Introduction

The AZ10 is the latest in a long line of high-quality combustion gas analyzers from ABB. The probe, based on a zirconium oxide cell, is mounted in close contact with the process. The resulting direct measurement provides accurate and rapid oxygen reading for combustion control/optimization and emissions monitoring purposes.

The AZ10 has been designed for extended periods of maintenance-free operation. The modular design, with reduced component count, improves the reliability and robustness of the system and simplifies breakdown repair if it occurs.

Kits containing all the parts needed to complete on-site repairs are available from ABB, ensuring service personnel can effect repairs quickly and efficiently at minimum cost.

For more information

Further publications for the AZ10 oxygen analyzer are available for free download from: www.abb.com/measurement

or by scanning this code:

1 Health & Safety

Information in this manual is intended only to assist our customers in the efficient operation of our equipment. Use of this manual for any other purpose is specifically prohibited and its contents are not to be reproduced in full or part without prior approval of the Technical Publications Department.

**WARNING**

The installation of the equipment should be performed exclusively by personnel specialized and authorized to work on electrical installations, in accordance with relevant local regulations.

To ensure that our products are safe and without risk to health, the following points must be noted:

- The relevant sections of these instructions must be read carefully before proceeding. Failure to do so could result in bodily harm or damage to the equipment.
- Warning labels on containers and packages must be observed.
- Installation, operation, maintenance and servicing must only be carried out by suitably trained personnel and in accordance with the information given.
- Normal safety precautions must be taken to avoid the possibility of an accident occurring when operating in conditions of high pressure and/or temperature.
- Chemicals must be stored away from heat, protected from temperature extremes and powders kept dry. Normal safe handling procedures must be used.
- When disposing of chemicals ensure that no two chemicals are mixed.

Safety advice concerning the use of the equipment described in this manual or any relevant Material Safety Data Sheets (where applicable) may be obtained from the Company address on the back cover, together with servicing and spares information.

**Electrical safety – CEI/IEC 61010-1**

This equipment complies with the requirements of CEI/IEC 61010-1 ‘Safety Requirements for Electrical Equipment for Measurement, Control and Laboratory Use’ and complies with US NEC 500, NIST and OSHA.

If the equipment is used in a manner NOT specified by the Company, the protection provided by the equipment may be impaired.

**Document symbols**

Symbols that appear in this document are explained below:

- **DANGER**
  
  The signal word ‘DANGER’ indicates an imminent danger. Failure to observe this information will result in death or severe injury.

- **WARNING**
  
  The signal word ‘WARNING’ indicates an imminent danger. Failure to observe this information may result in death or severe injury.

- **CAUTION**
  
  The signal word ‘CAUTION’ indicates an imminent danger. Failure to observe this information may result in minor or moderate injury.

- **NOTICE**
  
  The signal word ‘NOTICE’ indicates potential material damage.

**Note**

‘Note’ indicates useful or important information about the product.
Health & Safety

Information on ROHS Directive 2011/65/EU (RoHS II)

ABB, Industrial Automation, Measurement & Analytics, UK, fully supports the objectives of the ROHS II directive. All in-scope products placed on the market by IAMA UK on and following the 22nd of July 2017 and without any specific exemption, will be compliant to the ROHS II directive, 2011/65/EU.

Potential safety hazards

The following potential safety hazards are associated with operating the system:
- Electrical (line voltage)
- High operational temperature on probe
- Probe weight

WARNING

Bodily injury.

To ensure safe use when operating this equipment, the following points must be observed:
- Up to 240 V AC may be present. Be sure to isolate the supply before removing the terminal cover.
- Normal safety precautions must be taken to avoid the possibility of an accident occurring when operating in conditions of high pressure and/or temperature.

Safety advice concerning the use of the equipment described in this manual or any relevant Material Safety Data Sheets (where applicable) can be obtained from the Company, together with servicing and spares information.

Safety standards

This product has been designed to satisfy the requirements of IEC61010-1 ‘Safety Requirements for Electrical Equipment for Measurement, Control and Laboratory Use’ and complies with US NEC 500, NIST and OSHA.

Product symbols

Symbols that appear on this product are shown below:

- Protective earth (ground) terminal.
- Functional earth (ground) terminal.
- This symbol, when noted on a product, indicates a potential hazard which could cause serious personal injury and/or death. The user should reference this instruction manual for operation and/or safety information.
- This symbol, when noted on a product enclosure or barrier, indicates that a risk of electrical shock and/or electrocution exists and indicates that only individuals qualified to work with hazardous voltages should open the enclosure or remove the barrier.
- Recycle separately from general waste under the WEEE directive.

Product recycling and disposal (European customers only)

ABB is committed to ensuring that the risk of any environmental damage or pollution caused by any of its products is minimized as far as possible. The European Waste Electrical and Electronic Equipment (WEEE) Directive that initially came into force on August 13 2005 aims to reduce the waste arising from electrical and electronic equipment; and improve the environmental performance of all those involved in the life cycle of electrical and electronic equipment. In conformity with European local and national regulations, electrical equipment marked with the above symbol may not be disposed of in European public disposal systems after 12 August 2005.

NOTICE

For return for recycling, please contact the equipment manufacturer or supplier for instructions on how to return end-of-life equipment for proper disposal.
2 System overview

These Operating instructions provide the following information:

- schematics showing test gas requirements
- electrical connection details between the AZ10 probe and AZ10 transmitter (and AutoCal option)

**WARNING**

- System configuration must be performed only by users or personnel with approved access rights (user privileges).
- Read all relevant sections of this guide before configuring the system or modifying system parameters.
- Install and use this equipment as detailed in this guide. Install and use associated equipment in accordance with the relevant national and local standards.

The AZ10 oxygen probe measures oxygen concentration in process gas using an in situ ‘wet analysis’ method. The ‘wet analysis’ method avoids measurement error (typically 20% of reading higher than the actual value) that is introduced by a sampling system using the ‘dry analysis’ method.

System equipment comprises a (process-mounted) AZ10 probe controlled by the transmitter. During operation, a zirconia cell within the probe is held at a constant temperature of 700 °C (1292 °F) by a probe heater and control thermocouple assembly. If the heater control circuitry or software fails (unsafe), the probe heater power supply is switched off, ensuring the system fails ‘safe’ and protecting the heater from an over-temperature failure.

An output generated at the zirconia cell is processed in the transmitter giving a locally displayed O2 reading and a 4 to 20 mA retransmission signal (over any range between 0 and 25% O2).

Cyber security

This product is designed to be connected to and to communicate information and data via a digital communication interface. It is your sole responsibility to provide and continuously ensure a secure connection between the product and your network or any other network (as the case may be). You shall establish and maintain any appropriate measures (such as but not limited to the application of authentication measures etc.) to protect the product, the network, its system and the interface against any kind of security breaches, unauthorized access, interference, intrusion, leakage and/or theft of data or information.

ABB Ltd and its affiliates are not liable for damages and/or losses related to such security breaches, any unauthorized access, interference, intrusion, leakage and/or theft of data or information.
3 Mechanical installation

General installation requirements

**WARNING**
- Before installing the probe, check the probe data and alteration labels on the head of the probe – see Figure 1.
- Select a location away from strong electrical and magnetic fields. If this is not possible, particularly in applications where mobile communications equipment is expected to be used, screened cables within flexible, earthed metal conduit must be used.
- Before installing the probe, read the Safety notes in Section 1, page 3.

**CAUTION**
- Handle the probe with care. The probe inners have fragile ceramic components that are easily damaged.
- The probe must be used with clean, ash-free process gases only.
- Thermal shock may break the zirconia cell if the process is cleaned using water. If this method of cleaning is employed, remove the probe from the process prior to cleaning.

Unpacking

**WARNING**
- Handle the probe with care and do not subject it to hammer blows or other sharp shocks. The probe inners have fragile ceramic components that can be damaged.
- It is recommended to retain the protective probe packing materials to allow for re-shipping in the unlikely event of a return.

**CAUTION**
- Visually inspect equipment for damage after unpacking. Do not install damaged or faulty equipment.

Identifying the probe

The probe is identified by a label attached to the probe head. Separate transmitter-specific labels are attached to the system transmitter.

**CAUTION**
- Details on the probe label are unique to the cell/probe combination the label is attached to and cannot be used to identify any other probe or system.

Example code number – see Data Sheet (DZA10-EN), page 18.

Figure 1  Location of probe label
**Siting**

Select a position where the intake is located in the main gas stream. Gas temperature must be in the range 20 to 800 °C (68 to 1472 °F). The surface temperature of the duct must not exceed 400 °C (752 °F).

Avoid positions where obstructions or bends prevent installation (and subsequent removal) of the probe.

Avoid positions where vibration levels induced by other plant could result in mechanical failure of the probe.

To prevent acid dew-point corrosion, the probe mounting flange and body must be thermally lagged if the temperature of the flue wall and probe mounting flange is <150 °C (<302 °F) when the process is operating.

Maintain the probe terminal head temperature within the range –20 to 70 °C (–4 to 158 °F).

**CAUTION**

Do not exceed the probe terminal head maximum operating temperature. The probe must be sited in an area where:

- radiated heat from the process does not cause the maximum temperature to be exceeded

Probe dimensions are shown in Figure 3, page 8. A clearance of at least 25 mm (1 in) in excess of the overall probe length is necessary to enable installation or removal.

**Siting overview**

![Siting overview diagram]

* The probe can withstand 35 kPa (5.1 psi) – positive or negative pressure. Pressure compensation is required above 5 kPa (0.7 psi) – the transmitter can supply fixed pressure compensation.

**Figure 2**  Probe and transmitter temperature/environmental limits and power input/output supplies
4 Overall dimensions

Dimensions in mm (in)

**AZ10 probe**

Nominal insertion length
200, 350 or 650 (7.87, 13.78 or 25.6)

Mounting adaptor
2 in NPT or 2 in BSPT taper thread or flanges – see page 9

**AZ10 transmitter**

Wall-/Pipe-mount bracket (includes M8 fixings)

Use only ABB-supplied bolts – M8 x 1.25 pitch x 35 mm (SS hex. head)

**Auto-calibration unit**

Wall-mount arrangement
2 x M8 fixings through bracket

Pipe-mount arrangement using U-bolt/pipe clamp
Min. clamping dia. 42 (1.65)
Max. clamping dia. 60 (2.36)
5 Probe flanges (all probe lengths) and mounting plates for standard probe flanges

Comprising: mounting plate, gasket, 6 each: M6/M10 shakeproof washers, plain washers and nuts

**Figure 6** ABB standard mounting plate
6 Installation

General mounting requirements

**NOTICE**

- For optimum performance, mount the probe at 90° to the gas flow.
- The probe will function adequately in turbulent gas flows.
- Do not obstruct the flue gas exit hole.

**Figure 7** General mounting requirements

- Duct surface temperature 400 °C (752 °F) max.
- Ambient air temperature at probe terminal head –20 to 70 °C (–4 to 158 °F)
- If the flue is lagged, a stand-off tube of suitable length with a minimum internal diameter of 55 mm (2.16 in) may be used.
- Ash/soot/debris will accumulate here and block the probe cell.
- Do not mount the probe in such a manner that allows ash/soot/debris to accumulate in the probe.
Threaded NPT and BSP mountings

**WARNING**

Failure to observe this warning will result in serious injury.

Before fitting the probe, ensure that the boiler is off and the flue is cool enough to touch.

If hot process gases are flowing through the flue when the probe intake tube is inserted, it will direct those gases toward the operator.

**Notes**

- The probe can be supplied with either a 2 in NPT or a 2 in BSP mounting option.
- The gasket joints must be gas tight otherwise errors in the $O_2$ readings will occur.

Referring to Figure 8:

1. Cut a 75 mm (2.95 in) minimum diameter hole $A$ in the flue wall.
2. Weld a 2 in NPT or 2 in BSP female threaded boss $B$ (not supplied) into place, concentric with the hole in the flue.
3. Apply high temperature jointing compound to the threads $C$ of the probe mount adaptor and screw the adaptor into the boss.
4. Locate a gasket $D$ over the studs on the adaptor – see Notes, left.
5. Insert the probe intake tube $E$ through the adaptor, ensuring that the open side of the intake tube tip faces into the gas flow – see Figure 7, page 10 and Warning (left).
6. Align the bolt holes $F$ in the probe intake tube flange with the studs on the adaptor ensuring that the open side of the intake tube tip continues to face into the gas flow. An arrow $G$ is stamped on the tube flange to assist with orientation.
7. Locate a gasket $H$ over the studs on the adaptor – see Notes, left.
8. Fit the probe body $I$ over the studs on the adaptor ensuring Company name is uppermost.
9. Secure the probe and gasket using six M6 nuts and washers $J$.

**Figure 8** Standard (2 in NPT) and optional (2 in BSP) mountings
6 Installation

ABB standard flange mounting plate

**WARNING**

Failure to observe this warning will result in serious injury.

Before fitting the probe, ensure that the boiler is off and the flue is cool enough to touch.

If hot process gases are flowing through the flue when the probe intake tube is inserted, it will direct those gases toward the operator.

**Note.** The gasket joints must be gas tight otherwise errors in the O₂ readings will occur.

Referring to Figure 9, page 13:

1. Cut a 75 mm (2.95 in) minimum diameter hole A in the flue wall B.
2. Weld a mounting plate AZ1000098 C into place, concentric with the hole in the flue.
3. Locate a gasket D over the studs on the adaptor – see Note, left.
4. Insert the probe intake tube E through the adaptor, ensuring that the open side of the intake tube tip faces into the gas flow – see Figure 7, page 10 and Warning (left).
5. Align the bolt holes F in the probe intake tube flange with the studs on the adaptor ensuring that the open side of the intake tube tip continues to face into the gas flow. An arrow G is stamped on the tube flange to assist with orientation.
6. Locate a gasket H over the studs on the adaptor – see Notes, page 11.
7. Fit the probe body I over the studs on the adaptor ensuring Company name is uppermost.
8. Secure the probe and gasket using six M6 nuts and washers J.
Figure 9  ABB standard flange mounting plate
...6 Installation

Flange-mounted installations

**WARNING**

Failure to observe this warning will result in serious injury.

Before fitting the probe, ensure that the boiler is off and the flue is cool enough to touch.

If hot process gases are flowing through the flue when the probe intake tube is inserted, it will direct those gases toward the operator.

Notes

- This procedure is for AZ10 probes mounted to customer-supplied/installed flanges – see page 11 for threaded NPT/BSP installations.
- The gasket joints must be gas tight otherwise errors in the O₂ readings will occur.

Referring to Figure 10:
1. Fit a suitable mating flange (customer-supplied) A to the flue wall.
2. Secure flange B to the flue-mounted mating flange A using suitable fixings C (not-supplied).
3. Locate a gasket D over the studs on flanged boss B – see Notes, left.
4. Insert the probe intake tube E through the adaptor, ensuring that the open side of the intake tube tip faces into the gas flow – see Figure 7, page 10 and Warning (left).
5. Align the bolt holes F in the probe intake tube flange with the studs on the adaptor ensuring that the open side of the intake tube tip continues to face into the gas flow.
   An arrow G is stamped on the tube flange to assist with orientation.
6. Locate a gasket H over the studs on the adaptor – see Notes, left.
7. Fit the probe body I over the studs on the adaptor ensuring Company name is uppermost.
8. Secure the probe and gasket using six M6 nuts and washers J.
Figure 10  Flange-mounted installations
7 Electrical connections

⚠️ WARNING

Bodily injury.
- The transmitter is not fitted with a switch therefore a disconnecting device such as a switch or circuit breaker conforming to local safety standards must be fitted to the final installation. It must be fitted in close proximity to the instrument within easy reach of the operator and must be marked clearly as the disconnection device for the transmitter.
- The probe must be bonded to local earth using the external earth connection – see Figure 11.
- Electrical installation and earthing (grounding) must be in accordance with relevant national and local standards.
- Remove all power from supply, relay and any powered control circuits and high common mode voltages before accessing or making any connections.
- The AZ10 cable carries the screened signal wires and the separately screened 90 to 264 V AC heater wires safely. Do not use alternative wires.
- The equipment conforms to Installation Category II of IEC 61010.
- All connections to secondary circuits must have basic insulation.
- After installation, there must be no access to live parts, for example, terminals.
- Terminals for external circuits are for use only with equipment with no accessible live parts.
- If the equipment is used in a manner not specified by the Company, the protection provided by the equipment may be impaired.
- All equipment connected to the transmitter’s terminals must comply with local safety standards (IEC 60950, EN601010-1).

NOTICE

Earth bonding between the probe and transmitter is required to ensure effective EMC compliance. Min. 4mm² cable should be used.

⚠️ CAUTION

- Make connections only as shown.
- Maintain Environmental Protection at all times.
- Ensure the seal and mating surfaces are clean to maintain environmental rating.
- Ensure cable glands are tightened after wiring.

Cable entries

**Non-AutoCal system**

Maximum cable length – probe to transmitter: 100 m (300 ft)

**AutoCal system**

Maximum combined cable length – probe to AutoCal unit + AutoCal unit to transmitter: 100 m (300 ft)

---

**Figure 11** External earth connection

**Figure 12** Cable entries
Probes connections, general

**WARNING**

Bodily injury.

- Before making any connections, ensure that the power supply, any high voltage-operated control circuits and high common mode voltages are switched off.

Perform the procedures detailed below.

A 4 mm earth bonding point is provided on the back of the probe head – see Figure 11.

Access to probe terminals

Referring to Figure 13:

1. Release 2 captive screws securing terminal cover and remove the terminal cover.

**Figure 13** Removing probe terminal cover

Preparing the cable(s)

The cable(s) must be prepared to suit the non-AutoCal/AutoCal systems before connections can be made.

Cable requirements:

- one length of 14-core cable is required to connect non-AutoCal systems (probe to transmitter) – maximum length 100 m (300 ft).
- two lengths of 14-core cable are required to connect AutoCal systems (probe to AutoCal unit and AutoCal unit to transmitter) – maximum combined length 100 m (300 ft).

Refer to the following pages for connection requirements:

- page 19 for non-AutoCal systems (probe to transmitter)
- page 21 and page 22 for AutoCal systems (probe to AutoCal unit and AutoCal unit to transmitter)

Cable glands

**NOTICE**

The special EMC cable gland supplied with the probe/transmitter can be replaced by any ½ in NPT or ½ in BSP, EMC metal gland that forms a watertight seal on the outer sheath of the cable and an electrical contact to the braided copper shield.

The gland must form a good electrical contact with the probe for grounding purposes and form a NEMA 4X watertight seal with the probe – see Figure 10, page 14.

**EMC cable gland**

Locate cable glands before preparing cable.

**Figure 14** EMC Cable gland shown fitted to cable
...7 Electrical connections

Cable preparation – non-AutoCal systems (both ends)/AZ10 probe to AZ10 transmitter

**WARNING**

Bodily injury.

- The 14-core AZ10 cable carries the screened signal wires and the separately screened 90 to 264 V AC heater control wires safely.
- Before preparing cable wires, refer to Table 1, page 19 to identify unused AutoCal wires that must be cut back for non-AutoCal systems.

Referring to Figure 15:
1. Before preparing cable ends, slide a cable gland onto each end of the cable in the correct orientation.

2. Cut back the PVC outer sheaths by 155 mm (6.1 in).
3. Cut back Screen 2 braid leaving 25 to 30 mm (1 to 1.2 in) exposed. Do not cut back Screen 2 drain wire.
4. Cut back the PVC outer sheath of the 2 heater cores (brown and blue) and Screen 1 foil by 90 to 95 mm (3.7 in approx.). Do not cut back Screen 1 drain wire.
5. Twist Screen 1 and Screen 2 (drain) wires together to form a twisted pair at each end of the cable and fit a 40 mm (1.57 in) earth sleeve (not supplied) over each twisted pair.
6. Cut back all unused wires as instructed in Table 1, page 19 and cut the insulation back on each the remaining wires to expose 10 mm (0.4 in) of wire tail.

---

Cable preparation – AutoCal systems (both ends)/AZ10 probe to AZ10 AutoCal unit

**WARNING**

Bodily injury.

- The 14-core AZ10 cable carries the screened signal wires and the separately screened 90 to 264 V AC heater control wires safely.
- Before preparing cable wires, refer to Table 2, page 21 to identify unused wires that must be cut back for AutoCal systems.

Referring to Figure 17:

1. Before preparing cable ends, slide a cable gland onto each end of the cable in the correct orientation.

2. Cut back the PVC outer sheaths by 155 mm (6.1 in).

3. Cut back Screen 2 braid leaving 25 to 30 mm (1 to 1.2 in) exposed. Do not cut back Screen 2 drain wire.

4. Cut back the PVC outer sheath of the 2 heater cores (brown and blue) and Screen 1 foil by 90 to 95 mm (3.7 in approx.). Do not cut back Screen 1 drain wire.

5. Twist Screen 1 and Screen 2 (drain) wires together to form a twisted pair at each end of the cable and fit a 40 mm (1.57 in) earth sleeve (not supplied) over each twisted pair.

6. Cut back all unused wires as instructed in in Table 2, page 21 and cut the insulation back on each the remaining wires to expose 10 mm (0.4 in) of wire tail.

### Cable requirements – AZ10 AutoCal unit to AZ10 transmitter (AutoCal systems)

*Connect screen 2 (drain) to the AutoCal unit’s outer SCN connector only – do not connect it to the transmitter’s SCN terminal or transmitter external earth*

---

**Figure 20** Electrical connections – AutoCal systems/AZ10 AutoCal unit to AZ10 transmitter
8 Test gas and reference air connections

Test gas connection

⚠️ CAUTION

Use clean dry instrument air free from hydrocarbons, or traceable certified bottled test gas mixtures of O₂/N₂ only.

The sensor has one test gas inlet – see Figure 21. A flowmeter must be fitted to the test gas line to restrict/regulate the flow. The pressure is set to 1 bar (15 psi) then flow is restricted by the flowmeter.

Refer to page 25 to page 28 for pneumatic entry types.

Test gas inlet

The sensor test gas (calibration) inlet is provided for in situ sensor testing using a test gas.

If the sensor is connected permanently to the test gas supply pipework:
- fit a high quality, corrosion-resistant (stainless steel), solenoid valve, manually operated valve or non-return valve (that is leak-tight even at zero back-pressure) in the pipework, as close to the test gas inlet valve as possible
- keep the valve closed when the calibration system is not in use

⚠️ CAUTION

If the test gas connection is not sealed when not in use, air leaking into the sensor via the connection causes measurement errors. In a pressurized process, gases venting to atmosphere through the connection cause corrosion of, and/or block, the test gas tube. In a negative pressure process, air leakage causes high O₂ reading errors.

NOTICE

- It is preferable to use air (20.95 % O₂) as one of the test gases as this is the sensor’s zero point. Alternative representative gases can be used according to local environmental conditions.
- To ensure better accuracy, use 2 test gases that represent the top and bottom limits of the known operating range.
- Due to resolution accuracies, do not calibrate the system with gases of less than 1 % O₂.
Test gas supply configurations – non-AutoCal systems

**NOTICE**

- If using the ABB-supplied test gas port with standard filter option, the test gas supply must be 3 to 3.5 l/min (6.354 to 7.413 scfh).
- Test gas can be connected to the supplied sensor test gas connection or via optional AZ10 Autocal unit.
- If using customer’s manifold, flows may differ from values shown below.

System using air as test gas 1 and bottled gas as (optional) test gas 2

![Diagram of system using air as test gas 1 and bottled gas as (optional) test gas 2]

System using 2 bottled test gases

![Diagram of system using 2 bottled test gases]

**Figure 22** Test gas supply, non-AutoCal system – air (test gas 1) and optional bottled gas (test gas 2)

**Figure 23** Test gas supply, non-AutoCal system – 2 bottled test gases
...8 Test gas connections

Schematic – AutoCal system

System using air as test gas 1 and bottled gas as (optional) test gas 2

System using 2 bottled test gases

Figure 25  Test gas supply, AutoCal system with restrictors – air (test gas 1) and optional bottled gas (test gas 2)

Figure 26  Test gas supply, AutoCal system with restrictors – 2 bottled test gases
...8 Test gas connections

Test gas and reference air supply configurations – AutoCal systems without restrictors

System using air as test gas 1 and bottled gas as (optional) test gas 2

System using 2 bottled test gases

Figure 27 Test gas supply, AutoCal system without restrictors – air (test gas 1) and optional bottled gas (test gas 2)

Figure 28 Test gas supply, AutoCal system without restrictors – 2 bottled test gases
9 Start-up and operation

The AZ10 oxygen analyzer should now be ready to commission – refer to the transmitter User Guide (IM/AZ20E-EN).

Preparation and setting up test gases

⚠️ CAUTION

If the test gas connection is not sealed when not in use, air leaking into the sensor via the connection causes measurement errors. In a pressurized process, gases venting to atmosphere through the connection cause corrosion of, and/or block, the test gas tube. In a negative pressure process, air leakage causes high O₂ reading errors.

1. If the sensor is not connected permanently to test gas pipework, ensure a blanking plug (to be supplied separately) is fitted securely to the test gas inlet connection on the sensor.

2. If the sensor is connected permanently to test gas pipework, ensure that a valve is installed in the pipework adjacent to the test gas connection and is closed.

3. Check the connections on both the sensor and the test gas bottles. Test gas connections must be checked for leak tight joints. Leaks can cause errors and drain away expensive bottles of test gas.

4. If the ABB-supplied test gas entry is used, this section prepares the system for manual calibration routines by setting up the test gas flows – refer to page 25 to page 28 for test gas supply configurations.
10 System Specification

Measurement performance
Range:
0.01 to 100 % O2

Test gas response time
  • Initial dead time 3 seconds
  • T90 < 15 seconds

System accuracy
  < ±1 % of reading or 0.05 % O2, whichever is the greater, based on a nominal range of 0.01 to 25 % O2

Drift
  • < ±1 % maximum % O2 range value per month (without calibration)
  • < ±0.2 % typical

Error due to flue wall temperature changes
0.017 % of reading/°C (0.008 % of reading/°F) (based on a 2-point calibration against certified test gases)

Environmental data
Ambient operating temperature
  • Transmitter: –20 to 55 °C (–4 to 131 °F)
  • Probe: –20 to 70 °C (–4 to 158 °F)

Storage temperature
–40 to 85 °C (–40 to 185 °F)

Operating humidity
Up to 95 % RH, non-condensing

Sunlight
Store and operate out of direct sunlight

Ingress protection
  • Probe (excludes remote/integral transmitter): IP66 (NEMA 4X)
  • Electronics enclosures – remote and integral: IP66 (NEMA 4X)

Power supply
AC power supply
100 to 240 V AC ±10 % (90 V min. to 264 V max.) 50/60 Hz

Electronics
< 10 W

Probe heater
< 100 W

EMC
Emissions and immunity
Conforms to EN61326-1

Safety
General safety
Conforms to EN61010-1

Approvals and safety certification
CE mark

11 Probe specification

Physical

Process connection
  • ANSI B16.5 150 lb
  • 2.5, 3 in
  • DIN2501 Part 1
  • 65, 80 mm
  • 2 in NPT, 2 in BSP
  (flange pressure ratings do not apply)
  • ABB standard flange

Probe body material
316L stainless steel

Mounting angle
Horizontal to vertically down

Process conditions
Standard process temperature
–20 to 800 °C (–4 to 1472 °F)

Process pressure
Designed to withstand 35 kPa (5.1 psi) – positive or negative (pressure compensation required above 5 kPa (0.7 psi) – transmitter can apply fixed pressure compensation)

Operating requirements
Test gas
User-selectable, 100 to 0.1 % O2 balance N2 and/or air (air is recommended as one of the test gases)

  • AutoCal with restrictors
    1 bar (15 psi) – flowmeters not required as restrictors preset flow to 2.2 l/min (4.662 scfh)

  • AutoCal without restrictors
    1 bar (15 psi) – flowmeters required, set to 2.2 l/min (4.662 scfh)

  • No AutoCal
    1 bar (15 psi) – flowmeter required

Calibration
Manual, semi-automatic or automatic (controlled by Endura transmitter)

Automatic calibration unit
AutoCal hardware
  • Built-in solenoid valves for control of test gas flow
  • Built-in pressure switches to detect presence of test gases

Heater operational requirements
Probe
Nominally 190 Ω, 70 W at 115 V AC – power is limited to 70 W max. by transmitter over an 85 to 265 V AC range
12 Transmitter specification

Transmitter enclosures
Remote
  Wall-mounted
  4 gland entries
Optional ¼ in NPT, M20

Automatic calibration
AutoCal hardware
  • Isolated solenoid valve control as standard, 24 V @ 2 W per valve*
  • Dedicated isolated digital inputs to monitor pressure switch contacts as standard – voltage-free, normally closed with gas present

Display and switches
Display type
  Graphical 128 x 64 pixel LCD
Display backlight
  Green LED
Operator switches
  4 capacitive switches (operated through the front glass)

Relay outputs
Number
  2 standard
Type
  Normally closed, 5 A @ 230 V AC
  or 30 V DC (non-inductive)
Functions
  User-configurable – can be activated by one or more of the following signals:
  • Process alarm 1, 2, 3, 4
  • Calibration in progress
  • Calibration failed
  • Out of test gas 1, 2
  • Test gas 1 valve control
  • Test gas 2 valve control
  • Failure diagnostic
  • Out-of-specification diagnostic
  • Maintenance required diagnostic
  • Function check diagnostic

Analog outputs
Standard
  • 1 isolated current output
  • Programmable to retransmit oxygen (linear or logarithmic) or temperature
  • Programmable over 4 to 20 mA
  • Over-range capability to indicate system failure programmable from 4 to 22 mA

Optional
  • 1 isolated current output
  • Programmable to retransmit oxygen (linear or logarithmic) or temperature
  • Programmable over 0 to 20 mA
  • Over-range capability to indicate system failure programmable from 0 to 22 mA

*For driving internal automatic calibration (AutoCal) probes or can be used to drive external calibration units on remote transmitters only.
Transmitter specification

Digital I/O

Number of digital I/Os
2

I/O configuration
User-configurable as either input or output

Input type
Volt-free contact

Output
Transistor switch capable of sinking 220 mA, low output, < 2 V DC, switch voltage 30 V DC maximum

Isolation
Not isolated from each other or from the microprocessor circuitry

Input functions
- Automatic calibration start on falling edge (when a volt-free switch is closed)
- Automatic calibration start on rising edge (when a volt-free switch is open)
- Automatic calibration stop on falling edge (when a volt-free switch is closed)
- Automatic calibration stop on rising edge (when a volt-free switch is closed)
- Automatic calibration start/stop – starts auto-calibration on falling edge (volt-free switch is closed) and stops auto-calibration on rising edge (volt-free switch is open)
- Select 1-point/2-point calibration type – high level (volt-free switch is open) selects 1-point, low level (volt-free switch is closed) selects 2-point

Output functions
- Process alarm 1, 2, 3, 4
- Calibration in progress
- Calibration failed
- Out of test gas 1
- Out of test gas 2
- Test gas 1 valve control
- Test gas 2 valve control
- Failure diagnostic
- Out-of-specification diagnostic
- Maintenance required diagnostic
- Function check diagnostic

Hart communications

Version
5.7 as standard

Integration
- Device Type Manager (DTM) and Electronic Device Description (EDD)
- Provide online/offline device configuration, online monitoring of measurement values and diagnostic states

DTM
- FDT v1.2.1 compliant
- Works with FDT framework packages (for example, ABB Asset Vision Basic)

EDD
Compliant with suitable framework tools (for example, SDC 625 and Simatic PDM tools)

Languages
English

Calibration

Manual calibration
- 1 point (offset)
- 1 point (factor)
- 2 point (offset + factor)

Automatic calibration
- 1 point (offset)
- 2 point (offset + factor)

Calibration control
- Front panel controls
- Digital inputs
- HART commands
- User-defined schedule

Calibration scheduler
User-defined schedule enables automatic calibration frequency to be set from 1 day to 12 months
