Safety instructions

Overview

This chapter states the general safety instructions that must be followed when installing and operating the FSCA-01 RS-485 Adapter Module.

The material in this chapter must be studied before attempting any work on, or with, the unit.

In addition to the safety instructions given below, read the complete safety instructions of the specific drive you are working on.

General safety instructions

**WARNING!** All electrical installation and maintenance work on the drive should be carried out by qualified electricians.

The drive and adjoining equipment must be properly earthed.

Do not attempt any work on a powered drive. After switching off the mains, always allow the intermediate circuit capacitors 5 minutes to discharge before working on the frequency converter, the motor or the motor cable. It is good practice to check (with a voltage indicating instrument) that the drive is in fact discharged before beginning work.

The motor cable terminals of the drive are at a dangerously high voltage when mains power is applied, regardless of motor operation.

There can be dangerous voltages inside the drive from external control circuits even when the drive mains power is shut off. Exercise appropriate care when working on the unit. Neglecting these instructions can cause physical injury or death.

Before you start

It is assumed that the drive is installed and ready to operate before starting the installation of the extension module.

In addition to conventional installation tools, have the drive manuals available during the installation as they contain important information not included in this manual. The drive manuals are referred to at various points of this document.

Overview

This chapter contains a short description of the RS-485 standard and the FSCA-01 RS-485 Adapter Module, and a delivery checklist.

RS-485 standard

RS-485 is a serial interface standard for communication over a twisted-pair cable. Because the RS-485 signal transmission is differential, it provides better protection against noise and longer transmission distances than the RS-232. RS-485 is a half-duplex multi-drop network, which means that multiple devices may reside on line. Only one transmitter may be active at any given time.

The RS-485 standard specifies only the electrical characteristics of the bus system. The communication protocol and communication speed depend on the used application. For example, the electrical characteristics of the PROFIBUS and MODBUS are based on the RS-485 standard.

The RS-485 transmission line consists of two wires, A and B. The signal transmission is based on the voltage difference between the wires. The minimum detected voltage difference is 200 mV. The potential difference between the two wires determines the logic state bit: when B is at a higher voltage than A, the state is defined as bit 1 (data high) and when A is at a higher voltage than B, the state is defined as bit 0 (data low).

The common mode voltage between RS-485 network devices is limited to -5…+12 V. A ground wire and cable shield should be connected to prevent the common mode voltage between the network devices from drifting outside the allowable limits.

The RS-485 bus cable should be terminated with a 120 ohm resistor on both ends to prevent signal reflection. When no device on the network is transmitting, noise can be falsely interpreted as
communication data. To avoid this, a termination can be included with a fail-safe circuit (pull-up and pull-down resistors). The circuit forces the bus into a known idle state when no device is transmitting.

FSCA-01 RS-485 Adapter Module

The FSCA-01 RS-485 Adapter Module is an optional device for ABB Drives which enables the connection of the drive to a RS-485 network. The adapter module provides galvanic isolation between the drive and RS-485 network and converts the serial communication signals of the drive to the RS-485 signal levels.

The adapter module has a built-in bus termination with fail-safe circuitry. The termination can be activated with a jumper.

The adapter module is mounted into an option slot on the motor control board of the drive. See the drive documentation for module placement options.

Protocols used to access these functionalities over RS-485 connection (for example, Modbus/RTU) and configuration of the FSCA-01 RS-485 Adapter Module to use them are described in the respective Protocol Manual.

Compatibility

The FSCA-01 RS-485 Adapter Module is compatible with all stations that comply with RS-485.

Delivery check

The option package for the FSCA-01 RS-485 Adapter Module contains:

- RS-485 Adapter module, type FSCA-01
- FSCA-01 RS-485 Adapter Module Protocol Manual(s)
- this manual.
WARNING! Follow the safety instructions given in this manual and the drive documentation.

Mounting

Insert the FSCA-01 RS-485 Adapter Module into an available fieldbus adapter slot. Hold the module in place with plastic pins and one screw. The screw also provides the electrical connection between the module and drive frame for cable shield termination.

On installation of the module, the signal and power connection to the drive is made through a 20-pin connector. (All drives do not use all the available signals so the connector on the drive may have fewer pins.)

Mounting procedure:

• Insert the module carefully into its position on the drive.
• Fasten the screw.

Note: Correct installation of the screw is essential for fulfilling the EMC requirements and for proper operation of the module.
Mechanical installation
Overview

This chapter contains:

- general cabling instructions
- instructions for connecting the FSCA-01 RS-485 Adapter Module to the RS-485 network
- instructions for setting the bus termination.

**WARNING!** Before installation, switch off the drive power supply. Wait 5 minutes to ensure that the capacitor bank of the drive is discharged. Switch off all dangerous voltages connected from external control circuits to the inputs and outputs of the drive.

General cabling instructions

Arrange the bus cables as far away from the motor cables as possible. Avoid parallel runs. Use bushings at cable entries.

RS-485 connection

Connect the RS-485 cable to connector X1 on the FSCA-01 RS-485 Adapter Module.

**Bus termination**

Bus termination is required to prevent signal reflections from the bus cable ends. The FSCA-01 RS-485 Adapter Module is equipped with internal bus termination, which is configurable with jumper J1 pins. Termination should be activated on devices located at bus ends and deactivated on other devices. See the figure below.
