Further information
Safety instructions

Contents of this chapter

This chapter contains the safety instructions which you must obey when you install, operate and do maintenance on the safety functions of a drive.

Use of warnings and notes

Warnings tell you about conditions which can cause injury or death, or damage to the equipment. They also tell you how to prevent the danger. Notes draw attention to a particular condition or fact, or give information on a subject.

The manual uses these warning symbols:

WARNING!

Electricity warning tells about hazards from electricity which can cause injury or death, or damage to the equipment.
10 Safety instructions

WARNING!
General warning tells about conditions other than those caused by electricity, which can cause injury or death, or damage to the equipment.

WARNING!
Electrostatic sensitive devices warning tells you about the risk of electrostatic discharge which can cause damage to the equipment.

ATEX/UKEX-certified motor thermal protection functions

Only qualified specialists are permitted to install, control and maintain the ATEX/UKEX-certified motor thermal protection functions (see IEC/EN 60079-14). Obey all safety regulations required with application of Ex motors in Zone 1/21 (equipment category 2) or Zone 2/22 (equipment category 2 or 3).

Instructions for functional safety circuits

WARNING!
Obey the safety instructions of the drive. If you ignore them, injury or death, or damage to the equipment can occur.

This manual does not contain the complete safety instructions of the drive. It only includes the instructions related to the scope of this manual. The general instructions are given in this section and the option-specific instructions in the applicable chapter.
WARNING!
The safety function described in this manual does not isolate the main circuit or auxiliary circuit from the power supply. Do not do work on the drive, motor cable or motor before you have isolated the drive system from all power supplies and measured that there are no dangerous voltages. Before you start the work, do the steps in section *Electrical safety precautions (page 12).*
Electrical safety precautions

These electrical safety precautions are for all personnel who do work on the drive, motor cable or motor.

WARNING!
Obey these instructions. If you ignore them, injury or death, or damage to the equipment can occur.

If you are not a qualified electrical professional, do not do installation or maintenance work.

Go through these steps before you begin any installation or maintenance work.

1. Clearly identify the work location and equipment.

2. Disconnect all possible voltage sources. Make sure that re-connection is not possible. Lock out and tag out.
   • Open the main disconnecting device of the drive.
   • Open the charging switch if present.
   • Open the disconnector of the supply transformer. (The main disconnecting device in the drive cabinet does not disconnect the voltage from the AC input power busbars of the drive cabinet.)
   • Open the auxiliary voltage switch-disconnector (if present), and all other possible disconnecting devices that isolate the drive from dangerous voltage sources.
   • If you have a permanent magnet motor connected to the drive, disconnect the motor from the drive with a safety switch or by other means.
• Disconnect all dangerous external voltages from the control circuits.

• After you disconnect power from the drive, always wait 5 minutes to let the intermediate circuit capacitors discharge before you continue.

3. Protect any other energized parts in the work location against contact.

4. Take special precautions when close to bare conductors.

5. Measure that the installation is de-energized. Use a quality voltage tester. If the measurement requires removal or disassembly of shrouding or other cabinet structures, obey the local laws and regulations applicable to live working (including but not limited to – electric shock and arc protection).

• Before and after measuring the installation, verify the operation of the voltage tester on a known voltage source.

• Make sure that the voltage between the drive input power terminals (L1, L2, L3) and the grounding (PE) busbar is zero.

• Make sure that the voltage between the drive output terminals (T1/U, T2/V, T3/W) and the grounding (PE) busbar is zero. Important! Repeat the measurement also with the DC voltage setting of the tester. Measure between each phase and ground. There is a risk of dangerous DC voltage charging due to leakage capacitances of the motor circuit. This voltage can remain charged even long time after the drive power off. The measurement discharges the voltage.

• Make sure that the voltage between the drive DC terminals (UDC+ and UDC-) and the grounding (PE) terminal is zero.

**Note**: If cables are not connected to the drive DC terminals, measuring the voltage from the DC terminal screws can give incorrect results.
6. Install temporary grounding as required by the local regulations.

7. Ask for a permit to work from the person in control of the electrical installation work.
Introduction to the manual

Contents of this chapter
This chapter gives basic information on the manual.

Applicability
This manual is applicable to the CPTC-02 module and to the Safe motor temperature safety (SMT) function which uses the CPTC-02 module (option +L537+Q971).

Compatibility
The CPTC-02 module is compatible with:

- ACS580-01/-04, ACH580-01/-04/-31/-34, and ACQ580-01/-04/-31/-34 wall-mounted drives and drive modules to be installed in user-defined cabinet
- ACS580-07, ACH580-07, and ACQ580-07 cabinet-installed drives
- ACS580 standard control program version 1.70 or later
• ACH580 HVAC control program version 2.05 or later
• ACQ580 pump control program version 2.05 or later

Target audience

This manual is intended for people who install, commission, use and service the ATEX-certified thermistor protection module of the drive. Read the manual before working on the drive. You are expected to know the fundamentals of electricity, wiring, electrical components, electrical schematic symbols, functional safety, and Ex regulations.

Exclusion of liability

ABB is not responsible for the implementation, verification and validation of the overall safety system. It is the responsibility of the system integrator (or other party) who is responsible for the overall system, Ex regulations and system safety.

The system integrator (or other responsible party) must make sure that the entire implementation complies with the instructions in this manual, all relevant standards, directives and local electrical code, and that the system is tested, verified and validated correctly.

Hardware description

Contents of this chapter

This chapter gives a short description of the module.

Product overview

The CPTC-02 module has a motor thermistor connection for supervising the motor temperature and one relay output, which indicates motor overtemperature. To trip the drive at motor overtemperature, the relay output must be connected to the Safe torque off (STO) input of the drive.

The CPTC-02 module together with the drive STO implements the Safe motor temperature (SMT) safety function as defined in IEC/EN 61800-5-2.

The CPTC-02 module is Type Examined as a protective device within the scope of the European ATEX (and UKEX) Product Directive. This allows the use of the module in temperature protection of motors in explosive atmospheres (Ex motors).
Inside the module, there is reinforced insulation between the motor thermistor connection and the other terminals of the module. The insulation forms a reliable protective separation between the motor main circuit and the drive control circuits. Thus, the drive control unit is Protective Extra Low Voltage (PELV) compatible also when the CPTC-02 module and a thermistor protection circuit are installed.

### External power supply interface

The module has an external power supply interface, which can be used to power up the drive control unit if the drive power supply fails. If you do not need the back-up power supply, you do not have to connect it because the module is powered from the drive control unit by default.

### Layout

![Diagram of CPTC-02 module with labels:

**ATEX/UKEX markings**

The markings on the module show the ATEX/UKEX classification of the CPTC-02 module.
Specific marking of explosion protection

Equipment group II: Product for surface industry (other than mining applications)

Equipment category 2. Parentheses show that the module must be installed outside the potentially explosive atmosphere.

Certified for use in explosive atmospheres caused by: G = gases, vapors or mists, D = dust.

## Drive

### SMT function

When the CPTC-02 module is delivered as an add-on kit, the package contains a sticker to show the ATEX/UKEX classification of the Safe motor temperature (SMT) function. The user must attach this sticker near the type designation label of the drive to ensure the ATEX/UKEX compliance of the safety circuit.

In the cabinet-built drives, this sticker is attached to the cabinet door at the factory.
1 CE marking with Notified Body identification: The manufacturer declares that the product conforms with ATEX Product Directive 2014/34/EU. Notified Body: Eurofins Expert Services

3 Specific marking of explosion protection

4 Equipment group II: Product for surface industry (other than mining applications)

5 Equipment category 2. Parentheses show that the drive must be installed outside the potentially explosive atmosphere.

6 Certified for use in explosive atmospheres caused by: G = gases, vapors or mists, D = dust.

7 Certificate references
Option description

Contents of this chapter

This chapter describes the Safe motor temperature (SMT) function implemented with the CPTC-02 module and gives instructions for the user.

Overview

To implement the Safe motor temperature (SMT) function, the relay output of the CPTC-02 module must be connected to the Safe torque off (STO) input of the drive.

When the motor temperature rises above the PTC sensor limit temperature, the sensor resistance increases sharply. This indicates overtemperature to the CPTC-02 module. The module switches the drive Safe torque off (STO) circuit off which activates the drive STO function.

The STO function disables the control voltage of the power semiconductors of the drive output stage. This prevents the drive
from generating the torque required to rotate the motor. If the motor is running when STO function is activated, it coasts to a stop.

For more information on the drive STO function, see the appropriate drive hardware manual.

■ Wall-mounted drives and drive modules

The module is available as an add-on kit (option +L537+Q971). If you intend to retrofit the CPTC-02 module to an installed drive, you need to make sure that the ATEX/UKEX certification enables the retrofit. Contact your local ABB representative for more information.

The user:

• makes sure that the serial number of the drive starts with 1, 4, 7, 8, M or Y,

• pairs the CPTC-02 module with an ATEX/UKEX-certified ACS580, ACH580 or ACQ580 drive in the ABB Drives Installed Base (DIB) register. Refer to Instructions for pairing the module with an ATEX-certified drive (3AXD10001243391 [English]).

• attaches the included ATEX/UKEX label for the SMT function near the type designation label (CE/UKCA marking) of the drive,

• installs the option module to Option slot 2 of the drive control unit and sets the applicable drive parameters,

• connects the PTC temperature sensors of the motor to the PTC input of the option module, and

• connects the drive STO terminals to the relay output of the option module.

■ Cabinet-installed drives

For cabinet-installed drives, the module is available as a factory-installed option +L537+Q971.
The user connects the PTC temperature sensors of the motor to the PTC inputs of the module.

**Safe disconnection function**

The ATEX/UKEX-certified Safe motor temperature function described in this manual requires that the drive Safe torque off function (STO) is certified for use as a Safe disconnection function to protect equipment in potentially explosive atmospheres according to European ATEX (and UKEX) Product Directive. For more information on the drive STO function, see the applicable hardware manual.

You can use the CPTC-02 module only when serial number of the drive starts with 1, 4, 7, 8, M or Y.

**Note:** You do not need a separate ATEX/UKEX certification (and label) for the Safe disconnection function (option +Q971), because the ATEX/UKEX certificate of the SMT function includes also the ATEX/UKEX-certified Safe torque off function (STO).

**Commissioning the drive for a motor in a hazardous area**

Commission the drive according to the requirements and limitations set by the application, the motor manufacturer’s instructions, drive firmware manual, local laws and regulations and this manual.

The certificate of the Ex motor typically requires that you set a minimum limit for the output switching frequency of the drive. Make sure that the Ex motor is operated above the minimum output switching frequency specified by the motor manufacturer.

**Resetting the safety function**

A manual reset is mandatory in an ATEX/UKEX-certified safety function. The CPTC-02 module generates a fault indication to the drive when motor overtemperature is reached. The user must reset the drive before it is possible to restart the drive.
Note: The reset function of the safety function is not SIL classified.

Indications of the safety function

An indication of the safety function can come from two sources:

1. Overtemperature fault in the drive (fault 4991).
2. STO indication in the drive:
   - The drive STO indication is active when the SMT safety function has activated the drive STO function. The type of the indication is set with parameter 31.22.

To avoid parallel fault indications, set the STO indication parameter (31.22) to value Warning/Warning. See chapter Start-up and validation test for instructions.

Note: The indications of the safety function are not SIL classified.

Switching frequency limitation

The certificate of the Ex motor typically requires that you set a minimum limit for the switching frequency of the drive.

For ABB Ex motors, use parameter 95.15 to set the required minimum switching frequency. For more information, see the drive firmware manual.

For Ex motors supplied by other motor manufacturers, contact the motor manufacturer for the correct value and use parameters 97.01 and 97.02 to make the parameter setting in the drive.

Fault reaction function

- CPTC-02 module

The CPTC-02 module has a fault reaction function. When the module detects an internal fault or a fault in the temperature sensor circuit,
it sends a request to the drive control unit to stop modulation, and activates the drive STO function.

### STO function in the drive

The STO function in the drive has internal fault diagnostics and a fault reaction function. The fault reaction function causes a fault trip if it detects a redundancy fault of STO control signals or an internal failure. For more information, see the hardware and firmware manuals of the drive.
Mechanical installation

Contents of this chapter
This chapter contains a delivery checklist and instructions on installing the module.

Necessary tools and instructions
• Screwdriver and a set of suitable bits
For a complete list of tools, see the applicable drive hardware manual.

Unpacking and examining the delivery
1. Open the option package.
2. Make sure that the package contains:
   • CPTC-02 module
   • mounting screw
   • STO cable
34 Mechanical installation

- ATEX/UKEX label (with the ATEX/UKEX classification markings)
- this manual.

3. Make sure that there are no signs of damage to the items.

Installing the module

Install the module to Option slot 2 of the drive control unit. See the drive hardware manual.
Electrical installation

Contents of this chapter
This chapter contains instructions on wiring the module.

Warnings

WARNING!
Obey the safety instructions of the drive. If you ignore them, injury or death, or damage to the equipment can occur. If you are not a qualified electrical professional, do not do installation or maintenance work.

WARNING!
Cabinet-built drives: Do not connect, test or measure a drive based on the diagrams in this manual. Each delivery is unique. Before starting the work on the electric circuits of a drive, always refer to the delivery-specific circuit diagrams.
WARNING!
Make sure that the drive is disconnected from the input power during installation. Before you start the work, stop the drive and do the steps in section *Electrical safety precautions (page 12).*

Necessary tools and instructions

- Screwdriver with a set of suitable bits
- Cabling tools

Selecting the location for the drive

Install the drive, the CPTC-02 module, and the STO circuit outside any potentially explosive atmosphere. Consider the ambient conditions specification in the drive hardware manual.

General wiring instructions

1. For the STO circuit wiring, use the type of cable specified in the applicable drive hardware manual.

2. Install only the sensor circuit into the potentially explosive atmosphere.
   The sensor circuit in the Ex Zone must comply with the requirements for the applicable type of protection, such as:
   - Ex d (IEC/EN 60079-1)
   - Ex eb (IEC/EN 60079-7, Ex e in EN 60079-7:2007 and IEC 60079-7:2006)
3. Install the drive, including the components of the ATEX-certified motor thermal protection function, outside the potentially explosive atmosphere.

4. For the sensor connection, ABB recommends to use shielded twisted-pair cable. This type of cable decreases electromagnetic interference in the sensor circuit.

5. Route the sensor cables away from the motor cable. Power cables can cause electromagnetic interference in the sensor circuit.

6. Ground all sensor cable shields to a single grounding point outside the potentially explosive atmosphere. 360-degree grounding of the cable shields at the cable entry of the drive is recommended. Do not connect the cable shields to ground at the sensor end of the cable.

**PTC sensor input**

For the recommended cable type and correct tightening torque, see the technical data.

To enable the SMT function, connect the PTC sensor to the PTC IN input.

To disable the SMT function, connect a resistor (100 ohm … 1 kohm ¼ W wire-wound) to the PTC IN input.

Note: If you do not connect a PTC sensor or resistor to the PTC IN input, the STO function stays active. You cannot start the motor while the STO function is active.

**Wiring examples**

Connect the external control cables to the applicable module terminals. Ground the outer shield of the cables 360 degrees under a grounding clamp on the grounding shelf of the control cables.
Motor thermistor connection example

1…6 PTC thermistors connected in series.

1 Potentially explosive atmosphere

The PTC input is reinforced/double insulated. If the motor part of the PTC thermistor and wiring are reinforced/double insulated, voltages on the PTC wiring are within SELV limits.

If the motor PTC circuit is not reinforced/double insulated (that is, it is basic insulated), it is mandatory to use reinforced/double insulated wiring between the motor PTC and CPTC-02 PTC terminal.
Relay output connection

Connect the drive STO circuit to the relay output of the module as shown in this figure. In the cabinet-installed drives, the wiring is done at the factory.
An alternative connection with an external activation switch, for example a manually operated switch, an emergency stop push button, or the contacts of a safety relay.

### Power supply connection

1. External power supply, 24 V AC/DC
WARNING!
Do not connect the +24 V AC cable to the control unit ground when the control unit is powered using an external 24 V AC supply.
Start-up and validation test

Contents of this chapter

This chapter describes the start-up, validation test procedure, and validation of the safety function.

Validation of the safety functions

You must do a validation test to make sure that the safety function operates correctly and according to the safety requirements.

■ Competence

The person who does the validation test of the safety function must be a competent person with expertise and knowledge of the safety function and functional safety, as required by IEC 61508-1 clause 6 and Ex regulations. This person must document and sign the test procedures and report.
Validation procedure

You must do the validation test using the checklist given in this manual and the validation test plan of the complete safety system:

- at the initial start-up of the safety function
- after changes related to the safety function (wiring, components, safety function-related parameter settings, etc.)
- after maintenance work related to the safety function
- at the proof test of the safety function.

The validation test must include at least the following steps:

- you must have a validation test plan
- you must test all commissioned functions for proper operation, from each operation location
- you must document all validation tests
- you must sign and store the validation test report for further reference.

Validation test reports

You must store the signed validation test reports in the logbook of the machine and in the explosion protection document under the scope of the ATEX User Directive 1999/92/EC or The Dangerous Substances and Explosive Atmospheres Regulations 2002 (UK). The report must include, as required by the referred standards:

- a description of the safety application (including a figure)
- a description and revisions of safety components that are used in the safety application
- a list of all safety functions that are used in the safety application
- a list of all safety-related parameters and their values
Start-up activities, references to failure reports and resolution of failures

The test results for each safety function, checksums, date of the tests, and confirmation by the test personnel.

You must store any new validation test reports done due to changes or maintenance in the logbook of the machine and in the explosion protection document under the scope of the ATEX User Directive 1999/92/EC or The Dangerous Substances and Explosive Atmospheres Regulations 2002 (UK).

**Start-up**

The module is started up through drive parameters. Use the Drive composer PC tool or the control panel to set the parameter values.

1. Power up the drive.

2. If no warning is shown:
   - Make sure that the value of both parameter 15.02 Detected extension module and parameter 15.01 Extension module type is CPTC-02.
   - If warning A7AB Extension I/O configuration failure is shown:
     - Make sure that the value of parameter 15.02 Detected extension module is CPTC-02
     - Set parameter 15.01 Extension module type to CPTC-02.

You can now see the parameters of the extension module in parameter group 15 I/O extension module. See the firmware manual.

In addition, set the parameters in this table.
Selects which indications are given when one or both Safe torque off (STO) signals are switched off or lost. The indications also depend on whether the drive is running or stopped when this occurs.

STO indication run/stop

<table>
<thead>
<tr>

<th>Name / Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31.22</td>
<td>STO indication run/stop</td>
<td>The drive generates a warning. This parameter value does not affect the SMT function, but this is the recommended setting.</td>
</tr>
</tbody>
</table>

Activates (On) or deactivates (Off) the Safe motor temperature (SMT) fault indication (4991).

Safe motor temperature enable

<table>
<thead>
<tr>
<th>Index</th>
<th>Name / Value</th>
<th>Description</th>
</tr>
</thead>
</table>
| 35.31  | Safe motor temperature enable | Activates (On) or deactivates (Off) the Safe motor temperature (SMT) fault indication (4991).
0 = Off
1 = On
This parameter is automatically set to On, when CPTC-02 module is connected to the drive. If the module is removed from the drive, the parameter remains On, and the drive will trip to a fault. User must set parameter to Off manually and reset the fault to continue operation without the module. When the module is connected again, the parameter is automatically set to On. |

Defines hardware-related settings that can be enabled and disabled by toggling the specific bits.

Special HW settings

<table>
<thead>
<tr>
<th>Bit</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| 0   | EX motor | 1 = The driven motor is an Ex motor provided by ABB for potentially explosive atmospheres. This sets the required minimum switching frequency for ABB Ex motors (4 kHz).

**Note:** For non-ABB Ex motors, use parameters 97.01 and 97.02 to define the correct minimum switching frequency.

**Note:** Multimotor systems are not permitted.
### Index | Name / Value | Description
--- | --- | ---
97.01 | Switching frequency reference | Defines the switching frequency of the drive.
|  |  | **Note**: Multimotor systems are not permitted.
97.02 | Minimum switching frequency | Defines the minimum limit for the switching frequency.
|  |  | If parameter 95.15 is set to 1, drive sets the value to 4 kHz automatically.
|  |  | For non-ABB Ex motors, consult the motor manufacturer.
97.09 | Switching frequency mode | Defines the switching frequency mode.
|  |  | Normal = Used switching frequency is selected with parameters 97.01 and 97.02.
97.18 | Hexagonal field weakening | Activates (On) or deactivates (Off) the Hexagonal field weakening.
|  |  | 0 = Off
|  |  | For ABB Ex motors (parameter 95.15 is set to 1), this parameter is automatically set to Off.
|  |  | For non-ABB Ex motors (when parameter 95.15 bit 0 is not set), set this parameter to Off.

### Validation test
Use the Drive composer PC tool or a control panel to do the validation test.

<table>

⚠️ **WARNING!**
Obey the safety instructions of the drive. If you ignore them, injury or death, or damage to the equipment can occur.

<table>
<thead>
<tr>
<th>Initial status</th>
</tr>
</thead>
<tbody>
<tr>
<td>✗</td>
</tr>
</tbody>
</table>

Make sure that the drive is ready for use, that is, you have done the tasks of the drive start-up procedure. See the drive hardware manual.
48 Start-up and validation test

**Action**

- Make sure that the CPTC-02 module is installed and started up as instructed in this manual.
- Make sure that the drive STO function is configured and validated. See the hardware manual.

**Checks and settings with no voltage connected**

- Stop the drive and do the steps in section "Electrical safety precautions (page 12)" before you start the work.
- Make sure that the necessary ATEX/UKEX markings are attached.
- Make sure that the classification of the motor thermal protection function corresponds to the Ex classification of the environment and the Ex motor.
- The motor manufacturer selects the PTC sensors for the motor temperature measurement according to the specified temperature class. Make sure that the temperature on-off resistances match those of the module.
- If you have done any changes to the wiring, do a check of the connections against the applicable circuit diagrams.
- Make sure that the installation of the motor temperature sensor complies with the requirements for the applicable type of protection.
- Make sure that the SIL/PL of the safety function meets the target SIL/PL.
- Make sure that the wires are connected to the correct terminals and that the terminal connections are tightened to the correct torque.

**Settings with voltage connected**

- Make sure that you have set all the necessary parameters for the safety function.

**Validation test procedure**

- Make sure that you can run and stop the motor freely during the test.
- Start the drive and make sure that the motor is running.
- Do an overtemperature monitoring test: increase the resistance in the PTC input to more than 4 kohm (for example, open the circuit by disconnecting the wires).
- Make sure that the correct indications are activated: the SMT fault and other indications depending on the parameter settings.

Maintenance

Contents of this chapter

This chapter contains information for the maintenance and decommissioning of the safety function.

Safety circuit maintenance

After the safety function is validated, it must be maintained by periodic proof testing.

If you change the wiring or a component after the start-up, replace the CPTC-02 module, modify parameters, or restore parameters to their factory default values:

- Use only ABB-approved spare parts.
- Register the change to the change log for the safety circuit.
- **If parameters were restored to the factory default values:** Set the parameters related to the safety function.
• Do the validation test of the safety function.
• Document the tests and store the report into the logbook of the machine.

**Proof test**

To do a proof test, activate the safety function to make sure that it operates correctly. For guidelines, refer to the validation test procedure.

**Proof test interval**

After the operation of the safety function is validated at start-up, the safety function must be maintained by periodic proof testing. In high demand mode of operation, the maximum proof test interval is 20 years. In low demand mode of operation, the maximum proof test interval is 5 or 2 years (high or low demand as defined in IEC 61508 and EN ISO 13849-1). Regardless of the mode of operation, it is a good practice to check the operation of the safety function at least once a year.

The person responsible for the design of the complete safety function should also note the Recommendation of Use CNB/M/11.050 published by the European co-ordination of Notified Bodies concerning dual-channel safety-related systems with electromechanical outputs:

• When the safety integrity requirement for the safety function is SIL 3 or PL e (cat. 3 or 4), the proof test for the function must be done at least every month.
• When the safety integrity requirement for the safety function is SIL 2 (HFT = 1) or PL d (cat. 3), the proof test for the function must be done at least every 12 months.

This is a recommendation and depends on the required (not achieved) SIL/PL. For example, contactors, breakers, safety relays, contactor relays, emergency stop buttons, switches, etc. are typically safety devices which have electromechanical outputs. The CPTC-02 module
and the STO circuit of the drive do not have electromechanical outputs.

**Functional safety components**

The mission time of functional safety components is 20 years which equals the time during which failure rates of electronic components remain constant. This applies to the components of the standard Safe torque off circuit as well as any modules, relays and, typically, any other components that are part of functional safety circuits.

The expiry of mission time terminates the certification and SIL/PL classification of the safety function. The following options exist:

- Renewal of the whole drive and all optional functional safety module(s) and components.
- Renewal of the components in the safety function circuit. In practice, this is economical only with larger drives that have replaceable circuit boards and other components such as relays.

Note that some of the components may already have been renewed earlier, restarting their mission time. The remaining mission time of the whole circuit is however determined by its oldest component.

Contact your local ABB service representative for more information.

**Competence**

The person who does the maintenance and proof test activities of the safety function must be a competent person with expertise and knowledge of the safety function and functional safety, as required by IEC 61508-1 clause 6 and Ex regulations.

**Residual risk**

The safety functions are used to reduce the recognized hazardous conditions. In spite of this, it is not always possible to eliminate all
potential hazards. Thus, the warnings for the residual risks must be given to the operators.

**Intentional misuse**

The safety circuit is not designed to protect a machine against intentional misuse.

**Decommissioning**

When you decommission the module, make sure that the safety of the machine is maintained until the decommissioning is complete. Mark clearly on the module that it is decommissioned.
Technical data

Contents of this chapter

This chapter contains the technical data of the module, gives general rules, notes and definitions related to safety functions and lists the related standards and directives. The safety data, relevant certificates and Declarations of Conformity are also included.
Installation: Into Option slot 2 on the drive control unit

Degree of protection: IP20

Package: Cardboard
Isolation areas

The following figure shows the different isolation areas of the module.

Dashed line: reinforced insulation (IEC 61800-5-1).

Connections

- **Motor thermistor connection (60…61)**
  - Maximum wire size: 1.5 mm² (16 AWG)
  - Maximum wire length: 700 m (2300 ft) (1400 m [4600 ft] for the whole loop)
    With the specified cable type, detection of a short-circuited PTC sensor or cable is not guaranteed after 100 m (328 ft).
  - Type: Shielded, twisted-pair cable (Draka JAMAK 1×(2+1)×0.5 mm² or equivalent)
  - Tightening torque: 0.5 N·m (4.4 lbf·in)
Supported standards: DIN 44081 and DIN 44082

Number of PTC thermistors: 1…6 in series (in both inputs)

Triggering threshold: 3.6 kohm ±10%

Recovery threshold: 1.6 kohm ±10%

PTC terminal voltage: < 5.0 V

PTC terminal current: < 1 mA

Short-circuit detection: < 50 ohm ±25 ohm (for the effect of the cable length, see above).

■ Relay output (STO) connection (62…63)

- Maximum wire size: 1.5 mm² (16 AWG)
- Maximum wire length: 30 m (98 ft) for the whole loop
- Tightening torque: 0.5 N·m (4.4 lbf·in)
- Maximum contact rating: 250 V AC / 30 V DC / 5 A
- Maximum breaking capacity: 1000 VA

■ External power supply (40…41)

- Wire size max. 1.5 mm²
- 24 V AC / DC ±10% (GND, user potential)
- Maximum current consumption: 25 W, 1.04 A at 24 V DC

Ambient conditions

For the environmental limits for the safety functions and the drive, refer to the drive hardware manual.
Safety data

The CPTC-02 module is a type A safety component as defined in IEC 61508-2.

The table gives the safety data for the SMT function. The calculations are based on the worst case data of the drive Safe torque off (STO) function. The given safety data applies with proof test interval $T_1 = 20$ years (high demand and continuous mode of operation) and $T_1 = 2$ years or $T_1 = 5$ years (low demand mode of operation).

<table>

The $\text{MTTF}_D$ value (EN ISO 13849-1) of the CPTC-02 module:

- 11386 years (one-channel connection)

Safety block diagram

The components that are included in the safety data calculations are shown in this safety block diagram. The failure rate of the PTC sensor is not included in the calculations.

1 PTC sensor
2 CPTC-02 module
3 Drive STO
Response times

- CPTC-02 module: less than 10 ms
- SMT function: the response time of the PTC sensor + CPTC-02 module (< 10 ms) + drive STO (< 50 ms)

Relevant failure modes

- The SMT function activates when not necessary (safe failure)
- The SMT function does not activate when requested

A fault exclusion on the failure mode “short-circuit on printed circuit board” has been made (EN 13849-2, table D.5). The analysis is based on the assumption that one failure occurs at one time. No accumulated failures have been analyzed.

The failures of the PTC sensor (thermistor) are not included in the failure analysis. The customer is responsible for the applicability of the PTC element.

Compliance with the Machinery Directive (EU)

The drive is an electronic product which is covered by the Low Voltage Directive. However, the drive internal safety function of this manual (option +L537+Q971) is in the scope of the Machinery Directive as a safety component. This function complies with harmonized standards such as EN 61800-5-2. The declaration of conformity is shown below.

Compliance with the Supply of Machinery (Safety) Regulations (UK)

The drive is an electronic product which is covered by the Electrical Equipment (Safety) Regulations. However, the drive internal safety function of this manual (option +L537+Q971) is in the scope of the Supply of Machinery (Safety) Regulations as a safety component. This function complies with designated standards such as EN 61800-5-2. The declaration of conformity is shown below.
Compliance with the ATEX Directive (EU)

The safety function of this manual (option +L537+Q971) is within the scope of the ATEX product directive 2014/34/EU as a protective system. The function complies with European harmonized standard EN 50495. The declaration of conformity is shown below.

Compliance with the UKEX Directive (UK)

The safety function of this manual (option +L537+Q971) is within the scope of the The Equipment and Protective Systems Intended for Use in Potentially Explosive Atmospheres Regulations 2016 (+ amendment SI 2019 No. 696) as a protective system. The function complies with the designated standard EN 50495. The declaration of conformity is shown below.
EU Declaration of Conformity

We, ABB Oy, Homoeie 13, 00380 Helsinki, Finland,
+358 10 22 11

declare under our sole responsibility that the following products:

Frequency converters/Frequency converter components

With CPTC-02 module:
ACS580-01/-04/-07

   Directive 2014/34/EU

3. EU-Type Examination Certificate Number: EESF 20 ATEX 051
4. Product: Thermal motor protection system for converter drive ACS580, ACH580 and ACQ580 series
   Certified types: ACS580 +LS37 +Q971 (CPTC-02)
   AC580 +LS37 +Q971 (CPTC-02)
   ACQ580 +LS37 +Q971 (CPTC-02)
5. Manufacturer: ABB Oy Drives
6. Address: Hiomotie 13, 00380 Helsinki, Finland

Additional manufacturing locations:

ABB AS, Drives, Arukulla tee 59, Rae vaid, 75301 Harjumaa, Estonia

7. This product and any acceptable variation therein is specified in the schedule to this certificate and the documents therein referred to.
8. Eurofins Expert Services Oy, Notified Body number 0537, in accordance with Article 17 of Directive 2014/34/EU of the European Parliament and of the Council dated 26 February 2014, certifies that this product has been found to comply with the Essential Health and Safety Requirements relating to the design and construction of products intended for use in potentially explosive atmospheres given in Annex II to the Directive.

   The examination and test results are recorded in confidential report No. EUF/Exk-20001227-T3.
9. Compliance with the Essential Health and Safety Requirements has been assured by compliance with:
   EN 50495:2010
10. If the sign "X" is placed after the certificate number, it indicates that the product is subject to the Specific Conditions of Use specified in the schedule to this certificate.
11. This EU-Type Examination Certificate relates only to the design and construction of the specified product. Further requirements of the Directive apply to the manufacturing process and supply of this product. These are not covered by this certificate.
12. The marking of the product shall include the following:

13. Schedule

14. EU-Type Examination Certificate EESF 20 ATEX 051

15. Description of Product

Thermal protection is based on temperature monitoring CPTC-02 module. Safe disconnection is achieved by using “Safe Torque Off” (STO)-function which is integrated in the standard drive as an internal hardware-solution. Power that can cause rotation is not applied to the motor. The safety related part of the adjustable speed electrical power drive system P03 (SRP) will not provide energy to the motor which can generate torque. CPTC-02 together with the STO-function comprises the “Safe Motor Temperature” (SMT)-function.

16. Report Number

EUI29-20001227-T3

17. Specific Conditions of Use

None

18. Essential Health and Safety Requirements

Assessment using standard referred in point 9 have confirmed compliance with the Directive 2014/34/EU, Annex II and particular point 1.5.

19. Drawings and Documents

FPCTC-01-02, CPTC-02 SMT HW description, 3AXD100095387390, rev D
FPCT-01-02, CPTC-02 Integrated PTC temperature protection module CONCEPT, 3AXD10009381242, rev D
ACx580 ATEX schedule drawings with CPTC temperature monitoring, 3AXD100009510416 rev B (4 pages)
CPTC-02 Safety data calculation for ACx580/ACH580/ACQ580, 3AXD10009473878, rev H
Certificate No. SEBS-A-082710/15 V2.0 by TÜV Nord
Certificate No. SEBS-A-1012333/16 V1.0 by TÜV Nord
Certificate No. SEBS-A-1012332/16 V1.0 by TÜV Nord
Certificate No. SEBS-A-1012333/16 V1.0 by TÜV Nord

UK Type Examination Certificate  CML 21UKEX9301  Issue 0

United Kingdom Conformity Assessment

1. Product or Protective System Intended for use in Potentially Explosive Atmospheres UKSI 2016:1107 (as amended) – Schedule 3A, Part 1

2. Equipment  Thermal motor protection system for converter drive ACS580, ACH580 and ACQ580 series

3. Manufacturer  ABB Oy Drives  ABB AS, Drives

4. Address  Hiomotive 13, 00380 Helsinki, Finland  Aruküla tee 59, Rae vald, 75301 Harjumaa, Estonia

5. The equipment is specified in the description of this certificate and the documents to which it refers.

6. Eurofins E&E CML Limited, Newport Business Park, New Port Road, Ellesmere Port, CH65 4LZ, United Kingdom, Approved Body Number 2503, in accordance with Regulation 43 of the Equipment and Protective Systems Intended for Use in Potentially Explosive Atmospheres Regulations 2016, UKSI 2016:1107 (as amended), certifies that this equipment has been found to comply with the Essential Health and Safety Requirements relating to the design and construction of equipment intended for use in potentially explosive atmospheres given in Schedule 1 of the Regulations.

The examination and test results are recorded in the confidential reports listed in Section 12.

7. If an ‘X’ suffix appears after the certificate number, it indicates that the equipment is subject to specific conditions of use (affecting correct installation or safe use). These are specified in Section 14.

8. This UK Type Examination certificate relates only to the design and construction of the specified equipment. Further requirements of the Regulations apply to the manufacturing process and supply of the product. These are not covered by this certificate.

9. Compliance with the Essential Health and Safety Requirements, with the exception of those listed in the confidential report, has been demonstrated through compliance with the following documents:

   EN 50495:2010

10. The equipment shall be marked with the following:

   📊 Refer to attached certificate EESF 20 ATEX 051, Issue 0 for specific marking of explosion protection symbols.

   📊 Refer to attached certificate EESF 20 ATEX 051, Issue 0 for marked code and ambient temperature range.

This certificate shall only be copied in its entirety and without change

Note: Drawings that describe the equipment are listed or referred to in the Annex.

13 Conditions of Manufacture
For conditions of manufacture, refer to attached EESF 20 ATEX 051, Issue 0.
Any routine tests/verifications required by the ATEX certification shall be conducted.

14 Specific Conditions of Use
For specific conditions of use, refer to attached certificate EESF 20 ATEX 051, Issue 0.
TÜV Nord certificate

The TÜV Nord certificate for the CPTC-02 module and ACx580 drive series is shown below.
Further information

Product and service inquiries
Address any inquiries about the product to your local ABB representative, quoting the type designation and serial number of the unit in question. A listing of ABB sales, support and service contacts can be found by navigating to www.abb.com/searchchannels.

Product training
For information on ABB product training, navigate to new.abb.com/service/training.

Providing feedback on ABB manuals
Your comments on our manuals are welcome. Navigate to new.abb.com/drives/manuals-feedback-form.

Document library on the Internet
You can find manuals and other product documents in PDF format on the Internet at www.abb.com/drives/documents.
