Measurement made easy

ABB’s MT series Guided Wave Radar Level Transmitters are the only level transmitters in the world to be IEC 61508 certified for operation in SIL2 and SIL3 environments.

A new level of safety for hazardous industry environments

Introduction
The guided wave radar’s self-monitoring capability continually checks for any faults that could cause device failures or false indications. The device features a graphic display incorporated into an all digital electronics module. Using this new format, ABB has been able to add waveform screens to the modular electronics along with easy to follow multiple choice setup menus. These menus can be changed to many different languages for easy commissioning throughout the world. Pulses of microwave energy are directed to the product surface using a rigid rod or flexible cable type probe. This assembly has no moving parts and no loss of energy due to beam divergence.

Customer benefits
- Microwaves are unaffected by temperature, pressure, specific gravity and vapors
- Easy to install
- No moving parts
- Ignores light continuous coatings
- Good for vacuum service
- No beam angle to be concerned about like through-air radar or ultrasonic transmitters
- More direct energy return - more consistent signal
- No complicated setup, no computer or programmer required
- Built-in waveform screen (Scope Trace)
Principle of operation
Stable readings in the most challenging environments

ABB’s ability to provide engineered solutions for tough applications allows an engineer to specify the best coupler and probe design and material for the application. ABB can supply specialized couplers, rods, cables and probe-end connections.

These components can be supplied in stainless steel, Hastelloy C276, Hastelloy B, Titanium, Tantalum, Monel 400 or Inconel 625.

Time of Flight
Guided wave radar uses the time domain reflectometry measurement principle.

- Microwave pulses are created and propagated down the probe or cable of the device.
- When the microwave pulse makes contact with a change in dielectric a reflection is created.
- ABB’s radar sends and receives 64,000 pulses per second and provides two output readings in that time. The higher the dielectric of the material, the greater amount of energy reflected back to the transmitter.
- Using the time of flight principle, we measure the distance to the surface and back and then divide by two.

Graphic Display
The MT5000 series guided wave radar transmitters feature a graphic display incorporated into an all digital electronics module. Using this new format ABB has been able to add waveform screens to the modular electronics along with easy to follow multiple choice setup menus. These menus can be changed to many different languages for easy commissioning throughout the world. Pulses of microwave energy are directed to the product surface using a rigid rod or flexible cable type probe. This assembly has no moving parts and no loss of energy due to beam divergence. The waveform display allows engineers and technicians to view measurements in real-time and has onboard diagnostics.

Electronics
- HART Protocol
- Foundation Fieldbus
- Modbus

Industries and applications
The leader in level detection

- Typical industries:
  - Oil and gas production
  - Refining
  - Pharmaceutical and biotech – Power generation
  - Pulp and paper
  - Chemicals
  - Food and beverage
  - Marine

- Typical applications:
  - Storage vessels
  - Horizontal cylinders
  - Open atmosphere sumps
  - Cooling tower basins, flume and flumes
  - Precipitator / fly ash
  - Feedwater heaters
  - Oil and gas separators
  - Mud tanks
  - Crude or hydrocarbon condensate tanks
  - Process water tanks
  - Crude oil storage tanks
  - Chemical storage vessels
  - Blending tanks
  - Hydrocarbon storage
  - Ammonia storage
  - Service water storage
  - Demineralization tanks
  - Makeup water storage
  - Condensate storage
  - Condenser sump or hotwell
  - Deaerator
  - Steam boiler drums
  - Boiler blowdown tanks
  - Flash tanks
## Specifications
