About this manual

What this chapter contains

This chapter describes the intended audience and contents of the manual. It contains a flowchart of steps in checking the delivery, installing and commissioning the drive. The flowchart refers to chapters/sections in this manual and other manuals.

Target audience

This manual is intended for people who plan the installation, and install the drive module into a user-defined cabinet. Read the manual before the installation work. The reader is expected to know the fundamentals of electricity, wiring, electrical components and electrical schematic symbols.

The manual is written for readers worldwide. Both SI and imperial units are shown. Special US instructions for installations within the United States that must be installed per the National Electrical Code and local codes are marked with (US).

Safety

WARNING! Follow the safety instructions given in ACS800-04/04M/U4 Hardware Manual [3AFE64671006 (English)] when installing, operating and servicing the drive. If ignored, physical injury or death may follow, or damage may occur to the drive, the motor or driven equipment. Read the safety instructions before you work on the unit.

Other related manuals

See ACS800-04/04M/U4 Hardware Manual [3AFE64671006 (English)] for information concerning the drive module such as

• safety
• planning the electrical installation
• electrical installation
• motor control and I/O board (RMIO)
• maintenance
• technical data
• resistor braking.
For installation instructions of optional equipment, see their manuals.
For example installations in Rittal TS 8 cabinet, refer to ACS800-04/U4 Rittal TS 8 Cabinet Installation [3AFE68372330 (English)].

Categorization according to the frame size

The instructions, technical data and dimensional drawings which concern only certain frame sizes are marked with the symbol of the frame size R7 or R8. The frame size is not marked on the drive designation label. To identify the frame size of your drive, see the rating tables in chapter Technical data in ACS800-04/04M/U4 Hardware Manual [3AFE64671006 (English)].

Categorization according to the plus code

The instructions, technical data and dimensional drawings which concern only certain optional selections are marked with plus codes, e.g. +E210 or +H354. The options included in the drive can be identified from the plus codes visible on the type designation label of the drive. The plus code selections are listed in chapter The ACS800-04/U4 and ACS800-04M under Type code.

Contents

The chapters of this manual are briefly described below.

About this manual introduces this manual.

The ACS800-04/U4 and ACS800-04M describes the drive module.

Planning the cabinet installation instructs on general cabinet design, gives layout examples, free space requirements around the drive module for cooling and cabinet cooling data.

Mechanical installation of pre-assembled units (ACS800-04/U4) instructs how to mount a pre-assembled drive module into a cabinet.

Mechanical installation of non-pre-assembled units (ACS800-04M) instructs how to assemble the drive from the assembly kits.

Checking the installation helps in checking the mechanical and electrical installation of the drive.

Dimensional drawings contains the dimensional drawings of the drive modules.

Circuit diagrams shows an example circuit diagram for employing the Prevention of Unexpected Start function (+Q950).

Assembly drawings contains a few step-by-step assembly drawings.

Product and service inquiries

Address any inquiries about the product to your local ABB representative, quoting the type code and serial number of the unit in question. A listing of ABB sales, support and service contacts can be found by navigating to www.abb.com/drives and selecting Drives – World wide service contacts on the right pane.

Product training

For information on ABB product training, navigate to www.abb.com/drives and select Drives – Training courses on the right pane.

Providing feedback on ABB Drives manuals

Your comments on our manuals are welcome. Go to www.abb.com/drives, then select successively Drives – Document Library – Manuals feedback form on the right pane.
The ACS800-04/U4 and ACS800-04M

What this chapter contains

This chapter describes the construction and operating principle of the drive in short.

The ACS800-04/U4

The ACS800-04/U4 is an IP 00 drive module for controlling AC motors. It is to be installed into a cabinet by the customer with base or wall fastening. The input cable terminals are located at the top of the unit whereas the motor cable terminals are located at the left- or right-hand side of the unit. The unit is delivered pre-assembled with mounting pedestal and output busbars.

Slots for cables going to the RMIO board in the RDCU unit. The cables are coiled on the top of the module.

Terminal block for user connection of optional Prevention of Unexpected Start (+Q950). See ACS800-04/04M/U4 Cabinet Installation [3AFE68360323 (English)] chapter Circuit diagrams.
The ACS800-04M

The ACS800-04M is delivered as non-pre-assembled kits, which provide more alternatives in assembling the units than the basic ACS800-04.

Example configurations

Frame size R7

Motor and brake busbars on the left-hand long side of the module and DC busbars on the right-hand side

Motor and brake busbars on the right-hand long side of the module and DC busbars on the left-hand side

Output busbars on the short side of the module

Frame size R7 with bottom exit (optional top entry busbar shroud and bottom exit shroud included). Output busbars are located at the base of the module.

Output busbars on the short side of the module

Drive Control Unit (RDCU)
Type designation label

The type designation label includes an IEC and NEMA rating, C-UL US, and CSA markings, a type code and a serial number, which allow individual recognition of each unit. The first digit of the serial number refers to the manufacturing plant. The next four digits refer to the unit's manufacturing year and week respectively. The remaining digits complete the serial number so that there are no two units with the same serial number.

The type designation label is located on the front cover and the serial number label inside the unit. Example labels are shown below.
### Type code

The type code contains information on the specifications and configuration of the drive. The first digits from left express the basic configuration (e.g. ACS800-04-0170-5). The optional selections are given thereafter, separated by plus signs (e.g. +E202). The main selections are described below. Not all selections are available for all types. For more information, refer to ACS800 Ordering Information (EN code: 64556568, available on request).

</tr>
</tbody>
</table>
Printed circuit boards

The drive contains the following printed circuit boards as standard:

- main circuit board (AINT)
- motor control and I/O board (RMIO) with a fibre optic link to the AINT board
- input bridge control board (AINP)
- input bridge protection board (AIBP) which includes snubbers for the thyristors and varistors
- power supply board (APOW)
- gate driver control board (AGDR)
- diagnostics and panel interface board (ADPI)
- brake chopper control board (ABRC) with option +D150

Motor control

The motor control is based on the Direct Torque Control (DTC) method. Two phase currents and DC link voltage are measured and used for the control. The third phase current is measured for earth fault protection.
Planning the cabinet installation

What this chapter contains

This chapter guides in planning the installation of a converter module into a user-defined cabinet. The chapter gives free space requirements around the module for cooling, cabinet cooling data and layout examples. The issues discussed are essential for the safe and trouble-free use of the drive system.

Note: The installation must always be designed and made according to applicable local laws and regulations. ABB does not assume any liability whatsoever for any installation which breaches the local laws and/or other regulations.

Cabinet construction

The cabinet frame must be sturdy enough to carry the weight of the drive components, control circuitry and other equipment installed in it.

The cabinet must protect the converter module against contact and meet the requirements for dust and humidity, see chapter Technical data in ACS800-04/04M/U4 Hardware Manual [3AFE64671006 (English)].

Disposition of the devices

For easy installation and maintenance, a spacious layout is recommended. Sufficient cooling air flow, obligatory clearances, cables and cable support structures all require space.

The control boards must not be installed near main circuits or hot parts.

The following sections show a few layout examples. For example layouts in Rittal TS 8 cabinet, refer to ACS800-04/U4 Rittal TS 8 Cabinet Installation [3AFE68372330 (English)].
**Layout examples, door closed**

**IP 22**

1a Air inlet for the converter module  
1b Air inlet for the other equipment  
2a Air outlet for the converter module  
2b Air outlet for the other equipment  
2c Air outlet for the converter module and the other equipment, an extra exhaust fan  
3 Converter control panel (connected to the RMIO board in the RDCU unit inside the cabinet)  
4 Contactor control switch and emergency stop switch (connected to the contactor control circuit inside the cabinet)  
5 Operating handle of the disconnector

**IP 54**

**Roof air flow viewed from top**

Planning the cabinet installation
WARNING! For units without bottom exit kit (+H352), it is not allowed to connect the cables directly to the drive module terminals without the pedestal as the lead-through insulation material is not strong enough to carry the mechanical stress exerted by the cables.
**Grounding of mounting structures**

Make sure any cross-members or shelves on which components are mounted are properly grounded and the connecting surfaces left unpainted. The drive module will be grounded to the cabinet frame via its fastening screws.

**Busbar material and joints**

Tin-plated copper is recommended but aluminium can also be used.

Before joining aluminium busbars, remove the oxide layer and apply suitable anti-oxidant joint compound.

**Tightening torques**

The following table applies to grade 8.8 screws (with or without joint compound).

<table>
<thead>
<tr>

</tbody>
</table>

**Cabinet cooling**

The installation site must be sufficiently ventilated.

The cabinet must have enough free space for the components to ensure sufficient cooling. Observe the minimum clearances given for each component.

The heat dissipated by cables and other additional equipment must also be ventilated.

The air inlets and outlets must be equipped with gratings that

- guide the air flow
- protect against contact
- prevent water splashes from entering the cabinet.
The drawing below shows two typical cabinet cooling solutions. The air inlet is at the bottom of the cabinet, while the outlet is at the top, either on the upper part of the door or on the roof.

The internal cooling fans of the converter modules and reactors/chokes are usually sufficient to keep the component temperatures low enough in IP 22 cabinets.

In IP 54 cabinets, thick filter mats are used to prevent water splashes from entering the cabinet. This entails the installation of additional cooling equipment, such as a hot air exhaust fan.

Arrange the cooling air flow through the converter module so that the requirements given in chapter Technical data in ACS800-04/04M/U4 Hardware Manual [3AFE64671006 (English)] are met:

• cooling air flow
  
  **Note:** The figures apply to continuous nominal load. If the load is cyclic or less than nominal, less cooling air is required.

• allowed ambient temperature.

See section *Cabinet cooling data* for:

• allowed temperature rise inside the cabinet

• allowed pressure drop over the cabinet that the module fan can overcome

• air inlet and outlet sizes required for the module cooling and recommended filter material (if used).
Cabinet cooling data

**IP 22 cabinet with no extra fan**

The table below shows the data the IP 22 cabinet should meet to ensure efficient cooling of the converter module. No extra fan is used. The pressure drop over the cabinet is the additional counterpressure that the module fan is capable of overcoming while still maintaining the required air flow through the module.

<table>

**IP 54 cabinet with an extra fan**

The table below shows the data the IP 54 cabinet should meet to ensure efficient cooling of the converter module. An extra fan is used. The pressure drop over the cabinet is the counterpressure the extra fan must overcome. The given fan types and filter materials are examples. Corresponding products by another manufacturer may be used as well. See the manufacturer’s Internet site for the detailed specification.

* inlet filter 50 % unclean

Planning the cabinet installation
Preventing the recirculation of hot air

Outside the cabinet

Prevent hot air circulation outside the cabinet by leading the outcoming hot air away from the area where the inlet air to the cabinet is taken. Possible solutions are listed below:

- gratings that guide air flow at the air inlet and outlet
- air inlet and outlet at different sides of the cabinet
- cool air inlet in the lower part of the front door, and an extra exhaust fan on the roof of the cabinet.

Inside the cabinet

Prevent hot air circulation inside the cabinet with e.g. leak-proof air baffles at the positions shown in the diagrams in section Required free space around the drive module for cooling. No gaskets are usually required.

Cubicle heaters

Use a cubicle heater if there is a risk of condensation in the cabinet. Although the primary function of the heater is to keep the air dry, it may also be required for heating at low temperatures. When placing the heater, follow the instructions provided by its manufacturer.
Planning the cabinet installation

**Required free space around the drive module for cooling**

**Free space at the top of the drive module**

Required free space at the top of the module for frame sizes R7 and R8 is shown below (views of frame size R7). **Note:** Air inlet gratings only at the lower part of the cabinet door are not recommended without an extra fan. The air baffles are examples.

![Diagram of air outlet and high air inlet gratings in the cabinet door](image1)

![Diagram of air outlet on the cabinet roof and high air inlet gratings in the cabinet door](image2)

**Air outlet on the cabinet roof and low air inlet gratings in the cabinet door**

See also pages 31 and 32.

![Diagram of air outlet and low air inlet gratings in the cabinet door](image3)

**Air outlet on the cabinet roof and high air inlet gratings in the cabinet door**

See also pages 31 and 32.
Free space around units with busbars on the long side (bookshelf mounting +H354)

The figure below shows the required free space in a unit with motor and brake busbars connected to the left-hand side and DC busbars to the right-hand side of the module (+H354+H356+H362+H363). The required free space when no vertical busbars are used is also shown.

- 0 mm (0 in.) with air inlets as high as the grating in the module [R7: 675 mm (27 in.), R8: 1120 mm (44 in.)]
- 150 mm (5.91 in.) with air inlets at the lower part of the cabinet only.
Free space around units with busbars on the short side (flat mounting +H360)

The required free space at the air inlet side of the drive module:

- 0 mm (0 in.) if cabinet gratings are located at the air inlet side of the drive module and are as high as the grating in the module [R7: 675 mm (27 in.), R8: 1120 mm (44 in.)]

- 150 mm (5.91 in.) with air inlets at the lower part of the cabinet only or with cabinet gratings at the long side of the drive module only.

Air inlet gratings in the cabinet are recommended at the air inlet side of the drive module if free space in front of the long side of the module is less than 150 mm (5.91 in.). The required area of the gratings is approximately $3 \times 300 \text{ mm} \times 300 \text{ mm}$ ($3 \times 11.81 \text{ in.} \times 11.81 \text{ in.}$), the minimum area is given on page 28.

Air baffle. Not needed if the drive module touches the cabinet door or the module air inlet touches the air inlet grating of the cabinet.

Cables connected to the vertical output busbar terminals require 50 mm (1.97 in.) free space around the busbar terminals for cooling.

Cables connected to the output busbars of the pedestal require 100 mm (3.94 in.) free space around the busbars for cooling.

Location of air inlet gratings

Required area of air inlet gratings is approximately $3 \times 300 \text{ mm} \times 300 \text{ mm}$ ($3 \times 11.81 \text{ in.} \times 11.81 \text{ in.}$)
When the drive module is installed in another position than vertically

- Fasten the drive module by the fastening points.
- Lay support brackets below the module to carry the module weight.
- Ensure that hot air flows freely out of the cabinet and does not build up pressure.
- Reserve enough space for the cabling.
- In case of a short-circuit inside the drive module, hot ionized gases may escape sideways/upwards from the module through its ventilation holes. Ensure that the cabinet is constructed so that this will not cause any danger.
- The outlet cooling air is 25...30 °C (77...86 °F) hotter than the inlet air and flows sideways. Ensure that this does not cause danger.
- Ensure that the front panel, and preferably also the profiled side panel, can be removed and the cooling fan and capacitor pack changed.
- Ensure that the module can be changed, e.g. by sliding out of the cabinet on rails.

**Drive module of frame size R7 on its side**

**WARNING!** Do not place the support brackets under the studs. They cannot carry the weight of the drive module and the drive module would deform when placed onto them. The studs can be sawn off.

**Note:** Air inlet into the drive module goes through the front gratings of the module. Do not cover them.

Ensure that the cooling air will flow freely and is clean. Use filter mats if the input cooling air is taken near the floor surface and contains dust.

Place the support brackets on the same level as the spacers of the back plate of the bottom exit kit.

Prevent dripping water from entering the drive module.
Drive module of frame size R7 on its back

- Prevent dripping water from entering the drive module.
- Support the module from below. The fastening points are not sturdy enough to carry the weight of the module when laid on its back.
- Leave space above the module for maintenance.
- Air baffle for preventing cooling air recirculation.
- Note: Air inlet into the drive module goes through the front gratings of the module. Do not cover them.

Ensure that the cooling air will flow freely and is clean. Use filter mats if the input cooling air is taken near the floor surface and contains dust.

Ensure that the cooling air will flow freely and is clean. Use filter mats if the input cooling air is taken near the floor surface and contains dust.
**EMC requirements**

Generally, the fewer and smaller the holes in the cabinet, the better the interference attenuation. The maximum recommended diameter of a hole in galvanic metal contact in the covering cabinet structure is 100 mm. Special attention must be paid to the cooling air inlet and outlet gratings.

The best galvanic connection between the steel panels is achieved by welding them together as no holes are necessary. If welding is not possible, the seams between the panels are recommended to be left unpainted and equipped with special conductive EMC strips to provide adequate galvanic connection. Usually, reliable strips are made of flexible silicon mass covered with a metal mesh. The non-tightened touch-contact of the metal surfaces is not sufficient, so a conductive gasket between the surfaces is required. The maximum recommended distance between assembly screws is 100 mm.

Sufficient high-frequency grounding network must be constructed in the cabinet to avoid voltage differences and forming of high-impedance radiator structures. A good high-frequency grounding is made with short flat copper braids for low inductance. One-point high-frequency grounding cannot be used due to the long distances inside the cabinet.

*First environment EMC compliance*) of the drive requires 360° high frequency grounding of the motor cable shields at their entries. The grounding can be implemented by a knitted wire mesh screening as shown below.

*) First environment EMC compliance is defined in chapter *Technical data / CE marking* in ACS800-04/04M/U4 Hardware Manual [64671006 (English)].
360° high frequency grounding of the control cable shields is recommended at their entries. The shields can be grounded by means of conductive shielding cushions pressed against the cable shield from both directions:

**Grounding of cable shields**

*required for motor cables in first environment installations. First environment EMC compliance is defined in chapter Technical data / CE marking in ACS800-04/04M/U4 Hardware Manual [64671006 (English)].

**Installing the Drive Control Unit (RDCU)**

See RDCU Drive Control Unit Hardware Manual [3AFE64636324 (English)].
Fastening of the control panel (CDP312R)

The control panel can be fastened directly to the cabinet door, or a mounting platform or control panel holder (+J413) can be used.

Installing the control panel directly on the cabinet door

Fasten the control panel from the back side with two screws of one of the following types:

- standard screw with nominal diameter of 4 mm (0.16 in.)
- tapping screw with nominal diameter of 4.2 mm (0.17 in.) DIN 7981 C, DIN 7982 C, DIN 7983 C or DIN 7976 C
- PT screw for thermoplastics with nominal diameter of 4 mm (0.16 in.).

Control Panel Mounting Platform RPMP-11/13 (+J410)

For installation of the mounting platform, see RPMP-11/13 Control Panel Mounting Platform Kit Installation Guide [3AFE68400643 (English)].
Control Panel Holder RPMP-21 (+J413)

Fasten the control panel holder to the cabinet frame or wall with three screws. Do not fasten the panel holder to the drive module.
Mechanical installation of pre-assembled units (ACS800-04/U4)

What this chapter contains

This chapter describes how to install a pre-assembled drive module into a cabinet. First, before-installation information is given, such as required tools, moving the unit and checking the delivery. Then, the mechanical installation procedure is described.

Moving and unpacking the unit

**WARNING!** The drive is heavy [frame size R7: 100 kg (220 lb), frame size R8: 200 kg (441 lb)]. Lift the drive by the upper part only using the lifting lugs attached to the top of the unit. The lower part will be deformed from lifting. Do not remove the pedestal before lifting.

Do not tilt the drive. The centre of gravity of the unit is high. The unit will overturn from a tilt of about 6 degrees. An overturning unit can cause physical injury.

Views of frame size R7

Do not lift by the lower part of the frame.

Do not tilt!
Move the transport package by pallet truck to the installation site. Unpack the package as shown below.

The following items are located below the drive module:

**Drive Control Unit (RDCU)**

*Note:* Optional modules (if ordered) are factory installed onto the RMIO board in the RDCU unit. The fibre optic cables and power supply cable to be connected to the RMIO board are coiled on the top of the drive module.

- Base and wall fastening brackets, terminals for output cable connection and PE grounding. Screws are included in a plastic bag.
- Manuals (hardware, appropriate firmware, optional module), delivery documents, residual voltage warning stickers
- Control panel with a 3 m (98 in.) cable and RPMP control panel mounting kit (if ordered)

The following items are fastened to the drive module:
- pedestal
- output busbars U2, V2 and W2
- busbars for brake resistor connection if brake chopper is included.
- DC busbars if ordered

**Delivery check**

Check that there are no signs of damage. Before attempting installation and operation, check the information on the type designation label of the drive to verify that the unit is of the correct type.
**Required tools**

- set of screw drivers
- torque wrench with a 500 mm (20 in.) or $2 \times 250$ mm ($2 \times 10$ in.) long extension bar
- 19 mm (3/4 in.) socket
  - for frame size R7: 13 mm (1/2 in.) magnetic-end socket
  - for frame size R8: 17 mm (11/16 in.) magnetic-end socket.
Installation procedure

**Fasten the module to the cabinet**

Fasten the module to the base of the cabinet with the outside fastening brackets as described below. For instructions in alternative fastening methods, refer to *Mechanical installation of non-pre-assembled units (ACS800-04M)*.

It is recommended to fasten the module also from the fastening points at the top of the unit. Refer to *Dimensional drawings* for the horizontal and vertical fastening points.

**Clamping the pedestal with the outside brackets**

1. Fasten the front bracket to the pedestal with two screws.
2. Fasten the back fastening bracket onto the cabinet floor with two screws.
3. Place the pedestal on the cabinet floor and push it so that the tabs of the fastening bracket enter the slots in the pedestal.
4. Fasten the front bracket to the base with two screws.

![Diagram](image)

_Tightening torque: 5 Nm (3.7 lbf ft)

**Note**: Place the module on a solid base. The fastening brackets are not strong enough to carry the weight of the module on their own.

**Fasten the terminals to the busbars**

1. Connect the PE terminal to the long side plate of the pedestal with screws.
2. Connect the output cable terminals to the busbars with screws.

**Note 1**: The output cable terminals and PE terminal need not necessarily be used. The output cables can be also connected directly to the vertical output busbar holes with cable lugs. The PE conductors can be connected to the PE terminal screws. Busbars for output cables can be connected to the pedestal busbars.
View of output busbar connections of frame size R7 (DC and brake busbars included)

WARNING! The output busbars are fastened to the insulating supports with M8x16 screws when no cable lug terminal is connected, but with M8x20 screws when a cable lug terminal is also connected with the same screw. Screwing an M8x20 screw without a cable lug terminal through the busbar into the insulating support will break the insulating support. Fasten the cable lug terminals elsewhere with M10x25 screws.

Tightening torques
M8: 15...22 Nm (3.7 lbf ft)
M10: 30...44 Nm (22...32 lbf ft)
**WARNING!** Fasten the output busbars to the insulating supports with M10x20 screws when no cable lug terminal is connected, but with M10x25 screws when a cable lug terminal is connected as well. Screwing an M10x25 screw without a cable lug terminal through the busbar into the insulating support will break the insulating support.

---

**User connections of Prevention of Unexpected Start (+Q950)**

See pages 72 and 97.
Mechanical installation of non-pre-assembled units (ACS800-04M)

What this chapter contains

This chapter describes how to assemble the drive from the assembly kits. First, before-installation information is given, such as required tools, moving the unit and checking the delivery. Then, the working order of the mechanical installation is described. Thereafter, particular assembling instructions follow.

How to read this chapter

Units with bottom exit

1. Read sections Required tools and tightening torques and Moving and unpacking the unit.

2. Go to section Frame size R7 units with bottom exit (+H352) on page 49.

Units with pedestal and busbars on the long side (+H354, bookshelf mounting)

1. Read sections Required tools and tightening torques and Moving and unpacking the unit.

2. Identify your unit by its type code with the help of section Units with pedestal and busbars on the long side (+H354, bookshelf mounting) on page 57.

3. Choose the applying instructions in section Assembling procedure for units with busbars on the long side (+H354) on page 73.

Units with pedestal and busbars on the short side (+H360, flat mounting)

1. Read sections Required tools and tightening torques and Moving and unpacking the unit.

2. Identify your unit by its type code with the help of section Units with pedestal and busbars on the short side (+H360, flat mounting) on page 91.

3. Choose the applying instructions in section Assembling procedure for units with busbars on the short side (+H360) on page 104.
### Required tools and tightening torques

- set of screw drivers
- torque wrench with a 500 mm (20 in.) or 2 x 250 mm (2 x 10 in.) long extension bar
- 19 mm (3/4 in.) socket
  for frame size R7: 13 mm (1/2 in.) magnetic-end socket
  for frame size R8: 17 mm (11/16 in.) magnetic-end socket.

### Moving and unpacking the unit

**WARNING!** The drive is heavy [frame size R7: 100 kg (220 lb), frame size R8: 200 kg (441 lb)]. Lift the drive using the lifting lugs attached to the top of the unit. Do not tilt the drive. **The centre of gravity of the unit is high.** The unit will overturn from a tilt of about 6 degrees. **An overturning unit can cause physical injury.**
The module is delivered in a two-level package. Unpack the package as shown below.

Move the transport package by pallet truck to the installation site. Lift up the top cover. The following items are located in the upper package (1):
- pedestal
- output busbars U2, V2 and W2
- supports, screws and terminals for the output busbars and PE grounding
- fastening brackets for base and wall mounting
- busbars for brake resistor connection (if brake chopper is ordered)
- adapter (if output busbars on the short side of the module)
- DC busbars (if ordered)
- control panel and a 3 m (98 in.) cable (if ordered)
- control panel mounting platform (if ordered).

In the lower package (2):
- drive module.

Below the drive module (3):
- **Drive Control Unit (RDCU).** Note: The fibre optic cables and power supply cable to be connected to the RMIO board inside the RDCU unit are wound on the top of the drive module.
- optional modules (if ordered) factory installed onto the RMIO board in the RDCU unit
- residual voltage warning and output busbar stickers
- hardware manual
- appropriate firmware manuals and guides
- delivery documents
- optional module manuals.

Undo the fastening screws.
Fasten the lifting hooks to the lifting lugs of the drive module. A hook can be fastened to the base bracket also. Use at least three fastening points because the module is turns over easily.
Frame size R7 units with bottom exit (+H352)

Delivery check

Check that there are no signs of damage. Before attempting installation and operation, check the information on the type designation label of the drive to verify that the unit is of the correct type.

Example assembly+H352+B060: bottom exit with top entry busbar shroud and bottom exit shroud

---

**Mechanical installation of non-pre-assembled units (ACS800-04M)**
Assembling procedure

Assemble the units with bottom exit (+H352) as follows:

1. Remove the front cover of the drive module.
2. Fasten the L-plate to the base of the module.
   A. Insert the two pins of the longer side of the L-plate to the counter holes in the side plate of the drive module.
   B. Slide the L-plate horizontally to match the three pins in its shorter side with the counter holes in the drive module.
   C. Fasten the L-plate with 5 screws.
3. Fasten the bottom plate to the base of the drive module.

A. With brake chopper option (+D150), fasten R- busbar to the bottom plate with pin A1.
B. Insert the bottom plate onto its place.
C. Connect the busbars of the bottom plate to the busbars of the drive module with M8x25 combi screws using a torque wrench with an extension bar. Tightening torque: 15...22 Nm (11...16 lbf ft).
D. Fasten the bottom plate to the drive module with four M6 screws. Tightening torque: 6...9 Nm (3.7 lbf ft).

4. Fasten the front cover.
Fastening the spacer

Fasten the drive module to the cabinet or wall using a spacer at the top of the module on the fastening side.

Fastening the top entry busbar and bottom exit shrouds (+B060)

Top entry busbar shroud

Press the top cover on the sides inwards to enable its tabs to enter the slots in the shroud when it is placed in position (4).

Remove the protective film.

Step drill lead-throughs for the busbars.

Fasten the shroud to the drive module.
**Bottom exit shroud**

1. Step drill lead-throughs for the busbars.
2. Remove the protective film from all parts.
3. Fasten the L-plate to the drive module.
4. Fasten the side plates to the drive module.
5. Fasten the bottom to the shroud.
Units with pedestal and busbars on the long side (+H354, bookshelf mounting)

Delivery check

Check that there are no signs of damage. Before attempting installation and operation, check the information on the type designation label of the drive to verify that the unit is of the correct type.

Item packages

The following tables show what each item package contains:

• parts
• part list code
• plus code
• assembling instruction.

In the tables, the basic unit is described first, then the possible optional parts are listed. Choose the table and options of your delivery in the following sections:

• Item packages of frame size R7 with busbars on the long side on page 58.
• Item packages of frame size R8 with busbars on the long side on page 64.

Note: The complete assembling instructions are represented under Assembling procedure for units with busbars on the long side (+H354) on page 73.

Connecting the DC busbars to the pedestal (+H356 and +H363 only)

Procedure

1. Screw insulating supports (“a” below) onto the free pins (“b” below) on the inner sides of the pedestal.
2. Push busbars (c) through the R-, R+/UDC+ and UDC- lead-through insulators as the W2, V2 and U2 busbars.
3. Connect the connecting busbars (d, e, f) to the insulating supports and to the R-, R+/UDC+ and UDC busbars as shown below.

For +H363, see also Optional selection +H363 on page 79.

Photos of frame size R7
Photos of frame size R8

DC busbars connected
Busbars to the left- or right-hand side of the module?

The pedestal is delivered from the factory ready for left-hand side busbar connections. When required, the internal busbars of the pedestal can be swapped to the right side.

Swapping the busbars of the pedestal to the other side

When swapping the busbars from left to right, proceed as follows:

1. Turn the pedestal over to access the bolts which connect the pedestal power connections to the horizontal busbars.
2. Undo the connections.
3. Pull out the busbars and rotate them 180 degrees.
4. Reinsert the busbars so that the busbar ends with the hole protrude on the right-hand side of the pedestal.
5. Positions the busbars so that the small hole in the busbar is aligned with the hole in the insulator.
6. Tighten the connections (2).
7. Connect the right-hand side PE terminal.
**Optional selection +H363**

This selection enables the connection of the DC output and the brake resistor output to the opposite sides of the pedestal. The installation below requires also optional selection +H356. The UDC- busbar and R- busbar are taken from the +H356 parts, the R+/UDC+ busbar from the +H363 parts. For instruction on how to connect the busbars to the pedestal frame, see *Connecting the DC busbars to the pedestal (+H356 and +H363 only)* on page 76.

1. Connect the UDC- busbar.
2. Connect the R+/UDC+ busbar.
3. Connect the R- busbar.
Fastening the pedestal to the cabinet base (not for wall-mounted units)

Fasten the pedestal to the base of the cabinet either with the outside fastening brackets or by using the fastening holes inside the pedestal.

**Note:** Place the module on a solid base. The fastening brackets are not strong enough to carry the weight of the module on their own.

*Clamping the pedestal with the outside brackets*

1. Fasten the front bracket to the pedestal with two screws.
2. Fasten the back fastening bracket onto the cabinet floor with two screws.
3. Place the pedestal on the cabinet floor and push it so that the tabs of the fastening bracket enter the slots in the pedestal.
4. Fasten the front bracket to the base with two screws.

![Diagram of pedestal with outside brackets]

*M8 (5/16 in.)

Tightening torque: 5 Nm (3.7 lbf ft)*

Fastening the pedestal through the holes inside the pedestal

Fasten the pedestal to the base of the cabinet with four screws through the inside fastening points.

![Diagram of pedestal with inside fastening]

*M6, 5 Nm (3.7 lbf ft)*
Fastening the drive module by top to the cabinet frame

In addition to the base fastening, it is recommended to fasten the module to the cabinet also from the fastening points at the top. Refer to Dimensional drawings for the vertical fastening points.

If the module is not fastened from the back top to the cabinet frame, it must be fastened from the front top fastening points during transportation or in case of vibration.

Fastening the drive module to wall (wall-mounted units only, not for base-mounted units)

Requirements for protection

The drive module must be protected against contact, dust and humidity (see chapter Technical data in ACS800-04/04M/U4 Hardware Manual [64671006 (English)]).

Requirements for the wall

The wall must be as close to vertical as possible, of non-flammable material and strong enough to carry the weight of the unit. Check that there is nothing on the wall to inhibit the installation.

Floor

The floor/material below the installation must be non-flammable.
**Procedure**

- Place the wall mounting bracket onto the pedestal so that its pins enter the slots of the pedestal.

- Fasten the pins with nuts (1) from inside or fasten the bracket with screws from outside (2). The nuts and screws are included in the mounting bracket package.
• See *Dimensional drawings* for locations of the fastening points at the top of the module.

• Use a pallet truck or a lifter to move the unit to the final mounting place.

**WARNING!** Secure the unit to eliminate the danger of overturning and falling during the fastening procedure.

• Fasten the module through the slots in the wall mounting bracket and the fastening holes at the top of the module using spacers between the module and the wall.

  **Note:** In flat mounting, the spacers (at the top and bottom) provide a clearance of 15 mm (0.6 in.) between the drive module and the wall so that the protruding studs of the module will not press against the wall. In bookshelf mounting, the spacer removes a 4 mm (0.16 in.) gap between the drive module top and the wall so that the module will hang in an upright position.

• Fasten the module also by top front with a wall-fastened support bracket.
Units with busbars on the short sides (flat mounting, frame sizes R7 and R8)

Spacer (frame size R7)

Fastening points of frame size R7

Top

Bottom
Fastening the output busbars and PE terminal and sliding the module in

The steps of this installation procedure are shown in the photos on the next pages.

1. Connect the output busbars to the pedestal.
2. Fasten the PE terminal.
3. Screw the insulating supports onto the pins on the outer support bracket.
4. Fasten the output busbars and terminals to the insulating supports on the outer support bracket.
5. Fasten the inner support bracket to the drive module.

6. Remove the fastening brackets (screws “b” on photos under Fastening the drive module to the pedestal on page 89) from the pedestal.
7. Slide the module onto the pedestal so that the inner support bracket enters inside the outer support bracket.
8. Fasten the outer support bracket to the drive module.
9. Fasten the stickers to the output busbars.
View of output busbar connections of frame size R7 (DC and brake busbars included)

WARNING! Fasten the output busbars to the insulating supports with M8x16 screws when no cable lug terminal is connected, but with M8x20 screws when a cable lug terminal is also connected with the same screw. Screwing an M8x20 screw without a cable lug terminal through the busbar into the insulating support will break the insulating support. Fasten the cable lug terminals elsewhere with M10x25 screws.

Tightening torque
M8: 15...22 Nm (3.7 lbf ft)
M10: 30...44 Nm (22...32 lbf ft)
**WARNING!** Fasten the output busbars to the insulating supports with M10x20 screws when no cable lug terminal is connected, but with M10x25 screws when a cable lug terminal is connected as well. Screwing an M10x25 screw without a cable lug terminal through the busbar into the insulating support will break the insulating support.

**Tightening torque**
- M10: 30...44 Nm (22...32 lbf ft)
- M12: 50...75 Nm (37...55 lbf ft)
Fastening the drive module to the pedestal

- Remove the front cover of the module.
- Connect the busbars with screws [3 to 6 pcs (a)] using a torque wrench with an extension bar.
- Fasten the module to the pedestal with screws (b).

**WARNING!** Fastening of screws (b) is important because the screws are required for the grounding of the drive.

<table>

Tightening torque: 30...44 Nm (22...32 lbf ft) |
| (b) M6x16 combi screws  
Tightening torque: 5 Nm (3.7 lbf ft) |

- Match the three guide pins on the cover with the counter holes. Fasten the front cover to the module with screws.
Fastening the shrouds in frame size R8

Top entry busbar shroud

1. Step drill lead-throughs for the busbars.
2. Remove the protective film.
3. Fasten the shroud to the drive module.
4. Fasten the top cover to position (3) with the tabs entering the slots of the shroud.

Top entry busbar shroud fastened

Vertical busbar shroud

1. Cut the corner piece to make space for the PE terminal of the drive module.
2. Remove the protective film from the shroud surfaces.
3. Fasten the shroud plates to each other and to the drive module.

Vertical busbar shroud fastened

Note: When connecting the power cables, remove the front (and top and side) shroud by undoing the fastening screws.
Units with pedestal and busbars on the short side (+H360, flat mounting)

Delivery check

Check that there are no signs of damage. Before attempting installation and operation, check the information on the type designation label of the drive to verify that the unit is of the correct type.

Item packages

The following tables show what each item package contains:

- parts
- part list code
- plus code
- assembling instruction.

In the tables, the basic unit is described first, then the possible optional parts are listed. Choose the table and options of your delivery in the following sections:

- Item packages of frame size R7 with busbars on the short side on page 92.
- Item packages of frame size R8 with busbars on the short side on page 98.

Note: The complete assembling instructions are represented under Assembling procedure for units with busbars on the short side (+H360) on page 104.

| Base-mounted unit | Wall-mounted unit |
Swapping the pedestal output busbars to the left-hand side

- Disconnect the horizontal pedestal busbars from the busbars that connect them to the adapter.
- Push the horizontal busbars to the left.
- Reconnect the horizontal busbars to the adapter connecting busbars.

**Note:**
When the pedestal busbars are swapped to the left:
- vertical output busbars cannot be installed.
- the unit cannot be mounted on a wall with the wall mounting bracket included in the delivery.
- ensure that the required clearance between the cabinet base or floor and the cable lugs or busbars used in the cabling is at least 13 mm (1/2 in.). Otherwise, insulating material must be used below the drive module.
- fasten the left-hand side PE terminal in frame size R7. In frame size R8, fasten the PE busbar as follows.

![Diagram of PE busbar fastening in frame size R8](image-url)
Connecting the DC busbars to the pedestal (+H360 +H356 only)

Required parts

Procedure

1. Screw insulating supports ("a" above) onto the free pins ("b" above) on the inner sides of the pedestal.
2. Push busbars (c) through the R-, R+/UDC+ and UDC- lead-through insulators.
3. Connect the connecting busbars (d, e, f) to the insulating supports and to the R-, R+/UDC+ and UDC busbars as shown below.

See also chapter Assembly drawings.
Preparing the adapter (+H360 +H356 only)

Required parts

**Frame size R7**

**Frame size R8**

Procedure

1. Screw insulating supports (“a” above) onto the free pins (“b” above).
2. Connect the connecting busbars to the insulating supports as shown below. Connect busbar c to busbar d.

See also chapter *Assembly drawings*. 

---

*Mechanical installation of non-pre-assembled units (ACS800-04M)*
Fastening the adapter to the drive module

The DC busbars (+H356) are included in the installation examples below.

1. Fasten the screws.
2. Connect the busbars.

Frame size R7

Frame size R8

② Tightening torque
M8: 15...22 Nm (3.7 lbf ft)

② Tightening torque
M10: 30...44 Nm (22...32 lbf ft)
Fastening the drive module to the pedestal via the adapter

The DC busbars (+H356) are included in the installation examples below. The adapter has been connected to the drive module.

1. **Frame size R7**: Remove the “long front” side plate of the pedestal.
   **Frame size R8**: Remove the “long front” side plate of the adapter.

2. Slide the drive module with the adapter fastened onto the pedestal.

3. Connect the busbars.

4. **Frame size R7**: Fasten the side plate of the pedestal.
   **Frame size R8**: Fasten the side plate to the adapter and the pedestal.
Connecting the output busbars on the short side of the module

Procedure for frame size R7

The steps of this installation procedure are shown in the photos below and on the next page.

1. Fasten the inner support bracket (brackets if DC busbars ordered) to the drive module with four M6 screws.
2. Screw the insulating supports onto the pins on the outer support bracket(s).
3. Slide the outer support bracket(s) on the inner bracket(s).
4. Fasten the outer support bracket(s) with two M6 screws.
5. Connect the AC busbars.
6. Connect the DC busbars (if ordered).
7. Connect the cable lug terminals. Use a M8x20 screw when the terminal is placed on an insulating support and M10x25 screws elsewhere.
8. Connect the PE busbar.
WARNING! Fasten the output busbars to the insulating supports with **M8x16** screws when no cable lug terminal is connected, but with **M8x20** screws when a cable lug terminal is connected as well. Screwing an M8x20 screw without a cable lug terminal through the busbar into the insulating support will break the insulating support.

**Tightening torque**
- M6: 15...22 Nm (3.7 lbf ft)
- M10: 30...44 Nm (22...32 lbf ft)

Frame size R7 +H360: AC, DC and brake busbars connected (+H356 included)
Procedure frame size R8

The steps of this installation procedure are shown in the photo on the next page.

1. Fasten the inner support bracket to the drive module.
2. Screw the insulating supports onto the pins on the outer support bracket.
3. Slide the outer support bracket on the inner bracket.
4. Fasten the outer support bracket to the drive module.
5. Connect the AC busbars.
6. Connect the DC busbars (if ordered).
7. Connect the PE busbar.
WARNING! Fasten the output busbars to the insulating supports with **M10x20** screws when no cable lug terminal is connected, but with M10x25 screws when a cable lug terminal is connected as well. Screwing an M10x25 screw without a cable lug terminal through the busbar into the insulating support will break the insulating support.

**Frame size R8 +H360: AC, DC and brake busbars connected (+H356 included)**

**Tightening torque**
- M10: 30...44 Nm (22...32 lbf ft)
- M12: 50...75 Nm (37...55 lbf ft)
Checking the installation

What this chapter contains

This chapter contains checklists according to which the assembly of converter modules into a cabinet is inspected at ABB factory.

Visual inspection

Inspect the mechanical and electrical installation of the converter module visually to ensure safe testing and use of the drive.

Cabinet construction

Checks for cabinet construction are listed below.

<table>
<thead>
<tr>
<th>Step</th>
<th>Check item</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Cabinet construction</td>
</tr>
<tr>
<td>1.1</td>
<td>Frame, wall, floor and roof structures, busbar enclosures and cable entries are correct and completely assembled.</td>
</tr>
<tr>
<td>1.2</td>
<td>Mechanical joints are tightened and not broken.</td>
</tr>
<tr>
<td>1.3</td>
<td>Parts are clean and painted surfaces not scratched.  The cabinet frame and parts which are in metal to metal contact with the frame (e.g. seams, component fixing points on assembly plates, back of control panel mounting plate) are not finished with non-conducting paint or material.</td>
</tr>
<tr>
<td>1.4</td>
<td>IP enclosure class</td>
</tr>
<tr>
<td>1.5</td>
<td>There is a sufficient number of supports, bolts and nuts for cables.</td>
</tr>
</tbody>
</table>

Instrumentation, busbars and cabling

Checks for instrumentation, busbars, cabling, clearances and creepage distances are listed below. For more information, refer to ACS800-04/04M/U4 Hardware Manual [3AFE64671006 (English)]: Planning the electrical installation.

<table>
<thead>
<tr>
<th>Step</th>
<th>Check item</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>Instrumentation</td>
</tr>
<tr>
<td>2.1</td>
<td>Type and number of option modules and other equipment is correct. Option modules and other equipment are not damaged.</td>
</tr>
<tr>
<td>2.2</td>
<td>Option modules and terminals are labelled correctly.</td>
</tr>
<tr>
<td>2.3</td>
<td>The placement of option modules and other equipment inside the cabinet and on the cabinet door is correct.</td>
</tr>
<tr>
<td>2.4</td>
<td>The mounting of option modules and other equipment is correct.</td>
</tr>
</tbody>
</table>
### Step Check item

<table>
<thead>
<tr>
<th>Step</th>
<th>Check item</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>Busbars</td>
</tr>
<tr>
<td>3.1</td>
<td>The types (Al/Cu) and cross-sections of busbars are correct.</td>
</tr>
<tr>
<td>3.2</td>
<td>Busbars are intact and joint surfaces are clean. There are no metal scraps on the busbars that could cause a short-circuit.</td>
</tr>
<tr>
<td>3.3</td>
<td>The placement and mounting of busbars is correct.</td>
</tr>
<tr>
<td>3.4</td>
<td><strong>The electrical connection of busbars.</strong> Check that the surfaces in electrical connections of aluminium and uncoated busbars are rubbed. Check that anti-oxidant joint compound is used in electrical connections of aluminium busbars. Check that the number of washers and the sizes of bolts are correct.</td>
</tr>
<tr>
<td>3.5</td>
<td>Busbar supports and lead-in insulators are visually intact and degreased, and placed and mounted correctly.</td>
</tr>
<tr>
<td>3.6</td>
<td>The electrical connections on the main circuit are tightened to required torque and marked with a green marking.</td>
</tr>
<tr>
<td>4</td>
<td>Cabling and wiring</td>
</tr>
</tbody>
</table>
| 4.1  | Wiring of the main circuit. Check  
• AC supply input  
• AC output  
• supply for brake resistor (if used). |
| 4.2  | Wiring of the 230 VAC circuit. Check  
• terminal strips and relays  
• supply of cabinet fans (if used)  
• 24 VDC auxiliary voltage circuit (optional module supply)  
• supply for cooling fan of the braking resistor(s) (if used). |
| 4.3  | Wiring of the converter module circuit. Check  
• RDCU module (RMIO board) connections  
• control cable connections  
• control panel cable connections. |
| 4.4  | Cable types, cross-sections, colours and optional markings are correct. |
| 4.5  | Check the cabling for circuits susceptible to interference. Check the twisting of cables and cable routes. |
| 4.6  | Check that cables without short-circuit protection  
• can carry the load current  
• are shorter than 3 m (10 ft)  
• are assembled separate to other cables  
• are protected by an enclosure or duct. |
| 4.7  | Cable connectors and fibre optic cables are intact and according to instructions. Check the termination of cables (e.g. AMP connectors), the crimping of cable lugs and ferrules. Check that the connectors are suitable for the cables and the correct crimping tool has been used.  
Check that  
• insulation of the cable is not underneath the connector  
• all strands of the cable are inside the connector  
• connector is not broken  
• cable is deep enough in its connector. |
Groundings and protection

Checks for groundings and protections are listed below. Tips for installations where EMC emissions must be minimised are given in column *Extra requirements for EMC*.

<table>
<thead>
<tr>
<th>Step</th>
<th>Check item</th>
<th>Extra requirements for EMC</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.1</td>
<td>The grounding colours, cross-section and grounding points of modules and other equipment match the circuit diagrams.</td>
<td>No long routes for pigtails</td>
</tr>
<tr>
<td>6.2</td>
<td>Connections of PE cables and busbars are tight enough. Pull the cable to test that it does not loosen.</td>
<td>No long routes for pigtails</td>
</tr>
<tr>
<td>6.3</td>
<td>Doors equipped with electrical equipment are grounded.</td>
<td>No long grounding routes. From EMC standpoint best result is achieved with a flat copper braid.</td>
</tr>
<tr>
<td>6.4</td>
<td>Fans that can be touched are shrouded.</td>
<td></td>
</tr>
<tr>
<td>6.5</td>
<td>Live parts inside the doors are protected against direct contact to at least IP 2x (if required).</td>
<td></td>
</tr>
</tbody>
</table>
### Labels, switches, fuses and doors

Checks for labels, switches, fuses and doors are listed below.

<table>
<thead>
<tr>
<th>Step</th>
<th>Check item</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>7</strong></td>
<td><strong>Labels</strong></td>
</tr>
</tbody>
</table>
| 7.1 | The name plates are correct. The name plates are located correctly. Check the name plates for  
• cabinet  
• main circuit fuses  
• settings of the circuit-breakers  
• safety switches of the main circuit. |
| 7.2 | The warning and instruction stickers are located correctly.  
**Stickers required inside the cabinet:**  
• ( ) near all grounding connections  
• inside the cabinet door main fuse specification label, fuse installation (centring) note  
• on contact covers  
• warning of live terminals of a blown fuse on contact cover on the main fuses  
• warning about apparatus not disconnected from the supply network by the main switch on contact covers of these busbars and apparatus  
• warning sticker for residual voltages of the converter capacitor banks placed on the converter module.  
**Stickers required on the cabinet door:**  
• five-minute warning of residual voltage  
• .  
• sticker on the control panel mounting platform (if used)  
• emergency stop and start switch label (if applicable)  
• main switch label. |
| **8** | **Switches, fuses and doors** |
| 8.1 | Check the functioning of mechanical switches by closing and opening them. |
| 8.2 | Check that fuses can be changed with a fuse handle. Check that fuse disconnectors and sockets match each other. |
| 8.3 | Check the appropriate length and fastening of the operation rod of the main disconnecting switch.  
When switch fuses or disconnecting switches are closed, the corresponding cabinet doors cannot be opened:  
1. Lock the cabinet door with the main switch in OPEN position (0).  
2. Close the main switch (position 1).  
3. Unlock the door. It must not be possible to open the door by pulling the handle. |
Dimensional drawings
Frame size R7 without pedestal (mm)

Dimensional drawings
Frame size R7 with bottom exit (mm)
Frame size R7 with bottom exit and top entry and bottom exit shrouds (mm)
Frame size R7 with busbars on the left side (mm)
Frame size R7 with DC busbars on both sides (mm)
Frame size R7 pedestal busbars on the long side (mm)

### Dimensional Drawings

- **Frame Size R7 Pedestal Busbars**
- **Bilateral Output Busbar**
Frame size R7 with busbars on the short side (mm)

Fastening bracket for wall mounting only

Dimensional drawings
Frame size R8 without pedestal (mm)

Center of gravity
Frame size R8 with busbars on the left side (mm)
Frame size R8 with top entry and vertical busbar shrouds (mm)
Frame size R8 with busbars on both sides (mm)
Frame size R8 pedestal busbars on the long side (mm)
Frame size R8 with busbars on the short side (mm)
Wall mounting spacers

Frame size R7: long side against wall

Frame size R7: short side against wall

Frame size R8: long side against wall

Dimensional drawings
Frame size R8: short side against wall

Frame size R7 bottom exit kit (+H352)
Frame size R7 top entry busbar shroud and bottom exit shroud (+B060)
Control Panel Holder RPMP-21 (+J413)
Drive Control Unit (RDCU-02)

Can be mounted on a DIN rail
(EN 50022, 35 mm x 7.5 mm)
Dimensional drawings (USA)
Frame size R7 without pedestal (inches)

Center of gravity
Frame size R7 with bottom exit (inches)
Frame size R7 with bottom exit and top entry and bottom exit shrouds (inches)
Frame size R7 with busbars on the left side (inches)
Frame size R7 with busbars on both sides (inches)
Frame size R7 pedestal busbars on the long side (inches)
Frame size R7 with busbars on the short side (inches)

Fastening bracket for wall mounting only

Dimensional drawings
Frame size R8 without pedestal (inches)

Center of gravity

Dimensional drawings
Frame size R8 with busbars on the left side (inches)
Frame size R8 with top entry and vertical busbar shrouds (inches)
Frame size R8 with busbars on both sides (inches)
Frame size R8 pedestal busbars on the long side (inches)

Bilateral output busbar
Frame size R8 with busbars on the short side (inches)
Circuit diagrams

What this chapter contains

This chapter shows an example circuit diagram for employing the Prevention of Unexpected Start function (+Q950).
Components to be provided and wired by the user

ACS800-04/04M drive module

Safety relay

Components to be provided and wired by the user

ACS800-04/04M drive module

Safety relay
Assembly drawings

What this chapter contains

This chapter shows a few step-by-step assembly drawings.
Adding UDC+/R+, UDC- and R- busbars to the pedestal (frame size R7, +H356+H360)
Adding UDC+/R+, UDC- and R- busbars to the adapter (frame size R7, +H356+H360)
Adding UDC+/R+, UDC- and R- busbars to the pedestal (frame size R8, +H356+H360)
Adding UDC+/R+, UDC- and R- busbars to the adapter (frame size R8, +H356+H360)
