All asset-intensive businesses must manage their assets in order to realize the full lifecycle value of those investments – but managing a lot of assets does not mean that you are practicing asset management.

Implementing a fully-developed asset management system is a holistic exercise. It can be accomplished in stages, based on the budget, capacity for change, and each individual enterprise’s overall priorities. Nevertheless, it should start with a solid understanding of both the “big picture” and the component parts required, and the benefits of each.

Asset management overview training

This two-day training session, based on the ISO 55000 Standard for Asset Management Systems, will be tailored to the needs of your organization to provide a high-level end-to-end overview of all the components of a modern asset management system, and will guide you to identifying the most beneficial approach for your organization.
Proven methodology

Our service delivery methodology is a performance-proven, four-step process that yields results.

1 Prepare
ABB will work with you to determine the scope & objectives and identify key contributors.
ABB will schedule and prepare a two-day, on-site workshop, and schedule required attendees.

2 Execute
ABB will conduct an on-site workshop to provide a facilitated, high-level tour through the different components of asset management.
ABB’s ISO-certified facilitator will guide your executive team through localization and identification of both the implementation considerations and potential benefits of each.

3 Recommend
The workshops will end with a facilitated session to help your team coalesce a provisional action plan that will provide an immediate ROI, as well as longer-term strategy.

4 Review and follow up
Copies of all materials presented will be made available to attendees.
ABB can provide further specialized consulting packages to facilitate implementation of all the different asset management component parts covered in this training module.
