
Energy Policy

ABB Oy

ABB is a technology leader in electrification and automation, enabling a more sustainable and resource-efficient future. ABB Group's operations are organized into four global business areas: Electrification, Motion, Process Automation and Robotics & Discrete Automation.

ABB Oy's (ABB Finland) Energy Policy is based on the ABB Group's health, safety and environment (HSE), security and sustainability policies and targets.

At ABB, we embed sustainability in everything we do. We set an example to our customers, suppliers, competitors, and stakeholders to adopt sustainable practices by reducing the environmental impact of our own operations and supply chain.

Our greenhouse gas emission reduction targets have been validated by the Science Based Targets initiative as being in line with the 1.5°C scenario of the Paris Agreement.

We aim to reduce our energy consumption by eliminating energy waste and continuously improving both the energy performance of our facilities and processes and the energy management system. This includes considering energy efficiency and energy performance improvements as a design factor when creating new facilities, processes and products or updating existing ones, as well as a criterion when purchasing new equipment, and services, and when selecting suppliers.

Energy use and efficiency of products, equipment and services are considered for the planned or expected operating lifetime.

We ensure that all our operations comply with and exceed the applicable legal and other requirements on energy efficiency, consumption, sourcing, and use.

We set and regularly review objectives and energy targets and ensure that we have all necessary information and resources to achieve them.

We raise the awareness on energy saving and sustainability among our employees and stakeholders in our value chain to create a culture of energy efficiency.
