1 Release Information

1.1 General

Release Name
The release name is RobotStudio 6.04.00.01 and the build number is 6.04.7152.0140.

Release Date
The release date is November 10th, 2016.

Demo stations
The following demo stations are included in this version.
- Demo AW Station
- Demo Solar Simulation
- Demo Exhaust Pipe
- Demo FlexLoader

They are stored in the Pack & Go format (.rspag) and can be opened with the command Unpack & Work on the Share section of the RobotStudio menu.

ScreenMaker Demo Station and Project
There is a demo station and associated ScreenMaker project available.
- SCM_ExampleProject (ScreenMaker Project)
- SCM_ExampleStation (RobotStudio station)

These files are found in the 'Addins/ScreenMaker/Samples' folder under the RobotStudio installation folder.

Tutorials
Tutorials are available at the RobotStudio product pages at http://www.abb.com/roboticssoftware

Documentation
User documentation for RobotStudio is available from the Help button (§) in the upper-right corner of RobotStudio.

The complete documentation in PDF for RobotWare including RobotStudio is available on DVD and can be ordered separately from ABB.

1.2 System recommendation

Recommended Software

<table>
<thead>
<tr>
<th>Operating System</th>
<th>Edition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Microsoft Windows 7 SP1</td>
<td>32-bit</td>
</tr>
<tr>
<td>Microsoft Windows 7 SP1 (recommended)</td>
<td>64-bit</td>
</tr>
<tr>
<td>Microsoft Windows 10 (recommended)</td>
<td>64-bit</td>
</tr>
</tbody>
</table>
Recommended Hardware

<table>
<thead>
<tr>
<th>Item</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>CPU</td>
<td>2.0 GHz or faster processor, multiple cores recommended</td>
</tr>
<tr>
<td>Memory</td>
<td>3 GB if running Windows 32-bit</td>
</tr>
<tr>
<td></td>
<td>8 GB or more if running Windows 64-bit (recommended)</td>
</tr>
<tr>
<td>Disk</td>
<td>10+ GB free space, solid state drive (SSD)</td>
</tr>
<tr>
<td>Graphics card¹</td>
<td>High-performance, DirectX 11 compatible, gaming graphics card from any of the leading vendors. For the Advanced lightning mode Direct3D feature level 10_1 or higher is required.</td>
</tr>
<tr>
<td>Screen resolution</td>
<td>1920 x 1080 pixels or higher is recommended</td>
</tr>
<tr>
<td>DPI</td>
<td>Normal size (100% / 96 dpi) up to Large size (150% / 144 dpi)</td>
</tr>
<tr>
<td></td>
<td>Only Normal size supported for Integrated Vision.</td>
</tr>
<tr>
<td>Mouse</td>
<td>Three-button mouse</td>
</tr>
<tr>
<td>3D Mouse [optional]</td>
<td>Any 3D mouse from 3Dconnexion, see <a href="http://www.3dconnexion.com">http://www.3dconnexion.com</a></td>
</tr>
</tbody>
</table>

¹ A note on graphics cards and PC hardware. RobotStudio will not benefit from the additional features of so-called ‘Professional’ or ‘Workstation’ graphics cards. The price level of these are at a much higher range than gaming graphics cards with comparable performance from a RobotStudio point of view. High-end gaming PCs are very suitable for offline programming with RobotStudio. Such a PC will provide good performance for a limited budget.

Note

The Windows Firewall will try to block features necessary to run RobotStudio. Make sure to unblock these features when asked (Industrial Robot Discovery Server, RobotStudio StudioAppFramework module, Virtual RobotController (all published by ABB)). The blocking state of a certain program can be viewed and changed at Start/Control Panel/Windows Security Center/Windows Firewall. Read more on [http://www.microsoft.com](http://www.microsoft.com).

</tbody>
</table>
2 What’s new in RobotStudio 6.04

Overview

RobotStudio 6.04 contains several new features and enhancements described in this section.

2.1 New robots

IRB 6700 Inverted

The 6700 family has got a new member in the IRB 6700 Inverted which is designed for suspended mounting. It comes in two sizes that has reach 2.6 m and 2.9 m, respectively. It can be ordered as a naked robot or with dress pack for material handling or spot welding, with or without the LeanID wrist.

IRB 1200 Foundry Plus

The IRB 1200 is available with the Foundry Plus protection.

IRB 1660ID 1.55 m / 4 kg

The IRB 1660ID has got a smaller sibling in the new 4 kg variant. The reach is the same as the 6 kg version that was introduced with RobotStudio 6.03.01.
2.2 YuMi

Collision Avoidance for Smart Gripper

The Smart Gripper can be included in the collision avoidance function of the YuMi by using the new configuration tool in RobotStudio 6.04.

New definition of arm angle and configuration data

The arm angle and arm configuration data has been re-defined in RobotWare and RobotStudio 6.04. If you have an existing YuMi program created with RobotWare 6.03 or earlier you can configure YuMi to use the old arm angle definition using the Configuration Editor (MOC.CFG). The old definition will eventually be made obsolete in future versions of RobotWare.

TCP Trace

The TCP Trace function has been improved and is now able to color the trace depending on the value of any selected signal, e.g. the TCP speed. Markups can be created to indicate event log messages during the path execution or any motion related events such as 'Target changed'.
2.3 Data Recovery

Overview

There are four ways to help protect and recover your data in the event of a software failure: auto-save of RAPID, auto-save of stations, automatic backup of station files and automatic backup of virtual controllers. This is configured in the RobotStudio options.

Auto-save of RAPID for virtual controllers

Unapplied RAPID changes will automatically be saved by RobotStudio for possible recovery in the event of a software failure. RAPID changes made to a virtual controller since the last restart will be also automatically saved. These face the risk of being lost if the virtual controller need to be restarted without first being properly shut-down.

Auto-save of station

Changes made to a RobotStudio station since the last save operation will automatically be saved by RobotStudio at a regular interval if configured in the RobotStudio options. Changes will be stored in a file next to the original station file. The auto-save function requires a Solution.
Automatic backup of station files

When working with a RobotStudio Solution, station files may be optionally backed up automatically when saving. The last saved file will be copied to a sub-folder and renamed prior to saving the new changes. The maximum number of backup files is specified in the RobotStudio Options.

Automatic backup of virtual controllers

The virtual controllers that are part of a RobotStudio station may optionally be backed up when saving the station. The backup is stored in the solution structure. Only the latest backup will be stored.

2.4 Visualization and Offline Programming

Virtual Reality – HTC Vive

RobotStudio 6.04 and its Station Viewer works with HTC Vive. The HTC Vive comes with motion tracking sensors for location and orientation tracking of the headset and the hand controls. The hand controls can be used to interact with the virtual reality environment.

The functionality available in the VR environment can be customized by creating add-ins with e.g. Microsoft Visual Studio using the extensibility API that we are providing as a beta version in 6.04.

Note that the HTC Vive integration in RobotStudio 6.04 may change since it is still being developed and has not yet settled on a final solution regarding the interaction design.

The use of HTC Vive requires a high-performance gaming PC. Please check the supplier web page for details (http://www.vive.com/).
Add signals and properties in the Smart Component Design view.

Smart Component signals and properties can be added directly in the design view. Virtual Controller signals cannot be added in this view, but be made accessible through a drop-down menu. Through the connection context menu it is possible to display its properties or delete it. Double-clicking on a smart component in the design view will open its design view.

Create LOCAL RAPID declarations through RAPID synchronization

Before a target is synchronized to RAPID from the station the first time, it can be configured as being Local which will result in the creation of LOCAL robtargets in RAPID.

Graphics statistics

The new Statistics windows in the Graphics Tool tab will display the number of bodies, facets, triangles and vertices contained by a part. The information is useful when you want to improve the graphics performance in which case you want to identify the part(s) that has the biggest impact and try to reduce its load.
2.5 Commissioning

Shortcut to RobotWare Utility folder with general configuration files

When loading configuration parameters in RobotStudio 6.04 you get a shortcut to the Utilities folder of RobotWare. It contains template configuration files for various external equipment.

Compare files and folders

The comparison tool of RobotStudio has been improved in 6.04. It can compare any two folders and files. It is made 'RAPID-aware' in that you can exclude the backup time-stamp of the backinfo.txt file, PERS variables, comments, casing and spaces.

Compare folders:

Compare files:

Red for changed lines

Violet for new lines
Clear log of in RobotStudio and in the controller

The new button ‘Delete all logs’ will clear the event log window both in RobotStudio and on the FlexPendant.

SafeMove 1st generation: old SafeMove Configurator discontinued

The old SafeMove Configurator have been discontinued in favor of Visual SafeMove for 1st generation. The latter has got new icons in the same style as Visual SafeMove for 2nd generation.

SafeMove 2nd generation: General Output

The function ‘External PowerSupply’ has been given the option to stay activated regardless of the operating mode as opposed to how is used to be where it got disabled when the enabling device was released in manual mode. The desired behavior of the signal can be configured in the Post-Logic. Due to the generalized behavior it has been renamed to ‘General Output’.
Shortcut to change RobotWare options for virtual controller in station

A shortcut to the Change Options dialog allows easy change of options for virtual controllers in a station.

2.6 Fleet Management - Jobs

Command-line Job execution and Job scheduling

If the Job has been saved it can be executed from the command-line using the executable RunJob.exe available in the folder:

`...\Program Files (x86)\...\RobotStudio 6.0x\Bin\Addins\FleetManagement`

Note that RunJob.exe must be executed from its original location and must thus not be moved as it is dependent on the other RobotStudio files. By creating a batch file for the job, it can be scheduled using Windows Task Scheduler.

New action: Backup Program Modules

The new action ‘Backup Program Modules’ will back up only the program modules (.mod files). The motivation is to save only the relevant files if the purpose is to identify changes in program modules.
New Action: Compare folders

The new compare function can be executed through a Job. This is useful e.g. when comparing changes between two consecutive backups for each controller.

New action: Read Device Information

Any information from the Device Browser can be read through Jobs, e.g... fan speed, temperature (CPU and main computer) or memory.

Improved action: Read/Write File or Directory

The Read/Write File actions have been extended with support for directories.
**Improved action: Search RAPID data – extended with support for individual fields**

The action ‘Search RAPID data’ has been extended with support for individual record fields.

![Image of Improved action: Search RAPID data – extended with support for individual fields]

**Ease-of-use: Improved UI for replacement strings**

The user interface for building dynamic file and folder names using so-called replacement strings have been improved. The strings are now selectable from the browse button (‘…’).

![Image of Ease-of-use: Improved UI for replacement strings]

**Ease-of-use: Open folder location for Excel reports**

The location for the resulting Excel report can be opened from the context menu of the History browser.

![Image of Ease-of-use: Open folder location for Excel reports]

**Ease-of-use: Serial number in report**

The serial number has been added to the Excel report.

![Image of Ease-of-use: Serial number in report]
Multi-action Jobs

A Job can now consist of several actions. This is useful when you take a backup that you want to compare with a previous backup. Then you can create a job with two actions, Backup and Compare Folders.

32-bit / 64-bit versions

RobotStudio is available in both 32- and 64-bit versions. From 6.04 onwards, the 64-bit version has been made the default version and thus the title does not display the bitness of it. Instead, the bitness has been added to the title bar of the 32-bit version. In general it is always recommended to use the 64-bit version whenever possible, in particular if you work with offline programming.

<table>
<thead>
<tr>
<th>Summary of 32/64-bit support</th>
<th>32-bit</th>
<th>64-bit</th>
</tr>
</thead>
<tbody>
<tr>

<td>✔</td>
</tr>
<tr>
<td>Everything else in RobotStudio</td>
<td>✔</td>
<td>✔</td>
</tr>
</tbody>
</table>

The long term goal is to discontinue the 32-bit version which will be done when the 32-bit limitations for ScreenMaker and Integrated Vision are resolved.
3 Late Breaking Information

Overview

This section describes changes and additions done after the Operating Manual was finalized.

Jobs – Allow execution state running

By default, a Job will not execute if the controller is executing a program (Execution state = Running).

The reason is to reduce the risk of disturbing production if the robots are performing sensitive path following applications such as laser cutting, dispensing or arc welding. The option may be considered for Jobs that may put load on the controller, e.g. the Backup, and Search RAPID Data (if doing a general search with wild-cards).

5 Known Limitations

Overview

This section describes known limitations in RobotStudio.

5.1 Online

Visual SafeMove windows can be re-opened from the Quick Access Toolbar menu

Any windows that are closed can be re-opened using the Quick Access Toolbar menu, as the command Default Layout does not recover these windows.

Individual RAPID tasks cannot be stopped for RobotWare 5.60 and later

When running multitasking systems, it is not possible to start and stop individual tasks with the dropdown menu of the task node in the Controller browser. This is due a restriction introduced with RobotWare 5.60 and later.

However, from RobotWare 6.03 onwards, then RAPID tasks to execute or to stop can be selected from RobotStudio RAPID tab.

Signal Analyzer Online not available for RobotWare 5.60, RobotWare 5.15.02 and earlier

The feature Signal Analyzer Online is not available for controllers running RobotWare 5.60, RobotWare 5.15.02 and earlier. The reason is a vulnerability in RobotWare that may cause interruptions in the robot operation.

Signal Analyzer Online is supported by RobotWare 5.15.03 and later, and RobotWare 5.61 and later, where the problem has been corrected.

It is not recommended to use Signal Analyzer Online of RobotStudio 5.15.01 or 5.15.02 with RobotWare versions prior to 5.15.03 or 5.61.

SafeMove Tool Zone visualization in Online Monitor for robots with external axes

Only TCP robots and track mounted robots will be visualized in the Online Monitor, no other external axes or positioners.

As a consequence, the Online Monitor may show the robot in a non-violating position, even though the safety controller has detected a safety violation and stopped the robot.

FlexPendant Viewer running with automatic reloading

When having FlexPendant Viewer running with automatic reloading of the screens and at the same time jogging the robot with the joystick the robot jogging might halt when the FlexPendant Viewer reloads.

5.1.1 Online – Paint

Backup for Paint systems does not create backup of the PIB board

The Backup function of RobotStudio does not create a backup of the PIB board of the IRC5P system.

**Workaround:** Create the backup of the PIB board with the FlexPaint Pendant using an USB-stick.

Go Offline does not work for Paint systems

The Go offline function will not create a working Virtual controller system for Paint system unless the Paint package I/O option is set to Simulated.
5.1.2 Online – Integrated Vision

Emulated cameras not discovered when controller in Motors On

For RobotWare 5.61 onwards, the camera discovery mechanism is disabled when the controller is in Motors On. As a consequence, the camera nodes will not appear in the controller browser.

**Workaround:** Switch to Manual Reduced Speed and use the Refresh command on the Integrated Vision node in the browser to make the cameras appear.

**Information – Integrated Vision only works on 32-bit installations**

It is not possible to use Integrated Vision in the 64-bit version of RobotStudio.

**Information – Camera firmware version and update**

The minimum firmware version to be used with Integrated Vision is 4.08. If this version is not available for a specific camera model, then the newest version available shall be used.

There are two important things to know before upgrading a sensor:

- The user must make sure to first backup the files on the camera. This can be done using the Rapid snippets for camera backup/restore, or the FlexPendant Explorer.
- The latest available firmware version may vary across sensor types. However, when the firmware update utility presents the latest available version it shows the firmware with the highest version number which may not apply to the sensor to be updated. However, the appropriate firmware will be applied.

**Information – The spreadsheet view**

The spreadsheet view is not enabled when editing in the following modes “Add part location tool”, “Add part inspection tool”. Before entering the spreadsheet mode click for example “Setup Image” or Output to Rapid.

**Information – Calibration board without fiducial**

When using the calibration boards, checkerboard or board with dots, the user must select the preferred origin by clicking and accepting (press enter) three points on the board. Only after these three points have been selected is it possible to click “calibrate” to execute the calibration.

**Information - Use default camera settings**

If the camera is not using default communication settings the result may be that RAPID instructions return error code “Communication Error”. The safest method to get default settings is to go to Connect->Add Sensor Right click and select “Show all sensors”. Select the device to reset and click “Apply factory settings” in the lower right corner. The most important settings are:

- Telnet port: 23
- User: “admin”
- Password: “”

**Information – User Credentials**

It is now possible to create user profiles with different access levels on the camera. For detailed information about this, please refer to the Integrated Vision User Manual.
Remaining error – Save image on camera

It is not possible to save an image on the camera using “Save Image”. This is by design, but the dialog still allows the user to try to do this. The result is that the image is not saved and no error message is given.

Remaining error - Connect button greyed out for no reason

It may sometimes happen that the “Connect” button is greyed out, with the tooltip saying the camera is not on the correct subnet although the IP settings are OK.

Workaround: Restart the Integrated Vision Add-In.

Remaining error – VC started from Controller->Add controller does not detect cameras

A VC that is started from Controller->Add controller does not detect cameras on the network, even if the VC_network_definition.xml is correctly configured and the firewall is turned off. The reason is that the controller is not able to detect new cameras on the network when it is in "Motors On" state. When the VC is started stand-alone in RobotStudio it is automatically set to "Motors On" when started.

Workaround: To allow it to discover cameras, turn the control panel key to manual mode or launch the VC as part of a station.

User tip - Removing cameras from configuration

To remove a configured camera from the list of configured cameras, use the configuration editor. Enter Configuration->Communication->Application Protocols and remove the desired camera. Perform a warm start to complete the operation.

User tip – Viewing all cameras present on the network

Connect->Add Sensor is normally used for setting the IP addresses of sensors that are not currently on the correct subnet (192.168.125.X). Since the dialog shows all cameras “seen” by the PC, this dialog is useful when error tracing camera network problems.

If a camera does not appear on the network using the “Add sensor” dialog as suggested above, it is advisable to cycle the power of the camera. If the camera receives power from the controller, then cycle power by turning the mains switch.

User tip – Warm start the controller after changing network settings

Whenever changing the network settings of the camera, either from Connect->Add Sensor or Connect->Network settings, it is important to warm start the controller. If this is not done, RAPID instructions will give the error “Communication Error” and the FTP-mounted camera disk is not accessible. If DHCP address is used and persist, please try a static address instead.
5.2 Offline

5.2.1 General

*Some simulation models for IRB 6700 are missing in the ABB Library folder*

The following robot models are missing in the ABB Library/Robots folder:

- IRB6700Inv_210_290_MH6_01.rsl
- IRB6700Inv_210_290_SW6_01.rsl
- IRB6700Inv_245_290_MH3_01.rsl
- IRB6700Inv_270_260_MH6_01.rsl
- IRB6700Inv_270_260_SW6_01.rsl
- IRB6700Inv_300_260_MH3_01.rsl
- IRB6700_150_320_MH3_04.rsl
- IRB6700_150_320__04.rsl
- IRB6700_155_285_MH3_04.rsl
- IRB6700_155_285__04.rsl
- IRB6700_175_305_MH3_04.rsl
- IRB6700_175_305__04.rsl
- IRB6700_200_260_MH3_04.rsl
- IRB6700_200_260__04.rsl
- IRB6700_205_280_MH3_04.rsl
- IRB6700_205_280__04.rsl
- IRB6700_235_265_MH3_04.rsl
- IRB6700_235_265__04.rsl

As a consequence a variant of the following message may appear when RobotStudio identifies a virtual controller with any of the robots above.

```
The library of type '6700_2.85_155' for the mechanical unit 'ROB_1' in robot system 'IRB_6700_155kg_2.85m' is not defined. You must manually search for the library.
```

**Workaround:** Download the missing libraries from the following link  
http://cdn.robotstudio.com/install/MissingRobotsInRobotStudio6.04.00.01.zip

Unzip the package and copy the files to the folder:
C:\Program Files (x86)\ABB Industrial IT\Robotics IT\RobotStudio 6.04\ABB Library\Robots

Note that the path may be different if you have customized the installation.
The robot IRB 1600ID 1.55 m / 6 kg replaced by IRB 1660ID 1.55 m / 6 m in RobotWare 6.04

The robot IRB 1600ID 1.55 m / 6 kg is not available in RobotWare 6.04 and later. It has been renamed to IRB 1660ID 1.55 m / 6 kg. Virtual controller systems for IRB 1600ID 1.55 m / 6 kg based on RobotWare 6.03 cannot be upgraded to RobotWare 6.04 and later. This means that Pack&Go files for this robot based on RobotWare 6.03 cannot be upgraded to RobotWare 6.04 automatically.

Workaround: Re-build or modify the virtual controller system to use IRB 1660ID 1.55 m / 6 kg instead when using RobotWare 6.04 or later.

FlexPendant and RAPID applications run with logged in user rights

A FlexPendant or RAPID application running on the virtual controller runs with the rights of the logged-in Windows user. RAPID applications running in a background task will start to execute when the Pack&Go file is opened and FlexPendant applications will start to execute when the user starts the Virtual FlexPendant.

A warning message has been added to the Unpack&Work wizard to make the user aware that only Pack&Go files (.rspag) from trusted sources shall be opened.

Compatibility of RobotStudio Library and Stations with older RobotStudio versions

RobotStudio is generally not forwards compatible, i.e. it is not possible to load stations or libraries created in RobotStudio 6.04 into an earlier version of RobotStudio such as e.g. RobotStudio 5.x, 6.03.02 or earlier. However, RobotStudio is backwards compatible, which means stations and libraries created in versions 5.x, 6.03.02 or earlier can be opened in RobotStudio 6.04.

TrueMove path visualization fails for customized zone data.

The TrueMove path visualization function only supports predefined zonedata. It will not work for user defined zonedata.

Backup fails for RobotStudio solutions with SafeMove or Electronic Position Switches

Backups are automatically created for virtual controller systems that are part of a RobotStudio solution when saving the station. For virtual controller systems with the RobotWare options SafeMove or Electronic Positioning Switches the backup will fail since these systems contain files that are read-only. As a result, an error message is presented in the output window: “<System name>: Backup failed”. The station will be successfully saved but there will be no backup created.

Workaround: Ignore the error message “<System name>: Backup failed” and create a manual backup whenever needed. The RobotStudio Option “Enable automatic backup of controllers in solution” that is available in “RobotStudio Options -> Robotics -> Virtual Controller” can be de-selected to disable the backup function.
IRB 14000 cannot be combined with any other robot

The function system from layout fails if trying to create a MultiMove system where one robot is an IRB 14000. The reason is that the IRB 14000 cannot be combined with any other robot.

Workaround: Create a separate system for the IRB 14000.

The Work Envelope function does not support IRB 14000

The function is disabled for the IRB 14000 and cannot be activated.

The 2D work envelope fails for certain robot models

As a result, the generated work envelop may appear distorted.

Update of current selection in the 3D graphics window may be delayed

A problem related to the graphics driver has been observed on certain PCs. The problem is that the update of the current selection in the 3D graphics is delayed until the next redraw.

Workaround: Add or uncomment the following line in the file RobotStudio.exe.config

```
<add key="DoublePresentWorkaround" value="true" />
```

Failure to open Pack&Go file to same folder the second time

RobotStudio will prevent Pack&Go files to be opened to the same folder a second time if the station contains VC systems with the EPS or SafeMove option. This is by design to prevent the safety controller configuration file to be accidentally overwritten.

Workaround: Remove the write protection manually using Windows Explorer.

Updates of instruction template and code snippets

RobotStudio will not automatically update the user files for instruction templates and code snippets files in the folders:

```
...\My Documents\RobotStudio\Instruction Templates
...\My Documents\RobotStudio\Code snippets
```

Workaround: The user has to manually copy the latest files from

```
%ProgramFiles%\ABB Industrial IT\Robotics IT\RobotStudio 5.xx\Instruction Templates,
and

%ProgramFiles%\ABB Industrial IT\Robotics IT\RobotStudio 5.xx\Code Snippets
```

to the data folder.

IO signals configured with access level ‘DEFAULT’

When IO signals are configured with access level ‘DEFAULT’, only input signals are possible to set/reset from the I/O Simulator and I/O Window. To be able to affect also output signals, set the access level to ‘ALL’ for them in the Configuration Editor.

VC does not start with RRI option and GSI folder structure missing.

The VC will hang when started with a system containing the RobotWare option RRI (Robot Reference Interface) if the GSI folder structure is missing.

Workaround: create GSI Folder before starting the VC inside the HOME directory of the system. See the Application Manual for Robot Reference interface for more information.
**System in Guard Stop state in Automatic mode after run-time error**

Certain run-time errors may cause the controller system to enter Guard Stop state in Automatic mode. This is the same behavior as in a physical robot controller system. This typically happens when a run-time error related to Conveyor Tracking occurs. A simulation cannot be started when the controller is in this state.

**Workaround:** To reset the controller state, open the Control Panel window and first switch to Manual mode, and then back to Automatic mode.

**Information message starting system with IRB260/460/660/760**

Starting a system with IRB260/660 gives you an error message: ‘The number of joints is different between the library model and the controller configurations’. The reason is that the IRBx60 is modeled with six joints in RobotStudio of which two are locked, but has four joints in the VC.

**Path handling of instructions with multiple joint targets**

The path functions Rotate, Translate, and Mirror do not work as expected with instructions containing via points as joint targets. The functions will leave the joint targets as is. Interpolate Path gives an Unknown Error and Tool Compensation reports an error message.

**Event Manager: Simulation cannot be triggered by analog system signals**

The event manager only supports analog station signals, not analog system signals.

**Conveyor Tracking**

**Incorrect default values for c1Position and c1Speed for RobotWare 5 with the PaintWare option**

The default values for the parameters c1Position and c1Speed may become incorrect for a virtual controller system. The symptom is that its attribute values are all zero, see snapshot below.

**Workaround:** Save the following lines to a CFG file named ‘TEMP.CFG’ or similar and load in the virtual controller followed by a restart.

```plaintext
EIO:CFG_1.0:5:0:
#
EIO_SIGNAL:
  -Name "c1Position" -SignalType "AI" -Unit "CnvIf"
  -SignalLabel "ctPosition" -UnitMap "0-31" -Access "ALL"
```
5.2.3 Station Viewer

Memory problem when doing Save As Viewer or Record to Viewer with large stations

RobotStudio may run out of memory (OutOfMemory exception) when doing Save As Viewer or Record To Viewer if the station is very large.

Workaround: Use the 64-bit version of RobotStudio and create a 64-bit viewer by ticking the checkbox in the Save As Viewer file dialog.

5.2.4 MultiMove

MultiMove error: ‘Object reference not set to an instance of an object’

When the Test Play button is pressed in the MultiMove tool, the following error message may be displayed: ‘Object reference not set to an instance of an object’, but the robot moves and the Status ‘Calculation OK’ is displayed. In addition, when ‘Create Paths’ is pressed the following message is displayed: ‘Can't create paths : Value cannot be null’, and no paths are created. In the ‘Create Paths Settings’, is the WP TCP drop down empty.

Reason: Workobject is not set for the current task

5.2.5 External Axis

Error 50091: ‘Restart not possible’ after warm start of a system with external axis

When restarting a system with activated mechanical units the activation state is lost. Then the program can no longer be started from the Virtual FlexPendant, the RAPID Editor or the RAPID Tasks window.

Workaround: Reset the program pointer (‘Program Pointer to Main’) before starting the program from the Virtual FlexPendant, the RAPID Editor or the RAPID Tasks window, or, start the program from the Simulation Play button.

5.2.6 Network Drives and UNC Paths

RobotStudio on computers with roaming user profiles

RobotStudio may fail on PC configurations with roaming user profiles, i.e. when the users’ documents folder resides on a server and not on the local disk.

Workaround: Redefine the ‘User Project Folder’ to a folder on the local disk (File → Options → General → Files&Folders → User Project Folder).

Virtual Controller does not support UNC paths

UNC paths cannot be used to locate Virtual Controller systems. Using UNC paths for VC systems will cause the log message ‘Failed to initialize FW upgrade framework’ to appear when the system starts. Subsequent attempts to work with the VC such as synchronizing RAPID data will fail.

Creating and starting systems located on a network drive

When using a network drive to store RobotStudio data such as RobotWare systems or the RobotWare mediapool, the following problems may occur
- Virtual controller does not start
- Not possible to open Virtual FlexPendant

**Cause:** By default, the .NET Framework does not allow execution of code from a remote file system. This means the application may behave unexpectedly if the media used by the system or the system itself resides on a network share.

**Workaround:** To resolve this, the user must explicitly grant the required permissions:

1. Open the file Virtual FlexPendant.exe.config located in C:\Program Files (x86)\ABB Industrial IT\Robotics IT\RobotStudio 5.61\Bin
2. Add the following lines

```xml
<?xml version="1.0"?>
<configuration>
  <startup useLegacyV2RuntimeActivationPolicy="true">
    <supportedRuntime version="v4.0" sku=".NETFramework,Version=v4.0"/>
  </startup>
  <runtime>
    <loadFromRemoteSources enabled="true"/>
  </runtime>
</configuration>
```

The Virtual FlexPendant must be restarted for the changes to take effect.

---

**Note**

Windows security settings may prevent the file from being directly edited in the default location. Copy the file to your local Documents folder to edit it. Upon completion, you need to manually copy the file back to its original location.

---

**5.2.7 RAPID**

**Robtargets that are LOCAL to a PROCEDURE cannot be synchronized with RobotStudio**

The RobotStudio synchronization engine that translates 3D data of the station to RAPID code and vice versa does not support robtargets that are declared locally to a procedure.

**Workaround:** Declare the robtargets as global or local to a module instead.

**Robtarget names must be unique in RAPID even if they are LOCAL**

RobotStudio requires that robtarget names are unique for the RAPID synchronization to work properly, i.e. you cannot have a global robtarget named pMyTarget1 in module A and a local robtarget with the same name in Module B.

**Global robtargets cannot be made local through Synchronization to VC**

Global robtargets cannot be changed to local through Synchronization to VC, the option is disabled (PDD 3140).

**Workaround:** Change the robtargets to module local in the RAPID Editor and Synchronize to station.

**Error Message: Sync. to Station completed with errors**

*Error Message: Sync to Station completed with errors: New data <name> <type> has same name as existing object in same block <routine>.*
When this error message appears, there is a storage type mix-up between data already stored in RS and in the VC. Because of this, and per design, the data is not considered the same data.

**Workaround:**
1. Ensure all data declarations have the same definition in RS as in RAPID (there is no user interface for this).
2. Sync to station should now work.
3. Sync back to controller, and remember to change the data declarations back to what you want.

### 5.2.8 Paint

**Lack of Virtual Controller support for the Paint systems**

Paint systems that are configured using the Paint package I/O option Discrete, Compact or Fieldbus, will result in a SysFail state.

**Workaround:** Re-create the system with the simulated I/O option.

### 5.2.9 Graphics and Geometry

*For SolidWorks 2015 onwards only 64-bit Operating System is supported.*

The 32-bit version of RobotStudio is not supported.

**Some CAD converters not available in Premium trial license**

No trial license available for CAD converters for DXF/DWG, JT, NX, Parasolid, Solid Edge, and SolidWorks.

**Enforce selected graphics device for PCs with multiple graphics cards**

For best performance when running RobotStudio on a PC with multiple graphics cards, RobotStudio can be configured to use a specified device. By this option you can ensure maximum performance. This is useful for e.g. Lenovo W540 that has both an integrated Intel graphics device and a discrete NVIDIA card.

Open the file RobotStudio.exe.config that is located in the folders

C:\Program Files (x86)\ABB Industrial IT\Robotics IT\RobotStudio 6.0\Bin64

and

C:\Program Files (x86)\ABB Industrial IT\Robotics IT\RobotStudio 6.0\Bin

and uncomment the line

```xml
<add key="GraphicsDeviceType" value="Discrete"/>
```

Valid values are 'Discrete', 'Integrated' and 'Warp' (software renderer).

Note that there are two different files, one for the 32-bit version, and another for the 64-bit version.

**Problems when undoing Boolean operations on Geometry**

Undoing a Boolean operation might not succeed. To recover from these problems, you need to delete the items that caused the problem.

**Out of memory**

The application might fail when out of memory due to the import of very large ACIS files or load of very large stations.

**Workaround:** Use the 64-bit version that can handle more memory. Ensure that you have enough memory installed on the PC, see System Requirements.
5.3 ScreenMaker Limitations

A ScreenMaker application may fail to build if the DPI setting is not set to 100%

Certain UI controls in ScreenMaker may fail to build correctly if the DPI setting is not set to ‘Smaller – 100%’.

**Symptom:** The error message caused by this problem will read ‘System.Drawing.Font does not contain a constructor that takes 2 arguments.’

**Workaround:** Set DPI to 100% on your PC.

File changes to FlexPendant applications does not load the changes until a FlexPendant reset

With RobotWare 6.0x the controller’s restart will no longer reset the FlexPendant memory. This was part of an effort to improve the restart time of the controller.

This means that after placing a new FlexPendant application file(s) on the FlexPendant unit, you need to manually reset the FlexPendant for it to reload its assets.

To manually reset the FlexPendant you need to use the reset button on the FlexPendant’s backside. (See Operating Manual – IRC5 with FlexPendant, 3HAC16590)

Dynamic update of Rapid Data

The switch from Manual Mode to Auto Mode causes the RAPID boolean data bound to the enabled property of control change to value TRUE. This behavior is noticed when the mode is changed from a different screen and not on the screen where the control is bound to RAPID boolean data. An additional side effect is that the enabled property of RunRoutine button has been disabled as similar behavior was seen.

Running Routine with Movement

RunRoutine Button control does not always work correct when a routine with movements is called.

As a workaround use instructions like StopMove, StorePath, RestorePath and StartMove to control the movements of the robot.

A Trap routine could be called with a normal button control and in the Trap the above instructions can be used to control the movements of the robot.

PictureBox control as a Widget

If a Picture Box control is created as a widget from a Windows 8 operating system, the control is not shown on the FlexPendant. The behavior is fine with any other operating system like Windows 7.
6 RobotWare Compatibility

6.1 General

Supported RobotWare versions
RobotStudio 6.02.01 is distributed with RobotWare 6.02.01 and works with RobotWare 5.07 and later. Please check details below.

6.2 RobotWare 5.05 and 5.06 Compatibility
RobotWare 5.05 and 5.06 including revisions thereof are not supported by RobotStudio 5.15 and later versions. Please use the corresponding version of RobotStudio for managing robot controllers with any of these RobotWare versions.

6.3 RobotWare 5.07 Compatibility
RobotWare 5.07 and its revisions of are supported with the following limitations:

   General
   The location of the program pointer is not updated in the RAPID Editor during program execution.

   Offline
   A limitation in the versions 5.07.02, 5.07.03, and 5.07.04 of RobotWare may cause the Virtual Controller to System Failure state during I-start on certain computers. The problem is due to the ctrl.bin-file not being correctly created.
   Workaround: Create an empty ctrl.bin file in the INTERNAL folder of the controller system, and then perform a warm start.

   Note
   The problem will reappear if the system is I-started.

   The virtual controller does not support RobotWare 5.07.08 and RobotWare 5.07.07.

   Online
   FlexPendant Viewer does not work RobotWare 5.07

6.4 RobotWare 5.08 Compatibility
RobotWare 5.08 and its revisions of are supported with the following limitations:

   Offline
   RobotWare 5.08 is not supported.
   Workaround: Use RobotWare 5.08.01 or later.

6.5 RobotWare 5.10 Compatibility
RobotWare 5.10 and its revisions of are supported with the following limitations:

   Offline
   Starting a controller will generate internal UAS error in controller error log.

6.6 RobotWare 5.11 Compatibility
RobotWare 5.11 and its revisions of are supported with the following limitations:
Offline

Linear jogging of a robot across joint values that will cause a change of confdata may fail. For example, if the robot is jogged linearly when joint values is passing 90 degrees for axis 1 may cause the robot to stop or to change configuration.

6.7 RobotWare 5.12 Compatibility

RobotWare 5.12 and its revisions of are supported with the following limitations:

**Paint backups from RW 5.12.01 not compatible with RW 5.12.02 or later**

Restoring a paint system backup from RobotWare 5.12.01 will cause SysFail for RobotWare 5.12.02 or later

**Workaround:** Add the following parameters to the configuration files

**EIO.CFG**:

- **EIO_SIGNAL:**
  - _Name_ "doMainInMC" _-SignalType_ "DO" _-Unit_ "SysComm" _-UnitMap_ "44"
  - _Name_ "AIHVErrNo" _-SignalType_ "GO" _-Unit_ "SysComm" _-UnitMap_ "150-151"
  - _Access_ "ALL"
  - _Name_ "AIHVEn" _-SignalType_ "DO" _-Unit_ "SysComm" _-UnitMap_ "155"
  - _Access_ "ALL"

- **EIO_CROSS:**
  - _Res_ "AIHVEn" _-Act1_ "HVEnabled"

**SYS.CFG**:

**CAB_TASK_MODULES:**

- _File_ "INTERNAL:/pntrapid/T_ROB1/cycinfo.sys" _-ModName_ "cycinfo"
  - _Task_ "T_ROB1"
- _File_ "INTERNAL:/pntrapid/csvlkup.sys" _-ModName_ "csvlkup" _-AllTask_ "Hidden"

6.8 RobotWare 5.13 Compatibility

RobotWare 5.13 and its revisions of are supported with the following limitations:

**Paint backups from RW 5.12.02, 5.12.03 or RW 5.13 or 5.13.01 not compatible with RW 5.13.02 or RW 5.13.03**

There are several changes in the configuration database for I/O (EIO.CFG) and Controller (SYS.CFG) that will cause System Failure if an old backup is loaded. There are also changed in installed RAPID modules. To create a compatible configuration, proceed as follows:

1. Create and start a VC with a RobotWare 5.13.03 system containing the same options as your original backup, but do not load the backup.

2. Save the EIO.CFG and SYS.CFG to file.

3. Compare the saved files with the corresponding files of your backup. (You can use a text file comparison tool for simplification.)

4. Add your system-specific configuration to the general configuration files saved from the 5.13.01-system using a text editor.

5. Replace the files of the original backup with the corresponding modified configuration files.

6. Go through the RAPID modules of the backup and remove the default modules (i.e. those that are not changed by the user).

7. Load the backup and restart the system. You are done.
6.9 RobotWare 5.15 Compatibility

Signal Analyzer Online
The feature Signal Analyzer Online requires RobotWare 5.15.03 or later.

6.10 RobotWare 6 Compatibility

Overview
RobotWare 6.00 and 6.00.01 systems cannot be directly upgraded to RobotWare 6.01. To upgrade a system, you need to create backup and migrate it using the tool 'Migrate Backup or Folder', then recreate the system and finally, restore the backup.

For this reason, the functions ‘Unpack&Work’, ‘Go Offline’ and ‘New Solution with Station and Robot Controller – From backup’ are blocked to prevent upgrade from RobotWare 6.00 or 6.00.01 to RobotWare 6.01.

RobotStudio, however, is compatible with both RobotWare 6.00 / 6.00.01 and 6.01.

6.11 General Compatibility Limitations

RAPID Profiler
The profiler will be able to create a log file for the profiler automatically for RobotWare 5.14 or later. For RobotWare 5.13 or earlier, the log file must be created manually using the RAPID Spy command (SpyStart/SpyStop).

Safety Configuration
Safety configuration of a track motion IRC5 system equipped with a safety controller of type EPS or SafeMove can be done without the need to read track motion parameters manually when using RobotWare 5.11.01 or later. Encrypted parameters needed by the safety controller will be automatically read by EPS Wizard and SafeMove Configurator, respectively.

Signal Analyzer Online
Signal Analyzer Online requires RobotWare 5.15.01 or later.

Signal Analyzer.
The error message Failed to subscribe on signal may sometimes appear during signal recording for RobotWare 5.15 or earlier.

Workaround: Restart the VC or upgrade to RobotWare 5.15.01 or later.

Configurations
The feature Configurations for selecting the robot arm configuration (confdata) may fail, or not present all solutions, in some specific circumstances even when the target is reachable if RobotWare 5.14 or earlier is used.

Workaround: Upgrade to RW5.14.01 or later

6.12 ScreenMaker Compatibility

RobotWare
It is possible to use previous RobotWare versions, but with some limitations.

- ActionTrigger will work only on RobotWare 5.12.02 or later.
• The controls Button, TpsLabel and PictureBox controls was modified in RobotStudio 5.13. The property 'Allow MultipleStates' of these controls can be accessed from RobotWare 5.13 and later.

• Variant Button will work only on RobotWare 5.14.01 or later

• Conditional Trigger will work only on RobotWare 5.14.01 or later

• Widgets will work only on RobotWare 5.60 or later.

FlexPendant SDK

ScreenMaker should be used with FlexPendant SDK 5.12.02 or later. ScreenMaker allows selection of FlexPendant SDK version when it is launched. If only one version of FlexPendant SDK is available in the system, it is loaded by default.

6.13 Support for future RobotWare versions

RobotStudio 6.04.00.01 supports all future minor revisions of RobotWare 6.04, but no future major releases. For example, RobotStudio 6.04.00.01 will support RobotWare 6.04.01 (if, and when available) but not RobotWare 6.05, or 6.06.
