Affected Products

Relion® 670 series version 1p1r26 and earlier revisions.

Summary

The operating system used by the device (VxWorks) has a weakness in the random number generator of the TCP implementation that may allow remote attackers to predict the correct TCP ISN (Initial Sequence Number) from previous values. This vulnerability affects the product versions listed above.

Additional Information can be found here:

This vulnerability could be exploited remotely. Successful exploitation of this vulnerability may allow an attacker to spoof or disrupt TCP connections of the affected products.
Cyber Security Advisory

Severity rating
The CVSS score for this vulnerability is 5.8. This assessment is based on the types of systems that are affected by the vulnerability, how difficult it is to exploit, and the effect that a successful attack exploiting the vulnerability could have.

CVSS Overall Score: 5.8
CVSS Vector: (AV:N/AC:M/Au:N/C:P/I:N/A:P)

Corrective Action or Resolution
ABB has investigated this vulnerability and have found that Relion® 670 series version 1.1 is affected. Relion® 670 series version 1.1 is in the life cycle state classic.

In Relion® 670 series version 1.1, the protocols used haven’t been encrypted as there has been no risk of disclosure of user information since no connection to central account management systems have been featured.

ABB recommends that customers follow the steps outlined in the section “Mitigating Factors”.

Vulnerability Details
Affected products generate predictable TCP Initial Sequence Numbers which may allow an attacker to predict the correct TCP ISN and used to spoof or disrupt TCP connections of the affected products.

Mitigating Factors
Recommended security practices and firewall configurations can help protect a substation automation network from attacks that originate from outside the network.

Such practices include that substation automation systems are physically protected from direct access by unauthorized personnel, have no direct connections to the Internet, and are separated from other networks by means of a firewall system that has a minimal number of open ports, and others that have to be evaluated case by case.

Substation automation systems should not be used for Internet surfing, instant messaging, or receiving e-mails. Portable computers and removable storage media should be carefully scanned for viruses before they are connected to a substation automation system.

Workarounds
Workarounds are described in the Corrective Action or Resolution chapter above.
Frequently asked questions

What is the scope of the vulnerability?
An attacker who successfully exploits this vulnerability could spoof or disrupt TCP connections of the affected products.

What causes the vulnerability?
This vulnerability is caused by a weakness in the TCP random number generator algorithm implemented in the operating system (VxWorks) used by the Relion® 670 Series.

What is the affected product or component?
In the Relion® 670 series, the affected parts are IEC 61850, DNP 3.0 (TCP), FTP protocol and the tool access protocol. All protocols uses the TCP stack implemented by the operating system (VxWorks).

What might an attacker use the vulnerability to do?
An attacker who successfully exploits this vulnerability could spoof or disrupt TCP connections of the affected products.
How could an attacker exploit the vulnerability?
An attacker could try to exploit this vulnerability. It would require that the attacker has access to the system network, by connecting to the network either directly or through a wrongly configured or penetrated firewall, or that he installs malicious software on a system node or otherwise infects the network with malicious software. Recommended practices help mitigate such attacks, see section Mitigating Factors above.

Could the vulnerability be exploited remotely?
Yes, an attacker who has network access to an affected system node could exploit this vulnerability. Recommended practices include that substation automation systems are physically protected, have no direct connections to the Internet, and are separated from other networks by means of a firewall system that has a minimal number of ports exposed.

When this security advisory was issued, had this vulnerability been publicly disclosed?
Yes, this vulnerability has been publicly disclosed.

When this security advisory was issued, had ABB received any reports that this vulnerability was being exploited?
No, ABB had not received any information indicating that this vulnerability had been exploited in the 670 Series when this security advisory was originally issued.

Support
For additional information and support please contact your local ABB service organization.
