Instructions for installation, use and maintenance for the KEVA 17.5 B20 and KEVA 17.5 B21 voltage sensors

These instructions for installation, use and maintenance are valid for KEVA 17.5 B20 and KEVA 17.5 B21 type voltage electronic transformers (sensors) operating in indoor conditions. The voltage sensors type KEVA 17.5 B20 and KEVA 17.5 B21 are intended for use in voltage measurement in air insulated medium voltage switchgear. The voltage sensors have been designed to be used as a post insulator but can be used as a stand-alone unit as well.

1. Operating conditions

The sensor should be mounted in dry, indoor conditions without excess ingress of dust and corrosive gases. The sensor shall be protected against unusually heavy deposits of dust or similar pollution, as well as against direct sunshine. The sensor is designed for standard ambient temperature between -5 and +40°C (storage and transportation temperature between -40 and +80°C). The altitude for mounting should be lower than 1000 m above sea level. The sensor may also be used at higher altitudes when agreed upon with the manufacturer.

2. Technical details

For sensor dimensions see separate dimension drawings. Rated values for each individual sensor are mentioned on the rating plate glued to the sensor. Values mentioned on the rating plate must not be exceeded.
3. Instructions for installation

Safety instruction
Always ground the sensor grounding terminal.

Installation conditions
The sensor should be installed in dry, indoor conditions. The temperature during the assembly shall be between 0 and +40°C. The sensor cable shall not be moved or bent if the temperature is below 0°C.

Mechanical installation
There are two possibilities of cable output position from the sensor terminal part, see Fig. 5. The position of the sensor cable from the sensor terminal part determines sensor variant.

KEVA 17.5 B20
KEVA 17.5 B21
The sensor is designed to be fixed to the base plate using the screw M20. The mounting position for the sensor is determined by the protrusion at the sensor bottom side, see BOTTOM designation. Thus, the correct sensor orientation, cable direction and rating plate position are ensured. Primary connection is made on the sensor top side using the screw M16, see TOP designation.

Connection of the busbars to the primary terminal shall be done according to following instructions:
- Application voltage level up to 12 kV – non-insulated busbars allowed
- Application voltage level above 12 kV up to 17.5 kV – insulated busbars shall be used

Secondary cable, secondary connections
The secondary cable is a special shielded cable designed to give maximum EMI shielding. The secondary cable is inseparable part of each sensor and cannot be additionally extended, shortened, branched, modified, withdrawn or changed due to the guarantee of accuracy and performance of the sensor. The cable shall be connected directly (or via a connector adapter if needed) to Intelligent Electronic Device (e.g. protection relay). The electrical shielding of cable is connected to connector shielding and shall be earthed on IED side. The cable shall be fixed close to metal wall or inserted inside of metal cable tray far from power cables! The maximal bending radius for the cable is 7.5x cable diameter. The cable cannot to be moved if the temperature is below 0°C. If cable, connector or connector grommet is damaged please contact the manufacturer for instructions.

Connection to the IED
The sensor cable is terminated by shielded RJ45 plug connector that shall be connected to the inputs of the IED.

Note: It is recommended to use a cable tie to fasten long sensor cables approximately 10 cm from the RJ45 socket. The sensor plug connector pin’s assignment is shown on Fig. 8. (Front view).

A cable not connected to the IED can be left open or short-circuited without any harm for the sensor. Even during a primary short-circuit the voltage in the secondary circuit of the current sensor will be below 100 V. Nevertheless it is a good safety practice to earth cables not connected to the IED.

RJ45 plug connector has 8 contacts and locking latch coupling. The sensor connector plug shall be inserted properly with the IED matting receptacle before completing the coupling with the bayonet lock. Take care and do not use excessive force to plugin and plug-out these connectors.

The used RJ45-type connectors (EIA/TIA 568A Standard) are screened and designed to guarantee low resistance shielding; they are particularly adapted to applications where electromagnetic
compatibility (EMC) is important. The connectors are robust but it is necessary to be careful during their assembly – do not use force!

**Grounding terminal**
The sensor grounding terminal is located on the same side as the sensor secondary terminal part and shall be connected to the ground during the sensor operation.

4. Instructions for use
The voltage sensors are used:
- To convert large voltages in the primary circuit of the network to the appropriate signal for the secondary equipment (e.g. IEDs)
- To insulate primary and secondary circuits from each other
- To protect secondary equipments from harmful effects or large voltages during abnormal situations in the network
The use of a sensor for other purposes than those described above is forbidden.

**Routine test report**
The routine test report includes following tests:
- a) Verification of terminal marking
- b) Power-frequency withstand test on primary voltage terminal
- c) Partial discharge measurement
- d) Test for accuracy

Correction factors are measured separately for each sensor during routine testing and are marked on the rating plate. The use of correction factors is required condition in order to achieve the declared accuracy class.

5. Instructions for maintenance
Excessive dust or other kinds of pollution shall be brushed off the sensor. Polluted sensors can be cleaned with spirit, petrol or toluene. Otherwise, during normal use the sensors do not need any additional maintenance.

6. Transport and storage
The permissible transport and storage temperature for sensors is -40 and +80°C. During transport and storage the sensors shall be protected against direct sunshine. The sensors are delivered packed into wooden boxes or transport pallets.

7. Recommended procedure for disposal of the sensor
The sensor does not contain environmentally hazardous materials. For disposal of the product after it has been taken out of use, local regulations, if there are any, should be followed.
Appendix 1. Harsh environment installation

Despite the voltage sensors KEVA 17.5 B2x are intended to be used at their rated characteristic under normal service conditions defined by IEC 60044-7 and IEC 61869-11 (IEC 61869-1) standards, the voltage sensors might be used also in the indoor Switchgear and Controlgear panels under more severe conditions where the normal indoor service conditions could be affected by higher level of water condensation and dust pollution, generally called as harsh environment.

The basic normative reference to prove this installation is IEC 62271-304:2008, where are defined all environmental aspects above the standards IEC 60044-7 and IEC 61869-11 (IEC 61869-1) which refer to the normal service conditions for indoor applications.

The service conditions for the installation in harsh environment are considered as Degree of severity 2, which means the level of combinations marked as „ClPh” or „ChPi” or „ChPh”, where:

- Cl is non-frequent condensation (not more than twice a month),
- Ch is frequent condensation (more than twice a month),
- Pl is light pollution (ambient air NOT significantly polluted by dust, smoke, gases, salt),
- Ph is heavy pollution which exceed any from Pl (does not include area with conductive dust or smoke).

The three-phase installations of KEVA 17.5 B2x voltage sensors meet the requirements of the Design class 2, what was reliably validated by Level 2 ageing tests according to IEC62271-304:2008 standard.

The highly recommended three-phase installation of KEVA 17.5 B2x for harsh environment:

| L10 (mm) | 175 | Phase-to-ground |
| L12 (mm) | 150 | Phase-to-phase |
| L23 (mm) | 150 | Phase-to-phase |
| A (mm)   | 130 | Phase-to-ground |
| A1 (mm)  | 270 | Phase-to-ground |
| B (mm)   | 230 | Phase-to-ground |
| C (mm)   | 230 | Phase-to-ground |

Screw on terminal A:
ISO4762-M16x20-8.8 hot-dip zinc coating or A4 stainless steel

Cable on terminal A:
Single core high voltage stranded tinned copper conductor with silicone rubber insulation, 25 mm², rated voltage 7.2 kV/50 Hz, test voltage 10 kV/50 Hz

The sensors installation could be provided either in the vertical or horizontal positioning.

Note: For installation in other configurations in harsh environment than described above please contact ABB.

For more technical details please refer to the IEC 62271-304:2008 standard.
