_sDateFormat := 'MM.yyyy') and AlarmGlobals.g_sTimeFormat (example: AlarmGlobals.g_sTimeFormat := 'HH:mm').

Here you define the information to be displayed in the column.

- “Bitmap”
- “Time stamp”: Date and time of the last status change of the alarm
- “Time stamp active”: Date and time of the last activation of the alarm
- “Time stamp inactive”: Date and time of the last deactivation of the alarm
- “Time stamp acknowledge”: Date and time of the last acknowledgement
- “Value”: Actual value of the expression
- “Message”: Output of the message text
- “Priority”: Alarm priority
- “Class”: Alarm class
- “State”: Alarm state
- “Latch Variable <n>”: Value of the selected latch variables

### “Text alignment”

Alignment of the contents in the column

- “Left”
- “Centered”
- “Right”

---

**Element property 'Position'**

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

<table>
<thead>
<tr>
<th>“X”</th>
<th>X coordinate of the upper left corner of the element</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Specified in pixels.</td>
</tr>
<tr>
<td>Example:</td>
<td>10</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Y”</th>
<th>Y coordinate of the upper left corner of the element</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Specified in pixels.</td>
</tr>
<tr>
<td>Example:</td>
<td>10</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Width”</th>
<th>Specified in pixels.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>150</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Height”</th>
<th>Specified in pixels.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>30</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the box symbols (_drag_ ) to other positions in the editor.

See also

- % Chapter 1.3.5.3.2 “Positioning elements, adapting size and layer” on page 1113
Element property 'Center': The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

<table>
<thead>
<tr>
<th>“X”</th>
<th>X-coordinate of the point of rotation</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Y”</td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the symbols (φ) to other positions in the editor.

Element property 'Text properties': The properties contain fixed values for the text properties.

<table>
<thead>
<tr>
<th>“Font”</th>
<th>Example: “Default”</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>☀️: The “Font” dialog box opens.</td>
</tr>
<tr>
<td></td>
<td>⊖: Drop-down list with style fonts.</td>
</tr>
<tr>
<td>“Font color”</td>
<td>Example: “Black”</td>
</tr>
<tr>
<td></td>
<td>☀️: The “Color” dialog box opens.</td>
</tr>
<tr>
<td></td>
<td>⊖: Drop-down list with style colors.</td>
</tr>
<tr>
<td>“Transparency”</td>
<td>Whole number (value range from 0 to 255). This determines the transparency of the respective color.</td>
</tr>
<tr>
<td></td>
<td>Example: 255: The color is opaque.</td>
</tr>
<tr>
<td></td>
<td>0: The color is completely transparent.</td>
</tr>
<tr>
<td></td>
<td>Please note: If the color is a style color and already has a transparency value, then this property is write-protected.</td>
</tr>
</tbody>
</table>

| “Acknowledge variable” | A rising edge of this variable acknowledges the alarm. |

Handling of multiple active alarms

<table>
<thead>
<tr>
<th>“Automatic switch”</th>
<th>☑️: The display in the alarm banner is switched automatically according to the time to the next alarm as configured in “Every N second”.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Every N second”</td>
<td>Time period until the next switching. Available only if “Automatic switch” is selected.</td>
</tr>
<tr>
<td>“Next alarm”</td>
<td>Variable for switching to the next alarm. Available only if “Automatic switch” is not selected.</td>
</tr>
<tr>
<td>“Previous alarm”</td>
<td>Variable for switching to the previous alarm. Available only if “Automatic switch” is not selected.</td>
</tr>
<tr>
<td>“Multiple alarms active”</td>
<td>Variable that has the value TRUE if multiple alarms are active.</td>
</tr>
</tbody>
</table>

Element property 'Absolute movement': The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
### “Movement”

| **“X”** | Variable (numeric data type). Defines the X position (in pixels).  
Example: PLC_PRG.iPos_X.  
Increasing this value in runtime mode moves the element to the right. |
| --- | --- |
| **“Y”** | Variable (numeric data type). Defines the Y position (in pixels).  
Example: PLC_PRG.iPos_Y.  
Increasing this value in runtime mode moves the element downwards. |
| **“Rotation”** | Variable (numeric data type). Defines the angle of rotation (in degrees).  
Example: PLC_PRG.iAngle1.  
The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.  
In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right. |
| **“Interior rotation”** | Variable (numeric data type). Defines the angle of rotation (in degrees).  
Example: PLC_PRG.iAngle2.  
In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.  
The rotation point is shown as the symbol.  
Note: If a static angle of rotation is specified in the “Position ➔ Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed. |

You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.

See also
- Unit conversion
The variables control the element behavior dynamically.

**"Invisible"**

<table>
<thead>
<tr>
<th>Variable (BOOL)</th>
<th>Toggles the visibility of the element.</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRUE</td>
<td>The element is not visible at runtime.</td>
</tr>
</tbody>
</table>

The "Invisible" property is supported by the "Client Animation" functionality.

See also

- 

These properties are available only when you select the "Preview: Support client animations and overlay of native elements" option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.

<table>
<thead>
<tr>
<th>&quot;Animation duration&quot;</th>
<th>Time that the element executes an animation (in milliseconds)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: 500</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>&quot;Move to the foreground&quot;</th>
<th>Property value (BOOL)</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRUE</td>
<td>At runtime, the element is displayed in the foreground.</td>
</tr>
<tr>
<td>FALSE</td>
<td>At runtime, the element is displayed in the layer where it was inserted in the visualization editor.</td>
</tr>
</tbody>
</table>

**Element property ‘Position’**

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.
### Element property 'Background'

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>X</td>
<td>X coordinate of the upper left corner of the element. Specified in pixels. Example: 10.</td>
</tr>
<tr>
<td>Y</td>
<td>Y coordinate of the upper left corner of the element. Specified in pixels. Example: 10.</td>
</tr>
<tr>
<td>Width</td>
<td>Specified in pixels. Example: 150</td>
</tr>
<tr>
<td>Height</td>
<td>Specified in pixels. Example: 30</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the box symbols (_drag_ symbol) to other positions in the editor.

See also
- Chapter 1.3.5.3.2 “Positioning elements, adapting size and layer” on page 1113

#### Background color
Drop-down list with background colors.

Note: This property depends on the style. For example, there are no heterochromatic background images for "FlatStyle" and "Whitestyle".

#### Own image
- "image": Image ID of the background image. You select the background image from an image pool by clicking the image symbol.
  - Info: If you specify the "<default>" value or select the image from the "Default" category in the input assistant, then the original element background image is used.
- "Transparent color": Color of pixels that are displayed as transparent. Selection from drop-down list or input assistant.

#### Optimized drawing
- [✓]: The background image is drawn one time. If there is a change in the foreground, then only the affected part of the image is redrawn.
- [☐]: The background image is redrawn in cycles.

Note: Deactivating this option is sensible only in certain exceptional cases.

### Element property 'Bar'

#### Diagram type
- "Scale besides bar"
- "Scale in bar"
- "Bar in scale"
- "No scale"

#### Orientation
Orientation depending on the ratio of width to height of the bar display:
- "Horizontal"
- "Vertical"
### “Running direction”
Direction the values are increased.  
Drop-down list for “Orientation Horizontal”:  
- “Left to right”  
- “Right to left”  
Drop-down list for “Orientation Vertical”:  
- “Bottom to top”  
- “Top to bottom”

### “Optimum size for bar”
- The bar width requires the majority of the element surface.  
Note: This property depends on the style. It is not provided for “FlatStyle” or “WhiteStyle”.

---

#### Element property 'Scale'

### “Scale start”
Least value of the scale and the lower limit of the value range for the element.  
Example: 0  
- The property “Variable” is shown below.

### “Variable”
Variable (integer data type). Contains the scale start.  
Example: PLC_PRG.iScaleStart  
Declaration:  
```
PROGRAM PLC_PRG
VAR
  iScaleStart : INT := 0;
END_VAR
```

### “Scale end”
Greatest value of the scale and the upper limit of the value range for the element.  
Example: 100  
- The property “Variable” is shown below.

### “Variable”
Variable (integer data type). Contains the scale end.  
Example: PLC_PRG.iScaleEnd  
Declaration:  
```
PROGRAM PLC_PRG
VAR
  iScaleEnd : INT := 120;
END_VAR
```

### “Main scale”
Distance between 2 values on the rough scale.  
Example: 10  
- The property “Variable” is shown below.

### “Variable”
Variable (integer data type). Contains the distance.  
Example: PLC_PRG.iMainScale  
Declaration:  
```
PROGRAM PLC_PRG
VAR
  iMainScale : INT := 20;
END_VAR
```
**Subscale**

Distance between 2 values on the fine scale.
You can hide the fine scale by setting the value to 0.
Example: 2
φ: The property “Variable” is shown below.

**Variable**

Variable (integer data type). Contains the spacing.
Example: PLC_PRG.iSubScale

Declaration:

```plaintext
PROGRAM PLC_PRG
VAR
   iSubScale : INT := 5;
END_VAR
```

**Scale line width**

Specified in pixels.
Example: 3

**Scale color**

Color of scale lines
- ⚫️: The “Color” dialog box opens.
- ⬇️: A drop-down list with color names opens.

**Scale in 3D**

☑️: Tick marks are displayed with slight 3D shadowing.
Note: This property depends on the style. Not available for “FlatStyle”.

**Element frame**

☑️: A frame is drawn around the element.

---

**Element property 'Label'**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Unit</strong></td>
<td>Text that is displayed in the element. Example: Units displayed in m/s.</td>
</tr>
<tr>
<td><strong>Font</strong></td>
<td>Font for labels (example: scale numbering). Selection from the drop-down list or by clicking the “…” button.</td>
</tr>
</tbody>
</table>
| **Scale format (C Syntax)”** | Values scaled in "printf" syntax  
Example: %d, %5.2f |
| **Max. text width of labels”** | (optional) Value that redefines the maximum width of the scale label. The correct value is normally set automatically.  
Note: Change this value only if the automatic adjustment does not yield the expected result. |
| **Text height of labels”** | (optional) Value that redefines the maximum height of the scale label. The correct value is normally set automatically.  
Note: Change this value only if the automatic adjustment does not yield the expected result. |
| **Font color”**   | Selection from the drop-down list or by clicking the “…” button. |

---

**Element property 'Positioning'**
### Element properties 'Colors'

<table>
<thead>
<tr>

### Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
“Movement”

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“X”</td>
<td>Variable (numeric data type). Defines the X position (in pixels).</td>
</tr>
<tr>
<td></td>
<td>Example: PLC_PRG.iPos_X.</td>
</tr>
<tr>
<td></td>
<td>Increasing this value in runtime mode moves the element to the right.</td>
</tr>
<tr>
<td>“Y”</td>
<td>Variable (numeric data type). Defines the Y position (in pixels).</td>
</tr>
<tr>
<td></td>
<td>Example: PLC_PRG.iPos_Y.</td>
</tr>
<tr>
<td></td>
<td>Increasing this value in runtime mode moves the element downwards.</td>
</tr>
<tr>
<td>“Rotation”</td>
<td>Variable (numeric data type). Defines the angle of rotation (in degrees).</td>
</tr>
<tr>
<td></td>
<td>Example: PLC_PRG.iAngle1.</td>
</tr>
<tr>
<td></td>
<td>The midpoint of the element rotates at the “Center” point.</td>
</tr>
<tr>
<td></td>
<td>This rotation point is shown as the symbol.</td>
</tr>
<tr>
<td></td>
<td>In runtime mode, the alignment of the element remains the same with respect</td>
</tr>
<tr>

<td>to the coordinate system of the visualization. Increasing the value</td>
</tr>
<tr>
<td></td>
<td>rotates the element to the right.</td>
</tr>
<tr>
<td>“Interior rotation”</td>
<td>Variable (numeric data type). Defines the angle of</td>
</tr>
<tr>
<td></td>
<td>Example: PLC_PRG.iAngle2.</td>
</tr>
<tr>
<td></td>
<td>In runtime mode, the element rotates about the point of rotation specified</td>
</tr>
<tr>
<td></td>
<td>in “Center” according to the value of the variable. In addition, the</td>
</tr>
<tr>
<td></td>
<td>alignment of the element rotates according to the coordinate system of the</td>
</tr>
<tr>
<td></td>
<td>visualization. Increasing the value in the code rotates clockwise.</td>
</tr>
<tr>
<td></td>
<td>The rotation point is shown as the symbol.</td>
</tr>
<tr>
<td></td>
<td>Note: If a static angle of rotation is specified in the</td>
</tr>
<tr>
<td></td>
<td>“Position ➔ Angle” property, then the static angle of rotation is added to</td>
</tr>
<tr>
<td></td>
<td>the variable angle of rotation (offset) when the visualization is executed.</td>
</tr>
</tbody>
</table>

You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.

- Unit conversion
**Element property 'State variables'**

The variables control the element behavior dynamically.

| “Deactivate inputs” | Variable (BOOL). Toggles the operability of the element. TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated. |

**Element property 'Access rights'**

Requirement: User management is set up for the visualization.

| “Access rights” | Opens the “Access rights” dialog. There you can edit the access privileges for the element. Status messages: ● “Not set. Full rights.”: Access rights for all user groups: “operable” ● “Rights are set: Limited rights”: Access is restricted for at least one group. |

**Visualization element 'Meter 90°'**

Symbol:

![Meter 90° symbol]

Tag: “Measurement controls”

The element displays the value of a variable. The needle is positioned according to the value of the assigned variable. A meter is used to represent a tachometer, for example.

**Element properties**

| “Element name” | Example: GenElemInst_1 |
| "Type of element" | “Meter 90°” |
| "Value" | Variable (numeric data type) The variable value determines the pointer movement of the element. |

These properties are available only when you select the “Preview: Support client animations and overlay of native elements” option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.
### Animation duration

Time that the element executes an animation (in milliseconds)

**Example:** 500

### Move to the foreground

Property value (BOOL)

- **TRUE:** At runtime, the element is displayed in the foreground.
- **FALSE:** At runtime, the element is displayed in the layer where it was inserted in the visualization editor.

### See also

- Chapter 1.3.5.21.5 “Using client animation” on page 1962

### Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| **X** | X coordinate of the upper left corner of the element  
Specified in pixels.  
**Example:** 10. |
| **Y** | Y coordinate of the upper left corner of the element  
Specified in pixels.  
**Example:** 10. |
| **Width** | Specified in pixels.  
**Example:** 150 |
| **Height** | Specified in pixels.  
**Example:** 30 |

You can also change the values by dragging the box symbols to other positions in the editor.

</tbody>
</table>
### Variable

Variable (integer data type) Contains the distance between two values on the main scale

**Example:** PLC_PRG.iMainScale

**Declaration:**

```
PROGRAM PLC_PRG
VAR
  iMainScale : INT := 20;
END_VAR
```

### Sub scale

Distance between two values on the fine scale

You can hide the fine scale by setting the value to 0.

**Example:** 2

*The “Variable” property is shown below this.

### Variable

Variable (integer data type) Contains the distance between two values on the fine scale

**Example:** PLC_PRG.iSubScale

**Declaration:**

```
PROGRAM PLC_PRG
VAR
  iSubScale : INT := 5;
END_VAR
```

### Scale line width

Specified in pixels

**Example:** 3

### Scale color

Color of scale lines

- [ ] The “Color” dialog opens.
- [ ] A list box with style colors opens.

### Scale in 3D

*Scale lines are displayed with soft 3D shadowing.*

Note: This property is not displayed in “FlatStyle”.

### Show scale

*The scale is displayed.*

### Frame inside

* A frame is drawn at the inner end of the scale.

### Frame outside

* A frame is drawn at the outer end of the scale.

---

**Element property 'Label'**

### Label

Selection list

- “Outside”: Scale values are placed outside of the scale.
- “Inside”: Scale values are placed inside of the scale.

### Unit

Text that is displayed in the element.

**Example:** Units displayed in m/s.

### Font

Font for labels (example: scale numbering).

Selection from the drop-down list or by clicking the “” button.

### Scale format (C Syntax)

Values scaled in "printf" syntax

**Examples:** %d, %5.2f
### “Max. text width of labels”

(ground) Value that redefines the maximum width of the scale label. The correct value is normally set automatically.

Note: Change this value only if the automatic adjustment does not yield the expected result.

### “Text height of labels”

(ground) Value that redefines the maximum height of the scale label. The correct value is normally set automatically.

Note: Change this value only if the automatic adjustment does not yield the expected result.

### “Font color”

Selection from the drop-down list or by clicking the button.

---

**Element property ‘Positioning’**

| “Usage of”            |  ● “Preset style values”: Values from the current style  
<table>
<thead>
<tr>
<th></th>
<th>● “User-defined settings”: The subnode “Positioning” appears.</th>
</tr>
</thead>
</table>

**“Positioning”**

Requirement: “User-defined settings” is selected as “Usage of”.

The displayed positioning settings depend on the type of needle instrument and potentiometer, and partially on whether a custom background image is selected. The following settings are used for achieving the exact position relative to the background image.

<table>
<thead>
<tr>
<th>“Needle movement”</th>
<th>Length of the needle (in pixels)</th>
</tr>
</thead>
</table>
| “Scale movement”  | Distance from the tick marks to the center (in pixels)  
| Requirement: A customer image is selected as “Background”.  |
| “Scale length”    | Length of the tick marks (in pixels)  
| Requirement: A customer image is selected as “Background”.  |
| “Label offset”    | Distance from the labels to the tick marks (in pixels) |
| “Unit offset”     | Distance of the unit text “Label ➔ Unit” from the upper scale edge (in pixels) |
| “Origin offset”   | Offset of the element (in pixels)  
| Requirement: For the elements “Meter 180°” and “Meter 90°”, this property is displayed only if a custom image is selected as “Background”.  |

---

**Element property ‘Colors’**

| “Color areas”       |  }
|---------------------|---------------------------------------------------------------------------------------------------|
| “Durable color areas” |  □: All color areas are visible, regardless of the current value.  
|                     |  □: Only the color area is visible that includes the current value.  |
| “Use colors for scale” |  □: Colors in the color area are used only for the scale and frame.  |

| “Color areas”       |  }
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>“Create new”</td>
<td>A new color area is added to the “Elements” view.</td>
</tr>
<tr>
<td>“Delete”</td>
<td>The color area is removed from the list and the list is refreshed.</td>
</tr>
</tbody>
</table>
| “Begin of area”     | Start value of the color area  
| Example: 20         |  ▶: The property “Variable” is shown below.  |
**“Variable”**  
Variable (integer data type). Contains the start value.  
Example: PLC_PRG.iColorAreaStart0  
Declaration:  
```plaintext
PROGRAM PLC_PRG
VAR
  iColorAreaStart0 : INT := 80;
END_VAR
```

**“End of area”**  
End value of the color area  
Example: 120  
♦️: The property “Variable” is shown below.

**“Variable”**  
Variable (integer data type). Contains the end value.  
Example: iColorAreaEnd0  
Declaration:  
```plaintext
PROGRAM PLC_PRG
VAR
  iColorAreaEnd0 : INT := 100;
END_VAR
```

**“Color”**  
Color that is used for displaying the area.

---

**Element property 'Absolute movement'**  
The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

**“Movement”**

**“X”**  
Variable (numeric data type). Defines the X position (in pixels).  
Example: PLC_PRG.iPos_X.  
Increasing this value in runtime mode moves the element to the right.

**“Y”**  
Variable (numeric data type). Defines the Y position (in pixels).  
Example: PLC_PRG.iPos_Y.  
Increasing this value in runtime mode moves the element downwards.

**“Rotation”**  
Variable (numeric data type). Defines the angle of rotation (in degrees).  
Example: PLC_PRG.iAngle1.  
The midpoint of the element rotates at the “Center” point. This rotation point is shown as the ♦️ symbol.  
In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.
"Interior rotation" Variable (numeric data type). Defines the angle of rotation (in degrees).

Example: PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in "Center" according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol.

Note: If a static angle of rotation is specified in the "Position ➔ Angle" property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

Variable

Variable (integer data type) Contains the distance between two values on the fine scale
Example: PLC_PRG.iSubScale
Declaration:

```plaintext
PROGRAM PLC_PRG
VAR
  iSubScale : INT := 5;
END_VAR
```

Scale line width

Specified in pixels
Example: 3

Scale color

Color of scale lines
-  <textarea></textarea>: The “Color” dialog opens.
-   <*>: A list box with style colors opens.

Scale in 3D

☑️: Scale lines are displayed with soft 3D shadowing.
Note: This property is not displayed in “FlatStyle”.

Show scale

☑️: The scale is displayed.

Frame inside

☑️: A frame is drawn at the inner end of the scale.

Frame outside

☑️: A frame is drawn at the outer end of the scale.

Element property 'Label'

Label

Selection list
-  “Outside”: Scale values are placed outside of the scale.
-  “Inside”: Scale values are placed inside of the scale.

Unit

Text that is displayed in the element.
Example: Units displayed in m/s.

Font

Font for labels (example: scale numbering).
Selection from the drop-down list or by clicking the “” button.

Scale format (C Syntax)

Values scaled in "printf" syntax
Examples: %d, %5.2f

Max. text width of labels

(optional) Value that redefines the maximum width of the scale label. The correct value is normally set automatically.
Note: Change this value only if the automatic adjustment does not yield the expected result.

Text height of labels

(optional) Value that redefines the maximum height of the scale label. The correct value is normally set automatically.
Note: Change this value only if the automatic adjustment does not yield the expected result.

Font color

Selection from the drop-down list or by clicking the “” button.
"Usage of"
- "Preset style values": Values from the current style
- "User-defined settings": The subnode "Positioning" appears.

"Positioning"
Requirement: "User-defined settings" is selected as "Usage of".
The displayed positioning settings depend on the type of needle instrument and potentiometer, and partially on whether a custom background image is selected. The following settings are used for achieving the exact position relative to the background image.

<table>
<thead>

</tr>
<tr>
<td>iColorAreaEnd0 : INT := 100;</td>
<td></td>
</tr>
<tr>
<td>END_VAR</td>
<td></td>
</tr>
</tbody>
</table>

**Color**

Color that is used for displaying the area.

**Element property 'Absolute movement'**

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

**Movement**

<table>
<thead>
<tr>
<th><strong>X</strong></th>
<th>Variable (numeric data type). Defines the X position (in pixels). Example: PLC_PRG.iPos_X. Increasing this value in runtime mode moves the element to the right.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Y</strong></td>
<td>Variable (numeric data type). Defines the Y position (in pixels). Example: PLC_PRG.iPos_Y. Increasing this value in runtime mode moves the element downwards.</td>
</tr>
</tbody>
</table>

**Rotation**

The midpoint of the element rotates at the “Center” point. This rotation point is shown as the ☞ symbol.

In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

**Interior rotation**

In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the ☞ symbol.

Note: If a static angle of rotation is specified in the “Position ☞ Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.

Visualization element 'Meter'

Symbol:
Tag: “Measurement controls”

The element displays the value of a variable. The needle is positioned according to the value of the assigned variable. A meter is used to represent a tachometer, for example.

### Element properties

<table>
<thead>
<tr>
<th><strong>“Element name”</strong></th>
<th>Example: GenElemInst_1</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Type of element”</strong></td>
<td>“Meter”</td>
</tr>
<tr>
<td><strong>“Value”</strong></td>
<td>Variable (numeric data type).&lt;br&gt;The variable value determines the pointer movement of the element.</td>
</tr>
</tbody>
</table>

### Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

<table>
<thead>
<tr>
<th><strong>“X”</strong></th>
<th>X-coordinate of the point of rotation</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Y”</strong></td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the symbols (榉) to other positions in the editor.

These properties are available only when you select the “Preview: Support client animations and overlay of native elements” option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.

<table>
<thead>
<tr>
<th><strong>“Animation duration”</strong></th>
<th>Time that the element executes an animation (in milliseconds)</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong> 500</td>
<td></td>
</tr>
<tr>
<td><strong>“Move to the foreground”</strong></td>
<td>Property value (BOOL)&lt;br&gt;<strong>TRUE:</strong> At runtime, the element is displayed in the foreground.&lt;br&gt;<strong>FALSE:</strong> At runtime, the element is displayed in the layer where it was inserted in the visualization editor.</td>
</tr>
</tbody>
</table>

- ¶ Chapter 1.3.5.21.5 “Using client animation” on page 1962

### Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.
### Element property 'Background'

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Image color&quot;</td>
<td>List box containing background colors</td>
</tr>
<tr>
<td>&quot;Own image&quot;</td>
<td></td>
</tr>
</tbody>
</table>
  - "Image": ID of the background image.  
  - Info: If you specify the value "<default>" or select the image from the "Default" category in the Input Assistant, then the original element background image is used.  
  - "Transparency color": Selection from list box or Input Assistant. |

### Element property 'Arrow'

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Hand style&quot;</td>
<td>Drop-down list with different arrow types</td>
</tr>
<tr>
<td>&quot;Color&quot;</td>
<td></td>
</tr>
</tbody>
</table>
  - ▲: The "Color" dialog box opens.  
  - △: Drop-down list with color names                                           |
| "Arrow start"    | Angle (in degrees) between the scale start and the horizontal axis          |
| "Arrow end"      | Angle (in degrees) between the right edge of the pointer instrument and the horizontal axis |
| "Additional arrow" | ✅: An additional arrow is shown inside the scale.                         |

### Element property 'Scale'

You can also change the values by dragging the box symbols (_drag_ to other positions in the editor.

See also

- ☀ Chapter 1.3.5.3.2 “Positioning elements, adapting size and layer” on page 1113
### “Sub scale position”
- “Outside”: The subscale is displayed on the outer scale ring. (“Frame outside”)
- “Inside”: The subscale is displayed on the inner scale ring. (“Frame inside”)

### “Scale type”
Type of scale
- “Lines”
- “Dots”
- “Squares”

### “Scale start”
Least value of the scale and the lower limit of the value range for the element
Example: 0
*: The “Variable” property is displayed in the line below this.

### “Variable”
Variable (integer data type). Contains the scale start
Example: PLC_PRG.iScaleStart
Declarations:

```plaintext
PROGRAM PLC_PRG
VAR
  iScaleStart : INT := 0;
END_VAR
```

### “Scale end”
Greatest value of the scale and the upper limit of the value range for the element
Example: 100
*: The “Variable” property is shown below this.

### “Variable”
Variable (integer data type). Contains the scale end
Example: PLC_PRG.iScaleEnd
Declarations:

```plaintext
PROGRAM PLC_PRG
VAR
  iScaleEnd : INT := 120;
END_VAR
```

### “Main scale”
Distance between two values on the main scale
Example: 10
*: The “Variable” property is shown below.

### “Variable”
Variable (integer data type) Contains the distance between two values on the main scale
Example: PLC_PRG.iMainScale
Declarations:

```plaintext
PROGRAM PLC_PRG
VAR
  iMainScale : INT := 20;
END_VAR
```

### “Sub scale”
Distance between two values on the fine scale
You can hide the fine scale by setting the value to 0.
Example: 2
*: The “Variable” property is shown below this.
"Variable"  
Variable (integer data type) Contains the distance between two values on the fine scale  
Example: PLC_PRG.iSubScale  
Declarations:

```plaintext
PROGRAM PLC_PRG
VAR
  iSubScale : INT := 5;
END_VAR
```

"Scale line width"  
Specified in pixels  
Example: 3

"Scale color"  
Color of scale lines  
- [ ] : The “Color” dialog opens.  
- ▼ : A list box with style colors opens.

"Scale in 3D"  
☑️: Scale lines are displayed with soft 3D shadowing.  
Note: This property is not displayed in "FlatStyle".

"Show scale"  
☑️: The scale is displayed.

"Frame inside"  
☑️: A frame is drawn at the inner end of the scale.

"Frame outside"  
☑️: A frame is drawn at the outer end of the scale.

Element property 'Label'

"Label"  
Selection list  
- "Outside": Scale values are placed outside of the scale.  
- "Inside": Scale values are placed inside of the scale.

"Unit"  
Text that is displayed in the element.  
Example: Units displayed in m/s.

"Font"  
Font for labels (example: scale numbering).  
Selection from the drop-down list or by clicking the "" button.

"Scale format (C Syntax)"  
Values scaled in "printf" syntax  
Examples: %d, %.2f

"Max. text width of labels"  
(optional) Value that redefines the maximum width of the scale label. The correct value is normally set automatically.  
Note: Change this value only if the automatic adjustment does not yield the expected result.

"Text height of labels"  
(optional) Value that redefines the maximum height of the scale label. The correct value is normally set automatically.  
Note: Change this value only if the automatic adjustment does not yield the expected result.

"Font color"  
Selection from the drop-down list or by clicking the """ button.

Element property 'Positioning'
“Usage of”

- “Preset style values”: Values from the current style
- “User-defined settings”: The subnode “Positioning” appears.

“Positioning”

Requirement: “User-defined settings” is selected as “Usage of”.

The displayed positioning settings depend on the type of needle instrument and potentiometer, and partially on whether a custom background image is selected. The following settings are used for achieving the exact position relative to the background image.

<table>
<thead>
<tr>
<th>“Needle movement”</th>
<th>Length of the needle (in pixels)</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Scale movement”</td>
<td>Distance from the tick marks to the center (in pixels)</td>
</tr>
</tbody>
</table>

Requirement: A customer image is selected as “Background”.

<table>
<thead>
<tr>
<th>“Scale length”</th>
<th>Length of the tick marks (in pixels)</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Label offset”</td>
<td>Distance from the labels to the tick marks (in pixels)</td>
</tr>
<tr>
<td>“Unit offset”</td>
<td>Distance of the unit text “Label ➔ Unit” from the upper scale edge (in pixels)</td>
</tr>
<tr>
<td>“Origin offset”</td>
<td>Offset of the element (in pixels)</td>
</tr>
</tbody>
</table>

Requirement: For the elements “Meter 180°” and “Meter 90°”, this property is displayed only if a custom image is selected as “Background”.

Element property ‘Colors’

“Color areas”

<table>
<thead>
<tr>
<th>“Durable color areas”</th>
<th>All color areas are visible, regardless of the current value.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Only the color area is visible that includes the current value.</td>
</tr>
</tbody>
</table>

“Use colors for scale”

Colors in the color area are used only for the scale and frame.

“Color areas”

“Create new”

A new color area is added to the “Elements” view.

“Delete”

The color area is removed from the list and the list is refreshed.

“Begin of area”

Start value of the color area

Example: 20

✧: The property “Variable” is shown below.

“Variable”

Variable (integer data type). Contains the start value.

Example: PLC_PRG.iColorAreaStart0

Declaration:

```plaintext
PROGRAM PLC_PRG
VAR
  iColorAreaStart0 : INT := 80;
END_VAR
```

“End of area”

End value of the color area

Example: 120

✧: The property “Variable” is shown below.
### Variable

Variable (integer data type). Contains the end value.

**Example:** `iColorAreaEnd0`

**Declaration:**

```plaintext
PROGRAM PLC_PRG
VAR
  iColorAreaEnd0 : INT := 100;
END_VAR
```

### Color

Color that is used for displaying the area.

---

**Element property 'Absolute movement'**

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

---

### Movement

| **“X”** | Variable (numeric data type). Defines the X position (in pixels).  
**Example:** PLC_PRG.iPos_X.  
Increasing this value in runtime mode moves the element to the right. |
| --- | --- |

| **“Y”** | Variable (numeric data type). Defines the Y position (in pixels).  
**Example:** PLC_PRG.iPos_Y.  
Increasing this value in runtime mode moves the element downwards. |
| --- | --- |

| **“Rotation”** | Variable (numeric data type). Defines the angle of rotation (in degrees).  
**Example:** PLC_PRG.iAngle1.  
The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.  
In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right. |
| --- | --- |

| **“Interior rotation”** | Variable (numeric data type). Defines the angle of rotation (in degrees).  
**Example:** PLC_PRG.iAngle2.  
In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.  
The rotation point is shown as the symbol.  
Note: If a static angle of rotation is specified in the “Position ➔ Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed. |
| --- | --- |
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.

See also
- Unit conversion

Element property 'State variables'
The variables control the element behavior dynamically.

| "Invisible" | Variable (BOOL). Toggles the visibility of the element. TRUE: The element is not visible at runtime. |

The “Invisible” property is supported by the "Client Animation" functionality.

**Element property 'Scale'**
### “Sub scale position”
- **“Outside”**: The subscale is displayed on the outer scale ring. (“Frame outside”)
- **“Inside”**: The subscale is displayed on the inner scale ring. (“Frame inside”)

### “Scale type”
Type of scale
- **“Lines”**
- **“Dots”**
- **“Squares”**

### “Scale start”
Least value of the scale and the lower limit of the value range for the element

**Example:** 0

- The “Variable” property is displayed in the line below this.

### “Variable”
Variable (integer data type). Contains the scale start

**Example:** PLC_PRG.iScaleStart

**Declaration:**
```plaintext
PROGRAM PLC_PRG
VAR
  iScaleStart : INT := 0;
END_VAR
```

### “Scale end”
Greatest value of the scale and the upper limit of the value range for the element

**Example:** 100

- The “Variable” property is shown below this.

### “Variable”
Variable (integer data type). Contains the scale end

**Example:** PLC_PRG.iScaleEnd

**Declaration:**
```plaintext
PROGRAM PLC_PRG
VAR
  iScaleEnd : INT := 120;
END_VAR
```

### “Main scale”
Distance between two values on the main scale

**Example:** 10

- The “Variable” property is shown below.

### “Variable”
Variable (integer data type) Contains the distance between two values on the main scale

**Example:** PLC_PRG.iMainScale

**Declaration:**
```plaintext
PROGRAM PLC_PRG
VAR
  iMainScale : INT := 20;
END_VAR
```

### “Sub scale”
Distance between two values on the fine scale

You can hide the fine scale by setting the value to 0.

**Example:** 2

- The “Variable” property is shown below this.
**“Variable”**

Variable (integer data type) Contains the distance between two values on the fine scale

Example: PLC_PRG.iSubScale

Declaration:

```plaintext
PROGRAM PLC_PRG
VAR
  iSubScale : INT := 5;
END_VAR
```

**“Scale line width”**

Specified in pixels

Example: 3

**“Scale color”**

Color of scale lines

- □: The “Color” dialog opens.
- ▼: A list box with style colors opens.

**“Scale in 3D”**

☑: Scale lines are displayed with soft 3D shadowing.

Note: This property is not displayed in “FlatStyle”.

**“Show scale”**

☑: The scale is displayed.

**“Frame inside”**

☑: A frame is drawn at the inner end of the scale.

**“Frame outside”**

☑: A frame is drawn at the outer end of the scale.

---

**Element property 'Label'**

<table>
<thead>
<tr>
<th>“Label”</th>
<th>Selection list</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Outside”</td>
<td>Scale values are placed outside of the scale.</td>

<tr>
<td>“Inside”</td>
<td>Scale values are placed inside of the scale.</td>
</tr>
</tbody>
</table>

**“Unit”**

Text that is displayed in the element.

Example: Units displayed in m/s.

**“Font”**

Font for labels (example: scale numbering).

Selection from the drop-down list or by clicking the “” button.

**“Scale format (C Syntax)”**

Values scaled in “printf” syntax

Examples: %d, %5.2f

**“Max. text width of labels”**

(optional) Value that redefines the maximum width of the scale label. The correct value is normally set automatically.

Note: Change this value only if the automatic adjustment does not yield the expected result.

**“Text height of labels”**

(optional) Value that redefines the maximum height of the scale label. The correct value is normally set automatically.

Note: Change this value only if the automatic adjustment does not yield the expected result.

**“Font color”**

Selection from the drop-down list or by clicking the “” button.

"Color areas"

- "Durable color areas": All color areas are visible, regardless of the current value.
- "Use colors for scale": Only the color area is visible that includes the current value.

"Color areas"

- "Create new": A new color area is added to the "Elements" view.
- "Delete": The color area is removed from the list and the list is refreshed.

"Begin of area"

Start value of the color area
Example: 20

★ The property "Variable" is shown below.

"Variable"

Variable (integer data type). Contains the start value.
Example: PLC_PRG.iColorAreaStart0
Declaration:

```
PROGRAM PLC_PRG
VAR
   iColorAreaStart0 : INT := 80;
END_VAR
```

"End of area"

End value of the color area
Example: 120

★ The property "Variable" is shown below.
**“Variable”**

Variable (integer data type). Contains the end value.

Example: `IColorAreaEnd0`

Declaration:

```
PROGRAM PLC_PRG
VAR
  iColorAreaEnd0 : INT := 100;
END_VAR
```

**“Color”**

Color that is used for displaying the area.

---

**Element property 'State variables'**

The variables control the element behavior dynamically.

<table>
<thead>
<tr>
<th><strong>“Invisible”</strong></th>
<th>Variable (BOOL). Toggles the visibility of the element. TRUE: The element is not visible at runtime.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Deactivate inputs”</strong></td>
<td>Variable (BOOL). Toggles the operability of the element. TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated.</td>
</tr>
</tbody>
</table>

The “Invisible” property is supported by the “Client Animation” functionality.

---

**Element property 'Absolute movement'**

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

| **“Movement”** | 
|-----------------|--------------------------------------------------------------------------------------------------|
| **“X”** | Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right. |
| **“Y”** | Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards. |
“Rotation” Variable (numeric data type). Defines the angle of rotation (in degrees).

Example: PLC_PRG.iAngle1.

The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.

In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

“Interior rotation” Variable (numeric data type). Defines the angle of rotation (in degrees).

Example: PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol.

Note: If a static angle of rotation is specified in the “Position Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.

- Unit conversion

Element property ‘Access rights’ Requirement: User management is set up for the visualization.

“Access rights” Opens the “Access rights” dialog. There you can edit the access privileges for the element.

Status messages:
- “Not set. Full rights.”: Access rights for all user groups: “operable”
- “Rights are set: Limited rights”: Access is restricted for at least one group.

See also
- Chapter 1.3.5.19.3.1 “Dialog ‘Access Rights’” on page 1583
Visualization element 'Histogram'

Symbol:

Tag: “Measurement controls”
The element displays the data of a one-dimensional array as a histogram. You can define specific colors for certain value ranges.
See also
● Chapter 1.3.5.21.2 “Displaying array data in histograms” on page 1958

Element properties

<table>
<thead>
<tr>
<th>“Element name”</th>
<th>Example: GenElemInst_35</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Type of element”</td>
<td>“Histogram”</td>
</tr>
<tr>
<td>“Data array”</td>
<td>One-dimensional array with data displayed in this histogram.</td>
</tr>
<tr>
<td>Example: PLC_PRG.arr1</td>
<td></td>
</tr>
</tbody>
</table>

Element property 'Subrange of array'

| “Use subrange” | ☑: Only part of the array is displayed in the histogram. |
| “Start index” | First array index with a displayed value. |
| Requirement: “Use subrange” is activated. |
| “End index” | Last array index with a displayed value. |
| Requirement: “Use subrange” is activated. |

| “Display type” | ● “Bars”: Data is displayed as bars. |
| ● “Lines”: Data is displayed as lines. |
| ● “Curve”: Interpolation of data into a curve. |

| “Line width” | Specified in pixels |
| Requirement: “Curve” is selected as the “Display type”. |

| “Show horizontal lines” | ☑: Horizontal lines are drawn on the main scale. |
| Note: Not all visualization styles have this property. This element property is not available for visualization styles that have striped backgrounds (example: “Flat style”). |

| “Relative bar width” | Integer value between 1 and 100 |
| ● 1: The bars are drawn as lines. |
| ● 100: The complete width of the histogram is filled with the bars. |

Element property ‘Position’
The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“X”</td>
<td>X coordinate of the upper left corner of the element. Specified in pixels.</td>
</tr>
<tr>
<td></td>
<td>Example: 10.</td>
</tr>
<tr>
<td>“Y”</td>
<td>Y coordinate of the upper left corner of the element. Specified in pixels.</td>
</tr>
<tr>
<td></td>
<td>Example: 10.</td>
</tr>
<tr>
<td>“Width”</td>
<td>Specified in pixels.</td>
</tr>
<tr>
<td></td>
<td>Example: 150.</td>
</tr>
<tr>
<td>“Height”</td>
<td>Specified in pixels.</td>
</tr>
<tr>
<td></td>
<td>Example: 30</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the box symbols (.masks) to other positions in the editor.

**See also**
- Chapter 1.3.5.3.2 “Positioning elements, adapting size and layer” on page 1113

**Element property ‘Center’**
The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“X”</td>
<td>X-coordinate of the point of rotation</td>
</tr>
<tr>
<td>“Y”</td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the symbols (.) to other positions in the editor.

**Element property ‘Scale’**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Scale start”</td>
<td>Least value of the scale and the lower limit of the value range for the element.</td>
</tr>
<tr>
<td></td>
<td>Example: 0</td>
</tr>
<tr>
<td></td>
<td>♦: The property “Variable” is shown below.</td>
</tr>
<tr>
<td>“Variable”</td>
<td>Variable (integer data type). Contains the scale start.</td>
</tr>
<tr>
<td></td>
<td>Example: PLC_PRG.iScaleStart</td>
</tr>
<tr>
<td></td>
<td>Declaration:</td>
</tr>
<tr>
<td></td>
<td>PROGRAM PLC_PRG</td>
</tr>
<tr>
<td></td>
<td>VAR</td>
</tr>
<tr>
<td></td>
<td>iScaleStart : INT := 0;</td>
</tr>
<tr>
<td></td>
<td>END_VAR</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the box symbols (.) to other positions in the editor.
| **Scale end** | Greatest value of the scale and the upper limit of the value range for the element.  
Example: 100  
✦: The property “Variable” is shown below. |
| **Variable** | Variable (integer data type). Contains the scale end.  
Example: PLC_PRG.iScaleEnd  
Declaration:  
```plaintext
PROGRAM PLC_PRG  
VAR  
iScaleEnd : INT := 120;  
END_VAR
``` |
| **Main scale** | Distance between 2 values on the rough scale.  
Example: 10  
✦: The property “Variable” is shown below. |
| **Variable** | Variable (integer data type). Contains the distance.  
Example: PLC_PRG.iMainScale  
Declaration:  
```plaintext
PROGRAM PLC_PRG  
VAR  
iMainScale : INT := 20;  
END_VAR
``` |
| **Subscale** | Distance between 2 values on the fine scale.  
You can hide the fine scale by setting the value to 0.  
Example: 2  
✦: The property “Variable” is shown below. |
| **Variable** | Variable (integer data type). Contains the spacing.  
Example: PLC_PRG.iSubScale  
Declaration:  
```plaintext
PROGRAM PLC_PRG  
VAR  
iSubScale : INT := 5;  
END_VAR
``` |
| **Scale color** | Color of scale lines  
• ![Color](#): The “Color” dialog box opens.  
• ![Color](#): A drop-down list with color names opens. |
| **Base line** | Value of the main scale where the horizontal base line of the histogram is located.  
The drawing of the bar starts at the base line. |

Element property ‘Label’
| “Unit”        | Text that is displayed in the element.  
|              | Example: Units displayed in m/s.       |
|              |                                         |
| “Font”       | Font for labels (example: scale numbering).  
|              | Selection from the drop-down list or by clicking the “…” button. |
| “Scale format (C Syntax)” | Values scaled in "printf" syntax  
|              | Examples: %d, %5.2f                        |
| “Max. text width of labels” | Optional value that defines the maximum width of the scale label.  
|              | Note: Change this value only if the automatic adjustment does not yield the expected result. |
| “Text height of labels” | Optional value that defines the maximum height of the scale label.  
|              | Note: Change this value only if the automatic adjustment does not yield the expected result. |
| “Font color” | Selection from the drop-down list or by clicking the "…” button. |

**Element property 'Colors’**

| “Graph color” | Color of the bar in normal state.  
|              | Note: The normal state is in effect when the current value of the array component does not fulfill the alarm condition. |
| “Alarm value” | Threshold for the alarm |
| “Alarm condition” | If the current value of the array component fulfills the alarm condition, then the alarm condition is set.  
|              | ● “Less”: The current value is less than the “Alarm value”  
|              | ● “More”: The current value is greater than the “Alarm value” |
| “Alarm color” | Color of the bar in alarm state. |
| “Use color areas” | ☑: The color areas defined in this element are used.  
| “Color areas” |  |
| “Create new” | A new color area is added. |
| “Delete” | The color area is removed from the list. |
| “Begin of area” | The start value on the “Scale” of the histogram where the color area begins.  
| “End of area” | The end value on the “Scale” of the histogram where the color area ends.  
| “Color” | Color that is used for displaying the area. |

**Element property 'Absolute movement'**

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

| “Movement” |  |
| “X” | Variable (numeric data type). Defines the X position (in pixels).  
| | Example: PLC_PRG.iPos_X.  
<p>| | Increasing this value in runtime mode moves the element to the right. |</p>
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Example</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Y”</td>
<td>Variable (numeric data type). Defines the Y position (in pixels).</td>
<td>PLC_PRG.iPos_Y</td>
<td>Increasing this value in runtime mode moves the element downwards.</td>
</tr>
<tr>
<td>“Rotation”</td>
<td>Variable (numeric data type). Defines the angle of rotation (in degrees).</td>
<td>PLC_PRG.iAngle1</td>
<td>The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.</td>
</tr>
<tr>
<td>“Interior rotation”</td>
<td>Variable (numeric data type). Defines the angle of rotation (in degrees).</td>
<td>PLC_PRG.iAngle2</td>
<td>In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>The rotation point is shown as the symbol.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Note: If a static angle of rotation is specified in the “Position ➔ Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.</td>
</tr>
</tbody>
</table>

You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.

See also

- Unit conversion

These properties are available only when you select the “Preview: Support client animations and overlay of native elements” option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.
### Animation duration

Time that the element executes an animation (in milliseconds)

**Example:** 500

### Move to the foreground

**Property value** (BOOL)

- **TRUE:** At runtime, the element is displayed in the foreground.
- **FALSE:** At runtime, the element is displayed in the layer where it was inserted in the visualization editor.

**See also**

- Chapter 1.3.5.21.5 “Using client animation” on page 1962

### Element property 'Access rights'

Requirement: User management is set up for the visualization.

**“Access rights”**

Opens the “Access rights” dialog. There you can edit the access privileges for the element.

**Status messages:**

- **“Not set. Full rights.”:** Access rights for all user groups: “operable”
- **“Rights are set: Limited rights.”:** Access is restricted for at least one group.

**See also**

- Chapter 1.3.5.19.3.1 “Dialog ‘Access Rights’” on page 1583

### Visualization element 'Image switcher'

**Symbol:**

![Image switcher symbol]

**Tag:** "Lamps/Switches/Bitmaps"

The element displays one of three referenced images. Mouse actions change the displayed image. The images are defined in the "Image settings" element properties. The effects of mouse clicks are defined in the "Element behavior" property.

### Element properties

#### "Element name"

Optional

**Hint:** Assign individual names for elements so that they are found faster in the element list.

**Example:** ImageSwitcher_1

#### "Type of element"

"Image switcher"

### Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.
| **X** | X coordinate of the upper left corner of the element  
Specified in pixels.  
Example: 10. |
|-------|--------------------------------------------------|
| **Y** | Y coordinate of the upper left corner of the element  
Specified in pixels.  
Example: 10. |
| **Width** | Specified in pixels.  
Example: 150 |
| **Height** | Specified in pixels.  
Example: 30 |

You can also change the values by dragging the box symbols ( يبدو) to other positions in the editor.

See also
- Chapter 1.3.5.3.2 “Positioning elements, adapting size and layer” on page 1113

| **Variable** | Variable (BOOL).  
The value of the variable changes according to user input and it is independent of the “Element behavior” element property. |
|--------------|--------------------------------------------------|

**Image settings**

| **Image "on"** | Image ID from an image pool. The image can be selected using the input assistant.  
The image is used if the variable of the “Variable” property has the value TRUE. |
|----------------|--------------------------------------------------------------------------------|
| **Image "off"** | Image ID from an image pool. The image can be selected using the input assistant.  
The image is used if the variable of the “Variable” property has the value FALSE. |
| **Image "clicked"** | Image ID from an image pool. The image is selected using the input assistant.  
In runtime mode, the visualization displays the referenced image when the element is clicked (and the mouse button is held down).  
Requirement: The “Element behavior” is “Image toggler”. |
| **Transparency** | ☑: The “Transparent color” is selected. |
| **Transparent color** | The image pixels that have the transparent color are displayed as transparent.  
Requirement: “Transparency” is activated.  
- ☑️ The “Color” dialog box opens.  
- ☟: A drop-down list with color names opens. |
"Scaling type"  Defines how an image fits in the element frame.
- "Fixed": The original size of the image is retained, regardless of the dimensions of the element.
- "Isotropic": The entire image is shown in the element frame, either larger or smaller. As a result, the proportion of height and width are retained.
- "Anisotropic": The image resizes automatically to the dimensions of the element frame, filling the entire element frame. As a result, the proportions are not retained.

"Horizontal alignment"  Horizontal alignment of the image within the element frame or element
- Left
- Centered
- Right
Requirement: "Scaling type" is "Isotropic".

"Vertical alignment"  Vertical alignment of the image within the element frame or element
- Top
- Centered
- Bottom
Requirement: "Scaling type" is "Isotropic".

"Element behavior"  
- "Image toggler": Every mouse click switches the image.
- "Image tapper": While a visualization user holds down the mouse button, the image of the "Image on" property is displayed. At the same time, the value TRUE is assigned to the "Variable" property.

"Tap FALSE"  
☑: While the mouse button is pressed, the image of the "Image" property is displayed and the "Variable" property gets the value FALSE instead of the value TRUE, and back.
Requirement: "Image tapper" is selected in the "Element behavior" property.

Element property 'Center'  
The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

"X"  
X-coordinate of the point of rotation

"Y"  
Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (_symbol) to other positions in the editor.

Element property 'Texts'

"Tooltip"  
String display as tooltip for the element
Example: Valid access.
The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

**"Movement"**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
<th>Example</th>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;X&quot;</td>
<td>Variable (numeric data type). Defines the X position (in pixels).</td>
<td>PLC_PRG.iPos_X</td>
<td>Increasing this value in runtime mode moves the element to the right.</td>
</tr>
<tr>
<td>&quot;Y&quot;</td>
<td>Variable (numeric data type). Defines the Y position (in pixels).</td>
<td>PLC_PRG.iPos_Y</td>
<td>Increasing this value in runtime mode moves the element downwards.</td>
</tr>
<tr>
<td>&quot;Rotation&quot;</td>
<td>Variable (numeric data type). Defines the angle of rotation (in degrees).</td>
<td>PLC_PRG.iAngle1</td>
<td>The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.</td>
</tr>
<tr>
<td>&quot;Interior rotation&quot;</td>
<td>Variable (numeric data type). Defines the angle of rotation (in degrees).</td>
<td>PLC_PRG.iAngle2</td>
<td>In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. Note: If a static angle of rotation is specified in the &quot;Position ➔ Angle&quot; property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.</td>
</tr>
</tbody>
</table>

You can link the variables to a unit conversion.

The "X", "Y", "Rotation", and "Interior rotation" properties are supported by the "Client Animation" functionality.
See also
- Unit conversion

Element property 'State variables'
The variables control the element behavior dynamically.

| "Invisible" | Variable (BOOL). Toggles the visibility of the element. TRUE: The element is not visible at runtime. |
| "Deactivate inputs" | Variable (BOOL). Toggles the operability of the element. TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated. |

The "Invisible" property is supported by the "Client Animation" functionality.

See also
- Ä Chapter 1.3.5.21.5 "Using client animation" on page 1962

These properties are available only when you select the "Preview: Support client animations and overlay of native elements" option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.

| "Animation duration" | Time that the element executes an animation (in milliseconds) Example: 500 |
| "Move to the foreground" | Property value (BOOL) TRUE: At runtime, the element is displayed in the foreground. FALSE: At runtime, the element is displayed in the layer where it was inserted in the visualization editor. |

See also

Visualization element 'Dip switch', 'Power switch', 'Push switch', 'Push switch LED', 'Rocker switch'

Symbols:

Tag: “Lamps/Switches/Bitmaps”

The element assigns a value to a Boolean variable. The switch position "on" the value TRUE to the variable, and the switch position "off" assigns the value FALSE. Use the mouse to change the switch position.

**Element properties**

<table>
<thead>
<tr>
<th>“Element name”</th>
<th>Example: Operating_Switch</th>
</tr>
</thead>
<tbody>
<tr>
<td>Optional</td>
<td>Hint: Assign individual names for elements so that they are found faster in the element list.</td>
</tr>
<tr>
<td>“Type of element”</td>
<td>Depending on the element: “Dip switch”, “Power switch”, “Push switch”, “Push switch LED”, or “Rocker switch”</td>
</tr>
</tbody>
</table>

**Element property 'Position'**

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

<table>
<thead>
<tr>
<th>“X”</th>
<th>X coordinate of the upper left corner of the element</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Specified in pixels.</td>

</table>

| “Element behavior” | “Image toggler”: Every mouse click changes the switch and the “Variable” value. |
|                   | “Image tapper”: The switch is “on” and the “Variable” value is TRUE while the mouse button is pressed. |

| “Tap FALSE” | ☑: The value TRUE is assigned to the “Variable” property instead of the value FALSE, and back. |
|             | Requirement: “Image tapper” is selected in the “Element behavior” property. |

**Element property ‘Center’** The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the _ symbol. The point is used as the center for rotating and scaling.
<table>
<thead>
<tr>
<th>“X”</th>
<th>X-coordinate of the point of rotation</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Y”</td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

**Element property 'Texts'**

<table>
<thead>
<tr>
<th>“Tooltip”</th>
<th>String display as tooltip for the element</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Valid access.</td>
</tr>
</tbody>
</table>

**Element property 'Absolute movement'**

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

**“Movement”**

<table>
<thead>
<tr>
<th>“X”</th>
<th>Variable (numeric data type). Defines the X position (in pixels).</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>PLC_PRG.iPos_X.</td>
</tr>
<tr>
<td></td>
<td>Increasing this value in runtime mode moves the element to the right.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Y”</th>
<th>Variable (numeric data type). Defines the Y position (in pixels).</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>PLC_PRG.iPos_Y.</td>
</tr>
<tr>
<td></td>
<td>Increasing this value in runtime mode moves the element downwards.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Rotation”</th>
<th>Variable (numeric data type). Defines the angle of rotation (in degrees).</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>PLC_PRG.iAngle1.</td>
</tr>
<tr>
<td></td>
<td>The midpoint of the element rotates at the “Center” point. This rotation point is shown as the ⊕ symbol.</td>
</tr>
<tr>
<td></td>
<td>In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.</td>
</tr>
</tbody>
</table>
### "Interior rotation"

Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in "Center" according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the \( \circ \) symbol.

Note: If a static angle of rotation is specified in the "Position \( \rightarrow \) Angle" property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

---

**You can link the variables to a unit conversion.**

---

**The "X", "Y", "Rotation", and "Interior rotation" properties are supported by the "Client Animation" functionality.**

See also
- [Unit conversion](#)

---

**Element property 'State variables'**

The variables control the element behavior dynamically.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Invisible&quot;</td>
<td>Variable [BOOL]. Toggles the visibility of the element. TRUE: The element is not visible at runtime.</td>
</tr>
<tr>
<td>&quot;Deactivate inputs&quot;</td>
<td>Variable [BOOL]. Toggles the operability of the element. TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated.</td>
</tr>
</tbody>
</table>

---

**The "Invisible" property is supported by the "Client Animation" functionality.**

See also
- [Unit conversion](#)

---

These properties are available only when you select the "Preview: Support client animations and overlay of native elements" option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.
**Animation duration**
Time that the element executes an animation (in milliseconds)
Example: 500

**Move to the foreground**
Property value (BOOL)

- TRUE: At runtime, the element is displayed in the foreground.
- FALSE: At runtime, the element is displayed in the layer where it was inserted in the visualization editor.

See also
- Chapter 1.3.5.21.5 “Using client animation” on page 1962

**Image**
Drop-down list with background colors
Depends on the visualization style

**Access rights**
Requirement: User management is set up for the visualization.

<table>
<thead>
<tr>
<th><strong>Access rights</strong></th>
<th>Opens the “Access rights” dialog. There you can edit the access privileges for the element. Status messages:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>- “Not set. Full rights.”: Access rights for all user groups: “operable”</td>
</tr>
<tr>
<td></td>
<td>- “Rights are set: Limited rights”: Access is restricted for at least one group.</td>
</tr>
</tbody>
</table>

</tr>
<tr>
<td>☐ The “Color” dialog box opens.</td>
<td></td>
</tr>
<tr>
<td>☐ A drop-down list with style colors opens.</td>
<td></td>
</tr>
</tbody>
</table>
### “Scaling type”

Reaction of the element when the dimension of the “Frame” element is changed:
- **“Isotropic”**: The height and width of the image are resized proportionally to the “Frame”.
  
  Please note: To retain the alignment of elements also within a scaled “Frame” element, define the “Horizontal alignment” or “Vertical alignment” explicitly with “Centered”.
- **“Anisotropic”**: The image fills the entire “Frame” regardless of its proportions.

### “Horizontal alignment”

Horizontal alignment of the image within the element frame or element

- Left
- Centered
- Right

Requirement: “Scaling type” is “Isotropic”.

### “Vertical alignment”

Vertical alignment of the image within the element frame or element

- Top
- Centered
- Bottom

Requirement: “Scaling type” is “Isotropic”.

### “Element behavior”

- **“Image toggler”**: Every mouse click changes the switch and the “Variable” value.
- **“Image tapper”**: The switch is "on" and the “Variable” value is TRUE while the mouse button is pressed.

### “Orientation”

- **“At top”**: The rotary switch turns from the top right to the top left.
- **“At side”**: The rotary switch turns from the top right to the bottom right.

### “Color change”

- ☑: The element changes in color when “Variable” is TRUE.

---

**Element property ‘Center’**

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ☞ symbol. The point is used as the center for rotating and scaling.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>X</td>
<td>X-coordinate of the point of rotation</td>

- Data Source Manager
**Element property 'Position'**

The position defines the location and size of the element in the visualization window. This is based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

<table>
<thead>
<tr>
<th><strong>X</strong></th>
<th>The x-coordinate of the upper left corner of the element Specified in pixels Example: 10</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Y</strong></td>
<td>The y-coordinate of the upper left corner of the element Specified in pixels Example: 10</td>
</tr>
<tr>
<td><strong>Width</strong></td>
<td>Specified in pixels Example: 150</td>
</tr>
<tr>
<td><strong>Height</strong></td>
<td>Specified in pixels Example: 30</td>
</tr>
</tbody>
</table>

Tip: You can change the values in “X”, “Y”, “Width”, and “Height” by dragging the corresponding symbols to another position in the editor.

<table>
<thead>
<tr>
<th><strong>Angle</strong></th>
<th>Static angle of rotation (in degrees) Example: 35</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>The element is displayed rotated in the editor. The point of rotation is the center of the element. A positive value rotates clockwise. Tip: You can change the value in the editor by focusing the element to the handle. When the cursor is displayed as a rotating arrow, you can rotate the element about its center as a handle.</td>
</tr>
</tbody>
</table>

(1): Handle

Note: If a dynamic angle of rotation is also configured in the property “Absolute movement ➔ Internal rotation”, then the static and dynamic angles of rotation are added in runtime mode. The static angle of rotation acts as an offset.

- ☞ Chapter 1.3.5.3.2 “Positioning elements, adapting size and layer” on page 1113

<table>
<thead>
<tr>
<th><strong>Show cursor</strong></th>
<th>☑: A cursor (vertical line) is displayed at the mouse position. The trigger and variable values where the cursor points are displayed as a tooltip.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Overwrite existing trace on PLC</strong></td>
<td>☑: If a trace with the same name is on the PLC, then it is overwritten at download with the configuration that is defined here.</td>
</tr>
<tr>
<td><strong>Number format</strong></td>
<td>Number format of values in the tooltip in printf syntax (example: %d, %5.2f).</td>
</tr>
</tbody>
</table>

**Element property 'Control variables'**

The control variables are assigned automatically when you click "Insert elements for controlling trace".
### “Reset Trigger”
Variable (BOOL).
Standard control variable: bResetTrigger
**TRUE**: Resets the triggering. After the action is executed, the variable is set automatically to **FALSE**.

### “Start Trace”
Variable (BOOL).
Standard control variable: bStart
**TRUE**: Starts the trace. After the action is executed, the variable is set automatically to **FALSE**.

### “Stop Trace”
Variable (BOOL).
Standard control variable: bStop
**TRUE**: Stops the trace. After the action is executed, the variable is set automatically to **FALSE**.

### “Save trace to a file”

### “Save Trace”
Variable (BOOL).
Standard control variable: bStore
**TRUE**: Saves the current trace configuration and the data that is stored in the development system to a file. When the action is ended, the variable is set automatically to **FALSE**.

### “File name”
Variable (STRING) that contains the file name of the file to be saved.
Standard control variable: sStoreFilename

### “Load trace from file”

### “Load Trace”
Variable (BOOL).
Standard control variable: bRestore
**TRUE**: Reads the file specified below and loads its contents into the trace editor. The file contains a trace configuration and possibly also trace data. To do this, the stored trace configuration must match the application where the trace configuration is located. When the action is ended, the variable is set automatically to **FALSE**.

**Note**: A trace configuration can be loaded from a file only under special circumstances. The file must have been created with exactly the same (running) application with which it will then be loaded. The consequence of changing the running application (for example by downloading again) is that a file which was previously created from the application cannot no longer be read into the application. Even external manual changes to the file can cause this. You should edit only those configuration settings that have an effect on displaying the variables. If you change variable definitions directly in the file (for example by replacing variable x with v y), then the file cannot be loaded.

### “File name”
Variable (STRING) that contains the file name of the file to be read.
Standard variable: sRestoreFilename

**Element property ‘Center’**
The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⪪ symbol. The point is used as the center for rotating and scaling.
The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

**Element property 'Absolute movement'**

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

**Movement**

<table>
<thead>
<tr>
<th>“X”</th>
<th>X-coordinate of the point of rotation</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Y”</td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the symbols (ฤษขอ) to other positions in the editor.

**“Movement”**

<table>
<thead>
<tr>
<th>“X”</th>
<th>Variable (numeric data type). Defines the X position (in pixels).</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Example: PLC_PRG.iPos_X.</td>
</tr>
<tr>
<td></td>
<td>Increasing this value in runtime mode moves the element to the right.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Y”</th>
<th>Variable (numeric data type). Defines the Y position (in pixels).</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Example: PLC_PRG.iPos_Y.</td>
</tr>
<tr>
<td></td>
<td>Increasing this value in runtime mode moves the element downwards.</td>
</tr>
</tbody>
</table>

**“Rotation”**

Variable (numeric data type). Defines the angle of rotation (in degrees).

Example: PLC_PRG.iAngle1.

The midpoint of the element rotates at the “Center” point. This rotation point is shown as the ⟨rangle symbol.

In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

**“Interior rotation”**

Variable (numeric data type). Defines the angle of rotation (in degrees).

Example: PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the ⟨rangle symbol.

Note: If a static angle of rotation is specified in the “Position ➔ Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.
You can link the variables to a unit conversion.

The "X", "Y", "Rotation", and "Interior rotation" properties are supported by the "Client Animation" functionality.

Element property 'Access rights'
Requirement: User management is set up for the visualization.
"Access rights" Opens the "Access rights" dialog. There you can edit the access privileges for the element.
Status messages:
● "Not set. Full rights": Access rights for all user groups: "operable"
● "Rights are set: Limited rights": Access is restricted for at least one group.

See also
● ° Chapter 1.3.5.19.3.1 "Dialog 'Access Rights'" on page 1583

Visualization element 'Trend'
Symbol:

Tag: "Special controls"
The element displays the graphical curve of variable values over a longer period of time. It provides additional controls for the view.

Element properties

<table>
<thead>
<tr>
<th>&quot;Element name&quot;</th>
<th>Example: Velocity</th>
</tr>
</thead>
</table>
| "Data source" | Selection of the device and the application where the data to be visualized and the trend recording are generated
● Remote data source which accesses a remote device, accesses a remote application, and then transfers the data from there
Example: :DataSource_A
Below the (now visible) "Application" property, the remote application is displayed as configured in the data source.
Example: :App_A
Note: If the data source is accessed symbolically by means of a symbol file (CODESYS symbolic), then the required symbol file and the corresponding project have to be saved in the same folder.
● Local application below which the alarm configuration is located
Example: :<local application>"
Example: :Device_A.App_A

<table>

● Object 'Data source'

Element property 'Position'
The position defines the location and size of the element in the visualization window. This is based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.
### “X”
The x-coordinate of the upper left corner of the element
Specified in pixels
Example: 10

### “Y”
The y-coordinate of the upper left corner of the element
Specified in pixels
Example: 10

### “Width”
Specified in pixels
Example: 150

### “Height”
Specified in pixels
Example: 30

Tip: You can change the values in “X”, “Y”, “Width”, and “Height” by dragging the corresponding symbols to another position in the editor.

### “Angle”
Static angle of rotation (in degrees)
Example: 35
The element is displayed rotated in the editor. The point of rotation is the center of the element. A positive value rotates clockwise.

Tip: You can change the value in the editor by focusing the element to the handle. When the cursor is displayed as a rotating arrow, you can rotate the element about its center as a handle.

Note: If a dynamic angle of rotation is also configured in the property “Absolute movement → Internal rotation”, then the static and dynamic angles of rotation are added in runtime mode. The static angle of rotation acts as an offset.

See also
- § Chapter 1.3.5.3.2 “Positioning elements, adapting size and layer” on page 1113

### “Show cursor”
☑️: A cursor (vertical line) is displayed at the mouse position.

### “Show tooltip”
Requirement: “Show cursor” is activated.
☑️: The information about the variable is displayed in a tooltip at the cursor position.

### “Show frame”
☑️: The visualization element is drawn with a frame.

### “Number format”
Number format of values in the tooltip and in the legend in printf syntax (example: %d, %5.2f).
### Time stamp

"Absolute time stamps": The values of the time stamps are displayed in absolute time. Example: 18.03.2016, 14:05:30:000

The display formatting can be adjusted in the property "Internationalization (format strings)".

### Two-line labelling

- The time stamps are displayed in two lines. The date is displayed in the first line and the time is displayed in the second line.
- Time stamp is displayed in one line. The date and time can also be displayed in one line depending on the formatting.

### Omit irrelevant information in time stamp

- The time stamp has a shorter form. For example, the date is displayed only for the first tick mark, and only the time for the following tick marks. The settings in "Internationalization (format strings)" are ignored for this setting.
- All information is displayed for each time stamp.

### Internationalization (format strings)

Only active when the parameter "Omit irrelevant information in timestamps" is deactivated.

### Date

Definition of the date format. The default setting is taken from the Windows control panel.

### Time

Definition of the time format. The default setting is taken from the Windows control panel.

---

**Element property 'Assigned control elements'**

These elements are created automatically when the control elements are added with the command "Insert elements for controlling trend".

- **Date range picker**: Control element for changing the date and time of the displayed data sets. With all elements that have implemented the interface IDateRangeSelector are available.
- **Time picker**: Control element for changing the time of the displayed data sets. With all elements that have implemented the interface ITimeSelector are available.
- **Legend**: Control element for displaying a legend for the graphs. With all elements that have implemented the interface ILegendDisplayer are available.

See also

- § Chapter 1.3.5.19.2.18 “Command 'Insert Elements for Controlling the Trend'” on page 1577

**Element property 'Center'**

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

- **X**: X-coordinate of the point of rotation
- **Y**: Y-coordinate of the point of rotation

---

You can also change the values by dragging the symbols to other positions in the editor.
**Element property 'Absolute movement'**
The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

**“Movement”**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Example</th>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“X”</strong></td>
<td>Variable (numeric data type). Defines the X position (in pixels).</td>
<td>PLC_PRG.iPos_X.</td>
<td>Increasing this value in runtime mode moves the element to the right.</td>
</tr>
<tr>
<td><strong>“Y”</strong></td>
<td>Variable (numeric data type). Defines the Y position (in pixels).</td>
<td>PLC_PRG.iPos_Y.</td>
<td>Increasing this value in runtime mode moves the element downwards.</td>
</tr>
<tr>
<td><strong>“Rotation”</strong></td>
<td>Variable (numeric data type). Defines the angle of rotation (in degrees).</td>
<td>PLC_PRG.iAngle1.</td>
<td>The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.</td>
</tr>
<tr>
<td><strong>“Interior rotation”</strong></td>
<td>Variable (numeric data type). Defines the angle of rotation (in degrees).</td>
<td>PLC_PRG.iAngle2.</td>
<td>In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the symbol. Note: If a static angle of rotation is specified in the “Position → Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.</td>
</tr>
</tbody>
</table>

You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.
Element property 'State variables'

The variables control the element behavior dynamically.

<table>
<thead>
<tr>
<th>&quot;Invisible&quot;</th>
<th>Variable (BOOL). Toggles the visibility of the element.</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRUE: The element is not visible at runtime.</td>
<td></td>
</tr>
</tbody>

</thead>
</table>
You can also change the values by dragging the symbols (🄽) to other positions in the editor.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Orientation&quot;</td>
<td>Orientation of the element. The value is configured in the assigned element.   ● &quot;Horizontal&quot;   ● &quot;Vertical&quot;</td>
</tr>
<tr>
<td>&quot;Attached element instance&quot;</td>
<td>Example: Element_A</td>
</tr>
<tr>
<td>&quot;Show frame&quot;</td>
<td>![ ]: The element is shown in the class diagram.</td>
</tr>
<tr>
<td>&quot;Number format&quot;</td>
<td>The format of the value in printf syntax (example: %d, %5.2f)</td>
</tr>
</tbody>
</table>

**Element Property 'Layout'**

Defines how many variables can be displayed at a maximum and is calculated from the row and column number.

<table>
<thead>
<tr>
<th>Property</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Max. number of rows&quot;</td>
<td>3</td>
</tr>
<tr>
<td>&quot;Max. number of columns&quot;</td>
<td>2</td>
</tr>
</tbody>
</table>

**Element Property 'Text properties'**

The property affects the text configured in the associated element.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Text format&quot;</td>
<td>&quot;Default&quot;: The text will be cut and displayed in only the part that fits into the visualization element.</td>
</tr>
<tr>
<td></td>
<td>&quot;Linebreak&quot;: The text will be wrapped in rows.</td>
</tr>
<tr>
<td></td>
<td>&quot;Ellipsis&quot;: The text is cut and ellipsis . . . are added to indicate that something is missing.</td>
</tr>
<tr>
<td>&quot;Font&quot;</td>
<td>Font of the text. The entries of the selection list are defined in the visualization style.</td>
</tr>
<tr>
<td>&quot;Font color&quot;</td>
<td>Text color, for example Grey. The entries of the selection list are defined in the visualization style.</td>
</tr>
<tr>
<td>&quot;Transparency&quot;</td>
<td>Transparency value (255 to 0), which defines the transparency of the corresponding color. Example: 255: The color is opaque. 0: The color is fully transparent.</td>
</tr>
</tbody>
</table>

**Element property 'Absolute movement'**

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Movement&quot;</td>
<td>&quot;X&quot; Variable (numeric data type). Defines the X position (in pixels). Example: PLC_PRG.iPos_X.</td>

<td>“Rotation”</td>
<td>Variable (numeric data type). Defines the angle of rotation (in degrees).</td>
</tr>
<tr>
<td>“Interior rotation”</td>
<td>Variable (numeric data type). Defines the angle of rotation (in degrees).</td>
</tr>
</tbody>
</table>

You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.

See also
- Unit conversion

These properties are available only when you select the “Preview: Support client animations and overlay of native elements” option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.
**Animation duration**
Time that the element executes an animation (in milliseconds)
**Example:** 500

**Move to the foreground**
Property value (BOOL)
TRUE: At runtime, the element is displayed in the foreground.
FALSE: At runtime, the element is displayed in the layer where it was inserted in the visualization editor.

**Element property 'Access rights'**
Requirement: User management is set up for the visualization.

<table>
<thead>
<tr>
<th><strong>“Access rights”</strong></th>
<th>Opens the “Access rights” dialog. There you can edit the access privileges for the element. Status messages:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>● “Not set. Full rights.”: Access rights for all user groups: “operable”</td>
</tr>
<tr>
<td></td>
<td>● “Rights are set: Limited rights”: Access is restricted for at least one group.</td>
</tr>
</tbody>
</table>

See also
- [Chapter 1.3.5.19.3.1 “Dialog ‘Access Rights’” on page 1583](#)

**Visualization element ‘ActiveX’**
Symbol:

Tag: “Special controls”
The element is used for linking an existing ActiveX element in the visualization. In the element properties of the ActiveX element, you can configure the method calls and their parameters.

In the CODESYS Store, you will find a sample project for using ActiveX components in visualizations.

See also
- [CODESYS Store](#)

**Element properties**

<table>
<thead>
<tr>
<th><strong>“Element name”</strong></th>
<th>Example: GenElemInst_1</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Type of element”</strong></td>
<td>“ActiveX element”</td>
</tr>
<tr>
<td><strong>“Element”</strong></td>
<td>Installed ActiveX component that is linked to the visualization. Hint: To avoid typing errors, select the required ActiveX component with the input assistant.</td>
</tr>
</tbody>
</table>
The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

**Element property 'Position'**

<table>
<thead>
<tr>
<th>“X”</th>
<th>X coordinate of the upper left corner of the element Specified in pixels. Example: 10.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Y”</td>
<td>Y coordinate of the upper left corner of the element Specified in pixels. Example: 10.</td>
</tr>
<tr>
<td>“Width”</td>
<td>Specified in pixels. Example: 150</td>
</tr>
<tr>
<td>“Height”</td>
<td>Specified in pixels. Example: 30</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the box symbols (_drag_ ) to other positions in the editor.

See also

- ¶ Chapter 1.3.5.3.2 “Positioning elements, adapting size and layer” on page 1113

**Element property 'Center'**

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

<table>
<thead>
<tr>
<th>“X”</th>
<th>X-coordinate of the point of rotation</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Y”</td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the symbols (drag_ ) to other positions in the editor.

**Element property 'Absolute movement'**

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

<table>
<thead>
<tr>
<th>“Movement”</th>
<th>Variable (numeric data type). Defines the X position (in pixels). Example: PLC_PRG.iPos_X.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“X”</td>
<td>Increasing this value in runtime mode moves the element to the right.</td>
</tr>
</tbody>
</table>
### “Y”

Variable (numeric data type). Defines the Y position (in pixels).

**Example:** PLC_PRG.iPos_Y.

Increasing this value in runtime mode moves the element downwards.

### “Rotation”

Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle1.

The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.

In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

### “Scaling”

Variable (integer data type). Causes centric stretching.

**Example:** PLC_PRG.iScaling.

The reference point is the “Center” property.

The value 1 shrinks the element by a factor of 0.001. The value 1000 returns the element to its original size.

### “Interior rotation”

Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol.

Note: If a static angle of rotation is specified in the property “Position ➔ Angle”, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

---

### You can link the variables to a unit conversion.

### The properties “X”, “Y”, “Rotation”, and “Interior rotation” are supported by the “Client Animation” functionality.

**Element property 'Control variables'**

<table>
<thead>
<tr>
<th>Variable (STRING or WSTRING)</th>
<th>URL of the web page that is displayed in the visualization.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: PLC_PRG.stURL</td>
<td>If the variable contains a rising edge, then the visualization calls the web page given in &quot;URL&quot; and displays its contents in the 'Web browser' visualization element.</td>
</tr>
</tbody>
</table>

| Literal in single straight quotation marks | Example: 'http://de.wikipedia.org' |

<table>
<thead>
<tr>
<th>Variable (BOOL)</th>
<th>Controls the display of the &quot;Web browser&quot; element.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: PLC_PRG.bSetURL</td>
<td>If the variable contains a rising edge, then the visualization displays the contents of the previously displayed page.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Variable (BOOL)</th>
<th>Controls the back navigation in the &quot;Web browser&quot;.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: PLC_PRG.bGoBack</td>
<td>If the variable has a rising edge, then the visualization displays the contents of the previously displayed page.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Variable (BOOL)</th>
<th>Controls the forward navigation in the &quot;Web browser&quot;.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: PLC_PRG.bGoForward</td>
<td>If the variable has a rising edge, then the visualization displays the contents of the previously displayed page.</td>
</tr>
</tbody>
</table>

These properties are available only when you select the "Preview: Support client animations and overlay of native elements" option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.
“Animation duration”  
Time that the element executes an animation (in milliseconds)  
Example: 500

“Move to the foreground”  
Property value (BOOL)  
TRUE: At runtime, the element is displayed in the foreground.  
FALSE: At runtime, the element is displayed in the layer where it was inserted in the visualization editor.

● Chapter 1.3.5.19.3.1 “Dialog ‘Access Rights’” on page 1583

Visualization element ‘Waiting symbol cube’

Symbol: 

Tag: “Special controls”

In runtime mode, this element indicates automatically that the runtime system is busy or waiting for data.

Element properties

“Element name”  
Example: Data_Transfer  
Optional  
Hint: Assign individual names for elements so that they are found faster in the element list.

“Type of element”  
Waiting symbol cube

Element property 'Position'  
The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“X”</td>
<td>X coordinate of the upper left corner of the element. Specified in pixels. Example: 10.</td>
</tr>
<tr>
<td>“Width”</td>
<td>Specified in pixels. Example: 150</td>
</tr>
<tr>
<td>“Height”</td>
<td>Specified in pixels. Example: 30</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the box symbols in the editor.

See also

- Chapter 1.3.5.3.2 “Positioning elements, adapting size and layer” on page 1113

**Element property ‘Center’**

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“X”</td>
<td>X-coordinate of the point of rotation</td>
</tr>
<tr>
<td>“Y”</td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the symbols in the editor.

**Element property ‘Absolute movement’**

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Movement”</td>
<td>Variable (numeric data type). Defines the X position (in pixels). Example: PLC_PRG.iPos_X. Increasing this value in runtime mode moves the element to the right.</td>
</tr>
<tr>
<td>“Y”</td>
<td>Variable (numeric data type). Defines the Y position (in pixels). Example: PLC_PRG.iPos_Y. Increasing this value in runtime mode moves the element downwards.</td>
</tr>
</tbody>
</table>
### “Rotation”

Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle1.

The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.

In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

### “Interior rotation”

Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol.

Note: If a static angle of rotation is specified in the “Position Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.

Visualization element 'Waiting symbol flower'

Symbol:

Tag: “Special controls”

The element indicates that the system is busy or waiting for data.
**“Element name”**

Example: `Data_Transfer`

Optional

Hint: Assign individual names for elements so that they are found faster in the element list.

**“Type of element”**

“Waiting symbol flower”

---

**Element property 'Position’**

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

| **“X”** | X coordinate of the upper left corner of the element  
Specified in pixels.  
Example: 10. |
|---------|----------------------------------------------------------|
| **“Y”** | Y coordinate of the upper left corner of the element    
Specified in pixels.  
Example: 10. |
| **“Width”** | Specified in pixels.  
Example: 150 |
| **“Height”** | Specified in pixels.  
Example: 30 |

You can also change the values by dragging the box symbols to other positions in the editor.

<tbody>
<tr>
<td><strong>“Y”</strong></td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the symbols to other positions in the editor.

---

**Element property ‘Colors’**

The properties contain fixed values for setting colors.
### “Frame color”

<table>
<thead>
<tr>
<th>“Fill color”</th>
<th>Value (0 to 255) for defining the transparency of the selected color. Example 255: The color is opaque. 0: The color is completely transparent.</th>
</tr>
</thead>
</table>

### “Transparency”

<table>
<thead>
<tr>
<th>“Line width”</th>
<th>Value in pixels Example: 2</th>
</tr>
</thead>
</table>

Note: The values 0 and 1 both result in a line weight of 1 pixel. If no line should be displayed, then the “Line style” property must be set to the option “Invisible”.

### “Fill attributes”

The way in which the element is filled.

- **Filled**: The element is filled with the color from property “Colors ➔ Fill color”.
- **Invisible**: The fill color is invisible.

### “Line style”

Type of line representation

- **Solid**
- **Dashes**
- **Dots**
- **Dash Dot**
- **Dash Dot Dot**
- **not visible**

You can assign variables in the “Appearance variables” property for controlling the appearance dynamically. The fixed values here are overwritten.

### “Symbol color”

Selection of a color for the flower symbol.

### “Line”

Stroke width of the lines (in pixels).

### Element property ‘Appearance’

The properties contain fixed values for setting the look of the element.

### “Movement”

<table>
<thead>
<tr>
<th>“X”</th>
<th>Variable (numeric data type). Defines the X position (in pixels). Example: PLC_PRG.iPos_X. Increasing this value in runtime mode moves the element to the right.</th>
</tr>
</thead>
</table>

### “Y”
Variable (numeric data type). Defines the Y position (in pixels).

**Example:** PLC_PRG.iPos_Y.

Increasing this value in runtime mode moves the element downwards.

### “Rotation”
Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle1.

The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.

In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

### “Interior rotation”
Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol.

Note: If a static angle of rotation is specified in the “Position ➔ Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

---

You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.

---

Element property 'State variables'

The variables control the element behavior dynamically.

<table>
<thead>
<tr>
<th>“Invisible”</th>
<th>Variable (BOOL). Toggles the visibility of the element.</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRUE: The element is not visible at runtime.</td>
<td></td>
</tr>

Visualization element ‘Text editor’

Symbol:

Tag: “Special controls”

The element shows the contents of text files that are saved on the controller. Files can be encoded in ASCII or Unicode formats.

A visualization user can also edit the text.
Element properties

| "Element name" | Example: GenElemInst_1 |
| "Type of element" | "Text editor" |

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

| "X" | X coordinate of the upper left corner of the element  
Specified in pixels.  
Example: 10. |
| "Y" | Y coordinate of the upper left corner of the element  
Specified in pixels.  
Example: 10. |
| "Width" | Specified in pixels.  
Example: 150 |
| "Height" | Specified in pixels.  
Example: 30 |

You can also change the values by dragging the box symbols (_drag_box_) to other positions in the editor.

Element property 'Font'

| "Font name" | Non-proportional font used by the visualization to display the contents of the file  
Example: “Courier New” |
| "Size" | Font size  
Example: 12 |

Element property 'Control variables'
### Table 351: Element property “Control variables --> File”

| “Variable” | Variable (STRING). Contains the file names and optionally the location of the file. It is located in the file system of the controller.  
|            | Example: FLC_PRG.strFile: STRING := '/Documentation/Info.txt'; |
| “Open”     | Variable (BOOL). Controls opening the file which is defined in the “Variable” property  
|            | Example: bOpen: BOOL;  
|            | TRUE: The file is opened. |
| “Close”    | Variable (BOOL). Controls closing the file which is defined in the “Variable” property  
|            | Example: bClose: BOOL;  
|            | TRUE: The file is closed. |
| “Save”     | Variable (BOOL). Controls saving the file which is defined in the “Variable” property  
|            | Example: bStore: BOOL;  
|            | TRUE: The file is saved. |
| “New”      | Variable (BOOL). Controls creating a new file. The name is defined in the “Variable” property.  
|            | Example: bCreate: BOOL;  
|            | TRUE: A file is created and opened. |

### Table 352: Element property “Control variables --> Edit”

| “Variable” | Variable (STRING). Contains the string to search for in the file  
|            | Example: strFind: STRING := 'abc'; |
| “Find”     | Variable (BOOL). Controls executing the search for the string in the “Variable” property  
|            | Example: bFind: BOOL;  
|            | TRUE: The search is performed. The variable is automatically reset to FALSE. |
| “Find next”| Variable (BOOL). Controls the location to begin the search in the file  
|            | Example: bFindNext: BOOL;  
|            | TRUE: The search begins at the last search result location.  
|            | FALSE: The search begins at the beginning of the file. |

### Table 353: Element property “Control variables --> Cursor position”

| “Line” | Variable (integer data type). Contains the line of the cursor  
|        | Example: iRowCursor: INT; |
| “Column” | Variable (integer data type). Contains the column of the cursor  
|         | Example: iColumnCursor: INT; |
"Position"  Output variable (integer data type). Shows the **absolute** cursor position in the text.
Example: `iPosCursor: INT;`

"Set cursor"  Variable (BOOL). Controls the setting of the cursor at a specific location
Example: `iSetCursor: INT;`
TRUE: The cursor is moved. The new position is defined in the "Line" and "Column" properties.
FALSE: The "Line", "Column", and "Position" properties contain the actual values.
Note: The variable is used as the control variable for an input event triggered by a visualization user.

<table>
<thead>
<tr>
<th>Table 354: Element property “Control variables --&gt; Selection”</th>
</tr>
</thead>
</table>
| **Start position**  Output variable (integer data type). Shows the **absolute** position for starting the text selection
Example: `iPosSelection: INT;` |
| **End position**  Output variable (integer data type). Shows the **absolute** position for ending the text selection.
Example: `iPosEndSelection: INT;` |
| **Start line number**  Output variable (integer data type). Shows the line where the text selection begins
Example: `iRowSelection: INT;` |
| **Start column index**  Output variable (integer data type). Shows the column where the text selection begins
Example: `iColumnSelection: INT;` |
| **End line number**  Output variable (integer data type). Shows the line where the text selection ends
Example: `iRowEndSelection: INT;` |
| **End column index**  Output variable (integer data type). Shows the column where the text selection ends
Example: `iColumnEndSelection: INT;` |
| **Line to select**  Variable (integer data type). Contains the line number that is selected
Note: The selection is controlled by the variables in the "Trigger selection" property. |
| **Set selection**  Variable (BOOL). Controls the selection of a line.
Example: `bSetSelection: BOOL;`
TRUE: The line from the "Line to select" property is selected and highlighted in the text editor.
if the line is not in the current text segment of the text editor, then the text segment is moved to this line.
Note: The variable is used as the control variable for an input event triggered by a visualization user. The control variable is not reset automatically. You are responsible for this to occur in the visualization. |
Table 355: Element property "Control variables --> Error handling"

| Variable for error code | Variable (integer data type). Contains the error code when an error occurs. Example: iError: INT; The error codes are declared in GVL_ErrorCodes in the VisuElemTextEditor library. To display the error text, the VisuFctTextEditorGetErrorText() function of the library must be called. |

| Variable for content changed | Variable (BOOL). Shows whether the contents have changed. Example: bIsContentEdited: BOOL; TRUE: The contents of the text editor have changed. |

| Variable for access mode | Variable (BOOL). Controls the access privileges to the file. Example: bIsReadOnly: BOOL; TRUE: A visualization user has read-only permission. At runtime, the file contents are highlighted in gray in the text editor. FALSE: A visualization user has read/write permission. Note: The variable overwrites the setting in the “Editor mode” property. |

| Maximum line length | Maximum number of characters per line |

| Editor mode | ● "Read-only": A visualization user has read-only permissions to the file. At runtime, the file contents are highlighted in gray in the text editor. ● "Read/write": A visualization user has read-write permissions. |

Element property 'New files'

| Encoding | Character encoding of the new file: ● “ASCII” ● “Unicode (Little endian)” ● “Unicode (Big endian)” |

| New line character sequence | End of line character of the new file: ● “CR/LF”: Normal for Windows systems ● “LF”: Normal for UNIX systems Please note: When a visualization user opens an existing file, the end-of-line character of the file is detected and used automatically. |

These properties are available only when you select the “Preview: Support client animations and overlay of native elements” option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.

**Visualization element ‘Path3D’**

Symbol:

![Path3D Symbol](image)

Tag: “Special controls”

The visualization element “Path3D” graphically displays the curves of two independent records as a 3D path. It is specially designed for use with CODESYS SoftMotion CNC in order to display the trajectory of a machine tool or a robot. The programmed path (path) and the path actually traveled (track) is visualized.

Although the visualization element is designed for use with CODESYS SoftMotion CNC, it can also be used to display any other record. In this case the application must provide the path data. The sample application 3D Path Generator, which is available in the CODESYS Store, shows how these data can be generated.

If the element is used together with SoftMotion CNC, then function blocks from the library SM3_CNC_Visu help to generate the data from the path and track. These function blocks are used by the sample project CNC_File_3DPath, which is stored in the installation directory of CODESYS.

- SMC_PathCopier
- SMC_PathCopierCompleteQueue
- SMC_PathCopierFile
- SMC_PositionTracker
A description of the function blocks can be found in the Library Manager in the SM3_CNC_Visu library.

The element does not work with the CODESYS HMI display variant.

- CNC Example 6: Using Path3D with SoftMotion CNC

### Element properties

<table>
<thead>
<tr>
<th>“Element name”</th>
<th>Example: GenElemInst_1</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Type of element”</td>
<td>“Path3D”</td>
</tr>
</tbody>
</table>

### Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

| “X” | X coordinate of the upper left corner of the element  
Specified in pixels.  
Example: 10. |
| “Y” | Y coordinate of the upper left corner of the element  
Specified in pixels.  
Example: 10. |
| “Width” | Specified in pixels.  
Example: 150 |
| “Height” | Specified in pixels.  
Example: 30 |

You can also change the values by dragging the box symbols (_drag_ ) to other positions in the editor.

See also
- Chapter 1.3.5.3.2 “Positioning elements, adapting size and layer” on page 1113

### Path description
### Path data (VisuStruct3DTrack)

Variable of the type `VisuStruct3DTrack`, which is declared in the IEC code. Example: `PLC_PRG.pc.vs3dt`. A description of the structure can be found in the library manager in the library `VisuElem3DPath.library`.

The data structure describes a path or track through a certain number of points. The points are determined and buffered by the application. The track typically displays the last n positions, so that only a certain part of them is ever displayed at any one time. `VisuStruct3DTrack.pProjection` is a variable that is set by the visualization element and contains information about the path/track projection. It can be read (only) by the application. In addition, the methods `Projection.Apply` or `ApplyV` can be used in order to see whether the transformed position lies inside or outside the visualization display area, which is defined by `Projection.ElementRect`.

### Path color

Color of the path drawn

### Path line width

Path line width in pixels, e.g.: "2"

### Style of boundary points

Display of the points between two successive objects in the path
- End points are not displayed
- End points are marked with a circle
- End points are marked with a cross
- End points are marked with a plus

---

### Track description

The track data are structured in exactly the same way as the path data: `VisuStruct3DTrack`.

### Track data (VisuStruct3DTrack)

Variable of the type `VisuStruct3DTrack`, which is declared in the IEC code. Example: `PLC_PRG.pc.vs3dt`. A description of the structure can be found in the library manager in the library `VisuElem3DPath.library`.

### Track color

Color of the track drawn

### Track line width

Track line width in pixels, e.g.: "2"

---

### Camera control

The camera position for the 3D mode is controlled with a reference to the external data structure. This structure allows the following operations:

- Shifting to the left/to the right/upwards/downwards
- Rotation around the X/Y/Z axis
- Resetting of the view at X/Y, Y/Z or Z/X level, so that the path and the track are completely visible.

### Control data (VisuStruct3DControl)

Variable of the type `VisuStruct3DControl`, which is declared in the IEC code. Example: `PLC_PRG.pc.vs3dc`.

A description of the structure can be found in the library manager in the library `VisuElem3DPath`.

The values can be set via the application itself or via the visualization element "ControlPanel". The library `VisuElem3DPath` contains ready-to-use visualization frames that provide a possible user interface for these data.

### Additional aspects
### Highlighting

Individual parts of the path can be visually highlighted. This is typically used to mark the already processed part of a track with a different color. Each point in the path is given a unique ID, which in the case of a CNC editor is linked with the object ID on which the point lies. This ID ("highlight ID") can be specified via the application so that dynamic elements/parts of the track can be highlighted.

#### "Highlight mode"

Select one of the following highlight modes:
- Only the element whose ID corresponds to the value of the variable is highlighted.
- All elements whose ID (linked with the object ID in the case of a CNC editor) is smaller than or equal to the value in "Variable" are highlighted.

#### "Variable"

Project variable that specifies the ID of an element. Example: PLC_PRG.iVarElementID. This "highlight ID" is taken into account for the setting of the "highlight mode". The variable must be set in the IEC application.

#### "Highlight color"

These properties are available only when you select the "Preview: Support client animations and overlay of native elements" option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.

#### "Animation duration"

Time that the element executes an animation (in milliseconds)

Example: 500

#### "Move to the foreground"

Property value (BOOL)

**TRUE**: At runtime, the element is displayed in the foreground.

**FALSE**: At runtime, the element is displayed in the layer where it was inserted in the visualization editor.
Requirement: User management is set up for the visualization.

<table>
<thead>
<tr>
<th>“Access rights”</th>
<th>Opens the “Access rights” dialog. There you can edit the access privileges for the element.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status messages:</td>
<td>• “Not set. Full rights.”: Access rights for all user groups: “operable”</td>
</tr>
<tr>
<td></td>
<td>• “Rights are set: Limited rights”: Access is restricted for at least one group.</td>
</tr>
</tbody>
</table>

- Chapter 1.3.5.21.5 “Using client animation” on page 1962

Visualization element ‘Control Panel’

Symbol:

Tag: “Special controls”
This visualization element is used in connection with the “Path3D” visualization element. It is used for changing the position and orientation to the CNC path shown with “Path3D”.

<th>Displays the frame</th>
</tr>
</thead>
<tbody>
<tr>
<td>• “No frame”: The displayed area of the frame does not have borders.</td>
<td></td>
</tr>
<tr>
<td>• “Frame”: The displayed area of the frame has borders.</td>
<td></td>
</tr>
<tr>
<td>• “No frame with offset”: The displayed area of the frame does not have a border and the displayed area of the referenced visualization is reduced inwards by one pixel as compared to the frame area. The resulting gap prevents the referenced visualization from touching any adjacent elements.</td>
<td></td>
</tr>
</tbody>
</table>

See also

- Chapter 1.3.5.18.1.42 “Visualization element ‘Path3D’” on page 1499
**“Scaling type”**

Describes how the frame reacts when the visualization is resized:

- **“Isotropic”**: The frame retains its proportions. This allows the ratio of height to width to be preserved, even if the height and width of the visualization have been changed separately.
- **“Anisotropic”**: The frame depends on the size of the visualization, so that height and width of the referenced visualization can be changed separately.
- **“Fixed”**: The original size of the frame is retained, regardless of the visualization size. If you have also selected the “Clipping” option, then only the fitting part is displayed.
- **“Fixed and scrollable”**: The referenced visualization is displayed without scaling. If it is larger than the window area of the frame, then scrollbars are included on the frame. To set the position of the scrollbar with a variable, use the “Scroll position variable horizontal” or “Scroll position variable vertical” property.

**“Deactivation of the background drawing”**

- To optimize the performance of the visualization, the non-animated elements of the frame element are drawn as a background bitmap. This could result in the elements not being displayed in the expected order.
- Deactivation of the background drawing. This can prevent the behavior described above.

**Element property 'References'**

Contains the currently configured visualization references as a subnode

**“References”**

Clicking “Configure” opens the “Frame Configuration” dialog. This is used to manage the referenced visualizations.

Caution: Visualizations can be nested at any depth by means of frame elements. In order to use the “Switch to any visualization” frame selection type without any problems, a frame must not contain more than 21 referenced visualizations. For more information, see also the description for the “Input configuration” of an element: Action “Switch frame visualization”.

**List of the currently referenced visualizations**

Visualizations that have a button also have this displayed as a subnode. Each interface variable is listed with the currently assigned transfer parameters.

Example:

```
vis_FormA
```

- `iDataToDisplay_1:PLC_PRG.iVar1`
- `iDataToDisplay_2:PLC_PRG.iVar2`

Hint: You can change the assignment of the variables to an interface variable here and edit the value field. Or click the “Configure” button instead.

See also

- 🍃 Chapter 1.3.5.19.2.1 “Command 'Interface Editor'” on page 1556
- 🍃
- 🍃 Chapter 1.3.5.19.3.6 “Dialog 'Input Configuration'” on page 1586

**Element property 'Position'**

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.
### Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>X</code></td>
<td>X-coordinate of the point of rotation</td>
</tr>
<tr>
<td><code>Y</code></td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the symbols () to other positions in the editor.

### Element property 'Colors'

The properties contain fixed values for setting colors.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Color</code></td>
<td>Color for the element in its normal state. Please note that the normal state is in effect if the expression in the &quot;Color variables ➔ Toggle color&quot; property is not defined or it has the value FALSE.</td>
</tr>
<tr>
<td><code>Alarm color</code></td>
<td>Color for the element in alarm state. Please note that the alarm state is in effect if the expression in the &quot;Color variables ➔ Toggle color&quot; property has the value TRUE.</td>
</tr>
<tr>
<td><code>Transparency</code></td>
<td>Value (0 to 255) for defining the transparency of the selected color. Example 255: The color is opaque. 0: The color is completely transparent.</td>
</tr>
<tr>
<td><code>Use gradient color</code></td>
<td>☑: The element is displayed with a color gradient.</td>
</tr>
<tr>
<td><code>Gradient setting</code></td>
<td>The “Color gradient editor” dialog box opens.</td>
</tr>
<tr>
<td><code>Frame color</code></td>
<td>Example: “Black”</td>
</tr>
<tr>
<td><code>Fill color</code></td>
<td>Example: “Light gray”</td>
</tr>
</tbody>
</table>
Element property 'Appearance'

The properties contain fixed values for setting the look of the element.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Line width”</strong></td>
<td>Value in pixels</td>
</tr>
<tr>
<td></td>
<td>Example: 2</td>
</tr>
<tr>
<td></td>
<td>Note: The values 0 and 1 both result in a line weight of one pixel. If no line should be displayed, then the “Line style” property must be set to the option “Invisible”.</td>
</tr>
<tr>
<td><strong>“Line style”</strong></td>
<td>Type of line representation</td>
</tr>
<tr>
<td></td>
<td>“Solid”</td>
</tr>
<tr>
<td></td>
<td>“Dashes”</td>
</tr>
<tr>
<td></td>
<td>“Dots”</td>
</tr>
<tr>
<td></td>
<td>“Dash Dot”</td>
</tr>
<tr>
<td></td>
<td>“Dash Dot Dot”</td>
</tr>
<tr>
<td></td>
<td>“not visible”</td>
</tr>
</tbody>
</table>

You can assign variables in the “Appearance variables” property for controlling the appearance dynamically. The fixed values are defined here.

Element property 'Texts'

The properties contains character strings for labeling the element. The character string can also contain a placeholder with a format definition. In runtime mode, the placeholder is replaced by the current value in the specified format.

CODESYS accepts the specified texts automatically into the “GlobalTextList” text list. Therefore, these texts can be localized.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Text”</strong></td>
<td>Character string (without single straight quotation marks) for the labeling the element. Add a line break by pressing the keyboard shortcut [Ctrl] + [Enter]. Example: Accesses: %i The variable that contains the current value for the placeholder is specified in the property “Text variable ➔ Text”.</td>
</tr>
<tr>
<td><strong>“Tooltip”</strong></td>
<td>Character string (without single straight quotation marks) that is displayed as the tooltip of an element. Example: Number of valid accesses. The variable that contains the current value for the placeholder is specified in the property “Text variable ➔ Tooltip”.</td>
</tr>
</tbody>
</table>

See also

- § “Element property 'Appearance variables’” on page 1285
- § “Element property 'Text variables’” on page 1229
- § Chapter 1.3.5.18.2 “Placeholders with format definition in the output text” on page 1546
The properties contain fixed values for the text properties.

<table>
<thead>
<tr>
<th>“Horizontal alignment”</th>
<th>Horizontal alignment of the text within the element.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Vertical alignment”</td>
<td>Vertical alignment of the text within the element.</td>
</tr>
</tbody>
</table>

**“Text format”**
Definition for displaying texts that are too long
- **“Default”**: The long text is truncated.
- **“Line break”**: The text is split into parts.
- **“Ellipsis”**: The visible text ends with "..." indicating that it is not complete.

**“Font”**
Example: **“Default”**
- The “Font” dialog box opens.
- ▼: Drop-down list with style fonts.

**“Font color”**
Example: **“Black”**
- The “Color” dialog box opens.
- ▼: Drop-down list with style colors.

**“Transparency”**
Whole number (value range from 0 to 255). This determines the transparency of the respective color.
Example: **255**: The color is opaque.
**0**: The color is completely transparent.
Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

**“Movement”**

<table>
<thead>
<tr>
<th>“X”</th>
<th>Variable (numeric data type). Defines the X position (in pixels).</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>PLC_PRG.iPos_X.</td>
</tr>
<tr>
<td>Increasing</td>
<td>this value in runtime mode moves the element to the right.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Y”</th>
<th>Variable (numeric data type). Defines the Y position (in pixels).</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>PLC_PRG.iPos_Y.</td>
</tr>
<tr>
<td>Increasing</td>
<td>this value in runtime mode moves the element downwards.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Rotation”</th>
<th>Variable (numeric data type). Defines the angle of rotation (in degrees).</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>PLC_PRG.iAngle1.</td>
</tr>
<tr>
<td>The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.</td>
<td></td>
</tr>
<tr>
<td>In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.</td>
<td></td>
</tr>
</tbody>
</table>
### "Scaling"

Variable (integer data type). Causes centric stretching.

Example: PLC_PRG.iScaling.

The reference point is the "Center" property.

The value 1 shrinks the element by a factor of 0.001. The value 1000 returns the element to its original size.

### "Interior rotation"

Variable (numeric data type). Defines the angle of rotation (in degrees).

Example: PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in "Center" according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol.

Note: If a static angle of rotation is specified in the property "Position → Angle", then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

---

You can link the variables to a unit conversion.

The properties “X”, “Y”, “Rotation”, and “Interior rotation” are supported by the "Client Animation" functionality.

See also
- Unit conversion

---

**Element property 'Relative movement'**

The properties contains variables for moving the element. The reference point is the position of the element ("Position" property). The shape of the element can change.

<table>
<thead>
<tr>
<th>&quot;Movement top-left&quot;</th>
<th>&quot;Movement bottom-right&quot;</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>&quot;X&quot;</strong> Variable (integer data type). It contains the number (in pixels) that the left edge is moved horizontally. Incrementing the value moves the element to the right.</td>
<td><strong>&quot;Y&quot;</strong> Variable (integer data type). It contains the number (in pixels) that the top edge is moved vertically. Incrementing the value moves the element to the down.</td>
</tr>
<tr>
<td>Example: PLC_PRG.iDeltaX</td>
<td>Example: PLC_PRG.iDeltaY</td>
</tr>
</tbody>
</table>
| "X" | Variable (integer data type). It contains the number (in pixels) that the right edge is moved horizontally. Incrementing the value moves the element to the right.  
Example: PLC_PRG.iDeltaWidth |
| "Y" | Variable (integer data type). It contains the number (in pixels) that the bottom edge is moved vertically. Incrementing the value moves the element to the down.  
Example: PLC_PRG.iDeltaHeight |

See also
- “Element property ‘Absolute movement’” on page 1227

**Element property ‘Text variables’**

These properties are variables with contents that replace a format definition.

| "Text variable" | Variable (data type compliant with the format definition). It contains what is printed instead of the format definition.  
Example: PLC_PRG.iAccesses  
Note: The format definition is part of the text in the property “Texts ➔ Text”.  
Note: If you specify a variable of type enumeration with text list support, then the name of the enumeration data type is added automatically in angle brackets after the variable name. Example: PLC_PRG.enVar <enumeration name>. Then the symbolic value of the enumeration component is printed instead of the numeric value when text is printed. Refer to the help page for the enumerations. |
| "Tooltip variable" | Variable (data type compliant with the format definition). It contains what is printed instead of the format definition.  
Example: PLC_PRG.iAccessesInTooltip  
Note: The format definition is part of the text in the property “Texts ➔ Tooltip”. |

See also
- Chapter 1.3.5.18.2 “Placeholders with format definition in the output text” on page 1546
- “Element property ‘Texts’” on page 1226
- *Enumerations*

**Element property ‘Dynamic texts’**

Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.
"Text list" | Variable (string) or name of the text list as a fixed string in single straight quotation marks.  
Example: 'Errorlist'  
▼: Drop-down list with the dialogs available in the text lists.

"Text index" | Text list ID. This refers to the desired output text.  
● As fixed string with the ID in single straight quotation marks.  
Example: '1'  
● As a variable (STRING) for dynamically controlling the text output.  
Example: strTextID  
Sample assignment: PLC_PRG.strTextID := '1';

"Tooltip index" | Text list ID. This refers to the desired output text.  
● As fixed string with the ID in single straight quotation marks.  
Example: '2'  
● As a variable (STRING) for dynamically controlling the text output.  
Example: strToolTipID  
Sample assignment: PLC_PRG.strToolTipID := '2';

See also  
● Text list

Element property 'Font variables'  
The variables allow for dynamic control of the text display.

"Font name" | Variable (STRING). Includes the font of the text.  
Example: PLC_PRG.stFontVar := 'Arial';  
The selection of fonts corresponds to the default "Font" dialog.

"Size" | Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name.  
● <pt>: Points (default)  
Example: PLC_PRG.iFontHeight <pt>  
Code: iFontHeight : INT := 12;  
● <px> : Pixels  
Example: PLC_PRG.iFontHeight <px>  
Code: iFontHeight : INT := 19;

| pt |  
| px |

If you click in the value field, a drop-down list opens on the right for setting the unit.  

Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property "Text property ➔ Font".
<table>
<thead>
<tr>
<th><strong>“Flags”</strong></th>
<th>Variable (DWORD). Contains the flags for displaying fonts. Flags:</th>
</tr>
</thead>
<tbody>
<tr>
<td>● 1: Italics</td>
<td>● 2: Bold</td>
</tr>
<tr>
<td>● 4: Underline</td>
<td>● 8: Strikethrough</td>
</tr>
<tr>
<td>Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: PLC_PRG.dwFontType := 6;</td>
<td></td>
</tr>
</tbody>
</table>

| **“Character set”** | Variable (DWORD). Contains a character set number for the font. The selection of character set numbers corresponds to the “Script” setting of the standard “Font” dialog. |

| **“Color”** | Variable (DWORD). Includes the color of the text. Example: PLC_PRG.dwColorFont := 16#FF000000; |

<table>
<thead>
<tr>
<th><strong>“Flags for text alignment”</strong></th>
<th>Variable (integer data type). Contains the coding for text alignment. Example: PLC_PRG.dwTextAlignment. Coding:</th>
</tr>
</thead>
<tbody>
<tr>
<td>● 0: Top left</td>
<td>● 1: Horizontal center</td>
</tr>
<tr>
<td>● 2: Right</td>
<td>● 4: Vertical center</td>
</tr>
<tr>
<td>● 8: Bottom</td>
<td>Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: PLC_PRG.dwFontType := 5;</td>
</tr>
</tbody>
</table>

---

*Fixed values for displaying texts are set in “Text properties”.*

See also
- ¶ “Element property 'Text properties’” on page 1227

---

**Element property 'Colorvariables’**

The Element property is used as an interface for project variables to dynamically control colors at runtime.
“Toggle color”  The property controls the toggled color at runtime.
Value assignment:
- **FALSE**: The element is displayed with the color specified in the “Color” property.
- **TRUE**: The element is displayed with the color specified in the “Alarm color” property.
Assignment options:
- Placeholder for the user input variable
  - `<toggle/tap variable>`
  - `<NOT toggle/tap variable>`
The color change is not controlled by its own variable, but by a user input variable.
Note: Specify a variable for the mouse events “Tap” or “Toggle” in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both “Toggle” and “Tap”, then the variable specified in “Tap” is used.
Hint: Click the symbol to insert the placeholder “<toggle/tap variable>”. When you activate the “Inputconfiguration” “Tap FALSE” property, then the “<NOT toggle/tap variable>” placeholder is displayed.
- Instance path of a project variable (BOOL)
  Example: PLC_PRG.xColorIsToggeled
Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.

“Normal state”

“Alarm state”  The properties listed below control the color depending on the state. The normal state is in effect if the variable in “Color variables”, “Toggle color” is not defined or it has the value FALSE. The alarm state is in effect if the variable in “Colorvariables”, “Toggle color” has the value TRUE.

“Frame color”  Assignment options:
- Variable (DWORD) for the frame color
  Example: PLC_PRG.dwBorderColor
- Color literal
  Example of green and opaque: 16#FF00FF00

“Filling color”  Assignment options:
- Variable (DWORD) for the fill color
  Example: PLC_PRG.dwFillColor
- Color literal
  Example of gray and opaque: 16#FF888888

The transparency part of the color value is evaluated only if the “Activate semi-transparent drawing” option of the visualization manager is selected.

Select the “Advanced” option in the toolbar of the properties view. Then all element properties are visible.

See also
- § Chapter 1.3.5.8.3 “Animating a color display” on page 1152
### Element property 'Appearance variables'

The properties contain variables for controlling the appearance of the element dynamically.

<table>
<thead>
<tr>
<th>“Line width”</th>
<th>Variable (integer data type). Contains the line weight (in pixels). Note: The values 0 and 1 both result in a line weight of one pixel. If no line should be displayed, then the “Line style” property must be set to the option “Invisible”.</th>
</tr>
</thead>
</table>
| “Line style” | Variable (DWORD). Controls the line style. Coding:  
  - 0: Solid line  
  - 1: Dashed line  
  - 2: Dotted line  
  - 3: Line type "Dash Dot"  
  - 3: Line type "Dash Dot Dot"  
  - 8: Invisible: The line is not drawn. |

**Fixed values can be set in the “Appearance” property. These values can be overwritten by dynamic variables at runtime.**

See also
- § “Element property ‘Appearance’” on page 1238

### Element property 'Switch frame variable'

The variable controls the switching of the referenced visualizations. This variable indexes one of the referenced frame visualizations and this is displayed in the frame. When the value of the variable changes, it switches to the recently indexed visualization.

| “Variable” | Variable (integer data type) that contains the index of the active visualization. Example: PLC_PRG.uiIndexVisu  
  
  Hint: The “Frame Configuration” dialog includes a list of referenced visualizations. The visualizations are automatically numerically indexed via the order in the list. Note: This variant of switching usually affects all connected display variants.  
  
  Array element (integer data type) for index access via CURRENTCLIENTID. Example: PLC_PRG.aIndexVisu[CURRENTCLIENTID]  
  
  Note: This variant of switching applies to the current client only, and therefore only on one display variant. That is the display variant where the value change was triggered (for example, by means of user input). |

See also
- § Chapter 1.3.5.19.2.9 “Command ‘Frame Selection’” on page 1564

### Element property 'State variables'

The variables control the element behavior dynamically.
"Invisible" Variable (BOOL). Toggles the visibility of the element. 
TRUE: The element is not visible at runtime.

"Deactivate inputs" Variable (BOOL). Toggles the operability of the element. 
TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated.

The "Invisible" property is supported by the "Client Animation" functionality.

See also

These properties are available only when you select the "Preview: Support client animations and overlay of native elements" option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.

"Animation duration" Time that the element executes an animation (in milliseconds)
Example: 500

"Move to the foreground" Property value (BOOL) 
TRUE: At runtime, the element is displayed in the foreground.  
FALSE: At runtime, the element is displayed in the layer where it was inserted in the visualization editor.

See also

● Chapter 1.3.5.21.5 “Using client animation” on page 1962

Element property 'Input configuration' The properties contain the configurations for the user input when using the mouse or keyboard. A user input defines an event and one or more actions that are executed when an event occurs.

The "Configure" button opens the "Input configuration" dialog box for creating or modifying a user input. Configured user inputs are briefly listed below the events. They each include the action that is triggered and the setting in short form.

Example: "Execute ST code": # PLC_PRG.i_x := 0;

"OnDialogClosed" Input event: The user closes the dialog box.

"OnMouseClick" Input event: The user clicks the mouse button completely. The mouse button is clicked and released.

"OnMouseDown" Input event: The user clicks down on the mouse button.

"OnMouseEnter" Input event: The user drags the mouse pointer to the element.

"OnMouseLeave" Input event: The user drags the mouse pointer away from the element.

"OnMouseMove" Input event: The user moves the mouse pointer over the element area.

"OnMouseUp" Input event: The user releases the mouse button over the element area.
### “Tap”
When a mouse click event occurs, the variable defined in “Variable” is described in the application. The coding depends on the options “Tap FALSE” and “Tap on enter if captured”.

### “Variable”
Variable (BOOL) that is set on mouse click.

**Example:** PLC_PRG.bIsTapped

- **TRUE:** A mouse click event exists. It lasts while the user presses the mouse button over the element. It ends when the button is released.
- **FALSE:** A mouse click event does not exist.

**Requirement:** The “Tap FALSE” option is not activated.

### “Tap FALSE”
- **TRUE:** The mouse click event leads to a complementary value in “Variable”.
- **FALSE:** A mouse click event does not exist.

### “Tap on enter if captured”
- **TRUE:** During user input, it is also taken into consideration whether the mouse pointer is dragged within the element area or not while the mouse button is pressed.
- **FALSE:** While the mouse click event exists.

- **TRUE:** While the mouse click event exists and the mouse pointer is moved over the element area.
- **FALSE:** A mouse click event does not exist. Or the user moves the mouse pointer outside of the element area while the mouse button is pressed.

The value is **TRUE** again as soon as the user moves the pointer back to the element area. The mouse is then captured.

### “Shift”
With the onset of a mouse click event, the variable is set; when the mouse click event is completed, the variable is reset.

### “Variable”
Variable (BOOL). Its value toggled when the mouse click event is ended. This is when the user releases the mouse button while the mouse pointer is over the element area.

If the user releases the mouse button while the mouse pointer is outside of the element area, then the mouse click event is not ended and the value is not toggled.

**Tip:** The user can cancel a started toggle input by dragging the mouse pointer out of the element area.

### “Toggle on up if captured”
- **TRUE:** The value toggles regardless of where the mouse pointer is when the mouse button is released. The mouse is then captured.

### “Keyboard shortcuts”
Keyboard shortcut on the element for triggering specific input actions.

When the keyboard shortcut event occurs, the input actions in the “Event(s)” property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.

### “Key”
Key pressed for input action.

**Example:** [T]

**Note:** The following properties appear when a key is selected.
### Event(s)
- **None**
- **Mouse down**: Pressing the key triggers the input actions that are configured in the "OnMouseDown" property.
- **Mouse up**: Releasing the key triggers the input actions that are configured in the "OnMouseUp" property.
- **Mouse down/up**: Pressing and releasing the key triggers the input actions that are configured in the "OnMouseDown" property and the "OnMouseUp" property.

### Shift
- Combination with the Shift key
- Example: [Shift]+[T].

### Control
- Combination with the Ctrl key
- Example: [Ctrl]+[T].

### Alt
- Combination with the Alt key
- Example: [Alt]+[T].

---

> All keyboard shortcuts and their actions that are configured in the visualization are listed in the "Keyboard configuration" tab.

---

### Visualization element ‘Date range picker’

**Symbol:**

![Symbol](image)

**Tag:** “Date/time controls”

The element provides the capability of selecting the date and time range of a saved data set. The element is used with the “Trend” visualization element.

#### Element properties

<table>
<thead>
<tr>
<th>“Element name”</th>
<th>Example: DateTrend1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Optional</td>
<td>Hint: Assign individual names for elements so that they are found faster in the element list.</td>
</tr>
</tbody>
</table>

**Type of element**: “Date range picker”

---

### Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>X</td>
<td>X coordinate of the upper left corner of the element. Specified in pixels. Example: 10.</td>
</tr>
<tr>
<td>Y</td>
<td>Y coordinate of the upper left corner of the element. Specified in pixels. Example: 10.</td>
</tr>
<tr>
<td>Width</td>
<td>Specified in pixels. Example: 150</td>
</tr>
<tr>
<td>Height</td>
<td>Specified in pixels. Example: 30</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the box symbols to other positions in the editor.

See also

- Chapter 1.3.5.3.2 “Positioning elements, adapting size and layer” on page 1113

**Element property ‘Center’**

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>X</td>
<td>X-coordinate of the point of rotation</td>
</tr>
<tr>
<td>Y</td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the symbols to other positions in the editor.

**Element property 'Tick mark labels'**

- Show frame: The visualization element is displayed with a frame.
- Resolution: Resolution saved for the time stamp: “Millisecond” or “Microsecond”
- Attached element instance: The element can be assigned to a “Trend” visualization element. In this way, the time range of the trend element can be changed. The available visual elements are selected with the help of the input assistant.
"Two-line labelling"  
☑: The time stamps are displayed in two lines. The date is displayed in the first line and the time is displayed in the second line.  
☐: Time stamp is displayed in one line. The date and time can also be displayed in one line depending on the formatting.

"Omit irrelevant information in time stamp"  
☑: The time stamp has a shorter form. For example, the date is displayed only for the first tick mark, and only the time for the following tick marks. The settings in "Internationalization (format strings)" are ignored for this setting.  
☐: All information is displayed for all time stamps.

"Internationalization (format strings)"  
Only active when the parameter “Omit irrelevant information in timestamps” is deactivated.

"Date"  
Definition of the date format. The default setting is taken from the Windows control panel.

"Time"  
Definition of the time format. The default setting is taken from the Windows control panel.

Element property 'Text properties'  
The properties contain fixed values for the text properties.

"Horizontal alignment"  
Horizontal alignment of the text within the element.

"Vertical alignment"  
Vertical alignment of the text within the element.

"Font"  
Example: “Default”  
☑: The “Font” dialog box opens.  
▼: Drop-down list with style fonts.

"Font color"  
Example: “Black”  
☑: The “Color” dialog box opens.  
▼: Drop-down list with style colors.

"Transparency"  
Whole number (value range from 0 to 255). This determines the transparency of the respective color.  
Example: 255: The color is opaque.  
0: The color is completely transparent.  
Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

Element property 'Additional buttons'  

"Jump to the largest possible time stamp"  
☑: An additional button ( ) is displayed for jumping to the last time stamp.

"Jump to the smallest possible time stamp"  
☑: An additional button ( ) is displayed for jumping to the first time stamp.

"Zoom out"  
☑: An additional button ( ) is displayed for setting the current min./max. range to the maximum range. The selected range is left.

Element property 'Absolute movement'  
The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
### Movement

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Example</th>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>X</strong></td>
<td>Variable (numeric data type). Defines the X position (in pixels).</td>
<td>Example: PLC_PRG.iPos_X.</td>
<td>Increasing this value in runtime mode moves the element to the right.</td>
</tr>
<tr>
<td><strong>Y</strong></td>
<td>Variable (numeric data type). Defines the Y position (in pixels).</td>
<td>Example: PLC_PRG.iPos_Y.</td>
<td>Increasing this value in runtime mode moves the element downwards.</td>
</tr>
<tr>
<td><strong>Rotation</strong></td>
<td>Variable (numeric data type). Defines the angle of rotation (in degrees).</td>
<td>Example: PLC_PRG.iAngle1.</td>
<td>The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.</td>
</tr>
<tr>
<td><strong>Interior rotation</strong></td>
<td>Variable (numeric data type). Defines the angle of rotation (in degrees).</td>
<td>Example: PLC_PRG.iAngle2.</td>
<td>In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the symbol. Note: If a static angle of rotation is specified in the “Position ➔ Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.</td>
</tr>
</tbody>
</table>

You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.

See also
- Unit conversion
The variables control the element behavior dynamically.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| "Invisible"      | Variable (BOOL). Toggles the visibility of the element.  
|                  | TRUE: The element is not visible at runtime.         |

The "Invisible" property is supported by the "Client Animation" functionality.

See also
- 

These properties are available only when you select the "Preview: Support client animations and overlay of native elements" option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| "Animation duration" | Time that the element executes an animation (in milliseconds)  
|                  | Example: 500                                      |
| "Move to the foreground" | Property value (BOOL)  
|                  | TRUE: At runtime, the element is displayed in the foreground.  
|                  | FALSE: At runtime, the element is displayed in the layer where it was inserted in the visualization editor.         |

- Chapter 1.3.5.21.5 “Using client animation” on page 1962

Element property 'Access rights'

Requirement: User management is set up for the visualization.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| "Access rights" | Opens the "Access rights" dialog. There you can edit the access privileges for the element.  
|                  | Status messages:  
|                  | • "Not set. Full rights.": Access rights for all user groups: "operable"  
|                  | • "Rights are set: Limited rights": Access is restricted for at least one group.         |

See also
- Chapter 1.3.5.19.3.1 “Dialog ‘Access Rights’” on page 1583

Visualization element 'Time range picker'

Symbol:

Tag: “Date/time controls”
The element provides configurable buttons for setting the time range of a trend display to a defined time. In the process the end time of the previous display is left unchanged and the start time is adapted.

**Element properties**

<table>
<thead>
<tr>
<th><strong>“Element name”</strong></th>
<th>Optional</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hint: Assign individual names for elements so that they are found faster in the element list.</td>
<td></td>
</tr>
<tr>
<td>Example: TimeRangeTemperature</td>
<td></td>
</tr>
</tbody>
</table>

| **“Type of element”** | “Time range picker” |

**Element property 'Position'**

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

<table>
<thead>

</tr>
<tr>
<td></td>
<td>Please note: If the color is a style color and already has a transparency value, then this property is write-protected.</td>
</tr>
</tbody>
</table>

**Property 'Times'** In "Times", the buttons that the element provides at runtime are defined and configured in an array.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Provide &quot;All&quot; selection&quot;</td>
<td>☑️: Time selector bar extended by &quot;All&quot; button. The diagram represents a time interval that covers all time stamps.</td>
</tr>
<tr>
<td>&quot;Times&quot;</td>
<td>☑️: Adds another button to the time selection bar and increases the array by one entry. An additional index is present in the property &quot;Times ➔ Times ➔ Times ➔ [&lt;new&gt;]&quot;, &quot;Time&quot; is located under this index. The configuration of the button is to be entered there.</td>
</tr>
<tr>
<td></td>
<td>☑️: Array of all buttons in the time selection bar. Index corresponds to the number of buttons.</td>
</tr>
<tr>
<td></td>
<td>☑️: The associated button is removed from the time picker bar. The configuration entry is deleted from the &quot;Times&quot; property list.</td>
</tr>
<tr>
<td>&quot;[Index]&quot;</td>
<td>☑️: Time interval in standardized notation. Example: 3M for 3 months; 30m for 30 minutes. If a time interval is indicated in the field, then the button is labelled with it. If a user clicks on the button at runtime, the command is executed to switch the diagram to this time interval. The default is empty.</td>
</tr>
</tbody>
</table>

**Element property 'Control variables'**
<table>
<thead>
<tr>
<th><strong>Property</strong></th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Time”</strong></td>
<td>Displays which time is currently selected.</td>
</tr>
<tr>
<td>Variable</td>
<td>(STRING)</td>
</tr>
<tr>
<td>Example:</td>
<td>PLC_PRG.strSelectedTime</td>
</tr>
<tr>
<td><strong>“All” selected</strong></td>
<td>Displays the state of the &quot;All&quot; button</td>
</tr>
<tr>
<td>Variable</td>
<td>(BOOL)</td>
</tr>
<tr>
<td>Example:</td>
<td>PLC_PRG.AllTimesAreSelected</td>
</tr>
</tbody>
</table>

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

### Movement

<table>
<thead>
<tr>
<th><strong>Variable</strong></th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“X”</strong></td>
<td>Variable (numeric data type). Defines the X position (in pixels).</td>
</tr>
<tr>
<td>Example:</td>
<td>PLC_PRG.iPos_X</td>
</tr>
<tr>
<td>Increasing this value in runtime mode moves the element to the right.</td>
<td></td>
</tr>
<tr>
<td><strong>“Y”</strong></td>
<td>Variable (numeric data type). Defines the Y position (in pixels).</td>
</tr>
<tr>
<td>Example:</td>
<td>PLC_PRG.iPos_Y</td>
</tr>
<tr>
<td>Increasing this value in runtime mode moves the element downwards.</td>
<td></td>
</tr>
</tbody>
</table>

| **Rotation** | Variable (numeric data type). Defines the angle of rotation (in degrees). |
| Example: | PLC_PRG.iAngle1 |
| The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol. |
| In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right. |

| **“Interior rotation”** | Variable (numeric data type). Defines the angle of rotation (in degrees). |
| Example: | PLC_PRG.iAngle2 |
| In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. |
| The rotation point is shown as the symbol. |
| Note: If a static angle of rotation is specified in the “Position ➔ Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed. |
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

See also
- Unit conversion

Element property 'State variables'

Invisible
Variable (BOOL). Toggles the visibility of the element.
TRUE: The element is not visible at runtime.

The “Invisible” property is supported by the "Client Animation" functionality.

See also
-

These properties are available only when you select the “Preview: Support client animations and overlay of native elements” option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.

Animation duration
Time that the element executes an animation (in milliseconds)
Example: 500

Move to the foreground
Property value (BOOL)
TRUE: At runtime, the element is displayed in the foreground.
FALSE: At runtime, the element is displayed in the layer where it was inserted in the visualization editor.

See also
- Chapter 1.3.5.21.5 “Using client animation” on page 1962

Element property 'Access rights'

Requirement: User management is set up for the visualization.
"Access rights" Opens the "Access rights" dialog. There you can edit the access privileges for the element. Status messages:
● "Not set. Full rights." : Access rights for all user groups : “operable”
● "Rights are set: Limited rights": Access is restricted for at least one group.

See also
●  "Chapter 1.3.5.19.3.1 "Dialog 'Access Rights” on page 1583"

Visualization element 'Date picker'

Symbol:

Tag: “Date/time controls”
The element is a calendar that displays the current date. A user can click a tag to select a date, which is saved to a variable. In addition, it can customize the time interval that the calendar displays. Clicking the calendar header changes the year. Clicking the arrows in the calendar header changes the month.

Language-dependent texts of the element

The element contains language-dependent texts that are managed in the System text list. This deals with the names of the month and the days of the week written out completely or abbreviated. When the date picker is added to a visualization, CODESYS generates the text list automatically below the POU view. The IDs correspond to the default text and therefore English terms. The text list makes it possible to translate these texts.

<table>
<thead>
<tr>

Element properties

<table>
<thead>
<tr>
<th>&quot;Element name&quot;</th>
<th>Example: DueDateCalendar</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Type of element&quot;</td>
<td>&quot;Date picker&quot;</td>
</tr>
</tbody>
</table>

Element property 'Position'
The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.
“X”  
X coordinate of the upper left corner of the element  
Specified in pixels.  
Example: 10.

“Y”  
Y coordinate of the upper left corner of the element  
Specified in pixels.  
Example: 10.

“Width”  
Specified in pixels.  
Example: 150

“Height”  
Specified in pixels.  
Example: 30

You can also change the values by dragging the box symbols (منذ) to other positions in the editor.

See also
● Chapter 1.3.5.3.2 “Positioning elements, adapting size and layer” on page 1113

Element property ‘Center’  
The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ☑ symbol. The point is used as the center for rotating and scaling.

“X”  
X-coordinate of the point of rotation

“Y”  
Y-coordinate of the point of rotation

You can also change the values by dragging the symbols ( منذ) to other positions in the editor.

“Variable”  
Input variable (DATE). Contains the date that a user selects in the calendar.  
Example: PLC_PRG.dtDueDate

“Design”  
● “From style”: All settings are preconfigured according to the style.  
● “Explicit”: The “Design settings” property appears. Here you can customize the calendar.

Design settings  
Requirement: This property is visible only if the “Design” property is set to “Explicit”.  
The values of the property can be predefined in the style. Then they are available in the drop-down list.

| **Width of separator line** |                                                                              |
| **Background**             | Design of the calendar days                                                  |
| **Draw background**        | *From style*: The style defines whether and how a background is drawn.       |
|                            | *Yes*: The background is filled with the color in the “Fill color” property and framed in the “Frame color”. |
|                            | *No*: The background is not filled with a color.                             |
| **Fill color**             | Style color or user-defined color                                           |
| **Frame color**            |                                                                              |

**Element property 'Display type'**

<table>
<thead>
<tr>
<th><strong>Rows</strong></th>
<th>Number of month calendars per row (preset: 1)</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Columns</strong></td>
<td>Number of month calendars per column (preset: 1)</td>
</tr>
</tbody>
</table>

**Element property 'Absolute movement'**

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

<table>
<thead>
<tr>
<th><strong>Movement</strong></th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>X</strong></td>
<td>Variable (numeric data type). Defines the X position (in pixels).</td>
</tr>
<tr>
<td>Example: PLC_PRG.iPos_X.</td>
<td></td>
</tr>
<tr>
<td>Increasing this value in runtime mode moves the element to the right.</td>
<td></td>
</tr>
<tr>
<td><strong>Y</strong></td>
<td>Variable (numeric data type). Defines the Y position (in pixels).</td>
</tr>
<tr>
<td>Example: PLC_PRG.iPos_Y.</td>
<td></td>
</tr>
<tr>
<td>Increasing this value in runtime mode moves the element downwards.</td>
<td></td>
</tr>
</tbody>
</table>
**“Rotation”**
Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle1.

The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.

In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

---

**“Interior rotation”**
Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol.

Note: If a static angle of rotation is specified in the “Position Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

---

You can link the variables to a unit conversion.

---

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

---

- **Unit conversion**
- **

Element property ‘State variables’**
The variables control the element behavior dynamically.

<table>
<thead>
<tr>
<th><strong>“Invisible”</strong></th>
<th>Variable (BOOL). Toggles the visibility of the element.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>TRUE</strong></td>
<td>The element is not visible at runtime.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>“Deactivate inputs”</strong></th>
<th>Variable (BOOL). Toggles the operability of the element.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>TRUE</strong></td>
<td>User inputs do not have any effect in runtime more. The element is shown as deactivated.</td>
</tr>
</tbody>
</table>
The “Invisible” property is supported by the “Client Animation” functionality.

See also

These properties are available only when you select the “Preview: Support client animations and overlay of native elements” option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.

<table>
<thead>
<tr>
<th>“Animation duration”</th>
<th>Time that the element executes an animation (in milliseconds)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Example: 500</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Move to the foreground”</th>
<th>Property value (BOOL)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>TRUE: At runtime, the element is displayed in the foreground.</td>
</tr>
<tr>
<td></td>
<td>FALSE: At runtime, the element is displayed in the layer where it was inserted in the visualization editor.</td>
</tr>
</tbody>
</table>

**Visualization Element ‘Analog clock’**

Symbol:

Tag: “Date/time controls”

The element is a clock that displays the current time of day. The clock can also display any time.
### Element properties

<table>
<thead>
<tr>
<th>“Element name”</th>
<th>Example: GenElemInst_1</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Type of element”</td>
<td>“Analog clock”</td>
</tr>
</tbody>
</table>

#### Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

<table>
<thead>
<tr>
<th>“X”</th>
<th>X coordinate of the upper left corner of the element</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Specified in pixels.</td>
</tr>
<tr>
<td></td>
<td>Example: 10.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Y”</th>
<th>Y coordinate of the upper left corner of the element</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Specified in pixels.</td>
</tr>
<tr>
<td></td>
<td>Example: 10.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Width”</th>
<th>Specified in pixels.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Example: 150</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Height”</th>
<th>Specified in pixels.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Example: 30</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the box symbols (_drag_ ) to other positions in the editor.

See also
- [Chapter 1.3.5.3.2 “Positioning elements, adapting size and layer” on page 1113](#)

#### Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the _rotate_ symbol. The point is used as the center for rotating and scaling.

<table>
<thead>
<tr>
<th>“X”</th>
<th>X-coordinate of the point of rotation</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Y”</th>
<th>Y-coordinate of the point of rotation</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

You can also change the values by dragging the symbols (_rotate_ ) to other positions in the editor.
### “Use system time”
- The system time of the PLC is displayed.

### “Variable”
- Variable (time data type TOD, TIME_OF_DAY). This receives the time of day that is not the system time.
  - **Example:** PLC_PRG.todTimeTokio
- Requirement: The “Use system time” property is not activated.

**See also**
- *Time/date type TOD*

### “Design”
- “From style”: All settings are preconfigured according to the style.
- “Explicit”: The “Settings” property appears. Here you can customize the analog clock.

---

**Element property 'Absolute movement'**

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

### “Movement”

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“X”</strong></td>
<td>Variable (numeric data type). Defines the X position (in pixels).</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>PLC_PRG.iPos_X.</td>
</tr>
<tr>
<td></td>
<td>Increasing this value in runtime mode moves the element to the right.</td>
</tr>
<tr>
<td><strong>“Y”</strong></td>
<td>Variable (numeric data type). Defines the Y position (in pixels).</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>PLC_PRG.iPos_Y.</td>
</tr>
<tr>
<td></td>
<td>Increasing this value in runtime mode moves the element downwards.</td>
</tr>
<tr>
<td><strong>“Rotation”</strong></td>
<td>Variable (numeric data type). Defines the angle of rotation (in degrees).</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>PLC_PRG.iAngle1.</td>
</tr>
<tr>
<td></td>
<td>The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.</td>
</tr>
<tr>
<td></td>
<td>In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.</td>
</tr>
<tr>
<td><strong>“Scaling”</strong></td>
<td>Variable (integer data type). Causes centric stretching.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>PLC_PRG.iScaling.</td>
</tr>
<tr>
<td></td>
<td>The reference point is the “Center” property.</td>
</tr>
<tr>
<td></td>
<td>The value 1 shrinks the element by a factor of 0.001. The value 1000 returns the element to its original size.</td>
</tr>
</tbody>
</table>
"Interior rotation"  
Variable (numeric data type). Defines the angle of rotation (in degrees).  
**Example:** PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in "Center" according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol.

Note: If a static angle of rotation is specified in the property "Position → Angle", then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

"Use REAL values"  
Note: Only available if the device supports the use of REAL coordinates.

- The properties of the absolute movement are interpreted as REAL values. The values are not rounded.
- The option allows for the individual fine-tuning of drawing the element, for example for the visualization of a smoother rotation.
- **Hint:** If a horizontal or vertical line is drawn blurry on a specific visualization platform, then this can be corrected by an offset of 0.5px in the direction of the line thickness.

You can link the variables to a unit conversion.

The properties “X”, “Y”, “Rotation”, and “Interior rotation” are supported by the "Client Animation" functionality.

See also
- **Unit conversion**
- 

**Element property 'Settings'**

Requirement: The “Property” is “Explicit”. Only then is the “Clock Settings” category visible.

**Table 358: "Background"**

<table>
<thead>
<tr>
<th>&quot;Background color&quot;</th>
<th>Color variants of the default background image</th>
</tr>
</thead>
<tbody>
<tr>
<td>• &quot;Yellow&quot;</td>
<td>• &quot;Red&quot;</td>
</tr>
<tr>
<td>• &quot;Blue&quot;</td>
<td>• &quot;Green&quot;</td>
</tr>
<tr>
<td>• &quot;Black&quot;</td>
<td></td>
</tr>
</tbody>
</table>

| "Own background" | Background display with the specific "Image". Replaces the default background image. |
“Image” | Image from an image pool or library  
Example: myImagepool.myImage

“Transparency color” | The transparent color in the image representation.  
Example: “White”. The white parts of the image are transparent.

“Use background color” | The image background is displayed using the color defined in the “Background color” property.  
Requirement: No image reference is given in the “Image” property.

“Background color” | Style color or color  
Requirement: “Use background color” is activated.

Table 359: “Hands”

| “Hand style” | Example: “Thin arrow” |
| “Color hour hand” | Style color or color for the hands |
| “Color minute hand” |
| “Color second hand” |

Table 360: “Lines”

| “Lines style” | Clock face graduation  
- “None”  
- “Line”: Graduation lines by hour  
- “Hours and minutes”: Graduation lines by hours and minutes  
- “Dots”: Graduation dots by hour |
| “Color” | Color of the clock face graduation |
| “Line width” | Line weight of the clock face graduation |
| “Scale in 3D” | ✅ Representation of the clock face with 3D effect |

Table 361: “Numerics”

| “Style of numerics” | Digits on the clock face  
- “None”  
- “Quarter”  
- “All” |
| “Font” | Font for displaying the digits |
| “Font color” | Font for displaying the digits |

Table 362: “Center point”

| “Color” | Color of the center of the clock |

Table 363: “Positioning”

| “Usage of” |  
- “Default style values”: Presetting of the style values  
| “Positioning” | Requirement: Visible when the “Usage or” property is set to “Individual settings”.

**“Numerics movement”**
Value (in pixels) for shifting the digits.
Example: 80

**“Line movement”**
Value (in pixels) for shifting the hour lines.
Example: 100

**“Hands scaling”**
Factor for scaling the length of the hour hand. You can customize the exact position of the hour hand relative to the background image.
Example: 100

**“Scaling type”**
Defines the scaling of the height and width of the element.
- **“Anisotropic”**: The background image is scaled to the size of the element. The height and width are scaled independently of each other.
- **“Isotropic”**: The background image is scaled to the size of the element, retaining its proportion. The proportion of height and width is fixed.

**“Optimized drawing”**
- : The background image is drawn one time. When the hour hand moves, only the affected part of the image is redrawn.
- : The background image is redrawn in cycles.

**Hint:** Deactivate this option only for extreme exceptions.

**Element property 'Absolute movement'**
The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

**“Movement”**

**“X”**
Variable (numeric data type). Defines the X position (in pixels).
Example: PLC_PRG.iPos_X.
Increasing this value in runtime mode moves the element to the right.

**“Y”**
Variable (numeric data type). Defines the Y position (in pixels).
Example: PLC_PRG.iPos_Y.
Increasing this value in runtime mode moves the element downwards.

**“Rotation”**
Variable (numeric data type). Defines the angle of rotation (in degrees).
Example: PLC_PRG.iAngle1.
The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.
In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.
**“Interior rotation”**

Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol.

Note: If a static angle of rotation is specified in the “Position ➔ Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

---

**“Invisible”**

Variable (BOOL). Toggles the visibility of the element.

**TRUE:** The element is not visible at runtime.

**See also**
- Unit conversion
- 

**Element property ‘State variables’**

The variables control the element behavior dynamically.

**The “Invisible” property is supported by the "Client Animation" functionality.**

---

**See also**
- 

These properties are available only when you select the “Preview: Support client animations and overlay of native elements” option in the Visualization Manager.

You can animate a movement, a rotation, and the visibility of a visualization element.
“Animation duration”

Time that the element executes an animation (in milliseconds)

Example: 500

“Move to the foreground”

Property value (BOOL)

TRUE: At runtime, the element is displayed in the foreground.

FALSE: At runtime, the element is displayed in the layer where it was inserted in the visualization editor.

See also

● "Chapter 1.3.5.21.5 “Using client animation” on page 1962"

See also

● "Visualization element “Date and time picker”"

Symbol:

Tag: “Date/time controls”

The element provides the capability of selecting the date or time. The value can be changed by means of the keyboard or arrow keys. The date can be selected from a calendar.

Element properties

“Element name”

Optional

Hint: Assign individual names for elements so that they are found faster in the element list.

Example: StartDateAndTime

“Type of element”

“Date and time picker”

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

“X”

X coordinate of the upper left corner of the element

Specified in pixels.

Example: 10.

“Y”

Y coordinate of the upper left corner of the element

Specified in pixels.

Example: 10.
**“Width”**
Specified in pixels.
Example: 150

<table>
<thead>
<tr>
<th><strong>“Height”</strong></th>
<th>Specified in pixels.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Example: 30</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the box symbols (estruction) to other positions in the editor.

See also
- § Chapter 1.3.5.3.2 “Positioning elements, adapting size and layer” on page 1113

**Element property 'Center’**
The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

<table>
<thead>
<tr>
<th><strong>“X”</strong></th>
<th>X-coordinate of the point of rotation</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Y”</strong></td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the symbols (estruction) to other positions in the editor.

**“Variable”**
Variable (DATE, DT, TIME, LTIME, TOD)
The value of the value of the variable is shown by the element and can be modified by the element.
The data type automatically determines the displayed value units:
- **TIME**: Day, hour, minute, second (by default, milliseconds are not shown)
- **DATE**: Year, month, day
- **DT**: Year, month, day, hour, minute, second
- **TOD**: Hour, minute, second (by default, milliseconds are not shown)
- **LTIME**: Day, hour, minute, second (by default, milliseconds, microseconds, and nanoseconds are not shown)

**“Format string”**
The format can restrict the output to individual values.
Example for LTIME: Format: HH:mm:ss.ms.us.ns --> displayed: 08:15:12.780.150.360
LTIME limited: format: HH:mm --displayed: 08:15
Basically, all usual formats available for %t are also supported.

**“Design date time picker”**
- **“From style”**: All settings are preconfigured according to the style.
- **“Explicit”**: The property “Designsettings” appears. Here you can customize the calendar.
"Design date picker"
- "From style": All settings are preconfigured according to the style.
- "Explicit": The property "Design settings" appears. Here you can customize the calendar.

"Positioning date picker"
- "Dynamic": The calendar is adapted and positioned automatically.
- "Manual": The "Position settings" property appears. Here you can customize the calendar.

See also
- Chapter 1.3.5.18.2 “Placeholders with format definition in the output text” on page 1546

Element property 'Absolute movement'
The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"

<table>
<thead>

<tr>
<td>1.3.5.20.3</td>
<td>Editor ‘Visualization Style Editor’</td>
<td>1947</td>
</tr>
</tbody>
</table>

**1.3.5.20.1 Dialog ‘Create a New Visualization Style’**

**Symbol:** 🎨

**Function:** The dialog prompts you to specify data for a new created style file.

**Call:**
- In CODESYS:
  - In the “Visualization Manager” object (tab “Settings”, group “Style Settings”): 
    - Clicking 🎨 opens a drop-down list. Click “Create and Edit Derived Style”.
- In the visualization style editor:
  - Menu bar: “File ➤ New Style”

<table>
<thead>
<tr>
<th><strong>“Name”</strong></th>
<th>Name of the new style.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong> Style_CI</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>“Storage location”</strong></th>
<th>Working directory for style editing</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th><strong>“Base style”</strong></th>
<th>Style to base the new style on. The drop-down list includes all styles that are installed in the repository.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“&lt;none&gt;”:</strong> The new style does not derive itself from an existing style.</td>
<td></td>
</tr>
</tbody>
</table>
The profile is intended for informational purposes. For example, you find elements that are not preconfigured with special style entries, and information from the profile. In addition, CODESYS checks in the profile whether a required style is missing.

**Example:** CODESYS V3.5 SP9

Click “OK” The new style is created and opened for editing in the visualization style editor. It already includes all required style entries and the localization in German (language column de).

### 1.3.5.20.3 Editor ‘Visualization Style Editor’

**Symbol:** 📏

**Function:** The editor is used for creating, deriving, editing, and localizing visualization styles. In addition, it makes it possible to check and install a style or a hierarchy of styles.

**Call:**
- In CODESYS:
  - In the “Visualization Manager” object (tab “Settings”, group “Style Settings”, click for a drop-down list). Click “Open Style Editor”.
- Start menu > CODESYS installation folder > 'CODESYS' > 'Visualization Style Editor'
Menu 'File'

- **“New style”**
The “Create a New Visualization Style” dialog box opens.

- **“Open”**
The “Open Dialog” dialog box opens. This dialog prompts you to select a style file (format .visustyle.xml) to be opened and edited.

- **“Open as copy”**
The “Open Existing Style as Dialog” dialog box opens. This dialog prompts you to select a style that is copied, saved to the target location, and opened for editing.

- **“Close”**
Closes the style open in the editor.

- **“Save”**
Saves the changes of the open style.

- **“Save As”**
The “Select Visualization Style(s)” dialog box opens. This dialog prompts you to select a file to save the current settings.

- **“Save and Install”**
Saves the open visualization style and installs it to the visualization style repository.

- **“Recently opened files”**
Lists the files for selection that were last opened.

- **“Abort”**
Closes the visualization style editor.

See also
- Chapter 1.3.5.20.1 “Dialog ’Create a New Visualization Style’” on page 1946

Menu 'Styles'

- **“New Entry (as Child)”**
Creates another style entry as a child of the selected style property.

- **“New Entry (Afterwards)”**
Creates a new style entry in the list after the selected style property.

- **“Move Down”**
Moves the selected style entry down.
  Requirement: Sort order is flat.

- **“Move Up”**
Moves the selected style entry up.
  Requirement: Sort order is flat.

- **“Sort Order”**
Toggles between three sort orders:
  - Flat structure and alphabetical order
  - Flat structure and order according to the position of the entry in the XML style file
    This position also determines the position of the property in CODESYS. The property appears, for example, in the “Properties” view below the “Values” column in the drop-down list for style properties.
  - Hierarchical structure of entries
    Requirement: The names of the style properties contain at least one dash.

- **“Check”**
The settings of the style properties are checked for consistency errors. This check is also performed when saving the style.

Menu 'Localization'

- **“New Entry (as Child)”**
Creates another style entry as a child of the selected style property.

- **“New Entry (Afterwards)”**
Creates a new style entry in the list after the selected style property.

- **“Move Down”**
Moves the selected style entry down.
  Requirement: Sort order is flat.

- **“Move Up”**
Moves the selected style entry up.
  Requirement: Sort order is flat.

- **“Sort Order”**
Toggles between three sort orders:
  - Flat structure and alphabetical order
  - Flat structure and order according to the position of the entry in the XML style file
    This position also determines the position of the property in CODESYS. The property appears, for example, in the “Properties” view below the “Values” column in the drop-down list for style properties.
  - Hierarchical structure of entries
    Requirement: The names of the style properties contain at least one dash.

- **“Check”**
The settings of the style properties are checked for consistency errors. This check is also performed when saving the style.
## “Add Language”
The dialog box “Add New Language” opens. The dialog prompts you to specify data for creating a new language column.

## “Remove Selected Language”
Removes the columns of the selected cell.

## “Rename Selected Language”
The “Rename Language” dialog box opens. The dialog is used for renaming the column that defines the selected cell and removes all previous translations.

### Table 364: Dialog box “Add New Language”

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the new language as a language code according to ISO 639-1.</td>
</tr>
<tr>
<td>Example:</td>
<td>Example: de, en, es, it, fr, ja</td>
</tr>
<tr>
<td>Copy from existing</td>
<td>All existing language columns are available for selection. The selected language is copied with all entered translations.</td>
</tr>
<tr>
<td>&lt;do not copy text&gt;</td>
<td>The new language receives a blank translation column.</td>
</tr>
</tbody>
</table>

### Tab ‘General’
This tab contains the general metadata of the open style file and allows it to be edited.

### Table 365: “Identification”

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Company</td>
<td>Example: Xy-z GmbH</td>
</tr>
<tr>
<td>Tip</td>
<td>In the installed styles, CODESYS can filter by the company names specified here.</td>
</tr>
<tr>
<td>Name</td>
<td>Example: Style_A</td>
</tr>
<tr>
<td>Version</td>
<td>User-defined version number</td>
</tr>
<tr>
<td>Example:</td>
<td>1.1.1.1</td>
</tr>
</tbody>
</table>

### Table 366: “General Settings”

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Base style</td>
<td>Name and version of the style that the open style is based on.</td>
</tr>
<tr>
<td>Tip</td>
<td>The derived style properties from the base style are highlighted in yellow in the “Style Properties” tab.</td>
</tr>
<tr>
<td>Partial style (usable only as base for other visualization styles)</td>
<td>The style is identified as incomplete. Therefore, it can be used for other styles as a base style only.</td>
</tr>
<tr>
<td>Example:</td>
<td>Style only with color definitions that derive this to many other styles.</td>
</tr>
<tr>
<td>Note: CODESYS does not check for consistency errors of an incomplete style for itself.</td>
<td></td>
</tr>
<tr>
<td>From</td>
<td>The “Select Base Style” dialog box opens. This dialog prompts you to select a style file that is saved to the file system (and not does not have to be installed). The file is used as a base style.</td>
</tr>
</tbody>
</table>

### Table 367: “Informational”

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Visualization profile</td>
<td>The profile is intended for informational purposes. For example, you find elements that are not preconfigured with special style entries, and information from the profile. In addition, CODESYS checks in the profile whether a required style is missing.</td>
</tr>
</tbody>
</table>
Tab 'Style Properties'  
This tab lists the names of the style properties with the associated values and makes it possible to edit it, even by means of the commands in the “Styles” menu.

The style properties can be defined for colors, fonts, images, and any values.

The style properties defined in a base style are derived and highlighted in yellow.

| "Name" | Name of the style property.  
If the name contains a dash, then the Visualization Style Editor can sort the style properties by the prefixed terms before the dash and display them in a hierarchy. A name can contain more than one dash. |
| "Value" | Value that is assigned to the style property. |
| "Type" | Data type of the style property; selected from a drop-down list. Note: This is possible and necessary only for specific style properties with a data type that is not implicitly defined. |
| "Attribute" | "hide": The associated style property is not listed in the drop-down lists in CODESYS. |
| "Used by" | Visualization element that can be configured with this style property. Can be edited. |
| Comment | Example: Special setting for Bar Display. Optional. |
| Double-click a cell. | An input field opens for editing. |
| [Del] | Removes the selected row. |

Tab 'Localization'  
This tab makes it possible to translate the names of the style properties into other languages.

| "Name" | Lists the name of the style properties as they are defined in the “Style Properties” tab. |
| "<language>" | Identification of the language name (as language code according to ISO 639-1) in which the style property name should be translated. |
| Double-click a cell. | An input field opens for editing. |

This collection of instructions is expanded regularly.
1.3.5.21.1 Visualizing a refrigerator controller

This tutorial demonstrates how to add visualizations to the project and link the elements of the visualization to the variables of the control program.

Preparation

This tutorial is based on the sample program RefrigeratorControl, which was created in the section "Your First Program in CODESYS". The finished project is located in the found in the "Projects" subfolder of the CODESYS installation directory.

See also

- Your First CODESYS Program

Creating visualizations

The visualization consists of the following three visualization screens:

- **Visualization**: Control elements and display of the refrigerator
- **Diagnosis**: History of the set and actual temperature, parameter settings
- **Live Visu**: Animation with refrigerator

1. Select the “Application” object in the device tree.
2. Click “Project ➔ Add Object ➔ Visualization”.
3. Specify Live_Visu as the name.
4. Create two more visualizations with the names Diagnosis and Visualization.

Structure of the Visualization visualization

This screen consists of control and display elements that control the refrigerator.

- (1) Numeric display of the actual temperature
- (2) Pointer to display of the actual temperature
- (3) Numeric display of the set temperature
- (4) Potentiometer for setting the set temperature
- (5) Label for compressor lamp
1. Open the Visualization visualization in the editor.
2. Drag a “Rectangle” visualization element to the editor.
   Change the following properties:
   - “Texts ➔ Text”: Actual temperature: %2.1f °C
   - “Text variables ➔ Text variable”: Glob_Var.rTempActual
3. Drag a “Meter 180°” visualization element to the editor.
   Change the following properties:
   - “Value”: Glob_Var.rTempActual
   - “Scale ➔ Scale end”: 20
   - “Scale ➔ Main scale”: 5
   - “Scale ➔ Subscale”: 1
4. Drag a “Rectangle” visualization element to the editor.
   Change the following properties:
   - “Texts ➔ Text”: Temperature presetting: %.1f °C
   - “Text variables ➔ Text variable”: Glob_Var.rTempSet
5. Drag a “Potentiometer” visualization element to the editor.
   Change the following properties:
   - “Variable”: Glob_Var.rTempSet
   - “Background ➔ Background color”: “yellow”
   - “Pointer ➔ Color”: “red”
   - “Scale ➔ Subscale position”: “Outward”
   - “Scale ➔ Scale start”: 3
   - “Scale ➔ Scale end”: 13
   - “Scale ➔ Subscale”: 1
   - “Scale ➔ Main scale”: 1
   - “Label ➔ Unit”: “°C”
   - “Label ➔ Scale format (C syntax)”: %.0f
   - “Label ➔ Max. text width of labels”: 21
   - “Label ➔ Height of labels”: 15
6. Drag a “Label” visualization element to the editor.
   Change the following properties:
   - “Texts ➔ Text”: Cooling compressor
7. Drag a “Lamp” visualization element to the editor. Position it behind the text Cooling compressor.
   Change the following properties:
   - “Variable”: Glob_Var.bCompressor
8. Drag a “Label” visualization element to the editor.
   Change the following properties:
   - “Texts ➔ Text”: Signal (beep)
9. Drag a “Lamp” visualization element to the editor. Position it behind the text "Signal (beep)".
   Change the following properties:
   ● “Variable”: Glob_Var.bSignal
   ● “Background Image”: Red

10. Drag a “Rectangle” visualization element to the editor.
    Change the following properties:
    ● “Texts Text”: Door open

11. Drag a “Rocker switch” visualization element to the editor.
    Change the following properties:
    ● “Variable”: Glob_Var.rDoorOpen

In this screen, you can monitor the temperature curve and optimize the parameters.

Structure of Diagnosis visualization

- (1) “Label” elements for the heading
- (2) “Trace” element for displaying the temperature curve
- (3) “Rectangle” elements for displaying the values

1. Open the Diagnosis visualization in the editor.
2. Drag a “Label” visualization element to the editor.
   Change the following properties:
   ● “Texts Text”: Refrigerator Diagnosis & Service Menu
   ● “Text properties Font”: Arial, Standard, 18
3. Drag a “Trace” visualization element to the editor.
4. Click the Diagnosis_Trace1 value of the “Trace” property.
   The “Trace Configuration” dialog opens.
5. Select the “MainTask” in “Task”.
6. Click the “Add Variable” link.
   A variable is added to the trace. The variable settings are displayed in the dialog.
7. Select Glob_Var.bCompressor for the variable.
8. Add the Glob_Var.rTempSet and Glob_Var.rTempActual variables to the trace. For the other settings, you can use the default values.
9. Click “OK” to close the dialog.

10. Drag a “Rectangle” visualization element to the editor. Position it on the right next to the trace element.
    Change the following properties:
    ● “Texts ➔ Text”: %s
    ● “Text variable ➔ Text variable”: PLC_PRG.rHysteresis

11. Configure the “OnMouseDown” input configuration of the element. Click “Input configuration ➔ OnMouseDown ➔ Configure”.
    The “Input Configuration” dialog opens.

12. Assign the “Write Variable” command to the action. Accept the default values and click “OK”.

13. Drag a “Label” visualization element to the editor. Position it over the first rectangle.
    Change the following properties:
    ● “Texts ➔ Text”: Hysteresis Regulator

14. Adjust the size and position of both elements.

15. Select both of the “Rectangle” and “Label” elements and duplicate them by means of copy and paste.

16. Adjust the labels and variables of the copied elements.
    ● “Text”: Compressor Efficiency, “Text variable”: Simulation.P_Cooling
    ● “Text”: Time until Beep for DoorOpen, “Text variable”: Glob_Var.timDoorOpenThreshold
    ● “Text”: Time until Beep for Compressor On, “Text variable”: Glob_Var.timAlarmThreshold

See also
● § 1.3.5.19.3.6 “Dialog ‘Input Configuration’” on page 1586

Structure of 'Live Visu' visualization
This screen includes the representation of a refrigerator. The refrigerator consists of several polygon type visualization elements. The doors of the refrigerator are drawn in both the closed and open states. Both doors consist of a group of single elements.
1. Open the Live Visu visualization in the editor.
2. Select the "Polygon" visualization element in the "Toolbox" view.
3. Click several times in the editor to create a surface. Right-click to stop adding corner marks.
4. Move the corner marks to the required position so that the element (1) is formed.
5. Select the element. Change the following properties:
   - "Colors ➔ Use gradient color": ✔
   - "Appearance ➔ Line style": "Invisible"
6. Click in the property "Colors ➔ Use gradient color".
7. Select the color “Gray” for “Color 1” in the “Color gradient editor” dialog.

8. Create all other elements with the “Polygon” visualization element.

9. Group the elements of the closed doors (2+3+4) and the open doors (5+6+7+8). Select the elements by pressing the [Shift] key and clicking “Visualization ➔ Group”.

10. Move the elements together so that the completed refrigerator is formed. Position the open doors precisely on the closed doors.

11. Select the "Open doors" group.

12. In the properties, double-click the input field “State variable ➔ Invisible”.

13. Open the input assistance by pressing [F2].

14. Select the rDoorOpen variable in the “Variables” category (below “Application ➔ Glob_Var”).

15. Negate the variable with NOT (--> NOT Glob_Var.rDoorOpen).

   ⇒ If the rDoorOpen variable is FALSE (door is closed), then the element is invisible. Then the underlying doors are visible.

16. Copy the following elements from the Visualization screen:
   - Potentiometer for setting the temperature
   - Rectangle for displaying the set temperature
   - Door open switch
   - Cooling compressor lamp
   - Signal (beep) lamp

17. Insert the elements from the clipboard to the Live_Visu visualization screen.
18. Reduce the elements and position them on the refrigerator.

When the visualization is complete, test it in simulation mode.

1. Click “Online ➔ Simulation”.
2. Click “Online ➔ Login”.
   ➔ A dialog opens and prompts you to create and download the application.
3. Click “Yes” to confirm the dialog.
4. Click “Debug ➔ Start”.
5. Open the Live_Visu visualization in the editor.
   ➔ The refrigerator in online mode.
6. Open the doors with the switch and monitor the temperature and the alarms. Change the parameters in the Diagnosis screen and watch the reaction in the temperature curve.
1.3.5.21.2 Displaying array data in histograms

Setting element properties for histograms

Requirements

- A project contains a visualization object and a program.
- A one-dimensional array is declared in the program (example: `histogram : ARRAY[1..10] OF INT;`).
- In the program, `histogram` data is assigned to the array (example: within the range from 0 to 50).

1. Double-click the “Visualization” object in the device tree.
2. In the “Toolbox” view, click “Measurement Controls” and drag the “Histogram” element to the visualization editor.
3. In the visualization editor, click the inserted “Histogram”.
   ⇒ The “Properties” view opens.
4. In the “Properties” view, double-click the “Value” input field in the “Data array” element property. Then click .
5. In the “Input Assistant” dialog box in the “Variables” category of the “PLC (PRG)” program, select the array (example here: `histogram : ARRAY[1..10] OF INT;`) and click “OK”.
6. To display only part of the array as a histogram, activate the “Use subrange” option and specify the index values of the array in “Start index” and “End index” to define the subrange.
7. Select the “Display type” (example: “Bar”).
8. Specify a value between 1 and 100 (example: 30) for the “Relative bar width”.
9. Click the histogram in the visualization editor and change the size and position as desired.
   ⇒ The “Position” property changes its values accordingly.
10. Specify the values for the “Scale” element property. Select the values for “Scale start” and “Scale end” so that the array is displayed completely. For the example: “Scale start” 0, “Scale end” 50.
    For the distance between values on the rough scale, specify the value 10, for example, in “Main scale”.
11. In the “Label” element property, specify the “Unit” for the display values.
12. Click “Build ➔ Build”.
13. If the project has been compiled without errors, then click “Online ➤ Login” and start the application by clicking “Debug ➤ Start”.

   The histogram is displayed in the visualization as follows:

   ![Histogram Image]

   The visualization shows a histogram with bars all the same color (example: green). Now you want the bars with values less than 30, for example, to be displayed in another color (example: red).

   1. Click the element property “Colors ➤ Alarm color”.
   2. Specify the limiting value in “Alarm value” above or below which the bars should be displayed in another color.
   3. Select “More” from the drop-down list in “Alarm condition” if all values greater than the “Alarm value” should be displayed in another color. Otherwise, select “Less”.
   4. Select an “Alarm color” (example: “Red”).
   5. Click “Build ➤ Build”.

Defining alarm colors for the histogram
6. If the project has been compiled without errors, then click “Online ➤ Login” and start the application by clicking “Debug ➤ Start”.

⇒ In the example histogram, all bars with values greater than \(30\) are displayed in red.

See also
- § Chapter 1.3.5.18.1.29 “Visualization element 'Histogram'” on page 1443

### 1.3.5.21.3 Displaying structured variable values in tables

Subsequent instructions describe an example of how an array of a structure is displayed in a table. As a preparation, create the MyStruct DUT and the declarations in the PLC_PRG program.

```
TYPE MyStruct :
  STRUCT
    iNo  : INT;
    bOnStock : BOOL;
    strPartNumber : STRING;
  END_STRUCT
END_TYPE

PROGRAM PLC_PRG
VAR
  arrStruct : ARRAY[0..6] OF MyStruct;
  iSelectedColumn : INT;
END_VAR
```

1. Drag the “Table” visualization element to the visualization editor.
2. Assign the array variable `arrStruct` to the “Data array” property.
   ⇒ The structure members are displayed as column headings and the array index as row headings.
3. Change the “Columns ➤ Column ➤ [0] ➤ Column header” property to an informative heading (example: Number).

5. Assign a color to the “Selection ⇒ Selection color” property.

6. Define the “Selection ⇒ Selection type” property as Row selection.

7. In the “Selection ⇒ Variable for selected row” property, define the PLC_PRG.iSelectedColumn variable.

- The following display results in online mode:

<table>
<thead>
<tr>
<th>Number</th>
<th>in Stock</th>
<th>Part Number</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td>FALSE</td>
</tr>
<tr>
<td>1</td>
<td>0</td>
<td>FALSE</td>
</tr>
<tr>
<td>2</td>
<td>0</td>
<td>FALSE</td>
</tr>
<tr>
<td>3</td>
<td>0</td>
<td>FALSE</td>
</tr>
</tbody>
</table>

See also
- Chapter 1.3.5.18.1.13 “Visualization element ‘Table’” on page 1337

1.3.5.21.4 Displaying web content

Displaying websites in a visualization

☐ Requirement: A visualization open in a CODESYS project. The “Toolbox” and “Properties” views of the visualization are also open.

1. Drag the “Web Browser” element from “Special Controls” to the visualization editor.
2. Select the element in the editor.

- In the “Properties” view, the element properties are listed for the “Web Browser” element.

3. In the “Position” property, specify the size (in pixels) for the “Width” and the “Height” (example: 600).

4. In “Control variables ⇒ URL”, specify the URL for the website (example: 'http://de.wikipedia.org'). You can also specify a variable here (STRING or WSTRING) where the URL is assigned in the project.

5. In “Control variables ⇒ Display”, specify a Boolean variable (example: bSetURL).

- If the variable bSetURL has the value TRUE, then the website 'http://de.wikipedia.org' is displayed at runtime.

Configuring the buttons for forward and back navigation of the website

☐ Requirement: The “Web Browser” element of your visualization is configured as described above.

1. In a POU, declare both Boolean variables bGoBack and bGoForward.
2. In the visualization editor, click the “Web Browser”.
3. For the property "Control variables ➔ Back", select the variable bGoBack from the input assistant. For the property "Control variables ➔ Forward", select the variable bGoForward.

4. In “General Controls”, add the “Button” element to your visualization two times.

5. Click a “Button” in the visualization editor and drag the “Button” to the required position (for example above the “Web Browser” element).

6. In the property “Texts ➔ Text”, specify the character >. In “Text properties ➔ Font”, select a font from the input assistant (example: Arial, Fett, 14).

7. Configure the property “Input configuration ➔ OnMouseClick” so that the variable bGoForward switches.

8. Configure the second button for back navigation in the same way as described in steps 5 to 7. If the variable bSetURL has the value TRUE, then the website 'http://de.wikipedia.org' is displayed with the forward and back buttons. When you click the buttons, navigation to the previous and next websites is successful.

See also

● ☞ Chapter 1.3.5.18.1.38 “Visualization element 'Webbrowser'” on page 1483

● ☞ Chapter 1.3.5.19.3.6 “Dialog 'Input Configuration'” on page 1586

1.3.5.21.5 Using client animation

The example shows a visualization with 3 screens. A menu controls the navigation of the screens. The menu is hidden until it moves into view by means of a hamburger button. During the movement, the transparency of the menu is changed. After the screen is selected, the menu moves back out of view. The animation is computed entirely on the target system. The CODESYS visualization only defines the target values (positions, transparency).

1. Preparation

1. Create a new standard project with the CODESYS Control Win V3 controller.

2. Add a “Visualization” object below the “Application”. Choose the name Visu_Main.

3. Remove the “TargetVisu” object below the Visualization Manager.

4. Open the Visualization Manager in the editor and select the “Preview: Support client animations and overlay of native elements” option.

See also

● ☞

2. Creating the PLC_PRG program

The program checks whether the menu button has been pressed. If the menu bar is not visible (position ~300), then the position is moved to the visible area (0). If the menu bar is already visible (position 0), then the position is moved to the hidden area.
1. Open the “PLC_PRG” program in the editor.

2. Input the following code into the declaration editor:

```plaintext
PROGRAM PLC_PRG
VAR
  iSelection : INT;                  // to switch the
  xVisible : BOOL;                    // auxiliary variable to
toggle the menu bar
  iMenuPos : INT := -300;            // position of the menu bar
  xToggle : BOOL;                     // button variable to
toggle the menu bar
END_VAR
```

3. Input the following code into the implementation:

```plaintext
IF xToggle THEN
  xToggle := FALSE;
IF xVisible THEN
  xVisible := FALSE;
iMenuPos := -300;
ELSE
  xVisible := TRUE;
iMenuPos := 0;
END_IF
END_IF
```

3. Creating the menu bar

The menu bar has 3 menu items. A visualization screen is displayed by clicking the corresponding menu item.

1. Insert a “Visu_Menu” visualization below the application.
2. Open the object properties. In the “Visualization” tab, set the “Visualization size” to a “Width” of 300 and a “Height” of 180.
3. Open the visualization in the editor.
4. Select the “Advanced” option in the “Properties” view.
5. In the upper left corner, add a button with a “Width” of 300 and a “Height” of 60.
6. Label the button as “Visu 1”. Set the font size to 24.
7. Open the “Inputconfiguration ➔ OnMouseClick” property.
9. Input the following ST code:

```plaintext
PLC_PRG.iSelection := 0;
PLC_PRG.xToggle := TRUE;
```
10. Set the “Button state variable ➔ Digital variable” property to PLC_PRG.iSelection=0
11. Add two more buttons named “Visu 2” and “Visu 3”.

---

2020/12/10
12. Edit the button properties of "Visu2" (PLC_PRG.iSelection = 1) and "Visu3" (PLC_PRG.iSelection = 2).

Result:

4. Creating more visualization screens

1. Insert the "Visu1" visualization below the application.
2. Open the object properties. In the “Visualization” tab, set the “Visualization size” to a “Width” of 800 and a “Height” of 600.
3. Change the background color of the screen (for example, light gray).
4. Insert a “Label” object into the visualization screen and name the element (example: "Visu 1").
5. Insert two more visualizations "Visu2" and "Visu3" below the application. Edit the properties in the same way as for "Visu1".

5. Creating the main visualization screen

On this screen, you can see the menu bar and a button to show or hide the menu bar. The different visualization screens are navigated in a “Frame” visualization element.

1. Open the properties of the “Visu_Main” visualization. In the “Visualization” tab, set the “Visualization size” to a “Width” of 800 and a “Height” of 600.
2. Open the visualization in the editor.
3. Insert a “Frame” element into the visualization.
   ⇒ The “Frame Configuration” dialog opens.
4. Add the “Visu1” (Index 0), “Visu2” (Index 1), and “Visu3” (Index 2) visualizations.
5. Set the property values of “Position” as follows: “X” = 0, “Y” = 0, “Width” = 800, and “Height” = 600.
6. Set the property value of “Toggle variable ⇒ Variable” to PLC_PRG.iSelection.
7. Insert a “Button” element into the visualization.
8. Set the property values of “Position” as follows: “X” = 0, “Y” = 0, “Width” = 60, and “Height” = 60.
9. Set the property value of “Texts ⇒ Text” to =.
10. Set the property value of “Text properties ⇒ Font” to Arial; 36.
11. Open the “Inputconfiguration ⇒ OnMouseClick” property.
13. Input the following ST code:

   PLC_PRG.xToggle := TRUE;

14. Set the property value of “Button state variable ➔ Digital variable” to PLC_PRG.xVisible.
15. Insert the “Visu_Menu” visualization element from the “Current Project” category into the visualization.
16. Set the property values of “Position” as follows: “X” = 0, “Y” = 0, “Width” = 300, and “Height” = 180.
17. Set the property value “Absolute movement ➔ Movement ➔ X” to PLC_PRG.iMenuPos.
18. Set the property value of “State variables ➔ Invisible” to not(PLC_PRG.xVisible).
19. Set the property value of “Animation duration” to 2000.

Result:

![Visualization screenshot]

- Chapter 1.3.5.18.1.6 “Visualization element ‘Frame’” on page 1287

6. Downloading the project to the controller and starting the WebVisu

1. Build the project and download it to the PLC.
2. Start the project.
3. In the browser, connect to the visualization (http://localhost:8080).
   ⇒ The WebVisu connects to the controller and the visualization opens.
4. In the visualization, click the menu button.
   ⇒ The menu moves into view.
5. Select a menu item.
   ⇒ The visualization screen is selected and the menu moves back out of view.

1.4 Libraries and solutions

1.4.1 Information on customer libraries

Target change from AC500 V2 to AC500 V3

After a target change from AC500 V2 to AC500 V3 the customer libraries have to be converted manually using the Library Converter Target Change § Chapter 1.5.6.1.3 “Later change-over of target system” on page 3245.

Some Standard CODESYS libraries are automatically converted during the target change.

1.4.2 AC500 V3 libraries

Function block descriptions of all V3 libraries are available in the library manager.
1. Under “Application” open “Library Manager”.
2. Select “Add Library”.

A list of all available libraries is displayed.

Libraries in folder “ABB - AC500” are created by ABB and tested in combination with Automation Builder.

We recommend to use libraries of subfolder “Use Cases” for your project.

Libraries in subfolder “Intern” are necessary for internal procedures.

All 3S libraries distributed with Automation Builder are required by ABB libraries and have been tested in combination with AC500 and Automation Builder. Additional 3S libraries that are not distributed with Automation Builder can easily be added. There are no known major issues with using them, however, be aware that they are not tested by ABB.

3. Add a library.
4. Choose the added library in Library Manager to access the documentation.

1.4.2.1 Reference to CODESYS (V3)

Note that CODESYS V3 libraries are used. Documentation is integrated in the Library Manager.

For information on programming, see CODESYS programming Chapter 1.3.1.19.1 “Information for library developers” on page 372.
1.4.2.2 ACS/DCS drives libraries - System technology

1.4.2.2.1 Introduction

Scope of the document

The purpose of system technology document is to give an overview and explain the overall concepts of the Drives library in V3. The library contains function blocks to establish communication, to control the ABB ACS / DCS drives from AC500 V3 PLCs.

Safety instructions and preconditions to use drives library

The user has to read the following instructions and documents before using the libraries:

- All pertinent state, regional, and local safety regulations must be observed when installing and using this product. When functions or devices are used for applications with technical safety requirements, the relevant instructions must be followed.
- Read the complete safety instructions of the user's manuals for the devices you are using, before installation and commissioning.
- Read all safety instructions of the AC500 PLC. See System description AC500 in the online help in Automation Builder.
- Read the user information of the devices and functions you are using, see online help in Automation Builder.
- Installation and commissioning of the drive(s) is not part of this document nor the online help of Automation Builder. Installation and commissioning of the drive(s) must be done according to the related drives manuals and safety instructions.

The library package has been released for the software and firmware versions listed in the Readme file of the package only.

In no event will ABB or its representatives be liable for loss of data, profits, revenue or consequential, incidental or other damage that may result from the use of other versions of product, software or firmware versions. The error-free operation of the Drives V3 Library with other devices, software or firmware versions should be possible but cannot be guaranteed and may need adaptations e.g. of example programs.

The user must follow all applicable safety instructions and the guidelines mentioned in the user documents of the ABB products.

Read the complete safety instructions for the AC500 before installation and commissioning.

CAUTION!
Generally, the user in all applications is fully and alone responsible for checking all functions carefully, especially for safe and reliable operation.

The function blocks contained in the library can only be executed in RUN mode of the PLC, but not in simulation mode.

Comparison of V2 and V3 drives library

The below table compares the FBs in the V2 library package and corresponding adapted FBs in the V3 library package.

The V2 package (PS553-Drives) has different library files for each protocol and the same is replaced with a single library in V3 (ABB_Drives_AC500).

Overview of the drives library for V3 PLC

This document will briefly explain about communication settings between PLCs with drives, how to control the drives from PLC using the control function blocks.

Each input and output of the function blocks are explained in the integrated documentation in the library.

This library is released for the following products:

- AC500 V3 CPU
- ABB Drives:
  - ACS380, ACS480, ACS580, ACH580, ACQ580, ACSM1, ACS880, DCS550, DCS800, DCS880 other drives may still work, but are not tested.
  - To use the control blocks the Communication Profile must be “ABB Drives Profile” or “ABB Drives Profile enhanced”
- Fieldbus Adapters: FENA-01, FENA-11, FENA-21, FSCA-01, FCAN-01, FECA-01, RETA-01, RETA-02, RCAN-01.
  Fieldbus adapter support is dependent on the drive and for more details refer the corresponding drive manual.

Drives Library in V3 will support following protocols for the communication:

- Modbus TCP (onboard ETH1 and ETH2 ports)
- Modbus RTU (onboard COM1 port)
- PROFINET (using communication module CM579-PNIO)
- EtherCAT (using communication module CM579-ETHCAT)
- CANopen (onboard CAN port)

Modbus TCP

The following hardware components must be available:

- AC500 V3 PLC with ETH option. Configure onboard ETH1 or ETH2 for Modbus TCP.
- Drive with FieldBusPlug
  - ACS Drives and DCS880: FENA-01 or FENA-11 or FENA-21
  - DCS550 and DCS800: RETA-01
- RJ45 Ethernet cable
ACS drives

Fig. 13: FB - Overview of Modbus TCP connection with ACS drives

To exchange only status word, actual speed, control word and speed reference:

- Communication profile in drive parameters: ABB Drives classic
- Communication function block in AC500 program:
  Use function block 'DrvModbusTcp'. For more details see Chapter 1.4.2.2.2.3.1.8 “DrvModbusTcp” on page 1995.
- DrvModbusTcp
- Control function block in AC500 program:
  Use function block 'DrvControlModbusACS'. For more details see Chapter 1.4.2.2.2.3.1.4 “DrvControlModbusACS” on page 1991.
- Scaling of the speed or torque (optional):
  Use function block 'DrvScaling'. For more details see Chapter 1.4.2.2.2.3.1.1 “DrvScaling” on page 1986.

To exchange status word, actual value1 (speed), actual value2 (torque), control word, reference1 (speed), reference value2 (torque) and up to 12 more values read from drive and up to 12 more values write to the drive:

- Communication profile in drive parameters: ABB Drives enhanced
- Communication function block in AC500 program:
  Use the function block ‘DrvModbusTcp’ with input EnhancedProfile = TRUE. For more details see Chapter 1.4.2.2.2.3.1.8 “DrvModbusTcp” on page 1995.
- DrvModbusTcp
- Control function block in AC500 program:
  Use function block ‘DrvControlModbusACS’. For more details see Chapter 1.4.2.2.2.3.1.4 “DrvControlModbusACS” on page 1991.
- Scaling of the speed or torque (optional): Use function block ‘DrvScaling’. For more details see Chapter 1.4.2.2.2.3.1.1 “DrvScaling” on page 1986.
To exchange more than above mentioned values use additionally the following blocks:

- **Read the values:**
  Use the function block ‘DrvModbusRead’. For more details see Chapter 1.4.2.2.2.3.1.6 “DrvModbusRead” on page 1994.

- **Write the values:**
  Use the function block ‘DrvModbusWrite’. For more details see Chapter 1.4.2.2.2.3.1.7 “DrvModbusWrite” on page 1995.

- **Read Write the values:**
  Use the function block ‘DrvModbusReadWrite23’. For more details see Chapter 1.4.2.2.2.3.1.11 “DrvModbusReadWrite23” on page 2015.

### DCS drives

![Diagram of Modbus TCP connection with DCS drives](image)

*Fig. 14: FB - Overview of Modbus TCP connection with DCS drives*

**DCS550 and DCS800 drives**

To exchange only status word, actual speed, control word and speed reference:

- **Communication function block in AC500 program:**
  Use function block ‘DrvModbusTcp’. For more details see Chapter 1.4.2.2.2.3.1.8 “DrvModbusTcp” on page 1995.

- **DrvModbusTcp**

- **Control function block in AC500 program:**
  Use function block ‘DrvControlModbusDCS’. For more details see Chapter 1.4.2.2.2.3.1.5 “DrvControlModbusDCS” on page 1993.

- **Scaling of the speed or torque (optional):**
  Use function block ‘DrvScaling’. For more details see Chapter 1.4.2.2.2.3.1.1 “DrvScaling” on page 1986.
To exchange more than above mentioned values use additionally the following blocks:

- **Read the values:**
  Use the function block ‘DrvModbusRead’. For more details see Chapter 1.4.2.2.3.1.6 “DrvModbusRead” on page 1994.

- **Write the values:**
  Use the function block ‘DrvModbusWrite’. For more details see Chapter 1.4.2.2.3.1.7 “DrvModbusWrite” on page 1995.

- **Read Write the values:**
  Use the function block ‘DrvModbusReadWrite23’. For more details see Chapter 1.4.2.2.3.1.11 “DrvModbusReadWrite23” on page 2015.

**DCS80 drives**

To exchange only status word, actual speed, control word and speed reference:

- **Communication profile in drive parameters:** ABB Drives classic
- **Communication function block in AC500 program:**
  Use function block ‘DrvModbusTcp’. For more details see Chapter 1.4.2.2.3.1.8 “DrvModbusTcp” on page 1995.

- **DrvModbusTcp**
- **Control function block in AC500 program:**
  Use function block ‘DrvControlModbusDCS’. For more details see Chapter 1.4.2.2.3.1.5 “DrvControlModbusDCS” on page 1993.
- **Scaling of the speed or torque (optional):**
  Use function block ‘DrvScaling’. For more details see Chapter 1.4.2.2.3.1.1 “DrvScaling” on page 1986.

To exchange status word, actual value1 (speed), actual value2 (torque), control word, reference1 (speed), reference value2 (torque) and up to 12 more values read from drive and up to 12 more values write to the drive:

- **Communication profile in drive parameters:** ABB Drives enhanced
- **Communication function block in AC500 program:**
  Use the function block ‘DrvModbusTcp’ with input EnhancedProfile = TRUE. For more details see Chapter 1.4.2.2.3.1.8 “DrvModbusTcp” on page 1995.

- **DrvModbusTcp**
- **Control function block in AC500 program:**
  Use function block ‘DrvControlModbusDCS’. For more details see Chapter 1.4.2.2.3.1.5 “DrvControlModbusDCS” on page 1993.
- **Scaling of the speed or torque (optional):** Use function block ‘DrvScaling’. For more details see Chapter 1.4.2.2.3.1.1 “DrvScaling” on page 1986.

To exchange more than above mentioned values use additionally the following blocks:

- **Read the values:**
  Use the function block ‘DrvModbusRead’. For more details see Chapter 1.4.2.2.3.1.6 “DrvModbusRead” on page 1994.

- **Write the values:**
  Use the function block ‘DrvModbusWrite’. For more details see Chapter 1.4.2.2.3.1.7 “DrvModbusWrite” on page 1995.

- **Read Write the values:**
  Use the function block ‘DrvModbusReadWrite23’. For more details see Chapter 1.4.2.2.3.1.11 “DrvModbusReadWrite23” on page 2015.
Modbus RTU

The following hardware components must be available:

- AC500 V3 PLC. Configure onboard COM1 for the Modbus RTU communication.
- Drive with FieldBusPlug
  - ACS Drives and DCS880: Embedded fieldbus or FSCA-01
  - DCS550 and DCS800: Embedded fieldbus or RMBA-01
- Twisted pair serial cable

ACS drives

![ACS drives diagram](image)

*Fig. 15: FB - Overview of Modbus RTU connection with ACS drives*

To exchange only status word, actual speed, control word and speed reference:

- Communication profile in drive parameters: ABB Drives classic
- Communication function block in AC500 program:
  Use function block 'DrvModbusRtu'. For more details see *Chapter 1.4.2.2.2.3.1.9 “DrvModbusRtu” on page 2002.*
- DrvModbusRtu
- Control function block in AC500 program:
  Use function block 'DrvControlModbusACS'. For more details see *Chapter 1.4.2.2.2.3.1.4 “DrvControlModbusACS” on page 1991.*
- Scaling of the speed or torque (optional):
  Use function block 'DrvScaling'. For more details see *Chapter 1.4.2.2.3.1.1 “DrvScaling” on page 1986.*
To exchange status word, actual value1 (speed), actual value2 (torque), control word, reference1 (speed), reference value2 (torque) and up to 12 more values read from drive and up to 12 more values write to the drive:

- Communication profile in drive parameters: ABB Drives enhanced
- Communication function block in AC500 program:
  Use the function block ‘DrvModbusRtu’. For more details see \(\text{Chapter 1.4.2.2.3.1.9 “DrvModbusRtu” on page 2002}.\)

- DrvModbusRtu
- Control function block in AC500 program:
  Use function block ‘DrvControlModbusACS’. For more details see \(\text{Chapter 1.4.2.2.3.1.4 “DrvControlModbusACS” on page 1991}.\)
- Scaling of the speed or torque (optional): Use function block ‘DrvScaling’. For more details see \(\text{Chapter 1.4.2.2.3.1.1 “DrvScaling” on page 1986}.\)

To exchange more than above mentioned values use additionally the following blocks:

- Read the values:
  Use the function block ‘DrvModbusRead’. For more details see \(\text{Chapter 1.4.2.2.3.1.6 “DrvModbusRead” on page 1994}.\)

- Write the values:
  Use the function block ‘DrvModbusWrite’. For more details see \(\text{Chapter 1.4.2.2.3.1.7 “DrvModbusWrite” on page 1995}.\)

- Read Write the values:
  Use the function block ‘DrvModbusReadWrite23’. For more details see \(\text{Chapter 1.4.2.2.3.1.11 “DrvModbusReadWrite23” on page 2015}.\)

**DCS drives**

![Diagram of Modbus RTU connection with DCS drives](image-url)

*Fig. 16: FB - Overview of Modbus RTU connection with DCS drives*
To exchange only status word, actual speed, control word and speed reference:

- **Communication function block in AC500 program:**
  Use function block 'DrvModbusRtu'. For more details see Chapter 1.4.2.2.3.1.9 “DrvModbusRtu” on page 2002.
- **DrvModbusRtu**
- **Control function block in AC500 program:**
  Use function block 'DrvControlModbusDCS'. For more details see Chapter 1.4.2.2.3.1.5 “DrvControlModbusDCS” on page 1993.
- **Scaling of the speed or torque (optional):**
  Use function block 'DrvScaling'. For more details see Chapter 1.4.2.2.3.1.1 “DrvScaling” on page 1986.

To exchange more than above mentioned values use additionally the following blocks:

- **Read the values:**
  Use the function block ‘DrvModbusRead’. For more details see Chapter 1.4.2.2.3.1.6 “DrvModbusRead” on page 1994.
- **Write the values:**
  Use the function block ‘DrvModbusWrite’. For more details see Chapter 1.4.2.2.3.1.7 “DrvModbusWrite” on page 1995.
- **Read Write the values:**
  Use the function block ‘DrvModbusReadWrite23’. For more details see Chapter 1.4.2.2.3.1.11 “DrvModbusReadWrite23” on page 2015.

**DCS800 drives**

To exchange only status word, actual speed, control word and speed reference:

- **Communication profile in drive parameters:** ABB Drives classic
- **Communication function block in AC500 program:**
  Use function block ‘DrvModbusRtu’. For more details see Chapter 1.4.2.2.3.1.9 “DrvModbusRtu” on page 2002.
- **DrvModbusRtu**
- **Control function block in AC500 program:**
  Use function block ‘DrvControlModbusDCS’. For more details see Chapter 1.4.2.2.3.1.5 “DrvControlModbusDCS” on page 1993.
- **Scaling of the speed or torque (optional):**
  Use function block ‘DrvScaling’. For more details see Chapter 1.4.2.2.3.1.1 “DrvScaling” on page 1986.

To exchange status word, actual value1 (speed), actual value2 (torque), control word, reference1 (speed), reference value2 (torque) and up to 12 more values read from drive and up to 12 more values write to the drive:

- **Communication profile in drive parameters:** ABB Drives enhanced
- **Communication function block in AC500 program:**
  Use the function block ‘DrvModbusRtu’. For more details see Chapter 1.4.2.2.3.1.9 “DrvModbusRtu” on page 2002.
- **DrvModbusRtu**
- **Control function block in AC500 program:**
  Use function block ‘DrvControlModbusDCS’. For more details see Chapter 1.4.2.2.3.1.5 “DrvControlModbusDCS” on page 1993.
- **Scaling of the speed or torque (optional):** Use function block ‘DrvScaling’. For more details see Chapter 1.4.2.2.3.1.1 “DrvScaling” on page 1986.
To exchange more than above mentioned values use additionally the following blocks:

- **Read the values:**
  Use the function block ‘DrvModbusRead’. For more details see Chapter 1.4.2.2.2.3.1.6 “DrvModbusRead” on page 1994.

- **Write the values:**
  Use the function block ‘DrvModbusWrite’. For more details see Chapter 1.4.2.2.2.3.1.7 “DrvModbusWrite” on page 1995.

- **Read Write the values:**
  Use the function block ‘DrvModbusReadWrite23’. For more details see Chapter 1.4.2.2.2.3.1.11 “DrvModbusReadWrite23” on page 2015.

### PROFINET

The following hardware components must be available:

- AC500 V3 PLC with CM579-PNIO (PROFINET Master communication module)
- Drive with FieldBusPlug
  - ACS Drives and DCS880: FENA-01 or FENA-11 or FENA-21
  - DCS550 and DCS800: RETA-02
- RJ45 Ethernet cable

The following values should be mapped in the fieldbus configuration of the drive and the configuration of AC500. These settings must be done in the Automation Builder hardware configuration.

- **Drive → AC500:** Status word and actual value 1 (speed) and optional actual value 2 (torque).
- **AC500 → Drive:** Control word and reference value 1 (speed) and optional reference value 2 (torque).

The following function blocks can be configured in the AC500 program.

- **Communication profile:** ABB Drives Profile
- **Control block:**
  - ACS Drives: Use function block ‘DrvControlACS’. For more details see Chapter 1.4.2.2.2.3.1.2 “DrvControlACS” on page 1987.
  - DCS Drives: Use function block ‘DrvControlDCS’. For more details see Chapter 1.4.2.2.2.3.1.3 “DrvControlDCS” on page 1989.
- **Scaling of the speed or torque (optional):** Use function block ‘DrvScaling’. For more details see Chapter 1.4.2.2.2.3.1.1 “DrvScaling” on page 1986.
ACS drives

Fig. 17: FB - Overview of PROFINET connection with ACS drives

DCS drives

Fig. 18: FB - Overview of PROFINET connection with DCS drives

EtherCAT

The following hardware components must be available:

- AC500 V3 PLC with CM579-ETHCAT (EtherCAT Master communication module)
- Drive with FieldBusPlug
  - ACS Drives and DCS880: FECA-01
  - DCS550 and DCS800: RECA-01
- RJ45 Ethernet cable
The following values should be mapped in the fieldbus configuration of the drive and the configuration of AC500. These settings must be done in the Automation Builder hardware configuration.

- Drive → AC500: Status word and actual value 1 (speed) and optional actual value 2 (torque).
- AC500 → Drive: Control word and reference value 1 (speed) and optional reference value 2 (torque).

A direct Ethernet cable from CM579-ETHCAT to FECA-01 module is recommended, connection through switch is not recommended since it will slow down the connectivity. Also, the drives need to be connected in the same sequence as they are added in the Automation Builder when multiple drives are connected.

The following function blocks can be configured in the AC500 program.

- Communication profile: ABB Drives Profile
- Control block:
  - ACS Drives: Use function block ‘DrvControlACS’. For more details see Chapter 1.4.2.2.3.1.2 "DrvControlACS" on page 1987.
  - DCS Drives: Use function block ‘DrvControlDCS’. For more details see Chapter 1.4.2.2.3.1.3 "DrvControlDCS" on page 1989.
- Scaling of the speed or torque (optional): Use function block ‘DrvScaling’. For more details see Chapter 1.4.2.2.3.1.1 “DrvScaling” on page 1986.

ACS drives

![Fig. 19: FB - Overview of EtherCAT connection with ACS drives](image-url)
**DCS drives**

![Diagram of EtherCAT connection with DCS drives]

*Fig. 20: FB - Overview of EtherCAT connection with DCS drives*

**CANopen**

The following hardware components must be available:

- AC500 V3 PLC. Configure onboard CAN port for CANopen communication.
- Drive with FieldBusPlug
  - ACS Drives and DCS880: FCAN-01
  - DCS550 and DCS800: RCAN-01
- CANopen communication cable with 120 Ω resistor.

The following values should be mapped in the fieldbus configuration of the drive and the configuration of AC500. These settings must be done in the Automation Builder hardware configuration.

- Drive → AC500: Status word and actual value 1 (speed) and optional actual value 2 (torque).
- AC500 → Drive: Control word and reference value 1 (speed) and optional reference value 2 (torque).

The following function blocks can be configured in the AC500 program.

- Communication profile: ABB Drives Profile
- Control block:
  - ACS Drives: Use function block ‘DrvControlACS’. For more details see Chapter 1.4.2.2.3.1.2 “DrvControlACS” on page 1987.
  - DCS Drives: Use function block ‘DrvControlDCS’. For more details see Chapter 1.4.2.2.3.1.3 “DrvControlDCS” on page 1989.
- Scaling of the speed or torque (optional): Use function block ‘DrvScaling’. For more details see Chapter 1.4.2.2.3.1.1 “DrvScaling” on page 1986.
ACS drives

DCS drives

Fig. 22: FB - Overview of CANopen connection with DCS drives

CANopen with CAN CiA402 Profile for generic Drives

The following hardware components must be available:

- AC500 V3 PLC. Configure onboard CAN port for CANopen communication.
- Any drive with CAN FieldBusPlug and CAN CiA402 profile.
- CANopen communication cable with 120 Ω resistor.
The following values should be mapped in the fieldbus configuration of the drive and the configuration of AC500. These settings must be done in the Automation Builder hardware configuration.

- Drive → AC500: Status word and actual speed.
- AC500 → Drive: Control word and reference speed.

The following function blocks can be configured in the AC500 program.

- Communication profile: CANopen device profile CiA402
- Control block: Use function block ‘DrvControlCANCiA402’. For more details see Chapter 1.4.2.2.3.1.13 "DrvControlCANCiA402" on page 2018.

General drives with CAN CiA402 interface

![Fig. 23: FB - Overview of CANopen CiA402 with any drives](image)
Compatibility

To check the compatibility of the drives and their communication modules please refer to the following table, it shows the tested combinations.

<table>
<thead>
<tr>
<th>Communication Modules</th>

1.4.2.2.2 Overview of the library

Installation

The library is part of the Automation Builder 2.2. or higher. Use the Library manager to add the library into project.

For more details on the package, refer to the release notes of the latest Automation Builder.
## Hardware and software requirement

<table>
<thead>
<tr>
<th>Hardware</th>
<th>Software</th>
</tr>
</thead>
<tbody>
<tr>
<td>AC500 V3 PLCs: PM5630-2ETH, PM5650-2ETH, PM5670-2ETH and PM5675-2ETH</td>
<td>Automation Builder 2.2. or higher</td>
</tr>
<tr>
<td>ABB Drive: ACS380, ACS480, ACS580, ACH580, ACQ580, ACS880, ACM1, DCS550, DCS800, DCS880. (other drives may work, but are not tested)</td>
<td>Drive Composer Pro, Drive Studio, Drive Window or Drive Window Light</td>
</tr>
<tr>
<td>FieldBusPlug: FSCA-01, RMBA-01, FENA-01 / FENA-11 / FENA-21, RETA-01, FECA-01, RETA-02, FCAN-01, RCAN-01. (other FieldBusPlugs may work, but are not tested)</td>
<td></td>
</tr>
</tbody>
</table>

*Drive configuration tool and FieldBusPlug support is dependent on the drive used, for the compatible tool details refer to the drive manual.*

## Description of the library

This chapter briefly explains the functions, function blocks, structures, enumerations and visualization present in the library.
Fig. 24: FB - Overview of the Drives Library
Function Blocks

DrvScaling

DrvScaling function block is used to scale the speed or torque reference to the drive based on the maximum values defined.

Function block DrvScaling can be used to scale the variables from fieldbus equivalent values to values used in the program. Fieldbus variables are given in fieldbus equivalent values as INT values. With the scaling a conversion from INT (fieldbus) to REAL (program) and vice versa is performed. Reference1 and Actual Value1 (speed) are mostly given in the range of -20000 ... +20000. Reference2 and Actual Value2 (torque) are mostly given in the range of 0 ... +10000.
This function block can be used to control ACS drives with ABB drives profile using direct input of status word (SW) from drive via any supported fieldbus communication like PROFINET, EtherCAT, CANopen.

Control word (CW) will be built by the function block according to the ABB drives profile state machine. Output CW has to be send to the drive via any fieldbus communication supported. Function block provides standard start/stop signals to control the drive and standard diagnosis signals are read from the drive.

</tbody>
</table>
This function block can be used to control ACS drives with ABB Drives profile or ABB Drives enhanced profile using Modbus communication block like DrvModbusTcp or DrvModbusRtu.

Status Word (SW) is read from drive through Modbus communication block using DriveData interface (For more details on the structure refer to Chapter 1.4.2.2.3.3 “Structure: DrvDataType” on page 2019).
Control Word (CW) will be built by the function block according to the ABB drives profile state machine. CW will be sent via DriveData and the used communication block to the drive. Function block provides standard start/stop signals to control the drive and standard diagnosis signals are read from the drive.

The function block should be used for ACS drives using ABB drive (Classic/Enhanced) profile for Modbus protocol only. The data transfer to the ACS drive is realized via the IN_OUT variable DriveData, which must be connected to DrvModbusTcp or DrvModbusRtu function block.
This function block can be used to control DCS drives with ABB Drives profile using Modbus communication block like DrvModbusTcp or DrvModbusRtu.
