If a terminal base TB5xx or a terminal unit TU5xx should be mounted with screws, the wall mounting accessories TA526 must be inserted at the rear side first. This plastic parts prevent bending of terminal bases and terminal units while screwing up.

Handling instructions

Handling of the wall mounting accessory is described in detail in the section *Mounting and disassembling the terminal unit* ↬ *"Mounting with screws" on page 5328* and *Mounting/Disassembling Terminal Bases and Function Module Terminal Bases* ↬ *"Mounting with screws" on page 5326*.

TA541 - Battery

- Manganese dioxide lithium battery, 3 V
- Non-rechargeable

Purpose

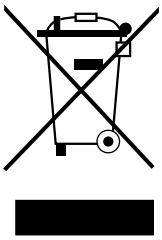
The TA541 lithium battery is the only applicable battery for PM595 *Chapter 1.6.2.3.2.2 “PM595-4ETH” on page 3863*. It is used to save RAM content of the processor module (PM595-4ETH-F only) and to back-up the real-time clock (all PM595 variants). It cannot be recharged.

The processor modules are supplied without a lithium battery. It therefore must be ordered separately. The lithium battery is used to save RAM contents of AC500 processor modules and back-up the real-time clock. Although the processor modules can work without a battery, its use is still recommended in order to avoid process data being lost.

The CPU monitors the discharge degree of the battery. A warning is output, before the battery condition becomes critical (about 2 weeks before). After the warning message has appeared, the battery should be replaced as soon as possible.

Handling instructions

- Do not short-circuit or re-charge the battery! It can cause excessive heating and explosion.
- Do not disassemble the battery!
- Do not heat up the battery and not put into fire! Risk of explosion.
- Store the battery in a dry place.
- Replace the battery with supply voltage ON in order not to risk data being lost.
- Recycle exhausted batteries meeting the environmental standards.



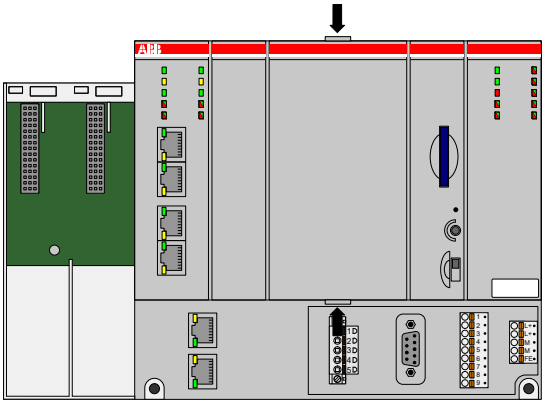
Battery lifetime

The battery lifetime is the time the battery can store data while the CPU is not powered. As long as the CPU is powered, the battery will only be discharged by its own leakage current.

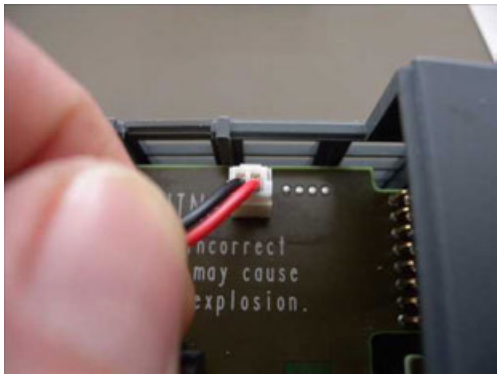
Insertion

The TA541 lithium battery is the only applicable battery for processor modules PM595.

1. Remove the front cover / display by pressing the marked areas with your fingers and pull it to the front.

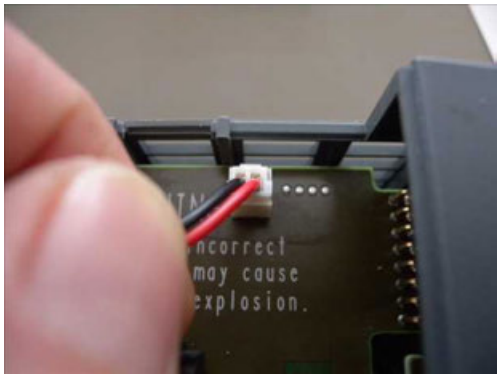


2. Remove the old battery from the battery compartment by pulling it by the small cable. Remove then the small connector from the socket.



3. Remove the battery from its package and hold it by the small cable.

4. Insert the battery connector into the connector port of the PCB. The connector is keyed to find the correct polarity (red = positive pole = right side).



5. Insert the battery into the battery compartment on the left side as shown in the figure.

6. Re-assemble the front cover / display by pressing it straight from the front until it snaps in.

In order to prevent data losses or problems, the battery should be replaced after 3 years of utilisation or at least as soon as possible after receiving the "low battery warning" indication.

Do not use a battery older than 3 years for replacement, do not keep batteries too long in stock.

Replacement of the battery

For PM595-4ETH-F only: battery replacement should be done with the system under power. Without battery and power supply there is no data buffering possible.

For PM595-4ETH-M-XC only: battery only back-ups the real-time clock.

1. Remove the front cover / display by pressing the marked areas and pull it to the front.
2. Remove the old battery from the battery compartment by pulling it by the small cable. Remove then the small connector from the socket, do this best by lifting it out with a screwdriver.

   Follow the previous instructions to insert a new battery.

CAUTION!

Risk of explosion!

Do not open, re-charge or disassemble a lithium battery. Attempts to charge lithium batteries lead to overheating and possible explosions.

Protect them from heat and fire and store them in a dry place.

Never short-circuit or operate lithium batteries with the polarities reversed. The batteries are likely to overheat and explode. Avoid chance short circuiting and therefore do not store batteries in metal containers and do not place them on metallic surfaces. Escaping lithium is a health hazard.

Technical data

Parameter	Value
Nominal voltage	3 V
Nominal capacity	1800 mAh

Parameter	Value

Installation of cable driver

OPERATION INSTRUCTION

PROGRAMMING CABLE TK503 / TK504

USB DRIVER INSTALLATION

Contents

1 Introduction and Basics

1.1 Intended Use

The TK503/TK504 programming cable can be used to operate and to configure the PLC via a PC or laptop. For this, CODESYS software, driver and utility programs must be installed and a TK503 or TK504 programming cable must be connected.

NOTICE!

The TK503/TK504 programming cable cannot be used for AC500 V3 Processor Modules.

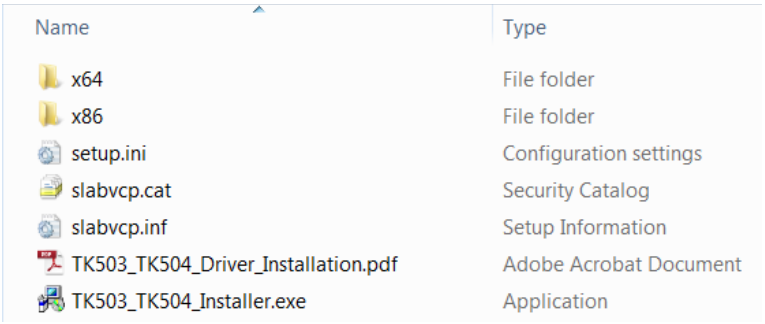
1.2 PC System Requirements

- Platform: Microsoft Windows Vista, Windows 7, Windows 10
- CD-ROM drive
- USB port available for connecting the TK503/TK504 programming cable

NOTICE!

Microsoft, Windows and the Windows logo are trademarks of Microsoft Corporation in the USA and/or other countries. All other product and company names are trademarks of their respective owners.

1.3 Content of the Installation Package



2 Installation

2.1 Installation Steps

Before you can use the TK503/TK504 programming cable, the appropriate USB driver must be installed on your PC or laptop.

The driver for the TK503/TK504 programming cable is installed in two steps:

– Pre-installation of the driver on your PC using the program *TK503_TK504_Installer.exe*.

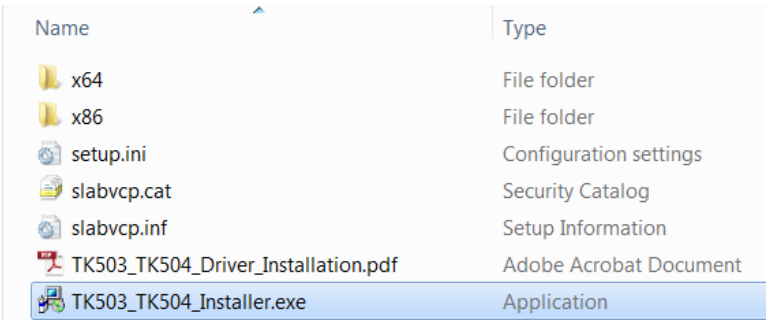
– Installation of the new hardware in Windows after the TK503 programming cable or TK504 programming cable is plugged in for the first time.

NOTICE!

Before you connect the TK503/TK504 programming cable with the PC, install the USB driver first.

2.2 Pre-Installation Routine

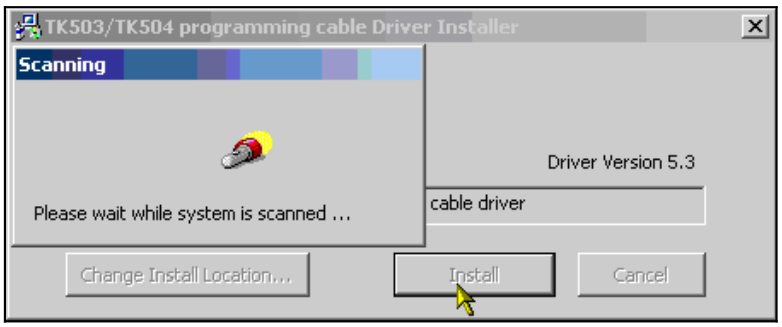
1. Uninstall all existing versions of the driver software.
2. Start the pre-installation of the driver by calling *TK503_TK504_Installer.exe.*



NOTICE!

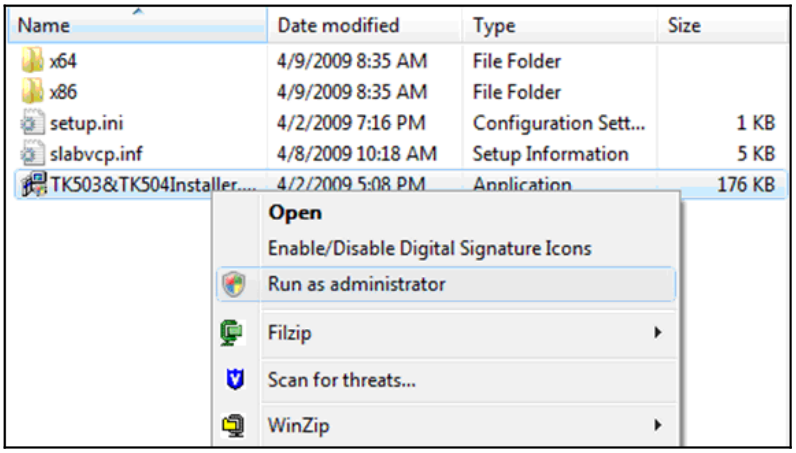
You must have administrator rights to run the installation.

3. Define the installation directory and click **Install**.



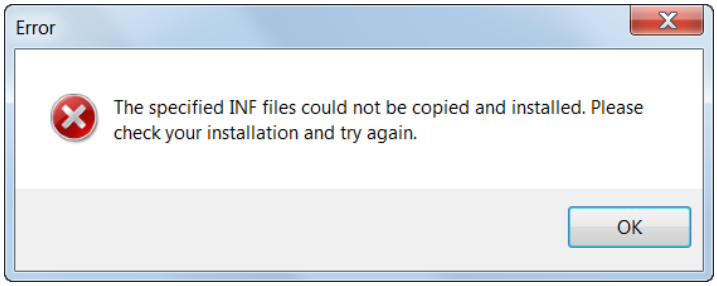
Windows Vista users only:

Start the *TK503&TK504Installer.exe* with the **Run as administrator** option, even if you have administrator rights. Acknowledge the following dialog with **Allow**.

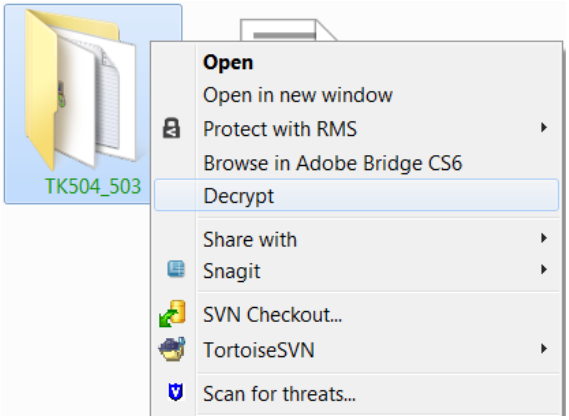


Windows 7 users only:

Windows will display an error message after clicking **Install**.



On this condition, decrypt the installation folder:



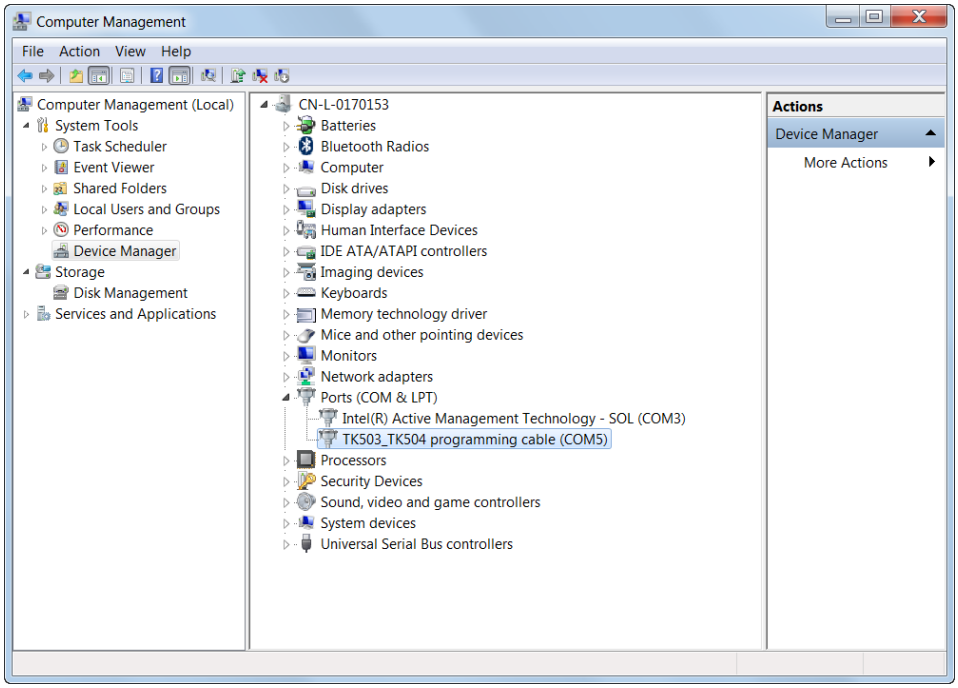
Then, start *TK503_TK504_Installer.exe* with the **Run as administrator** option again.

3 Communication

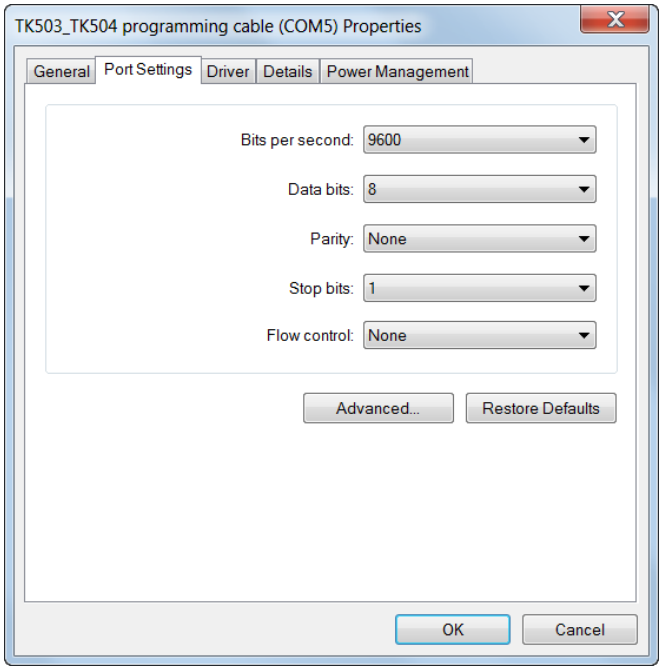
3.1 Virtual Communication Port Configuration

If the TK503/TK504 programming cable is plugged in a USB interface, Windows creates a virtual communication port (COM port).

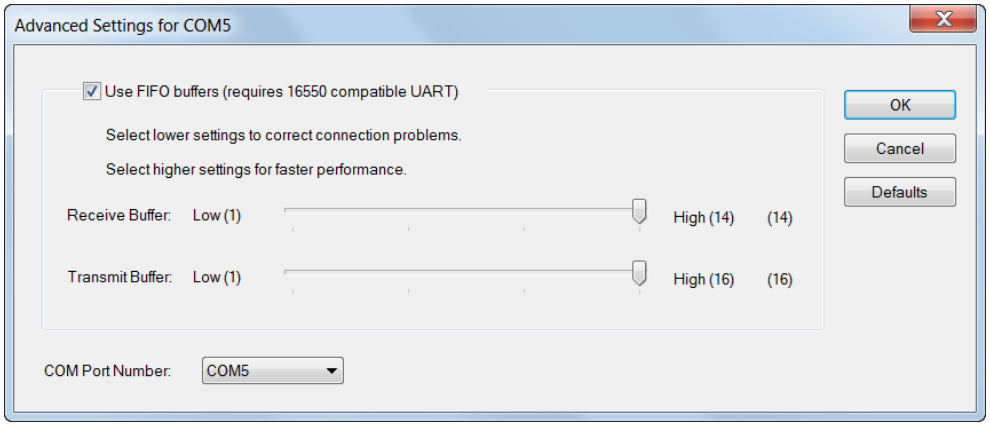
All communication ports can be viewed in the Windows Control Panel under Device Manager.



4. In the Ports settings click **Properties** to set the baud rate.



5. Set the COM port number under **Advanced** (up to COM32).

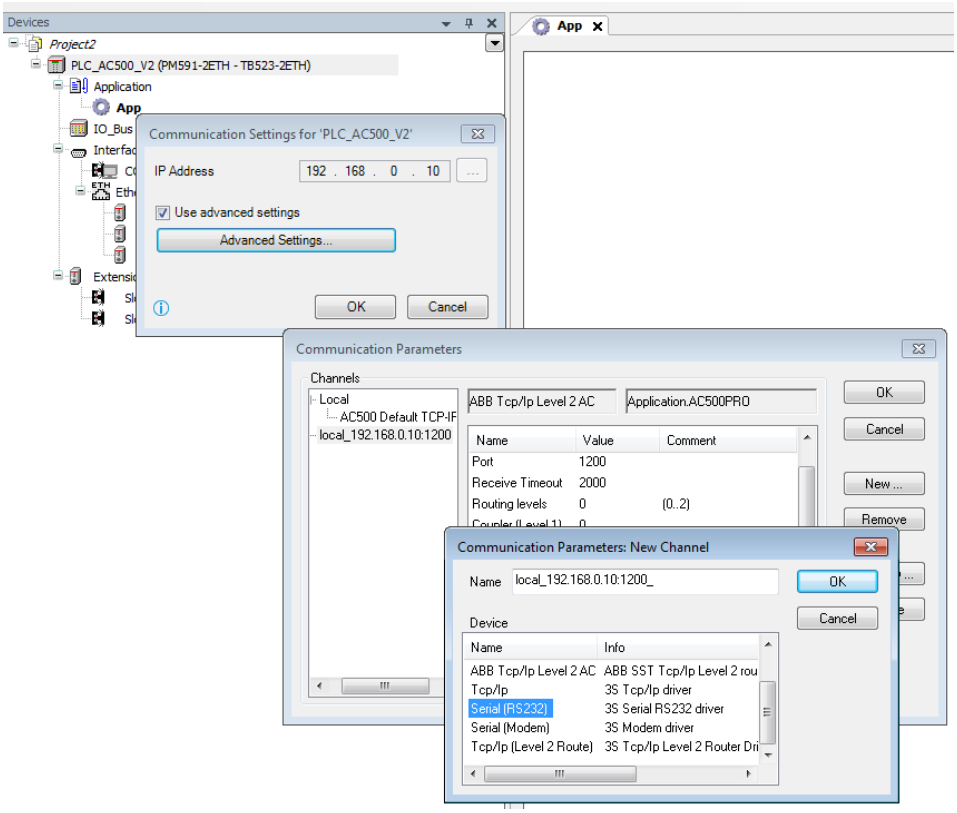


NOTICE!

When configuring the communication connection in CODESYS, the baud rate can also be set separately for each COM connection.

4 Automation Builder Communication

1. Install TK503/TK504 programming cable driver.
2. Connect the TK503 or TK504 programming cable to aPC or laptop. Windows detects the new hardware – complete the installation.
3. Start Automation Builder and open the project.
4. Right-click the PLC root node and select **Communication Parameters.**
5. Select the new virtual COM port.



NOTICE!

The port number must be the same as the port number in the Device manager – Port – TK503/TK504 programming cable (COMx). Otherwise the communication cannot be built up.

The number of COM ports depends on the availability on your computer.
The baud rate can be selected between 19200 and 115200 bps.

6. In CODESYS, create the communication between Automation Builder and the PLC.

1.6.2.9.3 S500-eCo

TA563-TA565 - Terminal blocks

These terminal blocks must only be used with AC500-eCo I/O modules and AC500-eCo processor modules.

Intended purpose

The TA563-TA565 terminal blocks are used to connect process signals and process voltages to AC500-eCo I/O modules and AC500-eCo processor modules (with -P extension inside their type designator only). 3 different kind of terminal blocks are available:

- Screw terminals with cable insertion on the side
- Screw terminals with cable insertion on the front
- Spring terminals with cable insertion on the front

Of each kind, 2 sizes are available:

- Terminals with 9 pins
- Terminals with 11 pins.

There are 2 compatible variants of each kind and size.

WARNING!

For screw terminals only: Danger of death by electric shock!

The IP 20 protection degree is only provided if all terminal screws are tightened.

Tighten all screws of unused load terminals of relay outputs if voltages > 24 V are connected to the relay group.

Technical data

Table 590: Screw-type terminals (TA563/TA564)

Parameter		Value
Type		Front terminal or side terminal (depending on model)
Conductor cross section		
	Solid	0.5 mm^2 to 2.5 mm^2
	Flexible	0.5 mm^2 to 2.5 mm^2
Stripped conductor end		
	TA563	8 mm
	TA564	10 mm
Width of the screwdriver		3.5 mm
Fastening torque		0.4 Nm - 0.5 Nm
Degree of protection		IP 20 (if all terminal screws are tightened)
Conductor cross section flexible, with ferrule with/without plastic sleeve		Min. 0.25 mm^2 Max. 1.5 mm^2

Table 591: Spring terminals (TA565)

Parameter		Value

1.6.2.9.4 S500

CP-E - Economic range

The power supplies feature series and parallel connection as well as a true redundant setup via a redundancy module.

- Wide-range input voltage
- Mounting on DIN rail
- High efficiency of up to 90 %
- Low power dissipation and low heating
- Wide ambient temperature range from -40 °C...+70 °C
- No-load-proof, overload-proof, continuous short-circuit-proof
- Power factor correction (depending on the type)
- Approved in accordance with all relevant international standards

Table 592: Ordering data

Order No.	Type	Input	Output	Overload capacity	Module width [mm]
1SVR427030R0000	CP-E 24/0.75	100-240 V AC or 120-370 V DC	24 V DC, 0.75 A	-	22.5

CP-C.1 - High performance range

The power supplies feature series and parallel connection as well as a true redundant setup via a redundancy module.

The CP-C.1 power supplies are ABB's high performance and most advanced range. With excellent efficiency, high reliability and innovative functionality it is prepared for the most demanding industrial applications. These power supplies have a 50 % integrated power reserve and operate at an efficiency of up to 94 %. They are equipped with overheat protection and active power factor correction. Combinded with a broad AC and DC input range and extensive worldwide approvals the CP-C.1 power supplies are the preferred choice for professional DC applications.

- Typical efficiency of up to 94 %
- Power reserve design delivers up to 150 % of the nominal output current
- Signaling outputs for DC OK and power reserve mode
- High power density leads to very compact and small devices
- No-load-proof, overload-proof, continuous short-circuit-proof
- Active power factor correction (PFC)

Table 593: Ordering data

Order No.	Type	Input	Output	Overload capacity	Module width [mm]

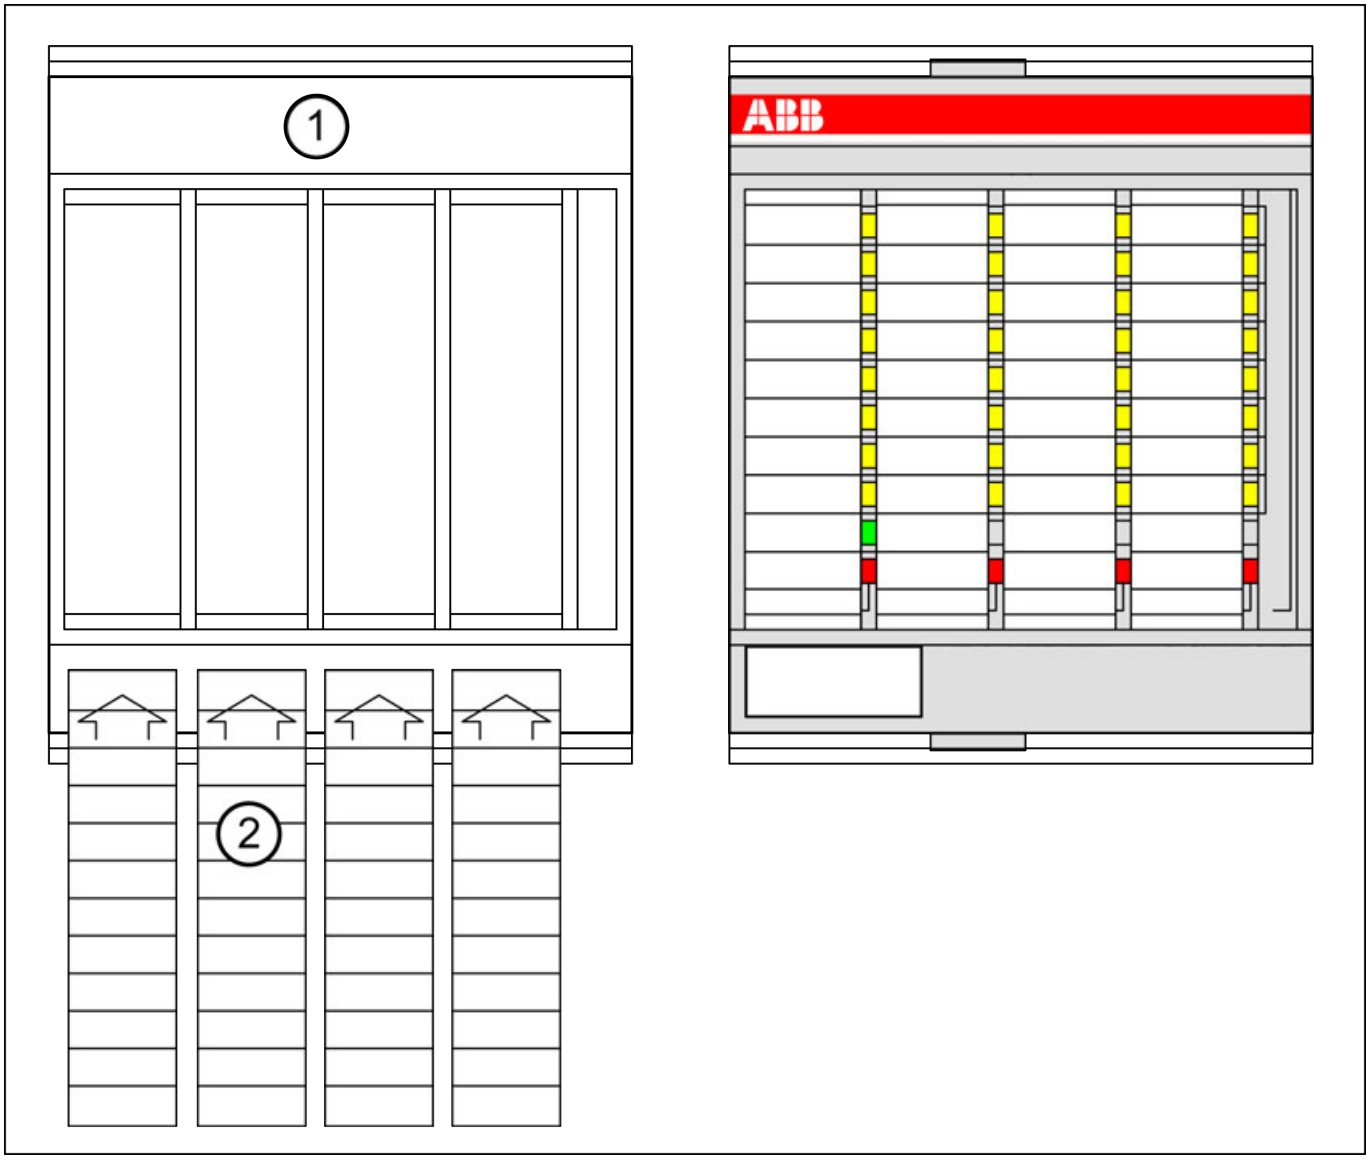
1SVR360763R1001	CP-C.1 24/20.0	110-240 V AC or 90-300 V DC	24 V DC, 20 A	+30 %	82

TA523 - Pluggable label mounting

For labelling the channels of S500 I/O modules.



1 Pluggable label mounting TA523
2 Plastic labels to be inserted into the holder

Purpose

The pluggable label mounting is used to hold 4 plastic labels, on which the meaning of the I/O channels of I/O modules can be written down. The holder is transparent so that after snapping it onto the module the LEDs shine through.

Handling instructions

The plastic labels can be printed out from TA563.doc *http://new.abb.com/products/ABB1SAP180500R0001*.

TA535 - Protective caps for XC devices

Purpose

Accessory to cover unused connectors of XC devices in salt mist environments.

One TA535 package includes different cap types for the following connectors:

- RJ45 connectors
- 9-pole D-sub connector
- FieldBusPlug connector

Protection should be done for all unused slots of -XC devices.

1.6.3 System assembly, construction and connection

1.6.3.1 Introduction

This chapter provides information on assembly, construction and connection of control systems of the product family AC500.

The AC500 product family consists of the sub-families:

- AC500 (standard): standard PLC that offers a wide range of performance levels and scalability.
- AC500-eCo: cost-effective PLC that offers total inter-operability with the core AC500 range.
- AC500-S: PLC for special safety requirements in all functional safety applications.

AC500 (standard) and AC500-S provide devices with -XC extension as a product variant. Those devices operate mainly identical to the appropriate AC500 product family, however, can be operated under extreme conditions ↳ *Chapter 1.6.3.7.1 “System data AC500-XC” on page 5389*.

AC500 product family is characterized by functional modularity, i.e. the devices of all AC500 sub-families can be combined flexible.

As assembly, construction and connection for the devices of the AC500 product family is similar, information that is valid for all sub-families is provided within an overall section. Details that are only valid for a specific AC500 sub-family are described in separate sections.

As assembly, construction and connection for the devices of the AC500 product family is similar, information that is valid for all sub-families is provided within an overall section ↳ *Chapter 1.6.3.4 “Overall information (valid for complete AC500 product family)” on page 5218*. Details that are only valid for a specific AC500 sub-family are described in separate sections.

Consider the safety instructions

In the description, special attention must be paid to designs using galvanic isolation, grounding and EMC measures for the reasons stated. Consider the safety instructions for AC500 product family ↳ *Chapter 1.6.3.3 “Safety instructions” on page 5214.*

1.6.3.2 Regulations

Appropriate system setup

The following regulations have to be taken into due consideration:

- DIN VDE 0100: "Regulations for the Setting up of Power Installations"
- DIN VDE 0110 Part 1 and Part 2: "The Rating of Creepage Distances and Clearances"
- DIN VDE 0160 and DIN VDE 0660 Part 500: "The Equipment of Power Installations with Electrical Components"

To ensure project success and proper installation of all systems, customers must be familiar and proficient with the following standards and must comply with their directives:

- DIN VDE 0113 Part 1 & Part 200: "Working & Process Machinery"
- DIN VDE 0106 Part 100: "Close proximity to dangerous voltages"
- DIN VDE 0160, DIN VDE 0110 Part 1: "Protection against direct contact"

The user has to guarantee that the devices and the components are mounted following these regulations. For operating the machines and installations, other national and international relevant regulations, concerning prevention of accidents and using technical working means, also have to be met.

AC500 devices are designed according to IEC 1131 Part 2 under overvoltage category II per DIN VDE 0110 Part 2.

For direct connection of AC Category III overvoltages provide protection measures for overvoltage category II according to IEC-Report 664/1980 and DIN VDE 0110 Part 1.

Equivalent standards:

- DIN VDE 0110 Part 1 ↔ IEC 664
- DIN VDE 0113 Part 1 ↔ EN 60204 Part 1
- DIN VDE 0660 Part 500 ↔ EN 60439-1 ↔ IEC 439-1

All rights reserved to change design, size, weight, etc.

Qualified personnel

Both the control system AC500 and other components in the vicinity are operated with dangerous contact voltages. Touching parts, which are under such voltages, can cause grave damage to health.

In order to avoid such risks and the occurrence of material damage, persons involved with the assembly, starting up and servicing must possess pertinent knowledge of the following:

- Automation technology sector
- Dealing with dangerous voltages
- Using standards and regulations, in particular VDE, accident prevention regulations and regulations concerning special ambient conditions (e.g. areas potentially endangered by explosive materials, heavy pollution or corrosive influences).

1.6.3.3 Safety instructions

The examples and diagrams in this manual are included solely for illustrative purposes. Because of the many variants and requirements associated with any particular installation, ABB cannot assume responsibility or liability for actual use based on the examples and diagrams.

No patent liability is assumed by ABB with respect to use of information, circuits, equipment or software described in this manual. No liability is assumed for the direct or indirect consequences of the improper use, improper application or inadequate maintenance of these devices. In no event will ABB be responsible or liable for indirect or consequential damages resulting from the use or application of this equipment.

PLC specific safety notices

The product family AC500 control system is designed according to EN 61131-2 IEC 61131-2 standards. Data, different from IEC 61131, are caused by the higher requirements of Maritime Services. Other differences are described in the technical data description of the devices.

NOTICE!

Avoidance of electrostatic charging

PLC devices and equipment are sensitive to electrostatic discharge, which can cause internal damage and affect normal operation. Observe the following rules when handling the system:

- Touch a grounded object to discharge potential static.
- Wear an approved grounding wrist strap.
- Do not touch connectors or pins on component boards.
- Do not touch circuit components inside the equipment.
- If available, use a static-safe workstation.
- When not in use, store the equipment in appropriate static-safe packaging.

NOTICE!

PLC damage due to operation conditions

Protect the devices from dampness, dirt and damage during transport, storage and operation!

NOTICE!

PLC damage due to wrong enclosures

Due to their construction (degree of protection IP 20 according to EN 60529) and their connection technology, the devices are suitable only for operation in enclosed switchgear cabinets.

Cleaning instruction

Do not use cleaning agent for cleaning the device.

Use a damp cloth instead.

Connection plans and user software must be created so that all technical safety aspects, legal regulations and standards are observed. In practice, possible shortcircuits and breakages must not be able to lead to dangerous situations. The extent of resulting errors must be kept to a minimum.

Do not operate devices outside of the specified, technical data!

Trouble-free functioning cannot be guaranteed outside of the specified data.

NOTICE!

PLC damage due to missing grounding

- Ensure to earth the devices.
- The grounding (switch cabinet grounding, PE) is supplied both by the mains connection (or 24 V supply voltage) and via DIN rail. The DIN rail must be connected to the ground before the device is subjected to any power. The grounding may be removed only if it is certain that no more power is being supplied to the control system.

In the description for the devices (operating manual or AC500 system description), reference is made at several points to grounding, galvanic isolation and EMC measures. One of the EMC measures consists of discharging interference voltages into the grounding via Y-type capacitors. Capacitor discharge currents must basically be able to flow off to the grounding (in this respect, see also VBG 4 and the relevant VDE regulations).

CAUTION!

Do not obstruct the ventilation for cooling!

The ventilation slots on the upper and lower side of the devices must not be covered.

CAUTION!

Run signal and power wiring separately!

Signal and supply lines (power cables) must be laid out so that no malfunctions due to capacitive and inductive interference can occur (EMC).

WARNING!

Labels on or inside the device alert people that dangerous voltage may be present or that surfaces may have dangerous temperatures.

WARNING!

Splaying of strands can cause hazards!

During wiring of terminals with stranded conductors, splaying of strands shall be avoided.

– Ferrules can be used to prevent splaying.

WARNING!

Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

Information on batteries

CAUTION!

Use only ABB approved lithium battery modules!

At the end of the battery's lifetime, always replace it only with a genuine battery module.

CAUTION!

Risk of explosion!

Do not open, re-charge or disassemble a lithium battery. Attempts to charge lithium batteries lead to overheating and possible explosions.

Protect them from heat and fire and store them in a dry place.

Never short-circuit or operate lithium batteries with the polarities reversed. The batteries are likely to overheat and explode. Avoid chance short circuiting and therefore do not store batteries in metal containers and do not place them on metallic surfaces. Escaping lithium is a health hazard.

Environment considerations

Recycle exhausted batteries. Dispose batteries in an environmentally conscious manner, in accordance to local-authority regulations.

Environment and enclosure information

This equipment is intended for use in a Pollution Degree 2 industrial environment, in overvoltage Category II applications (as defined in IEC publication 60664-1), at altitudes up to 2.000 meters without derating.

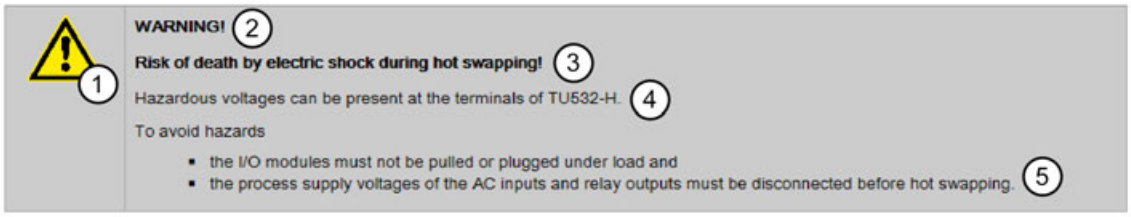
This equipment is considered Group 1, Class A industrial equipment according to IEC/CISPR Publication 11. Without appropriate precautions, there may be potential difficulties ensuring electromagnetic compatibility in other environments due to conducted as well as radiated disturbance.

This equipment is supplied as "open type" equipment. It must be mounted within an enclosure that is suitably designed for those specific environmental conditions that will be present and appropriately designed to prevent personal injury resulting from accessibility to live parts. The interior of the enclosure must be accessible only by the use of a tool. Subsequent sections of this publication may contain additional information regarding specific enclosure type ratings that are required to comply with certain product safety certifications.

Refer to NEMA Standards publication 250 and IEC publication 60529, as applicable, for explanations of the degrees of protection provided by different types of enclosure. Also see the appropriate sections in this manual.

1.6.3.3.1 Safety notice

Throughout the documentation we use the following types of safety and information notices according to ANSI Z535 make you aware of safety considerations or advice on AC500 products usage.



1 **Safety alert symbol** indicates the danger.
2 **Signal word** classifies the danger.
3 **Type and source of the risk** are mentioned.
4 **Possible consequences** of the risk are described.
5 **Measures to avoid these consequences** (enumerations).

Signal words

DANGER!
DANGER indicates a hazardous situation which, if not avoided, will result in death or serious injury.

Ensure to take measures to prevent the described impending danger.

WARNING!
WARNING indicates a hazardous situation which, if not avoided, could result in death or serious injury.

Ensure to take measures to prevent the described dangerous situation.

CAUTION!
CAUTION indicates a hazardous situation which, if not avoided, could result in minor or moderate injury.

Ensure to take measures to prevent the described dangerous situation.

NOTICE!
NOTICE is used to address practices not related to physical injury but might lead to property damage for example damage of the product.

Ensure to take measures to prevent the described dangerous situation.

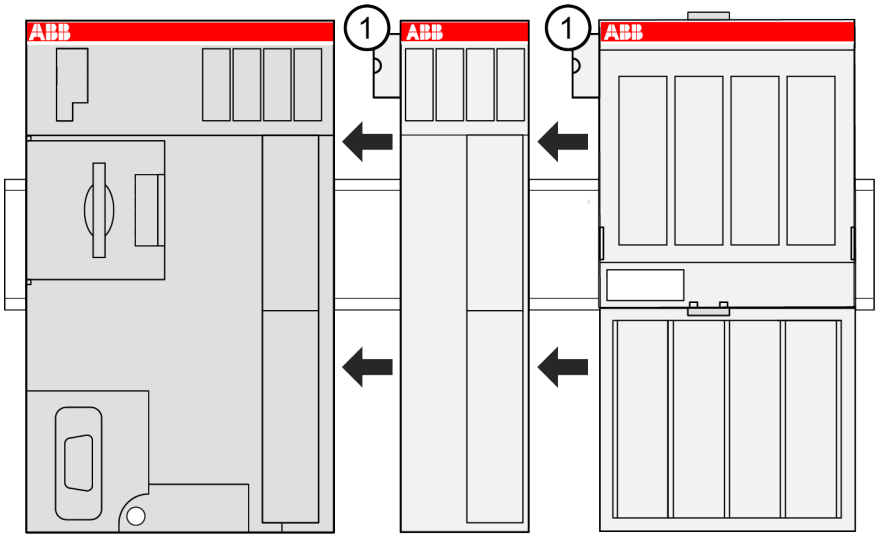
NOTE provides additional information on the product, e.g. advices for configuration or best practice scenarios.

1.6.3.4 Overall information (valid for complete AC500 product family)

1.6.3.4.1 Serial I/O bus

The synchronized serial I/O bus is the I/O data bus for the I/O modules connected with the processor modules or communication interface modules. Through this bus, I/O and diagnosis data are transferred.

Up to 10 I/O terminal units (for 1 I/O module each) can be added to one terminal base or to one AC500-eCo processor module. The I/O terminal units and the AC500-eCo I/O modules, have a bus input at the left side and a bus output at the right side. Thus the length of the I/O bus increases with the number of attached I/O modules.



1 I/O bus connection

The connection of the I/O bus is performed automatically by telescoping the modules on the DIN rail. The I/O bus provides the following signals:

- Supply voltage of 3.3 V DC for feeding the electronic interface components
- 3 data lines for the synchronized serial data exchange
- several control signals

NOTICE!

The I/O bus is not designed for plugging and unplugging modules while in operation. If a module is plugged or replaced while the bus is in operation, the following consequences are possible

- reset of the station or of the CPU
- system lockup
- damage of the module

WARNING!

Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

With its fast data transmission, the I/O bus obtains very low reaction times. Depending on the device and on the version of firmware and Automation Builder, the following numbers of I/O devices can be connected to the I/O bus.

Device	Version Automation Builder	Version firmware	Max. number of I/O devices
AC500-eCo PM55x and PM56x (-ETH variants only)	As of V2.0.0	As of V2.0.0	7
AC500-eCo PM55x and PM56x	As of V2.1.0	As of V2.0.6	10
CS31 bus modules DC551-CS31 and CI592-CS31-HA	All	All	7
CANopen bus modules CI581-CN and CI582-CN	As of V2.1.0	All	10
PROFIBUS bus modules CI541-DP and CI542-DP	As of V2.1.0	all	10
PROFINET bus modules CI504-PNIO and CI506-PNIO	As of V2.1.0	all	10
EtherCAT communication interface module CI511-ETHCAT and CI512-ETHCAT	As of V1.1	As of V2.0.x	10

Table 594: General data

Parameter	Value
Supply voltage, signal level	3.3 V DC ± 10 %
Max. supply current	On request
Type of the data interface	Synchronized serial data exchange
Bus data transmission speed	1.8 Mb/s
Minimum bus cycle time	500 µs [1])
Galvanic isolation	I/O bus is galvanic connected to CPU and communication interface logic ciruits. Galvanic isolation of I/O bus is I/O module specific. See each module specification for details.
Protection against electrostatic discharge (ESD)	TB5xx, TB56xx: with protection diodes, no ESD discharge allowed on the port.
Max. bus length	1 m
[1]) Minimum bus cycle time: This value is valid for all module combinations (from 1 to 10 I/O modules)	

Table 595: Wiring (bus connection)

Parameter	Value
Bus connection	Left-side and right-side connection from module to module via a 10-pole HE plug (male at the left side, female at the right side)
Mechanical connection	Established by the terminal units
Max. bus length	1 m

1.6.3.4.2 Mechanical encoding

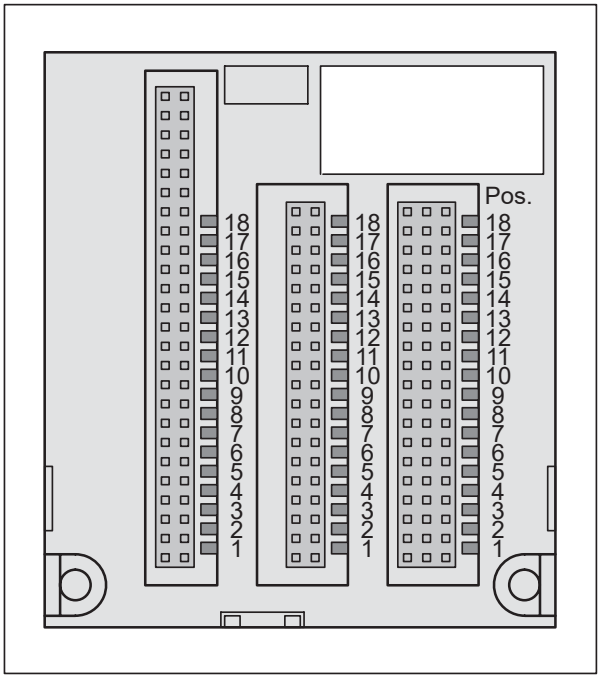


Fig. 1032: Possible positions for mechanical encoding (1 to 18)

NOTICE!
Terminal units and terminal bases have a mechanical coding which prevents modules (from) being inserted into the wrong places for cases that might result in dangerous parasitic voltages or if modules could be destroyed.

The coding either makes it impossible to insert the module to the wrong place or blocks its electrical function (outputs are not activated).

The following figures show the possible encodings.

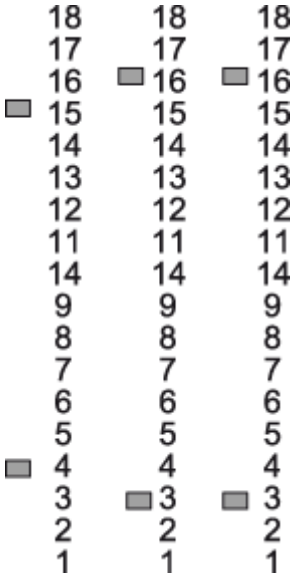

Fig. 1033: Encoding for processor modules with Ethernet interface

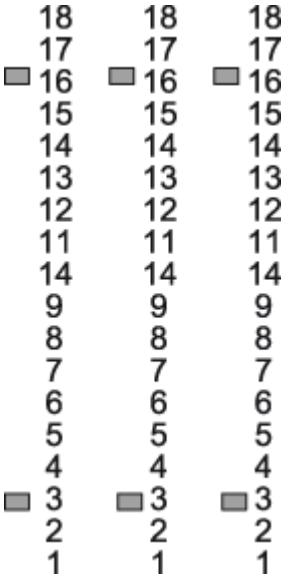

Fig. 1034: Encoding for processor modules with ARCNET interface

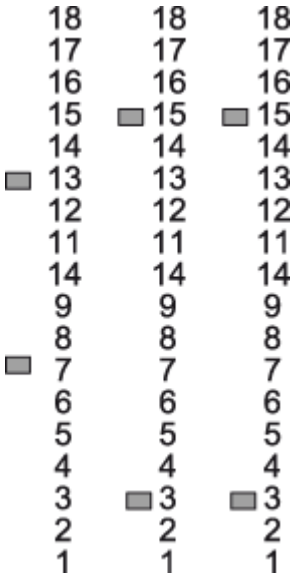

Fig. 1038: Encoding for communication interface modules with PROFINET interface

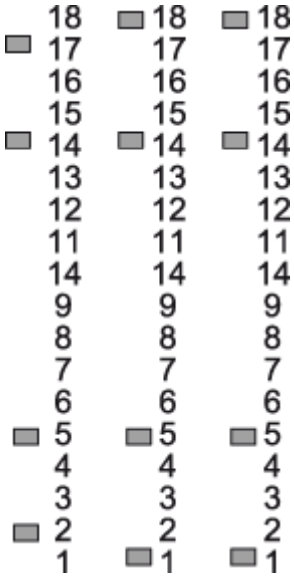

Fig. 1039: Encoding for I/O modules (120 VAC / 230 VAC)

Fig. 1040: Encoding for positioning modules

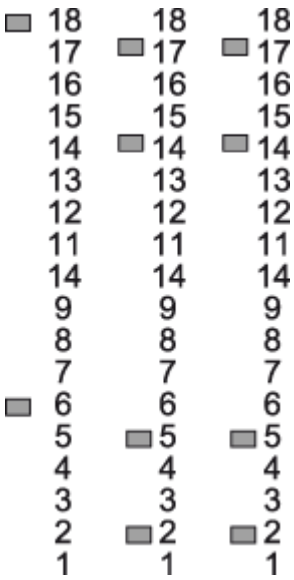

Fig. 1041: Encoding for CS31 fieldbus modules

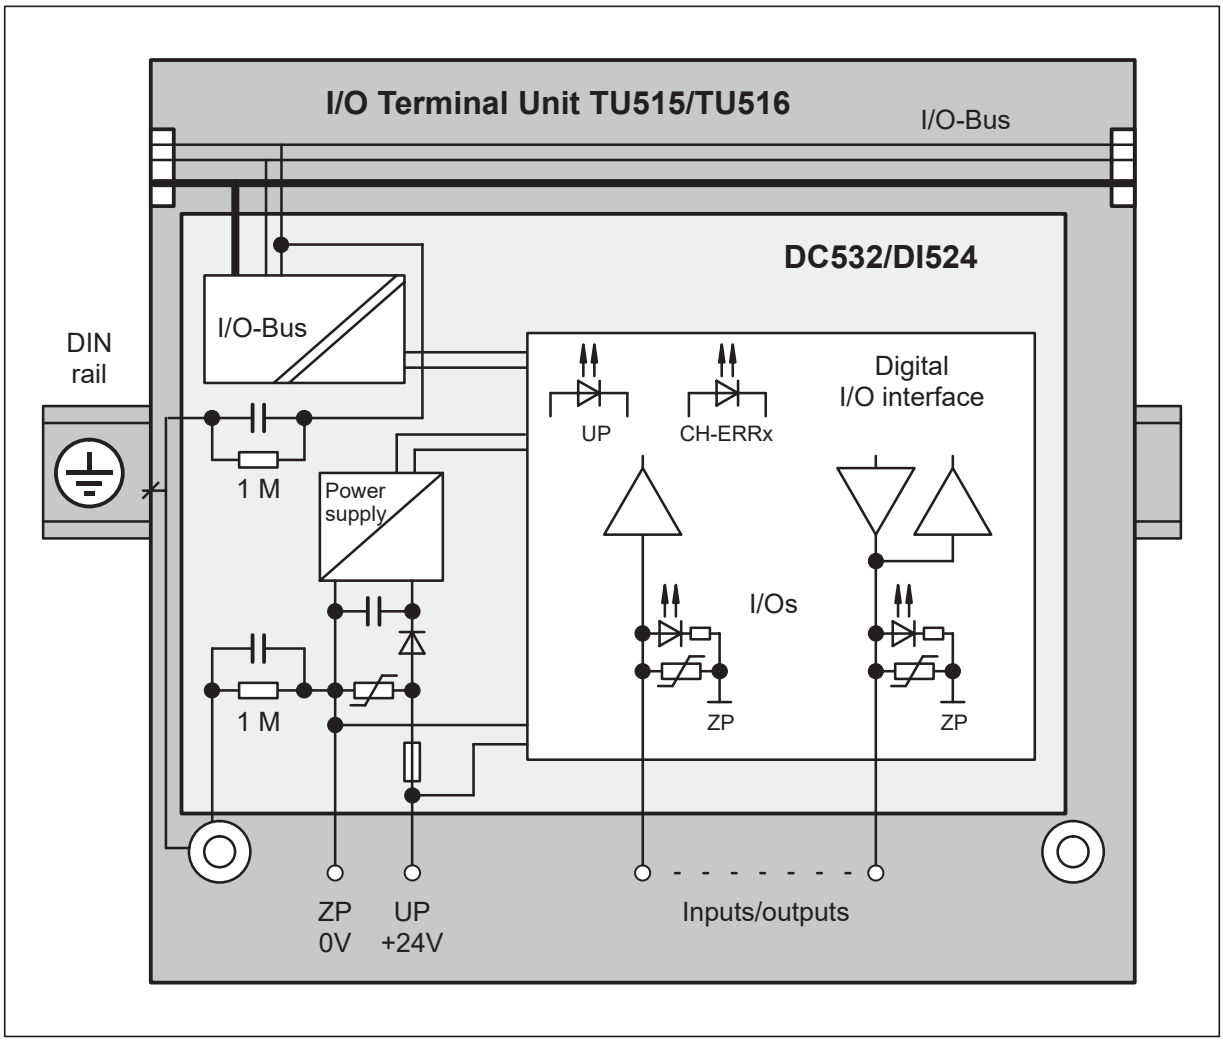
1.6.3.4.3 Earthing concept (Block diagrams)

NOTICE!

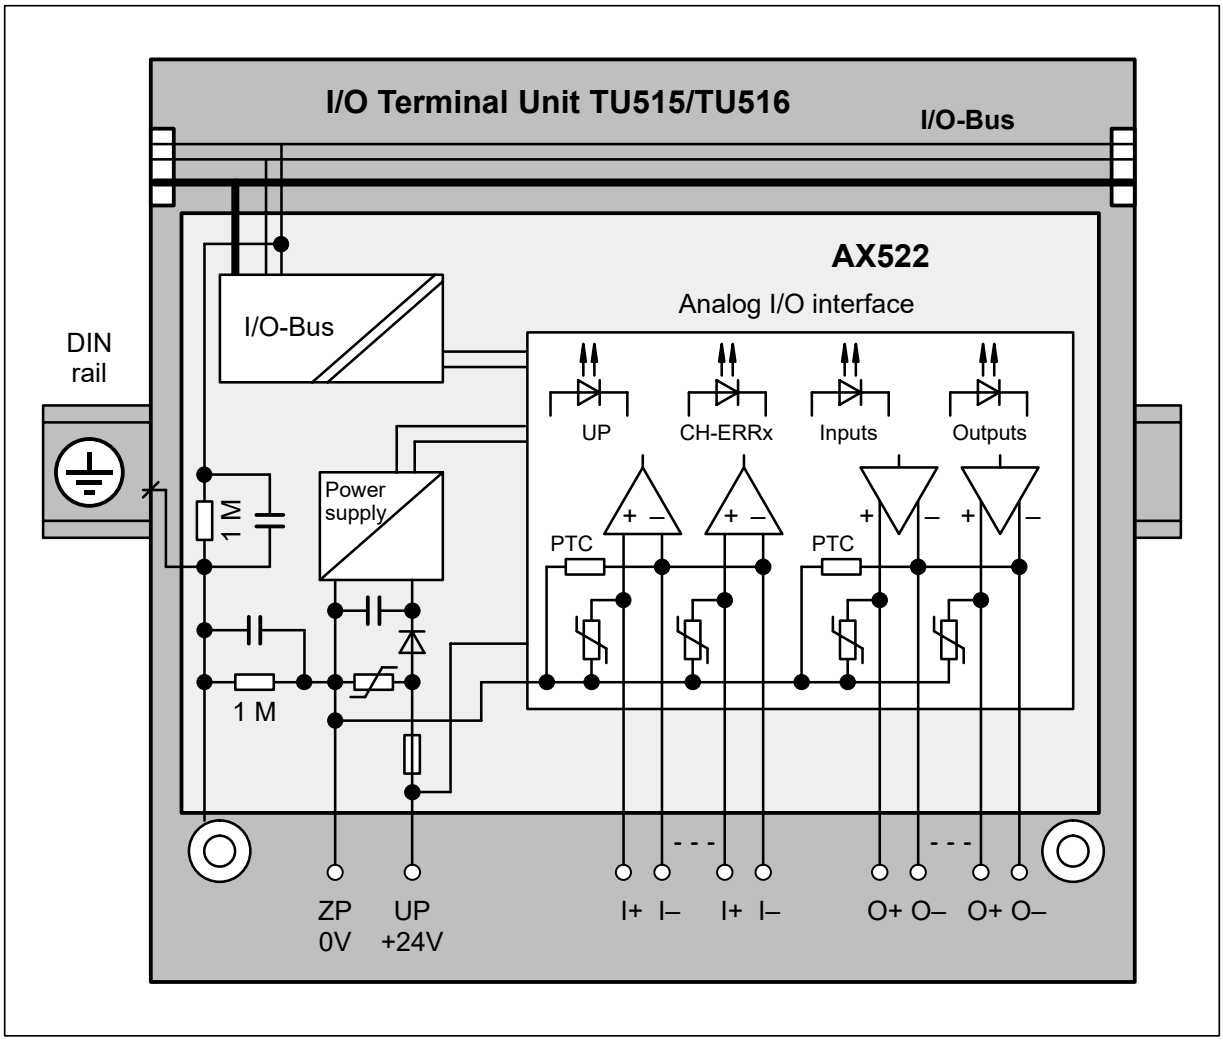
PLC damage due to missing grounding

- Ensure to earth the devices.
- The grounding (switch cabinet grounding, PE) is supplied both by the mains connection (or 24 V supply voltage) and via DIN rail. The DIN rail must be connected to the ground before the device is subjected to any power. The grounding may be removed only if it is certain that no more power is being supplied to the control system.

Block diagram: Digital I/O modules



Block diagram: Analog I/O modules



1.6.3.4.4 EMC-conforming assembly and construction

General principles

General considerations

Electric and electronical devices have to work correctly on site. This is also valid when electro-magnetic influences affect them in defined and/or expected strength. The devices themselves must not emit electro-magnetic noises.

Advant Controller components have a very high noise immunity.

When the wiring and grounding instructions are met, an error-free operation is given.

High electro-magnetic noises of nearby mounted applications must be taken in consideration during the planning phase.

An EMC compatible earthing concept will also guarantee an error-free operation here.

There are three important principles to be especially considered:

- *Keep all connections as short as possible (in particular the grounding conductors)*
- *Use large conductor cross sections (in particular for the grounding conductors)*
- *Create low-impedance, i.e. good and large-sized contacts (in particular for the grounding conductors)*

Pay attention to the following:

- *Use vibration-resistant connections*
- *Clean metallic contact areas*
- *Use solid plug and screw-type connections*
- *Use earth cable shields with clips on a well-grounded metallic surface*
- *Do not use aluminium parts*
- *Do not use sheath wires*
- *Do not use toothed lock washers under screw connections*

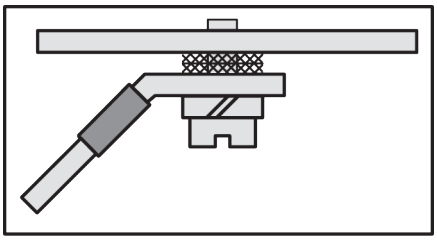


Fig. 1042: Assembly: wrong

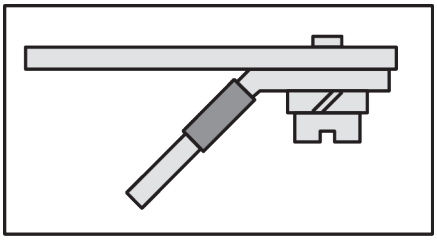

Fig. 1043: Assembly: correct

Make a connection between the DIN rails and PE (Protective Earth). For this, use an grounding wire with a minimum conductor cross section of 10 mm^2.

The wire is connected to the DIN rail with an M6 screw.

A large-area contact of the DIN rail with the metallic mounting plate improves the EMC behavior significantly, as the disturbances can be discharged more effective.

Cable routing

- Route cables meeting the standards.
- Sort the cables into cable groups:
  - Power current cables
  - Power supply cables
  - Signal cables
  - Data cables

- Rout signal cables and data cables separately from the power cables.
  – Separate cable ducts or cable bundles.
  – The distance should be 20 cm or greater.
- Lay signal and data cables close to earthed surfaces.

Cable shields

- Use only shielded data cables. The shield should be grounded at both ends.
  A cable shield only grounded at one end can only protect from capacitively coupled interference and low-frequency disturbances (50 Hz hum).
- Avoid parasitic currents flowing through the cable shields.
  This can be done by installing current-carrying equipotential bondings.
- Use only cables with braided shields.
  Foil shields are not robust enough, cannot be contacted well and have poor HF properties.
- Use only metallic or [metal]-plated plugs for shielded data cables.
- Use only shielded cables for analog signals.
  For small signals ground the shield only at one end.
- Ground the cable shield directly with a clip when entering the switchgear cabinet.
  Do not cut the shield until the cable reaches the module connected.

The connection between the PE bar and the shield bar must have a low impedance.

Switchgear cabinet

According to DNV GL mounting in a seperate metall cabinet is required for:

- *FM502-CMS*
- *FM502-CMS-XC*
- *TF501-CMS*
- *TF501-CMS-XC*
- *TF521-CMS*
- *TF521-CMS-XC*
- *SM560-S-FD-1*
- *CI521-MODTCP*
- *CI522-MODTCP*
- *CM589-PNIO*

Connections The connections between the switchgear cabinet, the mounting plates, the PE bar and the shield bar must have a low impedance.

Grounding Ground the switchgear cabinet doors with short and highly flexible conductors.

Illumination Only use filament lamps (bulbs) or fluorescent tubes with interference suppression.

For supplying the PC Use the mains socket which is located inside the switchgear cabinet.

↳ *Chapter 1.6.3.5.2.1 “Switchgear cabinet assembly” on page 5238*

Reference potential

- Provide a uniform reference potential in the entire installation and ground all electrical appliances if possible.
- Route your grounding conductors in a star configuration so that no ground loops can occur.

Equipotential bonding

The Installation of equipotential bondings are necessary if there are present or expected potential differences between parts of your application.

- *The impedance of equipotential bonding must be equal or lower than 10 % of the shield impedance of the shielded signal cables between the same points.*
- *The conductor cross section of a equipotential bonding must be 16 mm² to withstand the maximum possible compensating current.*
- *Equipotential bondings and shielded signal cables should be laid close to each other.*
- *Equipotential bondings must be connected to PE with low impedance.*

13 Fieldbus connection (e.g. Ethernet)

1.6.3.4.5 Power consumption of an entire station

The power consumption of a complete station consists of the sum of all individual consumptions.

- Consumers over terminals L+ and M on the AC500 terminal base/AC500-eCo CPU:
  - CPU itself
  - I/O modules attached on the I/O bus
  - Communication modules attached (AC500 terminal base)
- Consumers over the process supply voltage terminals ZP and UP of the AC500 terminal units / the L+/M or UP/ZP terminals of the AC500-eCo I/O modules:
  - Digital I/O modules
  - Analog I/O modules

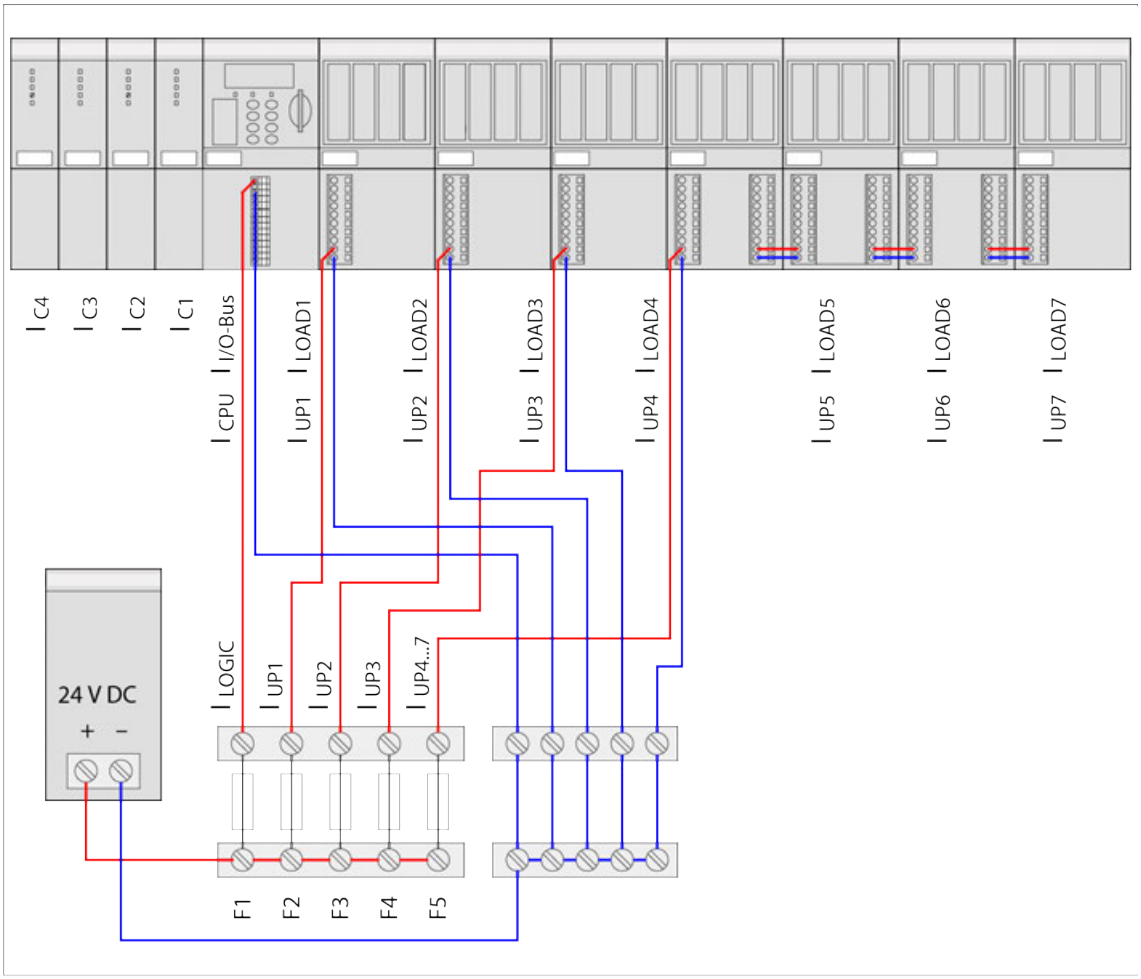
The two supply voltages can be provided by the same power supply unit. The CPU and the I/O modules should, however, be fused separately. Of course also separate power supplies are possible.

Calculation of the total current consumption

Example

In the example, the AC500 control system consists of the following devices:

- AC500 CPU with Ethernet interface
- 4 communication modules
- 7 I/O modules (digital and analog)
- As well as the required terminal bases and terminal units



Because of the high total current consumption of the digital I/O modules (from UP = 24 V DC), the supply is divided up into several electric circuits fused separately.

The maximum permitted total current over the supply terminals of the I/O terminal units is 8 A.

The total current can be calculated as follows:

$I_{Total} = I_{LOGIC} + I_{UP}$

with the assumptions

$I_{LOGIC} = I_{CPU} + I_{I/O\ bus} + I_{C1} + I_{C2} + I_{C3} + I_{C4}$ (CPU + communication modules + I/O bus)

$I_{I/O\ bus}$ = Number of expansion modules × Current consumption through the I/O bus per module

and

$I_{UP} = I_{UP1} + I_{LOAD1} + I_{UP2} + I_{LOAD2} + I_{UP3} + I_{LOAD3} + I_{UP4} + I_{LOAD4} + I_{UP5} + I_{LOAD5} + I_{UP6} + I_{LOAD6} + I_{UP7} + I_{LOAD7}$

If one assumes that all outputs are switched on and are operated with their maximum permitted load currents (under compliance with the maximum permitted currents at the supply terminals), then the following values are the result for an example shown above:

	I_{CPU} *)	I_{Cx} *)	$I_{I/O\ bus}$ *)	I_{UPx} *)	I_{LOADx} *)
CPU / communication module part					
CPU	0.110 A	-	-	-	-
C1	-	0.050 A	-	-	-
C2	-	0.085 A	-	-	-
C3	-	0.050 A	-	-	-
C4	-	0.050 A	-	-	-
I/O module part					
Analog1	-	-	0.002 A	0.150 A	-
Analog2	-	-	0.002 A	0.150 A	0.160 A
Analog3	-	-	0.002 A	0.100 A	0.080 A
Analog4	-	-	0.002 A	0.100 A	0.080 A
Digital1	-	-	0.002 A	0.050 A	8.000 A
Digital2	-	-	0.002 A	0.050 A	8.000 A
Digital3	-	-	0.002 A	0.050 A	8.000 A
Σ columns	0.110 A	0.235 A	0.014 A	0.650 A	24.320 A
	$\Sigma\ I_{LOGIC} \approx 0.4$ A			$\Sigma\ I_{UP} \approx 25$ A	
	$I_{Total} \approx 25.4$ A				
*) All values in this column are exemplary values					

Dimensioning of the fuses

To be able to select the fuses for the station correctly, both the current consumption and the inrush currents (melting integral for the series-connected fuse) must be taken into consideration.

Fuse	**for**	**Σ of the melting integrals in A^2s**	**$I_{Logic\ A}$**	**$I_{UPx\ A}$**	**Recommended fuse**	
					Type	**Value**
F1	CPU logic	1.000	≈ 0.4	-	Quick	10 A
F2	Module Digital1	0.005	-	8.050	Quick	10 A
F3	Module Digital2	0.008	-	8.050	Quick	10 A
F4	Module Digital3	0.007	-	8.050	Quick	10 A
F5	Modules Analog1 + Analog2 + Analog3 + Analog4	0.130	-	0.820	Quick	10 A

1.6.3.4.6 Decommissioning

Secure decommissioning of a functional CPU

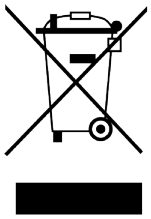
1. Delete applications.
2. Delete applications from memory card, if available.
3. If available, remove memory card and battery from CPU.
4. Demount and dispose the hardware modules ↳ *Chapter 1.6.3.5.3 “Mounting and demounting” on page 5241* ↳ *Chapter 1.6.3.6.3 “Mounting and demounting” on page 5325* ↳ *Chapter 1.6.3.4.7 “Recycling” on page 5233*.

Secure decommissioning of a not functional CPU

▷ If you can not access the data stored in the CPU, e.g., because the CPU is not functional any more, then physically destroy the device.

⇨ This ensures that the credentials that are stored in the device, can not be misused.

1.6.3.4.7 Recycling



Disposal and recycling information

This symbol on the product (and on its packaging) is in accordance with the European Union's Waste Electrical and Electronic Equipment (WEEE) Directive.

The symbol indicates that this product must be recycled/disposed of separately from other household waste.

It is the end user’s responsibility to dispose of this product by taking it to a designated WEEE collection facility for the proper collection and recycling of the waste equipment.

The separate collection and recycling of waste equipment will help to conserve natural resources and protect human health and the environment.

For more information about recycling, please contact your local environmental office, an electrical/electronic waste disposal company or the store where you purchased the product.

1.6.3.5 AC500-eCo

1.6.3.5.1 System data AC500-eCo

Environmental conditions

Table 596: Process and supply voltages

Parameter		Value
24 V DC		
	Voltage	24 V (-15 %, +20 %)
	Protection against reverse polarity	Yes
24 V AC		
	Voltage	24 V (-15 %, +10 %)
	Frequency	50/60 Hz (-6 %, +4 %)
100 V AC		
	Voltage	100 V (-15 %, +10 %)
	Frequency	50/60 Hz (-6 %, +4 %)
230 VAC		
	Voltage	230 V (-15 %, +10 %)

Parameter		Value
	Frequency	50/60 Hz (-6 %, +4 %)
100...240 V AC wide-range supply		
	Voltage	100 V...240 V (-15 %, +10 %)
	Frequency	50/60 Hz (-6 %, +4 %)
Allowed interruptions of power supply, according to EN 61131-2		
	DC supply	Interruption < 10 ms, time between 2 interruptions > 1 s, PS2
	AC supply	Interruption < 0.5 periods, time between 2 interruptions > 1 s

NOTICE!
Exceeding the maximum power supply voltage (> 30 V DC) for process or supply voltages could lead to unrecoverable damage of the system. The system might be destroyed.

Parameter		Value
Temperature		
	Operating	0 °C...+60 °C (horizontal mounting of modules) 0 °C...+40 °C (vertical mounting of modules and output load reduced to 50 % per group)
	Storage	-40 °C...+70 °C
	Transport	-40 °C...+70 °C
Humidity		Max. 95 %, without condensation
Air pressure		
	Operating	> 800 hPa / < 2000 m
	Storage	> 660 hPa / < 3500 m

Creepage distances and clearances

The creepage distances and clearances meet the requirements of the overvoltage category II, pollution degree 2.

Insulation test voltages, routine test

According to EN 61131-2

Parameter	Value	
200 V...240 V circuits against other circuitry	2500 V	1.2/50 µs
100 V...127 V circuits against other circuitry	1500 V	1.2/50 µs
100 V...240 V circuits against other circuitry	2500 V	1.2/50 µs

Parameter	Value	
24 V circuits (supply, 24 V inputs/outputs, analog inputs/ outputs), if they are galvanically isolated against other circuitry	500 V	1.2/50 µs
COM interfaces, galvanically isolated	500 V	1.2/50 µs
COM interfaces, electrically not isolated	Not applicable	Not applicable
FBP interface	500 V	1.2/50 µs
Ethernet	500 V	1.2/50 µs
ARCNET	500 V	1.2/50 µs
200 V... 240 V circuits against other circuitry	1350 V	AC 2 s
100 V circuits against other circuitry	820 V	AC 2 s
100 V...240 V circuits against other circuitry	1350 V	AC 2 s
24 V circuits (supply, 24 V inputs/outputs, analog inputs/ outputs), if they are galvanically isolated against other circuitry	350 V	AC 2 s
COM interfaces, galvanically isolated	350 V	AC 2 s
COM interfaces, electrically not isolated	Not applicable	Not applicable
FBP interface	350 V	AC 2 s
Ethernet	350 V	AC 2 s
ARCNET	350 V	AC 2 s

Power supply units

For the supply of the modules, power supply units according to SELV or PELV specifications must be used.

Safety Extra Low Voltage (SELV) and Protective Extra Low Voltage (PELV)

To ensure electrical safety of AC500/AC500-eCo extra low voltage circuits, 24 V DC supply, communication interfaces, I/O circuits, and all connected devices must be powered from sources meeting requirements of SELV, PELV, class 2, limited voltage or limited power according to applicable standards.

WARNING!

Improper installation can lead to death by touching hazardous voltages!

To avoid personal injury, safe separation, double or reinforced insulation and separation of the primary and secondary circuit must be observed and implemented during installation.

– Only use power converters for safety extra-low voltages (SELV) with safe galvanic separation of the primary and secondary circuit.
– Safe separation means that the primary circuit of mains transformers must be separated from the secondary circuit by double or reinforced insulation. The protective extra-low voltage (PELV) offers protection against electric shock.

Electromagnetic compatibility

Electromagnetic Compatibility		
Device suitable for:		
	Industrial applications	Yes
	Domestic applications	No
Immunity against electrostatic discharge (ESD):		According to IEC 61000-4-2, zone B, criterion B
	Electrostatic voltage in case of air discharge	8 kV
	Electrostatic voltage in case of contact discharge	4 kV, in a closed switchgear cabinet 6 kV [1])
	ESD with communication connectors	In order to prevent operating malfunctions, it is recommended, that the operating personnel discharge themselves prior to touching communication connectors or perform other suitable measures to reduce effects of electrostatic discharges.
Immunity against the influence of radiated (CW radiated):		According to IEC 61000-4-3, zone B, criterion A
	Test field strength	10 V/m
Immunity against transient interference voltages (burst):		According to IEC 61000-4-4, zone B, criterion B
	Supply voltage units (DC)	2 kV
	Supply voltage units (AC)	2 kV
	Digital inputs/outputs (24 V DC / 24 VAC)	1 kV
	Digital inputs/outputs (100 V AC...240 V AC)	2 kV
	Analog inputs/outputs	1 kV
	Serial RS-485 interfaces (COM)	1 kV
	Ethernet	1 kV
	I/O supply, DC-out	1 kV
Immunity against the influence of line-conducted interferences (CW conducted):		According to IEC 61000-4-6, zone B, criterion A
	Test voltage	10 V

Electromagnetic Compatibility		
High energy surges		According to IEC 61000-4-5, zone B, criterion B
	Power supply AC	2 kV CM / 1 kV DM [2])
	Power supply DC	1 kV CM / 0.5 kV DM [2])
	DC I/O supply, add. DC-supply-out	1 kV CM / 0.5 kV DM [2])
	Communication lines, shielded	1 kV CM [2])
	AC I/O unshielded [3])	2 kV CM / 1 kV DM [2])
	I/O analog, I/O DC unshielded [3])	1 kV CM / 0.5 kV DM [2])
Radiation (radio disturbance)		According to IEC 55011, group 1, class A

[1]) High requirement for shipping classes are achieved with additional specific measures (see specific documentation).

[2]) CM = Common Mode, DM = Differential Mode

[3]) When DC I/O inputs are used with AC voltage, external filters limiting high energy surges to 1 kV CM / 0.5 DM are required to meet requirements according IEC 61131-2.

Mechanical data

Parameter	**Value**
Mounting	Horizontal
Degree of protection	IP 20 (if all terminal screws are tightened)
Housing	Classification V-2 according to UL 94
Vibration resistance acc. to EN 61131-2	all three axes (DIN rail mounting) 5 Hz...8.4 Hz, continuous 3.5 mm 8.4 Hz...150 Hz, continuous 1 g
Shock test	All three axes 15 g, 11 ms, half-sinusoidal
Mounting of the modules:	
DIN rail according to DIN EN 50022	35 mm, depth 7.5 mm or 15 mm
Mounting with screws	Screws with a diameter of 4 mm
Fastening torque	1.2 Nm

Approvals and certifications

Information on approvals and certificates can be found in the corresponding chapter of the *Main catalog, PLC Automation*.

1.6.3.5.2 Mechanical dimensions

Switchgear cabinet assembly

Information on EMC-conforming assembly and construction is provided within the overall functions section ↳ Chapter 1.6.3.4.4 “EMC-conforming assembly and construction” on page 5226.

PLC enclosure

NOTICE!

PLC damage due to wrong enclosures

Due to their construction (degree of protection IP 20 according to EN 60529) and their connection technology, the devices are suitable only for operation in enclosed switchgear cabinets.

To protect PLCs against:

- unauthorized access,
- dusting and pollution,
- moisture and wetness and
- mechanical damage,

switchgear cabinet IP54 for common dry factory floor environment is suitable.

Maintain spacing from:

- enclosure walls
- wireways
- adjacent equipment

Allow a minimum of 20 mm clearance on all sides. This provides ventilation and galvanic isolation.

It is recommended to mount the modules on an grounded mounting plate, or an grounded DIN rail, independent of the mounting location.

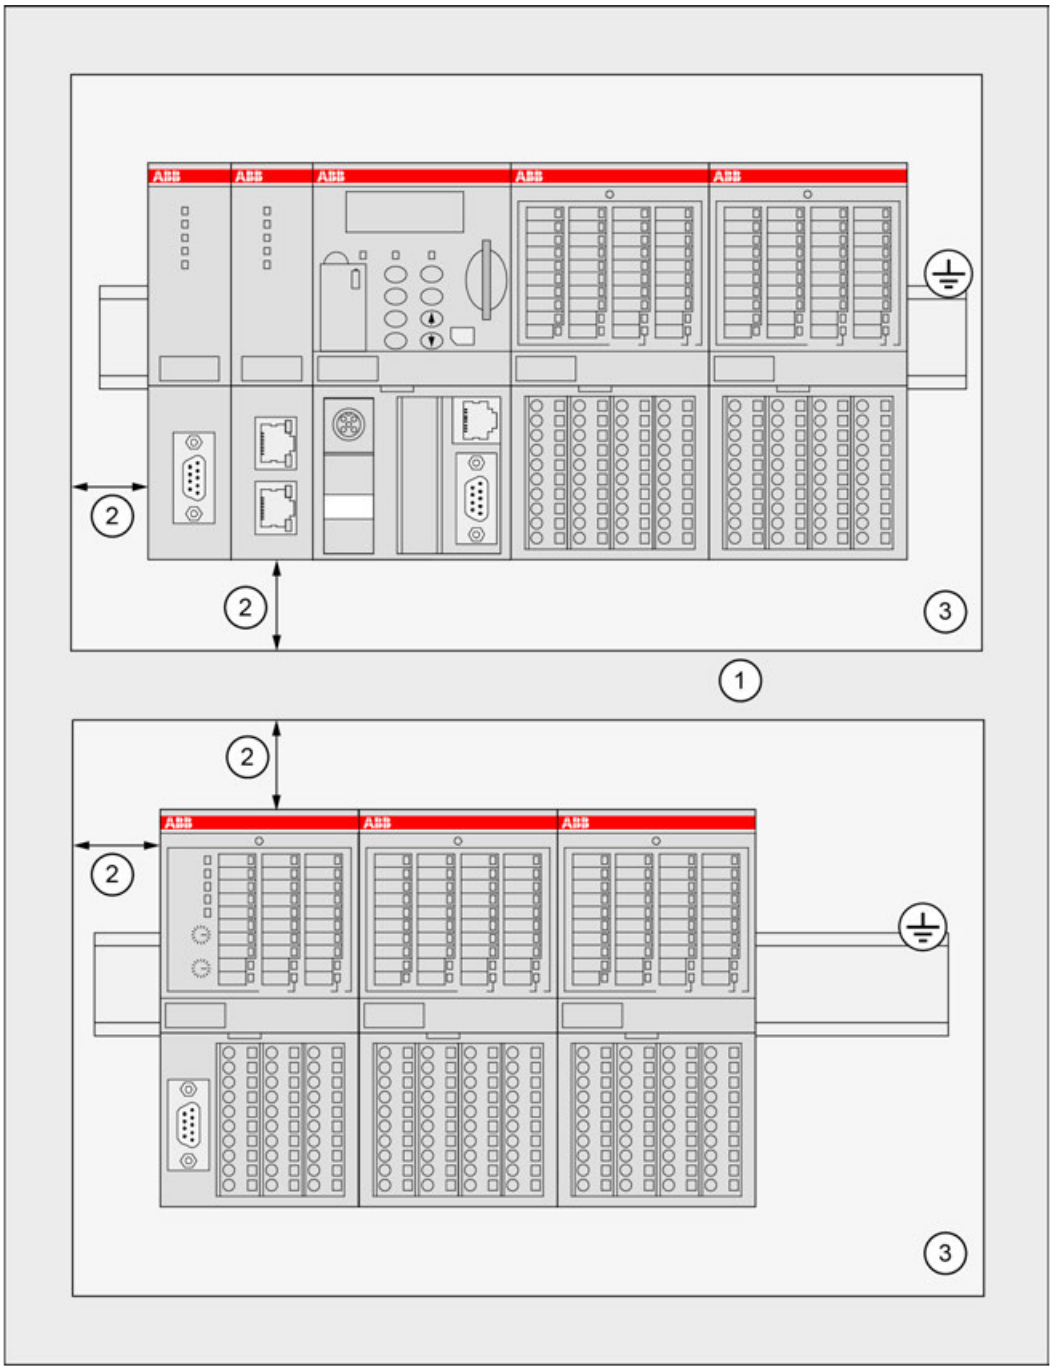


Fig. 1045: Installation of AC500/S500 modules in a switchgear cabinet

1 Cable duct
2 Distance from cable duct ≥20 mm
3 Mounting plate, grounded

NOTICE!

Horizontal mounting is highly recommended.

Vertical mounting is possible, however, derating consideration should be made to avoid problems with poor air circulation and overheating (see ↳ *Chapter 1.6.3.6.1.1 “Environmental conditions” on page 5313*).

When vertically mounted, always place an end-stop terminal block (e.g. type BADL, P/N: 1SNA399903R0200) on the bottom and on the top of the modules to properly secure the modules.

With high vibration applications and horizontal mounting, we also recommend to place end-stop terminals at the right and left side of the device to properly secure the modules, e.g. type BADL, P/N: 1SNA399903R0200.

Mechanical dimensions AC500-eCo

All mechanical dimensions are given in millimeters and inches. The value in brackets is the inch-value.

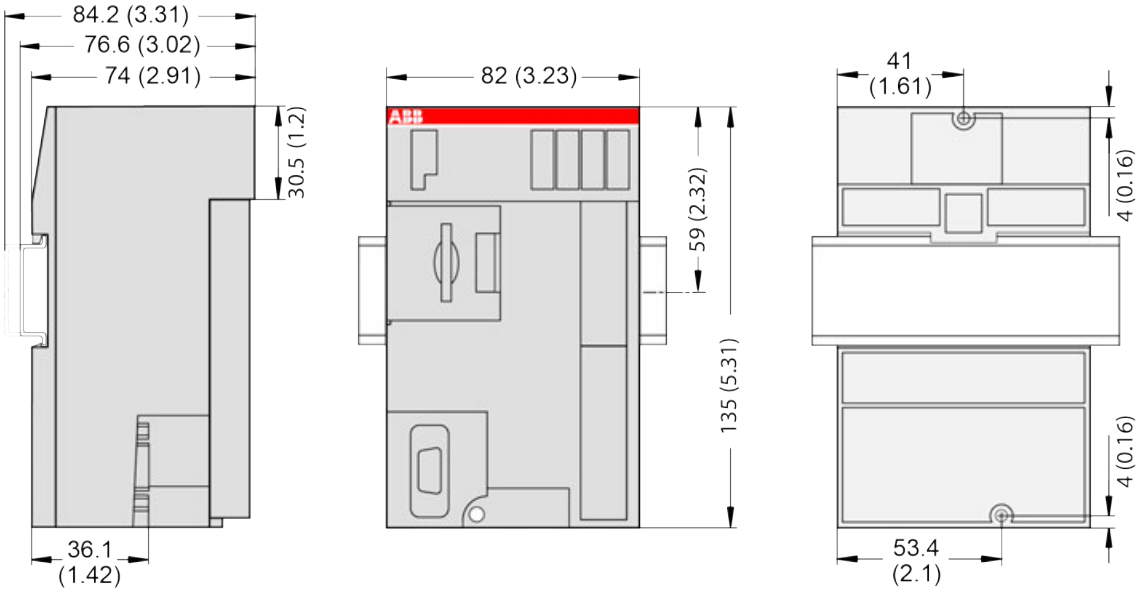

Fig. 1046: Side, front and back view

Mechanical dimensions S500-eCo

All mechanical dimensions are given in millimeters and inches. The value in brackets is the inch-value.

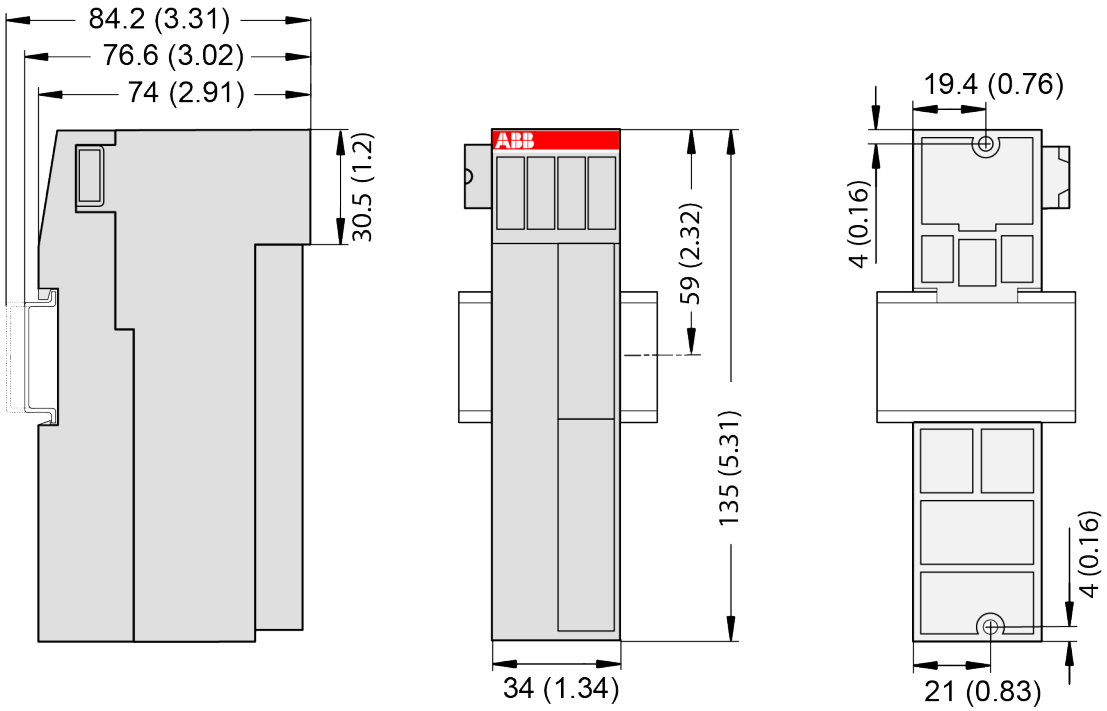

Fig. 1047: Side, front and back view

1.6.3.5.3 Mounting and demounting

The control system is designed to be mounted to a well-grounded mounting surface such as a metal panel. Additional grounding connections from the mounting tabs or DIN rail (if used), are not required unless the mounting surface cannot be grounded.

During panel or DIN rail mounting of all devices, be sure that all debris (metal chips, wire strands, etc.) is kept from falling into the controller. Debris that falls into the controller could cause damage while the controller is energized.

All devices are grounded through the DIN rail to chassis ground. Use zinc plated yellow-chromate stell DIN rail to assure proper grounding. The use of other DIN rail materials (e.g. aluminium, plastic, etc.) that can corrode, oxidize, or are poor conductors, can result in improper or intermittent grounding.

Mounting and demounting of the AC500-eCo CPUs

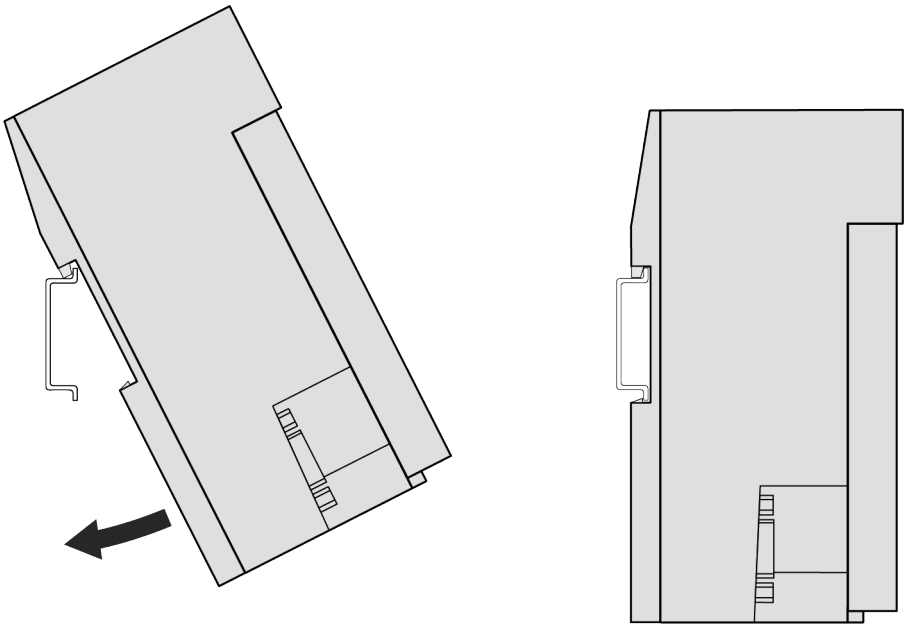
Mounting a processor module on a DIN rail

NOTICE!

Risk of function faults!

The processor module is grounded via DIN rail.

The DIN rail must be included into the earthing conception of the plant.

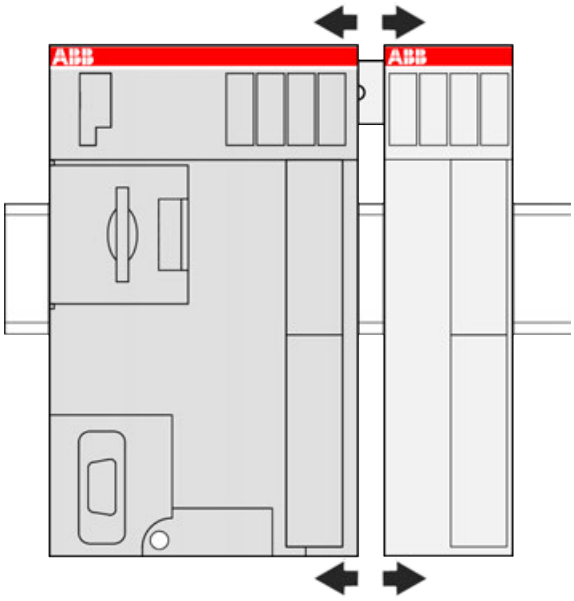


Mount the processor module at the top of the DIN rail, then snap it in below.

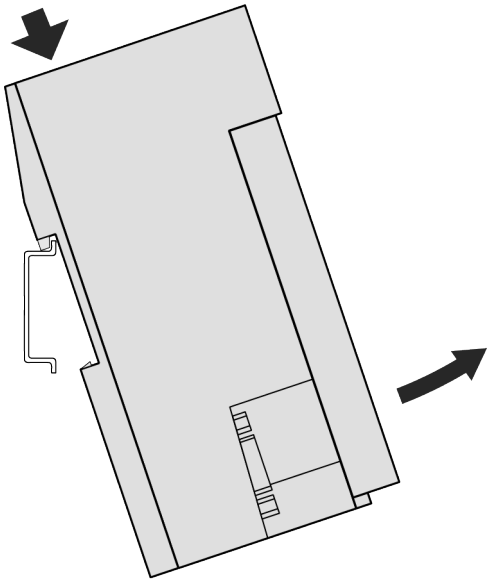
> *See Hardware description of PM55x-xP and PM56x-xP ↪ Chapter 1.6.2.3.1.1 “PM55x-xP and PM56x-xP” on page 3804 for connection.*

Demounting a processor module mounted on a DIN rail

1. Remove I/O modules if connected.



2. While pressing down processor module pull it away from DIN rail.

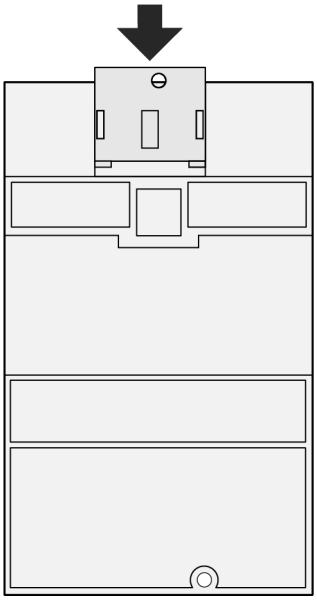


Mounting a processor module on a metal plate

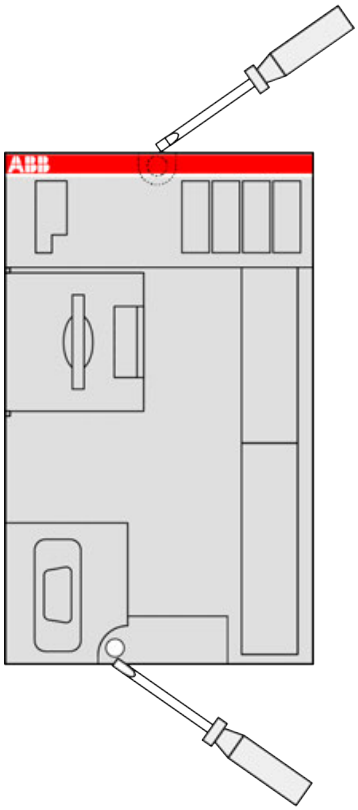
NOTICE!
Risk of function faults!
Missing electrical contact by isolating screws or washers!
Use metal screws on the metal plate.
The metal plate must be included into the earthing concept of the plant.
Do NOT use insulating washers!

One TA566 Wall Mounting Accessory ↪ Chapter 1.6.2.9.3.2 “ TA566 - Wall mounting accessory” on page 5205 is needed per processor module.

1. Snap in the TA566 at the back side of the processor module.



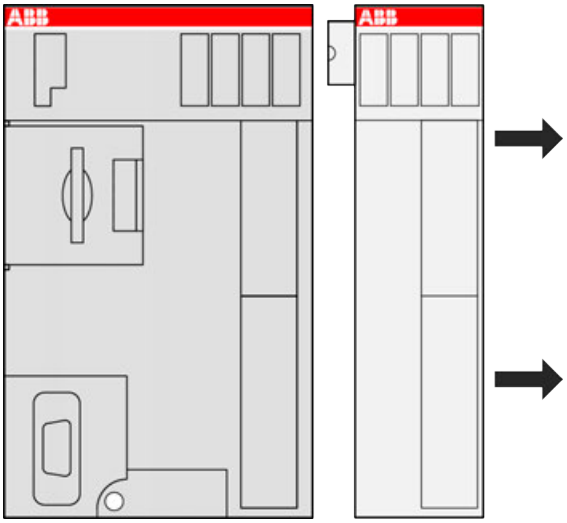
2. Fasten the processor module with two screws (max. diameter: 4 mm) to the metal plate.



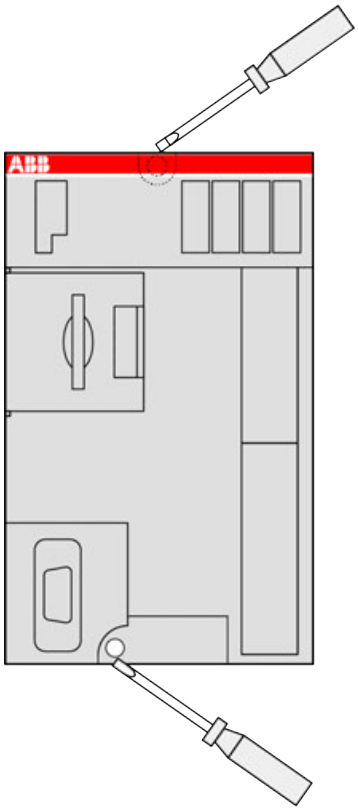
See Hardware description of PM55x-xP and PM56x-xP ↪ Chapter 1.6.2.3.1.1 “PM55x-xP and PM56x-xP” on page 3804 for connection.

Demounting a processor module mounted on a metal plate

1. Remove I/O modules if connected.



2. Remove the 2 screws.



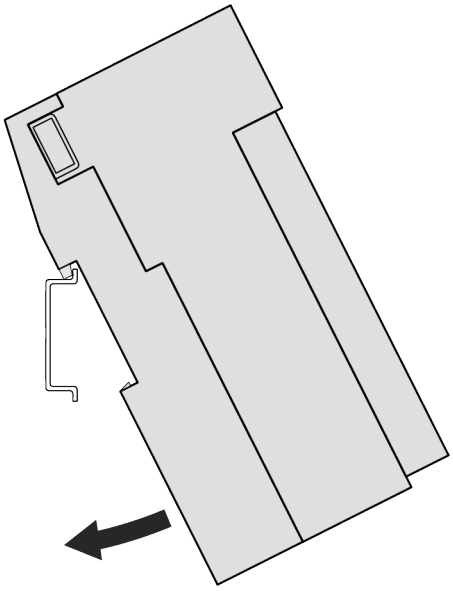
Mounting and demounting of S500-eCo I/O modules

S500-eCo I/O modules can be mounted either on a DIN rail or with screws on a metal plate.

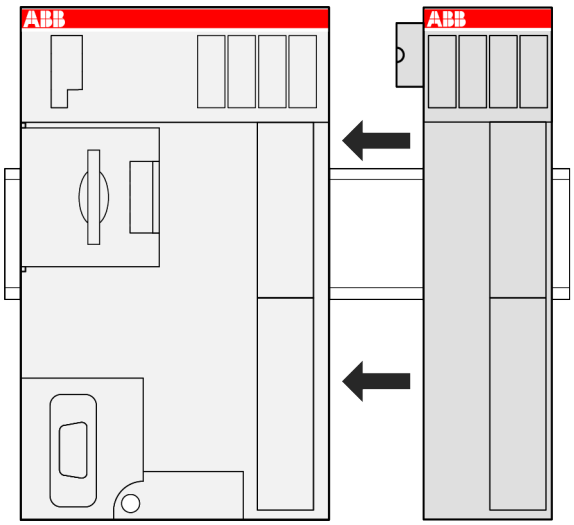
Mounting I/O modules on a DIN rail

NOTICE!
Risk of function faults!
The S500-eCo I/O modules are grounded via the DIN rail.
The DIN rail must be included into the earthing concept of the plant.
Use only metal screws.

1. Mount I/O module at the top of the DIN rail, then snap it in below.

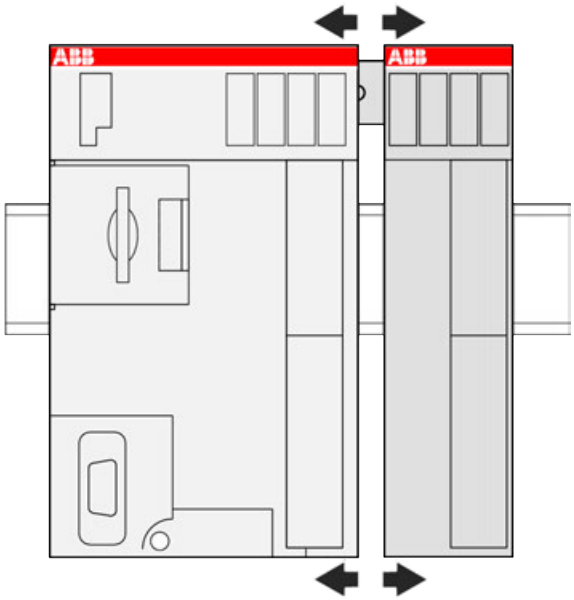


2. Attach I/O module by hand to an other module. The serial I/O bus is connected automatically.

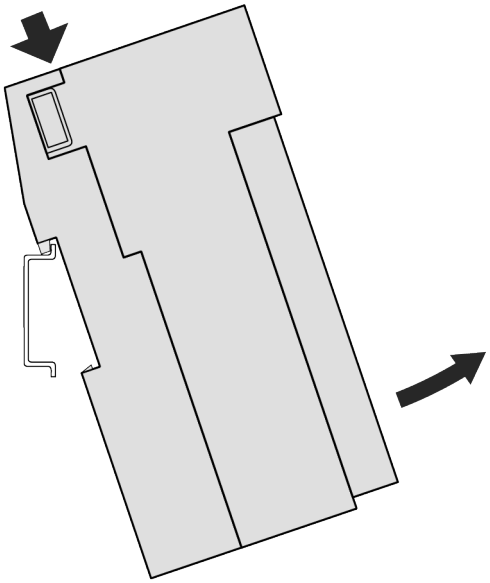


Demounting I/O modules mounted on a DIN rail

1. Remove I/O module by hand if connected.



2. While pressing down I/O module pull it away from DIN rail.



Mounting I/O modules on a metal plate

NOTICE!
Risk of function faults!
Missing electrical contact by isolating screws or washers!

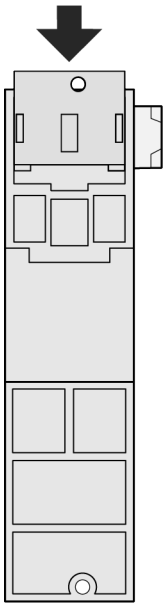
Use metal screws on the metal plate.

The metal plate must be included into the earthing concept of the plant.

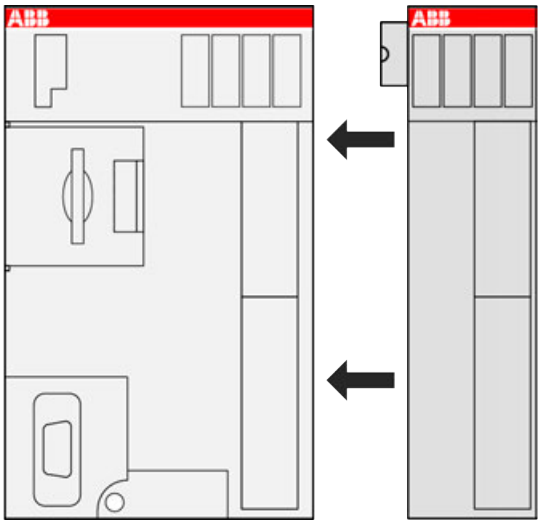
Do NOT use insulating washers!

> *One TA566 wall mounting accessory ↳ Chapter 1.6.2.9.3.2 “ TA566 - Wall mounting accessory” on page 5205 is needed per S500-eCo I/O module.*

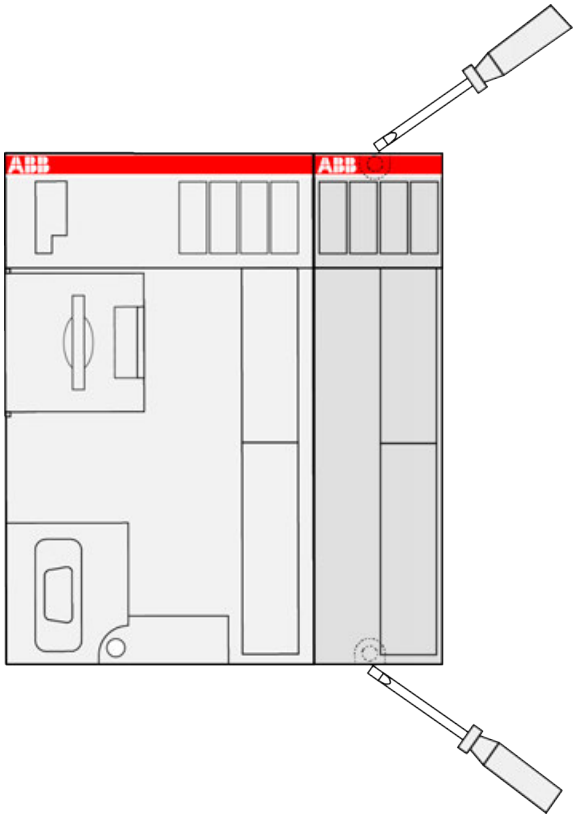
1. Snap in the TA566 at the back side of the I/O module.



2. Attach the I/O module by hand to an other module. The serial I/O bus is connected automatically.

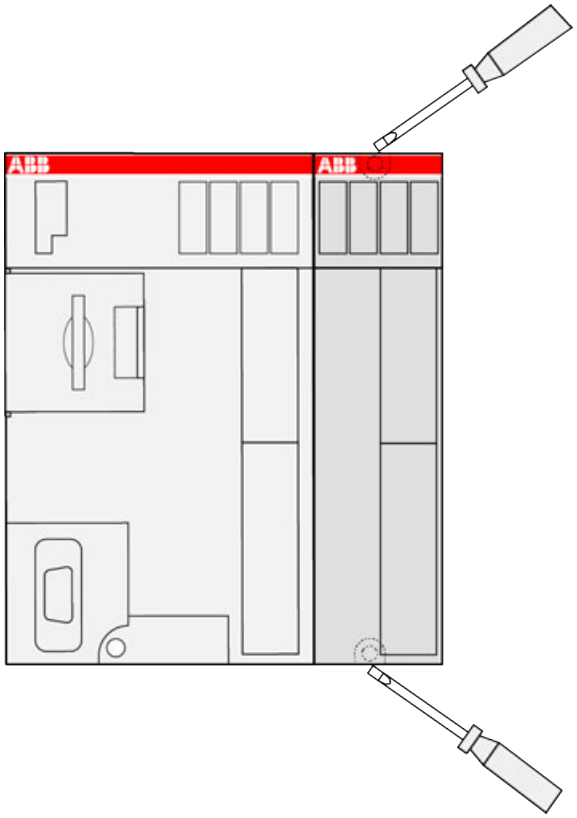


3. Fasten the I/O module with two screws (max. diameter: 4 mm) to the metal plate.

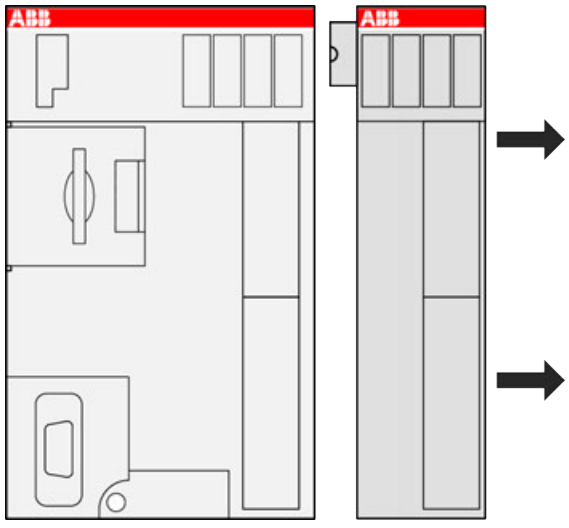


Demounting I/O modules mounted on a metal plate

1. Remove the 2 screws.



2. Remove the I/O module from the connected module by hand.



Mounting/Demounting the accessories

Additional components such as batteries, cables, etc. are required for commissioning the PLC system. Information on assembly, replacement or basic use of the orderable components can be found in the description of the respective accessory.

Chapter 1.6.3.6.5 “Handling of accessories” on page 5359

Hardware details can be found in the device specifications of the accessory.

↳ *Chapter 1.6.2.9 “Accessories” on page 5095*

1.6.3.5.4 Connection and wiring

For detailed information such as technical data of your mounted devices (AC500 product family) refer to the hardware device specification of the appropriate device.

NOTICE!
Attention:
All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 V DC.

Power supply

Power supply

Depending on the variant, the processor modules can be connected to the following supply voltages:

	24 V DC	100 - 240 V AC

The connection is established via a removable 5-pin terminal block. As the terminal block is also available as a spare part (inside TA570 Spare Part Set for AC500-eCo processor modules).

The 24 V DC variant contains 2 L+ and M terminals. The L+ terminal on the left side is the input and the right side is the output. The M terminals are internally interconnected. The supply can be easily looped through to the onboard digital inputs.

CAUTION!
Risk of damaging the processor module and the connected modules!
Voltages > 35 V DC (DC variants only) or > 288 V AC (AC variants only) might damage the processor module and the connected modules.

Make sure that the supply voltage never exceeds 35 V DC / 288 V AC.

CAUTION!
Risk of damaging the processor module!
Excess currents at 24 V DC output (24 V DC processor module variant) will damage the processor module.

Use an appropriate fuse ↳ *Chapter 1.6.2.3.1.1.8 “Technical data” on page 3814* within 24 V DC input connection.

The 100-240 V AC variant contains an internal power supply with a wide-range input. It provides a 24 V DC output at the terminals L+ and M which can be used to supply the onboard digital inputs.

> *The voltage output at 100 V AC ... 240 V AC variants can provide 180 mA max. The output is protected against overload by a self-resetting fuse (PTC).*

Serial interface COM1

The serial interfaces COM1 and COM2 are designed according to the standard EIA RS-485. Both interfaces can be operated in RS-485 mode.

Parameter	Value
Standard of the serial interfaces	RS-485
Interface connectors	COM1: 9-pin D-sub connector (female) COM2: 5-pole connector with screw-type connection (optional)
Electrical isolation	none (with TA562) 500 V DC (with TA569-RS-ISO)
Serial interface parameters	Configurable by the software
Operating modes	Programming or data exchange
Supported protocols	Modbus or serial data exchange using special software function blocks

Table 597: Pin assignment

Serial Interface	Pin	Signal	Description
Serial Interface 	1	FE	Functional earth
	2	SGND	0 V power supply, internally connected to M terminal
	3	RxD/TxD-P	Receive/Transmit positive
	4	Reserved	Reserved, not connected
	5	SGND	0 V power supply, internally connected to M terminal
	6	+3.3 V	3.3 V power supply
	7	Reserved	Reserved, not connected
	8	RxD/TxD-N	Receive/Transmit negative
	9	Reserved	Reserved, not connected
	Shield	Cable shield	Functional earth

The serial non-isolated interface COM1 is connected to a 9-pole D-sub connector. It is configurable for RS-485 and can be used for:

- online access with Automation Builder (via RS-485 programming cable e. g. TK504 ↳ *Chapter 1.6.2.9.1.12 “TK504 - COM2 USB programming cable” on page 5143*),
- as Modbus RTU, client and server
- for ASCII serial protocols
- a CS31 bus (RS-485), as master only.

The serial RS-485 interface is not galvanically isolation.

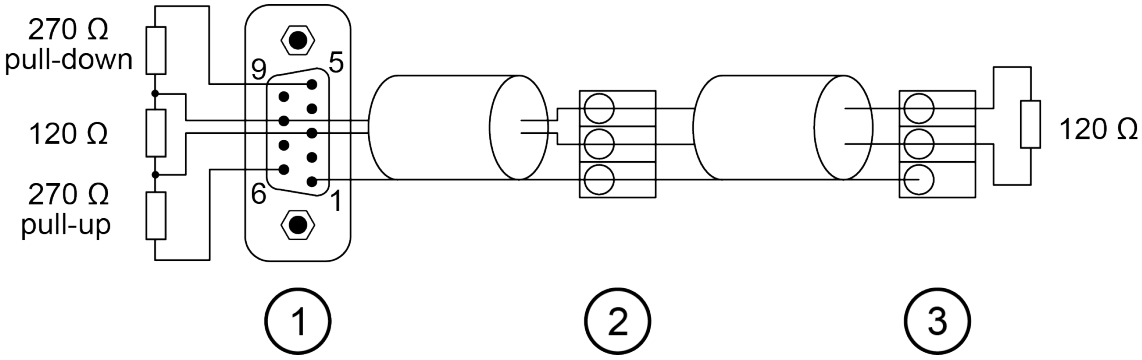
If the RS-485 bus is used, each interconnected bus line (each bus segment) must be electrically terminated. The following is necessary:

- 2 resistors of 120 Ω each at both line ends (to avoid signal reflections)
- In addition, a pull-up resistor at RxD/TxD-P and a pull-down resistor at RxD/TxD-N. These 2 resistors care for a defined high level on the bus, while there is no data exchange.

The pull-up, pull-down and termination resistors are not included inside the processor module and must be connected externally.

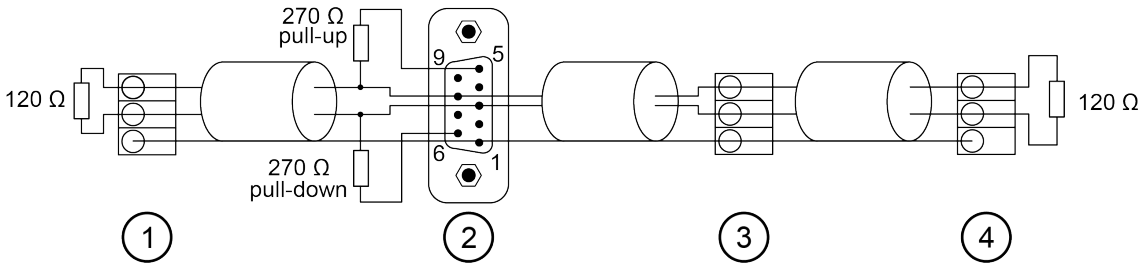
It is useful to add both the pull-up and the pull-down resistors, which only are necessary once on every bus line, at the bus master.

The following figure shows an RS-485 bus with the bus master at one line end.



1 Master at the bus line end, pull-up and pull-down activated, bus termination with 120 Ω resistors
2 Slave within the bus line
3 Slave at the bus line end, bus termination with 120 Ω resistors

If the master is located within the bus line, it does not need a terminating resistor. The pull-up and the pull-down resistors, however, are necessary:



1 Slave at the bus line end, bus termination with 120 Ω resistors
2 Master within the bus line, pull-up and pull-down activated
3 Slave within the bus line
4 Slave at the bus line end, bus termination with 120 Ω resistors

NOTICE!
Risk of EMC disturbances!
Unshielded cables may cause EMC disturbances.
Always use shielded cables and connect the shield at every device.

NOTICE!
Risk of malfunctions!
The pull-up/pull-down resistors must be used only one time within a bus line.
Use the pull-up/pull-down resistors only at 1 master.

The cable shields must be grounded. See CS31 bus *Chapter 1.6.3.5.4.4 “CS31 bus” on page 5257*.

Serial interface COM2

The serial interfaces COM1 and COM2 are designed according to the standard EIA RS-485. Both interfaces can be operated in RS-485 mode.

Parameter	Value
Standard of the serial interfaces	RS-485
Interface connectors	COM1: 9-pin D-sub connector (female) COM2: 5-pole connector with screw-type connection (optional)
Electrical isolation	none (with TA562) 500 V DC (with TA569-RS-ISO)
Serial interface parameters	Configurable by the software
Operating modes	Programming or data exchange
Supported protocols	Modbus or serial data exchange using special software function blocks

The serial interface COM2 is connected via a 5-pin terminal block and can be used for

- online access
- free protocol communication
- Modbus RTU, client and server

The serial RS-485 interface is not galvanically isolated using TA562-RS or TA562-RS-RTC.
Using TA569-RS-ISO the serial RS-485 interface has galvanic isolation.

It is not intended to use COM2 to establish a CS31 bus.

If the RS-485 bus is used, each interconnected bus line (each bus segment) must be electrically terminated. The following is necessary:

- 2 suitable resistors at both line ends (to avoid signal reflections)
- A pull-up resistor at RxD/TxD-P and a pull-down resistor at RxD/TxD-N. These 2 resistors care for a defined high level on the bus, while there is no data exchange.

The pull-up and the pull-down resistors are included inside the processor module's serial RS-485 adapter. The terminating resistor is not included inside the processor module and must be connected externally.

It is useful to activate both the pull-up and the pull-down resistors, which are only necessary once on every bus line, at the bus master. For this reason, these 2 resistors are already integrated within the COM2 interface of the processor module. They can be activated by connecting the terminals 1-2 and 3-4 of COM2.

For equipping AC500-eCo processor modules with a real-time clock and a second serial RS-485 interface COM2, use TA562-RS-RTC serial RS-485 and real-time clock adapter ↳ Chapter 1.6.3.5.5.8 “TA562-RS-RTC - Serial RS-485 adapter with real-time clock” on page 5296.

Table 598: Pin assignment

Serial Interface	Pin	Description
	1	Terminator P
	2	TxD/RxD-P
	3	TxD/RxD-N
	4	Terminator N
	5	Functional earth

NOTICE!
Risk of EMC disturbances!
Unshielded cables may cause EMC disturbances.

Always use shielded cables and connect the shield at every device.

NOTICE!
Risk of malfunctions!
The pull-up/pull-down resistors must be used only one time within a bus line.

Use the pull-up/pull-down resistors only at 1 master.

The ground potential of the interface COM2 is internally connected to the M terminal of the CPU power supply connector (not for TA569-RS-ISO).

The cable shields must be grounded. See CS31 bus ↳ *Chapter 1.6.3.5.4.4 “CS31 bus” on page 5257*.

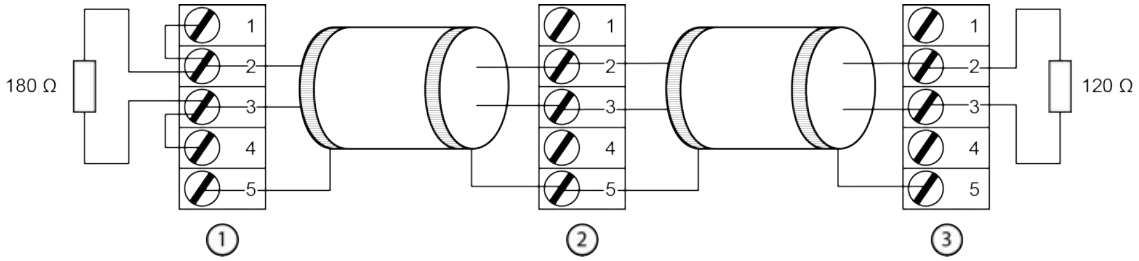
COM2 as master of RS-485 communication system

When COM2 is configured as a master in serial communication application, internal pull-up/pull-down resistors have to be activated to comply minimum 200 mV input voltage on A/B line during idle state.

COM2 as master at the bus line end

It is recommended to apply COM2 at the line end if RS-485 master is configured.

When COM2 is applied to the bus line end as a master it needs a 180 Ω terminator and pull-up/pull-downdown resistors wiring to comply with signal integrity and impedance matching. Terminator wiring and pull-up/pull-down resistors activating can be as:



1 COM2 as master at the end of bus line, pull-up and pull-down resistors are activated, bus termination with 180 Ω resistor
2 Slave within the bus line
3 Slave at the end of bus line, bus termination with 120 Ω resistor

AC500-eCo as master must always be located at the end of the bus line.

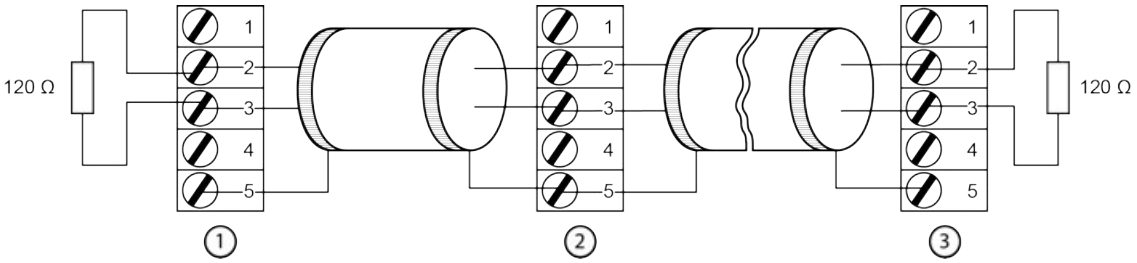
COM2 as slave of RS-485 communication system

When COM2 is configured as a slave in serial communication application, pull-up/pull-down resistors must be inactivated. Terminator wiring complies with the node position.

It does not matter wherever the master is located when COM2 is configured as slave in the line.

COM2 as slave at the bus line end

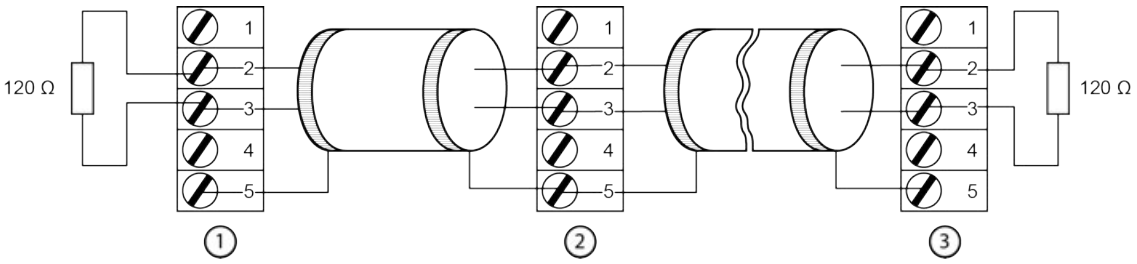
A 120 Ω 1/2 W resistor is a typical terminator to match the impedance of most of cable applied when COM2 is located at the end of bus line.



1 COM2 as slave at the end of bus line, bus termination with 120 Ω resistor, but the pull-up and pull-down termination must be inactivated
2 Slave within the bus line
3 Slave at the end of bus line, bus termination with 120 Ω resistor

COM2 as slave located within the bus line

If COM2 is configured as a slave node within the bus line, it does not need a terminator. Pull-up and pull-down resistors are not required by a slave node.



1 Slave at the end of bus line, bus termination with 120 Ω resistor
2 COM2 as slave within the bus line, pull-up and pull-down termination must be inactivated
3 Slave at the end of bus line, bus termination with 120 Ω resistor

CS31 bus

Connection

The AC500-eCo processor module can be used as a CS31 bus master. They cannot be used as a CS31 bus slave. The connection is performed via the serial interface COM1 used as a CS31 bus (see chapter Serial Interface COM1 ↯ *Chapter 1.6.2.3.1.1.3 “Connections” on page 3806*). Connection of the bus signals: pin 3 and pin 8.

Wiring

Bus line	
Construction	2 cores, twisted, with common shield
Conductor cross section	> 0.22 mm² (24 AWG)
Recommendation	0.5 mm² corresponds to 0.8 mm
Twisting rate	> 10 per meter (symmetrically twisted)
Core insulation	Polyethylene (PE)
Resistance per core	< 100 Ω/km
Characteristic impedance	ca. 120 Ω (100 Ω...150 Ω)
Capacitance between the cores	< 55 nF/km (if higher, the max. bus length must be reduced)
Terminating resistors	120 Ω ¼ W at both line ends
Remarks	Shielded cables with PVC core insulation and a core diameter of 0.8 mm can be used up to a length of ca. 50 m. In this case, the bus terminating resistor is ca. 100 Ω.

Wiring remarks Shielded cables with PVC core insulation and a core diameter of 0.8 mm can be used up to a length of ca. 50 m. In this case, the bus terminating resistor is ca. 100 Ω.

Bus topology A CS31 bus always contains only one bus master (CPU or Communication Module) which controls all actions on the bus. Up to 31 slaves can be connected to the bus, e. g. remote modules or slave-configured CPUs. Besides the wiring instructions shown below, the wiring and grounding instructions provided with the descriptions of the modules are valid additionally.

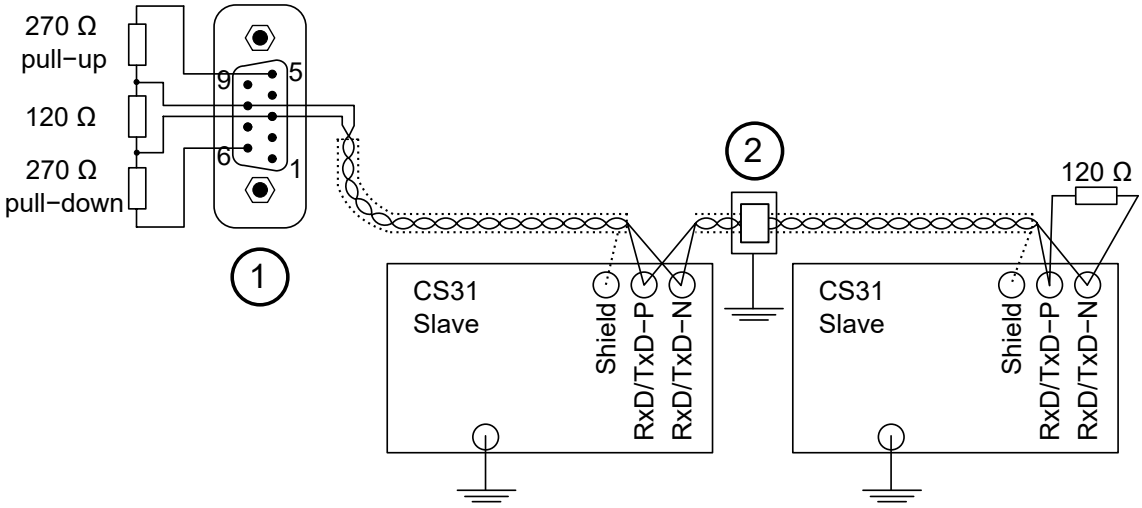


Fig. 1048: Bus topology for a CS31 bus at COM1 (Master is at the end of the bus line)

1 Master at the bus line end, pull-up and pull-down activated, bus termination with 120 Ω resistors
2 Direct grounding with clip or steel plate

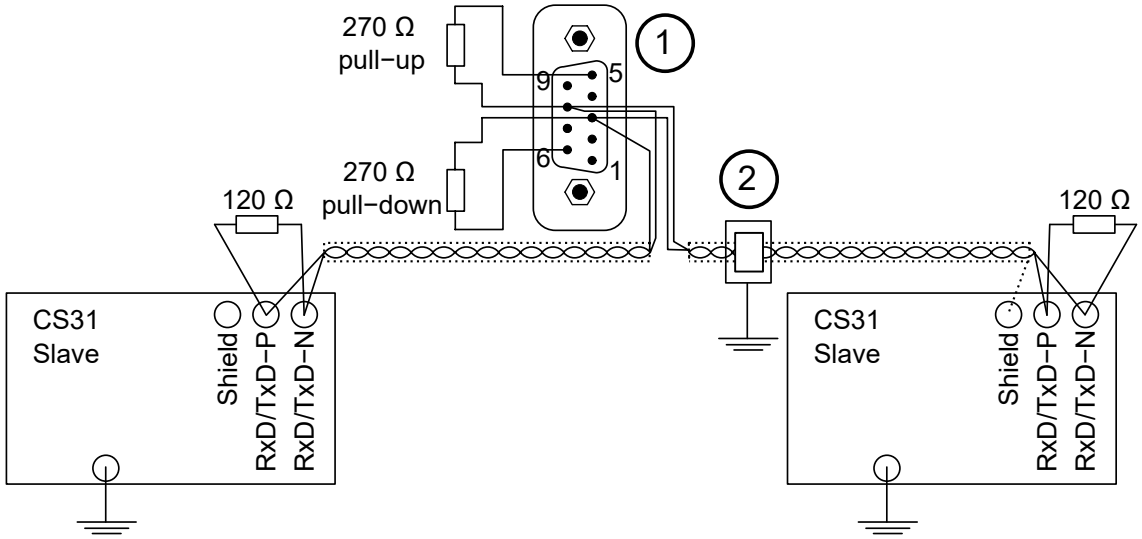

Fig. 1049: Bus topology for a CS31 bus at COM1 (Master is within the bus line)

1 Master within the bus line, pull-up and pull-down activated
2 Direct grounding with clip or steel plate

NOTICE!
Risk of malfunctions!
Spur lines are not allowed within the CS31 bus.
Loop the bus line from module to module.

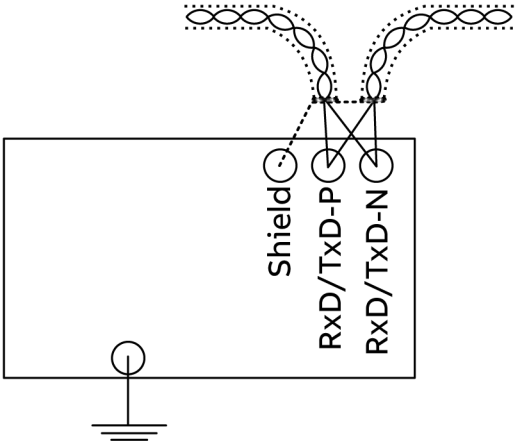

Fig. 1050: Correct

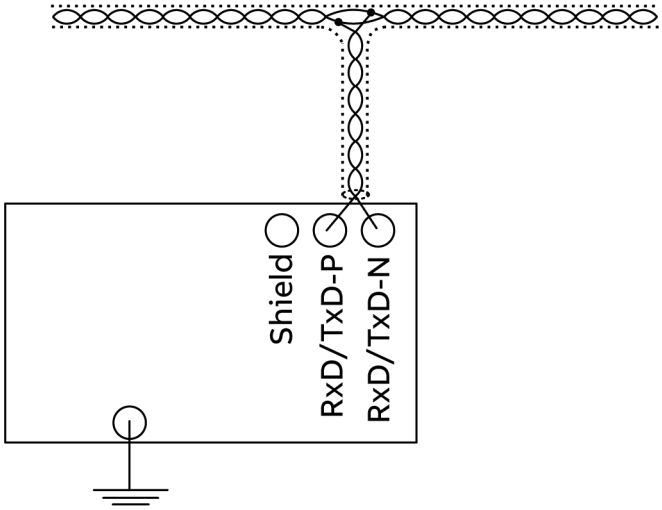

Fig. 1051: Wrong

Grounding In order to avoid disturbance, the cable shields must be grounded directly.

Case A Multiple switchgear cabinets: If it can be guaranteed that no potential differences can occur between the switchgear cabinets by means of current-carrying metal connections (grounding bars, steel constructions etc.), the direct grounding is chosen.

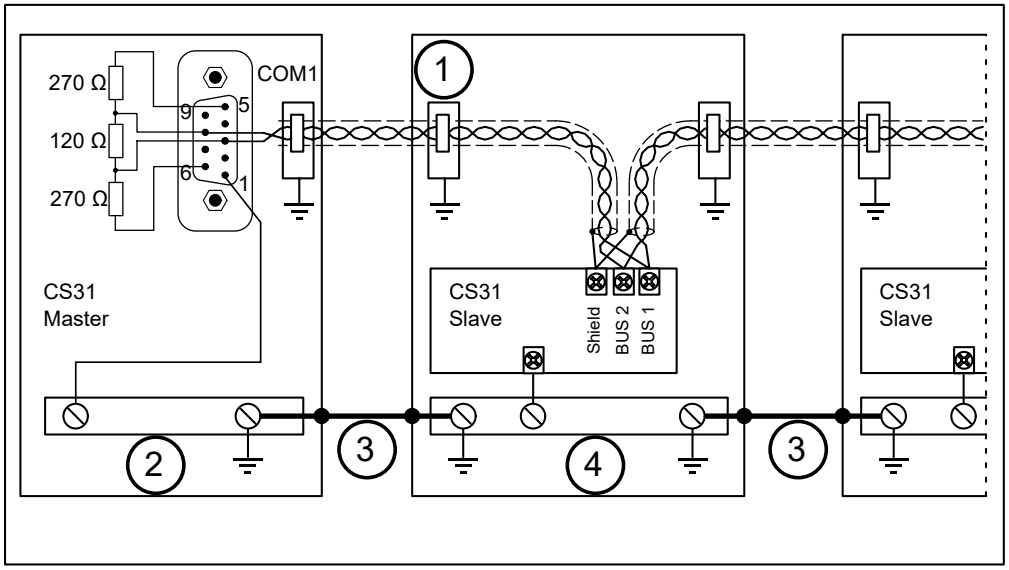

Fig. 1052: Direct grounding

1 Direct grounding with clip or steel plate
2 Ground of Cabinet 1
3 Current-carrying connection
4 Ground of Cabinet 2

Case B Multiple switchgear cabinets: If potential differences can occur between the switchgear cabinets, the capacitive grounding method is chose0n in order to avoid circulating currents on the cable shields.

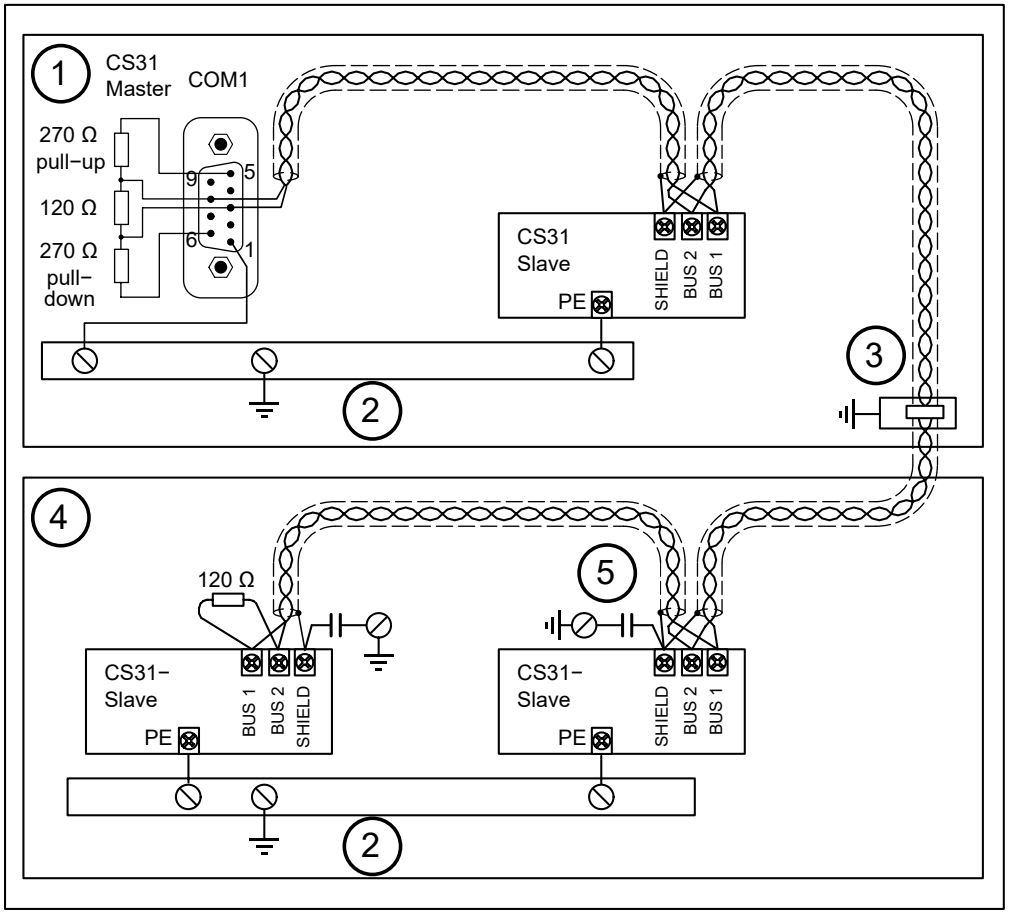

Fig. 1053: Earthing concept with several switchgear cabinets: direct grounding of cable shields when cables enter the first switchgear cabinet (containing the master), and capacitive grounding at the modules

1 Cabinet 1
2 Cabinet grounding
3 Direct grounding with clip or steel plate
4 Cabinet 2
5 Capacitive grounding with 0.1 μF X-type capacitor directly on the cabinet steel plate

Everywhere is valid: The total length of the grounding connections between the shield of the Terminal Base and the grounding bar must be as short as possible (max. 25 cm). The conductor cross section must be at least 2.5 mm².

VDE 0160 requires, that the shield must be grounded directly at least once per system.

Ethernet

Ethernet is also used for PROFINET, EtherCAT and Modbus TCP connection.

Ethernet interface

The Ethernet interface is carried out via a RJ45 jack. The pin assignment of the Ethernet interface:

Interface	Pin	Description	
	1	Tx+	Transmit Data +
	2	Tx-	Transmit Data -
	3	Rx+	Receive data +
	4	NC	Not connected
	5	NC	Not connected
	6	Rx-	Receive data -
	7	NC	Not connected
	8	NC	Not connected
	Shield	Cable shield	Functional earth

The supported protocols and used Ethernet ports can be found in a separate chapter ↳ *Chapter 1.6.4.1.6.1.1 “Ethernet protocols and ports for AC500 V2 products” on page 5442*.

Communication via Modbus TCP/IP is described in detail in a separate chapter ↳ *Chapter 1.6.4.1.8 “Communication with Modbus RTU” on page 5467*.

Wiring

Cable length restrictions

For the maximum possible cable lengths within an Ethernet network, various factors have to be taken into account. Twisted pair cables (TP cables) are used as transmission medium for 10 Mbit/s Ethernet (10Base-T) as well as for 100 Mbit/s (Fast) Ethernet (100Base-TX). For a transmission rate of 10 Mbit/s, cables of at least category 3 (IEA/TIA 568-A-5 Cat3) or class C (according to European standards) are allowed. For fast Ethernet with a transmission rate of 100 Mbit/s, cables of category 5 (Cat5) or class D or higher have to be used. The maximum length of a segment, which is the maximum distance between two network components, is restricted to 100 m due to the electric properties of the cable.

Furthermore, the length restriction for one collision domain has to be observed. A collision domain is the area within a network which can be affected by a possibly occurring collision (i.e. the area the collision can propagate over). This, however, only applies if the components operate in half-duplex mode since the CSMA/CD access method is only used in this mode. If the components operate in full-duplex mode, no collisions can occur. Reliable operation of the collision detection method is important, which means that it has to be able to detect possible collisions even for the smallest possible frame size of 64 bytes (512 bits). But this is only guaranteed if the first bit of the frame arrives at the most distant subscriber within the collision domain before the last bit has left the transmitting station. Furthermore, the collision must be able to propagate to both directions at the same time. Therefore, the maximum distance between two ends must not be longer than the distance corresponding to the half signal propagation time of 512 bits. Thus, the resulting maximum possible length of the collision domain is 2000 m for a transmission rate of 10 Mbit/s and 200 m for 100 Mbit/s. In addition, the bit delay times caused by the passed network components also have to be considered.

The following table shows the specified properties of the respective cable types per 100 m.

Table 599: Specified cable properties:

Parameter	10Base-T [10 MHz]	100Base-TX [100 MHz]
Attenuation [dB / 100m]	10.7	23.2
NEXT [dB / 100m]	23	24
ACR [dB / 100m]	N/A	4
Return loss [dB / 100m]	18	10
Wave impedance [Ohms]	100	100

Parameter	10Base-T [10 MHz]	100Base-TX [100 MHz]
Category	3 or higher	5
Class	C or higher	D or higher

TP cable

The TP cable has eight wires arranged in four pairs of twisted wires. Different color codes exist for the coding of the wires, the coding according to EIA/TIA 568, version 1, being the one most commonly used. In this code, the individual pairs are coded with blue, orange, green and brown color. One wire of a pair is unicolored and the corresponding second wire is striped, the respective color alternating with white. For shielded cables, a distinction is made between cables that have one single shield around all pairs of wires and cables that have an additional individual shield for each pair of wires. The following table shows the different color coding systems for TP cables:

Table 600: Color coding of TP cables:

Pairs	EIA/TIA 568 Version 1		EIA/TIA 568 Version 2		DIN 47100		IEC 189.2	
Pair 1	white/ blue	blue	green	red	white	brown	white	blue
Pair 2	white/ orange	orange	black	yellow	green	yellow	white	orange
Pair 3	white/ green	green	blue	orange	grey	pink	white	green
Pair 4	white/ brown	brown	brown	slate	blue	red	white	brown

Two general variants are distinguished for the pin assignment of the normally used RJ45 connectors: EIA/TIA 568 version A and version B. The wiring according to EIA/TIA 568 version B is the one most commonly used.

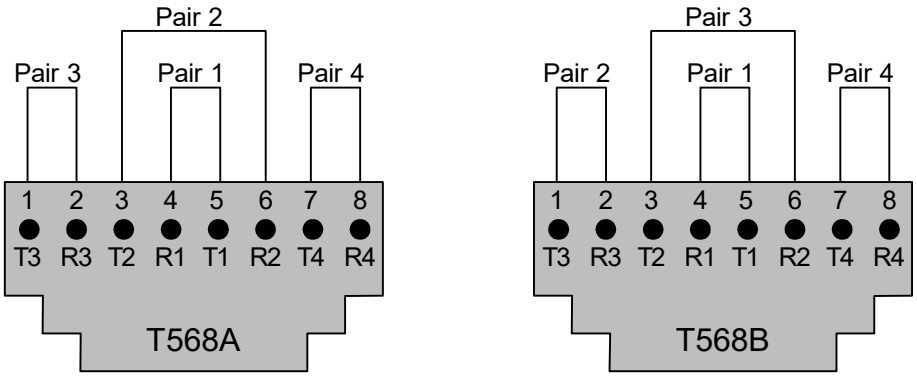

Fig. 1054: Pin assignment of RJ45 sockets

Cable types

Straight-through cable

For networks with more than two subscribers, hubs or switches have to be used additionally for distribution. These active devices already have the crossover functionality implemented which allows a direct connection of the terminal devices using straight-through cables.

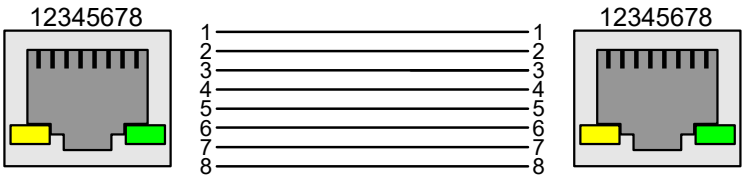

Fig. 1055: Wiring of a straight-through cable

CAUTION!
Risk of communication faults!
When using inappropriate cables, malfunctions in communication may occur.

Only use network cables of the categories 5 (Cat 5, Cat 5e, Cat 6 or Cat 7) or higher within PROFINET networks.

Modbus RTU connection details

The Modbus RTU protocol is implemented in the AC500 processor modules.

Modbus is a master-slave (client-server) protocol. The client sends a request to the server(s) and receives the response(s).

Available serial interfaces can work as Modbus interfaces simultaneously.

The Modbus client operating mode of an interface is set with the function block COM_MOD_MAST.

↳ *Chapter 1.5.4.22.1.1 “COM_MOD_MAST” on page 1698*

Technical data

The Modbus operating mode and the interface parameters are set in the ↳ *Chapter 1.6.5.2.11.4 “Setting COMx - Modbus” on page 6108*.

Table 601: Description of the Modbus protocol

Parameter	Value
Supported standard	PM55x and PM56x: EIA RS-485 PM57x, PM58x and PM59x: EIA RS-232 / RS-485
Number of connection points	1 client Max. 1 server with RS-232 interface Max. 31 servers with RS-485
Protocol	Modbus
Operating mode	Client/server
Address	Server only
Data transmission control	CRC16
Data transmission speed	From 300 bits/s to 187,500 bits/s

Parameter			Value
Encoding			1 start bit 8 data bits 1 parity bit, (optional) even, odd, mark or space 1 or 2 stop bits
Max. cable length for RS-485 on COM1 / COM2 for AC500 CPU			1.200 m at 19.200 baud
Max. cable length for RS-485 on COM1 / COM2 for AC500-eCo CPU			
	COM1:		
		Non-isolated:	Max. 50 m (with shielded cable)
		Isolated with TK506:	Max. 500 m at 19.200 baud (with shielded cable *)
	COM2:		
		Non-isolated with TA562:	Max. 50 m (with shielded cable)
		Isolated with TA569:	Max. 500 m at 19.200 baud (with shielded cable *)

*) 500 m cable type STP-120 Ω/AWG-20

If a processor module provides more than one serial interface, both interfaces (COM1/COM2) can be operated simultaneously as Modbus interfaces and can operate as Modbus server as well as Modbus client.

Bus topology

Point-to-point with RS-232 or bus topology with RS-485. Modbus is a master-slave protocol.

For further information on Modbus see chapter ↳ *Chapter 1.6.4.1.8 “Communication with Modbus RTU” on page 5467*.

1.6.3.5.5 Handling of accessories

This section only describes accessories that are frequently used for system assembly, connection and construction. A description of all additional accessories that can be used to supplement AC500 system can be found in the Hardware PLC device description.

CR2032 - Battery for real-time clock

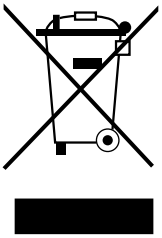
Intended purpose

A standard lithium battery (type CR2032) is used to backup the real-time clock (RTC) in the adapters TA561-RTC ↳ *Chapter 1.6.3.5.5.6 “TA561-RTC - Real-time clock adapter” on page 5284* and TA562-RS-RTC ↳ *Chapter 1.6.3.5.5.8 “TA562-RS-RTC - Serial RS-485 adapter with real-time clock” on page 5296* during power failures.

The CPU monitors the discharge degree of the battery. An diagnoses message is output before the battery condition becomes critical (about 2 weeks before). After the diagnosis message has appeared, the battery should be replaced as soon as possible.

Handling instruction

- The handling instructions of the battery manufacturer must be observed.
- The Material Safety Data Sheet (MSDS) of the battery manufacturer must be observed.
- Do not short-circuit or re-charge the battery! It can cause excessive heating and explosion.
- Do not disassemble the battery!
- Do not heat up the battery and not put into fire! Risk of explosion.
- Store the battery in a dry place.
- Recycle exhausted batteries meeting the environmental standards.



Transport

Transport of lithium batteries or equipment with installed lithium batteries:

- The transport and handling instructions of the battery producer must be observed.
- The transport regulations for transport of lithium batteries must be observed e.g. for transport by road or air.
- The forwarder must be informed if batteries are contained in the shipment.

Connections

Assembling and connection of the battery is described in chapters of TA561-RTC ↬ *Chapter 1.6.3.5.5.6 “TA561-RTC - Real-time clock adapter” on page 5284* and TA562-RS-RTC ↬ *Chapter 1.6.3.5.5.8 “TA562-RS-RTC - Serial RS-485 adapter with real-time clock” on page 5296*.

Battery lifetime

The battery lifetime is the time the battery can operate the RTC while the CPU is not powered. The typical lifetime is 300 days (at 25 °C).

As long as the CPU is powered, the battery will only be discharged by its own leakage current.

Technical data

The battery must meet die following technical data:

Parameter	Value
Battery designation	CR2032
Description	Manganese dioxide button cell, primary cell, not rechargeable
Nominal voltage	3 V DC
Capacity	230 mAh (measured with 5.6 kΩ load at 20 °C, discharging down to 2.0 V)
Typical lifetime (at 25 °C, CPU not powered)	300 days
Temperature range	≥ 0 °C ...+70 °C
Diameter	20 mm
Height	3.2 mm

MC502 - Memory card

- Solid state flash memory storage

1 MC502 memory card

> *The memory card has a write protect switch.*
>
> *In the position "LOCK", the memory card can only be read.*

Memory card type	AC500 V2	AC500-XC V2	AC500-eCo V2 [3])	AC500 V3	AC500-XC V3	AC500-eCo V3
MC502	x	x	x	x	x	-
MC5141	x	x	x	x	x	-
MC5102 **with** TA5350-AD micro memory card adapter	x [1])	x [1]) [2])	x [1])	x	x [2])	-
MC5102 **without** TA5350-AD micro memory card adapter	-	-	-	-	-	x

[1]) As of firmware 2.5.x

[2]) Temporary use of MC5102 is possible under normal environmental conditions, but MC5141 should be preferred.

[3]) A memory card can only be inserted when a MC503 memory card adapter is installed in the processor module.

> *The use of other memory cards is prohibited. ABB is not responsible nor liable for consequences resulting from use of unapproved memory cards.*

Purpose

Processor modules can be operated with and without (micro) memory card.

Processor modules are supplied without (micro) memory card. It must be ordered separately.

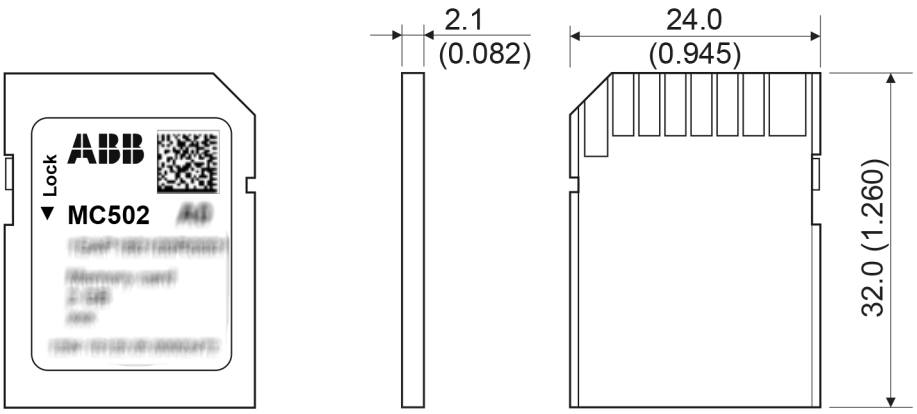
AC500-eCo V2 processor modules must be equipped with an MC503 memory card adapter if a memory card is used. *Chapter 1.6.3.5.5.3 “MC503 - Memory card adapter” on page 5272*

The memory card is used to store or backup application data and/or application programs or project source codes as well as to update the internal CPU firmware.

The memory card is intended for long-term use in standard and XC application.

The memory card can be read/written on a PC with a SDHC compatible memory card reader.

Dimensions



The dimensions are in mm and in brackets in inch.

Insert the memory card

AC500 V2 and AC500-eCo V2

1. Unpack the memory card.
2. Insert the memory card into the memory card slot of the processor module until locked.

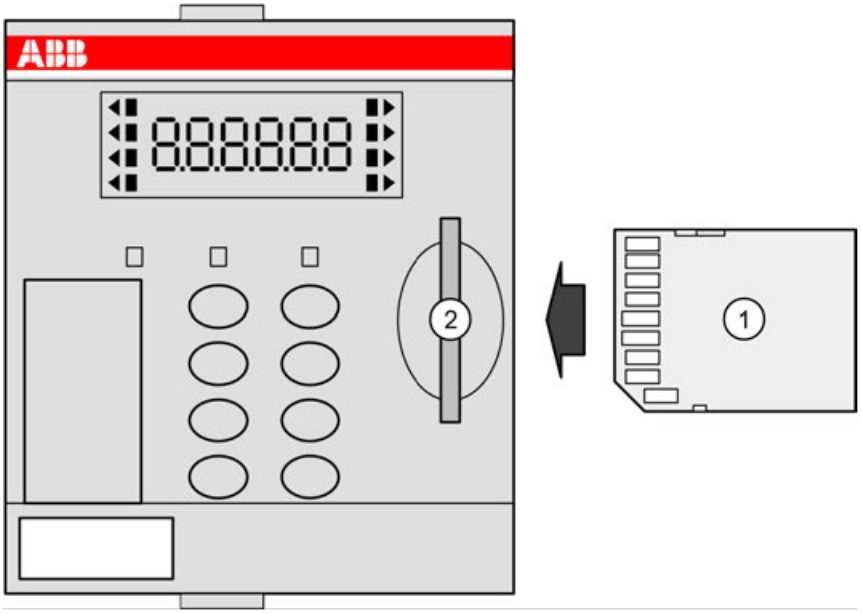


Fig. 1056: Insert memory card into PM57x, PM58x and PM59x

1 Memory card
2 Memory card slot

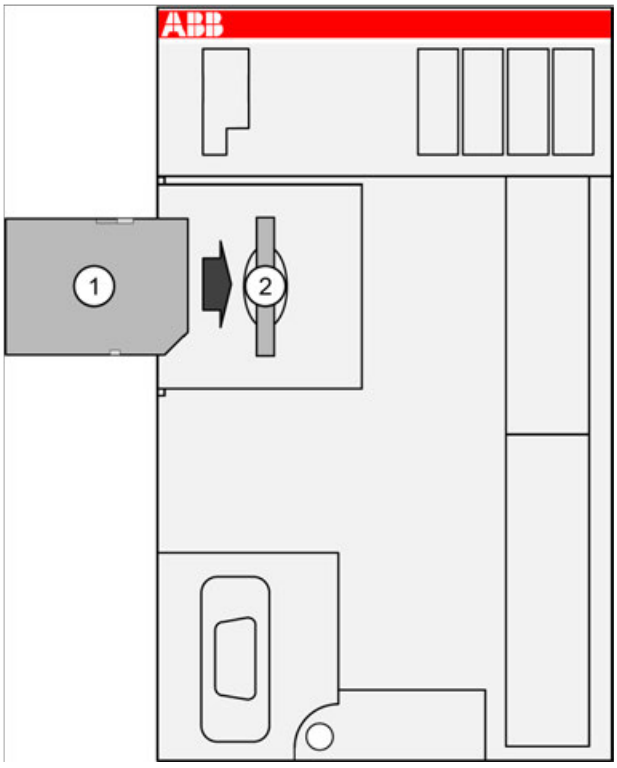

Fig. 1057: Insert memory card into PM55x-xP and PM56x-xP

1 Memory card
2 MC503 memory card adapter

Remove the memory card

AC500 V2 and AC500-eCo V2

NOTICE!

Removal of the memory card

Do not remove the memory card when it is working!

Remove the memory card only when the RUN LED is not blinking.

Otherwise the memory card and/or files on it might get corrupted and/or normal PLC operation might be disturbed.

1. To remove the memory card, push on the memory card until it moves forward.
2. By this, the memory card is unlocked and can be removed.

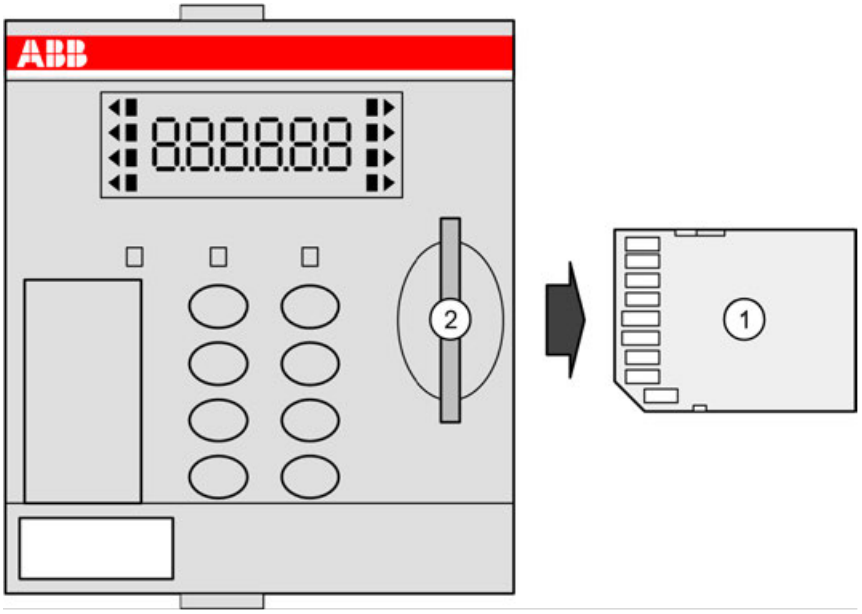

Fig. 1058: Remove memory card from PM57x, PM58x and PM59x

1 Memory card
2 Memory card slot

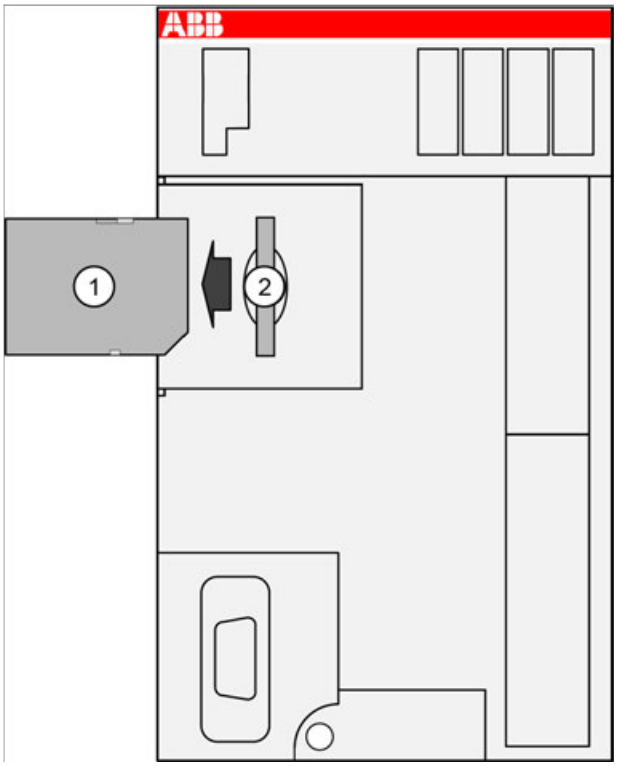

Fig. 1059: Remove memory card from PM55x-xP and PM56x-xP

1 Memory card
2 MC503 memory card adapter

Technical data

Parameter		Value
Memory capacity		2 GB
Total bytes written (TBW)		On request
Data retention		
	at beginning	10 years at 40 °C
	when number of write processes has been 90 % of lifetime of each cell	1 year at 40 °C
Write protect switch		Yes, at the edge of the memory card
Weight		2 g
Dimensions		24 mm x 32 mm x 2.1 mm

It is not possible to use 100 % of a device's memory space. About 10 % of the total available space must remain unused at any time to maintain normal device operation.

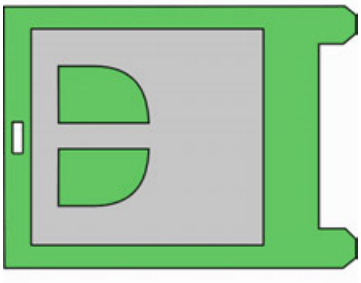
Further information on using the memory card in AC500 PLCs is provided in the chapter ↬ *Chapter 1.6.6.2 “Memory card in AC500 V2” on page 6339*.

Ordering data

Part no.	Description	Product life cycle phase *)
1SAP 180 100 R0001	MC502, memory card	Classic

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

MC503 - Memory card adapter



Intended purpose

The MC503 memory card adapter is used for expanding processor modules PM55x-xP or PM56x-xP with a memory card slot.

A memory card MC502 or a micro memory card MC5102 with micro memory card adapter is not included in the scope of delivery and must be ordered separately.

The memory card can be used for:

- saving process data,
- saving user programs,
- upgrading the firmware.

Insert the memory card adapter

1. Make sure, that the power supply of the processor module is turned off.

WARNING!

Risk of electric shock!

With an opened option board slot cover, energized parts of the processor module could be touched.

– Always turn off and disconnect the power supply for the processor module before you open the option board slot cover.
– Make sure that the option board slot cover is closed before reconnecting the processor module to the power supply.

2. Remove the option board slot cover of the processor module totally by pushing it to the left side.
3. Plug the memory card adapter to the left expansion slot of the processor module. Make sure that the 2 noses of the expansion module fit to the holes of the processor module printed circuit board.
4. Remove the bar located in the middle of the option board slot cover for memory card slot.
5. Refit the option board slot cover.

6. To insert the memory card, see MC502 ↳ *Chapter 1.6.3.5.5.2 “MC502 - Memory card” on page 5267* or MC5102 ↳ *Chapter 1.6.3.5.5.4 “MC5102 - Micro memory card with micro memory card adapter” on page 5273*.

Remove the memory card adapter

1. Make sure that the power supply of the processor module is turned off.

WARNING!
Risk of electric shock!
With an opened option board slot cover, energized parts of the processor module could be touched.

– Always turn off and disconnect the power supply for the processor module before you open the option board slot cover.
– Make sure that the option board slot cover is closed before reconnecting the processor module to the power supply.

2. Remove the option board slot cover of the processor module totally by pushing it to the left side.
3. Remove the memory card adapter out of the processor module by lifting it up with a screwdriver.
4. Refit the option board slot cover. The option board slot cover is available as a spare part (see TA570 spare part set for AC500-eCo V2 processor modules). ↳ *Chapter 1.6.3.5.5.12 “TA570 - Spare part set” on page 5309*

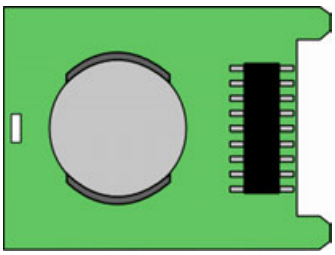
TA561-RTC - Real-time clock adapter



Intended purpose

The TA561-RTC real-time clock adapter is used for equipping AC500-eCo processor modules with a real-time clock.

The real-time clock can be buffered via an optional standard lithium battery (CR2032) during power supply failures (see lithium battery for real-time clock of AC500-eCo processor modules *Chapter 1.6.3.5.5.1 “CR2032 - Battery for real-time clock” on page 5265*).

Insertion and replacement of the adapter

WARNING!

Risk of electric shock!

With an opened option board slot cover, energized parts of the processor module could be touched.

– Always turn off and disconnect the power supply for the processor module before you open the option board slot cover.
– Make sure that the option board slot cover is closed before reconnecting the processor module to the power supply.

The option board slot cover is available as a spare part (see TA570 spare part set for AC500-eCo processor modules *Chapter 1.6.3.5.5.12 “TA570 - Spare part set” on page 5309*).

Replacement of the battery

WARNING!

Risk of death by electric shock!

Hazardous voltages can be present at the terminals of the module.

Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.

1. Switch off power supply of the system and verify that the CPU is powerless.

⇨ LEDs (PWR, RUN, ERR) must be off.

2. Remove the option board slot cover.

⇨ Remove the option board slot cover of the CPU totally by pushing it to the outer side.

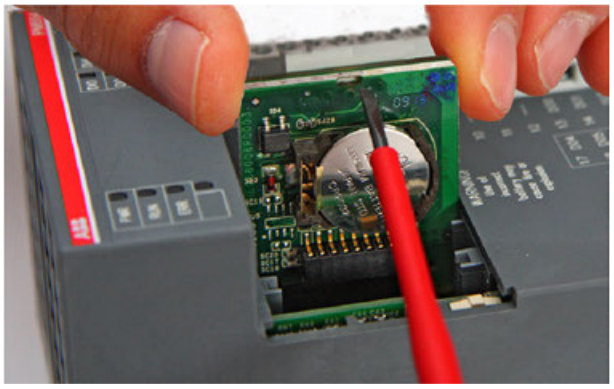
NOTICE!

Avoidance of electrostatic charging

PLC devices and equipment are sensitive to electrostatic discharge, which can cause internal damage and affect normal operation. Observe the following rules when handling the system:

- Touch a grounded object to discharge potential static.
- Wear an approved grounding wrist strap.
- Do not touch connectors or pins on component boards.
- Do not touch circuit components inside the equipment.
- If available, use a static-safe workstation.
- When not in use, store the equipment in appropriate static-safe packaging.

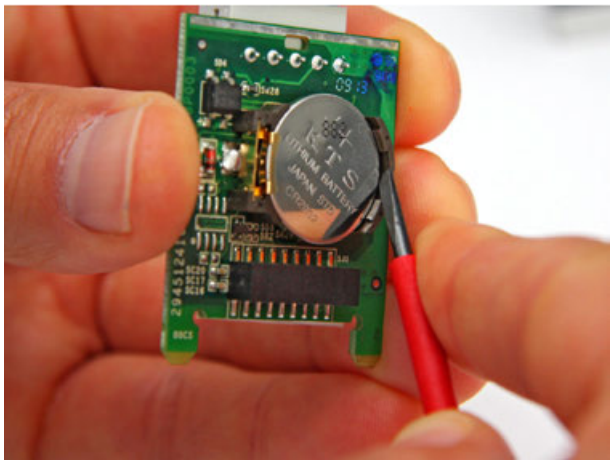
3. Remove the option board from the CPU by lifting it up with a screwdriver.

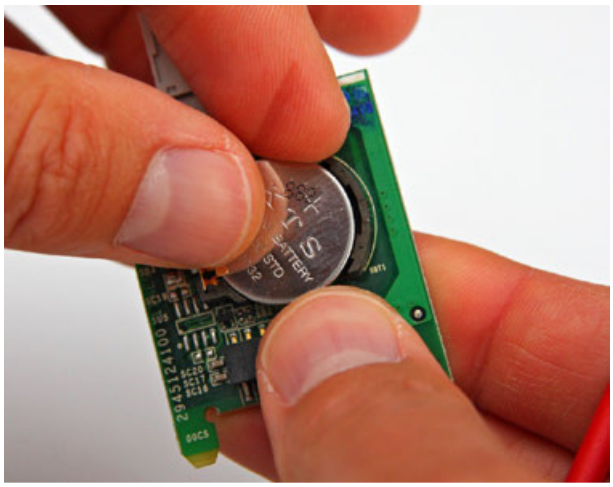


⇨

Remove memory card (if installed) / terminal block (COM2).

4. Remove the battery.





⇨

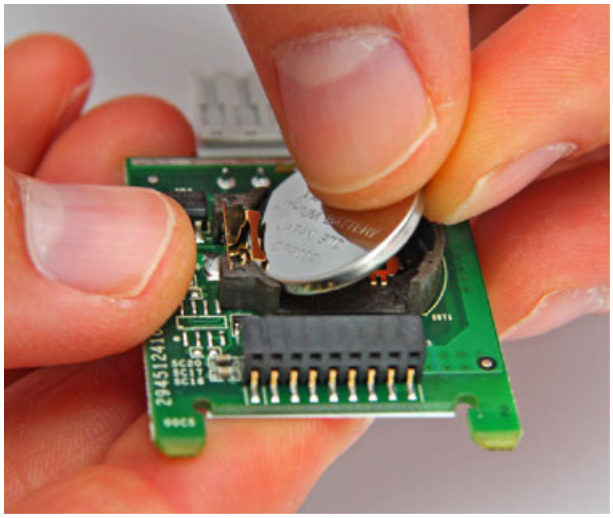
ATTENTION!

Lithium batteries must not be recharged, not be disassembled and not be disposed of in fire.

Exhausted batteries must be recycled to respect the environment.

Dispose of battery properly according to disposal procedures for lithium batteries.

5. Insert replacement battery.



⇨

ATTENTION!

*A standard battery CR2032 can be used for **TA561-RTC** and **TA562-RS-RTC**.*

*Nominal voltage: **3 V DC**.*

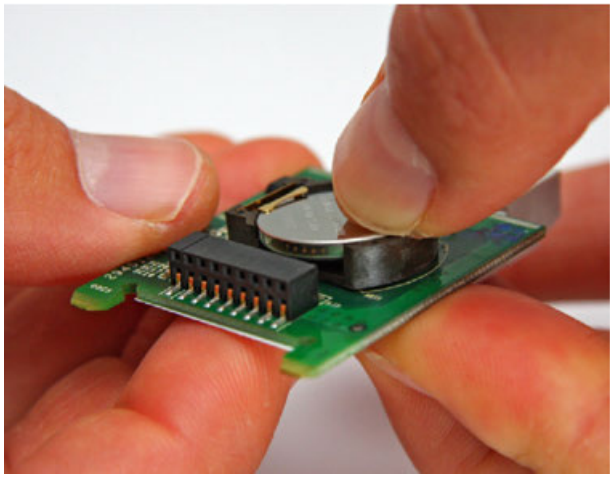
*Required capacity: **230 mAh**.*

*Required temperature range for discharge: **0 °C...+70 °C**.*

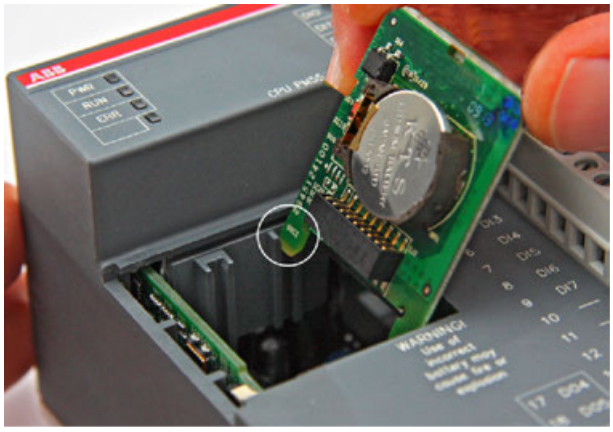
After replacement of the battery, the real-time clock (RTC) date and time must be set again by the user.

Don't use a battery older than 3 years for replacement (e.g. battery kept too long in stock).

Batteries must be stored in a dry place.



6. Insert option board into the CPU.



⇨ Insert the adapter TA56x-RTC into the slot on the right of the CPU.

> *Make sure that the 2 noses of the extension module fit to the holes of the CPU PCB.*
>
> *See white circle in figure above.*

7. Refit the option board slot cover of the CPU.

⇨

> *Remember to re-insert a memory card first if it has been removed previously.*

8. Only now the CPU can be connected to power.

> *Set the time of the real-time clock.*

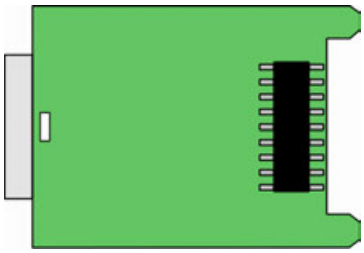
TA562-RS - Serial RS-485 adapter



Intended purpose

The serial RS-485 adapter is used for equipping AC500-eCo processor modules with a second serial interface COM2. The COM2 interface can be used for:

- online access
- free protocol communication
- Modbus RTU, client and server

> **CAUTION!**
> The serial RS-485 Interface is not galvanically isolated.

Insertion/ Removal of the adapter

WARNING!

Risk of electric shock!

With an opened option board slot cover, energized parts of the processor module could be touched.

– Always turn off and disconnect the power supply for the processor module before you open the option board slot cover.
– Make sure that the option board slot cover is closed before reconnecting the processor module to the power supply.

The option board slot cover is available as a spare part (see TA570 spare part set for AC500-eCo processor modules *Chapter 1.6.3.5.5.12 “TA570 - Spare part set” on page 5309*).

Removal of the option board

WARNING!

Risk of death by electric shock!

Hazardous voltages can be present at the terminals of the module.

Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.

1. Switch off power supply of the system and verify that the CPU is powerless.

⇨ LEDs (PWR, RUN, ERR) must be off.

2. Remove the option board slot cover.

⇨ Remove the option board slot cover of the CPU totally by pushing it to the outer side.

NOTICE!

Avoidance of electrostatic charging

PLC devices and equipment are sensitive to electrostatic discharge, which can cause internal damage and affect normal operation. Observe the following rules when handling the system:

- Touch a grounded object to discharge potential static.
- Wear an approved grounding wrist strap.
- Do not touch connectors or pins on component boards.
- Do not touch circuit components inside the equipment.
- If available, use a static-safe workstation.
- When not in use, store the equipment in appropriate static-safe packaging.

3. Remove the option board.

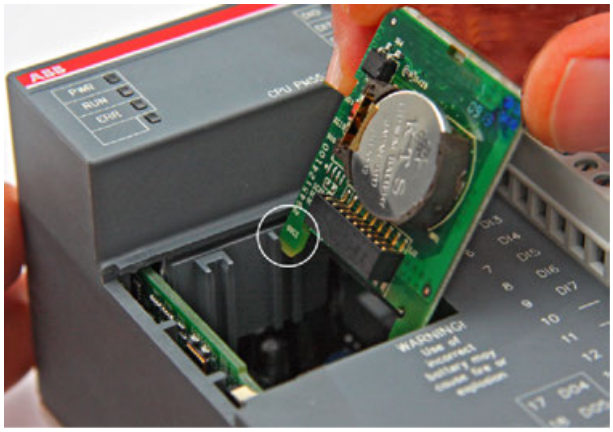
⇨

Remove memory card (if installed) / terminal block (COM2).

Remove the option board from the CPU by lifting it up with a screwdriver.

Insertion of the option board

1. Insert option board into the CPU.



⇨

Make sure that the 2 noses of the expansion module fit to the holes of the CPU PCB.

See white circle in figure above.

2. Refit the option board slot cover of the CPU.

⇨

Remember to re-insert a memory card first if it has been removed previously.

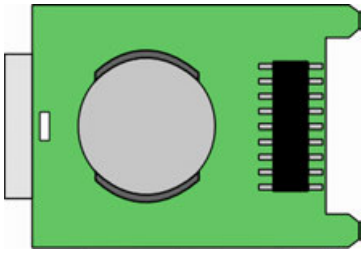
1TNE 968 901 R4300	TA562-RS, serial RS-485 adapter for PM55x/PM56x	Active

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

TA562-RS-RTC - Serial RS-485 adapter with real-time clock



Intended purpose

The TA562-RS-RTC serial RS-485 adapter with real-time clock is used for equipping AC500-eCo processor modules with a real-time clock and a second serial RS-485 interface COM2.

The real-time clock can be buffered via an optional standard lithium battery (CR2032) during power supply failures (see lithium battery for real-time clock of AC500-eCo processor modules ↳ *Chapter 1.6.3.5.5.1 “CR2032 - Battery for real-time clock” on page 5265*).

Insertion/ Removal of the adapter

WARNING!

Risk of electric shock!

With an opened option board slot cover, energized parts of the processor module could be touched.

- Always turn off and disconnect the power supply for the processor module before you open the option board slot cover.
- Make sure that the option board slot cover is closed before reconnecting the processor module to the power supply.

The option board slot cover is available as a spare part (see TA570 spare part set for AC500-eCo processor modules ↳ *Chapter 1.6.3.5.5.12 “TA570 - Spare part set” on page 5309*).

Replacement of the battery

WARNING!

Risk of death by electric shock!

Hazardous voltages can be present at the terminals of the module.

Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.

1. Switch off power supply of the system and verify that the CPU is powerless.

⇨ LEDs (PWR, RUN, ERR) must be off.

2. Remove the option board slot cover.

⇨ Remove the option board slot cover of the CPU totally by pushing it to the outer side.

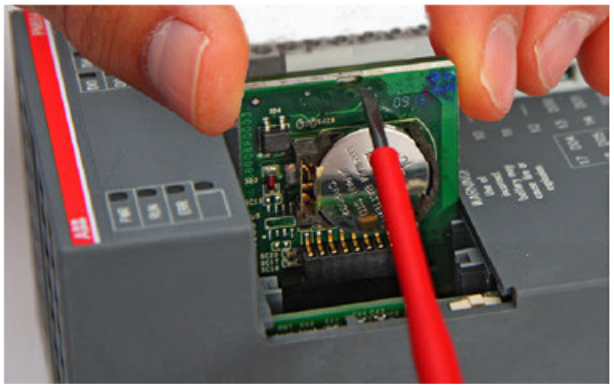
NOTICE!

Avoidance of electrostatic charging

PLC devices and equipment are sensitive to electrostatic discharge, which can cause internal damage and affect normal operation. Observe the following rules when handling the system:

- Touch a grounded object to discharge potential static.
- Wear an approved grounding wrist strap.
- Do not touch connectors or pins on component boards.
- Do not touch circuit components inside the equipment.
- If available, use a static-safe workstation.
- When not in use, store the equipment in appropriate static-safe packaging.

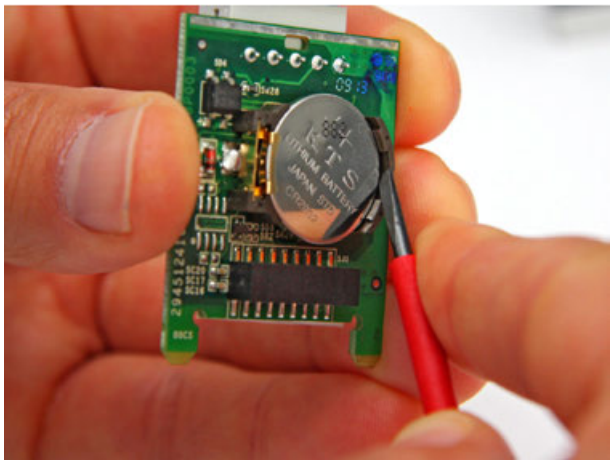
3. Remove the option board from the CPU by lifting it up with a screwdriver.

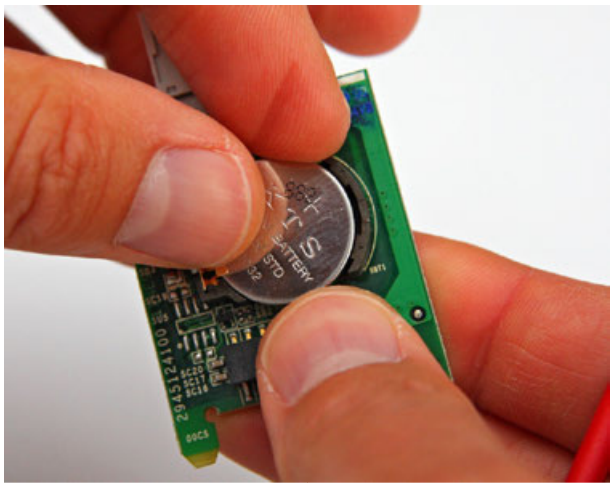


⇨

Remove memory card (if installed) / terminal block (COM2).

4. Remove the battery.





⇨

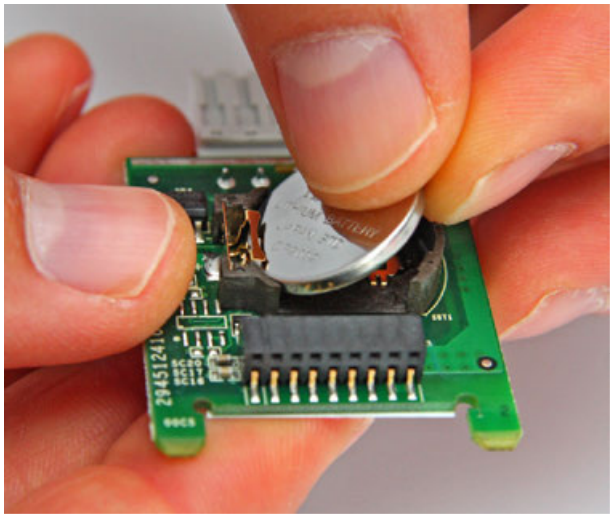
ATTENTION!

Lithium batteries must not be recharged, not be disassembled and not be disposed of in fire.

Exhausted batteries must be recycled to respect the environment.

Dispose of battery properly according to disposal procedures for lithium batteries.

5. Insert replacement battery.



⇨

ATTENTION!

*A standard battery CR2032 can be used for **TA561-RTC** and **TA562-RS-RTC**.*

*Nominal voltage: **3 V DC**.*

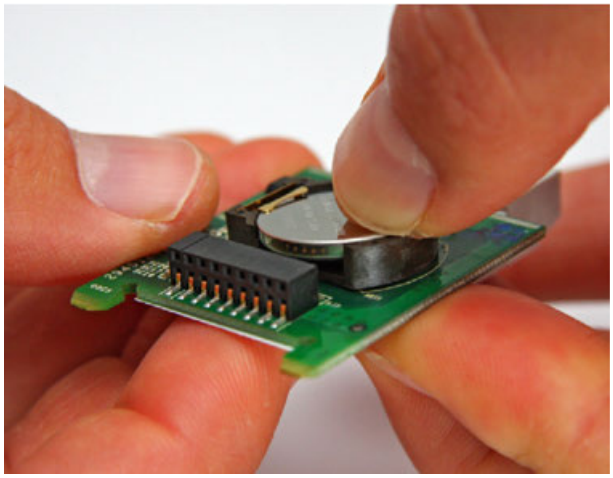
*Required capacity: **230 mAh**.*

*Required temperature range for discharge: **0 °C...+70 °C**.*

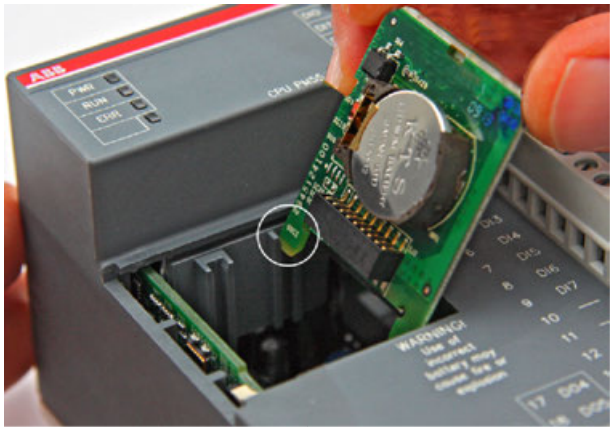
After replacement of the battery, the real-time clock (RTC) date and time must be set again by the user.

Don't use a battery older than 3 years for replacement (e.g. battery kept too long in stock).

Batteries must be stored in a dry place.



6. Insert option board into the CPU.



⇨ Insert the adapter TA56x-RTC into the slot on the right of the CPU.

> *Make sure that the 2 noses of the extension module fit to the holes of the CPU PCB.*
>
> *See white circle in figure above.*

7. Refit the option board slot cover of the CPU.

⇨

> *Remember to re-insert a memory card first if it has been removed previously.*

8. Only now the CPU can be connected to power.

> *Set the time of the real-time clock.*

TA563-TA565 - Terminal blocks

> *These terminal blocks must only be used with AC500-eCo I/O modules and AC500-eCo processor modules.*

Intended purpose

The TA563-TA565 terminal blocks are used to connect process signals and process voltages to AC500-eCo I/O modules and AC500-eCo processor modules (with -P extension inside their type designator only). 3 different kind of terminal blocks are available:

- Screw terminals with cable insertion on the side
- Screw terminals with cable insertion on the front
- Spring terminals with cable insertion on the front

Of each kind, 2 sizes are available:

- Terminals with 9 pins
- Terminals with 11 pins.

There are 2 compatible variants of each kind and size.

WARNING!

For screw terminals only: Danger of death by electric shock!

The IP 20 protection degree is only provided if all terminal screws are tightened.

Tighten all screws of unused load terminals of relay outputs if voltages > 24 V are connected to the relay group.

Technical data

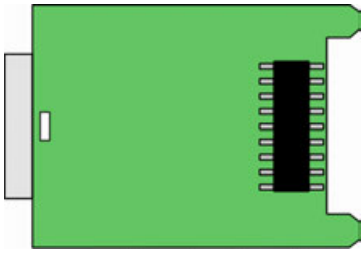
TA569-RS-ISO - Serial RS-485 isolated adapter



Intended purpose

The TA569-RS-ISO serial RS-485 isolated adapter is used for equipping AC500-eCo processor modules with a second serial interface COM2. The COM2 interface can be used for:

- online access
- free protocol communication
- Modbus RTU, client and server

The serial interface is isolated.

Insertion/ Removal of the adapter

WARNING!

Risk of electric shock!

With an opened option board slot cover, energized parts of the processor module could be touched.

– Always turn off and disconnect the power supply for the processor module before you open the option board slot cover.
– Make sure that the option board slot cover is closed before reconnecting the processor module to the power supply.

The option board slot cover is available as a spare part (see TA570 spare part set for AC500-eCo processor modules *Chapter 1.6.3.5.5.12 “TA570 - Spare part set” on page 5309*).

Removal of the option board

WARNING!

Risk of death by electric shock!

Hazardous voltages can be present at the terminals of the module.

Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.

1. Switch off power supply of the system and verify that the CPU is powerless.

⇨ LEDs (PWR, RUN, ERR) must be off.

2. Remove the option board slot cover.

⇨ Remove the option board slot cover of the CPU totally by pushing it to the outer side.

NOTICE!

Avoidance of electrostatic charging

PLC devices and equipment are sensitive to electrostatic discharge, which can cause internal damage and affect normal operation. Observe the following rules when handling the system:

- Touch a grounded object to discharge potential static.
- Wear an approved grounding wrist strap.
- Do not touch connectors or pins on component boards.
- Do not touch circuit components inside the equipment.
- If available, use a static-safe workstation.
- When not in use, store the equipment in appropriate static-safe packaging.

3. Remove the option board.

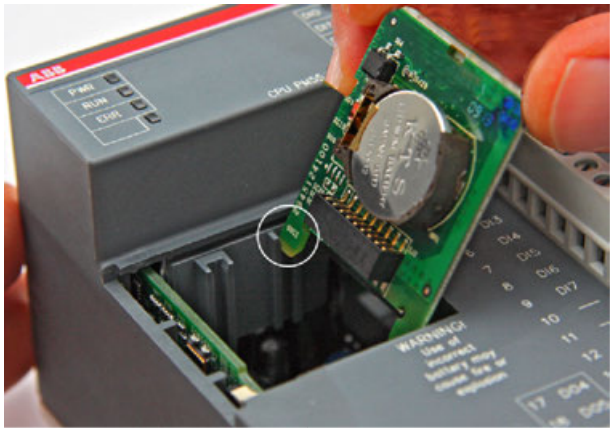
⇨

Remove memory card (if installed) / terminal block (COM2).

Remove the option board from the CPU by lifting it up with a screwdriver.

Insertion of the option board

1. Insert option board into the CPU.



⇨

Make sure that the 2 noses of the expansion module fit to the holes of the CPU PCB.

See white circle in figure above.

2. Refit the option board slot cover of the CPU.

⇨

Remember to re-insert a memory card first if it has been removed previously.

CP-E - Economic range

The power supplies feature series and parallel connection as well as a true redundant setup via a redundancy module.

- Wide-range input voltage
- Mounting on DIN rail
- High efficiency of up to 90 %
- Low power dissipation and low heating
- Wide ambient temperature range from -40 °C...+70 °C
- No-load-proof, overload-proof, continuous short-circuit-proof
- Power factor correction (depending on the type)
- Approved in accordance with all relevant international standards

CP-C.1 - High performance range

The power supplies feature series and parallel connection as well as a true redundant setup via a redundancy module.

The CP-C.1 power supplies are ABB's high performance and most advanced range. With excellent efficiency, high reliability and innovative functionality it is prepared for the most demanding industrial applications. These power supplies have a 50 % integrated power reserve and operate at an efficiency of up to 94 %. They are equipped with overheat protection and active power factor correction. Combinded with a broad AC and DC input range and extensive worldwide approvals the CP-C.1 power supplies are the preferred choice for professional DC applications.

- Typical efficiency of up to 94 %
- Power reserve design delivers up to 150 % of the nominal output current
- Signaling outputs for DC OK and power reserve mode
- High power density leads to very compact and small devices
- No-load-proof, overload-proof, continuous short-circuit-proof
- Active power factor correction (PFC)

Table 608: Ordering data

Order No.	Type	Input	Output	Overload capacity	Module width [mm]
1SVR360563R1001	CP-C.1 24/5.0	110-240 V AC or 90-300 V DC	24 V DC, 5 A	+50 %	40

1.6.3.6 AC500 (Standard)

1.6.3.6.1 System data AC500

Environmental conditions

Table 609: Process and supply voltages

Parameter		Value
24 V DC		
	Voltage	24 V (-15 %, +20 %)
	Protection against reverse polarity	Yes
120 V AC		
	Voltage	120 V (-15 %, +10 %)
	Frequency	50/60 Hz (-6 %, +4 %)
230 V AC		
	Voltage	230 V AC (-15 %, +10 %)
	Frequency	50/60 Hz (-6 %, +4 %)
120 V AC...240 V AC wide-range supply		
	Voltage	120 V...240 V (-15 %, +10 %)
	Frequency	50/60 Hz (-6 %, +4 %)
Allowed interruptions of power supply, according to EN 61131-2		

Parameter		Value
	DC supply	Interruption < 10 ms, time between 2 interruptions > 1 s, PS2
	AC supply	Interruption < 0.5 periods, time between 2 interruptions > 1 s

NOTICE!
Exceeding the maximum power supply voltage for process or supply voltages could lead to unrecoverable damage of the system. The system might be destroyed.

NOTICE!
Improper voltage level or frequency range which cause damage of AC inputs:
– AC voltage above 264 V
– Frenquency below 47 Hz or above 62.4 Hz

NOTICE!
Improper connection leads cause overtemperature on terminals.
PLC modules may be destroyed by using wrong cable type, wire size and cable temperature classification.

Parameter		Value
Temperature		
	Operating	0 °C...+60 °C: Horizontal mounting of modules. 0 °C...+40 °C: Vertical mounting of modules. Output load reduced to 50 % per group.
	Storage	-40 °C...+70 °C
	Transport	-40 °C...+70 °C
Humidity		Max. 95 %, without condensation
Air pressure		
	Operating	> 800 hPa / < 2000 m
	Storage	> 660 hPa / < 3500 m
Ingress protection		IP20

Creepage distances and clearances

The creepage distances and clearances meet the requirements of the overvoltage category II, pollution degree 2.

Insulation test voltages, routine test

According to EN 61131-2

Parameter	Value	
230 V circuits against other circuitry	2500 V	1.2/50 µs

120 V...240 V circuits against other circuitry	2500 V	1.2/50 µs
24 V circuits (supply, 24 V inputs/outputs, analog inputs/outputs), if they are galvanically isolated against other circuitry	500 V	1.2/50 µs
COM interfaces, galvanically isolated	500 V	1.2/50 µs
COM interfaces, electrically not isolated	Not applicable	Not applicable
FBP interface	500 V	1.2/50 µs
Ethernet	500 V	1.2/50 µs
ARCNET	500 V	1.2/50 µs
230 V circuits against other circuitry	1350 V	AC 2 s
120 V circuits against other circuitry	820 V	AC 2 s
120 V...240 V circuits against other circuitry	1350 V	AC 2 s
24 V circuits (supply, 24 V inputs/outputs, analog inputs/outputs), if they are galvanically isolated against other circuitry	350 V	AC 2 s
COM interfaces, galvanically isolated	350 V	AC 2 s
COM interfaces, electrically not isolated	Not applicable	Not applicable
FBP interface	350 V	AC 2 s
Ethernet	350 V	AC 2 s
ARCNET	350 V	AC 2 s

Power supply units

For the supply of the modules, power supply units according to SELV or PELV specifications must be used.

Safety Extra Low Voltage (SELV) and Protective Extra Low Voltage (PELV)

To ensure electrical safety of AC500/AC500-eCo extra low voltage circuits, 24 V DC supply, communication interfaces, I/O circuits, and all connected devices must be powered from sources meeting requirements of SELV, PELV, class 2, limited voltage or limited power according to applicable standards.

WARNING!

Improper installation can lead to death by touching hazardous voltages!

To avoid personal injury, safe separation, double or reinforced insulation and separation of the primary and secondary circuit must be observed and implemented during installation.

- Only use power converters for safety extra-low voltages (SELV) with safe galvanic separation of the primary and secondary circuit.
- Safe separation means that the primary circuit of mains transformers must be separated from the secondary circuit by double or reinforced insulation. The protective extra-low voltage (PELV) offers protection against electric shock.

Electromagnetic compatibility

Table 610: Range of use

Parameter	Value
Industrial applications	Yes
Domestic applications	No

Table 611: Immunity against electrostatic discharge (ESD), according to IEC 61000-4-2, zone B, criterion B

Parameter	Value
Electrostatic voltage in case of air discharge	8 kV
Electrostatic voltage in case of contact discharge	4 kV, in a closed switchgear cabinet 6 kV [1])
ESD with communication connectors	In order to prevent operating malfunctions, it is recommended, that the operating personnel discharge themselves prior to touching communication connectors or perform other suitable measures to reduce effects of electrostatic discharges.
ESD with connectors of terminal bases	The connectors between the Terminal Bases and processor modules or Communication Modules must not be touched during operation. The same is valid for the I/O bus with all modules involved.

[1]) High requirement for shipping classes are achieved with additional specific measures (see specific documentation).

Table 612: Immunity against the influence of radiated (CW radiated), according to IEC 61000-4-3, zone B, criterion A

Parameter	Value
Test field strength	10 V/m

Table 613: Immunity against fast transient interference voltages (burst), according to IEC 61000-4-4, zone B, criterion B

Parameter	Value
Supply voltage units (DC)	2 kV
Supply voltage units (AC)	2 kV
Digital inputs/outputs (24 V DC)	1 kV
Digital inputs/outputs (120 V AC...240 V AC)	2 kV
Analog inputs/outputs	1 kV
CS31 bus	1 kV
Serial RS-485 interfaces (COM)	1 kV
Serial RS-232 interfaces (COM, not for PM55x and PM56x)	1 kV
ARCNET	1 kV
FBP	1 kV
Ethernet	1 kV
I/O supply (DC-out)	1 kV

Table 614: Immunity against the influence of line-conducted interferences (CW conducted), according to IEC 61000-4-6, zone B, criterion A

Parameter		Value
Test voltage		3V zone B, 10 V is also met.
High energy surges		According to IEC 61000-4-5, zone B, criterion B
	Power supply DC	1 kV CM / 0.5 kV DM [2])
	DC I/O supply	0.5 kV CM / 0.5 kV DM [2])
	Communication Lines, shielded	1 kV CM [2])
	AC I/O unshielded [3])	2 kV CM / 1 kV DM [2])
	I/O analog, I/O DC unshielded [3])	1 kV CM / 0.5 kV DM [2])
Radiation (radio disturbance)		According to IEC 55011, group 1, class A

[2]) CM = Common Mode, DM = Differential Mode

[3]) When DC I/O inputs are used with AC voltage, external filters limiting high energy surges to 1 kV CM / 0.5 DM are required to meet requirements according IEC 61131-2.

Mechanical data

Parameter	Value
Mounting	Horizontal
Degree of protection	IP 20

Parameter	Value
Housing	Classification V-2 according to UL 94

Shock test	All three axes 15 g, 11 ms, half-sinusoidal
Mounting of the modules:	
DIN rail according to DIN EN 50022	35 mm, depth 7.5 mm or 15 mm
Mounting with screws	Screws with a diameter of 4 mm
Fastening torque	1.2 Nm

Approvals and certifications

Information on approvals and certificates can be found in the corresponding chapter of the *Main catalog, PLC Automation*.

1.6.3.6.2 Mechanical dimensions

Switchgear cabinet assembly

Information on EMC-conforming assembly and construction is provided within the overall functions section ↳ Chapter 1.6.3.4.4 “EMC-conforming assembly and construction” on page 5226.

PLC enclosure

NOTICE!

PLC damage due to wrong enclosures

Due to their construction (degree of protection IP 20 according to EN 60529) and their connection technology, the devices are suitable only for operation in enclosed switchgear cabinets.

To protect PLCs against:

- unauthorized access,
- dusting and pollution,
- moisture and wetness and
- mechanical damage,

switchgear cabinet IP54 for common dry factory floor environment is suitable.

Maintain spacing from:

- enclosure walls
- wireways
- adjacent equipment

Allow a minimum of 20 mm clearance on all sides. This provides ventilation and galvanic isolation.

It is recommended to mount the modules on an grounded mounting plate, or an grounded DIN rail, independent of the mounting location.

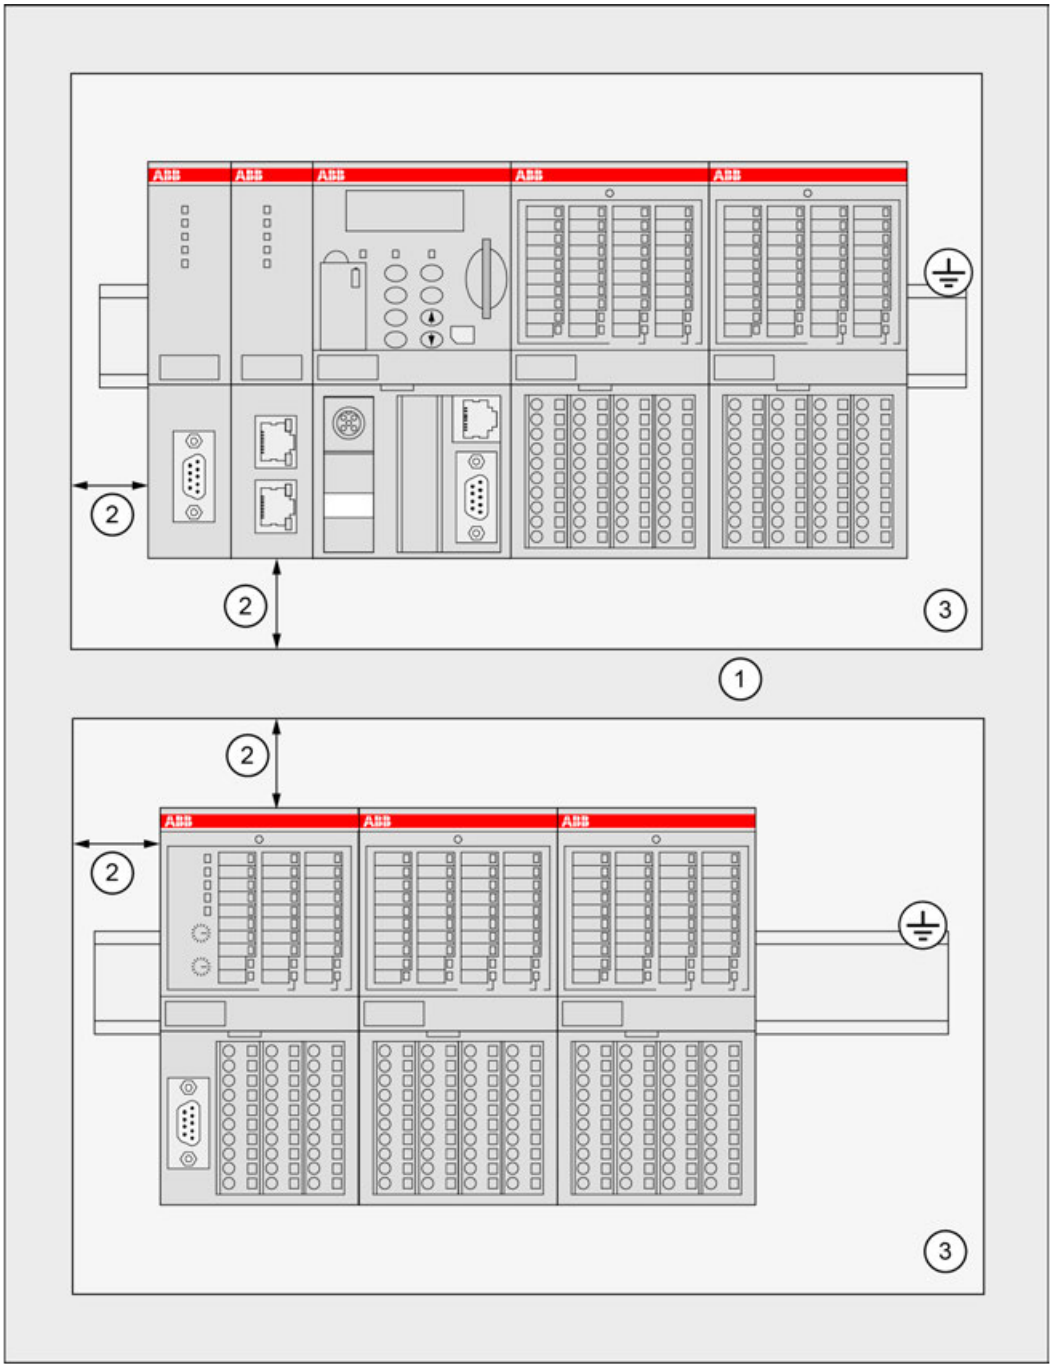

Fig. 1068: Installation of AC500/S500 modules in a switchgear cabinet

1 Cable duct
2 Distance from cable duct ≥20 mm
3 Mounting plate, grounded

NOTICE!

Horizontal mounting is highly recommended.

Vertical mounting is possible, however, derating consideration should be made to avoid problems with poor air circulation and overheating (see *Chapter 1.6.3.6.1.1 “Environmental conditions” on page 5313*).

When vertically mounted, always place an end-stop terminal block (e.g. type BADL, P/N: 1SNA399903R0200) on the bottom and on the top of the modules to properly secure the modules.

With high vibration applications and horizontal mounting, we also recommend to place end-stop terminals at the right and left side of the device to properly secure the modules, e.g. type BADL, P/N: 1SNA399903R0200.

1.6.3.6.3 Mounting and demounting

The control system is designed to be mounted to a well-grounded mounting surface such as a metal panel. Additional grounding connections from the mounting tabs or DIN rail (if used), are not required unless the mounting surface cannot be grounded.

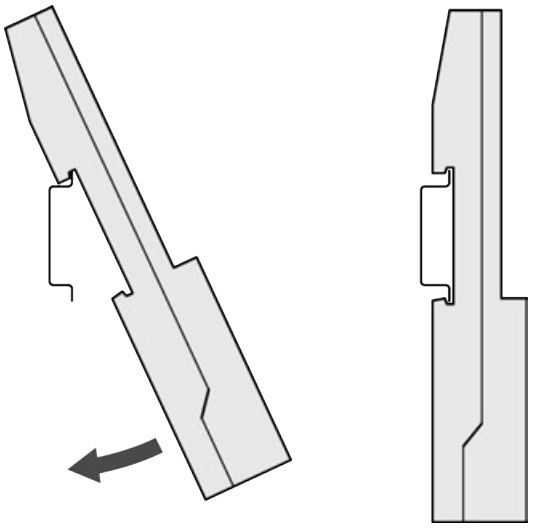
During panel or DIN rail mounting of all devices, be sure that all debris (metal chips, wire strands, etc.) is kept from falling into the controller. Debris that falls into the controller could cause damage while the controller is energized.

All devices are grounded through the DIN rail to chassis ground. Use zinc plated yellow-chromate stell DIN rail to assure proper grounding. The use of other DIN rail materials (e.g. aluminium, plastic, etc.) that can corrode, oxidize, or are poor conductors, can result in improper or intermittent grounding.

Mounting/Demounting terminal bases and function module terminal bases

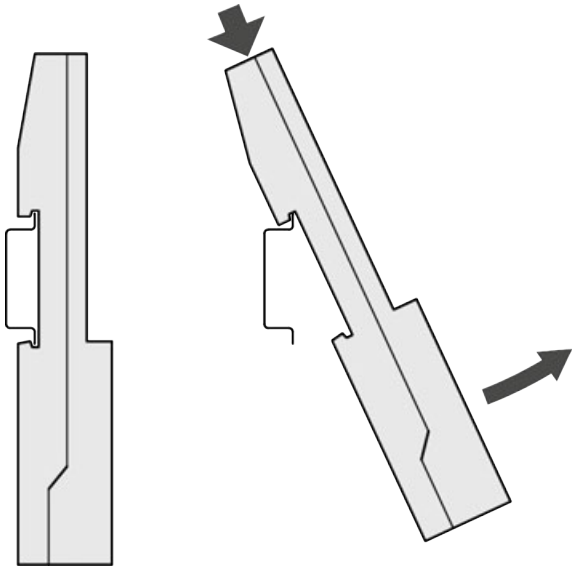
Demounting on DIN rail

1. Mount DIN rail 7.5 mm or 15 mm.
2. Mount the terminal base/function module terminal base:



⇨ The terminal base is put on the DIN rail above and then snapped-in below.

3. The demounting is carried out in a reversed order.



Mounting with screws

If the Terminal Base should be mounted with screws, wall mounting accessories TA526 ↳ *Chapter 1.6.3.6.5.5 “TA526 - Wall mounting accessory” on page 5378* must be inserted at the rear side first. These plastic parts prevent bending of the terminal base while screwing on. TB51x needs one TA526, TB52x and TB54x need two TA526.

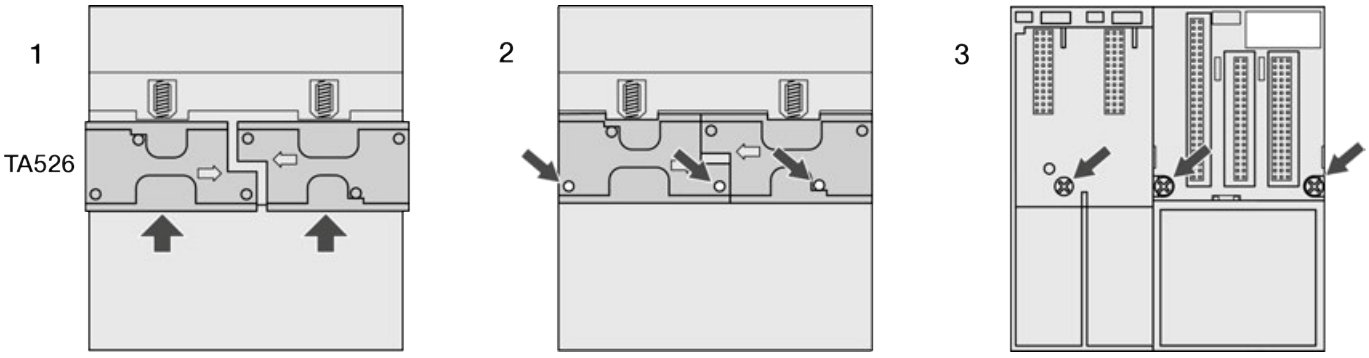


Fig. 1078: Terminal bases, Fastening with screws

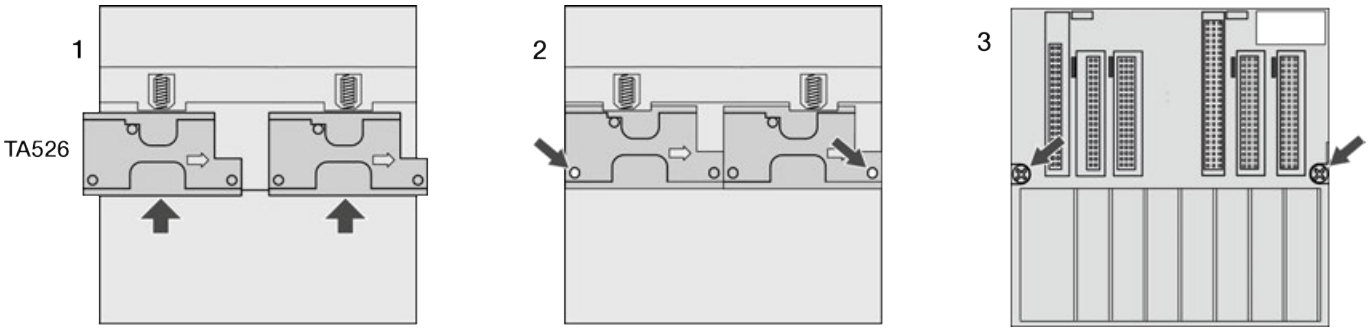

Fig. 1079: Function module terminal bases, Fastening with screws

> *By wall mounting, the terminal base is grounded through the screws. It is necessary that*
>
> – *the screws have a conductive surface (e.g. steel zinc-plated or brass nickel-plated)*
> – *the mounting plate is grounded*
> – *the screws have a good electrical contact to the mounting plate*

Practical tip

The following procedure allows you to use the mounted modules as a template for drilling holes in the panel. Due to module mounting hole tolerance, it is important to follow these procedures:

1. On a clean work surface, mount no more than 3 modules (e.g. one terminal base and two terminal units).
2. Using the mounted modules as a template, carefully mark the center of all module-mounting holes on the panel.
3. Return the mounted modules to the clean work surface, including any previously mounted modules.
4. Drill and tap the mounting holes for the screws (M4 or #8 recommended).
5. Place the modules back on the panel and check for proper hole alignment.
6. Attach the modules to the panel using the mounting screws.

> *If mounting more modules, mount only the last one of this group and put the others aside. This reduces remounting time during drilling and tapping of the next group.*

7. Repeat the steps for all remaining modules.

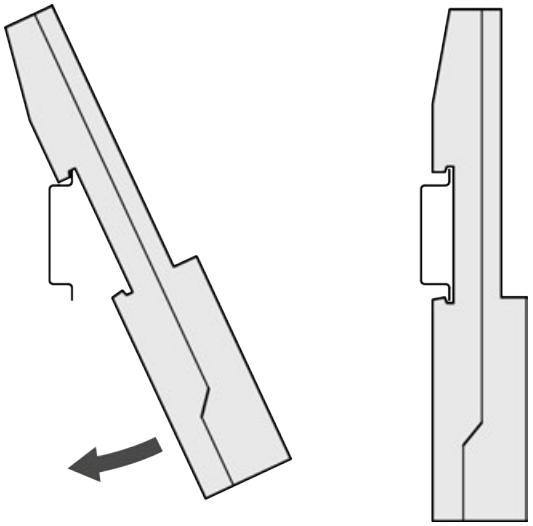
Mounting/Demounting the terminal unit

Mounting on DIN rail

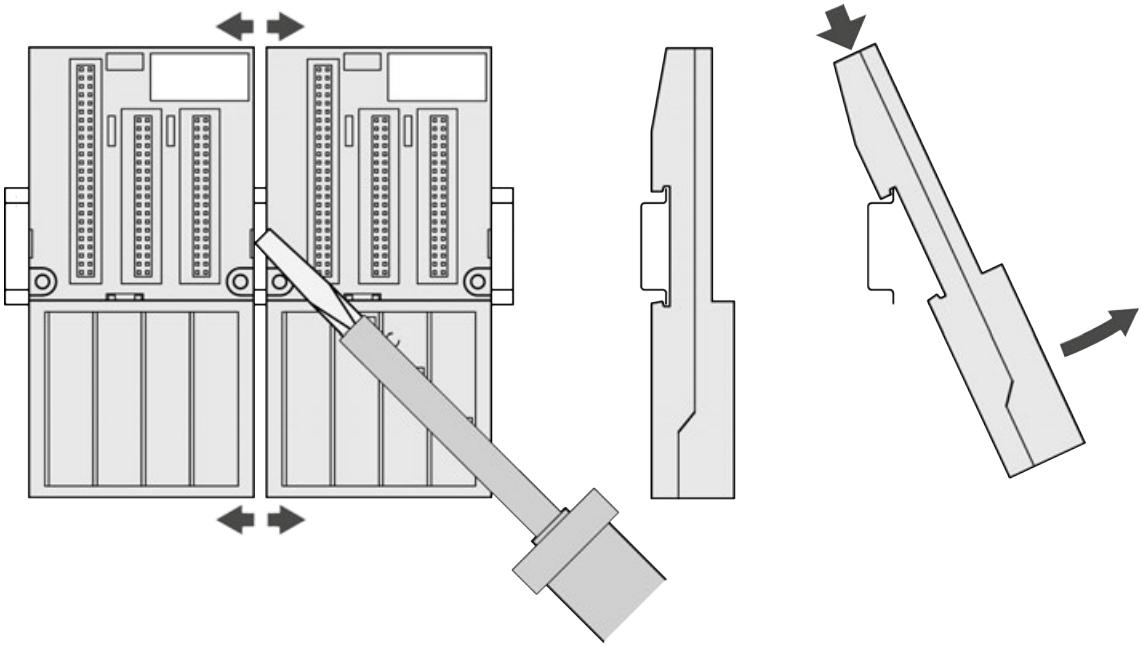
1. Mount DIN rail 7.5 mm or 15 mm.
2. Mount the terminal unit.

   The terminal unit is snapped into the DIN rail in the same way as the Terminal Base. Once secured to the DIN rail, slide the terminal unit to the left until it fully locks into place creating a solid mechanical and connection.

> *When attaching the devices, make sure the bus connectors are securely locked together to ensure proper connection. Max. 10 terminal units can be attached.*



3. Demounting: A screwdriver is inserted in the indicated place to separate the terminal units.



Mounting with screws

If the terminal unit should be mounted with screws, wall mounting accessories TA526 ↳ *Chapter 1.6.3.6.5.5 “TA526 - Wall mounting accessory” on page 5378* must be inserted at the rear side first. These plastic parts prevent bending of the Terminal Base while screwing on.

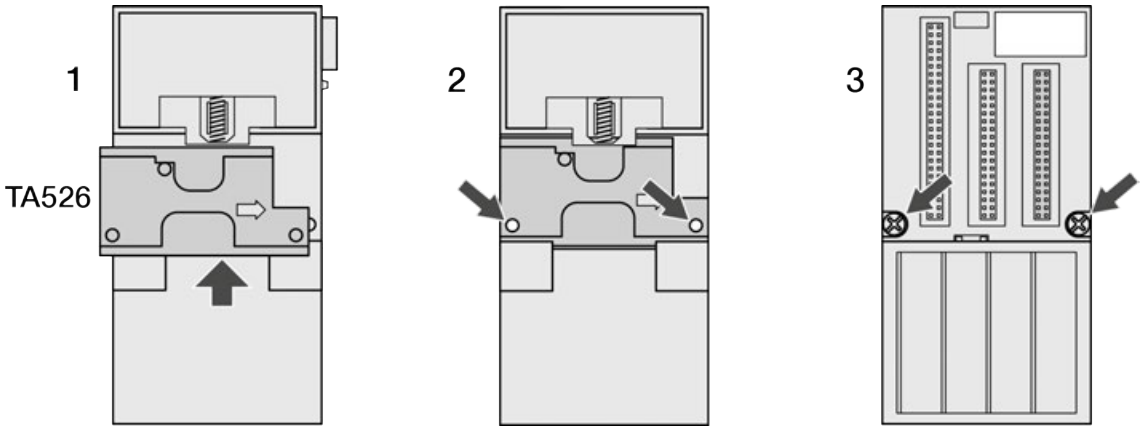


Fig. 1080: Fastening with screws

By wall mounting, the terminal unit is grounded through the screws. It is necessary that

- *the screws have a conductive surface (e.g. steel zinc-plated or brass nickel-plated)*
- *the mounting plate is grounded*
- *the screws have a good electrical contact to the mounting plate*

Practical tip

The following procedure allows you to use the mounted modules as a template for drilling holes in the panel. Due to module mounting hole tolerance, it is important to follow these procedures:

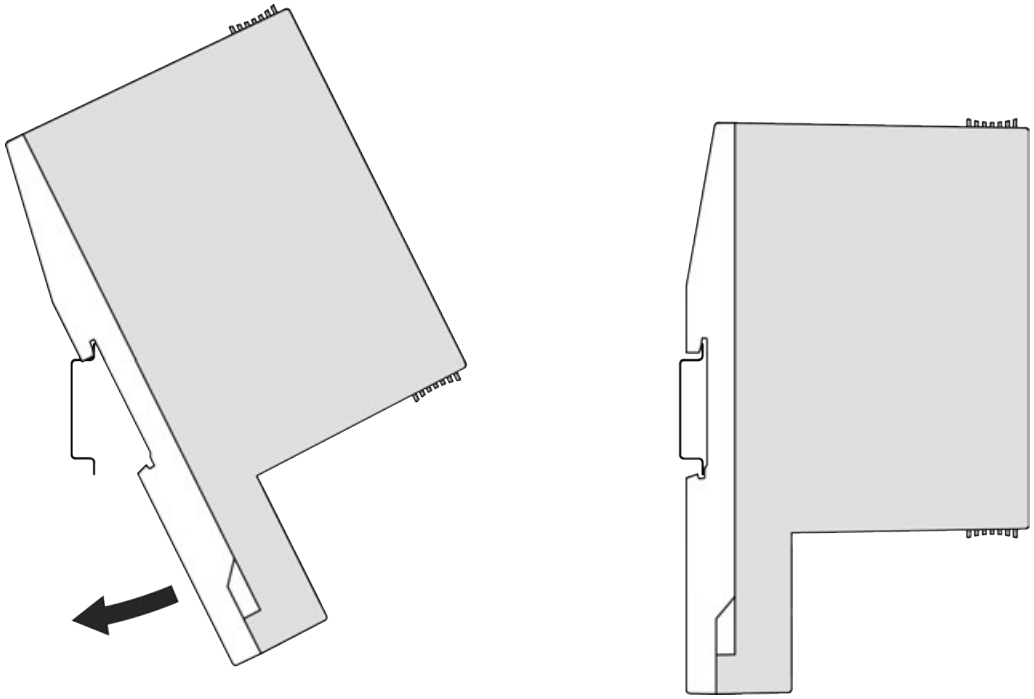
1. On a clean work surface, mount no more than 3 modules (e.g. one terminal base and two terminal units).
2. Using the mounted modules as a template, carefully mark the center of all module-mounting holes on the panel.
3. Return the mounted modules to the clean work surface, including any previously mounted modules.
4. Drill and tap the mounting holes for the screws (M4 or #8 recommended).
5. Place the modules back on the panel and check for proper hole alignment.
6. Attach the modules to the panel using the mounting screws.

   If mounting more modules, mount only the last one of this group and put the others aside. This reduces remounting time during drilling and tapping of the next group.

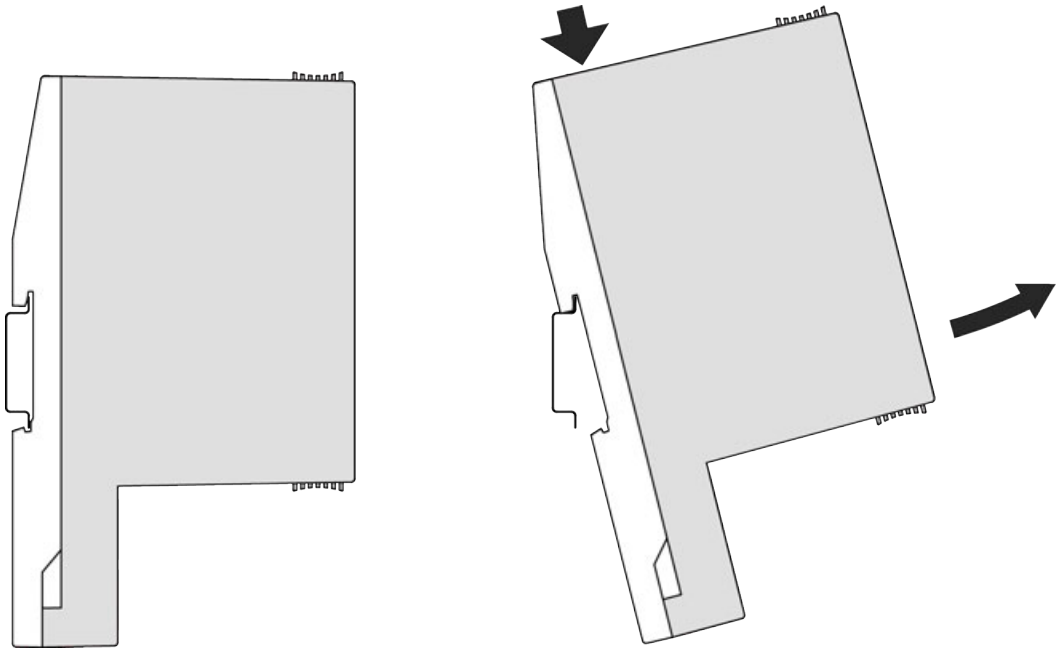
7. Repeat the steps for all remaining modules.

Mounting/Demounting the processor module PM595

Mounting on DIN rail



▷ Put the processor module on the DIN rail above and then snapped-in below. The demounting is carried out in a reversed order.



1. Pull down the processor module.
2. Remove it.

NOTICE!

Risk of malfunctions!

Unused slots for communication modules are not protected against accidental physical contact.

– Unused slots for communication modules must be covered with dummy communication modules to achieve IP20 rating ↳ *Chapter 1.6.3.6.5.7 “TA524 - Dummy communication module” on page 5383*.
– I/O bus connectors must not be touched during operation.

NOTICE!

Only use TA543 accessory when the PLC is to be screw mounted. With DIN rail mounting the PLC could not be removed from the rail without the risk of damaging the housing.

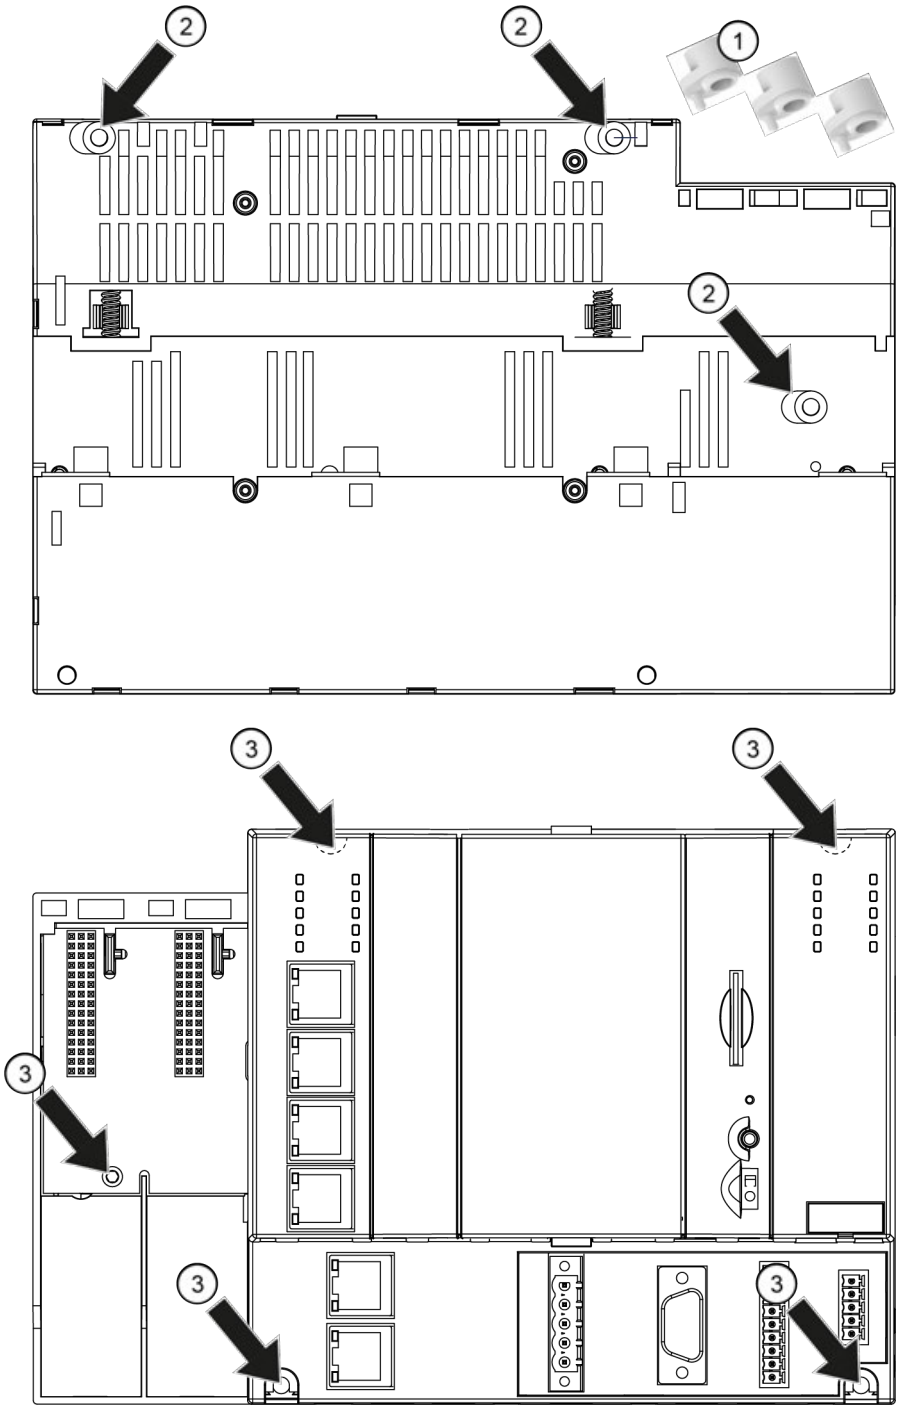
Mounting with screws

NOTICE!

Use screw mounting accessory to avoid damage!

For screw mounting, the use of the TA543 screw mounting accessory (1SAP182800R0001) is mandatory to prevent bending and damage to the module.

A dimension drawing for the position of screw's holes can be found in mechanical dimensions AC500 ↳ *Chapter 1.6.3.6.2.2 “Mechanical dimensions AC500” on page 5320.*



1 3 parts of screw mounting accessory TA543
2 3 slots for screw mounting accessory TA543
3 5 holes for screw mounting

1. Insert 3 parts of screw mounting accessory TA543 into the slots on the backside of the processor module PM595.

⇨

NOTICE!

Use screw mounting accessory to avoid damage!

For screw mounting, the use of the TA543 screw mounting accessory (1SAP182800R0001) is mandatory to prevent bending and damage to the module.

2. Fasten the processor module PM595 with 5 screws (M4, max 1.2 Nm) from the front side.

⇨

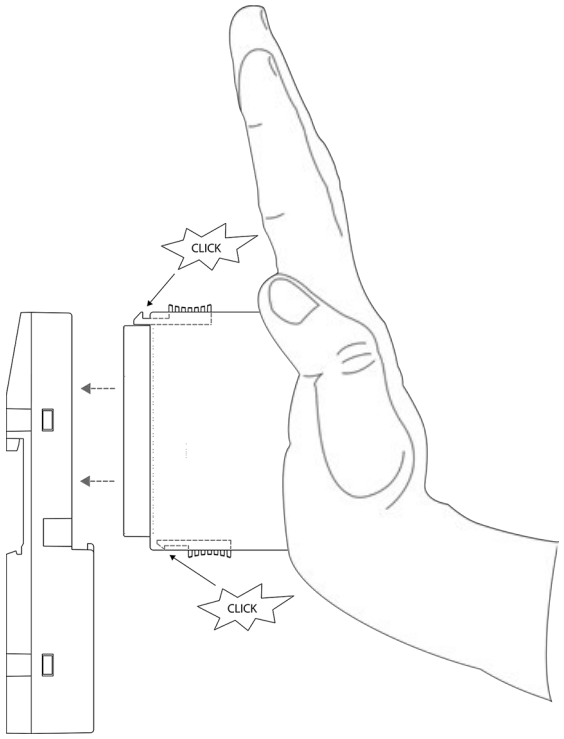
By screw mounting, the processor module PM595 is grounded through the screws. It is necessary that

- *the screws have a conductive surface (e.g. steel zinc-plated or brass nickel-plated)*
- *the mounting plate is grounded*
- *the screws have a good electrical contact to the mounting plate*

Thread lock washer is highly recommended to prevent the screw from loosening after long time use.

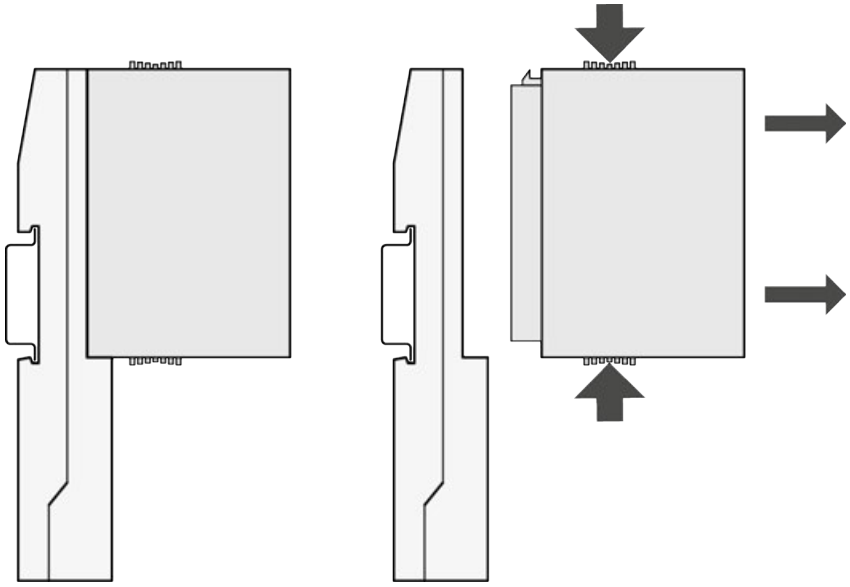
Mounting processor modules PM57x, PM58x, PM59x and PM56xx

1. After mounting the Terminal Base on the DIN rail, mount the processor module.



2. Press the processor module into the Terminal Base until it locks in place.

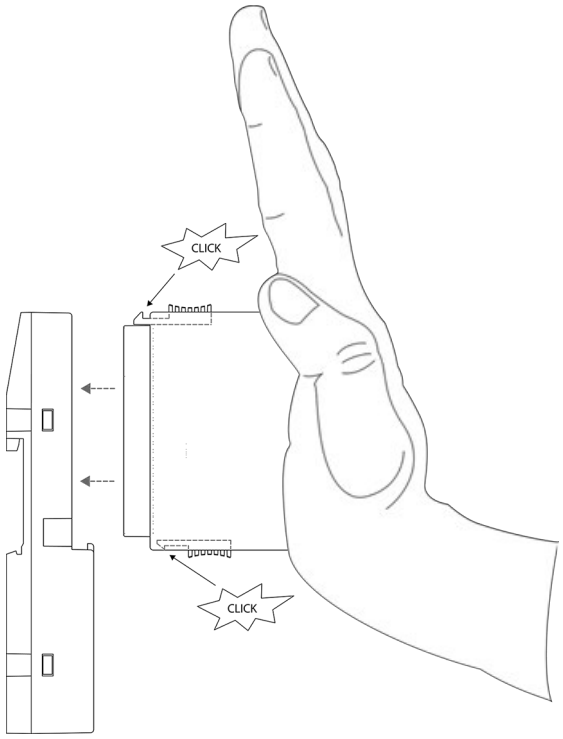
3. The demounting is carried out in a reversed order. Press above and below, then remove the processor module.



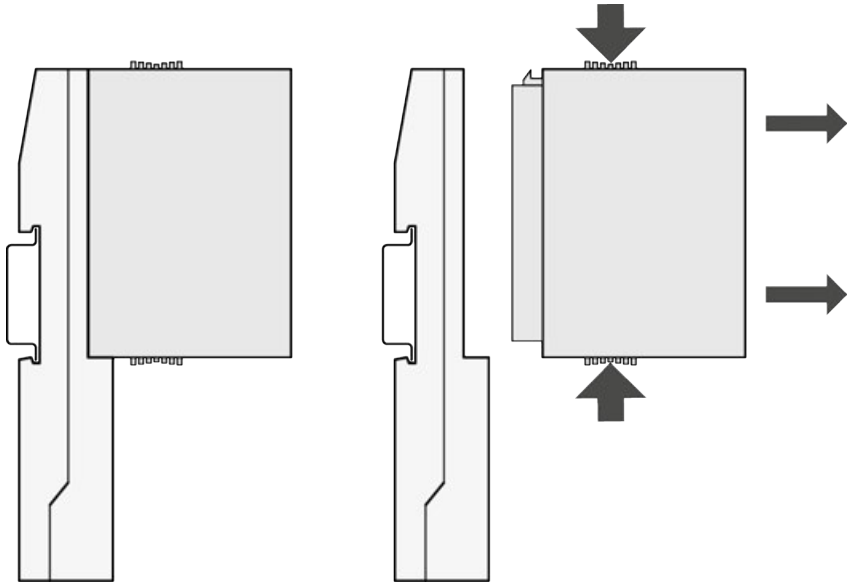
Mounting/Demounting the I/O modules

After mounting the terminal unit, mount the I/O modules.

1. Press the I/O module into the terminal unit until it locks in place.



2. The demounting is carried out in a reversed order.
   Press above and below, then remove the module.



Mounting/Demounting the communication modules

Communication modules are mounted on the left side of the processor module on the same terminal base. The connection is established automatically when mounting the communication module.

NOTICE!

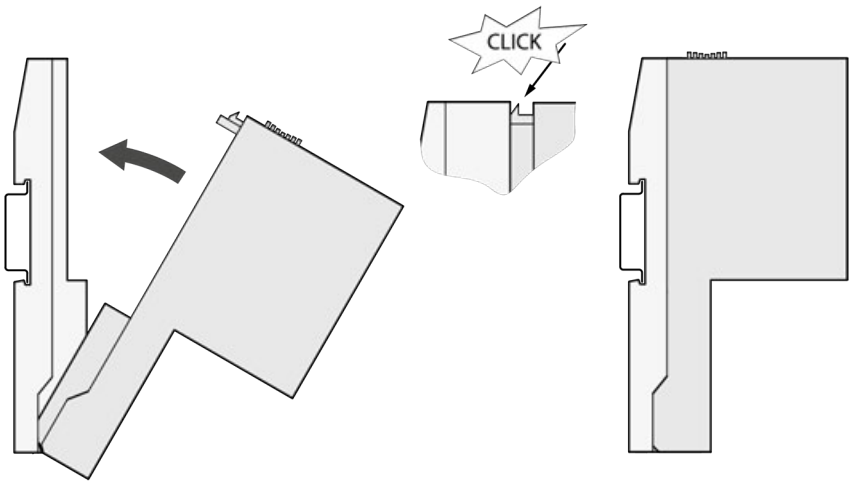
Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

After mounting the terminal base, mount the communication modules.

1. First insert the bottom nose of the communication module into the dedicated holes of the terminal base. Then, rotate the communication module on the dedicated terminal base slot until it is locked in place.



⇨

NOTICE!

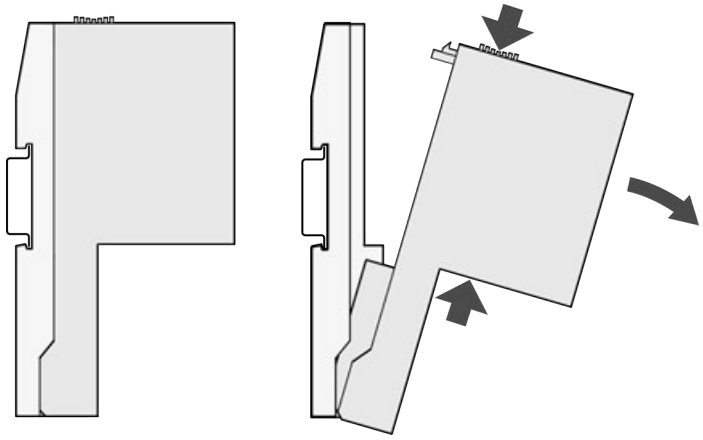
Risk of malfunctions!

Unused slots for communication modules are not protected against accidental physical contact.

– Unused slots for communication modules must be covered with dummy communication modules to achieve IP20 rating ↬ *Chapter 1.6.3.6.5.7 “TA524 - Dummy communication module” on page 5383*.
– I/O bus connectors must not be touched during operation.

2. The demounting is carried out in a reversed order.

   Press above and below, then rotate the communication module and remove it.



Mounting/Demounting the accessories

Additional components such as batteries, cables, etc. are required for commissioning the PLC system. Information on assembly, replacement or basic use of the orderable components can be found in the description of the respective accessory.

↬ *Chapter 1.6.3.6.5 “Handling of accessories” on page 5359*

Hardware details can be found in the device specifications of the accessory.

↬ *Chapter 1.6.2.9 “Accessories” on page 5095*

1.6.3.6.4 Connection and wiring

For detailed information such as technical data of your mounted devices (AC500 product family) refer to the hardware device description of the appropriate device.

NOTICE!

Attention:

The devices should be installed by experts who are trained in wiring electronic devices. In case of bad wiring, the following problems could occur:

- On the terminal base, the terminals L+ and M are doubled. If the power supply is badly connected, a short circuit could happen and lead to a destruction of the power supply or its fuse. If no suitable fuse exists, the terminal base itself might be destroyed.
- The terminal bases and all electronic modules and terminal units are protected against reverse polarity.
- All necessary measures should be carried out to avoid damages to modules and wiring. Notice the wiring plans and connection examples.

NOTICE!

Attention:

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 V DC.

NOTICE!

Attention:

Due to possible loss of communcation, the communication cables should be fixed with cable duct or bracket or clamp during application.

Power supply

AC500 system power supply

As soon as the power supply of the processor module (CPU) is higher than the minimum Process and supply voltage (see ↳ *Chapter 1.6.3.6.1.1 “Environmental conditions” on page 5313*), the power supply detection is activated and the processor module is started. Power supply of processor module and I/O modules should be powered on the same time, otherwise the processor module will not switch to run after startup.

When during operation the power supply is going down lower than the minimum Process and supply voltage (see ↳ *Chapter 1.6.3.6.1.1 “Environmental conditions” on page 5313*) for more than 10 ms, the processor module is switched to safety mode (display shows “AC500”). A restart of the processor module only occurs by switching the power supply off and on again.

If an I/O module is disconnected during normal operation from power supply while processor module is still powered, the processor module will continue its normal operation on all other powered peripherals (I/O modules, communication modules and communication interfaces), but freezes the input image. After recovery of I/O Module power supply it will continue normal operation and inputs and outputs were updated.

Logic Controller Supply: AC500 logic controller power supply is provided through terminals L+ / M.

Process Power Supply: S500 process power supply is provided through terminals UP / ZP.

Logic Controller Supply is galvanic isolated from Process Power Supply.

As system power supply for AC500/S500, the ABB CP power supply series can be used.

Power supply for processor modules

The supply voltage of 24 V DC is connected to a removable 5-pin terminal block. L+/M exist twice. It is therefore possible to feed e.g. external sensors (up to 8 A max. with 1.5 mm^2 conductor) via these terminals.

Pin assignment

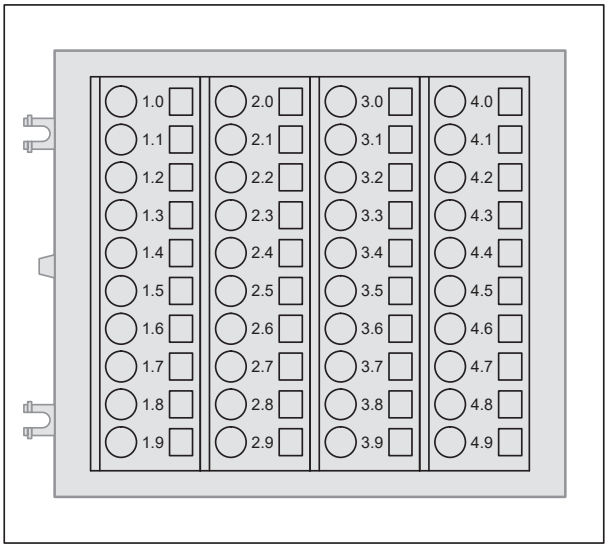
Pin Assignment		Label	Function	Description
 Terminal block removed	 Terminal block inserted	L+	+24 V DC	Positive pin of the power supply voltage
		L+	+24 V DC	Positive pin of the power supply voltage
		M	0 V	Negative pin of the power supply voltage
		M	0 V	Negative pin of the power supply voltage
		⏚	FE	Functional earth

Terminals for power supply and the COM1 interface

Terminal type: Spring terminal

Number of cores per terminal	Conductor type	Cross section
1	Solid	0.08 mm^2 to 1.5 mm^2
1	Flexible	0.08 mm^2 to 1.5 mm^2
1 with wire-end ferrule (without plastic sleeve)	Flexible	0.25 mm^2 to 1.5 mm^2
1 with wire-end ferrule (with plastic sleeve)	Flexible	0.25 mm^2 to 0.5 mm^2
1 (TWIN wire end ferrule)	Flexible	0.5 mm^2

Terminals at the terminal unit



Terminal type: Screw-type terminal

Front terminal, conductor connection vertically with respect to the printed circuit board.

Parameter	Value
Type	Front terminal
Degree of protection	IP 20
Stripped conductor end	9 mm, min. 8 mm
Fastening torque	0.6 Nm
Needed tool	Slotted screwdriver
Dimensions	Blade diameter 3.5 mm

Terminal units with product index < C0 e. g. 1SAP 212 200 R0001 B0

Number of cores per terminal	Conductor type	Cross section
1	Solid	0.08 mm^2 to 2.5 mm^2
1	Flexible	0.08 mm^2 to 2.5 mm^2
1 with wire-end ferrule	Flexible	0.25 mm^2 to 1.5 mm^2
2	Solid	Not intended
2	Flexible	Not intended
2 with TWIN wire end ferrule (length 10 mm) with plastic sleeve	Flexible	2 x 0.25 mm^2 or 2 x 0.5 mm^2 or 2 x 0.75 mm^2, with square cross-section of the wire-end ferrule also 2 x 1.0 mm^2

Terminal units with product index ≥ C0 e. g. 1SAP 212 200 R0001 C0

Number of cores per terminal	Conductor type	Cross section
1	Solid	0.08 mm^2 to 2.5 mm^2
1	Flexible	0.08 mm^2 to 2.5 mm^2
1 with wire-end ferrule without plastic sleeve	Flexible	0.08 mm^2 to 2.5 mm^2
1 with wire-end ferrule with plastic sleeve	Flexible	0.14 mm^2 to 1.5 mm^2
2	Solid	0.08 mm^2 to 1.5 mm^2
2	Flexible	0.08 mm^2 to 1.5 mm^2
2 with TWIN wire end ferrule (length 10 mm) with plastic sleeve	Flexible	2 x 0.5 mm^2 to 2 x 1.0 mm^2
2 with separate wire-end ferrule without plastic sleeve	Flexible	0.08 mm^2 to 0.75 mm^2

Terminal type: Spring terminal

Front terminal, conductor connection vertically with respect to the printed circuit board.

Parameter	Value
Type	Front terminal
Degree of protection	IP 20
Stripped conductor end	9 mm, min. 8 mm
Needed tool	Slotted screwdriver
Dimensions	2.5 x 0.4 to 3.5 x 0.5 mm, screwdriver must be at least 15 mm free of insulation at the tip

Number of cores per terminal	Conductor type	Cross section
1	Solid	0.08 mm^2 to 2.5 mm^2
1	Flexible	0.08 mm^2 to 2.5 mm^2
1 with wire-end ferrule	Flexible	0.25 mm^2 to 1.5 mm^2
2	Solid	Not intended
2	Flexible	Not intended
2 with TWIN wire end ferrule (length 10 mm) with plastic sleeve	Flexible	2 x 0.25 mm^2 or 2 x 0.5 mm^2 or 2 x 0.75 mm^2, with square cross-section of the wire-end ferrule also 2 x 1.0 mm^2

Connection of wires at the spring terminals

Connection

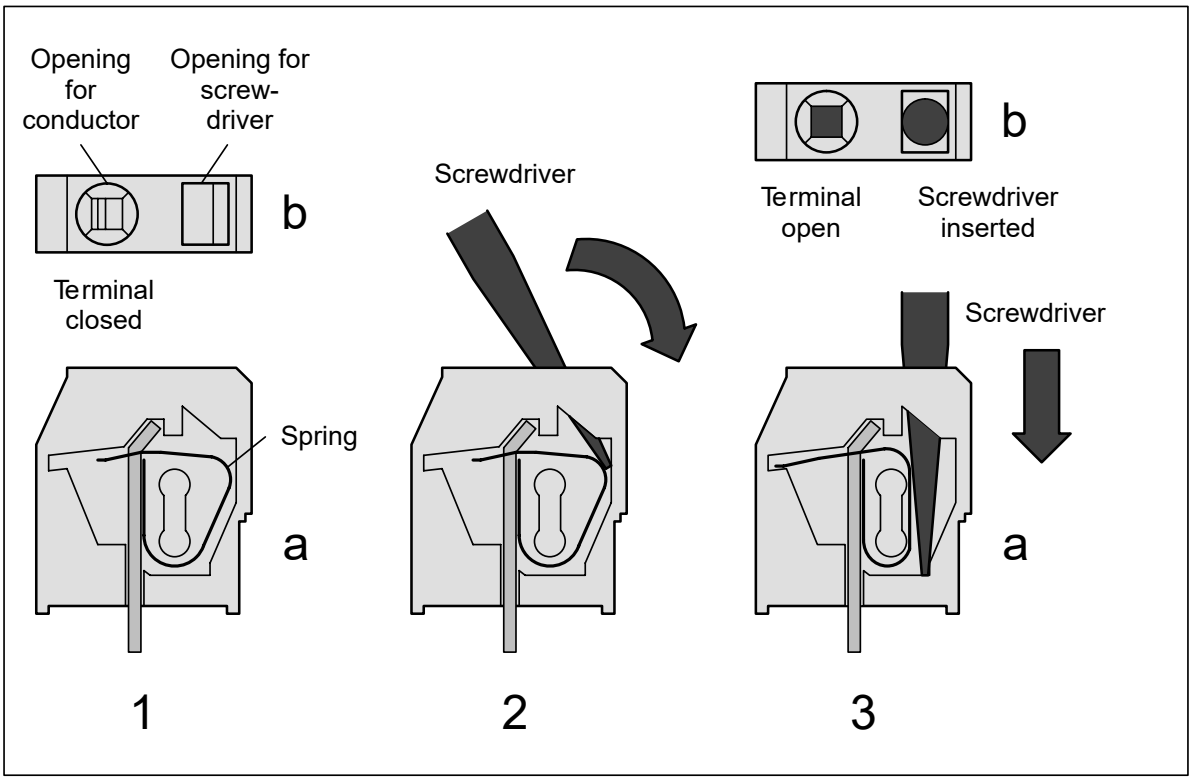


Fig. 1081: Connect the wire to the spring terminal (steps 1 to 3)

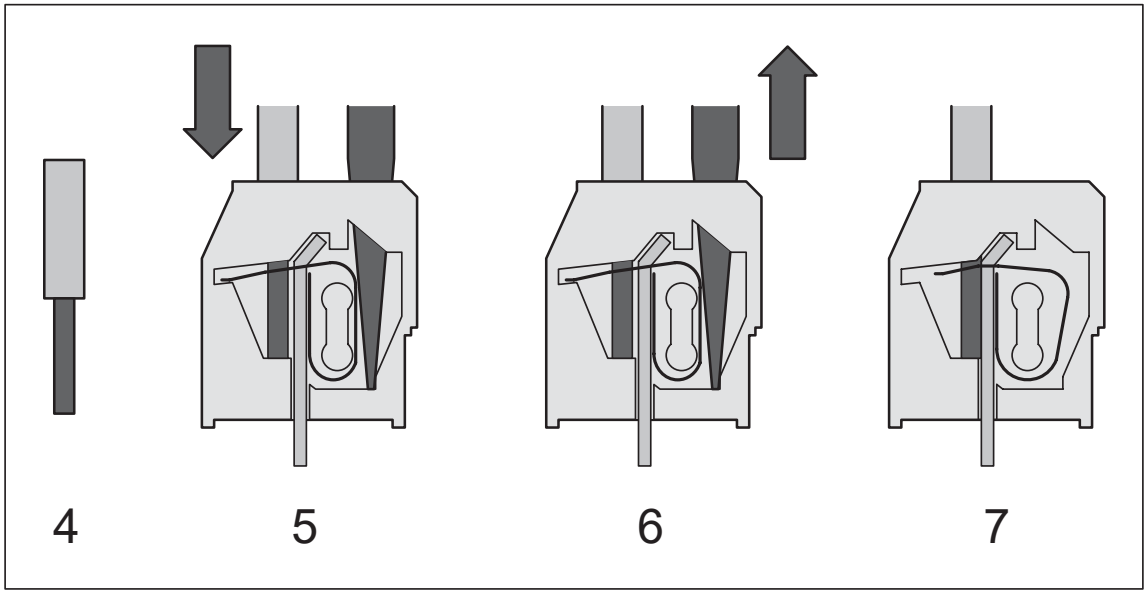

Fig. 1082: Connect the wire to the spring terminal (steps 4 to 7)

1. Side view (open terminal drawn for illustration)
2. The top view shows the openings for wire and screwdriver
3. Insert screwdriver (2.5 x 0.4 to 3.5 x 0.5 mm) at an angle, screwdriver must be at least 15 mm free of insulation at the tip
4. While erecting the screwdriver, insert it until the stop (requires a little strength)
5. Screwdriver inserted - terminal open
6. Strip the wire for 7 mm (and put on wire-end ferrule)
7. Insert wire into the open terminal
8. Done

Disconnection

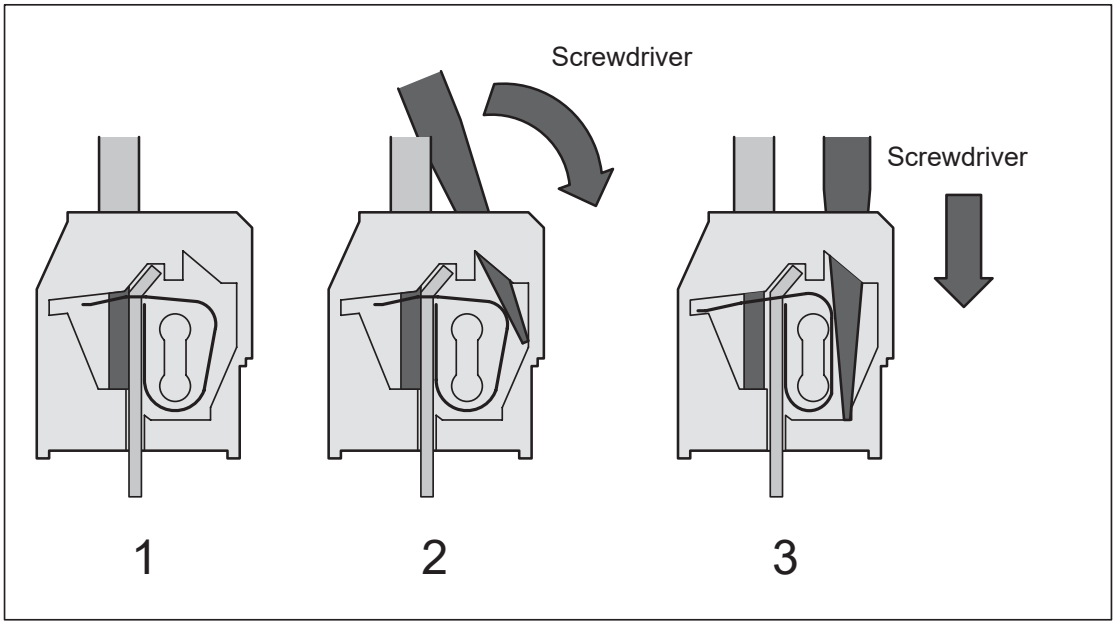

Fig. 1083: Disconnect wire from the spring terminal (steps 1 to 3)

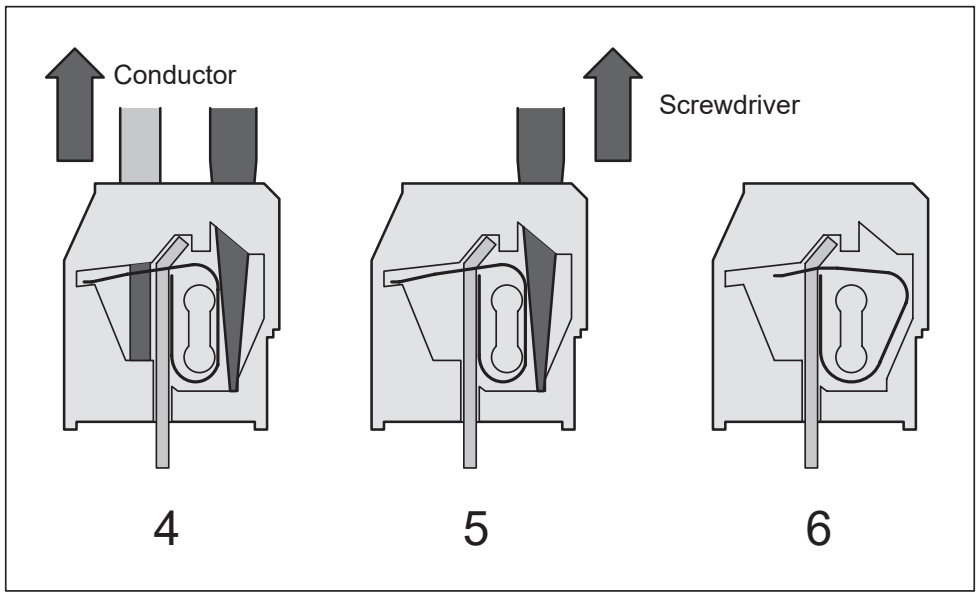

Fig. 1084: Disconnect wire from the spring terminal (steps 4 to 6)

1. Terminal with wire connected
2. Insert screwdriver (2.5 x 0.4 to 3.5 x 0.5 mm) at an angle, screwdriver must be at least 15 mm free of insulation at the tip
3. While erecting the screwdriver, insert it until the stop (requires a little strength) - terminal is now open
4. Remove wire from the open terminal
5. Done

Terminals for CANopen/DeviceNet communication modules

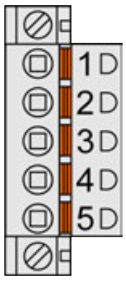

Fig. 1085: Combicon, 5-pole, female, removable plug with spring terminals

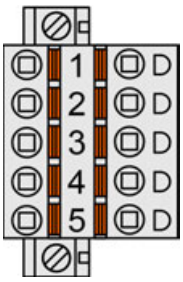

Fig. 1086: Combicon, 5-pole, female, removable plug with spring terminals

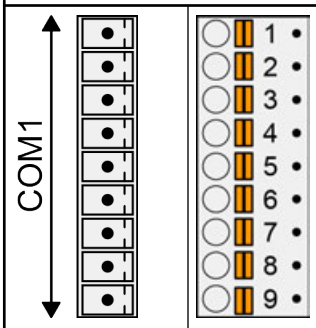
Terminal type: Spring terminal

Number of cores per terminal	Conductor type	Cross section	Stripped conductor end
1	solid	0.2 mm^2 to 2.5 mm^2	10 mm
1	flexible	0.2 mm^2 to 2.5 mm^2	10 mm
1 with wire-end ferrule (without plastic sleeve)	flexible	0.25 mm^2 to 2.5 mm^2	10 mm
1 with wire-end ferrule (with plastic sleeve)	flexible	0.25 mm^2 to 2.5 mm^2	10 mm

Serial interface COM1 of the terminal bases

The serial interface COM1 is connected via a removable 9-pin terminal block. It is configurable for RS-232 or RS-485 and can be used for:

- Online access (not valid for PM56xx),
- A free protocol,
- Modbus RTU, client and server,
- CS31 bus, as master only (not valid for PM56xx) *Chapter 1.6.3.6.4.8 “CS31 bus” on page 5347*.



Terminal block removed

Terminal block inserted

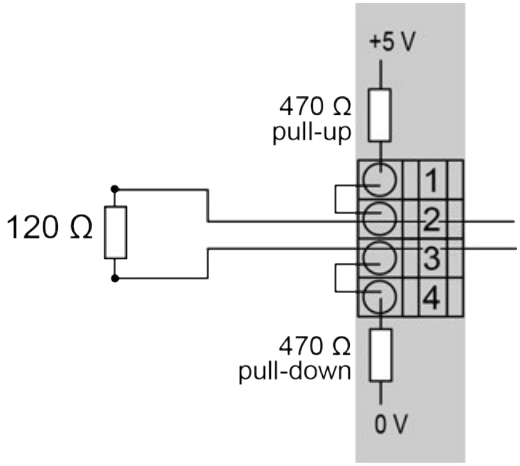
Pin	Signal	Interface	Description
1	Terminator P	RS-485	Terminator P
2	RxD/TxD-P	RS-485	Receive/Transmit, positive
3	RxD/TxD-N	RS-485	Receive/Transmit, negative
4	Terminator N	RS-485	Terminator N
5	RTS	RS-232	Request to send (output)
6	TxD	RS-232	Transmit data (output)
7	SGND	Signal Ground	
8	RxD	RS-232	Receive data (input)
9	CTS	RS-232	Clear to send (input)

RS-485 bus

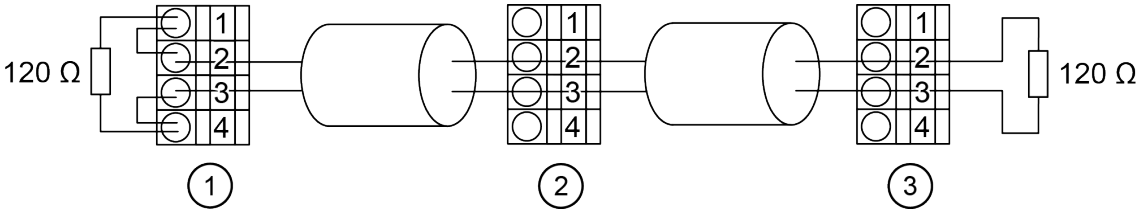
If the RS-485 bus is used, each interconnected bus line (each bus segment) must be electrically terminated. The following is necessary:

- 2 resistors of 120 Ω each at both line ends (to avoid signal reflections)
- Pull-up resistor at RxD/TxD-P and a pull-down resistor at RxD/TxD-N. These 2 resistors care for a defined high level on the bus, while there is no data exchange.

It is useful, to activate both the pull-up and the pull-down resistors, which only are necessary once on every bus line, at the bus master. For this reason, these two resistors are already integrated within the COM1 interface of the AC500 terminal bases. They can be activated by connecting the terminals 1-2 and 3-4 of COM1.

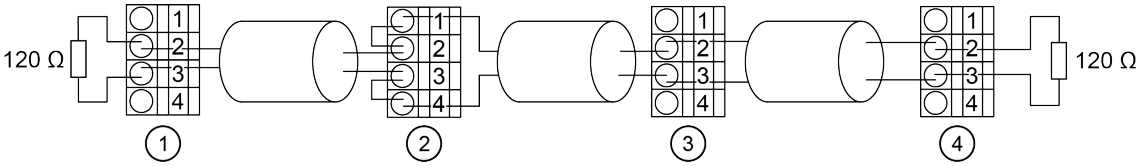


The following drawing shows an RS-485 bus with the bus master at the line end.



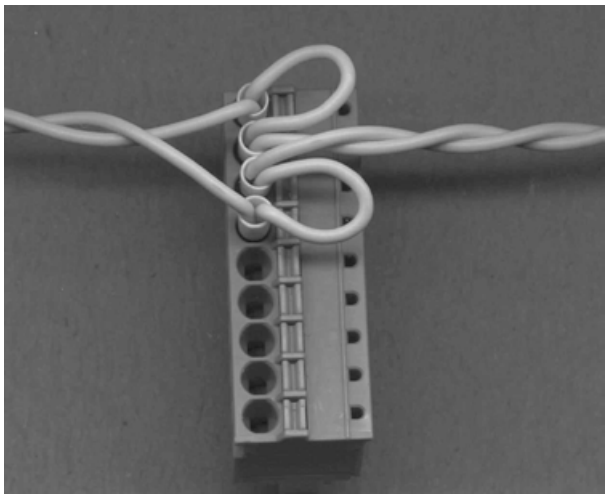
1 Master at the bus line end, pull-up and pull-down activated, bus termination with 120 Ω resistors
2 Slave within the bus line
3 Slave at the bus line end, bus termination with 120 Ω resistors

If the master is located within the bus line, it does not need a terminating resistor. The pull-up and the pull-down resistors, however, must be activated (see the following drawing).



1 Slave at the bus line end, bus termination with 120 Ω resistors
2 Master within the bus line, pull-up and pull-down activated
3 Slave within the bus line
4 Slave at the bus line end, bus termination with 120 Ω resistors

The following photo shows a wiring example "master within the bus line", wired at the COM1 bus connector of the terminal base:



If the bus is operated with several masters, the pull-up and pull-down resistors may only be activated at one master.

The grounding of the cable shields of the bus lines are described in the CS31 bus (PM57x, PM58x and PM59x) ↳ *Chapter 1.6.3.6.4.8 “CS31 bus” on page 5347*.

Serial interface COM2 of the terminal bases

The serial interface COM2 is not available at:

– *Processor modules with type designator -2ETH (e. g. PM591-2ETH)*
– *Processor modules PM56xx*

The serial interface COM2 is connected via a 9-pole D-sub connector. It is not intended to use COM2 to establish a CS31 system bus. It is configurable for RS-232 or RS-485 and can be used for

- online access
- a free protocol
- Modbus RTU, master and slave

If the RS-485 bus is used, each interconnected bus line (each bus segment) must be electrically terminated. The following is necessary:

- 2 resistors of 120 Ω each at both line ends (to avoid signal reflections)
- a pull-up resistor at RxD/TxD-P and a pull-down resistor at RxD/TxD-N. These 2 resistors care for a defined high level on the bus, while there is no data exchange.

It is useful, to activate both the pull-up and the pull-down resistors, which only are necessary once on every bus line, at the bus master.

Pin assignment

Serial Interface	Pin	Signal	Interface	Description	
	1	FE	-	Functional earth	
	2	TxD	RS-232	Transmit data	Output
	3	RxD/TxD-P	RS-485	Receive/Transmit	Positive
	4	RTS	RS-232	Request to send	Output
	5	SGND	Signal ground	0 V supply out	
	6	+5 V	-	5 V supply out	
	7	RxD	RS-232	Receive data	Input
	8	RxD/TxD-N	RS-485	Receive/Transmit	Negative
	9	CTS	RS-232	Clear to send	Input
	Shield	FE	-	Functional earth	

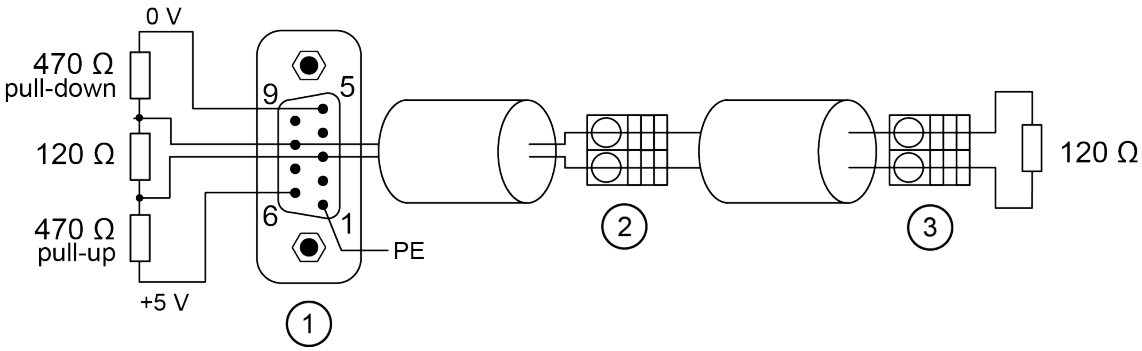
NOTICE!

Risk of corrosion!

Unused connectors and slots may corrode if XC devices are used in salt-mist environments.

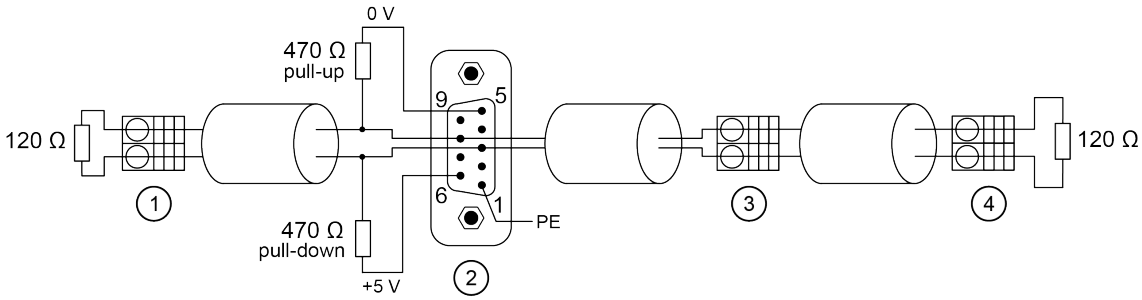
Protect unused connectors and slots with TA535 protective caps for XC devices. *Chapter 1.6.2.9.4.6 “TA535 - Protective caps for XC devices” on page 5212*

The following drawing shows an RS-485 bus with the bus master at the line end.



1 Master at the bus line end, pull-up and pull-down activated, bus termination with 120 Ω resistors
2 Slave within the bus line
3 Slave at the bus line end, bus termination with 120 Ω resistors

If the master is located within the bus line, it does not need a terminating resistor. The pull-up and the pull-down resistors, however, are necessary:



1 Slave at the bus line end, bus termination with 120 Ω resistors
2 Master within the bus line, pull-up and pull-down activated
3 Slave within the bus line
4 Slave at the bus line end, bus termination with 120 Ω resistors

NOTICE!

If the bus is operated with several masters, the pull-up and pull-down resistors may only be installed at one master.

The cable shields must be earthed. See CS31 system bus *Chapter 1.6.3.5.4.4 “CS31 bus” on page 5257*.

CS31 bus

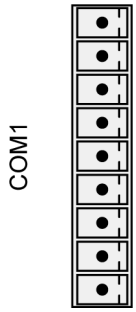
Connection of the processor module to the CS31 bus

*The PM56xx processor module does **not** support the CS31 bus.*

COM1 of the terminal base

The processor module can be used as a CS31 bus master. The connection is performed via the serial interface COM1 used as a CS31 bus.

Pin assignment (RS-485 / RS-232)



Terminal block removed

Terminal block inserted

Pin	Signal	Interface	Description
1	Terminator P	RS-485	Terminator P
2	RxD/TxD-P	RS-485	Receive/Transmit, positive
3	RxD/TxD-N	RS-485	Receive/Transmit, negative
4	Terminator N	RS-485	Terminator N
5	RTS	RS-232	Request to send (output)
6	TxD	RS-232	Transmit data (output)
7	SGND	Signal Ground	Signal Ground
8	RxD	RS-232	Receive data (input)
9	CTS	RS-232	Clear to send (input)

NOTICE!

Unused connector!

Make sure that the terminal block is always connected to the terminal base or communication module, even if you do not use the interface.

With connecting the terminals 1-2 and 3-4, a pull-up and a pull-down resistor can be activated (see chapter Serial Interface COM1 *Chapter 1.6.3.6.4.6 “Serial interface COM1 of the terminal bases” on page 5343*.

Wiring

Wiring

Bus line	
Construction	2 cores, twisted, with common shield
Conductor cross section	> 0.22 mm² (24 AWG)
Recommendation	0.5 mm² corresponds to 0.8 mm
Twisting rate	> 10 per meter (symmetrically twisted)
Core insulation	Polyethylene (PE)

Bus line	
Resistance per core	< 100 Ω/km
Characteristic impedance	ca. 120 Ω (100 Ω...150 Ω)
Capacitance between the cores	< 55 nF/km (if higher, the max. bus length must be reduced)
Terminating resistors	120 Ω ¼ W at both line ends
Remarks	Shielded cables with PVC core insulation and a core diameter of 0.8 mm can be used up to a length of ca. 50 m. In this case, the bus terminating resistor is ca. 100 Ω.

Remarks:

Cables with PVC core insulation and a core diameter of 0.8 mm can be used up to a length of ca. 250 m. In this case, the bus terminating resistor is ca. 100 Ω.

Cables with PE core insulation can be used up to a length of ca. 500 m.

Bus topology

A CS31 bus always contains only one bus master (CPU or communication module) which controls all actions on the bus. Up to 31 slaves can be connected to the bus, e.g. remote modules or slave-configured CPUs. Besides the wiring instructions shown below, the wiring and grounding instructions provided with the descriptions of the modules are valid additionally.

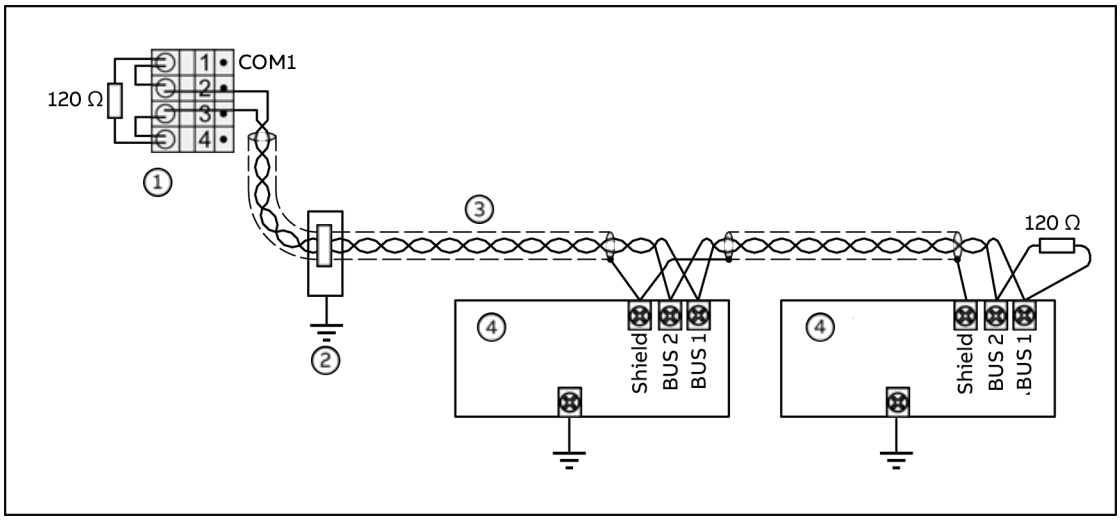


Fig. 1087: Bus topology for a CS31 bus at COM1 (bus master at one end of the bus line)

1 CS31 bus master (e.g. PM581, master at the bus line end, pull-up and pull-down activated, bus termination 120 Ω)
2 Direct earthing with clip on cabinet steel plate
3 CS31 bus
4 CS31 slave

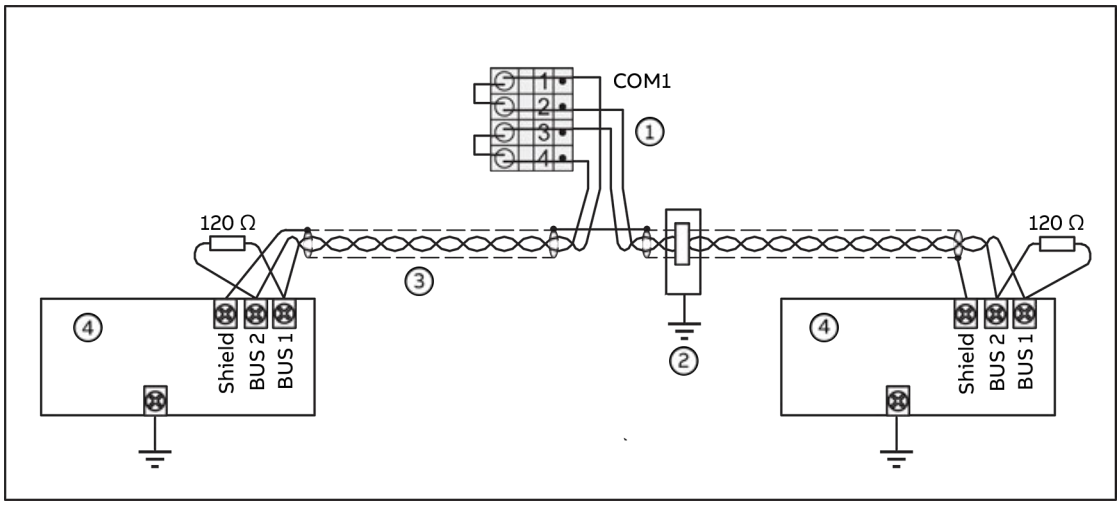

Fig. 1088: Bus topology for a CS31 bus at COM1 (bus master within the bus line)

1 CS31 bus master (e.g. PM581, master at the bus line end, pull-up and pull-down activated, bus termination 120 Ω)
2 Direct earthing with clip
3 CS31 bus
4 CS31 slave

NOTICE!
Risk of malfunctions!
Spur lines are not allowed within the CS31 bus.
Loop the bus line from module to module.

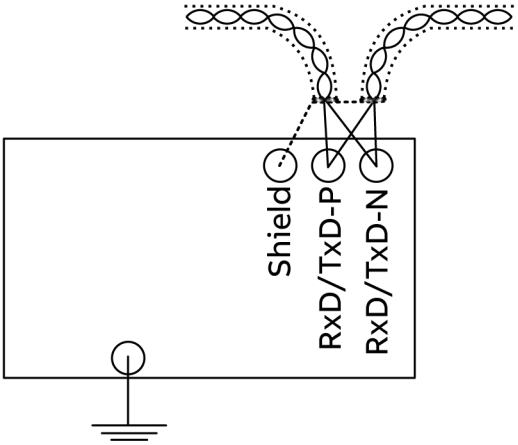

Fig. 1089: CS31 slave - Bus line: Correct

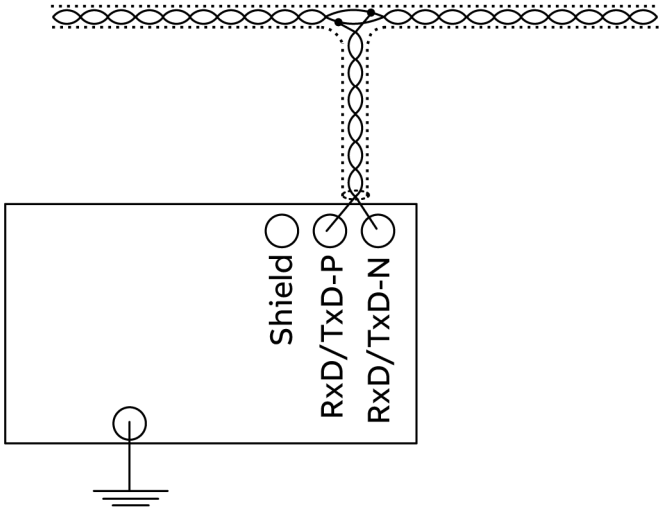

Fig. 1090: CS31 slave - Bus line: Wrong

Grounding

In order to avoid disturbance, the cable shields must be grounded directly.

Case a:

Multiple switchgear cabinets: If it can be guaranteed that no potential differences can occur between the switchgear cabinets by means of current-carrying metal connections (grounding bars, steel constructions etc.), the direct grounding is chosen.

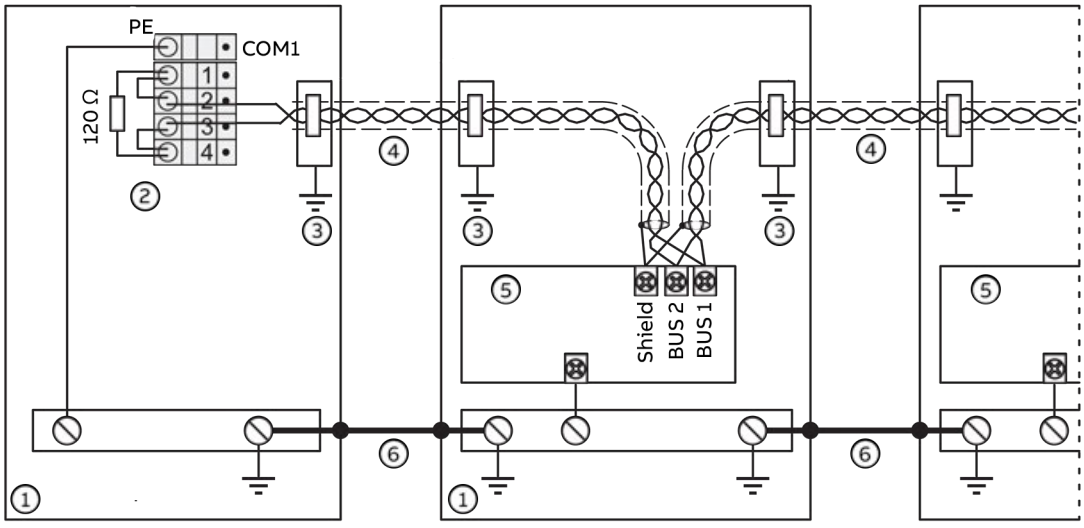

Fig. 1091: Direct grounding

1 Cabinet
2 CS31 bus master (e.g. PM581)
3 Direct grounding of shields when entering the cabinet
4 CS31 bus system
5 CS31 slave
6 Current-carrying connection

Case b:

Multiple switchgear cabinets: If potential differences can occur between the switchgear cabinets, the capacitive grounding method is chosen in order to avoid circulating currents on the cable shields.

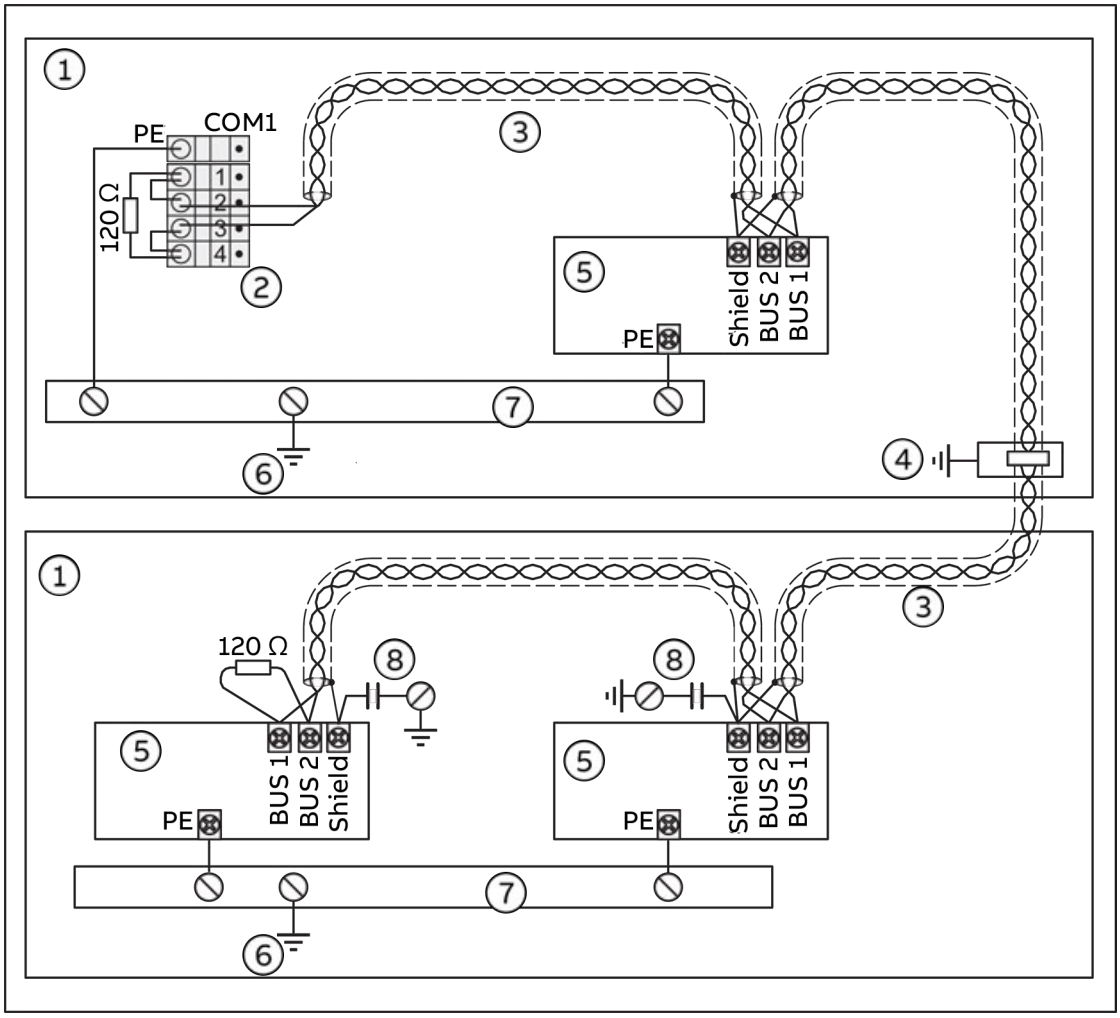

Fig. 1092: Earthing concept with several switchgear cabinets: direct grounding of cable shields when cables enter the first switchgear cabinet (containing the master), and capacitive grounding at the modules

1 Cabinet
2 CS31 bus master e.g. PM581
3 CS31 bus system
4 Direct grounding of shields when entering the cabinet
5 CS31 slave
6 Cabinet grounding
7 Grounding bar
8 Capacitive grounding 0.1 uF X-type capacitor directly on on the cabinet's steel plate

Everywhere is valid: The total length of the grounding connections between the shield of the Terminal Base and the grounding bar must be as short as possible (max. 25 cm). The conductor cross section must be at least 2.5 mm^2.

VDE 0160 requires, that the shield must be grounded directly at least once per system.

CANopen field bus

Types of bus cables

For CANopen, only bus cables with characteristics as recommended in ISO 11898 are to be used. The requirements for the bus cables depend on the length of the bus segment. Regarding this, the following recommendations are given by ISO 11898:

Length of segment [m]	Bus cable (shielded, twisted pair)			Max. transmission rate [kbit/s]
	Conductor cross section [mm²]	Line resistance [Ω/km]	Wave impedance [Ω]	
0...40	0.25...0.34 / AWG23, AWG22	70	120	1000 at 40 m
40...300	0.34...0.60 / AWG22, AWG20	< 60	120	< 500 at 100 m
300...600	0.50...0.60 / AWG20	< 40	120	< 100 at 500 m
600...1000	0.75...0.80 / AWG18	< 26	120	< 50 at 1000 m

NOTICE!

Risk of telegram and data errors!

The use of wrong cable type and quality could lead to limitations in cable length, causing telegram and data errors.

NOTICE!

Risk of damaging the terminating resistor!

A bus-line short-circuit to the 24 V DC power supply can cause damage by exceeding the power rating of the terminating resistor.

NOTICE!

Risk of telegram and data errors!

Miss- or unterminated data lines can cause reflections on the bus, leading to telegram and data errors. For maximum cable length and transmission rate, the bus must always be terminated on both ends with the characteristic impedance of the cable type.

NOTICE!

Verification of termination (Make sure the power supply on all CAN nodes is turned off)!

To verify the termination, the DC resistance between CAN_H and CAN_L can be measured. The value should be between 50 Ω and 70 Ω.

Check for correct resistor values, short circuits and correct number of terminating resistors, if the measurement is showing deviations.

Installation hint

Ensure that the termination and FE connection will not be removed when removing CAN modules from the bus.

Branches are not allowed in a CAN network. Stubs should be avoided or kept as short as possible (< 0.3 m).

When connecting the cable take care to use one dedicated twisted pair for the CAN signals (CAN_L and CAN_H) and another free wire for CAN_GND. CAN_GND must be connected as reference, to avoid common mode problems causing telegram errors.

Keep the CAN bus wiring away from electrical disturbance and close to earth potential to minimize interference.

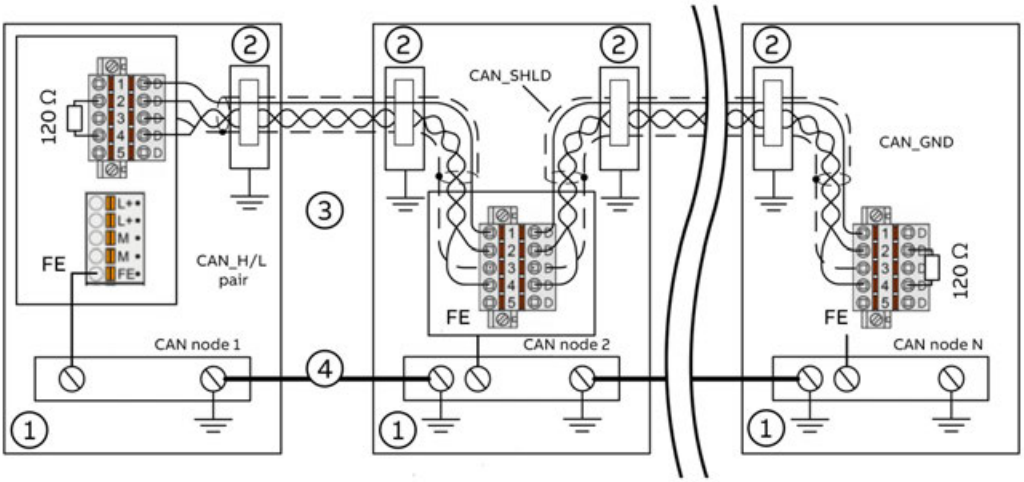

Fig. 1093: CAN bus, connection and wiring

See communication via Modbus RTU: *Chapter 1.6.4.1.8 “Communication with Modbus RTU” on page 5467*.

Wiring

Cable length restrictions

For the maximum possible cable lengths within an Ethernet network, various factors have to be taken into account. Twisted pair cables (TP cables) are used as transmission medium for 10 Mbit/s Ethernet (10Base-T) as well as for 100 Mbit/s (Fast) Ethernet (100Base-TX). For a transmission rate of 10 Mbit/s, cables of at least category 3 (IEA/TIA 568-A-5 Cat3) or class C (according to European standards) are allowed. For fast Ethernet with a transmission rate of 100 Mbit/s, cables of category 5 (Cat5) or class D or higher have to be used. The maximum length of a segment, which is the maximum distance between two network components, is restricted to 100 m due to the electric properties of the cable.

Furthermore, the length restriction for one collision domain has to be observed. A collision domain is the area within a network which can be affected by a possibly occurring collision (i.e. the area the collision can propagate over). This, however, only applies if the components operate in half-duplex mode since the CSMA/CD access method is only used in this mode. If the components operate in full-duplex mode, no collisions can occur. Reliable operation of the collision detection method is important, which means that it has to be able to detect possible collisions even for the smallest possible frame size of 64 bytes (512 bits). But this is only guaranteed if the first bit of the frame arrives at the most distant subscriber within the collision domain before the last bit has left the transmitting station. Furthermore, the collision must be able to propagate to both directions at the same time. Therefore, the maximum distance between two ends must not be longer than the distance corresponding to the half signal propagation time of 512 bits. Thus, the resulting maximum possible length of the collision domain is 2000 m for a transmission rate of 10 Mbit/s and 200 m for 100 Mbit/s. In addition, the bit delay times caused by the passed network components also have to be considered.

The following table shows the specified properties of the respective cable types per 100 m.

Table 615: Specified cable properties:

Parameter	10Base-T [10 MHz]	100Base-TX [100 MHz]
Attenuation [dB / 100m]	10.7	23.2
NEXT [dB / 100m]	23	24
ACR [dB / 100m]	N/A	4

Parameter	10Base-T [10 MHz]	100Base-TX [100 MHz]
Return loss [dB / 100m]	18	10
Wave impedance [Ohms]	100	100
Category	3 or higher	5
Class	C or higher	D or higher

TP cable

The TP cable has eight wires arranged in four pairs of twisted wires. Different color codes exist for the coding of the wires, the coding according to EIA/TIA 568, version 1, being the one most commonly used. In this code, the individual pairs are coded with blue, orange, green and brown color. One wire of a pair is unicolored and the corresponding second wire is striped, the respective color alternating with white. For shielded cables, a distinction is made between cables that have one single shield around all pairs of wires and cables that have an additional individual shield for each pair of wires. The following table shows the different color coding systems for TP cables:

Table 616: Color coding of TP cables:

Pairs	EIA/TIA 568 Version 1		EIA/TIA 568 Version 2		DIN 47100		IEC 189.2	
Pair 1	white/ blue	blue	green	red	white	brown	white	blue
Pair 2	white/ orange	orange	black	yellow	green	yellow	white	orange
Pair 3	white/ green	green	blue	orange	grey	pink	white	green
Pair 4	white/ brown	brown	brown	slate	blue	red	white	brown

Two general variants are distinguished for the pin assignment of the normally used RJ45 connectors: EIA/TIA 568 version A and version B. The wiring according to EIA/TIA 568 version B is the one most commonly used.

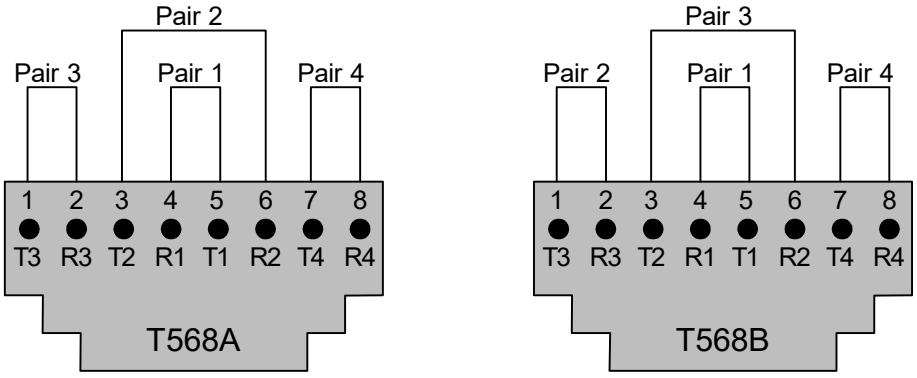

Fig. 1094: Pin assignment of RJ45 sockets

Cable types

Crossover cable

Particular use

Crossover cables are needed only for a direct Ethernet connection without crossover functionality. In particular for AC500 modules in product life cycle phase "Classic".

Crossover cables are for a direct Ethernet connection of two terminal devices as the simplest variant of a network. From transmission lines of the first station to the reception lines of the second station.

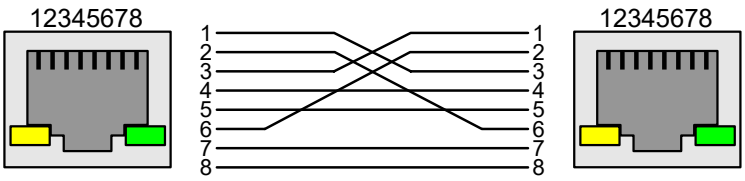

Fig. 1095: Wiring of a crossover cable

Straight-through cable

For networks with more than two subscribers, hubs or switches have to be used additionally for distribution. These active devices already have the crossover functionality implemented which allows a direct connection of the terminal devices using straight-through cables.

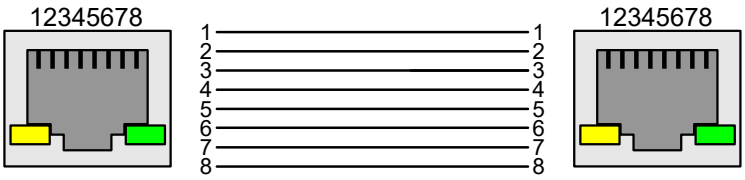

Fig. 1096: Wiring of a straight-through cable

CAUTION!

Risk of communication faults!

When using inappropriate cables, malfunctions in communication may occur.

Only use network cables of the categories 5 (Cat 5, Cat 5e, Cat 6 or Cat 7) or higher within PROFINET networks.

PROFIBUS connection details

Attachment plug for the bus cable

9-pin D-sub connector, male

Parameter	Value
Fastening torque	0.4 Nm

Assignment

Pin	Signal	Description
1	Shield	Shielding, protective ground
2	not used	-
3	RxD/TxD-P	Reception / transmission line, positive
4	CBTR-P	Control signal for repeater, positive (optional)
5	DGND	Reference potential for data lines and +5 V
6	VP	+5 V, supply voltage for bus terminating resistors
7	not used	-

Pin	Signal	Description
8	RxD/TxD-N	Reception / transmission line, negative
9	CNTR-N	Control signal for repeater, negative (optional)

Bus cable

Parameter	Value
Type	Twisted pair (shielded)
Characteristic impedance	135 Ω...165 Ω
Cable capacitance	< 30 pF/m
Conductor diameter of the cores	≥ 0.64 mm
Conductor cross section of the cores	≥ 0.34 mm²
Cable resistance per core	≤ 55 Ω/km
Loop resistance (resistance of two cores)	≤ 110 Ω/km

Cable lengths

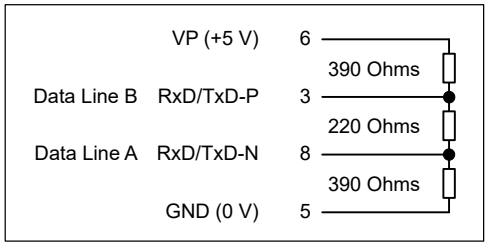
The maximum possible cable length of a PROFIBUS subnet within a segment depends on the tranmission rate (baud rate).

Transmission Rate	Maximum Cable Length
9.6 / 19.2 / 93.75 kBaud	1200 m
187.5 kBaud	1000 m
500 kBaud	400 m
1.5 MBaud	200 m
3 MBaud to 12 MBaud	100 m

Branch lines are generally permissible for transmission rates of up to 1500 kbit/s. But in fact they should be avoided for transmission rates higher than 500 kbit/s.

Bus terminating resistors

The line ends (of the bus segments) have to be terminated using bus terminating resistors according to the drawing below. The bus terminating resistors are usually placed inside the bus connector.



Repeaters

One bus segment can have up to 32 subscribers. Using repeaters a system can be expanded to up to 126 subscribers. Repeaters are also required for longer transfer lines. Please note that a repeater's load to the bus segment is the same as the load of a normal bus subscriber. The sum of normal bus subscribers and repeaters in one bus segment must not exceed 32.

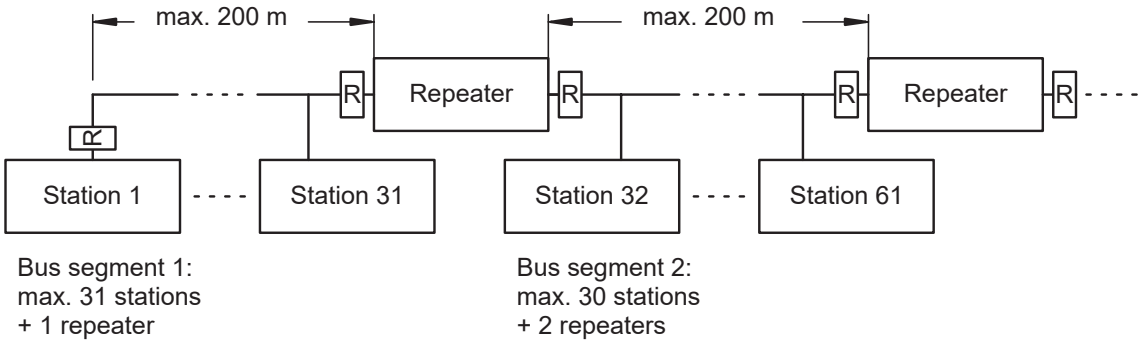


Fig. 1097: Principle example for a PROFIBUS-DP system with repeaters (1500 kbit/s baud rate)

Modbus RTU connection details

The Modbus RTU protocol is implemented in the AC500 processor modules.

Modbus is a master-slave (client-server) protocol. The client sends a request to the server(s) and receives the response(s).

Available serial interfaces can work as Modbus interfaces simultaneously.

The Modbus client operating mode of an interface is set with the function block COM_MOD_MAST.

Chapter 1.5.4.22.1.1 “COM_MOD_MAST” on page 1698

Technical data

The Modbus operating mode and the interface parameters are set in the *Chapter 1.6.5.2.11.4 “Setting COMx - Modbus” on page 6108*.

Table 617: Description of the Modbus protocol

Parameter	Value
Supported standard	PM55x and PM56x: EIA RS-485 PM57x, PM58x and PM59x: EIA RS-232 / RS-485
Number of connection points	1 client Max. 1 server with RS-232 interface Max. 31 servers with RS-485
Protocol	Modbus
Operating mode	Client/server
Address	Server only
Data transmission control	CRC16
Data transmission speed	From 300 bits/s to 187,500 bits/s
Encoding	1 start bit 8 data bits 1 parity bit, (optional) even, odd, mark or space 1 or 2 stop bits
Max. cable length for RS-485 on COM1 / COM2 for AC500 CPU	1.200 m at 19.200 baud

Parameter			Value
Max. cable length for RS-485 on COM1 / COM2 for AC500-eCo CPU			
	COM1:		
		Non-isolated:	Max. 50 m (with shielded cable)
		Isolated with TK506:	Max. 500 m at 19.200 baud (with shielded cable *)
	COM2:		
		Non-isolated with TA562:	Max. 50 m (with shielded cable)
		Isolated with TA569:	Max. 500 m at 19.200 baud (with shielded cable *)

*) 500 m cable type STP-120 Ω/AWG-20

If a processor module provides more than one serial interface, both interfaces (COM1/COM2) can be operated simultaneously as Modbus interfaces and can operate as Modbus server as well as Modbus client.

Bus topology Point-to-point with RS-232 or bus topology with RS-485. Modbus is a master-slave protocol.

For further information on Modbus see chapter *Chapter 1.6.4.1.8 “Communication with Modbus RTU” on page 5467*.

1.6.3.6.5 Handling of accessories

This section only describes accessories that are frequently used for system assembly, connection and construction. A description of all additional accessories that can be used to supplement AC500 system can be found in the Hardware PLC device description.

MC502 - Memory card

- Solid state flash memory storage

1 MC502 memory card

The memory card has a write protect switch.

In the position "LOCK", the memory card can only be read.

Memory card type	AC500 V2	AC500-XC V2	AC500-eCo V2 [3])	AC500 V3	AC500-XC V3	AC500-eCo V3
MC502	x	x	x	x	x	-
MC5141	x	x	x	x	x	-
MC5102 **with** TA5350-AD micro memory card adapter	x [1])	x [1]) [2])	x [1])	x	x [2])	-
MC5102 **without** TA5350-AD micro memory card adapter	-	-	-	-	-	x

[1]) As of firmware 2.5.x

[2]) Temporary use of MC5102 is possible under normal environmental conditions, but MC5141 should be preferred.

[3]) A memory card can only be inserted when a MC503 memory card adapter is installed in the processor module.

The use of other memory cards is prohibited. ABB is not responsible nor liable for consequences resulting from use of unapproved memory cards.

Purpose

Processor modules can be operated with and without (micro) memory card.

Processor modules are supplied without (micro) memory card. It must be ordered separately.

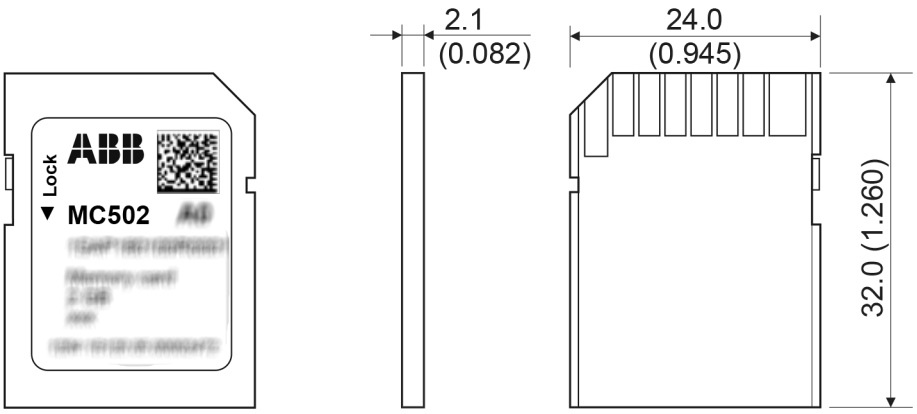
AC500-eCo V2 processor modules must be equipped with an MC503 memory card adapter if a memory card is used. *Chapter 1.6.3.5.5.3 “MC503 - Memory card adapter” on page 5272*

The memory card is used to store or backup application data and/or application programs or project source codes as well as to update the internal CPU firmware.

The memory card is intended for long-term use in standard and XC application.

The memory card can be read/written on a PC with a SDHC compatible memory card reader.

Dimensions



The dimensions are in mm and in brackets in inch.

Insert the memory card

AC500 V2 and AC500-eCo V2

1. Unpack the memory card.
2. Insert the memory card into the memory card slot of the processor module until locked.

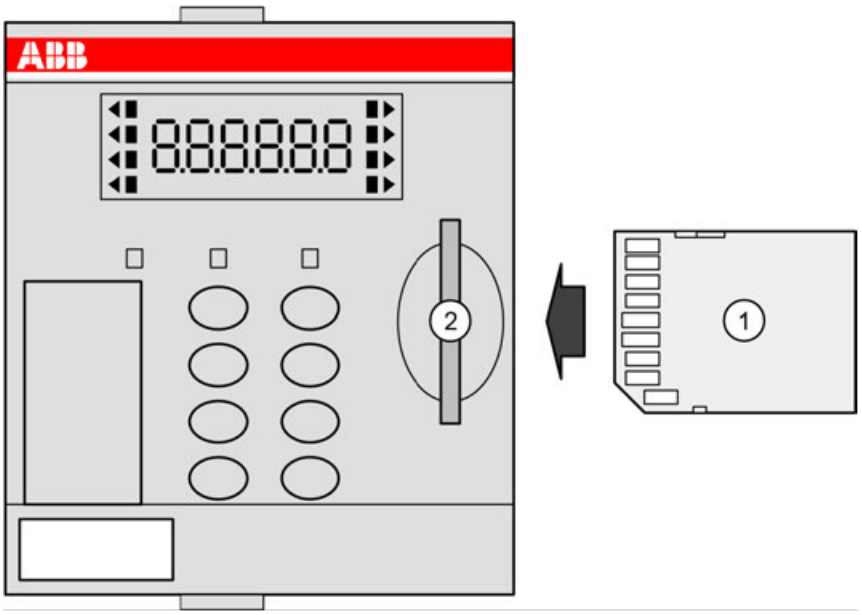


Fig. 1098: Insert memory card into PM57x, PM58x and PM59x

1 Memory card
2 Memory card slot

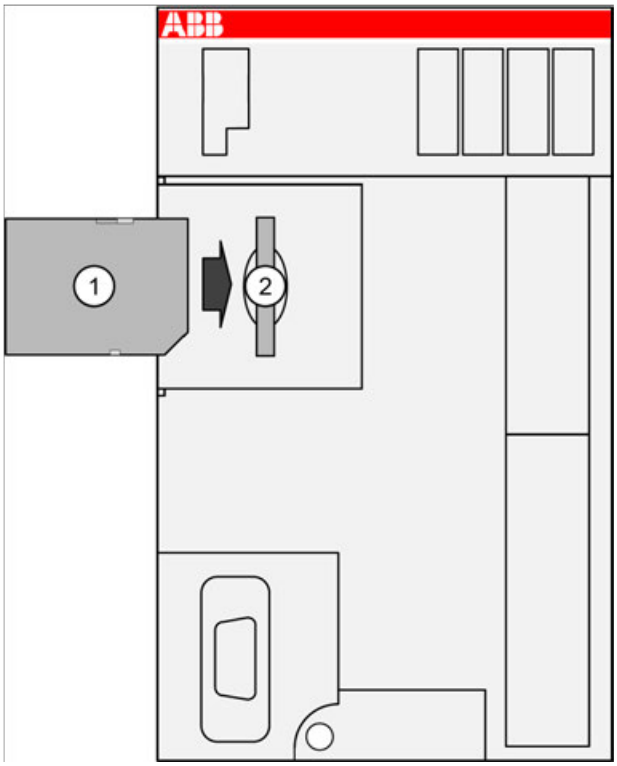

Fig. 1099: Insert memory card into PM55x-xP and PM56x-xP

1 Memory card
2 MC503 memory card adapter

Remove the memory card

AC500 V2 and AC500-eCo V2

NOTICE!

Removal of the memory card

Do not remove the memory card when it is working!

Remove the memory card only when the RUN LED is not blinking.

Otherwise the memory card and/or files on it might get corrupted and/or normal PLC operation might be disturbed.

1. To remove the memory card, push on the memory card until it moves forward.
2. By this, the memory card is unlocked and can be removed.

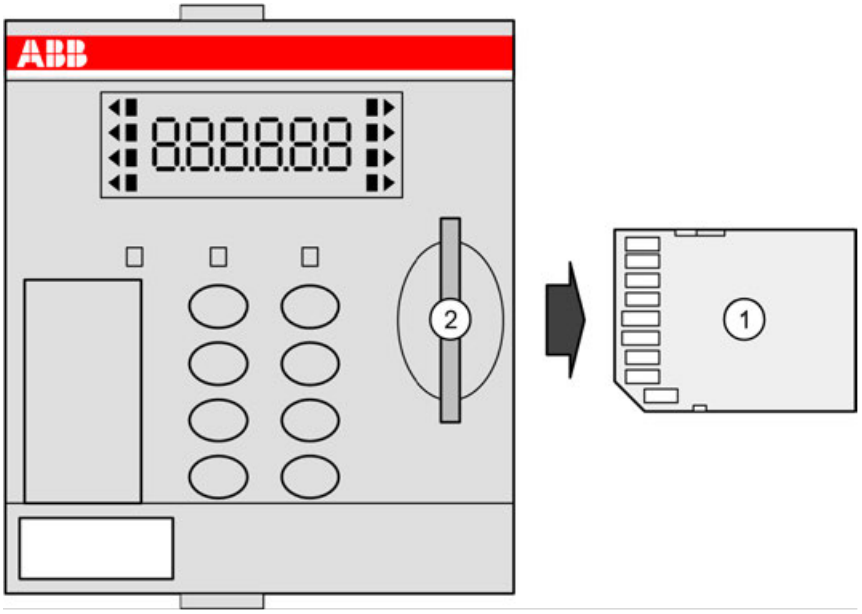

Fig. 1100: Remove memory card from PM57x, PM58x and PM59x

1 Memory card
2 Memory card slot

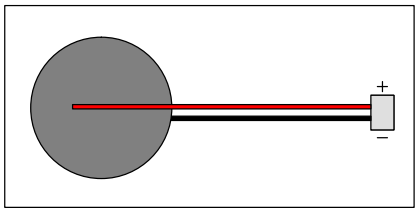
TA521 - Battery

- Manganese dioxide lithium battery, 3 V, 560 mAh
- Non-rechargeable



Purpose

The TA521 battery is the only applicable battery for the AC500 processor modules *Chapter 1.6.2.3.2.1 “PM57x (-y), PM58x (-y) and PM59x (-y)” on page 3848*. It cannot be recharged.

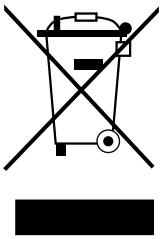
The processor modules are supplied without lithium battery. It must be ordered separately. The TA521 lithium battery is used for data (SRAM) and RTC buffering while the processor module is not powered.

See system technology - AC500 battery. *Chapter 1.6.4.1.4.2 “AC500 battery” on page 5419*

The CPU monitors the discharge degree of the battery. A warning is issued before the battery condition becomes critical (about 2 weeks before). Once the warning message appears, the battery should be replaced as soon as possible.

Handling instructions

- Do not short-circuit or re-charge the battery! It can cause excessive heating and explosion.
- Do not disassemble the battery!
- Do not heat up the battery and not put into fire! Risk of explosion.
- Store the battery in a dry place.
- Replace the battery with supply voltage ON in order not to risk data being lost.
- Recycle exhausted batteries meeting the environmental standards.



Battery lifetime

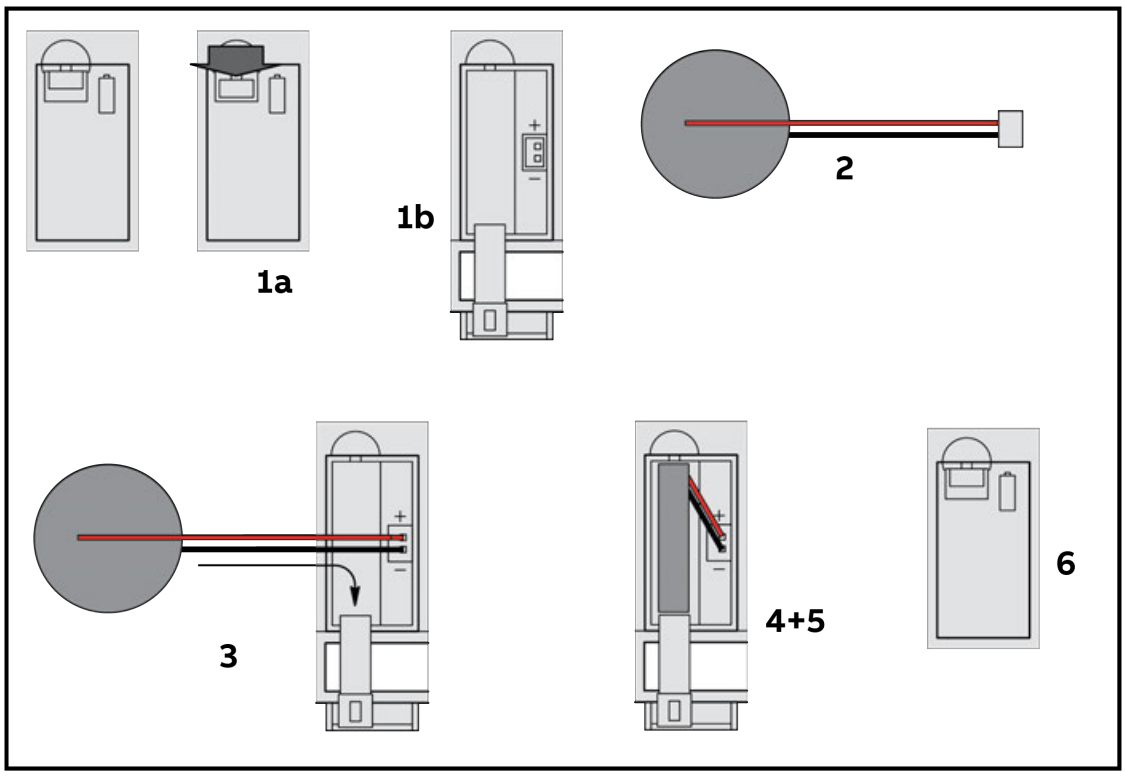
The battery lifetime is the time, the battery can store data while the processor module is not powered. As long as the processor module is powered, the battery will only be discharged by its own leakage current.

To avoid a short battery discharge, the battery should always be inserted or replaced while the process module is under power, then the battery is correctly recognized and will not shortly discharged.

Insertion

To ensure propper operation and to prevent data loss, the battery insertion or replacement must be always done with the system under power. Without battery and power supply there is no data buffering possible.

WARNING!
Risk of fire or explosion!
Use of incorrect Battery may cause fire or explosion.



1. Open the battery compartment with the small locking mechanism, press it down and slip down the door. The door is attached to the front face of the processor module and cannot be removed.
2. Remove the TA521 battery from its package and hold it by the small cable. Remove then the small connector from the socket, do this best by lifting it out with a screwdriver.
3. Insert the battery connector into the small connector port of the compartment. The connector is keyed to find the correct polarity (red = positive pole = above).
4. Insert first the cable and then the battery into the compartment, push it until it reaches the bottom of the compartment.
5. Arrange the cable in order not to inhibit the door to close.
6. Pull-up the door and press until the locking mechanism snaps.

In order to prevent data losses or problems, the battery should be replaced after 3 years of utilisation or at least as soon as possible after receiving the "low battery warning" indication.

Do not use a battery older than 3 years for replacement, do not keep batteries too long in stock.

Replacement of the battery

To ensure propper operation and to prevent data loss, the battery insertion or replacement must be always done with the system under power. Without battery and power supply there is no data buffering possible.

1. Open the battery compartment with the small locking mechanism, press it down and slip down the door. The door is attached to the front view of the processor module and cannot be removed.
2. Remove the old TA521 battery from the battery compartment by pulling it by the small cable. Remove then the small connector from the socket, do this best by lifting it out with a screwdriver.

3. Follow the previous instructions to insert a new battery.

CAUTION!

Risk of explosion!

Do not open, re-charge or disassemble a lithium battery. Attempts to charge lithium batteries lead to overheating and possible explosions.

Protect them from heat and fire and store them in a dry place.

Never short-circuit or operate lithium batteries with the polarities reversed. The batteries are likely to overheat and explode. Avoid chance short circuiting and therefore do not store batteries in metal containers and do not place them on metallic surfaces. Escaping lithium is a health hazard.

In order to prevent data losses or problems, the battery should be replaced after 3 years of utilisation or at least as soon as possible after receiving the "low battery warning" indication.

Do not use a battery older than 3 years for replacement, do not keep batteries too long in stock.

Technical data

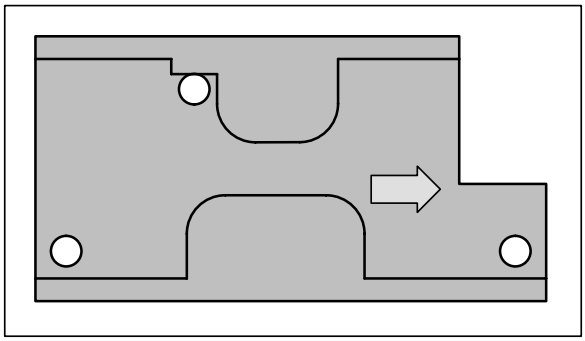
TA526 - Wall mounting accessory



Purpose

If a terminal base TB5xx or a terminal unit TU5xx should be mounted with screws, the wall mounting accessories TA526 must be inserted at the rear side first. This plastic parts prevent bending of terminal bases and terminal units while screwing up.

Handling instructions

Handling of the wall mounting accessory is described in detail in the section *Mounting and disassembling the terminal unit* ↳ *"Mounting with screws" on page 5328* and *Mounting/Disassembling Terminal Bases and Function Module Terminal Bases* ↳ *"Mounting with screws" on page 5326*.

TA541 - Battery

- Manganese dioxide lithium battery, 3 V
- Non-rechargeable

Purpose

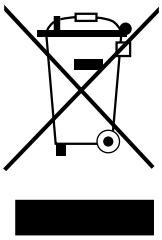
The TA541 lithium battery is the only applicable battery for PM595 ↳ *Chapter 1.6.2.3.2.2 "PM595-4ETH" on page 3863*. It is used to save RAM content of the processor module (PM595-4ETH-F only) and to back-up the real-time clock (all PM595 variants). It cannot be recharged.

The processor modules are supplied without a lithium battery. It therefore must be ordered separately. The lithium battery is used to save RAM contents of AC500 processor modules and back-up the real-time clock. Although the processor modules can work without a battery, its use is still recommended in order to avoid process data being lost.

The CPU monitors the discharge degree of the battery. A warning is output, before the battery condition becomes critical (about 2 weeks before). After the warning message has appeared, the battery should be replaced as soon as possible.

Handling instructions

- Do not short-circuit or re-charge the battery! It can cause excessive heating and explosion.
- Do not disassemble the battery!
- Do not heat up the battery and not put into fire! Risk of explosion.
- Store the battery in a dry place.
- Replace the battery with supply voltage ON in order not to risk data being lost.
- Recycle exhausted batteries meeting the environmental standards.



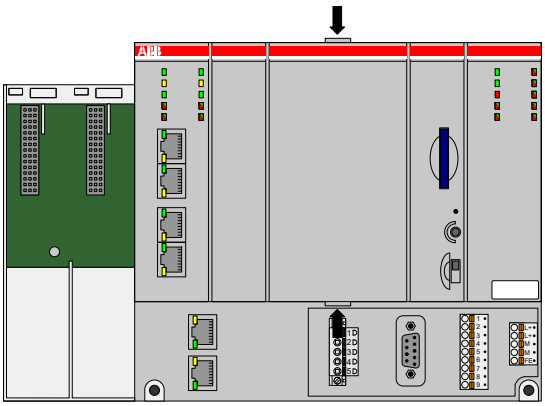
Battery lifetime

The battery lifetime is the time the battery can store data while the CPU is not powered. As long as the CPU is powered, the battery will only be discharged by its own leakage current.

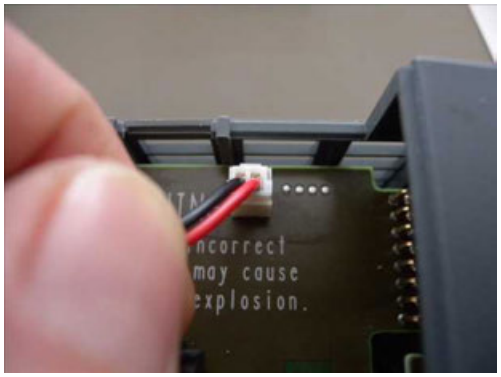
Insertion

The TA541 lithium battery is the only applicable battery for processor modules PM595.

1. Remove the front cover / display by pressing the marked areas with your fingers and pull it to the front.

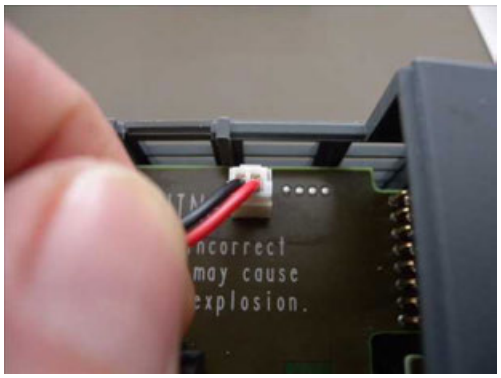


2. Remove the old battery from the battery compartment by pulling it by the small cable. Remove then the small connector from the socket.



3. Remove the battery from its package and hold it by the small cable.

4. Insert the battery connector into the connector port of the PCB. The connector is keyed to find the correct polarity (red = positive pole = right side).



5. Insert the battery into the battery compartment on the left side as shown in the figure.

6. Re-assemble the front cover / display by pressing it straight from the front until it snaps in.

In order to prevent data losses or problems, the battery should be replaced after 3 years of utilisation or at least as soon as possible after receiving the "low battery warning" indication.

Do not use a battery older than 3 years for replacement, do not keep batteries too long in stock.

Replacement of the battery

For PM595-4ETH-F only: battery replacement should be done with the system under power. Without battery and power supply there is no data buffering possible.

For PM595-4ETH-M-XC only: battery only back-ups the real-time clock.

1. Remove the front cover / display by pressing the marked areas and pull it to the front.
2. Remove the old battery from the battery compartment by pulling it by the small cable. Remove then the small connector from the socket, do this best by lifting it out with a screwdriver.

   Follow the previous instructions to insert a new battery.

CAUTION!

Risk of explosion!

Do not open, re-charge or disassemble a lithium battery. Attempts to charge lithium batteries lead to overheating and possible explosions.

Protect them from heat and fire and store them in a dry place.

Never short-circuit or operate lithium batteries with the polarities reversed. The batteries are likely to overheat and explode. Avoid chance short circuiting and therefore do not store batteries in metal containers and do not place them on metallic surfaces. Escaping lithium is a health hazard.

Technical data

Parameter	Value
Nominal voltage	3 V
Nominal capacity	1800 mAh
Temperature range	Operating: -40 °C...+70 °C Storage: -40 °C...+85 °C Transport: -40 °C...+85 °C

CP-E - Economic range

The power supplies feature series and parallel connection as well as a true redundant setup via a redundancy module.

- Wide-range input voltage
- Mounting on DIN rail
- High efficiency of up to 90 %
- Low power dissipation and low heating
- Wide ambient temperature range from -40 °C...+70 °C
- No-load-proof, overload-proof, continuous short-circuit-proof
- Power factor correction (depending on the type)
- Approved in accordance with all relevant international standards

CP-C.1 - High performance range

The power supplies feature series and parallel connection as well as a true redundant setup via a redundancy module.

The CP-C.1 power supplies are ABB's high performance and most advanced range. With excellent efficiency, high reliability and innovative functionality it is prepared for the most demanding industrial applications. These power supplies have a 50 % integrated power reserve and operate at an efficiency of up to 94 %. They are equipped with overheat protection and active power factor correction. Combinded with a broad AC and DC input range and extensive worldwide approvals the CP-C.1 power supplies are the preferred choice for professional DC applications.

- Typical efficiency of up to 94 %
- Power reserve design delivers up to 150 % of the nominal output current
- Signaling outputs for DC OK and power reserve mode
- High power density leads to very compact and small devices
- No-load-proof, overload-proof, continuous short-circuit-proof
- Active power factor correction (PFC)

Table 619: Ordering data

Order No.	Type	Input	Output	Overload capacity	Module width [mm]

1.6.3.7 AC500-XC

1.6.3.7.1 System data AC500-XC

Assembly, construction and connection of devices of the variant AC500-XC is identical to AC500 (standard) ↬ Chapter 1.6.3.6 “AC500 (Standard)” on page 5313. The following description provides information on general technical data of AC500-XC system.

Environmental conditions

Table 620: Process and supply voltages

Parameter		Value
24 V DC		
	Voltage	24 V (-15 %, +20 %)
	Protection against reverse polarity	Yes
120 V AC...240 V AC wide-range supply		
	Voltage	120...240 V (-15 %, +10 %)
	Frequency	50/60 Hz (-6 %, +4 %)
Allowed interruptions of power supply		
	DC supply	Interruption < 10 ms, time between 2 interruptions > 1 s, PS2

NOTICE!
Exceeding the maximum power supply voltage for process or supply voltages could lead to unrecoverable damage of the system. The system might be destroyed.

NOTICE!
For the supply of the modules, power supply units according to PELV or SELV specifications must be used.

The creepage distances and clearances meet the requirements of the overvoltage category II, pollution degree 2.

Parameter		Value
Temperature		
	Operating	-40 °C...+70 °C -40 °C...-30 °C: Proper start-up of system; technical data not guaranteed -40 °C...0 °C: Due to the LCD technology, the display might respond very slowly. -40 °C...+40 °C: Vertical mounting of modules possible, output load limited to 50 % per group +60 °C...+70 °C with the following deratings: ● System is limited to max. 2 communication modules per terminal base ● Applications certified for cULus up to +60 °C ● Digital inputs: maximum number of simultaneously switched on input channels limited to 75 % per group (e.g. 8 channels => 6 channels) ● Digital outputs: output current maximum value (all channels together) limited to 75 % per group (e.g. 8 A => 6 A) ● Analog outputs only if configured as voltage output: maximum total output current per group is limited to 75 % (e.g. 40 mA => 30 mA) ● Analog outputs only if configured as current output: maximum number of simultaneously used output channels limited to 75 % per group (e.g. 4 channels => 3 channels)
	Storage / Transport	-40 °C...+85 °C
Humidity		Operating / Storage: 100 % r. H. with condensation
Air pressure		Operating: -1000 m....4000 m (1080 hPa...620 hPa) > 2000 m (< 795 hPa): ● max. operating temperature must be reduced by 10 K (e.g. 70 °C to 60°C) ● I/O module relay contacts must be operated with 24 V nominal only
Immunity to corrosive gases		Operating: Yes, according to: ISA S71.04.1985 Harsh group A, G3/GX IEC 60721-3-3 3C2 / 3C3
Immunity to salt mist		Operating: Yes, horizontal mounting only, according to IEC 60068-2-52 severity level: 1

NOTICE!

Risk of corrosion!

Unused connectors and slots may corrode if XC devices are used in salt-mist environments.

Protect unused connectors and slots with TA535 protective caps for XC devices. *Chapter 1.6.2.9.4.6 “TA535 - Protective caps for XC devices” on page 5212*

Table 621: Electromagnetic compatibility

Parameter		Value
Device suitable for:		
	Industrial applications	Yes
	Domestic applications	No
Radiated emission (radio disturbances)		Yes, according to: CISPR 16-2-3
Conducted emission (radio disturbances)		Yes, according to: CISPR 16-2-1, CISPR 16-1-2
Electrostatic discharge (ESD)		Yes, according to: IEC 61000-4-2, zone B, criterion B
Fast transient interference voltages (burst)		Yes, according to: IEC 61000-4-4, zone B, criterion B
High energy transient interference voltages (surge)		Yes, according to: IEC 61000-4-5, zone B, criterion B
Influence of radiated disturbances		Yes, according to: IEC 61000-4-3, zone B, criterion A
Influence of line-conducted interferences		Yes, according to: IEC 61000-4-6, zone B, criterion A
Influence of power frequency magnetic fields		Yes, according to: IEC 61000-4-8, zone B, criterion A

In order to prevent malfunctions, it is recommended, that the operating personnel discharge themselves prior to touching communication connectors or perform other suitable measures to reduce effects of electrostatic discharges.

NOTICE!

Risk of malfunctions!

Unused slots for communication modules are not protected against accidental physical contact.

– Unused slots for communication modules must be covered with dummy communication modules to achieve IP20 rating ↳ *Chapter 1.6.3.6.5.7 “TA524 - Dummy communication module” on page 5383*.
– I/O bus connectors must not be touched during operation.

Mechanical data

Parameter	Value
Wiring method	Spring terminals
Degree of protection	IP 20
Vibration resistance	Yes, according to: IEC 61131-2 IEC 60068-2-6 IEC 60068-2-64
Shock resistance	Yes, according to: IEC 60068-2-27
Assembly position	Horizontal Vertical (no application in salt mist environment)
Assembly on DIN rail	
DIN rail type	According to IEC 60715 35 mm, depth 7.5 mm or 15 mm
Assembly with screws	
Screw diameter	4 mm

1.6.3.8 AC500-S

The AC500-S safety user manual must be read and understood before using safety configuration and programming tools of Automation Builder / PS501 Control Builder Plus. Only qualified personnel shall be allowed to work with AC500-S safety PLCs.

In order to have always the latest version and due to a different lifecycle compared to Automation Builder help, the *AC500-S safety user manual* is only available on our website.

The AC500-S safety PLC includes the following safety-relevant hardware components.

- SM560-S / SM560-S-FD-1 / SM560-S-FD-4
- DI581-S
- DX581-S
- AI581-S
- TU582-S

1.6.4 System technology for AC500 V2 products

This chapter provides advanced information on the system technology of AC500 control systems from a general perspective. It provides information to link the details from the hardware descriptions (provided in the device specifications section) with detailed information on configuring/programming a corresponding library (provided in the individual library sections).

Configuration of a specific device with Automation Builder is described in the PLC configuration section.

1.6.4.1 System technology of CPU and overall system

1.6.4.1.1 Inputs, outputs and flags for AC500 V2 products

All operands supported by CODESYS are described in the CODESYS documentation
↳ *Chapter 1.4.1.7 “Operands” on page 435*.

In the following details on the "address" operands (%I for inputs, %Q for outputs, %M area and %R area for variables with address) and the data backup and initialization.

All addressable operands can be accessed bitwise (X), bytewise (B), wordwise (W) and double-wordwise (D) in Automation Builder. The Motorola byteorder is used for operand access.

Declaration of addressable operands

The declaration of the operands in the addressable flag area is done as follows:

Symbol AT address : Type [:= initialization value]; (* comment *)

[.] optional

The inputs and outputs are declared using the PLC configuration.

Interfaces for inputs and outputs

PM57x, PM58x and PM59x (AC500)

The following input and output interfaces are available for the AC500 CPUs PM57x, PM58x and PM59x:

No.	Type	Designation	Number of Inputs and Outputs
1	I/O bus	Interface for I/O modules	Max. 10 modules with a maximum of 32 channels (IX, QX, IW, QW) per module
2	COM1	CS31 bus master	Max. 31 modules with a maximum of 32 channels per module, address 0-61
3	COM2	Reserved	RS-232 / RS-485
4	FBP	FieldBusPlug - Slave	Max. 8 modules with 16 IW + 16 QW + 16 IB + 16 QB with modular FBP, depending on fieldbus
5	Onboard I/Os	Reserved	Max. 96 bytes Inputs and Outputs
6	Line 0	Internal communication module	4 kB %I0.xx / %Q0.xx each
7	Line 1	Communication module 1	4 kB %I1.xx / %Q1.xx each
8	Line 2	Communication module 2	4 kB %I2.xx / %Q2.xx each
9	Line 3	Communication module 3	4 kB %I3.xx / %Q3.xx each
10	Line 4	Communication module 4	4 kB %I4.xx / %Q4.xx each
11	Line 5	Internal communication module ETH3 of PM595-4ETH	4 kB %I5.xx / %Q5.xx each
12	Line 6	Internal communication module ETH4 of PM595-4ETH	4 kB %I6.xx / %Q6.xx each

PM55x and PM56x (AC500-eCo)

The following inputs and outputs interfaces are available for the AC500-eCo CPUs PM55x and PM56x:

No.	Type	Designation	Number of Inputs and Outputs
1	I/O bus	Interface for I/O modules	Max. 10 I/O modules with a maximum of 32 channels (IX, QX, IW, QW) per module
2	COM1	CS31 bus master	Max. 31 modules with a maximum of 32 channels per module, address 0-61
3	COM2	Reserved	RS-485
4	Onboard I/O	Onboard I/O	Per module: Option 1: 8DI+6DO Option 2: 8DI+6DO+2AI+1AO

Address scheme for inputs and outputs

- The Communication Module I/Os are addressed as follows (two-stage process):
  %I(Q)B**Communication ModuleNumber.ByteCommunication Module**
- No Communication Module numbers are assigned to I/Os that are connected to the CPU. These I/Os are configured with the PLC configuration in Automation Builder.
- I/Os connected to the basic unit are assigned to the following address areas:

I/O Bus:	%IB0 ..	%IB999	and %QB0 ..	%QB999
COM1:	%IB1000 ..	%IB1999	and %QB1000 ..	%QB1999
COM2 :	%IB2000 ..	%IB2999	and %QB2000 ..	%QB2999
FBP slave:	%IB3000 ..	%IB3999	and %QB3000 ..	%QB3999
Onboard I/O	%IB4000 ..	%IB4095	and %QB4000 ..	%QB4095

- Addressing of the digital channels is done byte-oriented.
- Motorola byteorder is used to access the inputs and outputs.

Example for addressing in BOOL / BYTE / WORD / DWORD

Address	**Addr**	**Addr + 1**	**Addr +2**	**Addr +3**
	16#xxxx x000	16#xxxx x001	16#xxxx x002	16#xxxx x003
BYTE	**%IB0**	**%IB1**	**%IB2**	**%IB3**
BOOL	7 ... 0	7 ... 0	7 ... 0	7 ... 0
	%IX0.7 ... %IX0.0	%IX1.7 ... %IX1.0	%IX2.7 ... %IX2.0	%IX3.7 ... %IX3.0
WORD	**%IW0**		**%IW1**	
	15 ... 8	7 ... 0	15 ... 8	7 ... 0
DWORD	**%ID0**			
	31 ... 24	23 ... 16	15 ... 8	7 ... 0

Examples:

%IX0.0	:= TRUE		
	%IB0 := 1	:= 16#01	
	%IW0 := 256	:= 16#0100	(Bit 8 = TRUE)
	%ID0 := 16777216	:= 16#01000000	(Bit 24 = TRUE)

%IX3.0	:= TRUE		
	%IB3 := 1	:= 16#01	
	%IW1 := 1	:= 16#0001	
	%ID0 := 1	:= 16#00000001

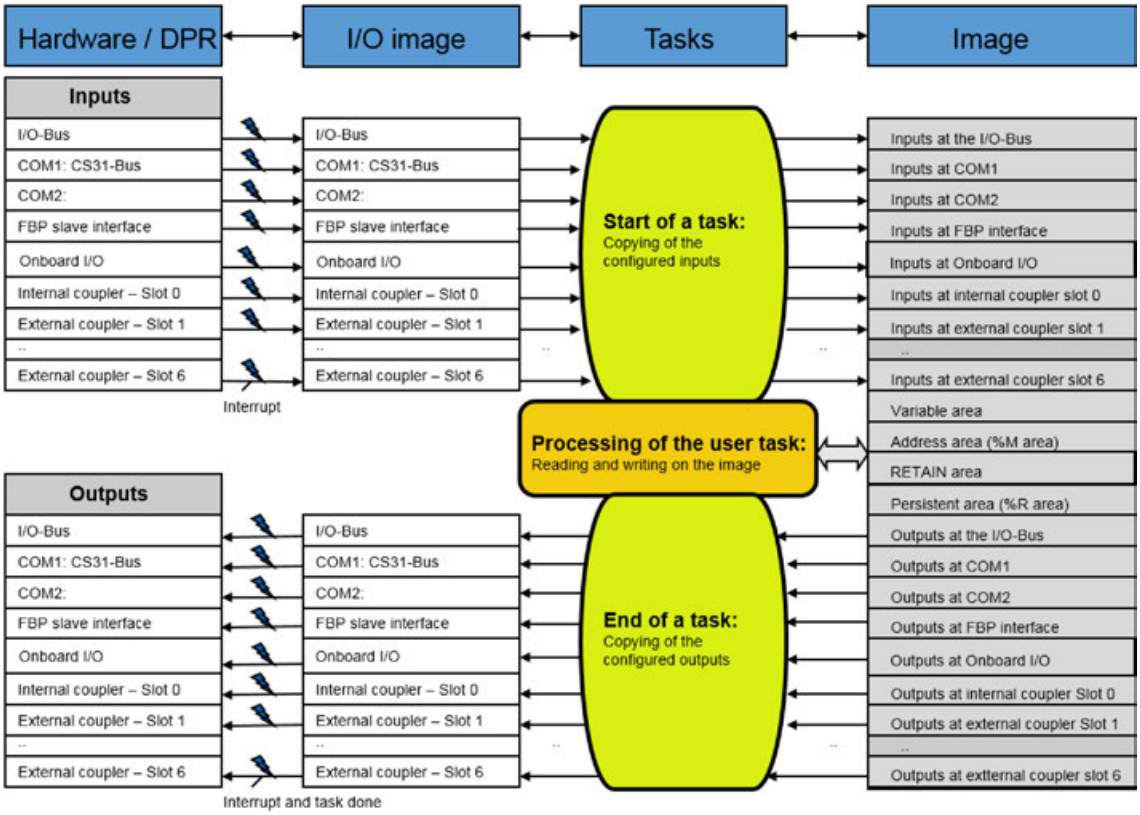
Processing of inputs and outputs in the multitasking system

CAUTION!
Multitasking
All configured inputs are updated in Image with the values of IO image at the start of an IEC task. All configured outputs are updated in IO image with the values of Image at the end of an IEC task (see following figure).

If, for example, task 1 has the higher priority and input %IX0.0 is used in task 1 and task 2, the value can change during the cycle of task 2 as it is updated every time task 1 is started. This is not relevant for programs with only one task.

The following figure shows how the inputs and outputs are processed in the multitasking system.



Generation of the input data image

Inputs at I/O bus

1. After all I/O modules have been processed at the I/O bus, a corresponding interrupt is generated in the processor. The inputs are copied to the input data image during the Interrupt Service Routine (ISR). If the outputs were updated by a task, the outputs in the output data image are copied.

Inputs at CS31 bus

2. After the CS31 driver has processed all I/O modules, a corresponding interrupt is generated in the processor. The inputs are copied to the input data image during the Interrupt Service Routine (ISR). If the outputs were updated by a task, the outputs in the output data image are copied.

Inputs of onboard I/O

3. After Onboard I/Os of AC500 PM55x and PM56x CPUs have been processed, a corresponding interrupt is generated in the processor. The inputs are copied to the input data image during the Interrupt Service Routine (ISR). If the outputs were updated by a task, the outputs in the output data image are copied.

Inputs of communication modules line 0 to 6

4. Once a Communication Module has received new data, a corresponding interrupt is generated in the processor. The inputs are copied from the DPR to the input data image of the processor during the Interrupt Service Routine (ISR). If the outputs were updated by a task, the outputs in the output data image are copied to the DPR.

   Precondition for this is a valid Communication Module configuration.

Starting a task When starting a task, all configured inputs are copied from the input data image to the image.

Processing a task All tasks access the image, i.e., inputs are read from the image and outputs are written to the image. In ONLINE mode, the inputs/outputs of the image are displayed.

Termination by a task At the end of the task processing, all configured outputs are copied from the image to the output data image.

Writing the outputs

1. Outputs at the I/O Bus: With the next interrupt of the I/O bus driver, the outputs of the output data image will be written.
2. Outputs at the CS31 bus: With the next interrupt of the CS31 processor, the outputs of the output data image will be written.
3. Outputs of Onboard I/O of AC500 PM55x and PM56x CPUs: With the next interrupt of the I/O Bus driver, the outputs of the output data image will be written.
4. Outputs of the Communication Module Line 0 to 6: With the next interrupt of the Communication Module, the outputs of the output data image will be written to the DPR.

I/O update task In order to update the inputs/outputs not used in the task, all inputs/outputs of the image are updated by a lower priority task (I/O update task). This task is only processed if no other user task runs.

Addressable flag area (%M area)

Allocation The addressable flag area for the AC500 is divided into several segments with a size of 64 kB per segment. A maximum of 8 segments can be addressed. The availability of the segments or partial segments depends on the CPU. The size of the %M area can be found in the technical data of the *Chapter 1.6.2.3 “Processor modules” on page 3803*.

Segment	Operands	Size, cumulative [kB]	PM55x/ PM56x	PM57x	PM573	PM58x	PM59x
0	%MB0.0...%MB0.65535	64	2 kB	4 kB	128 kB	+	+
1	%MB1.0...%MB1.65535	128	-	-	-	+	+
2	%MB2.0...%MB2.65535	192	-	-	-	-	+
3	%MB3.0...%MB3.65535	256	-	-	-	-	+
4	%MB4.0...%MB4.65535	320	-	-	-	-	+
5	%MB5.0...%MB5.65535	284	-	-	-	-	+
6	%MB6.0...%MB6.65535	448	-	-	-	-	+
7	%MB7.0...%MB7.65535	512	-	-	-	-	+

The %M area in PM55x and PM65x cannot be retained, even if declared as VAR_RETAIN. Use %R area instead of %M area if retained variables are needed.

Access to %M area

The Modbus TCP and Modbus RTU protocols are implemented in the AC500. With the help of the Modbus protocols, the segments 0 and 1 of the addressable flag area can be accessed. The chapter Modbus *Chapter 1.6.4.1.8 “Communication with Modbus RTU” on page 5467* in this documentation contains a detailed description of the Modbus protocols and the corresponding addressing.

For the AC500 CPUs PM55x and PM56x, 2kB = %MB0.0 .. %MB0.2047 (i.e., not a complete segment) are available for the addressable flag area. Thus, not all Modbus addresses can be accessed.

Access to operands

The operands in the %M area can be accessed bitwise, bytewise, wordwise and double-word-wise.

Absolute addresses of operands

ADR

For particular blocks or in case of accessing operands via pointers, the absolute address of an operand must be determined. To do this, Automation Builder provides the address operator ADR *Chapter 1.4.1.6.7.1 “ADR” on page 421*.

The following description describes only the peculiarities of bit operands.

The addresses provided by the address operator can be used as inputs for blocks that require absolute addresses (such as xxx_MOD_MAST, COM_SND). If these blocks shall be applied to internal variables, it must be guaranteed that the variables are set to successive addresses. This is achieved by declaring ARRAYs and STRINGs.

The address operator ADR provides the address of an operand in one double word DWORD (i.e., 32 bits). The address operator returns the address of the first byte of a variable (byte address). For the user-definable variables, variables of the type BOOL are stored as byte.

BITADR

For inputs, outputs and variables of the addressable flag area (%M area) or addressable PERSISTENT area (%R area), operands of the type BOOL occupy one bit. The address of this type of variables cannot be determined with the operator ADR.

When processing the statement: dwAddress := ADR(%MX0.0.0); the following error message appears:

Error 4031:

PLC_PRG(xx): ADR is not allowed for bits! Use BITADR instead.

BITADR returns the bit offset within the area %I, %Q or %M as DWORD.

The following table shows the position of the operands within the memory (considering %MD0.0 and %MD0.1 as example). Here you get information about which addresses the operator ADR returns and which offsets BITADR returns.

The addresses shown are example addresses and thus can have other values.

Position of operands within memory and values of operators ADR and BITADR:

Addressable PERSISTENT area (%R area)

Special features The addressable PERSISTENT area or %R area has the following peculiarities:

- Variables declared in the %R area are always located at the same position in the PLC's operand memory, because they have addresses assigned (like the variables in the %M area).
- Variables in the %R area are declared as follows:

```
VAR (caution: no RETAIN or PERSISTENT option),
   Symbol AT %RTypeSegment.Offset : TYPE;      (* Comment *), or also
   Symbol AT %RTypeSegment.Offset : ARRAY[start..end] OF TYPE  (*
Comment *)
END_VAR
```

where:	`Symbol`	symbolic name of the variable
	`Type`	X=BOOL (Bit), B=BYTE, W=WORD, D=DWORD
	`Segment`	0..15 (availability depends on CPU type)
	`Offset`	0..65535 (availability depends on CPU type)
	`TYPE`	BOOL, BYTE, WORD, DWORD or defined type (such as structure)
	`start`	Index of the first ARRAY element
	`end`	Index of the last ARRAY element

- For each segment in the %R area, an area can be set in the PLC configuration, which is buffered in case the **battery is installed and fully charged**. In this case, the variables behave like variables declared as VAR RETAIN PERSISTENT, i.e., they keep their values even after
  - Online changes (like all other variables),
  - Power OFF/ON (like VAR RETAIN), and
  - download (like VAR PERSISTENT).
- In contrast to the variables declared as VAR PERSISTENT, these variables have the great advantage that no program code is required for dumping the variables during a download.
- The buffered part of the %R area can be written to the memory card and read from the card (see *“Saving the buffered data of the %R area” on page 5406*).

Segmentation The addressable PERSISTENT area in the AC500 is divided into several segments with a size of 64 kB per segment. A maximum of 8 segments can be addressed. The availability of the segments or partial segments depends on the CPU:

	Operands	**eCo(-ETH)** **PM55x** **PM56x**	**PM572**	**PM573-ETH** **PM582** **PM583-ETH**	**PM590-ETH** **PM591-ETH/2ETH** **PM592-ETH**	**PM595-4ETH**

Segment 13	%RB13.0...%RB13.65535					+
Segment 14	%RB14.0...%RB14.65535					+
Segment 15	%RB15.0...%RB15.65535					+

Saving the buffered data of the %R area

The buffered part of the %R area can be saved on the memory card and read from the card. This can be necessary, if, for example, the controller has to be replaced.

Saving data

1. Copy the data from the %R area and write it to the CPU's RAM disk as file
2. Save the file to the memory card.

Reading data from the memory card

1. Load the file from the memory card to the CPU's RAM disk.
2. Copy the data from the RAM disk to the %R area.

CAUTION!
Data mismatch can occur!

The variables structure / layout has to be identical to the old one and should not be changed!

Saving and reading the data can be done using function blocks in the user program or with the PLC Browser contained in the Automation Builder. The function blocks are contained in the *Chapter 1.5.4.19 “Internal system library” on page 1500*.

Function	PLC Browser command	Function block
Copy from %R area to RAM disk	persistent save	PERSISTENT_SAVE
Save file to SD Card	persistent export	PERSISTENT_EXPORT
Read file from SD Card to RAM disk	persistent import	PERSISTENT_IMPORT
Copy data from RAM disk to %R area	persistent restore	PERSISTENT_RESTORE
Delete buffered data of the PERSISTENT area	persistent clear	PERSISTENT_CLEAR

CAUTION!

Cycle consistency for data

If cycle consistency is required for the data, this has to be implemented in the user program. That means, that the data may not be changed during copying to/from the %R area from/to the RAM disk. If saving is done using the PLC Browser, this can be easily carried out by stopping the user program.

CAUTION!

Cycle time for copying the PERSISTENT area

Copying the PERSISTENT area takes some milliseconds (see the following table). Thus, an according cycle time has to be set in the task configuration. Please note the remarks on the task configuration!

Action	Time in ms			
	CPU PM55x CPU PM56x	CPU PM57x	CPU PM58x	CPU PM59x

%RB15.65534	%RX7.65534.0...%RX7.65534. 7	%RW15.32767	
%RB15.65535	%RX7.65535.0...%RX7.65535. 7		

Only the first 4 kB in segment 0 are available for PM57x, i.e., %RB0.0..%RB0.4095 or %RW0.0..%RW0.2047 or %RD0.0..%RD0.1023. Only the first 1 kB in segment 0 are available for PM55x and PM56x, i.e., %RB0.0..%RB0.1023 or %RW0.0..%RW0.511 or %RD0.0..%RD0.255.

Access to the %R Area Using the Modbus Protocol:

As of PLC firmware version V2.1.3 and Control Builder Plus (CBP) 2.1.0 %M area (default) or %R area can be used for access via Modbus TCP or Modbus RTU. The selection is a parameter in the Modbus server settings.

With the help of the Modbus protocol, the segments 0 and 1 of the %R area can be accessed. Using this feature it is easy to access buffered data via Modbus TCP ↳ *Chapter 1.6.4.1 “System technology of CPU and overall system” on page 5395* or Modbus RTU ↳ *Chapter 1.6.4.1 “System technology of CPU and overall system” on page 5395*.

For the AC500 CPUs PM55x and PM56x, 1kB = %RB0.0 .. %RB0.1023 (i.e., not a complete segment) are available for the addressable flag area. Thus, not all Modbus addresses can be accessed.

System start-up / Program processing

See ↳ *Chapter 1.6.4.1.2.1 “System start-up / Program processing” on page 5412*.

Data backup and initialization

Initialization of variables, overview

The initialization of variables to 0 or to the initialization value is performed by switching power ON, by a reset or after downloading the user program.

AC500 supports all in IEC 61131-5 defined types of buffered data:

- VAR RETAIN - keep their value during online change
- VAR PERSISTENT - keep their value during online change and download
- VAR RETAIN PERSISTENT - keep their value during online change, download and power OFF/ON.

For this the variable are copied before and after download one by one. This copy process can take a long time.

So it is recommended to use VAR RETAIN PERSISTENT only, if there is a small amount (less 100) of buffered variables.

In addition to the IEC 61131-2 buffered variable types AC500 provides the so called PERSISTENT area (%R area). See detailed description ↳ *Chapter 1.6.4.1.1.6 “ Addressable PERSISTENT area (%R area)” on page 5405*.

The big advantage of the %R area is that there is no copy of variables necessary!

So its recommended to use the %R area for buffered variables.

If internal variables shall be buffered, these variables have to be marked as "VAR_RETAIN" or "VAR_RETAIN PERSISTENT". This applies to both the internal variables and the variables of the addressable flag area (%M area).

Variables of the addressable flag area (%M area) for AC500-eCo processor modules cannot be buffered.

The order of the internal RETAIN variables is only kept when using the online change command.

If the program is rebuilt, the order can change and, due to this, the buffered variables do no match. See CODESYS Remanent variables ↳ Chapter 1.4.1.3.9.7 “Remanent variables” on page 302.

Consider the description on the behavior of RETAIN variables on download.

The following table shows an overview of the initialization values of the individual variables:

Variable / Action	VAR and %MDx.x	VAR (%MDx.x) := Value	VAR_RETAIN (%MDx.x)	VAR_RETAIN (%MDx.x) := Value	VAR_PERSISTENT (%MDx.x)	VAR_PERSISTENT (%MDx.x) := Value	VAR_RETAIN PERSISTENT (%MDx.x)	VAR_RETAIN PERSISTENT (%MDx.x) := Value	%R not saved (:=Value)	%R saved (:=Value)
Download	0	Value	0	Value	unch.	unch.	unch.	unch.	0	unch.
Reset	0	Value	unch.	unch.	0	Value	unch.	unch.	0	unch.
Reset (cold)	0	Value	0	Value	0	Value	0	Value	0	unch.
Download after Reset (Origin)	0	Value	0	Value	0	Value	0	Value	0	0
Voltage OFF/ON without battery	0	Value	0	0	0	Value	0	0	0	0
Voltage ON/OFF with battery	0	Value	unch.	unch.	0	Value	unch.	unch.	0	unch.
Start/Stop	unch.	unch.	unch.	unch.	unch.	unch.	unch.	unch.	unch.	unch.
Online Change	unch.	unch.	unch.	unch.	unch.	unch.	unch.	unch.	unch.	unch.
Reset (Origin)	0	0	0	0	0	0	0	0	0	0

For AC500-eCo processor modules, there is a 1 kB VAR_RETAIN area and an 1 kB %R area.

Independently of an inserted battery, the memory values are stored in flash memory at power failures and are recovered when power returns.

For the %R area, the values can be configured in Automation Builder.

Declaration of buffered variables and constants

To guarantee the correct initialization or backing up of variables according to the table shown above, the following rules have to be observed when declaring variables.

Retentive internal variables

The variables have to be declared as VAR_RETAIN PERSISTENT or VAR_GLOBAL RETAIN PERSISTENT.

Example

(* Declaration in the global variable lists *)

```
VAR_GLOBAL RETAIN PERSISTENT
  byVar : BYTE;
  wVar  : WORD;
  rVar  : REAL;
END_VAR
```

(* Declaration in the program *)

```
VAR RETAIN PERSISTENT
  byVar1 : BYTE;
END_VAR
```

Buffered variables in %M area

The variables have to be declared as VAR_RETAIN PERSISTENT or VAR_GLOBAL RETAIN PERSISTENT.

See *Chapter 1.6.4.1.1.6 “ Addressable PERSISTENT area (%R area)” on page 5405*

Constants

Constants are declared as VAR_GLOBAL CONSTANT or VAR_CONSTANT.

Example

(* Declaration as global constants *)

```
VAR_GLOBAL CONSTANT
  byConst_1 : BYTE := 1;
END_VAR
```

(* Declaration in the program *)

```
VAR CONSTANT
  byConst_2 : BYTE := 2;
END_VAR
```

1.6.4.1.2 System processing

System start-up / Program processing

AC500-eCo processor modules do not have an integrated display and keyboard. All functions related to keyboard and display are not applied for those devices.

Definitions: PLC system start-up

Cold start

The AC500-eCo V3 does not use a battery for buffering the operand areas specified below, hence the “cold start” mode does not exist in this product.

- A cold start is performed by switching power OFF/ON if no battery is connected.
- All RAM memory modules are checked and erased.
- If no user program is stored in the Flash EPROM, the default values (as set on delivery) are applied to the interfaces.
- If there is a user program stored in the Flash EPROM, it is loaded into RAM.
- The default operating modes set by the PLC configuration are applied.

Warm start

- A warm start is performed by switching power OFF/ON with a battery connected.
- All RAM memory modules are checked and erased except of the buffered operand areas and the RETAIN variables .
- If there is a user program stored in the Flash EPROM, it is loaded into RAM.
- The default operating modes set by the PLC configuration are applied.

RUN -> STOP

- RUN -> STOP means pressing the RUN function key on the PLC while the PLC is in run mode (AC500 PLC display "run", AC500-eCo PLC "RUN LED" is ON).
- If a user program is loaded into RAM, execution is stopped.
- All outputs are set to FALSE or 0.
- Variables keep their current values, i.e., they are not initialized.
- The AC500 PLC display changes from "run" to "StoP", AC500-eCo "RUN LED" changes from ON to OFF.

START -> STOP

- START -> STOP means stopping the execution of the user program in the PLC's RAM using the menu item "Online/Stop" in the programming system.
- All outputs are set to FALSE or 0.
- Variables keep their current values, i.e., they are not initialized.
- The AC500 PLC display changes from "run" to "StoP".

Reset

- Performs a START -> STOP process.
- Preparation for program restart, i.e., the variables (VAR) (exception: RETAIN variables) are set to their initialization values.
- Reset is performed using the menu item "Online/Reset" in the programming system or pressing the function key RUN for $\geq$ 5 s in STOP mode.

Reset (cold)

- Performs a START -> STOP process.
- Preparation for program restart, i.e., the variables (VAR) (also RETAIN variables) are set to their initialization values.
- Reset (cold) is performed using the menu item "Online/Reset (cold)" in the programming system.

Reset (original)

- Resets the controller to its original state (deletion of Flash, SRAM (%M, area, %R area, RETAIN, RETAIN PERSISTENT), Communication Module configurations and user program!).
- Reset (original) is performed using the menu item "Online/Reset (original)" in the programming system.

STOP -> RUN

- STOP -> RUN means short pressing the RUN function key on the PLC while the PLC is in STOP mode (AC500 PLC display "StoP", AC500-eCo "RUN LED" is ON). "RUN LED" is OFF of the toggle switch of an AC500-eCo CPU.
- If a user program is loaded into RAM, execution is continued, i.e., variables will not be set to their initialization values.
- The AC500 PLC display changes from "StoP" to "run", AC500-eCo "RUN LED" changes from OFF to ON.

STOP -> START

- STOP -> START means continuing the execution of the user program in the PLC's RAM using the menu item "Online/Start" in the programming system.
- If a user program is loaded into RAM, execution is continued, i.e., variables will not be set to their initialization values.
- The AC500 PLC display changes from "StoP" to "run", AC500-eCo PLC "RUN LED" changes from OFF to ON.

Download

- Download means loading the complete user program into the PLC's RAM. This process is started by selecting the menu item "Online/Download" in the programming system or after confirming a corresponding system message when switching to online mode (menu item "Online/Login").
- Execution of the user program is stopped.
- In order to store the user program to the Flash memory, the menu item "Online/Create boot project" must be called after downloading the program.
- Variables are set to their initialization values according to the initialization table.
- RETAIN variables can have wrong values as they can be allocated to other memory addresses in the new project!
- A download is forced by the following:
  - changed PLC configuration
  - changed task configuration
  - changed library management
  - changed compile-specific settings (segment sizes)
  - execution of the commands "Project/Clean all" and "Project/Rebuild All".

Online change

- After a project has changed, only these changes are compiled when pressing the key <F11> or calling the menu item "Project/Build". The changed program parts are marked with a blue arrow in the block list.
- The term Online Change means loading the changes made in the user program into the PLC's RAM using the programming system (after confirming a corresponding system message when switching to online mode, menu item "Online/Login").
- Execution of the user program is not stopped. After downloading the program changes, the program is re-organized. During re-organization, no further online change command is allowed. The storage of the user program to the Flash memory using the command "Online/Create boot project" cannot be initiated until re-organization is completed.
- Online Change is not possible after:
  - changes in the PLC configuration
  - changes in the task configuration
  - changes in the library management
  - changed compile-specific settings (segment sizes)
  - performing the commands "Project/Clean all" and "Project/Rebuild All".

Data buffering

- Data buffering, i.e., maintaining data after power ON/OFF, is only possible, if a battery is connected for AC500 CPU and the buffering will take place in FLASH with AC500-eCo V3 CPU. The following data can be buffered completely or in parts:
  - Data in the addressable flag area (%M area)
  - RETAIN variable
  - PERSISTENT variable (number is limited, no structured variables)
  - PERSISTENT area (%R area)
- In order to buffer particular data, the data must be excluded from the initialization process (see *Chapter 1.6.4.1.1.8 “Data backup and initialization” on page 5410*).

Start of the user program

The user program (UP) is started according to the following table. It is assumed that a valid user program is stored to the Flash memory.

See *Chapter 1.6.6.1.4 “Storage device details” on page 6334*.

Action	No memory card with UP installed Auto run = ON	No memory card with UP installed Auto run = OFF	Memory card with UP installed Auto run = ON	Memory card with UP installed Auto run = OFF
Voltage ON or Warm start or Cold start	UP is loaded from Flash into RAM and started from Flash.	No UP is loaded from Flash. When logging in, the message "No program available in the controller ..." is displayed.	UP is loaded from the memory card into Flash memory and RAM and then started from RAM.	UP is loaded from the memory card to the Flash memory. RAM remains empty. When logging in, the message "No program available in the controller ..." is displayed.
STOP -> RUN	UP in RAM is started.	UP in RAM is started.	UP in RAM is started.	UP in RAM is started.
STOP -> START	UP in RAM is started.	UP in RAM is started.	UP in RAM is started.	UP in RAM is started.
Download [1)]	The UP currently stored in the CPU's RAM is stopped. The built UP is loaded from the PC into the PLC's RAM.	The built UP is loaded from the PC into the PLC's RAM.	The UP currently stored in the CPU's RAM is stopped. The built UP is loaded from the PC into the PLC's RAM.	The built UP is loaded from the PC into the PLC's RAM.
Online Change [2)]	Processing of the UP currently stored in the CPU's RAM is continued. The changes made to the UP are loaded from the PC into the PLC's RAM. The UP is reorganized and processed.	The changes made to the UP are loaded from the PC into the PLC's RAM. The UP is reorganized.	Processing of the UP currently stored in the CPU's RAM is continued. The changes made to the UP are loaded from the PC into the PLC's RAM. The UP is reorganized and processed.	The changes made to the UP are loaded from the PC into the PLC's RAM. The UP is reorganized.

Remarks:

[1)]: After the download is completed, the program is not automatically stored to the Flash memory. To perform this, create a boot project. If the UP is not stored to the Flash memory, the UP is reloaded from the Flash memory after voltage OFF/ON. Start the program either by pressing the RUN/STOP function key or using Automation Builder.

Processing times

Terms

The most important times for the use of the AC500 basic unit with or without connected remote modules are:

- The reaction time is the time between a signal transition at the input terminal and the signal response at the output terminal.
  For binary signals, the reaction time is composed of the input delay, the cycle time of the program execution and the bus transmission time if the system is expanded by remote modules.
- The cycle time determines the time intervals after which the processor restarts the execution of the user program.
  The cycle time has to be specified by the user. It should be greater than the program processing time of the user program plus the data transfer times and the related waiting times.
  The cycle time is also the time base for some time-controlled functions.
- The program processing time is the net time for processing the user program.

Program processing time

Statements	PM55x-xP PM56x-xP	PM57x	PM58x	PM59x
- Binary statements of the type:				
!M /M &M =M !NM /NM &NM =NM !M /M &M =SM !NM /NM &NM =RM Processing time for 1 instruction:	min. 0.08 µs	min. 0.06 µs	min. 0.05 µs	min. 0.002 µs
- Word statements of the type:				
!MW +MW -MW =MW !-MW -MW +MW =-MW !MW *MW :MW =MW !-MW *-MW :-MW =-MW Processing time for 1 instruction:	min. 0.1 µs	min. 0.09 µs	min. 0.06 µs	min. 0.004 µs
- Floating point:				
Processing time for 1 instruction:	min. 1.2 µs	min. 0.70 µs	min. 0.50 µs	min. 0.004 µs

Set cycle time

It is assumed that the processor always gets access in a moment with a worst-case condition.

The cycle time is stored in the task configuration and can be selected in steps of 1 ms. If the selected cycle time is too short, the processor will not be able to completely process the tasks assigned to it every cycle. This will result in a time delay.

If this lack of time becomes too large over several cycles, the processor aborts the program execution and outputs an error (E2).

For some function blocks, such as the PID controller, the error-free execution depends on an exact timing sequence. Make sure that there is a larger time reserve.

To check the correct cycle time, perform the following steps:

- Load the user program into the basic unit.
- Check the capacity utilization with "Online/PLC Browser/cpuload".
- Change the cycle time until the capacity utilization is below 80 %.

When setting the cycle time, consider the following values:

- Time for reading and copying the input signals from the I/O driver to the I/O image.
- Time for copying the input signals of the user task from the I/O image to the image memory.
- Program processing time.
- Time for copying the output signals of the user task from the image memory to the I/O image.
- Time for copying the output signals from the I/O image to the I/O driver and applying the I/Os to the I/O module.
- Receiving/sending interrupts from communication module telegrams within the cycle time.
- Receiving/sending interrupts from the serial interface within the cycle time.
- Task changes.
- Run time of the watchdog task.

Task configuration

The task model processes different kinds of tasks. Handling and configuration of the task processing depending on its priority is described in detail in the CODESYS task configuration section.

- *Chapter 1.4.1.4.8.1 “Overview” on page 390*

As of firmware V2.4

For a new project a task with the following properties is created:

- Type = cyclic
- Priority = 10
- Cycle time = t # 10 ms
- Program call = PLC_PRG
- Watchdog = t # 100 ms
- Sensitivity = 5

We recommend to create a task according to your needs.

Up to firmware V2.4

Specify a task in your project according to your needs.

All 32 priorities can be selected for the user tasks, where 0 is the highest priority and 31 the lowest. The default priority is 10.

Priorities lower than 10 are reserved for high-priority processes with a very short program execution time. The priorities 10 to 31 are intended for "normal" user tasks or tasks with a long program execution time.

NOTICE!
Using, for example, a priority lower than 10 for a task with a long program execution time can cause device errors, e.g. the CS31 bus.

System events

NOTICE!
System events belong to the group of online tasks. Floating point calculations are not allowed in online tasks, for they are not rechecked via software like IEC tasks.

Setting standard configuration

If the target setting configuration is changed, standard configuration can be restored:

1. Open CODESYS.
2. In the *"Resources"* tab, double-click *"PLC Configuration"*.
3. Select *"Menu Extras ➔ Standard Configuration"*.

1.6.4.1.3 User Management

With the help of the integrated user management, user groups with different access rights and authorizations can be defined. Configuration and handling of the user managment in Automation Builder and a AC500 V2 is decribed in an *application note*.

1.6.4.1.4 Real-time clock and battery

Notes on real-time clock

The real-time clock is an optional function for AC500-eCo V3 Basic processor modules (e.g. PM5012-x-ETH) and requires a TA5131-RTC. All other AC500-eCo V3 processor modules have an integrated real-time clock.

The real-time clock operates as a PC clock. It saves date and time to a DWORD in DT format (DATE AND TIME FORMAT), i.e., in seconds passed since the start time: 1 January 1970 at 00:00.

For AC500-eCo V3, Basic CPU with TA5131-RTC buffers the real-time clock for 7 days, and Standard/Pro CPU buffers the integrated real-time clock for 20 days. When the CPU is not powered over the buffering time, the real-time clock data will be cleared.

If a battery is connected and full, the real-time clock continues to run even if the control voltage is switched off.

If no battery is inserted or the battery is empty, the real-time clocks starts with the value 0 (=1970-01-01, 00:00:00).

When switching on the control voltage, the system clock of the operating system is set to the value of the real-time clock.

Real-time clock

Real-time clock with PLC browser

The PLC browser/PLC shell commands `date` and `time` are used to set the real-time clock.

The commands `date` <ENTER> or `time` <ENTER> display the current date and time of the real-time clock.

The command: `date yyyy-mm-dd`<ENTER> (year-month-day) sets the date.

The command: `time hh-mm-ss`<ENTER> (hours-minutes-seconds) sets the time.

Example:

The real-time clock should be set to 22 February 2005, 16:50.

1. Enter the date:

   `date 2005-02-22<ENTER>`

   ⇨ Display: `date 2005-02-22 Clock set to 2005-02-22 08:01:07`

   The time remains unchanged.

2. Enter the time:

   `time 16:50<ENTER>`

   ⇨ Display: `time 16:50 Clock set to 2005-02-22 16:50:00`

Real-time clock with user program

The following function blocks located in the folder "Realtime clock" of the system library *SysExt_AC500_Vxx.lib* can be used to set and display the real-time clock (RTC) with help of the user program:

Function block	Function
↬ *Chapter 1.5.4.16.1.2 “CLOCK” on page 1341*	Sets and displays the real-time clock with values for year, month, day, hours, minutes and seconds. Also the day of week is indicated (Mo=1, Tue=2, Wed=3, Thu=4, Fr=5, Sa=6, Su=0). Note: The week of day cannot be set. It is given by the real-time clock. The input DAY_SET is ignored.
↬ *Chapter 1.5.4.16.1.3 “CLOCK_DT” on page 1345*	Sets and displays the real-time clock in DT format, for example DT#2005-02-17-17:15:00.

The function blocks CLOCK and CLOCK_DT are described in the documentation for the system library *SysExt_AC500_Vxx.lib*.

AC500 battery

The AC500 battery buffers the following data in case of "control voltage off":

- Retentive variables in SRAM (VAR_RETAIN..END_VAR) ↬ *Chapter 1.6.4.1.1 “Inputs, outputs and flags for AC500 V2 products” on page 5395*
- Persistent data in %R area
- Date and time of the real-time clock

- *For AC500-eCo processor modules the battery is not required for retentive/persistent variables. These variables are stored in the flash memory when the processor module is shutting down.*
- *For AC500 (Standard) processor module PM595-4ETH-M, no battery is needed to buffer retentive/persistent variables as the MRAM will keep its content during power-off. Only the real-time clock is buffered by the battery.*

Further information:

- *Chapter 1.6.5.2.3.3 “Parameters of the processor module” on page 5839*
- *Chapter 1.7.3 “Diagnosis messages” on page 6429*

To prevent data loss when using the AC500 battery, the battery status should be periodically monitored by the user or by the user program.

If no battery is inserted or if the battery is empty, a warning (E4) is generated and the LED "ERR" lights up.

If no battery is required for the application (and thus no battery is inserted), a warning is generated and the error LED lights up each time the controller is switched on. To avoid this battery error indication, the parameter "Check Battery" is available under "CPU parameters" in the PLC configuration. The default setting of this parameter is "On", i.e., battery check is performed. If this parameter is set to "Off", the battery check is still performed and a corresponding error message is still generated each time the control voltage is switched on, but the system automatically quits this error and therefore the error LED does not light up (provided no further error exists).

Battery status

The battery status can be monitored either with the help of a user program on the PLC or in Automation Builder.

In the PLC browser of Automation Builder the command "batt" can be used . *Chapter 1.6.5.4.3 “AC500-specific PLC browser commands” on page 6222* The following is output:

0	Battery empty
20	Remaining battery charge below 20 %
100	Battery charge OK

In the user program, the battery status can be checked with the function *Chapter 1.5.4.16.1.1 “BATT” on page 1340* which is available in the folder "Battery" of the system library *SysExt_AC500_Vxx.lib*. The following is output:

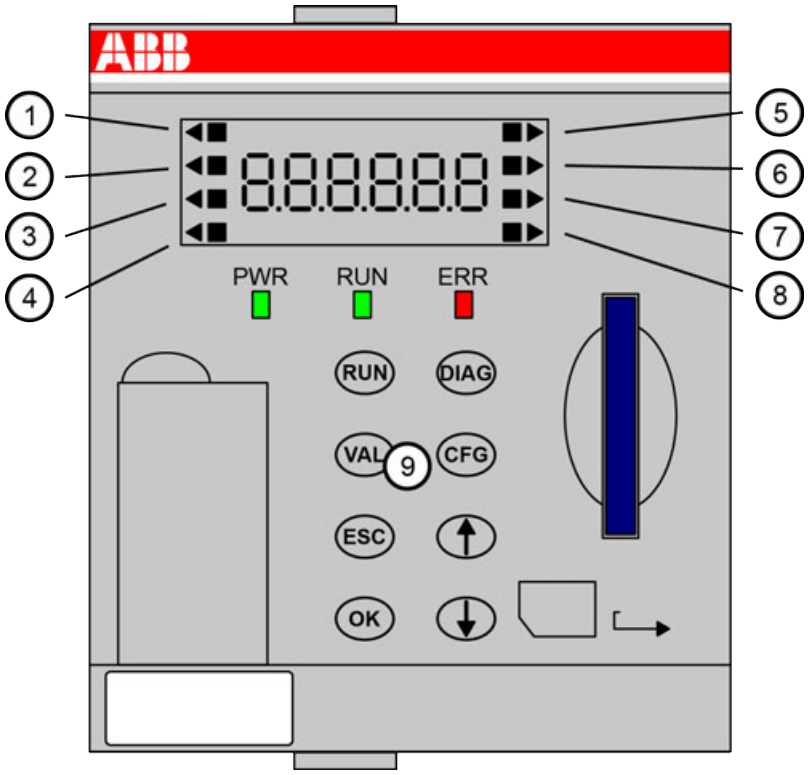
0	Battery empty
20	Remaining battery charge below 20 %, battery must be replaced
100	Battery charge OK

On the device, the battery status can be checked with the function keys of a processor module. *Chapter 1.6.4.1.5 “LEDs, display and function keys on the front panel” on page 5422*

Chapter 1.6.4.1.5.4.4 “Reading out values” on page 5440

1.6.4.1.5 LEDs, display and function keys on the front panel

Overview



The display of a processor module is equipped with a background-lighted 7-segment display. This display consists of 6 digits for plain text or error codes.

- error numbers and information on the error
- current settings of the processor module

Further, the display can be used for simple configurations such as address modifications.

Display indicators

- A black square (■) denotes the state/working activity of the corresponding object on the left/right side of the display. The black square flashes according to the device's activity, e.g. during data exchange on ETH1, COM1, etc.
- A black triangle (▶) points to the selected item/interface on the left/right side of the display to be configured or read. Further, it acts as a cursor for the count up/count down function keys.

> *A black triangle (◀) at the BATT item indicates a missing or uncharged battery.*

The indicators point to the following items on the left side of the display:

No.	On the left Side	Description
1	<empty item>	Cannot be used.
2	SYS (system)	Refers to the system status.
3	BATT (battery)	Refers to the battery status.
4	I/O bus	Refers to I/O bus connection.

The indicators point to the following items on the right side of the display:

No.	On the right side	Description
5	<empty item>	Cannot be used.
	ETH (Ethernet)	Refers to Ethernet interface or can be left empty.
	ETH1	Refers to the first Ethernet interface or can be left empty.
	ARCNET	Refers to ARCNET connection or can be left empty.
6	FBP (FieldBusPlug)	Refers to FBP (FieldBusPlug) or can be left empty.
	ETH2	Refers to the second Ethernet interface or can be left empty.
7	COM1	Refers to COM1 interface or can be left empty.
8	<empty item>	Cannot be used.
	COM2	Refers to COM2 interface or can be left empty.

9	Function keys on front panel

The following table describes the different displays of processor modules:

Processor module	Display variant	Description
PM5xx		Display of a processor module with FBP support.
PM5xx-ETH		Display of a processor module with FBP and Ethernet support.
PM5xx-ARC		Display of a processor module with ARCNET support.
PM5xx-2ETH		Display of a processor module with support for 2 Ethernet interfaces.

FieldBusPlug

All 127 FBP addresses can be set with Automation Builder. On the display only up to 99 FBP addresses can be set.

NOTICE!

Setting the FBP slave address by LEDs, display and function keys

Though it is possible to set the FBP slave address by using the LEDs, display and function keys, this is not recommended. Direct configuration on the device replaces address configurations defined via Automation Builder.

If the FBP address (set by Automation Builder or on the device) is different from the address assigned by the master device for the same station, the station cannot be accessed. The complete fieldbus cannot work properly or is completely down!

A modified address defined on the device is valid not until power OFF/ON of the processor module!

AC500 processor module equipped with FBP is always a slave device on the bus. To act as a master, the processor module should be equipped with a master communication module (e.g. CM592-DP for PROFIBUS DP).

Startup procedure of the PLC

The startup procedure depends on the selected PLC mode.

PLC Mode	Display	Startup Behavior
00		Boot project is loaded and PLC application is set to "RUN".
01		No boot project is loaded.
02		Boot project is loaded and the PLC application is set to "RUN" depending on CPU parameter "autostart".

State	Display	Description
0		Display on system start (power on).
1		PLC is in boot mode (see *Further information on page 5423*).
2		PLC is in initialization mode (see *Further information on page 5423*).
3		PLC is in STOP mode (see *Further information on page 5423*). **Same as status Stop in Automation Builder.**
4		PLC is in RUN mode (see *Further information on page 5423*). **Switch into RUN mode is only possible if a valid boot project is available in the flash memory.**

Description of LEDs

The LEDs below the display indicate the status of the processor module:

LED	State	Color	LED = ON	LED = OFF	LED flashes
Power LED (PWR)	Denotes the power supply state of the processor module	Green	Voltage is present (24 V DC)	Voltage is missing	-
Run LED (RUN)	Denotes the activity state of the processor module	Green	Processor module is in RUN mode	Processor module is in STOP mode	If the Run LED (RUN) flashes fast (4 Hz), the processor module is reading/writing the memory card. Together with a flashing Error LED (ERR), the processor module is writing the internal Flash. If the Run LED flashes slowly (1 Hz), a firmware update from the memory card is finished without errors.
Error LED (ERR)	Denotes an error	Red	An error has occurred. After pressing the DIAG function key, the error type and the error code will be displayed. The error codes can be shown by means of the DIAG and OK function keys.	No errors or only warnings have occurred.	If the Error LED flashes fast (4 Hz) together with a flashing Run LED, the firmware is updated and a Flash is written. If the Error LED flashes slowly (1 Hz) a firmware update from the memory card is finished with errors.

A running processor module is indicated with the state RUN on the display, a deactivated processor module is indicated with the state STOP. In both cases the display's backlight is off.

Description of the function keys

Overview

The processor module can be operated manually using the function keys on the front panel:

Function Key	Description	Description
	Run	Toggles between RUN and STOP mode. **Switching into RUN mode is only possible if an error free project has been created and downloaded with Automation Builder**.
	Value	Shows different state values of the processor module.

Function Key	Description	Description
ESC	Escape	Quits the current menu, submenu or function without saving.
OK	OK / Acknowledgement	Acknowledges the current value or selects a menu/ submenu. Changes that have been sent to the processor module successfully are confirmed with *donE* on the display.
DIAG	Diagnostic	Allows evaluation of error messages in detail.
CFG	Configuration	Allows navigation through addresses and system settings.
↑	Count up	Press the function key repeatedly in order to increase the value each time by 1. Keep the function key pressed in order to count up fast.
↓	Count down	Press the function key repeatedly in order to decrease the value each time by 1. Keep the function key pressed in order to count down fast.

Backlight is switched on for about 20 seconds by pressing any function key.

Start and stop PLC

Function key *RUN*

State	Description Menu level 0	Result on pressing one of the function keys		
		RUN	OK	ESC
0		Short click: State 1 is displayed. Long click (>5 sec): State 2 is displayed.	No action	No action
1	 PLC only in state RUN if a correct project is in RAM of PLC	State 0 is displayed. STOP - same as *Online stop* in Automation Builder (halt, no init of variables)		
2		***RUN*** LED=ON	Perform RESET same as *Online reset* in Automation Builder (stop and init variables) State 0 is displayed.	No RESET State 0 is displayed.

Configuration

Configuration: Version ≥ 2.4

The following tables describe how to configure a processor module manually. Processor module can be configured in RUN mode or STOP mode, hence this device state is called RUN/STOP mode in the following. By pressing the ***CFG*** function key repeatedly, you simply navigate through the statuses of the device.

However, to configure the processor module, use the ***OK***, ***ESC*** and ***CFG*** function keys alternately.

1. The processor module is in RUN/STOP mode. By pressing the ***CFG*** function key once, the IP configuration for Ethernet connection is displayed (IPETH1).
2. By pressing the ***CFG*** function key again, address configuration for Ethernet connection is displayed (Adr000).
3. By pressing the ***ESC*** function key, menu is aborted. You revert to the RUN/STOP mode.
4. By pressing the ***OK*** function key, submenu for Ethernet interface is opened. Either a static IP address can be set or a DHCP address is defined automatically.

Example: static IP address

The following example describes how to set a static IP address for Ethernet interface with a Processor Module with firmware Version ≥ 2.4.

Table 623: Function key CFG IPETH1 or IPETH2; DHCP not active

State	Description	Result on pressing one of the function keys		
		CFG	ESC	OK
1.1		State 4.2 is displayed.	Return into RUN/ STOP mode.	State 1.2 is displayed.
1.2	 IP Configuration (address, subnet mask, gateway)	State 1.3 is displayed.	Aborts the menu unchanged. Return to State 1.1	State 3.2 is displayed.
1.3	 Reset to production data (default settings)	State 1.4 is displayed.	Aborts the menu unchanged. Return to State 1.1	Activate RESET to default by pressing ***OK*** twice. Shows DONE, your settings are saved. Return into RUN/STOP mode.
1.4	 Activate DHCP Sets a DHCP address.	State 1.2 is displayed.	Aborts the menu unchanged. Return to State 1.1	Activate DHCP to default by pressing ***OK*** twice Shows DONE, your settings are saved. Return into RUN/STOP mode.

Table 624: Function key CFG IPETH1 or IPETH2; DHCP active

State	Description - Submenu 2	Result on pressing one of the function keys		
		CFG	ESC	OK
2.1		State 4.2 is displayed.	Aborts the menu unchanged. Return to State 0.	State 2.2 is displayed.
2.2	 DHCP active	State 2.3 is displayed.	Aborts the menu unchanged. Return to State 2.1.	--
2.3	 IP Configuration (address, subnet mask, gateway)	State 2.4 is displayed.	Aborts the menu unchanged. Return to State 2.1.	State 3.2 is displayed.
2.4	 Reset to production data (default settings)	--	Aborts the menu unchanged. Return to State 2.1.	Activate RESET to default by pressing ***OK*** twice Shows DONE, your settings are saved. Return into RUN/STOP mode.

Function key *CFG* submenu STATIC

State	Description - Submenu 3	Result on pressing one of the function keys		
		CFG	ESC	OK
3.1	 IP Configuration (address, subnet mask, gateway)	State 2.4 is displayed.	Aborts the menu unchanged. Return to State 1.1 (sub menu IPETH1 or IPETH2)	State 3.2 is displayed.
3.2	 IP address A1-A4 ★ Number is blinking if value has changed and is not yet sent to CPU	State 3.3 is displayed.	Aborts the menu unchanged. Return to State 1.1 (sub menu IPETH1 or IPETH2)	Sends changed values to CPU and go to default menue RUN/STOP Displays: DONE New settings stored in CPU. or: FAIL Failed to write new settings to CPU.

State	Description - Submenu 3	Result on pressing one of the function keys		
		CFG	ESC	OK
3.3	 Subnet mask N1-N4 ★ Number is blinking if value has changed and is not yet sent to CPU	Press ***CFG*** from n2 to n4 State 3.4 is displayed.	Aborts the menu unchanged. Return to State 1.1 (sub menu IPETH1 or IPETH2)	Sends changed values to CPU and go to default menue RUN/STOP Displays: DONE New settings stored in CPU. or: FAIL Failed to write new settings to CPU.
3.4	 Gateway G1-G4 ★ Number is blinking if value has changed and is not yet sent to CPU	Press ***CFG*** from g2 to g4 State 3.2 is displayed again.	Aborts the menu unchanged. Return to State 1.1 (sub menu IPETH1 or IPETH2) Aborts the menu unchanged. Return to State 1.	Sends changed values to CPU and go to default menue RUN/STOP Displays: DONE New settings stored in CPU. or: FAIL Failed to write new settings to CPU.

Function key *CFG* sub menu ADR

State	Description - Submenu 4	Result on pressing one of the function keys		
		CFG	ESC	OK
4.1		State 4.2 is displayed.	Aborts the menu unchanged. Return to State 1	*DHCP not active*: State 1.2 is displayed *DHCP active*: State 2.2 is displayed

State	Description - Submenu 4	Result on pressing one of the function keys		
		CFG	ESC	OK
4.2	 Change the values with the ***Count up/Count down*** function keys starting with current value. ★ Number is blinking if value has changed and is not yet sent to CPU	Next interface is displayed.	Aborts the menu unchanged. Return to State 4.1	Sends changed values to CPU and go to default menue RUN/STOP Displays: DONE New settings stored in CPU. or: FAIL Failed to write new settings to CPU.

Navigation through the display

Navigation through the display of a processor module as of version ≥ 2.4 starts with the processor module being in RUN/STOP mode (State 0). By pressing one of the three function keys a certain action is triggered. The result of this action is described in the result columns of the tables.

State	Description - Main menu	Result on pressing one of the function keys		
		CFG	ESC	OK
0	 The processor module is in RUN/STOP mode.	State 1 is displayed.	Remains in RUN/ STOP mode.	Remains in RUN/ STOP mode.
1	 IP configuration for Ethernet interface - if connected.	State 2 is displayed.	Return into RUN/ STOP mode.	Opens the submenu for IP configuration. Refer to State 1.1 in the following table.
2	 Address configuration for Ethernet interface. Change the values with the ***Count up/Count down*** function keys. ★ Number is blinking if value has changed and is not yet sent to CPU	State 3 is displayed.	Return into RUN/ STOP mode.	Your settings are saved. State 2 is displayed.

State	Description - Main menu	Result on pressing one of the function keys		
		CFG	ESC	OK
3	 Address configuration for FBP connection. Change the values with the **Count up/ Count** down function keys.	State 4 is displayed.	Return into RUN/ STOP mode.	Your settings are saved. State 3 is displayed.
4	 Address configuration for COM1 interface - if connected. Change the values with the ***Count up/Count down*** function keys.	State 5 is displayed.	Return into RUN/ STOP mode.	Your settings are saved. State 4 is displayed.
5	 Address configuration for COM2 interface - if connected. Change the values with the ***Count up/Count down*** function keys.	State 6 is displayed.	Return into RUN/ STOP mode.	Your settings are saved. State 5 is displayed.
6	 Startup mode configuration for the processor module. Change the values with the ***Count up/Count down*** function keys.	State 7 is displayed.	Return into RUN/ STOP mode.	Your settings are saved. State 1 is displayed.
7	 ID configuration for FlexConf for the processor module. Change the values with the ***Count up/Count down*** function keys.	State 8 is displayed.	Return into RUN/ STOP mode.	Your settings are saved. State 1 is displayed.
The following States are only displayed if CM597-ETH is plugged:				
8	 IP configuration for the Communication Module in slot 1 - if Ethernet interface is set.	State 9 is displayed.	Aborts the menu unchanged. Return to State 7.	Opens the submenu for slot 1 configuration. Refer to State 8.1 in the following table.

State	Description - Main menu	Result on pressing one of the function keys		
		CFG	ESC	OK
9	 IP configuration for the Communication Module in slot 1 - if Ethernet interface is set.	State 10 is displayed.	Aborts the menu unchanged. Return to State 7.	Opens the submenu for slot 2 configuration. Refer to State 8.1 in the following table.
10	 IP configuration for the Communication Module in slot 1 - if Ethernet interface is set.	State 11 is displayed.	Aborts the menu unchanged. Return to State 7.	Opens the submenu for slot 3 configuration. Refer to State 8.1 in the following table.
11	 IP configuration for the Communication Module in slot 1 - if Ethernet interface is set.	State 8 is displayed.	Aborts the menu unchanged. Return to State 7.	Opens the submenu for slot 4 configuration. Refer to State 8.1 in the following table.

States for CM597-ETH

The following states are only displayed if CM597-ETH is plugged

State	Description - Submenu 1	Result on pressing one of the function keys		
		CFG	ESC	OK
8.1	 Submenu for slot 1 configuration opens. Sets a DHCP address.	State 8.2 is displayed.	Aborts the menu unchanged. Return to State 1.	Opens the submenu 2. Refer to State 1.2.1 in the following table.
8.2	 Configuration of a static IP address.	Opens the submenu 2. Refer to State 1.2.1 in the following table.	Aborts the menu unchanged. Return to State 1.	No functionality.

***CFG* Submenu 2 *STATIC* IP-settings**

State	Description - Submenu 2	Result on pressing one of the function keys		
		CFG	ESC	OK
1.2.1	 Submenu opens. Configuration of address A1-A4. Change the values with the ***Count up/Count down*** function keys.	State 1.2.2 is displayed.	Aborts the menu unchanged. Return to State 1.	No functionality.
1.2.2	 Configuration of subnet mask N1-N4. Change the values with the ***Count up/Count down*** function keys.	State 1.2.3 is displayed.	Aborts the menu unchanged. Return to State 1.	Your settings are saved. State 1.1 is displayed.
1.2.3	 Configuration of gateway G1-G4. Change the values with the ***Count up/Count down*** function keys.	State 1.2.1 is displayed.	Aborts the menu unchanged. Return to State 1.	Your settings are saved. State 1.1 is displayed.
The following States are only displayed if CM597-ETH is plugged:				
8.1.1	 Submenu opens. Configuration of address A1-A4. Change the values with the ***Count up/Count down*** function keys.	State 8.1.2 is displayed.	Aborts the menu unchanged. Return to State 8.	No functionality.
8.1.2	 Configuration of subnet mask N1-N4. Change the values with the ***Count up/Count down*** function keys.	State 8.1.3 is displayed.	Aborts the menu unchanged. Return to State 8.	No functionality.
8.1.3	 Configuration of gateway G1-G4. Change the values with the ***Count up/Count down*** function keys.	State 8.1.1 is displayed.	Aborts the menu unchanged. Return to State 8.	No functionality.

Configurations: Version < 2.4

The following tables describe navigation through the display of a Processor Module with processor module Firmware Version < 2.4. Navigation starts with the processor module being in RUN/STOP mode (State 0). By pressing one of the three function keys a certain action is triggered. The result of this action is described in the result columns of the tables.

State	Description - Main menu	Result on pressing one of the function keys		
		CFG	ESC	OK
0	 The processor module is in RUN/STOP mode.	State 1 is displayed.	Remains in RUN/ STOP mode.	Remains in RUN/ STOP mode.
1	 *IP-Set*: IP configuration.	State 2 is displayed.	Return to RUN/STOP mode.	Opens the sub-menu 1 for IP configuration. Refer to State 1.1 in the following table.
2	 *Adr000*: Address configuration for Ethernet interface. Change the values with the ***Count up/Count down*** function keys.	State 3 is displayed.	You revert to the RUN/ STOP mode.	Return to RUN/ STOP mode.
3	 Address configuration for FBP connection. Change the values with the ***Count up/ Count*** down function keys.	State 4 is displayed.	You revert to the RUN/ STOP mode.	Return to RUN/ STOP mode.
4	 *Adr000*: Address configuration for COM1 interface - if connected. Change the values with the ***Count up/ Count down*** function keys.	State 5 is displayed.	You revert to the RUN/ STOP mode.	Return to RUN/ STOP mode.
5	 *Adr000*: Address configuration for COM2 interface - if connected. Change the values with the ***Count up/ Count down*** function keys.	State 6 is displayed.	You revert to the RUN/ STOP mode.	Return to RUN/ STOP mode.
6	 Startup mode configuration for the processor module. Change the values with the ***Count up/Count down*** function keys.	State 7 is displayed.	You revert to the RUN/ STOP mode.	Return to RUN/ STOP mode.

State	Description - Main menu	Result on pressing one of the function keys		
		CFG	ESC	OK
7	 ID configuration for FlexConf (multiple hardware configurations) for the processor module.	Return to State 1.	You revert to the RUN/ STOP mode.	Return to RUN/ STOP mode.

Function key *CFG* submenue 1

State	Description - Submenu 1	Result on pressing one of the function keys		
		CFG	ESC	OK
1.1	 Configuration of slot 1 - 4.	No functionality.	Aborts the menu unchanged. Return to State 1.	State 1.2 is displayed.
1.2	 Configuration of a static IP address.	State 1.3 is displayed.	Aborts the menu unchanged. Return to State 1.	Opens the submenu 2. Refer to State 1.2.1 in the following table.
1.3	 Reset option is displayed.	State 1.4 is displayed.	Aborts the menu unchanged. Return to State 1.	Reset to Production data (*reset*).
1.4	 Configuration of a DHCP address.	State 1.2 is displayed.	Aborts the menu unchanged. Return to State 1.	Return to RUN/ STOP mode.

CFG Submenu 2 _STATIC_ IP-settings

State	Description - Submenu 2	Result on pressing one of the function keys		
		CFG	ESC	OK
1.2.1	 Address configuration for A1. Change the values with the ***Count up/Count down*** function keys.	State 1.2.2 is displayed.	Aborts the menu unchanged. Return to State 1.	Return to RUN/ STOP mode.

State	Description - Submenu 2	Result on pressing one of the function keys		
		CFG	ESC	OK
1.2.2	 Address configuration for A2. Change the values with the ***Count up/Count down*** function keys.	State 1.2.3 is displayed.	Aborts the menu unchanged. Return to State 1.	Return to RUN/ STOP mode.
1.2.3	 Address configuration for A3. Change the values with the ***Count up/Count down*** function keys.	State 1.2.4 is displayed.	Aborts the menu unchanged. Return to State 1.	Return to RUN/ STOP mode.
1.2.4	 Address configuration for A4. Change the values with the ***Count up/Count down*** function keys.	State 1.2.5 is displayed.	Aborts the menu unchanged. Return to State 1.	Return to RUN/ STOP mode.
1.2.5	 Configuration of the subnet mask for N1. Change the values with the ***Count up/Count down*** function keys.	State 1.2.6 is displayed.	Aborts the menu unchanged. Return to State 1.	Return to RUN/ STOP mode.
1.2.6	 Configuration of the subnet mask for N2. Change the values with the ***Count up/Count down*** function keys.	State 1.2.7 is displayed.	Aborts the menu unchanged. Return to State 1.	Return to RUN/ STOP mode.
1.2.7	 Configuration of the subnet mask for N3. Change the values with the ***Count up/Count down*** function keys.	State 1.2.8 is displayed.	Aborts the menu unchanged. Return to State 1.	Return to RUN/ STOP mode.

State	Description - Submenu 2	Result on pressing one of the function keys		
		CFG	ESC	OK
1.2.8	 Configuration of the subnet mask for N4. Change the values with the ***Count up/Count down*** function keys.	State 1.2.9 is displayed.	Aborts the menu unchanged. Return to State 1.	Return to RUN/ STOP mode.
1.2.9	 Gateway configuration for G1. Change the values with the ***Count up/Count down*** function keys.	State 1.2.10 is displayed.	Aborts the menu unchanged. Return to State 1.	Return to RUN/ STOP mode.
1.2.10	 Gateway configuration for G2. Change the values with the ***Count up/Count down*** function keys.	State 1.2.11 is displayed.	Aborts the menu unchanged. Return to State 1.	Return to RUN/ STOP mode.
1.2.11	 Gateway configuration for G3. Change the values with the ***Count up/Count down*** function keys.	State 1.2.12 is displayed.	Aborts the menu unchanged. Return to State 1.	Return to RUN/ STOP mode.
1.2.12	 Gateway configuration for G4. Change the values with the ***Count up/Count down*** function keys.	Return to State 1.2.1.	Aborts the menu unchanged. Return to State 1.	Return to RUN/ STOP mode.

FBP slave address

It is recommended to set FBP slave address by using Automation Builder software. Neverthless it is possible, however not recommended, to set this address by LED display of the processor module.

All 127 FBP addresses can be set with Automation Builder. On the display only up to 99 FBP addresses can be set.

NOTICE!

Setting the FBP slave address by LEDs, display and function keys

Though it is possible to set the FBP slave address by using the LEDs, display and function keys, this is not recommended. Direct configuration on the device replaces address configurations defined via Automation Builder.

If the FBP address (set by Automation Builder or on the device) is different from the address assigned by the master device for the same station, the station cannot be accessed. The complete fieldbus cannot work properly or is completely down!

A modified address defined on the device is valid not until power OFF/ON of the processor module!

AC500 processor module equipped with FBP is always a slave device on the bus. To act as a master, the processor module should be equipped with a master Communication Module.

The FBP must have a properly assigned slave module address. The AC500 CPU gives the FBP an address at system power-up. The address can be set with the use of the LED display and the softkeys on the front panel.

To configure the FBP address, please follow the procedure described below:

First select the item to be configured by pressing the ***CFG*** key. The CPU changes to configuration mode and a small triangle is displayed on the LCD on the first right up position of the display beside the ETH inscription and the already configured address is diplayed.	CFG	
Press one time more the ***CFG*** key to select the item FBP. The FBP address is shown and a small triangle is displayed on the LCD beside the FBP inscription.	CFG	
Press the arrow keys ***UP*** or ***DOWN*** to increase or decrease the address. The modified value blinks to indicate that it differs from the previously stored one.	↑ ↓	
Once the desired address is reached, press ***OK*** to accept and quit. Or press ESC to exit the menu without saving the changes. The CPU status is then displayed run or Stop.	OK or ESC	

The modified address will only be valid after a Power OFF / Power ON.

A processor module equipped with a FieldBusPlug is always a slave device on the bus. To act as a master, an AC500 CPU should be equipped with master Communication Modules.

The FieldBusPlug module has to be connected to the master device and the power supply has to be provided. Please use the dedicated accessories to the FBP used for the desired Fieldbus.

Reading out values

Reading out values

The following settings of the processor module can be read out by pressing the function key ***VAL*** repeatedly:

1. Displays time of the processor module (hh.mm.ss).
2. Displays date of the processor module (yy.mm.dd).
3. Displays state of battery (ub 100 = 100%, ub 020 = 20% or ub 000 = empty).
4. Displays version of display firmware (e.g. d 2.5 r (= display version 2.5 release).
5. Displays version of CPU firmware (e.g. C 2.3.3r (= CPU version 2.5 release).
6. Displays CPU type.
7. Displays default text (RUN/STOP).

Reading out diagnosis messages on the CPU

Table 625: Example: no diagnosis message in status list

State	Display	Result on pressing one of the function keys				
		DIAG	↓	↑	ESC	OK
0	The processor module is in RUN/STOP mode.	State 1 is displayed	-	-	-	-
1			No action	No action	Return into RUN/STOP mode.	

Table 626: Example: diagnosis messages in status list

State	Display	Result on pressing one of the function keys				
		DIAG	↓	↑	ESC	OK
0	The processor module is in RUN/STOP mode.	State 1 is displayed	-	-	-	-
1	 Number of diagnosis messages; here 4		Go to first/ next diagnosis message in status list (e.g., state 2)	Go to last/ previous diagnosis message in status list	Return into RUN/STOP mode.	Return into RUN/STOP mode.
2	 Diagnosis message example: *Error battery empty or missing* Toggling between state 2 and 3	Selects displayed diagnosis message and shows details ↪ *Table 627 “Example: error battery empty or missing” on page 5441*	Go to first/ next diagnosis message in status list	Go to last/ previous diagnosis message in status list	Return into RUN/STOP mode.	Acknowledge and return into RUN/STOP mode.
3	 Error ID example Toggling between state 2 and 3

Overview of protocols, sockets and ports

Protocol	Port	Sockets
DHCP	67	1 socket during startup
BOOTP	67	
ABB netConfig	24567	1 permanent socket if configured in Automation Builder
Hilscher IPconfig	25383	1 permanent socket if configured in Automation Builder for CM597-ETH
Online access with driver 3S Tcp/Ip	1201	1 socket per connection + 1 listen
Online access with driver ABB Tcp/Ip L2 AC	1200	1 socket per connection + 1 listen
Online access with driver 3S Tcp/Ip L2 Route	1201	1 socket per connection + 1 listen
Modbus TCP Server	502	1 socket per server connection, number of server connections is configurable in Automation Builder
Modbus TCP Master with POU *Chapter 1.5.4.13.1.4 “ETH_MOD_MAST” on page 1202*	random	1 socket per instance of ETH_MOD_MAST
UDP with AC31 header	0 ... 65535	1 socket if enabled in Automation Builder
UDP no AC31 header (standard UDP)	0 ... 65535	1 socket per connection
TCP/IP out of user program with library SysLibSockets.lib	0 ... 65535	1 socket per connection
Web server on PLC with web visualization and JAVA applet	80	2 system sockets + 2 per connection
Web server on PLC with support of JAVA script (no applet)	80	2 system sockets + 2 per connection
SNTP (Simple Network Time Protocol)	123	1 permanent socket if configured in Automation Builder
SMTP client (Simple Mail Transfer Protocol) send email out of user program with POU *Chapter 1.5.4.13.1.8 “ETH_SMTP_EMAIL_SEND” on page 1215*	25	1 per connection if POU is enabled

Protocol	Port	Sockets
IEC60870-5-104 control station	random	1 per connection
IEC60870-5-104 substation	2404	1 per connection
FTP server	21	1 per session, max. 4 allowed
PING out of user program with POU ↳ *Chapter 1.5.4.13.1.2 “ETH_ICMP_PING” on page 1197*	none	1 per POU if POU is enabled
DNS - supplies the IP address of a host by its name with POU ↳ *Chapter 1.5.4.13.1.1 “ETH_DNS_RESOLVE” on page 1194*	53	1 per POU if POU is enabled

Numbers and usage of Ethernet sockets

Overview

Device	Number of sockets	Hereof system sockets	Hereof user sockets
PM55x-ETH	16	3	13
PM56x-ETH	16	3	13
PM573-ETH	16	3	13
PM583-ETH	25	3	22
PM585-ETH	32	3	29
PM590-ETH	32	3	29
PM591-ETH	32	3	29
PM592-ETH	32	3	29
PM556-ETH	16	3	13
PM591-2ETH	64	4	60
PM595-4ETH-F	64	4	60
PM595-4ETH-M	64	4	60
CM597-ETH	18	3	15

Online access - System sockets

3 sockets are required for Online Access:

- 1x driver 3S Tcp/Ip or 3S Tcp/Ip L2 Route on port 1201
- 1x driver ABB Tcp/Ip AC on port 1200
- 1x listen on port 1200/1201 if PLC has established online connection

↳ *Chapter 1.6.4.1.6.1.1 “Ethernet protocols and ports for AC500 V2 products” on page 5442*

Online access can be established from:

- CODESYS V2.3.9.x (Online -> Login)
- OPC Server
- Control Builder Plus up from V2.1.0/Automation Builder
- Panel CP600 series

Each established connection needs 1 socket.

In addition, 1 socket on port 1200 and 1 on port 1201 is listening.

Example

- Startup PLC
  => 2 sockets:
  1 socket on port 1200 and 1 on port 1201 listen
- Login from CODESYS V2.3.9.x via driver ABB Tcp/Ip L2 AC on port 1200
  => 3 sockets:
  2 sockets on port 1200 (1x Online, 1x Listen) and 1 socket on port 1201 listen
- Additional login out of PS501 Control Builder Plus with the same driver:
  3 sockets on port 1200 (2x Online, 1x Listen) and 1 socket on port 1201 listen
  => 4 sockets:
- Additional connect CP600 via driver 3S Tcp/Ip L2 Route => 5 sockets:
  3 sockets on port 1200 (2x Online, 1x Listen) and
  2 sockets on port 1201 (1x Panel, 1x Listen)

Maximum numbers of sockets per protocol

Table 629: Maximum numbers of sockets per protocol up to firmware V2.3.x

No.	Description	CPU							up from CPU firmware revision
		PM55x-ETH	PM56x-ETH	PM573-ETH	PM583-ETH	PM590-ETH	PM591-ETH	PM592-ETH	
8	Modbus TCP Slave	12	12	12	12	12	12	12	V2.0.2

13	Web server on PLC with web visualization and JAVA applet	7	7	9	18	25	25	25	V2.0.6
14	Web server on PLC with support of JAVA script (no applet)	7	7	9	18	25	25	25	V2.1.3
19	FTP server	2	2	2	2	4	4	4	V2.1.3

Maximum numbers of sockets per protocol as of firmware V2.4.x

No.	Description	CPU										CM	up from CPU firmware revision
		PM55x-ETH	PM56x-ETH	PM573-ETH	PM583-ETH	PM585-ETH	PM590-ETH	PM591-ETH	PM591-2 ETH	PM592-ETH	PM595-4 ETH	CM597-ETH	
8	Modbus TCP Slave	12	12	12	12	12	12	12	24	12	24	12	V2.0.2
11	UDP no AC31 header	12	12	12	12	12	12	12	24	12	24	12	V2.0.2

No.	Description	CPU										CM	up from CPU firmware revision
		PM5 5x-ETH	PM5 6x-ETH	PM5 73-ETH	PM5 83-ETH	PM58 5-ETH	PM5 90-ETH	PM5 91-ETH	PM5 91-2 ETH	PM5 92-ETH	PM5 95-4 ETH	CM5 97-ETH	
13	Web server on PLC with web visualization and JAVA applet	7	7	9	18	25	25	25	50	25	50	0	V2.0.6
14	Web server on PLC with support of JAVA script (no applet)	7	7	9	18	25	25	25	50	25	50	0	V2.1.3
19	FTP server	2	2	2	2	4	4	4	8	4	8	0	V2.1.3

The total number of sockets used by following protocols (over all Interfaces) must not exceed 32:

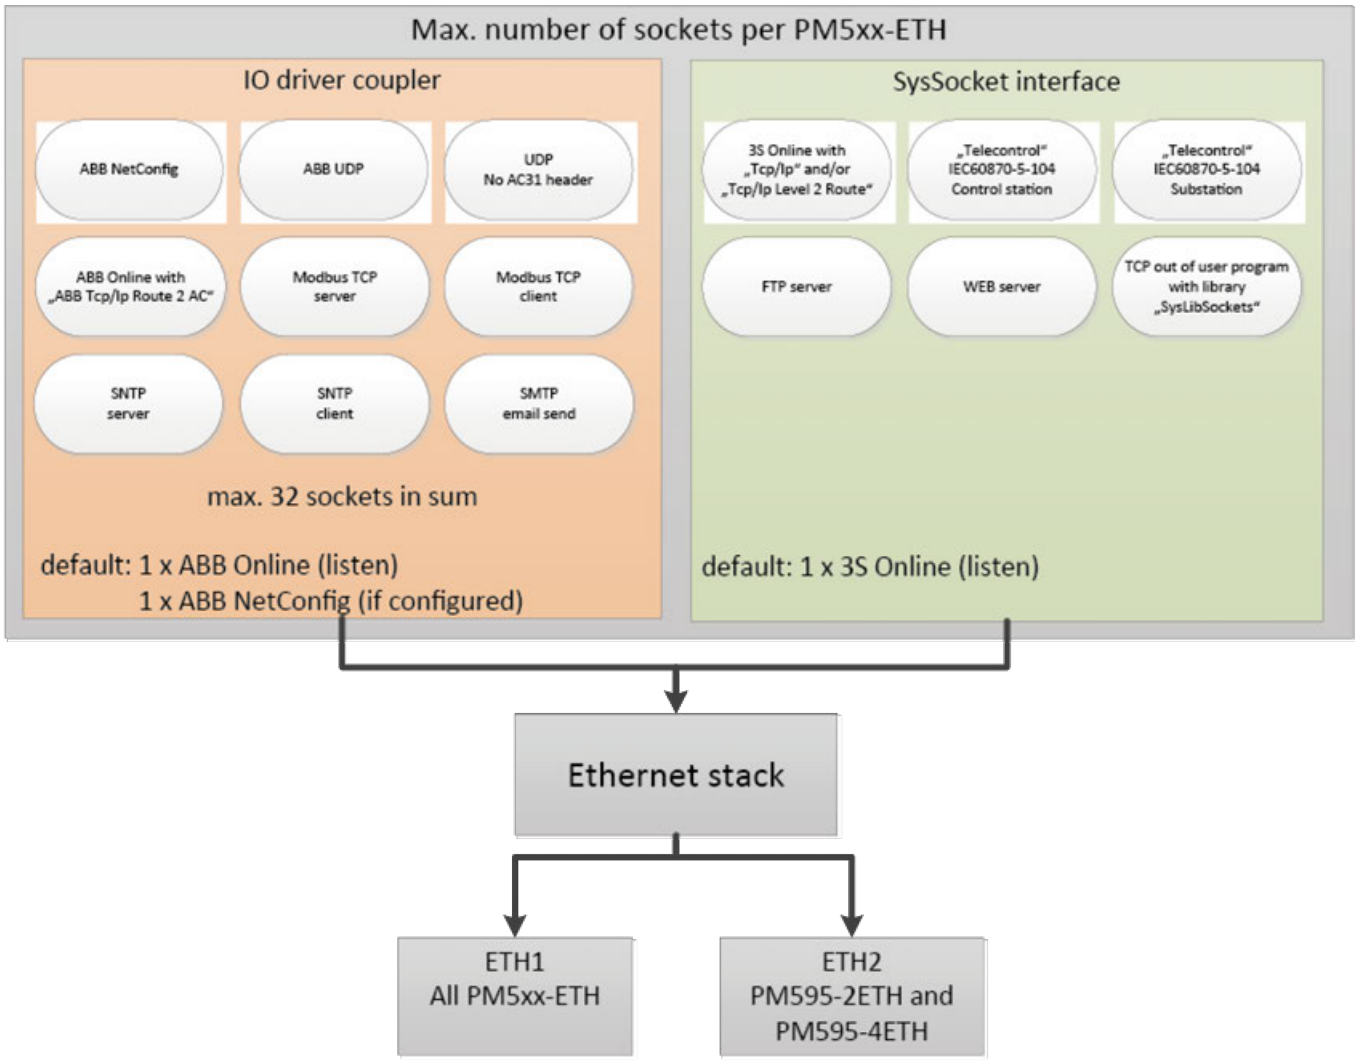
- *UDP data exchange*
- *UDP no AC31 Header*
- *ABB netConfig*
- *Online with ABB TCP/IP Level 2AC (listen, connected, routing)*
- *SNTP (onboard only)*
- *SMTP (onboard only)*
- *Modbus Client*
- *Modbus TCP server*

For CPUs with multiple Onboard Ethernet interface (e.g. PM591-2ETH, PM595-4ETH) the maximum number of sockets per protocol is the sum for all Ethernet interfaces.

Example: Max number of Modbus TCP server for PM591-2ETH is 24. If 1st Ethernet interface ETH1 uses 11 Modbus server connections, the 2nd Ethernet interface can use as maximum 13 Modbus server connections.

The usage of the sockets can be shown in the PLC browser or by using the command: `coupler settings`

Handling of Ethernet protocols in AC500 CPUs firmware as of V2.4.0



The usage of the sockets can be shown in the PLC browser or by using the command: `coupler settings`

SNTP client and server

All AC500 processor modules with onboard Ethernet support can be configured as Simple Network Time Protocol (SNTP) servers and clients.

The SNTP protocol is specified in *RFC 4330*.

Since the packet format is the same between NTP and SNTP, an AC500 SNTP client can also use any (full) NTP server to receive time information.

SNTP client

The AC500 can receive time information from NTP server(s) in the network and adjust its local clock accordingly. The configuration of the SNTP protocol (see *Chapter 1.6.5.3.6.2.1 “SNTP client configuration” on page 6183*) allows to specify two IP addresses for Servers as well as the interval of requests to the server.

When the main server cannot be reached for 5 consecutive times, an Error class 4 is raised and the backup server will be used. If the backup server also cannot be reached for 5 consecutive times, an Error class 3 is raised.

According to the RFC specification, the SNTP client will wait a random amount of time between 1 and 5 minutes before performing the first time request after starting up the user program (PLC in RUN).

To avoid this behavior, the configuration option *Wait for sync before RUN* can be set, so that the user program is not allowed to run before the time was synchronized at least once.

The PLC will try to sync for a configurable amount of time (*Time to wait for sync*) before either allowing the user program to switch to RUN or raising an error class 4 and keeping the PLC is STOP.

The clock in the AC500 is prone to drift just like any clock based on an oscillating quartz.

Any adjustments of the clock will be attempted by speeding up or slowing down the internal clock.

But there may be situations where the difference becomes too large to adjust the clock this way and the clock needs to be set to the new time without gradual adjustments. This is called a time jump and may not be wanted in some applications. To mitigate this, another set of configuration options exist: *Allow time jumps* and *allowed threshold for time jumps*”.

These parameters can be used to either completely disallow jumps or keep them in an acceptable range. By default time jumps are allowed with a maximum of 60 seconds difference. Any jumps higher than the configured threshold will not be allowed and raise an error class 4.

The first synchronization is always allowed to jump any value because the default date in the PLC is 01.01.1970 00:00 and thus needs to jump several years to reach current date.

SNTP server

The AC500 can function as an SNTP Server to other clients (such as other AC500 PLCs).

For PLCs with multiple Interfaces, the server can be configured to run on either one or both interfaces (ETH1, ETH2).

The configuration of the SNTP protocol (see *Chapter 1.6.5.3.6.2.2 “SNTP server configuration” on page 6185*) allows to restrict the IP address range which will be served by this SNTP server. By default, any request will be served with a reply. To restrict the requests to a specific subnet, the CIDR notation is used.

Example

- Restrict access to the SNTP server to the subnet from 192.168.0.1 to 192.168.0.254 by CIDR notation 192.168.0.0/24.
- Restrict access to the SNTP server to the subnet from 10.0.0.0 to 10.255.255.255 by notation 10.0.0.0/8

The SNTP server will use the local clock to serve its time.

Sync the local clock to a more precise time source:

- *Being SNTP client and receiving the time from a more reliable NTP server.*
- *By syncing the local clock to another time source like a GPS or DCF77 clock.*

ARCNET

- ARCNET (Attached Resource Computer Network) is a system for data transmission in local networks.
- The ARCNET protocol is based on the Token Passing principle.
- By passing an identifier (token) from station to station it is guaranteed, that only one station can start a data transmission (transmission without collision).
- The order of sequence, in which the stations are accessed, is automatically adapted by the existing conditions in the network, i.e. that the network is reconfigured automatically each time a station is added to the network or switched off.

ARCNET bus topology

The networking possibilities of linear ARCNET

- The Linear ARCNET connects the individual stations directly to each other, i.e. without using any distribution units.
- Each station is connected to the network by using a T connector.
- Both cable ends must be terminated by terminating resistors.
- A maximum of 8 stations can be connected to one Linear ARCNET.
- The maximum cable length of the network is 300 m.
- An additional segment can be connected at the end of the wired segment via an Active Hub (active distribution unit), see next but one drawing.

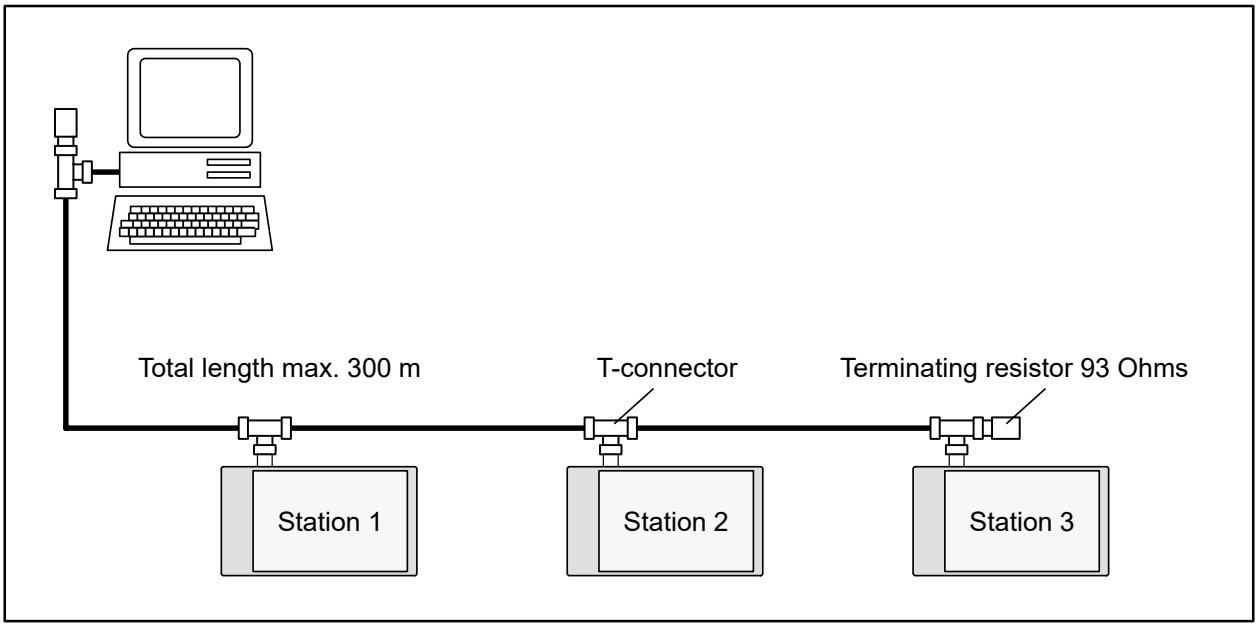

Fig. 1110: Linear ARCNET

Linear ARCNET, expanded by active distribution units (Active hubs)

Active Hubs amplify the arriving signals. So they stabilize the network configuration and allow especially for high distances. The Active Hub decouples the station connectors from each other. Therefore, the entire network does not fail when one of the connections fails.

The maximum length of the network is 6 km.

A maximum of 255 stations can be used.

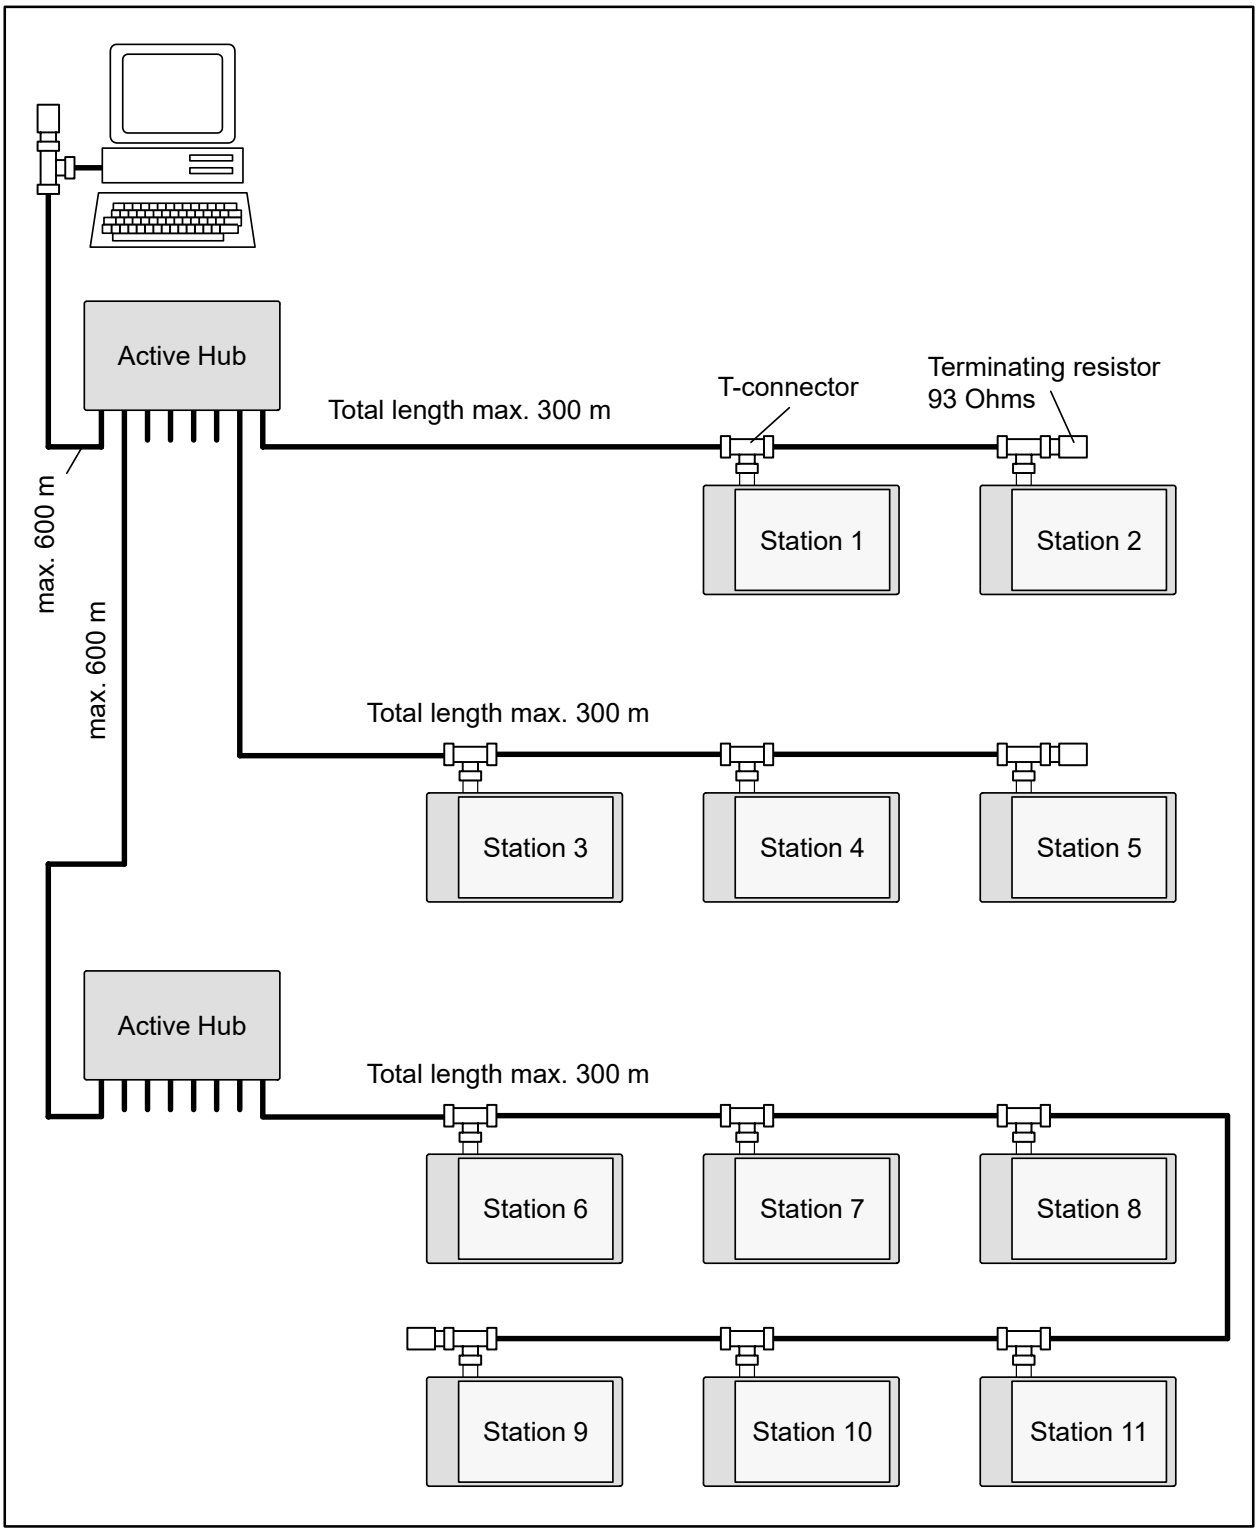

Fig. 1111: Linear ARCNET, expanded by active distribution units (Active Hubs)

1.6.4.1.7 Hot swap

Preconditions for using hot swap

Hot swap

WARNING!

Risk of explosion or fire in hazardous environments during hot swapping!

Hot swap must not be performed in flammable environments to avoid life-threatening injury and property damage resulting from fire or explosion.

WARNING!

Electric shock due to negligent behavior during hot swapping!

To avoid electric shock

- make sure the following conditions apply:
  - Digital outputs are not under load.
  - Input/output voltages above safety extra low voltage/ protective extra low voltage (SELV/PELV) are switched off.
  - Modules are fully interlocked with the terminal unit with both snap-fits engaged before switching on loads or input/output voltage.
- Never touch exposed contacts (dangerous voltages).
- Stay away from electrical contacts to avoid arc discharge.
- Do not operate a mechanical installation improperly.

NOTICE!

Risk of damage to I/O modules!

Hot swapping is only allowed for I/O modules.

Processor modules and communication interface modules must not be removed or inserted during operation.

H = **H**ot swap

Hot swap

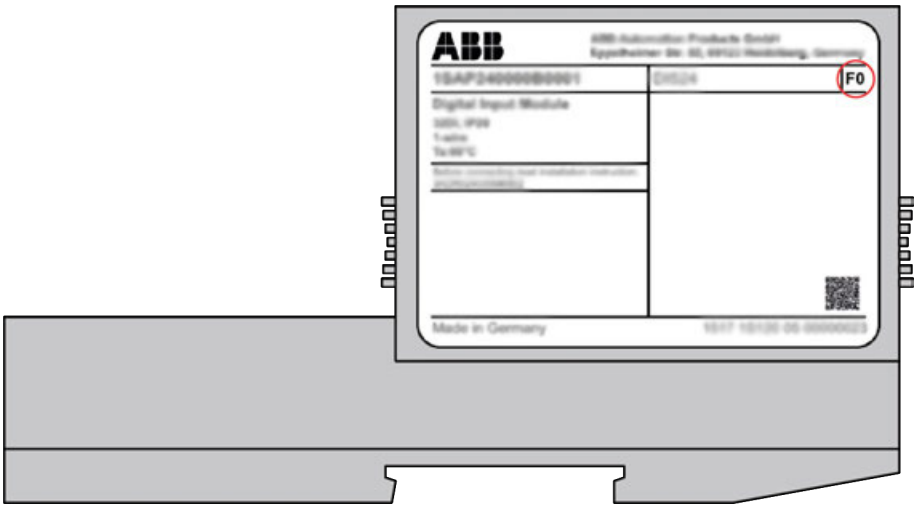
System requirements for hot swapping of I/O modules:

- *Types of terminal units that support hot swapping of I/O modules have the appendix TU5xx-**H**.*
- *I/O modules as of index F0.*

The following I/O bus masters support hot swapping of attached I/O modules:

- *Communication interface modules CI5xx as of index F0.*
- *Processor module PM585-ETH with firmware version as of V2.8.1.*

Hot swap is not supported by AC500-eCo V3 CPU!



The index of the module is in the right corner of the label.

NOTICE!

Risk of damage to I/O modules!

Modules with index below F0 can be damaged when inserted or removed from the terminal unit in a powered system.

NOTICE!

Risk of damage to I/O modules!

Do not perform hot swapping if any I/O module with firmware version lower than 3.0.14 is part of the I/O configuration.

For min. required device index see table below.

Device	Min. required device index for I/O module as of FW Version 3.0.14

Compatibility of hot swap

	Central I/O on V2 CPU
I/O module on TU5xx-H connected to I/O bus master	AC5000 V2 CPU types: PM585-ETH, PM59x-ETH, PM591-2ETH or PM595-4ETH
Required version of I/O bus master	Firmware as of V2.8.1
Fieldbus master when used as remote I/O with AC500 V2	-
When used as remote I/O on third party controller (PLC or DCS)	-

Hot swap behavior

The following table describes the behavior in case of I/O attached to the AC500 CPU with firmware supporting hot swap on the I/O bus.

Hot Swap Behavior	Central I/O on V2 CPU
Start-up behavior with missing or damaged I/O module on hot swap terminal unit TU5xx-H	System and I/O modules attached to the CPU are starting (except missing or damaged module when mounted on hot swap terminal unit). As soon as the correct and operational I/O module is plugged on the terminal unit, the module is configured and ready to start. Precondition: ● "Run On Config Fault" must be configured ● "Max Wait Run" = default (3000)
Start-up behavior with wrong I/O module type on any terminal unit	System and I/O modules are not starting
Diagnosis of presence of hot swap terminal unit	Diagnosis using PLC browser command "io-bus desc" in Automation Builder V2. The PLC browser then provides an overview of the modules on the I/O bus including the position of hot swap terminal units in the I/O bus.
Diagnosis of hot swap capability of I/O module mounted on hot swap terminal unit	I/O bus master generates ● Diagnosis in case that a not hot-swap-pable I/O module is plugged on a hot swap terminal unit ● Diagnosis in case that in a mixed configu-ration with at least one hot swap terminal unit an I/O module, that must not be used in a hot swap configuration, is mounted on any terminal unit of the configuration
Diagnosis while hot swap module is pulled or module (mounted on hot swap terminal unit) has stopped working	I/O bus master generates diagnosis in AC500 format. The diagnosis is available in the diagnosis system.
Input state in process image of controller while module is pulled or module is not operational	Input = ZERO
Diagnosis after plugging the I/O module on the hot swap terminal unit	Diagnosis message "diagnosis gone" is generated

1.6.4.1.8 Communication with Modbus RTU

Protocol description

The Modbus RTU protocol is implemented in the AC500 processor modules.

Modbus is a master-slave (client-server) protocol. The client sends a request to the server(s) and receives the response(s).

The Modbus operating mode of a serial interface is set in the PLC configuration. See *Chapter 1.6.5.2.11.4 “Setting COMx - Modbus” on page 6108*

Modbus client

In this operating mode, the telegram traffic with the server(s) is handled via the function block *Chapter 1.5.4.22.1.1 “COM_MOD_MAST” on page 1698*.

This function block sends Modbus request telegrams to the server(s) via the set interface and receives Modbus response telegrams from the server(s) via this interface.

The Modbus blocks transferred by the server contain the following information:

- Modbus address of the interrogated server (1 byte)
- Function code that defines the request of the client (1 byte)
- Data to be exchanged (n bytes)
- CRC16 control code (2 bytes)

Modbus server

In this operating mode, no function block is required for Modbus communication. Sending and receiving Modbus telegrams is performed automatically.

The AC500 CPUs process the following Modbus operation codes:

Function code		Description
DEC	HEX	
01 or 02	01 or 02	Read n bits
03 or 04	03 or 04	Read n words
05	05	Write one bit (encoded in one word)
06	06	Write one word
07	07	Fast reading the status byte of the CPU
15	0F	Write n bits (encoded in one byte)
16	10	Write n words
22	16	Mask write
23	17	Read/write multiple words in one telegram

The following restrictions apply to the length of the data to be sent:

Function code		Max. length
DEC	HEX	
01 or 02	01 or 02	2000 bits
03 or 04	03 or 04	125 words / 62 double words
05	05	1 bit

Function code		Max. length
DEC	**HEX**	
06	06	1 word
07	07	8 bits
15	0F	1968 bits
16	10	123 words / 61 double words
22	16	Write: 1 word
23	17	Read: 125 words / 62 double words Write: 120 words / 60 double words

Technical data

The Modbus operating mode and the interface parameters are set in the *Chapter 1.6.5.2.11.4 “Setting COMx - Modbus” on page 6108*.

Table 630: Description of the Modbus protocol

Parameter			Value
Supported standard			PM55x and PM56x: EIA RS-485 PM57x, PM58x and PM59x: EIA RS-232 / RS-485
Number of connection points			1 client Max. 1 server with RS-232 interface Max. 31 servers with RS-485
Protocol			Modbus
Operating mode			Client/server
Address			Server only
Data transmission control			CRC16
Data transmission speed			From 300 bits/s to 187,500 bits/s
Encoding			1 start bit 8 data bits 1 parity bit, (optional) even, odd, mark or space 1 or 2 stop bits
Max. cable length for RS-485 on COM1 / COM2 for AC500 CPU			1.200 m at 19.200 baud
Max. cable length for RS-485 on COM1 / COM2 for AC500-eCo CPU			
	COM1:		
		Non-isolated:	Max. 50 m (with shielded cable)
		Isolated with TK506:	Max. 500 m at 19.200 baud (with shielded cable *)
	COM2:		

Parameter			Value
		Non-isolated with TA562:	Max. 50 m (with shielded cable)
		Isolated with TA569:	Max. 500 m at 19.200 baud (with shielded cable *)

*) 500 m cable type STP-120 Ω/AWG-20

If a processor module provides more than one serial interface, both interfaces (COM1/COM2) can be operated simultaneously as Modbus interfaces and can operate as Modbus server as well as Modbus client.

Modbus addresses for AC500 CPUs

Modbus address table

A range of 128 kB is allowed for the access via Modbus, i.e., the segments line 0 and line 1 of the addressable flag area (%M area) can be accessed. Thus, the complete address range 0000hex up to FFFFhex is available for Modbus.

The availability of the segments depends on the CPU. The size of the %M area can be found in the technical data of the CPUs and in the target system settings.

Inputs and outputs cannot be directly accessed using Modbus.

Address assignment (bit accesses)

The address assignment for bit accesses is done according to the following table:

Modbus address		Byte	Bit (byte-oriented)	Word	Double word
HEX	DEC	BYTE	BOOL	WORD	DWORD
Line 0					
0000	0	%MB0.0	%MX0.0.0	%MW0.0	%MD0.0
0001	1		%MX0.0.1		
0002	2		%MX0.0.2		
0003	3		%MX0.0.3		
0004	4		%MX0.0.4		
0005	5		%MX0.0.5		
0006	6		%MX0.0.6		
0007	7		%MX0.0.7		
0008	8	%MB0.1	%MX0.1.0		
0009	9		%MX0.1.1		
000A	10		%MX0.1.2		
000B	11		%MX0.1.3		
000C	12		%MX0.1.4		
000D	13		%MX0.1.5		
000E	14		%MX0.1.6		
000F	15		%MX0.1.7		
0010	16	%MB0.2	%MX0.2.0	%MW0.1	
0011	17		%MX0.2.1		
0012	18		%MX0.2.2		

Modbus address		Byte	Bit (byte-oriented)	Word	Double word
HEX	DEC	BYTE	BOOL	WORD	DWORD
0013	19		%MX0.2.3		
0014	20		%MX0.2.4		
0015	21		%MX0.2.5		
0016	22		%MX0.2.6		
0017	23		%MX0.2.7		
0018	24	%MB0.3	%MX0.3.0		
0019	25		%MX0.3.1		
001A	26		%MX0.3.2		
001B	27		%MX0.3.3		
001C	28		%MX0.3.4		
001D	29		%MX0.3.5		
001E	30		%MX0.3.6		
001F	31		%MX0.3.7		
0020	32	%MB0.4	%MX0.4.0	%MW0.2	%MD0.1
0021	33		%MX0.4.1		
0022	34		%MX0.4.2		
...	...	...	...	...	...
0FFF	4095	%MB0.511	%MX0.511.7	%MW0.255	%MD0.127
1000	4096	%MB0.512	%MX0.512.0	%MW0.256	%MD0.128
...	...	...	...	...	...
7FFF	32767	%MB0.4095	%MX0.4095.7	%MW0.2047	%MD0.1023
8000	32768	%MB0.4096	%MX0.4096.0	%MW0.2048	%MD0.1024
...	...	...	...	...	...
FFFF	65535	%MB0.8191	%MX0.8191.7	%MW0.4095	%MD0.2047

Calculation of the bit variable from the hexa-decimal address:

Formula:			
	Bit variable (BOOL) := %MX0.BYTE.BIT		
where:	DEC	Decimal address	
	BYTE	DEC / 8	
	BIT	DEC mod 8	(Modulo division)

Examples:

- Address hexadecimal = 16#2002
  DEC := 8194
  BYTE := 8194 / 8 := 1024
  BIT := 8194 mod 8 := 2
  Bit variable: %MX0.1024.2
- Address hexadecimal = 16#3016
  DEC := 12310
  BYTE := 12310 / 8 := 1538,75 -> 1538
  BIT := 12310 mod 8 := 6
  Bit variable: %MX0.1538.6
- Address hexadecimal = 16#55AA
  DEC := 21930
  BYTE := 21930 / 8 := 2741,25 -> 2741
  BIT := 21930 mod 8 := 2
  Bit variable: %MX0.2741.2

Calculation of the hexadecimal address from the bit variable:

Examples:

- Bit variable := %MX0.515.4
  DEC := 515 * 8 + 4 := 4124
  Address hex := 16#101C
- Bit variable := %MX0.3.3
  DEC := 3 * 8 + 3 := 27
  Address hex := 16#001B
- Bit variable := %MX0.6666.2
  DEC := 6666 * 8 + 2 := 53330
  Address hex := 16#D052

Peculiarities for accessing Modbus addresses

Peculiarities for bit access:

- As you can see in the address table, a WORD in the %M area is assigned to each Modbus address 0000hex .. FFFFhex
- Bit addresses 0000hex .. FFFFhex are contained in the word range %MW0.0 .. %MW0.4095

Areas protected from read/write access by Modbus client

As described in the PLC configuration, one write-protected and one read-protected area can be defined for each segment line 0 and line 1. If you try to write to a write-protected area or to read from a read-protected area, an exception response is generated.

Segment exceedance for line 0 and line 1:

A write- or read-protected area that lies in both segments, line 0 and line 1, cannot be accessed with a write/read operation. In case of a segment exceedance, an exception response is generated.

Example

Read 10 words beginning at address := 7FFEhex

This includes the addresses: 7FFEhex...8007hex with the operands %MW0.32766...%MW1.7. Because line 0 is exceeded in this case, an exception response is generated.

Due to this, two requests have to be generated here:

1. Read 2 words beginning at address := 7FFEhex.

2. Read 8 words beginning at address := 8000hex.

Comparison between AC500 and AC31/S90 Modbus addresses

The following table shows the addresses for AC500 controllers and its predecessor AC31/S90:

Address HEX	FCT HEX	AC1131 operand	FCT HEX	AC500 operand
Bit accesses				
0000 ... 0FFF	01, 02	%IX0.0 ... %IX255.15	01, 02, 05, 07, 0F	%MX0.0.0 ... %MX0.511.7
0000		%IX0.0		%MX0.0.0
0001		%IX0.1		%MX0.0.1
0002		%IX0.2		%MX0.0.2
...		...		...
0010		%IX1.0		%MX0.2.0
...		...		...
0FFF		%IX255.15		%MX0.511.7
1000 ... 1FFF	01, 02, 05, 0F	%QX0.0 ... %QX255.15	01, 02, 05, 07, 0F	%MX0.512.0 ... %MX0.1023.7
1000		%QX0.0		%MX0.512.0
1001		%QX0.1		%MX0.512.1
1002		%QX0.2		%MX0.512.2
...		...		...

Local data of the Modbus client

The address of the area from which data are to be read or to which data are to be written is specified in the function block *Chapter 1.5.4.22.1.1 “COM_MOD_MAST” on page 1698* at input "Data", via the ADR operator.

For the AC500, the following areas can be accessed using the ADR operator:

- Inputs area (%I area)
- Outputs area (%Q area)
- Area of non-buffered variables (VAR .. END_VAR or VAR_GLOBAL END_VAR)
- Addressable flag area (also protected areas for %M area)
- Area of buffered variables (VAR RETAIN .. END_VAR or VAR_GLOBAL RETAIN .. END_VAR)

Modbus telegrams

The send and receive of telegrams shown in this section are not visible in the PLC. However, the complete telegrams can be made visible using a serial data analyzer connected to the connection line between server and client, if required.

The amount of user data depends on the capabilities of the server and the client.

For the following examples, it is assumed that one AC500 Modbus module is used as client and another one is used as server. There may be different properties if modules of other manufacturers are used.

FCT 1 or 2: Read n bits

Table 631: Client request

Server address	Function code	Server operand address		Number of bits		CRC	
		High	Low	High	Low	High	Low

Table 632: Server response

Server address	Function code	Number of Bytes	...Data...	CRC	
				High	Low

Example

Table 633: Example:

Modbus interface of the client	COM1
Client reads from	Server 1
Data	%MX0.1026.4 = FALSE %MX0.1026.5 = TRUE %MX0.1026.6 = FALSE
Source address at server	%MX0.1026.4 : 2014HEX = 8212DEC
Target address at client	abReadBool: ARRAY[0..2] OF BOOL
The values of the flags %MX0.1026.4..%MX0.1026.6 on the server are written to the ARRAY abReadBool on the client.	

Table 634: Modbus request of the client

Server address	**Function code**	**Server operand address**		**Number of bits**		**CRC**	
		High	**Low**	**High**	**Low**	**High**	**Low**
01HEX	01HEX	20HEX	14HEX	00HEX	03HEX	37HEX	CFHEX

Table 635: Modbus response of the server

Server address	**Function code**	**Number of bytes**	**Data**	**CRC**	
				High	**Low**
01HEX	01HEX	01HEX	02HEX	D0HEX	49HEX

EN	**COM**	**SLAVE**	**FCT**	**TIMEOUT**	**ADDR**	**NB**	**DATA**
FALSE -> TRUE	1	1	1	Application- specific	8212	3	ADR (abReadBool[0])

FCT 3 or 4: Read n words

Table 637: Client request

Server address	Function code	Server operand address		Number of words		CRC	
		High	Low	High	Low	High	Low

Table 638: Server response

Server address	Function code	Number of Bytes	Data		CRC	
			High	Low	High	Low

Example

Table 639: Example

Modbus interface of the client	COM1
Client reads from	Server 1
Data	%MW0.8196 = 4; %MW0.8197 = 5; %MW0.8198 = 6
Source address at server	%MW0.8196 : 2004HEX = 8196DEC
Target address at client	awReadWord : ARRAY[0..2] OF WORD;
The values of the flag words %MW0.8196..%MW0.8198 on the server are written to the ARRAY awReadWord on the client.	

Table 640: Modbus request of the client

Server address	**Function code**	**Server operand address**		**Number of words**		**CRC**	
		High	**Low**	**High**	**Low**	**High**	**Low**
01HEX	03HEX	20HEX	04HEX	00HEX	03HEX	4FHEX	CAHEX

Table 641: Modbus response of the server

Server address	**Function code**	**Number of bytes**	**Data**	**Data**	**Data**	**CRC**	
			High / Low	**High / Low**	**High / Low**	**High**	**Low**
01HEX	03HEX	06HEX	00HEX / 04HEX	00HEX / 05HEX	00HEX / 06HEX	40HEX	B6HEX

Table 642: Parameterization of the COM_MOD_MAST function block inputs

EN	**COM**	**SLAVE**	**FCT**	**TIMEOUT**	**ADDR**	**Number of words**	**DATA**
FALSE -> TRUE	1	1	3	Application- specific	8196	3	ADR (awRead-Word[0])

FCT 3 or 4: Read n double words

The function code "read double word" is not defined in the Modbus RTU standard. This is why the double word is composed of a low word and a high word (depending on the manufacturer) Same tables as *Chapter 1.6.4.1.8.5.2 “FCT 3 or 4: Read n words” on page 5475*.

Example

Table 643: Example:

Modbus interface of the client	COM1
Client reads from	Server 1

Data	%MD0.8193 = 32DEC = 00000020HEX %MD0.8194 = 80000DEC = 00013880HEX
Source address at server	%MD0.8193: 4002HEX = 16386DEC
Target address at client	adwReadDWord : ARRAY[0..1] OF DWORD
The values of the flag double words %MD0.8193..%MD0.8194 on the server are written to the ARRAY adwReadDWord on the client.	

Table 644: Modbus request of the client

Server address	**Function code**	**Server operand address**		**Number of words**		**CRC**	
		High	**Low**	**High**	**Low**	**High**	**Low**
01HEX	03HEX	40HEX	02HEX	00HEX	04HEX	F0HEX	09HEX

Table 645: Modbus response of the server

Server address	**Func-tion code**	**Number of bytes**	**Data**	**Data**	**Data**	**Data**	**CRC**	
			High / Low	**High / Low**	**High / Low**	**High / Low**	**High**	**Low**
01HEX	03HEX	08HEX	00HEX / 00HEX	00HEX / 20HEX	00HEX / 01HEX	38HEX / 80HEX	57HEX	B0HEX

Table 646: Parameterization of the COM_MOD_MAST function block inputs

EN	**COM**	**SLAVE**	**FCT**	**TIMEOUT**	**ADDR**	**Number of words**	**DATA**
FALSE -> TRUE	1	1	3	Applica-tion- spe-cific	16386	4	ADR (adwRead DWord[0])

FCT 5: Write 1 bit

For the function code "write 1 bit", the value of the bit to be written is encoded in one word.

BIT = TRUE -> Data word = FF 00 HEX

BIT = FALSE -> Data word = 00 00 HEX

Table 647: Client request

Function code	Server operand address		Number of words		CRC	
	High	Low	High	Low	High	Low

Table 648: Server response

Function code	Server operand address		Data		CRC	
	High	Low	High	Low	High	Low

Example

Table 649: Example:

Modbus interface of the client	COM1
Client writes to	Server 1
Data	bBit := TRUE
Source address at client	bBit : BOOL
Target address at server	%MX0.1026.7 : 2017HEX = 8215DEC
The value of the BOOL variable bBit on the server is written to %MX0.1026.7 on the server.	

Table 650: Modbus request of the client

Server address	**Function code**	**Server operand address**		**Data**		**CRC**	
		High	**Low**	**High**	**Low**	**High**	**Low**

Table 668: Parameterization of the COM_MOD_MAST function block inputs

EN	COM	SLAVE	FCT	TIMEOUT	ADDR	Number of bits	DATA
FALSE -> TRUE	1	1	15	Application- specific	8209	3	ADR (abWrite-Bool[0])

FCT 16: Write n words

Table 669: Client request

Server operand address		Number of words		Number of bytes	...Data...	CRC	
High	Low	High	Low			High	Low

Table 670: Server response

Function code	Server operand address		Number of words		CRC	
	High	Low	High	Low	High	Low

Example

Table 671: Example:

Modbus interface of the client	COM1
Client writes to	Server 1
Data	awWriteWord[0] := 1 awWriteWord[1] := 2 awWriteWord[2] := 3
Source address at server	awWriteWord : ARRAY[0..2] OF WORD
Target address at client	%MW0.8193 : 2001HEX = 8193DEC
The values of the WORD variables awWriteWord[0]..awWriteWord[2] on the client are written to %MW0.8193..%MW0.8195 on the server.	

Table 672: Modbus request of the client

Server address	Function code	Server operand address	Number of words	Number of bytes	Data	Data	Data	CRC
		High / Low	High / Low		High / Low	High / Low	High / Low	High / Low
01HEX	10HEX	20HEX / 01HEX	00HEX / 03HEX	06HEX	00HEX / 01HEX	00HEX / 02HEX	00HEX / 03HEX	C0HEX / 84HEX

Table 673: Modbus response of the server

Server address	Function code	Server operand address		Number of words		CRC	
		High	Low	High	Low	High	Low
01HEX	10HEX	20HEX	01HEX	00HEX	03HEX	DAHEX	08HEX

Table 674: Parameterization of the COM_MOD_MAST function block inputs

EN	COM	SLAVE	FCT	TIMEOUT	ADDR	Number of words	DATA
FALSE -> TRUE	1	1	16	Application- specific	8193	3	ADR (awWrite-Word[0])

FCT 16: Write n double words

The function code "write double word" is not defined in the Modbus RTU standard. This is why the double word is composed of a low word and a high word (depending on the manufacturer).

Table 675: Client request

Server operand address		Number of words		Number of bytes	...Data...	CRC	
High	Low	High	Low			High	Low

Table 676: Server response

Server address	Function code	Server operand address		Number of words		CRC	
		High	Low	High	Low	High	Low

Example

Table 677: Example:

Modbus interface of the client	COM1
Client writes to	Server 1
Data	adwWriteDWord[0] := 18DEC = 00000012HEX; adwWriteDWord[1] := 65561DEC = 00010019HEX;
Source address at client	adwWriteDWord : ARRAY[0..1] OF DWORD;
Target address at server	%MD0.8192 : 4000HEX = 16384DEC
The values of the Double WORD variables adwWriteDWord[0].. adwWriteDWord[1] on the client are written to %MD0.8192..%MD0.8193 on the server.	

Table 678: Modbus request of the client

Server address	Function code	Server operand address	Number of words	Number of bytes	Data	Data	Data	Data	CRC
		High / Low	High / Low		High / Low	High / Low	High / Low	High / Low	High / Low
01HEX	10HEX	40HEX / 00HEX	00HEX / 04HEX	08HEX	00HEX / 00HEX	00HEX / 12HEX	00HEX / 01HEX	00HEX / 19HEX	60HEX / B3HEX

Example

Table 689: Example

Modbus interface of the client	COM1
Client writes to	Server 1
Data	sData : COM_MOD_FCT23_TYPE sData.pByDataWrite := ADR(awWriteWord) sData.pByDataRead := ADR(awReadWord) sData.wDataAddressRead := 4193 sData.wNumDataUnitsRead := 5 awWriteWord[0] := 1 awWriteWord[1] := 2 awWriteWord[2] := 3
Source address at client	awWriteWord : ARRAY[0..2] OF WORD
Target address at client	awReadWord : ARRAY[0..4] OF WORD
Target address at server	%MW0.8193 : 2001HEX = 8193DEC
Source address at server	%MW0.4193 : 1001HEX = 4193DEC
The values of the WORD variables awWriteWord[0]..awWriteWord[2] on the client are written to %MW0.8193..%MW0.8195 on the server, the values read from server's . %MW0.4193..%MW0.4195 are written to the client's variables awReadWord[0]..awRead-Word[4]	

Table 690: Parameterization of the COM_MOD_MAST function block inputs

EN	**COM**	**SLAVE**	**FCT**	**TIMEOUT**	**ADDR**	**Number of words**	**DATA**
FALSE -> TRUE	1	1	17	Applica-tionspe-cific	8193	3	ADR (sData)

Exception response by server

In operating mode Modbus client, the AC500 does only send requests, if the parameters at the MOD_MAST inputs are logically correct.

Nevertheless, it can happen that a server cannot process the request of the client or that the server cannot interpret the request due to transmission errors or in case it's capabilities are exceeded in any way. In those cases, the server returns an exception response to the client. In order to identify this response as an exception response, the function code returned by the server is a logical OR interconnection of the function code received from the client and the value 80HEX.

Table 691: Server response

Server address	OR 80HEX	Error code	CRC	
			High	Low

Possible error codes of the client

Code	Description
01DEC	ILLEGAL FUNCTION The server does not support the function requested by the client
02DEC	ILLEGAL DATA ADDRESS Invalid operand address in the server or operand area exceeded
03DEC	ILLEGAL DATA VALUE At least one value is outside the permitted range of values
04DEC	SERVER DEVICE FAILURE An unrecoverable error occurred while the server was attempting to perform the requested action
05DEC	ACKNOWLEDGE Specialized use in conjunction with programming commands. The server has accepted the request and is processing it, but a long duration of time will be required to do so. This response is returned to prevent a timeout error from occurring in the client. The client can next issue a Poll Program Complete message to determine if processing is completed
06DEC	SERVER DEVICE BUSY Specialized use in conjunction with programming commands. The server is engaged in processing a long–duration program command. The client should retransmit the message later when the server is free.
07DEC	NEGATIVE ACKNOWLEDGE Specialized use in conjunction with programming commands. The server cannot perform the programming functions. Client should request diagnostic or error information from server.
08DEC	MEMORY PARITY ERROR Specialized use in conjunction with function codes 20 and 21 and reference type 6, to indicate that the extended file area failed to pass a consistency check. The server attempted to read record file, but detected a parity error in the memory. The client can retry the request, but service may be required on the server device.
10DEC	GATEWAY PATH UNAVAILABLE Specialized use in conjunction with gateways, indicates that the gateway was unable to allocate an internal communication path from the input port to the output port for processing the request. Usually means that the gateway is misconfigured or overloaded.
11DEC	GATEWAY TARGET DEVICE FAILED TO RESPOND Specialized use in conjunction with gateways, indicates that no response was obtained from the target device. Usually means that the device is not present on the network.

Example

Table 692: Example:

Modbus request of the client:			
	Function code:	01	Read n bits
	Server operand address:	4000HEX = 16384DEC	Area for read access disabled in server

Modbus response of the server:			
	Function code:	81HEX	
	Error code:	03	

Function block COM_MOD_MAST

This function block is only required in the operating mode Modbus client. It handles the communication (transmission of telegrams to the servers and receipt of telegrams from the servers). The function block can be used for the local serial interfaces of the controller. A separate instance of the function block has to be used for each interface.

↳ *Chapter 1.5.4.22.1.1 “COM_MOD_MAST” on page 1698* is contained in the library Modbus_AC500_V1x.lib.

1.6.4.1.9 Communication with Modbus TCP/IP

Protocol description

The Modbus TCP protocol is implemented in the AC500 processor modules.

Modbus is a master-slave (client-server) protocol. The client sends a request to the server(s) and receives the response(s).

Each Ethernet interface can work as Modbus client and server interface in parallel if required.

The Modbus operating mode of an Ethernet interface is set in ↳ *Chapter 1.6.5.3.3.1 “Modbus on TCP/IP protocol” on page 6173*.

Modbus client

In the operating mode client, the telegram traffic with the server(s) is handled via the function block ↳ *Chapter 1.5.4.13.1.4 “ETH_MOD_MAST” on page 1202* or ↳ *Chapter 1.5.4.13.1.19 “ETHx_MOD_MAST” on page 1250*. These function blocks send Modbus request telegrams to the server(s) via the set interface and receive Modbus response telegrams from the server(s) via this interface.

The Modbus function blocks transferred by the client contain the following information:

- Transaction identifier for synchronization between messages of server and client (2 byte)
- Protocol identifier (0 for Modbus/TCP) (2 byte)
- Length field (Number of bytes in frame) (2 byte)
- Unit identifier (1 byte)
- Function code that defines the request of the client (1 byte)
- Data to be exchanged (n bytes)

Modbus server

In this operating mode, no function block is required for Modbus communication. Sending and receiving Modbus telegrams is performed automatically.

The AC500 CPUs process the following Modbus operation codes:

Function code		**Description**
DEC	**HEX**	
01 or 02	01 or 02	Read n bits
03 or 04	03 or 04	Read n words
05	05	Write one bit (encoded in one word)
06	06	Write one word
07	07	Fast reading the status byte of the CPU
15	0F	Write n bits (encoded in one byte)
16	10	Write n words
22	16	Mask write
23	17	Read/write multiple words in one telegram

The following restrictions apply to the length of the data to be sent:

Function code		Max. length
DEC	HEX	
01 or 02	01 or 02	2000 bits
03 or 04	03 or 04	125 words / 62 double words
05	05	1 bit
06	06	1 word
07	07	8 bits
15	0F	1968 bits
16	10	123 words / 61 double words [1])
22	16	Write: 1 word
23	17	Read: 125 words / 62 double words Write: 120 words / 60 double words

Technical data

Configuration of Modbus on TCP/IP is described in the chapter *Chapter 1.6.5.3.3.1 “Modbus on TCP/IP protocol” on page 6173*.

Modbus addresses for AC500 CPUs

Modbus address table

A range of 128 kB is allowed for the access via Modbus, i.e., the segments line 0 and line 1 of the addressable flag area (%M area) can be accessed. Thus, the complete address range 0000hex up to FFFFhex is available for Modbus.

The availability of the segments depends on the CPU. The size of the %M area can be found in the technical data of the CPUs and in the target system settings.

Inputs and outputs cannot be directly accessed using Modbus.

The address assignment for word and double word accesses is done according to the following table:

Table 693: Modbus addresses (word accesses)

Modbus address		Byte	Bit (byte-oriented)	Word	Double word
HEX	DEC	BYTE	BOOL	WORD	DWORD
Line 0					
0000	0	%MB0.0	%MX0.0.0 ... %MX0.0.7	%MW0.0	%MD0.0
		%MB0.1	%MX0.1.0 ... %MX0.1.7

001E	30		%MX0.3.6		
001F	31		%MX0.3.7		
0020	32	%MB0.4	%MX0.4.0	%MW0.2	%MD0.1
0021	33		%MX0.4.1		
0022	34		%MX0.4.2		
...	...	...	...	...	...
0FFF	4095	%MB0.511	%MX0.511.7	%MW0.255	%MD0.127
1000	4096	%MB0.512	%MX0.512.0	%MW0.256	%MD0.128
...	...	...	...	...	...
7FFF	32767	%MB0.4095	%MX0.4095.7	%MW0.2047	%MD0.1023
8000	32768	%MB0.4096	%MX0.4096.0	%MW0.2048	%MD0.1024
...	...	...	...	...	...
FFFF	65535	%MB0.8191	%MX0.8191.7	%MW0.4095	%MD0.2047

Calculation of the bit variable from the hexadecimal address:

Formula:			
	Bit variable (BOOL) := %MX0.BYTE.BIT		
where:	DEC	Decimal address	
	BYTE	DEC / 8	
	BIT	DEC mod 8	(Modulo division)

Examples:

- Address hexadecimal = 16#2002
  DEC := 8194
  BYTE := 8194 / 8 := 1024
  BIT := 8194 mod 8 := 2
  Bit variable: %MX0.1024.2
- Address hexadecimal = 16#3016
  DEC := 12310
  BYTE := 12310 / 8 := 1538,75 -> 1538
  BIT := 12310 mod 8 := 6
  Bit variable: %MX0.1538.6
- Address hexadecimal = 16#55AA
  DEC := 21930
  BYTE := 21930 / 8 := 2741,25 -> 2741
  BIT := 21930 mod 8 := 2
  Bit variable: %MX0.2741.2

Calculation of the hexadecimal address from the bit variable:

Examples:

- Bit variable := %MX0.515.4
  DEC := 515 * 8 + 4 := 4124
  Address hex := 16#101C
- Bit variable := %MX0.3.3
  DEC := 3 * 8 + 3 := 27
  Address hex := 16#001B
- Bit variable := %MX0.6666.2
  DEC := 6666 * 8 + 2 := 53330
  Address hex := 16#D052

Peculiarities for accessing Modbus addresses

Peculiarities for bit access:

- As you can see in the address table, a WORD in the %M area is assigned to each Modbus address 0000hex .. FFFFhex
- Bit addresses 0000hex .. FFFFhex are contained in the word range %MW0.0 .. %MW0.4095

Areas protected from read/write access by Modbus client

As described in the PLC configuration, one write-protected and one read-protected area can be defined for each segment line 0 and line 1. If you try to write to a write-protected area or to read from a read-protected area, an exception response is generated.

Segment exceedance for line 0 and line 1:

A write- or read-protected area that lies in both segments, line 0 and line 1, cannot be accessed with a write/read operation. In case of a segment exceedance, an exception response is generated.

Example

Read 10 words beginning at address := 7FFEhex

This includes the addresses: 7FFEhex...8007hex with the operands %MW0.32766...%MW1.7. Because line 0 is exceeded in this case, an exception response is generated.

Due to this, two requests have to be generated here:

1. Read 2 words beginning at address := 7FFEhex.

2. Read 8 words beginning at address := 8000hex.

Comparison between AC500 and AC31/S90 Modbus addresses

The following table shows the addresses for AC500 controllers and its predecessor AC31/S90:

Address HEX	FCT HEX	AC1131 operand	FCT HEX	AC500 operand
Bit accesses				
0000 ... 0FFF	01, 02	%IX0.0 ... %IX255.15	01, 02, 05, 07, 0F	%MX0.0.0 ... %MX0.511.7
0000		%IX0.0		%MX0.0.0
0001		%IX0.1		%MX0.0.1
0002		%IX0.2		%MX0.0.2
...		...		...

Local data of the Modbus client

The address of the area from which data are to be read or to which data are to be written is specified in the function block *Chapter 1.5.4.13.1.4 “ETH_MOD_MAST” on page 1202* or *Chapter 1.5.4.13.1.19 “ETHx_MOD_MAST” on page 1250* at input "Data", via the ADR operator.

For the AC500, the following areas can be accessed using the ADR operator:

- Inputs area (%I area)
- Outputs area (%Q area)
- Area of non-buffered variables (VAR .. END_VAR or VAR_GLOBAL END_VAR)
- Addressable flag area (also protected areas for %M area)
- Area of buffered variables (VAR RETAIN .. END_VAR or VAR_GLOBAL RETAIN .. END_VAR)

Modbus telegrams

For a detailed description of the Modbus TCP telegrams and their elements please see the corresponding specifications on public websites.

Exception response by server

In operating mode Modbus client, the AC500 does only send requests, if the parameters at the MODMAST inputs are logically correct. Nevertheless, it can happen that a server cannot process the request of the client or that the server cannot interpret the request due to transmission errors or in case it’s capabilities are exceeded in any way. In those cases, the server returns an exception response to the client. In order to identify this response as an exception response, the function code returned by the server is a logical OR interconnection of the function code received from the client and the value 80HEX.

General telegram description

Table 694: Server response

Error code	CRC	
	High	Low

Possible error codes of the client

Code	Description
01DEC	ILLEGAL FUNCTION The server does not support the function requested by the client
02DEC	ILLEGAL DATA ADDRESS Invalid operand address in the server or operand area exceeded
03DEC	ILLEGAL DATA VALUE At least one value is outside the permitted range of values
04DEC	SERVER DEVICE FAILURE An unrecoverable error occurred while the server was attempting to perform the requested action
05DEC	ACKNOWLEDGE Specialized use in conjunction with programming commands. The server has accepted the request and is processing it, but a long duration of time will be required to do so. This response is returned to prevent a timeout error from occurring in the client. The client can next issue a Poll Program Complete message to determine if processing is completed
06DEC	SERVER DEVICE BUSY Specialized use in conjunction with programming commands. The server is engaged in processing a long–duration program command. The client should retransmit the message later when the server is free.
07DEC	NEGATIVE ACKNOWLEDGE Specialized use in conjunction with programming commands. The server cannot perform the programming functions. Client should request diagnostic or error information from server.
08DEC	MEMORY PARITY ERROR Specialized use in conjunction with function codes 20 and 21 and reference type 6, to indicate that the extended file area failed to pass a consistency check. The server attempted to read record file, but detected a parity error in the memory. The client can retry the request, but service may be required on the server device.
09DEC	UNDEFINED Actually not defined by Modbus specification but might be used by particular servers.
10DEC	GATEWAY PATH UNAVAILABLE Specialized use in conjunction with gateways, indicates that the gateway was unable to allocate an internal communication path from the input port to the output port for processing the request. Usually means that the gateway is misconfigured or overloaded.
11DEC	GATEWAY TARGET DEVICE FAILED TO RESPOND Specialized use in conjunction with gateways, indicates that no response was obtained from the target device. Usually means that the device is not present on the network.

Example

Table 695: Example:

Modbus request of the client:			
	Function code:	01	Read n bits
	Server operand address:	4000HEX = 16384DEC	Area for read access disabled in server

Modbus response of the server:			
	Function code:	81HEX	
	Error code:	03	

Function blocks ETH_MOD_MAST and ETHx_MOD_MAST

These function blocks are only required for the operating mode Modbus client. They handle the communication (transmission of telegrams to the servers and receipt of telegrams from the servers). The function blocks can be used for any Ethernet interface of the controller itself or it's communication modules.

↳ *Chapter 1.5.4.13.1.4 "ETH_MOD_MAST" on page 1202* and ↳ *Chapter 1.5.4.13.1.19 "ETHx_MOD_MAST" on page 1250* are contained in the library Ethernet_AC500_V1x.lib.

1.6.4.1.10 Fast counters

Fast counters in AC500 devices

For AC500 devices the function "fast counter" is available in S500 I/O modules as of firmware version V1.3.

For AC500-eCo devices the function "fast counter" is available in onboard I/Os of PM55x and PM56x.

Integrated fast counters are only available for digital I/O modules.

The digital I/O modules on the I/O bus contain two fast counters each.

If the counter is used, it needs up to 2 digital inputs and one digital output.

If the fast counter is deactivated, the inputs and outputs reserved for the counter can be used for other tasks.

See ↳ *Chapter 1.6.5.2.9.8 "Fast counter" on page 6063*.

A fast counter is available in the following constellations:

- In digital I/O modules, connected to an AC500 processor module.
- In AC500-eCo V2 processor modules PM55x and PM56x with onboard I/Os.
- In CS31 and CANopen communication interface modules.
- In Modbus, PROFIBUS and PROFINET communication interface modules and in the connected digital I/O modules.
- In digital I/O modules, connected to an EtherCAT communication interface module.

Fast counter integrated in S500 modules

The following table shows the S500 modules which contain a fast counter and which of the digital inputs and outputs are reserved for the counter.

Module	Assigned inputs [1])		Assigned output	Remarks
	Channel A	Channel B	Channel C [2]) or (CF)	
DA501	DC16	DC17	DC18	The counter function is not available if the modules are mounted on the communication interface modules CI581-CN or CI582-CN
DA502	DC16	DC17	DC18 - in mode 1 and mode 2 DO0 - in mode 101 and mode 102 [3])	
DC522	C8	C9	C10	
DC523	C16	C17	C18	
DC532	C24	C25	C26	
DI524	I24	I25	No hardware output available	
DX522	I0	I1	The counter does not activate any relay output	
DC551-CS31	C16	C17	C18	The counter function is activated by setting the correct address on the module [4])
CI501-PNIO, CI541-DP, CI581-CN, CI521-MODTCP	DI0	DI1	DO0	
CI502-PNIO, CI542-DP, CI582-CN; CI522-MODTCP	DI8	DI9	DO8	
CI590-CS31-HA	C8	C9	C10	The counter function is activated by setting the correct address on the module [4])
CI592-CS31	DC8	DC9	DC10	The counter function is activated by setting the correct address on the module [4])

[1]) The two hardware inputs (channels A and B) are also and always available within the normal process image, irrespective of the operating mode of the counter.

[2]) The hardware output channel C is activated by the fast counter only in the operating modes 1 and 2.

[3]) Especially for module DA502: The counter operating mode 101 is the same as mode 1, but the assigned output is DO0 instead of DC18. Also the counter operating mode 102 is the same as mode 2, but the assigned output is DO0 instead of DC18.

[4]) The counter function of the CS31 communucation interface module can only be activated if a bus address greater than 70 is set on the module by means of the address rotary switches. In this case, the effective bus address equals the set address minus 70, and the counter is ready for operation. Example: A set bus address of 83 means that the effective bus address = (83 - 70) = 13 and that the integrated fast counter can be used. In this case the parameter “Fast counter operating mode” may not be 0!

The counter function is performed within the communication interface module and, accordingly, in the digital I/O module(s). It works independently of the user program and is therefore able to respond quickly to external signals. A simultaneous counter operation of several digital I/O modules is possible.

Each module counter can be configured for one out of 10 possible modes. The desired operating mode is selected in the PLC configuration using module parameters. After that, it is activated during the initialization phase (power-on, cold start, warm start).

The data exchange to and from the user program is performed using input and output operands. While integrating a module containing a fast counter in the PLC configuration, the necessary operands are created and reserved immediately. Thus, a counter implementation carried out later on does not cause an address shift.

Features independent of the fast counter operating mode

- The pulses at the fast counters' inputs or the evaluated signals of the traces A and B in case of incremental position sensors are counted.
- The maximum counting frequency of digital I/O modules, operated at an AC500-CPU or CS31 communucation interface module, is 50 kHz. In certain operating modes, the maximum counting frequency is lower (see table *Chapter 1.6.5.2.9.8.1.2 “Operating modes” on page 6066*).
- The counting frequencies of the communication interface modules of PROFINET, PROFIBUS and CANopen are max. 200 kHz (in modes 1 to 6), max. 50 kHz (in mode 7), max. 35 kHz (in mode 9), and max. 20 kHz (in mode 10).
- If the modules DA501, DC522, DC523, DC532, DC551-CS31, CI592-CS31 and CI590-CS31-HA are used, each counting input must be circuited externally in series with a resistor of 470 Ω / 1 W, in order to safely avoid influences from the deactivated module outputs to the connected sensors.
- The positive signal edges are counted, if not noted differently.
- By setting the operating mode 0, the counting function is switched off. In this case, the reserved inputs and outputs can be used for other tasks. Simultaneous use of these terminals for the fast counter and other signals must be avoided.
- The fast counter's actual value is provided as a double word (32 bits).
- The fast counter can count upwards in all operating modes. It counts beginning at the start value (set value) up to the end value (max. from 0 to 4,294,967,295 or hexadecimal from 00 00 00 00 to FF FF FF FF. After reaching 4,294,967,295, the counter jumps with the next pulse to 0. When the counter reaches the programmed end value, the counter output is stored permanently as CF = TRUE (end value reached). Only when the fast counter is set again (set value), CF is reset to FALSE.

Further information

- Operating modes of the fast counter: *Chapter 1.6.5.2.9.8.1.2 “Operating modes” on page 6066*
- Configuration of the fast counter: *Chapter 1.6.5.2.9.8 “Fast counter” on page 6063*
- Operation with the library *Counter_AC500_V<>.lib*: *Chapter 1.5.4.9 “Counter library” on page 1037*

Fast counter in AC500-eCo (Onboard I/O in PM55x and PM56x)

For AC500 devices the function "fast counter" is available in S500 I/O modules as of firmware version V1.3.

For AC500-eCo devices the function "fast counter" is available in onboard I/Os of PM55x and PM56x.

In Processor Modules with onboard I/Os (AC500-eCo) fast counter functionality can be activated within the onboard I/O configuration. A Processor Module with onboard I/Os contains up to 2 fast counters (channel 0 and 1) according to the operating mode .

The fast counter can work in normal counter mode and A/B track counter mode. The normal counter detects the rising edge of the counter input. It will increase or decrease the count value at every rising edge. The A/B track counter is used to count the signal from a motion sensor. The counter can count with single phase, double phases or quad phases. In the following the behavior of the A/B track counter is described.

The fast counter cannot be used together with interrupt inputs at the same time.

Configuring the fast counter

The configuration of the fast counter is described in the chapter *Chapter 1.6.5.2.9.8 “Fast counter” on page 6063*.

Counting modes of the fast counter

The counting modes of the fast counters is described in the chapter *Chapter 1.6.5.2.9.8 “Fast counter” on page 6063*.

Operating the fast counter with the user program

The following function blocks can be used to operate the fast counter with help of user program:

Group: *Chapter 1.5.4.9 “Counter library” on page 1037*	
Chapter 1.5.4.9.1.2 “CNT_IO” on page 1043 *Chapter 1.5.4.9.1.3 “CNT_IO_EXT” on page 1050*	Fast counter of digital S500 I/O devices

Group: *Chapter 1.5.4.25 “Onboard IO library” on page 1733*	
Chapter 1.5.4.25.1.1 “ONB_IO_CNT” on page 1734	Handle fast counter on onboard I/Os

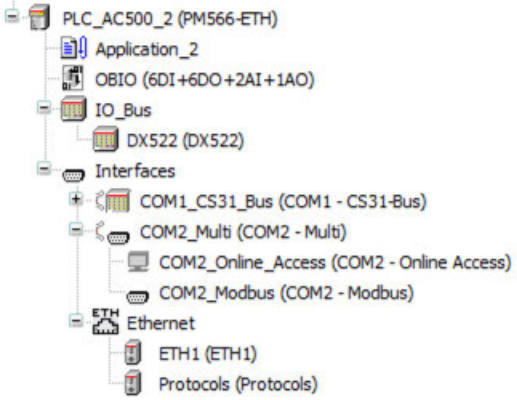
1.6.4.1.11 Special function blocks and programs

Function block COM_SET_PROT

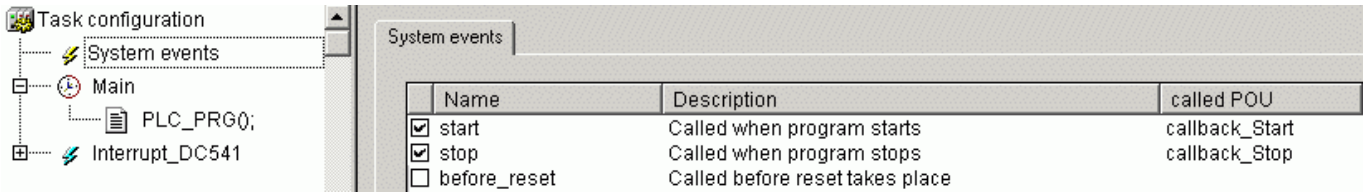
Function block *Chapter 1.5.4.19.3.1 “COM_SET_PROT” on page 1578* from SysInt_AC500_V10.lib can be used for different functions. In the following example COM2 is switched between "Online access" and Modbus (master):

1. In the device tree, append the *“COM2 - Multi”* protocol to the *“COM2”* node (*[Add object]*).
2. Append the *“COM2 - Online Access”* protocol to the *“COM2 - Multi”* node (Protocol with index 0).

3. Append the *"COM2 - Modbus"* protocol to the *"COM2 - Multi"* node (Protocol with index 1).



4. Set the system events START and STOP in the task configuration:



5. Call of block COM_SET_PROT in system events:

-

```
FUNCTION callback_Start: DWORD
VAR_INPUT
    dwEvent : DINT;
    dwFilter: DINT;
    dwOwner : DINT;
END_VAR
COM_SET_PROT(EN := FALSE);                      (* for edge
creation *)
COM_SET_PROT(EN := TRUE, COM := 2, IDX := 1);   (* switch to
Modbus *)

FUNCTION callback_Stop : BOOL
VAR_INPUT
    dwEvent : DINT;
    dwFilter: DINT;
    dwOwner : DINT;
END_VAR
COM_SET_PROT(EN := FALSE);                      (* for edge
creation *)
COM_SET_PROT(EN := TRUE, COM := 2, IDX := 0);   (* switch to
Online access *)
```

Sending/Receiving data with SysLibCom protocol

The following example shows how data is sent/received with the protocol "SysLibCom".

-> Telegrams of 32 bytes length are to be received and sent.

1. Declaration part of the program PROGRAM proSysLibCom_Test:

-

```
VAR

  strComSettings     : COMSETTINGS;             (* Structure of COM settings *)
  dwHandle           : DWORD;
  byStep             : BYTE;                    (* Step chain *)
  dwRead             : DWORD;                   (* Number of characters received
*)
  dwWritten          : DWORD;                   (* Number of characters sent *)
  bEnSend            : BOOL;                    (* Enable sending *)
  byCom              : BYTE := COM2;            (* COM number *)
  dwBaudrate         : DWORD := 19200;          (* Baudrate *)
  wLenRec            : WORD := 32;              (* Number of characters to be
received *)
  wLenTele           : WORD := 32;              (* Telegram length, here 32
characters for example *)
  wLenSend           : WORD := 32;              (* Number of characters to be
sent, for example 32 characters *)
  dwTimeoutSend      : DWORD := 0;              (* Timeout in [ms] for sending *)
  dwTimeoutRec       : DWORD := 0;              (* Timeout in [ms] for receiving *)
  abyRecBuffer       : ARRAY[0..271] OF BYTE;   (* Receive buffer, 272 bytes min.!
*)
  abyTeleBuffer      : ARRAY[0..543] OF BYTE;   (* Telegram buffer, 2 x receive
buffer min. *)
  aby SendBuffer     : ARRAY[0..271] OF BYTE;   (* Send buffer, telegram length
max.! *)
  strDataRec         : StrucReceiveData;        (* Structure of receive telegram
*)
  strDataSend        : StrucSendData            (* Structure of send telegram *)

END_VAR
```

2. Code part of the program

   -> Processing of a step chain containing the following steps:

   -

```
CASE byStep OF

0:  (* Step 0: Open the interface COMx -> SysComOpen -> get handle *)
    strComSettings.Port :=
byCom;                                                          (* COM_Number *)
    dwHandle :=
SysComOpen(strComSettings.Port);                                          (* Open
COM interface -> get handle *)
    byStep := SEL( dwHandle <> INVALID_HANDLE, 250,
1);                                  (* handle ok -> Step 1, otherwise error step
250 *)

1:  (* Step 1: Transfer of COMx interface parameters *)
    strComSettings.dwBaudRate :=
dwBaudrate;                                               (* Set baudrate *)
    (* Enter at this point the number of stop bits and parity, if necessary *)

    (* set COM settings -> if OK, run step 2, in case of an error step 250 *)
    byStep := SEL( SysComSetSettings(dwHandle, ADR(strComSettings)), 250, 2);

2:  (* Step 2: Initialization completed successfully -> now receiving and/or
sending *)

    (* Receive data: read all data received since last run, but wLenRec max.! *)
    dwRead := SysComRead (dwHandle, ADR(abyRead),
                          WORD_TO_DWORD(wLenRec),
dwTimeoutRec);                        (* READ DATA *)
    IF (dwRead > 0) THEN (* Number of characters received; in bytes *)
                         (* here, ignore for example all characters until valid
telegram start detected *)

                         (* Number of receiving cycles for the telegram *)
                         dwNumReadPerTele[byCom] := dwNumReadPerTele[byCom] + 1;
                         (* Copy data to buffer *)
                         SysMemCpy      (dwDest :=
ADR(abySumDataRead[dwSum]DataRead]),

1.6.4.2 System technology of the AC500 communication modules

1.6.4.2.1 Ethernet communication modules

Ethernet

Frame formats

One fundamental part of the Ethernet specification is the arrangement of the data transfer format. When transferring data via Ethernet, the actual user data are preceded by a so-called preamble (which is among other things used to synchronize the receiver stations) as well as the hardware source and target address and a type length field. A checksum follows after the user data. All information mentioned above together constitute an Ethernet frame. During the development of the Ethernet, different types of frames arose.

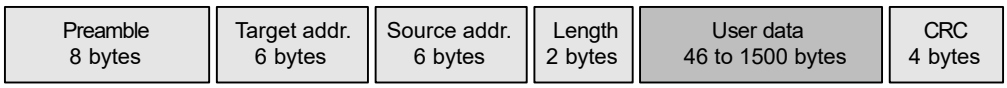

Fig. 1112: Structure of an Ethernet 802.3 frame

It has to be observed that the transferred user data do not inevitably contain only useful information. When transmitting data using a protocol above Ethernet (refer to 1.2.5), each protocol layer passed prior to the actual transmission supplements the original user data by its specific frame or header, so that the maximum number of actual user data is smaller, depending on the used protocols.

MAC address

Each Ethernet terminal device that has the MAC layer functions implemented (refer to 1.2.5 Ethernet and TCP/IP) has a world-wide unique hardware and MAC address. In this 6 bytes address, the two most significant bits of the first byte have specific functions. The most significant bit is also called the I/G bit (Individual/Group bit) and indicates whether it is an individual world-wide unique address (unicast address, I/G bit = 0) or a group address (I/G bit = 1). The second most significant bit is called the G/L bit and indicates whether it is a globally or a locally administered MAC address. A GAA (Globally Administered Address, G/L bit = 0) is an address which is fixed programmed by the device manufacturer and has to be unique all over the world. An LAA (Locally Administered Address, G/L bit = 1) can be a MAC address which has been changed afterwards for the use within a network. For this, it has to be observed that a MAC address has to be unique within a network.

The first 3 bytes of a MAC address are the manufacturer-related address part. Using this value, the manufacturer of an Ethernet chip can be determined. Each manufacturer of Ethernet components has one or several pre-defined address ranges assigned he can use for his products. 3COM, for example, uses among others the MAC address range 02-60-8C-xx-xx-xx.

For Ethernet, the MAC address is represented in a canonical form. This representation starts with the least significant bit (LSB) and ends with the most significant bit (MSB) of a byte. The following figure shows a global unicast address of the manufacturer 3COM.

Canonical representation 02-60-8C-00-00-01

Binary representation 01000000-00000110-00110001-00000000-00000000-10000000

Bus access methods

Ethernet uses the CSMA/CD access method (Carrier Sense Multiple Access / Collision Detection). With this method, the station that wants to transmit data, first "listens" to the carrier whether data are currently being transmitted by another station (carrier sense). If the carrier is busy, the station later tries to access the carrier again. If the carrier is idle, the station starts the transmission.

With this method, particularly in greater networks, it can happen that several stations try to transmit at the same time (multiple access). As a result, they "listen" to the carrier, detect that the carrier is free and correspondingly start the transmission. This can cause collisions between the different data packets. This is why each station verifies whether a collision occurred during transmission (collision detection). If this is the case, the station aborts the transmission and then tries to send its data again after a wait time which is determined by a random generator.

Collisions within an Ethernet network do not cause loss of data, but they reduce the available bandwidth of the network. In practice, for a network with 30 stations on the bus, a net bandwidth of approx. 40 % is assumed. This means that a bandwidth of only approx. 4 Mbit/s is available in a network with a theoretical bandwidth of 10 Mbit/s, for instance. This has to be considered when planning an Ethernet network. The number of collisions can be reduced to a minimum if the network is carefully planned and if only suitable network components are used (refer to 1.4 Cabling and 1.5.4 Media converters).

Half duplex and full duplex

If communication is only possible in one direction (transmission or reception), this is called half duplex mode. However, the separate transmit and receive lines of today's twisted pair cabling for Ethernet networks also allow full duplex operation. In full duplex mode, the stations can simultaneously exchange data in both directions independent from each other. Due to this, the CSMA/CD method is not necessary in full duplex mode. Networks with more than two stations working in full duplex mode can only be implemented using switches because these switches establish peer-to-peer connections between the individual stations (refer to 1.4 Cabling).

Auto negotiation

Today, Ethernet uses transmission rates of 10, 100 or 1000 Mbit/s in half duplex or in full duplex mode. However, not all devices support all possible settings. This particularly makes the optimum network configuration more difficult for networks using twisted pair cables of the same kind and components which can be used with 10 Mbit/s or 100 Mbit/s in half duplex or in full duplex mode as desired. Imperfect configurations can lead to link errors or at least to performance losses because the maximum possible transmission rate is not used.

Due to this, the auto negotiation functionality (in the past also called Nway) has been established with the introduction of Fast Ethernet. With this functionality, the stations agree on the highest possible transmission rate and, if possible, full duplex operation. Then, all subscribers on the network configure themselves optimally.

However, problems could arise if one component in one segment is configured manually, i.e. if it has been set to a fixed transmission rate and mode and the auto negotiation function has been switched off. In this case, a device operating in auto negotiation mode informs the manually configured device about its possible settings but does not receive any response.

Ethernet and TCP/IP

Like nearly all standards in the field of data transmission, Ethernet also follows the ISO/OSI layer model. Based on this reference model, the principle course of a transmission is described. Each of the 7 parts (layers) has a particular function and makes it available for the next higher layer.

The Ethernet standard IEEE-802.3 defines the function of the two lowest layers. These layers consist of the following components and the Logical Link Control (LLC) which is described in the IEEE standard 802.2.

- Media Access Control Protocol (MAC)
- Physical Layer Signalling (PLS)
- Attachment Unit Interface (AUI)
- Medium Dependent Interface (MDI)
- Physical Medium Attachment (PMA)

Since the ISO/OSI model did not yet exist when the development of TCP/IP protocols started, these protocols are based on the DoD architecture. The DoD model cannot be clearly transferred to the ISO/OSI model. The following figure shows a comparison of Ethernet in the ISO/OSI model and the TCP/IP protocols adapted to that model. This shall explain that Ethernet does not necessarily mean TCP/IP (and vice versa). To be precise, TCP/IP is only based on Ethernet and can also be used in other data networks (e.g. for satellite links). In return, TCP/IP is not the only protocol used in Ethernet networks. Actually, TCP/IP is only one of numerous protocols which are used side by side.

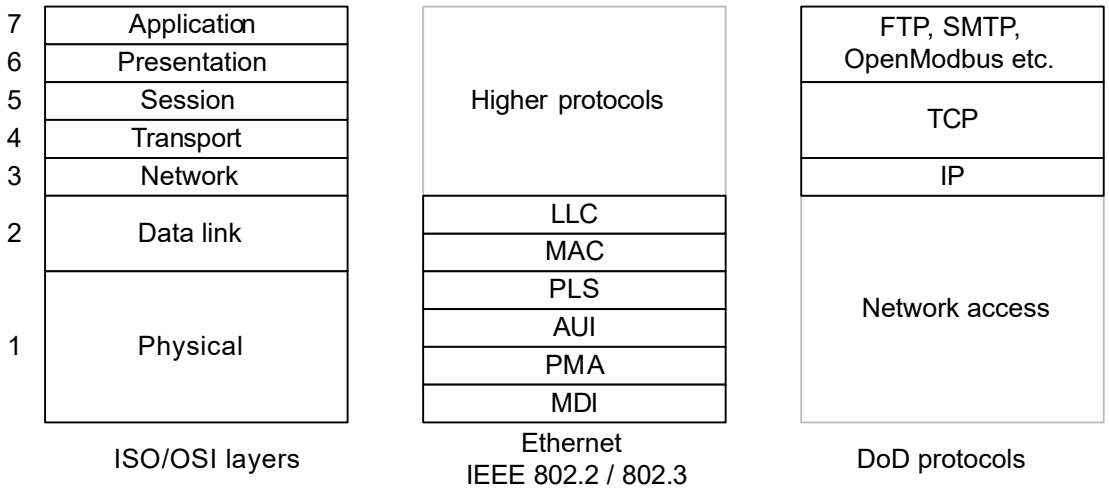

Fig. 1113: Ethernet in the ISO/OSI model

Supported protocols

IP - Internet protocol (RFC 791)

- Freely configurable IP address and network mask
- Configurable IP address of the standard gateway
- IP datagram size: 1500 bytes max.
- Route cache size: 32 entries
- Route timeout: 900 seconds
- Number of IP multicast groups: 64 for reception, unlimited for transmission

IP - Internet protocol (RFC 791)

TCP - Transmission control protocol (RFC 793, RFC 896)

Amount of user data for TCP telegrams: 1460 bytes max.

UDP - User datagram protocol (RFC 768)

Amount of user data for UDP telegrams: 1472 bytes max.

BOOTP - Bootstrap protocol (RFC 951, RFC 1542, RFC 2132)

DHCP - Dynamic host configuration protocol (RFC 2131, RFC 2132)

OpenModbus

- Client and/or server mode (several times)
- Up to 8 simultaneous client or server connections
- Supported function codes: 1, 2, 3, 4, 5, 6, 7, 15, 16. As of FW 2.2: in addition 22, 23

- Maximum amount of data per telegram: 100 coils (words) or 255 registers (bits)
- Configurable connection monitoring functions

NetIdent

- Devices can be identified and accessed via the network (even unconfigured devices)
- Unique identification and localization via rotary switch on the devices

ARP - Address resolution protocol (RFC 826)

- ARP Cache size: 64 entries
- ARP Timeout: 600 seconds

ICMP - Internet control message protocol (RFC 792)

IGMPv2 - Internet group management protocol, version 2 (RFC 2236)

Sockets

- Number of sockets: 16
- Socket options can be set individually

Restrictions

- IP fragmentation is not supported
- TCP Urgent Data is not supported
- TCP port 0 is not supported
- TCP port 502 is reserved for OpenModbus
- TCP port 1200 is reserved for gateway access
- UDP port 67 is reserved for BOOTP and DHCP
- UDP port 25383 is reserved for NetIdent protocol
- UDP port 32768 is reserved for UDP blocks

Designing and planning a network

Introduction

To obtain optimum performance within a network, it is absolutely essential to plan the network beforehand. This applies to both the initial installation as well as its expansion. Rashly installed networks can not only cause poor network performance, they even can lead to a loss of data since restrictions given by the standard are possibly not kept. At first glance, designing a network causes additional costs, but it will later reduce maintenance expenditures during operation.

The following sections shall explain some principle methods for determining a suitable network structure and give some hints how to find out the network utilization and performance.

Concepts for structuring a network

Designing and planning a network

To obtain optimum performance within a network, it is absolutely essential to plan the network beforehand. This applies to both the initial installation as well as its expansion. Rashly installed networks can not only cause poor network performance, they even can lead to a loss of data since restrictions given by the standard are possibly not kept. At first glance, designing a network causes additional costs, but it will later reduce maintenance expenditures during operation.

The following sections shall explain some principle methods for determining a suitable network structure and give some hints how to find out the network utilization and performance.

Models

Regarding the network technology the following three general models are distinguished:

- Hierarchy model
- Redundant model
- Safe model

The selection of the suitable model as a basis for planning a network depends on the specific requirements of the installation. Office networks are typically built up based on the hierarchy model since the individual clients do not very often exchange data with each other but only periodically contact the server. Installation-internal networks which do not have any connection to the company network often only consist of automation devices and do not have a server. The connected controllers transmit data in short intervals directly to each other. Furthermore, the operational safety of installation-internal networks has a higher importance since data transmission malfunctions can result in incorrect behavior of the installation or even in production stops. In such cases it is more suitable to choose the redundant model or a safe model.

In the end, all three models shown above are based on the use of switching hubs (switches). Whereas in the past simple hubs were increasingly used to set up a network wherever permitted by the requirements, today almost exclusively switches are used. Using switches, historic Ethernet rules such as the length restrictions of a collision domain no longer have to be observed. This considerably simplifies the network design. Even though the use of switches could make us believe that networks can be expanded to infinite size, it has to be considered that each switch involved in a data transfer causes a delay. Therefore, the IEEE-802.1d bridging standard recommends to limit the number of switches to be passed between two terminal devices to a maximum of seven switches.

Hierarchy model

The hierarchy model intends the subdivision of the network into several levels and a graduation of the data rate between the individual levels. For this purpose, normally at least two grades are used e.g. by connecting the server with a data rate of 100 Mbit/s to the network and the clients with 10 Mbit/s. The advantage of this design is that the server has 10 times the bandwidth of the clients available which enables the server to provide sufficient bandwidth and response time for several clients. Despite the fact that 10 times the bandwidth does not mean that 10 clients can simultaneously access the server, the data transmitted to or from the clients do only need one tenth of the time. In total, this reduces the response time for each individual client.

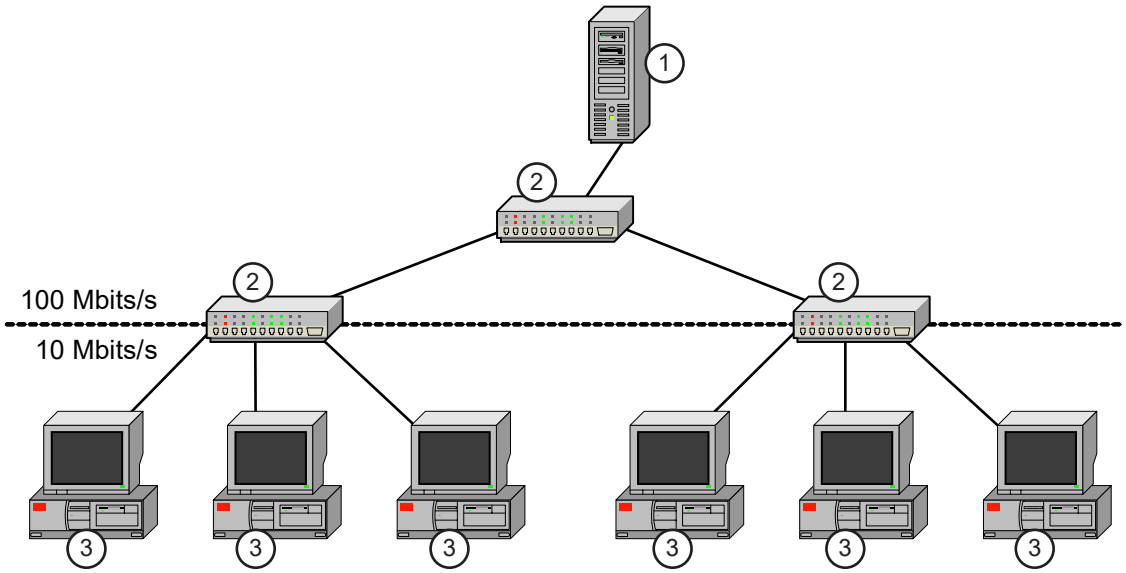

Fig. 1114: Hierarchy model

1	Server
2	Switch
3	Client

When dimensioning the individual levels the utilization of the particular level has to be considered. Devices connected to each other via hubs can only be operated in half-duplex mode. Consequently they have to share the commonly used network (shared media). If the utilization of such a shared media is higher than 40 % over a longer period of time, a switch should be used instead of a hub in order to subdivide the collision domain and thus remove load from it. The utilization threshold within such a switched media is 80 %. If this value is exceeded, the utilization should be reduced by selecting a smaller grouping.

Redundant model

The meshed Ethernet structure is a typical example for a redundant network model. To obtain fault tolerance, several connections have to be established between switches or nodes. This way, data exchange can be performed using another (redundant) connection if one connection fails.

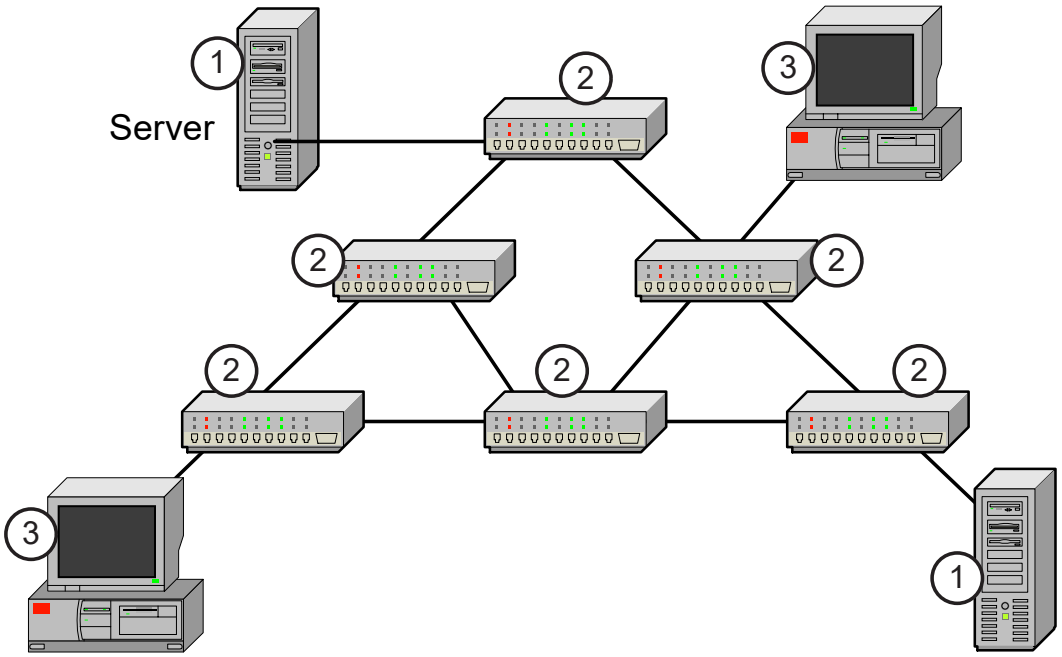

Fig. 1115: Redundant model

1	Server
2	Switch
3	Client

However, this meshed constellation leads to loops which would make well-ordered data exchange impossible. The loops would cause the broadcast or multicast data packets to endless stray in the network. In order to suppress such loops, the spanning tree mechanism ↳ *Chapter 1.6.4.2.1.3.3 “Network components” on page 5518* is used which always activates only one unique connection and deactivates all other possible connections. On the occurrence of a fault (e.g. caused by an interruption of the network line) the redundant connection is re-activated and then maintains communication between the switches. However, switching of the connection is not without interruption. The time needed for switching depends on the size and structure of the network.

The use of link aggregation which is often also called "trunking" likewise provides increased transmission reliability. Link aggregation actually means the parallel connection of several data lines. This way the bandwidths of the individual data lines are bundled in order to increase the total bandwidth. Furthermore, the parallel connection establishes a redundant connection. If one data line fails, the data can still be transmitted via the remaining lines even though only with reduced bandwidth.

Safe models

To obtain a certain grade of safety for the transmitted data against unauthorized access or to optimize the network utilization, it is suitable to design so-called Virtual Bridged Local Area Networks (VLANs). In a VLAN the data flow is grouped. The simplest variant of a VLAN is obtained by a port-related grouping which means that particular ports of a switch are assigned to a VLAN and data exchange is then only performed within this VLAN. A VLAN can be considered as a group of terminal stations which communicate like in a usual LAN although they can be located in different physical segments. In the end, establishing VLANs leads to a limitation of the broadcast domains. As a result, all subscribers of a VLAN only receive data packages which have been sent by subscribers of the same VLAN. Independent of their physical location, all subscribers of a VLAN are logically put together to one broadcast domain. The limitation of the broadcast domains relieves load from the network and provides safety since only the members of the VLAN are able to receive the data packets.

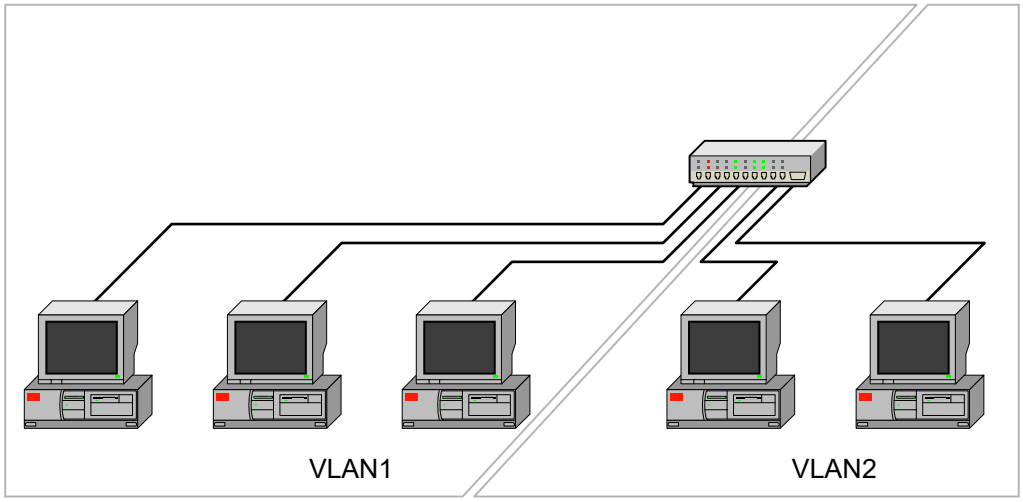

Fig. 1116: Safe models

In order to enable a terminal device connected to a switch to exchange data beyond the borders of the VLAN, the port of the switch has to be assigned to several VLANs. Apart from the simple variant of the port-based VLAN, it is also possible to establish VLANs by evaluating additional information contained in the Ethernet frames.

Utilization and performance

In the description of the network models it has already been mentioned that the existing hubs should be replaced by switches in order to subdivide the collision domain and thus remove load, if the utilization of a shared media is higher than 40 % over a longer period of time. If the utilization within such a switched media is permanently above 80 %, it is recommended to further relieve load by performing smaller grouping.

However, a network should basically not be dimensioned for the burst utilization. During normal operation usually many smaller data packets are transmitted rather than large data streams. This means that the network load regarding the bandwidth is not as high. Nevertheless, if any bottle-necks occur, the simplest method to eliminate them is to increase the data rate (e.g. from 10 Mbit/s to 100 Mbit/s). In existing networks, however, this is not always possible without problems since the cable infrastructure is possibly not suitable for the higher data rate and the expenditure for a new cabling is possibly not defensible. The only solution in such cases is a segmentation of the network which results in a reduction of the number of devices within the network or collision domain and thus provides more bandwidth for the remaining devices.

A segmentation of a network can be obtained with routers, bridges or switches. However, segmentation is only meaningful if the 80/20 rule is considered and observed. The 80/20 rule says that 80 % of the data traffic have to take place within the segment and only 20 % of the data traffic are forwarded to another segment. This is why a previous analysis of the network traffic is required to enable meaningful grouping. In this analysis it has to be determined which station is communicating with which other stations in the network and which amount of data is flowing for this communication. For shared media the network should be divided in a way that stations producing roughly the same load should be grouped in one collision domain, if it is not possible to make a division based on the communication paths. This way it is guaranteed that stations with lower data traffic are able to meet the typical requirements regarding short response times. Stations with permanently high data traffic generally cause a drastic increase of the response times.

Best performance increase can be obtained by using switches and connecting each single station directly to the switches. This way each station has its own connection to a switch and thus can use the full bandwidth of a port in full-duplex mode. This subdivision and the provision of the dedicated connections is called micro-segmentation. For micro-segmentation the 80/20 rule does no longer apply. It has only to be guaranteed that a switch is able to provide sufficient internal bandwidth.

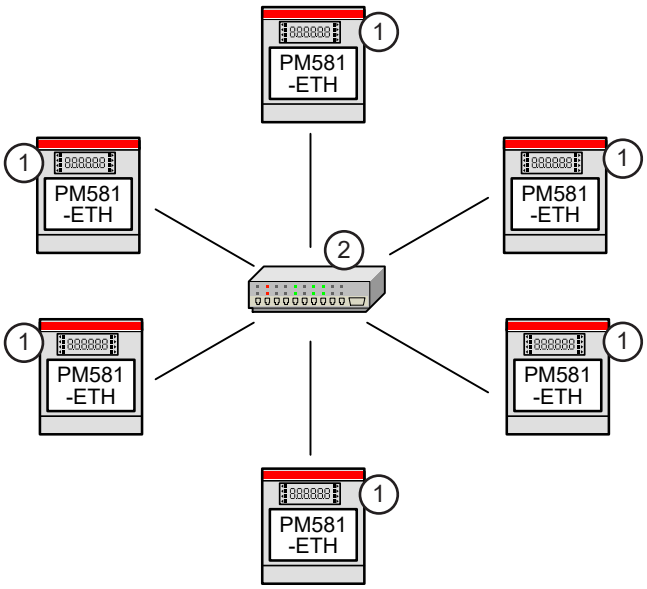

Fig. 1117: Direct connection of all stations to switches

1 AC500 Processor Module with Ethernet
2 Switch

In order to plan a network with optimum performance, we have to think about the question what a network is able to achieve at all. Taking the standards as a basis it can be determined how many data per time can be transmitted via a network theoretically. The smallest Ethernet frame size is 64 bytes long and contains 46 bytes of user data, the maximum frame size is 1518 bytes at 1500 bytes of user data, each plus 64 bits for the preamble and 96 bits for the inter-frame gap. This results in a minimum length of 672 bits (64 x 8 + 64 + 96) and a maximum length of 12304 bits (1518 x 8 + 64 + 96). The transmission of one bit takes 10 ns for fast Ethernet (100 Mbit/s) and 100 ns for Ethernet (10 Mbit/s). Using these values we can calculate how many data packets of the smallest and the maximum length can be transmitted per second theoretically (see tables). The calculation of the corresponding amount of user data which can be transmitted (without taking into account the additional overheads of the higher protocols) now shows the considerably higher protocol overhead caused by the small data packets.

Table 696: Data rate at 10 Mbit/s:

10 Mbit/s	Length [bits]	Time/bit [ns]	Time/frame [ns]	Frames [ns]	User data/ frame [1/s]	User data [bytes/s]
min. frame	672	100	67 200	14 880	46	684 480
max. frame	12 304	100	1 230 400	813	1 500	1 219 500

Table 697: Data rate at 100 Mbit/s:

100 Mbit/s	Length [bits]	Time/bit [ns]	Time/frame [ns]	Frames [ns]	User data/ frame [1/s]	User data [bytes/s]
min. frame	672	10	6 720	148 800	46	6 844 800
max. frame	12 304	10	123 400	8 127	1 500	12 195 000

The corresponding net bandwidth can be calculated from the ratio of the amount of user data per second to the available network bandwidth. The net bandwidth is independent of the transmission rate and calculated in the following table taking a transmission rate of 100 Mbit/s as an example.

Table 698: Net bandwidth at 100 Mbit/s:

100 Mbit/s	User data [bits/s]	Network bandwidth [bits/s]	Net bandwidth [%]
min. frame	54 758 400	100 000 000	54.7
max. frame	97 524 000	100 000 000	97.5

These calculations point out that the percentage of the network performance is considerably higher for the transmission of larger frames. The efficiency of the data transmission which is independent of the transmission rate is shown in the following table using some selected frame sizes as an example. However, the values given in the table only consider the protocol overhead of the MAC and the network layer. The user data are reduced accordingly by the additional overhead of the corresponding higher layers.

Table 699: Efficiency of data transmission:

User data [bits]	Frame size [bits]	Overhead [%]	Efficiency [%]
1500	1518	1.2	98.8
982	1000	1.8	98.2
494	512	3.6	96.4
46	64	39.1	60.9

A calculation of the typical transmitted frame sizes may be still possible for small closed networks inside an installation with only automation devices connected. But, for instance, if PCs are additionally connected to the network (even if they are connected only temporarily) the frame sizes can vary considerably. This makes it impossible to perform an exact calculation of the bandwidth or to make a precise statement regarding the performance. However, the following index values could be determined with the help of various studies about network performance.

- For low utilization of 0 to 50 % of the available bandwidth, short response times can be expected. The stations are able to send frames with a typical delay of smaller than 1 ms.
- For medium utilization between 50 and 80 %, the response times can possibly increase to values between 10 and 100 ms.
- For high utilization over 80 %, high response time and wide distribution can be expected. The sending of frames can possibly take up to 10 seconds.

This is why the following principles should be observed when designing an Ethernet network.

- Mixed operation of stations which have to transmit high data volumes and stations which have to operate with short response times (real time) should be avoided. Due to the wide distribution, short response times cannot be guaranteed within such combinations.
- As few as possible stations should be positioned inside of one collision domain. For this purpose, collision domains should be subdivided using switching hubs.

Utilization and performance

In the description of the network models it has already been mentioned that the existing hubs should be replaced by switches in order to subdivide the collision domain and thus remove load, if the utilization of a shared media is higher than 40 % over a longer period of time. If the utilization within such a switched media is permanently above 80 %, it is recommended to further relieve load by performing smaller grouping.

However, a network should basically not be dimensioned for the burst utilization. During normal operation usually many smaller data packets are transmitted rather than large data streams. This means that the network load regarding the bandwidth is not as high. Nevertheless, if any bottle-necks occur, the simplest method to eliminate them is to increase the data rate (e.g. from 10 Mbit/s to 100 Mbit/s). In existing networks, however, this is not always possible without problems since the cable infrastructure is possibly not suitable for the higher data rate and the expenditure for a new cabling is possibly not defensible. The only solution in such cases is a segmentation of the network which results in a reduction of the number of devices within the network or collision domain and thus provides more bandwidth for the remaining devices.

A segmentation of a network can be obtained with routers, bridges or switches. However, segmentation is only meaningful if the 80/20 rule is considered and observed. The 80/20 rule says that 80 % of the data traffic have to take place within the segment and only 20 % of the data traffic are forwarded to another segment. This is why a previous analysis of the network traffic is required to enable meaningful grouping. In this analysis it has to be determined which station is communicating with which other stations in the network and which amount of data is flowing for this communication. For shared media the network should be divided in a way that stations producing roughly the same load should be grouped in one collision domain, if it is not possible to make a division based on the communication paths. This way it is guaranteed that stations with lower data traffic are able to meet the typical requirements regarding short response times. Stations with permanently high data traffic generally cause a drastic increase of the response times.

Best performance increase can be obtained by using switches and connecting each single station directly to the switches. This way each station has its own connection to a switch and thus can use the full bandwidth of a port in full-duplex mode. This subdivision and the provision of the dedicated connections is called micro-segmentation. For micro-segmentation the 80/20 rule does no longer apply. It has only to be guaranteed that a switch is able to provide sufficient internal bandwidth.

In order to plan a network with optimum performance, we have to think about the question what a network is able to achieve at all. Taking the standards as a basis it can be determined how many data per time can be transmitted via a network theoretically. The smallest Ethernet frame size is 64 bytes long and contains 46 bytes of user data, the maximum frame size is 1518 bytes at 1500 bytes of user data, each plus 64 bits for the preamble and 96 bits for the inter-frame gap. This results in a minimum length of 672 bits (64 x 8 + 64 + 96) and a maximum length of 12304 bits (1518 x 8 + 64 + 96). The transmission of one bit takes 10 ns for fast Ethernet (100 Mbit/s) and 100 ns for Ethernet (10 Mbit/s). Using these values we can calculate how many data packets of the smallest and the maximum length can be transmitted per second theoretically (see tables). The calculation of the corresponding amount of user data which can be transmitted (without taking into account the additional overheads of the higher protocols) now shows the considerably higher protocol overhead caused by the small data packets.

Table 700: Data rate at 10 Mbit/s:

10 Mbit/s	Length [bits]	Time/bit [ns]	Time/frame [ns]	Frames [ns]	User data/ frame [1/s]	User data [bytes/s]
min. frame	672	100	67 200	14 880	46	684 480
max. frame	12 304	100	1 230 400	813	1 500	1 219 500

Table 701: Data rate at 100 Mbit/s:

100 Mbit/s	Length [bits]	Time/bit [ns]	Time/frame [ns]	Frames [ns]	User data/ frame [1/s]	User data [bytes/s]
min. frame	672	10	6 720	148 800	46	6 844 800
max. frame	12 304	10	123 400	8 127	1 500	12 195 000

The corresponding net bandwidth can be calculated from the ratio of the amount of user data per second to the available network bandwidth. The net bandwidth is independent of the transmission rate and calculated in the following table taking a transmission rate of 100 Mbit/s as an example.

Table 702: Net bandwidth at 100 Mbit/s:

100 Mbit/s	User data [bits/s]	Network bandwidth [bits/s]	Net bandwidth [%]
min. frame	54 758 400	100 000 000	54.7
max. frame	97 524 000	100 000 000	97.5

These calculations point out that the percentage of the network performance is considerably higher for the transmission of larger frames. The efficiency of the data transmission which is independent of the transmission rate is shown in the following table using some selected frame sizes as an example. However, the values given in the table only consider the protocol overhead of the MAC and the network layer. The user data are reduced accordingly by the additional overhead of the corresponding higher layers.

Table 703: Efficiency of data transmission:

User data [bits]	Frame size [bits]	Overhead [%]	Efficiency [%]
1500	1518	1.2	98.8
982	1000	1.8	98.2
494	512	3.6	96.4
46	64	39.1	60.9

A calculation of the typical transmitted frame sizes may be still possible for small closed networks inside an installation with only automation devices connected. But, for instance, if PCs are additionally connected to the network (even if they are connected only temporarily) the frame sizes can vary considerably. This makes it impossible to perform an exact calculation of the bandwidth or to make a precise statement regarding the performance. However, the following index values could be determined with the help of various studies about network performance.

- For low utilization of 0 to 50 % of the available bandwidth, short response times can be expected. The stations are able to send frames with a typical delay of smaller than 1 ms.
- For medium utilization between 50 and 80 %, the response times can possibly increase to values between 10 and 100 ms.
- For high utilization over 80 %, high response time and wide distribution can be expected. The sending of frames can possibly take up to 10 seconds.

This is why the following principles should be observed when designing an Ethernet network.

- Mixed operation of stations which have to transmit high data volumes and stations which have to operate with short response times (real time) should be avoided. Due to the wide distribution, short response times cannot be guaranteed within such combinations.
- As few as possible stations should be positioned inside of one collision domain. For this purpose, collision domains should be subdivided using switching hubs.

Network components

The topology of an Ethernet network is like a star or tree structure. Up to two stations can be connected to each segment where active distribution devices like hubs or switches are also considered as a station. The following figure shows an example of a simple Ethernet network.

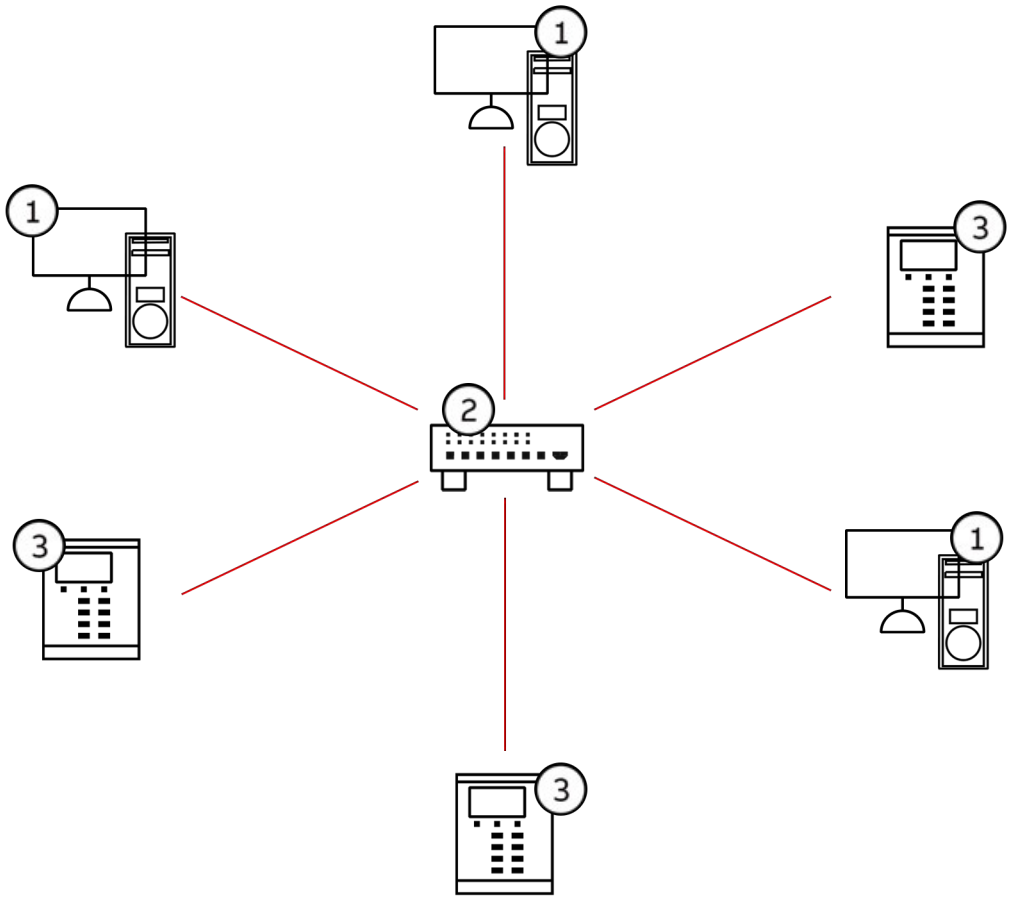

Fig. 1119: Example of a simple network

1 PC
2 Hub/Switch
3 AC500 processor module with Ethernet

The following sections introduce the different types of components required for a network.

Terminal devices

Terminal devices are devices that are able to send and receive data via Ethernet, e.g. controllers with an Ethernet Communication Module or PCs with an integrated network adapter. With this, one of the essential functions of a network adapter is to transfer all data packets to the PC itself instantly and without any loss. Occurring defiles or even errors can cause data packets to be lost. Such losses of data have to be got under control by higher protocols (e.g. TCP/IP) which results in considerable performance reductions. The direct implementation of higher protocols on the network adapter can increase the performance and save the resources of the host system (e.g. controller).

Repeaters and hubs

At the dawning of the Ethernet, the repeaters had only two network connections and were used to connect two segments to each other in order to extend the segment length. Later, repeaters with more than two network connections were available. Those star distributors are called hubs. They are able to connect several segments. Apart from the number of network connections the functionality of hubs and repeaters is identical. This is why we only use the term "hub" in the following descriptions.

Hubs are operating on the lowest layer of the ISO/OSI model and are therefore independent of the protocols used on Ethernet. The network connections of hubs are exclusively operated in half duplex mode. Due to this, collision domains can freely propagate beyond the hubs. A hub can only support one transmission rate for all connections. Therefore it is not possible to connect segments with different transmission rates via a simple hub. For this purpose a dual-speed hub has to be used. The fundamental functions of hubs are as follows:

- Restoration of the signal magnitude
- Regeneration of the signal timing
- Propagation of a detected collision
- Expansion of short fragments
- Creation of a new preamble
- Isolation of a faulty segment

When transmitted over the medium (e.g. a twisted pair cable) the data signal is attenuated. The task of a hub is to amplify an incoming signal in order to make the full signal magnitude available at the outputs again. Furthermore, a distortion of the binary signal's on-off ratio (jitter) can occur during data transmission. When transmitted via a hub, the hub is able to restore the correct on-off ratio of the signal which avoids propagation of the signal jitter beyond the segment.

However, one of the most important tasks of a hub is to propagate occurring collisions within the entire collision domain so that the collision can be detected by all connected stations. If it detects a collision on one of its connections, the hub sends a so-called jam signal over all connections. If a hub receives a data fragment which, by its principle, could only be created by a collision, it first brings the fragment to a length of 96 bits and then forwards it via the ports. This shall guarantee that the data fragment can be received by all stations independent of their distance to the hub and removed from the network. The detected data fragments are removed by the terminal devices by not forwarding them to the higher layers.

By means of the data packet preamble the beginning of a data packet is detected so that the recipient can synchronize to the incoming data stream. However, during the data transmission it can occur that the first bits of a preamble are lost. The task of the hub is to restore a possibly incomplete preamble before forwarding it.

If collisions occur within one segment in large numbers in a short period of time or if e.g. a short circuit on a data line causes failures, the hub switches off the faulty segment to avoid interference to the entire collision domain.

10 Mbit/s hubs

The 10Base-T connections of a 10 Mbit/s hub are implemented as MDI-X ports and therefore already crossed internally. The advantage is that the terminal devices can be directly connected using 1:1 twisted pair cables and no crossover cables are required. Some hubs additionally have a so-called uplink port which can be used to connect another hub. In order to also enable the use of a 1:1 cable for this port, it is implemented as a normal non-crossed MDI port. In many cases this port can also be switched between MDI and MDI-X or is implemented as a double port with two connections in parallel (1 x MDI, 1 x MDI-X). In this case, it has to be observed that these parallel ports may only be used alternatively and not at the same time.

Hubs are normally equipped with several LEDs for status indication. So, for example a Link LED indicates the correct connection between the terminal device and port at the hub. This way, incorrect cabling can be quickly detected. Further LEDs indicate for example the data traffic over a port or the collisions.

The maximum permitted number of 10 Mbit/s hubs within one collision domain is limited to 4. This restriction is due to two reasons. One reason is that the bit period time delay, which is inevitably increased by each hub, must not exceed 576 bit periods. The second reason is that the so-called interframe gap (IFG) must not be shorter than at least 47 bit periods. The interframe gap describes the time interval between two data packets and shall allow the receiving stations to recover from the incoming data stream. However, the regeneration of an incomplete preamble performed by the hub reduces the time between the data packets due to the completion of possibly missing bits.

One possibility to get round the restriction to four hubs is the use of stackable hubs. These hubs are connected to each other via a special interface instead of using the uplink port and therefore constitute one logic unit. As a result, they appear as one single big hub to the external.

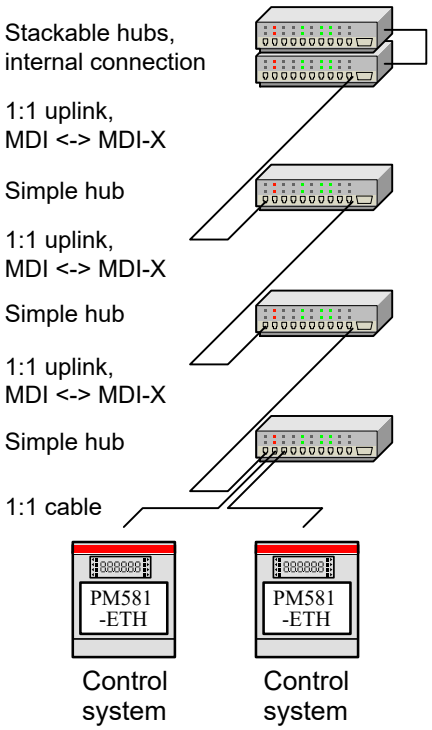

Fig. 1120: Stackable hubs

100 Mbit/s hubs

The principle operation of 100 Mbit/s hubs is like the 10 Mbit/s hubs. However, the hubs for 100 Mbit/s Ethernet have to be additionally distinguished to class I and class II hubs.

Class I hubs (or class I repeaters) are able to connect two segments with different transmission media. For this purpose the complete data stream has to be decoded on the receiving side and encoded again on the transmission side according to the transmission medium. This conversion process leads to higher delay times. Due to this, only one class I hub is permitted within one collision domain.

In contrast, class II hubs support only one transmission medium. No conversion of the data stream is required. This leads to shorter delay times compared with class I hubs. This is why for two segments with a maximum length of 100 m each, up to two class II hubs which are again connected to each other via a 5 m long segment can be used within one collision domain.

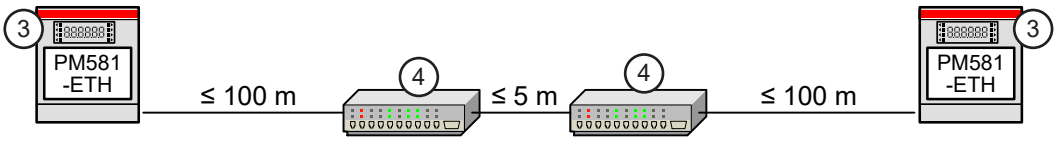

Fig. 1121: Use of a class II hub

3 AC500 Processor Module with Ethernet
4 Class II hub

10/100 Mbit/s dual-speed hubs

In contrast to the simple hubs, dual-speed hubs are able to support two transmission rates and thus enable to connect two Ethernet networks with different data rates to each other. Dual-speed hubs are internally structured like two separate hubs or paths (one for each data rate). By means of the auto negotiation function the transmission rate of the connected station is determined and automatically switched to the corresponding path. Each internal path is a separate hub. For the temporary storage of the data packets, the paths are connected to each other via an internal switch. Dual-speed hubs likewise operate in half duplex mode. However, the internal switch provides a clear separation of the 10 Mbit/s and the 100 Mbit/s side so that unlike the simple hubs a collision domain cannot reach beyond the borders of the corresponding side of the dual speed hub.

Bridges, switches and switching hubs

Basically the terms bridge, switch and switching hub designate the same. In the early beginning of the Ethernet, the term bridge was formed by the fact that a bridge had only two network connections. Later, so-called multiport bridges with several connections came up which were also called switches or switching hubs. This is why we use the common term "switch" in the following descriptions for all the components mentioned above.

The use of a switch is another variant of connecting network segments to each other. The decisive difference between a hub and a switch is that a switch is operating on the second layer of the ISO/OSI model, the MAC layer.

The following sections describe the functionality of such a layer 2 switch. For reasons of completeness it has to be mentioned that switches operating on higher and therefore protocol-specific layers also exist.

Using a switch, load separation between networks can be implemented which leads to an increased performance due to the reduced load of the individual segments. In contrast to a hub, a switch does not operate transparently (i.e. it doesn't forward all data packets via all ports) but decides on the basis of the MAC target address whether and via which port an incoming data packets has to be forwarded. The data packet is only forwarded if the target station is located in another segment or if the target address of the data packet contains a multicast or broadcast address.

As already mentioned, the decisive advantage of a switch is the logical separation of networks. Therefore, a switch represents a border for a collision domain. Aside from the performance improvement, the use of a switch allows a network to be extended beyond the usual borders.

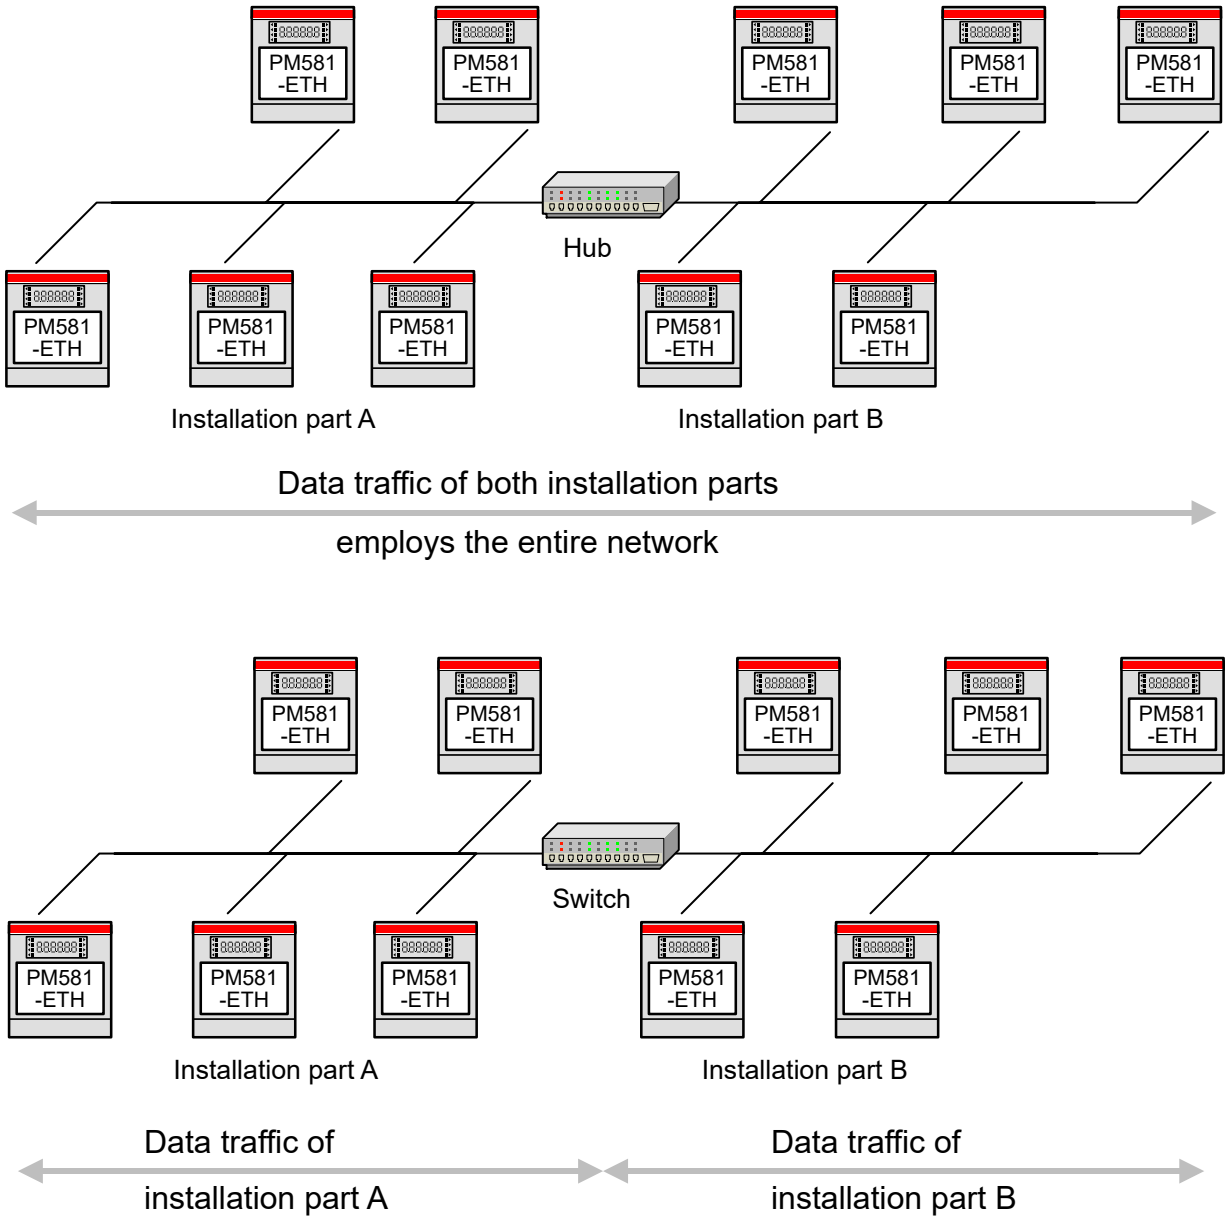

Fig. 1122: Use of hubs and switches

To enable crosswise traffic between the segments, a switch has to be able to temporarily store the incoming data packets until they can be transmitted on the forwarding segment. The decision about forwarding of data packets is done using address tables. These address tables are generated by the switch itself during a self-learning process. During this process, the switch remembers the source addresses (MAC addresses) of incoming data packets of a port. If it later receives further data packets, the switch compares their target addresses with the entries in the address tables of the ports and, in case of a match, forwards the respective package via the corresponding port. Here, the following cases have to be distinguished:

- If the source station and the target station are located within the same segment, the data packet is not forwarded.
- If the station of the target address is located in another segment than the source station, the data packet is forwarded to the target segment.
- Data packets containing a multicast or a broadcast address as the target address are forwarded via all ports.
- A data packet with a target address which is not contained in the address tables is forwarded via all ports (Frame Flooding).

The latter case normally only occurs during the first time after starting a switch since the address is usually entered after some time when exchanging a data packet.

In order to limit the size of the address tables, addresses which are not used over a longer period of time are additionally removed from the tables. This also avoids incorrect forwarding as it would appear e.g. when a station is moved within the network.

To enable the building of a redundant network structure (as it is often found in more complex networks) using switches, the so-called spanning tree method has been introduced. With this method, the switches exchange configuration messages among themselves. This way the optimum route for forwarding data packets is determined and the creation of endless loops is avoided. The exchange of messages is performed cyclic. As a result a connection breakdown is detected and forwarding is automatically changed to another route.

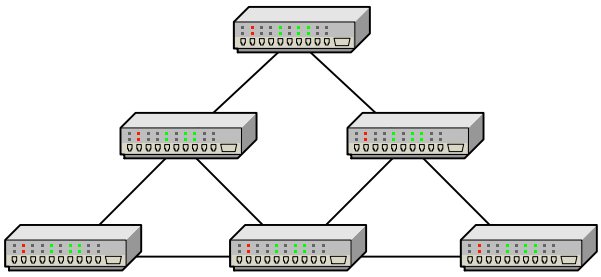

Fig. 1123: Redundant network structure using only switches

Using a switch instead of a hub increases the bandwidth of the individual segments and therefore leads to an increased performance. Building a network consistently with switches furthermore enables full duplex operation and thus simultaneous data traffic in both directions since switches are able to establish dedicated peer-to-peer connections between the individual ports. The use of the access method CSMA/CD is not required since collisions can no longer occur. Depending on the network structure, this can further increase the performance drastically. For full duplex connections furthermore no length restrictions of the collision domain have to be observed.

Media converters

Media converters provide the possibility of connecting components to each other via different media. The most frequently occurring case for this is the conversion between twisted pair (TP) and fibre optic cabling.

When using media converters it has to be observed that a connected port operating in half duplex mode is no collision domain border. This is often not considered when using optical fibres to bridge a larger distance. The fibre optical port of a media converter furthermore does not support the auto negotiation function. Due to this, if an Ethernet component is directly connected to the fibre optic side of a media converter, the transmission mode has to be set fixed according to the component connected on the twisted pair side. If a connection between two twisted pair components is established using two media converters, it is absolutely required that both twisted pair components are operating with the same transmission mode. If necessary, manual setting has to be performed.

Routers

Routers connect networks with identical protocols or addressing mechanisms. The main task of a router is to perform the routing for the transmission of data packets from the sender to the recipient. Routers are able to effectively reduce the data traffic between individual networks by using different algorithms. The dynamic routing leads to a load reduction for the entire network. If the router has several alternative routes to the target station available, it will always choose the optimum way depending on the current load on the network and the expected costs.

In contrast to the switches which forward the packets on the basis of layer 2 (e.g. Ethernet), the routers operate on layer 3 (e.g. IP). While the switches forward the packets on the basis of the MAC addresses, the routers evaluate the contained IP addresses. For this purpose, when receiving a data packet a router first has to remove the outer telegram frame in order to be able to interpret the addresses of the inner protocol and then it has to re-assemble the data packet again before forwarding it. This results in higher latency periods (time of stay)

of the data within the router itself. The investigation of a data packet necessary for routing makes clear that a router has to be able to process all network protocols to be routed over this router. Due to the increasing spread of heterogeneous networks, today often routers are used which are able to support several network protocols (e.g. IP, IPX, DECnet, AppleTalk) instead of special IP routers. Such routers which are able to process several network protocols are called multi-protocol routers. Some routers additionally have a bridge functionality (bridge routers, Brouters) which enables them to also forward the data packets of protocols a router cannot interpret or which do not support the routing function (e.g. NetBios).

Gateways

A gateway is a computer which is able to couple completely different networks. Gateways are operating on a layer above layer 3 of the ISO/OSI model. They are used to convert different protocols to each other. For the connected subnetworks, a gateway is a directly addressable computer (node) with the following tasks:

- Address and format transformation
- Conversions
- Flow control
- Necessary adaptations of transmission rates for the transition to the other subnetworks.

Gateways can furthermore be used to implement safety functions on the application layer (firewalls). For example, gateways are used for the coupling of PCs located in local area networks (LAN) to public long distance communications (wide area networks, WAN).

Programming access via Ethernet

Programming via Ethernet on TCP/IP in Automation Builder is described in the configuration chapter *Chapter 1.6.5.2.2.2.3 “Configuration of communication via Ethernet (TCP/IP)” on page 5829*.

Modbus on TCP/IP

Usage and configuration of Modbus on TCP/IP in Automation Builder is described in the configuration chapter *Chapter 1.6.5.3.3.1 “Modbus on TCP/IP protocol” on page 6173*.

Fast data communication via UDP/IP

Usage and configuration of UDP/IP in Automation Builder is described in the configuration chapter *Chapter 1.6.5.3.7.1 “Contents of the UDP protocol configuration” on page 6185*.

1.6.4.2.2 PROFIBUS DP communication modules

Introduction

This chapter gives a description of the PROFIBUS functionality in the AC500 system . The chapter contains of a general PROFIBUS overview, the specific handling in the AC500 system and describes the available ABB AC500 devices for PROFIBUS.

Topics and subtopics:

General PROFIBUS Description *Chapter 1.6.4.2.2.2 “PROFIBUS overview” on page 5525*

AC500 devices

- Communication Modules CM582-DP PROFIBUS DP Slave and CM592-DP-PROFIBUS DP Master (*Chapter 1.6.2.4.8 “PROFIBUS” on page 4075*).
- Communication Interface Modules (S500) CI541-DP, CI542-DP (*Chapter 1.6.2.8.6 “PROFIBUS” on page 4930*).

Configuration in Automation Builder

- *Chapter 1.6.5.2.6.2.1.2 “Configuration of a PROFIBUS DP master” on page 5883*
- *Chapter 1.6.5.2.6.2.2.1 “Configuration of PROFIBUS DP slave” on page 5894*
- Configuration of PROFIBUS-Devices
  - Configuration of CI541-DP and CI542-DP
  - Configuration of the *Chapter 1.6.5.2.6.2.1.4 “Configuration of the PROFIBUS DP slaves connected via FBP” on page 5889*
  - GSD based device (see *Chapter 1.6.5.2.6.2.1.3 “Configuration of 3rd party PROFIBUS DP slaves” on page 5887*).
- Online Diagnosis
  - CM592-DP PROFIBUS DP Communication Module Statistic Views
  - Fieldbus Commissioning (see *Chapter 1.7.2.7.1 “Fieldbus commissioning” on page 6392*)

IEC library

(see *Chapter 1.5.4.26.1 “Function blocks” on page 1750*)

- DPM_CTRL
- DPM_READ_INPUT
- DPM_READ_OUTPUT
- DPM_SET_PRM
- DPM_SLV_DIAG
- DPM_STAT
- DPM_SYS_DIAG
- DPV1_MSAC1_READ
- DPV1_MSAC1_WRITE

PROFIBUS overview

PROFIBUS basics

PROFIBUS DP is intended for fast data exchange in the field area. Here, central control units (e.g. PLC/PC) communicate with decentralized field devices like I/O, drives and valves via a fast serial connection. The data exchange with the decentralized modules is mainly performed cyclically.

The communication functions, required for data exchange, are defined by the PROFIBUS DP basic functions in accordance to IEC 61158/61784.

For parameterization, diagnosis and alarm handling during the running cyclic data exchange also non-cyclic communication functions are necessary for intelligent field devices.

ISO/OSI model

The definition of PROFIBUS is based on the experience concerning data transmission collected during long years.

One base is the ISO/OSI model (Open Systems Interconnection Reference Model). It is an open layer model with 7 layers for the communication in information processing systems. The model describes uniformed procedures and rules for the exchange of data.

Fieldbus systems normally use only three of the 7 layers:

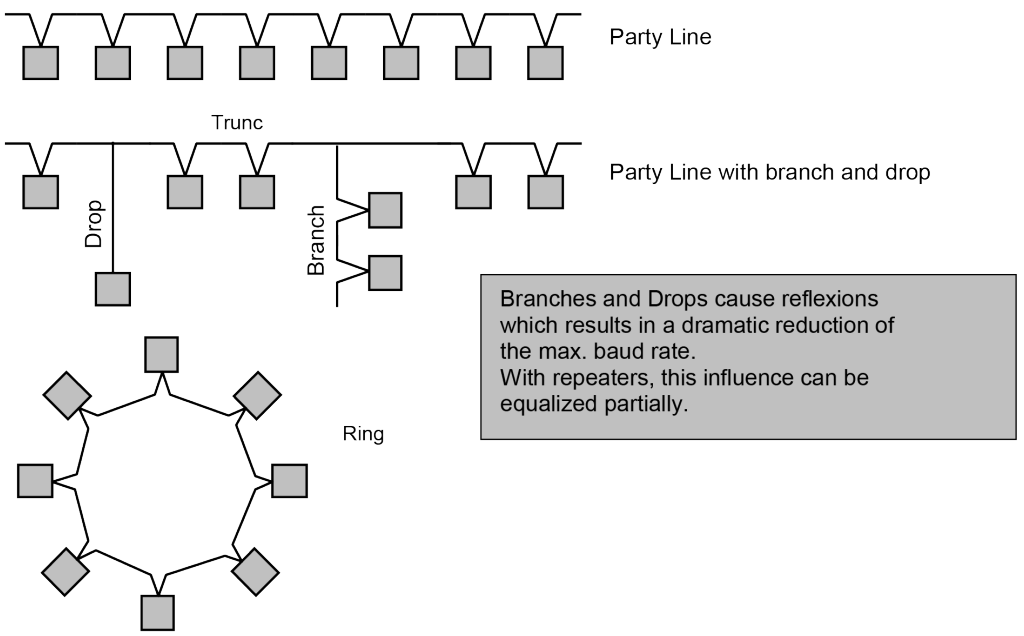
ISO/OSI	Transmitting CPU		Receiving CPU		
Layer 7	Application layer		Application layer	=	Interface to the application program (CPU) with application oriented commands (read, write)
...	...		...		
Layer 2	Data-link layer		Data-link layer	=	Access control (to the line), telegram (start, length,..), data security (e.g. CRC=Cyclic Redundancy Code)
Layer 1	Physical layer		Physical layer	=	Definition of the medium (Twinax, optical fiber, ..), coding ("1"=-4V), transmission speed (transmission rate)..
Transmission medium (physical)					

As a result of the ISO/OSI layer model, each layer can be defined separately and (nearly) independent of the other layers.

Indeed, it is possible and common to use conventional cables, but also optical fibers as physical layer for the PROFIBUS DP or have a mixture of both in a single bus configuration.

For the application layer, there are also different versions possible, e.g. PROFIBUS DP-V0, PROFIBUS DP-V1 but also others that are not regarded here.

Typical field bus topologies



Overview of transferred data

	Group	Type / example *	Direction	Comment
Cyclic data exchange	Monitored signals (inputs)	DI = digital input	read	
		AI = analog input	read	
	Commands (outputs)	DO=digital output	write	
		AO=analog output	write	
other basic data transfer	Diagnosis	Faults and warnings	read	DP/V0 and DP/V1
	Configuration, Identification	Qty. of DI, DO,...+ product code..	read / write	
	Bus specific data	baud rate, time-out..	read / write	
	Parameters**	Control function… trip class …	write	
Acyclic data exchange	Single parameters	Control function… trip class …	read / write	DP/V1 only

* The quantities of bytes/words are defined by the connected device.

** Parameters are transferred during power-up.

PROFIBUS DP-V0 <---> PROFIBUS DP-V1

Commands and monitoring signals

The transfer of commands and monitoring signals is the essential task of the field bus and the connected units.

They control and inform mainly about the process, e.g. control digital/analog outputs or read digital/analog inputs. They are the same for DP-V0 and DP-V1

Command and monitoring telegrams represent the cyclic data transfer.

Diagnosis

The diagnosis telegram provides detailed information if there is any problem, particularly in the process. A short circuit on a digital output is an example. Diagnosis data are automatically read by the PROFIBUS DP master if it gets a general fault info within a monitoring telegram.

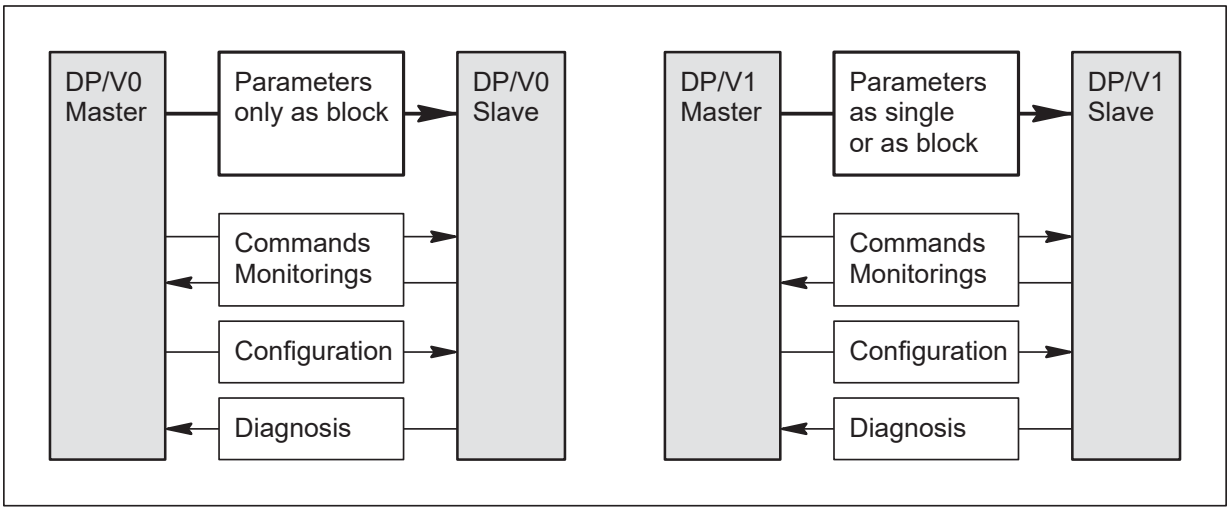
Parameters

Parameters are necessary to adapt the device to the process.

E.g., for the Digital S500 I/O modules the parameter "Input Delay" can be configured to filter contact switch bouncing

Parameters can also include service-oriented data such as "Operation hours".

The main difference between the PROFIBUS DP versions DP-V0 and DP-V1 is:



DP-V0 only allows to write the complete parameter set in one block.

The bus master sends the parameter block to the slave during power-up of the slave/device. Some control systems also allow to send the parameter block during normal operation.

DP-V1 offers reading and writing single parameters.

The possibility to read single parameters is an important advantage: E.g. to read single parameters of a drive (configuration parameters). In AC500 the function block DPV1_MSCAC1_READ can be used.

In all cases only the bus master can start the data exchange on the PROFIBUS DP bus.

PROFIBUS DP master class 1, PROFIBUS DP master class 2

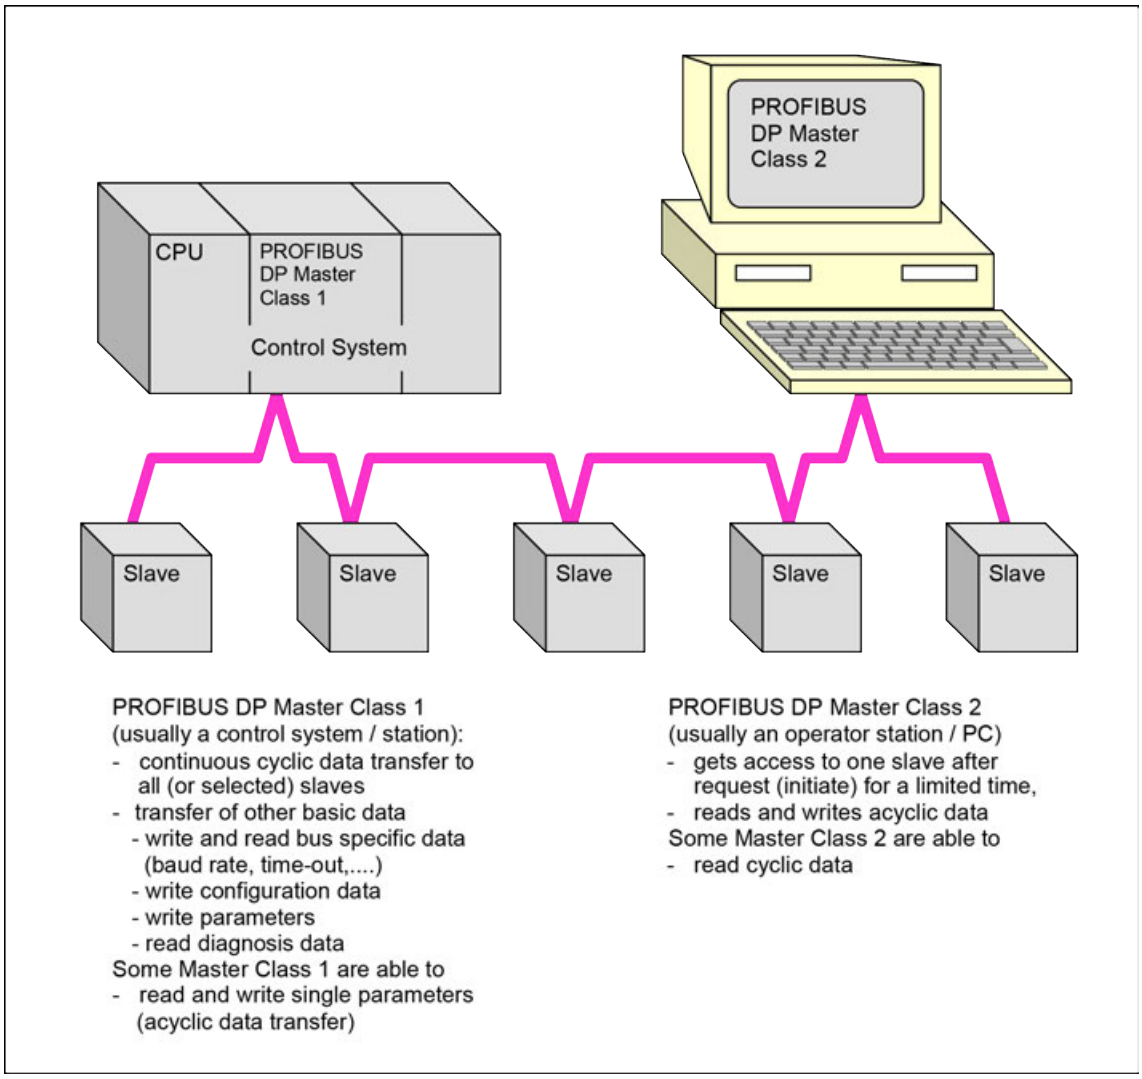


Fig. 1124: PROFIBUS DP master, class 1 and class 2

Features

Transmission technique

- RS-485, potential separated.
- Twisted pair cable or optical fibre as a medium for the bus.
- Up to 32 stations (master and slave modules) without repeaters and up to 126 stations on one bus with repeaters.
- Integrated repeater controller.

Communication

- Up to 244 bytes of input data and 244 bytes of output data per slave.
- Cyclic user data transfer between DP master and DP slave.
- Acyclic data transfer from master to master.
- Slave configuration check.
- Efficient diagnosis functions, 3 graduated diagnosis messaging levels.
- Synchronization of inputs and/or outputs via control commands.

Protection functions

- Message transfer with Hamming distance HD = 4.
- Errors during data transfer are detected by the CRC check and cause a repetition of the telegram.
- Access protection for inputs and outputs of the slaves.

- Incorrect parameter settings are avoided since bus stations with faulty parameters are not included in the user data operation.
- A failure of a bus station is registered in the master and indicated via a common diagnosis.

Standardization: PROFIBUS DP IEC61158 / DIN EN series

Terms, definitions and abbreviations

PROFIBUS DP

PROFIBUS DP	Process Fieldbus - Decentral Periphery
DPM1	DP master (class 1), normal bus master
DPM2	DP master (class 2), commissioning device
DPS	DP slave, I/O module
GSD	Modules master data
DPV1	Guideline for functional expansions of PROFIBUS DP
PNO	PROFIBUS Nutzer Organisation (PROFIBUS user organization)

Designing and planning a network

The PROFIBUS Communication Module is connected to the bus via the 9-pole SUB-D socket. For EMC suppression and protection against dangerous contact voltages, the shield of the bus line has to be connected to protective earth outside the housing.

Single master system

The single master system is the simplest version of a PROFIBUS network. It consists of a class 1 DP master and one or more DP slaves. Up to 31 DP slaves can be connected to the bus without using a repeater. If the number of bus segments is increased by means of repeaters, up to 126 DP slaves can be handled. The line ends of the bus segments have to be terminated using bus terminating resistors.

The DP master of class 1 is able to:

1. Parameterize DP slaves (e.g. timing supervision bus interchange). "bus interchange" means e.g. data and control Exchange on the Profibus.
2. Configure DP slaves (e.g. type / number of channels).
3. Read input and output data of the DP slaves.
4. Write output data of the DP slaves.
5. Read diagnosis data of the DP slaves.
6. Send control commands to the DP slaves (e.g. freezing input signals).

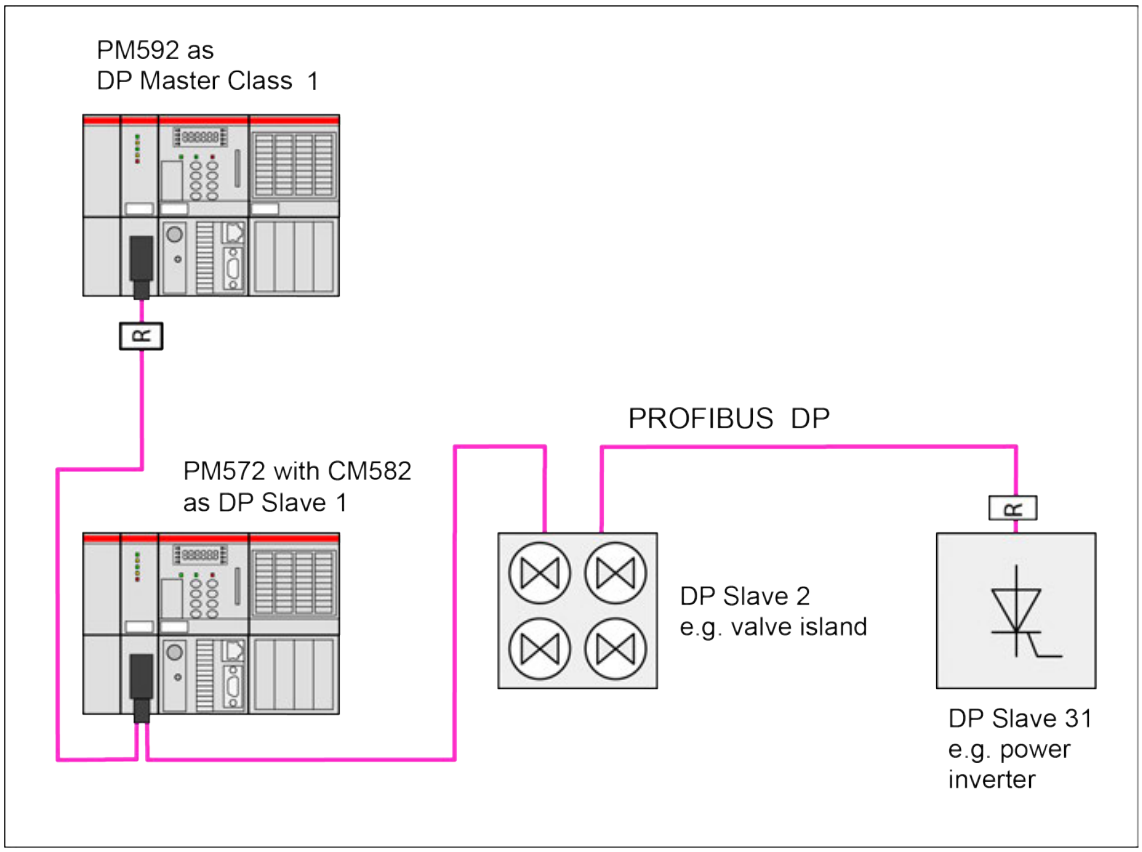

Fig. 1125: Single master system example

Multi master system

A PROFIBUS network containing several DP masters is called a multi-master system. Up to 32 stations (DP masters and DP slaves) can be operated on one bus segment. Using repeaters the system can be expanded to up to 126 stations. In a multi-master system no data exchange between the DP masters is performed. The entire system is divided into logical subsystems inside of which one DP master communicates with the assigned DP slaves. Each DP slave can be assigned to only one DP master. The master has unlimited access to its assigned slaves while all other masters on the bus can only read the input and output data of these slaves.

All DP masters of class 1 (normal bus master, here: AC500) and class 2 (commissioning device, typically a PC) can read the input and output data of all slaves.

Additionally the DP masters of class 1 and class 2 have the following access possibilities to their assigned DP slaves. They are able to:

- Parameterize DP slaves (e.g. timing supervision, bus interchange).
- Configure DP slaves (e.g. type / number of channels).
- Write output data of the DP slaves.
- Read diagnosis data of the DP slaves.
- Send control commands to the DP slaves (e.g. freezing input signals).

A DP master of class 2 is additionally able to:

- Read and write configuration data of the class 1 DP masters.
- Read configuration data of the DP slaves.
- Read diagnosis data of the class 1 DP masters.
- Read out the diagnosis data of the DP slaves assigned to the respective DP master.

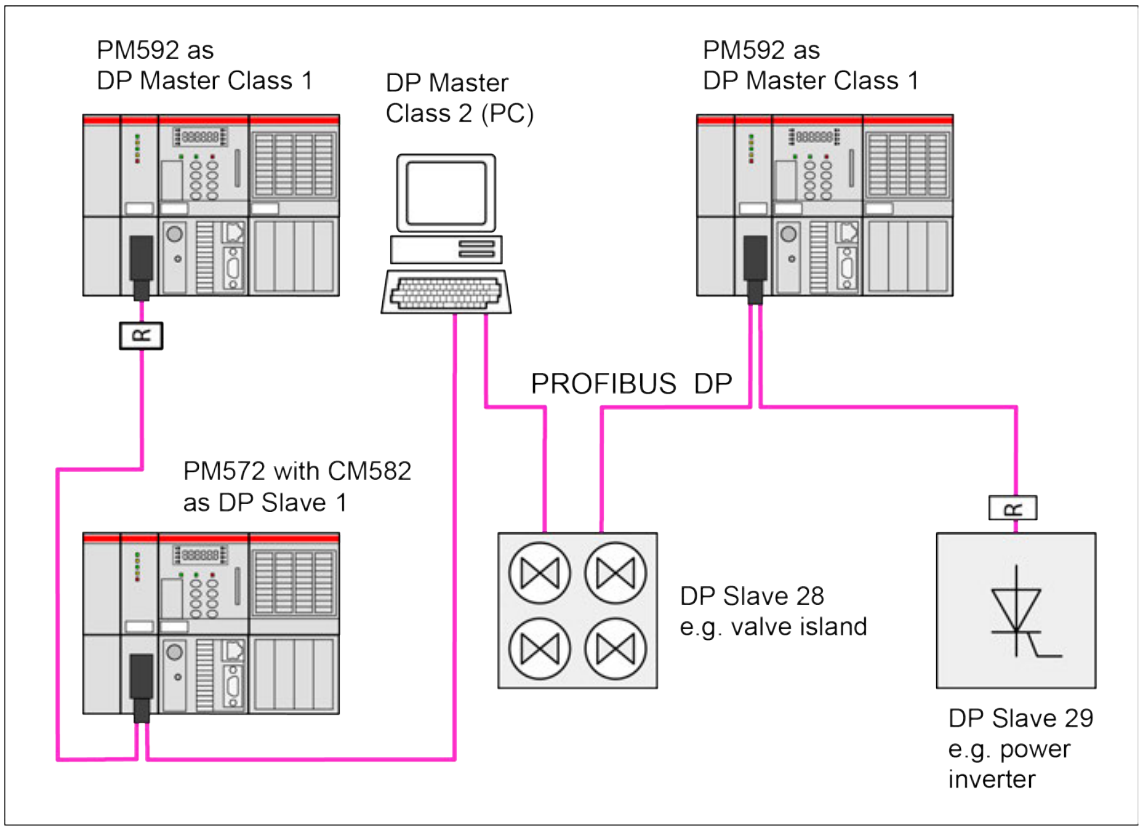

Fig. 1126: Multi master system example

PROFIBUS implementation

System start-up behavior

Initial Operation

The PROFIBUS DP protocol is automatically handled by the Communication Module and the operating system of the controller. The Communication Module is only active on the bus if it was correctly initialized before and if the user program is running. No connection elements are required for the cyclic exchange of process data via PROFIBUS DP. Special PROFIBUS DP functions can be realized using the function blocks of the corresponding PROFIBUS library.

Communication via PROFIBUS is established by the communication module when starting the user program and starts with the initialization of the configured slaves. After its successful initialization, the slave is added to the cyclic process data exchange. The "RDY" LED lights up steadily after at least one slave was successfully taken into operation. If the user program is stopped, the communication module shuts down the PROFIBUS system in a controlled manner.

The DP master operation mode is completely integrated to the operating system of the controller. The transmit or receive data of the slaves can be directly accessed in the corresponding operand areas. Access can be performed either via operands or symbolically. No function blocks are required.

The function block library contains various blocks which can be used e.g. to poll status information of the communication module or to execute specific acyclic PROFIBUS DP functions. If necessary, these blocks can be inserted additionally.

For further information on the configuration of PROFIBUS master/ PROFIBUS slave devices, see *Chapter 1.6.5.2.6.2 “PROFIBUS” on page 5883*.

Diagnosis

Error diagnosis

PROFIBUS DP communication errors are generally indicated by the red "ERR" LED of the Communication Module. Malfunctions of the PROFIBUS driver or the Communication Module itself are additionally indicated via the E error flags and the corresponding LEDs of the CPU.

Furthermore, the PROFIBUS library provides different function blocks that allow a detailed error diagnosis. Amongst other things, the following information can be polled:

- The condition of the Communication Module itself
- A detailed PROFIBUS diagnosis of an individual slave or
- A system diagnosis overview.

Function blocks

The function blocks listed in the table below are contained in the PROFIBUS DP Library
↳ *Chapter 1.5.4.26 “PROFIBUS DP library” on page 1750*.

Group	Function block	Function
General		
	PROFI_INFO	Reading of Communication Module information
Status / Diagnosis		
	↳ *Chapter 1.5.4.26.1.6 “DPM_STAT” on page 1775*	Reading the Communication Module status
	↳ *Chapter 1.5.4.26.1.5 “DPM_SLV_DIAG” on page 1765*	Reading the detailed PROFIBUS diagnosis of a slave
	↳ *Chapter 1.5.4.26.1.7 “DPM_SYS_DIAG” on page 1781*	Reading the system diagnosis
Parameter		
	↳ *Chapter 1.5.4.26.1.4 “ DPM_SET_PRM” on page 1762*	Sending user parameters to a DP slave
Controller		
	↳ *Chapter 1.5.4.26.1.1 “DPM_CTRL” on page 1750*	Sending control commands to slaves
Acyclic reading		
	↳ *Chapter 1.5.4.26.1.2 “DPM_READ_INPUT” on page 1756*	Reading input data of slaves which are not assigned to the master
	↳ *Chapter 1.5.4.26.1.3 “DPM_READ_OUTPUT” on page 1759*	Reading output data of slaves which are not assigned to the master

1.6.4.2.3 PROFINET communication modules

PROFINET overview

PROFINET is an open standard for the realization of Industrial Ethernet based automation applications. Time-critical and non-time-critical applications could be realized inside the same Network in parallel. Additionally, the network is further on usable for standard office TCP/IP communication.

PROFINET is a cyclic communication. Only for parameterization, diagnosis and alarm-messages of intelligent field devices, acyclic messages will be used.

> *AC500 PROFINET RT is PROFINET IO based on PROFINETRT.*

Standardization: PROFINET

- IEC 61131-3: PLC Standardization
- IEC 61158: PROFINET Standardization
- IEC 11801: Wire and connection elements for Ethernet

Device certification

To ensure that PROFINET devices particularly of different vendors can communicate with each other without problems the PNO brought up a certification procedure. In this procedure the conformance in hardware as well as in software matters are tested and documented by an accredited test laboratory.

Fig. 1127: PROFINET logo

The certification of the AC500 PROFINET devices took place according to conformance class B and was executed by the accredited laboratory.

Furthermore the AC500 PROFINET devices have CE declaration.

Terms, definitions and abbreviations

Table 704: PROFINET

CAT 5	Ethernet cable for 100 MHz data size
CAT 5e	Ethernet cable for 100 MHz data size for Gigabit-Ethernet
CAT 6	Ethernet cable for 250 MHz data size
CAT 7	Ethernet cable for 600 MHz data size
CAT 8	Ethernet cable for 1 GBit data size
GSDML	Device data sheet in XML
I/O controller	Conform to a master in a PROFINET network

I/O module	Conform to a slave in a PROFINET network
I/O supervisor	PC-based engineering tool for initial operating or diagnosis
IRT	Isochronous real time
NRT	Non-Real-Time
PNO	PROFIBUS Nutzerorganisation e. V.
PROFINET	Process fieldbus network
PROFINET CBA	PROFINET Component Based Automation for complex assembly modules
PROFINET IO	PROFINET for decentralized field bus devices, motion control, etc.
RT	Real-Time
VLAN-Tag	Virtual Local Area Network Tag, advanced telegram for Ethernet telegram priority

PROFINET designations

PROFINET CBA / PROFINET IO

PROFINET contains 2 different solutions:

- PROFINET IO
- PROFINET CBA (Component Based Automation)

PROFINET IO is used for communication with decentral periphery like IOs, drives, etc.

PROFINET CBA is a communication solution for autonomously acting partial units of machines or plants.

PROFINET IO and PROFINET CBA are using different kind of communications variations of PROFINET:

- PROFINET NRT (non-real-time)
- PROFINET RT (real-time)
- PROFINET IRT (isochronous real time)

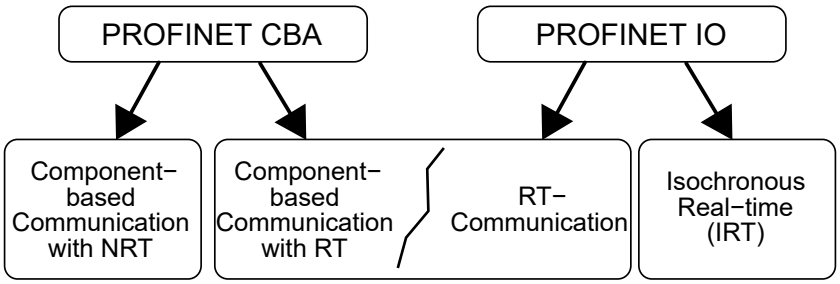

Fig. 1128: PROFINET CBA, PROFINET IO

PROFINET NRT PROFINET NRT is used by PROFINET CBA and PROFINET IO for the exchange of non-critical data by using standard TCP/IP and UDP/IP transfer mechanism according to IEE 802.3.

PROFINET RT PROFINET IO on RT is the real-time communication for time-critical process data between PLC and decentral periphery like I/O-devices, drives etc.

To reach the real-time behavior, PROFINET RT does not use the addressing features and control mechanisms of TCP and UDP. PROFINET RT is using a separate real-time channel for transmission with a reduced overhead. If used for communication between different networks, the "RT over UDP" mode is available.

PROFINET IO based on RT can be used in separate and existing networks. The PROFINET communication runs in parallel to TCP/IP and TCP/UDP communication.

PROFINET IRT PROFINET IRT is used for extremely time-critical applications (e. g. motion control). It uses hardware-aided real-time communication. To use PROFINET IRT, special hardware with cycle synchronization is necessary.

Real-time behavior means that a process has to be executed in a predefined time. The duration of this predefined time interval does not matter; it is only necessary that the process is done during this time. Due to this predictability of this process it is possible (with aid of additional synchronization methods) to cause chronologically adapted processes.

PROFINET nomenclature

I/O controller The I/O controller is the master in the PROFINET system. It coordinates the start of the bus communication and the parameterization of the I/O modules. The I/O controller gets the process data and the diagnostic alerts of the I/O modules and forwards them to the control system (for example PLC).

I/O module The I/O modules are the decentralized field devices (for example Input/Output devices or drives) in the PROFINET system.

The I/O modules get parameterized by the I/O controller (or I/O supervisor), and exchange process data with the I/O controller and send upcoming diagnostic alerts to the I/O controller.

I/O supervisor The I/O supervisor is the engineering tool to access the I/O modules temporarily for commissioning. This functionality can also be integrated into the I/O controller.

Transfer mechanism of PROFINET

The PROFINET IO communication is not a typical master-slave-communication. In fact there is a parameter in the controller that sets the communication basic cycle ("SendClockFactor"). For each I/O module it is possible to set a reduction rate ("ReductionRatio"). Due to this reduction rate the cycle time between I/O controller and each I/O module can be set separately in dependence of the performance requests *Chapter 1.6.4.2.3.4 “System performance” on page 5547*.

The I/O controller sends the output data to each planned I/O module (following the device specific parameterized cycle time). Each I/O module sends its input data with the same cycle time to the I/O controller.

Communication channels PROFINET IO is building up on standard Ethernet and uses two different communication channels:

For non-time-critical processes PROFINET IO uses standard Ethernet communication over UDP/IP (NRT communication). These non-time-critical processes are:

- "Start up" of the bus communication
- Allocation of the IP-addresses to the PROFINET IO devices (DHCP)
- Parameterization of the PROFINET IO devices

For time-critical data exchange PROFINET IO uses the RT communication channel. The time-critical processes are:

- Reading and writing of process data of the PROFINET IO devices
- Alarm messages of a certain PROFINET IO device
- Allocation of names and addresses to the PROFINET IO devices

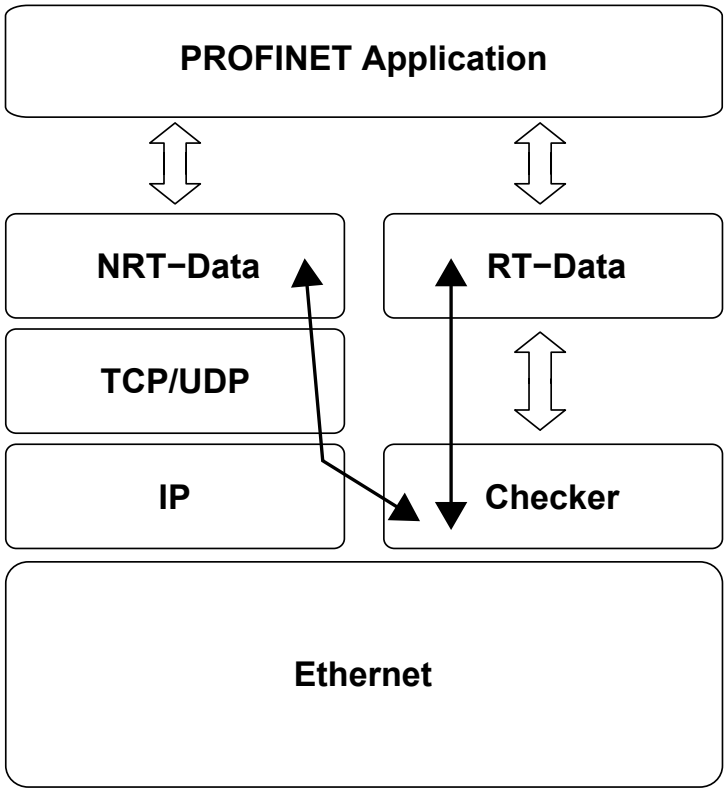

Fig. 1129: PROFINET NRT and RT

Frame structure The PROFINET RT frames consist of MAC header, process data and a checksum. The frames have the following structure:

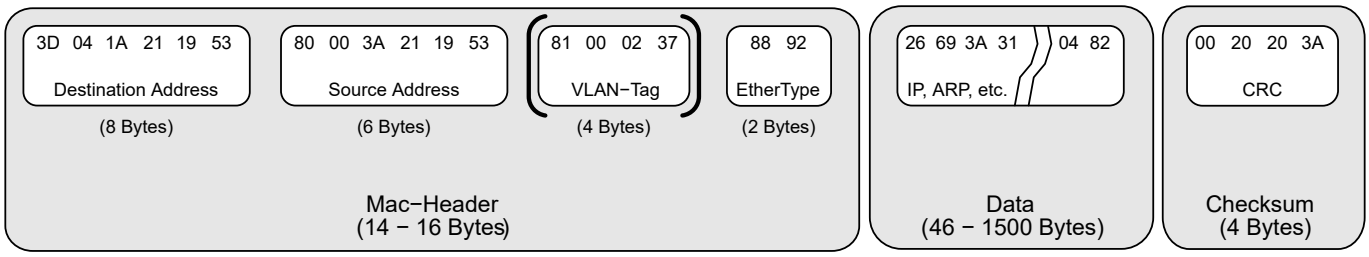

Fig. 1130: PROFINET RT telegram

The individual parts of the frame have the following sense:

- Destination address: MAC address of the receiver
- Source address: MAC address of the sender
- VLAN-Tag: prioritizing of the data exchange
- EtherType: Identifier of the following data (PROFINET RT uses 0x8892)
- Data: process data
- Checksum: checksum of the transferred data

The PROFINET NRT frames also contain IP/UDP, RPC NDR. In this case the VLAN tag is not used.

Prioritization of the data exchange with VLAN

For privileged forwarding of the PROFINET RT frames the real-time communication uses the VLAN tag according to IEEE802.1Q. So it is possible to define 7 different priorities. With the VLAN tag it is ensured that the PROFINET RT frames have the highest priority. Thereby "real-time" communication is made possible if PROFINET RT is used together with other network protocols (for example TCP/IP, basic network communication, internet).

The PROFINET RT communication is realizable with every commercial Ethernet controller that supports VLAN.

The VLAN tag has the following structure:

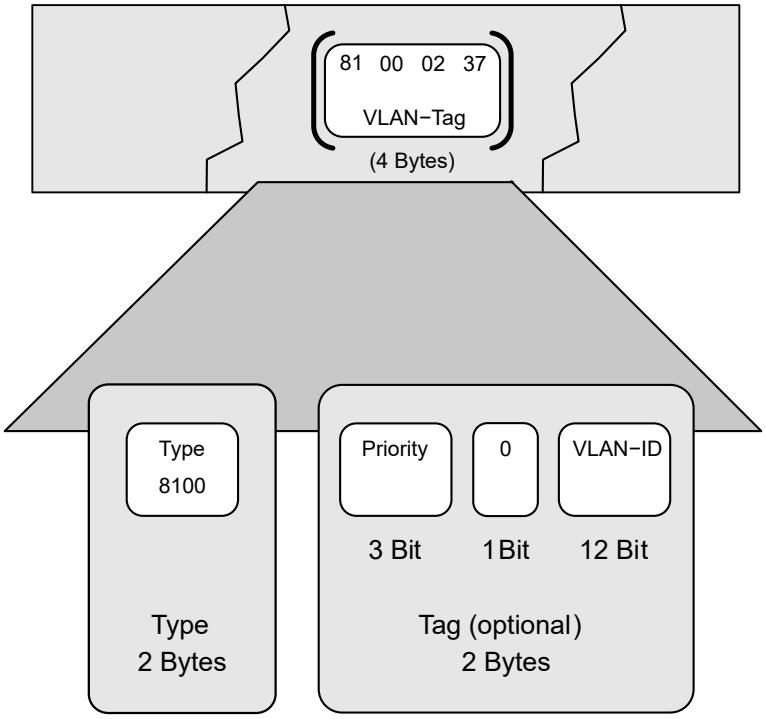

Fig. 1131: Contents of the VLAN-tag

The individual parts have the following sense:

- Type: Identifies the following data as a VLAN information
- Priority: Defines the priority of the telegram
- VLAN_ID: ID of the associated VLAN group

CAUTION!
Risk of communication faults!
PROFINET IO does not work in networks if Ethernet components do not support VLAN.

Make sure that all Ethernet components support the VLAN-tag.

Additional notices for the conformance classes

The MRP (Media Redundancy Protocol) is necessary for ring topology. It has to be integrated in the I/O controller as well as in the I/O modules and ensures the communication at a bus disconnect.

The I&M functions (Identification & Maintenance) are necessary for reading out the vendor and system specific information of an I/O module. The contents of these functions are defined in a specific PNO specification (Profile Guidelines Part 1: I&M fuctions, Rev. 1.1.1, order no. 3.502).

> *AC500 PROFINET RT is certified according to IEC 61158 and is conform to the conformance class CC A.*

Further information on PROFINET can be found on the website of the "PNO" following this link: *http://www.profibus.com*.

General station description file

The device specific features of a PROFINET IO device are documented in an electronic data sheet, the General Station Description File "GSDML". This XML-based GSD-file describes uniquely and completely the characteristics of a device in a vendor-independent format. For the CI50x-PNIO Devices these characteristics are:

- Description of the inputs and outputs of the I/O modules
- Parameters that are necessary for correct operation of the I/O modules
- Diagnostics and its meanings that can be delivered from an I/O module
- Description of the S500 expansion modules that can be used on the I/O bus

Due to the predefined file format the configuration of a PROFINET system is simplified. The GSDML files are normally supported by the vendors.

The PROFIBUS user organization (PNO) provides the GSDML files of several PROFINET devices in its product overview.

The address of the PNO is: *http://www.profibus.com*.

PROFINET conformance classes

PROFINET as an open standard that defines three conformance classes with raising functionality to provide multivendor interoperability and functionality compatibility.

Within a third party certification *Chapter 1.6.4.2.3.2 “PROFINET modules” on page 5540* is it ensured that a device provides the functionality of a certain conformance class. The conformance classes are divided in the categories CC A , CC B and CC C (see following figure).

The PROFINET certificate attests the norm compliance in a PROFINET network according to IEC 61158.

	- Switches with IEEE802-conformity with bus-, phase- and real-time clock synchronization - IRT communication - TCP/IP/RT and IRT redundancy	CC C

	- Switches with MRP support (conform with IEEE 802) - Providing of data for device-to-device-communication - Application of SNMP - Comfortable device-replacement without usage of an engineering tool - Client-functionality with MRP redundancy		CC B	
	- Conduction-bound and wireless data transfer - Cyclic RT communication - Acyclic TCP/IP communication - Alarms/diagnosis - Definition of transfer cycle - Automatic address resolution - Identification & maintenance functionality - Basic mechanism for detection of adjacent devices - Prioritization of data transfer according to IEEE standard - Transfer media: 100 Base TX/FX	CC A		
PROFINET conformance classes				

PROFINET modules

Communication modules and communication interface modules

The Communication Module ↬ *Chapter 1.6.2.4.9.1 “CM579-PNIO - PROFINET IO RT controller” on page 4084*acts as I/O controller in a PROFINET network. It is connected to the processor module via an internal communication bus.

The Communication Interface Modules CI50x-PNIO act as I/O modules for PROFINET network. The difference of those devices can be found in their input and output characteristics ↬ *Chapter 1.6.2.8.7.1 “Comparison of the CI5xx-PNIO modules” on page 4993*.

The communication modules ↬ *Chapter 1.6.2.4.9.2 “CM589-PNIO(-4) - PROFINET IO RT with 4 devices” on page 4089* enables an AC500 PLC to act as I/O module in a PROFINET network.

Device model of AC500 PROFINET IO devices

PROFINET standard defines modules and submodules to give structure to I/O modules data. These items are used in hierarchical order wherein a module may include one or more submodules. The input and output data of an I/O module are located inside these submodules. The modules and submodules can be identified via ident-numbers (module ident-number and submodule ident-number) and can be assigned to slots and subslots. Basically 32767 slot indexes and also 32767 subslot indexes are available to design the device structure.

PROFINET standard defines the following submodule types which represent the Device Access Point (DAP) to provide standard device functionality. In AC500 PROFINET IO devices the protocol stack defines to assign these special submodules at module slot 0.

Submodule type	Assigned subslot
DIM	1
Interface	32768
Port 1	32769
Port 2	32770

Automation Builder configuration assigns DIM, interface, port 1 and port 2 to desired slot/subslots. These modules are inserted automatically in hidden style so they are not visible to the user. It is only required to assign manually the modules/submodules needed for providing I/O data.

Module types provided by AC500 PROFINET IO devices support one single submodule only. This single submodule is inserted automatically in hidden style so it is not visible to the user. The available module types depend on the device type. See *Chapter 1.6.2.8.7.1 “Comparison of the CI5xx-PNIO modules” on page 4993* for CI50x module types and see *Chapter 1.6.2.4.9.2 “CM589-PNIO(-4) - PROFINET IO RT with 4 devices” on page 4089* for CM589-PNIO(-4) module types.

PROFINET standard defines the property API (Application Process Identifier) to define standardized behavior to I/O modules. In AC500 PROFINET IO devices support API 0 only. Automation Builder defines corresponding API setting automatically.

Allocation of the device name

General information

There are 2 possibilities for the allocation of the device name of the modules CI50x-PNIO and CM589-PNIO(-4):

- Allocation of the device name via DCP (Engineering Tool needed)
- Allocation of the device name via address switches (without Engineering Tool)

For the start-up of PROFINET, the address information "MAC address" and a unique "device name" is sufficient. The allocation of the IP address is performed via the I/O controller automatically during start-up of the bus communication.

CAUTION!
Malfunctions due to wrong device name settings!
Each device name can only be used once in a network to be explicit.

Make sure that each device has a unique device name.

A maximum of 256 PROFINET IO devices can be used within the same network. The ABB CM579-PNIO PROFINET IO Controller can handle up to 128 PROFINET IO devices.

Allocation of the device name via DCP

The allocation of the device name via DCP is standard for PROFINET networks. For this possibility of allocation, it is absolutely necessary to set both address switches to "00".

A device name set via DCP will be also present after a restart of the device (is stored permanently).

If the address switches are not set to "00", the device name via DCP is also stored permanently. But after a restart, the stored device name is not used.

Allocation of the device name via address switches

The AC500 PROFINET IO RT Devices (CI50x-PNIO and CM589-PNIO(-4)) are equipped with 2 rotary switches to set an explicit name to the I/O modules before commissioning. No engineering tool is needed.

The device gets its name (including the fixed part of the device name) directly from the setting of the switches (01h...FFh). This name can be used directly within the device configuration.

This name is for example:

ci501-pn-xx / cm589-pn-xx

ci501-pn- / cm589-pn- is the fixed part of the device name and "xx" represents the position of the rotary switch (0..255d or 0..FFh).

Designing and planning a network

With PROFINET IO it is also possible to include wireless parts using WLAN into the network. The only restriction is that the wireless component must support VLAN.

The reaction time will increase if using WLAN, because the wireless/WLAN transfer rate is slower than wired networking.

CAUTION!

Risk of communication faults!

Ethernet components without VLAN-tag-support will not work properly in PROFINET IO networks. Make sure that all Ethernet-devices support the VLAN-tag.

Because of PROFINET IO requirements on data throughput, switches with support of 100 MBit/s and full duplex are mandatory.

System performance

Bus communication

The PROFINET communication is realized using 100 MBit/s transfer rate. Real-time frames contain in addition to the process data (36 ... 1440 bytes) also an overhead of 44 bytes (gap, preamble and FCS included). The result is a frame length of 80 - 1484 bytes, that means a frame time of 6.4 µs up to 116.4 µs.

The modules CI50x-PNIO are the I/O modules for PROFINET RT. The difference of those devices can be found in their input and output characteristics ↬ *Chapter 1.6.2.8.7.1 “Comparison of the CI5xx-PNIO modules” on page 4993*.

- The PROFINET IO RT devices CI501-PNIO, CI502-PNIO and CI504-PNIO have a process data length of 80 bytes up to 213 bytes, depending on the usage of I/O modules. That results in a frame time of 6.4 µs up to 17.0 µs for 1 I/O module.
- The PROFINET IO RT device CI506-PNIO has a process data length of 80 bytes up to 1024 bytes, depending on the usage of I/O modules. That results in a frame time of 6.4 µs up to 81.7 µs for 1 I/O module.

To get the best performance for the PROFINET RT channel a few factors have to be taken into account. These parameters can be set in the configuration tool and define the frequency and distribution of the RT frames.

SendClockFactor

The SendClockFactor multiplied with a basic time of 31.25 µs defines the cyclic basic clock rate of the whole PROFINET system, i.e. the smallest cycle time for the exchange of process data. The typical value for the SendClockFactor is 32, that means the basic bus cycle is 1 ms. For 100 MBit/s it is recommended that the SendClockFactor is between 5 and 128.

Table 705: Examples for the SendClockFactor:

SendClockFactor	PROFINET basic cycle time	Annotation
5	156 µs	Fastest theoretical value for the basic cycle time at 100 MBit/s
32	1 ms	Fastest basic cycle time for the PROFINET IO controllers
128	4 ms	Slowest theoretical value for the basic cycle time at 100 MBit/s

The possible values for SendClockFactor and ReductionRatio (the product of both is the cycle time) of a CI506-PNIO device are dependent on the connected CANopen Slaves (number of PDOs. The dependency is shown in the following table.

For a CI506-PNIO for example:

PROFINET Cycle Time	Maximum number of CANopen PDOs *)
1 ms	8
2 ms	32
4 ms	128
16 ms	244

*) Remarks:

- 50 % RxPDO, 50 % TxPDO
- 8 byte process data for each PDO
- CANopen cycle time min. 4 ms or about 80 % CAN bus load (e.g. 20 ms for 128 PDOs)

ReductionRatio

This value can be set individually for each I/O module and defines its ReductionRatio to the basic cycle time of the PROFINET communication. That means if the basic cycle time is 1 ms and the ReductionRatio is set to 32, the process data will be exchanged every 32 ms between the I/O module and the communication module.

The ReductionRatio provides the user the possibility to adapt the network times of each slave individually and optimally to the system restrictions. With this it is possible to decrease the bus load for getting lower reaction times for more time critical data of other I/O modules.

Table 706: Examples for the ReductionRatio:

PROFINET basic cycle time	ReductionRatio of I/O module	Update time of the process data of an I/O module
1 ms	1	1 ms
1 ms	2	2 ms
1 ms	4	4 ms

Allowed values for the ReductionRatio are 1, 2, 4, 8, 16, 32, 128, 256 and 512.

For configuration of the ReductionRatio, attention should be paid to:

- the basic bus cycle time should not be overloaded, i.e. that not more RT frames can be transferred than would fit in the fastest bus cycle time.
- a time reserve for non RT frames (NRT) should be hold out (typically about 30 % of the projected basic bus cycle time)

Help on projecting

For getting an overview over the bus load, information is displayed in this section, with this information it is easier to configure a PROFINET IO system optimally.

The PROFINET IO frame has a minimal length of 80 bytes (44 bytes overhead and 36 bytes minimum user data). That means an extension of this frame size takes only place if the sum of the process data (respectively divided in input and output data) is greater than 36 Byte.

In the following figure this is pointed up again: The first 2 examples (CI501-PNIO alone and CI502-PNIO with 5 I/O modules DC532) will fit into the minimum frame size. In the third example, only two I/O modules AX522 are used on a CI501-PNIO but that suffices to get above the minimum frame size.

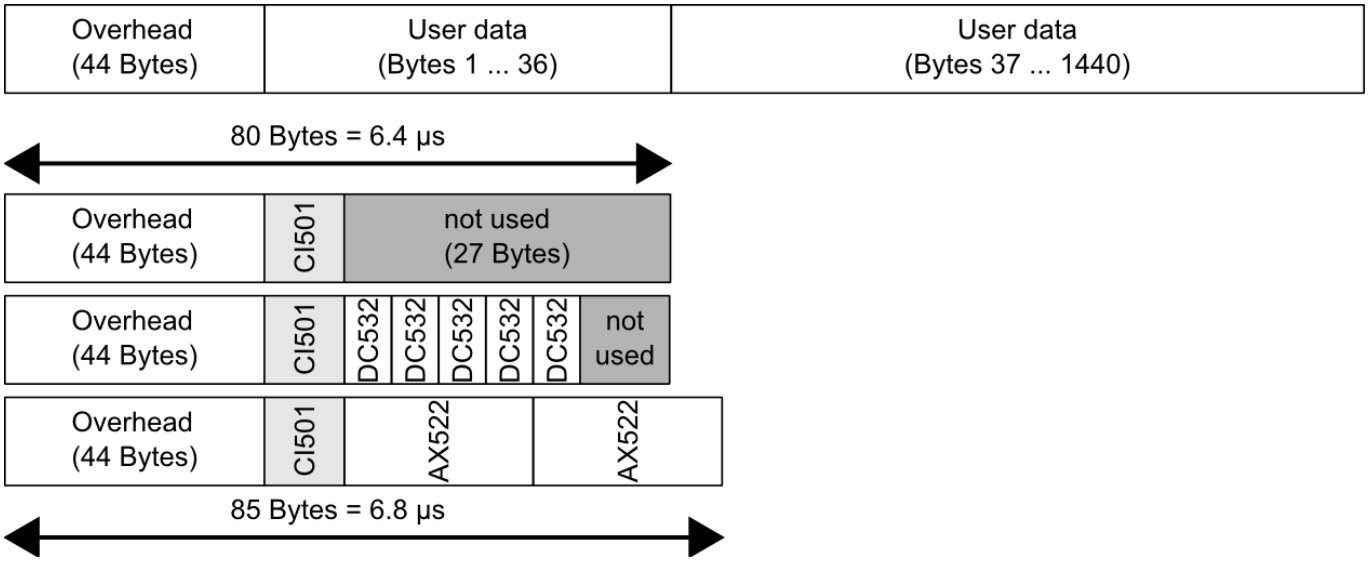

Fig. 1132: Effect of the process data length on the frame length

For better overview, the data length of the CRC, which follows the user data, is included into the overhead.

The following tables show the length of the process data of all available S500 PROFINET IO devices and of all S500 modules. With these tables and the aid of the following formula, it is possible to calculate the frame time for a modular I/O module (separately for input and output data).

Module type	Input data length [bytes]	Output data length [bytes]
CD522	24	32
CI501-PNIO	9	5
CI502-PNIO	2	2
CI504-PNIO	0 ... 36	0 ... 36
CI506-PNIO	0 ... 36	0 ... 36

Table 707: Length of the process data of the S500 I/O modules:

Module type	Input data length [bytes]	Output data length [bytes]
DA501	12	8
DC522	2	2
DC523	3	3
DC532	4	2
DC561	2	2
DI524	4	0
DI561	1	0
DI562	2	0
DI571	1	0
DO561	0	1
DO571	0	1
DO572	0	1
DX522	1	1
DX531	1	1
DX561	1	1
DX571	1	1
AI523	32	0
AI531	32	1
AI561	8	0
AI562	4	0
AI563	8	0
AO523	0	32
AO561	0	4
AX521	8	8
AX522	16	16
AX561	8	4

t_{input} = Max(6.4 µs, (SUM_{input} + 44) * 0.08 µs) / ReductionRatio

t_{output} = Max(6.4 µs, (SUM_{output} + 44) * 0.08 µs) / ReductionRatio

$t_{sum} = t_{input} + t_{output}$

For CI506-PNIO the I/O data size of connected CANopen slaves must also be considered.

With these values, an estimation of the expected bus load is possible. Afterwards, all frame times of input and output must be added. The result is the average time the complete communication needs. In the following table this is done for an example application for getting a sense of the expected times. The sum of the frame times of the different I/O modules is here 130.3 µs, that means with a basic cycle time of 1 ms the bus load is only 13.26 % and that means there is enough reserve for NRT data transfer for other network applications.

Device	DAP	EXP1	EXP2	EXP3	EXP4	EXP5	EXP6	EXP7	Send Clock Factor [ms]	Reduction Ratio	Time [µs]

Configuration examples and their delivery time

The following examples give an estimated overview of the PROFINET communication usage rate.

Example 1 (typical)

A typical entire module consists of a CI501-PNIO with one DC532 and one AX521. This constellation contains 21 bytes input data and 15 bytes output data. The RT telegram is sent in both directions with a time of 6.4 µs.

Bus cycle time = 1 ms

ReductionRatio (RR) = 1

RT transmission time = 1 ms -30 % = 700 µs

Number of I/O devices = 700 µs / (6.4 µs + 6.4 µs) = 55

You can operate with up to 55 I/O devices in one network and you still have enough reserves for the non-real-time channel.

The reserve of the real-time and non-real-time channel is decreased by using more than 55 I/O devices. (With 78 I/O devices, there are no reserves left.)

Example 2 (with 7 I/O modules)

An I/O module with a larger data range is a CI501-PNIO with seven AI523. This constellation contains 233 bytes input data and 5 bytes output data. In input direction a RT telegram is sent with about 24 µs.

Bus cycle time = 1 ms

ReductionRatio (RR) = 1

RT transmission time = 1 ms - 30 % = 700 µs

Number of I/O modules = 700 µs / (24 µs + 6.4 µs) = 24

You can operate with up to 24 I/O modules with the same configuration.

If more than 32 I/O modules are operating, the data exchange must be decreased by changing the ReductionRatio.

Ethernet TCP/IP Simultaneous operation of PROFINET and Ethernet TCP/IP in one network is possible. The parallel usage of non-real-time protocols (office applications, TCP/IP) has no influence to the real-time channel. On the other hand, a high usage rate of the real-time channel delays the non-real-time communication.

Simultaneous usage of PROFINET and EtherCAT

The simultaneous operation of PROFINET and EtherCAT in one network is not possible.

Simultaneous programming via network

The PROFINET Communication Module has no programming interface to the AC500 PLC. The PROFINET network is usable for programming purposes by connecting a CM597-ETH Communication Module or a PM5x1 Ethernet port to the PROFINET network.

Delivery time of CI501-PNIO and CI502-PNIO

The PROFINET Communication Module CM579-PNIO supports a communication with up to 128 I/O modules. The aimed delivery times raise by a greater upgrade of the system.

The following tables show the different delivery times in dependence of a CM579-PNIO Communication Module and the number of CI50x-PNIO modules.

The basic PROFINET cycle is 1 ms (SendClockFactor = 32). The I/O modules ReductionRatio value is 1 and the process update cycle is 1 ms.

Quantity of CI50x-PNIO	Terminal-to-terminal response time of digital IO [ms]	Comment

PROFINET implementation

System start-up behavior

Initial operation

The PROFINET protocol is handled automatically by the PROFINET Communication Module and the PLC operation system. When the Communication Module is initialized in the proper way and the user application is running, the Communication Module and the bus become active.

No function blocks are needed for the cyclic process data exchange. The access to the send and receive data to the according operands range can be performed in the direct way. The access takes place either via operands or symbolic variables. Special PROFINET functions are realised by function blocks of the PROFINET Library.

IP assignment

After switching on the power supply of the PLC the user application is loaded and the Communication Module is configured. Then the IP addresses of the IO devices will be assigned by means of DCP. For the identification of the IO devices the Profinet IO device name is used. Which has to be previously assigned using the DCP protocol. For ABB devices additionally the default name and the rotary switch can be used for name assignment.

Initialization

When the user application changes into the run mode, the configured I/O modules are initialized. At this time, the I/O modules get their configuration (and the configuration of possibly connected I/O modules) by the I/O controller.

Then the configured devices are compared with the available I/O modules and I/O modules of the real assembly. If the result of the compare is conformed, the I/O modules get their configuration. Otherwise the available devices get their configuration and the failure is displayed with the error LEDs of the communication interface module. The error can also be displayed by using the diagnosis function blocks.

The Communication Module and the I/O modules change into the cyclic process data exchange when the configuration transfer is completed.

If the configuration is not successful or the cyclic process data exchange between I/O controller and I/O module is broken (e. g. removing of the plug), both participant

- close their communication
- change their status into the initial condition
- try to build up a new connection.

This procedure has no influence on devices where the configuration was successful.

Because of that a replacement of a faulty I/O module can be done without restarting the PLC. But you have to consider that the new device must have the same position of the switches for setting the device identifier like the replaced one and switch off the power supply of the device you want to replace.

Diagnosis

In addition to the user data transportation PROFINET RT provides a wide range of commissioning and diagnostic functions. The upcoming diagnosis events from the I/O modules are centralized in the I/O controller and can be displayed using several function blocks. Due to this the localization of errors is made very simple *Chapter 1.6.4.2.3.6.4 “Diagnosis views” on page 5556*.

PROFINET function block library

The function block library PROFINET_AC500_V13.lib contains different function blocks to get I/O controller and connected I/O modules information about the status of communication and error states. These function blocks can be embedded additionally, especially for the initial operation.

A detailed function block description can be found in the PROFINET library.

PROFINET status and diagnosis via function blocks

The status messages of the PROFINET bus are requested by the function blocks PNIO_STATE and PNIO_SYS_DIAG, which give following information:

Function block name	Function
Chapter 1.5.4.27.1.9 “PNIO_STATE” on page 1826	Common information about the PROFINET bus state
Chapter 1.5.4.27.1.10 “PNIO_SYS_DIAG” on page 1829	Detailed information about the PROFINET bus state

PROFINET IO device error diagnosis via function blocks

Error and status messages describing I/O devices are queried by PNIO_DEV_ALARM.

Function block name	Function
Chapter 1.5.4.27.1.1 “PNIO_DEV_ALARM” on page 1794	Representation of diagnosis messages from connected I/O modules

Identification and maintenance functions

PROFINET standard defines "Identification & Maintenance" data (I&M) to have access to device specific information like serial number, order number etc. This I&M data is described as I&M0 and I&M1 – I&M5 data. I&M0 and I&M1 – I&M4 data should be provided by all types of I/O modules; I&M5 is optional.

Access to this data should be provided via PROFINET acyclic read/write services at specific slot/subslot indexes.

The following shows how to access I&M data in AC500:

	Read / Write	Accessible at Slot / Subslot	Supported by
I&M0	Read only	Any configured slot/subslot	CI50x + CM589-PNIO + CM589-PNIO-4
I&M1-4	Read	Any configured slot/subslot Responds with data stored at DAP submodule interface Serves as representative for all configured slots/subslots	CM589-PNIO + CM589-PNIO-4
I&M1-4	Write	DAP submodule Interface Representative for all configured slots/subslots	CM589-PNIO + CM589-PNIO-4
I&M5	Not supported	-	-

I&M data provides the following details:

I&M0	VendorID (WORD) OrderID (STRING:20) SerialNr (STRING:16) HW-Revision (WORD) SW-Revision (1 CHAR plus 3 x BYTE, e. g. V.1.2.3) RevisionCounter (WORD) ProfileID (WORD) IM_ProfileSpecType (WORD) IM_Version (2 x BYTE) IM_supported (WORD)
I&M1	Tag function (STRING:32) Tag location (STRING:22)
I&M2	Installation date (STRING:16)

I&M3	Descriptor (STRING:54)
I&M4	Signature (STRING:54)

AC500 PROFINET function block Library provides function block *PNIO_IM0* to read I&M 0 data for a certain I/O module.

See for detailed function block description *Chapter 1.5.4.27.1.6 “PNIO_IM0” on page 1813*.

The I/O modules CI501-PNIO and CI502-PNIO support I&M0 function.

The structure and the meaning of these information is specified in the PNO "Profile Guidelines Part 1: Identification & Maintenance Functions" (version 1.1.1, order number 3.502).

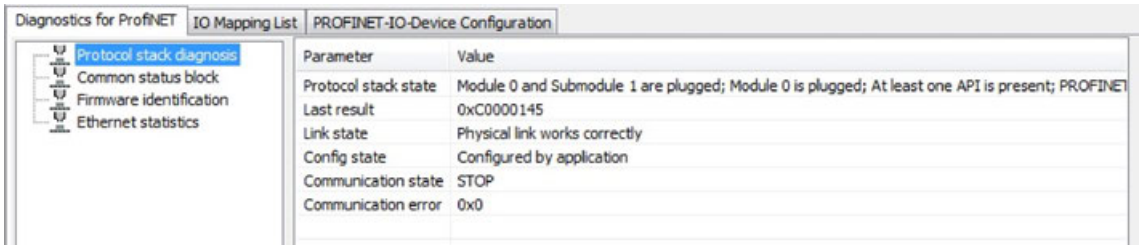
Online diagnosis

The online diagnosis is only available by using special function blocks.

Diagnosis views

PROFINET IO devices provide diagnosis views which consist of the following parts:

- *Basic diagnosis views* which are common for all netX based communication modules:
  - Common status block view
  - Firmware info view
- *Protocol specific views* which provide specific PROFINET IO information for the PROFINET IO device protocol.
  - Protocol stack diagnosis
  - Ethernet statistics



Protocol stack diagnosis view

The Protocol stack diagnosis shows PROFINET IO device protocol stack related diagnosis information.

Parameter	Description
Protocol stack state	Current state of the protocol stack. This value is bit coded and is able to carry several state information in combination. Following details may be combined to a value: ● Device Information set ● PROFINET stack started ● At least one API present ● Module 0 plugged ● Module 0 and sub-module 1 plugged ● Network communication allowed ● Network communication enabled ● Configuration locked ● Fatal error occurred ● PROFINET diagnosis exists ● PROFINET maintenance required ● PROFINET maintenance demanded ● FiberOptic maintenance demanded port 0 ● FiberOptic maintenance required port 0 ● FiberOptic maintenance demanded port 1 ● FiberOptic maintenance required port 1
Last result	Last error code that has occurred in past.
Link state	Current state of the communication link. Values: ● No information available ● Physical link works correctly ● Low speed of physical link ● No physical link present
Config state	Current state of configuration of the protocol stack. Values: ● Not configured ● Configured with DBM Files ● Error during configuration with DBM Files ● Configured by application ● Configuration by application is running ● Error during configuration by application ● Configured with warm-start parameters ● Configuration with warm-start parameters is running ● Error during configuration with warm-start parameters
Communication state	Current state of communication of the protocol stack. Values: ● Unknown ● Offline ● Stop ● Idle ● Operate
Communication error	Currently active error code. If the cause of an error is resolved the value is set 0 (OK) and can be checked in the entry *Last result*.

Firmware info view

Parameter	Description
System channel version	Version number of the system channel implementation
System channel firmware name	Firmware name of the system channel implementation
System channel firmware build date	Build date of the system channel implementation
Protocol channel version	Version number of the protocol channel implementation
Protocol channel firmware name	Firmware name of the protocol channel implementation
Protocol channel firmware build date	Build date of the protocol channel implementation

Ethernet statistics view

For analyzing this view, basic Ethernet knowledge is required.

Ethernet statistics provides information about transmit and receive traffic. The load and the quality of communication can be observed. Problems due to too much network load or internal resource problems will be shown here in terms of error counters.

Parameter	Description
Frames transmitted successfully	Number of frames transmitted successfully
Frames with single collision	Number of frames with single collision detected
Frames with multiple collisions	Number of frames with multiple collisions detected
Late collisions	Number of frames with collision detected later than 512 bit times
Link down during transmission	Number of frames transmitted while link state went down
UTX FIFO underflow	Number of UTX FIFO underflows occurred while transmitting frames
Fatal transmission errors	Number of TPU error codes detected while transmitting frames
Frames received successfully	Number of frames received successfully
Sequence check errors	Number of frames received with valid length but not passing the FCS check
Alignment errors	Number of frames received with not valid length and not passing the FCS check
Frame too long errors	Number of frames received with maximum permitted frame size exceeded
Valid frames with length between 42 and 63 bytes	Number of frames received with length between 42 to 63 bytes and valid checksum

Parameter	Description
Collision fragments	Number of frames received with length smaller than 64 bytes and invalid checksum
Dropped frames due to low resources	Number of frames received while no resources available to handle the frames
Dropped frames due to URX FIFO overflow	Number of UTX FIFO overflows occurred while receiving frames
Fatal receive errors	Number of RPU error codes detected while receiving frames

1.6.4.2.4 EtherCAT communication module

EtherCAT overview

Features

EtherCAT is an open standard for the realization of Industrial Ethernet based automation applications and is highly suitable for time critical applications. Its protocol minimizes overhead and increases the share of user data. Further, it provides mechanism to synchronize inputs and outputs. For general information on EtherCAT see *https://www.ethercat.org*.

EtherCAT is a cyclic communication. Only for parameterization, diagnosis and alarms-messages of intelligent field devices, non-cyclic messages will be used.

Standardization: EtherCAT

- IEC 61131-3: PLC Standardization
- IEC 61158: EtherCAT Standardization
- IEC 11801: Wire and connection elements for Ethernet

EtherCAT is registered trademark and patented technology, licensed by Beckhoff Automation GmbH, Germany

Terms, definitions, abbreviations

EtherCAT

CAT 5	Ethernet cable for 100 MHz data size
CAT 5e	Ethernet cable for 100 MHz data size for Gigabit-Ethernet
CAT 6	Ethernet cable for 250 MHz data size
CAT 7	Ethernet cable for 600 MHz data size
CAT 8	Ethernet cable for 1 GBit data size
CoE	CAN over EtherCAT
DC	Distributed Clock
DDF	Device Description File in XML format
ETG	EtherCAT Technology Group
EtherCAT	Ethernet for Control Automation Technology
FMMU	Fieldbus Memory Management Unit
NRT	Non Real-Time

RT	Real-Time
WKC	Working Counter

Transfer mechanism EtherCAT

Seen from Ethernet view, a EtherCAT bus is a single Ethernet participant. This participant receives and sends Ethernet telegrams. Inside this Ethernet participant there are many EtherCAT slaves, which process data on the fly.

The telegrams are only delayed for a few micro seconds by each slave. Each telegram is processed by all the slaves until it arrives at the last slaves in the line. The processed telegram is sent back from the last slave to the first slave (see figure), which relays it back to the master.

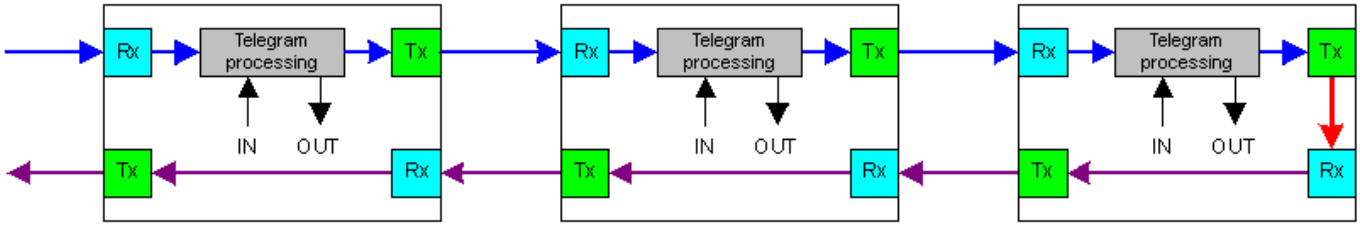


Fig. 1133: EtherCAT telegram routing

Telegram processing

The telegrams are processed on the fly. During forwarding the telegram to the next device, the slaves interpret the EtherCAT commands and read its input data. Output data for the master or for another slave is also inserted in the telegram.

The processing of telegrams is carried out by the hardware. Thus, the processing speed of an eventually connected micro processor does not influence the processing.

Several EtherCAT Process Data Units (PDU) can be embedded in one EtherCAT telegram. Each of them can address one or more slaves.

An EtherCAT PDU consists of

- Header
- Data Area
- "Working Counter".

The Working Counter is incremented by each slave which is addressed by this PDU and which has successfully carried out the command embedded in the header of the PDU. The master-communication-module compares the received Working Counter with the expected value (No. of slaves).

There are two types of EtherCAT telegrams: with and without UDP/IP. Telegrams without UDP/IP can only be used in an Ethernet subnet. Telegrams with UDP/IP allow IP routing and perform communication over router.

AC500 EtherCAT does not support UDP/IP at present.

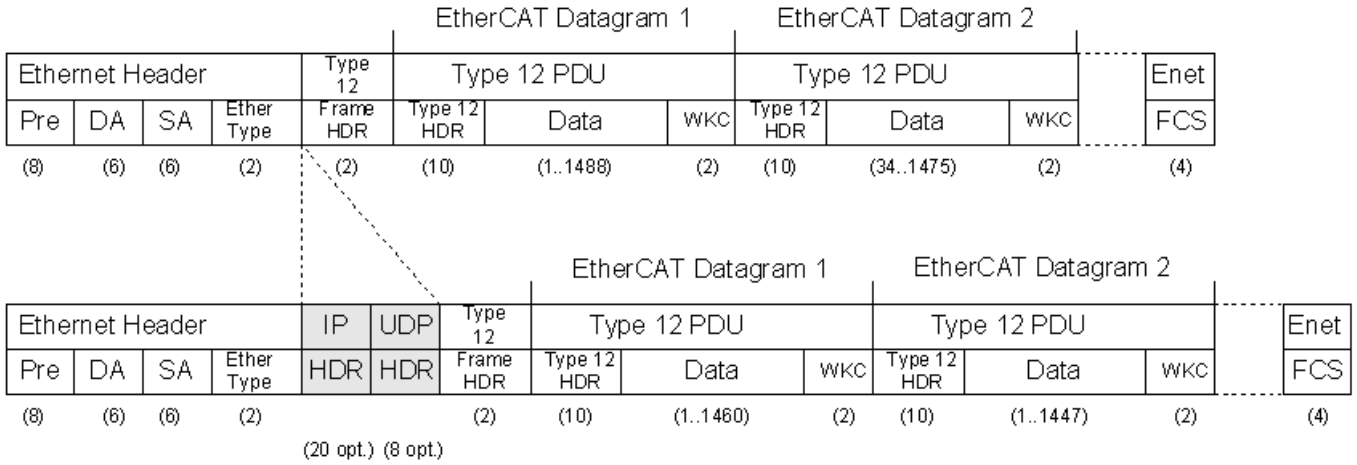

Fig. 1134: Telegram structure

Telegram structure

The individual parts of the frame have the following meaning:

Pre (Preamble)	For synchronization with the signal frequency
DA (Destination Address)	MAC address of the receiver
SA (Source Address)	MAC address of the sender
EtherType	Identifier of the following data (EtherCAT telegram uses 0x88A4)
IP HDR	Optional IP header
UDP HDR	Optional UDP header
Frame HDR	Contains protocol type and frame length
Type 12 PDU	EtherCAT Process Data Unit
Type 12 Header	contains among others: - CMD: command - IDX: index - Address - Length of the data
Data	Process data
WKC	Working Counter
FCS	Frame Checksum

Reduction of overhead

The overhead is reduced through two mechanisms:

- All slaves in an EtherCAT subnet can be addressed with a single telegram
- A telegram can consist of several EtherCAT Process Data Units which contain different commands and data. Each command can perform read/write operations on several slaves.

Addressing modes

Different addressing modes are supported for the slaves. Each telegram contains the segment addressing and a device addressing or a logical addressing.

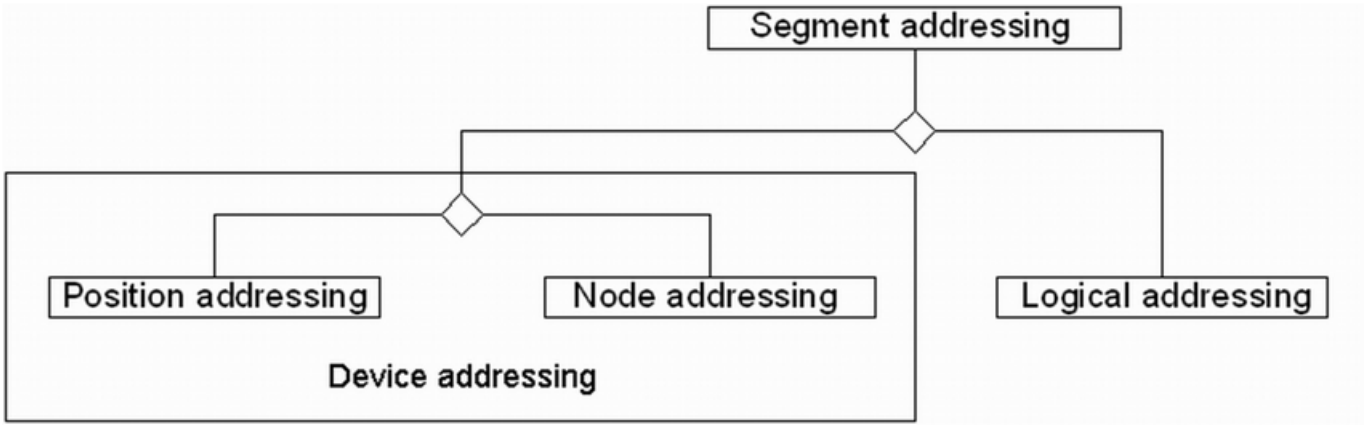

Fig. 1135: Addressing modes

The following figure shows how different addressing modes are integrated in the telegram structure:

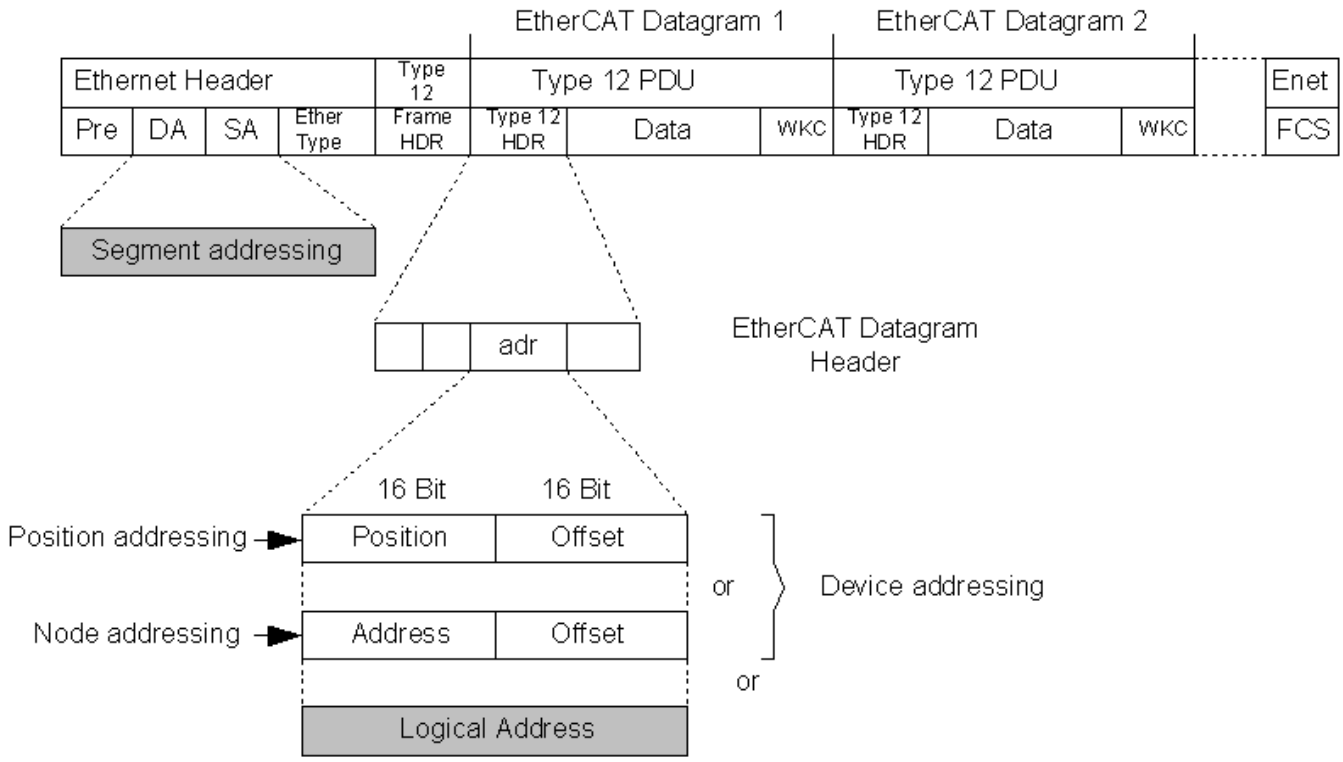

Fig. 1136: The different addressing modes in the telegram structure

Device addressing

In this addressing mode a single slave is addressed with the associated PDU. This addressing mode is usually used for transferring parameters.

There are two sorts of device addressing: position addressing and node addressing.

Position addressing

With this mode, the slaves are identified using their position in the communication network. Normally position addressing is used during start-up. After communication with the slaves is established, the master can give the slave a new node ID according to the projected value.

Node addressing

After receiving the node ID from the master, the slaves can be addressed by using the node addressing mode.

This ensures that, even if the segment topology is changed or devices are added or removed, the slave devices can still be addressed via the same configured address.

Logical addressing

With logical addressing, slaves are not addressed individually. Instead, a section of the segment-wide logical address space (data) is allocated to each salve. Any number of slaves may use separate, the same or overlapping sections.

The Fieldbus Memory Management Units (FMMU) on the slaves handle the assignment of slave local memory address to logical addresses. With this it is possible to address several slaves with a single PDU.

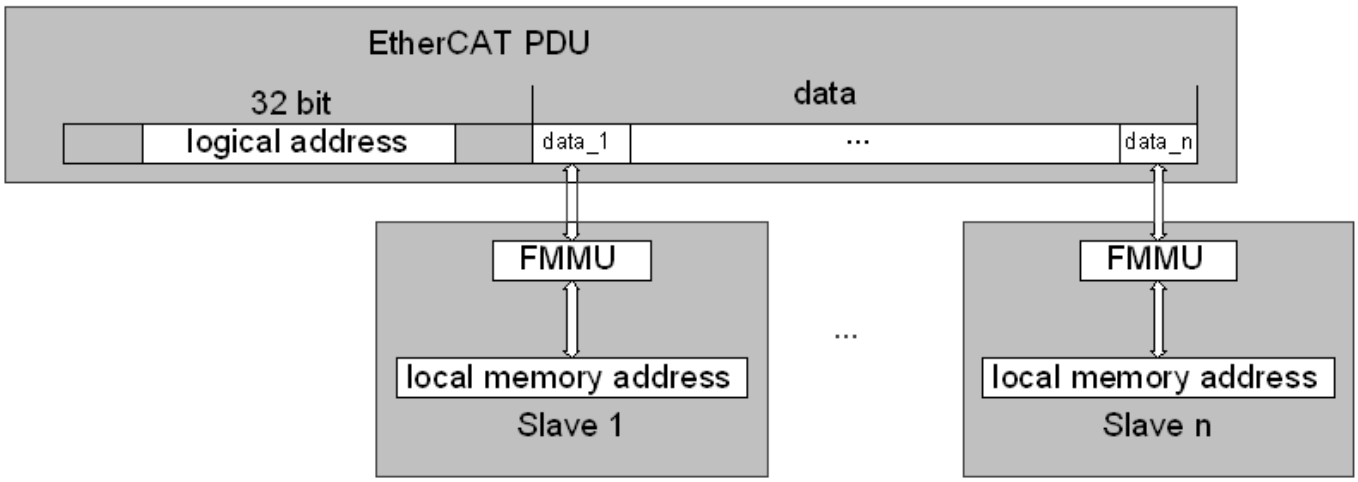

Fig. 1137: Examples of a simple logical address mapping

Distributed clock

Precisely synchronization between the slaves is always required if distributed slaves are used to carry out actions at the same time. One of those applications for example is the control of several servo axes, which shall carry out coordinated movements.

Another application is the AC500 camswitch functionality. In this application it is important to calculate the angle velocity and the position of the main axis precisely.

EtherCAT uses synchronization according to IEEE 1588. This method provides synchronization which is very resistant to communication disturbances.

This synchronization mechanism eliminates:

- different start-up times
- delay times between the slave with the master clock and all other slaves
- drift of the local clocks.

CANopen over EtherCAT (CoE)

The CANopen protocol is preferably used for transferring configuration parameters to the slaves. It can also used for the transmission of process data. Instead of a standard CANopen protocol, which can only transfer 9 bytes of user data, CoE can transfer a maximum of 1478 bytes. Therefor, the CoE protocol can be used to transfer process data with variable length.

Device description file (DDF)

The features of an EtherCAT slave are described in an electronic data sheet, the Device Description File (DDF). This XML-based document gives the characteristics of the device unambiguously and completely with a vendor-independence format.

The characteristics of the CI51x-ETHCAT devices are:

- Description of each input/output group of the device
- Parameters, which are required for the correct functionality of the device

The configuration of an EtherCAT system is highly simplified with the DDF, which is normally provided by the vendor.

Device names and allocation of addresses

The Communication Module ↳ *Chapter 1.6.2.4.6 "EtherCAT" on page 4066* acts as a master device in an EtherCAT master-slave arrangement. It is connected to the Processor Module via an internal communication bus.

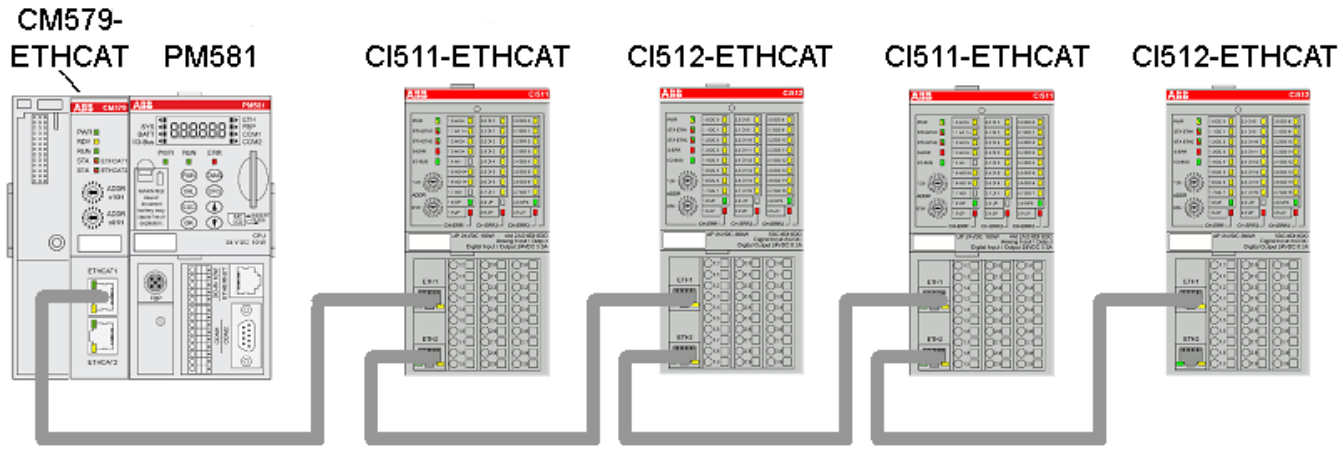
The Communication Interface Modules ↳ *Chapter 1.6.2.8.4 "EtherCAT" on page 4814* act as slave devices in an EtherCAT master-slave arrangement. The slave devices are identified through their position in the bus segment. Address switches are not used. Thus it is possible to give the devices a specific name with a configuration tool before system activation.

The default settings of the EtherCAT slaves need not to be changed before operation.

> ***Risk of communication faults!***
> *The device names are used to generate global variables for the PLC program. Each device names can only be used once within a network.*
>
> *Make sure that all device names are unique.*

Designing and planning a network

AC500 EtherCAT supports only the bus (line) structure.



System performance

Bus communication

The EtherCAT communication is realised using 100Mbit. There is one telegram for all EtherCAT slaves in a segment, so overhead is substantially reduced.

The terminal-to-terminal response time depends on the size of the total process image of all slaves and the CPU load of PLC.

Terminal-to-terminal response time of the CI511-ETHCAT/ CI512-ETHCAT

The terminal-to-terminal response time for digital I/Os of CI51x-ETHCAT is 2 bus cycles (e.g. 2 ms with bus cycle time set to 1 ms) with the CPU PM591, EtherCAT distributed clock activated and synchronized task type (triggered by external event). The terminal-to-terminal response time for analog I/Os is about 13 ms for bus cycle time of 1 ms.

50 % CI511-ETHCAT and 50 % CI512-ETHCAT means e. g. that in case of 16 devices, 8 CI511-ETHCAT and 8 CI512-ETHCAT are involved.

Distributed control cams with EtherCAT

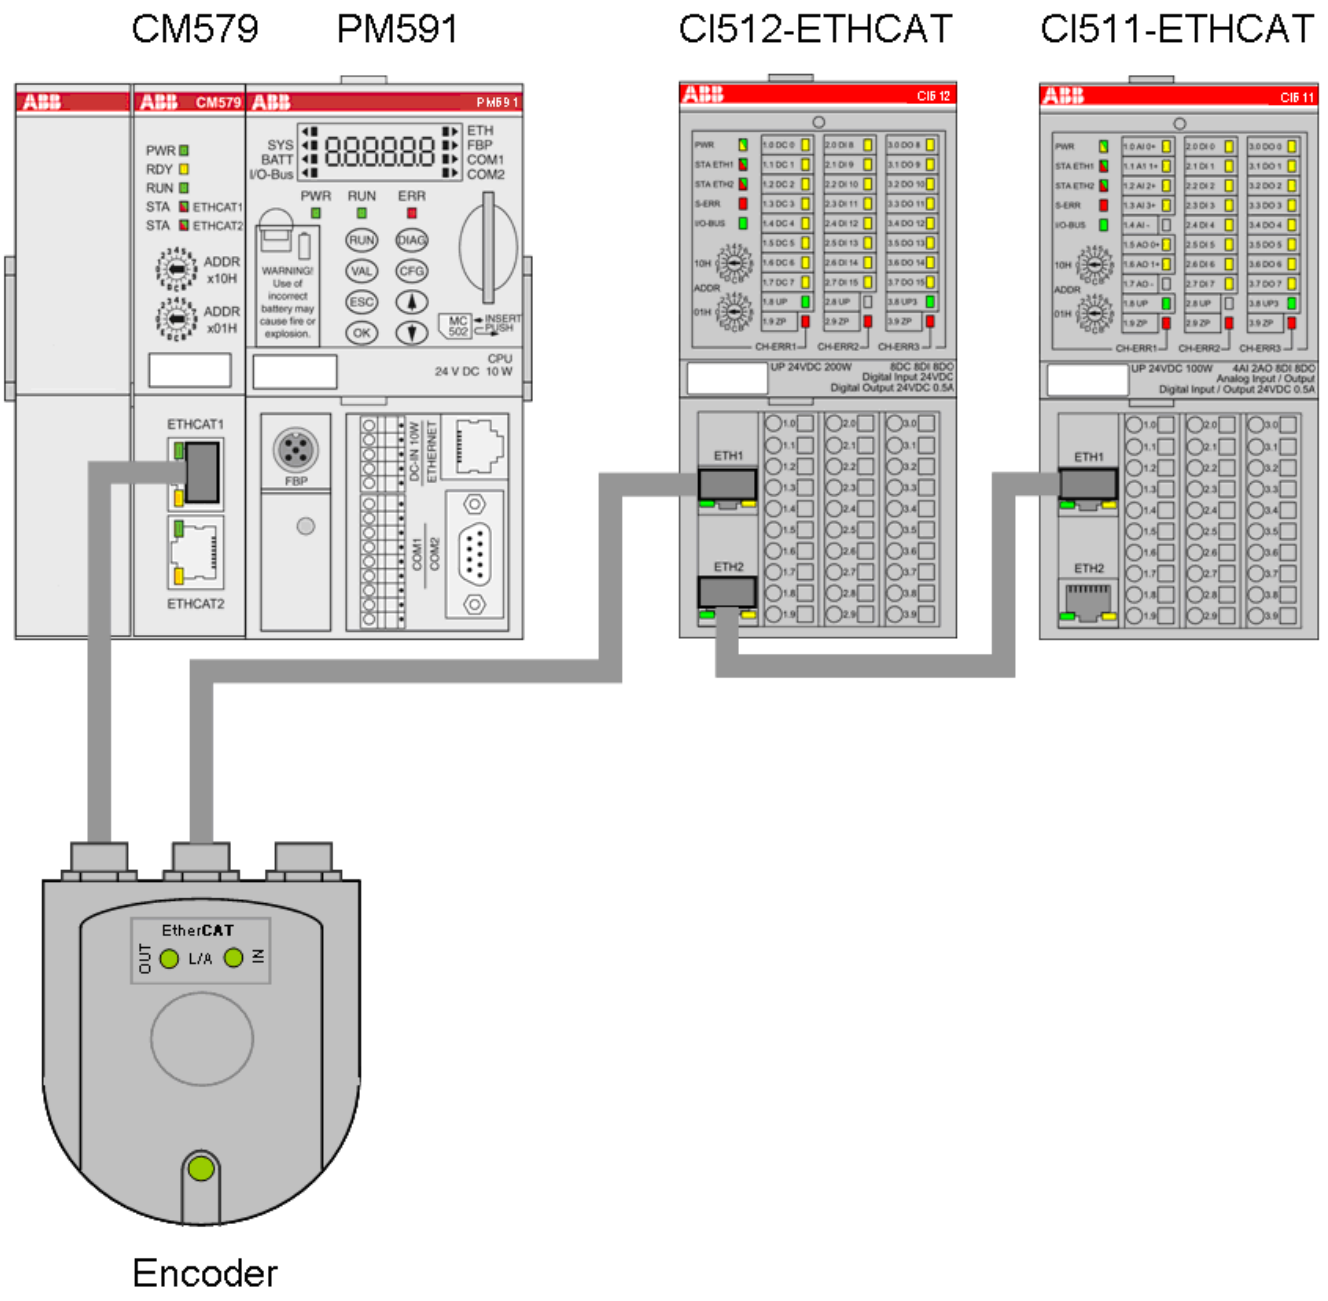
Concept

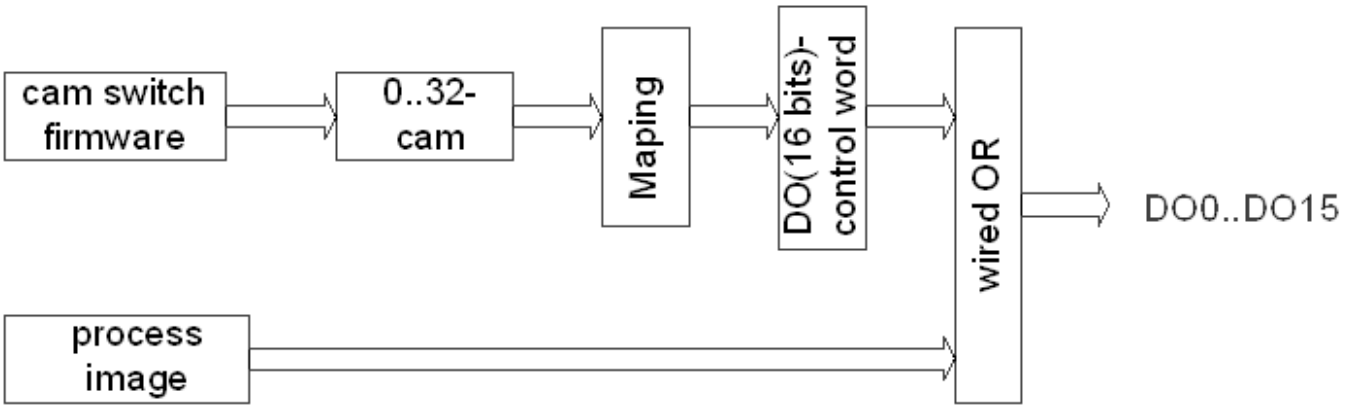
The devices CI511-ETHCAT and CI512-ETHCAT can be used as distributed electrical cams with communication over EtherCAT.

The encoder, which has to be the first slave of the line structure, generates the reference axis.

Each device has up to 8 (CI511-ETHCAT) respectively 16 (CI512-ETHCAT) digital outputs and up to 32 cams. The cams can be mapped to the digital outputs according to the user specifications.

The devices can also process dynamic cams with compensation time for each cam.





The 32 cams of each device can be assigned to any digital outputs, so several switching actions for each digital output and each turn are possible. Each cam consists of one switch-on and one switch-off-action. If a digital output is not assigned to a cam, it can be used as a standard output and controlled by the PLC.

The PLC can further more set any digital output at any time to overwrite the cam state. It can also clear the enable bit of the cams. In this case, the digital output will follow the value in the process image.

This conception allows a flexible utilization of the available digital outputs as cam output or standard digital outputs.

The mapping between the cams and the digital outputs is a part of the configuration and can not be changed online.

Cam accuracy

The cam in the CI51x-ETHCAT uses the positions with time stamp, which comes from the encoder with each telegram, to calculate its switching time. It uses the internal synchronized clock to eliminate

- dead times,
- jitter of EtherCAT telegrams,
- cycle time of the encoder.

The accuracy of the CI51x-ETHCAT cams implementation depends only on the number of the projected cams (parameter NumOfUsedCam) of each device.

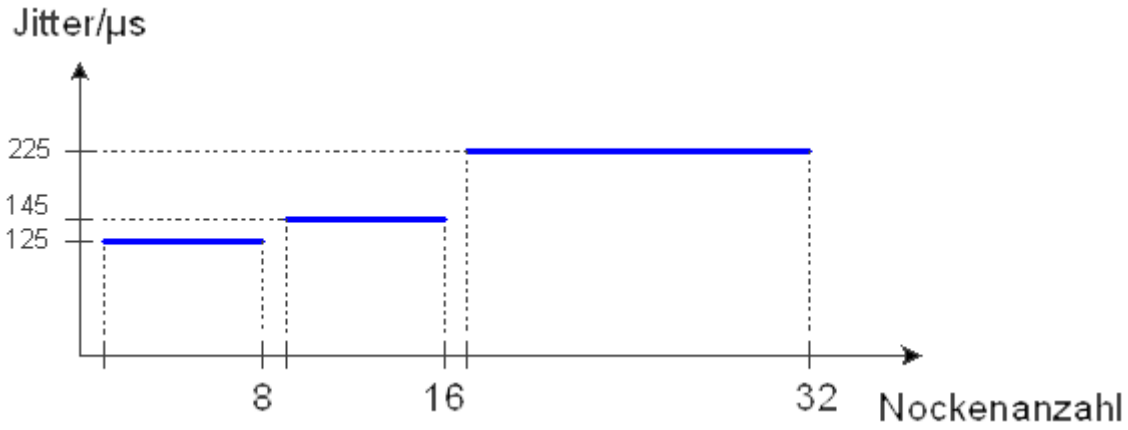


Fig. 1138: Cam accuracy (worst case)

Particular features

In order to reduce the data amount of the process data image, some parameters for the cams, e. g. FirstOnPosition, LastOnPosition and Compensation, are transferred to the EtherCAT slave using the multiplexing method. Parameters of only one cam out of 32 cams are embedded in each EtherCAT telegram. The multiplexing mechanism is handled completely by the function blocks. The user program is released from this task.

The enable-bits of the cams are treated differently: They are transferred to the slaves with each EtherCAT telegram, so the cam can be enabled or disabled very quickly.

Encoder

To facilitate the cam switch functionality, an encoder must be used. The encoder gives the time stamped position of the referent axis to the CI51x-ETHCAT. The encoder must be the first EtherCAT slave in the line structure.

ABB hardware-components work properly with the 18 bit encoder GBMMS or GBMMW of Baumer-IVO. Different bit resolutions of the encoder can be used, but a high resolution will reduce jitter of the cams. The specified data in Cam Accuracy is applied for encoder with 18 bits resolution.

Further details of the IVO encoder can be found at *http://www.ivo.de*.

Encoder wiring

ABB Components use Ethernet cables with RJ45 connectors, but the encoder uses a M12 connector. A suitable connection between the ETHCAT Communication Module (CM5xy-ETHCAT) and encoder respectively between encoder and ETHCAT Communication Interface Modules (CI5xy-ETHCAT) is required. The following connector can be used:

Table 708: Connection of EM 12 S OCTOPUS:

	Name	Ethernet cable	EM 12 S OCTOPUS
	TxD+	White/green	Yellow pin 1
	TxD-	Green	Orange pin 3
	RxD+	White/orange	White pin 2
	RxD-	Orange	Blue pin 4

Software components

In addition to the standard EtherCAT_AC500 library, there are two function blocks in the MC_EtherCAT_AC500 library: ↳ *Chapter 1.5.4.5.1.1 “MC_CamSwitch_DC” on page 853* and ↳ *Chapter 1.5.4.5.1.2 “PS_DigitalPLS” on page 857*.

The two function blocks allow a simply control of the cams.

Detail information about configuration and programming application with cam can be found in "EtherCAT configuration examples".

EtherCAT implementation

System start-up behavior

Initial operation

The EtherCAT protocol is handled by the EtherCAT Communication Module and the PLC operating system automatically. When the Communication Module is initiated in the proper way and the user application is running, the Communication Module and the bus become active.

No function blocks are necessary for exchanging process data via EtherCAT. Furthermore, it is possible to access the send data and the receive data in the according operands range directly. The access takes place with either operand or symbolic variables. Special EtherCAT functions can be realized by using the function blocks of the EtherCAT library.

To include an AC500 EtherCAT Communication Module in the PLC system, create an EtherCAT configuration and write it into the Communication Module. A detailed documentation can be found in the document "Example: EtherCAT Configuration".

System start-up

When the user application changes into the run mode, the communication module tries to establish communication with the configured slaves.

The communication module will not change into run mode if:

- the number of the configured slaves is not equal to the number of connected slaves.
- the type of the configured slaves is not equal to the type of connected slaves.

In this case, the LED STA2 ETHCAT (master communication module) switches on.

After communication to the slaves is established, the distributed clocks will be synchronized. This process can last up to 1 minute. During the synchronizing process, the LED S-ERR (slave) switches on. After a successful synchronization of the distributed clocks, the LED S-ERR switches off and the LED PWR, STA1 ETHCAT and STA2 ETHCAT of the slave are on.

For details see the device description of ↳ *Chapter 1.6.2.4.6.1 “CM579-ETHCAT - EtherCAT master” on page 4066*, ↳ *Chapter 1.6.2.8.4.1 “CI511-ETHCAT” on page 4814* and ↳ *Chapter 1.6.2.8.4.2 “CI512-ETHCAT” on page 4846*.

If a communication interface module will be disconnected from the EtherCAT network during operation, it will not continue with the communication after reconnecting. A restart of the whole system must be performed.

EtherCAT sync

Overview

The EtherCAT master CM579-ETHCAT supports 2 modes for synchronized operation. These modes can be used for synchronization between PLC task and IO image.

The master has the same functionality as in unsynchronized mode, but with every new bus cycle it additionally creates an interrupt. With this interrupt the PLC task will be triggered.

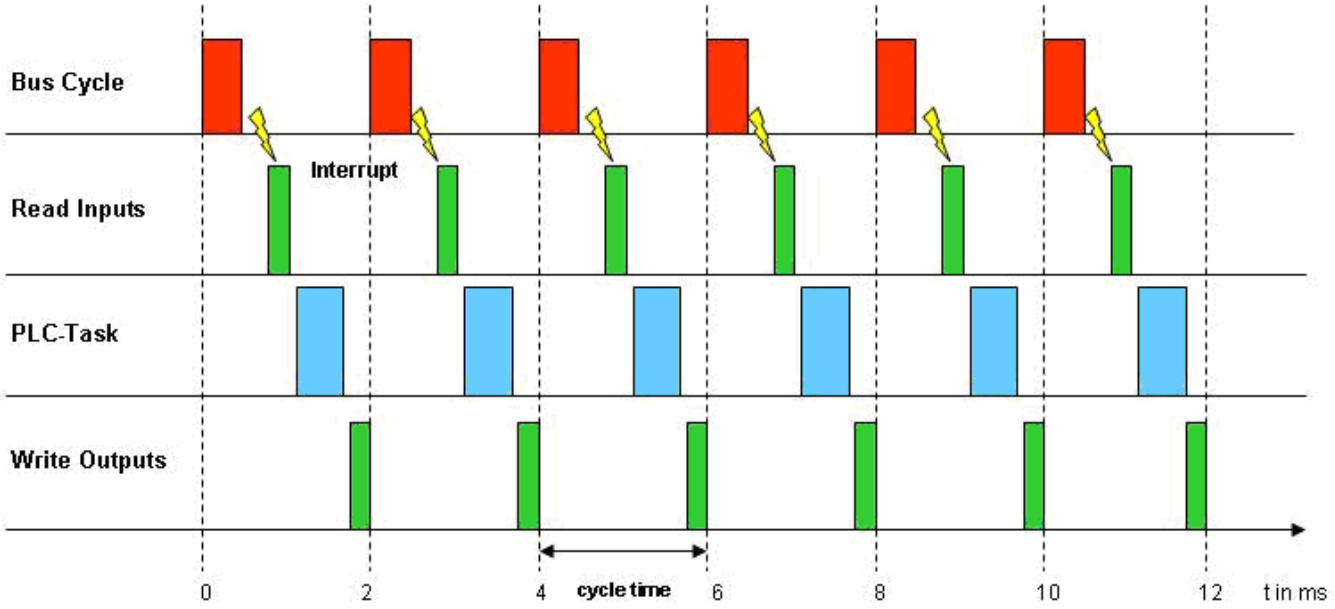
System requirements

The functionality described here has the following system requirements.

PLC	Firmware version 2.1.3
CM579-ETHCAT	Firmware version 2.4.11
Control Builder Plus	2.1.0
Automation Builder	1.0

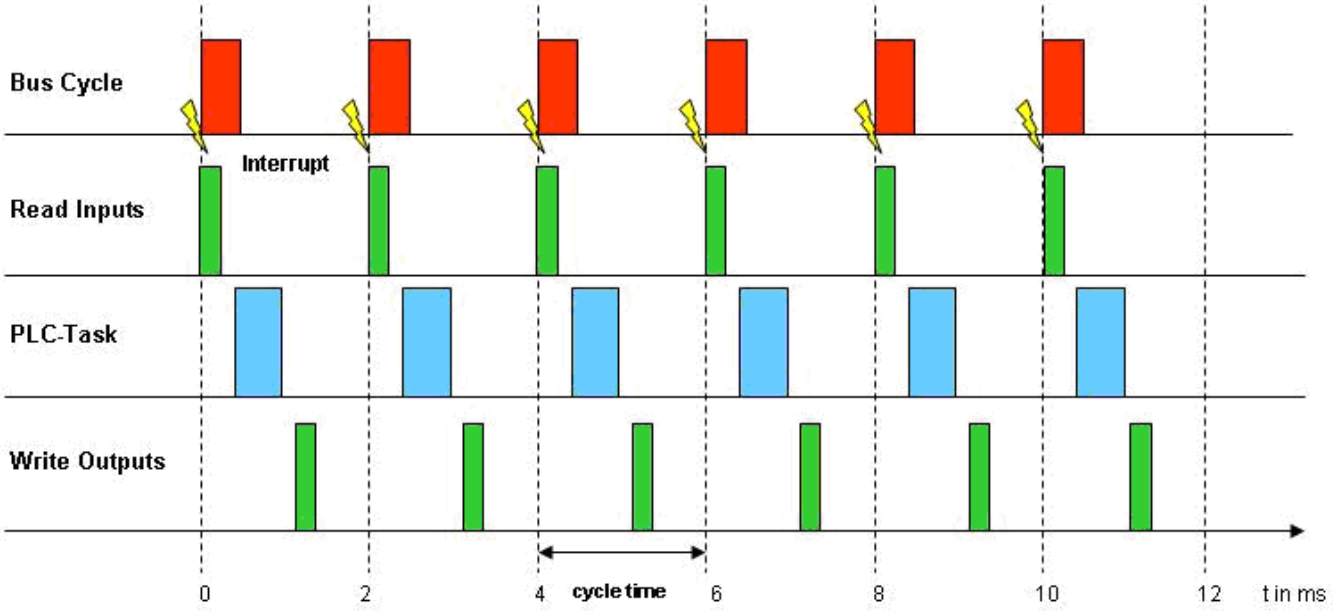
Sync mode 1

In this mode, the interrupt for task synchronization is generated at the end of the current bus cycle. If the PLC is triggered by this interrupt, it reads the input values at first. Then it starts the corresponding task. And at the end of the task, it writes the output values back to EtherCAT master. If the PLC task is not finished within a bus cycle a diagnosis message will be created.



Sync mode 2

The difference between sync mode 1 and sync mode 2 is the instant of time when the interrupt is generated. In sync mode 2 it will be generated at the beginning of a bus cycle. The PLC task uses therefore the input values of previous bus cycle. If the PLC task is not finished within a bus cycle a diagnosis message will be created.



Diagnosis

2 error counters are available for diagnosis purposes. It can be read and evaluated within a PLC program using function block ↳ *Chapter 1.5.4.14.1.7 “ECAT_SYNC” on page 1315* from EtherCAT Library. More detailed information can be found in the corresponding documentation of this library ↳ *Chapter 1.5.4.14 “EtherCAT library” on page 1295*.

Diagnosis

In addition to the user data transportation, EtherCAT provides a wide range of diagnostic functions, which can be useful for system activating. The upcoming diagnostic events from the EtherCAT slaves are centralized in the master and can be displayed by using several function blocks. Localization of failures is greatly simplified with this function.

EtherCAT function block library

The function block library EtherCAT_AC500_V13.lib (since firmware version 1.3.0) ↳ *Chapter 1.5.4.14 “EtherCAT library” on page 1295* contains different function blocks to get information about the status of communication and error states of the EtherCAT Communication Module and connected EtherCAT slaves. These function blocks can be embedded additionally, especially for the initial operation.

EtherCAT status and diagnosis via function blocks

The EtherCAT status messages can be requested by the following function blocks:

Function block name	Function
↳ *Chapter 1.5.4.14.1.6 “ECAT_STATE” on page 1311*	Common information about the status of the EtherCAT bus
↳ *Chapter 1.5.4.14.1.1 “ECAT_BUS_DIAG” on page 1296*	Information about the status of all bus participants
↳ *Chapter 1.5.4.14.1.4 “ECAT_GET_DCLK_DEVI” on page 1305*	Information about the distributed clock of every slave
Status function blocks in the library EtherCAT_AC500_V13.lib	

A detailed function block description is in the document The EtherCAT Library.

EtherCAT slave diagnosis via function blocks

Status and error messages, which describe the slave state, are requested via the ECAT_SLV_DIAG function block:

Function block name	Function
Chapter 1.5.4.14.1.5 “ECAT_SLV_DIAG” on page 1308	Representation of diagnosis messages of connected slaves
Slave diagnosis function blocks in the library EtherCAT_AC500_V13.lib	

Device revision

Hardware and firmware revision can be queried using the *Chapter 1.5.4.15.1.6 “ECAT_SOE_READ” on page 1333* function block with index (idx) 2006h and subindex (subidx) 1:

- HW-Revision (WORD) is stored in the first 2 bytes,
- SW-Revision (1 CHAR plus 3 x BYTE, e. g. V.1.2.3)

Online diagnosis

The online diagnosis in Automation Builder software is only available by using special function blocks *“EtherCAT slave diagnosis via function blocks” on page 5571*.

1.6.4.2.5 CANopen communication modules

CANopen overview

Features

Fundamental properties and fields of application

CANopen is a standardized layer 7 protocol used for decentralized industrial automation systems based on the Controller Area Network (CAN) and the CAN Application Layer (CAL). CANopen is based on a communication profile containing the determination of basic communication mechanisms and their descriptions, such as the mechanisms used for exchanging process data in real-time or for sending alarm telegrams. This common communication profile is the basis for the various CANopen device profiles. The device profiles describe the specific functionality and/or the parameters of a device class. Such device profiles are available for the most important device classes used in industrial automation, such as digital and analog I/O modules, sensors, drives, control units, regulators, programmable controllers or encoders. Further device profiles are projected.

The central element of the CANopen standard is the device functionality description in an object directory (OD). The object directory is divided into one general area containing information about the device (e.g. device identification, manufacturer's name, etc.) as well as communication parameters, and the device-specific area describing the particular functionality of the device. These properties of a CANopen module are documented in the form of a standardized "electronic data sheet" (EDS file).

A CANopen network can consist of a maximum of 128 modules, one NMT master and up to 127 NMT slaves. In contrast to the typical master-slave systems (e.g. PROFIBUS systems), the meanings of the terms master and slave are different for CANopen. In operational mode, all modules are independently able to send messages via the bus. Moreover, the master is able to change the operating mode of the slaves. The CANopen master is normally implemented by a PLC or a PC. The bus addresses of the CANopen slaves can be set in the range between 1 and 127. The device address results in a number of identifiers occupied by this module.

CANopen supports transmission rates of 10 kbit/s, 20 kbit/s, 50 kbit/s, 125 kbit/s, 250 kbit/s, 500 kbit/s, 800 kbit/s and 1 Mbit/s. Each CANopen device has at least to support a transmission rate of 20 kbit/s. Other transmission rates are optional.

Standardization: CANopen

CiA DS 401 V2.1 - CANopen Device Profile Generic I/O modules

CiA DS 402 V2.0 - CANopen Device Profile Driver and Motion Control

CiA DS 406 V3.0 - CANopen Device Profile Encoder

Terms, definitions and abbreviations

CANopen

CAL	CAN Application Layer
CAN	Controller Area Network
CiA	CAN in Automation e.V.
DLC	Data Length Code
EDS	Electronic Data Sheet
ISO	International Standardization Organization
NMT	Network Management
OD	Object Directory
PDO	Process Data Object
RTR	Remote Transmission Request
SDO	Service Data Object

CANopen

- Operating mode CANopen-Master
- Process image with a maximum of 57344 I/O points
- Supports min. boot-up, emergency messages and life guarding
- Supported PDO modes: Event-controlled, synchronous, cyclic and remote PDO transmission
- Integrated device profiles: CiA DS-401, CiA DS-402 and CiA DS-406

CAN (additional functionality, not necessary for pure CANopen operation)

- Support of 11 bit identifiers according to CAN 2.0 A and 29 bit identifiers according to CAN 2.0 B
- Transmission and reception of any CAN telegrams via function blocks in the user program

Transmission technique

- ISO 11898, potential separated
- Transfer rates of 20 kbit/s, 125 kbit/s, 250 kbit/s, 500 kbit/s and 1 Mbit/s
- Bus length up to 1000 m at 20 kbit/s and up to 40 m at 1 Mbit/s
- One bus can have up to 128 subscribers (master + 127 slaves)
- 5-pin COMBICON connector for bus

Communication

- Message-oriented bus access, CSMA/CA
- Predefined master-slave connections
- 8 bytes of non-fragmented user data, for fragmentation any size is possible
- Synchronization of inputs and/or outputs via synchronous PDOs

Protection functions

- Message transfer with Hamming distance HD = 6
- CAN fault recognition mechanisms via 15 bit CRC, frame check, acknowledge, bit monitoring and bit stuffing

- Incorrect parameter settings are avoided because bus subscribers with faulty parameters are not included in the user data operation.
- Adjustable behavior on subscriber failure. System continues normal operation and the error is indicated at the master or the entire system is stopped.
- Response monitoring of the subscribers (node guarding)

Communication mechanisms

CANopen distinguishes two basic mechanisms for data transmission: The fast exchange of short process data via Process Data Objects (PDOs) and the access to entries of the Object Directory using Service Data Objects (SDOs). Service Data Objects are primarily used to transmit parameters during device configuration. The transmission of Process Data Objects is normally performed event oriented, cyclic or on request as broadcast objects.

Service data objects

Service Data Objects (SDOs) are used to modify Object Directory entries as well as for status requests. Transmission of SDOs is performed as a confirmed data transfer with two CAN objects in the form of a peer-to-peer connection between two network nodes. The corresponding Object Directory entry is addressed by specifying the index and the sub-index of the entry. It is possible to transmit messages of unlimited length. If necessary, the data are segmented into several CAN messages.

Process data objects

For the transmission of process data, the Process Data Object (PDO) mechanism is available. A PDO is transmitted unconfirmed because, in the end, the CAN link layer ensures the error-free transmission. According to the CAN specification, a maximum of 8 data bytes can be transmitted within one PDO. In conjunction with a synchronization message, the transmission as well as the take over of PDOs can be synchronized over the entire network (synchronous PDOs). The assignment of application objects to a PDO can be set using a structural description (PDO mapping) that is stored in the object directory. Thus, an adaptation according to the requirements of the individual applications is possible. The transmission of process data can be performed by various methods.

Event

The PDO transmission is controlled by an internal event, e.g. by a changing level of a digital input or by an expiring device-internal timer.

Request

In this case, another bus subscriber is requesting the process data by sending a remote transmission request (RTR) message.

Synchronous

In case of synchronous transmission, synchronization telegrams are sent by a bus subscriber. These telegrams are received by a PDO producer which in turn transmits the process data.

Network management

Within a CANopen network, only one NMT master exists (NMT = Network management). All other modules are NMT slaves. The NMT master completely controls all modules and is able to change their states. The following states are distinguished:

Initialization

After switching-on, a node is first in the initialization state. During this phase, the device application and the device communication are initialized. Furthermore, a so-called boot-up message is transmitted by the node to signalize its basic readiness for operation. After this phase is finished, the node automatically changes to the pre-operational state.

Pre-operational In this state, communication with the node is possible via Service Data Objects (SDOs). The node is not able to perform PDO communication and does not send any emergency messages.

Operational In this state, SDO and PDO communication is possible. The access to the Object Directory via the SDO protocol depends on the device implementation and may be restricted

Stopped In the stopped state, a node is completely disconnected from the network. Neither SDO communication nor PDO communication is possible. A state change of the node can only be initiated by a corresponding network command (e.g. Start Node).

Node guarding and heartbeat

Testing the functionality of a CAN node is particularly required if the node does not continuously send messages (cyclic PDOs). Two mechanisms can alternatively be used to monitor the CANopen nodes. When the node guarding protocol is used, the NMT master sends messages to the available CANopen slaves which have to respond to these messages within a certain time period. Therefore, the NMT master is able to detect if a node fails. Furthermore, the heartbeat protocol can be used with CANopen. In this case, each node automatically sends a periodic message. This message can be monitored by each other subscriber in the network.

Object directory

The object directory describes the entire functionality of a CANopen device. It is organized as a table. The object directory does not only contain the standardized data types and objects of the CANopen communication profile and the device profiles. If necessary, it also contains manufacturer-specific objects and data types. The entries are addressed by means of a 16 bit index (table row, 65536 entries max.) and an 8 bit sub-index (table column, 256 entries max.). Thus, objects belonging together can be easily grouped. The following table shows the structure of this CANopen object directory:

Index		**Object**
dec	**hex**	
0	0000	not used
1...31	0001...001F	Static data types
32...63	0020...003F	Complex data types
64...95	0040...005F	Manufacturer-specific data types
96...607	0060...025F	Device profile specific data types
608...1023	0260...03FF	Reserved
1024...4095	0400...0FFF	Reserved
4096...8191	1000...1FFF	Communication profile (DS-301)
8192...24575	2000...5FFF	Manufacturer-specific parameters
24576...40959	6000...9FFF	Parameters of the standardized device profiles
40960...45055	A000...AFFF	Standardized network variable area

Index		Object
dec	hex	
45056…49151	B000…BFFF	Standardized system variable area
49152...65535	CA000...FFFF	Reserved

Several data types are defined for the objects themselves. If required, other structures (e.g. ARRAY, STRUCT) can be created from these standard types.

Identifiers

CANopen always uses identifiers with a length of 11 bits (standard frames). The number of available and allowed identifiers given by this is divided into several ranges by the pre-defined connection set. This structure is designed in a way that a maximum of 128 modules (1 NMT master and up to 127 slaves) can exist in a CANopen network. The list of identifiers is composed of some fix identifiers (e.g. network management identifier 0) and various functional groups where each existing node, that supports the corresponding function, is assigned to one unique identifier (e.g. Receive PDO 1 of node 3 = 512 + node number = 515). Using the pre-defined connection set therefore avoids double assignment of identifiers.

Identifier	Function	Calculation
0	Network management (NMT)	-
1...127	not used	-
128	Synchronization (SYNC)	-
129...255	Emergency message	128 + node ID
256	Timestamp message	-
257...384	not used	-
385...511	Transmit PDO 1	384 + node ID
512	not used	-
513...639	Receive PDO 1	512 + node ID
640	not used	-
641...767	Transmit PDO 2	640 + node ID
768	not used	-
769...895	Receive PDO 2	768 + node ID
896	not used	-
897...1023	Transmit PDO 3	896 + node ID
1024	not used	-
1025...1151	Receive PDO 3	1024 + node ID
1152	not used	-
1153...1279	Transmit PDO 4	1152 + node ID
1280	not used	-
1281...1407	Receive PDO 4	1280 + node ID
1408	not used	-
1409...1535	Transmit SDO	1408 + node ID
1536	not used	-

Identifier	Function	Calculation
1537...1663	Receive SDO	1536 + node ID
1664...1792	not used	-
1793...1919	NMT error (node guarding, heartbeat, boot-up)	1792 + node ID
1920...2014	not used	-
2015...2031	NMT, LMT, DBT	-

PDO mapping

As already explained, all 8 data bytes of a CAN message are available for the transmission of process data. As there is no additional protocol information, the data format has to be agreed between the sending (producer) and the receiving party (consumer). This is done by the so-called PDO mapping.

If a fixed mapping is used, the process data are arranged in a pre-defined order within the PDO message. This arrangement is predetermined by the device manufacturer and cannot be changed. If variable mapping is used, the process data can be arranged as desired within the PDO message. For this purpose, the address, consisting of index and sub-index, as well as the size (number of bytes) of an object directory entry are entered into the mapping object.

EDS files

The characteristic properties of a CANopen module are documented in the form of an electronic data sheet (EDS file, electronic data sheet). The file completely and clearly describes the characteristics (objects) of a module type in a standardized and manufacturer independent format. Programs for configuring a CANopen network use the module type descriptions available in the EDS files. This strongly simplifies the configuration of a CANopen system. Usually the EDS files are provided by the device manufacturer.

Master-Slave-Arrangement

CANopen master CM598-CN

The communication module CM598-CN is a master device in a CANopen master-slave arrangement. It is connected to the processor module via an internal communication bus. A detailed device description of the device can be found in the device description for ↳ *Chapter 1.6.2.4.5.2 “CM598-CN - CANopen master” on page 4060*

CANopen slaves CI581-CN / CI582-CN

The communication interface modules CI581-CN / CI582-CN are I/O slave devices in a CANopen master-slave arrangement.

A detailed description of the devices can be found in the device descriptions of ↳ *Chapter 1.6.2.8.2.2 “CI581-CN” on page 4685* and ↳ *Chapter 1.6.2.8.2.3 “CI582-CN” on page 4723*.

CANopen slave CM588-CN

The communication module CM588-CN is a slave device in a CANopen master-slave arrangement. It is connected to the processor module via an internal communication bus. The CM588-CN allows communicating of multiple processor modules within a CANopen network.

A detailed description of the device can be found in the device description of ↳ *Chapter 1.6.2.4.5.1 “CM588-CN - CANopen slave” on page 4053*.

Designing and planning a network

The CANopen communication module is connected to the bus using the 5-pin COMBICON connector. For EMC suppression and protection against dangerous contact voltages, the shield of the bus cable has to be connected to protective earth outside the housing. The line ends of the bus cable have to be terminated using bus terminating resistors.

Within a CANopen network, the controller with the CANopen communication module is the NMT master. No other NMT master is allowed in this network. The NMT master completely controls all modules and their operational states. Up to 127 NMT slaves can be connected to an NMT master.

The CANopen master is able to:

- Change operational states of the slaves
- Parameterize the slaves (e.g. communication connections, time supervision, bus traffic)
- Configure slaves (e.g. type, number and channel operating mode)
- Read input data of the slaves
- Write output data of the slaves
- Read diagnosis data of the slaves
- Monitor the availability of the slaves
- Transmit control commands to synchronize the inputs or outputs of the slaves
- Read and write slave objects even during running operation

The CANopen communication module is as well able to:

- Transmit and receive CAN telegrams according to CAN 2.0 A (11 bit identifier) and CAN 2.0 B (29 bit identifier). This additional functionality is not required for pure CANopen operation.

CANopen implementation

System start-up behavior

Initial Operation

The CANopen protocol is handled by the CANopen communication module and the PLC operating system automatically.

When the communication module is initiated in the proper way and the user application is running, the communication module and the bus become active.

No function blocks are necessary for exchanging process data via CANopen. Special CAN functions can be realized by using the function blocks of the CANopen library.

The communication module starts communication via CANopen after the user application is started and then attempts to initialize the configured slaves. After a successful initialization, the communication module and the slaves exchange the process data.

The behavior of the communication module when the user application is stopped can be configured with the CPU parameter *Behavior of outputs in Stop*. See description of the CPU parameters for details.

Synchronization of an application task with the I/O update

CANopen implements the synchronization (SYNC) protocol which is used to synchronize the I/O update of the CANopen slaves. It can also be used to synchronize the I/O update with the execution of an application task.

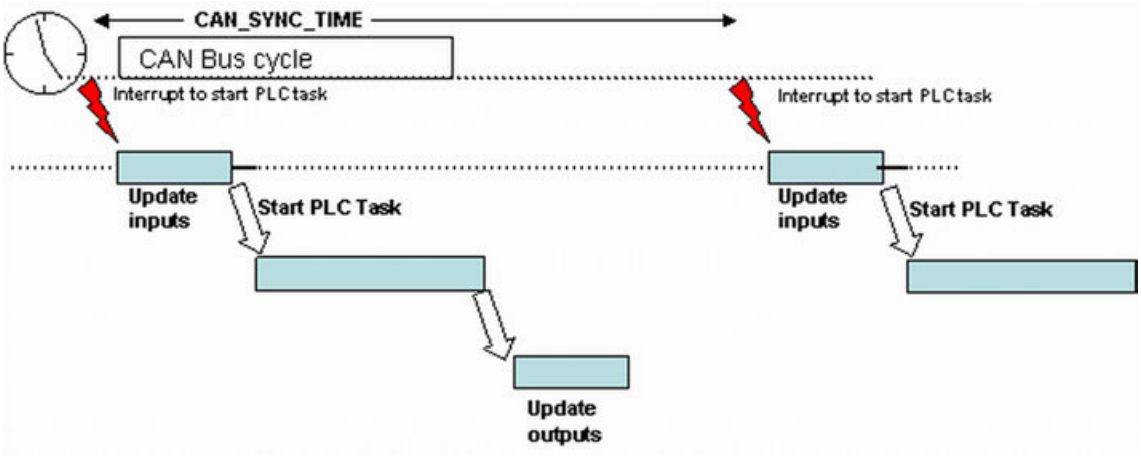
When the Sync message is sent the communication module generates an interrupt. This will trigger the execution of an associated application task.

The described functionality is supported as of the following firmware versions of PLC and communication module:

For CM598-CN

- PLC version: V2.5.3
- Communication module version: V2.0.0.2

The figure below gives a schematic overview of the synchronization between I/O update and execution of an application task:



The CAN_SYNC_TIME is the time between 2 messages of the synchronization protocol. This time has to be chosen long enough to update the I/Os and execute the application task within this time.

The execution time required by the application task can be checked online in the CODESYS task configuration.

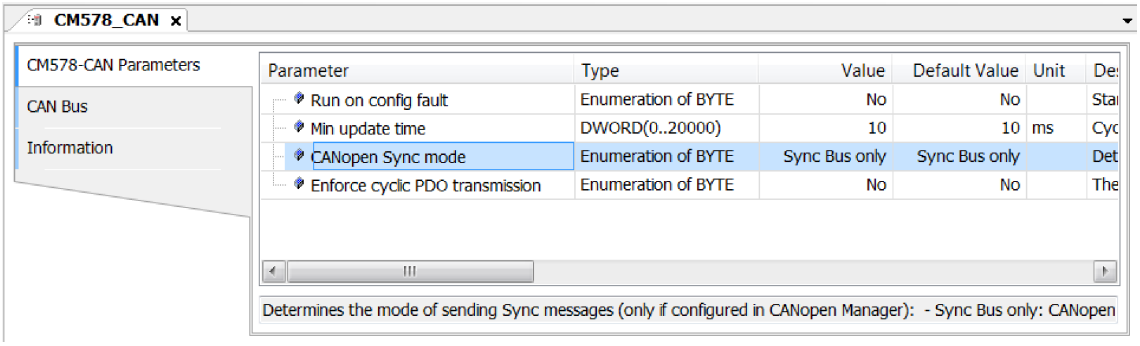
The tasks which are triggered with the CANsync interrupt have to be a higher priority than tasks which are running cyclically.

If other communication modules are attached to the same CPU, the MIN_UPDATE_TIME of those communication modules must be larger than the MIN_UPDATE_TIME of the CANsync communication module.

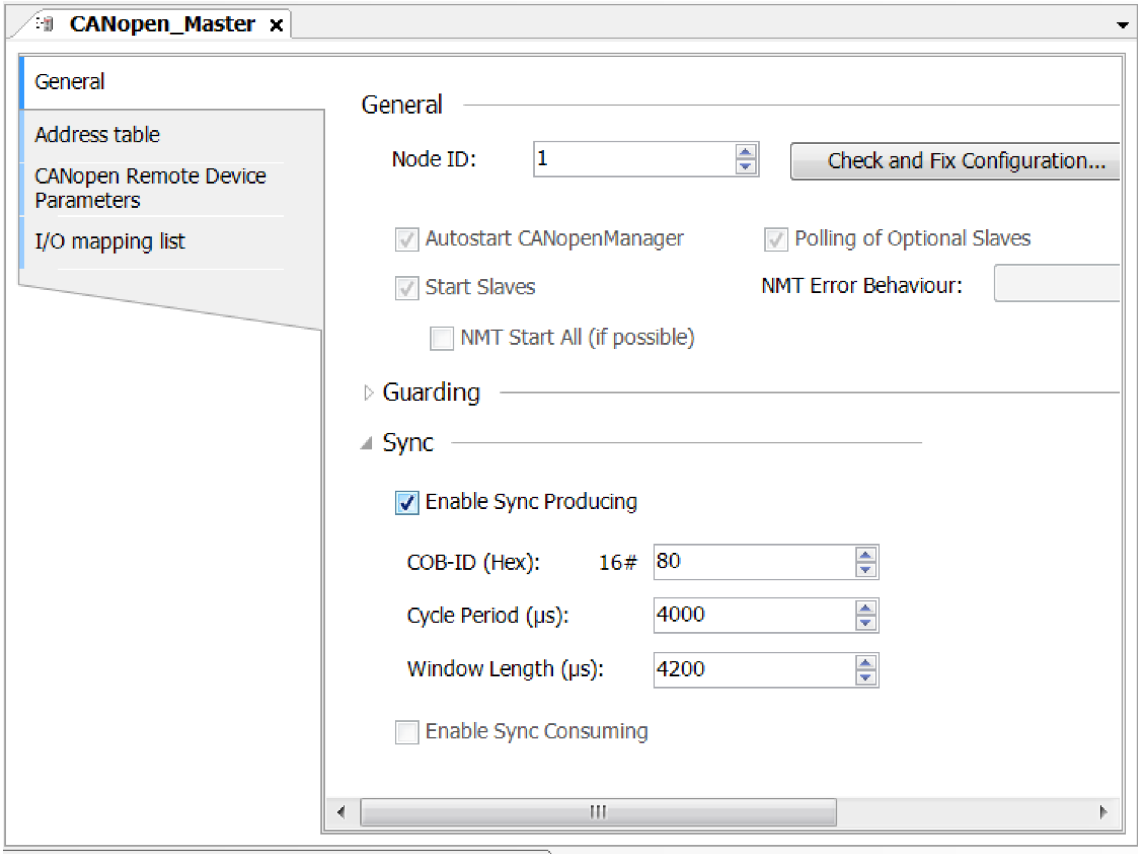
The online overview of the task configuration will display implausible values of the CANsync task. This will not influence the functionality.

Synchronization settings

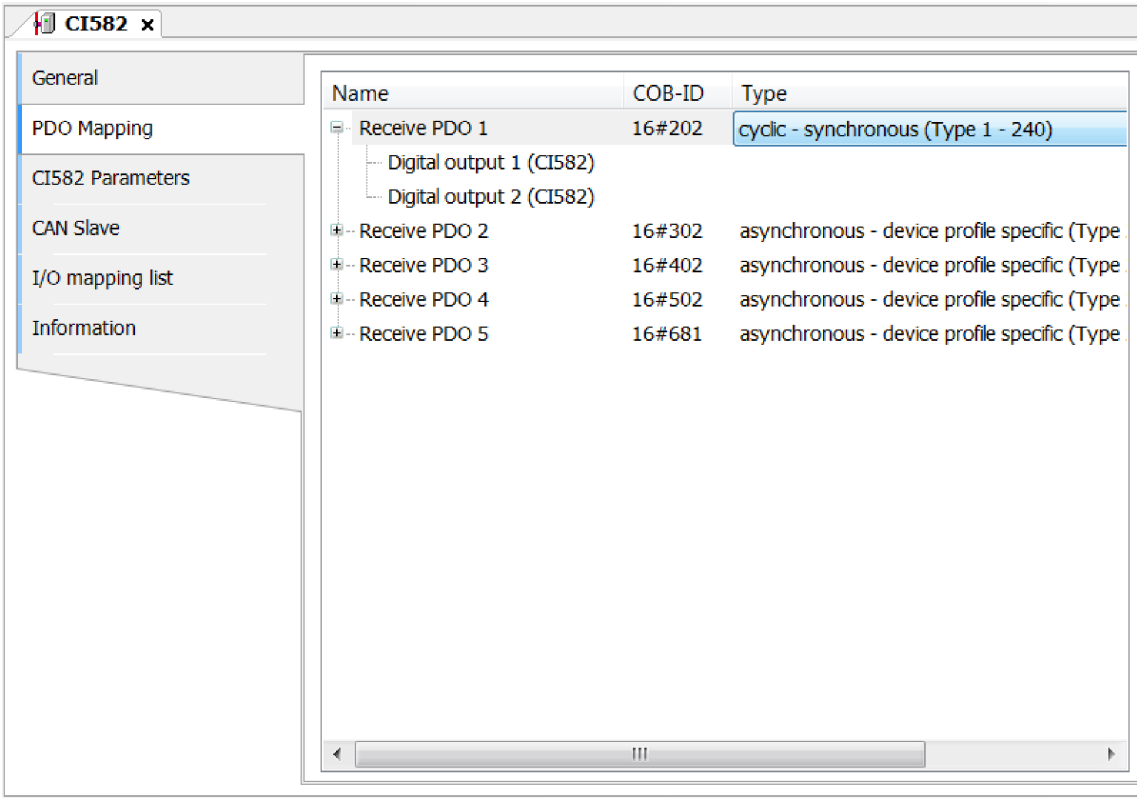
- Parameter *CANopen Sync mode* has to be set to the value *Sync Bus and Task*.



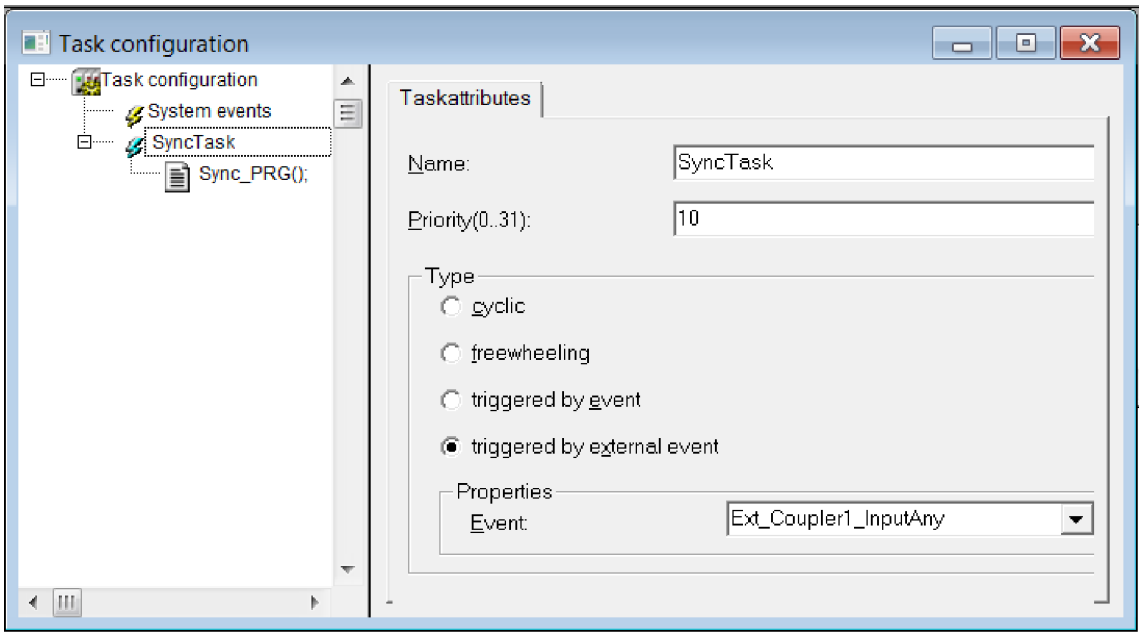
- Checkbox *Enable Sync Producing* has to be enabled in the CANopen configuration.



- At least one PDO should have a transmission mode of type *cyclic - synchronous (1-240)*.



- An application task has to be defined and linked with the associated external event.



Event	Communication module slot	Description
Int_Coupler0_ InputAny	0	Application task will be triggered by I/O update of the communication module at slot 1 - 6.
Ext Coupler <slot> InputAny	1 ... 6	Application task will be triggered by I/O update of the communication module at slot 1 - 6.

Special SDOs for CI581-CN / CI582-CN

Block wise single parameterization (Object 2700hex to 270Ahex)

In this mode the objects 2700hex to 270Ahex are used.

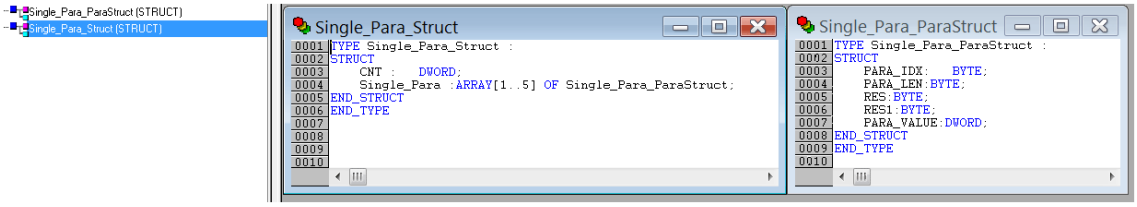
Only sub object 0 is used, the parameter index is transferred inside the data content.

Object 2700hex is for single parameters of CI581-CN / CI582-CN itself.

Objects 2701hex to 270Ahex are used for connected expansion modules in ascending order.

This mode only works if fragmented SDO transfer is available.

The transferred data must have the following structure:



The length of the SDO is dependent on the number of transferred single parameters (CNT = the number of parameters to be request) - (up to 5 parameters can be transferred with one SDO).

Very important:
The CAN uses Big Endian.
This means:
If CNT or PARA_VALUE is 2, you must assign a value: 16#02000000 to them.

The length in bytes is calculated as follows:

Length (bytes) = 4bytes + (number of single parameters * 8bytes).

So the minimum length is 12 bytes and the maximum length is 44 bytes.

If the length or any other data inside the SDO isn´t correct, the CI device will reject the SDO with abort code 0800 0000hex.

For the used parameter indexes see Parameter Indexes of CI581-CN ↳ *Chapter 1.6.4.2.5.4.3.1.1 “Parameter indexes of CI581-CN” on page 5581* and Parameter Indexes of CI582-CN ↳ *Chapter 1.6.4.2.5.4.3.1.2 “Parameter indexes of CI582-CN” on page 5582*.

Parameter indexes of CI581-CN

Parameter	Parameter index	Parameter length
Error LED Failsafe	4	1
Check supply	27	1
Analogue data format	28	1
Input Delay	29	1
Short circuit detection	31	1
Behavior binary outputs at communication fault	32	1
Substitute value binary outputs	33	1
Overvoltage monitoring	34	1
Behavior analogue outputs at communication fault	35	1
Configuration AI0	36	1
Check AI0	37	1
Configuration AI1	38	1
Check AI1	39	1
Configuration AI2	40	1
Check AI2	41	1
Configuration AI3	42	1
Check AI3	43	1
Configuration AO0	44	1
Check AO3	45	1
Substitute Value AO0	46	2
Configuration AO1	47	1
Check AO1	48	1
Substitute Value AO1	49	2

Parameter indexes of CI582-CN

Parameter	Parameter index	Parameter length
Error LED Failsafe	4	1
Check supply	27	1
Input Delay	28	1
Short circuit detection	30	1
Behavior binary outputs at communication fault	31	1
Substitute value binary outputs	32	2
Voltage Feedback monitoring	33	1
Overvoltage monitoring	34	1

Block wise read of single parameterization (Object 2710hex to 271Ahex)

For reading of single parameters a special sequence is needed:

- Writing of SDO to the corresponding object with data structure defined in Parameter Indexes of CI581-CN.
  - This writing requests the parameter indexes that should be read.
- Reading of SDO of the corresponding object to get the read parameters.
  - The delivered data uses the same structure as defined in Parameter Indexes of CI582-CN.
  - If the reading of the data isn´t finished the device will reject the read service with abort code 08000021hex
  - If no writing has been send before reading the device will reject the read service with abort code 08000000hex

Eeprom download (Object 3100hex)

This functionality is only used during production. All requests to this object will be rejected.

Factory test mode (Object 5010hex)

This functionality is only used during production. All requests to this object will be rejected.

CI581-CN / CI582-CN in DS401 mode

Activation of DS401 mode in CI581-CN / CI582-CN

The DS401 mode inside the CI581-CN / CI582-CN can be activated using the hexadecimal address switches.

The DS401 mode is activated if the addresses switch position is greater than 80hex.

The node ID in the CANopen network is then calculated as follows:

Node ID = address switch 80hex.

PDO mapping in DS401 mode

The PDOs 1...4 are mapped as described in the DS401 specification. For additional PDOs (up to 20 PDOs per direction possible) there is no fixed mapping.

RxPDO mapping in DS401 mode

As defined by DS401 the first RxPDO only contains binary outputs. The first bytes contain the onboard binary outputs of the CI581-CN / CI582- CN devices. If binary I/O expansion modules are connected to the CI581-CN / CI582-CN these output data will also be put into RPDO1.

The second RxPDO contains only analog outputs (as defined by DS401). In case of CI581-CN the first two analog outputs are the onboard AOs. If analog I/O expansion modules are connected to the CI581-CN / CI582-CN these output data will also be put into RPDO2.

RxPDO 3 and RxPDO 4 are reserved for additional analog outputs (as defined by DS401) of connected analog I/O expansion modules.

For RxPDO 5&20 there is no fixed mapping. This mapping is user defined.

For details see following charts:

RxPDO mapping in DS401 mode for CI581-CN

RxPDO 1	
CI581 DO0 (1 byte, 8 channels)	I/O bus binary expansion DO1..DO7 (7 bytes, 56 channels) (only if attached to CI581-CN)

RxPDO 2		
CI581 AO0 (2 bytes, 1 channel)	CI581 AO1 (2 bytes, 1 channel)	I/O bus analog expansion AO2, AO3 (4 bytes, 2 channels) (only if attached to CI581-CN)

RxPDO 3
I/O bus analog expansion AO4..AO7 (8 bytes, 4 channels) (only if attached to CI581-CN)

RxPDO 4
I/O bus analog expansion AO8&AO11 (8 bytes, 4 channels) (only if attached to CI581-CN)

RxPDO mapping in DS401 mode for CI582-CN

RxPDO 1		
CI582 DO0 (1 byte, 8 channels)	CI582 DO1 (1 byte, 8 channels)	I/O bus binary expansion DO2..DO7 (6 bytes, 48 channels) (only if attached to CI582-CN)

RxPDO 2
I/O bus analog expansion AO0..AO3 (8 bytes, 4 channels) (only if attached to CI582-CN)

RxPDO 3
I/O bus analog expansion AO4..AO7 (8 bytes, 4 channels) (only if attached to CI582-CN)

RxPDO 4
I/O bus analog expansion AO8..AO11 (8 bytes, 4 channels) (only if attached to CI582-CN)

TxPDO mapping in DS401 mode

As defined by DS401 the first TxPDO only contains binary inputs. The first bytes contain the onboard binary inputs of the CI581-CN / CI582-CN devices. If binary I/O expansion modules are connected to the CI581-CN / CI582-CN these input data will also be put into TPDO1.

The second TxPDO contains only analog inputs (as defined by DS401). In case of CI581-CN the first four analog inputs are the onboard AIs. If analog I/O expansion modules are connected to the CI581-CN / CI582-CN these inputs data will also be put into TPDO2.

TxPDO 3 and TxPDO 4 are reserved for additional analog inputs (as defined by DS401) of connected analog I/O expansion modules.

For TxPDO 5...20 there is no fixed mapping. This mapping is user defined.

For details see following charts:

TxPDO mapping in DS401 mode for CI581-CN

TxPDO 1	
CI581 DI0 (1 byte, 8 channels)	I/O bus binary expansion DI1..DI7 (7 bytes, 56 channels) (only if attached to CI581-CN)

TxPDO 2			
CI581 AI0 (2 bytes, 1 channel)	CI581 AI1 (2 bytes, 1 channel)	CI581 AI2 (2 bytes, 1 channel)	CI581 AI3 (2 bytes, 1 channel)

TxPDO 3
I/O bus analog expansion AI4..AI7 (8 bytes, 4 channels) (only if attached to CI581-CN)

TxPDO 4
I/O bus analog expansion AI8..AI11 (8 bytes, 4 channels) (only if attached to CI581-CN)

TxPDO mapping in DS401 mode for CI582-CN

TxPDO 1		
CI582 DI0 (1 byte, 8 channels)	CI582 DI1 (1 byte, 8 channels)	I/O bus binary expansion DI2..DI7 (6 bytes, 48 channels) (only if attached to CI582-CN)

TxPDO 2
I/O bus analog expansion AI0..AI3 (8 bytes, 4 channels) (only if attached to CI582-CN)

TxPDO 3
I/O bus analog expansion AI4..AI7 (8 bytes, 4 channels) (only if attached to CI582-CN)

TxPDO 4
I/O bus analog expansion AI8..AI11 (8 bytes, 4 channels) (only if attached to CI582-CN)

Parameterization of CI581-CN / CI582-CN in DS401 mode

In DS401 mode the CI581-CN / CI582-CN are parameterized during startup with 0 parameters that means all parameter values are set to 0. For description of parameters see the corresponding device description.

The parameters can be changed during run time using the single parameterization feature.

The two different single parameterization modes are described below.

In single parameterization the parameters are addressed by a parameter index which can be found in the tables below.

Block wise single parameterization (Object 2700hex to 270Ahex)

See Block Wise Single Parameterization (Object 2700hex to 270Ahex) for detail.

Single parameterization without fragmented SDOs (Object 2720hex to Object 272Ahex)

For systems without the capability to use fragmented SDOs there is a second method of single parameterization. This method only uses non-fragmented SODs.

The objects 2720hex to 272Ahex are used for this mode. The sub object here is the parameter index. The length is the parameter length. Object 2720hex is for single parameters of CI581-CN / CI582-CN itself. Objects 2721hex to 272Ahex are used for connected expansion modules in ascending order.

For the used parameter indexes see Parameter Indexes of CI581-CN and Parameter Indexes of CI582-CN.

Limitations for CI581-CN / CI582-CN in DS401 mode

- Fast counter functionality is not available in DS401 mode (except CD522).
- Single Parameterization of I/O modules is only supported for I/O modules as of firmware version 3.x.
- The following restrictions apply for connected I/O modules.

DA501

- The DA501 module only reports analog IOs even though it has also binary inputs / outputs.
- It uses the following IO data structure:
  Inputs:
  - Digital Inputs (channel 0..15) (16bits, 2 bytes)
  - Analog Input 0 (2 bytes)
  - Analog Input 1 (2 bytes)
  - Analog Input 2 (2 bytes)
  - Analog Input 3 (2 bytes)
  - Binary Inputs (channel 16..23) / reserved (16bits, 2 bytes)
    bits 0..7 binary inputs
    bits 8..15 reserved
    Outputs:
  - Analog Output 0 (2 bytes)
  - Analog Output 1 (2 bytes)
  - Reserved (2 bytes)
  - Binary Outputs (channel 0..7) / reserved (16bits, 2 bytes)
    bits 0..7 binary outputs
    bits 8..15 reserved

CD522

- The CD522 module only reports analog IOs even though it has also binary inputs / outputs.
- It uses the following IO data structure:
  Inputs
  - State S0/S1 % pulse (2 bytes)
  - State byte / inputs counter 0 (2 bytes)
  - TOUCH counter 0 value high word (2 bytes)
  - TOUCH counter 0 value low word (2 bytes)
  - 32-bit counter 0 high word (2 bytes)
  - 32-bit counter 0 low word (2 bytes)
  - 32-bit counter 1 high word (2 bytes)
  - 32-bit counter 1 low word (2 bytes)
  - Reserved (2 bytes)
  - State byte / inputs counter 1 (2 bytes)
  - TOUCH counter 1 value high word (2 bytes)
  - TOUCH counter 1 value low word (2 bytes)

  Outputs
  - PWM frequency 0 high-word (2 bytes)
  - PWM duty/cycle/pulse 0 low word (2 bytes)
  - PWM control byte C0 / reserved (2 bytes)
  - Reserved (2 bytes)
  - PWM frequency 1 high-word (2 bytes)
  - PWM duty/cycle/pulse 1 low word (2 bytes)
  - PWM control byte C1 / outputs (2 bytes)
  - Reserved (2 bytes)
  - Counter 0 settings high word (2 bytes)
  - Counter 0 settings low word (2 bytes)
  - Counter 0 control byte / counter (2 bytes)
  - Reserved (2 bytes)
  - Counter 1 settings high word (2 bytes)
  - Counter 1 settings low word (2 bytes)
  - Counter 1 control byte / counter (2 bytes)
  - Reserved (2 bytes)
- The IO data of the CD522 have to be mapped continuously in ascending order (without gaps or other IO data inbetween) beginning with a new PDO.
  For an example see the following figure:
  - AnalogueInput16Bit_5 to AnalogueInput16Bit_16 are the inputs of the CD522.
  - AnalogueOutput16Bit_3 to AnalogueOutput16Bit_18 are the outputs of the CD522.

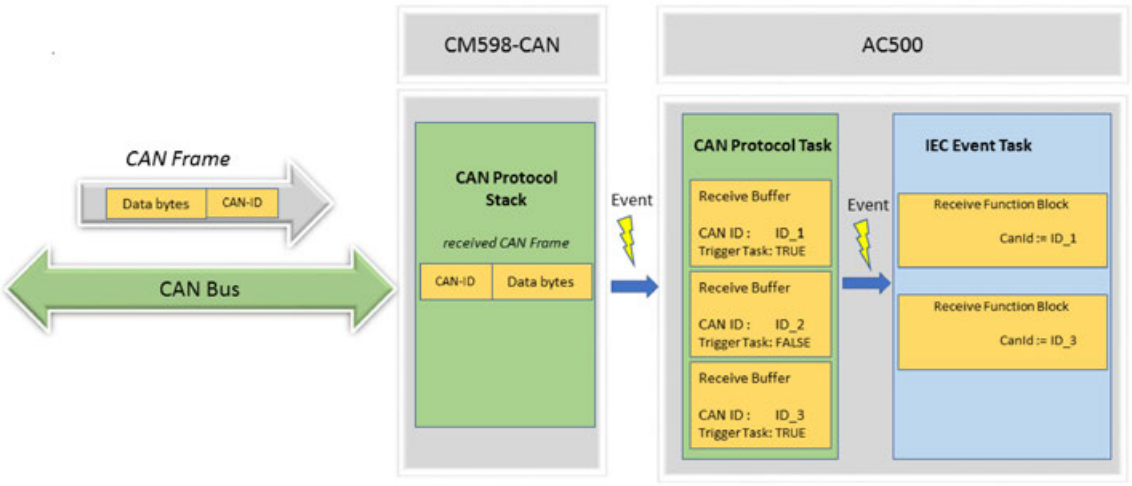
Triggering of event tasks with CAN-IDs

For CM598-CAN module the execution of a PLC application task can be triggered automatically by a certain event, i.e. by incoming CAN 2.0 A or CAN 2.0 B frames. For this, the PLC application task is to be configured as external event task.

Prerequisites

- *PLC firmware version 2.5.3 and Automation Builder as of version 1.2.2.*
- *For CAN 2.0. A and CAN 2.0 B a seperate PLC application task is required.*
- *Triggering of event tasks is only supported for the communication module CM598-CAN.*



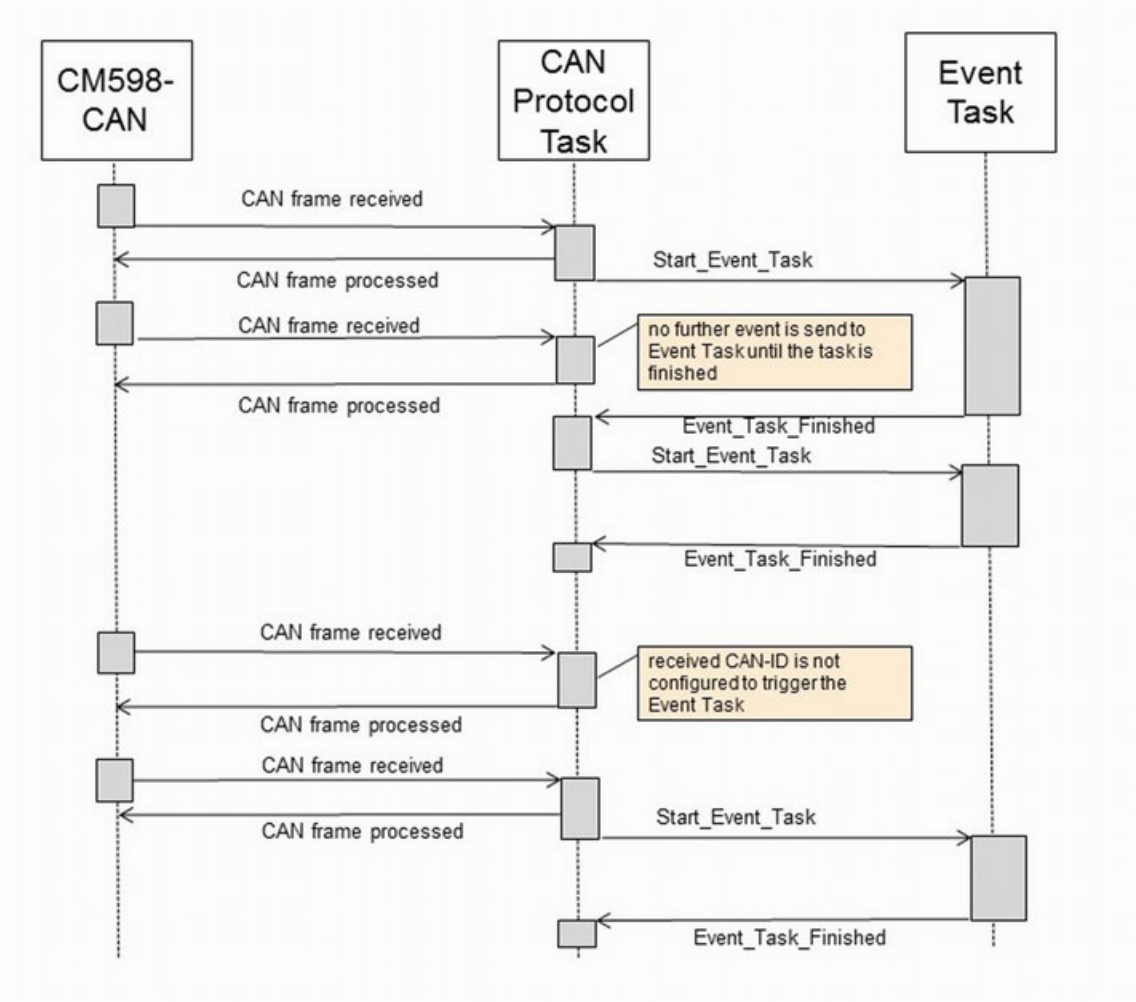
Every incoming CAN frame on a CM598-CAN module processes an event in the AC500 PLC. If the parameter "Trigger PLC Task" is set to TRUE, the CAN protocol task checks via the receive buffer configuration and the corresponding CAN-ID of the CAN frame whether a CAN frame is to be executed or not. Only those CAN-IDs that are configured in the protocol configuration will be processed. All other CAN frames will be rejected. If a CAN frame is to be processed, the CAN frame data is copied to the receive buffer and an event on the IEC event task is triggered.

The IEC event task will be executed for one cycle.

The IEC event task will be triggered continuously until all associated receive buffers have been emptied. Hence, ensure that the buffers are emptied by the task, otherwise the task will run into a loop.

CAN frame processing

The following figure shows the sequence CAN frames processing when the triggering of event task is used.



CM598-CAN
CAN Protocol Task
Event Task
CAN frame received
CAN frame processed
Start_Event_Task
CAN frame received
no further event is send to Event Task until the task is finished
CAN frame processed

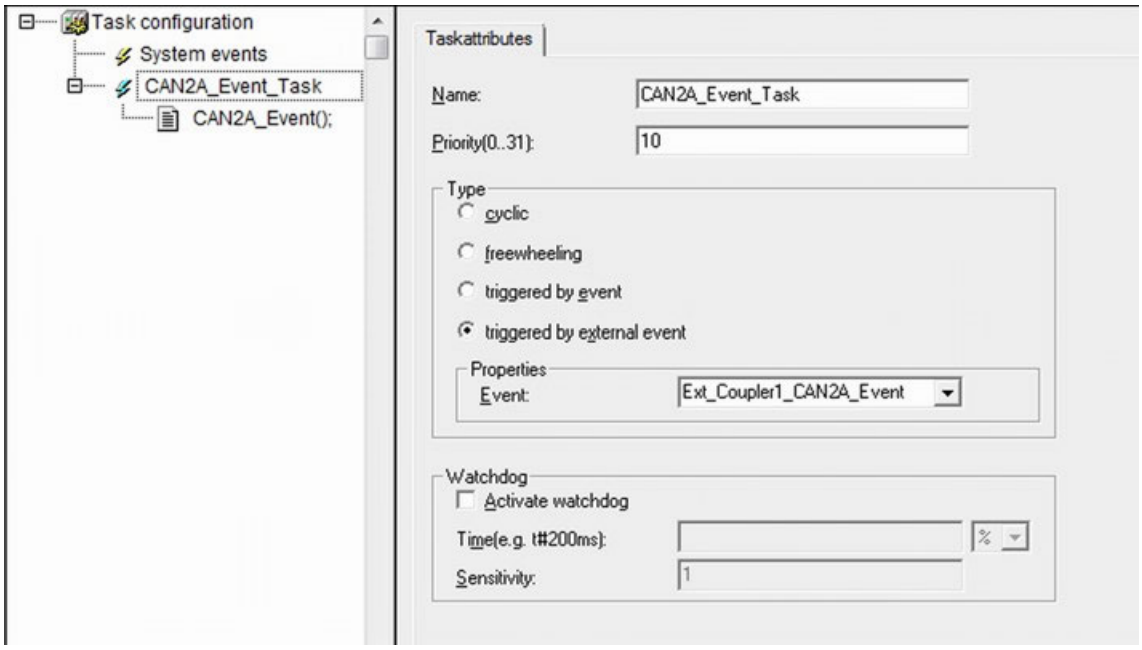
Start_Event_Task
Event_Task_Finished
CAN frame received
received CAN-ID is not configured to trigger the Event Task
CAN frame processed
CAN frame received
CAN frame processed
Start_Event_Task
Event_Task_Finished

- *One event task can be assigned to each of the protocols CAN 2.0 A and CAN 2.0 B.*
- *One common event for all of the selected CAN-IDs of one protocol. It must be evaluated which CAN-IDs have been received.*
- *It is possible that CAN frames are lost when necessary system resources are in use or when the CAN frames could not be processed in time due to high system load. So, the PLC application must monitor the task which consumes the events of the CAN protocol with a watchdog mechanism or something similar.*
- *During the execution of the PLC application task no further events are sent when new CAN frames are received before the task is finished. It is even possible to read newly received CAN frames in the current cycle of the PLC application task.*
- *The order of CAN frame reception could not be determined in the PLC application task.*
- *The task which should be triggered by the protocols CAN2A and CAN2B is a normal PLC application task and will be scheduled according its priority. So it is possible that events could not be processed on time due to the task is blocked by other tasks in the system.*
- *The setting of the parameter “behavior on receive buffer overflow” has an influence on the processing of CAN frames and the corresponding events. The documentation of the respective value has to be considered.*
- *CAN frames and events may be lost, if the receive buffer is full. Take care that the receive buffers are emtied in time and the PLC load and CAN bus load are not too high.*

Event task configuration



Event	Communication module slot	Description
Int_Coupler0_CAN2A_Event	0	PLC event task will be triggered when a CAN frame with a specified CAN ID was received by the CAN2A protocol running at communication module slot 0.
Int_Coupler0_CAN2B_Event	0	PLC event task will be triggered when a CAN frame with a specified CAN ID was received by the CAN2B protocol running at communication module slot 0.
Ext_Coupler<slot>_CAN2A_Event	1 ... 6	PLC event task will be triggered when a CAN frame with a specified CAN ID was received by the CAN2A protocol running at communication module slot 1 - 6.
Ext_Coupler<slot>_CAN2B_Event	1 ... 6	PLC event task will be triggered when a CAN frame with a specified CAN ID was received by the CAN2B protocol running at communication module slot 1 - 6.

Diagnosis

CANopen communication errors are indicated by the Communication Module LEDs. Malfunctions of the CANopen driver or the Communication Module itself are indicated by the corresponding error class in the PLC. Furthermore, the CANopen library provides different function blocks which allow detailed error diagnosis (refer to CANopen library ↳ *Chapter 1.5.4.7 “CANopen library” on page 912*).

Error messages

Error messages/emergency messages are used to signalize device errors. An emergency message contains a code that clearly identifies the error (specified in the communication profile DS-301 and in the individual device profiles DS-40x). The following table shows some of the available error codes. Emergency messages are automatically sent by all CANopen modules.

Error code (hex)	Description / error cause
00xx	Error on reset or no error
10xx	General error
20xx	Current error
21xx	- Error on device input side
22xx	- Error inside the device
23xx	- Error on device output side
30xx	Voltage error
31xx	- Supply voltage error
32xx	- Error inside the device
33xx	- Error on device output side
40xx	Temperature error
41xx	- Ambient temperature
42xx	- Temperature inside the device

Error code (hex)	Description / error cause
50xx	Hardware error in the device
60xx	Software error in the device
61xx	- Device-internal software
62xx	- Application software
63xx	- Data
70xx	Error in additional modules
80xx	Monitoring
81xx	Communication
90xx	External error
F0xx	Error of additional functions
FFxx	Device-specific errors

1.6.4.2.6 Serial communication module

CM574-RS - Serial communication module for AC500

Overview

The capabilities of the communication module correspond to a processor module. Further information on the processor module can be found in the corresponding device description *Chapter 1.6.2.3.2.1 “PM57x (-y), PM58x (-y) and PM59x (-y)” on page 3848*.

The communication module can be plugged into any slot for external communication modules on a AC500 terminal base. Up to four CM574-RS modules can be used in one AC500 system.

Programming can be done either directly via a serial cable between PC and serial interface of the communication module, or routed via the AC500 CPU using the serial interface or Ethernet or ARCNET.

Operation Modes

- CM574 is an additional CPU and program code to handle the serial interfaces run in CM574.
  Communication with the main PLC can be done in two ways:
  – Cyclic data exchange via Inputs/outputs *Chapter 1.6.4.2.6.2.6.2 “Cyclic data exchange CM574-RS/CS31 bus <-> AC500 CPU” on page 5597*
  – Acyclic data exchange via messages with FB’s from the user program *Chapter 1.6.4.2.6.3.1 “Function blocks for acyclic data exchange CM574-RS/AC500 CPU” on page 5607*
- CM574 work in shared mode. That mean module is a Interface extension (2 additional Serial Interfaces) and all the needed codes and configurations are running in the main PLC.

Option 1 reduces CPU Load in the main PLC, but communication between CM574 and main PLC must be done manually and especially for Modbus the use of the %M Area has to be considered.

Option 2 is easy to program and configure. Only configuration for shared mode must be download to the CM574. Configuration and code for the serial interfaces will be handled in the main PLC. Load for main PLC is higher.

User program size and operands of the CM574-RS

Values The following table shows the values set for program memory and operands in the CM574 target systems:

Parameter	Value
User program (code), see note 1	256 kB
Number of POUs	1024 kB
Number of tasks	3
Floating point processor, see note 2	no
Global and local variables: VAR or VAR GLOBAL	128 kB
Addressable flag area: VAR AT %Mx.y	128 kB
Persistent area: VAR AT %Rx.y	0 kB
Inputs %I, see note 4	4 kB
Outputs %Q, see note 4	4 kB
FLASH for user data	2 x 64 kB = 128 kB

Note 1 The user program is composed of:

- The compiled code of all POUs called in the program

- The initialization code for the variables

The configuration data are not included in the user program size.

Remark 2 All AC500 processor modules can perform floating point operations. For processor modules without floating point processor (like the CM574-RS), these operations are performed by an emulation library and are therefore slower. Emulation is faster for LREAL variables than for REAL variables. Thus, the use of LREAL variables is recommended.

Remark 3 The information shown in the message box exclusively contains the retain data of the RETAIN area, and not the variables of the addressable flag area %Mx.y. that are declared as VAR RETAIN.

The communication module CM574-RS is not equipped with a battery. For this reason, ALL operands are initialized once the control voltage is switched on.

In the communication module, data can be stored fail-safe in the flash memory using the blocks *Chapter 1.5.4.19.2.18 “FLASH_WRITE” on page 1547* and *Chapter 1.5.4.19.2.17 “FLASH_READ” on page 1544*.

Remark 4 For the inputs and the outputs, the same rules apply as for the AC500-CPUs.

The following input and output assignment applies for the CM574-RS:

CPU communication:	%IB0 ..	%IB999	and %QB0 ..	%QB999
Of this: Channel 1:	%IB0	%IB499	and %QB0 ..	%QB499
Channel 2:	%IB500 ..	%IB999	and %QB500 ..	%QB999
COM1:	%IB1000 ..	%IB1999	and %QB1000 ..	%QB1999
COM2 :	%IB2000 ..	%IB2999	and %QB2000 ..	%QB2999

Additional information can be found in the documentation "System Technology of the CPUs" in AC500 inputs, outputs and flags.

Connection and transmission media

Possibilities of connection The pin assignment of the serial interfaces COM1 and COM2 correspond to those on the terminal base for the processor modules PM57x, PM58x and PM59x *Chapter 1.6.2.2.1 “TB51x-TB54x” on page 3786*.

Information about connection options for the serial interfaces can be found in the system assembly chapter *Chapter 1.6.3.6.4 “Connection and wiring” on page 5337* .

Connection cables The programming cable for direct online communication between PC and CM574-COMx has the same pin assignment as the programming cable *Chapter 1.6.2.9.2.10 “TK502 - Programming cable” on page 5188* for the serial interface COM1 of PM57x, PM58x and PM59x.

Protocols of the serial interfaces of the CM574-RS

Protocol 'COMx - Online access'

This protocol can only be used, if CM574 is configured as a PLC. If configured as communication module within a PLC project, this protocol is not available.

See protocol description for the serial interfaces COM1 and COM2 ↳ *Chapter 1.6.5.2.11.2 “Setting COMx - Online access” on page 6099*.

If the transmisson rate of the interface is changed to another value, a corresponding gateway channel must be created. Example: COM1 is to be operated with 115200 baud and the protocol 'Online access'.

1. Configuration of COM1 -> Setting the transmission rate to 115200 baud.
2. Selection of the gateway channel -> e.g. COM4_19200 with transmission rate 19200 baud.
3. Login and download of user defined project (if required, create boot project).
4. Logout -> Interface is changed to 115200 baud.
5. Selection of the gateway channel -> e.g. COM4_115kB with transmission rate 115200 baud.
6. Login -> with 115200 baud.

Protocol 'COMx - ASCII'

See protocol description for the serial interfaces COM1 and COM2 ↳ *Chapter 1.6.5.2.11.3 “Setting COMx - ASCII” on page 6100*.

Protocol 'COMx - Modbus'

See protocol description for the serial interfaces COM1 and COM2 ↳ *Chapter 1.6.5.2.11.4 “Setting COMx - Modbus” on page 6108*.

The address assignment as well as a detailed description of all implemented Modbus functions can be found in the chapter of Communication with Modbus RTU .

In the CM574-RS, 128 kB data are available in the addressable flag range %M. This way, the entire Modbus address range 0000hex .. FFFFhex can be covered.

Protocol 'COMx - SysLibCom'

This protocol can only be used, if CM574 is configured as a PLC. If configured as Communication Module within a PLC project, this protocol is not available.

See protocol description for the serial interfaces COM1 and COM2 ↳ *Chapter 1.6.5.2.11.6 “Setting COMx - SysLibCom” on page 6110*.

Protocol 'COMx - Multi'

This protocol can only be used, if CM574 is configured as a PLC. If configured as Communication Module within a PLC project, this protocol is not available.

See protocol description for the serial interfaces COM1 and COM2 ↳ *Chapter 1.6.5.2.11.7 “Setting COMx - Multi” on page 6114*.

Protocol 'COM1 - CS31 Bus'

See protocol description for the serial interfaces COM1 and COM2 ↳ *Chapter 1.6.5.2.11.5 “Setting COMx - CS31” on page 6110*.

There are several options for processing the inputs and outputs of the CS31 bus modules:

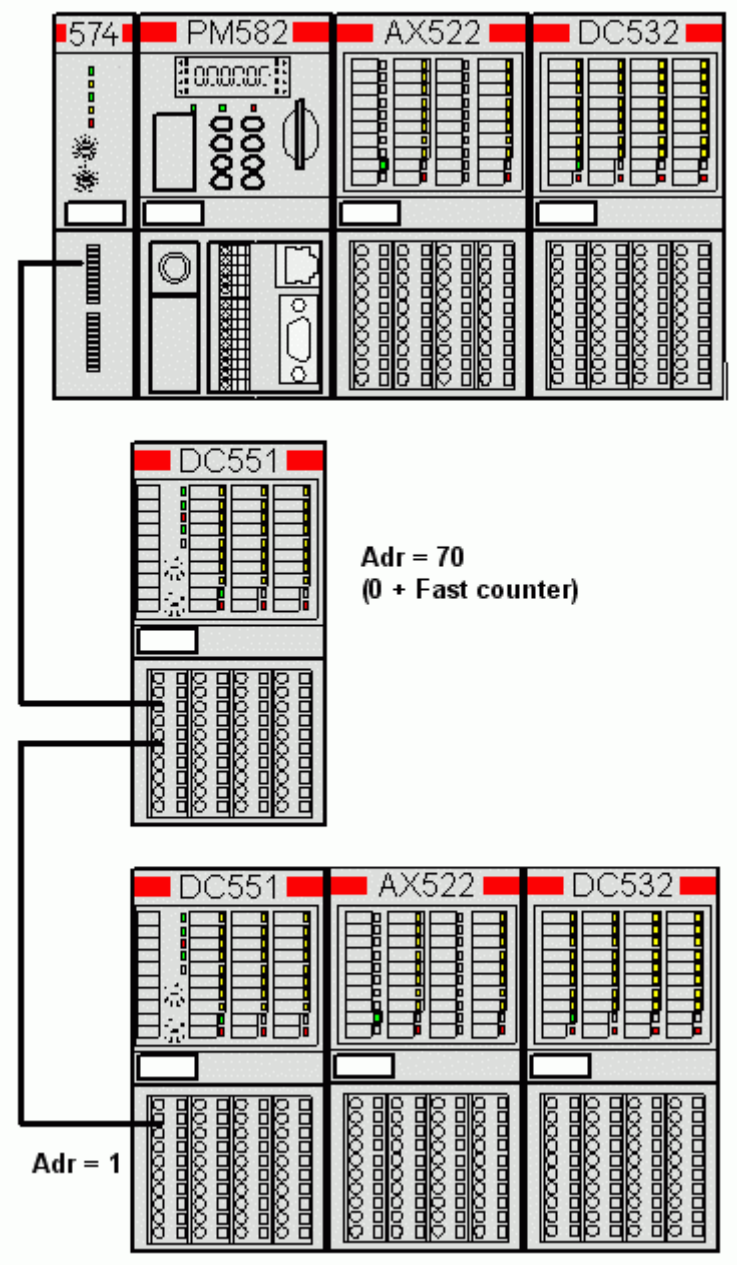
- Direct processing in the user-defined program of the CM574-RS
- Transfer to the AC500 CPU via cyclic data exchange

Transfer to the AC500 CPU via acyclic data exchange is not recommended.

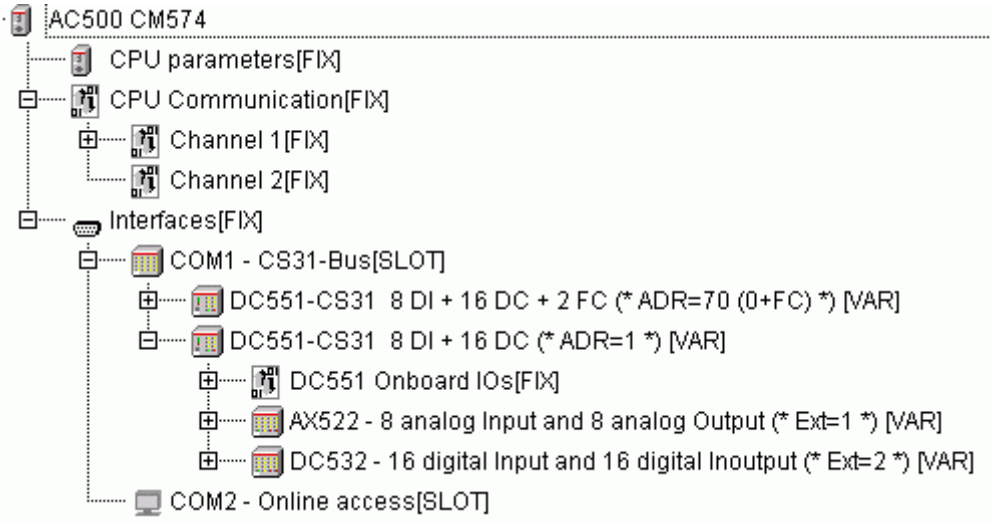
Planning example for CM574-RS/CS31 bus

Planning the cyclic data exchange of the inputs and outputs of the CS31 bus modules on the CM574-RS with a processor module is illustrated in the following example configuration:

- PM582 with CM574-RS in slot 1
- CM574-RS: COM1 CS31 bus, COM2 online access
- CS31 cluster 1: DC551 with HW address switch = 70, i.e. address 0 and fast counter enabled
- CS31 cluster 2: DC551 with HW address switch = 1 and S500 extensions 1xAX522 + 1xDC532



Accordingly, PLC configuration in the CM574-RS project is as follows:



If you open the last module (here: DC532), you can see that the highest input byte is %IB1037, and the highest output byte is %QB1041.

Thus, the configuration on the CS31 bus has

38 bytes for inputs and 42 bytes for outputs.

Cyclic data exchange CM574-RS/CS31 bus <-> AC500 CPU

In case of cyclic data exchange, the inputs and outputs of the modules on the CS31 bus are transferred by means of I/O modules via the DPRAM.

Cyclic data exchange is described in detail in Function blocks for acyclic data exchange CM574-RS/AC500 CPU ↳ *Chapter 1.6.4.2.6.3 “Acyclic data exchange CM574/AC500 CPU” on page 5607*.

Transfer of the inputs

For the transfer to the CPU, the inputs of the CS31 modules are outputs of the CM574-RS in the CPU communication. For this reason, the input modules in the CM574-RS include IEC outputs (%Q).

The following table shows how the inputs of the CS31 modules are transferred and where the respective operands are located in the CPU:

Inputs CS31 bus	**CM574 - COM1 CS31 bus**			**CM574 - DPR**			**AC500 CPU**

Transfer of the outputs

For the transfer to the CPU, the outputs of the CS31 modules are inputs of the CM574-RS in the CPU communication. For this reason, the output modules in the CM574-RS include IEC outputs (%Q).

Table 709: Transferring the outputs of the CS31 modules:

CS31 bus out-puts	CM574 - COM1 CS31 bus			CM574 - DPR			AC500 CPU

In the CPU, the input modules include IEC inputs (%I) and the output modules include IEC outputs (%Q). Consequently, from the CPUs point of view, the inputs of the CS31 module are read as IEC input, and the outputs of the CS31 module are written as output.

The easiest method to transfer the inputs in the PLC program of the CM574-RS is the *Chapter 1.5.4.20.1.2 “DPRAM_IO_COPY” on page 1629* function.

For this purpose, symbolic names are assigned to each first byte on the CS31 bus and in the CPU communication area. For automatic length calculation, the last input byte is required.

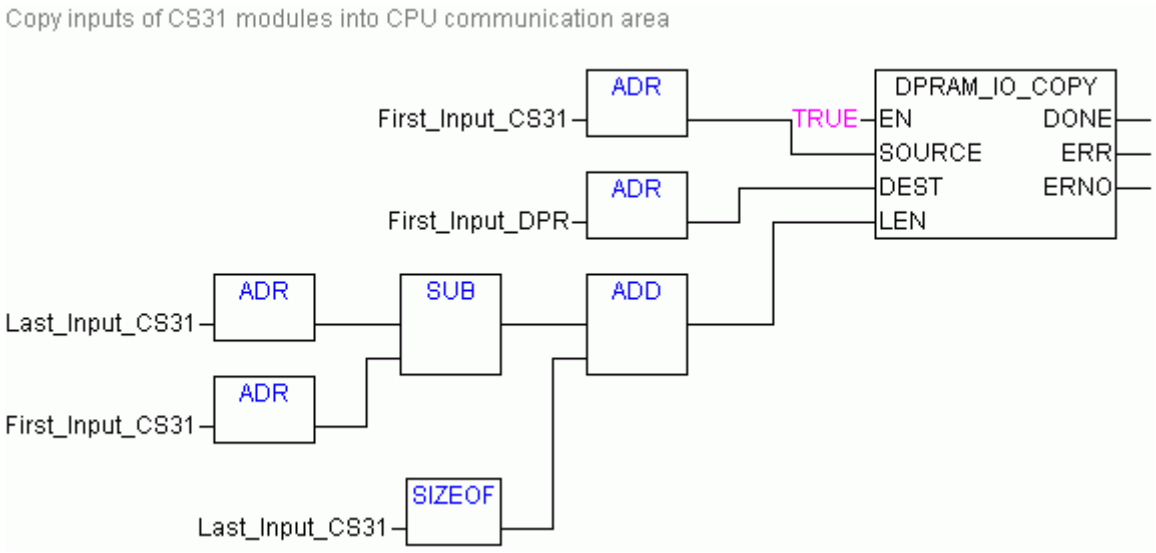
In the example, these are:

First_Input_CS31 for %IB1000,

Last_Input_CS31 for %IB1037 and

First_Input_DPR for %QB0

The PLC program (FBD) then includes the instruction:



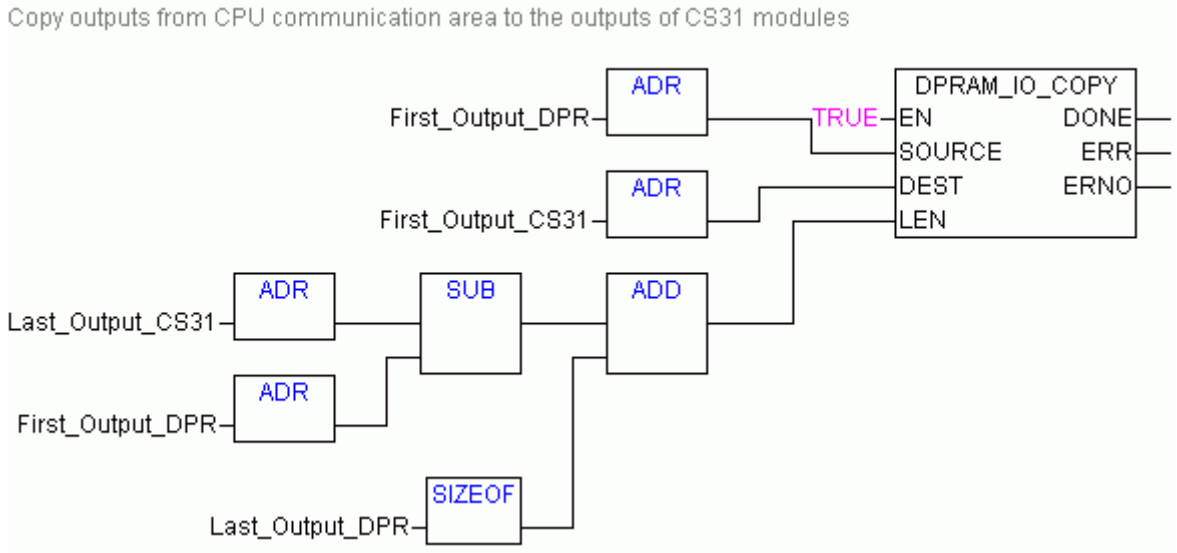
The transfer of the outputs from the CPU to the CS31 bus is performed analogously. The following symbolic names are entered into the PLC configuration:

First_Output_DPR for %IB0,

First_Output_CS31 for %QB1000 and

Last_Output_CS31 for %QB1041

The PLC program (FBD) then includes the instruction:



The entire PLC program on the CM574-RS consists of these two networks or function calls.

It is necessary to use the function block DPRAM_IO_COPY. If SysMemCpy is used instead, data consistency of the I/Os is not guaranteed.

Acyclic data exchange CM574/AC500 CPU

Function blocks for acyclic data exchange CM574-RS/AC500 CPU

Unlike the cyclic data exchange via input/output signals, the acyclic data exchange has to be programmed in the user program.

The acyclic data exchange is used mainly for transmitting commands for own protocols. For example, the entire data exchange between the AC500 CPU and a CM574-RCOM occurs via these blocks.

The following blocks are available:

Description	CM574-RS	AC500 CPU
Library	SysIntExt_AC500_V13.lib	SysInt_AC500_V10.lib
Transmission from the CM574 to the AC500 CPU or reception in the AC500 CPU from the Communication Module	*Chapter 1.5.4.20.1.5 “DPRAM_PM5XX_SEND” on page 1635*	*Chapter 1.5.4.19.2.15 “DPRAM_CM5XX_SEND” on page 1540*
Reception in the CM574 from the AC500 CPU or transmission from the AC500 CPU to the Communication Module	*Chapter 1.5.4.20.1.4 “DPRAM_PM5XX_REC” on page 1633*	*Chapter 1.5.4.19.2.14 “DPRAM_CM5XX_REC” on page 1537*

Programming example for acyclic data exchange

In the program example it is assumed that a maximum of 100 bytes is exchanged between CPU and Communication Module. The CM574-RS Communication Module is plugged into slot 1 (SLOT=1).

In principle, the program is the same in the AC500 CPU and the CM574-RS. The respective block names are to be used in the variable declaration for the CPU and the CM574.

In the example, the transmit and receive data are simply assigned to global byte ARRAYs:

```
VAR_GLOBAL
    abyRecDataCM574_1_1     : ARRAY[0..cdwMaxRec] OF BYTE;   (* Data from DPRAM *)
    abySendDataCM574_1_1    : ARRAY[0..cdwMaxSend] OF BYTE;  (* Data to DPRAM *)
END_VAR
VAR_GLOBAL CONSTANT
    cdwMaxRec               : DWORD := 99;                   (* +1 byte receive *)
    cdwMaxSend              : DWORD := 99;                   (* +1 byte send *)
END_VAR
```

The program for receiving and transmitting the data looks as follows:

```
PROGRAM proComm_CPU_CM574
VAR
                    bNewRecData         : BOOL;                 (* new data received *)
                    fbRecCM574_1        : DPRAM_CM5XX_REC;      (* CPU: receive data from first CM574 *)
                                        : DPRAM_PM5XX_REC;      (* CM574: receive data from CPU *)
                    bRecErr             : BOOL;                 (* receive error *)
                    wRecErno            : WORD;                 (* receive error number *)
                    bNewSend            : BOOL;                 (* new data from program *)
                    bNewSendData        : BOOL;                 (* new data available to send *)
                    bSendDone           : BOOL;                 (* data successfully sent *)
                    fbSendCM574_1       : DPRAM_CM5XX_SEND;     (* CPU: send data to first CM574 *)
                                        : DPRAM_PM5XX_SEND;     (* CM574: send data to CPU *)
                    bSendErr            : BOOL;                 (* send error *)
                    wSendErno           : WORD;                 (* send error number *)
END_VAR
VAR CONSTANT
                    cbySlotCM574_1      : BYTE := 1;            (* SLOT number of first CM574 *)
                    cbyChannelCM574_1_1 : BYTE := 1;            (* Channel 1 of first CM574 *)
                    cbyChannelCM574_1_2 : BYTE := 2;            (* Channel 2 of first CM574 *)
END_VAR
```

Part 1: Reception of data

```
(* receive data from CM574 --> DONE=TRUE -> new data available *)
bNewRecData := FALSE;                                           (* reset new receive data *)
fbRecCM574_1( EN := TRUE, SLOT := cbySlotCM574_1, CH := cbyChannelCM574_1_1,
                    DATA := ADR(abyRecDataCM574_1_1) );
IF fbRecCM574_1.DONE THEN                                       (* new receive *)
```

```
                IF NOT fbRecCM574_1.ERR THEN                (* with error ? *)
                                    bRecErr := FALSE;       (* receive OK *)
                                    bNewRecData :=          (* new data received
                                    TRUE;                   *)
                ELSE
                                    bRecErr := TRUE;        (* save receive error *)
                                    wRecErno :=             (* save receive error
                                    fbRecCM574_1.ERN        number *)
                                    O;
                END_IF; (* ERR *)
        END_IF; (* Rec DONE *)
```

Part 2: Processing of data

```
        IF bNewRecData THEN                                 (* new data received *)
                                                            (* process data *)
                                bNewSendData := TRUE;       (* send new data if possible *)
        END_IF; (* bNewRecData *)
```

Part 3: Transmission of data

```
        bSendDone := FALSE;                                 (* reset send
                                                            done *)
        IF fbSendCM574_1.EN OR bNewSendData THEN            (* send activ or
                                                            new cycle ? *)
                fbSendCM574_1( EN := TRUE, SLOT := cbySlotCM574_1, CH := cby-
                ChannelCM574_1_1,
                        DATA := ADR(abySendDa-
                        taCM574_1_1),
                        DATA_LEN := cdwMaxSend + 1);        (* run send POU
                                                            *)
                IF fbSendCM574_1.DONE THEN                  (* last send is
                                                            now ready *)

```

Special functions of the CM574-RS

Function blocks for data storage in flash memory

The library "SysInt_AC500_V10.lib" located in the directory "Data storage/Flash" contains the following blocks which are used to store data in the Flash memory:

Block	Function
Chapter 1.5.4.19.2.16 “FLASH_DEL” on page 1542	Deletes a data segment in the Flash memory
Chapter 1.5.4.19.2.17 “FLASH_READ” on page 1544	Reads a data segment from the Flash memory
Chapter 1.5.4.19.2.18 “FLASH_WRITE” on page 1547	Writes a data segment to the Flash memory

The blocks and their functionality are the same as for the AC500 CPU. These blocks are described in the library documentation of the Internal System Library *Chapter 1.5.4.19.2.18 “FLASH_WRITE” on page 1547*.

LEDs control of the CM574-RS

The library "SysIntExt_AC500_V10.lib" contains the function block LED_SET for controlling the LEDs of the CM574-RS. See description of the function block *Chapter 1.5.4.20.1.6 “LED_SET” on page 1638* for further information.

> *If the Error LED is to be activated from the user program, the parameter "Error LED" has to be set to "Off" Chapter 1.6.5.2.6.3.2 “Configuration of CM574-RS” on page 5903.*

Reading the address switch of the CM574-RS

The library "SysIntExt_AC500_V10.lib" contains the function block CPU_OWN_ADR for reading the address switch of the CM574-RS. See description of the function block *Chapter 1.5.4.20.1.1 “CPU_OWN_ADR” on page 1627* for further information.

The address set with the rotary switches is output at the ADDR output.

Programming access to the CM574-RS

Programming via the serial interface of the CM574-RS

Programming via the serial interface is performed with the same drivers and settings as programming via the serial interface COM1 or COM2 of the AC500 CPU *Chapter 1.6.5.2.6.3.2 “Configuration of CM574-RS” on page 5903*.

The pin assignment of the programming cable is the same as for COM1 of the AC500 CPU.

Programming the CM574-RS via the AC500 CPU (Routing)

For programming via the CPU, the following programming interfaces are available:

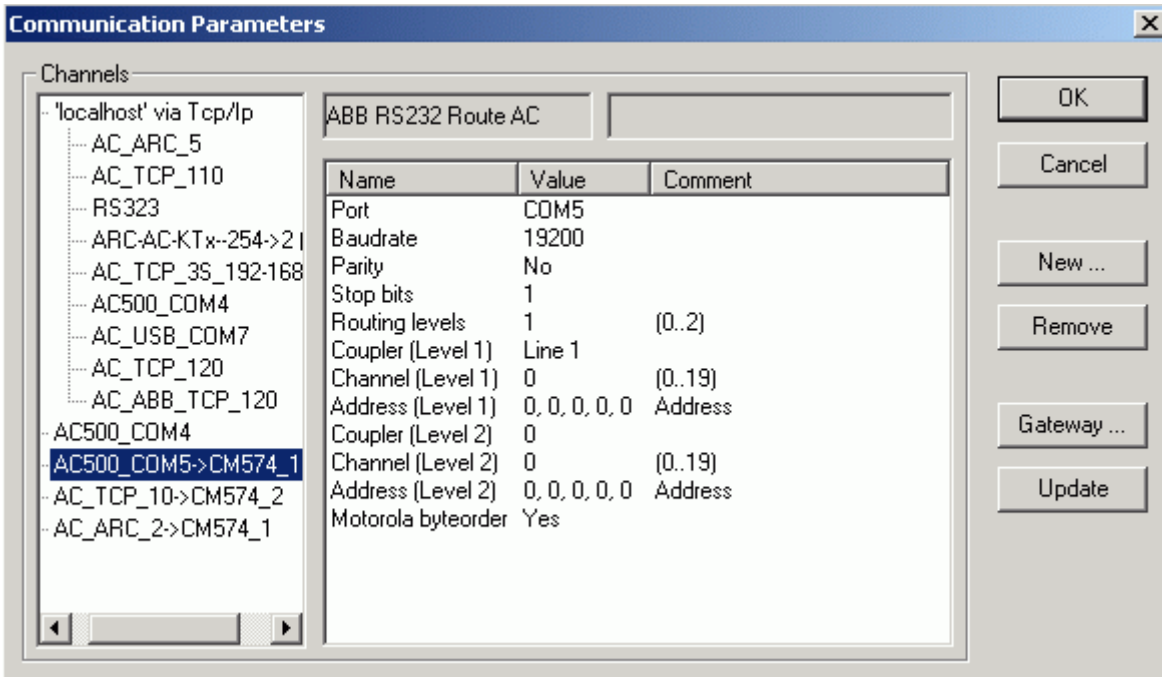
- Serial driver "ABB RS232 Route AC"
- Ethernet driver (TCP/IP) "ABB Tcp/Ip Level2 AC"
- ARCNET driver "ABB ARCNET AC"

Setting up a gateway channel is described in the section *Chapter 1.6.5.4.2 “Programming and testing” on page 6198*.

This chapter only describes the settings for the routing to the CM574-RS.

Programming via CPU with serial driver "ABB RS232 Route AC"

The following figure shows the setting of a gateway channel for COM5 of the PC with routing to the CM574-RS plugged into slot 1 (line 1).

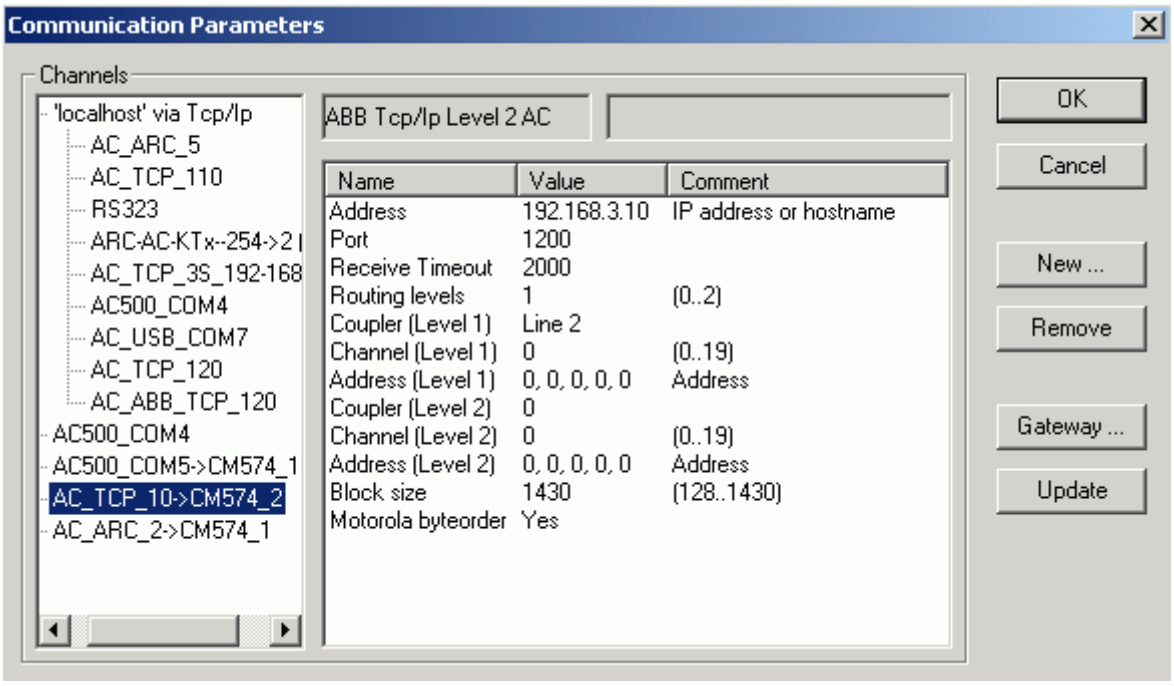


The following settings have to be specified:

Port	Serial interface (COMx) of the PC, in the example: COM5
Transmission rate	Transmission rate of COMx of the AC500 CPU
Routing levels	1
Communication Module (Level 1)	Line 1
Address (Level 1)	0,0,0,0,0
Motorola byteorder	Yes

Programming via CPU with Ethernet Driver "ABB Tcp/Ip Level2 AC"

The following figure shows the setting of a gateway channel for connection via the AC500 CPU with the IP address 192.168.3.10 with routing to the CM574-RS plugged into slot 2 (line 2).

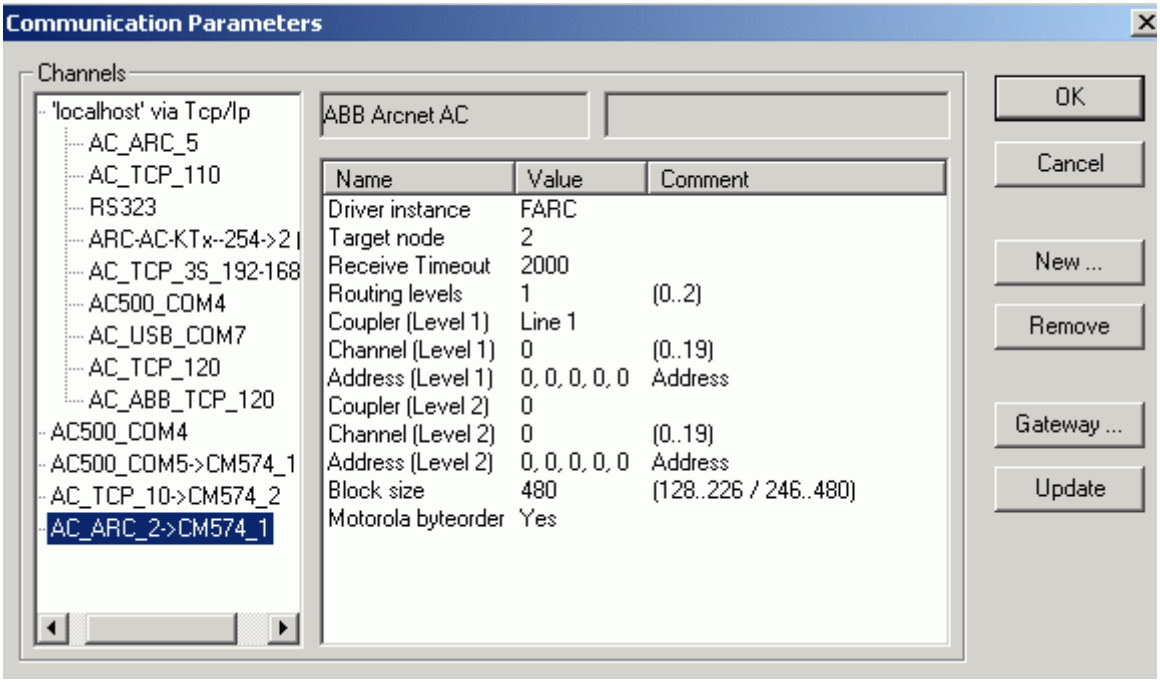


The following settings have to be specified:

Address	- IP address of the AC500 CPU, in the example: 192.168.3.10
Routing levels	- 1
Communication Module (Level 1)	- Line 2
Address (Level 1)	- 0,0,0,0,0
Motorola byteorder	- Yes

Programming via CPU with ARCNET Driver "ABB ARCNET AC"

The following figure shows the setting of a gateway channel for connection via the AC500 CPU with the ARCNET address (node) 2 with routing to the CM574-RS plugged into slot 1 (line 1).



The following settings have to be specified:

Target node	ARCNET address of the AC500 CPU, in the example: 2
Routing levels	1
Communication Module (Level 1)	Line 1
Address (Level 1)	0,0,0,0,0
Motorola byteorder	Yes

1.6.4.2.7 RCOM/RCOM+ communication module

CM574-RCOM - RCOM/RCOM+ communication module

Overview

The RCOM/RCOM+ communication module CM574-RCOM requires a processor module with firmware version V1.3.0 or above.

The capabilities of the communication module correspond to a processor module. Further information on the processor modules can be found in the corresponding device description ↳ *Chapter 1.6.2.3.2.1 “PM57x (-y), PM58x (-y) and PM59x (-y)” on page 3848*.

CM574-RCOM can be plugged into any slot for communication modules on a terminal base TB511, TB521 or TB541. Further information on the terminal bases can be found in the corresponding device description ↳ *Chapter 1.6.2.2.1 “TB51x-TB54x” on page 3786*. Up to 4 CM574-RCOM can be used in one AC500 system.

The communication module provides 2 serial interfaces which are designed according to the standards EIA RS-232 and EIA RS-485. The pin assignment of the interfaces corresponds to the pin assignment of COM1 at processor module PM57x, PM58x and PM59x.

Features

- The CM574-RCOM communication module can be configured as RCOM master or RCOM slave.
- Up to 254 RCOM slaves are possible in a network (max. 8 slaves when using Master-Piece 200 and max. 30 slaves when using dial-up operation).
- Available RCOM services are cold start, warm start, normalization, clock synchronization, writing and reading data, event polling.
- The RCOM interface for connecting the modem corresponds to EIA RS-232. Operation according to EIA RS-485 is also possible.
- An additional RS-232 interface (CONSOLE) is available for commissioning (for displaying communication history, planning phone numbers, etc.).
- Software clock (can be used by the PLC program).

RUN/STOP behavior

After initialization, the CM574-RCOM runs until it is reinitialized. The abortion of a running program can cause the interruption of RCOM connection elements. If a connection element does not respond within 2 seconds, the CM574-RCOM displays the message "command not reset by CPU" or "no CPU reaction".

If the communication module is configured as RCOM slave, the corresponding error message ("application part not ready", RCOM error number 4020h) is sent to the RCOM master.

If the communication module is configured as RCOM master, the interrupted job is repeated until the processor module resets the job. This is done at the latest with the next initialization performed by the RCOM_INIT connection element.

Single step and single cycle

Since the CM574-RCOM monitors the reaction of the CPU module in case of incoming and triggered services, it is not possible to run the RCOM connection elements in single step or single cycle mode. Thus, you should always run the communication part of the processor module program in "real time".

Communication module control

The communication module is controlled by the processor module by means of commands. The commands from the master station and the responses of the communication module are exchanged via the dual port RAM (DPRAM) of the AC500 processor module.

The user controls the communication module exclusively by means of the supplied connection elements of the RCOM library RCOM_AC500_V13.lib. The library contains connection elements for all system and data transmission services. This permits the user to define the required communication sequence very simply ↳ *Chapter 1.5.4.30 “RCOM/RCOM+ library” on page 1903*.

Function blocks for RCOM/ RCOM+

The communication between the processor module and the Communication Module CM574-RCOM is performed via function blocks of the RCOM library RCOM_AC500_V13.lib ↳ *Chapter 1.5.4.30 “RCOM/RCOM+ library” on page 1903*.

Parameters

All important parameters (transmission rate, timeout times etc.) for the communication module are defined in the PLC configuration of the processor module's PLC program. Further information can be found in the description of configuration of the communication module ↳ *Chapter 1.6.5.2.6.4.1 “Module parameters” on page 5907*.

The parameters for the individual services (e.g. slave address, data set number etc.) are preset directly on the connection element for this service.

Commissioning

A terminal can be connected to the CM574-RCOM in order to simplify commissioning. The communication module then issues messages concerning incoming commands from the processor module, received or transmitted RCOM telegrams and any occurring errors.

This function can be deactivated after commissioning. The communication processor then continues operation without a terminal.

Program examples for RCOM communication

When installing Automation Builder software, the example projects for RCOM dedicated line and RCOM dial-up line are installed.

RCOM/RCOM+ protocol

RCOM is a transmission protocol which is particularly suitable for data transmission over long distances (RCOM = Remote COMmunication).

The protocol is based on a simple V.24 interface and thus permits the use of standard data teletransmission devices (e.g. modems).

The main fields of application for RCOM are as follows:

- Networking AC500 systems to AC31 systems
- AC500 stations and AC31 stations
- Networking of AC500 stations

You can use either dedicated lines (e.g. existing cable paths or leased lines) or telephone lines with dial-up modems for communication.

Differences between RCOM and RCOM+

There are the following differences between RCOM and RCOM+ concerning data transmission:

- The "BREAK" character of RCOM is replaced by a transmission break of configurable length for RCOM+
- The 8 bit "exclusive-or check sum" (XOR) of RCOM is replaced by a 16 bit CRC16 checksum for RCOM+

Switching between RCOM and RCOM+

Switching between RCOM and RCOM+ is performed by selecting the corresponding operation mode in the PLC configuration ↬ *Chapter 1.6.5.2.6.4.1 “Module parameters” on page 5907*.

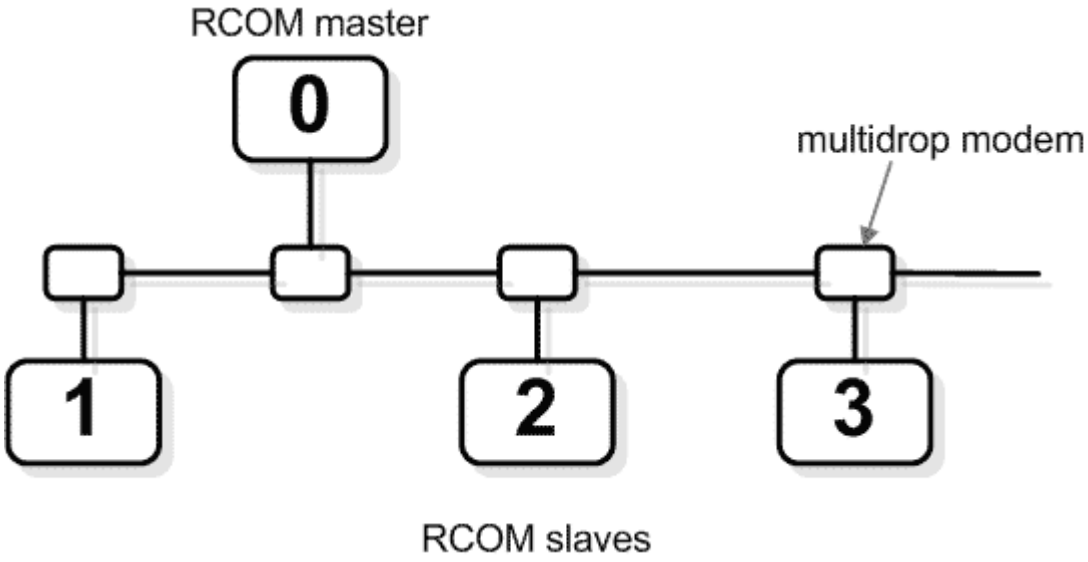
RCOM networks

A RCOM network consists of 2 or more users, e.g. control computers or substations etc. One user is always configured as RCOM master. All other users are RCOM slaves.

The users are connected by means of a transmission medium. In case of RCOM, this may be a direct line (point-to-point connection), a dedicated line with multi-drop modem (these permit coupling of several users to one line) or a dial-up connection over the public telephone network.

Each subscriber in the network has an address assigned that can be used to address (call) this specific device. This address is a number between 1 and 254 for slaves, or 0 for the master.

The figure below shows an RCOM network with multi-drop modems:



With each job, the master transfers the specific address of the addressed slave and only this slave will respond to the job.

Master-slave structure

There is a simple convention for controlling data communication on the line: One user in the network is the master. Only the master can send jobs to other users, the slaves. The slaves respond to a job telegram with a telegram that indicates whether the job has been understood and whether it has been possible to execute it.

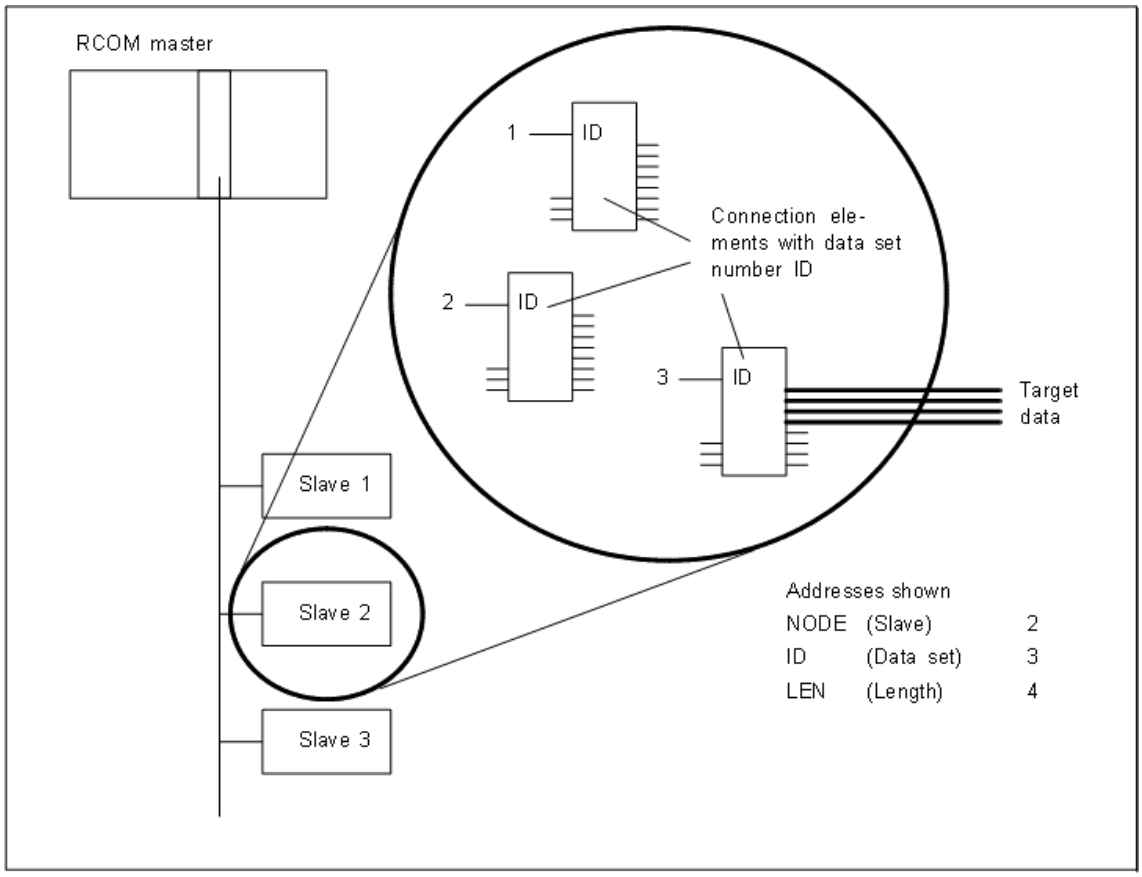
This always results in the sequence job telegram (response telegram) on the data line.

Addressing in the RCOM network

A complete address has to be specified in order to address a data set on a specific slave. This address consists of the following parts:

- Number of the slave (NODE). Up to 254 slaves may exist in an RCOM network. Number 0 is used by the master.
- Number of the data set (ID).
- Number of data words of the data set to be transmitted (LEN). Data sets do not always have to be transmitted completely. However, a minimum of two data words have to be transmitted and the number of data words has to be even-numbered. Transmission always starts with the first data word.

The figure below shows an example of a RCOM system and the addressing path:



Broadcast

Slave number FF hex (255) can be used to transmit specific services to all slaves simultaneously. Such a service is not answered by any of the slaves and is thus repeated several times by the master as a safety measure.

Broadcast is permitted only for jobs where no user data are transmitted (system services).

Job types

There are several types of jobs that can be divided into two groups:

- System services for RCOM network management, e.g. for connection set-up, clear down and reinitializing the network etc.
- Services for data transmission. After the RCOM network has been started successfully, the master triggers these jobs in order to transmit user data.

System services

The following services are provided for RCOM network management:

- Cold start: The addressed slave is reset, i.e. all protocol control characters are set to the initial state. In addition, the event queue is deleted. After a cold start, data sets cannot be transmitted again until normalization is completed.
- Warm start: During a warm start, the event queue is deleted. A warm start can be performed after a transmission error in order to resynchronize master and slave. After a warm start, data sets cannot be transmitted again until normalization is completed.
- Normalization (normalize user part): Normalization enables the transmission of data sets after a cold start or a warm start. This job has to be used to enable communication.
- Set clock (clock synchronization): The CM574-RCOM provides a clock that generates time stamps for events. This clock can be set by the master.
- All system services can be started in the master using corresponding connection elements. In the slave, the system services are handled automatically by the CM574-RCOM, i.e. nothing needs to be configured for the system services in the RCOM slaves.

All system services can be started in the master using corresponding connection elements. In the slave, the system services are handled automatically by the CM574-RCOM, i.e. nothing needs to be configured for the system services in the RCOM slaves.

Terms

Do not confuse the RCOM services cold start / warm start and the corresponding PLC commands referring to the hardware state. In this section, the terms "cold start" and "warm start" always refer to the RCOM system services and therefore only affect the protocol state.

Data transmission

Data sets

All user data in the RCOM network are transmitted in so-called data sets (DSs for short). They consist of a maximum of sixteen 16 bit data words (eight 32-bit double words in case of MasterPiece).

A maximum of one data set can be transferred in each job telegram. For transmission of large amounts of data should, several jobs have to be started.

For identification, each data set has a number ("ID") assigned, which is also transferred in the telegram.

In the PLC program, data sets can be stored in word arrays. The address of the start word must be set at input "DATA" by using the ADR operator.

For transmission, the data set number "ID", the first of 16 words (start word at "DATA") and the number of data words to be transferred ("LEN") has to be specified at the connection element used for transmitting the data set.

Three options for transmission of data sets are available:

- Write data sets to slave
- Read data sets from slave
- Event polling

Write data set

The master can write a data set to the slave by reading the user data and sending them to the slave by means of a telegram. The data are stored at the specified address of the function block, e.g. in a word array. The slave confirms the reception of data in the response telegram.

Read data set

The master reads a data set from the slave by first sending a job telegram to the slave. The slave receives this telegram, reads the data from the address specified by input "DATA" and returns the data in the response telegram. The data of the response telegram are stored at the address specified at input "DATA" of the corresponding function block.

Event polling

In many applications it is required that the slave transfer data to the master, e.g. if an important event is contained in the process.

Normally, the slave is not allowed to start communication itself (master-slave structure). This means, the slave has to wait until the master reads the required data set.

The RCOM protocol provides a simple mechanism to solve this problem: Event polling.

If the slave wants to transmit data to the master, it can initiate the transmission as follows:

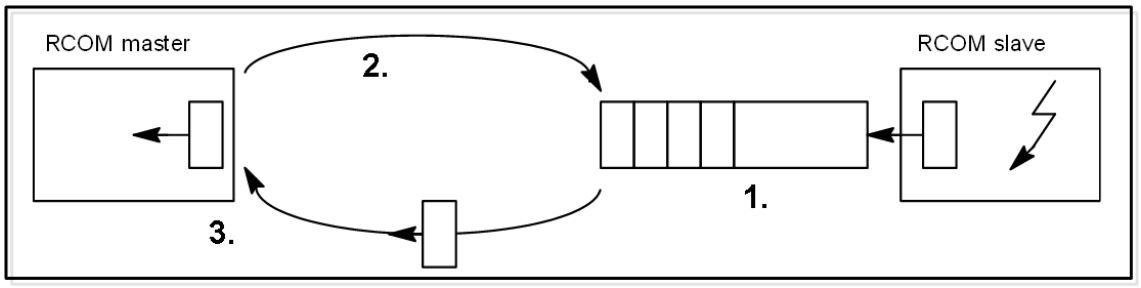
- The slave transfers the data set to a queue (event queue) on the CM574-RCOM Communication Module.
- The master cyclically polls all slaves consecutively to search for events in the queues. If an event is available, the addressed slave sends the data set in the response. If not, it sends the response Event queue empty.

This way, the slave can signal events to the master very easily. If no events occurred, no user data are exchanged. In this case, transmission is completed very quickly.

Since there is no correlation in time between triggering of the event (insertion in the queue) and event polling (read-out of the queue by the master), a time stamp is stored in the data set providing information regarding the time when the event occurred. Therefore, a data set can only contain a maximum of 14 data words and the last two words contain the time stamp.

The CM574-RCOM can store a maximum of 20 events in the queue. Further events are rejected with an error message.

The figure below shows the event-driven transmission.



The slave detects an event and transfers the data set to its event queue (1.). The RCOM master polls the slave (2.) and receives the corresponding data set contained in the slaves response telegram (3.).

Planning

To simplify the use of the communication module, connection elements are provided for all required services.

- RCOM_INIT block for initializing the communication module.
- Connection elements for the system services
  - cold start service (RCOM_COLDST)
  - warm start service (RCOM_WARMST)
  - normalization (RCOM_NORMAL)
  - event polling (RCOM_POLL)
  - telephone dialing (RCOM_DIAL)
  - telephone hang-up (RCOM_HANGUP)
- Connection elements RCOM_TRANSMIT (transmit data set) and RCOM_REC (receive data set) for writing data sets. These connection elements are also used for event-driven transmission. For event polling, the RCOM_POLL connection element has to be used in the master to trigger polling of the slave.
- The RCOM master uses the RCOM_READ connection element for reading data sets. The addressed slave provides the data to be read in the RCOM_READ_SLV connection element.

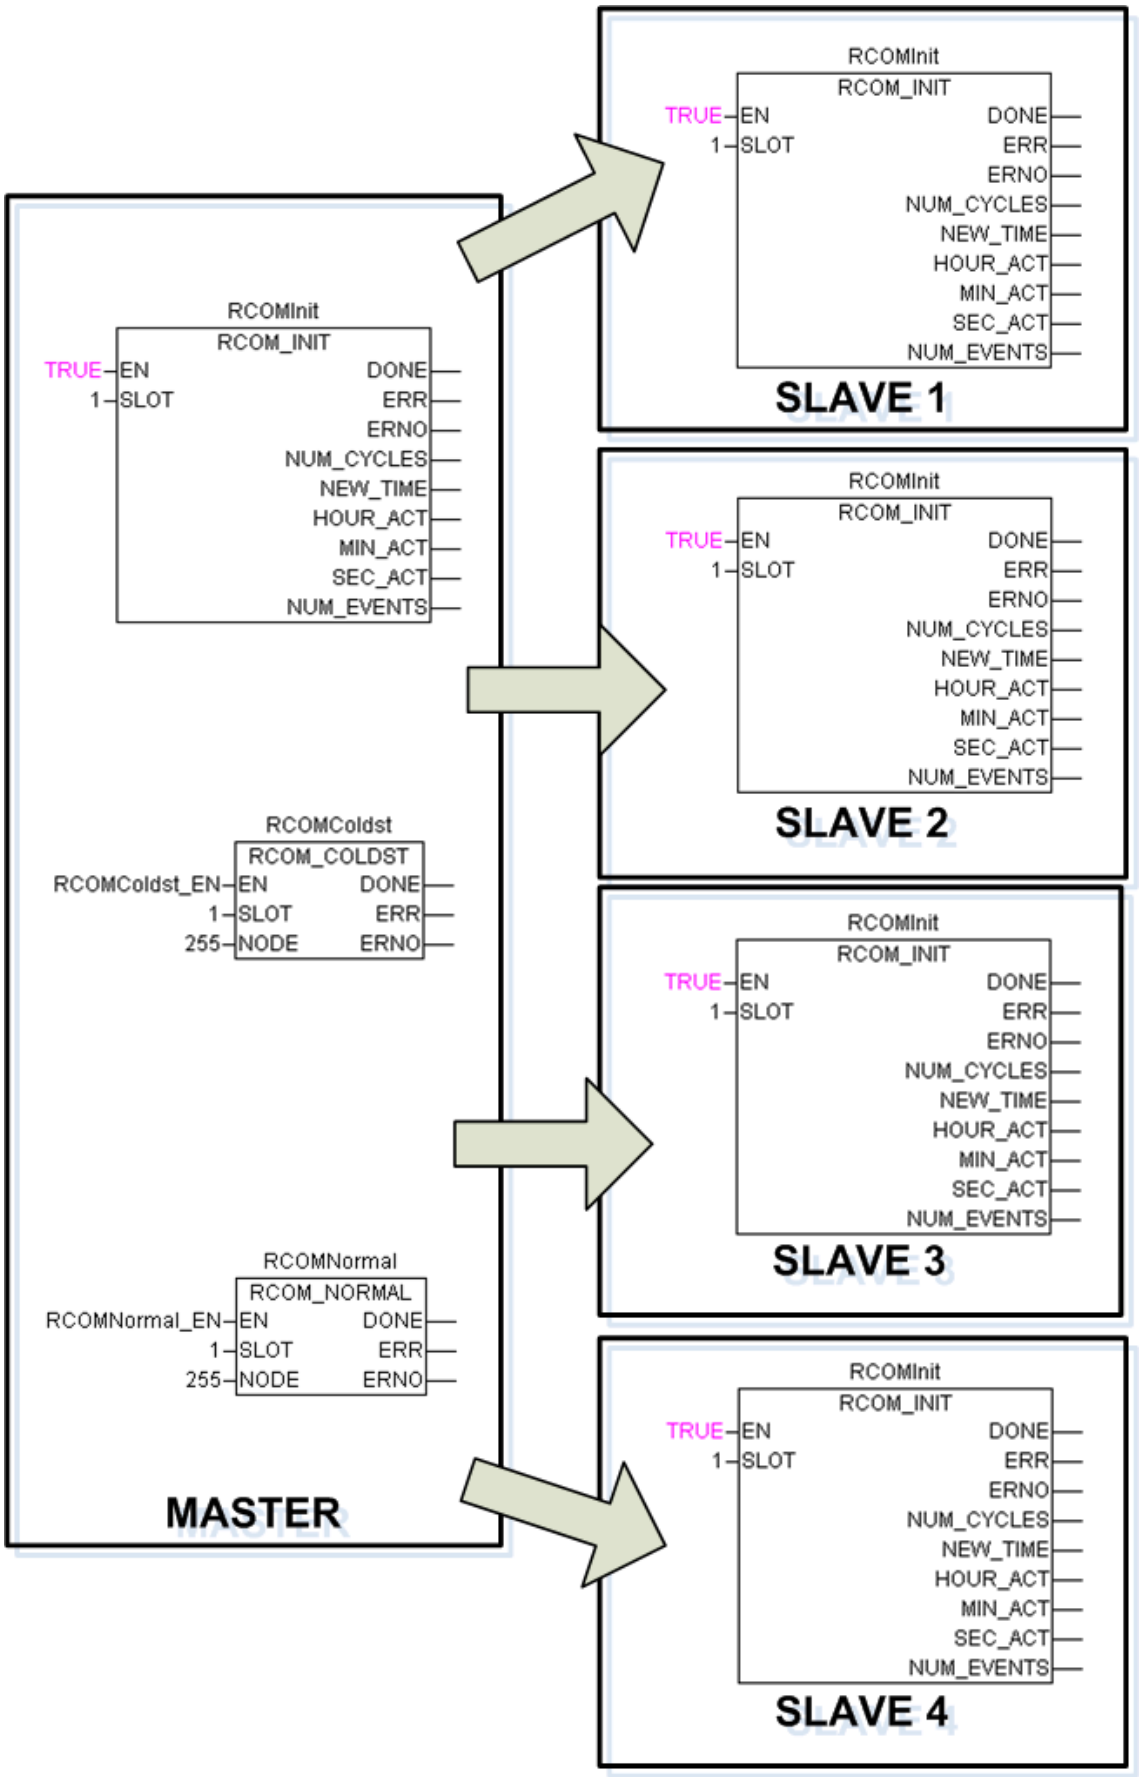
Initialization, cold start and normalization

The figure below shows the application of the connection elements RCOM_INIT, RCOM_COLDST and RCOM_NORMAL. These connection elements have to be used for initializing the communication processors and for starting the RCOM protocol.

Each RCOM user is initialized by the RCOM_INIT connection element, i.e. the transmission parameters, the network address and the timeout times etc. are defined.

The RCOM master then has to perform an RCOM cold start service (RCOM_COLDST) and data transmission has to be enabled by normalization (RCOM_NORMAL). In the example, cold start and normalization are implemented by broadcast telegrams (NODE = 255) so that all slaves are addressed simultaneously.

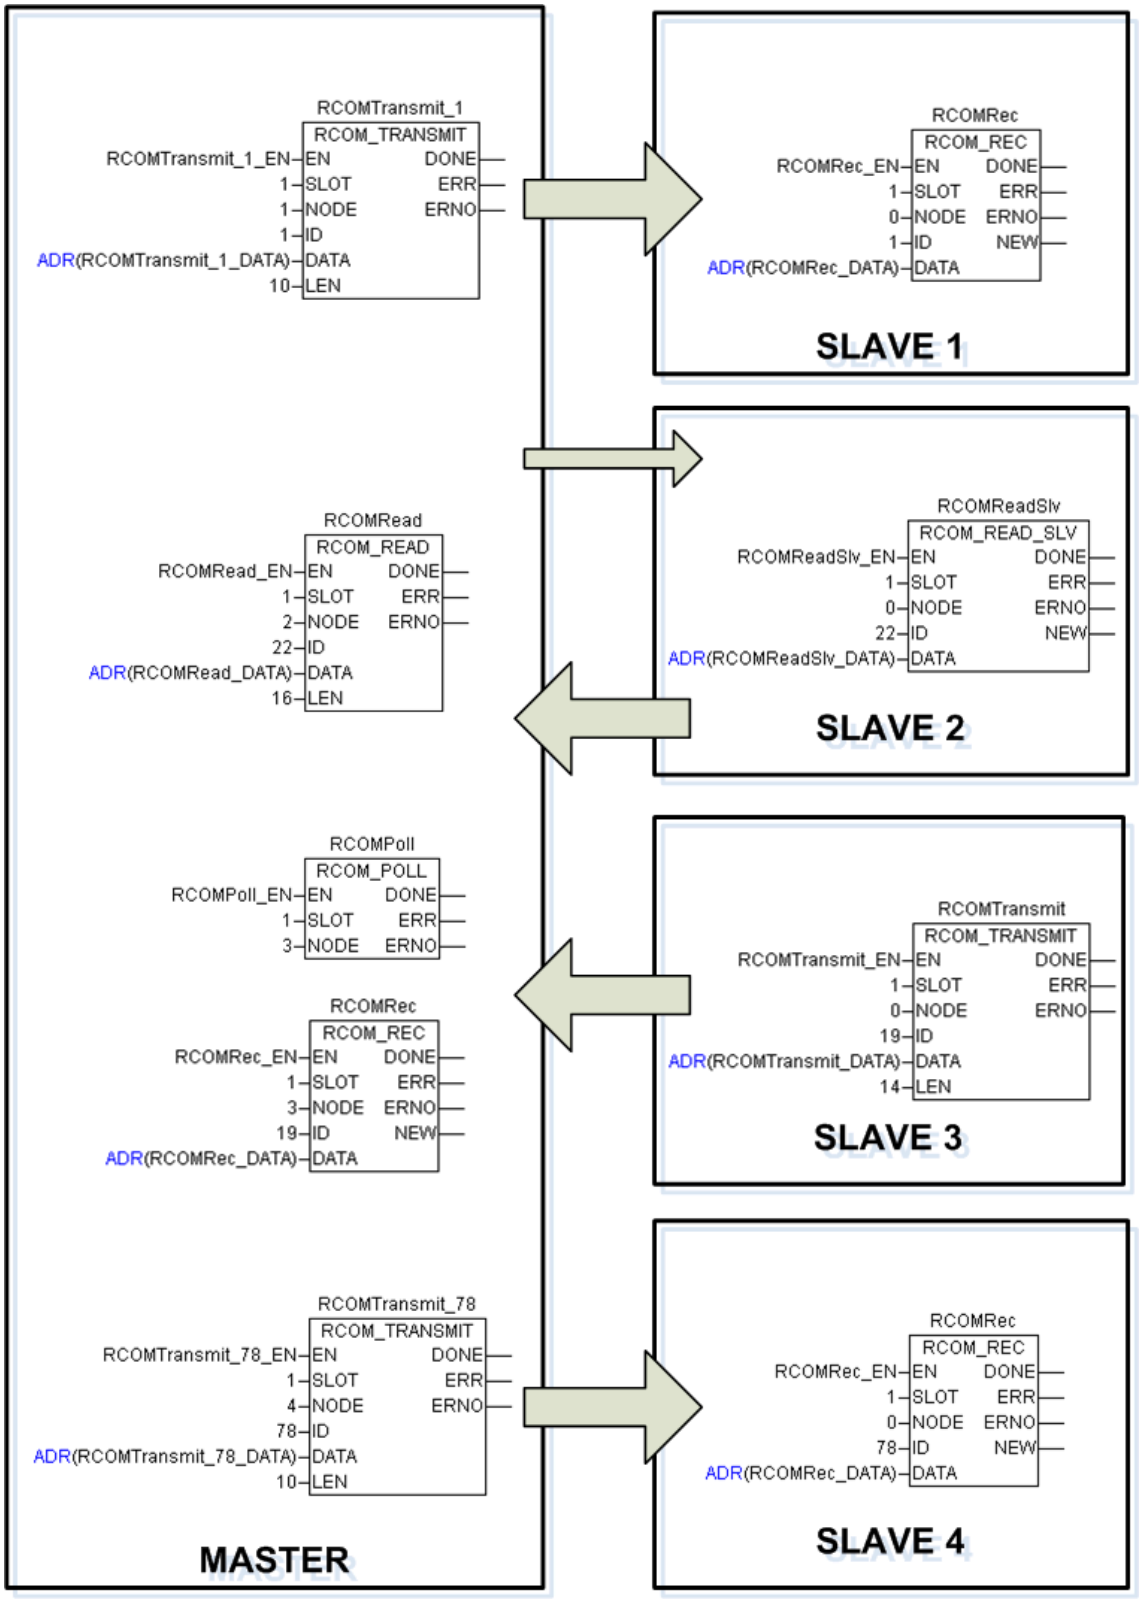
The RCOM network is ready for data transfer after the procedure above has been performed.



In the application shown above, the connection elements for initialization and for the RCOM services cold start and normalization are displayed in simplified form.

Data transmission

The figure below shows an example of transmission of data sets. It illustrates the relationship between connection elements and the significance of address and data set number ("ID").



In the application shown above, the connection elements for data transmission are shown in simplified form.

The following transmissions can be performed in the example:

- Data set 1 is transmitted from the master to slave 1.
- Data set 22 is read by slave 2.

- Data set 19 is sent from slave 3 to the master (event-driven). The master must first poll slave 3 (connection element RCOM_POLL).
- Data set 78 is sent from the master to slave 4.

The figure above does not show the logic for enabling of the connection elements.

For each connection element in the master, a corresponding partner is available in the slave. These two connection elements have the same data set number ("ID").

The data applied to the inputs and outputs of the connection element are not the actual user data but only parameters referencing the storage location of the user data instead.

All data sets in the slave are addressed by zero ("NODE") because jobs can be initiated only by the master.

A specific sequence of system services has to be observed for starting an RCOM network. This sequence ensures the correct initialization of the RCOM protocol.

All system services are triggered by the master using the corresponding connection elements. Nothing needs to be planned in the slaves for the system services. The CM574-RCOM configured as slave handles all system services independently.

Terms

Do not confuse the RCOM services cold start / warm start and the corresponding PLC commands referring to the hardware state. In this section, the terms "cold start" and "warm start" always refer to the RCOM system services and therefore only affect the protocol state.

Cold start

A cold start service has to be performed after the initialization of the RCOM master. The cold start can be transmitted either by broadcast to all slaves simultaneously or to each slave individually.

A cold start requires reinitialization of the entire protocol mechanism and clearing of the event queue contents. For this, a special cold start event is triggered in the addressed RCOM slaves. This event is required when operating ABB MasterPiece systems. In case of pure Advant Controller networks, the event is only indicated when polling.

After a cold start, always normalization has to be performed. Otherwise it is not possible to transmit data sets.

Warm start

By executing a warm start service, it is possible to clear the event queue of a slave (or all slaves). A warm start can be used to resume communication after transmission errors. This permits master and slave to resynchronize.

After a warm start, always normalization has to be performed. Otherwise it is not possible to transmit data sets.

Normalization

A slave has to be normalized after a cold start or a warm start. Normalization enables the transmission of data sets and events. If a slave is not normalized, it cannot trigger events. The RCOM_TRANSMIT connection element then displays a corresponding error message.

If a master polls a non-normalized slave, the RCOM_POLL connection element signals a corresponding error.

Set clock

When the CM574-RCOM is switched on, its software clock is set to 0:00 hours. You can use the RCOM_CLOCK connection element to set the clock of the RCOM master and the clocks of all slaves to the same time. This is important for evaluating time stamps in the case of event-driven data transmission.

Clock setting should always be performed after a cold start and should be repeated cyclically (e.g. every 24 h), if necessary.

The CM574-RCOM contains a software clock for generating time stamps. You can also use this software clock in the PLC program of your CPU module. The time information is made available at the outputs NEW_TIME, HOUR_ACT, MIN_ACT and SEC_ACT of the RCOM_INIT connection element and is updated there approximately every 5 seconds.

The RCOM time starts with 00:00.00 when the Communication Module is set to the RUN state.

The connection element RCOM_CLOCK sets the RCOM clock of the master and sends a set clock telegram to all slaves ("NODE" must be set to 255 for this purpose).

Proceed as follows to set the RCOM time: Read the actual time from the real-time clock and start the RCOM_CLOCK connection element in the RCOM master with this time (NODE = 255 in order to address all slaves). The new time is then transferred to the RCOM clock in the master and in all slaves and output NT is set to "1" for approx. 5 seconds. If individual slaves also use real-time clocks, you can use the edge of NEW_TIME to set these clocks. The master and all slaves use the same time then.

You should use the RCOM_CLOCK connection element even if the RCOM master does not have a real-time clock (e.g. with time 00:00.00 hours). All time stamps in events are then calculated relative to this arbitrary RCOM time.

When planning, you should first precisely analyze the required communication relationships in order to avoid subsequent modifications.

You should consider the following questions:

- How many slaves are necessary? Determine the slave numbers ("NODE").
- How many data words have to be transmitted for each slave? Define the subdivision of the data into data sets. Determine flag ranges for each data set.
- How do the individual data sets have to be transmitted? Cyclically? At the request of the PLC program? Event-driven? Define the communication sequences. Do not forget the required system services (e.g. cold start and normalization). Chapter Planning examples shows how such sequences can be implemented.
- How must the PLC program of the CPU module respond to transmission errors? The example program shows a possible solution.

Important planning rules

The following rules have to be observed during planning for the CM574-RCOM:

- "ID" (data set identifier) can have values between 1 and 255.
- Only an even number of data words can be transmitted in a data set.
- Connection elements must not be skipped once they have been started. This would disturb the logic sequence between the connection element and the CM574-RCOM and cause the connection element to block.
- The connection elements must not be started before the RCOM_INIT connection element has been executed successfully (initialization of the Communication Module). This would cause the connection elements to block.
- Data transmission with RCOM_READ jobs takes approximately twice as long as event-driven transmission. Consequently, you should prefer event-driven transmission in case of time-critical transmissions.
- Max. 14 words are permitted per data set for event-driven transmission. The time stamp is included in two data words, directly after the user data. The master must know the number of words transmitted, if it wishes to evaluate the time stamp (plan a fixed length).

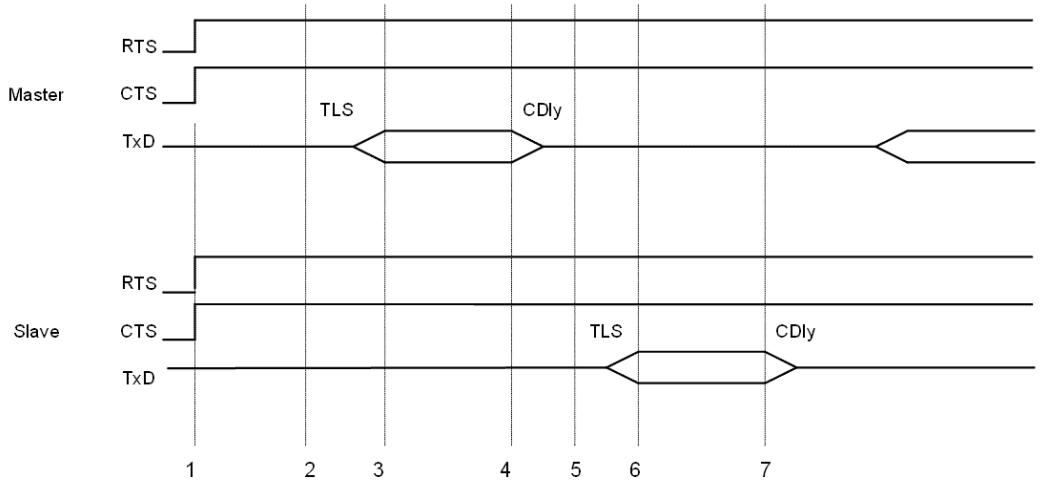
Full duplex

In case of full duplex mode, the RTS line of the Communication Module is set to "1" after initialization.

Prior to the transmission of characters, the Communication Module expects a valid CTS line. The modem may set CTS to zero during transmission in order to stop data flow.

Full duplex should be used for transmission links that provide a separate channel for each transmission direction, e.g. modem-zero cables, telephone connections or modem LS-01 of Messrs. Hedin-Tex.

The figure below shows full-duplex data communication on a CM574-RCOM used as RCOM slave.



1. The CM574-RCOM sets RTS to "1" during initialization. The modem responds with CTS = 1.
2. The CPU starts the job on the CM574-RCOM. The Communication Module waits for TLS.
3. The Communication Module checks CTS and starts transmission of the job telegram.
4. The telegram is finished. The Communication Module waits for CDly.
5. The slave recognizes the job and processes the telegram. TLS is expected before the response is transmitted.
6. The slave starts transmission of the response telegram.
7. After the telegram has been transmitted, the slave waits for CDly. This terminates transmission.

TLS is always expected before transmission of a telegram. CDly is expected after the transmission of a telegram. For error-free communication, TLS has to be greater than CDly of the remote station .

Delay times

Delays can increase the transmission reliability and can be planned before and after the telegram in full duplex mode and in half duplex mode.

Parameter TLS ("line stab. time") indicates the time expected before the transmission of a telegram and after the activation of the modem carrier with CTS = "1" (in case of half duplex only).

Parameter CDLY ("carrier delay") indicates the delay after the telegram.

The following condition has to be observed for full duplex and half duplex mode in order to guarantee reliable transmission: Own TLS > CDLY of the remote station.

The two delay times are entered as a number of characters (duration of transmission of a character at the given transmission rate) so that longer delays result in case of lower transmission rates.

Since the internal clock runs with a clock rate of 10 ms, only multiples of 10 ms are practical.

Examples:

- Transmission rate = 9600 baud -> 1 character = approx. 1 ms, practical time values: 10, 20, 30 etc.
- Transmission rate = 4800 baud -> 1 character = approx. 2 ms, practical time values: 5, 10, 15 etc.

Recommended values for TLS and CDLY at 1200 baud:

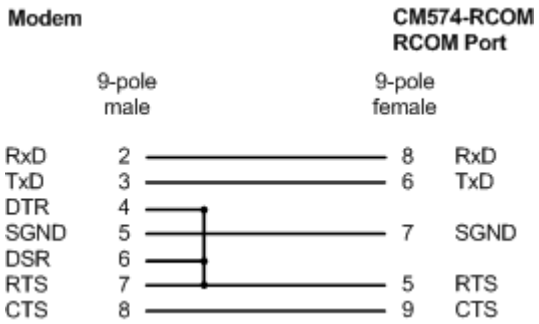
- with half duplex: TLS = 3 characters, CDLY = 2 characters
- with telephone connections: TLS = 2 characters, CDLY = 2 characters
- with full duplex (multidrop or point-to-point): TLS = 2 characters, CDLY = 0 characters.

Please note that these values depend on the modem used and should be determined experimentally, in particular in case of half-duplex links.

Using dial-up modems

The CM574-RCOM communication processor is able to handle communication via the public switched telephone network. For this purpose, it can control Hayes-compatible modems (controlled by AT commands).

The figure below shows an example pin assignment between a modem (RS232C interface) and the RCOM interface of the CM574-RCOM:



The figure below shows an example pin assignment between a modem (RS232C interface) and the RCOM interface of the CM574-RCOM:

- Use only Hayes-compatible modems. Deactivate any MNP options possibly
- Deactivate any MNP options possibly available on the modem. In case of MNP transmission, the correlation in time between telegrams is lost and transmission is disturbed.
- For transmission, a physical connection is necessary that allows the transmission of breaks and binary characters without loosing coherence in time (duration of the break signal, intervals of the characters). For most modems, these operating mode is called "direct mode".
- In the PLC program of the CPU module, connection has to be established (RCOM_DIAL connection element) prior to the transmission of RCOM services, and has to be terminated again afterwards (RCOM_HANGUP).

During commissioning, you should first attempt to address the modem with the operator command "MOD" (refer to chapter "Operator"). If you enter the command OPERATOR>MOD ATI4<CR>, you should see a table of the most important modem parameters. If this is not the case, modem configuration is probably incorrect (transmission rate, parity, etc.).

Communication sequence on the RCOM master

Observe the following sequence in the PLC program of the RCOM master for data transmission:

- Set modem parameter type to "Hayes compatible dial modem" in the PLC configuration.
- Initialize the CM574-RCOM using the RCOM_INIT connection element.
- Call the remote station: RCOM_DIAL. If RCOM_DIAL is completed and no error is signaled:
- Perform a cold start or warm start at the remote station, if required. Cold start and warm start delete the event queue of the called slave. Do not use broadcast telegrams with these services. Address the slave explicitly instead.
- Then perform normalization. This service always has to be performed in order to initialize the protocol mechanism for data transmission. Do not use broadcast telegrams with these services. Address the slave explicitly instead.

- Only if normalization does not signal an error, you may write and read data sets (RCOM_TRANSMIT and RCOM_READ) and poll the slave (RCOM_POLL and RCOM_REC).
- Then you have to terminate the connection (RCOM_HANGUP).

In case of transmission errors (which may occur particularly during normalization) you should terminate the connection using RCOM_HANGUP and start a new dialing attempt.

Communication sequence on RCOM slaves

No special connection elements need to be planned in the PLC program for regular data transmission (master calls and starts services) in case of RCOM slaves.

The slave "picks up" the telephone when it rings and then expects telegrams from the master. If no further telegrams arrive after the waiting time has expired (RCOM_HANGUP time), the slave "hangs up" automatically.

Event transmission: DIAL in slave

The slave can call the master, if it wants to transmit events to the master.

For this purpose, a DIAL connection element needs to be started in the slave. Communication is performed as follows:

- The slave calls the master using RCOM_DIAL.
- The master answers the telephone.
- After a short waiting time, the master starts to normalize all slaves configured in the telephone directory. Since only one slave can be the caller, only the calling slave will answer correctly.
- The master now automatically polls the recognized slave until it signals that the event queue is empty or until the number of polls defined by parameter "Maximum polls" set in the PLC configuration is reached. The received data sets are transferred to the RCOM_REC connection elements in the master.
- The master then "hangs up".
- The slave also "hangs up" after a waiting time ("Hang-up time").

The master automatically attempts to poll all slaves when it is called. No RCOM_POLL connection element is required for this purpose. The RCOM_POLL connection element is only required, if the master calls the slave.

No RCOM_HANGUP connection element needs to be planned in the slave, since the slave does not know when transmission is completed. The slave "hangs up" automatically after expiry of the "hang-up time" (refer to section "Timeouts").

The master and the slave strictly monitor whether RCOM telegrams are actually transmitted over the established connection ("telephone off hook").

If no telegrams were received by the slave or if no services were started in the master after expiry of the "hang-up time", the telephone connection is terminated again.

This prevents "wrong callers" who have dialed the wrong number for instance from blocking the telephone permanently.

Since the RCOM slave is not able to completely monitor the status of the modem (control only with RCOM_DIAL), you should select a short "hang-up time" for the slave, e.g. 10 seconds.

On the master, the timeout should never respond since the modem can be monitored completely by the PLC program of the CPU module (RCOM_DIAL and RCOM_HANGUP). Consequently, you can select a long "hang-up time", e.g. 30 seconds.

Correct settings for the modem are very important for error-free communication.

Certain parameters can be stored in a non-volatile memory in the modem. All other parameters can be stored on the CM574-RCOM in the Init string of the modem setup. They are then transferred to the modem when the CM574-RCOM is initialized.

To enable the CM574-RCOM to control the modem correctly, the following parameters always have to be configured:

- Commands are echoed by the modem
- Acknowledgements from the modem on
- Acknowledgements in plain text
- Break does not clear down connection
- MNP options off
- Data compression off (direct mode)
- Dialing with DTR off
- RTS/CTS handshake between modem and CM574-RCOM
- Automatic call acceptance off
- Escape character: &;;+’

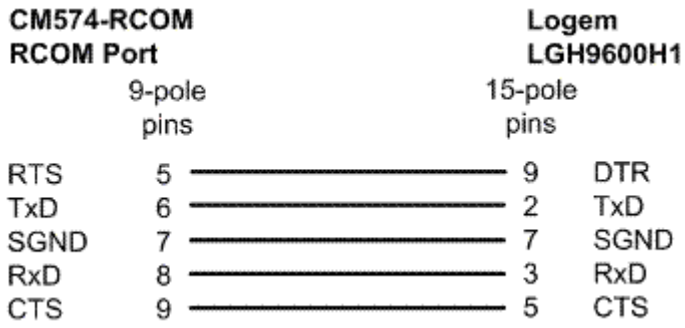
Special features

In "direct mode" the Logem LGH 9600H1 (in the following called LGH) cannot react on the sequence "+++". Consequently, switching from online to command mode for hang-up is not possible.

Therefore, the CM574-RCOM provides an operating mode enabling hang-up by means of the DTR signal (S1/108) of the modem. If the DTR signal is switched from active to passive, the modem hangs-up immediately and switches to the command mode.

Call acceptance and establishment of requested connections is only possible while the DTR signal is active.

Because the CM574-RCOM is not able to make an independent DTR signal available, the RTS signal is used (operating mode "RTS as DTR"). So the cable for connecting the Logem LGH 9600H1 to the CM574-RCOM is as follows:



Settings at the Logem LGH 9600H1

The following parameters have to be set permanently for the Logem LGH 9600H1, e.g. via a terminal directly connected to the Logem LGH 9600H1:

```
at&v
Version 2.02  D
F2 E1 L1 M1 Q0 X4 V1 P \Q2 \G0 \A1 \C0 \L0 \N1 \X1 \K0 \B3 %C1 %E1 %M0 &L0 &I0
&Y0 &X0 &G0 &M0 &C2 &D2 &R1 &S1
S00=000 S01=000 S02=043 S03=013 S04=010 S05=008 S07=100 S08=002 S10=002 S12=050
S20=255 S26=004 S28=000 S37=001 S39=017 S40=019 S45=000 S46=060 S50=002 S51=004
S60=000 S61=000 S80=000 S81=000 S100=042 S101=000 S102=000

OK
```

After entering the parameter "ATF2", ensure that the Logem LGH 9600H1 and the terminal are permanently set to 1200 Baud.

Save the parameters in the non-volatile memory of the Logem LGH 9600H1 by entering "AT&W"

The DIL switches at the Logem LGH 9600H1 have to be set in a way that the basic setting "0" is set in the software mode (all switches S5.1 to S5.5 at the front panel of the unit to "OFF").

Error codes

CAUTION!
For compatibility reasons, the error codes at output ERNO of the RCOM function blocks are not RCOM specific. To obtain the RCOM error code, 8000 hex has to be subtracted from the original value.

Various errors displayed by numbers can occur when using the RCOM Communication Module. The error number is indicated at output ERNO of the corresponding connection elements.

The errors can be divided into two groups: recoverable errors and fatal errors.

The recoverable errors include all errors which occur during transmission of telegrams (character losses, parity errors etc.). In some cases, the Communication Module attempts retransmission in case of transmission errors. The number of attempts can be specified via the parameter "Retransmissions" in the PLC configuration. Further information can be found in section Basic configuration of CM574-RCOM *Chapter 1.6.5.2.6.4.1 “Module parameters” on page 5907*.

In case of recoverable errors, the "RUN" LED flashes cyclic. The LED turns into normal operation mode ("ON") as soon as the error has been fixed.

Fatal errors

If fatal errors occur, the Communication Module terminates communication with the AC500 CPU and the RCOM partners. Fatal erros are indicated by the "ERR" LED.

A reset is required in order to reactivate the Communication Module, e.g. by switching it off and on again.

Table of error codes

The following table contains all possible error codes (hexadecimal and decimal), the error cause and the type of error (fatal or recoverable error).

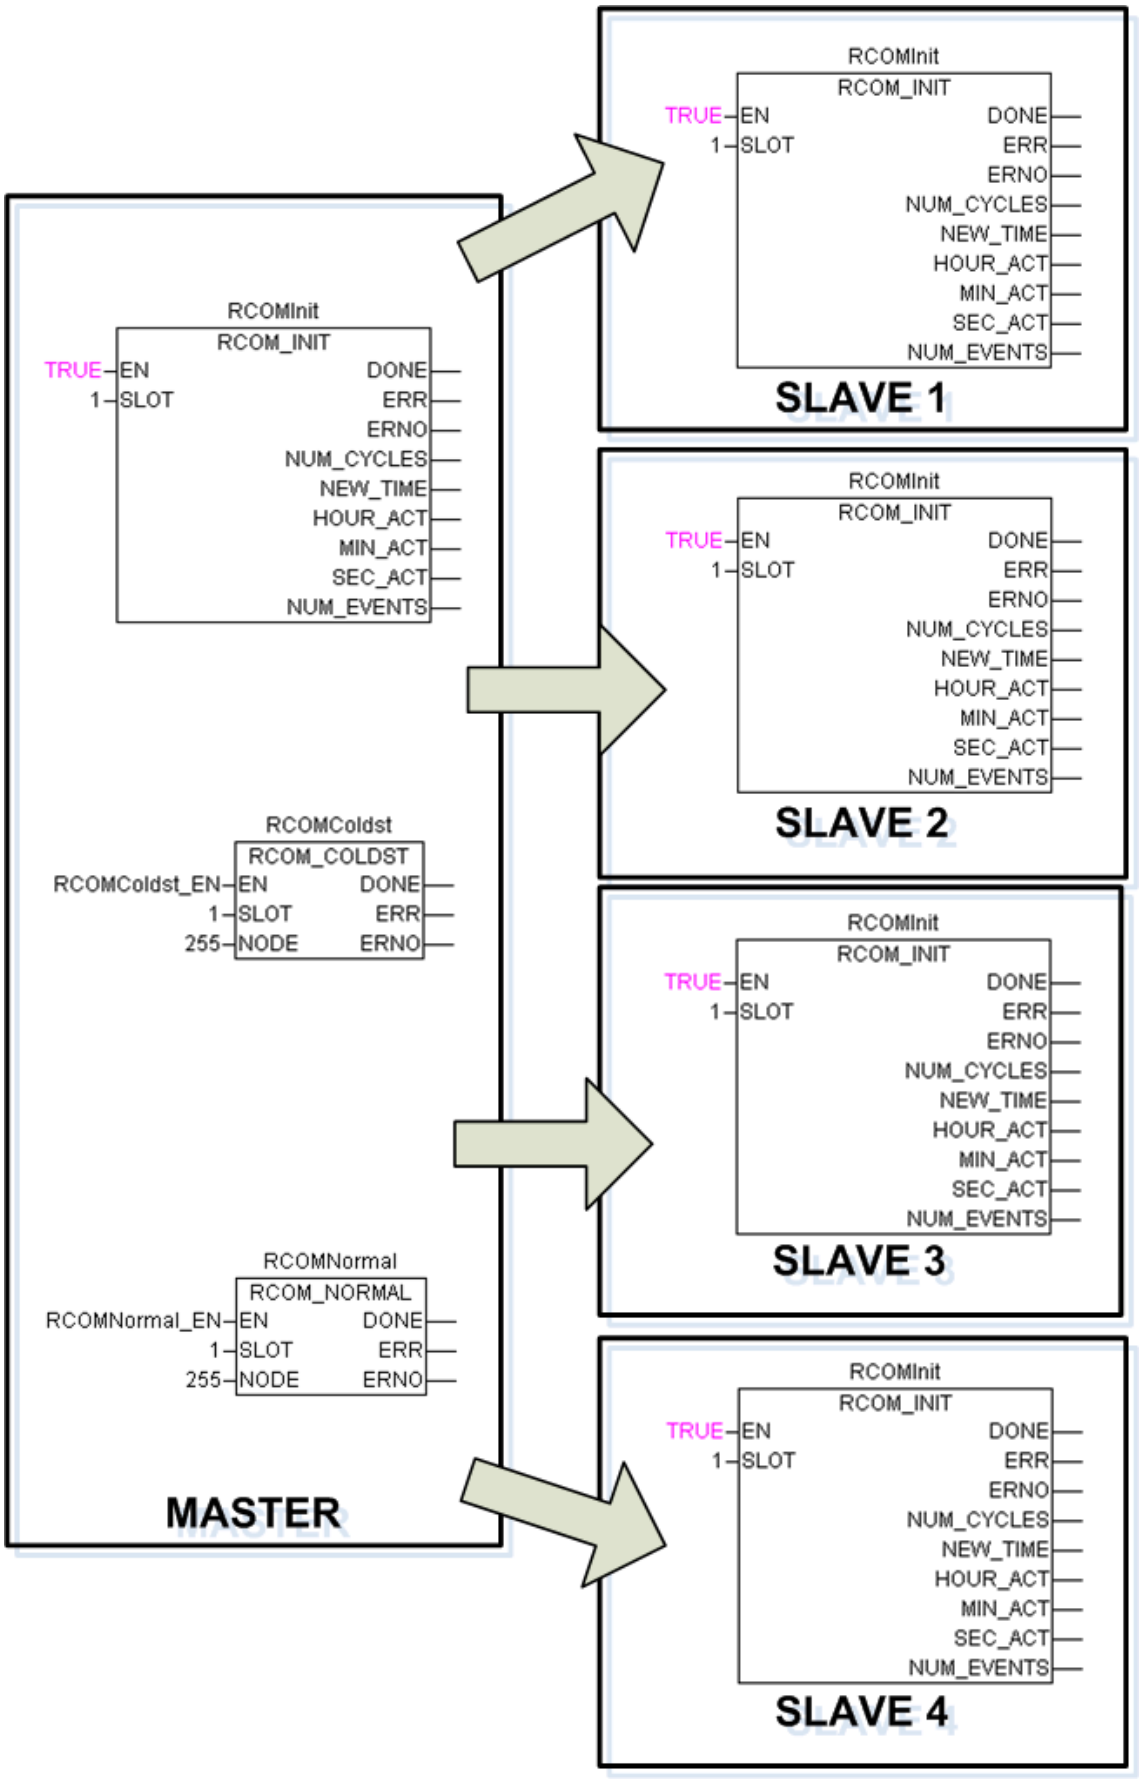
Error code		Cause
(hex)	(dec)	
0000	0	No error
0001	1	CPU does not respond (possible cause: missing connection element or CPU stopped)
1001	4097	Event queue full
2001	8193	Initialization error: Incorrect address (parameter NODE)
2002	8194	Initialization error: Incorrect address (parameter NODE)
2005	8197	Initialization error: Incorrect parity
2006	8198	Initialization error: Incorrect duplex mode
2007	8199	Initialization error: Incorrect line stab. Time (TLS)
2008	8200	Initialization error: Incorrect carrier delay
2009	8201	Initialization error: Incorrect character timeout
2010	8208	Initialization error: Incorrect turnaround time
2011	8209	Initialization error: Incorrect retransmissions
2012	8210	Initialization error: Incorrect number of preambles
2015	8213	Initialization error: Incorrect type of modem
2018	8216	Initialization error: Incorrect debug level
3001	12289	No CTS during transmission

Error code		Cause
(hex)	(dec)	
3002	12290	Timeout, no response telegram
3003	12291	Telegram error (incorrect length code)
3004	12292	Telegram error (incorrect checksum)
3005	12293	Incorrect slave responding
3006	12294	Telegram error (incorrect response code)
4001	16385	Service not known
4002	16386	Incorrect length entry (input LEN)
4003	16387	Incorrect length entry (input LEN)
4004	16388	Incorrect network number (currently unused)
4005	16389	Incorrect data set number (input ID)
4006	16390	Response telegram does not match service
4007	16391	Slave not normalized
4008	16392	Event queue blocked (not normalized)
4010	16400	Invalid time (connection element RCOM_CLOCK)
4020	16416	Slave responds: “application part not ready” (e.g. EN = FALSE)
4030	16432	Slave responds: “application part not ready” (e.g. EN = FALSE)
5000	20480	Communication Module not initialized (after reset) Remark: Requires restart of the AC500 PLC (abort and restart of the program
6001	24577	Telephone directory or setup data not found
6002	24578	Incorrect entry in telephone directory or setup data
6003	24579	No telephone modem planned
6004	24580	Modem not yet online (service started without RCOM_DIAL)
6005	24581	Modem already online (repeated RCOM_DIAL without RCOM_HANGUP)
FFFF	-1	Internal error (fatal)

Operator terminal

The second serial interface "CONSOLE" of the CM574-RCOM serves as a monitoring and debugging interface. The user can enter commands to get information about the protocol parameters or check modem connections and monitor the current RCOM messages.

The pin assignment to connect the interface to the COM-Port of a PC is shown below:



RCOMInit
RCOM_INIT
TRUE
EN
1
SLOT
DONE
ERR
ERNO
NUM_CYCLES
NEW_TIME
HOUR_ACT
MIN_ACT
SEC_ACT
NUM_EVENTS
SLAVE 1
SLAVE 2
SLAVE 3
SLAVE 4
RCOMColdst
RCOM_COLDST
RCOMColdst_EN
255
NODE
RCOMNormal
RCOM_NORMAL
RCOMNormal_EN
MASTER

It is recommended to provide several PCs for checking the data traffic via the console interfaces of the Communication Modules. Terminal programs are required (PCPLUS or Hyper Terminal; settings: 19200 Baud/s, 8 data bits, 1 stop bit, parity none).

Operator commands

A Communication Module can execute commands, if an according command is entered following the "OPERATOR>". E.g. "HELP" lists all available commands.

```
OPERATOR> help
available commands:

   help...................this text

   time...................show RCOM's system time

   event..................show event-queue

   rcom...................show RCOM parameters

   rcsw...................show RCOM status word

   show setup.............show setup-file

   show phone.............show telephone directory

   hangup.................hangup phone

   dial <slave>...........dial a slave

   mod <command>..........send a command to modem

   debug <level>..........show/set debug level
```

The following operator commands can be entered on the console:

HELP Displays a help text on the available commands.

TIME Displays the current RCOM system time.

EVENT Displays a table containing the events currently listed in the event queue. The table lists an event number, the event type (40: event with data set, 41: cold start event), data set number and length and the time when the event occurred.

RCOM Displays a table containing the current RCOM parameters. IMPORTANT: All times are specified in milliseconds. Some of the times are increased slightly by the Communication Module.

RCSW Displays the RCOM status word (RCSW).

SHOW SETUP Displays the setup data. Refer to section "Setups for dial-up modems".

SHOW PHONE Displays the telephone directory. Refer to section "Setups for dial-up modems".

HANGUP Hangs up the telephone (only if a dial-up modem is connected).

DIAL n Dials the telephone number stored in entry "n" in the telephone directory (only if a dial-up modem is connected).

MOD string Sends "string" to the modem (only if a dial-up modem is connected). The responses of the modem are displayed. Example: "MOD AT14 <ENTER>" -> the modem responds with a table of the most important parameters.

DEBUG<n> Sets the debug level to "n". This remains valid until the next initialization by the PLC. If you do not enter "n", the current debug level is displayed.

- In the first level, a message containing the most important parameters is output for each telegram received or transmitted by a slave and for each service started by the PLC.
- In the second level, the Communication Module outputs a message with each important action (including internal operations), e.g. to display received data words and transmitted telegrams, status changes in the RCSW (RCOM status word), status changes in the event queue, etc. The second debug level will probably be of interest in a few cases only. For testing (debugging) the PLC program, the first level is sufficient.

After initialization, the debug level can be set to "1" by entering the command

```
OPERATOR> debug 1
```

(corresponding to level 2). Deactivate the messages with

```
OPERATOR> debug 0
```

After commissioning, you should deactivate the messages for normal operation of the Communication Module.

Operator messages All operator messages have the following appearance:

typ-I-identification text

typ-W- identification text

typ-E- identification text

typ-F- identification text

Where:

- Type: Three letters indicating the origin of the message, i.e. "MST" for services performed by a master, "TEL" for telegrams received by a slave, "RPL" for responses transmitted by a slave, etc.
- I/W/E/F provides information on the type of message:
  - 'I':Information used to trace the sequence (debug levels 1 and 2).
  - 'W': Warning. Occurs, if e.g. telegrams arrive for which no connection element is planned. Warnings do not disturb the sequence in the Communication Module but do indicate a planning error.
  - 'E': An error message of the Communication Module, i.e. if an addressed slave does not respond. Errors disturb the Communication Module when processing the current service but can often be remedied by repeating the service. The "RUN" LED flashes cyclically in case of such an error. If it was possible to fix the error, the LED stops flashing and lights up continuously.
  - 'F': Fatal error, remedy not possible. Communication via RCOM to the PLC is aborted by the Communication Module and only operator entries are possible then. The "ERR" LED indicates that a fatal error has occurred.
- "identification": Abbreviation of the error message.
- "text": Actual message in plain text.

The following tables list the messages possibly output at the operator interface and their significance.

Certain messages contain designations for services that are specified in the following table.

Abbreviated	**Name of service**	**Triggered in the master with CONNECTION ELEMENT**	**Handled in the slave with CONNECTION ELEMENT**
Norm comm part	Normalize communictaion part	*1)	*3)
Quer comm part	Status query communication part	*1)	*3)
Cold start	Cold start	RCOM_COLDST	*3)
Warm start 1	Block all blocks	RCOM_WARMST	*3)
Warm start 2	Block unique blocks	*1)	*3)
Set clock	Set clock	RCOM_CLOCK	*3)
Norm user part	Normalize user part	*1)	*3)
Norm all blocks	Normalize all blocks	RCOM_NORMAL	*3)
Norm sep blocks	Normalize separate blocks	*1)	*3)
Write dataset	Write dataset	RCOM_TRANSMIT	RCOM_REC
Write cntrl	Write data to control register	*1)	*3)
Read dataset	Read dataset	RCOM_READ	RCOM_READ_SLV
Event request	Event request	RCOM_POLL	*3)
Repeat read	Repeat read command	*2)	*3)
Repeat write	Repeat write command	*2)	*3)
Dial	Dial up slave	RCOM_DIAL	*3)
Hangup	Hang up phone	RCOM_HANGUP	*3)

Remarks: *1) not used as master on CM574-RCOM

*2) performed automatically in case of transmission errors

*3) handled automatically in the CM574-RCOM

In the following table, the first column specifies the actual message of the Communication Module. The second column shows a description, the third column specifies the significance of the message, and the fourth column shows remarks indicating the cause of the error.

Message	Description	Significance	Remark
-EPL-E-CPUTO	Service timeout, no CPU reaction	An occurring event was not fetched by the CPU. RCOM_REC connection element missing	*1)
-EPL-I-EVENT	Event - ds: .., len: .., ..	Event arrived	
-EPL-I- CPUACC	Service accepted by CPU	Service accepted by CPU	
-EPL-I-SYSMES	System message	System event occurred (is ignored)	
-EPL-W-CPUREJ	Service rejected by CPU	Event rejected by CPU (EN in case of RCOM_REC = FALSE)	
-ERR-F-FATAL	Fatal error, communication canceled	Fatal error occurred, communication terminated	
-EVT-I-BLOCK	Blocking event queue	Blocking event queue	
-EVT-I-CLEAR	Clearing event queue	Clearing event queue	
-EVT-I-DEBLK	Deblocking event queue	Enable event queue	
-EVT-I-GET	Event queue empty	Event queue is empty	
-EVT-I-GET	Getting event	Fetching event from queue	
-EVT-I-PUT	Putting event	Inserting event in queue	
-EVT-W-PUT	Event-queue full	Event queue is full	
-INI-E-COMGRP	Error reading com group, code	Error reading special flags for communication processors	*2)
-INI-E-EXTINI	External init error, ...	Error during initialization	*2)
-INI-E-GRESI	Error resetting CPU communication, ...	It was not possible to reset system bus communication	*2)
-INI-E-MOD	Error initializing telephone modem, ...	It was not possible to initialize the telephone modem	*3)
-INI-E-OCCUP	Error occupying CPU, ...	It was not possible to assign the PLC	*2)
-INI-E-OPER	Error initializing operator, ...	It was not possible to initialize the commissioning interface	*3)

Message	Description	Significance	Remark
-INI-E-PARAM	Error in parameter, ...	Error in parameter	*1)
-INI-E-RCOM	Error during RCOM-init, ...	It was not possible to initialize the RCOM mechanism	
-INI-E-RCOM	Error initializing RCOM-channel, ...	It was not possible to initialize the RCOM interface	*3)
-INI-E-READ	Error reading parameters, ...	It was not possible to read the RCOM parameters	*2)
-INI-E-RS	Error reading RUN/STOP, ...	It was not possible to read the RUN/STOP switch	*2)
-INI-E-RSINI	Error initializing PLC communication, ...	It was not possible to initialize the system bus communication	*2)
-INI-I-CHECK	Checking RCOM-parameters	Checking RCOM parameters	
-INI-I-COMGRP	Waiting for valid com group	Waiting for valid communication area (in special flag for communication processors)	
-INI-I-EXTINI	External init done	External initialization completed	
-INI-I-EXTINI	Waiting for external init	Waiting for external initialization	
-INI-I-GRES	Resetting CPU communication	Resetting system bus communication	
-INI-I-RUN	Waiting for RUN-switch	Waiting for RUN/STOP switch = RUN	
-KPM-I-EXIT	Exit main loop, reason code ...	Quitting RCOM communication; cause ...	*4)
-KPM-I-GOODM	Good morning!!	It is midnight	
-KPM-I-LCNT	Lifecount ...	Cycle counter set to ...	
-MOD-E-DIAL	Cannot connect	It was not possible to establish the dial-up connection	*5)
-MOD-E-DIAL	Modem already connected	Modem is already on line	*5)
-MOD-E-DIAL	No modem available (modem type = 0)	No modem planned	*1)
-MOD-E-ENTRY	Bad entry in phone file	Entry error in telephone directory	*5)
-MOD-E-HANGUP	Cannot hang up	It was not possible to hang up	*3)
-MOD-E-INIT	Error during modem init	Error during modem initialization	*3)
-MOD-E-NOFILE	No valid files on EEPROM	No valid setup/telephone files on EEPROM	*5)

Message	Description	Significance	Remark
-MOD-E-RING	No modem available (modem type = 0)	No modem planned	*1)
-MOD-I-ANS	Answer ...	Modem response: ...	
-MOD-I-ANSCMP	Compare ... - ...	Comparing modem response with ...

-WDS-E-CPUTO	Service timeout, no CPU reaction	PLC not responding to write job (RCOM_REC connection element missing)	
-WDS-I-CPUACC	Service accepted by CPU	Service Write data set accepted by CPU	
-WDS-W-CPUREJ	Service rejected by CPU, ...	Service Write data set rejected by CPU (EN with RCOM_REC = FALSE)	

Remarks

*1) A planning error has probably occurred. Check whether all required connection elements are present and whether the correct parameters have been assigned to them.

*2) Error during system bus communication. Leads to fatal errors, if not remedied automatically. May be triggered by PS501, e.g. when transmitting programs.

*3) There is probably a fault in the cable. Check the wiring of RTS and CTS.

*4) The following causes are possible:

- Reinitialization was performed by the CPU module (RCOM_INIT connection element started)
- RUN/STOP switch was set to STOP
- A fatal error occurred

*5) There is probably an error in modem control. Check the module "dial-up modem" in your PLC configuration and its sub modules for errors concerning the setup or the phone book.

*6) A transmission error occurred. Check all RCOM parameters and timeout times in the PLC configuration.

*7) This occurs if the CPU is set to STOP.

*8) Internal error. Attempt to reset the unit and reinitialize it.

Planning examples

Example 1: Direct connection

This example shows how to realize data transmission between two RCOM Communication Modules using a direct serial connection in operation mode RCOM+. The transmission speed of the connection in the example is set to 9600 Baud/s (odd parity).

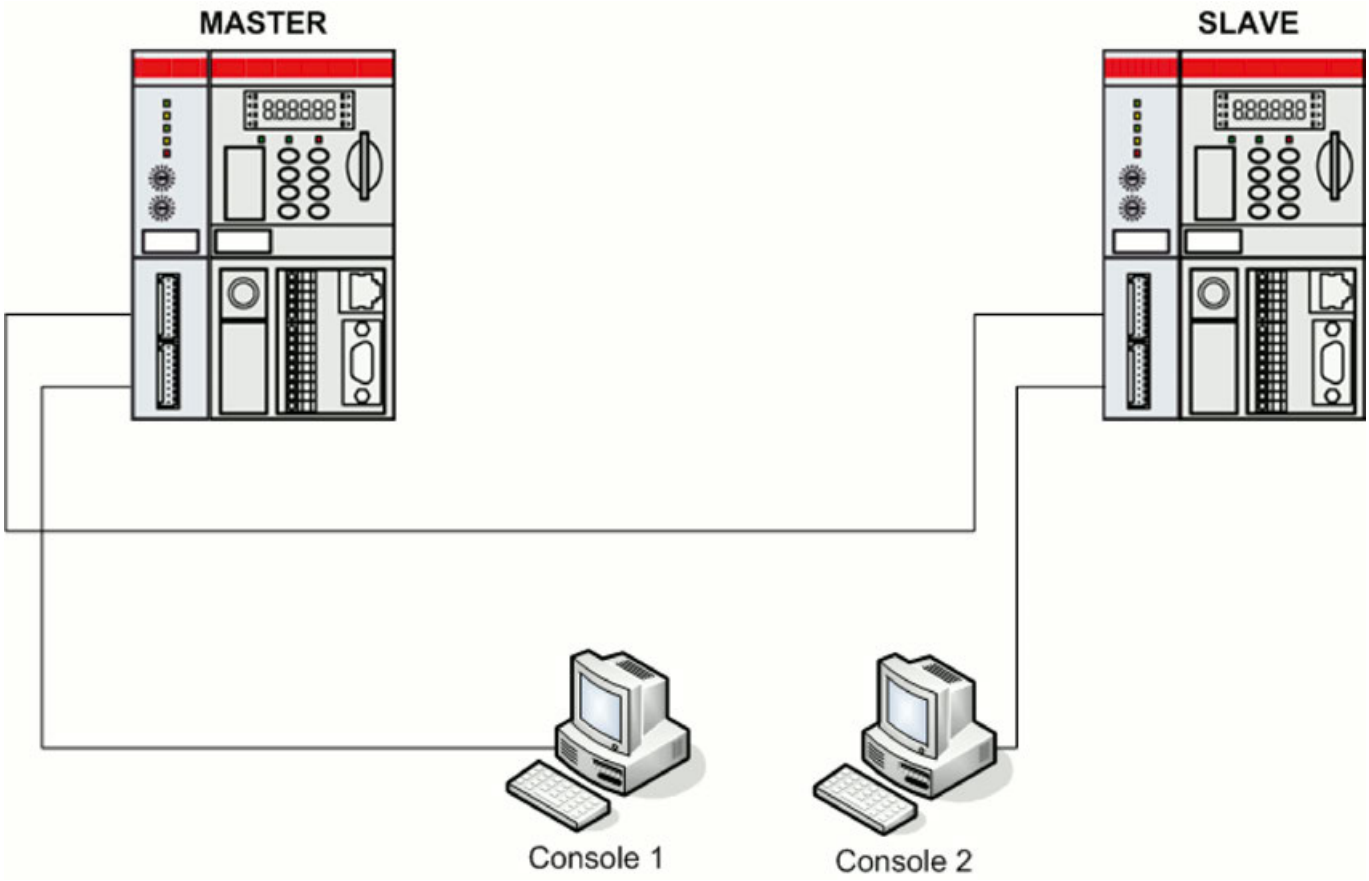
The set up of the AC500 PLCs will be described as well as the projecting of the master and slave devices.

The corresponding projects can be found in the examples folder:

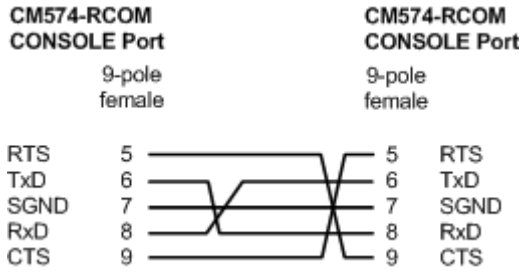
- RCOM Master: AC500_RCOM_DIRECT_MASTER_PM5xx_Vyy.pro
- RCOM Slave: AC500_RCOM_DIRECT_SLAVE_PM5xx_Vyy.pro

The basic hardware setup consists of two AC500 PLCs, each using

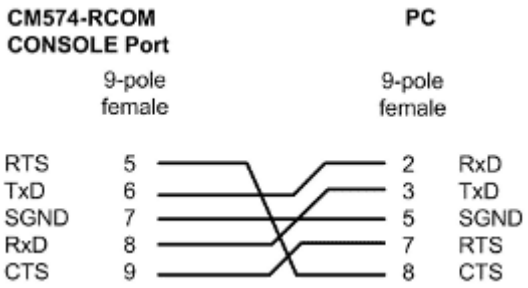
- 1 processor module
- 1 terminal base with at least one communication module slot
- 1 communication module CM574-RCOM.



To connect the communication modules, a serial cable with the following pin assignment is required (cross cable):



In addition to that, a cable is recommended that connects the CONSOLE port to a PC with a terminal emulation software to view protocol information or error messages.



Master-Slave-Arrangement

Configuring the master

To configure the CM574-RCOM as a master device, the parameter "Operation mode" must be set to "RCOM+ Master". The address or node number must be set to 0 while "Parity" is set to "Odd". All other parameters can remain default.

If the CONSOLE port is used (recommended), the parameter "Debug level" of module "CONSOLE" should be set to "Level 2" to obtain detailed information and error messages of the protocol.

Configuring the slave

To configure the CM574-RCOM as a slave device the parameter "Operation mode" must be set to "RCOM+ Slave". The parameter address must be set to a value greater than 0. In the example select 1 for the slave. "Parity" is set to "Odd". All other parameter can remain default.

If the CONSOLE port is used (recommended) the parameter "Debug level" of module "CONSOLE" should be set to "Level 2" to obtain detailed information and error messages of the protocol.

Implementation of the user program

The example shows how to write a dataset with word length 2 to the slave and how to read a dataset from the slave with word length 14.

Implementation of the master

The first step is the implementation of an instance of the function block RCOM_INIT that is used to initialize the RCOM communication module at the specified slot (1 in this case).

```
0001 RCOM_INIT(EN:= TRUE, SLOT:= 1);                    (*coupler initialization*)
0002 IF RCOM_INIT.DONE AND NOT RCOM_INIT.ERR THEN       (*check if done successfully*)
0003     byStep                          := 1;
0004 ELSIF RCOM_INIT.DONE AND RCOM_INIT.ERR THEN
0005     byStep                          := 0;
0006 END_IF
0007 IF byStep = 0 THEN                                 (*on init error disable all RCOM fb's
```

The function block must be called cyclically to ensure proper functionality of the RCOM communication module. The outputs DONE and ERR must be checked to retrieve the current state of initialization. Once the output DONE is TRUE and ERR is FALSE, the communication module is initialized and ready for further operation.

After a successful initialization the slave must go through the RCOM specific initialization sequence that consists of a cold start, a warm start and a normalization. These operations will ensure that the slave is ready to process incoming transmission requests of the master. Input NODE of all function blocks used is set to 1 to address the directly connected slave device.

```
0014 IF byStep = 1 THEN                                    (*do cold start*)
0015     RCOM_COLDST(EN:= TRUE, SLOT:= 1, NODE := 1);
0016     IF RCOM_COLDST.DONE AND NOT RCOM_COLDST.ERR THEN
0017         byStep                  := 2;
0018     ELSIF RCOM_COLDST.DONE AND RCOM_COLDST.ERR THEN
0019         byStep                  := 1;
0020     END_IF
0021 END_IF
0022 IF byStep = 2 THEN                                    (*do warm start*)
0023     RCOM_WARMST(EN := TRUE, SLOT := 1, NODE := 1);
0024     IF RCOM_WARMST.DONE AND NOT RCOM_WARMST.ERR THEN
0025         byStep                  := 3;
0026     ELSIF RCOM_WARMST.DONE AND RCOM_WARMST.ERR THEN
0027         byStep                  := 1;
0028     END_IF
0029 END_IF
0030 IF byStep = 3 THEN                                    (*do normalization*)
0031     RCOM_NORMAL(EN := TRUE, SLOT := 1, NODE := 1);
0032     IF RCOM_NORMAL.DONE AND NOT RCOM_NORMAL.ERR THEN
0033         byStep                  := 4;
0034     ELSIF RCOM_NORMAL.DONE AND RCOM_NORMAL.ERR THEN
0035         byStep                  := 1;
0036     END_IF
0037 END_IF
```

Once the normalization step has finished successfully, the calls of the data transmission function blocks can be started. In the example, the first step of data transmission is the execution of a write request to transfer a data set of word length 2 to the connected slave. The function block RCOM_TRANSMIT is used to realize this operation. The data that is written to the slave is located in the word array arwDataOut[0..1]. The input DATA of the function block is set to the array's address using the ADR operator. The input ID is set to 2 what specifies the data set number which must equal a corresponding data set on the slave side. The length of the data set is set to value 2 at input LEN.

After this step a read request will be started by using the function block RCOM_READ. The requested data set is specified at input ID (3 in this case). A corresponding data set is projected in the slave project described later. The received data is written to word array arwDataIn[0..13]. Input DATA must be set to the address of the array via the ADR operator. The length in words is specified at input LEN.

```
0038 IF byStep = 4 THEN                                    (*write request (data set 2)*)
0039     RCOM_TRANSMIT_DS_2(EN := TRUE, SLOT := 1, NODE := 1, ID := 2, DATA := ADR(arwDataOut[0]), LEN := 2);
0040     IF RCOM_TRANSMIT_DS_2.DONE AND NOT RCOM_TRANSMIT_DS_2.ERR THEN
0041         byStep                  := 5;
0042     ELSIF RCOM_TRANSMIT_DS_2.DONE AND RCOM_TRANSMIT_DS_2.ERR THEN
0043         byStep                  := 3;
0044     END_IF
0045 END_IF
0046 IF byStep = 5 THEN                                    (*read request (data set 3)*)
0047     RCOM_READ_DS_3(EN := TRUE, SLOT := 1, NODE := 1, ID := 3, DATA := ADR(arwDataIn[0]), LEN := 14);
0048     IF RCOM_READ_DS_3.DONE AND NOT RCOM_READ_DS_3.ERR THEN
0049         byStep                  := 4;
0050     ELSIF RCOM_READ_DS_3.DONE AND RCOM_READ_DS_3.ERR THEN
0051         byStep                  := 3;
0052     END_IF
0053 END_IF
```

In case of an error during data transmission, the slave must be normalized to reset its state and to maintain its ability to process incoming request telegrams of the master.

Implementation of the slave

As shown in the master implementation, the slave also requires the creation and call of an instance of the function block RCOM_INIT.

```
0001 RCOM_INIT(EN:= TRUE, SLOT:= 1);                          (*coupler initialization*)
0002 IF RCOM_INIT.DONE AND NOT RCOM_INIT.ERR THEN             (*check if done successfully*)
0003     byStep                          := 1;
0004 ELSIF RCOM_INIT.DONE AND RCOM_INIT.ERR THEN
0005     byStep                          := 0;
0006 END_IF
0007 IF byStep = 0 THEN                                       (*on init error disable all RCOM fb's
```

The 2 requests that are sent by the master require a corresponding implementation of the function blocks RCOM_READ_SLV and RCOM_REC which react to the read or write request telegrams of the master.

An instance of function block RCOM_READ_SLV with input ID set to 3 reacts to the read request projected in the master. The data that is read from the master is located in word array arwDataOut[0..13]. Its address is set at input DATA of the function block.

An instance of function block RCOM_REC with input ID set to 2 reacts to the incoming write request projected in the master. The data contained in the master's telegram is copied to word array arwDataIn[0..1]. Its address is set at input DATA of the function block.

```
0011 IF byStep = 1 THEN                                       (*normal operation: call RCOM fb's*)
0012     RCOM_REC_DS_2(EN:= TRUE, SLOT:= 1, NODE := 0, ID := 2, DATA := ADR(arwDataIn[0]));
0013     IF RCOM_REC_DS_2.NEW THEN
0014         dwInCnt                     := dwInCnt + 1;
0015     END_IF
0016     RCOM_READ_SLV_DS_3(EN := TRUE, SLOT:= 1, NODE:= 1, ID:= 3, DATA:= ADR(arwDataOut[0]));
0017     IF RCOM_READ_SLV_DS_3.NEW THEN
0018         dwOutCnt                    := dwOutCnt + 1;
0019     END_IF
0020 END_IF
```

Example 2: Dial-Up connection

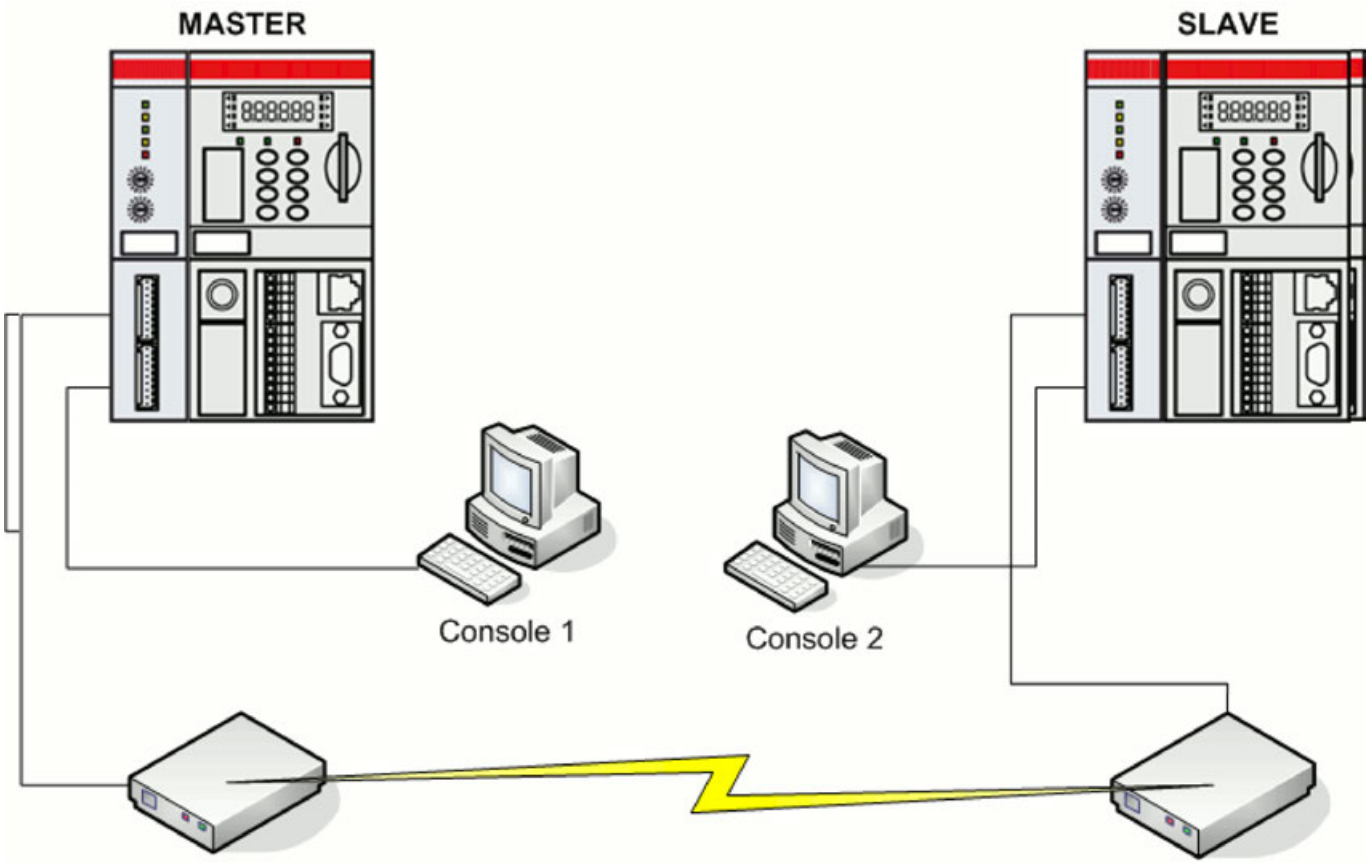
This example shows how to realize data transmission between two RCOM Communication Modules using a modem based dial-up connection in operation mode RCOM+. The transmission speed of the connection in the example is set to 9600 Baud/s (no parity).

The corresponding projects can be found in the examples folder:

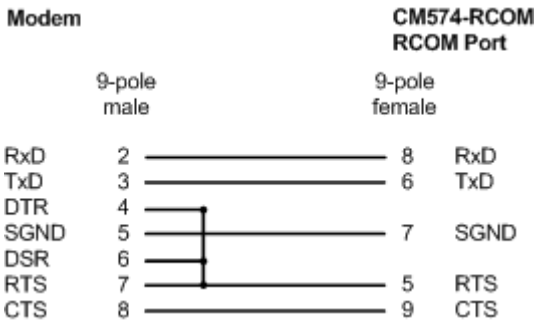
- RCOM Master: AC500_RCOM_DIAL_UP_MASTER_PM5xx_Vyy.pro
- RCOM Slave: AC500_RCOM_DIAL_UP_SLAVE_PM5xx_Vyy.pro

The basic hardware setup consists of two AC500 PLCs, each using

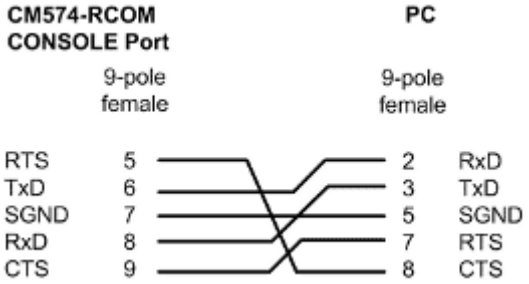
- 1 processor module
- 1 terminal base with at least 1 communication module slot
- 1 communication module CM574-RCOM



The connection between a modem and a CM574-RCOM communication module requires a cable with the following pin assignment:



In addition to that a cable is recommended that connects the CONSOLE port to a PC with a terminal emulation software to view protocol information or error messages.



Master-Slave-Arrangement

Configuring the master

To configure the CM574-RCOM as a master device the parameter "Operation mode" must be set to "RCOM Master". The address or node number must be set to 0 while "Parity" should be "None". Ensure that "Hayes compatible dial modem" is selected as "Type of modem". The "Character timeout" should be set to 50 ms. The value for the "Turnaround time" should be increased to 6000 ms.

If the CONSOLE port is used (recommended) the parameter "Debug level" of module "CONSOLE" should be set to "Level 2" to obtain detailed information and error messages of the protocol.

Configuring the slave

To configure the CM574-RCOM as a slave device the parameter "Operation mode" must be set to "RCOM Slave". The parameter address must be set to a value greater than 0. In the example select 1 for the slave. "Parity" should be "None". Ensure that "Hayes compatible dial modem" is selected as "Type of modem". The "Character timeout" should be set to 50 ms. The value for the "Turnaround time" should be increased to 6000 ms.

If the CONSOLE port is used (recommended) the parameter "Debug level" of module "CONSOLE" should be set to "Level 2" to obtain detailed information and error messages of the protocol.

Configuring the modem

The example uses ABB H&IT HSM-ECO remote modems that provide the ability to use both operation modes, RCOM and RCOM+.

Setting up the phone book

For both projects the telephone numbers of the RCOM devices must be configured. To use a dial-up modem, a corresponding module has to be appended to the RCOM/RCOM+ module in the PLC configuration as described in the PLC configuration steps of the CM574-RCOM.

For consistency reasons, the phone book of the master as well as the phone book of the slave(s) must be equal.

To add a new entry to the phone book, append a telephone number to the modem. The tab "Module parameters" provides the possibility to set up the corresponding dial prefix identifier and the corresponding telephone number of the node that should be configured.

Implementation of the User program

The example shows how to write a dataset with word length 2 to the slave and how to read a dataset from the slave with word length 14. In addition to that event polling is used to transfer a dataset from the slave to the master.

Implementation of the master

The first step is the implementation of an instance of function block RCOM_INIT that is used to initialize the RCOM communication module at the specified slot (1 in this case). To process incoming events of the slave a RCOM_REC function block is projected and called every cycle as soon as the initialization of the local Communication Module has been finished.

```
0001 RCOM_INIT(EN:= TRUE, SLOT:= 1);                                    (*coupler initialization*)
0002 IF RCOM_INIT.DONE AND NOT RCOM_INIT.ERR THEN                       (*check if done successfully*)
0003     RCOM_REC_DS_4(EN := TRUE, SLOT:= 1, NODE:= 1, ID := 4, DATA := ADR(arwDataRec[0]));
0004     IF RCOM_REC_DS_4.NEW THEN
0005         dwRecCnt                := dwRecCnt + 1;
0006     END_IF
0007     IF bTrigger THEN
0008         bTrigger                := FALSE;
0009         RCOM_DIAL_1(EN := FALSE, SLOT := 1);
0010         RCOM_COLDST_1(EN := FALSE, SLOT := 1);
0011         RCOM_WARMST_1(EN := FALSE, SLOT := 1);
0012         RCOM_NORMAL_1(EN := FALSE, SLOT := 1);
0013         RCOM_TRANSMIT_DS_2(EN := FALSE, SLOT := 1);
0014         RCOM_READ_DS_3(EN := FALSE, SLOT := 1);
0015         RCOM_POLL_1(EN := FALSE, SLOT := 1);
0016         byStep                  := 1;
0017         byStepNext              := 2;
0018     END_IF
0019 ELSIF RCOM_INIT.DONE AND RCOM_INIT.ERR THEN
0020     byStep                      := 0;
0021 END_IF
```

The function block must be called cyclically to ensure proper functionality of the RCOM communication module. The outputs DONE and ERR must be checked to get the initialization state. Once output DONE is TRUE and ERR is FALSE the communication module is initialized and ready for further operation.

After a successful initialization the variable bTrigger must be manually set to start the dialing process represented by function block RCOM_DIAL. Otherwise the master waits for incoming calls of the slave to show how the automatic polling process is executed.

```
0023 IF byStep = 1 THEN                                                 (*dial node 1*)
0024     RCOM_DIAL_1(EN := TRUE, SLOT := 1, NODE := 1);
0025     IF RCOM_DIAL_1.DONE AND NOT RCOM_DIAL_1.ERR THEN
0026         byStep                  := byStepNext;
0027     ELSIF RCOM_DIAL_1.DONE AND RCOM_DIAL_1.ERR THEN
0028         byStep                  := 1;
0029         byStepNext              := 2;
0030     END_IF
0031 END_IF
```

In case of a finished dialing process triggered by the master, the RCOM initialization function blocks for cold start, warm start and normalization are started in the next steps to initialize the slave and prepare it for further request telegrams that are used for data transmission.

```
0040 IF byStep = 2 THEN                                    (*do cold start*)
0041     RCOM_COLDST_1(EN:= TRUE, SLOT:= 1, NODE := 1);
0042     IF RCOM_COLDST_1.DONE AND NOT RCOM_COLDST_1.ERR THEN
0043         byStep                  := 3;
0044     ELSIF RCOM_COLDST_1.DONE AND RCOM_COLDST_1.ERR THEN
0045         byStepNext              := 2;
0046         byStep                  := 8;
0047     END_IF
0048 END_IF
0049 IF byStep = 3 THEN                                    (*do warm start*)
0050     RCOM_WARMST_1(EN := TRUE, SLOT := 1, NODE := 1);
0051     IF RCOM_WARMST_1.DONE AND NOT RCOM_WARMST_1.ERR THEN
0052         byStep                  := 4;
0053     ELSIF RCOM_WARMST_1.DONE AND RCOM_WARMST_1.ERR THEN
0054         byStepNext              := 2;
0055         byStep                  := 8;
0056     END_IF
0057 END_IF
0058 IF byStep = 4 THEN                                    (*do normalization*)
0059     RCOM_NORMAL_1(EN := TRUE, SLOT := 1, NODE := 1);
0060     IF RCOM_NORMAL_1.DONE AND NOT RCOM_NORMAL_1.ERR THEN
0061         byStep                  := 5;
0062     ELSIF RCOM_NORMAL_1.DONE AND RCOM_NORMAL_1.ERR THEN
0063         byStepNext              := 2;
0064         byStep                  := 8;
0065     END_IF
0066 END_IF
```

Once the normalization step has finished successfully the data transmission can be executed. In the example the first step of data transmission is the call of a write request to transfer a data set of word length 2 to the connected slave. The function block RCOM_TRANSMIT is used to realize this operation. The data that is written to the slave is located in the word array arwDataOut[0..1]. The input DATA of the function block is set to the array's address using the ADR operator. The input ID is set to 2 what specifies the data set number which must equal a corresponding data set on the slave side. The length of the data set is set to value 2 at input LEN.

After this step a read request will be started by using the function block RCOM_READ. The requested data set is specified at input ID (3 in this case). A corresponding data set is projected in the slave project that is also described in this documentation. The received data is written to word array arwDataIn[0..13]. Input DATA must be set to the address of the array via the ADR operator. The length in words is specified at input LEN.

The next step triggers an event poll (RCOM_POLL) on the slave to check for new events that will be read from the slave's event queue and processed by local RCOM_REC function blocks.

```
0067 IF byStep = 5 THEN                                          (*write request (data set 2)*)
0068     RCOM_TRANSMIT_DS_2(EN := TRUE, SLOT := 1, NODE := 1, ID := 2, DATA := ADR(arwDataOut[0]), LEN := 2);
0069     IF RCOM_TRANSMIT_DS_2.DONE AND NOT RCOM_TRANSMIT_DS_2.ERR THEN
0070         byStep                  := 6;
0071     ELSIF RCOM_TRANSMIT_DS_2.DONE AND RCOM_TRANSMIT_DS_2.ERR THEN
0072         byStepNext              := 4;
0073         byStep                  := 8;
0074     END_IF
0075 END_IF
0076 IF byStep = 6 THEN                                          (*read request (data set 3)*)
0077     RCOM_READ_DS_3(EN := TRUE, SLOT := 1, NODE := 1, ID := 3, DATA := ADR(arwDataIn[0]), LEN := 14);
0078     IF RCOM_READ_DS_3.DONE AND NOT RCOM_READ_DS_3.ERR THEN
0079         byStep                  := 7;
0080     ELSIF RCOM_READ_DS_3.DONE AND RCOM_READ_DS_3.ERR THEN
0081         byStepNext              := 4;
0082         byStep                  := 8;
0083     END_IF
0084 END_IF
0085 IF byStep = 7 THEN                                          (*do event poll*)
0086     RCOM_POLL_1(EN := TRUE, SLOT := 1, NODE := 1);
0087     IF RCOM_POLL_1.DONE AND NOT RCOM_POLL_1.ERR THEN
0088         byStep                  := 5;
0089     ELSIF RCOM_POLL_1.DONE AND RCOM_POLL_1.ERR THEN
0090         byStepNext              := 4;
0091         byStep                  := 8;
0092     END_IF
0093 END_IF
```

In case of an error the, master hangs up the phone (function block RCOM_HANGUP) and waits for incoming calls or a new dialing process that is started manually.

```
0094 IF byStep = 8 THEN                                          (*hangup phone*)
0095     RCOM_HANGUP(EN := TRUE, SLOT := 1, NODE := 1);
0096     IF RCOM_HANGUP.DONE THEN
0097         byStep                  := 0;
0098     END_IF
0099 END_IF
```

Implementation of the slave

As shown in the master implementation the slave also requires the creation and call of an instance of the function block RCOM_INIT.

The two requests that will be sent by the master require corresponding implementation of the function blocks RCOM_READ_SLV and RCOM_REC which will react to incoming read or write request telegrams of the master:

- An instance of function block RCOM_READ_SLV with input ID set to 3 reacts to the read request projected in the master. The data that will be read from the master is located in word array arwDataOut[0..13]. Its address is set at input DATA of the function block.
- An instance of function block RCOM_REC with input ID set to 2 reacts to the incoming write request projected in the master. The data contained in the master's telegram will be copied to word array arwDataIn[0..1]. Its address is set at input DATA of the function block.

Both function blocks are called cyclically to ensure proper reaction to the incoming telegrams. In case of data reception or the completion of a read request the output NEW of the corresponding function block is set to TRUE (until next call of the function block).

```
0001 RCOM_INIT(EN:= TRUE, SLOT:= 1);                                    (*coupler initialization*)
0002 IF RCOM_INIT.DONE AND NOT RCOM_INIT.ERR THEN                       (*check if done successfully*)
0003     byStep                          := 1;
0004 ELSIF RCOM_INIT.DONE AND RCOM_INIT.ERR THEN
0005     byStep                          := 0;
0006 END_IF
0007 IF byStep = 0 THEN                                                 (*on init error disable all RCOM fb's*)
0008     RCOM_REC_DS_2(EN := FALSE);
0009     RCOM_READ_SLV_DS_3(EN := FALSE);
0010     RcOM_TRANSMIT_DS_4(EN := FALSE);
0011 END_IF
0012 IF byStep = 1 THEN                                                 (*normal operation: call RCOM fb's*)
0013     RCOM_REC_DS_2(EN:= TRUE, SLOT:= 1, NODE := 0, ID := 2, DATA := ADR(arwDataIn[0]));
0014     IF RCOM_REC_DS_2.NEW THEN
0015         dwInCnt                     := dwInCnt + 1;
0016     END_IF
0017     RCOM_READ_SLV_DS_3(EN := TRUE, SLOT:= 1, NODE:= 1, ID:= 3, DATA:= ADR(arwDataOut[0]));
0018     IF RCOM_READ_SLV_DS_3.NEW THEN
0019         dwOutCnt                    := dwOutCnt + 1;
0020     END_IF
0021     IF bPutEvent THEN                                              (*manually triggered: put event to queue*)
0022         RCOM_TRANSMIT_DS_4(EN := TRUE, SLOT:= 1, NODE:= 0, ID:= 4, DATA:= ADR(arwDataSnd[0]), LEN:= 14);
0023         IF RCOM_TRANSMIT_DS_4.DONE THEN
0024             bPutEvent               := FALSE;
0025             IF NOT RCOM_TRANSMIT_DS_4.ERR THEN
0026                 bDialMaster         := TRUE;
0027             END_IF
0028             RCOM_TRANSMIT_DS_4(EN := FALSE);
0029         END_IF
0030     END_IF
0031 END_IF
```

The variable bPutEvent can be set to TRUE to add an event that contains data for the master to the slave's event queue with the function block RCOM_TRANSMIT. After the function block is done the program dials the master to trigger an event poll in case of a successful connection to the master.

1.6.4.3 System technology of the communication interface modules

1.6.4.3.1 Modbus communication interface module

Overview

The Modbus TCP communication interface module CI52x-MODTCP is used as decentralized I/O module in Modbus TCP networks. The network connection is performed via 2 RJ45 connectors which are integrated in the terminal unit.

CI521-MODTCP I/O channels properties:

- 4 analog inputs (1.0...1.3)
- 2 analog outputs (1.5...1.6)
- 8 digital inputs 24 V DC in 1 group (2.0...2.7)
- 8 digital outputs 24 V DC in 1 group (3.0...3.7)

Functionality

Parameter	Value
Interface	Ethernet
Protocol	Modbus TCP
Power supply	from the process supply voltage UP
Supply of the electronic circuitry of the I/O expansion modules attached	Through the I/O bus interface (I/O bus)
Rotary switches	For setting the last BYTE of the IP (00h to FFh)
Analog inputs	4 (configurable via software)
Analog outputs	2 (configurable via software)
Digital inputs	8 (24 V DC; delay time configurable via software)
Digital outputs	8 (24 V DC, 0.5 A max.)
LED displays	For system displays, signal states, errors and power supply
External supply voltage	Via terminals ZP, UP and UP3 (process supply voltage 24 V DC)

CI522-MODTCP I/O channels properties:

- 8 digital configurable inputs/outputs in 1 group (1.0...1.7)
- 8 digital inputs 24 V DC in 1 group (2.0...2.7)
- 8 digital outputs 24 V DC in 1 group (3.0...3.7)

Functionality

Parameter	Value
Interface	Ethernet
Protocol	Modbus TCP
Power supply	from the process supply voltage UP
Supply of the electronic circuitry of the I/O expansion modules attached	Through the I/O bus interface (I/O bus)
Rotary switches	For setting the last BYTE of the IP (00h to FFh)
Configurable digital inputs/outputs	8 (configurable via software)
Digital inputs	8 (24 V DC; delay time configurable via software)
Digital outputs	8 (24 V DC, 0.5 A max.)
LED displays	For system displays, signal states, errors and power supply
External supply voltage	Via terminals ZP, UP and UP3 (process supply voltage 24 V DC)

The inputs/outputs are galvanically isolated from the Ethernet network. There is no potential separation between the channels.

The configuration of the inputs/outputs is performed by software.

For usage in enhanced ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

Modbus TCP registers

Register layout for CI52x-MODTCP

The registers can be divided in 4 sections:

- Information data section 0x0000 to 0x0D50 (for acyclic use)
- I/O data and diagnosis section 0x0FFA to 0x2B00 (for cyclic use)
- Parameter data section 0x3000 to 0x3B00 (for acyclic use)
- Special functionality section 0x5A00 to 0x6A00 (for acyclic use)

Information data section (Acyclic data)

The information data section can be used to read out common and module specific information.

This section is read only.

Register (hex)	Description	Readable by Modbus function code	Writeable by Modbus function code
0	Device and FW information CI	3	x
50	Production data CI	3	x
100	Device and FW information 1. EXP	3	x
125	Device and FW information 1. Hot swap terminal unit	3 *)	x
150	Production data 1. EXP	3	x
175	Production data 1. Hot swap terminal unit	3 *)	x
...	...		x
A00	Device and FW information 10. EXP	3	x
A25	Device and FW information 10. Hot swap terminal unit	3 *)	x
A50	Production data 10. EXP	3	x
A75	Production data 10. Hot swap terminal unit	3 *)	x
D00	Common device information	3	x

*) supported from CI52x firmware version V3.2.0 (device index F0)

This section can be divided again in two sections:

- The module specific section (containing information for each module CI52x-MODTCP and expansion modules and hot swap terminal units)
- The common device information block

Module specific information registers

For each module (CI52x device, expansion modules and hot swap terminal units) the following data can be read out:

- Device and FW information
  This section consists of 20 WORDs per module and contains information on each module using the following structure:

Data	DATA TYPE	Description
Module ID	WORD	The module ID of the requested module
Module name	ARRAY [1..10] OF BYTE	The module name of the requested module
Version 1st processor	ARRAY [1..4] OF BYTE	The version of the 1st processor of the requested module
Version 2nd processor	ARRAY [1..4] OF BYTE	The version of the 2nd processor of the requested module
Version 3rd processor	ARRAY [1..4] OF BYTE	The version of the 3rd processor of the requested module

Data	DATA TYPE	Description
Version 4th processor	ARRAY [1..4] OF BYTE	The version of the 4th processor of the requested module
Hardware version [1])	ARRAY [1..4] OF BYTE	The hardware version of the 4 processors
Reserved	ARRAY [1..8] OF BYTE ARRAY [1..4] OF BYTE [2])	Reserved
Number input data	WORD	Number of input data of the requested module in BYTES
Number output data	WORD	Number of output data of the requested module in BYTES

[1]) supported from CI52x firmware version V3.2.0 (device index F0)

[2]) from CI52x firmware version V3.2.0 (device index F0) “Reserved” is ARRAY [1..4] OF BYTE

- Production / Traceability data:
  This section consists of 25 WORDs per module and contains the traceability data for each module using following structure:
  - Article number: Byte 01..15
  - Index: Byte 16..17
  - Name: Byte 18..29
  - Production date: Byte 30..33
  - Key number: Byte 34..38
  - Site: Byte 39..40
  - Year: Byte 41..42
  - Serial number: Byte 41..50 (The serial number implies the year)
- Production / Traceability data from CI5x2 firmware version V3.2.0 (device index F0):
  This section consists of 26 WORDs per module and contains the traceability data for each module using following structure:
  - Article number: Byte 01..15
  - Index: Byte 16..17
  - Name: Byte 18..31
  - Production date: Byte 32..35
  - Key number: Byte 36..40
  - Site: Byte 41..42
  - Year: Byte 43..44
  - Serial number: Byte 42..52 (The serial number implies the year)

Common device information registers

Common device information block

This section consists of 80 WORDs (90 WORDs from CI52x firmware version V3.2.0 (device index F0)) and contains cluster wide information (CI52x device and connected expansion modules using the following structure:

Data	DATA TYPE	Description
Device state	BYTE	The actual state of the device: 0: STATE_PREOP (device booting) 1: STATE_OPERATION (device in operational, no bus supervision active) 2: STATE_ERROR (device detected a bus error, bus supervision active) 3: STATE_IP_ERROR (the device has a IP address error) 4: STATE_CYCLIC_OPERATION (device in operational, bus supervision active)
Parameter state	BYTE	The actual parameter state of the device: 0: PARA_STATE_NO_PARA (the device has no parameters) 1: PARA_STATE_PARA_ACTIVE (parameterization process running) 2: PARA_STATE_PARA_DONE (the uses valid parameters) 3: PARA_STATE_ERROR (The device has invalid
Module ID CI device	WORD	Module ID of the CI52x device itself
Module ID 1st expansion	WORD	Module ID of the 1st connected expansion module
Module ID 2nd expansion	WORD	Module ID of the 2nd connected expansion module
...		
Module ID 10th expansion	WORD	Module ID of the 10th connected expansion module
Expansion bus error count	DWORD	Global telegram error count over all expansion modules
Good count onboard I/O	DWORD	Telegram good count onboard I/Os
Good count 1st expansion	DWORD	Telegram good count 1st expansion module
Good count 2nd expansion	DWORD	Telegram good count 2nd expansion module
...		
Good count 10th expansion	DWORD	Telegram good count 10th expansion module
Error count onboard I/O	DWORD	Telegram error count onboard I/Os
Error count 1st expansion	DWORD	Telegram error count 1st expansion module
Error count 2nd expansion	DWORD	Telegram error count 2nd expansion module
...		
Error count 10th expansion	DWORD	Telegram error count 10th expansion module
Input address onboard I/O	WORD	Modbus TCP register address for inputs of the onboard I/Os
Input address 1st expansion	WORD	Modbus TCP register address for inputs of the 1st expansion module
Input address 2nd expansion	WORD	Modbus TCP register address for inputs of the 2nd expansion module

Data	DATA TYPE	Description
...		
Input address 10th expansion	WORD	Modbus TCP register address for inputs of the 10th expansion module
Output address onboard I/O	WORD	Modbus TCP register address for outputs of the onboard I/Os
Output address 1st expansion	WORD	Modbus TCP register address for outputs of the 1st expansion module
Output address 2nd expansion	WORD	Modbus TCP register address for outputs of the 2nd expansion module
...		
Output address 10th expansion	WORD	Modbus TCP register address for outputs of the 10th expansion module
Module ID 1st hot swap terminal unit *)	WORD	Module ID of the 1st connected hot swap terminal unit *)
Module ID 2nd hot swap terminal unit *)	WORD	Module ID of the 2nd connected hot swap terminal unit *)
...		
Module ID 10th hot swap terminal unit *)	WORD	Module ID of the 10th connected hot swap terminal unit *)

*) supported from CI52x firmware version V3.2.0 (device index F0)

I/O / Process data and diagnosis section (Cyclic data)

Table 710: The cyclic data section for CI52x-MODTCP

Register (hex)	Description	Readable by Modbus function code	Writeable by Modbus function code
FCE *)	Module state	3,4, 23	x
FFA	Diagnosis	3,4, 23	x
1000	Inputs CI	3, 4, 23	x
1100	Inputs 1.EXP	3, 4, 23	x
...	...		x
1A00	Inputs 10.EXP	3, 4, 23	x
2000	Outputs CI	3, 23	6, 16, 23
2100	Outputs 1.EXP	3, 23	6, 16, 23
...	...		
2A00	Outputs 10.EXP	3, 23	6, 16, 23
2B00	Dummy output	3, 23	6, 16, 23

*) supported from CI52x firmware version V3.2.0 (device index F0)

This section can be divided again in three sections:

- Module state (containing the state of connected expansion modules and hot swap terminal units)
- Diagnosis data (containing diagnosis data in AC500 specific format)
- Process data (containing I/O data)

Module state

The module state section consists of 44 WORDs and contains the module state of connected expansion modules and hot swap terminal units using the following structure:

Data	DATA TYPE	Description
Module ID	WORD	Module ID of the CI52x
Expected module ID	WORD	Expected (configured) module ID of the CI52x
Module state	BYTE	The current module state of the CI52x: 0: NO_MOD (no module detected) 1: MOD_INIT (module detected, module is in initialization phase) 2: MOD_RUN (module detected and running or in failsafe state, input data are valid) 3: WRONG_MOD (wrong module detected, module ID doesn’t match expected module ID) 4: MOD_REMOVED (module removed or defective on hot swap terminal unit, no communication to module possible) 5: MOD_ERROR (module defective on hot swap terminal unit, no communication to module possible) 6: MOD_LOST (lost communication to module on not hot swap capable terminal unit) 7: UNKNOWN (module detected but not configured)
Diagnosis flag	BYTE	Diagnosis flag for the CI52x: 0: NO_DIAG (no diagnosis available from CI52x I/O cards) 1: DIAG_AVAILABLE (diagnosis available for CI52x I/O cards)
Terminal unit state	BYTE	Terminal unit state for the CI52x: 0: NO_HOTSWAP_TU (not hot swap terminal unit detected) 1: HOTSWAP_TU_RUNNING (hot swap terminal unit detected and working) 2: HOTSWAP_TU_ERROR (hot swap terminal unit detected, but communication errors for hot swap terminal unit detected)
Parameter state	BYTE	Parameter state of the CI52x: 0: NO_PARA (module is in initialization phase and not ready for parameterization) 1: WAIT_PARA (module awaits parameterization) 2: PARA_RUN (parameterization running) 3: LEN_ERR (length of parameters not correct) 4: ID_ERR (module ID inside parameters not correct) 5: PARA_DONE (parameterization finished without errors)
Module ID	WORD	Module ID of the 1st connected expansion module

Data	DATA TYPE	Description
Expected module ID	WORD	Expected (configured) module ID of the 1st connected expansion module
Module state	BYTE	The current module state of the 1st connected expansion module
Diagnosis flag	BYTE	Diagnosis flag for the 1st connected expansion module 0: NO_DIAG (no diagnosis available for expansion module) 1: DIAG_AVAILABLE (diagnosis available for expansion module)
Terminal unit state	BYTE	Terminal unit state for the 1st connected expansion module
Parameter state	BYTE	Parameter state of the 1st connected expansion module
...		
Module ID	WORD	Module ID of the 10th connected expansion module
Expected module ID	WORD	Expected (configured) module ID of the 10th connected expansion module
Module state	BYTE	The current module state of the 10th connected expansion module
Diagnosis flag	BYTE	Diagnosis flag for the 10th connected expansion module
Terminal unit state	BYTE	Terminal unit state for the 10th connected expansion module
Parameter state	BYTE	Parameter state of the 10th connected expansion module

Diagnosis data

The diagnosis data section contains one diagnosis message with the following structure (according to AC500 diagnosis):

Byte Number	Description	Possible Values
1	Diagnosis Byte, slot number	31 = CI52x-MODTCP (e. g. error at integrated 8 DI / 8 DO)
		1 = 1st connected S500 I/O Module
		...
		10 = 10th connected S500 I/O Module
2	Diagnosis Byte, module number	According to the I/O bus specification passed on by modules to the fieldbus master
3	Diagnosis Byte, channel	According to the I/O bus specification passed on by modules to the fieldbus master
4	Diagnosis Byte, error code	According to the I/O bus specification Bit 7 and Bit 6, coded error class 0 = E1 1 = E2 2 = E3 3 = E4 Bit 0 to Bit 5, coded error description
5	Diagnosis Byte, flags	According to the I/O bus specification Bit 7: 1 = coming error Bit 6: 1 = leaving error
6	Reserved	0

If a diagnosis message is read out, the next one will be automatically filled in.

If no more diagnosis messages are available the buffer will be reset to zero.

This ensures that each diagnosis message can be delivered to the Modbus TCP client/slave and no diagnosis will be lost.

I/O data

The I/O data section can use two different formats according to the module parameter “I/O Mapping Structure” (see ↬ *Chapter 1.6.2 “Device specifications” on page 3785* for details).

- Fixed I/O mapping
  In case of fixed I/O mapping each module has a predefined register range for each Inputs and Outputs.
- Dynamic I/O mapping
  In case of dynamic I/O mapping the mapping is build according to the actual configuration.

The dummy output at the end of the I/O data section can be used to retrigger the bus supervision and has no effect on the HW outputs.

Fixed I/O mapping

In case of fixed I/O mapping the following predefined register table is used:

Register (hex)	Description	Readable by Modbus function code	Writeable by Modbus function code
1000	Inputs CI	3, 4, 23	x
1100	Inputs 1.EXP	3, 4, 23	x
...	...		x
1A00	Inputs 10.EXP	3, 4, 23	x
2000	Outputs CI	3, 23	6, 16, 23
2100	Outputs 1.EXP	3, 23	6, 16, 23
...	...		
2A00	Outputs 10.EXP	3, 23	6, 16, 23
2B00	Dummy output	3, 23	6, 16, 23

If a certain expansion module has no inputs or outputs the corresponding registers remain empty.

Dynamic I/O mapping

In case of dynamic mapping only the start addresses of inputs and outputs are predefined:

Register (hex)	Description	Readable by Modbus function code	Writeable by Modbus function code
1000	Inputs CI	3, 4, 23	x
...	...		x
2000	Outputs CI	3, 23	6, 16, 23
...	...		
2B00	Dummy output	3, 23	6, 16, 23

The register addresses of the connected expansion modules are calculated dynamically based on the number of inputs and outputs of the previous modules (each module starts directly on the next register after the previous module).

The register addresses of each module can be read out via the common device register (see ↳ *Chapter 1.6.4.3.1.2.2.2 “Common device information registers” on page 5654*).

Comparative example

The difference between fixed I/O mapping and dynamic I/O mapping is shown in the following table.

For this comparison a cluster with CI522, AX522, DC532, AX521, DC523, DC532, AO523, AI523, DI524, AX522 and DC523 is used.

Fixed Mapping					Dynamic Mapping			
Register (hex)	**Description**	**Type**	**Data**		**Register (hex)**	**Description**	**Type**	**Data**
1000	Inputs CI	8 DC, 8 DI, FC	4 BYTE + 4 WORD		1000	Inputs CI	8 DC, 8 DI, FC	4 BYTE + 4 WORD
1100	Inputs AX522	8 AI	8 WORD		1006	Inputs AX522	8 AI	8 WORD
1200	Inputs DC532	16 DI, 16 DC	4 BYTE		100E	Inputs DC532	16 DI, 16 DC	4 BYTE

Fast counter control counter 1	BYTE	
Fast counter control counter 2	BYTE	

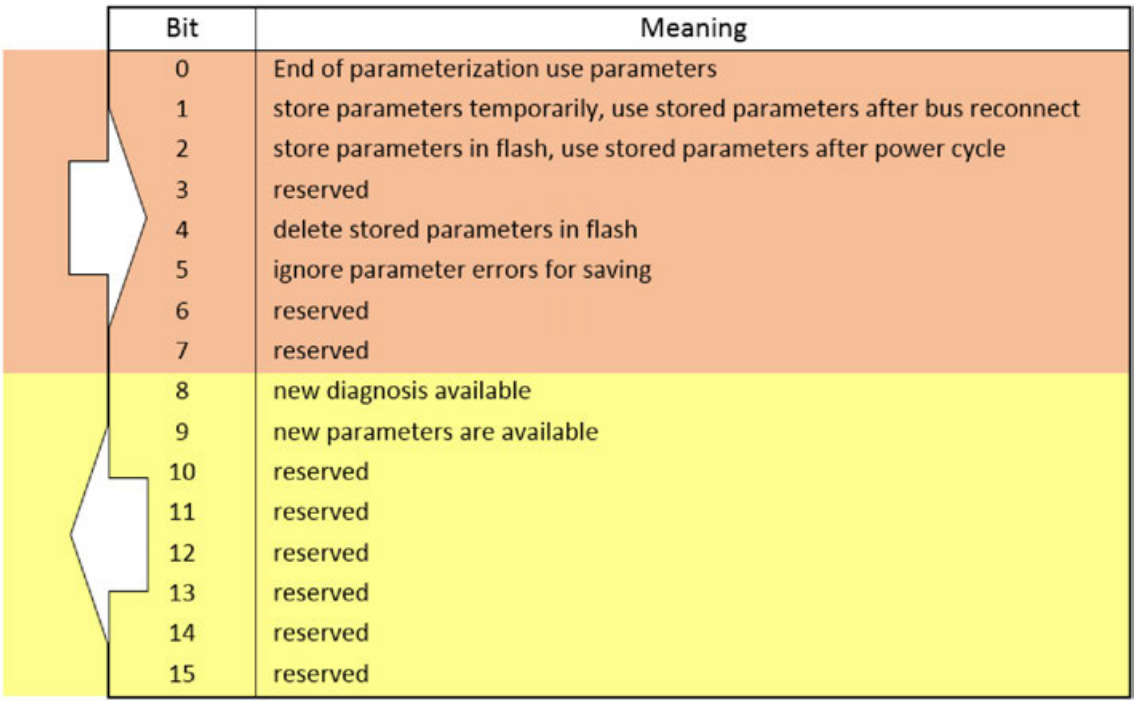
Parameter data (Acyclic data)

Register (hex)	Description	Readable by Modbus function code	Writeable by Modbus function code
3000	Parameters CI	3	6, 16
3080	Stored parameters CI	3	x
3100	Parameters 1. EXP	3	6, 16
3180	Stored parameters 10. EXP	3	x
...			
3A00	Parameters 10. EXP	3	6, 16
3A80	Stored parameters 10. EXP	3	x
3B00	controlword/statusword	3	6, 16

For each connected module the following parameter data are defined (the parameters are represented as ARRAY OF BYTE):

- Actual used parameter for each module
  In these sections the actual parameters are stored. This section is also used to write parameters to the module (For a description on how to parameterize see ↳ *Chapter 1.6.4.3.1.3.2 "Parameterization" on page 5670*).
- Stored parameters for each module
  If the module has stored nonvolatile parameters these can be read out using the corresponding registers.

The controlword/statusword is used to trigger a parameterization process. The single bits have the following meaning:



Bit	Meaning
0	End of parameterization use parameters
1	store parameters temporarily, use stored parameters after bus reconnect
2	store parameters in flash, use stored parameters after power cycle
3	reserved
4	delete stored parameters in flash
5	ignore parameter errors for saving
6	reserved
7	reserved
8	new diagnosis available
9	new parameters are available
10	reserved
11	reserved
12	reserved
13	reserved
14	reserved
15	reserved

The direction of the first 8 bits is client to server (master to slave).

The direction of the second 8 bits is server to client (slave to master). A description of the bits can be found in chapter behavior ↳ *Chapter 1.6.4.3.1.3.2 “Parameterization” on page 5670*.

The parameter register sections (actual and stored parameters) have the structure as explained in the of the corresponding module ↳ *Chapter 1.6.2 “Device specifications” on page 3785*.

Short description of the CI521-MODTCP parameters

Parameter	Single parameter index	Description	Additional Info
0		Module ID (high Byte)	Fixed, must be 16#1C
1		Module ID (low Byte)	Fixed, must be 16#E8
2		Ignore Module	Reserved, must be 0
3		Length of following parameter block	Fixed, must be 16#3F
4	0	Error LED / Failsafe	See ↳ *Chapter 1.6.2 “Device specifications” on page 3785*
5	1	Master IP Byte 0	IP Address for write restrictions (↳ *“Configurable write restriction” on page 5672*)
6		Master IP Byte 1

49	13	Voltage feedback monitoring	
50	14	Overvoltage monitoring	

Parameters of connected expansion modules

The parameters of the connected expansion modules are represented as byte array (the parameters valid for “CPU” in the ↳ *Chapter 1.6.2 “Device specifications” on page 3785* of the corresponding module are used):

Parameter	Description	Additional Info
0	Module ID (high byte)	Fixed, see ↳ *Chapter 1.6.2 “Device specifications” on page 3785* of corresponding module (the module ID of FBP is used)
1	Module ID (low byte)	Fixed, see of corresponding module (the module ID of FBP is used) ↳ *Chapter 1.6.2 “Device specifications” on page 3785*
2	Ignore module	Reserved must be 0
3	Length of following parameter block	Fixed, see ↳ *Chapter 1.6.2 “Device specifications” on page 3785* of corresponding module
4...	The rest of the parameter are described in the corresponding module	

Special functionality

This section contains special services like firmware update or single parameterization.

Register (hex)	Description	Readable by Modbus function code	Writeable by Modbus function code
4000	Firmware download	3	16
4100	Firmware download state	3	x
5000	Write single parameterization of CI	x	16
5100	Write single parameterization of 1. EXP	x	16
...			
5A00	Write single parameterization of 10. EXP	x	16
6000	Read single parameterization of CI	3	16
6100	Read single parameterization of 1. EXP	3	16
...			
6A00	Read single parameterization of 10. EXP	3	16

Behavior

IP address assignment

The delivery IP address of the CI52x-MODTCP is 192.168.0.xx (xx is the hardware address switch position of the device.

The devices support BOOTP, DHCP and fixed IP address setting (these can be set individual or together). If BOOTP and DHCP are enabled the following priority takes place:

- If DHCP configuration fails, the device will fall back to BOOTP.
- In case of a BOOTP failure, the fixed IP address will be used.

A new IP address (or changing of BOOTP and DHCP) can be set in two different ways:

- With the address switches of the corresponding module
- With the ↬ *Chapter 1.6.5.2.2.2.2 “Configuration of the IP settings with the IP configuration tool” on page 5816*

Using the address switches

With the address switches only the last byte of the IP address can be changed.

The IP address can only be set via the address switches in case of factory default or in case of the last byte of the IP address is set to zero with the ↬ *Chapter 1.6.5.2.2.2.2 “Configuration of the IP settings with the IP configuration tool” on page 5816*. The not allowed IP addresses are mapped as followed:

- Address switch position 255 is mapped to fixed IP 192.168.0.254 independent of other stored settings (by IP Configuration Tool).

  This is a backup so the module can always get a valid IP address and can be configured by the IP Configuration Tool.
- Address switch position 0 is mapped to last byte equal 1 and DHCP enabled.

Using the IP configuration tool

With the *Chapter 1.6.5.2.2.2.2 “Configuration of the IP settings with the IP configuration tool” on page 5816* a network scan can be executed, and the found devices can be assigned with new settings, e.g. enable BOOTP or DHCP and set a new fixed IP. If the last byte of the IP address of the CI52x-MODTCP devices is set to 0 with the IP Configuration Tool the address switch position is used instead (see *Chapter 1.6.4.3.1.3.1.1 “Using the address switches” on page 5669*).

Parameterization

The parameterization is done via the corresponding registers explained in the Modbus TCP registers *Chapter 1.6.4.3.1.2.4 “Parameter data (Acyclic data)” on page 5663*.

In addition to that the parameters can be directly transferred via Automation Builder (see documentation of Automation Builder for that).

There are two different parameter sections with different behavior.

Actual used parameters

After startup this section contains the following data:

- Default parameters (only module id and parameter length set all others zero) if no valid stored parameters are available (no or invalid parameters stored).
- Actual used / stored parameters if valid parameters are stored nonvolatile.

These parameters can be read out and changed by reading or writing of the corresponding registers, but will not be used automatically after writing them, the use of new written parameters has to be triggered by writing the parameter control word with the corresponding bits set (see below).

Stored parameters

This section always contains a copy of the nonvolatile stored parameters, if no parameters are stored nonvolatile this sections will be 0.

Controlword/statusword parameter

This parameter can be used to trigger and save new parameters.

The direction of the first 8 bit is client to server (master to slave). The direction of the second 8 bits is server to client (slave to master).

Bit	Description	
0	Use parameters / start parameterization	If this bit is set the CI Device starts the parameterization with the parameters in the actual parameters registers.
1	Store parameters volatile	If this bit is set the CI device will use the parameters temporarily, which means after a bus error detection and reconnection the parameters will be used again. **This bit should always be set.** **This bit is only evaluated when bit 0 is set.**
2	Store parameters nonvolatile	If this bit is set the CI device will store the parameters nonvolatile, which means after a power cycle the stored parameter data will be used again. **This bit is only evaluated when bit 0 is set.**
3	Reserved	-
4	Delete nonvolatile stored parameters	If this bit is set the CI device will delete its nonvolatile stored parameters. **This bit is only evaluated when bit 0 is set**.
5	Ignore parameter error for nonvolatile parameter storage	If this bit is set a parameter error during nonvolatile storage of parameters will be ignored, and the parameters will be stored. **This bit can only be set in combination with bit 0 and bit 2.**
6	Reserved	-
7	Reserved	-
8	New diagnosis available	The device will set this bit if new diagnosis data are available in the diagnosis data section.
9	New parameters available	The device will set this bit if new parameters are available in the actual parameter data section and these were not activated by setting bit 0 in the control word.
10...15	Reserved	-

Cyclic I/O data exchange

The I/O data can be exchanged cyclic by the master by reading, writing the corresponding registers.

I/O data exchange is only possible after successful parameterization of the device.

For writing of outputs **bus failure detection** can be activated by setting the corresponding parameter. This bus failure detection is described in the following chapter.

Bus failure detection

If the parameter "*"timeout"*" in the module parameters of the CI52x-MODTCP is set, the module will supervise the Modbus TCP "write telegrams".

After the first "write telegram" the bus will be supervised. If no new "write telegram" arrives at the CI52x-MODTCP within the configured time, the module will detect a bus failure and switch off its outputs or switch them to the configured failsafe state (see module parameter CI521 ↳ *Chapter 1.6.2.8.5.1.7 "Parameterization" on page 4884* and CI522 ↳ *Chapter 1.6.2.8.5.2.7 "Parameterization" on page 4914* for details).

Configurable write restriction

With the module parameters “Master IP”- “Master IP 7” it is possible to set write restrictions on the CI52x-MODTCP device.

If none of the parameters is set, all masters / clients in the network have read and write rights on the CI52x-MODTCP device and its connected expansion modules.

If at least one parameter is set only the configured masters / clients have write rights on the CI52x-MODTCP device.

All other masters / clients still have read access to the CI52x-MODTCP device.

Diagnosis behavior

Each diagnosis message signals if this error is coming or going , so it is possible to create a list in the master of actual pending diagnosis.

Diagnosis messages will be transferred again after a bus failure detection and reconnection.

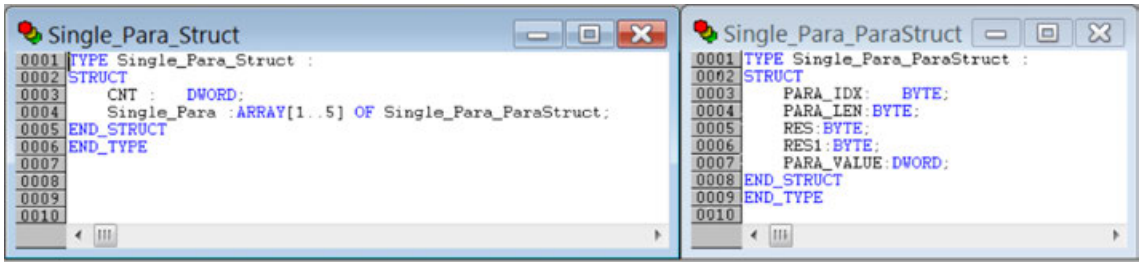
Diagnosis messages can be read out with function code 3,4,23. Function codes 3 and 4 can always read out diagnosis messages, function code 23 can only read out after successful parameterization of the device. See also table *Chapter 1.6.4.3.1.2.3.2 “Diagnosis data” on page 5659*.

Single parameterization

The single parameterization services can be used to read or write parameters during run time of device without the need of triggering a new parameterization process.

For indexes used for single parameterization services see parameter lists in section Modbus TCP registers of this document.

The read and write parameterization services are explained below, for each module (CI52x-MODTCP and connected expansion modules) a different section for read and write is defined see chapter Modbus TCP registers in this document). Both services are using the following data structure:



The length of the read / write service depends on the count of parameters that should be transferred (length = 4+ count*8).

Reading of single parameters

The read single parameterization works in two steps:

- Writing of a request list containing the indexes that should be read using the structure explained above.
  Only CNT and PARA_IDX has to be set.
  Up to 5 parameters can be requested with one telegram.
  The length of the write service depends on the count of parameters that should be transferred (length = 4+ count*8).
- Reading of the parameters list with the same length then the previous write request.
  If the internal reading process inside the CI52x-MODTCP device is done the data will be read out.
  If the internal reading process inside the CI52x-MODTCP device is not yet finished the read service will be rejected with Modbus TCP exception code 6 (device busy).

Writing of single parameters

For writing of single parameters only one step is necessary, the parameters are transferred with one write request using the structure described above.

The length of the write service depends on the count of parameters that should be transferred (length = 4+ count*8).

In case of write of single parameters the following values have to be set:

- CNT: number of parameters to be set
- And for each parameter:
  Parameter index
  Parameter length
  New parameter value

Written single parameters are not stored volatile and not stored nonvolatile. That means after a bus reconnection or power cycle the written parameters will be discarded.

Commissioning example

Set IP Address:

- The setting of the IP address is the first step to integrate the CI52x-MODTCP devices into a running system.
- The setting of the IP address of the CI52x-MODTCP devices is described in the chapter *Chapter 1.6.4.3.1.3.1 “IP address assignment” on page 5669* in this document.

Set Parameters (optional read parameters):

- The second step in configuring the CI52x-MODTCP devices is to set the module and channel parameters.
- A read of parameters is optional but can be used the get the module IDs and the parameter length.
- The reading and or writing of parameters is described in chapter *Chapter 1.6.4.3.1.3.2 “Parameterization” on page 5670*.

Set Control Word:

- After setting the parameter data these have to be activated by writing the control word.
- The meaning and usage of the control word is described in chapter *Chapter 1.6.4.3.1.3.2 “Parameterization” on page 5670*.

Exchange data:

- After setting and activating the parameters the CI52x-MODTCP device is ready for data exchange.
- The registers for data exchange are described in chapter *Chapter 1.6.4.3.1.2.3 “I/O / Process data and diagnosis section (Cyclic data)” on page 5656*.

Hot swap

With hot swap for AC500 and S500 it is possible to exchange expansion modules (with same type) during run time.

Preconditions for using hot swap

Information about preconditions for using hot swap see *“Hot swap” on page 5463*.

Compatibility of hot swap

	Modbus remote I/O
I/O module on TU5xx-H connected to I/O bus master	CI521-MODTCP or CI522-MODTCP
Required version of I/O bus master	Module index as of F0 Firmware as of V3.2.3
Fieldbus master when used as remote I/O with AC500 V2	Any AC500 V2 CPU as of PM57x with on-board Ethernet or CM597-ETH with MODTCP
When used as remote I/O on third party controller (PLC or DCS)	No limitation known

Hot swap behavior

The following table describes the behavior in case of I/O attached to communication interface module for Modbus TCP, CI521-MODTCP or CI522-MODTCP.

Hot Swap Behavior	Modbus TCP remote I/O
Start-up behavior with missing or damaged I/O module on hot swap terminal unit TU5xx-H	Remote I/O station is not starting As of device index F4 and Automation Builder Version 2.4.1 it is possible to configure the startup in case of missing modules on hot swap terminal units. If configured, the remote I/O station is starting up with missing or damaged I/O module, if the module is plugged later or replaced it will be automatically parameterized and I/O data will be exchanged. As the Automation Builder checks that all modules are available during configuration process, it is necessary that all I/O modules are available and in working order during configuration via Automation Builder. As the parameters are stored nonvolatile inside the CI52x devices later one the parameters have effect for power cycle or reconnection operations.
Start-up behavior with wrong I/O module type on any terminal unit	Remote I/O station is not starting
Diagnosis of presence of hot swap terminal unit	Information is available in Modbus registers of the communication interface module which can be accessed by the application program As of device index F4 and Automation Builder Version 2.4.1 it is possible to configure a list of required hot swap terminal units. If a required hot swap terminal unit is missing (normal one plugged) this will not prevent a normal operation but a diagnosis message will be generated for the corresponding slot.
Diagnosis of hot swap capability of I/O module mounted on hot swap terminal unit	Information can be obtained by reading Modbus registers in the communication interface module. Those Modbus registers contain: ● Diagnosis in case that a not hot-swappable I/O module is plugged on a hot swap terminal unit ● Diagnosis In case that in a mixed configuration with at least one hot swap terminal unit an I/O module, that must not be used in a hot swap configuration, is mounted on any terminal unit of the configuration ● Production data and version index of the modules
Diagnosis while hot swap module is pulled or module (mounted on hot swap terminal unit) has stopped working	Diagnosis is available in Modbus registers in the communication interface module
Input state in process image of controller while module is pulled or module is not operational	Input = ZERO
Diagnosis after plugging the I/O module on the hot swap terminal unit	Diagnose "diagnosis gone" is available in Modbus registers in the communication interface module

System behavior

If an expansion module is removed or defective during run time, the input data of this module will be set to “0” and the module state will be set to the corresponding value (see *Chapter 1.6.4.3.1.2.3 “I/O / Process data and diagnosis section (Cyclic data)” on page 5656*). A diagnosis message will be created in that case (see hardware description of *Chapter 1.6.2.8.5.1 “CI521-MODTCP” on page 4864* / *Chapter 1.6.2.8.5.2 “CI522-MODTCP” on page 4904* for diagnosis messages).

In case a module is replaced, the new module will automatically be parameterized with the last parameters of the removed module (if single parameters were written to the previously removed module, this parameters will be ignored).

During pulling or plugging of a certain module, all other module will continue to operate with one limitation: The reaction time of modules connected to the right of the affected module will be bigger in that case (up to 50 ms).

If the bus failure detection is active for CI52x and failsafe is configured (see *Chapter 1.6.4.3.1.3.3 “Cyclic I/O data exchange” on page 5671*) the following behavior applies if a module is removed and replugged during failsafe condition:

- Last value configured for output:
  - After a bus failure is detected, failsafe will be activated and the output will remain at its last value.
  - If the module is removed and plugged again, the output will remain off, and not be kept its last value, as the last value of the new module is “0” in that case.
- Substitute value configured for output:
  - After a bus failure is detected, failsafe will be activated and the output will be according to the configured substitute value.
  - If the module is removed and plugged again now, the output will be set according to the configured substitute value again.
- Substitute value for x seconds configured for output:
  - After a bus failure is detected, failsafe will be activated and the output will be according to the configured substitute value for the configured time.
  - If the module is removed and plugged again now, the output will be set according to the configured substitute value again, and the configured time starts again.

Mandatory rules for hot swapping

Mandatory rules for hot swapping:

- Between two pull and / or plug operations of I/O modules a pause of at least 1 second must be observed.
  - That means if a module is pulled or plugged there has to be at least a break of 1 second before the next module is pulled or plugged.
- At boot up of CI52x all configured expansion modules have to be physically available.
  - Start up with missing modules is not supported.
- In the application program it is possible to detect if a hot swap terminal unit is mounted in a specific position on the I/O bus. The information is available in the common device information registers. These can be accessed when the version of the communication interface module supports hot swap.
  - This has to be checked by application:

    Best way for checking if a hot swap terminal unit is available or not, is reading out the common device information registers (see *Chapter 1.6.4.3.1.2.2 “Information data section (Acyclic data)” on page 5653*). If the CI52x rejects this read out the CI52x doesn’t support hot swap at all.

1.6.4.3.2 PROFIBUS communication interface module

Hot swap

With hot swap for AC500 and S500 it is possible to exchange expansion modules (with same type) during run time.

Preconditions for using hot swap

Information about preconditions for using hot swap see *“Hot swap” on page 5463*.

Compatibility of hot swap

	PROFIBUS remote I/O
I/O module on TU5xx-H connected to I/O bus master	CI541-DP or CI542-DP
Required version of I/O bus master	Module index as of F0 Firmware as of V3.2.12
Fieldbus master when used as remote I/O with AC500 V2	Any AC500 V2 CPU as of PM57x with CM592-DP
When used as remote I/O on third party controller (PLC or DCS)	No limitation known

Hot swap behavior

The following table describes the behavior in case of I/O attached to communication interface module for PROFIBUS, CI541-DP or CI542-DP.

Hot Swap Behavior	PROFIBUS remote I/O with AC500 V2 CPU and CM592-DP as master	PROFIBUS remote I/O with third party controller (GSD used for configuration)
Start-up behavior with missing or damaged I/O module on hot swap terminal unit TU5xx-H a	Remote I/O station is not starting	Remote I/O station is not starting As of device index F1 and Automation Builder Version 2.5.0 it is possible to configure the startup in case of missing modules on hot swap terminal units. If configured, the remote I/O station is starting up with missing or damaged I/O module, if the module is plugged later or replaced it will be automatically parameterized and I/O data will be exchanged.
Start-up behavior with wrong I/O module type on any terminal unit	Remote I/O station is not starting	Remote I/O station is not starting
Diagnosis of presence of hot swap terminal unit	Information is available via acyclic services	Information is available via acyclic services As of device index F1 and Automation Builder Version 2.5.0 it is possible to configure a list of required hot swap terminal units. If a required hot swap terminal unit is missing (normal one plugged) this will not prevent a normal operation but a diagnosis message will be generated for the corresponding slot.

Hot Swap Behavior	PROFIBUS remote I/O with AC500 V2 CPU and CM592-DP as master	PROFIBUS remote I/O with third party controller (GSD used for configuration)
Diagnosis of hot swap capability of I/O module mounted on hot swap terminal unit	Diagnosis is transmitted as vendor specific diagnosis and can be accessed with the function block *Chapter 1.5.4.26.1.5 “DPM_SLV_DIAG” on page 1765*: ● Diagnosis in case that a not hot-swappable I/O module is plugged on a hot swap terminal unit ● Diagnosis in case that in a mixed configuration with at least one hot swap terminal unit an I/O module, that must not be used in a hot swap configuration, is mounted on any terminal unit of the configuration Production data and version index of the modules is accessible via acyclic services	Diagnosis is transmitted as vendor specific diagnosis: ● Diagnosis in case that a not hot-swappable I/O module is plugged on a hot swap terminal unit ● Diagnosis in case that in a mixed configuration with at least one hot swap terminal unit an I/O module, that must not be used in a hot swap configuration, is mounted on any terminal unit of the configuration Production data and version index of the modules is accessible via acyclic services
Diagnosis while hot swap module is pulled or module (mounted on hot swap terminal unit) has stopped working	Diagnosis is transmitted as vendor specific diagnosis "diagnosis gone" and can be accessed with the function block *Chapter 1.5.4.26.1.5 “DPM_SLV_DIAG” on page 1765*	Diagnosis is transmitted as vendor specific diagnosis.
Input state in process image of controller while module is pulled or module is not operational	Input = ZERO	Input = ZERO
Diagnosis after plugging of the I/O module on the hot swap terminal unit	Diagnosis is transmitted as vendor specific diagnosis "diagnosis gone" and can be accessed with the function block *Chapter 1.5.4.26.1.5 “DPM_SLV_DIAG” on page 1765*	Diagnosis is transmitted as vendor specific diagnosis "diagnosis gone"

System behavior

If an expansion module is removed or defective during run time, the input data of this module will be set to “0” and the module state will be set to the corresponding value. A diagnosis message will be created in that case (see hardware description of *Chapter 1.6.2.8.6.1 “CI541-DP” on page 4930* / *Chapter 1.6.2.8.6.2 “CI542-DP” on page 4969* for diagnosis messages).

In case a module is replaced, the new module will automatically be parameterized with the last parameters of the removed module (if single parameters were written to the previously removed module, this parameters will be ignored).

During pulling or plugging of a certain module, all other modules will continue to operate with one limitation: The reaction time of modules connected to the right of the affected module will be bigger in that case (up to 50 ms).

If the bus failure detection is active for CI54x and failsafe is configured the following behavior applies if a module is removed and replugged during failsafe condition:

- Last value configured for output:
  - After a bus failure is detected, failsafe will be activated and the output will remain at its last value.
  - If the module is removed and plugged again, the output will remain off, and not be kept its last value, as the last value of the new module is “0” in that case.
- Substitute value configured for output:
  - After a bus failure is detected, failsafe will be activated and the output will be according to the configured substitute value.
  - If the module is removed and plugged again now, the output will be set according to the configured substitute value again.
- Substitute value for x seconds configured for output:
  - After a bus failure is detected, failsafe will be activated and the output will be according to the configured substitute value for the configured time.
  - If the module is removed and plugged again now, the output will be set according to the configured substitute value again, and the configured time starts again.

Mandatory rules for hot swapping

Mandatory rules for hot swapping:

- Between two pull and / or plug operations of I/O modules a pause of at least 1 second must be observed.
  - That means if a module is pulled or plugged there has to be at least a break of 1 second before the next module is pulled or plugged.
- At boot up of CI54x all configured expansion modules have to be physically available.
  - Start up with missing modules is not supported.
- In the application program it is possible to detect if a hot swap terminal unit is mounted in a specific position on the I/O bus. The information is available via acyclic read requests. These can be accessed when the version of the communication interface module supports hot swap.
  - This has to be checked by application:

    Best way for checking if a hot swap terminal unit is available or not, is reading out the module info. If the CI54x rejects this read out the CI54x doesn’t support hot swap at all.

1.6.4.3.3 PROFINET communication interface module

Hot swap

With hot swap for AC500 and S500 it is possible to exchange expansion modules (with same type) during run time.

Preconditions for using hot swap

Information about preconditions for using hot swap see *“Hot swap” on page 5463*.

Compatibility of hot swap

	PROFINET remote I/O
I/O module on TU5xx-H connected to I/O bus master	CI501-PNIO or CI502-PNIO
Required version of I/O bus master	Module index as of F0 Firmware as of V3.2.10
Fieldbus master when used as remote I/O with AC500 V2	Any AC500 V2 CPU as of PM57x with CM579-PNIO
When used as remote I/O on third party controller (PLC or DCS)	Note: alarms must be acknowledged by fieldbus master. GSDML as of version GSDML-V2.3-ABB-S500-CI501-PNIO-20180822.xml or GSDML-V2.3-ABB-S500-CI502-PNIO-20180822.xml needed for full scope of vendor specific diagnosis.

Hot swap behavior

The following table describes the behavior in case of I/O attached to communication interface module for PROFINET, CI501-PNIO or CI502-PNIO.

Hot Swap Behavior	PROFINET remote I/O with AC500 V2 CPU and CM579-PNIO as master	PROFINET remote I/O with third party controller (GSDML used for configuration)
Start-up behavior with missing or damaged I/O module on hot swap terminal unit TU5xx-H	Remote I/O station is not starting	Remote I/O station is not starting As of device index F1 and Automation Builder Version 2.4.1 it is possible to configure the startup in case of missing modules on hot swap terminal units. If configured, the remote I/O station is starting up with missing or damaged I/O module, if the module is plugged later or replaced it will be automatically parameterized and I/O data will be exchanged.
Start-up behavior with wrong I/O module type on any terminal unit	Remote I/O station is not starting	Remote I/O station is not starting
Diagnosis of presence of hot swap terminal unit	Information is available either: ● via acyclic services or ● as cyclic state information in the process image Requires Automation Builder version as of 2.2.	Information is available either: ● via acyclic services or ● as cyclic state information in the process image As of device index F1 and Automation Builder Version 2.4.1 it is possible to configure a list of required hot swap terminal units. If a required hot swap terminal unit is missing (normal one plugged) this will not prevent a normal operation but a diagnosis message will be generated for the corresponding slot.

Hot Swap Behavior	PROFINET remote I/O with AC500 V2 CPU and CM579-PNIO as master	PROFINET remote I/O with third party controller (GSDML used for configuration)
Diagnosis of hot swap capability of I/O module mounted on hot swap terminal unit	Diagnosis is transmitted as alarm and can be accessed with the function block *Chapter 1.5.4.27.1.1 “PNIO_DEV_ALARM” on page 1794*: ● Diagnosis in case that a not hot-swappable I/O module is plugged on a hot swap terminal unit ● Diagnosis in case that in a mixed configuration with at least one hot swap terminal unit an I/O module, that must not be used in a hot swap configuration, is mounted on any terminal unit of the configuration Production data and version index of the modules is accessible via acyclic services	Diagnosis is transmitted as vendor specific PROFINET channel diagnosis: ● Diagnosis in case that a not hot-swappable I/O module is plugged on a hot swap terminal unit ● Diagnosis in case that in a mixed configuration with at least one hot swap terminal unit an I/O module, that must not be used in a hot swap configuration, is mounted on any terminal unit of the configuration Production data and version index of the modules is accessible via acyclic services
Diagnosis while hot swap module is pulled or module (mounted on hot swap terminal unit) has stopped working	Diagnosis is transmitted as alarm and can be accessed with the function block *Chapter 1.5.4.27.1.1 “PNIO_DEV_ALARM” on page 1794*. PROFINET standard "pull alarm" is generated and must be acknowledged with the function block *Chapter 1.5.4.27.1.1 “PNIO_DEV_ALARM” on page 1794*	PROFINET channel diagnosis is generated together with standard "pull alarm" which must be acknowledged
Input state in process image of controller while module is pulled or module is not operational	Input = ZERO	Input = ZERO In addition a standard PROFINET state information is transmitted saying "inputs not valid"
Diagnosis after plugging of the I/O module on the hot swap terminal unit	PROFINET standard "plug alarm" is generated and must be acknowledged with the function block *Chapter 1.5.4.27.1.1 “PNIO_DEV_ALARM” on page 1794*	PROFINET channel diagnosis is generated together with standard "plug alarm" which must be acknowledged

System behavior

If an expansion module is removed or defective during run time, the input data of this module will be set to “0” and the module state will be set to the corresponding value. A diagnosis message will be created in that case (see hardware description of *Chapter 1.6.2.8.7.2 “CI501-PNIO” on page 4995* / *Chapter 1.6.2.8.7.3 “CI502-PNIO” on page 5035* for diagnosis messages).

In case a module is replaced, the new module will automatically be parameterized with the last parameters of the removed module (if single parameters were written to the previously removed module, this parameters will be ignored).

During pulling or plugging of a certain module, all other module will continue to operate with one limitation: The reaction time of modules connected to the right of the affected module will be bigger in that case (up to 50 ms).

If the bus failure detection is active for CI50x and failsafe is configured the following behavior applies if a module is removed and replugged during failsafe condition:

- Last value configured for output:
  - After a bus failure is detected, failsafe will be activated and the output will remain at its last value.
  - If the module is removed and plugged again, the output will remain off, and not be kept its last value, as the last value of the new module is “0” in that case.
- Substitute value configured for output:
  - After a bus failure is detected, failsafe will be activated and the output will be according to the configured substitute value.
  - If the module is removed and plugged again now, the output will be set according to the configured substitute value again.
- Substitute value for x seconds configured for output:
  - After a bus failure is detected, failsafe will be activated and the output will be according to the configured substitute value for the configured time.
  - If the module is removed and plugged again now, the output will be set according to the configured substitute value again, and the configured time starts again.

Mandatory rules for hot swapping

Mandatory rules for hot swapping:

- Between two pull and / or plug operations of I/O modules a pause of at least 1 second must be observed.
  - That means if a module is pulled or plugged there has to be at least a break of 1 second before the next module is pulled or plugged.
- At boot up of CI50x all configured expansion modules have to be physically available.
  - Start up with missing modules is not supported.
- In the application program it is possible to detect if a hot swap terminal unit is mounted in a specific position on the I/O bus. The information is available in the process data area or can be read out via acyclic read. These can be accessed when the version of the communication interface module supports hot swap.
  - This has to be checked by application:

    Best way for checking if a hot swap terminal unit is available or not, is checking the corresponding information inside the process image.

1.6.4.4 System technology of the AC500 function modules

1.6.4.4.1 DC541-CM interrupt and counter module

Cycle time modification

Function blocks for the most module functions of DC541-CM are contained in the library DC541_AC500_V11.lib. The library is automatically included into the project and is described in detail in the library documentation *Chapter 1.5.4.11 “DC541 library” on page 1103*.

Access to the channels configured as normal inputs and outputs is performed using the function block Chapter 1.5.4.11.1.1.8 “DC541_IO” on page 1139.

The module's cycle time is set automatically depending on its channel configuration. The following values are possible for the cycle time:

CYCLE

Data type	Default value	Range	Unit
WORD	-	-	µs

CYCLE (cycle time) output displays the cycle time of the device. The cycle time is set during the device configuration and can have the following values depending on the channel configuration:

Parameter		Description	Value
IO device			50 µs
Counting device		1-2 functions	50 µs
		3-4 functions	100 µs
		5-8 functions	200 µs
"Functions"			
	PWM	Pulse-width modulator	
	FREQ	Time and frequency measurement	
	FREQ_OUT	Frequency output	
	32BIT_CNT	32-bit counter	
	FWD_CNT	32-bit count up counter	
	LIMIT	Limit value monitoring for the 32-bit counter	

The used cycle time can be read at output CYCLE of the block *Chapter 1.5.4.11.1.1.6 “DC541_GET_CFG” on page 1132*.

The following table shows an overview of all possible combinations.

Configured as	Function/ can be con- figured for channel	C0	C1	C2	C3	C4 to C7	Max. number of channels for this function	Remark and reference to alternative combinations (a and b)
Mode 1: Interrupt function; mutually exclusive with mode 2 (counting functions).								
Interrupt	Dig. input	1	1	1	1	4	8	Each channel can be configured individually as interrupt input or output.
	Interrupt inp.	1	1	1	1	4	8	
	Dig. output	1	1	1	1	4	8	
Mode 2: Counting functions and multifunctional I/Os; mutually exclusive with mode 1 (interrupt functions).								
Multi-function I/Os, PWM, counters, time and frequency measuring	Dig. input	1	1	1	1	4	8	Normal input
	Dig. output	1	1	1	1	4	8	Normal output
	PWM, resolution 10 kHz	1	1	1	1	4	8	Outputs a pulsed signal with an adjustable on-off ratio.
	Frequency output, resolution 2.5 kHz	1	1	1	1	4	8	Outputs an adjustable frequency (endless output or output of a specified number of pulses).

Config-ured as	Func-tion/ can be con- fig-ured for channel	C0	C1	C2	C3	C4 to C7	Max. number of chan-nels for this function	Remark and ref-erence to alter-native combi-nations (a and b)
	Up/down counter, 50 kHz	1	1	OK *1)	OK *1)	OK *1)	2	*1) a) Both channels (0 and 1) config-ured as 50 kHz counter => Chan-nels 2 to 7 can be config-ured as digital I/Os. b) Only one channel (0 or 1) config-ured as 50 kHz counter => Second channel can be config-ured as counter < 50 kHz or for time/ fre-quency meas-urement with a max. resolu-tion of 200 µs. The remainin g chan-nels (2 to 7) can be con-figured as digital I/Os.

Config-ured as	Func-tion/ can be con- fig-ured for channel	C0	C1	C2	C3	C4 to C7	Max. number of chan-nels for this function	Remark and ref-erence to alter-native combi-nations (a and b)

Configured as	Function/ can be con- figured for channel	C0	C1	C2	C3	C4 to C7	Max. number of channels for this function	Remark and reference to alternative combinations (a and b)
High-speed counter	Up/down 32-bit counter, 50 kHz max.	Channels 0 to 3: Track A, track B, zero track, touch trigger				OK *6)	1	For connection of an incremental transmitter. For signals up to 50 kHz. This frequency corresponds to a motor with a rotational speed of 3000 rpm. The counter always uses the first 4 channels (0 to 3). *6) The remaining channels (4 to 7) can be configured as limit values, as 5 kHz counters, for time/ frequency measurement with a resolution of 200 µs or as digital I/Os.

Config-ured as	Func-tion/ can be con- fig-ured for channel	C0	C1	C2	C3	C4 to C7	Max. number of chan-nels for this function	Remark and ref-erence to alter-native combi-nations (a and b)
	Axis of rotation (endless counting)	1				OK *7)	1	"End-less" for-ward counting. An over-flow occurs corre-sponding to the 32-bit value. *7) The remainin g chan-nels can be con-figured as limit values, as 5 kHz coun-ters, for time/ fre-quency meas-urement with a resolu-tion of 200 µs or as digital I/Os.

Config-ured as	Func-tion/ can be con- fig-ured for channel	C0	C1	C2	C3	C4 to C7	Max. number of chan-nels for this function	Remark and ref-erence to alter-native combi-nations (a and b)
	32-bit counter incl. sign	1				OK *8)	1	*8) The remainin g chan-nels can be con-figured as limit values, as 5 kHz coun-ters, for time/ fre-quency meas-urement with a resolu-tion of 200 µs or as digital I/Os.
	Limit values for 32-bit counter	OK *9)				1	1	Various counting values of the 32-bit counter can be dis-played directly via these outputs. *9) In this case, the channels 0 to 3 are used as 32-bit coun-ters.

Usage as interrupt I/O module

Creating an interrupt task for the interrupt inputs

If one or more channels of DC541-CM are configured as interrupt inputs, a corresponding interrupt task has to be created to enable the processing of the interrupt(s).

For this purpose, a new task has to be added in the task configuration of Automation Builder:

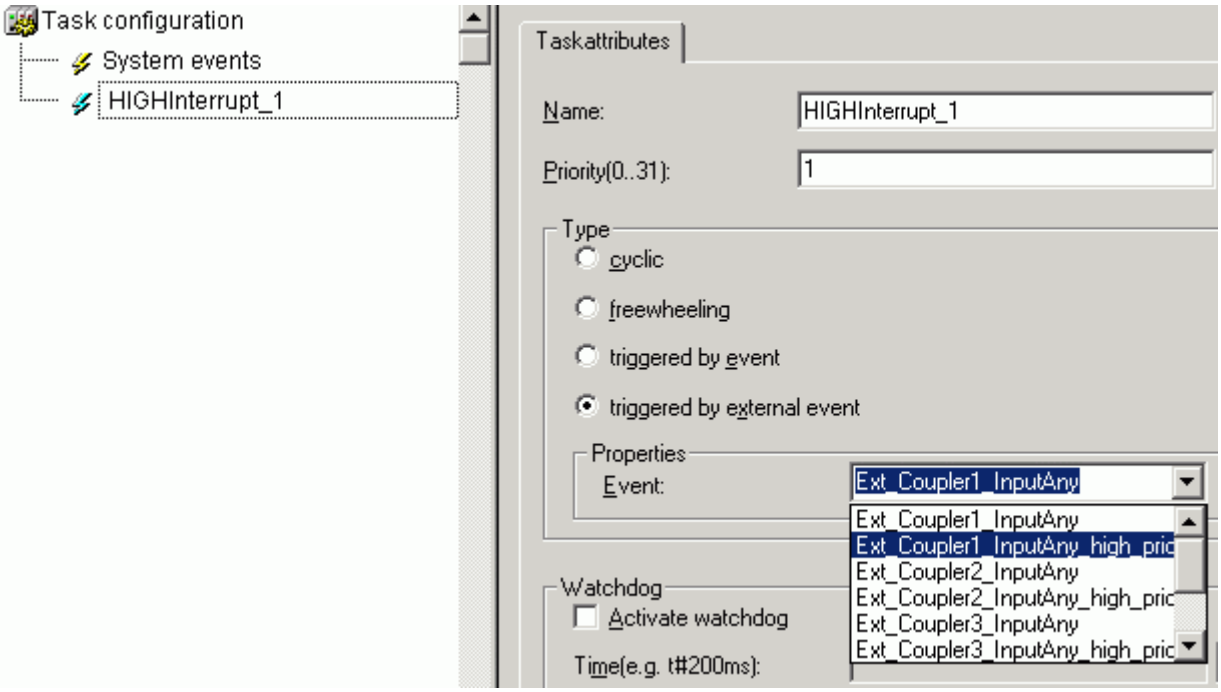
- Enter the task name
- Set the task type to "triggered by external event"
- Specify the event that triggers the task

For each Communication Module slot, two types of interrupt tasks are available in the Event list box:

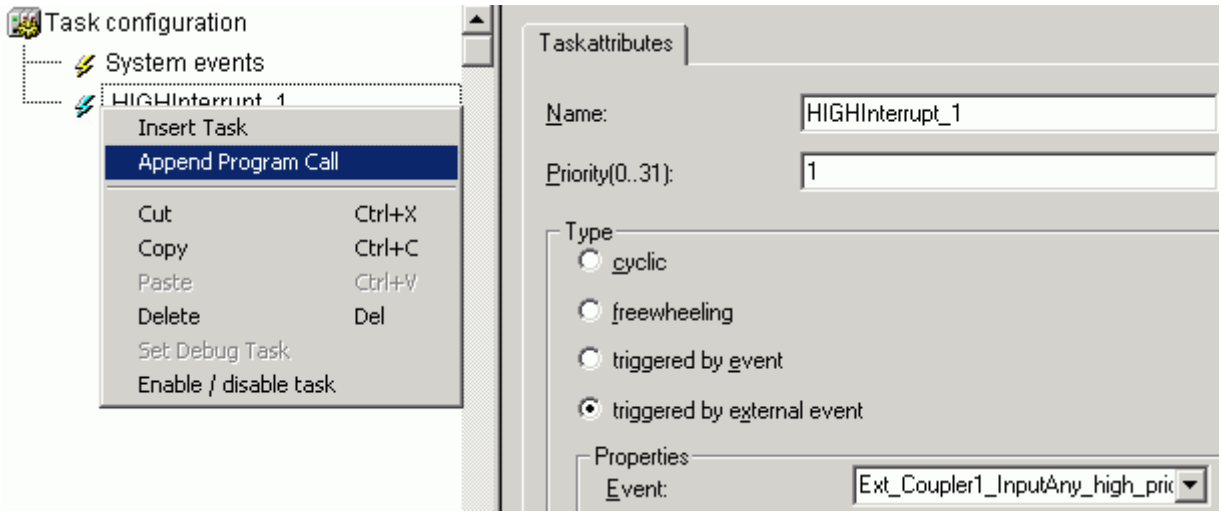
- Ext_Communication ModuleX_InputAny:
  The task is triggered by any interrupt from Communication Module slot X with the priority specified in the Priority field (0...31).
- Ext_Communication ModuleX_InpuAny_high_prio:
  The task is triggered by any interrupt from Communication Module slot X with highest priority, i.e. with a priority higher than the max. adjustable "0" and higher than the priority of the communication task. In this case, the priority (0...31) specified in the Priority field is without any significance.

> *If the interrupt task is started with highest priority, the program execution time must not be longer than approx. 400 µs. Otherwise online access is no longer possible.*

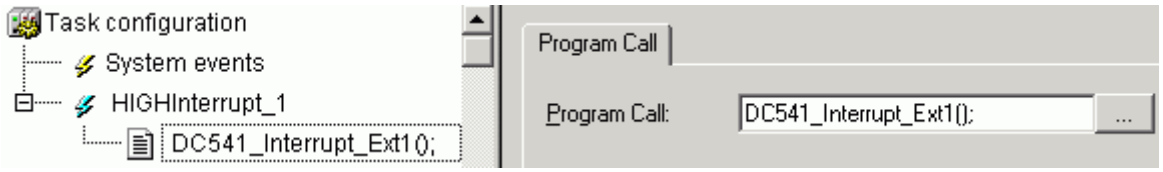
In the example below, the task is named HIGHInterrupt_1, meaning that it is a high-priority interrupt from Communication Module slot 1. The task type is "external event triggered" and the event to trigger the task is "Ext_Communication Module1_InputAny_high_priority".



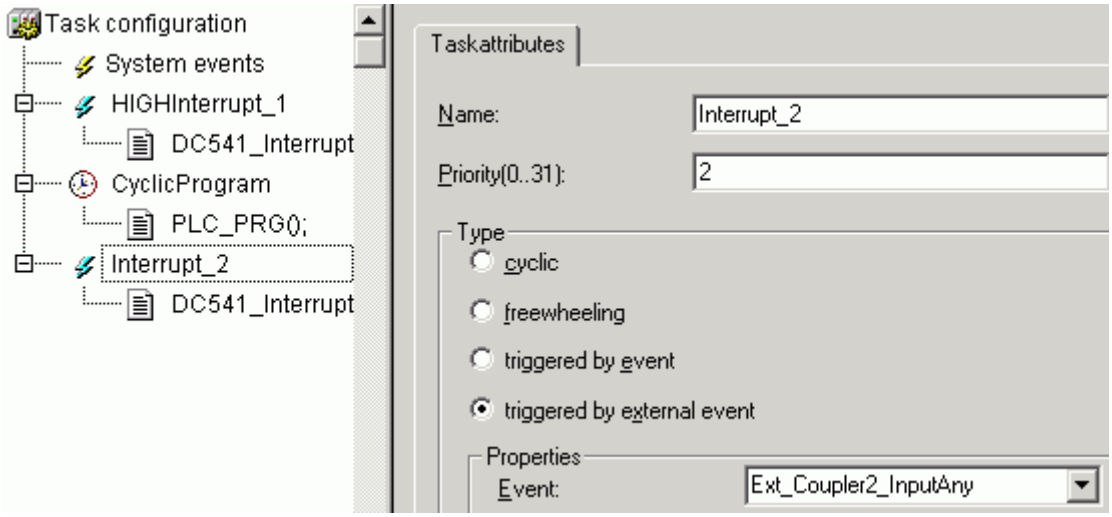
Like for all other tasks, a program call has to be assigned to the task.



In the example, the program DC541_Interrupt_Ext1() shall be started with any interrupt from Communication Module slot 1.



The task configuration for an AC500 equipped with two DC541-CM modules inserted in the Communication Module slots 1 and 2 and containing one cyclically running "background program" PLC_PRG could for example look as follows. Here, an interrupt from slot 1 should start the program DC541_Interrupt_Ext1 with high priority, an interrupt from slot 2 should start the program DC541_Interrupt_Ext2 with priority 2:



Structure of the interrupt program

The following blocks contained in the library DC541_AC500_V11.lib are available for the interrupt program:

- ↳ *Chapter 1.5.4.11.1.1.7 “DC541_INT_IN” on page 1136* Determination of the interrupt initiating source
- ↳ *Chapter 1.5.4.11.1.1.8 “DC541_IO” on page 1139* Reading and writing of channels C0...C7

It is possible to start one interrupt task per Communication Module slot. This task can be started by any channel (C0...C7) configured as interrupt input. Therefore, it is necessary for the interrupt program to differentiate which channel(s) triggered the interrupt in order to enable the processing of the corresponding actions.

The information whether a channel (C0...C7) has triggered an interrupt since the last call of the block is provided by the outputs IN0...IN7 of the block *Chapter 1.5.4.11.1.1.7 “DC541_INT_IN” on page 1136*. This is why this block always has to be called at the beginning of the interrupt program, if more than one channel is configured as interrupt input.

The access to the channels configured as inputs or outputs is done using the block DC541_IO. Therefore, it makes sense to call this block at the beginning of the interrupt program in order to read the inputs and at the end of the interrupt program in order to write the outputs.

--Configuration example: DC541-CM used as interrupt I/O device

Hardware configuration

The example control system shall have the following configuration:

- Terminal base TB521 (two Communication Module slots)
- DC541-CM in Communication Module slot 1 (first slot on the left of the CPU)
- PM591-ETH
- I/O module DC532 on the I/O Bus

Wiring

The channels are connected as follows:

DC532 / C16 ---------- DC541 / C0

DC532 / C17 ---------- DC541 / C1

DC532 / C18 ---------- DC541 / C2

DC532 / C19 ---------- DC541 / C3

DC532 / C20 ---------- DC541 / C4

DC532 / C21 ---------- DC541 / C5

PLC configuration

- DC541-CM in slot 1, operating mode "IO mode"

- Configuration:	Channels	C0...C4	Interrupt input
	Channel	C5	Input
	Channels	C6...C7	Outputs

- Specification of the Ethernet communication module as internal communication module (if available)
- DC532 on the I/O bus

Task configuration

- Task 1: Cyclic program / Prio = 10 / Interval = t#10ms / PLC_PRG
- Task 2: HIGHInterrupt_1 / DC541_Interrupt_Ext1()

DC541_Interrupt_Ext1()

The interrupt program should fulfill the following functionality:

- Counting of all interrupts
- Counting of the interrupts per input
- Calculation of the interrupt frequency in [Int/s]
- Reporting of the number of interrupts per input
- Input C4: Resetting the counters
- Input C5: Input

- Output C6: Status of input C5
- Output C7: Toggle output

The declaration part of the program looks as follows:

PROGRAM DC541_Interrupt_Ext1			
VAR			
	dwIntCount	: DWORD;	(* count all interrupts *)
	dwIntCountOld	: DWORD;	(* start value for next measure *)
	tActual	: TIME;	(* systemtick in ms *)
	tStart	: TIME;	(* start value of systemtick for next calculation *)
	dwUsedTime	: DWORD;	(* time for 1000 interrupts in ms *)
	dwFrequenz	: DWORD;	(* interrupt frequency in [Int / sec] *)
	DC541_IntSource	: DC541_INT_IN;	(* instance FB: read interrupt source *)
	DC541_Ios	: DC541_IO;	(* instance FB: read/ write inputs/outputs *)
	dwCount_InX	: ARRAY[0..cbyDC541_IntInp] OF DWORD;	(* count interrupts of In0..In3 *)
	dwCount_InXOld	: ARRAY[0..cbyDC541_IntInp] OF DWORD;	(* start value for next 1000 interrupts *)
	dwIntHisto	: ARRAY[0..cbyDC541_IntInp, 0..cbyDC541_MaxHist] OF DWORD;	(* histo data C0...C3 *)
	wIndex	: WORD;	(* index for histo data *)
	byInd	: BYTE;	(* loop index *)
END_VAR			
VAR CONSTANT			
	cbyDC541_SLOT	: BYTE := 1;	(* SLOT number of DC541 *)
	cbyDC541_MaxHist	: BYTE := 9;	(* max number of histo entries *)
	cbyDC541_IntInp	: BYTE := 4;	(* number of interrupt inputs -1 *)
END_VAR			

The instruction part looks as follows:

At the beginning, the interrupts are counted in dwIntCount. After each 1000 interrupts, a calculation of the frequency is performed and the counting values for the interrupts per input are stored.

dwIntCount := dwIntCount + 1;		(* count all interrupts *)
IF dwIntCount - dwIntCountOld >= 1000 THEN		(* after 1000 interrupts -> calculate frequency *)
	dwIntCountOld := dwIntCount;	(* save dwIntCount for next call *)
	tActual := TIME();	
	dwUsedTime := TIME_TO_DWORD(tActual - tStart);	(* duration in ms for 1000 interrupts *)
	dwFrequenz := 1000000 / dwUsedTime;	(* [Interrupt / sec] 1000 Int * 1000 ms/sec *)
	tStart := tActual;	(* for next measure *)
	dwIntHisto[0,wIndex] := dwCount_InX[0] - dwCount_InXOld[0];	(* IN0 interrupts of last 1000 *)
	dwCount_InXOld[0] :=dwCount_InX[0];	(* start value for next measure *)
	dwIntHisto[1,wIndex] := dwCount_InX[1] - dwCount_InXOld[1];	(* IN1 interrupts of last 1000 *)
	dwCount_InXOld[1] :=dwCount_InX[1];	(* start value for next measure *)
	dwIntHisto[2,wIndex] := dwCount_InX[2] - dwCount_InXOld[2];	(* IN2 interrupts of last 1000 *)
	dwCount_InXOld[2] :=dwCount_InX[2];	(* start value for next measure *)
	dwIntHisto[3,wIndex] := dwCount_InX[3] - dwCount_InXOld[3];	(* IN3 interrupts of last 1000 *)
	dwCount_InXOld[3] :=dwCount_InX[3];	(* start value for next measure *)
	wIndex := wIndex + 1;	(* increase index *)
	IF wIndex > cbyDC541_MaxHist THEN wIndex := 0; END_IF;	(* reset index, if >1000 *)
END_IF; (* 1000 Interrupts *)		

After this, the block DC541_INT_IN is called to identify the interrupt source and then the interrupt counters of the channels are updated depending on the outputs of this block.

```
(* Read interrupt source --> if output  = TRUE --> interrupt since last call *)
DC541_IntSource(EN := TRUE, SLOT := cbyDC541_SLOT);
(* count the interrupts for each interrupt input C0..C3 *)
dwCount_InX[0] := dwCount_InX[0] + BOOL_TO_DWORD(DC541_IntSource.IN0);
dwCount_InX[1] := dwCount_InX[1] + BOOL_TO_DWORD(DC541_IntSource.IN1);
dwCount_InX[2] := dwCount_InX[2] + BOOL_TO_DWORD(DC541_IntSource.IN2);
dwCount_InX[3] := dwCount_InX[3] + BOOL_TO_DWORD(DC541_IntSource.IN3);
dwCount_InX[4] := dwCount_InX[4] + BOOL_TO_DWORD(DC541_IntSource.IN4);
```

In case of an interrupt on channel 4, the counters are reset.

IF DC541_IntSource.IN4 THEN		(* Input channel C4 = TRUE *)
	dwIntCount := dwIntCoun-tOld := 0;	(* reset count all interrupts *)
	FOR byInd := 0 TO cbyDC541_IntInp-1 DO	(* reset channel interrupt counters C0..C3 *)
	dwCount_InX[byInd] := dwCount_InXOld[byInd] := 0;	
	END_FOR; (* byInd *)	
	wIndex := 0;	(* start historical data from 0 *)
END_IF; (* C4 = TRUE *)		

At the end, the static inputs and outputs are processed, i.e.:

- reading the inputs,
- execution of actions
- writing the outputs.

(* Read inputs of DC541 *)		
DC541_IOs(EN := TRUE, SLOT := cbyDC541_SLOT);		
DC541_IOs.OUT6 := DC541_IOs.IN5;	(* C6 := state of input channel C5 *)	
DC541_IOs.OUT7 := NOT DC541_IOs.OUT7;	(* toggle channel C7 *)	
(* Write outputs to DC541*)		
DC541_IOs(EN := TRUE, SLOT := cbyDC541_SLOT);		

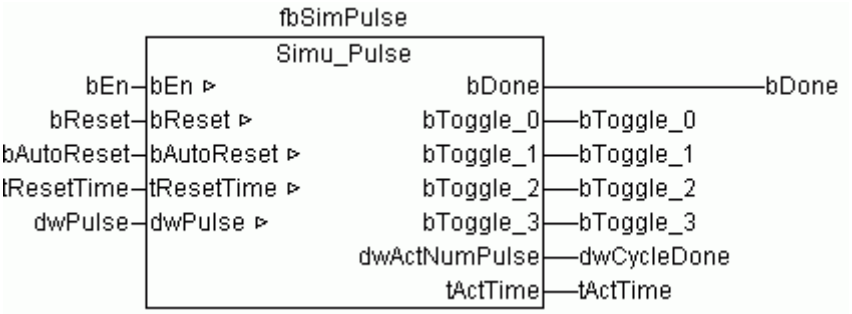
Purpose of the cyclic program PLC_PRG:

The cyclic program PLC_PRG contains the following functions:

- Cycles counter dwC := dwC + 1;
- Reading the configuration of the DC541 Calling of block DC541_GET_CFG
- Reading the status of the DC541 Calling of block DC541_STATE - Reading/writing the static channels of the DC541 Calling of block DC541_IO
- Simulation of the interrupts for the DC541 Calling of block Simu_Pulse

The blocks DC541_GET_CFG, DC541_STATE and DC541_IO are contained in the library DC541_AC500_V11.lib and described in detail in the library documentation ↳ *Chapter 1.5.4.11 “DC541 library” on page 1103*.

The block Simu_Pulse is used to generate an adjustable number of pulses. Its representation in the Function Block Diagram (FBD) is as follows:



The meanings of the block's inputs and outputs are as follows:

Instance		fbSimuPulse	Instance name
bEn	Input/Output	BOOL	Enabling of the pulse output
bAutoReset	Input/Output	BOOL	Automatic reset of the pulse counter after the specified number of pulses have been output and after expiration of tResetTime
bReset	Input/Output	BOOL	Reset of the pulse counter
tResetTime	Input/Output	TIME	Time until the reset is initiated after the specified number of pulses is reached, if bAutoReset = TRUE
dwPulse	Input/Output	DWORD	Number of pulses to be output: =0: Endless mode (pulse output continues until bEn = FALSE or bReset = TRUE > 0: Cyclic mode (output of the specified number of pulses)
bDone	Output	BOOL	Completion message after tResetTime has expired or bReset = TRUE for 1 cycle
bToggle_0	Output	BOOL	Provides a FALSE->TRUE edge with each 2nd call (i.e. the output is toggled with each call)
bToggle_1	Output	BOOL	Provides a FALSE->TRUE edge with each 4th call
bToggle_2	Output	BOOL	Provides a FALSE->TRUE edge with each 8th call
bToggle_3	Output	BOOL	Provides a FALSE->TRUE edge with each 16th call
dwActPulse	Output	DWORD	Displays the number of pulses output (corresponds to the number of edges at bToggle_0)
tActTime	Output	TIME	Displays the elapsed time while tResetTime is running

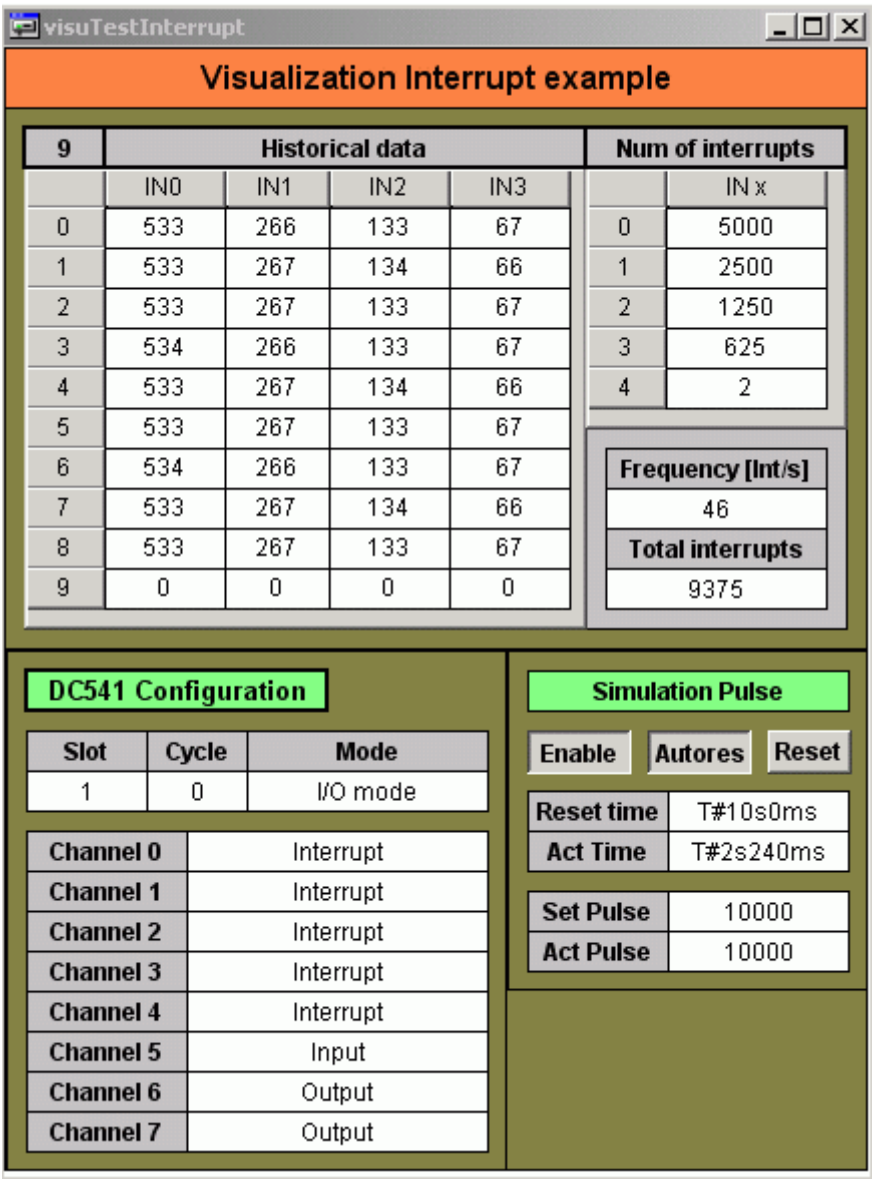
In the example, bEn: = bAutoReset: = TRUE. 10000 pulses are output (dwSetPulse). After the specified number of pulses has been reached, a wait time of 10 seconds is applied and then counting is started from the beginning.

The example has a visualization implemented which can be used to operate the program. After 10000 pulses, the visualization looks as follows:

9375 interrupts are generated:

5000 x C0 + 2500 x C1 + 1250 x C2 + 625 x C3 = 9375

Act Pulse					**Triggers the following interrupts:**
Value	**IN 3** **8**	**IN 2** **4**	**IN 1** **2**	**IN 0** **1**	
0	0	0	0	0	none
1	0	0	0	1	IN 0 -> in every 2. cycle (10000 : 2 = 5000)
2	0	0	1	0	IN 1 -> in every 4. cycle (10000 : 4 = 2500)
3	0	0	1	1	IN 0
4	0	1	0	0	IN 2 -> in every 8. cycle (10000 : 8 = 1250)
5	0	1	0	1	IN 0
6	0	1	1	0	IN 1
7	0	1	1	1	IN 0
8	1	0	0	0	IN 3 -> in every 16. cycle (10000 : 16 = 625)
9	1	0	0	1	IN 0
10	1	0	1	0	IN 1
11	1	0	1	1	IN 0
12	1	1	0	0	IN 2
13	1	1	0	1	IN 0
14	1	1	1	0	IN 1
15	1	1	1	1	IN 0
16	0	0	0	0	none



Usage as counter module

32-Bit up/down counter of module DC541-CM

The 32-bit bidirectional counter functionality is provided by the function block ↳ *Chapter 1.5.4.11.1.1.1 “DC541_32BIT_CNT” on page 1103*.

The 32-bit counter is a count up/count down counter with a directional discriminator. The counter can be used in two counting modes:

- EN_UD = FALSE: Encoder mode
  Connection of an incremental transmitter (track A / track B, offset by 90°)
  It is possible to count signals up to approx. 60 kHz. This corresponds to a motor with a rotational speed of 3.600 rpm and a transmitter with 1.000 pulses per rotation. Pulse multiplication (x2 or x4) is not used.
- EN_UD = TRUE: Up / down mode
  Up-/down counter
  It is possible to count signals up to approx. 60 kHz. Count-up for signals on channel C1, count-down for signals on channel C0.

The counter always uses the channels C0...C3 of the DC541:

- C0: Track A of the incremental transmitter.
- C1: Track B of the incremental transmitter.
- C2 and C3: Reference cam or touch trigger.

The counter can be used in two operating modes:

- Infinite counter (endless mode)
- Limiting counter (limit mode)

Function blocks for the most module functions of DC541-CM are contained in the library DC541_AC500_V11.lib. The library is automatically included into the project and is described in detail in the library documentation ↳ *Chapter 1.5.4.11 “DC541 library” on page 1103*.

32-Bit forward counter of module DC541-CM

The 32-bit forward counter functionality is provided by the block ↳ *Chapter 1.5.4.11.1.1.5 “DC541_FWD_CNT” on page 1127*.

The function block DC541_FWD_CNT provides a 32-bit count up counter which is able to count a maximum frequency of 50 kHz at the inputs C0 and C1 or 5 kHz at the inputs C2-C7. In the DC541, the counter is implemented as a 16 bit counter. The actual counter value ACT_CNT is bulit inside the function block by adding the counter differences that occur within the individual cycles. In order not to loose any counting pulses, the function block has to be called cyclically.

- Channel 0-1: 50 kHz max. -> 32767 / 50 = 655 ms
- Channel 2-7: 5 kHz max. -> 32767 / 5 = 6550 ms

Using the counter e.g. in a 100 ms task will prevent any loss of counting pulses.

Operating modes

- Infinite counter (endless mode)
- Limiting counter (limit mode)

The operating mode is selected at input EN_LIM.

If EN_LIM = FALSE, the counter operates as an infinite counter (endless mode). An overflow occurs corresponding to the 32-bit value at 16#FFFFFFFF = 4 294 967 295. In this mode, any exceeding of the limit value LIM_MAX or falling below the limit value LIM_MIN is displayed at the outputs MAX_LIM or MIN_LIM.

If EN_LIM = TRUE (limit mode), the counting range is between the limit values LIM_MIN and LIM_MAX. In case of an overflow, i.e. if LIM_MAX is reached, the counter restarts again at LIM_MIN.

The upper limit value LIM_MAX has to be higher than the lower limit value LIM_MIN. If LIM_MIN is higher than LIM_MAX, an error is displayed.

The device DC541 must be configured as counting device (counter mode).

The function block has an integrated visualization which can be used to control all function block functions in parallel to the user program, if input EN_VISU = TRUE.

Function blocks for the most module functions of DC541-CM are contained in the library DC541_AC500_V11.lib. The library is automatically included into the project and is described in detail in the library documentation ↳ *Chapter 1.5.4.11 “DC541 library” on page 1103*.

Configuration example: 32-Bit forward counter

All of the 8 channels of the DC541-CM can be used as count up counter. In the configuration example, all 8 channels of the DC541-CM are configured as 32-bit forward counter (count-up). The channels C0...C3 operate as infinite counters (endless mode), the channels C4...C7 as limit counters (limit mode).

The 32-bit count up counter configured as infinite counter (endless mode) corresponds to mode 1 (1 count up counter) of the high-speed counter of the digital input/output modules. In the configuration example, the counting pulses for the first forward counter are therefore applied in parallel to input C0 of the DC541-CM and counting input C24 of the DC532.

Hardware configuration

The example control system shall have the following configuration:

- Terminal base TB521 (two communication module slots)
- DC541-CM in Communication Module slot 1 (first slot on the left of the CPU)
- PM591-ETH CPU with internal Ethernet Communication Module
- I/O module DC532 on the I/O bus

Wiring

The channels are connected as follows:

- DC532 / C16 ---------- DC541 / C0
- DC532 / C17 ---------- DC541 / C1
- DC532 / C18 ---------- DC541 / C2
- DC532 / C19 ---------- DC541 / C3
- DC532 / C20 ---------- DC541 / C4
- DC532 / C21 ---------- DC541 / C5
- DC532 / C22 ---------- DC541 / C6
- DC532 / C23 ---------- DC541 / C7
- DC532 / C16 ---------- DC532 / C24

PLC configuration

- DC541-CM in slot 1, operating mode "Counter mode"
- Configuration: - Channel C0..C7 Forward counter
- Specification of the Ethernet communication module as internal communication module (if available)
- DC532 on the I/O bus / parameter "Fast counter" = 1-1 count up counter

Task configuration

- Task 1: Cyclic program / Prio = 10 / Interval = t#100ms / PLC_PRG
- Task 2: Simulation / Prio = 15 / Interval = t#5ms / Simulation_Task

The cyclic program PLC_PRG contains the following functions:

- Reading the cycle of PLC_PRG Calling of block TASK_INFO;
- Reading the configuration of the DC541 Calling of block DC541_GET_CFG
- Reading the status of the DC541 Calling of block DC541_STATE
- Reading/writing the static channels of the DC541 Calling of block DC541_IO
- Calling of the sequence control for the counters Calling of program proForwardCounter

The blocks DC541_GET_CFG, DC541_STATE and DC541_IO are contained in the library DC541_AC500_V11.lib and described in detail in the library documentation ↬ *Chapter 1.5.4.11 “DC541 library” on page 1103*.

The block TASK_INFO is contained in the library SysInt_AC500_V1.0 and described in detail in the corresponding documentation ↬ *Chapter 1.5.4.19 “Internal system library” on page 1500*.

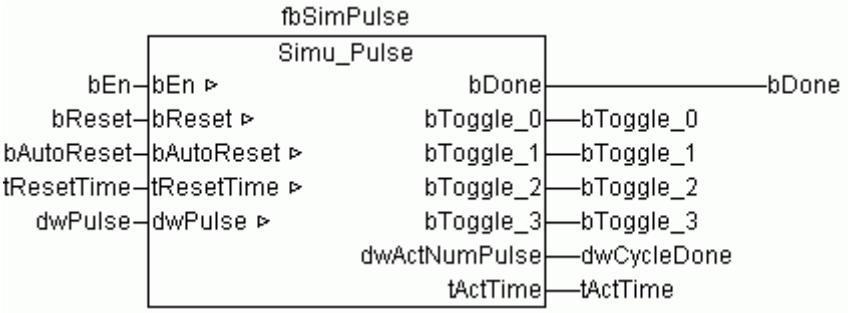
The actual execution of the 32-bit forward counter functionality is implemented in the program proForwardCounter.

Purpose of the program proForwardCounter:

The program proForwardCounter executes the following step chain:

Counter block	**DC541_FWD_CNT CNT_IO**								**CNT_IO**
Step | Channel	**C0**	**C1**	**C2**	**C3**	**C4**	**C5**	**C6**	**C7**	**1**
0 | Action	Init: SET = 0, endless counter, limit values MIN = 300 / MAX = 1300				Init: SET = 0, limit counter, limit values MIN = 300 / MAX = 1300				Init
| Value	0	0	0	0	0	0	0	0	0
1 | Action	Reset of SET input								
| Value	0	0	0	0	300	300	300	300	0
2 | Action	Start of pulse output - 2000 pulses								
| Value	0	0	0	0	300	300	300	300	0
3 | Action	Wait until pulse output is completed								
| Value	2000	1000	500	250	1299	1300	800	550	2000
4 | Action	Selection last step: byStep = 249								
| Value	2000	1000	500	250	1299	1300	800	550	2000
200 | Action	Manual operation								
| Value	xxx	xxx	xxx	xxx	xxx	xxx	xxx	xxx	xxx
249 | Action	Wait time 5 seconds, then restart from step 0								
| Value	2000	1000	500	250	1299	1300	800	550	2000

The block Simu_Pulse is used to generate an adjustable number of pulses. Its representation in the Function Block Diagram (FBD) is as follows:



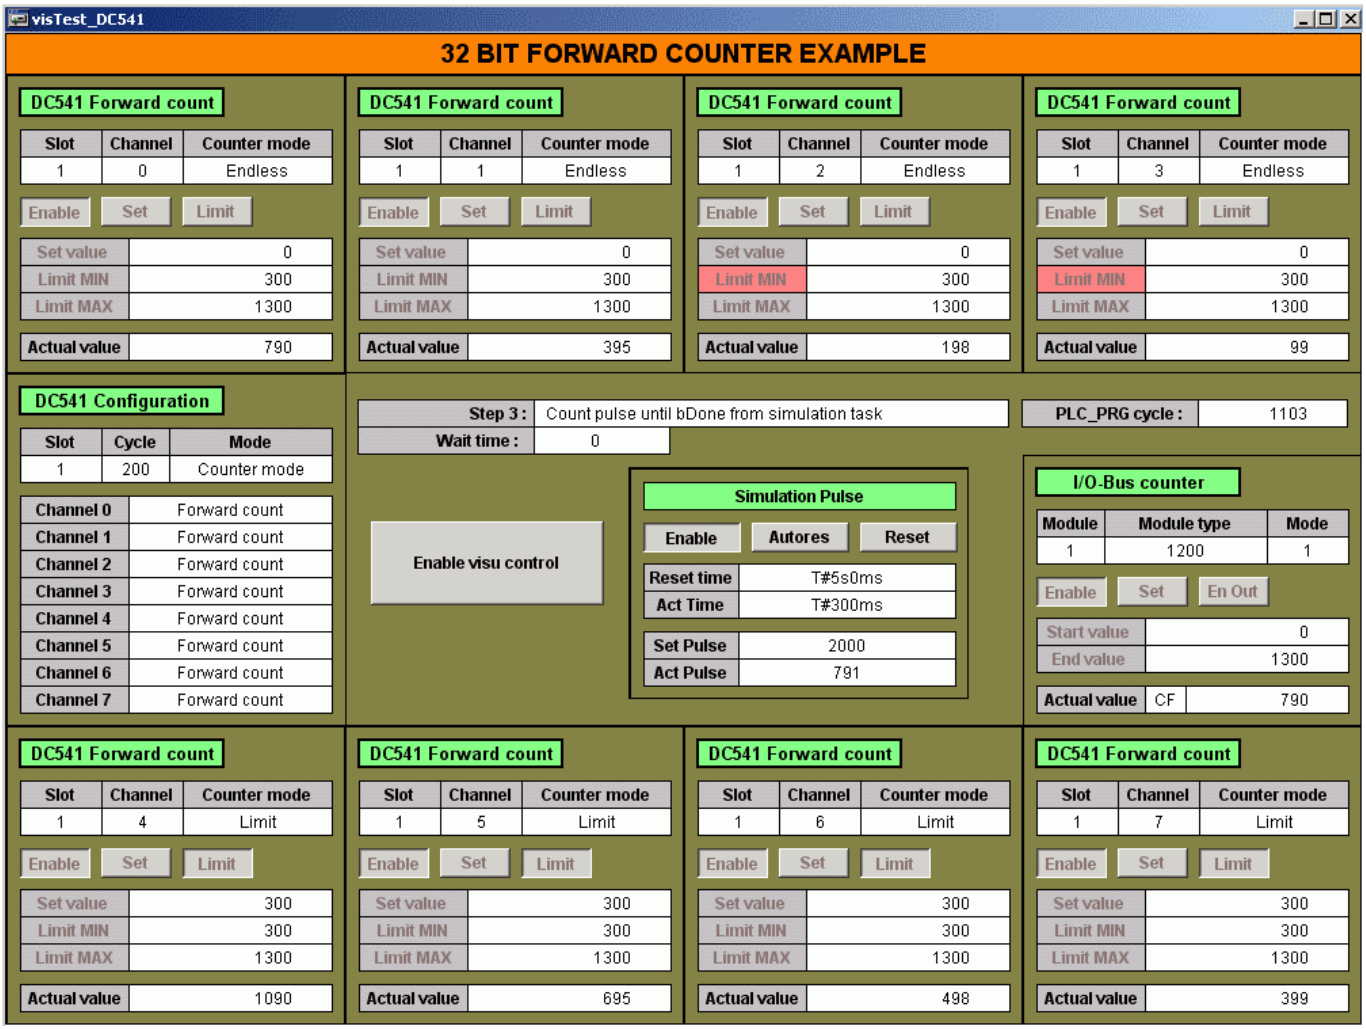
Instance		**fbSimuPulse**	**Instance name**
Ben	Input/Output	BOOL	Enabling of the pulse output
bReset	Input/Output	BOOL	TRUE = Reset of the pulse counter, bDone = TRUE

Instance		fbSimuPulse	Instance name
bAutoReset	Input/Output	BOOL	TRUE and cyclic mode - The time tResetTime is started when the number of pulses set with dwPulse is reached. After this time, the pulse output is restarted again.
tResetTime	Input/Output	TIME	Wait time until restart, if bAutoReset = TRUE
dwPulse	Input/Output	DWORD	Number of pulses to be output: = 0: Endless mode (pulse output continues until bEn = FALSE or bReset = TRUE) > 0: Cyclic mode (output of the specified number of pulses)
Bdone	Output	BOOL	Completion message after the number of pulses specified at dwPulse or after bReset if dwPulse = 0
bToggle_0	Output	BOOL	Output: Edge with each clock cycle
bToggle_1	Output	BOOL	Output: Edge with each 2. clock cycle
bToggle_2	Output	BOOL	Output: Edge with each 4. clock cycle
bToggle_3	Output	BOOL	Output: Edge with each 8. clock cycle
dwActNumPulse	Output	DWORD	Number of pulses output
tActTime	Output	TIME	Elapsed time in [ms] while tResetTime is running

In the example, the block Simu_Pulse is called in a 5 ms task. The pulse output is enabled or stopped via input bEn. If input dwPulse = 0, the output of pulses is performed continuously. If dwPulse > 0, only the specified number of pulses is output. When the specified number of pulses is reached, output bDone is set to TRUE.

In the example, the block is called with dwPulse = 2000. The wait time function is not used.

The example program has a visualization implemented that displays all states:



Clicking on the button <Enable visu control> (bEnVisuControl = TRUE) causes the program to jump from the current step to step 200 (manual operation). Then, the operation of the blocks is done via the corresponding buttons/switches of the individual blocks. When manual operation is switched off again (bEnVisuControl = FALSE), the program jumps to step 249 and restarts from step 0 after the wait time.

Usage for pulse width modulation

Automation Builder configuration

1. In the device tree, add a new object to the *"DC541-CM"* node and select *"DC541 IO mode"* from the list.
2. Double-click the added object and configure the I/O channels:

DC541 IO mode Configuration

Parameter	Type	Value	Default Value	Unit	Description
Channel 0	Enumeration of BYTE	Input	Input		Channel's operational mode
Channel 1	Enumeration of BYTE	Input	Input		Channel's operational mode
Channel 2	Enumeration of BYTE	Input	Input		Channel's operational mode
Channel 3	Enumeration of BYTE	Input	Input		Channel's operational mode
Channel 4	Enumeration of BYTE	Input	Input		Channel's operational mode
Channel 5	Enumeration of BYTE	Input	Input		Channel's operational mode
Channel 6	Enumeration of BYTE	Input	Input		Channel's operational mode
Channel 7	Enumeration of BYTE	Input	Input		Channel's operational mode

- Input
- Output
- Interrupt input

In the module parameters, you can specify the channels C0...C7 as inputs, outputs or interrupt inputs.

Calling the function blocks

The pulse width modulation functionality of the DC541 is provided by the block *Chapter 1.5.4.11.1.1.10 “DC541_PWM” on page 1146*.

Function blocks for the most module functions of DC541-CM are contained in the library DC541_AC500_V11.lib. The library is automatically included into the project and is described in detail in the library documentation *Chapter 1.5.4.11 “DC541 library” on page 1103*.

The function block DC541_PWM outputs a pulsed signal with an adjustable on-off ratio. The on and off times are adjusted as 8 bit numbers.

The minimum switching time is specified at input CYCLE, i.e. if an output has been switched to FALSE or TRUE by the PWM, this output remains in this state for at least this time (CYCLE µs).

The minimum time specified at input CYCLE must not be smaller than the cycle time of the device DC541. Depending on its configuration, the cycle time of the DC541 can be 50, 100 or 200 µs. The cycle time can be polled using the function block *Chapter 1.5.4.11.1.1.6 “DC541_GET_CFG” on page 1132* (output CYCLE).

Configuration example: Pulse width modulation (PWM)

In the configuration example, channel 0 of the DC541 is configured for pulse width modulation (PWM). The output signal is measured using the function Time and frequency measurement *Chapter 1.6.4.4.1.5 “Usage for time and frequency measurement” on page 5712* of the DC541-CM.

The following on-off ratio shall be used:

PULSE	PAUSE	CYCLE	Result (x = number of cycles of the DC541)
Cycle time of DC541 = 100 µs			
1	2	2000	20 x TRUE / 40 x FALSE / 20 x TRUE / 40 x FALSE / … i.e. 2000 µs = TRUE and 4000 µs = FALSE

Hardware configuration:

The example control system shall have the following configuration:

- Terminal base TB521 (two communication module slots)
- DC541 in communication module slot 1 (first slot on the left of the CPU)
- PM591-ETH
- I/O module DC532 on the I/O bus

Wiring:

The channels are connected as follows:

DC541 / C0 ---------- DC541 / C1

PLC configuration:

- DC541-CM in slot 1, operating mode "counter mode"			
- Configuration:	- Channel	C0	PWM
		C1	FREQ
		C2...C7	Input
- Specification of the Ethernet communication module as internal communication module (if available)			

Task configuration:

- Task 1: Cyclic program / Prio = 10 / Interval = t#1ms / PLC_PRG

Purpose of the cyclic program PLC_PRG:

The cyclic program PLC_PRG contains the following functions:

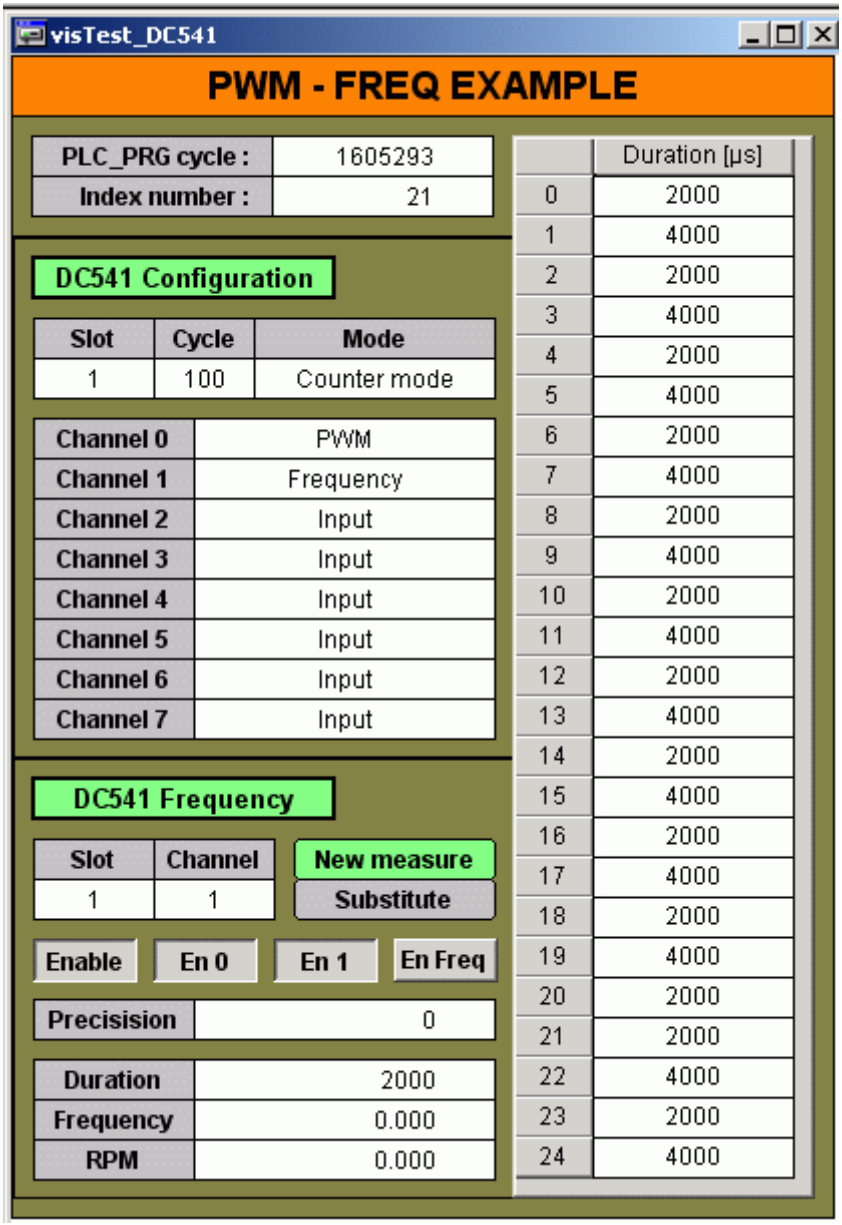
- Reading the cycle of PLC_PRG Calling of block TASK_INFO;
- Reading the configuration of the DC541 Calling of block DC541_GET_CFG
- Reading the status of the DC541 Calling of block DC541_STATE
- Reading/writing the static channels of the DC541 Calling of block DC541_IO
- Calling of the sequence control for PWM and FREQ Calling of program proPWM_FREQ

The blocks DC541_GET_CFG, DC541_STATE and DC541_IO are contained in the library DC541_AC500_V11.lib and described in detail in the library documentation ↳ *Chapter 1.5.4.11 “DC541 library” on page 1103*.

The block TASK_INFO is contained in the library SysInt_AC500_V1.0 ↳ *Chapter 1.5.4.19 “Internal system library” on page 1500* and described in detail in the corresponding documentation.

Calling the pulse width modulation functionality as well as measurement and acquisition of measured values are performed in the program proPWM_FREQ. The program proPWM_FREQ contains the calls for the function blocks ↳ *Chapter 1.5.4.11.1.1.10 “DC541_PWM” on page 1146* and ↳ *Chapter 1.5.4.11.1.1.2 “DC541_FREQ” on page 1111* as well as the acquisition of the measured values. The function block DC541_FREQ is configured in a way that it measures the time between each edge change.

The example program has a visualization implemented that displays all states:



Input EN_VISU of the function block DC541_FREQ is TRUE. Therefore, the inputs of the block can be modified using the buttons <Enable>, <En 0>, <En 1> and <En Freq> in the visualization.

The measured values are 2000, 4000 or 6000 µs depending on which edges were considered for measurement.

Usage for time and frequency measurement

Automation Builder configuration

1. In the device tree, add a new object to the *"DC541-CM"* node and select *"DC541 IO mode"* from the list.
2. Double-click the added object and configure the I/O channels:

DC541 IO mode Configuration

Parameter	Type	Value	Default Value	Unit	Description
Channel 0	Enumeration of BYTE	Input	Input		Channel's operational mode
Channel 1	Enumeration of BYTE	Input	Input		Channel's operational mode
Channel 2	Enumeration of BYTE	Input	Input		Channel's operational mode
Channel 3	Enumeration of BYTE	Input	Input		Channel's operational mode
Channel 4	Enumeration of BYTE	Input	Input		Channel's operational mode
Channel 5	Enumeration of BYTE	Input	Input		Channel's operational mode
Channel 6	Enumeration of BYTE	Input	Input		Channel's operational mode
Channel 7	Enumeration of BYTE	Input	Input		Channel's operational mode

- Input
- Output
- Interrupt input

In the module parameters, you can specify the channels C0...C7 as inputs, outputs or interrupt inputs.

Calling the function blocks

The time and frequency measurement functionality of the DC541-CM is provided by the block ↳ *Chapter 1.5.4.11.1.1.2 "DC541_FREQ" on page 1111*.

Function blocks for the most module functions of DC541-CM are contained in the library DC541_AC500_V11.lib. The library is automatically included into the project and is described in detail in the library documentation ↳ *Chapter 1.5.4.11 "DC541 library" on page 1103*.

The function block DC541_FREQ is used to measure times, frequencies and rotational speeds with a resolution of 100 µs.

It is able to measure frequencies from 0 to 2000 Hz (2 kHz). In order to obtain a precise measurement of frequencies > 50 Hz, a correspondingly high accuracy setting has to be chosen. It is recommended to use an accuracy of PREC = 1000, i.e. 0.001.

This function block has to be called cyclically, one time per second at least.

The inputs EN_0, EN_1 and EN_FREQ are used to determine the edges to be measured. If input EN_FREQ = TRUE, the frequency and the rotational speed are calculated in addition to the time measurement.

Configuration example: Frequency output

In the configuration example, channel 0 of the DC541-CM is configured for frequency output ↳ *Chapter 1.6.4.4.1.6 "Usage for frequency output" on page 5715*. The output signal is measured using the function "Time and frequency measurement" of the DC541-CM.

Hardware configuration:

The example control system shall have the following configuration:

- Terminal base TB521 (two communication module slots)
- DC541-CM in Communication Module slot 1 (first slot on the left of the CPU)
- PM591-ETH CPU with internal Ethernet communication module
- I/O module DC532 on the I/O bus

Wiring:

The channels are connected as follows:

DC541 / C0 ---------- DC541 / C1

PLC configuration:

DC541-CM in slot 1, operating mode "counter mode"			
Configuration	**Channel**	**C0**	**Frequency output**
		C1	Frequency measure-ment
		C2...C7	Input
Specification of the Ethernet communication module as internal communication module (if available)			

Task configuration:

- Task 1: Cyclic program / Prio = 10 / Interval = t#5ms / PLC_PRG

Purpose of the cyclic program PLC_PRG:

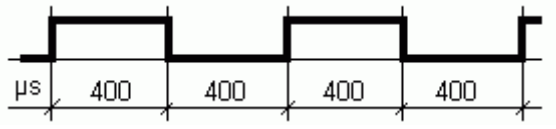
The cyclic program PLC_PRG contains the following functions:

- Reading the cycle of PLC_PRG Calling of block TASK_INFO;
- Reading the configuration of the DC541 Calling of block DC541_GET_CFG
- Reading the status of the DC541 Calling of block DC541_STATE
- Reading/writing the static channels of the DC541 Calling of block DC541_IO
- Calling of the sequence control for frequency output and measurement Calling of program proFrequency
-

The blocks *Chapter 1.5.4.11.1.1.6 “DC541_GET_CFG” on page 1132*, *Chapter 1.5.4.11.1.1.11 “DC541_STATE” on page 1151* and *Chapter 1.5.4.11.1.1.8 “DC541_IO” on page 1139* are contained in the library DC541_AC500_V11.lib and described in detail in the library documentation *Chapter 1.5.4.11 “DC541 library” on page 1103*.

The block *Chapter 1.5.4.19.3.22 “TASK_INFO read number of completed task cycles” on page 1620* is contained in the library SysInt_AC500_V1.0 *Chapter 1.5.4.19 “Internal system library” on page 1500* and described in detail in the corresponding documentation.

The calling of the frequency output functionality as well as the measurement and acquisition of measured values are performed in the program proFrequency. The program proFrequency contains the calls for the function blocks *Chapter 1.5.4.11.1.1.4 “DC541_FREQ_OUT” on page 1123* and *Chapter 1.5.4.11.1.1.2 “DC541_FREQ” on page 1111* as well as the acquisition of the measured values.



The example program has a visualization implemented that displays all states:

Input EN_VISU of the function blocks DC541_FREQ_OUT and DC541_FREQ is TRUE. Therefore, the block inputs can be controlled using the buttons in the visualization.

Channel 7	Enumeration of BYTE	Input	Input		Channel's operational mode

- Input
- Output
- Interrupt input

In the module parameters, you can specify the channels C0...C7 as inputs, outputs or interrupt inputs.

Calling the function blocks

The frequency output functionality of the DC541 is provided by the block ↳ *Chapter 1.5.4.11.1.1.4 "DC541_FREQ_OUT" on page 1123*.

Function blocks for the most module functions of DC541-CM are contained in the library DC541_AC500_V11.lib. The library is automatically included into the project and is described in detail in the library documentation ↳ *Chapter 1.5.4.11 "DC541 library" on page 1103*.

The function block DC541_FREQ_OUT is used to output pulses with a fixed frequency on one channel of the device DC541. It is able to output pulses with a frequency between 0.2 and 2.5 kHz. The pulse jitter depends on the cycle time of the DC541. The pulse length is always a multiple of the cycle time of the DC541.

In case of a presetting of PULSE = 0, the output of pulses is infinite. The pulse output is started with a positive edge at input START. The output is aborted if START = FALSE. A positive edge at input STOP interrupts the pulse output. The output is continued if STOP = FALSE.

If input PULSE > 0, the function block outputs the number of pulses specified at input PULSE with the frequency specified at input FREQ on the channel specified at input CH. After the function block has output the number of pulses specified at PULSE, the output RDY becomes TRUE.

The device DC541 must be configured as counting device (counter mode). Channel CH must be configured for frequency output.

The function block has an integrated visualization which can be used to control all function block functions in parallel to the user program, if input EN_VISU = TRUE.

For frequency output, the same configuration example is used as for the time and frequency measurement ↳ *Chapter 1.6.4.4.1.5 "Usage for time and frequency measurement" on page 5712*.

Application examples

Application examples of the DC541-CM Interrupt and Counter Module can be found in the *PLC Download Center*.

1.6.4.4.2 CD522 encoder and PWM module

Functionality of the CD522 module

The encoder and PWM module CD522 can be used at the following devices:

- Communication interface modules (e. g. CI501-PNIO, CI541-DP)
- Processor modules

Features:

- 2 independent counting functions with up to 12 configurable modes (including incremental position encoder and frequency input up to 300 kHz)
- 2 independent PWM (pulse-width modulator) or pulse outputs with push-pull driver
- Dedicated inputs/outputs for specific counting functions (e.g. touch, set, reset)
- All unused inputs/outputs can be used with the specifications of standard inputs/outputs range

For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

Depending on the configuration used, some inputs and outputs are dedicated to specific counting functions (touch, set, reset…). All unused inputs and outputs can be used with the specification of standard inputs/outputs range.

There are special function blocks available to manage and control the function of the CD522 Module. These function blocks are contained in the ↬ *Chapter 1.5.4.8 “CD522 library” on page 972* which is available with a runtime system of version V1.0.2 or above. The library is automatically included into the project when adding a CD522 Module to the Automation Builder project. Details on the hardware is provided in the device descriptions ↬ *Chapter 1.6.2.7.2.1 “CD522 - Encoder, counter and PWM module” on page 4635*.

Special features

The specific functionality is processed within CD522. It works independently of the user program and therefore it is able to response quickly to external signals. A simultaneous counting operation of several expansion modules is possible.

Each module counter can be configured for 1 mode out of 12 possible ones. The desired operating mode is selected in the PLC configuration using module parameters. After that, it is activated during the initialization phase (power-on, cold start, warm start).

The data exchange to and from the user program is performed using input and output operands. While integrating a module containing counters in the PLC configuration, the necessary operands are created and reserved immediately. Thus, a counter implementation carried out later does not cause an address shift.

Operating modes

Inputs and outputs, which are not used by the counters, are available for other tasks. In the following table, A means Input Channel A, B means Input Channel B and Z means Output Channel Z.

Operating Mode	Function	Used inputs	Description
0	No counter	None	This operating mode is selected, if the integrated fast counter is not needed.
1	Up/Down counter (A)	A = Counting input	One Up/Down (dynamic changes) counter with set and reset input, end value reached indicator, touch/catch value and overflow flag.
2	Up/Down with release input (B)	A = Counting input B = Enable input	One count up counter with enable input via terminal, counting is valid when input B is true. Dynamic Up/Down count possibility, end value reached indicator, Touch/catch value and Overflow flag
3	Up/Down counters (A,B)	A = Counting input 0 B = Counting input 1	2 counters with separate Up/Down and reset input
4	Up/Down (A, B on falling edges)	A = Counting input 0 B = Counting input 1	2 counters (counting on falling edge of input B) with separate Up/Down and reset input
5	Up/Down dynamic set (B) / rising edge	A = Counting input B = Dynamic set input	One Up/Down counter with set and reset input, end value reached indicator, touch/catch value and overflow flag. Additional function to mode 1 is the dynamic set input (B) on rising edge of physical input.
6	Up/Down dynamic set (B) / falling edge	A = Counting input B = Dynamic set input	One Up/Down counter with set and reset input, end value reached indicator, touch/catch value and overflow flag. Additional function to mode 1 is the dynamic set input (B) on falling edge of physical input.
7	Reserved	None	---
8	Up/Down with release (B), 0 cross detection	A = Counting input B = Enable input	One 16 bit counter (in range of -32768 to 32767) with zero cross over detection, counting valid when input B is true

Operating Mode	Function	Used inputs	Description
9	Reserved	None	---
10	Reserved	None	---
11	Incremental encoder	A = Trace A of the encoder B = Trace B of the encoder Z = Trace Z of the encoder (mechanical zero)	One Up/Down counter for encoder x1 count, touch/catch value, RPI function, reset and set
12	Incremental encoder X2	A = Trace A of the encoder B = Trace B of the encoder Z = Trace Z of the encoder (mechanical zero)	One Up/Down counter for position sensor x2 count, touch/catch value, RPI function, reset and set
13	Incremental encoder X4	A = Trace A of the encoder B = Trace B of the encoder Z = Trace Z of the encoder (mechanical zero)	One Up/Down counter for position sensor x4 count, touch/catch value, RPI function, reset and set
14	SSI, absolute encoder	A = Data signal B = Clock signal	Absolute positioning sensor using SSI interface
15	Time frequency meter	Z = Input signal	Time measurement of Z signal, rising edge, falling edge, rotation per minute and frequency calculation

CD522 used as encoder device

Incremental encoder

The function block *Chapter 1.5.4.8.1.1 “CD522_32BIT_ENCODER” on page 972* can be used to control an encoder device for relative positioning with the CD522 Module.

The module CD522 can be used in 12 different configurable operating modes. The operating mode is configured in PLC Configuration using module parameters. After that, it is activated during the initialization phase (power-on, cold start, warm start).

The data exchange from and to the user program is performed using input and output operands. These necessary operands are created and reserved automatically, when one module CD522 is added into the I/O bus configuration.

In order to configure and use the function encoder of module CD522, different operating modes are available. The function block CD522_32BIT_ENCODER should be used with one of these operating modes:

Operating Mode 11	"Incremental encoder"
Should be specified in PLC Configuration; parameter "mode counter" in order to use one bidirectional counter for position sensor x1 count, with possibility of touch/catch value, RPI function, set and reset actions.	
Operating Mode 12	"Incremental encoder X2"
Should be specified in PLC Configuration; parameter "mode counter" in order to use one bidirectional counter for position sensor x2 count, with possibility of touch/catch value, RPI function, set and reset actions.	
Operating Mode 13	"Incremental encoder X4"
Should be specified in PLC Configuration; parameter "mode counter" in order to use one bidirectional counter for position sensor x4 count, with possibility of touch/catch value, RPI function, set and reset actions.	

Absolute SSI encoder

The function block *Chapter 1.5.4.8.1.5 “CD522_SSI_CNT” on page 1006* can be used to control SSI absolute encoder function.

The module CD522 can be used in 12 different configurable operating modes. The operating mode is configured in PLC Configuration using module parameters. After that, it is activated during the initialization phase (power-on, cold start, warm start).

The data exchange from and to the user program is performed using input and output operands. These necessary operands are created and reserved automatically, when one module CD522 is added into the I/O bus configuration.

In order to configure and use the function counter of module CD522, different operating modes are available. The function block CD522_SSI_CNT should be used with one of these operating modes:

Operating Mode 14	"SSI, absolute encoder"
Should be specified in PLC Configuration; parameter mode counter in order to use absolute encoder with SSI interface.	

CD522 used as counter device

32-Bit bidirectional counter

The function block *Chapter 1.5.4.8.1.2 “CD522_32BIT_CNT” on page 982* can be used to control one 32-bit bidirectional counter function.

The module CD522 can be used in 12 different configurable operating modes. The operating mode is configured in PLC Configuration using module parameters. After that, it is activated during the initialization phase (power-on, cold start, warm start).

The data exchange from and to the user program is performed using input and output operands. These necessary operands are created and reserved automatically, when one module CD522 is added into the I/O bus configuration.

In order to configure and use the function counter of module CD522, different operating modes are available. The function block CD522_32BIT_CNT should be used with one of these operating modes:

Operating Mode 1	"Up/Down counter (A)"
Should be specified in PLC Configuration, parameter "mode counter" in order to use one up/down 32-bit counter on input A (dynamic changes) with set and reset input operation, end value reached indicator, touch/catch value and overflow flag.	
Operating Mode 2	"Up/Down counter with release input (B)"
Should be specified in PLC Configuration; parameter "mode counter" in order to use one up/down 32-bit counter with enable input. Counting is valid when input B is TRUE. Dynamic up/down count possibility, with set and reset input operation, end value reached indicator, touch/catch value and overflow flag.	
Operating Mode 5	"Up/Down dynamic set (B)/rising edge"
Should be specified in PLC Configuration; parameter "mode counter" in order to use one up/down 32-bit counter with set and reset input, end value reached indicator, touch/catch value and overflow flag. Additional function to mode 1 is the dynamic set input (B) on rising edge of physical.	
Operating Mode 6	"Up/Down dynamic set (B)/falling edge"
Should be specified in PLC Configuration; parameter "mode counter" in order to use one up/down 32-bit counter with set and reset input, end value reached indicator, touch/catch value and overflow flag. Additional function to mode 1 is the dynamic set input (B) on falling edge of physical.	

The module CD522 provides 2 Up/Down 32-bit counter functions. A signal used for pulse count is identified by A0 for counter 0 and A1 for counter 1. Another signal used for enable or dynamic set is identified by B0 for counter 0 and B1 for counter 1.

16-Bit bidirectional counter

The function block *Chapter 1.5.4.8.1.3 “CD522_16BIT_CNT” on page 991* can be used to control one 16-bit bidirectional counter function.

The module CD522 can be used in 12 different configurable operating modes. The operating mode is configured in PLC Configuration using module parameters. After that, it is activated during the initialization phase (power-on, cold start, warm start).

The data exchange from and to the user program is performed using input and output operands. These necessary operands are created and reserved automatically, when one module CD522 is added into the I/O bus configuration.

In order to configure and use the function counter of module CD522, different operating modes are available. The function block CD522_16BIT_CNT should be used with one of these operating modes:

Operating Mode 8	**"Up/Down with release (B), 0 cross detection"**
Should be specified in PLC Configuration; parameter "mode counter" in order to use one up/down 16 bit counter (in range of -32768 to 32767) with enable input and zero crossover detection (CF). Counting is valid when input B is TRUE. With set and reset input operation and touch/catch value.	

The module CD522 provides 2 Up/Down 16 bit counter functions. A signal used for pulse count is identified by A0 for counter 0 and A1 for counter 1. Another signal used for enable or dynamic set is identified by B0 for counter 0 and B1 for counter 1.

Two 16-bit bidirectional counter

The function block *Chapter 1.5.4.8.1.4 “CD522_16BIT_2CNT” on page 998* can be used to control two 16-bit bidirectional counter functions.

The module CD522 can be used in 12 different configurable operating modes. The operating mode is configured in PLC Configuration using module parameters. After that, it is activated during the initialization phase (power-on, cold start, warm start).

The data exchange from and to the user program is performed using input and output operands. These necessary operands are created and reserved automatically, when one module CD522 is added into the I/O bus configuration.

In order to configure and use the function counter of module CD522, different operating modes are available. The function block CD522_16BIT_2CNT should be used with one of these operating modes:

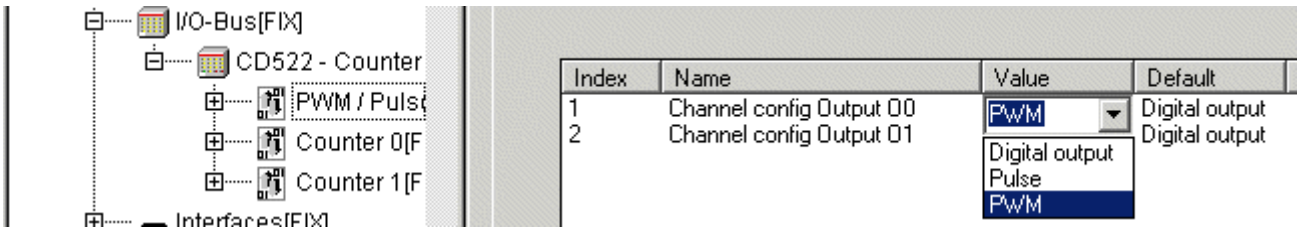
Operating Mode 3	"Up/Down counters (A,B)"
Should be specified in PLC Configuration, parameter "mode counter" in order to use 2 Up/Down 16 bit counter (on rising edge count) functions, with separate up/down, reset operation and overflow flag.	
Operating Mode 4	"Up/Down (A, B on falling edges)"
Should be specified in PLC Configuration, parameter mode counter in order to use two Up/Down 16 bit counter functions (with A on rising edge count and B on falling edge count), With separate up/down, reset operation and overflow flag.	

The module CD522 provides 4 Up/Down 16 bit counter functions. A signal used for pulse count is identified by A0 and B0 for counter A and A1 and B1 for counter B.

CD522 used as PWM output device

To use CD522 as PWM output device, function block *Chapter 1.5.4.8.1.6 “CD522_PWM_OUT” on page 1013* is required.

The module CD522 can be used to control one output pulsing signal (Max= 100 KHz) with an adjustable duty cycle (ON/OFF ratio, max=100%). The PWM operating mode is configured in Automation Builder.



After that, it is activated during the initialization phase (power-on, cold start, warm start).

The data exchange to and from the user program is performed using input and output operands. These necessary operands are created and reserved automatically, when one module CD522 is added in I/O bus configuration.

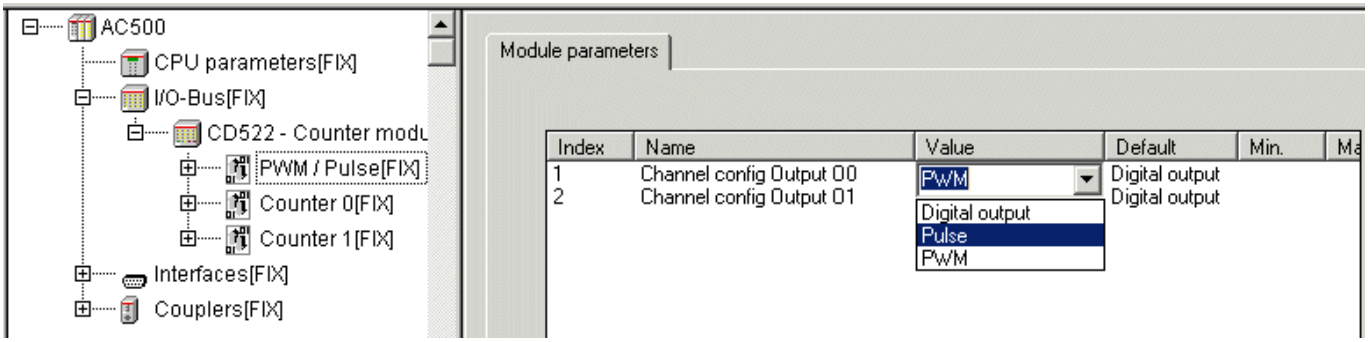
The module CD522 provides two independent outputs which can be used in PWM mode (O0 and O1). Both have the same specification and can work separately.

The function block CD522_PWM_OUT should be used to control with input EN_PWM, configure the frequency with input FREQ and the input duty cycle DUTY_CYCLE of PWM outputs (pulse-width modulator).

CD522 used as pulse output device

To use CD522 as pulse output device, function block *Chapter 1.5.4.8.1.7 “CD522_PULSE_OUT” on page 1016* is required.

The module CD522 can be used to control one output pulses signals with a fixed duty cycle (ON/OFF ratio 50 %) and number of pulses sent with a fixed frequency (can be modified) .The PULSE operating mode is configured in PLC Configuration using module parameters:



After that, it is activated during the initialization phase (power-on, cold start, warm start).

The data exchange from and to the user program is performed by using input and output operands. These necessary operands are created and reserved automatically, when one CD522 module is added into the I/O bus configuration.

The module CD522 provides two independents outputs used in PULSE mode (O0 and O1). Both have the same specification and can work separately.

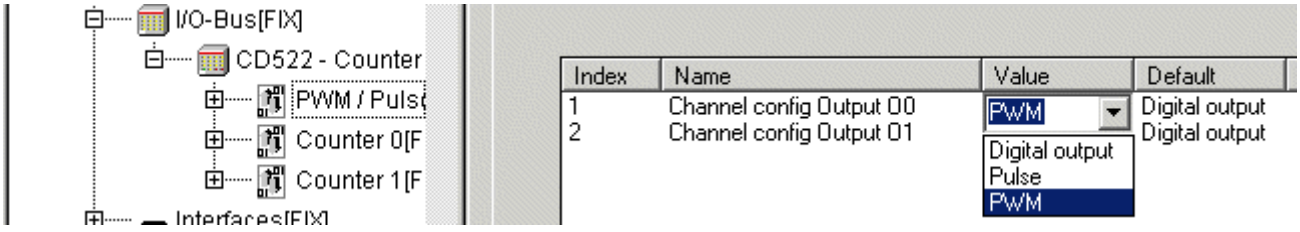
The function block CD522_PULSE_OUT should be used to control the pulse output, with input EN_FREQ, configure the frequency with input FREQ and the number of pulses with input NUM. The number of pulses sent can be displayed in percentage (from 0 % to 100%).

On the fast outputs O0 or O1, the brightness of yellow LED depends on the number of pulse emitted (from 0 and 100%), When the value 100% is obtained, the yellow LED status is off.

CD522 used as frequency output device

To use CD522 as frequency output device, function block *Chapter 1.5.4.8.1.8 “CD522_FREQ_OUT” on page 1020* is required.

The module CD522 can be used to control one output pulses signals with an fixed duty cycle (ON/OFF ratio 50 %).The PWM operating mode is configured in PLC Configuration using module parameters:



After that, it is activated during the initialization phase (power-on, cold start, warm start).

The data exchange to and from the user program is performed using input and output operands. These necessary operands are created and reserved automatically, when one module CD522 is added in I/O bus configuration.

The module CD522 provides two independent outputs which can be used in PWM mode (O0 and O1). Both have the same specification and can work separately.

The function block CD522_FREQ_OUT should be used to control with input EN_FREQ and configure the frequency with input FREQ of frequency outputs (1 kHz to 100 kHz).

CD522 used as time frequency meter

To use CD522 to measure times, frequency and rotation speeds on channel Z0 or Z1, function block *Chapter 1.5.4.8.1.9 “CD522_FREQ_SCAN” on page 1024* is required.

The module CD522 can be used in 12 different configurable operating modes. The operating mode is configured in PLC Configuration using module parameters. After that, it is activated during the initialization phase (power-on, cold start, warm start).

The data exchange from and to the user program is performed using input and output operands. These necessary operands are created and reserved automatically, when one module CD522 is added into the I/O bus configuration.

In order to configure and use the function counter of module CD522, different operating modes are available. The function block CD522_FREQ_SCAN should be used with one of these operating modes:

Operating Mode 15	**"Time frequency meter (Z)"**
Should be specified in PLC Configuration with the parameter mode counter.	

The module CD522 provides 2 channels (Z0 and Z1) which can be used to measure times, frequencies and rotational speeds with a resolution of 1 µs. Both have the same specification and can work separately.

The function block CD522_FREQ_SCAN should be used to control with input EN_CNT, configure the capture on falling edge with input EN_0 or rising edge with input EN_1 of signal, and the specification of the mode of the measurement (time, frequency and Rpm) with input EN_FREQ.

The table shows values measured according to configuration input parameters and this example of timing.

NOTICE!

Risk of malfunctions!

Never use the time measurement (bit EN_FREQ=FALSE) mode if the CD522 is connected to a CS31 communication interface module, e. g. CI592.

Depending on the input parameters of function block, the result of time measurement can be measured in time in µs, frequency in Hz or speed of rotation in rotation per minute.

1.6.4.4.3 FM502-CMS function module

Condition monitoring

Components of the condition monitoring system:

- Hardware
  - Function module FM502-CMS for condition monitoring, protection or as precise I/O module *Chapter 1.6.2.7.2.2 “FM502-CMS - Analog measurements” on page 4658*.
  - Function module terminal base TF5x1-CMS *Chapter 1.6.2.2.2 “TF501-CMS and TF521-CMS - Function module terminal bases ” on page 3796*
  - Processor module PM592-ETH *Chapter 1.6.2.3.2.1 “PM57x (-y), PM58x (-y) and PM59x (-y)” on page 3848*
- Configuration of FM502-CMS *Chapter 1.6.4.4.3.2 “FM502-CMS function module” on page 5724*.
- FM502-CMS library: The FM502-CMS library contains function blocks to manage and control the function of the Function Module FM502-CMS. The FM502-CMS library consists of the WAV-File library and the CMS-IO library. Once a Function Module has been added to the configuration, the libraries are automatically included with the next compilation of the project. *Chapter 1.5.8 “FM502-CMS library” on page 2519*.

Introduction to condition monitoring

Condition Monitoring (CM) is a broad term, which can be understood in different ways. For the FM502-CMS, CM means the acquisition and analysis of high-frequency data. CM does usually not occur in real-time. The data is analysed afterwards. If, however, online CM is controller integrated, real-time reaction, e.g. protection, is possible within the same device and using the same sensors. This feature is supported by AC500 and FM502.

The focus is often merely on mechanical CM. This is due to the fact that the movement or rotations of large masses which are connected to a motor (e.g. electric machine) via a shaft pose the greatest danger. Machines in operation inevitably generate measurable vibration, both free or forced, even in the normal operating states and in absence of any damage.

Yet, in electrical CM, electrical high-frequency quantities like currents, voltages or partial discharges can be measured by suitable sensors and can be analyzed in order to detect electrical failure patterns, e.g. inside electrical machines or equipment (transformers). Some electrically measurable failure patters can be induced by mechanical issues e.g. vibration.

Effective fault detection will only be possible if the data patterns indicating an arising defect can be singled out among the data collected.

Monitoring e.g. the vibration characteristics of a machine in operation gives an understanding of the "'health" condition of the machine and its development over time and load. This information can be used to detect arising problems at an early stage. Operating a machine until it breaks down might be acceptable if the machine were a "'disposable" one and the lifetime was very high and known for sure. But many failures can be considered statistical outliers and occur very early and spontaneously.

However, most machines are not "disposable" due to their cost. Therefore, regular monitoring of a machine’s condition can reveal potential problems. Subsequently, counter measures can be taken at an early stage in order to minimize damage and associated cost. If monitoring is permanent and controller integrated, even spontaneous failures can be detected in real-time, in order to prevent substantial damage to a larger part of the equipment and its environment.

Use cases of FM502-CMS

- Condition monitoring: Longer data-stream analyses
- Protection: Fast reaction to e.g. direct or RMS values based on limits
- Fast and precise analog measurements as with any other AC500 I/O module, but even more precise and faster
- Data logging: Fast, efficient data storage

Condition Monitoring typically means acquisition of longer data streams, also called “time series” or “signals”. These can be analyzed after measurement in the time domain (e.g. envelope, statistical analysis) or frequency domain (e.g. spectrum analysis).

The Function Module FM502-CMS works independently of the user program and therefore it is able to response quickly to external signals and fast acquisition of the analog channel values.

The analog channels can be configured in different modes. It is also possible to change individually the sample and acquiring settings for each channel. The counter can be configured in different modes. After that, it is activated during the initialization phase (power-on, cold start, warm start).

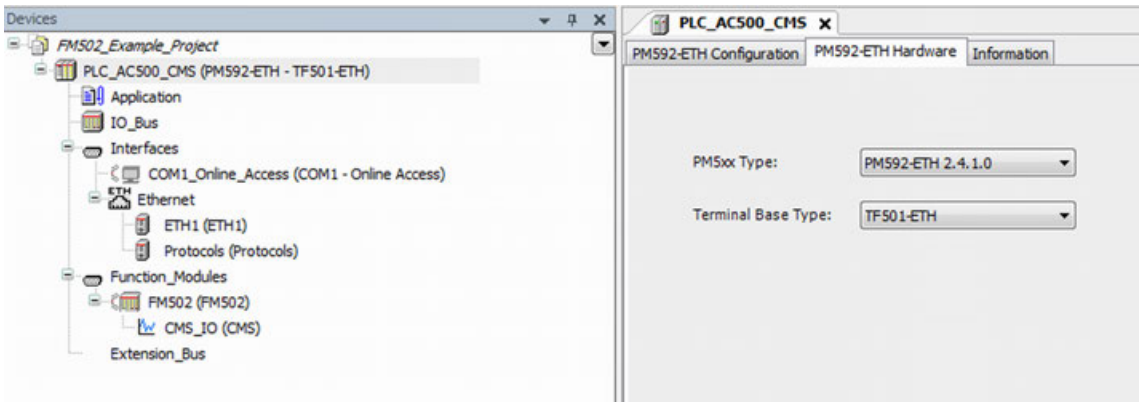
The data exchange to and from the user program is performed using input and output operands. While integrating a module containing counters in the PLC configuration, the necessary operands are created and reserved immediately. For the fast data acquisition the values are stored inside the module in a file and transferred via file transfer to the PLC after the measurement sequence is finished.

FM502-CMS function module

Preconditions

The hardware structure is automatically generated in configuration.

You can change the type of the TF5x1-CMS in the hardware configuration of the processor module:



Only one FM502-CMS can be connected to a processor module.

> *FM502-CMS cannot be used as an I/O on a remote communication interface.*

Configuration of FM502-CMS

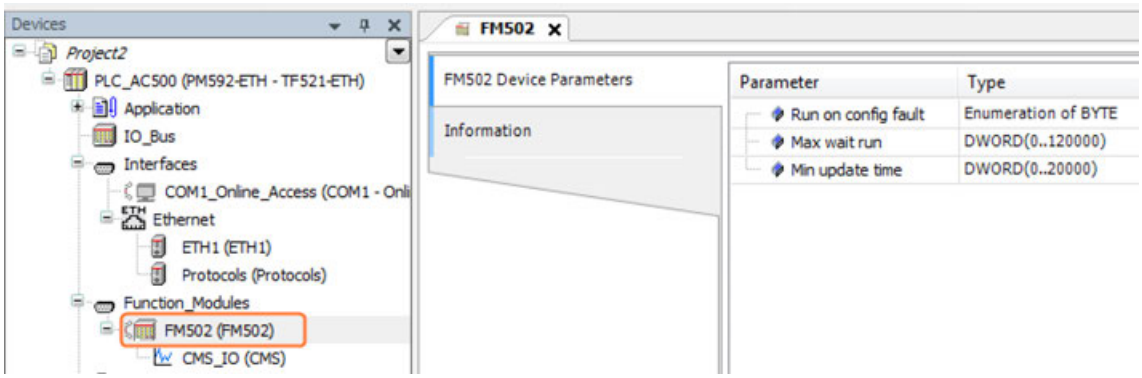


Fig. 1139: Change the behavior on the internal bus.

Parameter	Default value	Value	Description
Run on config fault	No	No	In case of a configuration error, the user program is not starting.
		Yes	The user program runs independent of a faulty I/O bus configuration
Max wait run	3000 [ms]	-	Maximum wait time for valid inputs (Do not change this parameter)
Min update time	10 [ms]	-	Cycle time for data exchange to IEC program The “Min update time” defines the time how often the I/O image will updated for the IEC program. If the IEC task is faster, the I/O image is not updated on every cycle.
Watchdog	400 [ms]	-	Watchdog time (Do not change this parameter)

Parameterization

The FM502-CMS does not store configuration data itself. The digital inputs and outputs can have specific functions depending on the selected configuration mode. All not otherwise configured inputs and outputs can be used with the specification of standard input/output range.

To change the parameterization you can choose the default parameterization in Automation Builder or the parameterization during run time in CODESYS.

The functionality of the module is directly influenced by the parameterization.

Parameterization - Automation Builder

For non-standard applications, it is necessary to adapt the parameters to your system configuration. After every startup of the device the default parameter set will be downloaded to the module.

The parameterization is divided in the following sections:

- Parameter for encoder/counter functionality
- Parameter for analog channel functionality
- Parameter for digital I/O configuration

Parameterization - CODESYS

In CODESYS for the parameterization you can use function blocks of FM502-CMS library ↳ *Chapter 1.5.8.2.1.9 “CMS_IO_CFG_WRITE” on page 2552* ↳ *Chapter 1.5.8.2.1.8 “CMS_IO_CFG_READ” on page 2550*.

Parameter set

Operation modes

Inputs and outputs which are not used by the counters are available for other tasks.

Table legend: A = input channel A, B = input channel B, Z = output channel Z.

Operation Mode	Function	Used inputs	Description	Function block
0-1	No counter	None	This operating mode is selected, if the integrated high-speed counter is not needed.	-
1-1	Up/down counter (A)	A = Counting input	1 bidirectional 32-bit counter on input A (dynamic changes) with set and reset input operation, end value reached indicator, touch/ catch value and overflow flag.	CMS_IO_32BIT_CNT

Operation Mode	Function	Used inputs	Description	Function block
2-1	Up/down with release input (B)	A = Counting input B = Enable input	1 bidirectional 32-bit counter with enable input. Counting is valid when input B is TRUE. Dynamic up/down count possibility, with set and reset input operation, end value reached indicator, touch/ catch value and overflow flag.	CMS_IO_32BIT_CNT
3-2	Up/down counters (A,B)	A = Counting input 0 B = Counting input 1	2 bidirectional 16-bit counter (on rising edge count) functions, with separate up/down, reset operation and overflow flag.	CMS_IO_16BIT_2CNT
4-2	Up/down (A, B on falling edges)	A = Counting input 0 B = Counting input 1	2 bidirectional 16-bit counter functions (with A on rising edge count and B on falling edge count), With separate up/down, reset operation and overflow flag.	CMS_IO_16BIT_2CNT
5-1	Up/down dynamic set (B) / rising edge	A = Counting input B = Dynamic set input	1 bidirectional 32-bit counter with set and reset input, end value reached indicator, touch/ catch value and overflow flag. Additional function to mode 1 is the dynamic set input (B) on rising edge sets START_VALUE.	CMS_IO_32BIT_CNT
6-1	Up/down dynamic set (B) / falling edge	A = Counting input B = Dynamic set input	1 bidirectional 32-bit counter with set and reset input, end value reached indicator, touch/ catch value and overflow flag. Additional function to mode 1 is the dynamic set input (B) on falling edge sets START_VALUE.	CMS_IO_32BIT_CNT
7-1	Reserved	None	-	-
8-1	Up/down with release (B), 0 cross detection	A = Counting input B = Enable input	1 bidirectional 16-bit counter (in range of -32768 to 32767) with enable input and zero crossover detection (CF). Counting is valid when input B is TRUE. With set and reset input operation and touch/catch value.	CMS_IO_16BIT_CNT
9-1	Reserved	None	-	-
10-1	Reserved	None	-	-

Opera-tion Mode	Function	Used inputs	Description	Function block
11-1	Incremental encoder	A = Trace A of the encoder B = Trace B of the encoder Z = Trace Z of the encoder (mechanical zero)	1 bidirectional counter for encoder x1 count, touch/ catch value, RPI function, reset and set Function block counts rising edges at input A.	CMS_IO_32BIT_ENCODER
12-1	Incremental encoder X2	A = Trace A of the encoder B = Trace B of the encoder Z = Trace Z of the encoder (mechanical zero)	1 bidirectional counter for position sensor x2 count, with possibility of touch/ catch value, RPI function, set and reset actions. Function block counts rising and falling edges at input A.	CMS_IO_32BIT_ENCODER
13-1	Incremental encoder X4	A = Trace A of the encoder B = Trace B of the encoder Z = Trace Z of the encoder (mechanical zero)	1 bidirectional counter for position sensor x4 count, with possibility of touch/ catch value, RPI function, set and reset actions. Function block counts rising and falling edges at input A and B.	CMS_IO_32BIT_ENCODER
14-1	SSI, absolute encoder	A = Data signal B = Clock signal	Absolute positioning sensor using SSI interface	CMS_IO_SSI_CNT
15-1	Time frequency meter	Z = Input signal	Time measurement of Z signal, rising edge, falling edge, rotation per minute and frequency calculation	CMS_IO_FREQ_SCAN

Process image (I/O data)

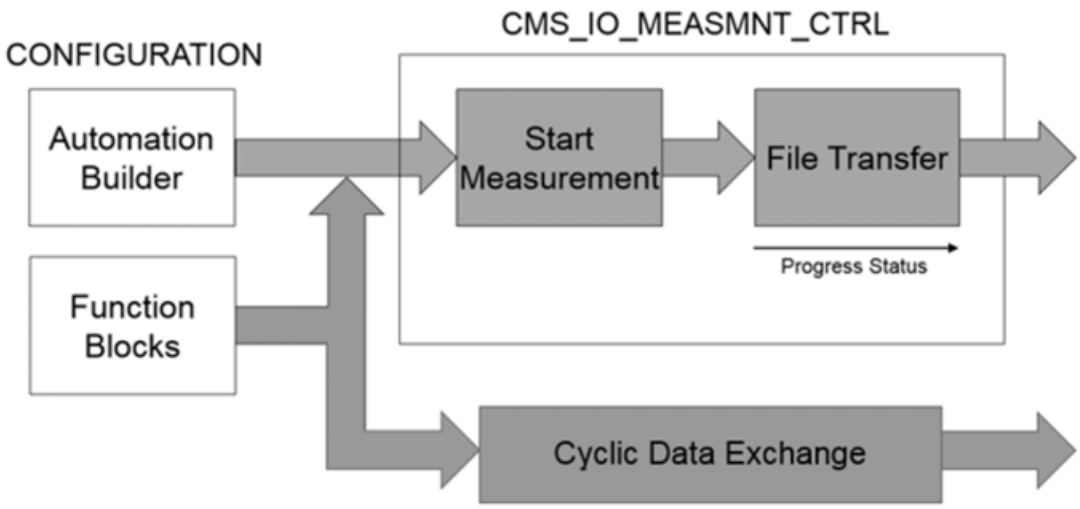
The cyclic data can be accessed to the addresses or variables defined in Automation Builder **I/O Mapping** tab.

FM502-CMS analog measurement

Possibilities to use the analog input signal values:

- The values of the configured analog channels in CODESYS can be used by referencing the I/O mapping variables. The refresh time for the cyclic data exchange of the analog input data is according to the minimum update time in the configuration.
- For detailed data analysis you can record the analog input data into WAV files and store them. In these files, every input data sample is stored.

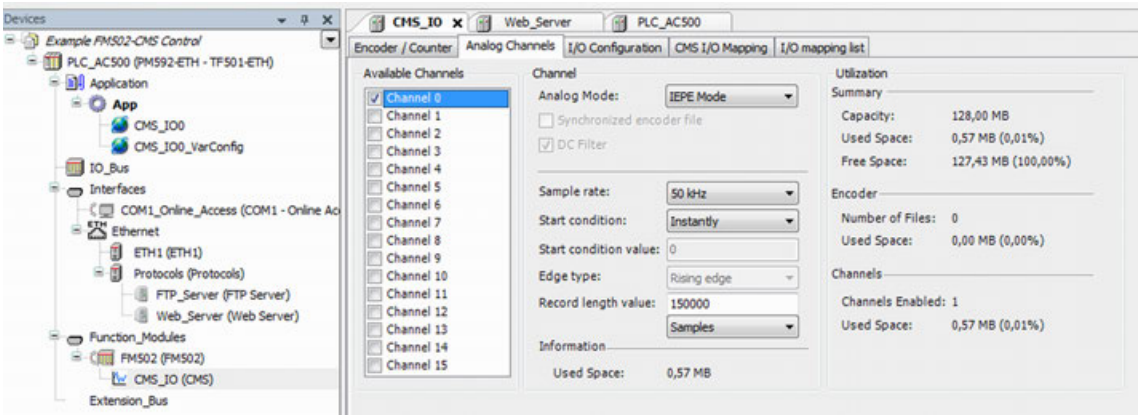
Both possibilities can be used simultaneously.



The DC filter needs 10 seconds to tune in after system power up. During that time the AI values can be accessed by the user program, but the readings are out of tolerance limit.

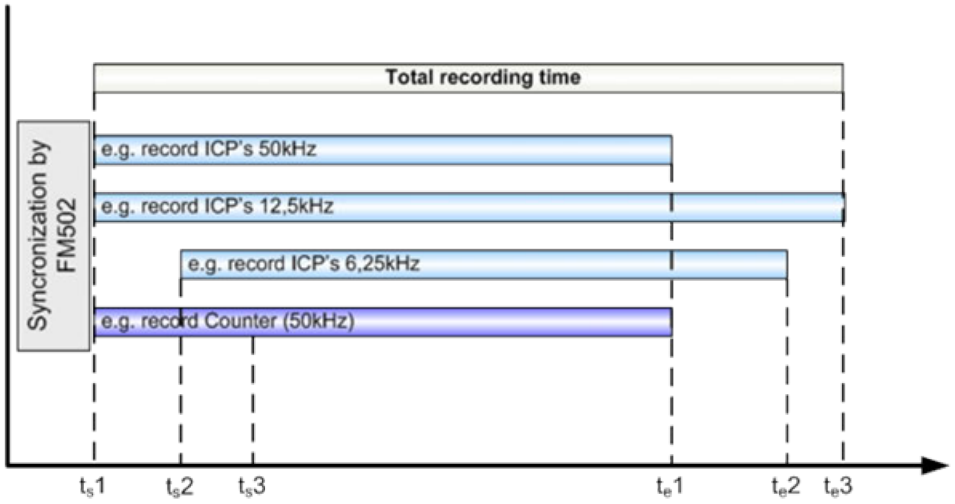
Configuration for analog measurements

▷ Configure at least one analog channel for data acquisition.



The measurement file size depends on the record length value and number of available channels. The maximum capacity of one measurement file is limited by the internal memory. The recording time for each channel is calculated by: recording time = record length value/sample rate.

The total recording time is determined by the earliest measurement start trigger of a channel to the measurement end of the last channel in the configuration.

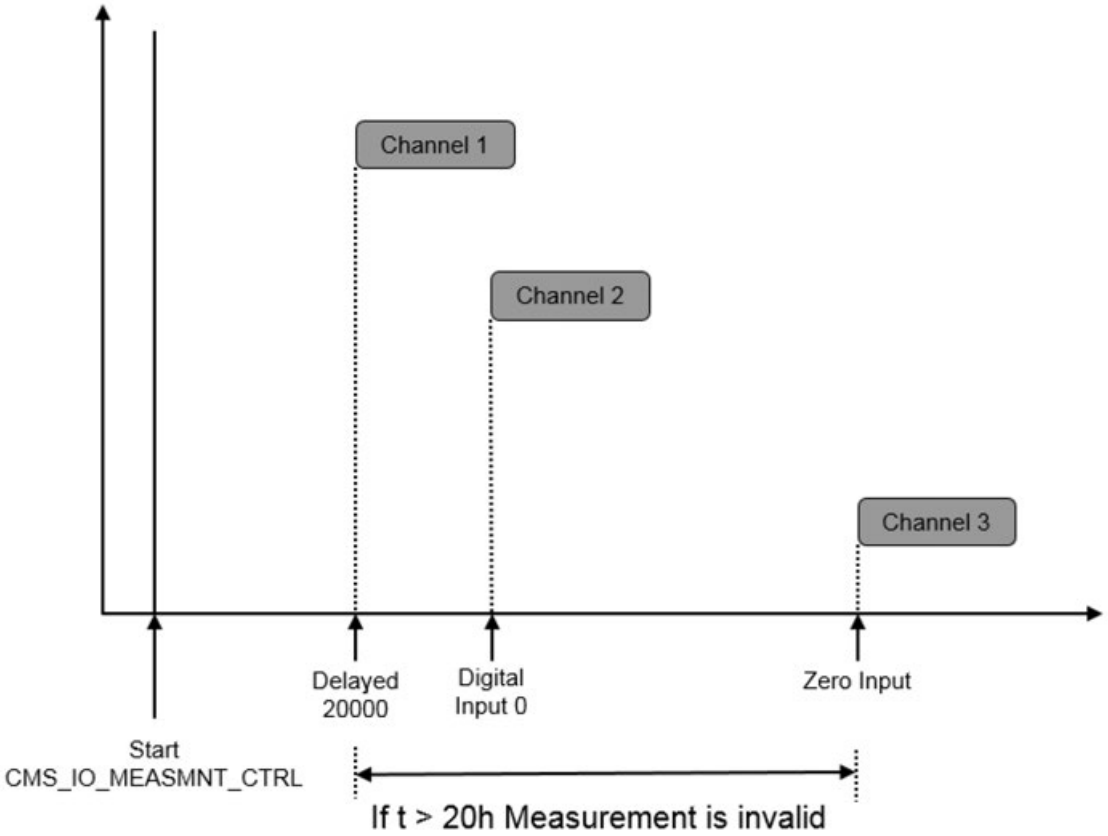


Make sure to configure the right analog mode for each channel. Take care that the sample rate is in relation to the maximum measured frequency.

Start conditions for each individual channel:

- Instantly: Starts measurement instantly after setting input EN to TRUE.
- Delayed: Measurement will start when input EN was set to TRUE and the start condition value [samples] is over.
- Digital input: Starts the measurement when input EN and the digital input was set to TRUE.
- Zero input: Starts the measurement when input EN was set to TRUE and the input Z+ gets a rising edge.
- Encoder value: Starts the measurement when input EN was set to TRUE and the start condition value is satisfied.

The start criteria of all analog channels in one measurement have to be in a 20 hour time window. Otherwise, the measurement is invalid and will be aborted.



The process image (I/O data) of the function module can be mapped for analog measurements.

Measurement files

The measurement data will be stored in the WAV file format. One WAV file will be created for each active channel.

Table 719: RIFF header

Data type	Endian	Length	File offset	Identifier	Value
BYTE[4]	Big	4	0 (0x00)	bfChunkID	"RIFX"
DWORD	Little	4	4 (0x04)	dwChunkSize	Data length - 8

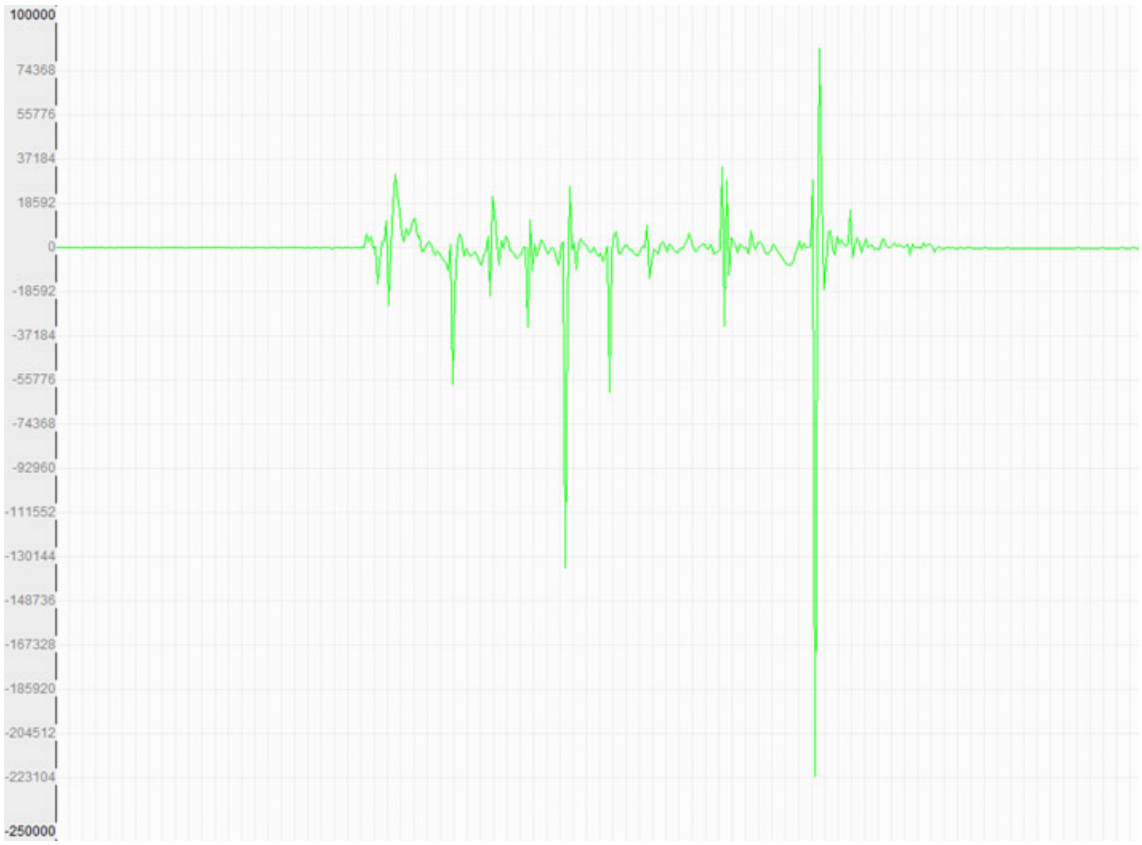
The WAV files will be stored in an uncompressed ZIP file at the destination path of CMS_IO_MEASMNT_CTRL. The file names for of the WAV files are given by the FM502-CMS and are directly corresponding to the analog channel and encoder configuration of the FM502-CMS.

Example With no encoder, the files are named: CH00_nEN.wav, CH01_nEN.wav, ... CH15_nEN.wav and stored in a ZIP file.

Programming

In CODESYS, the data of the configured analog channels can be seen and used with the I/O mapping variables.



Use the function block CMS_IO_MEASMNT_CTRL to start a measurement.

> *The name of the measurement ZIP file has to be in 8.3 file format. Example: abcdefgh.zip*

After the measurement is finished, the ZIP file is transferred from the FM502-CMS to the PM592-ETH via communication module bus. The progress of the data transfer can be seen at the output PROGRESS in percent. After a successful measurement and data transfer, the output DONE will change to TRUE.

FM502-CMS used as counter device

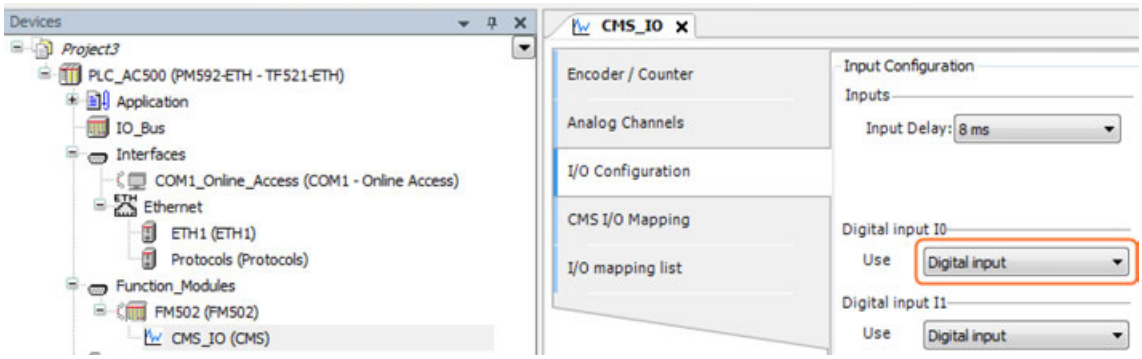


Fig. 1140: Input configuration.

32-bit bidirectional counter

The function block CMS_IO_32BIT_CNT can be used to control one 32-bit bidirectional counter function *Chapter 1.5.8.2.1.3 “CMS_IO_32BIT_CNT 32-bit counter” on page 2534*. A signal used for pulse count is identified by A+. Another signal used for enable or dynamic set is identified by B+.

Possible operation modes: 1-1, 2-1, 5-1, 6-1 *Table on page 5728*

Touch/Catch operation

The touch/catch operation is the way to acquire the counting position synchronously with hardware external signal removing all the latency time of I/O bus and network. This operation allows synchronization between 2 different encoder devices if the same hardware signal is used for touch/catch input.

On edge of the physical external signal, the current counter value (ACT) is stored in a dedicated double word (CNT_TOUCH). The touch/catch operation could be settled on rising or falling edge depending on parameter EDGE_TOUCH.

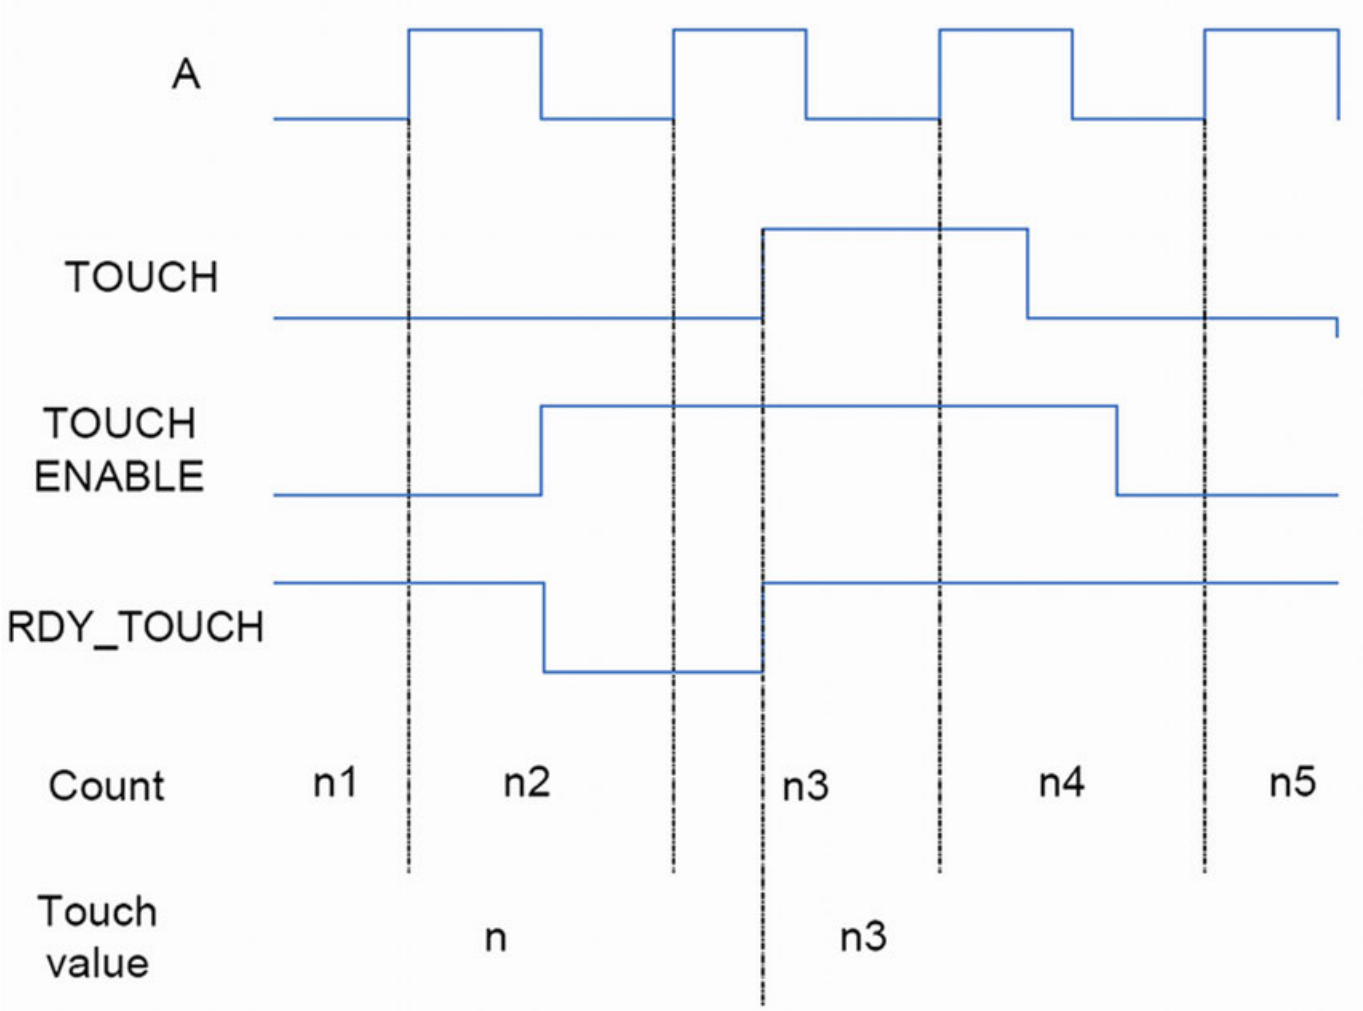

Fig. 1141: Procedure and associated counting value with signal A

Touch/catch operation is enabled through control bit (EN_TOUCH). This resets the status flag (RDY_TOUCH), when the pre-determined edge occurs; the current counter value is stored in the touch value double word. In the same time, the status RDY_TOUCH is set to TRUE.

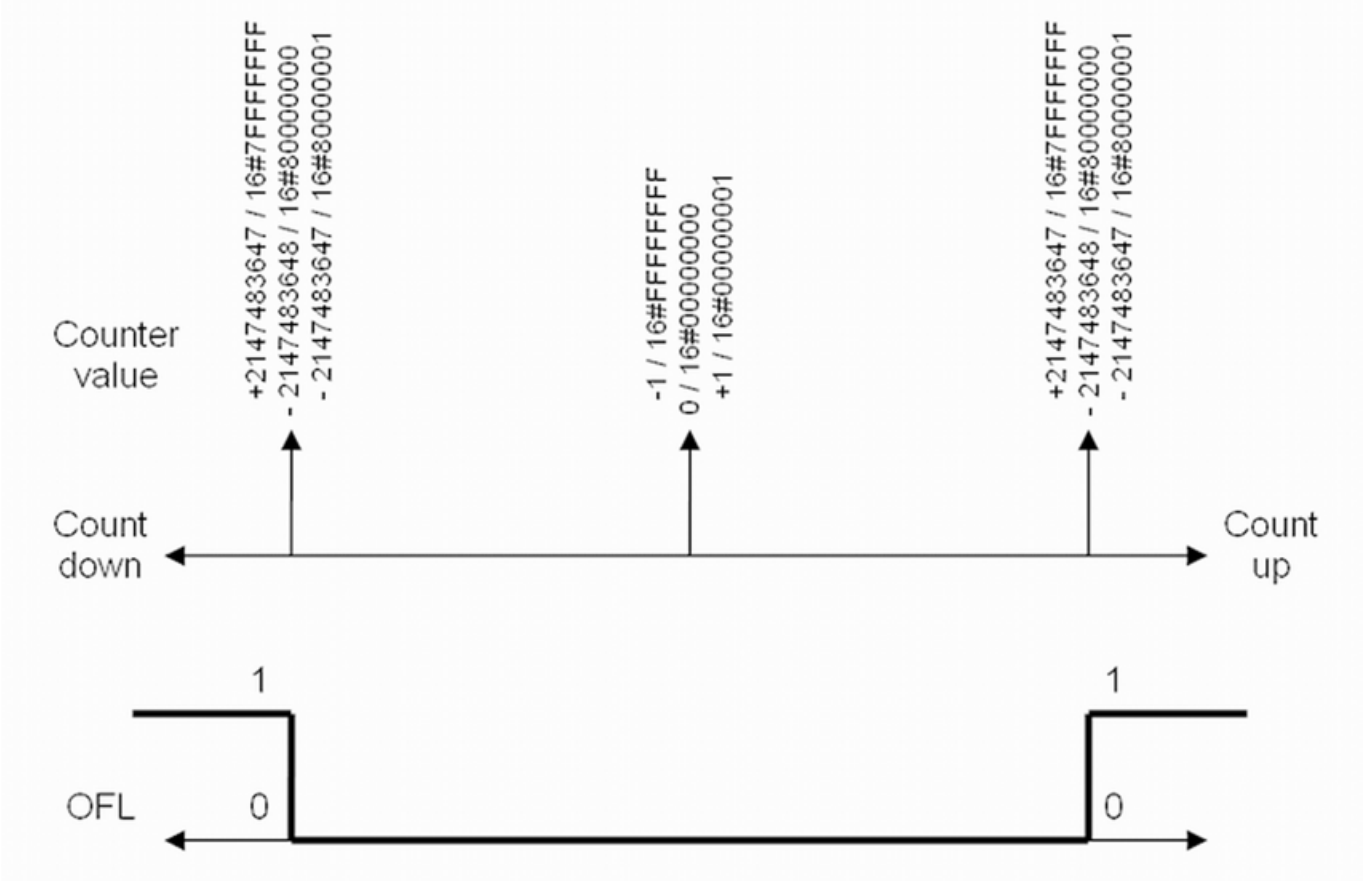
A rising edge at input DI0, DI1, DC2 or DC3 causes the function block to store the actual counter value and to display this value at output CNT_TOUCH.

SET operation

A rising edge at input DI0, DI1, DC2 or DC3 causes the function block to store the START_VALUE value and to display this value at output ACT.

RESET operation A rising edge at input DI0, DI1, DC2 or DC3 causes the block to reset the value at output ACT.

Overflow operation The counter operates as infinite counter. An overflow occurs corresponding to the 32-bit value at 16#80000000 = 2147483648 and any exceeding or falling below of this value (depending to up and down use) OFL will set to TRUE.



16-bit bidirectional counter

The function block CMS_IO_16BIT_CNT can be used to control one 16 bit bidirectional counter function *Chapter 1.5.8.2.1.2 “CMS_IO_16BIT_CNT” on page 2530*. A signal, used for pulse count, is identified by A+.

Possible operation modes: 8-1 *Table on page 5728*

Touch/Catch operation The touch/catch operation is the way to acquire the counting position synchronously with hardware external signal removing all the latency time of I/O bus and network. This operation allows synchronization between 2 different encoder devices if the same hardware signal is used for touch/catch input.

On edge of the physical external signal, the current counter value (ACT) is stored in a dedicated double word (CNT_TOUCH). The touch/catch operation could be settled on rising or falling edge depending on parameter EDGE_TOUCH.

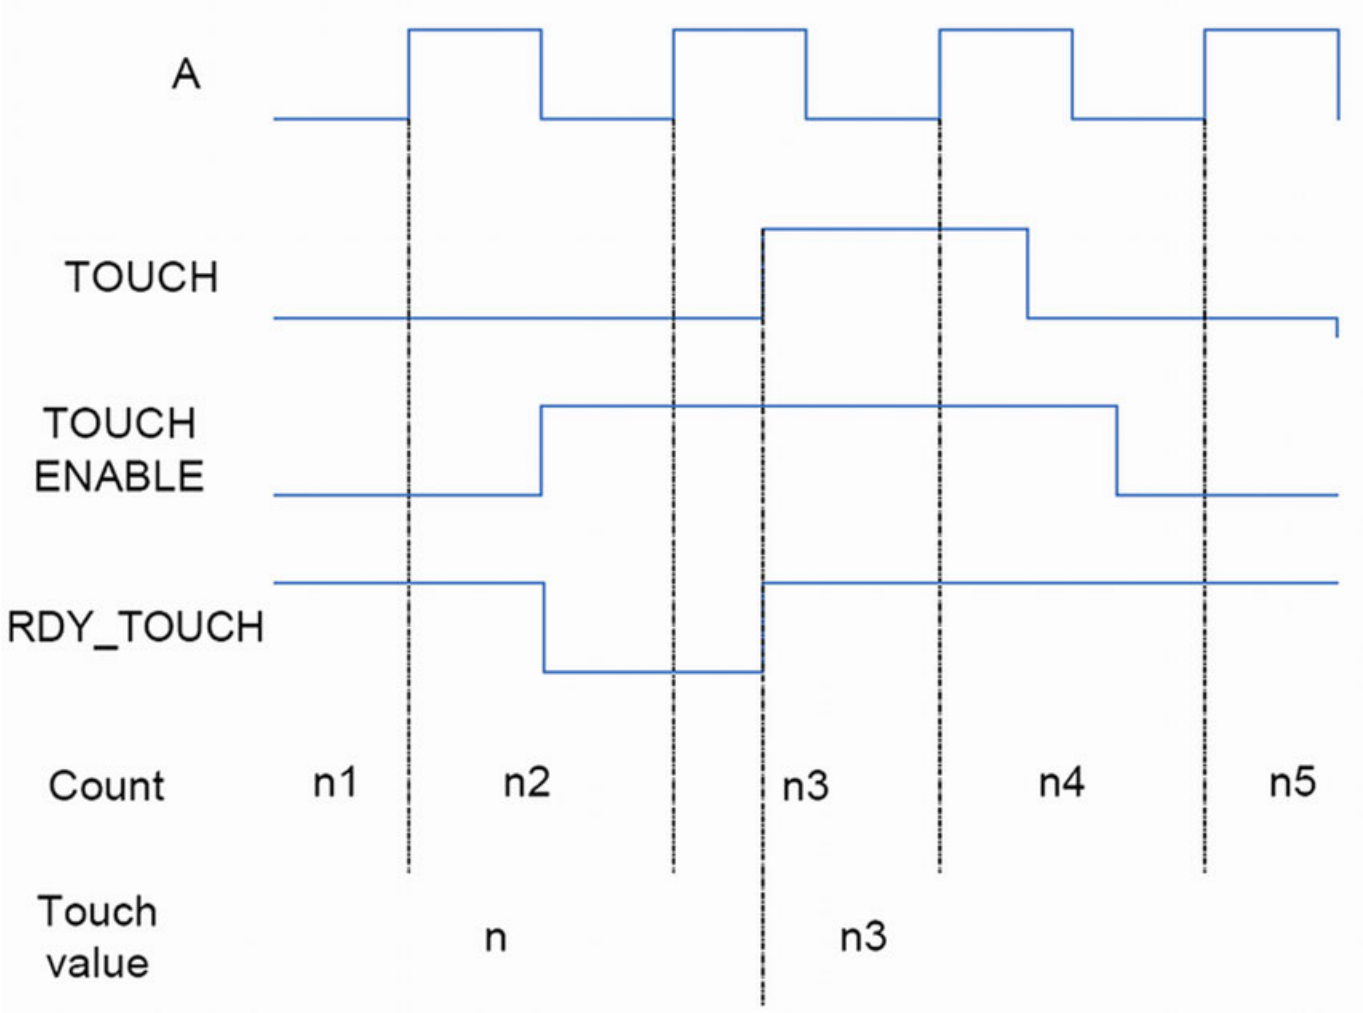


Fig. 1142: Procedure and associated counting value with signal A

Touch/catch operation is enabled through control bit (EN_TOUCH). This resets the status flag (RDY_TOUCH), when the pre-determined edge occurs; the current counter value is stored in the touch value double word. In the same time, the status RDY_TOUCH is set to TRUE.

A rising edge at input DI0, DI1, DC2 or DC3 causes the function block to store the actual counter value and to display this value at output CNT_TOUCH.

SET operation

A rising edge at input DI0, DI1, DC2 or DC3 causes the function block to store the START_VALUE value and to display this value at output ACT.

RESET operation

A rising edge at input DI0, DI1, DC2 or DC3 causes the block to reset the value at output ACT.

Two 16 bit up/down counters

The function block CMS_IO_16BIT_2CNT can be used to control two independent 16 bit bidirectional counter functions ↬ *Chapter 1.5.8.2.1.1 “CMS_IO_16BIT_2CNT” on page 2526*. A signal, used for pulse count, is identified by A+ and B+.

Possible operation modes: 3-2, 4-2 ↬ *Table on page 5728*

Touch/Catch operation

The touch/catch operation is the way to acquire the counting position synchronously with hardware external signal removing all the latency time of I/O bus and network. This operation allows synchronization between 2 different encoder devices if the same hardware signal is used for touch/catch input.

On edge of the physical external signal, the current counter value (ACT) is stored in a dedicated double word (CNT_TOUCH). The touch/catch operation could be settled on rising or falling edge depending on parameter EDGE_TOUCH.

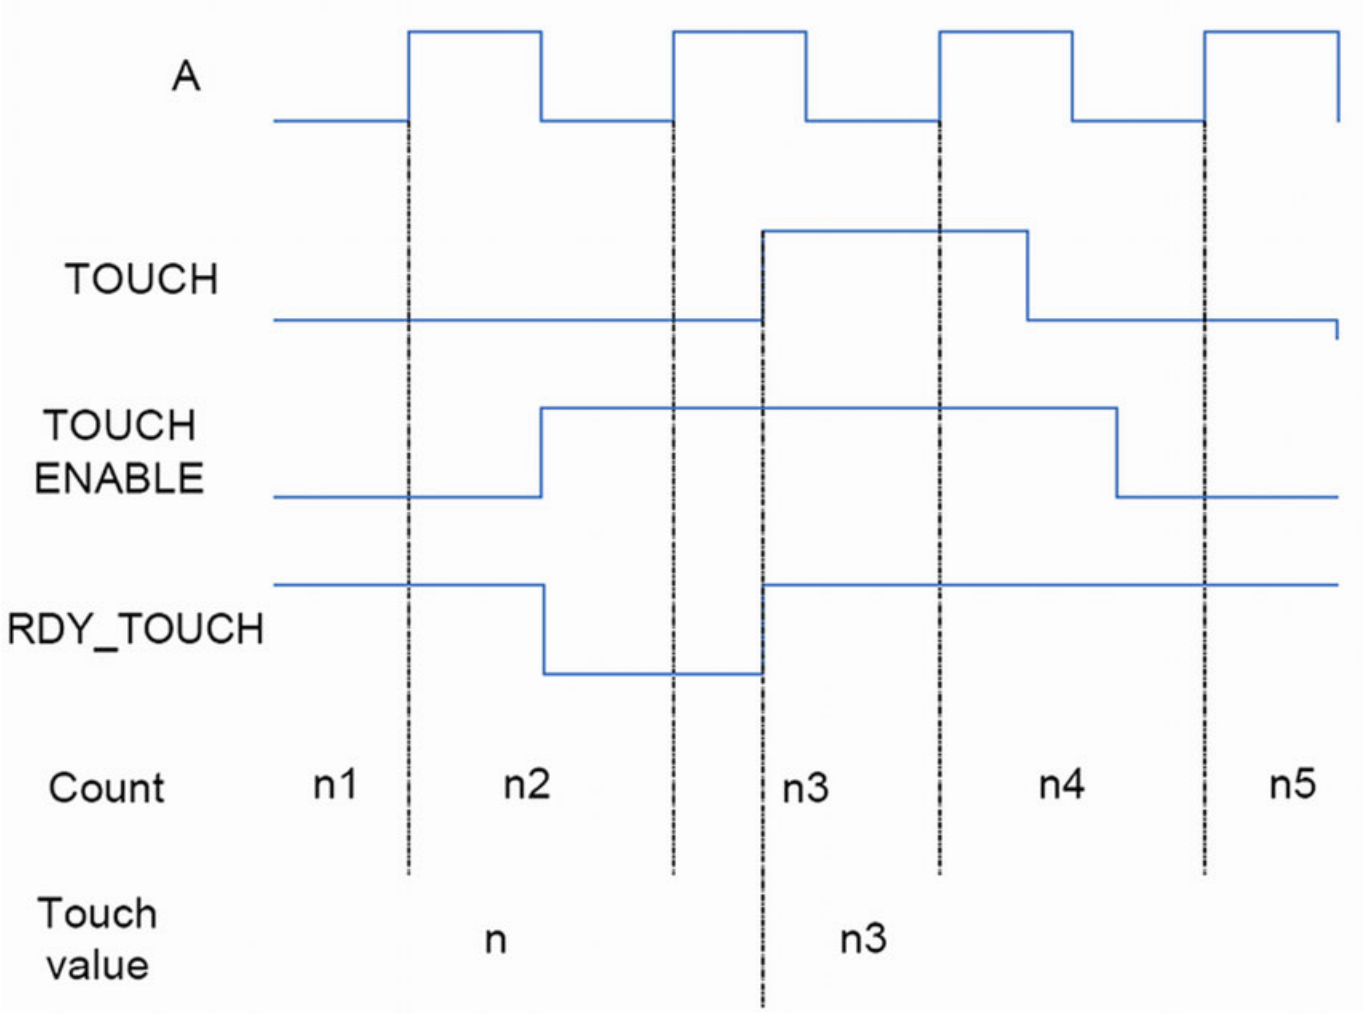

Fig. 1143: Procedure and associated counting value with signal A

Touch/catch operation is enabled through control bit (EN_TOUCH). This resets the status flag (RDY_TOUCH), when the pre-determined edge occurs; the current counter value is stored in the touch value double word. In the same time, the status RDY_TOUCH is set to TRUE.

A rising edge at input DI0, DI1, DC2 or DC3 causes the function block to store the actual counter value and to display this value at output CNT_TOUCH.

RESET operation

A rising edge at input DI0, DI1, DC2 or DC3 which is configured as RESET causes the function block to reset the value at output ACT1. A rising edge at input DI0, DI1, DC2 or DC3 which is configured as Reset 2nd Bit counter causes the function block to reset the value at output ACT2.

Overflow operation

The counter operates as an infinite counter. It is set to TRUE, when an overflow occurs, i.e. the counter value ACT1 or ACT2 goes up to value 16#FFFF= -1. Any exceeding or falling below of this value (depending to up use and down use) will set OFL1 = TRUE or OFL2 = TRUE.

FM502-CMS used as encoder device

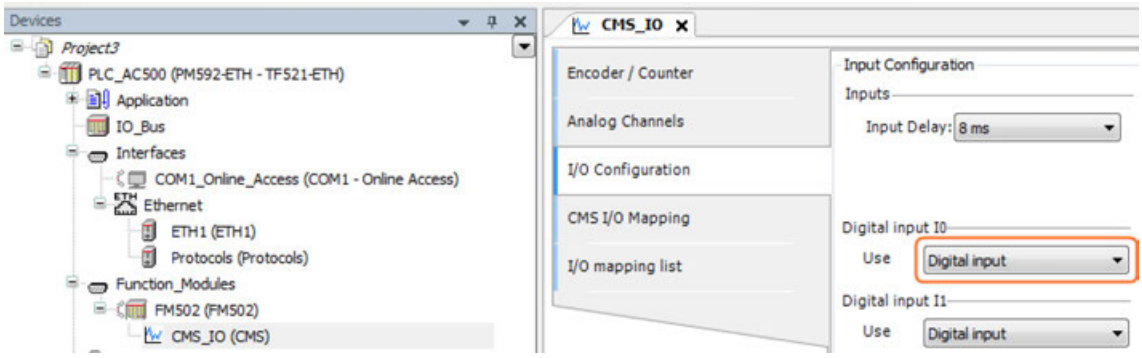

Fig. 1144: Input configuration.

Incremental encoder

The function block CMS_IO_32BIT_ENCODER can be used to control an encoder device for relative positioning with 3 signals ↳ *Chapter 1.5.8.2.1.4 “CMS_IO_32BIT_ENCODER” on page 2538*. 2 signals are used for rotation discrimination and pulse count, identified by A+ and B+. The third one is used in multi-turn encoder to count the number of rotation (mechanical zero), identified by Z+.

The rotation is identified with a shift angle (90°) between A and B signal. In the Function Module, the clockwise rotation is identified with A signal in advance to B.

Possible operation modes: 11-1, 12-1, 13-1 ↳ *Table on page 5728*

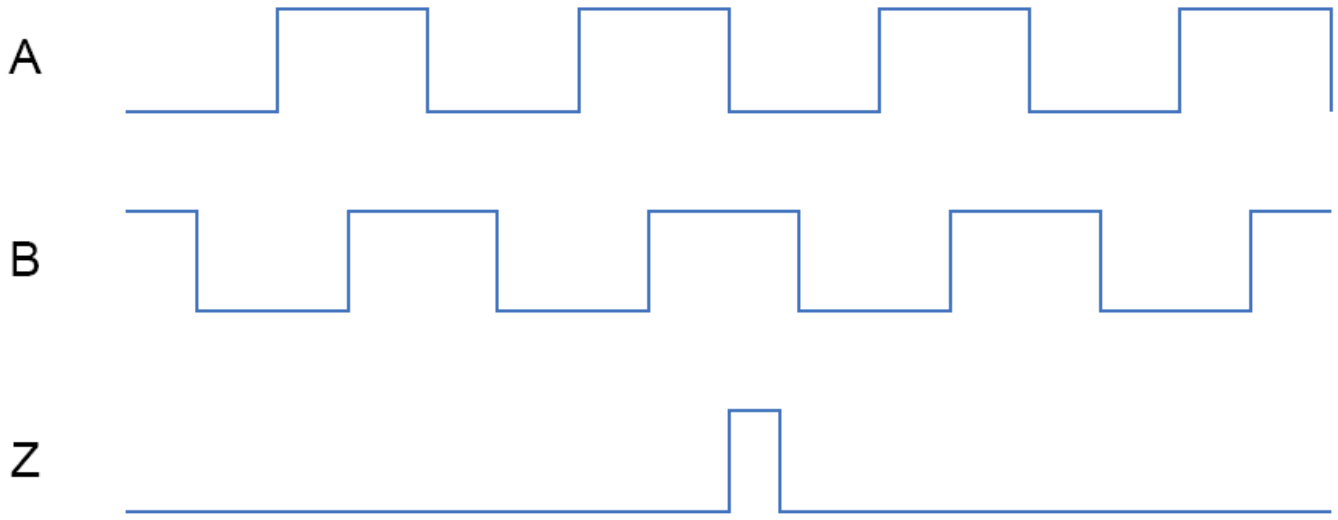

Fig. 1145: Clockwise rotation in the Function Module: A signal ahead from B signal

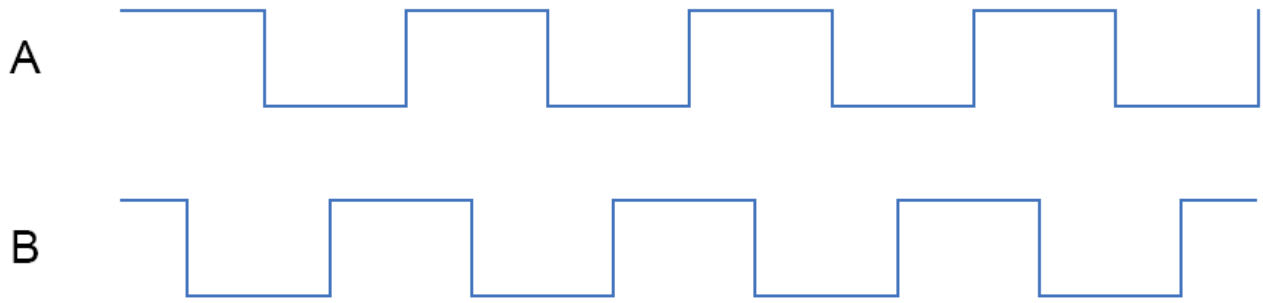

Fig. 1146: Counter-clockwise rotation in the Function Module: A signal late from B signal

Depending on choosen operation mode, the counting procedure will be x1, x2 or x4 count. Basically the x1 counting mode is used (operation mode 11-1). The encoder module discriminates the rotating way and count one pulse for each rising edge of the A signal.

With clockwise rotation, function block CMS_II_32BIT_ENCODER counts downwards. With counter-clockwise rotation, function block counts upwards.

In order to increase resolution, the x2 counting mode can be specified (operation mode 12-1). The encoder module counts one pulse on each rising and falling edge of A signal.

The resolution could be multiplied by 4, using the x4 counting mode (operation mode 13-1). The encoder module counts a pulse on both rising and falling edge of A signal and B signal.

Touch/Catch operation

The touch/catch operation is the way to acquire the counting position synchronously with hardware external signal removing all the latency time of I/O bus and network. This operation allows synchronization between 2 different encoder devices if the same hardware signal is used for touch/catch input.

On edge of the physical external signal, the current counter value (ACT) is stored in a dedicated double word (CNT_TOUCH). The touch/catch operation could be settled on rising or falling edge depending on parameter EDGE_TOUCH.

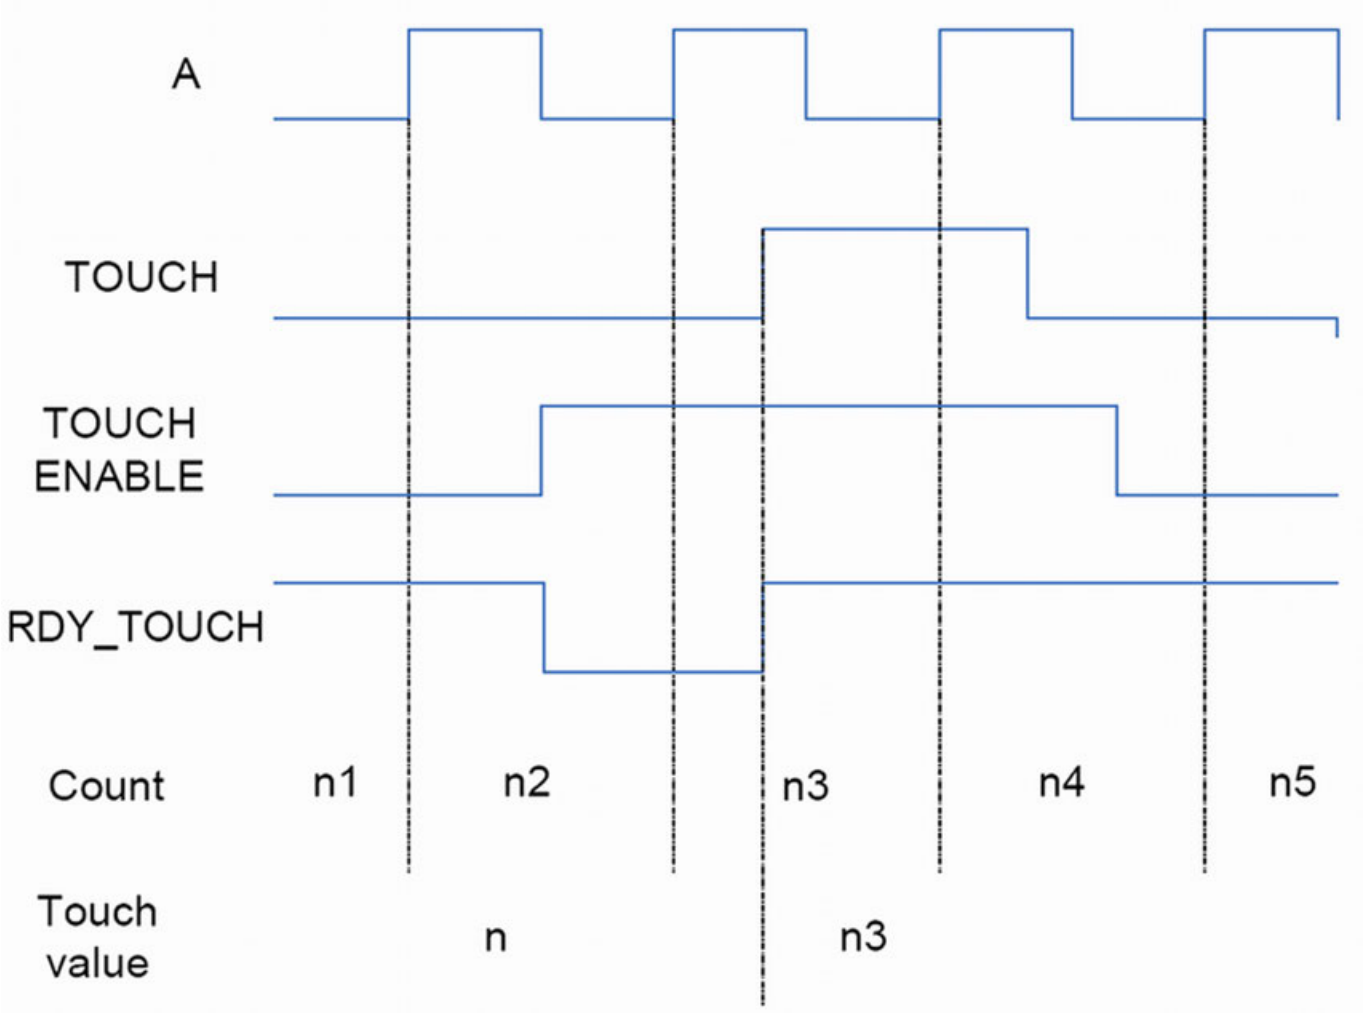

Fig. 1147: Procedure and associated counting value with signal A

Touch/catch operation is enabled through control bit (EN_TOUCH). This resets the status flag (RDY_TOUCH), when the pre-determined edge occurs; the current counter value is stored in the touch value double word. In the same time, the status RDY_TOUCH is set to TRUE.

A rising edge at input DI0, DI1, DC2 or DC3 causes the function block to store the actual counter value and to display this value at output CNT_TOUCH.

RPI procedure

The RPI (Reference Point Initialization) is used to synchronize the counter value with the mechanical zero reference based on signal Z.

RPI procedure is enabled with control bit (EN_RPI). If this control bit is set, the module checks for the Z signal. When the signal appears, the set value is copied in the current counter value and RDY_RPI is set (see figure below).

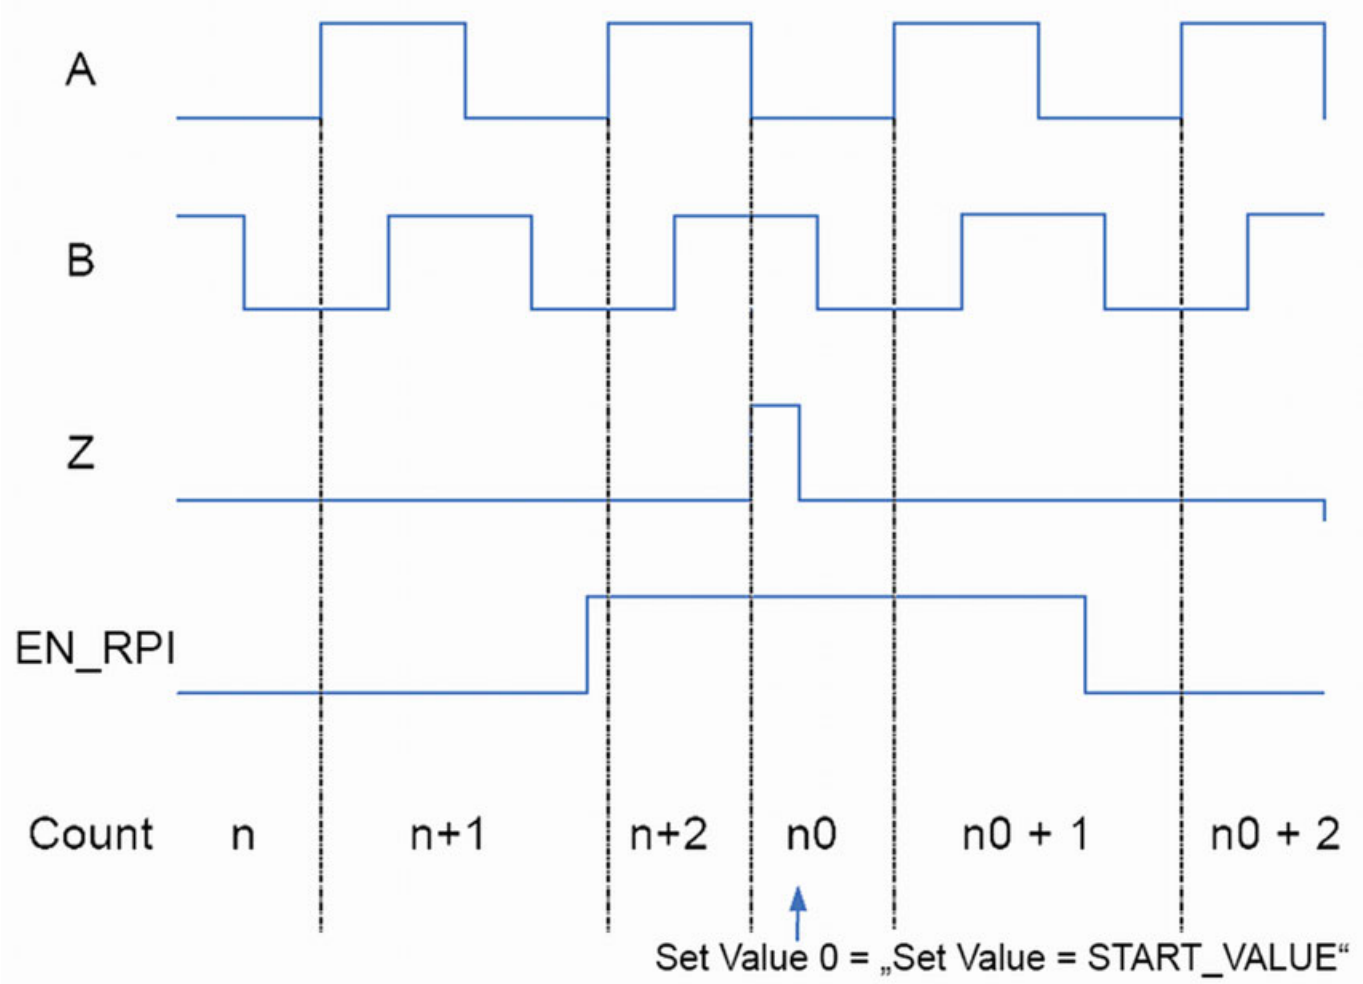

Fig. 1148: RPI operation

A rising edge at the digital inputs DI0, DI1, DC2 or DC3 activates the counter value capture and the counter reset during the capture.

Only one function may be enabled at one time, either the RPI (reference point indicator) or TOUCH (touch trigger measurement) function. If both functions are enabled simultaneously or if the execution of one function is not yet completed when enabling the other function, the RPI function will have a higher priority than the TOUCH function.

SET operation

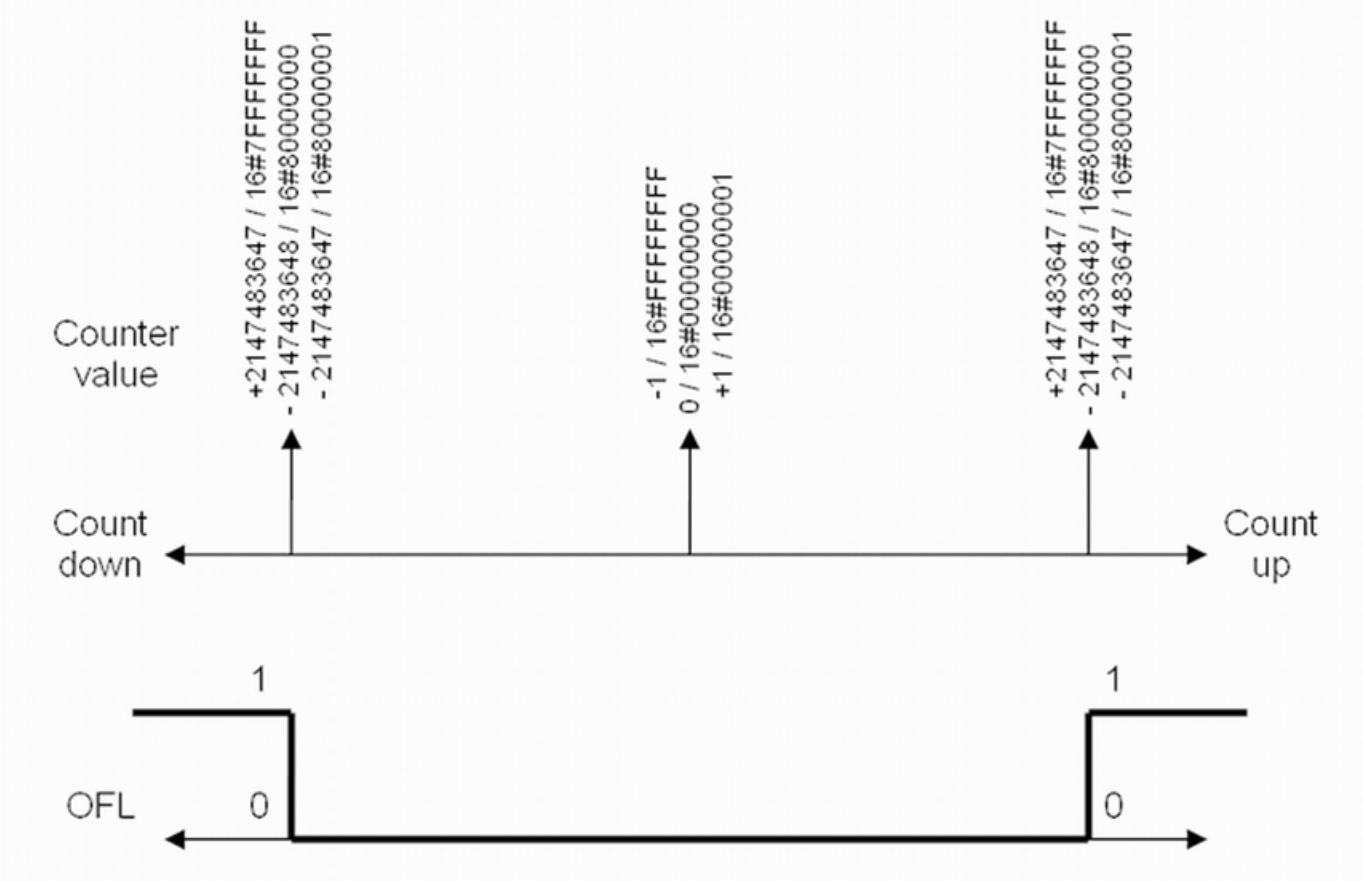
A rising edge at input DI0, DI1, DC2 or DC3 causes the function block to store the START_VALUE value and to display this value at output ACT.

RESET operation

A rising edge at input DI0, DI1, DC2 or DC3 causes the block to reset the value at output ACT.

Overflow operation

The counter operates as infinite counter. An overflow occurs corresponding to the 32-bit value at 16#80000000 = 2147483648 and any exceeding or falling below of this value (depending to up and down use) OFL will set to TRUE.



Absolute SSI encoder

The function block CMS_IO_SSI_CNT can be used to control SSI absolute encoder function ↳ *Chapter 1.5.8.2.1.6 "CMS_IO_SSI_ENC" on page 2545*. There is an interface for absolute angle and linear encoders (displacement measurement systems).

It allows the transmission of absolute position information through a serial data transfer.

The transmission is based on synchronous serial communication. The device sends a clock signal to the encoder and synchronously, the encoder returns the positioning data from the most significant to the less significant bit.

The synchronization for a new data stream is based on time without clock pulse. This quiet time depends on the encoder.

Possible operation modes: 14-1 ↳ *Table on page 5728*

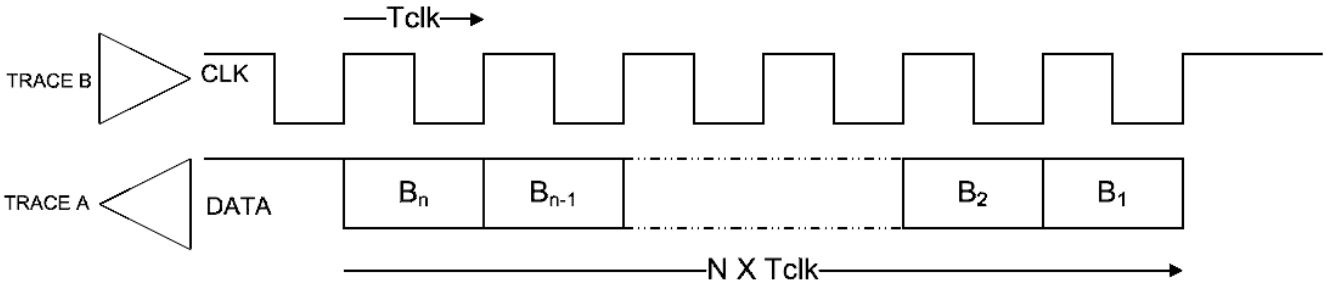


Fig. 1149: Chronogram with data organization with the clock pulse

Resolution For the resolution of the encoder device see technical data from manufacturer. The resolution can be set in configuration under *"SSI parameters ➔ SSI resolution"*.

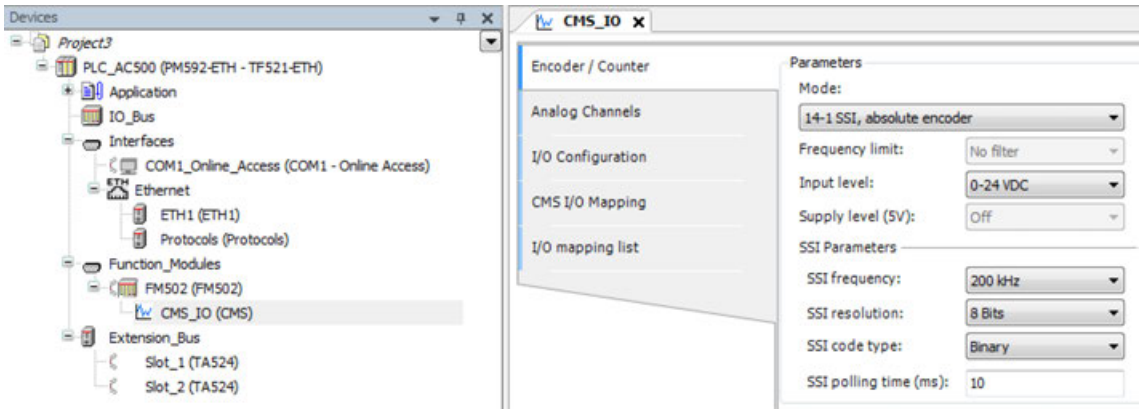

Fig. 1150: SSI parameters

The trace B of the FM502-CMS is switched as output signal (differential). On the rising edge of the signal, the sensor shifts a new value, starting from the most significant bit.

The clock frequency can be specified under *"SSI parameters ➔ SSI frequency"*.

CAUTION!
Risk of malfunctions!
The clock frequency is only an approximately value.

Do not use the clock frequency for any other purposes, e.g. time measurements.

SSI polling time definition

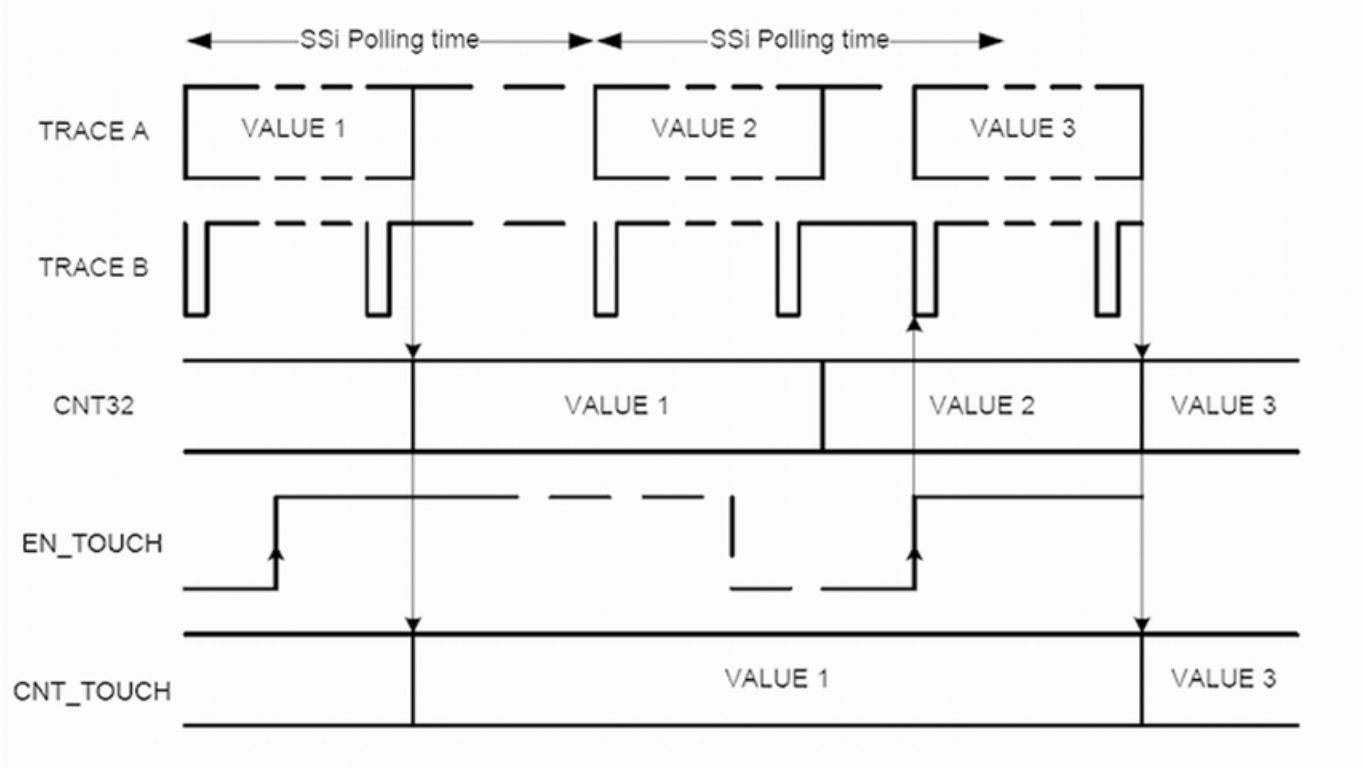
The complete read sequence is launched regularly by the Function Module. The interval between each sequence can be configured under *"SSI parameters ➔ SSI polling time"*.

SSI and touch/ catch operation

Touch operation is valid with SSI sensor. The goal of touch operation is to synchronize sensors with the same hardware signal. In the SSI mode the management is different depending on the reading procedure is running or not.

If the reading procedure has already started while the touch signal becomes active, the reading procedure finishes normally and the last read value is stored in the touch register.

If the reading procedure has not started, the encoder is in the interval between 2 measurements. The reading procedure is started one time more and the result of the last reading is stored in the touch register.

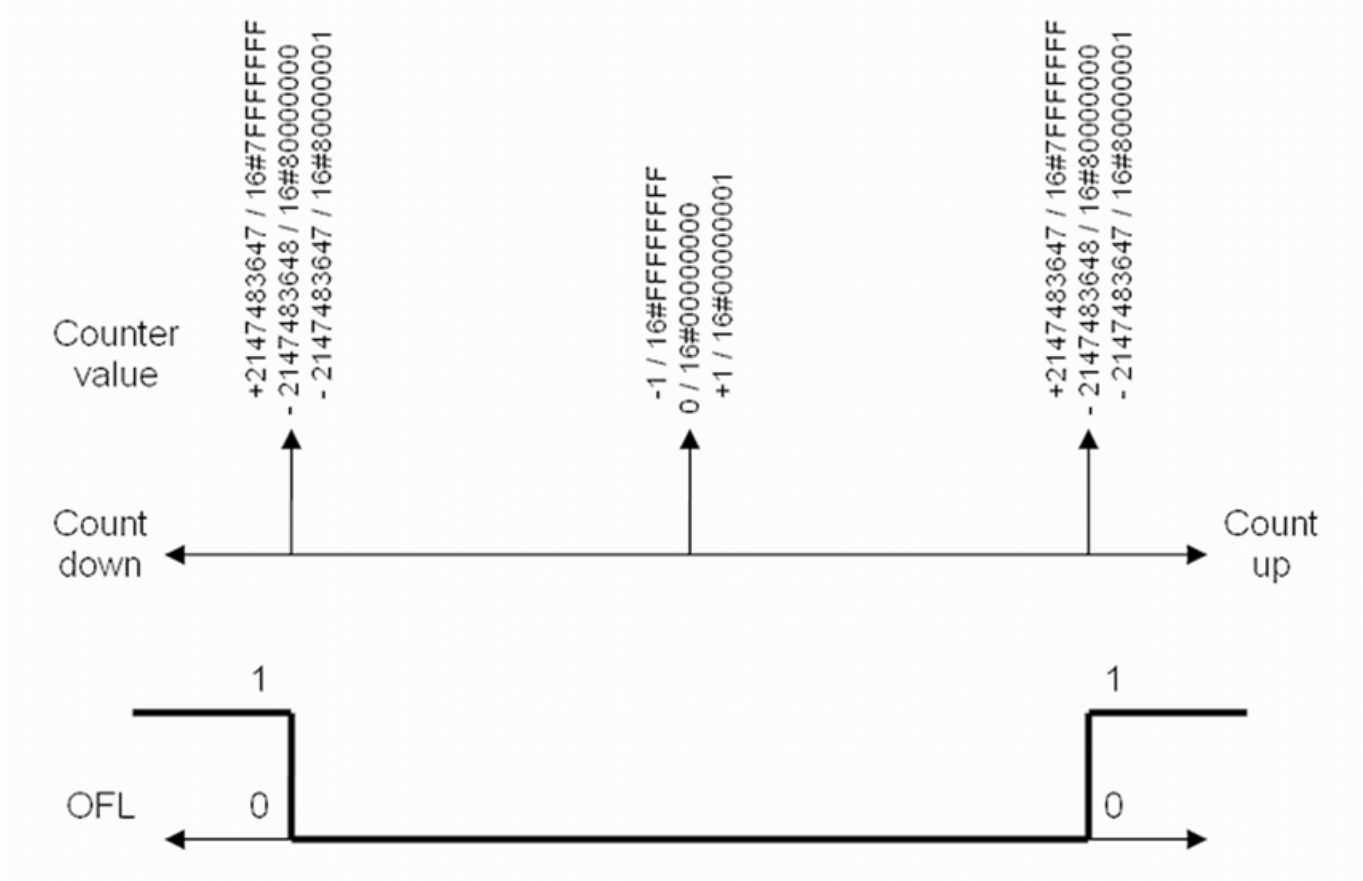


Touch/catch operation is enabled through control bit (EN_TOUCH). This resets the status flag (RDY_TOUCH), when the pre-determined edge occurs; the current counter value is stored in the touch value double word. In the same time, the status RDY_TOUCH is set to TRUE.

A rising edge at input DI0, DI1, DC2 or DC3 causes the function block to store the current counter value CNT32 (ACT) and to display this value at output CNT_TOUCH.

Overflow operation

The counter operates as infinite counter. An overflow occurs corresponding to the 32-bit value at 16#80000000 = 2147483648 and any exceeding or falling below of this value (depending to up and down use) OFL will set to TRUE.



FM502-CMS used as time frequency meter

The function block CMS_IO_FREQ_SCAN is used to measure times, frequency and rotation speeds on channel Z+ of the Function Module *Chapter 1.5.8.2.1.5 “CMS_IO_FREQ_SCAN” on page 2542*.

Possible operation modes: 15-1 *Table on page 5728*

The Function Module provides one channel (Z+) which can be used to measure times, frequencies and rotational speeds with a resolution of 1 µs.

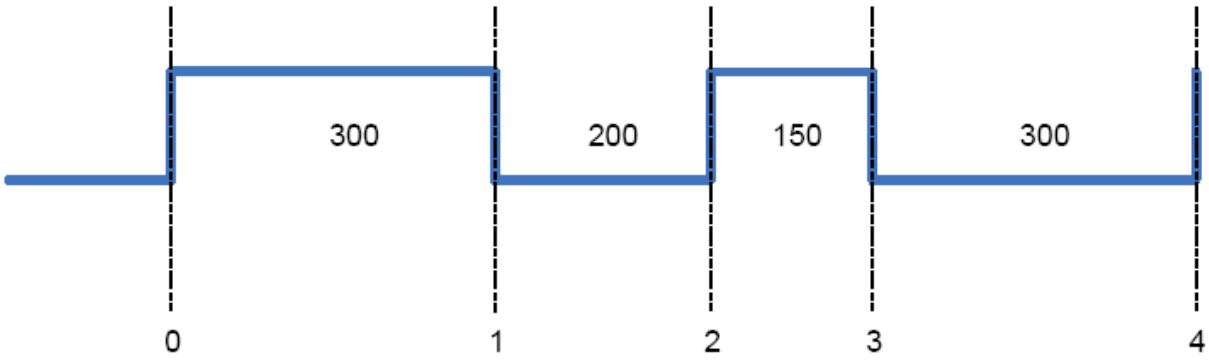


Fig. 1151: Example of timing

Table 723: Values measured according to configuration input parameters and example

EN_0	EN_1	EN_FREQ	Type	1	2	3	4
FALSE	FALSE	TRUE	No measurement	0	0	0	0
FALSE	TRUE	TRUE	Between 2 falling edges		500		450
TRUE	FALSE	TRUE	Between 2 rising edges			350	
TRUE	TRUE	TRUE	Between any 2 edges	300	200	150	300
FALSE	FALSE	FALSE	No measurement	0	0	0	0
FALSE	TRUE	FALSE	Between the rising edge and the subsequent falling edge	300		150	
TRUE	FALSE	FALSE	Between the falling edge and the subsequent rising edge		200		300
TRUE	TRUE	FALSE	Between any 2 edges (start between edge 0 and 1) *)		200		300
TRUE	TRUE	FALSE	Between any 2 edges (start between edge 1 and 2) *)			150	

*) The timing measurement is a single shot process. The function block manages renewal of the measurement as soon as the enable input is valid. Because of timing required to exchange management bits on the bus, it is not possible to provide the time measurement between two adjacent edges. Therefore, the time measured depends on when the measurement is started.

Depending on the input parameters of the function block, the result of the measurement can be read as time in µs, frequency in Hz or speed of rotation in rotation per minute.

FM502-CMS used with synchronized counter/encoder files

Refer to the operation modes and used function blocks ↬ *Table on page 5728*.

Configuration

▷ Configure at least an encoder mode and one analog channel which should be recorded.

⇨ When encoder mode is set, on the **analog channels** tab the check box *Synchronized encoder file* is selected.

The encoder track will only be recorded when the correct encoder function block is used and enabled.

Measurement files

The measurement data will be stored in the WAV file format. One WAV file will be created for each active channel.

Table 724: RIFF header

Data type	Endian	Length	File offset	Identifier	Value
BYTE[4]	Big	4	0 (0x00)	bfChunkID	"RIFX"
DWORD	Little	4	4 (0x04)	dwChunkSize	Data length - 8

BYTE[4]	Big	4	36 (0x24)	bfChunkID	"data"
DWORD	Little	4	40 (0x28)	dwChunkSize	Data length - 8
BYTE[]	Big	Undefined	44 (0x2C)	bfData	Measurement data

Table 727: Label chunk

Data type	Endian	Length	File offset	Identifier	Value
BYTE[4]	Big	4	44+sz(bfData)	bfChunkID	“labl”
DWORD	Little	4	48+sz(bfData)	dwChunkSize	Data length -8
DINT	Little	4	52+sz(bfData)	dwIdentifier	Identifier
BYTE[256]	Little	255	56+sz(bfData)	bfText	„Label Text“

The WAV files will be stored in an uncompressed ZIP file at the destination path of CMS_IO_MEASMNT_CTRL. The name of the WAV files is given by the Function Module and is corresponds directly with the analog channel and encoder configuration. For every encoder synchronized shannel with different sample rate, there will be a new encoder track which will be used for synchronization.

Example

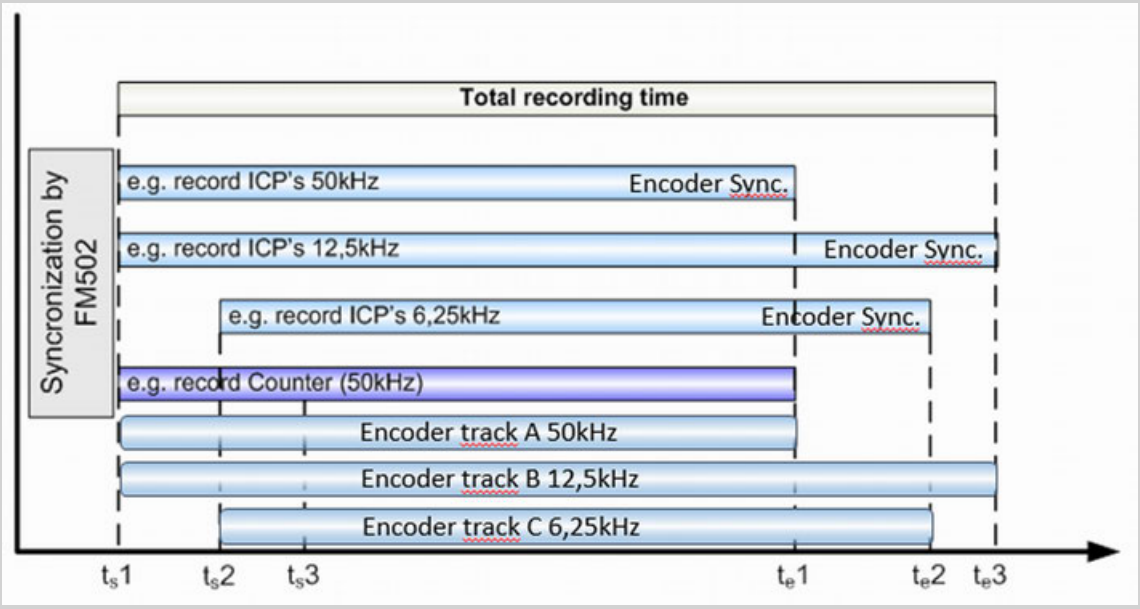
Encoder is configured as:

Channel 0: Sample rate 50 kHz, synchronized encoder file

Channel 1: Sample rate 12,5 kHz, synchronized encoder file

Channel 2: Sample rate 6,25 kHz, synchronized encoder file

Result: The ZIP file contains the WAV files: CH00_ENA.wav, CH01_ENB.wav, CH02_ENC.wav, Enc_A.wav, Enc_B.wav, Enc_C.wav



Example

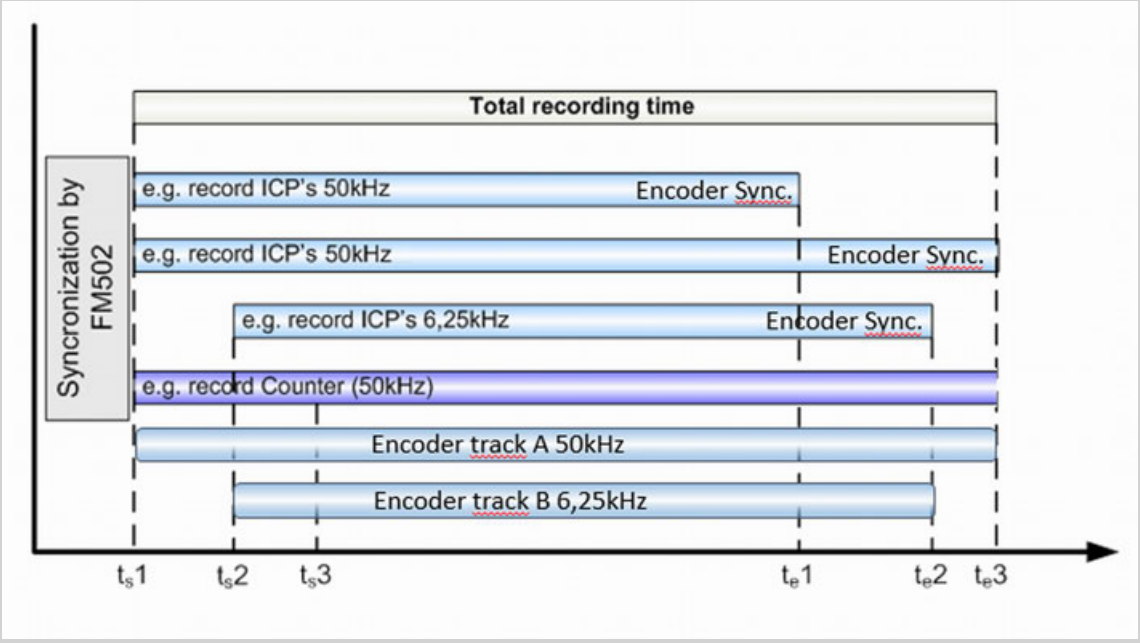
Encoder is configured as:

Channel 0: Sample rate 50 kHz, synchronized encoder file

Channel 1: Sample rate 50 kHz, synchronized encoder file

Channel 2: Sample rate 6,25 kHz, synchronized encoder file

Result: The ZIP file contains the WAV files: CH00_ENA.wav, CH01_ENA.wav, CH02_ENB.wav, Enc_A.wav, Enc_B.wav



The encoder/counter value at the output of the function block will reset when configuration data of the Function Module will be written in CODESYS.

1.6.4.4.4 FM562 module

Information on configuration in Automation Builder: *Chapter 1.6.5.2.8.4 "FM562 module" on page 6056*

Functionality of the FM562 Module

Basic features of the PTO module FM562

Digital inputs	4 inputs (2 inputs per axis) ● Input 0, Input 2: Enable input used for limit switches and enable signal (3 signals in 1 chain)  ● Input 1, Input 3: Stop/Registration input used as interrupt input ● Stop: emergency stop and give the actual position information, the deceleration value can be set via the function block which is provided by the library. ● Registration: give the actual position information, number can be viewed via the function block which is provided by the library, the registration input can be used for homing.

PTO outputs	PTO output mode can be configured by parameters. ● 2-axis control in 1 module ● PTO output type: RS-422 differential output ● PTO frequency: 0..250 kHz ● Configurable PTO output mode: Pulse + Direction / CW + CCW ● CW/CCW (clockwise/counterclockwise): pulse string is set out on 1 of the 2 differential channels according to motor rotation direction. The output channel is defined by a function block. Pulse+ / Pulse- (CW/CCW)  ● Pulse/direction: 1 differential channel for pulse string and 1 differential channel to set direction of movement Pulse + Direction (Pulse / Direction) PTO Output 0 (Pulse)  PTO Output 1 (Direction) Power supply for encoders	● Input voltage range: 18..31.2 V DC ● Reverse polarity protection: withstand 10 s ● Surge voltage: 35 V for 0.5 s ● Allowed interruptions of power supply :interruption < 10 ms, time between 2 interruptions > 1 s ● Isolation: 1.2/50 μs Impulse peak 500 V
LED displays	● 1 green LED for PWR (I/O Bus power) ● 1 red LED for ERR ● 1 yellow indicator for each digital input/output channel ● 1 yellow LED indicator for each pulse output channel

The function blocks used with FM562

The following function blocks are used for realizing positioning and speed control with PTO FM562.

The function blocks mentioned below are part of PS552-MC-E Libraries. These libraries are not part of Automation Builder and must be ordered separately.

Classification	Name	Description
PTO Function blocks	PTO_FM562_ACCESS	This function block is used to adapt specific PLCopen blocks to FM562 module and also adds other specialized function for FM562.
PLCopen Function blocks	MC_Power	This function block controls the power stage (on or off).
	MC_Stop	This function block aborts any ongoing function block execution.
	MC_Reset	This function block resets the current axis position to 0.
	MC_MoveAbsolute	This function block commands a controlled motion to a specified absolute position
	MC_MoveRelative	This function block commands a controlled motion of a specified distance relative to the actual position at the time of the execution.
	MCA_MoveVelocityContinuous	This function block commands a never ending controlled motion at a specified velocity and changes velocity on fly.

Latency of function block *PTO_FM562_ACCESS*

When the command for a movement is given, the function block transmits the parameters in several I/O bus cycles. Then the movement is started. The maximum reaction time can be calculated with the following formula:

Max. reaction time = 3 x (T + 3.32 ms)

T = Application program cycle time in ms (set in the configuration)

Example:

- Application program cycle time = 1ms.
  Max. reaction time = 3 x (1 ms + 3.32 ms) = 13 ms
- Application program cycle time = 10 ms.
  Max. reaction time = 3 x (10 ms + 3.32 ms) = 40 ms

Special features

FM562 provides a square wave output for a specified number of pulses and a specified cycle time. It can be programmed to produce either 1 train of pulses or a pulse profile consisting of multiple trains of pulses. For example, a pulse profile can be used to control a stepper motor through a simple ramp up, run, and ramp down sequence or more complicated sequences. The control positioning is achieved according to an open loop mode, meaning without the need for feedback information on the real position. The position loop is integrated in the servo-drive.

Parameter configuration

No.	Operation Object	Function	Description
1	Input 0	No Function	No Function
		Axis enable/Limit switch	When the input is high (24 V), axis can output pulses; when the input is low (0 V), axis cannot output pulses.
2	Input 1	No Function	No Function
		Stop	Stop the pulse output when the signal is high
		Registration	Triggered by the rising edge of the signal, the actual position information can be viewed via the function block which is provided by the library, the registration input can be used for homing.
3	Output	CW/CCW	Pulse string is set out on 1 of the 2 differential channels according to motor rotation direction
		Pulse/Direction	1 differential channel for pulse string and 1 differential channel to set direction of movement

1.6.4.5 System technology for AC31 adapter I/O modules

1.6.4.5.1 KP9x devices

Interrupt handler for KP9x devices

In case a KP9X coupler requires handling of incoming interrupts, an interrupt handler has to be configured.

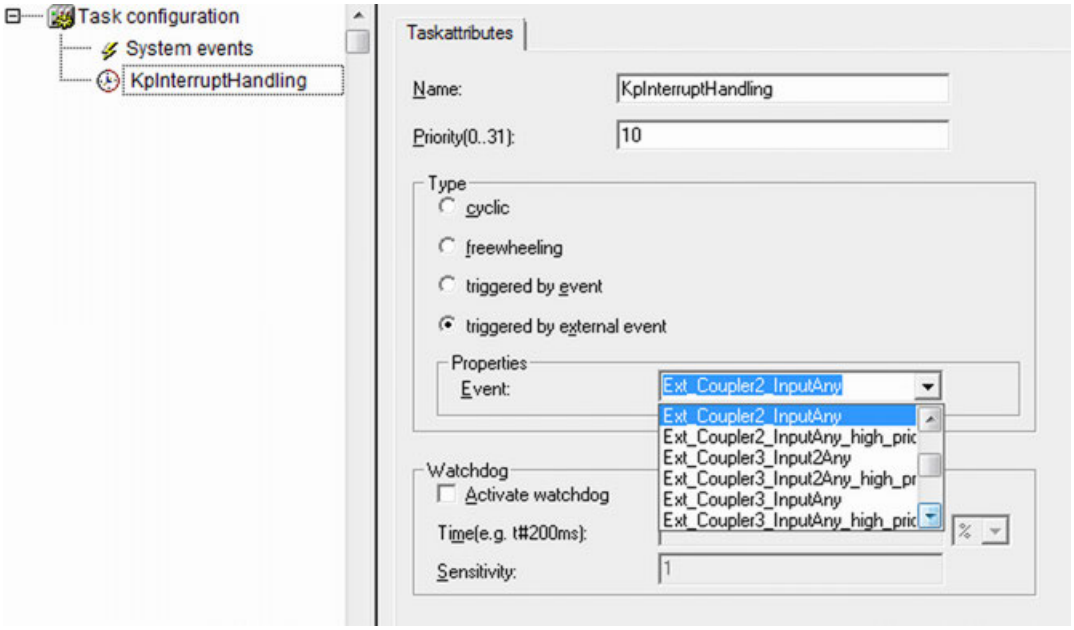
For this purpose, a new task has to be added in the task configuration of the Automation Builder. Enter the task name, set the task type to "external event triggered" and specify the event that triggers the task.

For each I/O bus slot, two types of interrupt tasks are available in the "Event" list box:

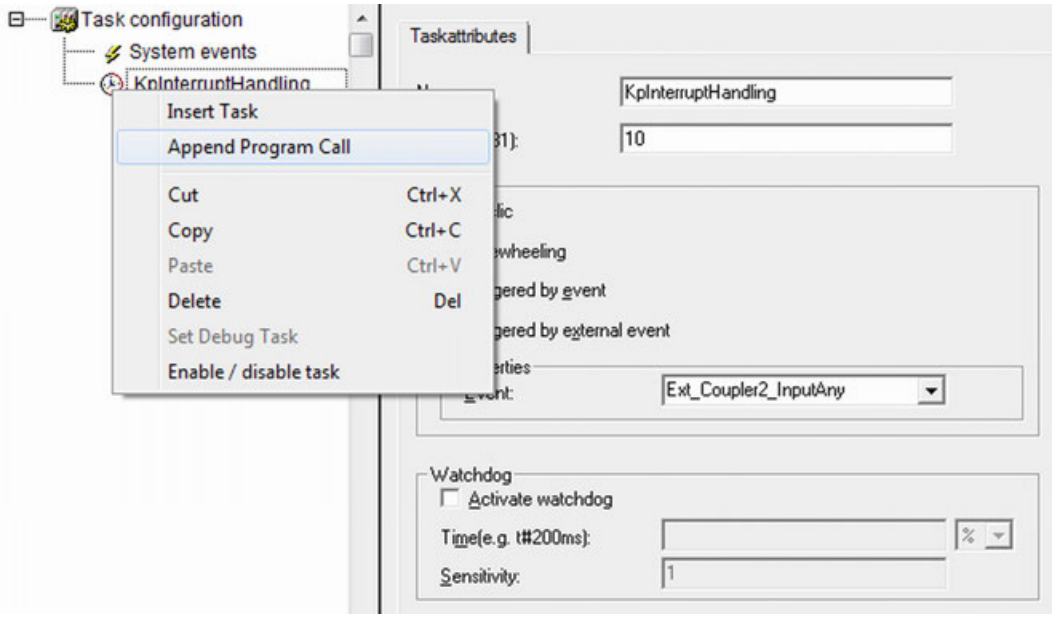
- Ext_CouplerX_InputAny:
  The task is triggered by any interrupt from I/O bus module slot X with the priority specified in the Priority field (0...31).
- Ext_CouplerX_InpuAny_high_prio:
  The task is triggered by any interrupt from I/O bus module slot X with highest priority, i.e. with a priority higher than the max. adjustable "0" and higher than the priority of the communication task. In this case, the priority (0...31) specified in the Priority field is without any significance.

NOTICE!
If the interrupt task is started with high priority (Ext_CouplerX_InpuAny_high_prio), the program execution time must not be longer than approx. 400 µs. Otherwise online access is no longer possible.

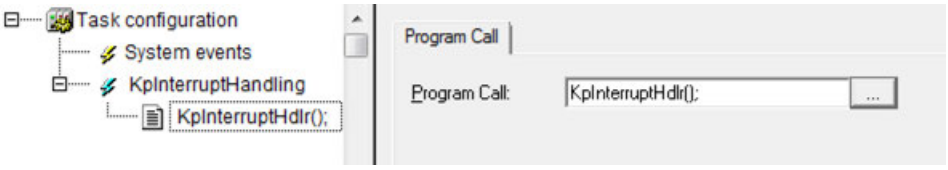
In the example below, the task is named KPInterruptHdlr_2, meaning that it is an interrupt from I/O bus located at slot 2 (where AC31 I/O bus is located for AC31 adapter systems). The task type is "external event triggered" and the event to trigger the task is "Ext_Coupler2_InputAny".



Like for all other tasks, a program call has to be assigned to the task.



In the example, the program KpInterruptHdlr() shall be started with any interrupt from Communication Module slot 1.



1.6.5 Configuration in Automation Builder for AC500 V2 products

1.6.5.1 General settings

This chapter describes the device configuration of AC500 product family with Automation Builder. Basic information on Automation Builder handling can be found in the *Chapter 1.2 "Getting started" on page 12*.

1.6.5.1.1 Project handling

What is a project?

- A project contains the objects which are necessary to create a controller program ("application"):
  - Pure POUs, for example programs, function blocks, functions, and GVLs.
  - Objects that are also required to be able to run the application on a PLC. For example, task configuration, Library Manager, symbol configuration, device configuration, visualizations, and external files.
- In a project, you can program multiple applications and connect multiple controller devices.
- CODESYS manages device-specific and application-specific POUs in the *"Devices"* view ("device tree") and project-wide POUs in the *"POUs"* view.
- For the creation of projects, there are templates that already contain certain objects.
- Basic configurations and information for the project are defined in the *"Project Settings"* and *"Project Information"*. For example:
  - Compiler settings
  - User management
  - Author
  - Data about the project file

  There are settings for the version compatibility of the project in the configuration dialogs in the *"Project Environment"*.

- You save a project as a file in the file system. As an option, you can pack it together with project-relevant files and information into a project archive. It is also possible to save files in a source code management system such as SVN.
- Each project contains the information about the CODESYS version with which it was created. When you open it in another version, CODESYS will notify you about possible or necessary updates regarding file format, library versions, etc.
- You can compare, import/export projects, and create documentation for them.
- You can protect a project from being changed, or even completely protect it from being read. By using user management, you can selectively control the access to the project and even to individual objects in the project.

Creating a new project

1. Select *"File ➔ New Project"*.

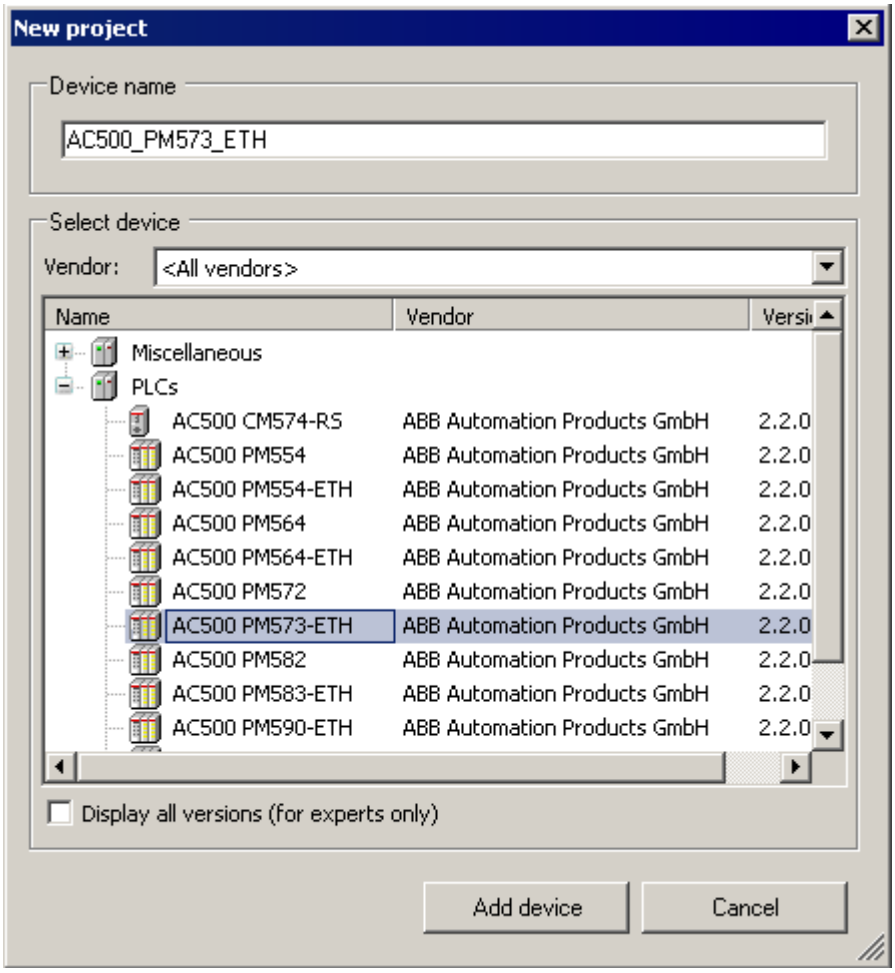
   If the used Automation Builder version is not the latest version, an information is displayed.

   - Select *"Change to newest installed version"* to create a project with the latest installed version of Automation Builder.
   - Select *"Continue to work with version: XXX"* to create a project in the current software version.

2. Select *"AC500 project"*, enter a project name and specify the storage location for the new project.

   With *"Empty project"* a project without a PLC is created.

3. Select the device type for the new project and click *[Add device]*.



⇨ A new project is created and can be configured.

Opening an existing project

NOTICE!

Risk of damaging Automation Builder projects!

Projects created with Automation Builder are incompatible with CODESYS V2.3.9.x. Do not open projects with CODESYS V2.3.9.x as this can cause corrupted Automation Builder projects.

Automation Builder performs an integrity check for the PLC configuration before generating the configuration.

Opening a project

1. Select *"File ➔ Open Project"*.
   ⇨ The *"Open Project"* dialog appears.
2. Select a previously saved project from the file system.
   ⇨ Automation Builder switches to the version of the project and opens the project.

Exporting and importing a project

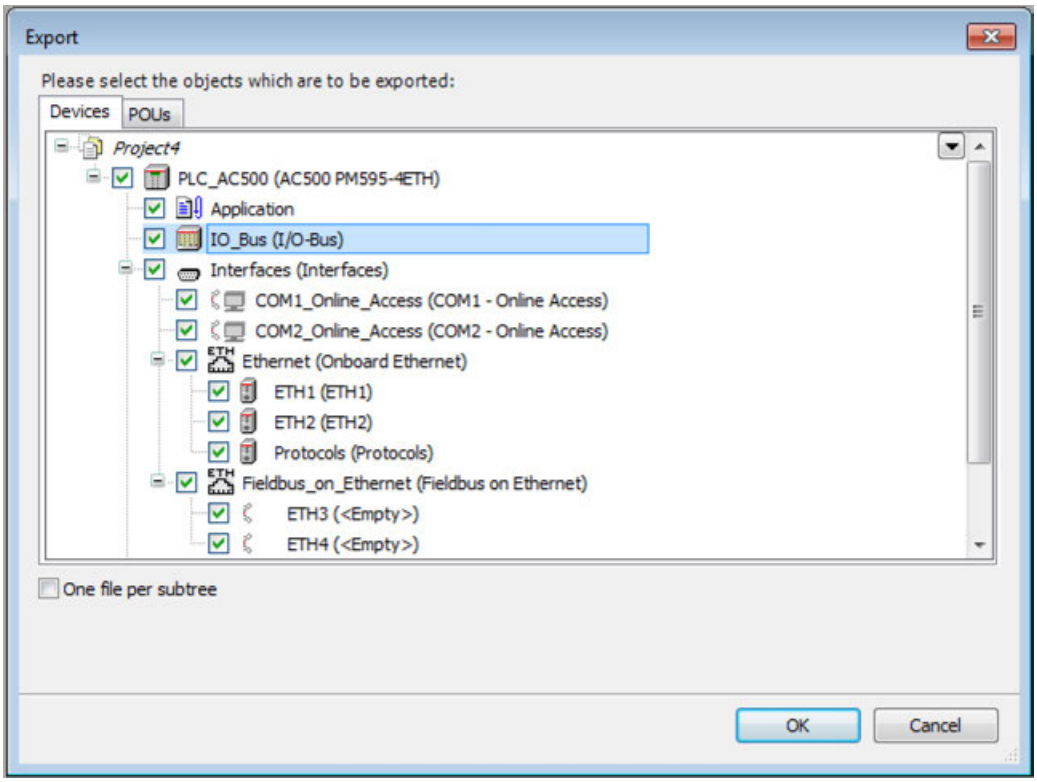
Configuration of a complete PLC or of single devices can be reused within the same project by copy-and-paste the desired nodes in the device tree.

In order to reuse a PLC configuration cross-over projects, the project configuration can be exported and imported afterwards into another project.

An exported project configuration can only be imported to a project with the same Automation Builder version. If the versions are not the same, the import fails with an error message.

Automation Builder performs an integrity check for the PLC configuration before generating the configuration.

Project export From the menu, select *"Project ➔ Export ➔ Project"*. Select the objects to be exported. The configuration of the selected items will be added to an export file (*.export).



"One file per subtree": If this option is activated, all objects belonging to the same subtree will be exported into the same export file, otherwise a separate file will be created for each particular object.

Project import

For importing a project a basic and an advanced function is available.

Basic project import: Users with a basic or a standard Automation Builder license can perform a **basic project import**. Command: *"Project ➔ Import ➔ Project"*.

> *A previously exported project configuration is imported into the current project. With this, the current project configuration is overwritten.*
>
> *In order to supplement the current project with the project configuration of a previously exported project, use the compare function. Command: "Project ➔ Compare".*
>
> *Chapter 1.6.5.1.1.6 "Comparing projects" on page 5765*

Advanced project import: Users with a premium Automation Builder license can perform an **advanced project import**. Command: *"Project ➔ Import ➔ Project with compare"*. This command allows to compare two projects, to check on differences and to adapt single parts of the project configuration easily.

Basic project import

1. From the menu, select *"Project ➔ Import ➔ Project"*.

> *A previously exported project configuration is imported into the current project. With this, the current project configuration is overwritten.*
>
> *In order to supplement the current project with the project configuration of a previously exported project, use the compare function. Command: "Project ➔ Compare".*
>
> *Chapter 1.6.5.1.1.6 "Comparing projects" on page 5765*

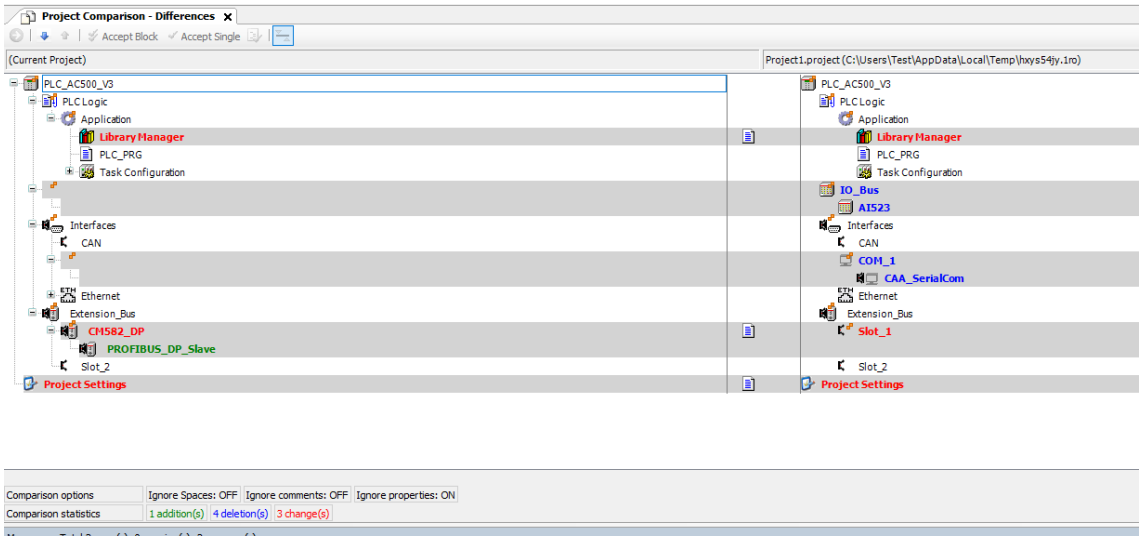
2. Select the export file from the file system and click *[Open]* to import the project configuration.

> *An exported project configuration can only be imported to a project with the same Automation Builder version. If the versions are not the same, the import fails with an error message.*

Advanced project import

Perform an advanced project import in order to compare two projects, to check on differences and to adapt single parts of a previously exported project configuration easily.

1. From the menu, select *"Project ➔ Import ➔ Project with compare"*.
2. Select the export file from the file system and click *[Open]* to import the project configuration.
   ⇨ The project import is started.
3. Once the project file is imported, a compare view is displayed. The left pane represents the current project, the right pane represents the imported project.



⇨ Differences between the current project and the imported project are highlighted in red color.

⇨ Additional modules in the current project that are not available in the imported project are highlighted in green color.

⇨ Additional modules in the the imported project or deleted modules in the current project are highlighted in blue color.

⇨ A summary of all differences within the projects is given in the *"Comparison statistics"* under the device tree.

4. Every highlighted item of both projects can be handled individually and can either be transferred to the current project or skipped.

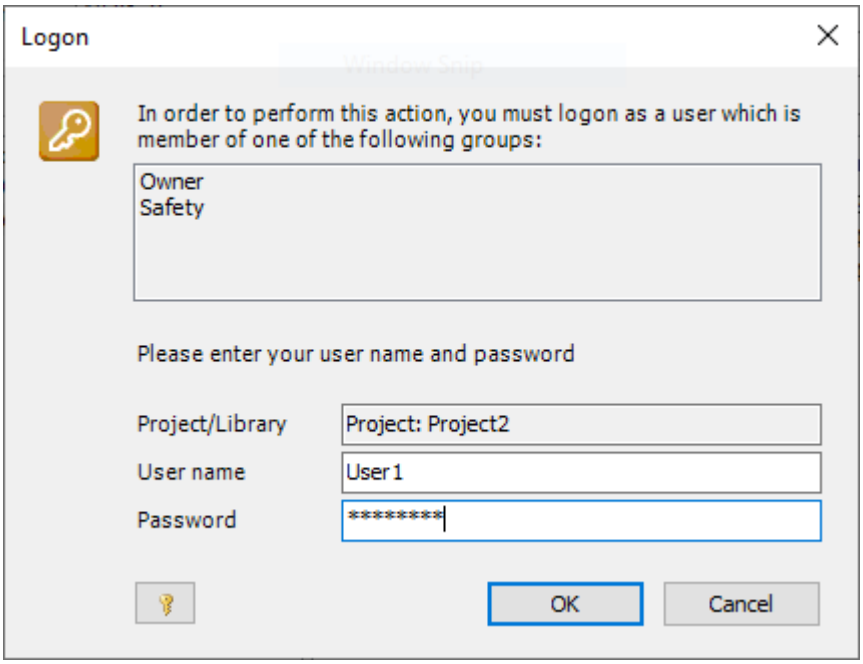
   - *[Accept Block]*: All items of the selected node are transferred to the current project with one click. Use this function for example to copy all nodes of a PLC configuration from the imported project to the current project (select *"I/O_Bus"* node).
   - *[Accept Single]*: Only a single item from a node is transferred to the current project. Use this function for example to copy certain I/O modules from the imported project to the current project.

   ⇨ All accepted items are highlighted in the current project in yellow color.

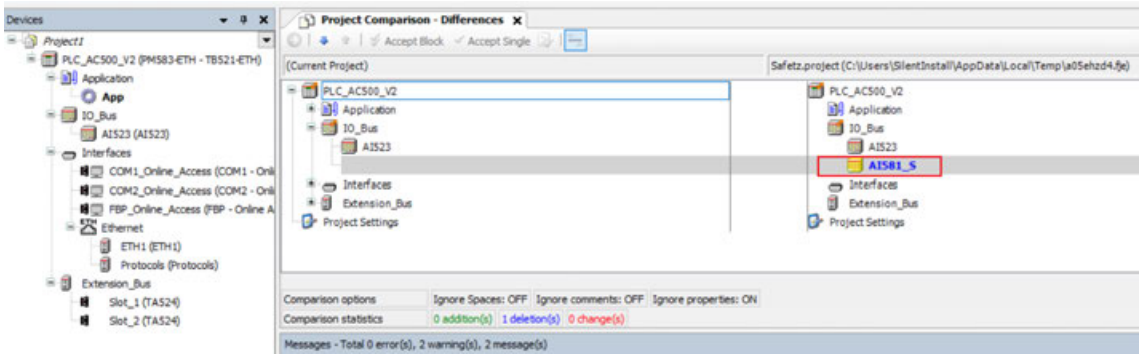
   ⇨ To undo a selection, again, click *[Accept Block]* or *[Accept Single]*.

   ⇨ To accept all changes on the current project, close the *"Project Comparison - Differences"* tab and confirm the prompted dialog.

5. If in the import project the PLC contains an AC500-S safety module, a security check is performed which requires user authentication:



6. After a successful user authentication the AC500-S safety modules are added to the compare view and can be imported to the current project.



Upgrading/ updating a project to a new Automation Builder version or profile

When upgrading or updating Automation Builder a previously configured project can be converted in order to be used in a new Automation Builder version or with a new Automation Builder profile.

Definition:

*Automation Builder upgrade: changing over to a major Automation Builder version (e.g. from version 2.**3**.1 to version 2.**4**.1).*

*Automation Builder update: changing over to a minor Automation Builder version (e.g. from version 2.4.**0** to version 2.4.**1**).*

Further, a project that has been configured for an AC500 V2 PLC can be converted to a project for an AC500 V3 PLC.

Chapter 1.6.5.6 “Converting an AC500 V2 project to an AC500 V3 project” on page 6330

Before the upgrade/update

Project archive

*Create a project archive before updating Automation Builder. Project archives contain all project data, including data that is not stored with a *.project file, e.g. device description files for third party devices.*

Chapter 1.6.5.1.1.7.1 “Creation of an archive ” on page 5768

RobotStudio station

RobotStudio integration has been discontinued as of Automation Builder 2.1.0. It is recommended to externally store the link to the RobotStudio station and to remove the RobotStudio station object prior to the upgrade.

Automation Builder profile

To use the Automation Builder profile of an older project, the old profile must have been installed. The installation of older Automation Builder profiles can be activated in the device dialog during the upgrade process.

Upgrading/ Updating a project

1. With opening a project Automation Builder automatically detects the project version. In case of an outdated project version a dialog is prompted.

   ⇨ If the update is confirmed, the project is automatically updated to the latest Automation Builder version.

   Automation Builder updates the complete project (complete device tree) to the latest version. Success messages, warnings and errors are described in the section *"All messages"*.

   ⇨ If the update is declined, the project is closed unchanged.

   In order to initiate a project update or upgrade later on, select *"Project ➔ Update Project"*.

   ⇨

   To keep an older project, it must be opened with the same Control Builder Plus/ Automation Builder version the project has been created. For this, the appropriate Control Builder Plus/ Automation Builder profil must be selected.

   In this mode, new Automation Builder features cannot be used.

   It is not possible to downgrade a project to an earlier Automation Builder version.

   Automation Builder performs an integrity check for the PLC configuration before generating the configuration.

AC500 V2 libraries

2. When upgrading Automation Builder, new available AC500 V2 system libraries are installed automatically. In difference to AC500 V3 libraries the AC500 V2 libraries are not versioned. Hence, after an Automation Builder update login to a PLC might only be possible after a rebuild and with an online change. This might be required although the application has not been changed and the previous version profile is still in use.

   To avoid this, add the AC500 V2 libraries to the Automation Builder project. The procedure on how to add a AC500 V2 (system) library to a project is described exemplarily.

Migrate third party devices

3. During the project upgrade, an option for migration of third party devices can be selected. If this option was not selected during the upgrade procedure, migration can be initiated manually after an Automation Builder upgrade in order to migrate all third party devices to the project.

   ↳ *Chapter 1.6.5.1.10 "Migration of third party devices" on page 5807*

4. Exception, for the CANopen device CM598-CN:

> *Usually, when upgrading Automation Builder or an existing project, new AC500 V2 system libraries are installed automatically and older library versions are removed.*
>
> *As an exception, for the CANopen device CM598-CN both library versions are available in the Library Manager due to compatibility reasons. However, coexistence of a new library version and an older library version is not possible. In order to avoid compile errors remove the older library version.*

Login

5. After the Automation Builder upgrade login to the PLC from Automation Builder: right-click *"Application ➔ App"* and select *"Login [PLC_AC500_V2]"*.

   ⇨ The firmware on the devices is upgraded.

> *Depending on the currently installed firmware versions, a login from CODESYS V2.3 might be impossible prior to the firmware update.*

Updating PLC devices

To update all devices of a PLC project, right-click the PLC node and select *"Update objects"*. In the dialog enable *"update subtree"* option to update all sub-objects. Otherwise only the processor module object is updated.

To update a specific device only, the command *"Update objects"* can be executed individually at the specific node.

I/O mapping export and import

Export I/O mapping

To exchange information on I/O mapping only, data can be exported as .csv file. This allows maintenance of I/O data outside Automation Builder, e.g. in MS Excel.

Right-click the *"Processor Module"* node or *"I/O_Bus"* node in the device tree and select *"Export -> IO mapping"*. To export the I/O Mapping for the complete project, e.g. with more than one configured processor modules, I/O data of the complete project can be exported *"Project -> Export -> I/O mapping"*.

Import I/O mapping

A previously exported .csv file can be imported to the project: *"Project -> Import -> I/O mapping"*.

Comparing projects

You can compare the currently open project with another project – a reference project. The differences in contents, properties, or access rights are detected and shown in a comparison view.

Clicking *"Project ➔ Compare"* opens the *"Project Compare"* dialog for you to configure and run the comparison. Then the result is shown in the comparison view *"Project Compare - Differences"* where the objects are aligned in a tree structure. Objects that indicate differences from the respective reference object are identified by colors and symbols. This is how you detect whether or not the contents, properties, or access rights are different.

For differences in the contents, you can also open the detailed compare view *"Project Compare - <object name> Differences"* in order to zoom into the object. In the detailed compare view, the contents of the object and reference object are displayed or their source code aligned. The detected differences are marked. Previously opened views are not closed. In this way, you can have any number of comparison views open and read them, in addition to the project compare view.

You can accept the detected differences from the reference project into the current project. This is possible only from the reference project into the open project. To do this, you activate differences (for example in the code) that should be accepted in the current project with the commands , , or in the active comparison view for accepting. These positions are highlighted in yellow. Make sure that any other open compare views are inactive (write-protected, read-only). therefore, you can activate differences to be accepted in exactly one comparison view only. When exiting the active compare view, if you confirm that the differences that are activated for acceptance are actually accepted into the current project, then the current project is modified.

In order to exit the project comparison completely, close the project compare view.

Creating a comparison view

Requirement: You have made changes in your current project and wish, for example, to compare it with the last-saved version. In the meantime, for example, you have added further POUs, removed a POU, changed single lines of code or the object properties in function blocks.

1. Select the command *"Project ➔ Compare"*.
   ⇨ The *"Project Comparison"* dialog box opens.
2. Enter the path to the reference project, for example the path to the last-saved version of your current project.
3. Leave the activation of the comparison option *"Ignore Spaces"* as it is.
4. Click on *"OK"*.
   ⇨ The comparison view opens. Title: *" Project Comparison – Differences"*. The Device trees of the current project and the reference project are displayed alongside each other and the changed objects are marked in color.
5. Select an object marked in blue in the tree of the reference project (right). The current project no longer contains this object.
   Click on *"Accept Single"*
   ⇨ The object is added to the tree of the current project (left). The line has a yellow background. appears in the middle column.
6. Select an object marked in green in the tree of the current project (left). The reference project does not contain this object.
   Click on *"Accept Single"*
   ⇨ The object is removed again from the tree of the current project (left). The line has a yellow background. appears in the middle column.
7. If changes are detected in the content of an object that is contained in both the current project and the reference project, this is indicated by red lettering. You can then switch to the detailed comparison view for the object by double-clicking on the object.
8. Close the comparison view and answer the query whether the changes made are to be saved with *"Yes"*.
   ⇨ The changes become effective in the project.

Opening the detailed compare view

Requirement: For example, a user modified the code in a POU of the current project. You have performed the project comparison by clicking *"Project ➔ Compare"*. The project compare view shows this POU highlighted in red in the aligned in the project tree.

1. Double-click the line of the aligned POU versions.
   ⇨ The compare view switches to the detailed compare view of the POU. The modified code lines are highlighted in gray and written in red.
2. Click .
   ⇨ Code lines with changes (red) are extended by two lines: an line with insert (left, green) and a line with delete (right, blue).
3. Click again.
   ⇨ The code line is marked again as modified.
4. Move the mouse pointer to the code line marked as modified and click *"Accept Single"*.
   ⇨ The code line from the reference project is activated for acceptance into the current project.
5. Click .
   ⇨ The project compare view opens for the entire project. It is write-protected (read-only) to prevent you from activating differences for acceptance. The link highlighted in yellow above the tree view also indicates this.
6. Click the link: *"Project compare view is read only because there are uncommitted changes in another view. Click here to switch to the modified view."*
   ⇨ The detailed compare view opens again. The unconfirmed changes are highlighted in yellow.
7. Click ✕ in the tab of the view and confirm that the changes should be saved.
   ⇨ The detail project view is closed and the POU is overwritten. Now it corresponds to the POU of the reference project. The project view is active again so that you can continue working with project compare.

> *If you do not click the link, but click ✕ instead to close the editor of the project compare view, then you will also confirm the acceptance of changes into the current project. The detail changes are accepted and then the project compare is closed completely.*

Project archive

Automation Builder supports the creation and the import of project archive files. Archive files contain all relevant project data including the PLC configuration, the project files of the CODESYS and all device descriptions. This allows exchanging Automation Builder projects without taking care of the target environment.

Creation of an archive

☑ The following steps describe the creation archive file from an Automation Builder project:

1. Select *“File ➔ Project Archive ➔ Save/Send Archive”*.
2. Select the information which should be included in the archive file from the list box.

Section/Control	Parameter	Description
Information selection list box	Options	Not supported
	Referenced devices	The referenced devices can be selected by expanding the "Referenced devices" item of the list box. It is strongly recommended to include all devices in the project archive to maintain consistency.
Additional files	-	Not supported
Comment	-	Opening a control window which allows the input of a comment to the project archive.
Save	-	Opening a dialog window to determine the path and the file name of the project archive and storing it to the file system.
Send	-	Not supported
Cancel	-	Canceling the operation and closing the dialog window.

With *[Comment]* additional information can be added to the project archive, for example to add a brief description or some information concerning the project.

3. Proceed with *[Save...]*.

It is strongly recommended to keep the default settings.

Section “Options” of the list box is not support. Do not enable this option.

Extraction of an archive

The currently loaded project will be closed automatically when extracting the selected project archive. It is recommended to open a new instance of Automation Builder before starting the extraction process.

☑ The following steps describe the extraction of an archive file and the import to Automation Builder.

1. Select *"File ➔ Project Archive ➔ Extract Archive"*.
2. Select the desired project file and click *[Open]*.

Section/ Control	Parameter	Description
Locations	Extract into the same folder where the archive is located	The project archive will be extracted to the same path where the archive is located.
	Extract into the following folder	Path to which the project archive should be extracted.
	Button ...	Opening a folder selection dialog which allows selecting the desired path.
Contents	Items	Select the items which should be extracted.
	Comment	Displaying comments included inside the Project archive file.
	Extract	Triggering the extraction process. Automation Builder extracts the archive and creates a project from out the archive. After creating the project Automation Builder checks the version of the project. If the project version and the activated Automation Builder version is not identical the workflow is the same as described in "Opening an Existing Project".
	Cancel	Closing the Extract Project Archive dialog and canceling the extraction process.

1.6.5.1.2 User and access rights management

User and access rights

The 'User Management' provide functions for defining user accounts and configure the access rights within a project. The rights to access project objects via specified actions are assigned only to user groups, not to a single user account. So each user must be member of a group.

User management

Before setting up users and user groups, notice the following: The configuration of users and groups is done in the Project Settings dialog *Chapter 1.6.5.1.2.3 "Project Settings - Users and groups" on page 5772*.

- Automatically there is always a group "Everyone" and by default primarily each defined user or other groups are members of this group. Thus each user account at least automatically is provided with defined default settings. Group "Everyone" cannot be deleted, just renamed, and no members can be removed from this group.
- Also automatically there is always a group "Owner" containing one user "Owner". Users can be added to or removed from this group, but at least one user must remain. This group also cannot be deleted and always has all access rights. Thus it is not possible to make a project unusable by denying the respective rights to all groups. Both group and user "owner" might be renamed.
- When starting the programming system resp. a project, primarily no user is logged on the project. But then the user optionally might log on via a defined user account with user name and password in order to have a special set of access rights.

Notice that each project has its own user management!
So, for example to get a special set of access rights for a library included in a project, the user must separately log on to this library. Also users and groups, set up in different projects, are not identical even if they have identical names.

CAUTION!
The user passwords are stored irreversibly!
If a password gets lost, the respective user account gets unusable. If the "Owner"-password gets lost, the entire project might get unusable!

Access right management

User management in a project is only useful in combination with the access right management. Notice the following:

- In a new project basically all rights are not yet defined explicitly but set to a default value. This default value usually is: "granted".
- In the further run of working on the project each right can be explicitly granted or denied resp. set back to default. The access right management of a project is done in the Permissions dialog *"Permissions" on page 5771*.
- Access rights on objects get "inherited". If an object has a "father" object (example: if an action is assigned to a program object, that is inserted in the structure tree below the program, then the program is the "father" of the action object) , the current rights of the father automatically will become the default settings of the child. Father-child relations of objects concerning the access rights usually correspond with the relations shown in the POUs or Devices tree and are indicated in the Permissions dialog by the syntax "<father object>.<child object>".

Example Action ACT is assigned to POU object PLC_PRG. So in the POUs window ACT is shown in the objects tree indented below PLC_PRG. In the Permissions dialog ACT is represented by "PLC_PRG.ACT" indicating that PLC_PRG is the "father" of ACT. If the "modify" right would be denied explicitly for PLC_PRG and a certain user group, the default value of the "modify" right for ACT automatically also would be "denied".

User management commands

The 'User Management UI' plug-in provides commands for command category 'User Management'.

These are used for:

- Configuration of access rights on the project objects
- Logging on or off to/from the project via a defined user account in order to get the access rights which are associated to this account

The configuration of user accounts and groups is done in the Project Settings subdialog User Management *Chapter 1.6.5.1.2.3 "Project Settings - Users and groups" on page 5772*.

By default the following commands are part of submenu 'User Management' in the 'Project' menu: Logon, Logoff, Permissions.

Logon Symbol: 

This command opens the Logon dialog for logging on to a project or library via a defined user account.

Logging on with a certain user account means to log on with those object access rights which are granted to the group which the user belongs to. The configuration of user accounts and groups is done in the Project Settings subdialog User Management.

To log on select the project or an included library from the selection list in the Project/Library field. Enter User name and Password of a valid user account, noticing that each project or library has an own user and access rights management. Log on with OK.

If already another user is logged on the project, this one will be logged out automatically by the new log-on action.

When you are logged on to a project or library and try to perform an action for which you have no right, automatically a Logon dialog will be opened, giving the possibility to log on with another user account provided with the appropriate rights.

The status bar always displays which user currently is logged on the project.

Logoff

Symbol: 

This command logs off the currently logged on user. If no user had been logged on to the currently opened project or to a referenced library an appropriate message will appear when trying to log off.

If the user currently is logged on to more than one project or referenced library (not necessarily with the same user account) a Logoff dialog will appear when trying to log off.

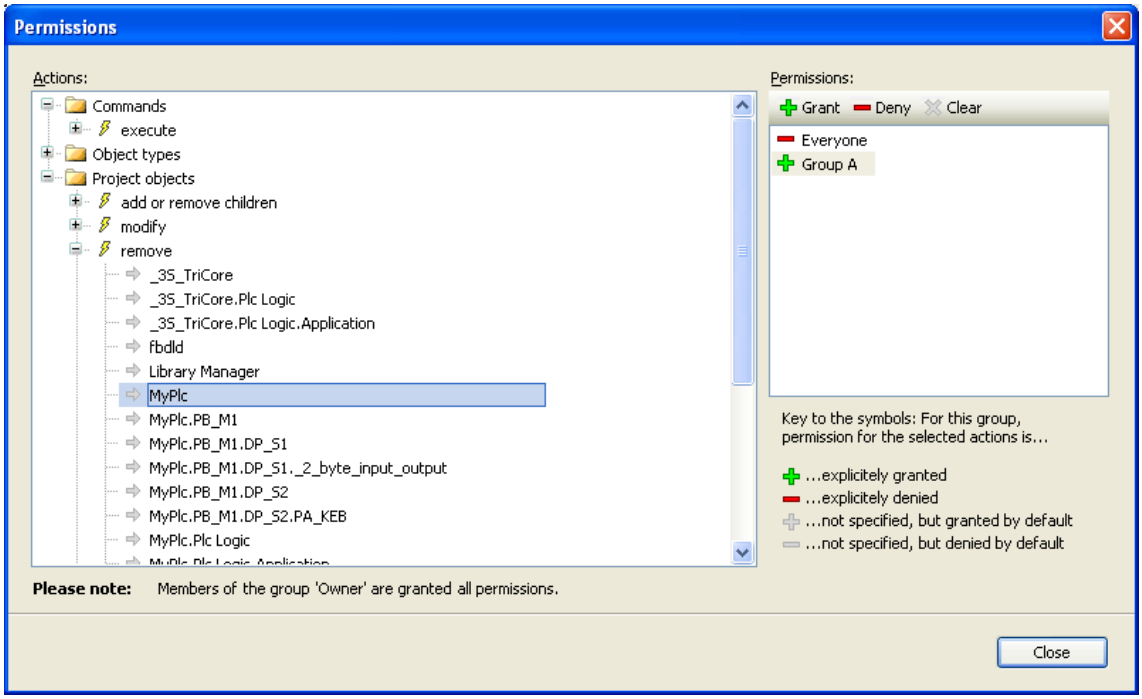
From the Project/Library selection list choose those project/library for which you want to log off. The name of the Current user is displayed just for information.

The status bar always displays which user currently is logged on the project.

Permissions

This command opens the Permissions dialog, where the rights to work on objects or to perform commands in the current project can be configured.

> *Any changes made in this dialog will be applied immediately.*



The Actions window displays all possible rights, that is all actions which might be performed on any object of the current project.

The tree is structured in the following way:

- Top-level see the names of some categories, which have been set up just for the purpose of optical structuring the rights management.
  They are grouping concerning the execution of Commands, the configuration of User accounts and Groups, the creation of Object Types, the viewing, editing, removing and handling of child objects of Project Objects.
- Below each category node there are nodes for the particular actions which might be performed on the command, user account, group, object type or project object. These nodes also only have optical function. Possible Actions:
  - execute (execution of a menu command)
  - create (creating a new object in the current project)
  - add or remove children (adding or removing of "child" objects to an existing object)
  - modify (editing an object in an editor)
  - remove (deleting or cutting an object)
  - view (viewing an object in an editor)

Below each action node find the possible targets, that is project objects, of the respective action.

The Permissions window provides a list of all currently available user groups (except the "Owner" group) and a toolbar for configuring rights to a group.

Select the group and configure it´s permissions.

Left to each group name one of the following icons indicates the currently assigned permission concerning the target which is currently selected in the Actions window:

- : The action(s) for the target(s) currently selected in the Actions window are granted for the selected group.
- : The action(s) for the target(s) currently selected in the Actions window are denied for the selected group.
- : The right to perform the action(s) which are currently selected for the selected target(s) in the Actions window, has not been granted explicitly, but is granted by default, for example because the corresponding right has been granted to the "father" object. (Example: The group has got the right for object "myplc", thus it by default it also has got it for object "myplc.pb_1".) Basically this is the default setting for all rights which not explicitly have been configured.
- : The right to perform the action(s) which are currently selected for the selected target(s) in the Actions window, has not been denied explicitly, but is denied by default, for example in case because the corresponding right has been assigned to the "father" object.

If currently multiple actions are selected in the Actions window, which do not have unique settings referring to the currently selected group, no icon will be displayed.

To configure the rights for a group select the desired action(s) and target in the Actions window and the desired group in the Permissions window. Then use the appropriate button in the toolbar of the Permissions window:

Grant: Explicit granting.

Deny: Explicit denying.

Clear: The currently granted right for the action(s) currently selected in the Actions window will be deleted, that is set back to the default.

Project Settings - Users and groups

The Project Settings dialog in category 'Users and Groups' provides three subdialogs for the user management for the current project: Users, Groups, Settings. For a general description on users and access rights management see help page *Chapter 1.6.5.1.2.1 “User and access rights” on page 5769*.

Users dialog

The currently registered users are listed in a tree structure. The ownerships of each user is displayed and each user is a member of a group by default *Chapter 1.6.5.1.2.1 "User and access rights" on page 5769*.

Define a new user account

1. Click *"Add"* to open the *"Add User"* dialog.
2. Define the user credentials and click OK to set up the new user. If there are incorrect entries (no login name, password mismatch, user already existing) you will get an appropriate error message.

Modify a user account Click *"Edit"* to open the *"Edit User"* dialog. The entry fields are the same as in the *"Add User"* dialog. The password fields however - for security reasons - will show 32 * characters. After having modified the desired entries close the dialog with OK to get applied the new settings.

Remove user accounts Enable the entries to be removed in the Users list and click *"Remove"*. Note that you will get no further inquiry! An error message appears if you try to delete all users from a group. At least one entry must remain.

Groups dialog

Add a group The currently available groups are displayed in a tree structure. A member also might be a group.

1. Click *"Add"* to open the *"Add Group"* dialog.
2. Define a name for the new group and enable all entries (single users or groups) which should be members of the new group.
3. Click OK to set up the new group. If there are incorrect entries (no name defined, group already existing, in Members having selected a group which would cause a "group cycle", you will get an appropriate error message.

Modify a group Click *"Edit"* to open the *"Edit User"* dialog. The entry fields are the same as in the 'Add Group' dialog (see above). After having modified the desired entries close the dialog with OK to get applied the new settings.

Remove groups Enable the entries to be removed in the groups tree and click *"Remove"*. Note that you will get no further inquiry! The members of the deleted groups will remain unmodified. An error message appears if you try to delete the groups "Everyone" and/or "Owner".

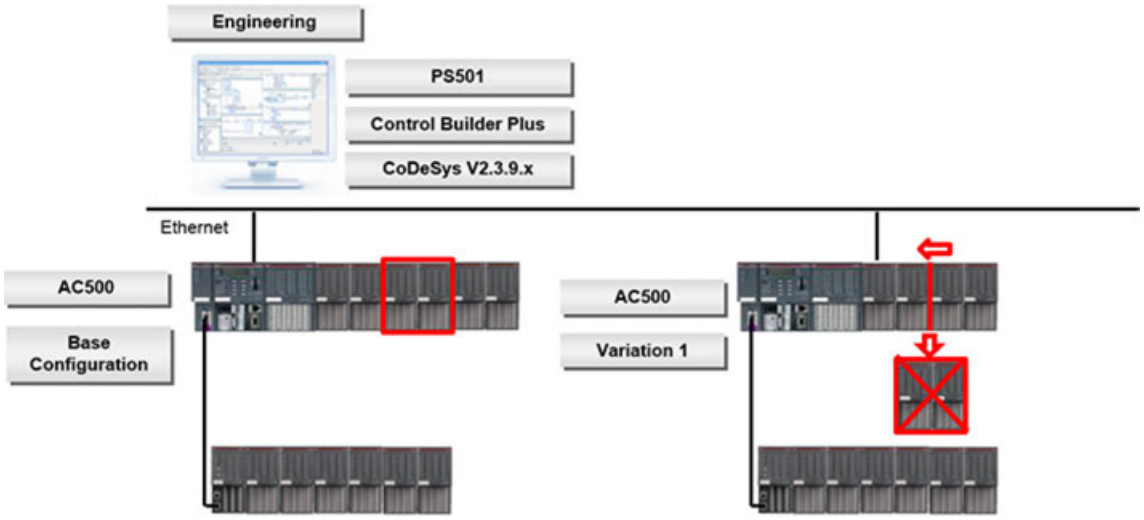
Settings dialog

The following basic options and settings concerning the user accounts can be made:

- Maximum number of authentication trials: If activated, the user account will be set invalid after the specified number of trials to log in with a wrong password. If not activated, the number of erroneous trials is unlimited. Default: option activated, number of trials: 3; permissible values: 1-10.
- Automatically log out after time of inactivity: If activated, the user account will be logged out automatically after the specified number of minutes of inactivity (no user actions via mouse or keyboard registered in the programming system). Default: option activated, time: 10 minutes; permissible time values: 1-180 minutes.

1.6.5.1.3 Flexible AC500 configuration

As of Automation Builder version 1.1 feature for flexible AC500 configuration is introduced. This feature enables you to use only one Automation Builder project for multiple different hardware configurations. Especially for product lines with many hardware variants, flexible configuration is a cost and time saving way for AC500 configuration.

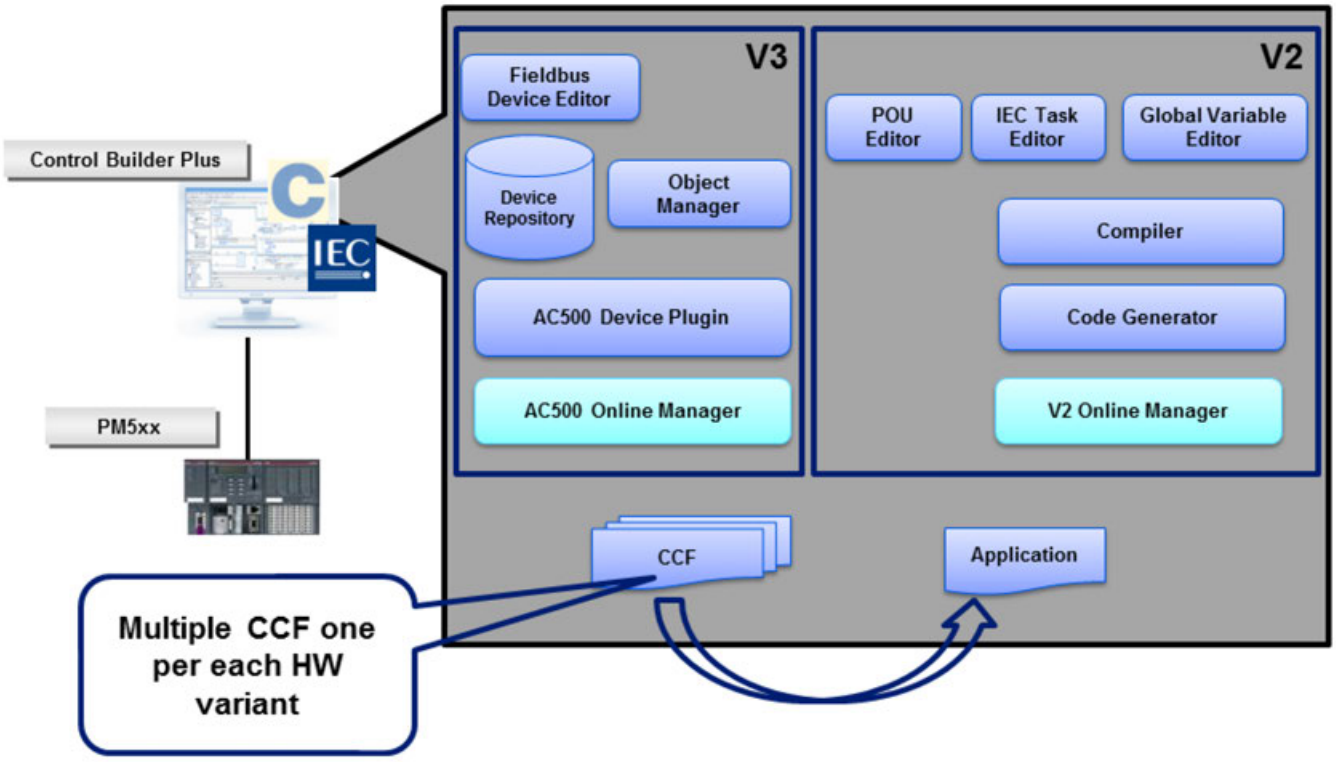


Flexible configuration is not supported for CM574-RS/RCOM and SM560 devices.

An Automation Builder project consists of CODESYS V3 hardware configuration and CODESYS V2 IEC application. Usually, from hardware configuration a *.ccf file is created and downloaded with IEC application to the PLC. Whenever an application is loaded to the PLC firmware, this *.ccf file is evaluated by I/O drivers.

By default, for configuration Config.ccf with FlexConfID 0 is created. When flexible configuration is enabled, Automation Builder creates one individual *.ccf file for each variant of hardware configuration: Cfg1.ccf with FlexConfID 1, Cfg2.ccf with FlexConfID2 etc. IEC application loads all available *.ccf files to the PLC, however, only one *.ccf file can be analyzed by PLC firmware at a time. The user decides which *.ccf file to be used by activation of the desired file. The active configuration is represented by the FlexConfID.

*Maximum number of manageable *.ccf files is limited to 255. FlexConfID 0 is occupied by the default configuration Config.ccf. Cfg0.ccf is not allowed.*



Application configuration and hardware configuration are separated but linked via I/O Mapping. Hence, flexible configuration is only operable in combination with an I/O bus. In order to use several hardware configurations with one application configuration I/O Mapping must be identical.

It is currently not possible to have alternative configurations of safety devices in a project with flexible configuration. However, if configuration of the safety devices is equal in all alternative configurations, flexible configuration is operable.

Software configuration

Depending on the use case and on your requirements on the hardware configuration of your variants, perform a standard or a advanced configuration.

- Standard Configuration: Use this configuration if the hardware configuration of your variants is close to the hardware configuration of your primary PLC and contains the same I/O modules in the same order. The parameterization for the hardware variants can vary. I/O modules that are unnecessary for one of your hardware variants can be deactivated easily with the Ignore Module parameter later on. However, the preset module order from the primary configuration must not be changed, as a I/O module can only be ignored but not replaced by another type ↬ *Chapter 1.6.5.1.3.1.1 “Standard configuration” on page 5776*.
- Advanced Configuration: Use this configuration if the order of the I/O modules must be changed, or if the variants require different I/O modules, or if your variants require different addresses for already preset channels. Note: Advanced Configuration requires additional manual actions: a) modifications in CODESYS for I/O Mapping b) file transfer to the file system ↬ *Chapter 1.6.5.1.3.1.2 “Advanced configuration” on page 5778*.

Standard configuration

1. Create an Automation Builder project with a PLC device. This PLC contains your primary hardware configuration (in the example: TargetPLC). Flexible configuration is only operable in combination with a I/O module. We recommend you, to add all S500 I/O modules that are required for the primary PLC or for a PLC of one of your hardware variants. Configure all PLCs in your primary hardware configuration.

   ⇨ Naming concept in the example:

   IOBus_Base_1: This I/O module is at first position of the PLC. It is valid for the primary configuration and for all variants.

   IOBus_Base_2: This I/O module is at second position of the PLC. It is valid for the primary configuration and for all variants.

   IOBus_Var_1_3: This I/O module is at third position of the PLC. It is only valid for the first hardware variant (Variant1_Cfg).

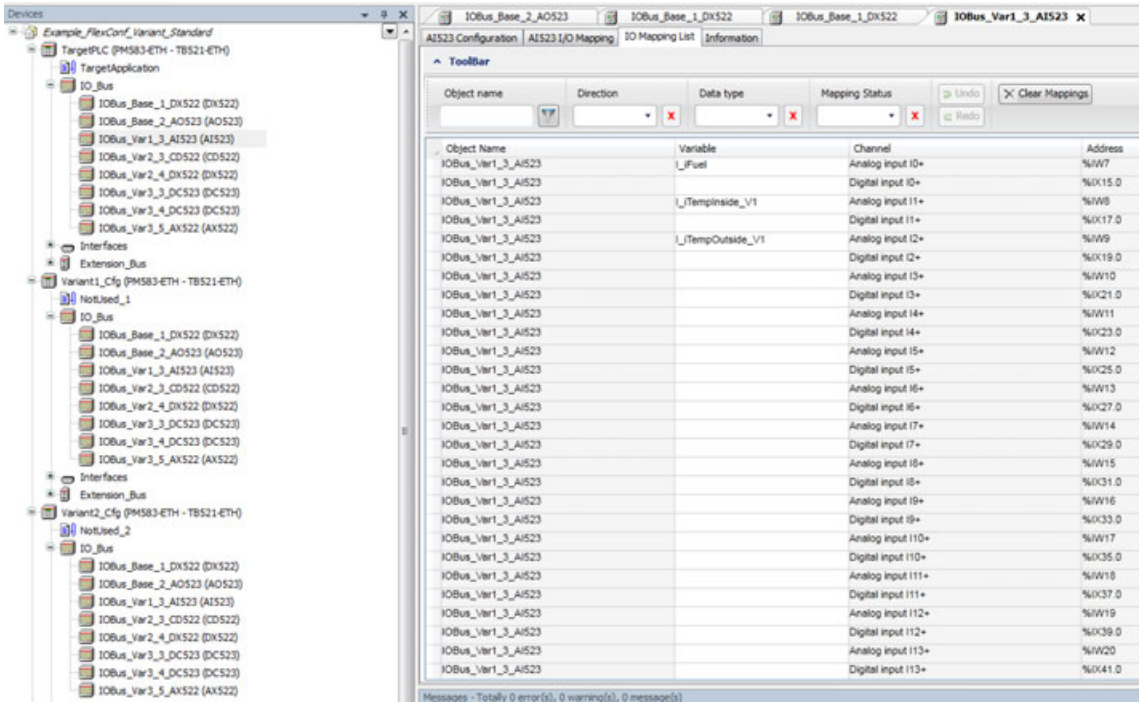
   IOBus_Var_2_3: This I/O module is at third position of the PLC. It is only valid for the second hardware variant (Variant2_Cfg).

2. In the I/O Mapping tab, define the Mapping for the IEC addresses. The variables of the I/O modules can be changed or even deactivated by enabling the parameter Ignore Module.

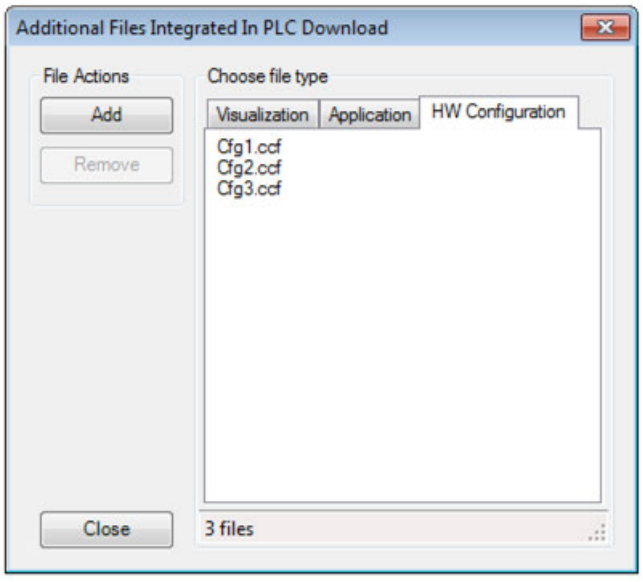
> *IEC addresses must not be changed in the configuration for the variants. If this is required, perform a advanced configuration ↳ Chapter 1.6.5.1.3.1.2 “Advanced configuration” on page 5778.*

3. Copy and paste your complete primary PLC configuration to your project (right-click on PLC_AC500). With this, variants of your hardware configuration are created.

4. Rename the copied PLC configurations. In the example: Variant1_Cfg ... Variant3_Cfg.



5. In order to manage all available *.ccf files, export the PLC hardware configuration to any folder in the file system: *“Export ➔ Export PLC Hardware configuration”*.
6. Repeat this step for each PLC variant to export all *.ccf files to one folder.
7. Right-click *“TargetApplication ➔ Manage additional files for PLC”* to load all *.ccf files to the PLC.
8. In the dialog open the *“HW Configuration”* tab. With *“Add”* select the *.ccf files from the folder previously defined. Ensure that the files to be added follow the syntax Cfg<FlexConfID>.ccf with a continuous FlexConfID number.



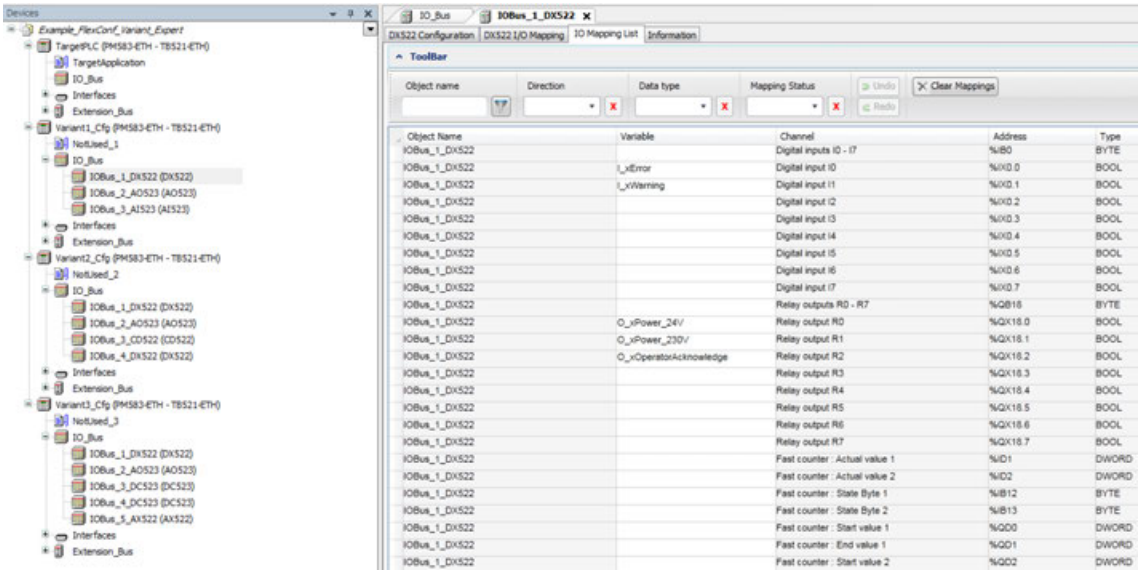
9. Close the dialog, compile the project and create a boot project to finish configuration. Then, activate the desired hardware configuration that shall be used ↳ *Chapter 1.6.5.1.3.2 “ Activating another hardware variant (Configuration file) ” on page 5780*.

Advanced configuration

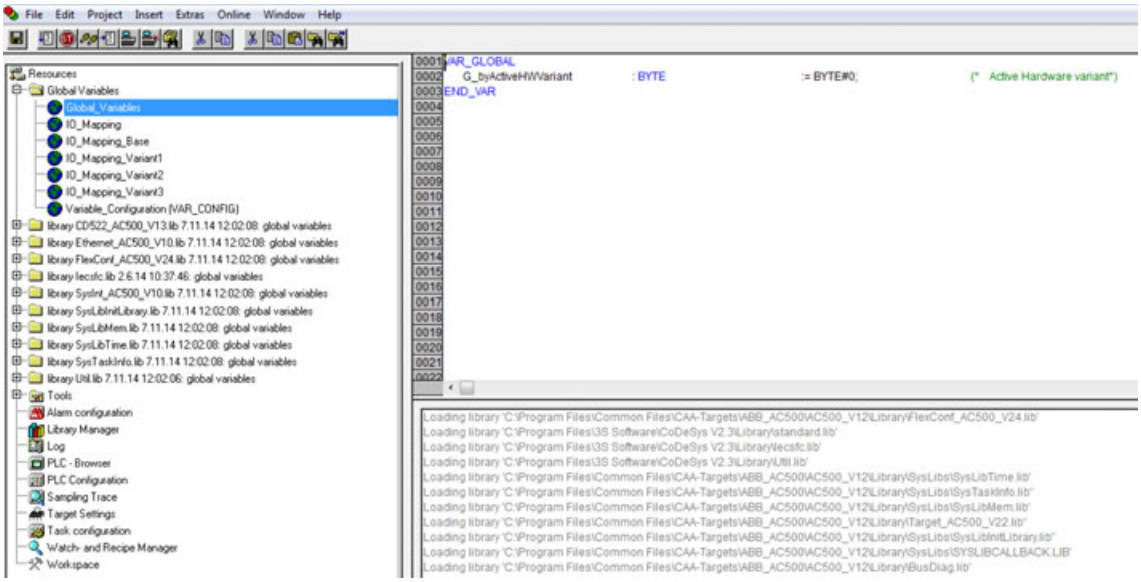
In a standard configuration the global variables for I/O Mapping are set automatically. As this is not possible for hardware variants with complex channel/address settings, global variables must be defined in CODESYS to map the channels in the applications. Advanced configuration allows to operate independent hardware configurations.

1. Create a Automation Builder project with a PLC device. This PLC contains your primary hardware configuration (in the example: TargetPLC).
2. Create as many PLC hardware variants as required.

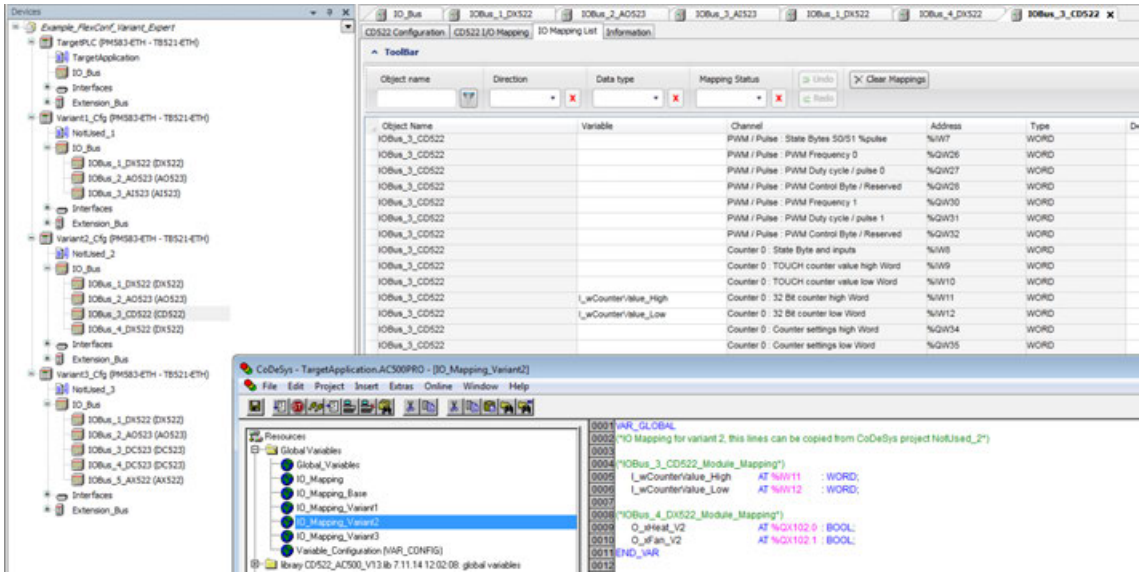
> *The main program that includes the hardware configuration of all your variants is defined in the TargetApplication object of your TargetPLC (not in the application objects of your variants (NotUsed_x)).*



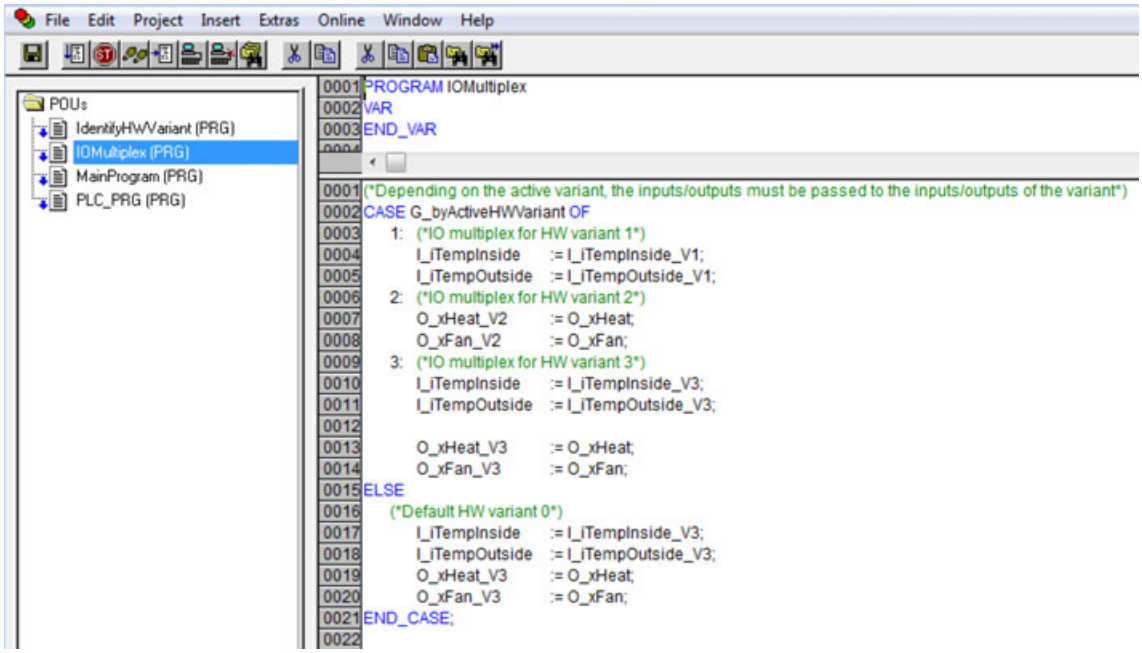
3. Double-click *"TargetApplication"* to define I/O Mapping for the IEC addresses in CODESYS. Due to a different module configuration this cannot be done in the *"I/O Mapping"* tab of Automation Builder.
4. Under *"Resources"* define a global variable that can be used to identify the active hardware variant (in the example G_byActiveHWVariant).



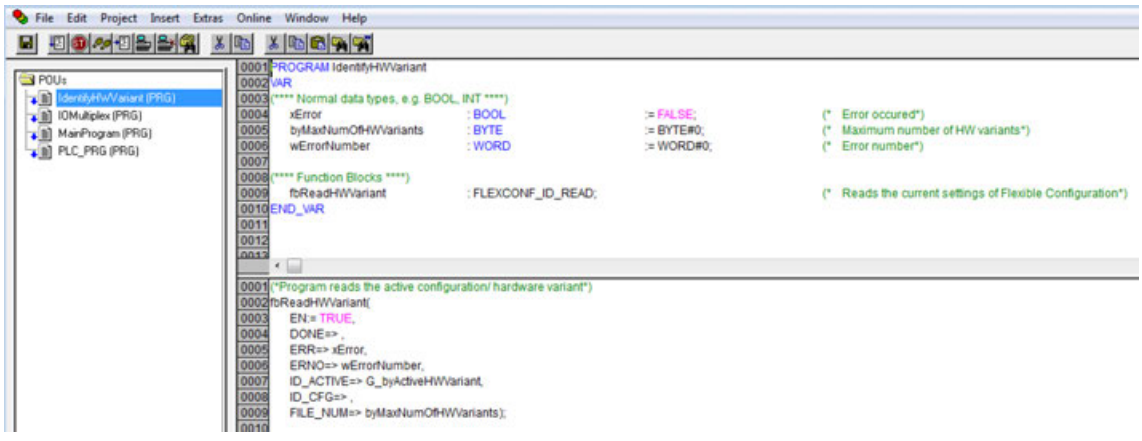
5. For a better readability we recommend you to create I/O Mapping objects for your variants which lists the address mapping for the inputs and outputs of a I/O module.



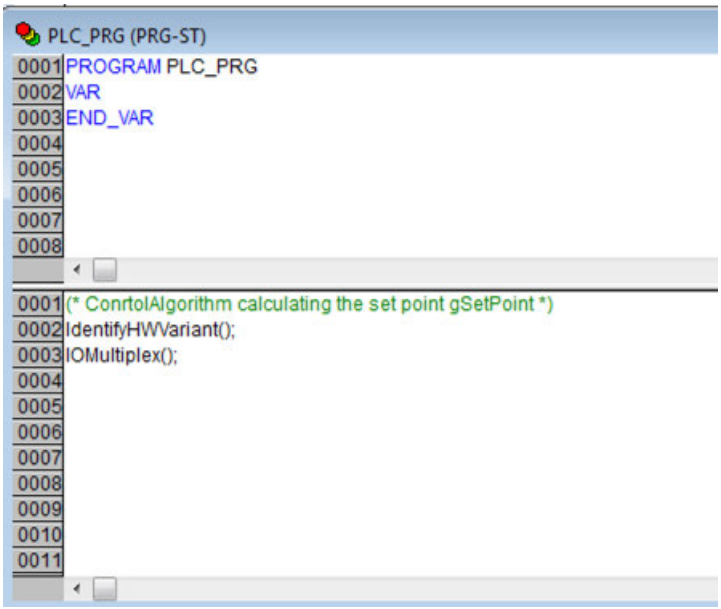
6. Under *“POUs”* create a new program (in the example IOMultiplex) which describes the addresses for inputs and outputs to be used for each hardware variant.



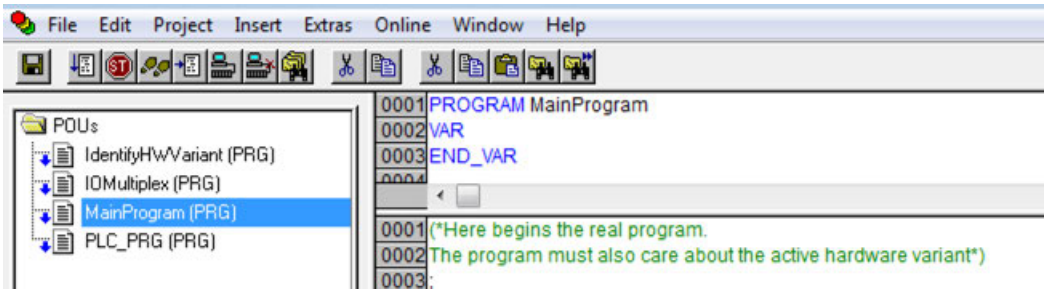
7. Under *“POUs ”* create a new program (in the example IdentifyHWVariant).



8. Under *"POUs"* create a new program (in the example PLC_PRG) which refers to the previously defined program (IOMultiplex) and your global variable (G_byActiveHWVariant).



9. Under *"POUs"* create a new program (in the example MainProgram).



10. Save and close your CODESYS configuration. Proceed with exporting the PLC configuration as described under Step: Exporting the PLC.

Activating another hardware variant (Configuration file)

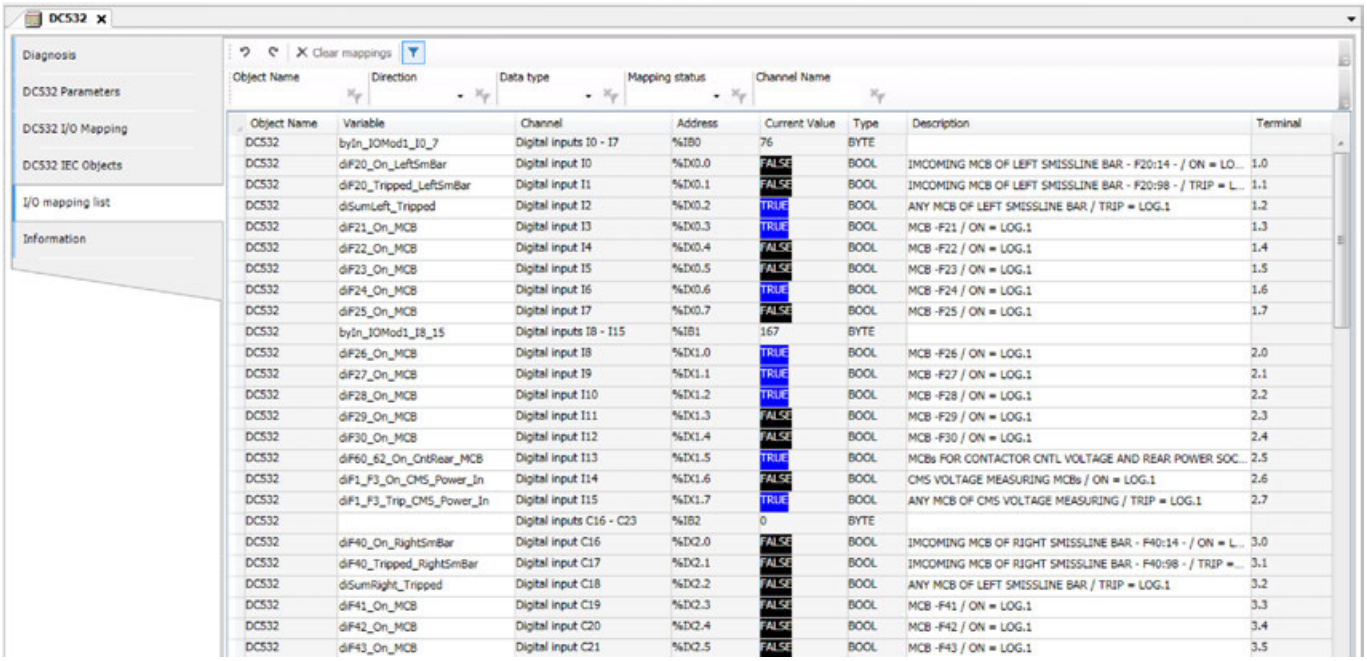
Only one hardware configuration (*.ccf file) can be loaded and analyzed by AC500 firmware at a time. Flexible configuration allows you to switch between hardware variants by using one of the following methods:

- Function block in the IEC application. See Flexible Configuration Library.
- AC500 display (CFG button until FL 000 is displayed). See Display and Operating Elements on the Front Panel of a processor module.
  Note: At the moment this configuration method is not supported for PM595-4ETH.
- A PLC browser command. Possible commands:
  – fcidget: Shows the current values of the settings for flexible configuration. Possible values: Active FlexConfID, Configured FlexConfID, Number of configuration files.
  – fcidset <flexconfid>: Changes the value of the FlexConfID in the confdata file.

> *Activation becomes valid only after PLC reboot - independent from the used method. Information on active configuration is stored in the confdata file in the PLC's flash memory. The online functions of Automation Builder are only supported for the configuration loaded to the PLC.*

1.6.5.1.4 I/O mapping list

Automation Builder contains an I/O mapping list feature for creating mapping variables with better usability support compared to the tree structured view. Details on the tree structured view is provided in the CODESYS Development System.



Functionalities of the I/O mapping list:

- Displays I/O mappings for current node and all valid subsequent child nodes.
- Displays channel information with additional columns.
- Supports keyboard functions such as *cut*, *copy*, *paste*, *delete*, and *select all* within the editor and within Excel spreadsheet (for bulk editing).
- Contains a toolbar for various actions, e.g. filtering, undo/redo and clear mappings.
- Supports single click edit and easy navigation using arrow keys.
- Improvised error handling:
  - Allows to enter invalid mapping variables. This provides flexibility in bulk editing. Only when saving the project, the errors - according to IEC 61131 standard - are displayed.
  - In the message window, the error log is visible. The user can track the errors to their corresponding channel in the editor.
- Allows multi-selection of rows and columns. (Random selection is not allowed.)

Configuring I/O mapping list

Automation Builder supports tree and list based editors for creating I/O mapping variables.

1. From the **Tools** menu, select **Options**.
2. Under **Automation Builder**, select the **Editors** tab.
3. Choose your desired mapping dialog and click **OK**.
   - Choose **tree based** to display the I/O mapping in tree structure.
   - Choose **list based** to display the I/O mapping as list with the functionalities of the ToolBar.
   - Choose **both** to display both the tree structure (**I/O Mapping** tab) and the list view (**I/O mapping list** tab).

Available channel information

The I/O mapping list displays the channel information in offline and online mode. In online mode, all columns are read-only. In offline mode, some columns are editable.

The order of the devices in I/O mapping list is synchronized with the order in the device tree.

The channels of a device are ordered by the device description file. If channels have a section, the channel information is represented in a specific format.

Example: Fast counter: Actual value 1. These channels are listed at last position of a device.

Editing I/O mapping list

1. In the device tree, double-click **IO_Bus** to configure entire I/O mapping list of different I/O devices.
2. Enter the variables and descriptions to map the I/O devices.

Do not start variable names with a number or a special character. When saving the project, this generates an error. Example: 12input3, @input4.

3. Click **Save Project** to save the I/O mapping changes.

Toolbar

Filtering

Especially in case of long I/O mapping lists, it might be helpful to filter the I/O mappings. For this, click the *"Filter"* icon to display all available criteria for filter options.

When reducing the width of the editor, some filters might be hidden.

Undo, redo and clear

- **Undo**: Cancels the last change.
- **Redo**: Repeats the last change.
- **Clear mappings**: Deletes all variables and descriptions.

1.6.5.1.5 Setting standard configuration

If the target setting configuration is changed, standard configuration can be restored:

1. Open CODESYS Development System.
2. In the *"Resources"* tab, double-click *"PLC Configuration"*.
3. Select *"Menu Extras ➔ Standard Configuration"*.

1.6.5.1.6 Later change-over of a target system

Changing the processor module type

In a project, you can change the target system by changing the type of processor module or terminal base type. If possible, the device configuration of fieldbusses and interfaces is kept and switched over to the device configuration of the new module.

Target change options:

- between platforms: from V2 platform to V3 platform (and vice versa)
- between module types: from AC500 (standard) to AC500-eCo (and vice versa)
- a combination of changed platform and changed module type

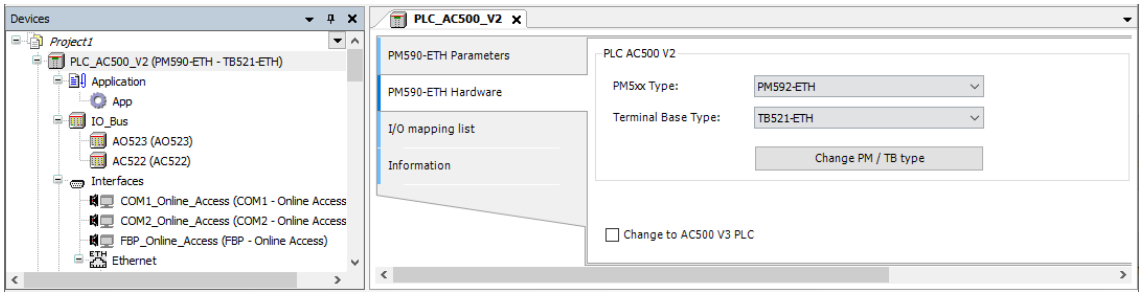
Target change from a V2 processor module to another V2 processor module

Target change options:

- AC500 V2 processor module ➜ AC500 V2 processor module
- AC500 V2 processor module ➜ AC500-eCo V2 processor module
- AC500-eCo V2 processor module ➜ AC500 V2 processor module
- AC500-eCo V2 processor module ➜ AC500-eCo V2 processor module

Procedure:

1. Close CODESYS.
2. Double-click the *PLC_AC500_V2 <...>* node and open the *"PM5<...> Hardware"* tab.
3. Select the desired V2 processor module from the *"PM5xx Type"* drop-down list.



4. Ensure the correct *"Terminal Base Type"* is selected and click *[Change PM / TB type]*.
   ⇨ The new V2 processor module is displayed in the navigation tree.
   ⇨ Change the node name of the processor module, if desired.

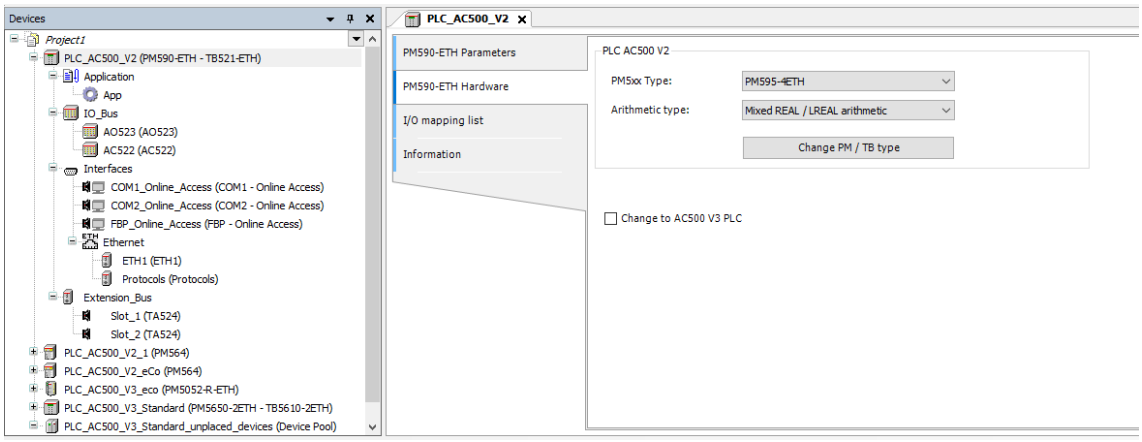
Target change to PM595

Target change options:

- AC500 V2 processor module ➜ PM595
- AC500-eCo V2 processor module ➜ PM595

Procedure:

1. Close CODESYS.
2. Double-click the *PLC_AC500_V2 <...>* node.
3. Open the *"PM5<...> Hardware"* tab and select 'PM595-4ETH' from the *"PM5xx Type"* drop-down list.



4. With the *Arithmetic type* item, processing of Structured Text can be modified.
   - *"Mixed REAL/LREAL arithmetic"* (default value):
     Calculation of LREAL variables is extended to the extended co-domain of 64 bit. In general, we recommend to keep the default setting as this setting provides enough accuracy for code calculation.
   - With *"Only REAL arithmetic"* the LREAL variables are processed as REAL variables (co-domain of 32 bit).
5. Click *[Change PM / TB type]*.
   ⇨ The PM595 is displayed in the navigation tree.
   ⇨ Change the node name of the processor module, if desired.

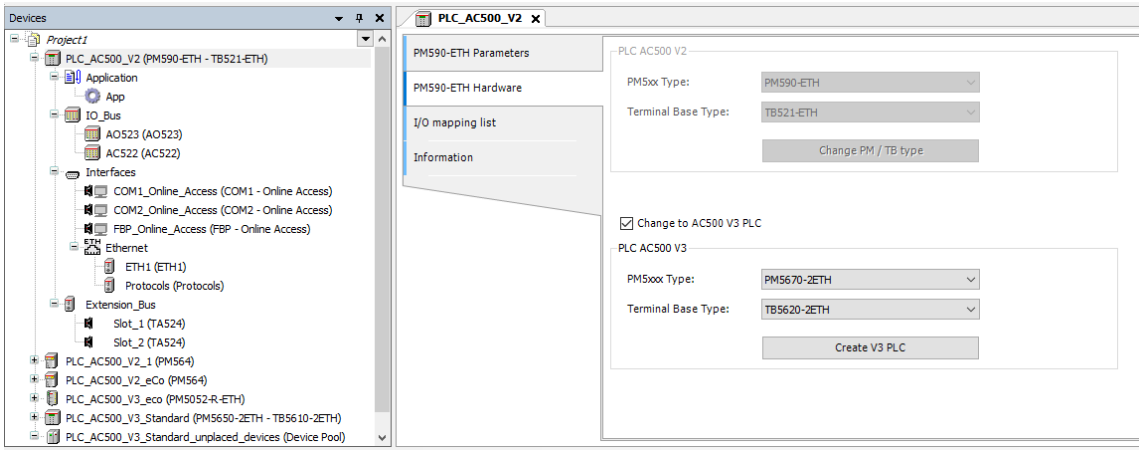
Target change from a V2 processor module to a V3 processor module

Target change options:

- AC500 V2 processor module ➜ AC500 V3 processor module
- AC500 V2 processor module ➜ AC500-eCo V3 processor module
- AC500-eCo V2 processor module ➜ AC500-eCo V3 processor module
- AC500-eCo V2 processor module ➜ AC500 V3 processor module

Procedure:

1. Close CODESYS.
2. Double-click the *PLC_AC500_V2 <...>* node and open the *"PM5<...> Hardware"* tab.
3. Enable *"Change to AC500 V3 PLC"* and select the desired V3 processor module from the *"PM5xx Type"* drop-down list.



4. Click *[Create V3 PLC]*.
   ⇨ The new V3 processor module is displayed in the navigation tree.
   ⇨ Change the node name of the processor module, if desired.

> *In case of a target change from AC500-eCo V2 to AC500-eCo V3, the I/O bus and Ethernet configuration is kept.*

Customer libraries

CODESYS for AC500 V2 products contains different types of libraries:

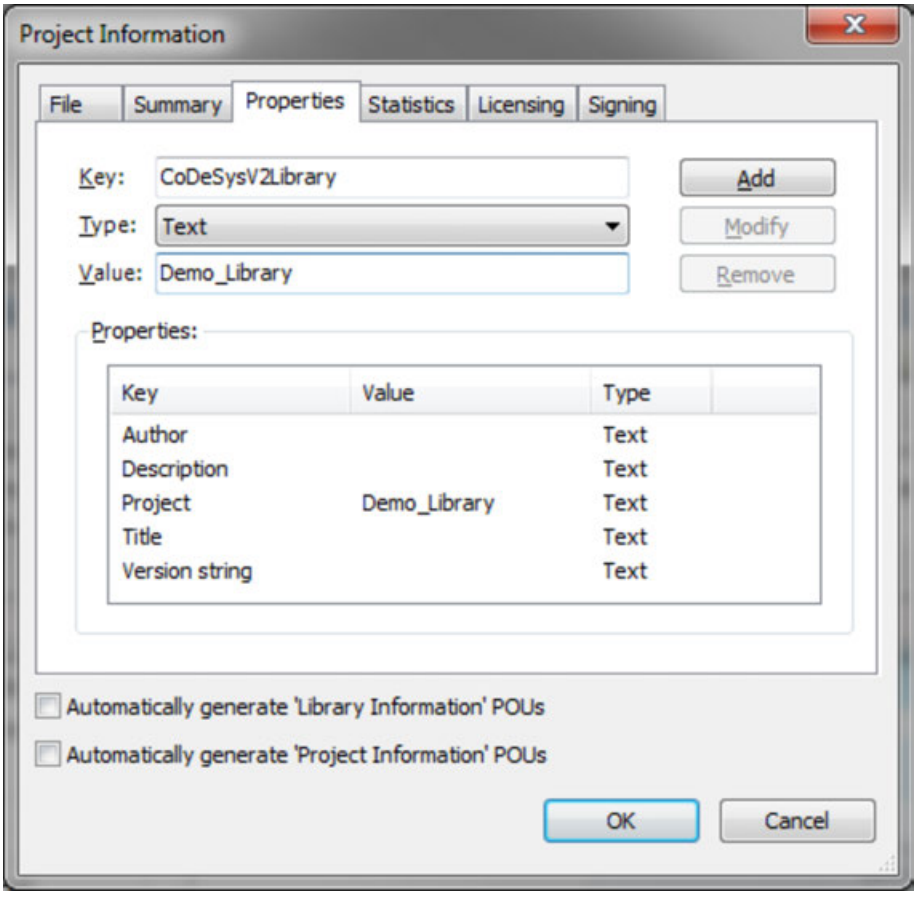
- Standard CODESYS libraries
- Specific AC500 libraries
- Customer libraries

In general, the Standard CODESYS libraries and the AC500 libraries are automatically converted during a target change from AC500 V2 to AC500 V3. Those libraries that cannot be converted (e. g. because there is no matching in V3) are created automatically in the V3 Library Manager and must be manually deleted by the user after the target change.

The customer libraries have to be converted manually using the Library Converter integrated into the Automation Builder installation:

1. In Automation Builder click *“File ➔ Open project”*.
2. Select the CODESYS library for AC500 V2 products which has to be converted.
3. After conversion of the library, open the view POUs in the device navigator and double-click *“Project Information”*.
4. To have the library automatically available in the V3 project, enter “Company”, “Title” and “Version” in the specific fields of the dialog.

   Then, open the *“Properties”* tab. For the target change the new *“Key”* "CoDeSysV2Library" has to be added. Under *“value”*, enter the name of the CODESYS library and click the *“Add”* button.



Click *“File ➔ Save project”* and install into the library repository.

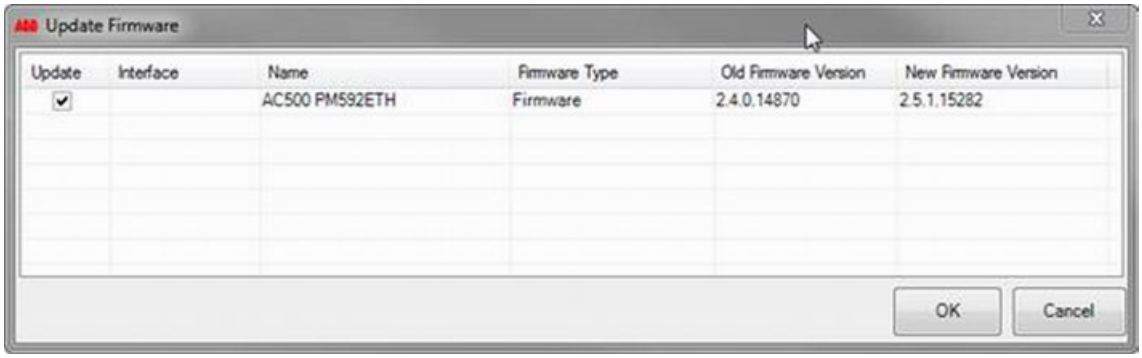
1.6.5.1.7 Firmware identification and update

> *Without direct access to the internet, a firmware update with the memory card is also possible.* *Chapter 1.6.6.2 “Memory card in AC500 V2” on page 6339*

General information

- Firmware for AC500 CPUs and communication modules is provided with Automation Builder
- Firmware versions specific for profile (Automation Builder major.minor version)
- Firmware download from Automation Builder in addition to other mechanisms possible
- Firmware can be stored to an *Chapter 1.6.6.2 “Memory card in AC500 V2” on page 6339*. This is done using a standard PC card reader with memory card interface.
- Firmware image from the Internet: The firmware- and bootcode files can be downloaded from the following ABB website: www.abb.com/plc. Use the according AC500 update description.

After pressing “Update Firmware” the following dialog will be shown. It displays the firmware that can be updated. If the CPU firmware version is lower than 2.5.0.0 the CPU firmware must be updated before any Communication Module firmware can be updated.



If multiple firmware types of a device can be updated, all firmware types must be updated in one step, thus selection in column update is possible on device level. Currently multiple firmware types exist only for CPUs.

After pressing “OK” the firmware files are downloaded to the RAM disk of the CPU and the update is triggered. Firmware update is only possible when:

- PLC is in “Stop”.
- The RAM disk has enough free space for the largest firmware file to download plus about one kByte for control files.
- The gateway settings in the CODESYS V2.3 project are correct.

The PLC must be rebooted after the firmware update has been completed. This could be done i.e. by power cycle or with PLC browser command “reboot”.

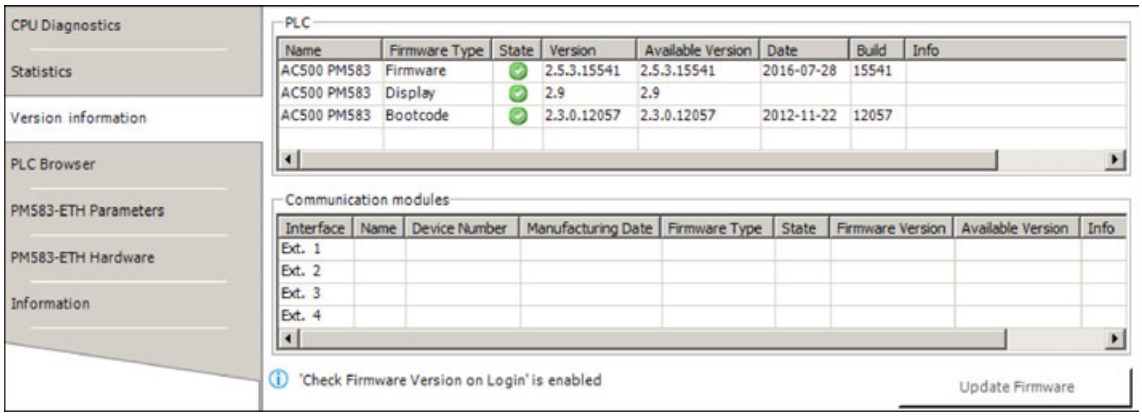
When updating the CPU firmware from a version below 2.5.0.0 to 2.5.x.x or higher the end of the firmware update can’t be detected automatically. The user must observe the PLC to check that firmware update has been completed before rebooting the PLC. See the documentation for the CPU type on how completion of update is indicated.

Version information

Information on the firmware versions of the processor modules or communication modules, is provided on the *“Version information”* tab.

Remarks:

- The *"Version information"* tab displays the version identified on the device and the version provided with Automation Builder.
- The firmware on the devices must match to the Automation Builder version. Upgrade or downgrade to version supplied with Automation Builder is recommended (especially for CPUs) to ensure correct functionality.
- The firmware type can be changed to the type required by the hardware configuration for devices that support changing the firmware type. E.g., the onboard field bus communication modules of PM595 that may be used as PROFINET, Ethernet or EtherCAT communication module.



State icons

	Firmware version on device matches version supplied with Automation Builder.
	Firmware version (or type) on device is different from version supplied with Automation Builder. Upgrade/downgrade to version supplied with Automation Builder is recommended.
	Only for communication modules if CPU firmware must be updated first. This happens when CPU firmware has version below 2.5.0.0. Firmware version (or type) on device is different from version supplied with Automation Builder. Upgrade/downgrade to version supplied with Automation Builder is recommended.
	Identified device is different from configured device, thus no firmware update is possible. Happens only for Communication Modules.
No icon	Firmware of device is not updateable or no newer firmware than the initial version is available.

The [Update Firmware] button to download the new firmware is only enabled if there is updateable firmware.

Updating the firmware of AC500 devices from the memory card

There are two options to update a device's firmware from a file stored on a memory card:

- Update automatically during system start.
- Trigger the update via a PLC Browser command.

The following table shows the update possibilities per device:

Device / File	From memory card during System start	From memory card with PLC-Browser command	Comment
CPU Bootcode	no	yes -> sdboot x with x = according version; e.g sdboot 2_3_1	
CPU Firmware	yes	yes -> sdfirm x with x = according version; e.g sdfirm 2_3_1	
CPU Display	yes	yes -> sddisplay x with x = according version; e.g sddis-play 2_3	only for PM57x, PM58x, PM59x
Communication Module Firmware	yes	yes -> sdcoupler x with x = [1|2|3|4] = external Communi-cation Module [1|2|3|4] (also CM574-RS)	
OnboardIO Firm-ware	yes	yes -> sdonboardio x x = according version; e.g sdonboardio 1_1_6	only for PM55x, PM56x
RTC Firmware	yes	yes -> sdrtcbat x x = according version; e.g sdrtcbat 1_1_7	only for TA561-RTC or TA562-RS-RTC as option of PM55x or PM56x

Please be aware, that during the update triggered with a PLC Browser Com-mand the file SDCARD.INI on the memory card is evaluated too. For additional details see Chapter 1.6.6.2 “Memory card in AC500 V2” on page 6339:

- *Memory Card File System on the general memory card structure.*
- *The Command File SDCARD.INI for details on the SDCARD.ini file and its keys.*
- *File content as of version V2.x for a detailed description of the behavior of the update keys.*

NOTICE!

No POWER OFF during flash process!

During the flash process it is not allowed to switch the power off; otherwise, the CPU could be damaged and unavailable anymore.

During the display update it is powered off and on automatically!

Update from memory card during system start

To update the firmware of the AC500 CPU via memory card without control by PLC-Browser commands, proceed as follows:

1. Download and extract the update files on your memory card or prepare the memory card, see *Chapter 1.6.6.2.4 “Storing/Loading the Firmware to the memory card for AC500 V2 products” on page 6354*.
2. Insert prepared memory card into the CPU. The file *SDCARD.INI* on the memory card contains settings that automatically perform the update (details see *Chapter 1.6.6.2.2.2 “Command file SDCARD.INI for AC500 V2 Products” on page 6342*).
3. Switch power on.

   The individual steps are indicated as follows:

Process	Indication	Remark
Reading the firmware	RUN LED flashes fast	If you remove the memory card during reading, the previously stored firmware version is kept.
Flashing the firmware	RUN LED and ERR LED flash fast	Warning: If the control voltage is switched off during flashing, the firmware will be corrupted!
Firmware update completed successfully	RUN LED flashes slow (app. 1Hz)	
Incorrect firmware update	ERR LED flash slow (app. 1Hz)	

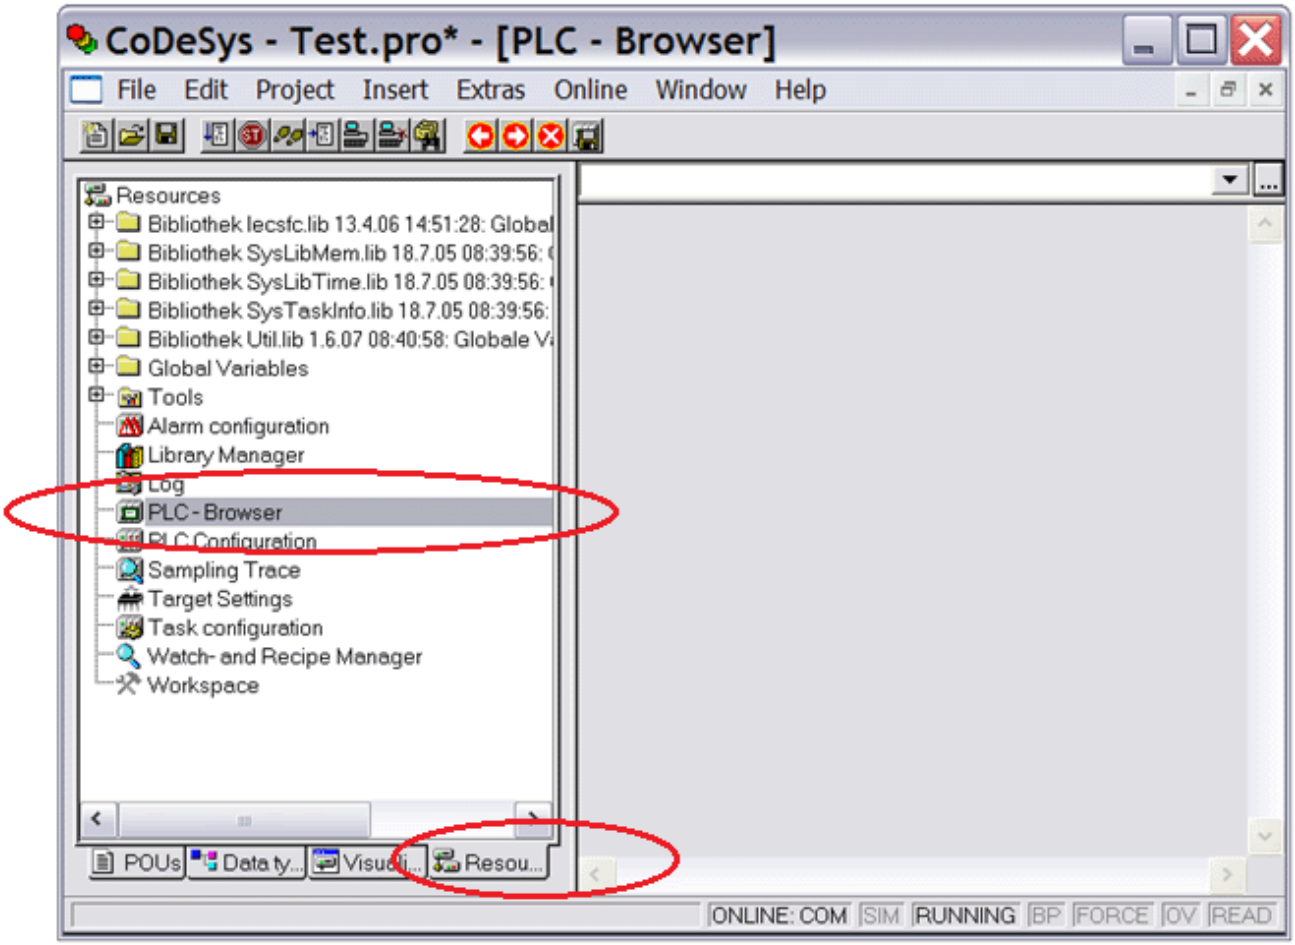
   ⇨ Updates operation starts (green LED blinking = reading from SD card / red and green LEDs blinking fast = flash process).
4. Reboot the CPU to load the updated firmware.

A specific firmware version can be loaded. This is done by setting the parameter CPUPM5x1=2 or 3 and creating an according key for the CPU. The firmware has to be copied to the according directory. See chapter The Command File *Chapter 1.6.6.2.2.2 “Command file SDCARD.INI for AC500 V2 Products” on page 6342* .

If the file SDCARD.INI contains the parameter setting FunctionOfCard=3 (firmware update / load user program), first the firmware and then the user program are read from the memory card and then stored in the according Flash memory.

Update from memory card with PLC browser commands (Online mode)

To start a firmware update from the PLC browser, it is necessary to be logged in into the CPU with your PC.



1. Open the PLC browser from the Resources tab (see above).
2. Insert the memory card with the correctly set *SDCARD.INI* file (see *Chapter 1.6.6.2.2.2 “Command file SDCARD.INI for AC500 V2 Products” on page 6342*) and corresponding firmware files on it into the PLC (see *Chapter 1.6.6.2.4 “Storing/Loading the Firmware to the memory card for AC500 V2 products” on page 6354*).
3. Write the requested command into the PLC browser.
4. The corresponding command is now activated, for example *sdfirm 2_5_1* command.
5. If the firmware update was successful, DONE is shown in the PLC Browser.
6. Remove the memory card and restart the CPU to load the new firmware.

NOTICE!

The memory card has to be removed before restart!

To get information about the firmware version of the CPU enter the command *rtsinfo* into the PLC-Browser.

Only for AC500-eCo PM5x4 modules with firmware version < 2.x: First the CPU firmware has to be updated from V1.3.x to V2.0.x. After doing the update the CPU has to be restarted.

Then any module can be updated as described in this chapter!

Update via FTP

With AC500 Firmware above V2.1 it is possible to update a CPU via the FTP server.

Only PLCs with onboard Ethernet (i.e. AC500 CPU with Ethernet) and firmware version 2.1.0 or higher support the FTP server!

Update steps

1. To update your CPU via FTP, you first must configure and activate the FTP server with the set checkbox "Allow Firmware update".

   Details: *Chapter 1.6.5.3.8.3 “Configuration of FTP server (>= CBP 2.4) ” on page 6191*.
2. Connect to your CPU's system RAM disk (i.e. memory location "ramdisk").

   Details: *Chapter 1.6.5.3.8.4 “Connection to a PLC running a FTP server” on page 6192*.
3. Switch your CPU to STOP.
4. Copy the according *.gza* file to the system RAM disk (= memory location *ramdisk*):

Product	Name of Firmware File
PM55x-ETH, PM56x-ETH	Pm55xE.gza
PM57x-ETH, PM58x-ETH	Pm58xN.gza
PM59x, PM59x-ETH	Pm59xRD.gza
PM595-x-4ETH	Pm595.gza

   ⇨ The CPU will automatically update its firmware with the downloaded file, flashing the RUN and ERR LEDs.

   As of V2.5 copy file *SDCARD.INI* to the system RAM disk. As of V2.5 all firmware updates are triggered by the command file *SDCARD.INI.* This is independent from the way of the firmware update (memory card, FTP, *write file to plc*, …). In addition a result file of the firmware update is generated (*SDCARD.RDY*, identical path as *SDCARD.INI*). The evaluation of this file shows the results of the updates.
5. Wait until all LEDs ceased toggling.
6. Power cycle your PLC and the new firmware will be loaded.

Potential problems:

- If you cannot connect to your CPU, check if the FTP server is configured and running correctly.
- If you cannot download the file, increase your configured "Sessions". Some FTP clients require more than one FTP connection for their operations, because logins and downloads are handled in separate sessions.
- If you downloaded the *.gza* file into the RAM disk, but the CPU does not start to update (i.e. the LEDs do not toggle):
  - Check, if the option *Allow firmware update* is set for the FTP server.
  - Check, if the CPU is in STOP state; in RUN state no firmware update is allowed.
  - Check, if you copied the correct firmware file.
  - Check, if you copied the file into the correct memory location (correct is *ramdisk* - incorrect is "sramdisk", "userdisk", "flashdisk", "sdcard").

Update PM595 firmware

Firmware update of the CPU

To update the firmware of the PM595 CPU proceed as follows:

1. Login on the CPU using Automation Builder.
2. Choose *“Version Information”* Menu.
3. Click *“Update”* at the bottom of the Menu
   ⇨ Run and ERR LED are blinking.
4. Wait until the blinking stops.
5. Reboot the CPU.
6. Update the internal communication module to actual PROFINET Firmware.

Firmware update of internal communication module for PROFINET

ABB recommends that users carry out the firmware update via Automation Builder. ↬ Chapter 1.6.5.1.7.2 “Version information” on page 5786

To update the internal communication module to actual PROFINET Firmware proceed as follows:

1. Unzip the file „Update_PNIO.zip“ on memory card.
2. Insert the memory card into the PM595 CPU.
3. Switch Power Off/On:
   ⇨ Run LED blinks

   Run and Rdy LEDs on the left side of the PM595 (left column) for 1st. Internal communication module blink

   RUN LED blinks

   Run and Rdy LED on the left side of the PM595 (right column) for 2nd. Internal communication module blink

   RUN LED blinks slowly

   The procedure should require 3 – 5 minutes
4. Remove the memory card.
5. Switch Power Off/On.
6. Login in Automation Builder:

   Navigate to Version Informations.
   ⇨ Firmware V 2.8.1.2 or newer for Internal communication module must be displayed.
7. Update Internal communication module on EtherCAT Firmware

Firmware update internal communication module of PM595 for EtherCAT

ABB recommends that users carry out the firmware update via Automation Builder. *Chapter 1.6.5.1.7.2 “Version information” on page 5786*

To update the internal communication module to actual EtherCAT Firmware proceed as follows:

1. Unzip the file „Update_ETHCAT.zip“ on memory card.
2. Insert the memory card into the PM595 CPU.
3. Switch Power Off/On.

   ⇨ Run LED blinks o Run and Rdy LEDs on the left side of the PM595 (left column) for 1st. Internal communication module blink

   RUN LED blinks

   Run and Rdy LED on the left side of the PM595 (right column) for 2nd. Internal communication module blink

   RUN LED blinks slowly

   The procedure should require 3 – 5 minutes.
4. Remove the memory card.
5. Switch Power Off/On.
6. Login in Automation Builder:

   Navigate to Version Informations.

   ⇨ Firmware V 4.2.23 (2) or newer for Internal communication module must be displayed.

Update CI52x-Modbus firmware

Requirement: A firmware update file is available, e.g. AC500_CI52x_Firmware_V3.2.8.bin.

The CI52x Modbus firmware update is only available in the Automation Builder IP Configuration Tool.

Installation of the IP configuration tool

1. In Automation Builder click *“Tools* ➔ *Installation Manager”* to start the Installation Manager.
2. Close any other running instances of Automation Builder. Then, click *“Modify”* in the Installation Manager.
3. Select the option *“IP Configuration Tool”* from the list and start the installation of the IP Configuration Tool.

Firmware update procedure

1. In the IP Configuration Tool click *“Scan”* to initialize a device scan.
2. From the list select the CI52x-MODTCP device(s) which shall be updated and click *“FW Update”*.
3. Select the firmware update file (e.g. AC500_CI52x_Firmware_V3.2.8.bin) to initialize a signature check and start the update procedure.
4. After the update, click *“Scan”* again to retrieve the firmware version of the device.

Troubleshooting

After the IP Configuration Tool has been installed, the firmware update of the CI devices can be initialized. If the CI firmware update fails, check the troubleshooting hints and follow the instructions.

General hints

- Close all unused applications on the update PC and do not open Automation Builder or any other applications during the firmware update.
- Stop the communication between AC500 PLC and the CI52x devices and disconnect the Ethernet connection of the update PC and the CI Modbus device(s).
- Do not close the IP Configuration Tool during a firmware update and do not switch off a CI Modbus device during the firmware update.

During a firmware update the operation of the device(s) is stopped. After the update, all outputs are set to zero.

Erroneous firmware update

Error	Solution
Error 1: Package Timeout Due to a primitive firmware update protocol a fast and stable network connection is required. Otherwise the update packages cannot be transferred within the requested time and a timeout occurs.	Locate the PC on which the update is performed as near as possible to the stationed CI Modbus devices. Avoid network switches.
Error 2: Unable to read device status After the firmware update the IP Configuration Tool reads out the status of the updated device in order to check if the update was successful.	Rescan and repeat the update. If this doesn't work, power cycle the device and retry the update.
Error 3: IP is not unique If more than one device hold the same IP address, a firmware update is not possible as the update command is IP based.	Correct the IP address, rescan and repeat the update. If this doesn't work, power cycle the device and retry the update.
Error 4: Internal Error An internal error on the CI52x Modbus device occurred during the firmware update.	Rescan and repeat the update. If this doesn't work, power cycle the device and retry the update.
Error 5: Cannot connect to device The TCP communication is not sufficient for a connection. Increase the connection quality.	See Error 1: Package Timeout.

Signature check failed

After the selection of the firmware file (*.bin) a signature check is performed. If either the firmware file or the signature file is corrupt, the signature check fails. In the event of an erroneous signature check, perform the following steps:

- Ensure the signature file is stored in the same directory as the firmware file.
- Check the file names. The name of the signature file must be the same as the firmware file + attached ".sig”.

File names	Name of the firmware file: c:\AC500\AC500_CI52x_Firmware_V3.2.8.bin Correct name of the signature file: c:\AC500\AC500_CI52x_Firmware_V3.2.8.bin.sig Wrong name of the signature file: c:\AC500\AC500_CI52x_Firmware_V3.2.8.sig

Indeterminate device firmware version

If the firmware version of the device cannot be determined, an error occurs. In this case, check that the device and the update PC are located in the same subnet and ping the device. If the ping is successful you can use the IP Configuration Tool to retrieve the device firmware version.

PC	Device	Result
192.168.14.71 / 255.255.255.0	192.168.14.10 / 255.255.255.0	OK
192.168.**10**.71 / 255.255.**255**.0	192.168.**14**.10 / 255.255.**255**.0	ERROR
192.168.10.71 / 255.255.0.0	192.168.14.10 / 255.255.0.0	OK

1.6.5.1.8 MultiOnlineChange tool

Introduction

The MultiOnlineChange tool/plugin for Automation Builder enables firmware update, download and online change of the same project to several PLCs.

Technically, the tool creates and executes a CODESYS 2.3 command file (*.cmd file) and several batch files, and deletes both types after an operation is finished.

The *.cmd file selects the configured gateway, loads the *.ri file for the PLC and performs the selected task (firmware update, online change, online access or multi download).

The batch files copy the *.ri file for each PLC to a specified directory.

Preconditions

- An Automation Builder project has been created and tested.
- A V2.3 CODESYS project in the master PLC has been created.
- 1 download has been issued to create all the files needed for the MultiOnlineChange tool.

The MultiOnlineChange tool may not work with the autoload option enabled in CODESYS V2.3.

Please check your current autoload option in CODESYS V2.3 in “ Project ➔ Options ➔ Load&Save” disable the option "Auto load".

> *The MultiOnlineChange tool relies on CODESYS V2.3 runtime system.*
> *As a consequence it will not work with AC500 V3 products.*

Usage of the MultiOnlineChange tool

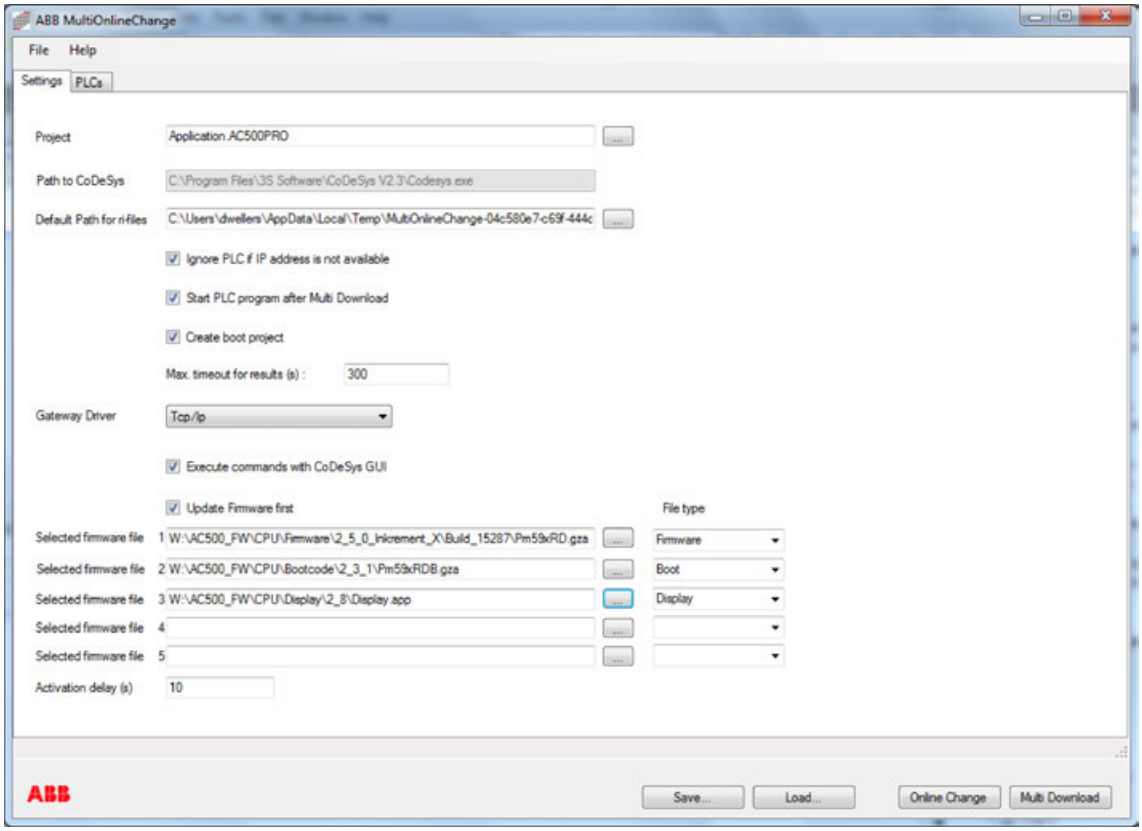
Overview

General options

- Defining of PLCs with IP address and a folder where the **.ri* file shall be stored for each PLC.
  The PLC on position one of the *"PLC"* tab list must be the master PLC. This is indicated by an orange frame. ↯ *" "PLCs" tab" on page 5798*
- Loading the given firmware file first to the PLC, and reboot it afterwards to start with the new firmware. ↯ *""Settings" tab" on page 5796*
- Performing *"Multi Download"* to download the project to all PLCs. ↯ *Chapter 1.6.5.1.8.4 "Performing a multi download" on page 5799*
- Changing the project in the master PLC. It is recommended to use the MultiOnlineChange tool to start CODESYS. ↯ *Chapter 1.6.5.1.8.6 "Editing the master PLC" on page 5802*
- Performing *"Online Change"* for all PLCs. ↯ *Chapter 1.6.5.1.8.7 "MultiOnlineChange" on page 5802*
- Showing the results of the download/online changes. ↯ *Chapter 1.6.5.1.8.5 "Verifying the download/online change success" on page 5800*

Step-by-step guide

***"Settings"* tab**



- In the *“Project”* text box, you can enter the project, which shall be distributed to all PLCs. This can either be done via opening a project file from the harddisk (in MOC stand-alone tool, see figure above) or via selection of the project, if the MOC was started from within Automation Builder.
- The field *“Path to CODESYS”* shows the path, where the file *CODESYS.exe* is available. This path is read from the registry. If the path cannot be retrieved from the registry, the tool will immediately exit after start-up.
- The field *“Default Path for *.ri files”* is an optional field. It is recommended that you define a folder here.

> *Due to compatibility reasons do not change the proposed path for Vista/Windows 7.*

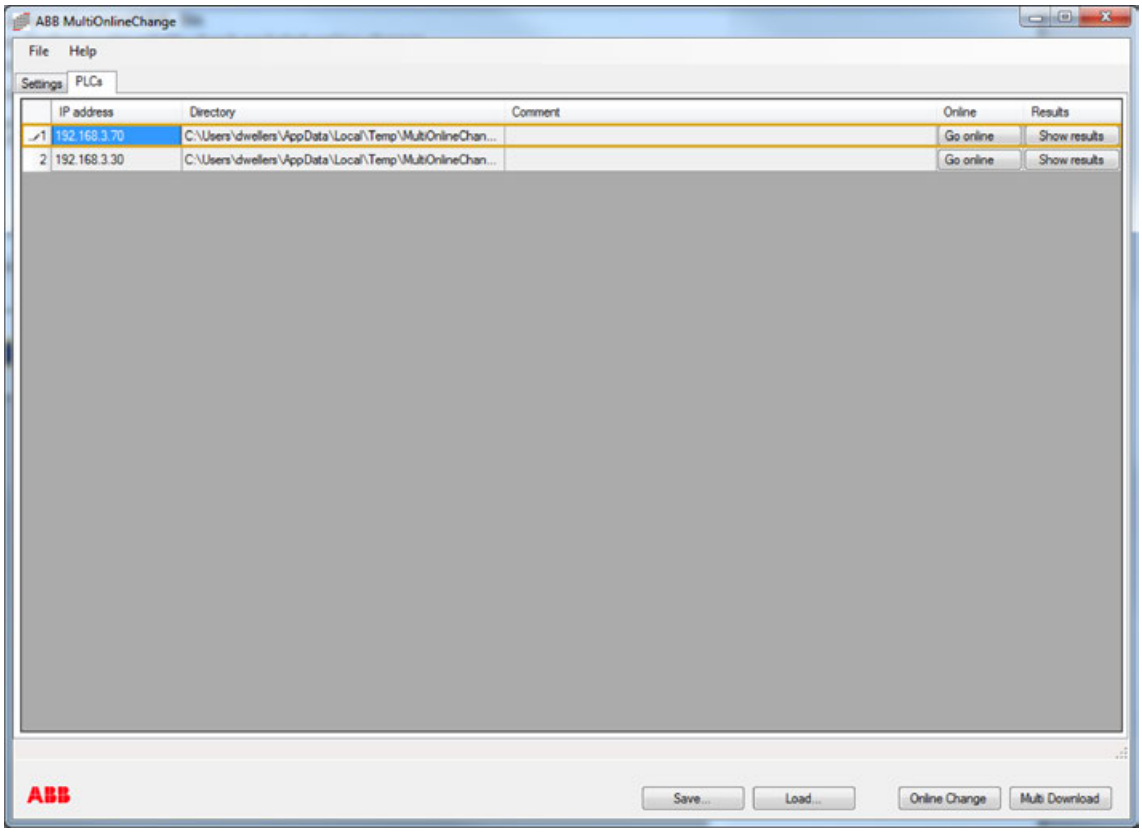
- If *“Ignore PLC if IP address is not available”* check box is enabled, then all functions will ignore any PLC, which does not reply to a *ping* command (the IP state of the PLC is shown by different background colours). In normal operation, this check box should be enabled. Otherwise the tool will try to access the defined IP in any case.
- If *“Start PLC program after Multi Download”* check box is enabled, the program is started on each PLC after a multidownload.
- If *“Create boot project”* check box is enabled, a boot project is created.
  If required, change the default setting for the *Max. timout for results*.
- The field *“Gateway Driver”* allows the selection of one of the following two options:
  – ABB TCP/IP Level 2 AC
  – TCP/IP
- If *“Execute commands with CODESYS GUI”* check box is enabled, CODESYS V2.3 UI will open up while the commands are executed. If the check box is disabled, all commands will be handled in background.
  “ Execute commands with CODESYS GUI” check box is only visible in the Stand-Alone tool.
- *“Update Firmware first”* check box shall be enabled, if the user wants to update the PLC firmware before sending any configuration to the PLC. The tool supports the update of up to 5 firmware files per PLC:
- The user has to enter the name of each firmware file in the text box *Selected firmware file* 1-5.
- The user has to select the type of any given firmware file (e.g. firmware, boot code or display) within the related box *File type*.
- The timeout to download one file and to reboot the PLC after all files have been downloaded may be extended in the box *Activation delay(s)*.

Buttons and status bar

- *Save*: After the definition of PLCs and settings is finished, all data can be saved in an XML file.
- *Load*: Load a previously saved XML file.
- *Online Change*: Perform a plausibility check and start online change.
- *Multi Download*: Perform a plausibility check and start multi download.

The status bar below the buttons shows information about the status of operations.

"PLCs" tab



The first row of the table defines the master PLC, which will be used for changing/testing the project before a download or online change is performed to the other PLCs listed in the table.

In the columns of the table, the following data is entered:

- Column *IP address*: Enter the IP address of the PLC.
- Column *Directory*: Define the directory, in which the **.ri* file will be stored. Each PLC must have its own directory. If you type a directory which does not exist yet, it will be created later during multi download.

> *If you have defined a default folder for *.ri files on the "Settings" tab, this column will be completed automatically by entering an IP address. In this case, the defined folder is the default folder and a subfolder with IP of the PLC (dots in the IP address are replaced by "-").*

> *Due to compatibility reasons do not change the proposed path for Vista/Windows 7.*

- Column *Comment*: The entered text has no influence on the operation of the MultiOnline-Change tool, but will be stored in the data XML file.
- Column *Go online*: By pressing this button CODESYS is started. You can log in to the PLC defined in this row.
- Column *Show results* will be explained in ↬ *Chapter 1.6.5.1.8.5 "Verifying the download/online change success" on page 5800*.

Each IP address and each directory must be unique. Do not define the same IP or directory twice. If you do so, you will get an error message when you try to perform an action.

The context menu of the table can be opened by right-click and contains the following functions:

- *Add single PLC line*: Adds 1 row to enter a new PLC.
- *Delete selected PLC lines*: Deleted selected rows.

- *Add IP range*: A range of IP addresses is added by defining the start IP address, the end IP address and the increment. E.g. if you select start IP 192.168.3.1 and end IP 192.168.3.10 and increment 3, the following IP addresses will be created:
  – 192.168.3.1
  – 192.168.3.4
  – 192.168.3.7
  – 192.168.3.10
- *Clear Data*: Deletes all entries in the table.
- *Check IPs*: Performs a check, using the *ping* command to see, if the defined PLCs are available. After the check, the IP addresses of all available PLCs are shown with green background, unavailable PLCs with a red background. White background means *state unknown*.

Performing a multi download

After you made settings and entered PLCs you want to download the project to, you can start a multi download by clicking the button Multi Download.

Important!

A multi download should be the first action you perform (after the configuration) when you start using the MultiOnlineChange tool. The multi download builds necessary infrastructure by performing the following tasks:

– *It creates all directories defined in the PLC table (this is the first and only time when folder are created).*
– *It copies the *.ri files to the folders.*

Without folder and the corresponding *.ri files in them, online access and online change are not possible. In fact, an online change will be executed even if folders or files are not available, but any PLCs without a defined folder or *.ri file will be skipped.

An error message will be shown if there are:

- Rows without IP address
- Rows without a defined directory
- Duplicate IPs or directories

During the multi download, no other operation is possible and the tool can no longer be operated until the operation is finished.

Multi download (as well as online change) might take a long time, depending on the number of PLCs. Each PLC requires approximately 15 seconds (without firmware update), i.e. 100 PLCs would require about half an hour. Therefore the timeout parameter in the tabpage Settings has to be adapted according to the project dimension.

Important!

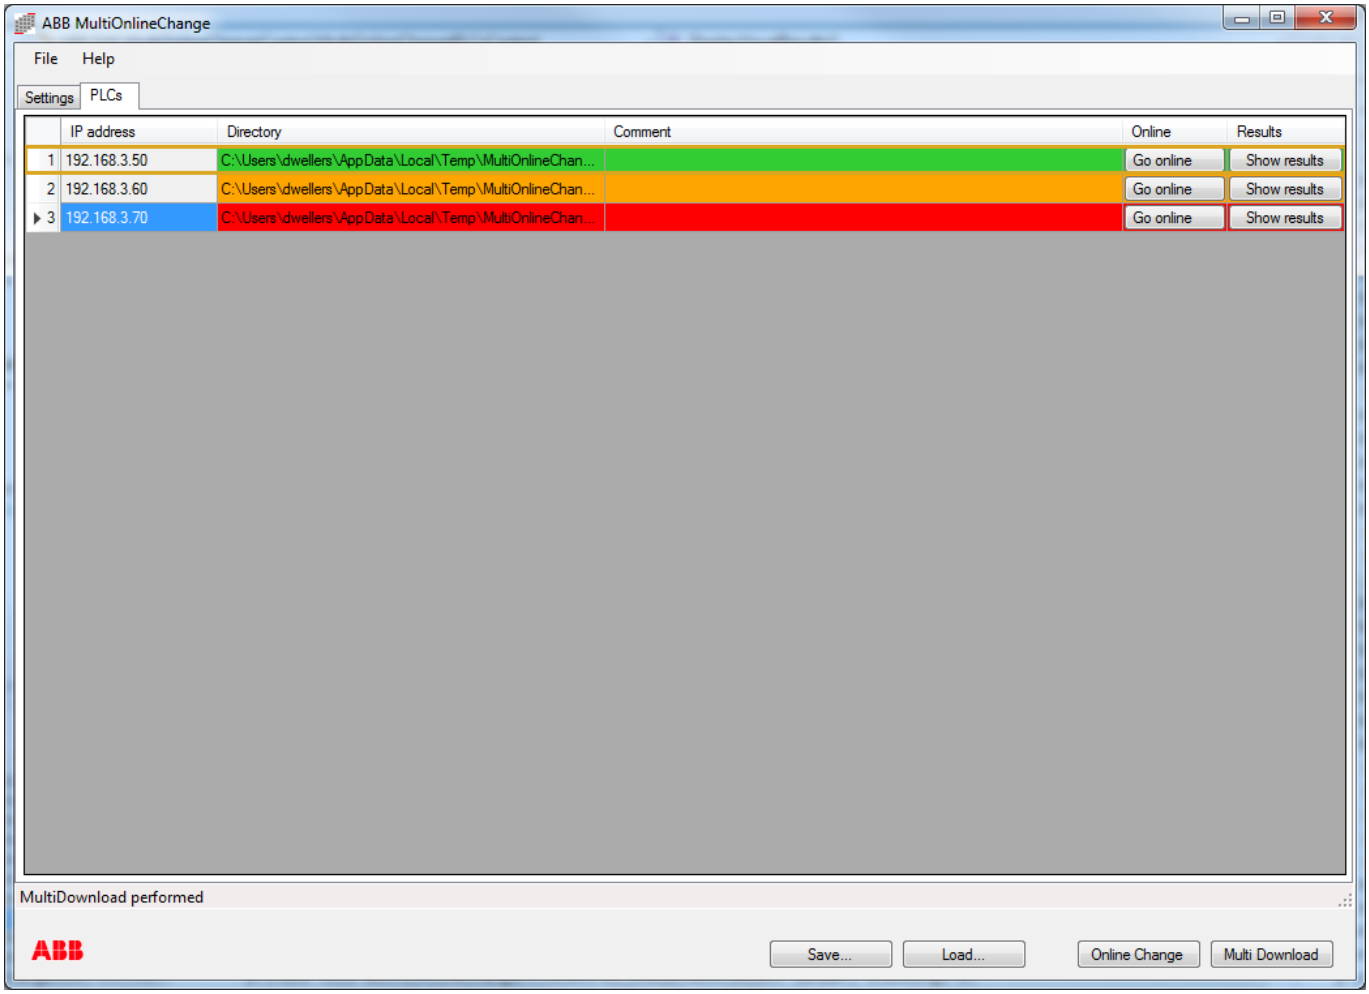
*If you change the IP addresses of a PLC or the folder where the corresponding *.ri file is stored, a multi download should be performed again to rebuild the infrastructure (folders etc.).*

Verifying the download/online change success

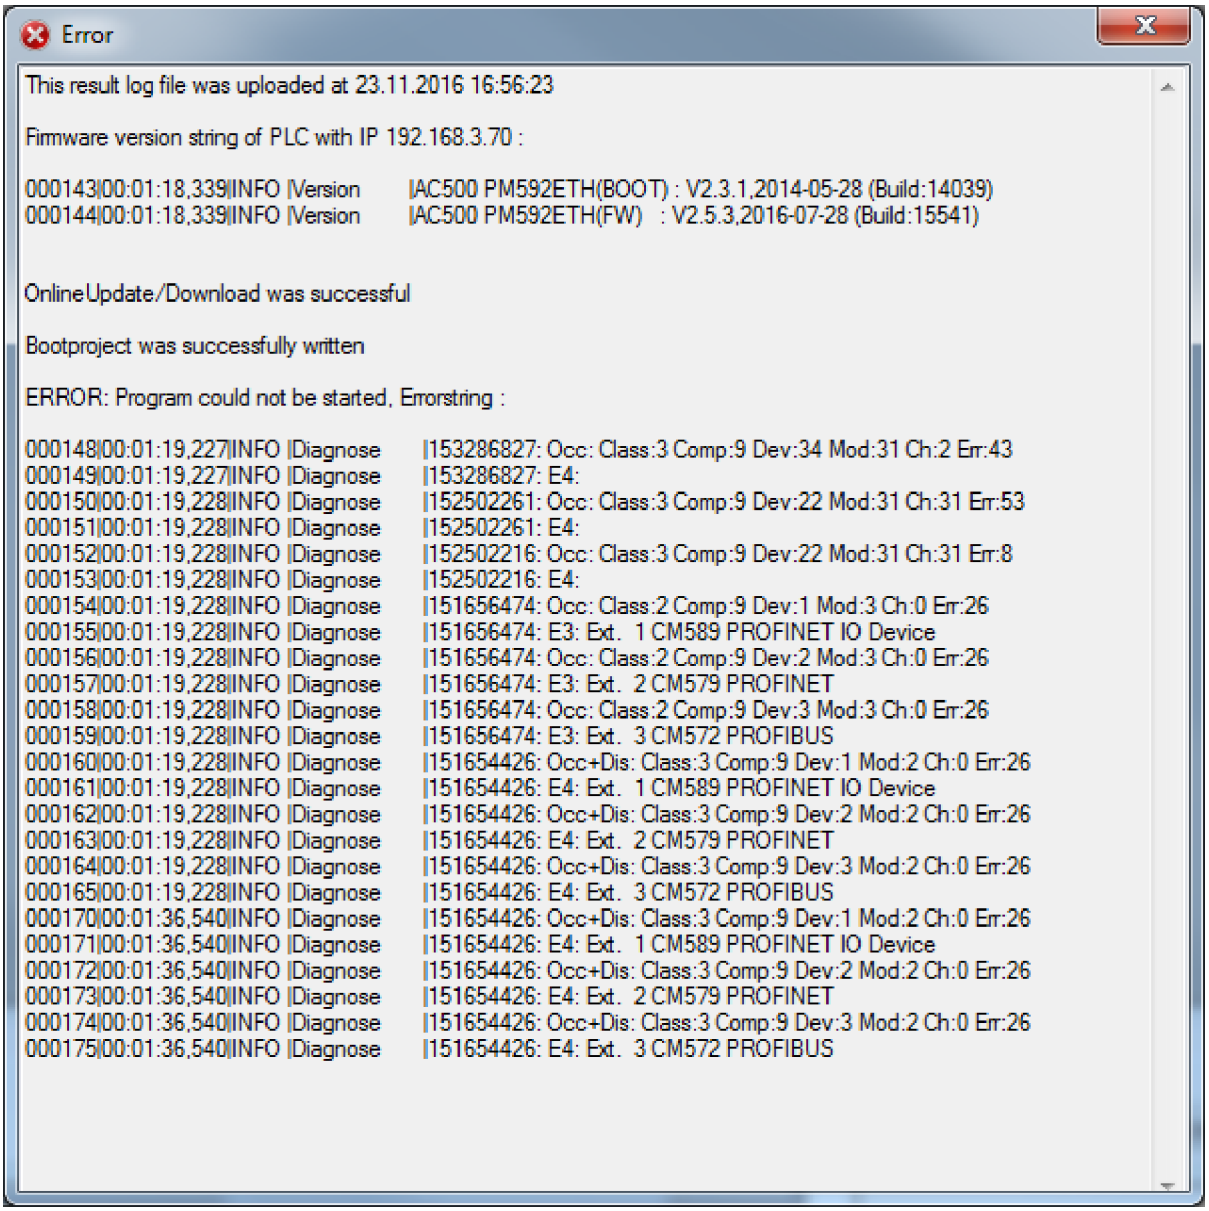
The verification is done via upload of a *.log file from each PLC where all operations are logging their success or failure. For diagnostic purposes these *.log files are not deleted afterwards. They are stored in the installation directory of the Automation Builder.

After starting the download/online change the PLC tab is active and will indicate the success or failure of the operation at the end by using different colored lines:

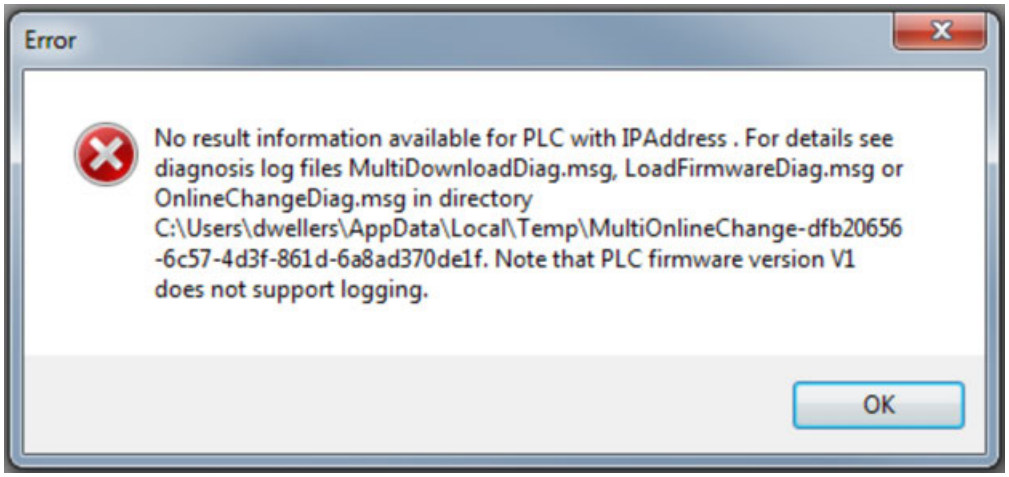
Example view after a run:



- GREEN: All successfully done.
- ORANGE: The download was done, but there were diagnostic errors, e.g. configuration faults or run time errors.
  If the button *"Show Results"* is pressed the contents of the selected PLC log file is displayed:



- RED colored line: Perhaps the PLC is offline, the IP address is wrong or the project has a wrong target (so download will be rejected immediately). In these special cases there is no detail information available because a log file could not be uploaded.
  If the button *"Show Results"* is pressed the following window is displayed:



- "MultiDownloadDiag.msg" is the log file for multi download operation.
- "LoadFirmwareDiag.msg" is the name of the log file of the firmware update operation.
- "OnlineChangeDiag.msg" is the name of the log for the online change operation.

Editing the master PLC

After downloading the project to all PLCs, you can change the project. To do so, click the "Go Online" button of the first row in the PLC table. CODESYS will start with the defined project and log in.

You can now log off, change the project, compile, log in, perform an online change etc. as usual. When you have finished, close CODESYS.

The tool cannot be operated during master edit.

MultiOnlineChange

If you made no breaking changes to your project (and thus only altered the program in the master PLC with online change "" no clean, rebuild, etc …), you can now perform an online change on all connected PLCs.

To do so, click the button *"Online Change"*. During the operation, the MultiOnlineChange tool is deactivated.

Online access

You can log in to any PLC by clicking the button *"Go Online"* in the table row of the PLC. You can log in in more than 1 PLC, as long as you do not log-in to the master PLC. If you do so, the tool operation is deactivated again (see *Chapter 1.6.5.1.8.5 "Verifying the download/online change success" on page 5800*). If the corresponding *.ri file is not available, online access cannot be performed and an error message is shown.

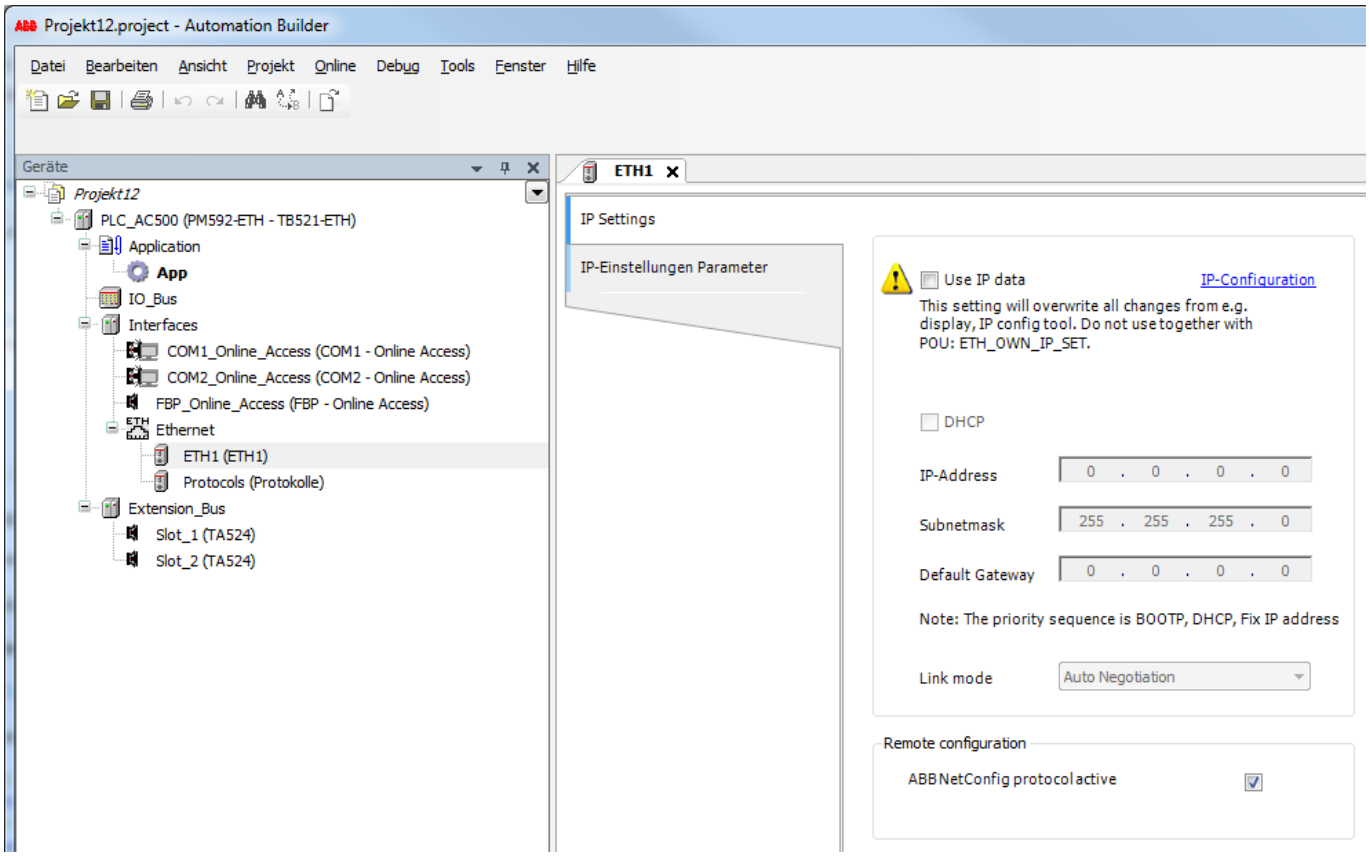
Important!

Do not edit any PLC except the master PLC!

Limitations in V2.x

Do not use fixed IP data!

In the IP settings parameter dialog of an Ethernet Communication Module there is an option to use the given IP data. If this option is used in the master project the MultiOnlineChange tool is not capable of loading the project to other PLCs.



Modify wait time of MultiDownload/Online change

Depending on the network infrastructure the MultiOnlineChange (MOC) might run into errors due to timeouts. The user will not be informed about these timeouts directly, but each timeout might result in errors.

Examples:

“Logfile cannot be read” (red line in PLC list even though the download/change was successful).

“Online Change not possible” (PLC changes state from “run” to “stop” during Online Change, because the wait time for loading the project was not sufficient).

To avoid these timeouts and the resulting errors the user can extend the wait times of the MultiOnlineChange plug-in/tool. These times can be adapted in the template XML file `"CmdTemplate.xml"` by increasing the values in the `delay` lines. The file has the following content:

```
<CmdTemplates>
...
<DownloadPLC>
  device instance "MyDriver"
  device parameter "Address" @@@ipAddress
  device parameter "Port" @@@port
  device parameter "Motorola byteorder" Yes
  onerror continue
  delay 1000
  query off no
  online login
  delay 5000
  online logout
  waitevent ONL_LOGGEDOUT
  query off no
  online login
```

```
  delay 3000
  online filewrite @@@iniFileForLogging
  waitevent ONL_FILEWRITTEN
  online filewrite @@@uniqueIdent
  waitevent ONL_FILEWRITTEN
  online logout
  waitevent ONL_LOGGEDOUT
  query off ok
  online login
  waitevent ONL_PROGRAMLOADED
  waitevent ONL_FILEWRITTEN
  delay 3000
  @@@bootproject online bootproject;
  waitevent ONL_FILEWRITTEN
  delay 10000
  online logout
  waitevent ONL_LOGGEDOUT
  query off no
  online login
  delay 15000 @@@enable online run
  delay 20000 online fileread @@@uploadLogFile
  waitevent ONL_FILEREAD
  delay 5000 online logout
  file save
  delay 1000
  system "@@@handleRiBatch"
  delay 2000
</DownloadPLC>
...
<OnlineChangePLC>
  project loadcompileinfo "@@@plcDirectory\@@@projectName.ri"
  device instance "MyDriver"
  device parameter "Address" @@@ipAddress
  device parameter "Port" @@@port
  device parameter "Motorola byteorder" Yes
  delay 10000 onerror continue
  query off no
  online login
  delay 10000 online filewrite @@@iniFileForLogging
  waitevent ONL_FILEWRITTEN
  online filewrite @@@uniqueIdent
  waitevent ONL_FILEWRITTEN
  online logout
  waitevent ONL_LOGGEDOUT
  query off ok
  delay 1000
  online login
  waitevent ONL_PROGRAMLOADED
  delay 3000
  @@@bootproject online bootproject
  waitevent ONL_FILEWRITTEN
  delay 10000
  online logout
  waitevent ONL_LOGGEDOUT
  query off no
  online login
  delay 15000
  online fileread @@@uploadLogFile
  waitevent ONL_FILEREAD
  delay 3000 online logout
  file save
```

```
  delay 1000
  system "@@@handleRiBatch"
  delay 2000
</OnlineChangePLC>
</CmdTemplates>
```

Each delay defines a wait time in milliseconds, which can be adapted by the user. As an example some of the delays are emphasized above:

- The three emphasized delay times in tag `<DownloadPLC>` can be increased to ensure that the MOC waits long enough for the log-file to be accessible after reboot before reading it.
- The four emphasized delay times in tag `<OnlineChangePLC>` can be increased to ensure that MOC waits long enough for loading the project, logging in to PLC and reading the log-file.

1.6.5.1.9 Embedding of AC500 V2 libraries

Situation

With new Automation Builder releases often new AC500 V2 system libraries are being installed.

In difference to AC500 V3 libraries, the AC500 V2 libraries are not versioned. An update of the Automation Builder might lead to the situation that a login to the PLC is only possible after a rebuild and with an online change – although the application has not been changed and the user is working with a previous version profile.

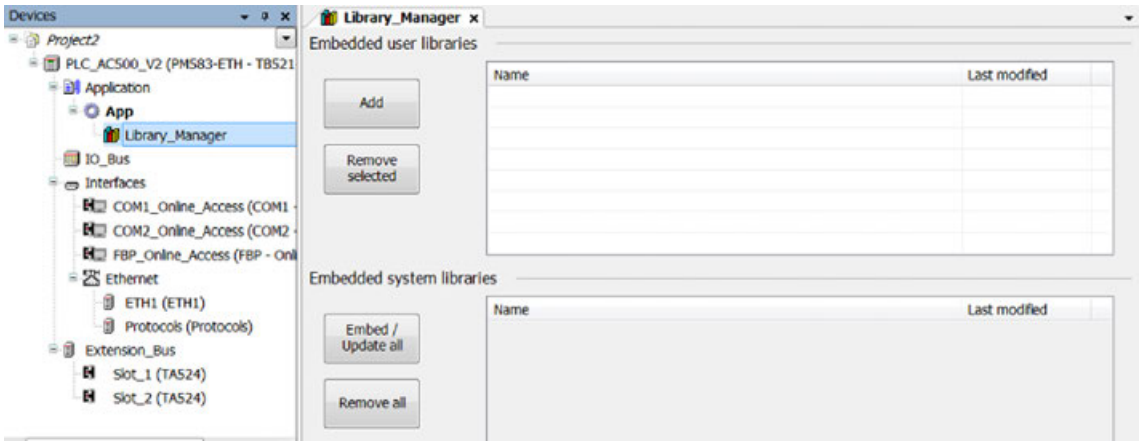
Avoidance

To avoid this situation, the AC500 V2 libraries can be embedded into the Automation Builder project.

> *The feature "Embedding of AC500 V2 libraries" is available as of Automation Builder 2.1.1.*

Embed user defined libraries

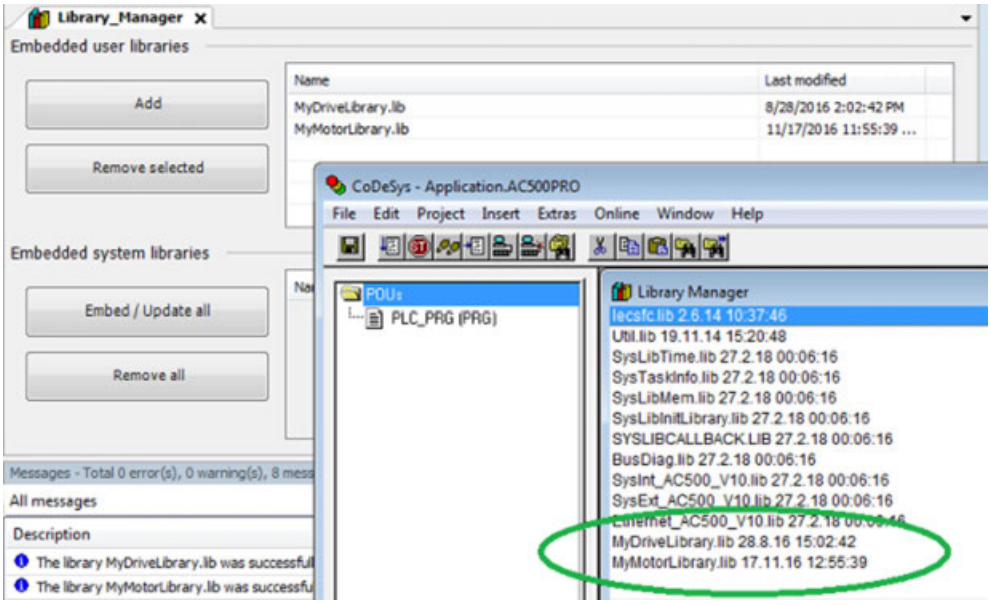
1. Right-click on the *"App"* node of your *"PLC_AC500_V2 <...>"* project and click *"Add object"*.
2. Select *"Library Manager"* in the appearing window and click *[Add object]*.
   ⇨ *"Library_Manager"* appears below your *"App"* node
3. Double-click on the *"Library_Manager"* object in the device tree.
   ⇨ The Library manager editor appears.



4. Click the *[Add]* button and embed your user defined libraries.

Success or failure of the embedding will be displayed in the message window below.

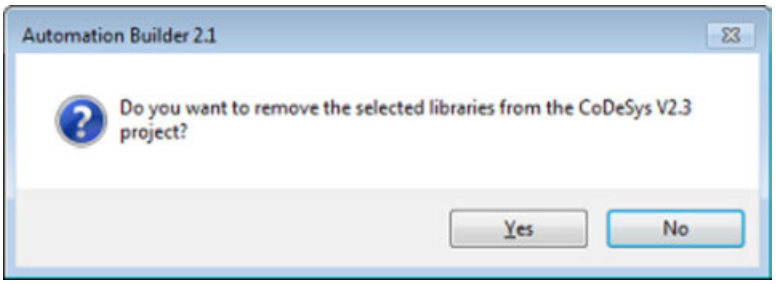
In case of success the libraries are automatically added to the corresponding CoDeSys V2.3 project



Remove user defined libraries

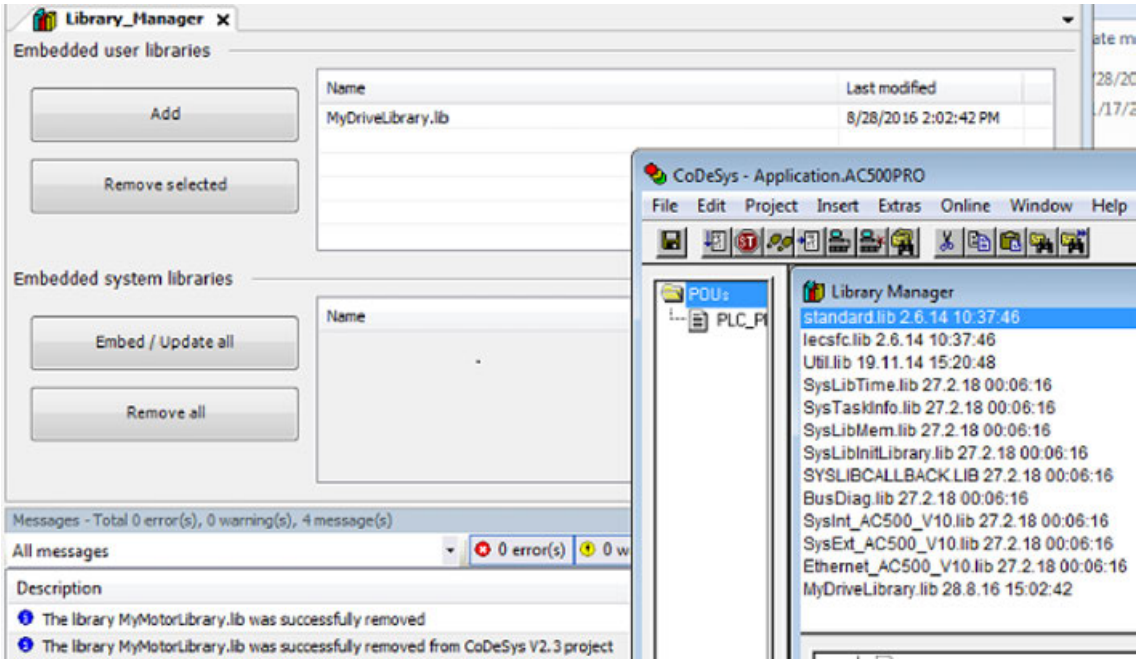
1. Select your libraries to remove (one or more libraries can be removed) in the library manager editor and click the *[Remove selected]* button.

   ⇨ A confirmation prompt appears.



2. Click *[Yes]*

   ⇨ Information messages are displayed in the message window and the selected libraries are removed from the CoDeSys V2 project.



Embed system libraries

- Click *[Embed / Update all]* in the Library Manager editor.

> *Via the [Embed / Update all] button all the system libraries are embedded into the Automation Builder project.*
>
> *The system libraries are not added into the CoDeSys V2 project.*
>
> *The CoDeSys V2 project will use automatically (for the referenced system libraries) these embedded system libraries instead of the system libraries of the latest Automation Builder installation.*

Remove system libraries

- Click *[Remove all]* in the Library Manager editor.

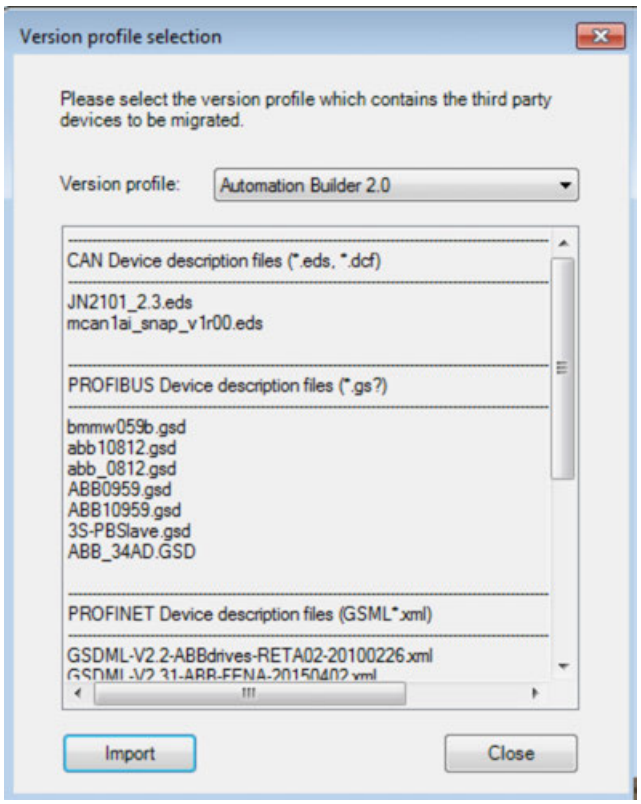
> *Via the [Remove all] button the system libraries will be removed from the Automation Builder project.*
>
> *The system libraries won't be removed from the CoDeSys V2 project.*
>
> *The CoDeSys V2 project will use automatically (for the referenced system libraries) the system libraries of the newest Automation Builder installation.*

1.6.5.1.10 Migration of third party devices

After an update of Automation Builder the device repository contains only ABB devices. The third party devices which were installed into previous versions of Automation Builder are not automatically installed in the newest version profile. This has to be triggered by the user.

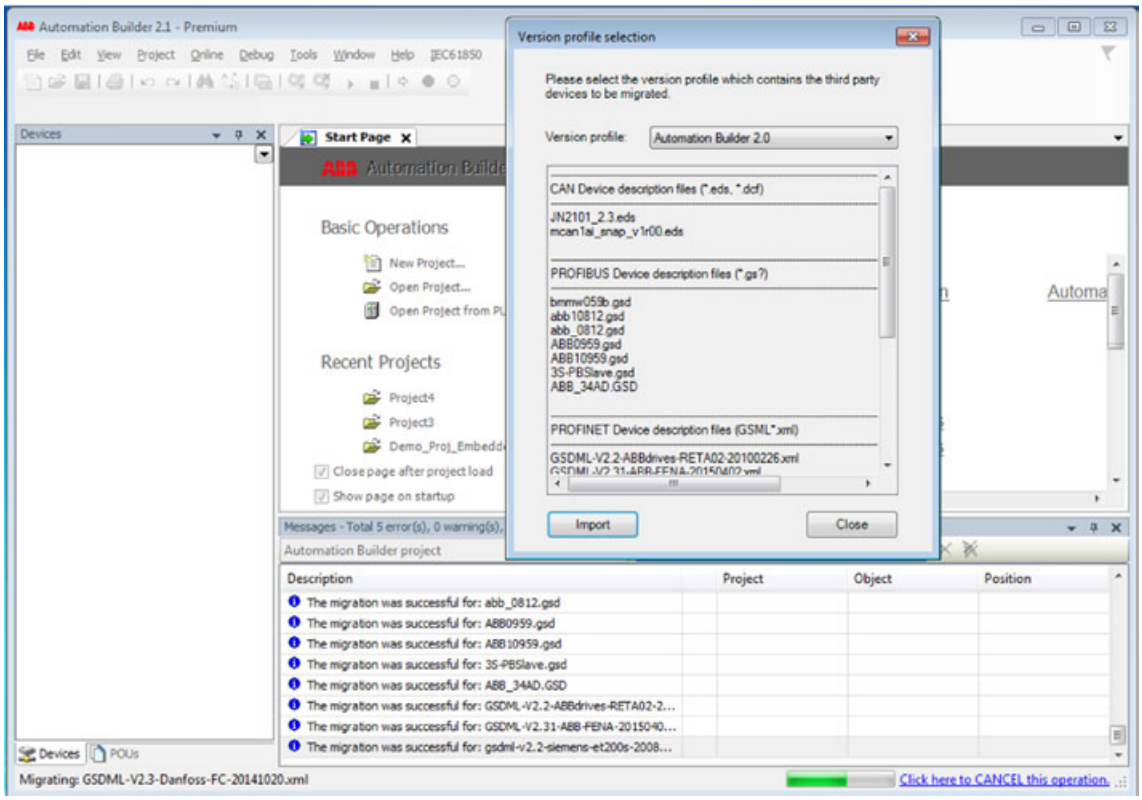
> *The feature "Migrate third party devices" is available as of Automation Builder 2.1.1.*

1. Click *"Tools"* in the main menu of Automation Builder.
2. Click *"Migrate third party devices"* in the drop-down list.
   ⇨ The window *Version profile selection* appears.
3. Select a version profile in the drop-down list containing previous Automation Builder / Control Builder Plus profiles. The active profile does not appear in the list.
   ⇨ After selection of a previous version profile, all the third party devices which have been installed inside this version profile are listed.



It is not possible to select or deselect some third party devices. Importing will affect all the third party devices which are listed in the list view.

4. Select *[Import]*.



⇨ During the migration the message window displays success or failure of device migration.

> *In case of failure during the migration the affected third party device description has to be installed manually via main menu "Tools ➔ Device Repository ➔ Install".*

In the status bar, the third party device which is on *Migrating:* <...> is displayed on the left side.

The import operation can be cancelled by clicking the *"Click here to CANCEL this operation"* link on the right side of the status bar. This becomes effective when the migration of the just migrating third party device is finished.

5. To close the dialog select the *[Close]* button of the *Version profile selection*.

1.6.5.1.11 Advanced IO device handling

Automation Builder provides the Advanced IO Device Handling feature for configuring identical IO device types at multiple instances.

This feature is supported by the following commands that works with IO devices only.

- Generate DUT
- Map to Existing DUT
- Release DUT mapping

These commands work on individual nodes and on CI (communication interface) level nodes.

Generating DUT

Each device generates two DUTs. One for the input and one for the output. Some devices contain only input or output type. In such cases, the device generates only one DUT of the relevant type.

- Right-click on the desired IO device and select *"Generate DUT"* to generate a DUT for an IO device.

The following example shows how to generate DUTs at CI level node.

- In the device tree, right-click on a master node such as PNIO_Controller and select *"Generate DUT"* to create DUTs for the child nodes.
- The DUTs of child nodes are generated in *"Application ➔ App ➔ IO_Device_Generated_Items"* folder.
- Generated DUT considers channels with BYTE datatype as members. If channels with BYTE datatype are not present in the given hierarchy, it adds the members with another higher datatype.
- Channels with BOOL datatype are not considered.

Mapping to existing DUT

This command is enabled for the IO device when the IO device is not mapped and when DUTs of matching size (calculated based on device channel list) are available in *"Application ➔ App ➔ IO_Device_Generated_Items"* folder.

1. Right-click on an IO device and select *"Map to Existing DUT"*.

   ⇨ Enter Instance Name dialog is displayed.

2. Enter the instance name which satisfies IEC naming validations and unique name in global scope.
3. Click *"OK"* to create a global variable associated with the mappings in DI (PRG).

   If you want to view mapped instances, double-click *"DI (PRG)"*.

With the 'Map to Existing DUT' command:

- Any device can be mapped only to one input DUT and one output DUT. If you have already mapped an input DUT, only the output DUT is shown in the options list and vice-versa.
- Mapping is also supported at CI level nodes. To create global variables for CI level nodes, the address of the first child is considered.

Releasing DUT mapping

This command is enabled on an IO device only when an IO device is mapped either to input, output or both DUTs. You can use this command to release (or revert) mappings and to delete global variables created during 'Map to Existing DUT'.

Right-click on an IO device and select *"Release DUT Mapping"*. The mapped DUT instance is deleted.

Using DUT variables in CODESYS application

1. In the Automation Builder project, double-click *"Application"* to launch CODESYS application.

   ⇨ CODESYS application is launched. CODESYS application contains mapped DUT instances.

2. Double-click *"PLC_PRG"* to create DUT variables.
3. Add DUT variables based on mapped DUTs.

For further information on mapping DUTs, see section *Chapter 1.6.5.1.11.2 "Mapping to existing DUT" on page 5810*.

For example, in the PLC_PRG, add analog I/O and digital I/O. If you insert a dot at a position where an identifier should be inserted, then a selection list is open, offering all the input and output variables which are found in the project.

After adding DUT variables, rebuild the program in CODESYS application using *"Project ➔ Rebuild"*.

Support for CI level node

The user can create DUTs for the entire hierarchy of CI level node (for example, IO_BUS), by right-clicking on the desired CI level node and by selecting *"Generate DUT"*. Further, all the DUTs are generated in *"Application ➔ App ➔ IO_Device_Generated_Items"* folder.

- The command generates DUT for the node itself and also for all child nodes.
- The DUT generated for the CI level node contains generated DUTs for the child nodes as their members.
- For every execution, the command checks, if any new child node is added and generates DUT.

If you delete child nodes in CI level node (for example, IO_BUS), the DUTs generated for these child nodes are not deleted automatically. You should delete the DUTs manually in the *"Application ➔ App ➔ IO_Device_Generated_Items"* folder if desired.

Configuration check

Configuration check for size is enabled to ensure that all devices are mapped with DUTs of the correct size. In case of any changes in the mapped DUT, configuration check verifies the size of the DUT. If it fails, an error message is displayed in Automation Builder messages window and does not allow to launch the application. This check can be performed in *"Create configuration data"*.

1.6.5.2 PLC devices and components

1.6.5.2.1 Device repository

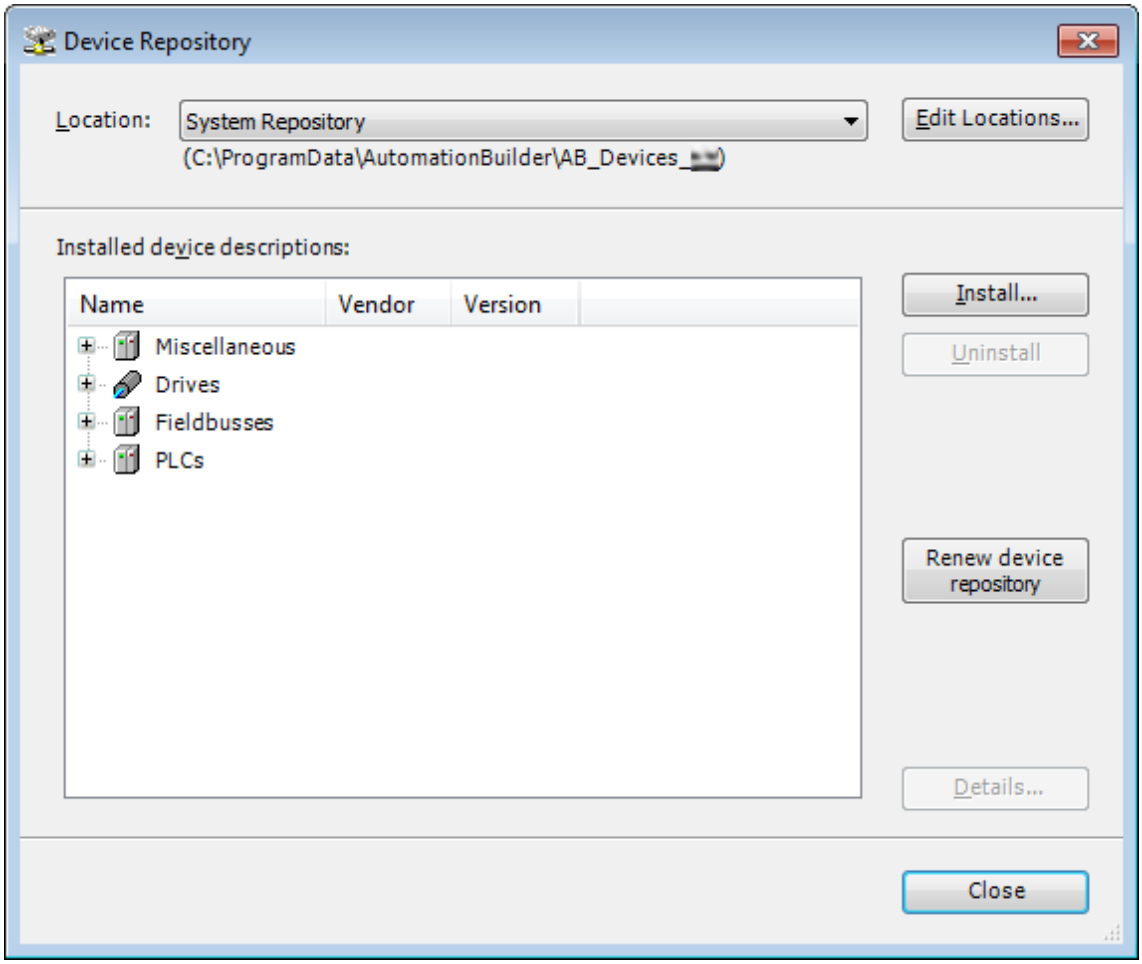
The Device Repository of Automation Builder manages the pool of devices that can be used in the PLC configuration.

You install or uninstall devices in the *"Device Repository"* dialog box. The system installs a device by reading the device description files, which define the device properties for configurability, programmability, and possible connections to other devices.

You can use the devices provided in the device repository by adding them to the device tree of your project.

Dialog device repository

1. Click *"Tools ➔ Device Repository"*.
   ⇨ The *"Device Repository"* dialog box opens.



[Edit Locations]: Changes the default repository location. The devices can be managed at different locations.

[Install] / *[Uninstall]*: Installs or uninstalls devices.

[Renew device repository]: Updates the device list, e.g. after uninstallation of a device.

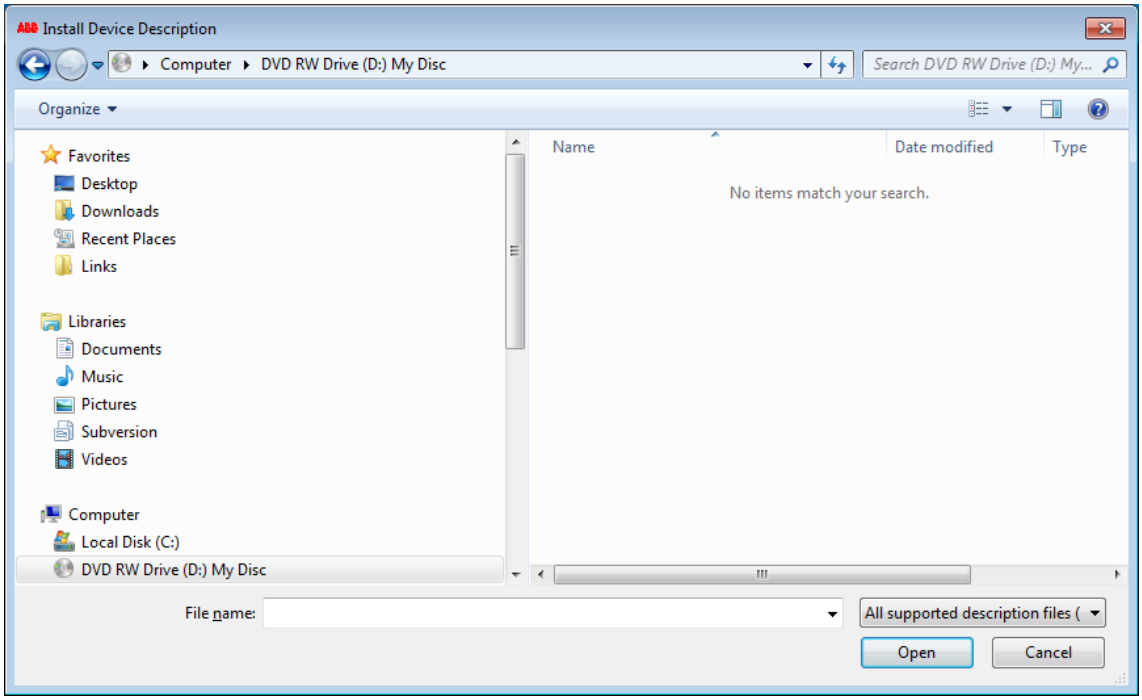
[Details]: Provides technical details on the selected device.

2. Select the install location. *"System Repository"* is set by default.

Installing devices

The device repository cannot be changed manually, e.g. by copying or deleting files. Use always the Device Repository dialog to add or remove devices.

1. Click *[Install]* and select the appropriate file format.
   ⇨ The *"Install Device Description"* dialog box opens.



2. Select the file path of the device description.
3. Select the file type filter of the required device description.
   ⇨ All device descriptions of the selected file type are listed.
4. Select the required device description and click *"Open"*.
   ⇨ Automation Builder adds the device description to the matching category of your device repository.

   If errors occur during installation (for example, missing files that are referenced by the device description), then Automation Builder displays them in the lower part of the device repository dialog box.

> *During the installation the device description files and all additional files referenced by that description will be copied to an internal location. Altering the original files will have no further effects to an internal location.*
>
> *The changes take only effect after reinstalling the corresponding device(s). The version number shown in the information section of the device should be verified.*

Uninstalling devices

Select the device you want to remove and click *[Uninstall]*.

The device is removed from the list.

> *Uninstalled devices which are used in existing projects are indicated by the symbol ❓. The device will not be configured properly.*

1.6.5.2.2 PLC start-up

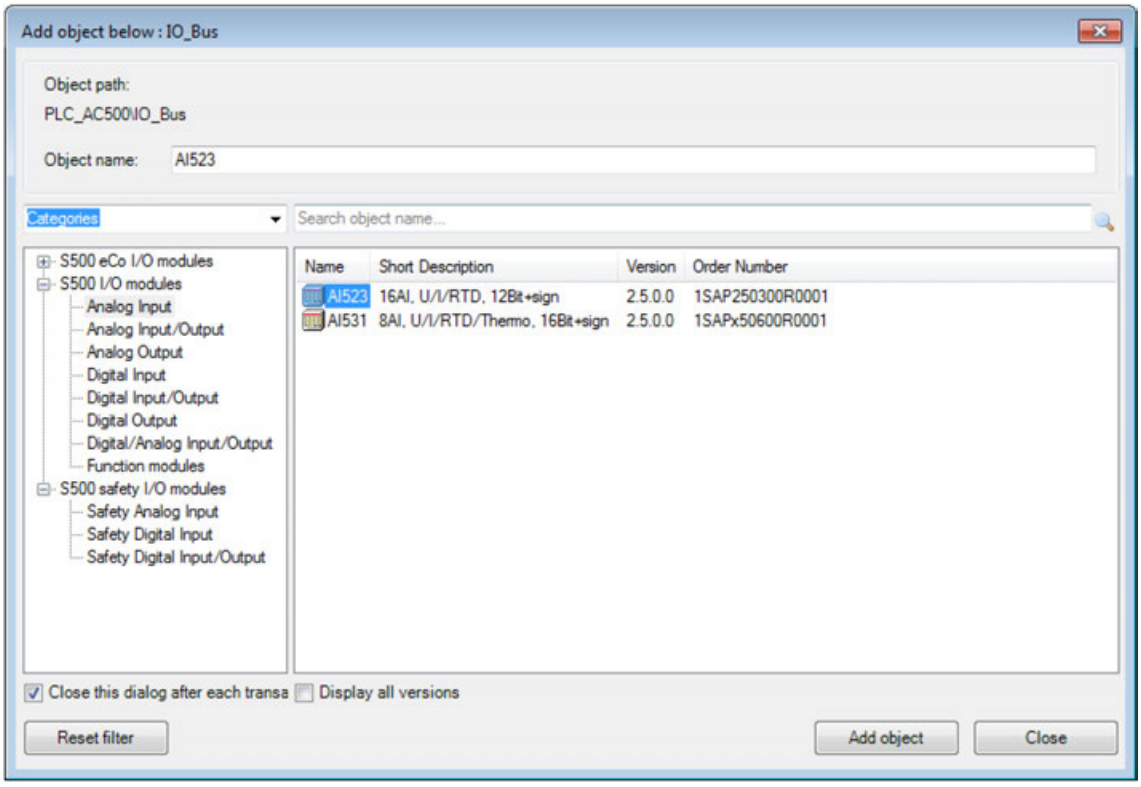
Connection of devices

All installed devices that are available in Automation Builder are listed in the ↳ *Chapter 1.6.5.2.1 "Device repository" on page 5811*.

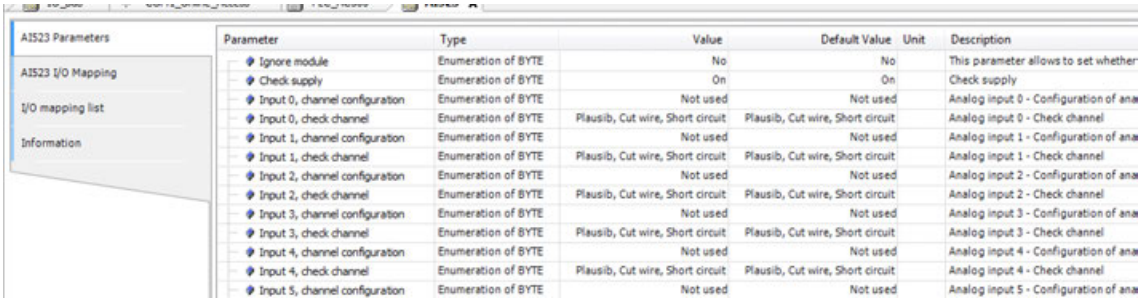
Configuring devices

Modify your Automation Builder project by adding device objects. Preset items can be replaced in the same way.

1. In the device tree, right-click an item node. Select *"Add object"*.



2. Select the desired object and click *[Add object]*.
3. Double-click the new object in the device tree to configure the device settings. Depending on the selected item different configuration tabs are available.



Symbolic names for variables, inputs and outputs

The IEC naming rules are not checked during input in Automation Builder.

Input and output mapping

Devices with I/Os provide an I/O Mapping tab in their configuration editor where the available I/O channels can directly be mapped to a global variable.

The corresponding variable declarations are automatically created in a global variables object in a subfolder of the Global Variables section in the CODESYS project.

All available I/O channels can easily be assigned to a variable.

Channels

Variable	Mapping	Channel	Address	Type	Unit	Description
		Digital inputs I0 - I15	%IW0			
w_Input_IW0		Digital inputs I0 - I15	%IW0	WORD		Digital inputs 0-15
		Bytes	%IB0			
		Digital inputs C16 - C31	%IW1			
		Digital outputs C16 - C31	%QW0			
Fast counter						

The variable is automatically added to the Global Variables in the CODESYS project after recreating the configuration data *Chapter 1.6.5.4.1.1 “Creating configuration data” on page 6196*.

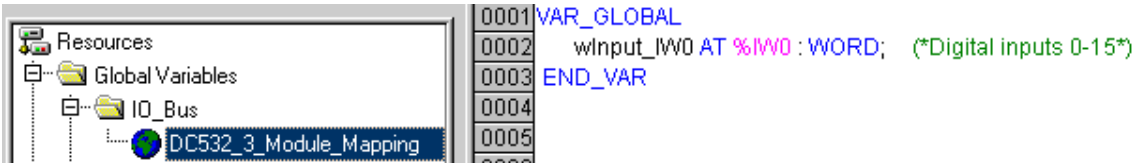
AC500 uses Motorola Byte Order (Big Endian).

The numbers in column Channel correspond to the channel numbers only and not to the bit position inside the WORD variable.

Only entries with a data type set in column "Type" can be mapped. These entries can be expanded to show the available I/O channels.

If the project has been imported from a previous Automation Builder version, all variables should be checked to avoid inconsistencies concerning the I/O mapping.

The variable is automatically added to the global variables in the CODESYS project after (re)creating the configuration data:



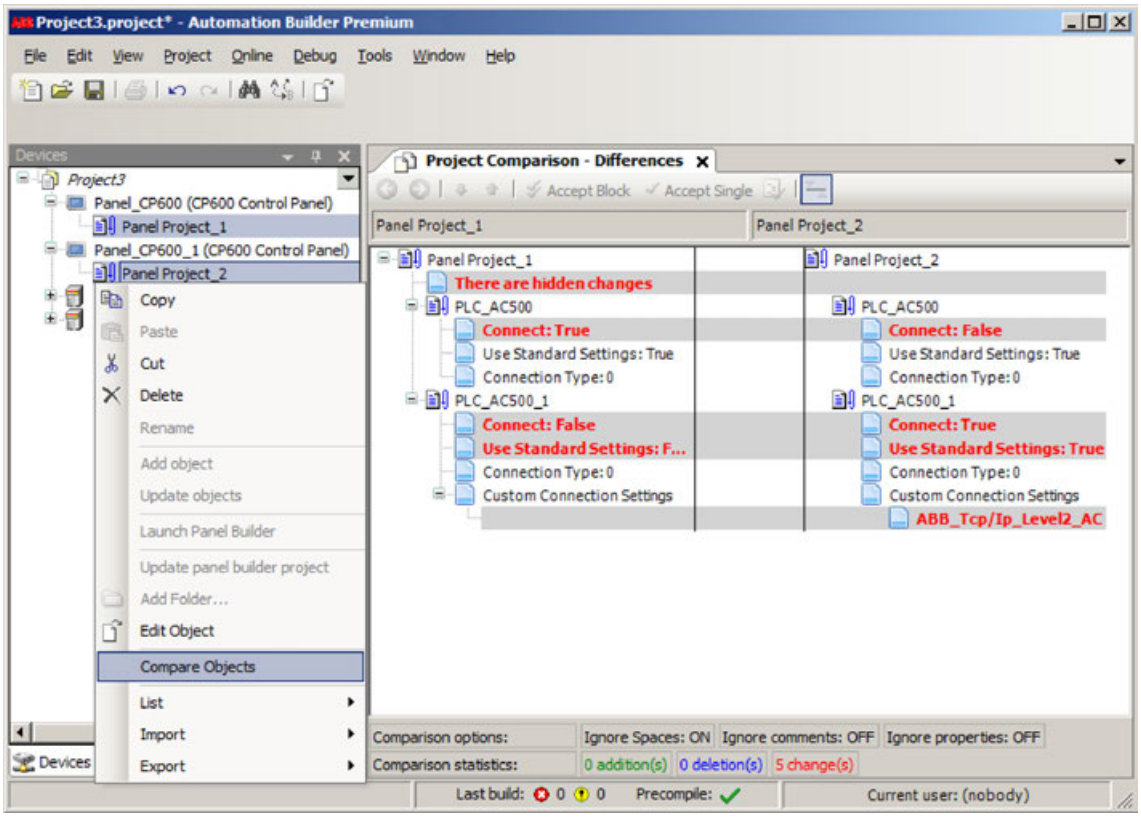
An additional GVL (Global Variables List) can be created and transferred to CODESYS V2.3. Editing of lists created in CODESYS V2.3 is not possible.

Update of AC500 devices

Perform a firmware update to update AC500 V2 devices. *Chapter 1.6.5.1.7 “Firmware identification and update” on page 5786*

Comparing objects

To compare similar objects within a project (such as the project configuration) select both objects. Right-click and select **Compare Objects** to see the differences.



IP settings

Configuration of the IP settings with the LED display

The IP settings for the PLC can be set directly on the processor module via keypad and LED display.

See *Chapter 1.6.4.1.5.4.3 “Configuration” on page 5428*.

Configuration of the IP settings with the IP configuration tool

The IP address for AC500 devices can be set or changed in Automation Builder using

- the IP configuration tool which is described in the following.
- the 'Communication Settings'. *Chapter 1.6.5.2.2.2.3 “Configuration of communication via Ethernet (TCP/IP)” on page 5829*

As an alternative the IP address can be changed at the hardware device itself. *Chapter 1.6.4.1.5.4 “Description of the function keys” on page 5426*

The IP configuration tool:

The IP configuration tool can be used

- to set or change the IP address of devices.
  Chapter 1.6.5.2.2.2.2.2.2 “Changing the IP address” on page 5821
- to scan the network for available hardware devices.
  Chapter 1.6.5.2.2.2.2.2.1 “Network scan” on page 5819

- to update the firmware of devices.
  This functionality is only supported if the IP configuration tool is used stand-alone.
  ↳ *Chapter 1.6.5.2.2.2.2.2.3 “Firmware update” on page 5822*
- to activate certain functionality on hardware devices.
  This feature is only available on AC500 V3 devices.
  ↳ *Chapter 1.6.5.2.2.2.2.2.4 “Blink functionality” on page 5826*

The IP configuration tool is part of Automation Builder and can be called via *“Tools ➔ IP-Configuration”*.

Further the IP configuration tool can be used stand-alone without an Automation Builder application running. The stand-alone variant requires a separate installation via the Installation Manager ↳ *Chapter 1.6.5.2.2.2.2.1 “Stand-alone installation” on page 5817*.

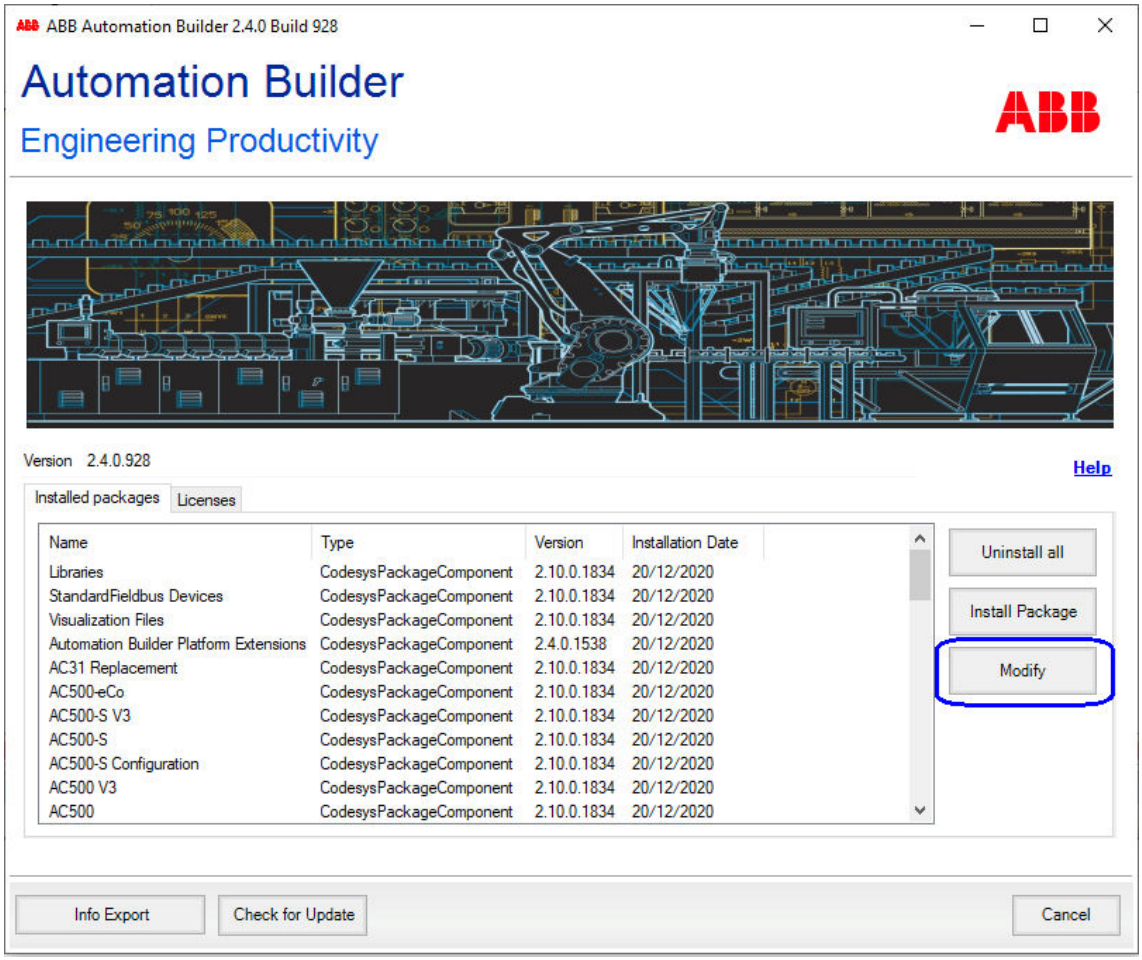
After the installation, the IP configuration tool is started via .exe file / desktop icon.

Some functionality is only supported if the IP configuration tool is used stand-alone, e.g. for firmware updates for communication interface devices.

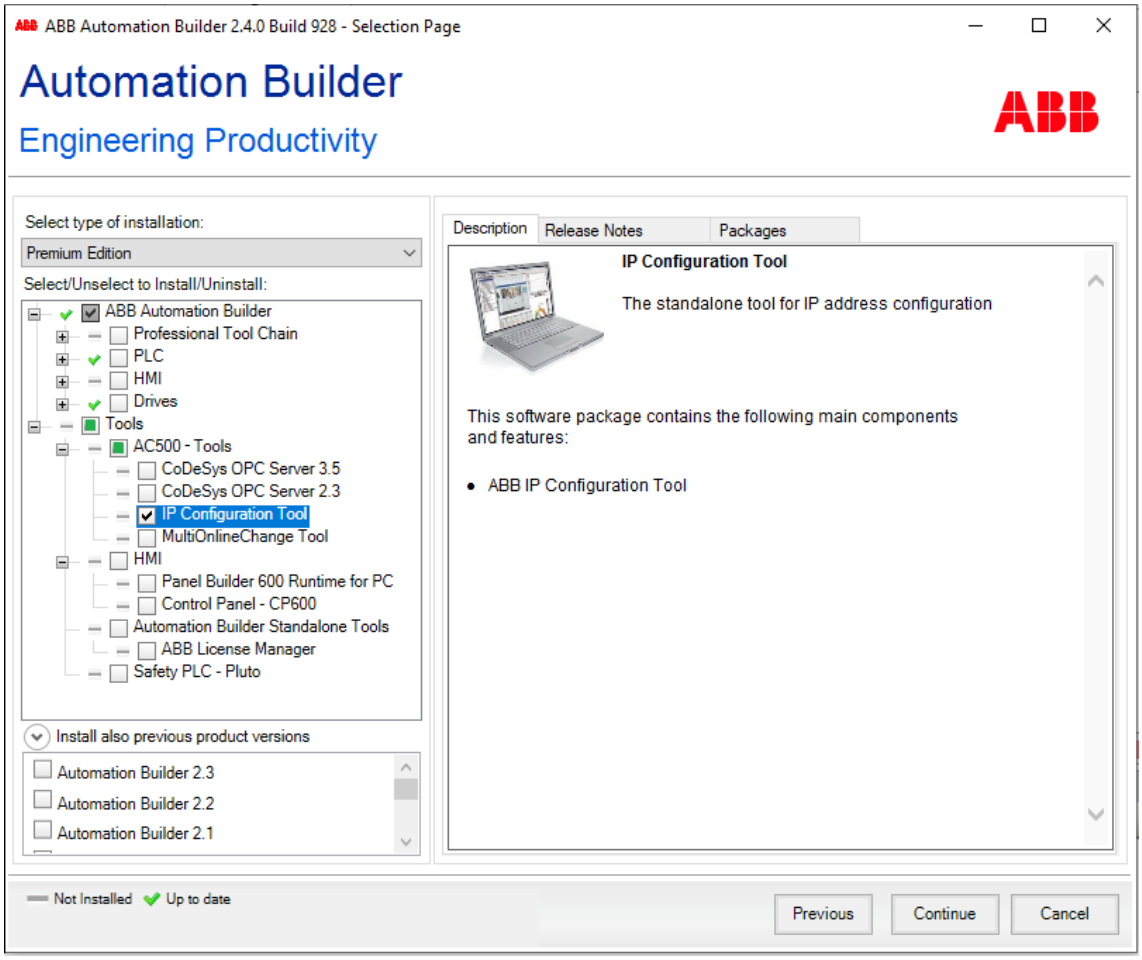
Stand-alone installation

The IP configuration tool is part of Automation Builder and can be called via “Tools ➔ IP-Configuration”. A separate installation is only required if the IP configuration tool shall be used stand-alone.

1. Open the Installation Manager in Automation Builder: *"Tools ➔ Installation Manager"*.
2. Close all other instances of Automation Builder as only one instance of the program can be executed at a time.



3. Click *"Modify"* and select the *"IP Configuration Tool"* from the structure tree.



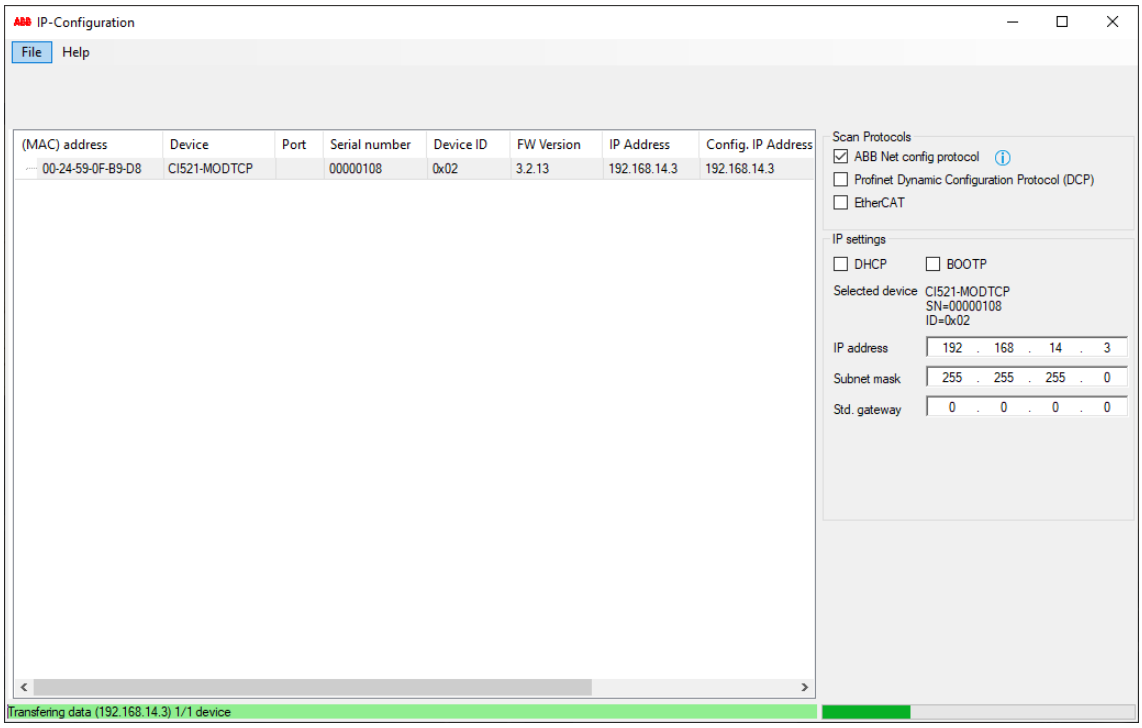
4. Click *"Continue"* to start the installation.
   - ⇨ After a successful installation the IP configuration tool is available as stand-alone tool (.exe).
   - ⇨ To start the IP configuration tool, click the new created desktop icon.

Using the tool functions

Network scan

With a network scan all devices that have been found in the network by the scan process are listed, i.e. ABB devices such as AC500 processor modules, AC500 communication interface modules or ABB Drives.

1. Start the IP configuration tool in Automation Builder (*"Tools ➔ IP-Configuration"*) or start it stand-alone (.exe).
2. The *"IP-Configuration"* dialog opens. Define the device type for the network scan by selecting the desired option under *"Scan Protocol"*:
   - *"ABB Net config protocol"*:
     Use this option for AC500 devices such as processor modules, CI5xx-Modbus devices or ABB Drives. The device(s) to be scanned must be connected to the PC via a direct Ethernet connection.
   - *"Profinet Dynamic Configuration Protocol (DCP)"*:
     Use this option for PROFINET communication interface modules. The device(s) to be scanned must be connected to the PC via a direct Ethernet connection (not via CM579).
     For the scan, a NPcap driver needs to be installed separately.
     Step 4 on page 5824
   - *"EtherCAT"*:
     Use this option for EtherCAT communication interface modules. The Ethernet cable must be connected directly to the first EtherCAT slave device of the EtherCAT fieldbus. Ensure that no EtherCAT master device is available on the bus when a scan is performed.
     "Emergency" option: Enable this option to check on failures in the EtherCAT assembly during the scan process, i.e. a frame loss or interchanged ports. Errors are displayed.
     For the scan, a NPcap driver needs to be installed separately.
     Step 4 on page 5824
3. Click *[Scan]* to start the scan process.



4. All devices that have been found in the network are listed including hardware and connection details. The following details can be changed under *"IP settings"*:

   ⇨ ● *"IP Address"*:
   Current IP address of the device.
   ● *"Conf. IP Address"*:
   Configured IP address of the device. A changed IP address will update this column.
   ● *"FW Version"*:
   Current installed firmware version of the device. This field is visible not until a first network scan. If this field is still empty after a network scan, check on connection errors.
   Chapter 1.6.5.2.2.2.2.3.1 "Trouble-shooting for firmware update" on page 5827

The IP address of some devices, e.g. EtherCAT devices cannot be changed.

Changing the IP address

1. In order to change the IP address of devices perform a network scan.

   Chapter 1.6.5.2.2.2.2.2.1 "Network scan" on page 5819

2. Select a device from the list and select the appropriate protocol under *"Scan protocol"*.

   "DHCP" or *"BOOTP"* option: If required, DHCP or BOOTP can be used to receive the IP address for the device from the server.

   "IP address", *"subnet mask"*, *"Std. gateway"*: Use these fields to change the IP address settings including the settings for the subnet mask and the standard gateway. Ensure that the combination of connection settings is correct.

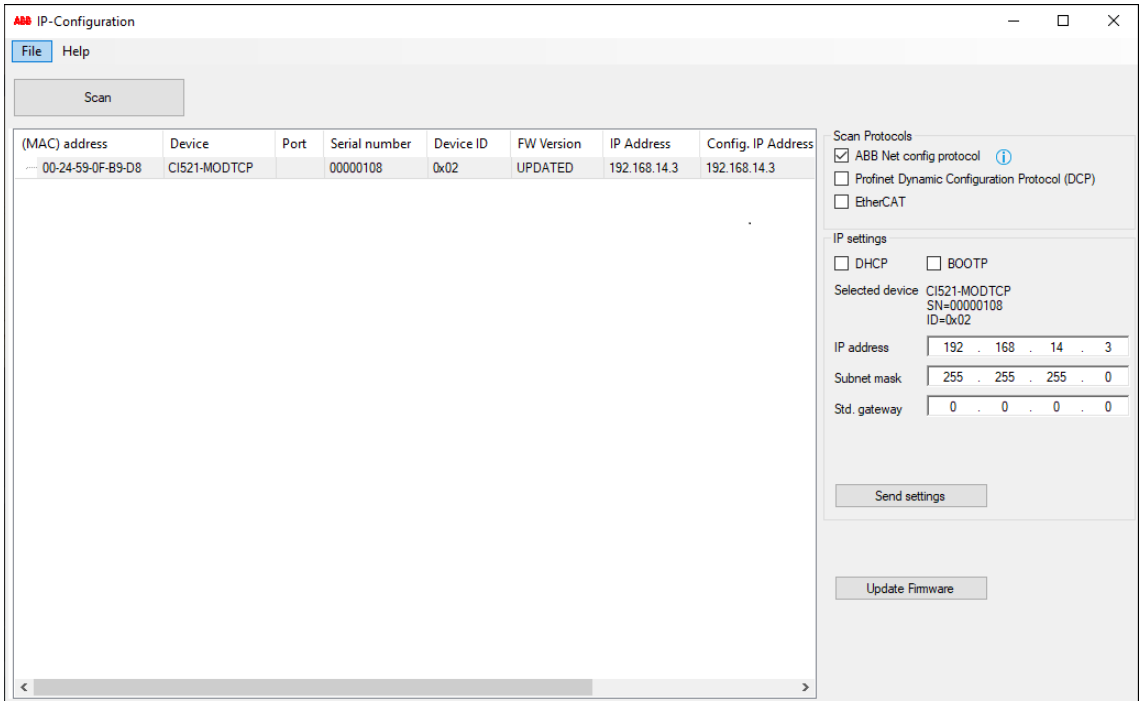
   "Check subnet configuration" on page 5827

Note for CI52x-Modbus devices

Consider the behavior of CI52x-Modbus devices if the last number of the IP address is set to "0".

"Check last number of IP address" on page 5828

3. Change the settings for the IP configuration and click *[Send settings]* to transmit the data to the device.



⇨

Note for PROFINET devices

The device name of PROFINET devices can be edited. If changing the name, ensure the following rules apply:

- *Labels must be separated by "."*
- *Total length: 1 to 240*
- *Label length: 1 to 63*
- *Labels can consist of characters [a-z] and numbers [0-9]*
- *Labels are not allowed to start with "-"*
- *Labels are not allowed to end with "-"*

4. In order to keep all IP changes after a power cycle, the settings can be stored permanently. Confirm the prompted message during the scan process.

Firmware update

The firmware of AC500 communication interface modules can be updated with the IP configuration tool.

For this, the IP configuration tool must be used as stand-alone variant.

↳ *Chapter 1.6.5.2.2.2.1 “Stand-alone installation” on page 5817*

It is not possible to perform a firmware update out of Automation Builder.

- *For PROFINET communication interface modules a firmware update is only supported for devices with firmware version ≥ 3.3.3.*
- *For EtherCAT communication interface modules a firmware update is only supported for devices with firmware version ≥ 2.1.4.*
- *For Modbus communication interface modules a firmware update is only supported for devices with firmware version ≥ 3.2.13.*

Requirements: **Before the firmware update**

- Ensure a fast and stable network connection
- Close all unused applications on the executing PC
- Stop the communication between AC500 PLC and the communication interface module that shall be updated

During the firmware update

- Do not close the IP configuration tool
- Do not open Automation Builder software or any other application
- Do not switch-off the communication interface module that shall be updated
- Do not disconnect the Ethernet connection of a communication interface module or the executing PC

The firmware update will stop the operation of the affected device(s). Hence, the device(s) will become unresponsive for 1 - 2 minutes.

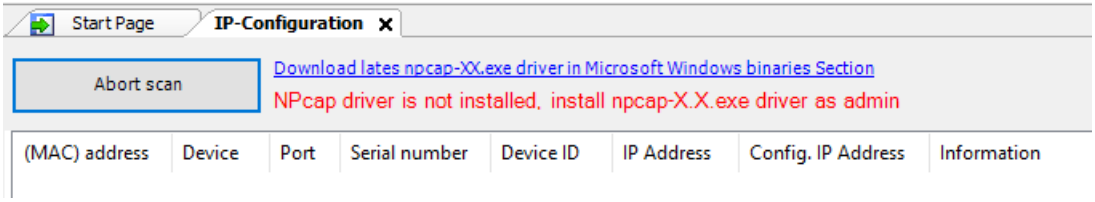
Procedure:

1. Start the IP configuration tool stand-alone (.exe).
2. Perform a network scan.

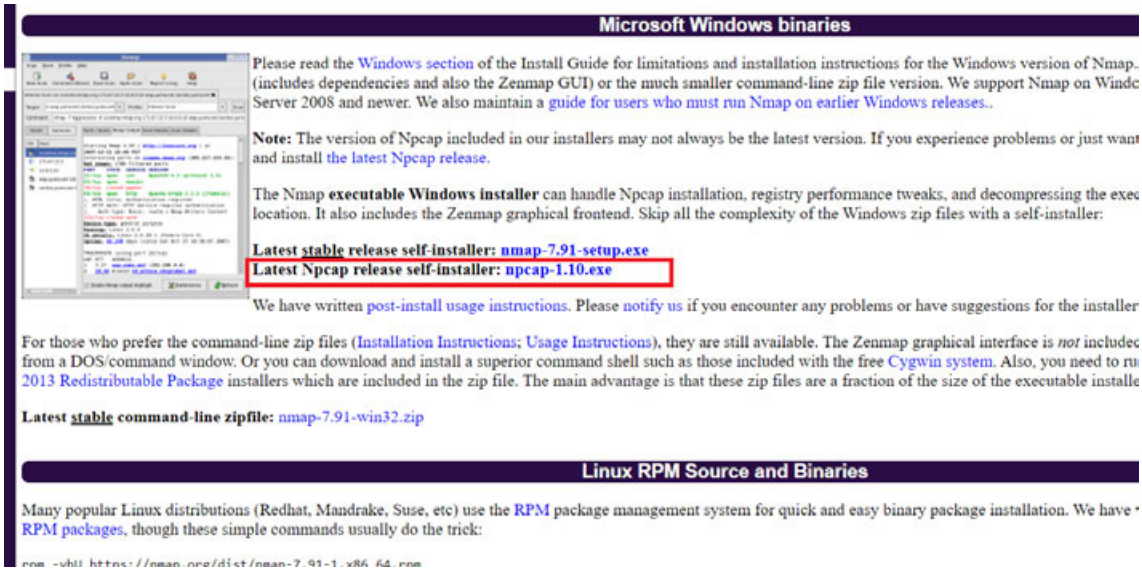
   Chapter 1.6.5.2.2.2.2.2.1 “Network scan” on page 5819
3. Select the devices that shall be updated from the list and click *[Scan]* to trigger the scan process.

   A multiple selection of several devices is possible via control key, however, ensure to select only devices of the same protocol at a time. Otherwise the firmware update fails.

4. This step is only required for devices that require an installed NPcap driver. In this case an appropriate message including a download link is prompted in the IP-Configuration dialog:



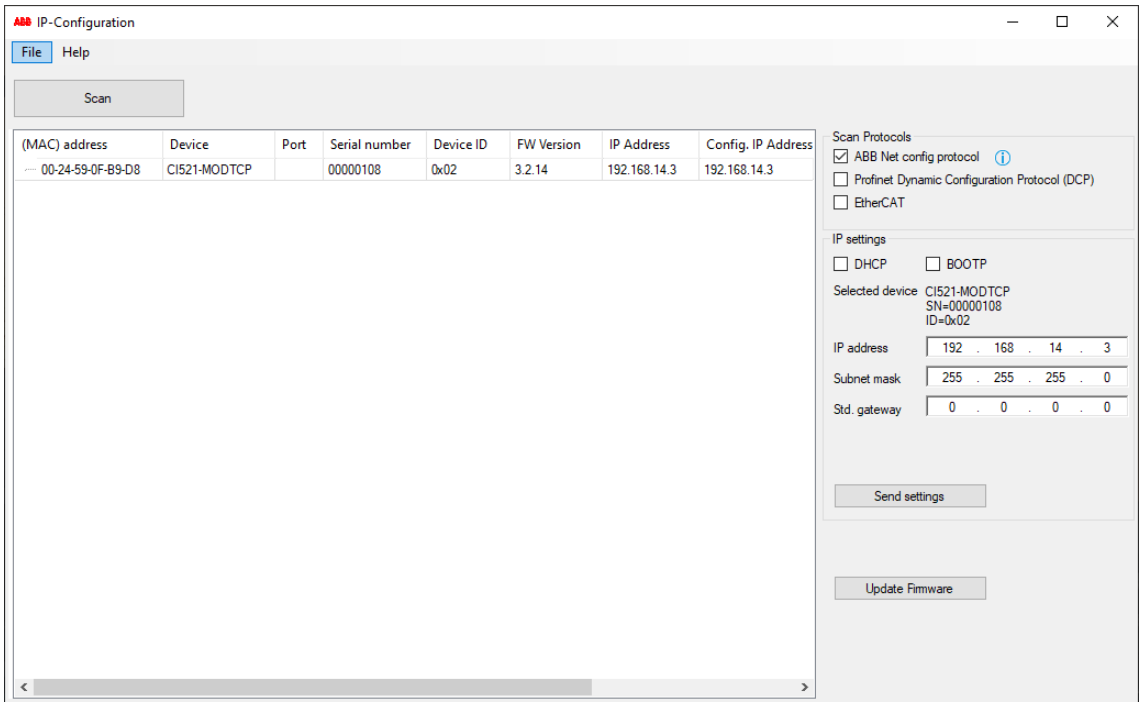
⇨ Click on the displayed link *https://nmap.org/download.html* and download the latest version of the *npcap-X.X.exe* file.



⇨ After the download, execute the file as administrator and restart the scan process.

⇨ The devices that have been scanned are listed.

5. Click *[Update Firmware]* to start the firmware update for the selected devices.



6. For CI50x, CI51x and CI52x devices a signature check is started. Select the appropriate firmware update file (*.bin) for the device(s). Example: C:\AC500\AC500_CI52x_Firmware_V3.2.8.bin.

   After a successful signature check the firmware update file (*.bin) and the respective signature file (*.bin.sig) are transferred to the device. This can last up to 3 minutes.

   If the signature check fails, check the availability of the *.bin file and the *bin.sig file.

   ↳ *"Signature check" on page 5828*

7. A status check followed by a device reboot followed by a second status check is performed automatically.

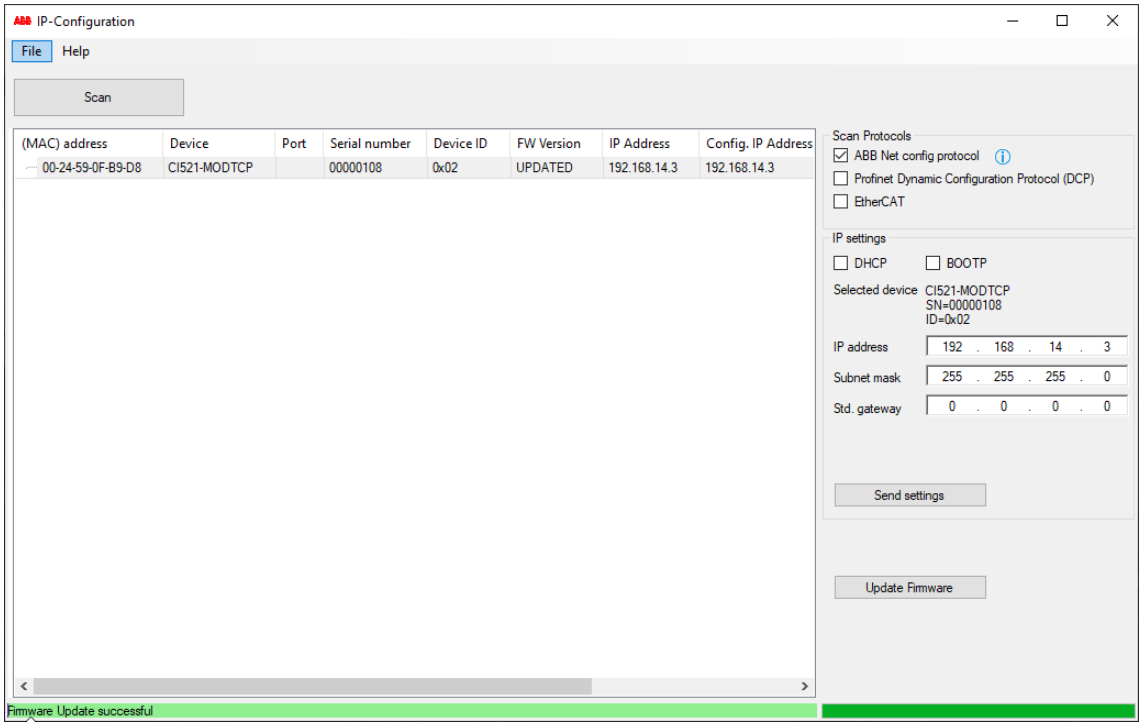
   > *After the firmware update all outputs of the updated devices are set to '0'.*

8. After a successful firmware update the update status or the new firmware version is displayed in the *"FW Version"* field.

   If this field is empty, there possibly is a connection error between the device and the executing PC.

   ↳ *"Error: Can't connect to device" on page 5829*

   Exception: For EtherCAT devices an empty *"FW Version"* field does not indicate a connection error.



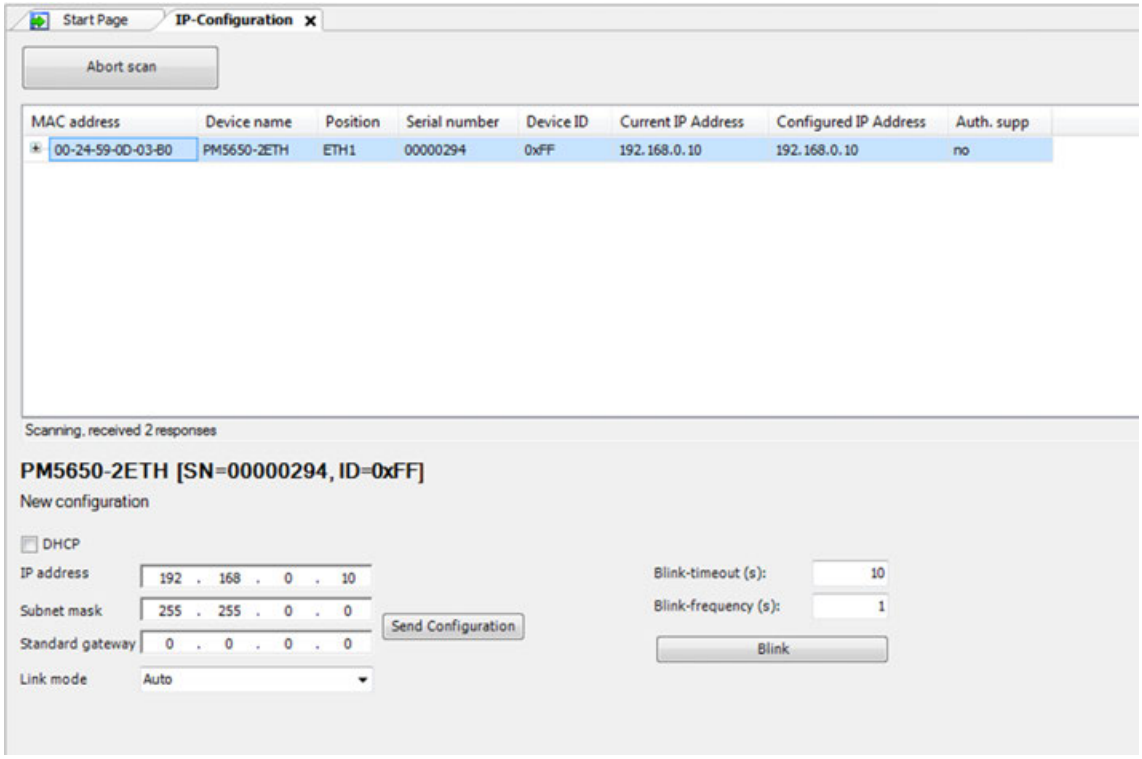
⇨ If the firmware update fails

- check the requirements for the update procedure.
  ↳ *"Requirements:" on page 5823*
- check the hints for trouble-shooting.
  ↳ *Chapter 1.6.5.2.2.2.2.3.1 "Trouble-shooting for firmware update" on page 5827*
- perform a network scan and repeat the update. If the error still persists power cycle the device and try the update again.

Blink functionality

This function activates flashing of the backlight of an AC500 LED display.

1. From the menu, select *"Tools ➔ IP-Configuration"*.
2. Click *[Scan]* to trigger the scan process for devices in the network.
   ⇨ A progress bar shows the progress. The IP settings of a selected device is displayed below the list and can be edited.
3. Adjust your desired time and click *[Blink]* to activate flashing.



Trouble-shooting for IP configuration tool

Firewall exceptions:

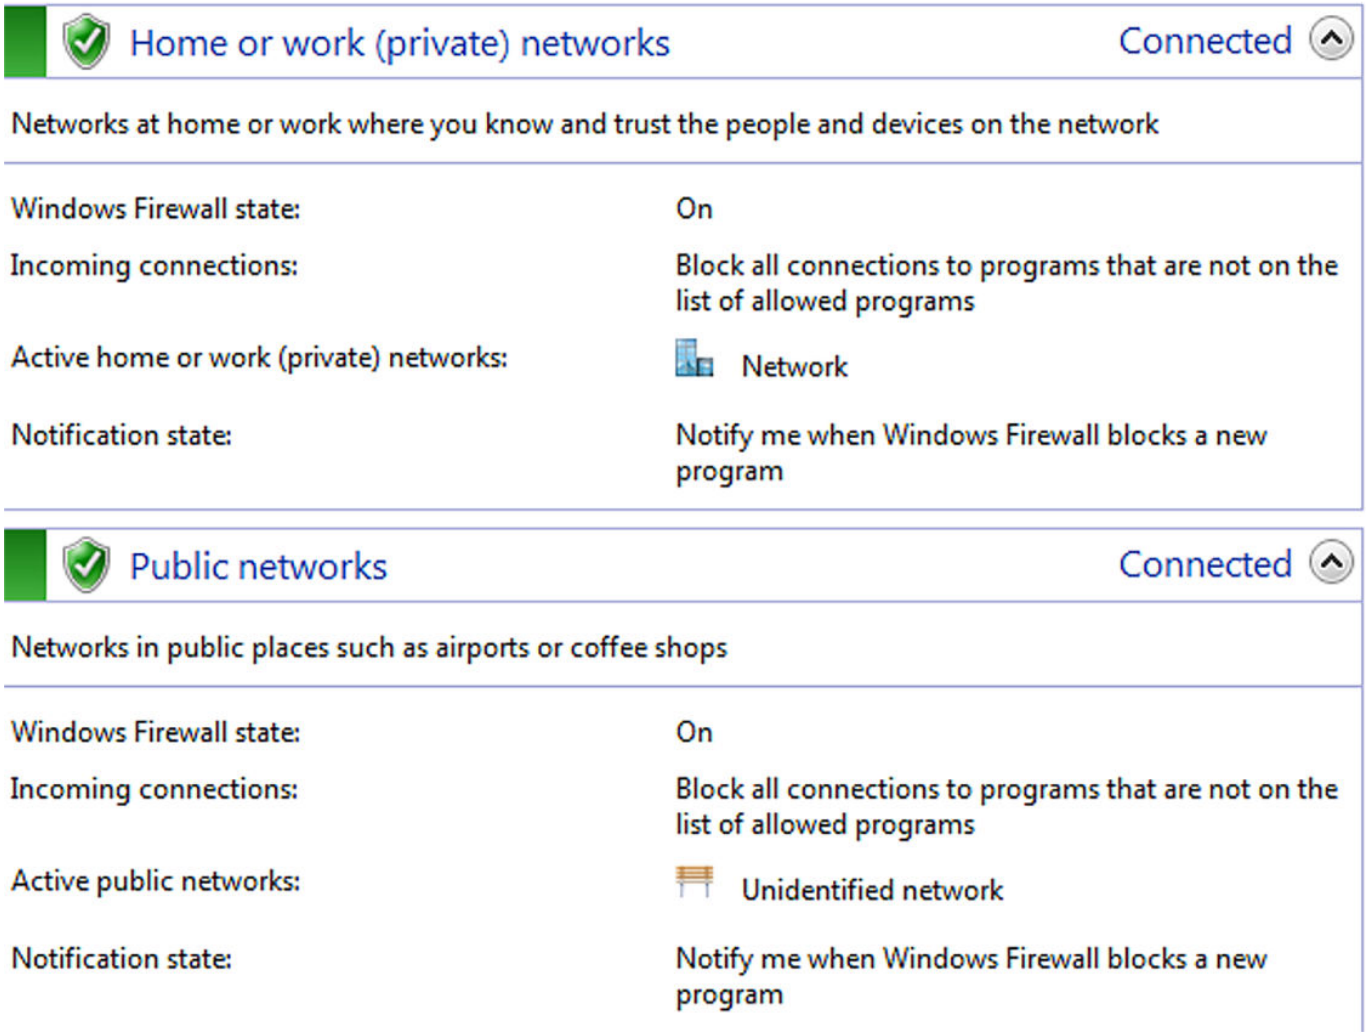
On a standard Windows 7 installation without third party firewall or security tools installed the IP configuration tool should work properly.

The Automation Builder setup installs rules or exceptions for the built-in Windows firewall to allow IPConfig to receive the responses for the IPConfig scan.

To check the Windows firewall is set correctly check the firewall settings.

Windows 7/ Windows 10:

On the network that is used for communication with the PLC, set *"Incoming connections"* to "Block all connections to programs that are not on the list of allowed programs".



If a third party firewall is used these exceptions must be configured manually.

> *Either exceptions for applications can be entered: Automation Builder and IP configuration tool must be added as application.*
>
> *Or the protocol and the port number must be given (for IPConfig: UDP protocol and port number 24576).*

Trouble-shooting for firmware update

Check the requirements

Ensure that all requirements have been considered before and during the update procedure.
↳ *"Requirements:" on page 5823*

Check subnet configuration

This hint is only valid for Modbus devices and PROFINET devices.

If the *"FW Version"* field is empty after the network scan or if the firmware version has not been updated after the update procedure, there possibly is a connection error between the device and the executing PC.

Ping the device from the executing PC. If no connection can be established, check whether the device and the PC are in the same subnet.

Example

PC	Device	Result
192.168.14.71 / 255.255.255.0	192.168.14.10 / 255.255.255.0	OK
192.168.**10**.71 / 255.255.**255**.0	192.168.**14**.10 / 255.255.**255**.0	ERROR
192.168.10.71 / 255.255.0.0	192.168.14.10 / 255.255.0.0	OK

Click *[Scan]* again to restart the network scan. If the connection is successful a newer firmware version is displayed in the *"FW Version"* column.

Check last number of IP address

This hint is only valid for CI52x-Modbus devices.

Check the last number of the IP address. If it is set to "0", the IP address setting for this last number will be used from the rotary switches on the hardware device.

Example:

Automation Builder	AC500 communication interface module (rotary switch)
IP address: 192.168.14.0	IP address: 6
	As a result, in the field *"IP Address"* the last number is set to "6": 	

Signature check

During the firmware update of CI50x, CI51x and CI52x devices a signature check is started.

The update procedure expects a firmware update file (**.bin*) and a signature file (**.bin.sig*) in the same directory. Without a signature file the signature check will fail.

Example:

Firmware update file:
*C:\AC500\AC500_CI52x_Firmware_V3.2.8.**bin***

Signature file:
*C:\AC500\AC500_CI52x_Firmware_V3.2.8.**bin.sig***

Error: Package timeout

A timeout error may occure due to an instable network.

Solution: Keep the executing PC as near as possible to the devices that shall be updated. Avoid network switches.

Error: Unable to read device status

A read error may occure due to errors in the firmware update protocol.

After the firmware update the IP configuration tool reads out the status of the updated device in order to check if the update was successful.

Error: IP is not unique

If an IP address is obtained by more than one device an error occures. A firmware update is not possible.

Error: Error State

Internal device error during the firmware update.

Solution:

Step 1: Scan again and repeat the firmware update.

Step 2: If this does not work, power cycle the device, scan again and repeat the firmware update.

Error: Can’t connect to device

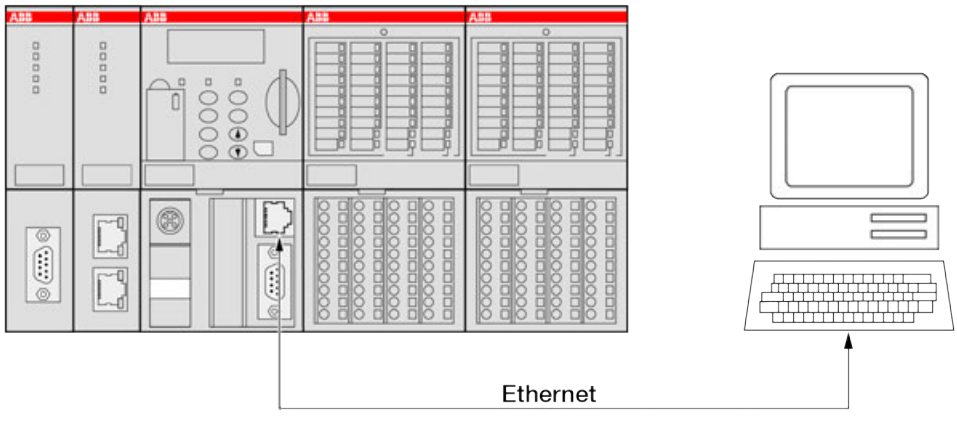
The TCP communication is not sufficient. Increase the connection quality.

Solution: Keep the executing PC as near as possible to the devices that shall be updated. Avoid network switches.

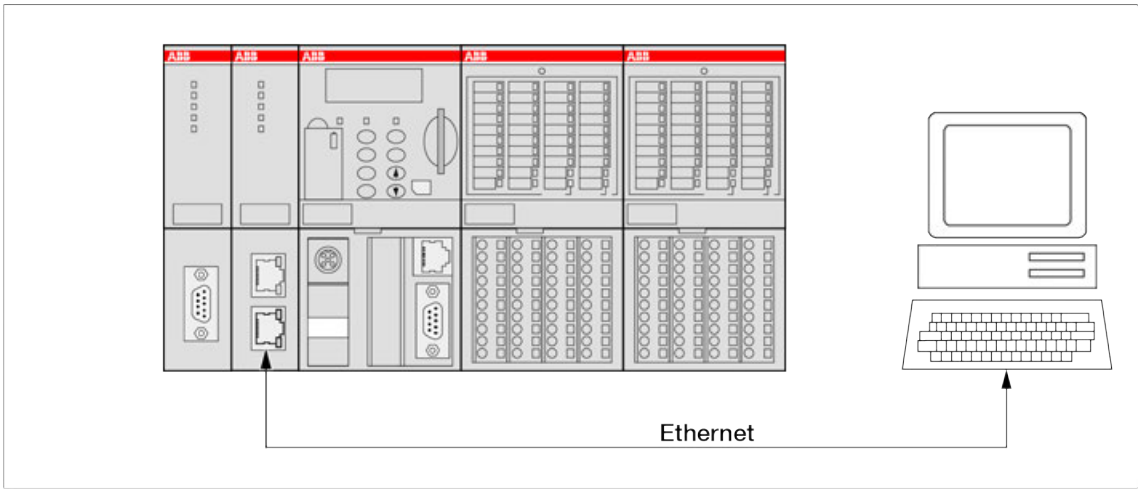
Configuration of communication via Ethernet (TCP/IP)

Programming via Ethernet is only possible on a PC with Ethernet board and installed network. Programming can be done via the internal and external Ethernet communication module.

Programming via internal (onboard) Ethernet communication module:



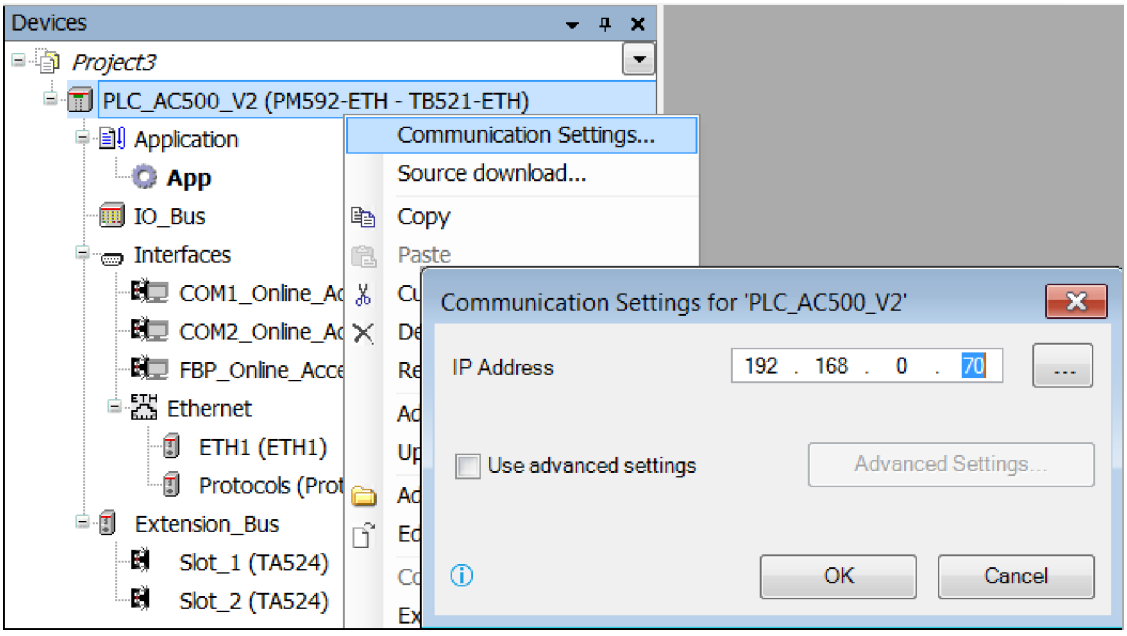
Programming via external Ethernet communication module (in the example communication module 1 in slot 1):



Enter a known PLC IP address

1. Right-click the top node *“PLC_AC500 <...>”* and select *“Communication Settings”* from the context menu.

   ⇨ Dialog box *Communication Settings <...>* appears.

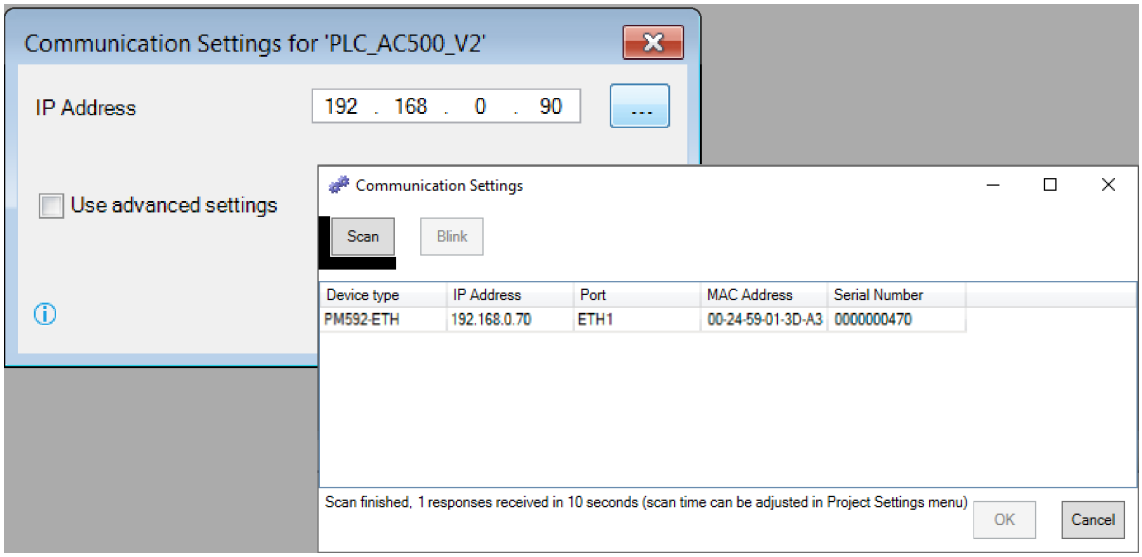


2. Enter your PLC *IP Address* and click *[OK]*.

Enter PLC IP address by scanning devices

1. Right-click the top node *"PLC_AC500 <...>"* and select *"Communication Settings"* from the context menu.

   ⇨ Dialog box *Communication Settings <...>* appears.



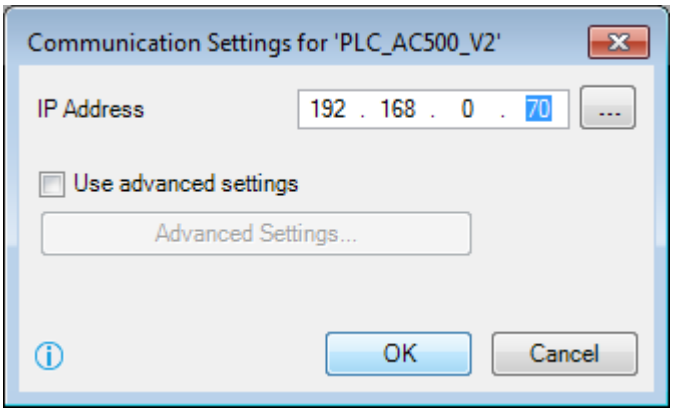
2. Click *[...]*.

   ⇨ Dialog box *Communication Settings <...>* appears.

3. Click *[Scan]*, select your desired PLC and click *[OK]*.

   ⇨ Entry is transferred to the dialog box *Communication Settings <...>*.

   Click *[OK]*.



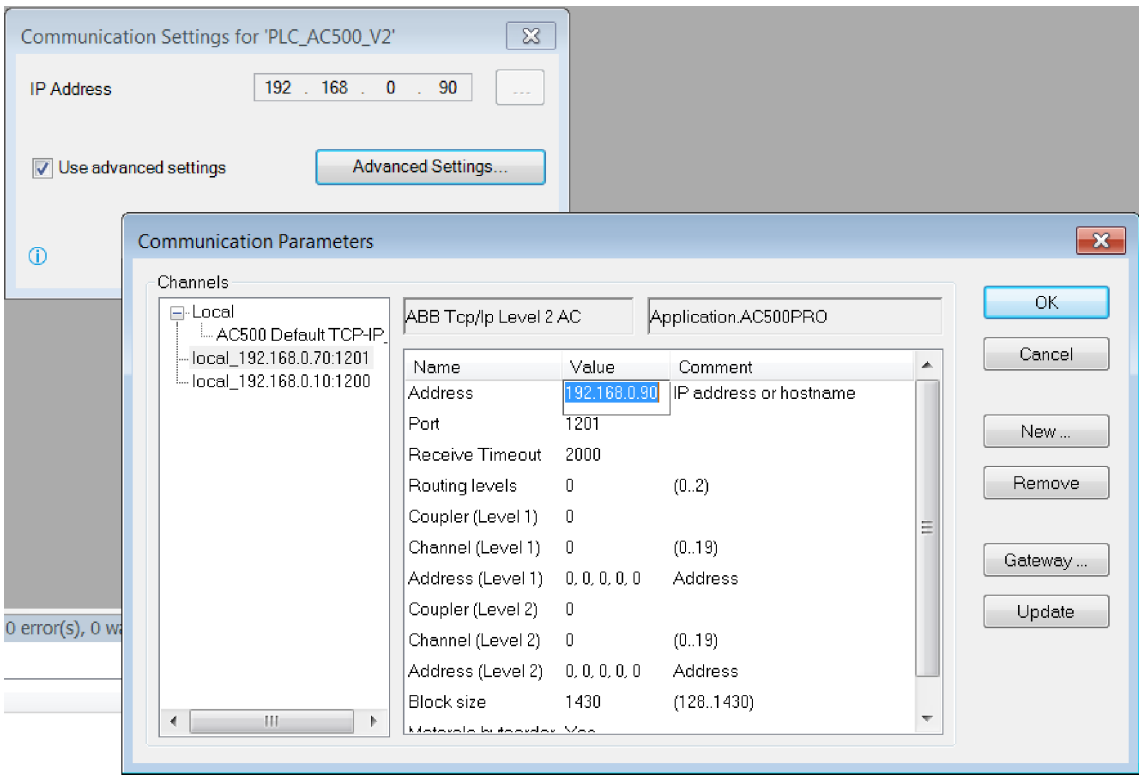
4. Click to log in the *"PLC_AC500_V2"* project.

Enter PLC IP address by *[Advanced Settings...]*

If a remote gateway instead of a local one has to be used it can be configured in the *[Advanced Settings...]*.

1. Right-click the top node *"PLC_AC500 <...>"* and select *"Communication Settings"* from the context menu.

   ⇨ Dialog box *Communication Settings* <...> appears.



2. Enable checkbox *Use advanced settings* and click *[Advanced Settings]*.

   ⇨ Dialog box *Communication Parameters* appears.

3. Select your channel, enter your PLC IP address and click *[OK]*.

   ⇨ Entry is transferred to the dialog box *Communication Settings* <...>.

   Click *[OK]*.

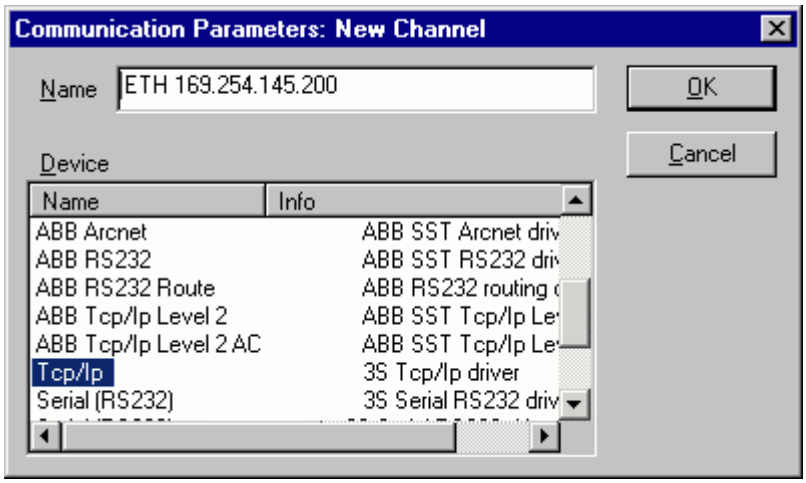
4. Click to log in the *"PLC_AC500_V2"* project.

Ethernet driver "TCP/IP"

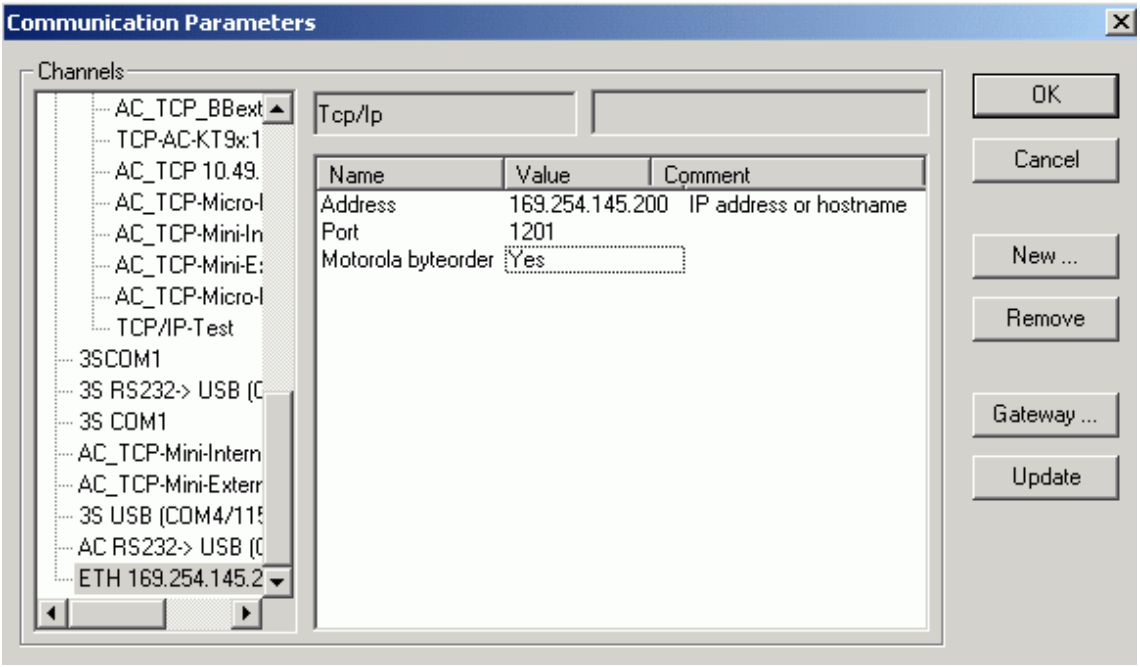
Programming AC500 controllers with internal and/or external Ethernet communication module via Ethernet can be done by using the driver "TCP/IP". This driver provides the following functions:

- Online operation of the PLC with the Control Builder
- OPC connection with OPC server, as of version V1.3
- Parallel operation of Control Builder and OPC server
- Parallel operation of Control Builder instances with several PLCs

To define a new gateway channel for the Ethernet interface, select "Online/Communication Parameters" and press the button "New" in the "Communication Parameters" window. In the appearing window, enter a name for the channel (for example ETH 169.254.145.200) and select the driver "TCP/IP" from the device list.



The following communication parameters can be set for the Ethernet driver "TCP/IP":



Parameter	Possible values	Description
Address	0.0.0.0	IP address or hostname of the PLC
Port	1201	Port 1201
Motorola byteorder	Yes (Yes/No)	Motorola or Intel byteorder (=Yes for AC500)

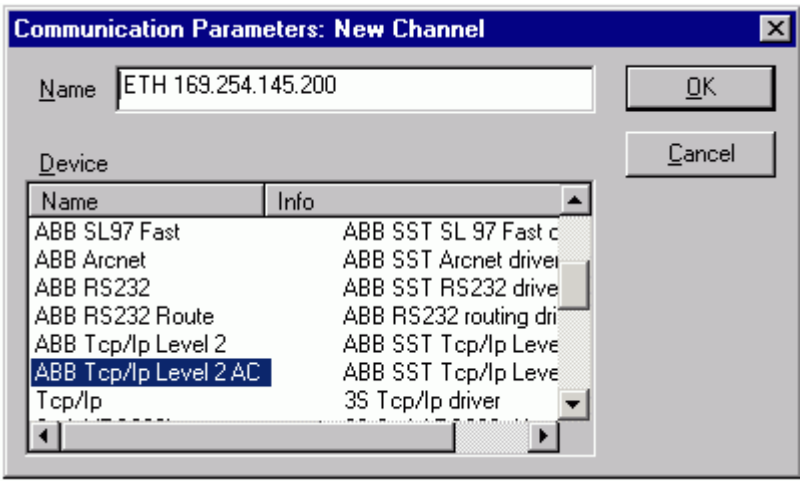
Ethernet driver "ABB TCP/IP Level 2 AC"

As of version V1.2, the driver "ABB TCP/IP Level 2 AC" is available for programming AC500 controllers with internal and/or external Ethernet communication module via Ethernet. This driver provides the following functions:

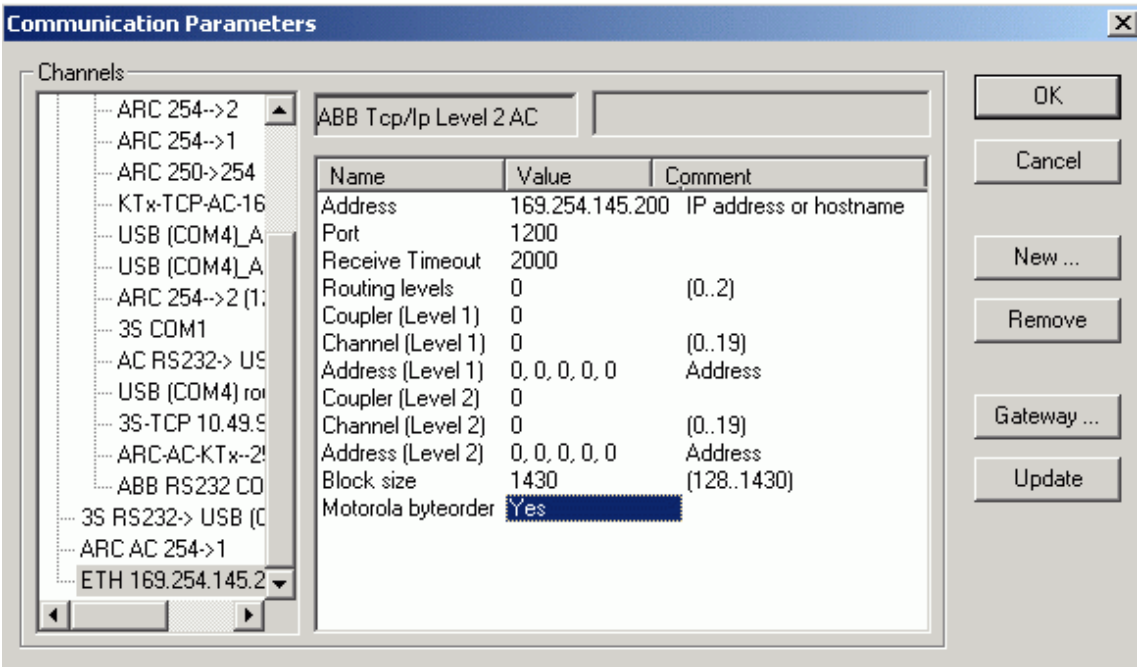
- Online operation of the PLC with the Control Builder
- OPC connection with OPC server, as of version V1.3
- Parallel operation of Control Builder and OPC server

- Parallel operation of Control Builder instances with several PLCs
- Online operation of PLCs connected via ARCNET. One PLC equipped with Ethernet communication module and one PLC with ARCNET communication module (Routing Ethernet -> ARCNET), as of version V2.x

To define a new gateway channel for the Ethernet interface, select "Online/Communication Parameters" and press the button "New" in the "Communication Parameters" window. In the appearing window, enter a name for the channel (for example ETH 169.254.145.200) and select the driver "ABB Tcp/Ip Level 2 AC" from the device list.



The following communication parameters can be set for the Ethernet driver "ABB TCP/IP Level 2 AC":

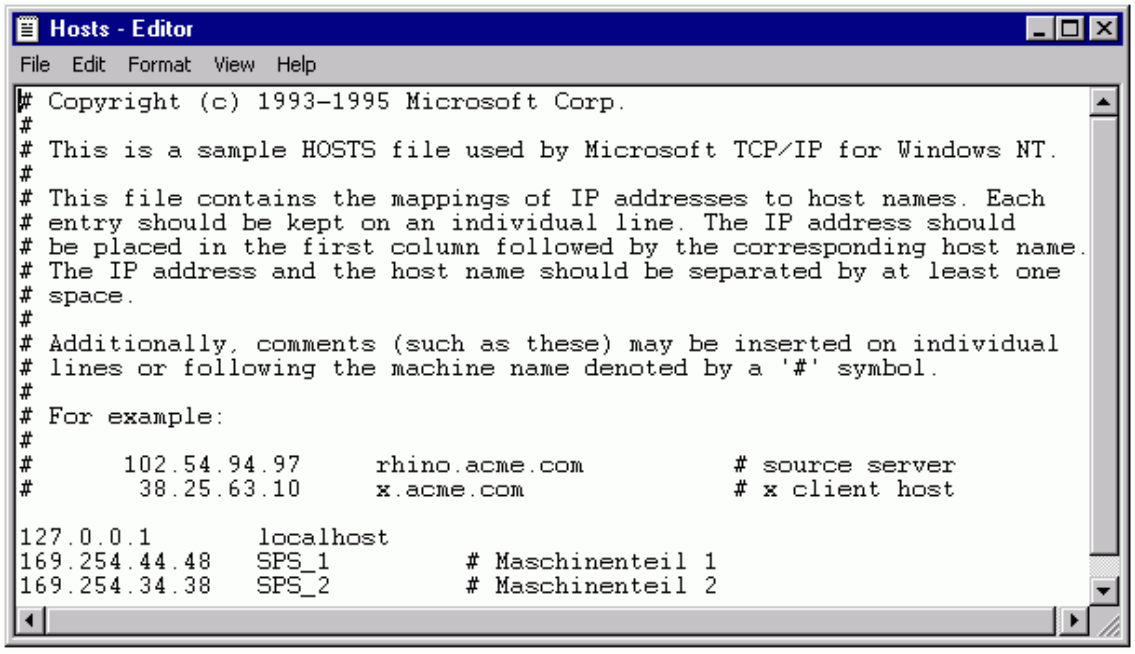


Parameter	Possible values	Description
Address	0.0.0.0	IP address or hostname of the PLC
Port	1200	Port 1200
Timeout (ms)	>= 2000	Timeout [ms] for response
Routing levels	0...2	Routing levels (0 = none)

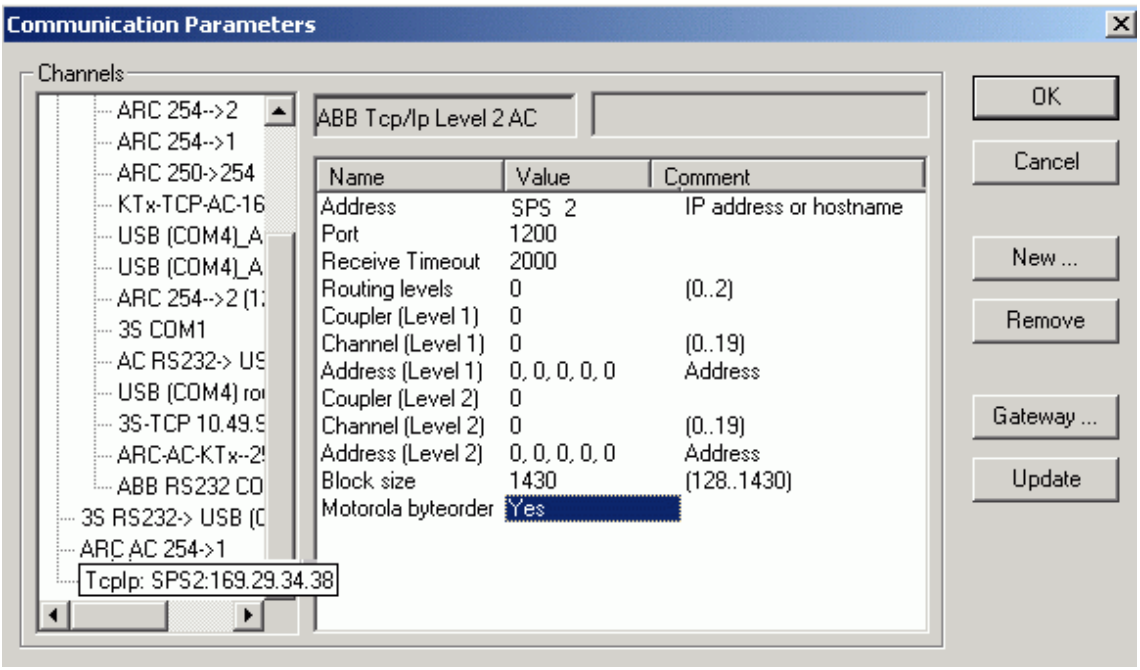
Parameter	Possible values	Description
Communication Module (Level 1)	0, line 0...line 4	Communication module for level 1
Channel (Level 1)	0...19	Channel on communication module level 1
Address (Level 1)	0, 0, 0, 0, 0 (max. 5 bytes)	Address in target communication module level 1
Communication Module (Level 2)	0, line 0...line 4	Communication module for level 2
Channel (Level 2)	0...19	Channel on Communication Module level 2
Address (Level 2)	0, 0, 0, 0, 0 (max. 5 bytes)	Address in target communication module level 2
Block size	1430 (128...1430)	Bytes per telegram (unallowed 227..245)
Motorola byteorder	Yes (Yes/No)	Motorola or Intel byteorder (=Yes for AC500)

If you want to use the Ethernet driver to directly access the PLC, set all routing parameters (parameter Routing levels and following parameters listed in the table above) to 0.

The "Address" parameter sets the IP address or hostname of the PLC. To be able to use hostnames, the names have to be added to the file "Hosts". Under Win2000, this file is located in the directory "WINNT\System32\drivers\etc".



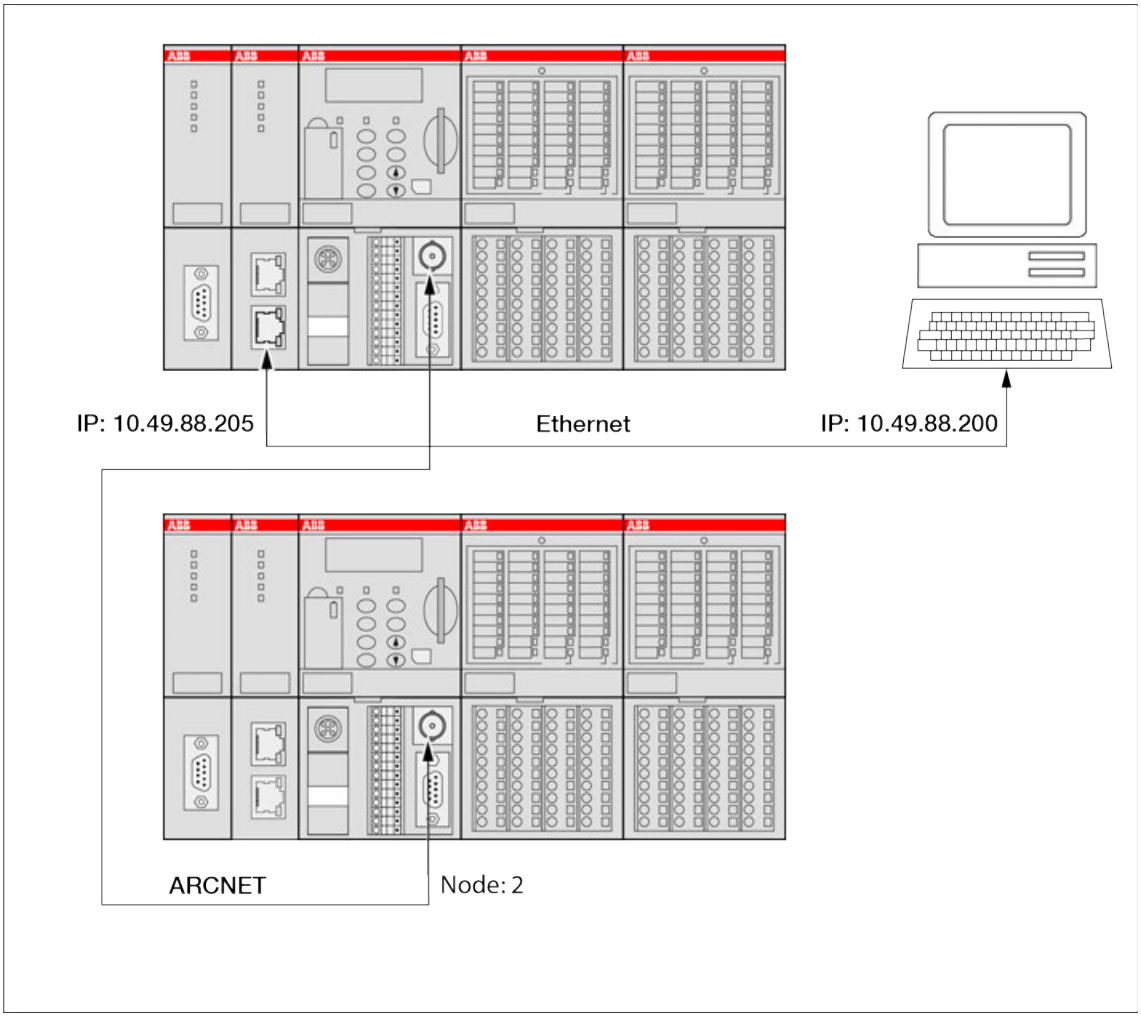
If you have changed the "Hosts" file accordingly, you can enter the symbolic name for the "Address" parameter instead of the IP address. In the following figure, the IP address "169.254.34.38" is replaced by the hostname "SPS_2".



Ethernet ARCNET routing

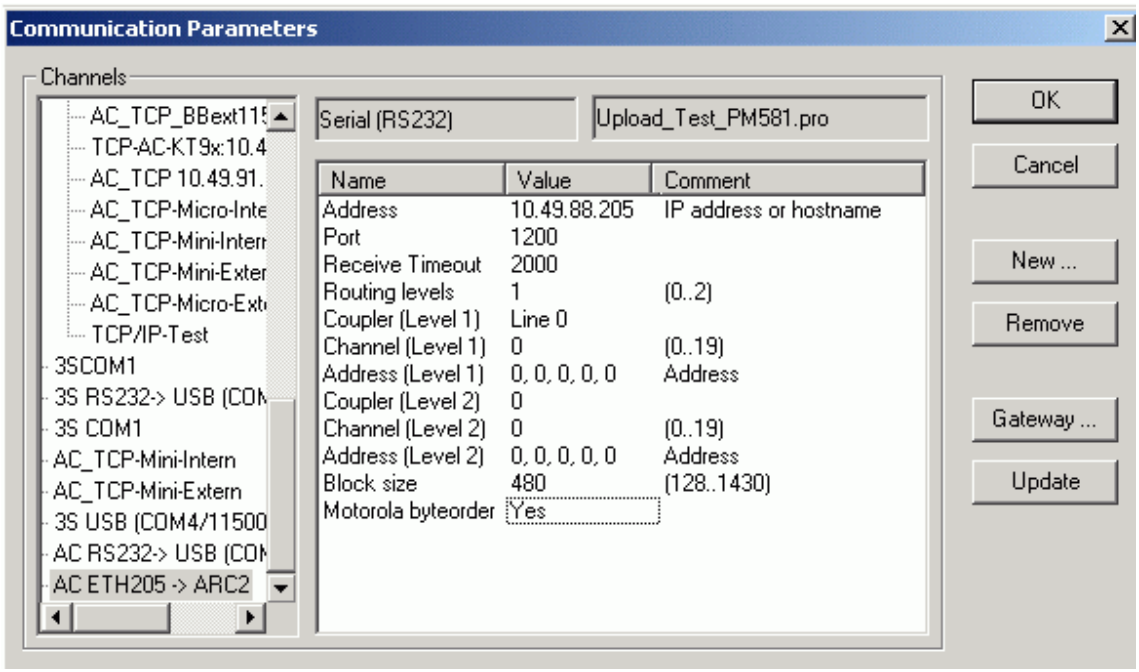
Routing is available as of PLC firmware version V1.3.

For controllers with Ethernet and ARCNET communication module, the PLCs connected via ARCNET can be programmed using the PLC Ethernet interface.



For each PLC connected via ARCNET, one gateway channel has to be defined. To do this, select "Online/Communication Parameters" and press the button "New" in the "Communication Parameters" window. In the appearing window, enter a name for the channel (for example TcpIp: PLC1:169.29.44.48 -> ARC_2) and select the driver "ABB Tcp/Ip Level 2 AC" from the device list.

For example, set the communication parameters as follows for the configuration shown above:



Parameter	Possible values	Description
Address	10.49.88.205	IP address of PLC 1
Port	1200	Port 1200
Timeout (ms)	2000	Timeout [ms] for response
Routing levels	1	Single-level routing
Communication Module (Level 1)	Line 0	Communication module for level 1 (internal: ARCNET)
Channel (Level 1)	0	Channel on Communication module level 1
Address (Level 1)	2, 0, 0, 0, 0	ARCNET node of the target PLC (Node 2)
Communication Module (Level 2)	0	No level 2
Channel (Level 2)	0	
Address (Level 2)	0, 0, 0, 0, 0	
Block size	480	Bytes per block: 128...1430
Motorola byteorder	Yes	

For the parameter "Communication Module (Level 1)", enter the slot where the ARCNET communication module "Line 0" is inserted (the ARCNET Communication Module is always the internal communication module).

The ARCNET communication module has only one communication channel. Thus, the "Channel" value must always be 0.

For the ARCNET communication module, 1 byte is required for the subscriber address (node). The address (Node=2) of the target PLC is entered to the first byte of the address byte.

The default value for the block size is 1430. If routing on ARCNET is required (and "large ARCNET packages" are enabled for the target PLC), the block size can be increased to 480 bytes. Values in the range of 227 .. 245 are not allowed.

1.6.5.2.3 Processor modules

Configure a processor module in the device tree

To configure your PLC in the Automation Builder:

1. Add a processor module to your project. ↳ *Chapter 1.6.5.1.1.1 “Creating a new project ” on page 5758*
2. Double-click the PLC node in the device tree.
   ⇨ This will open a new window with tabs for the device configuration:
   - *“PMxxx Parameters”* ↳ *Chapter 1.6.5.2.3.3 “Parameters of the processor module” on page 5839*
   - *“PM5xx Hardware”* ↳ *Chapter 1.6.5.2.3.4 “Changing the processor module type” on page 5844*
   - *“I/O mapping list”* ↳ *Chapter 1.6.5.1.4 “I/O mapping list” on page 5781*
   - *“Information”* General information about the device (name, vendor, version etc.)
3. Select the *“PMxxx Parameters”* tab to configure the parameters for the processor module. ↳ *Chapter 1.6.5.2.3.3 “Parameters of the processor module” on page 5839*
4. Select the *“I/O mapping list”* tab to create mapping variables with better usability support compared to the tree structured view. ↳ *Chapter 1.6.5.1.4 “I/O mapping list” on page 5781*

Processor modules with onboard interfaces: PM5xy-ETH, PM5xy-2ETH, PM5xy-ARC

- PM5xy-ETH: Processor module with network interface Ethernet RJ45 (onboard Ethernet).
- PM5xy-2ETH: Processor module with 2 network interfaces Ethernet RJ45 (onboard Ethernet).
- PM5xy-ARC: Processor module with network interface ARCNET BNC (onboard ARCNET)

Processor modules with the extension "-ETH" or "-ARC" provide an onboard interface for direct communication via Ethernet or ARCNET without using an additional communication module.

Ethernet for example can be used by using either a processor module with onboard Ethernet (e.g. PM591-ETH) or a communication module which supports Ethernet (e.g. CM597-ETH). Details on the configuration of processor modules with onboard Ethernet is provided in the configuration description for devices with onboard Ethernet. ↳ *Chapter 1.6.5.2.4.1.1 “Parameterization of PM5xy-ETH” on page 5860*

Details on the configuration of processor modules with onboard ARCNET is provided in the configuration description for devices with onboard ARCNET. ↳ *Chapter 1.6.2.3.2.1 “PM57x (-y), PM58x (-y) and PM59x (-y)” on page 3848*

Parameters of the processor module

Add the desired processor module to the device tree, then double-click the *“Processor Module”* node. In the editor window open the *“PMxxx Parameters”* tab and check whether the default configuration is to be changed.

For Processor Modules with onboard Ethernet see the Ethernet parameters and IP Settings ↳ Chapter 1.6.5.2.4.1.1 “Parameterization of PM5xy-ETH” on page 5860.

For Processor Modules with onboard ARCNET see the ARCNET parameters ↳ Chapter 1.6.5.2.3.6 “Parameters of PM5x1-ARCNET (onboard ARCNET)” on page 5846

The following parameters are available:

Parameter	Default	Value	Description
Auto run ↳ *Chapter 1.6.5.2.3.3.1 “Remark 1: Setting the parameters auto run and MOD using the display/keypad” on page 5841*	On	On	If the Flash memory contains a valid project, the project will be loaded into the RAM memory and executed when switching on the CPU.
		Off	If the Flash memory contains a valid project, this project will be loaded into the RAM memory but not executed when switching on the CPU.
Error LED ↳ *Chapter 1.6.5.2.3.3.2 “Remark 2: Error LED” on page 5842*	On	On	The error LED lights up for errors of all classes, no failsafe function activated.
		Off by E4	Warnings (E4) are not indicated by the error LED, no failsafe function activated.
		Off by E3	Warnings (E4) and minor errors (E3) are not indicated by the error LED, no failsafe function activated.
		On + Failsafe	The error LED lights up for errors of all classes and the failsafe function of the I/O Bus is activated.

Parameter	Default	Value	Description
		Off by E4 + Failsafe	Warnings (E4) are not indicated by the error LED, (no error Display with "diagnostic" button on the LCD possible), the failsafe function of the I/O Bus is activated.
		Off by E3 + Failsafe	Warnings (E4) and minor errors (E3) are not indicated by the error LED. The failsafe function of the I/O bus is activated.
Check battery	On	On	The presence of the battery and the battery status are checked. If no battery is available or the battery is empty, a warning (E4) is generated and the ERR LED lights up.
		Off	The presence of the battery is not checked. No warning (E4) is generated. The LCD display "Batt" (triangle) can not be acknowledged! This also applies if a battery is installed but empty.
Behavior of outputs in stop *Chapter 1.6.5.2.3.3.3 "Remark 3: Behavior of outputs in stop" on page 5842*	Off in hardware and online	Off in hardware and online	In case of STOP, all outputs at the hardware and in the online display are set to FALSE or 0.
		Off in hardware and actual state online	In case of STOP, all outputs at the hardware are set to FALSE or 0. The online display indicates the status from the last cycle of the user program.
		Actual state in hardware and online	The status of the last cycle of the user program is kept for the outputs at the hardware and in the online display.
Stop on error class	E2	E2	In case of a fatal or severe error (E1-E2), the user program is stopped.
		E3	In case of a fatal, severe or minor error (E1-E3), the user program is stopped.
		E4	In case of a fatal, severe or minor error (E1-E3) or a warning (E4) the user program is stopped.
Warmstart *Chapter 1.6.5.2.3.3.4 "Remark 4: Warmstart" on page 5842*	Off	Off	In case of a fatal error (E2), no warmstart is performed.
		On after E2 error	In case of a fatal error (E2), a warmstart is performed automatically.
		On after short voltage dip	A warmstart is performed after a short voltage dip.
		On after E2 or short voltage dip	In case of a fatal error (E2) or after a short voltage dip, a warmstart is performed automatically.
Reaction on floating point exceptions *Chapter 1.6.5.2.3.3.5 "Remark 5: Reaction on floating point exceptions" on page 5843*	E2 failure	E2 failure	Only for PM59X: If a floating point exception occurs, an E2 error (Err=38) is triggered. The CPU goes to STOP.
		No failure	Only for PM59X: If a floating point exception occurs, no E2 error is triggered. Using the block FPU_EXINFO in the user program allows to react on a possibly occurred exception.
Flexible configuration	None	None	No flexible configuration is used.

Parameter	Default	Value	Description
Chapter 1.6.5.1.3 “Flexible AC500 configuration ” on page 5774		Flash	FlexConf.ini is loaded from Flash.
		User Program	FlexConf.ini is loaded by user program.
		FTP file	FlexConf.ini is loaded from FTP.
Flexible configuration timeout *Chapter 1.6.5.1.3 “Flexible AC500 configuration ” on page 5774*	1000	0...65535	FlexConf.ini timeout in seconds [s].
Free wheeling pause	10	0...255	Free wheeling pause in milliseconds [ms]. *)
Task compatibility mode	File Handling priorized	Ethernet Handling priorized	Task compatibility mode.
		Balanced Handling of Ethernet and file operations	
		File Handling priorized	
Start PERSISTENT %R0x *Chapter 1.6.5.2.3.3.6 “Remark 6: Start PERSISTENT %Rsegment.x and end PERSISTENT %Rsegment.x” on page 5844*			Start offset for buffered area in PERSISTENT area %R0x
End PERSISTENT %R0x			End offset for buffered area in PERSISTENT area %R0x
...			
Start PERSISTENT %R7.x			Start offset for buffered area in PERSISTENT area %R7.x
End PERSISTENT %R7.x			End offset for buffered area in PERSISTENT area %R7.x

*) Setting this parameter to '0' causes the CPU to work with the default setting 10 ms.

Remark 1: Setting the parameters auto run and MOD using the display/keypad

Loading and running the user program also depends on the setting for the parameter MOD using the display/keypad (in AC500 CPUs PM57x, PM58x and PM59x). The display/keypad setting always has the higher priority.

The following applies:

MOD 00:	User program will be loaded and run according to the setting for the CPU parameter "Auto run" (default setting).
MOD 01:	User program will not be loaded/will not run.
MOD 02:	User program will be loaded and run independent of the setting for the CPU parameter "Auto run".

Keeping the RUN key pressed when booting the PLC automatically activates MOD 01, i.e. the user program is not loaded/does not run. Thus, it is possible to boot the PLC in Stop status. This may be required if, for example, both serial interfaces are set to Modbus and therefore no access with the Control Builder software is possible via the serial interface.

On CPUs PM55x and PM56x, a RUN/STOP switch is designed for the MOD function.

If the RUN/STOP switch is set to STOP mode before the CPU module is powered on, the program in the CPU will not run after the CPU is powered on. The program can only be executed when the switch is set to RUN mode and the program is downloaded on the CPU again.

If the serial interface COM1 or COM2 is set to communication mode in a running program (e.g. Modbus communication), it can be changed back to other mode (e.g. online access to Control Builder software) only by setting the switch to STOP mode.

Remark 2: Error LED

In addition to setting the behavior of the CPU's error LED ERR, this parameter is used to set the failsafe behavior of the I/O Bus.

Remark 3: Behavior of outputs in stop

The setting of the parameter Behavior of outputs in stop directly influences the failsafe function of the outputs of the S500 I/O Devices.

Remark 4: Warmstart

The parameter *“warmstart”* allows to set the behavior of the CPU in case of

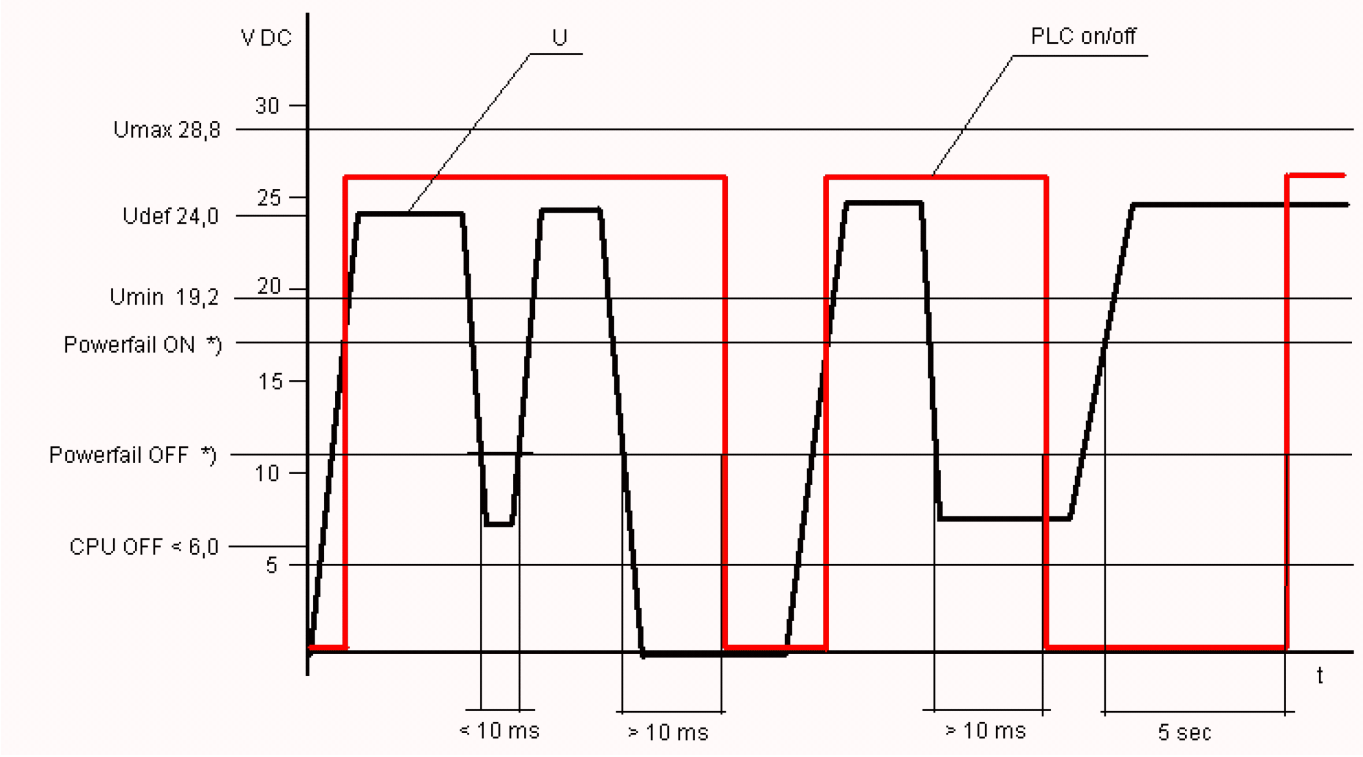
- severe errors (class E2) and
- short voltage dips (only variants with 24 V DC supply)

If the default setting is used, the CPU changes to STOP mode if a severe error occurs. The CPU is switched off for voltage dips >10 ms. The display shows AC500.

The new settings allow performing a warmstart of the CPU after a severe error or after short voltage dips or in case of both events.

The parameter “warmstart” after E2 error takes effect not before the configuration data of the project has been evaluated. If an E2 error occurs prior to this, it will be recorded into the diagnosis system, but no restart will be performed. The intention of this parameter is to raise the availability of the PLC during RUN mode (RUN) when non-systematic E2 errors occur.

The following figure shows the behavior of the CPU for different control voltage signals.



Short voltage dips, i.e., the control voltage falls below a value lower than "Powerfail OFF" (<11 V DC) for less than 10 ms, are bridged by the PLC, i.e., the CPU remains on.

If the control voltage is switched off, the CPU remains on for > 10 ms.

If the control voltage is lower than 11 V DC (but > 6 V DC) for longer than 10 ms and then goes back to the normal value, the behavior of the CPU depends on the setting for the parameter *"Warmstart"*. If the parameter is set to "Off", the CPU remains in power fail mode, i.e. it does not restart. A restart of the CPU can only be done by switching the control voltage OFF/ON. If the parameter is set to "On after short voltage dip" or "On after E2 or short voltage dip", the CPU is restarted when the control voltage is greater than 17 V DC for 5 seconds. However, if the control voltage falls once more below 11 V DC within these 5 seconds, the time is restarted. Thus, the control voltage must have a value > 17 V DC for 5 seconds.

Remark 5: Reaction on floating point exceptions

Behavior of PM59x regarding floating point exceptions can be set. In standard case, any floating point exception triggers an E2 error: class=E2, err=38, d1=9, d2=31, d3=31.

The CPU switches to STOP.

CPUs without floating point processor PM57x and PM58x do not trigger a floating point exception.

If the parameter Reaction on floating point exceptions is set to No failure, no error is triggered in case of a floating point exception. The CPU remains in RUN mode.

By means of the function block ↬ *Chapter 1.5.4.19.2.19 "FPU_EXCEPTION_INFO" on page 1551* (contained in SysInt_AC500_V10.LIB) it can be determined whether a floating point exception occurred during calculation. Depending on the result, either the calculation can be continued with default values or the machine can be shut down.

Remark 6: Start PERSISTENT %Rsegment.x and end PERSISTENT %Rsegment.x

The parameters "Start PERSISTENT %Rsegment.x" and "End PERSISTENT %Rsegment.x" are used to buffer this area. In the particular segment, "Start PERSISTENT %Rsegment.x" specifies the start byte and "End PERSISTENT %Rsegment.x" the end byte of the area to be buffered.

Changing the processor module type

In a project, you can change the target system by changing the type of processor module or terminal base type. If possible, the device configuration of fieldbusses and interfaces is kept and switched over to the device configuration of the new module.

Target change options:

- between platforms: from V2 platform to V3 platform (and vice versa)
- between module types: from AC500 (standard) to AC500-eCo (and vice versa)
- a combination of changed platform and changed module type

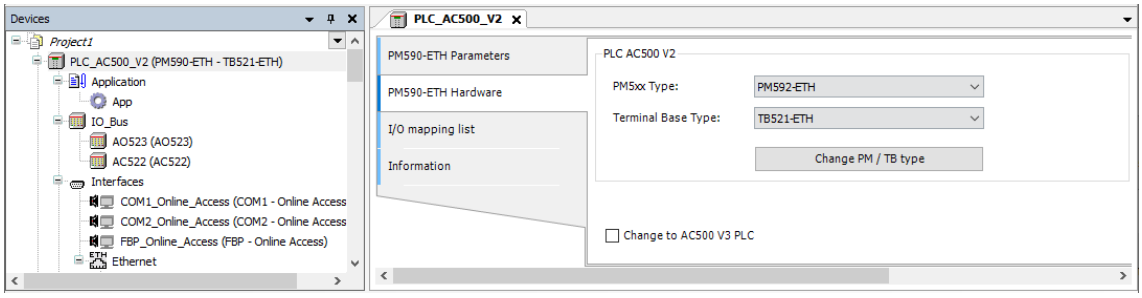
Target change from a V2 processor module to another V2 processor module

Target change options:

- AC500 V2 processor module ➜ AC500 V2 processor module
- AC500 V2 processor module ➜ AC500-eCo V2 processor module
- AC500-eCo V2 processor module ➜ AC500 V2 processor module
- AC500-eCo V2 processor module ➜ AC500-eCo V2 processor module

Procedure:

1. Close CODESYS.
2. Double-click the *PLC_AC500_V2 <...>* node and open the *“PM5<...> Hardware”* tab.
3. Select the desired V2 processor module from the *“PM5xx Type”* drop-down list.



4. Ensure the correct *“Terminal Base Type”* is selected and click *[Change PM / TB type]*.
   ⇨ The new V2 processor module is displayed in the navigation tree.
   ⇨ Change the node name of the processor module, if desired.

Target change to PM595

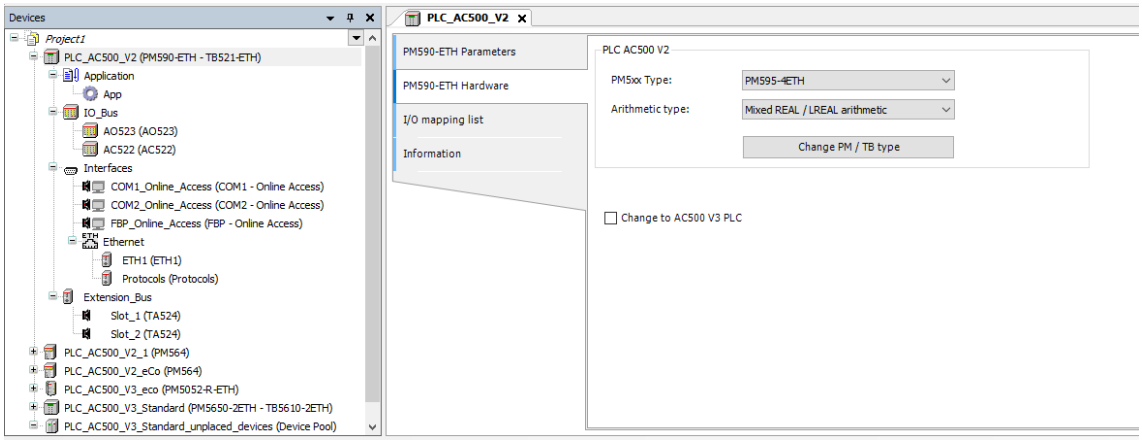
Target change options:

- AC500 V2 processor module ➜ PM595
- AC500-eCo V2 processor module ➜ PM595

Procedure:

1. Close CODESYS.
2. Double-click the *PLC_AC500_V2 <...>* node.

3. Open the *"PM5<...> Hardware"* tab and select 'PM595-4ETH' from the *"PM5xx Type"* drop-down list.



4. With the *Arithmetic type* item, processing of Structured Text can be modified.
   - *"Mixed REAL/LREAL arithmetic"* (default value):
     Calculation of LREAL variables is extended to the extended co-domain of 64 bit. In general, we recommend to keep the default setting as this setting provides enough accuracy for code calculation.
   - With *"Only REAL arithmetic"* the LREAL variables are processed as REAL variables (co-domain of 32 bit).
5. Click *[Change PM / TB type]*.
   ⇨ The PM595 is displayed in the navigation tree.
   ⇨ Change the node name of the processor module, if desired.

Target change from a V2 processor module to a V3 processor module

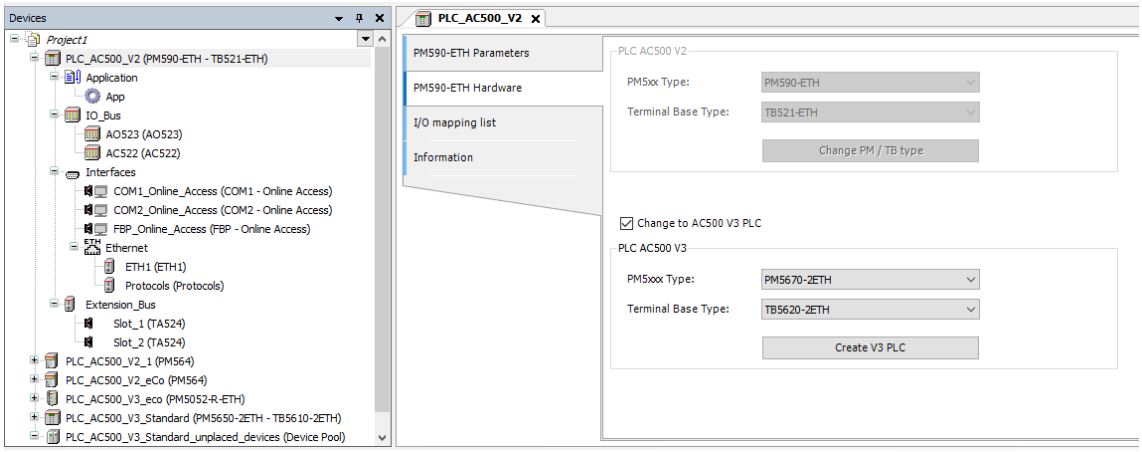
Target change options:

- AC500 V2 processor module ➜ AC500 V3 processor module
- AC500 V2 processor module ➜ AC500-eCo V3 processor module
- AC500-eCo V2 processor module ➜ AC500-eCo V3 processor module
- AC500-eCo V2 processor module ➜ AC500 V3 processor module

Procedure:

1. Close CODESYS.
2. Double-click the *PLC_AC500_V2 <...>* node and open the *"PM5<...> Hardware"* tab.

3. Enable *“Change to AC500 V3 PLC”* and select the desired V3 processor module from the *“PM5xx Type”* drop-down list.



4. Click *[Create V3 PLC]*.
   ⇨ The new V3 processor module is displayed in the navigation tree.
   ⇨ Change the node name of the processor module, if desired.

> *In case of a target change from AC500-eCo V2 to AC500-eCo V3, the I/O bus and Ethernet configuration is kept.*

PM5xy-ETH onboard Ethernet

Onboard Ethernet is provided for device types with -ETH extension, e.g. PM5xy-ETH. Further information is provided in the Onboard Ethernet Configuration section ↳ *Chapter 1.6.5.2.4.1.1 “Parameterization of PM5xy-ETH” on page 5860*.

Parameters of PM5x1-ARCNET (onboard ARCNET)

Add a processor module with onboard ARCNET (e.g. PM590-ARC) to the device tree. Double-click the node *“PM5x1_ARC_Internal_ARCNET”* to open the parameter settings for onboard ARCNET. Check whether the default configuration is to be changed.

The following parameters are available:

Parameter	Default value	Value	Description
Run config fault	No	No	In case of a configuration error, the user program is not started.
		Yes	The user program is started independent of a faulty configuration of the internal ARCNET Communication Module.

Parameter	Default value	Value	Description
Address see remark 1 ↳ *Chapter 1.6.5.2.3.6.1 "Remark 1: Setting behavior of the ARCNET node ID" on page 5848*	0	0...255	Address (node ID) of the ARCNET Communication Module
Tranmission rate see remark 2 ↳ *Chapter 1.6.5.2.3.6.2 "Remark 2: Tranmission rate of the ARCNET communication module" on page 5848*	2.5 MB/s	2.5 MB/s	Transmission set for the ARCNET Communication Module
		1.25 MB/s	
		625 kB/s	
		312.5 kB/s	
Extended timeout ET1/ET2	Very small net	Very small net (=0)	ARCNET timeout setting. The following applies: Bit 0 configures ET2 of the Communication Module Bit 1 configures ET1 of the Communication Module Value ET1 ET2 Meaning ---------- 0 0 0 Max. network expansion 2 km 1 1 0 2 0 1 3 1 1 for large networks
		Small net (=1)	
		Big net (=2)	
		Very big net (=3)	
Long packets	Enable	Enable	Enable long data packets (512 bytes)
		Disable	Incoming long data packets are received and dismissed. The SEND block indicates an error in case of long data packets.
Evaluate DIN on receipt see remark 3 ↳ *Chapter 1.6.5.2.3.6.3 "Remark 3: Check of DIN identifier on receipt" on page 5848*	Enable	Enable	Enable check of DIN identifier on receipt
		Disable	Disable check of DIN identifier on receipt

Remark 1: Setting behavior of the ARCNET node ID

Configured ARCNET Node ID			
#	In Project	In Display	Effect
1	0 [default]	0 [default]	Configuration error: Class=3 Comp=9 Dev=10 Mod=3 Ch=0 Err=26
2	0 [default]	!=0	No error
3	!=0 && != display setting	!=0	Configuration error: Class=3 Comp=9 Dev=10 Mod=3 Ch=0 Err=26
4	!=0 && == display setting	!=0	No error
5	!=0	0	No error, but display shows "Addr 0"

Remark 2: Tranmission rate of the ARCNET communication module

If the transmission rate set for the ARCNET Communication Module differs from the default value (2.5 MB/s), programming via ARCNET using the SoHard-ARCNET PC boards is no longer possible. The same transmission rate has to be set for all subscribers of the ARCNET network. The ARCNET PC boards are firmly set to 2.5 MB/s.

Remark 3: Check of DIN identifier on receipt

If the parameter "Evaluate DIN on receipt" is enabled (default setting), the following DIN identifiers are reserved:

DIN identifier		**Protocol**
Hex	**Dec**	
4F	79	"Online access" - Programming/OPC with IEC 61131-3 programming / AC1131
5F	95	5F_ARCNET (Ethernet functions for ARCNET)

DIN identifier		Protocol
Hex	**Dec**	
6F	111	PC331 programming (not used for AC1131/IEC 61131-3 programming)
7F	127	Default DIN identifier for data exchange with function blocks: ARC_REC, ARC_SEND, ARC_STO, ARC_INFO All DIN identifiers except the reserved identifiers can be used for data exchange.

If the parameter "Evaluate DIN on receipt" is disabled, programming and/or OPC via ARCNET is not possible!

"ARCNET data exchange" and "5F_ARC"

The protocols "ARCNET data exchange" and "5F_ARC" can be appended.

Right-click *“PM5x1_ARC_Internal_ARCNET”* node and select *[Add object]*.

The following parameters can be set for the "ARCNET data exchange" protocol:

Parameter	Default value	Value	Description
Size of receive buffer	8192	512...65535	Receive buffer size in bytes. The minimum size is equal to the maximum size of an UDP telegram.
Size of transmit buffer high prio	4096	0...65535	Size of transmit buffer (in bytes) for telegrams with high priority.
Size of transmit buffer low prio	4096	0...65535	Size of transmit buffer (in bytes) for telegrams with low priority.
Size of timeout buffer	2048	0...65535	Size of buffer (in bytes) for timeout data packets.
Number of header data	10	0...1464	Number of header data to be copied to the timeout buffer for timeout packages (in bytes).
Receive broadcast	Disable	Disable	Reception of broadcast telegrams disabled (data packets to all stations).

Parameter	Default value	Value	Description
		Enable	Reception of broadcast telegrams enabled (data packets to all stations).
Behavior on receive buffer overflow	Overwrite	Overwrite	Behavior on overflow of the receive buffer. The oldest data packets stored in the receive buffer are overwritten with the new incoming data packets.
		Reject	Behavior on overflow of the receive buffer. New incoming data are dismissed.

The following parameters can be set for the "5F_ARC" protocol:

Parameter	Default value	Value	Description
Disable write to %MB0.x from	0	0...65535	Disable write access for segment 0 starting at %MB0.x
Disable write to %MB0.x to	0	0...65535	Disable write access for segment 0 up to %MB0.x
Disable read %MB0.x from	0	0...65535	Disable read access for segment 0 starting at %MB0.x
Disable read %MB0.x to	0	0...65535	Disable read access for segment 0 up to %MB0.x
Disable write to %MB1.x from	0	0...65535	Disable write access for segment 1 starting at %MB1.x
Disable write to %MB1.x to	0	0...65535	Disable write access for segment 1 up to %MB1.x
Disable read %MB1.x from	0	0...65535	Disable read access for segment 1 starting at %MB1.x
Disable read %MB1.x to	0	0...65535	Disable read access for segment 1 up to %MB1.x

PM595-4ETH fieldbus communication

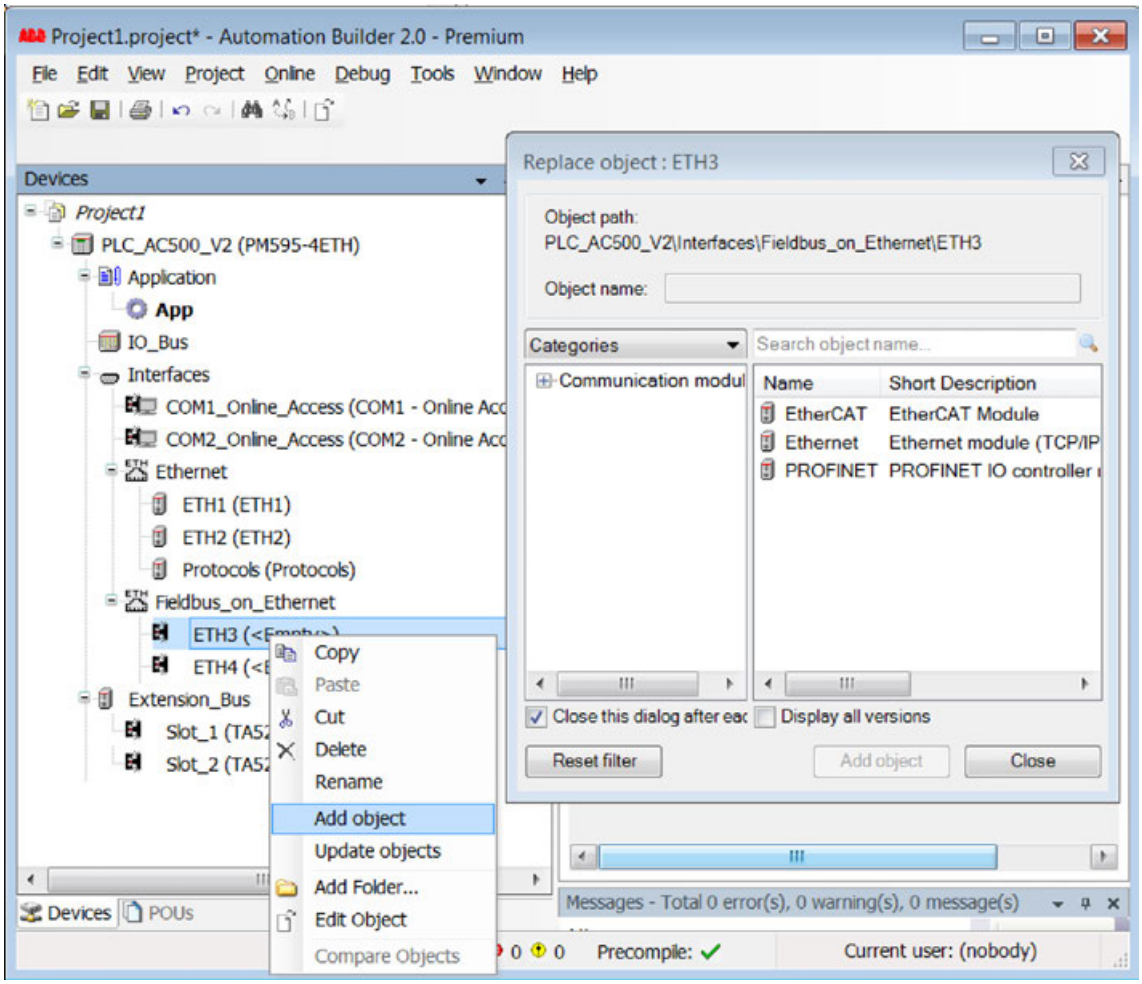
Configuration in Automation Builder

PM595-4ETH communication is provided either via a Communication Module (*“Extension_Bus”*) or onboard via *“Fieldbus_on_Ethernet”* -> node *“ETH3”* and *“ETH4”*.

In Automation Builder nodes ETH3 and ETH4 support 3 fieldbusses:

- EtherCAT
- Ethernet
- PROFINET

If one of them is selected the respective device will be added. This device can be extended with several communication devices. Those are identical to the Communication Modules, which can be added via *“Extension_Bus”*.



The configuration parameters are the same as for any other bus device.

Update firmware for fieldbusses on ETH3/4

After the fieldbus device has been added to the device tree, the user has to update the firmware of ETH3 or ETH4 in order to support the fieldbus in the PLC firmware.

The user can trigger the firmware update of ETH3/4 in the online view of the PLC (see ↳ *Chapter 1.6.5.1.7 “Firmware identification and update” on page 5786*).

Update Automation Builder 1.1 projects to Automation Builder 1.2

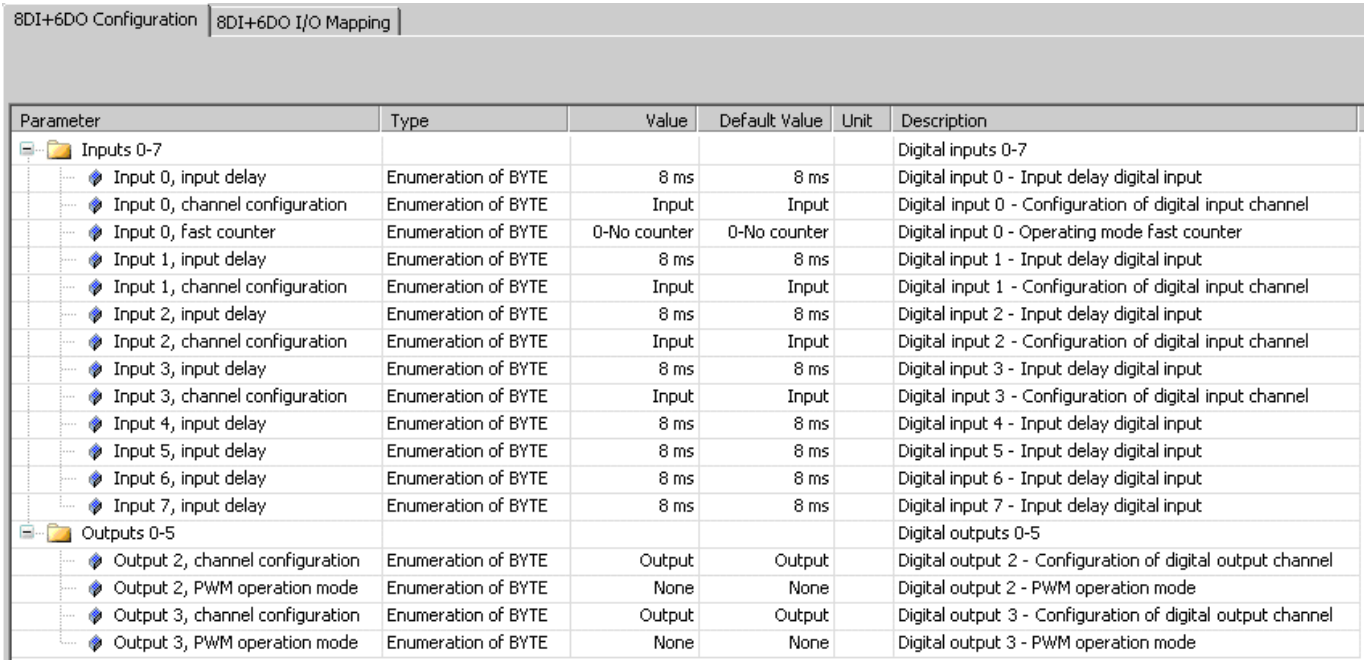
In Automation Builder 1.1 the ETH3/4 field bus can be configured as "<Empty>" or “PROFINET”. On project update from Automation Builder Version 1.1 to Version 1.2 the Automation Builder automatically copies any existing PROFINET configuration below ETH3/4 to the new structure in Automation Builder 1.2.

AC500-eCo onboard I/Os

Parameterization of the onboard I/Os for PM55x-xP

The inputs and outputs channels can be provided as WORD, BYTE and BOOL.

Double-click on *"OBIO (Onboard IO: 8DI+6DO)"* to open the 6DI+6DO configuration in the editor window.



Parameter	Type	Value	Default Value	Unit	Description
Inputs 0-7					Digital inputs 0-7
Input 0, input delay	Enumeration of BYTE	8 ms	8 ms		Digital input 0 - Input delay digital input
Input 0, channel configuration	Enumeration of BYTE	Input	Input		Digital input 0 - Configuration of digital input channel
Input 0, fast counter	Enumeration of BYTE	0-No counter	0-No counter		Digital input 0 - Operating mode fast counter
Input 1, input delay	Enumeration of BYTE	8 ms	8 ms		Digital input 1 - Input delay digital input
Input 1, channel configuration	Enumeration of BYTE	Input	Input		Digital input 1 - Configuration of digital input channel
Input 2, input delay	Enumeration of BYTE	8 ms	8 ms		Digital input 2 - Input delay digital input
Input 2, channel configuration	Enumeration of BYTE	Input	Input		Digital input 2 - Configuration of digital input channel
Input 3, input delay	Enumeration of BYTE	8 ms	8 ms		Digital input 3 - Input delay digital input
Input 3, channel configuration	Enumeration of BYTE	Input	Input		Digital input 3 - Configuration of digital input channel
Input 4, input delay	Enumeration of BYTE	8 ms	8 ms		Digital input 4 - Input delay digital input
Input 5, input delay	Enumeration of BYTE	8 ms	8 ms		Digital input 5 - Input delay digital input
Input 6, input delay	Enumeration of BYTE	8 ms	8 ms		Digital input 6 - Input delay digital input
Input 7, input delay	Enumeration of BYTE	8 ms	8 ms		Digital input 7 - Input delay digital input
Outputs 0-5					Digital outputs 0-5
Output 2, channel configuration	Enumeration of BYTE	Output	Output		Digital output 2 - Configuration of digital output channel
Output 2, PWM operation mode	Enumeration of BYTE	None	None		Digital output 2 - PWM operation mode
Output 3, channel configuration	Enumeration of BYTE	Output	Output		Digital output 3 - Configuration of digital output channel
Output 3, PWM operation mode	Enumeration of BYTE	None	None		Digital output 3 - PWM operation mode

The 8DI+6DO Onboard I/Os support the following channel functions:

Onboard I/O Type	Channel Function	Max. Number	Channel Name
Digital Onboard I/O	Digital Input	8	Channel 0..7
	Fast counter	2	Channel 0, 1
	Interrupt input	4	Channel 0..3
	Digital output	6	Channel 0..5
	PWM output	2	Channel 2..3

The following channel parameters for onboard I/Os can be configured:

Onboard I/O Type	Parameter	Channel Name	Default Value	Value	Description
Digital inputs	Input X, input delay	Channel 0..7	8 ms	0.1 ms	Configures 0.1 ms input delay
				1 ms	Configures 1 ms input delay
				8 ms	Configures 8 ms input delay
				32 ms	Configures 32 ms input delay

Onboard I/O Type	Parameter	Channel Name	Default Value	Value	Description
	Input X, channel configuration	Channel 0..7	Input	Input	Configures the channel as normal digital input
		Channel 0..3		Interrupt on rising edge	Triggers interrupt task when detecting the rising edge on the input channel
				Interrupt on falling edge	Triggers interrupt task when detecting the falling edge on the input channel
		Channel 0		Fast Counter	Configures the channel as fast counter
	Fast Counter *Chapter 1.6.5.2.3.8.4 "Fast counters in the onboard I/Os" on page 5856*	Channel 0, 1	No counter	0	No counter
				1	1 count up counter
				2	1 count up counter with release input
				3	2 UpDown counters
				4	2 UpDown counters (2nd on falling edge)
				5	1 UpDown counter dynamic set/ rising edge
				6	1 UpDown counter dynamic set/ falling edge
				7	1 UpDown counter directional discriminator
				8	Reserved
				9	1 UpDown directional discriminator x2

Onboard I/O Type	Parameter	Channel Name	Default Value	Value	Description
				10	1 UpDown directional discriminator x4
Digital outputs	Output X, channel configuration	Channel 2, 3	Output	Output	Configures the channel as normal digital output
				PWM	Configures the channel as PWM output
	Output X, PWM operation mode ↳ *Chapter 1.6.5.2.3.8.6 "Configuration of PWM outputs" on page 5858*		Millisec	Millisec	Configures ms as PMW time base
				Microsec	Configures µs as PMW time base

Parameterization of the onboard I/O for PM56x-xP

The 2 analog onboard inputs can be configured as 2 digital onboard inputs, so the maximal digital inputs number is 8. The input and output channels can be provided as WORD, BYTE and BOOL.

Double-click on *"I/O (onboard IOs)"* to open the DI+6DO+2AI+1AO configuration in the editor window:

8DI+6DO+2AI+1AO Configuration | 8DI+6DO+2AI+1AO I/O Mapping

Parameter	Type	Value	Default Value	Unit	Description
Digital + analog inputs					
Input 0, input delay	Enumeration of BYTE	8 ms	8 ms		Digital input 0 - Input delay digital input
Input 0, channel configuration	Enumeration of BYTE	Input	Input		Digital input 0 - Configuration of digital input channel
Input 0, fast counter	Enumeration of BYTE	0-No counter	0-No counter		Digital input 0 - Operating mode fast counter
Input 1, input delay	Enumeration of BYTE	8 ms	8 ms		Digital input 1 - Input delay digital input
Input 1, channel configuration	Enumeration of BYTE	Input	Input		Digital input 1 - Configuration of digital input channel
Input 2, input delay	Enumeration of BYTE	8 ms	8 ms		Digital input 2 - Input delay digital input
Input 2, channel configuration	Enumeration of BYTE	Input	Input		Digital input 2 - Configuration of digital input channel
Input 3, input delay	Enumeration of BYTE	8 ms	8 ms		Digital input 3 - Input delay digital input
Input 3, channel configuration	Enumeration of BYTE	Input	Input		Digital input 3 - Configuration of digital input channel
Input 4, input delay	Enumeration of BYTE	8 ms	8 ms		Digital input 4 - Input delay digital input
Input 5, input delay	Enumeration of BYTE	8 ms	8 ms		Digital input 5 - Input delay digital input
Input AI0, input delay	Enumeration of BYTE	8 ms	8 ms		Digital input AI0 - Input delay digital input
Input AI0, channel configuration	Enumeration of BYTE	Analog input 0...10 V	Analog input 0...10 V		Digital input AI0 - Configuration of analog input channel
Input AI1, input delay	Enumeration of BYTE	8 ms	8 ms		Digital input AI1 - Input delay digital input
Input AI1, channel configuration	Enumeration of BYTE	Analog input 0...10 V	Analog input 0...10 V		Digital input AI1 - Configuration of analog input channel
Digital + analog outputs					
Output 2, channel configuration	Enumeration of BYTE	Output	Output		Digital output 2 - Configuration of digital output channel
Output 2, PWM operation mode	Enumeration of BYTE	None	None		Digital output 2 - PWM operation mode
Output 3, channel configuration	Enumeration of BYTE	Output	Output		Digital output 3 - Configuration of digital output channel
Output 3, PWM operation mode	Enumeration of BYTE	None	None		Digital output 3 - PWM operation mode
Output 0, channel configuration	Enumeration of BYTE	Analog output 0...10 V	Analog output 0...10 V		Analog output 0 - Configuration of analog input channel

The 6DI+6DO+2AI+1AO onboard I/Os support the following channel functions:

Onboard I/O Type	Channel Function	Max. Number	Channel Name
Digital onboard I/O	Digital Input	8	Digital input channel 0..5 Analog input channel AI0..AI1 *
	Fast counter	2	Input channel 0, 1
	Interrupt input	4	Input channel 0..3
	Digital output	5	Output channel 0..5
	PWM output	2	Output channel 2..3
Analog onboard I/O	Analog input	2	Input channel AI0..AI1 *
	Analog output	1	Output channel AO0

* These 2 analog inputs can be configured as 2 digital inputs

Processor module PM56x-xP has a maximum of 8 digital onboard inputs and 6 digital onboard outputs. The channel parameters for onboard digital I/Os can be found in table onboard I/Os for PM554 *Table on page 5852*. Analog input channels AI0&AI1 on PM564 are for digital input channels 5&7 on PM554.

Table 728: PM564: Channel parameters for onboard analog I/Os

Onboard I/O Type	Parameter	Channel Name	Default Value	Value	Description
Analog inputs	Input delay digital input	Channel AI0&A1	8 ms	0.1 ms	Configure 0.1 ms input delay
				1 ms	Configure 1 ms input delay
				8 ms	Configure 8 ms input delay
				32 ms	Configure 32 ms input delay
	Channel configuration		Digital input	Digital input	Configure the channel as normal digital input
				Analog input 0..10 V	Configure the channel as 0..10 V analog input
Analog outputs	Channel configuration	Channel AO0	Analog output 0..10 V	Analog output 0..10 V	Configure the channel as 0..10 V analog output

Onboard I/O Type	Parameter	Channel Name	Default Value	Value	Description
				Analog output 0..20mA	Configure the channel as 0..20 mA analog output
				Analog output 4..20 mA	Configure the channel as 4..20 mA analog output

Default value of channel AI0&AI1 is digital input. The user has to change the configuration parameter to enable the analog input function.

Mapping of the I/O channels

Double-click on IO (Onboard IOs) to open the editor window.

->The tab xDI+yDO I/O Mapping shows the current settings of the I/O mapping.

See Symbolic Names for Variables, Inputs and Outputs for further details on mapping
↳ *Chapter 1.6.5.2.2.1.2 “Symbolic names for variables, inputs and outputs” on page 5815*.

Fast counters in the onboard I/Os

General details on fast counters see ↳ *Chapter 1.6.4.1.10 “Fast counters” on page 5498*.

Details on the configuration see ↳ *Chapter 1.6.5.2.9.8.2 “Configuration for onboard I/Os” on page 6070*.

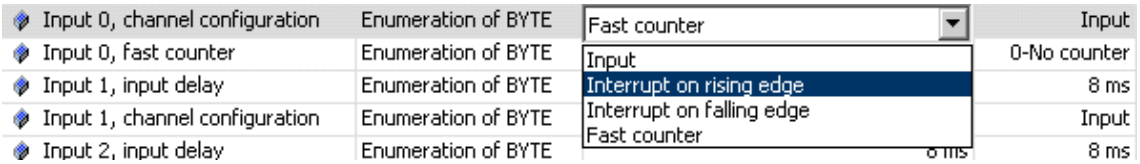
Configuration of interrupt inputs

The processor module PM55x-xP and PM56x-xP provide 4 onboard interrupt inputs. For using the interrupt functionality, the channels I0…I3 have to be configured accordingly.

In the channel parameters of onboard I/O / digital inputs, the channels I0...I3 can be specified as interrupt inputs. 2 interrupt values can be chosen for each channel:

- Interrupt on rising edge
- Interrupt on falling edge

The interrupt mode can be selected in parameter Input X, fast counter of the parameters list:



Creating an interrupt task

If one or more channels of the onboard I/Os are configured as interrupt inputs, a corresponding interrupt task has to be created to enable the processing of the interrupt(s).

For this purpose, a new task has to be added in the task configuration:

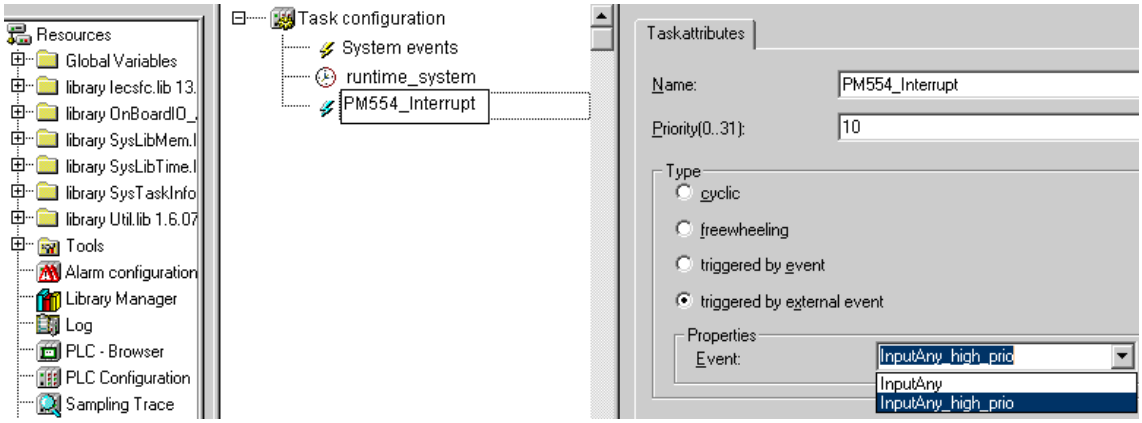
- Enter the task name
- Set the task type to triggered by external event
- Specify the event that triggers the task

2 types of interrupt tasks are available in the Event list box:

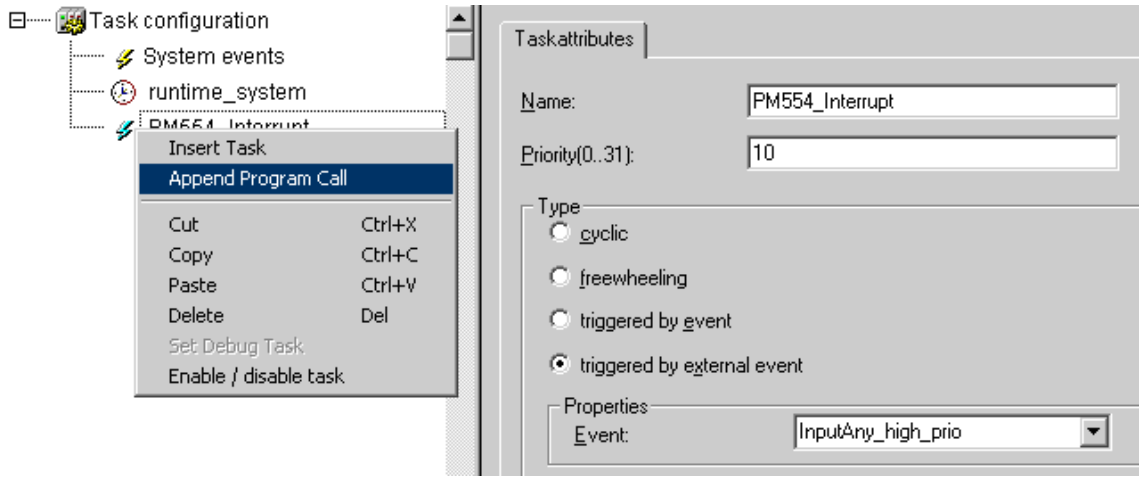
- InputAny
  The task is triggered by any interrupt with the priority specified in the Priority field (0...31).
- InpuAny_high_prio
  The task is triggered by any interrupt with highest priority, i. e. with a priority higher than the max. adjustable "0" and higher than the priority of the communication task. In this case, the priority (0...31) specified in the Priority field has no significance.

> *If the interrupt task is started with highest priority, the program execution time must not be longer than approx. 400 µs. Otherwise online access is no longer possible.*

In the example, the task is named PM554_Interrupt. It is configured as a high-priority interrupt. The task type is triggered by external event and the event to trigger the task is InputAny_high_priority.



Like for all other tasks, a program call has to be assigned to the task.



In the example, the program PM554_Interrupt_1() shall be started with any interrupt from onboard I/Os.

Structure of the interrupt program

The following block contained in the library OnBoardIO_AC500_V13.lib is available for the interrupt program:

- ONB_IO_INT_IN: Determination of the interrupt initiating source

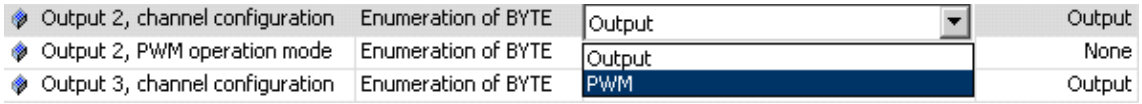
It is possible to start one interrupt task. This task can be started by any channel (I0...I3) configured as interrupt input. Therefore, it is necessary for the interrupt program to differentiate which channel(s) triggered the interrupt in order to enable the processing of the corresponding actions.

The information whether a channel (I0...I3) has triggered an interrupt since the last call of the block is provided by the outputs IN0...IN3 of the block ONB_IO_INT_IN. This is why this block always has to be called at the beginning of the interrupt program, if more than one channel is configured as interrupt input.

The interrupt program will be called every time if a pulse edge is detected. But if pulse edges are occurring simultaneously on several inputs which are configured as interrupt inputs, the interrupt program can be called once.

Configuration of PWM outputs

The processor module PM55x-xP and PM564-xP provide up to 2 PWM output channels with a maximum frequency of 20 KHz. The parameter of PWM output channel of Onboard I/O must be configured before it can be used. User should take these steps to configure the PWM output function.

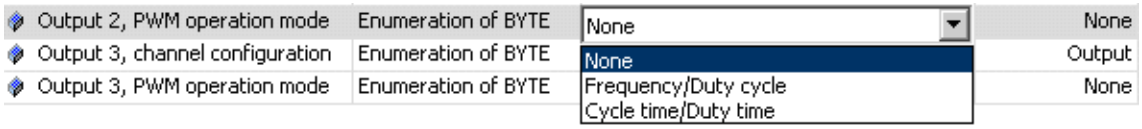


The 2 outputs can be controlled in 2 different configuration modes:

- Frequency mode
- Cycle time mode

Relay-type outputs of Onboard I/Os cannot be used for PWM functionality.

The mode can be configured with the parameter Output X, PWM operation mode in the parameters list:



In frequency mode, by setting the FREQ and DUTY_CYCLE input variables of PWM channel, the Onboard I/O can generate 125 Hz to 20 kHz frequency with 0..100 % duty cycle waveform in output channels 2 and 3.

In the cycle time mode, by setting the CYCLE_TIME and CYCLE_DUTY input variables of PWM channel, the Onboard I/O can generate 125 Hz to 20 kHz frequency with 0..100 % duty cycle waveform in output channels 2 and 3.

The PWM can be controlled via the corresponding mapped parameters in tab xDI+yDO I/O Mapping of the editor window. See Symbolic Names for Variables, Inputs and Outputs for further details on mapping ↳ *Chapter 1.6.5.2.2.1.2 “Symbolic names for variables, inputs and outputs” on page 5815*.

PWM						
		State byte PWM 2	%IB4002	BYTE		PWM 2 - State byte
		State byte PWM 3	%IB4003	BYTE		PWM 3 - State byte

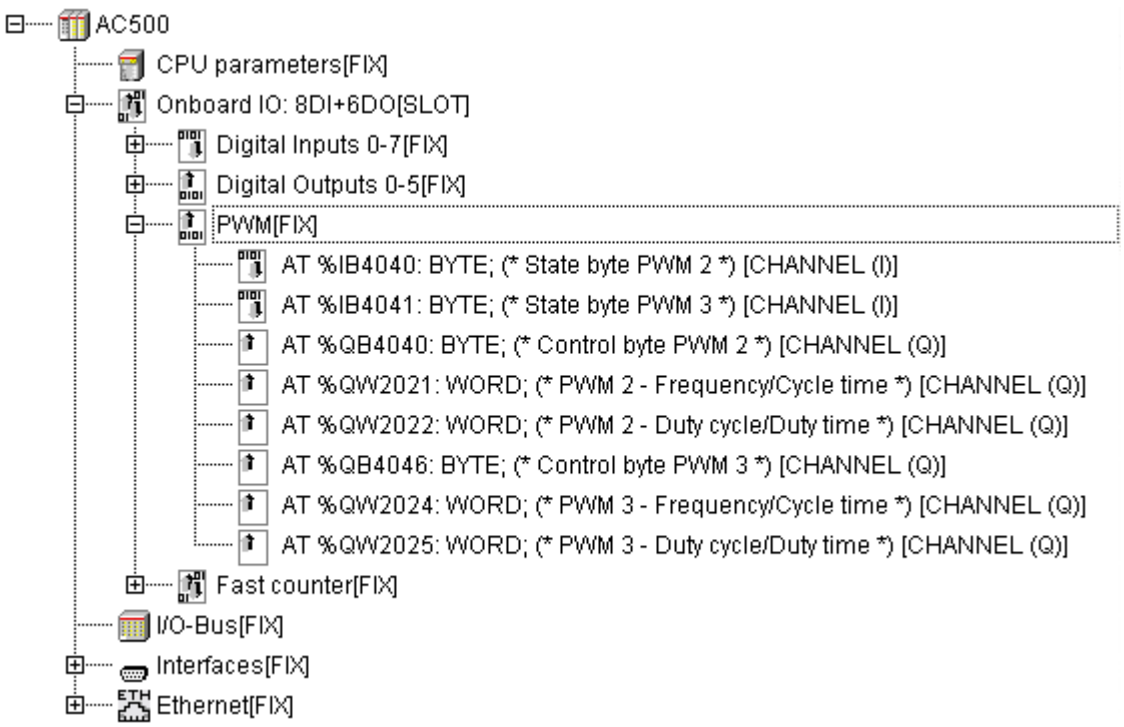
Channel	Direction	Width
State byte PWM X	Input	BYTE
Control byte PWM X	Output	BYTE
PWM X, frequency / cycle time	Output	DWORD
PWM X, duty cycle / duty time	Output	DWORD

Operating the PWM output with user program

The following methods can be used to configure PWM outputs:

- Configuration variables
- Function blocks

Using a configuration variable



Using function blocks

The following function blocks of the library OnBoardIO_AC500_V13.lib can be used to operate the PWM outputs with help of user program.

Group: PWM_OBIO	
ONB_IO_PWM_FREQ	Generate PWM Signal with Frequency and Duty Cycle on Onboard I/O
ONB_IO_PWM_TIME	Generate PWM Signal with Cycle Time and Duty Cycle on Onboard I/O

1.6.5.2.4 Onboard Ethernet configuration

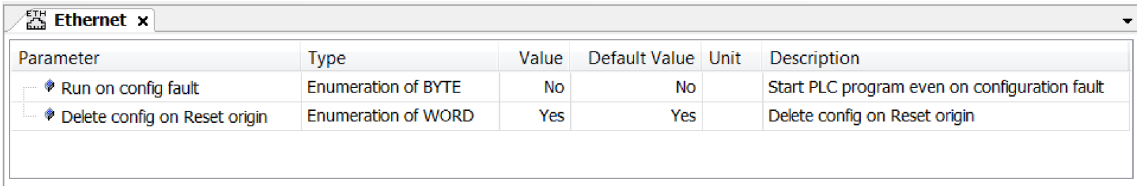
PM5xy-ETH - Onboard Ethernet

Processor modules with 2 onboard Ethernet interfaces:

- *Configure only 1 interface as default gateway.*
- *In case of 2 configured interfaces only the latter will be executed.*

Parameterization of PM5xy-ETH

Double-click the *"Ethernet"* node to open the onboard Ethernet configuration in the editor window:



Processor modules with 2 onboard Ethernet interfaces:

- *Configure only 1 interface as default gateway.*
- *In case of 2 configured interfaces only the latter will be executed.*

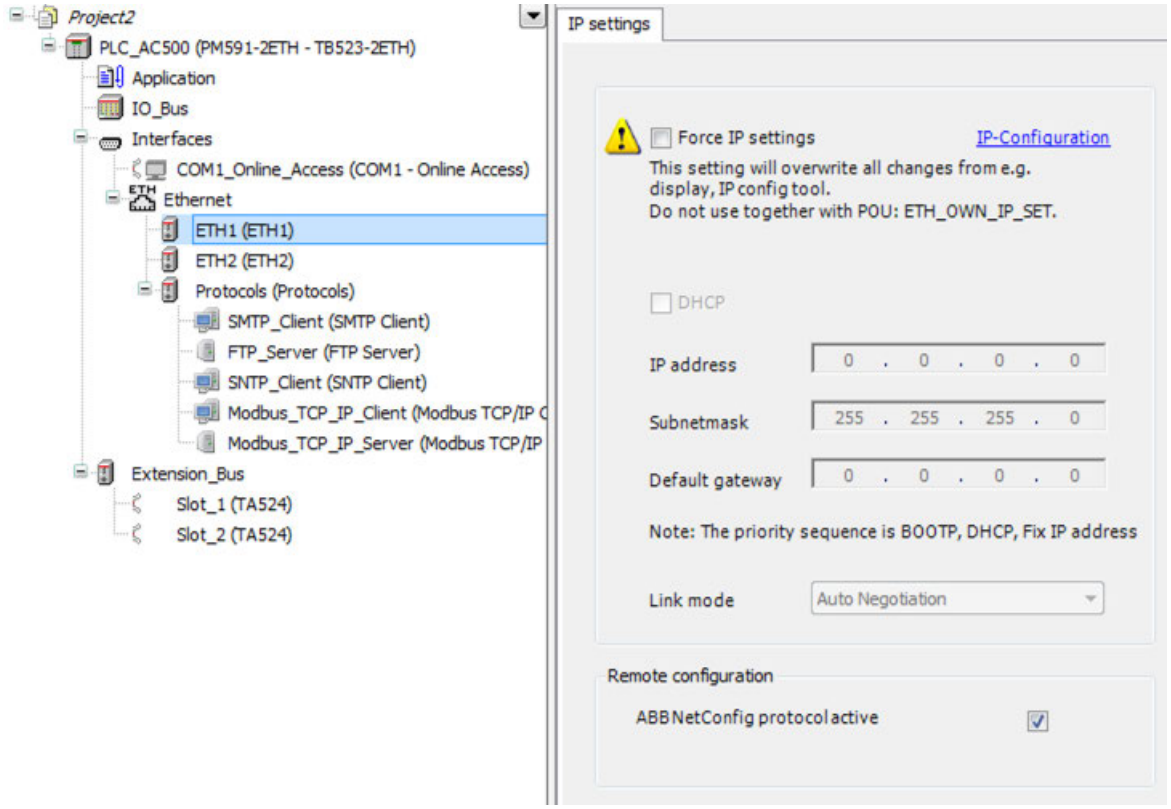
The following parameters are available:

Parameter	Default value	Value	Description
Run on config fault	No	No	In case of a configuration error, the user program is not started.
		Yes	The user program is started independent of a faulty configuration of the Onboard Ethernet Module.

Parameter	Default value	Value	Description
Delete config on Reset origin	Yes	Yes	The Ethernet configuration is deleted after Reset origin.
		No	The Ethernet configuration (e.g. IP address) is still available after Reset origin.

Configuration of the IP settings

In the Automation Builder project, double-click the Ethernet node to open the *"IP settings"*:



Processor modules with 2 onboard Ethernet interfaces:

- *Configure only 1 interface as default gateway.*
- *In case of 2 configured interfaces only the latter will be executed.*

Table 730: Parameters:

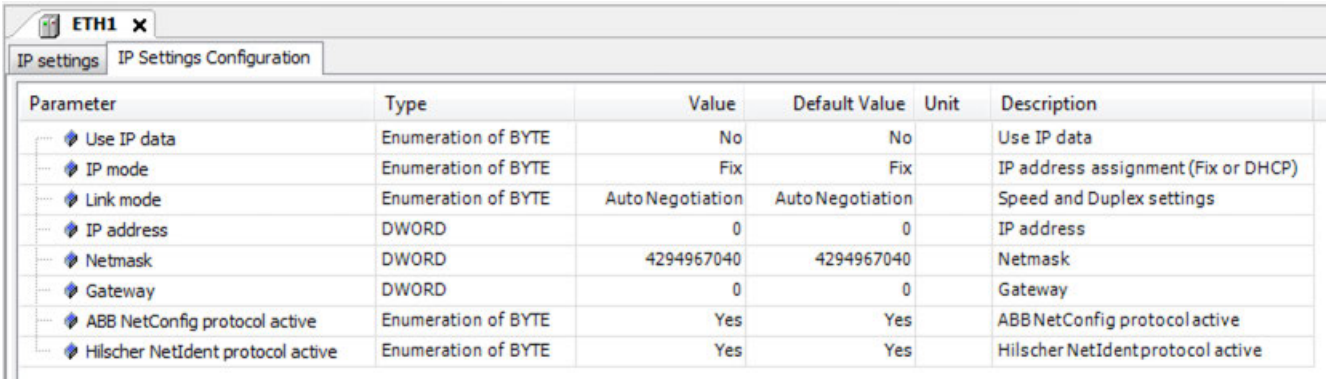
Parameter	Default	Value	Description	Parameter [1]) ↯ *Further information on page 5861*)
Force IP settings	Disabled	Disabled	The IP settings from this editor are not used.	Use IP data
		Enabled	The IP settings from this editor are used. After download of the user application and subsequent logoff, the new IP settings are used temporarily until power off the device. For a permanent usage of the IP settings, create a boot project.	
DHCP	Disabled	Disabled	The DHCP client services are disabled. A static IP address must be used.	IP mode (+ DHCP)
		Enabled	The DHCP client services are enabled. The IP address of the device will be set by a DHCP server in the network.	
IP address	0.0.0.0	Valid IP address	IP address of the device.	IP address
Subnetmask	255.255.255.0	Valid subnet mask	Subnet mask for the device.	Netmask
Default gateway	0.0.0.0	Valid gateway address	Default gateway address for the device.	Gateway
Link mode	Auto negotiation	Auto negotiation	The link mode will be detected automatically.	Link mode
		10 Mbit Half-Duplex	The link mode is statically set to 10 Mbit half-duplex.	
		10 Mbit Full-Duplex	The link mode is statically set to 10 Mbit full-duplex.	

Parameter	Default	Value	Description	Parameter [1]) ↳ *Further information on page 5862*)
		100 Mbit Half-Duplex	The link mode is statically set to 100 Mbit half-duplex.	
		100 Mbit Full-Duplex	The link mode is statically set to 100 Mbit full-duplex.	
ABBNetConfig protocol active	Enabled	Enabled	Remote configuration: ABB NetConfig protocol is enabled.	
		Disabled	Remote configuration: ABB NetConfig protocol is disabled.	

Remarks:

[1]): Generic Device Configuration View Parameters

For a list of all available parameters, open the *"IP Settings Parameters"*. This tab is only visible after enabling parameter 'Show generic device configuration views' under *"Tools ➔ Options"*:



Configuration of the IP settings with the IP configuration tool

The IP address for AC500 devices can be set or changed in Automation Builder using

- the IP configuration tool which is described in the following.
- the 'Communication Settings'. ↳ *Chapter 1.6.5.2.2.2.3 "Configuration of communication via Ethernet (TCP/IP)" on page 5829*

As an alternative the IP address can be changed at the hardware device itself. ↳ *Chapter 1.6.4.1.5.4 "Description of the function keys" on page 5426*

The IP configuration tool:

The IP configuration tool can be used

- to set or change the IP address of devices.
  ↳ *Chapter 1.6.5.2.4.1.3.2.2 "Changing the IP address" on page 5868*
- to scan the network for available hardware devices.
  ↳ *Chapter 1.6.5.2.4.1.3.2.1 "Network scan" on page 5866*

- to update the firmware of devices.
  This functionality is only supported if the IP configuration tool is used stand-alone.
  ↳ *Chapter 1.6.5.2.4.1.3.2.3 “Firmware update” on page 5869*
- to activate certain functionality on hardware devices.
  This feature is only available on AC500 V3 devices.
  ↳ *Chapter 1.6.5.2.4.1.3.2.4 “Blink functionality” on page 5873*

The IP configuration tool is part of Automation Builder and can be called via *“Tools ➔ IP-Configuration”*.

Further the IP configuration tool can be used stand-alone without an Automation Builder application running. The stand-alone variant requires a separate installation via the Installation Manager ↳ *Chapter 1.6.5.2.4.1.3.1 “Stand-alone installation” on page 5864*.

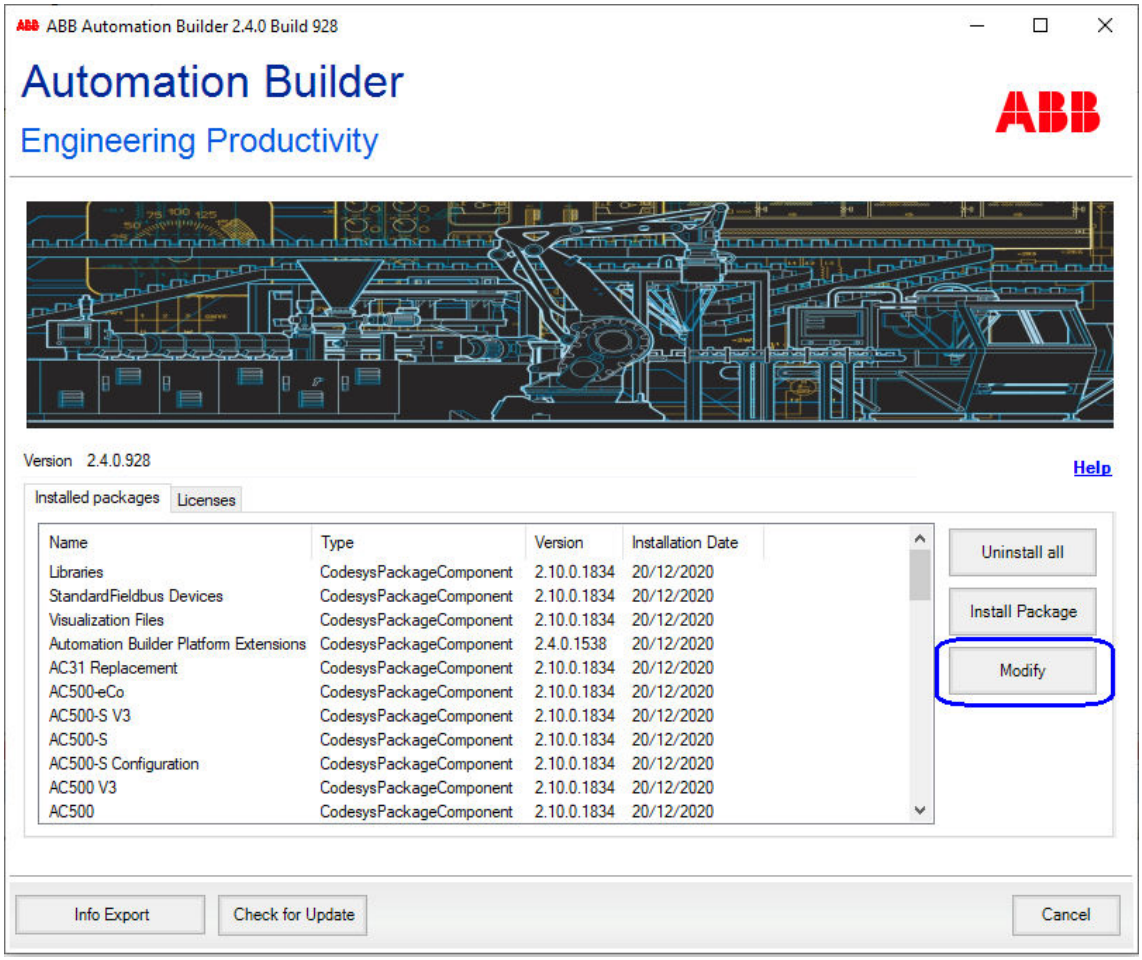
After the installation, the IP configuration tool is started via .exe file / desktop icon.

Some functionality is only supported if the IP configuration tool is used stand-alone, e.g. for firmware updates for communication interface devices.

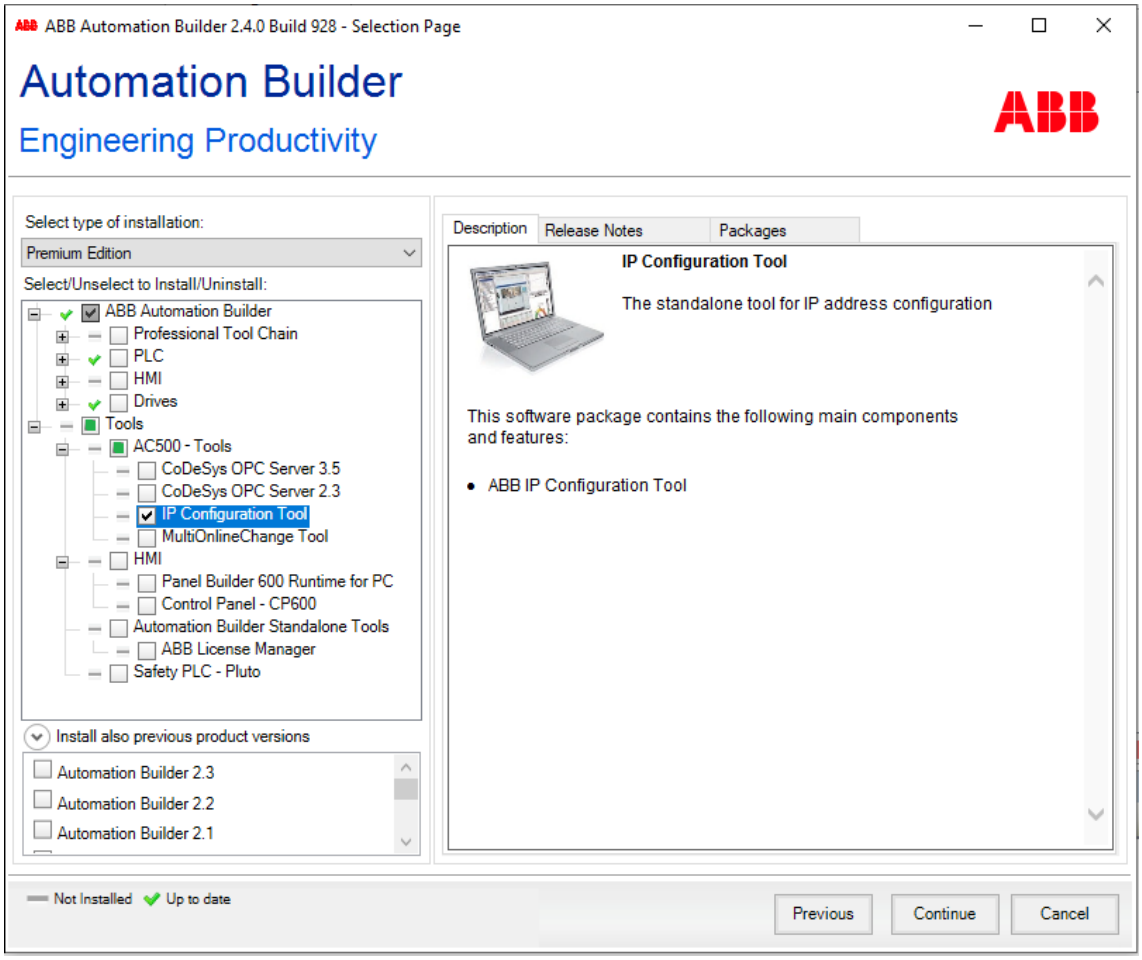
Stand-alone installation

The IP configuration tool is part of Automation Builder and can be called via “Tools ➔ IP-Configuration”. A separate installation is only required if the IP configuration tool shall be used stand-alone.

1. Open the Installation Manager in Automation Builder: *"Tools ➔ Installation Manager"*.
2. Close all other instances of Automation Builder as only one instance of the program can be executed at a time.



3. Click *"Modify"* and select the *"IP Configuration Tool"* from the structure tree.



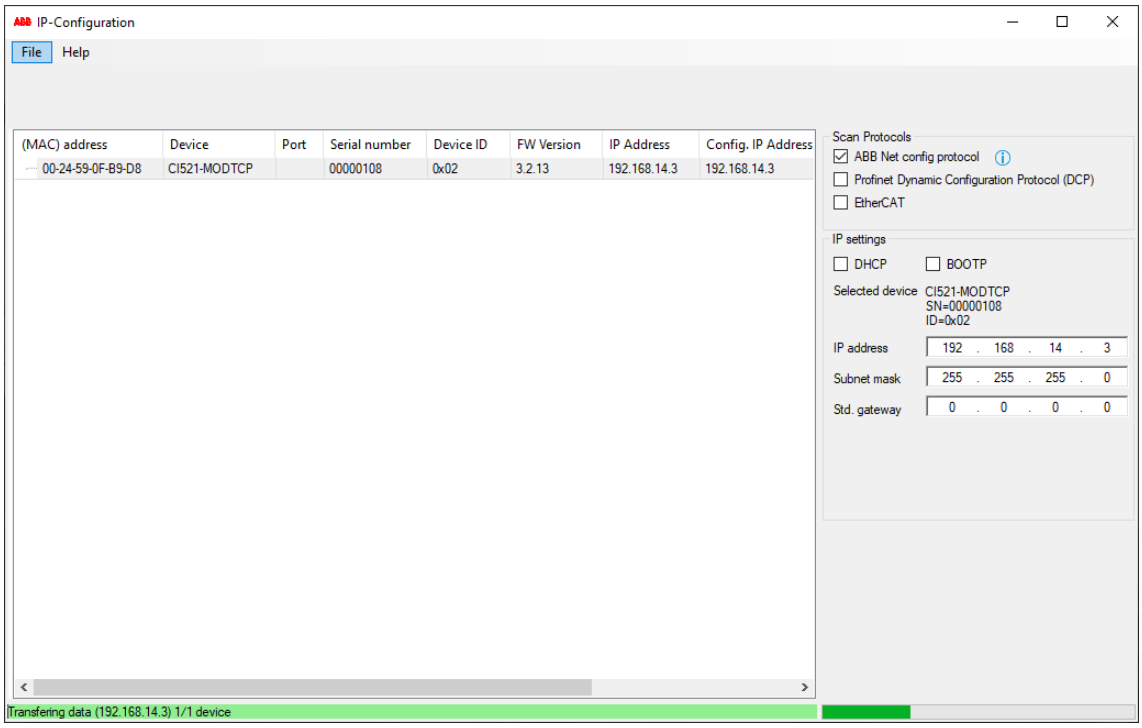
4. Click *"Continue"* to start the installation.
   - ⇨ After a successful installation the IP configuration tool is available as stand-alone tool (.exe).
   - ⇨ To start the IP configuration tool, click the new created desktop icon.

Using the tool functions

Network scan

With a network scan all devices that have been found in the network by the scan process are listed, i.e. ABB devices such as AC500 processor modules, AC500 communication interface modules or ABB Drives.

1. Start the IP configuration tool in Automation Builder (*"Tools ➔ IP-Configuration"*) or start it stand-alone (.exe).
2. The *"IP-Configuration"* dialog opens. Define the device type for the network scan by selecting the desired option under *"Scan Protocol"*:
   - *"ABB Net config protocol"*:
     Use this option for AC500 devices such as processor modules, CI5xx-Modbus devices or ABB Drives. The device(s) to be scanned must be connected to the PC via a direct Ethernet connection.
   - *"Profinet Dynamic Configuration Protocol (DCP)"*:
     Use this option for PROFINET communication interface modules. The device(s) to be scanned must be connected to the PC via a direct Ethernet connection (not via CM579).
     For the scan, a NPcap driver needs to be installed separately.
     Step 4 on page 5871
   - *"EtherCAT"*:
     Use this option for EtherCAT communication interface modules. The Ethernet cable must be connected directly to the first EtherCAT slave device of the EtherCAT fieldbus. Ensure that no EtherCAT master device is available on the bus when a scan is performed.
     "Emergency" option: Enable this option to check on failures in the EtherCAT assembly during the scan process, i.e. a frame loss or interchanged ports. Errors are displayed.
     For the scan, a NPcap driver needs to be installed separately.
     Step 4 on page 5871
3. Click *[Scan]* to start the scan process.



4. All devices that have been found in the network are listed including hardware and connection details. The following details can be changed under *"IP settings"*:

   ⇨ ● *"IP Address"*:
   Current IP address of the device.
   ● *"Conf. IP Address"*:
   Configured IP address of the device. A changed IP address will update this column.
   ● *"FW Version"*:
   Current installed firmware version of the device. This field is visible not until a first network scan. If this field is still empty after a network scan, check on connection errors.
   Chapter 1.6.5.2.4.1.3.3.1 "Trouble-shooting for firmware update" on page 5874

The IP address of some devices, e.g. EtherCAT devices cannot be changed.

Changing the IP address

1. In order to change the IP address of devices perform a network scan.

   Chapter 1.6.5.2.4.1.3.2.1 "Network scan" on page 5866

2. Select a device from the list and select the appropriate protocol under *"Scan protocol"*.

   "DHCP" or *"BOOTP"* option: If required, DHCP or BOOTP can be used to receive the IP address for the device from the server.

   "IP address", *"subnet mask"*, *"Std. gateway"*: Use these fields to change the IP address settings including the settings for the subnet mask and the standard gateway. Ensure that the combination of connection settings is correct.

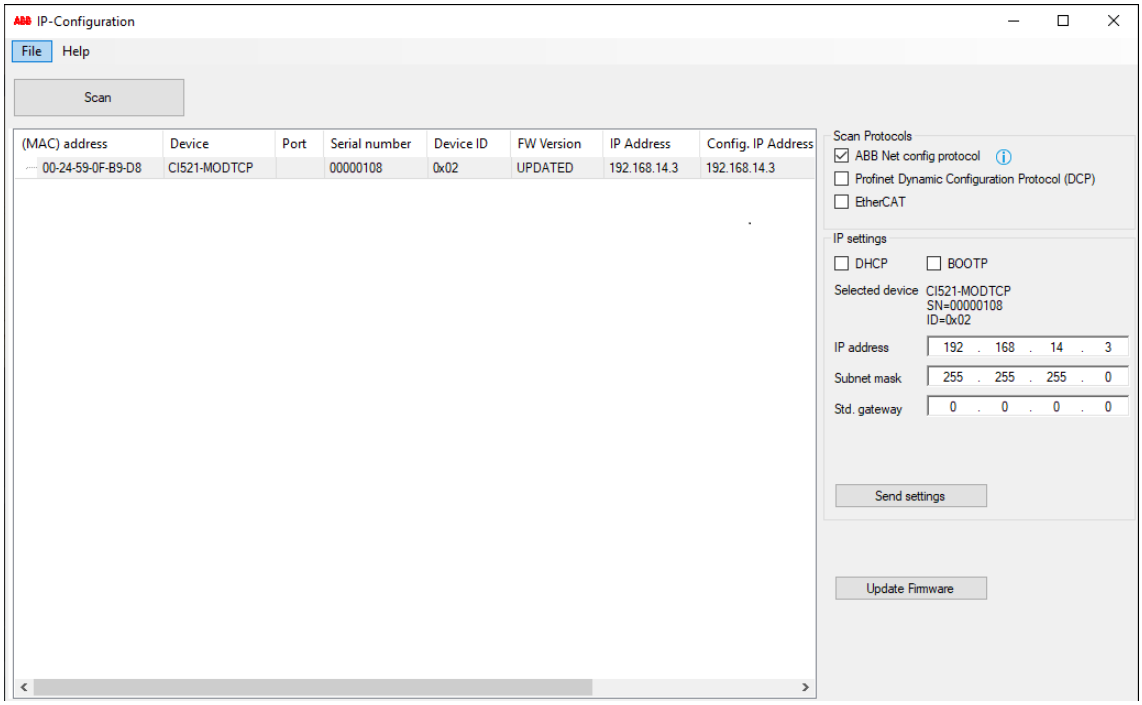
   "Check subnet configuration" on page 5874

Note for CI52x-Modbus devices

Consider the behavior of CI52x-Modbus devices if the last number of the IP address is set to "0".

"Check last number of IP address" on page 5875

3. Change the settings for the IP configuration and click *[Send settings]* to transmit the data to the device.



⇨

Note for PROFINET devices

The device name of PROFINET devices can be edited. If changing the name, ensure the following rules apply:

- *Labels must be separated by "."*
- *Total length: 1 to 240*
- *Label length: 1 to 63*
- *Labels can consist of characters [a-z] and numbers [0-9]*
- *Labels are not allowed to start with "-"*
- *Labels are not allowed to end with "-"*

4. In order to keep all IP changes after a power cycle, the settings can be stored permanently. Confirm the prompted message during the scan process.

Firmware update

The firmware of AC500 communication interface modules can be updated with the IP configuration tool.

For this, the IP configuration tool must be used as stand-alone variant.

↳ *Chapter 1.6.5.2.4.1.3.1 “Stand-alone installation” on page 5864*

It is not possible to perform a firmware update out of Automation Builder.

- *For PROFINET communication interface modules a firmware update is only supported for devices with firmware version ≥ 3.3.3.*
- *For EtherCAT communication interface modules a firmware update is only supported for devices with firmware version ≥ 2.1.4.*
- *For Modbus communication interface modules a firmware update is only supported for devices with firmware version ≥ 3.2.13.*

Requirements: **Before the firmware update**

- Ensure a fast and stable network connection
- Close all unused applications on the executing PC
- Stop the communication between AC500 PLC and the communication interface module that shall be updated

During the firmware update

- Do not close the IP configuration tool
- Do not open Automation Builder software or any other application
- Do not switch-off the communication interface module that shall be updated
- Do not disconnect the Ethernet connection of a communication interface module or the executing PC

The firmware update will stop the operation of the affected device(s). Hence, the device(s) will become unresponsive for 1 - 2 minutes.

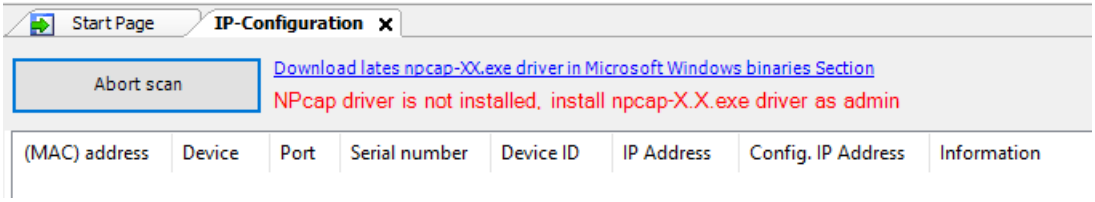
Procedure:

1. Start the IP configuration tool stand-alone (.exe).
2. Perform a network scan.

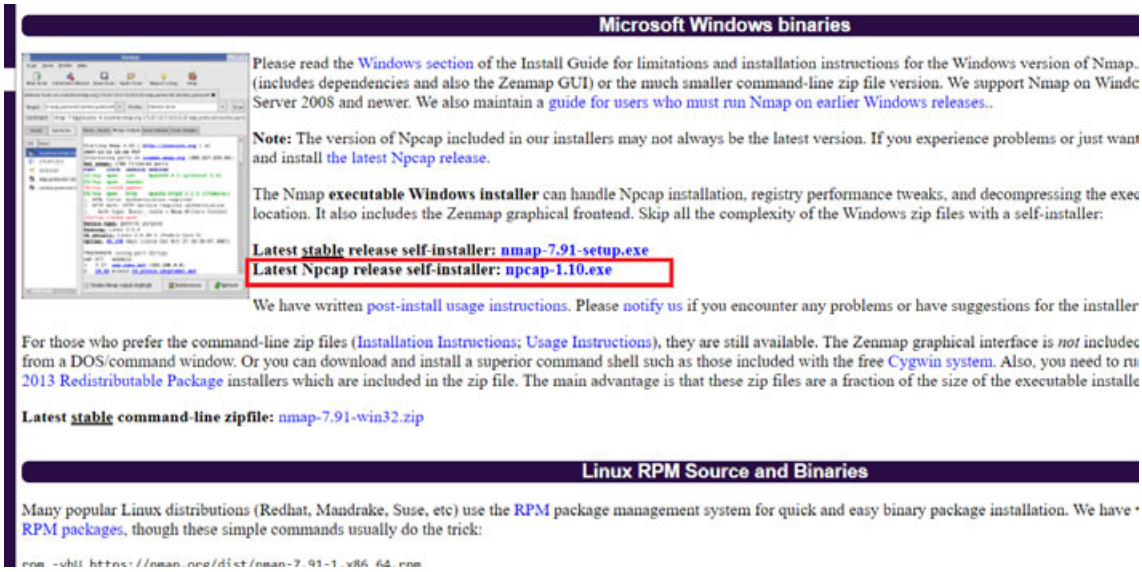
   Chapter 1.6.5.2.4.1.3.2.1 “Network scan” on page 5866
3. Select the devices that shall be updated from the list and click *[Scan]* to trigger the scan process.

   A multiple selection of several devices is possible via control key, however, ensure to select only devices of the same protocol at a time. Otherwise the firmware update fails.

4. This step is only required for devices that require an installed NPcap driver. In this case an appropriate message including a download link is prompted in the IP-Configuration dialog:



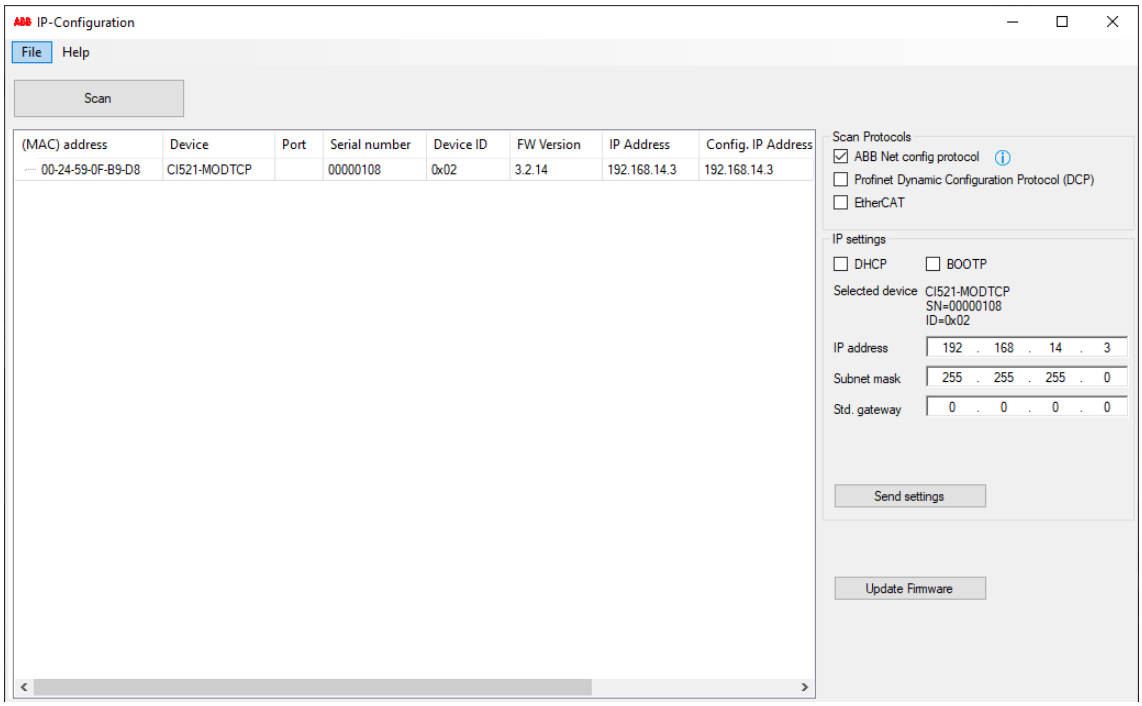
⇨ Click on the displayed link *https://nmap.org/download.html* and download the latest version of the *npcap-X.X.exe* file.



⇨ After the download, execute the file as administrator and restart the scan process.

⇨ The devices that have been scanned are listed.

5. Click *[Update Firmware]* to start the firmware update for the selected devices.



6. For CI50x, CI51x and CI52x devices a signature check is started. Select the appropriate firmware update file (*.bin) for the device(s). Example: C:\AC500\AC500_CI52x_Firmware_V3.2.8.bin.

   After a successful signature check the firmware update file (*.bin) and the respective signature file (*.bin.sig) are transferred to the device. This can last up to 3 minutes.

   If the signature check fails, check the availability of the *.bin file and the *bin.sig file.

   ↳ *"Signature check" on page 5875*

7. A status check followed by a device reboot followed by a second status check is performed automatically.

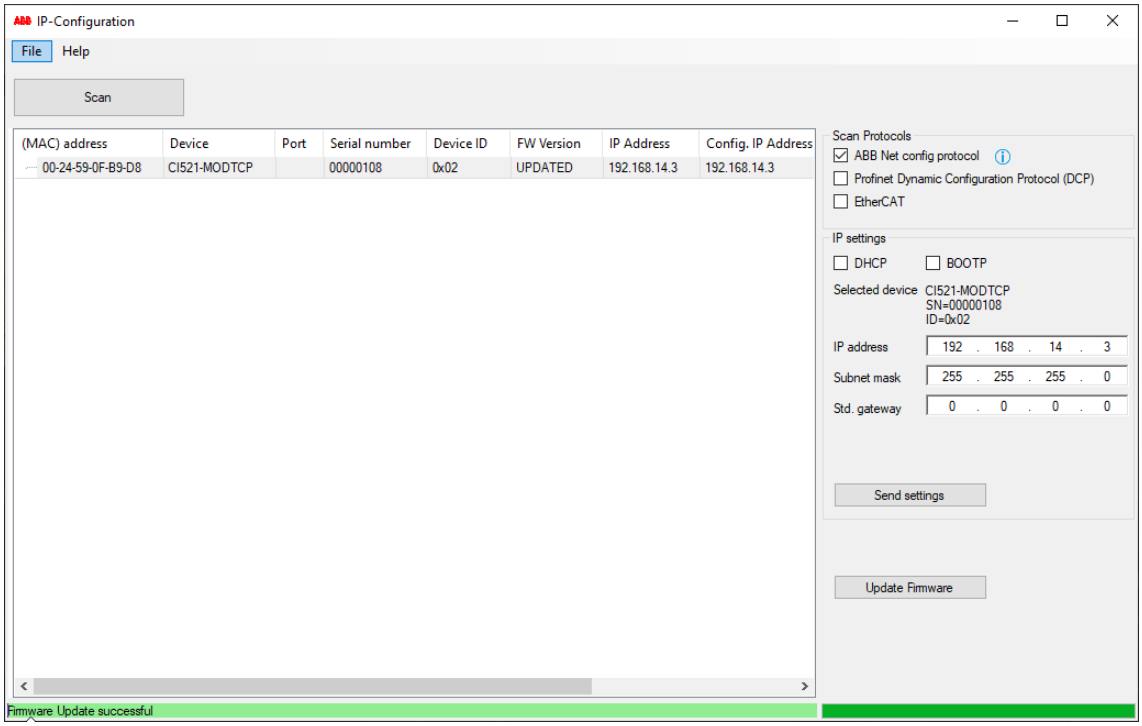
   > *After the firmware update all outputs of the updated devices are set to '0'.*

8. After a successful firmware update the update status or the new firmware version is displayed in the *"FW Version"* field.

   If this field is empty, there possibly is a connection error between the device and the executing PC.

   ↳ *"Error: Can't connect to device" on page 5876*

   Exception: For EtherCAT devices an empty *"FW Version"* field does not indicate a connection error.



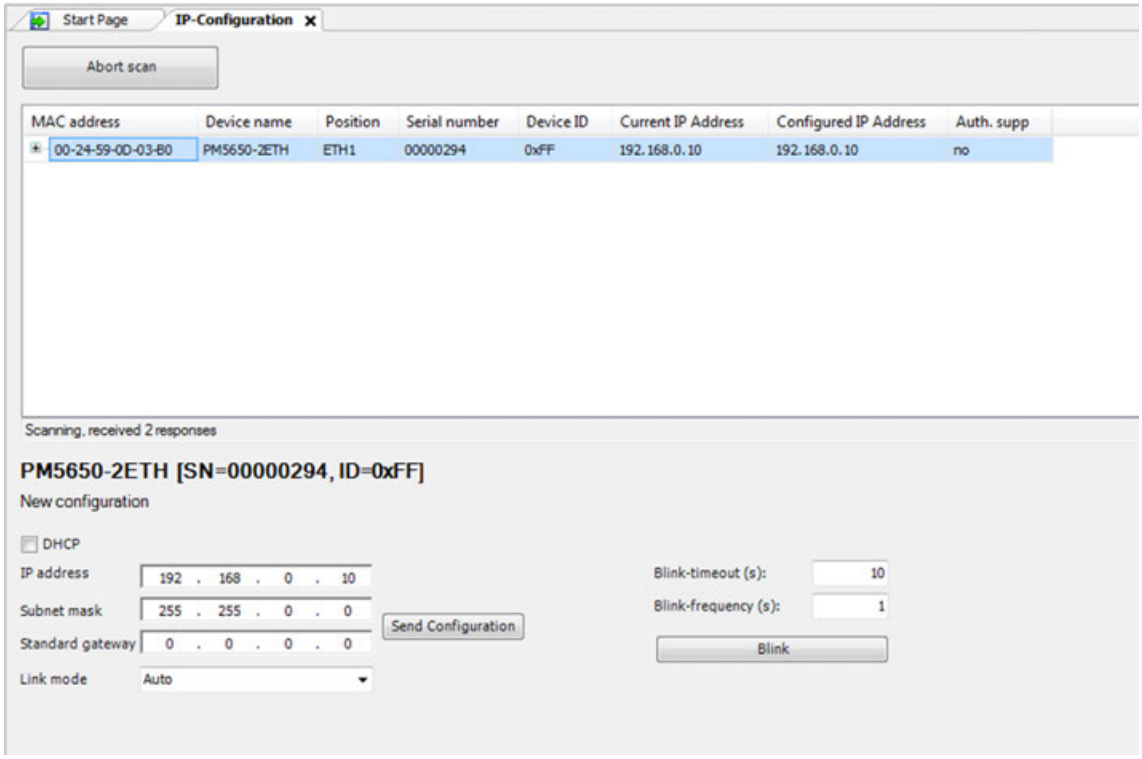
⇨ If the firmware update fails

- check the requirements for the update procedure.
  ↳ *"Requirements:" on page 5870*
- check the hints for trouble-shooting.
  ↳ *Chapter 1.6.5.2.4.1.3.3.1 "Trouble-shooting for firmware update" on page 5874*
- perform a network scan and repeat the update. If the error still persists power cycle the device and try the update again.

Blink functionality

This function activates flashing of the backlight of an AC500 LED display.

1. From the menu, select *"Tools ➔ IP-Configuration"*.
2. Click *[Scan]* to trigger the scan process for devices in the network.
   ⇨ A progress bar shows the progress. The IP settings of a selected device is displayed below the list and can be edited.
3. Adjust your desired time and click *[Blink]* to activate flashing.



Trouble-shooting for IP configuration tool

Firewall exceptions:

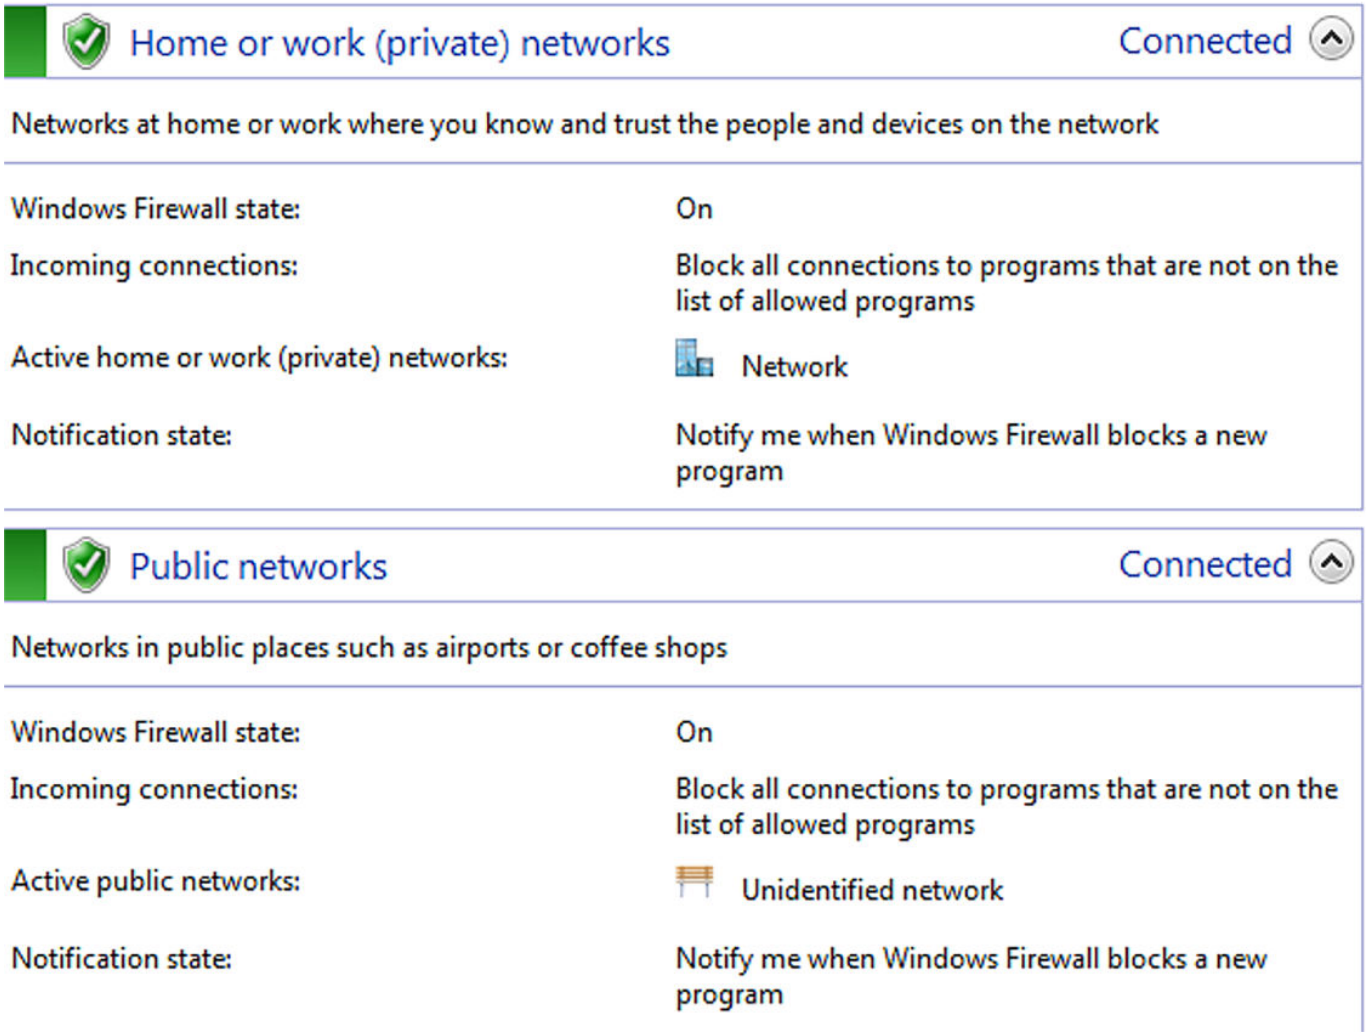
On a standard Windows 7 installation without third party firewall or security tools installed the IP configuration tool should work properly.

The Automation Builder setup installs rules or exceptions for the built-in Windows firewall to allow IPConfig to receive the responses for the IPConfig scan.

To check the Windows firewall is set correctly check the firewall settings.

Windows 7/ Windows 10:

On the network that is used for communication with the PLC, set *"Incoming connections"* to "Block all connections to programs that are not on the list of allowed programs".



If a third party firewall is used these exceptions must be configured manually.

> *Either exceptions for applications can be entered: Automation Builder and IP configuration tool must be added as application.*
>
> *Or the protocol and the port number must be given (for IPConfig: UDP protocol and port number 24576).*

Trouble-shooting for firmware update

Check the requirements

Ensure that all requirements have been considered before and during the update procedure.
“Requirements:” on page 5870

Check subnet configuration

This hint is only valid for Modbus devices and PROFINET devices.

If the *“FW Version”* field is empty after the network scan or if the firmware version has not been updated after the update procedure, there possibly is a connection error between the device and the executing PC.

Ping the device from the executing PC. If no connection can be established, check whether the device and the PC are in the same subnet.

Example

PC	Device	Result
192.168.14.71 / 255.255.255.0	192.168.14.10 / 255.255.255.0	OK
192.168.**10**.71 / 255.255.**255**.0	192.168.**14**.10 / 255.255.**255**.0	ERROR
192.168.10.71 / 255.255.0.0	192.168.14.10 / 255.255.0.0	OK

Click *[Scan]* again to restart the network scan. If the connection is successful a newer firmware version is displayed in the *"FW Version"* column.

Check last number of IP address

This hint is only valid for CI52x-Modbus devices.

Check the last number of the IP address. If it is set to "0", the IP address setting for this last number will be used from the rotary switches on the hardware device.

Example:

Automation Builder	AC500 communication interface module (rotary switch)
IP address: 192.168.14.0	IP address: 6
	As a result, in the field *"IP Address"* the last number is set to "6": 	

Signature check

During the firmware update of CI50x, CI51x and CI52x devices a signature check is started.

The update procedure expects a firmware update file (**.bin*) and a signature file (**.bin.sig*) in the same directory. Without a signature file the signature check will fail.

Example:

Firmware update file:
*C:\AC500\AC500_CI52x_Firmware_V3.2.8.**bin***

Signature file:
*C:\AC500\AC500_CI52x_Firmware_V3.2.8.**bin.sig***

Error: Package timeout

A timeout error may occure due to an instable network.

Solution: Keep the executing PC as near as possible to the devices that shall be updated. Avoid network switches.

Error: Unable to read device status

A read error may occure due to errors in the firmware update protocol.

After the firmware update the IP configuration tool reads out the status of the updated device in order to check if the update was successful.

Error: IP is not unique

If an IP address is obtained by more than one device an error occures. A firmware update is not possible.

Error: Error State

Internal device error during the firmware update.

Solution:

Step 1: Scan again and repeat the firmware update.

Step 2: If this does not work, power cycle the device, scan again and repeat the firmware update.

Error: Can’t connect to device

The TCP communication is not sufficient. Increase the connection quality.

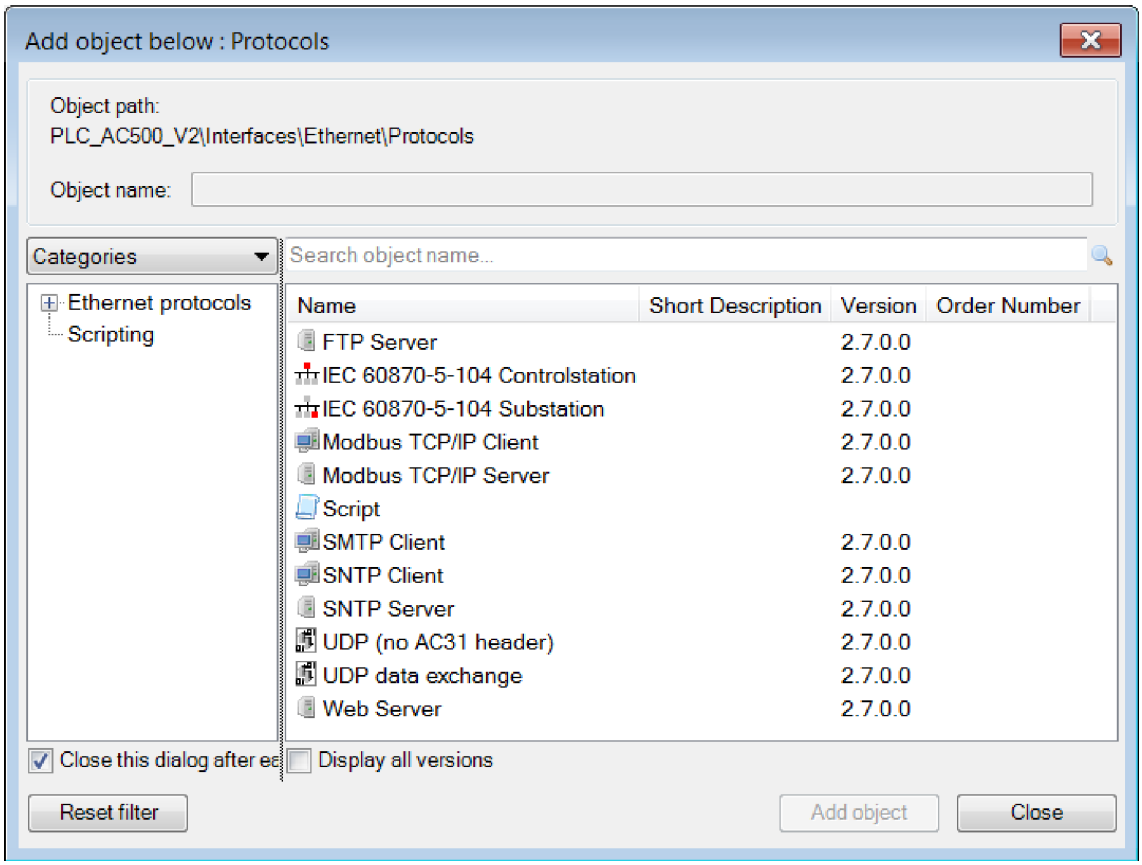
Solution: Keep the executing PC as near as possible to the devices that shall be updated. Avoid network switches.

CM5xy-ETH - External Ethernet communication module

See the description of the IP settings for Ethernet Communication Modules ↯ *Chapter 1.6.5.2.6.5.2 “Configuration of the external communication module CM597-ETH (IP data)” on page 5911*

Ethernet protocols

In the device tree, right-click the *“Protocols”* node under *“Ethernet”* and select *[Add object]*.



From the editor window select the desired protocol. Details on the available protocols are provided in the section *Chapter 1.6.4.1.6.1.1 "Ethernet protocols and ports for AC500 V2 products" on page 5442*.

1.6.5.2.5 Onboard ARCNET configuration

Parameters of PM5x1-ARCNET (onboard ARCNET)

Add a processor module with onboard ARCNET (e.g. PM590-ARC) to the device tree. Double-click the node *"PM5x1_ARC_Internal_ARCNET"* to open the parameter settings for onboard ARCNET. Check whether the default configuration is to be changed.

The following parameters are available:

Parameter	Default value	Value	Description
Run config fault	No	No	In case of a configuration error, the user program is not started.
		Yes	The user program is started independent of a faulty configuration of the internal ARCNET Communication Module.

Parameter	Default value	Value	Description
Address see remark 1 ↳ *Chapter 1.6.5.2.5.1.1 “Remark 1: Setting behavior of the ARCNET node ID” on page 5879*	0	0...255	Address (node ID) of the ARCNET Communication Module
Tranmission rate see remark 2 ↳ *Chapter 1.6.5.2.5.1.2 “Remark 2: Tranmission rate of the ARCNET communication module” on page 5879*	2.5 MB/s	2.5 MB/s	Transmission set for the ARCNET Communication Module
		1.25 MB/s	
		625 kB/s	
		312.5 kB/s	
Extended timeout ET1/ET2	Very small net	Very small net (=0)	ARCNET timeout setting. The following applies: Bit 0 configures ET2 of the Communication Module Bit 1 configures ET1 of the Communication Module Value ET1 ET2 Meaning ---------- 0 0 0 Max. network expansion 2 km 1 1 0 2 0 1 3 1 1 for large networks
		Small net (=1)	
		Big net (=2)	
		Very big net (=3)	
Long packets	Enable	Enable	Enable long data packets (512 bytes)
		Disable	Incoming long data packets are received and dismissed. The SEND block indicates an error in case of long data packets.
Evaluate DIN on receipt see remark 3 ↳ *Chapter 1.6.5.2.5.1.3 “Remark 3: Check of DIN identifier on receipt” on page 5879*	Enable	Enable	Enable check of DIN identifier on receipt
		Disable	Disable check of DIN identifier on receipt

Remark 1: Setting behavior of the ARCNET node ID

Configured ARCNET Node ID			
#	In Project	In Display	Effect
1	0 [default]	0 [default]	Configuration error: Class=3 Comp=9 Dev=10 Mod=3 Ch=0 Err=26
2	0 [default]	!=0	No error
3	!=0 && != display setting	!=0	Configuration error: Class=3 Comp=9 Dev=10 Mod=3 Ch=0 Err=26
4	!=0 && == display setting	!=0	No error
5	!=0	0	No error, but display shows "Addr 0"

Remark 2: Tranmission rate of the ARCNET communication module

If the transmission rate set for the ARCNET Communication Module differs from the default value (2.5 MB/s), programming via ARCNET using the SoHard-ARCNET PC boards is no longer possible. The same transmission rate has to be set for all subscribers of the ARCNET network. The ARCNET PC boards are firmly set to 2.5 MB/s.

Remark 3: Check of DIN identifier on receipt

If the parameter "Evaluate DIN on receipt" is enabled (default setting), the following DIN identifiers are reserved:

DIN identifier		**Protocol**
Hex	**Dec**	
4F	79	"Online access" - Programming/OPC with IEC 61131-3 programming / AC1131
5F	95	5F_ARCNET (Ethernet functions for ARCNET)

DIN identifier		Protocol
Hex	**Dec**	
6F	111	PC331 programming (not used for AC1131/IEC 61131-3 programming)
7F	127	Default DIN identifier for data exchange with function blocks: ARC_REC, ARC_SEND, ARC_STO, ARC_INFO All DIN identifiers except the reserved identifiers can be used for data exchange.

If the parameter "Evaluate DIN on receipt" is disabled, programming and/or OPC via ARCNET is not possible!

"ARCNET data exchange" and "5F_ARC"

The protocols "ARCNET data exchange" and "5F_ARC" can be appended.

Right-click *“PM5x1_ARC_Internal_ARCNET”* node and select *[Add object]*.

The following parameters can be set for the "ARCNET data exchange" protocol:

Parameter	Default value	Value	Description
Size of receive buffer	8192	512...65535	Receive buffer size in bytes. The minimum size is equal to the maximum size of an UDP telegram.
Size of transmit buffer high prio	4096	0...65535	Size of transmit buffer (in bytes) for telegrams with high priority.
Size of transmit buffer low prio	4096	0...65535	Size of transmit buffer (in bytes) for telegrams with low priority.
Size of timeout buffer	2048	0...65535	Size of buffer (in bytes) for timeout data packets.
Number of header data	10	0...1464	Number of header data to be copied to the timeout buffer for timeout packages (in bytes).
Receive broadcast	Disable	Disable	Reception of broadcast telegrams disabled (data packets to all stations).

Parameter	Default value	Value	Description
		Enable	Reception of broadcast telegrams enabled (data packets to all stations).
Behavior on receive buffer overflow	Overwrite	Overwrite	Behavior on overflow of the receive buffer. The oldest data packets stored in the receive buffer are overwritten with the new incoming data packets.
		Reject	Behavior on overflow of the receive buffer. New incoming data are dismissed.

The following parameters can be set for the "5F_ARC" protocol:

Parameter	Default value	Value	Description
Disable write to %MB0.x from	0	0...65535	Disable write access for segment 0 starting at %MB0.x
Disable write to %MB0.x to	0	0...65535	Disable write access for segment 0 up to %MB0.x
Disable read %MB0.x from	0	0...65535	Disable read access for segment 0 starting at %MB0.x
Disable read %MB0.x to	0	0...65535	Disable read access for segment 0 up to %MB0.x
Disable write to %MB1.x from	0	0...65535	Disable write access for segment 1 starting at %MB1.x
Disable write to %MB1.x to	0	0...65535	Disable write access for segment 1 up to %MB1.x
Disable read %MB1.x from	0	0...65535	Disable read access for segment 1 starting at %MB1.x
Disable read %MB1.x to	0	0...65535	Disable read access for segment 1 up to %MB1.x

1.6.5.2.6 Communication modules

Communication modules (CM5xx)

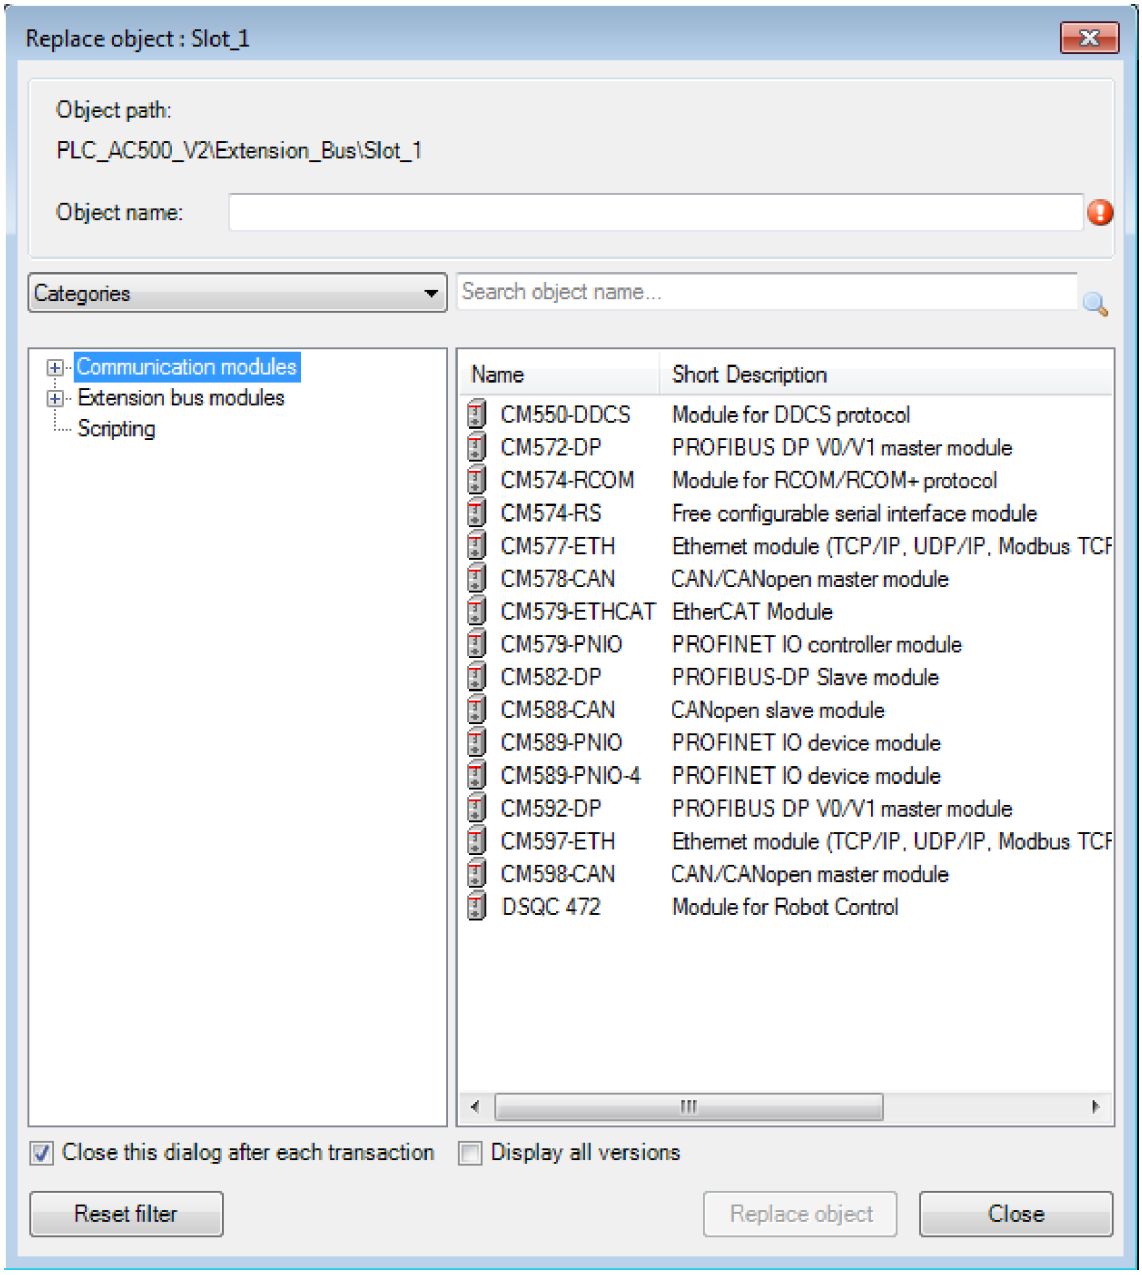
For a processor module with communication module devices, the communication modules must be specified in Automation Builder in the same order as they are installed in the AC500 PLC system:

- Slot 0 corresponds to the Internal communication module (installed in the processor module's housing)
- Slot 1 is the communication module installed in the first slot on the left of the processor module
- Slot 2 is the communication module installed in the second slot on the left of the processor module
- Slot 3 is the communication module installed in the third slot on the left of the processor module
- Slot 4 is the communication module installed in the fourth slot on the left of the processor module

The allocation of inputs/outputs for the communication modules is done slot-oriented and independent of the communication module type.

To append a communication module, add the communication module to the *"Extension_Bus"* node.

1. Right-click the desired *"Slot"* and select *"Add object"*.



2. Select the communication module from the list and click *[Replace object]*.

3. In the device tree, double-click the communication module node and configure the parameters according to the selected communication module.

PROFIBUS

The configuration of PROFIBUS Field Bus has to be done in the following steps:

- Parameterization of the Communication Modules (master and slave) ↳ *Chapter 1.6.5.2.6.2.1.1 “Parameterization of the CM582-DP/CM592-DP communication module” on page 5883*.
- Configuration of the PROFIBUS DP master ↳ *Chapter 1.6.5.2.6.2.1.2 “Configuration of a PROFIBUS DP master” on page 5883*.
- Configuration of the PROFIBUS DP slave ↳ *Chapter 1.6.5.2.6.2.2.1 “Configuration of PROFIBUS DP slave” on page 5894*
  - Configuration of I/O Data Objects ↳ *Chapter 1.6.5.2.6.2.2.1.1 “Configuration of I/O data objects” on page 5895*
  - Mapping of the PROFIBUS slave I/Os ↳ *Chapter 1.6.5.2.6.2.2.1.2 “Mapping of the I/Os” on page 5896*
- Optional:
  - Configuration of the PROFIBUS DP slaves (3rd party devices) ↳ *Chapter 1.6.5.2.6.2.1.3 “Configuration of 3rd party PROFIBUS DP slaves” on page 5887*.
  - Changing the target ↳ *Chapter 1.6.5.2.6.2.1.5 “Changing the target of a device” on page 5893*.

CM592-DP- PROFIBUS DP master communication module

Parameterization of the CM582-DP/CM592-DP communication module

To append a Communication Module, add the Communication Module to the *“Extension_Bus”* node.

- Right-click the desired slot and select *“Add object”*.
- Select the Communication Module from the list and click *[Replace object]*.

- Double-click the new node to open the CM582/CM592 - PROFIBUS DP (Interface) configuration in the editor window.

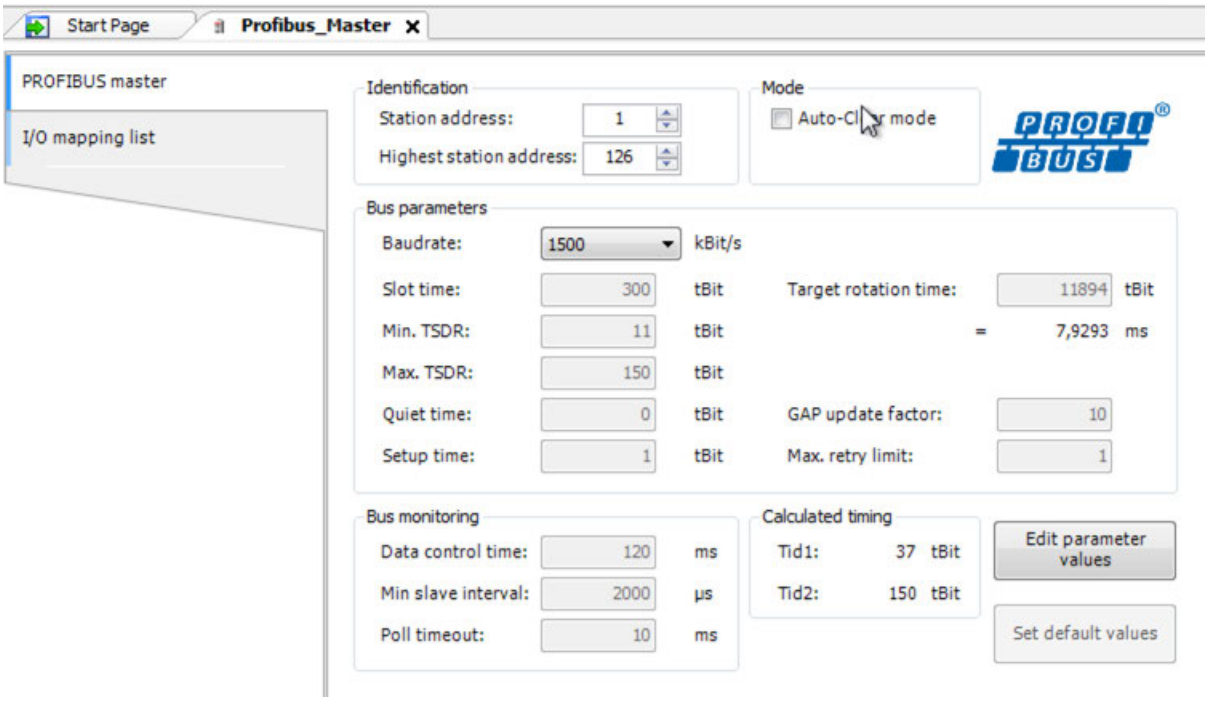
The following parameters are available:

Parameter	Default value	Value	Description
Run on config fault	No	No	In case of a configuration error, the user program is not started.
		Yes	The user program is started independent of a faulty configuration of the PROFIBUS Communication Module.
Min update time	10	0...20000	Minimum update time of inputs and outputs in [ms].

Configuration of a PROFIBUS DP master

Double-click on *“Profibus_Master_x (Profibus_Master)”* to open the *“Profibus_Master”* configuration in the editor window:

Click on tab *"General"* if not already opend.



Most of the parameters are calculated automatically. Click *[Edit parameter values]* to change the parameters manually. Once edited, click *[Set optimal values]* to calculate the optimal values. *[Set default values]* can be used to revert all parameters to the default values.

> *All times for the PROFIBUS parameters are given in bit time [tBit]. The bit time is the result of the reciprocal of the transmission rate:*
>
> *tBit = 1 / transmission rate in [bit/s]*
>
> *The conversion from milliseconds into a bit time is shown in following formula:*
>
> *tBit = Time in [ms] * transmission rate in [bit/s]*

The following parameters are available:

Parameter	Default	Value	Description	Parameter (Remark 1)
Identification				
Station address	1	0...125	The individual device address of the master device on the bus.	DpParameter -> Station address
Highest station address	126	0...126	The highest bus address up to which a master searches for another master at the bus in order to pass on the token. This station address must on no account be smaller than the master station address.	DpParameter -> Highest station address
Mode				

Parameter	Default	Value	Description	Parameter (Remark 1)
Auto-Clear mode	Enabled	Disabled	The master operation mode will stay in the mode 'Operate' and the communication to all available slaves is kept up.	AutoClear-Supported
		Enabled	The masters operation mode will change from 'Operate' to 'Clear' and it shuts down the communication to all assigned slaves, if at least 1 slave is not responding within the data control time.	
Bus parameters				
Transmission rate see *Chapter 1.6.2.4.8.2.2 "Connections" on page 4080*	1500	9.6 19.2 45.45 93.75 187.5 500 1500 3000 6000 12000	Data transfer speed in [kBits/s]. The baud rate must be set to the same value for all devices on the bus. The result of changing the baud rate is that all other parameters must be recalculated.	DpParameter -> Transmission rate
Slot time	300	37.. 65535	Monitoring time of the sender (requester) of a telegram for the acknowledgement of the recipient (responder). After expiration, a retry occurs in accordance with the value of maximum telegram retries.	DpParameter -> TSL
Min. TSDR	11	1...65535	Shortest time period that must elapsed before a remote recipient (responder) may send an acknowledgement of a received query telegram. The shortest time period between reception of the last bit of a telegram to the sending of the first bit of a following telegram.	DpParameter -> Min. TSDR
Max. TSDR	150	1...65535	Longest time period that must elapse before a sender (requestor) may send a further query telegram. Greatest time period between reception of the last bit of a telegram to the sending of the first bit of a following telegram. The sender (requestor, master) must wait at least for this time period after the sending of an unacknowledged telegram (e.g. broadcast only) before a new telegram is sent.	DpParameter -> Max. TSDR

Parameter	Default	Value	Description	Parameter (Remark 1)
Quiet time	0	0...127	Time delay that occurs for modulators (modulator-trip time) and repeaters (repeater-switch time) for the change over from sending to receiving.	DpParameter -> TQUI
Setup time	1	0...255	Minimum period reaction time between the receipt of an acknowledgement to the sending of a new query telegram (reaction) by the sender (requestor).	DpParameter -> TSET
Target rotation time	11894	1.. 2 -1 (=16777215)	Pre-set nominal token cycle time within the sender authorization (token). The available time for the master to send data telegrams to the slaves depends on the difference between the nominal and the actual token cycle time. The Target rotation time (TTR) is shown in Bit times [tBit] like the other bus parameters. Below the displayed bit time, the Target rotation time is also displayed in [ms]. The default value depends on the number of slaves attached to the master and their module configuration.	DpParameter -> TTR
GAP update factor	10	0...255	Factor for determining after how many token cycles an added participant is accepted into the token ring. After expiry of the time period G*TTR, the station searches to see whether a further participant wishes to be accepted into the logical ring.	DpParameter -> GAP update factor
Max. retry limit	1	1...15	Maximum number of repeats in order to reach a station.	DpParameter -> max. retry limit
Bus monitoring				
Data control time	120	1..2^{24}-1	Defines the time in [ms] within the Data_Transfer_List is updated at least once. After the expiration of this period, the master (class 1) reports its operating condition automatically via the Global_Control command. The default value depends on the transmission rate.	DpParameter -> Data control time

Parameter	Default	Value	Description	Parameter (Remark 1)
Min. slave interval	2000	1...65535	Defines the minimum time period between two slave list cycles in [µs]. The maximum value the active stations require is always given. The default value depends on the slave types.	DpParameter -> min. slave interval
Poll timeout	10		Sets the maximum period of time in [ms] during which the response has to be received.	DpParameter -> Poll timeout
Calculated timing				
Tid1 (read-only)	37	37	Tid1 starts after the initiator has received an acknowledgement, answer or a token telegram. Tid1 = max (T_{QUI} + 2 * T_{SET} + 2 + T_{SYN} , min T_{SDR}) T SYN : This is the minimum time that must be available to each device as a rest condition before it is allowed to accept the start of a query and it is determined at 33 bit times.	-
Tid2 (read-only)	150	150	Tid2 starts after the initiator has send a telegram which is not acknowledged.. Tid2 = max (T_{QUI} + 2 * T_{SET} + 2 + T_{SYN} , max T_{SDR}) T_{SYN}: This is the minimum time that must be available to each device as a rest condition before it is allowed to accept the start of a query and it is determined at 33 bit times.	-

Remark 1:

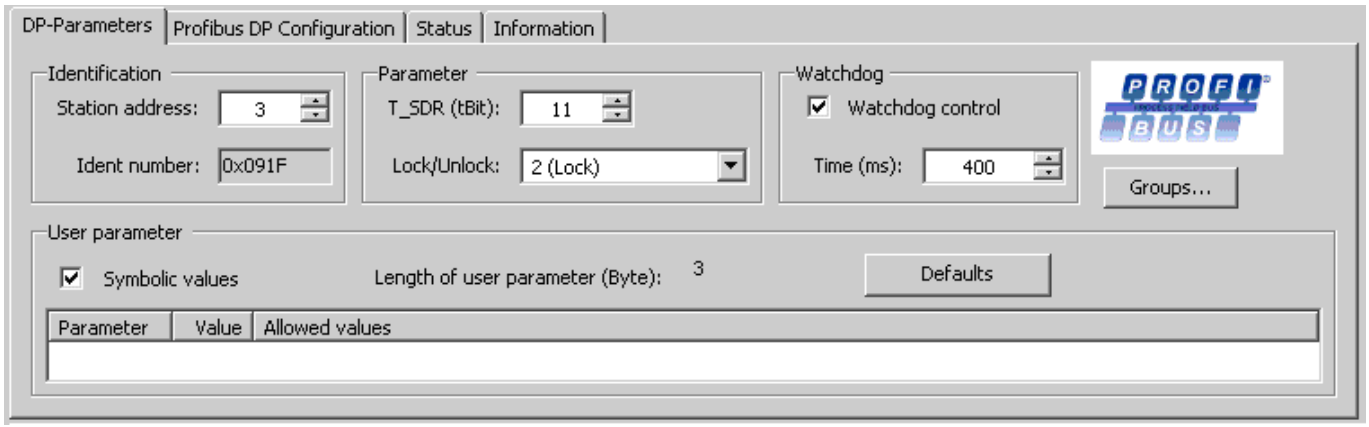
To display the parameters of this column, enable the option *“Show generic device configuration views”* under *“Tools ➔ Options ➔ Device editor”*.

Configuration of 3rd party PROFIBUS DP slaves

A PROFIBUS DP slave can be added by right-clicking on *“Profibus_Master_x (Profibus_Master)”* and selecting *“Add object”*.

If the desired device is not listed it can be installed via the *“Device Repository”* (menu item *“Tools” -> “Device Repository”*).

The slave configuration parameters can be edited in slave related editor window. To open this editor window, double-click the corresponding slave in the device tree.



All times for the PROFIBUS parameters are given in bit time [tBit]. The bit time is the result of the reciprocal of the transmission rate:

tBit = 1 / transmission rate in [bit/s]

The conversion from milliseconds into a bit time is shown in following formula:

*tBit = Time in [ms] * transmission rate in [bit/s]*

The following parameters are available:

Parameter	Default	Value	Description	Parameter (Remark 1)
Identification				
Station address	1	0...126	Station address of the PROFIBUS DP slave device.	StationAddress
Ident number	GSD file specific	FALSE	Station address of the PROFIBUS DP slave device.	SlavePrmData -> identNumber
Parameter				
T_SDR (tBit)	11	11...255	The parameter T_SDR (tBit) represents the minimum station delay of a responder (time a responder waits before generating the reply frame).	SlavePrmData -> minTsdr
Max. TSDR	2 (Lock)	0 (T_SDR unlock)	The TSDR and slave-specific parameter may be overwritten.	Bit 6 = 0 and bit 7 = 0 of bitmask SlavePrmData -> stationStatus
		1 (Will be unlocked)	The slave is released to other masters.	Bit 6 = 1 and bit 7 = 0 of bitmask SlavePrmData -> stationStatus

Parameter	Default	Value	Description	Parameter (Remark 1)
		2 (Lock)	The slave is locked to other masters, all parameters are accepted.	Bit 6 = 0 and bit 7 = 1 of bitmask SlavePrmData -> stationStatus
		3 (Unlock)	The slave is released to other masters.	Bit 6 = 1 and bit 7 = 1 of bitmask SlavePrmData -> stationStatus
Watchdog				
Watchdog control	Enabled	Disabled	The PROFIBUS slave does not utilize the Watchdog Control Time setting.	SlavePrmData -> wdFact1
		Enabled	The PROFIBUS slave utilizes the Watchdog Control Time setting in order to detect communication errors to the assigned master. When the slave finds an interruption of an already operational communication, defined by a Watchdog time, then the slave carries out an independent Reset and places the outputs into the secure condition.	
Time (ms)	400	0...2540	Watchdog time in [ms]. The default value depends on the number of slaves attached to the master and their configuration.	SlavePrmData -> wdFact2
User parameter				
Symbolic values	Enabled	Disabled	No symbolic names for the user parameters.	-
		Enabled	The values for the parameters are shown with symbolic names.	-
Length of user parameter (Byte)	3	Device-specific	The length of the user parameters in [bytes]. By default this value is 3 due to the existing reserved values.	-
Defaults	-	-	The button restores the default values of the user parameters.	-

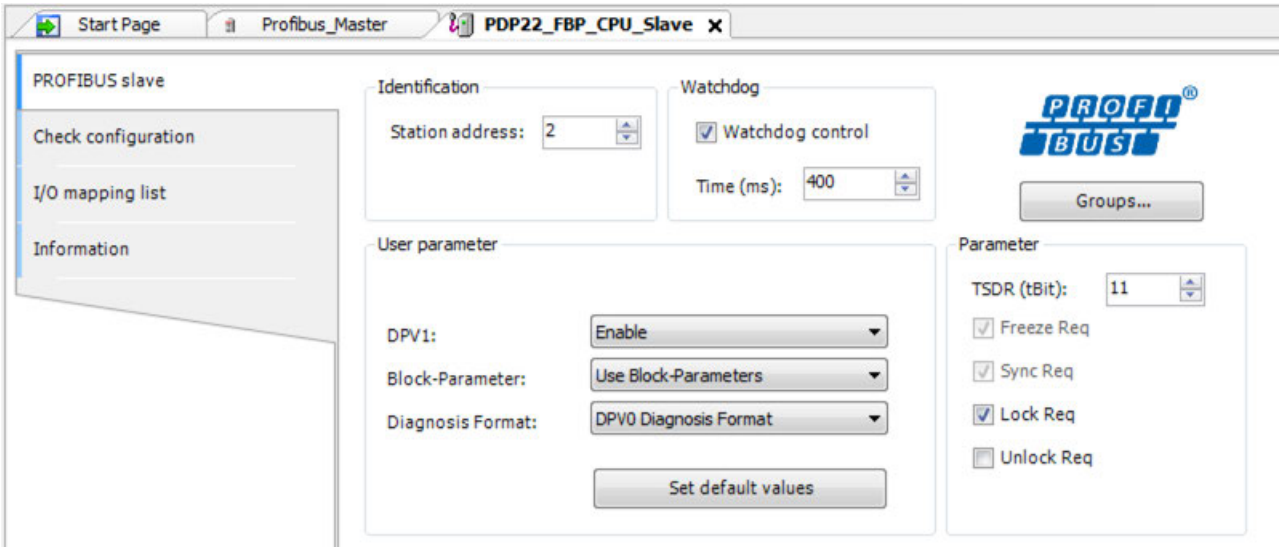
Remark 1:

To display the parameters of this column, enable the option *“Show generic device configuration views”* under *“Tools ➔ Options ➔ Device editor”*.

Configuration of the PROFIBUS DP slaves connected via FBP

A PROFIBUS DP slave can be added by right-clicking on Profibus_Master_x (Profibus_Master) and selecting *“Add object”*.

The slave configuration parameters can be edited in tab *“PROFIBUS slave”*:



All times for the PROFIBUS parameters are given in bit time [tBit]. The bit time is the result of the reciprocal of the transmission rate:

tBit = 1 / transmission rate in [bit/s]

The conversion from milliseconds into a bit time is shown in following formula:

*tBit = Time in [ms] * transmission rate in [bit/s]*

The following parameters are available:

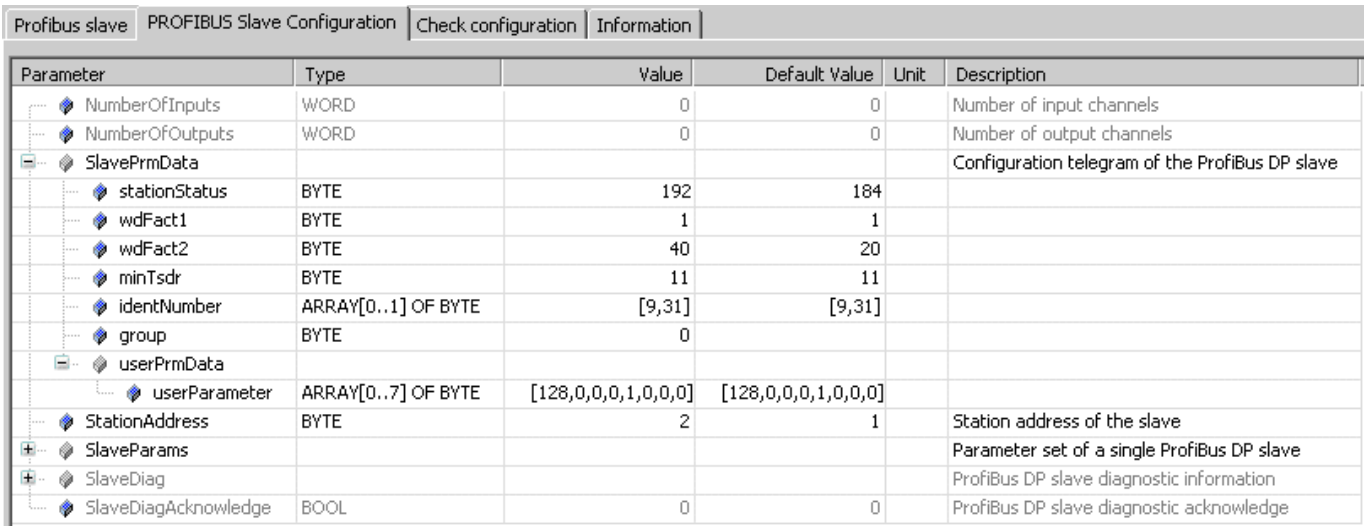
Parameter	Default	Value	Description	Parameter (Remark 1 *Further information on page 5889*)
Groups... Remark 2 *Further information on page 5889*	BUTTON	-	Opens the Group Properties dialog window	Bitmask Slave-PrmData -> group
Identification				
Station address	1	0...126	Station address of the PROFIBUS DP slave device.	StationAddress
Watchdog				
Watchdog control	Enabled	Disabled	The PROFIBUS slave does not utilize the Watchdog Control Time setting.	SlavePrmData -> wdFact1

Parameter	Default	Value	Description	Parameter (Remark 1 ↳ *Further information on page 5889*)
		Enabled	The PROFIBUS slave utilizes the Watchdog Control Time setting in order to detect communication errors to the assigned master. When the slave finds an interruption of an already operational communication, defined by a Watchdog time, then the slave carries out an independent Reset and places the outputs into the secure condition.	
Time (ms)	400	0...2540	Watchdog time in [ms]. The default value depends on the number of slaves attached to the master and their configuration.	SlavePrmData -> wdFact2
User parameter				
DPV1	Enabled	Disabled	DPV1 is disabled.	Item 7 of array SlavePrmData -> userPrmData -> userParameter (enabled = 128, disabled = 0)
		Enabled	DPV1 is enabled.	
Block Parameter	Use Block-Parameters	Use Block-Parameters	Use block parameters.	Item 4 of array SlavePrmData -> userPrmData -> userParameter (enabled = 1, disabled = 0)
		Ignore Block-Parameters	Ignore configured block parameters.	
Diagnosis format	DPV1 Diagnosis Format	DPV0 Diagnosis Format	Use DPV0 diagnosis format.	Item 3 of array SlavePrmData -> userPrmData -> userParameter (enabled = 1, disabled = 0)
		DPV1 Diagnosis Format	Use DPV1 diagnosis format.	
Set default values ...	-	-	The button restores the default values of the user parameters.	-
Parameter				
TSDR (TBit)	11		The TDSR in [tBit] represents the station delay of a responder (time a responder waits before generating the reply frame).	minTSDR

Parameter	Default	Value	Description	Parameter (Remark 1 ↳ *Further information on page 5889*)
Freeze Req	Enabled	Disabled	Freeze request is disabled.	Bit 4 of Slave-PrmData -> stationStatus
		Enabled	Freeze request is enabled.	
Sync Req	Enabled	Disabled	Sync request is disabled.	Bit 5 of Slave-PrmData -> stationStatus
		Enabled	Sync request is enabled.	
Lock Req	Enabled	Disabled	Lock request is disabled.	Bit 7 of Slave-PrmData -> stationStatus
		Enabled	Lock request is enabled.	
Unlock Req	Disabled	Disabled	Unlock request is disabled.	Bit 6 of Slave-PrmData -> stationStatus
		Enabled	Unlock request is enabled.	

Remark 1:

The parameters in this column are shown in tab PROFIBUS slave Configuration which is only visible if the parameter Show generic device configuration views is activated (open the Options dialog with *"Tools ➔ Options ➔ section Device editor"*):



The table shows all configuration parameters which are available for the device.

Remark 2:

Click *[Groups...]* to open the Group Properties dialog window. The relevant group(s) for the slave device can be selected by activating the corresponding item in the dialog window. The selection(s) can be confirmed with *[OK]*. To cancel the selection, use the cross symbol on the right of window title bar.

I/O configuration check

Tab *"Check configuration"* can be used to check the current I/O configuration. The device specific number of available I/Os can be compared with the actually configured I/Os to detect a faulty I/O configuration before downloading the program.

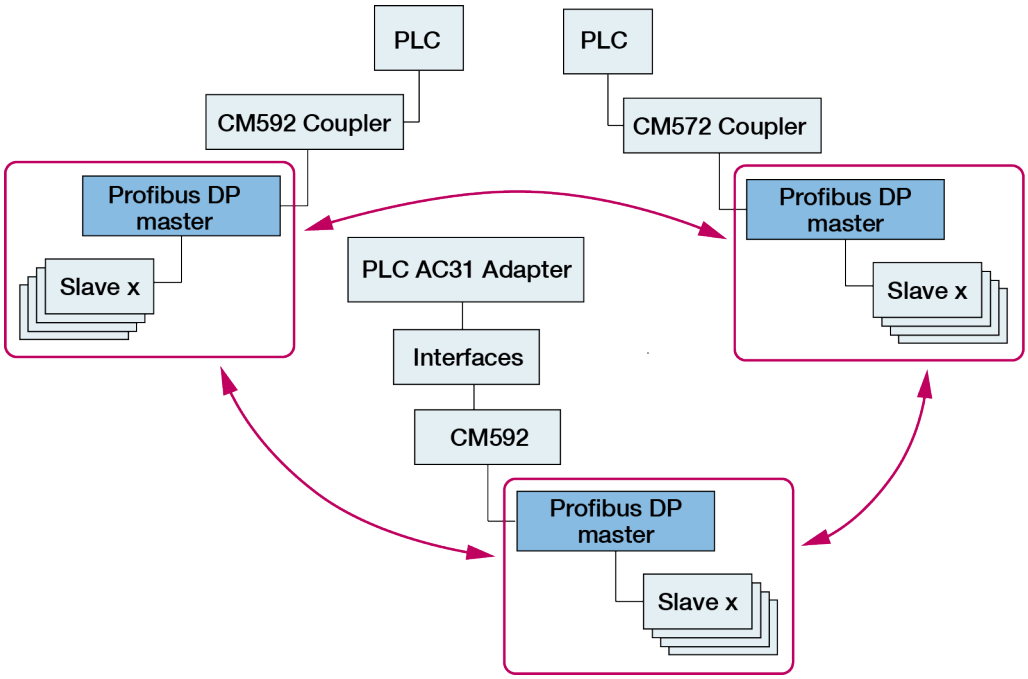
Parameter	Default value	Value	Description
I/O length			
	Device-specific	0...244	Length of the configured input data in [bytes].
	Device-specific	0...244	Length of the configured output data in [bytes].
	Device-specific	0...368	Length of the configured input/output data in [bytes].
Restriction on [device name]			
AI	Device-specific	0...128	Available analog inputs of the device in [words].
AO	Device-specific	0...128	Available analog outputs of the device in [words].
DI	Device-specific	0...32	Available digital inputs of the device in [bytes].
DO	Device-specific	0...32	Available digital outputs of the device [bytes].
Parameter length			
Parameter length	Device-specific	0...244	Parameter length in [bytes].

Changing the target of a device

As of Automation Builder 1.2, the support of Communication Module CM572-DP is discontinued by the manufactorer Hilscher.

In Automation Builder, you can update CM572-DP to CM592-DP. Automation Builder will preserve the protocol specific configuration after the device update.

Alternatively, you can copy the existing PROFIBUS protocol configuration to any new PROFIBUS device, e.g. from CM572-DP to CM592-DP or vice versa. Also the CM592-DP module of the AC31-Adapter is supported.



Update CM572-DP to CM592-DP

To update CM572-DP device to a CM592-DP, proceed as follows:

- Right-click *"CM572-DP"* node in the device tree and select *"Update objects"*.
- From the dialog select the CM592-DP device and select *"Update objects"*.
- Rename the node to CM592-DP.

Automation Builder configuration will be preserved after the device update.

Protocols in PROFIBUS devices

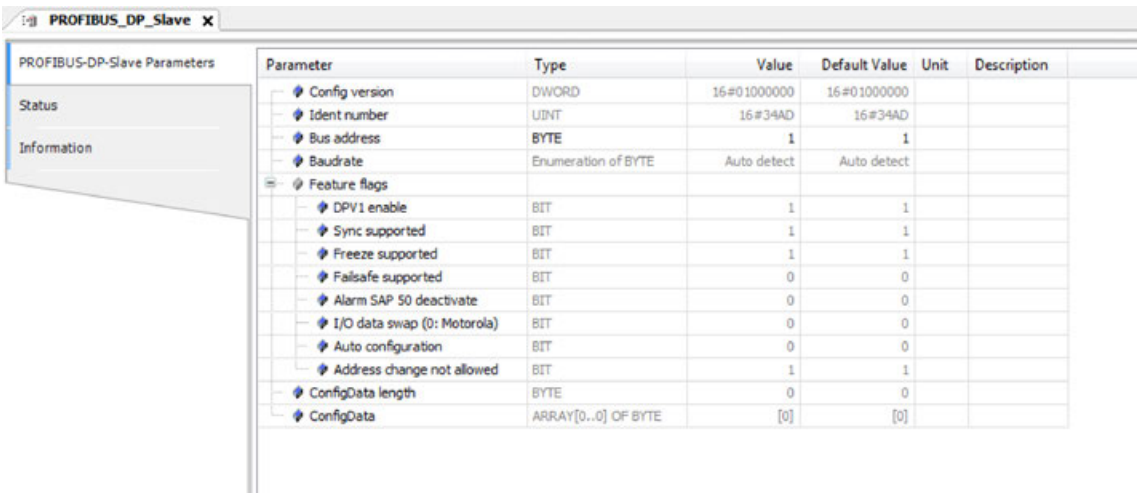
An existing PROFIBUS protocol configuration can be copied to any other PROFIBUS device, e.g. from a CM572-DP device to a CM592-DP device. For this, right-click the device node to be transferred and click copy. Right-click the device node to be changed and click paste.

Automation Builder configuration of CM592-DP is changed.

CM582-DP PROFIBUS DP slave communication module

Configuration of PROFIBUS DP slave

Double-click on *"PROFIBUS_DP_Slave"* to open the PROFIBUS slave configuration in the editor window:



The following parameters can be modified:

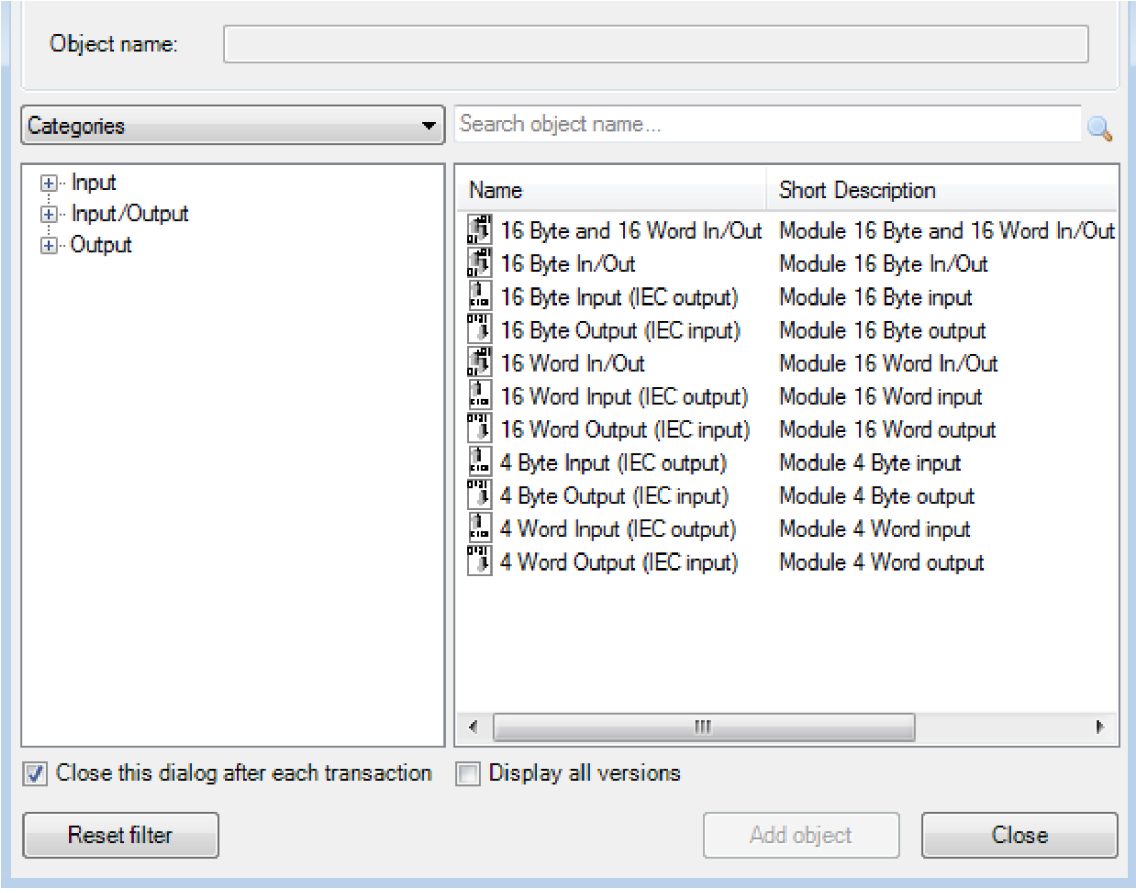
Parameter	Default value	Value	Description
Bus address	1	0...126	The bus address is the individual device address of the slave device on the bus.

Configuration of I/O data objects

To append I/O data, add the desired input / output objects to the Communication Module node.

Right-click the Communication Module node and select *"Add object"*.

Different types of data objects group I/O variables by size and direction. The I/O driver of the PLC firmware copies the amount of data bytes configured by these data objects cyclically. The time which is required for data copying is defined by the parameter *"Min. update time"* ↳ *Further information on page 5883*.



Select the desired I/O objects from the list and click *[Add object]*.

> *To keep basic load of PLC low, only configure as much I/O data objects as actually required. If further I/O variables need to be added later, additional data objects can be inserted.*

Technical details on the device such as the maximum amount of bytes used for I/O data is described in the device specification for ↳ *Chapter 1.6.2.4.8.1 "CM582-DP - PROFIBUS DP slave" on page 4075*.

Double-click an added I/O object node to open the preset configuration. As the I/O objects do not need user configuration all parameters in the *"Parameters"* tab are read-only.

Open the *"I/O Mapping"* tab to configure the mapping configuration for the I/O object.

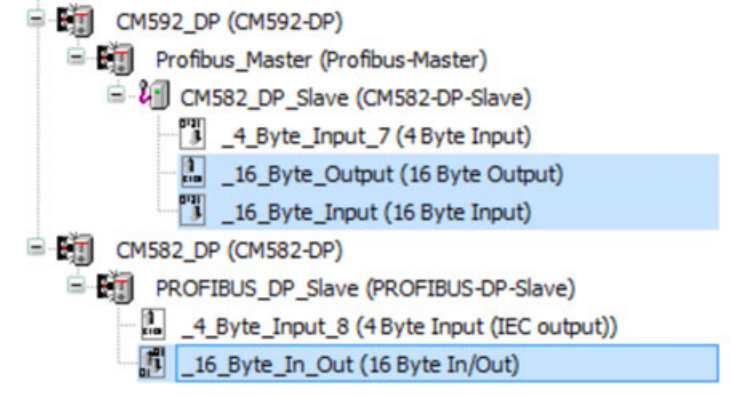
Possible inconsistency

On using CM582-DP slave device configured with modules types combining input and output data the following situation may happen:

Example

CM582-DP Communication Module configuration uses module type 16 Byte In/Out.

The device representation assigned to CM592-DP master uses module types 16 Byte Output and 16 Byte Input at the same place instead.



This mismatch will not be detected; neither by Automation Builder nor by PROFIBUS master and slave.

However, the communication will run stable and I/O data exchange is executed successfully.

Reason:

AC500 defines modules combining input and output directions to be split to two separated module configurations internally with output direction first.

Thus in AC500 the PROFIBUS configuration data for one module of type 16 Byte In/Out looks the same as for the combination of module types 16 Byte Output and 16 Byte Input.

Mapping of the I/Os

Double-click on the desired I/O data object in the device tree to show current I/O mapping connected to this data object.

See chapter Symbolic Names for Variables, Inputs and Outputs for further details on mapping inputs and outputs ↬ *Chapter 1.6.5.2.2.1.2 "Symbolic names for variables, inputs and outputs" on page 5815*.

CM574-RS - Programmable serial communication module

Configuration of the CM574-RS in the AC500 CPU project

To append a Communication Module, add the Communication Module to the *"Extension_Bus"* node.

- Right-click the desired slot and select *"Add object"*.
- Select the Communication Module from the list and click *[Replace object]*.

- Double-click on CM574_RS (CM574-RS) to open the CM574-RS configuration.

The following parameters are available:

Parameter	Default value	Value	Description
Run config fault	No	No	The user program is not started in case of a configuration error.
		Yes	The user program is started independent of a faulty configuration of the CM574.
Max. wait run	3000	0...120000	Max wait time for valid inputs.
Min. update time	10	10...2000	Minimum update time of inputs and outputs in [ms].
Enable debug	On	Off	The user program of the CPU only runs if the communication module is in RUN mode. The user program of the communication module only runs when the CPU is in RUN mode. Debug commands on the communication module are not permitted.
		On	The user program of the CPU runs independent of the communication module status, i.e., all debug commands are permitted on the communication module.
Watchdog	400	400..60000	Watchdog in [ms]

Basically 2 different modes can be configured at the sub modules of the CM574-RS communication module. Either cyclic data exchange (default setting) or remotely controlled COM port usage is available.

Using cyclic data exchange

The submodules Channel 1 and Channel 2 can be used to transfer I/O data cyclically between the processor module and the CM574-RS communication module. Input and output modules can be attached to these submodules. The procedure corresponds to the one of the *Chapter 1.6.4.1.1.3 “Processing of inputs and outputs in the multitasking system” on page 5399*.

Per channel, a maximum of 500 Bytes of I/O data can be exchanged.

A maximum of 32 sub modules can be attached. There is no automatic monitoring of the 500 bytes being exceeded. For this reason, it needs to be checked whether the last module exceeds the highest permissible input or output address. These addresses are:

Channel	Communication Module inputs in slot x			Communication Module outputs in slot x		
	%IBx.y	%IWx.y	%IDx.y	%QBx.y	%QWx.y	%QDx.y
Channel 1	%IBx.499	%IWx.249	%IDx.124	%QBx.499	%QWx.249	%QDx.124
Channel 2	%IBx.999	%IWx.499	%IDx.249	%QBx.999	%QWx.499	%QDx.249

In the project of the CM574-RS, the same I/O modules have to be configured for data exchange with the processor module.

Using COM protocols

In the CM574-RS project the corresponding COM port which should be remotely controlled by the AC500 CPU project must be set to COMx - Shared. At least an empty boot project with this setting must be deployed on the CM574-RS communication module.

If the cyclic data exchange is unused or not required for the project the corresponding channel can be switched to a COM protocol that is configured at a COM interface of the CM574-RS communication module and remotely controlled by the AC500 CPU. See Remote Control of COM ports of the CM571-RS communication module for further information ↳ *Chapter 1.6.5.2.6.3.3 "-Remote control of COM ports of the CM574-RS communication module" on page 5905*.

The protocol selection is done in the same way as it is known for the local COM interfaces ↳ *Chapter 1.6.5.2.11.1 "Setting up the protocol of a serial interface" on page 6098*.

Only the protocol CS31, Modbus and ASCII are allowed to be used remotely.

Shared Modbus Modus

Overview

CM547 as an additional CPU

Protocols of the serial interfaces of the CM574-RS

- Online Access
- CS31
- ASCII
- Modbus RTU
- Multi
- SysLibCom

View the different protocols here, ↳ *Chapter 1.6.4.2.6.2 "Protocols of the serial interfaces of the CM574-RS" on page 5594*

Communication Mode

The cyclic and acyclic data can be adjusted in the function blocks.

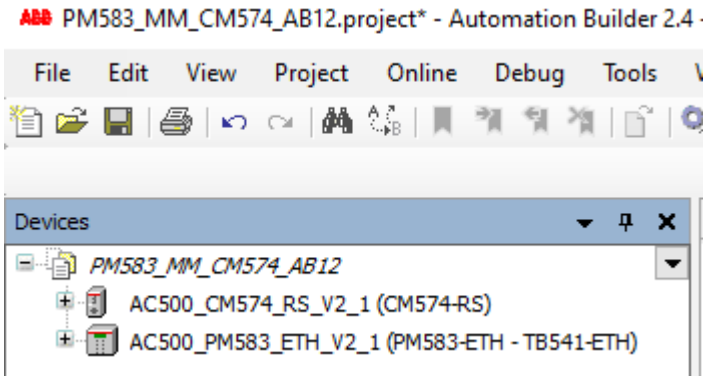
Example project

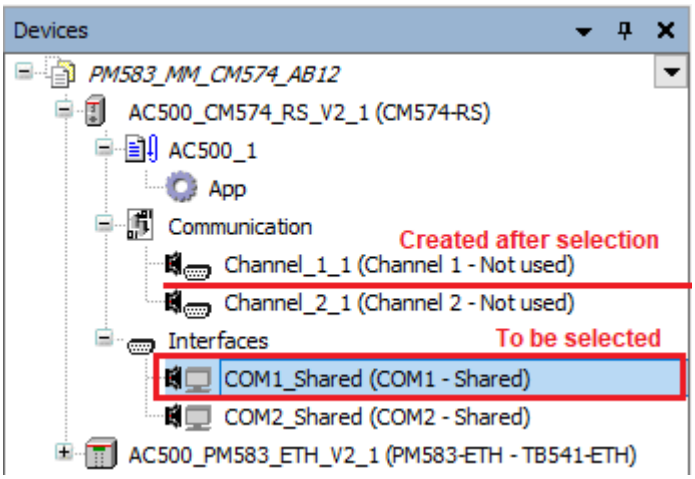
In the following, the configuration of the Modbus communication between a AC500 CPU and the CM574-RS via a common channel is described using an example project.

- Configuration protocols in CM574
  - CPU PM583
    CM574-RS mounted in the first slot
- Wiring
  - CM574-RS COM1 - CPU PM578-ETH COM1
- Functionality
  - CM574-RS is a Modbus Server. The COM1 of a CPU is a Modbus Client.
- Purpose
  - Direct access from the CPU program to the Modbus Clients wired to CM574-RS

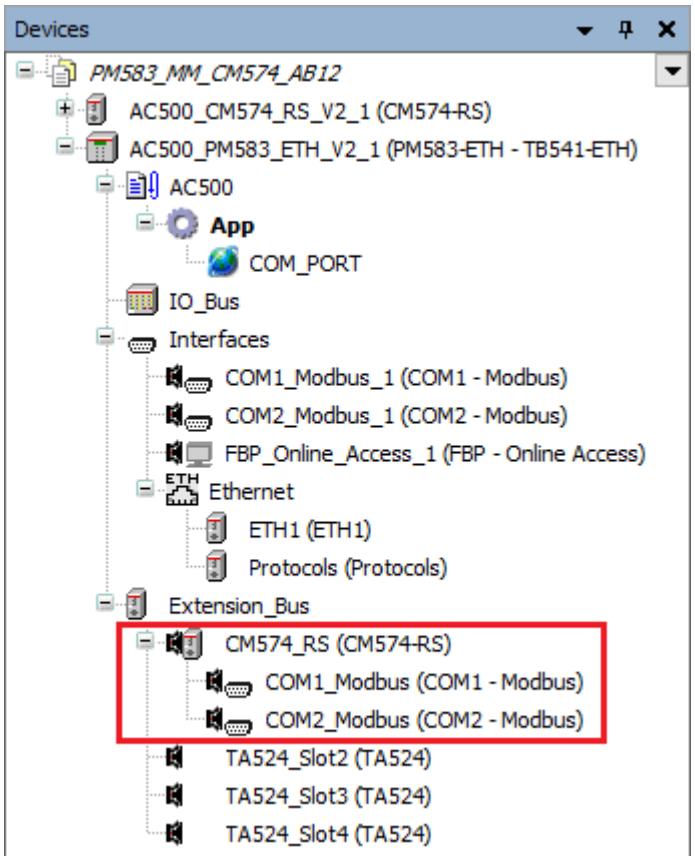
The project contains two sub-projects, one for the communication module CM574-RS and another one for the CPU.



1. Configure the settings in the CM574-RS project. See *Chapter 1.6.5.2.6.3.1 "Configuration of the CM574-RS in the AC500 CPU project" on page 5896*.



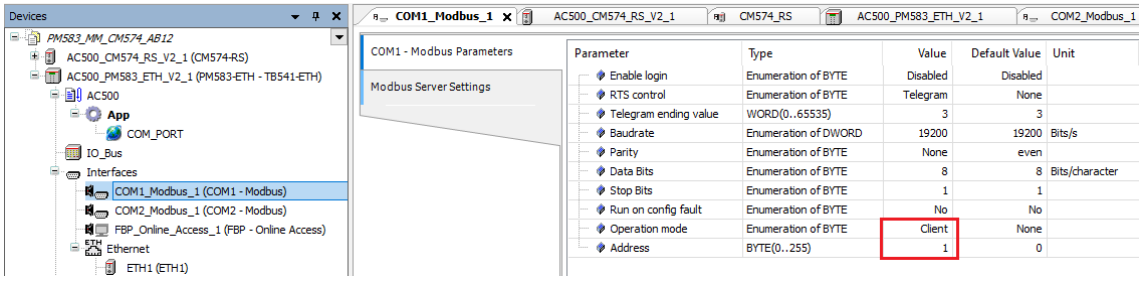
2. Configure the settings in the CPU project.



3. Configure the COM 1 port as Modbus Client. *Chapter 1.6.5.2.6.3.3 "-Remote control of COM ports of the CM574-RS communication module" on page 5905*
4. In the *"Device"* interface double-click on the *"COM1_Modbus_1 "*port.
   ⇨ The tab with the adjustable *"COM1 - Modbus Parameters"* opens on the right.

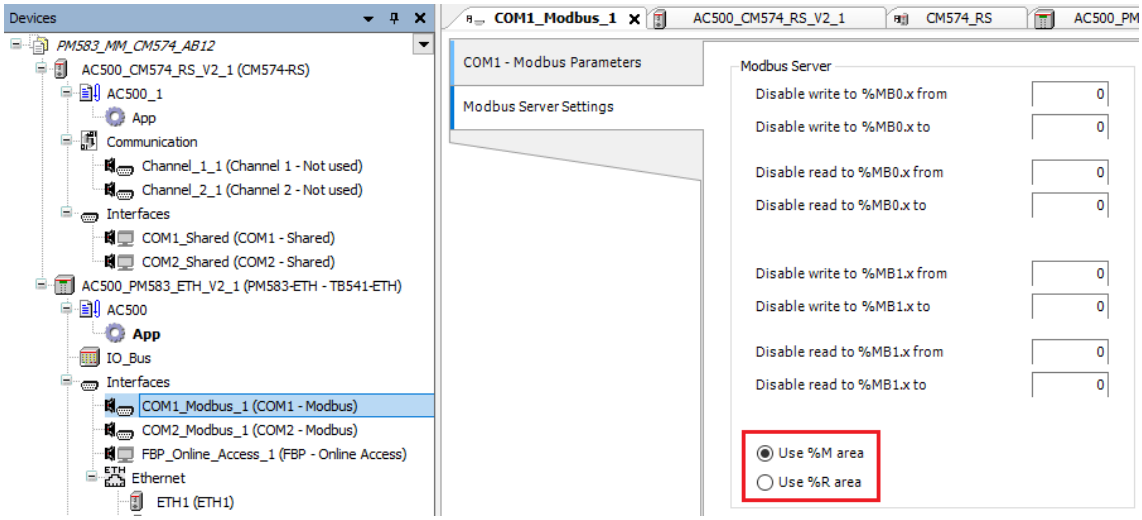
5. Double-click on the *"Value"* in the *"Operation mode"* to change the setting to *"Client"*.

   ⇨



6. Click to change to the *"Modbus Server Settings"*.

7. Compare the settings with the following figure, if necessary change the settings.



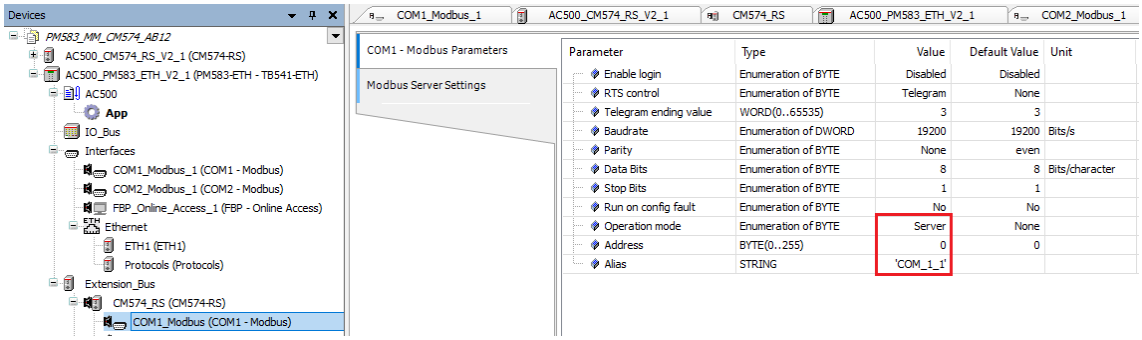
8. Set the CM574-RS as Modbus server in the CPU project.

9. In the *"Device"* interface double-click on the *"COM1_Modbus"* port.

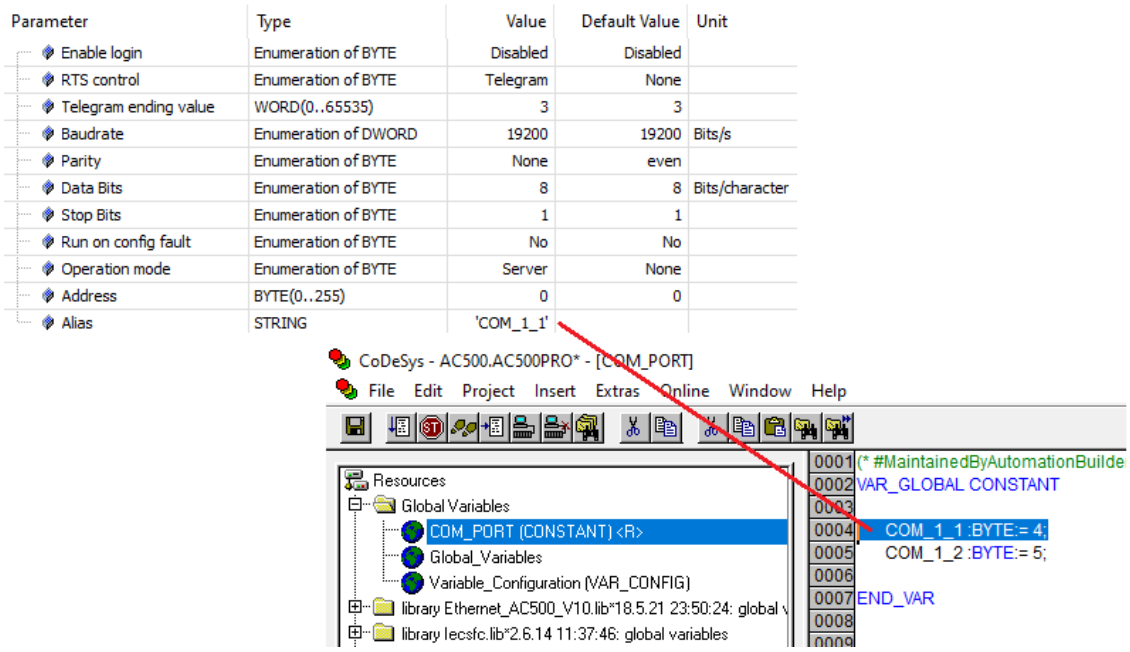
   ⇨ The tab with the adjustable *"COM1 - Modbus Parameters"* opens on the right.

10. Double-click on the *“Value”* in the *“Operation mode”* to change the setting to *“Server”*.

⇨



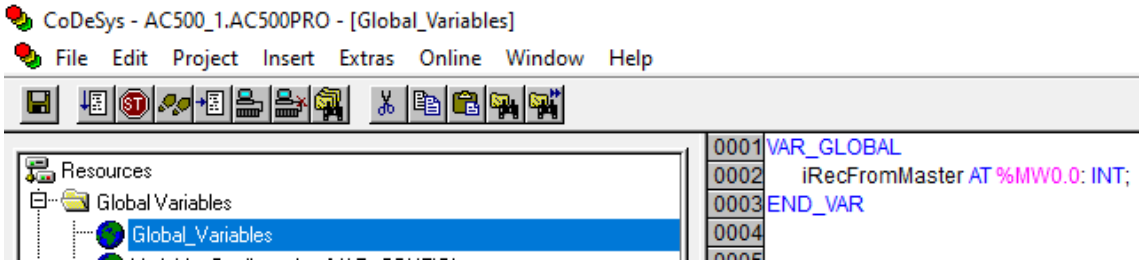
⇨ The *“COM_PORT”* for RCM574-RS COM 1 are now created.



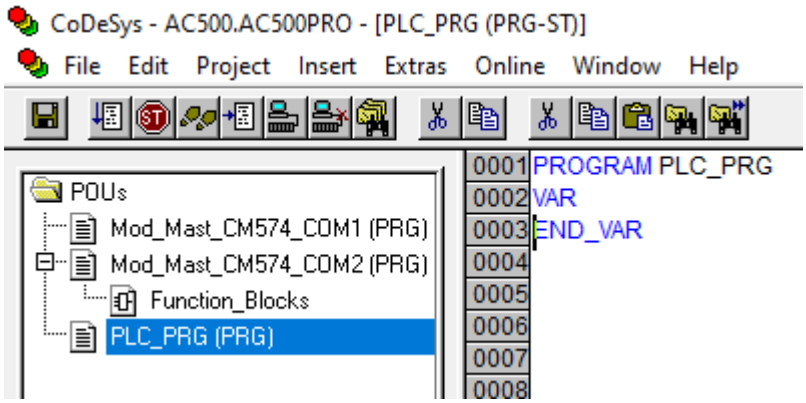
CPU project

- No program in the CM574-RS necessary
- The Server FB for the CM574-RS COM 1 is contained in the CPU program
- The COM number is given by the “alias” variable
- SLAVE=1
  communication with the client addressed with 1
- FCT=15
  master writes (sends) n words
- ADDR=0
  data from master will be stored in the slave from address %MW0.0
- NB=1 1
  word will be sent
- DATA=
  address of begin the data to be sent

Indication of the received data by client 1 in the CPU project.



In the CM574-RS project no programm is available.



Configuration of CM574-RS

A project for the serial communication module CM574-RS is created in the same way as an AC500 CPU project. See *Chapter 1.6.5.1.1.1 “Creating a new project ” on page 5758* for further details.

All interfaces of the Communication Module are pre-assigned with default values.

Parameterization

Double-click on *“CPU_parameters”* (CPU parameters) to open the CPU parameters configuration in the editor window.

Parameter	Default value	Value	Description
Error LED	On	On	The Error LED lights up in case of non-acknowledged errors in the diagnosis system.
		Off	The Error LED does not automatically light up in case of non-acknowledged error messages.
Flexible configuration	None	None	No flexible configuration is used.
		Flash	FlexConf.ini is loaded from Flash.
		User program	FlexConf.ini is loaded by user program.

Parameter	Default value	Value	Description
		FTP file	FlexConf.ini is loaded from FTP.
Flexible configuration timeout	1000	0...65535	FlexConf.ini timeout in seconds [s].
Free wheeling pause	10	0...255	Free wheeling pause.

If the Error LED should be activated by the user program, the parameter has to be set to "Off".

The library "SysIntExt_AC500_V10.lib" contains the function block LED_SET for controlling the LEDs of the CM574-RS. See description of the function block LED_SET of the Chapter 1.5.4.20 “Extended internal system library” on page 1626.

Configuration of the cyclic data exchange between CM574-RS and the processor module

Configuration of the cyclic data exchange of the CM574-RS with the AC500 CPU via inputs/ outputs is carried out in the entry CPU Communication.

In the project of the CM574-RS the same I/O channels have to be configured for data exchange with the AC500-CPU as they are configured in the AC500 CPU project.

The data exchange is cyclically but might be asynchronous. It cannot be ensured that all signals are present with chronological synchronism on the communication partners. This particularly applies in case of several tasks with different cycle times.

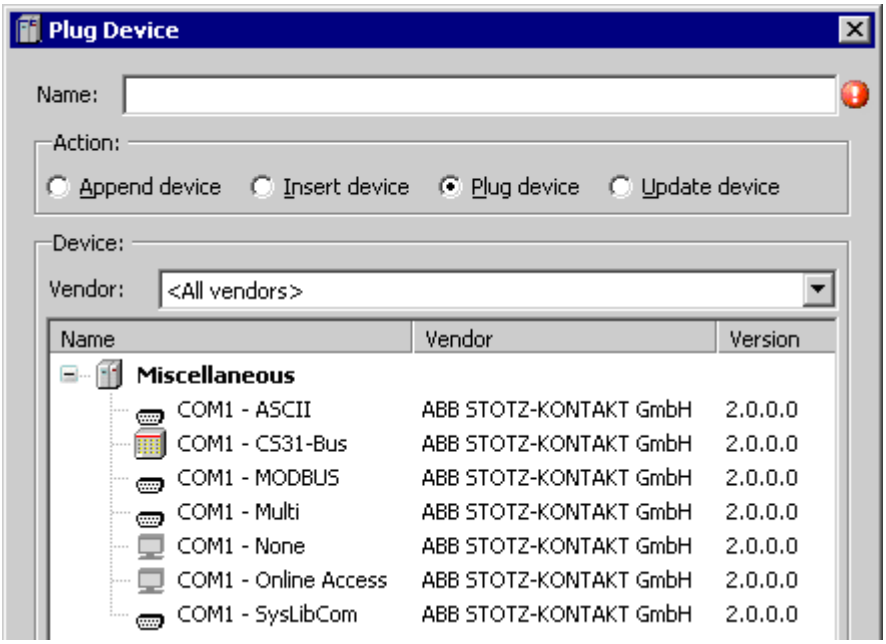
Configuration of the serial interfaces of the CM574-RS

If a COM port should be remotely controlled by the AC500 CPU project it must be set to COMx shared. At least an empty boot project with this setting must be deployed on the CM574-RS Communication Module.

In the standard configuration, the Serial Interfaces COM1 and COM2 of the CM574-RS are pre-assigned with the Online access protocol. Thus, online access from CODESYS can occur via one of the two interfaces with the serial driver Serial (RS-232) or ABB RS232 AC.

To set another protocol, proceed as follows:

Right-click the respective interface and select *“Plug Device”*.



Select the desired protocol and click *[OK]*.

The protocols have the same properties as for the serial interfaces of the AC500 CPUs PM57x, PM58x and PM59x.

The current interface settings can be displayed with the PLC browser command 'com settings'.

-Remote control of COM ports of the CM574-RS communication module

> *In order to use remote COM protocols for a CM574-RS serial port, the corresponding COM must be set to COMx- Shared within the CM574-RS CPU project.*

CM574-RS Communication Module's COM ports can be configured and used directly in the CPU project as if they were local COM interfaces. Each communication channel can be replaced by a COM port which is linked as follows:

- Channel 1 --> COM1 on CM574-RS Communication Module
- Channel 2 --> COM2 on CM574-RS Communication Module

The following protocols are available:

- ASCII
- Modbus RTU
- CS31 bus

The protocol selection as well as the configuration of the available parameters is done in the same way as it is known for a local COM interface. See Setting Up the Protocol of a Serial Interface *Chapter 1.6.5.2.11.1 “Setting up the protocol of a serial interface” on page 6098*.

Shared ports in the CM574-RS Project

In any case the COM port which should be remotely controlled must be "shared" by selecting the port to COMx-Shared within the CM574-RS Communication Module project. This option automatically sets the CPU Communication Module for the corresponding communication channel to Not Used. The ability to program the CM574-RS Communication Module is not affected.

CAUTION!
It is not possible to combine cyclic DPRAM-I/O data exchange with remote protocol functionality.

CS31 bus I/O configuration and access

The CS31 bus is configured as described for the local interfaces ↳ *Chapter 1.6.5.2.10.1 "Configuration of CS31 bus master" on page 6078*. The I/O mapping is done in exact the same way so that it is possible to access the CS31 bus I/Os locally in the project of the AC500 CPU.

When using the remotely controlled CS31 bus in combination with a CM574-RS Communication Module the I/O area size for each port is restricted to 500 bytes input and 500 bytes output data (for local interfaces 1000 bytes in each direction are available). Automation Builder automatically calculates the configured I/O sizes and warns as soon as the available size has been reached.

Alias parameter

The protocols ASCII ↳ *Chapter 1.6.5.2.11.3 "Setting COMx - ASCII" on page 6100* and Modbus ↳ *Chapter 1.6.5.2.11.4 "Setting COMx - Modbus" on page 6108* work with function blocks which require the target COM port number as an input. The COM port number of the remote controlled port is an internal identifier and might differ because it depends on the existing remote COM interfaces of the project. To address a remote COM interface the parameter Alias which represents the corresponding COM interface is used:

Parameter	Default	Value	Description
Alias	'COM_[x]_[y]'	STRING(80)	The alias of the COM port which represents the unique identifier of the COM port. By default the alias is generated by Automation Builder and consists of the slot number of the Communication Module (x) and the COM port's index at the Communication Module (y).

CAUTION!
It must be ensured that the alias string represents an IEC-conform variable name. Otherwise it will not be possible to compile the IEC project.

Automation Builder automatically adds a new section RemoteInterface to the Global Variables of CODESYS V2.3.9.x project after (re)creating the configuration data. This section contains the generated aliases as constant variables which can be used to address each remote COM interface at the existing function blocks of the protocols (COM_SEND, COM_REC, COM_MOD_MAST).

CM574-RCOM - RCOM/RCOM+ Communication module

Module parameters

The RCOM/RCOM+ Communication Module CM574-RCOM provides an implementation of the serial remote protocol RCOM/RCOM+ in master and slave mode.

1. In the device tree under *"Extension_Bus"*, right-click *"Slot_1"* or *"Slot_2"* node and select *[Add object]*. The slot corresponds to the slot of the Terminal Base.
2. Select *"CM574-RCOM"* from the list and click *[Replace object]*.
3. In the device tree, double-click the *"CM574-RCOM"* node.
   ⇨ The following parameters are available:

Parameter	Default value	Value	Description
Run on config fault	No	No	In case of configuration fault the user program will not be launched.
		Yes	The user program will be also launched in case of configuration error on the I/O Bus.
Min. update time	10	10...20000	Minimum update time of the in- and outputs in [ms].
Watchdog	400	400...60000	Watchdog time [ms].

For each interface of the Communication Module, a module is added in the project structure.

- RCOM (RCOM/RCOM+): represents the RCOM protocol interface ↳ *Chapter 1.6.5.2.6.4.3 "Configuration of the RCOM protocol interface" on page 5908*.
- Console (Console): represents the debugging terminal interface (operator terminal) ↳ *Chapter 1.6.5.2.6.4.2 "Configuration of the operator terminal" on page 5907*.

Configuration of the operator terminal

▷ In the device tree, double-click the *"Console (Console)"* node.
   ⇨ The following parameters are available for debugging the terminal interface (operator terminal):

Parameter	Default value	Value	Description
RTS control	None	None	RTS control is not enabled.
Transmisson rate	19200	19200	The transmission rate of the Operator terminal is 19200 Baud/sec (read-only).
Parity	None	None	The operator console COM port does not use a parity check (read-only).
Data Bits	8	8	The number of data bits is 8 (read-only).
Stop Bits	1	1	One stop bit is used (read-only).
Debug level	No messages	No messages	Only error messages are printed on the terminal.
		Level 1	Brief messages of protocol events like data transmissions are printed.
		Level 2	Detailed information of protocol events is printed.

Configuration of the RCOM protocol interface

▷ In the device tree, double-click the *“RCOM (RCOM/RCOM+)”* node.

⇨ The following parameters are available:

Parameter	Default value	Value	Description
Operation mode	RCOM+ master	RCOM+ Master	The Communication Module works as a master device in an RCOM+ network.
		RCOM+ Slave	The Communication Module works as a slave device in an RCOM+ network.
		RCOM Master	The Communication Module works as a master device in an RCOM network.
		RCOM Slave	The Communication Module works as a slave device in an RCOM network.
Address (NODE)	0	0...254	Address (node number) of the Communication Module.
Transmission rate	9600 baud/s	300 600 1200 2400 4600 9600 19200	Transmission rate in Baud per second.
Parity	None	None	No parity check is used for telegram transmission.
		Odd	Odd parity check is used for telegram transmission.
		Even	Even parity check is used for telegram transmission.
CDLY	0	0	Value for carrier delay. The value will be converted internally into [ms] according to the specified transmission rate.
Character timeout	30	30	Value for character timeout. The value is internally converted into [ms] according to the specified transmission rate.
Turnaround time	4000	4000	Turnaround time to calculate timeout [ms].
Type of modem	Direct connection	Direct connection	Setting for direct connections.
		Fixed line modem	Setting for usage of fixed line modems.
		Installed RS-485 interface	Settings for usage of Hayes compatible dial-up modems. This requires the configuration of a telephone list as described below (module Telephone number).
		Installed RS-485 interface	Setting for installed RS-485 interface.

Parameter	Default value	Value	Description
		Modem 23WT90 half duplex	Settings for usage of a 23WT90 modem in half duplex operation mode.
Retransmissions	2	0...255	Number of telegram retransmissions after a reply was not received from the corresponding slave.
Max. number of polls	3	0...255	Number of event polls that are sent by the master during one event polling phase.
Number of preambles	1	1...255	Number of preamble bytes.
Number of postambles	1	1...255	Number of postamble bytes. This value must be equal to the number of preambles. If the values are different, the Communication Module automatically sets both parameters to the configured number of preambles.

The values of the parameters TLS (line stab time) and CDLY (carrier delay) are dependent on the length of the line and the type of modems used and might vary from system to system.

Parameter TLS always must be higher than parameter CDLY.

If a dial-up connection is used for the RCOM network, proceed with dial-up configuration. If no dial-up configuration is used, skip this section.

Dial-up configuration

In order to use dial-up connections, a modem module has to be appended to the RCOM/ RCOM+ Communication Module in the project structure.

ABB recommends HSM Eco modems for usage with CM574-RCOM Communication Modules.

1. Right-click the *"RCOM (RCOM/RCOM+)"* node and select *"Add object"*.
2. Select *"Dial-up modem"* and click *[Add object]*.
3. In the device tree, double-click the new *"Dial-up modem object"*. The module contains all commands required for controlling the modem. It is preconfigured for the HSM Eco modem:

Parameter	Default value	Value	Description
Modem init	ATZ^M~~ATI4^M~	String	Hayes compatible AT command to initialize connected modem.
Dial prefix 1...6	ATDT	String	Hayes compatible AT command to dial a number. 6 different dial prefixes can be configured.
Dial suffix	^M	String	Hayes compatible AT command string that is appended to the dial string.
Connect answer	CONNECT	String	Message of the connected modem, if connection is established.

Parameter	Default value	Value	Description
Modem ring	RING	String	Message of the connected modem, if incoming call is registered.
No carrier	NO CARRIER	String	String Message of the connected modem, if no carrier is detected.
Command mode	~~+++~~	String	Hayes compatible AT command to switch modem to command mode.
Modem answer	ATA^M	String	Hayes compatible AT command to answer incoming call.
Modem hangup	ATA^M~~~~~	String	Hayes compatible AT command to hang up (terminate) an existing connection.
Max ring time	70	0...255	Maximum time [s] until a call is cancelled.
Max number of calls	3	0...255	Maximum number of calls executed to establish a connection to a communication partner.
Call delay	2	0...255	Delay time [s] between two calls.
Hangup time	30	0...255	Time until a hang up process is considered as completed.

After configuring the modem, a list of telephone numbers (phone book) has to be created for the nodes of the RCOM network. This is done by adding new sub entries to the Dial-up modem entry.

1. In the device tree, right-click the *“Dial_up_modem (Dial-up modem)”* node and select *“Add object”*. Select *“Telephone number”* and click *[Add object]*.
2. In the device tree, double-click the *“Telephone_number”* node to open the telephone number parameters.

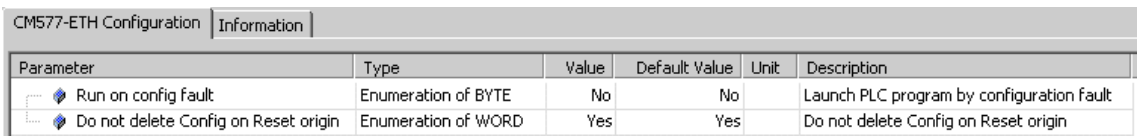
   ⇨ The following parameters are available:

Parameter	Default value	Value	Description
Dial prefix number	1	1...6	Identifier for the corresponding prefix. Prefixes can be configured under module "Dial-up modem" as described above.
Telephone number	-	Valid telephone number	Telephone number as a string.

CM597-ETH

Parameterization of the external communication module CM597-ETH

Double-click the *“CM597_ETH”* node:



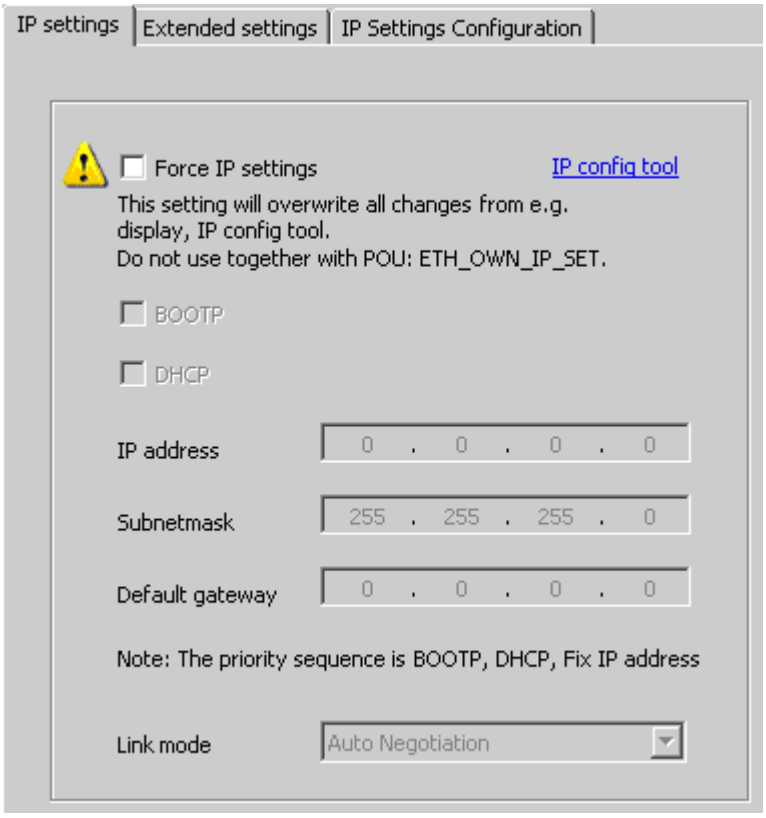
The following parameters are available:

Parameter	Default value	Value	Description
Run on config fault	No	No	In case of a configuration error, the user program is not started.
		Yes	The user program is started independent of a faulty configuration of the Internal Ethernet Communication Module.
Do not delete Config on Reset origin	0	0	The Ethernet configuration is deleted after Reset origin.
		1	The Ethernet configuration (e.g. IP address) is still available after Reset origin.

Configuration of the external communication module CM597-ETH (IP data)

The IP data are used with highest priority. Existing settings done by the display or any other method will be overwritten.

Double-click the *"IP_Settings"* node to open the IP settings in the editor window:

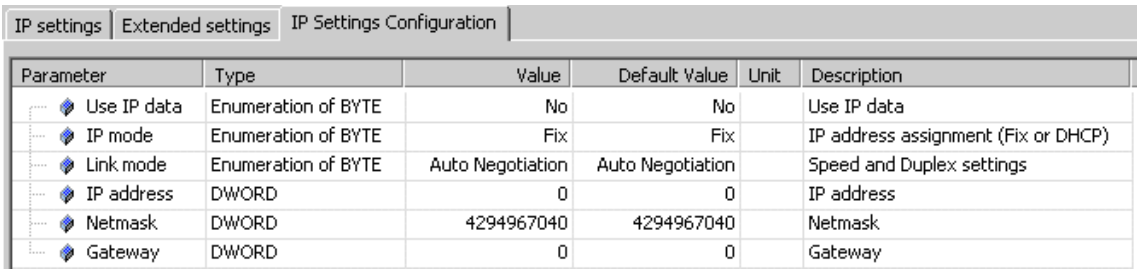


The following parameters are available:

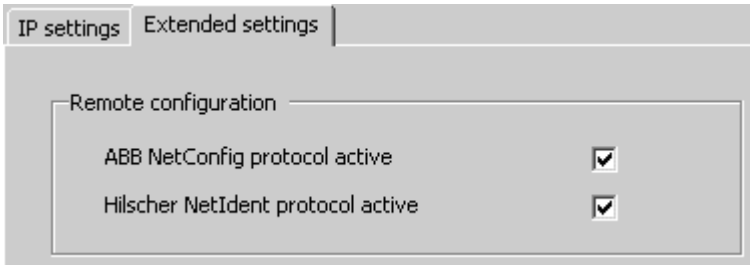
Parameter	Default	Value	Description	Parameter (Remark 1 ↳ *Further information on page 5911*)
Force IP settings	Enabled	Disabled	The IP data is not used. The device must be configured by another means of settings the IP data.	Use IP data
		Enabled	The IP data set in this editor is used for the device.	
DHCP	Disabled	Disabled	The DHCP client services are disabled. A static IP address must be used.	IP mode (+ DHCP)
		Enabled	The DHCP client services are enabled. The IP address of the device will be set by a DHCP server in the network.	
IP address	0.0.0.0	Valid IP address	IP address of the device.	IP address
Subnet-mask	255.255.255.0	Valid subnet mask	Subnet mask for the device.	Netmask
Default gateway	0.0.0.0	Valid gateway address	Default gateway address for the device.	Gateway
Link mode	Auto negotiation	Auto negotiation	The link mode will be detected automatically.	Link mode
		10 Mbit Half-Duplex	The link mode is statically set to 10 Mbit half-duplex.	
		10 Mbit Full-Duplex	The link mode is statically set to 10 Mbit full-duplex.	
		100 Mbit Half-Duplex	The link mode is statically set to 100 Mbit half-duplex.	
		100 Mbit Full-Duplex	The link mode is statically set to 100 Mbit full-duplex.	

Remark 1: Generic Device Configuration View Parameters

Tab IP Settings Configuration shows a list of all available parameters which is only visible if parameter 'Show generic device configuration views' is activated (in the menu click *“Tools ➔ Options ➔ section 'Device editor'”*).



Configuration of the external communication module CM597-ETH (Extended settings)



The following parameters are available:

Parameter	Default	Value	Description
Remote configuration			
ABB NetConfig protocol active	Enabled	Disabled	ABB NetConfig protocol is disabled. IP Config Tool is not supported in this case.
		Enabled	ABBNetConfig protocol is enabled. IP Config Tool can be used to configure the device.
Hilscher NetIdent protocol active	Enabled	Disabled	The Hilscher NetIdent protocol is disabled. Hilscher IP Config Tool is not supported in this case.
		Enabled	The Hilscher NetIdent protocol is enabled. Hilscher IP Config Tool can be used to configure the IP of the device temporarily.

ABB NetConfig protocol is more secure than Hilscher NetIdent protocol. It is recommended to disable the Hilscher NetIdent protocol if not needed.

CANopen

CM598-CN - CANopen master communication module

CM598-CN - CANopen manager communication module

The configuration of the CANopen field bus has to be done in the following steps:

- Parameterization of the AC500 Communication Module Bus Interface
- Parameterization of the CAN bus

Optionally the following steps are required to complete the configuration. These steps depend on the desired functionality:

- Configuration of the CAN2A
- Configuration of the CANopen Manager
- Configuration of the CANopen Slaves

Parameterization of CM598-CN

Presetting

– *Click menu “Tools ➔ Options ” and select “Device editor” in the Options window.*
– *Enable first checkbox “Show generic device configuration views” and click [OK].*

To append a Communication Module, add the Communication Module to the *“Extension_Bus”* node.

- Right-click the desired slot and select *“Add object”*.
- Select the Communication Module from the list and click *[Replace object]*.

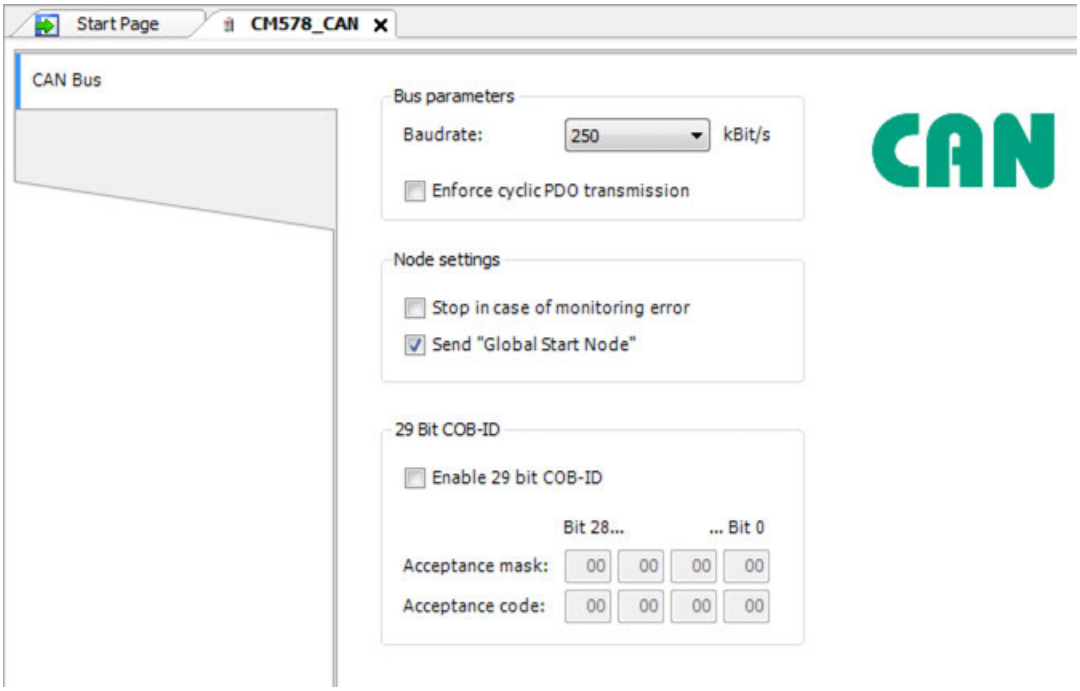
- Double-click on CM598_CAN to open the CM598-CAN configuration in the editor window.

The following parameters are available:

Parameter	Default value	Value	Description
Run on config fault	No	No	In case of a configuration error, the user program is not started.
		Yes	The user program is started independent of a faulty configuration of the CANopen communication module.
Min update time	10	0...20000	Minimum update time of inputs and outputs in [ms].

Parameter	Default value	Value	Description
CANopen Sync mode	Sync Bus only	Sync Bus only	The CANopen Manager sends Sync messages (if enabled) to CAN bus only. The properties of the sync message are configured in the CANopen Manger parameters.
		Sync Bus and Task	CANopen Manager sends Sync messages to CAN bus and triggers IEC Task. The associated task has to be added manually in the task configuration. If there is any problem with CANopen Sync, check the following points in configuration: 1. CANopen Sync mode has to be set to Sync Bus and Task. 2. Sync Message has to be enabled. 3. A task of type "triggered by external event" has to be configured. The external event has to be "Ext_CouplerX_InputAny". 4. PDO transmission type has to be "cyclic synchronous".

The tab *CAN Bus* contains the basic CAN bus parameters:



Parameter	Default value	Value	Description
Bus Parameters			
Transmission rate	250 kBit/s	10 kBit/s 20 kBit/s 50 kBit/s 100 kBit/s 125 kBit/s 250 kBit/s 500 kBit/s 800 kBit/s 1000 kBit/s	Transmission speed in [kBit/s]
Node settings			
Stop in case of monitoring error	Disabled	Disabled	The manager does not stop if a monitoring error (Node Guard or Heartbeat Error) appears. This function defines the behavior of the manager if the communication is interrupted to at least one node. If this function is enabled, the manager will also stop the communication to all further nodes which were still responding and active. If this function is disabled, a lost communication to one node has no influence on the communication of the still present nodes. For all the error affected nodes the master remains in the state to try the reestablishment of the communication again.
		Enabled	
Send "Global Start Node"	Enabled	Disabled	No "Global Start Node" message is sent after configuring the nodes.
		Enabled	After the manager started all nodes configured individually first, it sends a "Global Start Node" afterwards, in order to synchronize all nodes again.
29 Bit COB ID			
Enable 29 bit COB-ID	Disabled	Disabled	The receive filter of CAN2.0 B protocol is disabled. The 29-bit COB-ID is disabled. An 11-bit COB-ID is used.
		Enabled	Enable this option in order to receive CAN2.0 B frames when using CAN 2.0 B protocol. The 29-bit COB-ID is enabled.

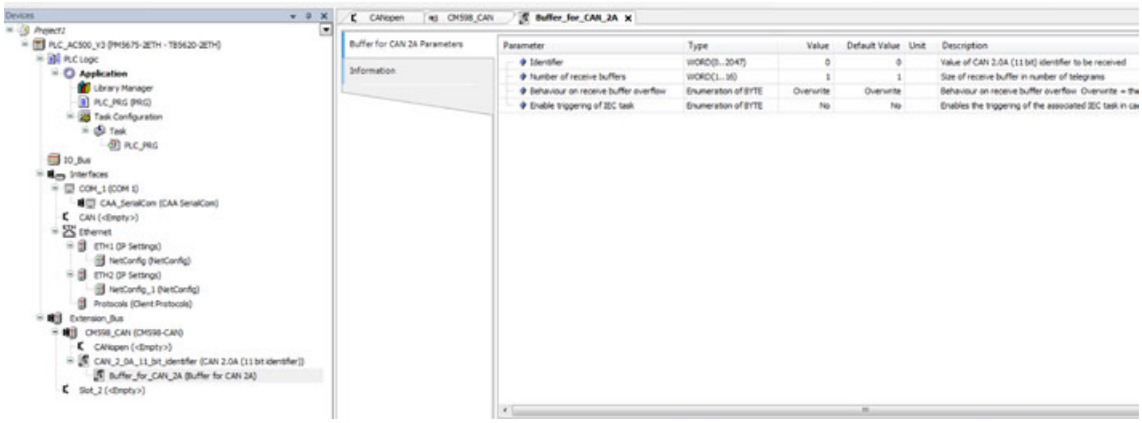
Parameter	Default value	Value	Description
Acceptance mask	0	29 bit	Here it is possible to define the bits, the filter uses. In other words: All not set bits will not be filtered out. The parameter Enable 29 bit COB-ID must be enabled.
Acceptance code	0	29 bit	Those are the bits set to filter the IDs. Those bits must have the value '1' in the acceptance code and the received COB ID to pass the filter. If a bit is not set in the acceptance mask, the filter will pass the message anyway. The parameter Enable 29 bit COB-ID must be enabled.

Configuration of the CAN protocols

The Communication Module CM598-CAN can be used to realize CAN bus based networks in combination with library CANopen_AC500_V11.lib.

1. Plug the communication module CM598-CAN to the desired slot of the communication module bus.
2. Right-click *"CM598_CAN (CM598-CAN)"* and select *"Add device"* in the context menu.
3. Select the desired *"CAN 2.0A"* protocol or *"CAN 2.0B"* protocol from the list.
4. The CAN data transmission requires a buffer for the incoming data.

   Right-click *"CAN_2_0A_11_bit_identifier_ (CAN 2.0A)"* or *"CAN_2_0B_29_bit_identifier_ (CAN 2.0B)"* and select *"Add object"*. Select the corresponding receive buffer for your selected CAN protocol from the list.



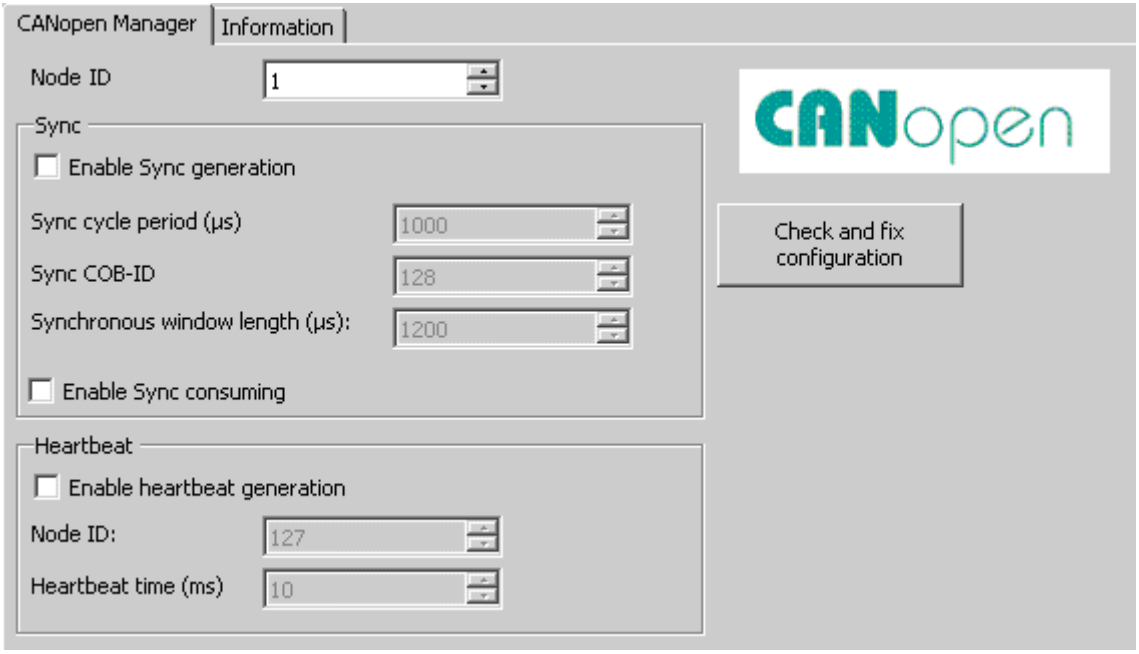
5. In the device tree, double-click on *"Buffer_for_CAN_2A (Buffer for CAN2A)"* or *"Buffer_for_CAN_2B (Buffer for CAN2B)"* to open the Buffer configuration in the editor window.

The following parameters are available:

Parameter	Default value	Value	Description
Identifier	0	CAN 2A: 0...2047 CAN 2B: 0...536870911	The value of the CAN identifier that is compared with the identifier of the incoming telegrams. The telegrams will be added to the buffer if the identifier matches.
Number of receive buffers	1	1..16	The size of the buffer in number of telegrams.
Behaviour on receive buffer overflow	Overwrite	Overwrite	The oldest telegram in the buffer is overwritten by the incoming telegram.
		Discard	The incoming telegrams are discarded as long as the buffer is full.
		Wait	The incoming telegram is stored as soon as a telegram is read out of the buffer.
Enable triggering of IEC task (only for CM598-CN)	No	No	No triggering of IEC task
		Yes	On receiving of a CAN object with this identifier the CAN manager triggers an IEC task. A task of type "triggered by external event" has to be configured. The external event has to be "CAN2A event"/"CAN2B event".

Configuration of CANopen manager

In the device tree, double-click *"CANopen_Master"* to open the configuration in the editor window. The following parameters are available on the the *"General"* tab:

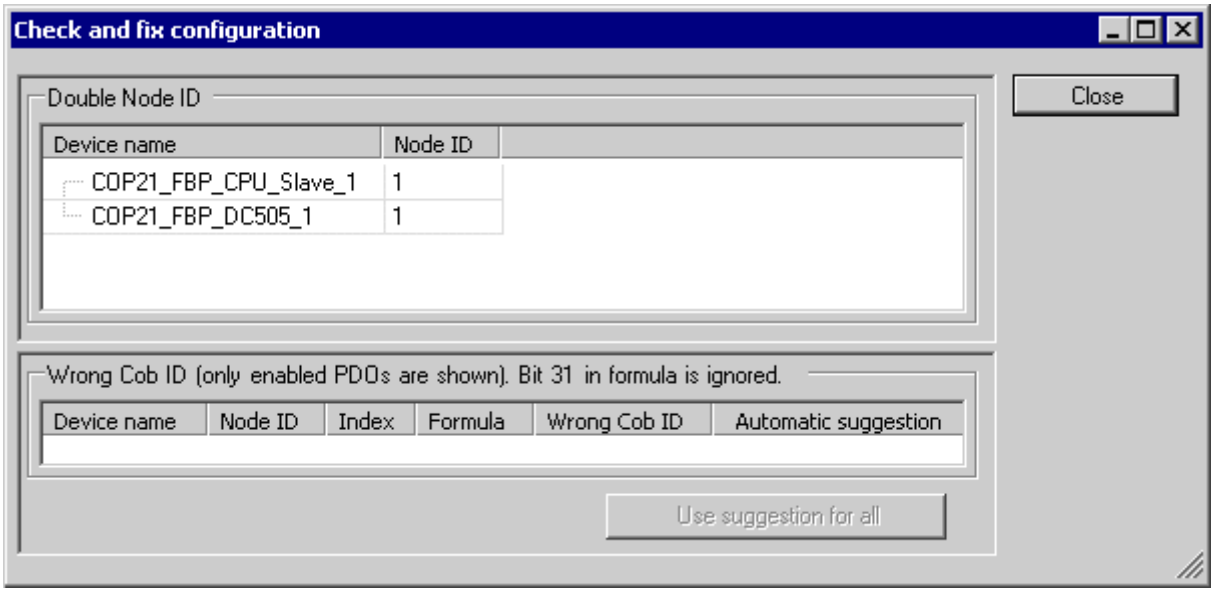


The following parameters are available:

Parameter	Default value	Value	Description
Node ID	127	1...127	Node ID of the communication module
Sync			
Sync cycle period [µs]	1000	100.. 2^{32}-1	Determines the interval in which the synchronization message will be sent.
Sync COB-ID	128	128 1664 1759 1761 1792 1920 2047	Sets the communication object identifier (COB-ID) which identifies the synchronization message.
Synchronous window length [µs]	1200	0.. 2^{32}-1	Determines the length of the time window for synchronous PDOs.
Check and fix configuration Remark 1 *Further information on page 5918*	-	-	This button opens the dialog that allows checking and fixing the current configuration.
Heartbeat			
Enable Heartbeat Producing	Disabled	Disabled	The heartbeat generation is disabled.
		Enabled	The master sends heartbeats according to the interval defined in parameter Heartbeat time. If new slaves with heartbeat functionality are added their behavior will automatically be enabled and configured appropriately. If the heartbeat generation of the CANopen manager is not enabled, nodeguarding is enabled instead. The CANopen slaves can be configured as heartbeat producers.
Node ID	127	1...127	Parameter Node ID determines the identifier of the heartbeat producer on the bus.
Heartbeat time [ms]	10	1...65535	Time interval for the heartbeat generation in [ms].

Remark 1: Check and fix configuration

The dialog Check and fix configuration shows an overview of the current conflicts of the configured node IDs and the COB-IDs. It detects double node IDs and shows the wrong COB-IDs of the PDOs of the remote devices:



The dialog gives suggestions to resolve the existing conflicts that can be accepted by clicking on the corresponding button. Alternatively the configuration must be adapted manually for the faulty devices.

Configuration of the CANopen remote devices

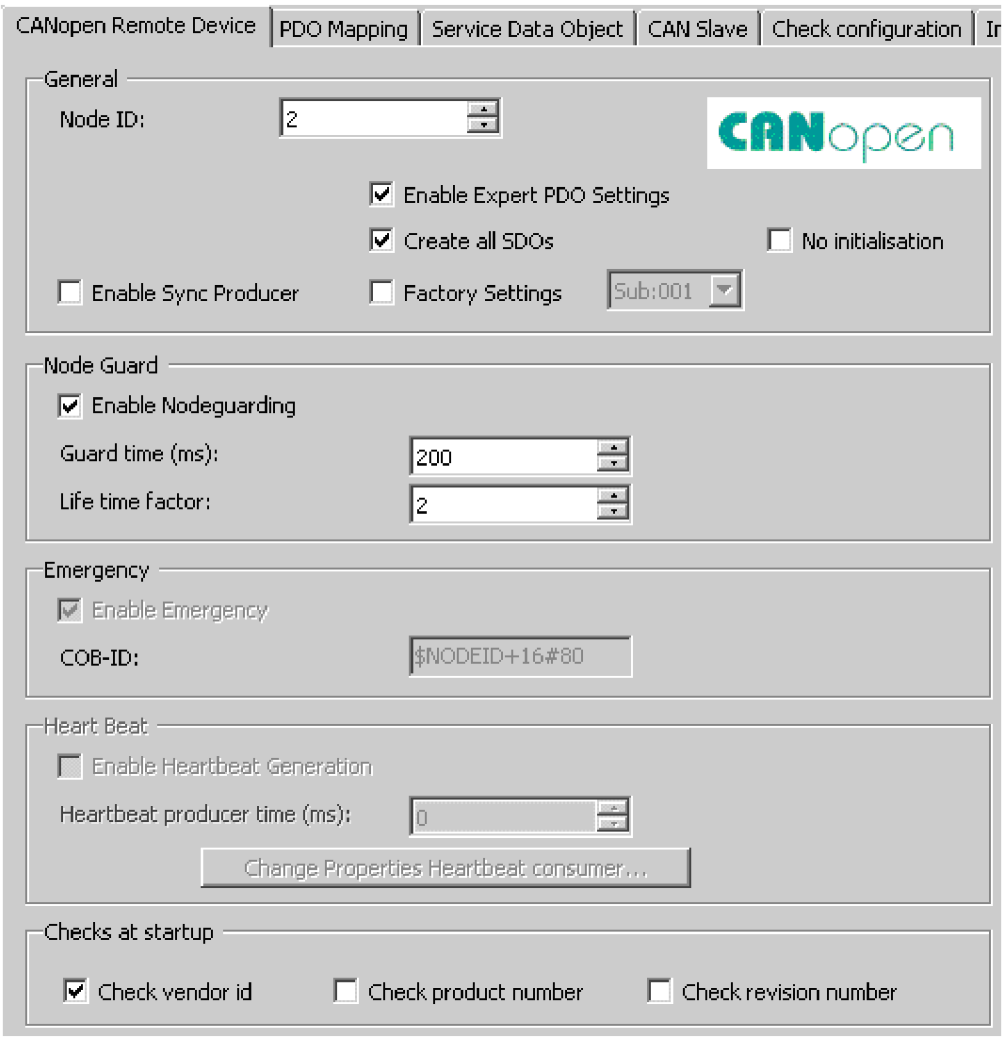
CANopen remote devices can be added to the module CM598_CAN (CM598-CAN).

Double-click on a remote device to open the corresponding CANopen remote device configuration in the editor window. The basic parameters of a remote device can be set up in *"CANopen Remote Device"* tab. See the following section for more information on the parameters.

> *If "Enable Expert PDO Settings" check box is enabled additional parameters to set PDO are displayed.*

Configuring the expert PDO settings

> *If "Enable Expert PDO Settings" check box is enabled additional parameters to set PDO are displayed.*



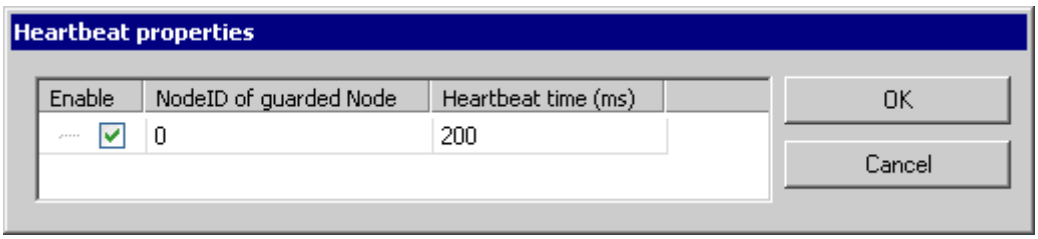
The following parameters are available:

Parameter	Default value	Value	Description
General			
Node ID	1	1...127	Note ID of the remote device
Enable Expert PDO Settings	Disabled	Disabled	Expert PDO settings are disabled.
		Enabled	Expert PDO settings are enabled.
Create all SDOs	Enabled	Disabled	Creation of all SDOs is disabled.
		Enabled	Creation of all SDOs is enabled.
No initialization	Disabled	Disabled	No initialization option is disabled.
		Enabled	No initialization option is enabled.
Enable Sync Producer	Disabled	Disabled	Sync producer is disabled.
		Enabled	Sync producer is enabled.
Factory Settings	Disabled	Disabled	No factory settings are used.

Parameter	Default value	Value	Description
		Enabled	Factory settings are used. The corresponding factory setting can be selected in the combo box right of the check box.
Node Guard			
Enable Node-guarding	Enabled	Disabled	Nodeguarding is disabled.
		Enabled	Nodeguarding is enabled. This function can only be enabled if Heartbeat Generation is disabled.
Guard time [ms]	200	0...65535	The parameter Guard time sets the cycle time for the Node-guarding in [ms].
Life time factor	2	0...255	The Life time factor sets the factor when the connection should be applied as lost. Warning: To reach a stable communication of the node on the CANopen, the Life time factor has to be set to minimal 2.
Emergency			
Enable Emergency (read only)	Enabled	Enabled	CANopen Remote Device sends emergency telegrams.
COB-ID (read only)	$NODEID+16#80	$NODEID+16#80	Communication Object Identifier of the remote device.
Heart Beat			
Enable Heartbeat Generation	Disabled	Disabled	Heartbeat generation is disabled.
		Enabled	Heartbeat Generation is enabled. This option can only be enabled if Nodeguarding is disabled.
Heartbeat producer time [ms]	10	0...65535	The Heartbeat producer time represents the cycle time for the Heartbeat Generation in [ms].
Change Properties Heartbeat consumer Remark 1 ↳ *Further information on page 5920*	-	-	The button Change Properties Heartbeat consumer opens the dialog Heartbeat Properties where the heartbeat parameters can be set.
Checks at startup			
Check vendor id	Enabled	Disabled	The vendor id will not be checked on startup.
		Enabled	The vendor id will be checked on startup.
Check product number	Disabled	Disabled	The product number will not be checked on startup.
		Enabled	The product number will be checked on startup.

Parameter	Default value	Value	Description
Check revision number	Disabled	Disabled	The revision number will not be checked on startup.
		Enabled	The revision number will be checked on startup.

Remark 1: Button *"Change Properties Heartbeat consumer"*



The dialog shows the nodes defined in the EDS files which can be selected for getting guarded. For this purpose set a check in the Enable field and enter the desired value in milliseconds in the Heartbeat time field (double-clicking on this field opens a selection box of time values). If the Heartbeat Consumer option is activated, then the corresponding module will listen to heartbeats which are sent by the master. As soon as no more heartbeats are received, the module will switch off the I/Os.

To reach a stable communication of the node on the CANopen bus the parameter Life Time factor has to be set to 2 at least.

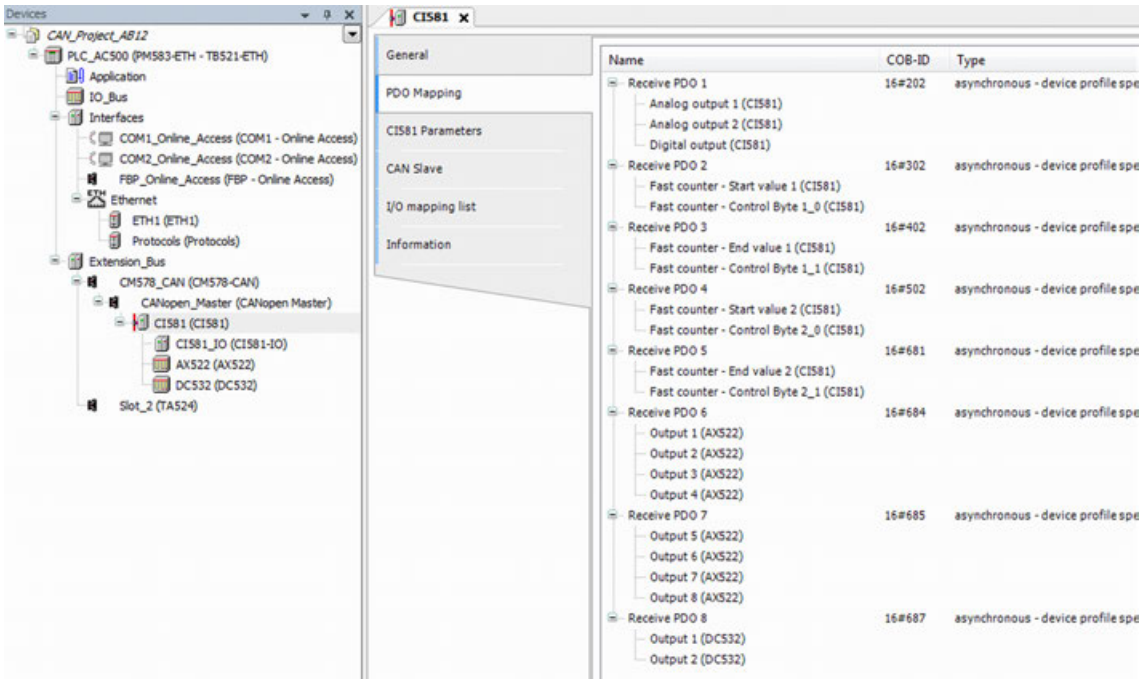
A life guarding can only be used if the master carries out a Nodeguarding. That means Life-Guarding presumes Nodeguarding.

PDO mapping editor

Overview

The PDO Mapping editor contains tree views respectively for the Receive and Transmit PDOs.

On opening the editor, all the PDO communication parameters entries are are displayed. Each PDO Mapping channel is displayed below the corresponding PDO:



Per default all PDOs are activated and preconfigured with a valid COB-ID.

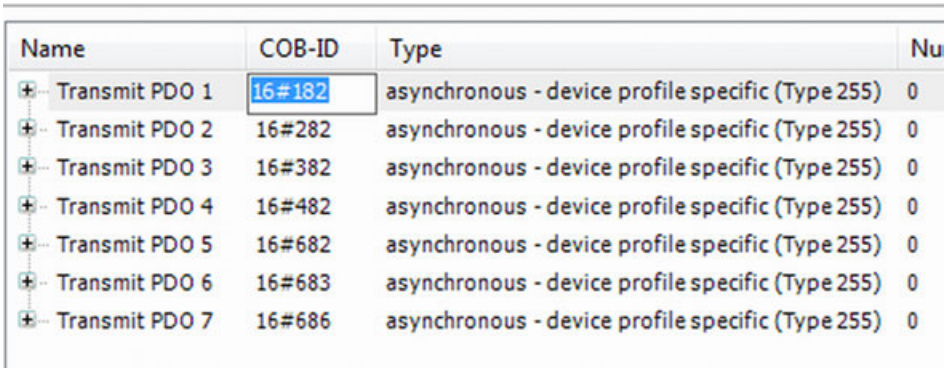
PDO configuration

Only the configurable elements are present at the user interface:

- For the Receive PDOs: COB-ID, Type and Num of syncs
- For the Transmit PDOs: COB-ID, Type, Num of syncs, Inhibit time, Event timer and RTR

The settings can be directly changed inside this editor. No additional dialog will be opened for this.

COB-ID

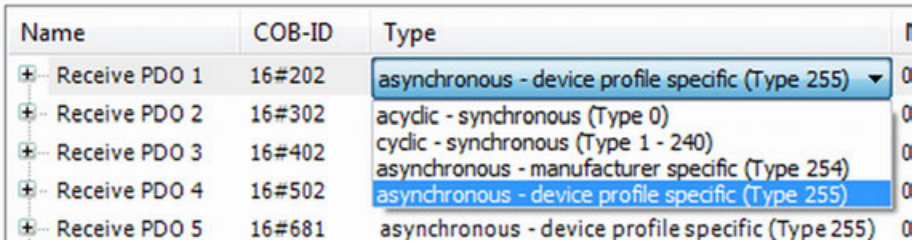


If an entered value is not correct, an error message is displayed and the entry will be reset to its original value.

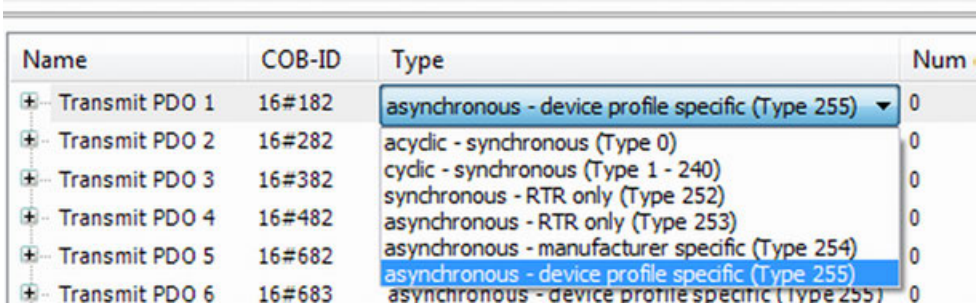
Transmission type

The allowed values for “Transmission type” depends on the type of PDO. For Receive PDOs, only Type 0, Type 1-240, Type 254 and Type 255 are allowed. The enumeration box displays in this case also only the configurable values:

- Receive PDO:

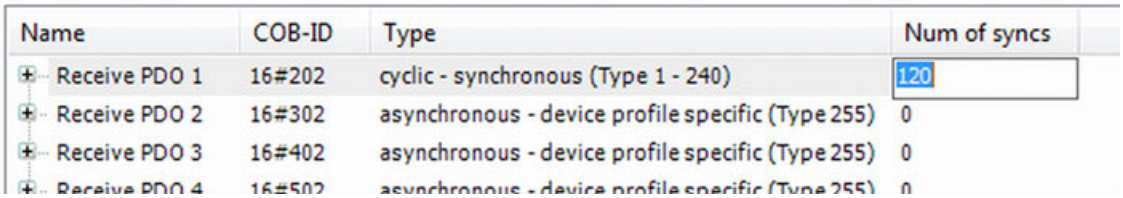


- Transmit PDO:



Number of syncs

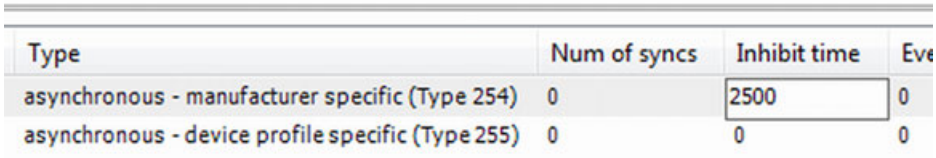
The field “Num of syncs” is only editable when the transmission type is configured to “Type 1 – 240”:



The allowed values for this field are 1 – 240. Entering a value outside this range generates an error message for the user. The value will be reset to its original value.

Inhibit time

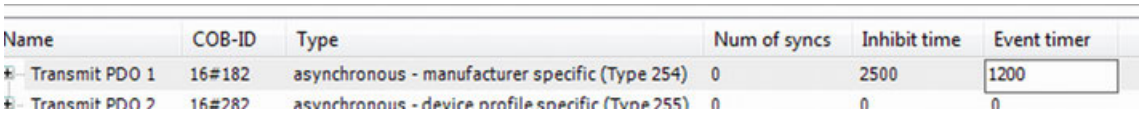
Inhibit time is only configurable for the Transmit PDOs and only when transmission type is configured to “Type 254” or “Type 255”.



The allowed values for this field are 0 – 65535. Entering a value outside this range generates an error message for the user. The value will be reset to its original value.

Event timer

Event timer is only configurable for the Transmit PDOs and only when transmission type is configured to “Type 254” or “Type 255”.



The allowed values for this field are 0 – 65535. Entering a value outside this range generates an error message for the user. The value will be reset to its original value.

RTR

RTR is only configurable for the Transmit PDOs.

When the field “RTR” is checked, the RTR flag for the PDO is set.

Configuring the service data object

During the initialization of the CANbus, the current configuration values will be transferred via Service Data Objects (SDO) to the CAN module.

In the Service Data Object configuration dialog, the desired SDOs can be configured and it can be defined in which sequence they should be transferred and what should happen in case of an incomplete transfer.

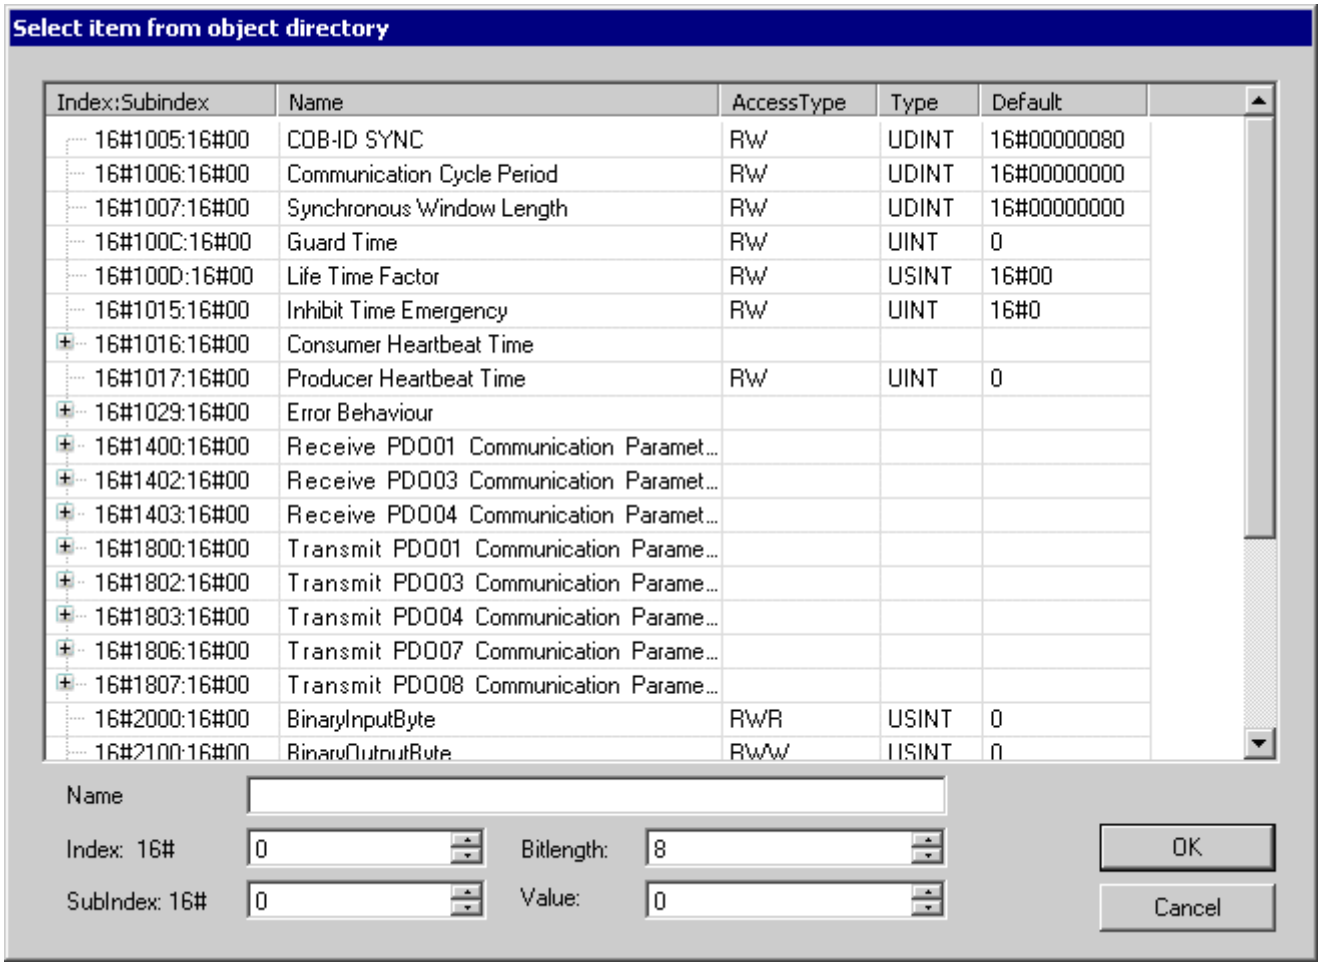
> *If option Enable expert PDO settings is not activated for the current device only the user-defined SDOs will be listed. for more information, see Enable Expert PDO Settings ↳ Chapter 1.6.5.2.6.6.1.5 “Configuration of the CANopen remote devices” on page 5920.*

The *“Service Data Object”* tab can be used to configure the Service Data objects. The view shows all parameters of the Service Data Object of the current device including the device-specific values and sizes.

Parameter	Default value	Value	Description
SDO table columns			
Line	Device-specific	Device-specific	Line number of the parameter.
Index:Subindex	Device-specific	Device-specific	Index and the subindex of the parameter.
Name	Device-specific	Device-specific	Name of the parameter.
Value	Device-specific	Device-specific	Configured value of the parameter.
Bitlength	Device-specific	Device-specific	Length of the parameter in [bit].
Abort if error	Device-specific	Device-specific	If this parameter is activated, transfer will be terminated on error detection.
Jump to line if error	Device-specific	Device-specific	If this parameter is activated, in case of an error the transfer will be continued with the line which is set in parameter 'Next line'.

Parameter	Default value	Value	Description
Next line	0	1...number of lines	In case of an error this parameter determines the line with which the transfer will be continued if the parameter 'Jump to line if error' is activated.
Comment	''	Device-specific	Shows a comment text of the corresponding line
Buttons			
Move up	-	-	The order (top-down) in the SDO table represents the sequence in which the SDOs will be transferred to the module. 'Move up' shifts up the selected entry.
Move down	-	-	The order (top-down) in the SDO table represents the sequence in which the SDOs will be transferred to the module. 'Move down' shifts up the selected entry.
New... see Remark 1	-	-	Opens the 'Select item from object directory' to add an SDO entry to the table.
Delete...	-	-	Deletes the currently selected line from the table.
Edit... see Remark 1	-	-	Opens the 'Select item from object directory' dialog where it can be edited.

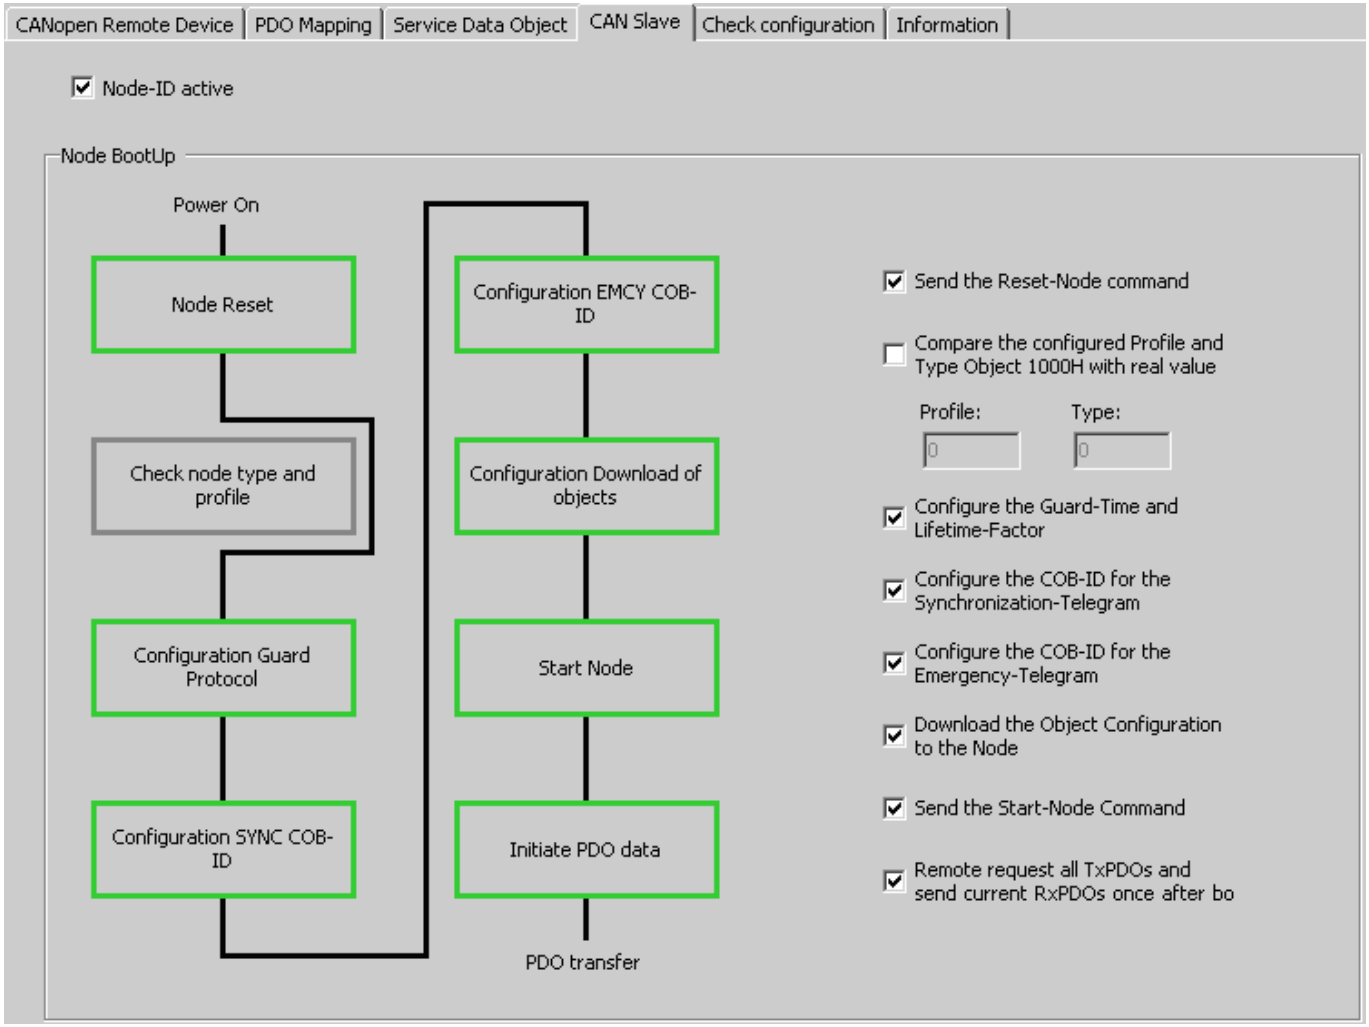
Remark 1: The dialog 'Select item from object directory' shows all entries defined in the EDS file:



The dialog allows editing the available SDOs before adding them to the table. New entries can be created and edited which are not defined in the EDS file.

Configuring the CAN slave boot up

"CAN slave" tab allows the configuration of the boot up behavior of the CAN slave:



The following options are available and can be set by either clicking on the graphics or selecting the corresponding check box on the right side of the editor window. The graphic illustrates the order of execution:

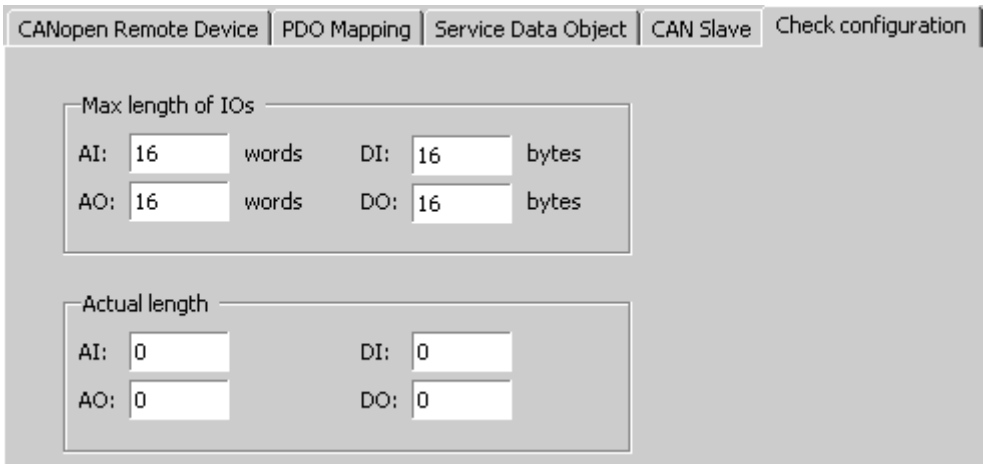
Parameter	Default value	Value	Description
Node ID-active	Enabled	Disabled	The node is inactive.
		Enabled	The node is active.
Node BootUp			
Node Reset (Send the Reset-Node command)	Enabled	Disabled	No specific node reset communication command is sent.
		Enabled	The master sends the CANopen specific node reset communication command.
Check node type and profile (Compare the configured Profile and Type Object 1000H with real value)	Disabled	Disabled	The content of the node object 1000H are not compared with the current parameters.
		Enabled	The master compares the content of the mandatory node object 1000H. If the values are different, the master will report a parameterization error.

Parameter	Default value	Value	Description
Configuration Guard Protocol (Configure the Guard-Time and Lifetime-Factor)	Enabled	Disabled	The guard time and Life-Time factor of the node configuration are not written.
		Enabled	A CANopen has 2 specific register responsible for the Node guarding protocol. The master writes the guard time and Life-Time factor of the node configuration into the corresponding objects of the node during startup.
Configuration SYNC COB-ID (Configure the COB-ID for the Synchronization-Telegram)	Enabled	Disabled	The master does not write the SYNC COB-ID of the configuration into the corresponding objects of the node.
		Enabled	The master will write the SYNC COB-ID of the configuration into the corresponding objects of the node during startup.
Configuration EMCY COB-ID (Configure the COB-ID for the Emergency-Telegram)	Enabled	Disabled	The master does not write the EMCY COB-ID of the configuration into the corresponding of the node.
		Enabled	The master writes the EMCY COB-ID of the configuration into the corresponding objects of the node during startup.
Configuration Download of objects (Download the Object Configuration to the Node)	Enabled	Disabled	
		Enabled	To get a PDO communication to a node working, the master has to send all relevant configuration objects to the Node. For example, the COB-IDs of PDOs are covered here in the mapping table. If enabled, all these parameter and also the user specific objects which are added manually in the Node object configuration window are written down to the Node by the master.
Start Node (Send the Start-Node Command)	Enabled	Disabled	No start node command is sent.
		Enabled	To reach the operational state in CANopen, a node has to get the CANopen specific start node command. The master sends the start node command to the node at the end of the boot-up procedure.

Parameter	Default value	Value	Description
Initiate PDO data (Remote request all TxPDOs and send current RxPDOs once after	Enabled	Disabled	PDOs are not written and read by the master automatically.
		Enabled	This item selects if the installed PDOs shall be automatically written and read by the master directly after the startup once. This ensures that the latest output data which can be found within the master's output process data area is sent to the node and that the latest node input data is read from the node and be placed into the input process data area.

Checking the I/O configuration

Tab *"Check configuration"* can be used to check the current I/O configuration. The device specific number of available I/Os can be compared with the actually configured I/Os to detect a faulty I/O configuration before downloading the program:



Parameter	Default value	Value	Description
Max. I/O length			
AI	Device specific	0...128	Available analog inputs of the device in [words].
AO	Device specific	0...128	Available analog outputs of the device in [words].
DI	Device specific	0...32	Available digital inputs of the device in [bytes].
DO	Device specific	0...32	Available digital outputs of the device [bytes].
Actual length			
AI	0	Read-only	Actually configured length of analog inputs in [words].
AO	0	Read-only	Actually configured length of analog outputs of the device in [words].

Parameter	Default value	Value	Description
DI	0	Read-only	Actually configured length of digital inputs in [bytes].
DO	0	Read-only	Actually configured length of digital outputs [bytes].

CM588-CN - CANopen slave communication module

Configuration steps

The configuration of the CM588-CN CANopen slave module has to be done in the following steps:

- Parameterization of the AC500 Communication Module interface ↳ *Chapter 1.6.5.2.6.6.2.2 "Parameterization of the CM588-CN communication module interface" on page 5932*
- Configuring the module CM588-CN for use as CANopen Slave device ↳ *Chapter 1.6.5.2.6.6.2.2 "Parameterization of the CM588-CN communication module interface" on page 5932*
- Parameterization of the CANopen slave protocol stack ↳ *Chapter 1.6.5.2.6.6.2.3 "Parameterization of the CANopen slave protocol stack" on page 5933*
- Configuring I/O data objects ↳ *Chapter 1.6.5.2.6.6.2.4 "Configuration of I/O data objects" on page 5933*
- Mapping of the CANopen Slave I/Os ↳ *Chapter 1.6.5.2.6.6.2.5 "Mapping of the I/Os" on page 5934*

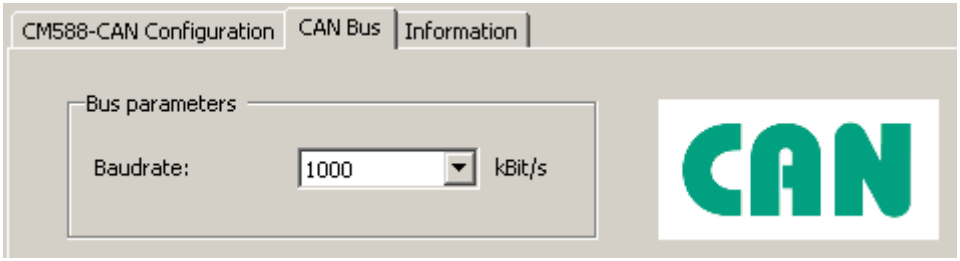
Parameterization of the CM588-CN communication module interface

Double-click on CM588_CAN (CM588-CAN) to open the CM588-CAN configuration in the editor window.

The following parameters are available:

Parameter	Default	Value	Description
Run on config fault	No	No	In case of a configuration error, the user program is not started.
		Yes	The user program is started even in case of configuration error.
Min. update time	10 ms	0 ms ... 20000 ms	Update time of inputs and outputs
Transmission rate	1000 kBit/s	1000 kBit/s 800 kBit/s 500 kBit/s 250 kBit/s 125 kBit/s 100 kBit/s 50 kBit/s 20 kBit/s 10 kBit/s	Supported transmission rates of the Communication Module

Parameter transmission rate can be configured also by using the *"CAN Bus"* tab.



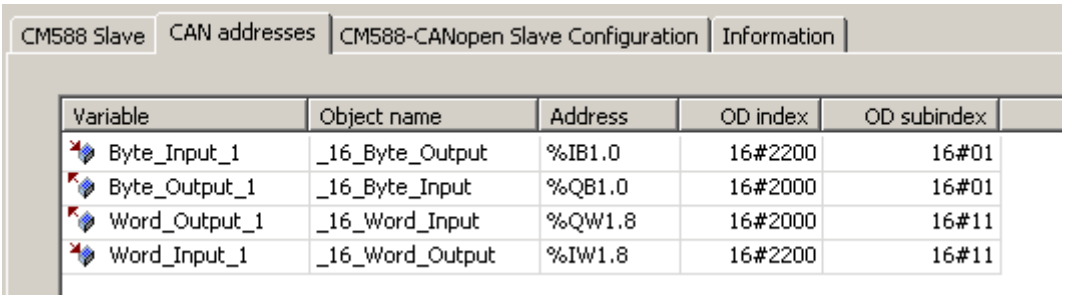
Parameterization of the CANopen slave protocol stack

Double-click on CM588_CANopen_Slave (CM588-CANopen slave) to open the *"CM588 Slave"* tab.

The following parameters are available:

Parameter	Default	Value	Description
Node-ID	1	1...127	The node-ID the CANopen Slave Communication Module uses on acting at the network.

"CAN addresses" tab provides overview of assigned I/O variables and how they are mapped to CANopen objects located in slave object dictionary. Find these object indexes and sub-indexes on looking at the PDO configuration of the CM588 CANopen slave from a CANopen Master configuration point of view.



"CAN addresses" tab only shows read-only data.

Further parameters are available in the *"CM588-CANopen Slave Configuration"* tab. Activate parameter *"Show generic device configuration views"* to get this tab visible. This setting is available under *"Tools ➔ Options"*.

Configuration of I/O data objects

Data objects added to CM588-CN CANopen Slave configures I/O data. Inserting variable names at the data objects maps the variables to dedicated I/O channels.

Several types of data object groups I/O variables by size and direction. The I/O driver of the PLC firmware copies the amount of data bytes configured by these data objects cyclically. The copy cycle time is defined by the parameter *"Min. update time"*.

Keep basic load of PLC low by configuring only as much data objects as really needed. If further I/O variables need to be added later additional data objects can be inserted.

The maximum amount of bytes used for I/O data is limited to 512 bytes for input data and 512 bytes for output data.

Inserting new data objects checks these limits and generates an error message if the new object does not fit. Pasting a single or a number of copied data objects checks these limits also. In case of a limit violation the paste operation is canceled completely and no data object is inserted.

Mapping of the I/Os

Double-click on the desired I/O data object in the device tree to show current I/O mapping connected to this data object.

See chapter Symbolic Names for Variables, Inputs and Outputs for further details on mapping inputs and outputs ↳ *Chapter 1.6.5.2.2.1.2 “Symbolic names for variables, inputs and outputs” on page 5815*.

PROFINET

CM579-PNIO - PROFINET communication module

The configuration of the PROFINET fieldbus has to be done in the following steps:

- Parameterization of the AC500 Communication Module Bus Interface ↳ *Chapter 1.6.5.2.6.7.1.1 “Parameterization” on page 5934*
- Configuration of the PROFINET IO controller ↳ *Chapter 1.6.5.2.6.7.1.2 “Configuration of the PROFINET IO controller” on page 5935*
- Configuration of the PROFINET IO devices:
  ABB PROFINET IO devices
  – ↳ *Chapter 1.6.5.2.7.2 “CI504-PNIO/CI506-PNIO” on page 5970*
  – ↳ *Chapter 1.6.5.2.6.7.1.3 “Configuration of ABB PROFINET IO devices” on page 5936*

  3rd party devices)
  – ↳ *Chapter 1.6.5.2.6.7.1.4 “Configuration of 3rd party PROFINET IO devices” on page 5941*
- Configuration of the PROFINET IO device names
- Configuration and mapping of the I/Os ↳ *Chapter 1.6.5.2.6.7.1.7 “Mapping of the PROFINET IO devices” on page 5950*
- Name Assignment of a PROFINET IO device ↳ *Chapter 1.6.5.2.6.7.1.6 “Name assignment of a PROFINET IO device” on page 5949*
- ↳ *Chapter 1.7.2 “Online diagnosis in Automation Builder” on page 6374*

Parameterization

To append a Communication Module, add the Communication Module to the *“Extension_Bus”* node.

- Right-click the desired slot and select *“Add object”*.
- Select the Communication Module from the list and click *[Replace object]*.

- Double-click on *"CM579_PNIO (CM579-PNIO)"* to open the CM579-PNIO configuration in the editor window.

The following parameters are available:

Parameter	Default value	Value	Description
Run on config fault	No	No	In case of a configuration error, the user program is not started.
		Yes	The user program is started independent of a faulty configuration of the CM579-PNIO communication module.
Min update time	10	0...20000	Minimum update time of inputs and outputs in [ms].
Inhibit error signaling on LED STA2	Off	On/Off	Inhibit error signaling on LED STA2 of PROFINET IO controller CM579-PNIO

Configuration of the PROFINET IO controller

Double-click on *"PNIO_Controller"* to open the PROFINET IO controller configuration in the editor window.

The following parameters are available:

Parameter	Default	Value	Description	Parameter
Identification				
IP-Address	192.168.0.1	Valid IP address	IP address of the PROFINET IO controller station.	IP address
Subnetmask	255.255.255.0	Valid subnet mask	Network mask of the PROFINET IO controller station.	Subnet Mask
Default gateway	0.0.0.0	Valid gateway address	Gateway address of the PROFINET IO controller station.	Default gateway
Station name	controller	Up to 240 characters	Network name of the PROFINET IO controller station. Must be a valid hostname.	Station name
Address settings for devices				
First IP-Address	192.168.0.2	Valid IP address	First IP address of the PROFINET IO devices. This parameter determines the address range of the PROFINET IO devices in combination with parameter Last IP address.	First IP address

Parameter	Default	Value	Description	Parameter
Last IP-Address	192.168.0.254	Valid IP address	Last IP address of the PROFINET IO devices. This parameter determines the address range of the PROFINET IO devices in combination with parameter First IP address.	Last IP address
Subnetmask	255.255.255.0	Valid subnet mask	Network mask of the PROFINET IO devices.	Default subnet mask
Default gateway	0.0.0.0	Valid gateway	Gateway address of the PROFINET IO devices.	Default gateway address

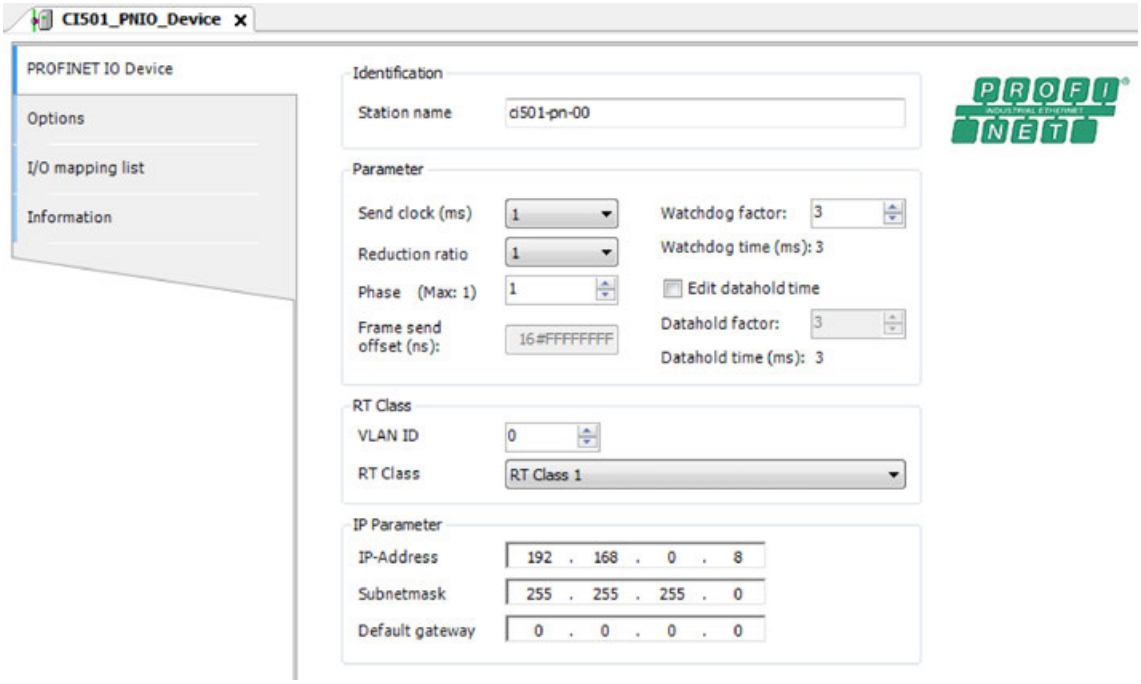
Chapter 1.6.5.2.6.7.1.3 “Configuration of ABB PROFINET IO devices” on page 5936

Configuration of ABB PROFINET IO devices

A PROFINET IO device can be added by right-clicking on a master module, e.g. *CM589-PNIO* and selecting *“Add device”*.

PROFINET IO device

Edit the communication parameters:



The following parameters are available:

Parameter	Default	Value	Description	Parameter
Identification				
Station name	Device-specific	Up to 240 characters	This is a system wide unique name for addressing the device. Must be a valid host-name.	Slave parameters -> Identification -> Station name

Parameter	Default	Value	Description	Parameter
Parameter				
Send clock (ms)	Device-specific	0.25 0.5 1 2 4	Parameter Send clock determines the SendCycle. SendCycle = Send clock x Reducation ratio <= 512ms x	Slave parameters -> Reduction ratio
Reduction ratio	Device-specific	1...16384	The Reduction ratio determines the factor for calculating the cycle time. Cycle time = Send clock x Reducation ratio	Slave parameters -> Reduction ratio
Phase	1	1…Reduction ratio	Defines the part of the SendCycle at which an IO frame is sent.	Phase
Watchdog factor	3	1...65535	The Watchdog time is calculated as Watchdog time = SendCycle * Watchdog factor. The transfer of a IO telegram is always checked of the consumer side. Within this time the next IO telegram must be received by a consumer. Otherwise it is checked if the Datahold has been expired too.	Watchdog factor
Datahold factor	3	1...65535	The Data Hold Time is calculated as Datahold time = SendCycle * Datahold factor. If the Watchdog time has been expired, the Data Hold Time will checked. If the Data Hold Time also has been expired, the substitution values of the IOs will be used. For RT_Class_1 communication Data Hold Time and the Watchdog time are usually configured with the same value.	Datahold factor
Frame send offset	0xFFFFFFFF (means: as soon as possible)	1...2^32 - 1	Only available for RT Class 3 Data-RTC-PDU	Frame send offset
RT Class				
RT Class	RT Class 1 Data-RTC-PDU	RT Class 1 Data-RTC-PDU RT Class 2 Data-RTC-PDU RT Class 3 Data-RTC-PDU	Defines the Realtime Class of cyclic data. Currently only RT Class 1 (legacy) and RT Class 1 are supported.	Slave parameters -> RT Class

Parameter	Default	Value	Description	Parameter
		RT Class UDP-RTC-PDU		
VLAN ID	0	0..4095 or 0..32767	In case of VLAN usage the parameter VLAN ID represents the ID of the virtual network. For VLAN type 802.1Q the range is 0..4095 while VLAN type ISL accepts values from 0 to 32767. The supported type depends on the used device.	Slave parameters -> VLAN ID
IP Parameter				
IP-Address	192.168.0.8	Valid IP address	IP address of the PROFINET IO Controller station.	Slave parameters -> Identification -> IP address
Subnetmask	255.255.255.0	Valid subnet mask	Network mask of the PROFINET IO Controller station.	Slave parameters -> Identification -> Subnet mask
Default gateway	0.0.0.0	Valid gateway address	Default gateway address of the PROFINET IO Controller station.	Slave parameters -> Identification -> Default gateway address

Chapter 1.6.5.2.6.7.1.3 “Configuration of ABB PROFINET IO devices” on page 5936

PROFINET IO timing

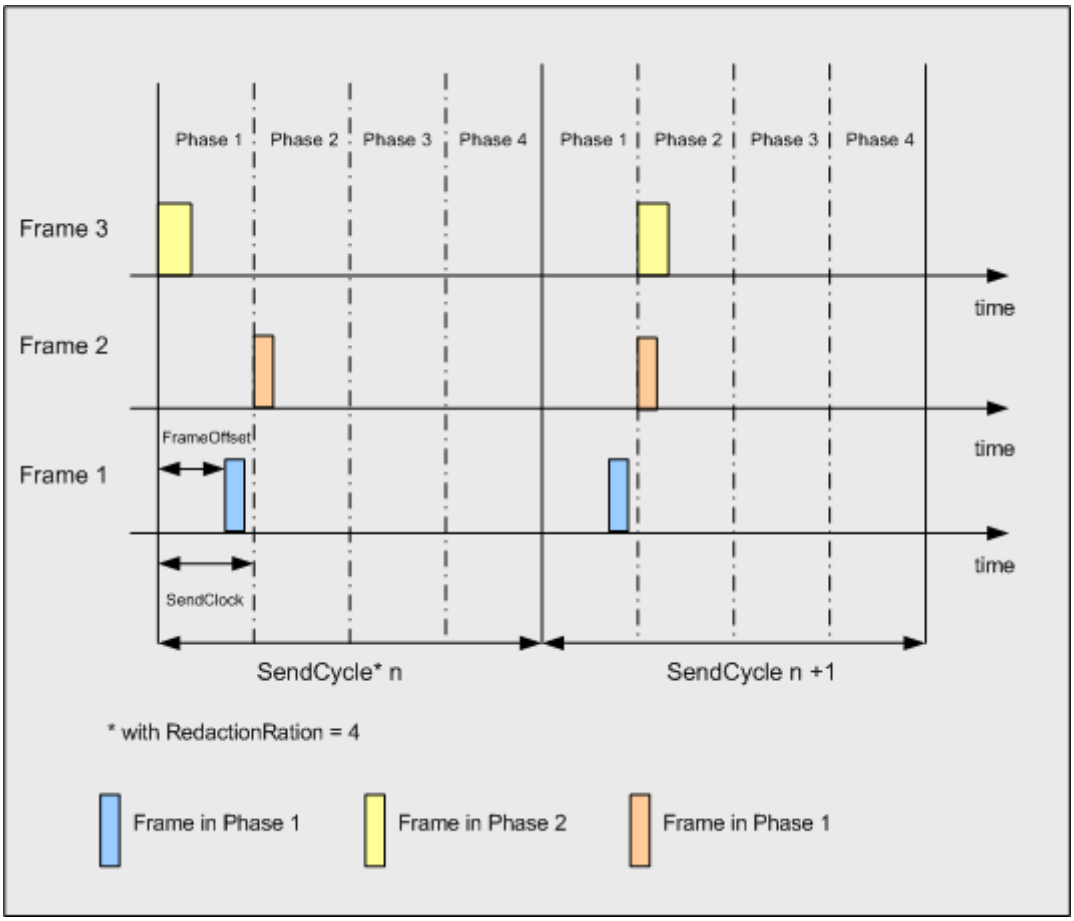
In the current implementation per device 2 *Communication Relations* (CR) between the controller and the device are defined. One CR describes the IO telegram from the controller to the device (outputs) and the other the IO telegram from the device to the controller (inputs).

The timing of the corresponding IO telegrams can be defined separately for each device.

The editable timing parameters are:

- Send clock
- Reduction ratio
- Phase
- FrameSendOffset.

The relation between these parameters is shown in the following drawing.



For each device a SendCycle must be configured, which determines the sending interval of IO frames.

It is based on a time base of 31.25 µs und is calculated as:

SendClock [ms] = SendClockFactor * 31.25 µs / 1000.

The cycle time of an IO telegram is defined by the SendCyle. It's calculated as:

SendCyle [ms] = SendClock [ms] * Reduction Ratio.

The values of the individual parameters are limited by the maximum value 512 ms of the SendCycle.

The following table summarizes the relation of the timing parameters.

Parameter	Description	Relation	Range
SendCycle	Is the cycle time of a RT telegrams.	SendCyle = Send-Clock * Reduction ratio.	1ms ..512 ms
SendClock	The SendCycle is divided into several time slots. The SendClock defines the size of a time slot within the SendCyle.	SendClock = SendClock factor * 31.25 µs;	SendClock * Reduction ratio ≤ 512 ms
SendClock factor	Is multiplied with the time base 31.25 µs to calculate the SendClock.	SendClock factor = Send-Clock / 31.25 µs	1..128
Reduction ratio	The reduction ratio defines the number of time slots within the SendCyle.	SendClock * Reduction factor ≤ 512 ms	1..16384

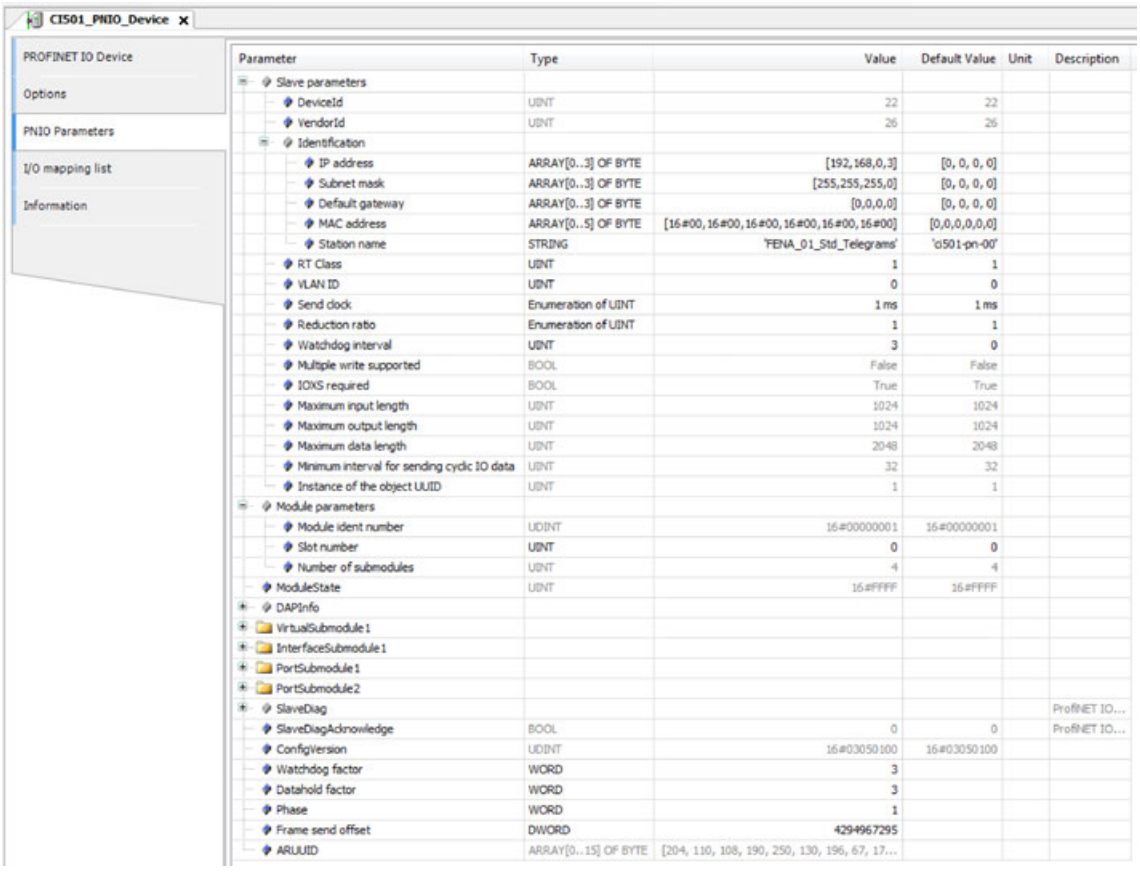
Parameter	Description	Relation	Range
Phase	The time slot in which the IO frame is sent.	A integer value of the range 1 … Reduction ratio	1..16384
FrameSen-dOffset	It's an offset value relative to the beginning of a time slot. For all RT_Classes the value 0xFFFFFFFF means sending as soon as possible.	Only for RT_CLASS_3 it is necessary to sup-port this param-eter.	0x0 … 0xFFFFFFFF

PNIO configuration

This tab is a generic view of all PROFINET IO device parameters. It is normally hidden and is normally not needed for configuration.

Use this dialog only, if you need to change a parameter, which is not visible in other dialogs.

This dialog could be activated with the parameter *"Show generic device configuration views"* in the Automation Builder options (*"Tools ➔ Options ➔ Device editor"*).



CI504-PNIO/CI506-PNIO

Configuration of CI504-PNIO and CI506-PNIO is described in the PROFINET IO Controller configuration ↳ *Chapter 1.6.5.2.7.2 "CI504-PNIO/CI506-PNIO" on page 5970*.

Configuration of 3rd party PROFINET IO devices

A *PROFINET IO device* can be added by right-clicking on *CM579_Master (CM579-PNIO master)* and selecting *"Add device"*.

The *"Add Device"* dialog appears where all available PROFINET IO devices are listed.

If the desired device is not listed you can add this device to the *"Device Repository"* by installing the associated *GSDML-File* (via *"Tools ➔ Device Repository ➔ Install"*).

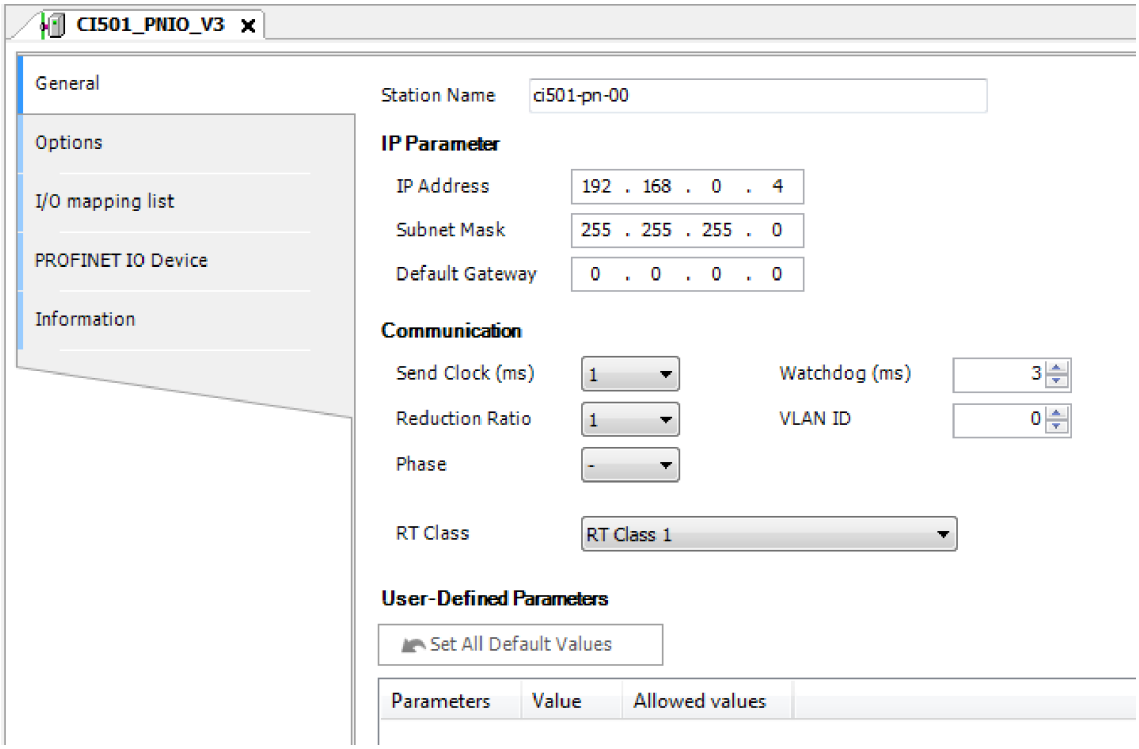
The device parameters are edited in the PROFINET IO device dialog, which is divided into 2 tab-sheets:

- PNIO Parameters
- PNIO Configuration.

To open the PROFINET IO device dialog, double-click on the desired device in the configuration tree.

PNIO parameters

In this *"General"* tab-sheet the *"IP Parameter"*, the *"Communication"* and the *"User-defined Parameters"* will be edited.



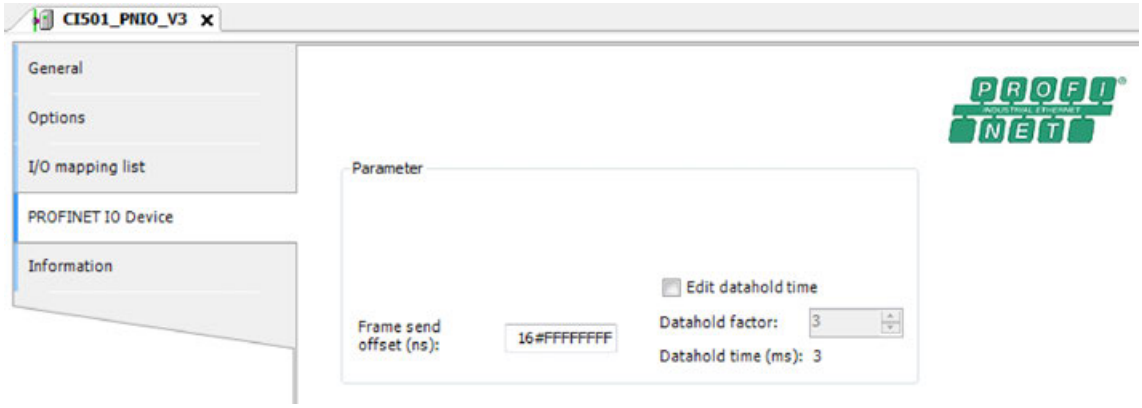
The following parameters are available:

Parameter	Default	Value	Description	Parameter (Remark 1)
Station name	Device-specific	Up to 240 characters	This is a system wide unique name for addressing the device. Must be a valid host-name.	Slave parameters -> Identification -> Station name
IP Parameter				

Parameter	Default	Value	Description	Parameter (Remark 1)
IP Address	192.168.0.4	Valid IP address	IP address of the PROFINET IO controller station.	Slave parameters -> Identification -> IP address
Subnet mask	255.255.255.0	Valid subnet mask	Network mask of the PROFINET IO controller station.	Slave parameters -> Identification -> Subnet mask
Default Gateway	0.0.0.0	Valid gateway address	Default gateway address of the PROFINET IO controller station.	Slave parameters -> Identification -> Default gateway address
Communication				
Send Clock (ms)	Device-specific	Device-specific	Parameter Send clock determines the sending interval in [ms].	Slave parameters -> Send clock
Reduction Ratio	Device-specific	1...512	The Reduction ratio determines the factor for calculating the SendCycle. Cycle time = Send clock x Reducation ratio <= 512ms	Slave parameters -> Reduction ratio
Phase	-	1…Reduction ratio	Defines the part of the SendCycle at which an IO frame is sent.	Phase
RT Class	RT Class 1 Data-RTC-PDU	RT Class 1 Data-RTC-PDU	Defines the real-time Class of cyclic data. Currently only RT Class 1 (legacy) and RT Class 1 are supported.	Slave parameters -> RT Class
		RT Class 2 Data-RTC-PDU		
		RT Class 3 Data-RTC-PDU		
		RT Class 1 UDP-RTC-PDU		
Watchdog [ms]	3	1...65535	The Watchdog time is calculated as Watchdog time = SendCycle * Watchdog factor. The transfer of a IO telegram is always checked of the consumer side. Within this time the next IO telegram must be received by a consumer. Otherwise it is checked if the Datahold has been expired too.	Watchdog time

Parameter	Default	Value	Description	Parameter (Remark 1)
VLAN ID	0	0..4095 or 0..32767	In case of VLAN usage the parameter VLAN ID represents the ID of the virtual network. For VLAN type 802.1Q the range is 0..4095 while VLAN type ISL accepts values from 0 to 32767. The supported type depends on the used device.	Slave parameters -> VLAN ID
User-Defined Parameters				
User-Defined Parameters	Device-specific	Device-specific	The parameters of a PROFINET device are stored as RecordData items. The table "User parameter" is a generic view of the elements of a RecordData item. The Record Data item and it's default values are read from *GSDML-File*.	-
Set All Default Values	-	-	The button restores the default values of the user parameters.	-

In this *"PROFINET IO device"* tab-sheet the following *"Parameter"* will be edited.



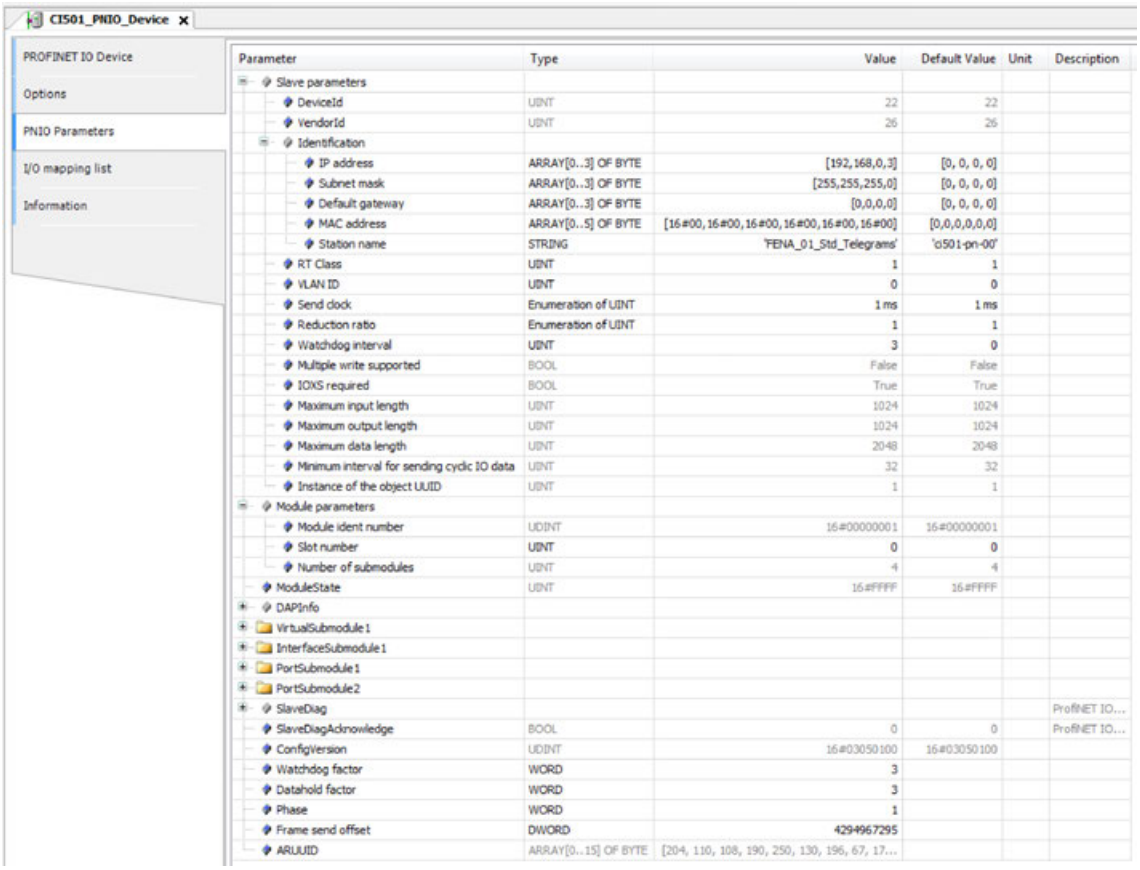
Parameter	Default	Value	Description	Parameter (Remark 1)
Frame send offset [ns]	0xFFFFFFFF (means: as soon as possible)	1...2^32 - 1	Only available for RT Class 3 Data-RTC-PDU	Frame send offset
Datahold factor	3	1 ...65535	The Data Hold Time is calculated as Datahold time = SendCycle * Datahold factor. If the Watchdog time has been expired, the Data Hold Time will checked. If the Data Hold Time also has been expired, the substitution values of the IOs will be used. For RT_Class_1 communication Data Hold Time and the Watchdog time are usually configured with the same value.	Datahold factor

PNIO configuration

This tab is a generic view of all PROFINET IO device parameters. It is normally hidden and is normally not needed for configuration.

Use this dialog only, if you need to change a parameter, which is not visible in other dialogs.

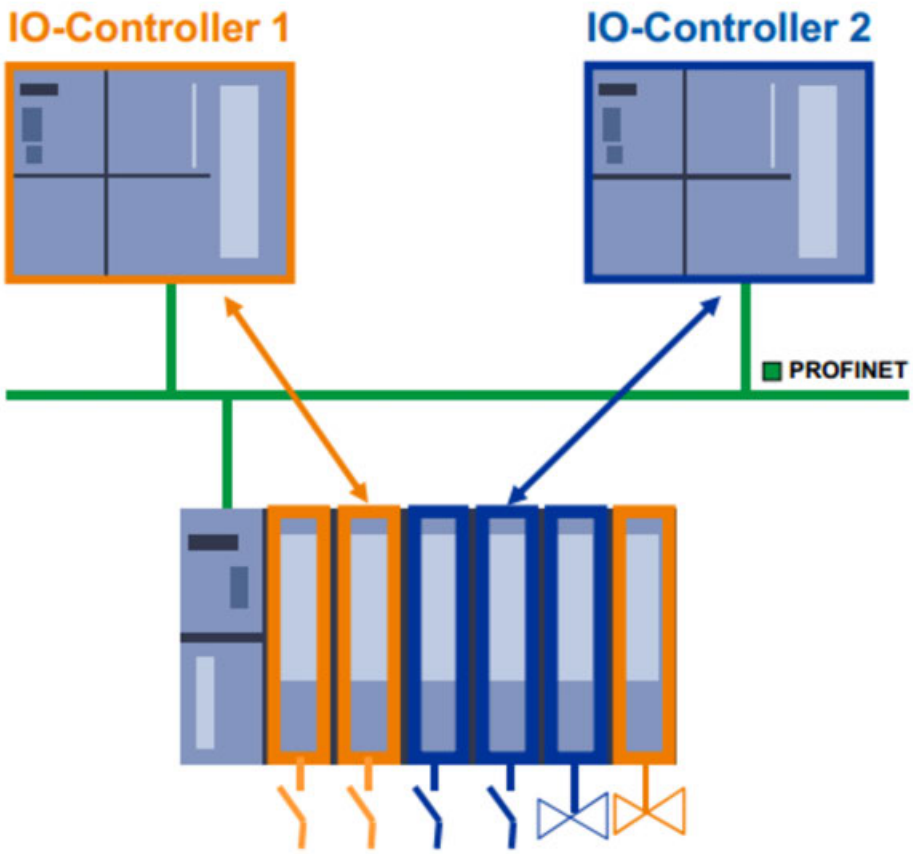
This dialog could be activated with the parameter *"Show generic device configuration views"* in the Automation Builder options (*"Tools ➔ Options ➔ Device editor"*).



Configuration of PROFINET shared device functionality

"PROFINET Shared Device Functionality" enables an IO device to be connected to more than one IO controller at the same time. In this situation the IO controllers share the IO devices IO modules/submodules to have access to the IO data. Each IO controller exclusively connects a set of IO modules/submodules as defined in its configuration. Accessing the same IO device modules/submodules by more than one IO controller in parallel is not allowed for Shared Device.

Following figure taken from *"PROFINET IO System Description"* as provided by PNO gives an impression about the concept of *"Shared Device Functionality"*.

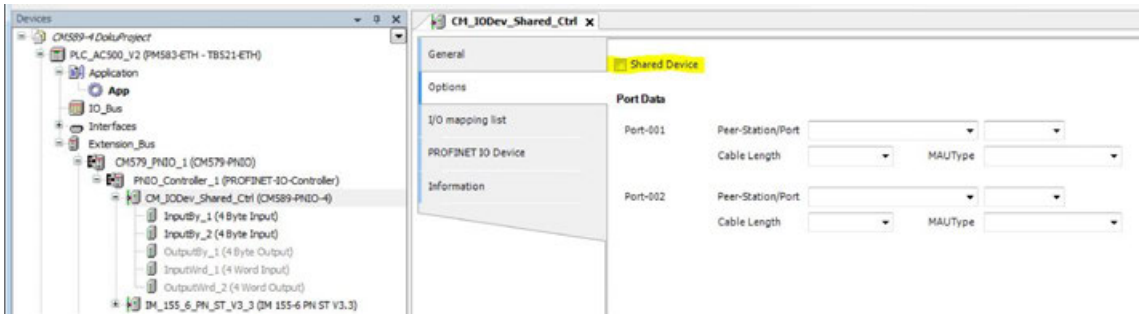


IO Controller 1 connects the modules labeled with orange color.
IO Controller 2 connects the modules labeled with blue color.

Each IO controller that should connect the shared IO device has to have this device configured in its device list. In Automation Builder all configurations of the shared IO device have to look the same at all IO controllers; all modules/submodules have to be configured in the same order. Each IO controller has to be configured which modules/submodules should be connected.

One of the IO controllers has to be defined as responsible to connect the IO device access point (DAP) with its assigned submodules. To do so Automation Builder provides the parameter *"Shared Device"*. This parameter can be found in the IO device configuration as part of the device list sub-tree of the IO controller. Parameter *"Shared Device"* defines which IO controller will connect the DAP and which IO controllers use the IO device just as shared device.

To connect the DAP this parameter must not be checked; at all other IO controllers this parameter has to be checked.



If this rule is not followed accurately the PROFINET communication will start anyway but the IO controllers / IO devices may signal errors.

Two possible error cases have to be considered:

Error Case 1	Effect
All IO controllers have parameter 'Shared Device' selected. Thus, no IO controller will connect the DAP to load related parameters.	No error will be signaled; PROFINET network will run with default parameters.

Error Case 2	Effect
More than one IO controller has parameter 'Shared Device' unselected. These IO controllers try to connect to the DAP in parallel.	One IO controller will succeed. The other IO controllers will fail but further modules/submodules can be connected with success. Communication will run to connected modules/submodules. The IO device responds with error signaling DAP's submodules as already connected.

In **Error case 2** IO controller and IO device specific diagnosis pages in Automation Builder, will show error information. See ↳ *Chapter 1.7.2.7.5.1 "IO controller views" on page 6408* and ↳ *Chapter 1.7.2.7.6 "CM579-PNIO PROFINET IO device views" on page 6413*.

In display *"CM579-PNIO PROFINET IO Device Views"* field *"Diagnosis state"* shows a text message describing the error. Basically this text depends on the type of device signaling the error. In case of *CM589-PNIO-4* the text *"The IO-Device reported a ModuleDiffBlock during connection establishment"* will be found.

Take care to have parameter "Shared Device" unselected at one IO controller device and have it selected at all other involved IO controller devices.

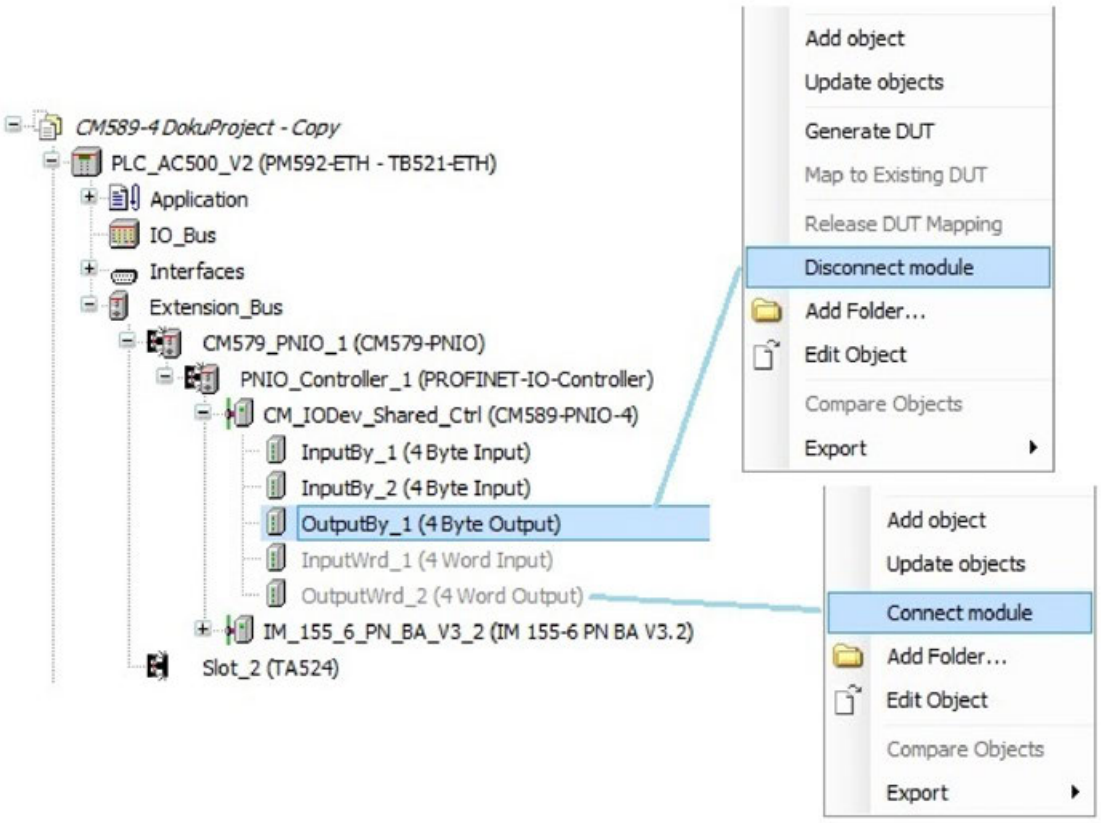
This rule also applies in case of using different Automation Builder projects or 3rd party IO controller devices.

The following workflow applies to configure an IO device to be connected by more than one IO controller as shared device:

- Add IO device at first IO controller
- Add list of IO modules as defined at IO device configuration itself
- Define set of IO modules to be connected by this IO controller
  - use function *"connect/disconnect"*
- Add same IO device the same way at further IO controllers
- Define set of IO modules to be connected for each of the further IO controllers
- Define one IO controller to be responsible to connect DAP
  - this may be a different IO controller outside this configuration
  - parameter *"Shared Device"* in Automation Builder; may be different approach at 3rd party tools

Inserting an IO module at a *"PROFINET IO device"* assigned to a *"CM579 IO controller"* defines this module as to be connected by default. If the module should not be connected by this IO controller this setting has to be adjusted. Via context menu at IO device module sub-tree Automation Builder provides the function *"disconnect module"* to define a certain module as not to be connected.

To define a not connected module as to be connected again the context menu shows the function *"connect module"*.



The module nodes that are configured to be connected will be shown in active state (black style). Modules not to be connected will be shown in in-active state (gray style).

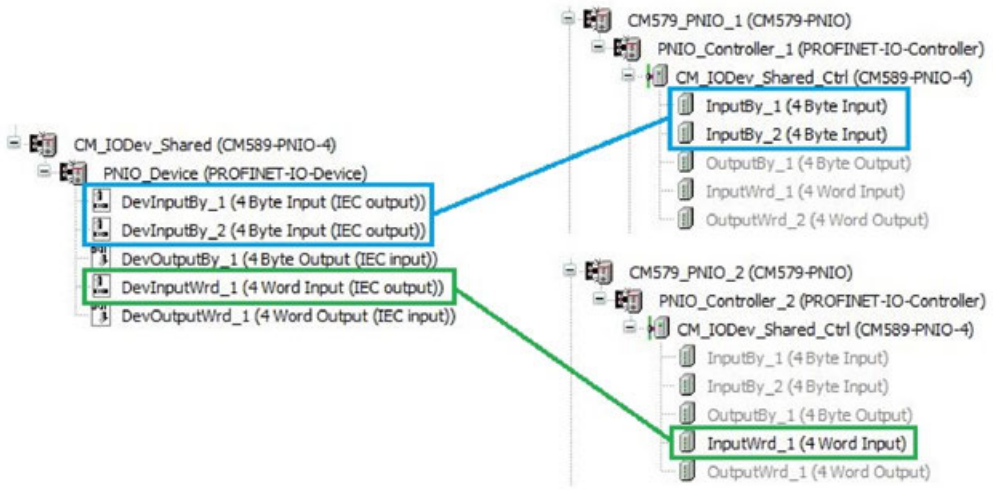
Once a PROFINET IO device is configured as child at an IO controller the IO device sub-tree (complete IO device or its module configuration) may be copied from one IO controller node to a different. The selection which modules should be connected has to be adjusted to the needs at the new position.

The following example shows a configuration of *"Shared Device"* usage by using one AC500 *"CM589-PNIO-4 IO device"* and two IO controllers represented by two ABB *"CM579-PNIO IO controller"* modules.

"CM579_PNIO_1" connects the modules *"InputBy_1"* and *"InputBy_2"* only; represented by *"CM589 PNIO_Device"* modules *"DevInputBy_1"* and *"DevInputBy_2"*.

"CM579_PNIO_2" connects module *"InputWrd_1"*; represented by *"PNIO_Device"* modules *"DevInputWrd_1"*.

The other modules are not connected here but may be connected from outside this configuration by an external IO controller.



In case of connecting the same module/submodule by more than one IO controller only the first connect will have success. All further connect attempts will fail. The IO device will reply to those attempts with a connect error. The effected IO controllers will show this error at their diagnosis interface.

See ↬ Chapter 1.7.2.7.5.1 “IO controller views” on page 6408 on how Automation Builder will show this diagnosis information.

In display *“CM579-PNIO PROFINET IO Device Views”* field *“Diagnosis state”* shows a text message describing the error. Basically this text depends on the type of device signaling the error. In case of *“CM589-PNIO-4”* the text *The IO-Device reported a ModuleDiffBlock during connection establishment* will be found.

Rules to be followed on using PROFINET “Shared Device” configurations:

- *All configurations of the IO device at IO controllers using this IO device have to look the same*
- *IP configuration (IP address, subnet mask) have to be the same*
- *Station name has to be the same*
- *Configure each IO module as to be connected at one single IO controller only*
- *Automation Builder is not able to check these details for consistency*

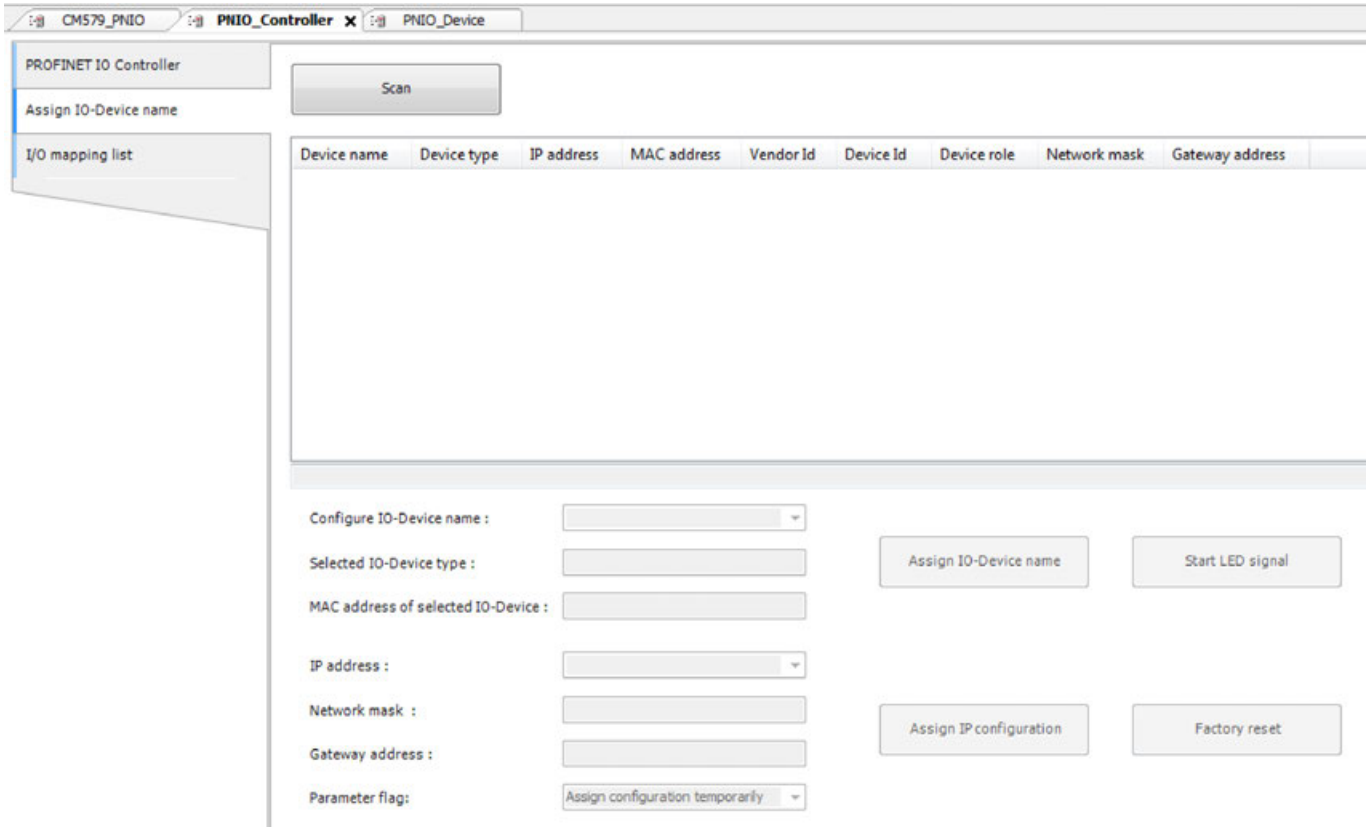
In case of using more than one single IO controller device in the same network take care to assign unique station names and IP addresses to these IO controller devices.

In case of having a configuration with overlapping module usage it cannot be foreseen which IO controller will connect to which module. The result of connecting the modules/submodules depends on the start-up sequence of the complete system. The IO controller running first will get the connection.

Name assignment of a PROFINET IO device

A *"PROFINET IO device"* is addressed with a system wide unique name.

This name is permanently stored in the device and must be assigned during the initial start-up of a PROFINET IO system.



Parameter	Description
Configure IO-Device name	Configure I/O device name
Selected IO-Device type	Selected I/O device type
MAC address of selected IO-Devices	MAC address of selected I/O devices
IP address	IP address
Network mask	Network mask
Gateway address	Gateway address
Parameter flag	Values: • Assign configuration temporarily: Store the IP configuration (IP address, network mask, gateway) temporarily. After powering off/on the configuration will be lost. • Assign configuration permanently: Store the IP configuration (IP address, network mask, gateway) permanently.

For name assignment to a PROFINET IO Device the following steps are necessary:

1. Configure the PROFINET IO controller and the PROFINET IO devices of your system as described in the previous sections of this chapter.
2. Configure a name for each *"PROFINET IO device"* in the PROFINET IO device parameter editor.
3. Configure a communication connection to AC500 in communication gateway.

4. Open the PROFINET IO controller parameter editor by double-clicking on the corresponding device. Open *“Assign IO-Device”* name.
5. Use the button *“Connect to PLC”* to open an online connection.
6. Perform PROFINET IO bus scan. All PROFINET IO devices, which are connected to the PROFINET IO controller, will appear in the device list after a while.
7. Select the desired PROFINET IO devices in the device list.
8. Select the desired name from the pull-down-box Configure station name. This box contains all names, which were configured in the PROFINET IO device parameter editor.
9. Press the button Assign station name to assign the desired name to the selected device.
10. Perform the steps 7 to 9 for all other devices, which have not yet a device name.

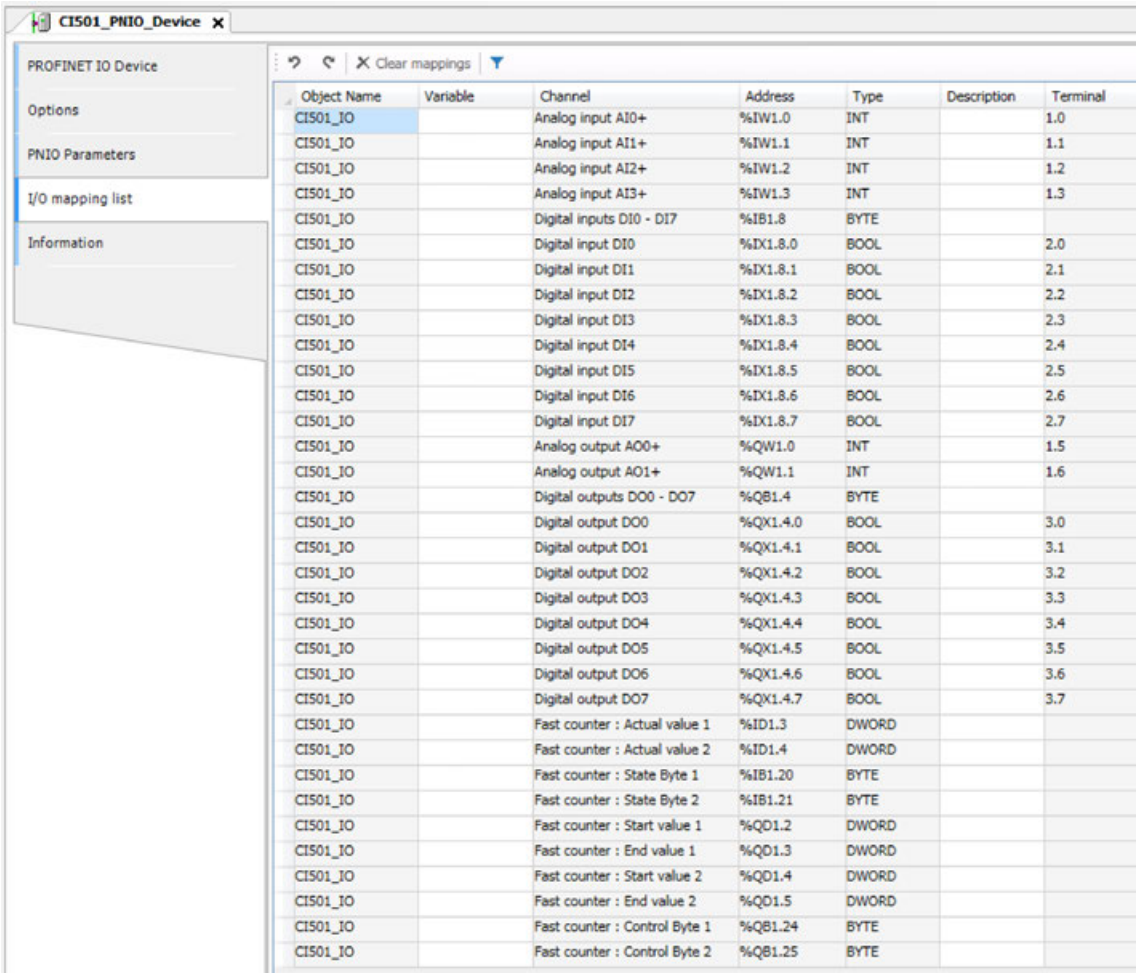
In addition to the name assignment, this dialog has the following functions:

- Start LED Signal:
  The button Start LED Signal can be used to find the device in the system. If it’s pressed the selected device will start blinking with it's LED.
- Factory reset:
  With this function a PROFINET IO device can be reset to factory settings.
- Assign IP configuration:
  The assignment of an ip address, network mask and gateway address can be performed in the same way as the name assignment. These values will be stored permanently in a device.

Mapping of the PROFINET IO devices

Doube-click on the *“PROFINET IO device”* or module in the configuration tree to open the configuration dialog.

Then select the mapping tab to show the current I/O mapping.



Object Name	Variable	Channel	Address	Type	Description	Terminal
CI501_IO		Analog input AI0+	%IW1.0	INT		1.0
CI501_IO		Analog input AI1+	%IW1.1	INT		1.1
CI501_IO		Analog input AI2+	%IW1.2	INT		1.2

See chapter Symbolic Names for Variables, Inputs and Outputs ↳ *Chapter 1.6.5.2.9.6 “Symbolic names for variables, inputs and outputs” on page 6060* for further details on mapping of inputs and outputs.

CM589-PNIO / CM589-PNIO-4 - PROFINET IO device communication module

CM589-PNIO / CM589-PNIO-4 - PROFINET IO device communication module

The configuration of the CM589-PNIO PROFINET IO device module has to be done in the following steps:

- Parameterization of the AC500 communication module interface ↳ *“Parameterization - CM interface” on page 5952*
- Parameterization of the PROFINET IO device protocol stack ↳ *“Parameterization - PROFINET IO stack” on page 5952*
- Configuring PROFINET IO device module structure ↳ *“Configuring PROFINET IO structure” on page 5952*
- Parameterization of the PROFINET IO device modules ↳ *“Parameterization - PROFINET IO device modules” on page 5953*
- Mapping of the I/Os ↳ *“Mapping of the I/Os” on page 5954*
- Configuration specific to CM589-PNIO-4 ↳ *“Configuration CM589-PNIO-4” on page 5955*

Configuration procedure for CM589-PNIO and CM589-PNIO-4 are basically the same. Thus this description refers to CM589-PNIO only. Differences between CM589-PNIO and CM589-PNIO-4 will be highlighted explicitly if necessary!

Parameterization - CM interface

For connecting a PLC as *"PROFINET IO device"*, plug *"CM589-PNIO / CM589-PNIO-4"* at the *"Extension_Bus"* node.

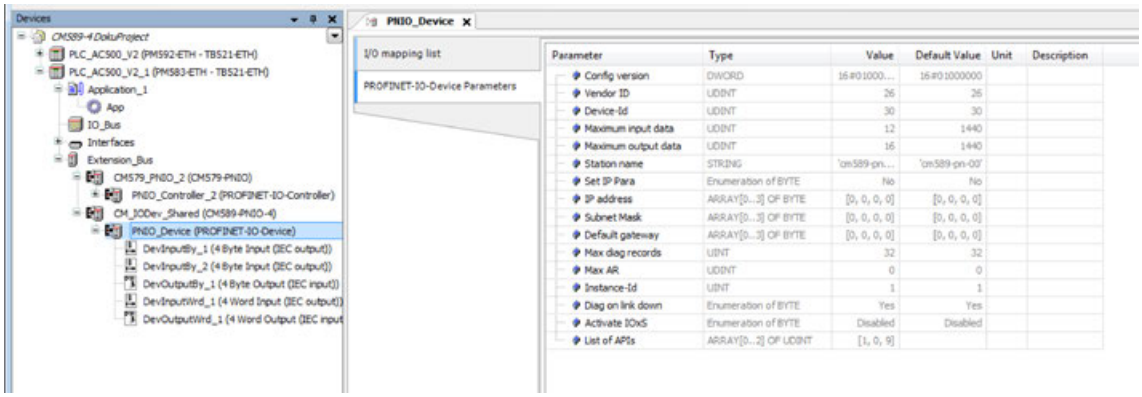
Double-click on *"CM589-PNIO"* to open the CM589-PNIO configuration in the editor window.

The following parameters are available:

Parameter	Default value	Value	Description
Run on config fault	No	No	In case of a configuration error, the user program is not started.
		Yes	The user program is started even in case of configuration error.
Min update time	10	0...20000	Update time of inputs and outputs in [ms].

Parameterization - PROFINET IO stack

"PROFINET IO device" protocol does not need user configuration. All needed parameters are set automatically by Automation Builder. Double-click on *"PROFINET IO device"* in tree view will show the parameter set in tab *"PROFINET IO device parameters"*. The parameters are displayed just for information and in read-only mode.

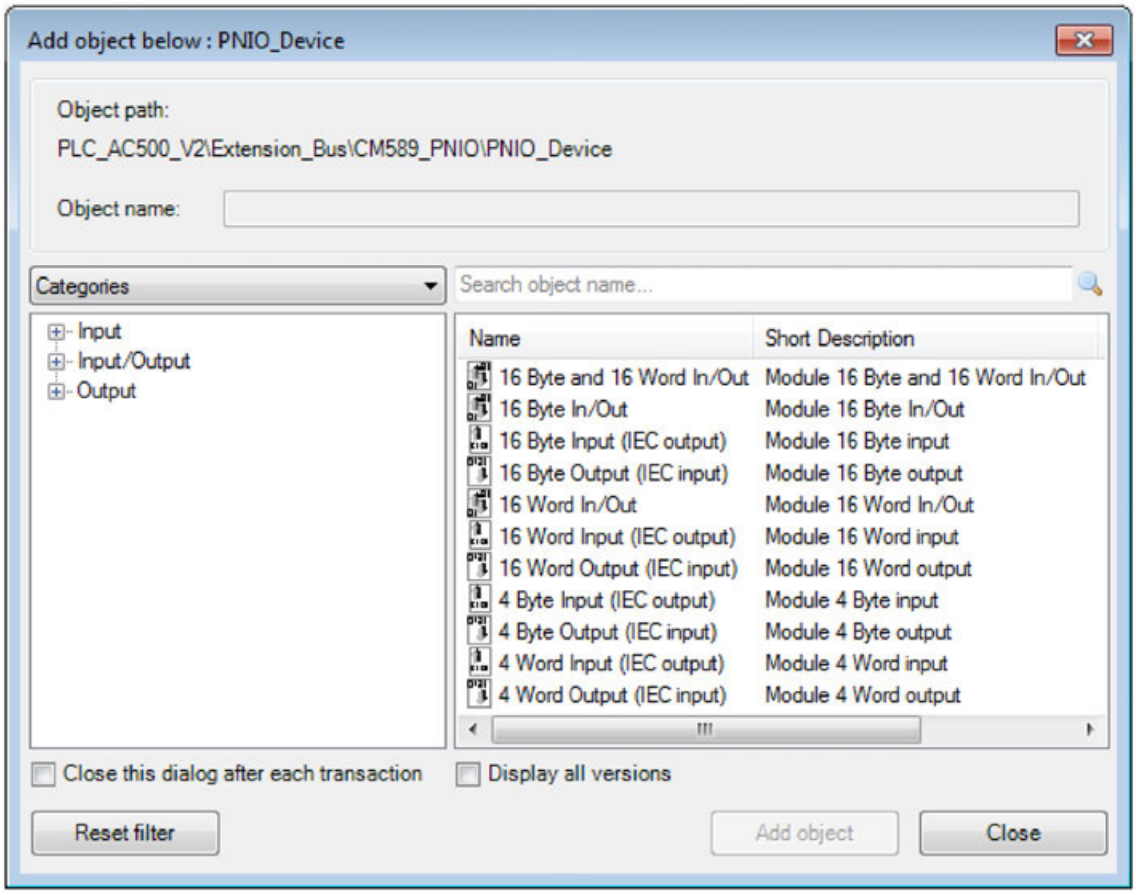


- *Station name: the default name is displayed. The real name used on acting at the field bus is combined out of this default name and the used setting of the rotary switches at the CM589 module ("cm589-pnio-00", "00" will be replaced by rotary switch value) or the name set via PROFINET set name service.*
- *Parameter "IP address", "Subnet Mask", "Default Gateway": the default values are displayed here. These values are not used as communication settings. "PROFINET IO controller" supplies the IO devices with IP settings on communication establishing.*

Configuring PROFINET IO structure

CM589-PNIO provides I/O data as modules with different data types and directions. Create an application specific I/O structure by compiling an appropriate combination of modules.

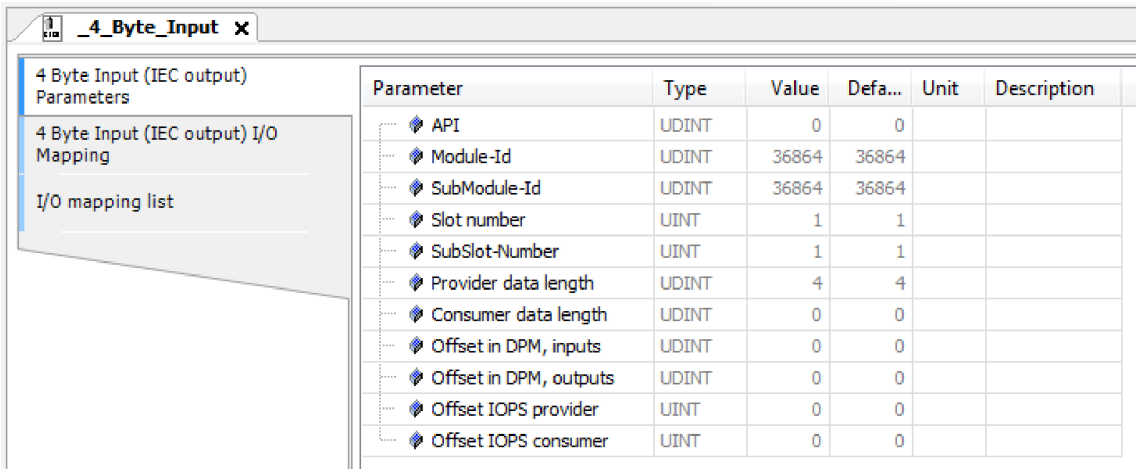
To assign I/O modules to *"PROFINET-IO-device"* node open *"Add Object"* dialog.



The maximum image size available for I/O data depends on CM589-PNIO modules FW revision (for details see *Chapter 1.6.2.4.9.2 “CM589-PNIO(-4) - PROFINET IO RT with 4 devices” on page 4089*). If FW revision run by connected CM589-PNIO module does not support the number of I/O data configured, download configuration will fail. See *“Calculating size of I/O data” on page 5954* how to calculate number of I/O data occupied by certain configuration.

Parameterization - PROFINET IO device modules

PROFINET-IO device modules do not need user configuration. All needed parameters are set automatically by Automation Builder. Double-click on a module node shows the parameter set just for information. This parameter set is identical for all module types and is displayed in read-only mode.



- *API: shows the API which is used by the CM589-PNIO modules. As API 0 is supported only CM589-PNIO modules do not provide configuration capabilities for this parameter*
- *Slot number, Sub-Slot-Number, Offset in DPM, inputs/outputs: will be set to default values on inserting a module. On creating configuration data Automation Builder calculates real values and overwrites the defaults*
- *Offset IOPS provider/consumer: not used and set to 0 values*

Calculating size of I/O data

PROFINET defines IO data and status information to be exchanged between IO controller and IO device. The status information is called *"Provider Status"* and *"Consumer Status"*. Both (IO data and status information) have to be considered on calculating allocated memory in input and output image.

- The number of status bytes depends on the type of module used.
- The different types of modules input, output and in/output have to be considered different.
- Some status bytes are reserved for predefined submodules have to be considered additionally.

A configured IO module allocates memory space at the corresponding IO image for data and status bytes. Additionally memory is allocated at the opposite directions IO image to store further status bytes. E.g. an input module allocates memory at the input image but additionally it allocates one byte for status at the output image. Summarized size of input and output data and status has to fit to the corresponding image.

See following table for an overview of IO module types and corresponding status bytes:

Module Type	**Input Data**			**Output data**		
	Inputs	**Provider Status Inputs**	**Consumer Status Outputs**	**Outputs**	**Provider Status Outputs**	**Consumer Status Inputs**
Reserved	0 Input Bytes	4 Bytes	0 Bytes	0 Bytes	0 Bytes	4 Bytes
Input Module (e.g. 4 Byte Input)	n Input Bytes	1 Byte	0 Bytes	0 Bytes	0 Bytes	1 Byte
Output Module	0 Input Bytes	0 Bytes	1 Byte	n Output Bytes	1 Byte	0 Bytes
Input/ Output Module	n Input Bytes	1 Byte	1 Byte	n Output Bytes	1 Byte	1 Byte

Following expressions calculate allocated sizes of input and output data:

Size Input =	**Input + Status + 4 bytes (reserved status)**
Size Output =	**Output + Status + 4 bytes (reserved status)**

- Input = summarized number input bytes all modules
- Output = summarized number output bytes all modules
- Status = count input modules + count output modules + 2 * count input/output modules

Mapping of the I/Os

Double-click on the desired *"PROFINET-IO-device"* module object in the device tree to show current I/O mappings connected to this module.

See chapter Symbolic Names for Variables, Inputs and Outputs *Chapter 1.6.5.2.9.6 "Symbolic names for variables, inputs and outputs" on page 6060* for further details on mapping inputs and outputs.

Configuration CM589-PNIO-4

CM589-PNIO-4 adds PROFINET *"Shared Device"* feature to already described CM589-PNIO device functionality. Thus CM589-PNIO-4 is able to communicate to 4 different PROFINET IO controllers in parallel.

Shared device usage of a CM589-PNIO-4 does not need to be considered on doing the configuration of the CM589-PNIO-4 communication module itself. It has to be considered only on doing the configuration of CM589-PNIO-4 as child to the CM579-PNIO IO controller. See *Chapter 1.6.5.2.6.7.1.5 "Configuration of PROFINET shared device functionality" on page 5945*.

CM579-ETHCAT - EtherCAT master communication module

AC500 CM579-ETHCAT - Communication module EtherCAT master

The configuration of the EtherCAT field bus has to be done in the following steps:

- Parameterization of the AC500 Communication Module Interface *Chapter 1.6.5.2.6.8.2 "Parameterization of the CM579-ETHCAT communication module interface" on page 5955*
- Configuration of the EtherCAT master *Chapter 1.6.5.2.6.8.3 "Configuration of the EtherCAT master" on page 5956*
- Configuration of the EtherCAT slaves *Chapter 1.6.5.2.6.8.4 "Configuration of the EtherCAT slaves" on page 5959*
- Mapping of the EtherCAT slave I/Os *Chapter 1.6.5.2.6.8.5 "Mapping of the EtherCAT slave I/Os" on page 5966*
- EtherCAT Sync - Synchronization of a PLC Task with the IO Image *Chapter 1.6.5.2.6.8.7 "EtherCAT Sync - Synchronization of a PLC task with the IO image" on page 5966*

Parameterization of the CM579-ETHCAT communication module interface

To append a Communication Module, add the Communication Module to the *"Extension_Bus"* node.

- Right-click the desired slot and select *"Add object"*.
- Select the Communication Module from the list and click *[Replace object]*.

- Double-click on *"CM579_ECAT (CM579-ECAT)"* to open the CM579-ECAT configuration in the editor window.

The following parameters are available:

Parameter	Default value	Value	Description
Run on config fault	No	No	In case of a configuration error, the user program is not started.
		Yes	The user program is started independent of a faulty configuration of the EtherCAT Communication Module.
Max wait run	3000	3000	Maximum wait time for the Master to build up the communication relation to the slaves. A restart to build up the communication is initiated as long as BootUpTime has not run out.

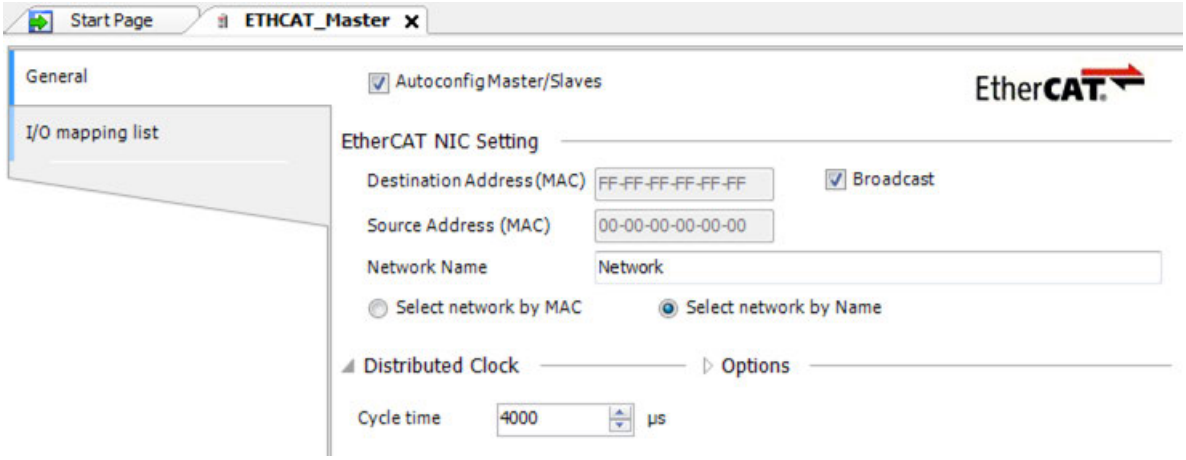
Parameter	Default value	Value	Description
Min update time	10	0...20000	Priority of the data exchange between CPU and Communication Module. This parameter should never be set to values under 10, otherwise important sequences in the CPU might be influenced.
Broken slave behavior	Leave all broken slaves down	Leave all broken slaves down	Broken slaves will not be served.
		Leave addressless slaves down	Only slaves without address will be left down.
		Leave no slaves down	Broken slaves will be ignored.
Distributed clocks	Inaktiv	Inactive	Distributed clocks are inactive.
		Active	Distributed clocks are active.
BootUpTime	10000	10000	Maximum wait time for the slaves to boot completely. This absolute time value must be a multiple of Max wait run. It defines the time in which Max wait run is restarted to wait for the slaves to boot up completely. The multiplication ratio between Max wait run and BootUpTime can be interpreted as number of trials to boot up the slaves.

Configuration of the EtherCAT master

To append a Communication Module, add the Communication Module to the *“Extension_Bus”* node.

- Right-click the desired slot and select *“Add object”*.
- Select the Communication Module from the list and click *[Replace object]*.

- Double-click the added object to open the Master configuration in the editor window.



The following parameters are available:

Parameter	Default	Value	Description	Parameter (Remark 1 *Further information on page 5956*)
Autoconfig Master/Slaves Remark 2 *Further information on page 5956*:	Enabled	Disabled	The automatic configuration is disabled.	Autoconfig
		Enabled	The configuration parameters are set automatically based on the given device description and network topology. Normally the parameters do not have to be modified for standard applications.	
Ethercat NIC Setting				
Destination Address (MAC)	FF-FF-FF-FF-FF-FF	Valid MAC address	Parameter Destination Address (MAC) determines the MAC address of the participant of the EtherCAT network which should receive the telegrams. If option Broadcast is activated, no specific address must be entered.	DestAddress1 and DestAddress 2
Source Address (MAC)	00-00-00-00-00-00	Valid MAC address	Parameter Source Address (MAC) determines the MAC address of the system.	SrcAddress1 and SrcAddress2
Network Name	empty	String	Parameter Network Name determines the network name of the system.	NetworkName
		Select network by MAC	If this option is selected, the network is selected by the MAC address determined by parameter Source Address (MAC).	SelectNetworkByName = FALSE
		Select network by Name	If this option is selected, the network is selected by the network name determined by parameter Network Name.	SelectNetworkByName = TRUE
Broadcast	Enabled	Disabled	The destination address is not the broadcast address. The parameter Destination Address (MAC) must be edited.	-
		Enabled	The destination address is set to broadcast address FF-FF-FF-FF-FF-FF. The parameter Destination Address (MAC) can not be edited.	
Distributed Clock				

Parameter	Default	Value	Description	Parameter (Remark 1 *Further information on page 5956*)
Cycle time	4000	0...10000	Period of time in [µs] after which a new data telegram is to be sent on the bus. If the Distributed Clock functionality is activated, the master cycle time will be transferred to the slave clocks. Thus an accurate synchronization of data exchange can be reached, which is particularly important in cases where spatially distributed processes require simultaneous actions (e.g. in applications where several servo axes carry out coordinated movements simultaneously). So a very precise network-wide timebase with a jitter of significantly less then 1 microsecond can be achieved.	MasterCycleTime
Options				
Use LRW instead of LWR/LRD	Disabled	Disabled	Slave-to-slave communication is not allowed.	MasterUseLRW
		Enabled	Slave-to-slave communication is allowed.	
Enable messages per task	Disabled	Disabled	This parameter is currently not supported.	EnableTaskMessage
		Enabled		
Auto restart slaves	Disabled	Disabled	This parameter is currently not supported.	
		Enabled		
Master Setting (only available if AutoconfigMaster/Slaves option is disabled)				
Image In Address	16#10880	16#00000000... 16#FFFFFFFF	Parameter Image In Address determines the first logical address of the first slave for input data.	ImageInAddress and ImageInLength
Image Out Address	16#10000	16#00000000... 16#FFFFFFFF	Parameter Image Out Address determines the first logical address of the first slave for output data.	ImageOutAddress and ImageOutLength

Remark 1: Tab CM579-Master Configuration

The parameters in this column are shown in tab EtherCAT Configuration which is only visible if the parameter Show generic device configuration views is activated (open the Options dialog window with menu item Tools -> Options, parameter is located under section Device editor):

Master | EtherCAT Configuration | Information

Parameter	Type	Value	Default Value	Unit	Description
Autoconfig	DWORD	0	1		Automatic configuration
MasterCycleTime	DWORD	10000	4000		Master Cycle Time
MasterUseLRW	BOOL	FALSE	FALSE		Master uses LRW command
SlaveAutorestart	BOOL	FALSE	FALSE		Slave restarts automatically
SlaveCheckMode	USINT	0	0		Mode for vendor product check
NetworkName	STRING(100)	''	''		Name of the network card
SelectNetworkByName	BOOL	True	FALSE		Select network by name
EnableTaskMessage	BOOL	FALSE	FALSE		Enable transmission per task
NumberOfOutputSlaves	DWORD	0	0		Number of Slaves with an Output
NumberOfInputSlaves	DWORD	0	0		Number of Slaves with an Input
SrcAddress1	DWORD	0	0		Two zero Bytes and the First Two Bytes of the Source Address
SrcAddress2	DWORD	0	0		Lower 4 Bytes of the Source Address
DestAddress1	DWORD	65535	65535		Two zero Bytes and the First Two Bytes of the Destination Address
DestAddress2	DWORD	4294967295	4294967295		Lower 4 Bytes of the Destination Address
ImageOutAddress	DWORD	1048575	65536		Address of the Output
ImageOutLength	DWORD	0	0		Length of the Output
ImageInAddress	DWORD	4294967295	67584		Address of the Input
ImageInLength	DWORD	0	0		Length of the Input

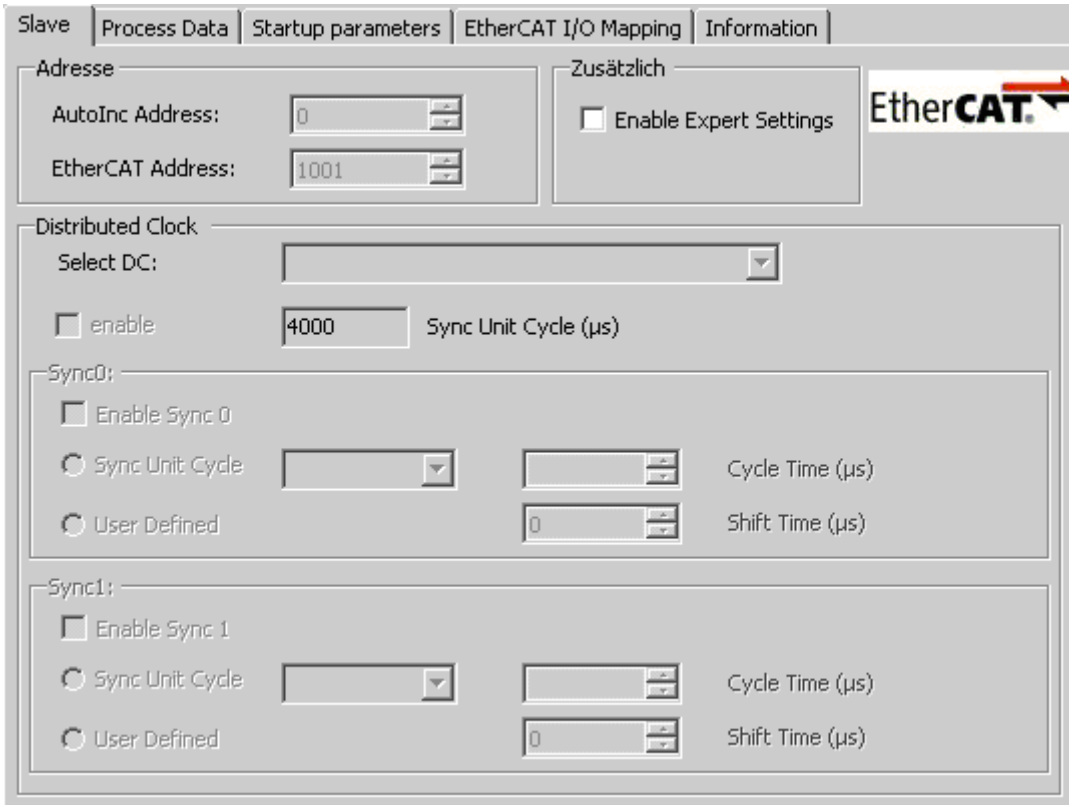
The table shows all configuration parameters.

Remark 2: Autoconfig

The autoconfig mode is activated by default and usually sufficient and strongly recommended for standard applications. If the option is deactivated, all configuration settings for the Master and the Slave(s) will have to be done manually and expert knowledge is required. For the configuration of a slave-to-slave communication the autoconfig option has to be deactivated.

Configuration of the EtherCAT slaves

Double-click on a EtherCAT slave module in the device tree:



All parameters are set to the device-specific standard values by default. To edit the parameters enable the *“Enable Expert Settings”* check box. This option also displays detailed parameters.

The following parameters are available:

Parameter	Default	Value	Description	Parameter (Remark 1 ↯ *Further information on page 5959*)
Address				
AutoInc Address	0	0...65535	Autoincremental address (16-bit), defined by the position of the slave in the network. This address is only used during startup, when the master is assigning the EtherCAT addresses to the slaves. When for this purpose the first telegram runs through the slaves, each run-through slave increases its AutoInc Address by 1. The slave with address 0 finally will receive the data. Possible input for example "-8".	General -> AutoIncr Address of the Slave
EtherCAT Address	0	0...65535	Final address of the slave, assigned by the master during startup. This address is independent from the position in the network.	General -> Physical Address of the Slave
Additional				
Enable Expert Settings	Disabled	Disabled	Expert settings are not editable.	-
		Enabled	Expert settings are editable.	
Distributed Clock				
Select DC	-	-	The drop-down menu provides all settings for distributed clocks provided by the device description file. Currently this parameter is deactivated.	-
Enable	Disabled	Disabled	The distributed clock is not enabled. The parameter setting for Sync0 and Sync1 are disabled and unused.	Distributed_Clock -> DC enable
		Enabled	The distributed clock is enabled. The parameter settings for Sync0 and Sync1 are enabled and can be edited.	

Parameter	Default	Value	Description	Parameter (Remark 1 ↳ *Further information on page 5959*)
Sync Unit Cycle (µs)	Device-specific	Device-specific	If the Distributed Clock functionality is enabled, the data exchange cycle time, displayed in the field Sync Unit Cycle (µs) will be determined by the master cycle time. Thus the master clock can synchronize the data exchange within the network. The master cycle time for the distributed clock can be determined by editing parameter Cycletime of section Distributed Clock in the Master editor window.	Parameter of the Master
Sync 0				
Enable Sync 0	Disabled	Disabled Enabled	Sync 0 is currently not supported.	Distributed_Clock -> DC sync0 enable
Sync Unit Cycle	x 1	/ 16 .. x 16		Distributed_Clock -> DC sync0 factor
Cycle time (µs)	-	0..2^{32}-1		Distributed_Clock -> DC sync0 cycletime
User defined	-	-		-
Shift Time (µs)	0	0..2^{32}-1		Distributed_Clock -> DC sync0 shift time
Sync 1				
Enable Sync 1	Disabled	Disabled Enabled	Sync 1 is currently not supported.	Distributed_Clock -> DC sync1 enable
Sync Unit Cycle	-	-		Distributed_Clock -> DC sync1 factor
Cycle time (µs)	-	0..2^{32}-1		Distributed_Clock -> DC sync1 cycletime
User defined	-	-		-
Shift Time (µs)				Distributed_Clock -> DC sync1 shift time

Parameter	Default	Value	Description	Parameter (Remark 1 ↳ *Further information on page 5959*)
Startup checking				
Check Vendor ID	Enabled	Disabled	The vendor ID is not checked against the current configuration settings.	General -> CheckVendorID
		Enabled	The vendor ID is checked against the current configuration settings. If a mismatch is detected the bus will be stopped and no further actions will be executed.	
Check Product ID	Enabled	Disabled	The product ID is not checked against the current configuration settings.	General -> CheckProductID
		Enabled	The product ID is checked against the current configuration settings. If a mismatch is detected the bus will be stopped and no further actions will be executed.	
Timeouts				
SDO Access	1000	0...10000	Timeout for sending SDO list at system startup in [ms].	General -> Timeout SDO Access
I -> P	1000	0...10000	Timeout for switch from mode Init to mode Preoperational in [ms].	General -> Timeout Init
P -> S / S -> O	10000	0...10000	Timeout for switch from mode Preoperational to Safe Operational resp. from Safe Operational to Operational in [ms].	General -> Timeout Preop to Safeop
DC cyclic unit control: assign to local µC				
Cyclic Unit	Disabled	Disabled	DC cyclic unit control is currently not supported.	-
		Enabled		
Latch Unit 0	Disabled	Disabled		
		Enabled		
Latch Unit 1	Disabled	Disabled		
		Enabled		
Station alias				
Enable (read-only)	Disabled	Disabled	Station alias is currently not supported.	-
Value (read-only)	0	0		-

Remark 1:

The parameters in this column are shown in tab EtherCAT Configuration which is only visible if parameter Show generic device configuration views is activated (open the Options dialog window under *"Tools ➔ Options ➔ Device editor"*).

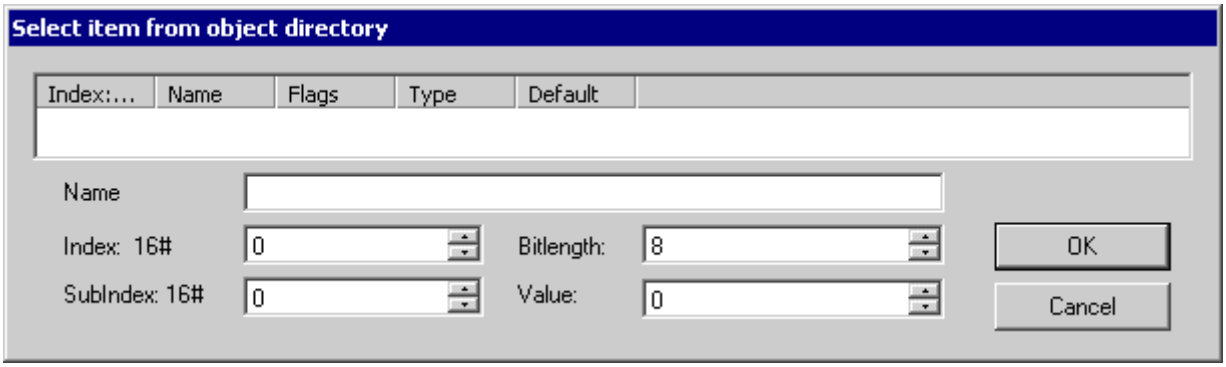
The following parameters are available:

Parameter	Default value	Value	Description
Startup parameters table columns			
Line	Device-specific	Device-specific	The line number of the parameter.
Index:Subindex	Device-specific	Device-specific	The index and the subindex of the parameter.
Name	Device-specific	Device-specific	The name of the parameter.
Value	Device-specific	Device-specific	The configured value of the parameter.
Bitlength	Device-specific	Device-specific	The length of the parameter in [bit].
Abort if error	Device-specific	Device-specific	If parameter Abort if error is activated the transfer will be terminated on error detection.

Parameter	Default value	Value	Description
Jump to line if error	Device-specific	Device-specific	If parameter Jump to line if error is activated, the transfer will be continued with the line which is set in parameter Next line in case of an error.
Next line	0	1 ... number of lines	The parameter Next line determines the line with which the transfer will be continued in case of an error if the parameter Jump to line if error is activated.
Comment	"	String	The parameter Comment shows a comment text of the corresponding line.
Buttons			
Move up	-	-	The order (top-down) in the startup parameters table represents the sequence in which the parameters will be transferred to the module. Button Move up shifts up the selected entry.
Move down	-	-	The order (top-down) in the startup parameters table represents the sequence in which the startup parameters will be transferred to the module. Button Move down shifts up the selected entry.
New... Remark 1 ↳ *Further information on page 5959*	-	-	The button New... opens the Select item from object directory to add a startup parameter entry to the table.
Delete...	-	-	The button Delete... deletes the currently selected line from the table.
Edit Remark 1 ↳ *Further information on page 5959*	-	-	The button Edit... opens the Select item from object dictionary dialog where it can be edited.

Remark 1

The dialog *"Select item from object dictionary"* shows all entries defined in the EtherCAT XML file:



The dialog allows editing the available startup parameters before adding them to the table. New entries can be created and edited which are not defined in the XML file.

Mapping of the EtherCAT slave I/Os

Double-click on the EtherCAT slave device in the device tree and select the mapping tab to show the current I/O mapping.

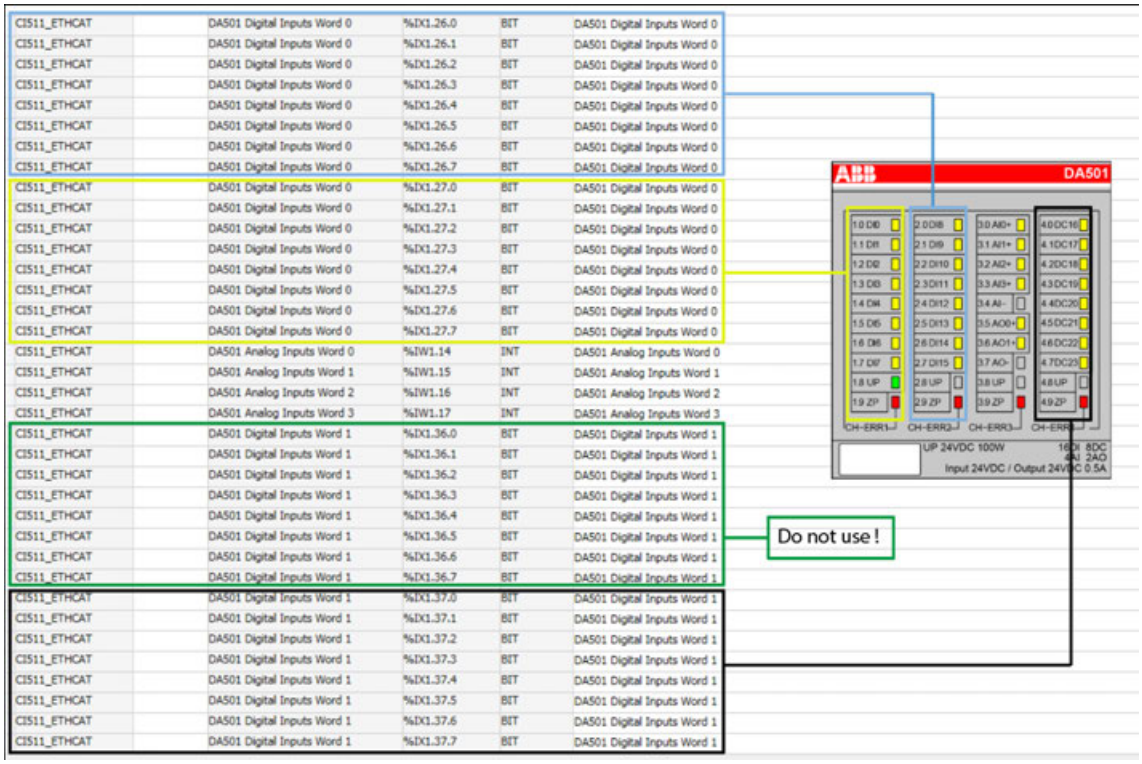
See Symbolic Names for Variables, Inputs and Outputs for further details on mapping of inputs and outputs *Chapter 1.6.5.2.9.6 “Symbolic names for variables, inputs and outputs” on page 6060*.

EtherCAT Master configuration of DA501

NOTICE!

Special attention is required for configuration of DA501 devices on EtherCAT networks:

- The order of the I/O channels in the Automation Builder I/O mapping editors is different from the order on the device
- The Automation Builder I/O mapping editors contain internal I/O channels that are not available on the device and must not be used in the configuration and application



EtherCAT Sync - Synchronization of a PLC task with the IO image

The EtherCAT master CM579-ETHCAT supports the synchronization of a PLC task with the IO image. For the configuration of EtherCAT Sync Automation Builder and the task configuration is used. Configuration of EtherCAT Sync is described in *Chapter 1.6.4.2.4.6.2 “EtherCAT sync” on page 5569*.

Configuration

☑ To configure EtherCAT synchronization perform the following steps:

1. Configure the EtherCAT master. ↳ *Chapter 1.6.5.2.6.8.3 “Configuration of the EtherCAT master” on page 5956*
2. Configure the EtherCAT slaves. This is identically to configuration in unsynchronized mode. ↳ *Chapter 1.6.5.2.6.8.4 “Configuration of the EtherCAT slaves” on page 5959*
3. ↳ *Chapter 1.6.5.2.6.8.7.1.1 “Configuration of the bus cycle time” on page 5967*
4. ↳ *Chapter 1.6.5.2.6.8.7.1.2 “Configuration of the master synchronization mode” on page 5967*
5. ↳ *Chapter 1.6.5.2.6.8.7.1.3 “Configuration of PLC task and synchronization mode” on page 5967*

Configuration of the bus cycle time

The bus cycle time can be set with the parameter "bus cycle time" which is part of the node CM579-ETHCAT of PLC configuration tree. It has a range from 0.5 ms to 20 ms.

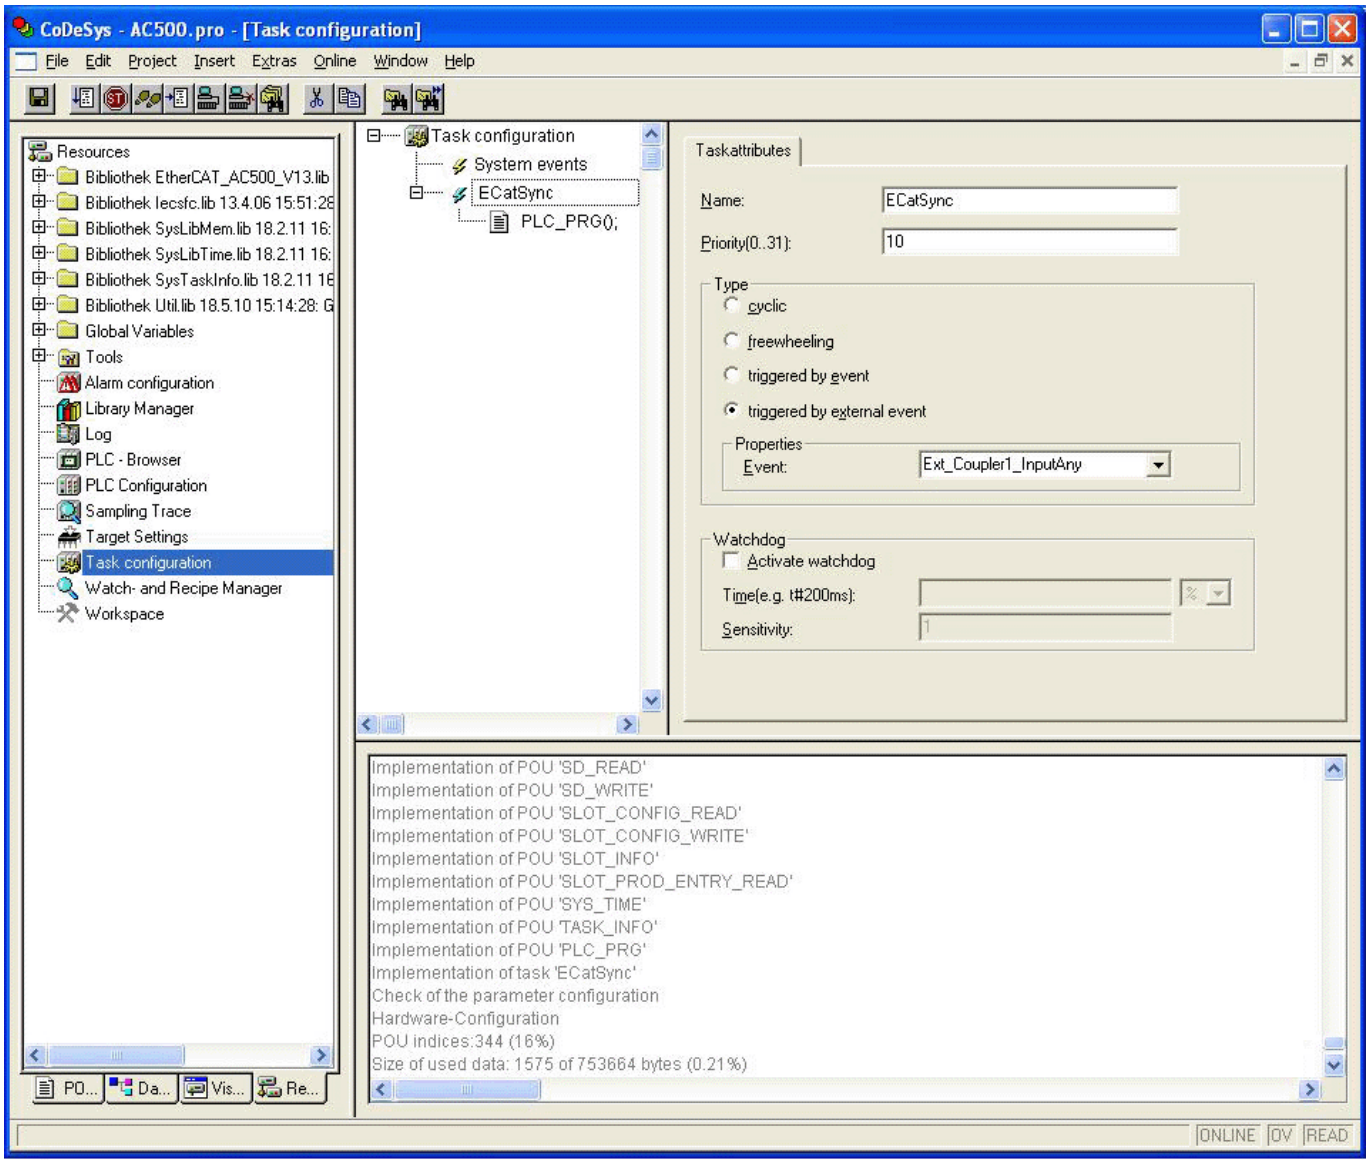
Configuration of the master synchronization mode

The EtherCAT can operate in "Cyclic mode" or "DC mode". The operation mode can be selected with the parameter "distributed clock" which is part of node CM579-ETHCAT of PLC configuration tree.

Parameter	Value	Description
Distributed clocks	Inactive	Cyclic mode
	Active	DC mode

Configuration of PLC task and synchronization mode

In Automation Builder the PLC program is written and assigned to a PLC task. For task creation and parameterization the dialog "task configuration" is used.



The task configuration is evaluated when a PLC project is loaded and the corresponding sync mode is activated for the EtherCAT master. The synchronization will be activated if the parameter task type is set to the value "triggered by external event". The mode of synchronization can be selected with the parameter event. Between the value of the parameter event and the synchronization mode exists the following relationship:

Parameter	Value	Description
Event	Ext_CouplerX_InputAny	Sync mode 1
	Ext_CouplerX_Input2Any	Sync mode 2
	Ext_CouplerX_InputAny_high_prio	Sync mode 1 with increased priority
	Ext_CouplerX_Input2Any_high_prio	Sync mode 2 with increased priority

1.6.5.2.7 Communication interface modules

Configuration of communication interface modules

Automation Builder can be used to configure the parameters of CI5xx devices.

Configuration of S500 I/O modules can be performed without CI5xx devices connected.

Adding CI5xx device to the device tree

1. Right click in the device tree on the node *“Slot1”* or *“Slot2”* of the *“Extension_Bus”* and click *“Add object”*.
   ⇨ The window *Replace object : Slot <...>* opens.
2. Select your *CM5xx master module* and click *[Add object]*.
   ⇨ The *CM5xx master* appears in the Slot.
3. Right click on the *CM5xx master module* and click *“Add object”*.
   ⇨ The window *Add object below : <...>_Master* opens.
4. Select your *“CI5xx”* device and click *[Add object]*.
   ⇨ The *“CI5xx”* device appears in your device tree.

Adding S500 I/O modules

1. Right click on your *“CI5xx”* device and click *[Add object]*.
   ⇨ The window *Add object below:* opens.
2. Select your I/O module and click *[Add object]*.
   ⇨ The I/O module is added.

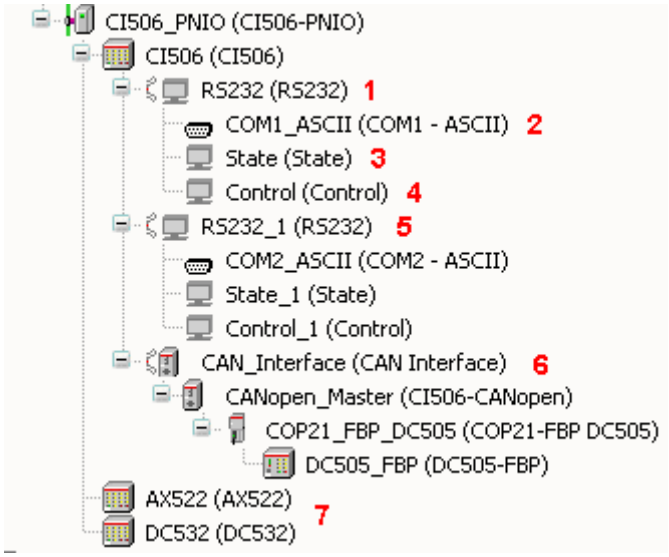
Configure parameters

▷ Double-click the *“CI5xx”* device to open editors and select the *“CI5xx_IO Parameters”* tab.

This editor shows the parameters that can be set for each device. For more information see ↳ *Chapter 1.6.2.8 “Communication interface modules (S500)” on page 4681*, and ↳ *Chapter 1.6.2.6 “I/O modules” on page 4124*.

CI504-PNIO/CI506-PNIO

Device tree



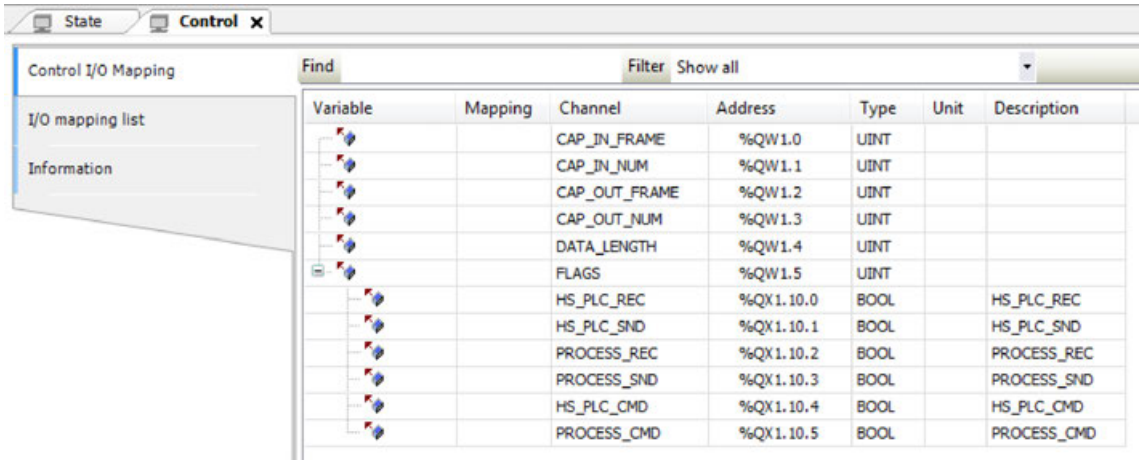
Remarks:

- The different hardware layers (RS-232, RS-485, RS-422) are configurable by plugging of corresponding module.
- For configuration of "COM1 ASCII", see The Setting "COMx ASCII" ↳ *Chapter 1.6.5.2.11.3 “Setting COMx - ASCII” on page 6100*.
- For inputs of serial (or raw CAN) interface see explanation below.
- For outputs of serial (or raw CAN) interface see explanation below.
- For configuration of "COM2 ASCII", see The Setting "COMx ASCII" ↳ *Chapter 1.6.5.2.11.3 “Setting COMx - ASCII” on page 6100*.
- For configuration of the CANopen master and underlying CANopen network, see Communication Module CANopen manager ↳ *Chapter 1.6.5.2.6.6.1.1 “CM598-CN - CANopen manager communication module” on page 5913*.

  => CANopen master is not available for CI504-PNIO. Instead a 3rd serial interface is available (configuration is the same as configuration of COM1)

  => CANopen master can be replaced by raw CAN (CAN 2A / CAN2B) at CI506-PNIO

Outputs of serial (or Raw CAN) interface



Variable	Mapping	Channel	Address	Type	Unit	Description
		CAP_IN_FRAME	%QW1.0	UINT		
		CAP_IN_NUM	%QW1.1	UINT		
		CAP_OUT_FRAME	%QW1.2	UINT		
		CAP_OUT_NUM	%QW1.3	UINT		
		DATA_LENGTH	%QW1.4	UINT		
		FLAGS	%QW1.5	UINT		
		HS_PLC_REC	%QX1.10.0	BOOL		HS_PLC_REC
		HS_PLC_SND	%QX1.10.1	BOOL		HS_PLC_SND
		PROCESS_REC	%QX1.10.2	BOOL		PROCESS_REC
		PROCESS_SND	%QX1.10.3	BOOL		PROCESS_SND
		HS_PLC_CMD	%QX1.10.4	BOOL		HS_PLC_CMD
		PROCESS_CMD	%QX1.10.5	BOOL		PROCESS_CMD

Name of Output	Type of Output	Description
CAP_IN_FRAME	UINT	Reserved for future use
CAP_IN_NUM	UINT	Reserved for future use
CAP_OUT_FRAME	UINT	Reserved for future use
CAP_OUT_NUM	UINT	Reserved for future use

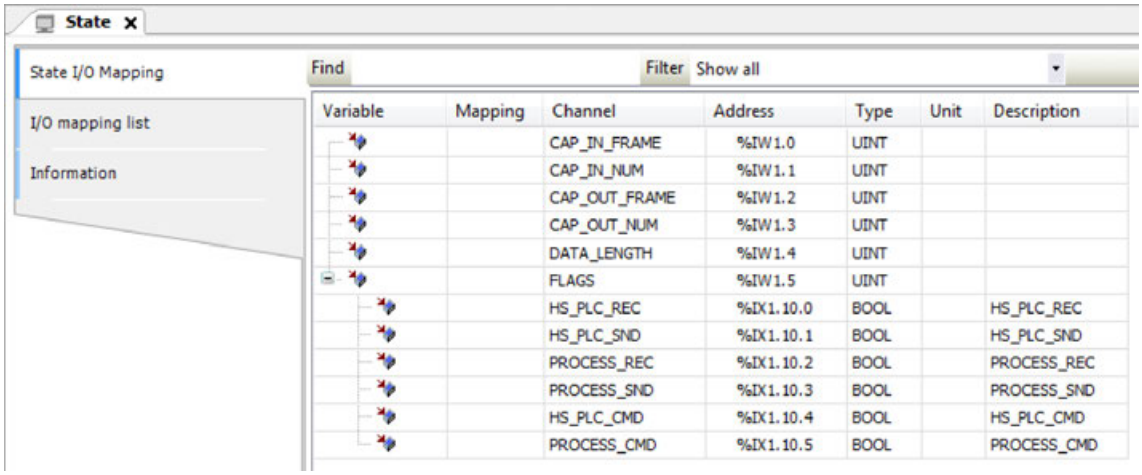
FLAGS	UINT	Reserved for function blocks - DO NOT USE

Inputs of serial (or Raw CAN) interface



Name of Input	Type of Input	Description
CAP_IN_FRAME	UINT	Remaining free capacity in the serial transmission FIFO (in frames)
CAP_IN_NUM	UINT	Remaining free capacity in the serial transmission FIFO (in bytes)
CAP_OUT_FRAME	UINT	Occupied level in serial reception FIFO (in frames)
CAP_OUT_NUM	UINT	Occupied level in serial reception FIFO (in bytes)
DATA_LENGTH	UINT	Reserved for function blocks - DO NOT USE
FLAGS	UINT	Reserved for function blocks - DO NOT USE

CI521-MODTCP/CI522-MODTCP

Unbundled CI52x-MODTCP configuration

Automation Builder can be used to configure the parameters of CI52x-MODTCP devices.

A direct Ethernet connection is required between the PC running Automation Builder and the CI52x-MODTCP module.

Configuration of S500 I/O modules can be performed without CI52x-MODTCPs modules connected.

Start a project from template

1. Select *"New Project"* in menue item *"File"*.
   ⇨ The window *"New Project"* appears.
2. Select the *"CI52x-MODTCP Configuration Project"* and click *"OK"*.
   ⇨ The window *"Select PLC"* opens.
3. Select a *"CI52x-MODTCP"* device and click *"Add device"*.
   ⇨ A project is created. More modules can be added.

Add CI52x-MODTCP to a project

1. Right click in the device tree on the root of the *"Project"* and click *"Add object"*.
   ⇨ The window *"Add object below"* opens.
2. Select *"Modbus devices"* and click *"Add object"*.
   ⇨ The node*"Modbus_devices"* appears in your device tree.
3. Right click on the node *"Modbus_devices"* and click *"Add object"*.
   ⇨ The window *"Select PLC"* opens.
4. Select your *"CI52x-MODTCP"* device and click *"Add device"*.
   ⇨ The *"CI52x-MODTCP"* device appears in your device tree.

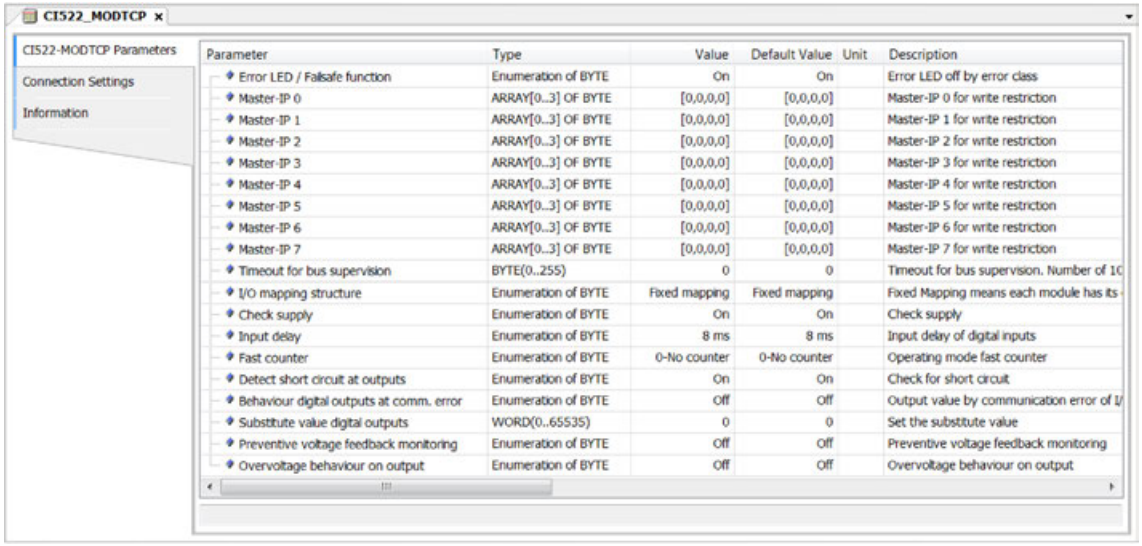
Add S500 I/O modules

1. *"Add object"* to your *"CI52x-MODTCP"* device.
   ⇨ The window *"Add object below: CI52x-MODTCP"* opens.
2. Select your I/O module and click *"Add object"*.
   ⇨ The I/O module is added.

Configure parameters

▷ Double-click the device to open editors and select the *"CI52x-MODTCP Parameters"* tab.

This editor shows the parameters that can be set for each device. For more information see *Chapter 1.6.2.8.5.1.7.1 "Parameters of the module" on page 4884* CI521, *Chapter 1.6.2.8.5.2.7.1 "Parameters of the module" on page 4914* CI522 and *Chapter 1.6.2.6 "I/O modules" on page 4124*.

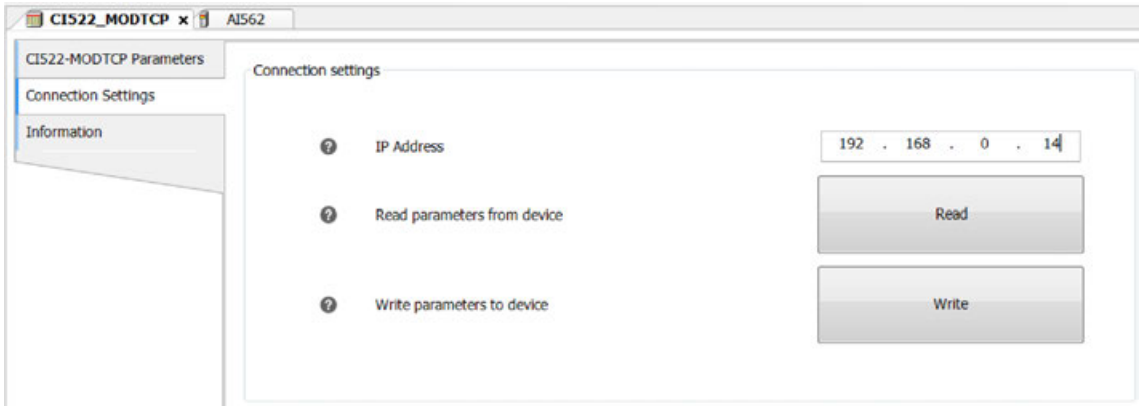


Connect to device

To read or write parameters, the CI52x-MODTCP module must be connected to the PC with an Ethernet connection.

See *Chapter 1.6.2.8.5.1.5 "Addressing" on page 4883* CI521 and *Chapter 1.6.2.8.5.2.5 "Addressing" on page 4914* CI522 of the CI52x-MODTCP hardware documentation for information on configuring the IP address of the device.

On the CI52x-MODTCP device editor, the *"Connection Settings"* tab allows the IP address of the device to be entered.



Read Reads the parameters from the CI52x-MODTCP and also for the attached S500 I/O modules.

Write Sends the parameters from the editors to the CI52x-MODTCP and also the S500 I/O modules.

Device checking

The CI52x-MODTCP module knows which I/O modules are attached.

While reading and writing parameters, the project must match the physical hardware. Otherwise an error will be given.

Communication errors will also result in error messages.

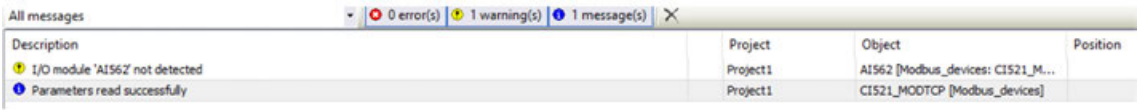
When the parameters have been read or written correctly, a message is seen in the *"All messages"* window:

Attached S500 modules

It is possible to read and write parameters when the S500 I/O modules are not attached to the CI52x-MODTCP module.

> *To perform a read, the project structure must still match the configuration of CI52x-MODTCP.*

A warning will be shown if an I/O module is not detected:



When writing parameters, the CI52x-MODTCP configuration is overwritten so the current configuration of missing (unplugged) modules does not matter.

If the I/O modules are attached, then the project must match the hardware, otherwise an error will be given.

Firmware update

As of Automation Builder 2.2.1, the IP Configuration Tool can be used to perform firmware updates for CI52x-MODTCP devices.

1.6.5.2.8 Function modules

DC541-CM interrupt and counter module

The function module DC541-CM can be used for a wide variety of control tasks. It can be configured to act for example as an interrupt I/O, as a fast counter or to provide pulse width modulation functionality.

Configuration in Automation Builder is mainly identical, however, programming with the provided function blocks differ. All necessary function blocks for DC541-CM programming are available in the *Chapter 1.5.4.11 “DC541 library” on page 1103*.

Details on the hardware is provided in the device descriptions *Chapter 1.6.2.6.1.2.4 “DC541-CM - Digital input/output module” on page 4290*.

General Automation Builder configuration

1. In the device tree, add the object *“DC541-CM”* (Extension Bus -> Slot).
2. Double-click the added object and configure the I/O channels.

   The following parameters are available:

Parameter	Default value	Value	Description
Run on config fault	No	No	In case of a configuration error, the user program is not started.
		Yes	The user program is started even if the internal Ethernet communication module is configured incorrectly.
Do not delete config on Reset (original)	On	On	The configuration of the DC541-CM is not deleted in case of a reset (original).
		Off	In case of a reset (original), the configuration of the DC541-CM is deleted, too.
Num edges ignore input 0	0	0...255	Number of edges that may occur at input 0 without initiating the interrupt task, if channel C0 is configured as interrupt input.
Watchdog	On	On	Mutual time monitoring between the CPU and the DC541-CM is switched on.
		Off	No time monitoring.

Depending on the desired use case of the function module DC541-CM, the appropriate operating mode is to be defined. For this, add a new object to the *“DC541-CM”* node and select an operating mode.

Usage as interrupt I/O device

Cycle time modification

Function blocks for the most module functions of DC541-CM are contained in the library DC541_AC500_V11.lib. The library is automatically included into the project and is described in detail in the library documentation ↬ *Chapter 1.5.4.11 “DC541 library” on page 1103*.

Access to the channels configured as normal inputs and outputs is performed using the function block ↬ *Chapter 1.5.4.11.1.1.8 “DC541_IO” on page 1139.*

The module's cycle time is set automatically depending on its channel configuration. The following values are possible for the cycle time:

CYCLE

Data type	Default value	Range	Unit
WORD	-	-	µs

CYCLE (cycle time) output displays the cycle time of the device. The cycle time is set during the device configuration and can have the following values depending on the channel configuration:

Parameter		Description	Value
IO device			50 µs
Counting device		1-2 functions	50 µs
		3-4 functions	100 µs
		5-8 functions	200 µs
"Functions"			
	PWM	Pulse-width modulator	
	FREQ	Time and frequency measurement	
	FREQ_OUT	Frequency output	
	32BIT_CNT	32-bit counter	
	FWD_CNT	32-bit count up counter	
	LIMIT	Limit value monitoring for the 32-bit counter	

The used cycle time can be read at output CYCLE of the block *Chapter 1.5.4.11.1.1.6 “DC541_GET_CFG” on page 1132*.

The following table shows an overview of all possible combinations.

Configured as	Function/ can be configured for channel	C0	C1	C2	C3	C4 to C7	Max. number of channels for this function	Remark and reference to alternative combinations (a and b)
Mode 1: Interrupt function; mutually exclusive with mode 2 (counting functions).								
Interrupt	Dig. input	1	1	1	1	4	8	Each channel can be configured individually as interrupt input or output.
	Interrupt inp.	1	1	1	1	4	8	
	Dig. output	1	1	1	1	4	8	
Mode 2: Counting functions and multifunctional I/Os; mutually exclusive with mode 1 (interrupt functions).								
Multi-function I/Os, PWM, counters,	Dig. input	1	1	1	1	4	8	Normal input
	Dig. output	1	1	1	1	4	8	Normal output

Config-ured as	Func-tion/ can be con- fig-ured for channel	C0	C1	C2	C3	C4 to C7	Max. number of chan-nels for this function	Remark and ref-erence to alter-native combi-nations (a and b)
time and fre-quency meas-uring	PWM, resolu-tion 10 kHz	1	1	1	1	4	8	Outputs a pulsed signal with an adjust-able on-off ratio.
	Fre-quency output, resolu-tion 2.5 kHz	1	1	1	1	4	8	Outputs an adjust-able fre-quency (endless output or output of a speci-fied number of pulses).

Config-ured as	Func-tion/ can be con- fig-ured for channel	C0	C1	C2	C3	C4 to C7	Max. number of chan-nels for this function	Remark and ref-erence to alter-native combi-nations (a and b)
	Up/down counter, 50 kHz	1	1	OK *1)	OK *1)	OK *1)	2	*1) a) Both channels (0 and 1) config-ured as 50 kHz counter => Chan-nels 2 to 7 can be config-ured as digital I/Os. b) Only one channel (0 or 1) config-ured as 50 kHz counter => Second channel can be config-ured as counter < 50 kHz or for time/ fre-quency meas-urement with a max. resolu-tion of 200 µs. The remainin g chan-nels (2 to 7) can be con-figured as digital I/Os.

Config-ured as	Func-tion/ can be con- fig-ured for channel	C0	C1	C2	C3	C4 to C7	Max. number of chan-nels for this function	Remark and ref-erence to alter-native combi-nations (a and b)
	Up/down counter, 5 kHz	1	1	1	1	OK *2)	4	*2) a) Four channels (0 to 3) config-ured as 5 kHz counter => Chan-nels 4 to 7 can be config-ured as digital I/Os. b) Only a portion of the 4 channels (0 to 3) config-ured as 5 kHz counter => The other ones (of channels 0 to 3) can be config-ured as desired: as 2.5 kHz counter or for time/ fre-quency meas-urement with a max. resolu-tion of 200 µs or as digital I/Os. The remainin

The remaining channels (2

Config-ured as	Func-tion/ can be con- fig-ured for channel	C0	C1	C2	C3	C4 to C7	Max. number of chan-nels for this function	Remark and ref-erence to alter-native combi-nations (a and b)
								to 7) can be con-figured as digital I/Os.
	Time/ fre-quency meas-urement, resolu-tion 200 µs	1	1	1	1	4	8	Times, frequen-cies and rota-tional speeds are meas-ured with a max. resolu-tion of 200 µs.

Config-ured as	Func-tion/ can be con- fig-ured for channel	C0	C1	C2	C3	C4 to C7	Max. number of chan-nels for this function	Remark and ref-erence to alter-native combi-nations (a and b)
High-speed counter	Up/down 32-bit counter, 50 kHz max.	Channels 0 to 3: Track A, track B, zero track, touch trigger				OK *6)	1	For con-nection of an incre-mental trans-mitter. For sig-nals up to 50 kHz. This fre-quency corre-sponds to a motor with a rota-tional speed of 3000 rpm. The counter always uses the first 4 channels (0 to 3). *6) The remainin g chan-nels (4 to 7) can be con-figured as limit values, as 5 kHz coun-ters, for time/ fre-quency meas-urement with a resolu-tion of 200 µs or as digital I/Os.

Config-ured as	Func-tion/ can be con- fig-ured for channel	C0	C1	C2	C3	C4 to C7	Max. number of chan-nels for this function	Remark and ref-erence to alter-native combi-nations (a and b)
	Axis of rotation (endless counting)	1				OK *7)	1	"End-less" for-ward counting. An over-flow occurs corre-sponding to the 32-bit value. *7) The remainin g chan-nels can be con-figured as limit values, as 5 kHz coun-ters, for time/ fre-quency meas-urement with a resolu-tion of 200 µs or as digital I/Os.

Config-ured as	Func-tion/ can be con- fig-ured for channel	C0	C1	C2	C3	C4 to C7	Max. number of chan-nels for this function	Remark and ref-erence to alter-native combi-nations (a and b)
	32-bit counter incl. sign	1				OK *8)	1	*8) The remainin g chan-nels can be con-figured as limit values, as 5 kHz coun-ters, for time/ fre-quency meas-urement with a resolu-tion of 200 µs or as digital I/Os.
	Limit values for 32-bit counter	OK *9)				1	1	Various counting values of the 32-bit counter can be dis-played directly via these outputs. *9) In this case, the channels 0 to 3 are used as 32-bit coun-ters.

Creating an interrupt task for the interrupt inputs

If one or more channels of DC541-CM are configured as interrupt inputs, a corresponding interrupt task has to be created to enable the processing of the interrupt(s).

For this purpose, a new task has to be added in the task configuration of Automation Builder:

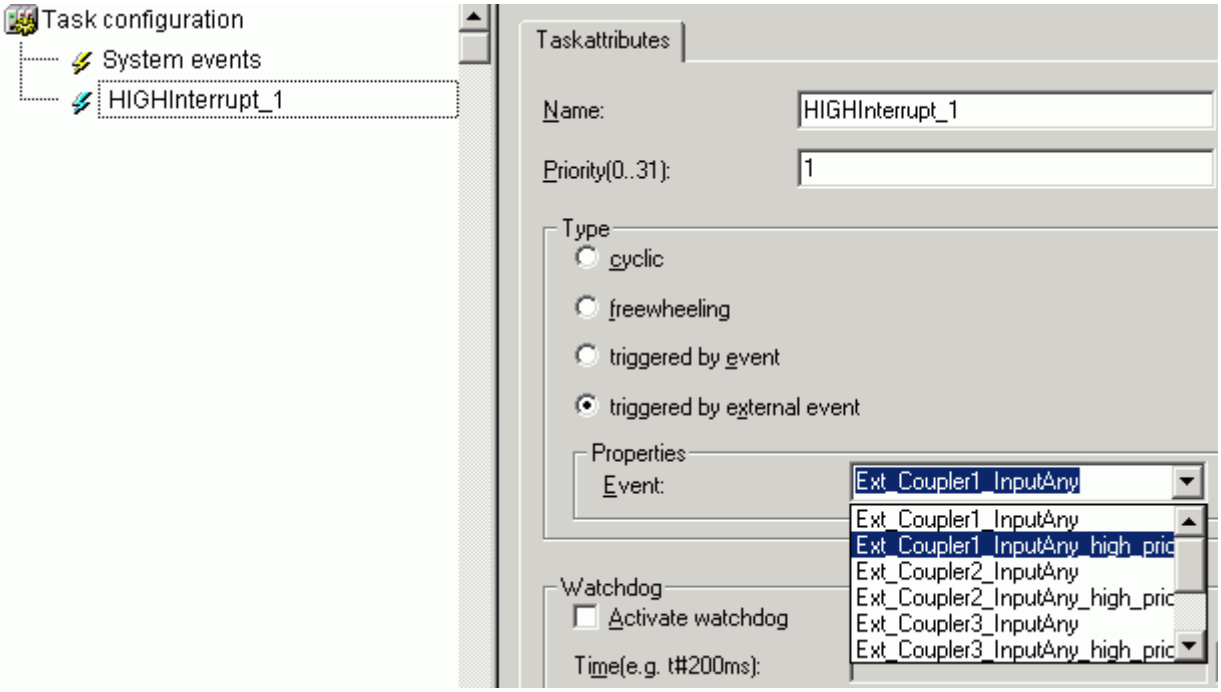
- Enter the task name
- Set the task type to "triggered by external event"
- Specify the event that triggers the task

For each Communication Module slot, two types of interrupt tasks are available in the Event list box:

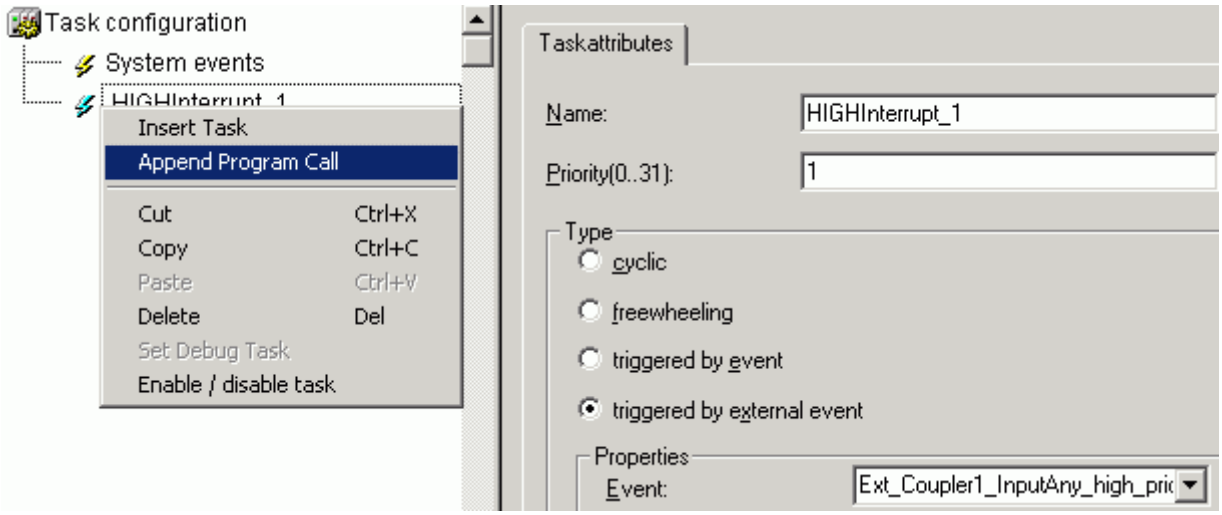
- Ext_Communication ModuleX_InputAny:
  The task is triggered by any interrupt from Communication Module slot X with the priority specified in the Priority field (0...31).
- Ext_Communication ModuleX_InpuAny_high_prio:
  The task is triggered by any interrupt from Communication Module slot X with highest priority, i.e. with a priority higher than the max. adjustable "0" and higher than the priority of the communication task. In this case, the priority (0...31) specified in the Priority field is without any significance.

> *If the interrupt task is started with highest priority, the program execution time must not be longer than approx. 400 µs. Otherwise online access is no longer possible.*

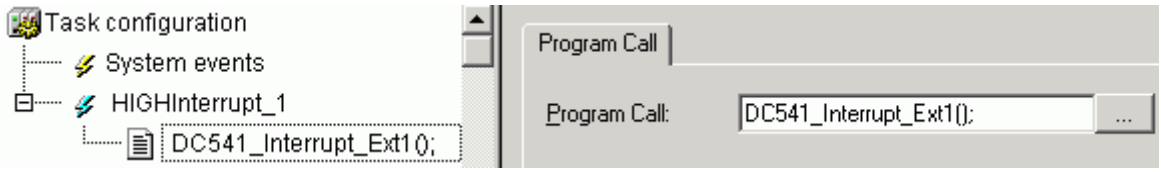
In the example below, the task is named HIGHInterrupt_1, meaning that it is a high-priority interrupt from Communication Module slot 1. The task type is "external event triggered" and the event to trigger the task is "Ext_Communication Module1_InputAny_high_priority".



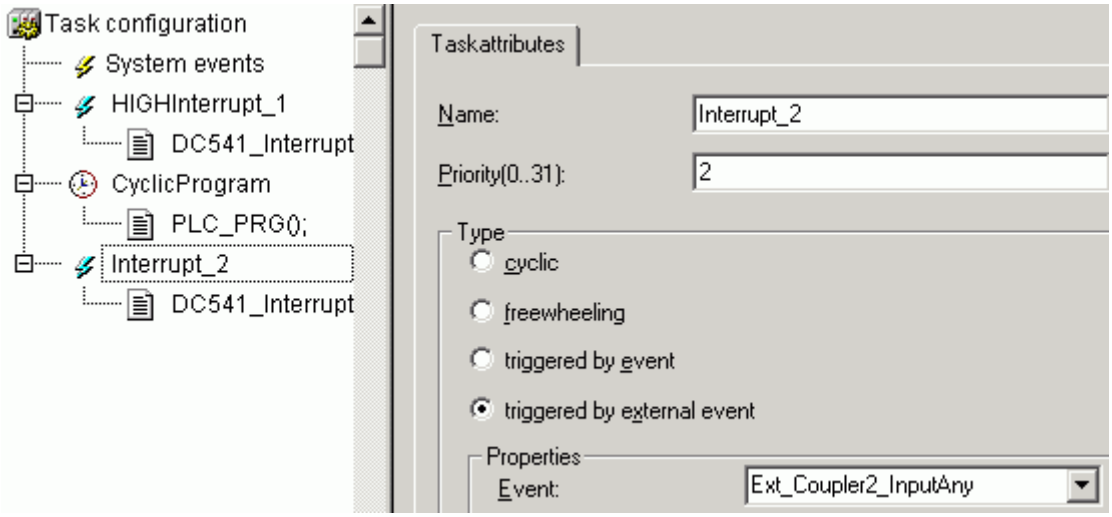
Like for all other tasks, a program call has to be assigned to the task.



In the example, the program DC541_Interrupt_Ext1() shall be started with any interrupt from Communication Module slot 1.



The task configuration for an AC500 equipped with two DC541-CM modules inserted in the Communication Module slots 1 and 2 and containing one cyclically running "background program" PLC_PRG could for example look as follows. Here, an interrupt from slot 1 should start the program DC541_Interrupt_Ext1 with high priority, an interrupt from slot 2 should start the program DC541_Interrupt_Ext2 with priority 2:



Structure of the interrupt program

The following blocks contained in the library DC541_AC500_V11.lib are available for the interrupt program:

- ↳ *Chapter 1.5.4.11.1.1.7 “DC541_INT_IN” on page 1136* Determination of the interrupt initiating source
- ↳ *Chapter 1.5.4.11.1.1.8 “DC541_IO” on page 1139* Reading and writing of channels C0...C7

It is possible to start one interrupt task per Communication Module slot. This task can be started by any channel (C0...C7) configured as interrupt input. Therefore, it is necessary for the interrupt program to differentiate which channel(s) triggered the interrupt in order to enable the processing of the corresponding actions.

The information whether a channel (C0...C7) has triggered an interrupt since the last call of the block is provided by the outputs IN0...IN7 of the block *Chapter 1.5.4.11.1.1.7 “DC541_INT_IN” on page 1136*. This is why this block always has to be called at the beginning of the interrupt program, if more than one channel is configured as interrupt input.

The access to the channels configured as inputs or outputs is done using the block DC541_IO. Therefore, it makes sense to call this block at the beginning of the interrupt program in order to read the inputs and at the end of the interrupt program in order to write the outputs.

--Configuration example: DC541-CM used as interrupt I/O device

Hardware configuration

The example control system shall have the following configuration:

- Terminal base TB521 (two Communication Module slots)
- DC541-CM in Communication Module slot 1 (first slot on the left of the CPU)
- PM591-ETH
- I/O module DC532 on the I/O Bus

Wiring

The channels are connected as follows:

DC532 / C16 ---------- DC541 / C0

DC532 / C17 ---------- DC541 / C1

DC532 / C18 ---------- DC541 / C2

DC532 / C19 ---------- DC541 / C3

DC532 / C20 ---------- DC541 / C4

DC532 / C21 ---------- DC541 / C5

PLC configuration

- DC541-CM in slot 1, operating mode "IO mode"

- Configuration:	Channels	C0...C4	Interrupt input
	Channel	C5	Input
	Channels	C6...C7	Outputs

- Specification of the Ethernet communication module as internal communication module (if available)
- DC532 on the I/O bus

Task configuration

- Task 1: Cyclic program / Prio = 10 / Interval = t#10ms / PLC_PRG
- Task 2: HIGHInterrupt_1 / DC541_Interrupt_Ext1()

DC541_Interrupt_Ext1()

The interrupt program should fulfill the following functionality:

- Counting of all interrupts
- Counting of the interrupts per input
- Calculation of the interrupt frequency in [Int/s]
- Reporting of the number of interrupts per input
- Input C4: Resetting the counters
- Input C5: Input

- Output C6: Status of input C5
- Output C7: Toggle output

The declaration part of the program looks as follows:

```
PROGRAM DC541_Interrupt_Ext1
VAR
    dwIntCount          : DWORD;                    (* count all interrupts *)
    dwIntCountOld       : DWORD;                    (* start value for next measure *)
    tActual             : TIME;                     (* systemtick in ms *)
    tStart              : TIME;                     (* start value of systemtick for next calculation *)
    dwUsedTime          : DWORD;                    (* time for 1000 interrupts in ms *)
    dwFrequenz          : DWORD;                    (* interrupt frequency in [Int / sec] *)
    DC541_IntSource     : DC541_INT_IN;             (* instance FB: read interrupt source *)
    DC541_Ios           : DC541_IO;                 (* instance FB: read/write inputs/outputs *)
    dwCount_InX         : ARRAY[0..cbyDC541_IntInp] OF DWORD;   (* count interrupts of In0..In3 *)
    dwCount_InXOld      : ARRAY[0..cbyDC541_IntInp] OF DWORD;   (* start value for next 1000 interrupts *)
    dwIntHisto          : ARRAY[0..cbyDC541_IntInp, 0..cbyDC541_MaxHist] OF DWORD;   (* histo data C0...C3 *)
    wIndex              : WORD;                     (* index for histo data *)
    byInd               : BYTE;                     (* loop index *)
END_VAR
VAR CONSTANT
    cbyDC541_SLOT       : BYTE := 1;                (* SLOT number of DC541 *)
    cbyDC541_MaxHist    : BYTE := 9;                (* max number of histo entries *)
    cbyDC541_IntInp     : BYTE := 4;                (* number of interrupt inputs -1 *)
END_VAR
```

The instruction part looks as follows:

At the beginning, the interrupts are counted in dwIntCount. After each 1000 interrupts, a calculation of the frequency is performed and the counting values for the interrupts per input are stored.

dwIntCount := dwIntCount + 1;		(* count all interrupts *)
IF dwIntCount - dwIntCountOld >= 1000 THEN		(* after 1000 interrupts -> calculate frequency *)
	dwIntCountOld := dwIntCount;	(* save dwIntCount for next call *)
	tActual := TIME();	
	dwUsedTime := TIME_TO_DWORD(tActual - tStart);	(* duration in ms for 1000 interrupts *)
	dwFrequenz := 1000000 / dwUsedTime;	(* [Interrupt / sec] 1000 Int * 1000 ms/sec *)
	tStart := tActual;	(* for next measure *)
	dwIntHisto[0,wIndex] := dwCount_InX[0] - dwCount_InXOld[0];	(* IN0 interrupts of last 1000 *)
	dwCount_InXOld[0] :=dwCount_InX[0];	(* start value for next measure *)
	dwIntHisto[1,wIndex] := dwCount_InX[1] - dwCount_InXOld[1];	(* IN1 interrupts of last 1000 *)
	dwCount_InXOld[1] :=dwCount_InX[1];	(* start value for next measure *)
	dwIntHisto[2,wIndex] := dwCount_InX[2] - dwCount_InXOld[2];	(* IN2 interrupts of last 1000 *)
	dwCount_InXOld[2] :=dwCount_InX[2];	(* start value for next measure *)
	dwIntHisto[3,wIndex] := dwCount_InX[3] - dwCount_InXOld[3];	(* IN3 interrupts of last 1000 *)
	dwCount_InXOld[3] :=dwCount_InX[3];	(* start value for next measure *)
	wIndex := wIndex + 1;	(* increase index *)
	IF wIndex > cbyDC541_MaxHist THEN wIndex := 0; END_IF;	(* reset index, if >1000 *)
END_IF; (* 1000 Interrupts *)		

After this, the block DC541_INT_IN is called to identify the interrupt source and then the interrupt counters of the channels are updated depending on the outputs of this block.

```
(* Read interrupt source --> if output  = TRUE --> interrupt since last call *)
DC541_IntSource(EN := TRUE, SLOT := cbyDC541_SLOT);
(* count the interrupts for each interrupt input C0..C3 *)
dwCount_InX[0] := dwCount_InX[0] + BOOL_TO_DWORD(DC541_IntSource.IN0);
dwCount_InX[1] := dwCount_InX[1] + BOOL_TO_DWORD(DC541_IntSource.IN1);
dwCount_InX[2] := dwCount_InX[2] + BOOL_TO_DWORD(DC541_IntSource.IN2);
dwCount_InX[3] := dwCount_InX[3] + BOOL_TO_DWORD(DC541_IntSource.IN3);
dwCount_InX[4] := dwCount_InX[4] + BOOL_TO_DWORD(DC541_IntSource.IN4);
```

In case of an interrupt on channel 4, the counters are reset.

IF DC541_IntSource.IN4 THEN		(* Input channel C4 = TRUE *)
	dwIntCount := dwIntCoun-tOld := 0;	(* reset count all interrupts *)
	FOR byInd := 0 TO cbyDC541_IntInp-1 DO	(* reset channel interrupt counters C0..C3 *)
	dwCount_InX[byInd] := dwCount_InXOld[byInd] := 0;	
	END_FOR; (* byInd *)	
	wIndex := 0;	(* start historical data from 0 *)
END_IF; (* C4 = TRUE *)		

At the end, the static inputs and outputs are processed, i.e.:

- reading the inputs,
- execution of actions
- writing the outputs.

(* Read inputs of DC541 *)		
DC541_IOs(EN := TRUE, SLOT := cbyDC541_SLOT);		
DC541_IOs.OUT6 := DC541_IOs.IN5;	(* C6 := state of input channel C5 *)	
DC541_IOs.OUT7 := NOT DC541_IOs.OUT7;	(* toggle channel C7 *)	
(* Write outputs to DC541*)		
DC541_IOs(EN := TRUE, SLOT := cbyDC541_SLOT);		

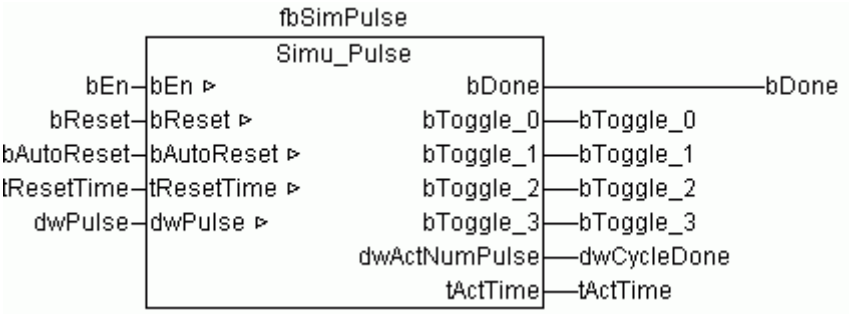
Purpose of the cyclic program PLC_PRG:

The cyclic program PLC_PRG contains the following functions:

- Cycles counter dwC := dwC + 1;
- Reading the configuration of the DC541 Calling of block DC541_GET_CFG
- Reading the status of the DC541 Calling of block DC541_STATE - Reading/writing the static channels of the DC541 Calling of block DC541_IO
- Simulation of the interrupts for the DC541 Calling of block Simu_Pulse

The blocks DC541_GET_CFG, DC541_STATE and DC541_IO are contained in the library DC541_AC500_V11.lib and described in detail in the library documentation *Chapter 1.5.4.11 “DC541 library” on page 1103*.

The block Simu_Pulse is used to generate an adjustable number of pulses. Its representation in the Function Block Diagram (FBD) is as follows:



The meanings of the block's inputs and outputs are as follows:

Instance		fbSimuPulse	Instance name
bEn	Input/Output	BOOL	Enabling of the pulse output
bAutoReset	Input/Output	BOOL	Automatic reset of the pulse counter after the specified number of pulses have been output and after expiration of tResetTime
bReset	Input/Output	BOOL	Reset of the pulse counter
tResetTime	Input/Output	TIME	Time until the reset is initiated after the specified number of pulses is reached, if bAutoReset = TRUE
dwPulse	Input/Output	DWORD	Number of pulses to be output: =0: Endless mode (pulse output continues until bEn = FALSE or bReset = TRUE > 0: Cyclic mode (output of the specified number of pulses)
bDone	Output	BOOL	Completion message after tResetTime has expired or bReset = TRUE for 1 cycle
bToggle_0	Output	BOOL	Provides a FALSE->TRUE edge with each 2nd call (i.e. the output is toggled with each call)
bToggle_1	Output	BOOL	Provides a FALSE->TRUE edge with each 4th call
bToggle_2	Output	BOOL	Provides a FALSE->TRUE edge with each 8th call
bToggle_3	Output	BOOL	Provides a FALSE->TRUE edge with each 16th call
dwActPulse	Output	DWORD	Displays the number of pulses output (corresponds to the number of edges at bToggle_0)
tActTime	Output	TIME	Displays the elapsed time while tResetTime is running

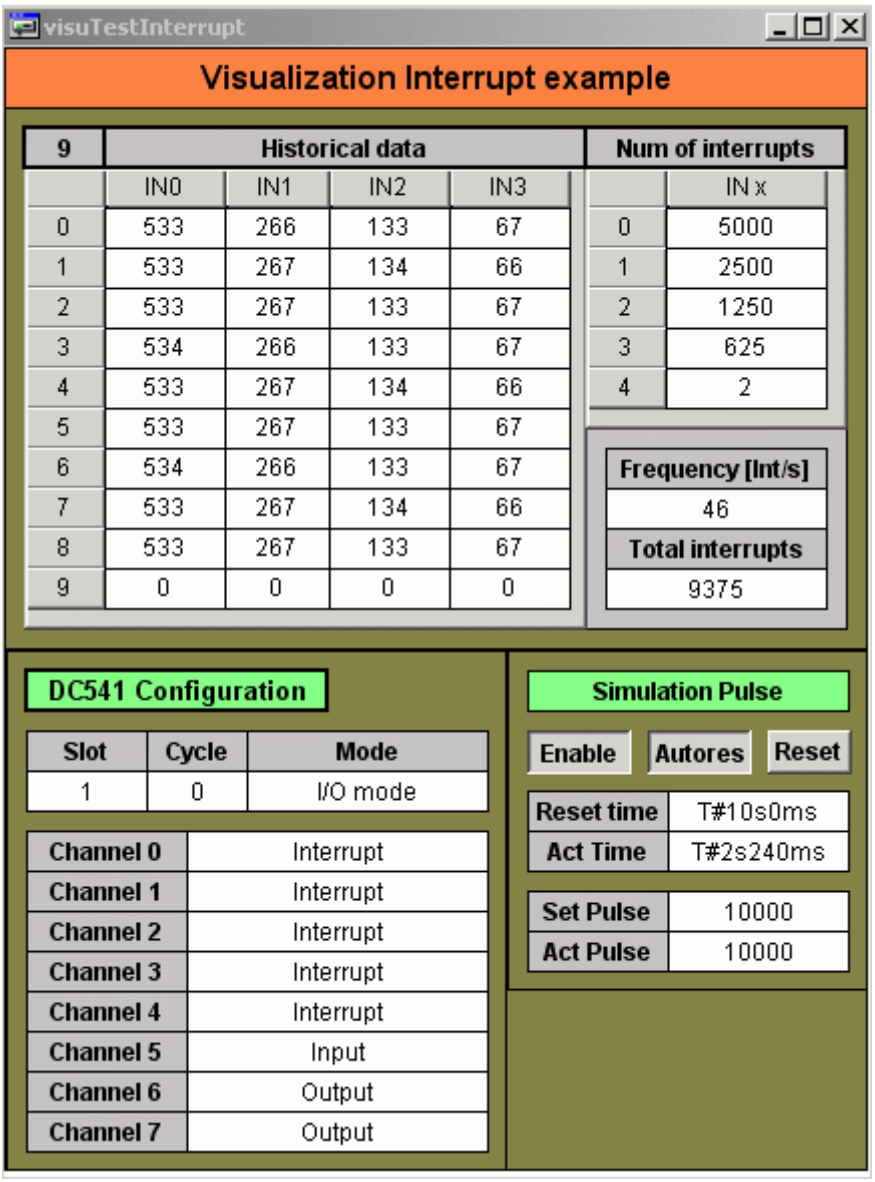
In the example, bEn: = bAutoReset: = TRUE. 10000 pulses are output (dwSetPulse). After the specified number of pulses has been reached, a wait time of 10 seconds is applied and then counting is started from the beginning.

The example has a visualization implemented which can be used to operate the program. After 10000 pulses, the visualization looks as follows:

9375 interrupts are generated:

5000 x C0 + 2500 x C1 + 1250 x C2 + 625 x C3 = 9375

Act Pulse					**Triggers the following interrupts:**
Value	**IN 3** **8**	**IN 2** **4**	**IN 1** **2**	**IN 0** **1**	
0	0	0	0	0	none
1	0	0	0	1	IN 0 -> in every 2. cycle (10000 : 2 = 5000)
2	0	0	1	0	IN 1 -> in every 4. cycle (10000 : 4 = 2500)
3	0	0	1	1	IN 0
4	0	1	0	0	IN 2 -> in every 8. cycle (10000 : 8 = 1250)
5	0	1	0	1	IN 0
6	0	1	1	0	IN 1
7	0	1	1	1	IN 0
8	1	0	0	0	IN 3 -> in every 16. cycle (10000 : 16 = 625)
9	1	0	0	1	IN 0
10	1	0	1	0	IN 1
11	1	0	1	1	IN 0
12	1	1	0	0	IN 2
13	1	1	0	1	IN 0
14	1	1	1	0	IN 1
15	1	1	1	1	IN 0
16	0	0	0	0	none



Usage as counting device

32-Bit up/down counter of module DC541-CM

The 32-bit bidirectional counter functionality is provided by the function block ↳ *Chapter 1.5.4.11.1.1.1 “DC541_32BIT_CNT” on page 1103*.

The 32-bit counter is a count up/count down counter with a directional discriminator. The counter can be used in two counting modes:

- EN_UD = FALSE: Encoder mode
  Connection of an incremental transmitter (track A / track B, offset by 90°)
  It is possible to count signals up to approx. 60 kHz. This corresponds to a motor with a rotational speed of 3.600 rpm and a transmitter with 1.000 pulses per rotation. Pulse multiplication (x2 or x4) is not used.
- EN_UD = TRUE: Up / down mode
  Up-/down counter
  It is possible to count signals up to approx. 60 kHz. Count-up for signals on channel C1, count-down for signals on channel C0.

The counter always uses the channels C0...C3 of the DC541:

- C0: Track A of the incremental transmitter.
- C1: Track B of the incremental transmitter.
- C2 and C3: Reference cam or touch trigger.

The counter can be used in two operating modes:

- Infinite counter (endless mode)
- Limiting counter (limit mode)

Function blocks for the most module functions of DC541-CM are contained in the library DC541_AC500_V11.lib. The library is automatically included into the project and is described in detail in the library documentation ↳ *Chapter 1.5.4.11 “DC541 library” on page 1103*.

32-Bit forward counter of module DC541-CM

The 32-bit forward counter functionality is provided by the block ↳ *Chapter 1.5.4.11.1.1.5 “DC541_FWD_CNT” on page 1127*.

The function block DC541_FWD_CNT provides a 32-bit count up counter which is able to count a maximum frequency of 50 kHz at the inputs C0 and C1 or 5 kHz at the inputs C2-C7. In the DC541, the counter is implemented as a 16 bit counter. The actual counter value ACT_CNT is bulit inside the function block by adding the counter differences that occur within the individual cycles. In order not to loose any counting pulses, the function block has to be called cyclically.

- Channel 0-1: 50 kHz max. -> 32767 / 50 = 655 ms
- Channel 2-7: 5 kHz max. -> 32767 / 5 = 6550 ms

Using the counter e.g. in a 100 ms task will prevent any loss of counting pulses.

Operating modes

- Infinite counter (endless mode)
- Limiting counter (limit mode)

The operating mode is selected at input EN_LIM.

If EN_LIM = FALSE, the counter operates as an infinite counter (endless mode). An overflow occurs corresponding to the 32-bit value at 16#FFFFFFFF = 4 294 967 295. In this mode, any exceeding of the limit value LIM_MAX or falling below the limit value LIM_MIN is displayed at the outputs MAX_LIM or MIN_LIM.

If EN_LIM = TRUE (limit mode), the counting range is between the limit values LIM_MIN and LIM_MAX. In case of an overflow, i.e. if LIM_MAX is reached, the counter restarts again at LIM_MIN.

The upper limit value LIM_MAX has to be higher than the lower limit value LIM_MIN. If LIM_MIN is higher than LIM_MAX, an error is displayed.

The device DC541 must be configured as counting device (counter mode).

The function block has an integrated visualization which can be used to control all function block functions in parallel to the user program, if input EN_VISU = TRUE.

Function blocks for the most module functions of DC541-CM are contained in the library DC541_AC500_V11.lib. The library is automatically included into the project and is described in detail in the library documentation ↳ *Chapter 1.5.4.11 “DC541 library” on page 1103*.

Configuration example: 32-Bit forward counter

All of the 8 channels of the DC541-CM can be used as count up counter. In the configuration example, all 8 channels of the DC541-CM are configured as 32-bit forward counter (count-up). The channels C0...C3 operate as infinite counters (endless mode), the channels C4...C7 as limit counters (limit mode).

The 32-bit count up counter configured as infinite counter (endless mode) corresponds to mode 1 (1 count up counter) of the high-speed counter of the digital input/output modules. In the configuration example, the counting pulses for the first forward counter are therefore applied in parallel to input C0 of the DC541-CM and counting input C24 of the DC532.

Hardware configuration

The example control system shall have the following configuration:

- Terminal base TB521 (two communication module slots)
- DC541-CM in Communication Module slot 1 (first slot on the left of the CPU)
- PM591-ETH CPU with internal Ethernet Communication Module
- I/O module DC532 on the I/O bus

Wiring

The channels are connected as follows:

- DC532 / C16 ---------- DC541 / C0
- DC532 / C17 ---------- DC541 / C1
- DC532 / C18 ---------- DC541 / C2
- DC532 / C19 ---------- DC541 / C3
- DC532 / C20 ---------- DC541 / C4
- DC532 / C21 ---------- DC541 / C5
- DC532 / C22 ---------- DC541 / C6
- DC532 / C23 ---------- DC541 / C7
- DC532 / C16 ---------- DC532 / C24

PLC configuration

- DC541-CM in slot 1, operating mode "Counter mode"
- Configuration: - Channel C0..C7 Forward counter
- Specification of the Ethernet communication module as internal communication module (if available)
- DC532 on the I/O bus / parameter "Fast counter" = 1-1 count up counter

Task configuration

- Task 1: Cyclic program / Prio = 10 / Interval = t#100ms / PLC_PRG
- Task 2: Simulation / Prio = 15 / Interval = t#5ms / Simulation_Task

The cyclic program PLC_PRG contains the following functions:

- Reading the cycle of PLC_PRG Calling of block TASK_INFO;
- Reading the configuration of the DC541 Calling of block DC541_GET_CFG
- Reading the status of the DC541 Calling of block DC541_STATE
- Reading/writing the static channels of the DC541 Calling of block DC541_IO
- Calling of the sequence control for the counters Calling of program proForwardCounter

The blocks DC541_GET_CFG, DC541_STATE and DC541_IO are contained in the library DC541_AC500_V11.lib and described in detail in the library documentation ↬ *Chapter 1.5.4.11 “DC541 library” on page 1103*.

The block TASK_INFO is contained in the library SysInt_AC500_V1.0 and described in detail in the corresponding documentation ↬ *Chapter 1.5.4.19 “Internal system library” on page 1500*.

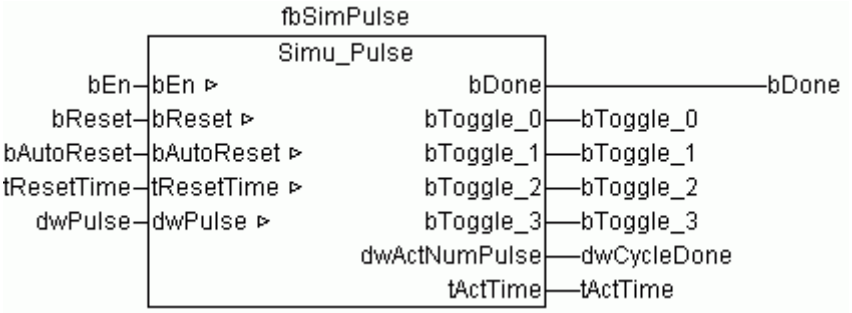
The actual execution of the 32-bit forward counter functionality is implemented in the program proForwardCounter.

Purpose of the program proForwardCounter:

The program proForwardCounter executes the following step chain:

Counter block	**DC541_FWD_CNT CNT_IO**								**CNT_IO**
Step | Channel	**C0**	**C1**	**C2**	**C3**	**C4**	**C5**	**C6**	**C7**	**1**
0 | Action	Init: SET = 0, endless counter, limit values MIN = 300 / MAX = 1300				Init: SET = 0, limit counter, limit values MIN = 300 / MAX = 1300				Init
| Value	0	0	0	0	0	0	0	0	0
1 | Action	Reset of SET input								
| Value	0	0	0	0	300	300	300	300	0
2 | Action	Start of pulse output - 2000 pulses								
| Value	0	0	0	0	300	300	300	300	0
3 | Action	Wait until pulse output is completed								
| Value	2000	1000	500	250	1299	1300	800	550	2000
4 | Action	Selection last step: byStep = 249								
| Value	2000	1000	500	250	1299	1300	800	550	2000
200 | Action	Manual operation								
| Value	xxx	xxx	xxx	xxx	xxx	xxx	xxx	xxx	xxx
249 | Action	Wait time 5 seconds, then restart from step 0								
| Value	2000	1000	500	250	1299	1300	800	550	2000

The block Simu_Pulse is used to generate an adjustable number of pulses. Its representation in the Function Block Diagram (FBD) is as follows:



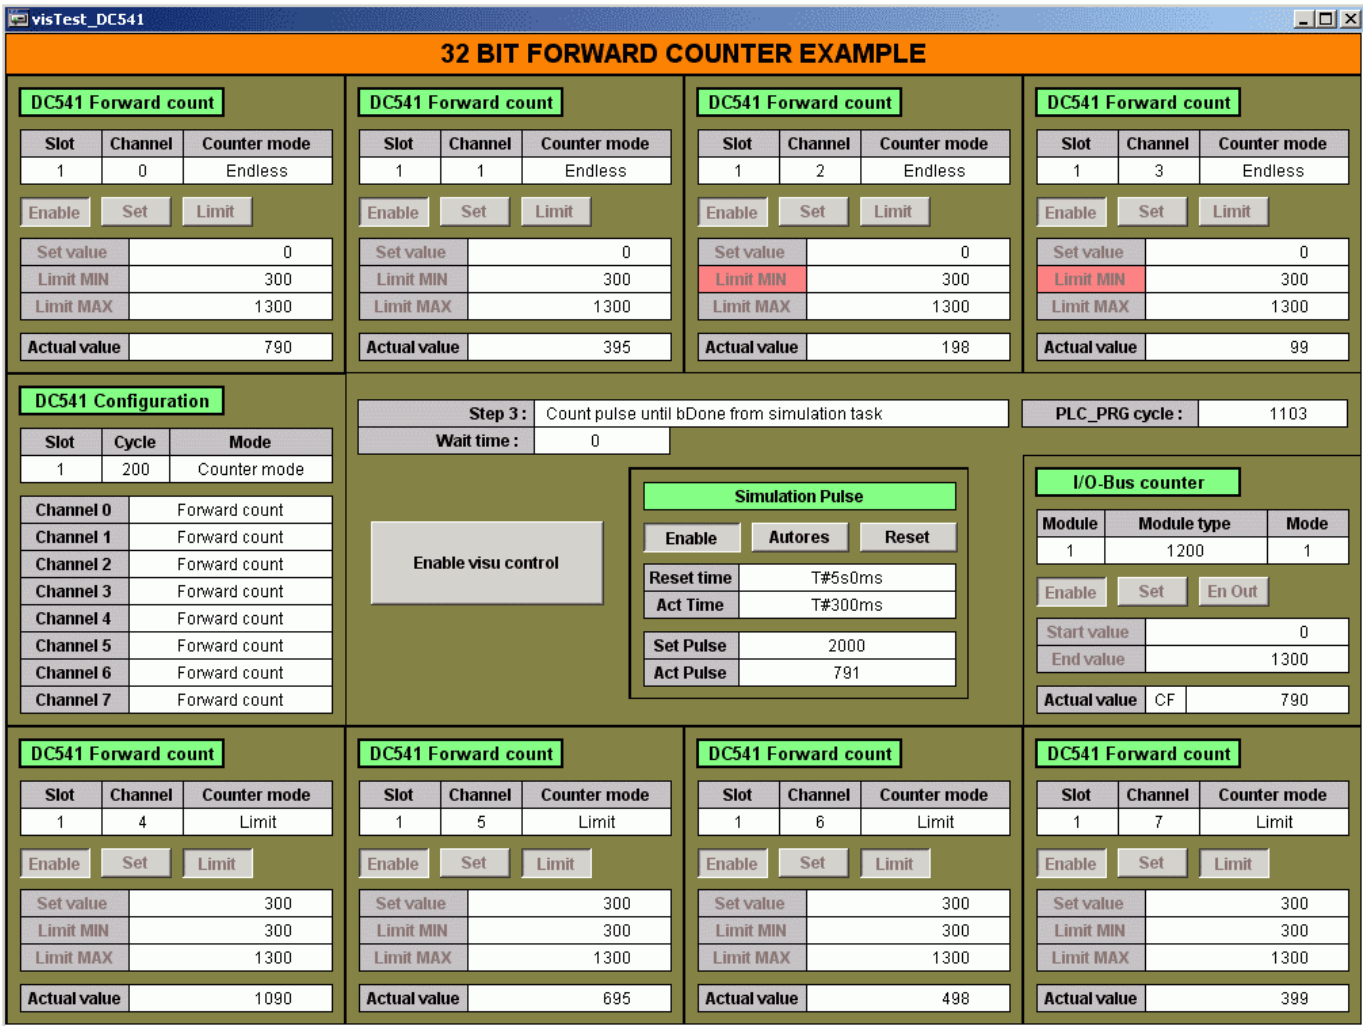
Instance		**fbSimuPulse**	**Instance name**
Ben	Input/Output	BOOL	Enabling of the pulse output
bReset	Input/Output	BOOL	TRUE = Reset of the pulse counter, bDone = TRUE

Instance		fbSimuPulse	Instance name
bAutoReset	Input/Output	BOOL	TRUE and cyclic mode - The time tResetTime is started when the number of pulses set with dwPulse is reached. After this time, the pulse output is restarted again.
tResetTime	Input/Output	TIME	Wait time until restart, if bAutoReset = TRUE
dwPulse	Input/Output	DWORD	Number of pulses to be output: = 0: Endless mode (pulse output continues until bEn = FALSE or bReset = TRUE) > 0: Cyclic mode (output of the specified number of pulses)
Bdone	Output	BOOL	Completion message after the number of pulses specified at dwPulse or after bReset if dwPulse = 0
bToggle_0	Output	BOOL	Output: Edge with each clock cycle
bToggle_1	Output	BOOL	Output: Edge with each 2. clock cycle
bToggle_2	Output	BOOL	Output: Edge with each 4. clock cycle
bToggle_3	Output	BOOL	Output: Edge with each 8. clock cycle
dwActNumPulse	Output	DWORD	Number of pulses output
tActTime	Output	TIME	Elapsed time in [ms] while tResetTime is running

In the example, the block Simu_Pulse is called in a 5 ms task. The pulse output is enabled or stopped via input bEn. If input dwPulse = 0, the output of pulses is performed continuously. If dwPulse > 0, only the specified number of pulses is output. When the specified number of pulses is reached, output bDone is set to TRUE.

In the example, the block is called with dwPulse = 2000. The wait time function is not used.

The example program has a visualization implemented that displays all states:



Clicking on the button <Enable visu control> (bEnVisuControl = TRUE) causes the program to jump from the current step to step 200 (manual operation). Then, the operation of the blocks is done via the corresponding buttons/switches of the individual blocks. When manual operation is switched off again (bEnVisuControl = FALSE), the program jumps to step 249 and restarts from step 0 after the wait time.

Usage as X4 counting device

The function module DC541-CM supports an encoder counting mode with channels A/B. This counting mode usually just supports to count 1 edge out of possible 4 edges from the 2 encoder lines. These are connected to C0 and C1 on DC541-CM.

	Counting in X1-mode Counting in X4-mode

For increasing the accuracy, it is possible to use a special mode with counting all 4 edges. This mode just supports a frequency up to 4 kHz. Despite of counting 4 edges on a lower frequency, the functionality is the same as 32-bit encoder on channel 0 and 1 and also the same function block ↳ *Chapter 1.5.4.11.1.1.1 "DC541_32BIT_CNT" on page 1103* has to be used.

Automation Builder configuration

For use of DC541-CM as a X4 counting device, the operating mode of the device has to be configured:

1. In the device tree, add a new object to the *"DC541-CM"* node and select *"DC541 Encoder X4 mode"* from the list.
2. Double-click the added object and configure the I/O channels:

DC541 Counter mode Configuration

Parameter	Type	Value	Default Value	Unit	Description
Channel 0	Enumeration of BYTE	Input	Input		Channel's operational mode
Channel 1	Enumeration of BYTE	Input	Input		Channel's operational mode
Channel 2	Enumeration of BYTE	Input	Input		Channel's operational mode
Channel 3	Enumeration of BYTE	Input	Input		Channel's operational mode
Channel 4	Enumeration of BYTE	Input	Input		Channel's operational mode
Channel 5	Enumeration of BYTE	Input	Input		Channel's operational mode
Channel 6	Enumeration of BYTE	Input	Input		Channel's operational mode
Channel 7	Enumeration of BYTE	Input	Input		Channel's operational mode

The channels C0..C3 are to be used for the encoder mode. In the module parameters, the channels C4..C7 can be configured as:

Input	-Input
Output	-Output

To do so, select the corresponding value for each channel.

> *The channels C1..C3 are automatically used, too. In the PLC configuration, these channels are left at the default setting "Input".*

The specified configuration can be read using the function block ↳ *Chapter 1.5.4.11.1.1.6 "DC541_GET_CFG" on page 1132*.

Usage for pulse width modulation

Automation Builder configuration

1. In the device tree, add a new object to the *"DC541-CM"* node and select *"DC541 IO mode"* from the list.
2. Double-click the added object and configure the I/O channels:

DC541 IO mode Configuration

Parameter	Type	Value	Default Value	Unit	Description
Channel 0	Enumeration of BYTE	Input	Input		Channel's operational mode
Channel 1	Enumeration of BYTE	Input	Input		Channel's operational mode
Channel 2	Enumeration of BYTE	Input	Input		Channel's operational mode
Channel 3	Enumeration of BYTE	Input	Input		Channel's operational mode
Channel 4	Enumeration of BYTE	Input	Input		Channel's operational mode
Channel 5	Enumeration of BYTE	Input	Input		Channel's operational mode
Channel 6	Enumeration of BYTE	Input	Input		Channel's operational mode
Channel 7	Enumeration of BYTE	Input	Input		Channel's operational mode

- Input
- Output
- Interrupt input

In the module parameters, you can specify the channels C0...C7 as inputs, outputs or interrupt inputs.

Calling the function blocks

The pulse width modulation functionality of the DC541 is provided by the block ↳ *Chapter 1.5.4.11.1.1.10 "DC541_PWM" on page 1146*.

Function blocks for the most module functions of DC541-CM are contained in the library DC541_AC500_V11.lib. The library is automatically included into the project and is described in detail in the library documentation ↳ *Chapter 1.5.4.11 "DC541 library" on page 1103*.

The function block DC541_PWM outputs a pulsed signal with an adjustable on-off ratio. The on and off times are adjusted as 8 bit numbers.

The minimum switching time is specified at input CYCLE, i.e. if an output has been switched to FALSE or TRUE by the PWM, this output remains in this state for at least this time (CYCLE µs).

The minimum time specified at input CYCLE must not be smaller than the cycle time of the device DC541. Depending on its configuration, the cycle time of the DC541 can be 50, 100 or 200 µs. The cycle time can be polled using the function block ↳ *Chapter 1.5.4.11.1.1.6 "DC541_GET_CFG" on page 1132* (output CYCLE).

Configuration example: Pulse width modulation (PWM)

In the configuration example, channel 0 of the DC541 is configured for pulse width modulation (PWM). The output signal is measured using the function Time and frequency measurement ↳ *Chapter 1.6.5.2.8.1.6 “Usage for time and frequency measurement” on page 6004* of the DC541-CM.

The following on-off ratio shall be used:

PULSE	PAUSE	CYCLE	Result (x = number of cycles of the DC541)
Cycle time of DC541 = 100 µs			
1	2	2000	20 x TRUE / 40 x FALSE / 20 x TRUE / 40 x FALSE / … i.e. 2000 µs = TRUE and 4000 µs = FALSE

Hardware configuration:

The example control system shall have the following configuration:

- Terminal base TB521 (two communication module slots)
- DC541 in communication module slot 1 (first slot on the left of the CPU)
- PM591-ETH
- I/O module DC532 on the I/O bus

Wiring:

The channels are connected as follows:

DC541 / C0 ---------- DC541 / C1

PLC configuration:

- DC541-CM in slot 1, operating mode "counter mode"			
- Configuration:	- Channel	C0	PWM
		C1	FREQ
		C2...C7	Input
- Specification of the Ethernet communication module as internal communication module (if available)			

Task configuration:

- Task 1: Cyclic program / Prio = 10 / Interval = t#1ms / PLC_PRG

Purpose of the cyclic program PLC_PRG:

The cyclic program PLC_PRG contains the following functions:

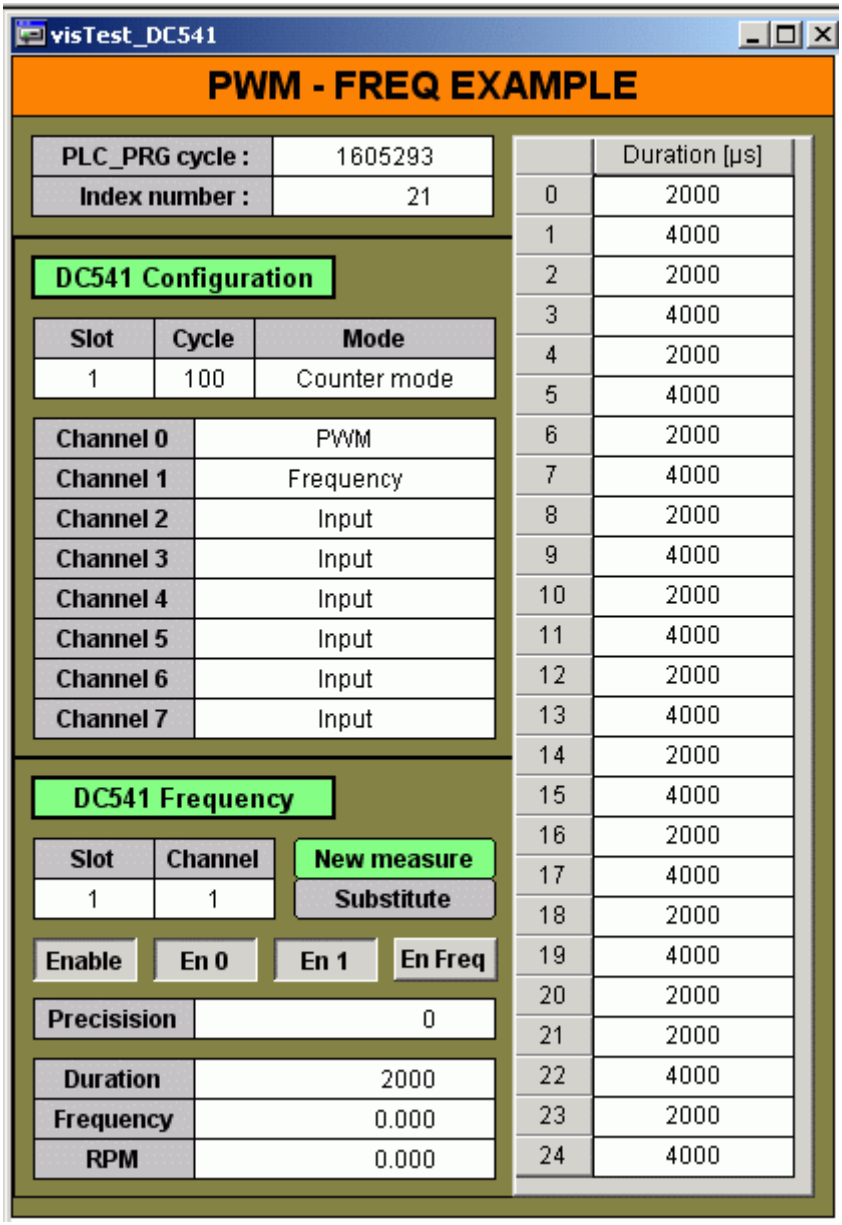
- Reading the cycle of PLC_PRG Calling of block TASK_INFO;
- Reading the configuration of the DC541 Calling of block DC541_GET_CFG
- Reading the status of the DC541 Calling of block DC541_STATE
- Reading/writing the static channels of the DC541 Calling of block DC541_IO
- Calling of the sequence control for PWM and FREQ Calling of program proPWM_FREQ

The blocks DC541_GET_CFG, DC541_STATE and DC541_IO are contained in the library DC541_AC500_V11.lib and described in detail in the library documentation ↳ *Chapter 1.5.4.11 “DC541 library” on page 1103*.

The block TASK_INFO is contained in the library SysInt_AC500_V1.0 ↳ *Chapter 1.5.4.19 “Internal system library” on page 1500* and described in detail in the corresponding documentation.

Calling the pulse width modulation functionality as well as measurement and acquisition of measured values are performed in the program proPWM_FREQ. The program proPWM_FREQ contains the calls for the function blocks *Chapter 1.5.4.11.1.1.10 “DC541_PWM” on page 1146* and *Chapter 1.5.4.11.1.1.2 “DC541_FREQ” on page 1111* as well as the acquisition of the measured values. The function block DC541_FREQ is configured in a way that it measures the time between each edge change.

The example program has a visualization implemented that displays all states:



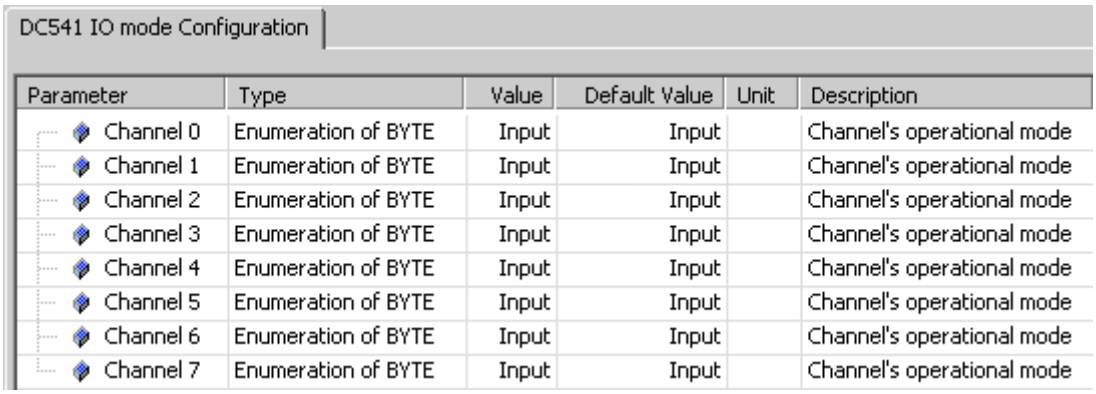
Input EN_VISU of the function block DC541_FREQ is TRUE. Therefore, the inputs of the block can be modified using the buttons <Enable>, <En 0>, <En 1> and <En Freq> in the visualization.

The measured values are 2000, 4000 or 6000 µs depending on which edges were considered for measurement.

Usage for time and frequency measurement

Automation Builder configuration

1. In the device tree, add a new object to the *"DC541-CM"* node and select *"DC541 IO mode"* from the list.
2. Double-click the added object and configure the I/O channels:



Parameter	Type	Value	Default Value	Unit	Description
Channel 0	Enumeration of BYTE	Input	Input		Channel's operational mode
Channel 1	Enumeration of BYTE	Input	Input		Channel's operational mode
Channel 2	Enumeration of BYTE	Input	Input		Channel's operational mode
Channel 3	Enumeration of BYTE	Input	Input		Channel's operational mode
Channel 4	Enumeration of BYTE	Input	Input		Channel's operational mode
Channel 5	Enumeration of BYTE	Input	Input		Channel's operational mode
Channel 6	Enumeration of BYTE	Input	Input		Channel's operational mode
Channel 7	Enumeration of BYTE	Input	Input		Channel's operational mode

- Input
- Output
- Interrupt input

In the module parameters, you can specify the channels C0...C7 as inputs, outputs or interrupt inputs.

Calling the function blocks

The time and frequency measurement functionality of the DC541-CM is provided by the block ↳ *Chapter 1.5.4.11.1.1.2 "DC541_FREQ" on page 1111*.

Function blocks for the most module functions of DC541-CM are contained in the library DC541_AC500_V11.lib. The library is automatically included into the project and is described in detail in the library documentation ↳ *Chapter 1.5.4.11 "DC541 library" on page 1103*.

The function block DC541_FREQ is used to measure times, frequencies and rotational speeds with a resolution of 100 µs.

It is able to measure frequencies from 0 to 2000 Hz (2 kHz). In order to obtain a precise measurement of frequencies > 50 Hz, a correspondingly high accuracy setting has to be chosen. It is recommended to use an accuracy of PREC = 1000, i.e. 0.001.

This function block has to be called cyclically, one time per second at least.

The inputs EN_0, EN_1 and EN_FREQ are used to determine the edges to be measured. If input EN_FREQ = TRUE, the frequency and the rotational speed are calculated in addition to the time measurement.

Configuration example: Frequency output

In the configuration example, channel 0 of the DC541-CM is configured for frequency output ↳ *Chapter 1.6.5.2.8.1.7 "Usage for frequency output" on page 6007*. The output signal is measured using the function "Time and frequency measurement" of the DC541-CM.

Hardware configuration:

The example control system shall have the following configuration:

- Terminal base TB521 (two communication module slots)
- DC541-CM in Communication Module slot 1 (first slot on the left of the CPU)
- PM591-ETH CPU with internal Ethernet communication module
- I/O module DC532 on the I/O bus

Wiring:

The channels are connected as follows:

DC541 / C0 ---------- DC541 / C1

PLC configuration:

DC541-CM in slot 1, operating mode "counter mode"			
Configuration	**Channel**	**C0**	**Frequency output**
		C1	Frequency measurement
		C2...C7	Input
Specification of the Ethernet communication module as internal communication module (if available)			

Task configuration:

- Task 1: Cyclic program / Prio = 10 / Interval = t#5ms / PLC_PRG

Purpose of the cyclic program PLC_PRG:

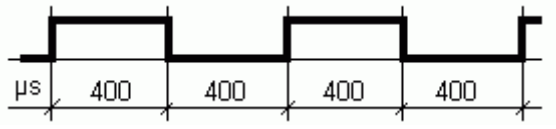
The cyclic program PLC_PRG contains the following functions:

- Reading the cycle of PLC_PRG Calling of block TASK_INFO;
- Reading the configuration of the DC541 Calling of block DC541_GET_CFG
- Reading the status of the DC541 Calling of block DC541_STATE
- Reading/writing the static channels of the DC541 Calling of block DC541_IO
- Calling of the sequence control for frequency output and measurement Calling of program proFrequency
-

The blocks *Chapter 1.5.4.11.1.1.6 “DC541_GET_CFG” on page 1132*, *Chapter 1.5.4.11.1.1.11 “DC541_STATE” on page 1151* and *Chapter 1.5.4.11.1.1.8 “DC541_IO” on page 1139* are contained in the library DC541_AC500_V11.lib and described in detail in the library documentation *Chapter 1.5.4.11 “DC541 library” on page 1103*.

The block *Chapter 1.5.4.19.3.22 “TASK_INFO read number of completed task cycles” on page 1620* is contained in the library SysInt_AC500_V1.0 *Chapter 1.5.4.19 “Internal system library” on page 1500* and described in detail in the corresponding documentation.

The calling of the frequency output functionality as well as the measurement and acquisition of measured values are performed in the program proFrequency. The program proFrequency contains the calls for the function blocks *Chapter 1.5.4.11.1.1.4 “DC541_FREQ_OUT” on page 1123* and *Chapter 1.5.4.11.1.1.2 “DC541_FREQ” on page 1111* as well as the acquisition of the measured values.



The example program has a visualization implemented that displays all states:

Input EN_VISU of the function blocks DC541_FREQ_OUT and DC541_FREQ is TRUE. Therefore, the block inputs can be controlled using the buttons in the visualization.

Channel 6	Enumeration of BYTE	Input	Input		Channel's operational mode
Channel 7	Enumeration of BYTE	Input	Input		Channel's operational mode

- Input
- Output
- Interrupt input

In the module parameters, you can specify the channels C0...C7 as inputs, outputs or interrupt inputs.

Calling the function blocks

The frequency output functionality of the DC541 is provided by the block ↳ *Chapter 1.5.4.11.1.1.4 "DC541_FREQ_OUT" on page 1123*.

Function blocks for the most module functions of DC541-CM are contained in the library DC541_AC500_V11.lib. The library is automatically included into the project and is described in detail in the library documentation ↳ *Chapter 1.5.4.11 "DC541 library" on page 1103*.

The function block DC541_FREQ_OUT is used to output pulses with a fixed frequency on one channel of the device DC541. It is able to output pulses with a frequency between 0.2 and 2.5 kHz. The pulse jitter depends on the cycle time of the DC541. The pulse length is always a multiple of the cycle time of the DC541.

In case of a presetting of PULSE = 0, the output of pulses is infinite. The pulse output is started with a positive edge at input START. The output is aborted if START = FALSE. A positive edge at input STOP interrupts the pulse output. The output is continued if STOP = FALSE.

If input PULSE > 0, the function block outputs the number of pulses specified at input PULSE with the frequency specified at input FREQ on the channel specified at input CH. After the function block has output the number of pulses specified at PULSE, the output RDY becomes TRUE.

The device DC541 must be configured as counting device (counter mode). Channel CH must be configured for frequency output.

The function block has an integrated visualization which can be used to control all function block functions in parallel to the user program, if input EN_VISU = TRUE.

For frequency output, the same configuration example is used as for the time and frequency measurement ↳ *Chapter 1.6.5.2.8.1.6 "Usage for time and frequency measurement" on page 6004*.

CD522 encoder and PWM module

Functionality of the CD522 module

The encoder and PWM module CD522 can be used at the following devices:

- Communication interface modules (e. g. CI501-PNIO, CI541-DP)
- Processor modules

Features:

- 2 independent counting functions with up to 12 configurable modes (including incremental position encoder and frequency input up to 300 kHz)
- 2 independent PWM (pulse-width modulator) or pulse outputs with push-pull driver
- Dedicated inputs/outputs for specific counting functions (e.g. touch, set, reset)
- All unused inputs/outputs can be used with the specifications of standard inputs/outputs range

For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

Depending on the configuration used, some inputs and outputs are dedicated to specific counting functions (touch, set, reset…). All unused inputs and outputs can be used with the specification of standard inputs/outputs range.

There are special function blocks available to manage and control the function of the CD522 Module. These function blocks are contained in the ↬ *Chapter 1.5.4.8 “CD522 library” on page 972* which is available with a runtime system of version V1.0.2 or above. The library is automatically included into the project when adding a CD522 Module to the Automation Builder project. Details on the hardware is provided in the device descriptions ↬ *Chapter 1.6.2.7.2.1 “CD522 - Encoder, counter and PWM module” on page 4635*.

Special features

The specific functionality is processed within CD522. It works independently of the user program and therefore it is able to response quickly to external signals. A simultaneous counting operation of several expansion modules is possible.

Each module counter can be configured for 1 mode out of 12 possible ones. The desired operating mode is selected in the PLC configuration using module parameters. After that, it is activated during the initialization phase (power-on, cold start, warm start).

The data exchange to and from the user program is performed using input and output operands. While integrating a module containing counters in the PLC configuration, the necessary operands are created and reserved immediately. Thus, a counter implementation carried out later does not cause an address shift.

Operating modes

Inputs and outputs, which are not used by the counters, are available for other tasks. In the following table, A means Input Channel A, B means Input Channel B and Z means Output Channel Z.

Operating Mode	Function	Used inputs	Description
0	No counter	None	This operating mode is selected, if the integrated fast counter is not needed.
1	Up/Down counter (A)	A = Counting input	One Up/Down (dynamic changes) counter with set and reset input, end value reached indicator, touch/catch value and overflow flag.
2	Up/Down with release input (B)	A = Counting input B = Enable input	One count up counter with enable input via terminal, counting is valid when input B is true. Dynamic Up/Down count possibility, end value reached indicator, Touch/catch value and Overflow flag
3	Up/Down counters (A,B)	A = Counting input 0 B = Counting input 1	2 counters with separate Up/Down and reset input
4	Up/Down (A, B on falling edges)	A = Counting input 0 B = Counting input 1	2 counters (counting on falling edge of input B) with separate Up/Down and reset input
5	Up/Down dynamic set (B) / rising edge	A = Counting input B = Dynamic set input	One Up/Down counter with set and reset input, end value reached indicator, touch/catch value and overflow flag. Additional function to mode 1 is the dynamic set input (B) on rising edge of physical input.
6	Up/Down dynamic set (B) / falling edge	A = Counting input B = Dynamic set input	One Up/Down counter with set and reset input, end value reached indicator, touch/catch value and overflow flag. Additional function to mode 1 is the dynamic set input (B) on falling edge of physical input.
7	Reserved	None	---
8	Up/Down with release (B), 0 cross detection	A = Counting input B = Enable input	One 16 bit counter (in range of -32768 to 32767) with zero cross over detection, counting valid when input B is true

Operating Mode	Function	Used inputs	Description
9	Reserved	None	---
10	Reserved	None	---
11	Incremental encoder	A = Trace A of the encoder B = Trace B of the encoder Z = Trace Z of the encoder (mechanical zero)	One Up/Down counter for encoder x1 count, touch/catch value, RPI function, reset and set
12	Incremental encoder X2	A = Trace A of the encoder B = Trace B of the encoder Z = Trace Z of the encoder (mechanical zero)	One Up/Down counter for position sensor x2 count, touch/catch value, RPI function, reset and set
13	Incremental encoder X4	A = Trace A of the encoder B = Trace B of the encoder Z = Trace Z of the encoder (mechanical zero)	One Up/Down counter for position sensor x4 count, touch/catch value, RPI function, reset and set
14	SSI, absolute encoder	A = Data signal B = Clock signal	Absolute positioning sensor using SSI interface
15	Time frequency meter	Z = Input signal	Time measurement of Z signal, rising edge, falling edge, rotation per minute and frequency calculation

CD522 configuration

CD522 on I/O bus

1. In the device tree, add a new object to the *"I/O-Bus"* node.
2. From the list, select *"S500 I/O modules ➔ Function modules"* and add the CD522 device.

A maximum of 10 CD522 modules can be appended to the I/O bus.

3. Double-click the added object and configure the parameters ↳ *Chapter 1.6.5.2.8.2.3.3 "Parameterization" on page 6011*.

CD522 Modules connected to the I/O bus occupy the address area %IB0 .. %IB999 or %QB0 .. %QB999.

There is no fix assignment between module number and the input/output addresses of the channels.

CD522 on CS31-bus

1. In the device tree, add a new object under *"Interfaces"* to COM1 or COM2.
2. From the list, select a CS31 device e.g. *"DC551-CS31"*.
3. Add a new object to the *"DC551-CS31"* node.
4. From the list, select *"S500 I/O modules ➔ Function modules"* and add the CD522 device.
5. Double-click the added object and configure the parameters ↳ *Chapter 1.6.5.2.8.2.3.3 "Parameterization" on page 6011*.

CD522 modules connected to the CS31-Bus occupy the address area %IB1000 .. %IB1999 or %QB1000 .. %QB1999.

There is no fix assignment between module number and the input/output addresses of the channels.

A maximum of 4 CD522 modules can be appended to the CS31-Bus. If the DC551-CS31 Module is configured with the fast counter function, the maximum number of CD522 Modules is decreased to 3 modules (without other I/O Modules).

Automation Builder does not check the validity/integrity (according to the I/O limitations) of the number of expansion modules configured. The check is only done during project compilation.

Parameterization

The Encoder and PWM Module CD522 does not store configuration data itself. The digital inputs and outputs are used to specific counting functions depending to configuration mode chosen. All unused inputs and outputs can be used with the specification of standard input/ output range.

For non-standard applications, it is necessary to adapt the parameters to your system configuration:

Operands for counting function

Input information for the counter	<	Output information for the user program
Counter settings 0	<	Output double word 0
High word	<	Output word 0.0
Low word	<	Output word 0.1
Control Byte 0	<	Output byte 0
Outputs counter 0	<	Output byte 1
Counter settings 1	<	Output double word 1

Input information for the counter	**<**	**Output information for the user program**
High word	<	Output word 2.0
Low word	<	Output word 2.1
Control Byte 1	<	Output byte 2
Outputs counter 1	<	Output byte 3

Input information for the counter:		
Counter settings 0	DWORD	Dependent on status bit 0 within output counter 0
		- SET value for the counter 0 If bit 0 = FALSE, the counter can be set to a start value. The start value is loaded into the counter by the user program using the SET signal.
		- END value for the counter 0 If bit 0 = TRUE, the end value for the counter is stored as comparison value into the module by the user program. The counter compares continuously whether the programmed end value is greater than or equal to its actual counter value or not. When the counter value reaches its programmed end value, the binary outputs C4 to C7 (output counter 0) can be set permanently.
		This value of the double word variable is loaded into the counter 0. Note: In mode 2 16 bit counters, the higher word is the value for counter A and the lower word is the value for counter B.
Counter settings 1	DWORD	Dependent on status bit 0 within output counter 1
		- SET value for the counter 1 If bit 0 = FALSE, the counter can be set to a start value. The start value is loaded into the counter by the user program using the SET signal.

Input information for the counter:		
		- END value for the counter 1 If bit 0 = TRUE, the end value for the counter is stored as comparison value into the module by the user program. The counter compares continuously whether the programmed end value is greater than or equal to its actual counter value or not. When the counter value reaches its programmed end value, the binary outputs C12 to C15 (output counter 1) can be set permanently.
		This value of the double word variable is loaded into the counter 0. Note: In mode 2 16 bit counters, the higher word is the value for counter A and the lower word is the value for counter B.
Control byte 0	BYTE	Control byte for the counter 0: Depending on operating modes, the different bits of Control byte 0 are used to manage and control the counting (see below table)
Control byte 1	BYTE	Control byte for the counter 1: Depending on operating modes, the different bits of Control byte 1 are used to manage and control the counting (see below table)
Output counter 0	BYTE	Outputs for the counters 0:
	Bit 0	Select SET/END value: FALSE= SET and TRUE = END
	Bit 1-3	Digital outputs unused
	Bit 4	Digital output C4, can be configured to indicate END value
	Bit 5	Digital output C5, can be configured to indicate END value
	Bit 6	Digital output C6, can be configured to indicate END value
	Bit 7	Digital output C7, can be configured to indicate END value
Output counter 1	BYTE	Outputs for the counters 1:
	Bit 0	Select SET/END value: FALSE= SET and TRUE = END
	Bit 1-3	Digital outputs unused

Input information for the counter:		
	Bit 4	Digital output C12, can be configured to indicate END value
	Bit 5	Digital output C13, can be configured to indicate END value
	Bit 6	Digital output C14, can be configured to indicate END value
	Bit 7	Digital output C15, can be configured to indicate END value

Control bytes (0 and 1) functions

	Used by operative modes:	**1**	**2**	**3**	**4**	**5**	**6**	**7**	**8**	**9**	**10**	**11**	**12**	**13**	**14**	**15**

Operands for PWM/pulse function

Input information for the output	<	Output information for the user program
PWM frequency 0	<	Output word 0
PWM duty cycle/pulse C0	<	Output word 1
PWM frequency C1	<	Output word 2
PWM duty cycle/pulse C1	<	Output word 3
PWM Control Byte C0	<	Output byte 0
PWM Control Byte C1	<	Output byte 1
PWM/Pulse Outputs	<	Output byte 2
Bit 0	<	Output bit 2.0
Bit 4	<	Output bit 2.4

Input information for the PWM/Pulse function:		
PWM Frequency C0	WORD	Frequency of channel O0 Unit: Hz or 10Hz (depending on bit 0 of PWM control byte 0)
PWM Frequency C1	WORD	Frequency of channel O1 Unit: Hz or 10Hz (depending on bit 0 of PWM control byte 1)
PWM Duty cycle/pulse C0	WORD	PWM duty cycle of channel O0 in 1/10 of percentage or Number of pulses to be send on channel O0
PWM Duty cycle/pulse C1	WORD	PWM duty cycle of channel O1 in 1/10 of percentage or Number of pulses to be send on channel O1

Input information for the PWM/Pulse function:		
PWM control byte 0	BYTE	Control byte for the PWM/ Pulse output O0: Depending on operating modes, the different bits of PWM control byte 0 are used to manage and control the counting (see below table)
PWM control byte 1	BYTE	Control byte for the PWM/ Pulse output O1: Depending to operating modes, the different bits of PWM control byte 1 are used to manage and control the counting (see below table)
PWM/Pulse Outputs	BYTE	Outputs for PWM/Pulse output:
	Bit 0	Output O0
	Bit 1-3	Digital outputs unused
	Bit 4	Output O1
	Bit 5-7	Digital outputs unused

Control bytes (0 and 1) functions

Byte	**Description**
Bit 0	FALSE = frequency multiplier x1 is enable TRUE = frequency multiplier x10 is enable
Bit 1	Not used
Bit 2	Not used
Bit 3	Start pulse emission, if one rising edge => start pulse emission on channel O0 or O1
Bit 4	Not used
Bit 5	Not used
Bit 6	Not used
Bit 7	FALSE = PWM/Pulse function is disabled TRUE = PWM/Pulse function is enabled

Output information of the PWM/Pulse	**>**	**Input information for the user program**
State Byte S0 %pulse	>	Input byte 0
State Byte S1 %pulse	>	Input byte 1

Output information of the PWM/Pulse:		
State Byte S0 %pulse	BYTE	Percentage of pulses already sent on channel O0
State Byte S1 %pulse	BYTE	Percentage of pulses already sent on channel O1

CD522 used as encoder device

Incremental encoder

The function block *Chapter 1.5.4.8.1.1 “CD522_32BIT_ENCODER” on page 972* can be used to control an encoder device for relative positioning with the CD522 Module.

The module CD522 can be used in 12 different configurable operating modes. The operating mode is configured in PLC Configuration using module parameters. After that, it is activated during the initialization phase (power-on, cold start, warm start).

The data exchange from and to the user program is performed using input and output operands. These necessary operands are created and reserved automatically, when one module CD522 is added into the I/O bus configuration.

In order to configure and use the function encoder of module CD522, different operating modes are available. The function block CD522_32BIT_ENCODER should be used with one of these operating modes:

Operating Mode 11	"Incremental encoder"
Should be specified in PLC Configuration; parameter "mode counter" in order to use one bidirectional counter for position sensor x1 count, with possibility of touch/catch value, RPI function, set and reset actions.	
Operating Mode 12	"Incremental encoder X2"
Should be specified in PLC Configuration; parameter "mode counter" in order to use one bidirectional counter for position sensor x2 count, with possibility of touch/catch value, RPI function, set and reset actions.	
Operating Mode 13	"Incremental encoder X4"
Should be specified in PLC Configuration; parameter "mode counter" in order to use one bidirectional counter for position sensor x4 count, with possibility of touch/catch value, RPI function, set and reset actions.	

Absolute SSI encoder

The function block *Chapter 1.5.4.8.1.5 “CD522_SSI_CNT” on page 1006* can be used to control SSI absolute encoder function.

The module CD522 can be used in 12 different configurable operating modes. The operating mode is configured in PLC Configuration using module parameters. After that, it is activated during the initialization phase (power-on, cold start, warm start).

The data exchange from and to the user program is performed using input and output operands. These necessary operands are created and reserved automatically, when one module CD522 is added into the I/O bus configuration.

In order to configure and use the function counter of module CD522, different operating modes are available. The function block CD522_SSI_CNT should be used with one of these operating modes:

Operating Mode 14	"SSI, absolute encoder"
Should be specified in PLC Configuration; parameter mode counter in order to use absolute encoder with SSI interface.	

CD522 used as counter device

32-Bit bidirectional counter

The function block *Chapter 1.5.4.8.1.2 "CD522_32BIT_CNT" on page 982* can be used to control one 32-bit bidirectional counter function.

The module CD522 can be used in 12 different configurable operating modes. The operating mode is configured in PLC Configuration using module parameters. After that, it is activated during the initialization phase (power-on, cold start, warm start).

The data exchange from and to the user program is performed using input and output operands. These necessary operands are created and reserved automatically, when one module CD522 is added into the I/O bus configuration.

In order to configure and use the function counter of module CD522, different operating modes are available. The function block CD522_32BIT_CNT should be used with one of these operating modes:

Operating Mode 1	"Up/Down counter (A)"
Should be specified in PLC Configuration, parameter "mode counter" in order to use one up/down 32-bit counter on input A (dynamic changes) with set and reset input operation, end value reached indicator, touch/catch value and overflow flag.	
Operating Mode 2	"Up/Down counter with release input (B)"
Should be specified in PLC Configuration; parameter "mode counter" in order to use one up/down 32-bit counter with enable input. Counting is valid when input B is TRUE. Dynamic up/down count possibility, with set and reset input operation, end value reached indicator, touch/catch value and overflow flag.	
Operating Mode 5	"Up/Down dynamic set (B)/rising edge"
Should be specified in PLC Configuration; parameter "mode counter" in order to use one up/down 32-bit counter with set and reset input, end value reached indicator, touch/catch value and overflow flag. Additional function to mode 1 is the dynamic set input (B) on rising edge of physical.	
Operating Mode 6	"Up/Down dynamic set (B)/falling edge"
Should be specified in PLC Configuration; parameter "mode counter" in order to use one up/down 32-bit counter with set and reset input, end value reached indicator, touch/catch value and overflow flag. Additional function to mode 1 is the dynamic set input (B) on falling edge of physical.	

The module CD522 provides 2 Up/Down 32-bit counter functions. A signal used for pulse count is identified by A0 for counter 0 and A1 for counter 1. Another signal used for enable or dynamic set is identified by B0 for counter 0 and B1 for counter 1.

16-Bit bidirectional counter

The function block *Chapter 1.5.4.8.1.3 "CD522_16BIT_CNT" on page 991* can be used to control one 16-bit bidirectional counter function.

The module CD522 can be used in 12 different configurable operating modes. The operating mode is configured in PLC Configuration using module parameters. After that, it is activated during the initialization phase (power-on, cold start, warm start).

The data exchange from and to the user program is performed using input and output operands. These necessary operands are created and reserved automatically, when one module CD522 is added into the I/O bus configuration.

In order to configure and use the function counter of module CD522, different operating modes are available. The function block CD522_16BIT_CNT should be used with one of these operating modes:

Operating Mode 8	**"Up/Down with release (B), 0 cross detection"**
Should be specified in PLC Configuration; parameter "mode counter" in order to use one up/down 16 bit counter (in range of -32768 to 32767) with enable input and zero crossover detection (CF). Counting is valid when input B is TRUE. With set and reset input operation and touch/catch value.	

The module CD522 provides 2 Up/Down 16 bit counter functions. A signal used for pulse count is identified by A0 for counter 0 and A1 for counter 1. Another signal used for enable or dynamic set is identified by B0 for counter 0 and B1 for counter 1.

Two 16-bit bidirectional counter

The function block *Chapter 1.5.4.8.1.4 “CD522_16BIT_2CNT” on page 998* can be used to control two 16-bit bidirectional counter functions.

The module CD522 can be used in 12 different configurable operating modes. The operating mode is configured in PLC Configuration using module parameters. After that, it is activated during the initialization phase (power-on, cold start, warm start).

The data exchange from and to the user program is performed using input and output operands. These necessary operands are created and reserved automatically, when one module CD522 is added into the I/O bus configuration.

In order to configure and use the function counter of module CD522, different operating modes are available. The function block CD522_16BIT_2CNT should be used with one of these operating modes:

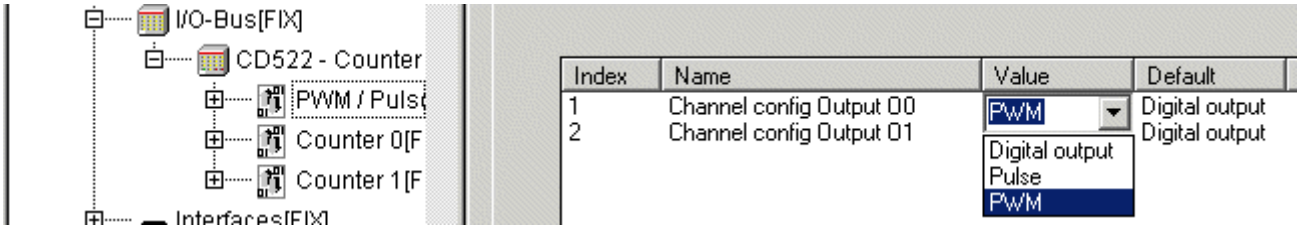
Operating Mode 3	"Up/Down counters (A,B)"
Should be specified in PLC Configuration, parameter "mode counter" in order to use 2 Up/Down 16 bit counter (on rising edge count) functions, with separate up/down, reset operation and overflow flag.	
Operating Mode 4	"Up/Down (A, B on falling edges)"
Should be specified in PLC Configuration, parameter mode counter in order to use two Up/Down 16 bit counter functions (with A on rising edge count and B on falling edge count), With separate up/down, reset operation and overflow flag.	

The module CD522 provides 4 Up/Down 16 bit counter functions. A signal used for pulse count is identified by A0 and B0 for counter A and A1 and B1 for counter B.

CD522 used as PWM output device

To use CD522 as PWM output device, function block *Chapter 1.5.4.8.1.6 “CD522_PWM_OUT” on page 1013* is required.

The module CD522 can be used to control one output pulsing signal (Max= 100 KHz) with an adjustable duty cycle (ON/OFF ratio, max=100%). The PWM operating mode is configured in Automation Builder.



After that, it is activated during the initialization phase (power-on, cold start, warm start).

The data exchange to and from the user program is performed using input and output operands. These necessary operands are created and reserved automatically, when one module CD522 is added in I/O bus configuration.

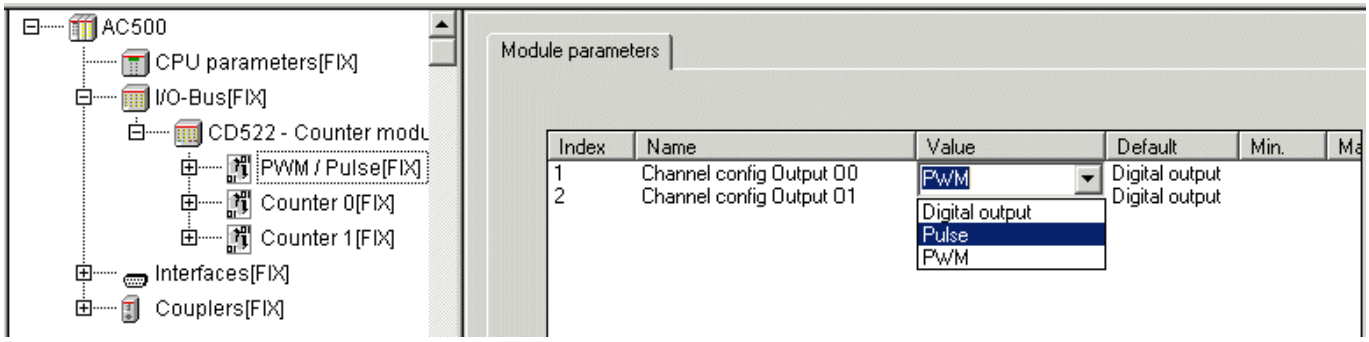
The module CD522 provides two independent outputs which can be used in PWM mode (O0 and O1). Both have the same specification and can work separately.

The function block CD522_PWM_OUT should be used to control with input EN_PWM, configure the frequency with input FREQ and the input duty cycle DUTY_CYCLE of PWM outputs (pulse-width modulator).

CD522 used as pulse output device

To use CD522 as pulse output device, function block *Chapter 1.5.4.8.1.7 “CD522_PULSE_OUT” on page 1016* is required.

The module CD522 can be used to control one output pulses signals with a fixed duty cycle (ON/OFF ratio 50 %) and number of pulses sent with a fixed frequency (can be modified) .The PULSE operating mode is configured in PLC Configuration using module parameters:



After that, it is activated during the initialization phase (power-on, cold start, warm start).

The data exchange from and to the user program is performed by using input and output operands. These necessary operands are created and reserved automatically, when one CD522 module is added into the I/O bus configuration.

The module CD522 provides two independents outputs used in PULSE mode (O0 and O1). Both have the same specification and can work separately.

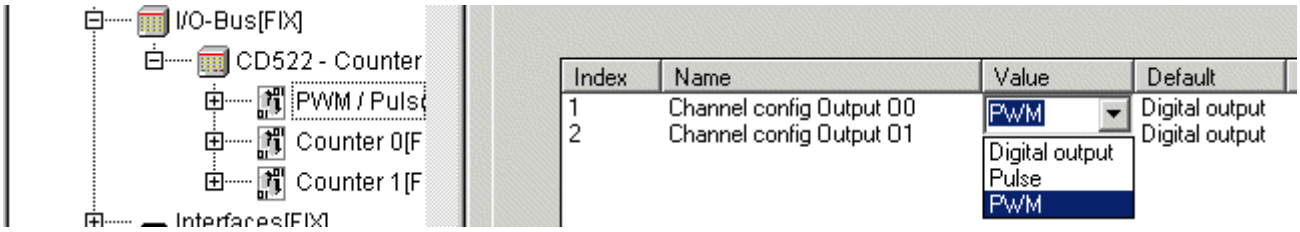
The function block CD522_PULSE_OUT should be used to control the pulse output, with input EN_FREQ, configure the frequency with input FREQ and the number of pulses with input NUM. The number of pulses sent can be displayed in percentage (from 0 % to 100%).

On the fast outputs O0 or O1, the brightness of yellow LED depends on the number of pulse emitted (from 0 and 100%), When the value 100% is obtained, the yellow LED status is off.

CD522 used as frequency output device

To use CD522 as frequency output device, function block *Chapter 1.5.4.8.1.8 “CD522_FREQ_OUT” on page 1020* is required.

The module CD522 can be used to control one output pulses signals with an fixed duty cycle (ON/OFF ratio 50 %).The PWM operating mode is configured in PLC Configuration using module parameters:



After that, it is activated during the initialization phase (power-on, cold start, warm start).

The data exchange to and from the user program is performed using input and output operands. These necessary operands are created and reserved automatically, when one module CD522 is added in I/O bus configuration.

The module CD522 provides two independent outputs which can be used in PWM mode (O0 and O1). Both have the same specification and can work separately.

The function block CD522_FREQ_OUT should be used to control with input EN_FREQ and configure the frequency with input FREQ of frequency outputs (1 kHz to 100 kHz).

CD522 used as time frequency meter

To use CD522 to measure times, frequency and rotation speeds on channel Z0 or Z1, function block *Chapter 1.5.4.8.1.9 “CD522_FREQ_SCAN” on page 1024* is required.

The module CD522 can be used in 12 different configurable operating modes. The operating mode is configured in PLC Configuration using module parameters. After that, it is activated during the initialization phase (power-on, cold start, warm start).

The data exchange from and to the user program is performed using input and output operands. These necessary operands are created and reserved automatically, when one module CD522 is added into the I/O bus configuration.

In order to configure and use the function counter of module CD522, different operating modes are available. The function block CD522_FREQ_SCAN should be used with one of these operating modes:

Operating Mode 15	**"Time frequency meter (Z)"**
Should be specified in PLC Configuration with the parameter mode counter.	

The module CD522 provides 2 channels (Z0 and Z1) which can be used to measure times, frequencies and rotational speeds with a resolution of 1 µs. Both have the same specification and can work separately.

The function block CD522_FREQ_SCAN should be used to control with input EN_CNT, configure the capture on falling edge with input EN_0 or rising edge with input EN_1 of signal, and the specification of the mode of the measurement (time, frequency and Rpm) with input EN_FREQ.

The table shows values measured according to configuration input parameters and this example of timing.

NOTICE!

Risk of malfunctions!

Never use the time measurement (bit EN_FREQ=FALSE) mode if the CD522 is connected to a CS31 communication interface module, e. g. CI592.

Depending on the input parameters of function block, the result of time measurement can be measured in time in µs, frequency in Hz or speed of rotation in rotation per minute.

FM502-CMS Function module

Condition monitoring

Components of the condition monitoring system:

- Hardware
  - Function module FM502-CMS for condition monitoring, protection or as precise I/O module *Chapter 1.6.2.7.2.2 “FM502-CMS - Analog measurements” on page 4658*.
  - Function module terminal base TF5x1-CMS *Chapter 1.6.2.2.2 “TF501-CMS and TF521-CMS - Function module terminal bases ” on page 3796*
  - Processor module PM592-ETH *Chapter 1.6.2.3.2.1 “PM57x (-y), PM58x (-y) and PM59x (-y)” on page 3848*
- Configuration of FM502-CMS *Chapter 1.6.5.2.8.3.2 “FM502-CMS function module” on page 6030*.
- FM502-CMS library: The FM502-CMS library contains function blocks to manage and control the function of the Function Module FM502-CMS. The FM502-CMS library consists of the WAV-File library and the CMS-IO library. Once a Function Module has been added to the configuration, the libraries are automatically included with the next compilation of the project. *Chapter 1.5.8 “FM502-CMS library” on page 2519*.

Introduction to condition monitoring

Condition Monitoring (CM) is a broad term, which can be understood in different ways. For the FM502-CMS, CM means the acquisition and analysis of high-frequency data. CM does usually not occur in real-time. The data is analysed afterwards. If, however, online CM is controller integrated, real-time reaction, e.g. protection, is possible within the same device and using the same sensors. This feature is supported by AC500 and FM502.

The focus is often merely on mechanical CM. This is due to the fact that the movement or rotations of large masses which are connected to a motor (e.g. electric machine) via a shaft pose the greatest danger. Machines in operation inevitably generate measurable vibration, both free or forced, even in the normal operating states and in absence of any damage.

Yet, in electrical CM, electrical high-frequency quantities like currents, voltages or partial discharges can be measured by suitable sensors and can be analyzed in order to detect electrical failure patterns, e.g. inside electrical machines or equipment (transformers). Some electrically measurable failure patters can be induced by mechanical issues e.g. vibration.

Effective fault detection will only be possible if the data patterns indicating an arising defect can be singled out among the data collected.

Monitoring e.g. the vibration characteristics of a machine in operation gives an understanding of the "'health" condition of the machine and its development over time and load. This information can be used to detect arising problems at an early stage. Operating a machine until it breaks down might be acceptable if the machine were a "'disposable" one and the lifetime was very high and known for sure. But many failures can be considered statistical outliers and occur very early and spontaneously.

However, most machines are not "disposable" due to their cost. Therefore, regular monitoring of a machine’s condition can reveal potential problems. Subsequently, counter measures can be taken at an early stage in order to minimize damage and associated cost. If monitoring is permanent and controller integrated, even spontaneous failures can be detected in real-time, in order to prevent substantial damage to a larger part of the equipment and its environment.

Use cases of FM502-CMS

- Condition monitoring: Longer data-stream analyses
- Protection: Fast reaction to e.g. direct or RMS values based on limits
- Fast and precise analog measurements as with any other AC500 I/O module, but even more precise and faster
- Data logging: Fast, efficient data storage

Condition Monitoring typically means acquisition of longer data streams, also called “time series” or “signals”. These can be analyzed after measurement in the time domain (e.g. envelope, statistical analysis) or frequency domain (e.g. spectrum analysis).

The Function Module FM502-CMS works independently of the user program and therefore it is able to response quickly to external signals and fast acquisition of the analog channel values.

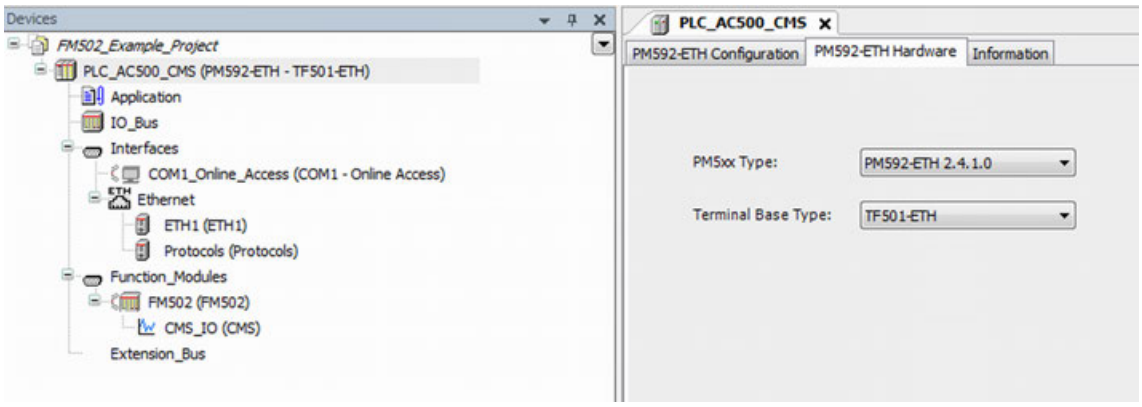
The analog channels can be configured in different modes. It is also possible to change individually the sample and acquiring settings for each channel. The counter can be configured in different modes. After that, it is activated during the initialization phase (power-on, cold start, warm start).

The data exchange to and from the user program is performed using input and output operands. While integrating a module containing counters in the PLC configuration, the necessary operands are created and reserved immediately. For the fast data acquisition the values are stored inside the module in a file and transferred via file transfer to the PLC after the measurement sequence is finished.

FM502-CMS function module

Preconditions The hardware structure is automatically generated in configuration.

You can change the type of the TF5x1-CMS in the hardware configuration of the processor module:



Only one FM502-CMS can be connected to a processor module.

> *FM502-CMS cannot be used as an I/O on a remote communication interface.*

Configuration of FM502-CMS

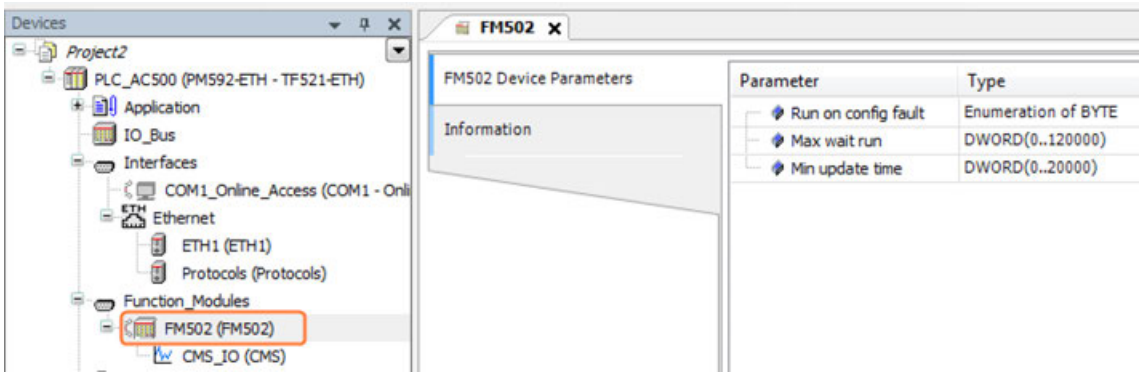


Fig. 1152: Change the behavior on the internal bus.

Parameter	Default value	Value	Description
Run on config fault	No	No	In case of a configuration error, the user program is not starting.
		Yes	The user program runs independent of a faulty I/O bus configuration
Max wait run	3000 [ms]	-	Maximum wait time for valid inputs (Do not change this parameter)
Min update time	10 [ms]	-	Cycle time for data exchange to IEC program The “Min update time” defines the time how often the I/O image will updated for the IEC program. If the IEC task is faster, the I/O image is not updated on every cycle.
Watchdog	400 [ms]	-	Watchdog time (Do not change this parameter)

Parameterization

The FM502-CMS does not store configuration data itself. The digital inputs and outputs can have specific functions depending on the selected configuration mode. All not otherwise configured inputs and outputs can be used with the specification of standard input/output range.

To change the parameterization you can choose the default parameterization in Automation Builder or the parameterization during run time in CODESYS.

The functionality of the module is directly influenced by the parameterization.

Parameterization - Automation Builder

For non-standard applications, it is necessary to adapt the parameters to your system configuration. After every startup of the device the default parameter set will be downloaded to the module.

The parameterization is divided in the following sections:

- Parameter for encoder/counter functionality
- Parameter for analog channel functionality
- Parameter for digital I/O configuration

Parameterization - CODESYS

In CODESYS for the parameterization you can use function blocks of FM502-CMS library ↳ *Chapter 1.5.8.2.1.9 “CMS_IO_CFG_WRITE” on page 2552*↳ *Chapter 1.5.8.2.1.8 “CMS_IO_CFG_READ” on page 2550*.

Parameter set

Table 732: Encoder/Counter

No.	Name	Value	Internal value	Internal type	Default	Min.	Max.

Operation modes

Inputs and outputs which are not used by the counters are available for other tasks.

Table legend: A = input channel A, B = input channel B, Z = output channel Z.

Operation Mode	Function	Used inputs	Description	Function block
0-1	No counter	None	This operating mode is selected, if the integrated high-speed counter is not needed.	-
1-1	Up/down counter (A)	A = Counting input	1 bidirectional 32-bit counter on input A (dynamic changes) with set and reset input operation, end value reached indicator, touch/ catch value and overflow flag.	CMS_IO_32BIT_CNT
2-1	Up/down with release input (B)	A = Counting input B = Enable input	1 bidirectional 32-bit counter with enable input. Counting is valid when input B is TRUE. Dynamic up/down count possibility, with set and reset input operation, end value reached indicator, touch/ catch value and overflow flag.	CMS_IO_32BIT_CNT
3-2	Up/down counters (A,B)	A = Counting input 0 B = Counting input 1	2 bidirectional 16-bit counter (on rising edge count) functions, with separate up/down, reset operation and overflow flag.	CMS_IO_16BIT_2CNT

Operation Mode	Function	Used inputs	Description	Function block
4-2	Up/down (A, B on falling edges)	A = Counting input 0 B = Counting input 1	2 bidirectional 16-bit counter functions (with A on rising edge count and B on falling edge count), With separate up/down, reset operation and over-flow flag.	CMS_IO_16BIT_2CNT
5-1	Up/down dynamic set (B) / rising edge	A = Counting input B = Dynamic set input	1 bidirectional 32-bit counter with set and reset input, end value reached indicator, touch/ catch value and overflow flag. Additional function to mode 1 is the dynamic set input (B) on rising edge sets START_VALUE.	CMS_IO_32BIT_CNT
6-1	Up/down dynamic set (B) / falling edge	A = Counting input B = Dynamic set input	1 bidirectional 32-bit counter with set and reset input, end value reached indicator, touch/ catch value and overflow flag. Additional function to mode 1 is the dynamic set input (B) on falling edge sets START_VALUE.	CMS_IO_32BIT_CNT
7-1	Reserved	None	-	-
8-1	Up/down with release (B), 0 cross detection	A = Counting input B = Enable input	1 bidirectional 16-bit counter (in range of -32768 to 32767) with enable input and zero crossover detection (CF). Counting is valid when input B is TRUE. With set and reset input operation and touch/catch value.	CMS_IO_16BIT_CNT
9-1	Reserved	None	-	-
10-1	Reserved	None	-	-
11-1	Incremental encoder	A = Trace A of the encoder B = Trace B of the encoder Z = Trace Z of the encoder (mechanical zero)	1 bidirectional counter for encoder x1 count, touch/ catch value, RPI function, reset and set Function block counts rising edges at input A.	CMS_IO_32BIT_ENCODER
12-1	Incremental encoder X2	A = Trace A of the encoder B = Trace B of the encoder Z = Trace Z of the encoder (mechanical zero)	1 bidirectional counter for position sensor x2 count, with possibility of touch/ catch value, RPI function, set and reset actions. Function block counts rising and falling edges at input A.	CMS_IO_32BIT_ENCODER

Operation Mode	Function	Used inputs	Description	Function block
13-1	Incremental encoder X4	A = Trace A of the encoder B = Trace B of the encoder Z = Trace Z of the encoder (mechanical zero)	1 bidirectional counter for position sensor x4 count, with possibility of touch/ catch value, RPI function, set and reset actions. Function block counts rising and falling edges at input A and B.	CMS_IO_32BIT_ENCODER
14-1	SSI, absolute encoder	A = Data signal B = Clock signal	Absolute positioning sensor using SSI interface	CMS_IO_SSI_CNT
15-1	Time frequency meter	Z = Input signal	Time measurement of Z signal, rising edge, falling edge, rotation per minute and frequency calculation	CMS_IO_FREQ_SCAN

Process image (I/O data)

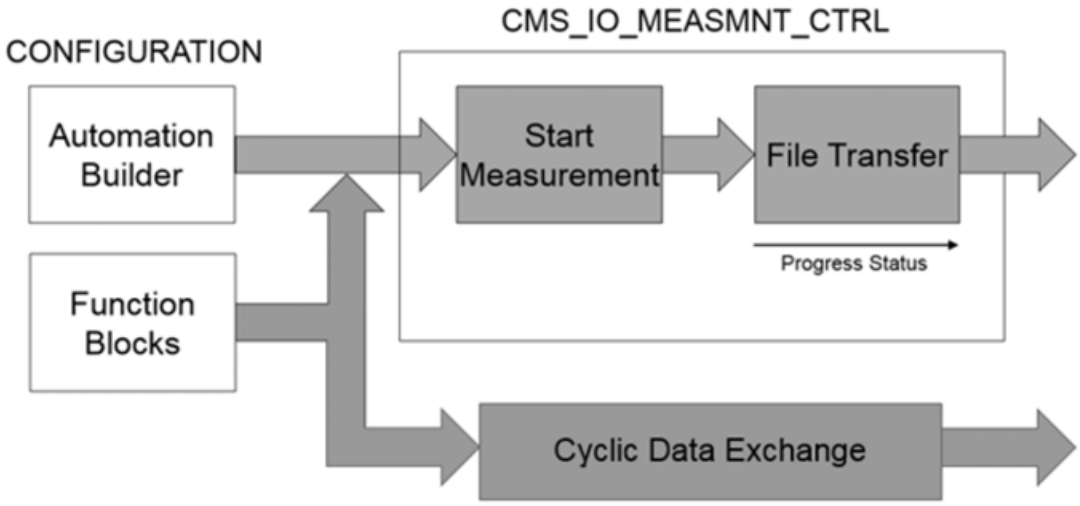
The cyclic data can be accessed to the addresses or variables defined in Automation Builder **I/O Mapping** tab.

FM502-CMS analog measurement

Possibilities to use the analog input signal values:

- The values of the configured analog channels in CODESYS can be used by referencing the I/O mapping variables. The refresh time for the cyclic data exchange of the analog input data is according to the minimum update time in the configuration.
- For detailed data analysis you can record the analog input data into WAV files and store them. In these files, every input data sample is stored.

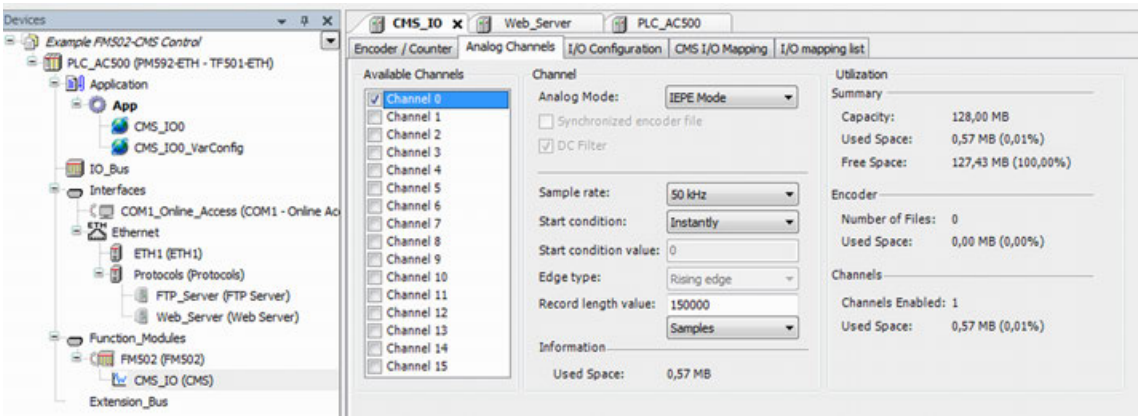
Both possibilities can be used simultaneously.



The DC filter needs 10 seconds to tune in after system power up. During that time the AI values can be accessed by the user program, but the readings are out of tolerance limit.

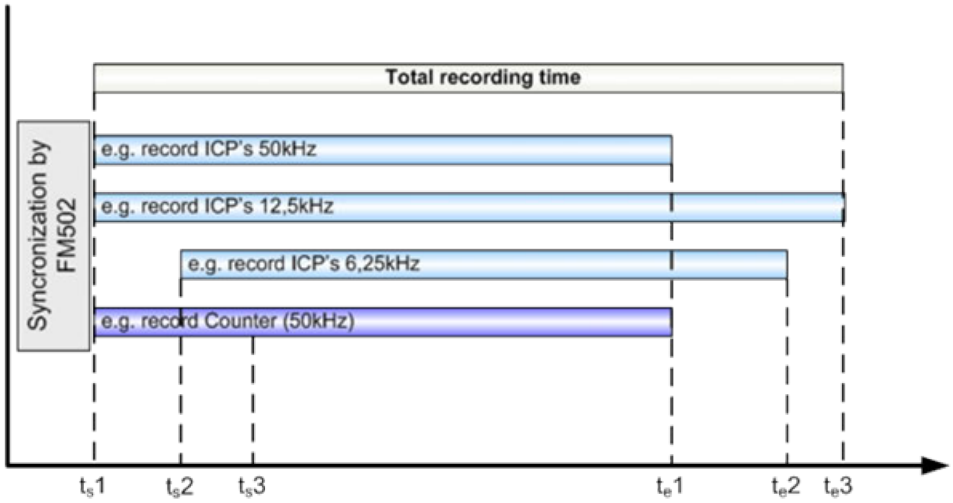
Configuration for analog measurements

▷ Configure at least one analog channel for data acquisition.



The measurement file size depends on the record length value and number of available channels. The maximum capacity of one measurement file is limited by the internal memory. The recording time for each channel is calculated by: recording time = record length value/sample rate.

The total recording time is determined by the earliest measurement start trigger of a channel to the measurement end of the last channel in the configuration.

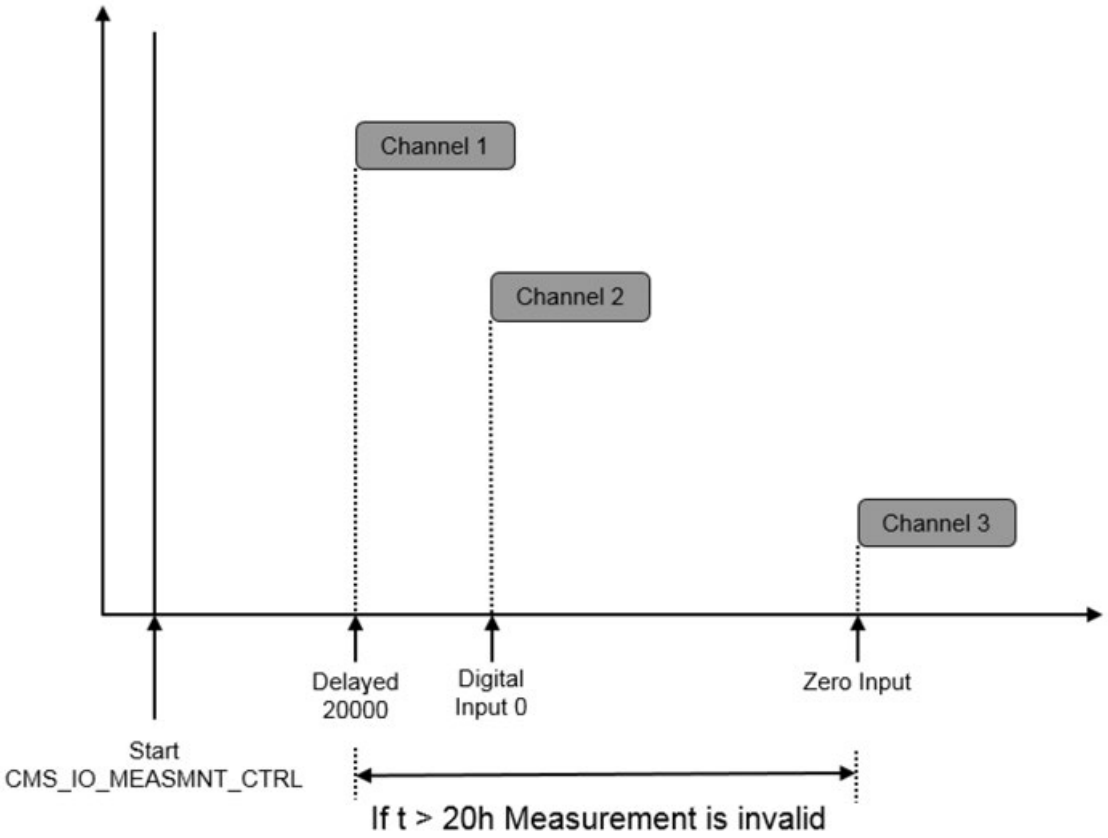


Make sure to configure the right analog mode for each channel. Take care that the sample rate is in relation to the maximum measured frequency.

Start conditions for each individual channel:

- Instantly: Starts measurement instantly after setting input EN to TRUE.
- Delayed: Measurement will start when input EN was set to TRUE and the start condition value [samples] is over.
- Digital input: Starts the measurement when input EN and the digital input was set to TRUE.
- Zero input: Starts the measurement when input EN was set to TRUE and the input Z+ gets a rising edge.
- Encoder value: Starts the measurement when input EN was set to TRUE and the start condition value is satisfied.

The start criteria of all analog channels in one measurement have to be in a 20 hour time window. Otherwise, the measurement is invalid and will be aborted.



The process image (I/O data) of the function module can be mapped for analog measurements.

Measurement files

The measurement data will be stored in the WAV file format. One WAV file will be created for each active channel.

Table 736: RIFF header

Data type	Endian	Length	File offset	Identifier	Value
BYTE[4]	Big	4	0 (0x00)	bfChunkID	"RIFX"

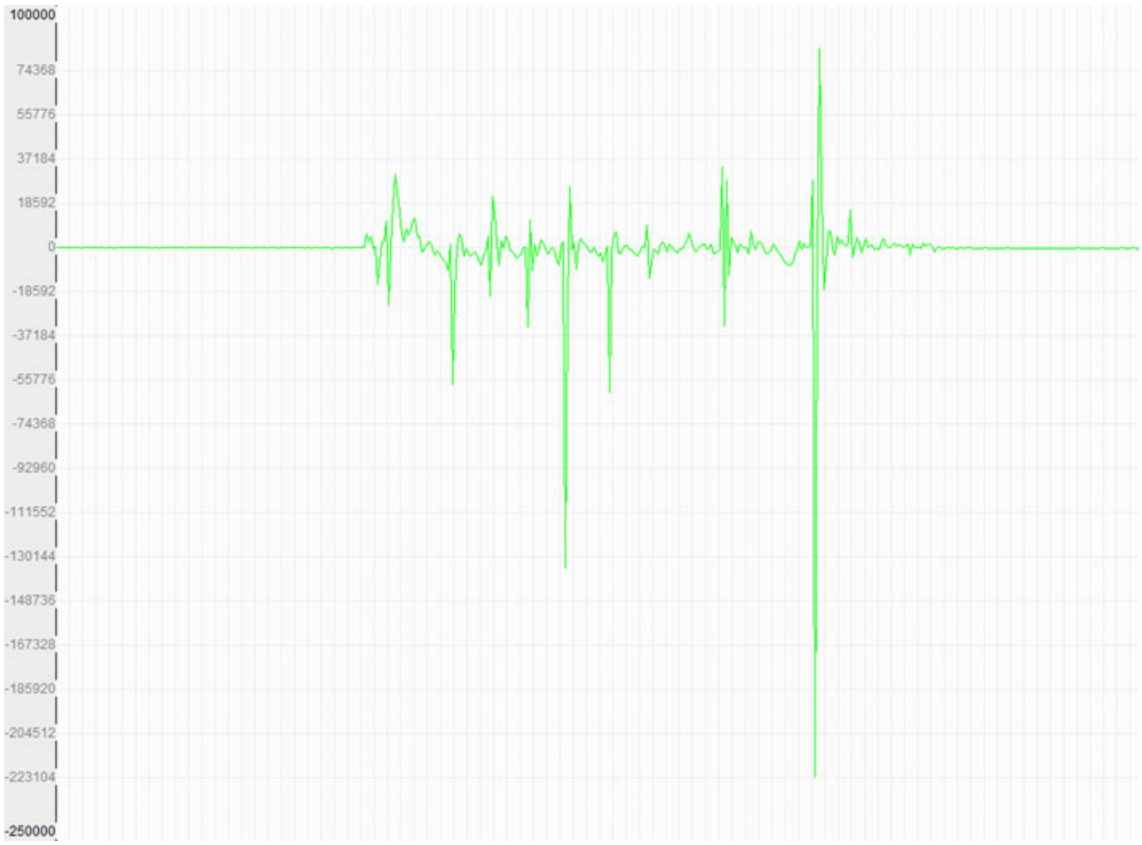
BYTE[256]	Little	255	56+sz(bfData)	bfText	„Label Text“

The WAV files will be stored in an uncompressed ZIP file at the destination path of CMS_IO_MEASMNT_CTRL. The file names for of the WAV files are given by the FM502-CMS and are directly corresponding to the analog channel and encoder configuration of the FM502-CMS.

Example With no encoder, the files are named: CH00_nEN.wav, CH01_nEN.wav, ... CH15_nEN.wav and stored in a ZIP file.

Programming

In CODESYS, the data of the configured analog channels can be seen and used with the I/O mapping variables.



Use the function block CMS_IO_MEASMNT_CTRL to start a measurement.

> *The name of the measurement ZIP file has to be in 8.3 file format. Example: abcdefgh.zip*

After the measurement is finished, the ZIP file is transferred from the FM502-CMS to the PM592-ETH via communication module bus. The progress of the data transfer can be seen at the output PROGRESS in percent. After a successful measurement and data transfer, the output DONE will change to TRUE.

FM502-CMS used as counter device

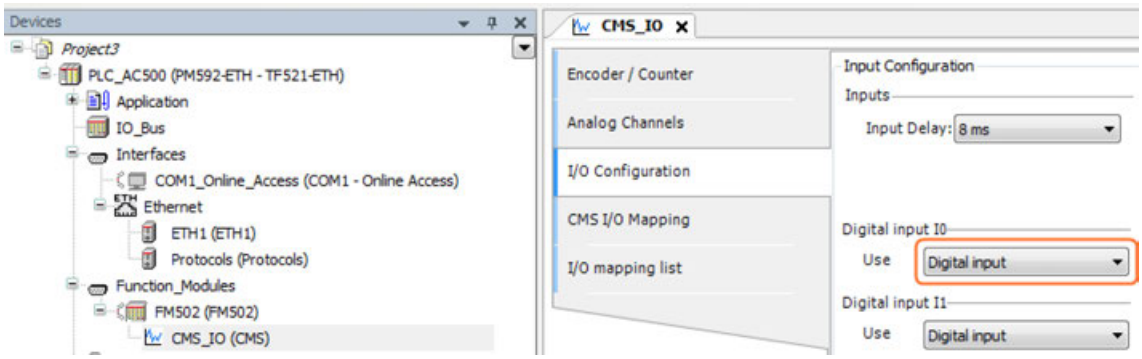


Fig. 1153: Input configuration.

32-bit bidirectional counter

The function block CMS_IO_32BIT_CNT can be used to control one 32-bit bidirectional counter function *Chapter 1.5.8.2.1.3 “CMS_IO_32BIT_CNT 32-bit counter” on page 2534*. A signal used for pulse count is identified by A+. Another signal used for enable or dynamic set is identified by B+.

Possible operation modes: 1-1, 2-1, 5-1, 6-1 *Table on page 6034*

Touch/Catch operation

The touch/catch operation is the way to acquire the counting position synchronously with hardware external signal removing all the latency time of I/O bus and network. This operation allows synchronization between 2 different encoder devices if the same hardware signal is used for touch/catch input.

On edge of the physical external signal, the current counter value (ACT) is stored in a dedicated double word (CNT_TOUCH). The touch/catch operation could be settled on rising or falling edge depending on parameter EDGE_TOUCH.

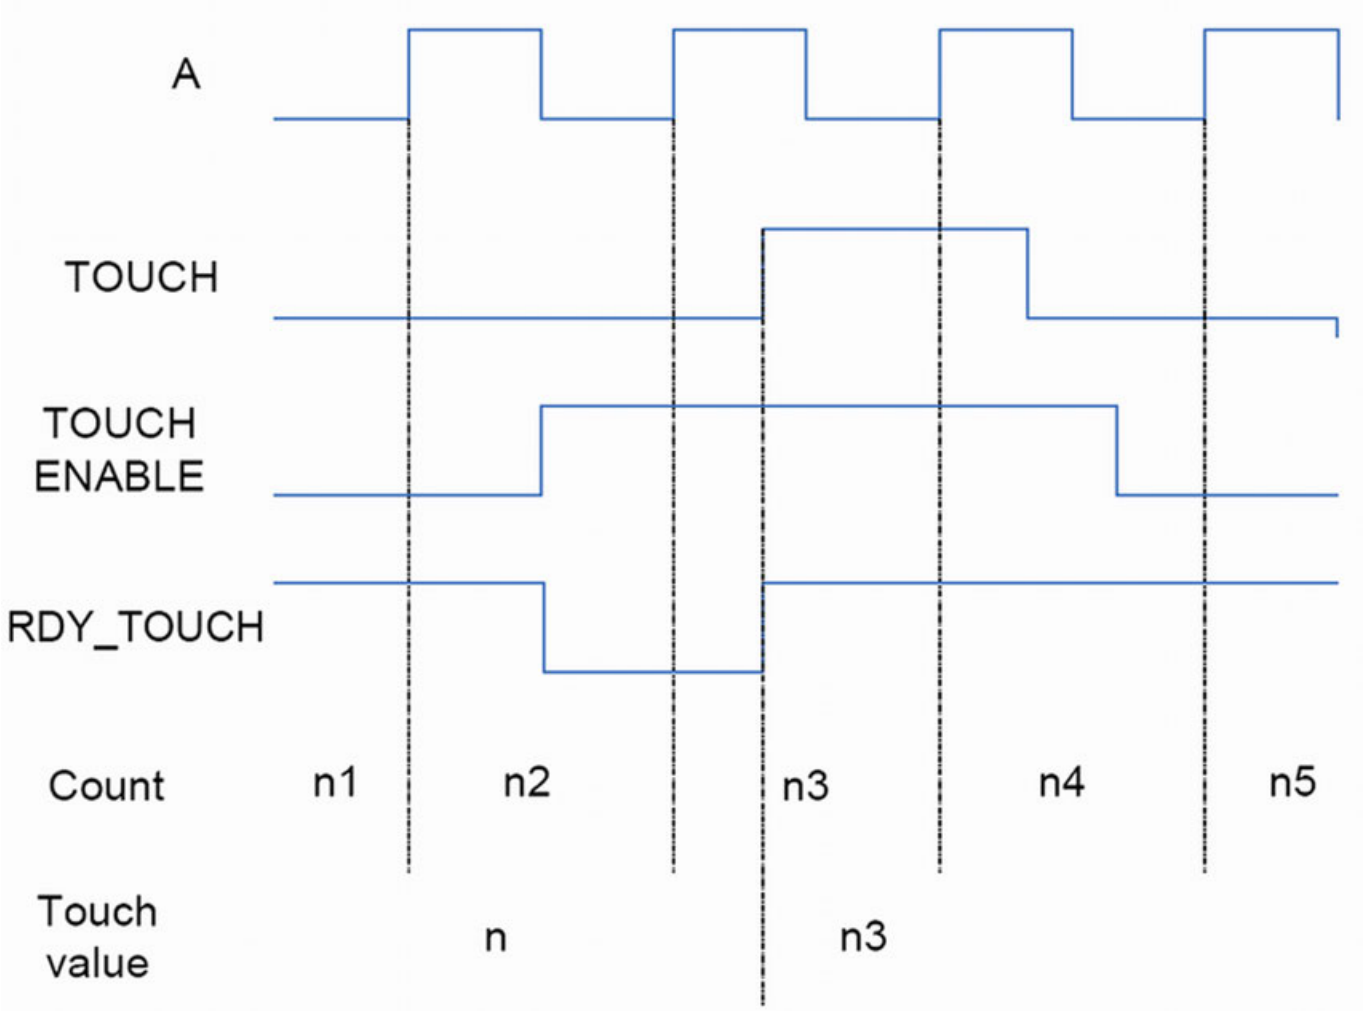

Fig. 1154: Procedure and associated counting value with signal A

Touch/catch operation is enabled through control bit (EN_TOUCH). This resets the status flag (RDY_TOUCH), when the pre-determined edge occurs; the current counter value is stored in the touch value double word. In the same time, the status RDY_TOUCH is set to TRUE.

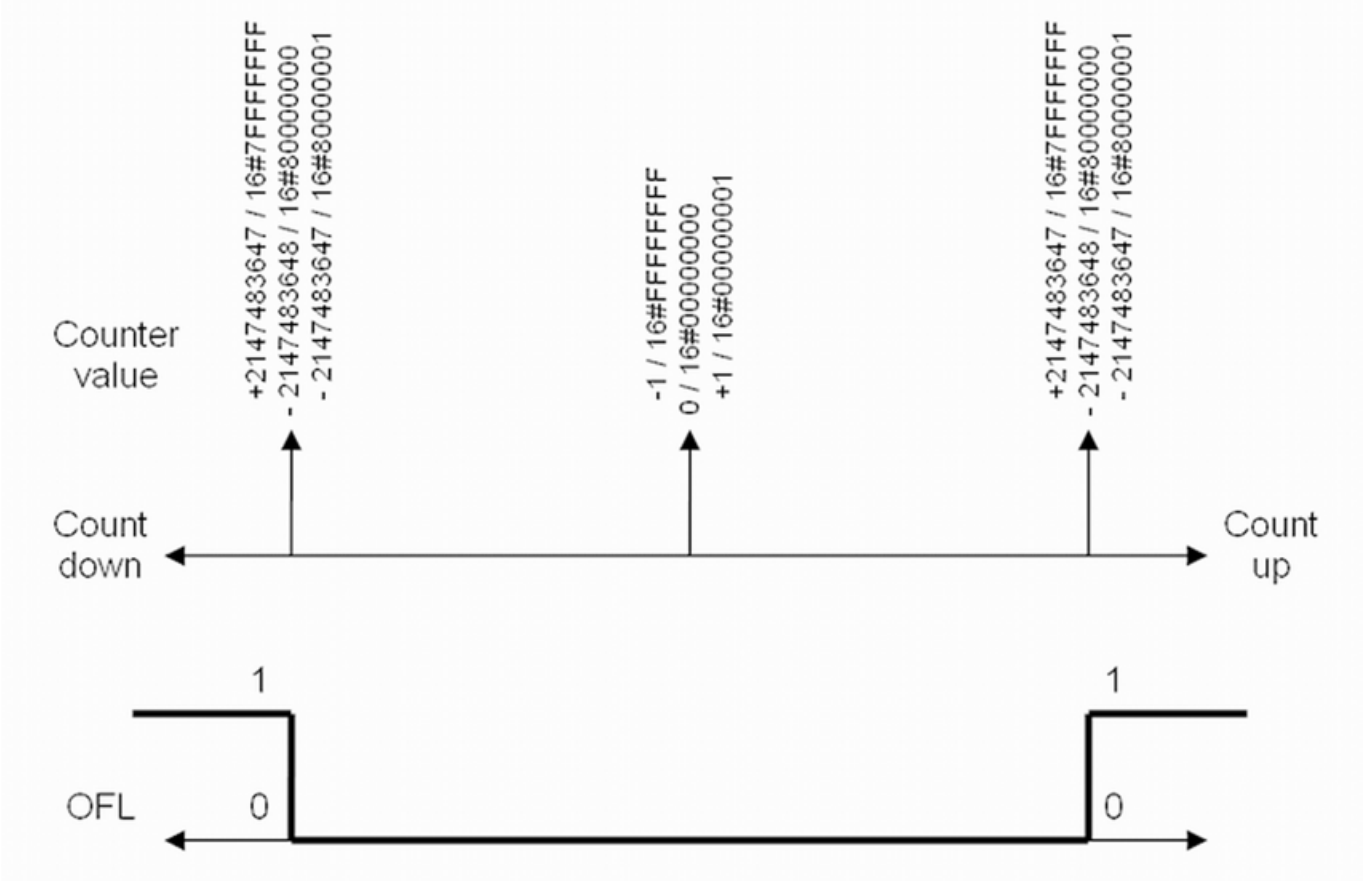
A rising edge at input DI0, DI1, DC2 or DC3 causes the function block to store the actual counter value and to display this value at output CNT_TOUCH.

SET operation

A rising edge at input DI0, DI1, DC2 or DC3 causes the function block to store the START_VALUE value and to display this value at output ACT.

RESET operation A rising edge at input DI0, DI1, DC2 or DC3 causes the block to reset the value at output ACT.

Overflow operation The counter operates as infinite counter. An overflow occurs corresponding to the 32-bit value at 16#80000000 = 2147483648 and any exceeding or falling below of this value (depending to up and down use) OFL will set to TRUE.



16-bit bidirectional counter

The function block CMS_IO_16BIT_CNT can be used to control one 16 bit bidirectional counter function *Chapter 1.5.8.2.1.2 “CMS_IO_16BIT_CNT” on page 2530*. A signal, used for pulse count, is identified by A+.

Possible operation modes: 8-1 *Table on page 6034*

Touch/Catch operation The touch/catch operation is the way to acquire the counting position synchronously with hardware external signal removing all the latency time of I/O bus and network. This operation allows synchronization between 2 different encoder devices if the same hardware signal is used for touch/catch input.

On edge of the physical external signal, the current counter value (ACT) is stored in a dedicated double word (CNT_TOUCH). The touch/catch operation could be settled on rising or falling edge depending on parameter EDGE_TOUCH.

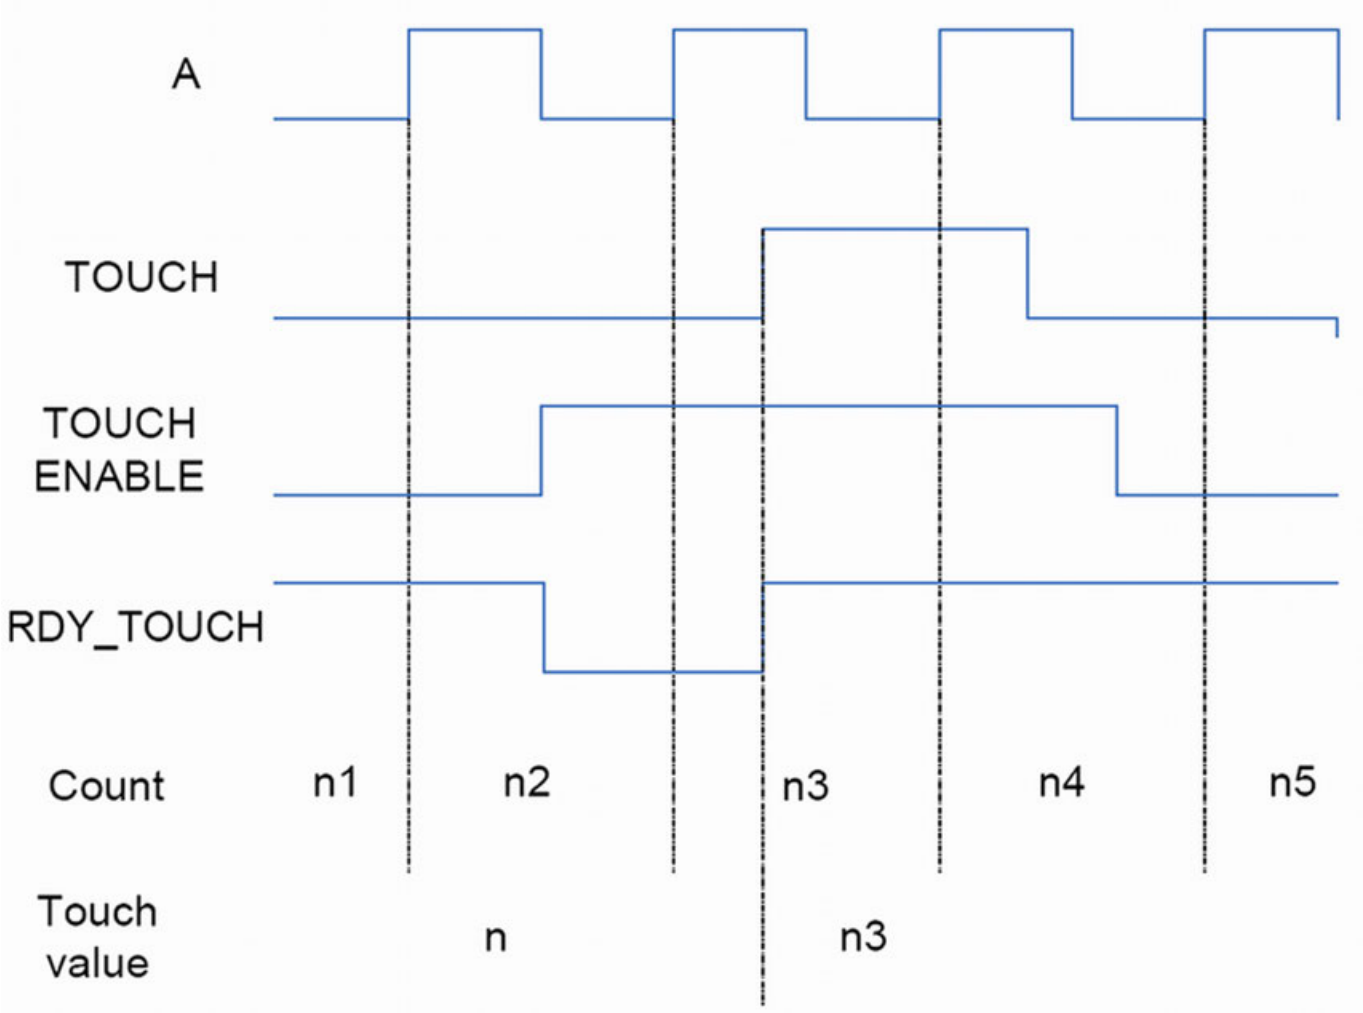


Fig. 1155: Procedure and associated counting value with signal A

Touch/catch operation is enabled through control bit (EN_TOUCH). This resets the status flag (RDY_TOUCH), when the pre-determined edge occurs; the current counter value is stored in the touch value double word. In the same time, the status RDY_TOUCH is set to TRUE.

A rising edge at input DI0, DI1, DC2 or DC3 causes the function block to store the actual counter value and to display this value at output CNT_TOUCH.

SET operation

A rising edge at input DI0, DI1, DC2 or DC3 causes the function block to store the START_VALUE value and to display this value at output ACT.

RESET operation

A rising edge at input DI0, DI1, DC2 or DC3 causes the block to reset the value at output ACT.

Two 16 bit up/down counters

The function block CMS_IO_16BIT_2CNT can be used to control two independent 16 bit bidirectional counter functions *Chapter 1.5.8.2.1.1 “CMS_IO_16BIT_2CNT” on page 2526*. A signal, used for pulse count, is identified by A+ and B+.

Possible operation modes: 3-2, 4-2 *Table on page 6034*

Touch/Catch operation

The touch/catch operation is the way to acquire the counting position synchronously with hardware external signal removing all the latency time of I/O bus and network. This operation allows synchronization between 2 different encoder devices if the same hardware signal is used for touch/catch input.

On edge of the physical external signal, the current counter value (ACT) is stored in a dedicated double word (CNT_TOUCH). The touch/catch operation could be settled on rising or falling edge depending on parameter EDGE_TOUCH.

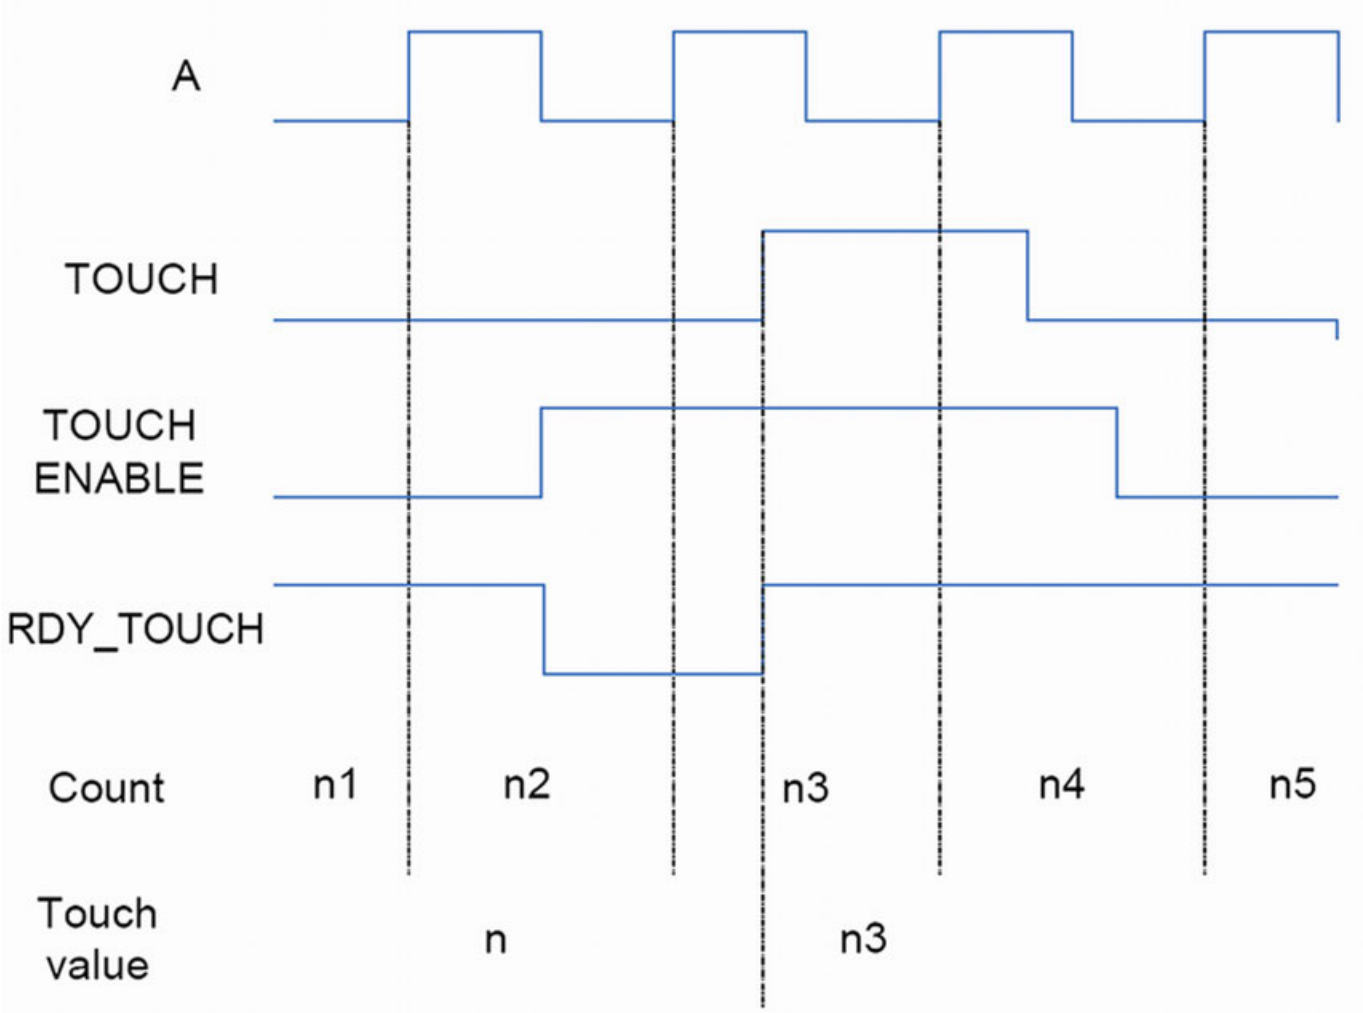

Fig. 1156: Procedure and associated counting value with signal A

Touch/catch operation is enabled through control bit (EN_TOUCH). This resets the status flag (RDY_TOUCH), when the pre-determined edge occurs; the current counter value is stored in the touch value double word. In the same time, the status RDY_TOUCH is set to TRUE.

A rising edge at input DI0, DI1, DC2 or DC3 causes the function block to store the actual counter value and to display this value at output CNT_TOUCH.

RESET operation

A rising edge at input DI0, DI1, DC2 or DC3 which is configured as RESET causes the function block to reset the value at output ACT1. A rising edge at input DI0, DI1, DC2 or DC3 which is configured as Reset 2nd Bit counter causes the function block to reset the value at output ACT2.

Overflow operation

The counter operates as an infinite counter. It is set to TRUE, when an overflow occurs, i.e. the counter value ACT1 or ACT2 goes up to value 16#FFFF= -1. Any exceeding or falling below of this value (depending to up use and down use) will set OFL1 = TRUE or OFL2 = TRUE.

FM502-CMS used as encoder device

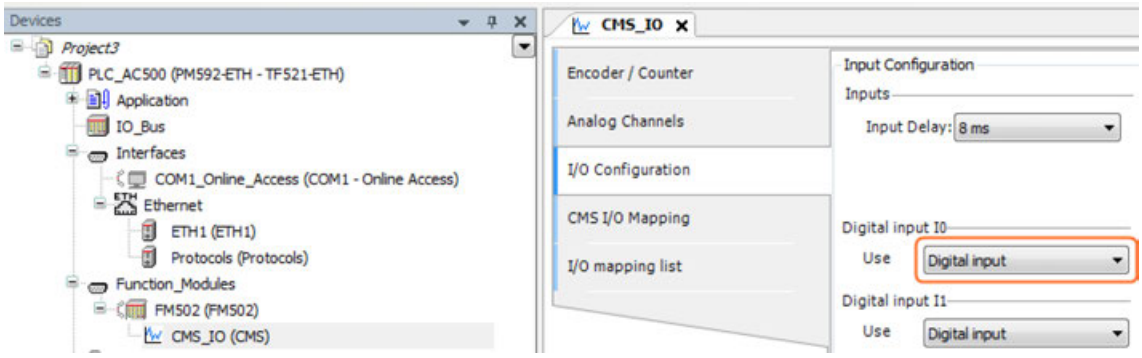

Fig. 1157: Input configuration.

Incremental encoder

The function block CMS_IO_32BIT_ENCODER can be used to control an encoder device for relative positioning with 3 signals ↳ *Chapter 1.5.8.2.1.4 “CMS_IO_32BIT_ENCODER” on page 2538*. 2 signals are used for rotation discrimination and pulse count, identified by A+ and B+. The third one is used in multi-turn encoder to count the number of rotation (mechanical zero), identified by Z+.

The rotation is identified with a shift angle (90°) between A and B signal. In the Function Module, the clockwise rotation is identified with A signal in advance to B.

Possible operation modes: 11-1, 12-1, 13-1 ↳ *Table on page 6034*

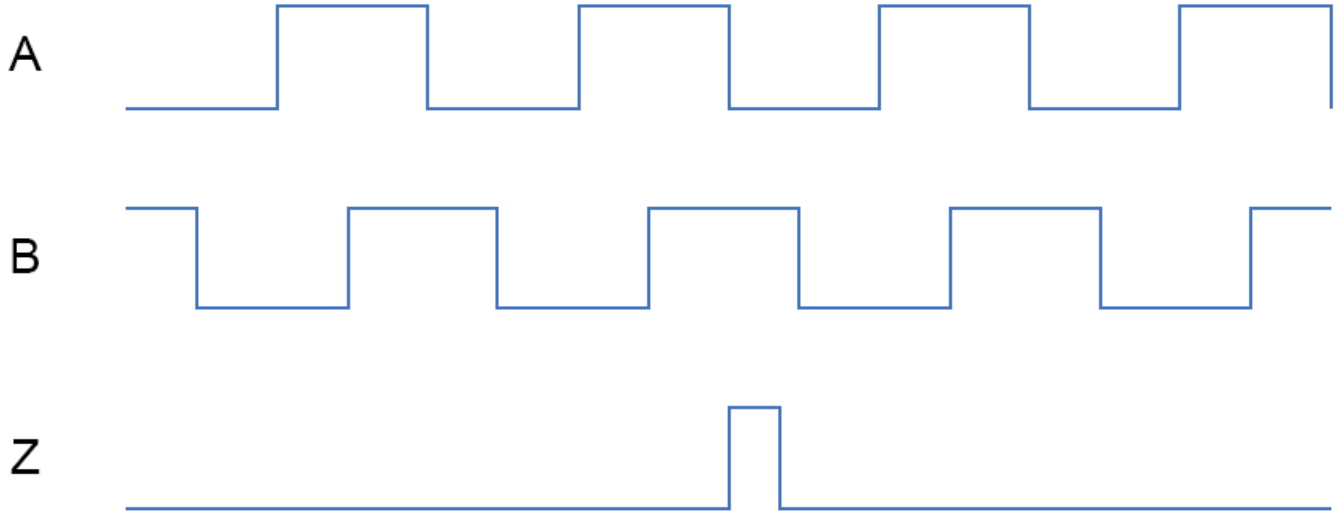

Fig. 1158: Clockwise rotation in the Function Module: A signal ahead from B signal

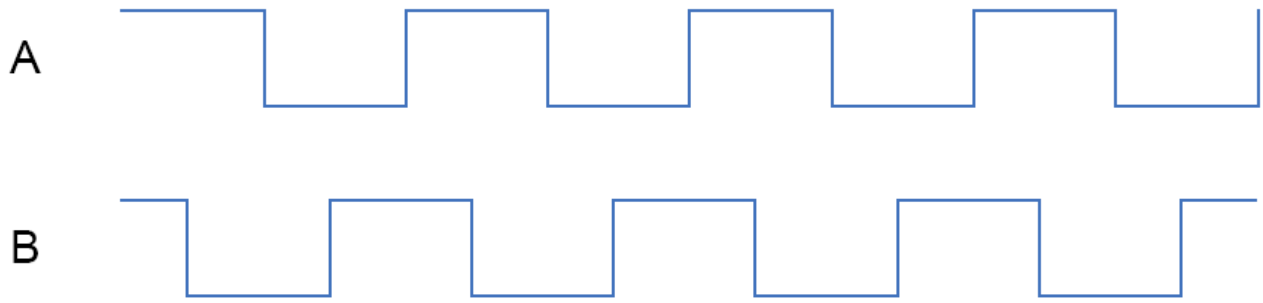

Fig. 1159: Counter-clockwise rotation in the Function Module: A signal late from B signal

Depending on choosen operation mode, the counting procedure will be x1, x2 or x4 count. Basically the x1 counting mode is used (operation mode 11-1). The encoder module discriminates the rotating way and count one pulse for each rising edge of the A signal.

With clockwise rotation, function block CMS_II_32BIT_ENCODER counts downwards. With counter-clockwise rotation, function block counts upwards.

In order to increase resolution, the x2 counting mode can be specified (operation mode 12-1). The encoder module counts one pulse on each rising and falling edge of A signal.

The resolution could be multiplied by 4, using the x4 counting mode (operation mode 13-1). The encoder module counts a pulse on both rising and falling edge of A signal and B signal.

Touch/Catch operation

The touch/catch operation is the way to acquire the counting position synchronously with hardware external signal removing all the latency time of I/O bus and network. This operation allows synchronization between 2 different encoder devices if the same hardware signal is used for touch/catch input.

On edge of the physical external signal, the current counter value (ACT) is stored in a dedicated double word (CNT_TOUCH). The touch/catch operation could be settled on rising or falling edge depending on parameter EDGE_TOUCH.

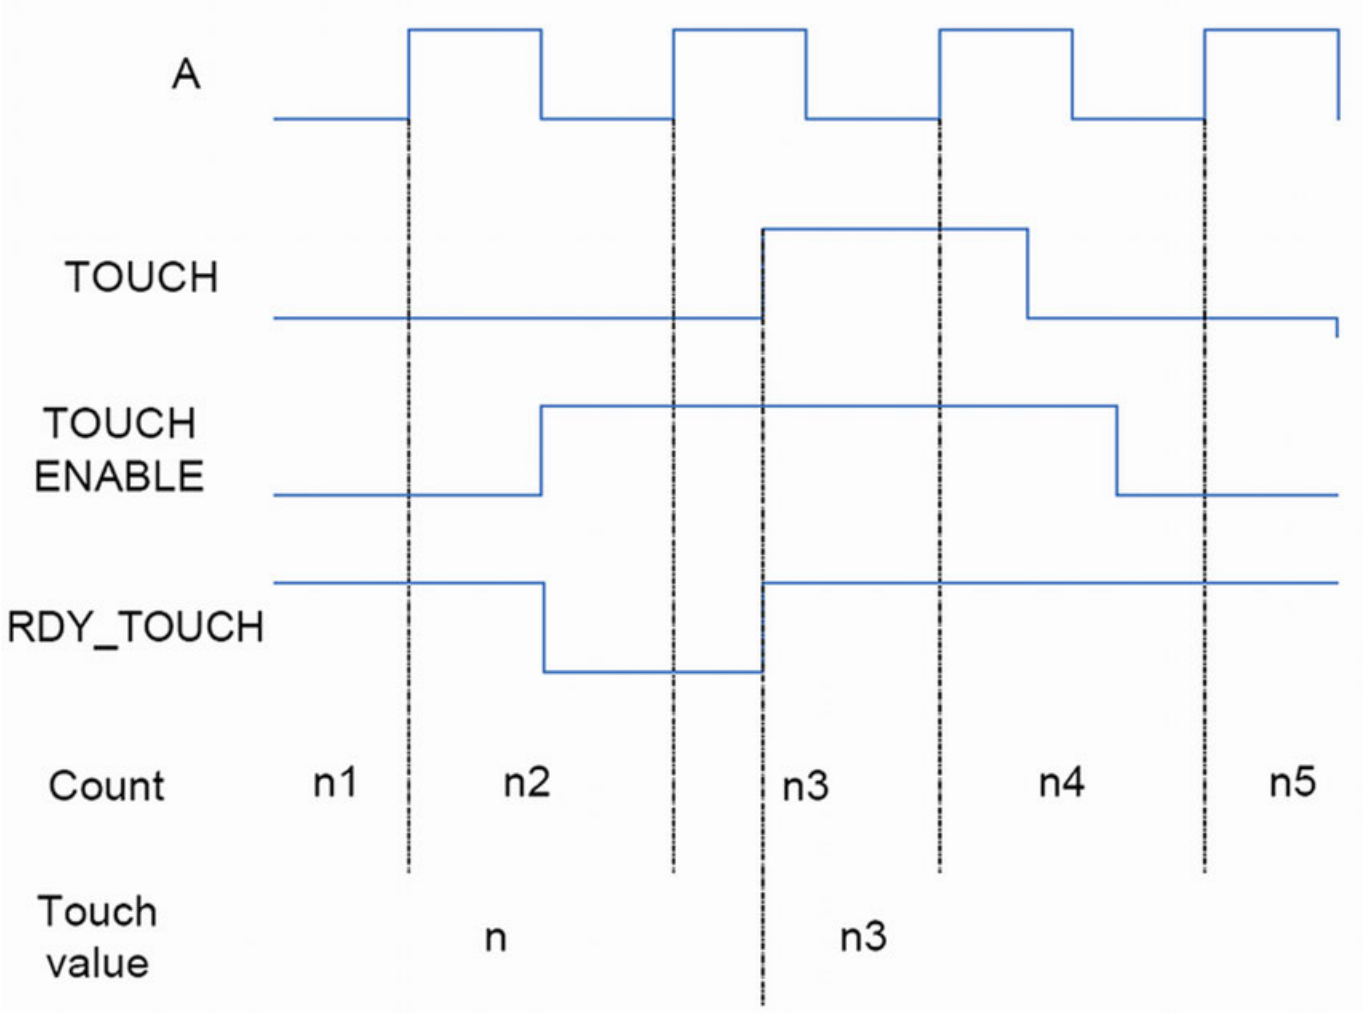

Fig. 1160: Procedure and associated counting value with signal A

Touch/catch operation is enabled through control bit (EN_TOUCH). This resets the status flag (RDY_TOUCH), when the pre-determined edge occurs; the current counter value is stored in the touch value double word. In the same time, the status RDY_TOUCH is set to TRUE.

A rising edge at input DI0, DI1, DC2 or DC3 causes the function block to store the actual counter value and to display this value at output CNT_TOUCH.

RPI procedure

The RPI (Reference Point Initialization) is used to synchronize the counter value with the mechanical zero reference based on signal Z.

RPI procedure is enabled with control bit (EN_RPI). If this control bit is set, the module checks for the Z signal. When the signal appears, the set value is copied in the current counter value and RDY_RPI is set (see figure below).

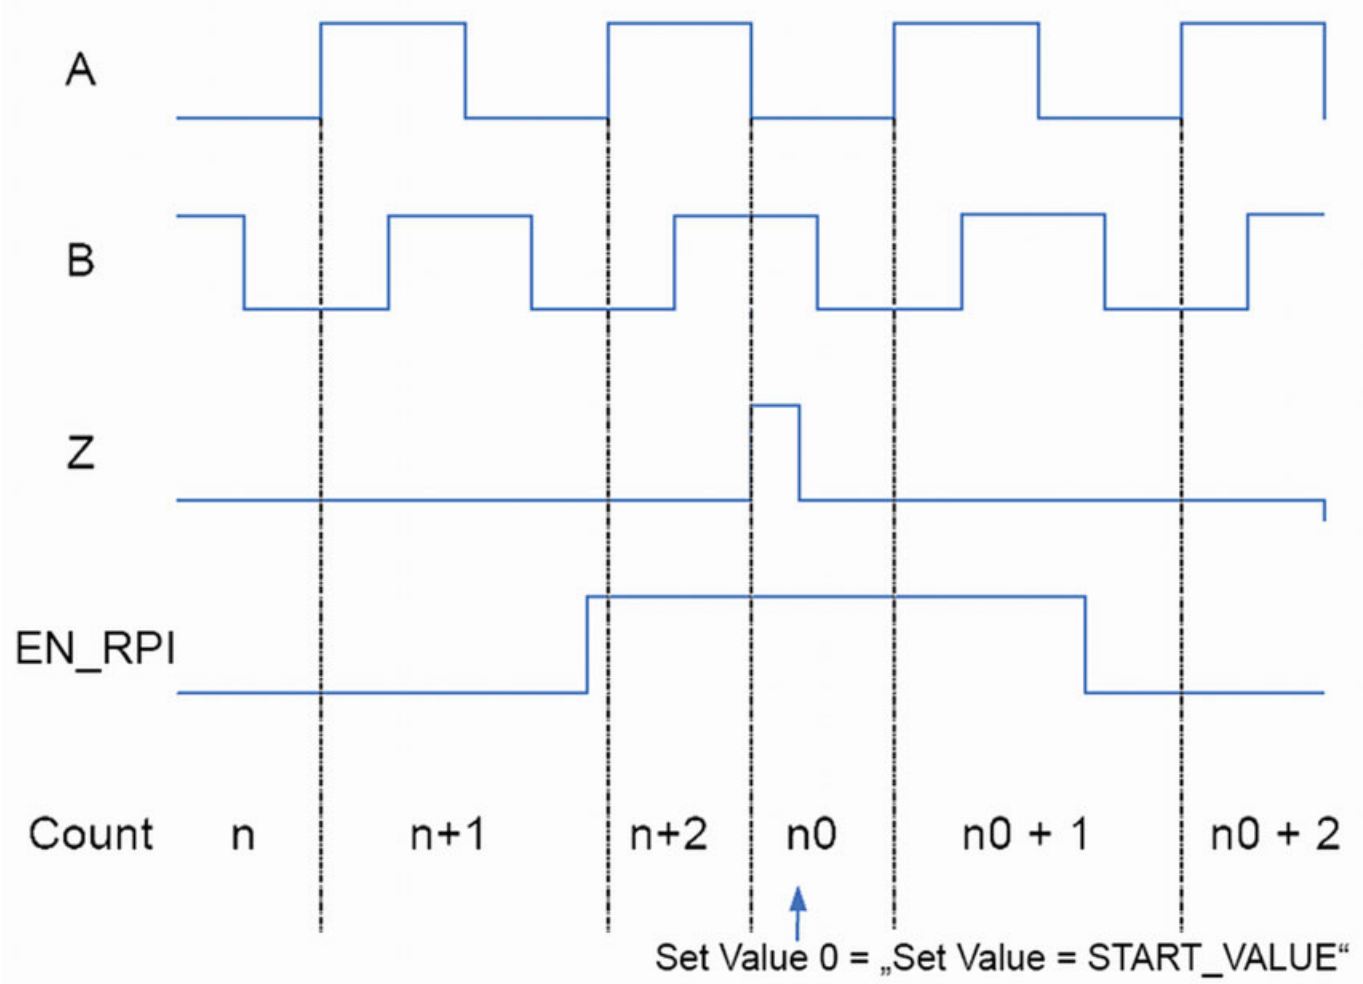

Fig. 1161: RPI operation

A rising edge at the digital inputs DI0, DI1, DC2 or DC3 activates the counter value capture and the counter reset during the capture.

Only one function may be enabled at one time, either the RPI (reference point indicator) or TOUCH (touch trigger measurement) function. If both functions are enabled simultaneously or if the execution of one function is not yet completed when enabling the other function, the RPI function will have a higher priority than the TOUCH function.

SET operation

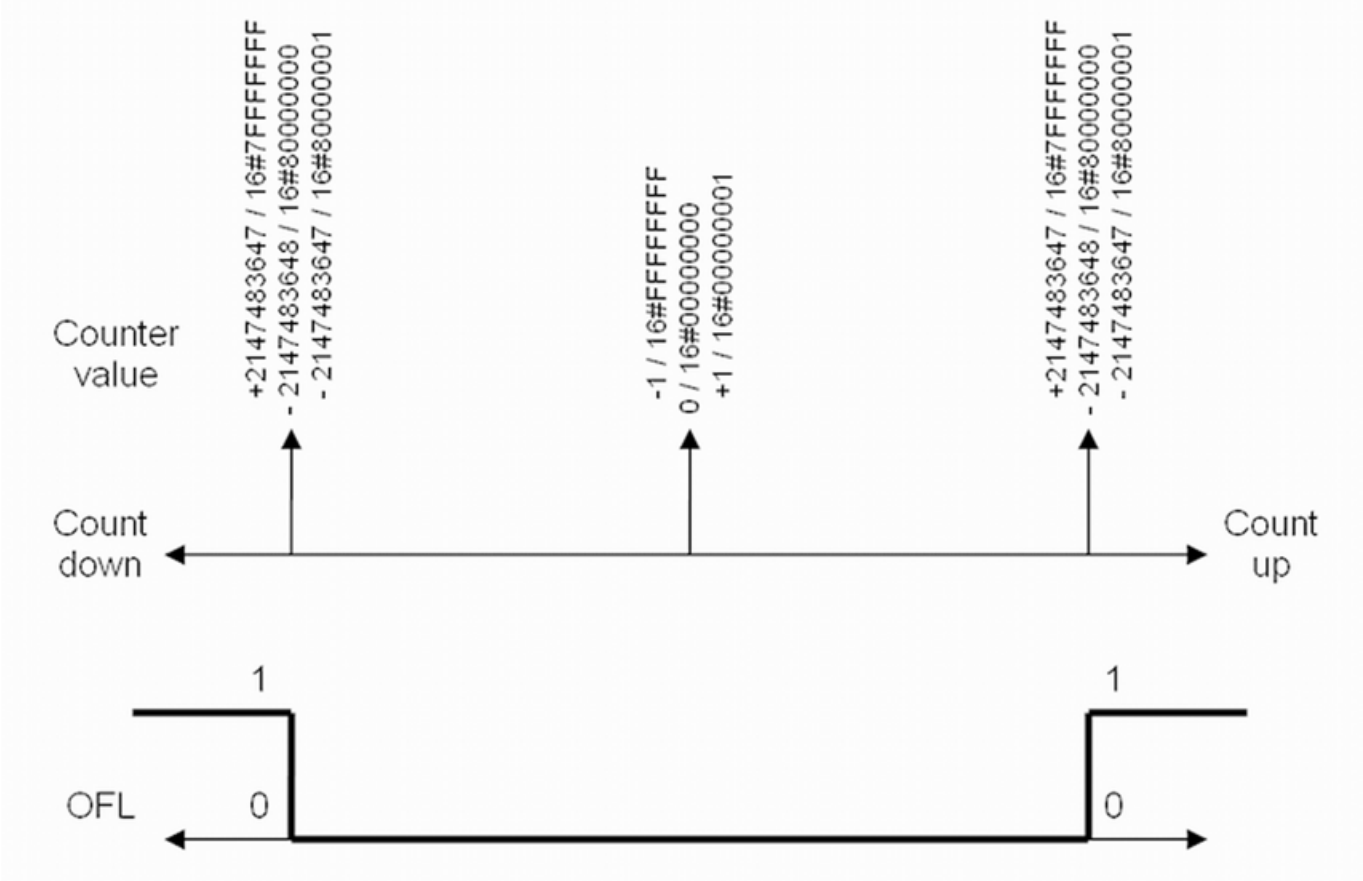
A rising edge at input DI0, DI1, DC2 or DC3 causes the function block to store the START_VALUE value and to display this value at output ACT.

RESET operation

A rising edge at input DI0, DI1, DC2 or DC3 causes the block to reset the value at output ACT.

Overflow operation

The counter operates as infinite counter. An overflow occurs corresponding to the 32-bit value at 16#80000000 = 2147483648 and any exceeding or falling below of this value (depending to up and down use) OFL will set to TRUE.



Absolute SSI encoder

The function block CMS_IO_SSI_CNT can be used to control SSI absolute encoder function ↳ *Chapter 1.5.8.2.1.6 “CMS_IO_SSI_ENC” on page 2545*. There is an interface for absolute angle and linear encoders (displacement measurement systems).

It allows the transmission of absolute position information through a serial data transfer.

The transmission is based on synchronous serial communication. The device sends a clock signal to the encoder and synchronously, the encoder returns the positioning data from the most significant to the less significant bit.

The synchronization for a new data stream is based on time without clock pulse. This quiet time depends on the encoder.

Possible operation modes: 14-1 ↳ *Table on page 6034*

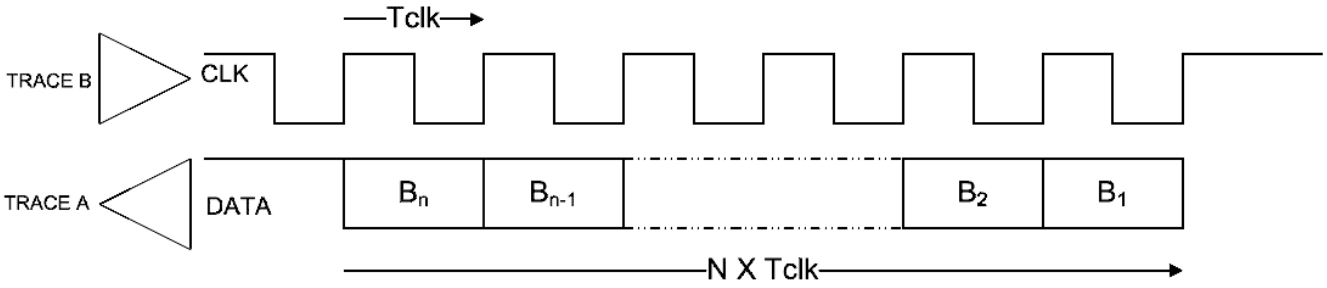


Fig. 1162: Chronogram with data organization with the clock pulse

Resolution For the resolution of the encoder device see technical data from manufacturer. The resolution can be set in configuration under *“SSI parameters ➔ SSI resolution”*.

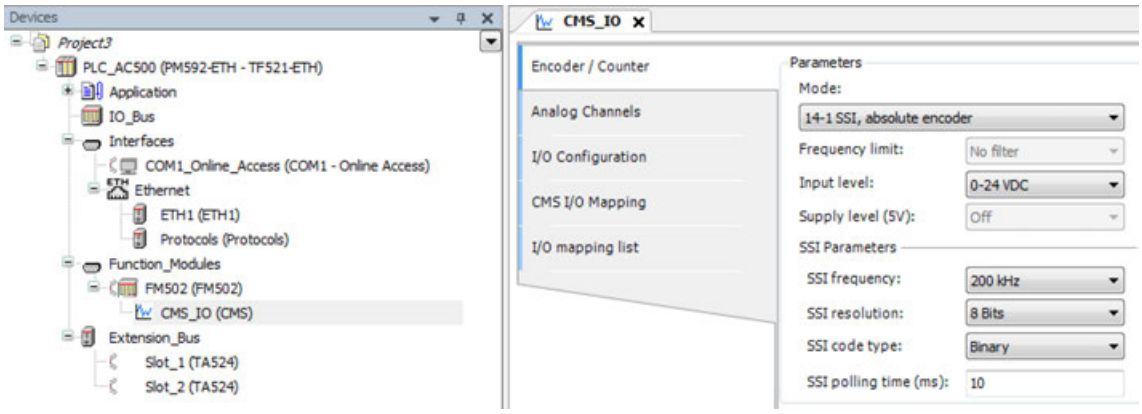

Fig. 1163: SSI parameters

The trace B of the FM502-CMS is switched as output signal (differential). On the rising edge of the signal, the sensor shifts a new value, starting from the most significant bit.

The clock frequency can be specified under *"SSI parameters ➔ SSI frequency"*.

CAUTION!
Risk of malfunctions!
The clock frequency is only an approximately value.

Do not use the clock frequency for any other purposes, e.g. time measurements.

SSI polling time definition

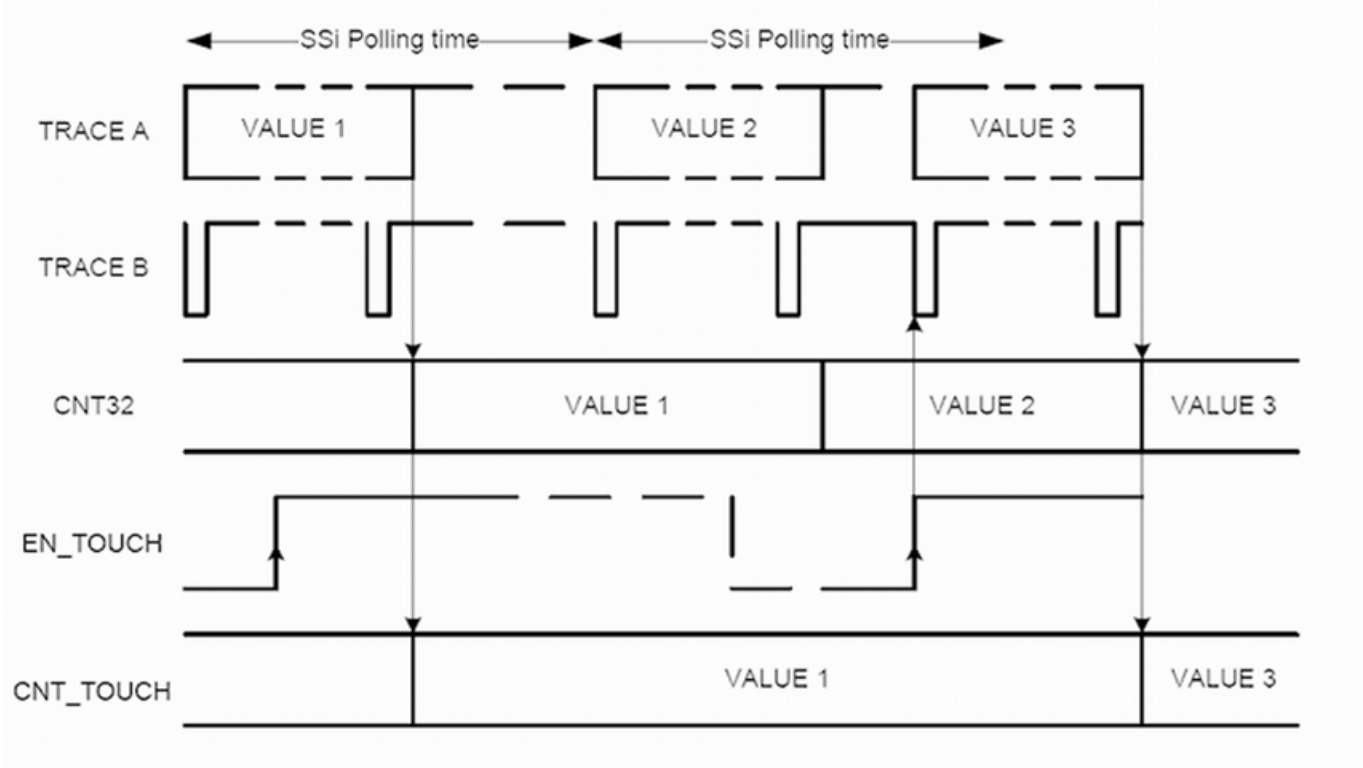
The complete read sequence is launched regularly by the Function Module. The interval between each sequence can be configured under *"SSI parameters ➔ SSI polling time"*.

SSI and touch/ catch operation

Touch operation is valid with SSI sensor. The goal of touch operation is to synchronize sensors with the same hardware signal. In the SSI mode the management is different depending on the reading procedure is running or not.

If the reading procedure has already started while the touch signal becomes active, the reading procedure finishes normally and the last read value is stored in the touch register.

If the reading procedure has not started, the encoder is in the interval between 2 measurements. The reading procedure is started one time more and the result of the last reading is stored in the touch register.

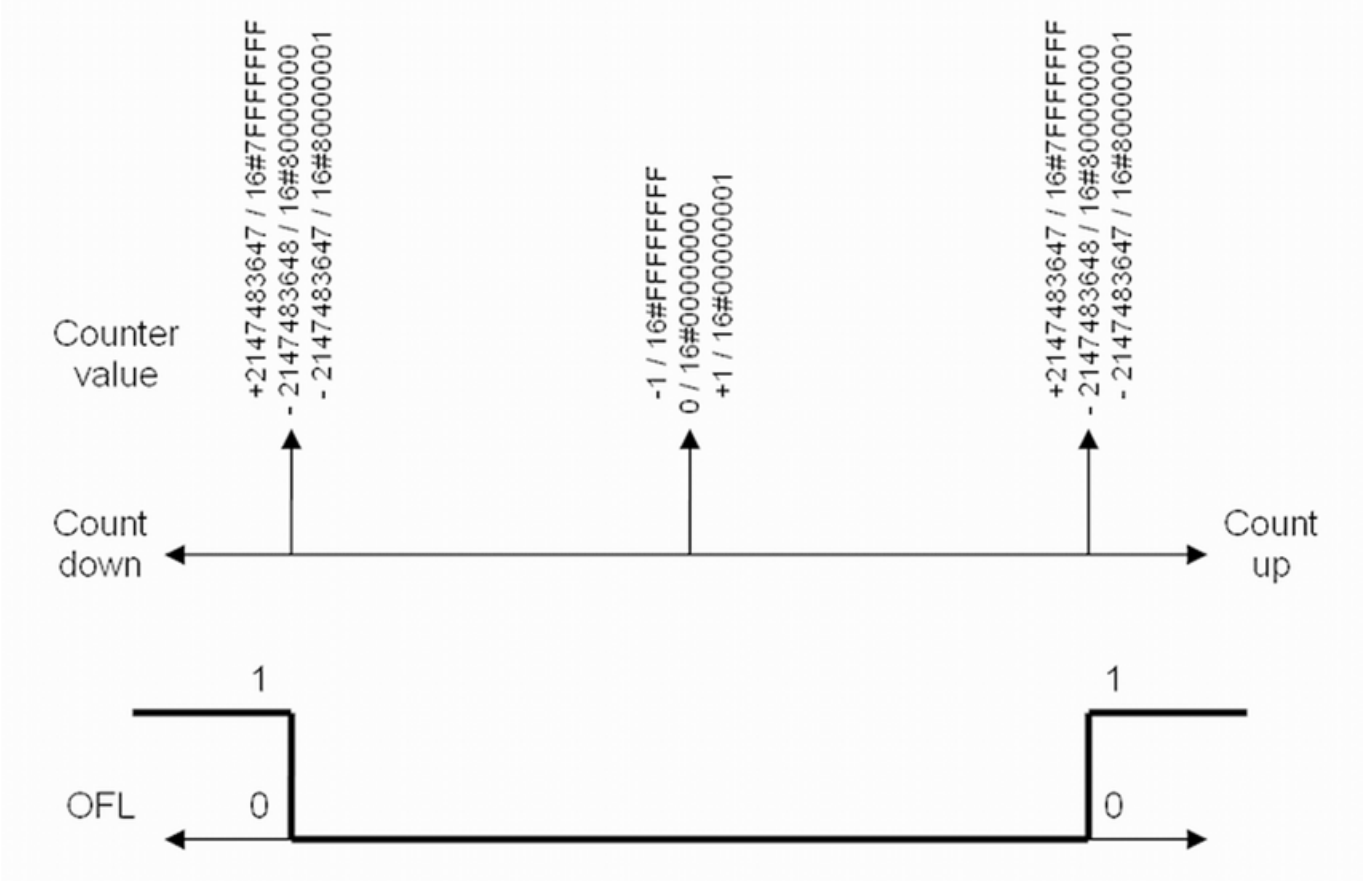


Touch/catch operation is enabled through control bit (EN_TOUCH). This resets the status flag (RDY_TOUCH), when the pre-determined edge occurs; the current counter value is stored in the touch value double word. In the same time, the status RDY_TOUCH is set to TRUE.

A rising edge at input DI0, DI1, DC2 or DC3 causes the function block to store the current counter value CNT32 (ACT) and to display this value at output CNT_TOUCH.

Overflow operation

The counter operates as infinite counter. An overflow occurs corresponding to the 32-bit value at 16#80000000 = 2147483648 and any exceeding or falling below of this value (depending to up and down use) OFL will set to TRUE.



FM502-CMS used as time frequency meter

The function block CMS_IO_FREQ_SCAN is used to measure times, frequency and rotation speeds on channel Z+ of the Function Module *Chapter 1.5.8.2.1.5 “CMS_IO_FREQ_SCAN” on page 2542*.

Possible operation modes: 15-1 *Table on page 6034*

The Function Module provides one channel (Z+) which can be used to measure times, frequencies and rotational speeds with a resolution of 1 µs.

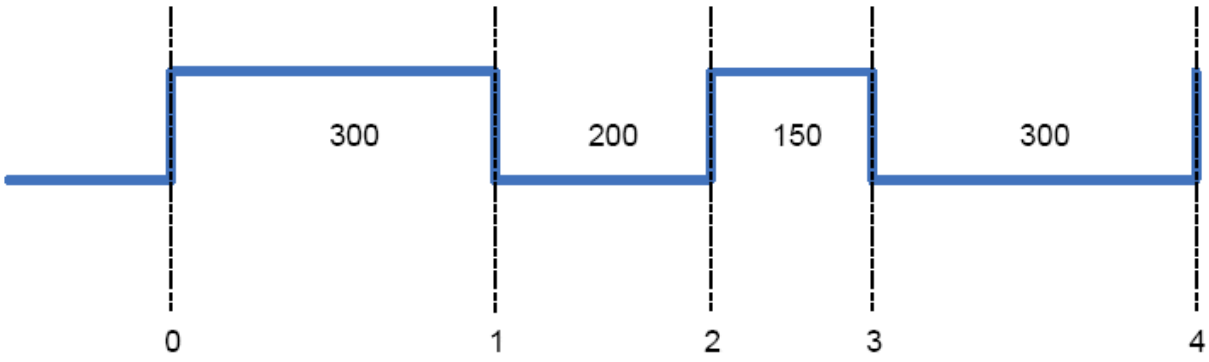


Fig. 1164: Example of timing

Table 740: Values measured according to configuration input parameters and example

EN_0	EN_1	EN_FREQ	Type	1	2	3	4
FALSE	FALSE	TRUE	No measurement	0	0	0	0
FALSE	TRUE	TRUE	Between 2 falling edges		500		450
TRUE	FALSE	TRUE	Between 2 rising edges			350	
TRUE	TRUE	TRUE	Between any 2 edges	300	200	150	300
FALSE	FALSE	FALSE	No measurement	0	0	0	0
FALSE	TRUE	FALSE	Between the rising edge and the subsequent falling edge	300		150	
TRUE	FALSE	FALSE	Between the falling edge and the subsequent rising edge		200		300
TRUE	TRUE	FALSE	Between any 2 edges (start between edge 0 and 1) *)		200		300
TRUE	TRUE	FALSE	Between any 2 edges (start between edge 1 and 2) *)			150	

*) The timing measurement is a single shot process. The function block manages renewal of the measurement as soon as the enable input is valid. Because of timing required to exchange management bits on the bus, it is not possible to provide the time measurement between two adjacent edges. Therefore, the time measured depends on when the measurement is started.

Depending on the input parameters of the function block, the result of the measurement can be read as time in µs, frequency in Hz or speed of rotation in rotation per minute.

FM502-CMS used with synchronized counter/encoder files

Refer to the operation modes and used function blocks ↬ *Table on page 6034*.

Configuration

▷ Configure at least an encoder mode and one analog channel which should be recorded.

⇨ When encoder mode is set, on the **analog channels** tab the check box *Synchronized encoder file* is selected.

The encoder track will only be recorded when the correct encoder function block is used and enabled.

Measurement files

The measurement data will be stored in the WAV file format. One WAV file will be created for each active channel.

BYTE[]	Big	Undefined	44 (0x2C)	bfData	Measurement data

Table 744: Label chunk

Data type	Endian	Length	File offset	Identifier	Value
BYTE[4]	Big	4	44+sz(bfData)	bfChunkID	“labl”
DWORD	Little	4	48+sz(bfData)	dwChunkSize	Data length -8
DINT	Little	4	52+sz(bfData)	dwIdentifier	Identifier
BYTE[256]	Little	255	56+sz(bfData)	bfText	„Label Text“

The WAV files will be stored in an uncompressed ZIP file at the destination path of CMS_IO_MEASMNT_CTRL. The name of the WAV files is given by the Function Module and is corresponds directly with the analog channel and encoder configuration. For every encoder synchronized shannel with different sample rate, there will be a new encoder track which will be used for synchronization.

Example

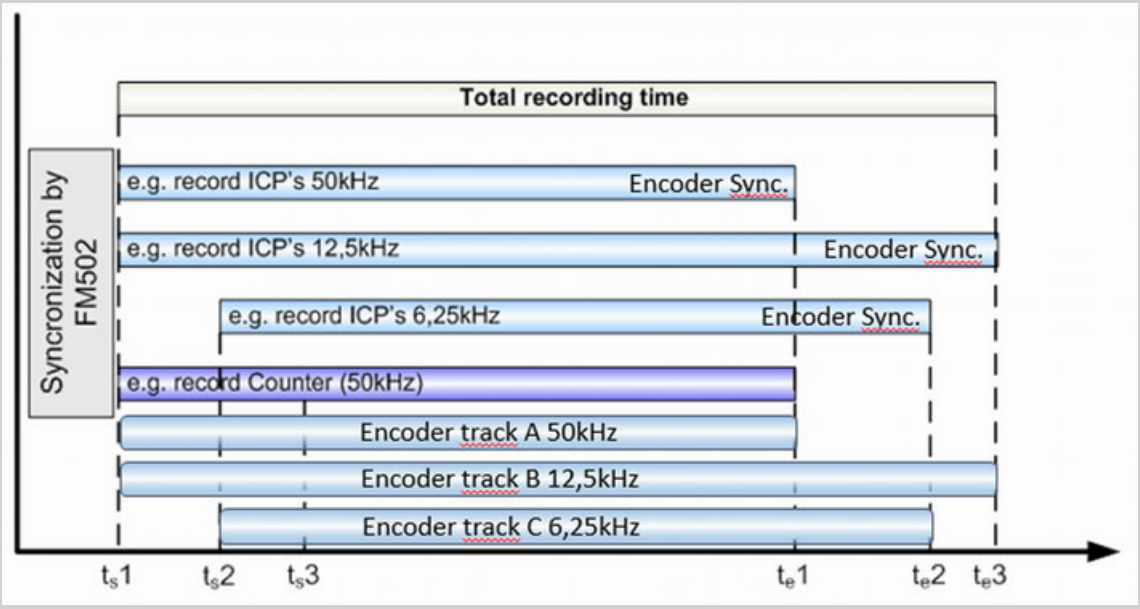
Encoder is configured as:

Channel 0: Sample rate 50 kHz, synchronized encoder file

Channel 1: Sample rate 12,5 kHz, synchronized encoder file

Channel 2: Sample rate 6,25 kHz, synchronized encoder file

Result: The ZIP file contains the WAV files: CH00_ENA.wav, CH01_ENB.wav, CH02_ENC.wav, Enc_A.wav, Enc_B.wav, Enc_C.wav



Example

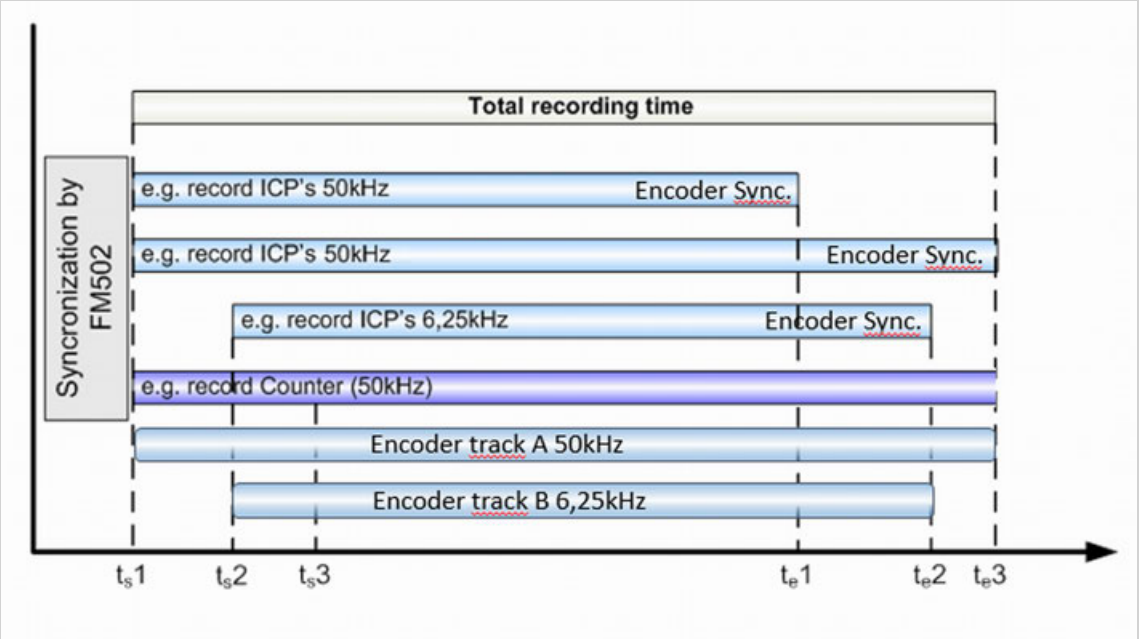
Encoder is configured as:

Channel 0: Sample rate 50 kHz, synchronized encoder file

Channel 1: Sample rate 50 kHz, synchronized encoder file

Channel 2: Sample rate 6,25 kHz, synchronized encoder file

Result: The ZIP file contains the WAV files: CH00_ENA.wav, CH01_ENA.wav, CH02_ENB.wav, Enc_A.wav, Enc_B.wav



The encoder/counter value at the output of the function block will reset when configuration data of the Function Module will be written in CODESYS.

FM562 module

The function module FM562 for pulse train output (PTO) is used for simple positioning tasks with servo drives or stepper drives. FM562 provides 2 axes with 2 inputs and 2 pulse-train outputs each.

It can be used at the following devices:

- Communication interface modules (e. g. CI501-PNIO, CI541-DP)
- Processor modules

It contains the following features:

- 2 axes control
- 2 configurable discrete digital inputs per axis for enable and limit switches signal inputs
- PTO output type: RS-422 differential output (P0, P1, P2 and P3)
- PTO frequency: 10 Hz to 250kHz
- Configurable PTO output mode: CW/CCW (clockwise/counterclockwise), pulse/direction
- Position and speed control with built in motion profile generators. Integration in the application program by PLCopen Motion Control function blocks (PS552-MC-E motion control library is required for programming)

The pulse outputs of the 2 axes are not galvanically isolated from each other.

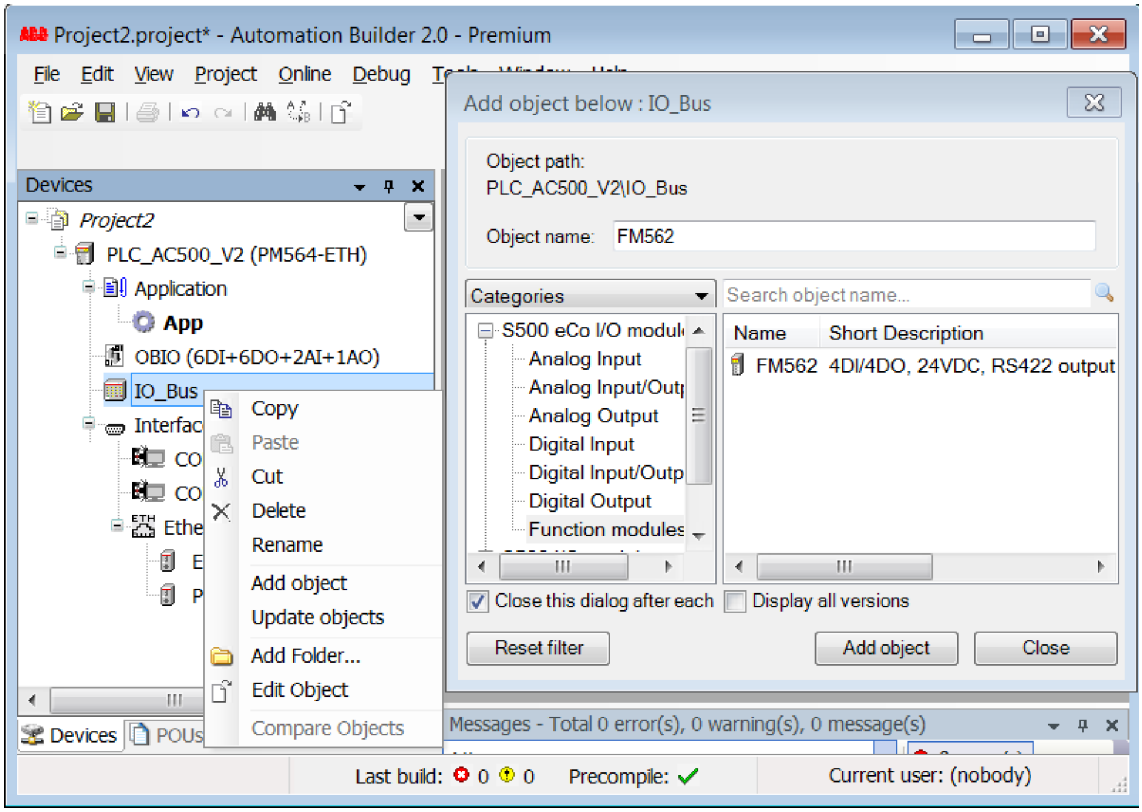
The other circuitry of the module is galvanically isolated from the inputs/outputs.

Special features

FM562 provides a square wave output for a specified number of pulses and a specified cycle time. It can be programmed to produce either 1 train of pulses or a pulse profile consisting of multiple trains of pulses. For example, a pulse profile can be used to control a stepper motor through a simple ramp up, run, and ramp down sequence or more complicated sequences. The control positioning is achieved according to an open loop mode, meaning without the need for feedback information on the real position. The position loop is integrated in the servo-drive.

See also: *Chapter 1.6.4.4.4 “FM562 module” on page 5751*

Inserting FM562 on I/O bus



1. Right-click on the *“IO_Bus”* element in the configuration tree opens the context menu.
2. Click *“Add object”* and open in the *“S500 eCo I/O module”* list the *“Function modules”*.
3. Select *“FM562”* and click *“Add object”*.

See also: *Chapter 1.6.2.7.1.1 “FM562 for pulse train output” on page 4617*

Configuring the Library Manager

> *Ensure that you have installed the library PS552-MC-E before you start using the FM562 module in your application program.*

The following library files of the PLCopen Motion Control Library PS552-MC-E are required for using the FM562 module inside an application:

PTO library file:

- PTO_FM562_MC_support_V22.lib

The PTO Library provides the access function block that contains the interface between the PLCopen function blocks and the FM562 PTO Module.

PLCopen Library files:

- MC_Base_AC500_V11.lib
- MC_Blocks_AC500_V11.lib

The PLCopen Library contains function blocks based on the PLCopen Motion Control standard and can be used for various motion devices, e.g: ACSM1, ACS350, ACS800, E100, E150 and FM562.

See also: *Chapter 1.6.4.4.4.1.2 “The function blocks used with FM562” on page 5753*

1.6.5.2.9 I/O bus and I/O modules

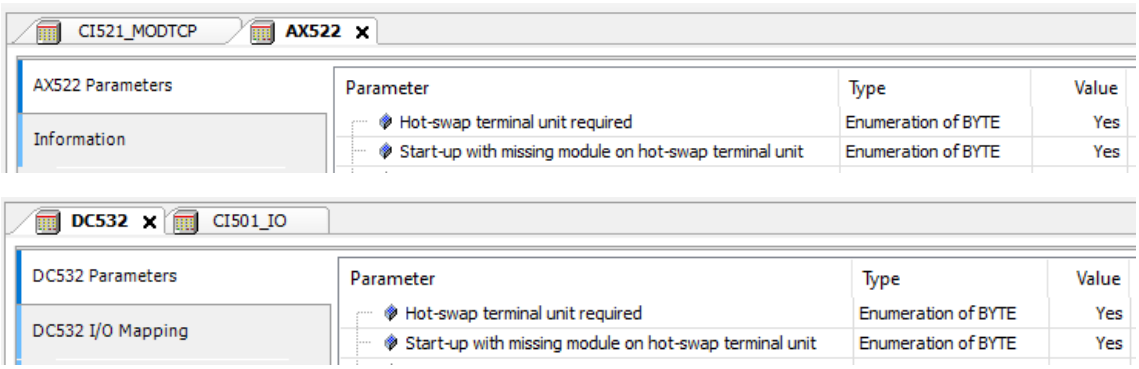
Hot swap configuration

Parameter configuration

I/O extension modules include the below parameters for hot swap configuration

Parameter	Purpose	Value
Hot-swap terminal unit required	To include diagnosis for missing hot-swap terminal unit	Yes: Communication Interface provides extended diagnosis for missing hot-swap terminal unit
		No (default): Extended diagnosis not available
Start-up with missing module on hot-swap terminal unit	Ignore missing module during start-up on hot-swap terminal unit. Incomplete I/O configurations must not prevent the system from starting.	Yes: Module is optional, start-up if there is no module available on hot-swap terminal unit
		No (default): Module is mandatory, start-up only if correct module is available

In Automation Builder projects for Modbus TCP and V2 PLCs, hot-swap parameters can be configured from the Parameters tab of respective I/O module



Parameterization of the I/O bus

Double-click the *"IO_Bus"* node in the device tree to open the I/O bus configuration.

The following parameters are available:

Parameter	Default	Value	Description
Run on config fault	No	No	In case of configuration fault the user program will not be launched.
		Yes	The user program will be also launched in case of configuration error on the I/O Bus.
Max wait run	3000	0...120000	Maximum waiting time for valid inputs.

In case of a digital I/O Module, the channels are provided as WORD, BYTE and BOOL. Because the analog inputs can also be configured as digital inputs, bit 0 of each channel is also available as BOOL.

The symbolic name of a channel can be entered in front of the string "AT" in the channel declaration.

All channels should have a symbolic name and only symbolic names should be used in the program code. If the hardware configuration has changed or if you want to download the project to a PLC with another hardware configuration and thus the PLC configuration has to be changed, the addresses of the inputs and outputs can change. In case of symbolic programming (i.e., symbolic names are used), the program code does not have to be changed.

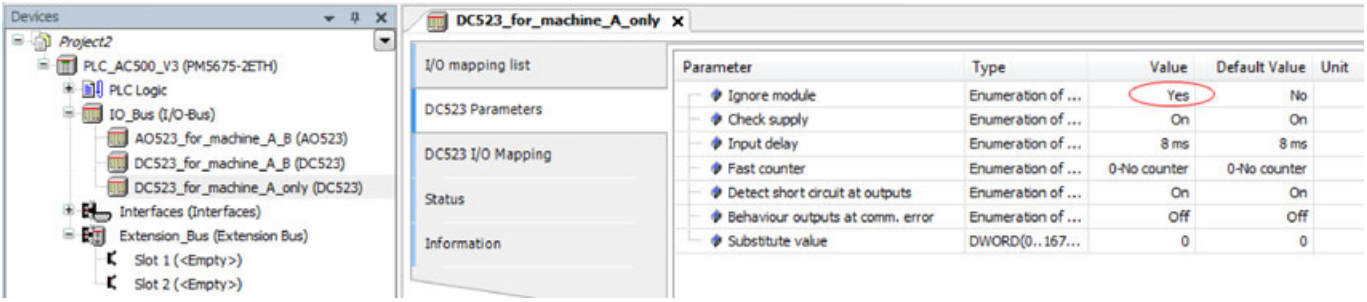
Parameter 'Ignore module'

All I/O devices provide the parameter "Ignore module". This parameter can be used for simulation purposes and determines whether an I/O device is considered or ignored during a PLC configuration check.

This allows to use an existing Automation Builder project/PLC configuration though some hardware devices are not physically available in a hardware installation.

> *I/O devices with one byte input and output cannot be detected if they are configured but not connected to the CS31-Bus.*

Example The Automation Builder project for machine A shall be used for machine B. However, the second DC523 device is missing in the hardware installation of machine B. Hence, for machine B the value for 'Ignore module' is set to 'YES'.



Insertion of S500 I/O devices

1. Right-click *"IO_Bus"* in device tree and select *[Add object]*.

   -> The Add Device dialog window where all available S500 I/O Devices are listed will open.

2. Append the S500 I/O Devices in the same order as they are mounted on the hardware.

   Input and output modules connected to the I/O bus occupy the I/O following area: %IB0 .. %IB999 or %QB0 .. %QB999.

> *AC500-eCo: PM55x-xP and PM56x-xP support up to 10 S500 I/O Devices.*
>
> *AC500 (Standard): PM57x, PM58x, PM59x support up to 10 S500 I/O Devices.*

Configuring the input and output modules and channels

The I/O channel configuration depends on the corresponding S500 I/O Device. See hardware documentation of the I/O Device for more information.

The individual configuration parameters can be opened in the editor window via double-click on the corresponding module and are listed in tab [S500 I/O device name] Configuration.

Symbolic names for variables, inputs and outputs

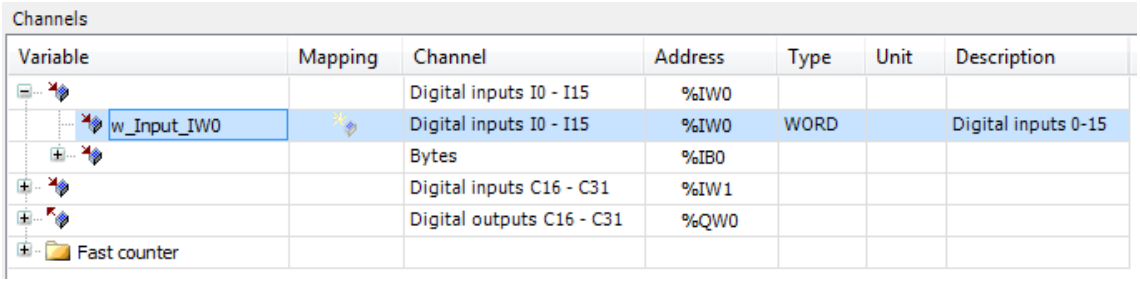
> *The IEC naming rules are not checked during input in Automation Builder.*

Input and output mapping

Devices with I/Os provide an I/O Mapping tab in their configuration editor where the available I/O channels can directly be mapped to a global variable.

The corresponding variable declarations are automatically created in a global variables object in a subfolder of the Global Variables section in the CODESYS project.

All available I/O channels can easily be assigned to a variable.



The variable is automatically added to the Global Variables in the CODESYS project after recreating the configuration data *Chapter 1.6.5.4.1.1 “Creating configuration data” on page 6196*.

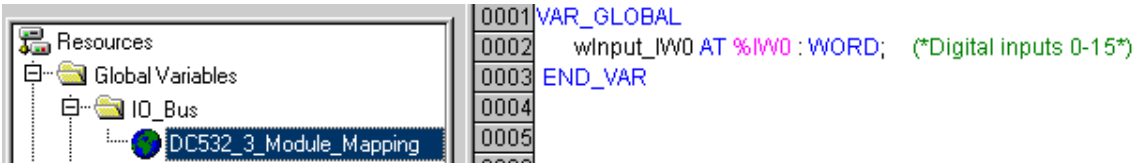
AC500 uses Motorola Byte Order (Big Endian).

The numbers in column Channel correspond to the channel numbers only and not to the bit position inside the WORD variable.

Only entries with a data type set in column "Type" can be mapped. These entries can be expanded to show the available I/O channels.

If the project has been imported from a previous Automation Builder version, all variables should be checked to avoid inconsistencies concerning the I/O mapping.

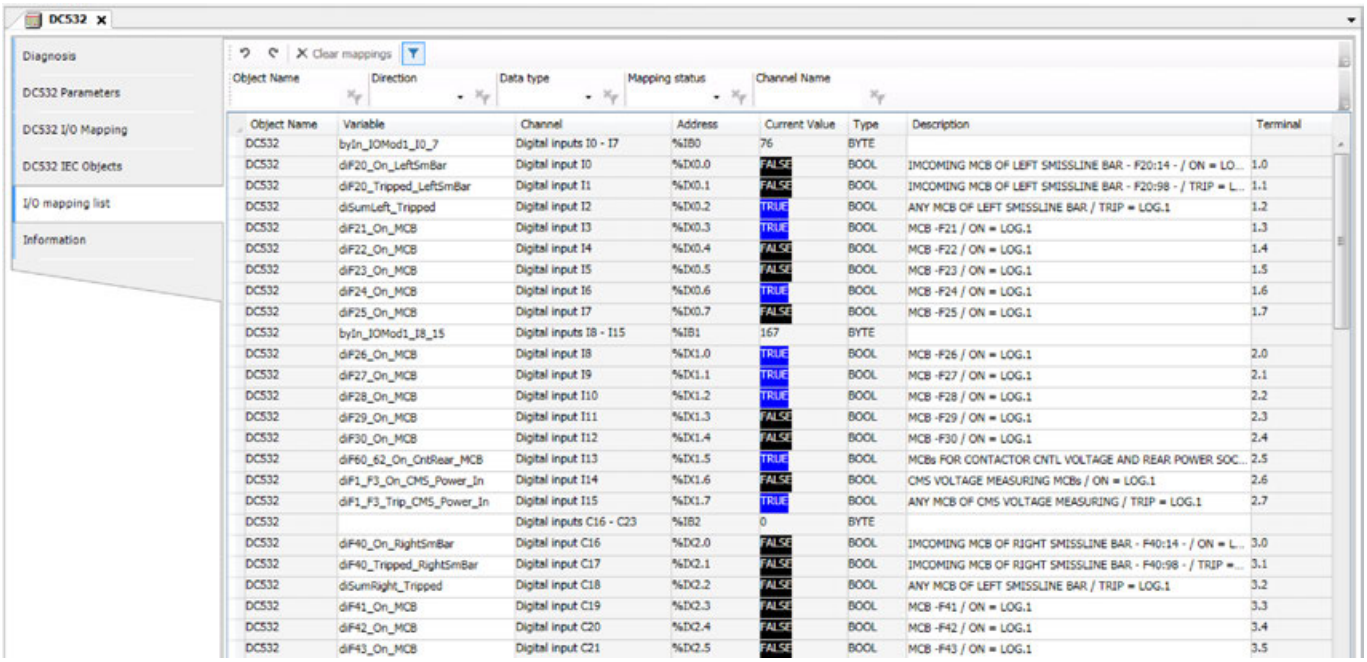
The variable is automatically added to the global variables in the CODESYS project after (re)creating the configuration data:



An additional GVL (Global Variables List) can be created and transferred to CODESYS V2.3. Editing of lists created in CODESYS V2.3 is not possible.

I/O mapping list

Automation Builder contains an I/O mapping list feature for creating mapping variables with better usability support compared to the tree structured view. Details on the tree structured view is provided in the CODESYS Development System.



Functionalities of the I/O mapping list:

- Displays I/O mappings for current node and all valid subsequent child nodes.
- Displays channel information with additional columns.
- Supports keyboard functions such as *cut*, *copy*, *paste*, *delete*, and *select all* within the editor and within Excel spreadsheet (for bulk editing).
- Contains a toolbar for various actions, e.g. filtering, undo/redo and clear mappings.
- Supports single click edit and easy navigation using arrow keys.
- Improvised error handling:
  - Allows to enter invalid mapping variables. This provides flexibility in bulk editing. Only when saving the project, the errors - according to IEC 61131 standard - are displayed.
  - In the message window, the error log is visible. The user can track the errors to their corresponding channel in the editor.
- Allows multi-selection of rows and columns. (Random selection is not allowed.)

Configuring I/O mapping list

Automation Builder supports tree and list based editors for creating I/O mapping variables.

1. From the **Tools** menu, select **Options**.
2. Under **Automation Builder**, select the **Editors** tab.
3. Choose your desired mapping dialog and click **OK**.
   - Choose **tree based** to display the I/O mapping in tree structure.
   - Choose **list based** to display the I/O mapping as list with the functionalities of the ToolBar.
   - Choose **both** to display both the tree structure (**I/O Mapping** tab) and the list view (**I/O mapping list** tab).

Available channel information

The I/O mapping list displays the channel information in offline and online mode. In online mode, all columns are read-only. In offline mode, some columns are editable.

The order of the devices in I/O mapping list is synchronized with the order in the device tree.

The channels of a device are ordered by the device description file. If channels have a section, the channel information is represented in a specific format.

Example: Fast counter: Actual value 1. These channels are listed at last position of a device.

Editing I/O mapping list

1. In the device tree, double-click **IO_Bus** to configure entire I/O mapping list of different I/O devices.
2. Enter the variables and descriptions to map the I/O devices.

> *Do not start variable names with a number or a special character. When saving the project, this generates an error. Example: 12input3, @input4.*

3. Click **Save Project** to save the I/O mapping changes.

Toolbar

Filtering

Especially in case of long I/O mapping lists, it might be helpful to filter the I/O mappings. For this, click the *"Filter"* icon to display all available criteria for filter options.

> *When reducing the width of the editor, some filters might be hidden.*

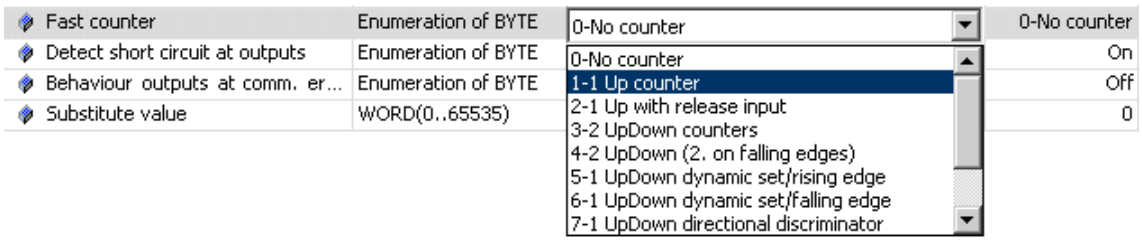
Undo, redo and clear

- **Undo**: Cancels the last change.
- **Redo**: Repeats the last change.
- **Clear mappings**: Deletes all variables and descriptions.

Fast counter

Configuration for S500 I/O modules

1. In the device tree, add a digital I/O module to the *"IO-Bus"* node.
2. Double-click the node for the I/O module, open the *"Parameters"* tab and set the counting mode ↳ *Chapter 1.6.5.2.9.8.2.1 "Counting modes" on page 6071* of the *"Fast counter"* parameter.



3. In the *"I/O Mapping"* tab channel configuration is displayed. ↳ *Chapter 1.6.5.2.9.8.3 "Control of the fast counter" on page 6075*

Operands

Table 745: Input information

Description of the input information	Output information of the user program	Description	
Start value 1	Output double word 0	Double word	Set values for the counters 1 and 2: Each counter can be set to a start value. Start values are loaded into the counter by the user program. Using the set signal (depending on the operating mode either via a terminal or the bit SET within the control byte 1 or 2), the values of the double word variables are loaded into the counter 1 or 2.
Start value 2	Output double word 1	Double word	
End value 1	Output double word 2	Double word	End value for the counters 1 and 2: The end values for the two counters are stored as comparison values into the module by the user program. Both counters compare continuously whether or not their programmed end value is equal to their actual value. When the counter (actual value) reaches its programmed end value, the binary output CF of the status byte is set permanently.
End value 2	Output double word 3	Double word	

Description of the input information	Output information of the user program	Description	
Control byte 1 see 1)	Output byte 0	Byte: Bit 0 = UP/DWN Bit 1 = EN Bit 2 = SET Bit 3 = CF_HW Bit 4 to Bit 7 free	Control bytes for the counter 1: **UP/DWN**: In some operating modes, the counter can count downwards, too. If counting down is desired, set the bit UP/DWN to TRUE and the bit SET to 1. When doing so, the counter starts counting downwards from the start value (set value) to the end value (max. from 4,294,967,295 to 0 or hexadecimal from FF FF FF FF to 00 00 00 00). After reaching 0 the counter jumps to 4,294,967,295. **EN**: Processing of the counter signals must be enabled. Depending on the operating mode, enabling is done via a terminal or by the bit EN = TRUE within the control byte. **SET**: The counter can be set to a start value (see the description of the set values for the counters 1 and 2 at the beginning of this table. **CF_HW** 0 = state of CF is set to hardware channel (only for mode 1 and 2) 1 = normal output is set to hardware channel Bit 3 is evaluated only in control byte of counter 1.
Control byte 2 see 1)	Output byte 0	Byte: Bit 0 = UP/DWN Bit 1 = EN Bit 2 = SET Bit 3 to Bit 7 free	Control bytes for the counter 2: **UP/DWN**: In some operating modes, the counter can count downwards, too. If counting down is desired, set the bit UP/DWN to TRUE and the bit SET to 1. When doing so, the counter starts counting downwards from the start value (set value) to the end value (max. from 4,294,967,295 to 0 or hexadecimal from FF FF FF FF to 00 00 00 00). After reaching 0 the counter jumps to 4,294,967,295. **EN**: Processing of the counter signals must be enabled. Depending on the operating mode, enabling is done via a terminal or by the bit EN = TRUE within the control byte.

Description of the input information	Output information of the user program	Description	
			SET: The counter can be set to a start value (see the description of the set values for the counters 1 and 2 at the beginning of this table.

1) Only for CI581-CN/CI582-CN: Control bytes 1 and 2 are available twice on grounds of data consistency. Hence, a Start and End evaluation is only effected if the signals "Control Byte1_0" and "Control Byte1_1" or "Control Byte2_0" and "Control Byte2_1" (process image) are identical.

Table 746: Output information

Output information	Input information for the user program	Description	
Actual Value 0	Input double word 0	Double word	Actual value of the counter 0
Actual Value 1	Input double word 1	Double word	Actual value of the counter 1
Status Byte 0	Input byte 0	Byte: Bit 0 = CF Bit 1 to Bit 7 free	CF: When the counter reaches the programmed end value, the counter output is stored permanently as CF = TRUE (end value reached). Only when the counter is set again (set value), CF is reset to FALSE.
Status Byte 1	Input byte 1		

Operating modes

Inputs and outputs which are not used by the counters, are available for other tasks.

Legend:

- A refers to input channel A
- B refers to input channel B
- C refers to output channel C

Operating mode	Function	Used inputs and outputs	Notes
0	No counter	none	This operating mode is selected if the integrated fast counter is not necessary.
1	One count up counter	A = Counting input C = End value reached	The counting input and the output "End value reached) are enabled by the bit EN = TRUE within the control byte.

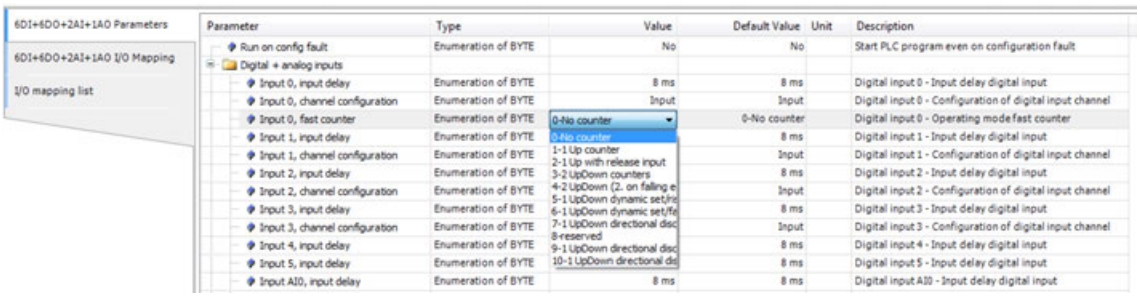
Operating mode	Function	Used inputs and outputs	Notes
2	One count up counter with enable input via terminal	A = Counting input B = Enable input C = End value reached	The enable input enables the counting input and the output "end value reached". The counter is only enabled if the enable input = TRUE (signal 1) AND the bit EN = TRUE within the control byte.
3	Two up/down counters	A = Counting input 0 B = Counting input 1	With this operating mode, two counters exist, which are independent of each other. The state "End value reached" is only readable from the two status bytes. It is not readable from output terminals. The counting direction is defined by the bit UP/DWN within the control byte.
4	Two up/down counters (1 counting input inverted)	A = Counting input 0 B = Counting input 1	This operating mode equals operating mode 3 with one exception: The counting input B (of counter 1) is inverted. It counts the TRUE/FALSE edges at input B.
5	One bidirectional counter with a dynamic set input via terminal	A = Counting input B = Dynamic set input	With this operating mode, one bidirectional counter is available which has a dynamic set input. Dynamic means that the set operation is performed at the FALSE/TRUE signal edge (0/1 edge) of the set input and not while the signal is TRUE. The state "End value reached" is only readable from the status byte, not from an output terminal.
6	One bidirectional counter with a dynamic set input via terminal	A = Counting input B = Dynamic set input	This operating mode equals operating mode 5 with one exception: The dynamic set input operates at the TRUE/FALSE edge (1-0 edge).

Operating mode	Function	Used inputs and outputs	Notes
7	One bidirectional counter for position sensors	A = Trace A of the position sensor B = Trace B of the position sensor	With this operating mode, incremental position sensors can be used which interchange their counting signals on tracks A and B in a 90° phase sequence. Depending on the sequence of the signals at A and B, the counter counts up or down. There is no pulse-multiplier function (e.g. x2 or x4). The position sensor must provide 24 V signals. Signals of 5 V sensors must be converted. Zero traces are not processed. The state "End value reached" is only readable from the state byte 0, not from an output terminal. The bit UP/DWN within the control byte must be FALSE. Otherwise, a parameter error occurrs. In this operating mode, the maximum counting frequency is: I/O modules 35 kHz. Communucation interface modules 50 kHz.
8	Reserved		

Operating mode	Function	Used inputs and outputs	Notes
9	One bidirectional counter for position sensors (pulse multiplier x2)	A = Trace A of the position sensor B = Trace B of the position sensor	This operating mode equals operating mode 7 with one exception: There is a pulse multiplication x2 with the evaluation of the counting inputs. This means, that the counter counts both the positive edges and the negative edges of trace A. This results in the double number of counting pulses. The precision increases correspondingly. In this operating mode, the maximum counting frequency is: I/O modules 30 kHz. Communucation interface modules 35 kHz.
10	One bidirectional counter for position sensors (pulse multiplier x4)	A = Trace A of the position sensor B = Trace B of the position sensor	This operating mode equals operating mode 7 with one exception: There is a pulse multiplication x4 with the evaluation of the counting inputs. This means that the counter counts the positive and negative edges of the traces A and B. This results in the fourfold number of counting pulses. The precision increases correspondingly. In this operating mode, the maximum counting frequency is: I/O modules 15 kHz. Communucation interface modules 20 kHz.

Configuration for onboard I/Os

1. In the device tree, double-click the *"Onboard I/O"* node (OBIO).
2. In the *"Parameters"* tab set the counting mode ↳ *Chapter 1.6.5.2.9.8.2.1 "Counting modes" on page 6071* for the fast counter.



3. In the *"I/O Mapping"* tab channel configuration is displayed. ↳ *Chapter 1.6.5.2.9.8.3 "Control of the fast counter" on page 6075*

Configuring the fast counter

The parameter of the fast counter channels of the Onboard I/O must be configured before they can be used. User should take these steps to configure the fast counter:

Channel	Direction	Width	Description
Actual value X	Input	DWORD	Current value of the fast counter.
State byte X	Input	BYTE	**Bit 0 = CF** If the counter reaches the programmed end value, the counter output is stored permanently as CF = TRUE (end value reached). Only, if the counter is set again (set value), CF is reset to FALSE. **Bit 1 to Bit 7 free**
Start value X	Output	DWORD	Each counter can be set to a start value. Start values are loaded into the counter by the user program. Using the set signal (dependent on the operating mode either via a terminal or the bit SET within the control byte X), the values of the double word variables are loaded into the counter X.
End value X	Output	DWORD	The end values for the two counters are stored as comparison values into the module by the user program. Both counters compare continuously, whether or not their programmed end value is equal to their actual value. If the counter (actual value) reaches its programmed end value, the binary output CF of the status byte is set permanently.

Channel	Direction	Width	Description
Control byte 1	Output	BYTE	**Bit 0 = UP/DWN** In some operating modes, the counter can count downwards, too. If counting down is desired, the bit UP/DWN must be set to TRUE. When doing so, the counter starts counting downwards at the start value (set value) to the end value (max. from 4,294,967,295 to 0 or hexadecimal from FF FF FF FF to 00 00 00 00). After reaching 0, the counter jumps to 4,294,967,295. **Bit 1 = EN** The processing of the counter signals must be enabled. Depending on the operating mode, enabling is done via a terminal or by the bit EN = TRUE within the control byte. **Bit 2 = SET** The counter can be set to a start value (see the description of the set values for the counters 1 and 2 at the beginning of this table). **Bit 3 = CF_HW** 0 = state of CF is set to hardware channel (only for mode 1 and 2) 1 = normal output is set to hardware channel Bit 3 is evaluated only in control byte of counter 1. **Bit 4 to Bit 7 free**
Control byte 2	Output	BYTE	**Bit 0 = UP/DWN** In some operating modes, the counter can count downwards, too. If counting down is desired, the bit UP/DWN must be set to TRUE. When doing so, the counter starts counting downwards at the start value (set value) to the end value (max. from 4,294,967,295 to 0 or hexadecimal from FF FF FF FF to 00 00 00 00). After reaching 0, the counter jumps to 4,294,967,295. **Bit 1 = EN** The processing of the counter signals must be enabled. Depending on the operating mode, enabling is done via a terminal or by the bit EN = TRUE within the control byte. **Bit 2 = SET** The counter can be set to a start value (see the description of the set values for the counters 1 and 2 at the beginning of this table). **Bit 3 to Bit 7 free**

Counting modes

The fast counter can be configured as one mode out of 10 possible modes. The desired operating mode is selected in the PLC configuration using configuration parameters. Inputs and outputs which are not used by the counter are available for other tasks. In the following table, A means input channel A, B means input channel B and C means output channel C.

CPUs	Integrated fast counter	Assigned inputs		Assigned Outputs	Remarks
		Channel A	Channel B	Channel C	
PM55x, PM56x	Yes	Input channel 0	Input channel 1	Output channel 0	Only 1 fast counter is available on the module. Input channel 0 is the default channel for fast counter. Input channel 1 can be used as another fast counter channel depending on fast counter mode.

Operating Mode	Function	Input channels	Description	Counting frequency (max.) for PM5x4-T and PM5x4-R
0	No counter	None	Fast counter is disabled	-
1	1 count up counter	A = Counter input C = End value reached	Counting up A from 0 to 0xFFFFFFFF When the end value is reached, C will be set to high.	30 kHz (before firmware V2.0.6) 50 kHz (since firmware V2.0.6)
2	1 count up counter with release input	A = Counter input B = Enable input C = End value reached	Counting up A from 0 to 0xFFFFFFFF The counter is enabled if B is high When the end value is reached, C will be set to high.	30 kHz (before firmware V2.0.6) 50 kHz (since firmware V2.0.6)

Operating Mode	Function	Input channels	Description	Counting frequency (max.) for PM5x4-T and PM5x4-R
3	2 Up/Down counters	A = Counter input 1 B = Counter input 2	2 independent counters. Status "End value reached" is only readable from the 2 status bytes, not from output terminals. The counting direction is defined by the Boolean parameters UD1 and UD2 of function block ONB_IO_CNT (Handle fast counter on Onboard I/O)	30 kHz (before firmware V2.0.6) 50 kHz (since firmware V2.0.6)
4	2 Up/Down counters (2nd on falling edges)	A = Counter input 1 B = Counter input 2	Same as operating mode 3, but counting input B is inverted (counts at TRUE/FALSE edges at input B).	30 kHz (before firmware V2.0.6) 50 kHz (since firmware V2.0.6)
5	1 Up/Down counter with dynamic set/ rising edge	A = Counter input B = Dynamic set input	1 Up/Down counter is available which counts on the rising edge of A and has a dynamic set input on B. Dynamic set input will set the start value at the rising edge of B.	30 kHz (before firmware V2.0.6) 50 kHz (since firmware V2.0.6)
6	1 Up/Down counter with dynamic set/ falling edge	A = Counter input B = Dynamic set input	1 Up/Down counter is available which counts on the rising edge of A and has a dynamic set input on B. Dynamic set input will set the start value at the falling edge of B.	30 kHz (before firmware V2.0.6) 50 kHz (since firmware V2.0.6)

Operating Mode	Function	Input channels	Description	Counting frequency (max.) for PM5x4-T and PM5x4-R
7	1 UpDown directional discriminator	A = Phase A B = Phase B	With this mode, incremental encoders can be used which give their counting signals on phase A and B in a 90° phase sequence to each other. Dependent on the sequence of the signals at A and B, the counter counts up or down. There is no pulse multiplier function.	12 kHz (before firmware V2.0.6) 35 kHz (since firmware V2.0.6)
8	Reserved	-	-	-

Operating Mode	Function	Input channels	Description	Counting frequency (max.) for PM5x4-T and PM5x4-R
9	1 UpDown directional discriminator X2	A = Phase A B = Phase B	This mode is the same as mode 7 with one exception: There is a pulse multiplication x2 with the evaluation of the counting inputs. This means that the counter counts both the positive edges and the negative edges of phase A. This results in the double number of counting pulses. The precision increases correspondingly.	11 kHz (before firmware V2.0.6) 30 kHz (since firmware V2.0.6)
10	1 UpDown directional discriminator X4	A = Phase A B = Phase B	This mode is the same as mode 7 with one exception: There is a pulse multiplication x4 with the evaluation of the counting inputs. This means that the counter counts both the positive edges and the negative edges of phase A and B. This results in the fourfold number of counting pulses. The precision increases correspondingly.	10 kHz (before firmware V2.0.6) 15 kHz (since firmware V2.0.6)

If channel 0 is configured as fast counter, the other channels 1,2 and 3 cannot be configured as interrupt inputs. Otherwise, a configuration error will appear and the CPU will be stopped.

Control of the fast counter

To control the fast counter configuration open the *“I/O Mapping”* tab.

The channels can be mapped as described in Symbolic Names for Variables, Inputs and Outputs and have the following meaning ↳ *Chapter 1.6.5.2.9.6 “Symbolic names for variables, inputs and outputs” on page 6060*:

Fast counter						
		Actual value 1	%ID17	DWORD		Actual value 1
		Actual value 2	%ID18	DWORD		Actual value 2
		State byte 1	%IB76	BYTE		State byte 1
		State byte 2	%IB77	BYTE		State byte 2
		Start value 1	%QD11	DWORD		Start value 1
		End value 1	%QD12	DWORD		End value 1
		Start value 2	%QD13	DWORD		Start value 2
		End value 2	%QD14	DWORD		End value 2
		Control byte 1	%QB60	BYTE		Control byte 1
		Control byte 2	%QB61	BYTE		Control byte 2

Channel	Direction	Width	Description
Actual value X	Input	DWORD	Current value of the fast counter
State byte X	Input	BYTE	Bit 0 = CF If the counter reaches the programmed end value, the counter output is stored permanently as CF = TRUE (end value reached). Only if the counter is set again (set value), CF is reset to FALSE. Bit 1 to Bit 7 free
Start value X	Output	DWORD	Each counter can be set to a start value. Start values are loaded into the counter by the user program. Using the set signal (dependent on the operating mode either via a terminal or the bit SET within the control byte X), the values of the double word variables are loaded into the counter X.
End value X	Output	DWORD	The end values for the 2 counters are stored as comparison values into the module by the user program. Both counters compare continuously whether or not their programmed end value is equal to their actual value. When the counter (actual value) reaches its programmed end value, the binary output CF of the status byte is set permanently.

Channel	Direction	Width	Description
Control byte 1	Output	BYTE	Bit 0 = UP/DWN In some operating modes, the counter can count downwards, too. If counting down is desired, the bit UP/DWN must be set to TRUE. If doing so, the counter starts counting downwards at the start value (set value) to the end value (max. from 4,294,967,295 to 0 or hexadecimal from FF FF FF FF to 00 00 00 00). After reaching 0 the counter jumps to 4,294,967,295. Bit 1 = EN The processing of the counter signals must be enabled. Depending on the operating mode, enabling is done via a terminal or by the bit EN = TRUE within the control byte. Bit 2 = SET The counter can be set to a start value (see the description of the set values for the counters 1 and 2 at the beginning of this table. CF = 0 Bit 3 = CF_HW 0 = state of CF is set to hardware channel (only for mode 1 and 2) 1 = normal output is set to hardware channel Bit 3 is evaluated only in control byte of counter 1. Bit 4 to Bit 7 free
Control byte 2	Output	BYTE	Bit 0 = UP/DWN In some operating modes, the counter can count downwards, too. If counting down is desired, the bit UP/DWN must be set to TRUE. If doing so, the counter starts counting downwards at the start value (set value) to the end value (max. from 4,294,967,295 to 0 or hexadecimal from FF FF FF FF to 00 00 00 00). After reaching 0 the counter jumps to 4,294,967,295. Bit 1 = EN The processing of the counter signals must be enabled. Depending on the operating mode, enabling is done via a terminal or by the bit EN = TRUE within the control byte.

Channel	Direction	Width	Description
			Bit 2 = SET The counter can be set to a start value (see the description of the set values for the counters 1 and 2 at the beginning of this table. Bit 3 to Bit 7 free

1.6.5.2.10 CS31 fieldbus

Configuration of CS31 bus master

If in the device tree, for the *"Interfaces"* node the protocol 'CS31-Bus' is selected for the interface COM1, the interface is set as CS31 bus master. CS31 cannot be used as a slave. COM2 cannot be used as CS31 bus interface.

Some modules do not support CS31 functionality.

Double-click *"COMx_CS31_Bus"* node to configure the parameters.

The following parameters are available:

Parameter	Default value	Value	Description
Run on config fault	No	No	The PLC program is executed even if there are faults in configuration.
		Yes	The PLC program is not executed if there are faults in configuration.
Operating mode (read only)	Master	Master	Operating mode of the CS31 device. This parameter is read-only (not editable).
Max wait run	0		Max. wait time for valid inputs.
Min update time	10		Cycle time for data exchange to IEC program.

Slave modules can be appended to the CS31 bus master ↳ *Chapter 1.6.5.2.10.2 "Configuration of the slave modules" on page 6078*.

Configuration of the slave modules

DC551-CS31 and S500 I/O devices as slave modules

If in the device tree, a CS31 bus master has been configured ↳ *Chapter 1.6.5.2.10.1 "Configuration of CS31 bus master" on page 6078*, the DC551-CS31 device can be used as CS31 slave.

1. Right-click *"COMx_CS31_Bus ➔ Add object"*.
2. DC551-CS31 module is available in two versions in the PLC configuration:
   - DC551-CS31 8 DI + 16 DC / without fast counter:
     The addresses 00...61 can be set at the module and in the PLC configuration.
   - DC551-CS31 8 DI + 16 DC + 2FC / with 2 fast counters:
     The hardware addresses 70...99 can be set at the module. This corresponds to the module addresses 00...29 with activated counter. In the PLC configuration and at the block CNT_DC551, the module address (00..29) is set *Chapter 1.5.4.9 "Counter library" on page 1037*.

   Select the desired module from the list.
3. Define the parameters in the *"Parameters"* tab.

The following parameters are available:

Table 747: Available parameters

Parameter	Default value	Value	Description
Ignore module *Chapter 1.6.5.2.9.3 "Parameter 'Ignore module'" on page 6059*	No	No	It is checked whether the module exists on the CS31 Bus.
		Yes	Module is not checked. -> available as of CPU firmware V1.2.0 and PS501 V1.2
Module address	0	0...69	Module address of the DC551-CS31 without fast counter
		0...29	Module address of the DC551-CS31 with fast counter
Error-LED *"Failsafe function of CS31" on page 6090*	On	On	The error LED lights up for errors of all classes, no failsafe function activated.
		Off_by_E4	Warnings (E4) are not indicated by the error LED, no failsafe function activated.
		Off_by_E3	Warnings (E4) and minor errors (E3) are not indicated by the error LED. No failsafe function activated.
		On+failsafe	The error LED lights up for errors of all classes and the failsafe function of the CS31 Bus is activated. -> available as of CPU firmware V1.2.0, DC551-CS31 firmware V1.9 and PS501 V1.2

Parameter	Default value	Value	Description
		Off_by_E4+failsafe	Warnings (E4) are not indicated by the error LED, the failsafe function of the CS31 Bus is activated. -> available as of CPU firmware V1.2.0, DC551 firmware V1.9 and PS501 V1.2
		Off_by_E3+failsafe	Warnings (E4) and minor errors (E3) are not indicated by the error LED, the failsafe function of the CS31 bus is activated. -> available as of CPU firmware V1.2.0, DC551-CS31 firmware V1.9 and PS501 V1.2
Check supply	On	On	Control voltage monitoring ON
		Off	Control voltage monitoring OFF
Input delay	8 ms	0.1 / 1 / 8 / 32 ms	Input delay 0.1 / 1 / 8 / 32 ms
Fast counter *“No counter” on page 6090*	0-No counter	0-No counter	Operation mode of the *Chapter 1.6.4.1.10 “Fast counters” on page 5498*
Detection short-circuits at outputs	On	On	Output short-circuit detection ON
		Off	Output short-circuit detection OFF
Behaviour of outputs at communication fault *“Failsafe function of CS31” on page 6090*	Off	Off	Behavior of outputs at communication faults on the CS31 Bus OFF
		Last value	Last value -> available as of CPU firmware V1.2.0, DC551-CS31 firmware V1.9 and PS501 V1.2
		Substitute value	Substitute value -> available as of CPU firmware V1.2.0, DC551-CS31 firmware V1.9 and PS501 V1.2
		Last value 5 sec.	Last value for 5 seconds -> available as of CPU firmware V1.2.0, DC551-CS31 firmware V1.9 and PS501 V1.2

Parameter	Default value	Value	Description
		Substitute value 5 sec.	Substitute value for 5 seconds -> available as of CPU firmware V1.2.0, DC551-CS31 firmware V1.9 and PS501 V1.2
		Last value 10 sec.	Last value for 10 seconds -> available as of CPU firmware V1.2.0, DC551-CS31 firmware V1.9 and PS501 V1.2
		Substitute value 10 sec.	Substitute value for 10 seconds -> available as of CPU firmware V1.2.0, DC551-CS31 firmware V1.9 and PS501 V1.2
Substitute value *“Failsafe function of CS31” on page 6090*	0	0...65535 0000hex...FFFFhex	Substitute value for the outputs, one bit per output, bit 0=C8 .. bit 15=C23 -> available as of CPU firmware V1.2.0, DC551-CS31 firmware V1.9 and PS501 V1.2

No counter

If a DC551 is configured as a fast counter module and in Automation Builder '0 - no Counter' is selected the channel ERR LEDs stays on and the module does not start up. The address was adjusted with '71'. Only the'0- no Counter' mode does not operate. If any other counter is selected e.g. '1-1 Up counter' the module starts up and can be utilized.

Failsafe function of CS31 bus

The setting of the parameter *“Behaviour”* of outputs in communication fault directly influences the failsafe function of the outputs of the S500 I/O modules.

S500/S500-eCo modules as slave modules

S500 / S500-eCo modules can be used as a slave module by appending the desired device to a configured DC551-CS31 device.

In the device tree, right-click the *“DC551-CS31”* node and select *“Add object”*. Select the desired S500 or S500-eCo module from the list.

When addressing S500 I/O devices at the CS31 bus, observe the following peculiarities concerning the CS31 bus in the AC500.

- A CS31 software module can occupy a maximum of -> 15 bytes of inputs and 15 bytes of outputs in the digital area. This corresponds to 15 x 8 = 120 digital inputs and 120 outputs.
- A CS31 software module can allocate a maximum of -> 8 words of inputs and 8 words of outputs in the analog area.
- A maximum of 31 of these CS31 software modules are allowed for connection to the CS31 bus.
- If a device has more than 15 bytes or 8 words of inputs or outputs, it occupies 2 or more of the 31 CS31 software modules.

- The DC551-CS31 can internally manage 2 CS31 software modules in the digital area and 5 CS31 software modules in the analog area. This corresponds to a maximum of: 240 digital inputs (2 x 15 bytes), 240 digital outputs (2 x 15 bytes), 40 analog inputs (5 x 8 words) and 40 analog outputs (5 x 8 words).
- Address setting is done at the DC551-CS31 using two rotary switches at the module's front plate.
- To enable the fast counter of the DC551-CS31, the hardware address (HW_ADR) has to be set to the module address + 70. With activated fast counter, the module addresses 0..28 (hardware address setting 70..98) are allowed. Then, the DC55-CS31 registers as 2 CS31 software modules using the module address (hardware address 70), once in the digital area and once in the analog area.
- CS31 software module 1 in digital area: Registers using the module address.
  CS31 software module 2 in digital area: Registers using module address+7 and bit "Channel >= 7" set.
  CS31 software module 1 in analog area: Registers using the module address.
  CS31 software module 2 in analog area: Registers using module address and bit "Channel >= 7" set.
  CS31 software module 3 in analog area: Registers using the module address+1.
  CS31 software module 4 in analog area: Registers using module address+1 and bit "Channel >= 7" set.
- The DC551-CS31 can manage a maximum of 255 parameters. This does not cause any restrictions in all configurations with the currently available S500 I/O Devices.
- The next free address for a DC551-CS31 is derived from the highest address occupied in the digital area or the analog area of the previous DC551-CS31.
- When connecting several S500 expansion modules to a DC551-CS31 via the I/O Bus, their inputs and outputs follow the DC551-CS31's inputs and outputs without gap. Such a cluster can occupy up to 6 CS31 software modules.

The fast counters of the input/output Modules (e.g. "DC532") are only available if the modules are connected to the CPU's I/O Bus.

Summary of input/output data

Table 748: Available input/output data and parameters with S500 I/O devices

Device	ID	I/O range	Digital area [Byte]		Analog area [Words]		Parameter [Byte]
			Inputs	Outputs	Inputs	Outputs	
CD522	1805	2 DI + 2 DI (encoder) + 8 DC + 2 DO PWM	6	7	8	8	6
DA501	1810	16 DI + 8 DC + 4 AI + 2 AO	3	1	5	2	8
DC551	2716	8 DI + 16 DC	3	2	0	0	15
DC551+FC	2715	8 DI + 16 DC + FC	5	4	4	8	16
AI523	1515	16 AI	0	0	16	0	36

AX561	6520	4 AI, U/I + 2 AO, U/I, configurable	0	0	8	4	8

Impossible configurations

Due to the peculiarities concerning the CS31 bus and the DC551-CS31 described at the beginning of this chapter, some configurations cannot be realized.

Example: DC551-CS31 + 6 x DC532

This configuration is not possible because the DC551-CS31 can manage a maximum of 30 bytes in the digital area (= 120 inputs/outputs).

Device	I/O range	Digital area [Byte]		Analog area [Words]		Parameter [Byte]
		Inputs	Outputs	Inputs	Outputs	
DC551	8 DI + 16 DC	3	2	0	0	15
DC532	16 DI + 16 DC	4	2	0	0	9
DC532	16 DI + 16 DC	4	2	0	0	9
DC532	16 DI + 16 DC	4	2	0	0	9
DC532	16 DI + 16 DC	4	2	0	0	9
DC532	16 DI + 16 DC	4	2	0	0	9
DC532	16 DI + 16 DC	4	2	0	0	9
DC532	16 DI + 16 DC	4	2	0	0	9
Total	**120 DI + 128 DC**	**31**	**16**	**0**	**0**	**78**

Example: DC551-CS31 + 6 (or more) AX522

This configuration is not possible because the DC551-CS31 can manage a maximum of 40 words in the analog area. For 7 AX522, the number of analog channels increases accordingly.

Device	I/O range	Digital area [Byte]		Analog area [Words]		Parameter [Byte]
		Inputs	Outputs	Inputs	Outputs	
DC551	8 DI + 16 DC	3	2	0	0	15
AX522	8 AI + 8 AO	0	0	8	8	40
AX522	8 AI + 8 AO	0	0	8	8	40
AX522	8 AI + 8 AO	0	0	8	8	40
AX522	8 AI + 8 AO	0	0	8	8	40
AX522	8 AI + 8 AO	0	0	8	8	40
AX522	8 AI + 8 AO	0	0	8	8	40
Total	**8 DI + 16 DC + 48 AI + 48 AO**	**3**	**2**	**48**	**48**	**255**

Example: DC551-CS31 + 3 (or more) AO523

This configuration is not possible because the DC551-CS31 can manage a maximum of 40 words in the analog area. For each further AO523, the number of analog channels increases accordingly.

Device	I/O range	Digital area [Byte]		Analog area [Words]		Parameter [Byte]
		Inputs	Outputs	Inputs	Outputs	
DC551	8 DI + 16 DC	3	2	0	0	15
AO523	16 AO	0	0	0	16	42
AO523	16 AO	0	0	0	16	42
AO523	16 AO	0	0	0	16	42
Total	**8 DI + 16 DC + 48 AO**	**3**	**2**	**0**	**48**	**141**

Example: DC551-CS31 + 3 (or more) AI523

This configuration is not possible because the DC551-CS31 can manage a maximum of 40 words in the analog area. For each further AI523, the number of analog channels increases accordingly.

Device	I/O range	Digital area [Byte]		Analog area [Words]		Parameter [Byte]
		Inputs	Outputs	Inputs	Outputs	
DC551	8 DI + 16 DC	3	2	0	0	15
AI523	16 AI	0	0	16	0	37
AI523	16 AI	0	0	16	0	37
AI523	16 AI	0	0	16	0	37
Total	**8 DI + 16 DC + 48 AI**	**3**	**2**	**48**	**0**	**126**

Example: DC551-CS31 with FC + 3 (or more) AO523

This configuration is not possible because the DC551-CS31 can manage a maximum of 40 words in the analog area. For each further AO523, the number of analog channels increases accordingly.

Device	I/O range	Digital area [Byte]		Analog area [Words]		Parameter [Byte]
		Inputs	Outputs	Inputs	Outputs	
DC551	8 DI + 16 DC + FC	5	4	4	8	16
AO523	16 AO	0	0	0	16	42
AO523	16 AO	0	0	0	16	42
AO523	16 AO	0	0	0	16	42
Total	**8 DI + 16 DC + FC + 48 AO**	**5**	**4**	**4**	**56**	**142**

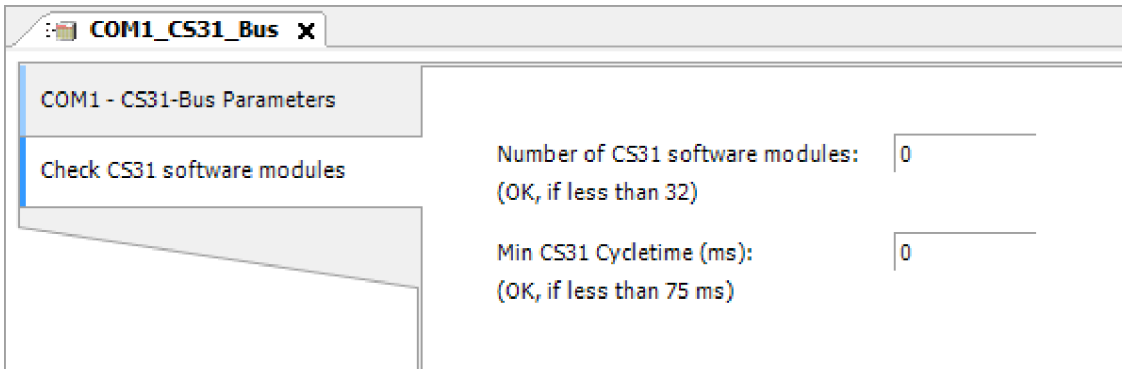
Example: DC551-CS31 with FC + 3 (or more) AI523

This configuration is not possible because the DC551-CS31 can manage a maximum of 40 words in the analog area. For each further AI523, the number of analog channels increases accordingly.

Device	I/O range	Digital area [Byte]		Analog area [Words]		Parameter [Byte]
		Inputs	Outputs	Inputs	Outputs	
DC551	8 DI + 16 DC + FC	5	4	4	8	16
AI523	16 AI	0	0	16	0	37
AI523	16 AI	0	0	16	0	37
AI523	16 AI	0	0	16	0	37
Total	**8 DI + 16 DC + FC + 48 AI**	**5**	**4**	**52**	**8**	**127**

Checking the CS31 modules

Double-click *"COMx_CS31_Bus"*:

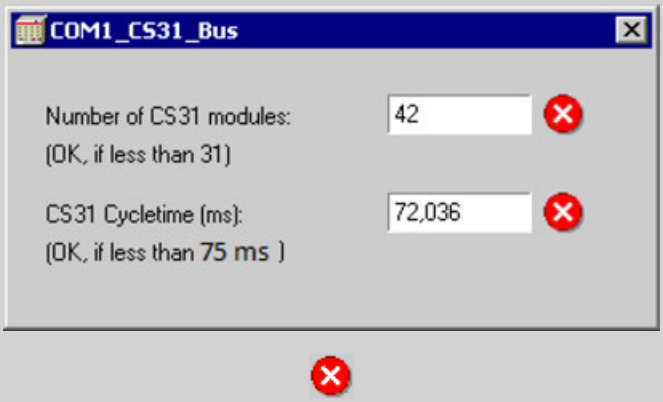


The following information is show in the view:

Parameter	Description
Number of CS31 software modules	The current number of configured CS31 modules at the CS31 master. It is not allowed to attach more than 31 slave devices to the bus.
Min. CS31 Cycletime (ms)	The predicted CS31 cycle time in [ms]. The value may not exceed 75 ms.

In case of a violation of the described parameters an error message appears.

Error message



The icon indicates the parameter that was violated.

The violation message does not block the download of an invalid configuration.

Connecting the DC551 and S500 I/O devices to the CS31 bus

The basic module DC551-CS31 is available in two versions in Automation Builder:

- DC551-CS31 8 DI + 16 DC / without fast counter
  The addresses 00...69 can be set at the module and in Automation Builder.
- DC551-CS31 8 DI + 16 DC + 2FC / with 2 fast counters
  The hardware addresses 70...99 can be set at the module. This corresponds to the module addresses 00...29 with activated counter. In Automation Builder and at the function block *Chapter 1.5.4.9.1.1 “CNT_DC551” on page 1037*, the module address (00..29) is set.

Table 750: Available parameters

Parameter	Default value	Value	Description
Ignore module *Chapter 1.6.5.2.9.3 “Parameter 'Ignore module'” on page 6059*	No	No	It is checked whether the module exists on the CS31 Bus.
		Yes	Module is not checked. -> available as of CPU firmware V1.2.0 and PS501 V1.2
Module address	0	0...69	Module address of the DC551-CS31 without fast counter
		0...29	Module address of the DC551-CS31 with fast counter
Error-LED *“Failsafe function of CS31” on page 6090*	On	On	The error LED lights up for errors of all classes, no failsafe function activated.
		Off_by_E4	Warnings (E4) are not indicated by the error LED, no failsafe function activated.

Parameter	Default value	Value	Description
		Off_by_E3	Warnings (E4) and minor errors (E3) are not indicated by the error LED. No failsafe function activated.
		On+failsafe	The error LED lights up for errors of all classes and the failsafe function of the CS31 Bus is activated. -> available as of CPU firmware V1.2.0, DC551-CS31 firmware V1.9 and PS501 V1.2
		Off_by_E4+failsafe	Warnings (E4) are not indicated by the error LED, the failsafe function of the CS31 Bus is activated. -> available as of CPU firmware V1.2.0, DC551 firmware V1.9 and PS501 V1.2
		Off_by_E3+failsafe	Warnings (E4) and minor errors (E3) are not indicated by the error LED, the failsafe function of the CS31 bus is activated. -> available as of CPU firmware V1.2.0, DC551-CS31 firmware V1.9 and PS501 V1.2
Check supply	On	On	Control voltage monitoring ON
		Off	Control voltage monitoring OFF
Input delay	8 ms	0.1 / 1 / 8 / 32 ms	Input delay 0.1 / 1 / 8 / 32 ms
Fast counter *“No counter” on page 6090*	0-No counter	0-No counter	Operation mode of the *Chapter 1.6.4.1.10 “Fast counters” on page 5498*
Detection short-circuits at outputs	On	On	Output short-circuit detection ON
		Off	Output short-circuit detection OFF
Behaviour of outputs at communication fault *“Failsafe function of CS31” on page 6090*	Off	Off	Behavior of outputs at communication faults on the CS31 Bus OFF

Parameter	Default value	Value	Description
		Last value	Last value -> available as of CPU firmware V1.2.0, DC551-CS31 firmware V1.9 and PS501 V1.2
		Substitute value	Substitute value -> available as of CPU firmware V1.2.0, DC551-CS31 firmware V1.9 and PS501 V1.2
		Last value 5 sec.	Last value for 5 seconds -> available as of CPU firmware V1.2.0, DC551-CS31 firmware V1.9 and PS501 V1.2
		Substitute value 5 sec.	Substitute value for 5 seconds -> available as of CPU firmware V1.2.0, DC551-CS31 firmware V1.9 and PS501 V1.2
		Last value 10 sec.	Last value for 10 seconds -> available as of CPU firmware V1.2.0, DC551-CS31 firmware V1.9 and PS501 V1.2
		Substitute value 10 sec.	Substitute value for 10 seconds -> available as of CPU firmware V1.2.0, DC551-CS31 firmware V1.9 and PS501 V1.2
Substitute value *“Failsafe function of CS31” on page 6090*	0	0...65535 0000hex...FFFFhex	Substitute value for the outputs, one bit per output, bit 0=C8 .. bit 15=C23 -> available as of CPU firmware V1.2.0, DC551-CS31 firmware V1.9 and PS501 V1.2

No counter

If a DC551 is configured as a fast counter module and in Automation Builder '0 - no Counter' is selected the channel ERR LEDs stays on and the module does not start up. The address was adjusted with '71'. Only the'0- no Counter' mode does not operate. If any other counter is selected e.g. '1-1 Up counter' the module starts up and can be utilized.

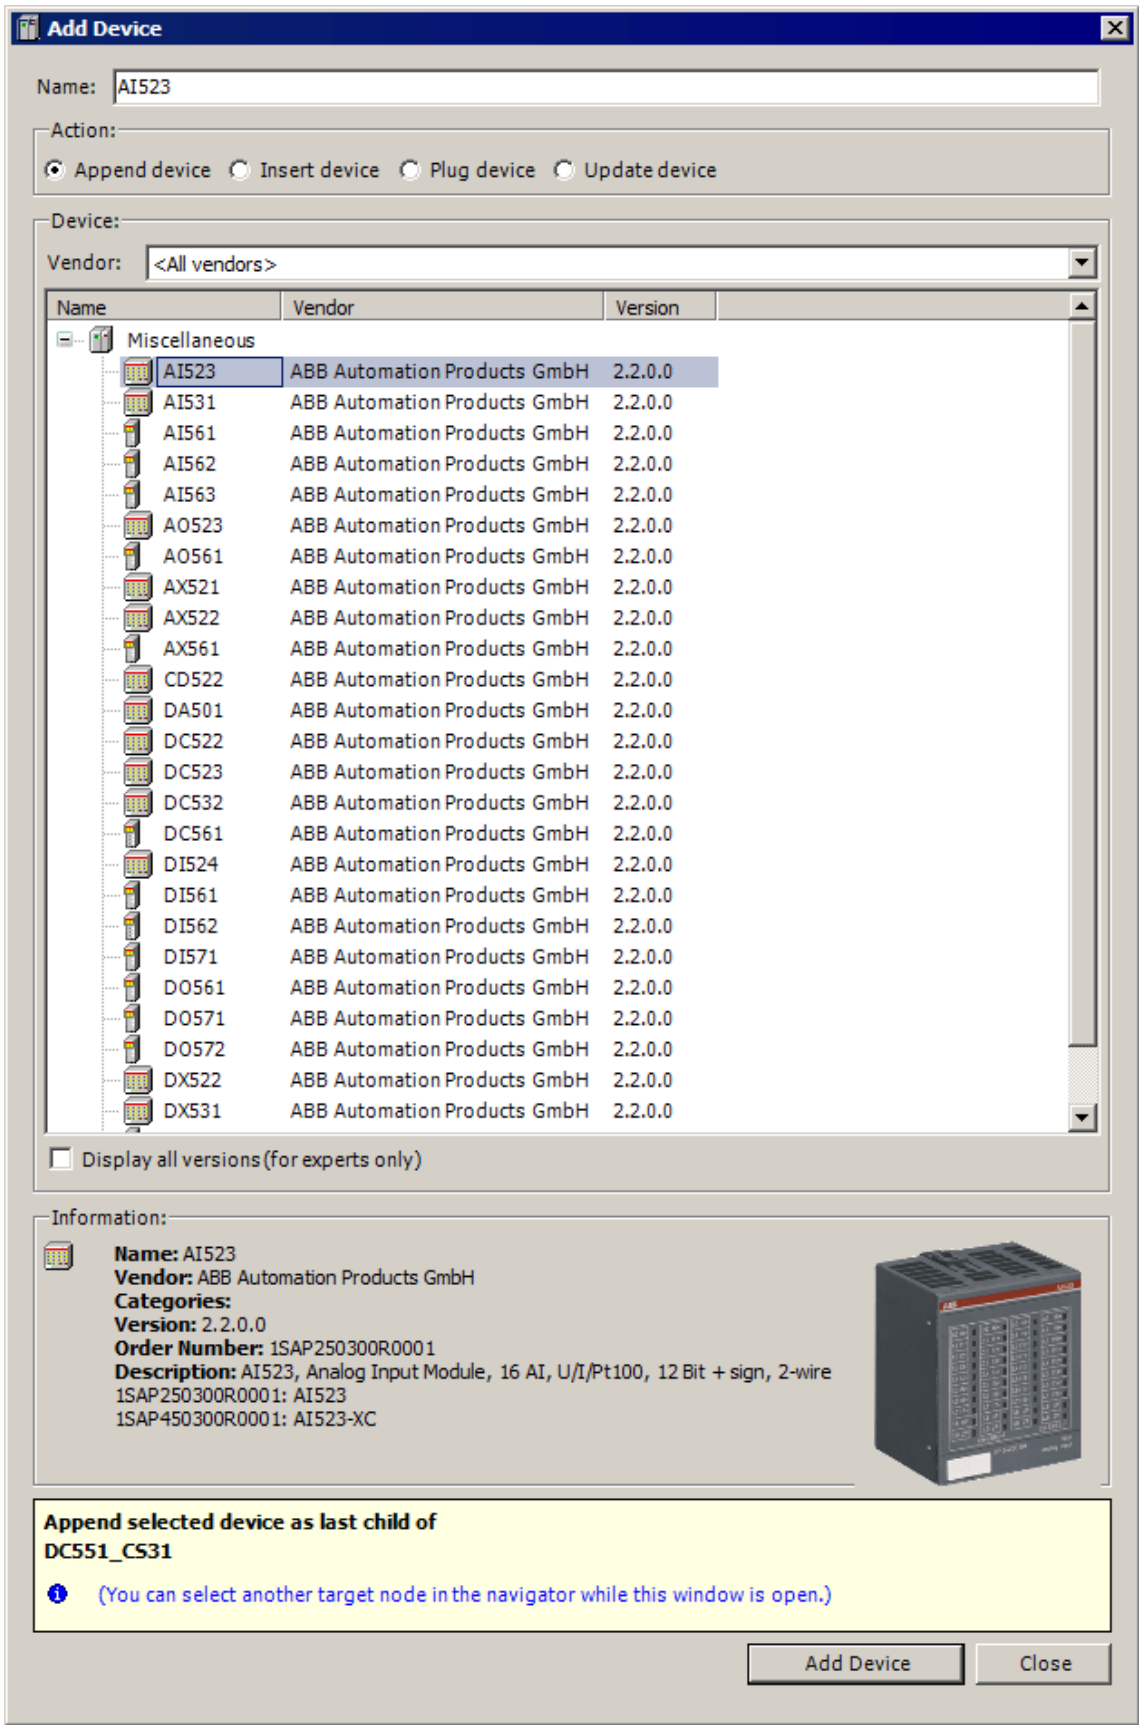
Failsafe function of CS31

The setting of the parameter Behaviour of outputs in communication fault directly influences the failsafe function of the outputs of the S500 I/O devices.

To connect further S500 I/O Modules to the basic module DC551-CS31 via the I/O Bus, see the following steps.

1. Right-click the element DC551-CS31 in the configuration tree and select the menu item *"Add device"*.

   ⇨ The *"Add Device"* dialog window appears. It shows all available I/O Modules that can be added to DC551-CS31.



2. Choose the modules you want to attach to DC551-CS31.

A maximum of 7 expansions with a total of 240 DI / 240 DO and 40 AI / 40 AO can be appended to the module.

When addressing S500 I/O devices at the CS31 bus, observe the following peculiarities concerning the CS31 bus in the AC500.

- A CS31 software module can occupy a maximum of -> 15 bytes of inputs and 15 bytes of outputs in the digital area. This corresponds to 15 x 8 = 120 digital inputs and 120 outputs.
- A CS31 software module can allocate a maximum of -> 8 words of inputs and 8 words of outputs in the analog area.
- A maximum of 31 of these CS31 software modules are allowed for connection to the CS31 bus.
- If a device has more than 15 bytes or 8 words of inputs or outputs, it occupies 2 or more of the 31 CS31 software modules.
- The DC551-CS31 can internally manage 2 CS31 software modules in the digital area and 5 CS31 software modules in the analog area. This corresponds to a maximum of: 240 digital inputs (2 x 15 bytes), 240 digital outputs (2 x 15 bytes), 40 analog inputs (5 x 8 words) and 40 analog outputs (5 x 8 words).
- Address setting is done at the DC551-CS31 using two rotary switches at the module's front plate.
- To enable the fast counter of the DC551-CS31, the hardware address (HW_ADR) has to be set to the module address + 70. With activated fast counter, the module addresses 0..28 (hardware address setting 70..98) are allowed. Then, the DC55-CS31 registers as 2 CS31 software modules using the module address (hardware address 70), once in the digital area and once in the analog area.
- CS31 software module 1 in digital area: Registers using the module address.

  CS31 software module 2 in digital area: Registers using module address+7 and bit "Channel >= 7" set.

  CS31 software module 1 in analog area: Registers using the module address.

  CS31 software module 2 in analog area: Registers using module address and bit "Channel >= 7" set.

  CS31 software module 3 in analog area: Registers using the module address+1.

  CS31 software module 4 in analog area: Registers using module address+1 and bit "Channel >= 7" set.
- The DC551-CS31 can manage a maximum of 255 parameters. This does not cause any restrictions in all configurations with the currently available S500 I/O Devices.
- The next free address for a DC551-CS31 is derived from the highest address occupied in the digital area or the analog area of the previous DC551-CS31.
- When connecting several S500 expansion modules to a DC551-CS31 via the I/O Bus, their inputs and outputs follow the DC551-CS31's inputs and outputs without gap. Such a cluster can occupy up to 6 CS31 software modules.
- A maximum of 7 S500 expansion modules (extensions) can be connected to a DC551-CS31.

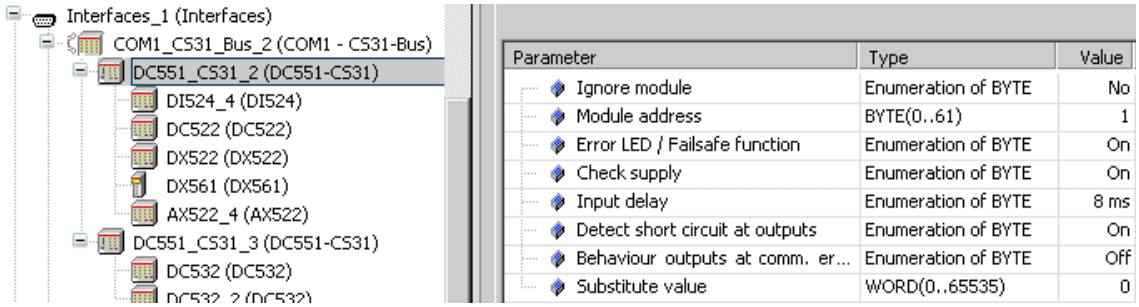


Fig. 1165: Possible configuration consisting of two combined input/output modules.

The fast counters of the input/output Modules (e.g. "DC532") are only available if the modules are connected to the CPU's I/O Bus.

Summary of input/output data

Table 751: Available input/output data and parameters with S500 I/O devices

Device	ID	I/O range	Digital area [Byte]		Analog area [Words]		Parameter [Byte]
			Inputs	Outputs	Inputs	Outputs	
CD522	1805	2 DI + 2 DI (encoder) + 8 DC + 2 DO PWM	6	7	8	8	6
DA501	1810	16 DI + 8 DC + 4 AI + 2 AO	3	1	5	2	8
DC551	2716	8 DI + 16 DC	3	2	0	0	15
DC551+FC	2715	8 DI + 16 DC + FC	5	4	4	8	16
AI523	1515	16 AI	0	0	16	0	36
AI531	1535	8 AI	0	0	8	1	36
AO523	1510	16 AO	0	0	0	16	41
AX521	1505	4 AI + 4 AO	0	0	4	4	23
AX522	1500	8 AI + 8 AO	0	0	8	8	39
DC522	1220	16 DC	2	2	0	0	8
DC523	1215	24 DC	3	3	0	0	10
DC532	1200	16 DI + 16 DC	4	2	0	0	8
DI524	1000	32 DI	4	0	0	0	4
DX522	1210	8 DI + 8 DX	1	1	0	0	6
DX531	1205	8 DI + 4 DX	1	1	0	0	6

Table 752: Available input/output data and parameters with S500-eCo I/O devices

Device	ID	I/O range	Digital area [Byte]		Analog area [Words]		Parameter [Byte]
			Inputs	Outputs	Inputs	Outputs	
DI561	6105	8 DI, 24 V DC	1	0	0	0	0
DI562	6110	16 DI, 24 V DC	2	0	0	0	0

Device	ID	I/O range	Digital area [Byte]		Analog area [Words]		Parameter [Byte]
			Inputs	Outputs	Inputs	Outputs	
DI571	6115	8 DI, 100-240 V AC	1	0	0	0	0
DO561	6120	8 DO 24 V DC, 0.5 A, transistor	0	1	0	0	0
DO571	6125	8 DO, up to 240 V AC/DC, 2.0 A, relay	0	1	0	0	1
DO572	6130	8 DO, 100-240 V AC, 0.5 A, triac	0	1	0	0	0
DX561	6135	8 DI 24 V DC + 8 DO 24 V DC, 0.5 A, transistor	1	1	0	0	0
DX571	6140	8 DI 24 V DC + 8 DO, up to 240 V AC/DC, 2.0 A, relay	1	1	0	0	1

Impossible configurations

Due to the peculiarities concerning the CS31 bus and the DC551-CS31 described at the beginning of this chapter, some configurations cannot be realized.

Example: DC551-CS31 + 6 x DC532

This configuration is not possible because the DC551-CS31 can manage a maximum of 30 bytes in the digital area (= 120 inputs/outputs).

Device	I/O range	Digital area [Byte]		Analog area [Words]		Parameter [Byte]
		Inputs	Outputs	Inputs	Outputs	
DC551	8 DI + 16 DC	3	2	0	0	15
DC532	16 DI + 16 DC	4	2	0	0	9
DC532	16 DI + 16 DC	4	2	0	0	9
DC532	16 DI + 16 DC	4	2	0	0	9
DC532	16 DI + 16 DC	4	2	0	0	9
DC532	16 DI + 16 DC	4	2	0	0	9
DC532	16 DI + 16 DC	4	2	0	0	9
DC532	16 DI + 16 DC	4	2	0	0	9
Total	**120 DI + 128 DC**	**31**	**16**	**0**	**0**	**78**

Example: DC551-CS31 + 6 (or more) AX522

This configuration is not possible because the DC551-CS31 can manage a maximum of 40 words in the analog area. For 7 AX522, the number of analog channels increases accordingly.

Device	I/O range	Digital area [Byte]		Analog area [Words]		Parameter [Byte]
		Inputs	Outputs	Inputs	Outputs	
DC551	8 DI + 16 DC	3	2	0	0	15
AX522	8 AI + 8 AO	0	0	8	8	40
AX522	8 AI + 8 AO	0	0	8	8	40
AX522	8 AI + 8 AO	0	0	8	8	40
AX522	8 AI + 8 AO	0	0	8	8	40
AX522	8 AI + 8 AO	0	0	8	8	40
AX522	8 AI + 8 AO	0	0	8	8	40
Total	**8 DI + 16 DC + 48 AI + 48 AO**	**3**	**2**	**48**	**48**	**255**

Example: DC551-CS31 + 3 (or more) AO523

This configuration is not possible because the DC551-CS31 can manage a maximum of 40 words in the analog area. For each further AO523, the number of analog channels increases accordingly.

Device	I/O range	Digital area [Byte]		Analog area [Words]		Parameter [Byte]
		Inputs	Outputs	Inputs	Outputs	
DC551	8 DI + 16 DC	3	2	0	0	15
AO523	16 AO	0	0	0	16	42
AO523	16 AO	0	0	0	16	42
AO523	16 AO	0	0	0	16	42
Total	**8 DI + 16 DC + 48 AO**	**3**	**2**	**0**	**48**	**141**

Example: DC551-CS31 + 3 (or more) AI523

This configuration is not possible because the DC551-CS31 can manage a maximum of 40 words in the analog area. For each further AI523, the number of analog channels increases accordingly.

Device	I/O range	Digital area [Byte]		Analog area [Words]		Parameter [Byte]
		Inputs	Outputs	Inputs	Outputs	
DC551	8 DI + 16 DC	3	2	0	0	15
AI523	16 AI	0	0	16	0	37
AI523	16 AI	0	0	16	0	37
AI523	16 AI	0	0	16	0	37
Total	**8 DI + 16 DC + 48 AI**	**3**	**2**	**48**	**0**	**126**

Example: DC551-CS31 with FC + 3 (or more) AO523

This configuration is not possible because the DC551-CS31 can manage a maximum of 40 words in the analog area. For each further AO523, the number of analog channels increases accordingly.

Device	I/O range	Digital area [Byte]		Analog area [Words]		Parameter [Byte]
		Inputs	Outputs	Inputs	Outputs	
DC551	8 DI + 16 DC + FC	5	4	4	8	16
AO523	16 AO	0	0	0	16	42
AO523	16 AO	0	0	0	16	42
AO523	16 AO	0	0	0	16	42
Total	**8 DI + 16 DC + FC + 48 AO**	**5**	**4**	**4**	**56**	**142**

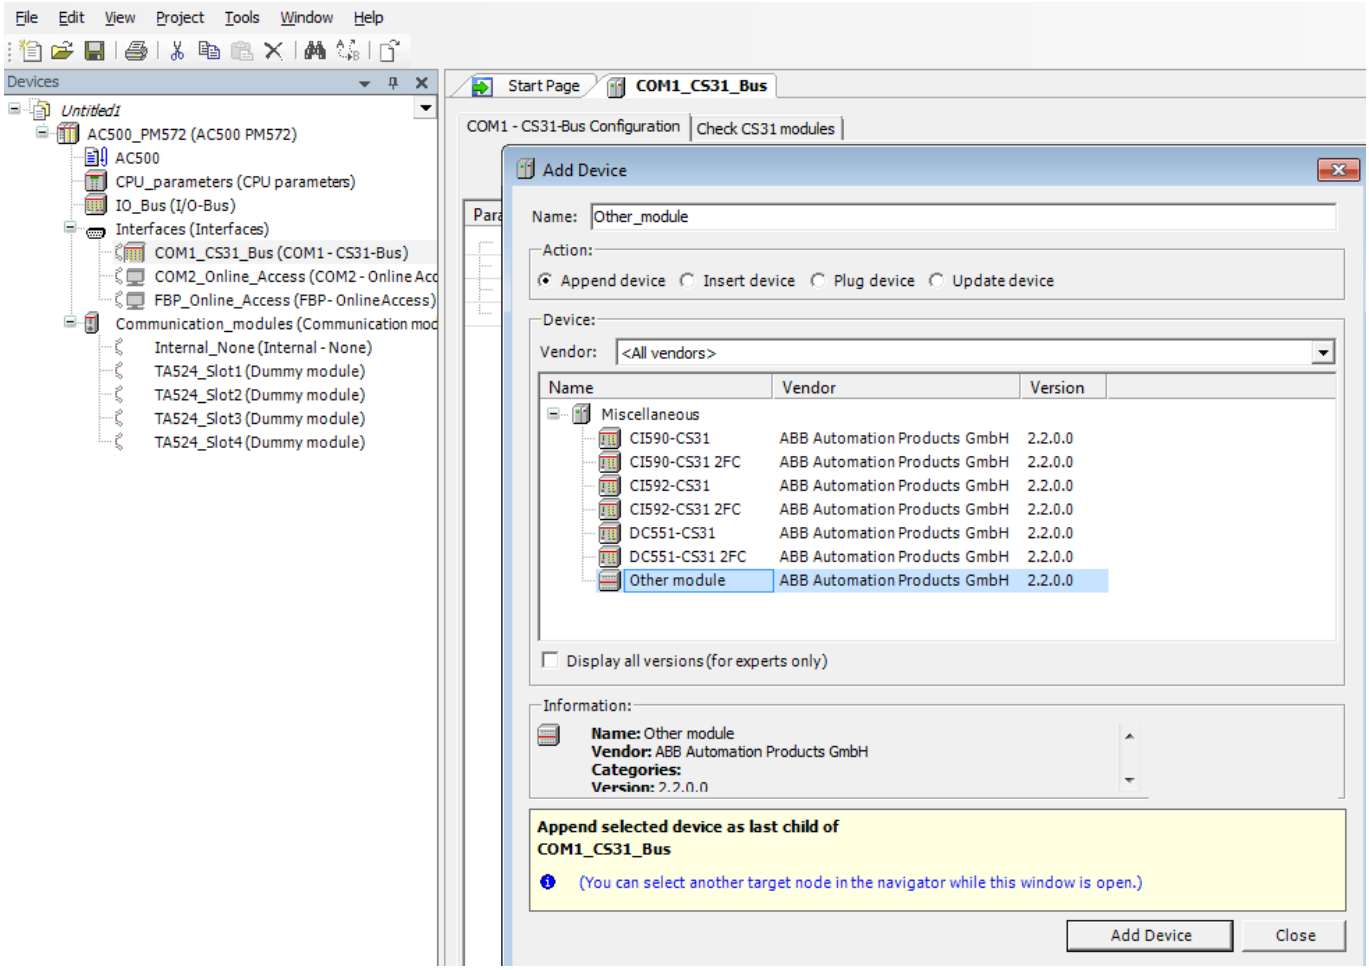
Example: DC551-CS31 with FC + 3 (or more) AI523

This configuration is not possible because the DC551-CS31 can manage a maximum of 40 words in the analog area. For each further AI523, the number of analog channels increases accordingly.

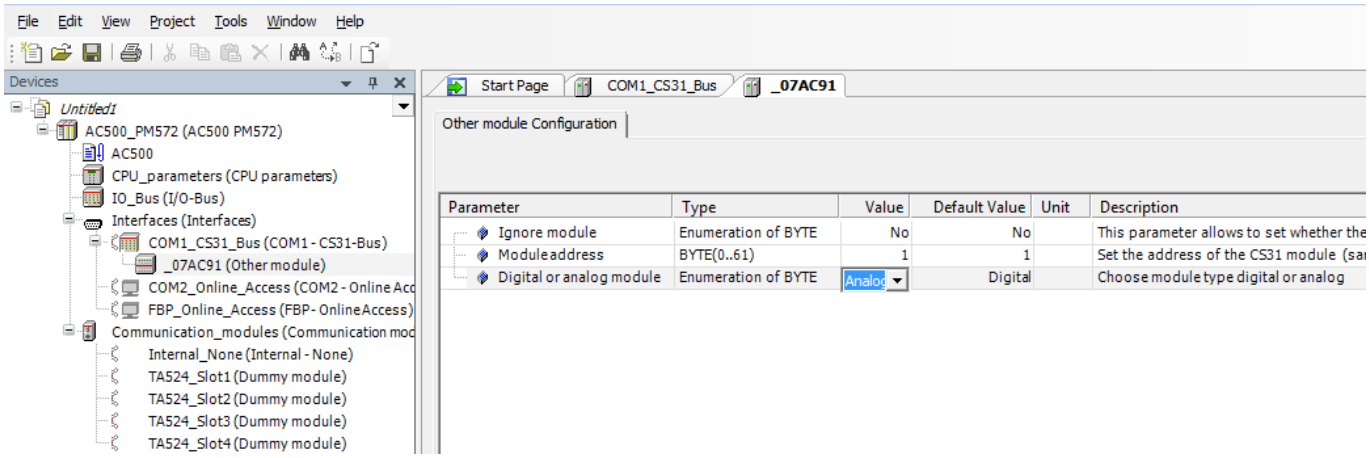
Device	I/O range	Digital area [Byte]		Analog area [Words]		Parameter [Byte]
		Inputs	Outputs	Inputs	Outputs	
DC551	8 DI + 16 DC + FC	5	4	4	8	16
AI523	16 AI	0	0	16	0	37
AI523	16 AI	0	0	16	0	37
AI523	16 AI	0	0	16	0	37
Total	**8 DI + 16 DC + FC + 48 AI**	**5**	**4**	**52**	**8**	**127**

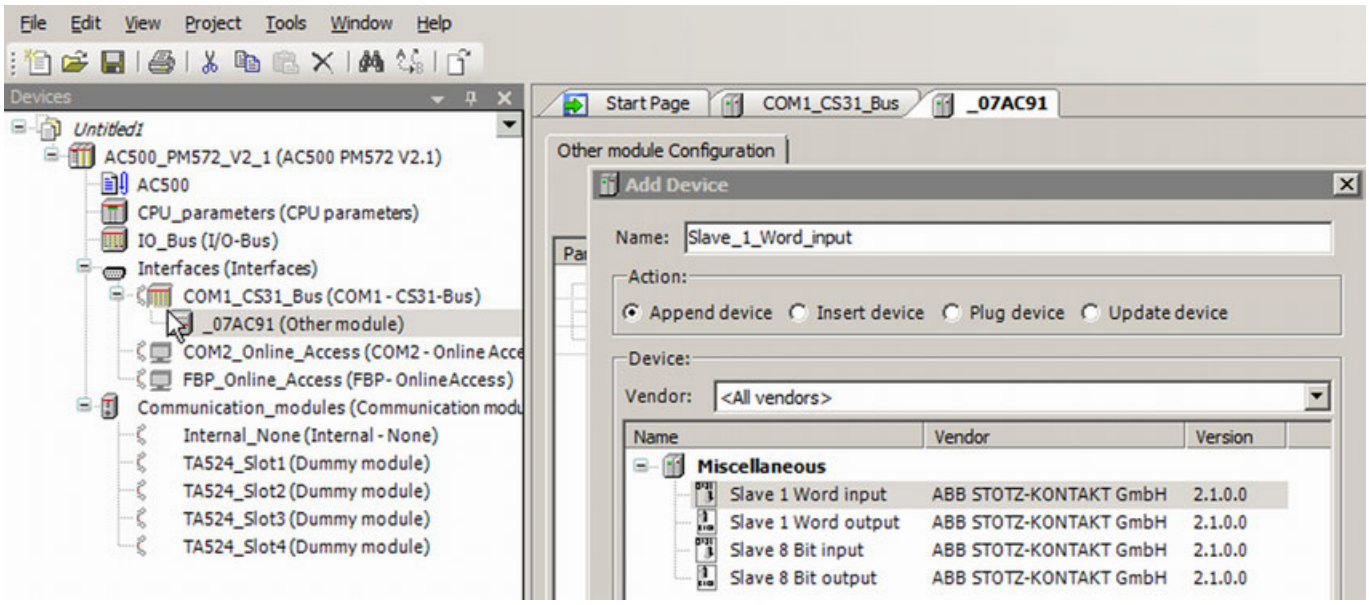
Configuration of other module

1. Right-click on COM1_CS31_Bus => Context menu opens.
2. Select Add Device => menu Add Device opens => select Other module.
3. Click button Add Device.



1. Double-click the moduls name and start configuration.
2. Double-click Digital in column Value =>set Digital or Analog.
3. Right-click the moduls name (Other module) => Add Device => Add Device menu opens.
4. Select In-/Outputs by double-clicking.





1.6.5.2.11 Serial interfaces COM1 and COM2

Setting up the protocol of a serial interface

AC500 CPUs PM57x, PM58x and PM59x are equipped with the two interfaces COM1 and COM2 which can be operated as RS-232 and RS-485.

Some AC500 CPUs such as PM56xy-2ETH are equipped with interface COM1 only.

> *RS-485 operation of an interface is only possible if the parameter RTS control is set to Telegram. The cabling of RS-232 or RS-485 is detected automatically by the hardware.*

AC500 PM55x and PM56x CPUs are equipped with two interfaces COM1 and COM2 (optional) which can be operated as RS-485 only. The parameter RTS control is set by default to Telegram and can not be changed.

Setting COMx - Online access

By default, the serial interfaces are set to 'Online access'. That means the access is done with help of Automation Builder.

If the default mode is set to another value, the interface protocol is directly set in the PLC configuration. No block (such as MODINIT, COMINIT) is required.

The serial interface settings can be read in online mode using the PLC browser commands "com settings" and "com protocols" ↳ *Chapter 1.6.5.4.3 “AC500-specific PLC browser commands” on page 6222*.

Configuration

Double-click *“COMx_Online_Access”* to open the COMx - Online Access Configuration in the editor window.

The following parameters are available:

Parameter	Default value	Value	Description
RTS control	Telegram	None	No RTS control (direction control, not for PM55x and PM56x).
		Telegram	RTS control activated (absolutely necessary for programming via RS-485!).
		RTS/CTS (DTE<->DTE)	RTS and CTS signals are controlled to simulate a DTE device at the PLC communicating with a DTE device.
		RTS/CTS (DTE-->DCE)	RTS and CTS signals are controlled to simulate a DTE device at the PLC communicating with a DCE device.
		RTS/CTS (DCE<--DTE)	RTS and CTS signals are controlled to simulate a DCE device at the PLC communicating with a DTE device.
Transmission rate	19200	300 1200 4800 9600 14400 19200 38400 57600 115200	Transmission rate (Baude)
Parity (read only)	None	None	Parity setting for the Online Access. This parameter is read-only (not editable).
Data bits (read only)	8	8	Number of data bits. This parameter is read-only (not editable).
Stop bits (read only)	1	1	Number of stop bits. This parameter is read-only (not editable).
Run on config fault	No	No	The PLC program is not executed if there are faults in configuration.
		Yes	The PLC program is executed even if there are faults in configuration.

The serial interface settings must match the settings for the serial gateway driver. Refer to the description for programming via the serial interfaces *Chapter 1.6.5.4.2.2 “Programming via the serial interfaces” on page 6200*.

Setting COMx - ASCII

With the selection ASCII, the initialization of the serial interface is done for the "free protocol", i.e. all interface parameters can be set and any protocol can be realized.

Sending and receiving data is done by means of the function blocks COM_SEND and COM_REC which are contained in *Chapter 1.5.4.3 “ASCII communication library” on page 783*.

To be able to receive data using the function block COM_REC, a buffer of the size 272 bytes must be available (for example abyRecData : ARRAY[0..271] OF BYTE).

This is also required if only short telegrams are received.

The operating system provides a total of 32 buffers with 272 bytes each for the transmission and reception of data. If the PLC is in STOP mode (= pause) or the input EN at the block COM_REC is set to FALSE or the function block is not called, these buffers run full.

If the function block COM_REC is called again (with EN = TRUE) before all buffers are used, the data received meanwhile are available.

If all buffers were full, the error Invalid handle with ERR = TRUE and ERNO = 16#2001 = 8193 is reported for one cycle. After this the reception is reset.

Receiving is always reset after a download or the command Online/Reset.

Configuration

Right-click *“COMx_Online_Access ➔ Add object”* and select *“COMx_ASCII ”* from the list.

The parameters define how the serial interface will be initialized. The parameters can be grouped. They are used to initialize the following functions:

- Monitoring the programming login:
  Enable login
- Modem control and RS-485:
  RTS control, TLS, CDLY
- Recognition of telegram ending for reception:
  Character timeout, Telegram ending selection, Telegram ending value, Telegram ending character
- Checksum
- Transmission parameters:
  Transmission rate, Parity, Data bits, Stop bits

The following parameters are available:

Parameter	Default value	Value	Description
Enable login *Chapter 1.6.5.2.11.3.1 “Enable login” on page 6102*	Disabled	Disabled	There is no check with regard to the Control Builder login telegram.
		Enabled	Telegrams received are checked with regard to the Control Builder login sequence. If the sequence is detected, the protocol setting is changed to Online access.

Parameter	Default value	Value	Description
RTS control s *Chapter 1.6.5.2.11.3.2 "Usage of modems" on page 6103*	None	None	No RTS control (direction control, not for PM55x and PM56x CPUs)
		Telegram	RTS control activated (absolutely necessary for RS-485!)
		RTS/CTS (DTE <--> DTE)	RTS and CTS signals are controlled to simulate a DTE device at the PLC communicating with a DTE device.
		RTS/CTS (DTE --> DCE)	RTS and CTS signals are controlled to simulate a DTE device at the PLC communicating with a DCE device.
		RTS/CTS (DCE <-- DTE)	RTS and CTS signals are controlled to simulate a DCE device at the PLC communicating with a DTE device.
TLS *Chapter 1.6.5.2.11.3.2 "Usage of modems" on page 6103*	0	0...65535	For AC500 CPUs and CM574-RS: Carrier lead time in [ms] (TLS > CDLY)
		0...850	For CI504-PNIO and CI506-PNIO: Carrier lead time in [ms] (TLS > CDLY)
CDLY *Chapter 1.6.5.2.11.3.2 "Usage of modems" on page 6103*	0	0...65535	For AC500 CPUs and CM574-RS: Carrier delay time in [ms] (CDLY <= TLS)
		0...850	For CI504-PNIO and CI506-PNIO: Carrier delay time in [ms] (CDLY <= TLS)
Character timeout *Chapter 1.6.5.2.11.3.3 "Telegram ending identifier" on page 6104*	0	0...65535	For AC500 CPUs and CM574-RS: Character timeout in characters (must be 0 if Telegram ending selection = Character timeout)
		0/32	For CI504-PNIO and CI506-PNIO: Character timeout in bits (must be 0 if Telegram ending selection = Character timeout)
Telegram ending selection *Chapter 1.6.5.2.11.3.3 "Telegram ending identifier" on page 6104* and *Chapter 1.6.5.2.11.3.4 "Checksum" on page 6107*	none	none	No telegram ending identifier
		String (check receive)	2 characters, e.g. <CR><LF> (16#0d, 16#0a -> 16#0d0a) in parameter "Telegram ending value" (not supported with COM2 of AC500-eCo CPUs)
		Telegram length	Telegram ending identifier set by telegram length
		Duration	Telegram ending identifier set by time (not supported with CI504-PNIO and CI506-PNIO)
		Character timeout	Telegram ending identifier set by character timeout
Telegram ending character *Chapter 1.6.5.2.11.3.3 "Telegram ending identifier" on page 6104*	16#0d	0...255	Up to version V1.1.x: Telegram ending character
	0	0...2	As of version V1.2.0: Number of end characters in case of telegram ending selection "String"

Parameter	Default value	Value	Description
Telegram ending value ↳ *Chapter 1.6.5.2.11.3.3 "Telegram ending identifier" on page 6104*	0	0...65535	Up to version V1.1.x: Telegram ending identifier value for settings "Duration" and "Character timeout"
	0	0...65535	As of version V1.2.0: Telegram ending identifier value for settings "Duration", "Character timeout" and "String"
Checksum ↳ *Chapter 1.6.5.2.11.3.4 "Checksum" on page 6107*	none	None	No checksum
		CRC8	CRC8 checksum
		CRC16	CRC16 checksum (Motorola format)
		LRC	Add all values to byte (ignore overflow), result multiplied by -1
		ADD	Add all values to byte (ignore overflow)
		CS31	CS31 bus checksum
		CRC8-FBP	CRC8 FBP field bus neutral protocol
		XOR	XOR all values to byte (ignore overflow)
		CRC16 (Intel)	Like CRC16, result swapped
Transmission rate	19200	300 1200 4800 9600 14400 19200 38400 57600 115200	Transmission rate (Baud)
Parity	none	None	No parity check
		Odd	Odd parity
		Even	Even parity
		Mark	Parity bit := TRUE (Not supported with CI504-PNIO and CI506-PNIO)
		Space	Parity bit := FALSE (Not supported with CI504-PNIO and CI506-PNIO)
Data bits	8	5, 6, 7, 8	Character length in bits/character
Stop bits	1	1, 2	Number of stop bits

Enable login

If Enable login is set to Yes, all received telegrams are checked with regard to the CODESYS login service.

It is recommended to activate the automatic login detection only for those projects for which this function is absolutely required because it slows down communication via the serial interface and also influences the PLC performance.

If the connection is directly made via RS-232, a login telegram will only be detected if the same parameters as used by CODESYS (Transmission rate=19200 Baud, Stop bits=1, Parity=None, Data bits=8 bit) are set when initializing the interface.

The same applies if the connection is made via RS-232/RS-485 interface converters. The login telegram can only be detected if the initialization parameters have the same values as the parameters set in CODESYS. Because for such an application usually more than one devices are connected to the RS-485 transmission line the following has to be observed additionally:

The CODESYS login telegram does not contain a device address. Thus, the service is first identified by all devices connected to the RS-485 transmission line that can be programmed using CODESYS and the interface of which is able to read the login telegram (interface with parameter Enable login set to Yes). Due to this, telegram collisions can occur during the subsequent acknowledgement of the login request by these devices, resulting in an interruption of the communication.

If the connection between CODESYS and the PLC is established via modem, the communication is not influenced by the interface parameters set in the PLC configuration. The parameter values required for the modem used have to be set. Once the initialization is completed, the mode processes the received telegrams according to the parameter settings. Also the assignment between login request and an individual PLC is guaranteed because the connection is established using the modem's phone number or MSN.

The login with CODESYS first causes a reinitialization of the interface. All blocks accessing this interface are locked during the online session, i.e. they do not perform any function. During this period the block outputs have the following values:

DONE = FALSE

ERR = TRUE

ERNO = PROTOCOL_PROTECTED = 16#301F = 12319

The blocks will be reactivated after the logout by CODESYS.

The login monitoring for an interface is only done if CODESYS is not already logged in via another interface (Ethernet, ARCNET or other COM).

Usage of modems

The ASCII protocol considers the special properties of modems, interface converters and repeaters. If these devices are used at a serial interface operated in 'free mode', the compression mechanism possibly supported by these devices has to be deactivated. For detailed information, refer to the operation manual of the used device.

Some repeaters, modems or interface converters require a control signal in order to set the transfer direction. The direction control can be enabled or disabled via the input RTSCTRL.

Various devices additionally require a lead time to stabilize their carrier signal. These devices can only transfer data in send direction after this time has elapsed. This carrier lead time can be set via the input TLS.

Additionally, for some devices it is necessary to sustain the carrier signal in send direction for some time after data transfer is completed. Only if this time has elapsed, the complete transfer of a telegram is ensured and the devices are ready for data transfer in opposite direction. This carrier delay time can be set via the input CDLY.

Carrier lead time (TLS) and carrier delay time (CDLY) must be adjusted for all communication devices connected to the same transmission line.

The times are only considered for RTS control set to telegram.

For CI504-PNIO and CI506-PNIO: For the time settings of TLS/CDLY, the used transmission rate listed in the following table has to be considered:

Transmission rate [Bd]	Max. value for TLS/CDLY [ms]
300	850
1200	212
2400	106
4800	53
9600	26
14400	17
19200	13
38400	6
57600	4
115200	2

Telegram ending identifier

The telegram ending identifier is set using the parameters Character timeout, Telegram ending selection, Telegram ending character and Telegram ending value.

Character silent time monitoring:

Monitoring of the character timeout can be set for all possible telegram ending settings (except Character timeout).

If the parameter Character timeout = 0, no character timeout monitoring is done.

With Character timeout > 0 the character timeout monitoring is activated.

The character silent time is defined in number of characters. The number of characters and the interface parameters (Transmission rate, Parity, Data bits and Stop bits) are used to calculate the silent time.

Example: Transmission rate=9600 Baud, Parity=none, Data bits=8, Stop bits=1, Character timeout=3

This results in a frame of 10 bits/character:

1 start bit + 8 data bits + 0 parity bit + 1 stop bit

Character silent time = 1000 x Character timeout x Frame / Transmission rate [ms]

Character timeout = 1000 x 3 x 10 / 9600 = 3.125 ms ~ 4 ms.

If the time between the reception of two characters exceeds the character silent time, the reception is aborted with an error and the characters received up to this moment are made available.

The following parameter combinations are possible:

Character timeout **see remark on character silent time monitoring**	**Telegram ending selection** **Type of telegram ending identifier**	**Telegram ending character = ignored**	**Telegram ending value = ignored**	**Description**
Number of characters 0 or > 0	None	-	-	No telegram ending identifier, i.e., the characters received since last call are provided. The maximum number of characters is limited to 256. For CI504-PNIO and CI506-PNIO: The data will only be provided after 256 characters have been received.
Number of characters 0 or > 0	String (check receive)	Number of telegram ending characters 1 or 2	2 characters (for example 16#0d0a)	According to value set for "Telegram ending character", it is checked for 1 or 2 ending characters. The ending character(s) is (are) not passed, i.e., they are not contained in DATA area.
	1	1	16#0d = 13dec = <CR>	After reception of 16#0d, telegram received is reported.
	2	2	16#0d0a = 3338dec = <CR><LF>	After reception of 16#0d and subsequently 16#0a, telegram received is reported.
Number of characters 0 or > 0	Telegram length	-	Number of characters > 0 and ≤ 256	Telegram received is reported once the number of characters defined in "Telegram ending value" is received.

Character timeout **see remark on character silent time monitoring**	**Telegram ending selection** **Type of telegram ending identifier**	**Telegram ending character = ignored**	**Telegram ending value = ignored**	**Description**
Number of characters 0 or > 0	Duration	-	Time in [ms]	Telegram received is reported once the time set for "Telegram ending value" (in [ms]) is elapsed. The time starts with the first FALSE -> TRUE edge at input EN of the receive block COM_REC.
0	Character timeout	-	For Onboard COM: Number of characters > 0 and ≤ 256	The number of characters set for Telegram ending value and the interface parameters (Transmission rate, Parity, Data bits and Stop bits) are used to calculate the silent time. Telegram received is reported if the silent time between two characters is ≥ the calculated silent time.
			For CI504-PNIO and CI506-PNIO: Number of bits (0 or 32)	The number of bits set for Telegram ending value define the silent time. Telegram received is reported if the silent time between 2 characters is ≥ the silent time.

AC500-eCo processor module do not support string (check receive) and character timeout at COM1 and COM2 as telegram ending selection.

Checksum

Sending with COM_SEND

With Checksum < > none, the selected checksum is appended when sending. If the parameter Telegram ending selection is set to String (check receive), the checksum of the ending character(s) is entered. The character(s) is/are appended according to the inputs END_LEN and END_CH of the function block COM_SEND.

Receiving with COM_REC

With Checksum < > none, the selected checksum is checked during reception. If the parameter Telegram ending selection is set to String (check receive), the checksum of the ending character(s) is expected.

The ending character(s) and the checksum are not output, i.e., they are not contained in the DATA area.

A telegram should look as follows:

Data 0	**Data 1**	**Data 2**	**..**	**Data n**	**Check 1**	**[Check 2]**	**End 1**	**[End 2]**

The values enclosed in [ ] are only relevant for 16 bit checksum or 2 ending characters.

At the blocks COM_SEND and COM_REC, the area addressed via the input DATA contains the following values:

Data 0	**Data 1**	**Data 2**	**..**	**Data n**

Example

Setting in PLC configuration:

"Telegram ending selection" = String

"Telegram ending character" = 2

"Telegram ending value" = 16#0d0a

"Checksum" = CRC16 (i.e., Motorola format)

Send with COM_SEND:

LEN = n+1 END_LEN = 2 END_CH = 16#0d0a

The area addressed via input DATA contains the following data:

Data 0	**Data 1**	**Data 2**	**..**	**Data n**

The following data are sent via the interface:

Data 0	**Data 1**	**Data 2**	**..**	**Data n**	**CRC16 high**	**CRC16 low**	**16#0d**	**16#0a**

Reception with COM_REC:

The interface receives the following telegram:

Data 0	**Data 1**	**Data 2**	**..**	**Data n**	**CRC16 high**	**CRC16 low**	**16#0d**	**16#0a**

The following data are written to the area addressed via DATA:

Data 0	**Data 1**	**Data 2**	**..**	**Data n**

Setting COMx - Modbus

Right-click *“COMx_Online_Access ➔ Add object ➔ COMx_MODBUS”*.

The following parameters are available:

Parameter	Default value	Value	Description
Enable login	Disabled	Disabled	There is no check with regard to the Control Builder login telegram.
		Enabled	Telegrams received are checked with regard to the Control Builder login sequence. If the sequence is detected, the protocol setting is changed to 'Online access'. -> available as of firmware V1.2.0
RTS control	None	None	No RTS control (not for PM55x and PM56x CPUs)
		Telegram	RTS control for telegram activated -> available as of firmware V1.2.0
TLS	0	0...65535	Carrier lead time in [ms] or characters (TLS > CDLY) -> available as of firmware V1.2.0
CDLY	0	0...65535	Carrier delay time in [ms] or characters (CDLY <= TLS) -> available as of firmware V1.2.0
Telegram ending value	3	0...65535	Number of characters for character timeout
Handshake	None	None	No flow control
		RTS/CTS	Hardware handshake -> available as of firmware V1.2.0
		XON/XOFF	Software handshake -> Not implemented

Parameter	Default value	Value	Description
Transmission rate	19200	300 1200 4800 9600 14400 19200 38400 57600 115200	Transmission rate (Baud)
Parity	Even	None	No parity
		Odd	Odd parity
		Even	Even parity
		Mark	Parity bit := TRUE
		Space	Parity bit := FALSE
Data bits	8	5, 6, 7, 8	Number of data bits, 5 to 8
Stop bits	1	1, 2	Number of stop bits, 1 or 2
Operation mode	None	None	None
		Server	Server
		Client	Client
Address	0	0...255	Address for Modbus slave
Disable write to %MB0.x from	0	0...65535	Disable write access for segment 0 starting at %MB0.x
Disable write to %MB0.x to	0	0...65535	Disable write access for segment 0 up to %MB0.x
Disable read to %MB0.x from	0	0...65535	Disable read access for segment 0 starting at %MB0.x
Disable read to %MB0.x to	0	0...65535	Disable read access for segment 0 up to %MB0.x
Disable write to %MB1.x from	0	0...65535	Disable write access for segment 1 starting at %MB1.x
Disable write to %MB1.x to	0	0...65535	Disable write access for segment 1 up to %MB1.x
Disable read to %MB1.x from	0	0...65535	Disable read access for segment 1 starting at %MB1.x
Disable read to %MB1.x to	0	0...65535	Disable read access for segment 1 up to %MB1.x

At AC500-eCo Processor Modules the parameter "Parity" cannot be configured as mark and/or space.

For Modbus slave operation, an area without read and/or write access can be set in the segments %M0.x and %M1.x. reading/writing is disabled beginning at the set address and is valid up to the set end address (inclusive).

The parameter "Data bits" always has to be set to 8 for Modbus.

Setting COMx - CS31

Right-click *"COMx_Online_Access ➔ Add object ➔ COMx_CS31"*.

The serial interface is definitely set as CS31 bus master. COM2 cannot be used as CS31 bus interface.

The following parameters are available:

Parameter	Default value	Value	Description
Run on config fault	No	No	The PLC program is executed even if there are faults in configuration.
		Yes	The PLC program is not executed if there are faults in configuration.
Operating mode (read only)	Master	Master	Operating mode of the CS31 device. This parameter is read-only (not editable).
Max wait run	0		Max. wait time for valid inputs.
Min update time	10		Cycle time for data exchange to IEC program.

For further information on configuring CS31 Modules and I/O channels, see AC500 CS31 Bus ↳ *Chapter 1.6.5.2.10.1 "Configuration of CS31 bus master" on page 6078*.

Setting COMx - SysLibCom

For AC500-eCo processor modules the serial interface COM2 cannot be configured as SysLibCom mode.

Right-click *"COMx_Online_Access ➔ Add object ➔ COMx_SysLibCom"*.

The serial interface COMx is prepared for operation with the blocks contained in the library SysLibCom.lib and the according protocols. For details see ↳ *Chapter 1.4.2.4.2.1 "Overview" on page 564*.

The following parameters are available:

Parameter	Default value	Value	Description
Enable login, see ASCII protocol description ↳ *Chapter 1.6.5.2.11.3.1 “Enable login” on page 6102*	Disabled	Disabled	There is no check with regard to the Control Builder login telegram.
		Enabled	Telegrams received are checked with regard to the Control Builder login sequence. If the sequence is detected, the protocol setting is changed to 'Online access'.
RTS control, see ASCII protocol description ↳ *Chapter 1.6.5.2.11.3.2 “Usage of modems” on page 6103*	None	None	No RTS control (direction control, not for PM55x and PM56x)
		telegram	RTS control activated (absolutely necessary for RS-485!)
TLS, see ASCII protocol description ↳ *Chapter 1.6.5.2.11.3.2 “Usage of modems” on page 6103*	0	0...65535	Carrier lead time in [ms] (TLS > CDLY)
CDLY, see ASCII protocol description ↳ *Chapter 1.6.5.2.11.3.2 “Usage of modems” on page 6103*	0	0...65535	Carrier delay time in [ms] (CDLY <= TLS)
Character timeout ↳ *Chapter 1.6.5.2.11.6.1 “Telegram ending identifier” on page 6112*	0	0...65535	Character timeout in characters (must be 0 if Telegram ending selection = Character timeout)
Telegram ending selection ↳ *Chapter 1.6.5.2.11.6.1 “Telegram ending identifier” on page 6112*	None	None	No telegram ending identifier
		String (check receive)	2 characters, e.g. <CR><LF> (16#0d, 16#0a -> 16#0d0a) in parameter "Telegram ending value" Setting not recommended! (not supported with COM2 of AC500-eCo processor modules)
		Telegram length	Telegram ending identifier set by telegram length Setting not recommended!
		Duration	Telegram ending identifier set by time Setting not recommended!
		Character timeout	Telegram ending identifier set by character timeout
Telegram ending character ↳ *Chapter 1.6.5.2.11.6.1 “Telegram ending identifier” on page 6112*	0	0...1	Number of end characters in case of telegram ending selection "String"
Telegram ending value ↳ *Chapter 1.6.5.2.11.6.1 “Telegram ending identifier” on page 6112*	0	0...65535	Telegram ending identifier value for settings "Duration", "Character timeout" and "String"

Parameter	Default value	Value	Description
Transmission rate	19200	300 1200 4800 9600 19200 38400 57600 115200	Transmission rate (Baude)
Parity	None	None	No parity check
		Odd	Odd parity
		Even	Even parity
		Mark	Parity bit := TRUE
		Space	Parity bit := FALSE
Data bits	8	5, 6, 7, 8	Character length in bits/character
Stop bits	1	1, 2	Number of stop bits

Telegram ending identifier

The telegram ending identifier is set using the parameters Character timeout, Telegram ending selection, Telegram ending character and Telegram ending value.

Character silent time monitoring:

Monitoring of the character timeout can be set for all possible telegram ending settings (except Character timeout).

If the parameter Character timeout = 0, no character timeout monitoring is done.

With Character timeout > 0 the character timeout monitoring is activated.

The character silent time is defined in number of characters. The number of characters and the interface parameters (Transmission rate, Parity, Data bits and Stop bits) are used to calculate the silent time.

Example: Transmission rate=9600 Baud, Parity=none, Data bits=8, Stop bits=1, Character timeout=3

This results in a frame of 10 bits/character:

1 start bit + 8 data bits + 0 parity bit + 1 stop bit

Character silent time = 1000 x Character timeout x Frame / Transmission rate [ms]

Character timeout = 1000 x 3 x 10 / 9600 = 3.125 ms ~ 4 ms.

If the time between the reception of two characters exceeds the character silent time, the reception is aborted with an error and the characters received up to this moment are made available.

The following parameter combinations are possible:

Character timeout **see remark on character silent time monitoring**	**Telegram ending selection** **Type of telegram ending identifier**	**Telegram ending character = ignored**	**Telegram ending value = ignored**	**Description**
Number of characters 0 or > 0	None	-	-	No telegram ending identifier, i.e., the characters received since last call are provided. The maximum number of characters is limited to 256.
Number of characters 0 or > 0	String (check receive)	Number of telegram ending characters 1 or 2	2 characters (for example 16#0d0a)	According to value set for "Telegram ending character", it is checked for 1 or 2 ending characters. The ending character(s) is (are) not passed, i.e., they are not contained in DATA area.
	1	1	16#0d = 13dec = <CR>	After reception of 16#0d, telegram received is reported.
	2	2	16#0d0a = 3338dec = <CR><LF>	After reception of 16#0d and subsequently 16#0a, telegram received is reported.
Number of characters 0 or > 0	Telegram length	-	Number of characters >0 and <=256	Telegram received is reported once the number of characters defined in "Telegram ending value" is received.
Number of characters 0 or > 0	Duration	-	Time in [ms]	Telegram received is reported once the time set for "Telegram ending value" (in [ms]) is elapsed. The time starts with the first FALSE -> TRUE edge at input EN of the receive block COM_REC.
0	Character timeout	-	Number of characters >0 and <=256	The number of characters set for "Telegram ending value" and the interface parameters (Transmission rate, Parity, Data bits and Stop bits) are used to calculate the silent time. Telegram received is reported if the silent time between two characters is >= the calculated silent time.

An example on how data is sent/received with the protocol "SysLibCom" is provided in the System Technology chapter *Chapter 1.6.4.1.11.2 “Sending/Receiving data with SysLibCom protocol” on page 5502*.

Setting COMx - Multi

> *For AC500-eCo processor modules the interface COM2 cannot be configured as “COM2 - Multi”.*

The serial interface COMx is prepared for operation with 2 selectable protocols.

1. Right-click *“COMx_Online_Access* ➔ *Add object”* and select *“COMx - Multi”* from the list.
2. In the device tree, append the desired protocols to the node (*[Add object]*).
3. Modify the parameters for the appended protocol nodes.

   The protocol parameters are identical to the parameters described for the individual protocols.

When restarting the program, i.e. after switching power ON, a download or a reset, the protocol appended first is always active.

Switching between the protocols is done using the function block COM_SET_PROT (contained in the library SysInt_AC500_V10.lib). At the function block input COM, the number of the serial interface is applied and at the input IDX the protocol index is set. The protocol appended first in the PLC configuration has the index 0, the second protocol the index 1.

An example which describes the usage of the function block can be found in the System Technology chapter *Chapter 1.6.4.1.11.1 “Function block COM_SET_PROT” on page 5501*.

1.6.5.2.12 AC500 FBP slave interface

> *Some processor modules do not provide a neutral FBP interface.*

The FBP slave interface is used to connect the AC500 controllers as fieldbus slave via FieldBusPlug (FBP).

The neutral FBP interface is configured as *“FBP_Online_Access”* by default. This allows programming and login via the FBP slave interface using the device UTF21-FBP adapter (USB connection on PC-side).

> *No protocol is set for the neutral FBP interface in the standard configuration (setting "FBP - none").*
>
> *If the FBP slave interface address (ADR > 0) is set using the display/keypad, this address has priority over the PLC configuration setting.*

The FBP slave interface occupies the I/O area:

%IB3000 .. %IB3999 or %QB3000 .. %QB3999.

Configuration of a FBP slave

1. Add the desired FBP module to the FBP node and modify the FBP slave parameters if required:

Parameter	Default value	Value	Description
Run on config fault	No	No	The PLC program is not executed if there are faults in configuration.
		Yes	The PLC program is executed even if there are faults in configuration.
Operation mode (read only)	Slave	Slave	Operation mode of FBP (Slave). This parameter is read-only (not editable).
Address	1	0...255	Address of the FBP slave.

2. Check the I/O configuration. I/O ranges of the different slaves:

FBP	Fieldbus	I/O range
PDP22 DP V1 modular	PROFIBUS DP V0/V1	8 modules, but a total of 32 bytes and 128 words in/out, 244 bytes max. per direction, a total of 368 bytes per slave
DNP21	DeviceNet	1 module with a maximum of 16 bytes and 16 words (inputs or outputs), for example 1 x "Module 16 Byte and 16 Word In/Out"
DNP21 modular	DeviceNet	8 modules, but a total of 16 bytes and 16 words (input or output)
COP21	CANopen	8 modules, but a total of 16 bytes and 16 words (input or output)

Depending on the fieldbus master, the processor module can exchange a different amount of input/output data with the master.

⇨ A maximum of 8 modules can be appended to the FBP slave interface. The size of possible modules depends on the used FBP, fieldbus and Communication Module (fieldbus master).

The byte inputs and outputs are provided as BYTE and BOOL and the word inputs and outputs as WORD, BYTE and BOOL.

The I/O modules saved in the PLC configuration and their addresses must match the entries in the configuration of the respective fieldbus master.

If you want to exchange less data than the maximum allowed amount of I/O data with the fieldbus master, you can setup a configuration consisting of different modules.

3. Set the I/O mapping.

See Symbolic Names for Variables, Inputs and Outputs for further details on mapping
↳ *Chapter 1.6.5.2.9.6 “Symbolic names for variables, inputs and outputs” on page 6060*.

1.6.5.2.13 Gateway configuration

1. In the Automation Builder project, right-click the topmost PLC tree node and select *“Communication Settings”*.

   ⇨ The dialog window Communication Settings appears.

2. Click *“Advanced Settings”* to open the Communication Parameters dialog and to change the communication settings.

   ⇨ This information will be stored in the project file.

3. Click *“Gateway”* to enter the gateway settings . Specify the connection type (e.g. TCP/IP) and the gateway address credentials if required.

   Confirm your settings with *“OK”*.

Gateway settings on windows server 2012

Gateway as a service

To allow multiple concurrent users from different user sessions on the server to connect to PLCs, the user has to run CODESYS gateway as a system service. This is managed by a service called "CoDeSys V2.3 Gateway Service Wrapper". The service starts on system start-up and launch the gateway.

If you want to restart the gateway, use "Services management console" to restart "CoDeSys V2.3 Gateway Service Wrapper".

Gateway settings

You can set the communication settings in the Automation Builder project for every PLC. Otherwise, an error message is displayed while trying to open CODESYS.

See the description for *Chapter 1.6.5.2.13 “Gateway configuration” on page 6116* and select "TCP/IP" under *“Connection”*.

1.6.5.2.14 Open Device Type editor

The Open Device Type editor has reached end-of-service-life with Automation Builder 2.4.0. All data can be accessed, but no further maintenance or support will be given. This option will be removed with Automation Builder 2.6.0.

Automation Builder provides Open Device Type editor to create device descriptions and parameters on any device connected through Modbus RTU/Modbus TCP/IP.

In the Automation Builder main menu click *“Tools ➔ Open Device Type Editor”* to launch the Open Device Type editor. The Open Device Type editor consists of device information, groups and parameters and custom parameter types.

Device information

The *“Device Information”* tab is used to add basic information of a device and to select the supported communication protocols.

See the following table to add basic information and communication settings of a device.

Device information	
Name	Name of the device.
Type	The device type is fixed for open devices.

Device information	
ID	The first four digits are fixed for ABB (i.e. 1020). The other four digits must be unique.
Version	The version field is enabled to edit and to add desired value.
Description	Device description.
Vendor	Name of the vendor.
Order number	Ordering information.
Icon	Default icons are used if not updated.
Image	Default images are used if not updated.

Communication settings	
Supported protocols	Supports through Modbus RTU, Modbus TCP/IP or both.

Groups and parameters

1. In the Open Device Type editor, click *"Groups and Parameters tab ➔ New"* to create parameter data.
2. Enter the basic information, range, scaling and parameter address information and save the changes.
3. Click *"Discard Changes"* to discard the changes while editing the parameter data.
4. To modify already existing parameter data, select the parameter and edit.

See the following table to create parameter data.

Basic information	
Group	Name of the parameter group.
Name	Name of a parameter.
Type	Type of parameter.
Description	Parameter data description.
Parameter ID	Numeric parameter ID.
Unit	Unit of parameter.
Offline Access	Validates the parameter read/write settings.
Online Access	Validates the parameter read/write settings.

Range information	
Minimum value	Minimum value of a parameter.
Maximum value	Maximum value of a parameter.
Default value	Default value of a parameter.

Scaling	
Numerator	Numerator value of a parameter scaling factor.
Denominator	Denominator value of a parameter scaling factor.

Parameter Address	
Register ID	Address used for Modbus (range 0...65536).

Bulk editing

The Open Device Type editor allows to copy-and-paste bulk parameters within the view and from/to MS Excel.

In *"Groups and Parameters"*, right-click on parameter data and do the following:

- Click *"Copy"* to copy bulk parameter data.
- Click *"Paste"* to paste bulk parameter data to the editor.
- Click *"Delete"* to delete bulk parameter data from the editor.

If the fields marked with are empty, a message is displayed.

For example, if the parameter data contains inappropriate data, those parameters are highlighted in red color. By selecting parameter data, the error is highlighted .

Custom parameter types

The *"Custom Parameter Types"* tab is used to create Bit Field and Enum custom parameter types. The custom parameter types are later used as bit field and enum type parameter.

Bit field

1. In the *"Custom Parameter Types"* tab, right-click *"Bit Field Type ➔ Add New"* to create a new bit field type.
2. In the Basic Info editor, add the parameter Name, Default Value and Base Type.
3. In the Member editor, create a parameter type by adding Name, Default Value and Visibility. Save the data.
4. Click *"Previous"* or *"Next"* to enable the bit field for editing.
5. Click *"Change sequence of members"* to change the bit field sequence.

See the following table to create the parameter type.

Basic info	
Name	Parameter name.
Default Value	Default value of a parameter.
Base Type	Parameter type.

Member	
Name	Selected bit field name.
Default Value	Default value of a bit field.
Visibility	Bit field visibility.

The newly created bit field parameter type is visible in the Type options in the *"Groups and parameters"* tab.

Enum type parameter

1. In the *"Custom Parameter Types"* tab, right-click *"Enum Type ➔ Add New"* to create a new Enum parameter type.
2. In the Basic Info editor, enter the parameter Name and select the Type.
3. In the Member editor, click *"New Member"* to add Enum Type values.
4. Save the Enum Type values to the Device description editor.
5. Click *"Previous"* or *"Next"* to enable the Enum value to rename and to change the member fields.
6. Click *"Discard Changes"* to discard the changes.

The newly created Enum type parameter is visible in *"Groups and parameters ➔ Type"*.

Exporting/Importing a device description file

The Open Device Type editor allows to export the device descriptions in DEVDESC format.

In the Open Device Type editor, click *"Export"* and save the file to the file system.

Select a location in the file system to save the file.

For the import of a customized device description file, click *"Import"* in the Open Device Type editor and select the device description file from the file system.

Installing a device description file to the device repository

The device description file can be installed in the Open Device Type editor or by using *"Tools ➔ Device repository"* in Automation Builder main menu.

Configuring a device description file in modbus RTU

1. In the Automation Builder project, right-click on Modbus RTU communication node and select *"Add object"*.
2. Select the installed device description file and click *"Add object"*.
   ⇨ The added device description file is created using Modbus RTU protocol.

Configuring a device description file in modbus TCP/IP

1. In the Automation Builder project, right-click *"Protocols ➔ Add object"*.
2. Select *"Modbus TCP/IP Server ➔ Add object"*.

3. Right-click *"Modbus_TCP_IP_Server ➔ Add object"*.
4. Select the operating data file and click *"Add object"*.
   - By default, the installed device description file is updated in CODESYS application.
   - After adding the device description file (for example, operating data) to Modbus TCP IP server, check the IP configuration in *"Tools ➔ IP configuration"*.
5. Right-click *"PLC_AC500 ➔ Communication Settings"* to set the gateway communication settings.

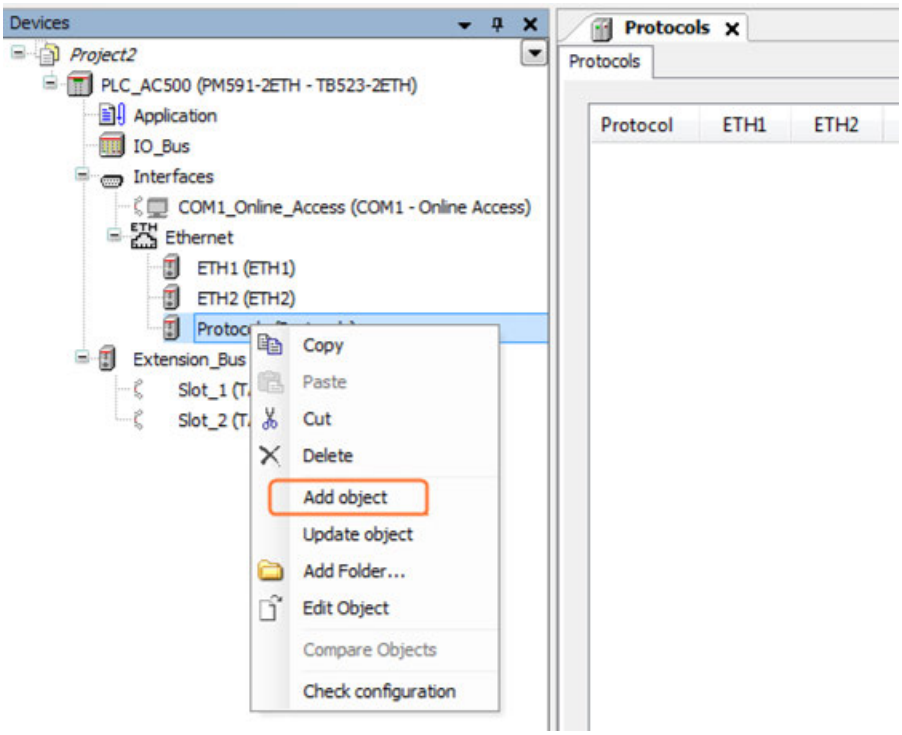
Task configuration

1. In the Automation Builder project, double-click *"Application"* to launch CODESYS application.
2. In the CODESYS application main menu, click *"Online ➔ Login"*.
3. Click *"Resources"* tab and configure the task configuration.
4. In the *"POU"* tab, double-click the device description file and change the status to TRUE.

1.6.5.3 Protocols and special servers

1.6.5.3.1 General configuration of protocols and special servers

As of Automation Builder 1.0 protocol configuration and the configuration of special servers such as FTP server configuration is done at a common device tree location under *"Ethernet ➔ Protocols"*.



Right-click *"Protocols ➔ Add object"* and select the object to be configured from the list.

1.6.5.3.2 IEC60870-5-104 (Telecontrol)

Configuration of IEC 60870-5-104 (Telecontrol)

> *Protocol IEC 60870-5-104 (telecontrol) is only available on AC500 CPUs with onboard Ethernet.*

Protocol IEC 60870-5-104 is described in *Chapter 1.5.4.18 “IEC60870 library” on page 1351*.

For further information on telecontrol, see the following chapters:

Configuration < CBP 2.4 *Chapter 1.6.5.3.2.3.1 “Configuration up to and including CBP 2.3” on page 6123*

Configuration >= CBP 2.4 *Chapter 1.6.5.3.2.4.1 “Configuration changes >= Automation Builder 1.1/CBP 2.4” on page 6138*

General information IEC60870

Introduction

The implemented IEC60870-5-104 protocol allows link-ups between AC500 CPUs with onboard Ethernet and external systems. The link-up takes place via the onboard Ethernet interface of the CPU. The telecontrol protocol according to IEC60870-5 is used.

The CPU can work as both control station and substation. In control direction, setpoints and commands can be set; in monitoring direction the control station sends status values, real values and discrete values to the substation. Via general inquiry, the substation requests the control station to send all status values, real values and discrete values. Otherwise, these values are sent by the control station on a change-driven basis, cyclically or when triggered by an application. Status values, real values and discrete values may contain timestamps. These are filled in with the time of the process station when sent. The CPU can time-synchronize the telecontrol link.

A module accepts the configuration of the physical interface (link layer) and the general protocol parts (application layer).

Send and receive blocks are available for data exchange. These blocks exist for the IEC60870-5 data types setpoint value, command value, double command value, status value, double status value, real value and discrete value. The inputs/outputs of the send and receive blocks are combined with the signals to be communicated. See documentation of IEC60870 library for more information.

Configuration

Note: As of AB 1.1 (CBP 2.4) telecontrol configuration has been changed. Hence, description can be found in the following chapters:

Configuration < CBP 2.4 *Chapter 1.6.5.3.2.3.1 “Configuration up to and including CBP 2.3” on page 6123*

Configuration ≥ CBP 2.4 *Chapter 1.6.5.3.2.4.1 “Configuration changes >= Automation Builder 1.1/CBP 2.4” on page 6138*

Data flow control

Each send or receive block can only process one data message. Ideally, new data are available at each user task run-through or new data can be sent.

If the output OV (send block only) indicates TRUE, the function block computes more quickly than the data can be sent. This can happen if the receive block is not computed quickly enough and has thus not collected all the data.

Alternatively, this block sends either cyclically or if the input value is changed. Ideally, the topical data can be sent via the telecontrol link in connection with every user task run-through.

Data integrity

With IEC60870-5 protocol, a distinction is made between data transmission in the monitoring direction (status values, real values, discrete values) and in the control direction (commands and setpoints).

All data transmissions are acknowledged from the link communication level by the receiver. This acknowledgement is not sent to the sender of the data in every telecontrol link.

For data transmission in control direction, additional acknowledgement (e.g. ACTTERM) is possible. These acknowledgements are not sent by every telecontrol link either. For safe data transmission, it is necessary, in such cases, to configure data readback. The receiver then sends the data received back to the sender via the corresponding send blocks.

Information in the monitoring direction is acknowledged by the receiver on the lowest communication level (link level) when received. This acknowledgement is generated by the telecontrol head itself with some telecontrol heads. In the event of overload/overrun, a data message may be lost. For data in the control direction, so-called ACTTERM acknowledgement can be used. This additional acknowledgement is sent back to the sender when the data have been executed in the process. If data are to be sent in the monitoring direction with guaranteed transmission, it is necessary to read back the sent value via another variable and, after observing a monitoring time, resend in the event of an error.

Data transmission

Send blocks

On the basis of the communication protocol, it is sensible to restrict the data types at one send block to one type. Therefore, there are 5 types of send blocks: send of status values, commands, real values, setpoints and discrete values. These types are mapped to the IEC1131 data types BOOL, REAL and DINT. See documentation of IEC60870 Library for more information.

Operating modes of the send blocks

The send blocks know three operating modes to send their data:

- Caused by request pin (SEND)
- Send in connection with a change of data (AUTO)
- Cyclic send of data (CYCLE)

Send via request pin

The SEND signal is evaluated on the rising edge, the RDY signal remains applied for one computation cycle. If a rising edge is generated again at the SEND signal although no acknowledgement has yet been received from the receiver, the OV pin is set in order to indicate that an overrun has happened. The evaluation of the receive acknowledgement is carried out before the evaluation of whether transmission is to take place. This means, assuming that there is an appropriately fast telecontrol link, that in connection with change-driven and cyclic transmission, a transmission job can be sent in connection with every computation of the block. In connection with send via the request pin it is possible to send only in connection with every second computation (send takes place only with a rising edge).

Change-driven send of data

Data are always sent when the value of the input variables changes. When changes take place, there is an internal simulation that the SEND pin changed from 0 to 1.

In order to prevent unnecessarily frequent send in the event of mild fluctuations in the input value, a threshold value can be configured for real values and setpoints. The input value is not sent until it differs positively or negatively from the value last sent by more than the threshold value.

If the input value changes again although no acknowledgement has yet been received from the receiver, the OV pin is set in exactly the same way as in connection with send via the request pin. If an error occurs during send, the job is automatically retried until the value has been sent without error.

Cyclic send

The data are automatically sent after expiration of a configurable cycle time (SCANDOWN). This cycle time is indicated in multiples of the task cycle time in which the block is computed. In this operating mode, an overrun error can occur if the transmission is faster than the response time of the receiver. For setpoints, it is necessary to ensure that an acknowledgement is generated by the receiver which is not sent until the setpoint is accepted. The send block is not ready for transmission again until after this acknowledgement has been received.

Receive blocks

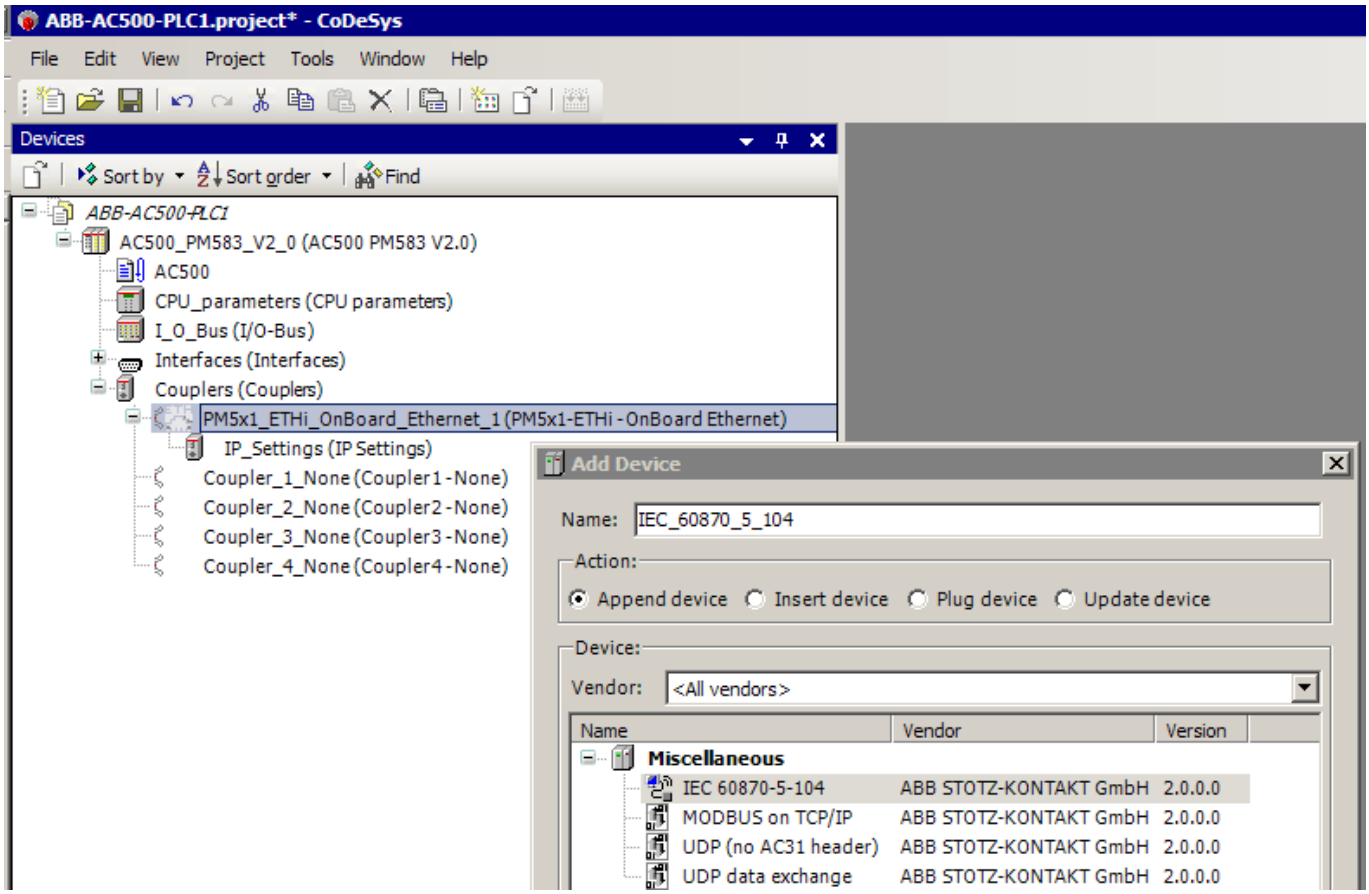
In receive direction, the jobs enter the device module via the interface. The device module selects the correct receive block using the telecontrol address. To this end, during installation the receive blocks pass their parameterized telecontrol addresses to the device module. The device module stores the data received and the receive blocks make the data available at their output pins in connection with the next computation of the user task.

Configuration < Automation Builder 1.1/CBP 2.4

Configuration up to and including CBP 2.3

The IEC 60870 protocol allows link-ups between AC500 CPUs with onboard Ethernet (e.g. PM573-ETH and PM583-ETH) and external systems.

The link-up takes place via the onboard Ethernet interface of the CPU.



For further information on configuration (> CBP 2.4), see the following chapters:

Control and Substations ↳ *Chapter 1.6.5.3.2.3.2 “Control station and substations < Automation Builder 1.1” on page 6124*

Global Address ↳ *Chapter 1.6.5.3.2.3.3 “Global address” on page 6129*

Data Points ↳ *Chapter 1.6.5.3.2.3.4 “Data points” on page 6131*

Validity Check of Configuration ↳ *Chapter 1.6.5.3.2.3.5 “Validity check of configuration (< Automation Builder 1.1/CBP 2.4)” on page 6135*

Creating Configuration Data in Automation Builder ↳ *Chapter 1.6.5.3.2.3.6 “Creating configuration data in Automation Builder” on page 6135*

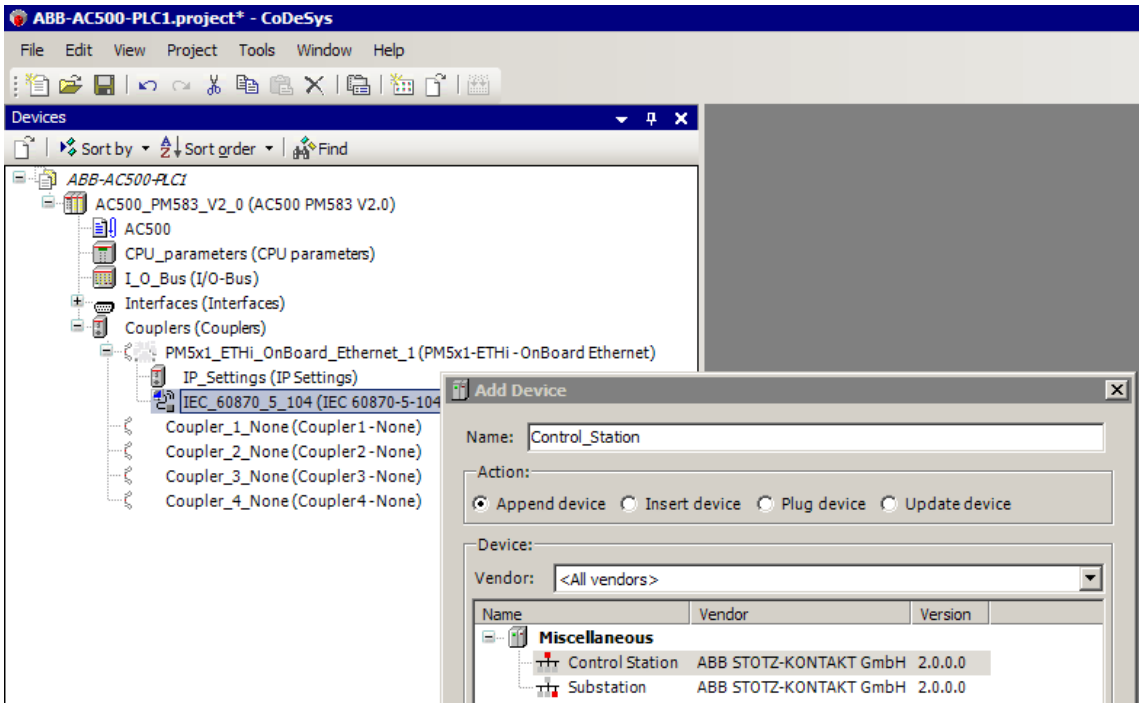
Using Control and Substations in CODESYS ↳ *Chapter 1.6.5.3.2.3.7 “Using control and substations in CODESYS” on page 6137*

Using Data Points in CODESYS ↳ *Chapter 1.6.5.3.2.3.8 “Using data points in CODESYS” on page 6137*

Control station and substations < Automation Builder 1.1

The CPU can work as both control station and substation.

Control station	Master, client, controlling station: Synonyms for a higher-level station (central station, monitors others stations)
Control direction	Data transfer direction from the control station to the substation
Substation	Server, slave, controlled station: synonyms for a subordinate IEC 60870-5-104 telecontrol station (which is monitored)
Monitoring direction	Data transfer direction from the substation to the controlling station



Control station and substation preferences

The application module contains all IEC 60870-5 application layer functionality. Within these functions the ASDU (Application Service Data Unit) is generated and decoded. Data is exchanged between the ASDU (protocol layer) and the telecontrol data points.

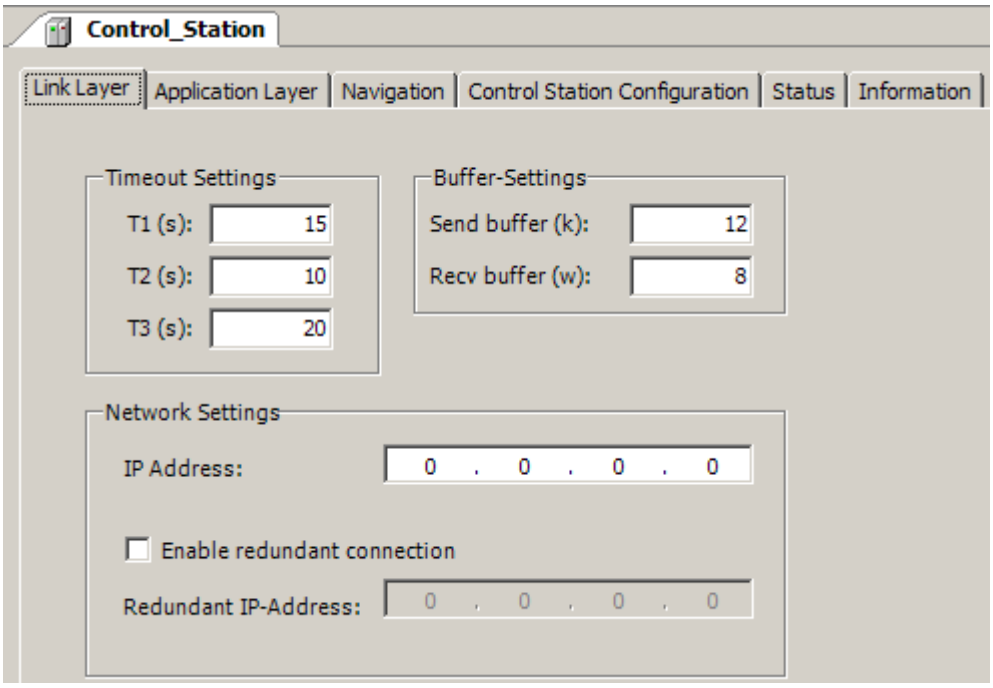
All functions within the IEC 60870 are handled by this code (ACTCON, ACTERM, General Inquiry etc).

To use them it is necessary to select the correct settings due to the Control- /Substation.

Tab link layer

The link layer (link level) is the communication layer which accesses to the Ethernet interface.

The link layer provides the following settings:



Timeout settings T1, T2, T3: The values for the connection control and message replication; timeout1/2/3.

Buffer settings This parameter gives the maximum number of outstanding messages and acknowledgement behaviour.

Send buffer (k):	Maximum difference receive sequence number to send state variable
Rec buffer (w):	Latest acknowledge after receiving w I format APDUs

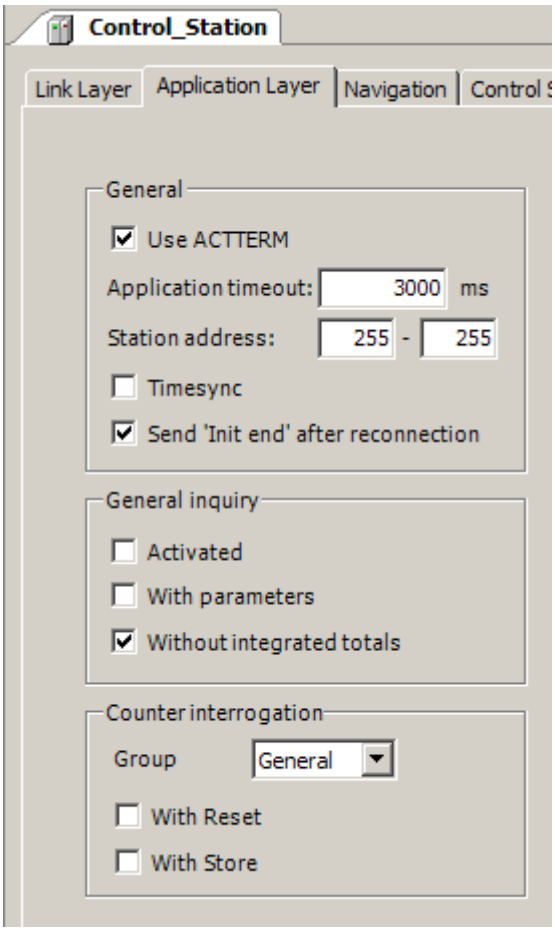
Network settings Network Settings are only available for control stations. The IP address of the control station and if available the IP address of another control station (Redundant IP address) can be selected by the user.

Tab application layer

The application layer is the communication layer with which the send and receive blocks work.

The application layer defines different information objects and services for their transmission.

A data point or information object is identified via a system-wide unambiguous address containing a maximum 5 bytes. ↳ *Chapter 1.6.5.3.2.3.4 “Data points” on page 6131*



General

Use ACTTERM This parameter concerns only setpoints and commands. If this parameter is checked, an acknowledgement with set ‘actterm’ is generated as reason for transmission at the time at which the receive block is computed and outputs its telecontrol data at its output pins. On transmission side, the data block awaits the reception of this ACTTERM acknowledgement and reacts with its corresponding output (see *Chapter 1.5.4.18 “IEC60870 library” on page 1351*) to the reception of this acknowledgement. For commands with execution time, the acknowledgement is generated when the command is terminated, for commands with continuous execution time and for setpoints, the acknowledgement is generated when the data are output to the output pins.

Application timeout This time indicates how long an acknowledgement will be awaited on the application level. An acknowledgement is generated only for commands and setpoints on the application level.

Station address The station address defines which station will be subject to a count query. The values define the 2 bytes for the common telecontrol address (GADU1 and GADU2).

Value	Description
0	The station address is not used.
1...254	The count is queried on the station defined by the station address.
255	The count is queried on all accessible stations.

Timesync After each new establishment of a link and once per hour, a ‘coarse time synchronisation’ message is generated. This time synchronisation is only supported from AC500 to external systems. Time synchronisation from an external system to AC500 is not provided!

Incoming time synchronisation messages are confirmed by the process station but not executed. Greenwich Mean Time (GMT) is used as the time for the synchronisation.

Send 'Init end' After each establishment of a link or only in connection with the first establishment of a link and after reconfiguration, an init end message is generated. After the init end message, there is a general inquiry, if configured.

General inquiry

Activated This parameter concerns only real values, discrete values and status values. The device module generates a general inquiry message after each new establishment of a link. The other side then generates a message with the reason for transmission ‘general inquiry’ for every data point and subsequently an init end message. This procedure ensures that, in the event of a new establishment of a link, all data are available on the reception side in topical form.

With parameters If general inquiry is activated the parameter values are sent.

Without integrated totals With a general inquiry no integrated total values are sent.

Counter interrogation

Group General, 1 .. 4: The count inquiry is executed for a specific group of counters (1 .. 4).

The count inquiry is executed for all groups of counters.

With reset The reset quality bit is sent along with the count inquiry.

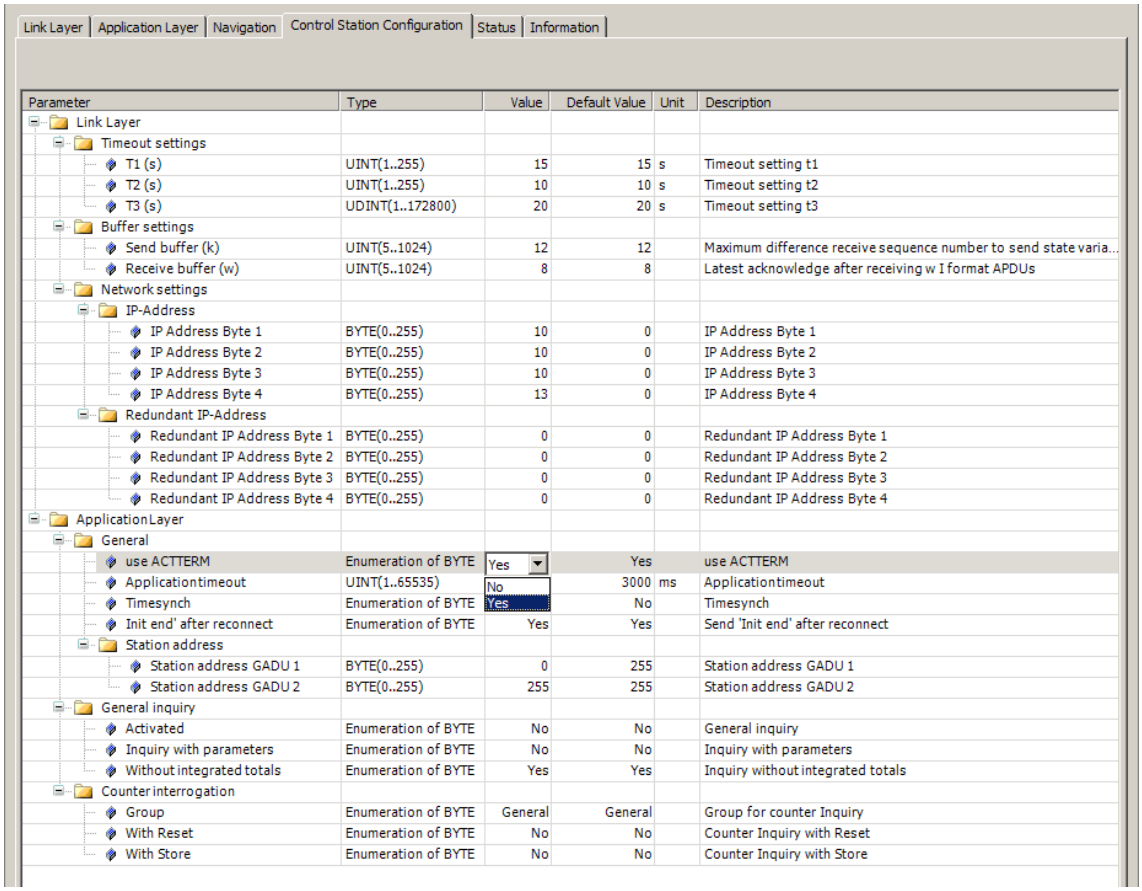
With relocate The relocate quality bit is sent along with the count inquiry.

Tab navigation

The defined Data Points from all defined global addresses were shown. Description of the columns: ↯ *Chapter 1.6.5.3.2.3.3 “Global address” on page 6129*

Tab control station configuration

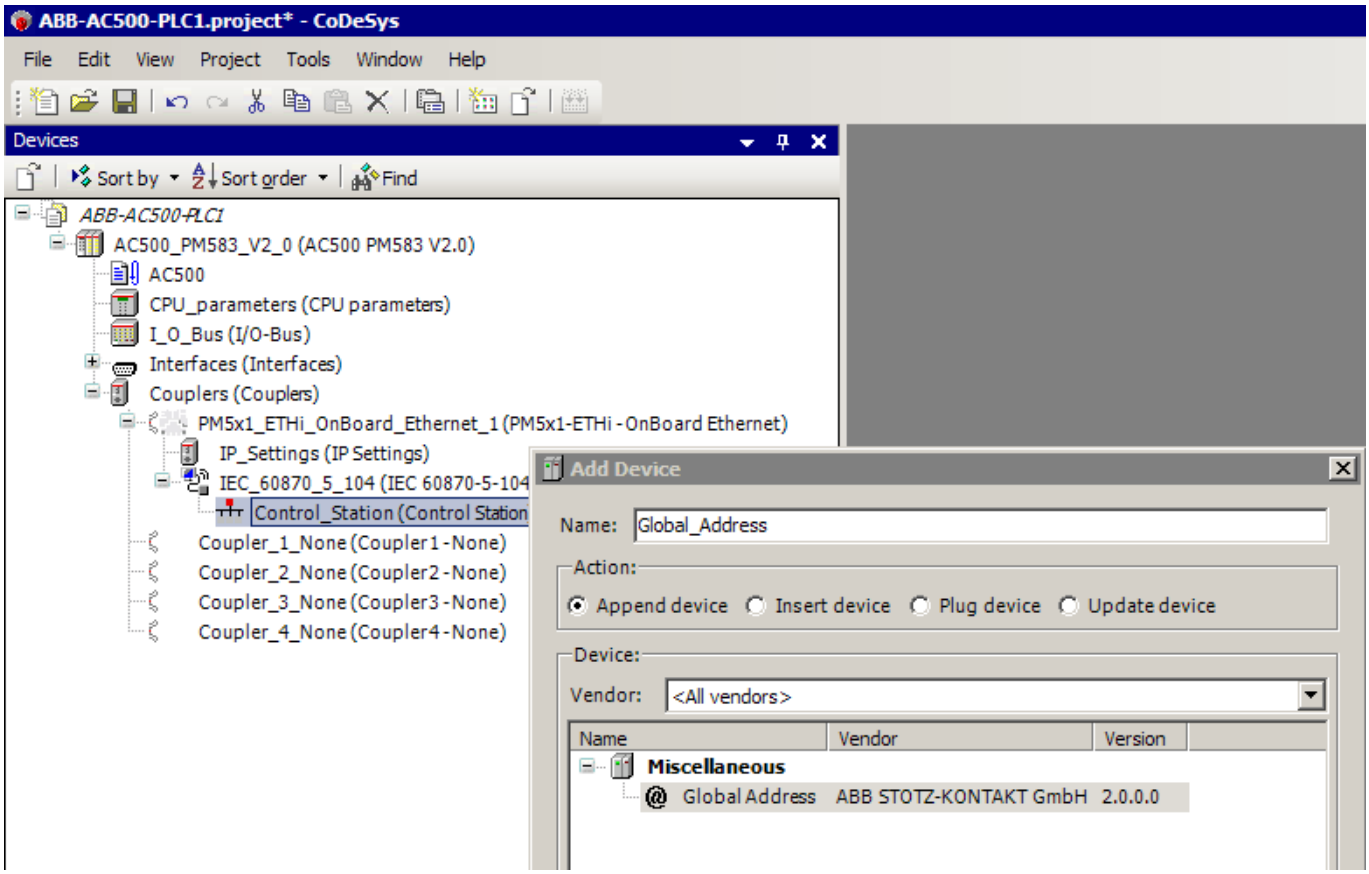
The Control Station Configuration register shows all selectable configurations of the Control and Substation.



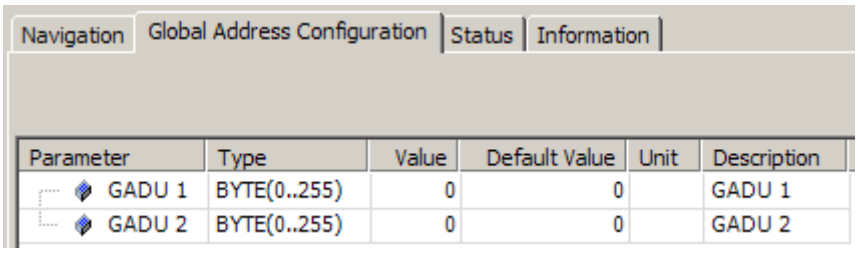
Furthermore it is possible to do the setup directly at this register. Otherwise the configuration can be done as described at the link layer and application layer register.

Global address

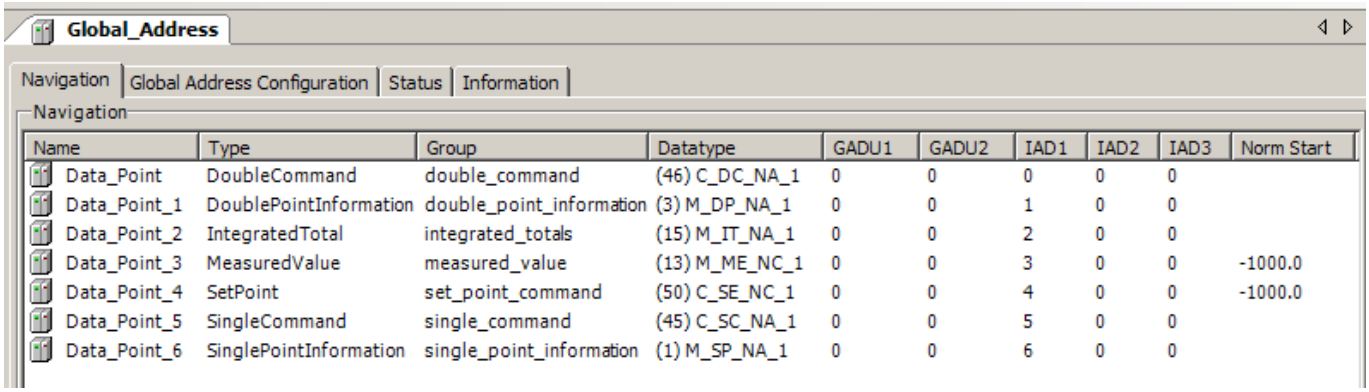
To select the correct Control Station / Substation it is necessary to assign the corresponding global address.



The configuration of the global address takes place by the following 2 global address bytes of the common telecontrol:



The Navigation menu reflects information about all configured data points ↳ *Chapter 1.6.5.3.2.3.4 "Data points" on page 6131*.



Description of the columns

Name: node name of the data point

Type: Type of the data point

Group: node name of the data point group

Data type: Data type of the data point

GADU1 / GADU2: Global address of the data point (parameter of the data group). Byte 1/2 of the common telecontrol address of the block

IAD1, IAD2, IAD3: Local address (Byte 1, 2 and 3) of the data point (parameter of the data point)

Norm Start / End / Threshold: Parameter of data point (only if available)

NORM. START: Low limit (0 %) of the normalized range for real values and setpoints.

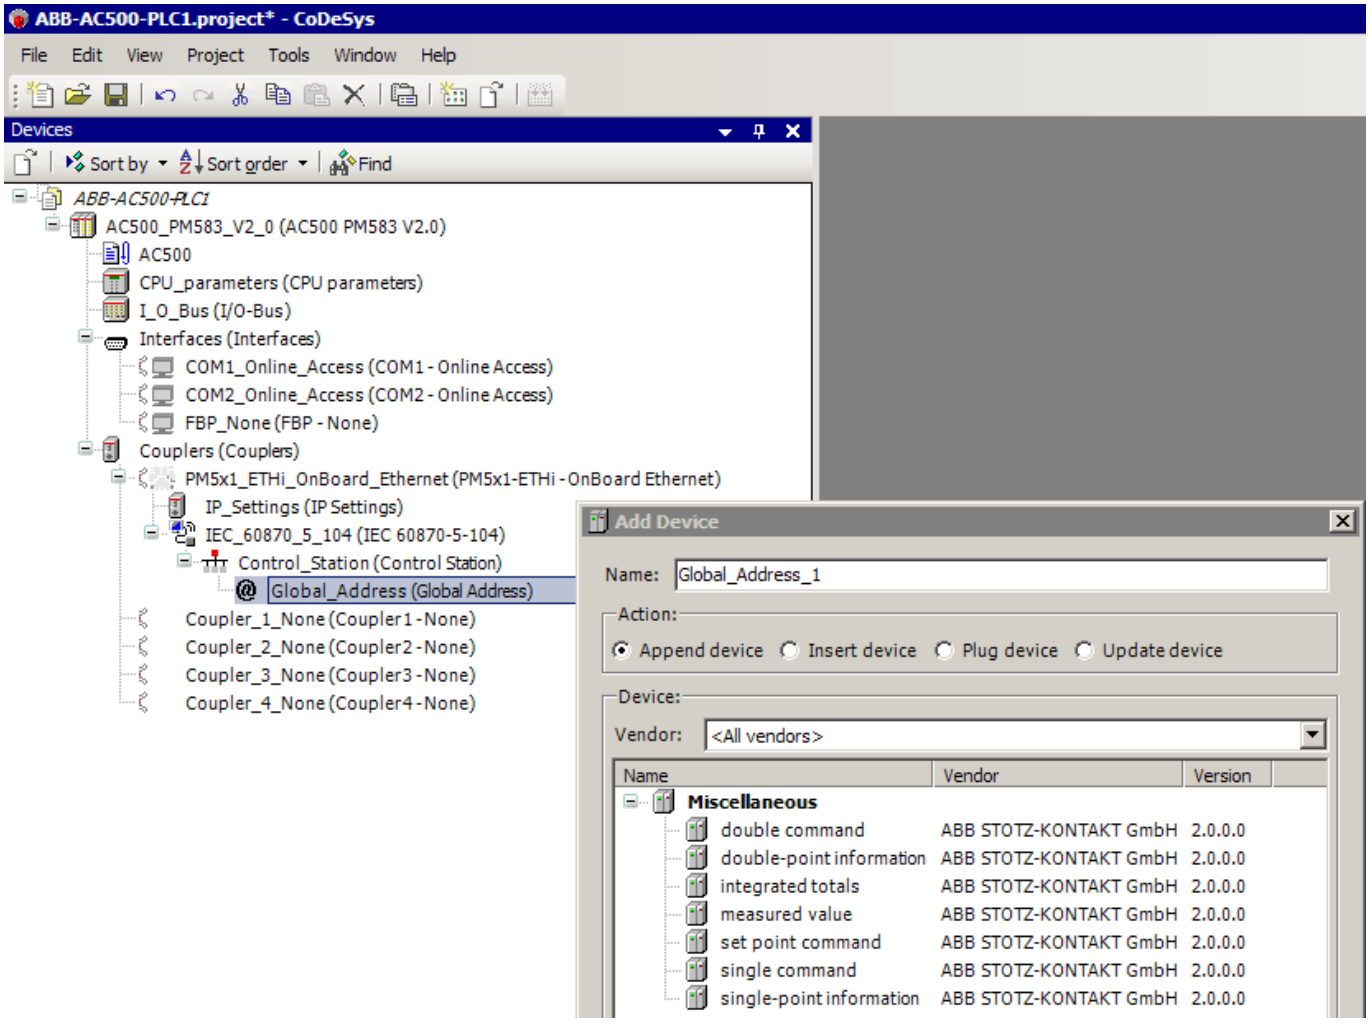
NORM. END: High limit (100 %) of the normalized range for real values and setpoints.

THRESHOLD: Threshold limit beyond which a change of the input value referred to.

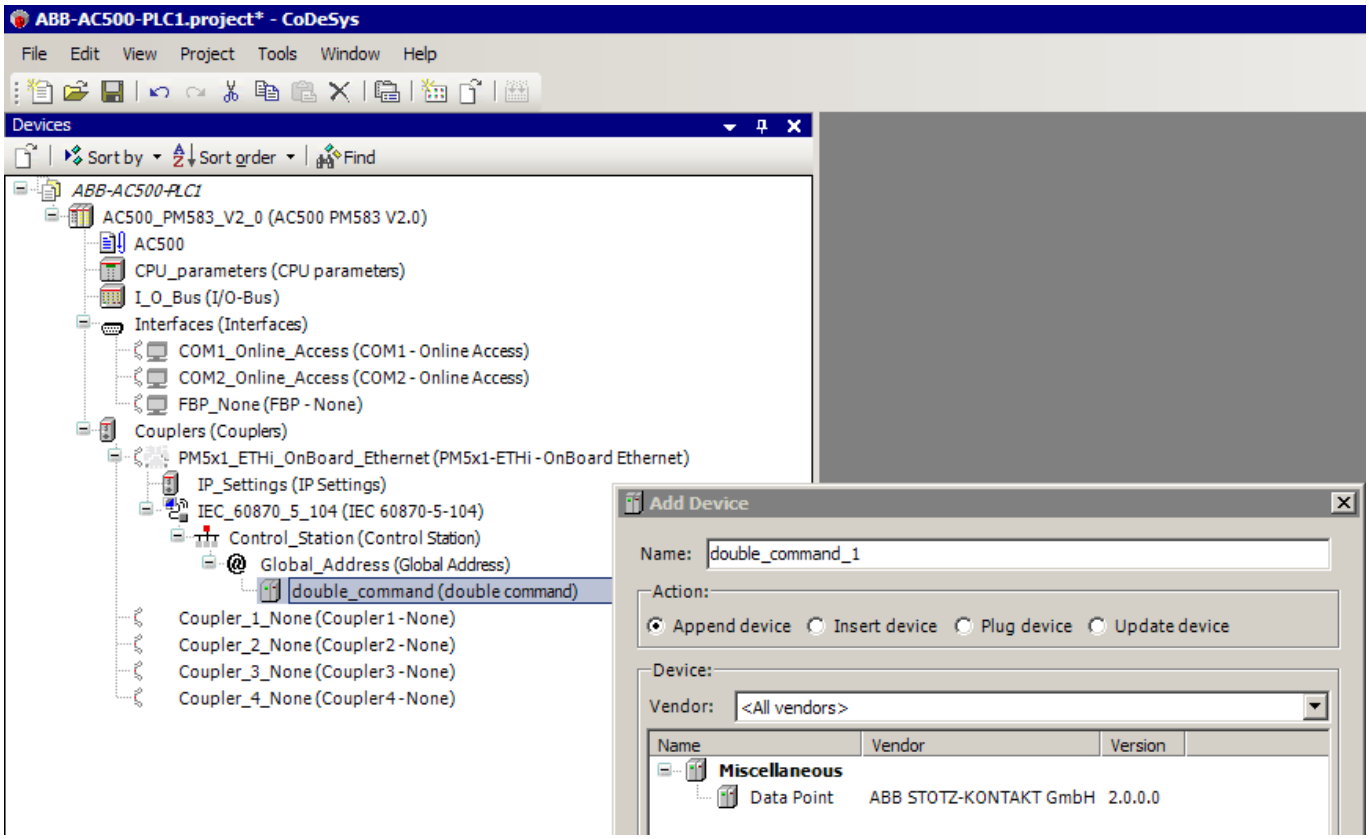
Data points

With the IEC 60870-5 protocol, a distinction is made between data transmission in the monitoring direction (status values, real values, discrete values) and in the control direction (commands and setpoints).

Therefore, the IEC 60870 protocol contains several data point types (called Pin Group), which were used due to their special functionality:



The Pin Groups are used by adding Data Points which have to be configured to use them.



Data point configuration

For a user friendly configuration the Data Points will be structured as described in following table:

Data Point type	Parameters Group	Parameters DP
	Timestamp	IA
single-point information (16)	Priority	
double-point information	Priority	
integrated totals	Group (none -> 4), Priority	
measured value (16)	Type (float/norm), Priority *1)	Threshold, Normalizing
single command		
double command		
set point command	Threshold, Normalizing	Threshold, Normalizing

*1) Priority will only be evaluated if the Data Point group will be sent. If the Data Point is connected with an receive function block the parameter will be ignored. It is also only necessary for an unbalanced mode. So for 5-104 variant this parameter will be hidden in the parameter mask.

All Data Point groups that are marked with (16) can be configured as multiple Data Points where all Data Points are sent in 1 telegram. It is not possible to receive multiple Data Points.

Mapping to IEC 60870-5-104 type identification

CP56Time2a	No timestamp		With timestamp	
Data point type	Norm	Floating point	Norm	Floating point
Measured value	(9) M_ME_NA_1	(13) M_ME_NC_1	(34) M_ME_TD_1	(36) M_ME_TD_1
Set point command	(48) C_SE_NA_1	(50) C_SE_NC_1	(61) C_SE_TA_1	(63) C_SE_TC_1

CP56Time2a Data Point type	No timestamp	Parameters DP
	Timestamp	IA
single-point information (16)	Priority	
double-point information	Priority	
integrated totals	Group (none -> 4), Priority	
measured value (16)	Type (float/norm), Priority *1)	Threshold, Normalizing
single command		
double command		
set point command	Threshold, Normalizing	Threshold, Normalizing

Data point modules

Beneath a Data Point group node the user can configure data point nodes. The Data Point module has parameters depending on the parent node as follows:

Local address (independent from parent node)

Data Point Configuration | Status | Information

Parameter	Type	Value	Default Value	Unit	Description
IA 1	BYTE(0..255)	0	0		local address IA 1
IA 2	BYTE(0..255)	0	0		local address IA 2
IA 3	BYTE(0..255)	0	0		local address IA 3

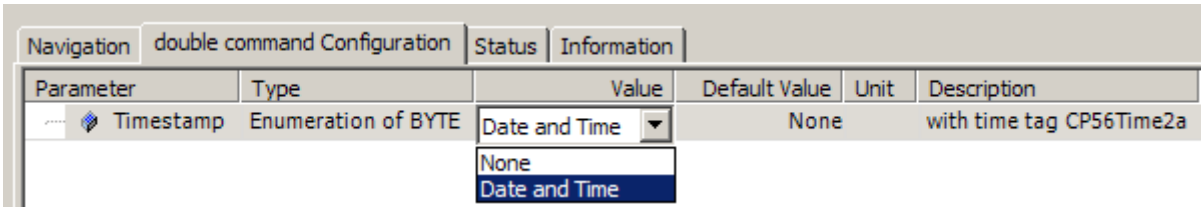
Threshold / Normalizing / Type (only beneath measured value and set point command)

Data Point Configuration | Status | Information

Parameter	Type	Value	Default Value	Unit	Description
IA 1	BYTE(0..255)	3	0		local address IA 1
IA 2	BYTE(0..255)	0	0		local address IA 2
IA 3	BYTE(0..255)	0	0		local address IA 3
Normalize start	REAL	-1000.0	-1000.0		Normalize start
Normalize end	REAL	1000.0	1000.0		Normalize end
Threshold	REAL	0.0	0.0		Threshold

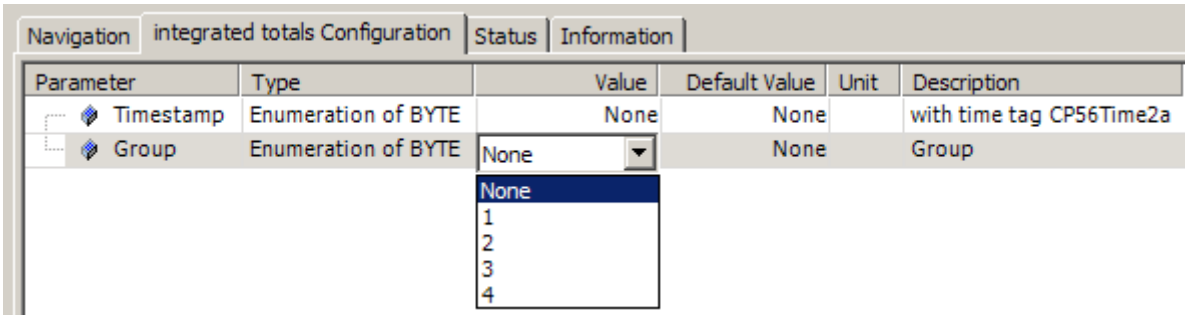
Timestamp

Available for Data Point type:	All
2 possible settings:	None
	Date and Time



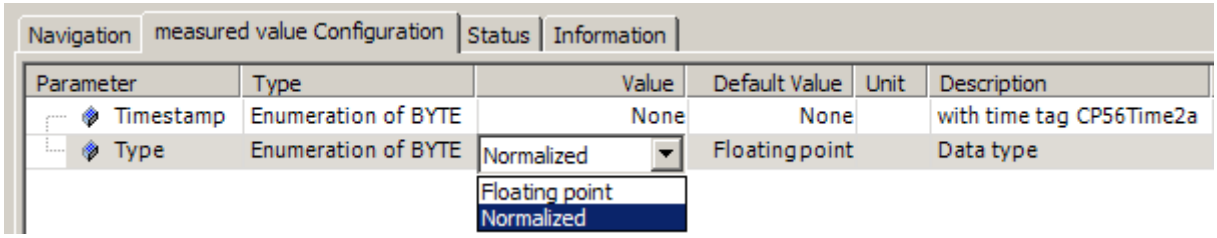
Group

Available for Data Point type:	Integrated totals
5 possible settings:	None
	1
	2
	3
	4



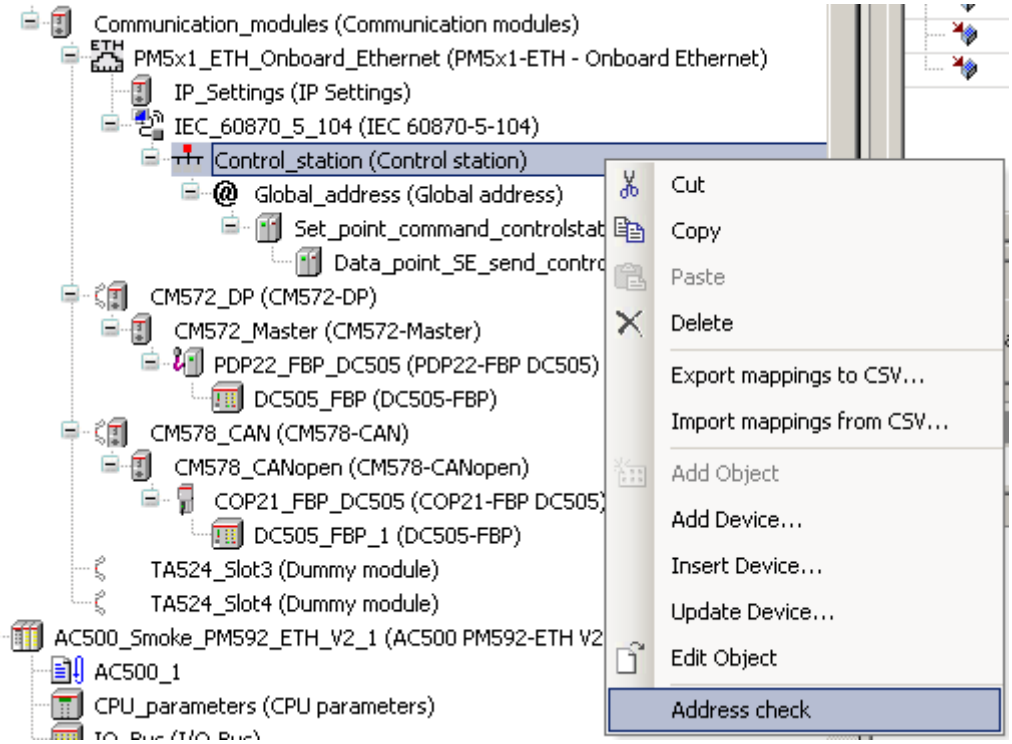
Type

Available for Data Point type:	Measured value
	Set point command
2 possible settings:	Floating point. Send/Rec data message as real value, floating-point number
	Normalized. Send/Rec data message as real value, normalised value



Validity check of configuration (< Automation Builder 1.1/CBP 2.4)

A validity check of the IEC configuration can be issued on different levels of the IEC 60870 tree elements via context menu:

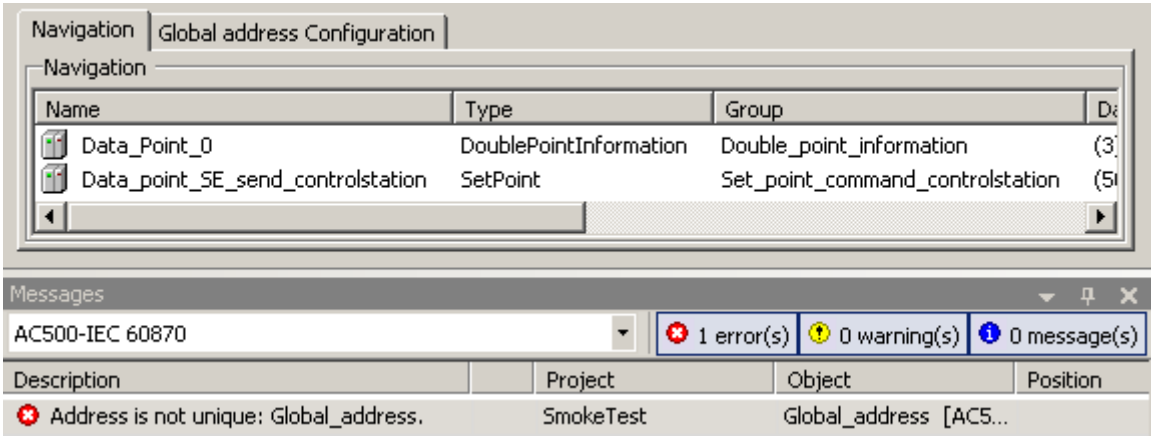


The scope for the check is the actual selected tree element and from there down the tree hierarchy. The overall check can be started from the top IEC60870 tree element.

The check will look for

- duplicate addresses
- stations and global addresses without a sub tree element
- missing data points

When a check finds errors this will be reported in a separate messages view:



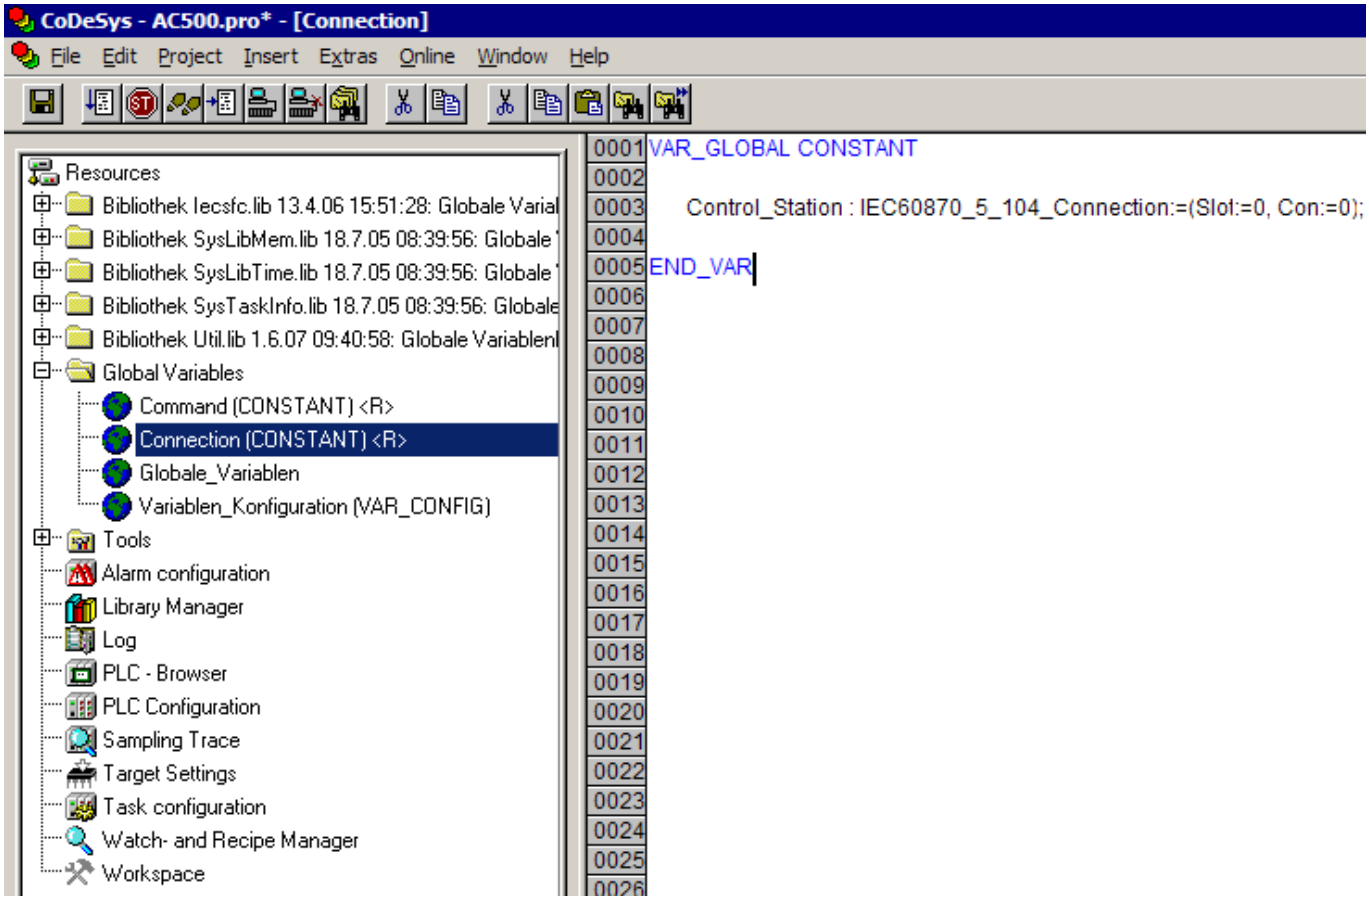
With a double-click on the error line, the part of the configuration with the violation will be opened. Now, you can correct the error.

Creating configuration data in Automation Builder

Information on creating configuration data in Automation Builder see ↬ *Chapter 1.6.5.4.1.1 “Creating configuration data” on page 6196*.

Connection

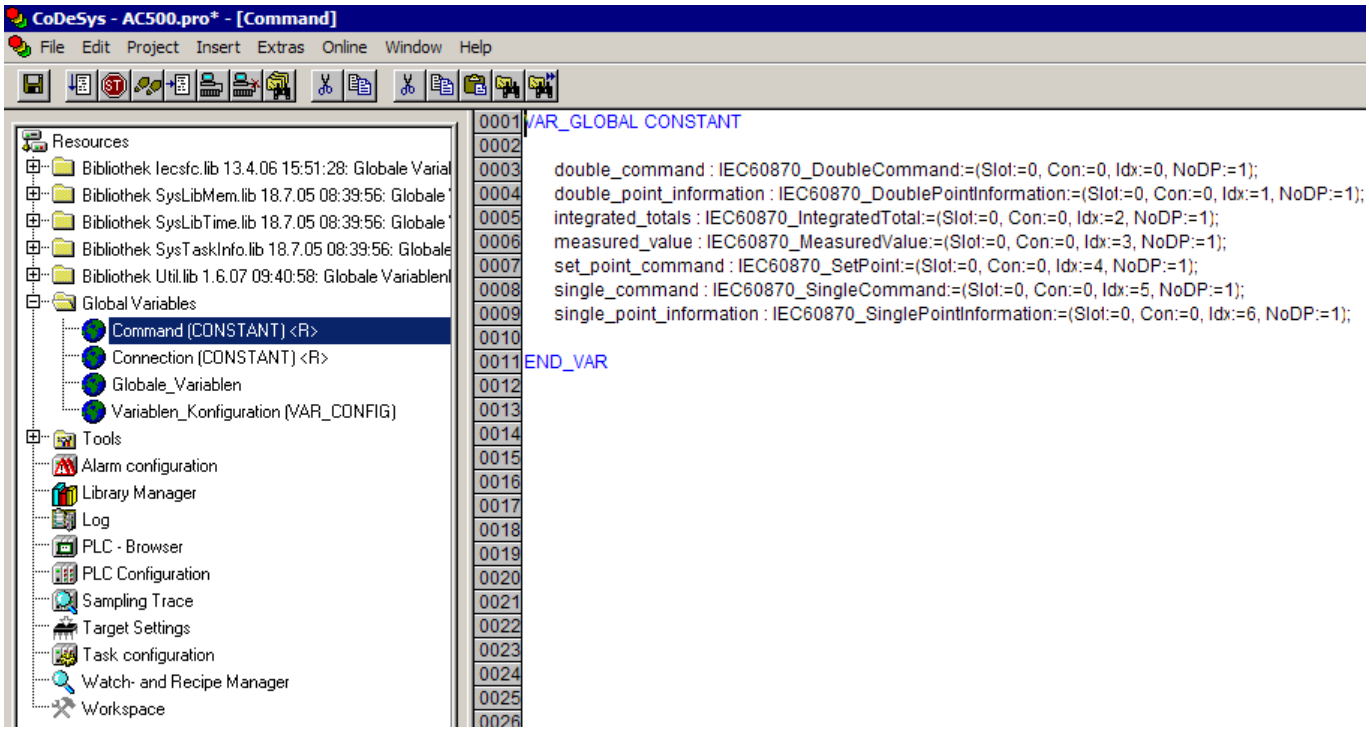
The created Control and Substations are read-only, i.e. the settings previously defined in Automation Builder can not be changed.



Commands

As well as the IEC 60870 Connections the created Data points, named Commands, are also available in CODESYS.

The created Commands are read-only, i.e. the settings previously defined in Automation Builder can not be changed.



Using control and substations in CODESYS

To map the IEC 60870-5-104 Control and Substation to CODESYS, use IEC 60870-5-104 function block library (see ↳ *Chapter 1.5.4.18 “IEC60870 library” on page 1351*).

The created Station (Control and Substation) which is available at the global variable list (see ↳ *Chapter 1.6.5.4.1.1 “Creating configuration data” on page 6196*) has to be assigned to the corresponding Input of the function blocks of the IEC60870 Library.

The created Control and Substation characteristics itself with:

- Unique names: Names of all connections (substation and control station)
- Unique addresses: All telecontrol addresses (consist of GADU1, GADU2, IA1, IA2, IA3) have to be unique within 1 telecontrol connection (all knots beneath 1 connection knot).
- Aliases: For the project planning the plug-in generates constant data structure aliases as global variables (read-only).

For each created connection (Substation and Control Station) the plug-in generates.

Example

```
VAR_GLOBAL CONSTANT
Control_Station : IEC60870_5_104_Connection:=(Slot:=0, Con:=0);
END_VAR
```

Description of the initialization values of the station

Slot: The number of the Communication Module slot (0: internal, 1: first external, ...)

Con: Index of connection (Substation / Control Station) beneath an IEC60870-5-104 node.

Using data points in CODESYS

To map the IEC 60870-5-104 Data Points to CODESYS, use IEC 60870-5-104 function block library (see ↳ *Chapter 1.5.4.18 “IEC60870 library” on page 1351*).

The created Data Points which are available at the global variable list have to be assigned to the corresponding Input of the function blocks of the IEC 60870 Library. See *Chapter 1.6.5.4.1.1 “Creating configuration data” on page 6196*.

For each Data Point group type an equivalent function block type in IEC60870 Library exists.

The implemented functionality of the IEC 60870-5-104 plug-in has the following characteristics:

- Unique names: Names of all connections (Substation and Control Station) and all names of the data groups are unique
- Unique addresses: All telecontrol addresses (consist of GADU1, GADU2, IA1, IA2, IA3) have to be unique within one telecontrol connection (all nodes beneath 1 connection node)
- Aliases: For the project planning the plug-in generates constant data structure aliases as global variables (read only)

For each created connection (Substation / Control Station) at the Automation Builder the plug-in generates 1 data point in CODESYS.

Example

```
VAR_GLOBAL CONSTANT
Rec_sp_inf_16 : IEC60870_SinglePointInformation:=(Slot:=0, Con:=0, Idx:=17, NoDP:=1);
END_VAR
```

Description of the initialization values of the station

Slot: The number of the Communication Module slot (0: internal, 1: first external, ...)

Con: Index of connection (Substation / Control Station) beneath an IEC60870-5-104 node.

Idx: Index of data group beneath a connection

NoDP: number of data points beneath this data group

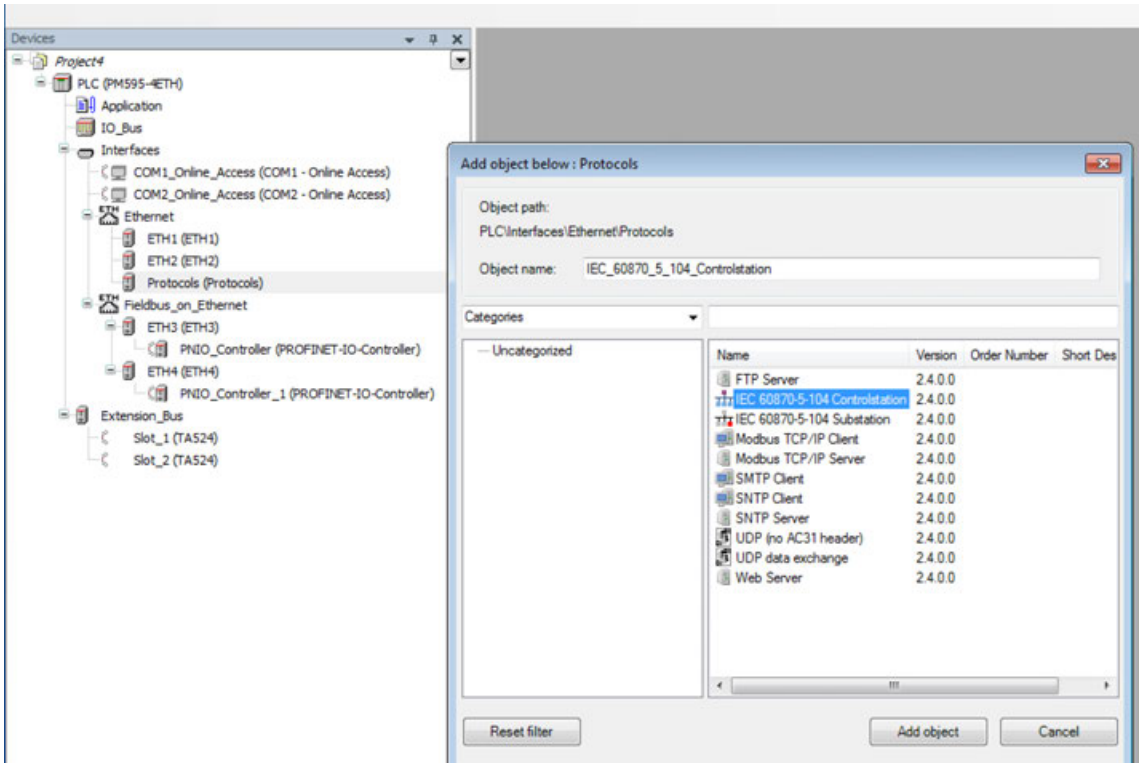
Configuration >= Automation Builder 1.1/CBP 2.4

Configuration changes >= Automation Builder 1.1/CBP 2.4

The IEC 60870 protocol allows link-ups between AC500 CPUs with onboard Ethernet (e.g. PM595-4ETH and PM591-2ETH) and external systems.

The link-up takes place via the onboard Ethernet interface of the CPU. As of Automation Builder Version 1.1 telecontrol is also supported for CPUs that provide more than one Ethernet interface (e.g. PM595-4ETH and PM591-2ETH). This allows to use different Ethernet interfaces for IEC 60870 connections, hence, telecontrol configuration is changed. Further, as of this version terminology is aligned with IEC 60870 standard and provides additional features that are described in this chapter. For a description on principle telecontrol configuration.

See Configuration *Chapter 1.6.5.3.2.3.1 “Configuration up to and including CBP 2.3” on page 6123*.



For further information on configuration changes, see the following chapters:

Control and Substations ≥ CBP 2.4 ↬ *Chapter 1.6.5.3.2.4.2 “Control station and substation configuration” on page 6139*

Import Export ≥ CBP 2.4 ↬ *Chapter 1.6.5.3.2.4.1 “Configuration changes >= Automation Builder 1.1/CBP 2.4” on page 6138*

Validity Check of Configuration ≥ CBP 2.4 ↬ *Chapter 1.6.5.3.2.4.4 “Validity check of configuration” on page 6158*

Control station and substation configuration

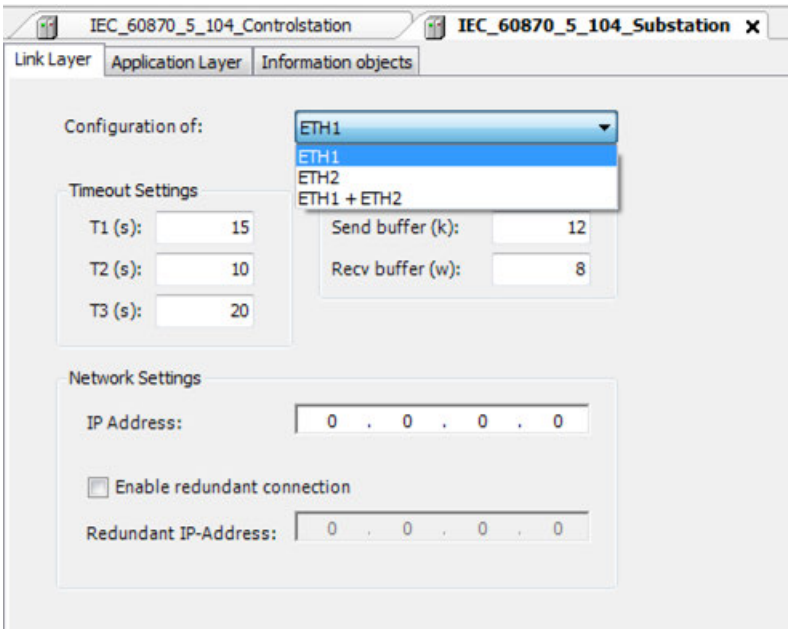
The CPU can work as both, control station and substation.

Control station	Client, master, controlling station: Synonyms for a higher-level station (central station, monitors other stations)
Control direction	Data transfer direction from the control station to the substation
Substation	Server, slave, controlled station: synonyms for a subordinate IEC 60870-5-104 telecontrol station (which is monitored)
Monitoring direction	Data transfer direction from the substation to the controlling station

Configure a control station in the device tree *PLC -> Interfaces -> Ethernet -> Protocols*:

1. Right-click *“Protocols ➔ Add objects”*.
2. Select the control station from the list and click *“Add object”*. Configure substations and further control stations in the same way. As of Automation Builder 1.1 any combination of control stations and substations can be configured, in due consideration of a total number of 10 stations.
3. Double-click the new control station node to open parameter configuration. In the Link Layer tab access to the Ethernet interface is configured.

Tab link layer



In order to provide flexible usage of control stations and substations as of Automation Builder 1.1 configuration of substations has been changed. As several substations can be operated with several Ethernet interfaces, select the Ethernet interface to be used from the pull-down menu. Enter the IP address to the control station and if required to another control station (redundant connection). If no IP address is defined, the substation accepts connection to any control station.

> *This field is not available in the Link Layer tab of control stations. Selection of ETH interface is only possible for substations. The control station is always configured on both interfaces by default.*

Timeout settings T1, T2, T3: The values for the connection control and message replication; timeout1/2/3.

Buffer settings This parameter gives the maximum number of outstanding messages and acknowledgement behavior.

Send buffer (k): Maximum difference receive sequence number to send state variable.

Rec buffer (w): Latest acknowledge after receiving w I format APDUs.

Network settings

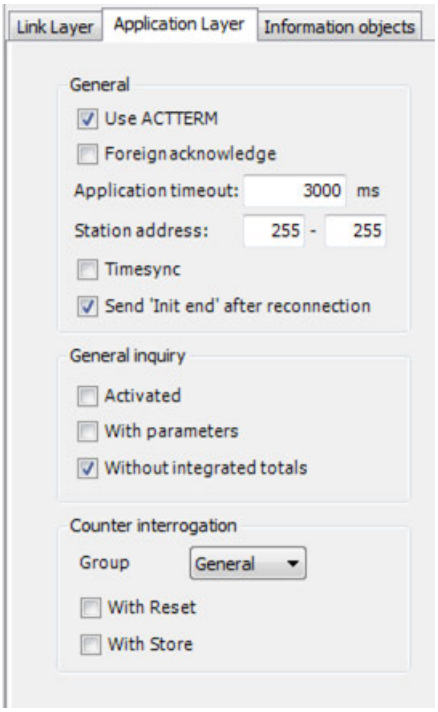
Network settings are available for control stations and for substations. The IP address of the control station and if available the IP address of another control station (redundant IP address) can be selected by the user.

For an overview on the configured Ethernet interfaces for the control stations and substations, double-click the *“Protocols”* node.

Tab application layer

Settings

The application layer is the communication layer with which the send and receive blocks work.



Use ACTTERM This parameter concerns only setpoints and commands. If this parameter is checked, an acknowledgement with set ‘actterm’ is generated as reason for transmission at the time at which the receive block is computed and outputs its telecontrol data at its output pins. On transmission side, the data block awaits the reception of this ACTTERM acknowledgement and reacts with its corresponding output (see *Chapter 1.5.4.18 “IEC60870 library” on page 1351*) to the reception of this acknowledgement. For commands with execution time, the acknowledgement is generated when the command is terminated, for commands with continuous execution time and for setpoints, the acknowledgement is generated when the data are output to the output pins.

ForeignAck-nowledge If this option is not enabled (default), a message that was sent is considered as ok as soon as transmission was successful. If you enable this option, a message that was sent is not considered as ok until a success message (foreign acknowledge) is returned from the receiver.

Application timeout This time indicates how long an acknowledgement will be awaited on the application level. An acknowledgement is generated only for commands and setpoints on the application level.

Station address The station address defines which station will be subject to a count query. The values define the 2 bytes for the common telecontrol address (Common addr.). The values concerned are as follows:

0: The station address is not used.

1...254: The count is queried on the station defined by the station address.

255: The count is queried on all accessible stations.

Timesync After each new establishment of a link and once per hour, a ‘coarse time synchronisation’ message is generated. This time synchronisation is only supported from AC500 to external systems. Time synchronisation from an external system to AC500 is not provided! Incoming time synchronisation messages are confirmed by the process station but not executed. Greenwich Mean Time (GMT) is used as the time for the synchronisation.

Send 'Init end' after reconnection After each establishment of a link or only in connection with the first establishment of a link and after reconfiguration, an init end message is generated. After the init end message, there is a general inquiry, if configured.

General inquiry

Activated This parameter concerns only real values, discrete values and status values. The device module generates a general inquiry message after each new establishment of a link. The other side then generates a message with the reason for transmission ‘general inquiry’ for every data point and subsequently an init end message. This procedure ensures that, in the event of a new establishment of a link, all data are available on the reception side in topical form.

With parameters If general inquiry is activated the parameter values are sent.

Without integrated totals With a general inquiry no integrated total values are sent.

Counter interrogation

Group General, 1 .. 4: The count inquiry is executed for a specific group of counters (1 .. 4). The count inquiry is executed for all groups of counters.

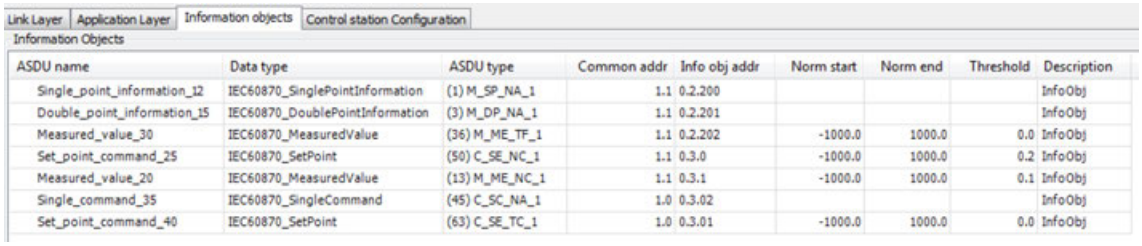
With reset The reset quality bit is sent along with the count inquiry.

With relocate The relocate quality bit is sent along with the count inquiry.

Tab information objects

Open the *“Information object”* tab to configure so called information objects and a common address (known as 'data points' and 'Global address' in former Automation Builder versions). In this tab different information objects and their services for transmission are defined. A data point or information object is identified via a system-wide unambiguous address containing a maximum 5 bytes.

1. Right-click in the empty view and select *“Add Information Object with ASDU”* to add a data group. Select the desired object from the list (e.g. M_SP_NA_1).
   ⇨ An information object with a corresponding ASDU (Application Service Data Unit) is created.
2. Configure the settings in the *“Information Object”* tab to your convenience.



ASDU name	Data type	ASDU type	Common addr	Info obj addr	Norm start	Norm end	Threshold	Description
Single_point_information_12	IEC60870_SinglePointInformation	(1) M_SP_NA_1	1.1	0.2.200				InfoObj
Double_point_information_15	IEC60870_DoublePointInformation	(3) M_DP_NA_1	1.1	0.2.201				InfoObj
Measured_value_30	IEC60870_MeasuredValue	(36) M_ME_TF_1	1.1	0.2.202	-1000.0	1000.0	0.0	InfoObj
Set_point_command_25	IEC60870_SetPoint	(50) C_SE_NC_1	1.1	0.3.0	-1000.0	1000.0	0.2	InfoObj
Measured_value_20	IEC60870_MeasuredValue	(13) M_ME_NC_1	1.1	0.3.1	-1000.0	1000.0	0.1	InfoObj
Single_command_35	IEC60870_SingleCommand	(45) C_SC_NA_1	1.0	0.3.02				InfoObj
Set_point_command_40	IEC60870_SetPoint	(63) C_SE_TC_1	1.0	0.3.01	-1000.0	1000.0	0.0	InfoObj

3. Double-click a table cell to modify pre-set values. For some ASDUs additional sub information objects can be configured. For this, right-click the already existing ASDU and select *“Add Information Object”* to selected ASDU option. This allows configuration of 16 data points at the most (depending on the ASDU type). With *“Remove Information Object”* the selected ASDU is deleted.

Description of the columns

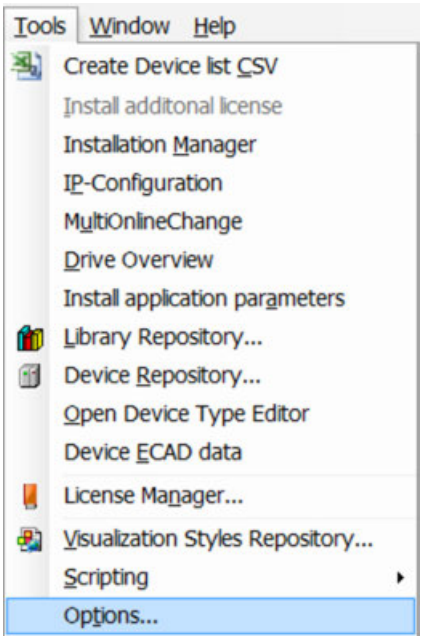
- ASDU name: node name of the information object (name of the ASDU).
- Data type: Data type of the ASDU.
- ASDU type: Type of ASDU.
- Common addr: Common address of the ASDU (known as 'Global Address' in former AB Versions). Byte 1/2 of the common telecontrol address of the block (range: 0...255).
- Info obj addr: Together with common address Info obj addr defines the endpoint (range: 0...255).
- Norm start: Low limit (0 %) of the normalized range for real values and setpoints.
- Norm end: High limit (100 %) of the normalized range for real values and setpoints.
- Threshold: Threshold limit beyond which a change of the input value referred to.
- Description: Table cell for free text. Use this field to describe your configuration settings e.g. differences between configuration variants.

Format of common addr and info obj addr

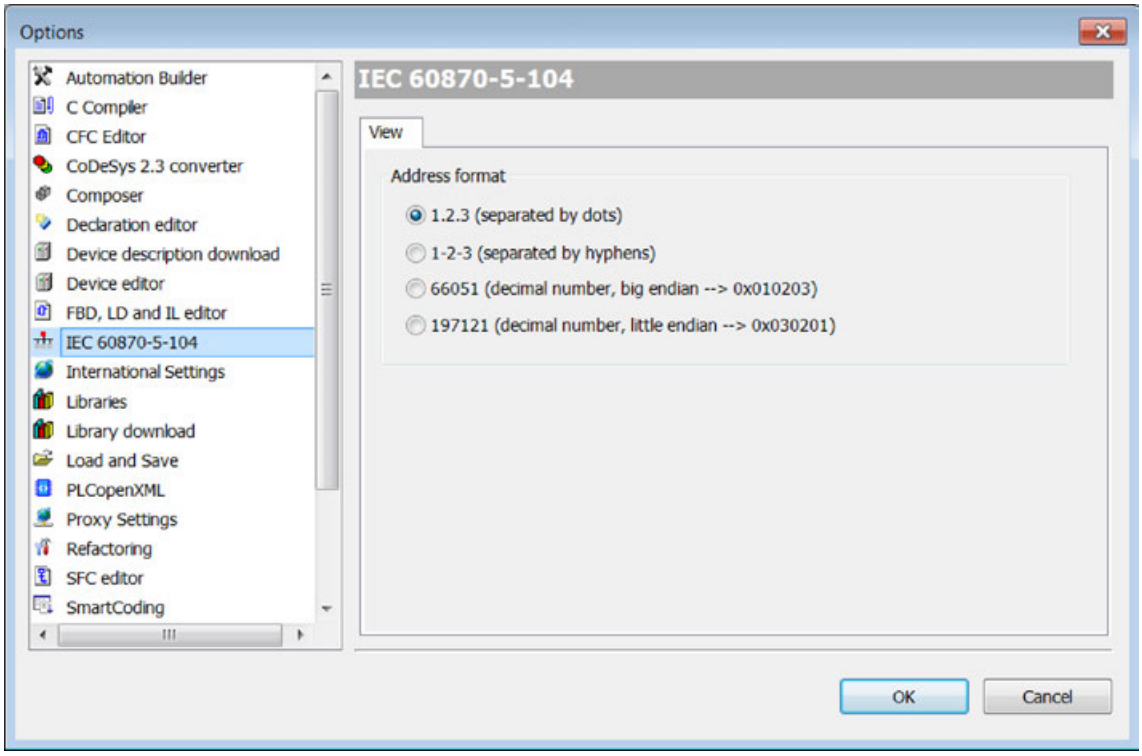
The following adress formats of your entries in the columns *Common addr* and *Info obj addr* of the Tab *Information Objects* are possible:

- 1.2 and 3.4.5 (Default format)
- 1-2 and 3-4-5
- 258 or hex 0x102 and 197637 or hex 0x30405
- 513 or hex 0x201 and 328707 or hex 0x50403

Previously you have to choose your preferred adress format:



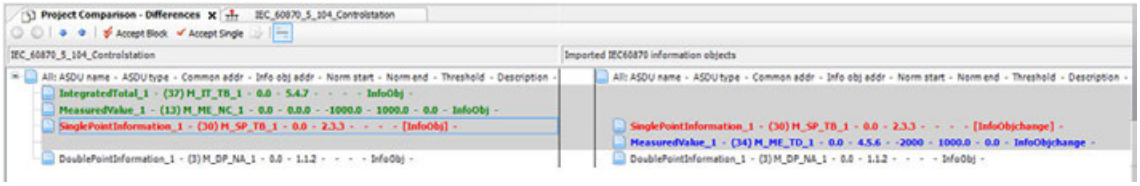
1. Click *“Tools”*and then *“Options...”*
   ⇨ The Window *Options* appears



2. Select *IEC 60870-5-104*, make your choice and click *OK*.

Import options of information objects

The User can accept the imported IEC60870 information objects as single change or change as block.



IEC60870-5-104 Multiple connections

An AC500 with more than one substation connection must be able to identify the corresponding control station clearly. This identification takes place exclusively via the control station’s IP address. In order to make it possible for a non-redundant control station to have redundant access to a substation with 2 Ethernet connections. The local substation address is ignored during connection establishment.

In the following descriptions, the term station must not be confused with the individual connection. One station can have several connections. An IEC60870-5-104 communication always takes place between a control station and a substation. A control station can manage several substations and also simultaneously be a substation for one or several control stations. However, these must then be realized using different stations.

A PLC may **not** be configured for another PLC repeatedly as a substation or a control station unless a disjunctive Ethernet infrastructure is used for this.

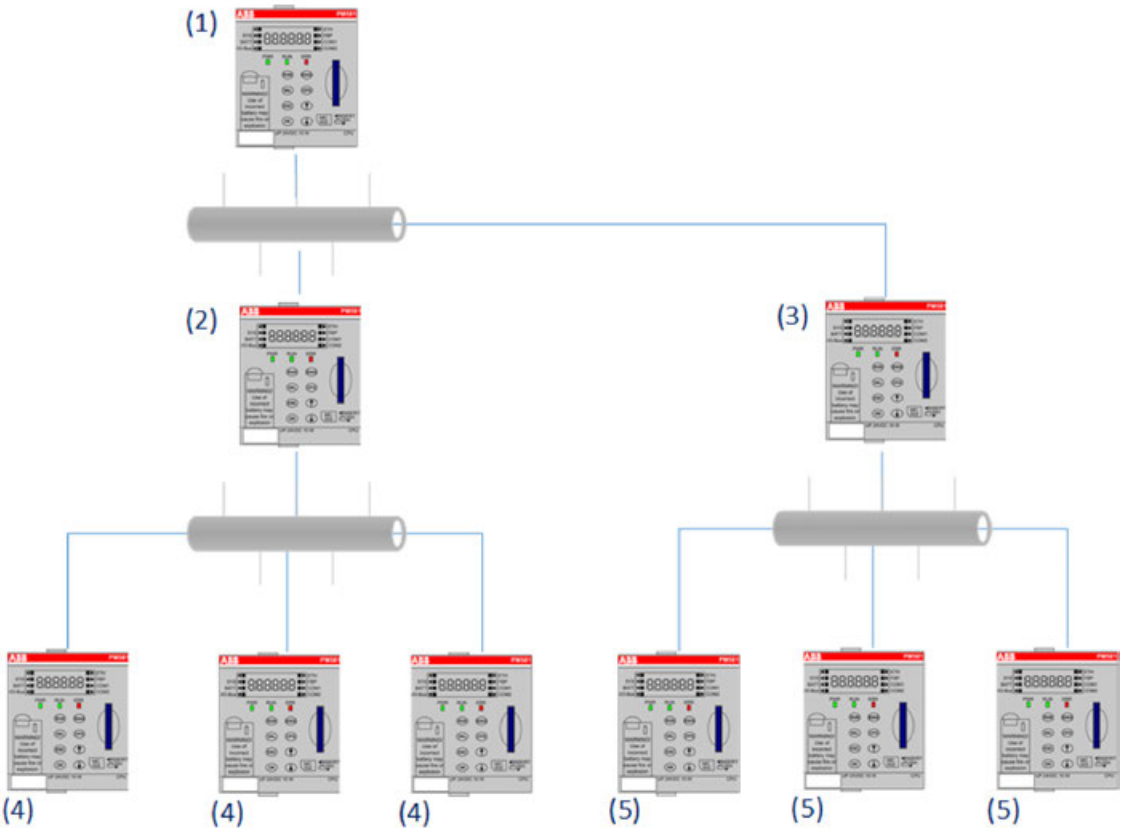
Redundant connections must be specified as such in the configuration.

An AC500 can be used only once as control station for another AC500, it makes no sense to use the same AC500 repeatedly as a control station for the same substation. Such a structure is configured as a redundant control station as long as only one AC500 exists as a control station per substation. However, this control station may have 2 IP addresses. Therefore, this configuration must either have the IP address 0.0.0.0 entered on the substation for the control station, meaning that all IP addresses are accepted and no other control station can access this AC500 or alternatively the possible control station addresses must be specified (ETH1 and ETH2).

Tree constellation

PM57x-/ PM58x-/ PM59x-ETH, PM5650-2ETH:

If you plan to control several substations with the AC500, they can be cascaded. This results in a tree structure.



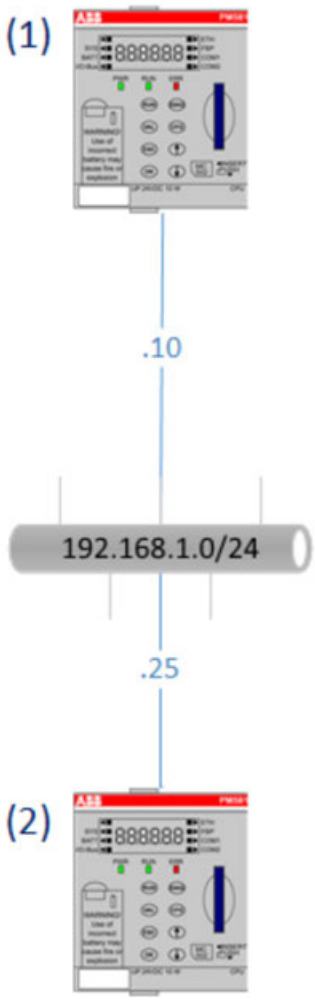
(1) 2 control stations
(2) Substation and 3 control stations
(3) Substation and 3 control stations
(4) Substation
(5) Substation

Structures of connections

In the following, the notation 192.168.1.0/24 is used for TCP/IP networks. Here, the figure /24 specifies the network mask with 255.255.255.0 and 192.168.1.0 describes the network. The valid addresses for this Class C network are 192.168.1.1 to 192.168.1.254! Only the last byte of the address is provided on the respective devices, with e.g. .10. This means that the respective device has the address 192.168.1.10.

Minimal structure

A control station with an Ethernet interface is connected to a substation with an Ethernet interface.



(1) Control station
(2) Substation

Configuration at control station

PM57x-/ PM58x-/ PM59x-ETH, PM5650-2ETH:

The respective substation IP address must be specified at the control station. For this, in the network settings of the control station (1) enter the IP address of the substation (in the example: 192.168.1.25). Option *“Enable redundant connection”* must be disabled.

Configuration at substation

PM57x-/ PM58x-/ PM59x-ETH, PM5650-2ETH:

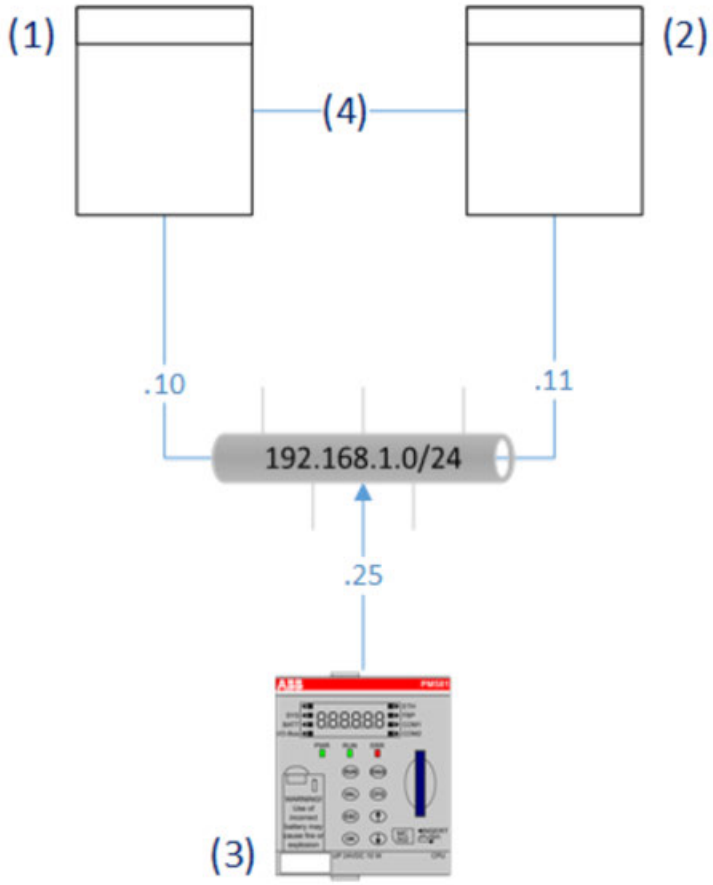
Either the control station IP address or the general address 0.0.0.0 must be specified at the substation (2). For this, in the network settings of the substation enter the IP address of the control station (in the example: 192.168.1.10). Option *“Enable redundant connection”* must be disabled.

> *If the general address 0.0.0.0 is used at the substation, no further control station can be configured on this controller for a further substation.*

Minimal redundancy structure

The most simple redundant structure with an AC500 consists of a redundant control station (not AC500) which is connected to the AC500 substation with 2 different IP addresses. These redundant control stations must synchronize which control station is active.

Only one control station can be active at any given time.



(1) Control station 1A (Not AC500)
(2) Control station 1B (Not AC500)
(3) Substation
(4) Redundancy link

Configuration at control stations

The respective substation IP address must be specified at the control stations 1 and 2 (not AC500). For this, in the network settings of both control stations enter the IP address of the substation (in the example: 192.168.1.25).

Configuration at substation

PM57x-/ PM58x-/ PM59x-ETH, PM5650-2ETH:

Either the control station IP addresses or the general address 0.0.0.0 must be specified at the substation (3). For this, in the network settings of the substation enter the IP addresses of the control station (in the example: 192.168.1.10 and 192.168.1.11). Option *“Enable redundant connection”* must be enabled.

> *If the general address 0.0.0.0 is used at the substation, no further control station can be configured on this controller for a further substation.*

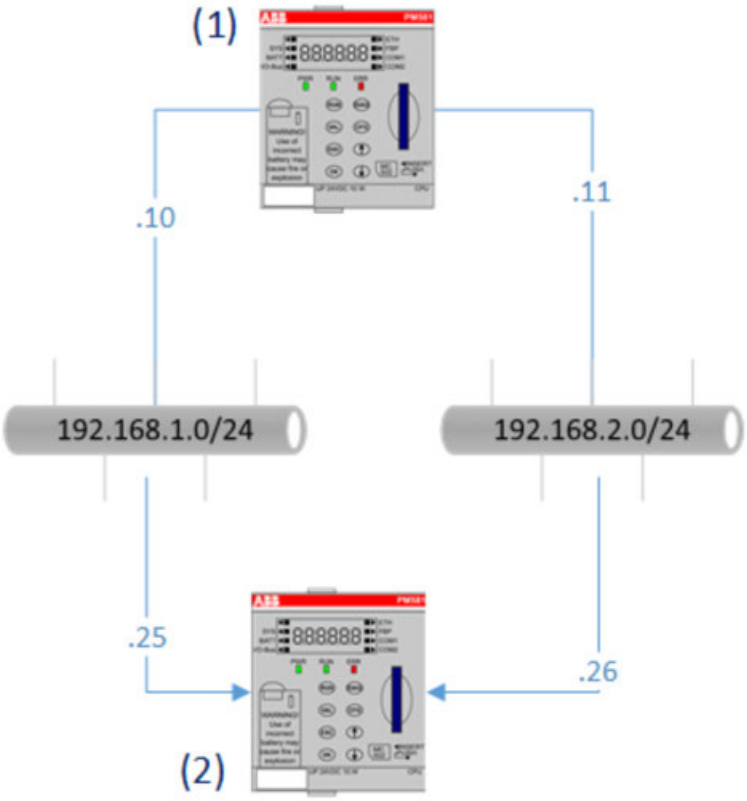
Network redundancy

For network redundancy a control station can reach a substation via 2 paths.

Both the control station and the substation can have 2 different IP addresses. Without special network routing, 2 separate networks should exist, within which both the substation and the control station each have 2 interfaces.

Possible variants of network redundancy are described in the following.

Network redundancy with 2 separate networks



(1) Control station with 2 redundant paths
(2) 1 Substation with 2 Ethernet interfaces

Configuration at control stations

PM591-2ETH, PM595-4ETH, PM5650-2ETH:

The substation's IP addresses must be specified at the control stations (1). For this, in the network settings of the control station enter the IP addresses of the substation (in the example: 192.168.1.25 and 192.168.2.26). Option *"Enable redundant connection"* must be enabled.

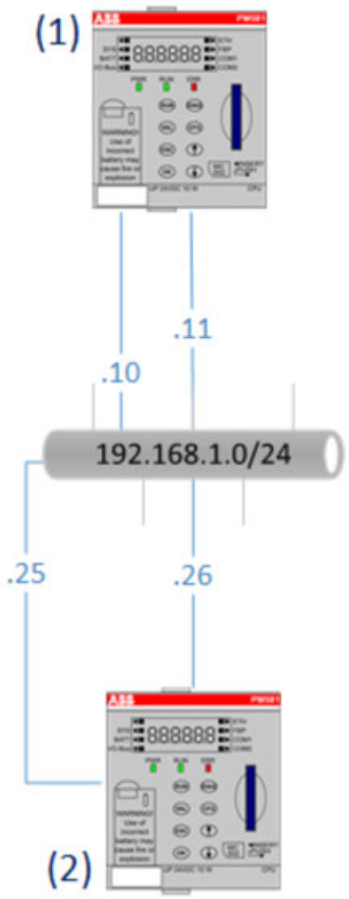
Configuration at substation

PM591-2ETH, PM595-4ETH, PM5650-2ETH:

Either the control station's IP addresses or the general address 0.0.0.0 must be specified at the substation (2). For this, in the network settings of the substation enter the IP addresses of the control station (in the example: 192.168.1.10 and 192.168.2.11). Option *"Enable redundant connection"* must be enabled.

> *If the general address 0.0.0.0 is used at the substation, no further control station on another substation can be configured on this controller. Equally, the substation connection must be activated for both interfaces.*

Network redundancy with 1 network and 2 Ethernet ports in substation



(1) Control station with 2 paths to reach substation
(2) 1 Substation with 2 Ethernet interfaces

Configuration at control stations

PM591-2ETH, PM595-4ETH, PM5650-2ETH:

The substation's IP addresses must be specified at the control stations (1). For this, in the network settings of the control station enter the IP addresses of the substation (in the example: 192.168.1.25 and 192.168.1.26). Option *"Enable redundant connection"* must be enabled.

Configuration at substation

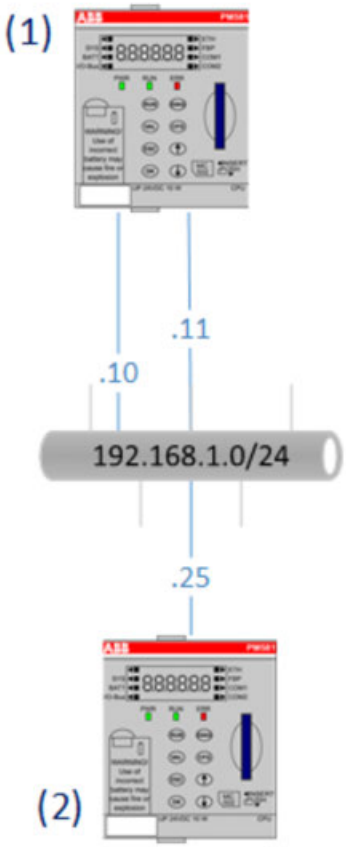
PM591-2ETH, PM595-4ETH, PM5650-2ETH:

Either the control station's IP addresses or the general address 0.0.0.0 must be specified at the substation (2). For this, in the network settings of the substation enter the IP addresses of the control station (in the example: 192.168.1.10 and 192.168.2.11). Option *"Enable redundant connection"* must be enabled.

> *If the general address 0.0.0.0 is used at the substation, no further control station on another substation can be configured on this controller. Equally, the substation connection must be activated for both interfaces.*

Network redundancy with 1 network and 1 Ethernet port in substation

> *No online redundancy.*
>
> *Only one connection will be established.*



(1) Control station with 2 paths to reach substation
(2) 1 Substation with 1 Ethernet interface

Configuration at control stations

PM591-2ETH, PM595-4ETH, PM5650-2ETH:

The substation's IP addresses must be specified at the control stations (1). For this, in the network settings of the control station enter the IP addresses of the substation (in the example: 192.168.1.25 and 0.0.0.0). Option *"Enable redundant connection"* must be disabled.

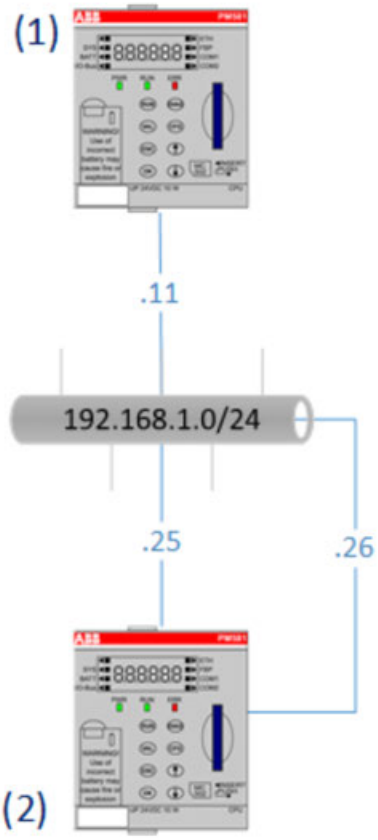
Configuration at substation

PM591-2ETH, PM595-4ETH, PM5650-2ETH:

Either the control station's IP addresses or the general address 0.0.0.0 must be specified at the substation (2). For this, in the network settings of the substation enter the IP addresses of the control station (in the example: 192.168.1.10 and 192.168.2.11). Option *"Enable redundant connection"* must be enabled.

> *If the general address 0.0.0.0 is used at the substation, no further control station on another substation can be configured on this controller. Equally, the substation connection must be activated for both interfaces.*

Network redundancy with 2 Ethernet ports in substation



(1) Control station with 2 paths to reach substation
(2) 1 Substation with 2 Ethernet interfaces

Configuration at control stations

PM591-2ETH, PM595-4ETH, PM5650-2ETH:

The substation's IP addresses must be specified at the control stations (1). For this, in the network settings of the control station enter the IP addresses of the substation (in the example: 192.168.1.25 and 192.168.1.26). Option *"Enable redundant connection"* must be enabled.

Configuration at substation

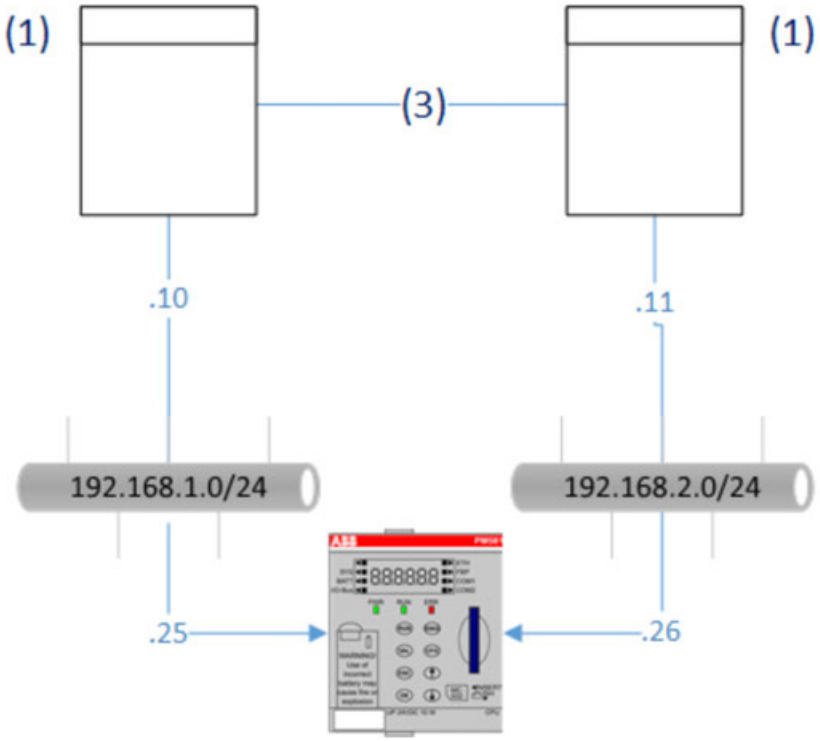
PM591-2ETH, PM595-4ETH, PM5650-2ETH:

Either the control station's IP addresses or the general address 0.0.0.0 must be specified at the substation (2). For this, in the network settings of the substation enter the IP addresses of the control station (in the example: 192.168.1.11 and 0.0.0.0). Option *"Enable redundant connection"* must be disabled.

> *If the general address 0.0.0.0 is used at the substation, no further control station on another substation can be configured on this controller. Equally, the substation connection must be activated for both interfaces.*

Full control station redundancy

A control stationcan consist of two fully redundant units (not AC500s), which are connected via a redundancy link. These control stations must ensure that only one of them at a time is actively connected to the substation and communicates with it. The inactive control station, however, can establish non-active connection with a substation and monitor it with keep alive packages.



(1) 2 redundant Control stations (Not AC500)
(2) 1 Substation with redundant Control station and 2 Ethernet interfaces (2nd port)
(3) Redundancy link

Configuration at control stations

The substation's IP address must be specified at the control stations (1) (not AC500). For this, in the network settings of the control station enter the IP addresses of the substation (in the example: 192.168.1.25 and 192.168.2.26).

Configuration at substation

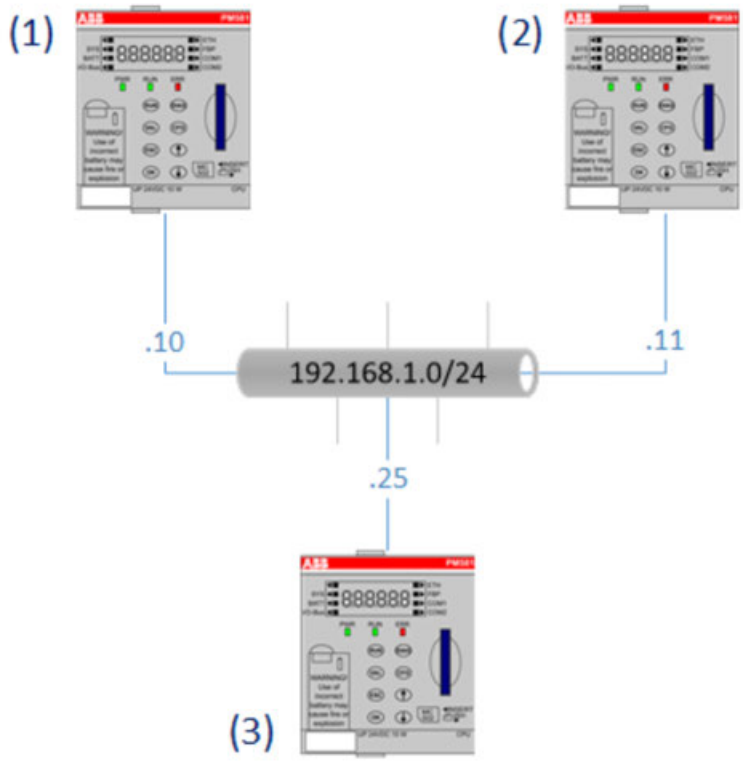
PM591-2ETH, PM595-4ETH, PM5650-2ETH:

Either the control station's IP addresses or the general address 0.0.0.0 must be specified at the substation (2). For this, in the network settings of the substation enter the IP addresses of the control station (in the example: 192.168.1.10 and 192.168.2.11). Option *"Enable redundant connection"* must be enabled.

> *If the general address 0.0.0.0 is used at the substation, no further control station on another substation can be configured on this controller. Equally, the substation connection must be activated for both interfaces.*

Multiple control stations on the same network

As of firmware version 2.4, an AC500 can be used as a substation for several control stations. For this, the control stations must be distinguished by their IP addresses. Should a control station have more than one IP address (redundancy), both possible IP addresses should also be entered for the allocated substation connection. As a result, even despite being equipped with several Ethernet interfaces, a device can only be one allocated control station at a time for a determined substation. Thus, several substations can be configured for different control stations on a AC500.



(1) Control station 1
(2) Control station 2
(3) 2 Substations (IEC60870-5-104 2nd Connection)

Configuration at control stations

PM57x-/ PM58x-/ PM59x-ETH, PM5650-2ETH:

The substation’s IP address must be specified at the control stations. For this, in the network settings of the control station (1 and 2) enter the IP addresses of the substation (in the example: 192.168.1.25). Option *“Enable redundant connection”* must be disabled.

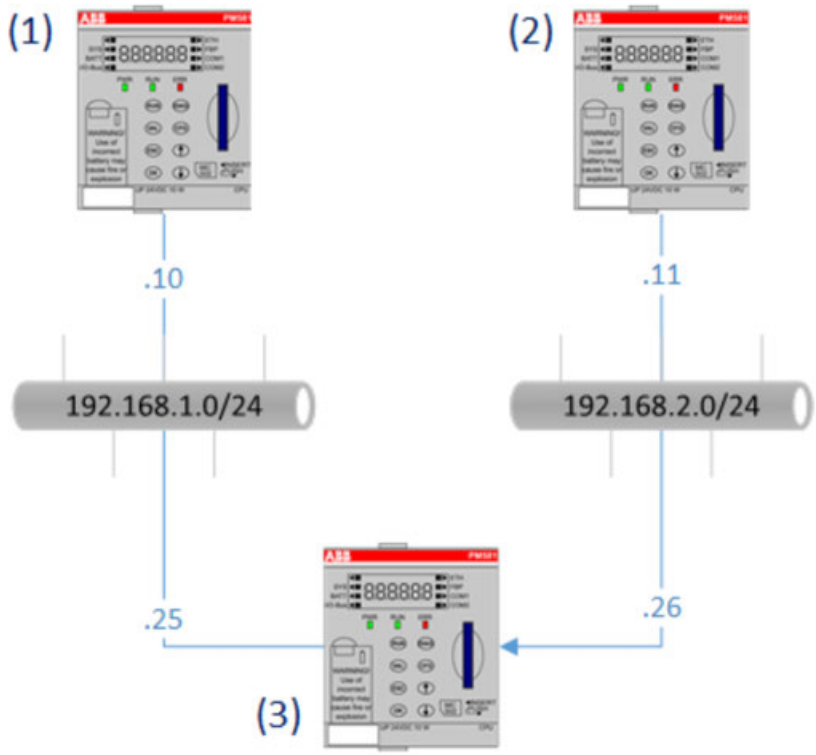
Configuration at substations

PM57x-/ PM58x-/ PM59x-ETH, PM5650-2ETH:

Both control station's IP addresses must be specified at the substation (3). For this, in the network settings of the substation enter the IP addresses of the control stations (in the example: 192.168.1.10 and 192.168.1.11). Option *“Enable redundant connection”* must be disabled.

Multiple control stations on different networks

As of firmware version 2.4, an AC500 can have several local Ethernet interfaces which can be used for separate control station connections. For this, a control station must be identified via its IP address. The substation address used locally is not used to distinguish a connection in order to enable a network and therefore route redundancy. On AC500, the acception of IEC60870-5-104 connections on an interface can only be prevented.



(1) Control station 1
(2) Control station 2
(3) 2 Substations with 2 Ethernet interfaces (2nd port and 2nd connection)

Configuration at control stations

PM57x-/ PM58x-/ PM59x-ETH, PM5650-2ETH:

The substation's IP addresses must be specified at the control stations (1 and 2). For this, in the network settings of the control station enter the IP addresses of the substation (in the example: 192.168.1.25 and 192.168.2.26). Option *"Enable redundant connection"* must be disabled.

Configuration at substations

PM591-ETH, PM595-ETH, PM5650-2ETH:

Both control station's IP addresses must be specified at the substation (3) under both substation connections. For this, in the network settings of the substation enter the IP addresses of the control stations (in the example: 192.168.1.10 and 192.168.2.11). Option *"Enable redundant connection"* must be disabled.

Double connection

*This configuration **does** work.*

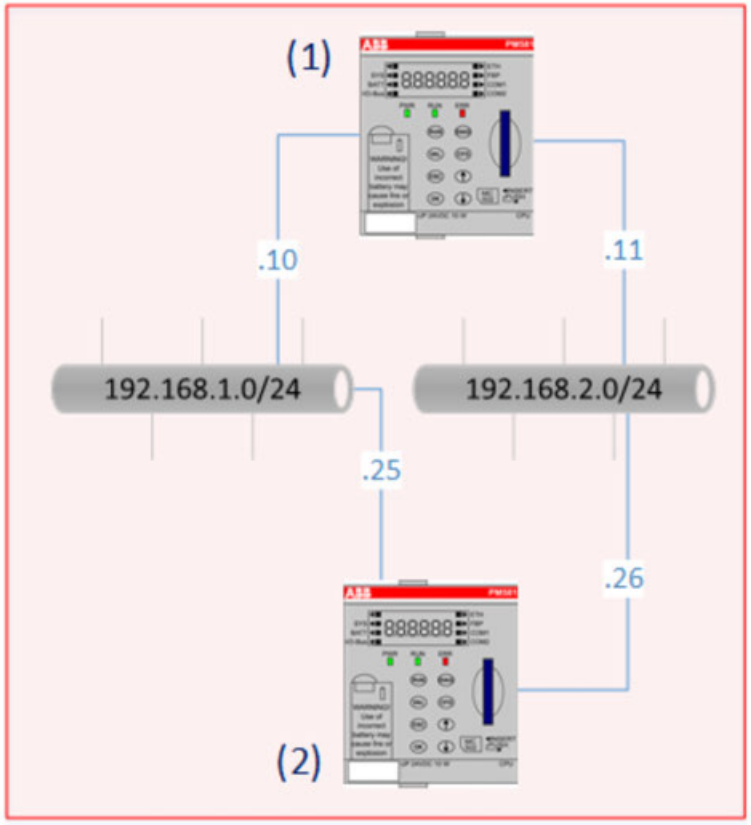
*But it is **senseless!***

It is possible to configure a double connection between 2 stations using 2 separate networks (at least logically separated sub-networks).

However, such a setup has no advantages via-à-vis the minimal structure right at the start *Chapter 1.6.5.3.2.4.2.6.1.1 “Minimal structure” on page 6146*.

For this setup, connection data must be double configured and double resources are also required at the stations, not providing any advantages whatsoever.

Rather the opposite is true, because such configurations are highly prone to errors.



(1) 2 Control stations with 2 Ethernet interfaces
(2) 2 Substations with 2 Ethernet interfaces

Faulty configuration

*This configuration **does not** work!*

If an AC500 is configured as a control station, the interface which is used to reach the substation is not defined.

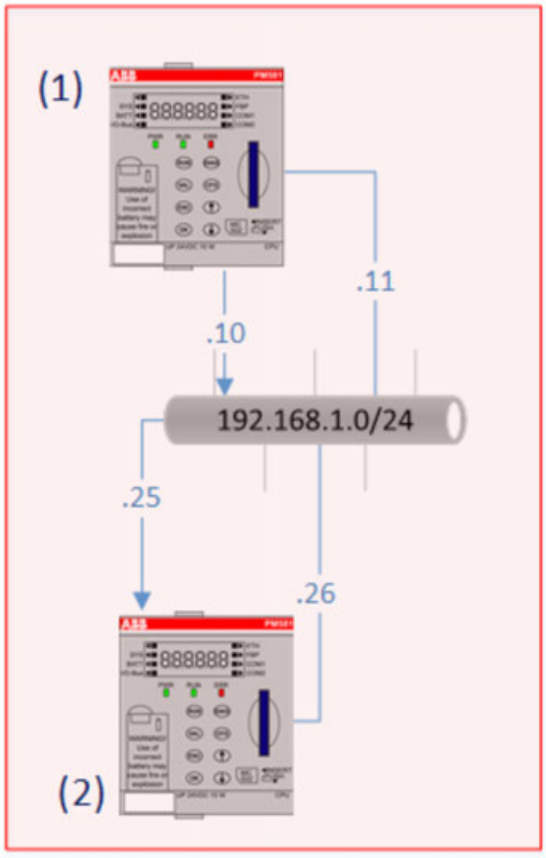
The decision as to which interface is used for this is taken by TCP/IP when running.

It is also dependent on the current network configuration.

Here, the current link status and the order of link recognition may be decisive for the interface to be used.

Such a scenario would not result in stable communication as both substations cannot clearly distinguish the control stations.

Instead, the connection management for a substation will assume that the control station has lost the connection and then establishes a connection.



(1) 2 Control stations with 2 Ethernet interfaces
(2) 2 Substations with 2 Ethernet interfaces

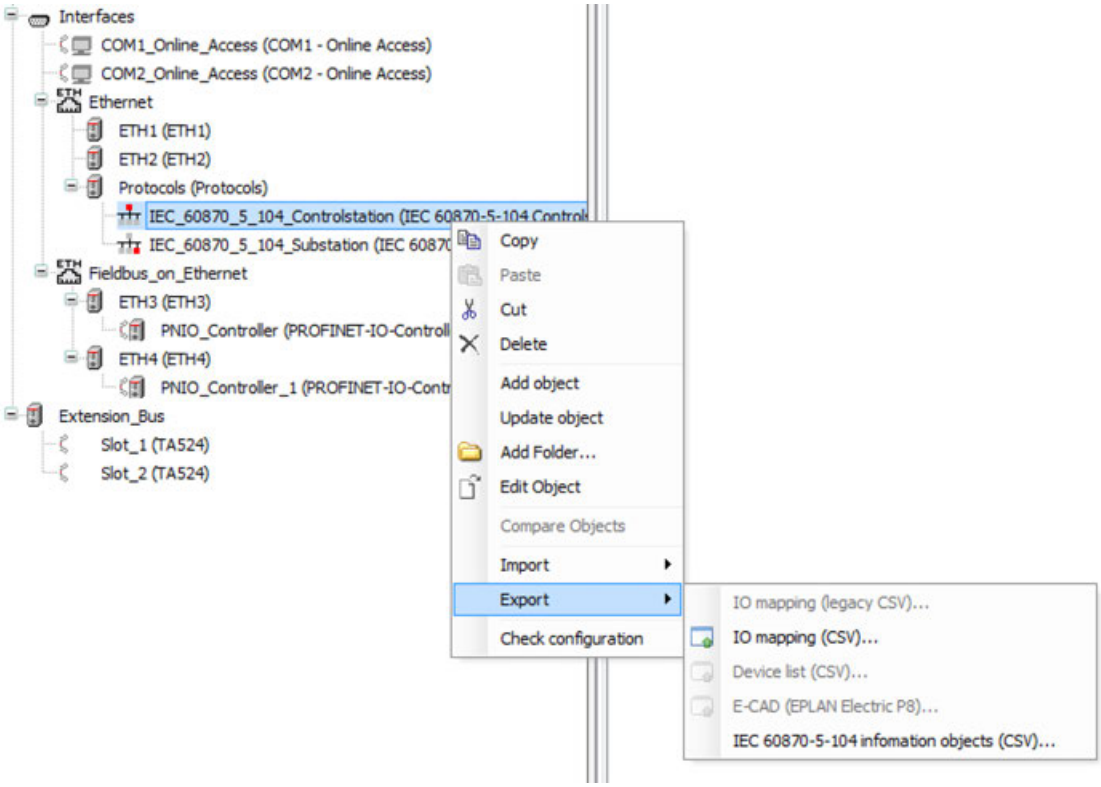
Export a CSV file

As an alternative many values can be modified at a time by exporting the configuration to a CSV file. After modifying the file data, import the CSV file ↳ *Chapter 1.6.5.3.2.4.3 “Import/Export functionality ” on page 6157*.

Import/Export functionality

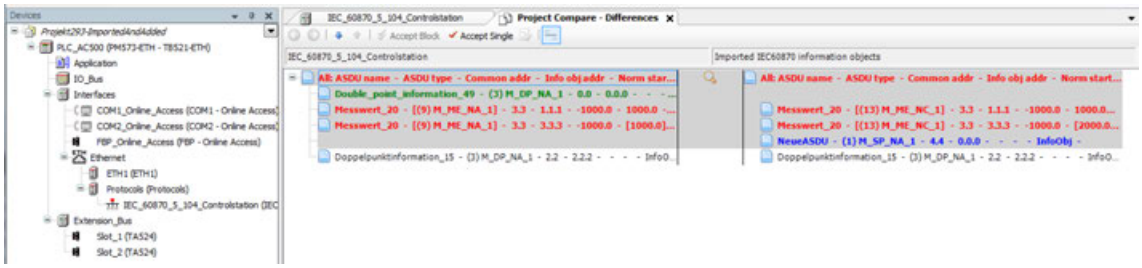
As of Automation Builder 1.1 (CBP >= 2.4) configuration of control stations and substations can be exported/imported via CSV file. Open the CSV file with a spreadsheet software (e.g. Microsoft Excel) and modify the values within the file to your convenience:

1. Export configuration data: right-click the node of the control station or substation to be exported.



2. Click *"Export ➔ IEC 60870-5-104 information objects (CSV)"* and store the CSV file to a desired directory.
3. Open the CSV file with a spreadsheet software (e.g. Microsoft Excel) and change the values to your convenience. Added table columns are only accepted after the last column.
4. Import configuration data: right-click the node of the control station or substation that has been exported previously.
5. Click *"Import ➔ IEC 60870-5-104 information objects (CSV)"* and select the CSV file from the file system. Configuration data is imported.

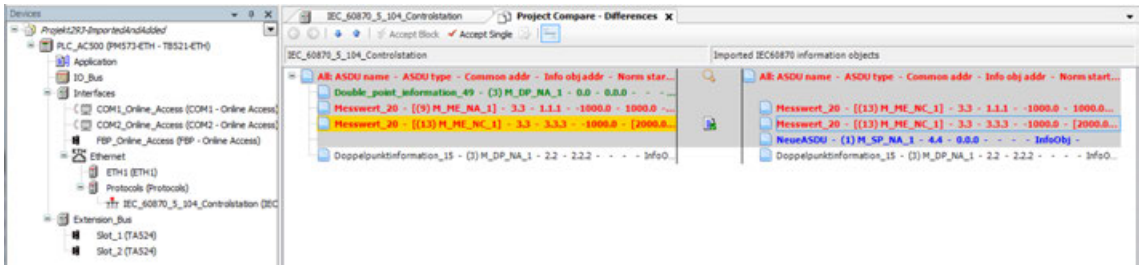
As of Automation Builder 1.1.1 during file import the project data is compared with the project data that is already available. In order to prevent data from being overwritten inadvertently, you can select the data that shall be imported in the *"Project Compare - Differences"* window:



Data on the left side of the window refers to already available project data. This data is displayed under *"Control station ➔ Information objects"* tab. Data on the right side of the window refers to new data that can be imported after your confirmation. Decide whether to import (and overwrite) the data or not.

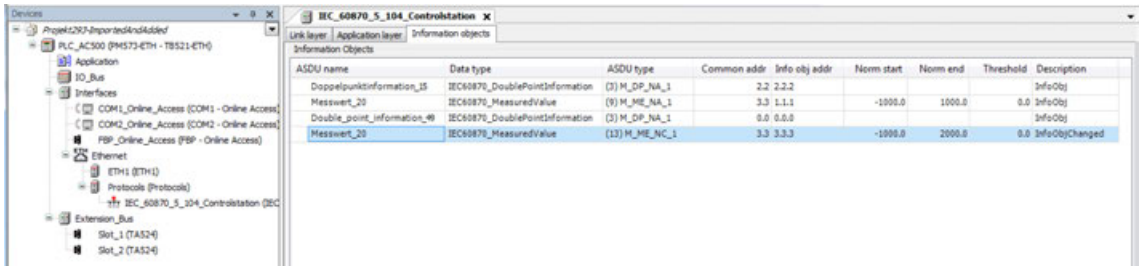
- Data in black color means the existing data and the data to be imported is identical.
- Data in red color means the existing data and the data to be imported differ. Decide whether to import the new data (and to overwrite the existing data) or not.
- Data in blue color means, the data to be imported is new and will be added to the existing data.
- Data that has been confirmed for the import already is displayed in green color (after clicking the *[Accept Single]* button).

In order to move data from one side of the window to another, select the data and click the *[Accept Single]* button. Data is highlighted in yellow.



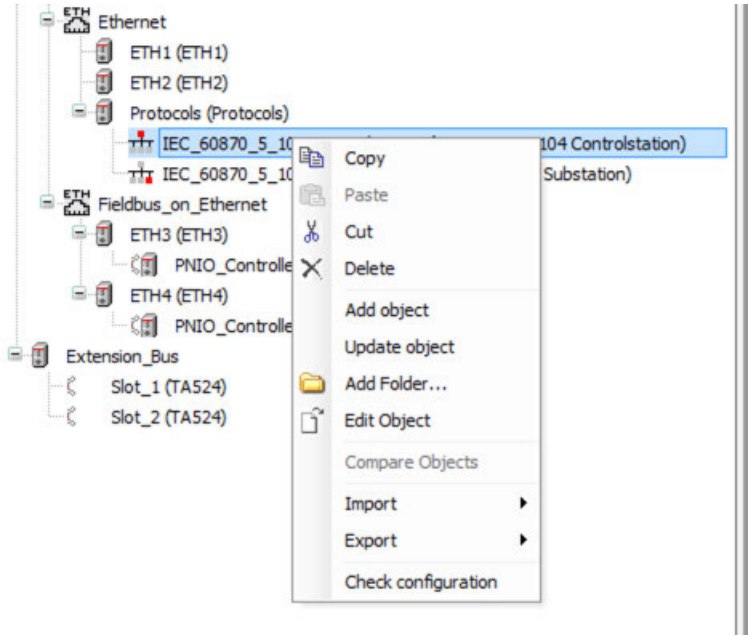
To confirm the import of all new data, click the top entry (here: All: ASDU name - ASDU tpye - Common addr - ...). Then, click the *[Accept Single]* button.

Close the *"Project Compare - Differences"* tab, save your project and confirm the message. The changes are displayed in the *"Information objects"* tab.



Validity check of configuration

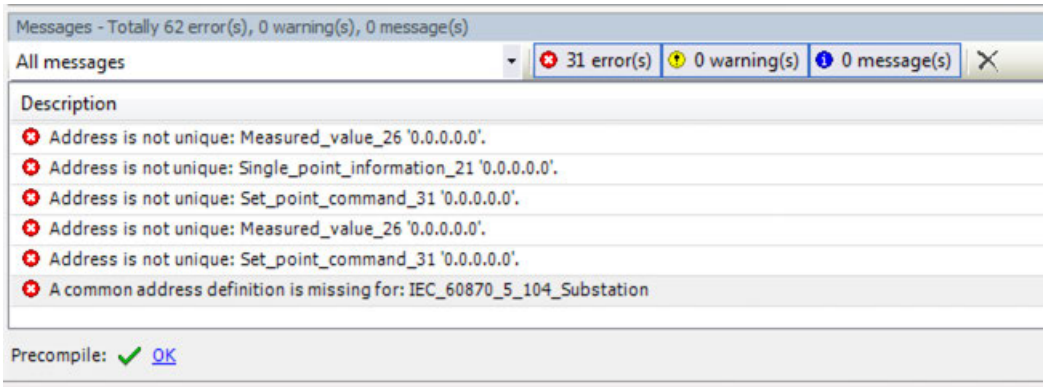
We recommend you to verify the IEC configuration of control stations and substations: Right-click a control station or substation -> Check configuration.



The check will look for the following topics:

- Duplicate addresses.
- Stations without any Information objects.
- ASDU names, which are not unique.

When a check finds errors or incompatibilities this will be reported in a separate messages view at the buttom of the window:



With a double-click on the error line, the part of the configuration with the violation will be opened. Now, you can correct the error.

IEC60870 compatibility list

AC500 V2.4 IEC60870-5-104 Compatibility List

9 Interoperability

This companion standard presents sets of parameters and alternatives from which subsets must be selected to implement particular telecontrol systems. Certain parameter values, such as the choice of "structured" or "unstructured" fields of the INFORMATION OBJECT ADDRESS of ASDUs represent mutually exclusive alternatives. This means that only one value of the defined parameters is admitted per system. Other parameters, such as the listed set of different process information in command and in monitor direction allow the specification of the complete set or subsets, as appropriate for given applications. This clause summarizes the parameters of the previous clauses to facilitate a suitable selection for a specific application. If a system is composed of equipment stemming from different manufacturers, it is necessary that all partners agree on the selected parameters.

The interoperability list is defined as in IEC 60870-5-101 and extended with parameters used in this standard. The text descriptions of parameters which are not applicable to this companion standard are strike-through (corresponding check box is marked black).

NOTE In addition, the full specification of a system may require individual selection of certain parameters for certain parts of the system, such as the individual selection of scaling factors for individually addressable measured values.

The selected parameters should be marked in the white boxes as follows:

☐ Function or ASDU is not used

☒ Function or ASDU is used as standardized (default)

☒ Function or ASDU is used in reverse mode

☒ Function or ASDU is used in standard and reverse mode

The possible selection (blank, X, R, or B) is specified for each specific clause or parameter.

A black check box indicates that the option cannot be selected in this companion standard.

9.1 System or device

(system-specific parameter, indicate definition of a system or a device by marking one of the following with "**X**")

☐ System definition

☐ Controlling station definition (Master)

☐ Controlled station definition (Slave)

9.2 Network configuration

(network-specific parameter, all configurations that are used are to be marked "**X**")

■ ~~Point-to-point~~ ■ ~~Multipoint~~

■ ~~Multiple point-to-point~~ ■ ~~Multipoint star~~

AC500 V2.4 IEC60870-5-104 Compatibility List

9.3 Physical layer

(network-specific parameter, all interfaces and data rates that are used are to be marked "**X**")

Transmission speed (control direction)

Unbalanced interchange Circuit V.24/V.28 Standard	Unbalanced interchange Circuit V.24/V.28 Recommended if >1 200 bit/s	Balanced interchange Circuit X.24/X.27	
~~100 bit/s~~	~~2 400 bit/s~~	~~2 400 bit/s~~	~~56 000 bit/s~~
~~200 bit/s~~	~~4 800 bit/s~~	~~4 800 bit/s~~	~~64 000 bit/s~~
~~300 bit/s~~	~~9 600 bit/s~~	~~9 600 bit/s~~

~~1 200 bit/s~~		~~38 400 bit/s~~	

9.4 Link layer

(network-specific parameter, all options that are used are to be marked "X". Specify the maximum frame length. If a non-standard assignment of class 2 messages is implemented for unbalanced transmission, indicate the Type ID and COT of all messages assigned to class 2.)

~~Frame format FT 1.2, single character 1 and the fixed time out interval are used exclusively in this companion standard.~~

Link transmission

- ~~Balanced transmission~~
- ~~Unbalanced transmission~~

Frame length

- ~~Maximum length L (number of octets)~~

Address field of the link

- ~~not present (balanced transmission only)~~
- ~~One octet~~
- ~~Two octets~~
- ~~Structured~~
- ~~Unstructured~~

AC500 V2.4 IEC60870-5-104 Compatibility List

When using an unbalanced link layer, the following ASDU types are returned in class 2 messages (low priority) with the indicated causes of transmission:

■ ~~The standard assignment of ASDUs to class 2 messages is used as follows:~~

Type identification	Cause of transmission
9, 11, 13, 21	<1>

■ ~~A special assignment of ASDUs to class 2 messages is used as follows:~~

Type identification	Cause of transmission

~~Note: (In response to a class 2 poll, a controlled station may respond with class 1 data when there is no class 2 data available).~~

9.5 Application layer

Transmission mode for application data

Mode 1 (Least significant octet first), as defined in 4.10 of IEC 60870-5-4, is used exclusively in this companion standard.

Common address of ASDU
(system-specific parameter, all configurations that are used are to be marked "**X**")

■ ~~One octet~~ [X] Two octets

Information object address
(system-specific parameter, all configurations that are used are to be marked "**X**")

■ ~~One octet~~
■ ~~Two octets~~
[X] Three octets

[ ] Structured
[ ] Unstructured

Cause of transmission
(system-specific parameter, all configurations that are used are to be marked "**X**")

■ ~~One octet~~ [X] Two octets (with originator address). Originator address is set to zero if not used

Length of APDU
(system-specific parameter, specify the maximum length of the APDU per system)

The maximum length of APDU for both directions is 253. It is a fixed system parameter.

■ Maximum length of APDU per system in control direction

AC500 V2.4 IEC60870-5-104 Compatibility List

■ Maximum length of APDU per system in monitor direction

Selection of standard ASDUs

Process information in monitor direction
(station-specific parameter, mark each Type ID "**X**" if it is only used in the standard direction, "**R**" if only used in the reverse direction, and "**B**" if used in both directions).

Either the ASDUs of the set <45> – <51> or of the set <58> – <64> are used.

System information in monitor direction
(station-specific parameter, mark with an "**X**" if it is only used in the standard direction, "**R**" if only used in the reverse direction, and "**B**" if used in both directions).

X	<70> :=	End of initialization	M_EI_NA_1

System information in control direction
(station-specific parameter, mark each Type ID "**X**" if it is only used in the standard direction, "**R**" if only used in the reverse direction, and "**B**" if used in both directions).

X	<100>:=	Interrogation command	C_IC_NA_1
X	<101>:=	Counter interrogation command	C_CI_NA_1
X	<102>:=	Read command	C_RD_NA_1
X	<103>:=	Clock synchronization command (option see 7.6)	C_CS_NA_1
	<104>:=	~~Test command~~	~~C_TS_NA_1~~
X	<105>:=	Reset process command	C_RP_NA_1
	<106>:=	~~Delay acquisition command~~	~~C_CD_NA_1~~
X	<107>:=	Test command with time tag CP56Time2a	C_TS_TA_1

AC500 V2.4 IEC60870-5-104 Compatibility List

Parameter in control direction
(station-specific parameter, mark each Type ID "**X**" if it is only used in the standard direction, "**R**" if only used in the reverse direction, and "**B**" if used in both directions).

X	<110>:= Parameter of measured value, normalized value	P_ME_NA_1
	<111>:= Parameter of measured value, scaled value	P_ME_NB_1
X	<112>:= Parameter of measured value, short floating point value	P_ME_NC_1
	<113>:= Parameter activation	P_AC_NA_1

File transfer
(station-specific parameter, mark each Type ID "**X**" if it is only used in the standard direction, "**R**" if only used in the reverse direction, and "**B**" if used in both directions).

	<120>:= File ready	F_FR_NA_1
	<121>:= Section ready	F_SR_NA_1
	<122>:= Call directory, select file, call file, call section	F_SC_NA_1
	<123>:= Last section, last segment	F_LS_NA_1
	<124>:= Ack file, ack section	F_AF_NA_1
	<125>:= Segment	F_SG_NA_1
	<126>:= Directory {blank or X, only available in monitor (standard) direction}	F_DR_TA_1
	<127>:= Query Log – Request archive file	F_SC_NB_1

Type identifier and cause of transmission assignments
(station-specific parameters)

Shaded boxes: option not required.

Black boxes: option not permitted in this companion standard

Blank: functions or ASDU not used.

Mark Type Identification/Cause of transmission combinations:

"**X**" if only used in the standard direction;

"**R**" if only used in the reverse direction;

"**B**" if used in both directions.

Type identification		**Cause of transmission**

AC500 V2.4 IEC60870-5-104 Compatibility List

9.6 Basic application functions

Station initialization
(station-specific parameter, mark "**X**" if function is used)

[X] Remote initialization

Cyclic data transmission
(station-specific parameter, mark "**X**" if function is only used in the standard direction, "**R**" if only used in the reverse direction, and "**B**" if used in both directions)

[X] Cyclic data transmission

Read procedure
(station-specific parameter, mark "**X**" if function is only used in the standard direction, "**R**" if only used in the reverse direction, and "**B**" if used in both directions)

[X] Read procedure

Spontaneous transmission
(station-specific parameter, mark "**X**" if function is only used in the standard direction, "**R**" if only used in the reverse direction, and "**B**" if used in both directions)

[X] Spontaneous transmission

Double transmission of information objects with cause of transmission spontaneous
(station-specific parameter, mark each information type "**X**" where both a Type ID without time and corresponding Type ID with time are issued in response to a single spontaneous change of a monitored object)

The following type identifications may be transmitted in succession caused by a single status change of an information object. The particular information object addresses for which double transmission is enabled are defined in a project-specific list.

- [ ] Single-point information M_SP_NA_1, M_SP_TA_1, M_SP_TB_1 and M_PS_NA_1
- [ ] Double-point information M_DP_NA_1, M_DP_TA_1 and M_DP_TB_1
- [ ] Step position information M_ST_NA_1, M_ST_TA_1 and M_ST_TB_1
- [ ] Bitstring of 32 bit M_BO_NA_1, M_BO_TA_1 and M_BO_TB_1 (if defined for a specific project)
- [ ] Measured value, normalized value M_ME_NA_1, M_ME_TA_1, M_ME_ND_1 and M_ME_TD_1
- [ ] Measured value, scaled value M_ME_NB_1, M_ME_TB_1 and M_ME_TE_1
- [ ] Measured value, short floating point number M_ME_NC_1, M_ME_TC_1 and M_ME_TF_1

AC500 V2.4 IEC60870-5-104 Compatibility List

Station interrogation
(station-specific parameter, mark "**X**" if function is only used in the standard direction, "**R**" if only used in the reverse direction, and "**B**" if used in both directions).

- [X] global
- [ ] group 1
- [ ] group 2
- [ ] group 3
- [ ] group 4
- [ ] group 5
- [ ] group 6
- [ ] group 7
- [ ] group 8
- [ ] group 9
- [ ] group 10
- [ ] group 11
- [ ] group 12
- [ ] group 13
- [ ] group 14
- [ ] group 15
- [ ] group 16

Information object addresses assigned to each group must be shown in a separate table.

Clock synchronization
(station-specific parameter, mark "**X**" if function is only used in the standard direction, "**R**" if only used in the reverse direction, and "**B**" if used in both directions).

- [X] Clock synchronization
- [ ] Day of week used
- [ ] RES1, GEN (time tag substituted/ not substituted) used
- [ ] SU-bit (summertime) used

optional, see 7.6

Command transmission
(object-specific parameter, mark "**X**" if function is only used in the standard direction, "**R**" if only used in the reverse direction, and "**B**" if used in both directions).

- [X] Direct command transmission
- [X] Direct set point command transmission
- [ ] Select and execute command
- [ ] Select and execute set point command
- [ ] C_SE ACTTERM used

- [ ] No additional definition
- [X] Short-pulse duration (duration determined by a system parameter in the outstation)
- [X] Long-pulse duration (duration determined by a system parameter in the outstation)
- [X] Persistent output

- [ ] Supervision of maximum delay in command direction of commands and set point commands
- [ ] Maximum allowable delay of commands and set point commands

AC500 V2.4 IEC60870-5-104 Compatibility List

Transmission of integrated totals
(station- or object-specific parameter, mark "**X**" if function is only used in the standard direction, "**R**" if only used in the reverse direction, and "**B**" if used in both directions).

- [ ] Mode A: Local freeze with spontaneous transmission
- [ ] Mode B: Local freeze with counter interrogation
- [ ] Mode C: Freeze and transmit by counter-interrogation commands
- [ ] Mode D: Freeze by counter-interrogation command, frozen values reported

- [X] Counter read
- [X] Counter freeze without reset
- [X] Counter freeze with reset
- [X] Counter reset

- [X] General request
- [X] Request counter group 1
- [X] Request counter group
- [X] Request counter group 3
- [X] Request counter group 4

Parameter loading
(object-specific parameter, mark "**X**" if function is only used in the standard direction, "**R**" if only used in the reverse direction, and "**B**" if used in both directions).

- [X] Threshold value
- [ ] Smoothing factor
- [ ] Low limit for transmission of measured values
- [ ] High limit for transmission of measured values

Parameter activation
(object-specific parameter, mark "**X**" if function is only used in the standard direction, "**R**" if only used in the reverse direction, and "**B**" if used in both directions).

- [ ] Act/deact of persistent cyclic or periodic transmission of the addressed object

Test procedure
(station-specific parameter, mark "**X**" if function is only used in the standard direction, "**R**" if only used in the reverse direction, and "**B**" if used in both directions).

- [X] Test procedure

AC500 V2.4 IEC60870-5-104 Compatibility List

File transfer
(station-specific parameter, mark "**X**" if function is used).

File transfer in monitor direction

☐ Transparent file
☐ Transmission of disturbance data of protection equipment
☐ Transmission of sequences of events
☐ Transmission of sequences of recorded analogue values

File transfer in control direction

☐ Transparent file

Background scan
(station-specific parameter, mark "**X**" if function is only used in the standard direction, "**R**" if only used in the reverse direction, and "**B**" if used in both directions).

☒ Background scan

Acquisition of transmission delay
(station-specific parameter, mark "**X**" if function is only used in the standard direction, "**R**" if only used in the reverse direction, and "**B**" if used in both directions).

■ ~~Acquisition of transmission delay~~

Definition of time outs

Parameter	Default value	Remarks	Selected value
t_0	30 s	Time-out of connection establishment	
t_1	15 s	Time-out of send or test APDUs	
t_2	10 s	Time-out for acknowledges in case of no data messages $t_2 < t_1$	
t_3	20 s	Time-out for sending test frames in case of a long idle state	

Maximum range for timeouts t_0 to t_2: 1 s to 255 s, accuracy 1 s.
Recommended range for timeout t_3: 1 s to 48 h, resolution 1 s.
Long timeouts for t_3 may be needed in special cases where satellite links or dialup connections are used (for instance to establish connection and collect values only once per day or week).

Maximum number of outstanding I format APDUs *k* and latest acknowledge APDUs (*w*)

Parameter	Default value	Remarks	Selected value
k	12 APDUs	Maximum difference receive sequence number to send state variable	
w	8 APDUs	Latest acknowledge after receiving *w* I format APDUs	

Maximum range of values *k*: 1 to 32767 (2^{15}–1) APDUs, accuracy 1 APDU

AC500 V2.4 IEC60870-5-104 Compatibility List

Maximum range of values *w*: 1 to 32767 APDUs, accuracy 1 APDU (Recommendation: *w* should not exceed two-thirds of *k*).

Portnumber

Parameter	Value	Remarks
Portnumber	2404	In all cases

Redundant connections

2 Number N of redundancy group connections used

RFC 2200 suite

RFC 2200 is an official Internet Standard which describes the state of standardization of protocols used in the Internet as determined by the Internet Architecture Board (IAB). It offers a broad spectrum of actual standards used in the Internet. The suitable selection of documents from RFC 2200 defined in this standard for given projects has to be chosen by the user of this standard.

☐ Ethernet 802.3

☐ Serial X.21 interface

☐ Other selection from RFC 2200:

1.6.5.3.3 Modbus protocol

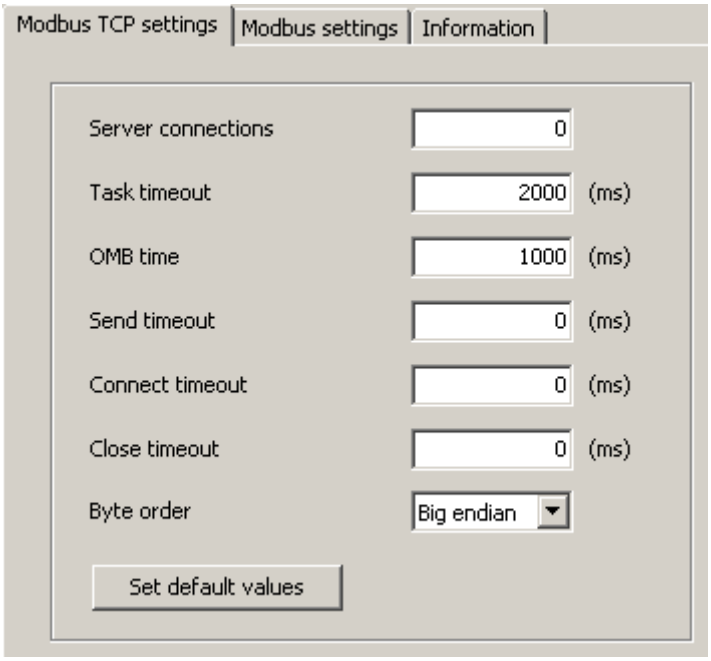
Modbus on TCP/IP protocol

Configuration of Modbus TCP/IP server settings

As of Automation Builder 1.1 (CBP 2.4.) Modbus configuration has been moved to another location within the device tree. Note: Principle of Modbus configuration remains unchanged.

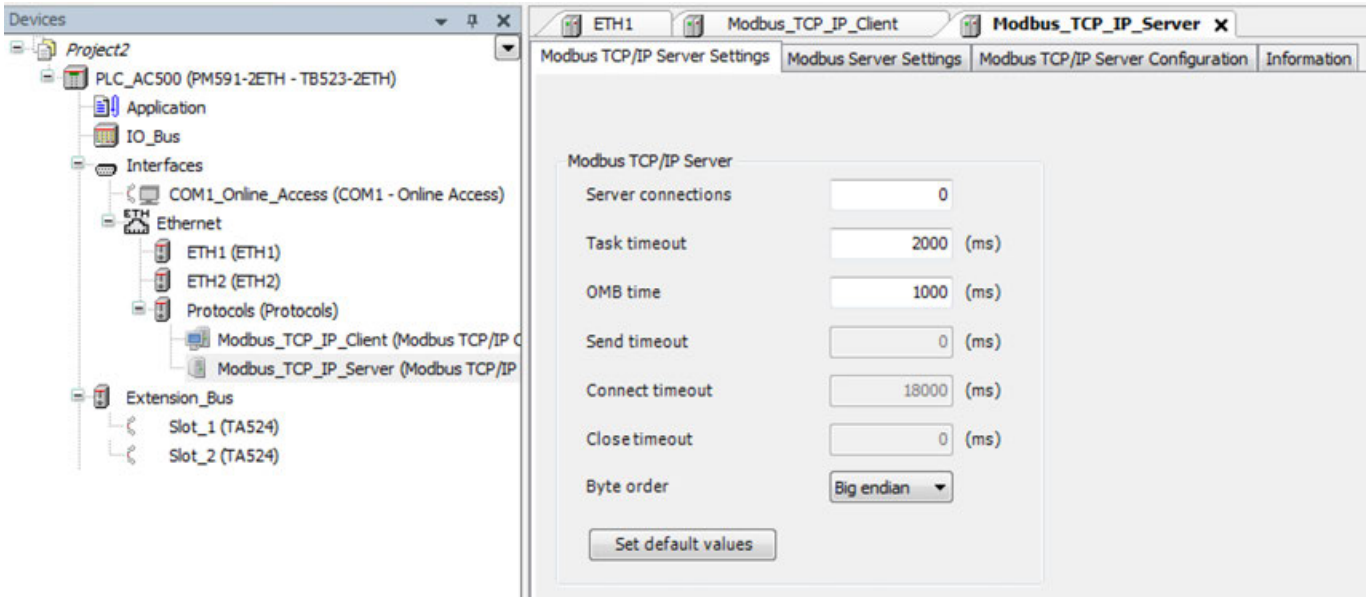
Configuration up to CBP 2.4

Double-click on *"MODBUS_on_TCP_IP (MODBUS on TCP/IP)"* to open the Modbus TCP settings in the editor window:



Configuration as of CBP 2.4

For Modbus TCP/IP protocol configuration add a new object for Modbus Server settings under *"Ethernet Interface ➔ Protocols"*. In the device tree double-click the new added item to open the configuration:



Parameters

Depending on the Automation Builder/CBP version some or all parameters are available:

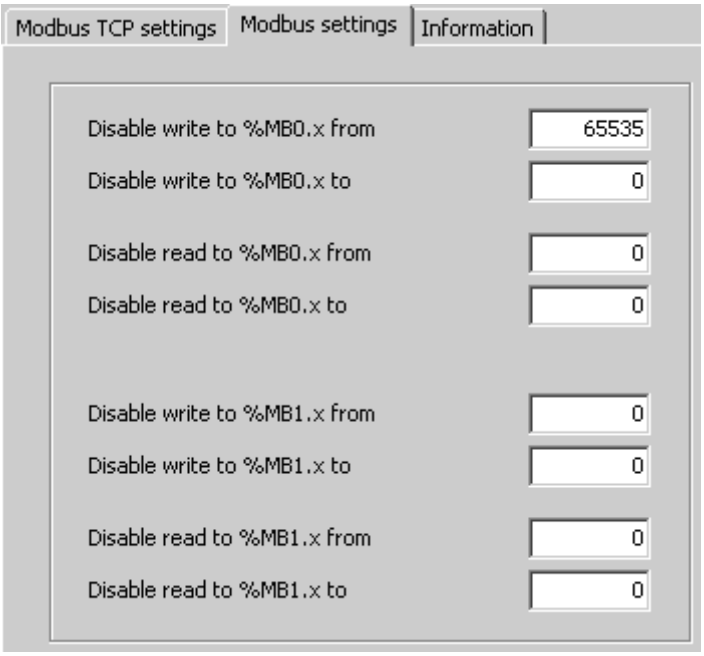
Parameter	Default	Value range	Description
Server connections	0	0...X (X depending on CPU)	Maximum number of logical server connections allowed in parallel. 0 means only client usage (Modbus master). Requests from other clients are ignored.
Task timeout	2000	100...6000000	Used for client mode only: A request is cancelled if no reply from the server is received during the time given in task timeout [in ms].
OMB time	1000	100...6000000	Used for server mode only: determining how long a logical connection in [ms] remains after receiving the reply message of a client. Establishing and terminating of connection takes some time. When the data communication between the controller and the servers should take place only at long intervals, it is useful to close the connection immediately after completion of the data communication.
Send timeout	0	0 ... 2000000000	Used for client mode only: definition, how long [in ms] the PLC tries to send a request to a server. CM579-ETH: 0 is default value 31000 ms Onboard Ethernet: not implemented
Connect timeout	0	0 ... 2000000000	Used for client mode only: definition, how long [in ms] the PLC tries to establish a TCP connection with a server. CM579-ETH: 0 is default value 31000 ms Onboard Ethernet: fixed value 18000 ms
Close timeout	0	0 ... 2000000000	Used for client mode only: definition, how long [in ms] the PLC tries to quit a TCP connection with a server. CM579-ETH: 0 is default value 31000 ms Onboard Ethernet: not implemented
Byte order	Big endian	Little endian Big endian	Valid for client and server mode. Format for the transmission of WORD values (register) within the telegram.
Set default values	-	-	Restoring the default values of all parameters.

Configuration of Modbus server settings

As of AB 1.1 (CBP 2.4.) Modbus configuration has been moved to another location within the device tree. Note: Principle of Modbus configuration remains unchanged.

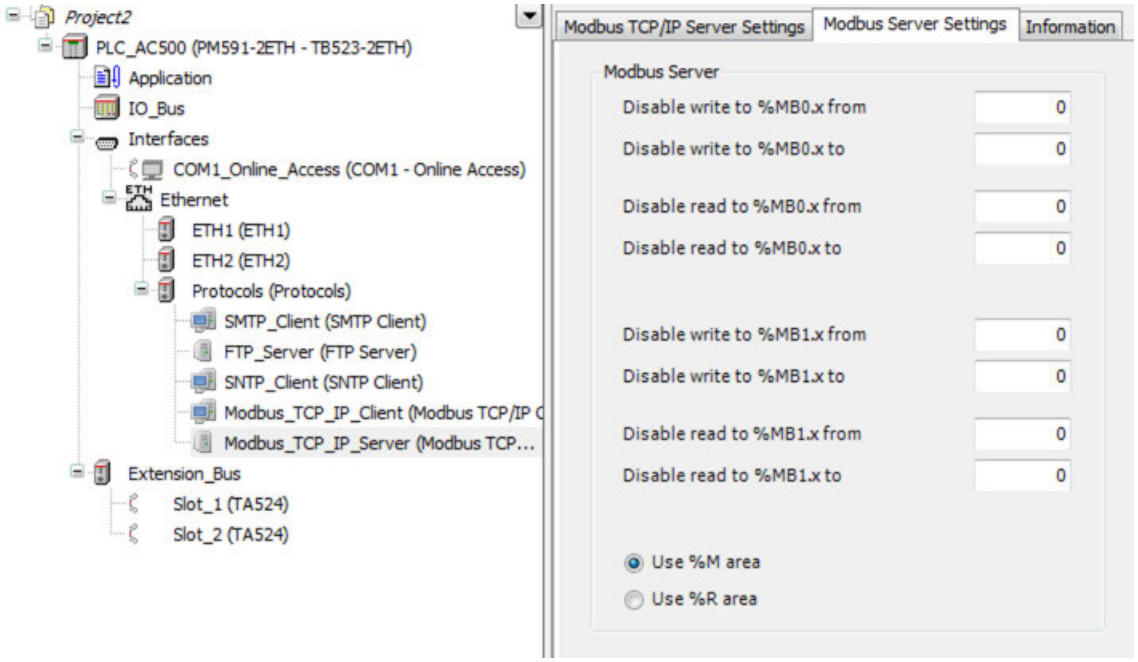
Up to CBP 2.4

Double-click on *"MODBUS_on_TCP_IP (MODBUS on TCP/IP)"* and select the tab *"Modbus settings"* to show the available Modbus settings in the editor window:



As of CBP 2.4

For Modbus TCP/IP protocol configuration add a new object for Modbus Server settings under Ethernet Interface. In the device tree double-click the new added item to open the configuration:



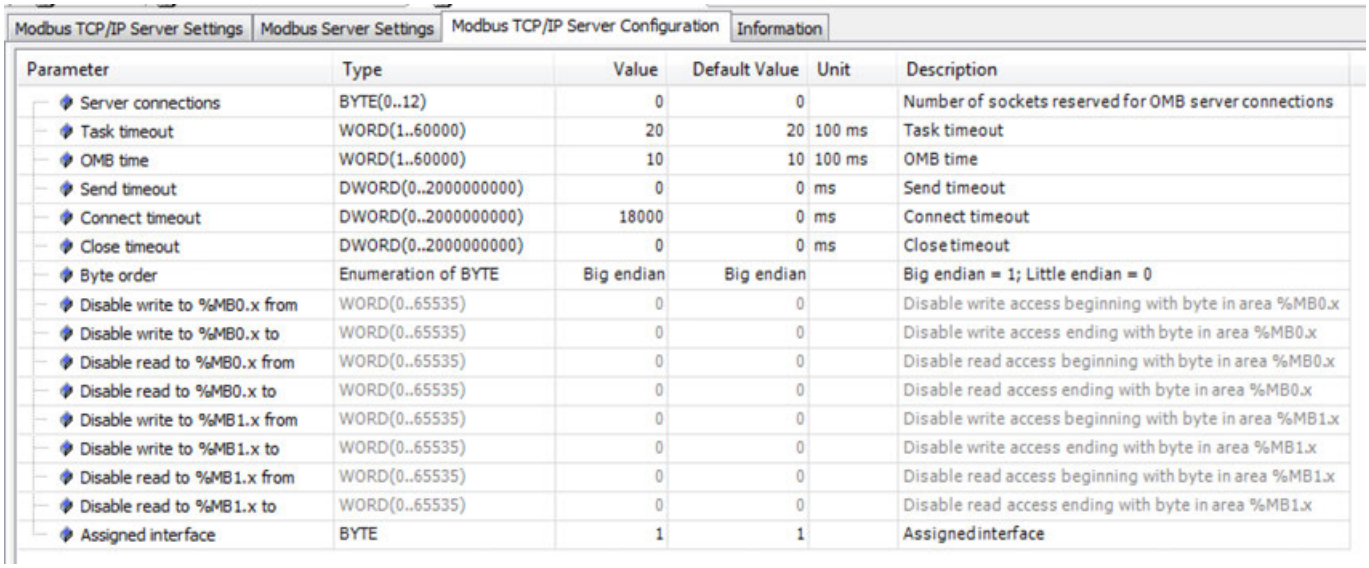
The following parameters are available:

Parameter	Default	Value	Description	Generic see remark 1
Disable write to %MB0.x from	0	0...65535	Disable write access for segment 0 starting at %MB0.x	Disable write to %MB0.x from
Disable write to %MB0.x to	0	0...65535	Disable write access for segment 0 up to %MB0.x	Disable write to %MB0.x to
Disable read to %MB0.x from	0	0...65535	Disable read access for segment 0 starting at %MB0.x	Disable read to %MB0.x from
Disable read to %MB0.x to	0	0...65535	Disable read access for segment 0 up to %MB0.x	Disable read to %MB0.x to
Disable write to %MB1.x from	0	0...65535	Disable write access for segment 1 starting at %MB1.x	Disable write to %MB1.x from
Disable write to %MB1.x to	0	0...65535	Disable write access for segment 1 up to %MB1.x	Disable write to %MB1.x to
Disable read to %MB1.x from	0	0...65535	Disable read access for segment 1 starting at %MB1.x	Disable read to %MB1.x from
Disable read to %MB1.x to	0	0...65535	Disable write access for segment 1 up at %MB1.x	Disable read to %MB1.x to

Like for Modbus RTU on the serial interfaces COMx, it is also possible to disable read and/or write access to individual segments for slave operation. Reading/writing is disabled beginning at the set address and is valid up to the set end address (inclusive).

Remark 1: Generic device configuration view parameters

Tab IP Settings Configuration or Modbus TCP/IP Server Configuration shows a list of all available parameters which is only visible if the parameter Show generic device configuration views is activated (open Options dialog window with menu item Tools -> Options, parameter is located under section Device editor):

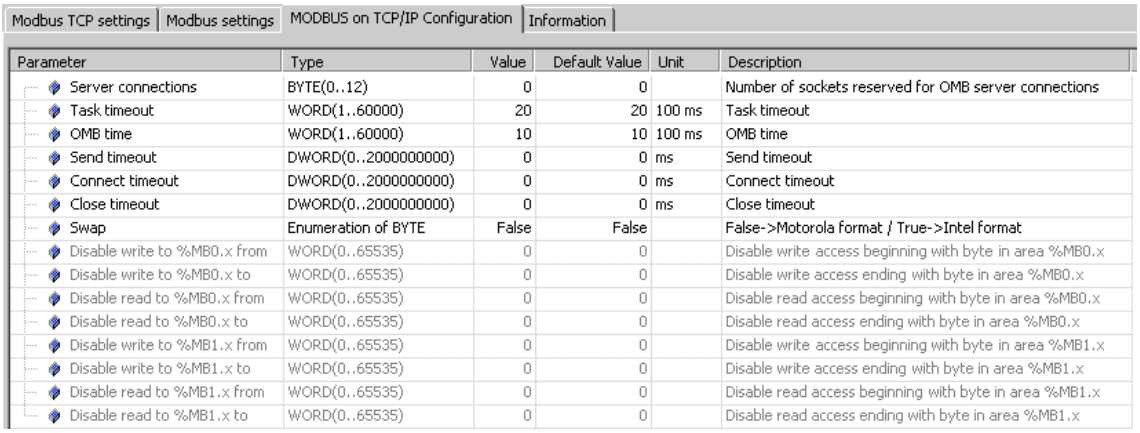


Configuration of Modbus TCP/IP configuration

As of Automation Builder 1.1 (CBP 2.4.) Modbus configuration has been moved to another location within the device tree. Note: Principle of Modbus configuration remains unchanged.

Configuration up to CBP 2.4

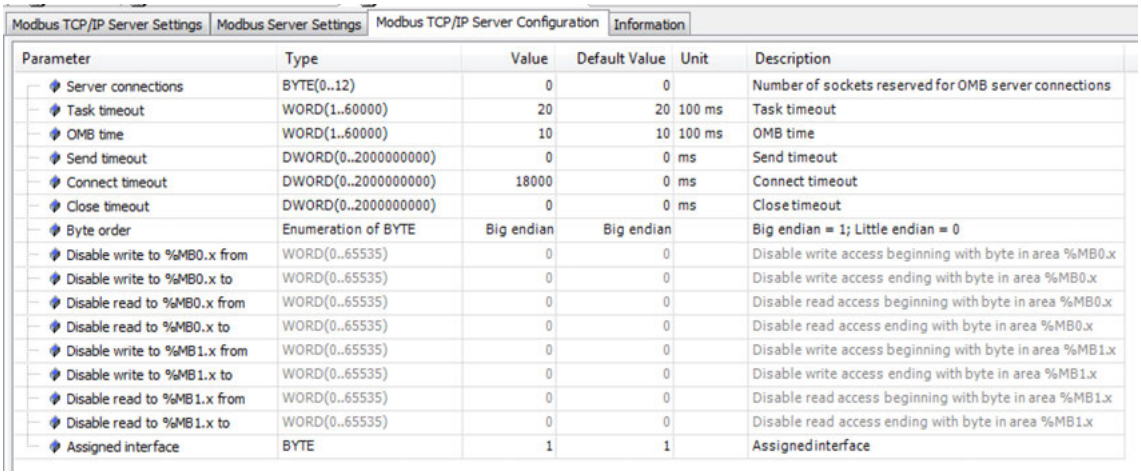
Double-click on *"MODBUS_on_TCP_IP (MODBUS on TCP/IP)"* and select the tab *"MODBUS on TCP/IP Configuration"* to show the available Modbus settings in the editor window:



Parameter	Type	Value	Default Value	Unit	Description
Server connections	BYTE(0..12)	0	0		Number of sockets reserved for OMB server connections
Task timeout	WORD(1..60000)	20	20	100 ms	Task timeout
OMB time	WORD(1..60000)	10	10	100 ms	OMB time
Send timeout	DWORD(0..2000000000)	0	0	ms	Send timeout
Connect timeout	DWORD(0..2000000000)	0	0	ms	Connect timeout
Close timeout	DWORD(0..2000000000)	0	0	ms	Close timeout
Swap	Enumeration of BYTE	False	False		False->Motorola format / True->Intel format
Disable write to %MB0.x from	WORD(0..65535)	0	0		Disable write access beginning with byte in area %MB0.x
Disable write to %MB0.x to	WORD(0..65535)	0	0		Disable write access ending with byte in area %MB0.x
Disable read to %MB0.x from	WORD(0..65535)	0	0		Disable read access beginning with byte in area %MB0.x
Disable read to %MB0.x to	WORD(0..65535)	0	0		Disable read access ending with byte in area %MB0.x
Disable write to %MB1.x from	WORD(0..65535)	0	0		Disable write access beginning with byte in area %MB1.x
Disable write to %MB1.x to	WORD(0..65535)	0	0		Disable write access ending with byte in area %MB1.x
Disable read to %MB1.x from	WORD(0..65535)	0	0		Disable read access beginning with byte in area %MB1.x
Disable read to %MB1.x to	WORD(0..65535)	0	0		Disable read access ending with byte in area %MB1.x

Configuration as of CBP 2.4

For Modbus TCP/IP protocol configuration double-click the Modbus item in the device tree and select the tab Modbus TCP/IP Server Configuration:



Parameter	Type	Value	Default Value	Unit	Description
Server connections	BYTE(0..12)	0	0		Number of sockets reserved for OMB server connections
Task timeout	WORD(1..60000)	20	20	100 ms	Task timeout
OMB time	WORD(1..60000)	10	10	100 ms	OMB time
Send timeout	DWORD(0..2000000000)	0	0	ms	Send timeout
Connect timeout	DWORD(0..2000000000)	18000	0	ms	Connect timeout
Close timeout	DWORD(0..2000000000)	0	0	ms	Close timeout
Byte order	Enumeration of BYTE	Big endian	Big endian		Big endian = 1; Little endian = 0
Disable write to %MB0.x from	WORD(0..65535)	0	0		Disable write access beginning with byte in area %MB0.x
Disable write to %MB0.x to	WORD(0..65535)	0	0		Disable write access ending with byte in area %MB0.x
Disable read to %MB0.x from	WORD(0..65535)	0	0		Disable read access beginning with byte in area %MB0.x
Disable read to %MB0.x to	WORD(0..65535)	0	0		Disable read access ending with byte in area %MB0.x
Disable write to %MB1.x from	WORD(0..65535)	0	0		Disable write access beginning with byte in area %MB1.x
Disable write to %MB1.x to	WORD(0..65535)	0	0		Disable write access ending with byte in area %MB1.x
Disable read to %MB1.x from	WORD(0..65535)	0	0		Disable read access beginning with byte in area %MB1.x
Disable read to %MB1.x to	WORD(0..65535)	0	0		Disable read access ending with byte in area %MB1.x
Assigned interface	BYTE	1	1		Assigned interface

Parameters

Depending on the Automation Builder/CBP version some or all parameters are available:

Parameter	Default	Value	Description
Server connections	0	0...X (X depending on PLC)	Maximum number of logical parallel connections, that are kept for connection requests by clients in operation mode as server. The value 0 means pure client mode (Modbus master) (0..X, depending on the performance of the PLC)
Task timeout	2000	100 ... 6000000	Only valid for client mode. A request is canceled when no response by the server is received within this time in [ms]. (100..6.000,000 ms)

Parameter	Default	Value	Description
OMB time	1000	100 ... 6000000	Only valid for server mode. Determining how long a logical connection in [ms] remains after receiving the reply message of a client. Establishing and terminating of connection takes some time. When the data communication between the controller and the servers should take place only at long intervals, it is useful to close the connection immediately after completion of the data communication. (100..6.000,000 ms)
Send timeout	0	0 ... 2000000000	Only valid for client mode. Determining how long the controller should try to send a request to a server. (0..2.000,000,000 ms)
Connect timeout	0	0 ... 2000000000	Only valid for client mode. Determining how long the controller should try to create a TCP connection with a server. (0..2.000,000,000 ms)
Close timeout	0	0 ... 2000000000	Only valid for client mode. Determining how long the controller should try to close a TCP connection with a server. (0..2.000,000,000 ms)
Byte order	Big endian	Little endian Big endian	Valid for client and server mode. Format of the transfer of word values (registers) in the telegram. Depending on the settings, the byte order will be changed by sending and receiving. Changing the byte order may be required e.g. when devices with different processor types are used.

Modbus on RTU protocol

Protocol description can be found in the chapter for Serial interfaces ↳ *Chapter 1.6.5.2.11.4 “Setting COMx - Modbus” on page 6108*.

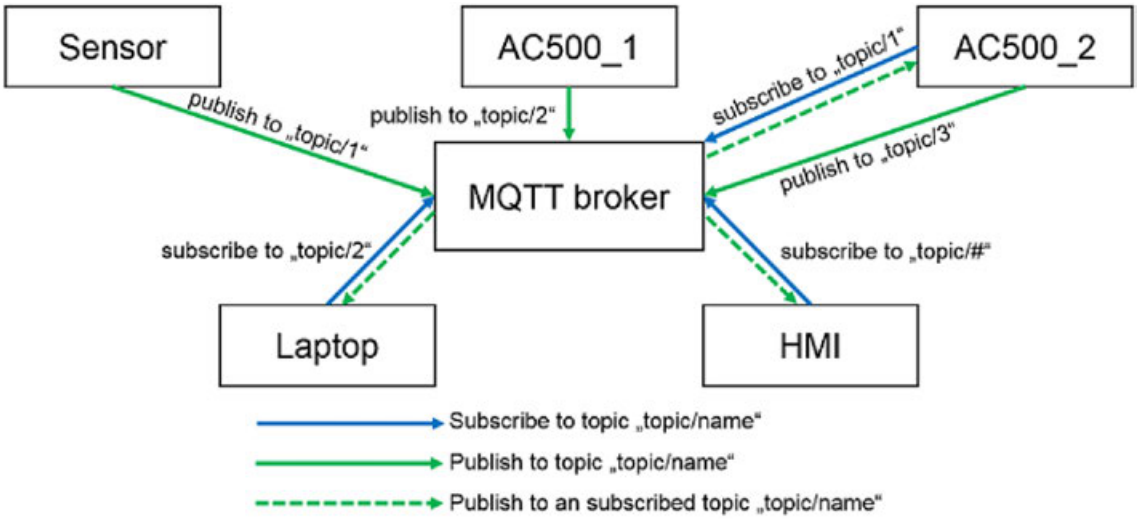
1.6.5.3.4 MQTT client protocol

System technology

The MQTT protocol is a lightweight communication protocol which is widely used on the internet to connect embedded device to the cloud.

The MQTT (Message Queuing Telemetry Transport) client library allows to integrate an AC500 processor module to act as a client in the MQTT protocol. Thus, it is possible to exchange data between the AC500 and other devices connected to the MQTT network.

In the figure below, there is an MQTT network with one broker (MQTT broker in the middle) and five clients. The figure shows the main functions of MQTT to send and receive data: publish and subscribe. The clients can publish messages with a specific topic to send data (e. g. the temperature of a connected sensor with a timestamp) to the MQTT broker. For example, the client “AC500_1” publishes a message to topic “topic/2”. On the other hand side clients can also subscribe to topics to receive data. For example, the client “Laptop” has subscribed topic “topic/2”. So all messages with the topic “topic/2” which has been published to the MQTT broker will be sent immediately to the client “Laptop”. This creates a message flow from the client "AC500_1" to the laptop.

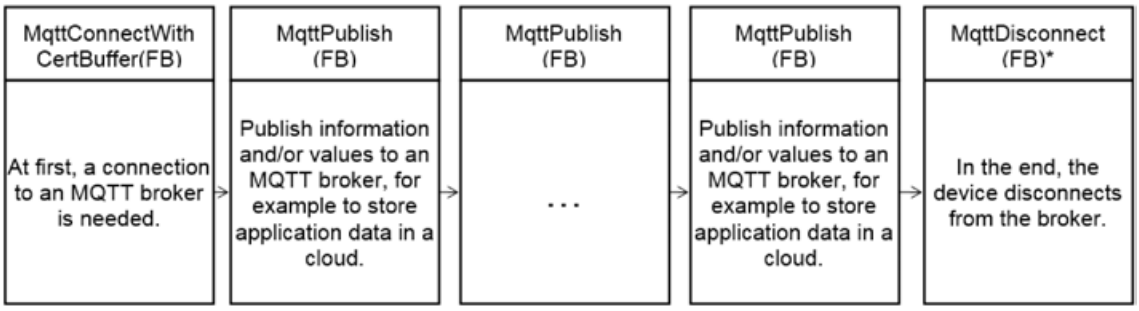


To realize the MQTT behavior, there are several function blocks implemented in the *Chapter 1.5.4.24 “MQTT client library” on page 1710*.

Table 753: Function blocks overview

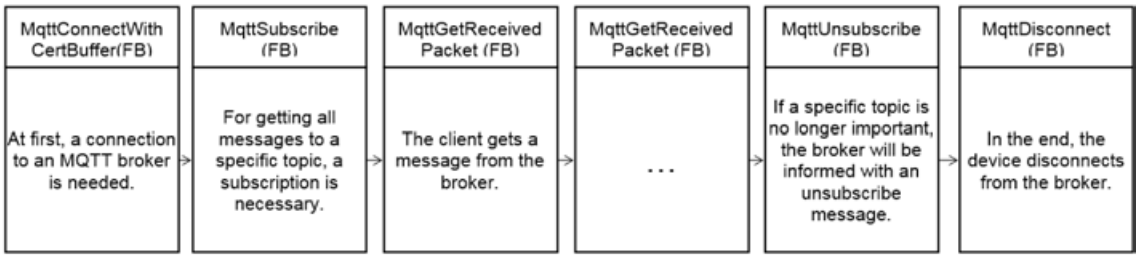
Function Block	Description
MqttConnectWithCertBuffer MqttConnectWithCertFile	Every MQTT use case starts with establishing a connection to an MQTT broker. Therefore, a connection structure needs to be created. The connection structure is used to identify the connection for subsequent operations like publish or subscribe. It is possible to establish an SSL connection. Using an SSL connection, at least a certificate for the server is needed. Certificates can be loaded from a buffer (program variable) or a file which is stored on the PLC.
MqttGetReceivedPacket MqttPing MqttPublish MqttSubscribe MqttUnsubscribe	These function blocks can be used on an established MQTT connection to realize the desired use case.
MqttDisconnect	This function block is the end of each use case.

One MQTT send use case could look like this:



*) It makes sense for several publish messages in a row (e. g. one message per second) not always open a new connection.

One MQTT receive use case could look like this:



TLS version

The MQTT client uses the TLS version 1.2.

Configuration in Automation Builder

For the MQTT client no configuration is needed.

Configuration in CODESYS

All function blocks have to be called in tasks with cyclically processing.

You can use the function blocks with:

- PLC_PRG with automatic task configuration or manual task configuration.
- One single program or different programs.
- One single task or different tasks.

With different programs assigned to different tasks you can define different cycle times and priorities.

Limitations

- No persistent session. After an interrupted connection, the client needs to subscribe on topics again in case of reconnect.
- One connection (MQTT_CONNECTION) cannot be shared between multiple tasks. Different connections can be used by different tasks or even within the same task.
- Only one FB can operate on a single connection at the same time. Always wait for the FB to complete before calling the next FB. To use two different FB's in parallel (like publish and receive) it is necessary to have two different connections, otherwise they must be called one after the other.

Hardware

The MQTT protocol requires AC500 devices with integrated Ethernet.

Examples

Example projects for the libraries can be found in the folder: \Users\Public\Documents\AutomationBuilder\Examples.

MQTT can be used using the MQTT client library or JSON. An introduction to programming with JSON is given in the *application example*.

1.6.5.3.5 SMTP protocol

Introduction of the SMTP protocol

> *SMTP Protocol is only available on the AC500 CPUs with onboard Ethernet.*

SMTP protocol allows a PLC to instruct a mail server in the network to send emails of user specified content to email accounts the SMTP server can reach (directly or via forwarding). The SMTP protocol is accompanied by the function block ETHx_SMTP_EMAIL_SEND within the AC500 Ethernet library. This function block replaces the previous ETH_SMTP_EMAIL_SEND function block of former CBP versions. Note: Input semantics have been changed.

Both function blocks allow users to transfer email content and data to the mail server via SMTP protocol implementation.

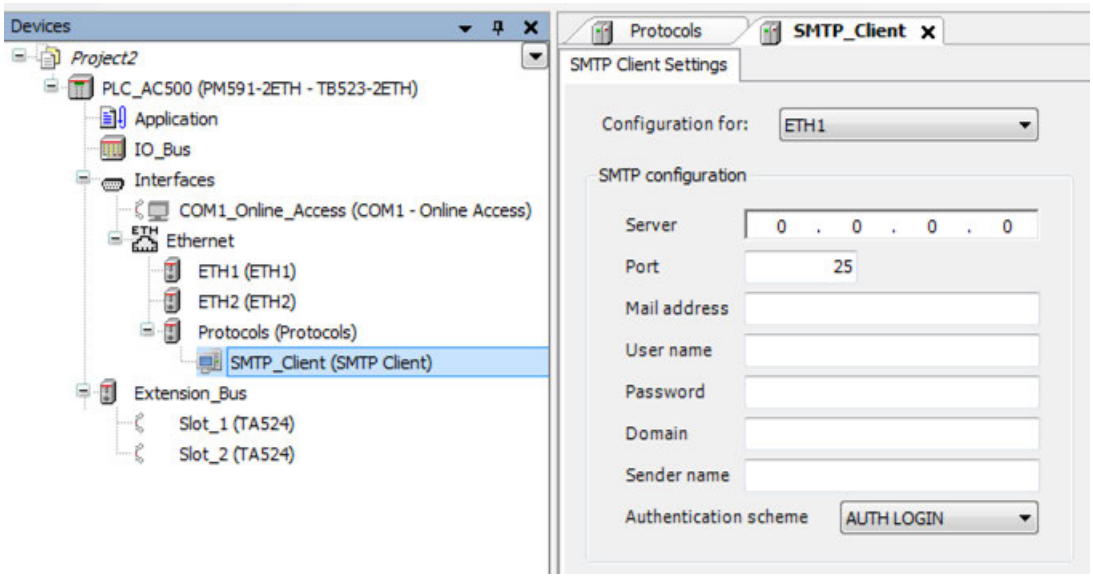
Please consider the following restrictions and constraints in the current AB Version:

- SMTP implementation only covers client functionality (AC500 can not receive emails) *Chapter 1.6.5.3.5.2 “Configuration of the SMTP protocol (>= CBP 2.4)” on page 6181*.
- Number of text lines in the email body is restricted to 20 lines with 255 characters each.
- Number of files attached to an email is restricted to 10 files with a file name of 255 chars and a path of 255 chars.
- SMTP implementation does not support secure connections to the SMTP server (like TLS or SSL).

Configuration of the SMTP protocol (>= CBP 2.4)

> *SMTP Protocol is only available on the AC500 CPUs with onboard Ethernet.*

For SMTP protocol configuration add a new object under Ethernet Interface. In the device tree double-click the new added item to open SMTP configuration:



The following parameters are available:

Parameter	Default	Value	Description
Configuration for SMTP configuration			
Server	0.0.0.0	-	Enter the IP address of the target SMTP server.
Port	25	-	Enter the SMTP port of the target SMTP server.
Mail address	Empty	-	Enter a valid email address.
User name / Password	Empty	-	Enter the user credentials for authentication at the SMTP server.
Domain	Empty	-	Domain of the target SMTP server. If an email address was entered, the data is set automatically.
Sender name	Empty	-	Name that will be used for SMTP mails. If an email address was entered, this address will be set by default.
Authentication scheme	AUTH LOGIN	AUTH LOGIN	With this authentication method, the users' password used for authentication is transferred in plain text to the target SMTP server.
		AUTH CRAM-MD5:	With this authentication method, the users' password used for authentication is transferred via CRAM-MD5 technology (Challenge-Response Authentication Mechanism, Message Digest 5) to the SMTP server.

1.6.5.3.6 SNTP protocol

Introduction of the SNTP protocol

- *SNTP Protocol is only available for AC500 CPUs with onboard Ethernet.*
- *If a high precision of system time is wanted, use a fully functional NTP server or at least a SNTP server with a high-precision time-source (e.g. DCF-77 receiver). Avoid cascading several levels of SNTP server / SNTP clients.*
- *Client requests are normally sent at intervals depending on the frequency tolerance of the client clock and the required accuracy. However, under no conditions requests should be sent at less than one minute intervals (see RFC 4330). Keep that in mind when setting polling-interval of the SNTP client, especially if a huge amount of clients use one single server.*
- *Be sure not to use broadcast or multicast addresses as server or backup-server since current SNTP implementation does not support manycast mode.*
- *If the AC500 PLC acts as SNTP server but is itself not synchronized with an external clock, e.g. a DCF77 device or the internet, the response telegram from the server back to the client will have the following flags:*
  - *Peer Clock Stratum: 15*
  - *Leap Indicator: unknown (clock unsychronized)*

  This might lead to negative effects on or with other devices that have contrary clock settings, e.g. a Peer Clock Stratum < 15. To avoid this, use the function block "RTC_SYNC_DISPLAY" (RTC_AC500_V20.lib) with the following settings:
  - *Peer Clock Stratum: primary reference (1)*
  - *Leap Indicator: no warning*

As of Automation Builder 1.1 SNTP protocol configuration has been moved to another location within the device tree. In former Versions SNTP protocol configuration has been configured under so-called *extended settings*.

As of and including Automation Builder 1.1 SNTP parameters for SNTP client and SNTP server are configured under the *Protocols* item in the device tree.

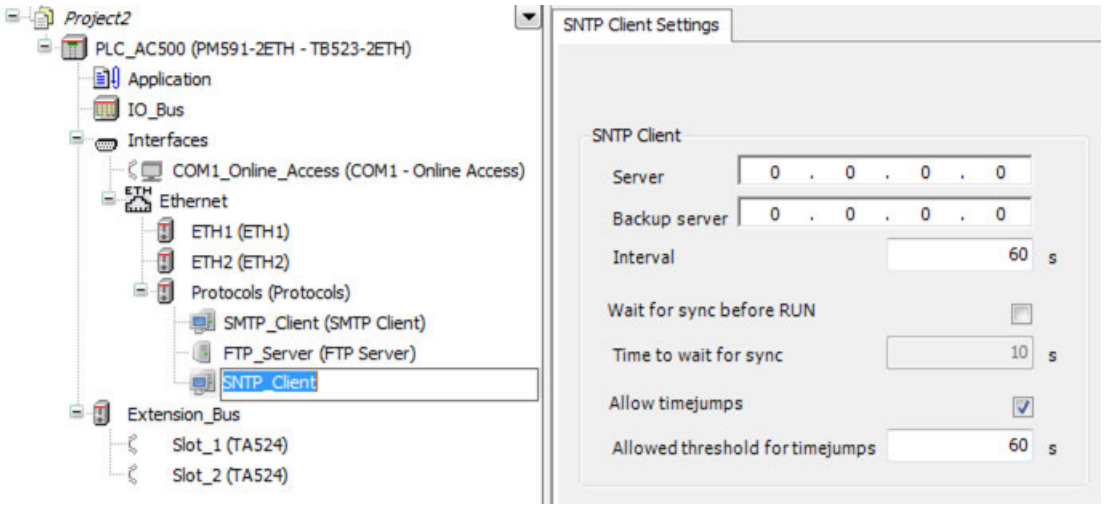
For further information on SNTP protocol configuration, see *Chapter 1.6.5.3.6.2 “Configuration of the SNTP protocol ” on page 6183*.

Configuration of the SNTP protocol

As of Automation Builder 1.1 SNTP protocol configuration has been moved to another location within the device tree. Note: Principle of SNTP configuration remains unchanged.

SNTP client configuration

For SNTP client configuration (Automation Builder 1.1) add a new object *“SNTP Client”* under *“Ethernet Interface ➔ Protocols”*:

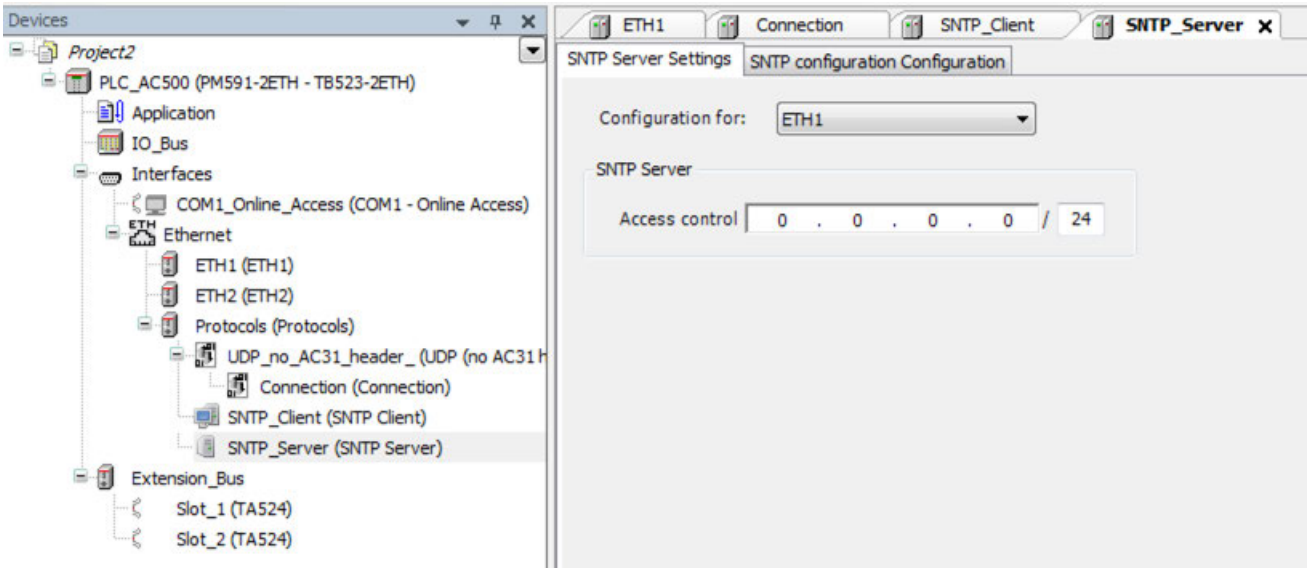


The following parameters are available:

Parameter	Default	Value	Description
SNTP Client			
Server	0.0.0.0	Valid IP address	IP address of the SNTP server.
Backup server	0.0.0.0	Valid IP address	IP address of the SNTP server which will be used if the primary server is unreachable.
Interval	60	15 ... 65535	Sets the interval in [s] for outgoing SNTP requests.
Wait for sync before RUN		Disabled	CPU does not wait for time synchronization from SNTP server and turns to RUN state immediately.
		Enabled	CPU waits for time synchronization from SNTP server and remains in Stop state after the time is over.
Time to wait for sync	10	1 ... 120	The time the CPU waits for receiving the time synchronization from SNTP server. If the CPU does not receive a valid time within the given period, an EC4 error appears.
Allow timejumps	Enabled	Disabled	Timejumps lead to an EC4 error in the CPU.
		Enabled	Timejumps are accepted. Parameter 'Allowed threshold for timejumps' can be adapted to determine the threshold for the timejumps. If the needed timejump exceeds the threshold, the CPU refuses the setting of time received from SNTP server and an EC4 error appears.
Allowed threshold for timejumps	60	1 ... 43200	Represents the threshold which is allowed for timejumps in [s].

SNTP server configuration

For SNTP server configuration (Automation Builder 1.1) add a new object *"SNTP Server"* under *"Ethernet Interface ➔ Protocols"*:



The following parameters are available:

Parameter	Default	Value	Description
Access control	0.0.0.0/24	Valid IP address	Sets the subnet from which incoming SNTP requests are accepted. Requests from other subnets will be ignored. Value 0.0.0.0/24 means IP address/ subnet mask. The subnet mask 24 means 255.255.255.0 The subnet mask 16 means 255.255.0.0

1.6.5.3.7 UDP protocol

Contents of the UDP protocol configuration

The available Ethernet devices support 2 types of UDP data exchange:

- UDP (no AC31 header): Up to 12 free UDP connections can be configured.
- UDP data exchange: up to 1 AC31 compatible UDP connection can be configured.

For further information on FTP server, see the following chapters:

Using UDP (No AC31 Header) *Chapter 1.6.5.3.7.2 "Using UDP (No AC31 header)" on page 6185*

Using UDP Data Exchange *Chapter 1.6.5.3.7.3 "Using UDP data exchange" on page 6187*

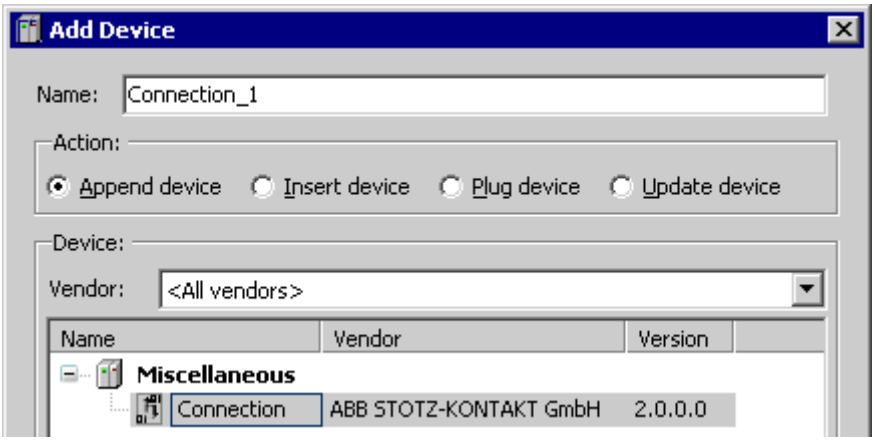
Using UDP (No AC31 header)

The UDP (no AC31 header) data exchange is a free UDP protocol that can be added to the AC500 Ethernet Communication Module. Up to 12 connections can be configured to each Ethernet device.

As of AB 1.1 (CBP 2.4.) UDP configuration has been moved to another location within the device tree. Note: Principle of UDP configuration remains unchanged.

Up to CBP 2.4

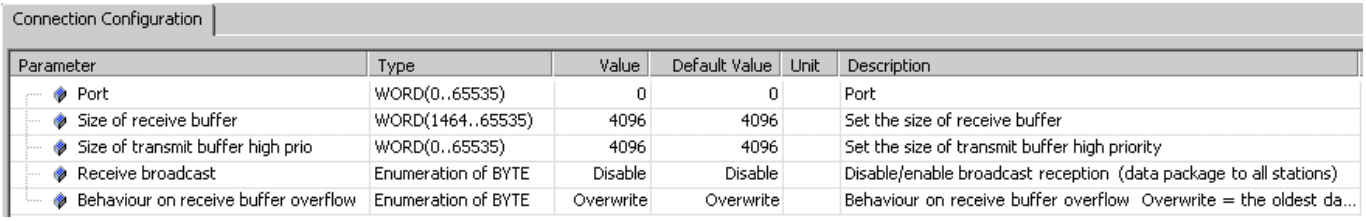
Right-click on the Communication Module and select Add device to open the Add Device dialog where the UDP data exchange module is listed:



Double-click on Connection (Connection) to open the Connection Configuration in editor window.

As of CBP 2.4

For UDP (no AC31 header) configuration add a new object under *“Ethernet Interface ➔ Protocols”*. In the device tree double-click the new added item to open the configuration:



The following parameters are available:

Parameter	Default	Value	Description
Port	0	0...65535	Port that is used for the UDP connection. See note below for further information.
Size of receive buffer	4096	1464...65535	Size of the receive buffer in [Bytes]. The behaviour in case of a full buffer can be determined with parameter Behaviour on receive buffer overflow.
Size of transmit buffer	4096	0...65535	Size of the transmit buffer in [Bytes].
Receive broadcast	Disable	Disable	Reception of broadcast packages is disabled.

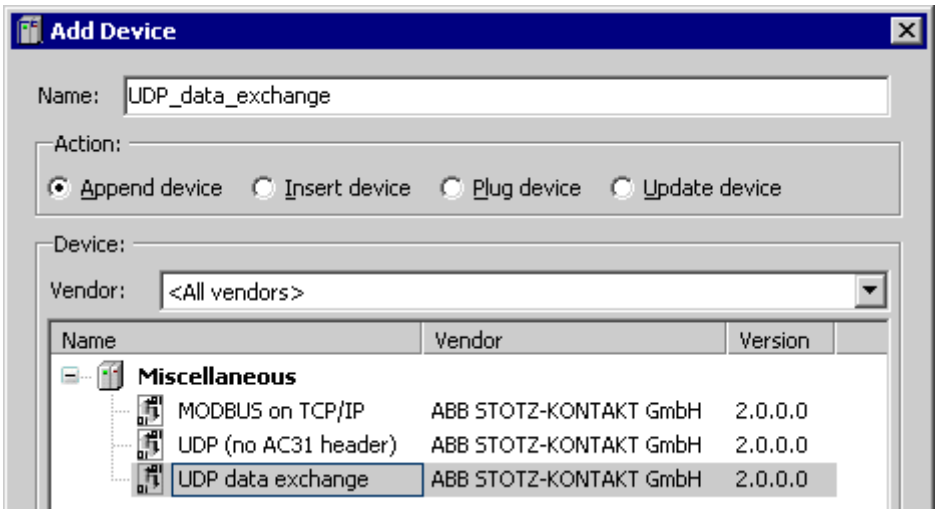
Parameter	Default	Value	Description
		Enable	Reception of broadcast packages is enabled. Broadcast packages will not be ignored by the controller.
Behaviour on receive buffer overflow	Overwrite	Overwrite	Incoming packages will overwrite the oldest packages in case of a full receive buffer.
		Reject	Incoming packages will be rejected in case of a full receive buffer.

The following ports are reserved and will cause a configuration error if selected: 1200, 1201, 123, 80, 24576, 25383.

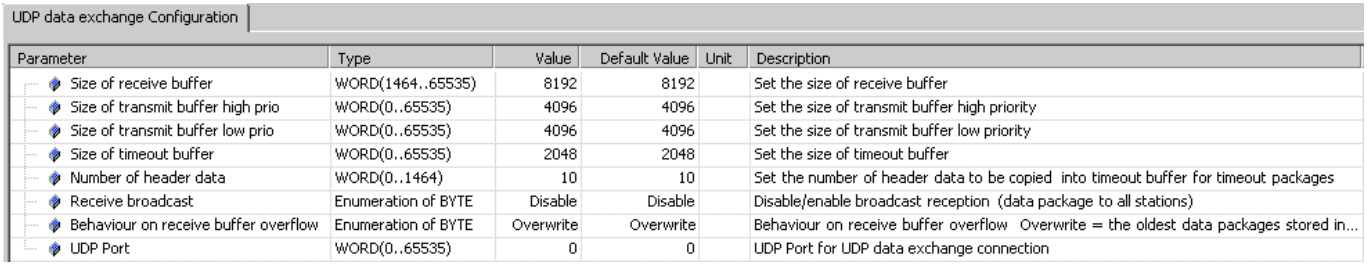
Using UDP data exchange

The UDP data exchange can be used to realize communication with AC31 devices and is an optional module that can be added to the AC500 Ethernet communication module.

Right-click on the communication module and select Add device to open the *Add Device* dialog where the UDP data exchange module is listed:



Double-click on *UDP_data_exchange* (UDP data exchange) to open the UDP data exchange Configuration in the editor window:



The following parameters are available:

Parameter	Default	Value	Description
Size of receive buffer	8192	1464...65535	Size of the receive buffer in [Bytes]. The behavior in case of a full buffer can be determined with parameter Behaviour on receive buffer overflow.
Size of transmit buffer high prio	4096	0...65535	Size of the high priority transmit buffer in [Bytes].
Size of transmit buffer low prio	4096	0...65535	Size of the low priority transmit buffer in [Bytes].
Size of timeout buffer	2048	0...65535	Size of the timeout buffer in [Bytes].
Number of header data	10	0...1464	Number of bytes that are copied into the timeout buffer for timeout packages.
Receive broadcast See note[1)]	Disable	Disable	Reception of broadcast packages is disabled.
		Enable	Reception of broadcast packages is enabled.
Behaviour on receive buffer overflow	Overwrite	Overwrite	Incoming packages will overwrite the oldest packages in case of a full receive buffer.
		Reject	Incoming packages will be rejected in case of a full receive buffer.
UDP Port See note[1)]	0	0...65535	Port used for the UDP connection.

Note[1)]

The following ports are reserved and will cause a configuration error if selected: 1200, 1201, 123, 80, 24576, 25383.

At this operating mode, the function blocks have no input for setting a port, so the port has to be identically at both sides. Otherwise, a communication is not possible.

UDP broadcast is only working properly with broadcast to the address 255.255.255.255.

1.6.5.3.8 FTP server

Preconditions for the use of the FTP server

- The FTP server is available on all AC500 PLCs with onboard Ethernet (i.e. AC500 CPU with Ethernet) and firmware version 2.1.0 or higher.
- To start the FTP server it has to be activated in the Automation Builder ↳ *Chapter 1.6.5.3.8.2 “Configuration of FTP server (< CBP 2.4)” on page 6189*.
- After downloading a project with an activated FTP server, you can connect to the PLC with a standard FTP client ↳ *Chapter 1.6.5.3.8.4 “Connection to a PLC running a FTP server” on page 6192* (e.g. "FileZilla").
- You can log in with different usernames giving access to different drives (for further details please see AC500_CPU_Memory_Locations.doc of the PLC):

Username	Accessible Drives	Comment
userdisk	user ramdisk "userdisk"	Size depends on product
ramdisk	system ramdisk "ramdisk" The system ramdisk should only be used for Firmware updates	Size depends on product
sdcard	SD card "sdcard"	Availability and size depends on inserted memory card
flashdisk	flashdisk "flashdisk"	PM592-ETH only
sramdisk	sramdisk "sramdisk"	Size depends on product
root	All available drives	-

Constraints for the usage of the FTP server are:

- User passwords are limited to 10 characters (no whitespaces).
- Directory and file names have to be in standard DOS 8.3 notation (e.g.: "abcdefgh.123" for a file or "12345678" for a directory) without \ / : * ? " < > |.
- Directory and file names may not contain whitespaces and are not case-sensitive.
- Maximum total path length: 255 characters.
- Maximum number of files in the root directory is limited (depends on memory location).

Configuration of FTP server (< CBP 2.4)

1. Open/Create a project for a PLC with onboard Ethernet (i.e. AC500 CPU with Ethernet).
2. Configure the onboard Ethernet.
3. Select: *“Node "IP_Settings"* ➔ *Tab "Extended settings"* ➔ *checkbox "FTP-Server active""*.
4. Configure the FTP server:

   "Port"

   --> TCP/IP-Port used to connect to the FTP-Server on the PLC.

   "Sessions"

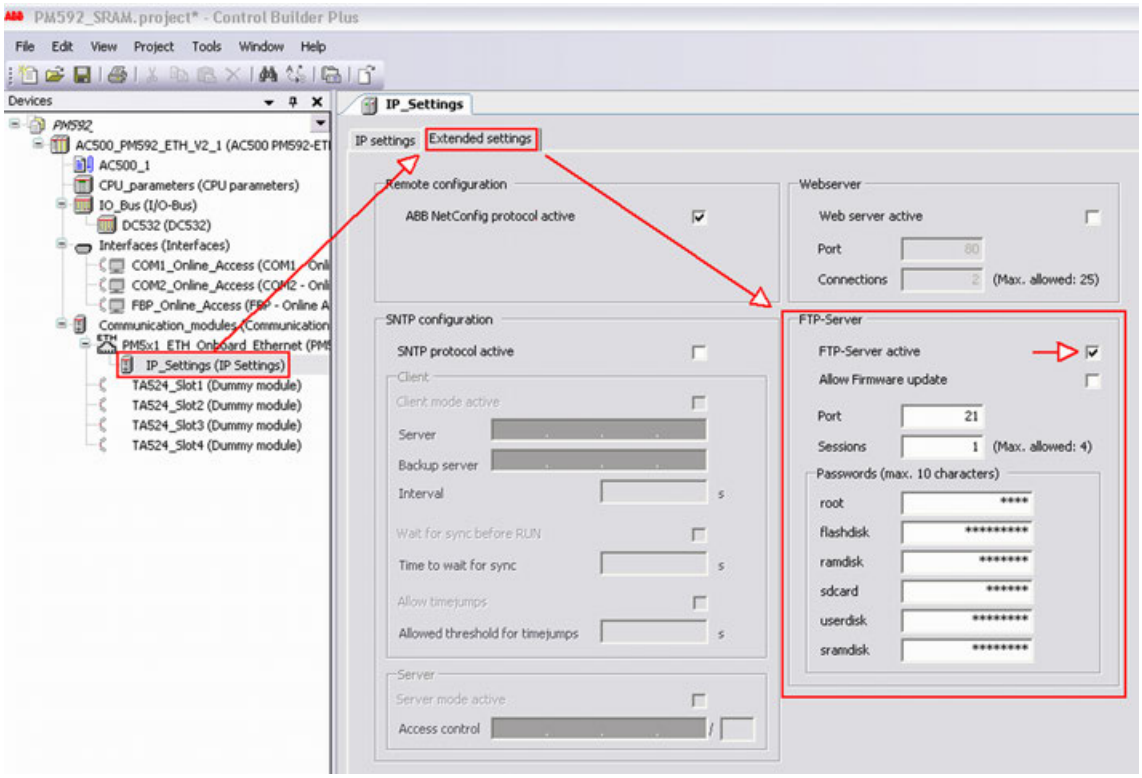
   --> maximum number of allowed simultaneous, parallel connections to the FTP-server

   each session uses one socket

   some FTP clients require several connections to work

   "Passwords"

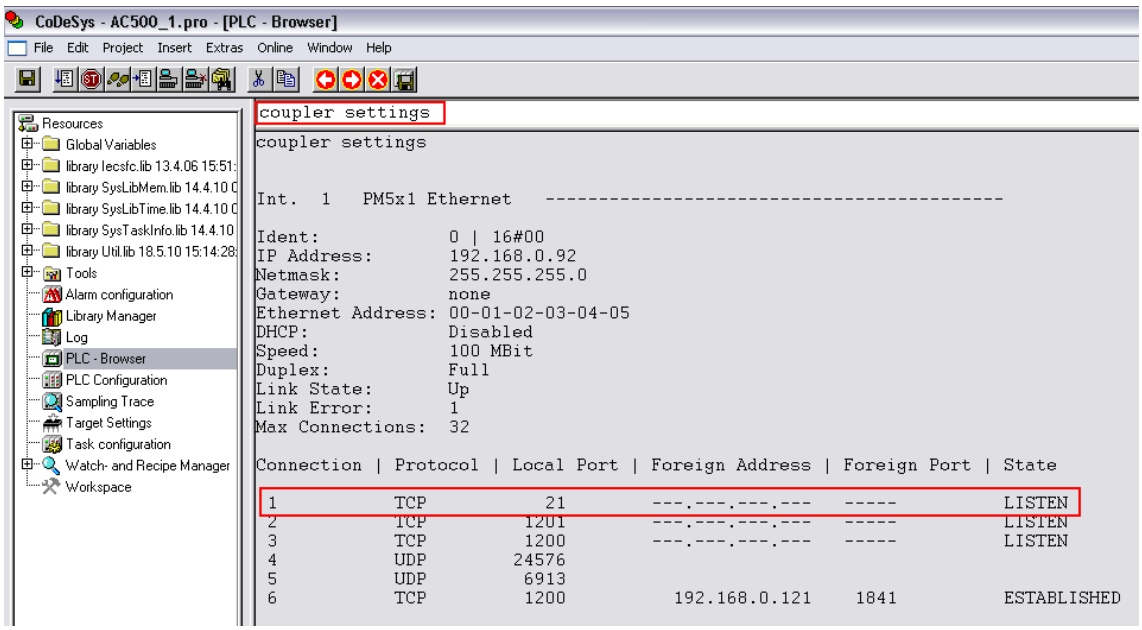
   --> set each user’s passwords for login (no entry means = no password).
5. Create configuration & download project to PLC.



If the checkbox "Allow Firmware update" is activated, you can download a PLC firmware to the RAM disk and the PLC will automatically update the device with the downloaded firmware. Afterwards a restart of the PLC is required. For further details please see FW_UPDATE_DOCUMENTATION.

> *The system RAM disk should only be used for Firmware updates.*

If the TCP protocol listens on the configured FTP port, the server is ready for login.

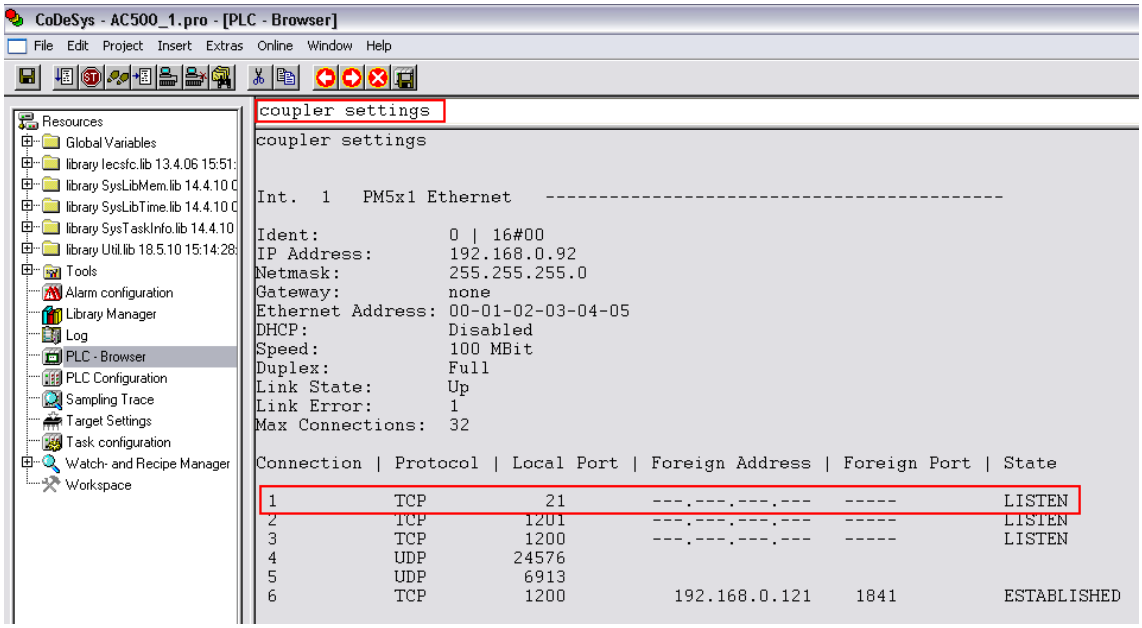


Configuration of FTP server (>= CBP 2.4)

1. Under Ethernet -> Protocols add a new object and select FTP server from the list.
2. Double-click the *"FTP_Server"* item to open FTP server configuration. Depending on the PLC device all or some of the following parameters and options are available:

Parameter		Default	Value	Description
Configuration for		ETH1	ETH1/ ETH2	Select the desired Ethernet connection used for FTP server.
FTP Server				
	Allow Firmware update	Disa-bled	Enabled	CBP firmware/Automation Builder firmware is not updated automatically. You can download a PLC firmware to the RAM disk and the PLC will automatically update the device with the downloaded firmware. Afterwards a restart of the PLC is required. For further details see FW_UPDATE_DOCUMENTATION.
			Disabled	CBP firmware is updated automatically.
	Port	21	1...x	Enter the TCP/IP-Port used to connect to the FTP server on the PLC.
	Sessions	1	1...4	Enter the max. number of allowed simultaneous and parallel connections to the FTP server. Each session uses one socket. Note: Some FTP cli-ents require several connections to work.
Passwords		-	-	Set each user's passwords for login. No entry = no password.
	root	-	-	
	ramdisk	-	-	The system RAM disk should only be used for firmware updates.
	sdcard	-	-	Inserted memory card.
	userdisk	-	-	User section of the flash disk.
	flashdisk	-	-	Only available with PM5675-2ETH
	sramdisk	-	-	

1. Create configuration & download project to PLC.
2. If the TCP protocol listens on the configured FTP port, the server is ready for login.



Connection to a PLC running a FTP server

After activating the FTP server, you can log onto the PLC from a PC with a FTP client. In the following example the web browser Microsoft Internet Explorer has been used:

1. Start the FTP client application.
2. Enter the URL with the syntax:

   "ftp://<USERNAME>:<USER_PASSWORD>@<HOST_IP>:<PORT>" into the address line with:

   "USERNAME" to the drive you want to access;

   "USER_PASSWORD" to the password of the user set in the Automation Builder;

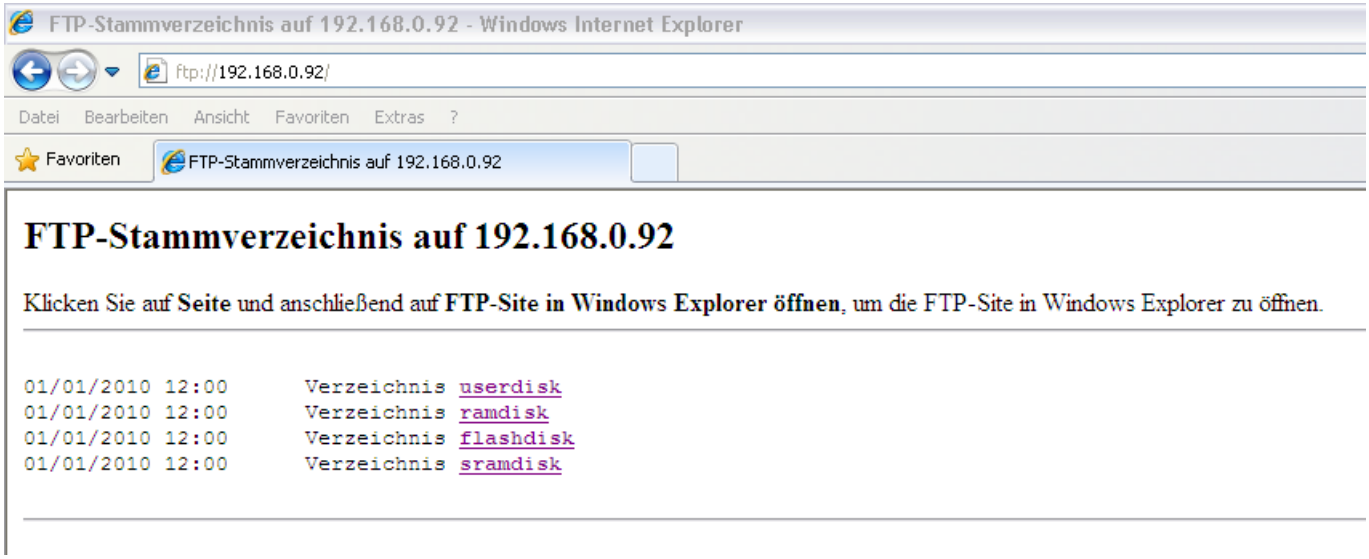
   "HOST_IP" to the IP address of your target PLC running the FTP server;

   "PORT" to the FTP port configured in the Automation Builder;

   for example:

   ftp://root:MyPwd@192.168.0.92:21

   ftp://sramdisk:Pwd123@192.168.0.83:20
3. Connect to the PLC (Press "Enter"-key).



If the connection has been established successfully, Internet Explorer will show the available contents of the root directory of the chosen user (i.e. the available drives is logged in as "root" as shown above). For further details on usage of a FTP client please refer to its documentation.

1.6.5.3.9 Web server

Configuration

Configuration in Automation Builder

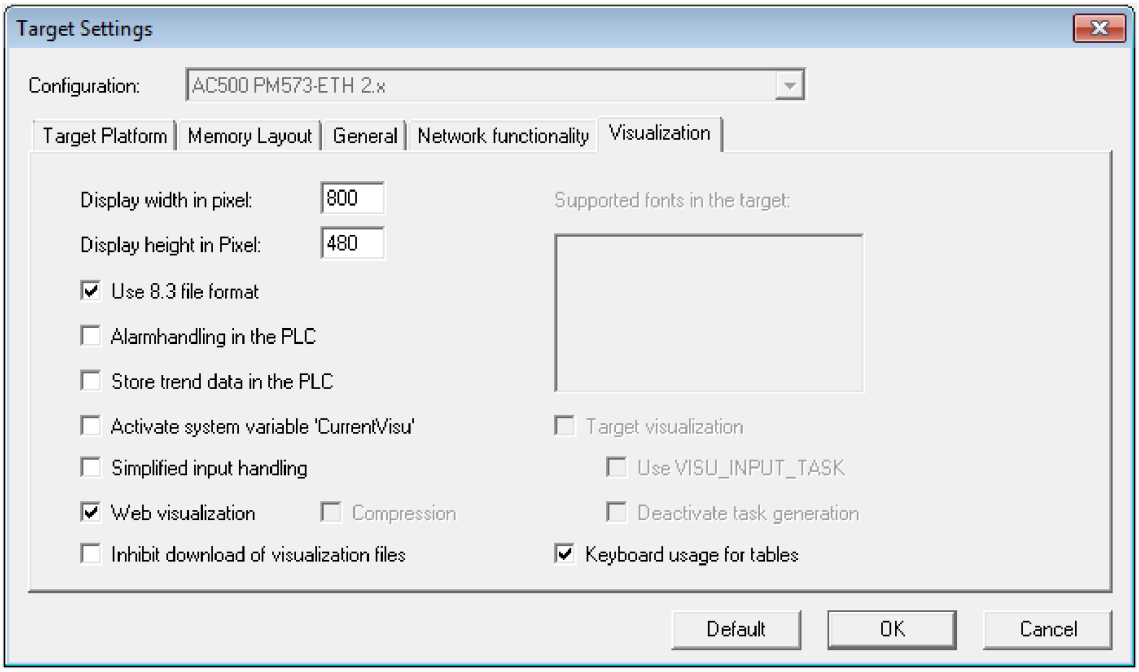
1. In your PLC project, click *"Interfaces ➔ Ethernet ➔ Protocols"* and add a new object *"Web Server"*.
2. Open the web server settings to change the default settings if required.

   Before changing the number of parallel connections for the web server, check the general information on *Chapter 1.6.4.1.6.1.1 "Ethernet protocols and ports for AC500 V2 products" on page 5442*.

Parameter	Default	Value	Description
Port	80	0 ... 65535	Listen port of the web server
Connections	2	1 ... 25 (depending on CPU type)	Number of parallel connections accepted by the web server. Depending on the CPU type and web-visu complexity it might be possible to have more connections to different clients. The connections will be opened and closed one after the other. This might lead to the impression of more parallel connections than configured.

Configuration in CODESYS

1. Open the CODESYS.
2. In the *“Resources”* tab click on *“Target Settings”* and select the *“Visualization”* tab.



⇨ If required, change *“Display width”* and *“Display height”* for the web pages.

Enable *“Web visualization”* check box, otherwise the webpages are only visible in online mode.

Ensure *“Inhibit download of visualization files”* check box is disabled.

> *If you enable “Activate system variable 'CurrentVisu'” check box and define a global variable “CurrentVisu” [STRING(40)] in your project, then the name of the active visualization will be stored in this variable. You can switch between your visualization pages by changing this value.*

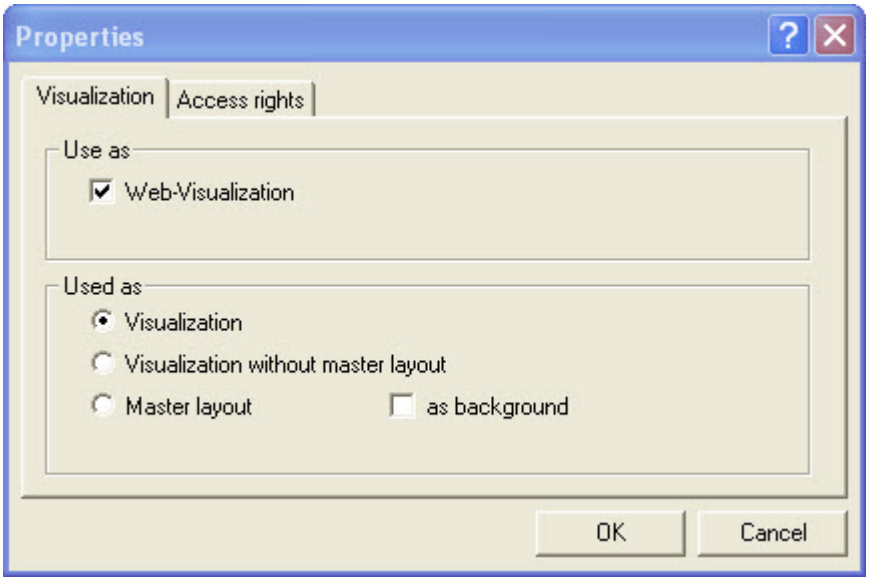
3. In CODESYS open the *"Visualizations"* tab to create the webpages. The first entry is the start page of your visualization project and must be named "PLC_Visu".

   ⇨ Further information on the creation and formatting of websites is provided in the CODESYS section ↳ *Chapter 1.4.5 "Web visualization" on page 721*. When building up your visualization project, consider the required disk space on the user RAM disk.

4. By default, all objects in the visualizations tab are marked for web visualization. When the project is built, all marked objects are saved as XML files (objectname.xml) into the project.

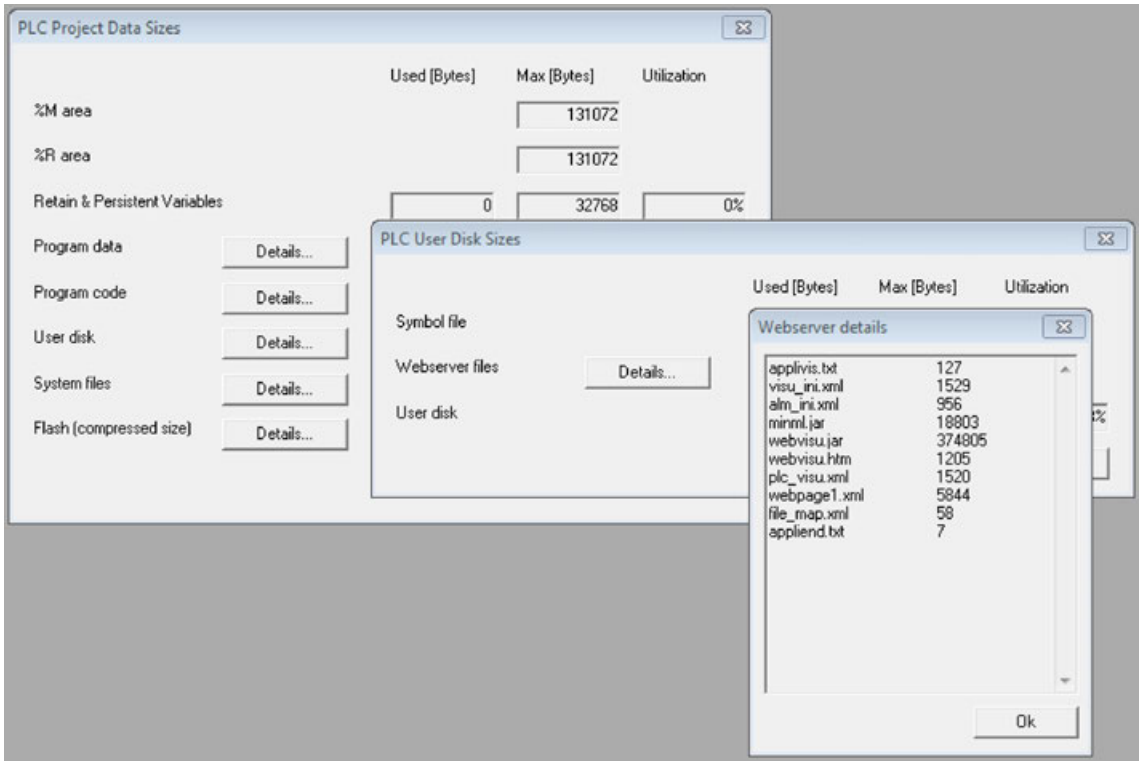
   To exclude a particular visualization object from the web visualization, click *"Project ➔ Object ➔ Properties"*.

   In the *"Visualization"* tab disable *Web-Visualization* check box.



5. Open a web browser and enter the IP address to the PLC (webserver project): http://<IP address/webvisu.htm>.

6. Click *“Online ➔ Show file information”* to check the *“PLC Project Data Sizes”*.



1.6.5.4 Data transfer and programming

1.6.5.4.1 Data transfer and CODESYS programming

Creating configuration data

☑ If the setup of all devices has been finished, you can create the configuration file.

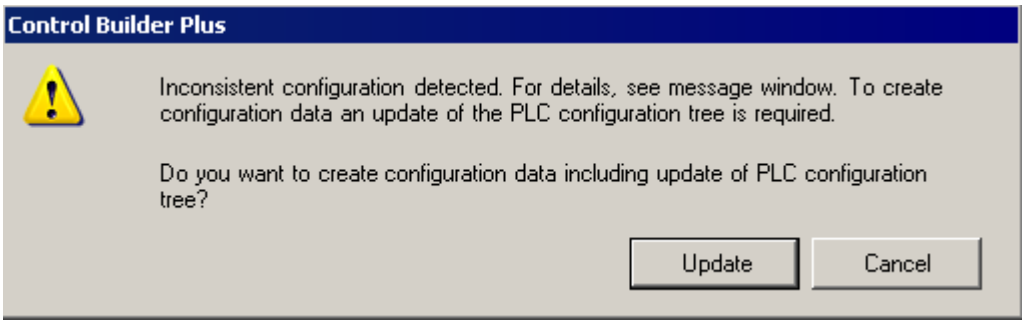
▷ Right-click on *“Application”* and select *“Create configuration data”* from context menu.

⇨ The generation process starts. The progress is shown in the status bar of Automation Builder.

Check integrity Within a Automation Builder version only device versions of this Automation Builder version can be used. By following the use case described in the chapter Use Cases the system takes care about this project integrity. Additionally Automation Builder performs an integrity check for the selected PLC before generating the configuration.

The integrity check can manually be called for the complete project:

1. Select the menu item *"Project ➔ Check integrity"*.
   ⇨ Automation Builder checks the project integrity for the complete project ("Project integrity" checks if all devices in the device tree are installed in the device repository).
   If the integrity check was successful a success message is displayed.
   If the integrity check was not successful the following message is displayed:



2. Click *"Update"* button:
   ⇨ Automation Builder updates the configuration to the latest version, creates configuration data and starts CODESYS V2.3.
3. Click *"Cancel"* button:
   ⇨ Creates configuration data and Automation Builder does not start CODESYS V2.3.

If the integrity check fails the Message Window displays further details.

In case of inconsistent configuration data update correct your project. Update all devices and install all 3rd party devices as used in the project.

Following error messages indicating that devices are not installed properly: "The device XXXXXX was not found in the device repository! Please reinstall this device using the menu item *"Tools ➔ DeviceRepository"*.

Install the device. ↳ *Chapter 1.6.5.2.1 "Device repository" on page 5811*.

"The version of device XXXXXX is not compatible with the current version."

Update to new version.

Launching programming system CODESYS V2.3.9.x

In your PLC project, double-click on *"Application"* to open the CODESYS V2.3.9.x project.

CAUTION!
Risk of damaged Automation Builder projects!
Projects created with Automation Builder are incompatible with CODESYS V2.3.9.x. Opening these projects directly with CODESYS V2.3.9.x may cause corrupted projects. Always use Automation Builder to open these projects.

If several instances of CODESYS V2.3.9.x are opened, double-clicking on the target item brings the corresponding CODESYS V2.3.9.x instance to the front.

CPU name

The name of the used AC500 CPU is shown in the main node of the device tree.

The names of the devices can be edited by selecting the corresponding entry and clicking the entry. The name must be unique and cannot be reused in the same project. Automation Builder automatically appends double entries with an up counting number as an suffix.

The IEC naming rules are not checked during input in Automation Builder.

Source download/upload in Automation Builder

Source download

The *"Source download"* downloads and stores the current project as a Zip-file on the PLC's memory card.

- Right-click *"PLC_AC500_V2 <...>"* node and click *"Source download"*.

Source upload

The *"Source upload"* retrieves a previously downloaded project from memory card to a selectable directory on the Automation Builder PC and optionally opens Automation Builder with this uploaded project.

- Click *"File"* in the main menu of Automation Builder and click *"Source upload"*.

Internally both commands are invoking a hidden instance of CODESYS V2.3 which is then working in batch mode to accomplish the download/upload.

Most of the error messages which could occur during the process are raised by CODESYS V2.3 and will then be displayed in Automation Builder as a result message box (the language of the message box is the installed language of CODESYS V2.3, the messages are sometimes quite "basic").

Before using the commands, check the following:

- *No CODESYS V2.3 instance started from within Automation Builder on the same PLC node should be running.*
- *To perform the download/upload, CODESYS V2.3 must be able to log in/on to the PLC. Therefore the gateway settings should be correct and saved to project file. It is recommended to test once the ability of CODESYS V2.3 to log in/on to the PLC.*
- *A formatted memory card must be mounted in the PLC's memory card slot.*

1.6.5.4.2 Programming and testing

Programming interfaces to the AC500 used by control builder plus / Automation Builder

The AC500 controllers provide the following interfaces for communication with other devices.

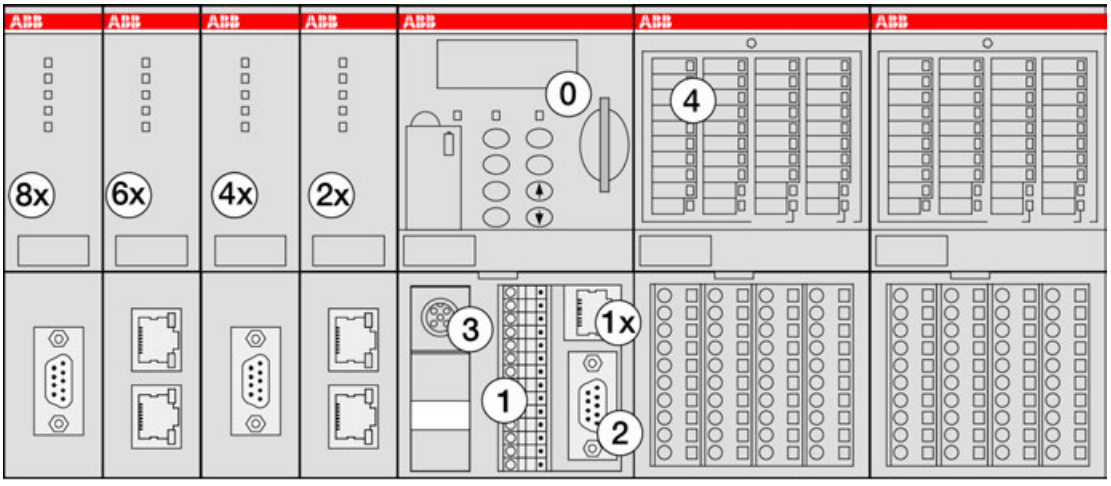
For all AC500 CPUs:

No.	Designation	Interface	Programming access
0	CPU	Own CPU	CPU for online operation
1	COM1	Serial interface COM1	yes
2	COM2	Serial interface COM2	yes

For PM57x, PM58x and PM59x only:

No.	Designation	Interface	Programming access
3	FBP	FBP slave interface	yes (as of FW V1.1.7)
4	I/O bus	I/O bus	no
1x	Line 0	Internal communication module with channel 0 x 9	depends on type
2x	Line 1	Communication module inserted in slot 1 with chan. 0 x 19	depends on type
4x	Line 2	Communication module inserted in slot 2 with chan. 0 x 19	depends on type
6x	Line 3	Communication module inserted in slot 3 with chan. 0 x 19	depends on type
8x	Line 4	Communication module inserted in slot 4 with chan. 0 x 19	depends on type

PM55x and PM56x CPUs only have RS-485 COM-interface, which can be transferred to RS-232 by using a RS-232->RS-485 adapter.



Communication drivers

The following communication drivers are available and recommended for programming the AC500:

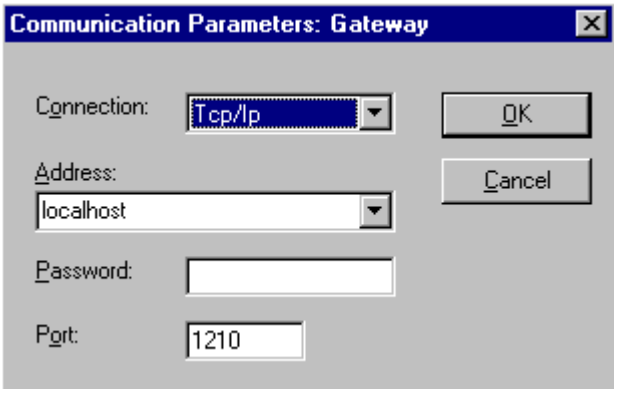
Communication driver	Description
Tcp/Ip	Ethernet driver
ABB Tcp/Ip Level 2 AC	Ethernet driver with routing functionality (as of PS501 V1.2, routing as of firmware V1.3.x)
Serial (RS-232)	Serial interface driver
ABB RS-232 Route AC	Driver for serial interfaces with routing functionality (as of PS501 V1.2, routing as of firmware V1.3.x)
ABB ARCNET AC	Driver for programming via ARCNET with routing and adjustable block size (as of PS501 V1.2, routing as of firmware V1.3.x)
Serial (Modem)	Modem driver for modem connected to serial interface of the PC and PLC
Note: It is recommended not to use the **Tcp/Ip (Level 2 Route)** driver for new projects. This driver is only available for compatibility reasons in order to support easy update of an old project.	

Routing is available with version V1.3.x of the Control Builder and PLC firmware.

Gateway configuration

In Control Builder, select "Online/Communication Parameters/Gateway" and select "Local" from the "Connection" list box:

The following gateway settings apply for the Ethernet driver "ABB Tcp/Ip Level 2 AC":



Communication parameters

The communication parameters and address data are set in the Control Builder by selecting the desired driver and specifying the parameters in the "Communication Parameters" window, which can be opened using the menu item "Online/Communication Parameters".

The following sections describe the drivers listed above and their settings.

Programming via the serial interfaces

The operation modes of the serial interfaces COM1 and COM2 are described in the chapter ↳ *Chapter 1.6.5.2.11 “Serial interfaces COM1 and COM2” on page 6098*. Both serial interfaces COM1 and COM2 are defined as programming interface by default.

The Installation guide provides information how to set the serial interfaces for the different PC operating systems.

For the CPUs PM57x, PM58x and PM59x, PC and PLC are connected via the Programming Cable TK501 or TK502.

For the CPUs PM55x and PM56x, PC and PLC are connected via the Programming Cable TK503 or TK504.

> *The load of PM55x and PM56x should not exceed 80 % in order to obtain a stable communication between the PLC and the PC via the serial interfaces. The load of the CPU can be displayed with the PLC Browser via the command cpuload.*

The interface parameters are set to fixed values and cannot be changed.

Transmission rate: 19200 baud

Parity bit: no

Data bits: 8

Stop bits: 1

Synchronization: none

Motorola byteorder: yes

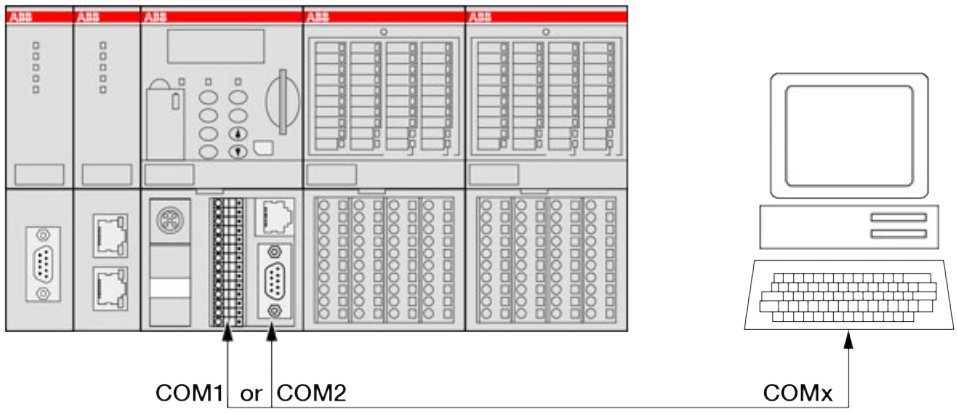
The following drivers are available for programming via the serial interfaces:

- Serial (RS-232)
- ABB RS-232 Route AC (as of PS501 V1.2, routing as of firmware V1.3.x)

Serial driver "Serial (RS-232)"

The serial driver "Serial (RS-232)" provides the following functions:

- Online operation of the PLC with the Control Builder
- OPC connection with OPC server, as of version V1.0
- Parallel operation of Control Builder and OPC server

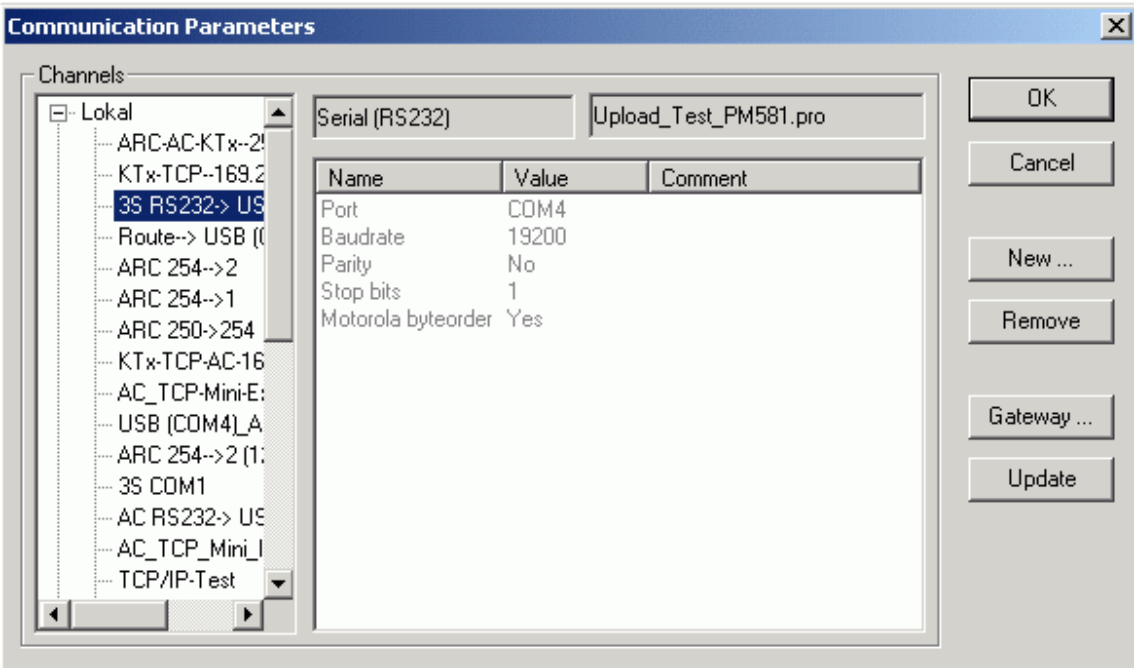


To define a new gateway channel for the serial driver, select "Online/Communication Parameters" and press the button "New" in the "Communication Parameters" window. In the appearing window, enter a name for the channel (for example USB->COM4) and select the driver "Serial RS232" from the device list. Select the desired values by double clicking the corresponding parameter:

Port: COM port on the PC

Transmission rate: 19200 Baud

Motorola byteorder: Yes

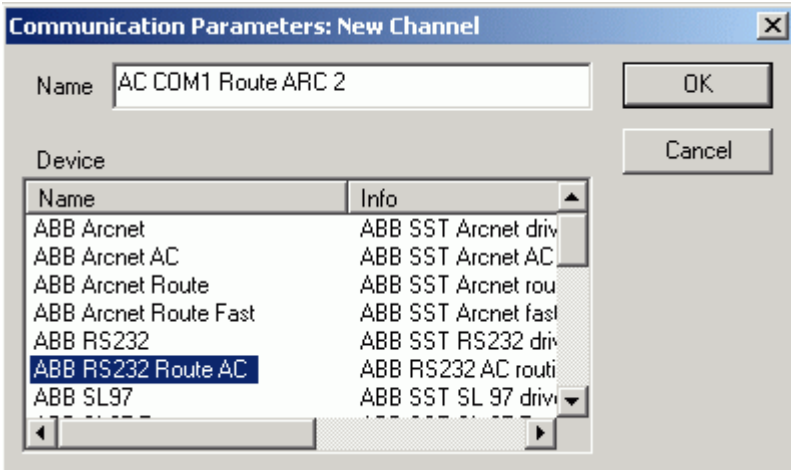


Serial driver "ABB RS232 Route AC"

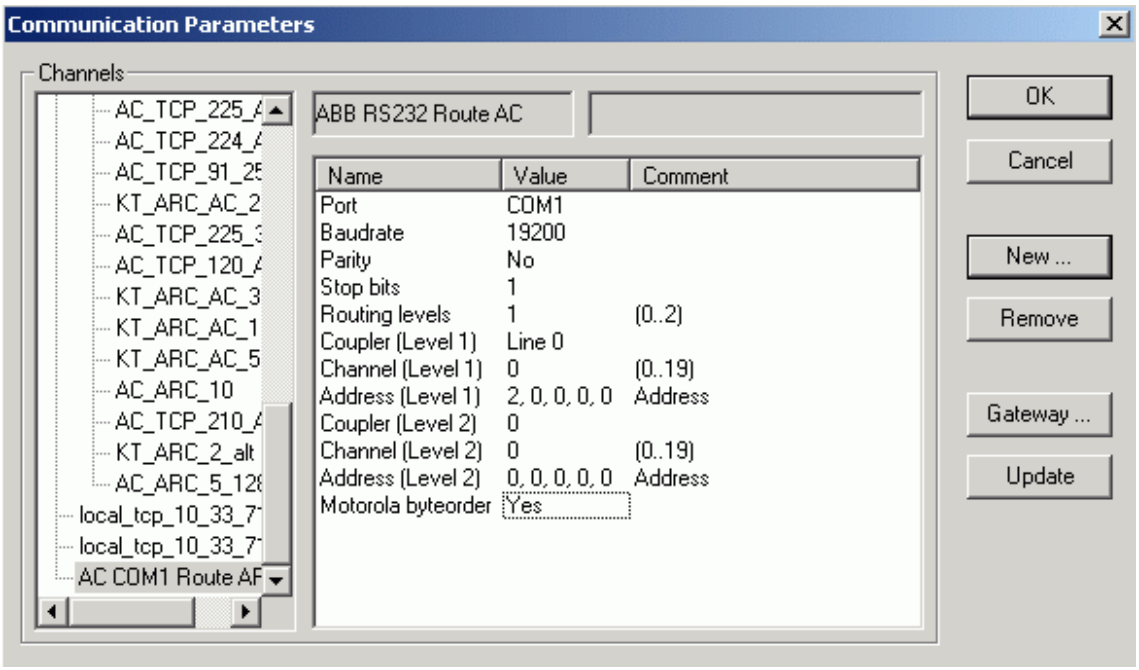
As of version V1.2.0, the serial routing driver "ABB RS232 Route AC" is available in addition to the serial driver. This driver provides the following functions:

- Online operation of the PLC with the Control Builder
- OPC connection with OPC server, as of version V1.2.0
- Online operation of PLCs connected via Ethernet or ARCNET using the serial interface (Control Builder version V1.3 and later)
- Parallel operation of Control Builder and OPC server

To define a new gateway channel for the serial routing driver, select "Online/Communication Parameters" and press the button "New" in the "Communication Parameters" window. In the appearing window, enter a name for the channel (for example AC COM1 Route ARC 2) and select the driver "ABB RS232 Route AC" from the device list.



The following communication parameters can be set for the serial routing driver "ABB RS232 Route AC":



Parameter	Possible values	Description
Port	COMx (PC dependant)	Serial interface of the PC
Transmission rate	19200	Always 19200 baud
Parity	No	Always no parity
Stop bits	1	Always one stop bit
Routing levels	0...2	Routing levels (0 = none)
Communication Module (Level 1)	0, line 0...line 4	Communication Module for level 1
Channel (Level 1)	0...19	Channel on Communication Module level 1
Address (Level 1)	0, 0, 0, 0, 0 (max. 5 bytes)	Address in target Communication Module level 1
Communication Module (Level 2)	0, line 0...line 4	Communication Module for level 2
Channel (Level 2)	0...19	Channel on Communication Module level 2
Address (Level 2)	0, 0, 0, 0, 0 (max. 5 bytes)	Address in target Communication Module level 2
Motorola byteorder	yes	Selection of Motorola or Intel byte order

If you want to use the serial routing driver in order to directly access the connected CPU, set all routing parameters (parameter Routing levels and following parameters listed in the table above) to 0.

Routing is available with version V1.3.x of the Control Builder and PLC firmware.

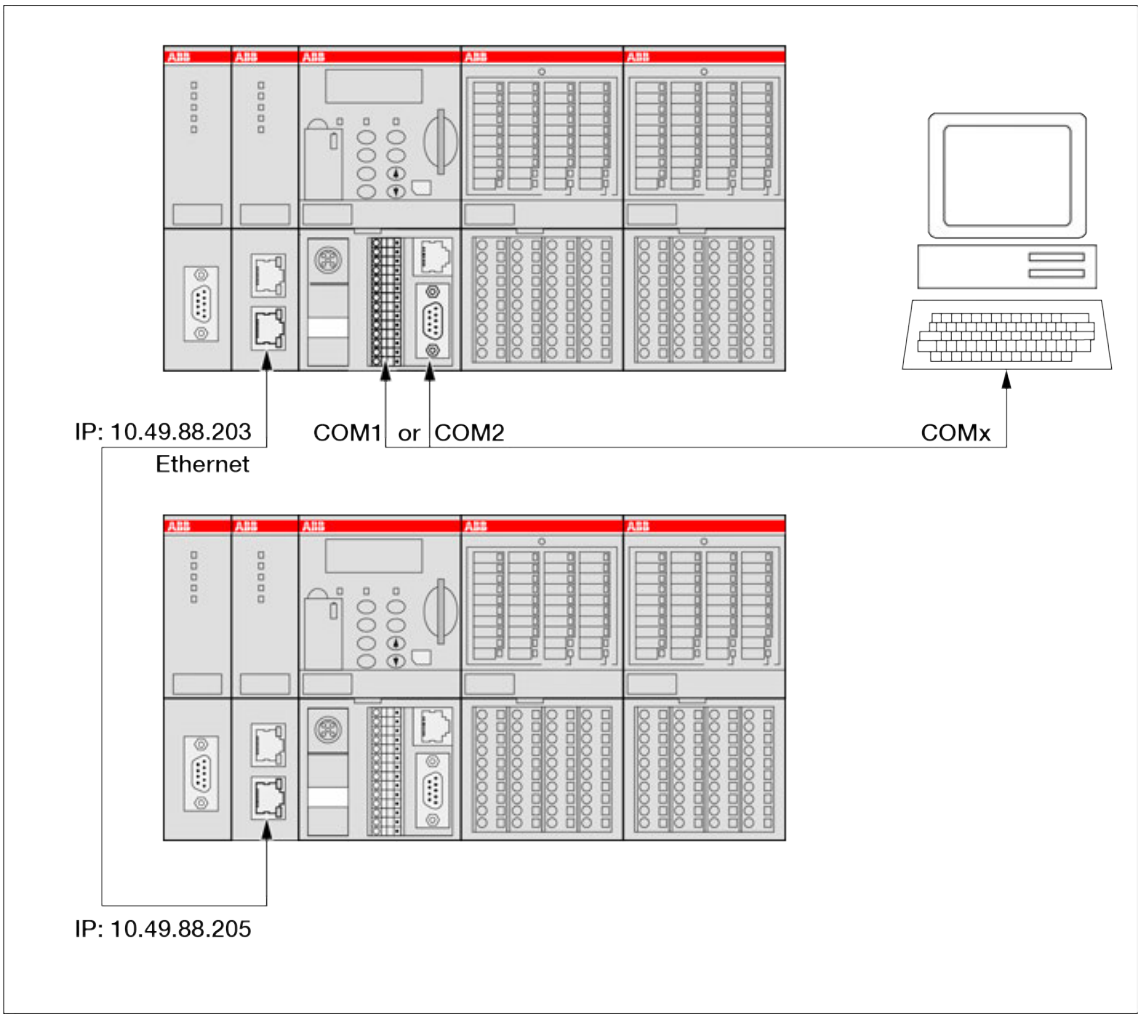
The following applies to the routing levels:

Routing levels = 0 No routing (parameters for Level 1 and Level 2 not set)

Routing levels = 1 Single-level routing (set parameters for Level 1)

Routing levels = 2 Double-level routing (set parameters for Level 1 and Level 2)

Example



Configuration of PLC 2 (IP: 10.49.88.205) shall be performed via the external Ethernet Communication Module (IP: 10.49.88.203) inserted in slot 1 of PLC 1. The serial PC interface COM2 is connected to the serial interface COM1 of PLC 1:

Parameter	Value	Remark
Port	COM2	PC COM2
Transmission rate	19200	
Parity	No	
Stop bits	1	
Routing levels	1	Single-level routing
Communication Module (Level 1)	Line 1	Communication Module in slot 1
Channel (Level 1)	0	Channel 1
Address (Level 1)	10, 49, 88, 205, 0	Subscriber address of the target PLC (Node 2)
Communication Module (Level 2)	0	No level 2

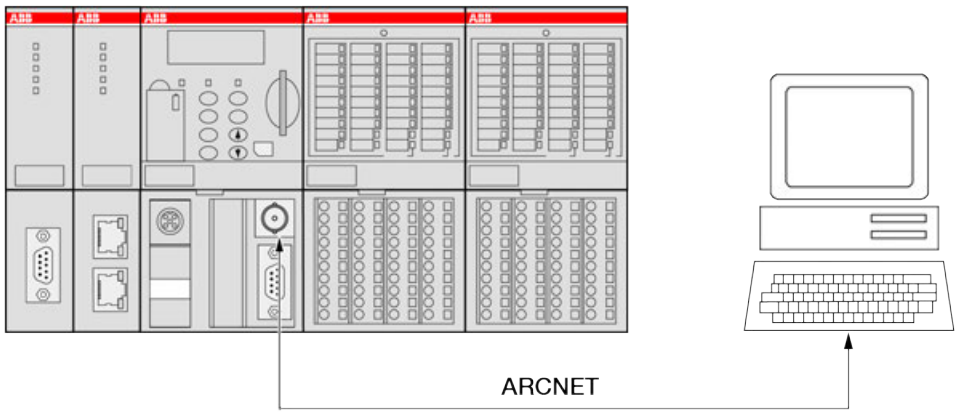
Parameter	Value	Remark
Channel (Level 2)	0	
Address (Level 2)	0, 0, 0, 0, 0	
Motorola byteorder	yes	Motorola byteorder

Programming via ARCNET

The ARCNET Communication Module is available as of Control Builder version V1.2 and PLC firmware version V1.2.0.

Programming via ARCNET is only possible on a PC with installed ARCNET board.

When programming via ARCNET, the PC is an ARCNET node.



The "sender node", i.e., the ARCNET subscriber address of the PC is set in the file:

Arcnet_xx.ini with the parameter NodeID1 = 254.

The file Arcnet_xx.ini is located in the folder where the PC operating system is installed (for example C:\WINNT for Win2000).

For a PC with installed ARCNET board, the file Arcnet_xx.ini contains for example the following entries:

[ARCNET]

DriverAccessName1=FARC

;Default = Farc

NodeID1 = 254

; Default = 254

;DriverAccessName2=FARC1

; Default = Farc1

;NodeID2 = 253

; Default = 253

;DriverAccessName3=FARC11

; Default = Farc11

;NodeID3 = 252

; Default = 252

;DriverAccessName4=FARC111

; Default = Farc111

;NodeID4 = 251

; Default = 251

The current card drivers can be downloaded from the SoHard website. The driver versions listed in the "Driver file" column were tested.

Installation of ARCNET cards

Overview of Supported ARCNET cards

Support of ARCNET cards is available as of version V2.x

The following ARCNET cards are available for the programming of AC500 PLCs in the integrated ARCNET Communication Module.

ARCNET card	Bus type	Operating system	Driver file (on SoHard website)	Driver
SH FARC E3 (K) (with COM20022)	ISA	Win2000/XP	W2K_RAW_DRIVER_V0518.zip ..\ARCNET\Win2000	Farc.sys
SH ARC PCI	PCI	Win2000/XP	W2K_RAW_DRIV-ERSH FARC E3 (K) (with COM20022)_V0518.zip ..\ARCNET\Win2000	Farc.sys
SH ARC PCMCIA with SH KOAX-PCMCIA	PCMCIA	Win2000/XP	W2K_RAW_DRIVER_V0518.zip ..\ARCNET\Win2000	Farc.sys

The current card drivers can be downloaded from the SoHard website. The driver versions listed in the "Driver file" column were tested.

Installation of ARCNET cards under Win2000 / XP

SH ARC PCI - ARCNET card SH ARC PCI - ARCNET Card for PCI Bus under Win2000 / XP

Driver files Internet: W2K_RAW_DRIVER_V05xx.zip

CD V5.x: ..\CD_Menu\Files_V5x\ARCNET\Win2000\farc.sys (sharcraw.inf)

packed: W2K_RAW_DRIVER_V0517.zip

Driver after installation: ..\WINNT\system32\drivers\farcpci.sys

Installing the card Proceed as follows to install the ARCNET card:

1. Delete the possibly existing old ARCNET driver (V4.xx).

   To do so, delete the following path in the registry:

   HKEY_LOCAL_MACHINE\System\CurrentControlSet\Services\farc (or farc66)
2. Reboot the PC afterwards.
3. Copy the driver without any subdirectory to a floppy disk.
4. Shut down the operating system of the PC and then switch the computer off.
5. Install the ARCNET card to a PCI slot.
6. Reboot the PC. The card is automatically detected since it supports PnP.

   The message "Found new Hardware / Network controller -> Please wait" is displayed.

   The "Hardware Wizard" is executed. This may take some time.
7. After the "Found ..." message is displayed, click on "Have Disk" and select:

   "A:\sharcraw.inf" and "Next". The driver is going to be installed.
8. Reboot the PC.
9. Select "Start => Settings => Control Panel => System => Hardware => Device Manager" and then "SoHard ARCNET / SH ARC PCI (RAW)".
10. In the "Properties", change the DriverAccessName from FARCPCI to FARC.
11. Reboot the PC.

Uninstalling the card

Proceed as follows to remove the ARCNET card:

1. Select "Start => Settings => Control Panel => System => Hardware => Device Manager".
2. Select "SoHard ARCNET / SH ARC PCI (RAW)".
3. Select "Delete".
4. Shut down the operating system of the PC and then switch the computer off.
5. Remove the card and restart your PC.

Tips and tricks

The following notes will help you, if the communication does not work properly after the installation.

- The card SH ARC PCI requires PCI version V2.10 and hardware level V1.1.
- Test program for the drivers:
  The program arcread.exe is supplied together with the drivers. Start it from a DOS shell using the following command:
  arcread farc 254<ENTER>
  The driver will either be started or a corresponding error message will be displayed!
- LED indication:
  If the driver is activated correctly and no ARCNET cable is connected, both LEDs should flash (on/off time approx. 1 s).
  If only the green LED flashes, the interrupt has failed!
- If necessary, use another PCI slot.

SH ARC PCMCIA card

SH ARC PCMCIA - ARCNET-PCMCIA Card under Win2000 / XP

Driver files

Internet: W2K_RAW_DRIVER_V05xx.zip

CD V5.x: ..\CD_Menu\Files_V5x\ARCNET\Win2000\farc.sys (sharcraw.inf) packed: W2K_RAW_DRIVER_V0517.zip

Driver after installation: ..\WINNT\system32\drivers\farcpcmcia.sys

Installing the card

Proceed as follows to install the ARCNET card:

1. Delete the possibly existing old ARCNET driver (V4.xx).
   To do so, delete the following path in the registry:
   HKEY_LOCAL_MACHINE\System\CurrentControlSet\Services\farc (or farc66)
   After this, reboot the PC.
2. Copy the driver without any subdirectory to a floppy disk.
3. Shut down the operating system of the PC and then switch the computer off.
4. Install the ARCNET card to a PCMCIA slot.
5. Reboot the PC. The card is automatically detected since it supports PnP.
   The message "Found new Hardware / Network controller -> Please wait" is displayed.
   The "Hardware Wizard" is executed. This may take some time.
6. After the "Found ..." message is displayed, click on "Have Disk" and select:
   "A:\sharcraw.inf" and "Next". The driver is going to be installed.
7. Reboot the PC.
8. Select "Start => Settings => Control Panel => System => Hardware => Device Manager" and then "SoHard ARCNET / SH ARC PCMCIA (RAW)".
9. In the "Properties" change the DriverAccessName from FARCPCMCIA to FARC.
10. Reboot the PC.

Uninstalling the card

Proceed as follows to remove the ARCNET card:

1. Select "Start => Settings => Control Panel => System => Hardware => Device Manager".
2. Select "SoHard ARCNET / SH ARC PCMCIA (RAW)".
3. Select "Delete".
4. Shut down the operating system of the PC and then switch the computer off.
5. Remove the card and restart your PC.

Tips and tricks

The following notes will help you, if the communication does not work properly after the installation.

- Verify that the IRQ and/or the I/O range are not assigned twice.
  To do so, select
  "Start => Settings => Control Panel => Network => Network Adapter => Resources".
- Test program for the drivers:
  The program arcread.exe is supplied together with the drivers. Start it from a DOS shell using the following command: arcread farc 254 <ENTER>
  The driver will either be started or a corresponding error message will be displayed!
- If the error message ..59 (E_FARC_NO_NEXTID) is displayed, the selected interrupt has failed. In this case you should change between master PIC (IRQ 0-7) and slave PIC (IRQ 8-15). IRQ 5 or IRQ 7 should work in almost every case.
- LED indication:
  If the driver is activated correctly and no ARCNET cable is connected, both LEDs should flash (on/off time approx. 1 s). If only the green LED flashes, the interrupt has failed!

SH FARC E3 [K] card

SH FARC E3 [K] - ARCNET Card for ISA Bus under Win2000 / XP

Driver files

Internet: W2K_RAW_DRIVER_V05xx.zip

CD V5.x: ..\CD_Menu\Files_V5x\ARCNET\Win2000\farc.sys

packed: W2K_RAW_DRIVER_V0517.zip

Driver after installation: ..\WINNT\system32\drivers\farc0.sys

Installing the card

Proceed as follows to install the ARCNET card:

1. Delete the possibly existing old ARCNET driver (V4.xx). To do so, delete the following path in the registry: HKEY_LOCAL_MACHINE\System\CurrentControlSet\Services\farc (or farc66) After this, reboot the PC.
2. Determine a free IRQ and I/O range (16 bytes), e.g. by selecting "Start => Programs => Accessories => System Tools => System Information => Hardware Resources".
3. Shut down the operating system of the PC and then switch the computer off.
4. On the card, set the I/O range and the interrupt IRQ according to the enclosed documentation.

   The following settings are set ex works:

   I/O-Address = 120 hex

   IRQ = 10

   KOAX mode

   2.5 MHz

5. Install the ARCNET card to an ISA slot.
6. Reboot the PC.
7. Copy the driver without any subdirectory to a floppy disk.
8. Select "Start => Settings => Control Panel => System => Hardware => Hardware Wizard => OK".
9. Select "Choose a Hardware device" and "Add new device" and then confirm with "Next".
10. A new hardware component is searched. This may take some time. Since the card does not support PnP, the message "Does not find any new devices on your computer" is displayed.
11. Select "Other devices" and click on "Have disk".
12. Insert the floppy disk and confirm with "OK". The message "Install from disk" is displayed.
13. Select "A:\tsharcraw.inf" and confirm with "OK". The driver is going to be installed.
14. Enter the following card properties:

    Controller: COM20022

    DriverAccess: FARC (is entered automatically)

    IRQ: Free IRQ determined in step 2

    I/O Address: Free I/O range determined in step 2
15. Confirm with "Ready" and "Close" and answer the message dialog with "Yes" to restart the PC.

Uninstalling the card

Proceed as follows to remove the ARCNET card:

1. Select "Start => Settings => Control Panel => System => Hardware => Device Manager".
2. Select "SoHard ARCNET / SH FARCxx (RAW)".

3. Select "Delete".
4. Shut down the operating system of the PC and then switch the computer off.
5. Remove the card and restart your PC.

Tips and tricks

The following notes will help you, if the communication does not work properly after the installation.

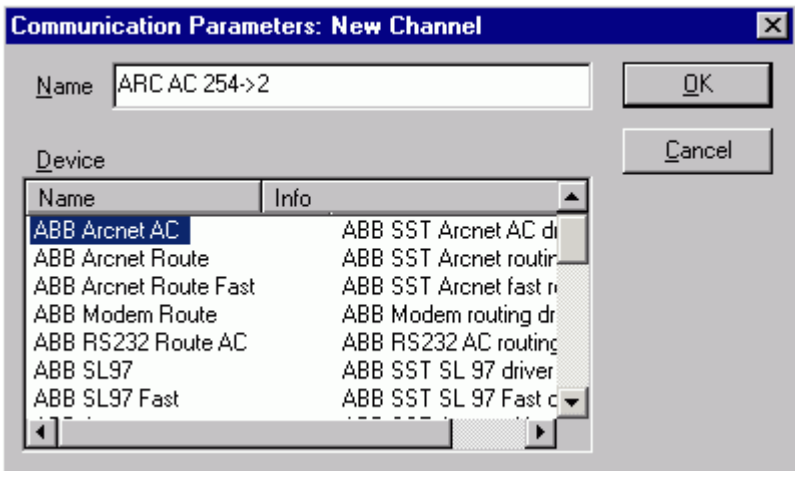
- Verify that the IRQ and/or the I/O range are not assigned twice.
  To do so, select
  "Start => Settings => Control Panel => System => Hardware => Device Manager => SoHard ARCNET => SH FARCxx".
- The interrupt must be enabled for ISA in the BIOS.
- Test program for the drivers:
  The program arcread.exe is supplied together with the drivers. Start it from a DOS shell using the following command: arcread farc 254<ENTER>
  The driver will either be started or a corresponding error message will be displayed!
- If the error message ..59 (E_FARC_NO_NEXTID) is displayed, the selected interrupt has failed. In this case you should change between master PIC (IRQ 0-7) and slave PIC (IRQ 8-15). IRQ 5 or IRQ 7 should work in almost every case.
- LED indication:
  If the driver is activated correctly and no ARCNET cable is connected, both LEDs should flash (on/off time approx. 1 s).
  If only the green LED flashes, the interrupt has failed!

ARCNET driver "ABB ARCNET AC"

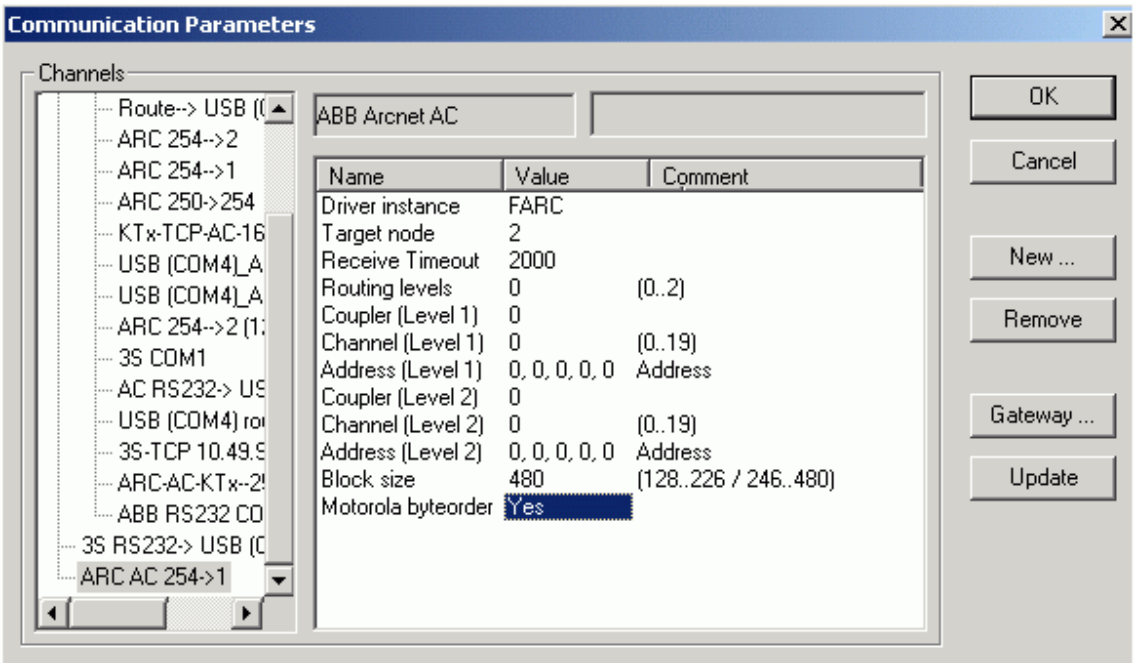
As of runtime system version V1.2.0 and Control Builder version V1.2, the driver "ABB ARCNET AC" is available. This driver provides the following functions:

- Online operation of the PLC with the Control Builder
- OPC connection with OPC server, as of version V1.3
- Parallel operation of Control Builder and OPC server
- Parallel operation of Control Builder instances with several PLCs

To define a new gateway channel for the ARCNET routing driver, select "Online/Communication Parameters" and press the button "New" in the "Communication Parameters" window. In the appearing window, enter a name for the channel (for example ARC AC 254 -> 2) and select the driver "ABB ARCNET AC" from the device list.



The following communication parameters can be set for the ARCNET routing driver "ABB ARCNET AC":

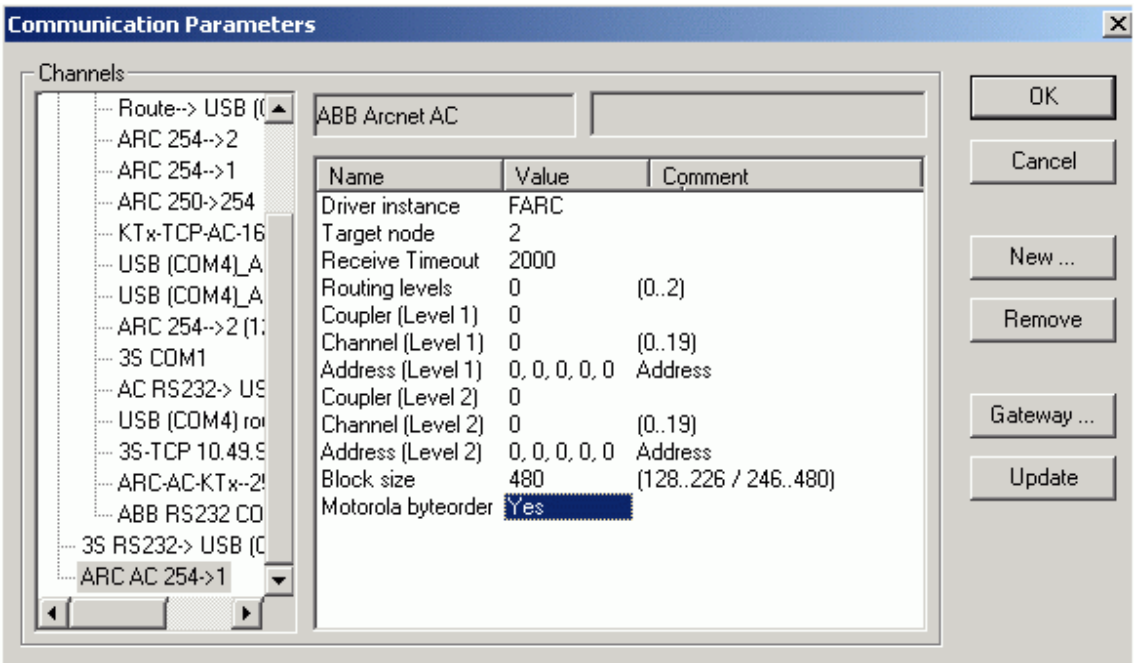


Parameter	Possible values	Description
Driver instance	FARC	DriverAccessName set in Arcnet_xx.ini
Target node	1...255	ARCNET subscriber address of the PLC
Receive Timeout	≥ 2000	Timeout [ms] for response
Routing levels	0...2	Routing levels (0 = none)
Communication Module (Level 1)	0, line 0...line 4	Communication module for level 1
Channel (Level 1)	0...19	Channel on communication module level 1
Address (Level 1)	0, 0, 0, 0, 0 (max. 5 bytes)	Address in target communication module level 1
Communication Module (Level 2)	0, line 0...line 4	Communication module for level 2
Channel (Level 2)	0...19	Channel on communication module level 2
Address (Level 2)	0, 0, 0, 0, 0 (max. 5 bytes)	Address in target communication module level 2
Block size	128...226 / 246...480	User data size
Motorola byteorder	yes/no	Motorola or Intel byte order

If you want to use the ARCNET routing driver to directly access the connected CPU, set all routing parameters (parameter Routing levels and following parameters listed in the table above) to 0.

The parameter "Block size" (128...480) sets the number of user data within one block. The default value is 480 (this is the maximum allowed block size). Values in the range of 227 .. 245 are not allowed.

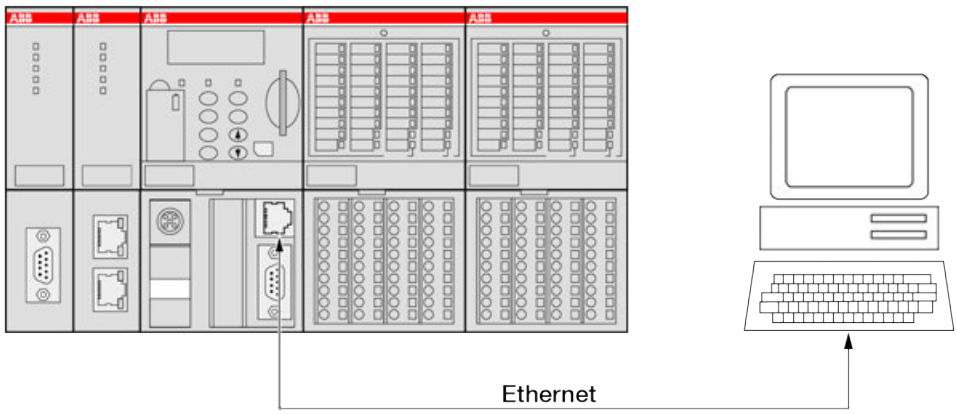
The parameter "Motorola byteorder" must be set to "Yes" for AC500 controllers.



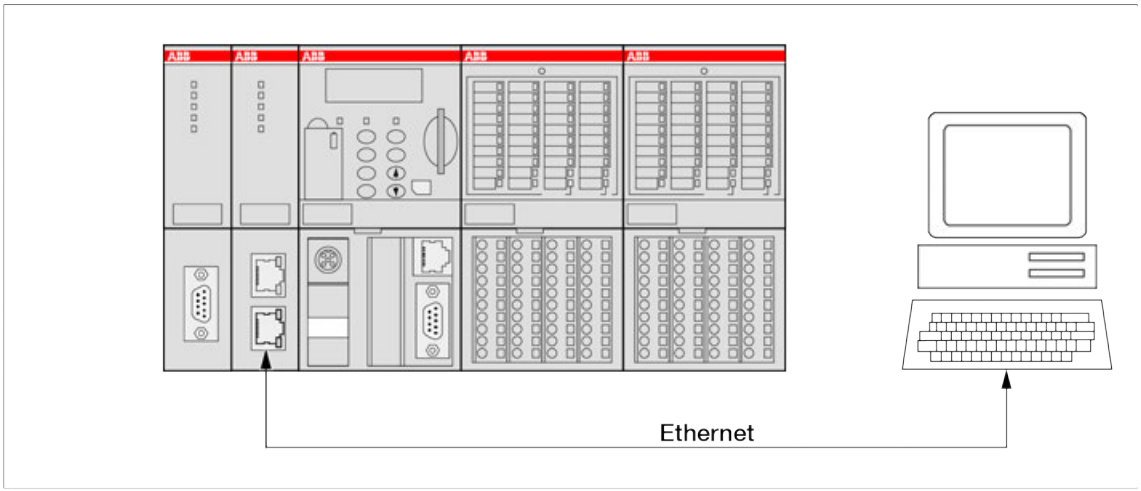
Configuration of communication via Ethernet (TCP/IP)

Programming via Ethernet is only possible on a PC with Ethernet board and installed network. Programming can be done via the internal and external Ethernet communication module.

Programming via internal (onboard) Ethernet communication module:



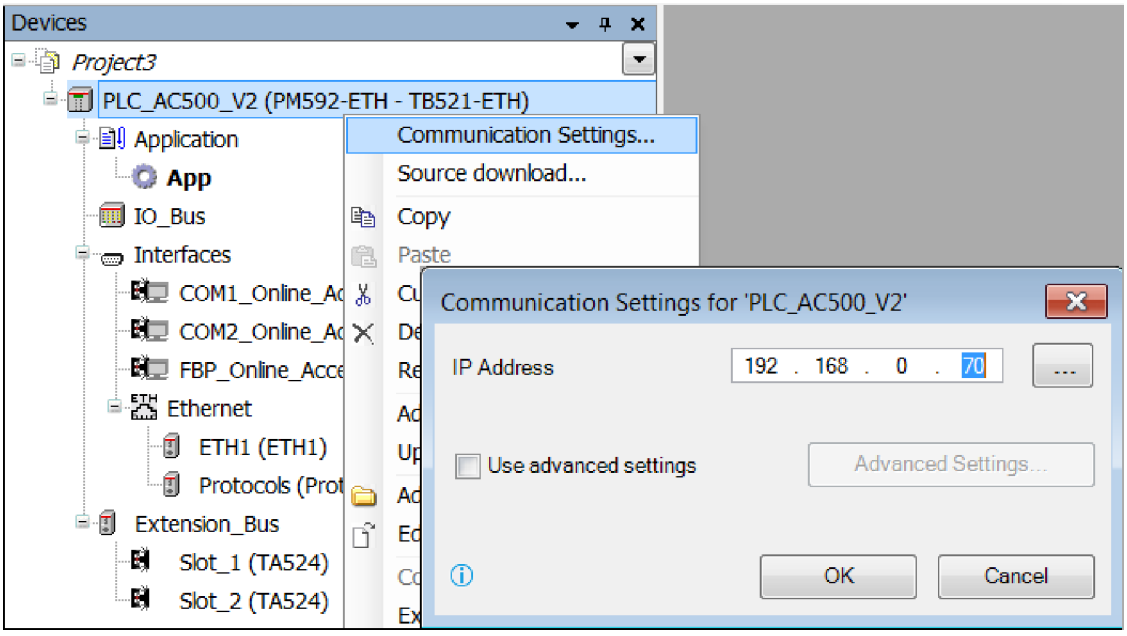
Programming via external Ethernet communication module (in the example communication module 1 in slot 1):



Enter a known PLC IP address

1. Right-click the top node *“PLC_AC500 <...>”* and select *“Communication Settings”* from the context menu.

   ⇨ Dialog box *Communication Settings <...>* appears.

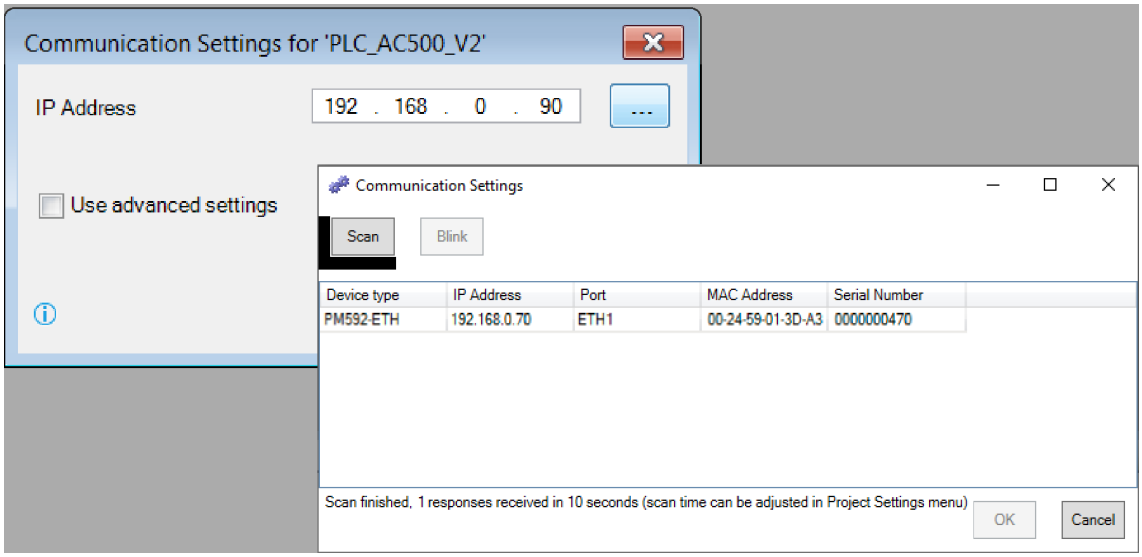


2. Enter your PLC *IP Address* and click *[OK]*.

Enter PLC IP address by scanning devices

1. Right-click the top node *"PLC_AC500 <...>"* and select *"Communication Settings"* from the context menu.

   ⇨ Dialog box *Communication Settings <...>* appears.



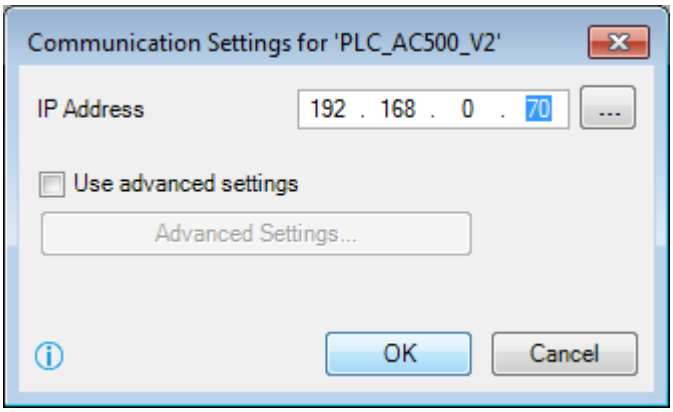
2. Click *[...]*.

   ⇨ Dialog box *Communication Settings <...>* appears.

3. Click *[Scan]*, select your desired PLC and click *[OK]*.

   ⇨ Entry is transferred to the dialog box *Communication Settings <...>*.

   Click *[OK]*.



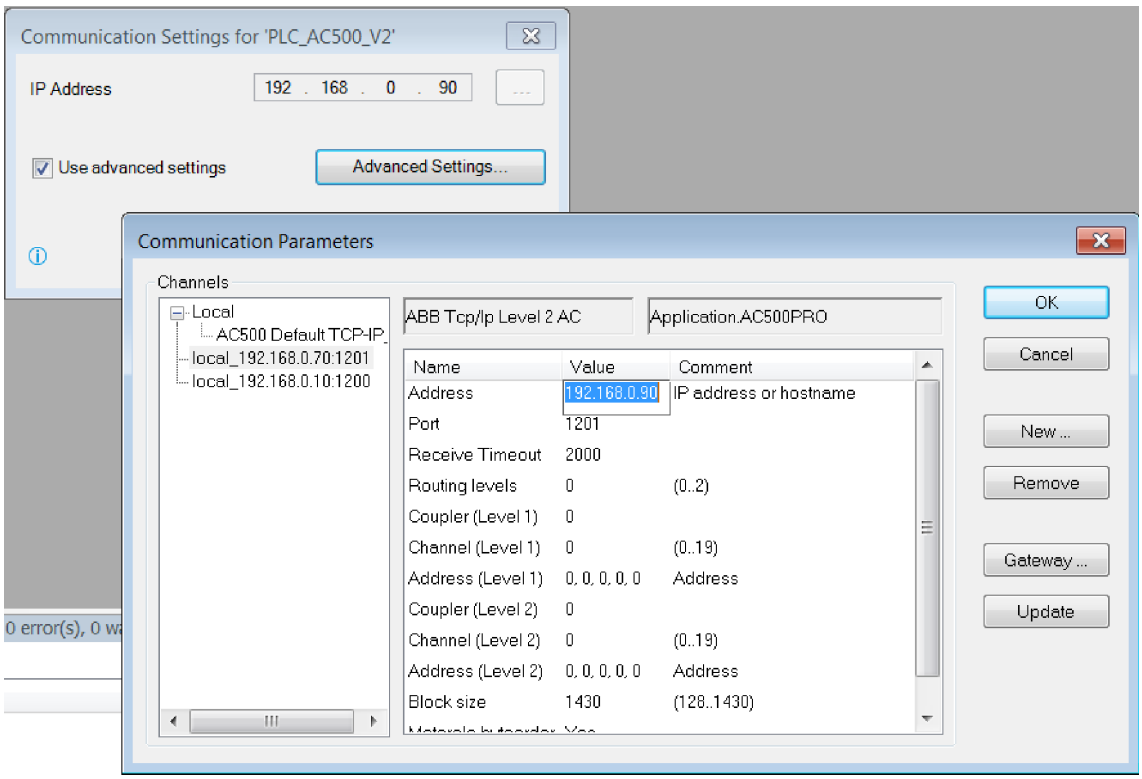
4. Click to log in the *"PLC_AC500_V2"* project.

Enter PLC IP address by *[Advanced Settings...]*

If a remote gateway instead of a local one has to be used it can be configured in the *[Advanced Settings...]*.

1. Right-click the top node *"PLC_AC500 <...>"* and select *"Communication Settings"* from the context menu.

   ⇨ Dialog box *Communication Settings <...>* appears.



2. Enable checkbox *Use advanced settings* and click *[Advanced Settings]*.

   ⇨ Dialog box *Communication Parameters* appears.

3. Select your channel, enter your PLC IP address and click *[OK]*.

   ⇨ Entry is transferred to the dialog box *Communication Settings <...>*.

   Click *[OK]*.

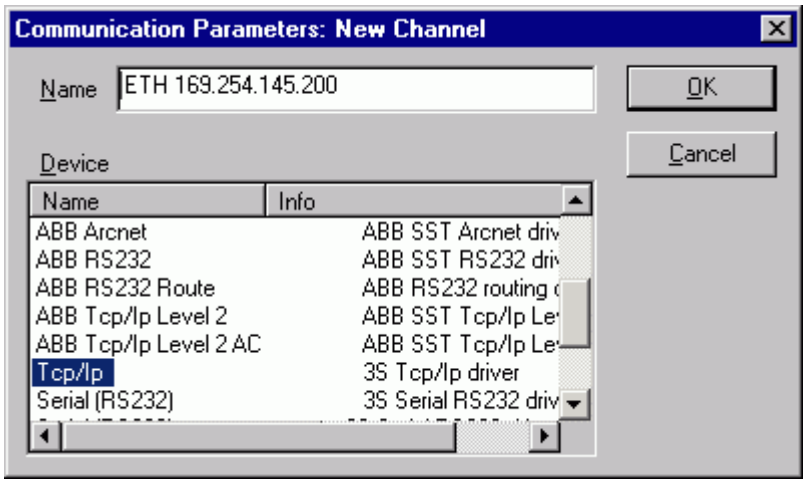
4. Click to log in the *"PLC_AC500_V2"* project.

Ethernet driver "TCP/IP"

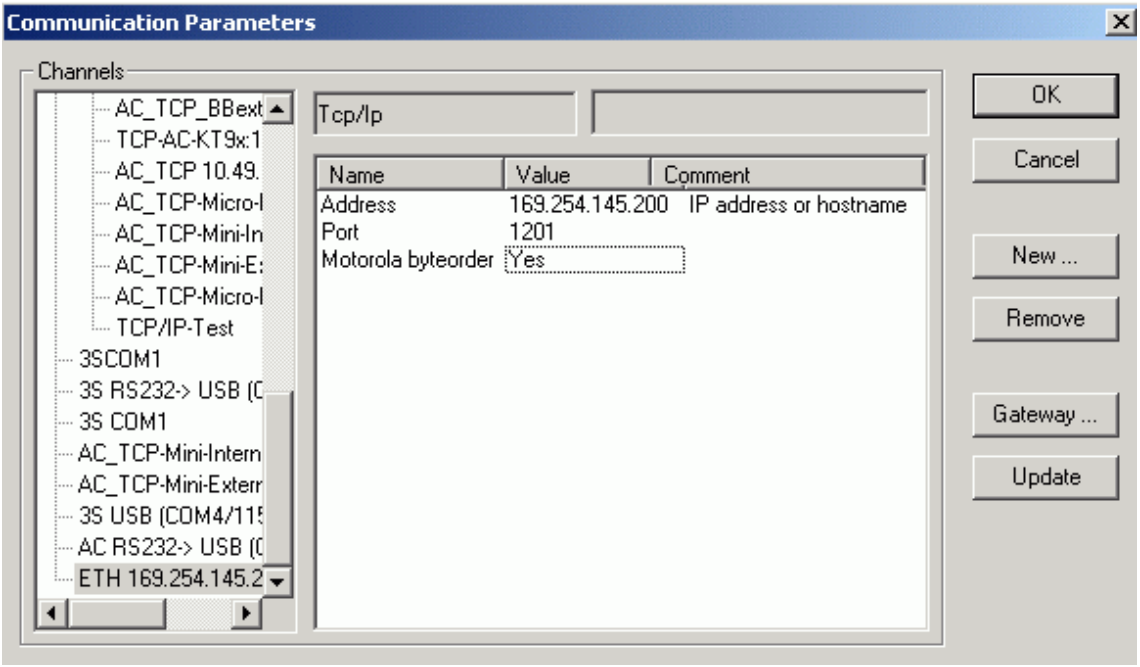
Programming AC500 controllers with internal and/or external Ethernet communication module via Ethernet can be done by using the driver "TCP/IP". This driver provides the following functions:

- Online operation of the PLC with the Control Builder
- OPC connection with OPC server, as of version V1.3
- Parallel operation of Control Builder and OPC server
- Parallel operation of Control Builder instances with several PLCs

To define a new gateway channel for the Ethernet interface, select "Online/Communication Parameters" and press the button "New" in the "Communication Parameters" window. In the appearing window, enter a name for the channel (for example ETH 169.254.145.200) and select the driver "TCP/IP" from the device list.



The following communication parameters can be set for the Ethernet driver "TCP/IP":



Parameter	Possible values	Description
Address	0.0.0.0	IP address or hostname of the PLC
Port	1201	Port 1201
Motorola byteorder	Yes (Yes/No)	Motorola or Intel byteorder (=Yes for AC500)

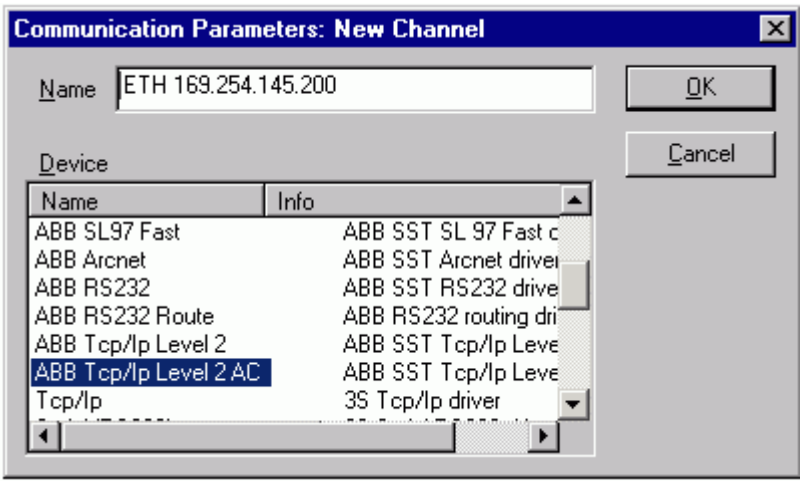
Ethernet driver "ABB TCP/IP Level 2 AC"

As of version V1.2, the driver "ABB TCP/IP Level 2 AC" is available for programming AC500 controllers with internal and/or external Ethernet communication module via Ethernet. This driver provides the following functions:

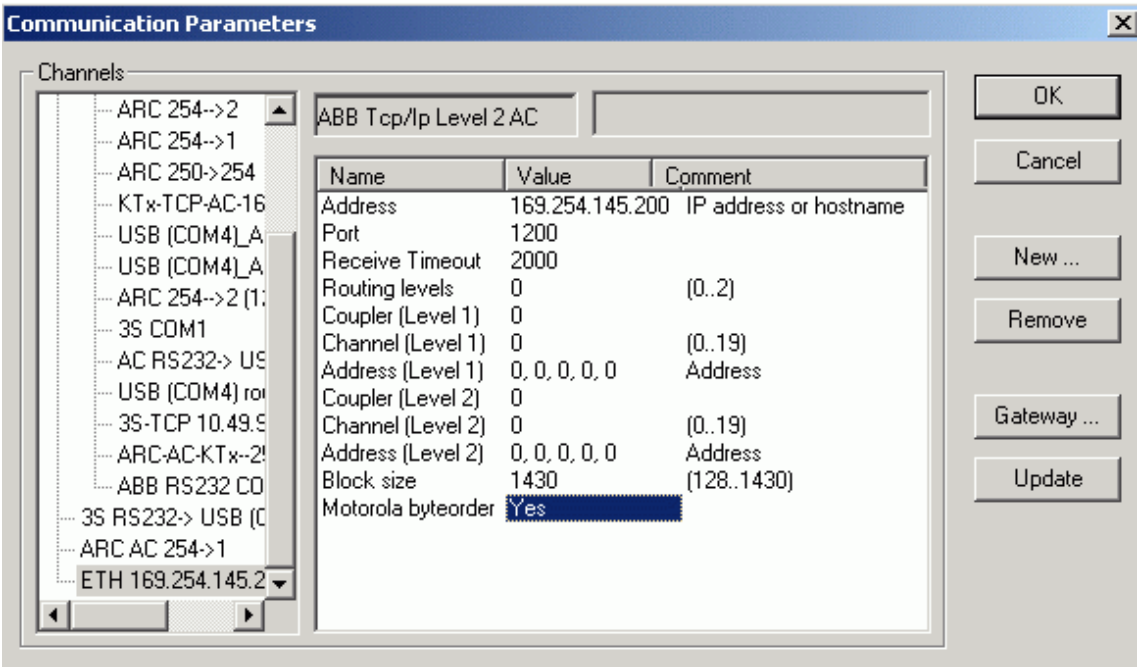
- Online operation of the PLC with the Control Builder
- OPC connection with OPC server, as of version V1.3
- Parallel operation of Control Builder and OPC server

- Parallel operation of Control Builder instances with several PLCs
- Online operation of PLCs connected via ARCNET. One PLC equipped with Ethernet communication module and one PLC with ARCNET communication module (Routing Ethernet -> ARCNET), as of version V2.x

To define a new gateway channel for the Ethernet interface, select "Online/Communication Parameters" and press the button "New" in the "Communication Parameters" window. In the appearing window, enter a name for the channel (for example ETH 169.254.145.200) and select the driver "ABB Tcp/Ip Level 2 AC" from the device list.



The following communication parameters can be set for the Ethernet driver "ABB TCP/IP Level 2 AC":

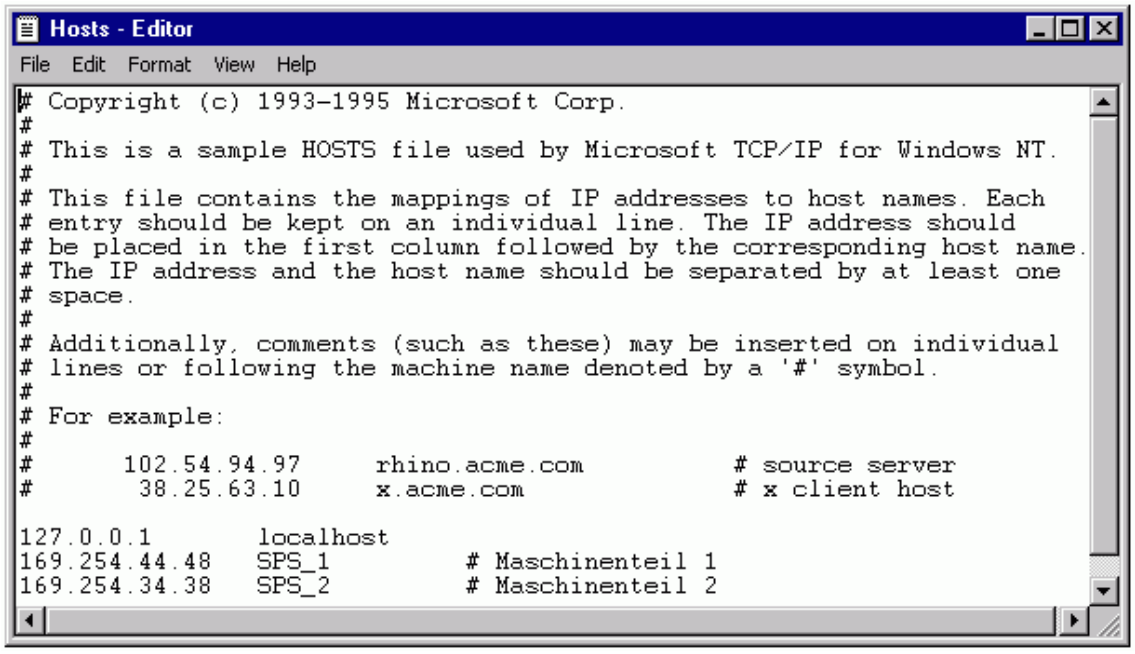


Parameter	Possible values	Description
Address	0.0.0.0	IP address or hostname of the PLC
Port	1200	Port 1200
Timeout (ms)	>= 2000	Timeout [ms] for response
Routing levels	0...2	Routing levels (0 = none)

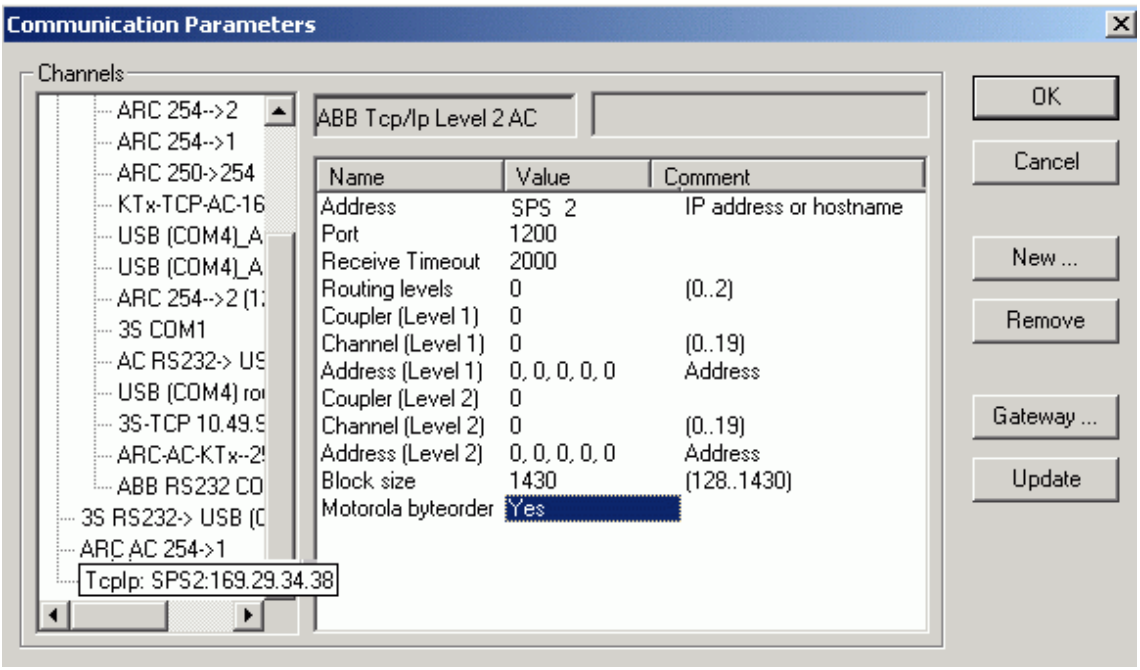
Parameter	Possible values	Description
Communication Module (Level 1)	0, line 0...line 4	Communication module for level 1
Channel (Level 1)	0...19	Channel on communication module level 1
Address (Level 1)	0, 0, 0, 0, 0 (max. 5 bytes)	Address in target communication module level 1
Communication Module (Level 2)	0, line 0...line 4	Communication module for level 2
Channel (Level 2)	0...19	Channel on Communication Module level 2
Address (Level 2)	0, 0, 0, 0, 0 (max. 5 bytes)	Address in target communication module level 2
Block size	1430 (128...1430)	Bytes per telegram (unallowed 227..245)
Motorola byteorder	Yes (Yes/No)	Motorola or Intel byteorder (=Yes for AC500)

If you want to use the Ethernet driver to directly access the PLC, set all routing parameters (parameter Routing levels and following parameters listed in the table above) to 0.

The "Address" parameter sets the IP address or hostname of the PLC. To be able to use hostnames, the names have to be added to the file "Hosts". Under Win2000, this file is located in the directory "WINNT\System32\drivers\etc".



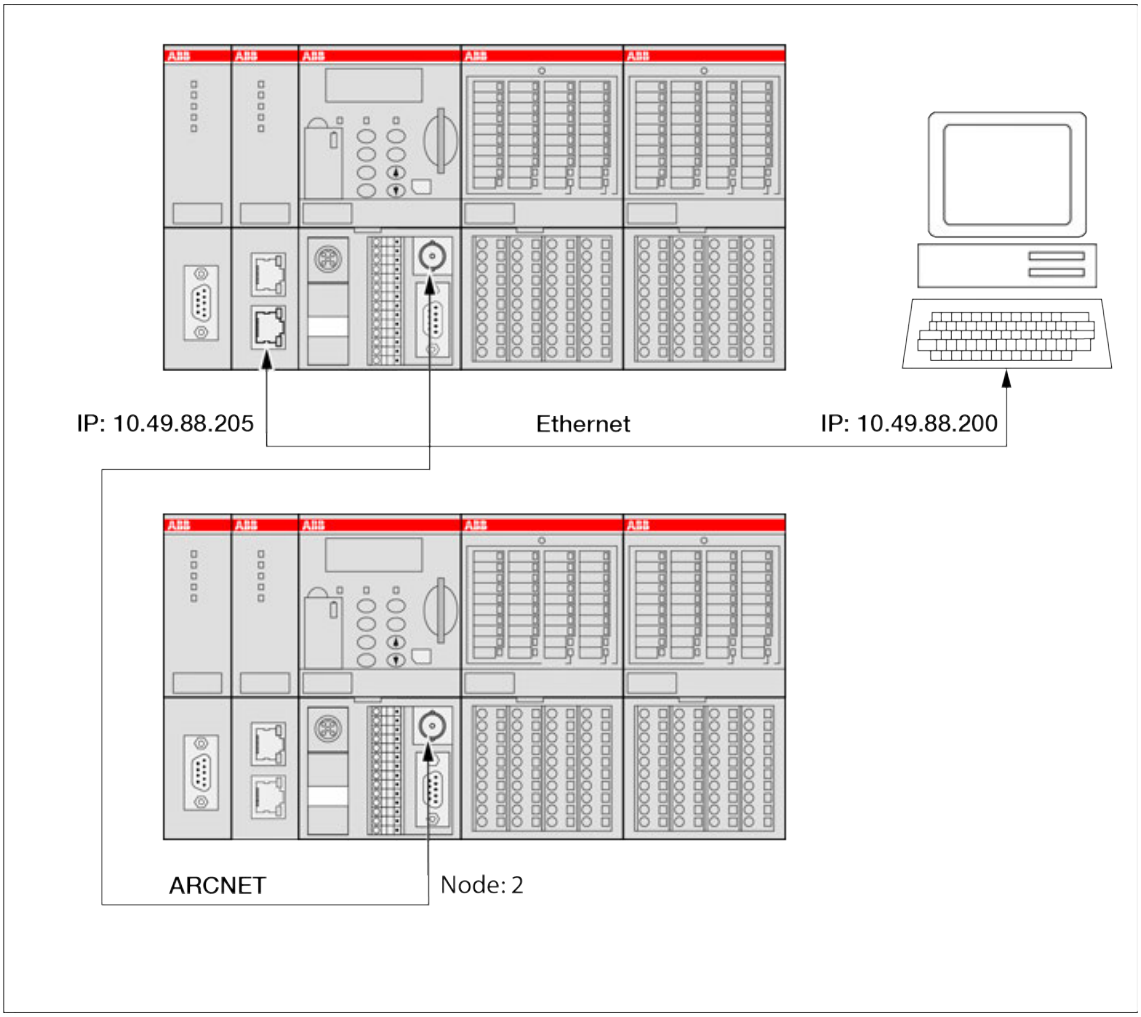
If you have changed the "Hosts" file accordingly, you can enter the symbolic name for the "Address" parameter instead of the IP address. In the following figure, the IP address "169.254.34.38" is replaced by the hostname "SPS_2".



Ethernet ARCNET routing

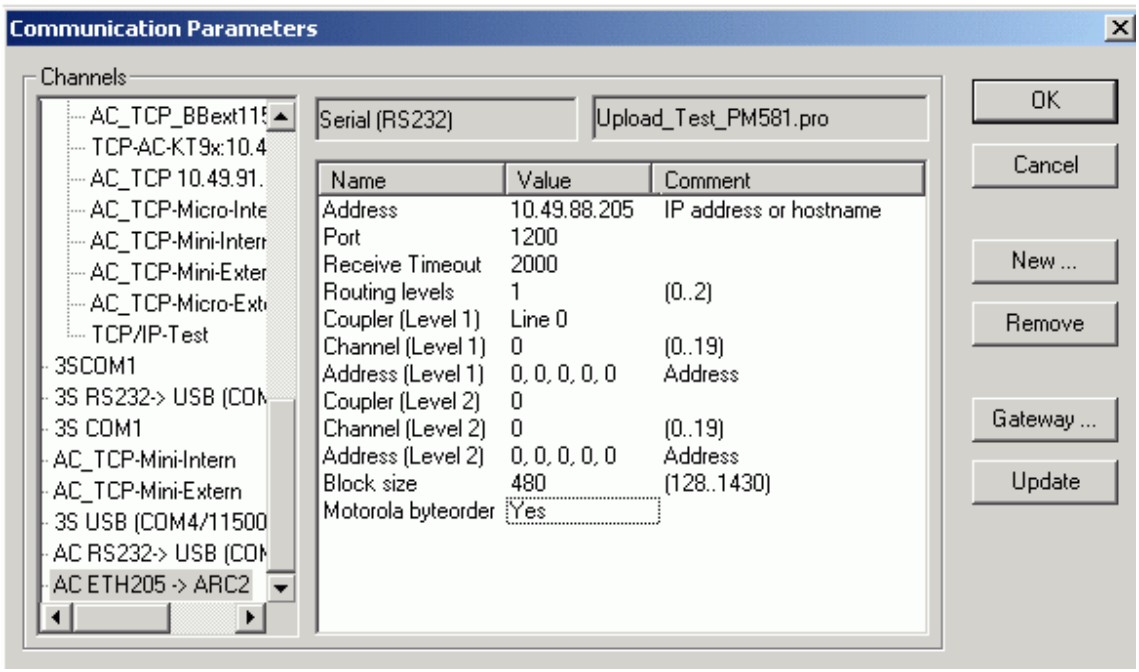
Routing is available as of PLC firmware version V1.3.

For controllers with Ethernet and ARCNET communication module, the PLCs connected via ARCNET can be programmed using the PLC Ethernet interface.



For each PLC connected via ARCNET, one gateway channel has to be defined. To do this, select "Online/Communication Parameters" and press the button "New" in the "Communication Parameters" window. In the appearing window, enter a name for the channel (for example TcpIp: PLC1:169.29.44.48 -> ARC_2) and select the driver "ABB Tcp/Ip Level 2 AC" from the device list.

For example, set the communication parameters as follows for the configuration shown above:



Parameter	Possible values	Description
Address	10.49.88.205	IP address of PLC 1
Port	1200	Port 1200
Timeout (ms)	2000	Timeout [ms] for response
Routing levels	1	Single-level routing
Communication Module (Level 1)	Line 0	Communication module for level 1 (internal: ARCNET)
Channel (Level 1)	0	Channel on Communication module level 1
Address (Level 1)	2, 0, 0, 0, 0	ARCNET node of the target PLC (Node 2)
Communication Module (Level 2)	0	No level 2
Channel (Level 2)	0	
Address (Level 2)	0, 0, 0, 0, 0	
Block size	480	Bytes per block: 128...1430
Motorola byteorder	Yes	

For the parameter "Communication Module (Level 1)", enter the slot where the ARCNET communication module "Line 0" is inserted (the ARCNET Communication Module is always the internal communication module).

The ARCNET communication module has only one communication channel. Thus, the "Channel" value must always be 0.

For the ARCNET communication module, 1 byte is required for the subscriber address (node). The address (Node=2) of the target PLC is entered to the first byte of the address byte.

The default value for the block size is 1430. If routing on ARCNET is required (and "large ARCNET packages" are enabled for the target PLC), the block size can be increased to 480 bytes. Values in the range of 227 .. 245 are not allowed.

1.6.5.4.3 AC500-specific PLC browser commands

Automation Builder provides IEC 61131 standard commands as well as AC500-specific commands.

Online help is available for all commands. The help information is displayed language-dependent by entering command "?" when operating in online mode. The command "?" lists all available firmware commands.

The commands listed in online mode can differ from the commands shown when pressing the button *[...]* as Automation Builder version and firmware version can differ.

Depending on the device, the PLC browser provides the following commands:

Command	Description	Implementation
?	Displays all implemented commands	Standard
mem	Memory dump of an area Usage: mem [from-addr] [to-addr]	Standard
memc	Memory dump relative to code area	Standard

Command	Description	Implementation
memd	Memory dump relative to data area	Standard
reflect	Reflect current command (for test purposes)	Standard
dpt	Displays the data pointer table	Standard
ppt	Displays the block pointer table	Standard
pid	Displays the project ID	Standard

pinf	Displays project information in the format:
	`pinf`
	`Address of Structure: 16#0013CF74`
	`Date: 4213949F`
	`Project Name: MODBUS_Test_BB.pro`
	`Project Title: Test MODBUS`
	`Project Version: V1.0`
	`Project Author: Test User`
	`Project Description:`
	`Test of serial interfaces`
	`End of Project-info.`
		Standard

Command	Description	Implementation

tsk	Displays the IEC task list with task information in the format:
	`tsk`
	`Number of Tasks: 1`
	`Task 0: Main program, ID: 1519472`
	`Cycle count: 45402`
	`Cycle time: 1 ms`
	`Cycle time (min): 1 ms`
	`Cycle time (max): 1 ms`
	`Cycle time (avg): 1 ms`
	`Status: RUN`
	`Mode: CONTINUE`
	`----`
	`Priority: 10`
	`Interval: 5 ms`
	`Event: NONE`
	`----`
	`Function pointer: 16#00601584`
	`Function index: 131`
		Standard

tskclear	Clears IEC Task information (cycle count & overall maximum and minimum cycle time)	Specific as of V2.0
startprg	Starts the user program	Standard (with CPU firmware below V2.3.0) No (with CPU firmware V2.3.0 and higher)
stopprg	Stops the user program	Standard (with CPU firmware below V2.3.0) No (with CPU firmware V2.3.0 and higher)
resetprg	Resets the user program	Standard (with CPU firmware below V2.3.0) No (with CPU firmware V2.3.0 and higher)
resetprgcold	Resets the user program (cold)	Standard (with CPU firmware below V2.3.0) No (with CPU firmware V2.3.0 and higher)

Command	Description	Implementation
resetprgorg	Resets the user program (origin)	Standard (with CPU firmware below V2.3.0) No (with CPU firmware V2.3.0 and higher)
reload	Reloads the boot project from user flash memory	Standard (not supported with CPU firmware V2.2 or higher)

getprgprop	Displays program properties in the format:
	`getprgprop`
	`Name: MODBUS_FBP_Test_BB.pro`
	`Title: Test MODBUS`
	`Version: V1.0`
	`Author: Test User`
	`Date: 4213949F`
		Standard

getprgstat	Displays the program status in the format:
	`getprgstat`
	`Status: Run`
	`Last error: Id 00000000 TimeStamp 000055F3 Parameter 00000000 Text`
	`Flags:`
		Standard

filecopy	File command copy	No
filerename	File command rename	No
filedelete	File command delete	No
filedir	File command dir	No
saveretain	In V1.0 and V1.1: Saves the RETAIN variables to the memory card. As of V1.2: Writes the RETAIN variables to RAM (same as retain save)	Specific
restoreretain	In V1.0 and V1.1: Restores the RETAIN variables from the memory card. As of V1.2: Restores the RETAIN variables from RAM (same as retain restore)	Specific

Command	Description	Implementation
setpwd	Sets the PLC password (required at logon!) Note: From CPU firmware V2.3.0 and higher, this command works as follows: ● If there is no password set, a password can be set with: setpwd <new_password> ● If a [new] password has been set, the old password must also be inserted.: setpwd <old_password> <new_password>	Standard (with CPU firmware to V2.3.0) Specific (with CPU firmware V2.3.0 and higher)
delpwd	Deletes the PLC password Note: From CPU firmware V2.3.0 and higher, this command works only if a password has been set. Also, you have to specify the old password to delete it, i. e. syntax is: delpwd <current_password>	Standard (with CPU firmware to V2.3.0) Specific (with CPU firmware V2.3.0 and higher)
plcload	Displays the PLC utilization (system + IEC + tasks + communication)	Standard

Command	Description	Implementation

rtsinfo	Displays the firmware information (version, driver) in the format:
	
	`rtsinfo`
	`rts version: 2.4.7.24`
	`OS version: SMX smxPPC 3.5.2`
	`uses IO driver interface`
	`rts api version: 2.408`
	`4 driver(s) loaded`
	`driver 1: AC500 CPU driver, device interface version: 2.403`
	`driver 2: AC500 I/O-BUS driver, device interface version: 2.403`
	`driver 3: AC500 COM driver, device interface version: 2.403`
	`driver 4: AC500 Coupler driver, device interface version: 2.403`
	`AC500 PM___(DISP) : V2.1`
	`AC500 PM___(BOOT) : V2.0.5, 2017-10-26 (Build: 9603, 13:55:09, Rel)`
	`AC500 PM___(FW) : V2.0.4, 2017-10-12 (Build: 9530, 14:30:50, Rel)`
		Specific

traceschedon	Enables task tracing	No
traceschedoff	Disables task tracing	No
traceschedstore	Stores task trace to RAM	No
fdir <path>	Show content of a drive or directory <path> (e.g. `fdir userdisk`, `fdir sdcard/userdata`)	Specific as of V2.1
fread <path>	Dump a file's content	Specific as of V2.1
fmove <path>	Move a file to a directory	Specific as of V2.1
mkdir <path>	Create a directory	Specific as of V2.1
deldir <path>	Delete an empty directory	Specific as of V2.1
rndir <old path> <new path>	Rename a directory	Specific as of V2.1

Command	Description	Implementation
ipaddr	Sets the IP address of the CPU	No
basetick	Sets the basetick to µs	No
diagreset	Resets the diagnosis system	Specific
diagack all	Acknowledges all errors	Specific
diagack x	Acknowledges all errors of the class X (with X= 1...4)	Specific

diagshow all	Shows all errors in the format:
	`diagshow all`
	`--- All errors ---`
	`State Class Comp Dev Mod Ch Err`
	`0152502216`
	`active and acknowledged 4 9 22 31 31 8`
	`1970-01-01 00:00:08 occurred`
	`disappeared`
	`1970-01-01 00:00:15 ack.`
	`0152369165`
	`active not acknowledged 49 2031013`
	`1970-01-01 01:19:12 occurred`
	`- disappeared`
	`- ack.`
	`--- end ---`
		Specific

time	Displays and sets the time of the real-time clock. If no battery is inserted in the PLC and the control voltage is switched on, the PLC clock is set to "01. January 1970, 00:00".	Specific
date	Displays and sets the date of the real-time clock. If no battery is inserted in the PLC and the control voltage is switched on, the PLC clock is set to "01. January 1970, 00:00".	Specific
batt	Polls the battery status	Specific

Command	Description	Implementation
sdappl	Saves the boot project to the memory card	Specific
sdclone	Copys the user program and the user data to the memory card.	For AC500-S only!
sdfunc	Displays and changes the memory card function	Specific
sdsys	Save firmware to memory card	Specific
sdboot	Updates the bootcode from the memory card	Specific
sddisplay	Updates the MMI firmware from the memory card	Specific
sdfirm	Updates the firmware from the memory card	Specific
sdcoupler x	Updates the firmware of Communication Module x from the memory card	Specific
cpuload	Displays the CPU load (current, min., max., average)	Specific
delappl	Deletes the user program in the user flash memory	Specific
retain	Saving and restoring the RETAIN variables: retain clear -> Clears all RETAIN variables retain save -> Saves the RETAIN variables to the RAM disk retain restore -> Restores the RETAIN variables from the RAM disk retain export -> Exports the RETAIN variables from the RAM disk to the memory card retain import -> Imports the RETAIN variables from the memory card to the RAM disk	Specific as of V1.2

Command	Description	Implementation
persistent	Saving and restoring the persistent area %R area: persistent clear -> Clears the %R area persistent save -> Saves the buffered %R area to the RAM disk persistent restore -> Restores the buffered %R area from the RAM disk persistent export -> Exports the buffered %R area from the RAM disk to the memory card persistent import -> Imports the buffered %R area from the memory card to the RAM disk	Specific as of V1.2
cfginfo	Print expected and active configuration version. This is for internal use.	Specific
hashappl	Hash the user program	Specific
io-bus stat	Displays the I/O bus statistic	Specific
io-bus desc	Displays the I/O bus configuration	Specific
com protocols	Displays the protocols available for the serial interfaces	Specific
com settings	Displays the serial interface settings	Specific
coupler desc	Displays information on the communication module interfaces (type, firmware, serial number, date)	Specific
coupler settings	Displays the current communication module settings, for example, IP address and socket assignment	Specific as of V1.2
ping	Ping a address, usage: ping <ipaddr> <couplerid> <ms>	Specific as of V2.1.3
reboot	Reboots the PLC (IEC 61131 performs a logout when restarting or logout possible up to 3 seconds after command input) (This command is not available for CM574-RS as of firmware revision V2.1.x)	Specific

Command	Description	Implementation
diskcfg	Access to drive maintenance Command Syntax: `diskcfg [option] [drivename]` Command Options: ● `unlock` : unlock a drive for writing MBR or formating ● `lock` : lock drive again ● `writembr` : write clean MBR (unlock required) ● `format` : write clean file system (unlock required) ● `settings` : show drive configuration details ● `desc` : show drive overview ● `help` : show this help ● `[none]` : no option shows this help Available Drives (not all commands are supported on all drives): ● Flash memory ● Memory card ● RAM disk ● Userdisk ● Flash disk ● SRAM disk	Specific as of V2.1

Command	Description	Implementation

proddata	Shows Production Data of PLC
	`proddata`
	`Production data`
	`---------------`
	`Ident : 1SAP123456R0001`
	`Index : B1`
	`Type : PM___`
	`Date : 0447`
	`BA-Inst : 1S120`
	`Factory : 05`
	`Year : 17`
	Serial No. : 00007134
	MAC-Addr : "
		Specific as of V2.0

confdata	Shows Configuration Data of PLC It is possible to save and load PLC specific configuration of any kind with the function blocks (from SysInt_AC500_V10.lib): *Chapter 1.5.4.19.2.3 “CPU_CONFIG_READ” on page 1508* *Chapter 1.5.4.19.2.4 “CPU_CONFIG_WRITE” on page 1511* The AC500 firmware also uses this INI file for settings like IP addresses.	Specific

1.6.5.4.4 Watch- and recipe manager

General information

Since CODESYS 2.3.9.25 (Control Builder Plus V2.1), the programming environment is extended by the Watch- and Recipe Manager which provides more comfortable online debugging functions.

For general information, see *Chapter 1.4.1.4.9 “Watch- and recipe manager” on page 395*.

Function

In the Watch- and Recipe Manager (Resources tab of the Object Organizer) the current values of specified variables can be viewed in so-called "watch lists (Monitoring).

Further on the variables listed in a watch list can be preset with constant values and this set of values, named "Recipe" be transferred to the PLC. Also the current values of the variables of a watch list can be read from the PLC to the Watch and Recipe Manager as a preset/recipe. In this context regard the possibility to save recipes in files and to reload them to the Recipe Manager when required. For further information on the usage of recipes see *Chapter 1.4.1.4.9.2 “Creating watch lists, recipes” on page 397*.

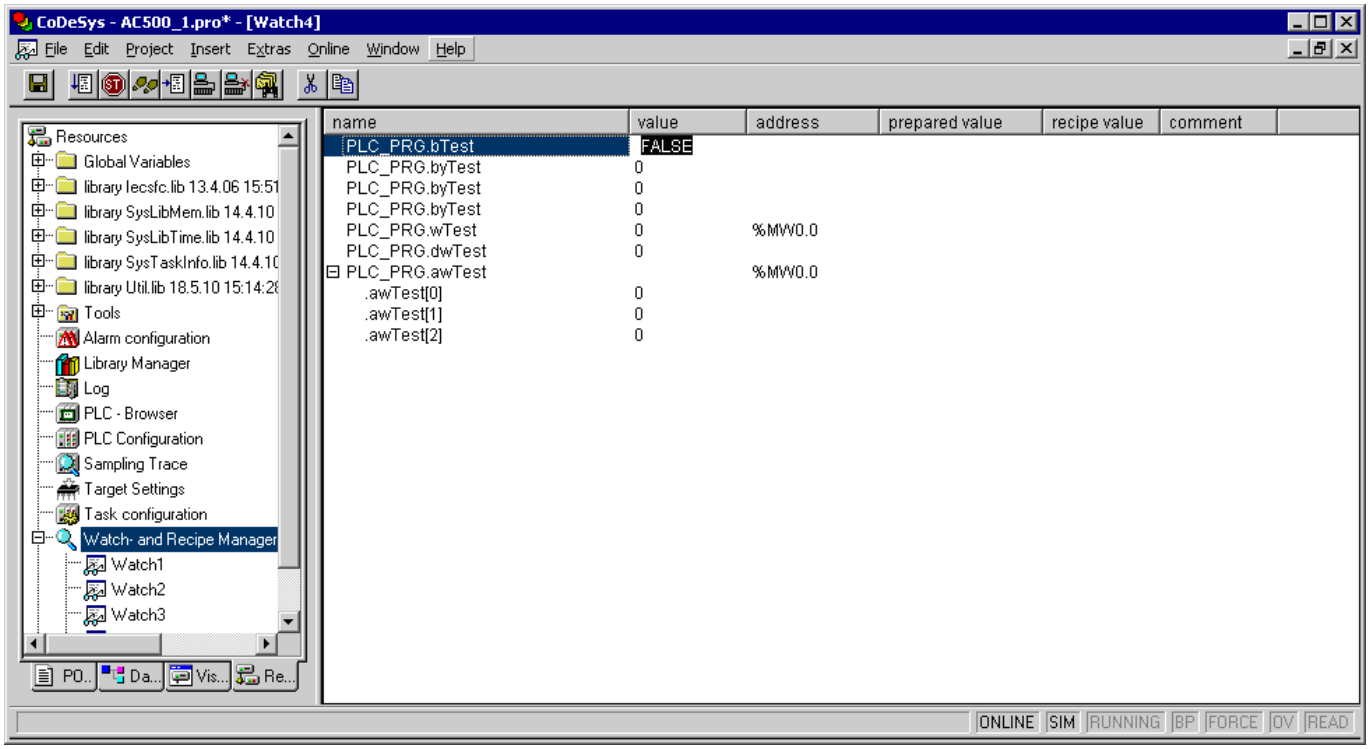
In online mode watch lists as well can be used to Write (*Chapter 1.4.1.2.6.16 “'Online' 'Write values'” on page 286*) and Force (*Chapter 1.4.1.2.6.17 “'Online' 'Force values'” on page 287*) variables.

All these functions for example can be used for logging and setting of control parameters.

Watch- and recipe manager extensions

Activate the Watch- and Recipe Manager with “ Project ➔ Options ➔ Tab Desktop ➔ Tabular watch editor”.

The Watch window displays the values in a table oriented view.



The table display is used in both offline and online mode. It is not necessary to switch on/off monitoring mode to insert or delete a variable. It is possible to insert and append a variable in online and offline mode at any time. In addition it is also possible to add an address range.

The online value is displayed in CODESYS in online mode only.

A "+" will appear in the first column in case of function block instances, structured variables and arrays. It allows to expand and collapse them.

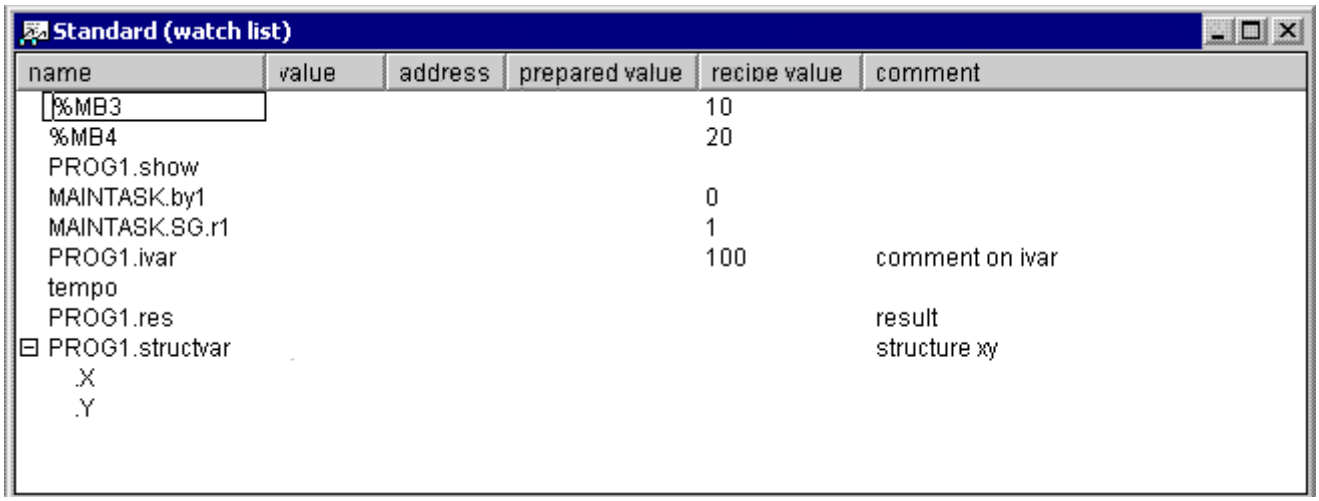
The editor allows manually to

- add watch entries
- delete watch entries
- change the name of a watch entry.

In online mode, the prepared value can be defined with a dialog. More than one prepared value can be selected. It is possible to enter the same value for all of them. One or more prepared values can be sent to the PLC via *"Online ➔ Write Variables or Online ➔ Force variables"*.

Tabular editor

Each watch list is viewed in a separate tabular editor window and multiple windows can be opened at the same time. In this case the available watch lists will be shown as entries in the *"Resources"* tab and can be opened by double-click.

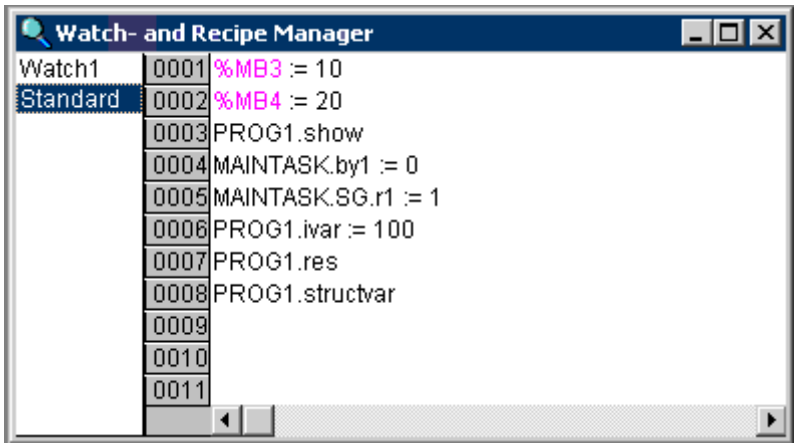


- name: Here a variable identifier according to the following syntax must be entered of an address in standard format:
  <POU name>.<variable name>
  In case of global variables the POU name is dropped. The variable name can be multilevel. Addresses can be entered directly (e.g. "%IB0.0").
  Example for a multilevel variable:
  PLC_PRG.Instance1.Instance2.Structure.Component
  Example for a global variable:
  globalvar.component1
- address, comment: As specified in the declaration of the variable.
- value: In online mode here the current value of the variable is displayed (Monitoring).
- recipe value: Here a value can be entered, which will be transferred to the PLC when command *Chapter 1.4.1.4.9.14 "'Extras' 'Write Recipe'" on page 401* is applied on the whole watch list. The recipe values of all variables of the list can be replaced by the current values from the PLC by using command *Chapter 1.4.1.4.9.15 "'Extras' 'Read Recipe'" on page 402*.
  In case of function block instances and structured variables a plus respectively minus sign appears in front of the name in the first column. It serves to expand resp. collapse the list of components. For function block variables the context menu is extended by the items 'Open function block' and 'Open instance'.

By a double-click on a non-editable position within the editor window, the table gets adapted to the window width and the column widths get optimized.

1-Window-editor

There is only one bipartite editor window, in the left part of which you find all available watch lists. For the list currently selected the right part of the window shows the associated variables. This editor view is opened via object 'Watch- and Recipe Manager' in the *"Resources"* tab in the Object Organizer. The watch variables are entered line by line and a recipe value can be assigned to each by ":=".



Adding variables to watch lists is possible in offline mode by typing, or in online mode directly out of the POU editors. See ↳ *Chapter 1.4.1.4.9.2 "Creating watch lists, recipes" on page 397*

A 'Cross Reference List' can be called directly from a watch list, when one of the watch variables is selected. In this case the command ↳ *Chapter 1.4.1.3.7 "Show cross references" on page 295* in the Extras menu or in the context menu is available.

Adding variables to watch window from language editors

If one or more variables or elements are selected in a language editor or the declaration editor, the following additional menu items will appear in the *"Extras"* menu:

- *"Into new watch list"*
- *"Add to watch list"*

1. Select *"Into new watch list"* to automatically create a new watch list for the selected variables.

2. Select *"Add to watch list"* to open a submenu containing a list of all existing watch lists. After that, select the desired watch list to append the variables to that watch list.

If an area with more than one variables is selected in a language editor (it is dependent on the language editor how multiple selections of elements is realized, see below), all selected variables will be added to the watch list.

It is not necessary to enable/disable monitoring active manually.

To enable/disable monitoring active manually (to add a variable manually), press *[ALT]* + *[X]* + *[M]*.

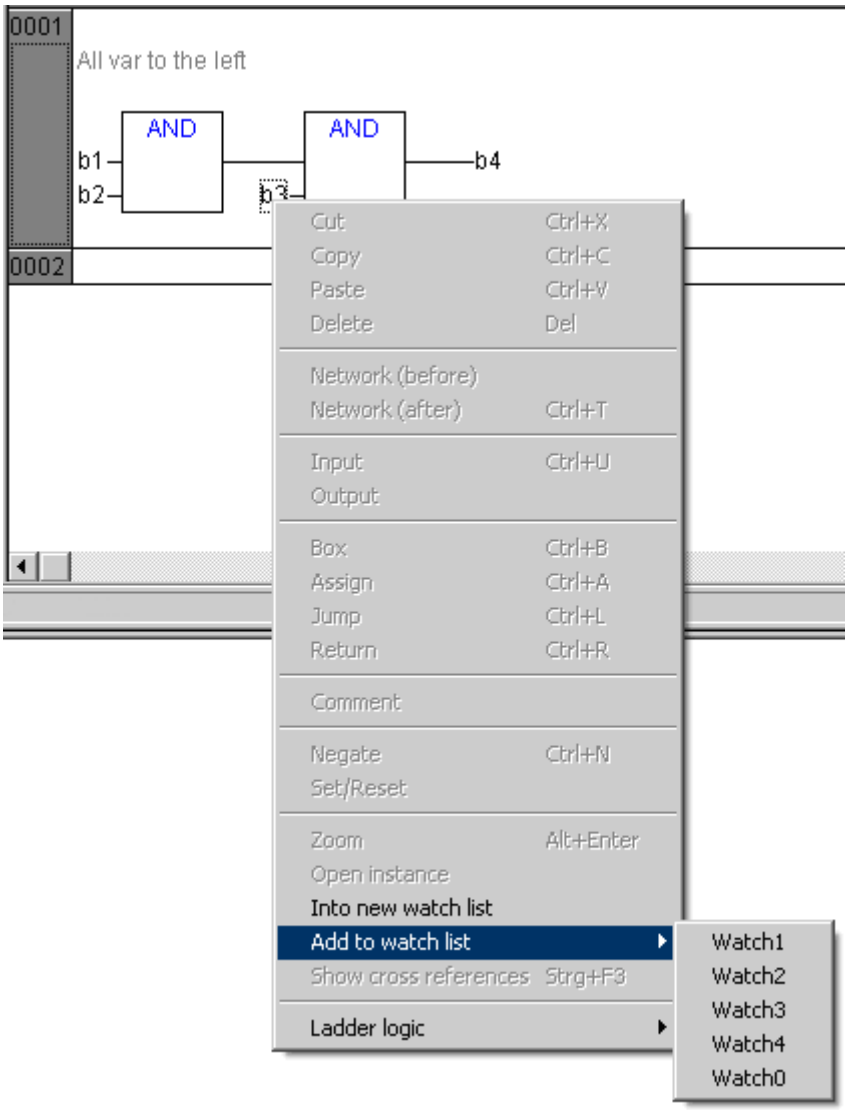
These menu items are available in online mode only, if the full instance path of a variable inside a function block is known.

The possibilities of multiple selections are explained in the following sections.

Function Block Diagram (FBD)

The FBD editor has a tree-oriented selection. By selecting one box in the tree, all elements to the left of it are selected, too.

In the following example, variable b3 is selected.

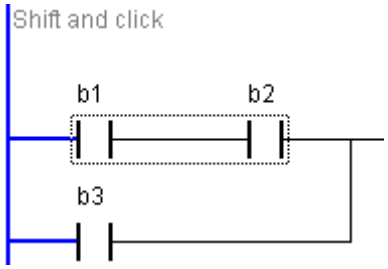


Right-click onto the selected variables to open the context menu and adding them to a watch window.

Ladder Diagram (LD)

Press *[SHIFT]* and click onto the desired elements to do a multiple selection. Only consecutive elements can be selected for a multiple selection.

In the following example, variables b1 and b2 are selected.

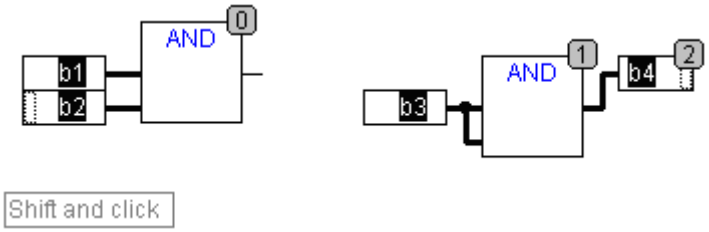


Right-click onto the selected elements to open the context menu and adding them to a watch window.

Continous function chart (CFC)

Press *[SHIFT]* and click onto the desired elements to do a multiple selection.

In the following example, variables b2 and b4 are selected.



Right-click onto the selected variables to open the context menu and adding them to a watch window.

Instruction list (IL)

In Online Mode, the IL editor window displays the IL text on the left side and the variables and their online values on the right side of the window.

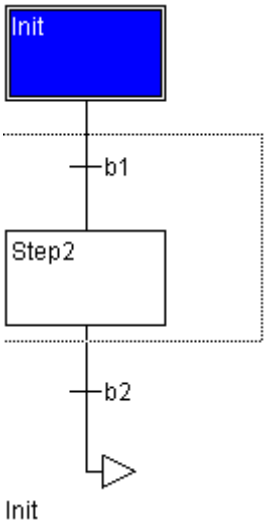
To select multiple variables, mark the text on the left side of the window.

Right-click on the text to open the context menu and adding them to a watch window.

Sequential function chart (SFC)

Multiple selection is possible with consecutive elements.

Press *[SHIFT]* and click onto the desired elements to do a multiple selection.

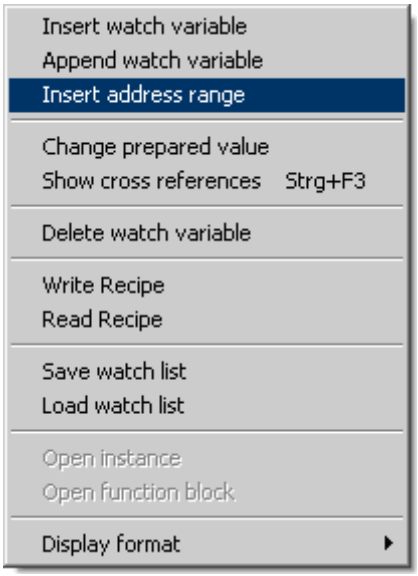


Right-click onto the selected variables to open the context menu and adding them to a watch window.

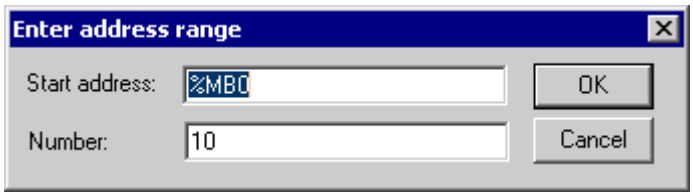
Adding an address range to the watch window

☑ To add an address range to a watch list, proceed as follows:

1. Right-click the Watch Window and select *“Insert address range”*.



2. In the *Enter address range* dialog box enter the name or address of the variable and the number of element you want to insert.



3. Confirm the dialog box with *[OK]*.

Filtering within input assistant

1. Press *[F2]* within the Watch Window to open the *Input assistant* dialog.

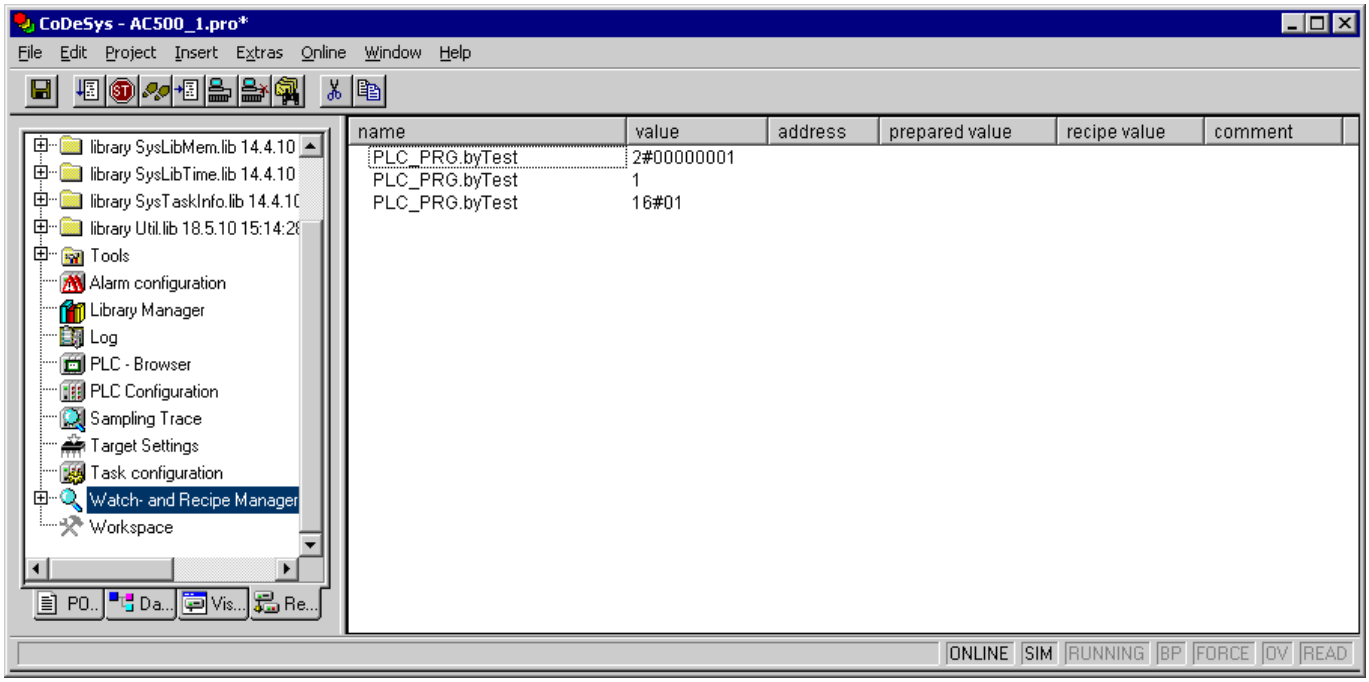
   ⇨ If check box *"Structured"* is enabled, the variables are displayed in a structured way by global variable lists, POUs, libraries and folders.

   If check box *"Structured"* is disabled, all variables are displayed in one list.

2. Enter the filter text in text field 'Filter'. Select one of the 3 filter criteria from the pull-down menu:
   - *"Prefix"*: Beginning of the variables is compared with the filter text.
   - *"Suffix"*: Ending of the variables is compared with the filter text.
   - *"Substring"*: Complete variable name is compared with the filter text.

Defining display format for each watch variable separately

With an additional column in the Watch Window table, the display format of integer variables can be selected. A drop-down list allows to select between decimal, hexadecimal, binary and default display format. This selection can be made for every variable separately. One variable at a time can be selected to change the display format.



Default format means that the display format of the variable is defined by the global setting.

1.6.5.4.5 Cross-reference list in watch- and recipe manager

General information

In this chapter extended features for the cross-reference list are described.

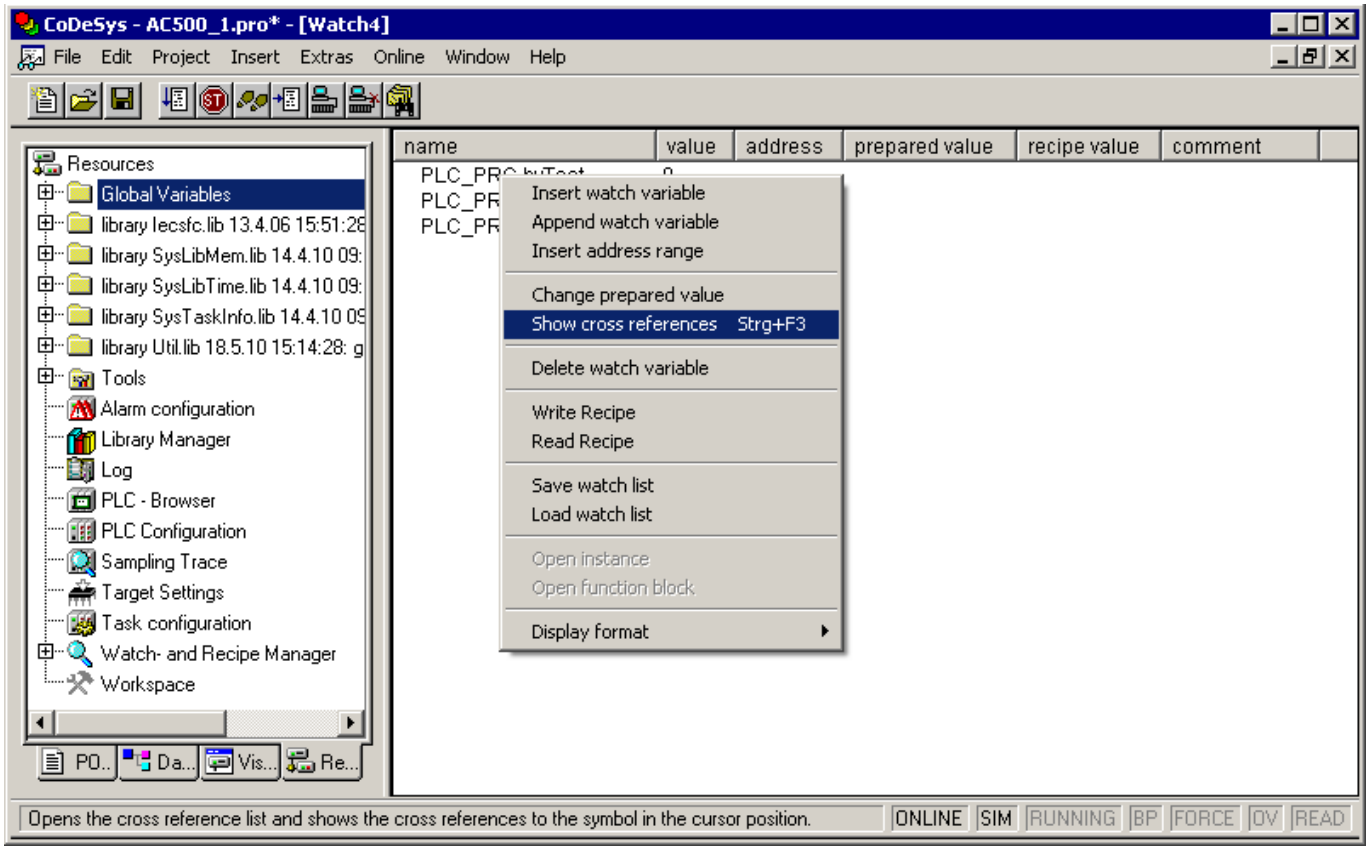
Extended Features:

- Open *"Cross Reference List"* from Watch Windows
- Open *"Cross Reference List"* from Language Editors
- Including Visualizations into *"Cross Reference List"*
- Including arrays, structures and addresses into *"Cross Reference List"*

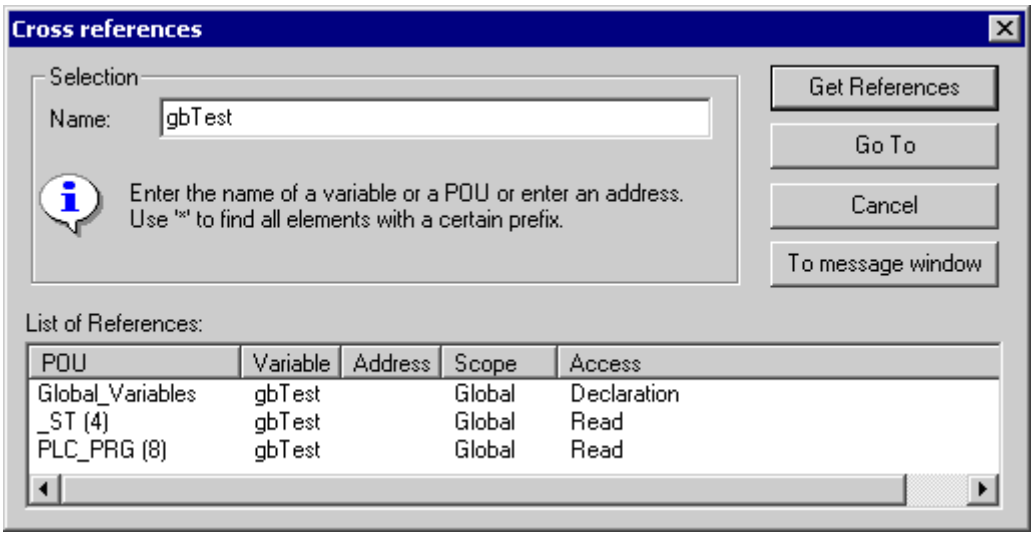
Open *"Cross Reference List"* from watch window

To open the cross-reference list from Watch Window (possible in Online and Offline Mode), proceed as follows:

1. Select the desired variable, e.g. PLC_PRG.ByTest.



2. Right-click on the variable and select Show cross references in the context menu.



⇨ The Cross references window appears which displays the full path names.

Open *"Cross Reference List"* from language editors

To open the cross-reference list from a language editor, proceed as follows:

▷ Right-click on the variable in the language editor window and select Show cross references.

⇨ The Cross references window appears which displays the full path names.

The following language editors are supported:

- FBD
- LD
- CFC
- ST
- IL
- SFC

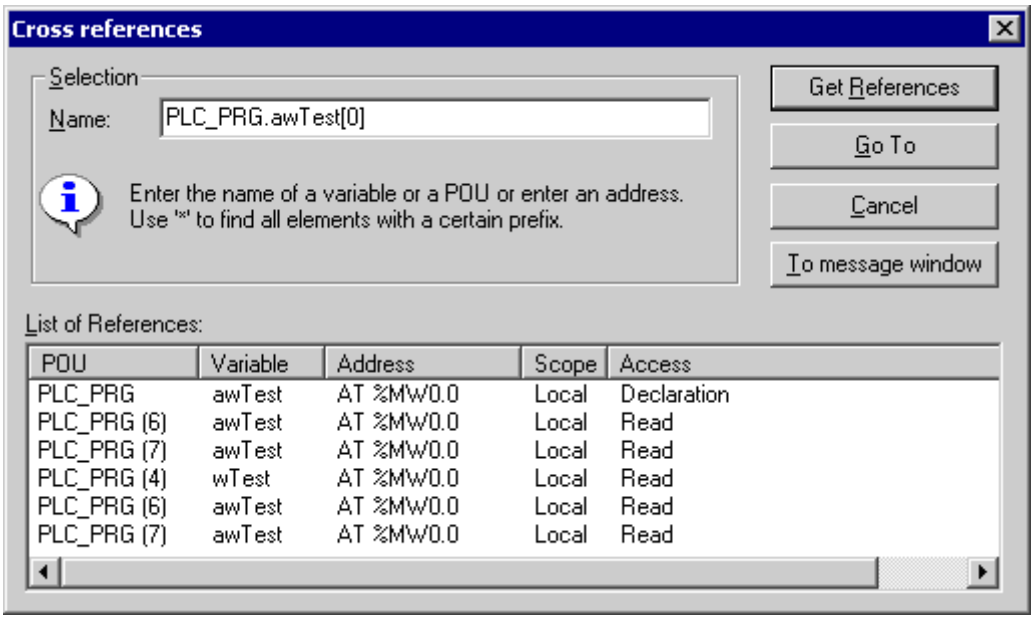
Cross references in visualizations

The Cross reference window will display the usage of a variable also in a visualization. Visualization can use variables in read- and write access.

The visualization will be shown in the POU column of the Cross reference window. Information will be added to indicate it is a visualization. For example: vis1 (VIS).

Cross references for arrays, structures and addresses

The Cross references window displays the usage of variables that are within the address range of a structure or array.



1.6.5.4.6 Reference to libraries

Library configuration is described in the chapter *Chapter 1.5 “Libraries and solutions” on page 735*.

1.6.5.4.7 Programming in C code

Preface

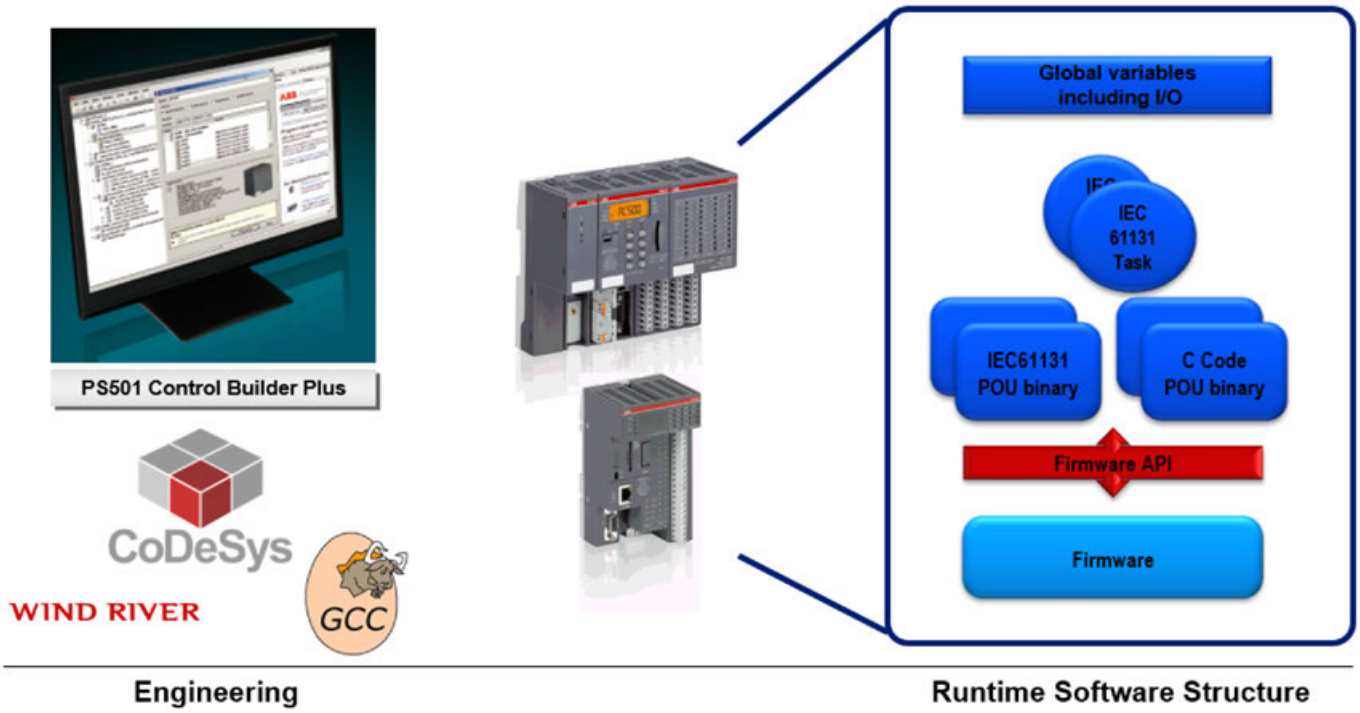
The user shall be able to implement custom application parts in C or C++ code and call them from IEC application. This document shows how to create a simple application with parts of it written in C or C++ code.

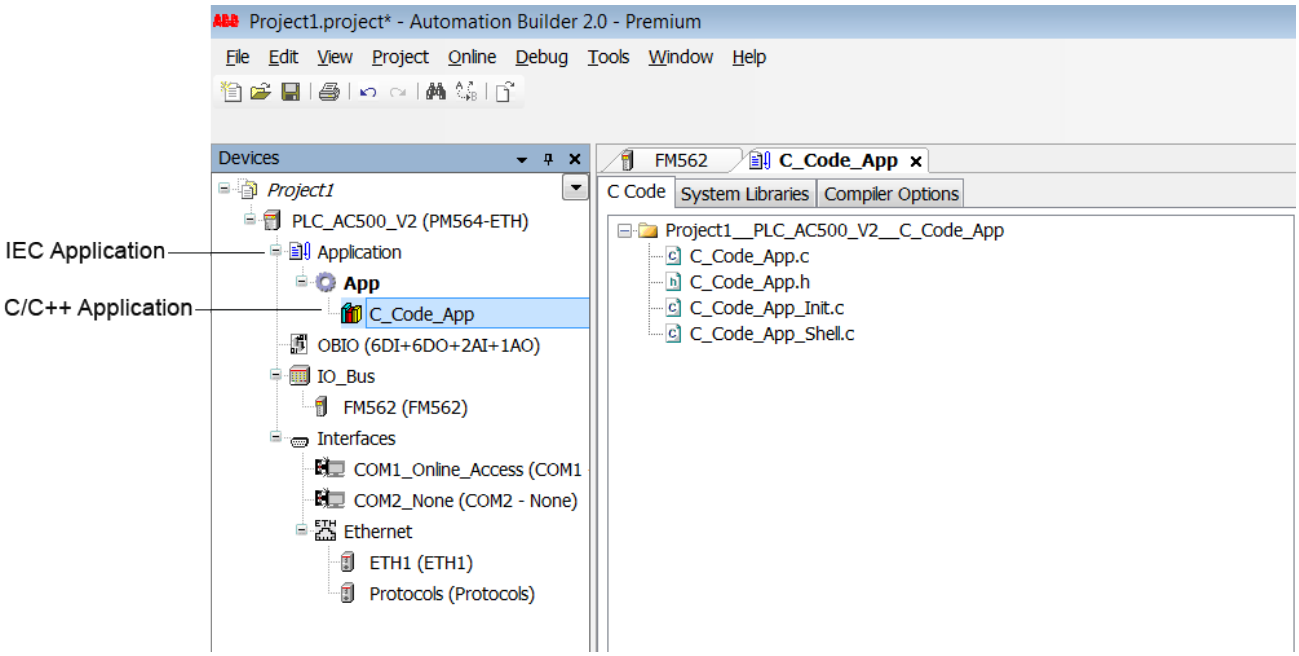
Table 754: Abbreviations

Abbreviation	Definition
OBJ	**OBJ**ect file
FW	**F**irm**W**are
PLC	**P**rogrammable **L**ogic **C**ontroller
ST	**S**tructured **T**ext
AB	**A**utomation **B**uilder
POU	**P**rogram **O**rganization **U**nit

Overview

C/C++ application is part of IEC application and hence seamlessly integrated into Automation Builder engineering tool.





Key facts:

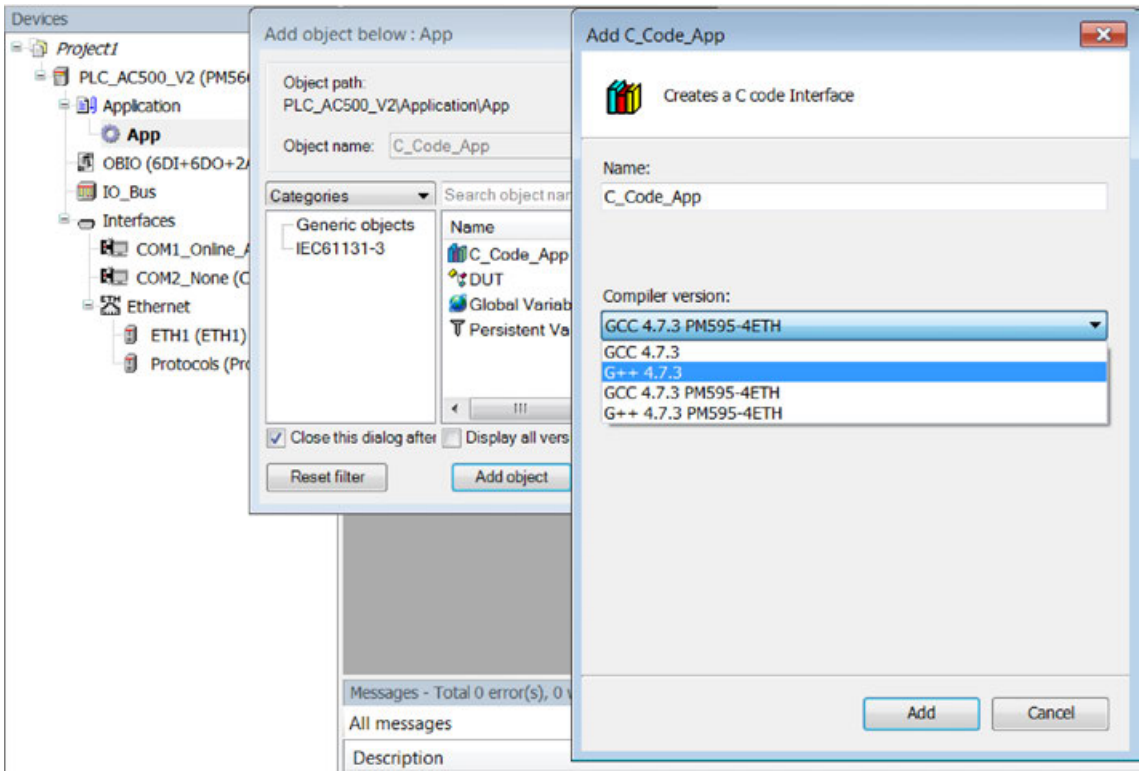
- AC500 and AC500-eCo POUs (Program Organization Units) can be implemented in IEC61131-3 or C/C++ code.
- C/C++ code can use C/C++ standard libraries and can access the PLC functions e.g. floating point calculations, memory allocation, µs-resolution, real-time clock, file access. ↳ *Chapter 1.6.5.4.7.4.2 “Firmware Application Programming Interface (FWAPI)” on page 6254*
- C/C++ compilation with target CPU specific optimization, like FPU. ↳ *Further information on page 6264*
- Application libraries can be implemented in C/C++. As only the object files need to be shipped to the customer, knowledge within the code is protected. ↳ *Chapter 1.6.5.4.7.4.5 “Binary Deployment of C/C++ Application” on page 6257*

How to Create a C/C++ Application

This chapter will guide you through the necessary steps to create an AB project using a simple POU implemented in C/C++.

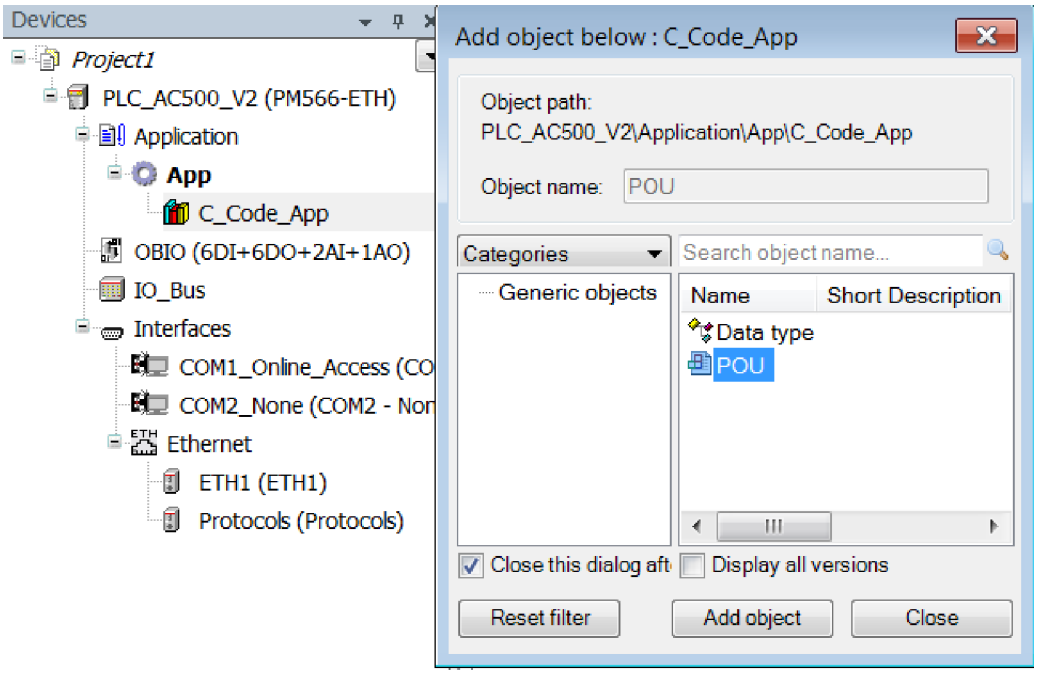
Creating a “Hello World” Application

1. In the tree view right-click on *“App”* node and add a new object.

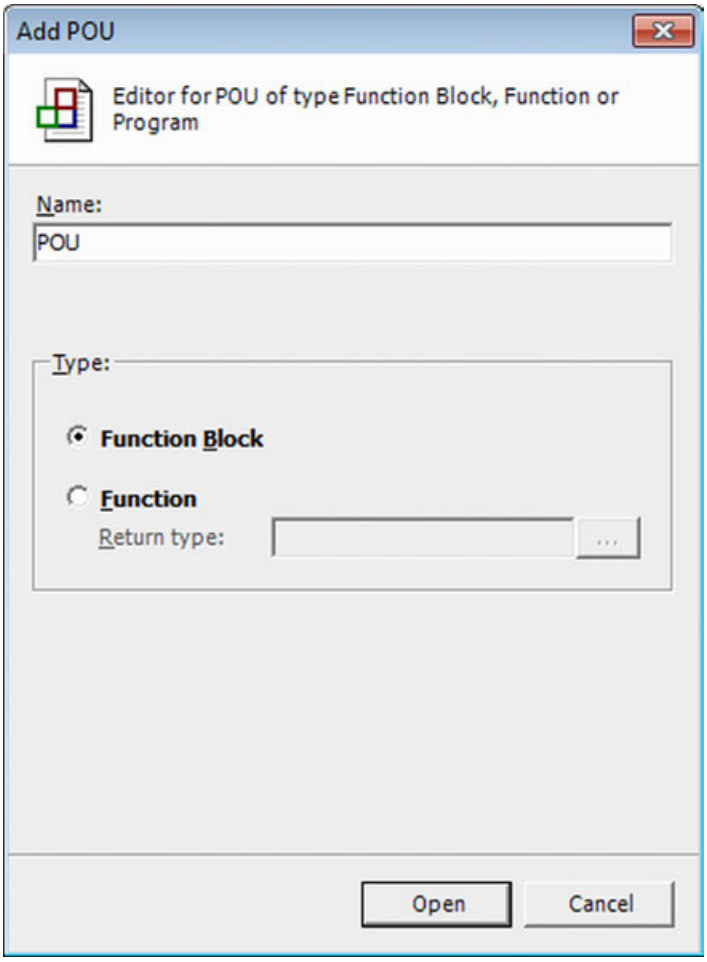


2. In the following dialog select *“C_Code_App”* and click *“Add object”*.

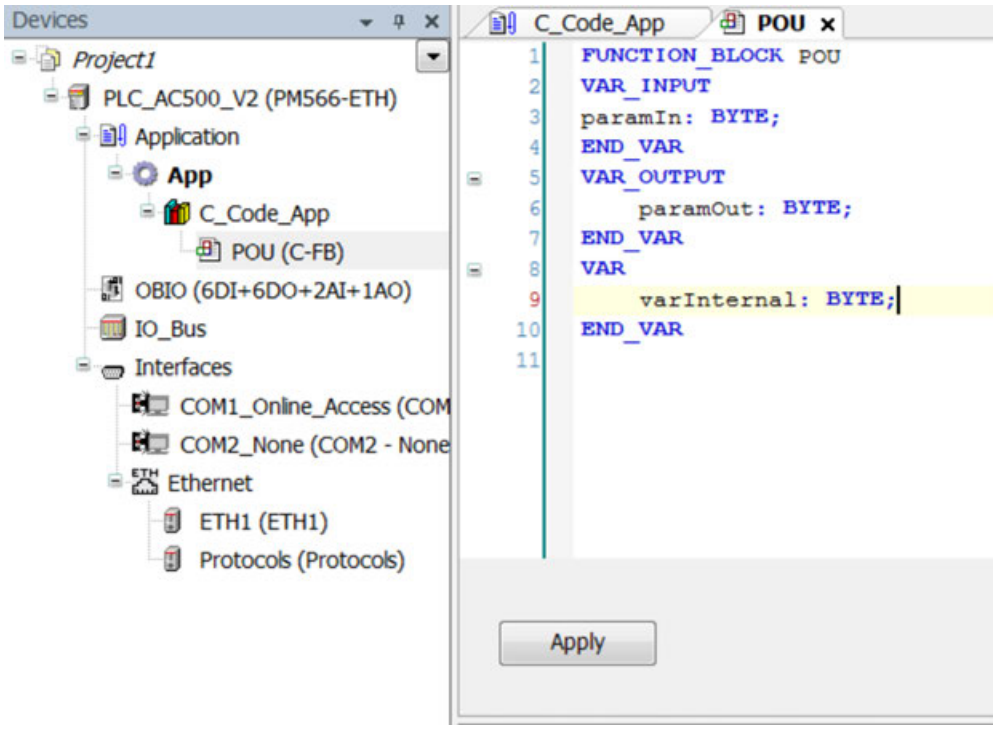
   Select the compiler to be used for the new C/C++ application and click *“Add”*.



3. In the following dialog select *"POU"* and click *"Add object"*.

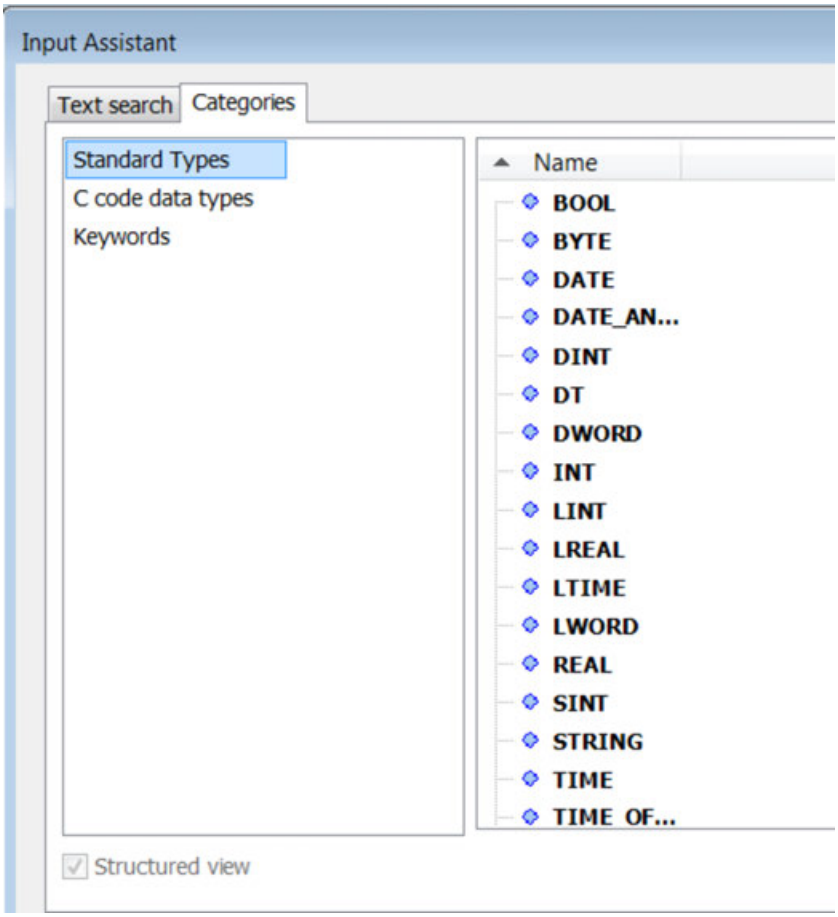


4. Select the type for the POU object and click *"Open"*.

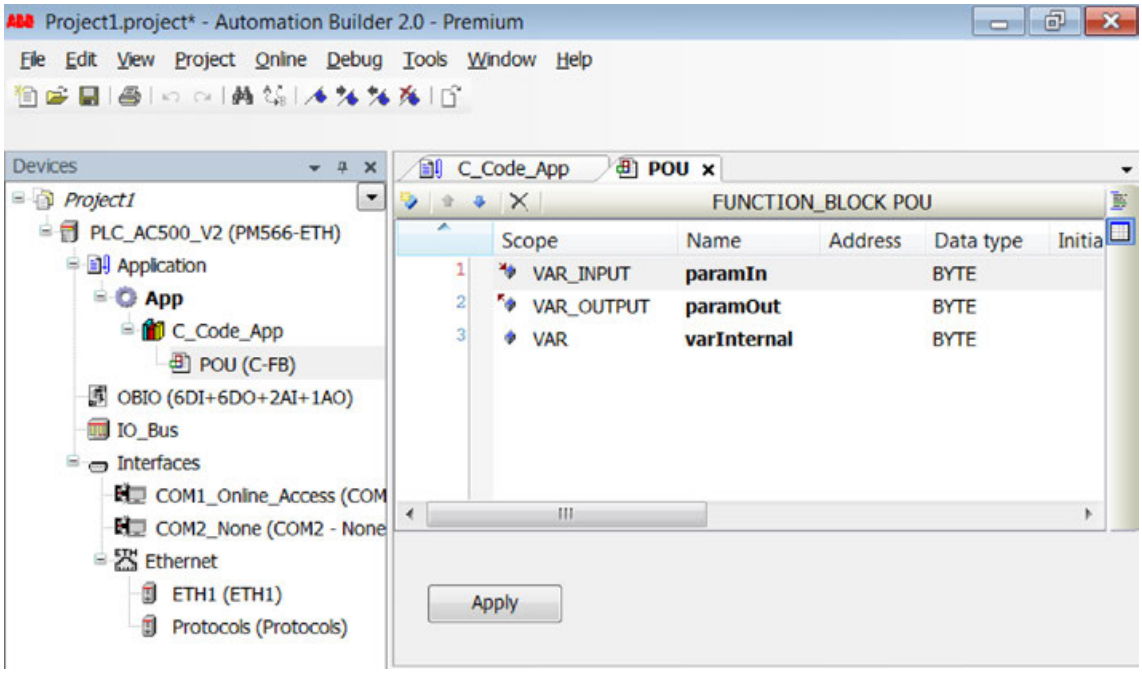


5. Enter a parameter and variable declaration.

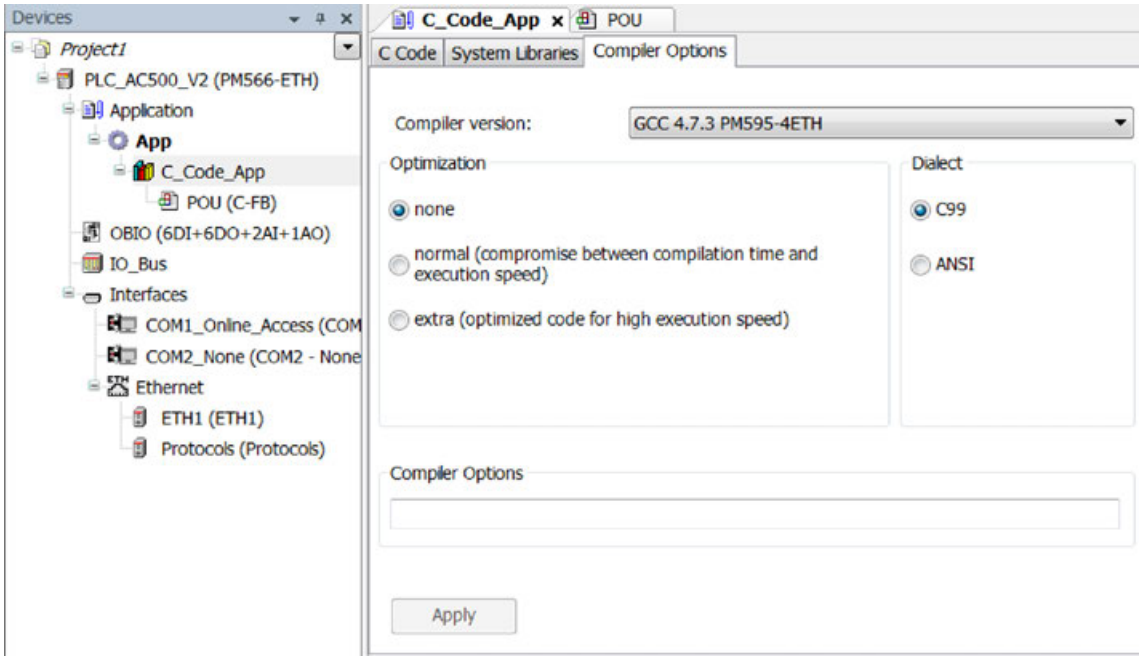
6. Right-click at the desired code position and select *"Input Assistant"* in order to define the data type:



7. Then, click *"Apply"* to update the interface. As an alternative the interface can be displayed tabularly. Tabular view is a comfortable way to edit parameters:

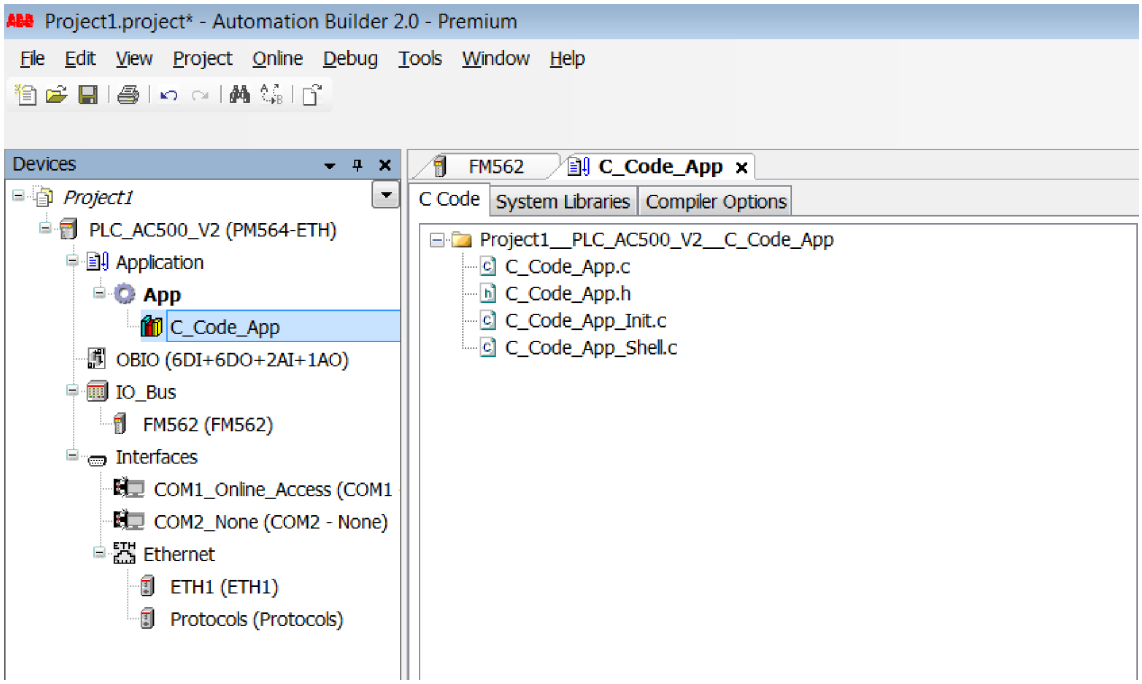


8. On the *"C_Code_App"* tab open the *"Compiler options"* tab. Select a compiler and configure compiler settings for the C/C++ application. These settings enable the compiler to interprete and process the source files listed on the *"C-Code"* tab.



9. Open the *"C-Code"* tab. The following files are listed:

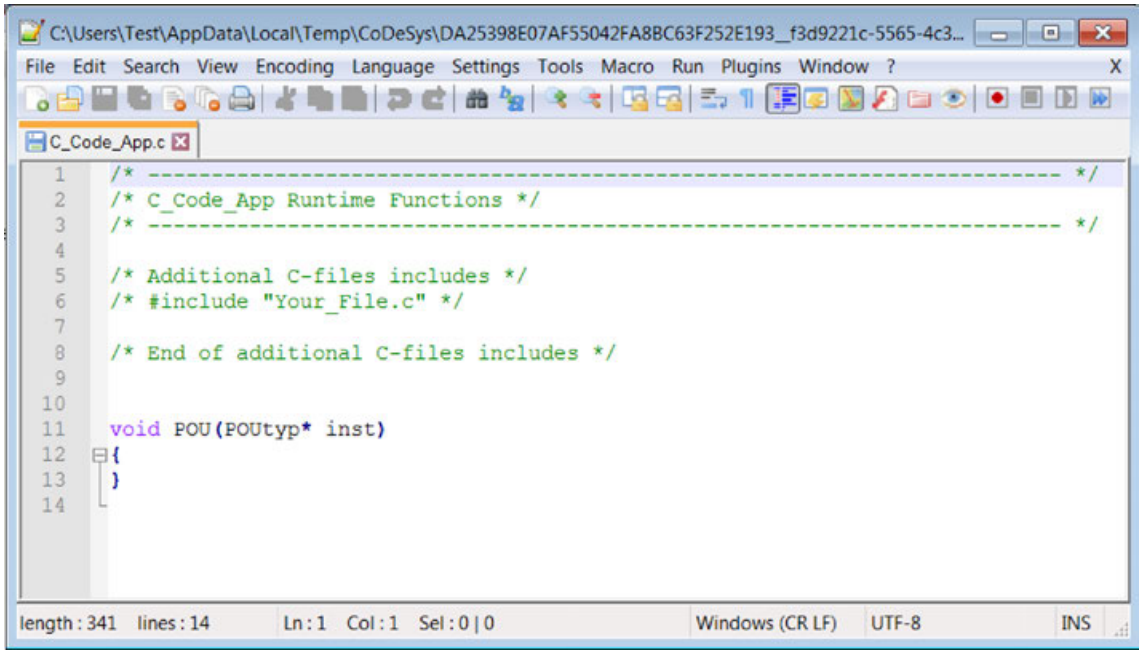
- *C_Code_App.c*: Implementation of POU.
- *C_Code_App.h*: C/C++ Interface of POU.
- *C_Code_App_Init.c*: Initialization of POU variables and parameters.
- *C_Code_App_Shell.c*: Main module.



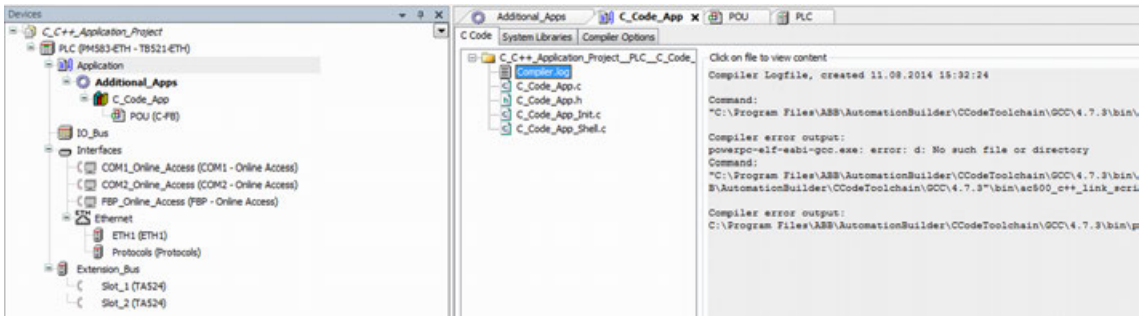
⇨

Double-click the Folder icon to open the directory in Windows Explorer.

10. To edit the POU implementation double-click or right-click a file and select *“Open...)”*. The *.c and *.h files are opened in your operating system’s default editor.

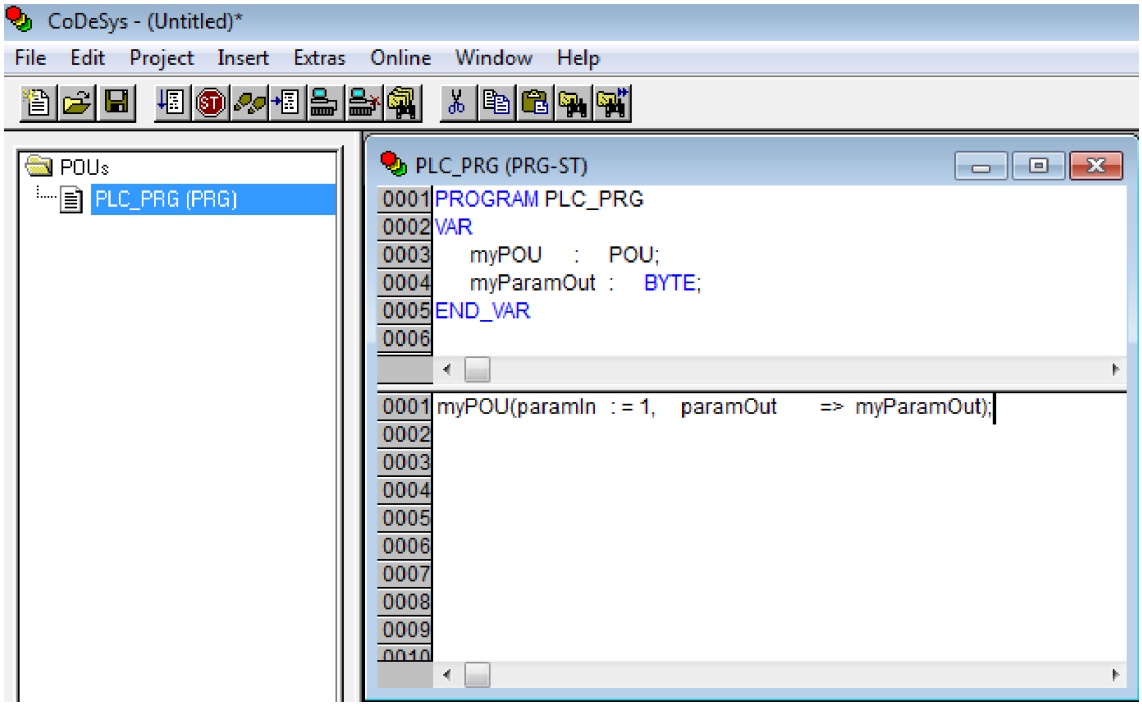


11. Save your settings and click *“Compile”* on the right side of the screen. The object files are generated from source code. Compilation errors are reported within a message window. Details on the error can be found in the *compiler.log* file.



12. Save your project. In the tree view double-click *“Application”*. CODESYS is started with C/C++ interface. From the *“C_Code_App”* node an external library is generated. This library can be found in CODESYS 2.3 in the Library Manager.

13. Call the C/C++ code POU from your IEC application.



⇨

> *In order to lookup C/C++ POUs, press F2 and open section "Standard Functions / Standard Function Blocks" .*

14. Build the project via *"Project ➔ Build"*: C/C++ application parts are linked together with IEC application.

    ⇨ Application is ready for download.

Interface between C/C++ and IEC Code

C/C++ applications may contain POUs as well as data types. Declaration and definition of stubs both are automatically done by Automation Builder when a POU or data type is created by the user. Following sections show how this is done in detail.

POU Type Function

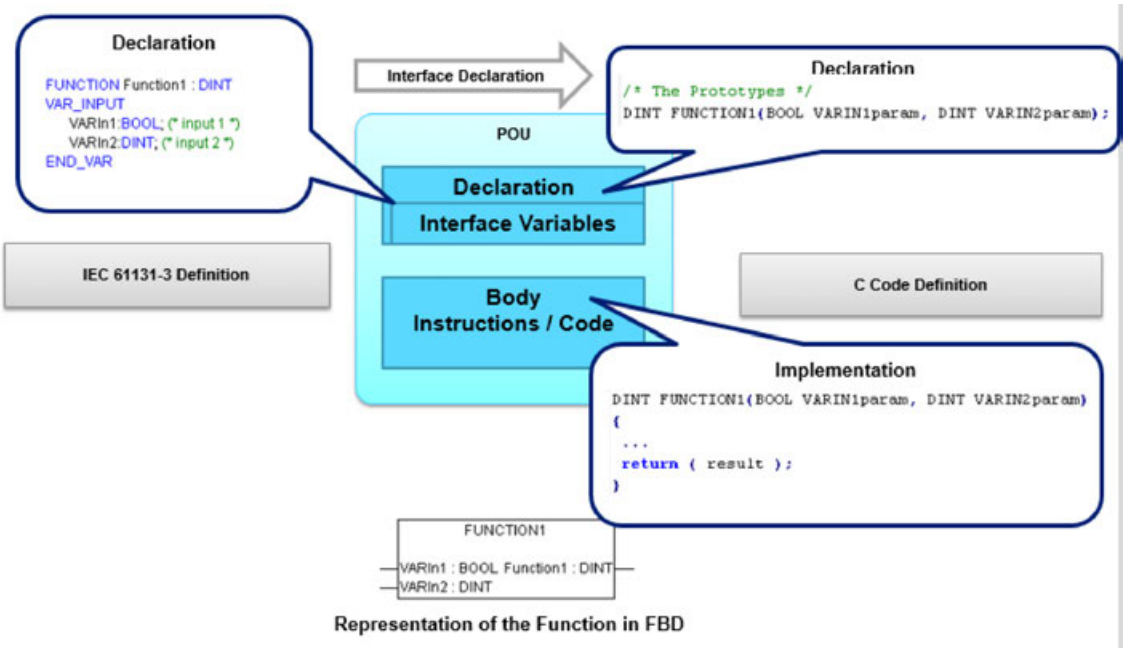


Fig. 1166: Interface between C/C++ and IEC code: POU type function.

POU type function block

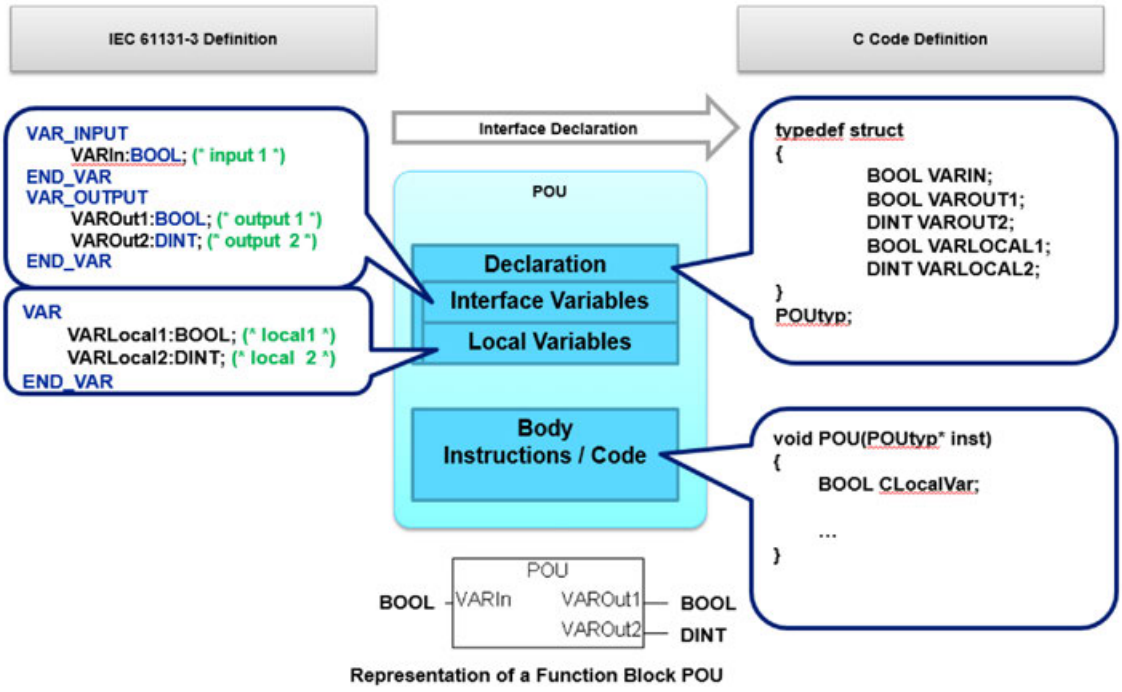

Fig. 1167: Interface between C/C++ and IEC code: POU type function block.

POU Structure with VAR_IN_OUT

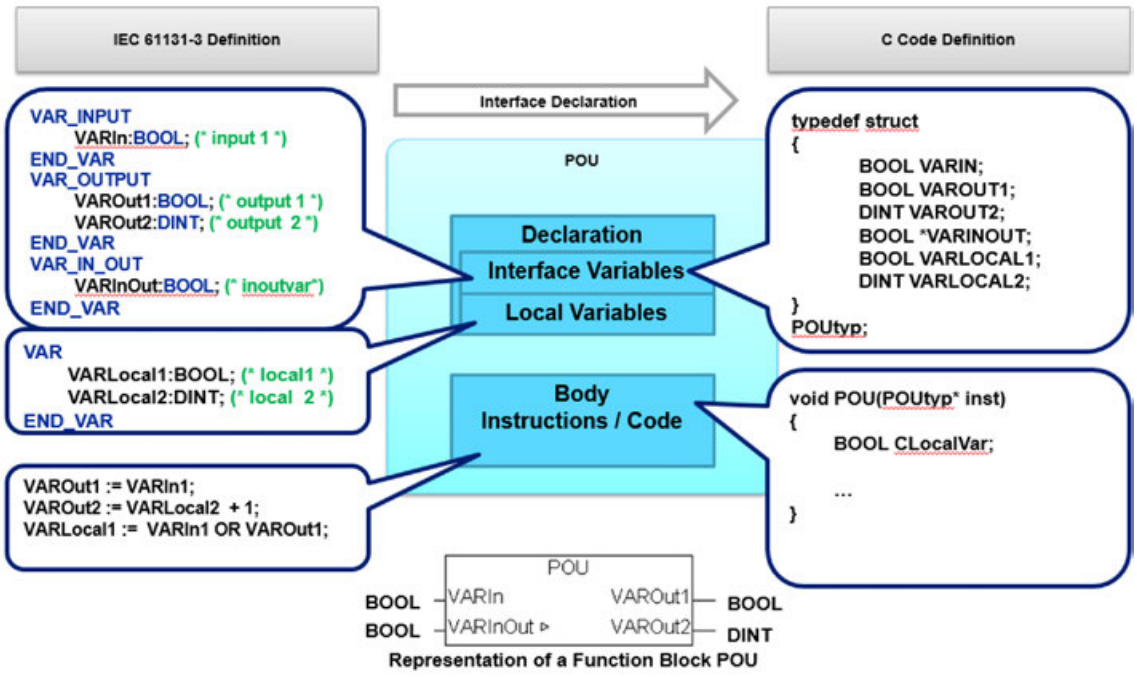

Fig. 1168: Interface between C/C++ and IEC code: POU structure with VAR_IN_OUT.

VAR_IN_OUT parameters are passed as reference to C/C++ implementation (parameter is implemented as pointer).

Function block instance data

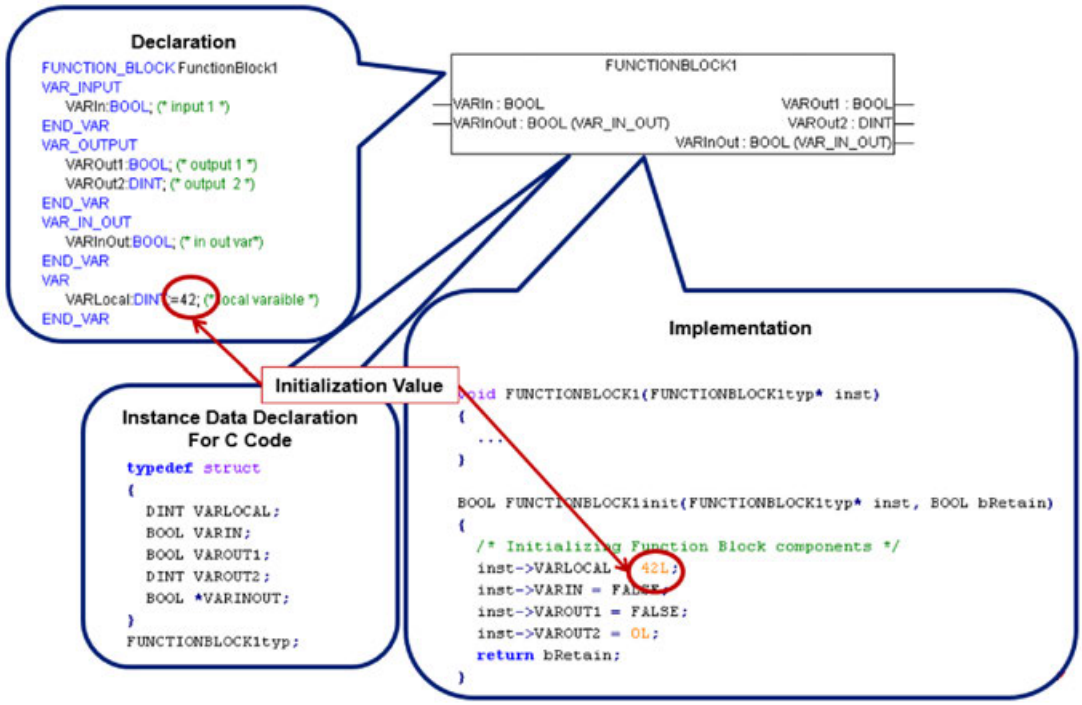

Fig. 1169: Interface between C/C++ and IEC code: function block instance data.

For each POU an *init* function is generated. This function is called on load-time and on reset of IEC application. Within this function, all parameters (VAR_IN, VAR_OUT, VAR_IN_OUT) and instance variables (VAR) are set to zero. If an instance variable is initialized in IEC declaration, this value is automatically taken for initialization inside of *init* function.

Data Type

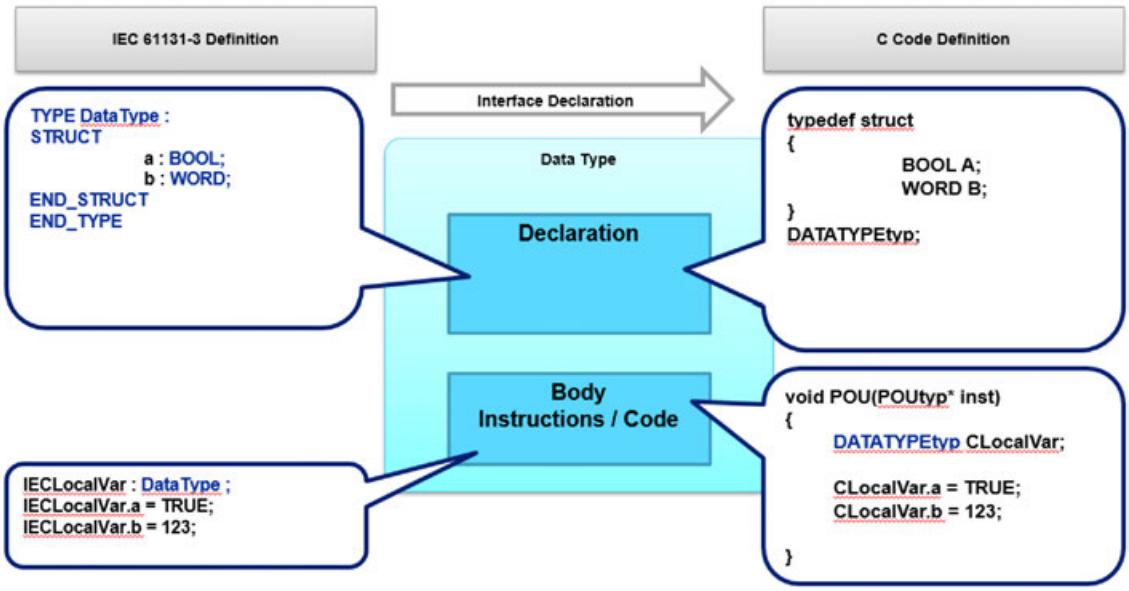

Fig. 1170: Interface between C/C++ and IEC code: Data type.

Advanced Topics

Debugging C/C++ Code

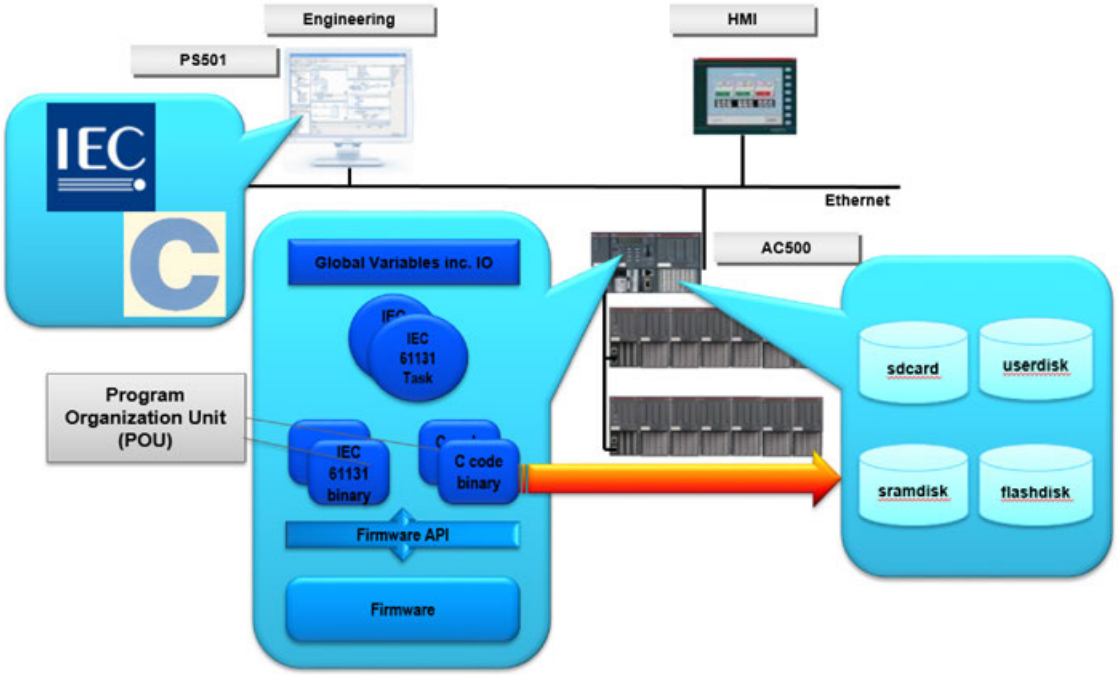

Fig. 1171: Debugging C/C++ code.

Debugging with Local POU Variables

Local POU variables are accessible via CODESYS and OPC server, thus they can be utilized to any means to reflect the state of the C/C++ implementation as desired.

Write User-defined Content to File

You can create your own logging messages. Write them to any memory location available for IEC access e.g. to read the file via the PLC's FTP server.

1. Use the *SysLibFile.h* or *stdio.h* file.
2. For further information, please refer to the CODESYS online help (chapter AC500 CPU Storage Devices).

Send User-defined Content via Ethernet

You can create your own logging messages. Send them to any other PLC or PC for further analysis.

1. Use the *SysLibSocket.h* file.
2. For further information, please refer to the CODESYS online help (chapter AC500 Ethernet Protocols and Ports).

Firmware Application Programming Interface (FWAPI)

Access to AC500 firmware from C/C++ application part is gained via the FWAPI (Firmware Application Programming Interface). It consists of a set of libraries sorted in two categories (C standard libraries and SysLib libraries). This allows a fine-grained selection of needed functionality.

▷ In order to use FWAPI from C/C++ application part, select the **Libraries** tab and click **Apply**.

⇨ `#include` statements are automatically included into source files.

FWAPI implements a subset of C standard library. ↯ *Chapter 1.6.5.4.7.5 "Known Issues and Frequently Asked Questions" on page 6258*

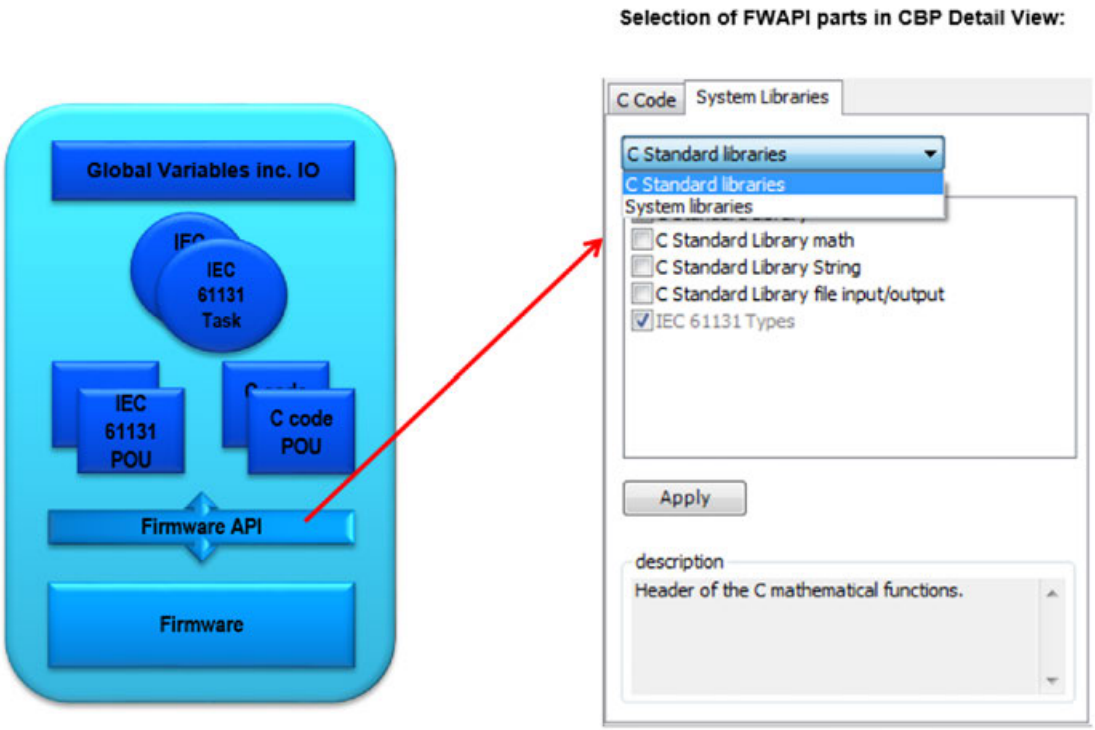

Fig. 1172: FWAPI (Firmware Application Programming Interface).

1. Right-click a list entry to open the context menu.
2. Select *“Display”* to open the header file in your default editor.

Additional Source Code Files in C/C++ Application

The C/C++ application can be split into any number of header and source files, as long as they are assembled via `#include` directives into one of the auto-generated .c files: *<application name>_shell.c* or *<application_name>_app.c*. In V2.3 this is to be done manually.

Adding files to C/C++ application:

1. Copy the files to the project’s source folder. You might have to compile or change the tabs to update the file list in the Automation Builder.
2. Right-click the project’s source folder, select *“Add files”* and use the dialog.
   ⇨ A copy of the selected files is placed in the project’s source folder.

Removing files from the project:

1. Delete the files from the project’s source folder. You might have to compile or change the tabs to update the file list in the Automation Builder.
2. Right-click the file and select *“Delete”*.

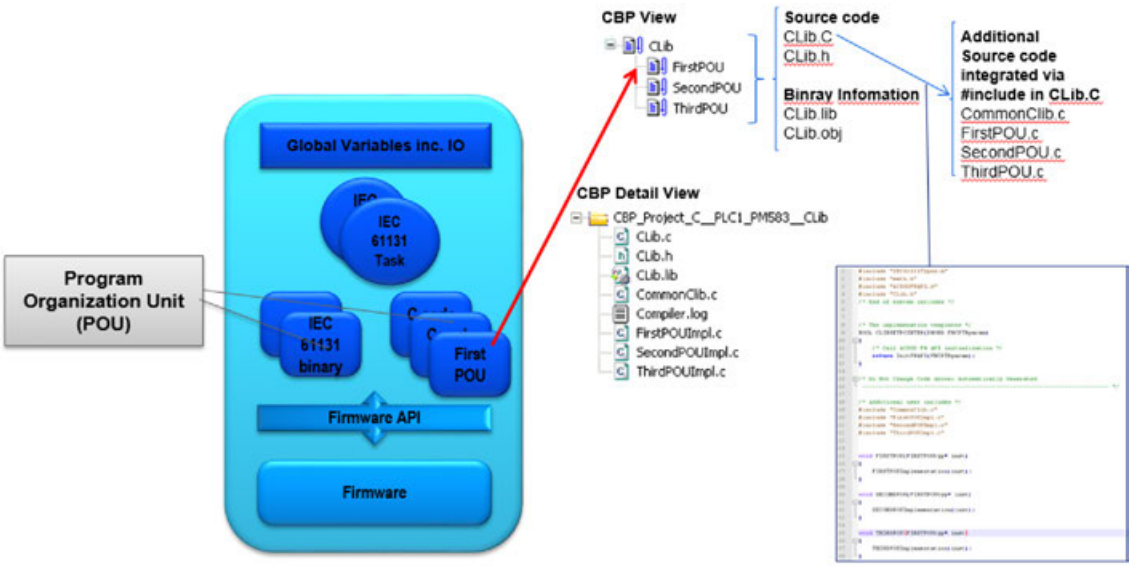

Fig. 1173: Integration of additional source code into C/C++ application.

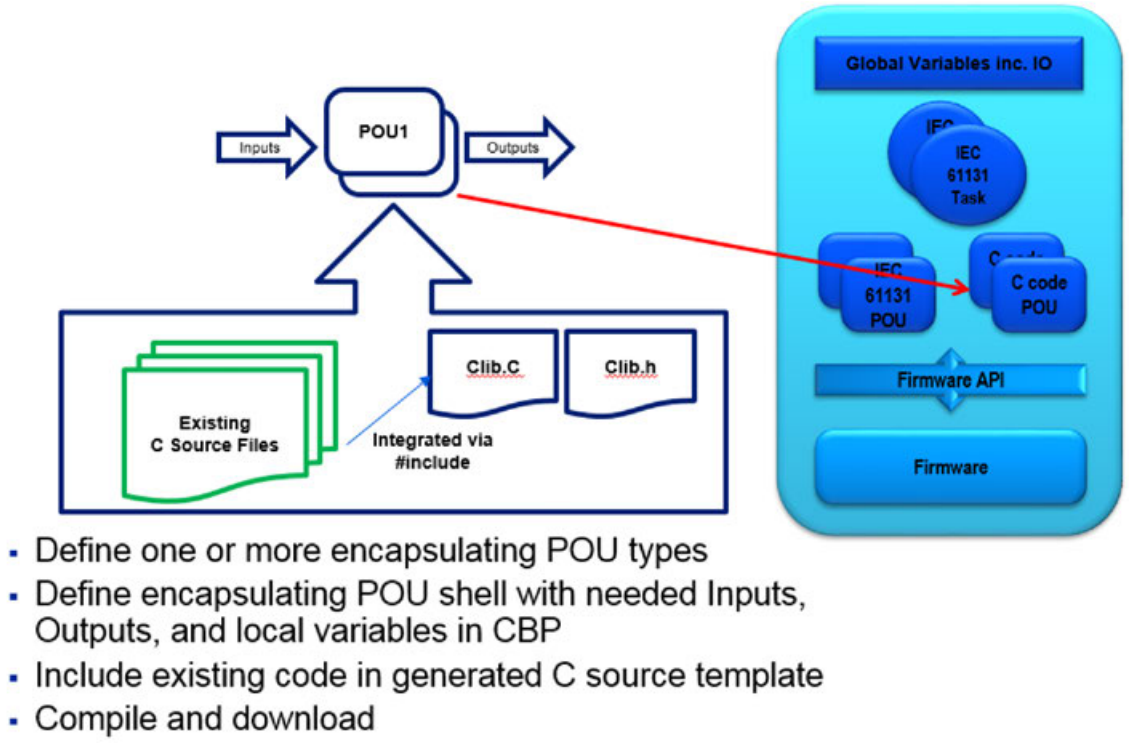
Migration of Existing Applications

An existing C/C++ application can be used as part of an IEC application. All functions, which shall be called from IEC application have to be wrapped by a POU.

> ***Exception:*** *Functions of an existing application, which shall exclusively be called from other parts of the C/C++ code, do not need to be wrapped by POU definitions.*



- Define one or more encapsulating POU types
- Define encapsulating POU shell with needed Inputs, Outputs, and local variables in CBP
- Include existing code in generated C source template
- Compile and download

Fig. 1174: Migration of existing applications

Wrapping a function by a POU:

1. Define one or more encapsulating POU types for each corresponding function.
2. Define encapsulating POU shell with needed inputs, outputs, and local variables in Automation Builder.
3. Include existing code in generated C source template.
4. Compile and download the function.

Binary Deployment of C/C++ Application

Application libraries can be implemented in C/C++ code. Only the object files need to be shipped to the customer. This protects the knowledge within the code.

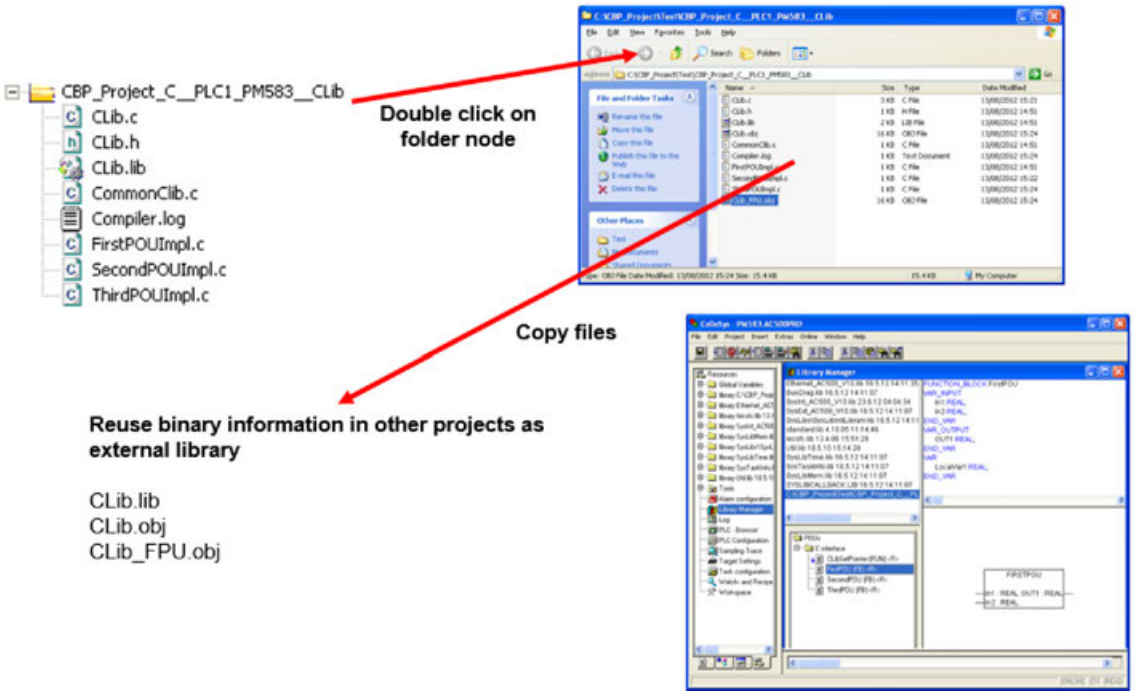


Fig. 1175: Binary deployment of C/C++ application.

Export/Import of C/C++ Code

Export/Import of C/C++ Application

Not supported yet.

Export/Import of Data Type

To import/export an interface of a single data type, right-click on the POU in tree view.

Export/Import of POU Interface

To import/export an interface of a single POU, right-click on the POU in tree view.

Project Backup Mechanism

The .c and .h files are saved in TEMP user directory under CCodeFiles\ProjectName. A copy of these files is always created on interface update (e.g. POU changes - definitions/names). A timestamp is added to the file name by copying in the TEMP user directory.

Location of the default TEMP directory:

Windows 7/8.1: %USERPROFILE%\AppData\Local\Temp. By default, "AppData" is hidden.

These files are never removed by the system. The user can decide when to delete.

Known Issues and Frequently Asked Questions

Supported compiler toolchains:

- GCC 4.7.3

CAUTION!
Support for Windriver DIAB 5.9.2 has been dropped.

Supported compiler toolchains for AC500 PLCs are shipped along with Automation Builder.

If using another version or another C/C++ cross compiler toolchain or to modify the predefined environment settings, the compiler settings must be configured manually:

1. From the **Tools** menu select **Options**. From the menu list select **C compiler settings**.

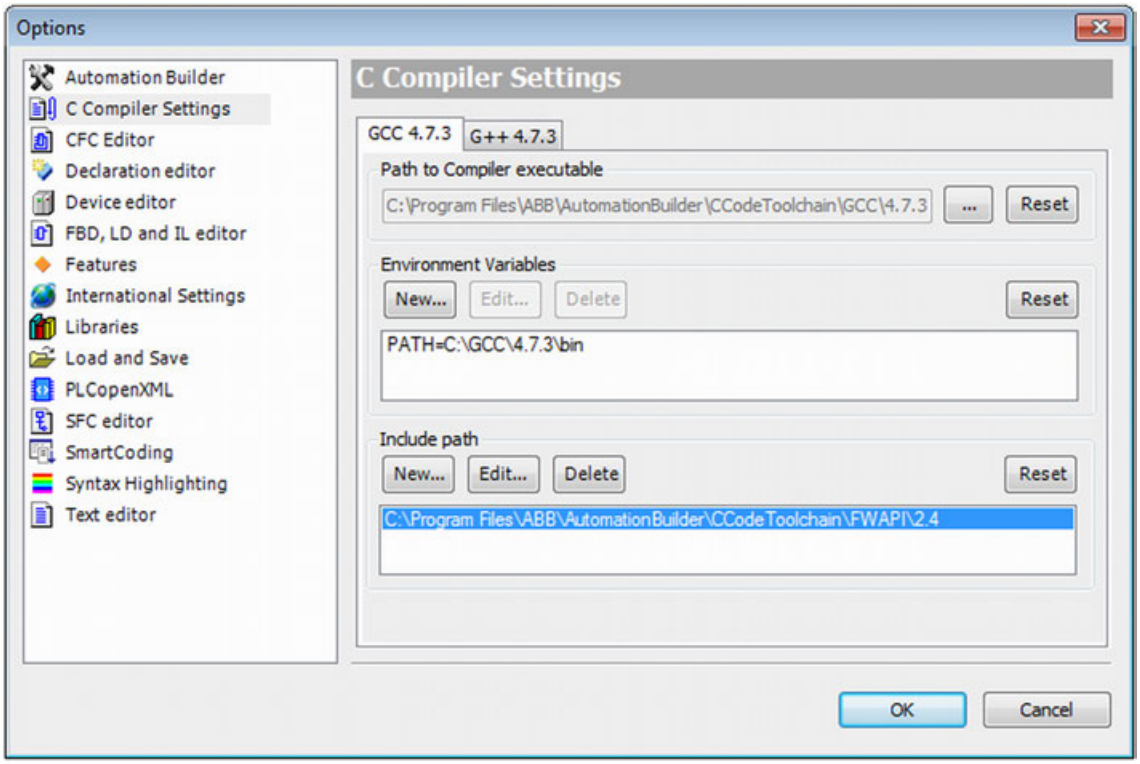

Fig. 1176: Defining compiler settings.

2. Open the **GCC <>** tab.
3. Under **Environment Variables** click **New** to enter the path to compiler executable.
4. Under **Include path** click **New** to add custom include paths. The include path to FWAPI is automatically detected and cannot be changed.

CAUTION!
Changes on the preset FWAPI path lead to ending support service.

Specifying optimization level

When optimizing for size, GCC uses primitives for saving and restoring GPR and FPR registers from *libgcc*. Since C/C++ application is not linked against *libgcc*, this results in link errors (symbol not found). Therefore optimization level –Os is not available in the compiler settings.

Restrictions

Restrictions on C:

Language elements: ANSI C and C99 language extension are supported.

Restrictions on C++ :

- Online change functionality is not available, if C++ toolchain is used. After changes in IEC application part, always a full download will occur.
- Language elements: ISO C++98 and ISO C++2003 C++ dialects are supported as it is supported by GCC –std option.
- We currently do not support:
  – RTTI (Runtime Type Information)
  – Exceptions

  When existing code is imported, please ensure that the code works with these restrictions.

Restrictions for PM595:

Do not use 64-bit data types (LREAL, LINT, ULINT, LWORD) as return value of Function POUs.

Workaround: Use either function block POU, or encapsulate 64-bit return values in a STRUCT declaration and return this data instead.

Problems with accessing function block parameters from C/C++ application:

In order to convert the parameter names of POUs or DUTs automatically, follow the following rules:

- Function block parameters/DUT members get converted to uppercase (e.g. FirstParam -> FIRSTPARAM).
- Function parameters get converted to uppercase and a postfix is added (e.g. abc -> ABC-param).

Using standard output/standard error:

Access to standard streams (e.g. via printf, puts, etc.) is not available. Please use standard file access instead (e.g. fprintf, fputs, etc.).

Supported parts of C standard library

A description on available functions in the standard library (FWAPI functions) is provided under <AB InstallDirectory>\CCodeTool-chain\FWAPI\2.4\doc\index.html.

Header	Description	Sup-ported	Remarks
assert.h	Contains the assert macro, used to assist with detecting logical errors and other error types in debugging versions of a program.	Yes	-
com-plex.h	A set of functions for manipu-lating complex numbers.	Yes	-

Header	Description	Sup-ported	Remarks
ctype.h	Defines a set of functions used to classify characters by their types or to convert between uppercase and lowercase in a way that is independent of the used character set (typically ASCII or one of its extensions, although implementations utilizing EBCDIC are also known).	Partially	Not supported: setchrclass
errno.h	For testing error codes reported by library functions.	Yes	-
fenv.h	Defines a set of functions for controlling floating-point environment.	Yes	-
float.h	Defines macro constants specifying the implementation-specific properties of the floating-point library.	Yes	-
inttypes.h	Defines exact-width integer types.	Yes	-
iso646.h	Defines several macros that are equivalent to some of the operators in C. For programming in ISO-646 variant character sets.	Yes	-
limits.h	Defines macro constants specifying the implementation-specific properties of the integer types.	Yes	-
locale.h	Defines localization functions.	Yes	Standard C/POSIX locales only
math.h	Defines common mathematical functions.	Partially (ANSI and C99)	Not supported: Macros: NAN, HUGE VAL
setjmp.h	Declares the macros setjmp and longjmp, which are used for non-local exits.	Yes	-
signal.h	Defines signal handling functions.	No	-
stdalign.h	For querying and specifying the alignment of objects.	No	Part of C11: Not supported by GCC 4.7.3
stdarg.h	For accessing a varying number of arguments passed to functions.	Yes	-
stdatomic.h	For atomic operations on data shared between threads.	No	Part of C11: Not supported by GCC 4.7.3
stdbool.h	Defines a boolean data type.	Yes	-
stddef.h	Defines several useful types and macros.	Yes	-
stdint.h	Defines exact-width integer types.	Yes	-

Header	Description	Sup-ported	Remarks
stdio.h	Defines core input and output functions.	Partially	Not supported: **Operations on files:** tmpfile, tmpnam **File access:** freopen, setbuf, setvbuf **Formatted input/output:** scanf, vscanf **Character input/output:** getc, getchar, gets, ungetc **Error-handling:** clearerr, ferror, perror **Macros:** BUFSIZ, FILENAME_MAX, FOPEN_MAX, L_tmpnam, TMP_MAX
stdlib.h	Defines numeric conversion functions, pseudo-random numbers generation functions, memory allocation, process control functions.	Partially	Not supported: **Pseudo-random sequence generation:** srand **Environment:** abort, atexit, at_quick_exit, exit, getenv, quick_exit, system, _Exit **Integer arithmetics:** llabs, lldiv **Multibyte characters /strings:** mblen, mbtowc, wctomb, mbstowcs, wcstombs **Macros:** EXIT_FAILURE, EXIT_SUC-CESS, MB_CUR_MAX
stdnore-turn.h	For specifying non-returning functions.	No	Part of C11: Not supported by DIAB C lib and GCC 4.7.3
string.h	Defines string handling functions.	Partially	Not supported: **Comparison:** strcoll, strxfrm **Searching:** strtok (alternative: strtok_r) **Other:** strerror
tgmath.h	Defines type-generic mathematical functions.	Yes	-
threads.h	Defines functions for managing multiple threads as well as mutexes and condition variables.	No	Part of C11: Not supported by GCC 4.7.3
time.h	Defines date and time handling functions.	Partially	Not supported: **Conversion:** localtime
uchar.h	Types and functions for manipulating unicode characters.	No	-
wchar.h	Defines wide string handling functions.	No	-
wctype.h	Defines set of functions used to classify wide characters by their types or to convert between uppercase and lowercase.	No	-

Supported parts

A description on available functions in the standard library (FWAPI functions) is provided under <AB InstallDirectory>\CCodeTool-chain\FWAPI\2.4\doc\index.html.

Header	Description	Supported
<c*> (.h)	C library headers	Yes
array	Containers	No
bitset	Containers	No
deque	Containers	No
forward_list	Containers	No
list	Containers	No
map	Containers	No
queue	Containers	No
set	Containers	No
stack	Containers	No
unordered_map	Containers	No
unordered_set	Containers	No
vector	Containers	No
ios	Input/output base classes	No
streambuf	Stream buffer	No
istream	Input streams	No
ostream	Output streams	No
iostream	Standard input/output streams library	No
fstream	File streams	No
sstream	String streams	No
iomanip	IO manipulators	No
iosfwd	Input/output forwarding	No
atomic	Atomics and threading library	No
condition_variable	Atomics and threading library	No
future	Atomics and threading library	No
mutex	Atomics and threading library	No
thread	Atomics and threading library	No
algorithm	Algorithms	No
chrono	Time	No
complex	Complex numbers	No
functional	Function objects	No
initializer_list	Initializer list	No
iterator	Iterator definitions	No
limits	Numeric limits	No

Header	Description	Supported
memory	Memory elements	No
new	Dynamic memory	Yes
numeric	Generalized numeric operations	No
random	Random	No
ratio	Ratio header	No
regex	Regular expressions	No
string	Strings	No
system_error	System errors	No
tuple	Tuple library	No
typeindex	Type index	No
typeinfo	Type information	No
type_traits	type_traits	No
utility	Utility components	No
valarray	Library for arrays of numeric values	No

Floating point instructions:

Support for floating point instructions (single and double precision) in hardware.

Debugging:

At the moment the development environment does not support debugger, i.e. debugging while running on PLC target is not possible.

Linking third-party binaries or libraries:

At the moment it is not possible to link against third-party binaries or libraries.

Adding third-party source code to C/C++ applications:

Chapter 1.6.5.4.7.4.3 “Additional Source Code Files in C/C++ Application” on page 6255

Compiler/linker options for compiling C/C++ code:

CAUTION!
These compiler/linker settings are activated by default, and cannot be changed by end-users, since otherwise compilation/linking may fail or lead to unexpected results.

In addition to that, following options are configurable by end users via C/C++ compiler settings dialog.

Table 755: Compile options:

Type of PLC	GCC (C)	G++ (C++)
PM55x, PM56x, PM57x, PM58x	-mcpu=860 -fno-common -msdata=none -fno-jump-tables -fno-section-anchors -fno-merge-constants -fno-builtin -nostdlib -Wconversion -Werror-implicit-function-declaration fstack-usage	-
PM590, PM591, PM592	-mcpu=603e -fno-common -msdata=none -fno-jump-tables -fno-section-anchors -fno-merge-constants -fno-builtin -nostdlib -Wconversion -Werror-implicit-function-declaration fstack-usage	-fmessage-length=0 -fno-rtti -fomit-frame-pointer -fno-exceptions -fno-asynchronous-unwind-tables -fno-unwind-tables
PM595	-mcpu=8540 -mdouble-float -mfloat-gprs=double -mspe -mabi=spe -fno-common -msdata=none -fno-jump-tables -fno-section-anchors -fno-merge-constants -fno-builtin -nostdlib -Werror-implicit-function-declaration -Wconversion -fstack-usage	-

Dialect options

Table 756: GCC (C):

Option	GCC (C)
C99	-std=c99
ANSI	-ansi

Table 757: G++ (C++):

Option	GCC (C)
ISO C++98	-std=c++98
ISO C++03	-std=c++03

Optimization options:

Option	GCC (C) and G++ (C++)
none	-
normal	-O2
extra	-O3

Linker options:

Linker options are used in exactly the order as shown in the following table.

C	C++
--emit-relocs	--emit-relocs
--no-check-sections	--no-check-sections
-L%TOOLCHAINPATH%\powerpc-elf-eabi\lib	-L%TOOLCHAINPATH%\powerpc-elf-eabi\lib
-L%TOOLCHAINPATH%\lib\gcc\powerpc-elf-eabi\4.7.3	-L%TOOLCHAINPATH%\lib\gcc\powerpc-elf-eabi\4.7.3
	%TOOLCHAINPATH%\lib\gcc\powerpc-elf-eabi\4.7.3\ecrti.o
	%TOOLCHAINPATH%\lib\gcc\powerpc-elf-eabi\4.7.3\crtbegin.o
userapplication.obj	userapplication.obj
-	-lstdc++

C	C++
-	%TOOLCHAINPATH%\lib\gcc\powerpc-elf-eabi\4.7.3\crtend.o %TOOLCHAINPATH%\lib\gcc\powerpc-elf-eabi\4.7.3\ecrtn.o
%TOOLCHAINPATH%\powerpc-elf-eabi\lib\lib_a-setjmp.o %FWAPIPATH%\libFWAPI.a" -o user_libname.obj --strip-debug --script=ac500_link_script	%TOOLCHAINPATH%\powerpc-elf-eabi\lib\lib_a-setjmp.o %FWAPIPATH%\libFWAPI.a" -o user_libname.obj --strip-debug --script=ac500_link_script

Why are VAR_IN_OUT parameters of a function block not initialized in corresponding init function?

During initialization of the function block the pointer `BYTE *B;` is not valid. It is getting valid during first call of the function block in IEC, therefore it is first accessible in FB main function code.

CODESYS compiler complains about unresolved symbols _f_sub, __subsf3, …:

Your PLC uses math emulation. Please include math standard library (math.h) to support this.

Type char:

Type `char` is implemented as `unsigned char`. Hence, its definition is equal to IEC type BYTE.

Why does GCC generate code that aborts application when va_list is used?

If you use `va_list`, GCC performs an automatic type promotion of the list members:

- `char/short` ➔ `int`
- `unsigned char/unsigned short` ➔ `unsigned int`
- `float` ➔ `double`

When extracting list members with `va_arg()`, ensure using the **promoted** type (e.g. `int` instead of `char`). We recommend you, to check the compiler warnings. In case of type mismatch, GCC will throw a warning similar to the following:

```
warning: 'unsigned char' is promoted to 'int' when passed through
'...' [enabled by default]
note: (so you should pass 'int' not 'unsigned char' to 'va_arg')
note: if this code is reached, the program will abort
```

CAUTION!
In this case call to `va_arg()`. Otherwise GCC will insert a trap instruction, that halts your application.

Parameters of POU or the members of data types defined in Automation Builder differ from definition in C sources:

On code generation, parameters of POU and members of data types are slightly transformed:

- Names of POU and data types are converted to uppercase (e.g. mypou -> MYPOU).
- Parameters of POUs and members of data types are converted to uppercase.
- Parameters of POU type FUNCTION: A postfix "param" is added (e.g. myByte -> MYBYTE-param).

Number of POUs or data types for a Automation Builder project:

Up to 50 POUs or data types can be created in one single Automation Builder project.

Searching for a POU or data type name in Automation Builder:

Search with *Edit -> Find/Replace -> Find does* not work is not supported yet.

Online change after changes in C/C++ application parts:

After a change in C/C++ application part, online change is not possible. Perform a "Clean All" function before downloading to PLC.

If changes are in IEC code only, online changes are still possible.

Appendix

IEC vs. C/C++ Operators

IEC	C	Remark
a **AND** b	a **&&** b	Logical AND
a **OR** b	a **||** b	Logical OR
a **AND** b	a **&** b	Bitwise AND
a **OR** b	a **|** b	Bitwise OR
NOT a	**!**a	Logical negation
NOT	**~**a	Bitwise negation
XOR	**^**a	Bitwise XOR
SHL(a,b**)**	a **<<** b	Bitwise left shift
SHR(a,b**)**	a **>>** b	Bitwise right shift
a **>** b	a **>** b	Greater than
a **>=** b	a **>=** b	Greater than or equal to
a **<** b	a **<** b	Less than
a **<=** b	a **<=** b	Less than or equal to
a **=** b	a **==** b	Equal to
a **<>** b	a **!=** b	Not equal to
a **:=** b	a **=** b	Assignment
ADR(a**)**	**&**a	Reference (address of)
a**^**	***a**	Indirection (object pointed to by)
a**^.**b	a**->**b	Structure dereference
a**.**b	a**.**b	Structure reference

IEC	C	Remark
a **+** b	a **+** b	Addition
a **–** b	a **–** b	Subtraction
a ***** b	a ***** b	Multiplication
a **/** b	a **/** b	Division
MOD(a,b**)**	a **%** b	Modulo
n/a	**++**a	Pre-increment
n/a	a**++**	Post-increment
n/a	**--**a	Pre-decrement
n/a	a**--**	Post-decrement

IEC vs. C/C++ Types

IEC	C	Remark
BOOL	Unsigned char	-
BYTE	Unsigned char	-
WORD	Unsigned short	-
DWORD	Unsigned long	-
SINT	Signed char	-
USINT	Unsigned char	-
INT	Short	-
UINT	Unsigned short	-
DINT	Long	-
UDINT	Unsigned long	-
REAL	Float	-
LREAL	Double	-
STRING(size)	Char[size+1]	Size specifier is optional. Default size is 80 characters (IEC). Size in C code is +1 due to null termination.
TIME	Unsigned long	Milliseconds starting from 00:00:00
TIME_OF_DAY (TOD)	Unsigned long	Milliseconds starting from 00:00:00
DATE	Unsigned long	Seconds starting from 1.1.1970 at 00:00:00
DATE_AND_TIME (DT)	Unsigned long	Seconds starting from 1.1.1970 at 00:00:00
LWORD	Unsigned long long	-
LINT	Long long	-
ULINT	Unsigned long long	-

C 99 vs. ANSI C

For further information refer to *http://www.open-std.org/jtc1/sc22/WG14/www/docs/n1256.pdf*:

- Restricted pointers: *http://gcc.gnu.org/onlinedocs/gcc/Restricted-Pointers.html*.
- Variable-length arrays: *http://gcc.gnu.org/onlinedocs/gcc/Variable-Length.html*.
- Flexible array members: *http://gcc.gnu.org/onlinedocs/gcc/Zero-Length.html*.
- `static` and type qualifiers in parameter array declarators.
- `long long int` type:*http://gcc.gnu.org/onlinedocs/gcc/Long-Long.html*.
- Additional floating-point characteristics in `<float.h>`.
- Removed implicit `int`.
- Reliable integer division.
- Universal character names (`\u` and `\U`).
- Compound literals:*http://gcc.gnu.org/onlinedocs/gcc/Compound-Literals.html*.
- Non-constant initializers:*http://gcc.gnu.org/onlinedocs/gcc/Initializers.html*.
- Designated initializers:*http://gcc.gnu.org/onlinedocs/gcc/Designated-Inits.html*.
- // comments:*http://gcc.gnu.org/onlinedocs/gcc/C_002b_002b-Comments.html*.
- Extended integer types and library functions in `<inttypes.h>` and `<stdint.h>`.
- Removed implicit function declaration.
- Preprocessor arithmetic done in `intmax_t/uintmax_t`.
- Mixed declarations and code:*http://gcc.gnu.org/onlinedocs/gcc/Mixed-Declarations.html*.
- New block scopes for selection and iteration statements.
- Integer constant type rules.
- Integer promotion rules.
- Macros with a variable number of arguments.
- The vscanf family of functions in `<stdio.h>` and `<wchar.h>`.
- Additional math library functions in `<math.h>`.
- Floating-point environment access in `<fenv.h>`.
- IEC 60559 (also known as IEC 559 or IEEE arithmetic) support.
- Trailing comma allowed in `enum` declaration.
- `%lf` conversion specifier allowed in `printf`.
- Inline functions.
- The snprintf family of functions in `<stdio.h>`.
- Boolean type in `<stdbool.h>`.
- Empty macro arguments.
- New struct type compatibility rules (tag compatibility).
- Additional predefined macro names.
- `_Prama` preprocessing operator.
- Standard pragmas.
- `__func__` predefined identifier.
- `va_copy` macro.
- Additional `strftime` conversion specifiers.
- Deprecate `ungetc` at the beginning of a binary file.
- Removed deprecation of aliased array parameters.
- Conversion of array to pointer not limited to values.
- Relaxed constraints on aggregate and union initialization.
- `return` without expression not permitted in function that returns a value (and vice versa).

C++ 98 vs. C++ 03

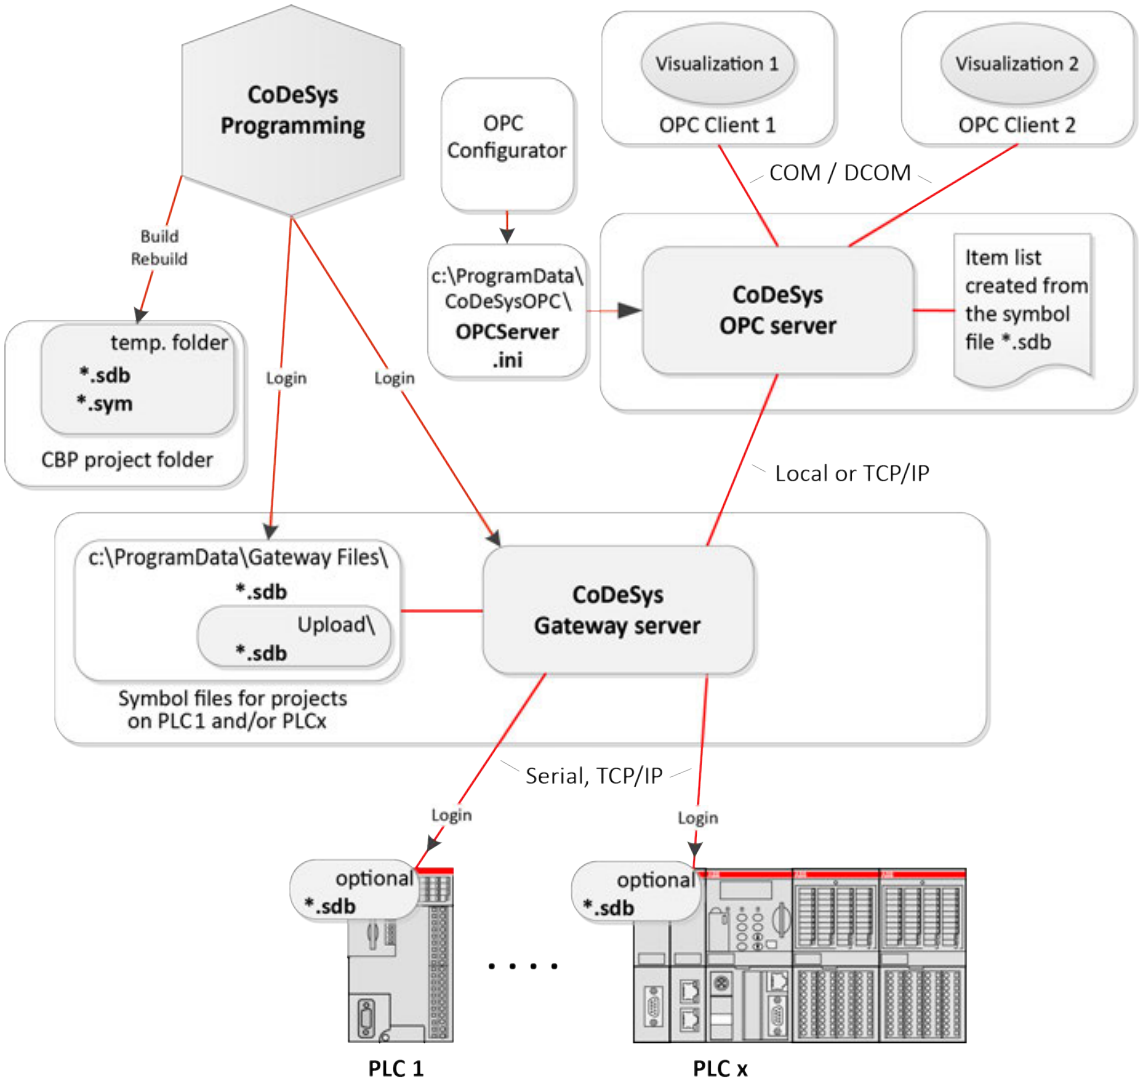
As C++ 98 and C++ 03 can be used interchangeably, programming is identical.

1.6.5.5 Server installation

1.6.5.5.1 OPC server for AC500 V2 products

Introduction

Architecture of the CODESYS OPC server



Essential documents

For further information see ↳ *Chapter 1.6.5.5.1.2 “Hints” on page 6277*.

Hints

When using OPC server V2 or V3

Required functions of the OPC client	OPC server V2	OPC server V3	Hints
Windows 7 32-bit, Windows 7 64-bit, Windows Server 2003, Windows Server 2008	X	X	
OPC client runs as service	-	X	
Support alarm/event	-	X	
Support AC500 HA	-	X	
OPC performance	-	Faster	Comparison with OPC server V2 to V3: transmission rate
Support VB, VBA OPC clients (Automation Interface, Automation Wrapper)	X	X	OPC server V3 supports VBA OPC clients. However, a OPC server V2 must be installed additionally as otherwise an essential DLL is missing.
Resource-saving to older OPC clients, which support only the old OPC DA 1.0a (Async I/O 1.0a) groups.	X	X	See hints *Chapter 1.6.5.5.1.3.4 “Behavior OPC server V3 via interface IOPCAsyncIO” on page 6308*
Simulation without AC500	-	X	

Several OPC clients used at the same time, must run in the same session.

See Hints Chapter 1.6.5.5.1.3.3 “Session isolation” on page 6306.

*If folder **C:\ProgramData** is missing, select "Show hidden files, folders and drives" at "Control Panel ➔ All Control Panel Items ➔ Folder Options ➔ View ➔ Hidden files and folders".*

Installation of OPC server

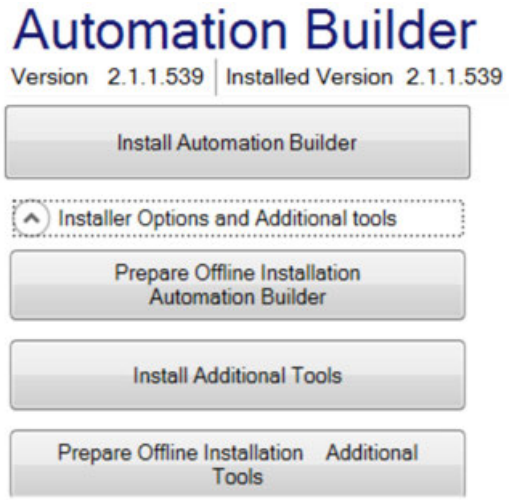
Prerequisites

The following applications are closed:
- *All OPC clients*
- *ABB OPC tunnel*
- *CODESYS gateway server*

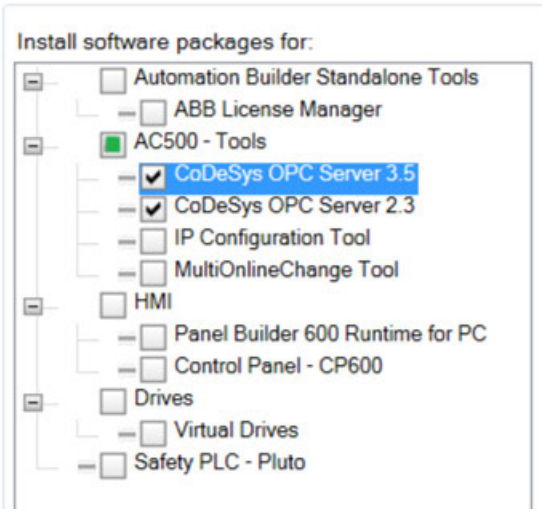
Ensure termination of the following processes:
- *Gateway.exe*
- *CoDeSysOPC.exe*
- *WinCoDeSysOPC.exe*
- *OCTsvc.exe*

Installing with Automation Builder

1. Go to homepage *http://new.abb.com/plc/automationbuilder/platform/software* .
2. Click button of *Latest Automation Builder version (recommended)* and run the installer.



3. Open *"Installer Options and Additional Tools"* and click *[Install Additional Tools]*.
4. Agree to the *"License Terms"*.



5. Select *“Version 2 and/or 3”* and install.

   ⇨ All required files are installed for OPC and the OPC server is registered automatically as user application.

Manual registration and unregistration

It is possible to register or to uninstall the OPC server manually either as COM server (user application) or as a service.

Register the OPC server as interactive software in the Windows registry:

Command for OPC 3: ***`WinCoDeSysOPC/RegServer`***

Command for OPC 2: `CoDeSysOPC/RegServer`

Register the OPC server as system service:

Command for OPC 3: ***`WinCoDeSysOPC/Service`***

Unregister the OPC server from the Windows registry and from the service entry:

Command for OPC 3: ***`WinCoDeSysOPC/UnRegServer`***

Command for OPC 2: `CoDeSysOPC/UnRegServer`

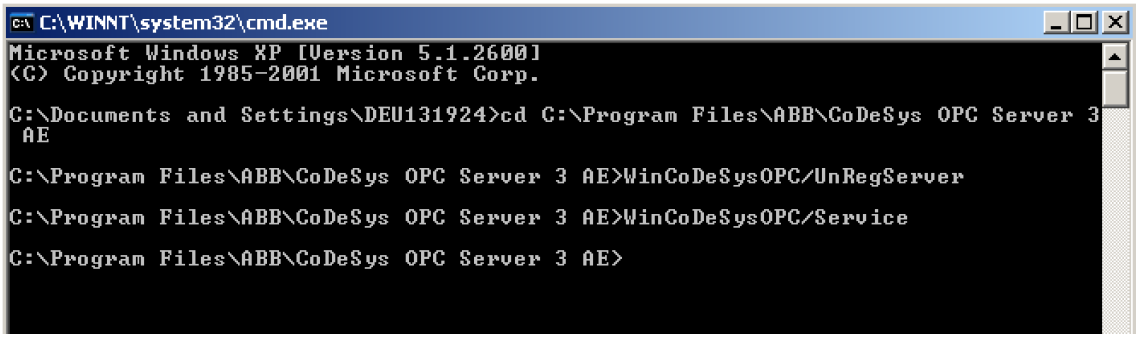
Please see REF1 chapter 3 (OPC 3) and REF6 chapter 2.2 (OPC 2) ↳ Table on page 6272 for details.

Register OPC server V3 as a system service

Prerequisites

- All programs, processes and services which connect to the OPC server are closed.

1. Start the *"Command Prompt"* with command *"cmd"* in the *"Start ➔ Run... "* window.



2. Go to the *CoDeSysOPC V2* installation folder.
3. Unregister the OPC server with `WinCoDeSysOPC/UnRegServer`.
4. Register the OPC server as system service with `WinCoDeSysOPC/Service`.

OPC clients for tests

Free of charge test clients can be found in the web:

https://industrial.softing.com/us/downloads.html

http://www.matrikonopc.com/products/opc-desktop-tools/index.aspx

CODESYS settings

Please refer to REF5 Online Help of PS501 chapter OPC for details ↳ *Table on page 6272.*

Symbol file

AC500 (V1 and V2)

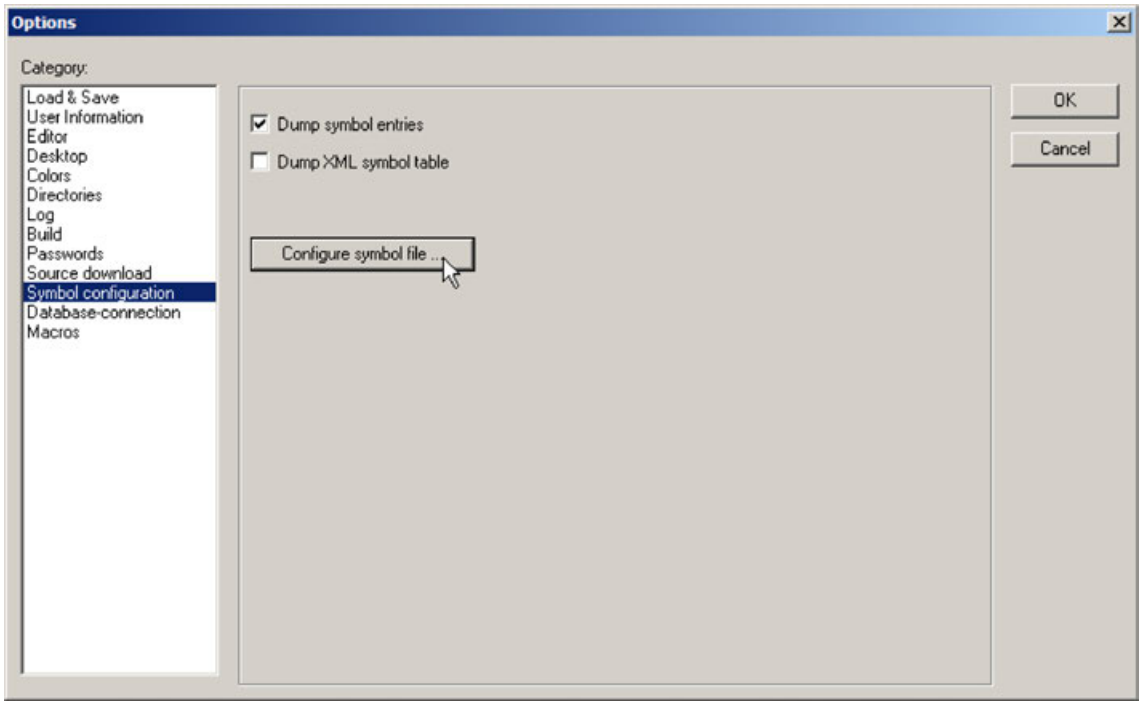
Configure a symbol file

Symbol files contain the items (variables) which are exchanged with the PLC for OPC communication. After the project has been build, the following symbol files are generated and stored in the project (*.pro*) folder:

- *.sdb*
  Important binary file needed by OPC server (computer-readable).
- *.sym*
  Human-readable file with content from *.sdb*. It can be used to check if *.sdb* has been generated correctly.

> *Please refer to REF5 Online Help of PS501 for how to configure a symbol file*
> ↳ *Table on page 6272.*

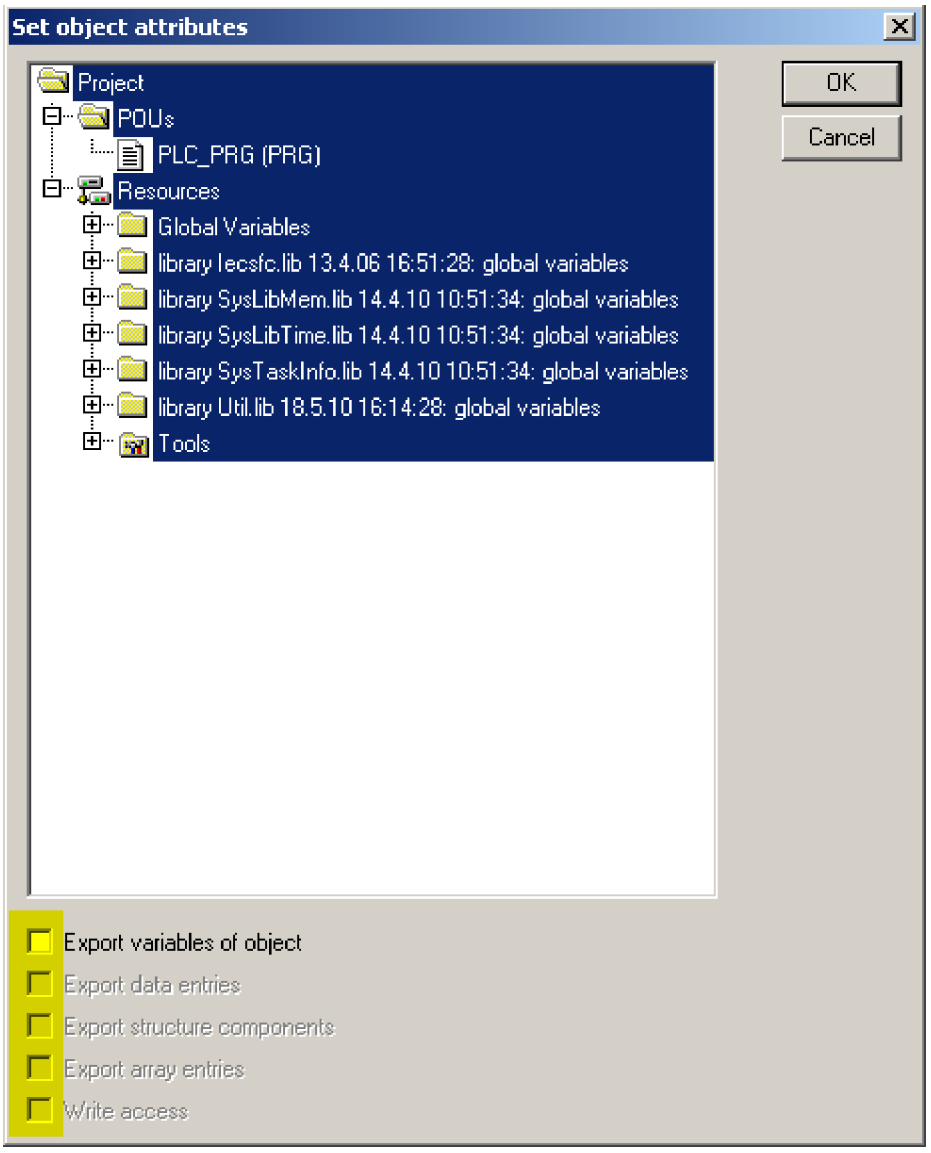
1. Open *CoDeSys - Application.AC500PRO* by double-click *“Application”* in the device tree.
2. Select the *“Symbol configuration”* in menu *“Project ➔ Options”*.



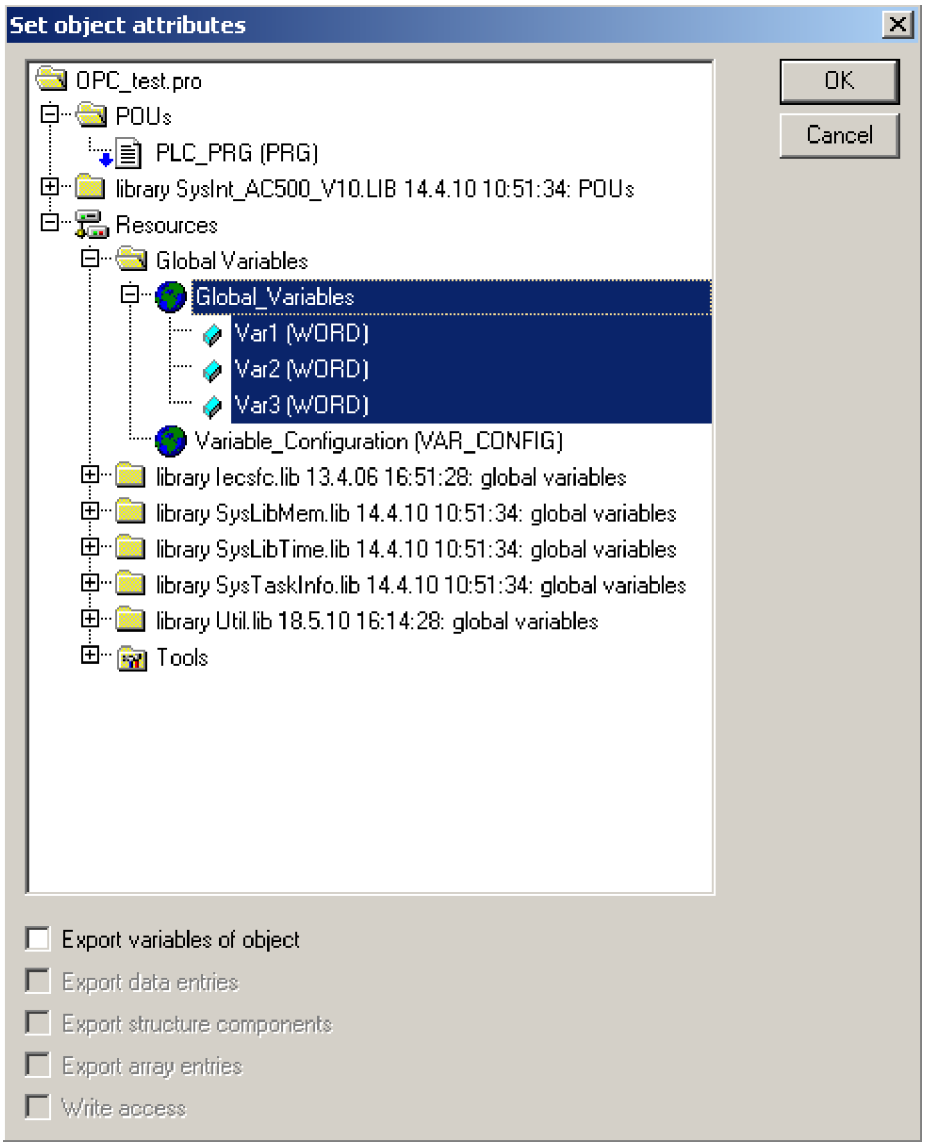
3. Enable checkbox *“Dump symbol entries”* and click *[Configure symbol file]*.

⇨

> *In the case a symbol file gets corrupt and e.g. contains additional symbols, please follow the steps to recreate a clean symbol file.*



1. Disable all checkboxes in window *Set object attributes* and confirm twice with *[OK]*.
2. Go to *“Project ➔ Options” “Symbol configuration”* and click *[Configure symbol file]*.



⇨ Select the variables which should be communicated as symbol:

3. Enable the following checkboxes:
   - *Export variables of object*
   - *Export structure components*
   - *Export array entries*
   - *Write access*
4. Confirm twice with *[OK]*.

   ⇨ Rebuild the project.

Create and download a symbol file

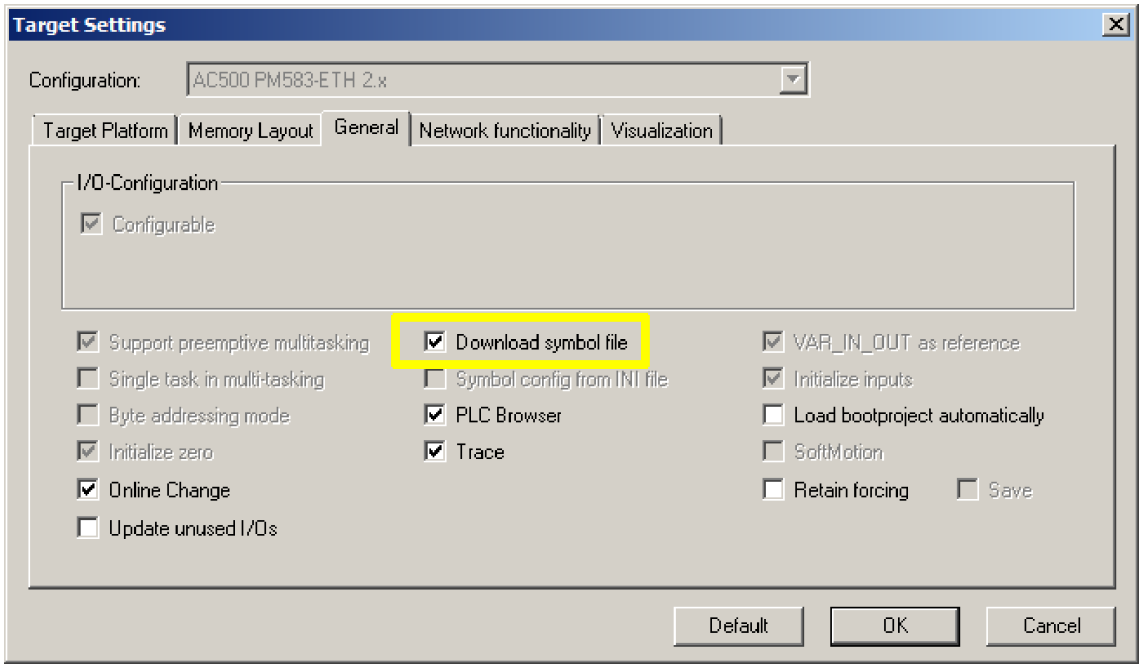
For CPU with FW V1:

If the PLC hardware is available, use *"login / download program"* to copy the *.sdb* file automatically to the gateway folder, e.g. *"C:\WINNT\Gateway Files"*. If the PLC hardware is not available, copy the *.sdb* file manually to the gateway folder.

When the OPC server is started, the *.sdb* file will be copied to the folder for gateway communication, e.g. to *"C:\WINNT\Gateway Files\Upload"*.

For CPU with FW V2:

Following option can be chosen to download the *.sdb* file also to the PLC.



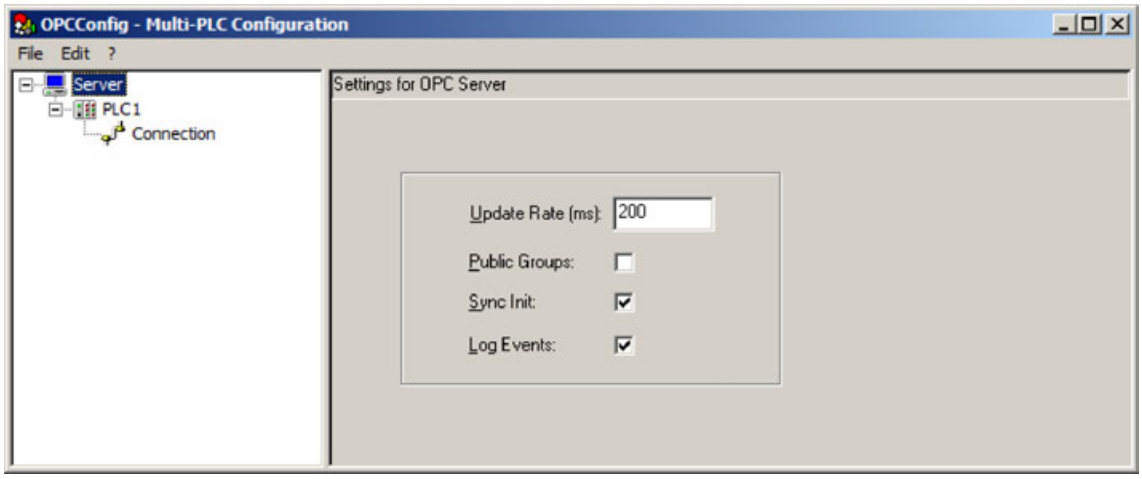
When the OPC server is started, *.sdb* will be copied from the PLC (if available) or from the gateway folder to *"C:\WINNT\Gateway Files\Upload"*.

> *Do not configure the program as a cyclic program, use a task configuration. Call the PLC Browser and have a look at the task time (command "tsk" in the command line). For example, if the program has a cycle time of 40 ms, use a task time of 50 or 60 ms to enable the CPU to answer the OPC request from the OPC server between the tasks.*

Configure OPC server

Configure OPC server V2 (for AC500 V1 and V2)

1. Start the OPC Configurator and select *Server*.



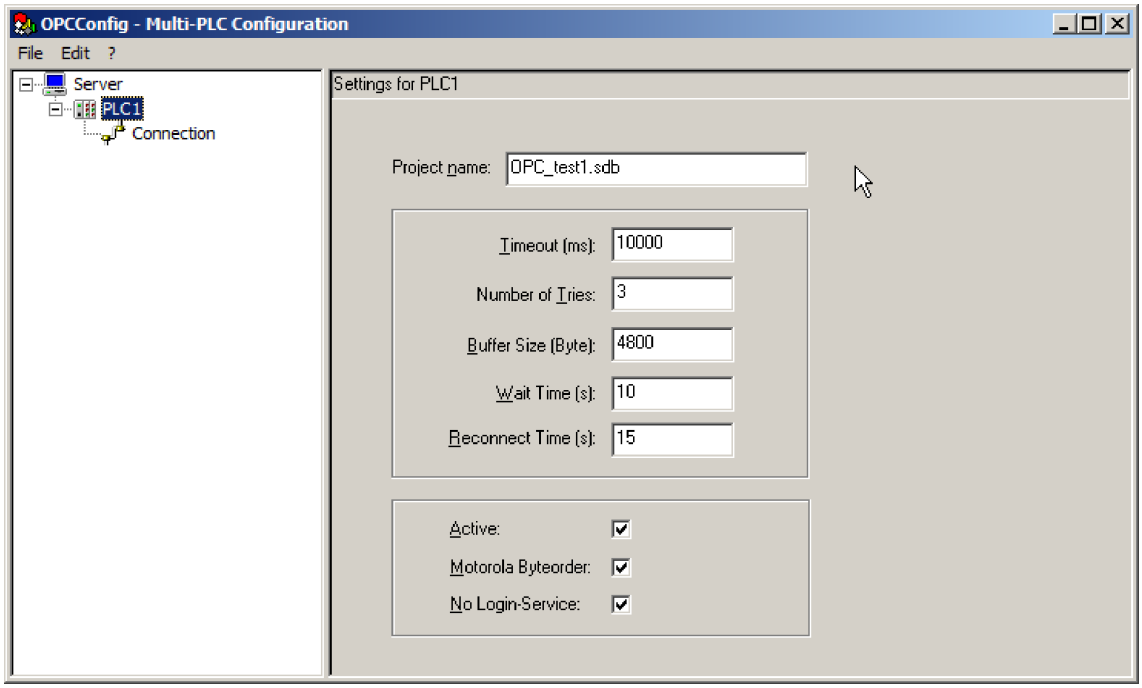
⇨

Update rate

- *The Update Rate may not be 0 (ms)!*
- *The default value of 200 ms is a suitable value of many applications.*
- *The adjustment for the Update Rate depends on the number of symbols (variables).*
- *For a big number of symbols it can be better to increase the Update Rate.*

The checkboxes Sync Init and Log Events must be enabled.

2. Select the 'PLC1' node.

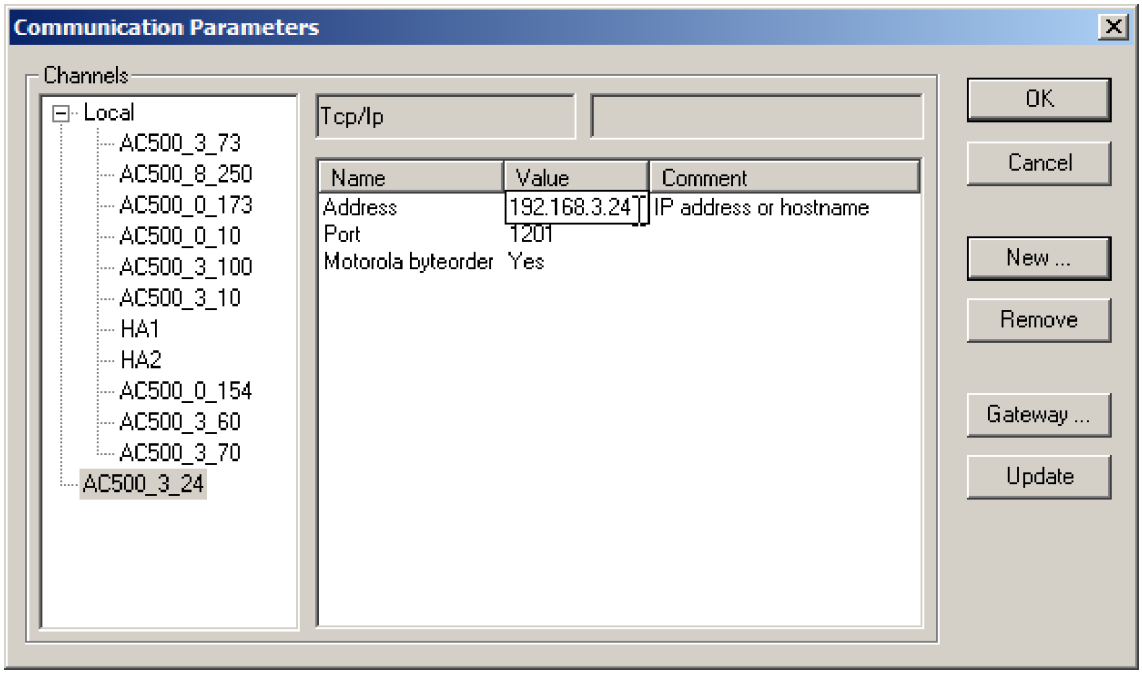


⇨

- *If the *.sdb files should be loaded from the "Gateway Files" directory on PC, the project name must be identical with project name in CODESYS. The extension is not necessary.*
- *If the symbol information should be loaded from V2.x, the project name is not required and can also be empty.*
- *The parameters displayed in the screenshot above are recommended default settings.*
- *The checkboxes Active, Motorola Byteorder and No Login-Service must be enabled.*

3. Select *"Connection"* and click *[Edit]*.
4. Choose a channel of the channel list (normally the channel which is used for programming) or click *"New"*.

5. Define a *Name*, select *"TCP/IP"* and click *[OK]*.



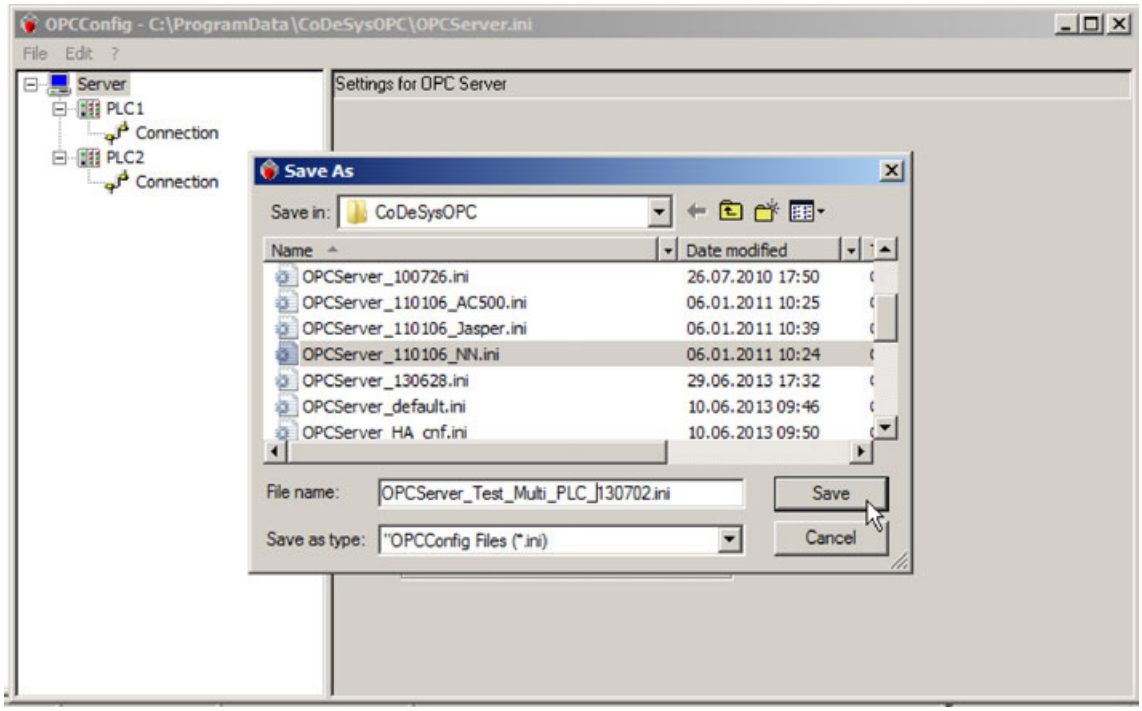
6. Under *Value*, enter the gateway address (192.168.0.10) and click *[OK]*.

If you have more than one PLC, repeat the steps 2 - 5.

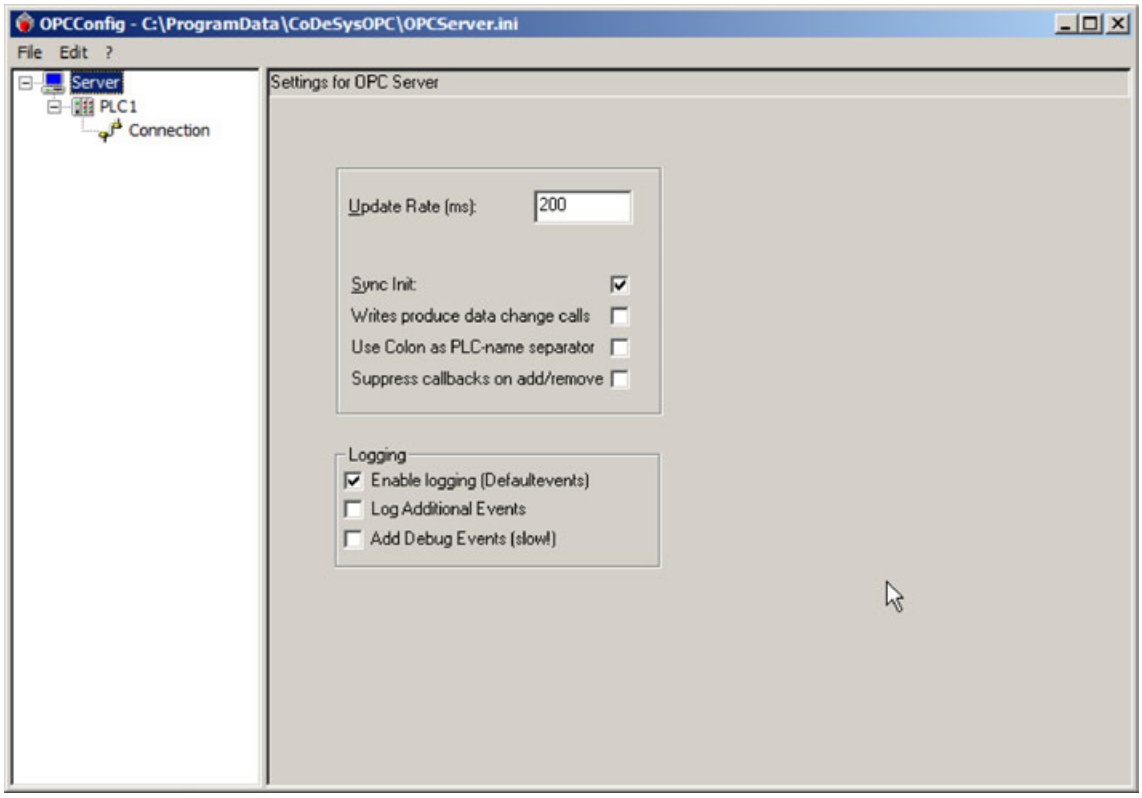
Previous settings of gateway channels are only visible, after the first time the connection has been built up.

Configure OPC Server V3

1. Start CODESYS/ CoDeSysOPC Server V3/OPC Configurator.



2. If the configuration is needed furthermore, save the configuration.



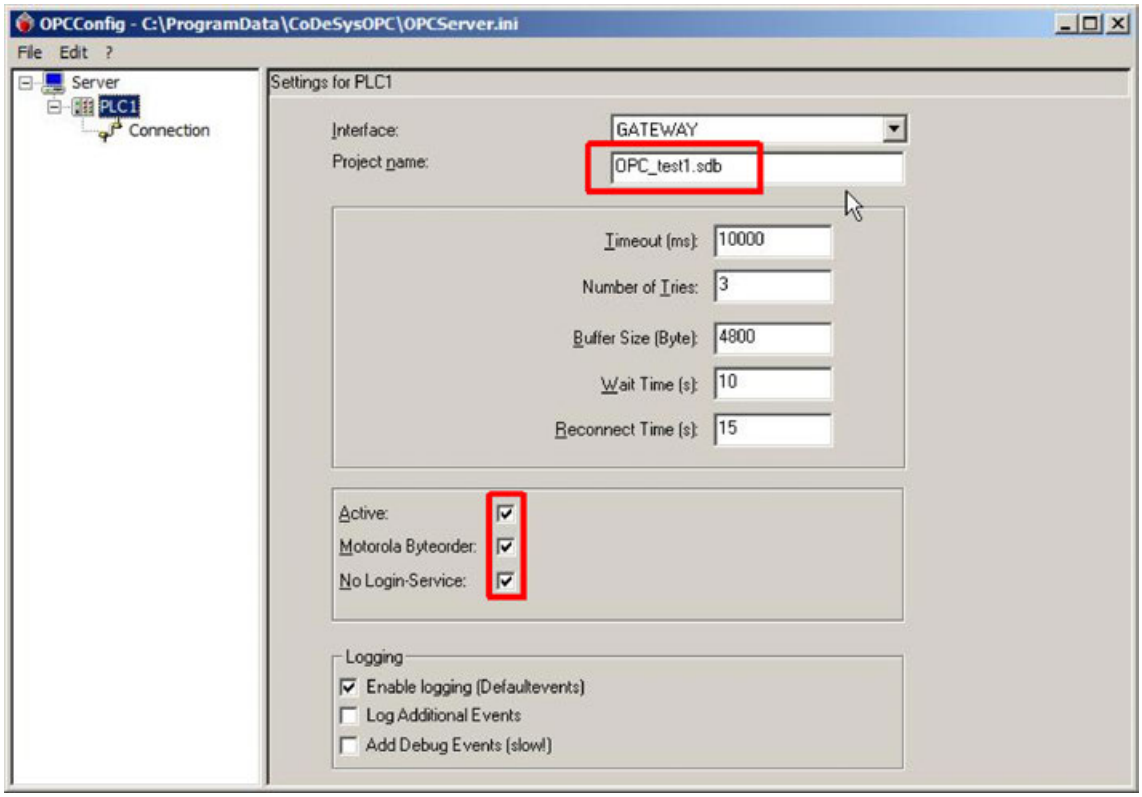
⇨

Update rate

- *The Update Rate may not be 0 (ms)!*
- *The default value of 200 ms is a suitable value of many applications.*
- *The adjustment for the Update Rate depends on the number of symbols (variables).*
- *For a big number of symbols it can be better to increase the Update Rate.*

The checkboxes Sync Init and Enable logging (Defaultevents) must be enabled.

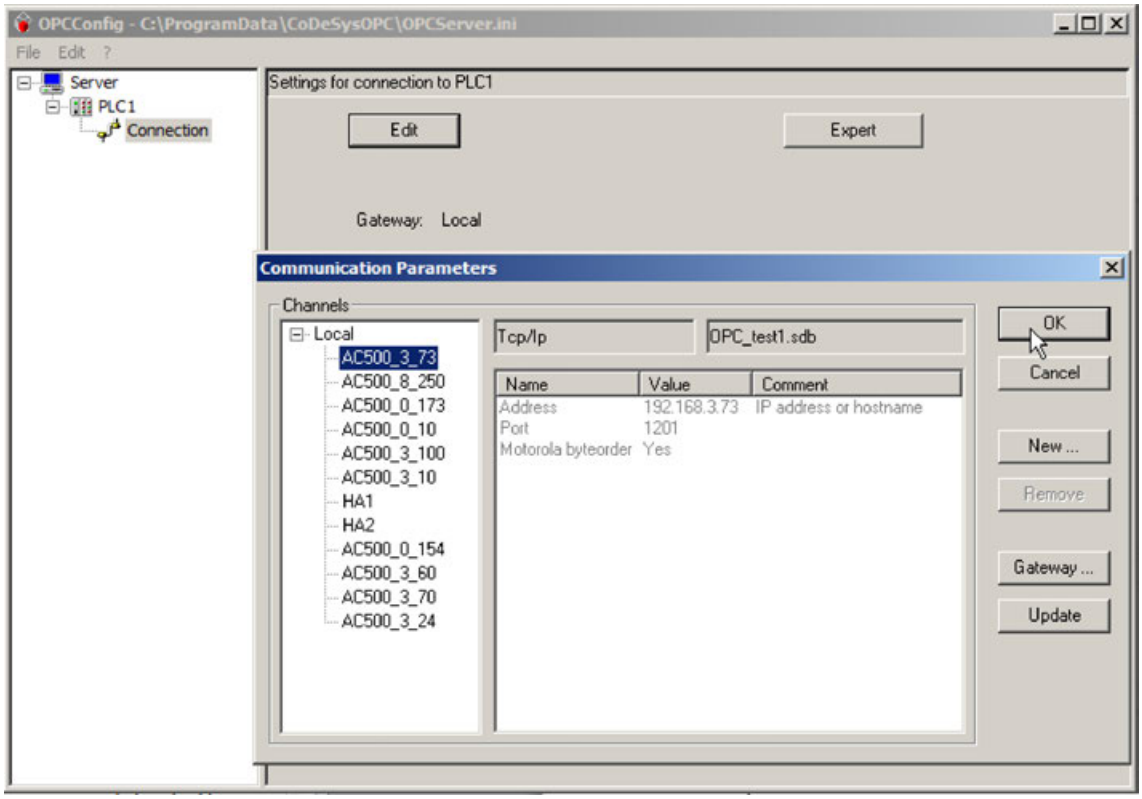
3. Select *“PLC1”*.



⇨

- *If the *.sdb files should be loaded from the “Gateway Files” directory on PC, the project name must be identical with project name in CODESYS. The extension is not necessary.*
- *If the symbol information should be loaded from AC500 V2.x, the project name is not required and can also be empty.*
- *The parameters displayed in the screenshot above are recommended default settings.*
- *The checkboxes Active, Motorola Byteorder and No Login-Service must be enabled.*
- *Enabled checkbox “Enable logging” allows a later diagnosis.*

4. Select *“Connection”* and click *[Edit]*.



5. Choose a channel of the channel list (normally the channel which is used for programming) or click *[New]*.

6. Define *Name* select *“TCP/IP”* and click *[OK]*.

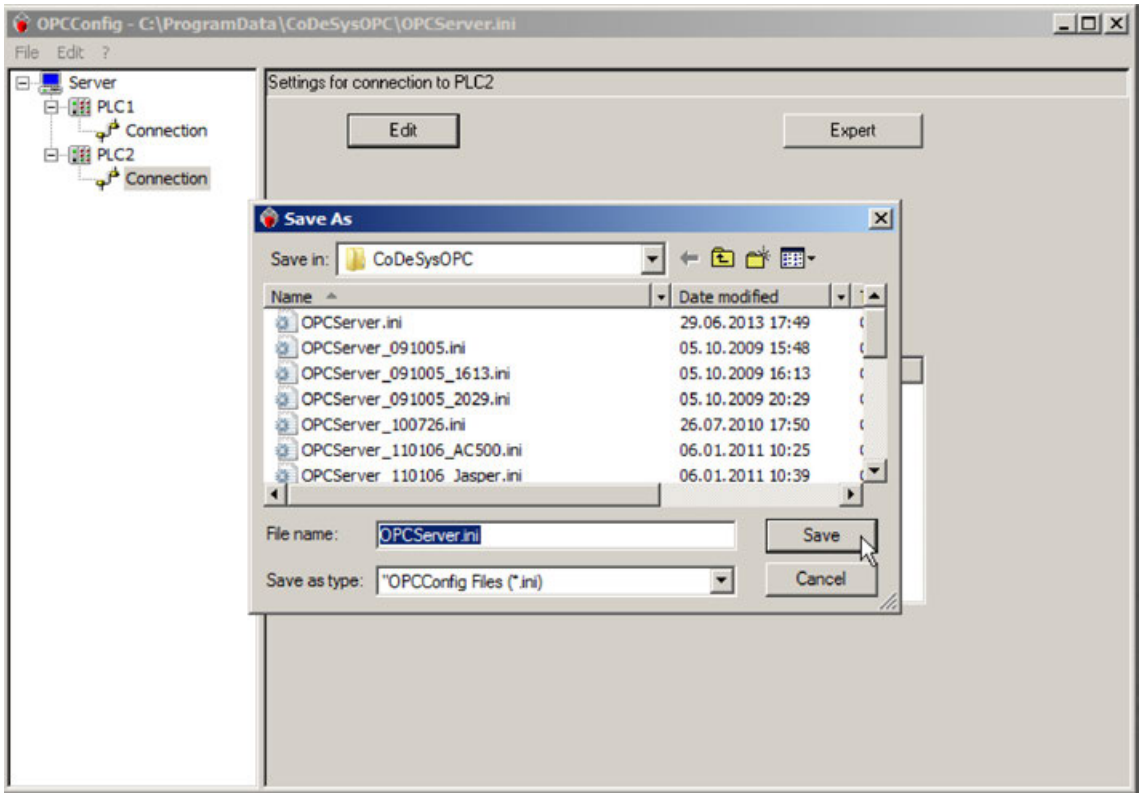
⇨

– *Previous settings of gateway channels are only visible, after the first time the connection has been built up.*
– *See Ref 5 Online Help of PS501 CoDeSys, Help, Contents, System Technology, OPC* *Table on page 6272.*
– *Use of the CODESYS OPC server.*
– *Configure the OPC server with OPCconfig.exe.*

If there are more than one PLC, then repeat for the other PLCs (gateway depends on version of AC500).

7. Save As.

   Click *“File ➔ Save as...” OPCserver.ini “Save”* and *“File ➔ Exit” OPCConfig*.



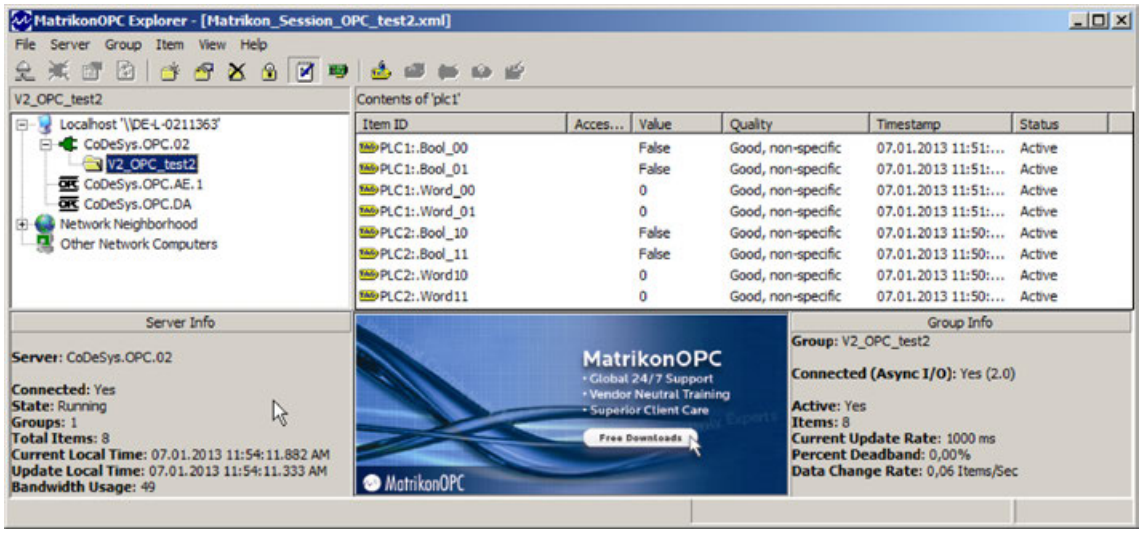
Check OPC function with AC500

It is urgently recommended to check the function of the previous configuration steps.

In order to check the OPC function without AC500, see ↳ Chapter 1.6.5.5.1.4.1 “Test OPC function without AC500” on page 6309.

Check OPC server V2

1. Start *OPCExplorer.exe* and connect *“CoDeSys.OPC.02”*.

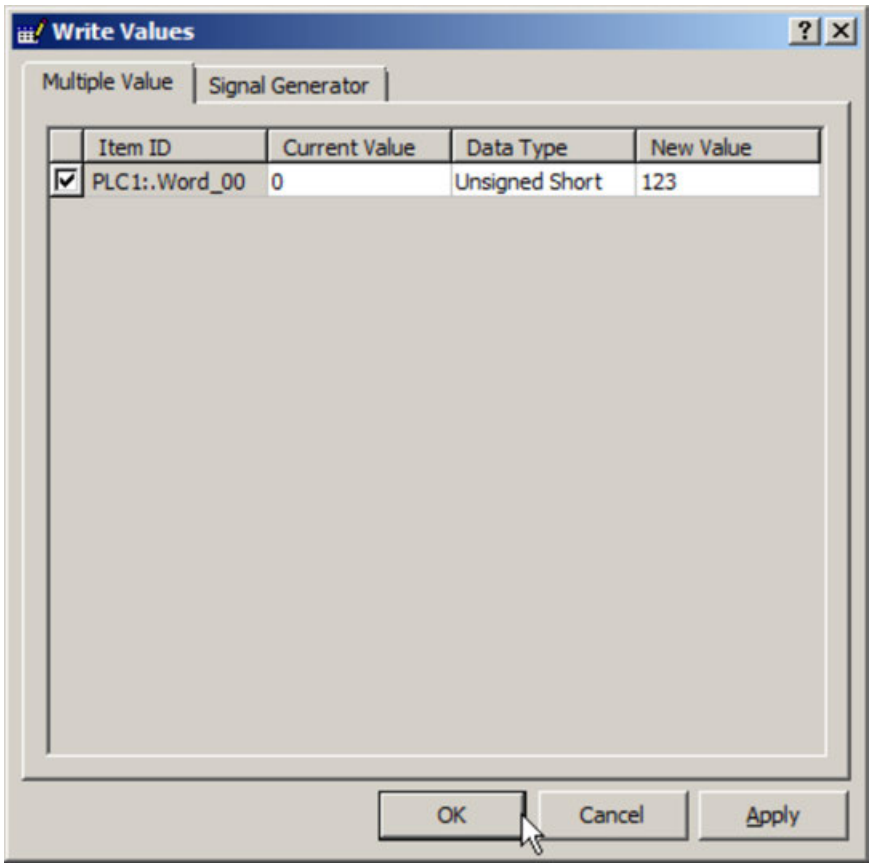


2. Add Group, add Items, select availabe Items in *“Server CoDeSys.OPC.02”*.

   Add to Tag List, close the .

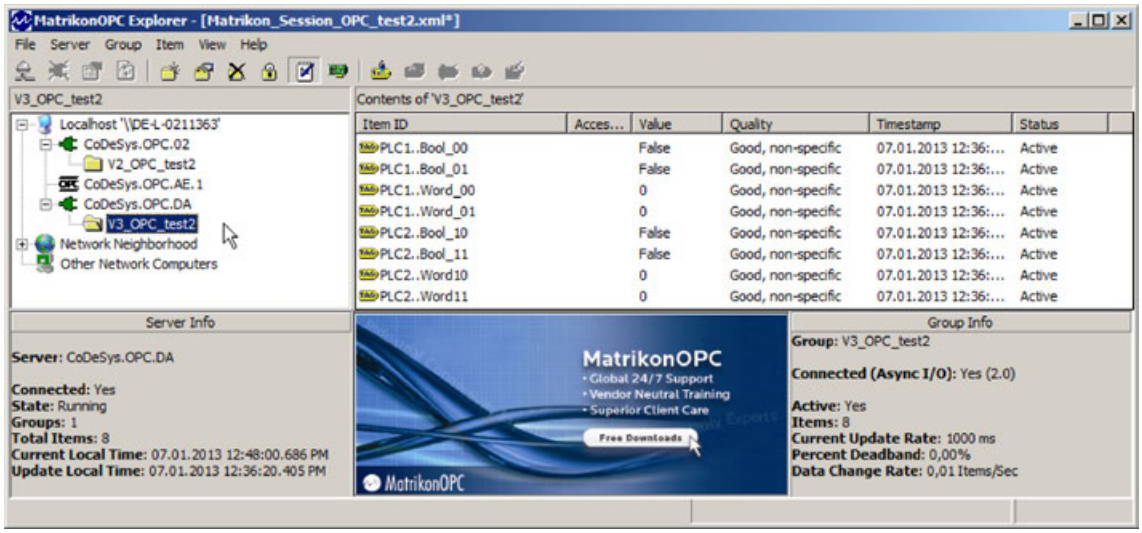
   ⇨ If anything is right, then *“CoDeSys.OPC.02”* is connected, is running and the *“Quality”* of the items is good.

3. With the *“Matrikon”* is it possible to read / write the values of the items.



Check OPC server V3

1. Start *OPCExplorer.exe* and connect *“CoDeSys.OPC.DA”*.

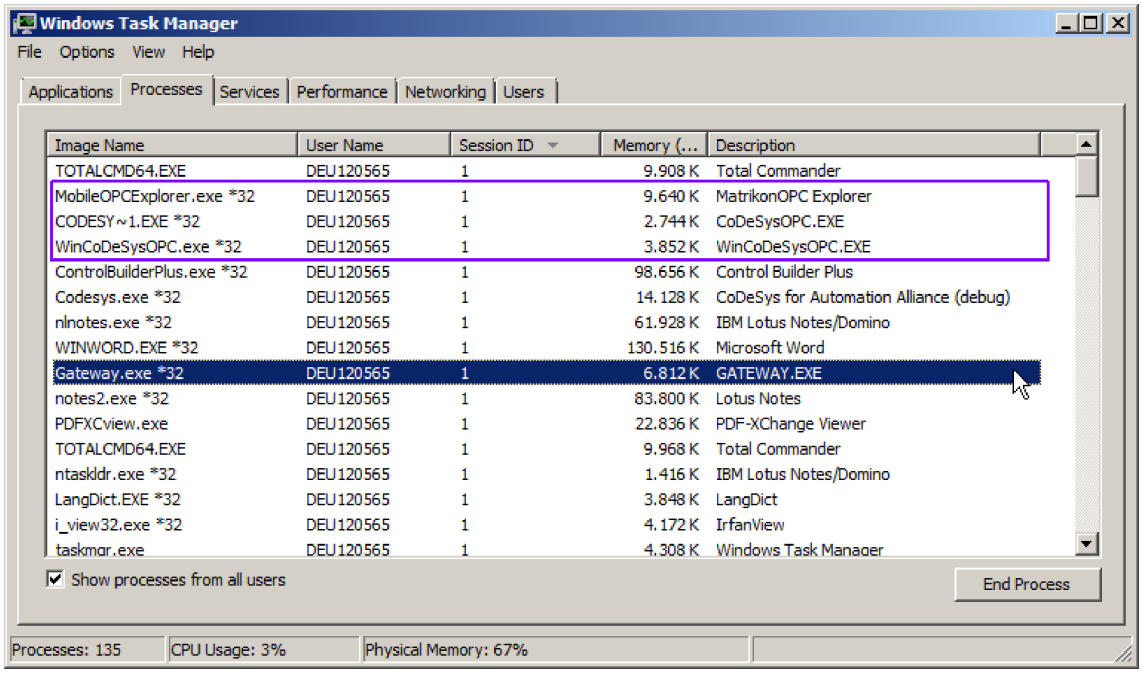


2. Add Group, add Items, select availabe Items in Server *“CoDeSys.OPC.DA”*.

   Add to Tag List, close the Item browser.

   ⇨ If anything is right, then *“CoDeSys.OPC.DA”* is connected, is running and the *“Quality”* of the items is good.

Check processes with windows task manager



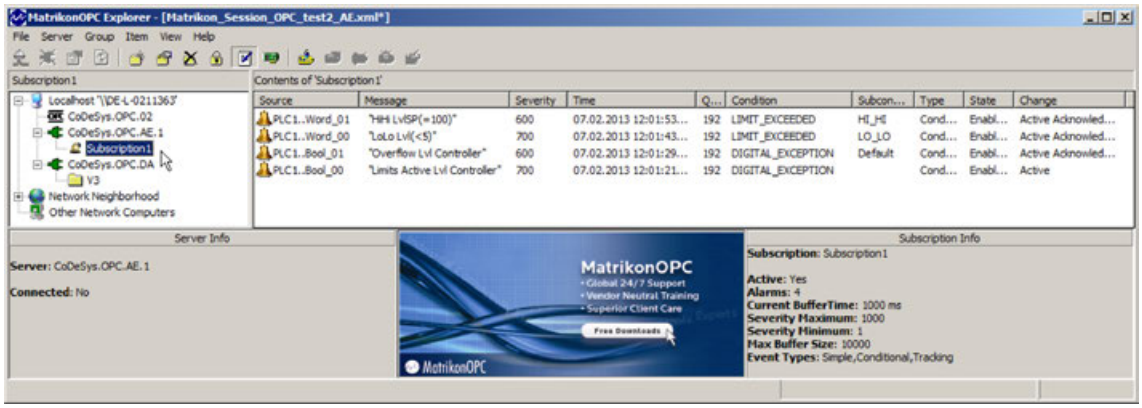
Correct configuration: All processes run with the same *“User Name”* and with the same *“Session ID”*.

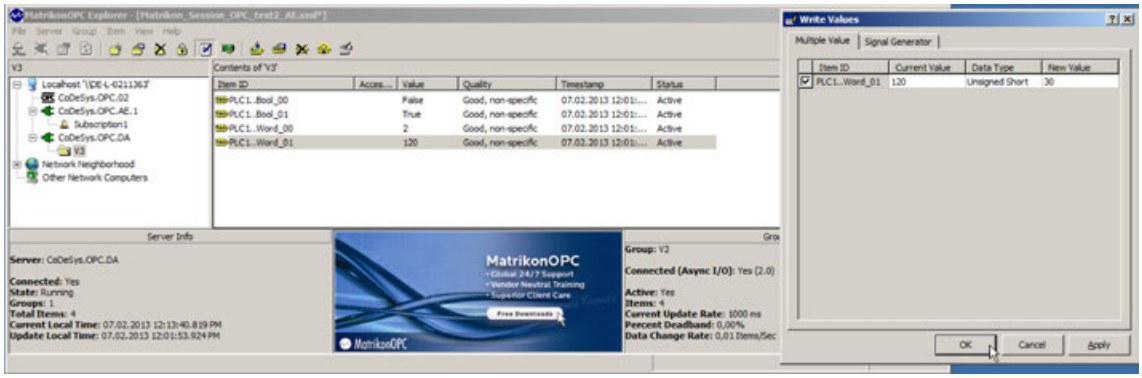
Configure AlarmEvents

Refer to REF2 AeConfigurator_UserGuide.pdf for details ↳ *Table on page 6272.*

Check AlarmEvents

The function of the *“AlarmEvents”* can be checked with *“MatrikonOPC Explorer”*.





The *“AlarmEvents”* can be simulated by writing the value of the Items.

Configure user account for OPC server

Please refer to REF3 ReadMe.rtf and REF4 ReleaseNotes OPCV3 AE for HA ↳ *Table on page 6272.*

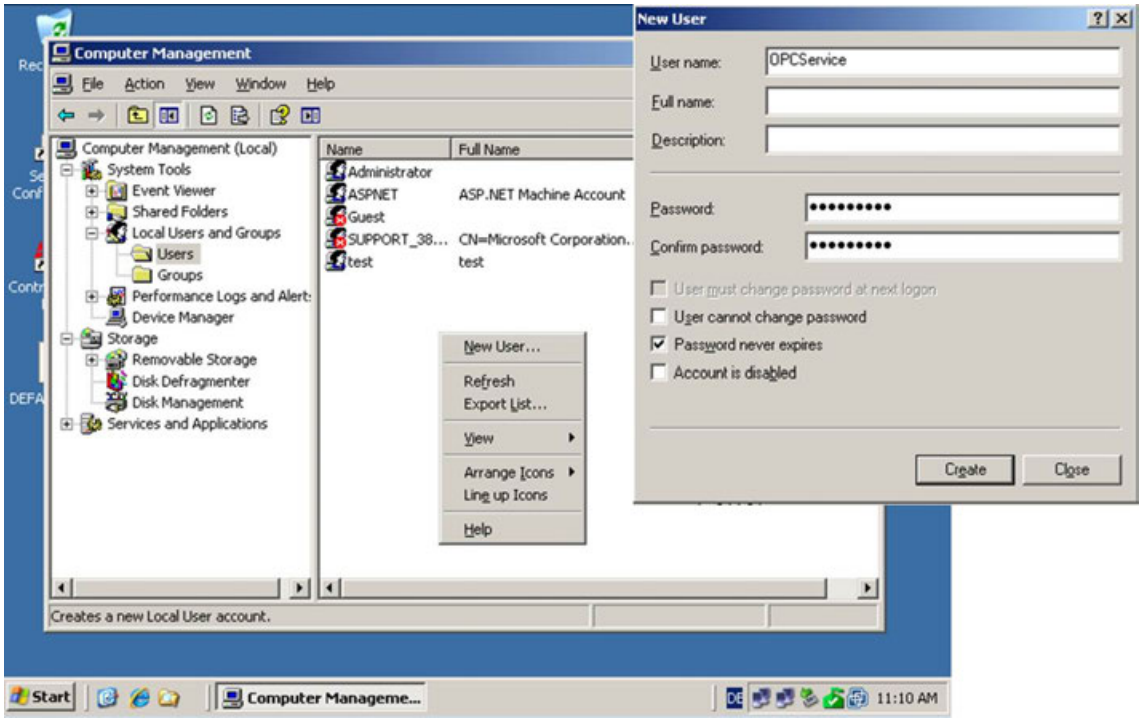
OPC server V3 on Windows Server 2003/ 2008/ 2012/ 2016

When running the OPC server V3 on Windows Server 2003/ 2008/ 2012 /2016 multiple sessions need to be supported. Therefore the installation of the OPC server as service running with a dedicated user account is recommended.

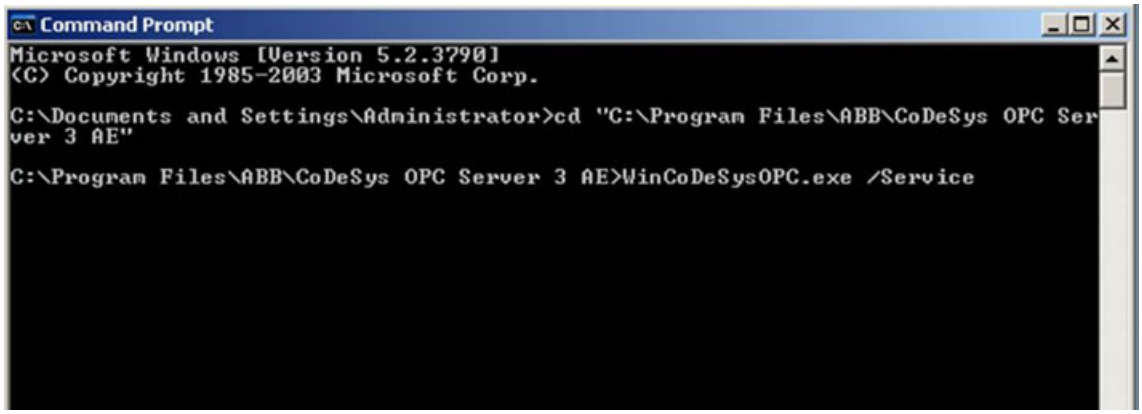
Configuration steps

- Create specific user, no administrator account is required
- Register V3 OPC server as service
- Configure V3 OPC server as service

Create specific user



Registration



Register the OPC Server executable as service from the command line.

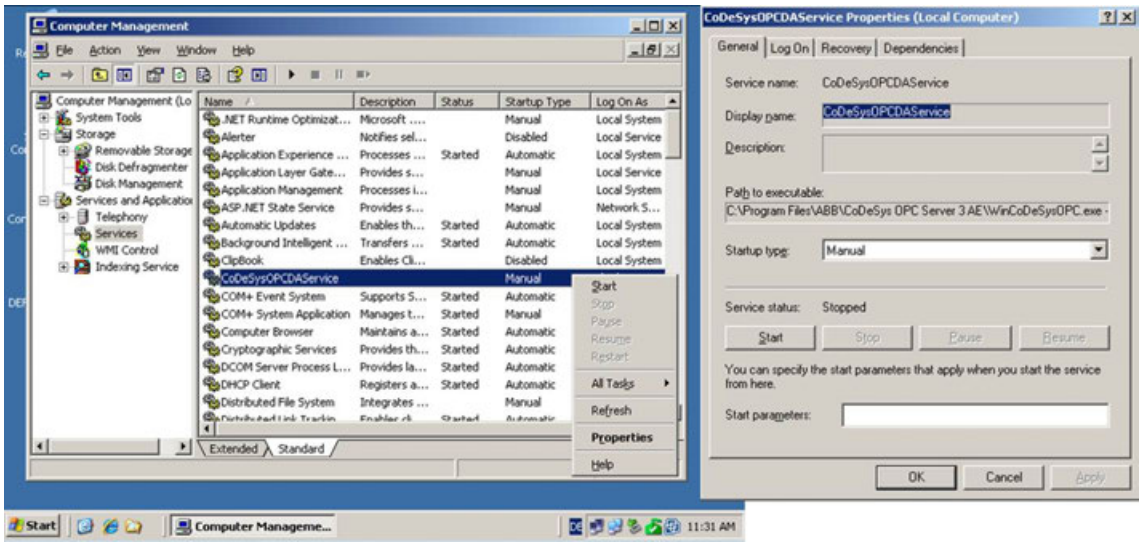
With command “WinCoDeSysOPC /Service” WinCoDeSysOPC.exe gets installed as system service.

Started once, the service will stay “started” until the system gets terminated.

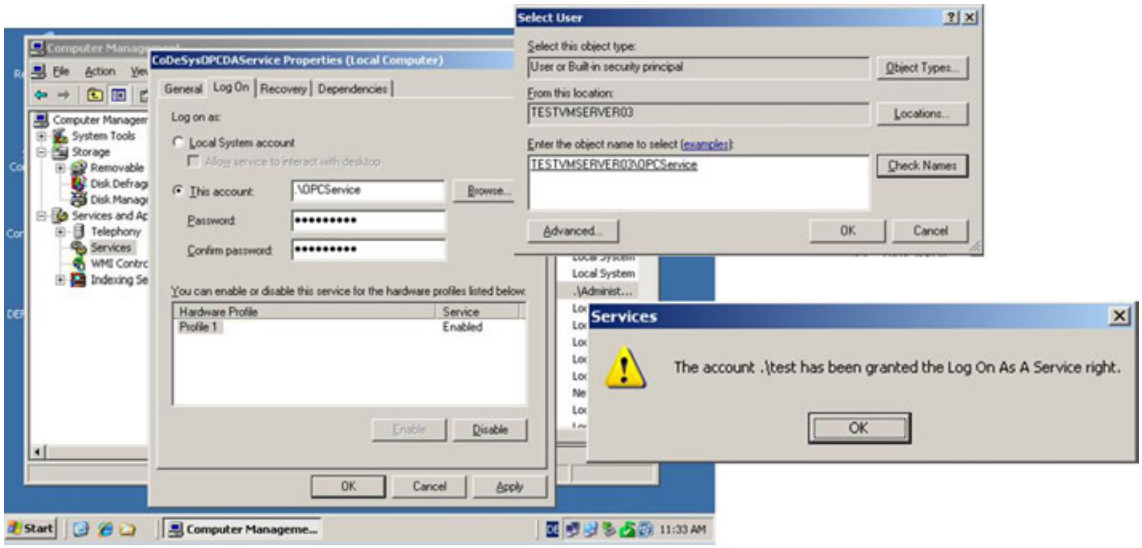
The communication to the configured PLCs survives.

Also here the service gets installed in the current position of WinCoDeSysOPC.exe.

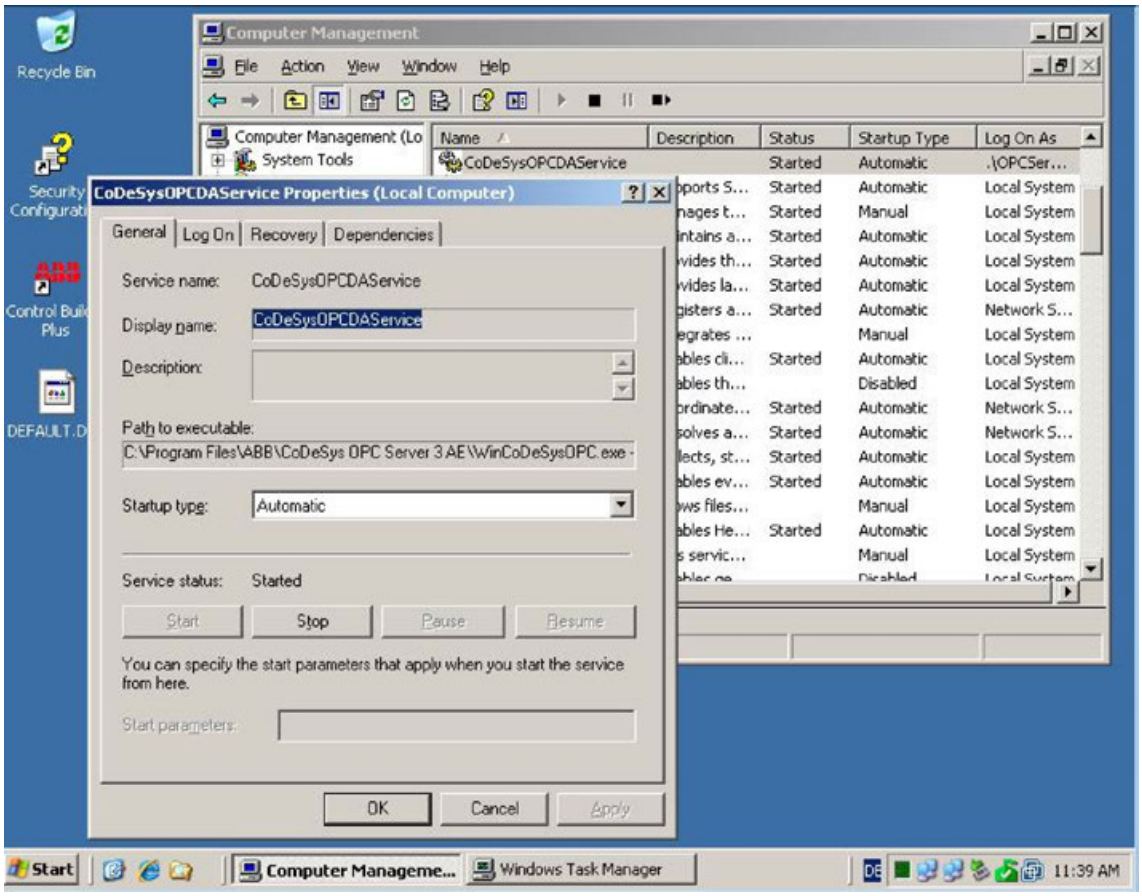
Configuration



At *“Computer Management* ➔ *Services and Applications* ➔ *Services”* open the *“Properties”* of the *“CoDeSysOPCDAService”*.

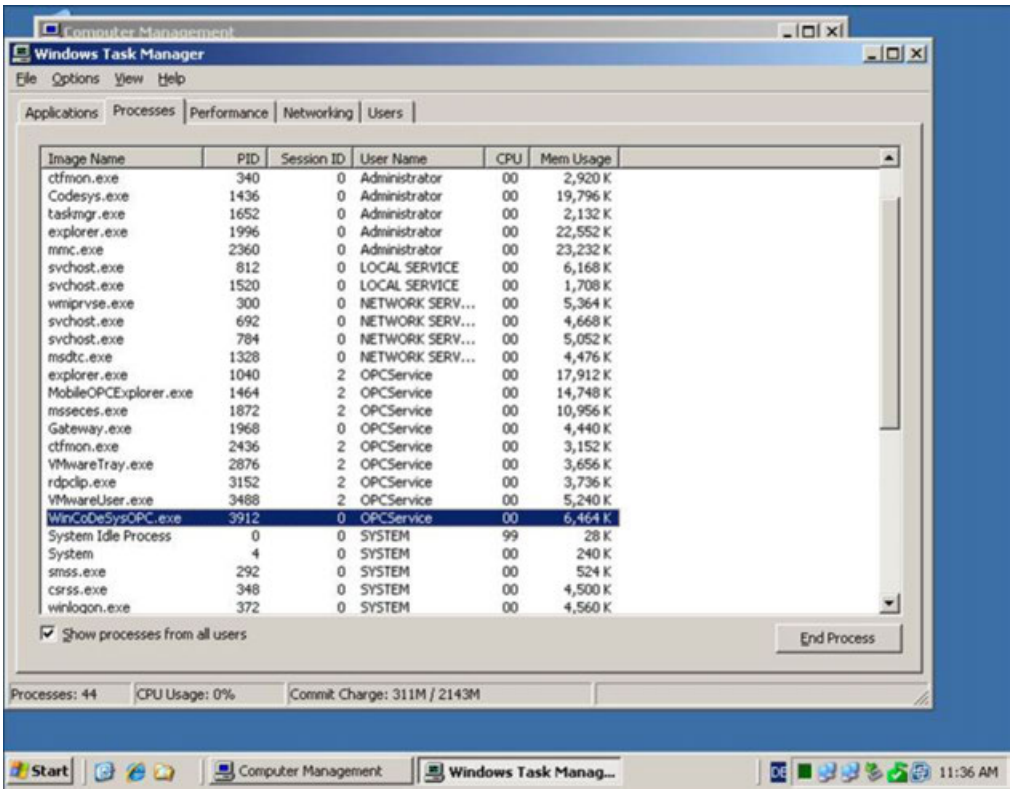


Complete the Service Configuration



Testing

Check Users and Session during Test Cases



Check the *“Session ID”* and *“User Name”* of

- *Gateway.exe*,
- *WinCoDeSysOPC.exe* and
- OPC Client

on different test cases like multi session with terminal service sessions.

Potential issues

Gateway communication not possible

The CODESYS Gateway server uses TCP port 1210 for communication.

> – *The gateway communication is not possible if gateway ports 1210 and 1211 are used by other applications.*

Possible applications that also use port 1210 and/or 1211:

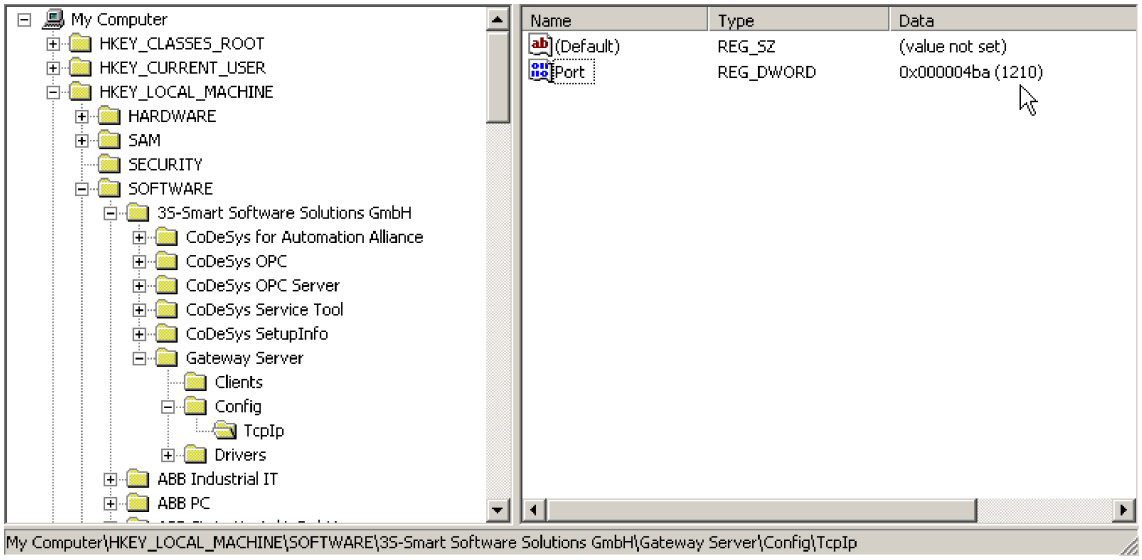
- Java update client
- ABB 800xA System

If there are problems to establish a gateway communication, check the usage of port 1210 (via any port scanning tool, e.g. *SysInternals*) and close the application which uses this port.

ABB 800xA system

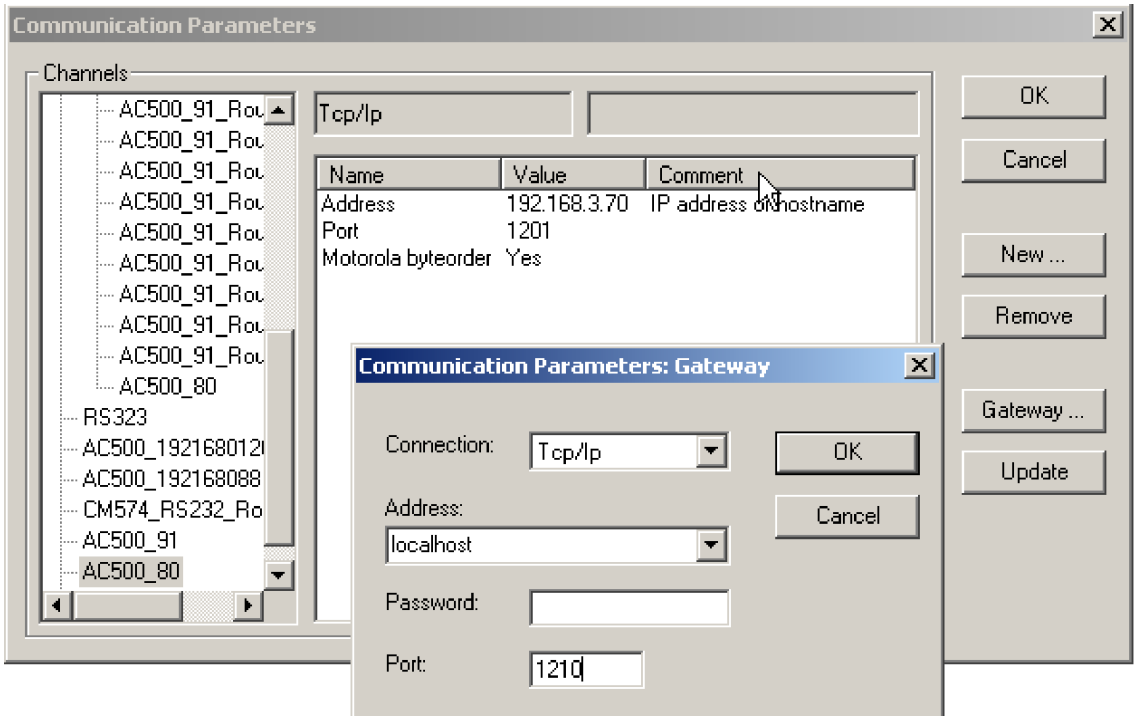
Change port number of ABB 800xA System:

1. Open the registry editor and double-click *“Port”*.



2. Change the *“registry key”* from 1210 to 51000 and click *[OK]*.
3. Restart the *“Gateway Server”* and close all applications.

4. Close the processes *gateway.exe* in Windows Task Manager.



5. Change the port number of Gateway communication parameter from standard port number 1210 to 51000 (in the example).
6. The OPC Server Configuration (*OPCConfig.exe*) must be renewed to enter this change in the ↳ *Chapter 1.6.5.5.1.2.6.2 “Configure OPC Server V3” on page 6292OPCServer.ini*.

Windows Server 2012/ 2016

At Windows Server 2012 /2016 (64-bit) the path for the Reg Key is:

“HKEY_LOCAL_MACHINE ➔ Software ➔ WOW6432Node ➔ 3S-Smart Software Solutions GmbH ➔ Gateway Server ➔ Config ➔ TcpIp”

Symbol file from AC500 not loaded

Situation

OPC server is shown, but no OPC variables are to be found.

OPC with symbol file on AC500 does not work.

OPC server does not load the symbol file (*.sdb*) from AC500 PLC (FW V2) to PC

Possible reason

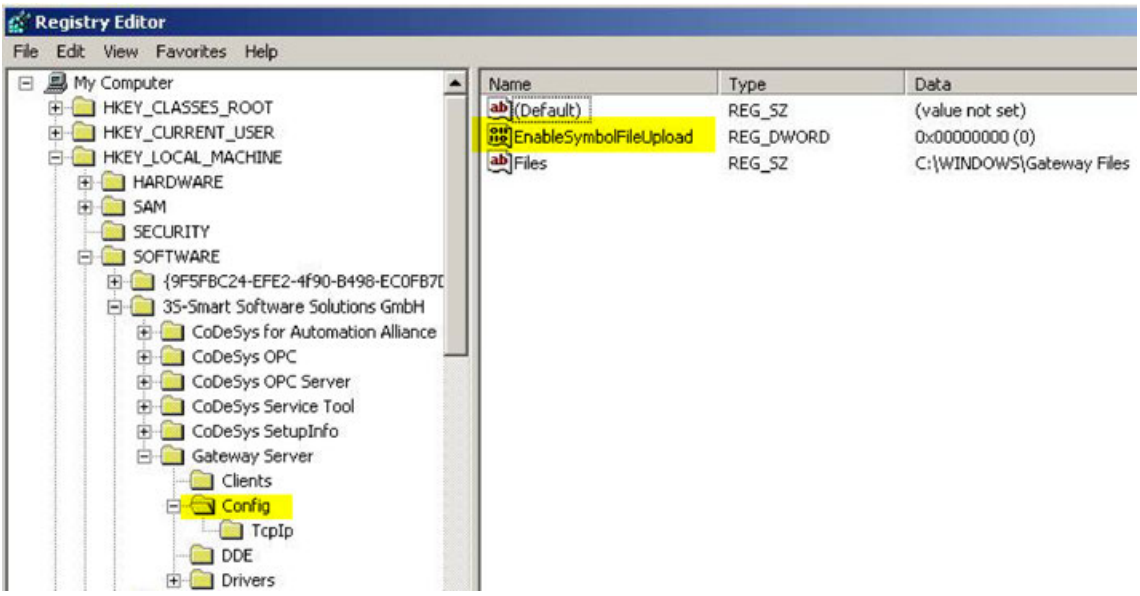
- Programming Software *"907AC1131"* is installed.

Problem solving

1. Check the registry item: *"HKEY_LOCAL_MACHINE\ SOFTWARE\ 3S-Smart Software Solution GmbH\ Gateway Server\ Config\ EnableSymbolFileUpload"*.

   If this item is inside, the symbol file will not be loaded from AC500 PLC to PC. For Control Builder Plus this item must be deleted but for AC1131 this item must be available. You must ckeck this.

2. In Windows, go to *"Start ➔ Run"* type *"regedit"* and click *[OK]*.



3. Open the folder *"Config"* in *"Registry Editor"*.
   - For AC500 FW V2 delete the item *"EnableSymbolFileUpload"*.
   - For AC1131 the item *"EnableSymbolFileUpload"* must be available.

Session isolation

Situation

With Windows Server 2003, Windows Server 2008, Windows Server 2016 the Windows 7 services are alone in session 0. User applications run in session 1 (2 and so on).

Services:

A Windows service is a computer program that operates in the background.

Windows services can be configured to start when the operating system is started or can be started manually and run in the background as long as Windows is running. They can operate when a user is not logged on.

Services are:

Windows operating systems include numerous services. OPC client like S+ OPC scanner PGIM, Aspen CIM-IO Manager, ICONICS, .. can also installed as a service.

User applications are:

Microsoft Word, Notepad, MatrikonExplorer, *ControlBuilderPlus.exe* and *Codesys.exe*

Problem

Service and user application are isolated in their session. They can not communicate with each other directly.

OPC Server uses, like the CBP and CODESYS, the gateway server from CODESYS (*gateway.exe*) for the communication with the AC500 and starts the gateway in their session. That creates undefined behavior, if the OPC Server runs as a service. The gateway server is not able to run in multi sessions.

Resolutions

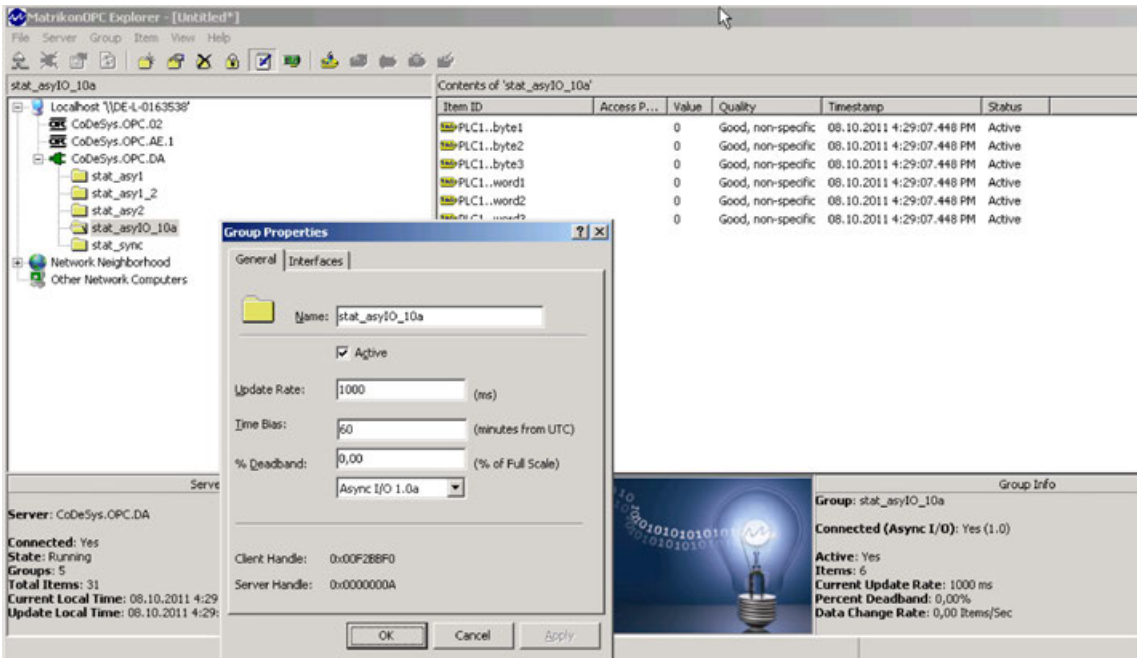
- Install all OPC clients and OPC Server, which use the gateway server, in the same session.
- The OPC Server as a service (session 0) may not be connected at the same time (in parallel) with an OPC server as a user application or CBP or CODESYS (all in session 1) with the AC500. If this function is necessary, different PC or virtual machines must be used.
- Use tools like OPC tunnel. In a DigiVis 500 setup context the OPC server must not be registered as service. The OPC tunnel itself starts the OPC server within its service.

See also http://msdn.microsoft.com/en-us/windows7trainingcourse_sessionisolation_unit .

Behavior OPC server V3 via interface IOPCAsyncIO

Using of an *"OPC client"*[1)] with the older OPC standard Interface IOPCAsyncIO (OPC DA V1.0a) creates a higher communication load on the OPC client, because the OPC Server sends also the unchanged items in every scan cycle to the client.

Test setup



Reason

If OPC Items are registered via Interface IOPCAsyncIO (OPC DA V1.0a), the OPC Server sends mostly with each ready cycle a data change event, including also unchanged values. The change detection is correct when using the interface IOPCAsyncIO2 (OPC DA V2).

Workaround

- Use the interface IOPCAsyncIO2 (OPC DA V2).
- If the OPC client does not support IOPCAsyncIO2 interface, then use the OPC Server V2. The OPC Server does not show this behavior.

"OPC client" [1)]:

Visualization software in VISU PMS (Fa. epro GmbH) uses an older standard OPC with the interface IID_IAdviseSink than data sink.

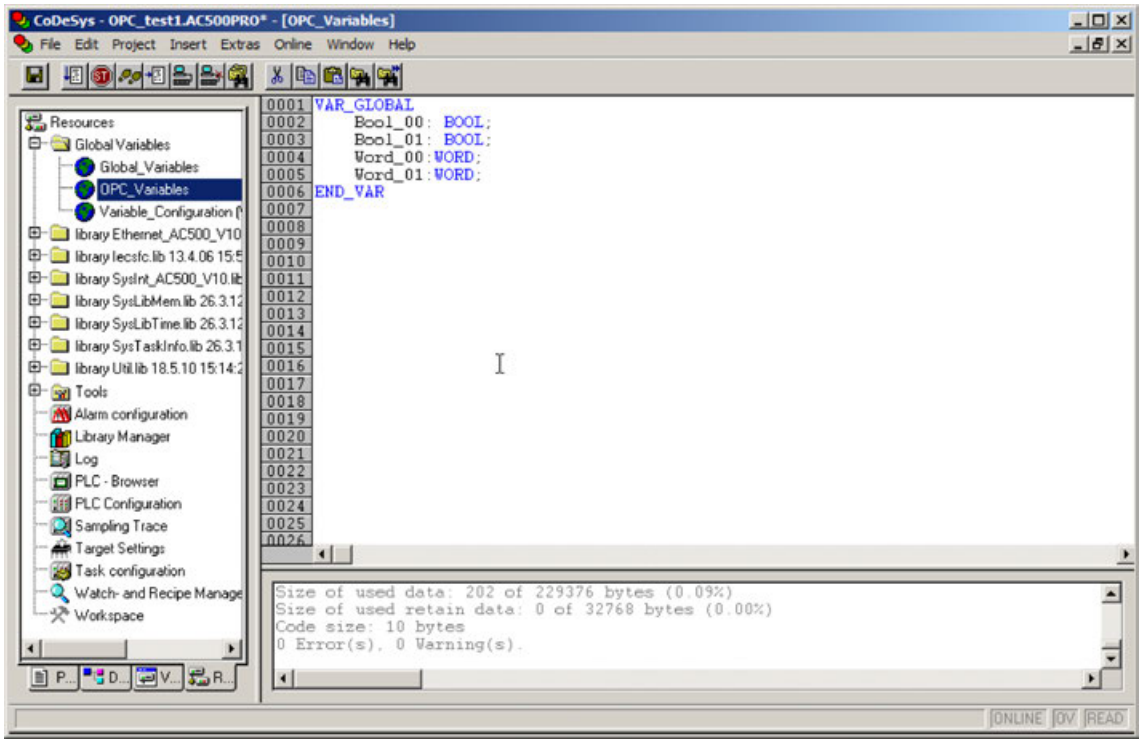
Examples

Test OPC function without AC500

The example shows, how the OPC server V2/V3 can be tested/simulated without available AC500.

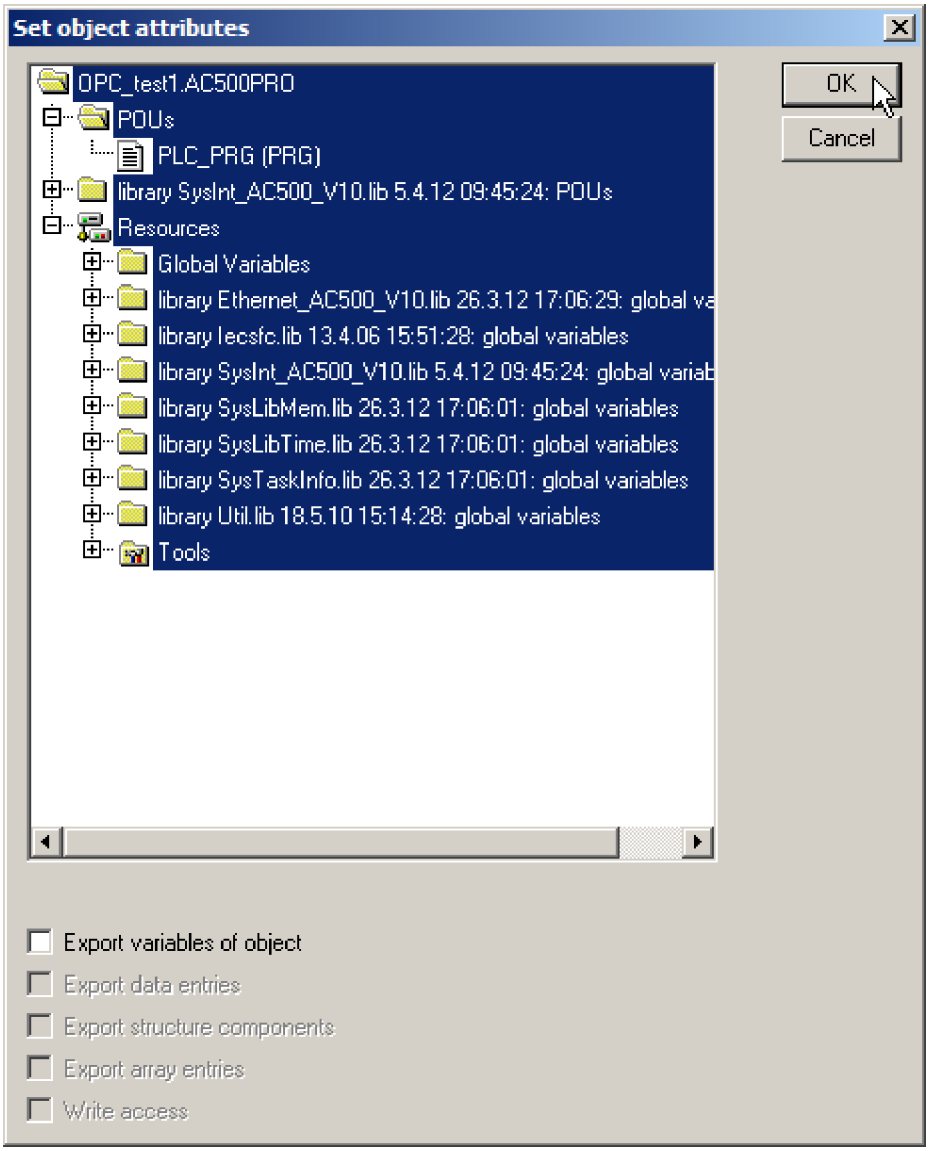
AC500 project

1. Open *CoDeSys Application*.



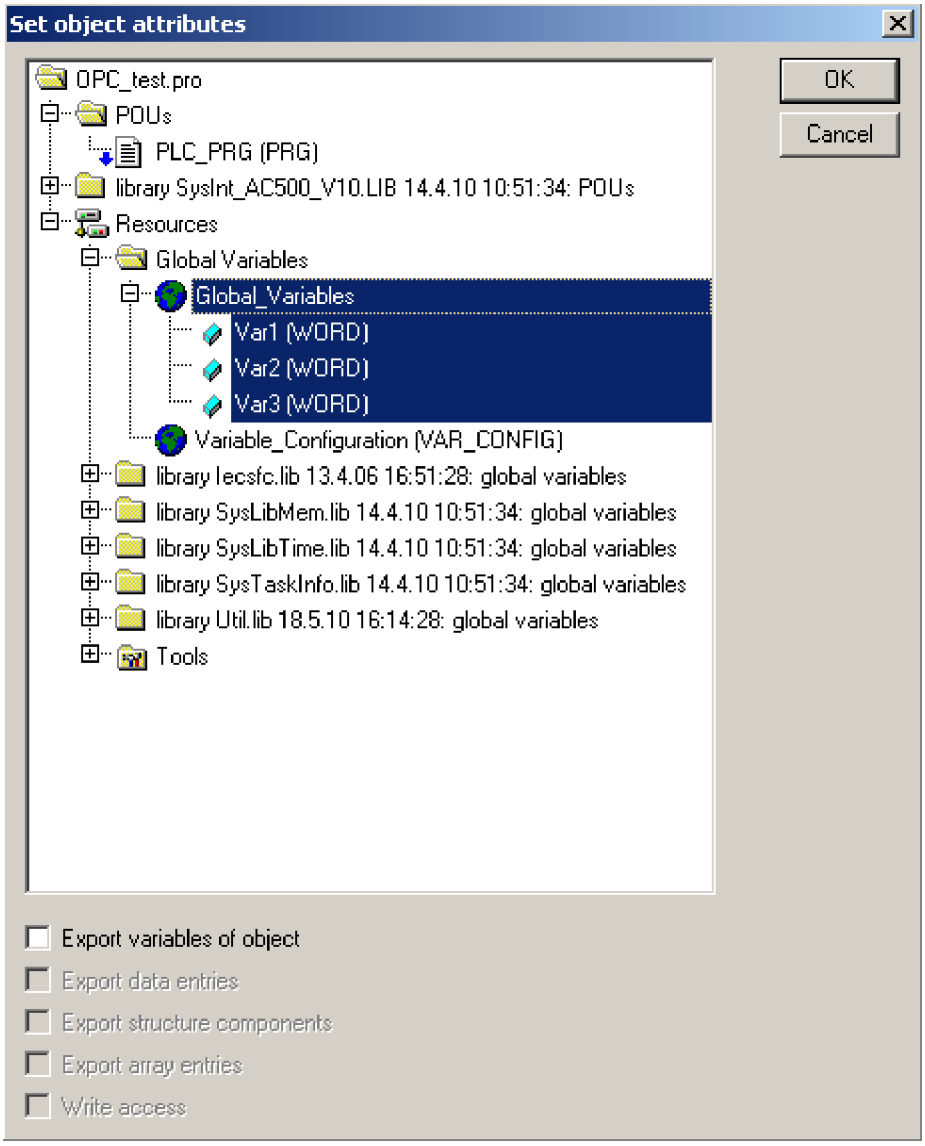
2. Collect all OPC variables in a separate *“Global Variables”* list.

3. Under *"Project ➔ Options "* select the *"Symbol configuration"*.
   Enable checkbox *"Dump symbol entries"* and click *[Configure symbol file]*.



4. Disable all the checkboxes and confirm twice with *[OK]*.

5. Under *"Project ➔ Options " "Symbol configuration"* click *[Configure symbol file]* again.

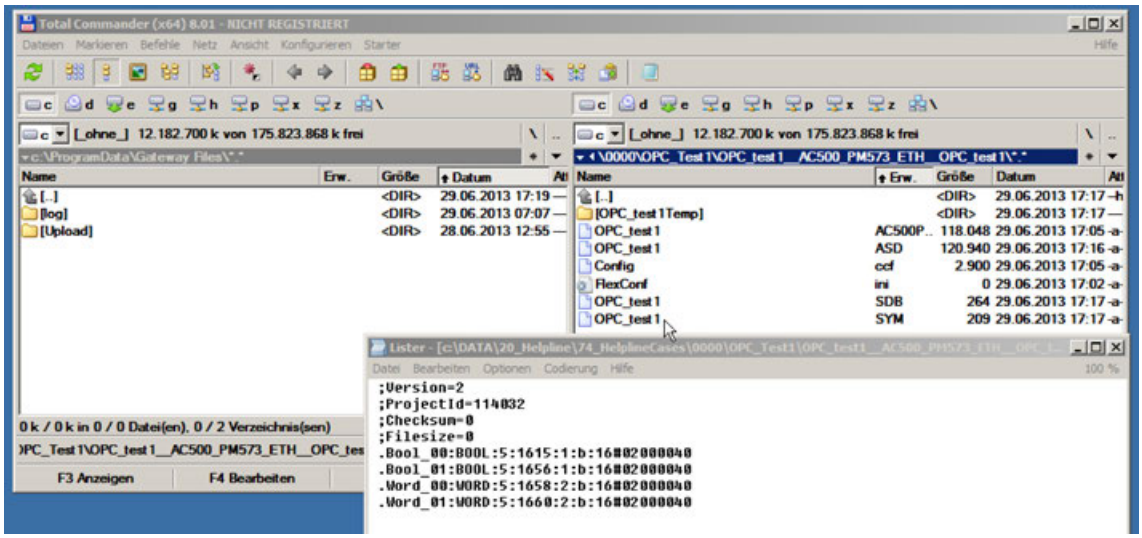


6. Select the variables which should be communicated as symbol.

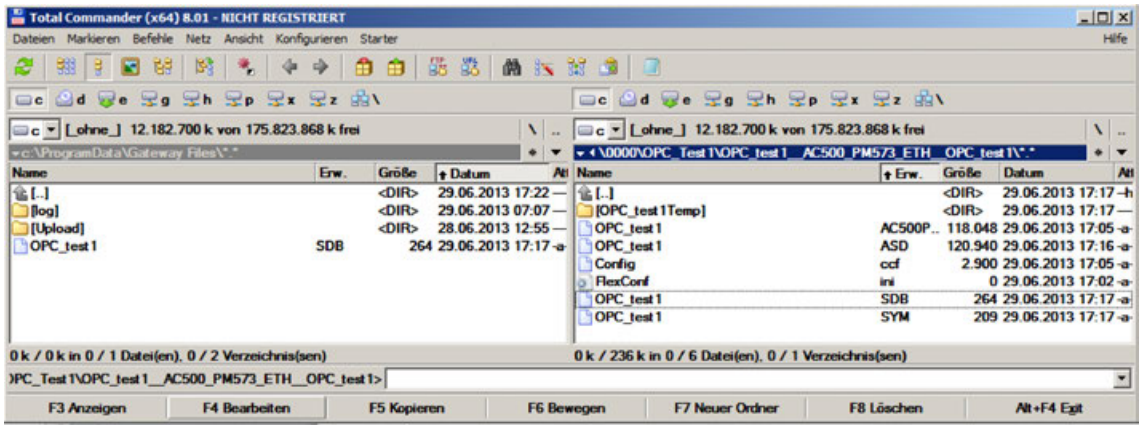
   Enable the following checkboxes:

   - *Export variables of object*
   - *Export structure components*
   - *Export array entries*
   - *Write access*

7. Confirm twice with *[OK]*.
8. Under *"Project ➔ Rebuild all"* rebuild the project.

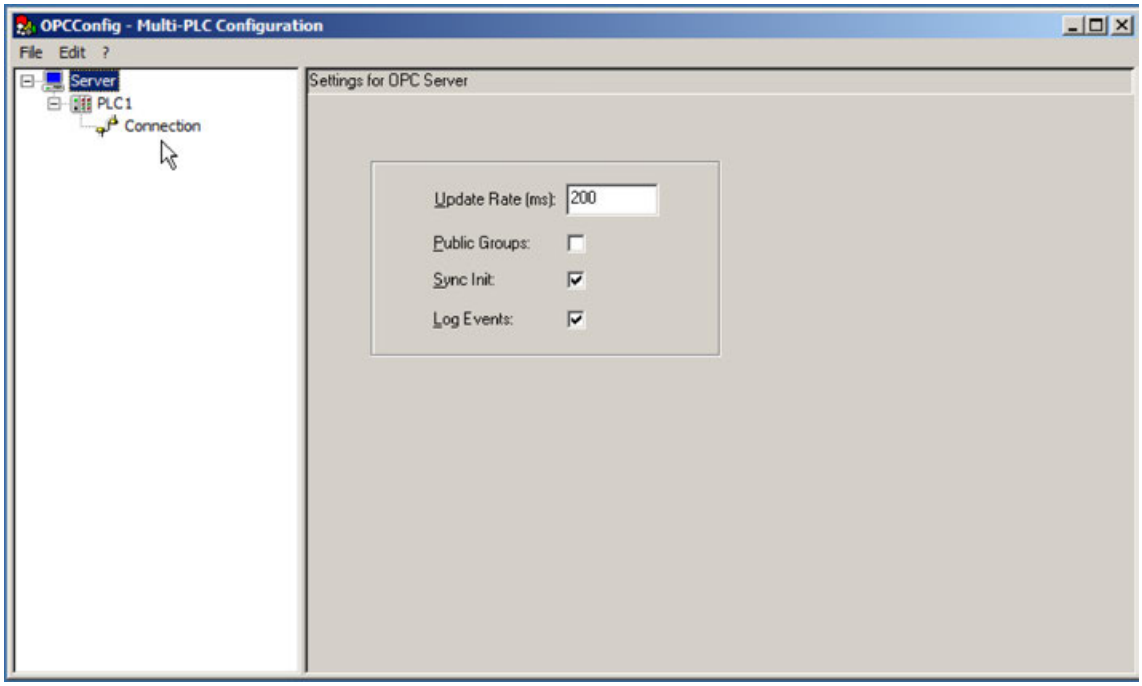


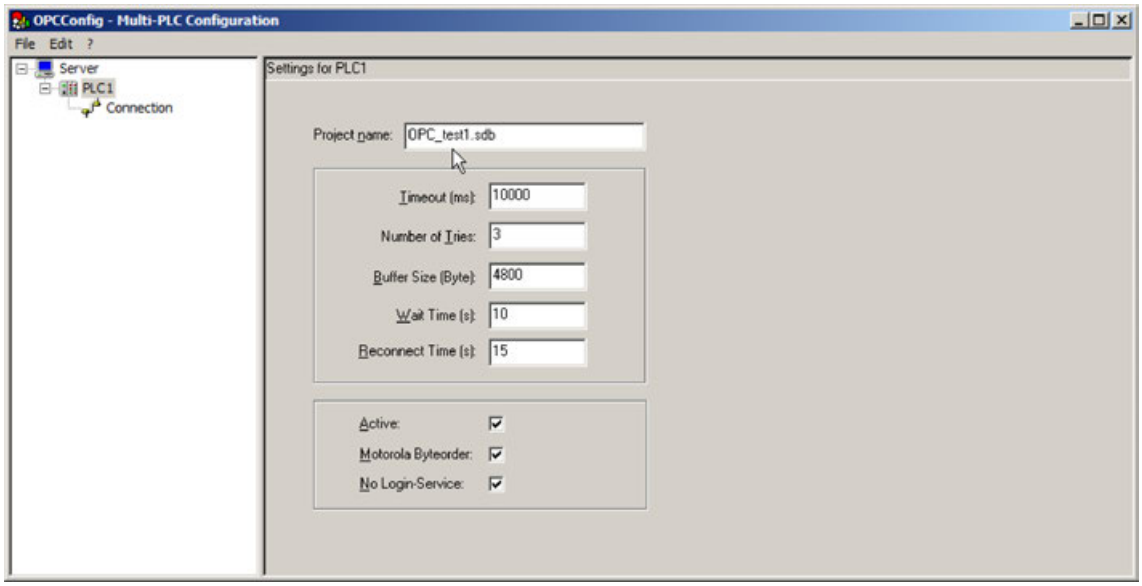
9. In the project folder is the subfolder *"OPC_test1__AC500_PM573_ETH__OPC_test1"*. It contains symbol files **.SYM* and **.SDB* with the time of the *"Rebuild all"*. The items in the file **.SYM* can be checked with Notepad. The binary file **.SDB* contains the items for the OPC server. With *<Online>* *<Login>* it will copied in the gateway files directory and optionally on the AC500.



10. The folder *"OPC_test1__AC500_PM573_ETH__OPC_test1"* is a temporary folder, if the CBP project is opened. For the simulation of the server OPC it is copied **.SDB* by hand.

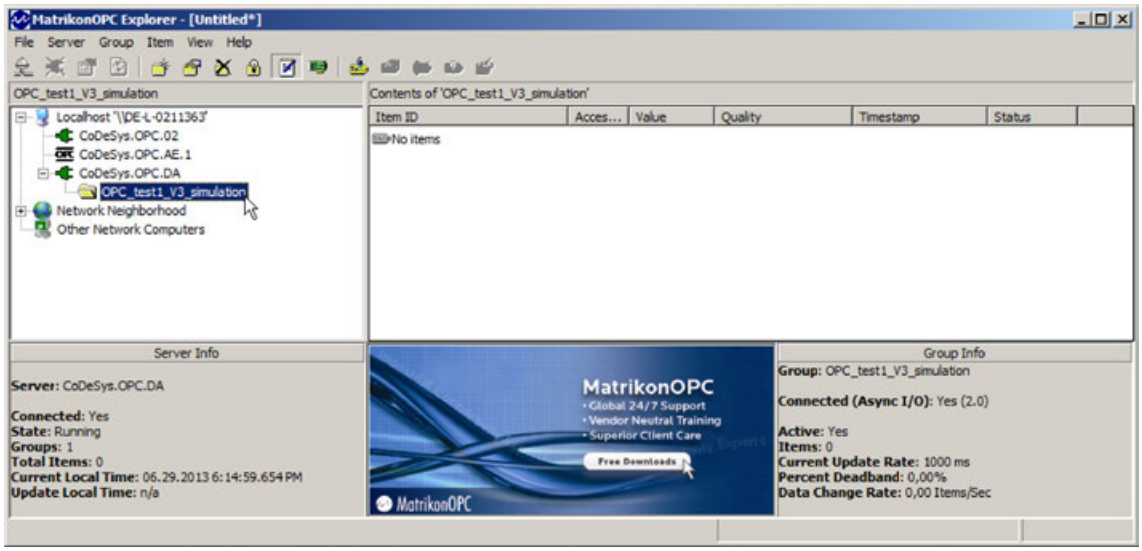
Configure OPC server V2



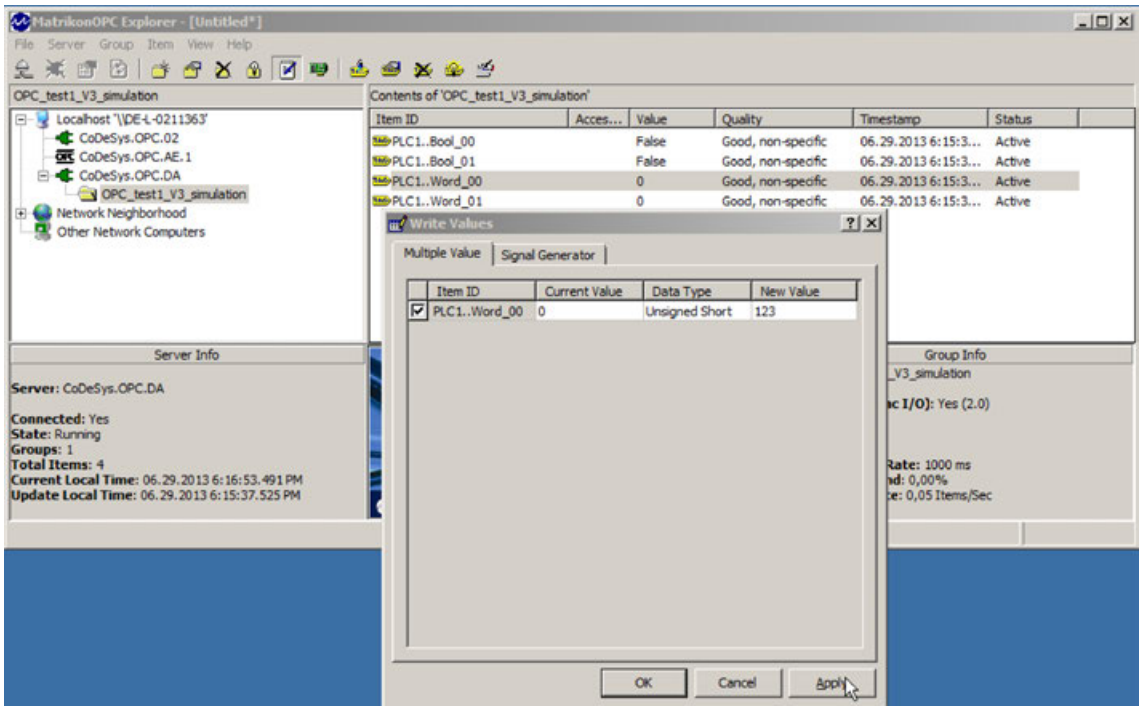


▷ Only the *"Project name"* may be specified.

Check OPC server with MatrikonOPCExplorer

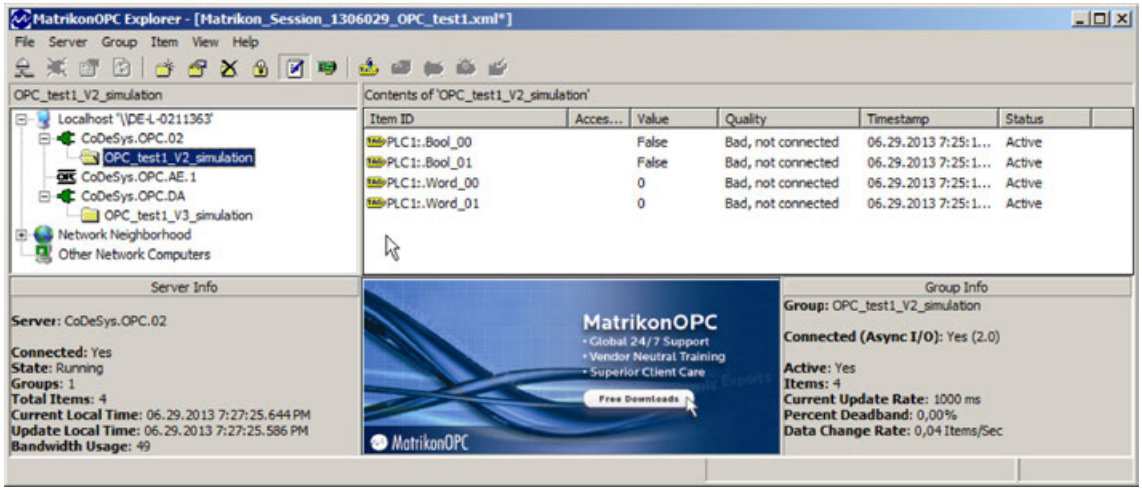


1. OPC Server V3: *"Connect CoDeSys.OPC.DA"*. Add *"Group"*, add *"Items"*, select *"Availabe Tags"* and add to *"Tag List"*.



2. The OPC Server V3 (*"CoDeSys.OPC.DA"*) is connected, running and the *"Quality"* is good.

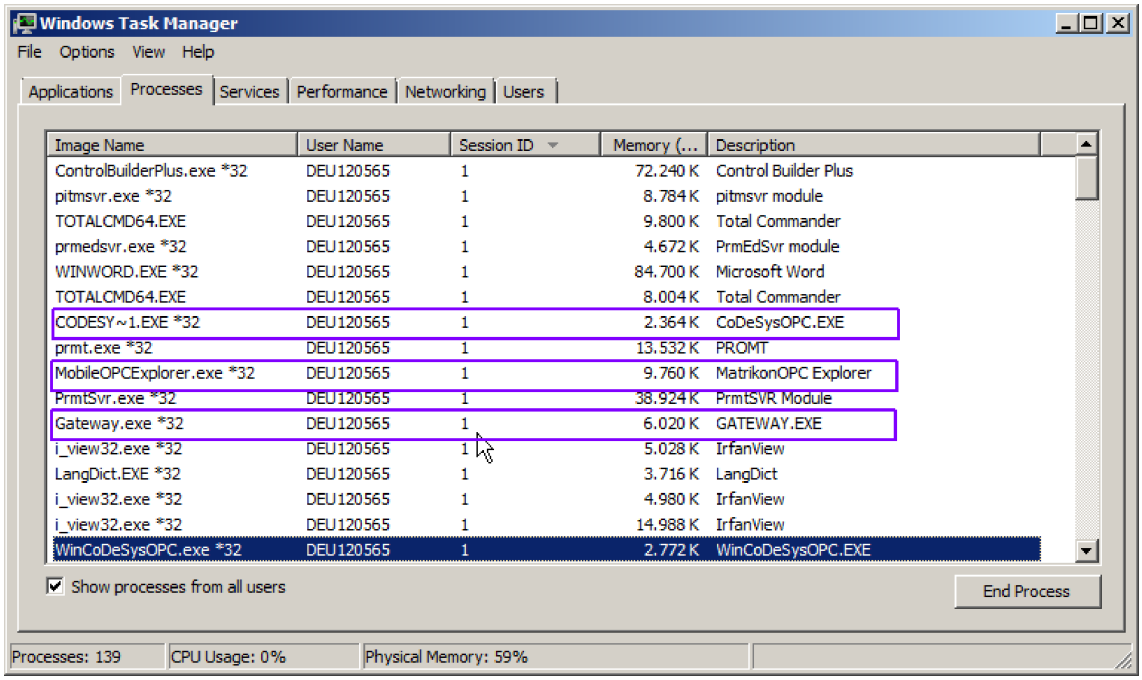
   One OPC client can read / write the values of the items.



3. Similar configuration as above.

   The OPC Server V2 (*"CoDeSys.OPC.02"*) is connected, running and the configured items are found. But the *"Quality"* is bad. One OPC client can not read / write the values of the items.

Check processes with windows task manager



Correct configuration: All *"Processes"* run with the same *"User Name"* and with the same *"Session ID"*.

Summary

The correct function of OPC Server V2 and V3 can be checked without AC500.

With OPC Server V3 with the configuration “SIMULATION” the Project name with the directory name has to be specified. The values of the items can be read and write by one OPC client.

With OPC Server V2, as well as with OPC Server V3 in configuration “GATEWAY”, only the project name may be specified. The configured items are found, but the quality is bad. The values of the items can not be read and not write by one OPC client.

Refer to REF5 Online Help of PS501 chapter OPC for details ↬ Table on page 6272.

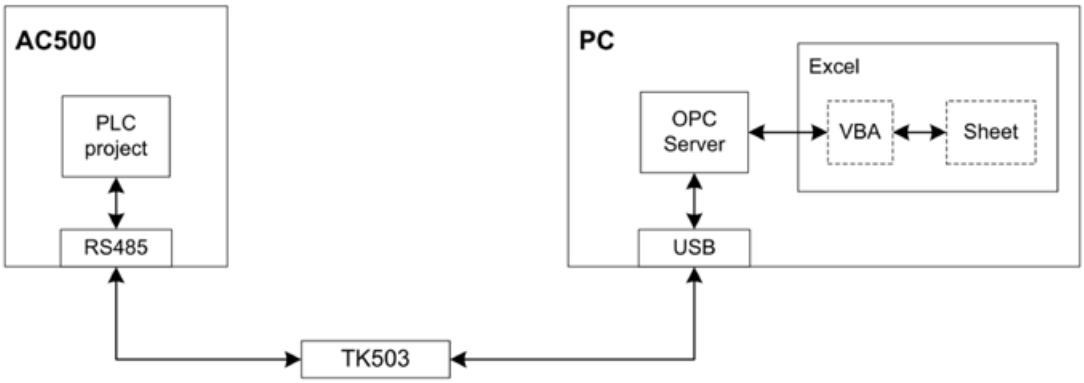
Create an OPC client with Microsoft Excel

How do you create an OPC client with Microsoft Excel?

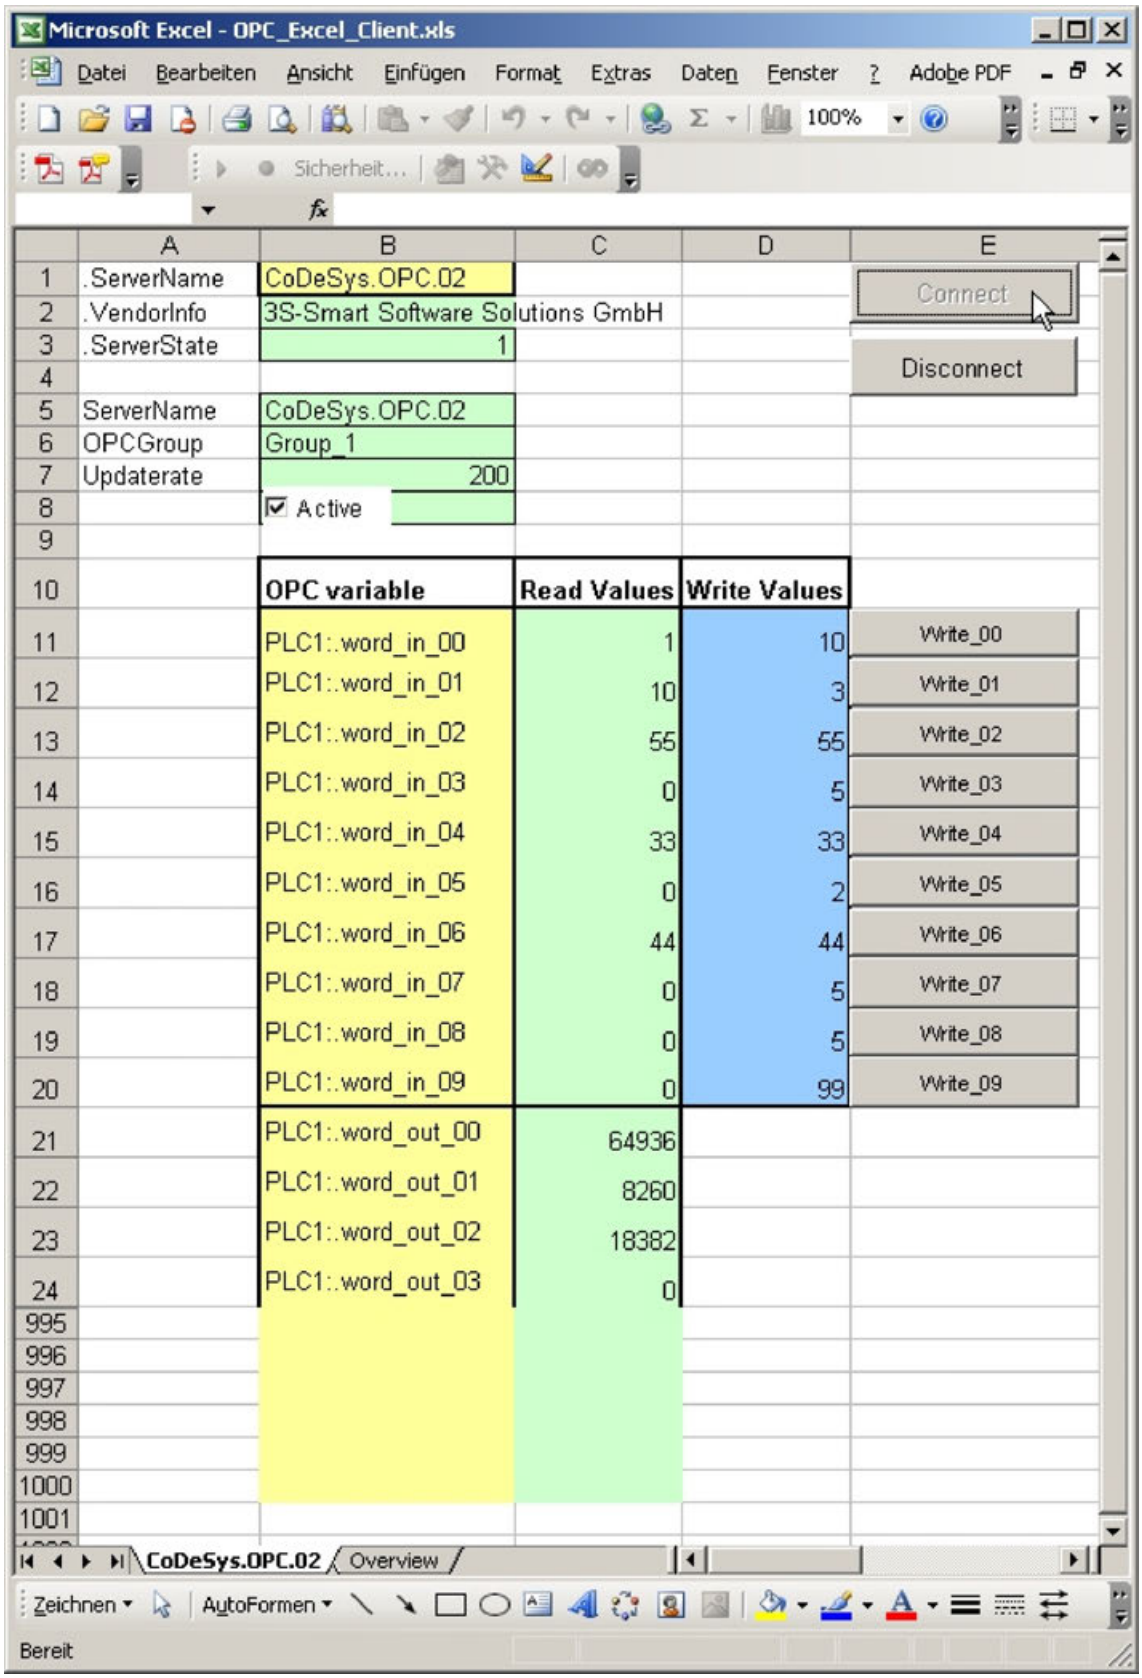
See *Application Example, OPC*.

This application example consists of two parts:

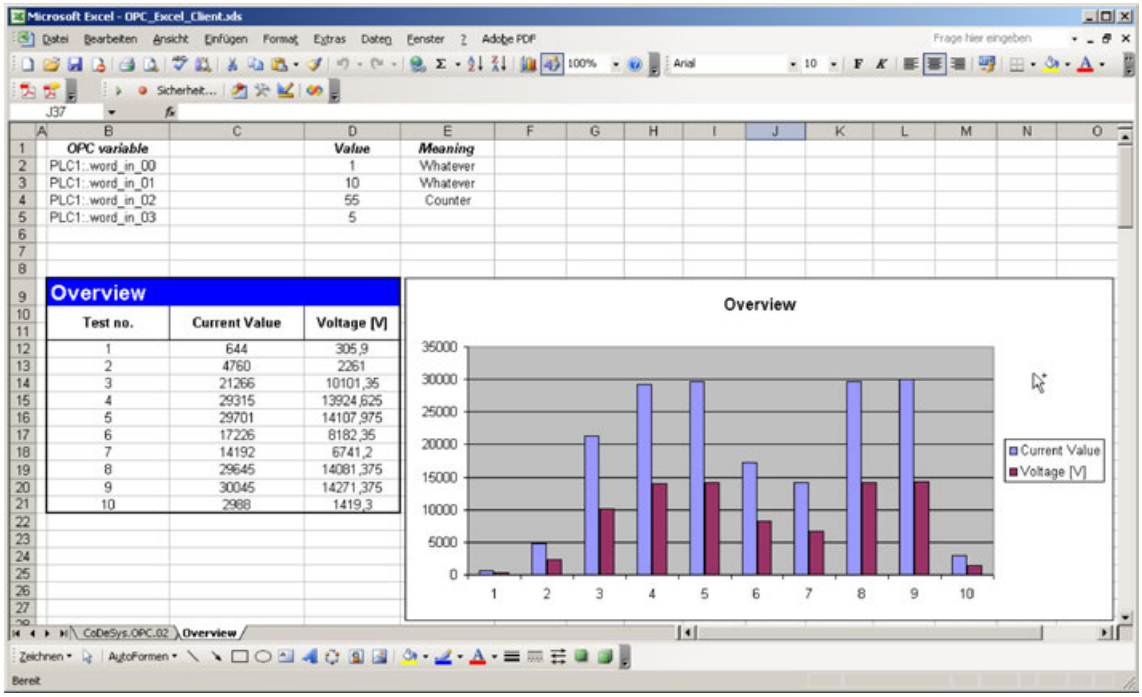
- AC500_to_OPC_Excel_Client.pro: AC500eCo project with symbol and CoDeSysOPC
- OPC_Excel_Client.xls: MS Excel sheet with VBA program



Block Diagram



Worksheet *"Control panel"* for the communication with the OPC-Server.



Worksheet *"Overview"* for visualization.

This works also with OPC Server V3 but because of a missing DLL the OPC Server V2 must be installed also.

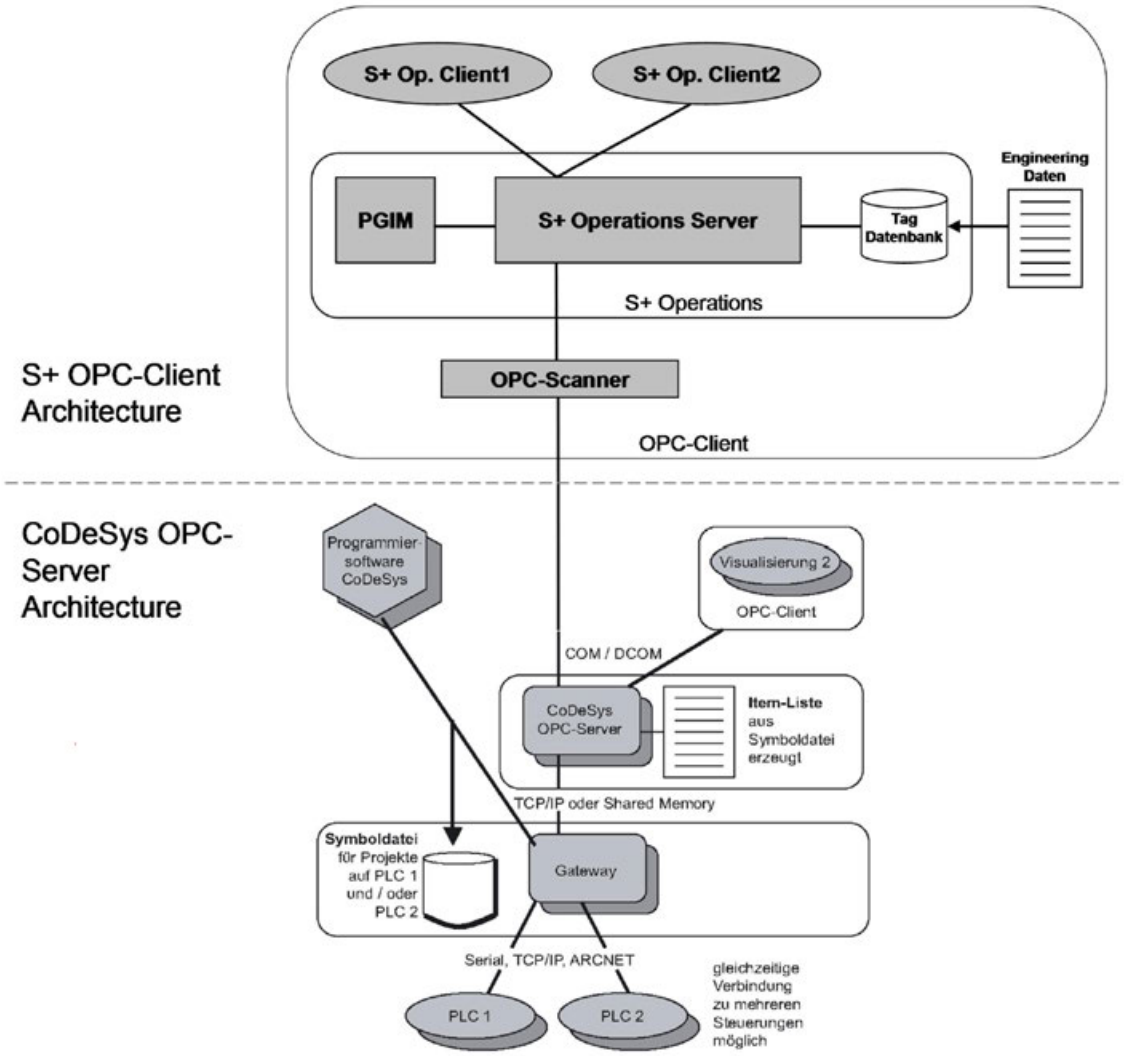
It will be fixed in later Releases as V2.3.

OPC server V3 with S+

Setup

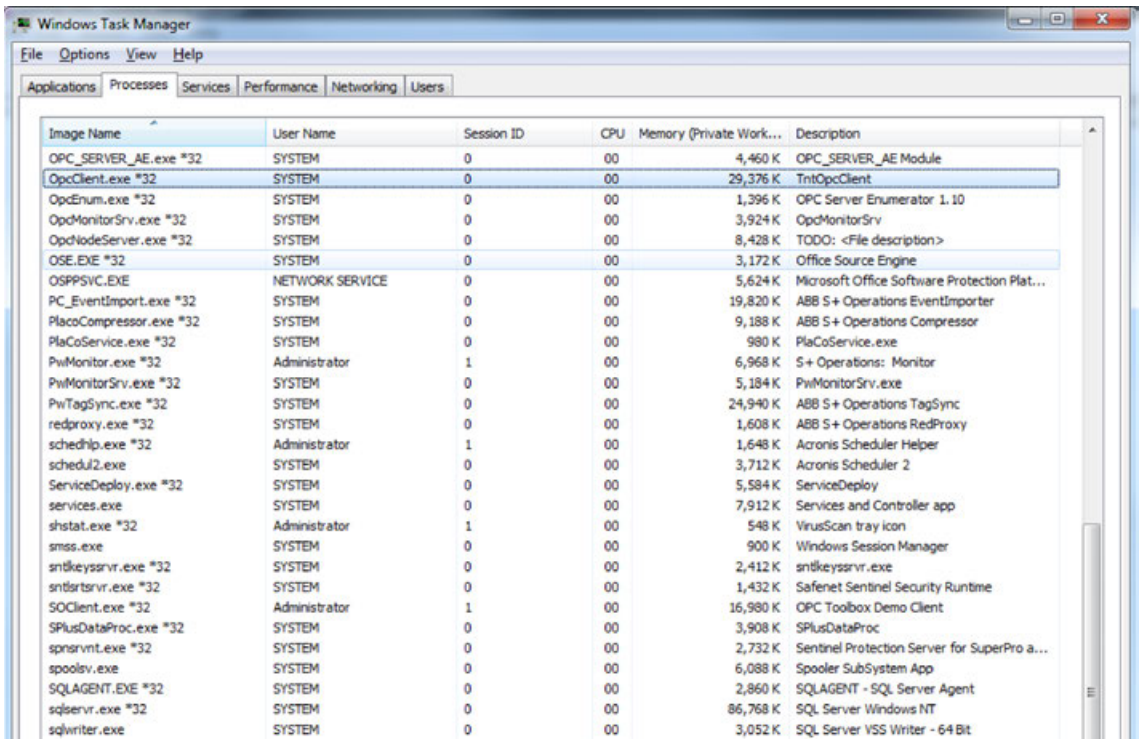
Test with ABB PS Mannheim, 2012. Communication via OPC with AC500.

- Windows Server 2008 64 Bit
- S+
- OPC Server V3



Procedure

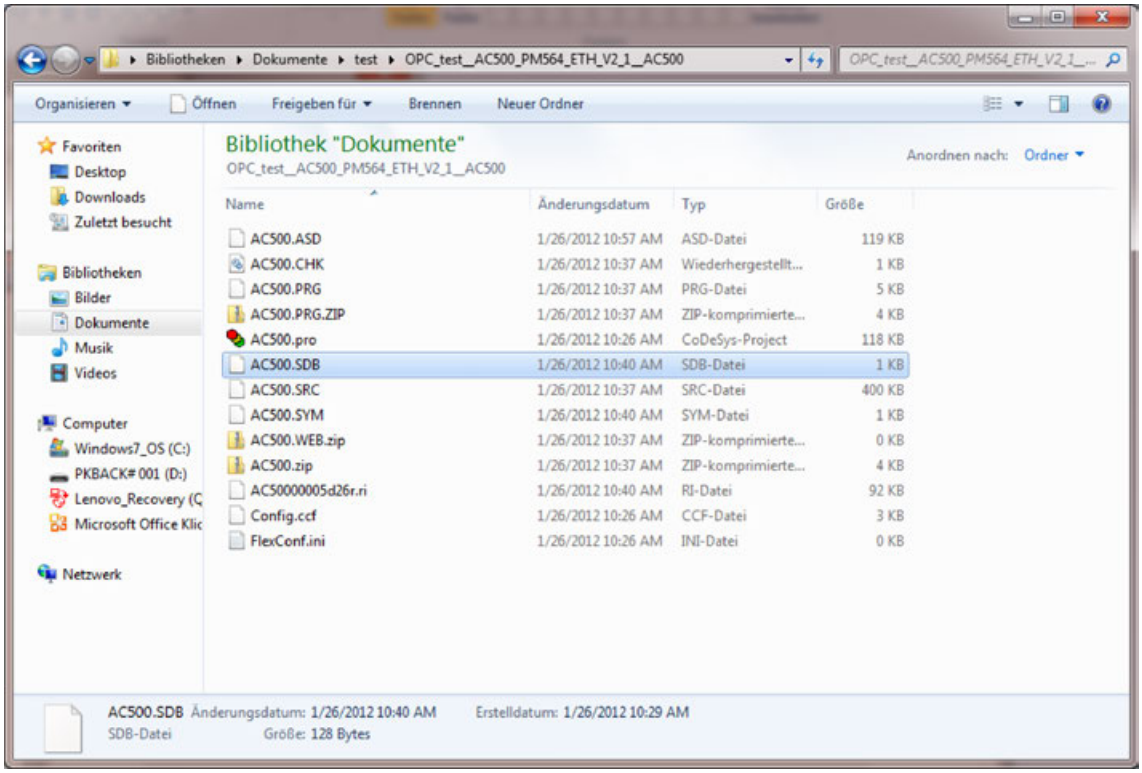
1. Install OPC-Server V3 from folder CBP.
   ⇨ After the installation OPC server runs in session ID: 1
2. Test with Testclients, as *Softing* or *Matrikon OPC*, if the data is able to be called up.
   ⇨ The S+ OPC-Scanner runs as a service.
3. Configure OPC Server V3 according to Hints ↳ *Chapter 1.6.5.5.1.2.6.2 “Configure OPC Server V3” on page 6292*.
4. Configure User account for OPC server ↳ *Chapter 1.6.5.5.1.2.8 “Configure user account for OPC server” on page 6299*.
   ⇨ The OPC server runs then in session ID: 0.



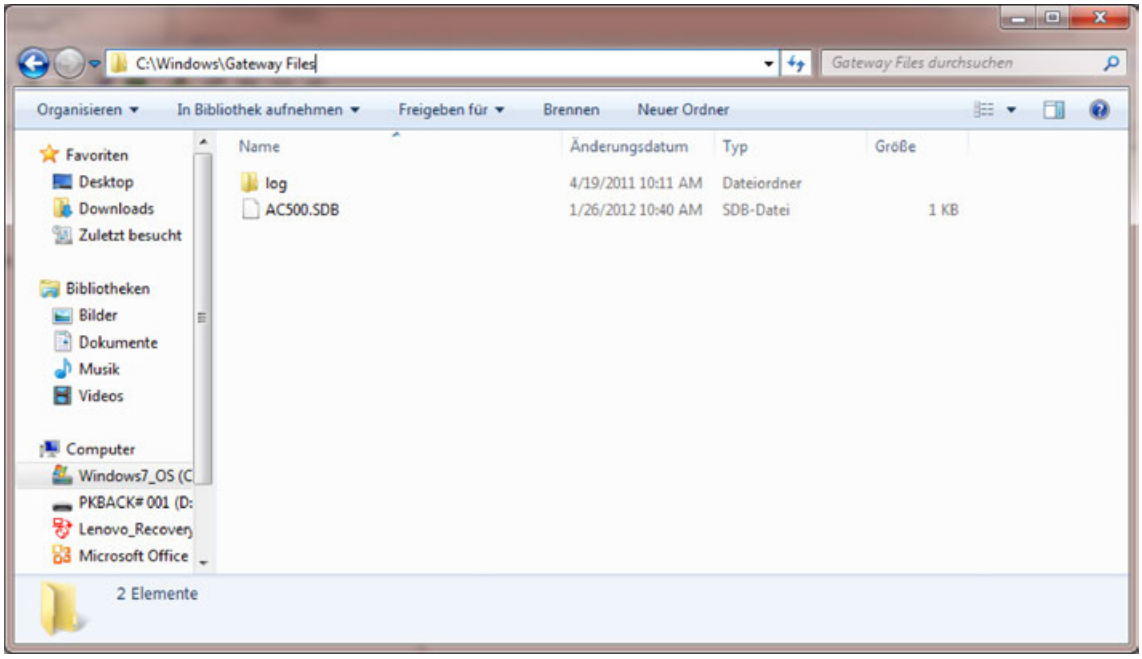
Win7 64 bit OPC server V3 symbol file local

1. Create a new project and take a look at your symbol file.

   The project must be opened to see this file.

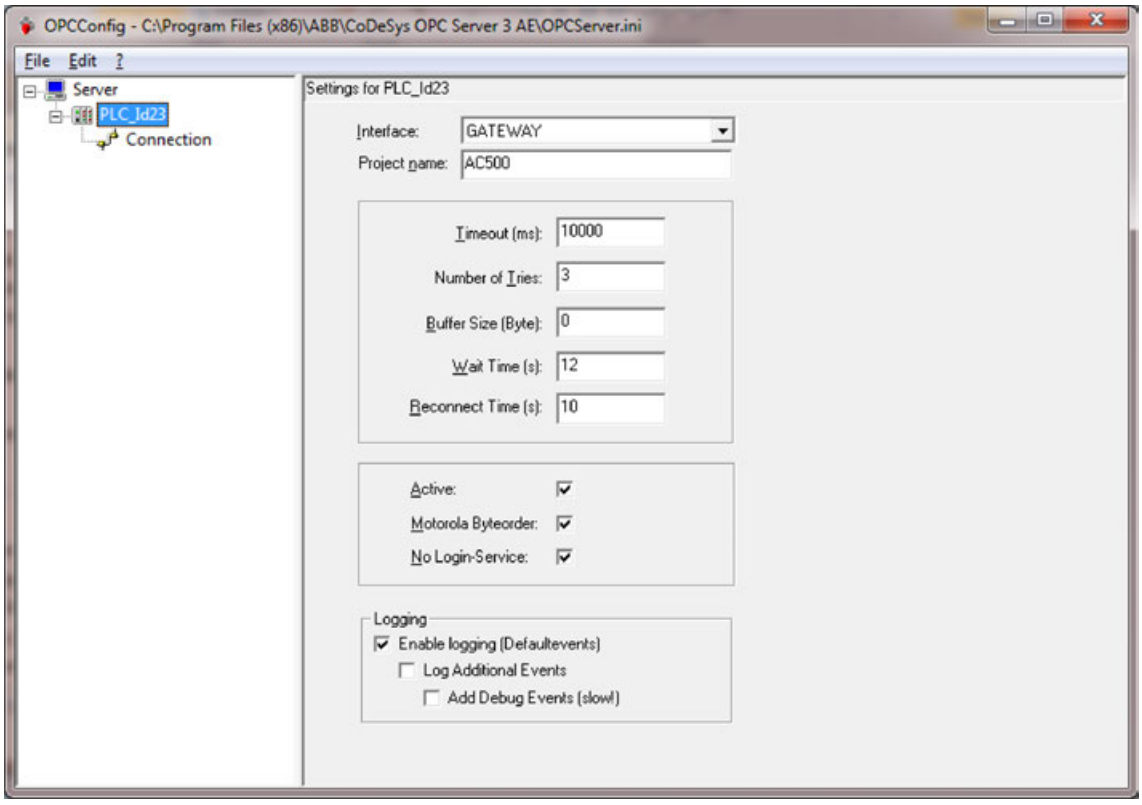


2. Copy your **.sdb* file to the following folder *"C:\Windows\Gateway Files"*.

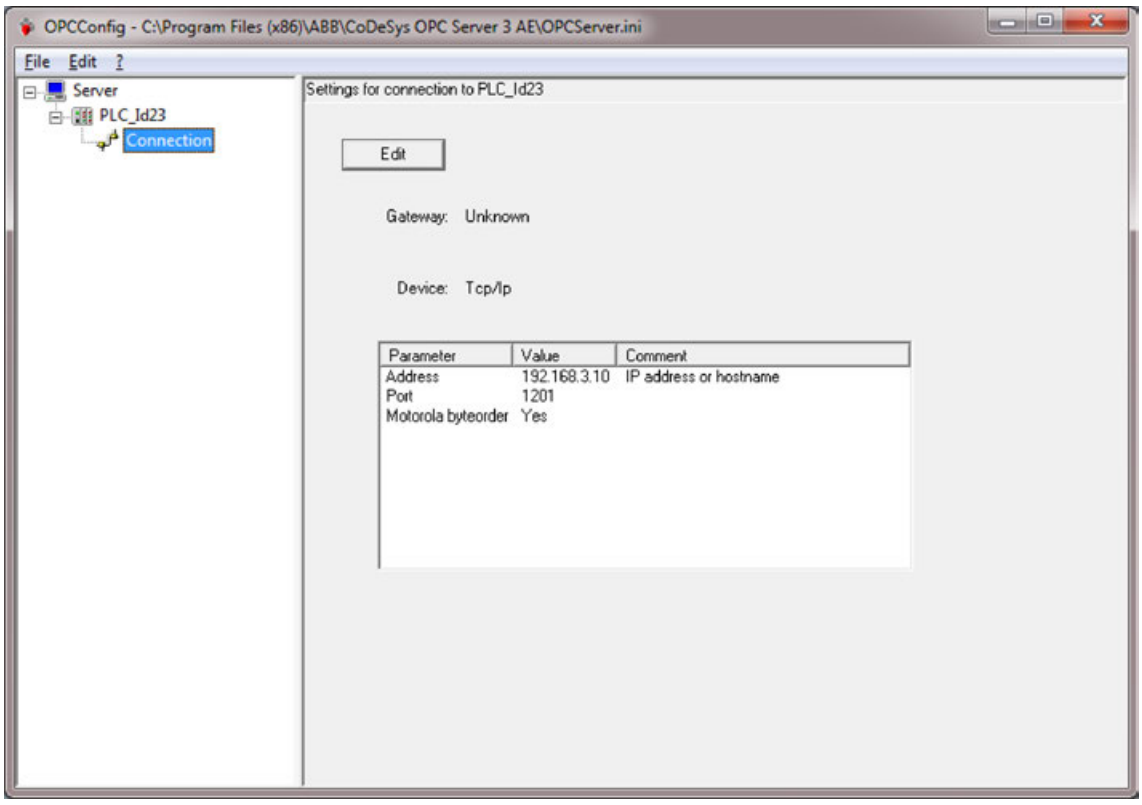


3. Open the OPCConfig and select *"PLC<...>"*. The *Project name* must be the same as the name of the symbol file.

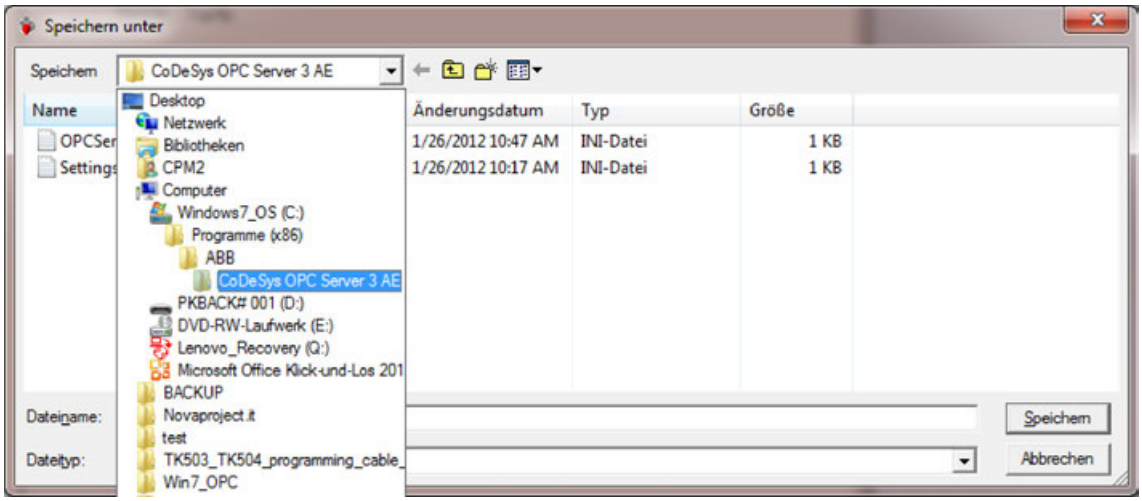
   Enable check boxes *Active*, *Motorola Byteorder*, *No Login-Service* and *Enable logging (Defaultevents)*.



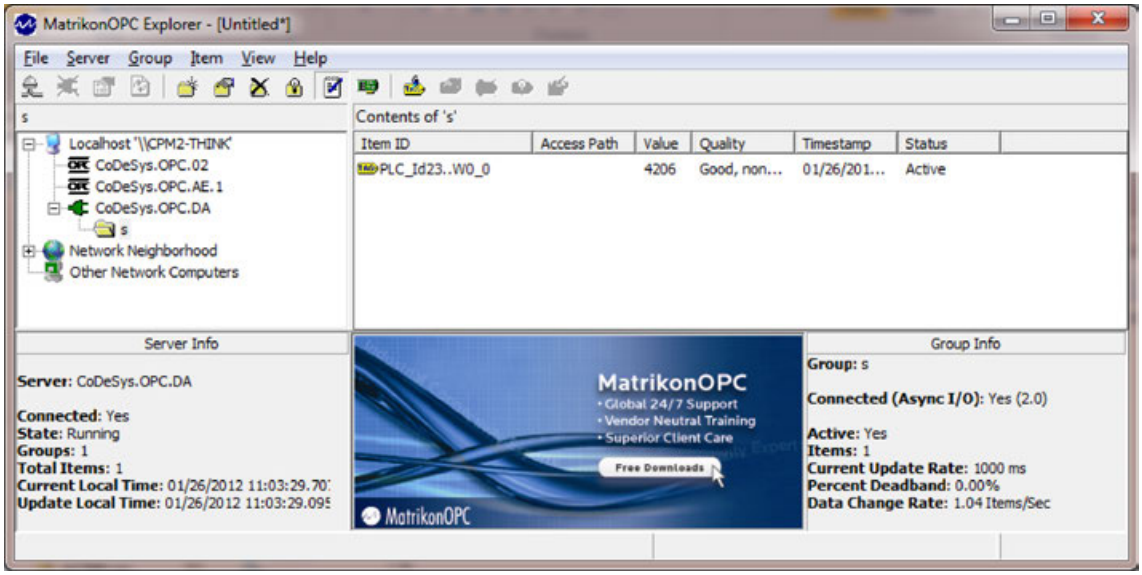
4. Select *"Connection"* to the PLC.



5. Save the current *OPCServer.ini* in the following folder *"C:\Programme (x86)/ABB/CoDeSys OPC Server 3 AE"*.



6. Check the OPC connection with a OPC client e.g. Matrikon.



Appendix

Transmission rate - Comparison with OPC server V2 to V3

Some figures about OPC Server transmission rates of a special test setup of HHZ:

- PC Lenovo T430, Windows 7, 64 bit
  - OPC client (OPC Systemtest Teststand, LabView 8.6 application)
  - OPC Server V2 und V3
- AC500 PM592 (task freewheeling and t=2 ms shown similar values)
- OPC client application: 100 cycles (write item, read item, compare value, increment value)

OPC Server	Item Byte			
	Connect [ms]	**Mean value [ms]**	**Max. value [ms]**	**Disconnect [ms]**
OPC Server V2: write cycle	2	2.374	4	0
OPC Server V2: read cycle	2	127.2	**133**	0
OPC Server V3: write cycle	2	1.838	4	1
OPC Server V3: read cycle	2	96.8889	**99**	1

OPC Server	Item Byte			
	Connect [ms]	**Mean value [ms]**	**Max. value [ms]**	**Disconnect [ms]**
OPC Server V2: write cycle	1	2.333	4	0
OPC Server V2: read cycle	1	127.152	**133**	0
OPC Server V3: write cycle	1	1.616	4	1
OPC Server V3: read cycle	1	97.1414	**99**	1

Performance - Comparison with OPC server V3 and TCPIP drivers

Measured on a Lenovo Thinkpad with Core-I5, Windows 7-64, 8GB RAM using a minimum OPC-Client (console application) written in C# with use of OpcNetApi-Library.

V2.3 project with 5 AC500 PLCs

TCPIP - Driver Name	**Buffer size setting in *opcserver.ini***	**Average CPU Load (PM591) [%]**	**Throughput Cyclic items per second at OPC-Client**
3S TCPIP	0	16	**8500**
ABB TCP/IP Level 2 AC	1000	19	**2886**
ABB TCP/IP Level 2 AC	5000	19	4770
ABB TCP/IP Level 2 AC	7000	19	5202

1.6.5.5.2 Web server

Use of the web server for the AC500

Integrated web server on AC500

As of firmware 2.0 an integrated web server on AC500/AC500-eCo PLCs is available. A web browser communicates with the web server on the PLC and displays the visualization by means of a Java applet using http 1.0.

Prerequisite: The processor module provides onboard Ethernet. No access via the interface of an Ethernet Communication Module.

Features:

- Web visualization (created in CODESYS)
- Download and storage of the webpages as part of the boot project on RAM disk of the CPU
- Access to the integrated AC500 web server with web browsers that contain a Java plug-in
- Access to the integrated AC500 web server with web panels e.g. CP6xx-WEB.
- File transfer from the PLC to the web browser on the PC.
- No special license required.

Usage of the web server occupies storage on the user RAM disk.

Table 758: User RAM disk (required for Java)

PM55x-xP-ETH PM56x-xP-ETH	PM556	PM573-ETH	PM583-ETH	PM590-ETH	PM591-ETH	PM592-ETH	PM595
512 kB (+ 400 kB)	1024 kB (+ 400 kB)	1024 kB (+ 400 kB)	4096 kB (+ 400 kB)	8 MB (+ 400 kB)	8 MB (+ 400 kB)	8 MB (+ 400 kB)	32 MB (+ 400 kB)

Configuration

Configuration in Automation Builder

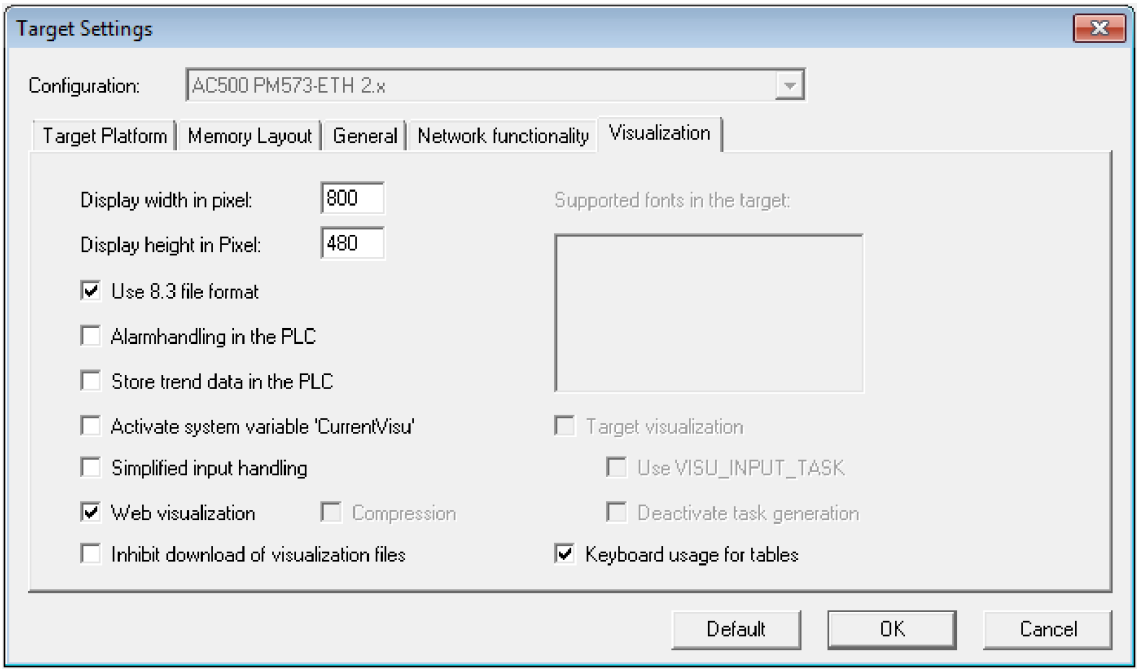
1. In your PLC project, click *“Interfaces ➔ Ethernet ➔ Protocols”* and add a new object *“Web Server”*.
2. Open the web server settings to change the default settings if required.

   Before changing the number of parallel connections for the web server, check the general information on *Chapter 1.6.4.1.6.1.1 “Ethernet protocols and ports for AC500 V2 products” on page 5442*.

Parameter	Default	Value	Description
Port	80	0 ... 65535	Listen port of the web server
Connections	2	1 ... 25 (depending on CPU type)	Number of parallel connections accepted by the web server. Depending on the CPU type and web-visu complexity it might be possible to have more connections to different clients. The connections will be opened and closed one after the other. This might lead to the impression of more parallel connections than configured.

Configuration in CODESYS

1. Open the CODESYS.
2. In the *“Resources”* tab click on *“Target Settings”* and select the *“Visualization”* tab.



⇨ If required, change *“Display width”* and *“Display height”* for the web pages.

Enable *“Web visualization”* check box, otherwise the webpages are only visible in online mode.

Ensure *“Inhibit download of visualization files”* check box is disabled.

> *If you enable “Activate system variable 'CurrentVisu'” check box and define a global variable “CurrentVisu” [STRING(40)] in your project, then the name of the active visualization will be stored in this variable. You can switch between your visualization pages by changing this value.*

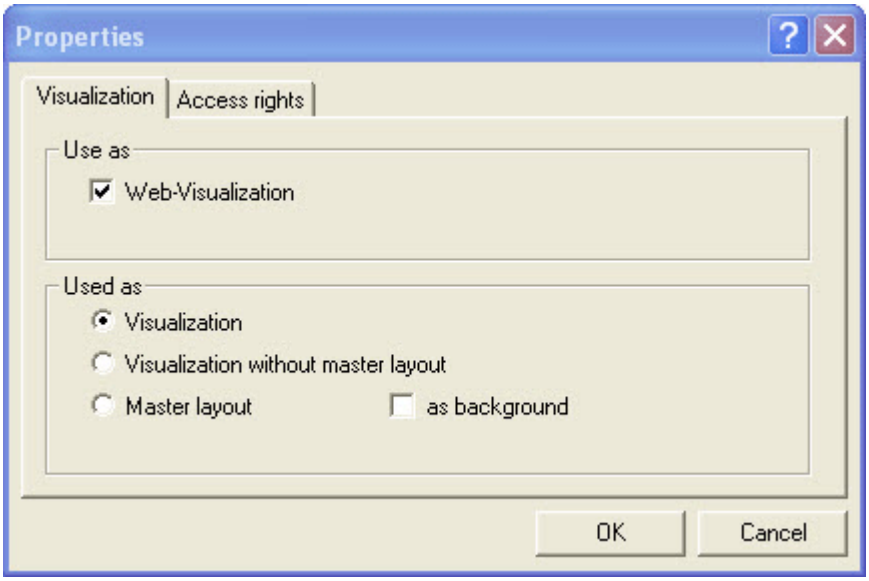
3. In CODESYS open the *"Visualizations"* tab to create the webpages. The first entry is the start page of your visualization project and must be named "PLC_Visu".

   ⇨ Further information on the creation and formatting of websites is provided in the CODESYS section ↳ *Chapter 1.4.5 "Web visualization" on page 721*. When building up your visualization project, consider the required disk space on the user RAM disk.

4. By default, all objects in the visualizations tab are marked for web visualization. When the project is built, all marked objects are saved as XML files (objectname.xml) into the project.

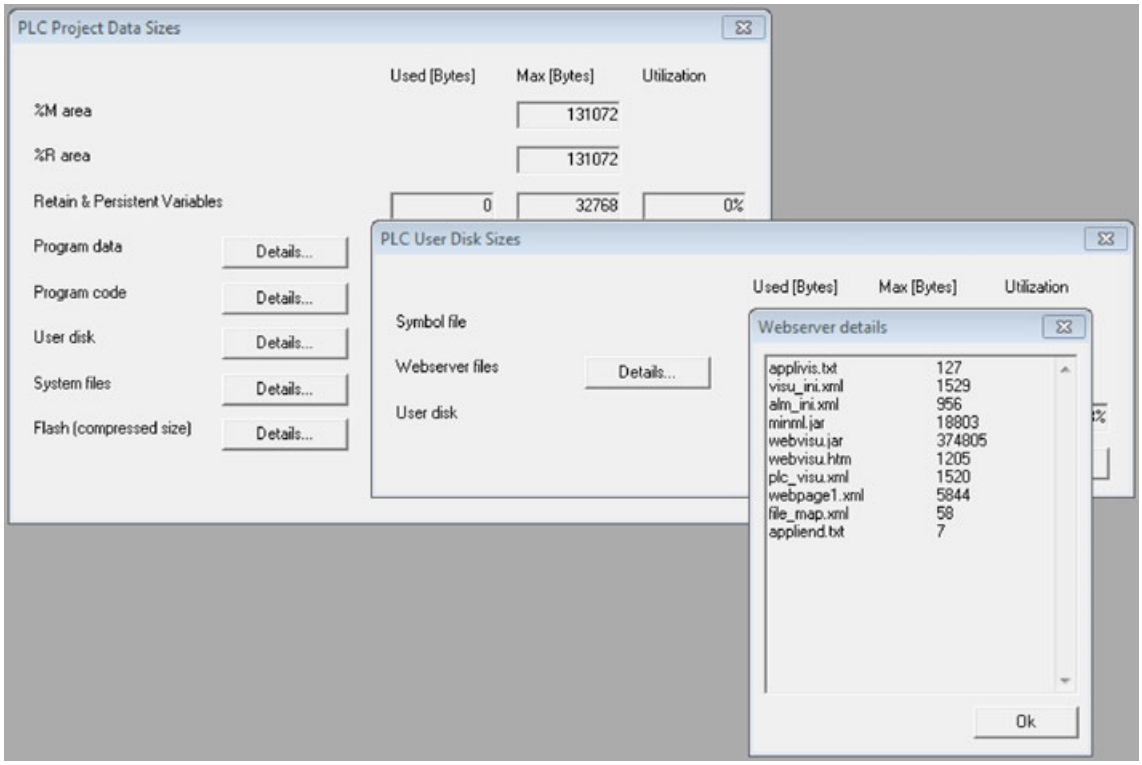
   To exclude a particular visualization object from the web visualization, click *"Project ➔ Object ➔ Properties"*.

   In the *"Visualization"* tab disable *Web-Visualization* check box.



5. Open a web browser and enter the IP address to the PLC (webserver project): http://<IP address/webvisu.htm>.

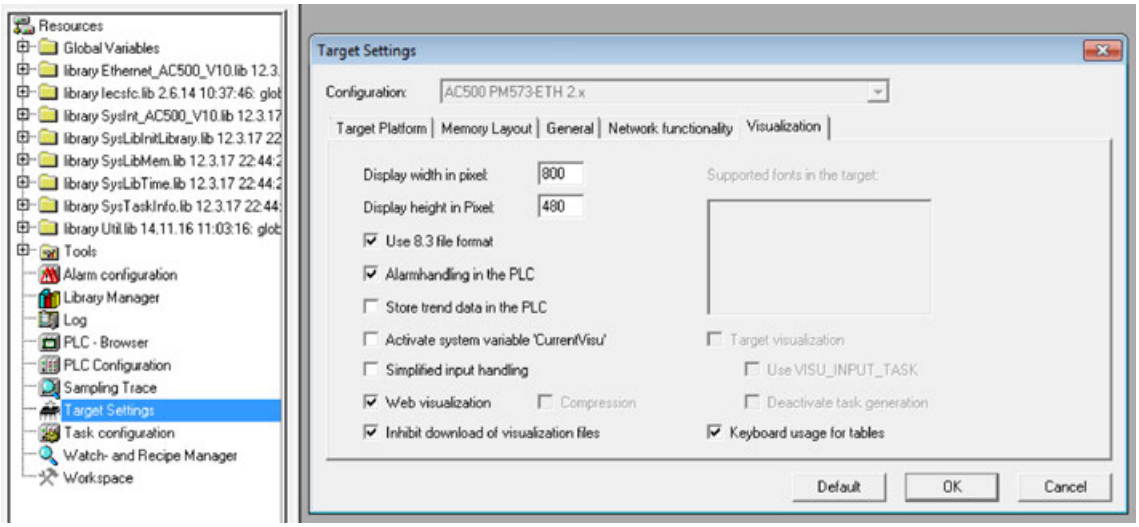
6. Click *"Online ➔ Show file information"* to check the *"PLC Project Data Sizes"*.



Alarm configuration

In case of a required alarm configuration via web server, alarms in the web server can be configured.

1. In your PLC project, open the CODESYS.



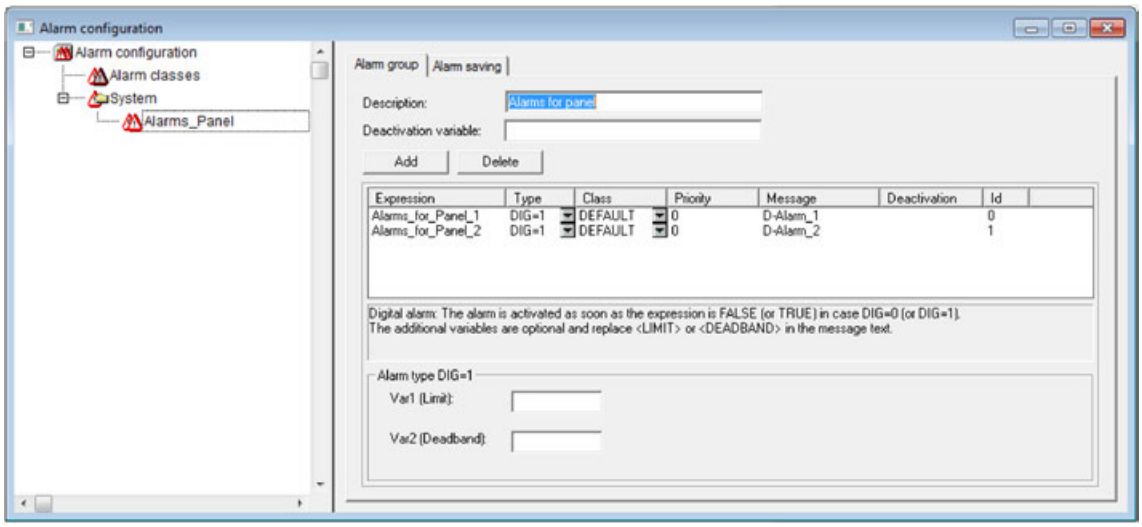
2. Enable *"Alarmhandling in the PLC"*.

   ⇨ In the *"Task configuration"* section a new task ALARM_TASK is created and the following CODESYS libraries are loaded:

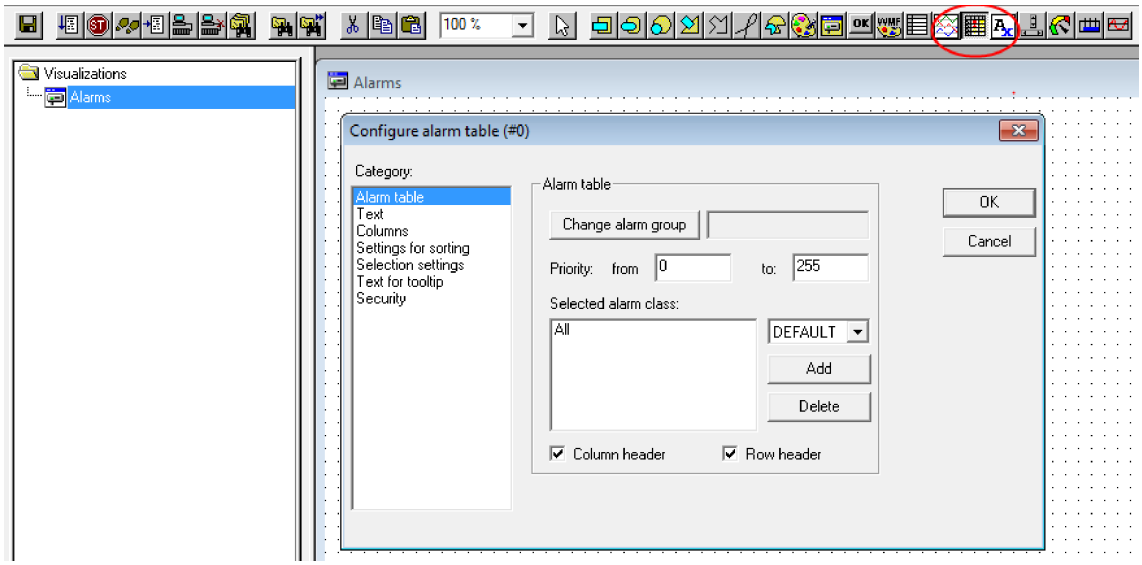
   - SysLibAlarmTrend
   - SysLibFile

3. In the *"Alarm configuration"* modify the default settings for the alarm classes if required.

   Under *"System"* append an alarm group.



4. Open the *"Visualizations"* view and add a new object.
5. If necessary, create a configuration table. However, do not change the alarm group to the option *"All alarm groups"*.



1.6.5.6 Converting an AC500 V2 project to an AC500 V3 project

A project that has been configured for an AC500 V2 PLC can be converted to a project for an AC500 V3 PLC.

Essentially, the conversion is done in Automation Builder, however, some additional actions have to be executed manually. The complete procedure is described in the application example

Instructions on how to convert a V2 project to a V3 project and differences between V2 and V3.

1.6.6 Storage devices for AC500 V2 products

1.6.6.1 Introduction of AC500 storage devices for AC500 Products

1.6.6.1.1 Overview

AC500 PLCs offer a variety of storage devices. The following table gives a short overview and a description on these storage devices:

IEC access means that the storage device can be accessed by function blocks of an IEC program.

FTP access means that the device can be accessed via FTP server on the PLC (if available).

Component	Description	IEC access	FTP access	CPUs AC500 V2
RAM disk	System RAM disk Volatile storage device placed in the SDRAM Used by the firmware during its operation For internal firmware use only!	No	Yes FTP user = "ramdisk"	All
User disk	User RAM disk Volatile storage device placed in the SDRAM Can be used for any application purpose	Yes	Yes FTP user = "userdisk"	All
SRAM disk	Battery-buffered, non-volatile RAM disk placed in the SRAM Can be used for any application purpose	Yes	Yes FTP user = "sramdisk"	All processor modules for AC500 (Standard) V2 *Chapter 1.6.1.7.2 “Device list: Processor modules (CPUs) ” on page 3713*
Internal flash	PLCs persistent memory Used for storing firmware, user application and user data	Yes	No	All

Component	Description	IEC access	FTP access	CPUs AC500 V2
Flash disk	Internal persistent mass storage device Can be used for any application purpose	Yes	Yes FTP user = "flashdisk"	PM592-ETH PM595-4ETH
memory card (removable)	memory card (removable) Removable persistent mass storage device Can be used for any application purpose	Yes	Yes FTP user = "sdcard"	All processor modules with memory card slot *Chapter 1.6.1.7.2 “Device list: Processor modules (CPUs) ” on page 3713*

1.6.6.1.2 Functionalities

The maximum number of files opened at the same time is limited to 1007.

The max. length of the user string (path and filename) is 241 characters.

Component	As of CPU firmware	Functionality
RAM disk	V2.0.2	Load / save boot project Firmware update Internal system files
	V2.1.3	Files via FTP server (e. g. firmware update)
User disk	V2.0.2	WebVisu files and Java applet for web server Symbol file for OPC server and CP600 panels
	V2.1.3	Java script files for web server User data via CAA_File_xxx.lib *Chapter 1.5.4.4 “CAA_File library” on page 789* Files via FTP server
SRAM disk	V2.1.3	User data via CAA_File_xxx.lib *Chapter 1.5.4.4 “CAA_File library” on page 789* Files via FTP server
Internal flash	V2.0.2	CPU firmware Traceability and configuration data User application: boot project, symbol file and WebVisu files (BOOT.ZIP + WEBVISU.ZIP) User data via *Chapter 1.5.4.19 “Internal system library” on page 1500* Internal System Library -> FLASH_<...>

Component	As of CPU firmware	Functionality
Flash disk	V2.1.3	User data via CAA_File_xxx.lib *Chapter 1.5.4.4 “CAA_File library” on page 789* Files via FTP server
Memory card (removable)	V2.0.2	Firmware update Load / save boot project Source code of user project load / save User data via POUs *Chapter 1.5.4.19.2.23 “SD_WRITE” on page 1563* and *Chapter 1.5.4.19.2.22 “SD_READ” on page 1558* Retain data Persistent data
	V2.1.3	User data via CAA_File_xxx.lib *Chapter 1.5.4.4 “CAA_File library” on page 789* Files via FTP server

Unlike the PLC's memory areas like %M or Retain, where 1 byte actually consumes 1 byte, all storage device utilize a file system.

That means there is a difference between a files size and its size on the disk.

On disks the files are stored in so-called clusters which are a group of disk sectors. "Size on disk" refers to the amount of cluster(s) a file is taking up, while "file size" is an actual byte count of the file data. So you will usually find that the size on disk is larger than the file size. This is not an error, but a result of the disk organization via a file system. Since sector and cluster sizes vary depending on a disk's size and the used file system, the ratios between the size on disk and the file size also vary between the various storage devices.

1.6.6.1.3 Memory sizes

PLC type	RAM disk	User RAM disk	SRAM disk	Flash memory		Flash disk	memory card *)
				User Data	User Application		
PM554	2048 kB	256 kB	None	128 kB	704 kB	None	up to 2 GB
PM564	2048 kB	256 kB	None	128 kB	704 kB	None	up to 2 GB
PM554-ETH	4096 kB	512 kB	None	128 kB	1024 kB	None	up to 2 GB
PM556-ETH	4096 kB	512 kB	None	-	-	None	up to 2 GB
PM564-ETH	4096 kB	512 kB	None	128 kB	1024 kB	None	up to 2 GB
PM572	4096 kB	512 kB	32 kB	128 kB	1024 kB	None	up to 2 GB
PM573-ETH	8192 kB	1024 kB	32 kB	128 kB	3072 kB	None	up to 2 GB

PLC type	RAM disk	User RAM disk	SRAM disk	Flash memory		Flash disk	memory card *)
				User Data	User Application		
PM582	8192 kB	512 kB	64 kB	128 kB	2048 kB	None	up to 2 GB
PM583-ETH	8192 kB	4096 kB	64 kB	128 kB	4096 kB	None	up to 2 GB
PM585-ETH	8192 kB	4096 kB	64 kB	-	-	None	up to 2 GB
PM590-ETH	16384 kB	8192 kB	256 kB	128 kB	12288 kB	None	up to 2 GB
PM590-ARC	16384 kB	8192 kB	256 kB	-	-	None	up to 2 GB
PM591-ETH	16384 kB	8192 kB	256 kB	128 kB	16384 kB	None	up to 2 GB
PM591-2 ETH	16384 kB	8192 kB	256 kB	-	-	None	up to 2 GB
PM592-ETH	16384 kB	8192 kB	256 kB	128 kB	16384 kB	4 GB	up to 2 GB
PM595-4 ETH-M	65535 kB	65535 kB	960 kB	-	-	4 GB	up to 2 GB
PM595-4 ETH-F	65535 kB	65535 kB	960 kB	-	-	4 GB	up to 2 GB

*) Size of the MC502 memory card.

It is not possible to use 100 % of a device's memory space. About 10 % of the total available space must remain unused at any time to maintain normal device operation.

1.6.6.1.4 Storage device details

This section contains some details on each storage device. For further details on specific topics please also refer to the following chapters:

Storage device sizes	see *Chapter 1.6.4.1.1 “Inputs, outputs and flags for AC500 V2 products” on page 5395*
IEC access	*Chapter 1.5.4.4 “CAA_File library” on page 789* *Chapter 1.5.4.19 “Internal system library” on page 1500*
FTP access	*Chapter 1.6.5.3.8 “FTP server” on page 6188*
PLC browser commands	*Chapter 1.7.2.5.5 “AC500-specific PLC browser commands” on page 6382*

RAM disk

The RAM disk is a volatile storage device placed in the SDRAM. It is used by the firmware during its operation and download. Via the *Chapter 1.6.5.3.8 “FTP server” on page 6188* it is possible to load new firmware to the PLC. The system files must not be deleted during run time.

Further, the RAM disk is used to temporarily save the PLC's web visualization before it is moved to the User disk.

Size	Product specific, see table Memory Sizes *Chapter 1.6.6.1.3 “Memory sizes” on page 6333*
Diagnosis device number	17

User disk

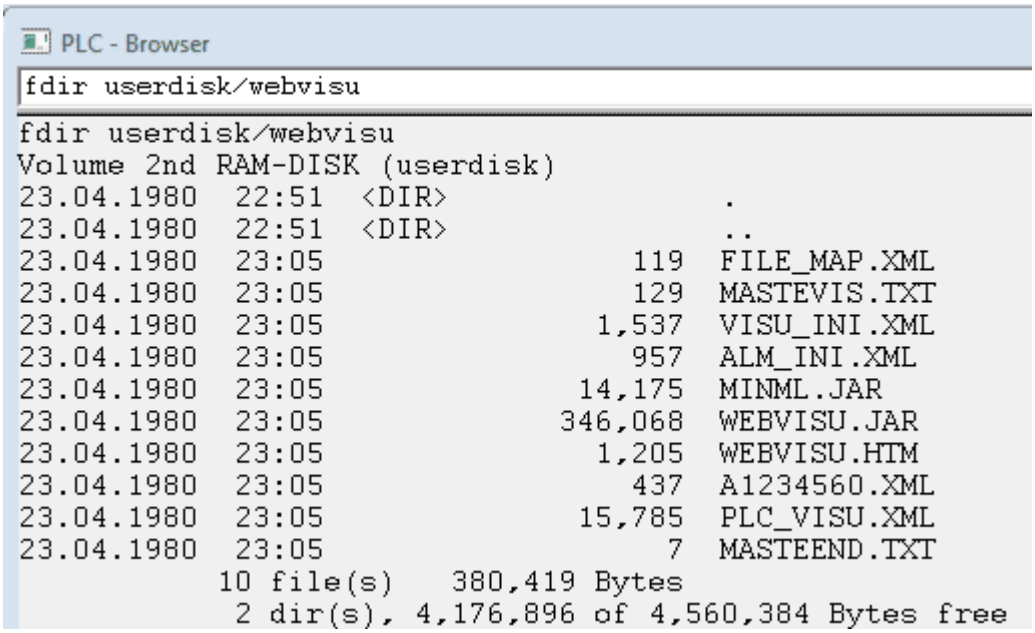
The User disk is a volatile storage device located in the SDRAM. It can be used for any application purpose. If activated, the PLC's web visualization is saved in the User Disk's subdirectory WEBVISU. If configured, the symbol file is also stored in the User disk.

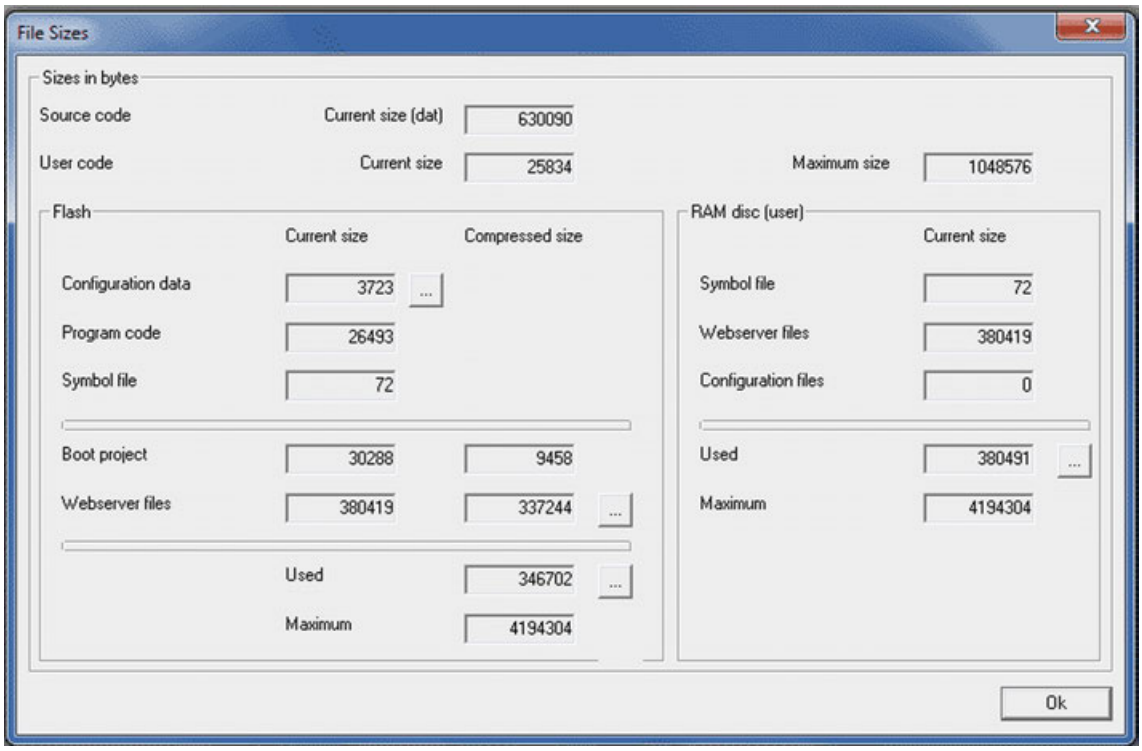
Size	Product specific, see table Memory Sizes *Chapter 1.6.6.1.3 “Memory sizes” on page 6333*
IEC access	*Chapter 1.5.4.4 “CAA_File library” on page 789*
Diagnosis device number	17

Additional hint for the size of the User disk:

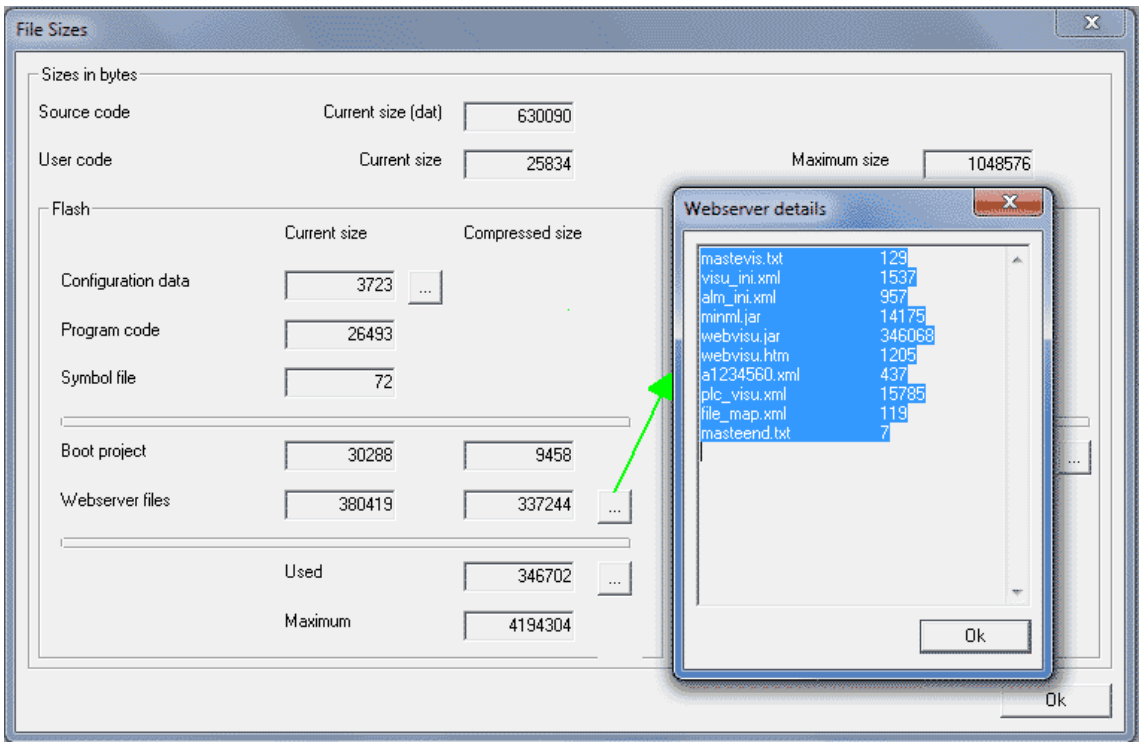
The web visualization's size is the sum of the user's visualization data plus the web visualization overhead (e.g. some Java applets (.jar files)). This means, the actual size of the User disk may differ from the offical documented size.

This difference can be recognized by comparing the sizes of the PLC browser command fdir userdisk and the information in the dialog *“File Sizes”*. This additional space is reserved for the web visualization's overhead.

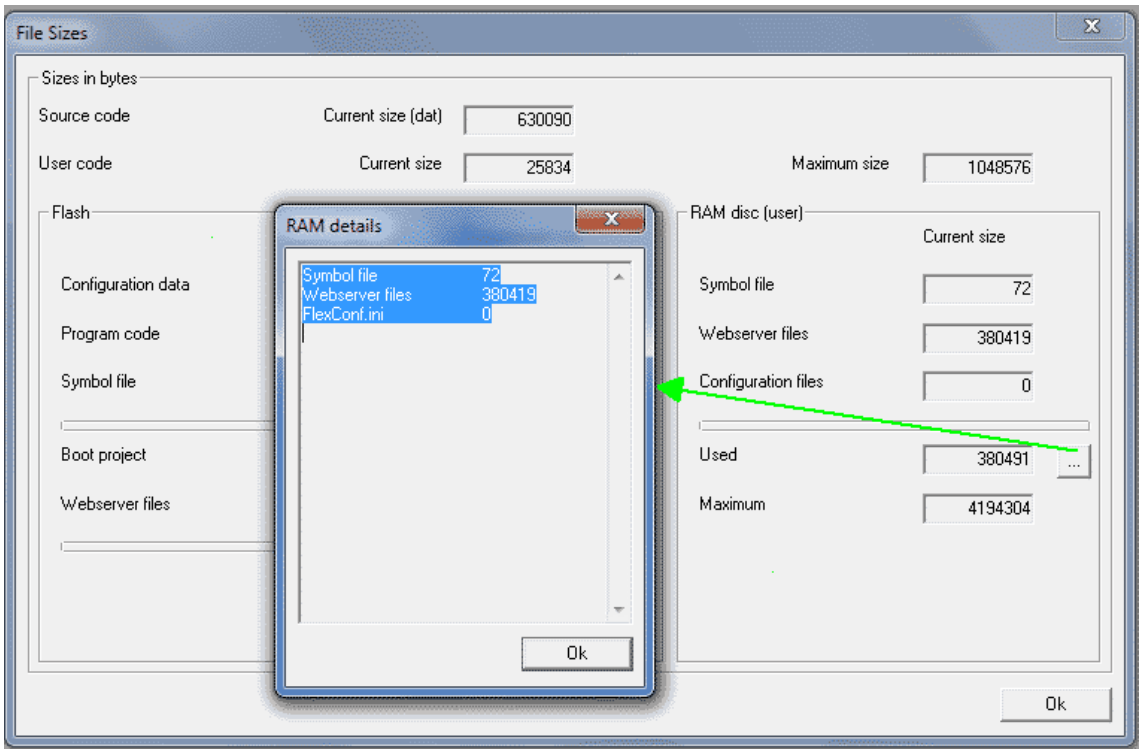




To get detailed information on your web visualization files, click *"..."* in the *"File Sizes"* dialog.



To get a summary of the various data which will be downloaded into the User disk, click *"..."* in line *"Used"* of the *"File Sizes"* dialog.



Thus, the number in line *"Used"* of the *"File Sizes"* dialog, means "total sum of the web visualization in Bytes" and the number in line *"Maximum"* means "Maximum allowed user data for web visualization". So, it is possible that *"Used"* becomes bigger than *"Maximum"*.

SRAM disk

The SRAM disk is a battery-buffered, nonvolatile RAM disk located in the SRAM and can be used for any application purpose. If a battery is inserted into the processor module, the data stored in the SRAM disk will not get lost during a power-down cycle. During PLC startup, the SRAM disk will be formatted automatically if no or an empty battery is inserted into the processor module. In this case, the PLC issues an E4 error (#0153286827 = [4-9-34-31-2-43], i.e. SRAM disk has been formatted). To enable the visibility of errors, set the CPU parameter *"Check for battery"* to TRUE. With this, the system will signal errors during the formatting of the SRAM disk.

Size	Product specific, see table Memory Sizes ↬ *Chapter 1.6.6.1.3 "Memory sizes" on page 6333*
IEC access	↬ *Chapter 1.5.4.4 "CAA_File library" on page 789*
Diagnosis device number	34

Memory card

The memory card is a removable persistent mass storage device and can be used for any application purpose. Both firmware updates and boot project updates can be run from the memory card ↬ *Chapter 1.6.6.2 "Memory card in AC500 V2" on page 6339*.

Size	Product specific, see table Memory Sizes ↳ *Chapter 1.6.6.1.3 “Memory sizes” on page 6333*
IEC access	↳ *Chapter 1.5.4.4 “CAA_File library” on page 789* ↳ *Chapter 1.5.4.19 “Internal system library” on page 1500*
Diagnosis device number	20

Flash

The internal flash is the PLCs persistent memory.

It is used for storing firmware.

It is used for storing firmware, user application and user data (see chapter 'Data Storage in Flash Memory' ↳ *Chapter 1.6.6.3 “Data storage in flash memory for AC500 V2 products” on page 6364*).

Size	Product specific, see table Memory Sizes ↳ *Chapter 1.6.6.1.3 “Memory sizes” on page 6333*
Diagnosis device number	18

Flash disk

The flash disk is an internal persistent mass storage device and can be used for any application purpose.

It has a memory capacity of 4 GB (preformatted).

The flash disk is capable of high data throughput, however, the actual values to be achieved depend on the use cases ↳ *Chapter 1.6.6.4 “Flash disk for AC500 V2 products” on page 6364*. If the performance seems to get insufficient, check the following:

- If the PLCs CPU load is high, reduce overall CPU load of the PLC to have more performance for file operations.
- If the device has low free space, cleanup the disk.
  Please consider the cluster size of 4 kB in your application design to achieve optimal usage of the flash disks space and access performance. For example, 10 files with 10 byte each require 10*4 kB disk space, while 1 file with 100 byte requires only 4 kB.
- If the device is fragmented, cleanup the disk.

Size	Product specific, see table Memory Sizes ↳ *Chapter 1.6.6.1.3 “Memory sizes” on page 6333*
IEC access	↳ *Chapter 1.5.4.4 “CAA_File library” on page 789*
Diagnosis device number	33

1.6.6.2 Memory card in AC500 V2

1.6.6.2.1 Memory card functions for AC500 V2 products

Summary

AC500 processor modules contain a user flash memory card of the type *memory card* as external storage device which is accessed by the CPU like a floppy disk drive. The memory card is used to transfer data between a commercially available PC with memory card interface and the AC500 PLC.

> **NOTICE!**
> **Removal of the (micro) memory card**
> Do not remove the (micro) memory card when it is working!
>
> Remove the memory card or micro memory card with micro memory card adapter only when the RUN LED is not blinking.
>
> Otherwise the (micro) memory card and/or files on it might get corrupted and/or normal PLC operation might be disturbed.

The memory card can be used to:

- update the AC500 CPU processor firmware
- update the CPU boot code
- update the display controller firmware (as of version V2.0)
- update of the RTC_Batt module (eCo)
- update of the onboard I/O firmware (eCo)
- update the Communication Module firmware
- load and save user programs (boot project)
- load and save the source code of the user program
- load and save retentive variables (RETAIN, %R area)
- load and save user data (with blocks)

The memory card can be operated by:

- writing/reading files using a standard PC card reader with memory card interface
- specific PLC-Browser commands
- reading and writing data from the user program using specific blocks
- using FTP client (firmware version > V2.1.x and a Processor Module with onboard Ethernet)

PLC browser commands

For accessing the memory card the following PLC browser commands can be used:

- persistent
- retain
- sdappl
- sdboot x
- sdcoupler x
- sddisplay x
- sdfirm x
- sdfunc
- sdonboardio x
- sdrtcbat x

For details on the PLC browser commands for AC500 V2 products see *Chapter 1.7.2.5.5 “AC500-specific PLC browser commands” on page 6382*

1.6.6.2.2 Firmware and/or application update with memory card

Memory card file structure for AC500 V2 products

File structure as of version V2.x

The following table provides information on the file structure of version V2.x. Depending on the version, the directory names of the actual firmware may differ.

Module Type	Directory (Root)	Data File (SDCARD.INI)	Supported as of Version
CM574-RS CM574-RCOM	FIRMWARE\CM574\2_1_3\	C574.gza C574B.gza RCOM.PRG RCOM.CHK	V1.3.x

Command file *SDCARD.INI* for AC500 V2 Products

FW version V2.0 to V2.4

[Status] FunctionOfCard=2	0 = Perform no function when inserting the memory card or voltage ON 1 = Load user program according to entry in group [UserProg] 2 = Start firmware update according to entry in group [FirmwareUpdate] 3 = Update firmware according to entry in group [FirmwareUpdate] and load user program according to entry in [UserProg]
[FirmwareUpdate] CPUPM5x1=2	0 = No update 1 = Update firmware always from base directory on the CPU (supported for CPU firmware only, but not for other firmware components, e. g. display firmware, firmware of onboard I/Os etc.). 2 = Update with specific version, the update is only performed if the key *version* in a product section (for example [PM583]) and the*) according file returns a different result than the version on the CPU. If the key *version* is missing, no update is performed. 3 = Update with newer version, the update is only performed if the key *version* in a product section (for example [PM583]) and the*) according file returns a newer version than the version on the CPU. If the key *version* is missing, no update is performed.
Display=2	0 = No update 2 = Update with specific version, the update is only performed if the key *version* in a product section (for example [PM583]) and the according file returns a different result than the version on the CPU. If the key *version* is missing, no update is performed. 3 = Update with newer version, the update is only performed, if the key *version* in a product section (for example [PM583]) and the according file returns a newer version than the version on the CPU. If the key *version* is missing, no update is performed.

OnboardIO=2	0 = No update 2 = Update with specific version, the update is only performed if the key *OnboardIO* in a product section (for example [PM554]) and the according file returns a different result than the version on the CPU. If the key *OnboardIO* is missing, no update is performed. 3 = Update with newer version, the update is only performed if the key *OnboardIO* in a product section (for example [PM554]) and the according file returns a newer version than the version on the CPU. If the key *version* is missing, no update is performed.
RtcBatt=2	0 = No update 2 = Update with specific version, the update is only performed, if the key *RtcBatt* in a product section (for example [PM554]) and the according file returns a different result than the version on the CPU. If the key *OnboardIO* is missing, no update is performed. 3 = Update with newer version, the update is only performed if the key *RtcBatt* in a product section (for example [PM554]) and the according file returns a newer version than the version on the CPU. If the key *version* is missing, no update is performed.
Coupler0=0	Update communication module slot 0 0 = No update 2 = Update with specific version, the update is only performed if the key Version in a product section (for example [PM5x1]) and the according file returns a different result than the version on the CPU. If the key *version* is missing, no update is performed. 3 = Update with newer version, the update is only performed if the key *version* in a product section (for example [PM5x1]) and the according file returns a newer version than the version on the CPU. If the key *version* is missing, no update is performed.
Coupler1=0 Coupler2=0 Coupler3=0 Coupler4=0 Coupler5=0 Coupler6=0	Update module slot 1; available modes: 0/2/3; see description Coupler0) Update module slot 2; available modes: 0/2/3; see description Coupler0) Update module slot 3; available modes: 0/2/3; see description Coupler0) Update module slot 4; available modes: 0/2/3; see description Coupler0) Update module slot 5; available modes: 0/2/3; see description Coupler0) Update module slot 6; available modes: 0/2/3; see description Coupler0)
LedBoard=0	Update LED Board of PM595-4ETH CPU 0 = No update 2 = Update with specific version, the update is only performed, if the key *version* in the product section (for PM595-4ETH]) and the according file returns a different result than the version on the CPU. If the key *version* is missing, no update is performed. 3 = Update with newer version, the update is only performed if the key *version* in the product section (for PM595-4ETH) and the according file returns a newer version than the version on the CPU. If the key *version* is missing, no update is performed.

FW version V2.5 As of firmware version 2.5 all firmware updates are triggered by the command file *SDCARD.INI*. This is independent from the way of the firmware update (memory card, FTP, *write file to plc*, …). In addition a result file of the firmware update is generated (*SDCARD.RDY*, identical path as *SDCARD.INI*, see *Initializing an memory card* ↬ *Chapter 1.6.6.2.2.4.1 “Using the AC500 PLC for AC500 V2 Products” on page 6349*). For the group [FirmwareUpdate] the new parameters 11, 12 and 13 are defined.

```

SDCARD.INI for update via FTP in part:

In this case the files *PM595.gza*, *AC500eth.nxf*, *S560_1.gza*, *S560_2.gza*, *AC500pnm.nxf* and *NX_ECM.nxf* are transferred via FTP to the RAM disk of the PLC. The last step is the transfer of the file *SDCARD.INI* to the RAM disk of the PLC. At the end of the update the result file *SDCARD.RDY* is generated. The evaluation of this file shows the results of the updates.

[FirmwareUpdate] CPUPM5x1=2	In addition to the unchanged parameters 0, 1, 2 and 3 the parameters 11, 12 and 13 are defined. 11 = Update firmware always with the file specified in module's section [CPU] and component's path key *Boot* or/and *Firmware* (for SM560 the component's path keys *Boot2* and *Firmware2* are defined additionally). 12 = Update with specific version, the update is only performed if the version of the file specified by the component path key *Boot* and/or *Firmware* in module's section [CPU] differs from the current version of the CPU. 13 = Update with newer version, the update is only performed, if the version of the file specified by the component key *Boot* and/or *Firmware* in module's section [CPU] is newer than the current version of the CPU.
Display=2	In addition to the unchanged parameters 0, 2 and 3 the parameters 11, 12 and 13 are defined. 11 = Update firmware always with the file specified in module's section [CPU] and component's path key *Display*. 12 = Update with specific version, the update is only performed, if the version of the file specified by the component path key *Display* in module's section [CPU] differs from the current version of the Display. 13 = Update with newer version, the update is only performed, if the version of the file specified by the component key *Display* in module's section [CPU] is newer than the current version of the Display.
OnboardIO=2	In addition to the unchanged parameters 0, 2 and 3 the parameters 11, 12 and 13 are defined. 11 = Update firmware always with the file specified in module's section [CPU] and component's path key *OnboardIO*. 12 = Update with specific version, the update is only performed, if the version of the file specified by the component path key *OnboardIO* in module's section [CPU] differs from the current version of the OnboardIO. 13 = Update with newer version, the update is only performed, if the version of the file specified by the component key *OnboardIO* in module's section [CPU] is newer than the current version of the OnboardIO.
OnboardCan=2	Update OnboardCan of PM595-4ETH CPU 0 = No update 2 = Update with specific version, the update is only performed, if the key Version in the product section (for PM595-4ETH]) and the according file returns a different result than the version on the CPU. If the key *version* is missing, no update is performed. 3 = Update with newer version, the update is only performed, if the key *version* in the product section (for PM595-4ETH) and the according file returns a newer version than the version on the CPU. If the key *version* is missing, no update is performed. 11 = Update firmware always with the file specified in module's section [CPU] and component's path key *OnboardCan*. 12 = Update with specific version, the update is only performed, if the version of the file specified by the component path key *OnboardCan* in module's section [CPU] differs from the current version of the OnboardCan. 13 = Update with newer version, the update is only performed, if the version of the file specified by the component key *OnboardCan* in module's section [CPU] is newer than the current version of the OnboardCan.

RtcBatt=2	In addition to the unchanged parameters 0, 2 and 3 the parameters 11, 12 and 13 are defined. 11 = Update firmware always with the file specified in module's section [CPU] and component's path key *RtcBatt*. 12 = Update with specific version, the update is only performed, if the version of the file specified by the component path key *RtcBatt* in module's section [CPU] differs from the current version of the RtcBatt. 13 = Update with newer version, the update is only performed, if the version of the file specified by the component key *RtcBatt* in module's section [CPU] is newer than the current version of the RtcBatt.
LedBoard=0	Update LED Board of PM595-4ETH CPU 0 = No update 2 = Update with specific version, the update is only performed, if the key *version* in the product section (for PM595-4ETH]) and the according file returns a different result than the version on the CPU. If the key *version* is missing, no update is performed. 3 = Update with newer version, the update is only performed, if the key *version* in the product section (for PM595-4ETH) and the according file returns a newer version than the version on the CPU. If the key *version* is missing, no update is performed. 11 = Update firmware always with the file specified in module's section [CPU] and component's path key *LedBoard*. 12 = Update with specific version, the update is only performed, if the version of the file specified by the component path key *LedBoard* in module's section [CPU] differs from the current version of the Led-Board. 13 = Update with newer version, the update is only performed, if the version of the file specified by the component key *LedBoard* in module's section [CPU] is newer than the current version of the LedBoard.
Coupler0=0	In addition to the unchanged parameters 0, 2 and 3 the parameters 11, 12 and 13 are defined. 11 = Update firmware always with the file specified in module's section [Coupler0] and component's path key *Firmware*. 12 = Update with specific version, the update is only performed, if the version of the file specified by the component path key *Firmware* in module's section [Coupler0] differs from the current version of the Coupler. 13 = Update with newer version, the update is only performed, if the version of the file specified by the component key *Firmware* in module's section [Coupler0] is newer than the current version of the Coupler.
Coupler1=0	Update module slot 1; see description Coupler0)
Coupler2=0	Update module slot 2; see description Coupler0)
Coupler3=0	Update module slot 3; see description Coupler0)

Description of LEDs

The LEDs below the display indicate the status of the processor module:

LED	State	Color	LED = ON	LED = OFF	LED flashes
Power LED (PWR)	Denotes the power supply state of the processor module	Green	Voltage is present (24 V DC)	Voltage is missing	-
Run LED (RUN)	Denotes the activity state of the processor module	Green	Processor module is in RUN mode	Processor module is in STOP mode	If the Run LED (RUN) flashes fast (4 Hz), the processor module is reading/writing the memory card. Together with a flashing Error LED (ERR), the processor module is writing the internal Flash. If the Run LED flashes slowly (1 Hz), a firmware update from the memory card is finished without errors.
Error LED (ERR)	Denotes an error	Red	An error has occurred. After pressing the DIAG function key, the error type and the error code will be displayed. The error codes can be shown by means of the DIAG and OK function keys.	No errors or only warnings have occurred.	If the Error LED flashes fast (4 Hz) together with a flashing Run LED, the firmware is updated and a Flash is written. If the Error LED flashes slowly (1 Hz) a firmware update from the memory card is finished with errors.

A running processor module is indicated with the state RUN on the display, a deactivated processor module is indicated with the state STOP. In both cases the display's backlight is off.

Initializing an memory card

Using the AC500 PLC for AC500 V2 Products

The file structure is created on the memory card when a formatted memory card is inserted into the AC500 PLC. The file SDCARD.INI contains the following entries:

```
[Status]FunctionOfCard=0
[FirmwareUpdate]
CPUPM5x1=0
Display=0
Coupler0=0
Coupler1=0
Coupler2=0
Coupler3=0
Coupler4=0
Coupler5=0
Coupler6=0
OnboardIO=0
```

```
RtcBatt=0
OnboardCAN=0
LEDboard=0
[UserProg]
UserProgram=0
RetainData=0
AddressData=0
```

By default, not all AC500 processor modules are listed in the SDCARD.INI file. Not until the memory card is inserted in the processor module, all data is added to the SDCARD.ini file and the folders are created.

Table 759: The following error message is displayed, if you insert a non-formatted memory card:

152369164	EC4 Warning	Unable to read the memory card

Other files or subdirectories in the root directory on the memory card are kept unchanged.

The file SDCARD.INI as of V2.5 looks as follows:

```
;File sdcard.ini to be used by CPU FW version >= 2.5.
;For usage in CPU FW version < 2.5 delete all comments and
whitespaces.
;
[Status]
;FunctionOfCard
;0 = Perform no function when inserting the card or voltage ON

;-<num> Individual error code on performing update
```

1.6.6.2.3 Content of the memory card for firmware/application update

Only advanced users should apply the instructions in this chapter.

1.6.6.2.4 Storing/Loading the Firmware to the memory card for AC500 V2 products

1. Initialize the memory card, i.e., create the file structure the CPU requires by, for example, inserting a new memory card into the AC500 PLC *Chapter 1.6.6.2.2.4.1 “Using the AC500 PLC for AC500 V2 Products” on page 6349*.
2. Copy the firmware files into the corresponding directory:

AC500 CPU	Directory	File
PM5xy	FIRMWARE\<PLC type>\<firmware version number> Example: FIRMWARE\PM564\2_4_4	*.GZA

3. Change the command file *SDCARD.INI* located in the root directory on the memory card as follows:
   - In section `[Status]` set the key FunctionOfCard to "2", if you only want to update the firmware or "3" for firmware and user program update (i.e. `FunctionOfCard=2`).
   - In section `[FirmwareUpdate]` set the key CPUPM5x1 to "1" [=update always] (i.e. `CPUPM5x1=1`)

A specific firmware version can be loaded. This is done by setting the key CPUPM5x1 to "2" [= update, if versions are different] or "3" [= update, if version on the memory card is newer] and creating an according key for the CPU in the product specific section of *SDCARD.INI*. The firmware has to be copied to the according directory *Chapter 1.6.6.2.2 “Firmware and/or application update with memory card” on page 6340*.

1.6.6.2.5 Storing/Loading the user program to/from the memory card for AC500 V2 products

Storing the user program to the memory card

Online

To store the user program to the memory card, proceed as follows:

1. Build the complete project. *“Project ➔ Clean all and Project ➔ Rebuild all”*.
2. Load the project into the AC500 PLC.
3. Create the bootproject on the controller using *“Online ➔ Create boot project”*.

   The bootproject files (<project name>.PRG.ZIP and <project name>.WEB.ZIP) are loaded into the AC500 PLC and flashed.

   The RUN LED on the AC500 PLC flashes while data flashing is in progress.

4. Insert the memory card. If the memory card does not already contain the required file structure, the structure will be created ↳ *Chapter 1.6.6.2.2.4.1 “Using the AC500 PLC for AC500 V2 Products” on page 6349*.

> **NOTICE!**
> **Overwriting of files on the memory card**
> If a user program is already stored on the memory card, i.e., the directory UserData\PM5x1\UserPrg already contains the files DEFAULT.PRG and DEFAULT.CHK, these files will be overwritten without any warning.
>
> If you want to store several user programs to the memory card, you have to copy them into other directories using the PC.

5. Open the PLC Browser/ PLC Shell and enter the command **"sdappl"<ENTER>**.

   The files <project name>.PRG.ZIP and <project name>.WEB.ZIP are loaded from the user flash memory and stored as BOOT.ZIP / WEBVISU.ZIP to the directory User-Data\PM5x1\UserPrg on the memory card.

   In the file SDCARD.INI, the parameter `FunctionOfCard` is set to 1 (bit 0 = 1) and the parameter `UserProgram` is set to 1, i.e. the function "Load the user program" is activated.

   The RUN LED on the AC500 PLC flashes while writing to the memory card is in progress.

   If you insert the memory card containing the user program into the AC500 PLC, the memory card is loaded into the user flash memory of the AC500 PLC.

Offline

Furthermore it is possible to create a project offline. Before creating it offline the project has to be compiled. After creating the bootproject the files are available at according storage folders of the project.

- PM5xy: <project name>.PRG.ZIP / <project name>.WEB.ZIP has to be renamed to BOOT.ZIP / WEBVISU.ZIP and copied to the according PM5xy CPU folder: USER-DATA\PM5xx\USERPRG folder.
- CM574-RS: Copy the created CM574 ZIP file into the according PM5xy CPU folder: USER-DATA\PM5xx\USERPRG and rename it to CM574_X1.bpz (X = Slot number).
-

Loading the user program from the memory card to the AC500 PLC

If a memory card is inserted into the AC500 PLC when the CPU is in STOP mode, or if the memory card is already inserted when switching on the control voltage, the file structure on the memory card is checked. If the file structure exists, the file SDCARD.INI is read. If the parameter "FunctionOfCard" is set to 1 (bit 0 = 1) and the parameter "UserProgram" = 1 and for the CM574-RS (CouplerConfigX=1 X = Slotnumber), the files DEFAULT.PRG and DEFAULT.CHK (CM574_X1.PRG and CM574_X2.CHK (X=Slotnumber) (*PS501V1*) or Boot.zip (CM574_X1.bpz - X = Slot number) (*PS501V2.x*) in the directory UserData\PM5xy\UserPrg on the memory card are loaded into the user flash memory of the AC500 PLC.

The RUN LED on the AC500 PLC flashes while loading. Flashing the user program is in progress.

The loaded program is activated after a CPU restart. If the user program cannot be loaded (for example, due to missing files, wrong directory structure or mismatching project for the controller), a corresponding error message appears. A summary of the memory card errors can be found in the section memory card error messages.

If you insert the memory card into the AC500 PLC when the CPU is in RUN mode, the user program is not loaded independent of the settings for the parameters "FunctionOfCard" (bit 0=1) and "UserProgram" (=1). Thus, the function "Load user program" can be deactivated with the PLC Browser "sdfunc 0" even if no PC card reader is available.

1.6.6.2.6 Storing/Reading user data for AC500 V2 products

Structure of data files stored on the memory card

Depending on the AC500 CPU type, the data is stored in the following memory card directory:

AC500 CPU	Directory	File
PM5xy	..\UserData\PM5xy\UserDat	USRDATxx.DAT
PM5xy-ETH	..\User-Data\PM5xyETH\UserDat	USRDATxx.DAT

A maximum of 100 files (USRDAT00.DAT...USRDAT99.DAT) can be stored in one directory.

Each data file USRDATxx.DAT can be divided into individual sectors, if necessary. The "sector label" enclosed in square brackets (such as [Sector_01]<CR><LF>) indicates the start of the sector. Within a sector, data are saved as data sets in ASCII format. The individual values of a data set are separated by semicolon. Each data set is closed with <CR><LF> (0Dhex, 0Ahex).

This enables the direct import/export of the data from/to MS Excel. The data files can be viewed and edited using a standard ASCII editor (such as Notepad).

When saving/loading data files, observe the following rules:

- Data sets within a sector must always have the same number of values.
- Data sets in different sectors can have a different number of values.
- Values of integer data types can be stored. REAL or LREAL variables cannot be stored.
- The values of a data set must have the same data format (BYTE, WORD, INT,..).
- A sector can have data sets with different data format.
  Warning: The user has to know the structure of the data for reading them.
- The data sets are always appended to the end of the file when writing.
- Searching for a "sector label" within a file is possible when reading it.
- Data sets can be read starting from a particular "sector label".
- A particular data set of a sector cannot be read or written.
- If you want to read each data set individually, a "sector label" must be inserted before each data set.
- Reading and writing the data with help of the user program is done with the blocks SD_READ and SD_WRITE.
- The values of a data set must be available in variables successively stored in the CPU (e.g., ARRAY, STRING, %M area).
- A data file can be deleted with help of the CPU program.
- Individual data sets and/or sectors cannot be deleted with the user program. This has to be done on the PC using an ASCII editor such as Notepad.

Data file examples

Example 1: Data file USRDAT5.DAT without sectors:

-> 5 data sets, each with 10 DINT values:

600462;430;506;469;409;465;466;474;476;-1327203

600477;446;521;484;425;480;482;490;491;-1327187

600493;461;537;499;440;496;497;505;507;-1327172

600508;477;552;515;456;511;513;521;522;-1327156

600524;492;568;530;471;527;528;536;538;-1327141

Example 2: Data file USRDAT7.DAT with sectors:

-> 3 sectors, each with 3 data sets and 10 DINT values per data set:

[Sector_01]

610439;10408;10483;10446;10387;10442;10444;10452;10453;-1317225

Function blocks for storing/reading user data to/from the memory card

The following function blocks from the SysInt_AC500_Vxx.lib library are used to write and read user data from the CPU program to/from the memory card:

- *Chapter 1.5.4.19.2.23 “SD_WRITE” on page 1563* - writes user data
- *Chapter 1.5.4.19.2.22 “SD_READ” on page 1558* - reads user data

The SysInt_AC500_Vxx.lib library and the SysExt_AC500_Vxx.lib library are loaded automatically when creating a project for an AC500 CPU.

Storage folder: ..\Data Storage\SD memory card.

Table 760: Inputs and outputs of SD_WRITE

Name	Type	Assignment
Inputs		
EN	BOOL	The FALSE->TRUE edge starts the write process
ATTRIB	BYTE	Write attribute of the function block: 1 - Delete file 2 - Write append 3 - Write sector label
FILENO	BYTE	Consecutive file number 0 <=xx<=99 (USRDATxx.DAT)
SEG	POINTER TO STRING	Pointer to sector label string (via ADR operator)

Name	Type	Assignment
FORMAT	BYTE	Data format: 00 hex - 0 - BYTE 01 hex - 1 - CHAR 10 hex - 16 - WORD 11 hex - 17 - INT 20 hex - 32 - DWORD 21 hex - 33 - DINT
NVAR	WORD	Number of variables to be written
ADRVAR	DWORD	Address of the first variable, starting from which the data are available in the CPU (via ADR operator)
Outputs		
DONE	BOOL	Function completed
ERR	BOOL	Error: FALSE=no error, TRUE=error
ERNO	INT	Error number

Table 761: Inputs and outputs of SD_READ

Name	Type	Assignment
Inputs		
EN	BOOL	The FALSE->TRUE edge starts the read process
ATTRIB	BYTE	Read attribute of the function block: 1 - Open file, seek sector, read data set 2 - Open file, read data set 3 - Open and read next data set 4 - Read data set, close file 5 - Close file
FILENO	BYTE	Consecutive file number 0 <=xx<=99 (USRDATxx.DAT)
SEG	POINTER TO STRING	Pointer to sector label string (via ADR operator)
FORMAT	BYTE	Data format: 00 hex - 0 - BYTE 01 hex - 1 - CHAR 10 hex - 16 - WORD 11 hex - 17 - INT 20 hex - 32 - DWORD 21 hex - 33 - DINT
NVAR	WORD	Number of variables to be read
ADRVAR	DWORD	Address of the first variable, starting from which the data are stored to the CPU (via ADR operator)
Outputs		
DONE	BOOL	Function completed

Name	Type	Assignment
ERR	BOOL	Error: FALSE=no error, TRUE=error
ERNO	INT	Error number

Deleting a data file stored on the memory card

To delete a data file from the memory card, proceed as follows:

1. Insert the memory card.
2. Call the function block *Chapter 1.5.4.19.2.23 “SD_WRITE” on page 1563* with the following settings:

EN	:= TRUE	
ATTRIB	:= 1	(* delete *)
FILENO	:= 0...99	(* number of the file to be deleted *)
SEG, FORMAT, NVAR, ADRVAR - any		

Storing user data to the memory card

Data file without sectors

To store user data to the memory card in a data file without sectors, proceed as follows:

1. Insert the memory card.
2. Write a data set by calling the function block *Chapter 1.5.4.19.2.23 “SD_WRITE” on page 1563* with the following settings:

EN	:= TRUE	(* FALSE/TRUE edge starts writing *)
ATTRIB	:= 2	(* write append *)
FILENO	:= 0...99	(* number of the file to which the data set is to be appended *)
SEG	:= Address of the variable of the sector label (*any*)	
FORMAT	:= Data format	
NVAR	:= Number of values in data set	
ADRVAR	:= Address of the first variable to be written	
If no corresponding file exists, then it is created. The write process is successfully completed when output DONE:=TRUE and output ERR:=FALSE. A write error is indicated by ERR:=TRUE and ERNO<>0		

3. Further data sets can be written with the same function block settings after the completion message is displayed (output DONE=TRUE). This process is started with a FALSE/TRUE edge at input EN.

The file USRDATxx.DAT is saved as USRDATxx.BAK for each write process. An "Open file / Write file / Close file" procedure is performed.

Data file with sectors

Proceed as follows to store user data to the memory card in a data file with sectors:

1. Insert the memory card.
2. Write the sector label by calling the function block ↳ *Chapter 1.5.4.19.2.23 “SD_WRITE” on page 1563* with the following settings:

EN	:= TRUE	
ATTRIB	:= 3	(* write sector *)
FILENO	:= 0...99	(* number of the file to which the data set is to be appended *)
SEG	:= Address of the variable of the sector label	
FORMAT	:= Data format	
NVAR	:= Number of values in data set	
ADRVAR	:= Address of the first variable to be written	
If no corresponding file exists, then it is created. The sector is successfully completed when output DONE:=TRUE and output ERR:=FALSE. A write error is indicated by ERR:=TRUE and ERNO<>0		

3. Write a data set by calling the function block SD_WRITE with the following settings:

EN	:= TRUE	(* FALSE/TRUE edge starts writing *)
ATTRIB	:= 2	(* write append *)
FILENO	:= 0...99	(* number of the file to which the data set is to be appended *)
SEG	:= Address of the variable of the sector label	
FORMAT	:= Data format	
NVAR	:= Number of values in data set	
ADRVAR	:= Address of the first variable to be written	
The write process is successfully completed when output DONE:=TRUE and output ERR:=FALSE. A write error is indicated by ERR:=TRUE and ERNO<>0		

4. Further data sets can be written with the same function block settings after the completion message is displayed (output DONE=TRUE). This process is started with a FALSE/TRUE edge at input EN.
5. If you want to write further sectors and data sets, repeat the steps as of step 2.

The file USRDATxx.DAT is saved as USRDATxx.BAK for each write process. An "Open file / Write file / Close file" procedure is performed.

Loading user data from the memory Card for AC500 V2 products

Data file without sectors

Proceed as follows to read user data from a data file without sectors on the memory card and write them to the CPU:

1. Insert the memory card.
2. Read a data set by calling the function block *Chapter 1.5.4.19.2.22 “SD_READ” on page 1558* with the following settings:

EN	:= TRUE	(* FALSE/TRUE edge starts writing *)
ATTRIB	:= 2	(* open / read *)
FILENO	:= 0...99	(* number of the file which is to be read *)
SEG	:= Address of the variable of the sector label (*any*)	
FORMAT	:= Data format	
NVAR	:= Number of values in data set	
ADRVAR	:= Address of the first variable into which data are to be written	
The read process is successfully completed when output DONE:=TRUE and output ERR:=FALSE. A read error is indicated by ERR:=TRUE and ERNO<>0		

3. Further data sets can be read with the following settings after the completion message is displayed (output DONE=TRUE). This process is started with a FALSE/TRUE edge at input EN:

EN	:= TRUE	(* FALSE/TRUE edge starts reading *)
ATTRIB	:= 3	(* continue read *)
FILENO	:= 0...99	(* number of the file which is to be read*)
SEG	:= Address of the variable of the sector label (*any*)	
FORMAT	:= Data format	
NVAR	:= Number of values in data set	
ADRVAR	:= Address of the first variable into which data are to be written	
If an unexpected sector label or the end of file (EOF) is detected when reading, a corresponding error message is generated.		

4. To read a further data set and to close the file afterwards, call the function block SD_READ with the following settings after the completion message (output DONE=TRUE) and start the process with a FALSE/TRUE edge at input EN:

EN	:= TRUE	(* FALSE/TRUE edge starts reading *)
ATTRIB	:= 4	(* read / close *)
FILENO	:= 0...99	(* number of the file which is to be read*)
SEG	:= Address of the variable of the sector label (*any*)	
FORMAT	:= Data format	
NVAR	:= Number of values in data set	
ADRVAR	:= Address of the first variable into which data are to be written	
If an unexpected sector label or the end of file (EOF) is detected when reading, a corresponding error message is generated.		

5. To close the file, call the function block SD_READ with the following settings after the completion message (output DONE=TRUE) and start the process with a FALSE/TRUE edge at input EN:

EN	:= TRUE	(* FALSE/TRUE edge starts reading *)
ATTRIB	:= 4	(* close *)
FILENO	:= 0...99	(* number of the file which is to be read*)
SEG	:= Address of the variable of the sector label (*any*)	
FORMAT	:= Data format	
NVAR	:= Number of values in data set (*any*)	
ADRVAR	:= Address of the first variable (*any*)	

Data file with sectors

Proceed as follows to read user data from a data file with sectors on the memory card and write them to the CPU:

1. Insert the memory card.
2. Seek a sector label and read a data set by calling the function block ↳ *Chapter 1.5.4.19.2.22 “SD_READ” on page 1558* with the following settings:

EN	:= TRUE	(* FALSE/TRUE edge starts writing *)
ATTRIB	:= 1	(* open / seek / read *)
FILENO	:= 0...99	(* number of the file which is to be read *)
SEG	:= Address of the variable of the sector label	
FORMAT	:= Data format	
NVAR	:= Number of values in data set	
ADRVAR	:= Address of the first variable into which data are to be written	
The read process is successfully completed when output DONE:=TRUE and output ERR:=FALSE. A seek error is indicated by ERR:=TRUE and ERNO<>0		

3. Further data sets can be read with the following settings after the completion message is displayed (output DONE=TRUE). This process is started with a FALSE/TRUE edge at input EN:

EN	:= TRUE	(* FALSE/TRUE edge starts reading *)
ATTRIB	:= 3	(* continue read *)
FILENO	:= 0...99	(* number of the file which is to be read*)
SEG	:= Address of the variable of the sector label (*any*)	
FORMAT	:= Data format	
NVAR	:= Number of values in data set	
ADRVAR	:= Address of the first variable into which data are to be written	
If an unexpected sector label or the end of file (EOF) is detected when reading, a corresponding error message is generated.		

4. If you want to read further sectors / data sets, close the file and repeat the steps 2 and 3.

5. To read a further data set and to close the file afterwards, call the function block SD_READ with the following settings after the completion message (output DONE=TRUE) and start the process with a FALSE/TRUE edge at input EN:

EN	:= TRUE	(* FALSE/TRUE edge starts reading *)
ATTRIB	:= 4	(* read / close *)
FILENO	:= 0...99	(* number of the file which is to be read*)
SEG	:= Address of the variable of the sector label	
FORMAT	:= Data format	
NVAR	:= Number of values in data set	
ADRVAR	:= Address of the first variable into which data are to be written	
If an unexpected sector label or the end of file (EOF) is detected when reading, a corresponding error message is generated.		

6. To close the file, call the function block SD_READ with the following settings after the completion message (output DONE=TRUE) and start the process with a FALSE/TRUE edge at input EN:

EN	:= TRUE	(* FALSE/TRUE edge starts reading *)
ATTRIB	:= 4	(* close *)
FILENO	:= 0...99	(* number of the file which is to be read*)
SEG	:= Address of the variable of the sector label	
FORMAT	:= Data format	
NVAR	:= Number of values in data set (*any*)	
ADRVAR	:= Address of the first variable (*any*)	

1.6.6.2.7 Storing force values onto memory card

The force values can be written onto a memory card to reactivate them after a loss of power supply voltage. A precondition for storing is that a memory card is plugged into the CPU.

For storing the force values, there is no need for a special program. It is performed automatically if the respective options are configured in the CODESYS project.

1. In the CODESYS open the *“Resources”* tab. Then, open the *“Target Settings”*.
2. In the *“General”* tab, activate the check boxes *“Retain forcing”* and *“Save”*.
3. Compile the project and store it to the user flash memory of the CPU (use *“Create boot project”*).
   ⇨ The current force values are stored onto the memory card at every forcing and a warning message is displayed with every logout from the PLC. To keep the forced values, confirm this message with **No**.

After a loss of power supply voltage, the values are read from the memory card automatically and the forcing is activated.

The force values are only deleted from the memory card by deactivation of the forcing function.

1.6.6.3 Data storage in flash memory for AC500 V2 products

Used function blocks

The library "SysInt_AC500_V10.lib" ↳ *Chapter 1.5.4.19 “Internal system library” on page 1500* contains the following function blocks which are used to store data in the flash memory:

Block	Function
↳ *Chapter 1.5.4.19.2.16 “FLASH_DEL” on page 1542*	Deletes a data segment in the flash memory
↳ *Chapter 1.5.4.19.2.17 “FLASH_READ” on page 1544*	Reads a data segment from the flash memory
↳ *Chapter 1.5.4.19.2.18 “FLASH_WRITE” on page 1547*	Writes a data segment to the flash memory

1.6.6.4 Flash disk for AC500 V2 products

Some AC500 CPUs (e.g. PM592-ETH, PM595) are equipped with an non-removable and non-volatile flash disk. It contains no moving parts. The flash disk is designed for operation in industrial environments and applications. A wear levelling algorithm and a power-fail protected file system provide industrial robustness. To write on the flash disk the ↳ *Chapter 1.5.4.4 “CAA_File library” on page 789* is required.

NOTICE!

The flash disk has a finite number of write cycles.

A warning will be generated when the flash disk reaches 80 % of its max. number of write cycles. The flash disk will be set into read-only mode to avoid data loss, when the max. number of write cycles is reached.

Number of max. write cycles

Technically, the flash chip used in flash disk has 100000 Erase-Cycles (Write cycles).

Due to the produced write overhead, the optimum achievable number of write cycles is 50000 (for typical payload sizes of 256 kB).

Example

The write overhead is indicated by the *write amplification factor* (WAF).

$$\mathrm{WAF} = \frac{\text{Flash Write (in Bytes)}}{\text{Host Write (in Bytes)}}$$

Table 762: Rule of thumb for assessing the flash lifetime for an application:

Typical payload sizes	WAF	Max. write cycles
256 kB	2	50000
128 kB	4	25000
64 kB	8	12500
...	...	...
1024 Byte	512	< 200
512 Byte	1024	< 100

Lifetime of flash disk will also depend on the operating environment.

E.g. high ambient temperatures will impose stress on the user flash memory and reduce the total overwrites achievable.

Read cycles are unlimited.

Important hints

- Programmer should keep the amount of cyclic written data low to assure long availability.
- To increase the number of write cycles, the programmer could choose to use only 90 %, 75 % or even 50 % of the flash disk capacity. The disk space left free will automatically be used by the wear levelling algorithm.
- The wear levelling information of the flash disk can be read from the PLC browser with the command `diskcfg settings flash disk`. In applications with high data generating processes (typical more then 1,5 GByte/day) this information should be monitored during implementation.

1.7 Diagnosis and debugging for AC500 V2 products

1.7.1 The diagnosis system

The AC500 contains a diagnosis system that allows to manage up to 100 error messages in a circular buffer. For each of these events, a time stamp with date and time based on the controller's real-time clock (RTC) is generated in the runtime system.

Each error message has a unique internal error number. The error number provides the following information:

- State: error occured (come), error disappeared (gone), error acknowledged ↳ *Chapter 1.7.1.5.1 “State (come, gone, acknowledged)” on page 6370*
- Error class ↳ *Chapter 1.7.1.5.2 “Error severity” on page 6371*
- Faulty component or interface
- Faulty device
- Faulty module
- Faulty channel
- Error identifier ↳ *Chapter 1.7.1.5 “Structure of error numbers” on page 6369*

↳ *Chapter 1.7.1.5 “Structure of error numbers” on page 6369*

1.7.1.1 Access to diagnosis data

Diagnosis data of the devices can be accessed by:

- CPU display ↳ *Chapter 1.7.1.2 “Diagnosis in CPU display” on page 6365*
- Automation Builder: status line ↳ *Chapter 1.7.1.3 “Diagnosis in Automation Builder” on page 6367*
- Automation Builder: PLC commands ↳ *“PLC browser commands” on page 6368*
- IEC application ↳ *Chapter 1.7.1.4 “Diagnosis in IEC application” on page 6369*

1.7.1.2 Diagnosis in CPU display

1.7.1.2.1 Device state

If there is at least one active diagnosis message, the error LED ERR is on.

The behavior of the error LED depends on the setting of CPU parameter *“Error LED”* ↳ *Chapter 1.6.5.2.3.3 “Parameters of the processor module” on page 5839*.

Diagnosis of AC500-eCo CPUs can only be shown by LED ERR at CPU. No display is available.

General information on the LEDs, the display and the function keys can be found in chapter ↳ *Chapter 1.6.4.1.5 “LEDs, display and function keys on the front panel” on page 5422*.

1.7.1.2.2 Diagnosis descriptions

If one or several unacknowledged errors exist, the errors can be displayed and acknowledged using the *[DIAG]* key. The latest unacknowleged error is displayed first (LIFO-principle: last in first out). Pressing the *[DIAG]* key the first time displays the error class ↳ *Chapter 1.7.1.5.2 “Error severity” on page 6371* and error identifier ↳ *Chapter 1.7.1.5.3 “Error identifiers” on page 6371*. After this, pressing the *[DIAG]* key several times browses through the detailed information:

d1 - Component

d2 - Device

d3 - Module

d4 - Channel

If the "d4" information is displayed and the *[DIAG]* key is pressed once more, the error class/ error identifier is re-displayed.

If you quit the diagnosis display by pressing *[ESC]*, the error remains unacknowledged and will be displayed again when pressing the *[DIAG]* key.

If you quit the diagnostic display with the *[OK]* key, the error is acknowledged.

The LED ERR goes off when all errors are acknowledged.

Example Battery empty or not installed

Key	Display	Description
[DIAG]	E4 008	E4 = warning Error identifier 008 = empty or missing
[DIAG]	d1 009	d1 = component 009 = CPU
[DIAG]	d2 022	d2 = device 022 = battery
[DIAG]	d3 031	d3 = module 031 = no specification
[DIAG]	d4 031	d4 = channel 031 = no specification
[DIAG]	E4 008	See above
[ESC]	run/StoP	Diagnosis display is quit without error acknowledgement.
[DIAG]	E4 008	See above
[OK]	run/StoP	Diagnosis display is quit with error acknowledgement. If no further unacknowledged errors exist, the LED ERR goes off.

1.7.1.3 Diagnosis in Automation Builder

When the Automation Builder is switched to online mode, incoming error messages or state changes of an error message (come, gone, acknowledged) are displayed as plain-text in the status line *Chapter 1.7.2 “Online diagnosis in Automation Builder” on page 6374*.

Example The error "Battery empty or not installed" is displayed in online mode as follows:

#152502216: x 1970-01-01 06:33:53 E4 : No battery or battery empty

#152502216	-	Error number
x	-	State: + = error occured (come), - = error removed (gone) x = error acknowledged
1970-01-01 06:33:53	-	Time stamp: date and time of acknowledgement
E4 :	-	Error class 4 = Warning
No battery or battery empty	-	Error description

The error description is read from the file Errors.xml and displayed according to the error number. The language of the error description is dependent of the language in Automation Builder. Errors which do not have an entry in the file Errors.xml are displayed without error description. The file Errors.xml is part of the target support package (TSP) and located in the directory ..\Targets\ABB_AC500 or ..\Targets\ABB_AC500\AC500_V12.

PLC browser commands

With the PLC browser commands all errors or errors of a certain error class can be displayed and/or acknowledged, the complete diagnosis system can be deleted *Chapter 1.7.2.5.5 “AC500-specific PLC browser commands” on page 6382*.

The error information of the internal error number and the plain-text and online text is diplayed as plain-text interpretation of component/interface, device, module and channel.

1.7.1.3.1 Diagnosis history

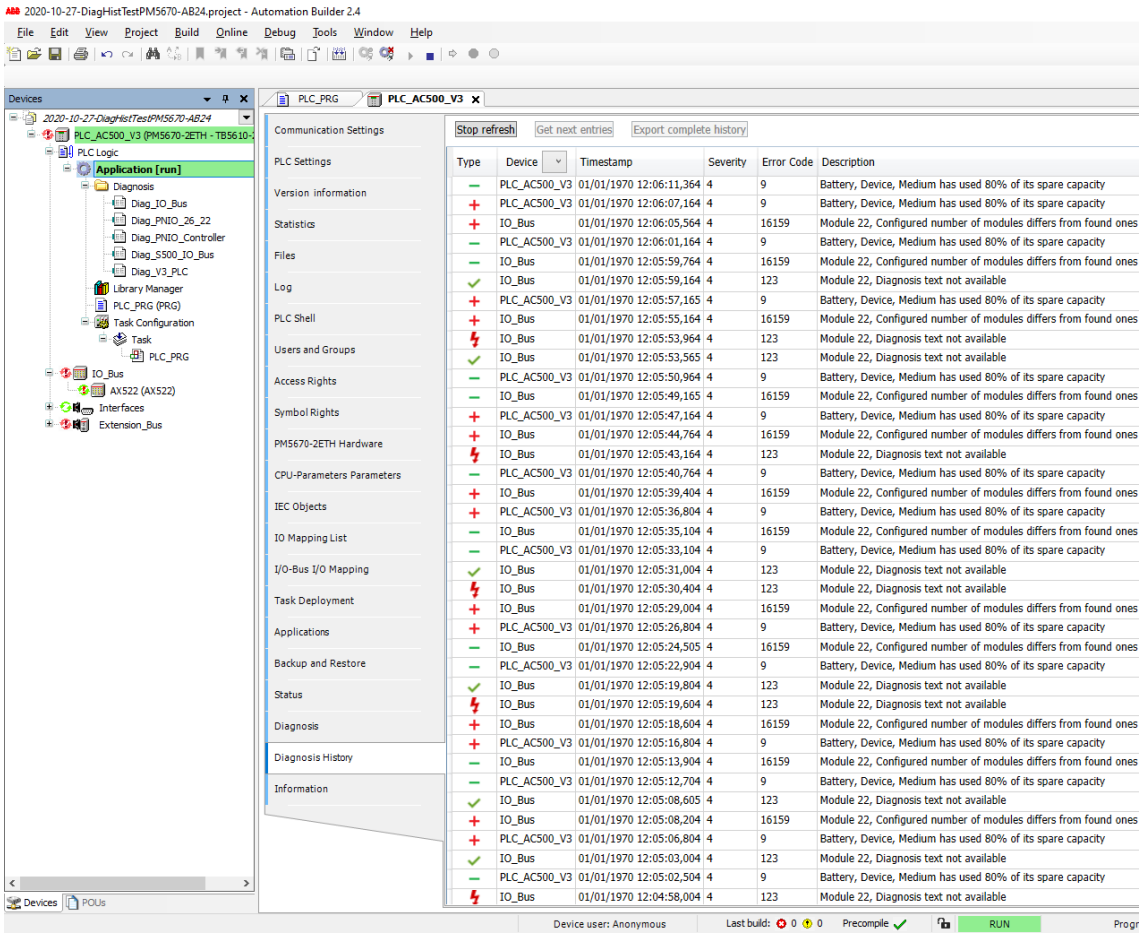
Diagnosis history is available as of Automation Builder 2.4.0 / System FW 3.4.0 the diagnosis system has been extended with diagnosis history.

The 'Diagnosis History' view provides an overview of the current and past system events that resulted in a diagnosis event.

- Incoming diagnosis events are indicated with +.
  After the problem that causes a diagnosis event has been resolved, this diagnosis event is indicated automatically with −.
- Alarm events, e.g. PROFINET alarms are indicated with .
  In the 'Diagnosis' view the user can acknowledge an alarm. Note that an alarm event can be acknowledged though the problem that causes the alarm still persists.
  The acknowledge action is indicated with on the concerning event entry. If the icon changes to , the acknowledge action has been completed by the PLC.

The following buttons are available in the 'Diagnosis History' view:

- Start/Stop refresh:
  Enables or disables the automatic refresh mode. In refresh mode new diagnosis events will be displayed automatically. Only the last 100 entries are shown in this view, the latest events on top of the list.
- Get next entries:
  Adds the previous (older) 100 diagnosis events at the bottom of the list.
- Export complete history:
  Creates a csv file with all events from the diagnosis history (not only the visible ones).



1.7.1.4 Diagnosis in IEC application

The diagnosis messages can be accessed with the library SysInt_AC500_Vxx.lib. All function blocks from the folder "Diagnosis" can be used for diagnosis. ↳ *Chapter 1.5.4.19 “Internal system library” on page 1500*

1.7.1.5 Structure of error numbers

For each error, an internal error number is stored in the firmware. This error number is coded as follows:

Table 763: Error number, 32 bit

Bit	Bit length	Possible values	Definition	Description
-	4 bits	-	State	↳ *Chapter 1.7.1.5.1 “State (come, gone, acknowledged)” on page 6370*
28 ... 29	2 bits	0 ... 3	Error class	E1 ... E4 ↳ *Chapter 1.7.1.5.2 “Error severity” on page 6371*

Bit	Bit length	Possible values	Definition	Description
24 ... 27	4 bits	0 ... 15	Component	1 ... 6 = external communication module 8 = local I/O 9 = CPU 10 = internal communication module 11 = COM1 12 = COM2 13 = FBP 14 = I/O bus 15 = user *Chapter 1.7.3.1 "Possible error combinations" on page 6429*
16 ... 23	8 bits	0 ... 255	Device	Component specific *Chapter 1.7.3.1 "Possible error combinations" on page 6429*
11 ... 15	5 bits	0 ... 31	Module	Device specific, but mostly: 1 = initialization 2 = runtime 3 = project / configuration 4 = protocol 31 = device itself
6 ... 10	5 bits	0 ... 31	Channel	Module specific *Chapter 1.7.3.1 "Possible error combinations" on page 6429*
0 ... 5	6 bits	0 ... 63	Error identifier	0 ... 63 *Chapter 1.7.1.5.3 "Error identifiers" on page 6371*

1.7.1.5.1 State (come, gone, acknowledged)

In addition to the error information, the diagnosis message also contains state information (1 bit per state). Each state is set by a specific event:

State value	Description
Bit 0	not used
Bit 1	Error occured (come)
Bit 2	Error removed (gone)
Bit 3	Error acknowledged

The diagnosis message is generated when an error occurs. In this case, the state bit 1 is set. If this error is acknowledged or removed afterwards, the corresponding state bits are set additionally.

1.7.1.5.2 Error severity

Bit 29	Bit 28	Error class	Type	Description	Example
0	0	E1	Fatal errors	Safe operation of the operating system is no longer ensured.	Checksum error in system flash, RAM error
0	1	E2	Severe error	The operating system works correctly, but the error-free execution of the user program is not ensured.	Checksum error in user flash, task cycle times exceeded
1	0	E3	Minor error	It depends on the application whether the user program has to be stopped by the operating system or not. The user decides which reaction is to be done.	Flash memory cannot be programmed, I/O module failed
1	1	E4	Warnings	Errors that occur on peripheral devices or that will have an effect only in the future. The user decides which reactions are to be done.	Short circuit in an I/O module, battery empty/not installed

Errors with error severitiy 1 - fatal errors

Errors with error severity 1 are not entered in the diagnosis system. These errors do not allow normal operation of the PLC. These errors are detected during PLC start-up and stop the PLC immediately.

Examples are RAM errors or checksum errors when starting the firmware.

Such errors are indicated by rapid flashing of the ERR LED.

1.7.1.5.3 Error identifiers

The error identifier specifies which kind of error occured. It is kept generally in order to reach a maximum systematic. The exact meaning of each error depends on the information provided by the error messages. The error message is a combination of the error identifier and the information where the error occured.

Error identifier	Description
0	General
1	Wrong value

Error identifier	Description
2	Invalid value
3	Timeout
4	Highest level
5	High level
6	Low level
7	Lowest level
8	Empty or missing
9	Full
10	Too big / overflow
11	Too small
12	Read
13	Write
14	Delete
15	Alloc memory
16	Free memory
17	Access
18	Test
19	Checksum
20	Message
21	Put message
22	Get message
23	Wait message
24	Message deleted
25	Wait answer
26	Config data
27	No config
28	Different config
29	Write config
30	Read config
31	Wrong type or model
32	Unknown type or model
33	Wait reset
34	Wait ready
35	Wait run
36	Wait com
37	Cycle time
38	Exception
39	Unknown POU
40	Version
41	Transmit

Error identifier	Description
42	Receive
43	Internal
44	No adjustment values
45	Cut wire
46	Overload
47	Short circuit
48	Overload / Cut wire
49	Short-circuit / Cut wire
50	Overload / Short-circuit

1.7.1.6 Diagnosis history file

Diagnosis history is available as of Automation Builder 2.4.0 / System FW 3.4.0 the diagnosis system has been extended with diagnosis history.

Diagnosis history is the entry of all diagnoses into a file according to their time of occurrence.

The diagnosis history file is in the root directory of the user disk and has the name *“DiagHistory.csv”*. The max. number of entries is 2000. When 2000 entries are reached, the oldest entry is overwritten. The max. size of the extended data is 32 bytes.

An entry consists of following data:

Name	Type	Comment	Example
timestamp	ARRAYDT OF BYTE	RTC time of event in milliseconds consists of diTimestamp in DT format and uiMs milliseconds.	1603371910177
event	BYTE	Event type (1=comes, 2=gone).	1
class	BYTE	Severity of error event.	4
compID	UDINT	Component ID	270540802

Name	Type	Comment	Example
conn	UDINT	Connector	0xb17777ac
connIdx	UDINT	Connector index	0
sub	DWORD	SubsystemID: Any number describing detail/location within device, device specific	369098752
addl	DWORD	AdditionalID: Additional number describing detail/location within device, optional, device specific	0
error	DWORD	Error code	9
extended data	ARRAYDT OF BYTE	Extended diagnosis data, max. 32 bytes	

As shown in the example data of the diagnosis history file is not easily readable. The entries must be interpreted according to device and/or fieldbus. Therefor the Automation Builder consists a special view for diagnosis history ↳ *Chapter 1.7.1.3.1 “Diagnosis history” on page 6368*.

With the entries CompID, conn and connID, the device generating the event is clearly identified in the device tree.

If the PLC configuration is changed, the values of this entries may be changed also.

Therefore, the diagnosis history will be deleted during each download.

1.7.2 Online diagnosis in Automation Builder

1.7.2.1 Short description and overview

To use the diagnosis system in Automation Builder, login to the online mode is required ↳ *Chapter 1.7.2.2 “Entering/leaving the online mode” on page 6375*. The online diagnosis in Automation Builder consists of a set of partly animated, mostly read only views. They can be invoked by a double-click on a project tree element which shows a circle indicating that this element is able to show diagnosis messages ↳ *Chapter 1.7.2.3 “Project tree in online mode” on page 6375*.

Available online diagnosis and statistics:

- **Error messages**
  When the Automation Builder is switched to online mode, incoming error messages or status changes of an error message (come, gone, acknowledged) are displayed as plain-text in the status line. ↳ *Chapter 1.7.2.4 “Error messages, warnings and notes (dialogs)” on page 6376*
- **CPU/PLC diagnosis**
  ↳ *Chapter 1.7.2.5 “CPU diagnosis views” on page 6378*.
  All errors or errors of a certain error class can be displayed and/or acknowledged using the PLC browser. Also the complete diagnosis system can be deleted ↳ *Chapter 1.7.2.5.4 “PLC browser” on page 6381*.
- **I/O module diagnosis**
  ↳ *Chapter 1.7.2.6 “Live values in views with I/O components” on page 6391*.
- **Communication module and fieldbus diagnosis**
  ↳ *Chapter 1.7.2.7 “Communication module and fieldbus diagnosis” on page 6392*

1.7.2.2 Entering/leaving the online mode

Prerequisite: Set the gateway before entering the online mode. ↳ *Chapter 1.6.5.2.13 “Gateway configuration” on page 6116*

Enter the online mode

Right-click the PLC tree node and select *“Login”*.

The Automation Builder project login to online mode updates the latest changes of the project.

> *The online mode can be entered or left for each PLC in the project separately.*

Leave the online mode

Right-click the PLC tree node and select *Logout*.

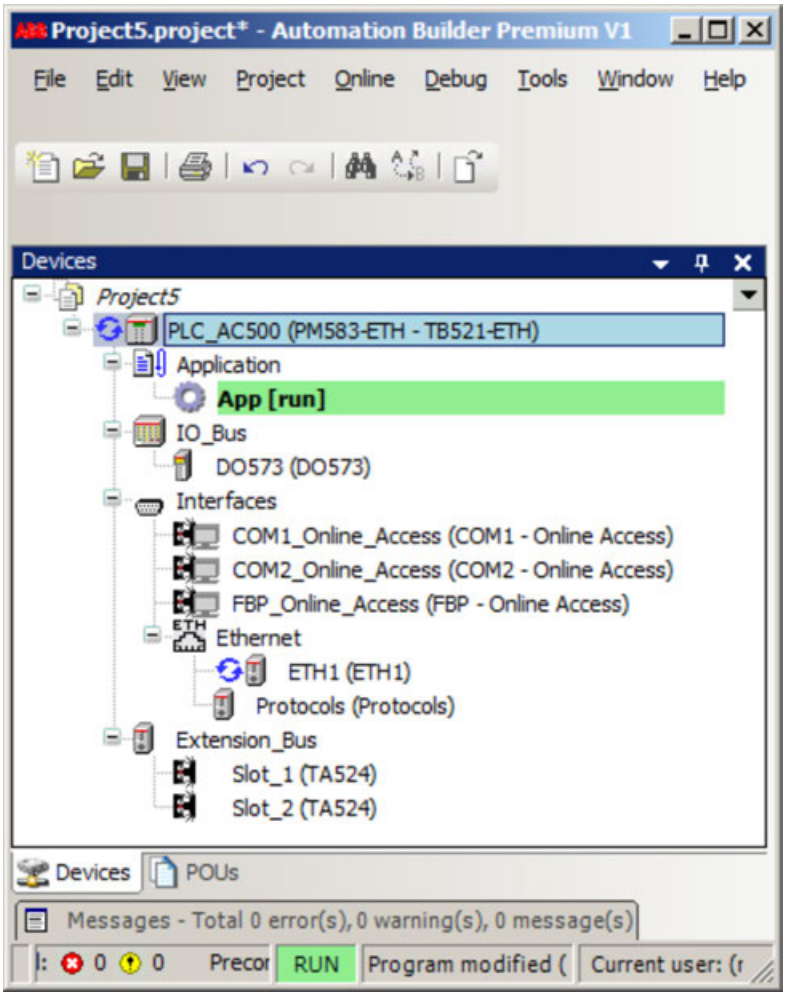
When online mode is active, a thread is running on Automation Builder project which sends cyclically a message to the PLC and expects a response. If the PLC does not respond, the online mode is left programmatically.

1.7.2.3 Project tree in online mode

When Automation Builder enters the online mode internally, an identification message is sent to all configured communication modules.

The connection's status can be recognized by a symbol in the device tree:

	Module responds to identification message and is available for online connection.
	Module responds to identification message, but some warning messages are available. See ↳ *Chapter 1.7.2.4 “Error messages, warnings and notes (dialogs)” on page 6376*.
	Module does not respond to identification message and is not available for online connection.



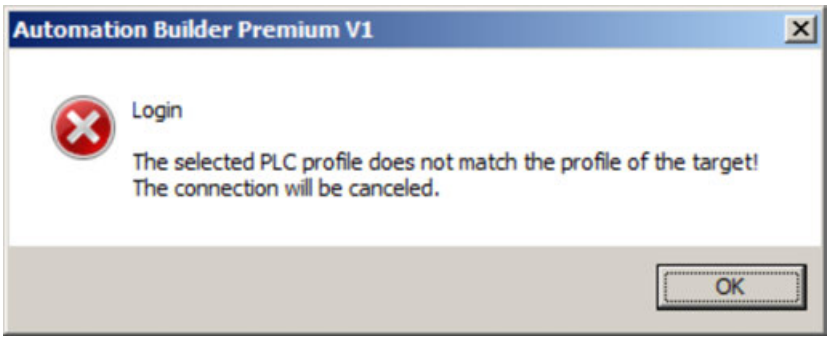
The identification is done once when switching from offline to online mode.

If a communication module is a master unit and contains several configured slave devices below the level (e.g., PROFIBUS, CANopen, PROFINET) will always have the same master, i.e. there is no identification check for the slaves of the fieldbus.

Apart from the online availability the blue circle icon indicates the possibility to activate a diagnosis view on the right screen by a double-click the tree node with the green circle.

1.7.2.4 Error messages, warnings and notes (dialogs)

Wrong target



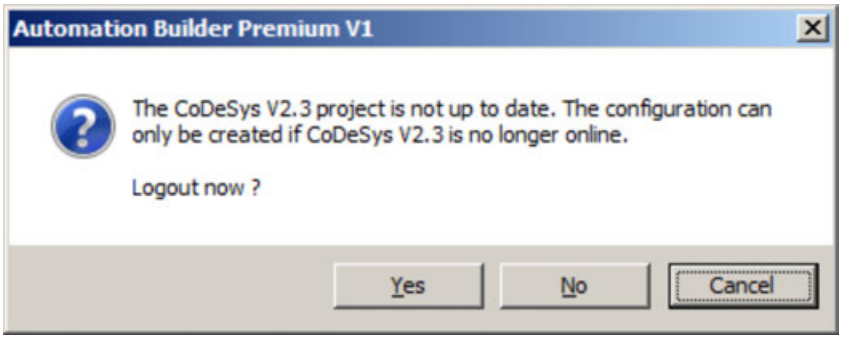
This error message appears if there is a mismatch between the selected target in Automation Builder and the CPU hardware. For example, the selected CPU type is PM583-ETH and in Automation Builder project, the configured CPU type is PM573-ETH.

A login to the CPU is not possible.

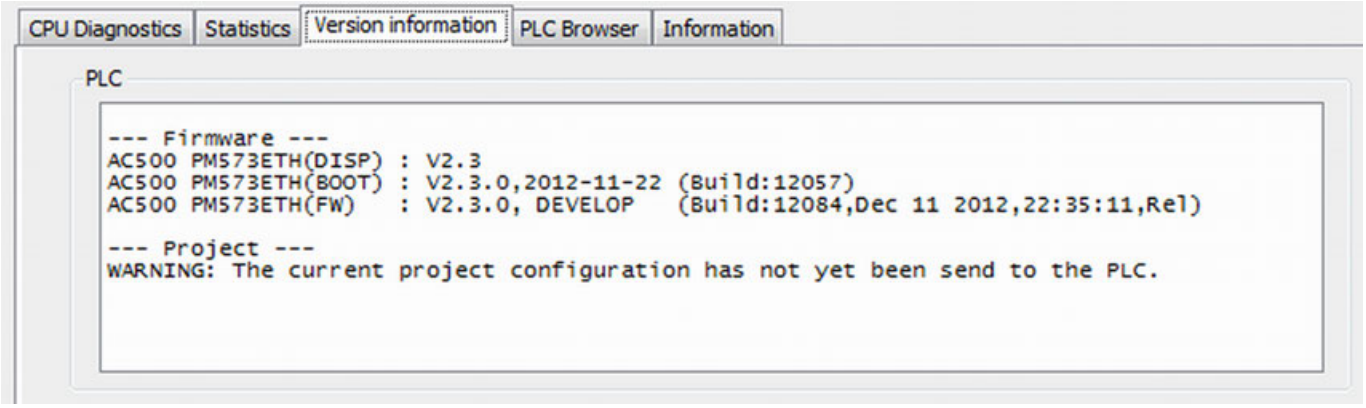
To avoid this error message, correct the project to the appropriate CPU target.

Configuration not yet in PLC

The following warning message will only appear with CPU firmware V2.3.0 or higher.



This warning message appears if the current project in Automation Builder and the project located inside the PLC are different.

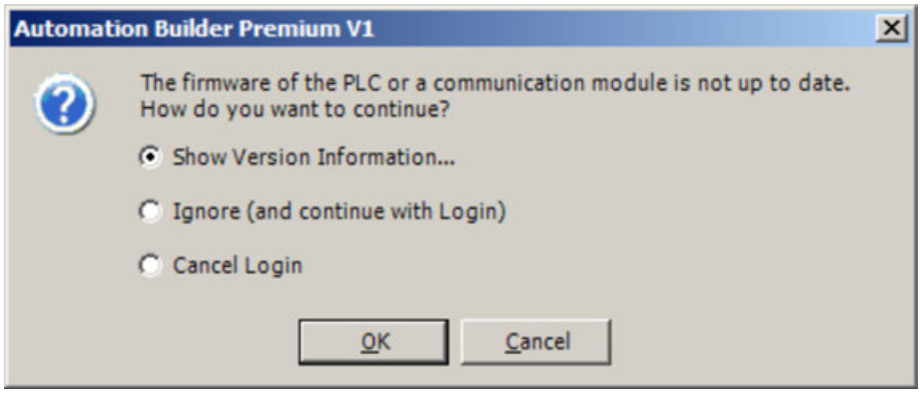


To avoid this warning message, perform the following tasks:

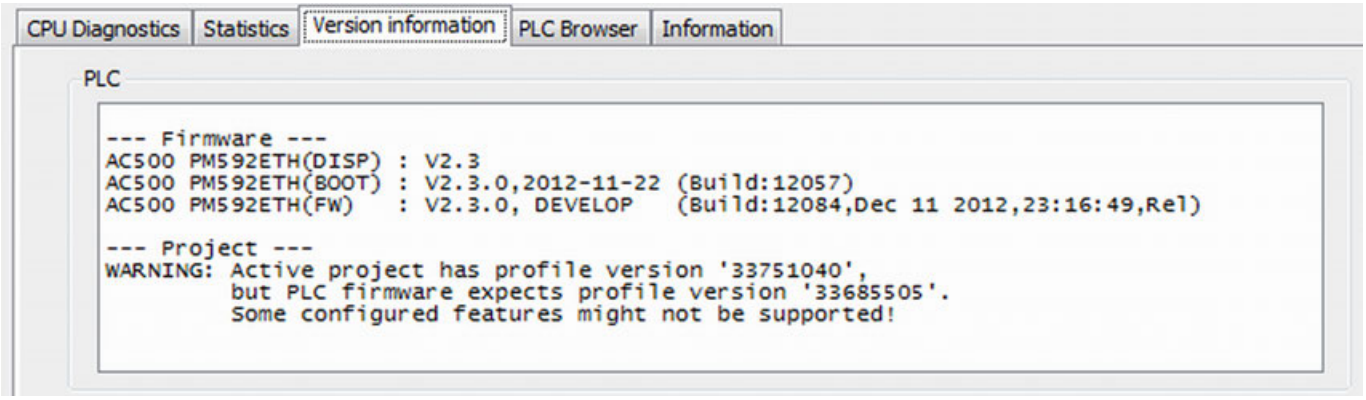
- Log out from the PLC.
- Re-create configuration data (right-click on *"AC500 ➔ Check configuration"*).
- Download the IEC application program to the PLC via CODESYS V2.3.x (a full download is needed).
- Log in for Online Diagnosis again.

Old profile in firmware

The following warning message will only appear with CPU firmware V2.3.0 or higher.



This warning messages appears, if the firmware version inside the PLC is older than the version profile of Automation Builder and therefore, the CPU's firmware does not support all features of the current version profile of Automation Builder.

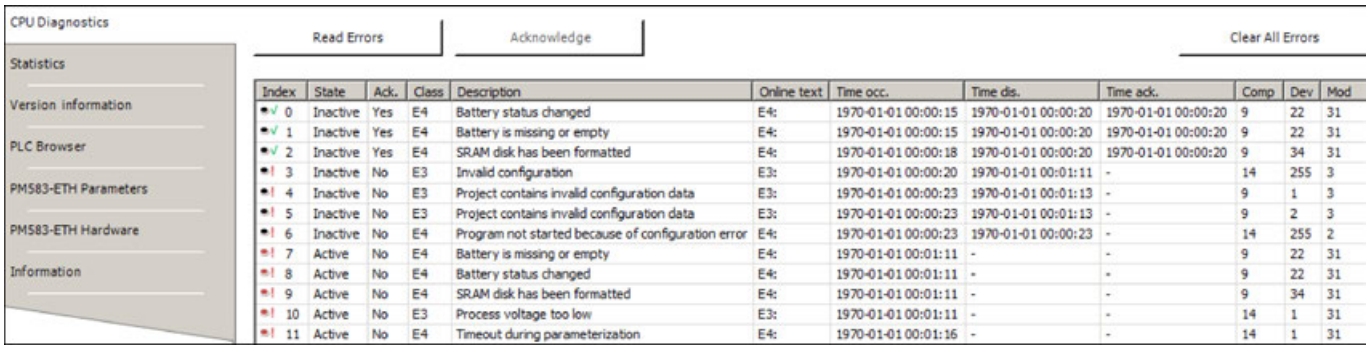


To avoid this warning message, perform one of the following tasks:

- Update the CPU's firmware to the version which is equivalent to the Automation Builder version profile.
- Select a version profile in Automation Builder which is equivalent to the firmware version of the CPU.

1.7.2.5 CPU diagnosis views

1.7.2.5.1 CPU diagnostics (error log)



“Read Errors”: fetches the actual contents of the CPU diagnosis buffer (max. 100 entries possible at the moment).

“Acknowledge”: acknowledges one selected entry. The display will refresh automatically and the time of the acknowledge is shown.

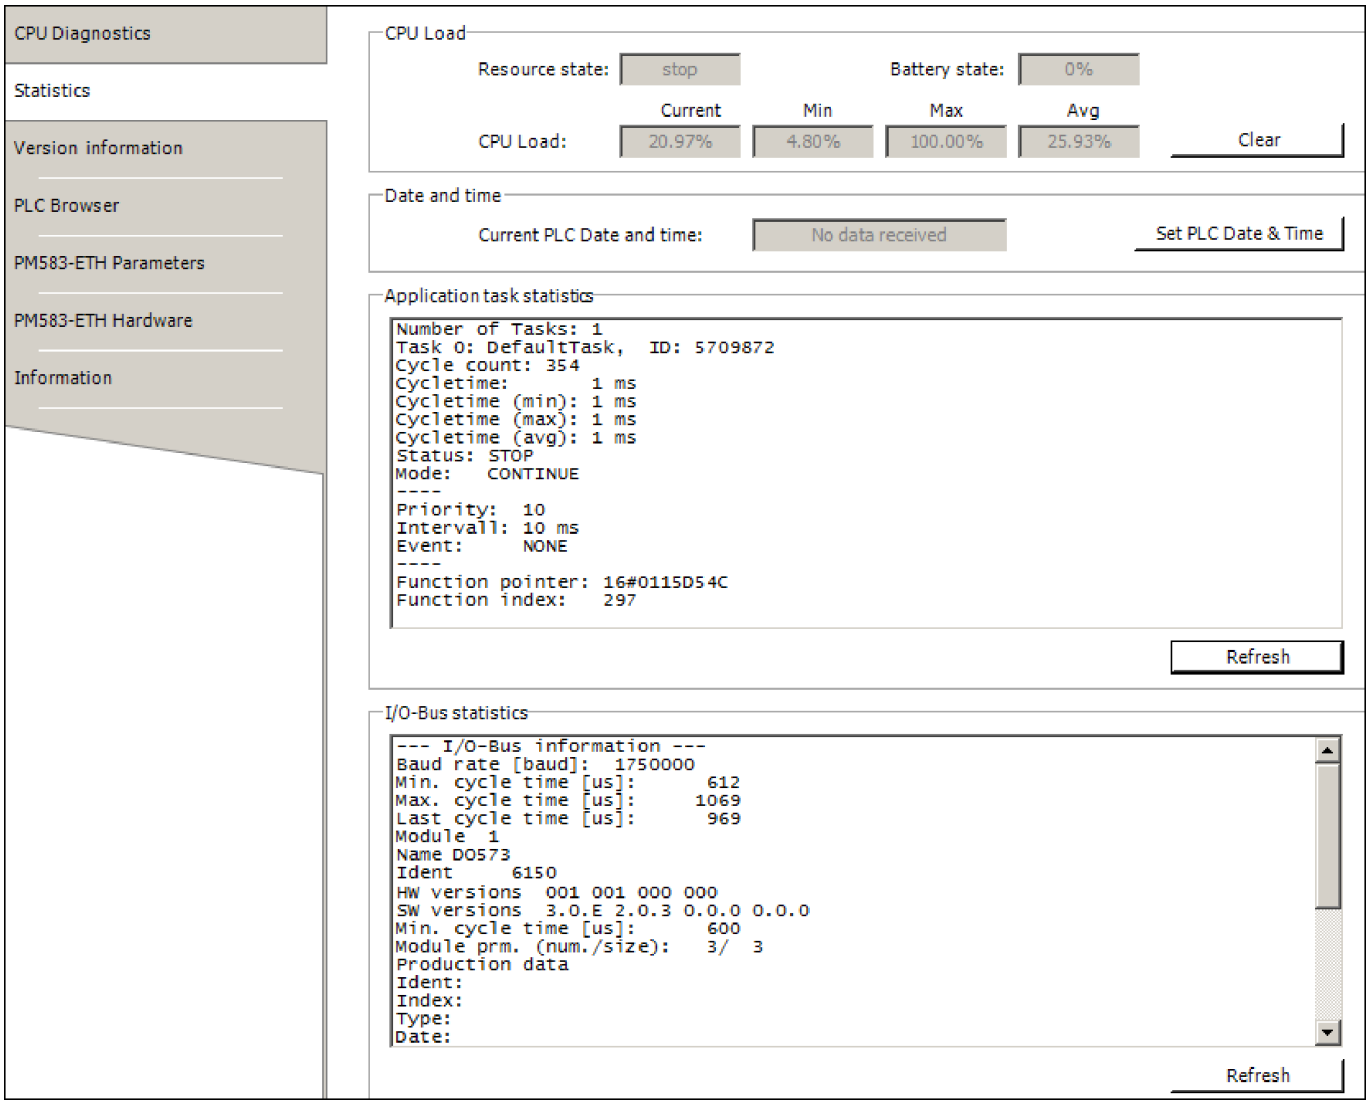
“Clear All Errors”: clears the error buffer on the PLC.

As a result of the Clear Errors command the PLC could go into RUN after next run command.

Description of the columns:

- *Index:* Sequence of the errors entered in the diagnosis buffer, with icon reflecting the states active/inactive/acknowledged/not acknowledged.
- *State:* Active/inactive: When inactive the reason for the entry is gone "“ with timestamp ("Time dis.").
- *Acknowledged:* If yes, the timestamp in *“Time ack.”* column is also displayed.
- *Class:* Severity classes E1-E4 (E1 is most severe).
- *Description:* A description for this error code is displayed (multilingual). The last columns Comp, Dev till Error number are needed to decode this message.
- *Online Text:* Error or warning message delivered from the firmware (non multilingual).
- *Mostly:* Indicates the Communication Module position (Ext.1-4) or I/O Bus Module where a problem exists.

1.7.2.5.2 Statistics



The *"Statistics"* tab shows the following information:

- *CPU Load:* The actual resource run state and the battery load state are shown. The CPU load values "Min", "Max" and "Avg." can be cleared with the *"Clear"* button.
- *Date and time:* The actual date and time of the PLC is shown. It can be set or synchronized with the date/time of the PC via *"Set PLC Date & Time"* button.
- *Application task statistics:* Information on the number of application tasks.
- *Local I/O statistics:* Information on the locally connected I/O Modules.

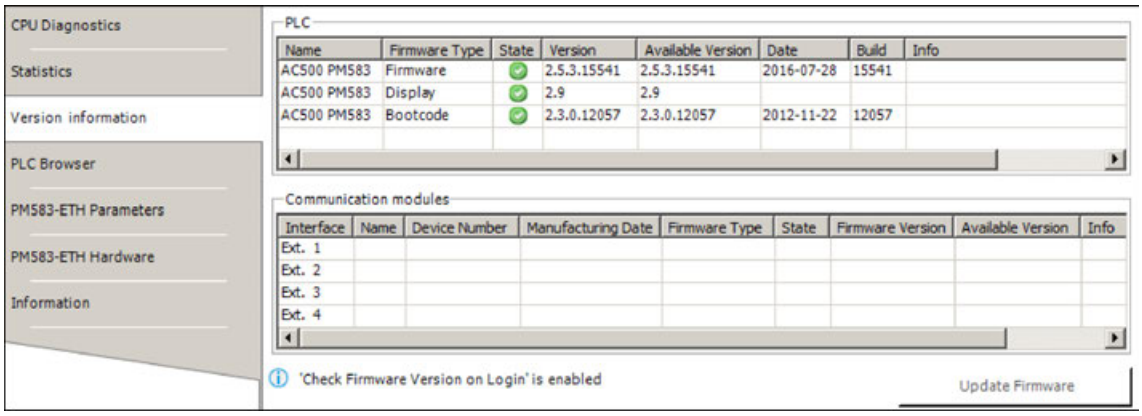
> *This complete view is refreshed cyclically (refresh rate is depending on the underlying communication protocol).*

1.7.2.5.3 Version information

Information on the firmware versions of the processor modules or communication modules, is provided on the *"Version information"* tab.

Remarks:

- The *"Version information"* tab displays the version identified on the device and the version provided with Automation Builder.
- The firmware on the devices must match to the Automation Builder version. Upgrade or downgrade to version supplied with Automation Builder is recommended (especially for CPUs) to ensure correct functionality.
- The firmware type can be changed to the type required by the hardware configuration for devices that support changing the firmware type. E.g., the onboard field bus communication modules of PM595 that may be used as PROFINET, Ethernet or EtherCAT communication module.



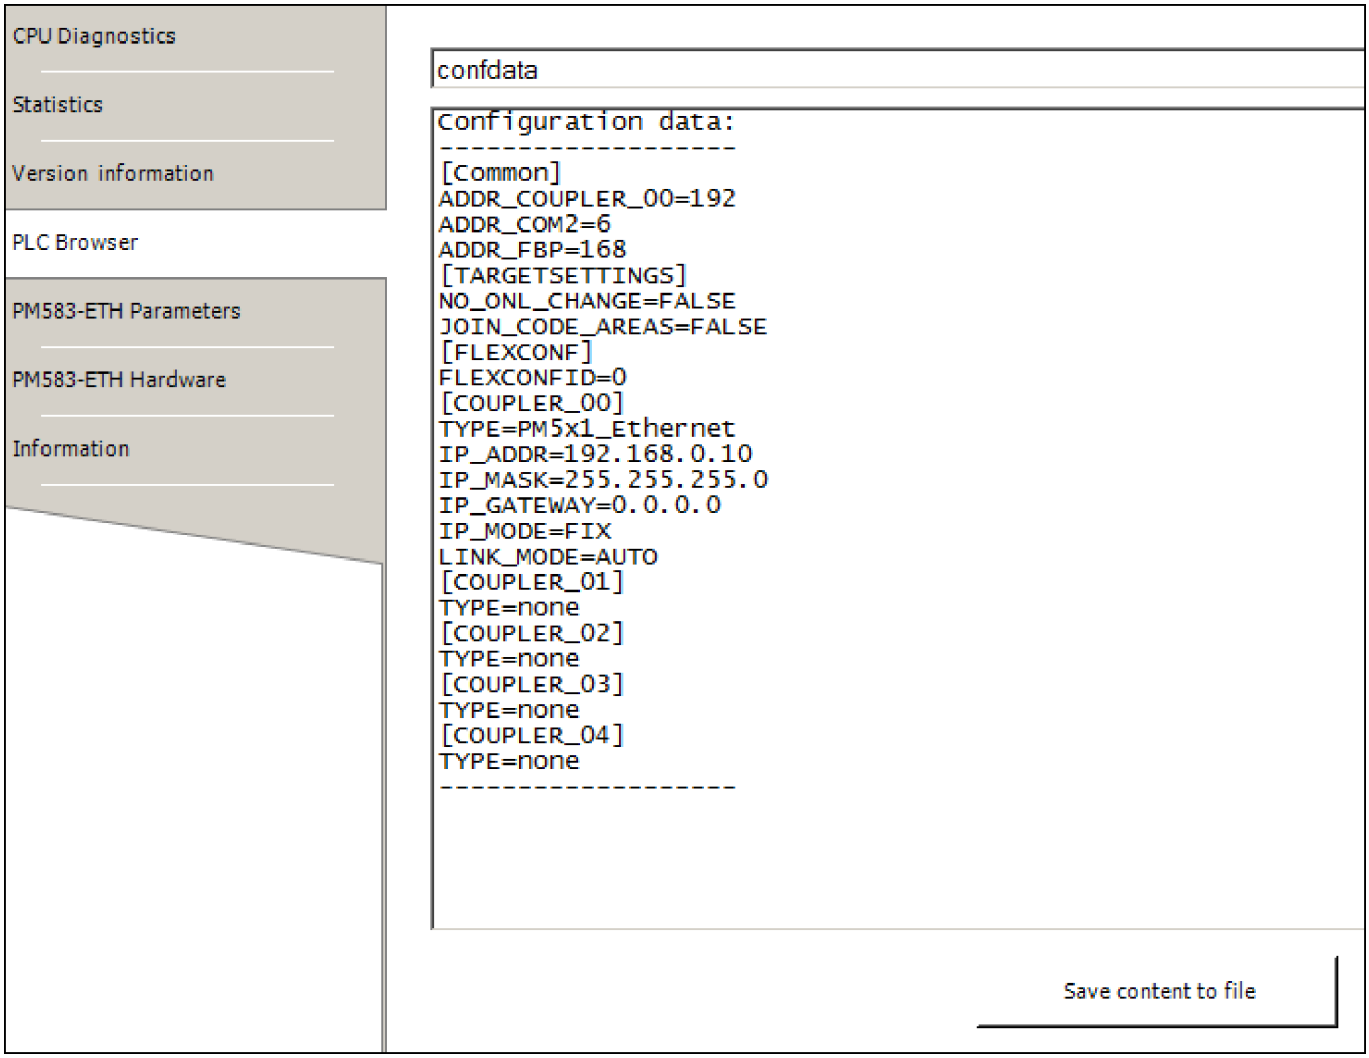
State icons

	Firmware version on device matches version supplied with Automation Builder.
	Firmware version (or type) on device is different from version supplied with Automation Builder. Upgrade/downgrade to version supplied with Automation Builder is recommended.
	Only for communication modules if CPU firmware must be updated first. This happens when CPU firmware has version below 2.5.0.0. Firmware version (or type) on device is different from version supplied with Automation Builder. Upgrade/downgrade to version supplied with Automation Builder is recommended.

	Identified device is different from configured device, thus no firmware update is possible. Happens only for Communication Modules.
No icon	Firmware of device is not updateable or no newer firmware than the initial version is available.

The [Update Firmware] button to download the new firmware is only enabled if there is updateable firmware.

1.7.2.5.4 PLC browser



In the *"PLC Browser"* tab all supported PLC browser commands can be entered.

Via *"Save content to file"* the content of the output can be saved to a text file.

This view has the same functionality as the PLC browser in CODESYS V2.3.

See *Chapter 1.7.2.5.5 "AC500-specific PLC browser commands" on page 6382*.

1.7.2.5.5 AC500-specific PLC browser commands

Automation Builder provides IEC 61131 standard commands as well as AC500-specific commands.

Online help is available for all commands. The help information is displayed language-dependent by entering command `"?"` when operating in online mode. The command `"?"` lists all available firmware commands.

The commands listed in online mode can differ from the commands shown when pressing the button *[...]* as Automation Builder version and firmware version can differ.

Depending on the device, the PLC browser provides the following commands:

Command	Description	Implementation
?	Displays all implemented commands	Standard
mem	Memory dump of an area Usage: mem [from-addr] [to-addr]	Standard
memc	Memory dump relative to code area	Standard
memd	Memory dump relative to data area	Standard
reflect	Reflect current command (for test purposes)	Standard
dpt	Displays the data pointer table	Standard
ppt	Displays the block pointer table	Standard
pid	Displays the project ID	Standard

pinf	Displays project information in the format:
	`pinf`
	`Address of Structure: 16#0013CF74`
	`Date: 4213949F`
	`Project Name: MODBUS_Test_BB.pro`
	`Project Title: Test MODBUS`
	`Project Version: V1.0`
	`Project Author: Test User`
	`Project Description:`
	`Test of serial interfaces`
	`End of Project-info.`
		Standard

Command	Description	Implementation

tsk	Displays the IEC task list with task information in the format:
	`tsk`
	`Number of Tasks: 1`
	`Task 0: Main program, ID: 1519472`
	`Cycle count: 45402`
	`Cycle time: 1 ms`
	`Cycle time (min): 1 ms`
	`Cycle time (max): 1 ms`
	`Cycle time (avg): 1 ms`
	`Status: RUN`
	`Mode: CONTINUE`
	`----`
	`Priority: 10`
	`Interval: 5 ms`
	`Event: NONE`
	`----`
	`Function pointer: 16#00601584`
	`Function index: 131`
		Standard

tskclear	Clears IEC Task information (cycle count & overall maximum and minimum cycle time)	Specific as of V2.0
startprg	Starts the user program	Standard (with CPU firmware below V2.3.0) No (with CPU firmware V2.3.0 and higher)
stopprg	Stops the user program	Standard (with CPU firmware below V2.3.0) No (with CPU firmware V2.3.0 and higher)
resetprg	Resets the user program	Standard (with CPU firmware below V2.3.0) No (with CPU firmware V2.3.0 and higher)
resetprgcold	Resets the user program (cold)	Standard (with CPU firmware below V2.3.0) No (with CPU firmware V2.3.0 and higher)

Command	Description	Implementation
resetprgorg	Resets the user program (origin)	Standard (with CPU firmware below V2.3.0) No (with CPU firmware V2.3.0 and higher)
reload	Reloads the boot project from user flash memory	Standard (not supported with CPU firmware V2.2 or higher)

getprgprop	Displays program properties in the format:
	`getprgprop`
	`Name: MODBUS_FBP_Test_BB.pro`
	`Title: Test MODBUS`
	`Version: V1.0`
	`Author: Test User`
	`Date: 4213949F`
		Standard

getprgstat	Displays the program status in the format:
	`getprgstat`
	`Status: Run`
	`Last error: Id 00000000 TimeStamp 000055F3 Parameter 00000000 Text`
	`Flags:`
		Standard

filecopy	File command copy	No
filerename	File command rename	No
filedelete	File command delete	No
filedir	File command dir	No
saveretain	In V1.0 and V1.1: Saves the RETAIN variables to the memory card. As of V1.2: Writes the RETAIN variables to RAM (same as retain save)	Specific
restoreretain	In V1.0 and V1.1: Restores the RETAIN variables from the memory card. As of V1.2: Restores the RETAIN variables from RAM (same as retain restore)	Specific

Command	Description	Implementation
setpwd	Sets the PLC password (required at logon!) Note: From CPU firmware V2.3.0 and higher, this command works as follows: ● If there is no password set, a password can be set with: setpwd <new_password> ● If a [new] password has been set, the old password must also be inserted.: setpwd <old_password> <new_password>	Standard (with CPU firmware to V2.3.0) Specific (with CPU firmware V2.3.0 and higher)
delpwd	Deletes the PLC password Note: From CPU firmware V2.3.0 and higher, this command works only if a password has been set. Also, you have to specify the old password to delete it, i. e. syntax is: delpwd <current_password>	Standard (with CPU firmware to V2.3.0) Specific (with CPU firmware V2.3.0 and higher)
plcload	Displays the PLC utilization (system + IEC + tasks + communication)	Standard

Command	Description	Implementation

rtsinfo	Displays the firmware information (version, driver) in the format:
	
	`rtsinfo`
	`rts version: 2.4.7.24`
	`OS version: SMX smxPPC 3.5.2`
	`uses IO driver interface`
	`rts api version: 2.408`
	`4 driver(s) loaded`
	`driver 1: AC500 CPU driver, device interface version: 2.403`
	`driver 2: AC500 I/O-BUS driver, device interface version: 2.403`
	`driver 3: AC500 COM driver, device interface version: 2.403`
	`driver 4: AC500 Coupler driver, device interface version: 2.403`
	`AC500 PM___(DISP) : V2.1`
	`AC500 PM___(BOOT) : V2.0.5, 2017-10-26 (Build: 9603, 13:55:09, Rel)`
	`AC500 PM___(FW) : V2.0.4, 2017-10-12 (Build: 9530, 14:30:50, Rel)`
		Specific

traceschedon	Enables task tracing	No
traceschedoff	Disables task tracing	No
traceschedstore	Stores task trace to RAM	No
fdir <path>	Show content of a drive or directory <path> (e.g. `fdir userdisk`, `fdir sdcard/userdata`)	Specific as of V2.1
fread <path>	Dump a file's content	Specific as of V2.1
fmove <path>	Move a file to a directory	Specific as of V2.1
mkdir <path>	Create a directory	Specific as of V2.1
deldir <path>	Delete an empty directory	Specific as of V2.1
rndir <old path> <new path>	Rename a directory	Specific as of V2.1

Command	Description	Implementation
ipaddr	Sets the IP address of the CPU	No
basetick	Sets the basetick to µs	No
diagreset	Resets the diagnosis system	Specific
diagack all	Acknowledges all errors	Specific
diagack x	Acknowledges all errors of the class X (with X= 1...4)	Specific

diagshow all	Shows all errors in the format:
	`diagshow all`
	`--- All errors ---`
	`State Class Comp Dev Mod Ch Err`
	`0152502216`
	`active and acknowledged 4 9 22 31 31 8`
	`1970-01-01 00:00:08 occurred`
	`disappeared`
	`1970-01-01 00:00:15 ack.`
	`0152369165`
	`active not acknowledged 49 2031013`
	`1970-01-01 01:19:12 occurred`
	`- disappeared`
	`- ack.`
	`--- end ---`
		Specific

time	Displays and sets the time of the real-time clock. If no battery is inserted in the PLC and the control voltage is switched on, the PLC clock is set to "01. January 1970, 00:00".	Specific
date	Displays and sets the date of the real-time clock. If no battery is inserted in the PLC and the control voltage is switched on, the PLC clock is set to "01. January 1970, 00:00".	Specific
batt	Polls the battery status	Specific

Command	Description	Implementation
sdappl	Saves the boot project to the memory card	Specific
sdclone	Copys the user program and the user data to the memory card.	For AC500-S only!
sdfunc	Displays and changes the memory card function	Specific
sdsys	Save firmware to memory card	Specific
sdboot	Updates the bootcode from the memory card	Specific
sddisplay	Updates the MMI firmware from the memory card	Specific
sdfirm	Updates the firmware from the memory card	Specific
sdcoupler x	Updates the firmware of Communication Module x from the memory card	Specific
cpuload	Displays the CPU load (current, min., max., average)	Specific
delappl	Deletes the user program in the user flash memory	Specific
retain	Saving and restoring the RETAIN variables: retain clear -> Clears all RETAIN variables retain save -> Saves the RETAIN variables to the RAM disk retain restore -> Restores the RETAIN variables from the RAM disk retain export -> Exports the RETAIN variables from the RAM disk to the memory card retain import -> Imports the RETAIN variables from the memory card to the RAM disk	Specific as of V1.2

Command	Description	Implementation
persistent	Saving and restoring the persistent area %R area: persistent clear -> Clears the %R area persistent save -> Saves the buffered %R area to the RAM disk persistent restore -> Restores the buffered %R area from the RAM disk persistent export -> Exports the buffered %R area from the RAM disk to the memory card persistent import -> Imports the buffered %R area from the memory card to the RAM disk	Specific as of V1.2
cfginfo	Print expected and active configuration version. This is for internal use.	Specific
hashappl	Hash the user program	Specific
io-bus stat	Displays the I/O bus statistic	Specific
io-bus desc	Displays the I/O bus configuration	Specific
com protocols	Displays the protocols available for the serial interfaces	Specific
com settings	Displays the serial interface settings	Specific
coupler desc	Displays information on the communication module interfaces (type, firmware, serial number, date)	Specific
coupler settings	Displays the current communication module settings, for example, IP address and socket assignment	Specific as of V1.2
ping	Ping a address, usage: ping <ipaddr> <couplerid> <ms>	Specific as of V2.1.3
reboot	Reboots the PLC (IEC 61131 performs a logout when restarting or logout possible up to 3 seconds after command input) (This command is not available for CM574-RS as of firmware revision V2.1.x)	Specific

Command	Description	Implementation
diskcfg	Access to drive maintenance Command Syntax: `diskcfg [option] [drivename]` Command Options: ● `unlock` : unlock a drive for writing MBR or formating ● `lock` : lock drive again ● `writembr` : write clean MBR (unlock required) ● `format` : write clean file system (unlock required) ● `settings` : show drive configuration details ● `desc` : show drive overview ● `help` : show this help ● `[none]` : no option shows this help Available Drives (not all commands are supported on all drives): ● Flash memory ● Memory card ● RAM disk ● Userdisk ● Flash disk ● SRAM disk	Specific as of V2.1

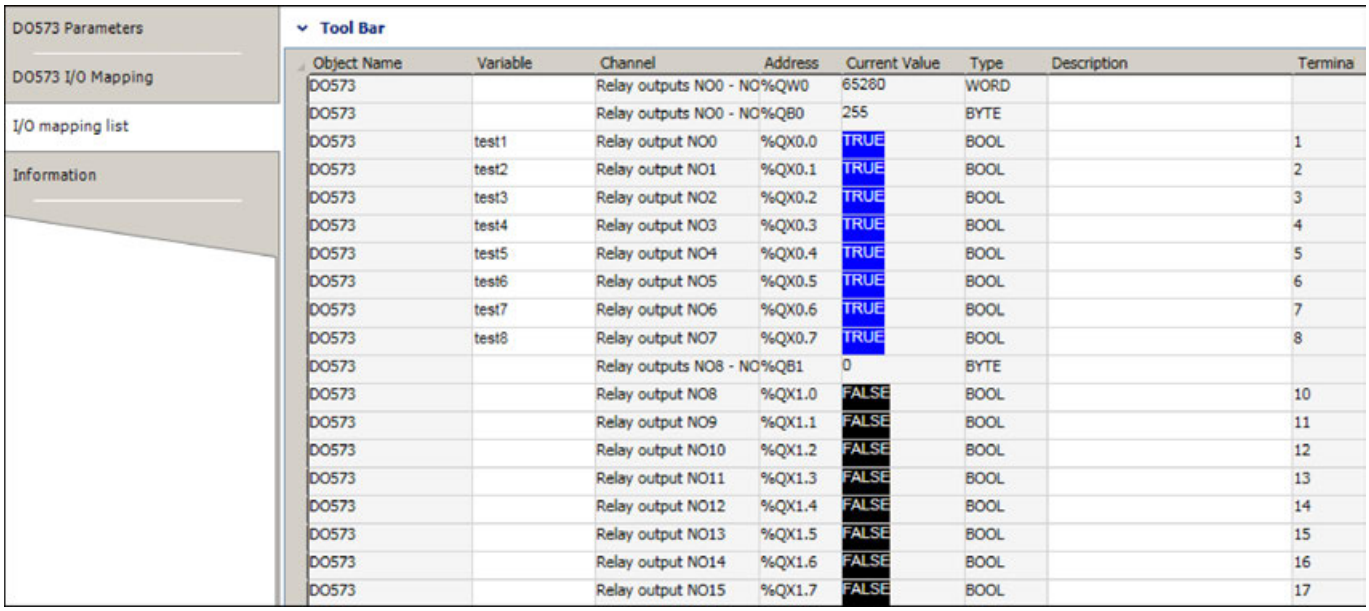
Command	Description	Implementation

proddata	Shows Production Data of PLC
	`proddata`
	`Production data`
	`---------------`
	`Ident : 1SAP123456R0001`
	`Index : B1`
	`Type : PM___`
	`Date : 0447`
	`BA-Inst : 1S120`
	`Factory : 05`
	`Year : 17`
	Serial No. : 00007134
	MAC-Addr : "
		Specific as of V2.0

confdata	Shows Configuration Data of PLC It is possible to save and load PLC specific configuration of any kind with the function blocks (from SysInt_AC500_V10.lib): *Chapter 1.5.4.19.2.3 "CPU_CONFIG_READ" on page 1508* *Chapter 1.5.4.19.2.4 "CPU_CONFIG_WRITE" on page 1511* The AC500 firmware also uses this INI file for settings like IP addresses.	Specific

1.7.2.6 Live values in views with I/O components

"I/O mapping list" tab: In online mode, all Automation Builder views, which contain I/O component mapping tables, show animated live values which are updated every second.



Object Name	Variable	Channel	Address	Current Value	Type	Description	Termina
DO573		Relay outputs NO0 - NO	%QW0	65260	WORD		
DO573		Relay outputs NO0 - NO	%QB0	255	BYTE		
DO573	test1	Relay output NO0	%QX0.0	TRUE	BOOL		1
DO573	test2	Relay output NO1	%QX0.1	TRUE	BOOL		2
DO573	test3	Relay output NO2	%QX0.2	TRUE	BOOL		3
DO573	test4	Relay output NO3	%QX0.3	TRUE	BOOL		4
DO573	test5	Relay output NO4	%QX0.4	TRUE	BOOL		5
DO573	test6	Relay output NO5	%QX0.5	TRUE	BOOL		6
DO573	test7	Relay output NO6	%QX0.6	TRUE	BOOL		7
DO573	test8	Relay output NO7	%QX0.7	TRUE	BOOL		8
DO573		Relay outputs NO8 - NO	%QB1	0	BYTE		
DO573		Relay output NO8	%QX1.0	FALSE	BOOL		10
DO573		Relay output NO9	%QX1.1	FALSE	BOOL		11
DO573		Relay output NO10	%QX1.2	FALSE	BOOL		12
DO573		Relay output NO11	%QX1.3	FALSE	BOOL		13
DO573		Relay output NO12	%QX1.4	FALSE	BOOL		14
DO573		Relay output NO13	%QX1.5	FALSE	BOOL		15
DO573		Relay output NO14	%QX1.6	FALSE	BOOL		16
DO573		Relay output NO15	%QX1.7	FALSE	BOOL		17

1.7.2.7 Communication module and fieldbus diagnosis

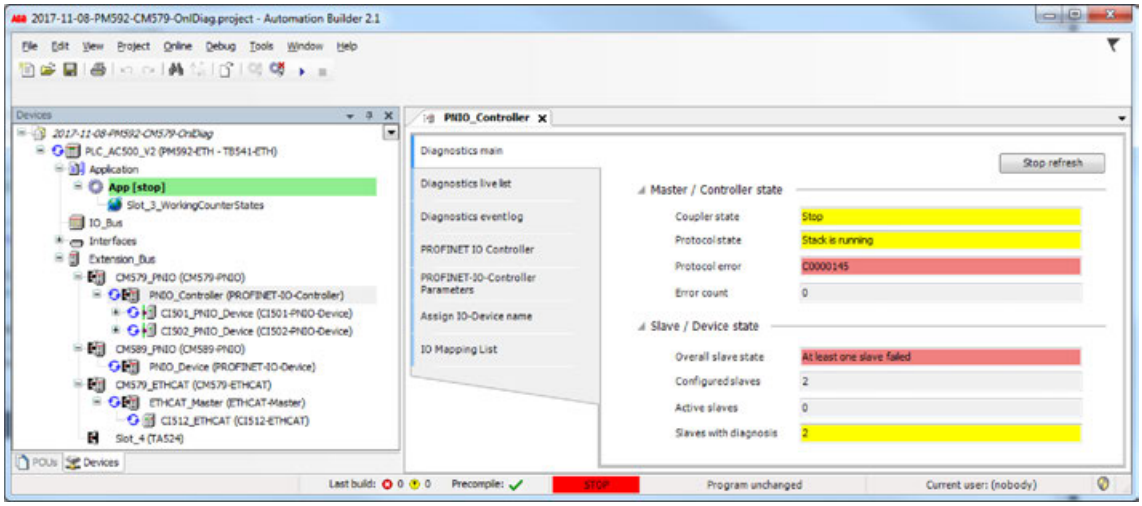
1.7.2.7.1 Fieldbus commissioning

Common online diagnosis views for all netX-based communication modules (e. g. CM579-ETHCAT, CM579-PNIO) can be accessed whenever the related PLC is in online mode ↳ *Chapter 1.7.2.2 “Entering/leaving the online mode” on page 6375*.

Master/controller modules

Master/controller modules like CM579-ETHCAT or CM579-PNIO, provide the following diagnosis views:

- *“Diagnostics main”*: provides diagnosis messages which are common for all protocols (e.g., protocol state and error)
- *“Diagnostics live list”*: provides a list of connected slaves/devices and their state ↳ *Chapter 1.7.2.7.1.1.1 “ PROFINET scan and comparison view” on page 6393*
- *“Diagnostics eventlog”*: provides diagnosis messages from the master/controller and its connected slaves/devices



PROFINET scan and comparison view

PNIO_Controller

1. After going online, double-click on *"PNIO_Controller (PROFINET-IO-Controller)"* in the device tree.

   ⇨ The editor *"PNIO_Controller"* is displayed.

2. Select tab *"Diagnostics live list"* and click *[Scan]* to find all hardware devices that exist.

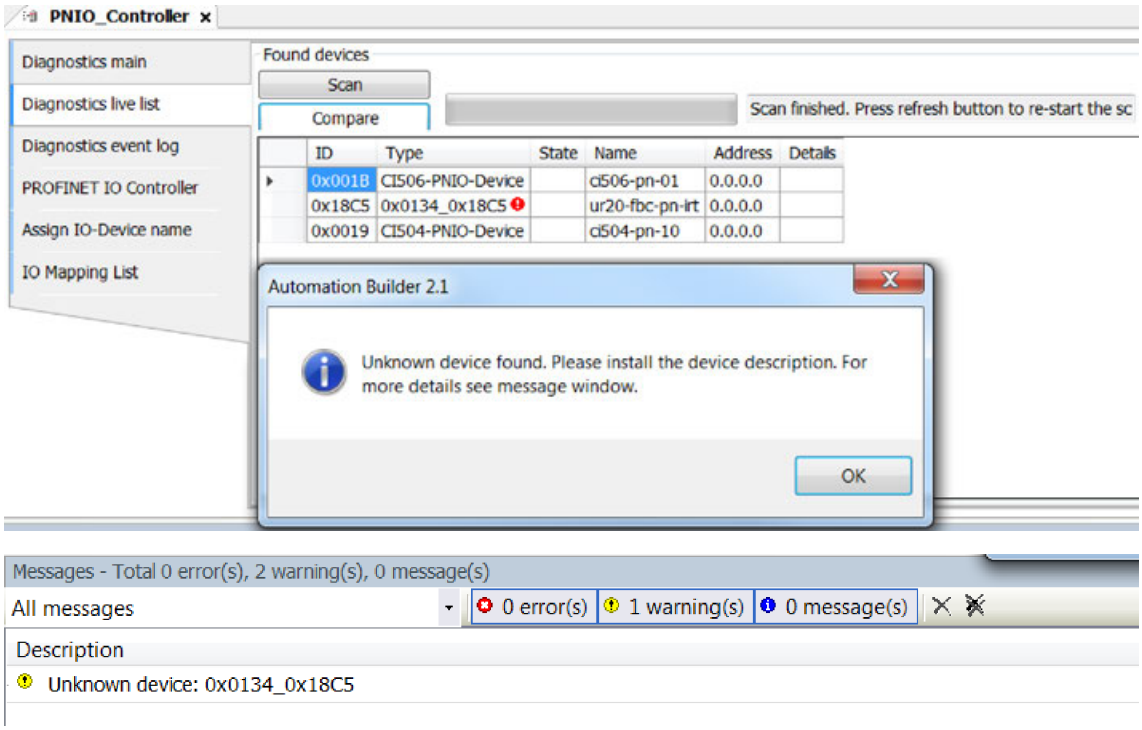
   ⇨ The found devices are listed in a table.

3. Click *[Compare]* to compare the found hardware I/O devices with the current project configuration.

Unknown hardware

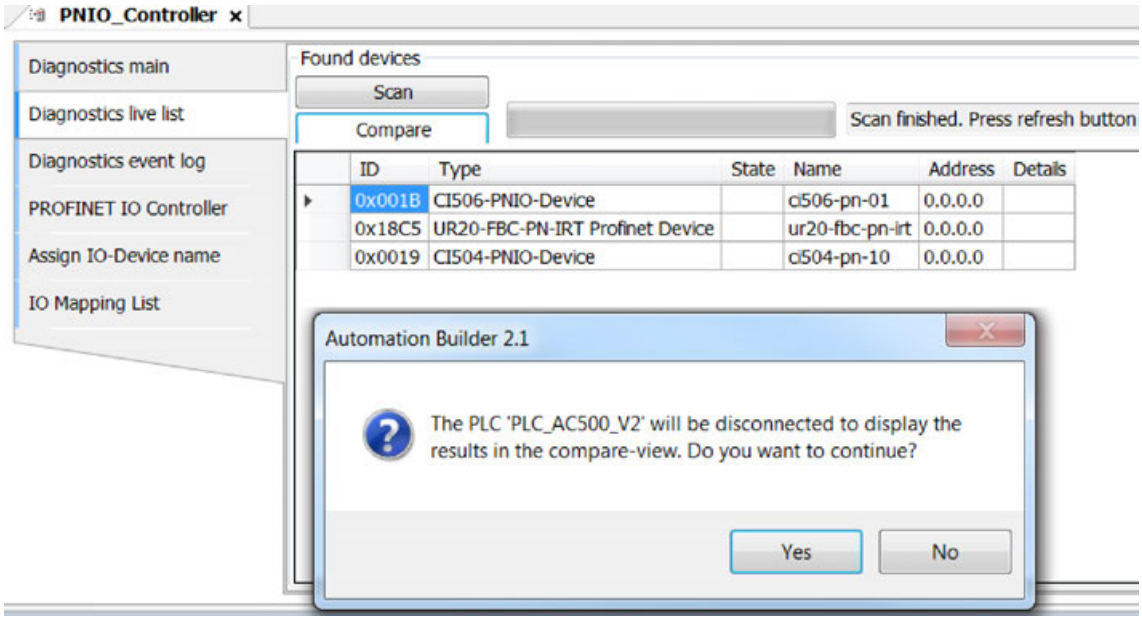
If any I/O hardware device is unknown:

- The devices will be marked with a red exclamation mark.
- A message box will be appear for each unknown device.
- Automation Builder generates a message with information about its vendor ID and device ID.



Comparison view

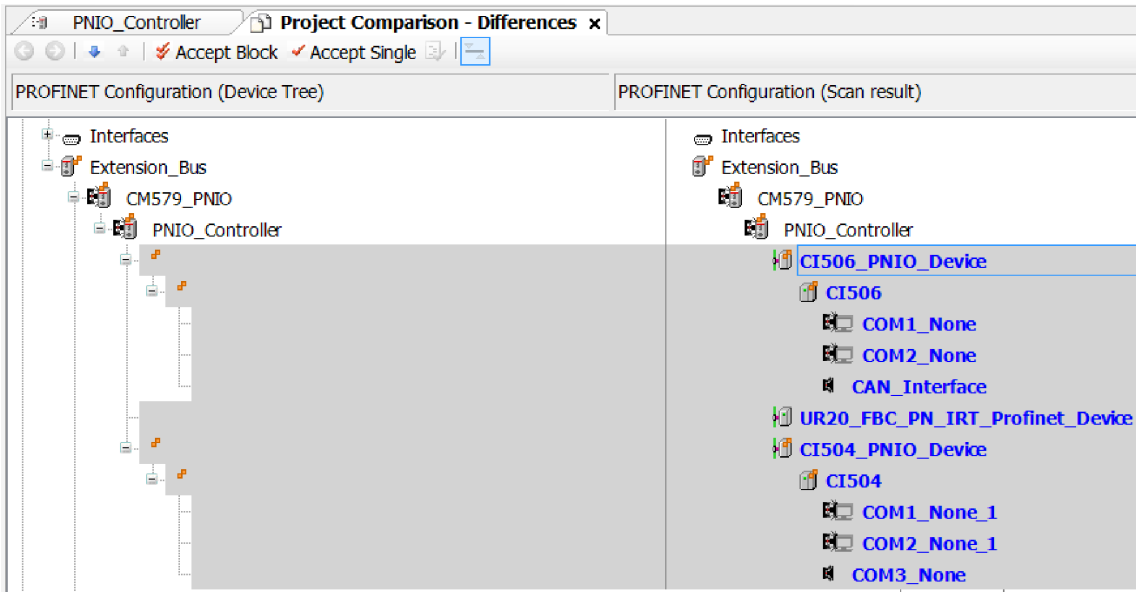
1. To display the comparison view, install the device description for the unknown device.
2. After installing the device description, click *[Scan]* and click *[Compare]*.



⇨ The message box informs you, that the application will go offline to display the comparison view.

3. Click *[Yes]*.

⇨ The *"Project Comparison - Differences"* tab displays the difference between the PROFINET configuration in Automation Builder (left side) and the real hardware configuration (right side).

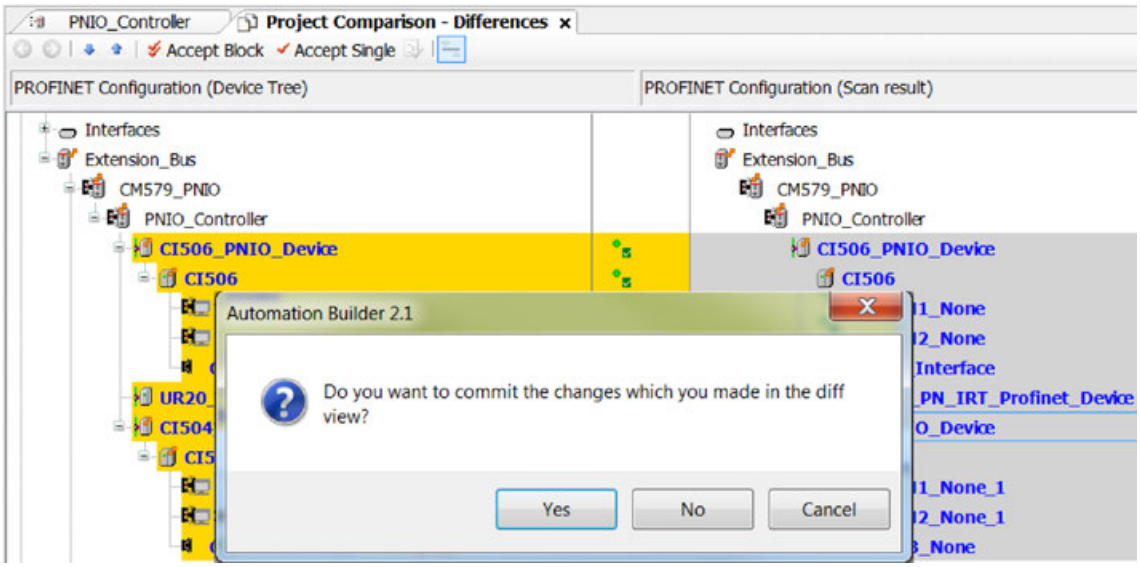


4. Click *[Accept Single]* to accept only a part of the differences or *[Accept Block]* to accept all differences.

⇨ After clicking on the Button *[Accept Single]* or *[Accept Block]* the found devices will be moved from the right side to the left side.

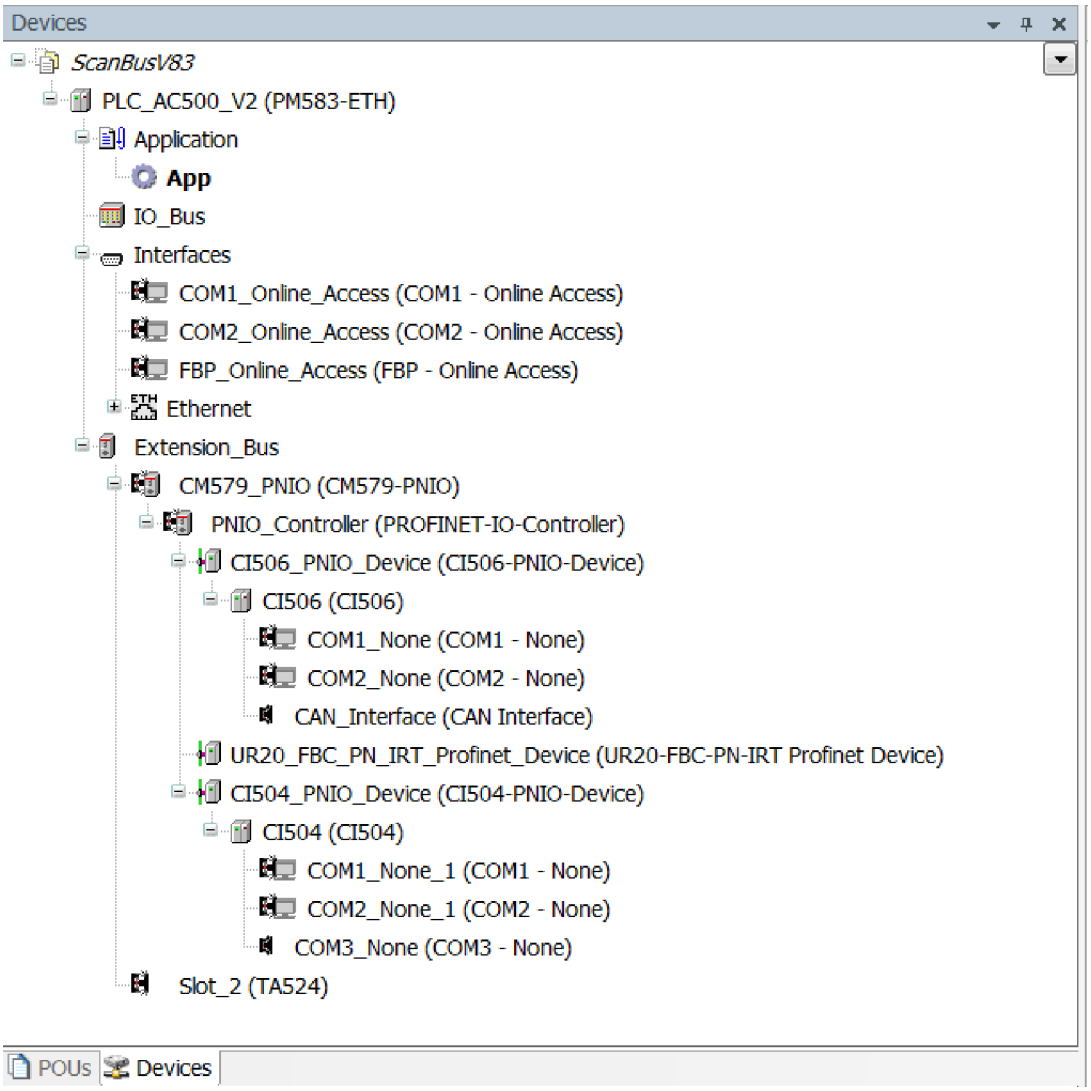
5. Close tab *“Project Comparison - Differences”*.

   ⇨ A message will be displayed to ask if you want to commit the new changes into project.



6. Click *[Yes]*.

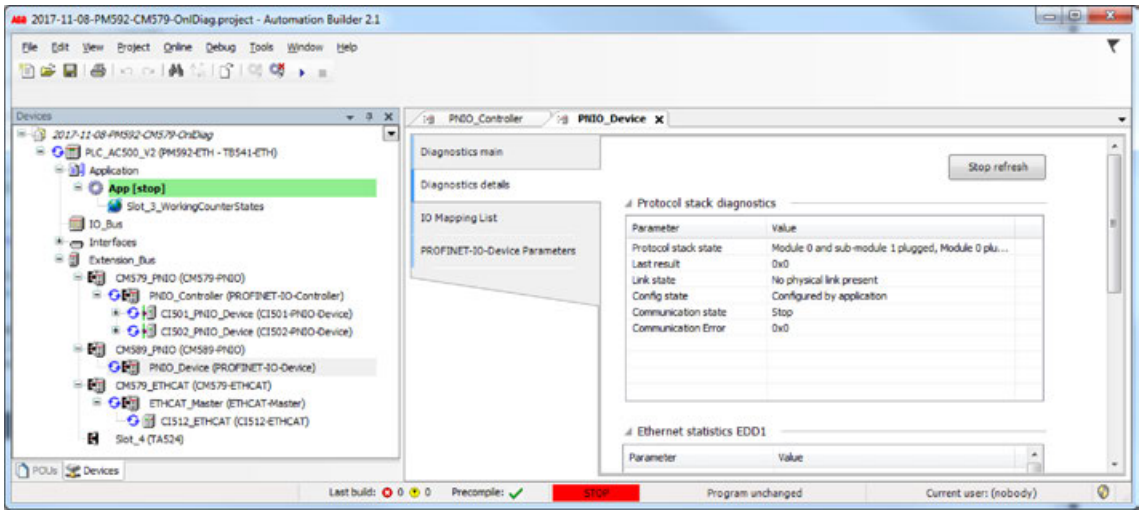
   ⇨ The changes will be saved and the devices will be added to the project.



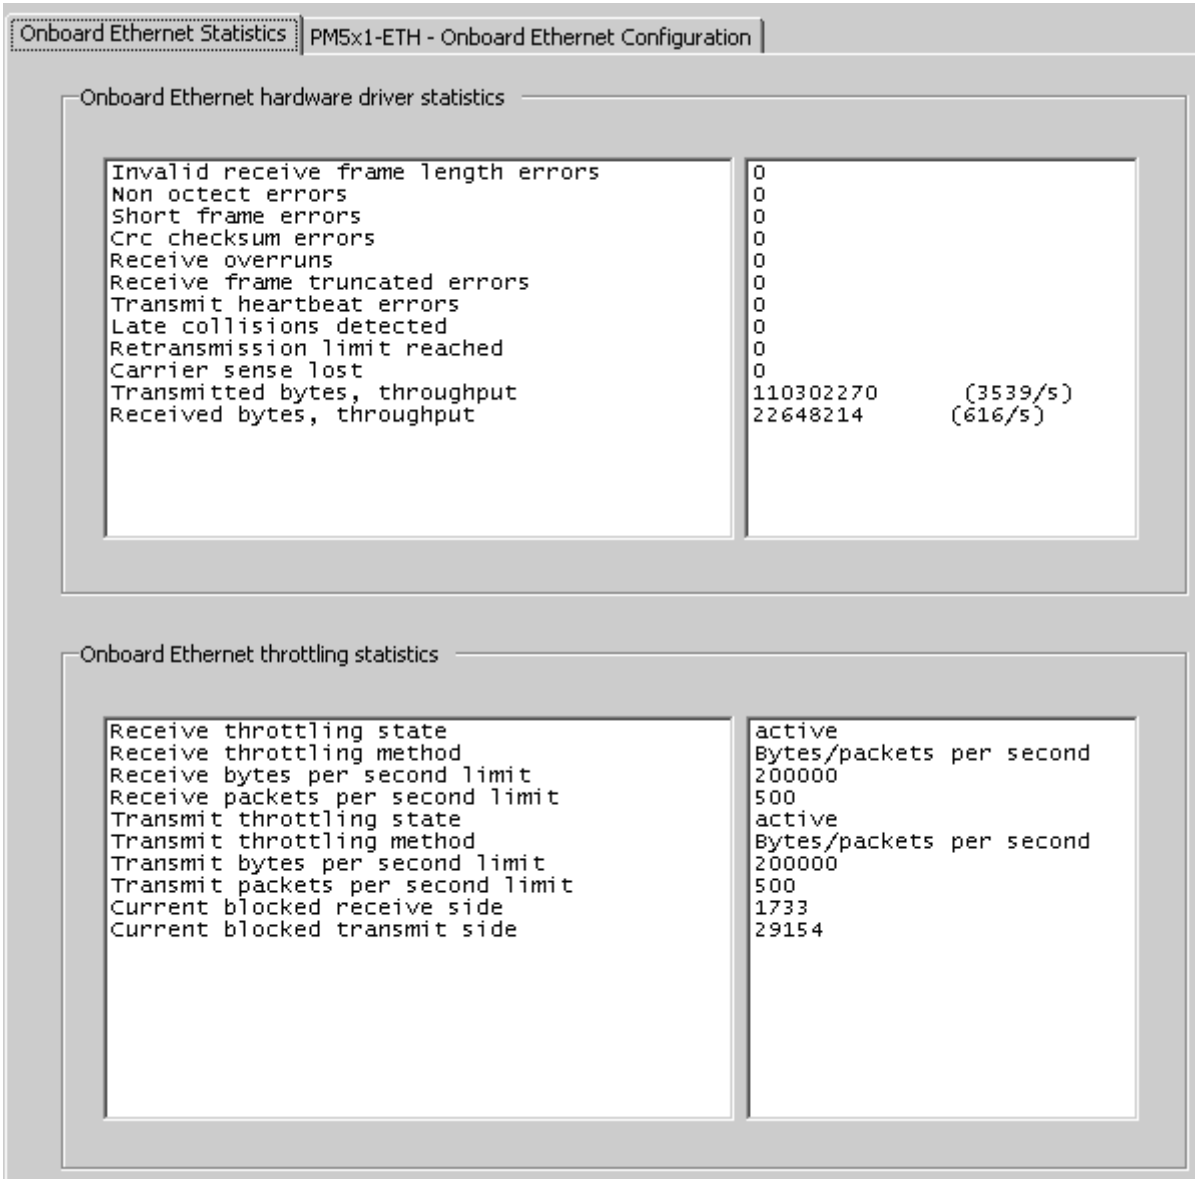
Slave/device communication modules

Diagnosis views for slave/device communication modules like CM589-PNIO:

- *"Diagnostics main"*: provides diagnosis messages which are common for all protocols
- *"Diagnostics details"*: provides protocol specific diagnosis messages



1.7.2.7.2 Onboard Ethernet statistic



This view is refreshed cyclically and shows in above part the common Ethernet errors like late collisions, invalid frame errors.

If these error counters are growing, this indicates problems with the Ethernet cabling or overload.

Transmitted and received bytes are shown as a sum and bytes per second.

The lower part shows information about the throttling status.

Throttling is a mechanism that could protect the PLC from network bursts, "brute force" or DoS (denial of service) attacks.

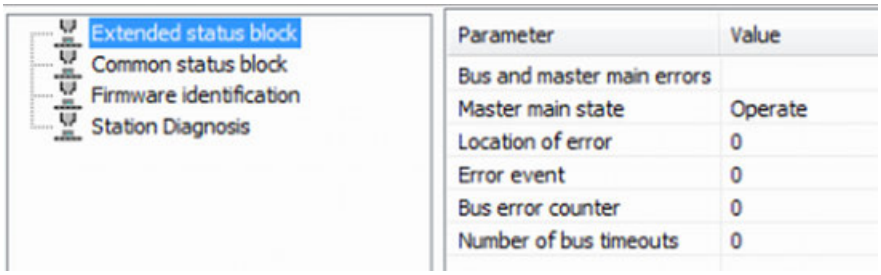
The receive/transmit parts of the network driver are handled separately.

If throttling is active (default) depending on the throttling method (which can be "bytes/second", "packets/second" or both) every cycle (depends on CPU type, about 10 ms) the firmware decides, if the limits (bytes per second limit or packets per second limit) are exceeded.

If this happens, the receiver or transmitter will ignore the data at least for 1 cycle and then calculates again.

1.7.2.7.3 CM592-DP PROFIBUS DP communication module statistic views

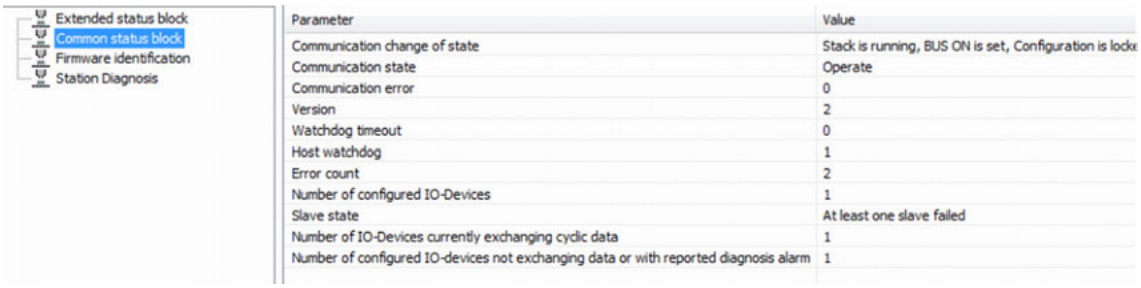
Extended status block view



Parameter	Values	Description
Bus and master main errors	MSK_PROFIBUS_APM_EXT_STA_CTRL_ERR	CONTROL-ERROR: This error is caused by incorrect parameterization.
	MSK_PROFIBUS_APM_EXT_STA_ACLR_ERR	AUTO-CLEAR-ERROR: The device stopped the communication to all slaves and reached the auto-clear end state
	MSK_PROFIBUS_APM_EXT_STA_NEXC_ERR	NON-EXCHANGE-ERROR: At least one slave has not reached the data exchange state and no process data are exchanged with it.
	MSK_PROFIBUS_APM_EXT_STA_FATL_ERR	FATAL-ERROR: Because of a severe bus error, no bus communication is possible any more
	MSK_PROFIBUS_APM_EXT_STA_NRDY	Host-NOT-READY-NOTIFICATION: Indicates, if the host program has set its state to operative or not. If the bit is set, the host program is not ready to communicate
	MSK_PROFIBUS_APM_EXT_STA_TOUT	TIMEOUT-ERROR: The device has detected an overstepped timeout supervision time because of rejected PROFIBUS telegrams. It's an indication for bus short circuits while the master interrupts the communication. The number of detected timeouts are fixed in the Time_out_cnt variable. The bit will be set when the first timeout was detected and will not be deleted any more.

Parameter	Values	Description
Master main state	Offline	In OFFLINE state, there is no communication (data transfer) permitted at all. This is the state after initialization. This means, the master is waiting for a signal to start and does not participate in the token ring of the PROFIBUS access control mechanism
	Stop	In STOP state, there is no data transfer permitted between master and slaves. Data transfer to other masters in multi-master system is allowed, however. The bus parameter set has been loaded successfully in order to get into STOP state.
	Clear	In CLEAR state, the master is able to read the input data from the DP slaves. The master forces the outputs to the slaves to be in a safe state (i.e. they contain only the value 0). For instance, incorrect data transfer of a slave can cause the PROFIBUS DP master to fall back from OPERATE state to CLEAR state. Parameterization and configuration checks are possible in this state.
	Operate	In OPERATE state, unrestricted data transfer is possible. This data transfer is cyclic, i.e. periodically, the input values are read from the slaves and the output data are written to the slaves.
Location of error	0..125	Address of the slave with error
Error event		Not used currently
Bus error counter		Counter for the bus error events
Number of bus timeouts		Counter for bus timeouts

Common status block view



Parameter	Description
Communication change of state	The communication change of state register contains information about the current operating status of the communication channel and its firmware ↳ *Table 764 "Communication change of state flags" on page 6401*.
Communication state	The communication state field contains information regarding the current network status of the communication channel. Depending on the implementation all or a subset of the following definitions is supported: ● UNKNOWN ● NOT_CONFIGURED ● STOP ● IDLE ● OPERATE
Communication error	This field holds the current error code of the communication channel. If the cause of error is resolved, the communication error field is set to 0 (= RCX_SYS_SUCCESS) again. Depending on the implementation protocol stacks use all or a subset of the following error codes: ● SUCCESS 0x00000000 ● Runtime Failures: – WATCHDOG TIMEOUT 0xC000000C ● Initialization Failures: – INITIALIZATION FAULT 0xC0000100 – DATABASE ACCESS FAILED 0xC0000101 ● Configuration Failures – NOT CONFIGURED 0xC0000119 – CONFIGURATION FAULT 0xC0000120 – INCONSISTENT DATA SET 0xC0000121 – DATA SET MISMATCH 0xC0000122 – INSUFFICIENT LICENSE 0xC0000123 – PARAMETER ERROR 0xC0000124 – INVALID NETWORK ADDRESS 0xC0000125 – NO SECURITY MEMORY 0xC0000126 ● Network Failures – NETWORK FAULT 0xC0000140 – CONNECTION CLOSED 0xC0000141 – CONNECTION TIMED OUT 0xC0000142 – LONELY NETWORK 0xC0000143 – DUPLICATE NODE 0xC0000144 – CABLE DISCONNECT 0xC0000145
Version	The version field holds version of this structure. It starts with 1. 0 is not defined. Version should be 1.
Host watchdog	This field holds the configured watchdog timeout value in milliseconds. The application may set its watchdog trigger interval accordingly. If the application fails to copy the value from the host watchdog location to the device watchdog location, the protocol stack will interrupt all network connections immediately regardless of their current state.

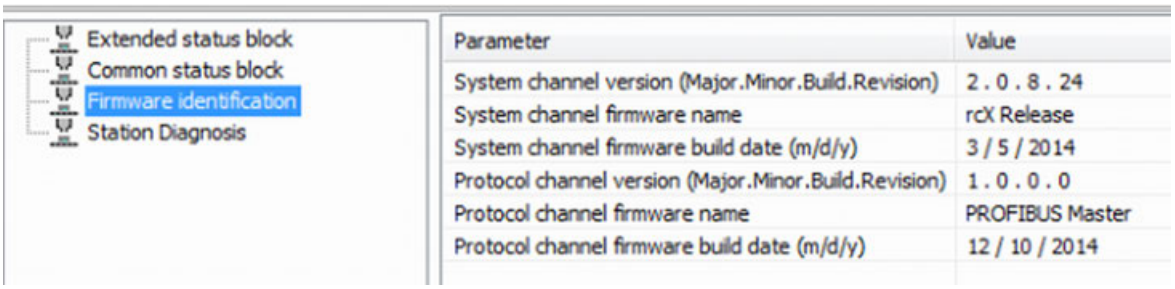
Parameter	Description
Error count	This field holds the total number of errors detected since power-up, respectively after reset. The protocol stack counts all sorts of errors in this field no matter if they were network related or caused internally.
Number of configured I/O devices	The firmware maintains a list of slaves to which the master has to open a connection. This list is derived from the configuration database. This field holds the number of configured slaves.
Slave state	The slave state field indicates whether the master is in cyclic data exchange to all configured slaves. In case there is at least 1 slave missing or if the slave has a diagnostic request pending, the status is set to FAILED. For protocols that support non-cyclic communication only, the slave state is set to OK as soon as a valid configuration is found. (UNDEFINED, NO_FAULT, FAILED)
Number of I/O devices currently exchanging cyclic data	The firmware maintains a list of slaves to which the master has successfully opened a connection. Ideally, the number of active slaves is equal to the number of configured slaves. For certain fieldbus systems it could be possible that the slave is shown as activated, but still has a problem in terms of a diagnostic issue. This field holds the number of active slaves.
Number of configured I/O devices not exchanging data or with reported diagnosis alarm	If a slave encounters a problem, it can provide an indication of the new situation to the master in certain fieldbus systems. As long as those indications are pending and not serviced, the field holds a value unequal 0. If no more diagnosis information is pending, the field is set to 0.

Table 764: Communication change of state flags

Value	Description
Ready	0 - ... 1 - The *Ready* flag is set as soon as the protocol stack is started properly. Then the protocol stack is awaiting a configuration. As soon as the protocol stack is configured properly, the *Running* flag is set, too.
Running	0 - ... 1 - The *Running* flag is set if the protocol stack has been configured properly. Then the protocol stack is awaiting a network connection. Now both the *Ready* flag and the *Running* flag are set.
Bus On	0 - ... 1 - The *Bus On* flag is set to indicate to the host system whether or not the protocol stack has the permission to open network connections. If set, the protocol stack has the permission to communicate on the network. If cleared, the permission was denied and the protocol stack will not open network connections.

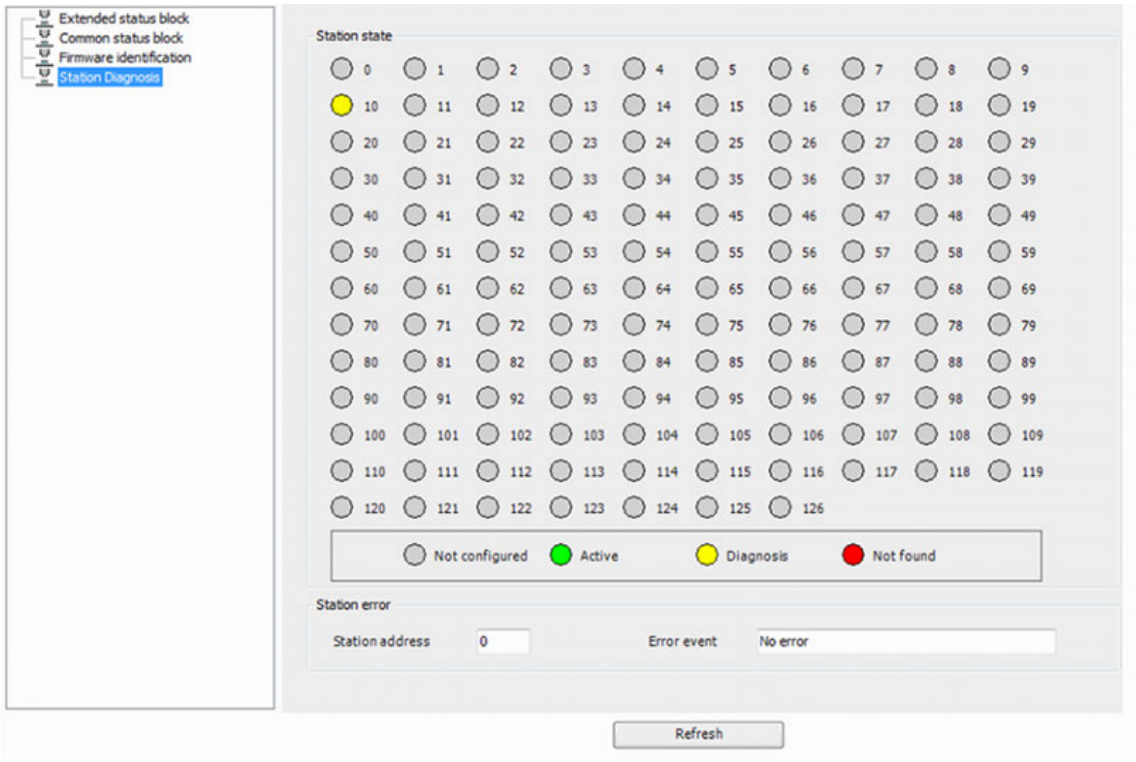
Value	Description
Configuration Locked	0 - ... 1 - The *Configuration Locked* flag is set, if the communication channel firmware has locked the configuration database against being overwritten. Re-initializing the channel is not allowed in this state. To unlock the database, the application has to clear the *Configuration Locked* flag in the control block.
Configuration New	0 - ... 1 - The *Configuration New* flag is set by the protocol stack to indicate that a new configuration became available, which has not been activated. This flag may be set together with the Restart Required flag.
Restart Required	0 - ... 1 - The *Restart Required* flag is set if the channel firmware requests to be restarted. This flag is used together with the Restart Required Enable flag below. Restarting the channel firmware may become necessary, if a new configuration was downloaded from the host application or if a configuration upload via the network took place.
Restart Required Enable	0 - ... 1 - The *Restart Required Enable* flag is used together with the Restart Required flag above. If set, this flag enables the execution of the Restart Required command in the netX firmware (for details on the Enable mechanism see section 2.3.2 of the netX DPM Interface Manual).

Firmware identification view



Parameter	Description
System channel version	Version of the RcX operating system
System channel firmware name	Name of the operating system
System channel firmware build date	Date of the operating system
Protocol channel version	Version of the communication module
Protocol channel name	Name of the communication module
Protocol channel date	Date of the communication module

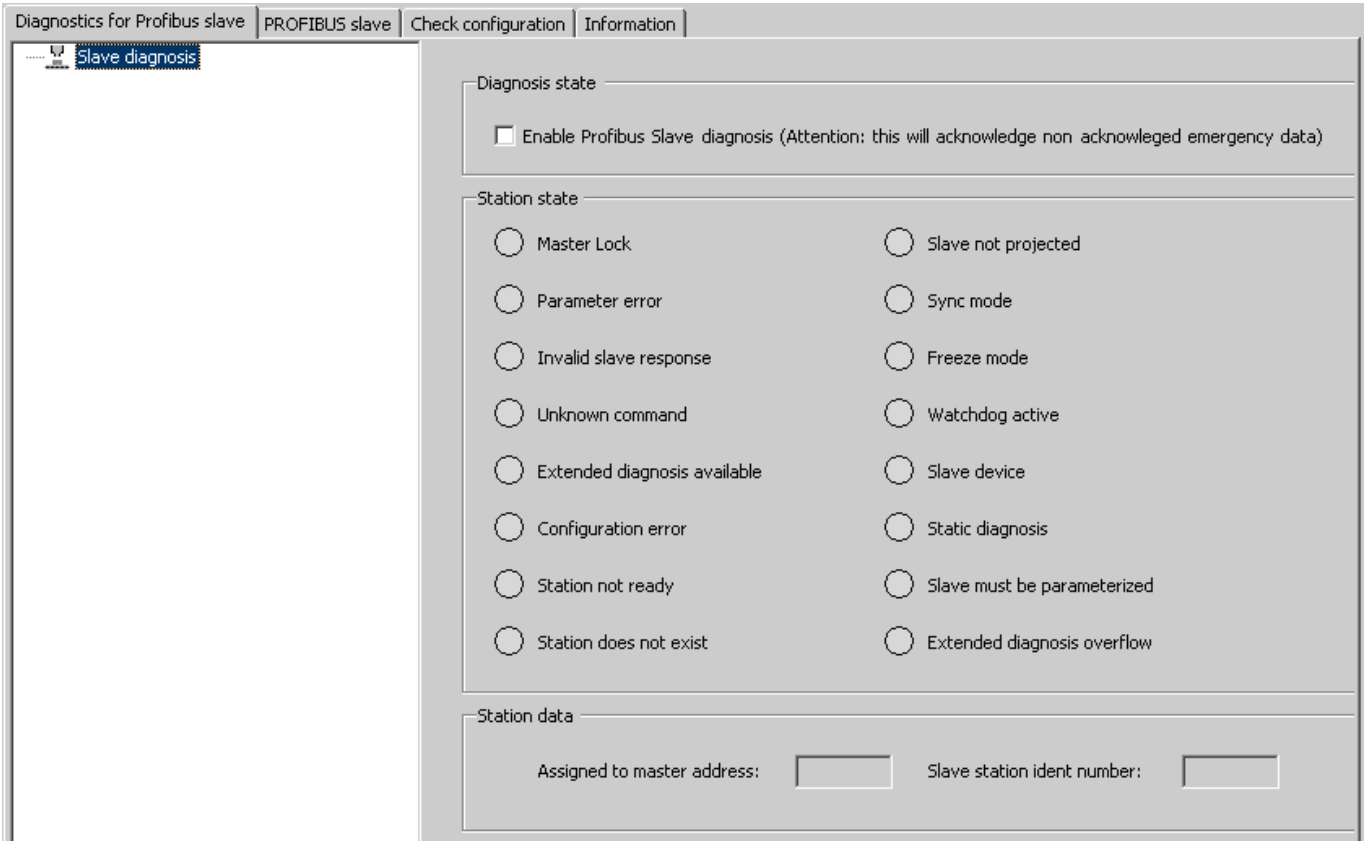
Station diagnosis view



For every configured slave the following data is displayed:

Value	Description
Not configured	Not configured
Active	All OK: slave is in data exchange
Diagnosis	Configured, active has diagnosis
Not found	Configured but not found

1.7.2.7.4 CM592-DP PROFIBUS DP slave view



The PROFIBUS Slave diagnosis must be enabled explicit by the user every time he opens this view (the enabled state will not be saved). This has the following reason:

Each time, when a diagnosis read request is sent to a slave which has actual diagnosis data, the diagnosis data is automatically acknowledged. Thus, an alarm handling function block running on PLC, will possibly miss this alarm. So enabling this view should only be done, if no function blocks are used to handle alarms/diagnosis data.

Table 765: Meaning of Station Status 1

Station Status 1	Activated by	Description and Remedy
Master Lock (Bit 7)	Master	Description: The slave has been parameterized by another master, and is locked for accesses by the selected master.
		Remedy: This is a safety mechanism of PROFIBUS DP. Firstly, you should decide which master should have access to the slave. After that, the slave has to be added into the configuration of that master, which should have access to the slave. Finally, the slave must be deleted in the configuration of the other master(s).

Station Status 1	Activated by	Description and Remedy
Parameter Error (Bit 6)	Slave	Description: This bit is set by the slave automatically, if the parameter, which the master has output, is wrong or incomplete. Each received partner telegram is checked completely by the slave. If the slave recognises an error, it will report an parameter error. Furthermore, the slave verifies its ident number with the ident number the master has sent.
		Remedy: Firstly, verify the ident number inside the device with the ident number inside the GSD file. They must me equal. If they are different, there is either a the wrong GSD file used or a wrong device has been connected to the bus. If both ident numbers are equal, check the parameter data.
Invalid Slave answer (Bit 5)	Master	Description: This bit is set by the master, if an invalid reply from the slave has been received. The physical connection to the slave has been established, but the logical answer could not be understood.
		Remedy: There can be an error on the physical cable line, e. g. inter-changed wires, missing bus termination or missing shield connection. Use a PROFIBUS DP slave, which is corre-sponding to the norm. This error can also happen, if a PROFIBUS-FMS slave is connected instead of a PROFIBUS DP slave to the DP master. Then the slave cannot understand the TP telegram and returns it to the sender. It will be recognized by the master as an invalid slave reply.
Function not sup-ported (Bit 4)	Slave	Description: This bit is set by the slave, if it should process a function it does not support. No version of slaves normally support Sync- and Freeze commands. This is mentioned inside the GSD file and is read by Automation Builder and sent as parameter telegram to the slave.
		Remedy: If this error occurs, the GSD file contains at least 1 function, which is not supported by the slave. Ask the device vendor for the correct GSD file which belongs to the slave.
Enhanced device diagnosis available (Bit 3)	Slave	Description: This bit is set by the slave, if enhanced diagnosis data have been read. These data are optional and are used by the slave to output vendor-specific diagnosis messages.
		Remedy: Activate the enhanced diagnosis to display the enhanced diagnosis data and read the manual of the device vendor for the meaning. If the GSD file contains information about the enhanced device diagnosis, the evaluation can also be threatened by the DTM.

Station Status 1	Activated by	Description and Remedy
Configuration error (Bit 2)	Slave	Description: During the PROFIBUS DP initialization, the slave compares its internal I/O configuration to the configuration of the master. If the slave recognises a difference, it will report a configuration error. This means the master has an other I/O constellation than the slave.
		Remedy: First of all, check whether the I/O modules detected by the slave and the connected I/O modules match. Make sure that the sequence of the modules also matches. At the beginning some slaves need virtual I/O modules or empty modules to achieve an even number of modules. This slave-specific behavior should be mentioned in the vendor manual as it cannot be read inside the GSD file. Pay attention to the configuration hints of the device vendor.
Station not ready (Bit 1)	Slave	Description: The PROFIBUS DP slave is not ready for data exchange yet.
		Remedy: The norm does not specify why and when a slave sets this bit; therefore, there may be several reasons. Mostly this error occurs combined with other errors. Verify the parameters and the configuration. The error *Station not ready* is often a consecution of a parameter or configuration error. Eventually, the power supply of the slave has just been turned on. Wait until the device has started.
Station is not existing (Bit 0)	Master	Description: This bit is set automatically by the master if the slave in the bus does not reply or is not reachable.
		Remedy: Check the PROFIBUS cable. Both signal lines must be connected correctly between all devices. Additionally, both cable ends must be equipped with terminators. Check the power supply connection of the slave. Check the slave station address and the configuration of the master. Verify, whether the slave supports the configured transmission rate. Some older slaves will only work up to 1.5 MBaud or must be set to a special PROFIBUS DP conform behavior.

Table 766: Meaning of Station Status 2

Station Status 2	Activated by	Description
Slave deactivated (Bit 7)	Master	This bit is set by the master, if the parameterization of the slave marks itself as inactive. Thus, it will be excluded from the cyclically data exchange.
Reserved (Bit 6)	-	-
Sync Mode (Bit 5)	Slave	This bit is set by the slave, if a Sync command has been received.

Station Status 2	Activated by	Description
Freeze Mode (Bit 4)	Slave	This bit is set by the slave, if a Freeze command has been received.
Watchdog active (Bit 3)	Slave	This bit is set by the slave, if time monitoring is activated for controlling the communication with the associated master.
Slave device (Bit 2)	Slave	This bit is always set by the slave.
Static diagnosis (Bit 1)	Slave	This bit is set by the slave to signal the master, that it has a general error and is out of order. Typically, the slave is not available for the exchange of user data. In this case, the master should request diagnosis data as long as the bit is set to 0 again. The event or point of time the bit is set, is not described in the norm and cannot be specified more precisely.
Re-parameterization requested (Bit 0)	Slave	This bit is set by the slave to signal the master, that it asks for a new parameterization. The bit stays set until the parameterization is processed. If this error occurs, firstly compare the ident number of the device with the ident number inside the GSD file. These numbers must match. Additionally, check the parameter data.

Table 767: Meaning of Station Status 3

Station Status 3	Activated by	Description
Overflow enhanced diagnosis (Bit 7)	Master Slave	This bit is set, if more enhanced diagnosis data are sent to the master than match into a diagnosis telegram. For example, the slave sets this bit, if more diagnosis data are pending than fit into its buffer.
Reserved (Bit 6)	-	-

The display of the extended diagnosis of a PROFIBUS slave is not supported.

Diagnosis	Description
Assigned to master address	At Assigned to master address, the address of the master, which has parameterized and configured the slave, is displayed. The value 255 shows that the slave is neither parameterized nor configured or the received parameterization and configuration information was rejected with errors.
Slave station ident number	At slave station ident number, the (real) ident number of the used slave is displayed. If the value 0000 is shown, the master has no connection to the PROFIBUS DP slave yet.
Update	Updates the displayed diagnosis conditions.

The ident number, deposited in the device, must match to the ident number in the GSD file. If they are different, either a wrong GSD file is used or the wrong device is connected to the PROFIBUS.

1.7.2.7.5 CM579-PNIO PROFINET IO controller views

IO controller views

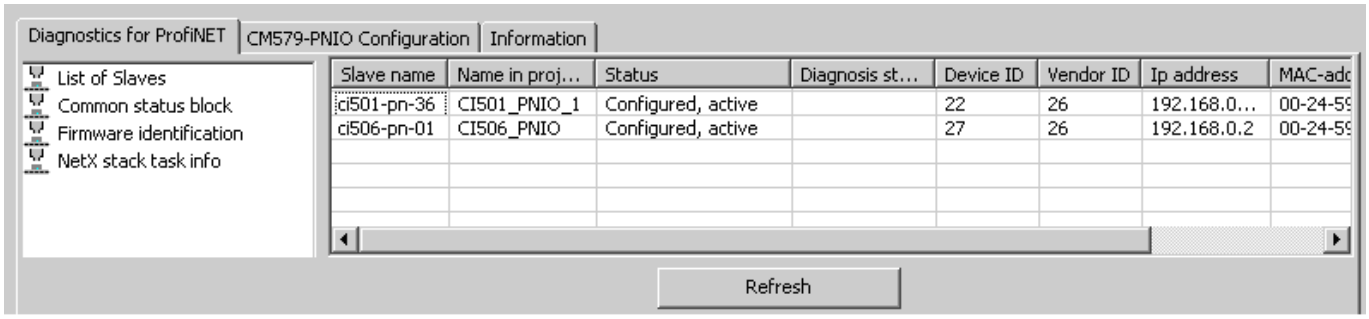
The views in PROFINET master and slave are not refreshed cyclically, because of the big communication load this would impose. For updating the data the Refresh button is available.

Chapter 1.7.2.7.5.2 “IO controller list of slaves view” on page 6408

Chapter 1.7.2.7.5.4 “IO controller common status block view” on page 6409

Chapter 1.7.2.7.5.3 “IO controller firmware and task info view” on page 6408

IO controller list of slaves view



This is the main diagnosis view for the PROFINET IO Controller: List of slaves table view.

For every configured slave the following data are displayed:

Slave name: This is the main identifier on the PROFINET. (This name can be set or changed using the Assign station name editor tab available at the CM579 master level)

Name in Project: Name of the node in the Project Tree where this Device is configured

Status:

- *configured, active* -> all OK, slave is in data exchange
- *configured, inactive* -> configured, but not found
- *configured, inactive, faulted* -> configured, not in data exchange but with errors
- *configured, active, has active alarm, not acknowledged*
- *configured, active, has active alarm, acknowledged*

Diagnosis state: special diagnosis error messages (independent of alarms)

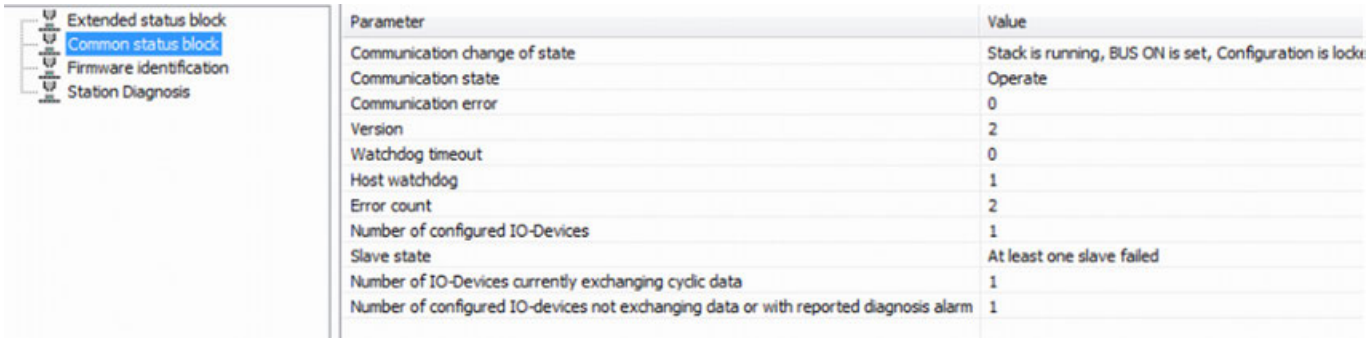
Device ID: type ID given by the Vendor

VendorID: identifies the Vendor, ID is unique

IO controller firmware and task info view

The last 2 sections provide information about the communication module's firmware versions, build dates and internal information about the different running tasks on the communication module side.

IO controller common status block view



Parameter	Description
Communication state of change	The communication change of state register contains information about the current operating status of the communication channel and its firmware. Possible state changes (see below table for details) are: ● *Restart Required Enable* ● *Restart Required* ● *Configuration New* ● *Configuration Locked* ● *Bus On* ● *Running* ● *Ready*
Communication state	The communication state field contains information regarding the current network status of the communication channel. Depending on the implementation, all or a subset of the definitions below is supported: UNKNOWN NOT_CONFIGURED STOP IDLE OPERATE

Parameter	Description
Communication error	This field holds the current error code of the communication channel. If the cause of error is resolved, the communication error field is set to 0 (= RCX_SYS_SUCCESS) again. Not all of the error codes are supported in every implementation. Protocol stacks may use a subset of the error codes below: SUCCESS 0x00000000 **Runtime Failures:** WATCHDOG TIMEOUT 0xC000000C **Initialization Failures:** INITIALIZATION FAULT 0xC0000100 DATABASE ACCESS FAILED 0xC0000101 **Configuration Failures** NOT CONFIGURED 0xC0000119 CONFIGURATION FAULT 0xC0000120 INCONSISTENT DATA SET 0xC0000121 DATA SET MISMATCH 0xC0000122 INSUFFICIENT LICENSE 0xC0000123 PARAMETER ERROR 0xC0000124 INVALID NETWORK ADDRESS 0xC0000125 NO SECURITY MEMORY 0xC0000126 **Network Failures** NETWORK FAULT 0xC0000140 CONNECTION CLOSED 0xC0000141 CONNECTION TIMED OUT 0xC0000142 LONELY NETWORK 0xC0000143 DUPLICATE NODE 0xC0000144 CABLE DISCONNECT 0xC0000145
Version	The version field holds version of this structure. It starts with 1; 0 is not defined. Version should be 1.
Host Watchdog	This field holds the configured watchdog timeout value in milliseconds. The application may set its watchdog trigger interval accordingly. If the application fails to copy the value from the host watchdog location to the device watchdog location, the protocol stack will interrupt all network connections immediately regardless of their current state.
Error Count	This field holds the total number of errors detected since power-up, respectively after reset. The protocol stack counts all sorts of errors in this field no matter if they were network related or caused internally.
Number of configured slaves	The firmware maintains a list of slaves to which the master has to open a connection. This list is derived from the configuration database. This field holds the number of configured slaves.

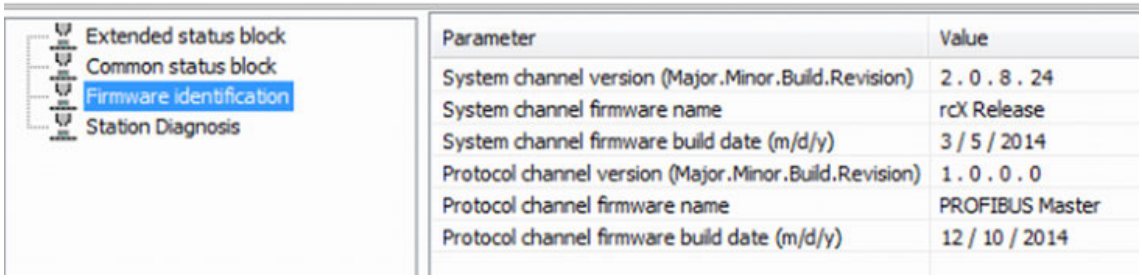
Parameter	Description
Slave state	The slave state field indicates whether the master is in cyclic data exchange to all configured slaves. In case there is at least 1 slave missing or if the slave has a diagnostic request pending, the status is set to FAILED. For protocols that support non-cyclic communication only, the slave state is set to OK as soon as a valid configuration is found. (UNDEFINED, NO_FAULT,FAILED)
Number of IO-Devices currently exchanging cyclic data	The firmware maintains a list of slaves to which the master has successfully opened a connection. Ideally, the number of active slaves is equal to the number of configured slaves. For certain fieldbus systems it could be possible that the slave is shown as activated, but still has a problem in terms of a diagnostic issue. This field holds the number of active slaves.
Number of configured IO-Devices not exchanging …	If a slave encounters a problem, it can provide an indication of the new situation to the master in certain fieldbus systems. As long as those indications are pending and not serviced, the field holds a value unequal 0. If no more diagnosis information is pending, the field is set to 0.

Table 768: Communication change of state flags

Bit Definition	Description
Ready	0 - … 1 - The *Ready* flag is set as soon as the protocol stack is started properly. Then the protocol stack is awaiting a configuration. As soon as the protocol stack is configured properly, the Running flag is set, too.
Running	0 - … 1 - The *Running* flag is set if the protocol stack has been configured properly. Then the protocol stack is awaiting a network connection. Now both the Ready flag and the Running flag are set.
Bus On	0 - … 1 - The *Bus On* flag is set to indicate to the host system whether or not the protocol stack has the permission to open network connections. If set, the protocol stack has the permission to communicate on the network; if cleared, the permission was denied and the protocol stack will not open network connections.
Configuration Locked	0 - … 1 - The *Configuration Locked* flag is set, if the communication channel firmware has locked the configuration database against being overwritten. Re-initializing the channel is not allowed in this state. To unlock the database, the application has to clear the Lock Configuration flag in the control block.
Configuration New	0 - … 1 - The *Configuration New* flag is set by the protocol stack to indicate that a new configuration became available, which has not been activated. This flag may be set together with the Restart Required flag.

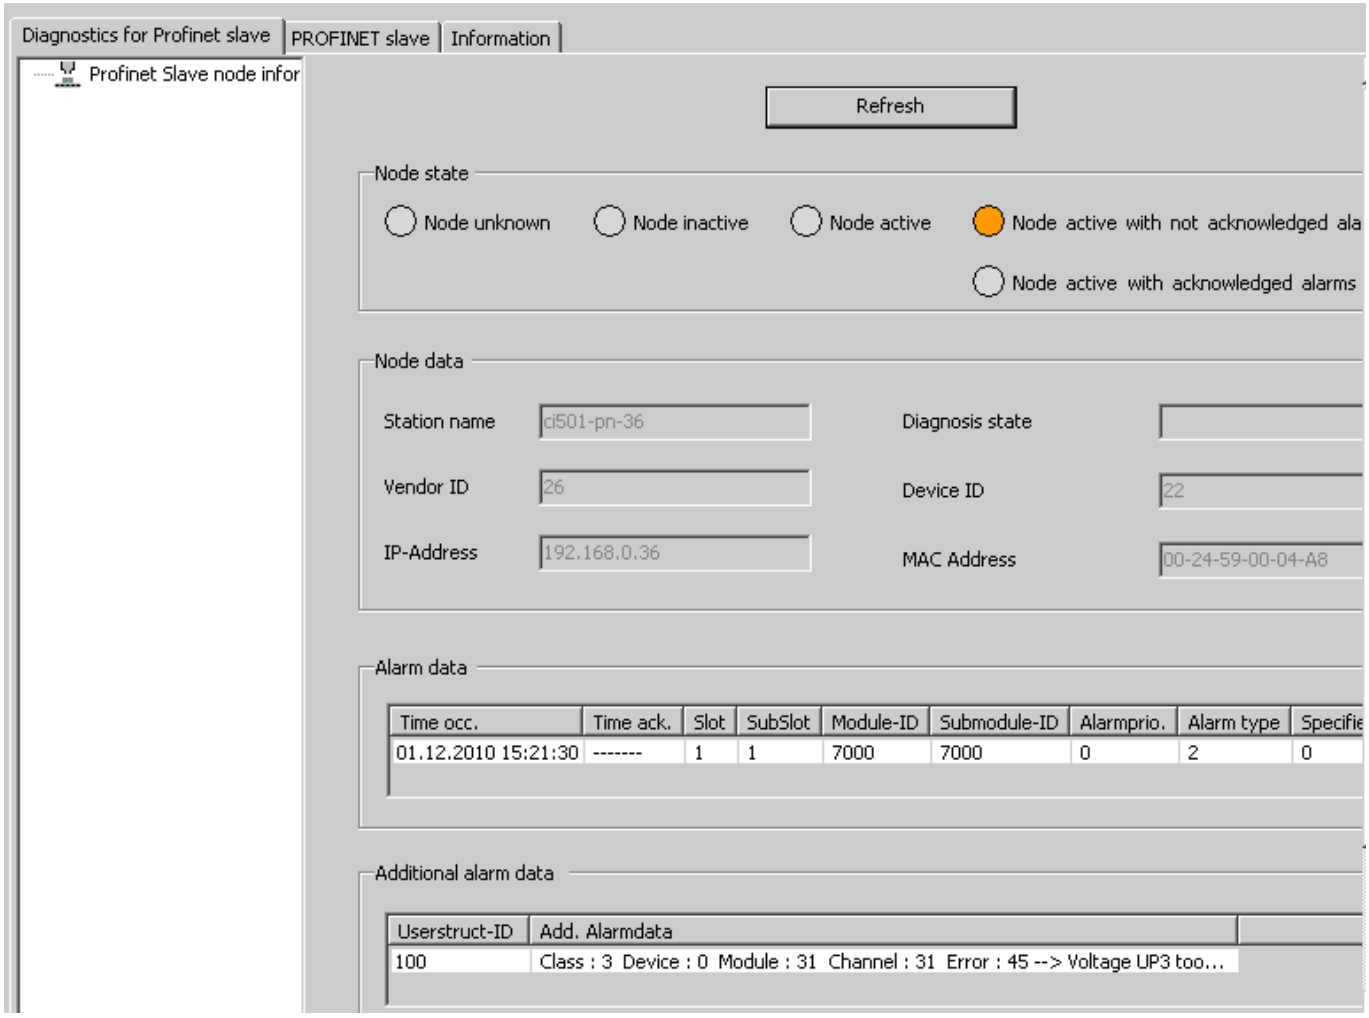
Bit Definition	Description
Restart Required	0 - … 1 - The *Restart Required* flag is set if the channel firmware requests to be restarted. This flag is used together with the Restart Required Enable flag below. Restarting the channel firmware may become necessary, if a new configuration was downloaded from the host application or if a configuration upload via the network took place.
Restart Required Enable	0 - … 1 - The *Restart Required Enable* flag is used together with the Restart Required flag above. If set, this flag enables the execution of the Restart Required command in the netX firmware (for details on the Enable mechanism see section 2.3.2 of the netX DPM Interface Manual).

IO controller firmware identification view



Parameter	Description
System channel version	Version of the RcX operating system
System channel firmware name	Name of the operating system
System channel firmware build date	Date of the operating system
Protocol channel version	Version of the communication module
Protocol channel name	Name of the communication module
Protocol channel date	Date of the communication module

1.7.2.7.6 CM579-PNIO PROFINET IO device views



The different states for node state and the entries for node data are the same data already described in CM579_PROFINET_CM_controller_list_slaves_views ↬ *Chapter 1.7.2.7.5.2 “IO controller list of slaves view” on page 6408*.

Alarm data

In PROFINET every device can have only 1 active alarm. The PROFINET IO device diagnosis view displays the alarm data of the last active alarm of the selected device.

> *The read out of these diagnosis data does NOT affect the alarm function blocks like it does in CANopen and PROFIBUS. Automation Builder reads only a local copy of the alarm data.*

Time occurred

Date and time the alarm was triggered.

Time acknowledged

Date and time, the user has acknowledged the alarm via alarm function block.

There is no "alarm off" notification, but it is possible to get this information:

During the time the alarm condition is still active, the PROFINET IO device repeats its alarm message to the master continuously. So, if the alarm function block acknowledges an alarm, and shortly afterwards the alarm is again in not acknowledged state -> this means, the alarm cause is not gone. Otherwise it is gone.

If there is more than 1 alarm triggered on 1 slave, it could happen that after the acknowledgement of 1 alarm the other alarm gets the active alarm. So the data displayed could switch between the different alarm causes.

Slot / SubSlot / ModuleID and *SubModuleID* are addressing information to locate the alarm cause/area on a PROFINET IO device.

Alarm priority There are 2 alarm priorities : ALARM_HIGH and ALARM_LOW

Alarm type (hexadecimal)

0x0000	Reserved
0x0001	Diagnosis
0x0002	Process
0x0003	Pull a)
0x0004	Plug
0x0005	Status
0x0006	Update
0x0007	Redundancy
0x0008	Controlled by supervisor
0x0009	Released
0x000A	Plug Wrong Submodule
0x000B	Return of Submodule
0x000C	Diagnosis disappears
0x000D	Multicast communication mismatch notification
0x000E	Port data change notification
0x000F	Sync data changed notification
0x0010	Isochronous mode problem notification
0x0011	Network component problem notification
0x0012	Time data changed notification
0x0013	0x001D Reserved
0x001E	Upload and retrieval notification
0x001F	Pull module b)
0x0020	0x007F Manufacturer specific
0x0080	0x00FF Reserved for profiles
0x0100	0xFFFF Reserved

Alarm specifier Bit Meaning Value

0 ... 10	Alarm Sequence Number 0 … 2047
11	Channel Diagnosis 0 ... 1
12	Manufacturerspecific Diagnosis 0 ... 1
13	Submodule Diagnosis State 0 ... 1
14	Reserved 0
15	AR Diagnosis State 0 ... 1

The additional alarm data are completely manufacturer specific data.

Every manufacturer can specify a User structure-ID which describes a structured data called *Additional Alarmdata.*

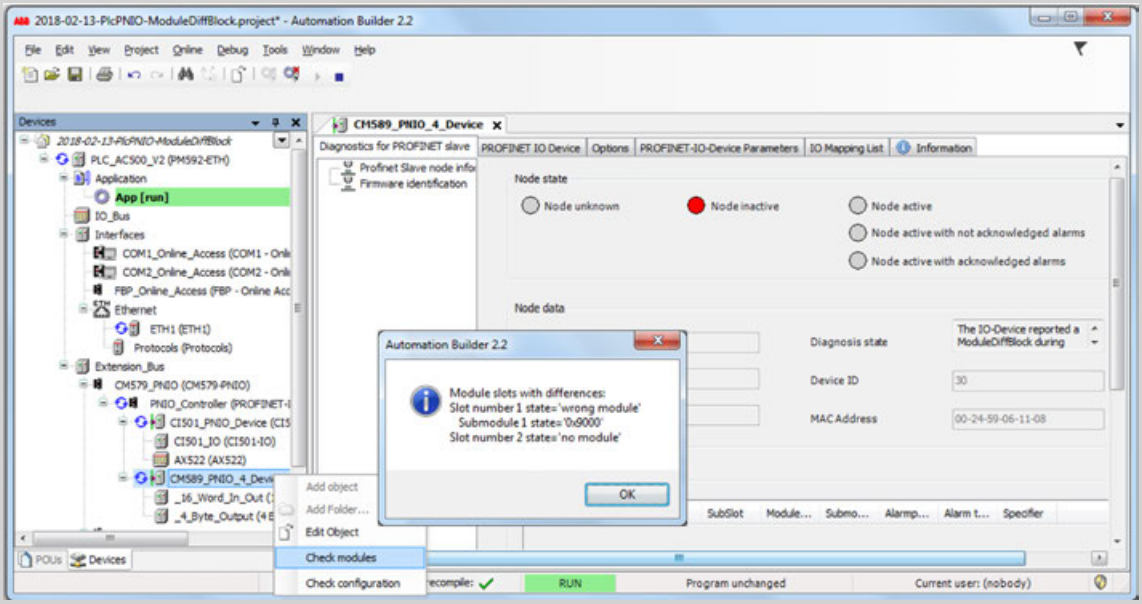
For ABB PROFINET IO devices the structure is well known and the add. Alarm data can be displayed decoded into details and error codes.

ModuleDiffBlock error

As of Automation Builder 2.1.1 the user can read diagnosis information about modules below any PROFINET IO device (e.g. CI50x or CM589).

If a modular PNIO device detects an issue with one of its modules, like plugged module does not match configuration, it reports a ModuleDiffBlock error.

Example



1. Double-click the node *“CM589_PNIO_4_Device”* and open view *“Diagnosis for PROFINET slave”*.

   ⇨ In the section *Node state* appears *Node inactive* and in the section *Node data* the *Diagnosis state* >The IO-Device reported a ModuleDiffBlock...during...<.

2. Right-click the node *“CM589_PNIO_4_Device”* and click *“Check modules”*

   ⇨ A popup-window appears.

   It shows a list of all modules that are different from the current configuration.

   The list contains the slot number(s) of the erroneous module so that a user knows which module(s) causes the issue.

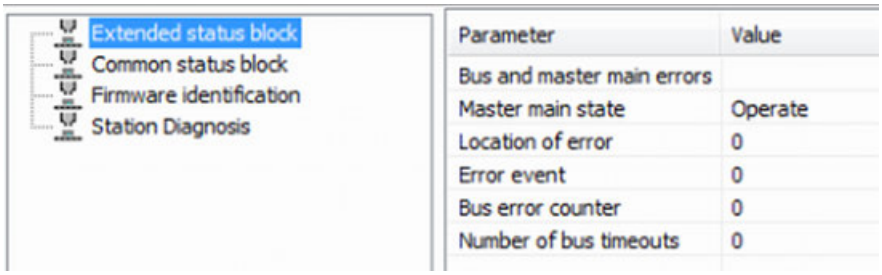
The related context menu item “Check modules” is visible in online mode of V2 PLCs only.

Automation Builder does not show the popup-window in case of no differences.

In any case the Automation Builder adds a message with the result in the message window.

1.7.2.7.7 CM598-CN CANopen communication module statistic views

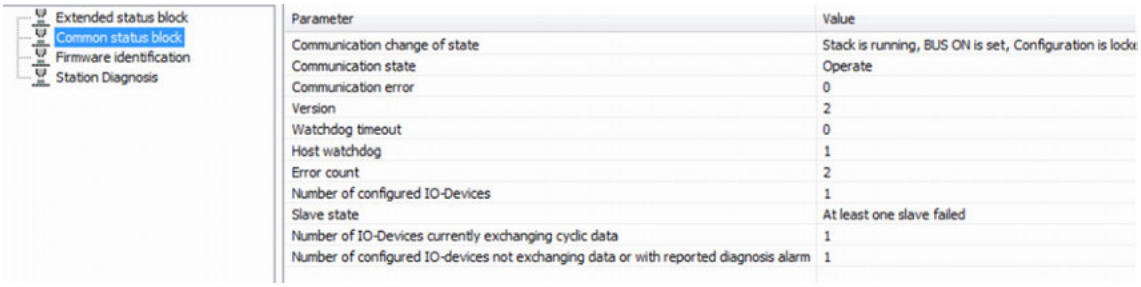
Extended status block view



Parameter	Values	Description
Bus and master main errors	TIMEOUT-ERROR	The DEVICE has detected an overstepped timeout supervision time of at least one CAN message to be sent. The transmission of this message was aborted. The data ist lost. It is an indication that no other CAN device was connected or responsive at this time to acknowledge the sent messages requests. The number of detected timeouts is fixed in the Msg_Time_Out variable. The bit will be sent when the first timeout was detected and will not be deleted anymore.
	HOST-NOT-READY-NOTIFICATION	Indicates if the HOST program has set its state to operate or not. If the bit is set the HOST program is not ready to communicate.
	EVENT-ERROR	The DEVICE has detected transmission errors. The number of detected events are fixed in the Bus_Error_Cnt and Bus Off Cnt variables. The bit will be sent when the first event was detected and will not be deleted anymore.
	NON-EXCHANGE-ERROR	At least one node hast not reached the data exchange state and no process data is exchanged with it.
	AUTO-CLEAR-ERROR	Device stopped the communication to all nodes and reached the autoclear end state.
	CONTROL-ERROR	Parameterization error or severe run time error.
Master main state	Offline	In OFFLINE state, there is no communication (data transfer) permitted at all. This is the state after initialization. This means, the master is waiting for a signal to start and does not participate in the token ring of the PROFIBUS access control mechanism

Parameter	Values	Description
	Stop	In STOP state, there is no data transfer permitted between master and slaves. Data transfer to other masters in multi-master system is allowed, however. The bus parameter set has been loaded successfully in order to get into STOP state.
	Clear	In CLEAR state, the master is able to read the input data from the DP slaves. The master forces the outputs to the slaves to be in a safe state (i.e. they contain only the value 0). For instance, incorrect data transfer of a slave can cause the PROFIBUS DP master to fall back from OPERATE state to CLEAR state. Parameterization and configuration checks are possible in this state.
	Operate	In OPERATE state, unrestricted data transfer is possible. This data transfer is cyclic, i.e. periodically, the input values are read from the slaves and the output data are written to the slaves.
Location of error	0..125	Address of the slave with error
Error event		not used currently
Bus error counter		Counter for the bus error events
Number of bus timeouts		Counter for bus timeouts

Common status block view



Parameter	Description
Communication state of change	The communication change of state register contains information about the current operating status of the communication channel and its firmware. Possible state changes (see below table for details) are: ● *Restart Required Enable* ● *Restart Required* ● *Configuration New* ● *Configuration Locked* ● *Bus On* ● *Running* ● *Ready*
Communication state	The communication state field contains information regarding the current network status of the communication channel. Depending on the implementation, all or a subset of the definitions below is supported: UNKNOWN NOT_CONFIGURED STOP IDLE OPERATE

Parameter	Description
Communication error	This field holds the current error code of the communication channel. If the cause of error is resolved, the communication error field is set to 0 (= RCX_SYS_SUCCESS) again. Not all of the error codes are supported in every implementation. Protocol stacks may use a subset of the error codes below: SUCCESS 0x00000000 **Runtime Failures:** WATCHDOG TIMEOUT 0xC000000C **Initialization Failures:** INITIALIZATION FAULT 0xC0000100 DATABASE ACCESS FAILED 0xC0000101 **Configuration Failures** NOT CONFIGURED 0xC0000119 CONFIGURATION FAULT 0xC0000120 INCONSISTENT DATA SET 0xC0000121 DATA SET MISMATCH 0xC0000122 INSUFFICIENT LICENSE 0xC0000123 PARAMETER ERROR 0xC0000124 INVALID NETWORK ADDRESS 0xC0000125 NO SECURITY MEMORY 0xC0000126 **Network Failures** NETWORK FAULT 0xC0000140 CONNECTION CLOSED 0xC0000141 CONNECTION TIMED OUT 0xC0000142 LONELY NETWORK 0xC0000143 DUPLICATE NODE 0xC0000144 CABLE DISCONNECT 0xC0000145
Version	The version field holds version of this structure. It starts with 1; 0 is not defined. Version should be 1.
Host Watchdog	This field holds the configured watchdog timeout value in milliseconds. The application may set its watchdog trigger interval accordingly. If the application fails to copy the value from the host watchdog location to the device watchdog location, the protocol stack will interrupt all network connections immediately regardless of their current state.
Error Count	This field holds the total number of errors detected since power-up, respectively after reset. The protocol stack counts all sorts of errors in this field no matter if they were network related or caused internally.
Number of configured slaves	The firmware maintains a list of slaves to which the master has to open a connection. This list is derived from the configuration database. This field holds the number of configured slaves.

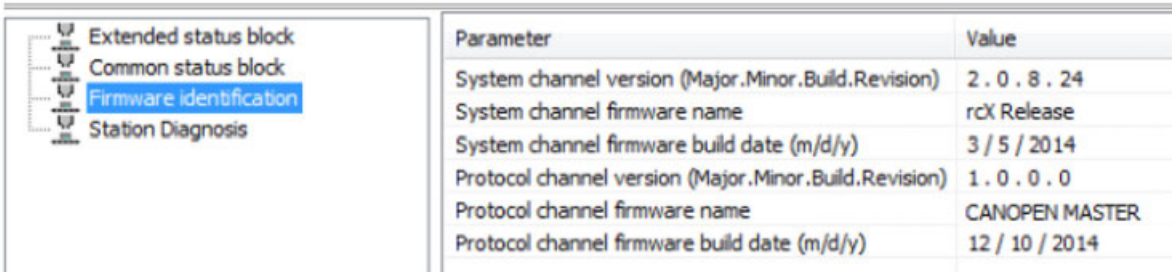
Parameter	Description
Slave state	The slave state field indicates whether the master is in cyclic data exchange to all configured slaves. In case there is at least 1 slave missing or if the slave has a diagnostic request pending, the status is set to FAILED. For protocols that support non-cyclic communication only, the slave state is set to OK as soon as a valid configuration is found. (UNDEFINED, NO_FAULT,FAILED)
Number of IO-Devices currently exchanging cyclic data	The firmware maintains a list of slaves to which the master has successfully opened a connection. Ideally, the number of active slaves is equal to the number of configured slaves. For certain fieldbus systems it could be possible that the slave is shown as activated, but still has a problem in terms of a diagnostic issue. This field holds the number of active slaves.
Number of configured IO-Devices not exchanging …	If a slave encounters a problem, it can provide an indication of the new situation to the master in certain fieldbus systems. As long as those indications are pending and not serviced, the field holds a value unequal 0. If no more diagnosis information is pending, the field is set to 0.

Table 769: Communication change of state flags

Bit Definition	Description
Ready	0 - … 1 - The *Ready* flag is set as soon as the protocol stack is started properly. Then the protocol stack is awaiting a configuration. As soon as the protocol stack is configured properly, the Running flag is set, too.
Running	0 - … 1 - The *Running* flag is set if the protocol stack has been configured properly. Then the protocol stack is awaiting a network connection. Now both the Ready flag and the Running flag are set.
Bus On	0 - … 1 - The *Bus On* flag is set to indicate to the host system whether or not the protocol stack has the permission to open network connections. If set, the protocol stack has the permission to communicate on the network; if cleared, the permission was denied and the protocol stack will not open network connections.
Configuration Locked	0 - … 1 - The *Configuration Locked* flag is set, if the communication channel firmware has locked the configuration database against being overwritten. Re-initializing the channel is not allowed in this state. To unlock the database, the application has to clear the Lock Configuration flag in the control block.
Configuration New	0 - … 1 - The *Configuration New* flag is set by the protocol stack to indicate that a new configuration became available, which has not been activated. This flag may be set together with the Restart Required flag.

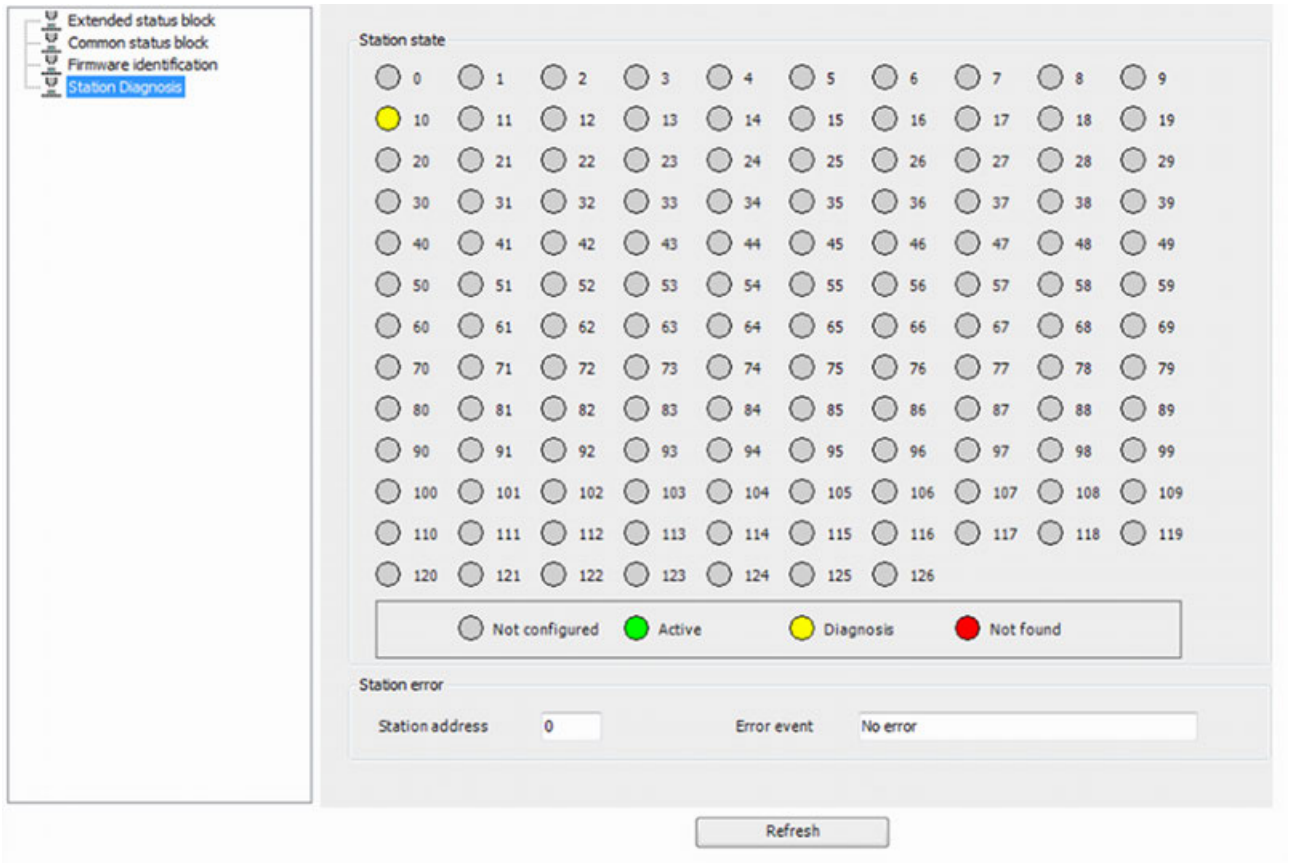
Bit Definition	Description
Restart Required	0 - … 1 - The *Restart Required* flag is set if the channel firmware requests to be restarted. This flag is used together with the Restart Required Enable flag below. Restarting the channel firmware may become necessary, if a new configuration was downloaded from the host application or if a configuration upload via the network took place.
Restart Required Enable	0 - … 1 - The *Restart Required Enable* flag is used together with the Restart Required flag above. If set, this flag enables the execution of the Restart Required command in the netX firmware (for details on the Enable mechanism see section 2.3.2 of the netX DPM Interface Manual).

Firmware identification view



Parameter	Description
System channel version	Version of the RcX operating system
System channel firmware name	Name of the operating system
System channel firmware build date	Date of the operating system
Protocol channel version	Version of the communication module
Protocol channel name	Name of the communication module
Protocol channel date	Date of the communication module

Station diagnosis view



For every configured slave the following data is displayed:

Value	Description
Not configured	Not configured
Active	All OK: slave is in data exchange
Diagnosis	Configured, active has diagnosis
Not found	Configured but not found

1.7.2.7.8 CI506-PNIO communication interface CANopen master view

Master view

The PROFINET slave CI506-PNIO has a built-in CANopen gateway. The user can plug a CANopen Master.

Because of diverse components and assemblies some diagnosis views are different and there are differences in operation.

All these CI506 CANopen views have a refresh button and are not refreshed cyclically.

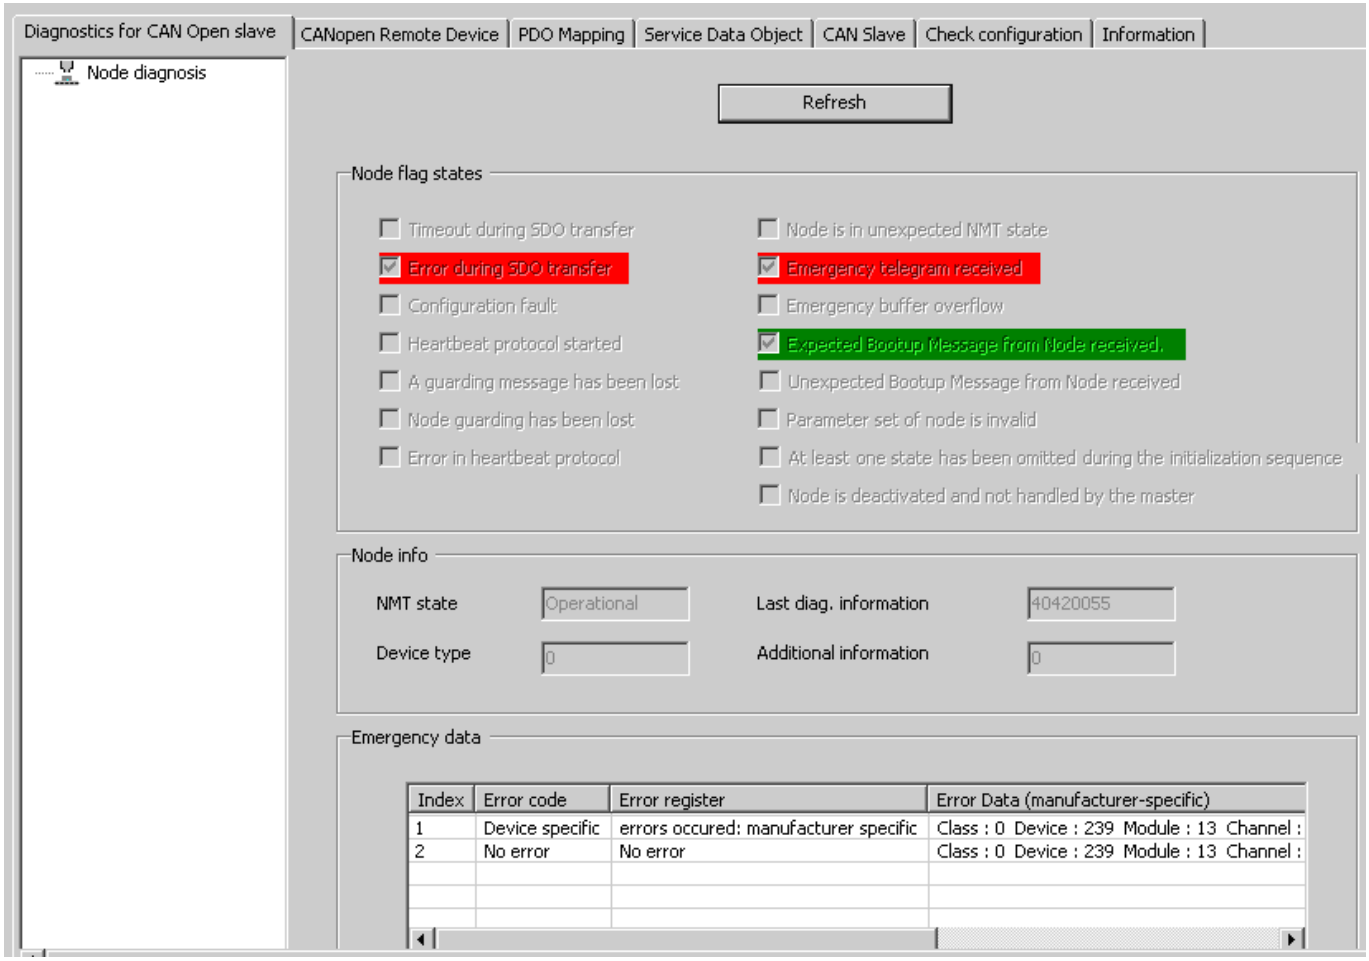
1.7.2.7.9 CI506-PNIO communication interface CANopen slave view



The node flag is an unsigned integer (32 bits) which represents different states of the Slave:

States with green background are normal and expected. All other states have a red background when active indicating that something unexpected has happened or diagnosis data is available.

Node flag This variable is organized as a bitfield as described in the table below:

Node Diagnostic Flags	Bit Name Description
D31 FLAG_DEACTIVATED	Node is deactivated and not handled by the Master. This bit does not generate an entry in the diagnostic list.
D30 FLAG_STATE_NOT_HANDLED	At least one state has been omitted during the initialization sequence of the node. This bit does not generate an entry in the diagnostic list.
D13 ..	Reserved
D29 ..	Reserved
D12 FLAG_INVALID_PARAMETER	Parameter set of node is invalid.
D11 FLAG_UNEXPECTED_BOOTUP	Unexpected Bootup Message from node received.
D10 FLAG_BOOTUP	Expected Bootup Message from node received.
D9 FLAG_EMCY_BUFF_OVER	Emergency buffer overflow
D8 FLAG_EMCY_RECEIVED	Emergency telegram received.
D7 FLAG_UNEXPECTED_STATE	Node is in unexpected NMT state.

Node Diagnostic Flags	Bit Name Description
D6 FLAG_HEARTBEAT_ERROR	Error in heartbeat protocol.
D5 FLAG_CON_LOST	Node guarding has been lost.
D4 FLAG_GUARD_ERROR	A guarding message has been lost. This bit does not generate an entry in the diagnostic list.
D3 FLAG_HEARTBEAT_STARTED	Heartbeat protocol started. This bit does not generate an entry in the diagnostic list.
D2 FLAG_CFG_FAULT	Configuration fault.
D1 FLAG_SDO_ERROR	Error during SDO transfer.
D0 FLAG_SDO_TIMEOUT	Timeout during SDO transfer.

Nmt (network management) state

This variable holds the internal NMT state of the node according to the following table:

NMT State	Value
CANOPEN_MASTER_NODE_NMT_STATE_UNKNOWN	0x00000000L
CANOPEN_MASTER_NODE_NMT_STATE_INITIALISING	0x00000001L
CANOPEN_MASTER_NODE_NMT_STATE_STOPPED	0x00000002L
CANOPEN_MASTER_NODE_NMT_STATE_OPERATIONAL	0x00000003L
CANOPEN_MASTER_NODE_NMT_STATE_PRE_OPERATIONAL	0x00000004L
CANOPEN_MASTER_NODE_NMT_STATE_RESET_APPLICATION	0x00000005L
CANOPEN_MASTER_NODE_NMT_STATE_RESET_COMM	0x00000006L

Last diag info

In this information the last diagnosis information of this node station is held down.

Device type valid

This variable indicates whether the device type in variable DeviceType is valid or not.

DeviceType

These 4 bytes are read out from the node while startup. There are several predefined profile numbers existing, each described in an own specification manual. Here is an extract of these:

	decimal
Device Profile for I/O modules	401
Device Profile for Drives and Motion Control	402
Device Profile for Encode	406

Emergency data

Each slave can held up to 5 emergency data structures which consists of 8 bytes each.

An Emergency data structure consist of a 2 byte error code, a 1 byte error register and 5 bytes emergency data (which are always manufacturer specific):

Emergency Error Codes (hex)	Error Code Description
00xx	Error Reset or No Error
10xx	Generic Error
20xx	Current
21xx	Current, device input side
22xx	Current inside the device
23xx	Current, device output side
30xx	Voltage
31xx	Mains Voltage
32xx	Voltage inside the device
33xx	Output Voltage
40xx	Temperature
41xx	Ambient Temperature
42xx	Device Temperature
50xx	Device Hardware
60xx	Device Software
61xx	Internal Software
62xx	User Software
63xx	Data Set
70xx	Additional Modules
80xx	Monitoring
81xx	Communication
8120	CAN in Error Passive Mode
8130	Life Guard Error or Heartbeat Error
8140	Recovered from bus off
8150	Transmit COB-ID collision
82xx	82xx
8210	PDO not processed due to length error
8220	PDO length exceeded
90xx	External Error
F0xx	Additional Functions
FFxx	FFxx Device specific

The bits of the error register have the following meaning:

Error Code	
CANOPEN_MASTER_ERROR_REGISTER_GENERIC_BIT	0x01
CANOPEN_MASTER_ERROR_REGISTER_CURRENT_BIT	0x02
CANOPEN_MASTER_ERROR_REGISTER_VOLTAGE_BIT	0x04
CANOPEN_MASTER_ERROR_REGISTER_TEMPERATURE_BIT	0x08
CANOPEN_MASTER_ERROR_REGISTER_COMM_ERROR_BIT	0x10
CANOPEN_MASTER_ERROR_REGISTER_DEV_PROFILE_BIT	0x20

Error Code	
CANOPEN_MASTER_ERROR_REGISTER_RESERVED_BIT	0x40
CANOPEN_MASTER_ERROR_REGISTER_MANU_SPEC_BIT	0x80

For some ABB CANopen Slaves the emergency data is well known and can be displayed in a decoded way.

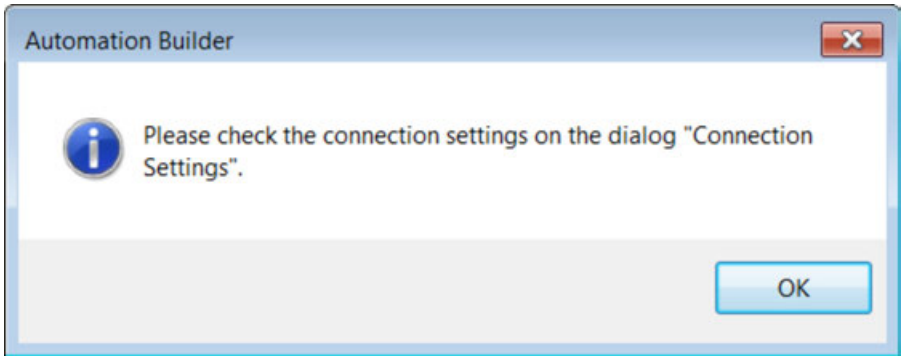
ABB CANopen Slaves are signalling the "Alarm Off/Gone" situation by sending a second emergency data with error code "No Error"

1.7.2.7.10 CI52x Modbus diagnosis

1. Double-click node *"CI52x_MODTCP"* in the device tree.
2. Select *"CI52x Diagnosis"* tab.
   ⇨ The button *[Get Diagnosis]* appears in the tab view.
3. Click on the button *[Get Diagnosis]*.
   ⇨ One of the following use cases will be displayed:
   - Device not connected *"Device not connected" on page 6428*
   - No Errors on the device *"No errors on the device" on page 6428*
   - Diagnosis list *"Diagnosis list" on page 6429*

Device not connected

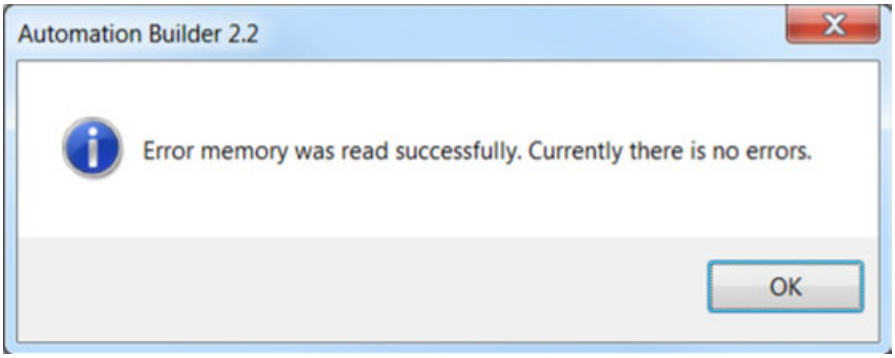
If there is no device connected to the project, the following dialog will be displayed:



1. Select tab *"Connection Settings"* and enter the IP address for the device.
2. Click again button *[Get Diagnosis]*.

No errors on the device

If there are no errors on the device the following dialog will be displayed:



Diagnosis list If the device is not correctly configured the errors will be displayed with *"Error Code"* and *"Code Description"*.

	Error Code	Code Description
▸	234946507	Process voltage too low
	234946541	Process voltage switched off
	234881072	Module number: 1: Measurement overflow or cut wire at the analog input
*		

1.7.3 Diagnosis messages

1.7.3.1 Possible error combinations

The following tables contain the possible combinations of error numbers.

  - Module = Byte 4
  - Channel = Byte 5
  - Error identifier = Byte 6 Bit 0..5
- FBP diagnosis blocks do not contain the interface identification.

1.7.3.2 CPU diagnosis

Table 770: Diagnosis messages directly reported by the CPU

Error class	Component d1	Device d2	Module d3	Channel d4	Error identifier	Error message	Remedy	Error number	Online text
E2	9	0	2	0	15	Not enough memory to generate the external reference list		150 999 055	E2:
E2	9	0	2	1	40	Expected and current FWAPI version are incompatible	Update to newer version of PLC firmware	150 999 144	E2:
E2	9	0	2	2	2	Heap check failed / heap is corrupt	1) Check project regarding usage of pointers for write access. 2) Check project regarding usage of loops containing write accesses to variables probably exceeding their borders. 3) Check project regarding usage of dynamically allocated memory. 4) Check stack size of application task.	150 999 170	E2:
E2	9	0	2	2	37	Cycle time is greater than the set watchdog time	Change task configuration	150 999 205	E2:
E2	9	0	2	2	38	Access violation by an IEC task, e. g. zero pointer (details in call hierarchy) Exception cannot be assigned to an IEC task	Correct program	150 999 206	E2:
E2	9	0	2	3	27	No configuration available	Please contact AC500 support	150 999 259	E2:
E2	9	0	2	x ≥ 4	38	x = 2: Exception cannot be assigned to IEC Task x ≥ 4: Index of the faulty IEC task, Task Index = x - 4	Correct program	150 999 334	E2:
E2	9	0	x ≥4	2	38	x = 2: Exception cannot be assigned to IEC Task x ≥ 4: Index of the faulty IEC task, Task Index = x - 4	Correct program	151 003 302	E2: IEC Task 1

Error class	Component d1	Device d2	Module d3	Channel d4	Error identifier	Error message	Remedy	Error number	Online text
E2	9	0	x	2	37	Cycle time of IEC task index x - 4 is greater than watchdog time (x = 31 -> IEC task index > 27)	Change task configuration	151 003 301	E2: IEC Task 0
E2	9	0	5	2	37	Cycle time is greater than the set watchdog time Cycle time exceeded, but shorter than watchdog time	Change task configuration	151 003 301	E2: IEC Task 1
E2	9	1..6/ 10	1	0	15	• Watchdog task could not be installed • Installation of the Communication Modbus bus driver failed • Initialization error, not enough memory	Check communication module Check CPU firmware version	151 652 367	E2: Ext. [1..6] [COUPLER] E2: Int. [COUPLER]
E2	9	1..6/ 10	1	0	17	Access test failed.	Check communication module Check CPU FW version. For safety PLC: Check safety PLC switch address setting. Restart safety PLC. If this error persists, replace safety PLC.	151 652 369	E2: Ext. [1..6] [COUPLER] E2: Int. [COUPLER
E2	9	1..6/ 10	1	0	18	Watchdog test for the Communication Module failed	Check communication module	151 652 370	E2: Ext. [1..6] [COUPLER] E2: Int. [COUPLER]
E2	9	1..6/ 10	1	0	30	Error in configuration data, PLC cannot read configuration data	Create new configuration data	151 652 382	E2: Ext. [1..6] [COUPLER] E2: Int. [COUPLER]
E2	9	1..6/ 10	1	0	34	Timeout when setting the warm start parameters of the Communication Module	Check communication module	151 652 386	E2: Ext. [1..6] [COUPLER] E2: Int. [COUPLER]
E2	9	1..6/ 10	1	0	38	Installation of the Communication Module driver failed	Check communication module and FW version	151 652 390	E2: Ext. [1..6] [COUPLER] E2: Int. [COUPLER]

Error class	Component d1	Device d2	Module d3	Channel d4	Error identifier	Error message	Remedy	Error number	Online text
E2	9	1..6	1	0	43	Internal error	For safety PLC: Check safety PLC switch address setting. Restart safety PLC. If this error persists, replace safety PLC.	151 652 395	E2: Ext. [1..6] [COUPLER]
E2	9	1..6	2	0..1	0	This error occurs, if the CPU was stopped but a coupler does not stop the communication.	Restart CPU or call support	151 654 400 151 654 464	E2: Ext. [1..6] [COUPLER]

E4	8	1	2	0	52	Frequency at interrupt input too high	Check task configuration and PLC program	151 523 380	E3: Onboard I/O
E4	8	1	2	1	2	Invalid configuration value for PWM channel. Frequency / cycletime for the PWM channel of the 8DI+6DO and 8DI+6DO+2AI+1AO module are common and if both channel are configured for PWM, the frequency of the second channel must be set to 0.	Correct frequency	134 287 426	E4: Onboard I/O PWM Ch: 1
E4	8	4	2	0..1	48	Analog input value too high	Correct value	134 484 016 134 484 080	E4: Onboard I/O AI Ch: 0/1
E4	8	5	2	0	48	Analog output value too high	Correct value	134 549 552	E4: Onboard I/O AO Ch: 0
E4	8	255	0	0	43	Unspecified or internal error occured	Replace CPU	150 929 451	E4: Onboard I/O Ch: 0
E4	8	255	2	0	26	PLC was put into RUN state, although a configuration error is present, because parameter Run on config fault is set to YES	Correct PLC configuration	150 933 530	E4: Onboard I/O Ch: 0
E4	9	8	3	0	28	Different configuration -> old firmware with new Automation Builder or new firmware with old Automation Builder	Update CPU firmware	151 525 404	E4: Onboard I/O

Table 774: Diagnosis messages of the communication module interface [1])

Error class	Component d1	Device d2	Module d3	Channel d4	Error identifier	Error message	Remedy	Error number	Online text
E2	1..6	11/12	3	0	27	Error configuration	Check configuration	167 772 187	E2: Ext. [1..6] [COUPLER], [COUPLER] 11..12, 3, 0
E2	1..6/ 10	255	3	0	2	Same Node ID twice in the net	Use node IDs only once	184 489 986	E2: Ext. [1..6] [COUPLER] E2: Int. [COUPLER]
E3	1..6	0.. 254	31	31	20	Slave-To-Slave communication fails	Check configuration and version	167 837 652	E3: Ext. [1..6] [COUPLER]
E3	1..6	0.. 254	31	31	41	Error on distributed clocks	Check configuration and version	167 837 673	E3: Ext. [1..6] [COUPLER]
E3	1..6/ 10	255	3	0	26	Incorrect or missing Communication Module configuration. Setting of IP parameters failed.	Configure communication module. Check the IP.	184 490 010	E3: Ext. [1..6] [COUPLER] E3: Int. [COUPLER]
E3	1..6/ 10	255	5	0.. 15	0..15	Error message of the operating system of the Communication Module: Channel = Bit 4..7 Error = Bit 0..3	↳ *Chapter 1.7.3.4 “Communication modules diagnosis” on page 6489*	184 494 080	E3: Ext. [1..6] [COUPLER] OS E3: Int. [COUPLER] OS
E3	1..6/ 10	255	6.. 12	0.. 15	0..15	Error message of the task x of the Communication Module: Task x = 'Module' - 5 Channel = Bit 4..7 Error = Bit 0..3	↳ *Chapter 1.7.3.4 “Communication modules diagnosis” on page 6489*	184 496 128	E3: Ext. [1..6] [COUPLER] Task [1..7] E3: Int. [COUPLER] Task [1..7]
E3	1..6/ 10	255	31	0	33	Timeout while waiting for reset of the Communication Module	Check communication module	184 547 361	E3: Ext. [1..6] [COUPLER] E3: Int. [COUPLER]
E3	1..6/ 10	255	31	0	34	Timeout while waiting for readiness of the Communication Module	Check communication module	184 547 362	E3: Ext. [1..6] [COUPLER] E3: Int. [COUPLER]
E3	10	255	1	1	25	Error timeout DHCP (≥ 30 s); fallback IP set by configurator	Check network (IP address, wiring, ...), check DHCP server	184 485 977	E3: Int. [COUPLER]

Error class	Component d1	Device d2	Module d3	Channel d4	Error identifier	Error message	Remedy	Error number	Online text
E3	10	255	3	0	28	Error: changing IP parameter while using this interface; no IP parameters can be changed if the device is in use	Log out, log in and set to run	184 490 012	E3: Int. [COUPLER]
E3	10	255	4	5	25	SNTP: Error - Timeout, no answer in PRESync timeout, program does not start	Check network (IP address, wiring, ...), change PREsync timeout in configuration	184 492 377	E3: Int. [COUPLER]
E3	10	255	4	5	38	SNTP: Error - No answer from server (normal and backup), try again	Check network (IP address, wiring, ...)	184 492 390	E3: Int. [COUPLER]
E4	1..6/ 10	0..7	31	31	47	Short-circuit Communication Module/ channel	Fix short-circuit	167 837 679	E4: Ext. [1..6] [COUPLER], [COUPLER] [1..7] E4: Int. [COUPLER], [COUPLER] [1..7]
E4	1..6/ 10	0.. 254	31	0.. 15	0..15	Communication error to the slave, Channel = Bit 4..7 Error = Bit 0..3	*Chapter 1.7.3.4 "Communication modules diagnosis" on page 6489*	167 835 648	E4: Ext. [1..6] [COUPLER], [COUPLER] [1..254] E4: Int. [COUPLER], [COUPLER] [1..254]
E4	1..6	2	31	1	1	PROFIBUS Slave device <device number>: connection lost Error initalization of slave configuration	Check connection Check configuration values of slave	167 835 713	E4: PROFIBUS Slave device 4 E4: Ext. [1..6] [COUPLER] , [COUPLER] 2
E4	1..6	2	31	1	14	Error initialization of slave configuration	Check slave configuration	167 835 726	E4: Ext. [1..6] [COUPLER] , [COUPLER] 2
E4	1..6	2	31	2	2	Runtime error of slave	Check slave configuration	167 835 778	E4: Ext. [1..6] [COUPLER] , [COUPLER] 2
E4	1..6/ 10	255	2	0.. 15	0..15	Communication error of the Communication Module, Channel = Bit 4..7 Error = Bit 0..3	*Chapter 1.7.3.4 "Communication modules diagnosis" on page 6489*	184 487 936	E4: Ext. [1..6] [COUPLER] E4: Int. [COUPLER]
E4	10	255	4	5	3	SNTP: Error finding connection to server; tried 5 times to get connection	Check network (IP address, wiring, ...)	184 492 355	E4: Int. [COUPLER]

Error class	Component d1	Device d2	Module d3	Channel d4	Error identifier	Error message	Remedy	Error number	Online text
E4	10	255	4	5	10	SNTP: Error time; time difference makes time jump necessary, but too big / not allowed	Set time manually or allow bigger time jumps	184 492 362	E4: Int. [COUPLER]
E4	10	255	4	5	34	SNTP: Could not sync time before configured timeout	Check connection to time server and/or configure bigger timeout	184 482 386	E4: Int. [COUPLER]

[1]) Communication module errors: 1 = UDP DataExchange, 2 = UDP no AC31 Header, 3 = Online Protocol, 4 = Netconfig, 5 = SNTP, 6 = Modbus

Table 775: Diagnosis messages of the serial interfaces

Error class	Component d1	Device d2	Module d3	Channel d4	Error identifier	Error message	Remedy	Error number	Online text
E2	11.. 13	255	31	0	17	Access errors: ● Interface could not be closed ● Interface could not be opened ● Timeslotmode could not be activated	Check FW version, replace CPU if necessary	201 324 561 234 878 993	E2: COM [1..2] E2: FBP
E4	13	255	4	0	42	Receiving error or timeout of the FBP slave interface		234 823 722	E4: FBP

Table 776: Diagnosis messages of the CS31 bus (COM1 = CS31 master)

Error class	Component d1	Device d2	Module d3	Channel d4	Error identifier	Error message	Remedy	Error number	Online text
E3	11	0..61	0..5	0	8	No module found on the CS31 bus	Adapt configuration	184 549 384	E3: COM1 [PROTOCOL] [0..61], [0..5], 0
E3	11	0..61	1..8	0.. 31	0..63	S500 class 3 diagnostic sent by DC551	↳ *Chapter 1.7.3.3 “S500 I/O modules diagnosis” on page 6472*	184 549 376 to 184 549 439	E3: COM1 [PROTOCOL] [0..61], [1..8], [0..30 | (≥) 31]
E3	11	255	1	0	8	No module found on the CS31 Bus	Check configuration	201 263 112	E3: COM1

Error class	Component d1	Device d2	Module d3	Channel d4	Error identifier	Error message	Remedy	Error number	Online text
E4	11	0..61	0..5	0	8	ICMK 14 with extensions configured, the extensions was not found on the bus	Check configuration	184 549 384	E4: COM1 [PROTOCOL] [0..61], [0..5], 0
E4	11	0..61	0..5	0	28	Module discarded and registered again; is only reported at the start		184 549 404	E4: COM1 [PROTOCOL] [0..61], [0..5], 0
E4	11	0..61	0..5	0	32	Not configured module found on the bus, again discarded	Check CS31 bus, insert CS31_DIAG function block into the project	184 549 408	E4: COM1 [PROTOCOL] [0..61], [0..5], 0
E4	11	0..61	0..5	0.. 15	1	Internal error (error 1), reported by an AC31 I/O module	Check module	184 549 377	E4: COM1 [PROTOCOL] [0..61], [0..5], [0..15]
E4	11	0..61	0..5	0.. 15	28	Configured module does not match the module registered to the bus	Check PLC configuration, insert CS31_DIAG function block into the project	184 549 404	E4: COM1 [PROTOCOL] [0..61], [0..5], [0..15]
E4	11	0..61	0..5	0.. 15	32	Not configured module registered to the bus	Check PLC configuration, insert CS31_DIAG function block into the project	184 549 408	E4: COM1 [PROTOCOL] [0..61], [0..5], [0..15]
E4	11	0..61	0..5	0.. 15	47	Short-circuit on CS31 module/channel	Fix short-circuit	184 549 423	E4: COM1 [PROTOCOL] [0..61], [0..5], [0..15]
E4	11	0..61	0, 2, 4	0.. 15	2	Cut wire (Error 2) of an AC31 I/O module	Remove error at the module or the channel	184 549 378	E4: COM1 [PROTOCOL] [0..61], [0|2|4], [0..15]
E4	11	0..61	0, 2, 4	0.. 15	4	Overload (Error 4) of an AC31 I/O module		184 549 380	E4: COM1 [PROTOCOL] [0..61], [0|2|4], [0..15]
E4	11	0..61	0, 2, 4	0.. 15	6	Overload + cut wire (Error 6) of an AC31 I/O module		184 549 382	E4: COM1 [PROTOCOL] [0..61], [0|2|4], [0..15]
E4	11	0..61	0, 2, 4	0.. 15	10	Short-circuit + cut wire or "out of range" at analog modules (Error 10) of an AC31 I/O module		184 549 386	E4: COM1 [PROTOCOL] [0..61], [0|2|4], [0..15]
E4	11	0..61	0, 2, 4	0.. 15	12	Overload + short-circuit (Error 12) of an AC31 I/O module		184 549 388	E4: COM1 [PROTOCOL] [0..61], [0|2|4], [0..15]

Error class	Component d1	Device d2	Module d3	Channel d4	Error identifier	Error message	Remedy	Error number	Online text
E4	11	0..61	0, 2, 4	0.. 15	14	Short-circuit + overload + cut wire (Error 14) of an AC31 I/O module		184 549 390	E4: COM1 [PROTOCOL] [0..61], [0|2|4], [0..15]
E4	11	0..61	1, 3, 5	0.. 15	3	Analog value exceeded (Error 3) of an AC31 I/O Module		184 549 379	E4: COM1 [PROTOCOL] [0..61], [1|3|5], [0..15]
E4	11	0..61	1, 3, 5	0.. 15	9	Cut wire (Error 9) of an AC31 analog module		184 549 385	E4: COM1 [PROTOCOL] [0..61], [1|3|5], [0..15]
E4	11	0..61	1..8	0.. 31	0..63	E4 error messages of DC551 and S500 I/O Modules, see table below	↳ *Chapter 1.7.3.3 "S500 I/O modules diagnosis" on page 6472*	184 549 376	E4: COM1 [PROTOCOL] [0..61], [1..8], [0..30 | (≥) 31]
E4	11	0..61	31	31	9	Impossible configuration DC551 and S500 I/O Modules (too many I/Os in one cluster)	Change configuration	184 614 857	E4: COM1 [PROTOCOL] [0..61]
E4	11	0..61	31	31	31	Impossible configuration DC551 and S500 I/O Modules (too many parameters in one cluster)	Change configuration	184 614 879	E4: COM1 [PROTOCOL] [0..61]
E4	11	0..61	31	31	34	Outputs are written before the configuration of the modules DC551 + S500 I/O have been finished		184 614 882	E4: COM1 [PROTOCOL] [0..61]

1.7.3.3 S500 I/O modules diagnosis

Table 777: S500 I/O module errors

Error class	Component d1	Device d2	Module d3	Channel d4	Error identifier	Error message	Remedy	Error number	Online text
E3	14	1..10	1	0..7	4	Measurement overflow at the I/O module	Check channel wiring and sensor power supply	234881028	E4: I/O-Bus, Mod. [1..10], 1, [0..7]
	11 / 12	ADR	1..10					184549380	E4: COM [1|2] [PROTOCOL] [ADR], [1.. 10], [0..7]

Error class	Component d1	Device d2	Module d3	Channel d4	Error identifier	Error message	Remedy	Error number	Online text
E3	14	1..10	31	31	3	Timeout in the I/O Module	Replace I/O module	234946499	E3: I/O-Bus, Mod. [1..10]
	11 / 12	ADR	1..10					184549379	E3: COM [1|2] [PROTOCOL] [ADR], [1..10], (≥)31
E3	14	1..10	31	31	9	Overflow diagnosis buffer	Restart	234946505	E3: I/O-Bus, Mod. [1..10]
	11 / 12	ADR	1..10					184549385	E3: COM [1|2] [PROTOCOL] [ADR], [1.. 10], (≥)31
E3	14	1..10	31	31	10	Process voltage too high	Check process voltage	234946506	E3: I/O-Bus, Mod. 1..10
	1..4	ADR	1..10						
E3	14	1..10	31	31	11	Process voltage too low	Check process voltage	234946507	E3: I/O-Bus, Mod. [1..10]
	11 / 12	ADR	1..10					184549387	E3: COM [1|2] [PROTOCOL] [ADR] [1.. 10], (≥) 31
E3	14	1..10	31	31	18	Plausibility check failed (iParameter)	Check configuration	234946514	E3: I/O-Bus, Mod. 1..10
	1..4	ADR	1..10						
E3	14	1..10	31	31	19	Checksum error in the I/O Module	Non-safety I/O: Replace I/O Module Safety-I/O: Check safety configu-	234946515	E3: I/O-Bus, Mod. [1..10]

Error class	Component d1	Device d2	Module d3	Channel d4	Error identifier	Error message	Remedy	Error number	Online text
	11 / 12	ADR	1..10				ration and CRCs for iParameters and F-Parameters	184549395	E3: COM [1|2] [PROTOCOL] [ADR], [1.. 10], (≥) 31
E3	14	1..10	31	31	20	PROFIsafe communication error	Restart I/O Module. If this error persists, contact ABB technical support.	234946516	E3: I/O-Bus, Mod. 1..10
	1..4	ADR	1..10						
E3	14	1..10	31	31	25	PROFIsafe watchdog timed out	Restart I/O Module. If this error persists, increase PROFIsafe watchdog time.	234946521	E3: I/O-Bus, Mod. 1..10
	1..4	ADR	1..10						
E3	14	1..10	31	31	26	Parameter value	Check master or configuration	234946522	E3: I/O-Bus, Mod. [1.. 10]
	11 / 12	ADR	1..10					184549402	E3: COM [1|2] [PROTOCOL] [ADR], [1.. 10], (≥)31
E3	14	1..10	31	31	28	F-Parameter configuration and address switch value do not match	Check I/O Module's F-Parameter configuration and module address switch value	234946524	E3: I/O-Bus, Mod. 1..10
	1..4	ADR	1..10						
E3	14	1..10	31	31	36	Internal data interchange disturbed	Replace I/O Module	234946532	E3: I/O-Bus, Mod. [1.. 10]

Error class	Component d1	Device d2	Module d3	Channel d4	Error identifier	Error message	Remedy	Error number	Online text
	11 / 12	ADR	1..10					184549412	E3: COM [1|2] [PROTOCOL] [ADR], [1.. 10], (≥)31
E3	14	1..10	31	31	40	Different hardware and firmware versions in the module	Replace I/O Module	234946536	E3: I/O-Bus, Mod. [1.. 10]
	11 / 12	ADR	1..10					184549416	E3: COM [1|2] [PROTOCOL] [ADR], [1.. 10], (≥)31
E3	14	1..10	31	31	43	Internal error in the device	Replace I/O Module	234946539	E3: I/O-Bus, Mod. [1.. 10]
	11 / 12	ADR	1..10					184549419	E3: COM [1|2] [PROTOCOL] [ADR], [1.. 10], (≥)31
E3	14	1..10	31	31	47	Sensor voltage too low	Check sensor voltage	234946543	E3: I/O-Bus, Mod. [1.. 10]
	11 / 12	ADR	1..10					184549423	E3: COM [1|2] [PROTOCOL] [ADR], [1.. 10], (≥)31
E4	14	1..10	31	31	45	Process voltage switched off (ON->OFF)	Process voltage ON	234946541	E4: I/O-Bus, Mod. [1.. 10]
	11 / 12	ADR	1..10					184549421	E4: COM [1|2] [PROTOCOL] [ADR], [1.. 10], (≥)31

Table 778: Channel errors of the S500 I/O modules

Error class	Component d1	Device d2	Module d3	Channel d4	Error identifier	Error message	Remedy	Error number	Online text
E4	14	1..10	1	0..7	1	Wrong measurement; wrong temperature at the compensations channel	Check temperature compensation channel	234881025	E4: I/O-Bus, Mod. [1..10], 1, [0..7]
	11 / 12	ADR	1..10					184549376	E4: COM [1|2] [PROTOCOL] [ADR], [1.. 10], [0..7]
E4	14	1..10	1	0..7	2	AI531: Wrong measurement; potential difference is to high CD522: PWM duty cycle out of duty area	AI531: Check potential difference CD522: Check min/max values	234881026	E4: I/O-Bus, Mod. [1..10], 1, [0..7]
	11 / 12	ADR	1..10					184549378	E4: COM [1|2] [PROTOCOL] [ADR], [1.. 10], [0..7]
E4	14	1..10	1	0..7	4	Measurement overflow at the I/O module	Check channel wiring and sensor power supply	234881028	E4: I/O-Bus, Mod. [1..10], 1, [0..7]
	11 / 12	ADR	1..10					184549380	E4: COM [1|2] [PROTOCOL] [ADR], [1.. 10], [0..7]
E4	14	1..10	1	0..7	7	Measurement underflow at the analog input	Check input value	234881031	E4: I/O-Bus, Mod. [1..10], 1, [0..7]
	11 / 12	ADR	1..10					184549383	E4: COM [1|2] [PROTOCOL] [ADR], [1.. 10], [0..7]
E4	4	1..10	1	0..7	10	Input/output value to high	Check input/ output value	234881034	E4: I/O-Bus, Mod. [1..10], 1, [0..7]

Error class	Component d1	Device d2	Module d3	Channel d4	Error identifier	Error message	Remedy	Error number	Online text
	11 / 12	ADR	1..10					184549386	E4: COM [1|2] [PROTOCOL] [ADR], [1.. 10], [0..7]
E4	14	1..10	1	0..7	11	AI531:Output voltage 10 V to small CD522: Output voltage 5 V to small (sensor)	AI531: Check charge of the output voltage CD522: Check connection	234881035	E4: I/O-Bus, Mod. [1.. 10], 1, [0..7]

	11 / 12	ADR	1..10					184549424	E4: COM [1|2] [PROTOCOL] [ADR], [1.. 10], [0..7]
E4	14	1..10	3	0..7	49	Short-circuit / Cut wire	Check terminal	234881073	E4: I/O-Bus, Mod. [1..10], 3, [0..7]
	11/12	ADR	1..10					184549425	E4: COM [1|2] [PROTOCOL] [ADR], [1.. 10], [0..7]
E4	14	1..10	3	0..7	7	Measurement underflow at the analog output	Check output value	234881031	E4: I/O-Bus, Mod. [1..10], 3, [0..7]
E4	14	1..10	31	5	8	I/O module removed from hot-swap terminal unit or defective module on hot-swap terminal unit [1)]	Plug I/O module, replace I/O module	234944840	E4: I/O-Bus, Mod. [1..10], 31, [5]

Error class	Component d1	Device d2	Module d3	Channel d4	Error identifier	Error message	Remedy	Error number	Online text
E4	14	1..10	31	5	28	Wrong I/O module plugged on hot-swap terminal unit [1])	Remove wrong I/O module and plug projected I/O module	234944860	E4: I/O-Bus, Mod. [1..10], 31, [5]
E4	14	1..10	31	5	42	No communication with I/O module on hot-swap terminal unit [1])	Replace I/O module	234944874	E4: I/O-Bus, Mod. [1..10], 31, [5]
E4	14	1..10	31	5	54	I/O module does not support hot swap [1]) [2])	Power off system and replace I/O module	234944886	E4: I/O-Bus, Mod. [1..10], 31, [5]
E4	14	1..10	31	6	8	Hot-swap terminal unit required but not found [1])	Replace terminal unit with hot-swap terminal unit and restart	234944904	E4: I/O-Bus, Mod. [1..10], 31, [6]
E4	14	1..10	31	6	42	No communication with hot-swap terminal unit [1])	Restart, if error persists replace terminal unit	234944938	E4: I/O-Bus, Mod. [1..10], 31, [6]

[1]) Diagnosis for hot swap available as of version index F0.

[2]) In case of an I/O module doesn't support hot swapping, do not perform any hot-swap operations (also not on any other terminal units (slots)) as modules may be damaged or I/O bus communication may be disturbed.

Table 779: Module errors DC551-CS31 and CI590

Error class	Component d1	Device d2	Module d3	Channel d4	Error identifier	Error message	Remedy	Error number	Online text
E3	11	ADR	31	31	3	Timeout in the I/O Module	Replace I/O Module	184614851	E3: COM1 [PROTOCOL] [ADR]
E3	11	ADR	31	31	9	Overflow of diagnosis buffer	Restart	184614857	E3: COM1 [PROTOCOL] [ADR]
E3	11	ADR	31	31	11	Process voltage too low	Check process voltage	184614859	E3: COM1 [PROTOCOL] [ADR]
E3	11	ADR	1..7	31	17	No communication with the I/O Module	Replace I/O Module	184549393	E3: COM1 [PROTOCOL] [ADR], [1..7], (≥)31
E3	11	ADR	31	31	19	Checksum error in the I/O Module	Replace I/O Module	184614867	E3: COM1 [PROTOCOL] [ADR]
E3	11	ADR	31	31	26	Parameter error	Check master	184614874	E3: COM1 [PROTOCOL] [ADR]
E3	11	ADR	31	31	28	Configuration of PLC 1 and PLC 2 are different	Check PLC CS31 Module configuration	184614876	E3: COM1 [PROTOCOL] [ADR]
E3	11	ADR	31	31	36	Internal data interchange disturbed	Check PLC program	184614884	E3: COM1 [PROTOCOL] [ADR]
E3	11	ADR	31	31	40	Different hardware and firmware versions in the module	Replace I/O Module	184614888	E3: COM1 [PROTOCOL] [ADR]
E3	11	ADR	31	31	43	Internal error in the module	Replace I/O Module	184614891	E3: COM1 [PROTOCOL] [ADR]

Error class	Component d1	Device d2	Module d3	Channel d4	Error identifier	Error message	Remedy	Error number	Online text
E4	11	ADR	31	31	33	PLC conflict 3)	Check PLC program	184614881	E4: COM1 [PROTOCOL] [ADR]
E4	11	ADR	31	31	34	Outputs are different (synchronization error) 4)	Check PLC program and synchronize	184614882	E4: COM1 [PROTOCOL] [ADR]
E4	11	ADR	31	31	45	Process voltage ON/OFF	Process voltage ON	184614893	E4: COM1 [PROTOCOL] [ADR]
E4	11	ADR	31	31	32	Wrong I/O Module on the slot	Replace I/O Module and check configuration	184614882	E4: COM1 [PROTOCOL] [ADR], [1..10], (≥)31
			1..10					184549410	E4: COM1 [PROTOCOL] [ADR]
E4	11	ADR	31	31	34	No response during initialization of the I/O Module	Replace I/O Module	184614880	E4: COM1 [PROTOCOL] [ADR]
			1..10					184549408	E4: COM1 [PROTOCOL] [ADR], [1..10], (≥)31

[3]) FB HA control mode is both primary or both secondary. Could be only an error output of FB if too much diagnosis

[4]) if no other error occurs, the programs are not identical and parameter is set to report an error in this case

Table 780: Channel errors DC551-CS31 and CI590

Error class	Component d1	Device d2	Module d3	Channel d4	Error identifier	Error message	Remedy	Error number	Online text
E4	11	ADR	1..10/31	8..23	47	Short-circuit at the digital output	Check terminal	184549423	E4: COM1 [PROTOCOL] [ADR] E4: COM1 [PROTOCOL] [ADR], [1..10], (≥)31
E4	11	ADR	1..10/31	8..23	7	Measurement underflow at the analog in/output	Check value	1846133383	E4: COM1 [PROTOCOL] [ADR] E4: COM1 [PROTOCOL] [ADR], [1..10], (≥)31

Table 781: Parameter errors

Error class	Component d1	Device d2	Module d3	Channel d4	Error identifier	Error message	Remedy	Error number	Online text
E3	14	1..10	31	3	1	Wrong parameter value	Check configuration	234944705	
E3	14	1..10	31	3	19	Checksum error has occured in iParameter or F-Parameters	Check safety configuration and CRCs for iParameter and F-Parameters	234944723	E3: I/O-Bus, Mod. 1
E3	14	1..10	31	3	28	F-Parameter configuration and address switch value do not match	Check I/O Module F-Parameter configuration and module address switch value	234944732	E3: I/O-Bus, Mod. 1

Table 782: Runtime errors

Error class	Component d1	Device d2	Module d3	Channel d4	Error identifier	Error message	Remedy	Error number	Online text
E3	14	1..10	31	2	3	PROFIsafe watchdog timed out	Restart I/O Module. If this error persists, increase PROFIsafe watchdog time	234944643	E3: I/O-Bus, Mod. 1
E3	14	1..10	31	2	19	Checksum error has occured in iParameters	Restart I/O Module. If this error persists, replace I/O module. Contact ABB technical support	234944659	E3: I/O-Bus, Mod. 1
E3	14	1..10	31	2	20	PROFIsafe communication error	Restart I/O Module. If this error persists, contact ABB technical support	234944660	E3: I/O-Bus, Mod. 1
E3	14	1..10	31	2	28	Internal error	Contact ABB technical support. Replace I/O Module	234944668	E3: I/O-Bus, Mod. 1
E3	14	1..10	31	2	43	Internal runtime error in I/O module	Contact ABB technical support. Replace I/O module	234944683	E3: I/O-Bus, Mod. 1

Table 783: Background test errors

Error class	Component d1	Device d2	Module d3	Channel d4	Error identifier	Error message	Remedy	Error number	Online text
E3	14	1..10	31	2	4	I/O Module overvoltage	Check I/O module power supply	234944644	E3: I/O-Bus, Mod. 1
E3	14	1..10	31	2	7	I/O Module undervoltage	Check I/O module power supply	234944647	E3: I/O-Bus, Mod. 1
E3	14	1..10	31	2	18	Internal error	Restart I/O module. If this error persists, replace I/O module. Contact ABB technical support	234944658	E3: I/O-Bus, Mod. 1

Table 784: Specific errors AI, DI and DO

Error class	Component d1	Device d2	Module d3	Channel d4	Error identifier	Error message	Remedy	Error number	Online text
E3	14	1..10	0	0..15	3	Discrepancy time expired	Check discrepancy time value, channel wiring and sensor	234881027	E3: I/O-Bus, Mod. 1-10, 0, 0-15
E3	14	1..10	0	0..15	12	Module 0: Test pulse error	Check wiring and sensor	234881036	E3: I/O-Bus, Mod. 1-10, 0, 0-15

Error class	Compo-nent d1	Device d2	Module d3	Channel d4	Error identi-fier	Error message	Remedy	Error number	Online text
			2	0..8		Module 2: Channel stuck-at error	Check I/O Module wiring. Restart I/O Module, if needed. If this error persists, replace I/O Module.		E3: I/O-Bus, Mod. 1..10, 2, 0..8
E3	14	1..10	0	0..15	13	Module 0: Channel test pulse cross-talk error	Check wiring and sensor. If this error persists, replace I/O Module. Contact ABB technical support	234881037	E3: I/O-Bus, Mod. 1-10, 0, 0-15
			2	0..7		Module 2: Channel readback error	Check I/O Module wiring. Restart I/O Module, if needed. If this error persists, replace I/O Module.		E3: I/O-Bus, Mod. 1..10, 2, 0..8

Error class	Compo-nent d1	Device d2	Module d3	Channel d4	Error identi-fier	Error message	Remedy	Error number	Online text
E3	14	1..10	0	0..15	18	Channel test error	Check I/O module wiring. Restart I/O module, if needed. If this error persists, replace I/O Module	234881042	E3: I/O-Bus, Mod. 1-10, 0, 0-15
E3	14	1..10	0	0..15	25	Channel stuck - at error	Check I/O Module wiring. Restart I/O Module, if needed. If this error persists, replace I/O Module.	234881049	E3: I/O-Bus, Mod. 1..10, 0, 0..15
E3	14	1..10	0	0..15	28	Channel cross-talk error	Check I/O module wiring. Restart I/O module, if needed. If this error persists, replace I/O Module	234881052	E3: I/O-Bus, Mod. 1-10, 0, 0-15
E3	14	1..10	1	0..3	4	Measurement overflow at the I/O Module	Check channel wiring and sensor power supply	234881028	E4: I/O-Bus, Mod. 1..10, 1, 0..3

Error class	Component d1	Device d2	Module d3	Channel d4	Error identifier	Error message	Remedy	Error number	Online text
E3	14	1..10	1	0..3	7	Measurement underflow at the I/O Module	Check channel wiring and sensor power supply	234881031	E3: I/O-Bus, Mod. 1..10, 1, 0..3
E3	14	1..10	1	0..3	45	Cut wire	Check channel wiring and sensor power supply	234881069	E3: I/O-Bus, Mod. 1, 1, 1 - 3
E3	14	1..10	1	0..3	51	Overload	Check channel wiring and sensor power supply	234881075	E3: I/O-Bus, Mod. 1, 1, 1 - 3
E3	14	1..10	1	0..3	55	Channel value difference too high	Adjust tolerance window for channels. Check channel wiring and sensor configuration.	234881079	E3: I/O-Bus, Mod. 1, 1, 1 - 3
E3	14	1..10	2	0..7	18	Channel cross-talk error	Check I/O Module wiring. Restart I/O Module, if needed. If this error persists, replace I/O Module.	234881042	E3: I/O-Bus, Mod. 1..10, 4, 0..8
E3	14	1..10	2	0..8	43	Internal error	Contact ABB technical support. Replace I/O Module.	234881067	E3: I/O-Bus, Mod. 1, 4, 0-7

Error class	Component d1	Device d2	Module d3	Channel d4	Error identifier	Error message	Remedy	Error number	Online text
E3	14	1..10	4	0..7	13	Channel test error	Check I/O module wiring. Restart I/O Module, if needed. If this error persists, replace I/O module	234881037	E3: I/O-Bus, Mod. 1, 4, 0-7
E3	14	1..10	4	0..7	17	Channel test error	Check I/O module wiring. Restart I/O module, if needed. If this error persists, replace I/O Module	234881025	E3: I/O-Bus, Mod. 1, 4, 0-7

1.7.3.4 Communication modules diagnosis

1.7.3.4.1 Errors of the communication module's operating system

[1]):

- The error information is also available at the output ERNO of the blocks used for the Communication Module.
- The following applies: ERNO := 6000hex OR error.

1.7.3.4.3 CM579-ETHCAT

Status codes

Hexadecimal Value	Definition	Description
0x00000000	TLR_S_OK	Status ok
0xC0650005	TLR_E_ETHERCAT_MASTER_ERROR_BUSSCAN_FAILED	Existing bus does not match config-ured bus.
0xC0650006	TLR_E_ETHERCAT_MASTER_NOT_ALL_SLAVES_AVAIL	Not all slaves are available.
0xC065000B	TLR_E_ETHERCAT_MASTER_INVALID_BUSCYCLETIME	The requested bus cycle time is invalid.
0xC065000C	TLR_E_ETHERCAT_MASTER_INVALID_BROKEN_SLAVE_BEHAV-IOUR_PARA	Invalid parameter for broken slave behavior.
0xC065000F	TLR_E_ETHERCAT_MASTER_COE_INVALID_SLAVEID	Invalid SlaveId was used for CoE.
0xC0650012	TLR_E_ETHERCAT_MASTER_COE_INVALID_INDEX	Invalid Index on slave requested.
0xC0650013	TLR_E_ETHERCAT_MASTER_COE_INVALID_COMMUNICA-TION_STATE	Invalid bus communication state for CoE-Usage.
0xC0650014	TLR_E_ETHERCAT_MASTER_COE_FRAME_LOST	Frame with CoE data is lost.

Hexadecimal Value	Definition	Description
0xC0650015	TLR_E_ETHERCAT_MASTER_COE_TIMEOUT	Timeout during CoE service.
0xC0650016	TLR_E_ETHERCAT_MASTER_COE_SLAVE_NOT_ADDRESSABLE	Slave is not addressable (not on bus or power down?).
0xC0650017	TLR_E_ETHERCAT_MASTER_COE_INVALID_LIST_TYPE	Invalid list type requested (during GetOdList).
0xC0650018	TLR_E_ETHERCAT_MASTER_COE_SLAVE_RESPONSE_TOO_BIG	Data in slave response is too big for confirmation packet.
0xC0650019	TLR_E_ETHERCAT_MASTER_COE_INVALID_ACCESSBITMASK	Invalid access mask selected (during GetEntryDesc).
0xC065001A	TLR_E_ETHERCAT_MASTER_COE_WKC_ERROR	Slave Working Counter Error during CoE service.
0xC065001C	TLR_E_ETHERCAT_MASTER_INVALID_COMMUNICATION_STATE	Command is not usable in the communication state.
0xC065001E	TLR_E_ETHERCAT_MASTER_BUS_SCAN_CURRENTLY_RUNNING	The scan is already running. It cannot be started twice at the same time.
0xC065001F	TLR_E_ETHERCAT_MASTER_BUS_SCAN_TIMEOUT	Timeout during bus scan. But at least a link is established.
0xC0650020	TLR_E_ETHERCAT_MASTER_BUS_SCAN_NOT_READY_YET	The bus scan was not started before or is not finish yet.
0xC0650021	TLR_E_ETHERCAT_MASTER_BUS_SCAN_INVALID_SLAVE	The requested slave is invalid.
0xC0650022	TLR_E_ETHERCAT_MASTER_COE_INVALIDACCESS	Slave does not allow reading or writing (CoE-Access).
0xC0650023	TLR_E_ETHERCAT_MASTER_COE_NO_MBX_SUPPORT	Slave does not support a mailbox.
0xC0650024	TLR_E_ETHERCAT_MASTER_COE_NO_COE_SUPPORT	Slave does not support CoE.
0xC0650025	TLR_E_ETHERCAT_MASTER_TASK_CREATION_FAILED	Task could not be created during run time.
0xC0650026	TLR_E_ETHERCAT_MASTER_INVALID_SLAVE_SM_CONFIGURATION	The Sync Manager configuration of a slave is invalid.
0xC0650027	TLR_E_ETHERCAT_MASTER_SDO_ABORTCODE_TOGGLE	SDO abort code: Toggle bit not alternated.
0xC0650028	TLR_E_ETHERCAT_MASTER_SDO_ABORTCODE_TIMEOUT	SDO abort code: SDO protocol timed out.
0xC0650029	TLR_E_ETHERCAT_MASTER_SDO_ABORTCODE_CCS_SCS	SDO abort code: Client/server command specifier not valid or unknown.
0xC065002A	TLR_E_ETHERCAT_MASTER_SDO_ABORTCODE_BLK_SIZE	SDO abort code: Invalid block size (block mode only).
0xC065002B	TLR_E_ETHERCAT_MASTER_SDO_ABORTCODE_SEQNO	SDO abort code: Invalid sequence number (block mode only).
0xC065002C	TLR_E_ETHERCAT_MASTER_SDO_ABORTCODE_CRC	SDO abort code: CRC error (block mode only).
0xC065002D	TLR_E_ETHERCAT_MASTER_SDO_ABORTCODE_MEMORY	SDO abort code: Out of memory.
0xC065002E	TLR_E_ETHERCAT_MASTER_SDO_ABORTCODE_ACCESS	SDO abort code: Unsupported access to an object.

Hexadecimal Value	Definition	Description
0xC065002F	TLR_E_ETHERCAT_MASTER_SDO_ABORTCODE_WRITEONLY	SDO abort code: Attempt to read a write only object.
0xC0650030	TLR_E_ETHERCAT_MASTER_SDO_ABORTCODE_READONLY	SDO abort code: Attempt to write a read only object.
0xC0650031	TLR_E_ETHERCAT_MASTER_SDO_ABORTCODE_INDEX	SDO abort code: Object does not exist in the object dictionary.
0xC0650032	TLR_E_ETHERCAT_MASTER_SDO_ABORTCODE_PDO_MAP	SDO abort code: Object cannot be mapped to the PDO.
0xC0650033	TLR_E_ETHERCAT_MASTER_SDO_ABORTCODE_PDO_LEN	SDO abort code: The number and length of the objects to be mapped would exceed PDO length.
0xC0650034	TLR_E_ETHERCAT_MASTER_SDO_ABORTCODE_P_INCOMP	SDO abort code: General parameter incompatibility reason.
0xC0650035	TLR_E_ETHERCAT_MASTER_SDO_ABORTCODE_I_INCOMP	SDO abort code: General internal incompatibility in the device.
0xC0650036	TLR_E_ETHERCAT_MASTER_SDO_ABORTCODE_HARDWARE	SDO abort code: Access failed due to an hardware error.
0xC0650037	TLR_E_ETHERCAT_MASTER_SDO_ABORTCODE_DATA_SIZE	SDO abort code: Data type does not match, length of service parameter does not match.
0xC0650038	TLR_E_ETHERCAT_MASTER_SDO_ABORTCODE_DATA_SIZE1	SDO abort code: Data type does not match, length of service parameter too high.
0xC0650039	TLR_E_ETHERCAT_MASTER_SDO_ABORTCODE_DATA_SIZE2	SDO abort code: Data type does not match, length of service parameter too low.
0xC065003A	TLR_E_ETHERCAT_MASTER_SDO_ABORTCODE_OFFSET	SDO abort code: Sub-index does not exist.
0xC065003B	TLR_E_ETHERCAT_MASTER_SDO_ABORTCODE_DATA_RANGE	SDO abort code: Range of values of parameter exceeded (only for write access).
0xC065003C	TLR_E_ETHERCAT_MASTER_SDO_ABORTCODE_DATA_RANGE1	SDO abort code: Value of parameter written too high.
0xC065003D	TLR_E_ETHERCAT_MASTER_SDO_ABORTCODE_DATA_RANGE2	SDO abort code: Value of parameter written too low.
0xC065003E	TLR_E_ETHERCAT_MASTER_SDO_ABORTCODE_MINMAX	SDO abort code: Maximum value is less than minimum value.
0xC065003F	TLR_E_ETHERCAT_MASTER_SDO_ABORTCODE_GENERAL	SDO abort code: general error.
0xC0650040	TLR_E_ETHERCAT_MASTER_SDO_ABORTCODE_TRANSFER	SDO abort code: Data cannot be transferred or stored to the application.
0xC0650041	TLR_E_ETHERCAT_MASTER_SDO_ABORTCODE_TRANSFER1	SDO abort code: Data cannot be transferred or stored to the application because of local control.
0xC0650042	TLR_E_ETHERCAT_MASTER_SDO_ABORTCODE_TRANSFER2	SDO abort code: Data cannot be transferred or stored to the application because of the present device state.

Hexadecimal Value	Definition	Description
0xC0650043	TLR_E_ETHERCAT_MASTER_SDO_ABORTCODE_DICTIONARY	SDO abort code: Object dictionary dynamic generation fails or no object dictionary is present (e.g. object dictionary is generated from file and generation fails because of an file error).
0xC0650044	TLR_E_ETHERCAT_MASTER_SDO_ABORTCODE_UNKNOWN	SDO abort code: unknown code.
0xC0CC0001	ECM_ERROR_LLD_TIMEOUT	LLD: Timeout
0xC0CC0003	ECM_ERROR_LLD_UNSUPPORTED_COMMAND	LLD: Unsupported command
0xC0CC0004	ECM_ERROR_LLD_DUPLICATE_FIXED_STATION_ADDRESS	LLD: Duplicate fixed station address
0xC0CC0005	ECM_ERROR_LLD_SII_CHECKSUM_ERROR	LLD: SII Checksum Error
0xC0CC0006	ECM_ERROR_LLD_SII_EEPROM_LOADING_ERROR	LLD: SII EEPROM Loading Error
0xC0CC0007	ECM_ERROR_LLD_SII_MISSING_ERROR_ACK	LLD: SII Missing Error Ack
0xC0CC0008	ECM_ERROR_LLD_STATE_CHANGE_FAILED	LLD: State Change Failed
0xC0CC0009	ECM_ERROR_LLD_UNEXPECTED_AL_STATUS	LLD: Unexpected AL Status
0xC0CC000A	ECM_ERROR_LLD_UNEXPECTED_WKC	LLD: Unexpected WKC
0xC0CC000B	ECM_ERROR_LLD_MAILBOX_NOT_AVAILABLE	LLD: Mailbox not available
0xC0CC000C	ECM_ERROR_LLD_MAILBOX_MESSAGE_TOO_LARGE	LLD: Mailbox message too large
0xC0CC000D	ECM_ERROR_LLD_CONFIGURATION_IN_PROGRESS	LLD: Configuration in progress
0xC0CC000E	ECM_ERROR_LLD_TOO_MANY_CYCLIC_FRAMES	LLD: Too many cyclic frames
0xC0CC000F	ECM_ERROR_LLD_CYCLIC_FRAME_EXCEEDS_MTU	LLD: Cyclic frame exceeds MTU
0xC0CC0010	ECM_ERROR_LLD_INVALID_CYCLIC_TELEGRAM_CONFIG	LLD: Invalid cyclic telegram config
0xC0CC0011	ECM_ERROR_LLD_BUILDING_COPY_ROUTINES_FAILED	LLD: Building copy routines failed
0xC0CC0012	ECM_ERROR_LLD_UNSUPPORTED_SLAVE_STATION_ADDRESS	LLD: Unsupported slave station address
0xC0CC0013	ECM_ERROR_LLD_STATION_ADDRESS_NOT_ALLOWED	LLD: Station Address not allowed
0xC0CC0014	ECM_ERROR_LLD_INVALID_STD_TX_MBX_PHYS_OFFSET	LLD: Invalid Std TxMbx PhysOffset
0xC0CC0015	ECM_ERROR_LLD_INVALID_STD_RX_MBX_PHYS_OFFSET	LLD: Invalid Std Rx Mbx PhysOffset
0xC0CC0016	ECM_ERROR_LLD_INVALID_BOOT_TX_MBX_PHYS_OFFSET	LLD: Invalid BOOT Rx Mbx PhysOffset

Hexadecimal Value	Definition	Description
0xC0CC0017	ECM_ERROR_LLD_INVALID_BOOT_RX_MBX_PHYS_OFFSET	LLD: Invalid BOOT Tx Mbx Phys-Offset
0xC0CC0018	ECM_ERROR_LLD_INVALID_STD_TX_MBX_SM_NO	LLD: Invalid Std Tx Mbx SmNo
0xC0CC0019	ECM_ERROR_LLD_INVALID_STD_RX_MBX_SM_NO	LLD: Invalid Std Rx Mbx SmNo
0xC0CC001A	ECM_ERROR_LLD_INVALID_BOOT_TX_MBX_SM_NO	LLD: Invalid BOOT Tx Mbx SmNo
0xC0CC001B	ECM_ERROR_LLD_INVALID_BOOT_RX_MBX_SM_NO	LLD: Invalid BOOT Rx Mbx SmNo
0xC0CC001C	ECM_ERROR_LLD_UNCON-FIGURED_SLAVE_STA-TION_ADDRESS	LLD: Unconfigured slave station address
0xC0CC001D	ECM_ERROR_LLD_WRONG_SLAVE_STATE	LLD: Wrong slave state
0xC0CC001E	ECM_ERROR_LLD_CYCLE_TIME_TOO_SMALL	LLD: Cycle time too small
0xC0CC001F	ECM_ERROR_LLD_REPETI-TION_COUNT_NOT_SUPPORTED	LLD: Repetition count not supported
0xC0CC0020	ECM_ERROR_LLD_INVALID_CALLBACK_TYPE	LLD: Invalid callback type
0xC0CC0021	ECM_ERROR_LLD_INVALID_CYCLE_MULTIPLIER	LLD: Invalid cycle multiplier
0xC0CC0022	ECM_ERROR_LLD_UNKNOWN_ERROR	LLD: Unknown Error
0xC0CC0023	ECM_ERROR_LLD_INVALID_REG_LENGTH	LLD: Invalid reg length
0xC0CC0024	ECM_ERROR_LLD_INVALID_PARAMETER	LLD: Invalid parameter
0xC0CC0025	ECM_ERROR_LLD_IRQ_NOT_AVAILABLE	LLD: IRQ not available
0xC0CC0026	ECM_ERROR_LLD_IOMEM_IRQ_NOT_AVAILABLE	LLD: IOMem Irq not available
0xC0CC0027	ECM_ERROR_LLD_HW_INIT_FAILED	LLD: Hardware init failed
0xC0CC0028	ECM_ERROR_LLD_MUTEX_CRE-ATION_FAILED	LLD: Mutex creation failed
0xC0CC0029	ECM_ERROR_LLD_DC_RX_LATCH_COM-MAND_REQUIRED_FOR_DC	LLD: DC Rx Latch command is not configured within cyclic frames
0xC0CC002A	ECM_ERROR_LLD_TX_PROCESS_IMAGE_EXCEEDED	LLD: Transmit process image is exceeded
0xC0CC002B	ECM_ERROR_LLD_RX_PROCESS_IMAGE_EXCEEDED	LLD: Receive process image is exceeded
0xC0CC002C	ECM_ERROR_LLD_MBX_STATE_IMAGE_EXCEEDED	LLD: Mailbox State image is exceeded
0xC0CC002D	ECM_ERROR_LLD_RESULT_DUPLICATE_BWR_RX_LATCH_CMD	LLD: Duplicate BWR Rx DC Latch command detected in cyclic frames

Hexadecimal Value	Definition	Description
0xC0CC002E	ECM_ERROR_LLD_RESULT_DUPLICATE_EXT_SYSTIME_CONTROL_CMD	LLD: Duplicate External Sync SysTime Control command detected in cyclic frames
0xC0CC002F	ECM_ERROR_LLD_CC_PROCESS_IMAGE_EXCEEDED	LLD: Cross Communication Process image exceeded
0x40CD0017	ECM_INFO_EMC_BUS_IS_OFF	Bus is off
0xC0CD0001	ECM_ERROR_EMC_REQUEST_DESTINATION_PROBLEM	Request Destination Problem
0xC0CD0002	ECM_ERROR_EMC_INVALID_SLAVE_STATION_ADDRESS	Invalid slave station address
0xC0CD0003	ECM_ERROR_EMC_CONFIGURATION_BUFFER_IS_OPEN	Configuration buffer is open
0xC0CD0004	ECM_ERROR_EMC_WRONG_STATE_FOR_RECONFIGURATION	Wrong state for reconfiguration
0xC0CD0005	ECM_ERROR_EMC_CONFIGURATION_BUFFER_IS_NOT_OPEN	Configuration buffer is not open
0xC0CD0006	ECM_ERROR_EMC_SLAVE_STATION_ADDRESS_ALREADY_IN_CONFIG	Slave station address already in config
0xC0CD0007	ECM_ERROR_EMC_INVALID_STD_MBX_PARAMETERS	Invalid Std Mbx parameters
0xC0CD0008	ECM_ERROR_EMC_INVALID_BOOT_MBX_PARAMETERS	Invalid BOOT Mbx parameters
0xC0CD0009	ECM_ERROR_EMC_STD_MBX_SM_ARE_OVERLAPPING	Std Mbx SMs are overlapping
0xC0CD000A	ECM_ERROR_EMC_BOOT_MBX_SM_ARE_OVERLAPPING	BOOT Mbx SMs are overlapping
0xC0CD000B	ECM_ERROR_EMC_SM_PARAMS_ALREADY_ADDED	SM Params already added
0xC0CD000C	ECM_ERROR_EMC_INVALID_SM_NUMBER	Nvalid SM number
0xC0CD000D	ECM_ERROR_EMC_FMMU_PARAMS_ALREADY_ADDED	FMMU params already added
0xC0CD000E	ECM_ERROR_EMC_INVALID_FMMU_NUMBER	Invalid FMMU number
0xC0CD000F	ECM_ERROR_EMC_INVALID_MIN_STATE	Invalid min state
0xC0CD0010	ECM_ERROR_EMC_CYCLE_FRAME_AMOUNT_EXCEEDED	Cycle frame amount exceeded
0xC0CD0011	ECM_ERROR_EMC_INVALID_CYCLIC_FRAME_IN_CONFIGURATION	Invalid cycle frame in configuration
0xC0CD0012	ECM_ERROR_EMC_CYCLE_FRAME_INDEX_NOT_VALID	Cycle frame index not valid
0xC0CD0013	ECM_ERROR_EMC_INVALID_TELEGRAM_LENGTH	Invalid telegram length
0xC0CD0014	ECM_ERROR_EMC_CYCLE_FRAME_LENGTH_EXCEEDED	Cycle frame length exceeded

Hexadecimal Value	Definition	Description
0xC0CD0015	ECM_ERROR_EMC_AMOUNT_OF_TELE-GRAMS_IN_CYCLIC_FRAME_EXCEEDED	Amount of telegrams in cyclic frame exceeded
0xC0CD0016	ECM_ERROR_EMC_STATE_CHANGE_IN_PROGRESS	State change in progress
0xC0CD0018	ECM_ERROR_EMC_TOO_MANY_SLAVES_GIVEN	Too many slaves given
0xC0CD0019	ECM_ERROR_EMC_DUPLI-CATE_STA-TION_ADDRESS_IN_LIST	Duplicate station address in list
0xC0CD001A	ECM_ERROR_EMC_COM-MAND_TYPE_NOT_ALLOWED_FOR_SLAVE_FSM	Command type not allowed for slave FSM
0xC0CD001B	ECM_ERROR_EMC_CONFIGURA-TION_DATA_INCORRECT	Configuration data incorrect
0xC0CD001C	ECM_ERROR_EMC_VEN-DORID_MISMATCH	VendorID mismatch
0xC0CD001D	ECM_ERROR_EMC_PRODUCT-CODE_MISMATCH	ProductCode mismatch
0xC0CD001E	ECM_ERROR_EMC_REVI-SIONNO_MISMATCH	Revision number mismatch
0xC0CD001F	ECM_ERROR_EMC_SERI-ALNO_MISMATCH	Serial number mismatch
0xC0CD0020	ECM_ERROR_EMC_LOST_CON-NECTION	Lost connection
0xC0CD0021	ECM_ERROR_EMC_UNKNOWN_STATE_CHANGE_HAPPENED	Unknown state change happened
0xC0CD0022	ECM_ERROR_EMC_UNEX-PECTED_STATE_CHANGE_HAP-PENED	Unexpected state change happened
0xC0CD0023	ECM_ERROR_EMC_SLAVE_CHANGED_STATE	Slave changed state
0xC0CD0026	ECM_ERROR_EMC_DC_RX_TIME-STAMP_ERROR	DC Rx Timestamp error
0xC0CD0027	ECM_ERROR_EMC_DC_MASTER_PORT_TIMESTAMP_ERROR	DC master port timestamp error
0xC0CD0028	ECM_ERROR_EMC_INVALID_SLAVE_INDEX	Invalid slave index
0xC0CD0029	ECM_ERROR_EMC_WRONG_MASTER_STATE	
0xC0CD002A	ECM_ERROR_EMC_INVALID_TRANSFER_ID	Invalid Transfer Id
0xC0CD002B	ECM_ERROR_EMC_INVALID_SEGMENTATION	Invalid Segmentation
0xC0CD002C	ECM_ERROR_EMC_IP_PARAMS_ALREADY_ADDED	EoE IP Params already added
0xC0CD002D	ECM_ERROR_EMC_EOE_SUP-PORT_NOT_AVAILABLE	EoE support not available

Hexadecimal Value	Definition	Description
0xC0CD002E	ECM_ERROR_EMC_END_CONFIGURATION_IN_PROGRESS	End configuration in progress
0xC0CD002F	ECM_ERROR_EMC_WRONG_STATE_FOR_RECONFIGURATION_BUS_IS_ON	Wrong state for reconfiguration (Bus Is On)
0xC0CD0030	ECM_ERROR_EMC_WRONG_STATE_FOR_RECONFIGURATION_BUS_SCAN_ACTIVE	Wrong state for reconfiguration (Bus Scan Active)
0xC0CD0031	ECM_ERROR_EMC_WRONG_STATE_FOR_RECONFIGURATION_IN_PROGRESS_TO_BUSOFF	Wrong state for reconfiguration (In Progress to Bus off)
0xC0CD0032	ECM_EROR_EMC_NO_DIAG_ENTRY_AVAILABLE	No Diag Entry available
0xC0CD0033	ECM_ERROR_EMC_SLAVE_SYNC_PARAMS_NOT_POSSIBLE_WITHOUT_WORKING_DC	A slave has been configured to have SYNC0 and/or SYNC1 but does not support DC at all.
0xC0CD0034	ECM_ERROR_EMC_MANDATORY_SLAVE_MISSING	At least one required slave for boot up is missing.
0xC0CD0035	ECM_ERROR_EMC_WRONG_SLAVE_AT_POSITION	A wrong slave at a specific position has been detected.
0xC0CD0036	ECM_ERROR_EMC_NO_DC_REF_CLOCK	No DC reference clock
0xC0CD0037	ECM_ERROR_EMC_DC_REF_CLOCK_DOES_NOT_PROVIDE_64BIT	DC Reference clock does not provide 64 Bit
0xC0CD0038	ECM_ERROR_EMC_INVALID_DC_REF_CLOCK	Invalid DC Reference clock
0xC0CD0039	ECM_ERROR_EMC_COE_SUPPORT_NOT_AVAILABLE	CoE support not available
0xC0CD003A	ECM_ERROR_EMC_SOE_SUPPORT_NOT_AVAILABLE	SoE support not available
0xC0CD003B	ECM_ERROR_EMC_FOE_SUPPORT_NOT_AVAILABLE	FoE support not available
0xC0CD003C	ECM_ERROR_EMC_AOE_SUPPORT_NOT_AVAILABLE	AoE support not available
0x40CD003E	ECM_INFO_EMC_RECONNECTED	Reconnected
0x80CD003F	ECM_WARN_EMC_DC_STOPPED	DC stopped
0xC0CD0040	ECM_ERROR_EMC_STOPPED_DUE_SYNC_ERROR	Stopped due Sync Error
0xC0CD0041	ECM_ERROR_EMC_MANDATORY_SLAVE_NOT_IN_OP	At least one mandatory slave is not in OP
0xC0CD0042	ECM_ERROR_EMC_BUS_CYCLE_TIME_NOT_POSSIBLE	Bus Cycle Time not possible
0xC0CD0043	ECM_ERROR_EMC_TOPOLOGY_ERROR_DETECTED	Topology error detected
0xC0CD0044	ECM_ERROR_EMC_TOPOLOGY_MISMATCH_DETECTED	Topology mismatch detected
0xC0CD0045	ECM_ERROR_EMC_NO_VALID_TOPOLOGY_CONFIGURATION_DATA	No valid topology configuration data

Hexadecimal Value	Definition	Description
0xC0CD0046	ECM_ERROR_EMC_UNEX-PECTED_SLAVE_AT_PORT0	Unexpected slave at port 0 of slave.
0xC0CD0047	ECM_ERROR_EMC_UNEX-PECTED_SLAVE_AT_PORT1	Unexpected slave at port 1 of slave.
0xC0CD0048	ECM_ERROR_EMC_UNEX-PECTED_SLAVE_AT_PORT2	Unexpected slave at port 2 of slave.
0xC0CD0049	ECM_ERROR_EMC_UNEX-PECTED_SLAVE_AT_PORT3	Unexpected slave at port 3 of slave.
0xC0CD004A	ECM_ERROR_EMC_UNEX-PECTED_SLAVE_RECONNECTED	-
0xC0CD004B	ECM_ERROR_EMC_UNEX-PECTED_MISSING_SLAVE_AT_PORT0	Missing slave at port 0 of slave.
0xC0CD004C	ECM_ERROR_EMC_UNEX-PECTED_MISSING_SLAVE_AT_PORT1	Missing slave at port 1 of slave.
0xC0CD004D	ECM_ERROR_EMC_UNEX-PECTED_MISSING_SLAVE_AT_PORT2	Missing slave at port 2 of slave.
0xC0CD004E	ECM_ERROR_EMC_UNEX-PECTED_MISSING_SLAVE_AT_PORT3	Missing slave at port 3 of slave.
0xC0CD004F	ECM_ERROR_EMC_SLAVE_NOT_CHECKED	Slave is not checked.
0xC0CD0050	ECM_ERROR_EMC_UNEX-PECTED_SLAVE_AT_PORT0_1	Unexpected slave at port 0 and 1 of slave.
0xC0CD0051	ECM_ERROR_EMC_UNEX-PECTED_SLAVE_AT_PORT0_2	Unexpected slave at port 0 and 2 of slave.
0xC0CD0052	ECM_ERROR_EMC_UNEX-PECTED_SLAVE_AT_PORT0_3	Unexpected slave at port 0 and 3 of slave.
0xC0CD0053	ECM_ERROR_EMC_UNEX-PECTED_SLAVE_AT_PORT1_2	Unexpected slave at port 1 and 2 of slave.
0xC0CD0054	ECM_ERROR_EMC_UNEX-PECTED_SLAVE_AT_PORT1_3	Unexpected slave at port 1 and 3 of slave.
0xC0CD0055	ECM_ERROR_EMC_UNEX-PECTED_SLAVE_AT_PORT2_3	Unexpected slave at port 2 and 3 of slave.
0xC0CD0056	ECM_ERROR_EMC_UNEX-PECTED_SLAVE_AT_PORT0_1_2	Unexpected slave at port 0, 1 and 2 of slave.
0xC0CD0057	ECM_ERROR_EMC_UNEX-PECTED_SLAVE_AT_PORT0_1_3	Unexpected slave at port 0, 1 and 3 of slave.
0xC0CD0058	ECM_ERROR_EMC_UNEX-PECTED_SLAVE_AT_PORT0_2_3	Unexpected slave at port 0, 2 and 3 of slave.
0xC0CD0059	ECM_ERROR_EMC_UNEX-PECTED_SLAVE_AT_PORT1_2_3	Unexpected slave at port 1, 2 and 3 of slave.
0xC0CD005A	ECM_ERROR_EMC_MISSING_SLAVE_AT_PORT0_1	Missing slave at port 0 and 1 of slave.
0xC0CD005B	ECM_ERROR_EMC_MISSING_SLAVE_AT_PORT0_2	Missing slave at port 0 and 2 of slave.
0xC0CD005C	ECM_ERROR_EMC_MISSING_SLAVE_AT_PORT0_3	Missing slave at port 0 and 3 of slave.

Hexadecimal Value	Definition	Description
0xC0CD005D	ECM_ERROR_EMC_MISSING_SLAVE_AT_PORT1_2	Missing slave at port 1 and 2 of slave.
0xC0CD005E	ECM_ERROR_EMC_MISSING_SLAVE_AT_PORT1_3	Missing slave at port 1 and 3 of slave.
0xC0CD005F	ECM_ERROR_EMC_MISSING_SLAVE_AT_PORT2_3	Missing slave at port 2 and 3 of slave.
0xC0CD0060	ECM_ERROR_EMC_MISSING_SLAVE_AT_PORT0_1_2	Missing slave at port 0, 1 and 2 of slave.
0xC0CD0061	ECM_ERROR_EMC_MISSING_SLAVE_AT_PORT0_1_3	Missing slave at port 0, 1 and 3 of slave.
0xC0CD0062	ECM_ERROR_EMC_MISSING_SLAVE_AT_PORT0_2_3	Missing slave at port 0, 2 and 3 of slave.
0xC0CD0063	ECM_ERROR_EMC_MISSING_SLAVE_AT_PORT1_2_3	Missing slave at port 1, 2 and 3 of slave.
0xC0CD0065	ECM_ERROR_EMC_HC_PARTICIPANT_NOT_ALLOWED_IN_MANDATORY_SLAVE_LIST	A Hot Connect group participant is not allowed to be configured a mandatory slave
0xC0CD0066	ECM_ERROR_EMC_HC_PARTICIPANT_NOT_ALLOWED_IN_MULTIPLE_HC_GROUPS	A Hot Connect group participant is not allowed to be configured in multiple Hot Connect groups
0xC0CD0067	ECM_ERROR_EMC_GC_GROUP_HEAD_IS_NOT_LISTED_FOR_HC_DETECTION	Hot Connect group head is not listed for Hot Connect detection
0xC0CD0068	ECM_ERROR_EMC_DC_SETUP_CALCULATION_ERROR	DC Setup calculation has encountered an error
0xC0CD0069	ECM_ERROR_EMC_NON_DC_SLAVE_MORE_THAN_2_PORTS_IN_DC_SETUP	A slave, which does not support DC, has more than 2 ports in a DC setup
0xC0CD006A	ECM_ERROR_EMC_HC_GROUP_CONTAINS_NOT_CONFIGURED_SLAVE	A Hot Connect group has been defined to include a slave address that has no configuration
0xC0CD006B	ECM_ERROR_EMC_ALCONTROL_TIMEOUT	AL Control Timeout happened i.e. a slave ESM state change was not completed in time
0xC0CD006C	ECM_ERROR_EMC_DC_MEASUREMENT_ERROR	DC measurement encountered an error
0xC0CD006D	ECM_ERROR_EMC_RX_DESTINATION_EXCEEDS_RX_IMAGE_SIZE	Receive destination exceeds receive image size
0xC0CD006E	ECM_ERROR_EMC_TX_SOURCE_EXCEEDS_TX_IMAGE_SIZE	Transmit source exceeds transmit image size
0xC0CD006F	ECM_ERROR_EMC_WCSTATEBIT_EXCEEDS_RX_IMAGE_SIZE	WcState bit placement exceeds receive image size
0xC0CD0070	ECM_ERROR_EMC_WKC_MAPPING_EXCEEDS_RX_IMAGE_SIZE	Wkc value placement exceeds receive image size
0xC0CD0071	ECM_ERROR_EMC_DC_RX_LATCH_ERROR_AT_PORT0	DC Latch Error detected at port 0 of slave
0xC0CD0072	ECM_ERROR_EMC_DC_RX_LATCH_ERROR_AT_PORT1	DC Latch Error detected at port 1 of slave
0xC0CD0073	ECM_ERROR_EMC_DC_RX_LATCH_ERROR_AT_PORT2	DC Latch Error detected at port 2 of slave

Hexadecimal Value	Definition	Description
0xC0CD0074	ECM_ERROR_EMC_DC_RX_LATCH_ERROR_AT_PORT3	DC Latch Error detected at port 3 of slave
0xC0CD0075	ECM_ERROR_EMC_DC_RX_LATCH_ERROR_AT_PORT0_1	DC Latch Error detected at ports 0 and 1 of slave
0xC0CD0076	ECM_ERROR_EMC_DC_RX_LATCH_ERROR_AT_PORT0_2	DC Latch Error detected at ports 0 and 2 of slave
0xC0CD0077	ECM_ERROR_EMC_DC_RX_LATCH_ERROR_AT_PORT0_3	DC Latch Error detected at ports 0 and 3 of slave
0xC0CD0078	ECM_ERROR_EMC_DC_RX_LATCH_ERROR_AT_PORT1_2	DC Latch Error detected at ports 1 and 2 of slave
0xC0CD0079	ECM_ERROR_EMC_DC_RX_LATCH_ERROR_AT_PORT1_3	DC Latch Error detected at ports 1 and 3 of slave
0xC0CD007A	ECM_ERROR_EMC_DC_RX_LATCH_ERROR_AT_PORT2_3	DC Latch Error detected at ports 2 and 3 of slave
0xC0CD007B	ECM_ERROR_EMC_DC_RX_LATCH_ERROR_AT_PORT0_1_2	DC Latch Error detected at ports 0, 1 and 2 of slave
0xC0CD007C	ECM_ERROR_EMC_DC_RX_LATCH_ERROR_AT_PORT0_1_3	DC Latch Error detected at ports 0, 1 and 3 of slave
0xC0CD007D	ECM_ERROR_EMC_DC_RX_LATCH_ERROR_AT_PORTS0_2_3	DC Latch Error detected at ports 0, 2 and 3 of slave
0xC0CD007E	ECM_ERROR_EMC_DC_RX_LATCH_ERROR_AT_PORTS1_2_3	DC Latch Error detected at ports 1, 2 and 3 of slave
0xC0CD007F	ECM_ERROR_EMC_DC_RX_LATCH_ERROR_AT_PORTS0_1_2_3	DC Latch Error detected at ports 0, 1, 2 and 3 of slave
0xC0CD0080	ECM_ERROR_EMC_ASSIGN_PDO_IS_MISSING_PDO_MAPPING	AssignPDO data is missing related PDO mapping data
0xC0CD0081	ECM_ERROR_EMC_EXT_SYNC_OBJ_IS_NOT_MAPPED_TO_SAME_SM	Parts of Ext Sync object are not mapped to the same SyncManager
0xC0CD0082	ECM_ERROR_EMC_DUPLICATE_EXT_SYNC_OBJ	Duplicate Ext Sync object mapping
0xC0CD0083	ECM_ERROR_EMC_UNSUPPORTED_EXT_SYNC_OBJ_RECORD	Unsupported Ext Sync object record detected
0xC0CD0084	ECM_ERROR_EMC_UNSUPPORTED_MAPPING_OF_EXT_SYNC_OBJ_RECORD	Unsupported mapping of Ext Sync object record detected
0xC0CD0085	ECM_ERROR_EMC_MISSING_MAPPING_OF_EXT_SYNC_OBJ_RECORD	Missing mapping of Ext Sync object record detected
0xC0CD0086	ECM_ERROR_EMC_EXT_SYNC_OBJ_IS_NOT_MAPPED_TO_SAME_FMMU	Parts of Ext Sync object are not mapped to the same FMMU
0xC0CD0087	ECM_ERROR_EMC_EXT_SYNC_OBJ_INTERNAL_ERROR	Internal error detected regarding Ext Sync object
0xC0CD0088	ECM_ERROR_EMC_EXT_SYNC_OBJ_IS_NOT_MAPPED_IN_ONE_CYCLIC_CMD	Parts of Ext Sync object are not mapped within the same cyclic command

Hexadecimal Value	Definition	Description
0xC0CD0089	ECM_ERROR_EMC_UNSUP-PORTED_FMMU_MAP-PING_OF_EXT_SYNC_OBJ_RECORD	Unsupported FMMU mapping of Ext Sync object detected
0xC0CD008A	ECM_ERROR_EMC_EXT_SYNC_REQUIRES_ADJUST_EXT_SYNC_CMD	Unicast Ext Sync control (APWR/FPWR 0x910) is required
0xC0CD008B	ECM_ERROR_EMC_EXT_SYNC_CMD_DOES_NOT_MATCH_XRMW_CMD	Unicast Ext Sync control does not match xRMW command
0xC0CD008C	ECM_ERROR_EMC_EXT_SYNC_REQUIRES_XRMW_CMD	Ext Sync requires DC configuration (xRMW command to 0x910)
0xC0CD008D	ECM_ERROR_EMC_EXPLICIT_DEV_IDENT_FAILED_ALSTATUS	Explicit Device identification via ALSTATUS failed
0xC0CD008E	ECM_ERROR_EMC_EXPLICIT_DEV_IDENT_FAILED_REG	Explicit Device identification via register failed
0xC0CD008F	ECM_ERROR_EMC_COPY_INFOS_FOUND_AT_UNMAPPED_RECEIVE_DATA	CopyInfos found at unmapped receive data
0xC0CD0090	ECM_ERROR_EMC_COPY_INFO_RECEIVE_DATA_AREA_NOT_MATCHING	CopyInfo receive data area is not matching
0xC0CD0091	ECM_ERROR_EMC_SDO_UPLOAD_TOO_LONG	SDO Upload data too long
0xC0CD0092	ECM_ERROR_EMC_SDO_UPLOAD_TOO_SHORT	SDO Upload data too short
0xC0CD0093	ECM_ERROR_EMC_SDO_UPLOAD_COM-PARE_DOES_NOT_MATCH_EXPECTATION	SDO Upload compare does not match expectation
0xC0CD0094	ECM_ERROR_EMC_SOE_READ_TOO_LONG	SoE Read IDN data too long
0xC0CD0095	ECM_ERROR_EMC_SOE_READ_TOO_SHORT	SoE Read IDN data too short
0xC0CD0096	ECM_ERROR_EMC_SOE_READ_COM-PARE_DOES_NOT_MATCH_EXPECTATION	SoE Read compare does not match expectation
0xC0CD0097	ECM_ERROR_EMC_REG_INITCMD_COM-PARE_DOES_NOT_MATCH_EXPECTATION	Register read compare does not match expectation
0xC0CD0098	ECM_ERROR_EMC_REDUN-DANCY_PORT_ONLY_POS-SIBLE_ONCE	Redundancy port can only be placed once into configuration
0xC0CD0099	ECM_ERROR_EMC_STARTUP_SCAN_SII_FAILED	Startup scan of SII failed
0xC0CD009A	ECM_ERROR_EMC_STARTUP_VERIFY_SII_FAILED	Startup verification of SII failed
0xC0CD009B	ECM_ERROR_EMC_MAIN_PORT_NOT_CONNECTED	Main port not connected during topology scan

Hexadecimal Value	Definition	Description
0xC0CD009C	ECM_ERROR_EMC_BUS_SCAN_TOO_MANY_SLAVES	Bus scan detects too many slaves
0xC0CD009D	ECM_ERROR_EMC_BUS_SCAN_SPLIT_RING_NOT_SUPPORTED	Bus Scan detects unsupported split ring topology
0xC0CD009E	ECM_ERROR_EMC_BUS_SHUT-DOWN	Bus is shutting down
0xC0CD009F	ECM_ERROR_EMC_MASTER_ADDRESS_NOT_ALLOWED_AS_STATION_ADDRESS	Master address (0) is not allowed as station address
0xC0CD00A0	ECM_ERROR_EMC_FIRST_STATION_HAS_INVALID_PORT_0	First station has invalid port 0
0xC0CD00A1	ECM_ERROR_EMC_STATION_HAS_INVALID_PORT	Station has invalid port
0xC0CD00A2	ECM_ERROR_EMC_STATION_HAS_NOT_LISTED_STATION_ADDRESS_IN_PORT	Station has not listed station address in port
0xC0CD00A3	ECM_ERROR_EMC_PORT_CONNECTION_BETWEEN_STATIONS_DOES_NOT_MATCH	Port connection between stations does not match
0xC0CD00A4	ECM_ERROR_EMC_STATION_HAS_ALREADY_USED_STATION_ADDRESS_IN_PORT	Station has already used station address in port
0xC0CD00A5	ECM_ERROR_EMC_INVALID_SM_PHYS_START_ADDRESS	Invalid Sm physical start address
0xC0CD00A6	ECM_ERROR_EMC_DC_TOPOLOGY_ON_REDUNDANCY_PORT_NOT_SUPPORTED	DC topology on redundancy port connection not supported. DC slaves having AutoIncrement positions behind redundancy port
0xC0CD00A7	ECM_ERROR_EMC_SM_ASSIGN_PDO_ALREADY_ADDED	Sm AssignPdo already added
0xC0CD00A8	ECM_ERROR_EMC_BASE_SYNC_OFFSET_PERCENTAGE_OUT_OF_RANGE	Base Sync Offset percentage out of range
0xC0CF0001	ECM_ERROR_COE_INITIALIZATION_ERROR	CoE: Initialization Error
0xC0CF0002	ECM_ERROR_COE_INVALID_TRANSFER_HANDLE	CoE: Invalid transfer handle used
0xC0CF0003	ECM_ERROR_COE_NO_MAILBOX_AVAILABLE	CoE. No mailbox available
0xC0CF0004	ECM_ERROR_COE_INVALID_TRANSFER_STATE	CoE: Invalid transfer state
0xC0CF0005	ECM_ERROR_COE_TRANSFER_SEGMENT_TOO_LONG	CoE: Transfer segment is too long
0xC0CF0006	ECM_ERROR_COE_SHUTTING_DOWN	CoE is shutting down.
0xC0CF0007	ECM_ERROR_COE_MAX_TOTAL_BYTES_SMALLER_THAN_ACTUAL_TOTAL_BYTES	CoE: Maximum total bytes is smaller than actual total bytes.
0xC0CF0008	ECM_ERROR_COE_MAILBOX_TRANSMIT_FAILED	CoE: Mailbox transmit failed

Hexadecimal Value	Definition	Description
0xC0CF0009	ECM_ERROR_COE_TRANSFER_ABORTED	CoE: Transfer has been aborted.
0xC0CF000A	ECM_ERROR_COE_SDOINFO_INITIALIZATION_ERROR	0xC0CF000B
0xC0CF000C	ECM_ERROR_COE_PROTOCOL_ERROR	CoE Protocol Error
0xC0CF000D	ECM_ERROR_COE_NO_AOE_AVAILABLE	CoE: No AoE available
0xC0CF000F	ECM_ERROR_COE_INVALID_SLAVE_STATION_ADDRESS	CoE: Invalid slave station address
0xC0CF8000	ECM_ERROR_COE_ABORTCODE_TOGGLE_BIT_NOT_ALTERNATED	SDO Abort Code: Toggle Bit not alternated
0xC0CF8001	ECM_ERROR_COE_ABORTCODE_COMMAND_SPECIFIER_NOT_VALID	SDO Abort Code: Command specifier not valid
0xC0CF8002	ECM_ERROR_COE_ABORTCODE_PROTOCOL_TIMEOUT	SDO Abort Code: Protocol Timeout
0xC0CF8003	ECM_ERROR_COE_ABORTCODE_OUT_OF_MEMORY	SDO Abort Code: Out Of Memory
0xC0CF8004	ECM_ERROR_COE_ABORTCODE_UNSUPPORTED_ACCESS	SDO Abort Code: Unsupported access
0xC0CF8005	ECM_ERROR_COE_ABORTCODE_OBJECT_IS_WRITE_ONLY	SDO Abort Code: Object is write only
0xC0CF8006	ECM_ERROR_COE_ABORTCODE_OBJECT_IS_READ_ONLY	SDO Abort Code: Object is read only
0xC0CF8007	ECM_ERROR_COE_ABORTCODE_SUBINDEX_CANNOT_BE_WRITTEN_SI0_NZ	SDO Abort Code: Subindex cannot be written if subindex 0 is not zero
0xC0CF8008	ECM_ERROR_COE_ABORTCODE_COMPLETE_ACCESS_NOT_SUPPORTED	SDO Abort Code: Complete access not supported
0xC0CF8009	ECM_ERROR_COE_ABORTCODE_OBJECT_LENGTH_EXCEEDS_MAILBOX_SIZE	SDO Abort Code: Object length exceeds mailbox size
0xC0CF800A	ECM_ERROR_COE_ABORTCODE_OBJECT_MAPPED_TO_RXPDO_NO_WRITE	SDO Abort Code: Object mapped to RxPDO, SDO Download blocked
0xC0CF800B	ECM_ERROR_COE_ABORTCODE_OBJECT_DOES_NOT_EXIST	SDO Abort Code: Object does not exist
0xC0CF800C	ECM_ERROR_COE_ABORTCODE_OBJECT_CANNOT_BE_PDO_MAPPED	SDO Abort Code: Object cannot be mapped to PDO
0xC0CF800D	ECM_ERROR_COE_ABORTCODE_PDO_LENGTH_WOULD_EXCEED	SDO Abort Code: PDO Length would exceed maximum size
0xC0CF800E	ECM_ERROR_COE_ABORTCODE_GEN_PARAM_INCOMPATIBILITY	SDO Abort Code: General parameter incompatibility

Hexadecimal Value	Definition	Description
0xC0CF800F	ECM_ERROR_COE_ABORT-CODE_ACCESS_FAILED_DUE_TO_HW_ERROR	SDO Abort Code: Access failed due to hardware error
0xC0CF8010	ECM_ERROR_COE_ABORT-CODE_DATA-TYPE_DOES_NOT_MATCH	SDO Abort Code: Data type does not match
0xC0CF8011	ECM_ERROR_COE_ABORT-CODE_DATA-TYPE_LENGTH_TOO_LONG	SDO Abort Code: Data type length too long
0xC0CF8012	ECM_ERROR_COE_ABORT-CODE_DATA-TYPE_LENGTH_TOO_SHORT	SDO Abort Code: Data type length too short
0xC0CF8013	ECM_ERROR_COE_ABORT-CODE_SUB-INDEX_DOES_NOT_EXIST	SDO Abort Code: Subindex does not exist
0xC0CF8014	ECM_ERROR_COE_ABORT-CODE_RANGE_OF_PARAM-ETER_EXCEEDED	SDO Abort Code: Range of parameter exceeded
0xC0CF8015	ECM_ERROR_COE_ABORT-CODE_VALUE_OF_PARAM_WRITTEN_TOO_HIGH	SDO Abort Code: Value of parameter written too high
0xC0CF8016	ECM_ERROR_COE_ABORT-CODE_VALUE_OF_PARAM_WRITTEN_TOO_LOW	SDO Abort Code: Value of parameter written too low
0xC0CF8017	ECM_ERROR_COE_ABORT-CODE_MIN_VALUE_IS_LESS_THAN_MAX_VALUE	SDO Abort Code: Minimum value is less than maximum value
0xC0CF8018	ECM_ERROR_COE_ABORT-CODE_GENERAL_ERROR	SDO Abort Code: General Error
0xC0CF8019	ECM_ERROR_COE_ABORT-CODE_NO_TRANSFER_TO_APP	SDO Abort Code: Data cannot be transferred or stored to the application
0xC0CF801A	ECM_ERROR_COE_ABORT-CODE_LOCAL_CONTROL	SDO Abort Code: Data cannot be transferred or stored to the application because of local control
0xC0CF801B	ECM_ERROR_COE_ABORT-CODE_NO_TRANSFER_DUE_TO_CURRENT_STATE	SDO Abort Code: Data cannot be transferred or stored to the applcation because of the present device state
0xC0CF801C	ECM_ERROR_COE_ABORT-CODE_NO_OBJECT_DIC-TIONARY_PRESENT	SDO Abort Code: Object dictionary dynamic generation fails or no object dictionary is present
0xC0CF801D	ECM_ERROR_COE_ABORT-CODE_UNKNOWN_ABORT_CODE	SDO Abort Code: Unknown abort code
0xC0CF801E	ECM_ERROR_COE_ABORT-CODE_GEN_INTERNAL_COMPAT	SDO Abort Code: General internal incompatibility in the device
0xC0D00001	ECM_ERROR_EOE_INVALID_MAC_ADDRESS	Invalid MAC address
0xC0D00002	ECM_ERROR_EOE_INVALID_CALLBACK_TYPE	Invalid callback type
0xC0D00003	ECM_ERROR_EOE_DESTINA-TION_UNREACHABLE	Destination unreachable

Hexadecimal Value	Definition	Description
0xC0D00004	ECM_ERROR_EOE_INVALID_EOE_RESPONSE	Invalid EoE Response
0xC0D00005	ECM_ERROR_EOE_UNKNOWN_ERROR	SetIPParam/SetFilterParam: Unknown error
0xC0D00006	ECM_ERROR_EOE_UNSPECIFIED_ERROR	SetIPParam/SetFilterParam: Unspecified Error
0xC0D00007	ECM_ERROR_EOE_UNSUPPORTED_FRAME_TYPE	SetIPParam/SetFilterParam: Unsupported frame type
0xC0D00008	ECM_ERROR_EOE_NO_IP_SUPPORT	SetIPParam/SetFilterParam: No IP support
0xC0D00009	ECM_ERROR_EOE_DHCP_NOT_SUPPORTED	SetIPParam/SetFilterParam: DHCP not supported
0xC0D0000A	ECM_ERROR_EOE_NO_FILTER_SUPPORT	SetIPParam/SetFilterParam: No filter supported
0xC0D0000B	ECM_ERROR_EOE_TIMEOUT	EoE Timeout
0xC0D0000C	ECM_ERROR_EOE_SHUTTING_DOWN	EoE is shutting down
0xC0D0000D	ECM_ERROR_EOE_MASTER_ADDRESS_NOT_ALLOWED	EoE: Master address is not allowed to use here
0xC0D0000E	ECM_ERROR_EOE_CONFIGURATION_IS_NOT_OPEN	EoE: Configuration is not open
0xC0D0000F	ECM_ERROR_EOE_CONFIGURATION_IS_ALREADY_OPEN	EoE: Configuration is already open
0xC0D00010	ECM_ERROR_EOE_DUPLICATE_IP_ADDRESS	EoE: Duplicate IP address
0xC0D00011	ECM_ERROR_EOE_DUPLICATE_MAC_ADDRESS_ON_MULTIPLE_PORTS	EoE: Duplicate MAC address on multiple ports
0xC0D00012	ECM_ERROR_EOE_FRAME_TOO_LARGE	EoE: Frame too large
0xC0D00013	ECM_ERROR_EOE_IF_INITIALIZATION_ERROR	EoE: Interface initialization error
0xC0D00014	ECM_ERROR_EOE_IF_NO_FRAME_AVAILABLE	EoE: No Frame available
0xC0D00015	ECM_ERROR_EOE_LINK_DOWN	EoE: Link down
0xC0D10002	ECM_ERROR_FOE_ERROR_UNKNOWN_ERROR	-
0xC0D10003	ECM_ERROR_FOE_INVALID_TRANSFER_HANDLE	FoE: Invalid transfer handle
0xC0D10004	ECM_ERROR_FOE_INVALID_TRANSFER_STATE	FoE: Invalid transfer state
0xC0D10005	ECM_ERROR_FOE_INVALID_SLAVE_STATION_ADDRESS	FoE: Invalid slave station address
0xC0D10006	ECM_ERROR_FOE_WRONG_SLAVE_STATE	FoE: Wrong slave state
0xC0D10007	ECM_ERROR_FOE_NO_MAILBOX_AVAILABLE	FoE: No mailbox available
0xC0D10008	ECM_ERROR_FOE_TRANSFER_ABORTED	FoE: Transfer has been aborted

Hexadecimal Value	Definition	Description
0xC0D10009	ECM_ERROR_FOE_PROTOCOL_TIMEOUT	FoE: Protocol Timeout
0xC0D1000A	ECM_ERROR_FOE_TRANSFER_SEGMENT_TOO_LONG	FoE: Transfer segment is too long
0xC0D1000B	ECM_ERROR_FOE_MAILBOX_TRANSMIT_FAILED	FoE: Mailbox transmit failed
0xC0D1000C	ECM_ERROR_FOE_FILENAME_TOO_LONG	FoE: Filename is too long
0xC0D1000D	ECM_ERROR_FOE_BUFFER_EXCEEDED	FoE: Buffer is exceeded
0xC0D1000E	ECM_ERROR_FOE_FIRST_SEGMENT_SHOULD_NOT_BE_EMPTY	FoE: First segment should not be empty
0xC0D1000F	ECM_ERROR_FOE_SEGMENT_SHOULD_BE_EMPTY	FoE: Segment should be empty
0xC0D18000	ECM_ERROR_FOE_ERROR_NOT_DEFINED	FoE: Error Response: not defined
0xC0D18001	ECM_ERROR_FOE_ERROR_NOT_FOUND	FoE: Error Response: Not Found
0xC0D18002	ECM_ERROR_FOE_ACCESS_DENIED	FoE: Error Response: Access Denied
0xC0D18003	ECM_ERROR_FOE_ERROR_DISK_FULL	FoE: Error Response: Disk full
0xC0D18004	ECM_ERROR_FOE_ERROR_ILLEGAL	FoE: Error Response: Illegal
0xC0D18005	ECM_ERROR_FOE_ERROR_PACKET_NUMBER_WRONG	FoE: Error Response: Packet number is wrong
0xC0D18006	ECM_ERROR_FOE_ERROR_ALREADY_EXISTS	FoE: Error Response: Already exists
0xC0D18007	ECM_ERROR_FOE_ERROR_NO_USER	FoE: Error Response: No User
0xC0D18008	ECM_ERROR_FOE_ERROR_BOOTSTRAP_ONLY	FoE: Acces to specified file is only allowed in BOOT state
0xC0D18009	ECM_ERROR_FOE_ERROR_NOT_BOOTSTRAP	FoE: Access to specified file is only allowed when in PREOP, SAFEOP or OP
0xC0D1800A	ECM_ERROR_FOE_ERROR_NO_RIGHTS	FoE: No Rights
0xC0D1800B	ECM_ERROR_FOE_ERROR_PROGRAM_ERROR	FoE: Program Error
0xC0D20001	ECM_ERROR_SOE_UNKNOWN_SOE_ERROR	SoE: Unknown SoE Error
0xC0D20002	ECM_ERROR_SOE_INITIALIZATION_ERROR	SoE: Initialization error
0xC0D20003	ECM_ERROR_SOE_INVALID_TRANSFER_HANDLE	SoE: Invalid transfer handle
0xC0D20004	ECM_ERROR_SOE_NO_MAILBOX_AVAILABLE	SoE: No Mailbox available
0xC0D20005	ECM_ERROR_SOE_INVALID_TRANSFER_STATE	SoE: Invalid transfer state

Hexadecimal Value	Definition	Description
0xC0D20006	ECM_ERROR_SOE_TRANSFER_SEGMENT_TOO_LONG	SoE: Transfer segment is too long
0xC0D20007	ECM_ERROR_SOE_SHUTTING_DOWN	SoE is shutting down
0xC0D20008	ECM_ERROR_SOE_MAX_TOTAL_BYTES_SMALLER_THAN_ACTUAL_TOTAL_BYTES	SoE: Maximum total bytes is smaller than actual total bytes
0xC0D20009	ECM_ERROR_SOE_MAILBOX_TRANSMIT_FAILED	SoE: Mailbox transmit failed
0xC0D2000A	ECM_ERROR_SOE_INVALID_SOE_HEADER	SoE: Invalid SoE header
0xC0D2000B	ECM_ERROR_SOE_PROTOCOL_TIMEOUT	SoE: Protocol Timeout
0xC0D2000C	ECM_ERROR_SOE_PROTOCOL_ERROR	SoE: Protocol Error
0xC0D2000D	ECM_ERROR_SOE_TRANSFER_ABORTED	SoE: Transfer has been aborted
0xC0D2000E	ECM_ERROR_SOE_WRONG_SLAVE_STATE	SoE: Wrong slave state
0xC0D2000F	ECM_ERROR_SOE_NO_AOE_AVAILABLE	SoE: No AoE available
0xC0D20010	ECM_ERROR_SOE_INVALID_SLAVE_STATION_ADDRESS	SoE: Invalid slave station address
0xC0D21001	ECM_ERROR_SOE_SSC_NO_IDN	SoE: No IDN
0xC0D21009	ECM_ERROR_SOE_SSC_INVALID_ACCESS_TO_ELEMENT_1	SoE: Invalid access to element 1
0xC0D22001	ECM_ERROR_SOE_SCC_NO_NAME	SoE: IDN has no name
0xC0D22002	ECM_ERROR_SOE_SSC_NAME_TRANSMISSION_IS_TOO_SHORT	SoE: Name transmission is too short
0xC0D22003	ECM_ERROR_SOE_SSC_NAME_TRANSMISSION_IS_TOO_LONG	SoE: Name transmission is too long
0xC0D22004	ECM_ERROR_SOE_SSC_NAME_CANNOT_BE_CHANGED	SoE: Name cannot be changed
0xC0D22005	ECM_ERROR_SOE_SSC_NAME_IS_WRITE_PROTECTED_AT_THIS_TIME	SoE: Name is write protected at this time
0xC0D23002	ECM_ERROR_SOE_SSC_ATTRIBUTE_TRANSMISSION_IS_TOO_SHORT	SoE: Attribute transmission is too short
0xC0D23003	ECM_ERROR_SOE_SSC_ATTRIBUTE_TRANSMISSION_IS_TOO_LONG	SoE: Attribute transmission is too long
0xC0D23004	ECM_ERROR_SOE_SSC_ATTRIBUTE_CANNOT_BE_CHANGED	SoE: Attribute cannot be changed
0xC0D23005	ECM_ERROR_SOE_SSC_ATTRIBUTE_IS_WRITE_PROTECTED_AT_THIS_TIME	SoE: Attribute is write protected at this time
0xC0D24001	ECM_ERROR_SOE_SSC_NO_UNIT	SoE: IDN has no unit

Hexadecimal Value	Definition	Description
0xC0D24002	ECM_ERROR_SOE_SSC_UNIT_TRANSMISSION_IS_TOO_SHORT	SoE: Unit transmission is too short
0xC0D24003	ECM_ERROR_SOE_SSC_UNIT_TRANSMISSION_IS_TOO_LONG	SoE: Unit transmission is too long
0xC0D24004	ECM_ERROR_SOE_SSC_UNIT_CANNOT_BE_CHANGED	SoE: Unit cannot be changed
0xC0D24005	ECM_ERROR_SOE_SSC_UNIT_IS_WRITE_PROTECTED_AT_THIS_TIME	SoE: Unit is write protected at this time
0xC0D25001	ECM_ERROR_SOE_SSC_NO_MAXIMUM_VALUE	SoE: IDN has no maximum value
0xC0D25002	ECM_ERROR_SOE_SSC_MINIMUM_VALUE_TRANSMISSION_IS_TOO_SHORT	SoE: Minimum value transmission is too short
0xC0D25003	ECM_ERROR_SOE_SSC_MINIMUM_VALUE_TRANSMISSION_IS_TOO_LONG	SoE: Minimum value transmission is too long
0xC0D25004	ECM_ERROR_SOE_SSC_MINIMUM_VALUE_CANNOT_BE_CHANGED	SoE: Minimum value cannot be changed
0xC0D25005	ECM_ERROR_SOE_SSC_MINIMUM_VALUE_IS_WRITE_PROTECTED_AT_THIS_TIME	SoE: Mimum value is write protected at this time
0xC0D26001	ECM_ERROR_SOE_SSC_NO_MAXIMUM_VALUE	SoE: IDN has no maximum value
0xC0D26002	ECM_ERROR_SOE_SSC_MAXIMUM_VALUE_TRANSMISSION_IS_TOO_SHORT	SoE: Maximum value transmission is too short
0xC0D26003	ECM_ERROR_SOE_SSC_MAXIMUM_VALUE_TRANSMISSION_IS_TOO_LONG	SoE: Maximum value transmission is too long
0xC0D26004	ECM_ERROR_SOE_SSC_MAXIMUM_VALUE_CANNOT_BE_CHANGED	SoE: Maximum value cannot be changed
0xC0D26005	ECM_ERROR_SOE_SSC_MAXIMUM_VALUE_IS_WRITE_PROTECTED_AT_THIS_TIME	SoE: Maximum value is write protected at this time
0xC0D27002	ECM_ERROR_SOE_SSC_OPDATA_TRANSMISSION_IS_TOO_SHORT	SoE: OpData transmission is too short
0xC0D27003	ECM_ERROR_SOE_SSC_OPDATA_TRANSMISSION_IS_TOO_LONG	SoE: OpData transmission is too long
0xC0D27004	ECM_ERROR_SOE_SSC_OPDATA_CANNOT_BE_CHANGED	SoE: OpData cannot be changed
0xC0D27005	ECM_ERROR_SOE_SSC_OPDATA_IS_WRITE_PROTECTED_AT_THIS_TIME	SoE: OpData is write protected at this time
0xC0D27006	ECM_ERROR_SOE_SSC_OPDATA_IS_LOWER_THAN_MINIMUM_VALUE	SoE: OpData is lower than minimum value

Hexadecimal Value	Definition	Description
0xC0D27007	ECM_ERROR_SOE_SSC_OPDATA_IS_HIGHER_THAN_MAXIMUM_VALUE	SoE: OpData is higher than maximum value
0xC0D27008	ECM_ERROR_SOE_SSC_OPDATA_IS_INVALID	SoE: OpData is invalid
0xC0D27009	ECM_ERROR_SOE_SSC_OPDATA_IS_WRITE_PROTECTED_BY_PASSWORD	SoE: OpData is write protected by password
0xC0D2700A	ECM_ERROR_SOE_SSC_OPDATA_IS_WRITE_PROTECTED_DUE_CYCLICALLY_CONFIGURED	SoE: OpData is write protected due to being cyclically configured
0xC0D2700B	ECM_ERROR_SOE_SSC_OPDATA_INVALID_DIRECT_ADDRESSING	SoE: Invalid direct addressing
0xC0D2700C	ECM_ERROR_SOE_SSC_OPDATA_IS_WRITE_PROTECTED_DUE_OTHER_SETTINGS	SoE: OpData is write protected due to other settings.
0xC0D2700D	ECM_ERROR_SOE_SSC_OPDATA_INVALID_FLOATING_POINT_NUMBER	SoE: Invalid floating point number
0xC0D2700E	ECM_ERROR_SOE_SSC_OPDATA_IS_WRITE_PROTECTED_AT_PARAMETERIZATION_LEVEL	SoE: OpData is write protected at parameterization level
0xC0D2700F	ECM_ERROR_SOE_SSC_OPDATA_IS_WRITE_PROTECTED_AT_OPERATION_LEVEL	SoE: OpData is write protected at operation level
0xC0D27010	ECM_ERROR_SOE_SSC_OPDATA_PROCEDURE_COMMAND_ALREADY_ACTIVE	SoE: Procedure command already active
0xC0D27011	ECM_ERROR_SOE_SSC_OPDATA_PROCEDURE_COMMAND_NOT_INTERRUPTIBLE	SoE: Procedure command not interruptible
0xC0D27012	ECM_ERROR_SOE_SSC_OPDATA_PROCEDURE_COMMAND_NOT_EXECUTABLE_AT_THIS_TIME	SoE: Procedure command is not executable at this time
0xC0D27013	ECM_ERROR_SOE_SSC_OPDATA_PROCEDURE_COMMAND_NOT_EXECUTABLE_INVALID_PARAM	SoE: Procedure command is not executable due to invalid parameter
0xC0D4005C	ECM_ERROR_ENI_NO_SLAVES_IN_ENI	ENI does not contain any slaves
0xC0D50001	ECM_ERROR_ALSTATCODE_UNSPECIFIED_ERROR	ALStatusCode: Unspecified error
0xC0D50002	ECM_ERROR_ALSTATCODE_NO_MEMORY	ALStatusCode: No memory
0xC0D50003	ECM_ERROR_ALSTATCODE_INVALID_DEVICE_SETUP	ALStatusCode: Invalid Device Setup
0xC0D50011	ECM_ERROR_ALSTATCODE_INVALID_REQUESTED_STATE_CHANGE	ALStatusCode: Invalid requested state change

Hexadecimal Value	Definition	Description
0xC0D50012	ECM_ERROR_ALSTAT-CODE_UNKNOWN_REQUESTED_STATE	ALStatusCode: Unknown requested state
0xC0D50013	ECM_ERROR_ALSTAT-CODE_BOOTSTRAP_NOT_SUP-PORTED	ALStatusCode: Bootstrap not supported
0xC0D50014	ECM_ERROR_ALSTAT-CODE_NO_VALID_FIRMWARE	ALStatusCode: No valid firmware
0xC0D50015	ECM_ERROR_ALSTAT-CODE_INVALID_BOOT_MAILBOX_CONFIGURATION	ALStatusCode: Invalid BOOT mailbox configuration
0xC0D50016	ECM_ERROR_ALSTAT-CODE_INVALID_PREOP_MAILBOX_CONFIGURATION	ALStatusCode: Invalid PREOP mailbox configuration
0xC0D50017	ECM_ERROR_ALSTAT-CODE_INVALID_SYNC_MAN-AGER_CONFIGURATION	ALStatusCode: Invalid sync manager configuration
0xC0D50018	ECM_ERROR_ALSTAT-CODE_NO_VALID_INPUTS_AVAIL-ABLE	ALStatusCode: No valid inputs available
0xC0D50019	ECM_ERROR_ALSTAT-CODE_NO_VALID_OUTPUTS	ALStatusCode: No valid outputs
0xC0D5001A	ECM_ERROR_ALSTAT-CODE_SYNCHRONIZA-TION_ERROR	ALStatusCode: Synchronization error
0xC0D5001B	ECM_ERROR_ALSTAT-CODE_SYNC_MAN-AGER_WATCHDOG	ALStatusCode: Sync Manager watchdog
0xC0D5001C	ECM_ERROR_ALSTAT-CODE_INVALID_SYNC_MAN-AGER_TYPES	ALStatusCode: Invalid Sync Manager Types
0xC0D5001D	ECM_ERROR_ALSTAT-CODE_INVALID_OUTPUT_CON-FIGURATION	ALStatusCode: Invalid output configuration
0xC0D5001E	ECM_ERROR_ALSTAT-CODE_INVALID_INPUT_CONFIGU-RATION	ALStatusCode: Invalid input configuration
0xC0D5001F	ECM_ERROR_ALSTAT-CODE_INVALID_WATCHDOG_CONFIGURATION	ALStatusCode: Invalid Watchdog configuration
0xC0D50020	ECM_ERROR_ALSTAT-CODE_SLAVE_NEEDS_COLD_START	ALStatusCode: Slave needs cold start
0xC0D50021	ECM_ERROR_ALSTAT-CODE_SLAVE_NEEDS_INIT	ALStatusCode: Slave needs INIT
0xC0D50022	ECM_ERROR_ALSTAT-CODE_SLAVE_NEEDS_PREOP	ALStatusCode: slave needs PREOP
0xC0D50023	ECM_ERROR_ALSTAT-CODE_SLAVE_NEEDS_SAFEOp	ALStatusCode: slave needs SAFEOP
0xC0D50024	ECM_ERROR_ALSTAT-CODE_INVALID_INPUT_MAPPING	ALStatusCode: Invalid Input Mapping

Hexadecimal Value	Definition	Description
0xC0D50025	ECM_ERROR_ALSTAT-CODE_INVALID_OUTPUT_MAP-PING	ALStatusCode: Invalid Output Map-ping
0xC0D50026	ECM_ERROR_ALSTAT-CODE_INCONSISTENT_SET-TINGS	ALStatusCode: Inconsistent settings
0xC0D50027	ECM_ERROR_ALSTAT-CODE_FREERUN_NOT_SUP-PORTED	ALStatusCode: FreeRun not sup-ported
0xC0D50028	ECM_ERROR_ALSTAT-CODE_SYNCMODE_NOT_SUP-PORTED	ALStatusCode: SyncMode not sup-ported
0xC0D50029	ECM_ERROR_ALSTAT-CODE_FREERUN_NEEDS_3BUFF ER_MODE	ALStatusCode: FreeRun needs 3Buffer mode
0xC0D5002A	ECM_ERROR_ALSTAT-CODE_BACK-GROUND_WATCHDOG	ALStatusCode: Background Watchdog
0xC0D5002B	ECM_ERROR_ALSTAT-CODE_NO_VALID_INPUTS_AND_ OUTPUTS	ALStatusCode: No valid Inputs and Outputs
0xC0D5002C	ECM_ERROR_ALSTAT-CODE_FATAL_SYNC_ERROR	ALStatusCode: Fatal Sync error
0xC0D5002D	ECM_ERROR_ALSTAT-CODE_NO_SYNC_ERROR	ALStatusCode: No Sync error
0xC0D50030	ECM_ERROR_ALSTAT-CODE_INVALID_DC_SYNC_CON-FIGURATION	ALStatusCode: Invalid DC SYNC configuration
0xC0D50031	ECM_ERROR_ALSTAT-CODE_INVALID_DC_LATCH_CON-FIGURATION	ALStatusCode: Invalid DC Latch configuration
0xC0D50032	ECM_ERROR_ALSTAT-CODE_PLL_ERROR	ALStatusCode: PLL error
0xC0D50033	ECM_ERROR_ALSTAT-CODE_DC_SYNC_IO_ERROR	ALStatusCode: DC Sync IO error
0xC0D50034	ECM_ERROR_ALSTAT-CODE_DC_SYNC_TIMEOUT_ERR OR	ALStatusCode: DC Sync Timeout Error
0xC0D50035	ECM_ERROR_ALSTAT-CODE_DC_INVALID_SYNC_CYCL E_TIME	ALStatusCode: DC Invalid Sync Cycle Time
0xC0D50036	ECM_ERROR_ALSTAT-CODE_DC_SYNC0_CYCLE_TIME	ALStatusCode: DC Sync0 Cycle Time
0xC0D50037	ECM_ERROR_ALSTAT-CODE_DC_SYNC1_CYCLE_TIME	ALStatusCode: DC Sync1 Cycle Time
0xC0D50041	ECM_ERROR_ALSTAT-CODE_MBX_AOE	ALStatusCode: MBX_AOE
0xC0D50042	ECM_ERROR_ALSTAT-CODE_MBX_EOE	ALStatusCode: MBX_EOE
0xC0D50043	ECM_ERROR_ALSTAT-CODE_MBX_COE	ALStatusCode: MBX_COE

Hexadecimal Value	Definition	Description
0xC0D50044	ECM_ERROR_ALSTAT-CODE_MBX_FOE	ALStatusCode: MBX_FOE
0xC0D50045	ECM_ERROR_ALSTAT-CODE_MBX_SOE	ALStatusCode: MBX_SOE
0xC0D5004F	ECM_ERROR_ALSTAT-CODE_MBX_VOE	ALStatusCode: MBX_VOE
0xC0D50050	ECM_ERROR_ALSTAT-CODE_EEPROM_NO_ACCESS	ALStatusCode: EEPROM no access
0xC0D50051	ECM_ERROR_ALSTAT-CODE_EEPROM_ERROR	ALStatusCode: EEPROM error
0xC0D50060	ECM_ERROR_ALSTAT-CODE_SLAVE_RESTARTED_LOCALLY	ALStatusCode: Slave restarted locally
0xC0D50061	ECM_ERROR_ALSTAT-CODE_DEVICE_IDENTIFICA-TION_VALUE_UPDATED	ALStatusCode: Device identificatin value updated
0xC0D500F0	ECM_ERROR_ALSTAT-CODE_APPLICATION_CON-TROLLER_AVAILABLE	ALStatusCode: Application controller available
0xC0D58000	ECM_ERROR_ALSTAT-CODE_VENDOR_SPE-CIFIC_CODE_START	Begin of vendor-specific ALStatus-Code mapping
0xC0D5FFFF	ECM_ERROR_ALSTAT-CODE_VENDOR_SPE-CIFIC_CODE_END	End of vendor-specific ALStatus-Code mapping
0xC0D60001	ECM_ERROR_IF_COE_SUP-PORT_NOT_AVAILABLE	CoE support is not configured
0xC0D60002	ECM_ERROR_IF_SOE_SUP-PORT_NOT_AVAILABLE	SoE support is not configured
0xC0D60003	ECM_ERROR_IF_FOE_SUP-PORT_NOT_AVAILABLE	FoE support is not configured
0xC0D60004	ECM_ERROR_IF_AOE_SUP-PORT_NOT_AVAILABLE	AoE support is not configured
0xC0D60005	ECM_ERROR_IF_INVALID_TRANS PORT_TYPE	Invalid transfer type
0xC0D60006	ECM_ERROR_IF_SOE_INVALID_D RIVE_NO	SoE: Invalid drive number
0xC0D60007	ECM_ERROR_IF_SOE_INVALID_E LEMENT_FLAGS	SoE: invalid element flags
0xC0D60008	ECM_ERROR_IF_INVALID_SOE_T RANSFER_ID	SoE: Invalid transfer ID
0xC0D60009	ECM_ERROR_IF_TRANSFER_AB ORTED	Transfer aborted
0xC0D6000A	ECM_ERROR_IF_OUT_OF_PACKE TS	Out of packets
0xC0D6000B	ECM_ERROR_IF_OUT_OF_TRAN SFER_CONTEXTS	Out of transfer contexts
0xC0D6000C	ECM_ERROR_IF_INVALID_SUB-INDEX_FOR_COMPLETE_ACCESs	CoE: Invalid subindex for Complete Access

Hexadecimal Value	Definition	Description
0xC0D6000D	ECM_ERROR_IF_INVALID_COE_TRANSFER_ID	CoE: Invalid transfer ID
0xC0D6000E	ECM_ERROR_IF_INVALID_COE_SDOINFO_LISTTYPE	CoE: Invalid SDOINFO ListType
0xC0D6000F	ECM_ERROR_IF_FILE_READ_ERROR	File Read Error
0xC0D60010	ECM_ERROR_IF_COULD_NOT_OPEN_FILE	Could not open file
0xC0D60011	ECM_ERROR_IF_INVALID_CONFIG_NXD	Invalid config.nxd detected
0xC0D60012	ECM_ERROR_IF_CONFIG_NXD_WITHOUT_SLAVES	Config.nxd does not contain any slaves
0xC0D60013	ECM_ERROR_IF_INVALID_FILE_NAME	Invalid file name
0xC0D60014	ECM_ERROR_IF_INVALID_FOE_TRANSFER_ID	Invalid FoE transfer id
0xC0D60015	ECM_ERROR_IF_INVALID_GET_TOPOLOGY_TRANSFER_ID	Invalid GetTopology transfer id

1.7.3.4.4 CM589-PNIO(-4) errors

Error class	Component d1	Device d2	Module d3	Channel d4	Error identifier	Error message	Remedy	Error number	Online text
E4	1..6	255	2	0	45	CM589 PNIO device communication module has no connection to network	Check cabeling	184487981	E4: Ext. [1..6] [COUPLER], E4: Int. [COUPLER]

1.7.3.4.5 CM598-CN errors

CM598-CN Errors can be read out with function blocks:

↳ *Chapter 1.5.4.7.1.9 “CANOM_NODE_DIAG_EXT” on page 937*

↳ *Chapter 1.5.4.7.1.14 “CANOM_STATE ” on page 952*

↳ *Chapter 1.5.4.7.1.15 “CANOM_SYS_DIAG” on page 957*.

1.7.3.4.6 AC500-S: errors from safety CPU and safety I/O modules

Table 790: Common error messages for SM560-S / SM560-S-FD-1 / SM560-S-FD-4 safety CPUs

Error severity	Component or interface	Device	Module	Channel	Error	Error text	Remedy
E2	1 ... 4	255	30	1	0	Operation finished.	Change safety PLC switch address setting or remove memory card from non-safety PLC. Restart safety PLC. If this error persists, replace safety PLC.
E2	1 ... 4	255	30	1	1	Wrong user data	Delete user data from safety PLC. Restart safety PLC and write user data again.
E2	1 ... 4	255	30	1	2	Internal PROFIsafe initialization error	Restart safety PLC. If this error persists, replace safety PLC. Contact ABB technical support.
E2	1 ... 4	255	30	1	12	Flash read error	Restart safety PLC. If this error persists, replace safety PLC. Contact ABB technical support.
E2	1 ... 4	255	30	1	18	Internal error	Contact ABB technical support. Replace safety PLC.
E2	1 ... 4	255	30	1	28	Boot project download error	Reload boot project. If this error persists, replace safety PLC.
E2	1 ... 4	255	30	1	40	Wrong firmware version	Update safety PLC firmware. Restart safety PLC. If this error persists, replace safety PLC.
E2	1 ... 4	255	30	1	43	Internal error	Contact ABB technical support. Replace safety PLC.
E2	1 ... 4	255	30	1	48	Overvoltage or undervoltage detected	Restart safety PLC. Check safety PLC setting for power supply error. If this error persists, replace safety PLC.
E2	1 ... 4	255	30	1	52	Internal error	Contact ABB technical support. Replace safety PLC.
E2	1 ... 4	255	30	2	0	User program triggered safe stop	Check user program
E2	1 ... 4	255	30	2	1	Internal error	Contact ABB technical support. Replace safety PLC.
E2	1 ... 4	255	30	2	2	Internal PROFIsafe error	Restart safety PLC. If this error persists, replace safety PLC. Contact ABB technical support.
E2	1 ... 4	255	30	2	3	Internal error	Contact ABB technical support. Replace safety PLC.
E2	1 ... 4	255	30	2	10	Internal error	Contact ABB technical support. Replace safety PLC.

Error severity	Component or interface	Device	Module	Channel	Error	Error text	Remedy
E2	1 ... 4	255	30	2	13	Flash write error	Restart safety PLC. If this error persists, replace safety PLC. Contact ABB technical support.
E2	1 ... 4	255	30	2	17	Internal error	Contact ABB technical support. Replace safety PLC.
E2	1 ... 4	255	30	2	18	Internal error	Contact ABB technical support. Replace safety PLC.
E2	1 ... 4	255	30	2	19	Checksum error has occurred in safety PLC.	Restart safety PLC. If this error persists, replace safety PLC.
E2	1 ... 4	255	30	2	25	Internal error	Contact ABB technical support. Replace safety PLC.
E2	1 ... 4	255	30	2	37	Cycle time error in safety PLC	Check safety PLC watchdog time.
E2	1 ... 4	255	30	2	38	Internal error	Contact ABB technical support. Replace safety PLC.
E2	1 ... 4	255	30	2	42	Internal error	Contact ABB technical support. Replace safety PLC.
E2	1 ... 4	255	30	2	43	Internal error	Contact ABB technical support. Replace safety PLC.
E2	1 ... 4	255	30	2	52	Internal error	Contact ABB technical support. Replace safety PLC.
E2	1 ... 4	255	30	2	54	Internal error	Contact ABB technical support. Replace safety PLC.
E2	1 ... 4	255	30	3	30	PROFIsafe configuration error	Check F-Parameter configuration of I/O module and reload boot project.
E2	9	1 ... 4	1	0	17	Access test failed	Check safety PLC switch address setting. Restart safety PLC. If this error persists, replace safety PLC.
E2	9	1 ... 4	1	0	43	Internal error	Check safety PLC switch address setting. Restart safety PLC. If this error persists, replace safety PLC
E2	9	1 ... 4	31	0	43	Internal error	Replace module
E3	1 ... 4	255	30	1	26	Error in configuration data, safety PLC cannot read configuration data	Create new configuration data
E3	1 ... 4	255	30	1	27	Error in configuration data, safety PLC cannot read configuration data	Create boot project

Error severity	Component or interface	Device	Module	Channel	Error	Error text	Remedy
E4	1 ... 4	255	30	1	0	Operation finished	Change safety PLC switch address setting or remove memory card from non-safety PLC. Restart safety PLC. If this error persists, replace safety PLC.
E4	1 ... 4	255	30	1	4	Boot project not loaded, maximum power dip reached	Restart safety PLC
E4	1 ... 4	255	30	1	8	Power dip data missed or corrupted. Default power dip data was flashed by safety PLC.	Warning
E4	1 ... 4	255	30	1	19	Checksum error has occured in safety PLC configuration.	Create new boot project and restart safety PLC
E4	1 ... 4	255	30	2	13	Flash write error (production data)	Warning
E4	1 ... 4	255	30	2	26	No or wrong configuration data from PM5x, run state not possible	Create correct boot project at PM5x
E4	1 ... 4	255	30	2	39	More than one instance of SF_WDOG_TIME_SET or SF_MAX_POWER_DIP_SET	Warning
E4	1 ... 4	255	30	4	13	Flash write error (boot project)	Warning
E4	1 ... 4	255	30	5	13	Flash write error (boot code)	Warning
E4	1 ... 4	255	30	6	13	Flash write error (firmware)	Warning
E4	1 ... 4	255	30	7	13	Flash write error (password)	Warning
E4	1 ... 4	255	30	8	13	Flash write error (user data)	Warning
E4	1 ... 4	255	30	9	13	Flash write error (user data)	Warning
E4	1 ... 4	255	30	10	13	Flash write error (internal)	Warning
E4	1 ... 4	255	30	11	13	Flash write error (internal)	Warning
E4	1 ... 4	255	30	12	13	Flash write error (internal)	Warning

Table 791: Specific error messages for SM560-S-FD-1 / SM560-S-FD-4 safety CPUs

Error severity	Component or interface	Device	Module	Channel	Error	Error text	Remedy
E2	1 ... 4	255	28	0 ... 31	43	Internal PROFIsafe F-Device error	Restart safety PLC. If this error persists, replace safety PLC. Contact ABB technical support.
E3	1 ... 4	255	28	0 ... 31	1	Safety destination address not valid (F_Dest_Add)	Check safety PLC configuration or switch address setting. Restart safety PLC. If this error persists, replace safety PLC.
E3	1 ... 4	255	28	0 ... 31	2	Safety source address not valid (F_Source_Add)	Check safety PLC configuration.
E3	1 ... 4	255	28	0 ... 31	10	Parameter "F_SIL" exceeds SIL from specific device application	Check safety PLC configuration.
E3	1 ... 4	255	28	0 ... 31	11	Safety watchdog time value is 0 ms (F_WD_Time)	Check safety PLC configuration.
E3	1 ... 4	255	28	0 ... 31	19	CRC1-Fault	Check safety PLC configuration. If this error persists, contact ABB technical support.
E3	1 ... 4	255	28	0 ... 31	28	Mismatch of safety destination address (F_Dest_Add)	Check safety PLC configuration or switch address setting. Restart safety PLC. If this error persists, replace safety PLC.
E3	1 ... 4	255	28	0 ... 31	42	Parameter "F_CRC_Length" does not match the generated values	Check safety PLC configuration.
E3	1 ... 4	255	28	0 ... 31	40	Version of F-Parameter set incorrect	Check safety PLC configuration.
E3	1 ... 4	255	30	1	17	Safety source addresses cannot be checked	Check PROFIsafe F-Host library version (2.0.0 or above). If this error persists, contact ABB technical support.
E3	1 ... 4	255	30	1	54	PROFIsafe F_Dest_Add rules are violated	Check safety PLC configuration or switch address setting against PROFIsafe F_Dest_Add configuration rules. Restart safety PLC. If this error persists, contact ABB technical support.

Error severity	Component or interface	Device	Module	Channel	Error	Error text	Remedy
E3	1…4	255	28	0…31	26	F_Block_ID not supported	Check safety PLC configuration
E3	1…4	255	28	0…31	20	Transmission error: data inconsistent (CRC2 error)	Check installation and wiring
E3	1…4	255	28	0…31	25	Transmission error: timeout (F_WD_Time or F_WD_Time_2 elapsed)	Check safety PLC configuration

Table 792: Error messages for safety I/O modules (channel or module reintegration is possible)

Error severity	Component or interface	Device	Module	Channel	Error	Error text	Remedy
E3	14	1..10	0	0..15	3	Discrepancy time expired	Check discrepancy time value, channel wiring and sensor.
E3	14	1..10	0	0..15	12	Test pulse error	Check wiring and sensor.
E3	14	1..10	0	0..15	13	Channel test pulse cross-talk error	Check wiring and sensor. If this error persists, replace I/O module. Contact ABB technical support.
E3	14	1..10	0	0..15	25	Channel stuck-at error	Check I/O module wiring. Restart I/O module, if needed. If this error persists, replace I/O module.
E3	14	1..10	0	0..15	28	Channel cross-talk error	Check I/O module wiring. Restart I/O module, if needed. If this error persists, replace I/O module.
E3	14	1..10	1	0..3	4	Measurement overflow at the I/O module	Check channel wiring and sensor power supply.
E3	14	1..10	1	0..3	7	Measurement underflow at the I/O module	Check channel wiring and sensor power supply.
E3	14	1..10	1	0..3	55	Channel value difference too high	Adjust tolerance window for channels. Check channel wiring and sensor configuration.
E3	14	1..10	2	0..7	13	Channel read-back error	Check I/O module wiring. Restart I/O module, if needed. If this error persists, replace I/O module.
E3	14	1..10	2	0..7	18	Channel cross-talk error	Check I/O module wiring. Restart I/O module, if needed. If this error persists, replace I/O module.

Error severity	Compo-nent or interface	Device	Module	Channel	Error	Error text	Remedy
E3	14	1..10	31	31	10	Process voltage too high	Check process voltage
E3	14	1..10	31	31	11	Process voltage too low	Check process voltage
E3	14	1..10	31	31	20	PROFIsafe communication error	Restart I/O module. If this error persists, contact ABB technical support.
E3	14	1..10	31	31	25	PROFIsafe watchdog timed out	Restart I/O module. If this error persists, increase PROFIsafe watchdog time.
E3	14	1..10	31	31	43	Internal error in the device	Replace I/O module

Table 793: Error messages for safety I/O modules (channel or module reintegration is not possible)

Error severity	Compo-nent or interface	Device	Module	Channel	Error	Error text	Remedy
E3	14	1..10	31	31	18	Plausibility check failed (iParameter)	Check configuration
E3	14	1..10	31	31	19	Checksum error in the I/O module	Check safety configuration and CRCs for I- and F-Parameters.
E3	14	1..10	31	31	26	Parameter error	Check master or configuration
E3	14	1..10	31	31	28	F-Parameter configuration and address switch value do not match.	Check I/O module F-Param-eter configuration and module address switch value.

1.7.3.5 Error messages of the AC500 V2 function block libraries

1.7.3.5.1 0000hex...0FFFhex - telegram error

1.7.3.5.2 1000hex...1FFFhex - device error

DEC	HEX	Error description
4097	1001	Device does not exist
4098	1002	Command not supported by the device. The function is not supported by the device firmware/hardware. Block library newer than the device firmware. FC..: No high-speed counter available at the given module.
4100	1004	Error operating mode. FC..: Operating mode "0" -> No counter set in the PLC configuration.
4101	1005	Invalid status FLASH_READ: Block is not written yet FLASH_WRITE: Block was already written RETAIN..: No program loaded Library PROFINET IO: PNIO_WRITE, PNIO_READ: Internal error. Restart the PLC.
4117	1015	Format error SD..: File cannot be read because of an invalid format. Data could not be read or not be read completely.
4119	1017	Incorrect length PERSISTENT..: Data have an incorrect length RETAIN..: Data have an incorrect length
4120	1018	Checksum error
4122	101A	FC..: Internal error (e.g. no CS31 Adr parameter found, wrong size of CS31 Adr) HA..: Internal error (e.g. null pointer received, wrong return value of internal function, no entry in configuration found)

DEC	HEX	Error description
4123	101B	Device access error Flash..: Resources are not available HA..: Remote CPU failure: Other CPU is off or out of order PERSISTENT..: Data could not be copied, access error or no data do exist RETAIN..: Data could not be copied, access error or no data do exist SD..: Access to the memory card is not possible (e.g. memory exhausted, file already opened, etc.
4124	101C	Incorrect number PERSISTENT..: Because of the current CPU parameters, data are loaded only partly
4127	101F	Access protection SD..: Memory card is write protected
4128	1020	Error when opening SD..: Error when opening a file stored on the memory card
4129	1021	Not found FC..: CS31 Bus Module not found EtherCAT Modul not found HA_CS31_CONTROL: Own CI590-CS31-HA slave failure (missing module) HA_CS31_DIAG: One or more CI590-CS31-HA slave(s) is/are inactive HA_CS31_DIAG_VIA_CM574-RS: One or more CI590 are inactive SD..: The searched sector could not be found in the file TASK_INFO: Unknown task
4130	1022	End reached SD..: Section end or end of file reached PERSISTENT..: Because of the current CPU parameters, data are not loaded
4131	1023	Reading error FLASH..: Reading error in data segment: Incorrect checksum
4132	1024	Writing error FLASH..: Block cannot be programmed SD..: File could not be deleted or written
4137	1029	FC..: Wrong configuration (e.g. no CM574-RS configured on specified slot) HA..: Remote CI590-CS31-HA slave failure (missing module)
8191	1FFF	Not ready Flash..: The command is already executed by an other instance SD..: Command cannot be executed. Another instance is already active.

1.7.3.5.3 2000hex...2FFFhex - interface error

DEC	HEX	Error description
8193	2001	Invalid interface, Communication Module number or slot ID COM: Interface is not configured in the "free mode" HA: Wrong COM number at input COM ETH-MOD-MAST: Invalid interface or slot ID
8194	2002	Command not supported by the interface. The function is not supported by the device firmware. Block library newer than the device firmware.
8195	2003	Invalid interface or Communication Module type. Block is not suitable for this type.
8197	2005	HA..: CS31 Bus failure
8198	2006	Fault on both local and remote CPU.
8211	2013	Timeout COM_MOD_MAST: Slave did not respond within the specified time HA..: No Ethernet link, Error in DPRAM communication between CM574-RS and AC500 CPUs. ECAT_COE_READ, ECAT_COE_Write: Response timeout occurs
8212	2014	Framing error (incorrect transmission rate, number of stop bits and/or bits per character)
8213	2015	Parity error HA: Remote CS31 slave sync error. Difference in digital/ analog output buffer of PLC A and B
8214	2016	Idle error COM..: Character timeout occurred
8215	2017	Invalid length COM_MOD_MAST: Invalid data length received COM_REC: Received more data than expected
8216	2018	Checksum error
8217	2019	Handshake error
8218	201A	Service failed COM_REC: Unknown error message of the interface COM_SET_PROT: Interface hardware not accessible. Initialization already failed during system start-up. COM_MOD_SLV_SET_ADDR..: Internal error (e.g. wrong return value of internal function, null pointer received) CS31..: Internal error (e.g. CS31 communication failed) FC..: Internal error (e.g. null pointer received, wrong return value of internal function, no entry in config found) HA..: Internal error (e.g. null pointer received, wrong return value of internal function, no entry in configuration found)
8219	201B	Access error HA..: Remote CS31 Bus failure: Other CPUs' CS31 Bus is out of order IO..: Module number does not exist

DEC	HEX	Error description
8220	201C	Incorrect number (quantity) COM_SET_PROT: Invalid protocol index. Index is not supported by the device firmware. COM_MOD_SLV_SET_ADDR..: Invalid protocol index. HA..: Numbers of CI590-CS31-HA devices configured in line A and line B are different IO..: Invalid module number
8223	201F	Access denied COM..: Access to the interface is not possible at present. Automation Builder, OPC or another program is logged in via the interface.
8226	2022	COM_MOD_SLV_SET_ADDR..: Wrong configuration (No protocols configured). FC..: Wrong configuration (e.g. no Automation Builder configuration, no CS31 configured, no CS31 modules found). HA..: Overflow of HA_DATA reference table
8233	2029	● HA_CS31_CONTROL: – CI590-CS31-HA slave configuration not complete – CI590-CS31-HA slaves in Bus1 and Bus2 are mix-wired – Remote CI590-CS31-HA Failure – CS31 Master Cross Wired / No CS31 configuration / No submodules on CS31 bus ● HA_CS31_DIAG/ HA_CS31_DIAG_VIA_CM574-RS – CI590-CS31-HA slaves in line A and line B are mix-wired.
8234	202A	HA: configuration error: ● Wrong CM574-RS communication ● CM574-RS COM interface is not configured for shared communication ● CM574-RS not added to Communication Module slot ● Wrong configuration of DIAG blocks

1.7.3.5.4 3000hex...3FFFhex - protocol error

DEC	HEX	Error description
12289	3001	Unknown protocol or protocol not configured. MqttClient: The Network Connection has been made but the MQTT service is unavailable on the specified port.
12290	3002	Command not supported by the protocol. The function is not supported by the device firmware. Block library newer than the device firmware.
12291	3003	Another protocol is configured. FC_DC551: The selected interface (COMx) is not set to the CS31 protocol. COM_MOD_SLV_SET_ADDR..: The selected interface (COMx) is not set to the Multi protocol. COM_MOD_SLV_SET_ADDR..: Wrong protocol index (No Modbus protocol on specified index). HA: No CS31 protocol at COM. BACnet B-ASC: Multiple function block instances, one instance allowed only.

DEC	HEX	Error description
12292	3004	Operating mode error COM_MOD_MAST: Invalid operating mode (master/slave).
12293	3005	Protocol status error Fieldbus Communication Module .._SYS_DIAG: Master is not in the OPERATE state. ETH_SMTP_EMAIL_SEND: Internal error (ulHandle wrong). BACnet B-ASC: No device object instantiated.
12307	3013	IEC..: ACTCON timeout ETH_SMTP_EMAIL_SEND: Server timeout MqttClient: The timeout value for the communication has been exceeded.
12308	3014	IEC..: NACK received
12309	3015	ETH_SMTP_EMAIL_SEND: Syntax error in mail address
12310	3016	IEC..: Timeout
12311	3017	Incorrect length ARC..: Buffer is full CAN2..: Total length of all messages too high IEC..: Queue overrun ETH_UDP..: Buffer is full. MqttClient: Received topic or payload is too long.
12313	3019	IEC..: ACTERM timeout Wait answer ETH_SMTP_EMAIL_SEND: Could not connect to server. Not reachable or does not answer.
12314	301A	Execution failed COM_SET_PROT: Initialization of the protocol failed IEC..: Send failed due to queue deleted COM_MOD_SLV_SET_ADDR..: Internal error (e.g. null pointer received, wrong return value of internal function) ETH_SMTP_EMAIL_SEND: Internal error. Mail not sent. (e.g. out of resources) ETH_ICMP_PING: Target Host did not answer the ping echo request before the specified timeout MqttClient: MQTT broker did not answer the ping. MQTT client has passed the KeepAlive or MQTT broker is unreachable.
12315	301B	Access error ARC..: Buffer does not exist / is not specified CAN2..: Buffer does not exist / is not specified ETH_UDP..: Buffer does not exist / is not specified IEC..: Protocol access error IO..: There is no module in the selected slot
12316	301C	Wrong number IO..: Invalid module number > max.

DEC	HEX	Error description
12319	301F	Access denied COM..: Access to the interface is not possible at present. Automation Builder, OPC or another program is logged in via the interface. MqttClient: The Client identifier is correct UTF-8 but not allowed by the Server.
12320	3020	Error when opening ARC..: Error during protocol initialization. Protocol not yet ready. CAN2..: Error during protocol initialization. Protocol not yet ready. IEC..: Data type mismatch for this PIN when data arrived. ETH_UDP..: Error during protocol initialization. Protocol not yet ready. ETH_SMTP_EMAIL_SEND: ● File for attachment cannot be opened ● Server not ready (wrong port configured?) MqttClient: The Server does not support the level of the MQTT protocol requested by the Client.
12321	3021	ETH_SMTP_EMAIL_SEND: File for attachment not found CPU_PROD_ENTRY_READ: Entry not found
12325	3025	Address error COM_MOD_MAST: Receive telegram does not contain the expected register address. ETH_MOD_MAST: Cannot connect to server (IP address) OR response telegram contains wrong UNIT_ID (must be the same as in request). ETH_SMTP_EMAIL_SEND: Internal error (Could not bind sockets). ETH_UDP_REC: Wrong INDEX for connection. ETH_UDP_SEND: Wrong INDEX for connection or IP Destination does not contain a valid IP address. MqttClient: Connection refused, maybe the IP address is malformed.
12326	3026	Function error COM_MOD_MAST: The received FCT does not correspond to the sent FCT.
12327	3027	Invalid value COM_MOD_MAST: Receive telegram contains an unexpected value. MqttClient: Network error on MqttSubscribe/MqttUnsubscribe. Maybe the topic is not valid.
12328	3028	ETH_SMTP_EMAIL_SEND: Out of sockets. Mail not sent (resource starvation). ETH_ICMP_PING: Could not create internal Task (not enough resources). BACnet B-ASC: Protocol task start failed.
12329	3029	HA..: CI590-CS31-HA slave configuration is not complete.
12331	302B	Unspecified error MqttClient: Internal library returned an unspecified error.
12333	302D	No connection, sending not possible due to no connection, either closed or not established yet MqttClient: No connection to an MQTT Broker.
12540	30FC	ETH_SMTP_EMAIL_SEND: Mailbox unavailable or not found on target server. SMTP error by server.

DEC	HEX	Error description
12788	31F4	ETH_SMTP_EMAIL_SEND: Syntax Error. SMTP error by server.
12789	31F5	Syntax error in parameters or arguments.
12790	31F6	Command not implemented. SMTP error by server.
12791	31F7	The SMTP server has encountered a bad sequence of commands, or it requires an authentication.
12823	3217	ETH_SMTP_EMAIL_SEND: Wrong user login and/or password. Check configuration. SMTP Error by server. MqttClient: Authentication failed: Bad username, password OR client id.
12838	3226	ETH_SMTP_EMAIL_SEND
12839	3227	ETH_SMTP_EMAIL_SEND: Mailbox unavailable or not found on target server. SMTP Error by server.
12840	3228	ETH_SMTP_EMAIL_SEND: Exceeded mailbox storage on target server. SMTP Error by server.
12841	3229	ETH_SMTP_EMAIL_SEND: Mailbox name not allowed. SMTP Error by server.
12848	3230	MqttClient: Error on TLS handshake.
12849	3231	MqttClient: Server certificate not valid. Check if PLC date has been set correctly.
12850	3232	MqttClient: Server certificate format is not formatted as PEM.
12851	3233	MqttClient: Server certificate has expired.
12852	3234	MqttClient: Client certificate not valid. Check if PLC date has been set correctly.
12853	3235	MqttClient: Client certificate or client key format is not formatted as PEM.
12854	3236	MqttClient: Client certificate has expired.
16383	3FFF	Not ready. Resources currently not available. COM_MOD_MAST: Transmission is not possible at the moment. Another instance of the function block is already transmitting. COM_SEND: Transmission is not possible at the moment. Another instance of the function block is already transmitting. BACnet B-ASC: No memory for BACnet objects.

1.7.3.5.5 4000hex...4FFFhex - block input error

The error 4xxxhex is used in case of detected function block input parameter errors. The error is structured as follows:

4 X1 X2 X3 hex

X...	Value	Error Description
X1 + X2	1....FF	Number of the input
X3	0	Invalid value
	1	Value too low
	2	Value too high
	3	Wrong combination of the parameters

1.7.3.5.6 5000hex...5FFFhex - request error

DEC	HEX	Error description
20482	5002	The request is not supported (e.g. in the simulation mode of the Automation Builder).
20485	5005	Invalid internal state -> function block probably called in invalid manner/ sequence
20499	5013	Timeout error ECAT_COE_READ, ECAT_COE_Write: Request timeout occurs
20503	5017	Incorrect length ARC..: Invalid data length CAN2..: Invalid DLC in message ETH_UDP..: Invalid data length ECAT_COE_READ, ECAT_COE_Write: Request/ Response length invalid
20504	5018	Traceability data is corrupted.
20507	501B	Access error COM_MOD_MAST: Invalid memory address DATA or DATA + NB. At least one datum is outside of the access range of the user program. The range includes different flag ranges. ETH_MOD_MAST: Invalid memory address DATA or DATA + NB. At least one datum is outside of the access range of the user program. The range includes different flag ranges.
20508	501C	Invalid number (quantity) CAN2A_SEND: Invalid number of messages at input NUM COM_MOD_MAST: Invalid number of data at NB (0 or more than permitted). ETH_MOD_MAST: Invalid number of data at NB (0 or more than permitted).20515
20513	5021	IO_PROD_ENTRY_READ: I/O Module not found: input MODULE invalid
20515	5023	Failed to read traceability data from I/O Module.
20517	5025	Address error ARC..: Invalid IP address CAN2..: Invalid identifier in message COM_MOD_MAST: Invalid slave address. Broadcast not permitted in connection with the selected function code. ETH_MOD_MAST: Invalid slave address. Broadcast not permitted in connection with the selected function code. ETH_UDP..: Invalid IP address.
20518	5026	Function error COM_MOD_MAST: Invalid function code FCT. ETH_MOD_MAST: Invalid function code FCT.
20735	50FF	DIAG..: Simulation mode
24575	5FFF	Operation pending / busy -> wait and try again later

1.7.3.5.7 6000hex...6FFFhex - communication module errors

DEC	HEX	Error description
24577	6001	EtherCAT: Invalid command received PNIO: Creating a TLR-timer-packet in RPC task failed due to insufficient memory
24578	6002	EtherCAT: No link exists OR the watchdog expired CAN..: Service was rejected by the node with SDO abortion. Index/subindex not valid or no access to the specified node. DNM..: Resource not available or invalid class ID DPM../DPV1..: Resource not available. Free buffer memory in slave is not sufficient for the requested service. PNIO: Generic RPC-error code or not enough memory
24579	6003	EtherCAT: Error during reading the bus configuration OR the requested watchdog time is too small. DPM../DPV1..: Requested service (e.g. DPV1) is not active in the slave.
24580	6004	Communication Module does not support DPRAM message communication function blocks OR There is no receive function block active in IEC project of Communication Module. EtherCAT: Error during processing the bus configuration OR The requested watchdog time is too large.
24581	6005	EtherCAT: Existing bus does not match configured bus OR Error during reset (resetting watchdog).
24582	6006	EtherCAT: Not all slaves are available OR Error during reset (cleanup dynamic resources) DPM../DPV1..: Slave address not configured
24583	6007	EtherCAT: Error during reset (stopping the master) OR master is in critical error state, reset required.
24584	6008	EtherCAT: Error during reset (deinitializing the master) OR error activating the watchdog. DNM..: Service not available in module. Read/write function not supported by the selected class.
24585	6009	EtherCAT: Error during reset (cleanup the dynamic resources) OR size of configured input data is larger than cyclic DPM input data size. DNM..: Attribute invalid or not supported DPM../DPV1..: No data received from slave
24586	600A	EtherCAT: Master is in critical error state. Reset required OR size of configured output data is larger than DPM data output size.
24587	600B	EtherCAT: The requested bus cycle time is invalid DNM..: Request is already in progress
24588	600C	EtherCAT: Invalid parameter for broken slave behavior. DNM..: Conflict of the object status
24589	600D	EtherCAT: Master is in wrong internal state
24590	600E	EtherCAT: The watchdog expired DNM..: Attribute cannot be set or writing is not permitted
24591	600F	EtherCAT: Invalid SlaveID was used for CoE DNM..: Permission check faulty or access denied

DEC	HEX	Error description
24592	6010	EtherCAT: No available resources for CoE Transfer DNM..: Status conflict. Device prohibits execution
24593	6011	EtherCAT: Internal error during CoE usage CAN..: No response from the selected node DNM..: No response from the selected device DPM../DPV1..: No response received from slave.
24594	6012	EtherCAT: Invalid index on slave requested DPM../DPV1..: Master not in logical "token ring". PNIO: Internal error inside Communication Module's firmware
24595	6013	EtherCAT: Invalid bus communication state for CoE-usage CAN..: Selected node is not ready for operation DNM..: Not enough receive data
24596	6014	EtherCAT: Frame with CoE data is lost CAN..: Local resources are not available. Requested bus parameters are not available. Communication Module is not configured. DNM..: Local resources are not available. Requested bus parameters are not available. Communication Module is not configured. PNIO: Internal error inside Communication Module's firmware
24597	6015	EtherCAT: Timeout during CoE service CAN..: Parameter error DNM..: Parameter error
24598	6016	EtherCAT: Slave is not addressable (not on bus or power down) DNM..: Object does not exist
24599	6017	EtherCAT: Invalid list type requested Other Communication Modules: Received data length too big. Internal buffer too small.
24600	6018	EtherCAT: Data in slave response is to large for confirmation packet. PNIO: Internal error inside Communication Module's firmware
24601	6019	EtherCAT: Invalid access mask selected (during GetEntryDesc) DPM../DPV1..: Unexpected reaction of slave or reaction not in accordance with standard.
24602	601A	EtherCAT: Slave Working Counter error during CoE service PNIO: Another request is already running ETH2 not supported on AC500 CPU with Ethernet
24603	601B	EtherCAT: The service is already in use
24604	601C	EtherCAT: Command is not usable in this communication state
24605	601D	EtherCAT: Distributed Clocks must be activated for this command
24606	601E	EtherCAT: The scan is already running. It cannot be started twice at the same time
24607	601F	EtherCAT: Timeout during bus scan, but at least one link is established
24608	6020	EtherCAT: The bus scan was not started before or it is not finished yet
24609	6021	EtherCAT: The requested slave is invalid

DEC	HEX	Error description
24610	6022	EtherCAT: Internal error during CoE usage
24612	6024	PNIO: Internal error inside Communication Module's firmware
24615	6027	EtherCAT: Internal error of SDO protocol
24616	6028	EtherCAT: Internal error of SDO protocol
24617	6029	EtherCAT: Internal error of SDO protocol
24618	602A	EtherCAT: Internal error of SDO protocol
24619	602B	EtherCAT: Internal error of SDO protocol
24620	602C	EtherCAT: Internal error of SDO protocol
24621	602D	EtherCAT: Not enough memory
24622	602E	EtherCAT: Selected object could not be accessed
24623	602F	EtherCAT: Selected object is write only
24624	6030	EtherCAT: Selected object is read only CAN..: Function timeout DNM..: Device not configured PNIO: Internal error inside Communication Module's firmware
24625	6031	EtherCAT: Selected object does not exist PNIO: Internal error inside Communication Module's firmware
24626	6032	EtherCAT: PDO mapping failed DNM..: Format error in the received data ETH_UDP..: TCP/UDP task not available or IP task not ready. PNIO: Internal error inside Communication Module's firmware
24627	6033	EtherCAT: Selceted object is to large to be mapped to PDO CAN..: Maximum buffer size of the receive data exceeded ETH_UDP..: Internal task with configuration data not available PNIO: The ALPMR protocol-machine corresponding to the index in request packet is invalid
24628	6034	EtherCAT: General parameter error occured CAN..: Function not available. Code unknown. DNM..: Code unknown ETH_MOD..: Invalid parameter for "ServerConnection" ETH_UDP..: No MAC address available PNIO: The ALPMR protocol-machine is invalid for the current request
24629	6035	EtherCAT: Internal device error occured CAN..: Unknown area. Buffer exceeded. DNM..: Overflow of buffer length ETH_MOD..: Invalid parameter for "Task Timeout" ETH_UDP..: Waiting for warm start performed by the application

DEC	HEX	Error description
24630	6036	EtherCAT: Hardware error occured CAN..: Unknown function in HOST message or function still active DNM..: Other service still active ETH_MOD..: Invalid parameter for "OBM Timeout" ETH_UDP..: Unknown flag in start parameters DPM../DPV1..: Slave denied access to the requested data
24631	6037	EtherCAT: Invalid data type CAN..: Parameter error DNM..: Parameter error or MAC ID beyond the valid range ETH_MOD..: Invalid parameter for "Mode" ETH_UDP..: Invalid IP address in start parameters PNIO: The index of ALPMR protocol-machine is invalid
24632	6038	EtherCAT: Invalid data type ETH_MOD..: Invalid parameter for "Send Timeout" ETH_UDP..: Invalid subnet mask in start parameters
24633	6039	EtherCAT: Invalid data type CAN..: Sequence error DNM..: Sequence error or one MAC ID was multiple used in one network ETH_MOD..: Invalid parameter for "Connect Timeout" ETH_UDP..: Invalid gateway IP in start parameters
24634	603A	EtherCAT: Invalid sub-index ETH_MOD..: Invalid parameter for "Close Timeout".
24635	603B	EtherCAT: Invalid parameter value CAN..: Data error DNM..: Data error ETH_MOD..: Invalid parameter for "Swab" ETH_UDP..: Unknown device type
24636	603C	EtherCAT: Invalid parameter value CAN..: Node address configured twice DNM..: Display of total number of data sets incorrect ETH_MOD..: TCP task not ready ETH_UDP..: Access to IP address in the specified source failed
24637	603D	EtherCAT: Invalid parameter value CAN..: ADD table incorrect DNM..: ADD table incorrect ETH_MOD..: PLC task not ready ETH_UDP..: Initialization of the driver layer failed

DEC	HEX	Error description
24638	603E	EtherCAT: Invalid parameter value CAN..: Total length of the node parameters incorrect DNM..: Size of the I/O configuration table incorrect ETH_MOD..: Error during initialization ETH_UDP..: No source specified for IP address (BOOTP, DHCP, IP address parameter)
24639	603F	EtherCAT: Internal error of SDO protocol CAN..: Transmission type unknown DNM..: I/O configuration does not match with the ADD table
24640	6040	EtherCAT: Internal device error occured CAN..: Length of the PDO-cfg file too big DNM..: Parameter size incorrct or channel/handler already in use PNIO: Internal error inside Communication Module's firmware
24641	6041	EtherCAT: Internal device error occured CAN..: Unknown transmission rate DNM..: Number of defined inputs in the ADD table does not match with the I/O configuration PNIO: Internal error inside Communication Module's firmware
24642	6042	EtherCAT: Internal device error occured CAN..: COB-ID SYNC beyond the valid range DNM..: Number of defined outputs in the ADD table does not match with the I/O
24643	6043	EtherCAT: Internal device error occured CAN..: Value of the synchronization timer invalid DNM..: Unknown data type in the I/O configuration
24644	6044	EtherCAT: Unknown SDO protocol error CAN..: Input offset of the PDOs too big DNM..: Defined data type of an I/O module does not match with the defined data size
24645	6045	CAN..: Output offset of the PDOs too big DNM..: The configured output address of an I/O module is not within the permitted address range of 3584 bytes
24646	6046	CAN..: Inconsistency between the PDO and the ADD table DNM..: The configured input address of an I/O module is not within the permitted address range of 3584 bytes
24647	6047	CAN..: Length of the ADD table inconsistent DNM..: Unknown connection type
24648	6048	CAN..: Total data length inconsistent DNM..: Several identical connections defined
24649	6049	CAN..: COB-ID Emergency beyond the permitted range DNM..: The configured value of the "Exp_Packet_Rate" of a connection is smaller than the value of the "Prod_Inhibit_Time"

DEC	HEX	Error description
24650	604A	CAN..: COM-ID Node Guard beyond the permitted range DNM..: Inconsistent parameter field "DNM_PRED_MSTSL_CFG_DATA"
24651	604B	CAN..: Configured PDO length greater than 8 DNM..: Device could not perform "Duplicate_MAC-ID check". Incorrect transmission rate or no connection to the device possible.
24652	604C	CAN..: Number of defined objects in SDO data too big DNM..: Value of "usRecFragTimer" beyond the permitted range
24657	6051	PNIO: The current bus state is OFF and no frames can be sent
24659	6053	PNIO: The state of APMS protocol-machine is invalid for the current request
24660	6054	PNIO: APMS was not able to get an Edd_Frame buffer for sending a packet
24661	6055	PNIO: An error occurred while APMS was trying to send an Edd_Frame
24662	6056	PNIO: Device not reachable (DEV_NAME is not projected)
24663	6057	PNIO: Insufficient memory for APMS_send_req_Date() to allocate a timer-indication packet
24672	6060	PNIO: The acyclic service failed. The I/O module answered with an error code. See output STATUS (EtherCAT status) for details.
24679	6067	PNIO: The maximum amount of data supported by this service is exceeded.
24686	606E	ETH_UDP..: Timeout has occurred
24687	606F	ETH_MOD..: Unknown send or receive telegram ETH_UDP..: Invalid timeout parameter
24688	6070	ETH_MOD..: TCP responds with an error ETH_UDP..: Invalid socket
24689	6071	ETH_MOD..: No corresponding socket found ETH_UDP..: Command cannot be executed in the current socket state
24690	6072	ETH_MOD..: Command with invalid value
24691	6073	ETH_MOD..: TCP task status error ETH_UDP..: No access to target IP address
24692	6074	ETH_UDP..: Invalid option parameter
24693	6075	ETH_MOD..: No free socket found ETH_UDP..: Invalid command parameter
24694	6076	ETH_MOD..: TCP command is directed to an unknown socket ETH_UDP..: Invalid IP address or no access to address HA..: Wrong IP address configured
24695	6077	ETH_MOD..: Time for a client job is over ETH_UDP..: Invalid port number or port not available
24696	6078	ETH_MOD..: Socket has been closed unexpectedly ETH_UDP..: Connection closed
24697	6079	ETH_MOD..: Not-Ready flag has been set by the user ETH_UDP..: Connection reset
24698	607A	ETH_MOD..: OMB task cannot open socket ETH_UDP..: Invalid protocol

DEC	HEX	Error description
24699	607B	ETH_MOD..: Watchdog event in PLC task, only in I/O mode ETH_UDP..: No socket available
24700	607C	ETH_MOD..: TCP task in configuration state ETH_UDP..: Invalid MAC address
24701	607D	ETH_MOD..: PLC task not initialized
24702	607E	ETH_MOD..: Server socket was closed without response from the device
24703	607F	ETH_MOD_MAST.
24705	6081	DPM../DPV1..: DPV1 not in "OPEN" state
24706	6082	ETH_UDP..: Invalid mode parameter DPM../DPV1..: Invalid parameters received from slave. Communication stopped.
24707	6083	ETH_UDP..: Maximum data length exceeded or ARP cache full DPM../DPV1..: Service still active. Parallel operation is not possible
24708	6084	ETH_UDP..: Maximum number of messages exceeded DPM../DPV1..: Data length too high for the reserved buffer
24709	6085	ETH_UDP..: Maximum number of IP multicast groups exceeded DPM../DPV1..: Wrong parameter
24710	6086	ETH_UDP..: ARP input not found in ARP cache
24725	6095	ETH_UDP..: Invalid message response received
24727	6097	ETH_MOD..: Invalid message length ETH_UDP..: Invalid message length
24728	6098	CAN..: Unknown message command DNM..: Unknown message command ETH_MOD..: Unknown message command ETH_UDP..: Unknown message command
24730	609A	DPM../DPV1..: Invalid message command
24732	609C	ETH_UDP..: Sequence error during transmission in Sequence Message Mode
24734	609E	ETH_UDP..: Command cannot be executed or command is currently executed
24736	60A0	ETH_MOD..: Error in telegram header
24737	60A1	CAN..: Node address beyond the permitted range DNM..: Device address beyond the permitted range ETH_MOD..: Invalid address detected in the telegram DPM../DPV1..: Invalid slave address
24738	60A2	CAN..: Invalid address range DNM..: Invalid address range
24739	60A3	CAN..: Data buffer overflow DNM..: Data buffer overflow ETH_MOD..: Invalid data address

DEC	HEX	Error description
24741	60A5	CAN..: Incorrect data counter DNM..: Incorrect data counter ETH_MOD..: Invalid data counter
24742	60A6	CAN..: Unknown data type DNM..: Unknown data type
24743	60A7	CAN..: Unknown function DNM..: Unknown function ETH_MOD..: OBM task received an error in the response of the TCP task
24776	60C8	CAN..: Communication Module is not configured DNM..: Communication Module is not configured ETH_UDP..: Task not initialized
24778	60CA	ETH_MOD..: OBM task does not have a segment from RCS
24779	60CB	ETH_MOD..: Unknown or invalid sender specified with the command
24786	60D2	ETH_UDP..: No configuration data available
24788	60D4	ETH_UDP..: Error while reading the configuration data
24789	60D5	ETH_UDP..: Error while creating the diagnosis structure
24794	60DA	ETH_UDP..: Not enough memory available
24832	6100	PNIO: Generic RPC-error code. See output STATUS (PROFINET-status) for details.
24847	610F	ETH_MOD_MAST: Wrong MBAP header received
24848	6110	ETH_MOD..: Invalid Unit Identifier received
24850	6112	ETH_MOD_MAST: Invalid MBAP header Length value
25088	6200	PNIO: Internal error inside Communication Module's firmware
25089	6201	PNIO: Internal error inside Communication Module's firmware
26117	6605	PNIO: Internal error inside Communication Module's firmware
26118	6606	PNIO: Internal error inside Communication Module's firmware
26119	6607	PNIO: Internal error inside Communication Module's firmware

Abbreviations	
RPC	Remote Procedure Call
CMCTL	Controller Context Management
APMS	Acyclic Protocol-Machine sender
APMR	Acyclic Protocol-Machine receiver

1.7.3.5.8 7000hex...7FFFhex - product libraries

Table 794: Drives library

Dec	Hex	Error description
28672	7000	Any activity was NOT completed within an appropiate TIME
28673	7001	Read or write parameter could not be completed

Dec	Hex	Error description
28674	7002	A parameter at the function block is out of the possible range. This does not refer to the parameter range which is allowed for the drive but just to the 32-bit integer which is used for internal calculation
28675	7003	The field bus connection is faulty
28677	7005	Wrong PPO type
28678	7006	Wrong or no adapter type could be detected
28679	7007	Drive type does not match to function block
28680	7008	Function aborted
28681	7009	Error while reading scaling parameter for REF1
28682	700A	Wrong parameter number at read/write parameter
28683	700B	COM interface differs from others on same LINE_TOKEN variable
28684	700C	Profile type error
28685	700D	Function block Read_Parameters has been executed with error
28686	700E	Function block Write_Parameters has been executed with error
28687	700F	No connection to communication block, or error in communication block
28688	7010	Error at reading the drives communication profile value
28689	7011	Drive communication profile can not be used with this function block
28690	7012	PROFINET or PROFIBUS write packet size exceed 240 byte data limit

Table 795: Solar library

Dec	Hex	Error description
28928	7100	ALARM: Limit exceeded. System has moved more than POS_DEG_LIMIT distance without any moving command.
28929	7101	ALARM: Timeout. The system has not reached POS_DEG_LIMIT within the tolerance time (3 * t POS_TIME_LIMIT [ms]).
28930	7102	ALARM: Limit at wrong side reached. System has reached POS_DEG_LIMIT distance in the opposite DIR to actual movement order.
28931	7103	ALARM: Low Limit exceeded. Tracker position is less than VIRTUAL_LIMIT_MIN.
28932	7104	High Limit exceeded. Tracker position is more than VIRTUAL_LIMIT_MAX.
28933	7105	Warning: Interlocking. Try to move BACKWARD while STOP_BWD input is set.
28934	7106	Warning: Interlocking. Try to move FORWARD while STOP_FWD input is set.
28935	7107	Warning: Interlocking. Both STOP_BWD and STOP_FWD input are set.

Table 797: Temperature control library

Dec	Hex	Error description
29312	7280	Fault (TuneFault): "Tuning failed": outputs disabled, see Tune_Status Remedy: Check for tune set point and currrent temperatur
29313	7281	Fault (TC_Fault_1): "Bad Thermocouple reading": outputs disabled. Remedy: Bad Thermocouple reading: outputs disabled
29314	7282	Fault (TC_Fault_2): "Plausibility check not passed": outputs disabled. Remedy: Check for inverted connection of Thermocouple.
29315	7283	Fault (HighHighTempFalt): "HighHigh temperature alarm": outputs disabled. Remedy ● Check for defective cooling device. ● Check for correct setting of HIGHHIGH_TEMP and SET_TEMP.
29316	7284	Fault (LowLowTempFault): "LowLow temperature alarm": outputs disabled. Remedy ● Check for defective heating device. ● Check for correct setting of LOWLOW_TEMP and SET_TEMP.
29319	7287	High temperature alarm
29320	7288	Low temperature alarm
29321	7289	High deviation alarm
29330	7292	Zone_size and zone_index are not assigned
29335	7297	No group function block call possible: internal Group function call for TECT_TEMP_CONTROL or TECT_PWM8 failed.
29336	7298	TimeOut of one operation state.
29337	7299	Read data failed: no correct format of data items.
29322	728A	Low deviation alarm
29323	728B	Fault: (NoHighHighLowLow): "No plausible HighHigh or LowLow limit is defined" Remedy: Check the HighHighTemp and low low temp.
29324	728C	Fault (WrongLimits): "No plausible wrong limits defined" Remedy: Check the defined limits.
29325	728D	Heat and Cool are not enabled: Monitoring only.
29326	728E	Faut (NoAutoTune): "AutoTune cannot be started" Remedy: Process in Manual mode or Heat is not enabled
29327	728F	Fault (NoPIDProcess): "PID process cannot be started" Remedy: Process in Manual mode or no KS, TU, TG parameters are accepted.
29328	7290	Fault (Improper setting of HigHigh and High): HighHigh and High limits are not set correctly. Values are not taken by process/ADR_ZONEDATA. Remedy: Check parameter settings.
29329	7291	Fault (Improper setting of LowLow and Low): LowLow and Low limits are not set correct. Values are not taken by process/ADR_ZONEDATA. Remedy: Check parameter settings.
29330	7292	Fault (No assignment for zone index and size): Zone_size and zone_index are not assigned. Remedy: Check parameter settings.

Dec	Hex	Error description
29335	7297	Fault (No Group function possible):no Group function block call possible: internal Group function call for TECT_TEMP_CONTROL or TECT_PWM8 failed.
29336	7298	TimeOut of one operation state.
29337	7299	Fault (Reading failed):Read data failed: no correct format of data items. Remedy: Check parameter settings.
29338	729A	Fault (Incomplete log saving): Restart of the EN is required since last log saving is not complete
29339	729B	Fault (Less zone data available in RECIPE file than requested):Mismatch in number of zones declared and zone data in recipe. Remedy: Check the zone data in CSV file and Num_of_zones declared in RECIPE.

29572	7384	Error during reading wave file - check wave file for format compatibility.
29573	7385	Could not open indicated wave file.

1.8 Engineering interfaces and tools

1.8.1 Export and import interfaces

1.8.1.1 Exporting and importing ECAD data (PBF)

Automation Builder provides an ECAD interface for exchanging the PLC configuration data with EPLAN Electric P8 and Zuken E3. This feature removes double data entry between electrical engineering in the ECAD tool and the control logic programming in Automation Builder by synchronizing the PLC hardware including topology and I/O signals between these tools.

Automation Builder - ECAD interface supports various flexible workflows:

- Enables PLC hardware planning and configuration in the ECAD tool and allows importing the exported data from the ECAD tool through the *PBF* file (process integration bus interchange format) into the Automation Builder project with diff and merge functionality, providing full control on selective import/merge.
- Enables PLC hardware configuration in Automation Builder and allows exporting the configuration to the ECAD tool through a *PBF* file.
- Supports bi-directional roundtrip engineering with loss less data exchange between Automation Builder and the ECAD tool.

Automation Builder uses the rack information to identify the relations between:

- PLC and devices plugged to I/O bus or extension bus.
- Fieldbus slave and attached IO devices.

It is recommended to assign the PLC, IO devices, communication modules and fieldbus slaves properly to the rack in the ECAD project. If the rack information is missing, devices will be imported to the device pool and must be arranged manually in the Automation Builder project or mapped to already existing devices.

1.8.1.1.1 Requirements on EPLAN electric P8

- EPLAN Electric P8 with PLC and Bus Extension. It is recommended to use version 2.3 or later.
- Use of appropriate part data and macros for ABB devices. This can be achieved by getting the part data and macros from the EPLAN data portal.

1.8.1.1.2 Importing PLC data from the ECAD tool

You can create a new Automation Builder PLC project from the existing PLC hardware configuration in your ECAD tool, by importing the exported *PBF* file to Automation Builder.

Import *PBF* file to Automation Builder

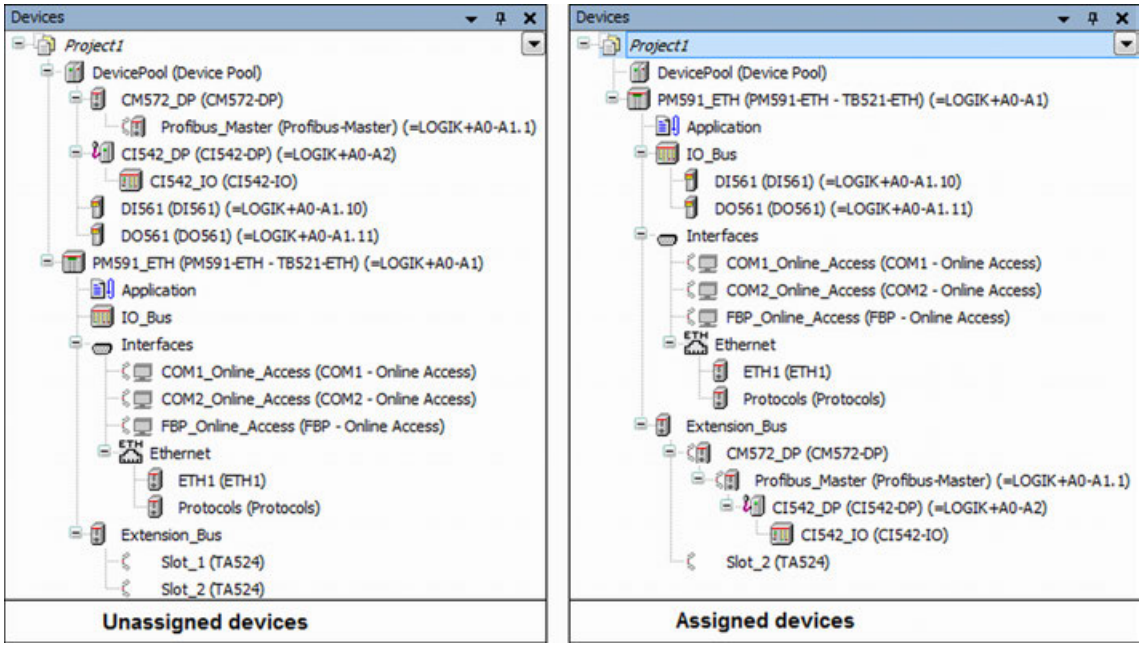
1. From the main menu, select *“Project ➔ Import ➔ ECAD (PBF)”*.
2. From the file system, select the *PBF* file.

   Automation Builder starts importing the devices and its associated signals from the *PBF* file. After a successful import, the result is displayed in the **Project Compare –Differences** view. You can now decide and selectively merge the differences.
3. Select the DevicePool node and click *“Accept Block”* to accept the complete PLC structure in the ECAD tool.
4. Select the PLC node and click *“Accept Block”* to accept all child device nodes.

   The DevicePool node holds all devices coming from the ECAD tool without any hierarchy information. The missing hierarchy information can be defined after closing the editor.
5. Close the **Project Compare – Differences** view to accept the changes.

6. Arrange unassigned devices in the DevicePool to the PLC hardware structure by drag-and-drop.



⇨ The I/O signals assigned to I/O devices in the *PBF* file are imported and allocated to IO devices. IO signals can be viewed in I/O mapping editor of the I/O devices.

1.8.1.1.3 Importing third party devices

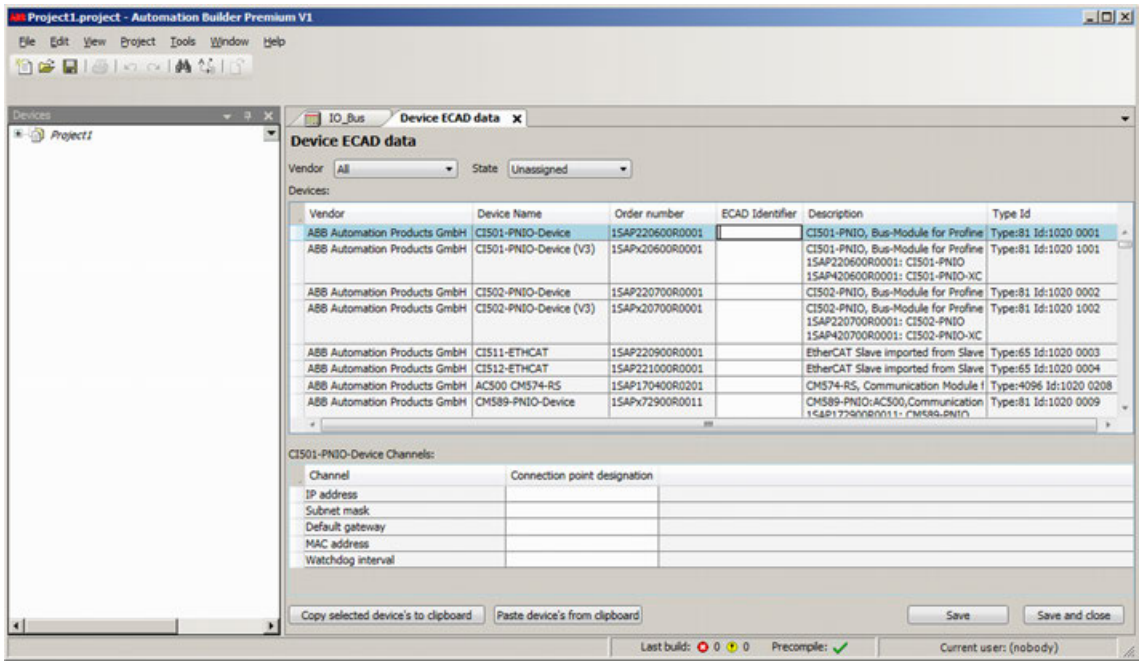
Prerequisite: To import third party devices from ECAD to Automation Builder, install third party fieldbus devices (for example, GSD, GSDML and EDS files) using *"Tools ➔ Device repository"* in Automation Builder.

1. From the main menu, select *"Project ➔ Import ➔ ECAD (PBF)"*.
2. From the file system, select the ECAD *pbf* file which consists of third party devices.

   ⇨ When the device identifier of the third party device installed in Automation Builder does not match with the device identifier of the device imported from ECAD, an error window is shown with the devices which are failed to import with error identifier 14.

   To import third party devices, it is required to assign ECAD identifier (PLC type designation/order number) in Automation Builder in *"Tools ➔ Device ECAD data"*. Click the link in the *Import* window to see the error messages in a text file.
3. Click *"Continue"* in the Import window to import valid devices to the project that are imported successfully or click *"Cancel"* to cancel the import process.
4. In Automation Builder, click *"Tools ➔ Device ECAD data"*.

5. In the Device ECAD data editor, add the ECAD identifier for the devices shown in the import errors window with error identifier 14, to enable these devices for export and import.



⇨ Also, add the ECAD identifiers for all devices which need to support export/import in ECAD.

6. Reimport the *pbf* file to import the third party devices.

1.8.1.1.4 Exporting PLC data to ECAD tool

1. Open the existing PLC project.
2. In the device tree, right-click *“PLC ➔ Export ➔ ECAD (PBF)”*.
3. Select the desired location in the file system to save the *PBF* file.

   The ECAD user can import the exported *PBF* file from Automation Builder and can use the imported PLC data for electrical engineering purpose. If the user modifies imported PLC data in the ECAD project, the data can be imported back to the Automation Builder project which supports the round trip engineering efficiently with loss less synchronization of the data.

1.8.1.1.5 Exporting third party devices

1. Right-click on a PLC device, click *“Export”* and select *“ECAD (PBF)”*.
2. Save the file to the desired location in the file system.

   If the third party devices does not contain assigned ECAD identifiers, a message is displayed showing which devices cannot be exported.

   ⇨ To add ECAD identifiers to the devices, see *Importing third party devices* ↳ *Chapter 1.8.1.1.3 “Importing third party devices” on page 6551*.

   After adding ECAD identifiers to the third party devices, execute *“Export”* to export the devices including third party devices.

1.8.1.1.6 Importing ECAD PLC data to existing AB project

Automation Builder ECAD interface supports concurrent engineering by importing the ECAD data to the existing Automation Builder PLC project.

1. From the main menu, select *“Project ➔ Import ➔ ECAD (PBF)”*.
2. Select the PBF file which has been created during the export from the ECAD tool.
3. Select the PLC from the list and click *“OK”*.
   ⇨ A dialog window is displayed if the Automation Builder project provides PLCs of the identical type as defined in the PBF file.

   By selecting *“None”* in the dialog window a new PLC is defined in the ECAD tool.
4. In the **Project Compare – Differences** view, click  to merge device signals.
   ⇨ The differences between the current PLC hardware configuration in Automation Builder and the ECAD PLC data are displayed.
5. Select the differences as desired and click *“Accept Single”* to accept the selected difference block.
6. Close the **Project Compare – Differences** view to accept the changes.

1.8.1.1.7 Arrange or map devices imported to the device pool

Devices that are imported to the device pool because of missing hierarchy information (mainly rack information) must be arranged manually in the Automation Builder project or mapped to already existing devices.

Arrange devices imported to the device pool

Arrange the unassigned devices in the DevicePool to the PLC hardware structure by drag-and-drop.

Map devices imported to the device pool

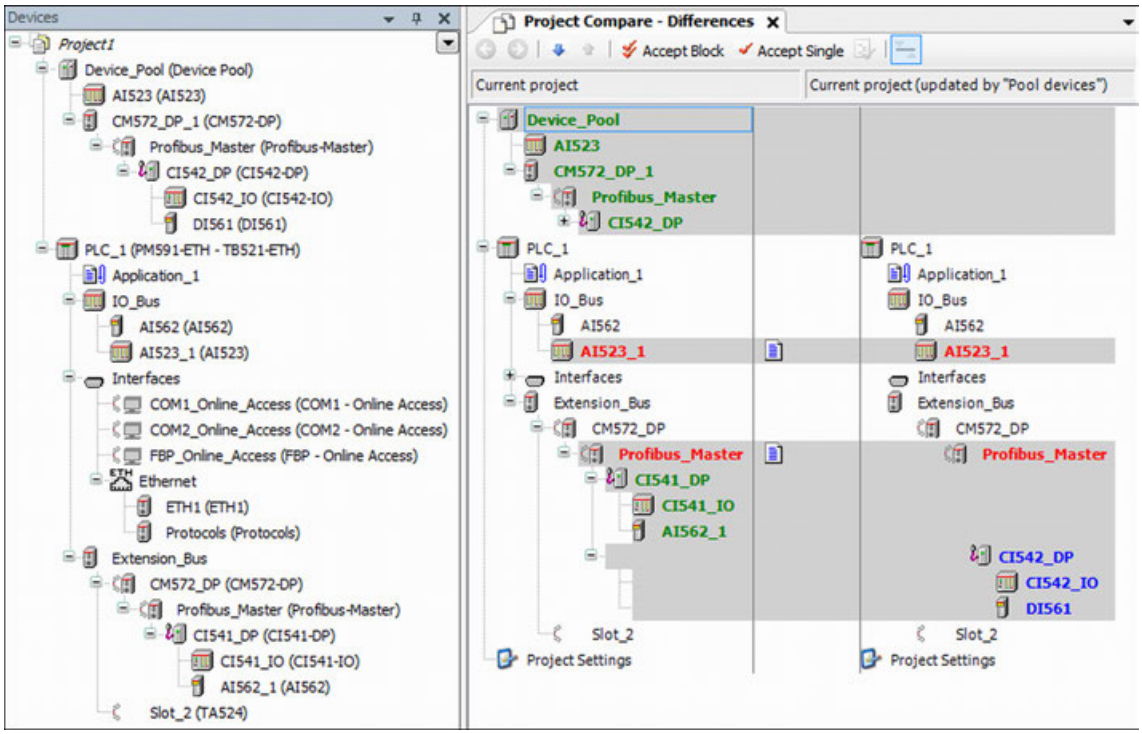
If the devices are already added to the Automation Builder project prior to the import, you have to map the instances of the same type manually (one instance in the Automation Builder project tree and one instance in the DevicePool).

After mapping the devices, you can selectively merge the device parameter or signal in the difference view.

To map pool devices, proceed as follows:

1. In the device tree, select the Device Pool node, click *“Project”* and select *“Map pool devices”*.
2. Map the device pool instances of identical types in the project from the drop-down list and click *“OK”*.

   ⇨ Pool devices which are mapped are removed from the device pool and mapped to the corresponding Automation Builder device. Differences between the signals of the mapped I/O devices are displayed. e.g. AI523_1 device:



1.8.1.1.8 Limitations

The following limitations are considered when working with the Automation Builder ECAD interface:

- The scope of a PBF file is limited to one single PLC including all connected devices.
- There is no representation of XC variants of devices in Automation Builder. Therefore, always use the standard variant for export. This might lead to part data mismatch when importing into the ECAD tool.
- In reimport or round trip import cases, if any changes are made in ECAD by adding a new communication module with connecting to one of the PLC slot or replacing existing communication module, then those device changes to the communication modules are not displayed as connected to PLC slots during the import in Automation Builder diff and import, instead those CM modules are added under the device pool. After merging and importing is completed, to work with device pool devices ↳ *Chapter 1.8.1.1.7 “Arrange or map devices imported to the device pool” on page 6553*.
- IO mapping data cannot be imported for IO devices plugged to an EtherCAT slave when they are imported individually to the device pool because of missing hierarchy information. After arranging the devices properly in the device tree, the import can be done again to import also the IO mapping data.

1.8.1.2 Exporting and importing I/O mapping (CSV)

The I/O module mappings of an Automation Builder project can be exported to CSV for bulk editing in MS Excel or other documentation purposes. I/O mappings can be exported at single I/O module level or at PLC level.

Further, the I/O module mappings can be imported with the option of displaying differences and merging each single changed or import all signals at once by overwriting existing I/O module signals.

1.8.1.2.1 Exporting IO mapping data to CSV

To export I/O mappings to a CSV signal list, proceed as follows:

1. In the device tree, right-click *"PLC ➔ Export ➔ IO mapping (CSV)"*.
2. Save the **IO mappings CSV** to the desired location in the file system.

   If the CSV signal list has been exported successfully, a success message is displayed. The status of the export is shown in the dialog.
3. In the export dialog, click the link to open the exported **IO mapping CSV** file in MS Excel.

> *The template can only be opened if MS Excel is installed and configured to open .csv files.*

4. In the IO mapping (CSV) file, change **Variable** and **Description** fields to edit I/O mappings.

	A	B	C	D	E	F
1	//Automation Builder IO Mappings Export V1.0					
2	//Important: change only first and fourth column in Excel					
3	*Variable	Channel name	Data type	*Description	Terminal	Device name
4	//AI562 (PLC\IO_Bus)					
5	Drive act speed	Analog input I0+	INT	Actual drive speed	11	AI562
6		Analog input I1+	INT		14	AI562
7	//AI523_1 (PLC\IO_Bus)					
8	ai0	Analog input I0+	INT	ai0 desc	2	AI523_1
9		Digital input I0+	BOOL		2	AI523_1
10		Analog input I1+	INT		2.1	AI523_1
11		Digital input I1+	BOOL		2.1	AI523_1
12		Analog input I2+	INT		2.2	AI523_1
13		Digital input I2+	BOOL		2.2	AI523_1
14		Analog input I3+	INT		2.3	AI523_1
15		Digital input I3+	BOOL		2.3	AI523_1
16		Analog input I4+	INT		2.4	AI523_1

⇨

> *Do not modify other field's data in IO mapping (CSV) file.*

1.8.1.2.2 Importing I/O mapping data from CSV

To import an edited I/O mapping (CSV) file, proceed as follows:

1. From the main menu, select *“Project ➔ Import ➔ IO mapping (CSV) ➔ Open”*.
2. A CSV signal list import dialog is displayed.
   ⇨ With *“YES”*, all I/O mappings will be imported without difference view. With *“NO”*, the difference view is displayed with the I/O mapping differences.
3. In the **Project Compare – Differences** view, click  to merge I/O mappings.
4. Select the signal row for which the difference is to be accepted. Select the **Variable** field and click *“Accept Single”* to merge the I/O mappings.
5. Close the **Project compare – Differences** view to accept the changes and merge the I/O mappings with the Automation Builder project.

1.8.1.3 Exporting and importing device list (CSV)

The Automation Builder project devices can be exported to CSV for bulk device renaming or adding device tag labels to devices in MS Excel or other documentation purposes. A devices export is only possible at PLC level.

Automation Builder provides importing devices in bulk based on device type, instance and hierarchy information provided in the CSV file.

1.8.1.3.1 Exporting device list to CSV

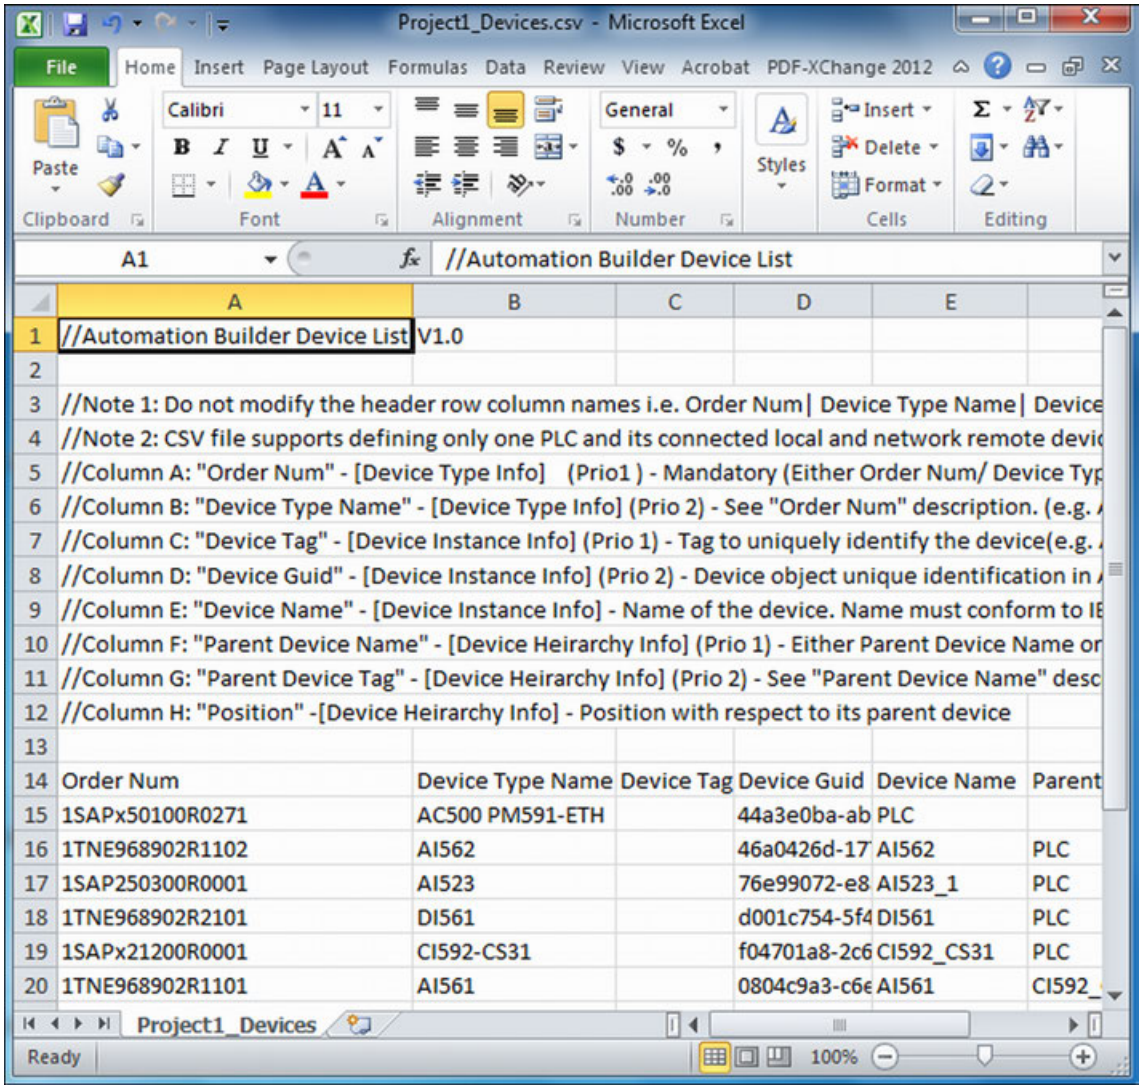
To export a CSV device list, proceed as follows:

1. In the device tree, right-click *“PLC ➔ Export ➔ Device list (CSV)”*.
2. Select the desired location in the file system to save the **Device list (CSV)**.

   If the CSV device list is exported successfully, a success message is displayed.

3. In the Export dialog, click the link to open the exported CSV device list.

   The exported CSV device list consists of all devices connected to the PLC that is exported. Each row represents a device with its device type and hierarchy information.



1.8.1.3.2 Creating CSV device list

To create the devices in CSV, use the device list template provided in Automation Builder.

▷ In the main menu, click *"Tools ➔ Create CSV Device list"*.

⇨ The device list template is opened in the MS Excel.

> *The template can only be opened if MS Excel is installed and configured to open .csv files.*

In this file, add each device in a separate row with device information like Device Type (Order Num or Device Type Name) and instance details (name, tag) and hierarchy information (parent Device name, parent Device Tag, position). The mandatory information required to import CSV is only Device Type. All other fields are optional. After editing the device list CSV file, save it in the file system and close.

1.8.1.3.3 Importing a device list from CSV

To import devices from CSV in bulk, proceed as follows:

1. From the main menu, click *“Project ➔ Import ➔ Device list (CSV)”*.
2. Select the device list CSV file from the file system and click *“Open”* in the Import dialog.

   All devices that are defined in the CSV are imported. The **Project Compare – Differences** view displays the current project and the project that has been updated by the import file.
3. Select the desired devices and click *“Accept Block”* to accept all the devices and its child device nodes or *“Accept Single”* to accept only a single device.
4. After closing the **Project Compare – Differences** view, the devices are imported to the Automation Builder project.

   ⇨ The devices (except PLC) are placed under the device pool if the valid device hierarchy information is not provided in the CSV device list file. By drag-and-drop devices can be assigned to the desired PLC hardware structure ↬ *Chapter 1.8.1.1.7 “Arrange or map devices imported to the device pool” on page 6553*.

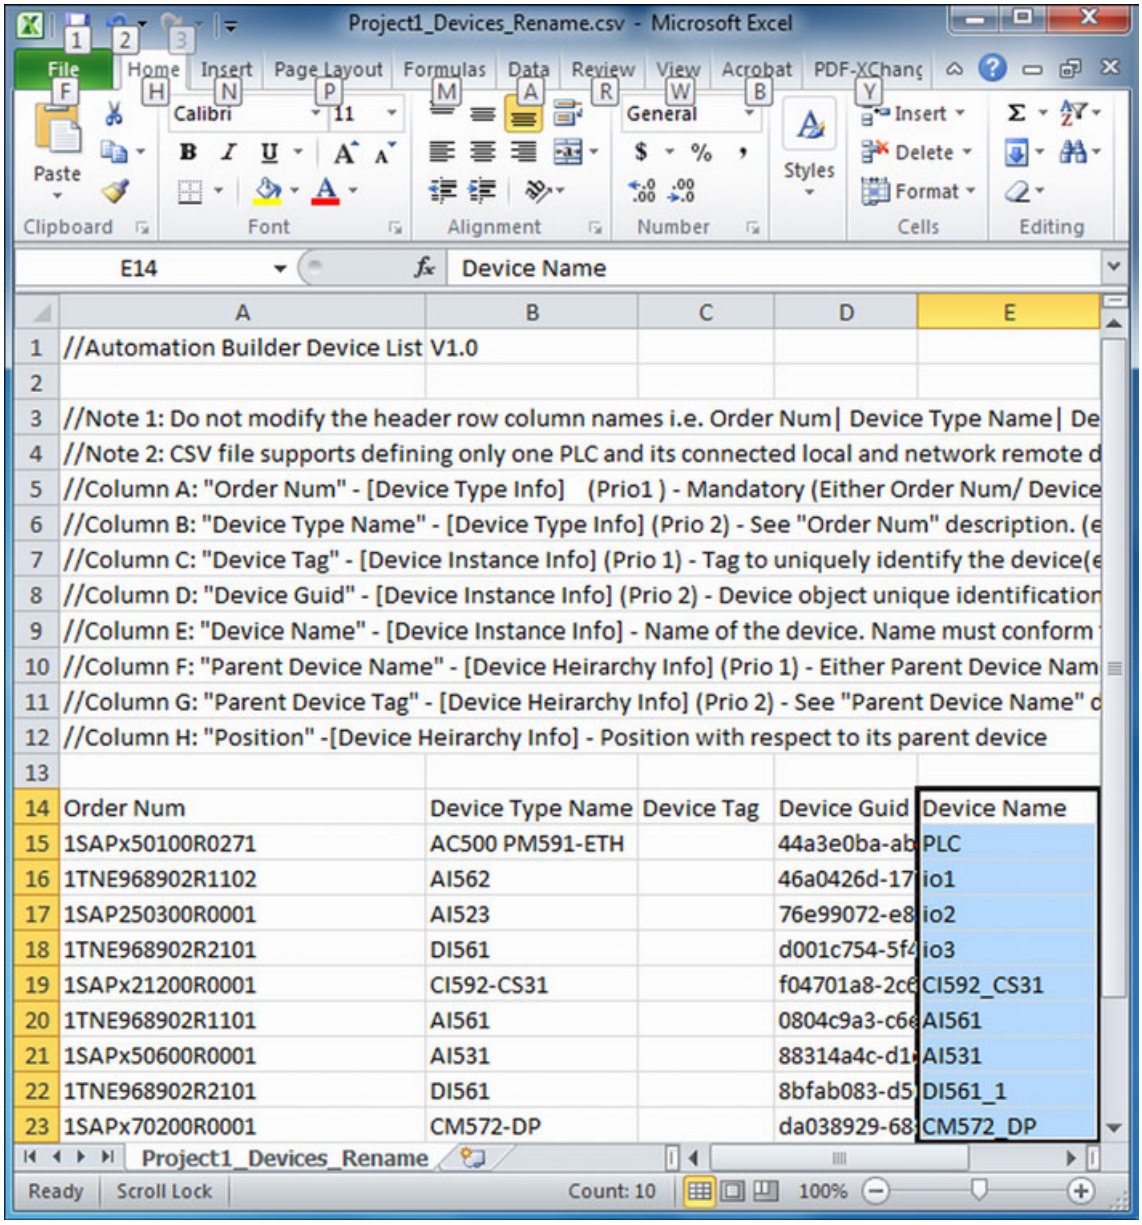
   If a device tag is provided for a device in CSV, it appears next to each device node in the device tree.

1.8.1.3.4 Renaming devices

To rename the devices, proceed as follows:

1. In the device tree, right-click *“PLC ➔ Export ➔ Device list (CSV)”*.
2. Select the desired location from the file system to save the CSV device list.

3. Rename the device names in the column **Device Name**:



4. Click *“Project ➔ Import ➔ Device list (CSV)”*.

5. Select the updated CSV file from the file system.

   Open the **Project Compare – Differences** view. If only the device names have been changed in the CSV file, the difference view does not show the changes.

> *Device Name changes are not displayed as changes in the difference view.*

6. Close the **Project Compare – Differences** view. The Renamed Devices dialog is displayed with the current name and the new name provided in the CSV file.

7. In the Rename Devices window, select the desired devices and click *“OK”*.

   The device names are updated in the Automation Builder project.

1.8.2 Virtual commissioning technology

Virtual Commissioning Technology offers the user to do commissioning of the devices in advance. The user can verify variable data exchange between different devices and run those in simulation. The user need to create system model which represents physical system for commissioning.

Virtual Commissioning Technology supports AC500 V2 PLC, ACS380 Drive and ACS580 Drive. To work with this feature, apart from essential license, the user need to enable Virtual Mode (*"Online ➔ Virtual Mode"*).

Drive parameterization is required to start data exchange between virtual drive and virtual PLC. For information on drive parameterization, see PROFIBUS and PROFINET manuals.

1.8.2.1 Virtual mode

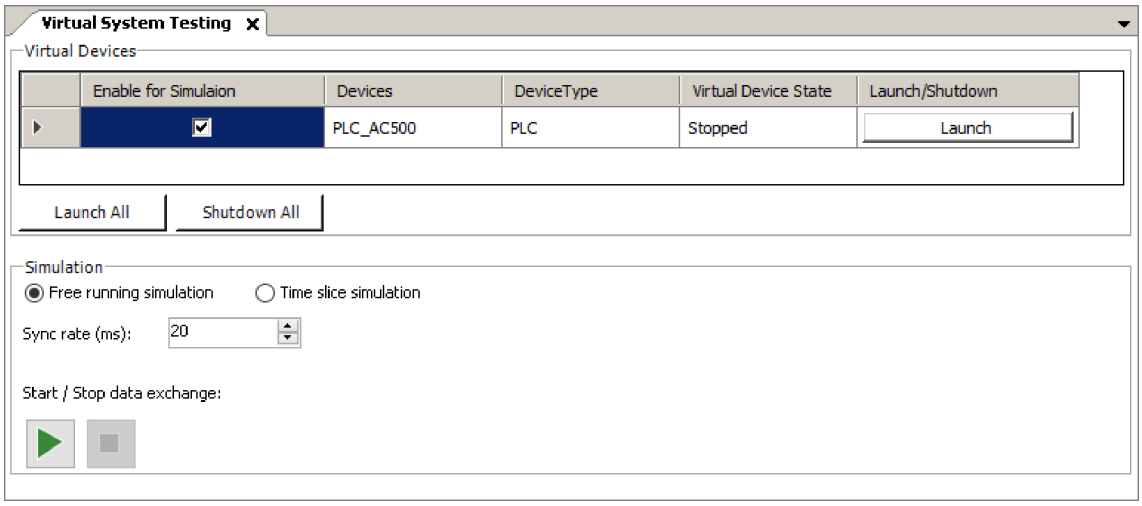
Virtual Mode option enables virtual mode for Automation Builder. This mode is retained even after closing the project. To disable virtual mode, the user need to undo the selection of Virtual Mode option. To enable Virtual Mode, select *"Online ➔ Virtual Mode"* in the Automation Builder main menu.

The Virtual Mode is enabled and the Virtual System Testing selection appears in the menu.

1.8.2.2 Virtual system testing

Virtual System Testing devices (launch/shutdown) monitor its process state and allows simulation of those devices based on selection.

The Virtual System Testing editor contains Virtual Devices and Simulation sections.



Virtual devices

Virtual Devices section helps the user to process and monitor virtual devices by:

- Launching virtual device(s)
- Monitoring state of virtual device
- Shutdown virtual device(s)
- Selection of devices for simulation

Launching virtual devices

The user can launch all the virtual devices together using *"Launch All"* or for individual virtual device using *"Launch"*. The state of buttons changes from launch to shutdown when the selected virtual device starts running. Virtual Device State represents the state of virtual device process and independent of simulation state.

Virtual online mode

The process of logging in to virtual PLC is same as real PLC.

After launching the virtual device, login the application in the device tree to enter online mode.

- In the devices tree, right-click on *"App"* and select *"Login"* to login the application.

The virtual device enters online mode and connected virtually with the PLC device.

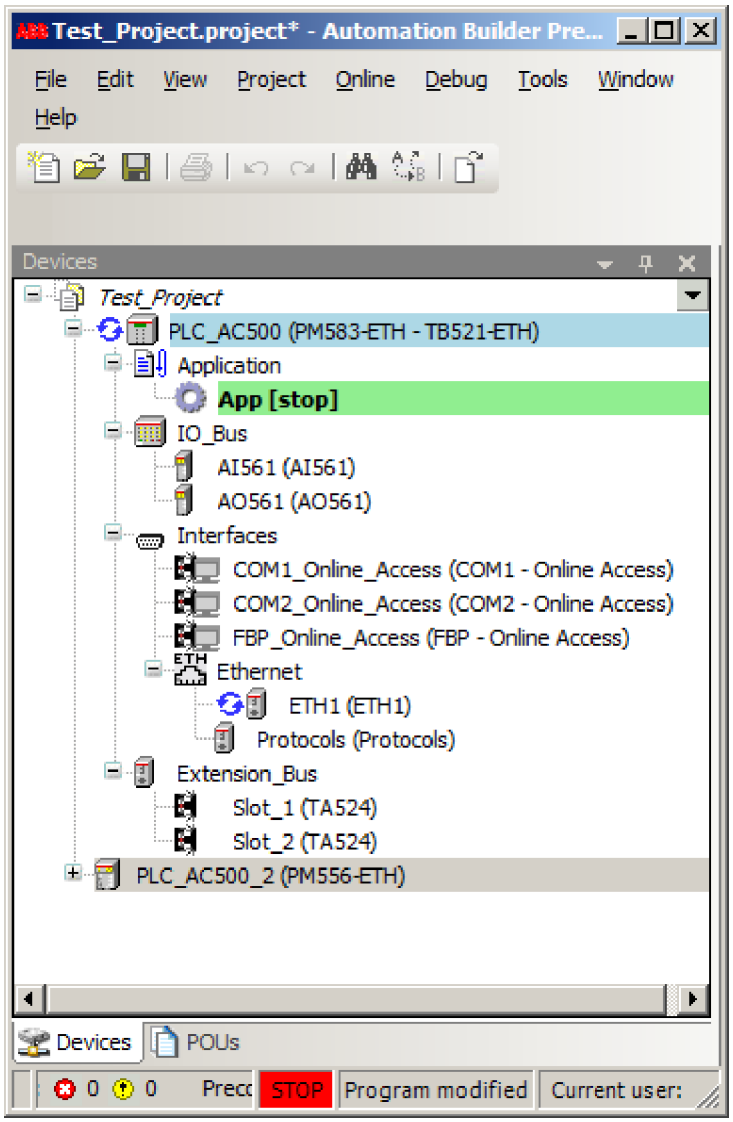


Fig. 1177: Online mode

> *If there is no program on the controller, the application notifies to download a new program.*

Shutdown virtual devices

The user can shutdown all the virtual devices together using *"Shutdown All"* or for individual virtual device using *"Shutdown"*. The state of buttons changes from shutdown to launch when the selected virtual device stops.

1.8.2.3 Simulation

The simulation runs a program in virtual devices which are selected in Virtual Devices section. The configuration of a system model should be correct to proceed with the simulation. The variable exchange between different devices occurs when the simulation is running.

Without system model, the simulation can be run independently for selected devices. The user can do this when there is no variable data exchange desired.

The simulation supports **Free running simulation** and **Time slice simulation** modes. The user need to choose the mode and then launch virtual devices in respective mode. After launching virtual devices, switching to the other mode is not allowed.

Checking signal consistency

Before starting simulation, the signal consistency check is performed on the following criteria.

- In a System Model, the broken signal should not exist. While configuring System Model, if you delete any mapped model block instance then it will create a broken signal. The user need to clear broken connections using **Clear Broken Connection**.
- Any input pin cannot be mapped to multiple output pins.
- Any mapped signal must have variable associated with it.
- Variable associated with mapped signal must have a matching data type.

If a configured system model fails to achieve any of these criteria, an error message is shown to the user and the simulation cannot be allowed to continue.

Free running simulation

In Free running simulation, the virtual devices are not synchronized through virtual time. Each device which has participated is running freely. The user can only Start and Stop the simulation. The time elapsed is displayed to indicate the time for which simulation is running.

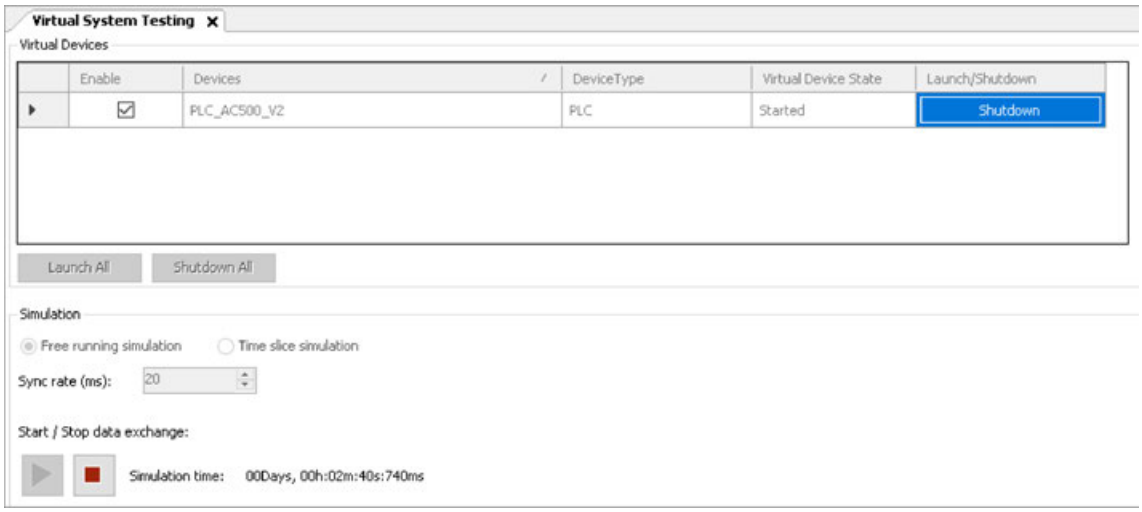

Fig. 1178: Free running simulation

Before starting simulation, the user need to define:

- **Cycle time**: Defines interval for variable data exchange in free running mode.
- **Reset PLC**: If selected, earlier state of virtual device will be reset.

Time slice simulation

In Time slice simulation mode, the virtual devices are always synchronized through virtual devices. In this mode, the Steps and Pause buttons are enabled. The user has the two entry points Start or Steps for simulation.

The Virtual time displays the time for which the virtual devices are running. This time is different than that of real time.

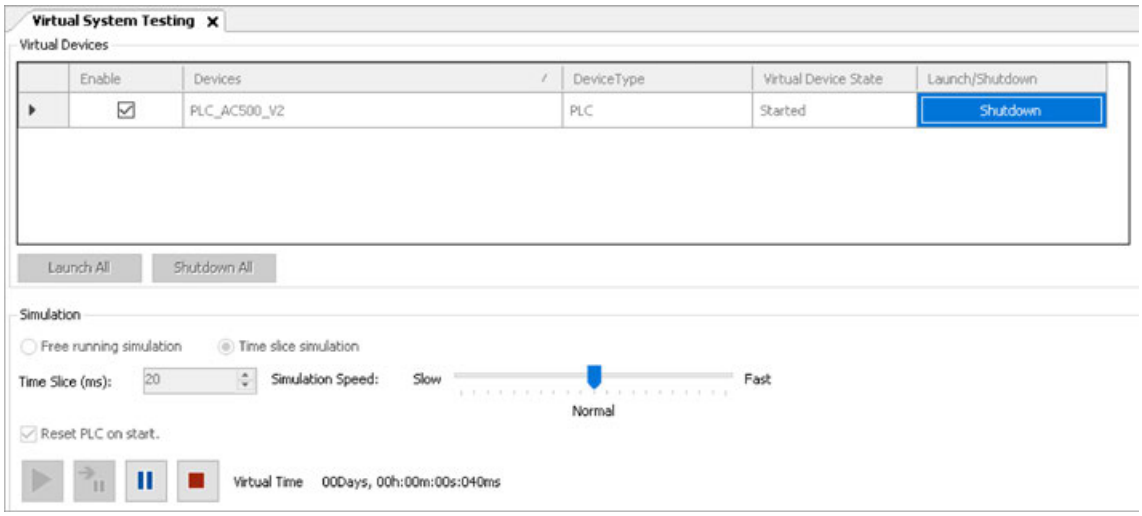

Fig. 1179: Time slice simulation

Before starting simulation, the user need to define:

- **Time Slice (ms)**: Indicates time for which the virtual devices are running before synchronizing with each other. Also, indicates the time interval for variable data exchange in time slice mode. For example, if the selected time-slice for simulation is 20 ms and scan time of PLC is 10 ms, it means in each time-slice, the PLC executes its program twice.
- **Simulation Speed**: Indicates or decides how fast the simulation is executed. The user can change the value even when the simulation is in progress. The simulation speed is independent of time-slice.
- **Reset PLC on start**: If selected, earlier state of virtual device is reset.

> *If variable exchange is not occurring as per expectations, make sure that all the variables defined in system model are available in symbol file. To update symbol file, make sure that the symbol file generation option is selected from CODESYS application ("Project ➔ Options").*

1.8.2.4 Protocol switch

In Automation Builder, the projects can be switched between real PLC mode to/from virtual mode. Automation Builder internally manages the commands and parameters that are given to Panel Builder software to update the changes in protocol to communicate with real or virtual PLC.

Automation Builder verifies the following conditions each time Panel Builder is launched.

- If the project is switched between virtual to normal mode or vice versa, a message is displayed. You can update the panel project to use new protocol or cancel the update.
- If the project is switched between virtual to normal mode or vice versa and the Drive application program is not build, an error message is displayed. The Drive application program must be configured and rebuild to update Panel Builder project.
- When the virtual mode project is switched to normal mode during which Panel Builder is already open, a message is displayed. You can close and relaunch Panel Builder by activating Update Panel Builder project on launch check box.
- When the virtual mode project is switched to normal mode, during which if you try to launch Panel Builder with Update Panel Builder project on launch unchecked, a message is displayed. The tags and protocol information of panel project will not synchronize with Automation Builder.

1.8.2.5 Virtual AC500 V2 extensions

1.8.2.5.1 Introduction

The Virtual AC500 V2 is a virtual PLC running on the PC. The target is to create the engineering and the commissioning in the same way as for a real AC500 V2, with some minor exceptions which are described in the following. Only the AC500 function blocks listed in this documentation are supported by the Virtual AC500 V2.

This documentation provides only the exceptions, limitations and hints with the Virtual AC500 V2. For further information about the function blocks please follow the AC500 documentation.

1.8.2.5.2 General

The PLC configuration created in Automation Builder is not taken into account by the Virtual AC500 V2. Some configuration parameters that are required must be created in a Global Variable List (GVL) “VirtualAC500_Configuration” in CODESYS V2.3.

It is also required that all these variables are added to the symbol file of the PLC.

1.8.2.5.3 UDP/IP function blocks

The supported function block are:

- ETH_UDP_STD_INFO
- ETH_UDP_STD_SEND
- ETH_UDP_STD_REC
- ETH_UDP_STD_INFO
- ETH_UDP_STD_SEND
- ETH_UDP_STD_REC

Function block in- and outputs

Input “SLOT” is ignored in all function blocks.

Only the status information about the level of all receive buffers in bytes (output “LEVR_BY” and “LEV_BY”) is evaluated. All other status informations are always 0.

Configuration

In the Virtual AC500 V2 receiving of broadcast messages is always enabled and cannot be disabled.

The connection parameter “Port” is required and must be added as variable to the GVL “VirtualAC500_Configuration”.

Syntax

ETH_UDP_STD function blocks

CCF_UdpConnection<Index>_Port

- <Index> is the number of the connection.

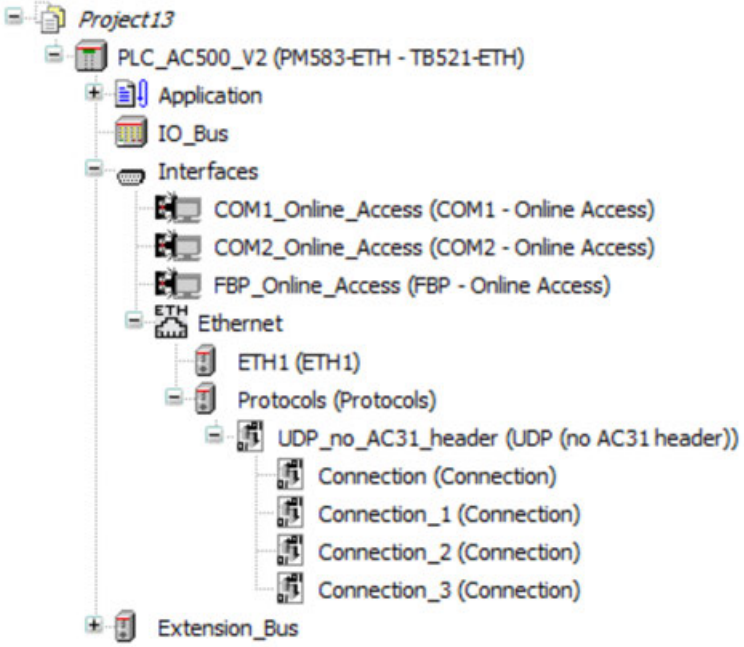
ETHx_UDP_STD function blocks

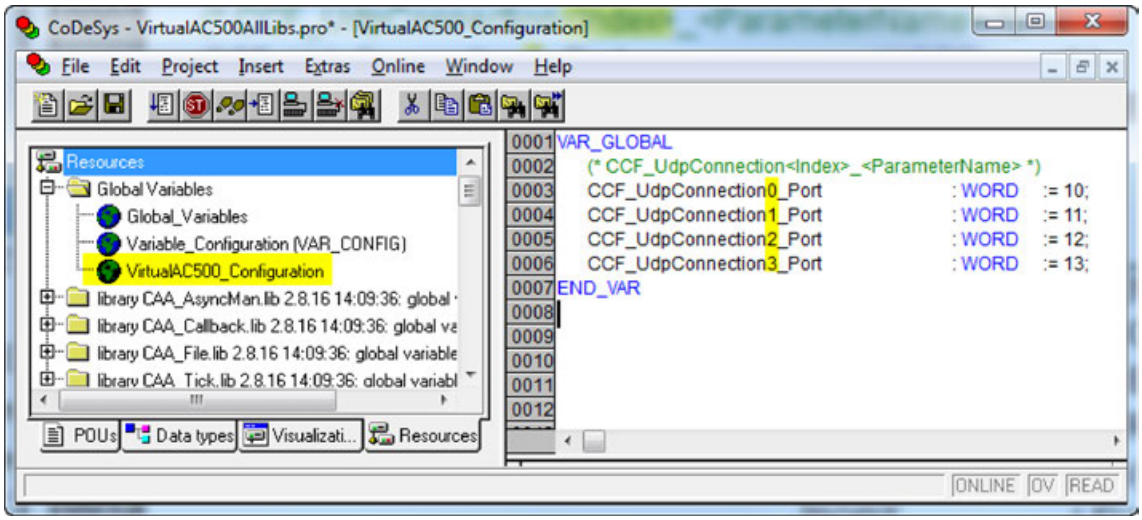
CCF_ETH<ETH index>_UdpConnection<Index>_Port

- <ETH index> is the value of the input variable *ETH* of the UDP function blocks.
- <Index> is the number of the connection.

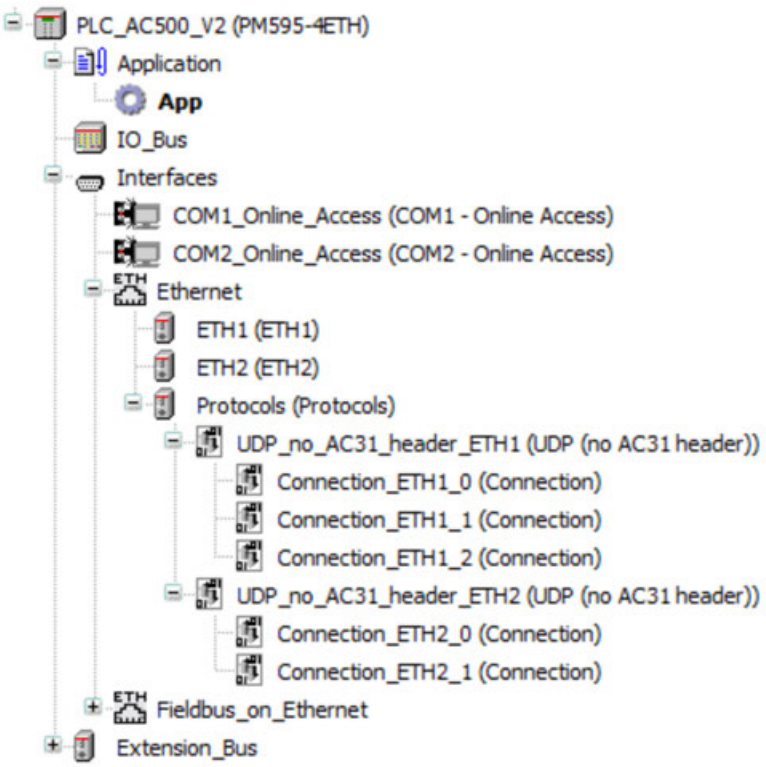
Examples

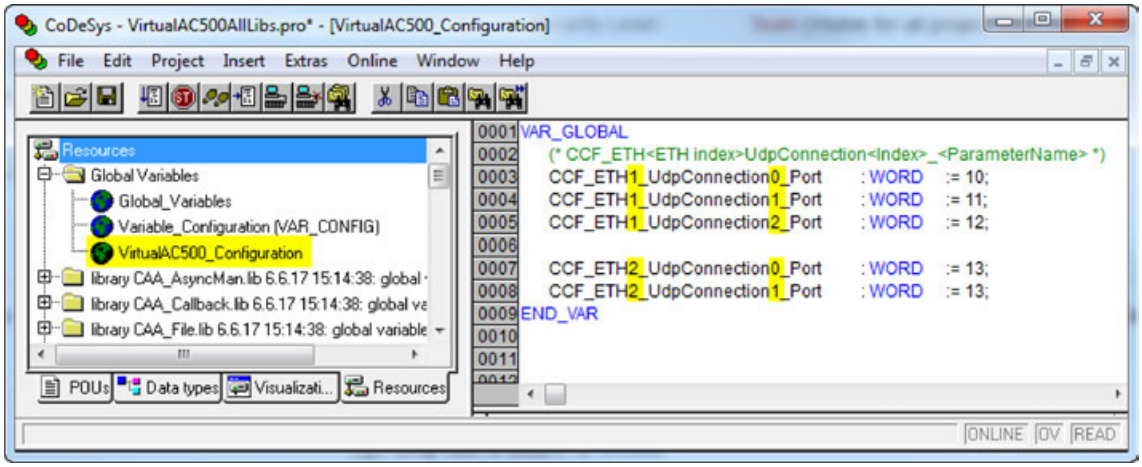
ETH_UDP_STD function blocks





ETHx_UDP_STD function blocks





1.8.2.5.4 CAA_File function blocks

The supported function blocks are:

- FILE_Open
- FILE_Close
- FILE_Read
- FILE_Write

The CAA_File function blocks are used for accessing directories and files. There are several directories from the PLC from where files can be read and written equal to the real AC500, e.g.: flash disk, user disk, memory card. The files and directories are created on the local file system in the working directory of the Virtual AC500 V2.

1.8.2.5.5 Clock function blocks

The supported function blocks are:

- CLOCK
- CLOCK_DT

These two function blocks are used to get and set the current time and date. The current time and date is initialized with the Windows clock during startup of the PLC. All further changes on time and date are independent from the Windows clock, so it is possible to define time and date for each Virtual AC500 V2 instance.

1.8.2.5.6 Ethernet function blocks

The supported function blocks are:

- ETH_OWN_IP
- ETH_ICMP_PING

The function block “ETH_OWN_IP” delivers the IP address of the Ethernet interfaces of the PC where the Virtual AC500 V2 is running. With input “SLOT” it is possible to get the settings from all Ethernet interfaces (0 = first interface, 1 = second, etc.).

The function block “ETH_ICMP_PING” ignores the input value “SLOT”.

1.8.2.5.7 Error numbers

The error numbers of the Virtual AC500 are depending on the associated guest operating system.

Therefore the error numbers of the Virtual AC500 can be different to real AC500 V2.

A list with possible error numbers are to be found in MSDN.

1.8.3 System model

The System Model provides the abstract view of the system which the user wants to configure. It captures physical devices and signals that are exchanged between different devices. Features like virtual commissioning use the system model to capture information needed for variable exchange and simulation.

The System Model object represents all the information configured using system model editors. The user can have only one system model object in Automation Builder project.

To complete the System Model configuration, the user needs to ceate model block class objects and model block instance objects.

1.8.3.1 Creating a system model

1. In the devices tree, right-click on project and click *“Add object”* to add System Model.
2. Select System Modelling in the Categories section and click *“Add object”*.
   ⇨ System Model object is added to Automation Builder project.

3. Under *“System Model”*, add *“Model Block Class”* and their instance objects.

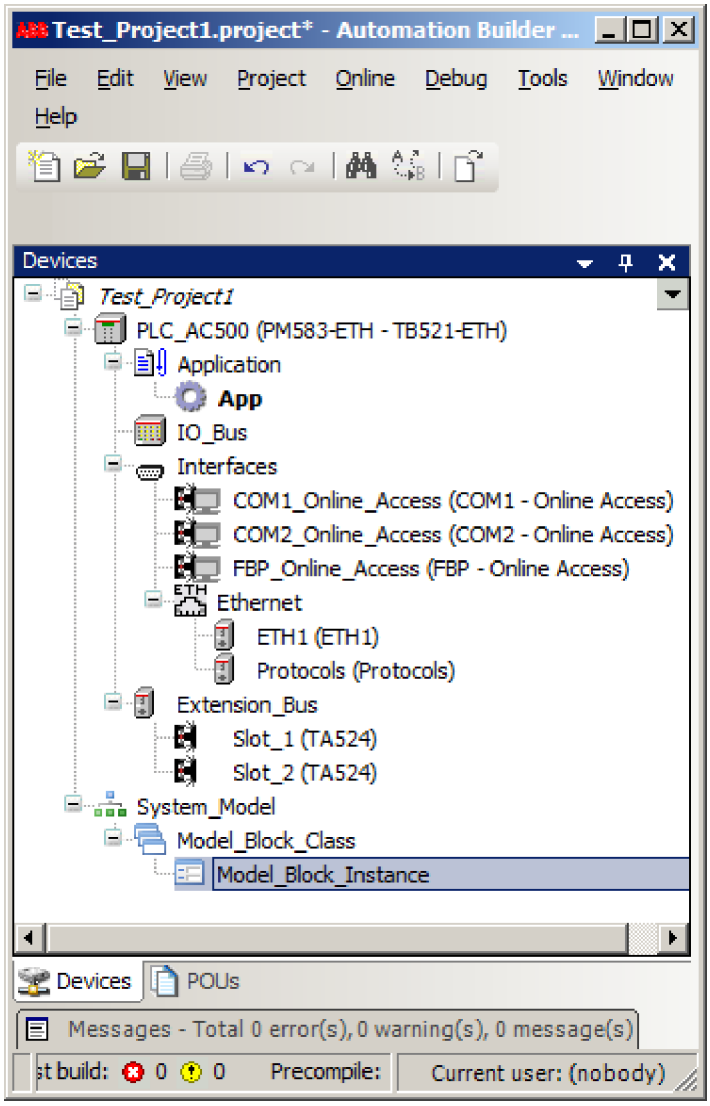


Fig. 1180: Model Block Instance

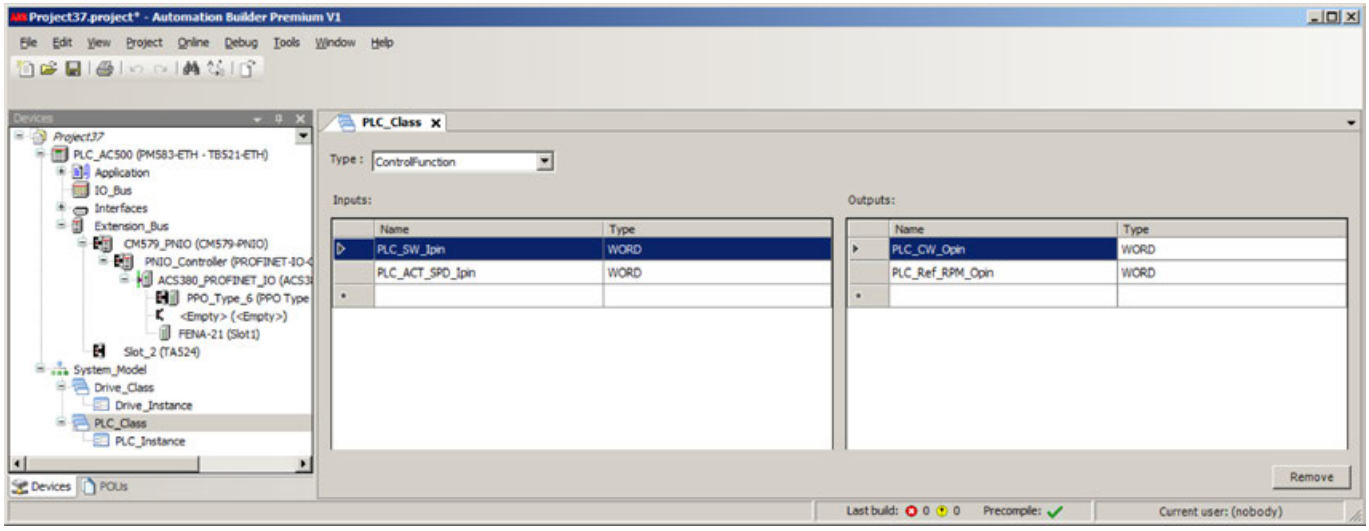
1.8.3.1.1 Model block class editor

The Model Block Class editor represents model block class object and supports following functions.

- **Create pin definitions** - The user can create definitions for input and output pin. The pin definition includes name and type of a pin. The pin name should be unique.
- **Remove pin definitions** - The user can remove pin definitions either by using 'Remove' button or by using 'Delete' Key. The user may remove multiple pin definitions at once.
- **Auto correcting pin definitions** - The pin name should be unique within a model block class object. If a duplicate pin names exists, the user can auto-correct the names. Appropriate indexes are used to correct duplicate names if the user chooses for auto correction.



1.8.3.1.2 Model block instance editor

The Model Block Instance editor represents the instances of the class object. The instance editor derives all the pin definitions from the class object and enables the user to create pin connections between different instance objects.

Using instance editor, you can do the following:

- Assigning a device
- Assigning variables
- Assigning endpoint
- Clear broken connections

Assigning a device

In the instance editor, first select the virtual device from the 'Assigned Device' drop down. No changes are allowed to the object or in the editor until the user selects the 'Assigned Device'.

Assigning variables

Variables defined in 'IO mapping' or as global variables are created as pins in the model block class object. The user can assign the variables using the inline editor or by using the **Assign Variable** button.

- To assign variables in the inline editor, enter the variable name in the 'Variable' column.
- To assign variables using 'Assign Variable' button, click **Assign Variables** to show a dialog containing all IO mapping and global variables of the corresponding device. Select the required variable and click **OK**. Connect Variable indicates a variable associated with connected endpoint.
- Only variables which match the direction and type of a pin are available for mapping. In case of any incorrect data, an error is displayed in the **Variable** column.

> *Use the Refresh button to fetch if the user makes any changes to variables, either using IO Mapping tab or using a Codesys application.*

Assigning endpoint

Defines the instances and pin connections (Source Block and Source Pin for inputs and Sink Block and Sink Pin for outputs). The user can assign endpoints using Inline editor or by Assign Endpoint button.

- To assign instances and pin connections in an Inline editor, enter the value in Source Block and Source Pin for inputs and Sink Block and Sink Pin for outputs or click on drop-down which displays the list of instances and pins.
- To assign instance and pin connections, click **Assign Endpoint** which displays the endpoint selection dialog. Select the required instance or pin and click **OK**.

Clear broken connections

The Clear Broken Connection clears all the broken source block instance and pin connections between Model Class objects. If there are any broken connection, the cell is indicated with an error icon. When an instance associated with any mapped signal is deleted, it will generate broken signal.

1.8.3.2 Generating system model

System Modelling allows you to generate System Model for Drives and I/O devices which can be readily used for Virtual System Testing.

- System Model generation is only implemented for AC500 V2 products.
- Deleting one node of a generated System Model will result in the entire System Model being deleted.
- Symbols are exposed for the devices which are used in System Model generation.
- It is recommended that the manual changes should not be made to any generated objects.
- If any changes are made to the devices which have a System Model, it is recommended to use ‘Update System Model’ command to keep the System Model up-to-date.

The System Model generation commands can be found in the context menu of a System Model object in the device tree.

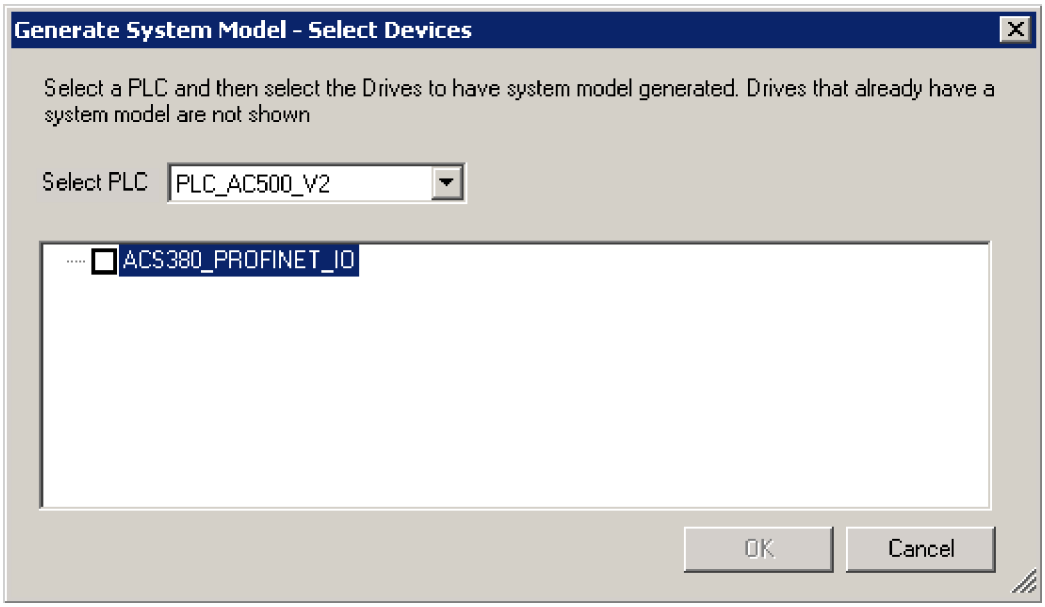
- Generate System Model for Drives
- Generate System Model for I/O
- Update System Model

Generating system model for drives

To generate System Model for the Drives, the user has to configure Automation Builder project with PROFIBUS or PROFINET drive and minimum of one variable mapping. To expose the symbols of a device, launch CODESYS application and generate the symbol file.

The command will generate a System Model for one or more selected drives.

1. Right-click on System Model node and select *“System Modelling ➔ Generate System Model for Drives”*.



2. Select the desired PLC from the drop-down list and select the Drive and click **OK** to generate a System Model.

   ⇨ The System Model is generated for the selected device(s). You can see multiple nodes are been added to the device tree under the System Model node.

   - Two Class and two Instance objects are generated for each device selected for generation.
   - The Drive Class object contain pin definitions for all the mapped variables on the selected device.
   - The Drive Instance object contain information about which pin/variable is mapped to the PLC Instance.

The PLC instance will contain exposed variables and the Drive instance will contain internal drive variables (FBAdatain/FBAdataout), but with the pin directions reversed. (for example, If the drive has an input variable ‘var’ mapped, the PLC equivalent will have an output variable ‘var’ mapped). At this point, the System Model is successfully generated and is ready for use in Virtual System Testing.

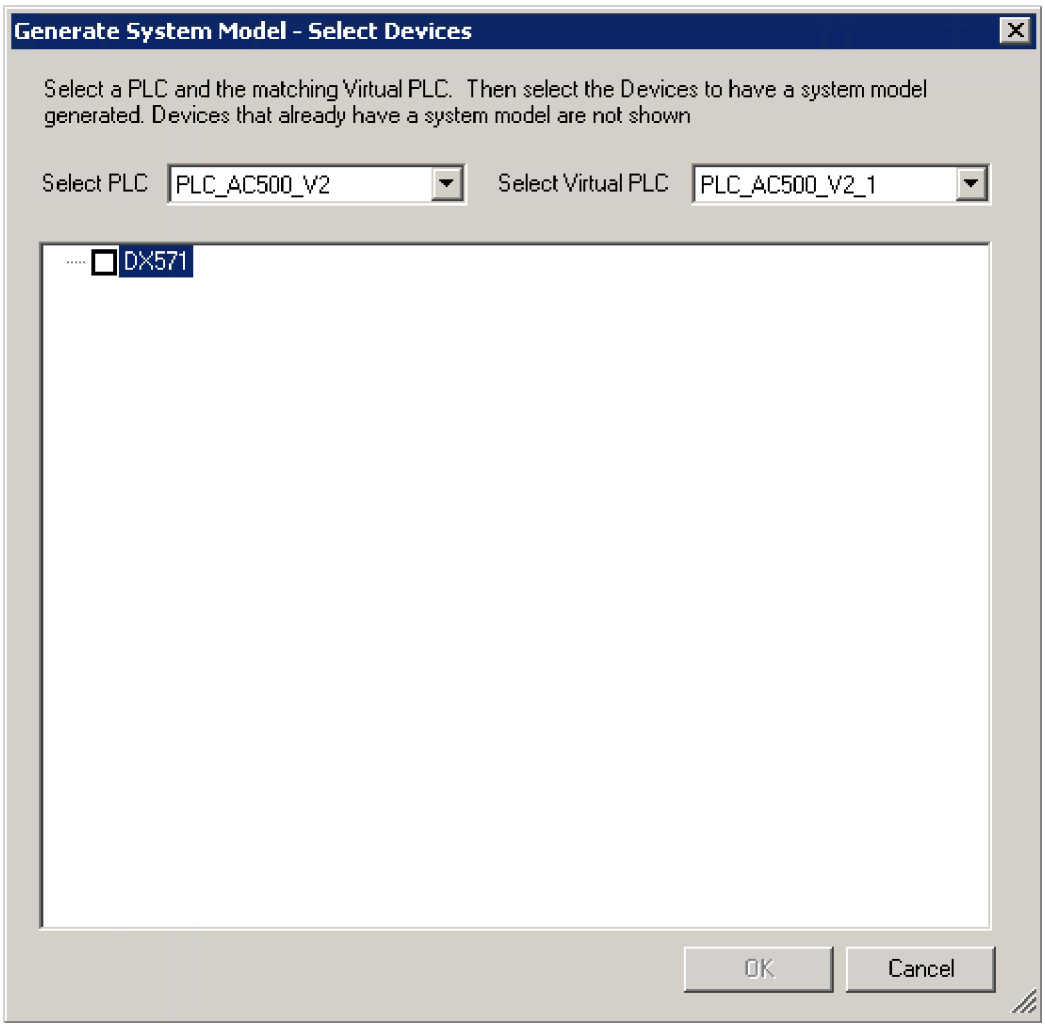
Generating system model for I/O

To generate a System Model for I/O modules, the user has to create an I/O module minimum of one variable mapping. The same type of device have to exist under the virtual PLC and have variable mappings with the same names and types but in opposite directions.

The command will generate a System Model for one or more selected I/O modules.

1. Right-click on System Model node and select *“System Modelling ➔ Generate System Model for I/O”*.

   ⇨ Generate System Model dialog shows the devices which are suitable for generating System Model.



2. From the drop-down list, select the real and virtual PLCs which displays the I/O modules that are associated with the real PLC.

   ⇨ The System Model for I/O mdoules are generated successfully.

Two Class and two Instance objects are generated for each device. One Real Class and Instance, and one Virtual Class and Instance. It is possible that the generation of a System Model can fail or generate warnings or errors. See sections ↳ *“Warnings” on page 6573* and ↳ *“Errors” on page 6573*.

The Class objects contain pin definitions for the variables which are in real and virtual devices. The Instance objects contain the information of pin mappings.

Update system model

Update System Model command updates all the existing System Models to reflect the current state of the devices.

1. Right-click on System Model node and select **System Modelling** -> **Update System Model** to update the System Models.
2. Confirm an upcoming message with *“OK”*.

   ⇨ Any manual changes made to the existing generated System Models are overwritten and they are updated to reflect the information contained within the devices.

Warnings

When a System Model generation is failed due to the selected device with no variable mappings, a warning 'Model not generated for device: No variable mappings found' is displayed.

The device should contain minimum of one variable mapping to generate a System Model.

Errors

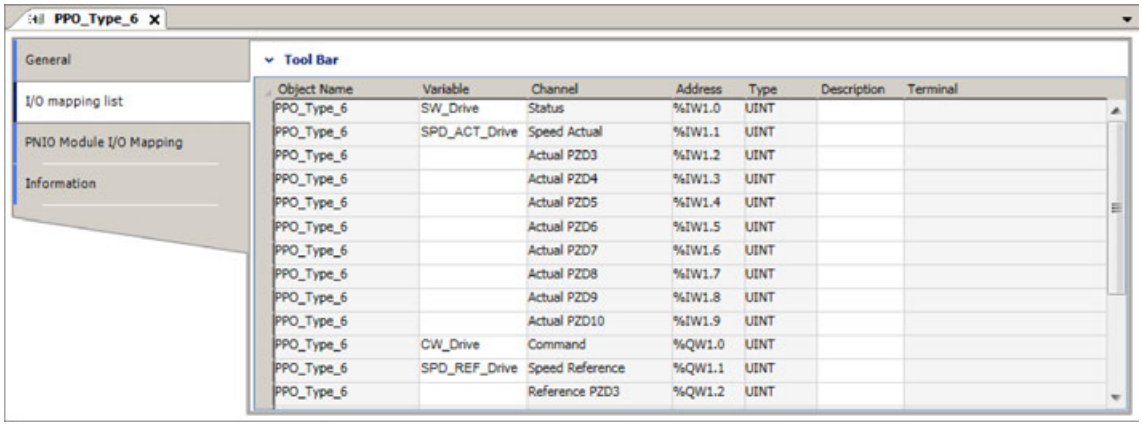
When a System Model is generated for a device which does not have the symbols exposed, an error 'The required symbols are not exposed. Please generate the symbol file for device x' is displayed.

The System Model can be generated without exposing the symbols. However, you cannot use in Virtual System Testing until the symbols of the device are exposed.

1.8.3.3 Example

In the example, the PLC will send Start, Stop (CW) and Speed Reference to the drive and read Actual speed and Drive Status (SW) using the fieldbus (PROFIBUS or PROFINET) device.

1. In the Automation Builder project, create a CODESYS application program and configure ACS380 Drive and its variables in the PPO Type editor.



2. Add a System Model under Automation Builder project.
3. Under System Model, add a model class and their instances for the drive and PLC (virtual devices).
4. Define input and output pins and their data types for the drive.

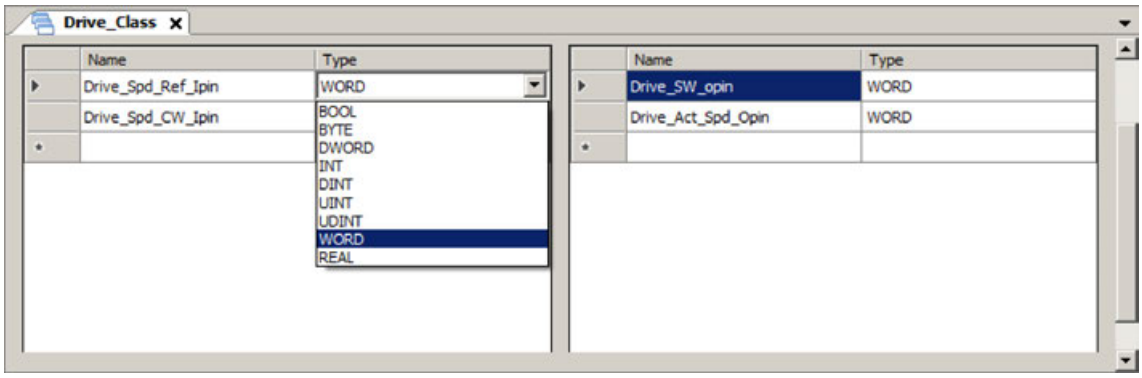


Fig. 1181: Drive Class Inputs and Outputs

⇨ Similarly, define input and output pins and their data types for the PLC.

5. In the Drive Instance editor, select a device (ACS380_PROFINET_IO) from the assigned device drop down which represents an instance.

> *The pins and their data types are defined in the class editor for a drive and PLC are displayed in the drive and PLC editors.*

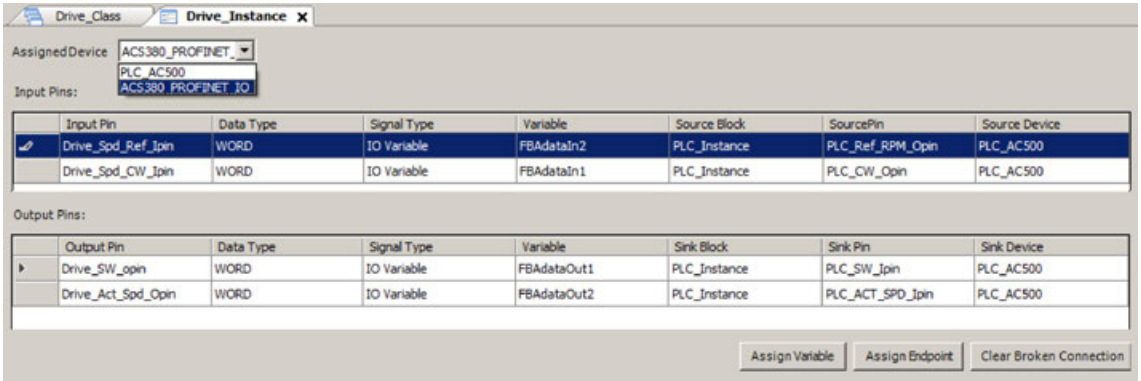

Fig. 1182: Assigned devices

6. Assign a variable using Inline editor or by Assign Variable button.
7. Assign Source Block and Source Pin for inputs and Sink Block and Sink Pin for outputs using the inline editor or by Assign Endpoint button.

> *If the connections between drive and PLC input and output pins are incorrect, click "Clear Broken Connection" to delete the broken connection pins.*

1.8.4 Drive composer pro integration

Drive Composer Pro is a start-up and maintenance tool for ABB's common architecture drives. The tool is used to view and set drive parameters, and to monitor and tune process performance.

Drive Composer Pro provides:

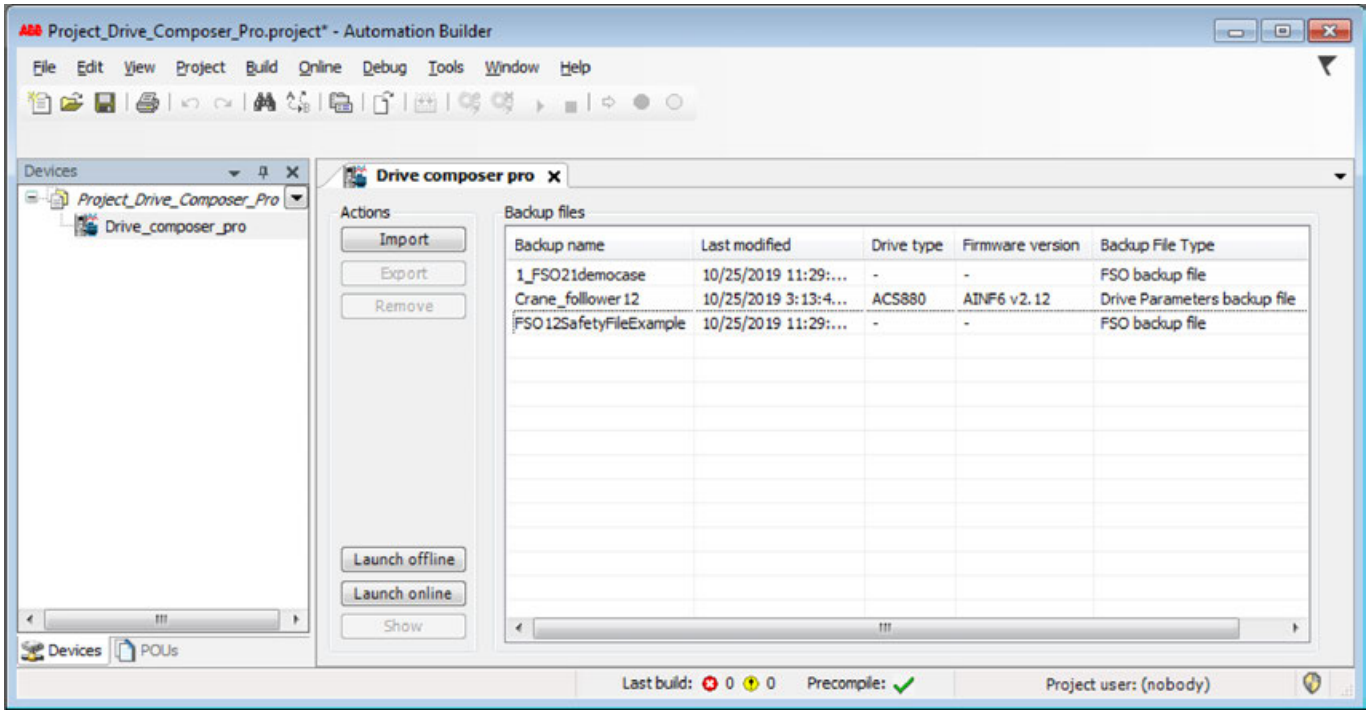
- Setting parameters,
- taking local control of the drive from the PC,
- event logger handling
- control diagrams,
- fast monitoring,
- working with multiple drives on the PC tool network,
- macro script editing for parameters and much more.

1. Add *"Drive Composer Pro"* object into the tree via add object dialog.
2. Open the *"Drive Composer Pro"* with double-click on the object.

In the following section important functions are described.

Import of backup files

1. Import of FSO backup files (*.dcsafety) and Drive Parameters backup files (*.dcparamsbak) into Automation Builder project via the Drive Composer Pro object in the device tree.
2. View of integrated FSO backup files and Drive Parameters backup files in Automation Builder project - refer to figure below.

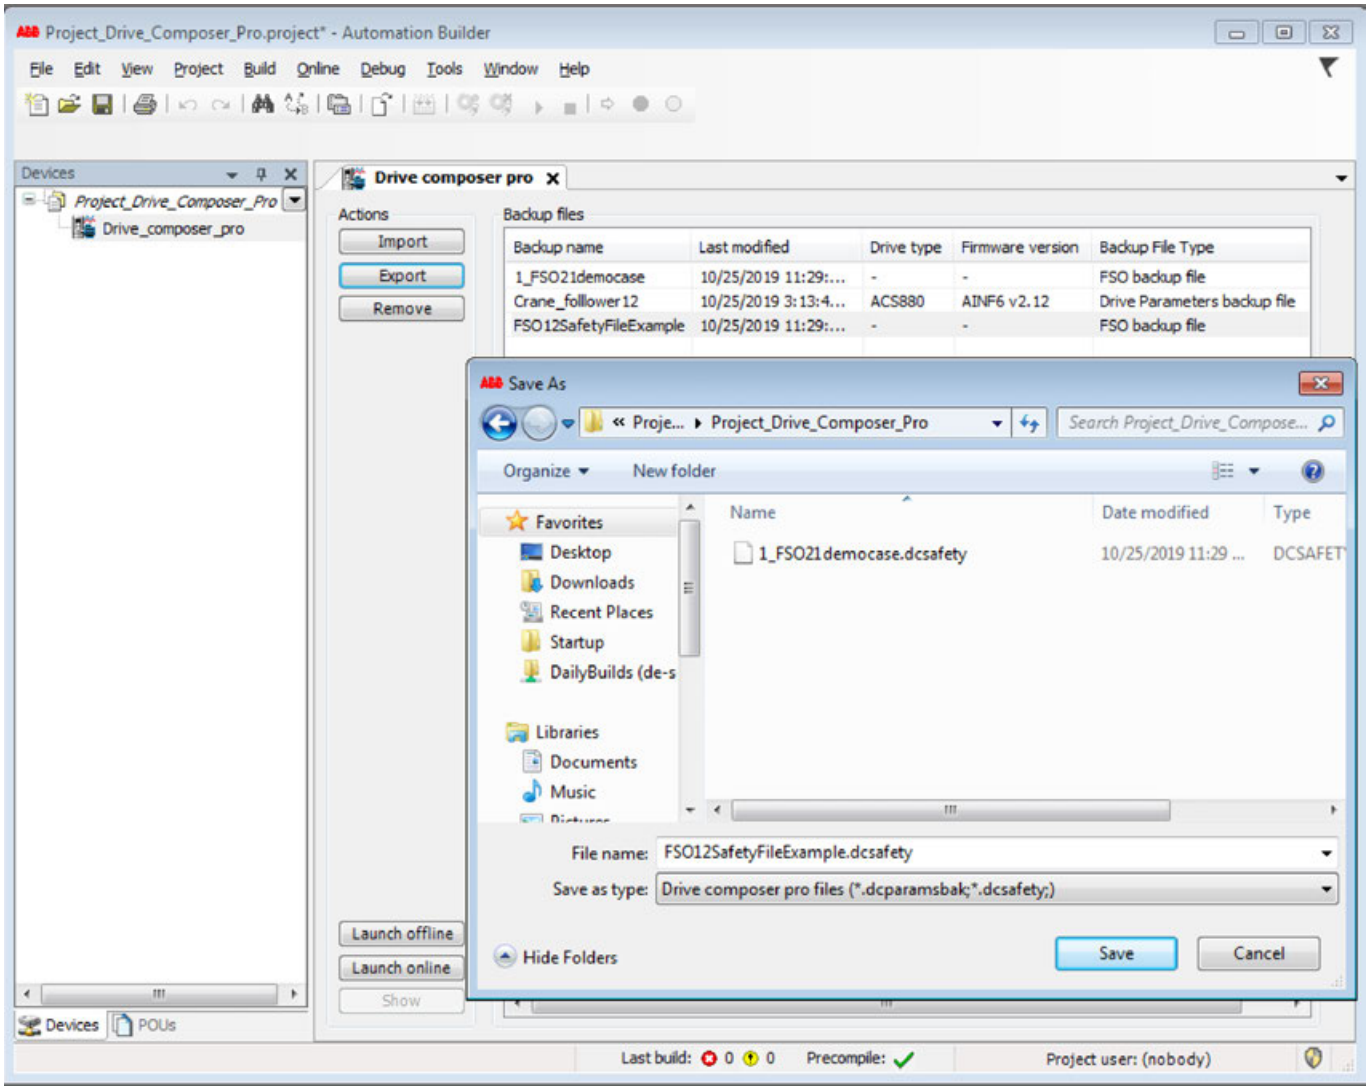


⇨

Drive Composer Pro can't be launched directly with integrated “FSO backup files” but they have to be loaded manually via context menu on the drive in Drive Composer Pro → “Safety Settings”.

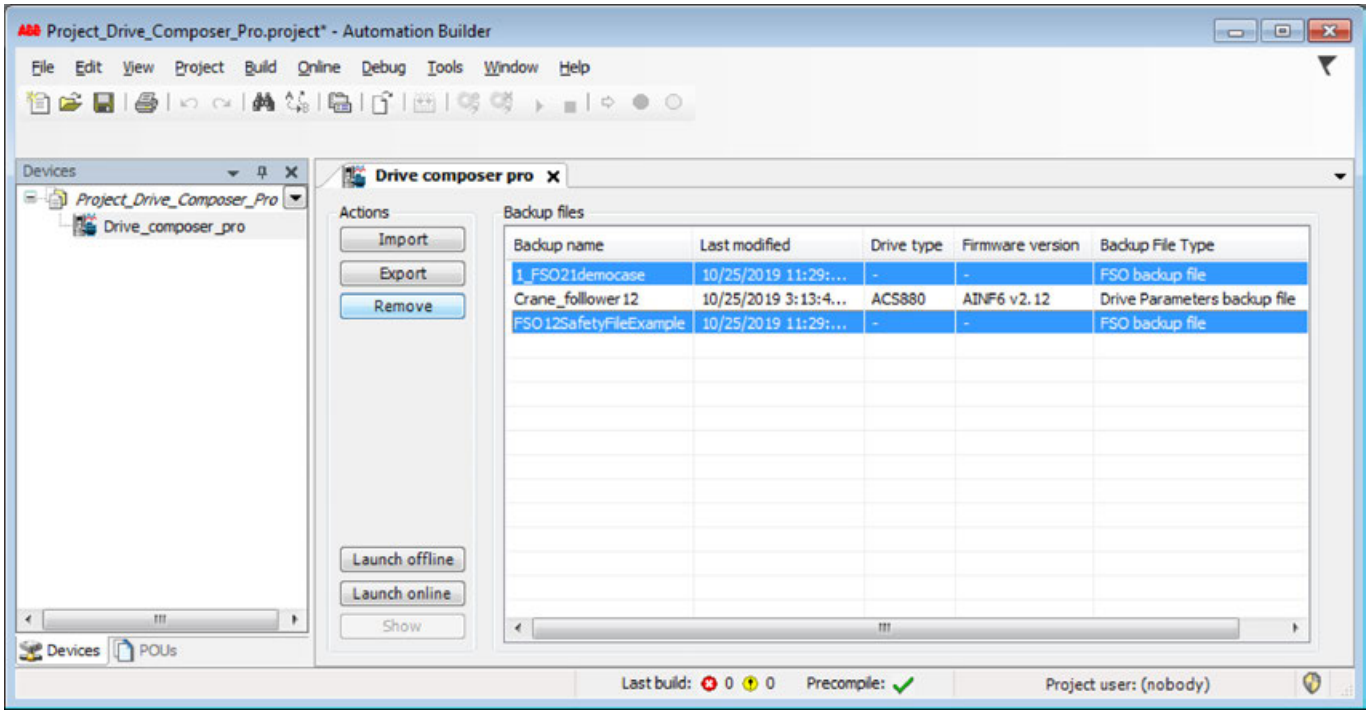
Export of backup files

1. Select the FSO and Drive Parameters backup files.
2. Export the selected file by clicking *[Export]*.
   ⇨ Select the desired storage path.



Remove of backup files

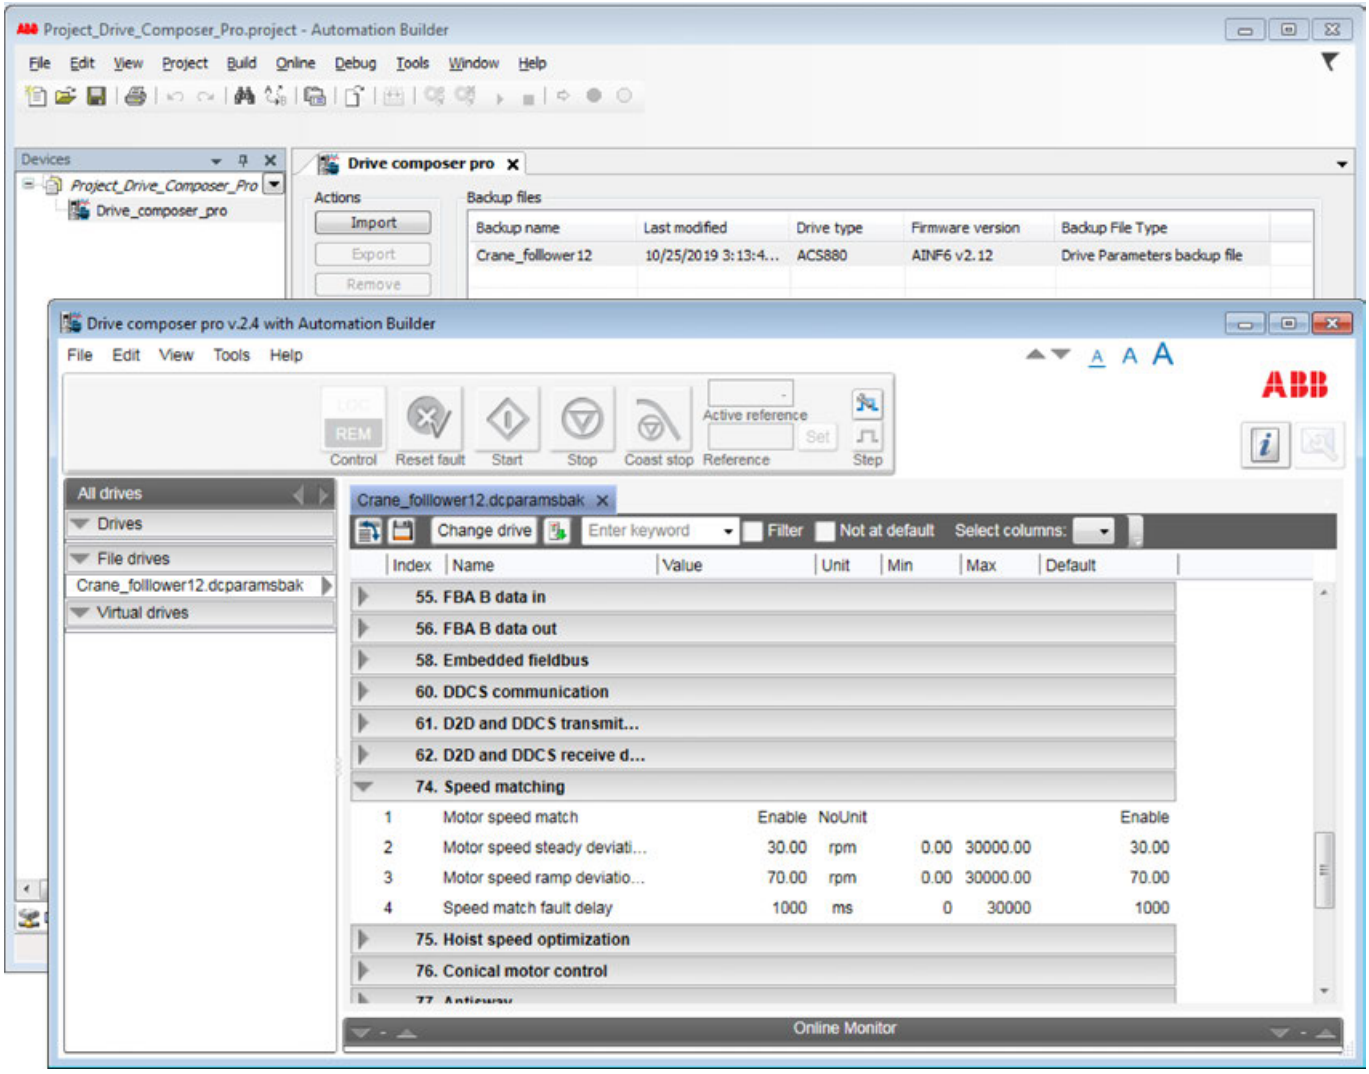
1. Select the FSO and Drive Parameter backup files from Automation Builder project.
2. Remove the selected files by clicking *[Remove]*.



View standard drive parameter backup files

1. Open the *“Crane_follower12.dcparamsbak”* with double-click.
2. The *“Drive Composer Pro”* starts automatically.

> *Standard Drive Parameter backup files (*.dcparamsbak) are automatically displayed under “File Drives”.*



3. Saved changes in the standard drive parameter backup file are automatically updated in the Automation Builder project.

1.8.5 Professional Version Control

SVN integration in CODESYS

Professional Version Control allows for the development of CODESYS projects under version control by Apache™ Subversion®. Professional Version Control provides an SVN client integrated in CODESYS. The objects of your project are versioned in a central *SVN repository*.

As a rule, the SVN repository should be created in a server configuration and located on a server. For testing purposes, you can create a local SVN repository where you can access via `file://`.

Professional Version Control requires a valid license and can be installed using the Automation Builder Installer or the Automation Builder Installation Manager.

1.8.5.1 Getting Started

The following steps are required in order to develop your CODESYS project with Professional Version Control with version control by Apache™ Subversion®:

1. Install the Professional Version Control package in CODESYS.
2. Install an SVN server.
3. Create an SVN repository.
4. Open your CODESYS project in CODESYS.
5. Import the CODESYS project into the SVN project archive.
   ⇨ The CODESYS project is saved in the SVN repository.
6. To edit and further develop the project with SVN version control, the project is edited in CODESYS and then committed to the SVN repository.

A detailed description of these individual steps is located in the following sections.

See also

- *Chapter 1.8.5.3 “Using an SVN Repository” on page 6579*
- *Chapter 1.8.5.4 “Using Working Copies” on page 6581*

1.8.5.2 Version control

What is version control?

Apache™ Subversion® (SVN) is a tool for version and revision management of current and previous versions of files, such as source code, websites, and documentation. Apache™ Subversion® is a registered trademark of the Apache Software Foundation.

Revision management (also known as version control, version management, and source code management) is the management of changes to documents, programs, and other information that is stored as computer files. Version control is employed frequently in software development when a team of employees works on the same files.

Tasks

- Co-writing of changes in revisions: At any time, you can show who made which changes at which time.
- Restoring of old revisions of individual files: At any time, you can reverse accidental changes to files.
- Archiving of special revisions of a project: At any time, you can revert to older versions.
- Coordination of common access of developers to data
- Development of a project simultaneously in multiple branches

Script Engine SVN Add-on API

Professional Version Control provides a scripting-interface for SVN.

1.8.5.3 Using an SVN Repository

An *SVN repository* usually saves information as a file system tree, a hierarchy of files, and directories. Any number of clients connects to the SVN repository and reads or writes changes to the files in revisions.

Creating an SVN repository

NOTICE!

Consult with your IT specialists for more information, for example how to create an SVN repository. For production purposes, we recommend a strictly dedicated administrative SVN server.

We recommend that you create the suggested default directory structure in the SVN repository.

See also

– *http://svnbook.red-bean.com/en/1.8/svn.tour.importing.html#svn.tour.importing.layout*

Creating an SVN repository for testing purposes

NOTICE!

Use the `file://` access method for testing purposes only.

You can reach SVN repositories that were created in format 1.8 or 1.9 via the `file://` protocol.

For testing purposes, you can create a local SVN repository without installing your own server. The SVN repository is accessed via `file://` and provides the same functionality as a server.

Creating a test repository with TortoiseSVN

☑ Requirement: The SVN client TortoiseSVN 1.9 is installed on the development system.

1. Create a new, empty folder on your local file system. The test repository will be created there.
   ⇨ Example: `D:\SVN repository`
2. Click *"TortoiseSVN ➔ Create repository here"*.
   ⇨ The dialog *"Create repository"* opens.
3. Click *"Create directory tree"*.
   ⇨ The `SVN repository` is created.

See also

- Documentation TortoiseSVN *Documentation TortoiseSVN*

Accessing the SVN repository

Table 799: SVN repository URLs

`file:///`	Direct access to an SVN repository (on local hard drive)
`http://`	Access via WebDAV protocol to Apache server that is supported by SVN
`https://`	As `http://`, but with SSL encryption
`svn://`	Access via own protocol to an `svnserve` server
`svn+ssh://`	As `svn://`, but tunneled via SSH

Import the project into the SVN repository.

1. Open the CODESYS project that you want to save in the SVN repository.
   ⇨ Example: `A.project` is open.
2. Click *"Project ➔ SVN ➔ Import project to SVN"*.
   ⇨ The *"Browse SVN repository"* dialog opens.
3. Select the directory `file:///D:/SVN repository/trunk` in the directory tree.
4. Select the command.
   ⇨ The *"Create remote directory"* dialog opens.
5. Specify the URL for the new directory.
   Note: Because the new directory should contain the CODESYS project, specify the project name with extension here.
   ⇨ `file:///D:/SVN%20repository/trunk/A.project`
6. Click *"OK"* to close the dialog.
7. Select the new project and click *"OK"* to exit the *"Browse SVN repository"* dialog.
   ⇨ The *"Import Project to SVN"* dialog opens. The directory `file:///D:/SVN repository/trunk/A.project` is specified in *"URL of SVN repository"*.

- *Chapter 1.8.5.5.1 "Overlay Icons" on page 6582*

1.8.5.4 Using Working Copies

Checking out a project

You can copy CODESYS projects to your development system that are saved in the SVN repository.

Creating a working copy

1. Open CODESYS.
2. Click *"Project ➔ SVN ➔ Checkout"*.
   ⇨ The *"Checkout"* dialog opens.
3. Specify the URL of the SVN repository and select a project in the SVN repository tree.
   If a CODESYS project has the extension `.project` or `_project`, then it is recognized automatically as a project at checkout. If it has the extension `.library` or `_library`, then it is recognized as a library project.
4. In *"Checkout to"*, specify the name and location of the working copy on your development system.
5. Click *"OK"* to close the dialog.
   ⇨ The project opens in CODESYS. In the object tree of the project, the SVN link is shown with overlaid icons. Now the project is saved as a working copy on your development system.

See also

- *Chapter 1.8.5.5.1 "Overlay Icons" on page 6582*

Editing the working copy

Update the working copy before you start editing, especially if the project is revised by a team. This is how you avoid conflicts.

1. Open the working copy.
2. Click *"Project ➔ SVN ➔ Update project"* (symbol:).
   ⇨ You working copy is current.
3. Revise your project.
4. Click *"Project ➔ SVN ➔ Edit SVN working copy"*.
   ⇨ The dialog opens. There you can browse your changes.
5. Close the dialog.
6. If necessary, you can click *"SVN ➔ Revert"* in the context menu.
   ⇨ The file is reverted back to the base revision and your changes are discarded.
7. If necessary, you can click *"Compare"* in the context menu of an edited object.
   ⇨ The compare dialog opens. You can resolve any conflicts here.
8. Close the compare dialog.
9. Click *"Project ➔ SVN ➔ Commit project"* (symbol:).
   ⇨ The *"Commit"* dialog opens.
10. In *"Message"*, specify a log entry that describes your changes. Example: `Changes for customer ABC, request 1234.`
    ⇨ Your changes are saved in the SVN repository as a revision with a revision number.

See also

- *Chapter 1.8.5.5.2.1 "Command 'SVN Repository Browser'" on page 6585*

Changed working copy format in Professional Version Control `V4.1.0.0` and later

For projects in version Professional Version Control `V4.1.0.0` and later, the working directory (working copy) has a new format.

If you open a project that was created with `V4.0.4.0` or earlier, then the project is updated automatically to the new format when it is opened.

If you open a project that was created with `V4.0.4.0` or earlier and the project is based on an older SVN version of `1.7.x` or earlier, then you are prompted whether or not CODESYS should update the format. If you decline the update, then the SVN link of the project is deactivated. You can still load and edit the project.

The update does not have an effect on saving to the SVN server. You can also checkout projects with earlier versions of the client. The new format affects only the local working directory.

1.8.5.5 Reference, User Interface

1.8.5.5.1 Overlay Icons

Every object in CODESYS has a status value in the SVN repository. This status value is displayed in the object tree (in the *"POUs"*, *"Devices"*, or *"Modules"* views) for each object by overlay icons.

Table 800: Overlay icons

	Object is planned to be added to the SVN repository.
	Object conflicted
	Object deleted
	Object modified
	Object with modification in the metadata
	Object with modifications in the memory format
	Object normal
	Object write-protected (read-only)
	Object locked
	Object with deleted subobjects
	Object ignored on commit
	External object
	Ignored object
	Unversioned object
	Object with modified subobjects
	The object is not saved in the SVN repository. It will be created again when loaded from SVN.
	`SVN_VERSION_INFO` temporarily unavailable, for example as with interface libraries
	The status of the object is not updated.
	The object was modified on the server (**U**pdate available).
	The object was locked on the server by another user (or in another working directory).
	Tree conflict by changes to the structure of the project

1.8.5.5.2 Commands

Not all commands are available in the logged in state because some SVN commands of the project could be changed.

Table 801: Availability of commands

Command	Not Logged In	Logged In
Chapter 1.8.5.5.2.1 “Command 'SVN Repository Browser'” on page 6585	X	X
Chapter 1.8.5.5.2.2 “Command 'Edit SVN working copy'” on page 6586	X

Command 'SVN Repository Browser'

Symbol: 

Function: This command opens the SVN repository browser. The contents of an SVN repository is shown in a tree structure here. You can search through the repository in the browser.

Call: Menu bar: *“Project ➔ SVN”*.

Depending on the selected object, the following commands are available in the context menu:

- *“Show log”*
- *“Checkout”*
- *“Create folder”*
- *“Copy to”*
- *“Rename”*
- *“Delete”*

Double-clicking the object with the right mouse button opens the log dialog.

Dialog 'SVN Repository Browser'

"URL"	URL in SVN repository Example: `https://svnserver/repository/trunk/ControlABC.project` Tip: As soon as a valid SVN repository is specified, you can browse and select a specific project by means of the adjacent button.
15	Opens the dialog *"Select revision"*. The button is labeled with the currently selected revision: ● *"HEAD"*: Top revision (latest). Preset ● *"3"*: Revision number of the selected revision ● *"23.12.2016 11:59:59 (UTC)"*: Change date of the selected revision (UTC) Note: The dialog provides the same options as the *"Revision"* group.
	Updates the browser view by rescanning the SVN repository.
	Navigates the URL address up by one folder.
Left area	Directory tree in the SVN repository. Project nodes are shown in bold.  Note: In this view, you can directly edit the project name and the name of the superordinate folder.
Right area	List of objects of the selected directory
"Close"	Closes the dialog

See also

- *Chapter 1.8.5.5.3.3 "Dialog 'Select revision'" on page 6614*

Command 'Edit SVN working copy'

Symbol:

Function: This command opens the dialog *"Edit SVN working copy"* and displays the working copy in a browser from the SVN view.

Call: Menu bar: *"Project ➔ SVN"*.

The functionality of the browser allows for:

- Access to and actions on objects that are not displayed in the *"Devices"* view.
- Actions on objects that can lead to exceptions in the *"Devices"* view.
- Editing of global objects that are modified, in conflict, or blocked.

Dialog 'Edit SVN working copy'

Table 802: "Edit SVN working copy: <project name> - <project URL>"

"Path in SVN repository"	Display of working copy from SVN view. The file and folder structure of the objects in the project are presented in a tree view. In this way, the recursion depth of an object is clear. : Object selected for the following menu command
"Name of object"	File name of the object Example: `Application`
" Node type"	The top node is the project root directory.
"Text status"	Object status: ● *"modified"* ● *"added"* ● *"deleted"* ● *"non-versioned"* ● *"Conflicted"*
"Property status"	Status in SVN repository: ● *"modified"* ● *"added"* ● *"deleted"* ● *"Conflicted"* ● *"normal"*
"Revision"	Revision number
"Conflict information"	File conflict, property conflict, or tree conflict
"Lock"	For locked objects, the user who applied the lock is displayed. Example: `b.mayer`
"Lock comment"	Lock message. Implicit, normal, or stolen lock.
"URL"	URL of the object

Table 803: Menu commands

"Select ➔ All"	Selects all files.
"Select ➔ None"	Deselects all files.
"Select ➔ Modified"	Selects the modified files.
"Select ➔ Conflicted"	Selects the conflicted files.
"Select ➔ Locked"	Selects the locked files.
	Updates the working copy. Changes made by others are added from the SVN repository to your working copy.
"Update ➔ Project"	Updates all files of the project.
"Update ➔ Selected nodes"	Updates only the selected files.
"Update ➔ Selected nodes and children"	Updates the selected files and subordinate files.
"Reset"	Discards your changes to the working copy. Then the object corresponds to the revision in the repository.

"Delete ➔ Selected nodes"	Deletes the selected objects from the working copy.

"Commit"	Commits your changes to the SVN repository. Any locked objects will be unlocked.
"Commit ➔ Project"	Commits all files in the project.
"Commit ➔ Selected nodes"	Commits only the selected files.
"Commit ➔ Selected nodes and children"	Commits the selected files and subordinate files.

	Commands for managing locks.
"Locks ➔ Revalidate all"	Checks the validity of locks in the working copy. Any invalid locks will be unlocked.
"Locks ➔ Release locks"	Releases the lock.
"Locks ➔ Acquire locks"	Locks the object from editing by others.
"Locks ➔ Steal locks"	Locks the file for you and removes the lock of another user. Tip: Avoid stealing a lock because the changes made by another user can be lost.

	Commands to resolve conflicts.
"Conflicts ➔ Mark as resolved"	Indicates a displayed conflict in the SVN repository as marked and resolved. Note: Select the command if you edited and resolved the displayed conflict. Then you can commit changes again.
"Conflicts ➔ Resolve using theirs"	Resolves the conflict: In the SVN repository, the changes are accepted that were committed by other users. Your changes are discarded.
"Conflicts ➔ Resolve using mine"	Resolves the conflict: In the SVN repository, the changes to your working copy are accepted and the changes by other users are discarded.

"Show log"	Opens the dialog *"Log - Application"*. The history of the selected node is shown here. The previous revisions are displayed with the respective actions.

"Change location"	Changes the storage location of the selected object within the working copy. Example: You can resolve a tree conflict by saving the local object to another location. Then update the parent object to apply it to the locked children.

"Update"	Updates the browser view by rescanning the working copy.

"Cleanup"	Executes an SVN cleanup operation on the working copy.

Command 'Import project to SVN'

Symbol: 

Function: This command opens the *"Import Project to SVN"* dialog for importing a CODESYS project to the SVN repository.

Call: Menu bar: *"Project ➔ SVN"*.

Requirement

- You have access to an SVN repository and you know its URL.
- You have read access to the entire project.

> **NOTICE!**
> Projects are always saved unencrypted on the server. Therefore, take appropriate security measures (for example, respective access rights to the SVN server) for protecting your projects.

See also

- User and access management in *Protect and save project*

Dialog 'Import Project to SVN'

"URL of SVN repository"	URL of the SVN repository with the new project folder where the files are imported Example: `https://svnserver/repository/trunk/ControlABC.project` Hint: When importing libraries, specify the extension `.library` or `_library`. For projects, specify the extension `.project` or `_project`. Then the project type is recognized automatically at checkout and the options are set accordingly in the *"Checkout"* dialog.
	Opens the *"SVN Repository Browser"* dialog The previous project structure is displayed and you can edit them here.
"Import message"	Text for use as log message Example: `Control project for customer A`
"Recent messages"	Opens the *"Recent Messages"* dialog. There you can reuse the last log messages.
"Generate SVN_VERSION_INFO"	☐: The object `SVN_VERSION_INFO` is not created automatically during the import operation. Therefore, the project does not get any global constants or variables for the project metadata.
"OK"	Creates the current project in the SVN repository and imports the project objects. The local project in CODESYS Development System is linked to the SVN repository. Overlay icons show this in the object trees.

See also

- *Chapter 1.8.5.5.2.4 "Command 'Checkout'" on page 6589*
- *Chapter 1.8.5.5.2.1 "Command 'SVN Repository Browser'" on page 6585*
- *Chapter 1.8.5.5.1 "Overlay Icons" on page 6582*

Command 'Checkout'

Symbol: 

Function: This command opens the *"Checkout"* dialog. Here you can checkout a project stored in the SVN repository as a working copy.

Call: Menu bar: *"Project ➔ SVN"*.

Dialog 'Check-out'

Table 804: "URL of SVN repository"

https://svnserver/repository/trunk/ControlABC.project	URL of the project in the SVN repository Example: `https://svnserver/repository/trunk/ControlABC.project` Tip: As soon as a valid SVN repository is specified, you can click the adjacent button or use the options to browse in *"Revision"* and select a specific project.
15	Opens the dialog *"Select revision"*. The button is labeled with the currently selected revision: ● *"HEAD"*: Top revision (latest). Preset ● *"15"*: Revision number of the selected revision ● *"23.12.2016 11:59:59 (UTC)"*: Change date of the selected revision (UTC) Note: The dialog provides the same options as the *"Revision"* group.
...	Opens the *"SVN repository browser"* dialog Here you can browse the SVN repository.

Table 805: "Checkout to"

"Name"	Name of the working copy Example: `ControlABC.project`
"Location"	Storage location of the working copy Example: `/D:/svn/repository/trunk/ControlABC.project`

Table 806: "Checkout as"

"Project"	The project is saved as a CODESYS project "`<project name>.project`".
"Library"	The project is saved as a CODESYS library file "`<project name>.library`".
"Auto-detect"	CODESYS attempts to recognize the project type by means of the extension. The current implementation checks whether the URL of the project ends with "`_library`" or "`.library`". In this case, the project is recognized as a library or a project.

Table 807: "Checkout options"

"Omit externals":	☑: Externals (external objects) are not copied to the working directory.

Table 808: "Revision"

For a description, refer to the section "Dialog 'Select revision'". Note: The group provides the same options as the *"Revision"* dialog.

"OK"	Checks out the project from the SVN repository, saves it locally to the specified location, and opens it in CODESYS as the primary project.

If files were encrypted when imported to the SVN repository, or if they have been committed, then note the following:

When committing to the SVN repository, the information about an encrypted project file is included. However, the type of encryption is not included (password, Wibu security key, X509 certificate). Therefore, it may be necessary to encrypt the working copy again in the project settings. In this case, a dialog opens when exiting the command to notify you of this. Then you are able to switch directly to the project settings.

- *Chapter 1.8.5.5.3.3 “Dialog 'Select revision'” on page 6614*
- *Chapter 1.8.5.5.2.1 “Command 'SVN Repository Browser'” on page 6585*
- *"Version control with Subversion", Section "Revision identifier"*

Command 'Commit', Command 'Commit Project'

Symbol:

Function: The command commits changes that were made in CODESYS to the SVN repository. The *“Commit”* dialog opens for this purpose.

Call:

- Context menu: *“SVN”* to commit exactly this object
- *“Project ➔ SVN ➔ Commit Project”* to commit all changes in the project at the same time

Requirement: At least one object was modified. An object whose contents have been modified is overlaid in the object tree with the , , or symbol.

When you execute the command, the lock on the objects to be committed is lifted automatically.

See also

- *Chapter 1.8.5.5.1 “Overlay Icons” on page 6582*

Dialog 'Commit'

Table 809: “Commit to: <URL project/object>”

	URL in SVN repository Example: `file:///D:/SVN repository/trunk/ControlABC.project`
“Log message”	Type in a log message that comments your change. Example: `Bug fix error 123`
“Recent Messages”	Opens the *“Recent Messages”* dialog for displaying the last log messages. You can click a log message to accept it.

Table 810: "Changes made (double-click on object for compare, right-click on object for more operations)"

	List of objects that were changed and can therefore be committed. The SVN URLs mirror the hierarchy of the object in the SVN repository. The objects are highlighted in color according to the object status: ● Blue: Modified ● Green: Added ● Dark red: Deleted ● Red: Conflicted ● Black: Non-versioned (not in SVN repository) Note: These objects are displayed when the *"Show non-versioned objects"* option is selected. ● Gray: Excluded from commit Note: This is the case when the *"Ignore during commit"* option is selected. The list also contains objects which have not been modified but have a lock. This helps to prevent locking from going unnoticed in the repository. Double-click an object in order to open the compare dialog. The revision of the working copy is compared with the base revision. The compare dialog also opens when you click *"Compare"* in the context menu. Right-click an object in order to open the context menu. Note: When the *"Commit Project"* command has been executed, a list of objects is shown here. When the *"Commit"* command is applied to a specific object, only this object is shown (if modified or locked) and its modified or locked child objects.
"Object"	☑: The object is selected for the commit. Example: ☑ Device\Plc Logic\Application\PLC_PRG
"Text status"	Object status in CODESYS ● *"Modified"* ● *"Added"* ● *"Deleted"* ● *"Non-versioned"* ● *"Conflicted"*
"Property status"	Status of the metadata of the object ● *"Modified"* ● *"Added"* ● *"Deleted"* ● *"Conflicted"* ● *"Normal"*
"Lock"	If the object has a lock, then it is shown here the user who applied the lock. Example: `b.mayer`
"Description"	Display of the log message
"Select/Deselect All"	☑: All objects in the list are selected.

"Keep Locks"	☑: Your locked object remains in locked after the commit.
"Keep Change Lists":	☑: The change list also remains after the commit. ☐: The change list is not deleted after the commit.
"Update After Commit (recommended)"	☑: The object/project is updated after the commit. Select this check box to ensure that the project is up-to-date and to prevent conflicts resulting from mixed revisions of working copies.

Button *"Update Project"*	Updates the project Hint: Prevent conflicts by committing a previously updated project/object.
"OK" Keyboard shortcut *[Ctrl]+[Enter]* Keyboard shortcut *[Ctrl]+[Enter]*	Checks the working copy first. Starts the commit of changes when the working copy is current. Opens a dialog when the working copy is outdated. You can then select from the following: ● *"Abort the commit, I want to investigate the issue."* ● *"Yes, I want to update this project now."* ● *"Continue with the commit, I know what I do."* Note: The history of the commit is displayed in the *"Messages"* view. The messages are highlighted in color. ● Blue: Commit a change ● Green: Add an object ● Dark red: Delete/replace an object ● Black: Other messages (summary)

Handling external objects

If the external object is in the same SVN repository, then changes in this external object are listed in the commit dialog and committed together with the internal project. If an external object is in another SVN repository, then you are notified about changes in the external project and you have to commit these separately.

An external object has the "externals" property.

See also

- *Chapter 1.8.5.5.2.6 "Command 'Compare'" on page 6594*
- SVN help: *http://svnbook.red-bean.com/en/1.7/svn.basic.in-action.html#svn.basic.in-action.mixedrevs)*

Context menu (right-click on object)

"Compare"	Opens the compare dialog to compare the working copy with the top-level revision.
"Compare with HEAD version"	Opens the compare dialog to compare the working copy with the HEAD revision.
"Compare with Revision"	The list entries are highlighted in color according to the object status: ● Blue: Modified ● Green: Added ● Dark red: Deleted ● Red: Conflicted ● Black: Non-versioned (not in SVN repository) Note: These objects are displayed when the *"Show non-versioned objects"* option is selected. ● Gray: Excluded from commit Note: This is the case when the *"Ignore during commit"* option is selected for the object.
"Revert"	Discards your changes to the working copy. Then the object corresponds to the revision in the SVN repository.
"Show log"	Shows the version history of the selected object.

"Properties"	Opens the *"SVN Properties"* dialog. The properties are displayed there and you can edit them.
Move to change list	Note: This command has not been implemented yet.

Command 'Compare'

Symbol: 🔍

Function: This command opens a tab that shows the result of the comparison of your working copy and the BASE revision. The base revision is the top-level revision in the SVN repository.

Call:

- Menu bar: *"Project ➔ SVN"*.
- Context menu

Requirement: The object is versioned, it was modified locally, and it does not contain any conflicts.

Multiple tabs can be open at the same time with the comparison of different objects.

Comparison by object type

The comparison dialog makes use of the functionality of the CODESYS command "Project ➔ Compare". In this way, objects are compared according to their object type.

See also

- *Chapter 1.6.5.1.1.6 "Comparing projects" on page 5765*

Command 'Compare with HEAD revision'

Symbol: 🔍

Function: This command opens a tab that shows the result of the comparison of your working copy and the HEAD revision. The HEAD revision is the top-level revision in the branch. You can revert specific changes that were committed to the HEAD revision.

Call: Context menu: *"SVN"*

Requirement: The object is versioned and not conflicted.

Multiple tabs can be open at the same time with the comparison of different objects.

Comparison by object type

The comparison dialog makes use of the functionality of the CODESYS command "Project ➔ Compare". In this way, objects are compared according to their object type.

Command 'Compare with revision'

Symbol: 🔍

Function: This command opens the *"Project log"* dialog or *"Log - <object> "* where the version history is displayed from the project or an object of the CODESYS project. Here you can select a revision. A tab opens and shows the result of the comparison of your working copy and the revision.

Call: Context menu: *"SVN"*

Requirement: The object is versioned and not conflicted.

Multiple tabs can be open at the same time with the comparison of different objects.

> ***Comparison by object type***
> *The comparison dialog makes use of the functionality of the CODESYS command "Project ➔ Compare". In this way, objects are compared according to their object type.*

See also

- *"Tab 'Project log', Dialog 'Log - <object>'" on page 6600*

Command 'Compare to remote project...'

Symbol:

Function: This command opens the dialog *"Select Remote Project for Comparison"*.

Call: Menu bar: *"Project ➔ SVN"*.

Dialog 'Select Remote Project for Comparison'

Table 811: "URL of SVN repository"

https://svnserver/repository/trunk/ControlABC.project	URL of the project in the SVN repository that is compared. Example: `file:///D:/SVN repository/trunk/ControlDEF.project` As soon as a valid SVN repository is specified, you can click the adjacent button or use the options to browse in *"Revision"* and select a project.
15	The label on the button corresponds to the selected revision: ● *"HEAD"*: Top revision (latest). ● *"15"*: Revision number of the selected revision ● *"23.12.2016 11:59:59 (UTC)"*: Change date of the selected revision (UTC) After clicking the button, the dialog *"Select revision"* opens. Note: The dialog provides the same options as the *"Revision"* group.
...	Opens the dialog *"Browse SVN repository"* to search the SVN repository.

Table 812: "Checkout options"

"Omit externals":	☑: External objects are not compared.

Table 813: "Revision"

Options for selecting a specific revision Note: the current valid selection is also displayed next to the SVN repository URL.	
"HEAD"	◉: The HEAD revision is selected. This is the latest revision (top revision) within a branch.
"Revision"	◉: A specific revision is selected by the revision number. Example: `3`

"Date"	: The specific revision is selected by the modification date. Example: `12/23/2016 11:59:59`
"Use UTC Time":	: Modification date in universal time.

Table 814: "compare options"

"Ignore Whitespace"	: No comparison of whitespace characters. Semantically relevant whitespaces, such as in strings, are compared anyway.
"Ignore Comments"	: No comparison of comments.
"Ignore Properties"	: No comparison of properties. Folders, the property *"Exclude from build"*, and POU images are not compared. See: Dialog 'Properties'

"OK"	Compares the SVN project with the working copy.

See also

- *Chapter 1.8.5.5.2.1 "Command 'SVN Repository Browser'" on page 6585*

Command 'Include externals to project', Command 'Include externals'

Symbol:

Function: These commands open the dialog *"Include externals"*.

Call:

- Menu bar: *"Project ➔ SVN"*.
- Context menu: *"SVN"*

Requirement: An object is selected in the object tree. The external objects are linked below that. If you have selected nothing or the project root directory, then the command *"Include externals to project"* is available. If you have selected an object, then the command *"Include externals"* is available.

The same external objects cannot be linked multiple times at different locations in the same project. This leads to problems in CODESYS because of conflicts with the internal identification of the object.

Dialog 'Include externals'

Table 815: "URL of SVN repository"

file:///D:/SVN repo A/trunk/DSTest.project/Source	URL of the external object that is linked. The object to be linked is versioned and can have sub-objects. External objects are located at another location in the SVN repository than the project. It can even be in another SVN repository. Example: `file:///D:/SVN repo A/trunk/DSTest.project/GlobalTextList` Note: The objects that should be linked below the selected object must have a matching object type. For example, only a task can be linked below the *"Task configuration"* object.

15	Opens the dialog *"Select revision"*. Here you can select a revision. The button is labeled with the currently selected revision: ● *"HEAD"*: Top revision (latest). Preset ● *"15"*: Revision number of the selected revision ● *"23.12.2016 11:59:59 (UTC)"*: Change date of the selected revision (UTC) Note: The dialog provides the same options as the *"Revision"* group.
...	Opens the *"SVN repository browser"* dialog Here you can browse the SVN repository.

Table 816: "Revision"

Options for selecting a revision Note: the current valid selection is also displayed in the buttons next to the SVN repository URL.	
"HEAD"	◉: Latest revision (top revision) selected in a branch.
"Revision"	◉: A specific revision by the revision number. Example: `3`
"Date"	◉: A specific revision by the modification date. Example: `12/23/2016 11:59:59`
"Use UTC Time":	☑: Modification date in universal time.

"OK"	Adds the external object and its sub-objects with the property `svn:externals` to your project (below the selected object). The working copy is updated and the external object is overlaid with the ↗ symbol. Example: Source (external device `Source`) Note: If the linking fails (for example when adding a device below a task configuration), then the complete operation fails and reverts back. Note: Renaming or moving individual external objects is permitted inly within an external tree, whereby it is not permitted to move the top object. To move a complete tree, you have to remove it and link it to another location.

"... You should seriously consider using explicit revision numbers in all of your externals definitions. Doing so means that you get to decide when to pull down a different snapshot of external information, and exactly which snapshot to pull. Besides avoiding the surprise of getting changes to third-party repositories that you might not have any control over, using explicit revision numbers also means that as you backdate your working copy to a previous revision, your externals definitions will also revert to the way they looked in that previous revision, which in turn means that the external working copies will be updated to match the way they looked back when your repository was at that previous revision. For software projects, this could be the difference between a successful and a failed build of an older snapshot of your complex codebase. ..."

This is a quote from:

http://svnbook.red-bean.com/nightly/en/svn.advanced.externals.html).

Command 'Ignore on commit'

Function: This command identifies an object and adds it to the "ignore-on-commit" list. Then it is deactivated in the commit dialog by default.

Call: Menu bar: *“SVN”*

Requirement: At least one object is available that is not in the change list `ignore-on-comment`.

Objects of the "ignore-on-commit” list are overlaid with the symbol in the object tree. By default, they are not selected in the commit dialog, unless a dependency of a selected object requires it. These objects can always be selected manually in the dialog.

See also

- *Chapter 1.8.5.5.2.26 “Command 'Un-Ignore on commit'” on page 6606*

Command 'SVN Info'

Function: This command provides information about the selected object in the SVN repository. The *“SVN Information”* dialog opens for this purpose.

Call: Context menu: *“SVN”*

Requirement: A versioned object (with SVN link) is selected in the object tree.

Dialog 'SVN Information'

Example

```
Name: Device_4\Plc Logic\Application\PLC_PRG
URL: file:///D:/SVN repository/trunk/ControlABC.project/Device/Plc
Logic/Application/PLC_PRG/svnobj
Repository Root: file:///D:/SVN repository/
Repository UUID: 185325d7-73eb-e54b-ab50-206aa23c8b42
Revision: 29
Node Kind: File
Schedule: Normal
Last Changed Author: a.mayer
Last Changed Rev: 8
Last Changed Date: 17.01.2017 12:33:51
Text Last Updated: 17.01.2017 12:33:51
Checksum: d5fb4d91ebaea06f26bcdb15942724d57932b6a3
```

Command 'Show properties'

Symbol:

Function: This command opens the *“SVN Properties”* dialog. Here you can edit the properties of the versioned object.

Call: Context menu: *“SVN”*

Requirement: A versioned, unlocked object is selected.

Dialog 'SVN Properties'

Table 817: "properties for: <object name>"

"Name"	Name of the property Example: `myprop:customer-number` Note: SVN has some reserved properties. Example: `svn:mime-type`
"Value"	Example: `1234` Double-click in the field to edit the value.
"Add"	Opens a dialog to define another property with its value.
"Remove"	Deletes the selected property.
"Show binary properties"	☑: The binary properties are also displayed.
"Reset"	Resets the changes displayed in green.
"OK"	Accepts the changes.

See also

- *http://svnbook.red-bean.com*.

Command 'Get lock'

Symbol:

Function: This command locks the object explicitly for you. The *"Lock Message"* dialog opens for this purpose.

Call: Context menu: *"SVN"*

Requirement: The versioned object is not locked (not overlaid with the symbol).

Dialog 'Lock Message'

"Enter the reason why you lock the object:"	Lock message Example: `Locked for processing task 123`
Button *"Recent Message"*	Shows message in the dialog that have already been used. There you select one in order to use the lock message.
"Recursive"	☑: The object is locked with all subordinate child objects.
"OK"	Locks the object When the lock is successful, the object (in the object tree) is overlaid with the symbol.

Command 'Steal locks'

Symbol:

Function: This command steal the lock of the object. The *"Lock Message"* dialog opens for this purpose.

Call: Context menu: *"SVN"*

Requirement: The versioned object is locked by someone else (overlaid with the symbol).

Dialog 'Lock Message'

"Enter the reason why you lock the object:"	Lock message Example: `a.mayer had to steal the lock because the changes need to be implemented so urgently.`
"Recent Message"	Shows message in the dialog that have already been used. There you select one in order to use the lock message.
"Recursive"	☑: The lock is stolen by the object and all subordinate child objects.
"OK"	Steals the lock. When the stolen lock is successful, the object (in the object tree) is overlaid with the symbol.

Command 'Release lock'

Symbol:

Function: This command releases the lock of an object.

Call: *"Context menu ➔ SVN"*

Requirement: The object is locked.

Command 'Release locks recursively'

Symbol:

Function: This command releases the lock of an object explicitly with all of its subordinate objects.

Call: *"Context menu ➔ SVN"*

Requirement: The object is locked.

Command 'Show log', Command 'Show project log'

Symbol:

Function: These commands open the tab *"Project log"* or *"Log - <object>"*. The version history of the project or an object of the CODESYS project is displayed in the tab.

Call:

- Menu bar: *"Project ➔ SVN"*.
- *"Context menu ➔ SVN"*

If you select nothing or the base node in the object tree, then the history of the entire project is displayed (*"Show project log"*). If you select one or more objects, then the history of these elements is displayed (*"Show log"*).

Multiple tabs can be open at the same time with the version history of different objects.

Tab 'Project log', Dialog 'Log - <object>'

Upper area ● *“Revision”*: Revision number ● *“Author”* ● *“Date”* ● *“Message”*: Message entered at commit	List of all revisions of the project or the selected objects in the information. The first 100 revisions are displayed by default. The *“Next 100”* and *“All”* buttons are provided for displaying more or all revisions. Several commands are available in the context menu of each revision. These context menu commands are described below.
Middle area	Display of the *“Message”* of the revision that is selected in the upper area.
Lower area ● *“Action”* ● *“Path”*: Object path in SVN ● *“Copy from path”* ● *“Copy from revision”*	List of actions that were performed on the objects of the project in the selected revision:
“Hide unrelated changed paths”	☑: All changes of this revision are hidden that do not have any relevance to the object.
“Stop on copy/rename”	☑: If the object was copied from another location in the SVN repository, then no more log messages are retrieved. This is especially beneficial when branches or tags are monitored and only changes within the branch are relevant.
“Filter/Range”	Opens the *“Filter”* dialog
“All”	All revisions are listed.
“Next 100”	The next 100 revisions are listed.

Table 818: Dialog “Filter”

“Revision range”	The displayed revisions can be filtered by *“Head”*, *“Revision”*, or *“Date”*. ☑: The option fields for *“Start revision”* and *“End revision”* are editable. *“Use UTC time”*: Date display in universal time. For more detailed information, refer to the description “Dialog ‘Select revision’“.
“Message contains”	Display of revision logs that contain a special text in the *“Message”*
“ Author contains”	Display of revision logs of the specified author
“Path contains”	Display of revision logs of the specified path

Table 819: Context menu commands of the revisions

“Compare with base working copy”	Compares the selected revision of the object with the base working copy (without local changes).
“Com with working copy”	Compares the selected revision of the object with the working copy.
“Compare with HEAD revision”	Compares the selected revision of the object with the HEAD revision.
“Compare with previous revision”	Compares the selected revision of the object with the previous revision.
“Update item to revision”	Updates the object to the selected revision. Note: Changes of the project by this command cannot be committed. For VSS users: This is comparable to loading an older version without checkout. To revert a previous commit, the command *“Revert to this revision”* has to be used.

"Revert to this revision"	Reverts the object to the selected revision. This command does not have an effect on the SVN repository as long as the changes are not committed. Internally, SVN reverts the merges for all changes that were made after the selected revision in order to revert the changes of the preceding commits.
"Edit author"	Opens a dialog for changing the author of the revision.
"Edit log message"	Opens a dialog for changing the log message of the revision.
"Revision properties"	Opens the dialog *"Revision properties"* where the properties are displayed. In the dialog, you can activate the *"Add"* and *"Remove"* properties and the option *"Show binary properties"*.
"Create branch/tag from this revision"	Creates a branch or tag from the selected revision.
"Browse SVN repository"	Opens the *"SVN repository browser"* dialog
"Copy to clipboard"	Copies log details of the selected revision to the clipboard This is the revision number, author, date of revision, log message, and the list of changes objects for each revision.

- *Chapter 1.8.5.5.3.3 "Dialog 'Select revision'" on page 6614*

Command 'Revert', Command 'Revert project'

Symbol: 

Function: This command opens the *"Revert"* dialog. In the dialog, select the objects whose local changes should be reverted, and those that are reverted to the state of the base revision of the working copy.

Call:

- Menu bar: *"Project ➔ SVN"*.
- *"Context menu ➔ SVN"*

If you select nothing or the main node in the device tree, then all modified objects are listed in this dialog (*"Revert project"*). If you selected one or more objects, then only the changes to this object are listed and recursively their sub-objects (*"Revert"*).

Dialog 'Revert'

"Group externals"	☑: The external definitions are grouped by their external storage locations.
"Keep locks"	☑: The lock is retained for all files that are modified by the revert command.
"Select/deselect all"	

When external objects are deleted, Professional Version Control cannot restore this data in SVN offline mode. The user is prompted how to proceed:

- Switch back to SVN online mode and call the external objects.
- Connect now to the SVN server one time in order to complete the current operation, but afterwards switch back to SVN offline mode.
- Skip the retrieval of the external objects. They can be fetched later by updating the project.

See also

- *Chapter 1.8.5.5.2.20 “Command 'Revert to revision', Command 'Revert project to revision'” on page 6603*

Command 'Revert to revision', Command 'Revert project to revision'

Symbol:

Function: This command opens the *“Select revision”* dialog. In this dialog, you select the revision to which the project or the selected objects revert.

Call:

- *“Project ➔ SVN”*
- *“Context menu ➔ SVN”*

If nothing or the base node is marked in the object tree, then the entire project is reverted to a specific revision (*“Revert project to revision”*). If one or more objects are selected, then these objects and their sub-objects are reverted (*“Revert to revision”*).

Dialog 'Select revision'

For a description of the dialog, refer to the section "Select revision".

See also

- *Chapter 1.8.5.5.3.3 “Dialog 'Select revision'” on page 6614*
- *Chapter 1.8.5.5.2.19 “Command 'Revert', Command 'Revert project'” on page 6602*
- *Chapter 1.8.5.5.2.18 “Command 'Show log', Command 'Show project log'” on page 6600*

Command 'Update', Command 'Update project'

Symbol:

Function: This command commits changes in the SVN repository to the project. The update is performed with the HEAD revision.

Call:

- Menu bar: *“Project ➔ SVN”*.
- *“Context menu ➔ SVN”*

If nothing or the main node is selected, then the entire project is updated (*“Update project”*). If one or more objects are selected, then these objects and their sub-objects are updated (*“Update SVN”*).

The following cases are possible:

- Projects are added to the project that are present in the SVN repository, but not in the project. In this case, the message "Added <object>" is issued to the message view.
- Objects that no longer exist in the SVN repository, but are present in the project locally (and not marked as "added"), are treated according to the Subversion standard procedure: If local changes are present, then the object remains in the project as unversioned. If there are no local changes, then the object is also deleted locally because the user can retrieve the object from an older version at any time. In this case, "Deleted object" is issued to the message view.
- Versioned objects that exist in both the SVN repository and the project are updated if they are different. Three cases to observe:
  - No local changes have been made since the last update: In this case, the local object is overwritten by the contents from the SVN repository. The message *"Object updated"* is issued to the message view.
  - Local changes have been made since the last update and the corresponding object type can be merged. When versions have been merged successfully, the message *"Objects merged"* is issued to the message view. If the command is not executed successfully, then the object is marked as "Conflicted object" in the object tree and the message *"Conflicted object"* is issued.
  - Local changes have been made since the last update and the corresponding object type cannot be merged. In this case, the object is marked as "Conflicted object" in the object tree and the message *"Conflicted object"* is issued.

If only some of the objects are updated, it may be that objects with the same name already exist. For example, this situation can come from moving objects to a folder.

For this conflict, you can react in the following ways:

- Do nothing and leave the conflict-causing objects as they are.
- Update (and remove) the conflicting objects in order to correct the conflict.
- Update the entire project in order to remove all conflicting objects and correct the conflict.

See also

- *Chapter 1.8.5.5.2.22 "Command 'Update to revision'" on page 6604*

Command 'Update to revision'

Symbol:

S**Function**: This command opens the *"Update"* dialog. In the dialog, the revision is defined for updating the project.

Call:

- *"Project ➔ SVN"*
- *"Context menu ➔ SVN"*

If you select nothing or the base node in the object tree, then the entire project is updated to a revision (*"Update project to revision"*). If you select one or more objects, then these objects are updated and their sub-objects are updated recursively (*"Update to revision"*). As an option, you can define that the sub-objects are not updated.

The behavior of the updating process (for example merging of conflicts) is similar to the *"Update project"* and *"Update"* commands.

Dialog 'Update'

"HEAD"	: This command behaves the same as the *"Update"* and *"Update project"* commands.
"Revision"	: The revision to which was last updated is selected by the revision number. ...: Opens the dialog *"Log"* for selecting the revision.

"Date"	: The revision to which was last updated is selected by the modification date. *"Use UTC time"*: : The date is displayed in universal time.
"Recursive"	: Default setting. The selected part is updated recursively. This means that all elements below the selected object are also updated.
"Omit external objects"	: External objects are not updated.

See also

- *Chapter 1.8.5.5.2.21 "Command 'Update', Command 'Update project' " on page 6603*
- *Chapter 1.8.5.5.3.3 "Dialog 'Select revision'" on page 6614*

Command 'Update only this'

Symbol:

Function: The command updates the selected objects. In contrast to the *"Update"* and *"Update to Revision"* commands, the child objects are not updated.

Call: *"Context menu ➔ SVN"*

See also

- *Chapter 1.8.5.5.2.21 "Command 'Update', Command 'Update project' " on page 6603*
- *Chapter 1.8.5.5.2.22 "Command 'Update to revision'" on page 6604*

Command 'Disconnect project from SVN'

Symbol:

Function: This command deletes all connections of the current project to SVN by converting the project into a non-versioned project.

Call: Menu bar: *"Project ➔ SVN"*.

Because this operation cannot be reversed, the operation must be confirmed before the command is executed.

Use the command "Connect to existing project" to connect to the SVN repository again at a later time.

See also

- *Chapter 1.8.5.5.2.30 "Command 'Connect to existing project'" on page 6608*

Command 'Switch'

Symbol:

Function: This command opens the *"SVN switch"* dialog. In this dialog, you specify a URL in the SVN repository to which the current working copy of the project is updated. The command switches a project from a branch or tag to another.

Call: Menu bar: *"Project ➔ SVN"*.

Requirement: The project is versioned.

Dialog 'SVN switch'

"From"	Current SVN URL of the project
"To"	Input field for the target URL in SVN ● *"HEAD"*: The *"Select revision"* dialog opens. ● ...: The *"SVN Repository Browser"* dialog opens. There you select the target URL in the SVN repository.

See also

- *Chapter 1.8.5.5.2.1 "Command 'SVN Repository Browser'" on page 6585*

Command 'Un-Ignore on commit'

Function: This command removes an unversioned object from the ignore list so that the object is checked by default on commit.

Call: Context menu: *"SVN"*

Requirement: The command *"Ignore on commit"* was executed for the object. The object is marked with the symbol.

See also

- *Chapter 1.8.5.5.2.11 "Command 'Ignore on commit'" on page 6597*

Command 'SVN Cleanup'

Function: This command opens the *"SVN Cleanup"* dialog. In the dialog, you define actions that are performed when cleaning up the SVN working copy.

Call: Menu bar: *"Project ➔ SVN"*.

Dialog 'SVN Cleanup'

Table 820

"Internal SVN working copy"	
"Update time stamps (speeds up SVN status display)"	☑: Corrects recorded time stamps for unchanged files in the working directory. This leads to a reduction in the compare time for future checks. It is not necessary to execute this in regular intervals in the normal workflow.
"Vacuum cached pristine copies (may reduce the size of your project file)"	☑: Cleans the buffer for the original copies by deleting older versions that are no longer referenced by the current project. Advantage: The size of the project file is reduced. Disadvantage: If you downgrade to older revisions, or if you switch between different branches, then the retrieved data size will become larger.
"Clear work queue and force unlock of SVN internal data structures (emergency only!)"	☑: Cleans up the internal SVN task queues and unlocks internal SVN data structures. This should never be necessary during normal work by Professional Version Control. Note: Use this option only if errors occur for SVN commands due to locked working copies. When this is the case, it refers to an error in Professional Version Control. Then please send us an error report (if possible with steps to repeat) to the CODESYS support. Info: These are administrative locks that are internal locks in the SVN working copy. These locks are not set up by context menu commands. For more information, refer to the section "The three meanings of locks" in: *http://svnbook.red-bean.com/en/1.8/svn.advanced.locking.html*
"Project contents"	

“Revert all local changes (use with care!)”	Reverts all local changes to the original status in the SVN repository.
“Release all locks”	Releases all advisory locks in the project (locks visible to the user). These locks are activated by *“Acquire lock”* and *“Steal lock”*.
“Revalidate all locks against the repository (they could have been stolen)”	Checks whether the locally available advisory locks are still valid or have been stolen by someone else for example. All invalid locks are removed.
“Status caches”	
“Clear all caches and refresh status icons”	Deletes all internal caches that Professional Version Control has and updates the status icons. Required only if it issues an error in Professional Version Control through which the caches or the status display are inconsistent.

Command 'Clear authentication data'

Function: This command opens the *“CODESYS”* dialog. In this dialog, define the caches that will be deleted.

Call: Menu bar: *“Project ➔ SVN”*.

Dialog 'CODE-SYS'

The authentication memory contains the authentication data of all SVN repositories for which the user has selected for saving the authorization data. This memory is deleted completely by this command.	
“Clear the shared on-disk cache.”	☑: The data saved on the computer is deleted.
“Clear the RAM cache of this instance.”	☑: The data saved in the RAM is deleted.

The authentication data saved on the computer is stored in `%APPDATA%\Subversion\auth`. This memory path is also used for most other Subversion client applications (for example, TortoiseSVN and AnkhSVN). Therefore, deleting the authentication data affects these applications as well.

Command 'Merge changes'

Symbol: 

Function: This command opens the *“Merge”* dialog. In this dialog, you determine the revisions with the changes to be merged with the working copy of the project.

Call: Menu bar: *“Project ➔ SVN”*.

Requirement: The project is linked to SVN.

Dialog 'Merge'“”

"Kind of merge"	• *"Sync/Reintegrate/Symmetric merge"*: Synchronizes all missing changes from trunk (or a different branch) into this branch. • *"Cherry pick"*: Integrates specifically selected revisions from one branch to another branch. This is necessary, for example, if any error trapping has to be ported back to an older version.
"Merge source"	SVN URL of the SVN repository • Input field • *"HEAD"*: HEAD revision • ...: Dialog *"SVN Repository Browser"* opens for selecting the SVN repository.
"Define start and end revision"	Select this option to merge a cohesive range of revisions with the working copy.
"Start revision"	Defines the range of revisions that are merged with the working copy: • *"HEAD"*: HEAD revision • *"Revision"*: Start and end revision of the range • *"Date"*: Date of the start and end revisions
"End revision"	
"Define revision range"	Select this option to merge individual revisions with the working copy. You can also highlight the individual revisions in the *"Log"* dialog. Note: When defining ranges, CODESYS SVN behaves like other graphical clients, such as Tortoise SVN), and not like the command-line client. Example: For a range of `4-7`, revisions 4, 5, 6, and 7 are merged. See also: *Merging a Range of Revisions*
"Dry run (simulation)"	☑: This command is executed without changing the working copy. Files that are changed during an actual merge are displayed, as well as ranges where conflicts occur.
"Record only"	☑: The revision is marked as "merged" without actually performing the merge.
"Ignore ancestry "	☑: SVN uses path-based differences only, not history-based differences.

See also

- *Chapter 1.8.5.5.3.3 "Dialog 'Select revision'" on page 6614*
- *Chapter 1.8.5.5.2.1 "Command 'SVN Repository Browser'" on page 6585*

Command 'Connect to existing project'

Symbol:

Function: This command opens the *"Connect to SVN repository"* dialog. In the dialog, you define the URL and the revision of the SVN repository with which the unversioned project is connected.

Call: Menu bar: *"Project ➔ SVN"*.

Requirement: The project is disconnected from SVN.

NOTICE!
Only users who have read access to the entire project (see the CODESYS user and access management) can import the project into the SVN repository or can link to an existing database project.

NOTICE!
This command functions reliably only when the project has already been imported into SVN and then disconnected with the command *"Disconnect project from SVN"*.

Dialog 'Connect to SVN repository'

"URL of existing project"	URL of the SVN repository *"HEAD"*: Selection of the revision in the *"Select revision"* dialog ...: Selection of the SVN repository in the *"SVN Repository Browser"*
"Checkout options"	*"Omit externals"*: External objects are not checked out.
"Revision"	● *"HEAD"*: HEAD revision ● *"Revision"*: Number of the revision ● *"Date"*: Date of the revision *"Use UTC time"*: ☑: Date display in universal time.

See also

- *Chapter 1.8.5.5.2.1 "Command 'SVN Repository Browser'" on page 6585*

Command 'Resolve conflict'

Symbol: 🔍

Function: This command opens the *"<object>"* dialog. In the dialog, the conflicts are displayed and functions for resolving conflicts are prepared in order to merge changes.

Call: Context menu of the object.

Requirement: The object has a conflict that has occurred by updating the object with local changes.

Dialog '<object>'

"Compare"	The local objects are displayed on the left side, and the version from the SVN repository is displayed on the right side.
"Use mine"	A local change is used.
"Use yours"	A change of the version from the SVN repository is changed.
"Apply"	All changes are accepted that you made in this dialog. The status of the object is changed.
"Cancel"	Cancels all changes that you made in this dialog. But the object keeps the conflicted status.

Command 'Work in offline mode'

Function: This command switches to SVN offline mode. In SVN offline mode, the implicit locking and all commands that access the SVN repository are not possible.

Call:

- Menu bar: *"Project ➔ SVN"*.
- Context menu: *"SVN"*

Requirement: The project is linked to SVN.

When switching back to SVN online mode, all present locks on the working copy are checked against the server. If this locking is invalid, then it is released.

Uses case

The user on a machine wants to make changes to the project without disconnecting the connection. At the moment, there is not connection to the server. Despite this, when automatic locking is activated, work is possible because the SVN offline mode deactivates the automatic lock temporarily.

Command 'Copy (Branch/Tag)'

Symbol: 

Function: This command opens the *“SVN Copy Branch/Tag”* dialog. There you can *“Branch”* or *“Tag”* a revision of your project. A specific revision of your project is saved there at this position. A branch is normally used in order to save changes isolated in one version. A tag is used for marking a specific state, for example a shipping version. Internally, it is copied not in the actual sense, but more refers to the revision.

Call: Menu bar: *“Project ➔ SVN”*.

Requirement: The project is versioned.

Dialog 'SVN Copy (Branch/Tag)'

Table 821: “SVN repository”

“From”	SVN path of the current project Example: `https://svnserver/repository/trunk/ControlABC.project`
“To”	Target path in the SVN repository for the copy operation Example of tag: `https://svnserver/repository/tags/V4.4.4.4/ControlABC.project` ...: Dialog *“SVN Repository Browser”* opens for selecting the target path.

Table 822: “Log message”

Input field	Comment the change in a log message. Example: `Tag for version 4.4.4.4 created.`
“ Recent Messages”	Opens the dialog *“Recent Messages”* to display the last log messages. You can click a log message to accept it.

Table 823: “Create copy from”

“Working copy (including local changes)”	The new branch/tag refers to the working copy including all local changes. The local changes are committed to the SVN repository for this purpose.
“Base revision of working copy (<revision number>)”	The new branch/tag refers to the base revision of your working copy whose revision number is displayed in the parentheses. If the working copy already contains local changes, then these are not committed to the SVN repository.
“HEAD revision of the repository”	The new branch/tag refers to the HEAD revision of your project.
“Specific revision in SVN repository” 	The new branch/tag refers to a revision that is displayed on the adjacent button. Click the button to change the revision. The *“ dialog opens.”*.

“Switch to new location ”	☑: After the dialog is confirmed, the working copy switches to the new branch/ tag.

“OK”	The target path is created (as a new tag `../repository/tags/V4.4.4.4` or as a new branch `../repository/branches/new_feature`). Then the revision specified in *“Create copy from”* is copied there.

See also

- *Chapter 1.8.5.5.2.1 “Command 'SVN Repository Browser'” on page 6585*

Command 'Pending Changes'

Symbol:

Function: The command opens the *“Pending Changes”* view. All objects are listed there which have changed from the base revision or which are locked.

Call: *“View ➔ Pending Changes”*

View 'Pending Changes'

The modified or locked objects are shown in the lower half of the view. You can use the *“Commit”*, *“Revert”*, and *“Update”* commands on single or multiple objects. You will find commands for comparing and displaying the version history in the context menu of a selected object.

Double-clicking the object opens the project comparison.

“Select”	Selection or clearing of all objects
“Commit”	Commits local changes to the SVN repository
“Revert”	Reverts the local changes to the state of the base revision of the working copy
“Update”	The command commits changes in the SVN repository to the project. The update is performed with the HEAD revision.
“Keep Locks”	☑ Lock is not released automatically after commit
“Recent Messages”	Shows the last used log messages. You can click a log message to accept it.
“Messages”	Type in a log message that comments your change. Example: `Bug fix error 123`

- *Chapter 1.8.5.5.2.21 “Command 'Update', Command 'Update project' ” on page 6603*

1.8.5.5.3 Dialogs

Dialog 'Options' - 'SVN Settings'

Tab 'General' Symbol: 

Function: This tab includes the basic settings for Professional Version Control.

Call: Menu bar: *"Tools ➔ Options"*.

Table 824: "Automatic locking and merging"

"Merge"	Behavior for the commands *"Update"*, *"Merge"*, or *"Switch"*, when both sides (working copy and SVN repository) have changed from the base version. ● *"Mark all colliding changes as conflicts"*: The objects are not merged automatically. All changes with a conflict are marked as "With conflict", even if some of them can be merged automatically. ● *"Merge mergeable changes, mark the others as conflicts"*: Changes that can be merged are merged automatically. All others are marked as "With conflict". ● *"Merge mergeable changes, ask the user for the others"*: Changes that can be merged are merged automatically. The user is prompted for all others. ● *"Always ask the user, even for mergeable changes"*: For all changed objects, the user is prompted, even if some of them can be merged automatically.
"Locks"	Behavior such as Professional Version Control objects when they are changed locally. ● *"Always try to lock before modification"*: All objects are locked before they are changed, even if they can be merged. ● *"Only lock the objects which don't support merging"*: Only those objects are locked that cannot be merged automatically. ● *"Never acquire a lock automatically"*: No objects are locked, not even if they can be merged automatically.
"Marker"	● *"Use conflict markers when merging objects"*: If objects with conflicts exist that cannot be merged, then these conflicts are marked in the source code with conflict markers. In addition, the object itself is marked as being merged successfully (no conflict). ● *"Leave non-mergeable objects as conflicted"*: No conflict marker is set. Objects that cannot be merged remain in the status "With conflict".
"Prompt the user when automatic locking fails."	☑: If it is not possible, to lock the object, then the dialog *"Automatic locking failed"* opens (see dialog description).

Example of conflict markers

```
Foo();
>>>>>>>>>>>>>>>
I := I + 1;
===============
I := I + 2;
<<<<<<<<<<<<<<<
```

Table 825: "Server check"

"Check server for updates and locks"	☑: Professional Version Control checks in the specified time interval that objects have been updated on the server. In addition, it checks whether objects are locked or locks have been stolen.
"Check interval (minutes)"	Example: 10

Table 826: "Ignore for comparison"

Ignore whitespace	☑: Whitespace differences between the current project and the reference project are ignored.
Ignore comments	☑: Comments in the programming code are excluded from the comparison.
Ignore Properties	☑: Object properties are excluded from the comparison.

> *Some of the SVN options can be overwritten by the project-specific settings.*
>
> *Project-specific settings are defined in the menu "Project ➔ Project settings", category "SVN Settings".*

See also

- *Chapter 1.8.5.5.3.5 "Dialog 'Automatic locking failed'" on page 6617*
- *Chapter 1.8.5.5.3.2 "Dialog 'Project Settings' - 'SVN Settings'" on page 6613*

Tab 'SSH'

Symbol:

Function: This tab contains the settings for the SSH protocol.

Call: Menu bar: *"Tools ➔ Options"*.

Table 827: "SSH client implementation"

"libssh2 (recommended)"	Professional Version Control uses Libssh2 for establishing a connection via SSH protocol. This is the recommended setting.
"SharpPlink (backwards compatibility)"	Professional Version Control uses plink.exe for establishing a connection with SSH servers. This option is required only for communication with outdated servers that support the deprecated SSH-1 protocol.

> *The SSH configuration can be overwritten by means of the environment variable `SVN_SSH` or server-specific by means of the SVN configuration file.*

See also

- *Tunneling via SSH*

Dialog 'Project Settings' - 'SVN Settings'

Symbol:

Function: The behavior of the integrated SVN version control system is configured in this dialog.

Call: Menu bar: *"Project ➔ Project Settings"* (*"SVN Settings"*).

Requirement: A project is open.

Table 828: "Automatic locking and merging"

With these settings, you can overwrite the default settings that were made in the dialog *"Tools ➔ Options"*, category *"SVN Settings"*.	
"Merge"	Behavior for the commands *"Update"*, *"Merge"*, or *"Switch"*, when both sides (working copy and SVN repository) have changed from the base version.

“Locks”	Behavior such as Professional Version Control objects when they are changed locally.
“Marker”	Behavior for conflicts

Table 829: “Settings SVN version info”

“Create SVN_VERSION_INFO constants for IEC access”	☑: The object `SVN_VERSION_INFO` is created and includes global constants or variables for the project metadata. ☐: The object `SVN_VERSION_INFO` is not available. When you activate the option, the object is created automatically. When you deactivate the option, the object is removed from the project automatically.

See also

- *Chapter 1.8.5.5.3.1 “Dialog 'Options' - 'SVN Settings'” on page 6612*

Dialog 'Select revision'

Function: This dialog shows the currently selected revision. You can edit the selection there.

“Revision”	
“HEAD”	◉: The latest revision (top revision) within a branch is displayed.
“Revision”	◉: A specific revision is displayed by the revision number. Example: `3` Tip: Click … to show the revisions. Then the *“Log”* dialog opens to display the revisions and the associated actions. The revision that you select there is applied.
“Date”	◉: A specific revision is checked out by the modification date. This is the highest revision at the given time (the last revision before that time). Example: `12/23/2016 11:59:59` Tip: See section "Revision identifiers" in "Version control with Subversion"
“Use UTC Time”:	☑: Modification date in universal time is used.
“Reset recursively”	☑: All objects below the selected object are also reset. The action fails if ● Objects have been moved in or out of the hierarchy below ● Objects outside of the hierarchy would be changed by implicit dependencies

- *"Version control with Subversion", Section "Revision identifier"*

Dialog 'Subversion Authentication'

The dialogs are used for authenticating the server/client connection. A server or client authentication is performed depending on the initial situation and protocol.

Overview of possible protocols and dialogs

- `svn://`: The SVN protocol; either unencrypted or SSL/TLS encrypted
  - Can prompt for user name and password (even for an unencrypted connection)
  - Can prompt for a server certificate from the dialog for authentication in order to confirm the server if a certificate is unknown, defective, or invalid (for TLS/SSL encryption)
  - As an alternative or in addition to the user name and password prompt, the client can also be authenticated with client certificates (for TLS/SSL encryption). The dialogs for authentication open with the client certificate.
- `http://`: SVN via http, unencrypted
  - Can prompt for user name and password
- `https://`: SVN via http, SSL/TLS encrypted.
  - Can prompt for user name and password
  - Can prompt for a server certificate from the dialog for authentication in order to confirm the server if a certificate is unknown, defective, or invalid.
  - As an alternative or in addition to the user name and password, the client can also be authenticated with client certificates. The dialogs for authentication open with the client certificate.
- `svn+ssh://`: The SVN protocol, encrypted through an SSH tunnel. SSH (Secure Shell) is the usual networking tool in Linux/Unix for accessing other computers.
  - Can prompt for user name and password
  - Prompts for server certificate in the dialog for authentication if the server is still unknown in order to be sure that it is the correct server.

Dialog for authentication with a server certificate

Initial situation: CODESYS (as a client) receives an unknown or defective server certificate.

This dialog shows information about the certificate. There you can confirm the identity of the server.

“Authentication area”	Connection that is secured Example: `https://svn repository:443`

Table 830: “Certificate information” (for SSL/TLS connections)

“Host name”	Example: `svn repository`
“Thumbprint”	
“Valid from”	
“Valid to”	
“Issuer”	Example: `ABB AG`
“Certificate”	

Table 831: “SSH server key information” (for SSH connections)

“Key type”	
“Key size (bits)”	
“Key thumbprint”	

“Save information to RAM”	☑: The certificate is saved to the working memory. Then the client recognizes in the current CODESYS session for future connections. If you restart CODESYS, then you have to accept the certificate again.
“Save to disk”	☑: The certificate is saved on the computer and it is available for future connections. If you restart CODESYS, then the saved certificate is used.

“OK”	Authenticates and established the connection.

The certificate memory is secured cryptographically and distributed with other SVN clients.

See also

- *Version Control with Subversion*

Dialog for authentication with a client certificate

Initial situation: The SVN server requires a client certificate for authentication.

In this dialog, you select the client certificate in order to confirm the identity.

“Authentication area”	Connection that is secured Example: `https://svn repository:443`

Table 832: “The SSL server requires a client certificate file.”

“File”	Client certificate file

“Save information to RAM”	☑: The certificate is saved to the working memory. Then the client recognizes in the current CODESYS session for future connections. If you restart CODESYS, then you have to accept the certificate again.
“Save to disk”	☑: The certificate is saved on the computer and it is available for future connections. If you restart CODESYS, then the saved certificate is used.

“OK”	Authenticates and established the connection.

Dialog for authentication with a pass phrase

Initial situation: The SVN server is configured so that it demands a client certificate for authentication. The applied certificate is protected by a pass phrase.

“Authentication area”	Connection that is secured Example: `https://svn repository:443`

Table 833: “A pass phrase is needed to unlock the certificate.”

“Pass phrase”	Example: `***`

“Save information to RAM”	☑: The pass phrase is saved to the working memory. Then the client recognizes in the current CODESYS session for future connections. If you restart CODESYS, then you have to accept the certificate again.
“Save to disk”	☑: The pass phrase is saved on the computer and it is available for future connections. If you restart CODESYS, then the saved certificate is used.

“OK”	Authenticates with client certificates by means of a pass phrase and establishes the connection.

Dialog for authentication with a user name and password

Initial situation: The SVN server is configured so that it demands a user name and password for authentication.

“Authentication area”	Connection that is secured Example: `https://svn repository:443`

“User name”	Example: `a.mayr`
“Password”	Example: `***`

“Save information to RAM”	☑: Saved to the working memory. Then the client recognizes in the current CODESYS session for future connections. If you restart CODESYS, then you have to accept the certificate again.
“Save to disk”	☑: Saved on the computer and it is available for future connections. If you restart CODESYS, then the saved certificate is used.

“OK”	Establishes the connection and authenticates it.

Dialog 'Automatic locking failed'

The dialog shows a list of all objects for which an automatic locking was not possible. In the optoins you define how Professional Version Control will resolve the confilict.

Table 834: “Automatic Locking and Merging”

• *“Try to steal the lock for the affected objects”* • *“Activate the "Offline Mode" to temporarily suppress locking”*	These options are displayed if another user has locked the object.
• *“Update the affected objects to the newest revision”* • *“Update the whole project to the newest revision”* • *“Activate the "Offline Mode" to temporarily suppress locking”*	These options are displayed if there exists a more current version of the object on the server.
• *“Activate the "Offline Mode" to temporarily suppress locking”*	These options are displayed if no connection can be established to the server.
“SVN Project Settings”	Opens the SVN project settings dialog (menu *“Project ➔ Project Settings”*). There you can change the settings for the automatic locking.
“SVN Settings”	Opens the general SVN project settings dialog (menu *“Tools ➔ Options”*).

See also

- *Chapter 1.8.5.5.3.1 “Dialog 'Options' - 'SVN Settings'” on page 6612*
- *Chapter 1.8.5.5.3.2 “Dialog 'Project Settings' - 'SVN Settings'” on page 6613*

1.8.5.5.4 Objects

Object 'SVN_VERSION_INFO'

Symbol: 

The object contains the SVN metadata of the project as global constants or variables in a variable list. It is located in the *“POUs”* view. You can specifically retrieve the data of the global constants or variables by the application. By calling specific data, you can also reduce the memory usage on the controller.

The SVN metadata is provided for this purpose, subdivided over multiple global variable lists (GVLs):

- *“SVN_VERSION_INFO”*
- *“SVN_Info_Summary”*
- *“SVN_Info_SummaryW”*
- *“SVN_Info_URI”*
- *“SVN_Info_Revisions”*
- *“SVN_Info_Flags”*
- *“SVN_info_LastChange”*

The SVN_VERSION_INFO object is created automatically when a project is imported to a SVN repository. To do so the option *“Create SVN_VERSION_INFO”* in the dialog *“Import project to SVN”* must be activated.

Furthermore you can create the object or remove it from the project with the option *“Generate SVN_VERSION_INFO constants for IEC Access”* (Dialog *“Project ➔ Project Settings”*, category *“SVN Settings”*).

Table 835: Global Constants

Name	Data type	Description
MINREVISION	LINT	Lowest revision number of the working copy
MAXREVISION	LINT	Highest revision number of the working copy
PARTIAL	BOOL	TRUE: The working copy is incomplete. Example: Cancellation during the last update due to a network error or a checkout.
MODIFIED	BOOL	TRUE: Local changes were made.
SWITCHED	BOOL	TRUE: Parts of the project were branched (with the *"Switch"* command).
VERSION	STRING	Version identification, similar to Apache™ Subversion® (subversion.exe) Example: 12:34M, means MINREVISION = 12, MAXREVISION = 34, MODIFIED = TRUE For more information, refer to the documentation for Apache™ Subversion®.
CLEAN	BOOL	TRUE: The version is clean. This is the case when MINREVISION is equal to MAXREVISION, the working copy is complete, and non-versioned, and is was not switched.
URL	WSTRING	SVN-URL of the project Example: https://svnserver/repository/trunk/ControlABC.project

If a controller does not support the data type WSTRING, then a compiler error is issued when accessing the object SVN_VERSION_INFO.

1.8.6 Subversion

1.8.6.1 Project Version Control with Subversion

Introduction

Automation Builder projects can be stored in Subversion (SVN) repositories by using the Project Version Control. The Project Version Control can be used to track changes on a project and to have access to historic versions of the whole project or objects in the project. It is possible to hold different versions of a project in branches and to compare these versions. The Project Version Control enables multiple engineers to work collaboratively on the same project.

Basic knowledge

Make yourself familiar with the concepts of SVN.

This manual about Project Version Control is additionally to the following information and describes mainly the specific behavior of Subversion in Automation Builder.

- Homepage of Subversion: *http://subversion.apache.org/*
- Online user manual for Subversion: *http://svnbook.red-bean.com/*
- Documentation on SVN integration in Automation Builder: Refer to subfolder .

1.8.6.1.1 Preconditions

Automation Builder

- In Automation Builder, the Project Version Control must be installed.
- A valid license for the Project Version Control must be activated.
- All collaborating users working on the same project need:
  - Automation Builder installed in the same version with the same features.
  - License for same edition.
  - Same set of optional third party device descriptions.
  - Same set of optional customer specific packages.

SVN server

The Project Version Control can be used in combination with an SVN server in version 1.6 or newer, the repository format should be 1.5, 1.6 or 1.7. Newer repository formats are not yet supported.

The usage of local repositories in the local file system or even on a network share is strongly discouraged.

1.8.6.1.2 Working with Project Version Control

- All objects in the device tree or POU tree are represented by an object in the SVN repository, there might be hidden objects that are not visible in the tree but that exist in SVN.
- The smallest unit in the SVN repository is one object including all its data like name, parameters, device identification.
- Objects are identified in the SVN repository by their name. Renaming one object in Automation Builder means to delete it from the SVN repository and add a new one to the SVN repository. Renaming an object causes a break in the history of that object.
- By default objects are locked before they are changed to prevent other users from changing the object. The locking strategy can be changed in the user options.
- Objects can be compared to other versions of the same object, many differences/changes between the current object in the Automation Builder project and the compared object can be merged into the object in the Automation Builder project. Merging changes could be used to resolve conflicts in case concurrent changed can not be avoided.

- To ensure consistency it is required and also enforced that some changes can be committed or reverted only together.
  - All changes to device objects in the hardware tree that are sub-nodes to the same top level device. Note: Objects that are not devices are excluded, e.g. the application node.
  - All changes below the AC500 PLC application node.
- Most SVN operations can not be performed while other external applications like CODESYS or Panel Builder work on files that are embedded in Automation Builder project.
- Some operations like changing the target or updating the project to the latest device (description) versions do a recursive lock of the whole AC500 PLC. If the lock can’t be obtained the operation is aborted.
- Some objects contain internal data that has no meaning to the end user but is also important. Changes on such data are not shown in the compare dialog or are summarized by a placeholder like "There are hidden changes".
- Including externals is not supported.

1.8.6.1.3 Recommendations on Working with Project Version Control

Be collaborative

- Multiple users that work collaboratively on the same project should agree on their responsibility for certain parts of the project where they do changes to avoid conflicts and tree conflicts.
- Agree on locking strategy used by all users working on the same project.
- Distribute the work between multiple users meaningful.
  - It is suggested to setup the hardware structure at first before other users checkout a project to work on it and limit structure changes in the hardware tree to the minimum.
  - Before adding objects, especially top level objects, users should agree that only one user adds objects at top level or below the same parent, or agree on unique names for the objects to add. The default naming scheme for new objects bears the risk of name conflicts. These conflicts could be resolved only by reverting the changes of the user who later tried to commit the changes.

Be careful

- The SVN integration (and also project compare) gives lot of power to the user, users should be sure to do only things they fully understand. Especially by merging changes incomplete it is possible to create inconsistent data.
- Adding devices, removing devices or even changing parameters can have side effects to other devices, do not change objects/parameters to their original state by merging that were not done explicitly.
- Commit changes frequently to SVN.
  - To release locks that you don’t longer need.
  - To reduce the risk of conflict with co-workers.
  - To keep the sets of changes to commit small.
- Do frequent updates when collaborating in a team.
  - To be up-to date.
  - To keep the sets of changes to get from SVN small.
  - To reduce the risk of losing work results in case of conflicts.
- To avoid conflicts, it is suggested to stay with the default setting to automatically lock objects before doing changes. Consider explicit recursive locks of sub-trees where you plan bigger changes.
- Prefer a clean checkout over using the switch command to change between different branches.
- Do not use the switch command to change between unrelated projects, this could corrupt the Automation Builder project (local copy, not in SVN) easily.
- Commit local changes to the SVN repository before creating a branch.

Be effective

- Give objects good/correct names after adding them and use renaming of objects already committed to SVN sparely to maintain a continuous history in the SVN repository.
- The goal to revert only single changes of all changes done that must be committed/reverted together, could be achieved by using project compare or the object compare dialog.
- If changes can’t be committed to the SVN repository because of locks hold by other users, it is possible to create a branch, use the switch command to change to this branch and commit the changes there. The branch and base line could be merged together later.

1.8.6.1.4 Known Issues and Troubleshooting

Not all changes are shown for all objects, but hidden changes are also important.

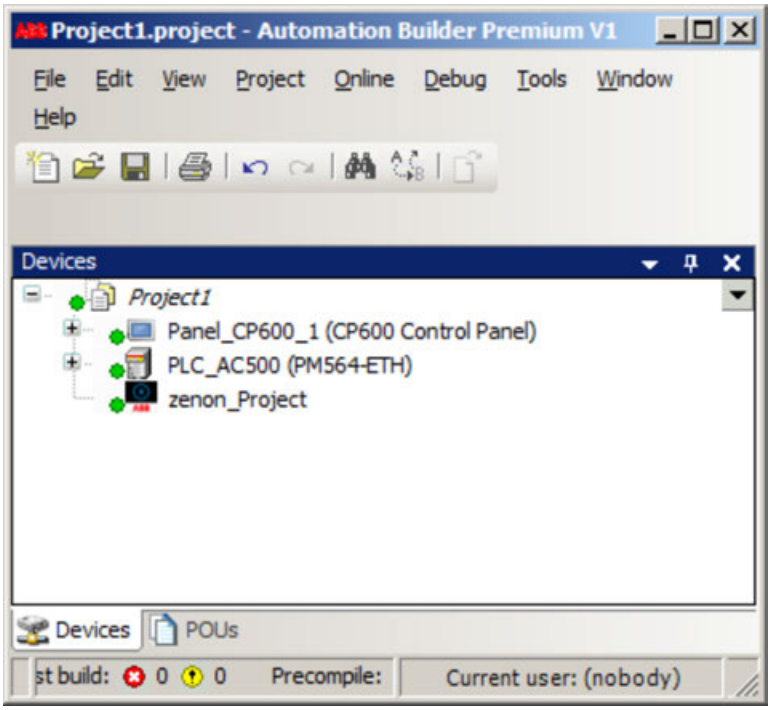
The device pool may be changed as side effect of several operations, including opening the project.

When a project was corrupted (by performing an update that tried to add an AC500 Communication Module) it is possible to save this project and merge changes to a project that has been cleanly checked out by project compare.

1.8.6.2 SVN Support Examples

1.8.6.2.1 Importing Automation Builder Project to SVN Repository

1. In the Automation Builder main menu, go to *“Project ➔ SVN ➔ Import Project to Subversion”*.
2. Enter user credentials and click *“OK”*.
3. Select SVN server repository to import Automation Builder project and click *“OK”*.
   ⇨ The Automation Builder project is imported into the selected repository and connected automatically to the repository. The imported project nodes are identified with green indicators.



1.8.6.2.2 Logging in User2

1. In the Automation Builder main menu, go to *“Project ➔ SVN ➔ Checkout”*.
2. Enter user credentials and click **OK**.
3. Select the repository location, project folder and revision if any and click *“OK”*.
   ⇨ The project will checked out of the repository, saved in the selected location and opened as a primary project.

The tables below provide the descriptions of the options availlable in the check-out dialog.

Checkout options	
Omit externals	Do not checkout external objects.
As library project	Saves the project as a CODESYS library file.

Revisions	
HEAD	Checks out the Head revision.
Revision	Allows to select the required revision of the project.
Date	Allows to select a revision date of the project.

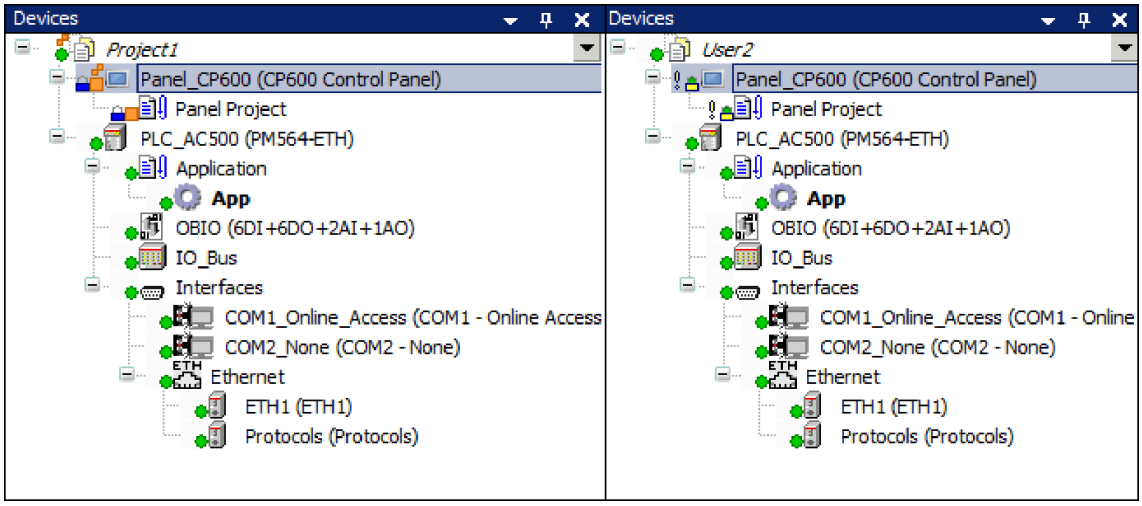
The following instances can occur in the workflow.

- If the project contains any updates, the specific project level node is indicated with .
- If a new object is added to the project, the newly added node is indicated with .
- If the project node is deleted, the specific node is indicated with .

1.8.6.2.3 Examples

Example 1

If User1 modifies Panel_CP600 project, then the node indicator turns to orange with lock symbols. If User2 need to modify the same Panel_CP600 project, the Panel_CP600 project appears with a lock symbol.

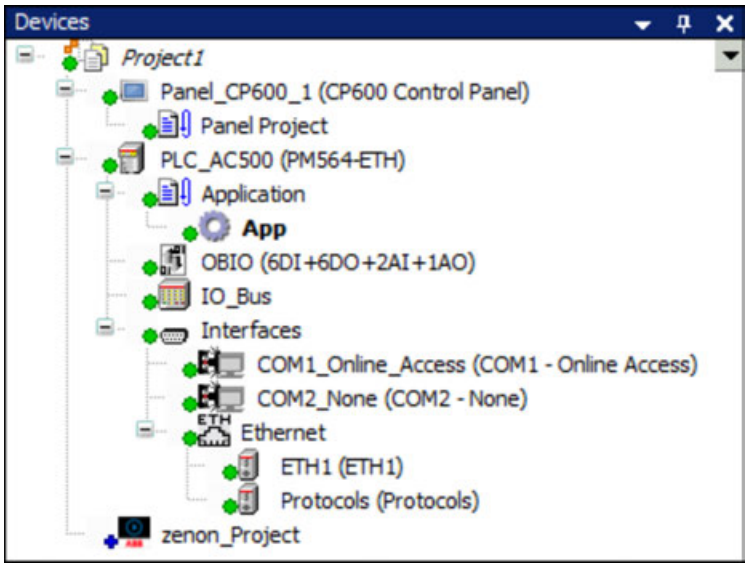


To steal the lock of an affected object, proceed as follows:

1. Double-click *"Panel_CP600"* project.
   ⇨ Automatic lock failed dialog is displayed.
2. Enable *"Try to steal the lock for the affected objects"* and click *"OK"* to steal the lock.
3. In the Lock Message window, enter the reason to steal the lock and click *"OK"*.
4. User2 can modify and commit the project.

Example 2

If User1 adds a new object to the project and commit the changes, then User2 can update the project to see the latest modifications.



Example 3

The user can revert to any of the available project revisions.

1. Right-click on object node and select *"SVN ➔ Revert to Revision"*.
2. Select or enter the revision number and click *"OK"*.
   ⇨ The revision command reverts local changes of this object back to the specific revision of the working copy.
3. Right-click on the object node and select *"SVN ➔ Commit"*.
4. In the commit window, enter the reason to change the project and click *"OK"* to make the changes.
   ⇨ The project node is updated with the latest changes.

Example 4

SVN server allows to select the required revisions of Automation Builder project. You can checkout the project using *"Project ➔ SVN ➔ Checkout"* and then enter the credentials and click *"OK"*.

In the check-out dialog, do the following:

1. Select the project repository.
2. Activate *"Revision"* and select or enter the revision number and click *"OK"*.

The user can work on the selected revision. To commit the changes to the project, right-click on project and select *"SVN ➔ Commit Project"*.

1.8.7 Python

1.8.7.1 Python script support

Using scripts

Scripting allows python scripts to be used to automate project configuration in Automation Builder. Parameters can be added to scripts, so that a generic script can be customized before execution. The user can add a script to most parts of the device tree. A script can be started either from the user interface (by a command or with the python scripting editor) or from the Windows command line and is saved with the project.

With the scripting feature commands or complex program operations can be automated.

Examples of use cases:

- Integration of Automation Builder in automatic build server environments:
  - continuous integration (CI)
  - continuous delivery (CD)
  - continuous testing
- Integration with third-party software, for example:
  - code generators
  - creation of projects that are custom tailored to a specific machine configuration
- Creation of documentation
- Updating of libraries: Setting of project information during the release process
- Automatic testing: Mostly in connection with the Professional Test Manager
- Outputting variables via monitoring APIs

Licensing

A valid license is required to use the scripting. If you open a project with the existing script object without a valid license, you are not allowed to add or edit the scripts. However, the scripts are not removed from the project.

Scripting language

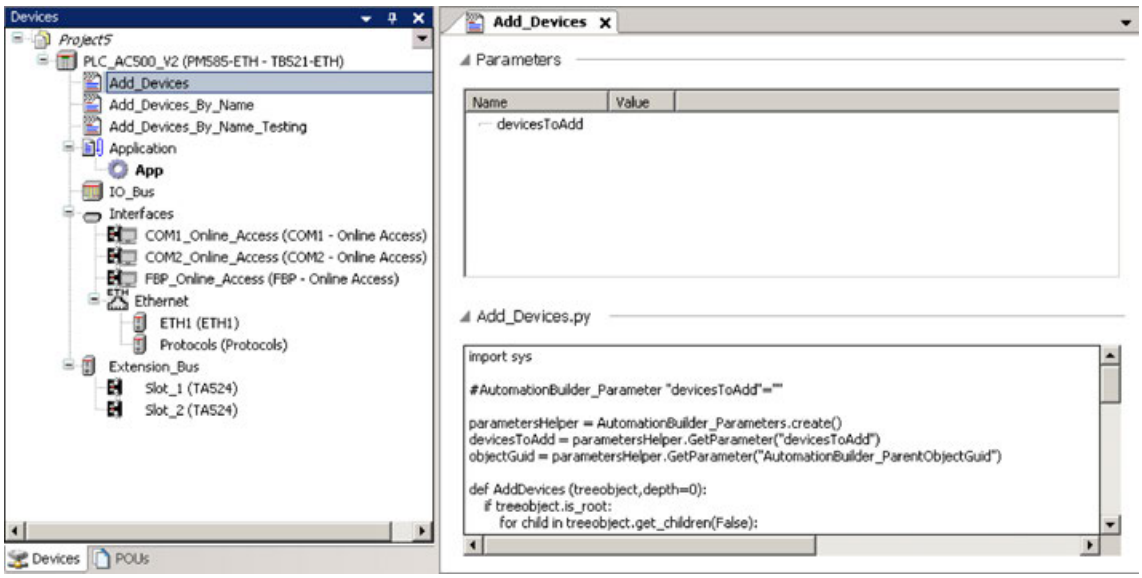
The Automation Builder scripting language is modular and based on IronPython. For this purpose, the Automation Builder “ScriptEngine” component combines the IronPython interpreter with the Automation Builder development environment which makes the extensive python framework libraries available including file access in networks and much more.

1.8.7.2 Working with script objects

Scripts to execute can be added to and stored in the Automation Builder project. Additionally, parameters can be added to scripts, so that generic scripts can be customized before execution.

Adding a script object to the project

1. In the device tree, right-click on a node (e.g. a PLC node) and click *“Add object”*.
2. Under *“Scripting category”* select *“Script ➔ Add object”*.
   ⇨ The 'Add Script' dialog is displayed.
3. Browse and select a script from the file system or create a new script by clicking *[Add]*.
   ⇨ A script is added below the selected node and the editor is opened.



4. The default parameter values are read from the script. The user can edit the default values as required.

Editing scripts within Automation Builder is not supported. You can use an external editor to edit the script and then import it to Automation Builder.

The script objects can be reused within the project via copy-and-paste around the device tree.

Execution

The user can execute the script with the parameter values via the execute button in the editor or via right-click on the script object in the device tree by selecting *“Script ➔ Execute”*.

Import

The user can import the script from the file system. This will replace the contents of the current script object with the contents of the imported file. Optionally, parameter values will be preserved if the imported script has a matching named parameter. In the device tree, right-click on a script object and select *“Script ➔ Import”*.

Export

The user can export the selected script and saved it as a new file in the file system. The exported file does not include any edited parameter values. In the device tree, right-click on a script object and select *“Script ➔ Export”*.

Parameters

The following instructions help the user to create parameters in the python script:

- Parameters must be defined in the script.
- Parameters and values are optional.
- The `ParameterName` and the `ParameterValue` must be delimited with symbols. The format must be as follows:
  "#AutomationBuilder_Parameter {"ParameterName"} {= "ParameterValue"}
- {ParameterName} is the name given to the parameter. This allows the values to be referenced in the python script.
- {ParameterValue} is the default value given to the parameter. This value can be modified in the editor.

The example below shows the format of the `ParameterName` and `ParameterValue` in the script.

- #AutomationBuilder_Parameter "numWidgets": creates a new parameter called `numWidgets`.
- #AutomationBuilder_Parameter "numWidgets" = "4": creates a new parameter called `numWidgets` and initializes to the value 4.

Using parameters within the python script:

- Parameters can be used in the script by creating an instance of the parameter helper: parameterHelper = AutomationBuilder_Parameters.create()
- Individual parameters are retrieved by calling: GetParameter(parameterName). devicename = parameterHelper.GetParameter("Name")

Python script examples

A set of python script examples are available in the path %Public%\Documents\Automation-Builder\Examples\Python scripts.

1.8.7.3 Python script editor

In Automation Builder a browser-based python script editor is integrated. This allows the user to modify the existing python script, to create a python script from the scratch and to finally execute the script. Moreover, it assists the user in writing the script with the following features:

- Auto suggest
  - IntelliSense suggestions for the python syntax during typing.
  - IntelliSense for CODESYS script engine and Automation Builder injected script objects.
  - Built-in language service that provides complete code intelligence for objects, properties and methods.
  - Details of the object with *[CTRL]* + *[spacebar]*.
- Auto completion
  Press the Enter key on a function suggested by IntelliSense in order to insert it.
- Python syntax highlighting (basic syntax colorization)
  The function and its respective namespace is automatically colored in order to match colors.
- Matching brackets
  Matching brackets are highlighted as soon as the cursor is near to one of them using the command palette.
- Zoom
  Changes the font size of the editor's content.
- Find and replace
  Support of 'Find' (search for a keyword) and 'Find and replace' (search and replace a keyword). This feature is supported in the editor, however not integrated in Automation Builder platform.
- Minimap
  High level overview of the script for a quick navigation and code understanding.
- Copy/paste
  Support of 'copy and paste' of the script text within and into the editor.
- Undo/redo
  Support of 'undo/redo' for editing actions. This feature is supported in the editor, however not integrated in Automation Builder platform.
- Keyboard shortcuts
  Keyboard shortcuts allow to perform most tasks directly from the keyboard (e.g. *[CTRL]* + *[Z]*, *[CTRL]* + *[Y]*) including copy and paste. For further keyboard shortcuts refer to the command palette (*[F1]*).
- Folding
  Support of folding and expanding script regions.
- Comment/uncomment the code
  Support of commenting (*[CTRL]* + *[K]*) and uncommenting (*[CTRL]* + *[C]*) code through shortcuts.
- 'Execution' button
  Executes the script directly in the editor window.
- In order to start a new script from the scratch the user can start with an empty editor. This can be done via the 'Add script' dialog without script file selection.

For further features that can be used in the python script editor refer to the command palette (*[F1]*).

Limitations with CODESYS script engine IntelliSense

- No IntelliSense available for return type of a property.
- No support of IntelliSense for keyword “None”.
- No IntelliSense support for method overloading.
- No IntelliSense support for methods that return an object.
- Private methods are also part of IntelliSense. Refer to the CODESYS script engine document to verify the access modifier.

1.9 Human machine interface

1.9.1 Panel Builder interface

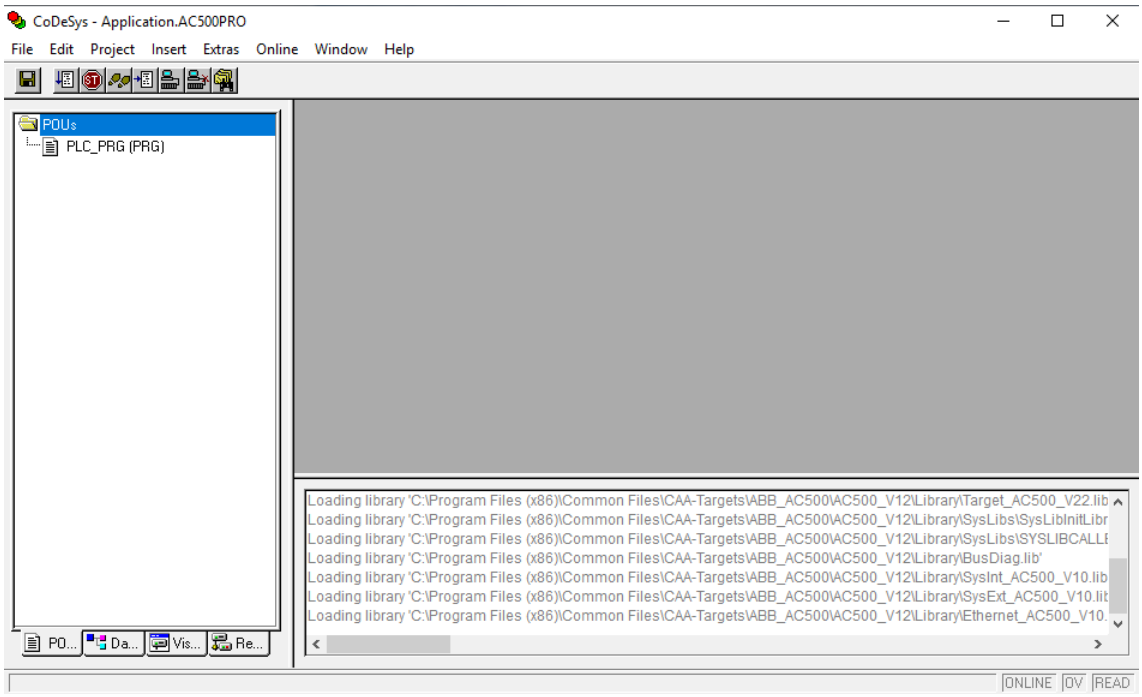
This document describes HMI CP600 Control Panel configuration in Automation Builder and starting HMI configuration and programming software Panel Builder 600 from Automation Builder. The Panel Builder project created for the HMI CP600 is stored within the Automation Builder project.

1.9.1.1 Adding desired AC500 PLC to the project

Basic settings in CODESYS application

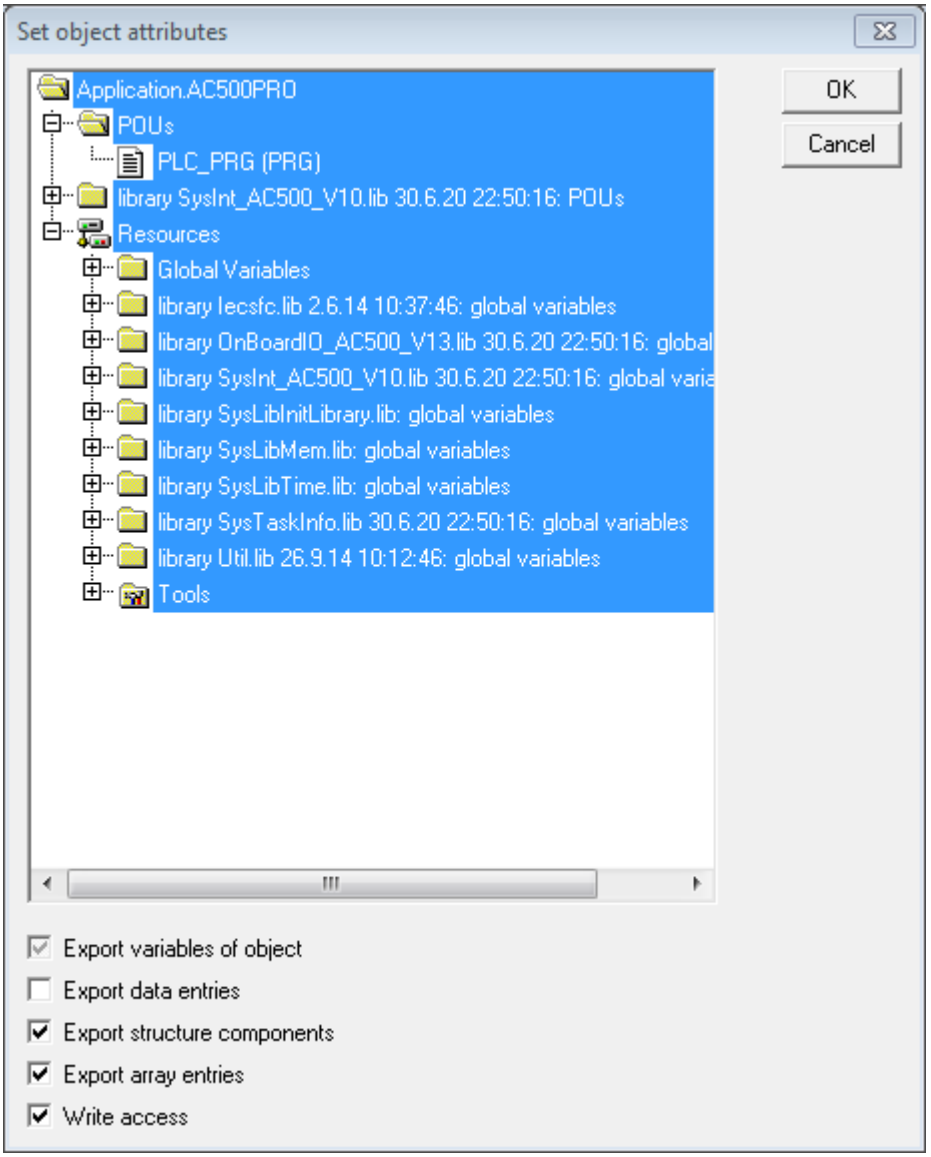
Before configuring basic settings, define the variables in CODESYS application.

1. In the Automation Builder device tree double-click the *“Application”* node, to start the CODESYS application.



2. In the CODESYS application main menu, click *“Project ➔ Options”*.
3. In the 'Options dialog', click *“Symbol configuration”* and enable the options *“Dump symbol entries”* and *“Dump XML symbol table”*. Then, click *“Configure symbol file”*.

4. Enable the following checkboxes and click *[OK]*.



⇨

> *Export variables of the object will be in gray background. Double-click to activate.*

5. In the CODESYS application window, click *"Resources ➔ Target settings ➔ General tab"*. Enable *"Download symbol file"* and then click *[OK]*.
6. In the CODESYS application main menu, select *"Project ➔ Build"* to compile the project.

After adding/modifying the variables, update the Panel Builder project. For further information, see *"Project information" on page 6632*.

Exporting symbol file

1. In the device tree, right-click the *"Application"* node and click *"Export ➔ Symbol file"*.

> *The precondition to generate a symbol file is to create the application and to perform PLC program build in CODESYS.*

2. Select the desired location in the file system to save the symbol file.
3. In the device tree, double-click *"Application"* to start CODESYS application.

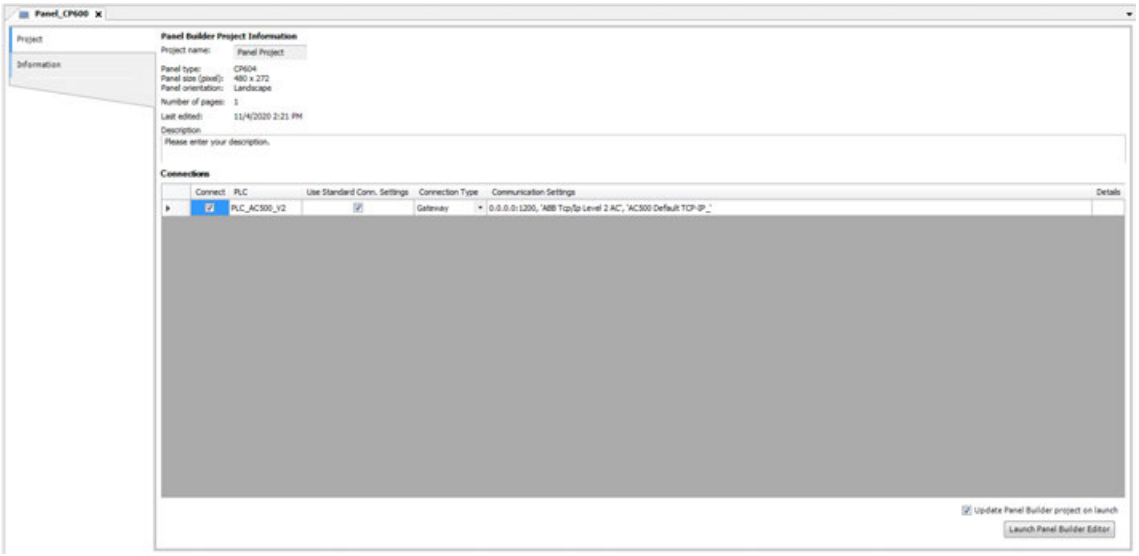
1.9.1.2 Creating a Panel Builder project

Adding a panel object

1. Right-click in the Automation Builder device tree and click *"Add object ➔ Panel-CP600"*
2. Click on *"CP600 Control Panel"* and click *"Add object"*
   ⇨ A Control Panel object is added to the Automation Builder device tree.

Starting a Panel Builder project

1. In the device tree, double-click *"Panel CP600"* object to start Panel CP600 screen.



2. Select the required PLC and enable the checkbox in the 'Use Standard Connection Settings' column to use it as a standard gateway connection.

   You can set communication settings using the application program or by creating custom communication settings. Custom communication settings can be configured by clicking the button in the 'Details' column.
3. Enable the *"Update Panel Builder project on launch"* checkbox and click *[Launch Panel Builder Editor]*.

> *If you update Automation Builder project with new variables and data types or if there are changes in existing Automation Builder project variables and data types (new, modified, deleted), recompile CODESYS application to refresh the symbol file, then launch Panel Builder editor.*

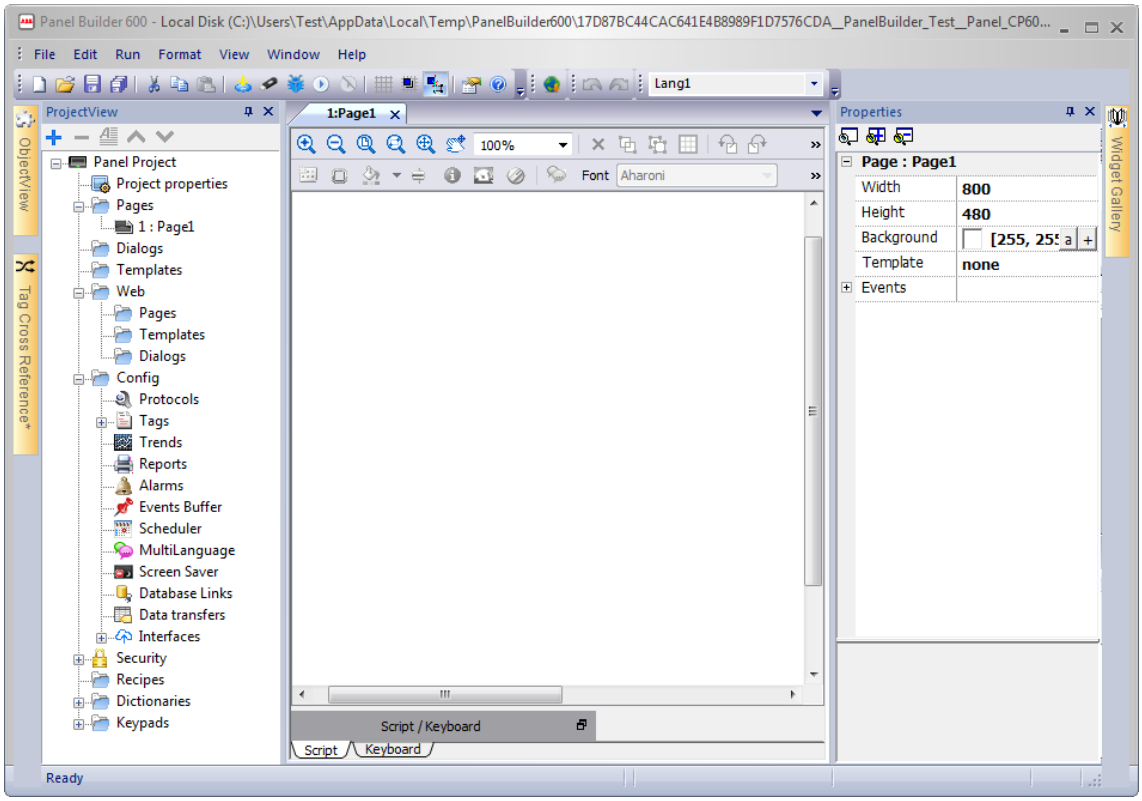
4. Select *“New”* and click *“Open”* to create a new HMI project.

   ⇨ A project wizard is displayed.

> *If you want to import an already existing Panel Builder project file from the file system, select “Import existing project file” and proceed.*

5. Select the required panel type and orientation and click *“Finish”*.

   ⇨ A new project wizard starts only if the Panel project is empty.

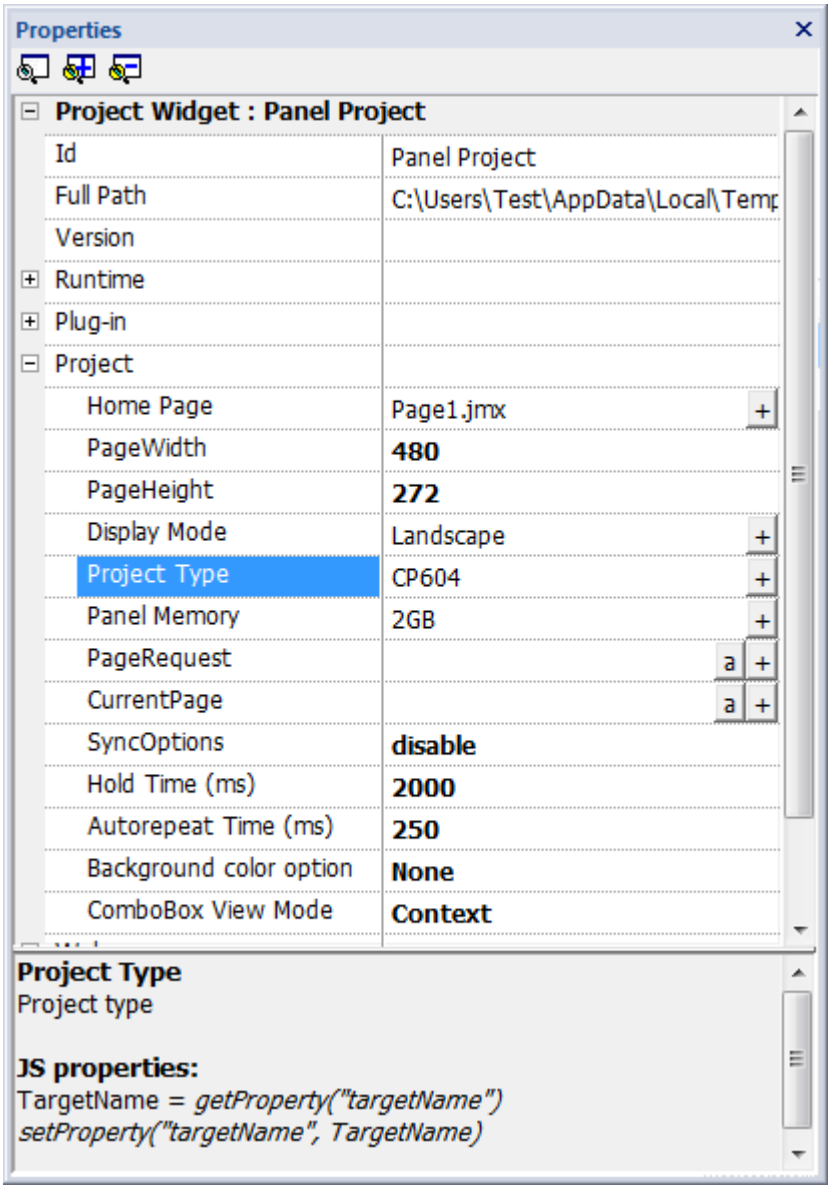


> *The panel projects can be compared in Automation Builder using the “Compare Objects” option.*

Changing panel type

1. In the Panel project, double-click *"Project properties"* to change the panel type to the panel which is used.

   ⇨ The Properties dialog is displayed.



2. In the Properties dialog, expand *"Project"* and click *"Project Type "*.

   ⇨ A project wizard dialog is displayed.

3. Select the desired panel type and click *"Finish"*.

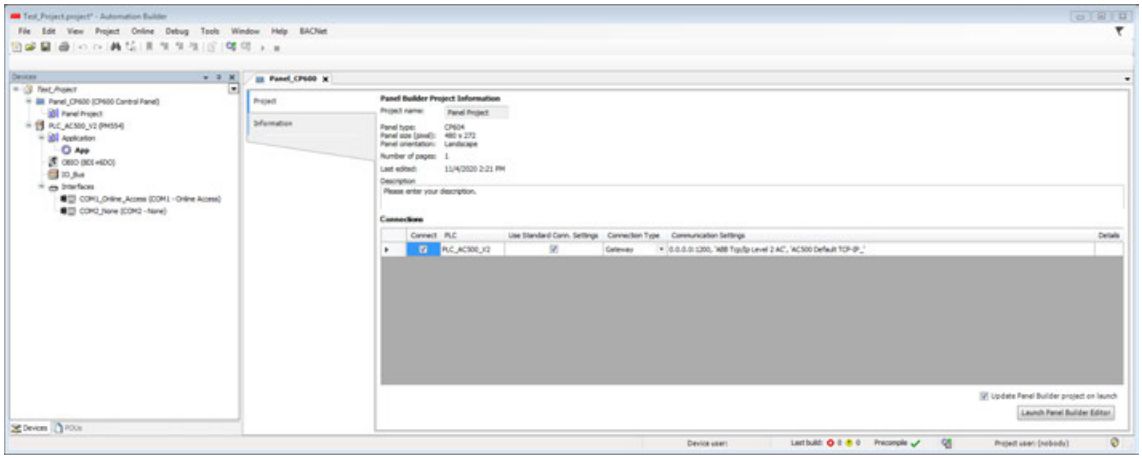
Project information

The project information view provides an overview of the Panel Builder project without opening the project. To open the project information, double-click the *"Panel_CP600"* object.

The project information is updated every time the Panel Builder project is edited. You can rename the Panel Builder project via context menu.

> *The project name is internally used as a base for the Panel Builder project file name. Therefore, the project name has to comply with general file name restrictions.*

The Panel Builder project information shows the list of PLCs added to the project.

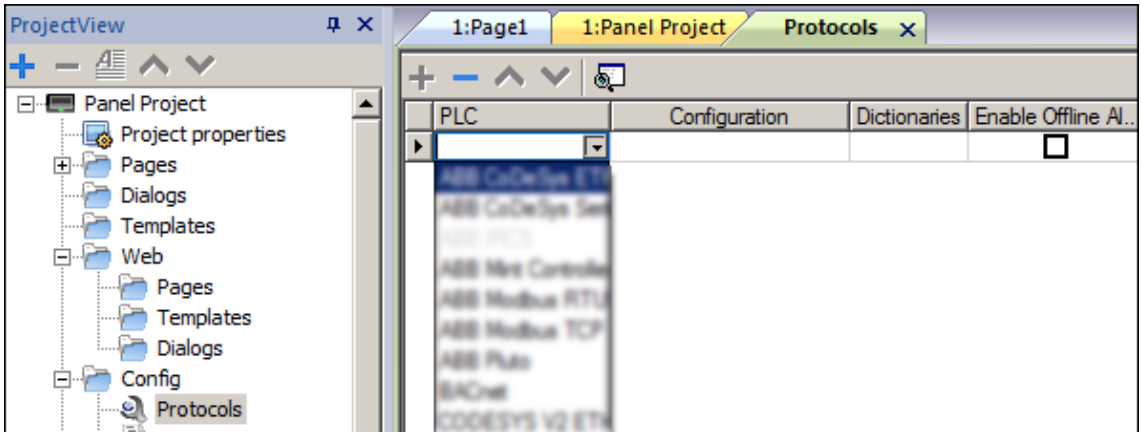


1.9.1.3 Configuring Panel Builder

Configuring communication protocols

> *The user can configure a panel project manually in Panel Builder editor when there is a need to create individual panel projects. Otherwise, the configuration is updated in the panel project while launching Panel Builder editor in Automation Builder.*

1. In the Panel Builder project structure, double-click *"Config ➔ Protocols"*.
2. Click + to add a protocol.



3. Select the desired protocol and set the IP address, port, protocol type and PLC models. Click *[OK]*.

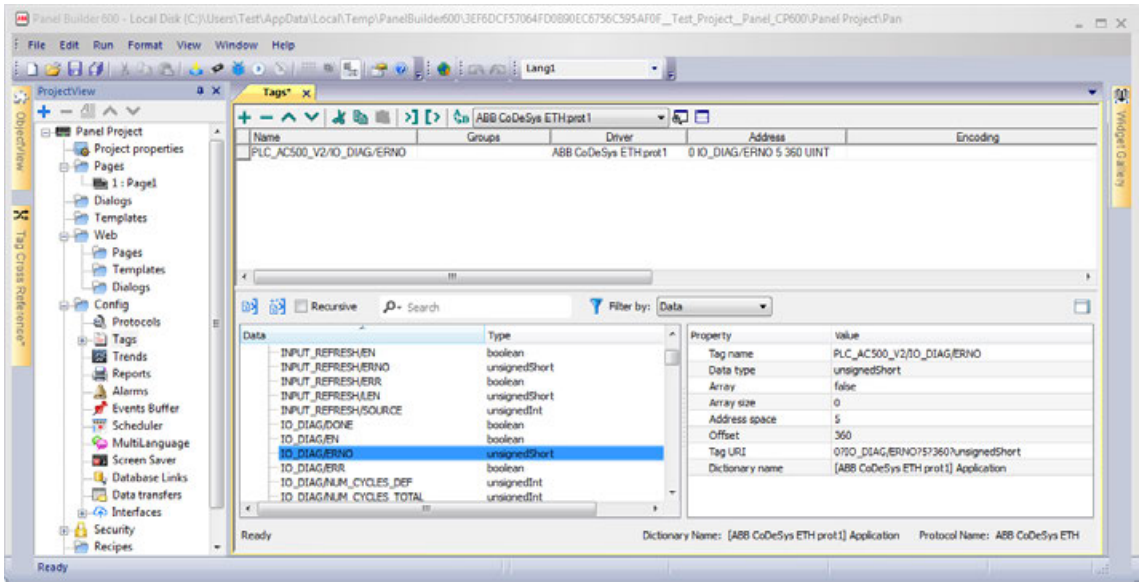
Importing tags

1. In the Panel project view, click *"Config ➔ Tags"*.
2. Select the protocol from the drop-down list and click ›] to import tags.

> *If the Panel Builder contains multiple tag importers, a dialog is displayed to select the required importer type.*

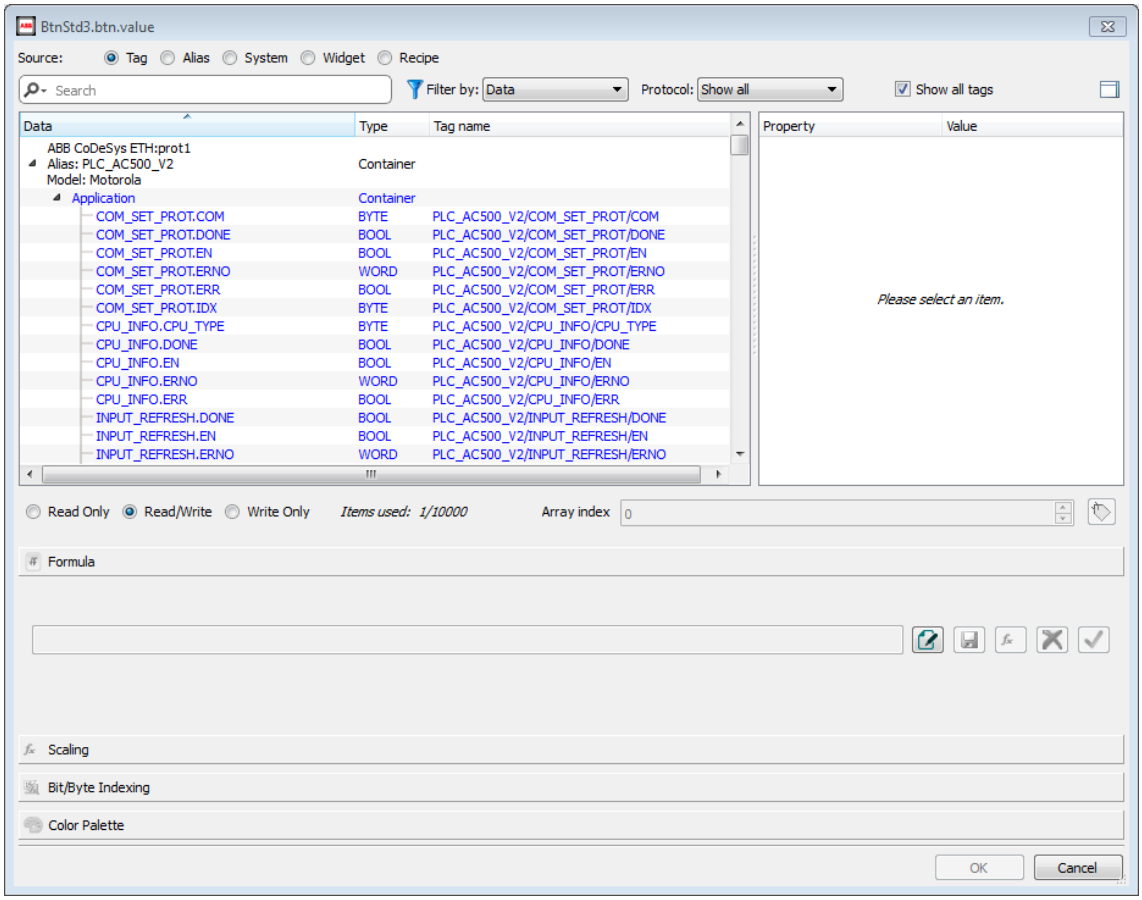
3. Select the symbol file which was exported to the file system.

4. In the lower part of the tag editor, mark the desired tags and click *"Import Tag (s)"* to import the tags to the Panel Builder project.



Attaching tags to widgets

1. In the project view, expand *"Pages"* and double-click **Page1**.
2. In the Panel Builder 600 main menu, select *"View* ➔ *Toolbars and Docking Windows* ➔ *Widget Gallery"*.
3. Drag-and-drop the desired widget to the page editor.
4. Right-click on the widget value and select *"Attach To"* to attach a tag to the widget.



5. Select the desired tag and select the desired option for the authorization *“Read Only”* or *“Read/ Write”* or *“Write Only”*. Then, click *[OK]*.

Downloading a project to panel

1. In the Panel Builder main menu, click *“Run ➔ Download To Target”*.
2. Select the CP600 project from the drop-down list and click *“Download”*.

Importing an existing Panel Builder project

1. In the Automation Builder device tree, right-click the Panel project and click *“Import ➔ Panel Builder Project”*.

   System prompts to overwrite the exiting project object data.
2. Click *“Yes”* to confirm.
3. Select the existing Panel Builder 600 project from the file system and click *“Open”*.

   ⇨ The imported project is displayed.

Exporting Panel Builder project

1. In the Automation Builder device tree, right-click the Panel Builder 600 project and click *“Export ➔ Panel Builder Project”*.
2. Click *“Browse”* and select the desired location in the file system and save the project file.

   ⇨ A success message is displayed, if the project file exports successfully.

When you double-click the Panel Builder project node, the compressed information of the node is extracted into a temporary folder and then the external Panel Builder program is started. After the external Panel Builder program is closed, the corresponding Panel Builder files can be compressed back into the node and saved in the Automation Builder project.

We recommend to edit the Panel Builder project by starting Panel Builder through the Automation Builder. You can also export a Panel Builder project to the file system to edit the project by using the external Panel Builder. Then, reimport it to Automation Builder.

1.9.2 SCADA Integration

Overview

This document describes SCADA integration configuration in Automation Builder using zenon editor. The configured device network address information and variables are synchronized with zenon editor to avoid double entry.

The Automation Builder supports both standard and multi-user functionality.

1.9.2.1 Creating Workspace and Project

1. In the device tree, double-click *“zenon_Project”*.

   ⇨ To launch the zenon editor, click *[Launch Zenon Editor]*.

   To update the zenon project with latest changes of application program, click *[Update zenon project]*.

2. Select the required PLC and select the *“Use Standard Conn. Settings”* option to use as a standard gateway connection.

   This enables the user to use the same communication settings that Automation Builder uses to communicate to the PLC.

> *The configured gateway communication settings made in Automation Builder are displayed in the column 'Connection Type'.*

   As an alternative you can create custom communication settings: Deselect the *“Use Standard Conn. Settings”* option and click the button in the 'Details' column.

3. Click *[Launch Zenon Editor]* to create a new workspace and project.

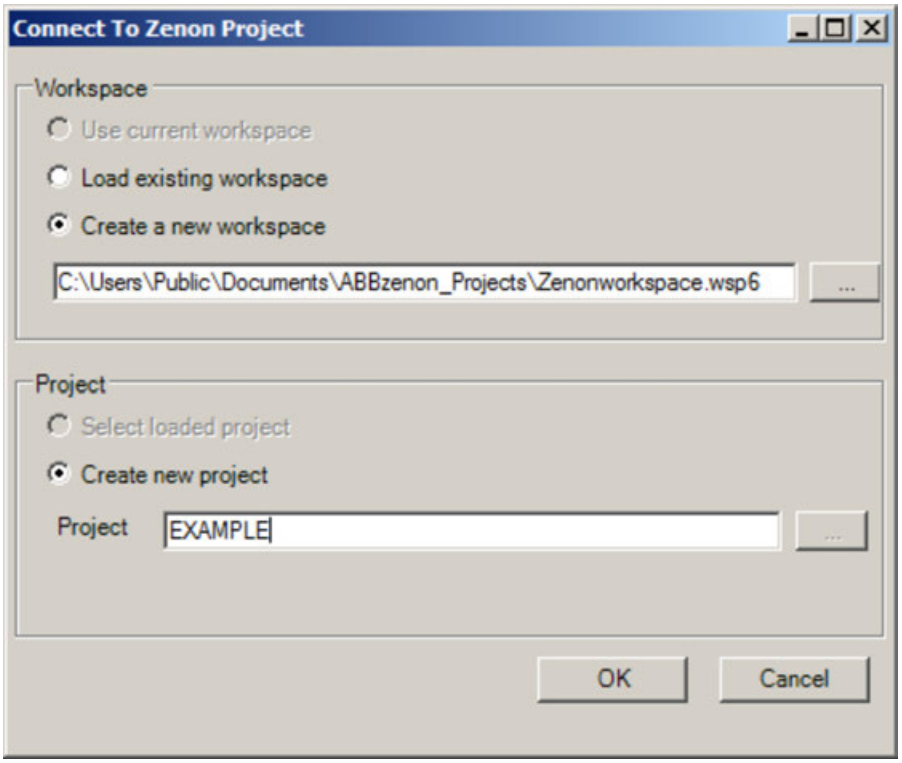


Fig. 1183: Connect to zenon project

⇨

> *If Zenon Editor is already running, then select the "Use current workspace" option.*

4. Select the *"Create a new workspace"* option and select the file location to create a new workspace.
5. Select the *"Create new project"* option to create a project.
   ⇨ ABB zenon editor is displayed.

> *If you update or change an Automation Builder project with new variables or data types (new, modified, deleted), recompile the application to refresh the symbol file and click [Update zenon project].*

After creating the project and workspace in Automation Builder, it is not required to set it again for the zenon object. A double-clicking on the zenon project shows the previously configured zenon project and the workspace.

1.9.2.2 Loading existing Workspace and Project

You can load an existing workspace and project to ABB zenon supervisor.

1. In the zenon_Project screen, click *[Update zenon project]*.
   ⇨ Connection to the zenon project dialog is displayed.
2. In the workspace area, enable *"Load existing workspace"* and select the location.

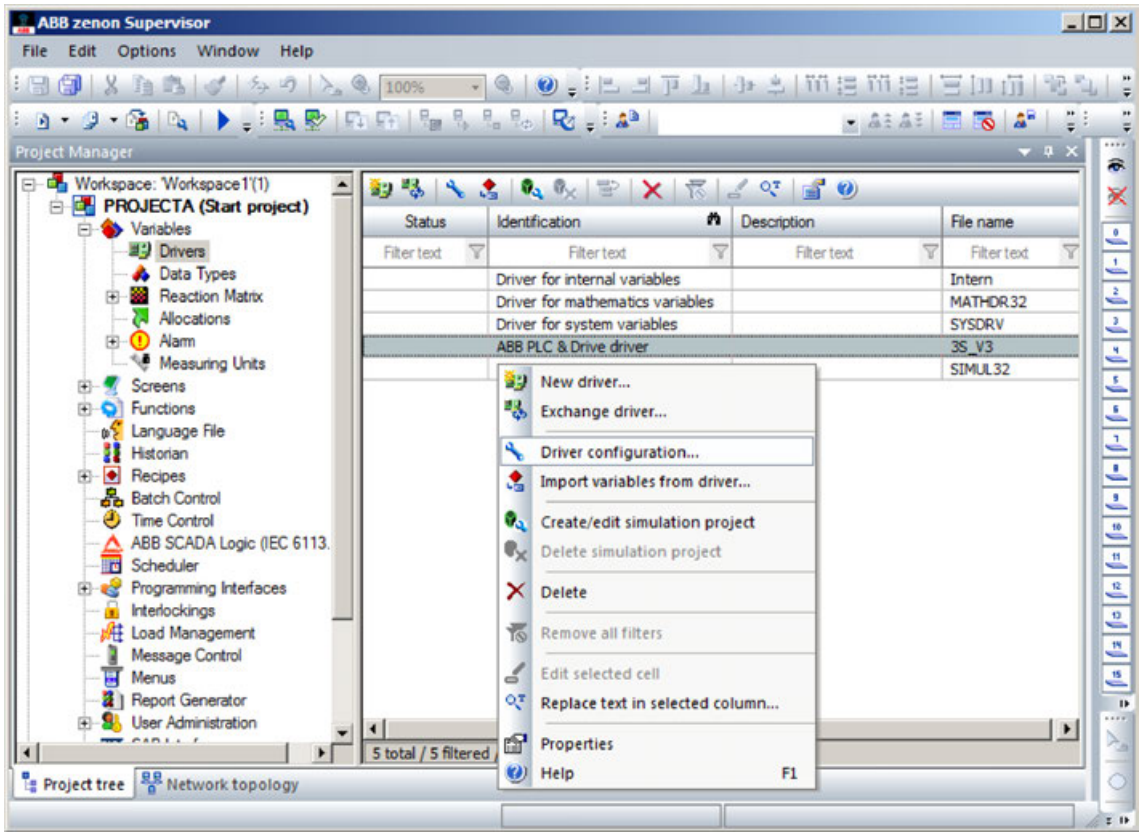
3. In the project area, enable *“Select loaded project”* and click *[OK]*.

   ⇨ Zenon editor loads the selected existing workspace and the project.

1.9.2.3 Checking the Gateway Settings in a Zenon Project

The gateway settings configured in Automation Builder can be checked in a zenon project. The IP address configured in Automation Builder are displayed in the zenon driver configuration.

In the Project Manager structure of the zenon editor, click *“Variables ➔ Drivers”* to configure the driver configuration.



The *“Settings”* tab shows all gateway settings based on the number of configured PLCs in Automation Builder. The IP address should be similar to the project gateway settings in Automation Builder.

> *In the zenon project window, the **Connect** column should be checked to transfer the desired number of PLC connection settings to the zenon editor.*

1.9.2.4 Generating a Symbol File

Before generating the symbol file, define the variables in theCODESYS application.

1. In the CODESYS application main menu, click *“Project ➔ Options”*.
2. In the *“Options”* dialog, click *“Symbol configuration”*. Enable *“Dump symbol entries”* and *“Dump XML symbol table”* and click *“Configure symbol file”*.

   ⇨ Set object attributes dialog is displayed.

3. Enable *“Export variables of object”*. If this option has a gray background, double-click on it to activate.

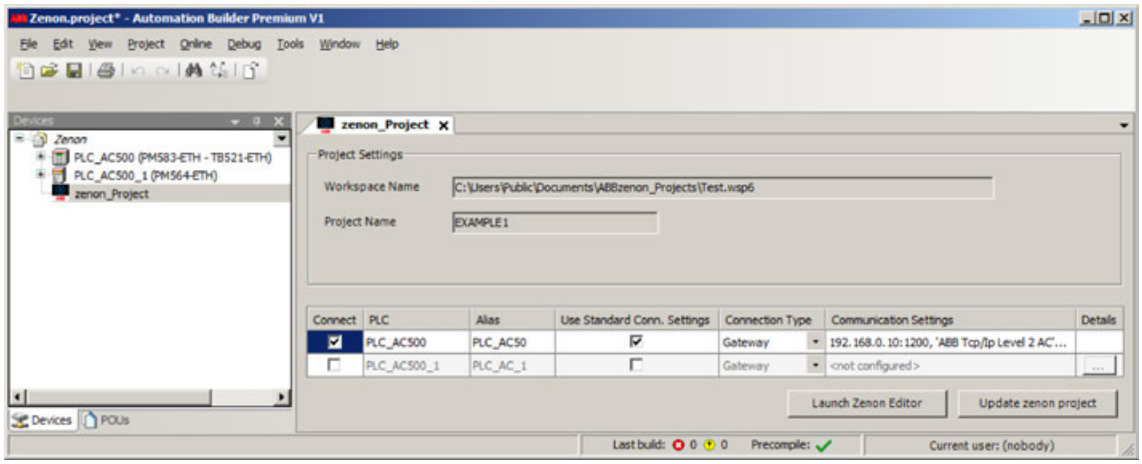
4. In the CODESYS application window, click at the bottom of the window and click *"Resources ➔ Tools ➔ Target settings"*.
5. In the target settings dialog, open the *"General"* tab and enable *"Download symbol file"*.
6. From the CODESYS application main menu, select *"Project ➔ Build"* to compile the project.

> *Precondition to generate a symbol file is to create the application and perform a PLC program build in CODESYS application.*

The symbol file is generated after the build. The data exchange can be transferred to the zenon project by clicking *[Update zenon project]* in Automation Builder.

1.9.2.5 Updating Standard Data Types

The standard data types created in CODESYS application can be updated to the zenon project by clicking on *"Update zenon project"*.



> *Data types and variables can be updated from the desired number of PLCs configured in the zenon project of Automation Builder.*

In the zenon project, double-click *"Variables"* and check the updated standard data type.

1.9.2.6 Creating Data Types

1. In the CODESYS application open the *"Data types"* tab. Right-click *"Data types ➔ Add object"* to create a new data type.
2. Enter the user defined data type name.
3. In *"POUs"* tab, add the user defined variable data type and compile.

   ⇨ The user defined data type is created and can be imported in the zenon editor.

> *If you modify or delete the data types in CODESYS application, compile with "Rebuild all option".*

1.9.2.7 Importing Data Types in zenon Editor

1. In the zenon project, click *[Update zenon project]* to update the data types.
2. Click *"Update"* to update the variables and data types to the zenon project.
   ⇨ The user defined variables and data types are imported to the zenon project.

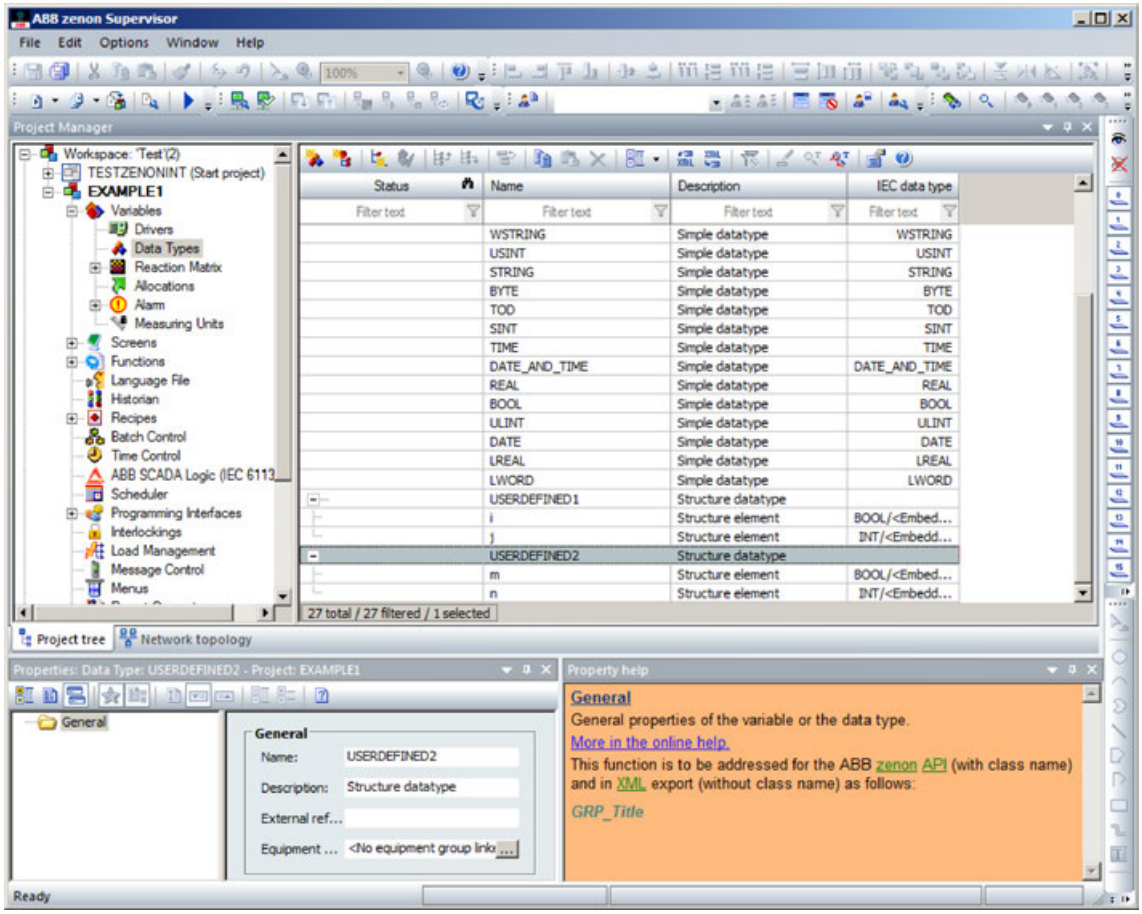


Fig. 1184: User defined variables
