Further information
Introduction to the manual

Contents of this chapter
This chapter describes the manual in short and gives some general information for the reader.

Applicability
The manual applies to the ACS800-01/04LC/04M/11/14/31/104/104LC and ACS800-U1/U4/U11/U31 drives and inverter modules which have the option +Q967: Safe torque off (STO).

Safety instructions
Only a qualified electrician who has appropriate knowledge on functional, machine and process safety is allowed to install, start up and maintain the safety circuit.

WARNING! The Safe torque off function does not disconnect the voltage of the main and auxiliary circuits from the inverter. Therefore maintenance work on electrical parts of the inverter or the motor can only be carried out after isolating the inverter from the main supply.

WARNING! The Safe torque off functionality is only achieved, when the ASTO board is installed on the inverter module. True Safe torque off functionality is not achieved, if the option board is installed on other types of modules, such as the supply unit or the brake unit.
**WARNING!** (With permanent magnet motors only) In case of a multiple IGBT power semiconductor failure, the inverter system can produce an alignment torque which maximally rotates the motor shaft by $180/p$ degrees regardless of the activation of the Safe torque off function. $p$ denotes the number of pole pairs.

**WARNING!** Read and obey all safety instructions in the drive hardware manual. If you ignore them, injury or death, or damage to the equipment can occur.

This manual does not repeat the complete safety instructions of the drive but it only includes the instructions related to the scope of this manual.

**Target audience**

This manual is intended for people who install, start up, use and service the drive safety option. Read the manual before working on the drive. You are expected to know the fundamentals of electricity, wiring, electrical components, electrical schematic symbols, and functional safety.

**Contents**

The chapters of this manual are briefly described below.

*Introduction to the manual* (this chapter) introduces this manual and gives safety instructions.

*Option description* describes the Safe torque off (STO) function of the drive and inverter modules and lists the indications and response times of the Safe torque off function.

*Installation* describes the installation procedure, wiring and allowed cable type of the Safe torque off function.

*Start-up and use* contains the start-up and acceptance test procedure for the Safe torque off function and gives instructions for its use.

*Maintenance and fault tracing* describes the maintenance procedure, required competence for maintenance personnel and fault tracing information for the Safe torque off function.

*Technical data* contains the technical details of the ASTO-11 and ASTO-21 boards, the safety data for the STO and example information of safety relays, safety logic and activation switches. It also lists the related standards and directives, and contains declarations of conformity with the European Machinery Directive.

Contents of this chapter
This chapter describes the Safe torque off (STO) function of the drive and inverter modules and lists the indications and response times of the Safe torque off function.

Description
The Safe torque off function can be used, for example, to construct safety or supervision circuits that stop the inverter in case of danger (such as an emergency stop circuit). Another possible application is a prevention of unexpected start-up function that enables short-time maintenance operations like cleaning or work on non-electrical parts of the machinery without switching off the power supply.

When activated, the Safe torque off function disables the control voltage of the power semiconductors of the inverter output stage. This prevents the inverter from generating the torque required to rotate the motor. If the motor is running when Safe torque off is activated, it coasts to a stop.
The STO function corresponds to Prevention of unexpected start-up as specified by EN ISO 14118:2018 (ISO 14118:2017), and Uncontrolled stop (stop category 0) as specified in EN/IEC 60204-1.

**Operation principle**

1. The user opens the Safe torque off circuit with an STO activation switch (or it is opened by a device such as safety relay).
2. The STO inputs on the drive/inverter de-energize.
3. The STO cuts off the control voltage from the inverter IGBTs.
4. The control program generates an indication as defined in the table below.
5. Motor coasts to a stop (if running). The drive/inverter cannot restart while the activation switch or safety relay contacts are open. After the contacts close, a new start command may be required to start the drive (depends on parameter settings).
The table below describes the operation of the STO function in detail depending on:

- status of the STO inputs
- the fault or warning START INHIBI (see chapter *Maintenance and fault tracing*).

<table>

4) STO indication response time = delay between de-energizing the STO relay and indication of STO input de-energization
Installation

Contents of this chapter
This chapter describes the installation procedure, wiring and allowed cable type of the Safe torque off function.

Supply voltage

**WARNING!** The supply voltage of the STO circuit (ASTO boards) is 24 V DC. Never supply the ASTO board with 230 V AC or 115 V AC. This can damage the board and it must be replaced.

**Note:** Since former option +Q950 (Prevention of unexpected start-up function) uses 230 V or 115 V supply voltage, it is not possible to use it with Safe torque off function (option +Q967) or vice versa. Note this when using spare parts.

**Note:** The Safe torque off function can be installed afterwards (that is, after the factory assembly) to drive modules. Contact ABB Drives Service for further information.

Connections

- **STO input**

The STO input can be supplied from an external power supply or from an RMIO control unit 24 V DC output. In both cases the requirements given below must be fulfilled.
Specifications of the STO input:

- Connector pitch: 5.08 mm, maximum wire size 2.5 mm²
- Operation voltage: 24 V DC +/- 10%
- Logic levels: "0" < 5 V DC, "1" > 17 V DC
- For the drive to start, both STO inputs must be "1".
- Current consumption: 20 mA per STO channel.

**Note:** If an external power supply is used for the STO, the power supply must have over-voltage and over-current protections.

**Note:** For STO input connection diagrams and pin numbers, see the following connection diagrams.

### Activation switch

The activation switch is shown in the diagram on page 22 as well as in the Safe torque off with safety relay examples. This represents a component such as a manually operated switch, an emergency stop push button, the contacts of a safety relay or a safety PLC.

If a manually operated activation switch is used, the switch must be of a type that can be locked out to the open position.

### Cable types and lengths

#### Cable between STO activation switch and drive/inverter module or ASTO board

The cable from the STO activation switch runs to the drive/inverter module connector in frame sizes R2i-R8i and R7-R8. In frame sizes R2-R6, the cable runs from the STO activation switch to an external ASTO board. This cable is not included in the delivery but it must be acquired by the customer. Make sure that it meets the specifications in this section.

A single-shielded twisted-pair cable is required.

Maximum cable lengths:

- 300 m (980 ft) between the activation switch and ASTO board.

#### Cable between ASTO board and drive/inverter module

Only the WSTO wire harnesses supplied with the Safe torque off option board can be used between the ASTO and the INT board within the drive/inverter module. The SIL/PL classification is only valid when the WSTO wire harnesses are used.

**Drive modules, frame sizes R2...R6 with an external ASTO board**

Use only the cable ordered for the ASTO board and included in the delivery (type WSTO).

Several cable lengths are available. The options are shown in the table below.

<table>

<td>10000</td>
<td>3AUA0000067826</td>
</tr>
</tbody>
</table>

**WARNING!** Drive modules, frame sizes R2...R6: For connecting the ASTO board and the module, use only the wire kits delivered by ABB. If you use other cables or modify the cables, you may cause a malfunction of the drive.
Example wiring diagrams

Connect the cables as shown in the diagram below. For more information on the components, see chapter *Technical data*.

- **STO connections without safety relays**

  The following diagrams show the STO connections without safety relays in:
  - connecting an emergency stop push button to the drive/inverter module without safety relay (page 22).
  - single drives R2-R6 and R7-R8 (page 18)
  - inverter modules R2i-R4i, R5i, R7i, R8i, R7iLC and R8iLC (pages 19-21)

- **Connecting the STO activation switch**

  We recommend using a safety relay between the activation switch and the STO input, because the STO is not capable of detecting any redundancy fault of the switch (such as a welded contact).
Frame sizes R2 to R6

Frame sizes R7 and R8
Frame sizes R2i to R4i

Frame size R5i
Frame size R7i

Frame size R8i
Liquid-cooled modules of frame sizes R7i and R8i
**STO connections with safety relays**

The following diagrams show examples of STO connections with safety relays for:

- single drives R2-R6 and R7-R8 (page 22)
- inverter modules R2i-R4i, R5i, R7i and R8i (pages 24-27)
- multiple drive/inverter modules or inverter units (page 28).

**Note:** The safety relay is not included in the delivery when the drive is equipped with option +Q967. In the examples below, the recommended customer wiring of the safety circuit (the activation switch, safety relay and ASTO board) are shown with a dashed line (on the customer's responsibility). The connection from ASTO board to drive/inverter is shown with a solid line (included in STO kit deliveries).

**Frame sizes R2 to R6**

![Diagram of STO connections with safety relays for frame sizes R2 to R6](image-url)
Frame sizes R7 and R8
Frame sizes R2i to R4i
Frame size R5i
Connecting several drive/inverter modules or inverter units to one safety relay
In the example, R8i modules are used, but the same principle applies to any frame size.
Start-up and use

Contents of this chapter

This chapter contains the start-up and acceptance test procedure for the Safe torque off function and gives instructions for its use.

Start-up and acceptance test

To ensure the safe operation of a safety function, validation is required. The final assembler of the machine must validate the function by performing an acceptance test. The acceptance test must be performed

• at initial start-up of the safety function
• after any changes related to the safety function (circuit boards, wiring, components, settings, etc.)
• after any maintenance work related to the safety function.

Competence

The acceptance test of the safety function must be carried out by a competent person with adequate expertise and knowledge of the safety function as well as functional safety, as required by IEC 61508-1 clause 6. The test procedures and report must be documented and signed by this person.
Acceptance test reports

You must store the signed acceptance test reports in the logbook of the machine. The report must include, as required by the referred standards:

- description of the safety application (including a figure)
- a description and revisions of safety components that are used in the safety application (STO and other components)
- a list of all safety functions using STO that are used in the safety application
- a list of all safety related parameters and their values (STO has no safety-related parameters)
- documentation of start-up activities, references to failure reports and resolution of failures
- the test results for each safety function, checksums (not relevant for the STO safety component), date of the tests and confirmation by the test personnel.

You must store any new acceptance tests performed due to changes or maintenance in the logbook of the machine.

Acceptance test procedure

After wiring the Safe torque off function, validate its operation as follows.

<table>
<thead>
<tr>
<th>Action</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>WARNING!</strong> Obey the safety instructions given in the relevant hardware manual and ACS800 Multidrive and Multidrive modules Safety Instructions (3AFE64760432 [English]). If you ignore them, it can cause physical injury or death, or damage to the equipment.</td>
<td>☑</td>
</tr>
<tr>
<td>Ensure that the drive/inverter can be run and stopped freely during start-up.</td>
<td>☐</td>
</tr>
<tr>
<td>Stop the drive/inverter (if running), switch the input power off and isolate the drive/inverter from the power line by a disconnector.</td>
<td>☐</td>
</tr>
<tr>
<td>Check the Safe torque off circuit connections against the wiring diagram.</td>
<td>☐</td>
</tr>
<tr>
<td>Close the disconnector and switch the power on.</td>
<td>☐</td>
</tr>
</tbody>
</table>
| Test the operation of the STO function when the motor is stopped.  
  • Give a stop command for the drive/inverter (if running) and wait until the motor shaft is at a standstill.  
  Ensure that the drive/inverter operates as follows:  
  • Open the STO circuit. The drive/inverter generates a "START INHIBI" warning.  
  • Give a start command to verify that the STO function blocks the operation of the drive/inverter. The motor should not start.  
  • Close the STO circuit.  
  • Reset any active faults. Restart the drive/inverter and check that the motor runs normally. | ☐ |
| Test the operation of the STO function when the motor is running.  
  • Start the drive/inverter and ensure the motor is running.  
  • Open the STO circuit. The motor should stop. The drive/inverter generates a "START INHIBI" fault.  
  • Reset any active faults and try to start the drive/inverter.  
  • Ensure that the motor stays at a standstill and the drive/inverter operates as described above in testing the operation when the motor is stopped.  
  • Close the STO circuit.  
  • Reset any active faults. Restart the drive/inverter and check that the motor runs normally. | ☐ |
| Document and sign the acceptance test report which verifies that the safety function is safe and accepted for operation. | ☐ |
**Use**

1. Open the activation switch, or activate the safety functionality that is wired to the STO connection.

2. STO inputs on the ASTO board de-energize, and the ASTO board cuts off the control voltage from the drive/inverter IGBTs.

3. The control program generates an indication as defined in section *STO status indications* on page 13.

4. The motor coasts to a stop (if running). The drive/inverter cannot restart while the activation switch or safety relay contacts are open. After the contacts close, a new start command may be required to start the drive (depends on parameter settings).

5. Deactivate the STO by closing the activation switch, or resetting the safety functionality that is wired to the STO connection.

6. Reset any faults before restarting.

---

**WARNING!** The Safe torque off functionality is only achieved, when the ASTO board is installed on the inverter module. True Safe torque off functionality is not achieved, if the option board is installed on other types of modules, such as the supply unit or the brake unit.

---

**WARNING!** (With permanent magnet motors only) In case of a multiple IGBT power semiconductor failure, the inverter system can produce an alignment torque which maximally rotates the motor shaft by \(180/p\) degrees regardless of the activation of the Safe torque off function. \(p\) denotes the number of pole pairs.

---

**Notes:**

- If a running drive/inverter is stopped by using the Safe torque off function, the drive/inverter will cut off the motor supply voltage and the motor will coast to a stop. If this causes danger or is not otherwise acceptable, stop the drive/inverter and machinery using the appropriate stop mode before activating the Safe torque off function.

- The Safe torque off function overrides all other functions of the drive/inverter.

- The Safe torque off function is ineffective against deliberate sabotage or misuse.

- The Safe torque off function has been designed to reduce the recognized hazardous conditions. In spite of this, it is not always possible to eliminate all potential hazards. The assembler of the machine must inform the final user about the residual risks.
Start-up and use
Maintenance and fault tracing

Contents of this chapter

This chapter describes the maintenance procedure, required competence for maintenance personnel and fault tracing information for the Safe torque off function.

Maintenance

In addition to proof testing, it is a good practice to check the operation of the function when other maintenance procedures are carried out on the machinery.

Include the Safe torque off operation test described above in the routine maintenance program of the machinery that the drive/inverter runs.

If any wiring or component change is needed after start up, follow the test given in section Acceptance test procedure (page 30).

Use only spare parts approved by ABB.

Record all maintenance and proof test activities in the machine logbook.

- Proof test interval

After the operation of the circuit is validated at start-up, the STO function shall be maintained by periodic proof testing. In high demand mode of operation, the maximum proof test interval is 20 years. In low demand mode of operation, the maximum proof test interval is 2 years (high or low demand as defined in IEC 61508, EN/IEC 62061 and EN ISO 3849-1). The test procedure is given in section Acceptance test procedure (page 30).
The person responsible for the design of the complete safety function should also note the Recommendation of Use CNB/M/11.050 published by the European co-ordination of Notified Bodies concerning dual-channel safety-related systems with electromechanical outputs:

- When the safety integrity requirement for the safety function is SIL 3 or PL e (cat. 3 or 4), the proof test for the function must be performed at least every month.
- When the safety integrity requirement for the safety function is SIL 2 (HFT = 1) or PL d (cat. 3), the proof test for the function must be performed at least every 12 months.

This is a recommendation and depends on the required (not achieved) SIL/PL. For example, safety relays, contactor relays, emergency stop buttons, switches etc. are typically safety devices which contain electromechanical outputs. The STO circuit of the inverter unit does not contain any electromechanical components.

### Competence

The maintenance and proof test activities of the safety function must be carried out by a competent person with adequate expertise and knowledge of the safety function as well as functional safety, as required by IEC 61508-1 clause 6.

### Fault tracing

#### Warning messages generated by the drive

<table>
<thead>
<tr>
<th>Warning</th>
<th>Cause</th>
<th>What to do</th>
</tr>
</thead>
<tbody>
<tr>
<td>START INHIBI</td>
<td>Safe torque off function has been activated while the drive was stopped.</td>
<td>Close Safe torque off function switch. If the switch is closed and the warning is still active, check power supply at ASTO board input terminals. Replace ASTO board.</td>
</tr>
</tbody>
</table>

#### Fault messages generated by the drive

<table>
<thead>
<tr>
<th>Fault</th>
<th>Cause</th>
<th>What to do</th>
</tr>
</thead>
<tbody>
<tr>
<td>GD DISABLED X</td>
<td>ASTO board power supply of parallel-connected R8i inverter module has been switched off during run. X (1…12) refers to inverter module number.</td>
<td>Check Safe torque off function circuit of this module (X). Replace ASTO board of R8i inverter module.</td>
</tr>
<tr>
<td>START INHIBI</td>
<td>Safe torque off has been activated during motor run or motor start command has been given when Safe torque off is active.</td>
<td>Close Safe torque off function switch. If the switch is closed and the fault is still active, check power supply at ASTO board input terminals. Replace ASTO board.</td>
</tr>
</tbody>
</table>

Any failures of the Safe torque off function must be reported to ABB.
Technical data

Contents of this chapter
This chapter contains the technical details of the ASTO-11 and ASTO-21 boards, the safety data for the STO components and example information of safety relays and activation switches. It also lists the related standards and directives, and contains declarations of conformity with the European Machinery Directive.

STO components

- ASTO-11/21 board

<table>
<thead>
<tr>

<tr>
<td>R2…R6</td>
<td>ASTO-11</td>
</tr>
<tr>
<td>R7i…R8i</td>
<td>ASTO-21</td>
</tr>
<tr>
<td>R7…R8</td>
<td>ASTO-21</td>
</tr>
</tbody>
</table>

Note: In frame sizes R2…R6 of the ACS800-01, -U1, -04, -04M, -04LC, -U4, -11, -U11, -31 and -U31 drives the ASTO board is ASTO-11 with enclosure. In frames R7…R8 and R2i…R8i the ASTO board is inside the drive module.

Dimensions of the ASTO board with enclosure
STO safety relay type

General requirements | IEC 61508 and/or EN/ISO 13849-1
Example 1 | Simple SIL3 approved safety relay
Type and manufacturer | DOLD LG 5925.48/60 AC/DC 24 V
ABB BT50 24DC
Approvals | SILCL 3 according to EN 62061 and PL e according to EN ISO 13849-1
Example 2 | Programmable safety logic
Type and manufacturer | ABB AC500-S
Approvals | IEC 61508, SIL3; and EN ISO 13849-1, PL e

Push-button to be used with emergency stop

Type | A push-button operated switch with a palm or mushroom head type. Actuators of emergency stop devices are colored red.
Example | ABB CE4T-10R-02

Switch to be used with Prevention of unexpected start-up function implemented with STO

Type | A lockable selector switch with a reliable and unambiguous indication of positions.
Example | Kraus & Naimer DH11 A291-600, FT22-V+S0V845/A11/D11

Safety data

Note: The safety relay is not included in the safety data given in this chapter.

STO in ACS800 drives and inverter modules

The data applies to both air-cooled and liquid-cooled modules.

- The following temperature profile is used in safety value calculations:
  - 670 on/off cycles per year with $\Delta T = 71.66$ °C
  - 1340 on/off cycles per year with $\Delta T = 61.66$ °C
  - 30 on/off cycles per year with $\Delta T = 10.0$ °C
  - 32 °C board temperature at 2.0% of time
  - 60 °C board temperature at 1.5% of time
  - 85 °C board temperature at 2.3% of time.

- The STO is a type A safety component as defined in IEC 61508-2.

- Relevant failure modes:
  - The STO trips spuriously (safe failure)
  - The STO does not activate when requested

A fault exclusion on the failure mode "short circuit on printed circuit board" has been made (EN 13849-2, table D.5). The analysis is based on an assumption that one failure occurs at one time. No accumulated failures have been analyzed.

- Reaction times are described in section [STO function activation and indication response times](#) on page 14.
Related standards and directives

The Safe torque off function of the inverter complies with these standards:

<table>
<thead>
<tr>
<th>Standard</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>EN 60204-1:2016</td>
<td>Safety of machinery – Electrical equipment of machines – Part 1: General requirements</td>
</tr>
<tr>
<td>IEC 61511-1:2016</td>
<td>Functional safety – Safety instrumented systems for the process industry sector</td>
</tr>
<tr>
<td>EN ISO 13849-1:2015</td>
<td>Safety of machinery – Safety-related parts of control systems – Part 1: General principles for design</td>
</tr>
<tr>
<td>2006/42/EC</td>
<td>European Machinery Directive</td>
</tr>
</tbody>
</table>

The Safe torque off function also corresponds to Prevention of unexpected start-up as specified by EN ISO 14118:2018 (ISO 14118:2017), and Uncontrolled stop (stop category 0) as specified in EN/IEC 60204-1.

Compliance with the European Machinery Directive

The drive is an electronic product which is covered by the European Low Voltage Directive. However, the drive internal safety function of this manual (option +Q967) is in the scope of the Machinery Directive as a safety component. This function complies with European harmonized standards such as EN/IEC 61800-5-2. The declarations of conformity are given below.
Declarations of Conformity

EU Declaration of Conformity
Machinery Directive 2006/42/EC

We, ABB Oy
Hietaniemi 13, 00380 Helsinki, Finland.
+358 10 22 11

declare under our sole responsibility that the following product:

Frequency converter(s)
ACS800-1/-U11
ACS800-3/-U31

with regard to the safety function(s)

Safe Torque Off (Option +Q867)

is/are in conformity with all the relevant safety component requirements of EU Machinery Directive 2006/42/EC, when the listed safety function is used for safety component functionality.

The following harmonized standards have been applied:
EN 61800-5-2:2007
EN 62061:2005
EN ISO 13849-1:2015
EN ISO 13849-2:2012

The following other standards have been applied:
IEC 61508:2010 parts 1-2

Adjustable speed electrical power drive systems – Part 5-2: Safety requirements - Functional
Safety of machinery – Functional safety of safety-related electrical, electronic and programmable electronic control systems
Safety of machinery – Safety-related parts of control systems.
