IMPORTANT SAFETY INSTRUCTIONS

This manual contains important safety instructions that must be followed during installation and maintenance of the equipment.

Operators are required to read this manual and scrupulously follow the indications reported in it, since ABB cannot be held responsible for damages caused to people and/or things, or the equipment, if the warranty conditions are not observed.

Introduction and general information

Warranty and Supply Conditions

The warranty conditions are considered to be valid if the customer adheres to the indications in this manual; any conditions deviating from those described herein must be expressly agreed in the purchase order.

The equipment complies with the pertinent legislation currently in force in the country of installation and it has issued the corresponding declaration of conformity.

Not included in the supply

ABB accepts no liability for failure to comply with the instructions for correct installation and will not be held responsible for systems upstream or downstream the equipment it has supplied. It is absolutely forbidden to modify the equipment. Any modification, manipulation, or alteration not expressly agreed with the manufacturer, concerning either hardware or software, shall result in the immediate cancellation of the warranty. The Customer is fully liable for any modifications made to the system.

Given the countless array of system configurations and installation environments possible, it is essential to check the following: sufficient space suitable for housing the equipment; airborne noise produced depending on the environment; potential flammability hazards.

ABB will NOT be held liable for defects or malfunctions arising from: improper use of the equipment; deterioration resulting from transportation or particular environmental conditions; performing maintenance incorrectly or not at all; tampering or unsafe repairs; use or installation by unqualified persons.

ABB will NOT be held responsible for the disposal of: displays, cables, batteries, accumulators etc. The Customer shall therefore arrange for the disposal of substances potentially harmful to the environment in accordance with the legislation in force in the country of installation.

Scope and target audience

Purpose and document structure

This operating and maintenance manual is a useful guide that will enable you to work safely and carry out the operations necessary for keeping the equipment in good working order.

⚠️ If the equipment is used in a manner not specified in this manual, the protection provided by the equipment may be impaired.

⚠️ The language in which the document was originally written is ITALIAN; therefore, in the event of inconsistencies or doubts please ask the manufacturer for the original document.

List of appendix documents

In addition to this operating and maintenance manual (if applicable or on request), the following documentation is supplied:
- EC declaration of conformity
- Quick installation guide (QIG)

Part of the information given in this document is taken from the original supplier documents. This document contains only the information considered necessary for the use and routine maintenance of the equipment.

Operator and maintenance personnel skills/prerequisites

Personnel in charge of using and maintaining the equipment must be skilled for the described tasks and must reliably demonstrate their capacity to correctly interpret what is described in the manual.

⚠️ For safety reasons, only a qualified electrician who has received training and/or demonstrated skills and knowledge of the inverter’s structure and operation may install the inverter.

⚠️ The installation must be performed by qualified installers and/or licensed electricians in accordance with the existing regulations in the country of installation.

⚠️ Inverter operation and maintenance by a person who is NOT qualified, is intoxicated, or on narcotics, is strictly forbidden.

⚠️ The customer has civil liability for the qualification and mental or physical state of the personnel who interact with the equipment. They must always use the personal protective equipment (PPE) required by the laws of the country of destination and whatever is provided by their employer.
**Symbols and Signs**

In the manual and/or in some cases on the equipment, the danger or hazard zones are indicated with signs, labels, symbols or icons.

<table>
<thead>
<tr>
<th>Table: Symbols</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Symbol" /> <strong>This</strong> points out that it is mandatory to consult the manual or original document, which must be available for future use and must not be damaged in any way.</td>

</tbody>
</table>
Field of use, general conditions

ABB shall not be liable for any damages whatsoever that may result from incorrect or careless operations.

You may not use the equipment for a use that does not conform to that provided for in the field of use. The equipment MUST NOT be used by inexperienced staff, or even experienced staff if carrying out operations on the equipment that fail to comply with the indications in this manual and enclosed documentation.

Intended or allowed use

This equipment is an inverter designed for:
- transforming a continuous electrical current (DC) supplied by a photovoltaic generator (FV)
- in an alternating electrical current (AC) suitable for feeding into the public distribution grid.

Limits in field of use

The inverter can be used only with photovoltaic modules which have ground isolated input poles, unless they are accessories installed that enable earthing of the inputs. In this case you must install an insulating transformer on the AC side of the system.

Only a photovoltaic generator can be connected in the input of the inverter (do not connect batteries or other sources of power supply).

The inverter can be connected to the electricity grid only in countries for which it has been certified/approved.

The inverter cannot be connected to the DC side in parallel to other inverters to convert energy from a photovoltaic generator with a power greater than the nominal power of the single inverter.

The inverter may only be used in compliance with all its technical characteristics.

Improper or prohibited use

IT IS STRICTLY FORBIDDEN TO:
- Install the equipment in environments subject to particular conditions of flammability or in adverse or disallowed environmental conditions, (temperature and humidity).
- Use the equipment with safety devices which are faulty or disabled.
- Use the equipment or parts of the equipment by linking it to other machines or equipment, unless expressly provided for.
- Modify operating parameters that are not accessible to the operator and/or parts of the equipment to vary its performance or change its isolation.
- Clean with corrosive products that could eat into parts of the equipment or generate electrostatic charges.
- Use or install the appliance or parts of it without having read and understood the contents of the user and maintenance manual.
- Heat or dry rags and clothing on the parts in temperature. In addition to being hazardous, doing so would compromise component ventilation and cooling.
General conditions

A description of the equipment characteristics is provided to identify its main components and specify the technical terminology used in the manual.

This chapter contains information about the models, details of the equipment, characteristics and technical data, overall dimensions and equipment identification.

The customer/Installer takes full responsibility if, when reading this manual, the chronological order of its presentation provided is not observed. All information is provided considering occasional inclusion of information in previous chapters.

In certain cases, there may be a need to separately document software functionality or attach supplementary documentation to this manual which is intended for more qualified professionals.
Models and range of equipment

The specific models of monophase inverters covered by this manual are divided into two groups according to their maximum output power: 5.0 kW or 6.0 kW.

For inverters of equal output power the variant between the various models is the presence or lack thereof of the DC disconnect switch.

The choice of the inverter model must be made by a qualified technician who knows about the installation conditions, the devices that will be installed outside the inverter and possible integration with an existing system.

Identification of the equipment and the manufacturer

The technical data shown in this manual do not in any case replace those shown on the labels attached to the equipment.

*The labels attached to the equipment must NOT be removed, damaged, dirtied, hidden, etc.*

The approval label contains the following information:
1. Manufacturer
2. Model
3. Rating data
4. Certification marks

N.B. The labels must NOT be hidden with objects and extraneous parts (rags, boxes, equipment, etc.); they must be cleaned regularly and kept visible at all times.

*Abb*
In addition to the label showing the specifications of the inverter, there are two part identification labels for the inverter and wiring box. These labels list the following information:

- Inverter model
  - XXXX = Inverter power rating:
  - Y = Integrated disconnect switch
- Inverter Part Number
- Inverter Serial Number composed of:
  - YY = Year of manufacture
  - WW = Week of manufacture
  - SSSSSS = Sequential number
- Week/Year of manufacture

The officially required information is located on the approval label. The identification label is an accessory label which shows the information necessary for the identification and characterisation of the inverter by ABB.

N.B. The labels must NOT be hidden with objects and extraneous parts (rags, boxes, equipment, etc.); they must be cleaned regularly and kept visible at all times.

Overall dimensions

The overall dimensions are expressed in millimetres and inches and include the wall installation bracket.

![Overall dimensions diagram]
Bracket dimensions

The wall mounting bracket dimensions are expressed in mm and inches.

[Diagram showing bracket dimensions with measurements in mm and inches.]

**Efficiency curves**

The equipment was designed in consideration of current energy conservation standards, to avoid waste and unnecessary leakage.

Graphs of the efficiency curves of all models of inverter described in this manual are shown below.

*The efficiency curves are linked to technical parameters that are continually being developed and improved and should therefore be considered approximate.*
Power derating

In order to allow inverter operation in safe thermal and electrical conditions, the unit automatically reduces the value of the power fed into the grid.

Power limiting may occur due to:
- Adverse environmental conditions (thermal derating)
- Percentage of output power (value set by the user)
- Grid voltage over frequency (mode set by user)
- Grid over voltage U>10min Der. (enabling carried out by user)
- Anti-islanding
- Grid under voltage
- Input voltage values too high.
- Input current values too high.

Power derating due to environmental conditions

The power reduction value and the inverter temperature at which it occurs depend on the ambient temperature and on many operating parameters. Example: input voltage, grid voltage and power available from the photovoltaic field.

The inverter can therefore reduce the power during certain periods of the day according to the value of these parameters.

In any case, the inverter guarantees the maximum output power even at high temperatures, provided the sun is not shining directly on it.
Power reduction due to the input voltage

The graphs show the automatic reduction of supplied power when input voltage values are too high or too low.
Characteristics of a photovoltaic generator

A PV generator consists of an assembly of photovoltaic panels that transform solar radiation into DC electrical energy and can be made up of:
- Strings: X number of PV panels connected in series
- Array: group of X strings connected in parallel

Strings and Arrays

In order to considerably reduce the cost of installing a photovoltaic system, mainly associated with the problem of wiring on the DC side of the inverter and subsequent distribution on the AC side, the string technology has been developed. A photovoltaic panel consists of many photovoltaic cells mounted on the same support.
- A string consists of a certain number of panels connected in series.
- An array consists of two or more strings connected in parallel.

Large photovoltaic systems can be made up of several arrays, connected to one or more inverters.

By maximizing the number of panels inserted into each string, it is possible to reduce the cost and complexity of the connection system of the photovoltaic system.

The current of each array must fall within the limits of the inverter.

To work, the inverter must be connected to the national electricity grid since its operation can be equated to a current generator that supplies power in parallel with the grid voltage. That is why inverters cannot support the grid voltage (islanding).
Description of the equipment

This equipment is an inverter that converts direct electric current from a photovoltaic generator into alternating electric current and feeds it into the national grid.

Photovoltaic panels transform energy from the sun into direct current (DC) electrical energy (through a photovoltaic field, also called photovoltaic (PV) generator; in order to use it it is necessary to transform the type of alternating current into “AC”. This conversion, known as DC to AC inversion, is made efficiently without using rotating parts and only through static electronic devices.

In order to allow inverter operation in safe thermal and electrical conditions, in the event of adverse environmental conditions or unsuitable input voltage values, the unit automatically reduces the value of the power fed into the grid.

This way the solar energy system compensates for the energy drawn from the utilities connected to the grid to which it is linked.

The solar energy system therefore powers all connected electrical devices, from lighting to household appliances, etc.

When the photovoltaic system is not supplying sufficient power, the power needed to ensure normal operation of the connected electrical devices is drawn from the national grid. If, on the other hand, excess power is produced, this is fed directly into the grid, so becoming available to other consumers.

In accordance with local and national regulations, the power produced can be sold to the grid or credited towards future consumption, so bringing about a saving of money.

Operating diagram
Connection of several inverters together

If the photovoltaic system exceeds the capacity of a single inverter, it is possible to make a multiple connection of inverters to the system, with each one connected to a suitable section of the photovoltaic field, on the DC side, and connected to the grid on the AC side. Each inverter will work independently of the others and will supply the grid with the maximum power available from its section of photovoltaic panels.

Notes on the sizing of the system

Decisions about how to structure a photovoltaic system depend on a certain number of factors and considerations to make, such as for example, the type of panels, the availability of space, the future location of the system, energy production goals over the long term, etc.

A configuration program that can help to correctly size the photovoltaic system is available on the web site of ABB.
**Functionality and components of the equipment**

**Configurable relay**
The inverter is equipped with a configurable switching relay, which can be used in different operating configurations that can be set in the dedicated menu. A typical example of application is the activation of the relay in the event of an alarm.

**Remote switch-on/switch-off**
This command can be used to turn off/turn on the inverter via an external (remote) command. This functionality must be enabled in the menu and when active, switching on the inverter, besides being dictated by the presence of normal parameters which allow the inverter to be connected to the grid, also depends on the external control for switching on/off.

**Reactive power feed into the grid**
The inverter is capable of producing reactive power, and then feeding it into the grid through this connection, by setting the phase factor. Managing the input can be controlled directly by the grid company via a dedicated RS485 serial interface or set by the display or through the configuration software, Aurora Manager TL. Power feeding modes vary according to the country of installation and the grid companies. For detailed information on the parameters and characteristics of this function, contact ABB directly.

**Limiting the active power fed into the grid**
The inverter, if enabled and set using the display or the Aurora Manager configuration software, can limit the amount of active power fed into the grid by the inverter to the desired value (expressed as a percentage).

**Data transmission and control**
The inverter or a network of several inverters, can also be monitored remotely via an advanced communication system based on a RS-485 serial interface. The range of optional ABB devices that can be connected to this communication line allow you to monitor the device locally or remotely through an internet connection.
Topographic diagram of the equipment

The diagram summarises the internal structure of the inverter.

The main blocks are the DC-DC input converters (called "boosters") and the output inverter. The DC-DC converter and the output inverter both work at a high switching frequency, and so are small and relatively light. Each of the input converters is dedicated to a separate array, with independent maximum power point tracking (MPPT) control.

This means that the two arrays may be installed with various positions or orientations. Each array is controlled by an MPPT control circuit.

The two trackers can be configured (where required) in parallel to handle power levels and/or current higher than those that a single tracker can handle.

This inverter version is of the type without transformer, that is without galvanic insulation between the input and the output. This allows ultimately an increase in conversion efficiency. The inverter is already equipped with all the protections necessary for safe operation and compliance with the norms, even without the insulating transformer.

The inverter is controlled by two independent DSPs (Digital Signal Processors) and a central microprocessor.

The connection to the power grid is thus kept under control by two independent computers, in full compliance with the electric field norms both for power supply to the systems as well as security.

The operating system carries out the task of communicating with its components in order to carry out data analysis.

In doing all this, we guarantee optimal operation of the whole complex and a high performance in all sunlight conditions and always ensuring full compliance with the relevant directives, standards and regulations.
Safety devices

Anti-Islanding

In the event of a local grid outage by the electricity company, or when the equipment is switched off for maintenance operations, the inverter must be physically disconnected to ensure the protection of the people working on the grid, in accordance with the relevant national laws and regulations. To prevent possible islanding, the inverter is equipped with an automatic safety disconnection system called “Anti-Islanding”.

Anti-islanding protection mechanisms are different depending on the grid standards, even if they all have the same purpose.

Ground fault of the photovoltaic panels

This inverter must be used with panels connected in “floating” mode, i.e. with no earth connections on the positive and negative terminals. An advanced ground fault protection circuit continuously monitors the ground connection and disconnects the inverter when a ground fault indicating the fault condition by means of the red "GFI" LED on the LED panel on the front side.

Other safety devices

The inverter is equipped with additional protective devices to ensure safe operation in any circumstance. These protections include:
- Constant monitoring of the grid voltage to ensure that voltage and frequency values remain within operating limits;
- Internal temperature control to automatically limit the power if necessary to prevent overheating of the unit (derating).

The numerous control systems determine a redundant structure to ensure absolutely safe operations.
Safety information and instructions

The equipment has been manufactured in accordance with the strictest accident-prevention regulations and supplied with safety devices suitable for the protection of components and operators.

For obvious reasons, it is not possible to anticipate the great number of installations and environments in which the equipment will be installed. It is therefore necessary for the customer to appropriately inform the manufacturer about particular installation conditions.

ABB accepts no liability for failure to comply with the instructions for correct installation and cannot be held responsible for the upstream or downstream equipment.

It is essential to provide operators with correct information. They must therefore read and comply with the technical information provided in the manual and in the attached documentation.

The instructions provided in the manual do not replace the safety devices and technical data for installation and operation labels on the product, and they do not replace the safety regulations in force in the country of installation.

The manufacturer is willing to train staff, at its premises or on site, in accordance with conditions agreed to in the contract.

Do not use the equipment if you find any operating anomalies.

Avoid temporary repairs. All repairs should be carried out using only genuine spare parts, which must be installed in accordance with their intended use.

Liabilities arising from commercial components are delegated to the respective manufacturers.
Hazardous areas and operations

Environmental conditions and risks

The equipment can be installed outdoors, but only in environmental conditions that do not prevent its regular operation. These conditions are reported on the technical data and on installation chapter.

ABB CANNOT be held responsible for disposal of the equipment: displays, cables, batteries, accumulators, etc., and therefore the customer must dispose of these substances, which are potentially harmful to the environment, in accordance with the regulations in force in the country of installation.

The same precautions should be adopted for dismantling the equipment.

The equipment is not equipped to operate in environments that have particular flammability or explosive conditions.

The customer and/or installer must appropriately train operators or anyone who may come near the equipment, and highlight, if necessary with notices or other means, the hazardous areas or operations at risk if required: magnetic fields, hazardous voltages, high temperatures, possibility of discharges, generic hazard, etc.

Signs and Labels

The labels attached to the equipment must absolutely NOT be removed, damaged, dirtied, hidden, etc.

The labels must be cleaned regularly and kept visible at all times, that is, they must NOT be hidden with objects and extraneous parts (rags, boxes, equipment, etc.)

The technical data shown in this manual do not in any case replace those shown on the labels attached to the equipment.
**Thermal hazard**

**WARNING:** removal of guards or covers is allowed only after the voltage has been removed; this is to let components cool down and allow any electrostatic charges and parasitic voltages to be discharged.

When the equipment has just been switched, it may have hot parts, as a result of overheating of the surfaces at temperature (e.g.: transformers, accumulators, coils, etc.) so be careful where you touch.

*In the event of fire, use CO$_2$ extinguishers and use auto extraction systems to fight fire in closed environments.*

**Clothing and protective devices for staff**

**ABB** has eliminated sharp edges and corners, but in some cases it is not possible to do anything, and we therefore advise wearing the clothing and personal protective devices provided by the employer.

*Staff must not wear clothes or accessories that can start fires or generate electrostatic charges or, in general, clothing that can impede personal safety.*

All operations on the equipment should be performed with suitably insulated clothes and instruments.

E.g.: Insulated gloves (class 0, category RC)

Maintenance operations must be carried out with the equipment disconnected from the grid and from the photovoltaic generator.

*Staff must NOT go near the equipment with bare feet or wet hands.*

The maintenance technician must in any case make sure no one else can switch on or operate the equipment during the maintenance operations, and must report any anomaly or damage due to wear or ageing so that the correct safety conditions can be restored.

The installer or maintenance technician must always pay attention to the work environment, so that it is well lit and has sufficient spaces to ensure they have an escape route.

In the installation, consider or make sure the *noise emitted based on the environment* is not such that it exceeds thresholds allowed by law (less than 80 dBA).
Residual risks

Despite the warnings and safety systems, there are still some residual risks that cannot be eliminated. These risks are listed in the following table with some suggestions to prevent them.

Table of residual risks

<table>
<thead>
<tr>
<th>RISK ANALYSIS AND DESCRIPTION</th>
<th>SUGGESTED REMEDY</th>
</tr>
</thead>
<tbody>
<tr>
<td>Noise pollution due to installation in unsuitable environments or where staff work permanently.</td>
<td>Reassess the environment or the place of installation.</td>
</tr>
<tr>
<td>Suitable local ventilation that does not cause overheating of the equipment and is sufficient not to create discomfort to people in the room.</td>
<td>Restore suitable ambient conditions and air the room.</td>
</tr>
<tr>
<td>External weather conditions, such as water seepage, low temperatures, high humidity, etc.</td>
<td>Maintain ambient conditions suitable for the system.</td>
</tr>
<tr>
<td>Overheating of surfaces at temperature (transformers, accumulators, coils, etc.) can cause burns. Also be careful not to block the cooling slits or systems of the equipment.</td>
<td>Use suitable protective equipment or wait for the parts to cool down before switching on the equipment.</td>
</tr>
<tr>
<td>Inadequate cleaning: compromises cooling and does not allow the safety labels to be read.</td>
<td>Clean the equipment, labels and work environment adequately.</td>
</tr>
<tr>
<td>Accumulation of electrostatic energy can generate hazardous discharges.</td>
<td>Ensure the devices have discharged their energy before working on them.</td>
</tr>
<tr>
<td>Inadequate training of staff.</td>
<td>Ask for a supplementary course.</td>
</tr>
<tr>
<td>During installation, temporarily mounting the equipment or its components may be risky.</td>
<td>Be careful about and disallow access to the installation area.</td>
</tr>
<tr>
<td>Accidental disconnections of the quick-fit connectors with the equipment in operation, or wrong connections, may generate electric arcs</td>
<td>Be careful about and disallow access to the installation area.</td>
</tr>
</tbody>
</table>
General conditions

Some recommendations apply only to large size product or multiple small size product packaging.

Transport and handling

Transport of the equipment, especially by road, must be carried out with means for protecting the components (in particular, the electronic components) from violent shocks, humidity, vibration, etc. During handling, do not make any sudden or fast movements that can create dangerous swinging.

Lifting

ABB usually stores and protects individual components by suitable means to make their transport and subsequent handling easier, but as a rule, it is necessary to utilize the experience of specialized staff in changes of loading and unloading the components.

The ropes and equipment used for lifting must be suitable for bearing the weight of the equipment.

Do not lift several units or parts of the equipment at the same time, unless otherwise indicated.

Unpacking and checking

Packaging elements (cardboard, cellophane, staples, adhesive tape, straps, etc.) may cause cuts and/or injuries if not handled with care. They should be removed with the proper equipment.

The components of the packaging must be disposed of in accordance with the regulations in force in the country of installation.

When you open an equipment package, check that the equipment is undamaged and make sure all the components are present. If you find any defects or damage, stop unpacking and consult the carrier, and also promptly inform ABB Service.
### List of components supplied

Supplied with the inverter are all the components required to correctly install and connect the inverter.

General conditions

Equipment performance will be enhanced by proper equipment installation.

Staff authorized to carry out the installation must have received suitable training on this type of equipment.

Equipment operation must be carried out by staff who comply with instructions in this manual.

For safety reasons only a qualified electrician, who has received training or/and has demonstrated skills and knowledge in operation of this unit, can install this inverter.

The installation is done by qualified installers and/or licensed electricians according to applicable local regulations.

The connection of an inverter energy system to an electrical installation connected to the grid shall be approved by the appropriate electrical distributor.

The installation must be carried out with the equipment disconnected from the grid and from the photovoltaic generator.

When the photovoltaic panels are exposed to light, these supplies a direct current voltage to the inverter.
Environmental checks

- Consult the technical data to check the environmental parameters to be observed (degree of protection, temperature, humidity, altitude, etc.)
- The installation to direct sunlight must be avoided (otherwise the warranty will be cancelled) because it may cause:
  - Phenomena of power limitation by the inverter (with consequent reduction of energy production)
  - Premature aging of electronic/electromechanical components
  - Premature aging of mechanical components (gaskets) and user interface (display)
- Do not install in small closed rooms where air cannot circulate freely.
- To avoid overheating, always make sure the flow of air around the inverter is not blocked.
- Do not install in presence of flammable materials in the close surroundings (3m minimum distance).
- Do not install on walls made of wood or flammable materials.
- Do not install in rooms where people live or where the prolonged presence of people or animals is expected, because of the high noise level that the inverter produces during operation. The level of the sound emission is heavily influenced by where the inverter is installed (for example: the type of surface around the inverter, the general properties of the room, etc.) and the quality of the electricity supply.
- Avoid electromagnetic interference that can compromise the correct operation of electronic equipment, with consequent situations of danger.

The final installation of the inverter should not prevent access to any outside disconnection means. Refer to the warranty conditions to evaluate the possible exclusions from warranty related to improper installation.

Installations above 2000 metres

On account of the rarefaction of the air (at high altitudes), particular conditions may occur that should be considered when choosing the place of installation:

- Less efficient cooling and therefore a greater likelihood of the device going into derating because of high internal temperatures.
- Reduction in the dielectric resistance of the air that, in the presence of high operating voltages (DC input), can create electric arcs (discharges) that can reach the point of damaging the inverter.

As the altitude increases, the failure rate of some electronic components increases exponentially because of cosmic radiation.

All installations at altitudes of over 2000 metres must be assessed case by case considering the aforesaid criticalities.
**Installation position**

When choosing the place of installation, comply with the following conditions:

- Install on a wall or strong structure suitable for bearing the weight.
- Install in safe, easy to reach places.
- If possible, install at eye-level so that the display and status LEDs can be seen easily.
- Install at a height that considers the heaviness of the equipment. If this condition is not complied with, it can create problems in the event of servicing unless suitable means are provided to carry out the operation.
- Install vertically with a maximum inclination of +/- 5°. If this condition is not complied with, the inverter could go into temperature derating because of the worsening of heat dissipation.

- To carry out maintenance of the hardware and software of the equipment, remove the covers on the front. Check that there are the correct safety distances for the installation that will allow the normal control and maintenance operations to be carried out.
- Comply with the indicated minimum distances.

- For a multiple installation, position the inverters side by side.

- If the space available does not allow this arrangement, position the inverters in a staggered arrangement as shown in the figure so that heat dissipation is not affected by other inverters.
Wall/Pole mounting

During installation do not place the inverter with the front cover facing towards the ground.

• Position the bracket so that it is perfectly level on the wall and use it as a drilling template. On the bracket there are 9 fixing holes; 3 fixing points are enough to support the inverter if it is installed on stable, sturdy supports (Step A).

• Make the necessary holes, using a drill with a 10 mm bit. The depth of the holes must be around 70 mm. (Step A).

• Secure the bracket to the wall with the 10 mm wall plugs supplied with it (Step A).

• Hook the 3 screws on the back of the inverter in correspondence with the insertion points in the bracket (Step B).

• Mount the safety bar (highlighted in blue) on the upper part of the wall-mounting bracket (Step C).

• Drill 1 hole in correspondence with the central hole on the lower bracket of the inverter, using a drill with a 10 mm bit. The holes must be approximately 70 mm deep (Step D)

Anchor the lower part of the inverter using plugs with a diameter of 10 mm, supplied (Step D).

• Unscrew the 4 screws and open the front cover in order to make all the necessary connections.

Do not open the inverter in the case of rain, snow or a high level of humidity (>95%)

• Once the connections have been made, close the cover by tightening the 4 screws on the front to a minimum tightening torque of 1.5 Nm.
Operations preparatory to PV generator connection

Checking the correct polarity of the strings

Using a voltmeter, check that the voltage of each string observes the correct polarity and falls within the input voltage limits accepted by the inverter (see technical data).

*Inversion polarity can cause serious damage*

If the voltage without load of the string is near the maximum value accepted by the inverter, it must be borne in mind that with low ambient temperatures the string voltage tends to increase (in a different way according to the photovoltaic module used). In this case, it is necessary to carry out a check of the sizing of the system and/or a check on the connections of the modules of the system (e.g.: number of modules in series higher than the design number).

Checking of leakage to ground of the photovoltaic generator

Measure the voltage present between positive and negative pole of each string with respect to ground.

If a voltage is measured between an input pole and ground, it may be that there is a low insulation resistance of the photovoltaic generator and the installer will have to carry out a check to solve the problem.

*Do not connect the strings if a leakage to ground has been found because the inverter might not connect to the grid.*

Choice of differential protection downstream of the inverter

All ABB string inverters marketed in Europe are equipped with a device for protection against ground faults in accordance with the safety standard set in Germany by Standard VDE V 0126-1-1:2006-02 (please refer to section 4.7 of the Standard).

In particular, ABB inverters are equipped with a redundancy on the reading of the ground leakage current sensitive to all components of both direct and alternating current. Measurement of the ground leakage current is carried out at the same time and independently by 2 different processors: it is sufficient for one of the two to detect an anomaly to trip the protection, with consequent separation from the grid and stopping of the conversion process.

There is an absolute threshold of 300 mA of total leakage current AC+DC with protection tripping time at a max. of 300 msec.

In addition, there are another three tripping levels with thresholds respectively at 30 mA/sec, 60 mA/sec and 150 mA/sec to cover the “rapid” changes in fault current induced by accidental contact with leaking live...
parts. The max. tripping times are progressively shortened as the speed of change in the fault current increases and, starting from the 300 msec/ max for the 30 mA/sec change, they are shortened respectively to 150 msec and 40 msec for 60 mA and 150 mA changes.

It should in any case be noted that the integrated device only protects the system against ground faults that occur upstream of the AC terminals of the inverter (namely towards the DC side of the photovoltaic system and consequently towards the photovoltaic modules). The leakage currents that can occur in the AC section between the draw/feed in point and the inverter are not detected and require an external protection device.

For protection of the AC line, on the basis of the aforesaid with regard to the differential protection integrated in ABB inverters, it is not necessary to install a type B ground fault interrupter.

In accordance with article 712.413.1.1.1.2 of Section 712 of IEC Standard 64-8/7, we hereby declare that, because of their construction, ABB inverters do not inject ground fault direct currents.

The use of an AC type circuit breaker with differential thermal magnetic protection with tripping current of 300 mA is advisable so as to prevent false tripping, due to the normal capacitive leakage current of photovoltaic modules.

In the case of systems consisting of multiple inverters connected to a single switch with differential protection, it is recommended to install a device that allows the adjustment of the trip value and timing of intervention.
Independent or parallel input channels configuration

All the inverter models are equipped with two input channels (thus benefitting from two trackers for MPPT maximum power point tracking) which work independently of one another, which can be paralleled by leveraging a single MPPT.

Strings of photovoltaic modules having the same type and number of panels in series must be connected to each single channel; they must also have the same installation conditions (in terms of orientation to the SOUTH and inclination from the horizontal plane).

When connecting the two input channels in parallel, you must comply with the above requirements in order to benefit from the ability to leverage the full power of the inverter output on a single channel.

The dual MPPT structure however allows management of two photovoltaic generators which are independent of each other (one for each input channel), and which may differ between themselves with regard to installation conditions, type and number of photovoltaic modules connected in series. A necessary condition for the two MPPT to be used independently is that the photovoltaic generator connected to each of the inputs has a lower power than the power limit of the single input channel and a maximum current lower than the current limit of the single input channel.

All input parameters that must be met for correct inverter operation are shown in the "technical data" table.

<td>(*) This condition is sufficient from the point of view of the energy production of the system, not from the point of view of inverter operation.&lt;br&gt;(**) This condition is advisable from the point of view of the energy production of the system, not from the point of view of inverter operation.</td>
</tr>
</tbody>
</table>
**Independent channel configuration (default configuration)**

This configuration involves the use of the two input channels (MPPT) in independent mode. This means that the jumpers between the two channels (positive and negative) of the DC input terminal block must not be installed and the switch located on the main board must be set to “IND”.

**Parallel channel configuration**

This configuration uses the two input channels (MPPT) connected in parallel. This means that the jumpers between the two channels (positive and negative) of the DC input terminal block must be installed and the switch located on the main board must be set to “PAR”.
Input connection to PV generator (DC side)

Once preliminary checks have been carried out and no problems found with the photovoltaic system, and the channel configuration has been selected (parallel or independent) you may connect the inputs to the inverter.

According to the system configuration, check the correct setting of the channels to independent or in parallel mode. An incorrect setting of the input channels can lead to loss of energy production.

Polarity inversion can cause serious damage. Check polarity before connecting each string!

When the photovoltaic panels are exposed to sunlight they provide continuous DC voltage to the inverter. To avoid risks of electrical shock, all wiring operations must be carried out with the DC disconnect switch (internal or external to the inverter) off.

For the string connections it is necessary to use the quick fit connectors (usually Weidmüller PV-Stick or WM4, MultiContact MC4 and Amphenol H4) located on the bottom of the mechanic.

Refer to the document “String inverter – Product Manual appendix” available at www.abb.com/solarinverters to know the brand and the model of the quick fit connector. Depending on the model of the connector of the own inverter, it is necessary to use the same model and the respective counterpart (check the compliant counterpart on the website of the manufacturer or in ABB)

Using corresponding parts that are not compliant with the quick fit connector models on the inverter could cause serious damage to the unit and lead to invalidation of the warranty.
Connect all the strings required by the system, always checking the seal of the connectors.

The figure below shows a connection example of the string inputs on a PVI-6000-TL-OUTD-S inverter (with dual input channel). Each input channel is connected to a string, while the protective covers are installed to unused connectors.

If any string inputs are not required, you must ensure that covers are installed to the connectors, and install any which are missing. This is necessary both for the inverter seal, and to avoid damage to the free connector which may be used at a later time.
Installation procedure for quick fit connectors

There are typically four different types of quick-fit connector models used on ABB inverters: Weidmüller PV-Stick or WM4, MultiContact MC4 and Amphenol H4.

Refer to the document “String inverter – Product Manual appendix” available at www.abb.com/solarinverters to know the brand and the model of the quick fit connector.

The model of connectors installed on your inverter must be matched by the same model of the respective corresponding parts to be used (checking the conforming corresponding part on the manufacturer’s website).

Using corresponding parts that are not compliant with the quick fit connector models on the inverter could cause serious damage to the unit and lead to invalidation of the warranty.

CAUTION: To avoid damage to the equipment, when attaching cables, pay particular attention to polarity.

1. WEIDMÜLLER PV-Stick quick fit connectors

Installation of Weidmuller connectors does not require any special tooling.

- Strip the cable to which you want to apply the connector (after verifying that it complies with the connector limits)

- Insert the wire into the connector until you hear a locking “click”

- Tighten the knurled ring nut for optimal clamping
2. WEIDMÜLLER WM4 quick fit connectors

Installation of Weidmüller WM4 connectors requires crimping to be carried out with suitable equipment.

- Strip the cable to which you want to apply the connector (after verifying that it complies with the connector limits).

- Apply the terminal to the conductor using suitable crimping pliers.

- Insert the cable with the terminal into the interior of the connector, until you hear the click indicating that the terminal is locked inside the connector.

- Firmly tighten the cable gland using the relevant tool to finish the operation.
3. MULTICONTACT MC4 quick fit connectors

Installation of Multicontact MC4 connectors requires crimping to be carried out with suitable equipment.

- Strip the cable to which you want to apply the connector (after verifying that it complies with the connector limits).

- Apply the terminal to the conductor using suitable crimping pliers.

- Insert the cable with the terminal into the interior of the connector, until you hear the click indicating that the terminal is locked inside the connector.

- Firmly tighten the cable gland using the relevant tool to finish the operation.
4. AMPHENOL H4 quick fit connectors

Installation of Amphenol H4 connectors requires crimping to be carried out with suitable equipment.

- Strip the cable to which you want to apply the connector (after verifying that it complies with the connector limits).

- Apply the terminal to the conductor using suitable crimping pliers.

- Insert the cable with the terminal into the interior of the connector, until you hear the click indicating that the terminal is locked inside the connector.

- Firmly tighten the cable gland using the relevant tool to finish the operation.
Grid output connection (AC side)

For the connection to the inverter grid you need 3 connections: ground, neutral and phase. The ground connection to the inverter is obligatory. Any failure of the inverter when it is not connected to earth through the appropriate terminal is not covered by the warranty.

Plug the grid cable into the inverter using the specific AC cable gland and connect the AC output terminal block.

Use a properly sized tripolar cable and check the tightness of the AC cable gland at the end of the installation.

Characteristics and sizing of the line cable

The cross-section of the AC line conductor must be sized in order to prevent unwanted disconnections of the inverter from the grid due to high impedance of the line that connects the inverter to the power supply point; In fact, if the impedance is too high, it causes an increase in the AC voltage that, on reaching the limit set by the country of installation, causes the inverter to switch off.

The table shows the maximum length of the line conductor based on the cross-section of this conductor:

<table>
<thead>
<tr>
<th>Cross-section of the line conductor (mm²)</th>
<th>Maximum length of the line conductor (m)</th>
</tr>
</thead>
<tbody>
<tr>
<td>PVI-5000-TL-OUTD</td>
<td>PVI-6000-TL-OUTD</td>
</tr>
<tr>
<td>4 mm² (up to 40 °C Ambient temperature)</td>
<td>11 m</td>
</tr>
<tr>
<td>6 mm²</td>
<td>16 m</td>
</tr>
<tr>
<td>10 mm²</td>
<td>28 m</td>
</tr>
</tbody>
</table>

The values are calculated in nominal power conditions, considering:
- loss of power along the line no greater than 1%.
- use of copper cable, with HEPR rubber insulation and positioned in open air.

Load protection switch (AC disconnect switch)

To protect the AC connection line of the inverter, we recommend installing a device for protection against over current and leakage with the following characteristics:

<table>
<thead>
<tr>
<th>PVI-5000-TL-OUTD</th>
<th>PVI-6000-TL-OUTD</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Automatic circuit breaker with differential thermal magnetic protection</td>
</tr>
<tr>
<td>Voltage rating</td>
<td>230 Vac</td>
</tr>
<tr>
<td>Current rating</td>
<td>32 A</td>
</tr>
<tr>

<td>B/C</td>
</tr>
<tr>
<td>Type of differential protection</td>
<td>A/AC</td>
</tr>
<tr>
<td>Differential sensitivity</td>
<td>300 mA</td>
</tr>
<tr>
<td>Number of poles</td>
<td>2</td>
</tr>
</tbody>
</table>
Connection to the AC side terminal board

To prevent electrocution hazards, all the connection operations must be carried out with the disconnect switch downstream of the inverter (grid side) open and locked.

For all inverter models, connection is carried out using the AC output terminal block (10) passing the cables internally through the AC cable gland (19).

Remove the protective film located on the hole to be used for the AC cables (19), insert the M32 cable gland in the hole and secure it using the M32 lock nut (to ensure environmental protection IP65 it is necessary to fix the cable gland to the inverter chassis with a minimum tightening torque of 8.0 Nm).

Strip 12-13 mm of sheathing from the AC grid connection cables then plug the AC line cable into the inverter, passing it through the previously installed cable gland; the maximum diameter accepted by the cable gland is from 13 to 21 mm².

The procedure for opening the contacts of AC output terminal block (10) and tightening cables is as follows:

1) Insert the WAGO screwdriver (supplied) in slot with the screwdriver facing downwards; lightly press the screwdriver from the top to the bottom; insert the screwdriver until the clamp opens.
2) Insert the cable in the clamp.
3) Remove the WAGO screwdriver.

Connect on the terminal block (10) the protective earth (yellow-green) cable to the contact labelled with the symbol, the neutral cable (normally blue) to the terminal labelled with the letter N and the phase cable to the terminal labelled with the letter L; each terminal of the terminal block accepts a cable with cross-section which can vary from 0.2 up to 10 mm².

Pay special attention and ensure you do not reverse the phase with the neutral!

Once the connection to the terminal board has been made, tighten the cable gland firmly (tightening torque 5.0Nm) and check the seal.
## Communication and control board

</tbody>
</table>
Connections to the communication and control board

Each cable which must be connected to the communication and control board must pass through one of the three service cable glands M20, which take a cable with a diameter of 7 mm to 13 mm. Gaskets with two holes are supplied as standard to insert into the cable gland, which enables two separate cables of a maximum cross-section of 5 mm to be accommodated.

The procedure for opening the contacts of signal terminal block 20 and tightening cables is as follows:

a) Insert the WAGO screwdriver (supplied) in slot with the screwdriver facing downwards; insert the screwdriver until the clamp opens.

b) Insert the cable in the clamp.

c) Remove the WAGO screwdriver.

Each terminal accepts a cable with cross-section which can vary from 0.08 up to 2.5 mm².
Serial Connection Communication (RS485)

On the inverter there is a RS485 communication line, dedicated to connecting the inverter to monitoring devices or to carrying out “daisy-chain” (“in-out”) connections of multiple inverters. The line may also be used to store settings with the dedicated advanced configuration software.

Cables connecting the RS485 line may use two different types of connection:

• Connection of the conductors using the terminal connectors *(+T/R, -T/R and RTN)*

• Connection of conductors with RJ45 connectors *

The two RJ45 connectors RS485(A) and RS485(B) available for the RS485 communication, are equivalent to each other and can be used interchangeably for the arrival or for the output of the line in realising the daisy chain connection of the inverters.

The same is true for connections made using the terminal connectors *(+T/R, -T/R and RTN)*.

<table>
<thead>
<tr>
<th>Pin No.</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>+T/R</td>
</tr>
<tr>
<td>4</td>
<td>+R</td>
</tr>
<tr>
<td>5</td>
<td>-T/R</td>
</tr>
<tr>
<td>7</td>
<td>RTN</td>
</tr>
<tr>
<td>1, 2, 6, 8</td>
<td>not used</td>
</tr>
</tbody>
</table>

Table: crimping diagram for RJ45 connectors

Use a connector with metal body to provide cable shield continuity!

For long distance connections, the connection on terminal connector is preferable using a shielded twisted pair cable with characteristic impedance of \(Z_0=120\) Ohm like the one shown on the following table:

<table>
<thead>
<tr>
<th>Signal</th>
<th>Symbol</th>
</tr>
</thead>
<tbody>
<tr>
<td>Positive data</td>
<td>+T/R</td>
</tr>
<tr>
<td>Negative datum</td>
<td>-T/R</td>
</tr>
<tr>
<td>Reference</td>
<td>RTN</td>
</tr>
</tbody>
</table>

Shield continuity must be provided along the communication line and must be grounded at a single point.
Procedure for connection to a monitoring system

Connect all the units of the RS485 chain in accordance with the “daisy-chain” arrangement (“in-out”) observing the correspondence between signals, and activate the termination resistance of the communication line in the last element of the chain by switching switch 15 (to ON position).

If a single inverter is connected to the monitoring system, activate the termination resistance of the communication line by switching switch 15 (to ON position).
Set a different RS485 address on each inverter of the chain. No inverter should have “Auto” as its address. An address can be chosen freely from out of 2 to 63. The address on the inverter is set through the display and the push-button panel (see relevant chapter).

We recommend not exceeding a length of 1000m for the communication line. No more than 62 inverters can be connected to the same RS485 line.

When using an RS-485 connection, if one or more inverters are added later to the system, you must remember to return to OFF position the switch of the termination resistance used of the inverter that was previously the last one of the system.
Each inverter is dispatched with two (2) as the predefined RS485 address and with switch for setting termination resistance 15 to OFF position.
Remote control connection

The connection and disconnection of the inverter to and from the grid can be controlled through an external control.

The function must be enabled in the relevant menu. If the Remote control function is disabled, the switching on of the inverter is dictated by the presence of the normal parameters that allow the inverter to connect to the grid.

If the Remote control function is operating, besides being dictated by the presence of the normal parameters that allow the inverter to connect to the grid, the switching ON of the inverter also depends on the state of the R+ terminal compared to the R- terminal present on the connector

When the R+ signal is brought to the same potential as the R- signal (i.e. by making a short circuit between the two terminals of the connector), this causes the inverter to disconnect from the grid.

The remote control OFF condition is shown on the display.

The connections of this control are made between the “R+” input and “R-”. Since this is a digital input, there are no requirements to be observed as regards cable cross-section (it only needs to comply with the sizing requirement for passing cables through the cable glands and the terminal connector).

Configurable Relay connection (ALARM)

The inverter is equipped with a multifunction relay with configurable activation. It can be connected with normally open contact (being connected between the N.O. terminal and the common contact C.) and with normally closed contact (being connected between the N.C. terminal and the common contact C.).

Different types of devices (light, sound, etc.) can be connected to the relay, provided they comply with the following requirements:

Relay Ratings
Maximum Voltage: 230 Vac
Maximum Current: 1 A

Cable requirements
External diameter: from 5 to 17 mm
Conductor cross-section: from 0.08 to 2.5 mm²

This contact can be used in different operating configurations that can be selected by accessing the “SETTINGS → Alarms” menu.
General conditions

One of the first rules for preventing damage to the equipment and to the operator is to have a thorough knowledge of the instruments. We, therefore, advise that you carefully read this manual. If you are not sure about any information in this manual, please ask ABB Service for more detailed information.

Do not use the equipment if:
- you do not have suitable qualifications to work on this equipment or similar products;
- you are unable to understand how it works;
- you are not sure what will happen when the buttons or switches are operated;
- you notice any operating anomalies;
- there are doubts or contradictions between your experience, the manual and/or other operators.

ABB cannot be held responsible for damage to the equipment or the operator if it is the result of lack of knowledge, insufficient qualifications or lack of training.
**Description of keyboard and LED Panel**

Using the combination of keyboard keys, under the display, it is possible to set values or scroll through the data items to view them. LED indicators are located alongside the keyboard, indicating the operating state of the inverter.

<table>
<thead>
<tr>
<th>LED</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>POWER (GREEN)</strong></td>
<td><strong>ON</strong> if the inverter is working correctly. <strong>Flashes</strong> when checking the grid or if there is insufficient sunlight.</td>
</tr>
<tr>
<td><strong>ALARM (YELLOW)</strong></td>
<td>The inverter has detected an anomaly; the anomaly is shown on the display.</td>
</tr>
<tr>
<td><strong>GFI (RED)</strong></td>
<td>Ground fault on the DC side of the PV generator; the error is shown on the display.</td>
</tr>
</tbody>
</table>

The LEDs, in various multiple available combinations, can signal multiple conditions other than the original single condition; see the various descriptions explained in the manual.

<table>
<thead>
<tr>

<td>It can be used to confirm an action, to access the submenu for the selected option (indicated by the &gt; symbol) or to switch to the next digit to be edited. By pressing and holding the key, the cyclical display of the parameters can be: ⬤ Locked or ⬬ Cyclical.</td>
</tr>
</tbody>
</table>

The Keys, in various multiple available combinations, allow you to access actions other than the original single action; see the various descriptions explained in the manual.
General conditions

Before checking the operation of the equipment, it is necessary to have a thorough knowledge of the Instruments chapter 6 and the functions that have been enabled in the installation process.

The equipment operates automatically without the aid of an operator; the operating state should be controlled through the equipment’s instrumentation.

The interpretation or variation of some data is reserved exclusively for specialized and qualified staff.

The incoming voltage must not exceed the maximum values shown in the technical data, section 2 in order to avoid damaging the equipment. Consult the technical data for further details.

During operation, check that the environmental and logistical conditions are correct (see installation chapter 5). Make sure that environmental and logistical conditions have not changed over time and that the equipment is not exposed to adverse weather conditions.
Monitoring and data transmission

As a rule, the inverter operates automatically and does not require special checks. When there is not enough solar radiation to supply power for export to the grid (e.g. during the night), it disconnects automatically and goes into stand-by mode. The operating cycle is automatically restored when there is sufficient solar radiation. At this point, the luminous LEDs on the LED panel will indicate this state.

User interface mode

The inverter is able to provide information about its operation through the following instruments:

- Warning lights (luminous LEDs)
- LCD display for displaying operating data
- Data transmission on the dedicated RS-485 serial line. Data may be collected by a PC or a data logger with an RS-485 port. Contact the ABB support service with any queries about device compatibility.

Types of data available

The inverter provides two types of data, which can be retrieved through the special interface software and/or the display.

Real-time operating data
Real-time operating data can be transmitted on request through the communication lines and are not recorded in the inverter.

Internally stored data
The inverter internally stores a set of data that are necessary for processing statistical data and an error log with time marking.

Measurement tolerance

The data supplied by the inverter may differ from measurements taken by certified measuring instruments (e.g. output meters, multimeters and grid analysers); since the inverter is not a measuring instrument it has wider tolerances for the measurements it makes. The tolerances are generally:

- ±5% for real-time measurements with output power below 20%
- ±3% for real-time measurements with output power above 20%
- ±4% for all statistical data
Commissioning

Do not place objects of any kind on the inverter during operation! Do not touch the heat sink while the inverter is operating! Some parts may be very hot and could cause burns.

Before proceeding with commissioning, make sure you have carried out all the checks and verifications indicated in the section on preliminary checks.

The procedure for commissioning the inverter consists of the following steps:

• Move the integrated switch 16 (version –S) to the ON position or close the external switches: If the input voltage applied to one of the two input channels is greater than the minimum starting voltage, the inverter will start up.
• When the inverter is turned on for the first time you will be asked to select the “Nation” of installation. This selection allows the inverter to automatically configure its parameters to ensure that compliance with local standards; the default language corresponding to the selected “Nation” will also be set.

After the grid standard was set you have 24 hours to make any changes to the grid standard value; 24 hours later the “Nation Select.” functionality will be blocked, and any subsequent changes can only be made using a password provided on request by ABB.

• After you have set the “Nation” value, the message “Initializing...Please Wait” is displayed. Depending on the input voltage value, the inverter will show various messages on the display and change the behaviour of the three LED.

<table>
<thead>
<tr>
<th>Input Voltage</th>
<th>Display Message</th>
<th>LED Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vin &lt; Vstart</td>
<td>Waiting Sun</td>
<td>Green = Blinking, Yellow = OFF, Red = OFF</td>
<td>The input voltage is not sufficient to permit connection to the grid.</td>
</tr>
<tr>
<td>Vin &gt; Vstart</td>
<td>Missing Grid</td>
<td>Green = Blinking, Yellow = ON, Red = OFF</td>
<td>There is sufficient input voltage to permit connection to the grid: the inverter waits until there is grid voltage to carry out the parallel connection.</td>
</tr>
</tbody>
</table>

The inverter is powered ONLY by the voltage coming from the photovoltaic generator: presence of grid voltage alone IS NOT SUFFICIENT to permit the inverter to start up.

• With the inverter in “Missing Grid” status, close the AC switch downstream the inverter so as to supply the grid voltage to the inverter: the inverter performs the grid voltage check, measures the photovoltaic generator insulation resistance against earth and carries out other self-diagnosis checks. During the checks before the parallel with the grid, the green LED keeps flashing, the others are off.
During the grid voltage check and measurement of the insulation resistance, the values for the grid voltage and frequency and the insulation resistance measured by the inverter are shown on the display. The inverter completes parallel connection with the grid SOLELY if the grid parameters meet the ranges provided for by the regulations in force and if the insulation resistance is greater than 1Mohm.

If the preliminary checks for parallel connection to the grid are successful, the inverter connects to the grid and begins to export power to the grid. At this stage, the display shows the inverter’s parameters in cycles. The green LED stays lit whereas the others are off.

The “Nation” value (grid standard) that can be selected are listed in the following table:

<table>

[1] Select the “CEI021 INT” Nation if you wish to use the interface protections integrated in the inverter for systems with a power lower than 6kW; Select “CEI021 EXT” if the inverter is connected to a system with a power greater than 6kW or if you wish to use external interface protections for systems with a power lower than 6kW.

[2] Invalid nation for models PVI-5000/6000-TL-OUTD installed in Germany

The list of grid standards given in the table was valid at the time of issue of the manual. It will be continually updated as new country standards with which the inverter is compatible are introduced.
Display access and settings

Once the inverter has been commissioned, it is possible/necessary to configure the inverter by accessing the Settings Menu directly from the display. The following are the main adjustable parameters (see the section on “Menu descriptions”)

- **RS485 address**: setting required in the case of system monitoring via the RS485 line
- **Vstart**: setting required if requested by the configurator during the system sizing procedure (“Vstart” parameter)
- **MPPT scan**: allows maximum power point tracking with settable sensitivity and time interval (“MPPTScan EN/DIS” parameter).
- **Reactive power feed-in setting (where present)**: setting necessary for managing the different ways of feeding reactive power into the grid (“Reactive Power” parameter)
- **Active power limitation setting (where present)**: setting necessary to set a limit on the active power supplied by the inverter (“Power reduction” parameter)
## LED behaviour

Indicates that a leakage to ground from the FV generator has been detected, causing the inverter to disconnect from the grid. |
Specifications on the operation of the LEDs

In correspondence to each status of the inverter indicated by the constant or intermittent lighting of the specific LED, the display also shows a message identifying the operation which is being carried out or the defect/anomaly recorded (see specific chapter).

In the case of malfunction it is extremely dangerous to intervene personally to try and eliminate the defect. The instructions below must be followed scrupulously; if you do not have the necessary experience and training to intervene safely, please contact a specialist.

LED insulation fault

Interventions after warning of insulation fault
When the red LED comes on, first try to reset the warning by pressing the multi-function ESC button on the keyboard.
If the inverter reconnect normally to the network, the fault was due to temporary phenomena.

You are advised to have the plant inspected by the installer or a specialist if this malfunction occur repeatedly.

If the inverter doesn’t reconnect to the grid, isolate it on both the AC and DC sides (by using the disconnect switches), then contact the installer or authorised centre to repair the fault in the photovoltaic generator.
Description of the menus

The inverters are equipped with a Display, consisting of 2 lines of 16 characters each, which can be used to:
• Display the operating state of the inverter and the statistical data
• Display the service messages for the operator
• Display the alarm and fault messages for the operator
• Changing the settings of the inverter

General information

While the inverter is operating, the display shows various items of information on the main parameters measured, the operating conditions and the inverter’s operating status.

The display cycles through the information when the icon is shown on the display; if the icon shown on the display is a padlock , it means that the display of information is locked and the UP and DOWN buttons can be used to scroll through the screens of information instead. You can switch between the two display modes by pressing the ENTER button.

The sequence of screens displayed is shown below, with a description of the parameters monitored.
Inverter status. The code for any malfunction will be displayed.
Date and time as set on the inverter

**Inverter OK**

- **Type**: Outdoor inverter type (OUTD)
- **P/N**: ABB product identification code
- **S/N**: Sequential serial number
- **FW rel.**: Firmware version installed
- **E-day**: Energy produced today
- **$-day**: Today's savings/earnings
- **E-tot**: Energy produced since the inverter was commissioned
- **$-tot**: Savings/earnings since the inverter was commissioned
- **Pout**: Instantaneous output power
- **Phase difference set for feeding in reactive power**
- **Reactive power regulation mode currently set**
- **Tboost**: Internal temperature in the booster circuit (DC/DC)
- **Tinv**: Internal temperature in the inverter circuit (DC/AC)
- **Ppk**: Maximum output power peak since the inverter was commissioned
- **Ppk-Day**: Maximum daily output power peak
- **Vgrid**: Output voltage
- **Vgrid Avg**: Average output voltage
- **Igrid**: Output current
- **Fgrid**: Output frequency
- **Riso**: Insulation resistance on DC input side (PV generator)
- **Ileak**: Leakage current on DC input side (PV generator)
Statistics Menu

Selecting STATISTICS from the three main sub-menus gives access to:

1. **Lifetime**
   - This section of the menu displays the Lifetime statistics:
     - **Time**: Total operating time
     - **E-tot**: Total energy produced
     - **Val.**: Total production value, calculated using the currency and conversion coefficient set in the relevant section of the SETTINGS menu
     - **CO$_2$**: Amount of CO$_2$ saved compared to fossil fuels

2. **Partial**
   - This section of the menu displays the Partial statistics:
     - **Time**: Partial operating time
     - **E-par**: Partial energy produced
     - **P-Peak**: Peak power value
     - **Val.**: Partial production value, calculated using the currency and conversion coefficient set in the relevant section of the SETTINGS menu
     - **CO$_2$**: Partial amount of CO$_2$ saved

To reset all the counters of this sub-menu, press the ENTER button for more than 3 seconds. At the end of this time, you will hear a sound repeated 3 times.

3. **Today**
   - This section of the menu displays today's statistics:
     - **E-day**: Energy produced today
     - **P-Peak**: Today's peak power value
     - **Val.**: Value of today's production, calculated using the currency and conversion coefficient set in the relevant section of the SETTINGS menu
     - **CO$_2$**: Amount of CO$_2$ saved today
4. Last 7 days
This section of the menu displays the statistics for the last 7 days:
• **E-7d**: Energy produced over the last 7 days
• **Val.**: Value of production over the last 7 days, calculated using the currency and conversion coefficient set in the relevant section of the SETTINGS menu
• **CO₂**: Amount of CO₂ saved over the last 7 days

5. Last month
This section of the menu displays the statistics for the last month:
• **E-mon**: Energy produced during the current month
• **Val.**: Value of the last month's production, calculated using the currency and conversion coefficient set in the relevant section of the SETTINGS menu
• **CO₂**: Amount of CO₂ saved during the current month

6. Last 30 days
This section of the menu displays the statistics for the last 30 days:
• **E-30d**: Energy produced over the last 30 days
• **Val.**: Value of production over the last 30 days, calculated using the currency and conversion coefficient set in the relevant section of the SETTINGS menu
• **CO₂**: Amount of CO₂ saved over the last 30 days

7. Last 365 days
This section of the menu displays the statistics for the last 365 days:
• **E-365d**: Energy produced over the last 365 days
• **Val.**: Value of production over the last 365 days, calculated using the currency and conversion coefficient set in the relevant section of the SETTINGS menu
• **CO₂**: Amount of CO₂ saved over the last 365 days

8. User period
This section of the menu displays the statistics for a period chosen by the user:
Once the start and end dates for the period have been set, the following data are available:
• **E**: Energy produced over the selected period
• **Val.**: Value of production over the selected period, calculated using the currency and conversion coefficient set in the relevant section of the SETTINGS menu
• **CO₂**: Amount of CO₂ saved over the selected period
**Settings Menu**

Selecting SETTINGS from the three main sub-menus brings up the first screen, asking for the password.  
**The default password is "0000".**

This can be changed by using the display buttons, following the same procedure as always:

- ENTER scrolls through the digits (from left to right)
- ESC returns to the previous digit (from right to left)
- Press ESC several times to return to the previous menus
- DOWN scrolls down the numerical scale (from 9 to 0)
- UP scrolls up the numerical scale (from 0 to 9)

After entering the password, press ENTER to access the information in this section:

```

(*) Available for the Italian country standard only. Refer to the section on this topic in the manual.
1. Address
This section of the menu allows you to set the serial port addresses of the individual inverters connected to the RS485 line.
The addresses that can be assigned are 2 to 63. The UP and DOWN buttons scroll through the numerical scale.
‘AUTO’ selection cannot be used at present.

2. Display Set
This section of the menu allows you to set the display properties:
• Light: sets the lighting mode and adjusts the display backlight
  ON: Light always on
  OFF: Light always off
  Auto: Automatic backlight control. The light is switched on whenever a button is pressed and stays on for 30 sec, after which it gradually dims out.
• Intensity: adjusts display brightness (scale from 1 to 9)
• Contrast: adjusts display contrast (scale from 1 to 9)
• Buzzer: sets button sound
  ON: button sound is on
  OFF: button sound is off

3. Service
This section of the menu is reserved for installers.
A special access password is required, which may be obtained from the website https://registration.ABBsolarinverters.com.
Before connecting to the site, make sure you have all the information required to calculate your password:
Inverter Model, Serial Number, week of manufacture.

When you have a password you can set the parameters in the menu.

Changing the above-mentioned parameters may prevent disconnection from the grid if the new values exceed those given in the standards of the country of installation. If these parameters are changed to values outside the standard range, an interface protection must be installed external to the inverter in accordance with the requirements of the country of installation.
The table below shows the parameters that can be changed and the range of values that may be set for each:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>

</table>

4. New PW

This section of the menu allows you to change the settings menu password (default 0000).

We advise you to memorize the new password with great care.

If the Password is lost you will not have access to the inverter, since there is no Reset function for security reasons.
5. Cash
This section of the menu allows you to set the name of the currency and the value of 1 kWh of energy produced. Setting these parameters correctly allows the actual earnings/savings achieved by the system to be displayed.
- **Name**: sets the desired currency (default is EUR)
- **Val/KWh**: indicates the cost/incentive for 1 kWh in the chosen currency (default is 0.50).

6. Time
Allows you to set the current date and time (not counting summer time)

7. Nation
Allows you to change the grid standard (selected at the first switch on of the inverter) within 24 hours when the inverter is working.
- **Nation Select**: set the desired grid standard
- **Remaining Time**: indicates the remaining time before the “Nation Select” function is blocked.

> After the grid standard was set you have 24 hours to make any changes to the grid standard value; 24 hours later the “Nation Select.” functionality will be blocked, and any subsequent changes can only be made using a password provided on request by ABB.

8. Language
Allows you to set the language you prefer for the menus

9. Vstart
This section of the menu allows you to set the Vstart voltage (for the two channels separately if they are configured independently) to suit the system requirements.

> We advise changing the activation voltage only if really necessary and to set it to the correct value: the photovoltaic generator sizing tool available on the ABB website will indicate whether Vstart needs changing and what value to set it at.

10. Autotest
This section of the menu is available only for the Italian country standard. Refer to the section on this topic in the manual.
11. Alarm

This section of the menu allows you to set the activation status of a relay (available either as contact normally open – N.O. – or as contact normally closed – N.C.).

This contact can be used, for example, to: activate a siren or a visual alarm, control the disconnect device of an external transformer, or control an external device.

The relay can be set to switch in 2 different modes:

• **Production (display text “PRODUCTION”)**
  The relay is activated (state: switched) whenever the inverter connects to the grid; as soon as the inverter is disconnected from the network (for whatever reason that caused disconnection), the relay is in its resting position.

• **Alarm with reset at the end of the alarm signalling process (display text “FAULT”):**
  The relay is activated (state: switched) whenever an error is present (code Exxx) on the inverter; this does not apply to warnings (Warning – code Wxxx). The alarm returns to its resting position when the alarm signal ends, i.e. before the inverter checks the grid parameters after the alarm state. This is because grid control state is not an alarm state but a state of normal operation.

### Alarms for which the relay is activated

</tr>
</tbody>
</table>

*If the alarm condition is persistent, the alarm contact cyclically switches from its resting state to its activated state.*

*In the presence of W003 signalling (Grid Fail – Network parameters out of tolerance), the alarm contact switches to then reset itself at the end of the alarm signal. This means that during the absence of grid voltage (display message “Vac Absent”) the alarm contact remains in its resting position.*

*In the presence of W002 signalling (UV Input – input voltage below the limit of operation), the alarm contact switches to then reset itself at the end of the alarm signal. This means that during the reduced input voltage (display message “Waiting sun”) the alarm contact remains in its resting position.*
12. Remote Control
This section of the menu allows you to enable/disable the connection/disconnection of the inverter to/from the grid through the relevant control signal (R ON/OFF).
- **Disable**: the connection/disconnection of the inverter to/from the grid is dictated by the input (voltage from the photovoltaic generator) and output (grid voltage) parameters of the inverter.
- **Enable**: the connection/disconnection of the inverter to/from the grid is dictated by the state of the R ON/OFF signal compared to the GND signal, as well as by the input (voltage from the photovoltaic generator) and output (grid voltage) parameters of the inverter.

13. UV Prot. Time
This section of the menu allows you to set the time for which the inverter stays connected to the grid after the input voltage has dropped below the Under Voltage limit (set at 70% of Vstart). ABB sets the time at 60 sec. The user can set it at any time from 1 to 3600 sec.
Example: with UV Prot. Time set at 60 seconds, if voltage Vin drops below 70% of Vstart at 9:00, the inverter stays connected to the grid (taking power from it) until 9:01.

14. MPPTScan En/Dis
This section of the menu allows you to set the parameters of the maximum power point tracking (MPPT) function. This function is useful when there are areas of shade on the PV generator, which may create several points of maximum power on the operating curve.
- **Enable/Disable**: Enables/disables the scan for identifying the maximum power point of the system.

15. Scan Interval
This section allows you to set the time between scans. It should be borne in mind that the shorter the scan interval the greater the loss of production, due to the fact that energy is transferred to the grid during the scan but not at the maximum power point. Each scan takes roughly 2 seconds.

16. Alarm Message
This section of the menu allows you to set a custom alarm message that will be shown on inverter’s display in presence of an alarm status; this function can be enabled/disabled in the relevant menu.
- **Enable/Disable**: Enables/disables the custom alarm message function
- **Compose Message**: Compose the custom alarm message using the inverter’s keyboard (max. length of message: 32 chars)
17. Reactive power
This section of the menu may be used to manage the supply of reactive power into the grid. There are 4 possible types of management:

- **Disable**: no regulation of reactive power. To enable this mode, press **Enter** then press **Enter** to confirm.

- **Cos-phi fixed**: Sets the power rating to a fixed value. To enable this mode, press **Enter** and set the Cos-Phi value (as either Over or Under excited, from 1.000 to 0.800); press **Enter** to confirm.

- **Std Cos-phi-0.90**: Power rating as a function of the active power supplied by the inverter. To enable this mode, press **Enter** then press **Enter** to confirm.

```
\begin{array}{|c|c|c|c|c|}
\hline
\text{Cos-phi (Over excited)} & 0.95 & 0.9 & 0.85 & 0.8 \ \hline
\end{array}
```

```
\begin{array}{|c|c|c|c|c|}
\hline
\text{Cos-phi (Under excited)} & 0.8 & 0.7 & 0.5 \ \hline
\end{array}
```

- **Std Q(U)**: reactive power as a function of the grid voltage measured by the inverter. To enable this mode, press **Enter** then press **Enter** to confirm.

```
\begin{array}{|c|c|c|c|c|}
\hline
\text{Q/Pn} & -0.3 & -0.2 & -0.1 & 0 \ \hline
\end{array}
```

\begin{align*}
\text{Vout} & \quad 210 & 220 & 230 & 240 & 250 \\
\text{Q/Pn} & \quad -0.30 & -0.35 & -0.30 & -0.25 & -0.20 \\
\end{align*}

18. Power reduction
This section of the menu allows you to adjust the limit to the active power that the inverter can feed into the grid by setting the percentage of nominal power at which the limit should be triggered.

Setting it to 100% resets the default maximum power, which in some installation country standards may be 110% of nominal power.
**Info Menu**

Selecting INFO from the three main sub-menus gives access to:

1. **Part No.**
   Displays the model code.

2. **Serial No.**
   Displays the serial number and week and year of manufacture of the equipment.

3. **Firmware**
   Displays the firmware version installed in the equipment.

4. **Country Code**
   Displays information on the grid standard set.
AUTOTEST procedure in accordance with standard CEI 0-21

The autotest run in accordance with grid standard CEI-021 may be initiated from the display menu or by using an RS485/USB converter with the dedicated interface software (Aurora Communicator).

The conditions required to perform an Autotest are:
• The grid standard must be set to CEI-021.
• You must not intervene in any way while the test is underway
• You must check that the device has a stable network connection.

Running the tests from the display menu

In the Autotest section of the SETTINGS menu, select the type of test the device is to run from the following:

**OV Test – parameters:**
U>>; U>; U> (10Min)
Disconnection from the distribution grid due to “Over-voltage”

**UV Test – parameters:**
U<<; U<
Disconnection from the distribution grid due to “Under-voltage”

**OF Test – parameters:**
F>> and F>
Disconnection from the distribution grid due to “Over-frequency”

**UF Test – parameters:**
F<< and F<
Disconnection from the distribution grid due to “Under-frequency”

Go to the SETTINGS > Autotest menu

Various signs may be displayed alongside the parameters on which the autotest can be performed. These have the following meanings:
N/A - Test cannot be performed because the relevant parameter is not active
Idle - Test enabled but not yet performed
OK - Test enabled and performed successfully

If one of the protections is disabled (from the Service menu), N/A (not applicable) will appear next to the name of the test.
While one of the tests is being performed, the set limits will be gradually increased/reduced (depending on the type of test) until the threshold at which the inverter is disconnected from the grid is reached. The procedures for running the Autotest comply with the legislation in force.
The display shows the message “Performing Test” when the test has started.

At the end of the test, when the inverter has disconnected from the grid, the results and values of the test performed will appear on the display. You can move from one screen to another using the UP/DOWN arrow keys.

Details of the data available in each screen are provided below:

**Screen 1 of 3**
- Inverter serial number
- Parameter tested (e.g. U>>)
- Screen number
- Test result

**Screen 2 of 3**
- Inverter serial number
- Parameter tested (e.g. U>>)
- Screen number
- Value of the grid parameter detected when the protection was tripped
- Measured protection tripping time

**Screen 3 of 3**
- Inverter serial number
- Parameter tested (e.g. U>>)
- Screen number
- Protection tripping value
- Set protection tripping time

The test results should be considered valid on the basis of the following tolerances, as reported in the applicable legislation:

- ≤ 5% for voltage thresholds
- ± 20 mHz for frequency thresholds
- ≤ 3% ± 20 ms for tripping times

Press ESC to go back to the Autotest menu, from where you may select the next test to be performed.
General conditions

Routine and periodic maintenance operations must only be carried out by specialized staff with knowledge of how to perform these tasks.

Maintenance operations must be performed with the apparatus disconnected from the grid (power switch open) and the photovoltaic panels obscured or isolated, unless otherwise indicated.

For cleaning, DO NOT use rags made of filamentary material or corrosive products that may corrode the equipment or generate electrostatic charges.

Avoid temporary repairs. All repairs should be carried out using only genuine spare parts. The maintenance technician is to promptly report any anomalies.

DO NOT allow the equipment to be used if problems of any kind are found.

Always use personal protective equipment (PPE) provided by the employer and comply with local safety regulations.
Routine maintenance

Scheduled maintenance operations are not mandatory, but are recommended to preserve the efficiency of the PV plant.

We recommend that maintenance operations be carried out by qualified personnel or by the personnel of ABB (as set forth in a maintenance contract).

The periodicity of the maintenance operations may vary in accordance with local environmental conditions and the installation.

Table: routine maintenance

| Annual visual inspection | • Check that the inverter is operating correctly, and that no fault alarms are present  
| | • Ensure all the labels and safety symbols are visible  
| | • Test the integrity of the cables, connectors, and plugs external to the inverter  
| | • Check that the environmental conditions have not changed drastically since the installation of the system |

| Annual operations | • Check that cable glands and connection block screws are tight  
| | • Check that the wiring box cover is properly closed  
| | • If no monitoring system is present, check the history log of alarms and errors using the instructions given in the manual in order to look for recent malfunction warnings |

| Annual cleaning | • Clean the equipment; in particular the bottom grille of the wiring box and the heat sink |

Troubleshooting

Follow the table shown in the following paragraph in order to understand and resolve warning (Wxxx) and error (Exxx) messages displayed by the inverter.

The operations carried out on the inverter in order to identify and resolve malfunctions may be carried out only by the organization that carried out the installation or by qualified personnel.

Alarm Messages

The equipment is able to indicate errors/warnings on the display only if the input voltage is higher than the Vdcmin voltage (POWER LED flashing or on; see operation chapter).

The messages and their codes are indicated on the display.

The following table gives the complete list of errors/warnings relating to string inverters. Some error/warning codes may not be used depending on the inverter model installed.

</table>
**Power limitation messages**

The equipment can signal possible output power limitations which may occur on the basis of:
- settings made by the user
- settings required by the grid standard of the country of installation
- protective devices inside the inverter

The notices of messages are shown on the display.

The following table gives the complete list of power limitation messages relating to string inverters. Some messages may not be used depending on the inverter model installed.

<table>
<thead>
<tr>
<th>Message on display</th>
<th>Name of Derating and Cause</th>
<th>Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>- LIMxxx% CODE:00 -  ▤ Display symbol b6</td>
<td>Power limitation: The message indicates that the user has set an output power limitation for the inverter. LIM xxx% = Power reduction percentage Examples: LIM 100% = no power limitation LIM 50% = limitation to 50% of the output nominal power</td>
<td>• Check the limitation value set in the &quot;Settings &gt; Power Limitation&quot; menu</td>
</tr>
<tr>
<td>- LIMxxx% CODE:01 -  ▤ Display symbol b6</td>
<td>Power limitation for over-frequency: The message indicates that the user has set a power limitation due to over frequency in order to reduce the maximum output power of the inverter when the grid frequency exceeds certain limits. LIM xxx% = Power reduction percentage Examples: LIM 100% = no power limitation LIM 50% = limitation to 50% of the output nominal power</td>
<td>• Check the limitation value set in the &quot;Settings &gt; Service &gt; OF Derating&quot; menu</td>
</tr>
<tr>
<td>Message on display</td>
<td>Name of Derating and Cause</td>
<td>Solution</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------------------------</td>
<td>----------</td>
</tr>
<tr>
<td><strong>Power limitation for over-voltage:</strong></td>
<td>The message indicates that the user has set a power limitation due to over voltage (parameter $U &gt; (10 \text{ min})$) in order to reduce the maximum output power of the inverter when the reading of the average grid voltage exceeds certain limits. The sampling of readings is done every 10 minutes ($U &gt; (10 \text{ min})$). LIM xxx% = Power reduction percentage. Examples: LIM 100% = no power limitation, LIM 50% = limitation to 50% of the output nominal power.</td>
<td>• Check the limitation value set in the “Settings &gt; Service &gt; U &gt; (10 \text{ min}) Der.” menu</td>
</tr>
<tr>
<td><strong>Anti-islanding power limitation:</strong></td>
<td>The message indicates that a power limitation is active since an “islanding” condition has been recorded. LIM xxx% = Power reduction percentage. Examples: LIM 100% = no power limitation, LIM 50% = limitation to 50% of the output nominal power.</td>
<td>• If the inverter remains connected to the grid and the limitation is active, contact customer assistance.</td>
</tr>
<tr>
<td><strong>Power limitation due to low grid voltage:</strong></td>
<td>The message indicates that an output power limitation may occur since a low grid voltage (AC) condition has been recorded. LIM xxx% = Power reduction percentage. Examples: LIM 100% = no power limitation, LIM 50% = limitation to 50% of the output nominal power.</td>
<td>• Check that the grid voltage is lower than the minimum voltage. Should this condition persist, contact the grid operator to resolve the problem.</td>
</tr>
<tr>
<td><strong>Power limitation due to excess temperature:</strong></td>
<td>The message indicates that a power limitation is active since an excess temperature condition has been recorded inside the inverter (This parameter depends also on the power which the inverter must provide since the measurement of temperatures is taken internally and is influenced by the heat dissipated by the components of the inverter itself). LIM xxx% = Power reduction percentage. Examples: LIM 100% = no power limitation, LIM 50% = limitation to 50% of the output nominal power.</td>
<td>• Check that the inverter is not exposed to direct sunlight. Wait for the temperatures to which the inverter is exposed to return to the operating range and for the inverter to cool down. - If the problem (once the ambient temperature has returned within the range) persists, contact customer assistance.</td>
</tr>
<tr>
<td><strong>Power limitation for input over-voltage:</strong></td>
<td>The message indicates that a power limitation is active since an input over voltage (AC) has been recorded. LIM xxx% = Power reduction percentage. Examples: LIM 100% = no power limitation, LIM 50% = limitation to 50% of the output nominal power.</td>
<td>• It is necessary to measure the input voltage inside the inverter with a voltmeter. - If it is higher than the maximum voltage of the operating range, the alarm is genuine and it is necessary to check the configuration of the PV generator. If the voltage has also exceeded the maximum input threshold the inverter could be damaged. - If it is lower than the maximum voltage of the operating range, the alarm is caused by an internal malfunction and it is necessary to contact customer assistance.</td>
</tr>
</tbody>
</table>
Registration on “Registration” website and calculation of second-level password (Service Menu)

In order to obtain the second-level password needed to access the inverter’s service menu, it is necessary to go through the following stages:

Stage 1 - Collection of information relating to the inverter.

Collect the following information relating to each inverter for which you wish to have a password:
- **S/N** - Serial number of the inverter. This information can be found on the label giving the identity details of the inverter or on the display by accessing the “INFORMATION” menu→Serial No.”
  The serial number consists of 6 digits (the last 6 in models with a label giving a 10-digit S/N)
- **WK** - Production week. This information can be found on the label giving the identity details of the inverter or on the display by accessing the “INFORMATION” menu→Serial No.”
  The production week consists of 4 figures, indicating the week (first 2 digits) and the year of production (last 2 digits)
- **Update Version** - This information is available only for some inverter models and can be found on the display by accessing the menu “INFORMATION→Firmware”.

Stage 2 - Registration on [https://registration.abbsolarinverters.com](https://registration.abbsolarinverters.com)
- Go online and access [https://registration.abbsolarinverters.com](https://registration.abbsolarinverters.com)
- Set the desired language and click on the specific icon to start registration
- Insert the personal data requested and end the registration stage
- An email will be sent to the email address used with a link to complete the registration process.
- Once the registration process is over, a further email will be sent with the password to access the website.

The password obtained enables access also to the advanced “Installer” mode present on the configuration software for inverters. The configuration software can be downloaded in a specific section of the website [https://registration.abbsolarinverters.com](https://registration.abbsolarinverters.com)
Stage 3 - Request for second level password

- Go online and access https://registration.abbsolarinverters.com
- Insert the Username (corresponding to the email used during registration) and the Password obtained at the end of Stage 2

- Access the section dedicated to requesting the second-level password

- Choose the inverter model from the drop-down list and insert Update Ver., Serial Number and Week of Production of the inverter which were obtained previously (Stage 1)
- Click on icon to request password.

Should there be an error in inputting data, the fields containing the error will be highlighted in red. If, on the other hand, the data are correct, the passwords will be shown in a new window and at the same time sent to the email address used for registration.

The second-level password enables access to the service menu which allows the inverter's sensitive parameters to be changed. Proceed to changing the aforementioned parameters only when requested by the grid operator or by customer assistance.
Resetting the time remaining to change the grid standard

From the time a valid grid standard is entered and the inverter is turned on, a period of 24 hours is available to modify the grid standard setting.

*The 24 hours are counted only when the inverter is turned on.*

Check that the date and time are set correctly. Otherwise it may not be possible to access the “Nation Select” menu to reset the timer.

After this period the “Nation Select.” functionality will be blocked, and any subsequent changes can only be made using a password provided on request by ABB.

To request this password, contact the ABB Customer Service and communicate the serial number (S/N) of the inverter and the “Authorization Key” code, which can be obtained by selecting the sub-menu SETTINGS > NATION > NATION SELECT

```
Settings
ENTER
Password 0000
ENTER
Nation
ENTER
Nation Select
ENTER
Auth. Key 123456
```

After obtaining the password, select SETTINGS > NATION > NATION SELECT, press ENTER and digit the password supplied by ABB

```
Settings
ENTER
Password 0000
ENTER
Nation
ENTER
Nation Select
ENTER
Auth. Key 123456
ENTER
Password 0****
```

After you have entered the password, the “Nation” value can be changed for a further period of 24 hours.
Replacement of the buffer battery

Replacement of the buffer battery may be necessary in case of:

1. Error signal on display
2. Reset of the date and time settings

The battery is of the CR2032 type and is installed on the motherboard.

Procedure to replace the buffer battery:

1. Disconnect the inverter by removing the AC and DC disconnect switches
2. Open the front cover
3. Remove the battery to be replaced
4. Install the new battery, taking care to handle it with insulating gloves in order not to compromise the charge and respecting the polarity shown on the diagram on the motherboard.
5. Close the front cover
6. Carry out the procedure for the commissioning of the inverter
Verification of ground leakage

In the presence of anomalies or report of ground fault (where provided), there may be a ground leakage from the PV generator (DC side).

To check this, measure the voltage between the positive pole and ground and between the negative pole (of the PV generator) and ground using a voltmeter whose input accepts a voltage sufficient for the dimensions of the photovoltaic generator.

Behaviour of a system without leakage

Due to the capacitive effect of the PV generator, during the first moments that the voltmeter is connected between one of the two poles and ground, it will measure a voltage of about $V_{oc}/2$, which will tend to stabilize to around 0V if there is no ground leakage, as shown in the graph below:

The internal resistance of the voltmeter tends to zero the voltage present on the PV generator due to the capacitive effect.

How to make the measurement:
Behaviour of a system with leakage

If the voltage measured between one of the two poles and ground does not tend to 0V and stabilizes on a value, there is a ground leakage from the PV generator.

Example: When the measurement is made between positive pole and ground, a voltage of 200V is measured.

This means that if the system is made up of 10 modules in series and each one supplies 50V, the leakage can be located between the 4th and 5th PV module.

\[ \begin{array}{c}
\text{Va} = \text{voltage measured between + pole and } + \text{ = 200V} \\
\text{Vb} = \text{voltage measured between - pole and } - \text{ = 300V} \\
\text{In all measurements with } \text{, the ground of the inverter is indicated.}
\end{array} \]
Measuring the insulation resistance of photovoltaic generator

To measure the insulation resistance of the PV generator compared to ground, the two poles of the PV generator must be short-circuited (using a suitably sized switch).

Once the short-circuit has been made, measure the insulation resistance ($R_{iso}$) using a megohmmeter positioned between the two shorted poles and ground (of the inverter).

- **TL MODELS (transformerless).** If the measured insulation resistance ($R_{iso}$) is less than 1Mohm the inverter does not connect to the grid due to a low insulation of photovoltaic generator respect to ground.

- **I MODELS (with high frequency transformer).** If the measured insulation resistance ($R_{iso}$ in case of input poles floating respect to ground or QF=1 if the one of input poles is grounded) is less than 0.2Mohm the inverter does not connect to the grid due to a low insulation of photovoltaic generator respect to ground.

*The insulation resistance is affected by the environmental conditions the PV generator is in (E.g.: photovoltaic module wet from dump or rain), and therefore the measurement must be made immediately after the anomaly*
Storage and dismantling

Storage of the equipment or long period of non-use

If the equipment is not being currently used or is to be stored for a long period of time, check that it is correctly packed and contact ABB for storage instructions.

The equipment must be stored in well-ventilated indoor areas and in an environment that doesn’t damage the components of the equipment.

Restarting after a long period of non-use requires the equipment be inspected and, in some cases, the removal of oxidation and dust will be required that has settled inside the equipment.

Dismantling, decommissioning and disposal

ABB CANNOT be held responsible for disposal of the equipment (displays, cables, batteries, accumulators, etc.). The customer must dispose of these substances, which are potentially harmful to the environment, in accordance with the regulations in force in the country of installation.

If the equipment is dismantled, in order to dispose of the products that it is composed of, you must adhere to the regulations in force in the country of destination to avoid a hazardous disposal situation.

Dispose of the various types of materials that are part of the equipment at facilities that are suitable for the purpose.
