TURNKEY SaaS SOLUTION FOR RENEWABLE DEVELOPERS

ABB Ability™ Renewable Insights
The connected source for economic risk analysis.
Renewable electric generation development continues to experience accelerated growth on a global scale; the ensuing level of steep competition has motivated developers to push for greater insight into the operational and financial performance of project sites. ABB’s convenient SaaS solution offers specific data for individual North American renewable project analysis sold on a site-by-site basis at a fraction of the usual price.

The market
Rapid growth in the renewable electric generation development space is largely due to impacts from project scalability, renewable portfolio standards releases, corporate power purchase agreements, tax credits and evolving technologies. Easy public access to these resources has helped bring the renewables market to a point where developments across a broad range of size & scope have become financially viable.

Financing & power purchase agreement negotiations also require developers to understand and demonstrate awareness of their market impact and exposure. With major tax credits gradually reducing beyond 2020 and new regulations driving up costs, trustworthy financial and operational analysis has become an industry-wide imperative.

Industry challenges
Gathering the required intelligence is typically a time-intensive, unpredictable and costly process with limited courses of action. Developers either purchase and implement a robust enterprise software instance run by trained staff or hire a series of analysts and consultants to procure and provide the necessary data and analytics.

These collective challenges inspired our team at ABB to create an affordable and comprehensive software solution that provides all needed intelligence for assessing risk, reviewing project sites and making better decisions – fast.
Our solution

ABB Ability™ Renewable Insights is our modular, turnkey software-as-a-service solution that provides developers with the site-specific capability and functionality of two of ABB’s most powerful enterprise software solutions:

- **Velocity Suite** – collects, cleans and formats analysis from 3,000 different sources.
- **Reference Case** – provides unbiased market intelligence and reliable forecasts.

ABB supports additional analysis in this solution with proprietary research into potential permits needed in each state, as well as proposed generation or transmission expected in the area. It also incorporates Independent System Operator generator Interconnection Queues from the surrounding area, enhanced with ABB research to identify specific power plants and substations referenced in the queue, while leveraging cleaned power transaction data from the Federal Energy Regulatory Commission. The tool currently covers the geography of North America and is designed to enhance the analysis process for any development site.
Purchase and SaaS delivery

As a convenience for larger developers or the main use tool for smaller developers, Renewable Insights is available on the ABB Ability™ Marketplace and can be engaged for one site or multiple sites in bundles up to 20 with discounts at each tier.

The solution is downloaded directly from the Marketplace where there are resources providing an overview, video demos, tutorials and supporting documentation with detailed help guides and data explanations. Users can learn at their own pace and research specific tasks at their convenience. The solution is accessible on all devices & most Internet browsers.

ABB Ability™ Marketplace

The new ABB Ability Marketplace makes all of ABB’s software services accessible from one central portal. Customers can purchase, tailor, and manage their digital solutions online, wherever and whenever is convenient.
