

MEDIUM VOLTAGE PRODUCT

KECA 80 C104; KECA 80 C165

Indoor current sensor

01 Sensor characteristics

Parameters for Application	Value
Rated primary current of application	up to 1 250/4 000 A

Sensor Parameters	Value
Highest voltage for equipment, U_m	0.72 kV
Rated power frequency withstand voltage	3 kV
Rated primary current, I_{pr}	80 A
Rated continuous thermal current, I_{cth}	1 250 A 4 000 A
Rated transformation ratio, K_{ra}	80 A/ 150 mV at 50 Hz 180 mV at 60 Hz
Current accuracy class	0.5/5P400 0.5/5P630
Length of cable	5 m

Sensor principles

Electronic Instrument Transformers (Sensors) offer an alternative way of making the current measurements needed for the protection and monitoring of medium voltage power systems. Sensors based on alternative principles have been introduced as successors to conventional instrument transformers in order to significantly reduce size, increase safety, and to provide greater rating standardization and a wider functionality range. These well known principles can only be fully utilized in combination with versatile electronic relays.

Sensor characteristics

Construction of ABB's current sensors is done without the use of a ferromagnetic core. This fact

results in several important benefits for the user and the application.

The main benefit is that the behavior of the sensor is not influenced by non-linearity and width of hysteresis curve, which results in a highly accurate and linear response over a wide dynamic range of measured quantities. A linear and highly accurate sensor characteristic in the full operating range enables the combination of metering and protection classes in one winding. With KECA 80 Cxxx sensors measuring **class 0.5** is reached for continuous current measurement in the extended accuracy range from 5% of the rated primary current I_{pr} **not only up to 120% of I_{pr}** (as being common for conventional current transformers), **but even up to the rated continuous thermal current I_{cth}** . For dynamic current measurement (protection purposes) the ABB sensors KECA 80 Cxxx fulfill requirements of protection class **5P up to an impressive value reaching the rated short-time thermal current I_{th}** . That provides the possibility to designate the corresponding accuracy class as **5P400 and 5P630**, proving excellent linearity and accuracy measurements.

Current sensor

Current measurement in KECA 80 Cxxx sensors is based on the Rogowski coil principle. A Rogowski coil is a toroidal coil, without an iron core, placed around the primary conductor in the same way as the secondary winding in a current transformer. However, the output signal from a Rogowski coil is not a current, but a voltage:

- 02 Rogowski coil principle
- 03 IED and sensor
- 04 Current sensors installed in MV air insulated switchgear UniGear ZS1 12/17.5 kV
- 05 Current sensors installed in MV air insulated switchgear UniGear ZS1 12/17.5 kV

In all cases, a signal that represents the actual primary current waveform is easily obtained by integrating the transmitted output signal.

Protection and control IEDs (Intelligent Electronic Devices)

Protection and control IEDs incorporate the functions of a traditional relay, as well as allow new additional functions. The information transmitted from the sensors to the IED is very accurate, providing the possibility of versatile relay functionality.

However, the IED must be able to operate with sufficient accuracy at a sensor’s low input signal level, and the signal from the Rogowski coil must be integrated. Modern IEDs (such as ABB’s 615 series relays) are designed for such sensor use, and they are also equipped with built-in integrators for Rogowski coil sensor inputs.

Modern digital apparatuses (microprocessor based relays) allow protection and measurement functions to be combined. They fully support current sensing realized by the single sensor with double the accuracy class designation (e.g.: current sensing with combined accuracy class 0.5/5P630).

03

Sensor applications

The current sensors type KECA 80 Cxxx are intended for use in current measurement in medium voltage air insulated switchgear type UniGear ZS1 12/17.5 kV as well as in OneFit hard-bus retrofill design concept for MV circuit breakers.

Differences between Sensors and Instrument Transformers

There are some noticeable differences between Sensors and conventional Instrument Transformers:

Linearity

Due to the absence of a ferromagnetic core the sensor has a linear response over a very wide primary current range, far exceeding the typical CT range. Thus, current sensing for both measurement and protection purposes could be realized with single secondary winding with a double rating. In addition, one standard sensor can be used for a broad range of rated currents and is also capable of precisely transferring signals containing frequencies different from rated ones.

06 Combined accuracy class

—
07 Example of a sensor label

For this type of sensor, the variation of amplitude and phase error or composite error in a current range from 5% of rated primary current I_{pr} up to the rated short-time thermal current I_{th} is within the limits specified by IEC 60044-8.

Example of current measurement range with rated current 80 A and accuracy class 0.5/5P400 and 0.5/5P630:

Metering accuracy class 0.5 is, according to the IEC 60044-8 standard, guaranteed from 5% of I_{pr} up to $K_{pcr} \times I_{pr}$ where K_{pcr} is rated extended primary current factor and I_{pr} is rated primary current. Factor K_{pcr} is in the case of conventional CTs usually just 1.2, but in the case of the KECA 80 Cxxx sensors the K_{pcr} factor is several times higher and equals 15.625 for KECA 80 C104 and 50 for KECA 80 C165.

Protection accuracies 5P400 and 5P630 are guaranteed, for the advanced KECA 80 Cxxx sensors, from the current equal to $K_{pcr} \times I_{pr}$ up to the current corresponding to $K_{alf} \times I_{pr}$ value, where K_{alf} is, according to IEC 60044-8, the accuracy limit factor.

For this type of sensors the value of $K_{pcr} \times I_{pr}$ is equal to the rated continuous thermal current I_{cth} (1 250 or 4 000 A) and the value of $K_{alf} \times I_{pr}$ is equal to the rated short-time thermal current I_{th} (31.5 and 50 kA). The accuracy limits are described on the graph below.

—
06

Compactness

Since the sensing elements are particularly small, and the same elements are used for both measurement and protection, the current sensors can be easily integrated into the switchgear. These facts enable the design of sensors in a very optimal way which contributes to high level of switchgear simplification.

Rated parameters

Because the sensors are highly linear within a very wide range of currents, the same single sensor can be used for the various rated currents associated with each specific application up to the specified maximum voltage for equipment. There is no need to specify other parameters such as burden, safety factor, etc. since they are standard over the defined range. To achieve the correct function of the protection and control IED, the selected rated current, as well as the rated transformation ratio, must be properly set into the IED.

Energy savings concept

As there is no iron core, no necessity for high burden values and thus a possibility for low current losses and only one secondary winding needed, KECA 80 Cxxx sensors exhibit extremely low energy consumption that is just a fraction of that transferred to heat in conventional CTs. This fact contributes to huge energy savings during its entire operating life, supporting the world-wide effort to reduce energy consumption.

Correction factors

The amplitude and phase error of a current sensor is, in practice, constant and independent of the primary current. Due to this fact it is an inherent and constant property of each sensor and it is not considered as unpredictable and influenced error. Hence, it can be easily corrected in the IED by using appropriate correction factors, stated separately for every sensor.

Values of the correction factors for the amplitude and phase error of a current sensor are mentioned on the sensor label (for more information please refer to Instructions for installation, use and maintenance) and should be uploaded without any modification into the IED before the sensors are put into operation (please check available correction in the IED manual). To achieve required accuracy classes it is recommended to use all correction factors (Cfs): amplitude correction factor (al) and phase error correction factor (pl) of a current sensor.

KECA 80 C165		S/N 1VLT5408001587

07

Secondary cables

The sensor is equipped with a cable for connection with the IED. The cable connector is type RJ-45. The sensor accuracy classes are verified up to the RJ-45 connector, i.e. considering also its secondary cable. These cables are intended to be connected directly to the IED, and subsequently neither burden calculation nor secondary wiring is needed. Every sensor is therefore accuracy tested when equipped with its own cable and connector.

08

Connector adapters

To provide connectivity between a sensor with a RJ-45 cable connector and IEDs with Twin-BNC connectors a group of adapters were designed. To provide connectivity between current and voltage sensors with RJ-45 cable connectors and IEDs with RJ-45 connector the coupling adapter was designed. The use of connector or coupling adapters has no influence on the current and/or voltage signal and accuracy of the sensor with the cable. For more information about connector adapters and coupling adapter refer to Doc. No. 1VLC000710 - Sensor accessories.

Standards

Current sensors: IEC 60044-8 (2002-07)
Instrument transformers –
Part 8: Electronic current transformers

Highest voltage for equipment and test voltages

- Highest voltage for equipment, U_m : 0.72 kV
- Power frequency voltage withstand test on primary terminals: 3 kV

Current sensor, rated values

- Rated primary current, I_{pr} : 80 A
- Rated transformation ratio, K_{ra} :
80 A/0.150 V at 50 Hz
80 A/0.180 V at 60 Hz
- Rated secondary output, U_{sr} : 3 mV/Hz
i.e. 150 mV at 50 Hz
or 180 mV at 60 Hz

- Rated continuous thermal current, I_{cth} :
1 250 A for KECA 80 C104
4 000 A for KECA 80 C165
- Rated short-time thermal current, I_{th} :
31.5 kA/3s for KECA 80 C104
50 kA/3s for KECA 80 C165
- Rated dynamic current, I_{dyn} :
80 kA for KECA 80 C104
125 kA for KECA 80 C165
- Rated frequency, f_r : 50/60 Hz
- Rated extended primary current factor, K_{pcr} :
15.625 for KECA 80 C104
50 for KECA 80 C165
- Accuracy limit factor, K_{alf} : 630
400 for KECA 80 C104
630 for KECA 80 C165
- Accuracy class: 0.5/5P400 for KECA 80 C104
0.5/5P630 for KECA 80 C165
- Rated burden, R_{br} : 10 M Ω

Temperature category

- Operation -5°C/+40°C
- Transport and storage: -40°C/+80°C

Cable

- Length: 5 m
- Connector: RJ-45 (CAT-6)

Ordering data

- KECA 80 C104
for UniGear ZS1 12/17.5 kV 1VL5400065V0101
- KECA 80 C104 for other applications
(e.g. OneFit) 1VL5400065V0102
- KECA 80 C165 for UniGear ZS1 12/17.5 kV
1VL5400069V0101
- KECA 80 C165 for other applications
(e.g. OneFit) 1VL5400069V0102
