1 Introduction:
This application note shows you step-by-step to create a basic PLC program with ABB eCo PLC and CP635 panel using Automation Builder software tool. It also guides you to create hardware configuration, program and go online with PLC and HMI.

2 Objective:
In this application example, we use AC500 eCo PM564 ETH CPU with digital input simulator and CP635 panel. The personal computer will connect to PLC and HMI via 2 Ethernet ports on CP635 panel. These ethernet ports work like an unmanaged switch for ethernet connection.

Equipment list for this application note:

<table>
<thead>
<tr>
<th>Description</th>
<th>Quantity</th>
</tr>
</thead>
<tbody>
<tr>
<td>PM564 ETH CPU</td>
<td>1</td>
</tr>
<tr>
<td>CP635 Panel</td>
<td>1</td>
</tr>
<tr>
<td>PC with Automation Builder V1.0 or later software installed</td>
<td>1</td>
</tr>
<tr>
<td>Power Supply 120vac in/24vdc out, 1.25A</td>
<td>1</td>
</tr>
<tr>
<td>CAT5 Ethernet patch cables</td>
<td>2</td>
</tr>
</tbody>
</table>
3 Creating a new project:

3.1 Double click on ABB Automation Builder software tool icon on the desktop.

(If Automation Builder icon is not available on your desktop, click Start, go to All Programs, select ABB folder and click on Automation Builder software tool.)

3.2 The Automation Builder Screen will appear as shown below, if Internet access is available Automation Builder will show the default ABB homepage for PLC products

3.3 Create a new project by clicking the New button or selecting the File > New Project

3.4 Enter project name as shown in example below: My First eCo PLC and CP600 panel project

3.5 Select the location to store the project

3.6 Select OK to start the project

3.7 Click the + of PLC to open the popup menu.

3.8 Click AC500-eCo then select AC500 PM564-ETH CPU

3.9 Click on Add PLC to complete the selection
4 Specifying the hardware configuration:

To specify the hardware configuration, the I/Os and their symbolic names have to be defined. Configure your I/O by double clicking I/O (Onboard I/Os) and refer to the mapping tab window opened on the right side where you can give variable names to each I/O points.

4.1 Double click AC500 (PM564-ETH) on the left to open this hardware menu

4.2 Change the value of Check battery from **ON** to **OFF** (if no battery present for this example)

![Hardware Configuration Screenshot]

4.3 To create I/O variable for the CPU, double click on the OBIO selection. The I/O tab will open on your right window with 3 child tabs. The 1st tab is I/O configuration, click on the 2nd tab for I/O Mapping for this application example.

- **MotorRunning** for Digital output DO0 channel

![I/O Mapping Screenshot]

⚠️ Note, if you made a mistake during the process, you can always undo by going to Edit on the left hand top corner and click **Undo**.
5 Setup the Ethernet communication in Windows:

Before you are able to download the compiled program the first time from the PC to the PLC, you have to setup the communication parameter. There are two options you can use to login to the PLC, either with Ethernet or serial with TK503 USB cable.

For this exercise, we are using Ethernet connection for online access to this PLC.

Make sure that your PC address is in the same class as the CPU’s IP address. The factory setting of the CPU for IP address is 192.168.0.10. Then the IP of the PC should be 192.168.0.x, x should be different number than 10 so that it will not have an IP conflict with the CPU. Subnet mask should be 255.255.255.0.

To change the IP address in your PC:

5.1 Windows Control Panel > Network and Internet > Network and Sharing Center
5.2 Click on Change adapter settings
5.3 Select Local Area Connection (in this example is PLC network connection below) and right click it to open the menu.

Choose Properties (the status is active when the Ethernet connection between PC and PLC is active)
5.4 Select Internet Protocol Version 4 (TCP/IPv4) and double click to see properties.
5.5 Type in your desired IP address and subnet mask then click OK.
6 Setup the IP address in Automation Builder software:
   6.1 Make sure the CPU’s RUN switch is **STOP** position
   6.2 Click **IP-Configuration** to access Scan tool

   ![](image)

   6.3 Click on Scan button for searching active PLC on the network
   6.4 Highlight the active IP address in the search window
   6.5 Change the IP address to new IP address such as **192.168.3.20**
   6.6 Click on Send Configuration button to send new IP address to PLC.

   ![Image]

   • The warning message window display is shown below for this change.
   • This screen shows the progress of IP address settings is sending to CPU. Wait about 30 seconds for CPU to register new IP address (the RUN and ERR lights are flashing during this process).
   • Click OK to accept this new IP address for this CPU.

   ![Image]

   • Press “**Scan**” button again to verify the IP address of CPU. This window shows the Configured IP address sent to CPU successfully. This IP address will be used in IEC 61131-3 CoDeSys to download your PLC project to CPU.
7 IEC-61131-3 Programming window - Task Configuration:

From My First eCo PLC project windows, Right click on Application>Create Configuration to compile the hardware configuration for this project.

After the Create configuration data complete, double click on Application to goto IEC-61131-3 programming environment as shown on next section.

7.1 Click on Resource tab to access to Global Variables > OBIO_Module_Mapping window. Verify that the mapping variables for this exercise are correct and transferred from Automation Builder OBIO configuration.

7.2 Click on task configuration to goto settings
7.3 Right click on Task configuration then select Append Task to add a task for this CPU.
7.4 The task set up parameters:
   - Name: MainProgram
   - Priority (0..31) = 10
   - Type: Cyclic
   - Properties: T#10ms

8 Writing the program code in Ladder Diagram Editor:
   In this CoDeSys Program Organization Units (POUs) window, Structure text (ST) program is default, but it can be changed to Function Block Diagram (FBD), Ladder Diagram (LD), Instruction List (IL), Continuous
Function Chart (CFC) and Sequential Function Chart (SFC). In this exercise, we will change it to Ladder Diagram (LD) editor.

8.1 Click **Project > Rebuild** all to compile the PLC codes. Make sure there is no error in the project!

8.2 Right click POUs, select **Convert Object…** to convert it to LD editor

8.3 Select LD then click OK to accept the changes.

8.4 Double click on PLC_PRG(PRG) to go to Ladder Diagram editor.

8.5 Click on the instruction set and insert  to the network rail below
8.6 Highlight then hit Shift + F2 to open Declare Variable table. Type Name: MotorStartPB, Type: BOOL and Class: Global_Variables for this contact.

8.7 Repeat this step for this and select MotorStopPB for its variable tag as shown below.

8.8 Insert another then click Shift-F2 to access Declare Variable table. Assign MotorTimeDone as variable name as shown below then click OK to accept the changes.

8.9 Insert a coil ( ) to this network then press F2 to access to Input assistant table. Select MotorRunning from OBIO_Module_Mapping global variables.
The complete codes for network #1:

8.10 Click on the rail of network1 then right click to open the pop-up menu (or Ctrl+T). Select Network (after) to insert new network below the current one.

8.11 On this network #2, add MotorRunning contact then right click on the network line to add Timer(TON) from pop-up menu.

8.12 Press Shift+F2 to enter Motor_timer1 as variable name for this timer.

8.13 Add ElapseTime for ET with Type: TIME for this variable.
The complete PLC codes for network #2.

8.14 Add network #3, insert Motor_timer_done contact then add CTU function block by right click on the network line.

8.15 Add TIME_TO_REAL function block to convert from Time base to Real number for display in HMI project.

8.16 Click on Function Block… to select CTU for this counter Up function block.

8.17 For this CTU, add CounterDone: BOOL and CounterValue: WORD to complete this function block for this motor control logic.

The complete network #2 look like below:

8.18 Click Project > Rebuild all to compile this PLC logic.
Here is the complete PLC project for this application note:

```
VAR
MotorTimer TON;
MotorTimerDone BOOL;
MotorRunningCounter CTU;
CounterReset BOOL;
CounterDone BOOL;
END_VAR

MotorStartPB MotorStopPB MotorTimerDone MotorRunning

\[
\begin{array}{c}
\text{MotorRunning} \\
\text{MotorTimer} & \quad \text{ElapsedTime} \\
\text{TIME_TO_REAL} & \quad \text{ElapsedTime_HMI} \\
\text{CounterDone} & \quad \text{CounterValue}
\end{array}
\]
```
Configure and download Symbol file to CPU:

- Click on Resources tab>Target Settings to access to Target Settings tab

  Under General tab, activate the automatic Download symbol file option, the symbol file will be transferred in AC500 CPU flash memory with the project after download

  1. Click on the tab “General”
  2. Activate the checkbox “Download symbol file” and “OK”

In CoDeSys\Project\Options tab

  1. Activate the check box “Dump symbol entries”
  2. Click “Configure Symbol file…”
  3. Select “Global Variables”
  4. Activate the options shown below then OK twice to accept all the changes.

In CoDeSys\Project tab

  1. Select “Clean all” then “Rebuilt all”.
  2. After “Clean all” and “Rebuild all” operation the symbol files will create automatically in project directory and they will be transferred in AC500 CPU with the download operation
  3. Click Online\login to download the updates to CPU. Once the download complete, click Create Boot Project to download the symbol file to CPU flash memory. Save and close CoDeSys project.

ABB CoDeSys Ethernet protocol - Export Symbol file
In Automation Builder project:
1. Right click on “Application”
2. Then select “Export”
3. And select “Symbol file”
4. Finally select the desired location path to save this symbol file on PC folder

10 CP600 Control Panel system settings

Basic Unit Settings: System Settings: System basic settings are available from Control Panel, which is accessible through the PB610 PanelBuilder 600 configuration mode.

10.1 Press and hold your finger on the screen for a few seconds until the context menu appears.

10.2 Touch on Show system settings to access the system settings tools.

10.3 The system settings tool is a rotating menu through which you can scroll the menu using Next and Back buttons.
The system settings tool includes the following entries:

- Calibrate Touch: To calibrate the touch screen if needed
- Display Settings: Backlight and brightness control
- Time: Internal RTC settings
- BSP Settings: Operating system version
- Unit Operating Timers: Power up and activated backlight timers: Buzzer control, battery LED control

**NOTE:** Settings selected and confirmed with the OK button in the upper right corner of the dialog are automatically saved to the registry.

The system settings tool includes the following entries:

- Calibrate Touch: To calibrate the touch screen if needed
- Display Settings: Backlight and brightness control
- Time: Internal RTC settings
- BSP Settings: Operating system version
- Unit Operating Timers: Power up and activated backlight timers: Buzzer control, battery LED control
- Network: Enter or verify this IP settings= 192.168.3.62 - IP address for this panel

**NOTE:** Settings selected and confirmed with the OK button in the upper right corner of the dialog are automatically saved to the registry.

11 Create new CP600 Control Panel project in Automation Builder

11.1 In Automation Builder project, right click on My First eCo PLC select Add object
11.2 Select the CP600 Control Panel then Add object to create new CP600 Control Panel project.

11.3 Double click on Panel Builder 600 project, select New then Open from Import Project File menu
11.4 Click on Project properties to open Project Widget for panel size selection
11.5 Click on **Show Advanced Properties** icon to access all the properties of this control panel project.

11.6 Click on Project Type to change to CP635 panel for this project.

11.7 Confirm Landscape type for this panel and “Yes” to accept all the changes.

12 **PB610 Panel Builder 600 Project:**

This section describes the steps to create a simple PB610 Panel Builder 600 project.

12.1 From Project View window, Double click on Protocol window

12.2 Click the + icon to insert the new protocol

12.3 Select **ABB CoDeSys ETH** under pull down menu as shown below
12.4 Enter the IP address: 192.168.3.35 and other values as shown in the table below

13 Import tags import from AC500 PLC

13.1 Double click on the Tags icon in the Project View to open the tag configuration

13.2 Press the Import tags button shown below to import the tags and click OK

13.3 The symbol file is placed in PC's file location folder as shown below

13.4 Select the Application.SYM and “Open” it
13.5 The accessible tags are shown on in the lower part of the tag editor

13.6 Click **Import tags** icon to import the highlight tags to tags data editor above.

13.7 Verify all the tags are imported into this window
14  Create template and screen for CP600 panel project:

14.1 Right click on **Template** to create a template for this project. Add ABB logo and title for this HMI screen as shown below.

14.2 To add new page, right click on **Pages** node from project tree and select “Insert new page” and name it “**Main page**” then click OK to accept it.

15  Create static and dynamic objects using Widget Gallery:

15.1 Select the this button from the Widget Gallery, then drag and drop it on the Main page workspace.

15.2 Label this button as Motor Start PB as momentary type, color: Green.
15.3 Click on \( \text{Attach To...} \) then select Attach To... to access the tags database. Select MotorStartPB for this button then “OK” to accept it.

15.4 Repeat these steps for Motor Stop PB as shown below:

15.5 Open the widget gallery to select Light -Standard group then select this \( \text{Motor Status Light} \) for motor status light.
15.6 Click on Color in Properties then select Add/Remove Color to modify color selection below. Click + or – to add or remove the number of color selection for this object.

15.7 Select the **MotorRunning** from tag manager for this pilot light.

15.8 Select Label from Text/Numeric widget gallery for this light. Type “Motor Status” for this pilot light
16  Create the numeric display:

16.1  Click on Widget Gallery then select Text/Numeric tool. Drag numeric display to Main Page working window.

16.2  Select Countervalue for this numeric display object.

16.3  Use the property Value to attach a tag to this widget. Click in the field, press + button and select Attach To…, counter value.

16.4  Add another numeric display for Motor Running timer with field value as ElapseTime_HMI as shown below.
Here is the complete HMI screen for this project:

17  Save and download the PB610 Panel Builder 600 Project

17.1  Click Save Project from File menu

a.

17.2  Select Run/Download or use the marked symbol to start download dialog
17.3 Select your CP635 panel’s IP address then download the project to the panel.

![Download to Target window](image1.png)

17.4 You can test the CP600 application using the CP635 panel as shown below.

17.5 Use **Start Simulator** mode: You can test the CP600 application using Online Simulator. Click on **Start Simulator** to go to this mode.

![Start Simulator window](image2.png)

17.6 Go Online with HMI: Uncheck **Use Simulation** to go online HMI and AC500 PLC.

17.7 Here is the HMI Simulator screen online with this PM578 ETH CPU.
Click the short cut CP600 Windows Client on the desktop to activate this window below.

Type this CP635 panel’s IP address: 192.168.3.11 in this panel address window.
Press ENTER or click this circle symbol.

And this is the progress window for this CP600HMI Client connect to this CP635 panel over internet connection.

CP635 panel in Windows Client mode

Congratulations!!! You are controlling this CPU using Windows Client over internet connection.
