**Introduction**

The electronic unit builds the interface between the actuator and the control system. During continuous positioning, the electronic unit varies the motor torque continuously until the actuator force and the control valve force are balanced.

High response sensitivity and high positioning accuracy with short positioning time ensure an excellent control quality and a long actuator life.

**Additional Information**

Additional documentation on EAS822, EBS852, EBS862 is available for download free of charge at www.abb.com/actuators. Alternatively simply scan this code:

1 Safety

General information and instructions

These instructions are an important part of the product and must be retained for future reference. Installation, commissioning, and maintenance of the product may only be performed by trained specialist personnel who have been authorized by the plant operator accordingly. The specialist personnel must have read and understood the manual and must comply with its instructions.

For additional information or if specific problems occur that are not discussed in these instructions, contact the manufacturer. The content of these instructions is neither part of nor an amendment to any previous or existing agreement, promise or legal relationship.

Modifications and repairs to the product may only be performed if expressly permitted by these instructions. Information and symbols on the product must be observed. These may not be removed and must be fully legible at all times. The operating company must strictly observe the applicable national regulations relating to the installation, function testing, repair and maintenance of electrical products.

Warnings

The warnings in these instructions are structured as follows:

⚠️ DANGER
The signal word ‘DANGER’ indicates an imminent danger. Failure to observe this information will result in death or severe injury.

⚠️ WARNING
The signal word ‘WARNING’ indicates an imminent danger. Failure to observe this information may result in death or severe injury.

⚠️ CAUTION
The signal word ‘CAUTION’ indicates an imminent danger. Failure to observe this information may result in minor or moderate injury.

NOTICE
The signal word ‘NOTICE’ indicates possible material damage.

Note
‘Note’ indicates useful or important information about the product.
1 Safety

Intended use
The electronic units of type EAS822, EBS852, EBS862 interconnected as illustrated in this operating instruction are used exclusively to control the PME120, LME620, RHD... and RSD... series control actuators. Using these actuators for any other purpose will introduce a risk of personal injury and can also damage or impair the device’s operational reliability.

Improper use
The following are considered to be instances of improper use of the device:

- For use as a climbing aid, for example for mounting purposes.
- For use as a bracket for external loads, for example as a support for piping, etc.
- Material application, for example by painting over the housing, name plate or welding/soldering on parts.
- Material removal, for example by spot drilling the housing.

Notes on data safety
This product is designed to be connected to and to communicate information and data via a network interface. It is operator’s sole responsibility to provide and continuously ensure a secure connection between the product and your network or any other network (as the case may be). Operator shall establish and maintain any appropriate measures (such as but not limited to the installation of firewalls, application of authentication measures, encryption of data, installation of anti-virus programs, etc.) to protect the product, the network, its system and the interface against any kind of security breaches, unauthorized access, interference, intrusion, leakage and / or theft of data or information. ABB Automation Products GmbH and its affiliates are not liable for damages and / or losses related to such security breaches, any unauthorized access, interference, intrusion, leakage and / or theft of data or information.

Warranty provisions
Using the device in a manner that does not fall within the scope of its intended use, disregarding this manual, using underqualified personnel, or making unauthorized alterations releases the manufacturer from liability for any resulting damage. This renders the manufacturer’s warranty null and void.

2 Design and function

Design

EAS822 / EBS852

The EBS862 electronic unit is made up of two housing halves (electronic cover / electronic unit lower part) which can be separated for easier assembly.
... 2 Design and function

Principle of operation

The electronic unit builds the interface between the actuator and the control system.
During continuous positioning, the electronic unit varies the motor torque continuously until the actuator force and the control valve force are balanced. High response sensitivity and high positioning accuracy with short positioning time ensure an excellent control quality and a long actuator life.

Electronic units are available for assembly in the field near the actuator, remotely in a mounting rack or for integrated assembly (smallest actuator type). In addition to the terminals, the electronic unit contains the microprocessor, frequency converter for motor control, analog and binary inputs and outputs, PROFIBUS® or HART® communication interfaces, the commissioning and service field and a plug connection to connect a PC.
No matter what the motor power of the respective actuator is, all electronic units are supplied single-phase by 230 V or 115 V mains supply (50 Hz or 60 Hz). The commissioning and service field enables the end positions and direction of rotation to be set on the actuator. Moreover, status information is displayed using LEDs. Push buttons can be used to operate the actuator and set the operating mode (Automatic, Out of Service).

Note

In electronic units which can be separated for assembly, the name plate for the hardware is located on the lower part of the electronic unit (Figure 1). The name plate for the software (Figure 2) and an additional name plate for the hardware (Figure 3) are located on the electronic unit cover. The lower part of the electronic unit and the electronic cover are independent assemblies, therefore the respective manufacturing numbers can differ.

Scope of delivery

EBS852
- Cable clamps for strain relief of the connection cable

EBS862
- Metric tap holes for cable entries with IP 66 sealing plugs
Delivery status
The individual actuator configuration may vary from the standard setup above. This information can be displayed via the user interface.
Unless otherwise specified by the user, the electronic units are delivered with the following standard configuration:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Setting</th>

4 Transport and storage

Inspection
Check the devices immediately after unpacking for possible damage that may have occurred from improper transport. Details of any damage that has occurred in transit must be recorded on the transport documents. All claims for damages must be submitted to the shipper without delay and before installation.

Transporting the device

Safety instructions

DANGER
Danger to life due to falling or toppling loads.
Risk of death or serious injury due to the device falling down or toppling over!
• Standing under suspended loads is prohibited.
• Do not detach the hoisting equipment until installation is complete.
• Only use the dedicated load pick-up devices (eyebolts) for suspending the components.

Consider the following items during transport:
• Pay attention to the device weight details.
• Do not expose the device to humidity during transport. Pack the device accordingly.
• Pay attention to the permissible transportation temperatures for the device.

Returning devices
For the return of devices, follow the instructions in Repair on page 38.

Storing the device
The electronic units EAS822, EBS852, EBS862 comply with IP rating IP 20. The electronic units should be stored in accordance with this IP rating. Condensation is not permitted.

The permissible storage temperatures as well as the ambient conditions (humidity) should be complied with (see Device designs on page 8).

For longer storage periods, we recommend packing the units in foil with a dessicant added. The dessicant must be checked for regularly for effectivity.
5 Installation

Safety instructions

⚠️ DANGER

Danger to life due to falling or toppling loads.
Risk of death or serious injury due to the device falling down or toppling over!
- Standing under suspended loads is prohibited.
- Do not detach the hoisting equipment until installation is complete.
- Only use the dedicated load pick-up devices (eyebolts) for suspending the components.

Please observe the following safety instructions
- Only qualified specialists may mount and adjust the control actuator, and make the electrical connection.
- When working on the actuator or the electronics always observe the locally valid accident prevention regulations and the regulations concerning the construction of technical installations.
- Switch off the supply voltage and take precautions to prevent unintentional switch-on.

Mounting

NOTICE

Damage to components!
Damage to components caused by ingress of foreign bodies or humidity.
- Keep all housing covers and terminal compartments closed during installation to prevent the ingress of foreign bodies such as drilling shavings, liquids or dust.

When installing the electronic unit, observe the following points:
- You must be able to activate the power supply of the electronic unit on-site.
- All signal cables and the motor cable between the actuator and electronic unit must be shielded.
- The cable shield must be placed on both housings when connecting the electronic unit and the actuator.
- The maximum vibration load must be observed during installation, see Device designs on page 8.
- When mounting the electronic unit in work and traffic areas that may be accessed by unauthorized persons, the operator is required to take suited protective measures.

EAS822 / EBS852

1. Fasten the electronic unit to the vertical mounting rail of the mounting rack using grade 8.8 screws. Tensile strength 800 N/mm² (116032 pounds/square in.), yield strength 640 N/mm² (92826 pounds/square in.).
2. Provide adequate room for installation and ensure easy access.
3. The cable entries must be directed to the right.

EBS862

Note
The total weight of the electronic unit is 40 kg (88 lbs). For this reason, the electronic unit is equipped with a load-bearing eyelet.
If, for technical reasons, the load-bearing eyelet cannot be used, the two halves of the housing can be installed separately.

Separating the housing halves
1. Place the electronic unit on a horizontal surface.
2. Unscrew the cover screws (Figure 2).
3. Flip open the electronic unit cover.
4. Disconnect the internal plug connection between the housing halves.
5. Close the electronic unit cover.
6. Unscrew the hinge screw (Figure 2).
7. Flip the electronic unit cover forward while lifting it up and off the hinge pin. Precisely guide the cover of the electronic unit cover in the process.

Mounting
1. Fasten the electronic unit or the lower part of the electronic unit to the vertical mounting rail of the mounting rack using grade 8.8 screws. Tensile strength 800 N/mm² (116032 pounds/square in.), yield strength 640 N/mm² (92826 pounds/square in.).
2. Provide adequate room for installation and ensure easy access.
3. The cable entries must be directed down.

Mounting the housing halves
1. Set the electronic unit cover down on the hinge pin and screw in the hinge screw. Precisely guide the cover of the electronic unit cover in the process.
2. Reconnect the internal plug connection.
3. Close the electronic unit cover and screw in the cover screws (Figure 2 on page 5).
Assembly and cable routing in the mounting rack

When installing the electronic units in a mounting rack (on site), we recommend laying the cables in accordance with the following illustrations.

Safety instructions

**WARNING**

Risk of injury due to live parts!
When the housing is open, contact protection is not provided and EMC protection is limited.

- Before opening the housing, switch off the power supply.

**WARNING**

Danger due to electric current!
Danger of electric shock by residual voltage at the terminals after switching off the power supply.

- Before opening the terminal compartment, switch off the power supply and wait for > 2 minutes.

**NOTICE**

Damage to the device due to improper handling!

- When replacing the defective safety fuses, only fuses with types and characteristics should be used (see Fuses on page 39).

The electrical connection may only be established by authorized specialist personnel.
Notices on electrical connection in this instruction must be observed; otherwise, electric safety and the IP-rating may be adversely affected.

Safe isolation of electric circuits which are dangerous if touched is only guaranteed when the connected devices fulfill the requirements of EN 61140 (basic requirements for secure separation).
To ensure safe isolation, install supply lines so that they are separate from electrical circuits which are dangerous if touched, or implement additional isolation measures for them.

Each actuator requires a suited Contrac electronic unit with installed actuator-specific software. Observe the information in the operating instruction. The specifications on the name plates of the electronic unit and actuator must match to guarantee correct hardware and software allocation.

**Instructions on the use of Error Current Circuit Breakers (RCDs)**

If additional protection against accidental contact due to the use of an RCD is required by local regulations, the following items should be observed:

- For the electronic unit EBS822, the use of a type B RCD is not necessary, since from a design viewpoint, no voltage levels > 60 V DC which can be dangerous upon contact can occur.
- The use of a Type B RCD is recommended for the electronic units EBS852 and EBS862.
- The operator is responsible for the correct layout of additional protection against accidental contact due to the use of an RCD!

<td>M25 × 1.5 (1 x)</td>
</tr>
</tbody>
</table>

Selection of suited connection cables

Please observe the following information when selecting cables:
- Use shielded cables for the motor/brake cable, the sensor cable, and the signal cable to the control system/controller.
- Connect the shielding of the motor/brake cable and the sensor cable on both sides (to the actuator and to the Contrac electronic unit).

Potential equalization

In order to avoid the risk of an electric shock, it must not be possible to come into contact with dangerous live parts and conductive parts that can be touched should not become dangerous live parts either under standard conditions or under conditions when a single fault occurs.

The actual current flowing in the event of a fault is obtained from the phase to ground voltage and the total impedance present in the fault circuit.

For long cables, the voltage drop may be dangerous to come into contact with high current flowing.

Preferably, the electronic unit and the actuator must be connected with low resistance (ground resistance < 0.1 Ω) to the potential equalization.

In the process, the respective standards of the VDE 100 series must be observed.
**Scenario 1**
If the PE of the actuator is done only via the PE conductor of the motor cable, the maximum permissible cable lengths for the electronic units EAS822 and EBS852 are reduced in accordance with the following table.
The maximum permissible shutdown time of 200 ms in case of a fault is complied with in the process.

<table>
<thead>
<tr>
<th>Max. cable length</th>
<th>Conductor cross-section</th>
<th>EBS852</th>
<th>EBS862</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.5 mm² (16 AWG)</td>
<td>176 m (577 ft)</td>
<td>48 m (157 ft)</td>
<td></td>
</tr>
<tr>
<td>2.5 mm² (14 AWG)</td>
<td>235 m (771 ft)</td>
<td>79 m (259 ft)</td>
<td></td>
</tr>
<tr>
<td>4 mm² (12 AWG)</td>
<td>460 m (1509 ft)</td>
<td>127 m (416 ft)</td>
<td></td>
</tr>
<tr>
<td>6 mm² (10 AWG)</td>
<td>–</td>
<td>190 m (623 ft)</td>
<td></td>
</tr>
</tbody>
</table>

**Scenario 2**
By laying an extra potential equalization conductor between the electronic unit and the actuator, with a small conductor cross-section of the motor cable (e.g. 1.5 mm²), the maximum permissible cable length can be increased.
The ground resistance of the potential equalization conductor must be < 0.1 Ω.
The maximum permissible shutdown time of 200 ms in case of a fault is complied with in the process.

<table>
<thead>
<tr>
<th>Max. cable length</th>
<th>Conductor cross-section</th>
<th>EBS852</th>
<th>EBS862</th>
</tr>

</tr>
<tr>
<td>6 mm² (10 AWG)</td>
<td>460 m (1509 ft)</td>
<td>190 m (623 ft)</td>
<td></td>
</tr>
<tr>
<td>10 mm² (8 AWG)</td>
<td>460 m (1509 ft)</td>
<td>317 m (1040 ft)</td>
<td></td>
</tr>
</tbody>
</table>

**Scenario 3**
If the cable lengths specified in Actuator assignment and maximum cable lengths on page 20 are fully utilized, an additional protective potential equalization must be connected. To do this, the electronic unit and the actuator must be connected via a short cable with a minimum cross-section of 4 mm² (12 AWG) to the on-site potential equalization. The installation regulations for setting up grounding systems must be observed and followed.

Electronic Unit EBN862 (Contrac)

Note
- The electrical connection is provided by a universal plug on the control actuator and the screw terminals on the electronic unit.
- If you are using a separate heat supply, the heater must be protected with a 2 to 6 A medium time-lag fuse (e.g. NEOZED D01 E14).

Figure 12: Control via analog input 0/4 to 20 mA, HART® communication or digital inputs
Connection examples

Operation following a continuous set point (standard)
In the standard configuration, the binary inputs are configured as ‘MANUAL OPERATION’. To switch the actuator to automatic mode (AUT), the following conditions must be met:
- The binary input 1 must be connected with +24 V DC (automatic operation).
- The ‘AUT’ operating mode must be selected through the graphic user interface.

Figure 13: Connection example for operation following a continuous set point (standard configuration)
... 6 Electrical connections

... Connection examples

Operation downstream from step controller

Contrac actuators can be driven using step controller pulses instead of an analog setpoint. The following conditions must be fulfilled in order to implement the step controller pulses:

- The binary inputs must be configured using the ‘STEP CONTROLLER’ function.
- The binary input 1 must be connected with +24 V DC (automatic operation).
- The ‘AUT’ operating mode must be selected through the graphic user interface.

External fuse for electronic unit
Safety fuse 35 A (Lindner) + thermal circuit breaker 16 A (ETA) (fuses are in the scope of delivery)

External fuse for heating (dewing protection) 2 to 6 A, medium time-lag

Binary inputs and outputs - communication

Conventional communication

Analog input
0 / 4 to 20 mA, internal load: 300 Ω

Analog output
0 / 4 to 20 mA, electrically isolated, maximum load: 500 Ω

3 digital inputs, 1 to 3
Digital 0: −3 to 5 V or open, electrically isolated
Digital 1: 12 to 35 V, electrically isolated

3 digital outputs, 1 to 3
Potential-free relay contact, max. 60 V, 150 mA

Digital communication
RS232 for commissioning and service, optionally FSK / HART®

Default settings
Conventional communication on page 11

Voltage output Uv
24 V, 15 mA, electrically isolated, for scanning external contacts, or similar applications

Connection for transmitter (optional)
Supply for two-wire transmitter with activated process controller in Contrac

Individual settings
See data sheet ‘DS/CONTRAC/SETTING’ or available upon request.
Connection of the power and signal cable on the electronic unit

Power supply
Observe the following points when connecting the power supply:
- You must be able to activate the power supply of the electronic unit on-site.
- In the power supply, the supplied fuses must be installed for certain electronic units (see External fuses for EBS862 on page 27).
- Connect the power supply to the corresponding terminals of the electronic unit (see electrical connections starting on page Electronic unit EAS822 (Contrac) / EBS852 (Contrac) on page 21).

External fuses for EBS862

230 V AC
1~

1 2 3

1 External safety fuse 35 A
2 External safety fuse 16 A
3 Electronic unit

Figure 15: External fuses

Note
The conductor cross-section between the fuses and the electronic unit must be at least 2.5 mm² (AWG 14).

In addition to the internal fuses, the EBS862 electronic unit requires two additional external fuses which are supplied separately with the assembly.
The fuses are switched externally in the power supply.
The fuses guarantee safe operation under the special starting conditions of the electronic unit.

Figure 16: Terminal box
6 Electrical connections

Connection of the power and signal cable on the electronic unit

EBS862

- 6 Electrical connections

Figure 17: Terminal box

1. Remove the cover for the terminal compartment.
2. Cut the cable sheath to the required length.
3. Separate the cable shield and pull it back over the outer sheath.
4. Push the cable through the cable gland and fasten it with the clamp.
5. Make sure that the cable shield is in contact with the clip and the housing.
6. Connect the cable (see electrical connections starting on page Electronic Unit EBN862 (Contrac) on page 22).
7. Check the cable connections for tight fit and fasten the cable gland.
8. Screw the cover of the connection chamber back on tight.

Note
When installing the cover for the connection area, take care not to damage the sealing ring. If the sealing ring is damaged, contact the manufacturer.
Connection of the power and signal cable on the actuator

**Note**
A metal divider separates the two cable areas inside the universal plug.
To exclude mutual interference from electromagnetic fields, the signal and power cables in the connector housing must be routed and connected separately.

![Diagram of universal plug on the actuator](image)

1. Remove the connector housing.
2. Cut the cable sheath to the required length.
3. Separate the cable shield and pull it back over the outer sheath.
4. Push the cable through the cable gland and fasten it with the clamp.
5. Make sure that the cable shield is in contact with the clamp and the connector housing.
6. Connect the cable (see Electronic unit EAS822 (Contract) / EBS852 (Contract) on page 21).
7. Check the cable connections for tight fit and fasten the cable gland.
8. Insert the connector housing and re-tighten.

---

**NOTICE**

Damage due to improper installation!
When connecting the shielding, make sure that the individual wires of the cables are not damaged.

- When installing the connector housing, make sure that the sealing ring is not damaged.
- If the sealing ring is damaged, contact the manufacturer.
7 Commissioning and operation

Note
It is imperative that you observe the operating instruction of the corresponding actuator for the commissioning of the electronic unit!

Note
The operating range of the actuator is not factory-set. Set up the mechanical end stops in accordance with the operating instruction for the relevant actuator.

If there is a chance that safe operation is no longer possible, take the device out of operation and secure it against unintended startup.

General information
The basic settings ‘Define end positions’ and ‘Initial diagnosis’ can be configured via the commissioning and service field on the electronic unit.
The commissioning and service field is used to adjust the actuator to the working area and set the direction of action without using a PC.

The following configuration types are available for advanced adjustment of the actuator and its parameterization:
- With DTM
  Configuration can be performed within an FDT frame application that is approved for use with the DTM.
- With EDD
  Configuration can be performed within an EDD frame application that is approved for use with the EDD.

Communication with the electronic unit is optionally done through the RS 232 interface on the commissioning and service field or in field electronic units through digital communication with HART® or PROFIBUS®.

Note
For detailed information on the parameterization of the actuator, consult the associated configuration and parameterization instruction.

Engineering Software ECOM688 and ECOM700
Using the ECOM688 / ECOM700 engineering software, the user can read out, store, and write back the actuator-related data from the electronic unit of a Contrac control actuator. Depending on the software version of the electronic unit, two different engineering software versions are available.
- Contrac electronic units with software version ≥ 2.00 require ECOM700.
- Contrac electronic units with software version < 2.00 require ECOM688.
Data cannot be read or written with an incorrect ECOM version.

Note
For detailed information, observe the corresponding operating instruction of the ECOM688 / ECOM700 Engineering Software.

Checks prior to commissioning
Before powering up the power supply
Before switching on the power supply and commissioning the device, check the following points:
- Correct wiring (see Electrical connections on page 17).
- Close all housing covers and terminal compartments.
- Do not open the housing cover or terminal compartments during operation!
- The actuator must have been installed in accordance with the corresponding operating instruction. The working zone and mechanical end stops must have been adjusted.
- Make sure that there is no danger of injury for persons due to movement of the actuator!

1. Switch on the power supply.

After powering up the power supply
Check the following items after powering up the power supply:
- The write protection switch on the commissioning and service field is in the ‘OFF’ position.
- The electronic unit is in the ‘MAN’ operating mode; there is no +24 V signal on binary input 1.
- No error (if an error is pending, both LEDs on the commissioning and service field will flash alternately at 4 Hz).

2. Perform parameterization and basic settings on the electronic unit.

### 7 Commissioning and operation

#### Commissioning and service field

**Meaning of the LED indicators**

The LEDs 100 % / 0 % on the commissioning and service field (Figure 20, Pos. 2 + 6) flash at different rates, depending on the function that has been initiated.

<table>
<thead>
<tr>
<th>LED Flash code 0 % / 100 %</th>
<th>Description</th>
</tr>
</thead>
</table>
| ![Adjustment mode](image) | Adjustment mode  
Both LEDs flash synchronously at 4 Hz. |
| ![Accept 1. Position correct](image) | Accept 1. Position correct  
Depending on which position is approached first, either LED 100 % flashes at 1 Hz and LED 0 % continues to flash at 4 Hz, or vice versa. |
| ![Accept 2 Position correct](image) | Accept 2 Position correct  
Both LEDs flash at 1 Hz. |
| ![Failure](image) | Failure  
Both LEDs flash alternately at 4 Hz. |
| ![ECOM688 or ECOM700 mode](image) | ECOM688 or ECOM700 mode  
Both LEDs light continuously (from software version 2.00). |
| ![MAN operating mode (manual) through ISF](image) | MAN operating mode (manual) through ISF  
The LED 0 % flashes at 1 Hz, LED 100 % is off (from software version 2.00). |
| ![MAN (Manual) operating mode via binary input or graphical user interface](image) | MAN (Manual) operating mode via binary input or graphical user interface  
The LED 100 % lights continuously, LED 0 % is off (from software version 2.00). |

**Note**

The flash codes for MAN (manual) operating mode through ISF or binary input / graphic user interface can also occur at the same time.
Hardware settings

Hardware write protection
If write protection is active, the device parameterization cannot be changed.
Activating and sealing the write protection switch WP (Figure 20, 7) protects the device against tampering.

<table>
<thead>

<tr>
<td></td>
<td>With step control</td>
</tr>
</tbody>
</table>

Basic Setup

Setting the end positions 0 % / 100 %

Note
Once commissioning is complete, set the write protection switch to ‘ON’.

1. Switch the electronic unit to the ‘Adjustment’ operating mode. Press and hold down both travel buttons (Figure 20, pos. 10) for approx. 5 seconds, until both LEDs (Figure 20, pos. 2 and 6) flash in sync at approx. 4 Hz.

Defining the initial position (0 % or 100 %)
2. Use one of the travel buttons to move to the desired position.
3. Press the Accept button to accept the position (Figure 20, pos. 3 or 5); if successful, the corresponding LED flashes at a rate of 1 Hz. The other LED will continue to flash at approx. 4 Hz.

Defining the second position (0 % or 100 %)
4. Use one of the travel buttons to move to the second position.
5. To accept the position, press the Accept button. If successful, both LEDs will flash at a rate of approx. 1 Hz.

Saving the settings
6. Press both Accept buttons to accept the settings. The LEDs will stop flashing after a short period of time and the setup process is complete.

Note
If the range selected for the actuator is too small, both LEDs begin to flash again at 4 Hz and the setup procedure must be repeated with a larger value (min. actuator travel). (Information regarding actuator travel appears on the actuator name plate.)

Correcting your settings
- If after accepting the initial value for the settings you need to make a correction, press the reset button and repeat the setting procedure.
- If you need to make a correction after saving your settings, you will need to repeat the entire setup procedure from the beginning.

After commissioning
After commissioning has been performed, it is recommended that you use the control system to operate the actuator and that you check the actuator’s response and its signaling behavior. In order for the actuator to go into automatic mode after commissioning, there must be a 24 V DC-signal on binary input 1 in actuators with active binary input function (standard setting). If the digital input function is switched off, the actuator will switch to automatic mode immediately on completion of the setup process.
... 7 Commissioning and operation

Manual (MAN)- and Automatic Operation (AUT)

Software version 2.00 and higher
In the manual operating mode (MAN), the actuator solely reacts upon actuation of either of the two travel buttons on the commissioning and service field. Any control via the setpoint or digital input will be ignored.
The operating mode is saved in the non-volatile memory of the electronic unit. As a result, the actuator will not start up unintentionally after a power failure.

Activating manual operating mode (MAN) on the commissioning and service field
- Simultaneously press the Accept buttons 100 % / 0 % (Figure 20 on page 31, 2, 4) for at least 5 seconds.
The LED for the 0%-Position will begin to flash.

Activating automatic operating mode (AUT) on the commissioning and service field
- Simultaneously press the Accept buttons 100 % / 0 % (Figure 20 on page 31, 2, 4) for a brief amount of time.
The LED for the 0%-Position will go out.

Activating the automatic operating mode (AUT) through the binary input or the graphic user interface
- Apply a +24 V DC signal to binary input 1 and / or select the AUT operating mode on the graphic user interface.
With the manual operating mode (MAN) activated, the LED for the 100 % position is continually lit up.

Signaling on the commissioning and service field

</tbody>
</table>

Special Requirements
- Standard operation: MAN / AUT. The LEDs are not lit.
- Travel via the operating button on the commissioning and service field takes priority over the control system.

Error (both LEDs flashing alternately at 4 Hz)
- Press the RESET button to reset the error messages. If there are no other errors pending, both LEDs will go out.
- Reset if the operating range is overshot: After approx. 5 seconds, the LEDs will stop flashing
- Press and hold down both travel buttons for 5 seconds and then press the RESET button. briefly. After a ‘reset’, the electronic unit will be in Adjustment Mode

ECOM Mode
- The ECOM688 engineering tool is used to access the electronic unit. Both LEDs light up continuously.
8 Diagnosis / error messages

Definition – Alarms and Errors

Alarms
The actuator / electronic unit is in a critical state (e.g., high temperature), which currently does not affect the actuator, electronic unit, process or persons.
The actuator functions are available. Previous alarms are stored in the ‘Saved Alarms’ area in the electronic unit. Use the graphic user interface to read out saved alarms.

Errors
The actuator / electronic unit is in a critical state, e.g. control circuit monitoring, which is directly impairing the actuator, electronic unit, process or persons.
The actuator is switched off and the actuator functions are no longer available. Previous error messages are stored in the ‘Saved Errors’ area in the electronic unit. Use the graphic user interface to read out saved errors. Error messages cannot be reset until the cause of the error has been eliminated.

9 Maintenance

Electronic unit

The electronic unit does not require any maintenance if it operated in line with intended use under normal operating conditions.

Note
Manipulation by users shall immediately render the warranty for the device invalid.

Control actuator

Note
For detailed information on the maintenance of the actuator, consult the operating instruction of the actuator!

Contrac actuators feature a robust construction. As a result, they are highly reliable and require minimal maintenance. The maintenance intervals depend upon the effective load and are therefore not specified here.

The built-in microprocessor evaluates the actual load factors (e.g. torques, forces, temperatures, etc.) and derives the remaining operating time until the next routine maintenance is required.

Use the configuration program to view this information.

10 Repair

Repair and maintenance activities may only be performed by authorized customer service personnel.

When replacing or repairing individual components, use original spare parts.

Returning devices

Use the original packaging or a secure transport container of an appropriate type if you need to return the device for repair or recalibration purposes.

Fill out the return form (see Return form on page 41) and include this with the device.

In accordance with the EU Directive governing hazardous materials, the owner of hazardous waste is responsible for its disposal or must observe the following regulations for shipping purposes:

All devices delivered to ABB must be free from any hazardous materials (acids, alkalis, solvents, etc.).

Please contact Customer Center Service acc. to page 4 for nearest service location.

* The 35 A safety fuse and the 16 A thermal circuit breaker are included in the scope of delivery. The conductor cross-section between the fuse and the electronic system must be at least 2.5 mm² (14 AWG).
11 Recycling and disposal

Note
Products that are marked with the adjacent symbol may not be disposed of as unsorted municipal waste (domestic waste). They should be disposed of through separate collection of electric and electronic devices.

This product and its packaging are manufactured from materials that can be recycled by specialist recycling companies.

Bear the following points in mind when disposing of them:
• As of 8/15/2018, this product will be under the open scope of the WEEE Directive 2012/19/EU and relevant national laws (for example, ElektroG - Electrical Equipment Act - in Germany).
• The product must be supplied to a specialist recycling company. Do not use municipal waste collection points. These may be used for privately used products only in accordance with WEEE Directive 2012/19/EU.
• If there is no possibility to dispose of the old equipment properly, our Service can take care of its pick-up and disposal for a fee.

Notice on RoHS II-Directive 2011/65/EU
As of 7/22/2019, the products provided by ABB Automation Products GmbH fall within the scope of regulations on hazardous substances with restricted uses or the directive on waste electrical and electronic equipment in accordance with ElektroG.

Note
Detailed information on the RoHS Directive is available in the ABB download area.

12 Approvals and certifications

CE mark
The version of the device as provided by us meets the requirements of the following EU directives:
• EMC directive 2014/30/EU
• Machinery Directive 2006/42/EC / 2006/42/EG
• Low Voltage Directive 2014/35/EU
• RoHS II Directive 2011/65/EU (as of 7/22/2019)

13 Additional documents

Note
All documentation, declarations of conformity and certificates are available in ABB's download area.

14 Appendix

Return form

Statement on the contamination of devices and components

Repair and/or maintenance work will only be performed on devices and components if a statement form has been completed and submitted. Otherwise, the device/component returned may be rejected. This statement form may only be completed and signed by authorized specialist personnel employed by the operator.

Notes
Introduction

The electronic unit builds the interface between the actuator and the control system. During continuous positioning, the electronic unit varies the motor torque continuously until the actuator force and the control valve force are balanced.

High response sensitivity and high positioning accuracy with short positioning time ensure an excellent control quality and a long actuator life.

Additional Information

Additional documentation on EAS822, EBS852, EBS862 is available for download free of charge at www.abb.com/actuators. Alternatively simply scan this code:
