

ABB MEASUREMENT & ANALYTICS | DATA SHEET

ControlMaster CM10

Universal process controller, 1/8 DIN

Measurement made easy

Making process control easy

Comprehensive display of process status

- Crystal-clear, full-color TFT display

Exceptionally easy to use

- Intuitive user interface and clear text prompts make installation, commissioning and operation quick and simple

PC Configuration

- Time saving off-line software tool including report generation

Profile control

- Setpoint profiling function

Flexible control functionality

- On / Off, time proportioning, analog PID and motorized valve control strategies

Problem-solving capability

- Flexible functionality including math and logic providing power to solve application requirements

Built to survive

- IP 66 and NEMA 4X environmental protection

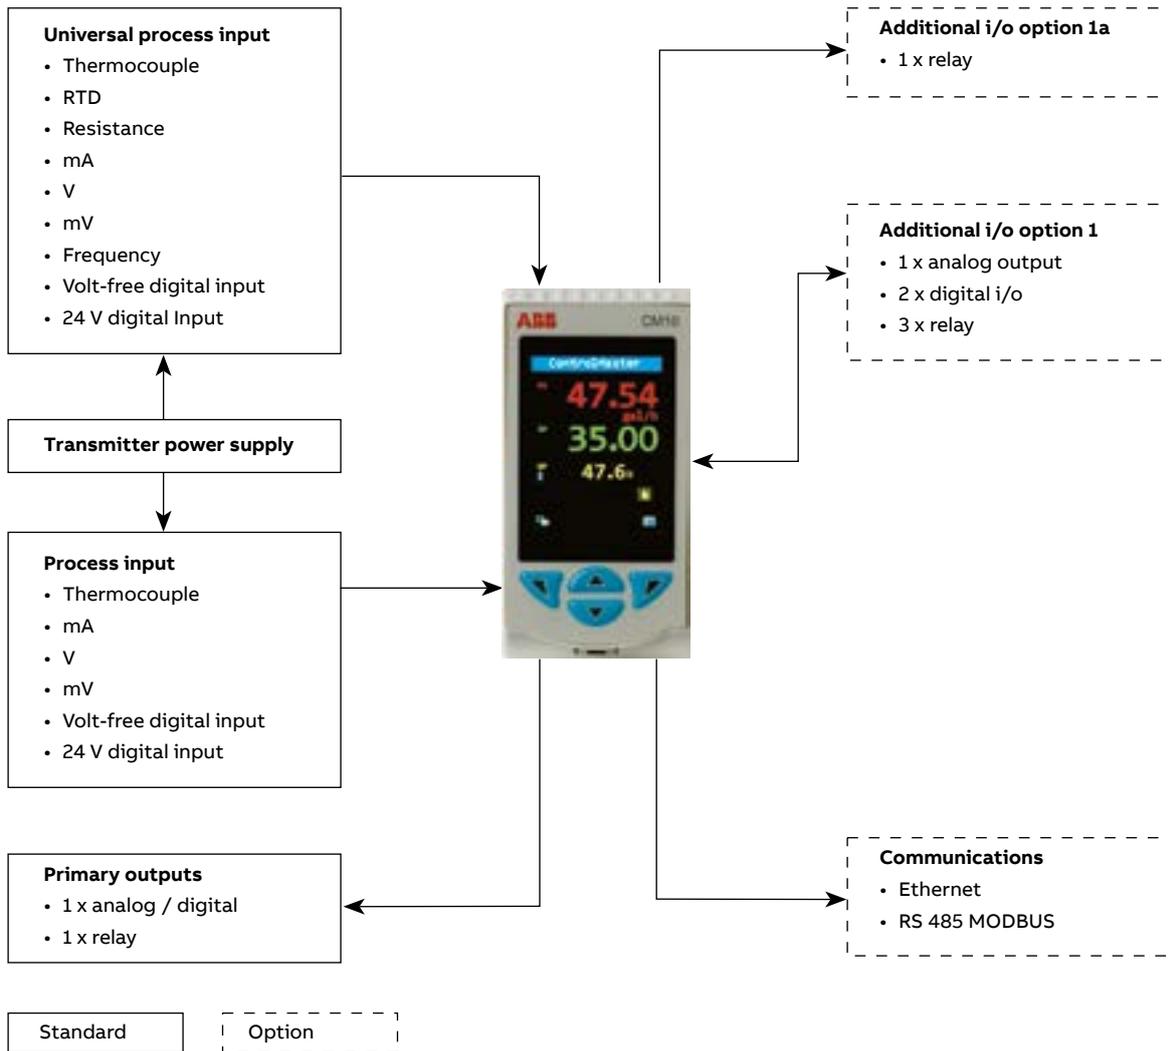

Overview

The ControlMaster CM10 is a flexible, 1/8 DIN, universal PID process controller. Detailed process information is presented clearly on the CM10's full-color TFT display and an intuitive operator interface simplifies configuration and operation.

Scalable in both hardware and software functionality, a CM10 can be specified easily to meet the needs of your application requirements. Flexible control functionality including on / off, time proportioning, analog PID, split output control and math & logic make the CM10 suitable for a wide range of process applications.

Fully configurable via the easy-to-navigate front panel menus or PC configuration software, the CM10 can be commissioned rapidly and then tuned via the advanced autotune functionality.

MODBUS and Ethernet communication options ensure easy integration into a control system.

Scalable functionality

The CM10 is scalable in terms of both hardware and software, enabling it to meet your application requirements. The basic CM10 meets the needs of a simple control loop. Additional templates and functionality can be enabled by adding a function key to the basic model as shown in Fig. 1, while retaining previous templates and functionality. For I/O builds, see “Ordering information” on page 16.

Level	Function keys	Template	Functionality
Base	0 	Single loop Single loop with remote setpoint	Process alarms Basic setpoint switching Basic control <ul style="list-style-type: none"> Analog PID On / Off or time proportioning Auto tune Split output control
Standard	1 	Auto / Manual station low signal selection Auto / Manual station digital signal selection * Analog backup station low signal selection Analog backup station digital signal selection * Single indicator / manual loader Dual indicator / manual loader	Standard setpoint switching Standard control <ul style="list-style-type: none"> Gain scheduling Motorized valve control † Output tracking Logic Math Custom linearizers Delay timers Real time alarms Standard profile Bank control Template customization

Recommended I/O build:

* Basic + option board 1

† Basic + option board 1a

Figure 1 Overview of template options

Powerful operator display

The CM10 features a full-color 5.5 cm (2.2 in.) display for displaying detailed process information to the user. Process details such as alarm messages and diagnostic information are displayed clearly in full text without the need for difficult-to-read scrolling displays.

Example of an operator page

Automatic selection of standard display templates immediately makes best use of the CM10's display. Extensive customization features then enable the displayed information to be tailored to suit the process requirements.

Figure 2 Single loop display

Diagnostics and alarm status display

The diagnostics and alarm status display provides detailed information on any active alarm or diagnostic condition. The operator can see, at-a-glance, the status of any alarm condition present within the process. Additionally, diagnostic messages are presented clearly to the operator, enabling rapid notification and simple diagnosis of any critical instrument status condition.

Historical information of diagnostic messages can also be viewed in the controller's diagnostic log.

Figure 3 Alarm status display

Exceptionally easy to use

The CM10's full-text display and simple-to-navigate, pop-up menu makes operation exceptionally easy.

A programmable soft key enables commonly used functions, such as auto / manual selection, alarm acknowledgement and display selection, to be accessed easily by the operator.

Figure 4 Pop-up menu

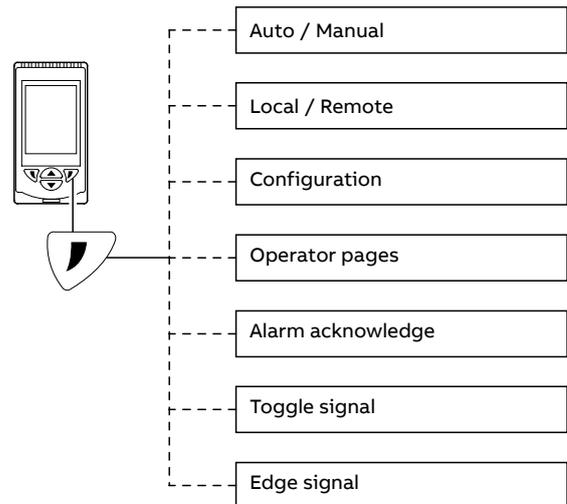

Figure 5 Programmable soft key

Flexible control functionality

The CM10 features flexible control functionality making it suitable for a wide range of applications. Features include:

Autotune

Once initial configuration is complete, a powerful autotune facility enables automatic calculation of the PID values required, enabling rapid commissioning of the CM10.

Gain scheduling

The CM10's gain scheduling functionality is used for efficient control of non-linear processes. Up to 3 different sets of PID parameters are selected automatically from a reference signal ensuring optimum control response, regardless of the process status.

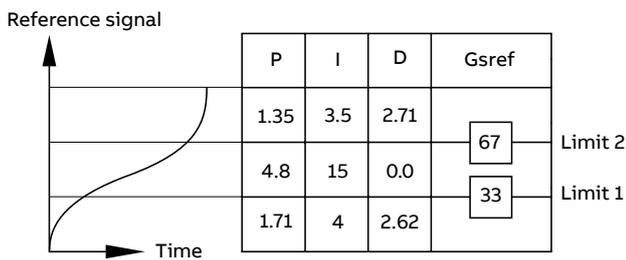

Figure 6 Gain scheduling example

Split output control

The CM10 can also be configured to perform split output control, for example, when both heating and cooling of a single process is required.

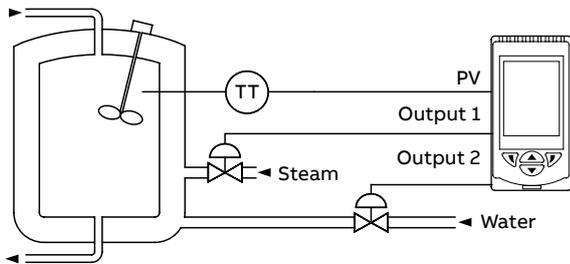

Figure 7 Split output control example

Remote auto / manual switching

In addition to switching via the front panel, the CM10 can be switched between automatic and manual control mode using an external signal. When switched to manual mode via a digital signal, the value of the control output can be preset, for example, to open a control valve automatically during a cleaning cycle.

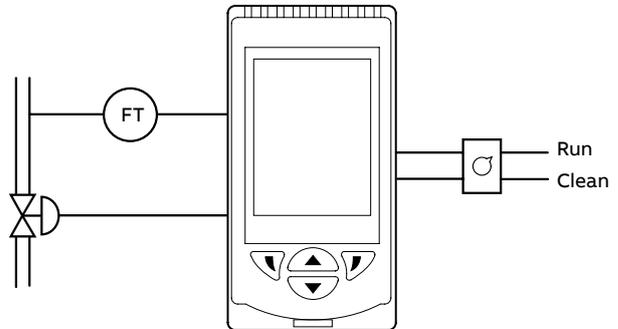

Figure 8 Remote auto / manual switching

External setpoint selection

The CM10's control setpoint can be selected via external digital signals, for example, simplifying operation by selecting different setpoints using external push buttons.

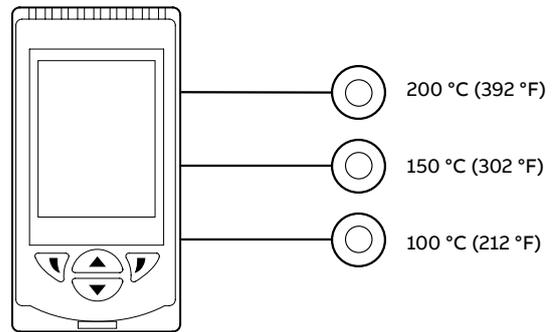

Figure 9 External setpoint selection

Problem solving flexibility

Extensive functionality is available to provide flexible problem-solving capability; making the CM10 much more than just a process controller.

Process alarms

8 independent process alarms can monitor any analog signal within the CM10, enabling extensive process monitoring capability. Alarms can be used to drive physical outputs or soft-wired to other functions within the controller.

Real-time alarms

The 'alarm clock' functionality provided by the CM10's real-time alarms enables time-of-day decisions to be introduced into the controller's actions or specific functions to be triggered routinely at specified times.

Delay timers

Event sequencing is enabled through the use of the CM10's delay timers. A predetermined delay and output duration can be programmed into each delay timer and timers can be linked together.

Custom linearizers

The CM10 has 2 independent 20-point custom linearizers that can be applied to any analog signal within the controller. These linearizers can be used in applications such as level-to-volume conversion of a non-linear tank level or to accommodate special input signals or output devices.

Math

8 math blocks provide arithmetic, averaging, min. / max. hold, square root and signal switching functionality. Simple equations can be performed in a single math block or multiple math blocks can be nested together to construct complex equations.

Signal switching 'multiplexer' math blocks switch between 2 analog signals based on a trigger signal. For example, a backup sensor could be selected automatically on failure of a primary sensor.

Logic

8 comprehensive logic equations provide powerful interlock functionality. Inputs and outputs of the logic equations can be soft-wired to any digital signal within the controller to maximize flexibility.

Bank control

Bank control enables improved control of multi-element output devices such as banks of heaters, pumps and fans. Aimed at minimizing wear caused by over-use of one specific 'duty' device, bank control enables wear to be levelled by sharing duty and assist handling between every device in the bank.

Bank control gives users the choice of either 'Rotate' or 'First In, First Out (FIFO)' wear-leveling schedules. If required, bank control can be combined with PID control, assigning the PID output signal to the bank control function.

Bank control can also be utilized when split output control is configured. For example, when two variable speed pumps are being controlled in a duty assist configuration. Each time both pumps are stopped the duty and assist outputs are alternated.

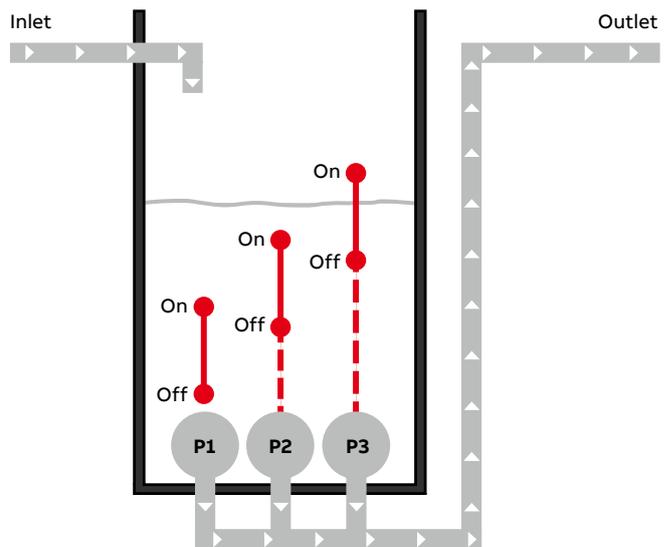

Figure 10 Independent on and off trip points

Communications

Extensive communication options enable the CM10 to be integrated into larger control systems easily or connected to other process instrumentation.

RS 485 MODBUS

Using RS 485 MODBUS, values and status can be communicated to and from the controller in real-time via an RS 485 connection.

Ethernet

Optional Ethernet communications enable ControlMaster to be integrated in to an Ethernet network quickly. The following functionality is provided:

- Email
 - Notification of a critical process event or status can be made by email. Multiple events can trigger an email that can be sent to multiple recipients
- Webserver
 - ControlMaster's integrated webserver enables the current status of the process and controller to be viewed remotely using a standard web browser

Figure 11 Webserver

- MODBUS TCP
 - Process values and status can be communicated to and from the CM10 in real-time using MODBUS TCP, enabling it to be integrated easily into larger control systems or connected to a data recorder.

PC configuration

The CM10 can be fully configured using ABB's ConfigPilot software. Available free of charge, ConfigPilot enables off-line creation and editing of configuration files. Configurations are transferred to and from a controller via its standard IrDA port and a USB IrDA adapter.

Figure 12 Analog input configuration

Figure 13 Profile configuration

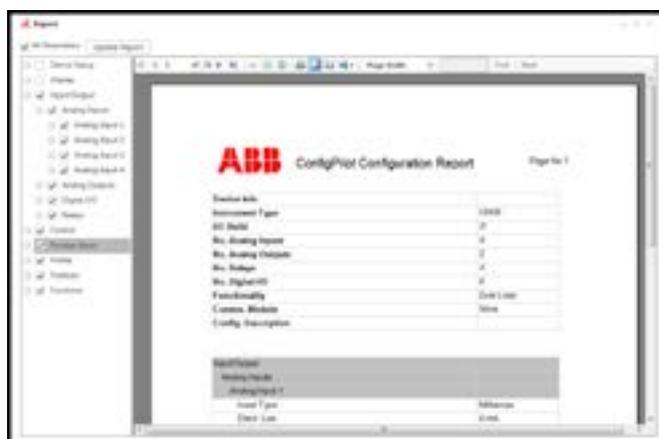

Figure 14 Configuration report generation

Setpoint profile

Setpoint profile capability makes the CM10 ideally suited to thermal processing applications where a specific temperature profile must be followed. A profile can be created quickly by programming up to 10 segments (for example, ramp, hold, wait or step). Process operators can then activate and monitor the program easily via dedicated profile operator displays and menus.

A CM10 can have a single profile of up to 10 segments.

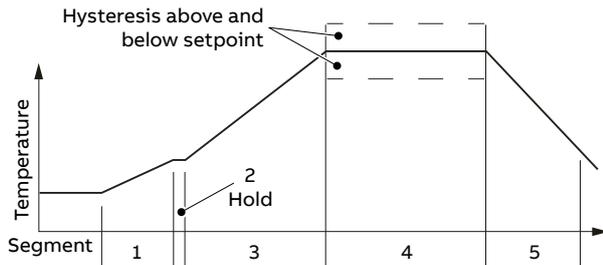

Figure 15 Profile control

Fast run mode

When activated fast run mode runs a profile at 8 times normal speed allowing complex or long duration programs to be tested prior to use.

Guaranteed ramp / soak

For processes where strict tolerances must be adhered to during a profile cycle, guaranteed ramp/soak can be applied to appropriate segments. A configurable hysteresis can be applied to a segment; if the process variable exceeds these limits the program is placed on hold until the process recovers. Once back within limits the profile can be configured to continue, or repeat, the current segment. Hysteresis limits can be above, below or above and below the setpoint value.

Sequencing and interlocks

When interlocks are required, wait segments can be placed in a program. On arriving at a wait segment the profile waits until a required condition is met (for example, digital input received) before continuing with the program.

Dedicated profile displays

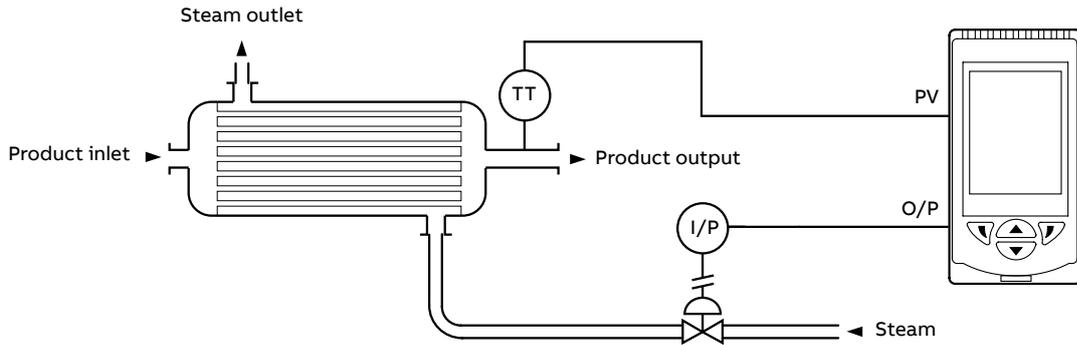

To make day-to-day operation as easy as possible, profile control has dedicated display templates. A concise display detailing the program name, status and time remaining is shown to the operator. A more detailed program and segment status information is available on sub-pages.

Application templates

To minimize commissioning time, the CM10 features up to 8 preconfigured control strategy templates. By selecting the required control strategy, the template configures the CM10's function blocks and display automatically. Customization of the preconfigured templates is also possible, providing the flexibility to create customized solutions.

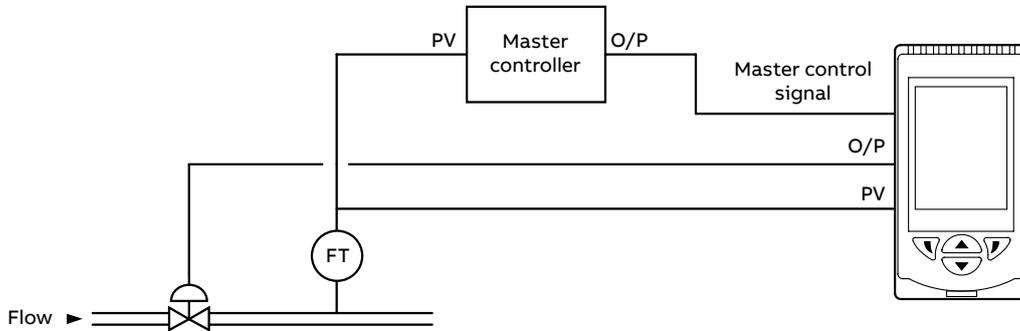

Single loop

This template provides standard, single loop process control and is available with or without a remote setpoint. In this example, the temperature of a product heated by a heat exchanger is regulated via the control of the steam feed to the heat exchanger.

Auto / Manual station and analog backup station

These templates configure the CM10 to backup a master controller, typically a PLC or DCS. A fault condition is detected via a low output signal from the master controller or a digital signal. On detection of a fault signal, the CM10 can take control of the process (analog backup template), freeze its output or switch to a safe output (auto / manual station template). In this example, a critical control of flow is backed-up by the CM10.

Technical specification

Operation

Display

Color, ¼ VGA TFT, liquid crystal display (LCD) with built-in backlight

Language

English, German, French, Italian and Spanish

Operator keypad

4 tactile membrane keys

Security

Password protection

Basic / Advanced – user-assigned password protection (not set at factory)

Standard functions

Base templates

Single loop with local setpoint
Single loop with remote setpoint

Standard templates

Auto / Manual station (low signal detection)
Auto / Manual station (digital signal selection)
Analog backup station (low signal detection)
Analog backup station (digital signal detection)
Single indicator / manual loader station
Dual indicator / manual loader station

Control output types

Current proportioning
Time proportioning
On / Off
Motorized valve with feedback
Motorized valve without feedback
Split output – with combinations of relay, digital output and current outputs
