

ELR: ABB range of front panel residual current relays

Protection device according to IEC/EN 60947-2 Annex M

Power and productivity  
for a better world™

# Tested, certified, reliable

## Network monitoring and protection

The electronic residual current relays allow monitoring and protection of the low voltage distribution network through the use of a toroidal transformer. Protection is achieved in combination with the MCBs and MCCBs.

Compliance with protection standard IEC/EN 60947-2 Annex M allows to offer a cumulative operational time (residual current relay, shunt-trip, circuit breaker) guaranteed by the manufacturer. The new ABB ELR front panel residual current relays are tested for this purpose.

### Carrying out the protection

Thanks to the residual current relays it is possible to measure the leakage current to earth. These relays work in conjunction with a separate external toroid. The active conductors that pass through the toroid create a magnetic field proportional to the current flow. Under normal conditions and in the absence of leakage current, the vector sum of the current is zero. Any fault condition causes an unbalance in the vector sum proportional to the value of the leakage current. The value of the fault current is constantly detected by the toroid: when the residual current relay receives a signal from the toroid, it switches its output contacts. Then the shunt-trip opens the circuit breaker.

### Compliance to IEC/ EN 60947-2 Annex M

When the product is in compliance with IEC/EN 60947-2 Annex M, the manufacturer is responsible for respecting operational times.

The new range of ELR products from ABB comply with IEC/EN 60947-2 Annex M and is tested within a configuration that includes residual current relay, toroid, shunt-trip, MCCB/MCB available in ABB offer.

1. A residual current causes a flow unbalance detected by the toroid
2. The residual current relay receives the signal from the toroid and switches its output contacts
3. The shunt-trip relay opens the circuit breaker.

The new range of ELR front panel residual current relays has been tested in combination with miniature circuit breaker (S200 range) and moulded case circuit breakers (Tmax series up to T5 630 A) conforming with IEC/EN 60947-2 Annex M.

In order to ensure compliance to IEC/EN 60947-2 Annex M ABB has considered the following parameters:

**Operational time:** time that elapses between the occurrence of a fault and the intervention of the relay contacts

**Cumulative operational time:** time that elapses between the occurrence of a fault and the intervention (opening) of the associated circuit breaker.

**Non-operation time:** delay, adjustable on the device, which defines how long the fault should last before the relay contacts switch. This value is important to ensure selectivity and resistance to unwanted tripping of the associated circuit breaker.

# Completeness of the range

## Technical features

## Toroidal transformers

The choice of toroidal transformers is made according to the useful diameter and the minimum value of the leakage current to be detected.

Table 1

Type	Toroid useful diameter [mm]	Max rated current [A]	Min measurable current [mA]
TRM	29	65	30
TR1	35	75	30
TR2	60	85	30
TR3	80	160	100
TR4	110	250	100
TR4/A	110	250	300
TR160	160	400	300
TR160/A	160	400	500
TR5	210	630	300
TR5/A	210	630	500

Table 1 shows toroidal transformers selection for use with ELR according to IEC/ EN 60947-2 Annex M in combination with MCBs S200 range and MCCBs Tmax range up to T5.

Table 2

Type	Toroid useful diameter [mm]	Min measurable current [mA]	Maximum capacity [A]
TRM	29	30	160
TR1	35	30	250
TR2	60	30	400
TR3	80	100	800
TR4	110	100	1250
TR4/A	110	300	1250
TR160	160	300	2000
TR160/A	160	500	2000
TR5	210	300	3200
TR5/A	210	500	3200

Table 2 shows the technical features of the toroidal transformers.

# Compliance with standards, ongoing monitoring

## The features and benefits of the residual current relays

### Adjusting sensitivity and tripping times

The sensitivity  $I_{\Delta n}$  can be set from 0.03 to 30 A while the tripping times from 0 to 5 seconds, thus ensuring flexibility for many applications.

### Alarm

#### (72P and 96P versions only)

If the alarm function is ON, the alarm contact switches when the fault current exceeds 60% of the threshold  $I_{\Delta n}$  selected.

### Fail Safe

#### (P version only)

The new range of ELR residual current relays allows, through a selector switch, to enable or not the fail safe function.

If Fail safe is OFF, the relay activates the shunt-trip once the fault current is detected and also when there is no connection between the relay and toroid.

If Fail Safe is ON, the relay activates the shunt-trip also when there is lack of supply to the residual current relay.

The Fail Safe prevents the line from not being protected when there is no auxiliary power to the device.

### Remote reset

The output contacts of the ELR residual current relays can be reset remotely, using push-buttons.

### Autoreset

When the fault will be removed from the network, the relay contacts will switch automatically, without the need to press the reset button from a local or remote position.

### Frequency filtering (ELR96PF and ELR96PD versions only)

This feature makes the relay stronger in presence of currents with harmonic components that are not due to an effective fault in the circuit but they are typically caused by the presence of electronic filters (e.g. when using frequency converters driving motors).

### Fault Memory LED (ELR96PF version only)

The fault memory LED turns on in case of a fault and is only resettable manually. In this way it is possible to know if the relay has tripped even if the fault is no longer present and the contacts have returned into the standard position thanks to the autoreset.

### Digital display (ELR96PD version only)

The digital display allows instant reading of the value of earth leakage current. It is possible, through a minidip, to block the display on the residual current value that has generated the intervention of the circuit breaker.

# Cutting-edge features

## ELR range details

### ELR72P

Minidip set-up: Alarm, multiplication constants of sensitivity and intervention time, Fail Safe (on both output contacts)

Sensitivity adjustment  $I_{\Delta n}$  (from 0.03 to 30A)

Test push-button

Reset push-button

Supply voltages  
110, 230, 400 V a.c. (ELR72P)  
or 24 - 48 V a.c./d.c. (ELR72V24P)

Blank space for identification of the residual current relay and the associated toroid and breaker

Intervention time adjustment  $\Delta t$

#### ELR48P (48x48 mm)

As the other models it allows to adjust  $I_{\Delta n}$  (from 0.03 to 30 A) and intervention times (from 0 to 5 sec). It is equipped with test and reset buttons, 2 status LEDs and 2 contact outputs. Furthermore it is possible to set the reset logic (automatic or manual) and Fail Safe. The ELR48P version provides supply voltages of 110 V a.c./d.c. and 230 V a.c.; the ELR48V24P version operates from 24 to 48 V a.c./d.c.

#### ELR72 (72x72 mm)

The device has 1 output contact. It is possible to set the reset in automatic or manual mode. The supply voltage can be 110 V a.c./d.c. and 230 V a.c. The ELR72V24 version provides supply voltages from 24 to 48 V a.c./d.c.

## ELR96PD

### ELR96 (96x96 mm)

This model offers the possibility of adjusting  $I_{\Delta n}$  (from 0.03 to 30 A) and intervention times (from 0 to 5 sec). The most important functions of this device are: test push-button, reset push-button, status LEDs and output contact. It is possible to set the reset logic (automatic or manual). The supply is 110 V a.c./d.c., 230 and 400 V a.c.; the ELR96V24 version operates from 24 to 48 V a.c./d.c.

### ELR96P (96x96 mm)

This model has an "ALARM" LED (the fault current has exceeded 60% of the  $I_{\Delta n}$  selected), 2 contact outputs (trip and alarm) and the Fail Safe function can be set for both the contacts. The supply is 110 V a.c./d.c., 230 and 400 V a.c. or from 24 to 48 V a.c./d.c. (ELR96V24P). Trip, Alarm and Autoreset contacts are available, with the possibility of remote reset.

### ELR96PF (96x96 mm)

It has the same features as the ELR96, but it is provided with a LED light which turns on in the event of a trip and can only be reset manually. The frequency filtering function makes the product stronger against unwanted trippings due to faults with harmonic components. The supply voltage is 110, 230 or 400 V a.c.
