High Voltage Service

Upgrades
Standard service offering

Improved transmission
This upgrade is composed by the complete substitution of junction and transmission. In the old version, that can be easy recognized because of the black color, the covering of junction was made of rubber, that can be damaged by atmospheric agents in particular environments. The new version, characterized by a white color, is made by a siliconic compound with more resistance. This brings an improved resistance to ageing to all the mechanical system. Together with covering of transmission the leverage is replaced, with a new stainless steel leverage that drives the disconnector.

Pollution Protected Gas Hoses
The upgrade is mainly developed in order to improve the resistance of gas hoses in polluted environments. The upgrade includes the substitution of the following components:

– Valve
– Junctions
– Gas Pipes.
Gas pipes are an improved revision, with a metal core.
