Features

- Single-line diagram (SLD)
  - All primary SLD devices are displayed in one screen. The SLD recognises different voltage levels and different busbar systems, for example, single busbar, double busbar, duplex systems, etc. The SLD can include a Local/Remote selection switch indication. SLD can be used to view any available measured values from the process devices. Alarm and generic indication symbols can be placed in the SLD. Generic control buttons can further be added to control objects.

- BusBar colouring
  - Four different modes of BusBar colouring are available. The colours represent the busbar status. The colouring is freely configurable.

- Alarms and Events
  - Alarms and Events are identified by the following identifications: Date, Time, Bay, Device, Object Description and Status. Alarms and Events can be automatically filtered according to the voltage level or bay criteria. The maximum memory capacity is 65535 events. First-in, first-out logic is used for overwriting events. The user can export an event list to a .csv file for further analysis.

- Control
  - A separate control dialog is used for controlling the switching device. It provides information on switching device identification, reservation status and interlocking conditions. The select before execute logic is used to prevent malfunction. By reserving the switching device for only one user the risk of controlling the device from two different locations is eliminated. Tap changer function for RET 54 is supported.

- Freely defined web links
  - The user can define web links during runtime. This applies to any switching device.

- Measurements
  - Measured values from process devices are displayed on the Human Machine Interface (HMI).

- Disturbance Recorder upload
  - The protection and control IED generates disturbance records that can be uploaded from the HMI for further analysis.
  - The supported format is COMTRADE via IEC 61850-8-1.

- Parameter setting
  - The Parameter setting tool can be used for viewing and/or setting the parameters in IEDs supporting transparent SPA or IEC 61850 parameterization.

- System diagnostic
  - The communication diagnostic of each network level component is supervised. This includes process devices.

- User management
  - There are four different types of user: Viewer, Operator, Engineer and Administrator.

- National language support
  - The HMI can be translated to any language with the assistance of ABB Oy, Distribution Automation.

- Protocol conversion gateway for substation automation:
  - Process communication: LON-LAG, SPA, IEC 60870-5-103, IEC 61850-8-1, Modbus serial, Modbus TCP, DNP3 serial, DNP3 TCP
  - Remote communication: IEC 60870-5-101, IEC 60870-5-104, DNP 3.0 Serial, DNP 3.0 LAN/WAN, SPA Router, External OPC Client (DA, AE)

True IEC 61850 communication gateway:
- IEC 61850-6 - Substation Configuration Language (SCL)
- IEC 61850-7 - Communication modeling and cross-referencing between protocols
- IEC 61850-8-1 - Mapping for MMS-TCP/IP – Ethernet

Configuring:
- Efficient and intuitive configuration tool
- Cross-referencing between protocols based on the IEC61850-7 models
- Drag-and-drop protocol mapping to map complete structures from the source data
- Efficient handling of large amounts of data in list views
- Tooltips
- Remote configuration and administration

- Communication redundancy (requires optional LAN card)
  - IEC 62439/PRP (parallel redundancy protocol)
  - SFT (switch fault tolerance)

- MNS iS connectivity
  - Connectivity to ABB’s Low Voltage Motor Control Center MNS iS with an OPC server in COM600. COM600 receives data from the MNS iS devices and provides HMI and gateway functionality
  - Extensive support for commissioning and diagnostics:
    - Online diagnostics for different components

- Security:
  - User authentication
  - Individual user accounts
  - Password authentication
  - Role-based access control
  - Host-based firewalls
  - Communication encryption - HTTPS

**Application**

Station computer COM615 combines the features and functionality of Control and Monitoring Unit COM 605 and Communication Gateway COM 610. COM615 provides gateway functions for mapping signals between protection and control IEDs in industrial or utility substations and higher-level systems, and an HMI (Human Machine Interface) that provides an interface, data and information from the substation to the users. COM615 gathers the data from protection and control products, and also from process devices using different protocols. COM615 uses web technology to display data to different users in a professional and user-friendly manner. COM615 uses web technology and transferred to Network Control Centre (NCC) or Distributed Control System (DCS).

Fig. 1 displays an overview of a typical utility system with the COM615 Station.

Fig. 2 displays an industrial system overview.
The supported protocols can be combined freely in one station computer, limited only by the number of hardware interfaces.

**Example:**

COM615 has four serial ports. That allows a maximum of four connections using a serial protocol, for example, 3 SPA + 1 IEC_101 or 2 SPA + 1 IEC_103 +1 IEC_101, etc.

The LON-LAG protocol uses a specific board to connect the fibres, both plastic and glass. COM615 can have one board, that is, one LON line.

It is possible to extend COM615 by increasing the number of Ethernet interfaces. This increases the number of Ethernets lines.

**Connectivity Packages**

To make the configuration of COM615 more efficient, connectivity packages are available for ABB’s protection and control IEDs. A connectivity package includes descriptions of the data and signals available in the IED, and the descriptions are used to automatically configure the master communication in the COM615 3.2 gateway.

Connectivity packages for some IEDs are already available, and more will be released in due course. At present the following connectivity packages are available:

- REF 541/3/5, REM 543/5, RET 541/3/5
- REF 542plus
- REX 521
- RE_610
- SPACOM (Conn Pack v. 2.0 supports SPAJ 140, SPAJ 141, SPAJ 142, SPAJ 144, SPAD 346, SACO 16D1, SACO 16D2, SACO 64D4)

COM615 station computer’s configurability and functionality depends on the type of communication protocol used for communication between the COM615 and the IEDs. For more details, please refer to the document “Protocols versus Functions for IEDs”, 1MRS756223.
**Design**

COM615 station computer consists of the OPC Data Access (DA, AE) server and client components. The OPC Servers provide the master/client protocol stacks access to the data in the devices connected with the protocol. The OPC Clients are used for slave/server protocol stacks to enable external systems to access data available in the OPC Servers. They are also used for exposing data to embedded web server to enable external clients, connected to the COM615 over LAN/WAN networks, to access data available in the web server.

![Diagram showing the components and connections of the COM615 station computer.](image)

Fig. 3 Example of COM615 Station Computer

**Available protocols**

The table below displays the protocols supported by COM615 station computer. New protocols will be available according to the market demands.

The process communication uses the master protocols. For more detailed information on the protocols, refer to the User’s guides listed in References.

**System requirements for the Communication Engineering Tool**

The Communication Engineering Tool runs on Microsoft® Windows® XP. A PC capable of running this program is usually sufficient also for running the Communication Engineering Tool.

Microsoft® .NET Framework 2.0 is required for running the Communication Engineering Tool.

It is automatically installed during the installation of the Communication Engineering Tool if it is not already available on the PC.

- Free hard disk space required: minimum 500 MB, recommended 1 GB.

---

**Hardware Design**

- Ruggedised mechanics
  - No moving parts - no fans, no hard disks
- System
  - Intel® Pentium® M 1.6 GHz
  - 1 GB SDRAM system memory
  - 2 GB Industrial SSD compact flash memory
- Power supply units:
  - 76-240 V dc
- Interfaces
  - 3 RS 232 serial ports
  - 1 RS 232/485 serial port
  - 2 10/100Base-TX RJ-45 connectors
  - 4 USB 2.0 ports
- Optional PCI extensions:
  - 1 LON interface (Operating temperature 0°C - +70°C)
  - 8 RS232/485 serial interfaces (Operating temperature 0°C - +55°C)
  - 2 10/100/1000Base-TX RJ-45 connectors (Operating temperature 0°C - +60°C)
- Mechanics and environment:
  - Operation -25°C to +70°C
  - Storage -40°C to +70°C
  - Dimensions (without fastening brackets): 214 mm (W) x 122.5 mm (H) x 313 mm (D)
  - Net weight: 6.8 kg
  - Degree of protection: IP 4x
  - Operating humidity: 5-95% at +40°C, non-condensing
  - EMC CE/FCC class B
  - Anti-vibration and anti-shock tests

---

**System requirements for the Communication Engineering Tool**

The Communication Engineering Tool runs on Microsoft® Windows® XP. A PC capable of running this program is usually sufficient also for running the Communication Engineering Tool.

Microsoft® .NET Framework 2.0 is required for running the Communication Engineering Tool.

It is automatically installed during the installation of the Communication Engineering Tool if it is not already available on the PC.

- Free hard disk space required: minimum 500 MB, recommended 1 GB.
COM615 is attached with four screws. Refer to Fig. 3 below.

Fig. 4  COM615 mounting dimensions
Ordering

When ordering COM615, use Fig. 5 to generate the correct ordering code.

The ordering code specifies the HW and the SW. If you need an additional PCI card, specify it by selecting the corresponding letter. The standard delivery of a COM615 unit includes one communication protocol for the process devices and one communication protocol for a higher-level system as well as an HMI Web Server.

Fig. 5 COM615 ordering code

Also specify in the ordering code:

- if you need to gather data from a substation using two or three different protocols.
- if you need to send data from COM615 using two different protocols.

You do not need to specify the protocols in the order. The protocols needed are selected when the COM615 unit is configured. COM615 is limited only by the number of the slaves and masters ordered. When ordering, please state language, simplified Chinese or Russian, if not English which is the default language.

For more information about ordering and availability, please contact ABB Oy, Distribution Automation.
