

Preventing MV supply outages?

Absolutely.

ABB has developed the new AutoLink three-phase sectionalizer to improve the reliability and flexibility of MV overhead lines. It prevents network interruptions while protecting downstream devices. Thanks to its easily reconfigurable design, the three-phase AutoLink can help save installation time and costs, and it can be repositioned without the need for special tools. AutoLink is just one element in ABB's comprehensive portfolio of MV power solutions that deliver continuous and reliable energy supplies for homes and industries.
