Oil Preservation System, Dehydrating Breather
PTAP-ADB934
IZUA 4674-210
Installation Guide
Unless otherwise specified dimensions given in this document are in millimeters.
**Introduction**

Dehydrating Breathers are used to prevent the normal moisture in the air from coming in contact with the oil in electrical equipment as the load or temperature changes. This reduces the degeneration of the oil and helps maintain its insulation capability. When used with a conservator system with a rubber air cell it reduces moisture accumulation in the cell.

Dehydrating Breathers come in seven sizes for application on electrical equipments with oil volumes from 235 gallons to 9,600 gallons. They can be applied in parallel to meet larger requirements.

The Dehydrating Breathers are filled with Silicagel which can absorb 20% of its own weight in moisture. The breathers are also provided with an oil trap preventing continuous contact between the moist air and the Silicagel, allowing for longer life of the Silicagel and lower maintenance.

When dry, the Silicagel has a blue color and when it has become saturated with moisture the color changes to a pale pink. This indicates it is time to replace the Silicagel with new or regenerated Silicagel. All breathers are sized to allow changing of the Silicagel approximately once a year based on normal humidity and average load cycling.
Dehydrating Breather
Model 4101

Installation procedure.

Mounting:

1. The breather is mounted by screwing into a breather pipe from the conservator system or other part of the electrical equipment.

Installation:

1. Loosen the wing nuts to enable the plexiglass container to be removed to the side.
2. Fill the plexiglass container with the correct amount of Silicagel.
3. Remove the oil trap and fill with new transformer oil to the level indicated on the trap. New oil should be used each time the Silicagel is replaced.
4. Replace oil trap and plexiglass container.
5. Tighten wing nuts, checking that both seals are in the correct position and that a good seal is achieved.

Dehydrating Breather
Model 4170
for Vertical Mounting

Installation procedure.
Mounting:

1. The breather is mounted by screwing into a breather pipe from the conservator system or other part of the electrical equipment.

Installation:

1. Loosen the wing nuts to enable the plexiglass container to be removed to the side.
2. Fill the plexiglass container with the correct amount of Silicagel.
3. Remove the oil trap and fill with new transformer oil to the level indicated on the trap. New oil should be used each time the Silicagel is replaced.
4. Replace oil trap and plexiglass container.
5. Tighten wing nuts, checking that both seals are in the correct position and that a good seal is achieved.
Installation procedure.

Mounting:

1. The breather is mounted by screwing into a breather pipe from the conservator system or other part of the electrical equipment. The top cover is equipped with a mounting flange. Models 4130-4 and 4140 are also equipped with mounting flange on the bottom cover.

Installation:

1. Loosen the top wing nuts and fold forward the front support bolt. Remove the plexiglass container and fill with the correct amount of Silicagel.
2. Replace the plexiglass container, check that the seals are in the right position insuring a good seal and tighten the top wing nuts.
3. Loosen the bottom wing nuts, remove the oil cup and fill with new transformer oil to level indicated on the trap. New oil should be used each time the Silicagel is replaced.
4. Replace oil trap and plexiglass container.
