Typical use case in production

The total efficiency of one production line is lower than that of another.

What are the reasons for this deviation?

Time efficiency is on the same level as other production lines, but material efficiency is worse.

Is this a general problem or is it due to a single factor?

One grade has produced more reject than other grades over the past few days, reducing the overall material efficiency.

Is the reject order or quality-related?

There is nothing wrong with the time efficiency but the amount of roll reject is high.

Is there a common factor for roll reject?

There is a clear increase in reject due to “Dirt on the track”. Most rolls originate from a certain reel position.

Corrective actions:

The problem can be traced to a certain problem in the process, and corrective measures are taken.

Were the corrective measures efficient?

The trend in terms of significant quality measures has normalized and values have actually improved compared to the long-term trend.
What is DSS800?
DSS800 is a powerful system for analyzing and reporting production, consolidating production reporting into one system. It consists of a data warehouse and reporting portal. The system helps to improve mill performance by providing the right industry-standard performance metrics for top-level analyses, combined with the complete transparency of the entire production process. Information access is easy: It is fully web-based using modern Business Intelligence and reporting tools.

Features
- The system contains fully web-based reporting features including analytical and ad hoc reporting.
- Unique flexibility in combining data from different sources for in-depth analysis of production processes and the analysis of performance and production processes.
- Plug and play interface to ABB CPM product suite.
- Standardized interface to third party CPM and other systems.
- Pre-configured data model, including industry-standard performance metrics (Zellcheming Merkblatt III / 2004).
- Pre-configured reports
- Easy-to-use efficient ad hoc reporting tool

Platform independent
- Microsoft Windows
- Unix
- Linux

Benefits
- Financial managers can easily obtain figures for reporting without the extensive manual work traditionally involved.
- DSS800 is an efficient gateway to other corporate level systems, presenting users with a single, clear and truthful picture of production, thereby simplifying corporate reporting. The system has an open interface to third party systems and has been SAP certified (Certified for SAP NetWeaver, Powered by SAP NetWeaver).
- On-line strategy follow-up - DSS can be used for Balanced Score Card metric follow-ups.

Applications
- DSS800 has several usage areas in a corporate or mill environment:
  - A corporate or mill manager can use the system to obtain an overall picture of the entire production process. This overview can include several aspects of the production process, ranging from production to inventories and quality metrics.
  - Managers can use the system to analyze production efficiently and in detail. Tools such as drilling, slicing and dicing quickly reveal the root causes of emerging problems.
  - Process developers can use the data trending and benchmarking features for analysis, generating continuous improvement.

Improved mill performance
- Time savings - Reduced reaction time. Problem areas are detected and isolated quickly.
- Increased transparency - Easy benchmarking - Helps identify best practices and targets for development.
- Continuous performance improvement - Efficient follow-up reporting - Industry-standard performance metrics.

Reduced Total Cost of Ownership
- Productized solution - Fast implementation
- Full life cycle product support
- Full vertical integration – One system for reporting
- Superior accessibility – internet, ABB CPM suite, ERP/SAP integration
- Multiple data sources – from automation to ERP.
Decision Support System – DSS800
