

#### RobotStudio Machining PowerPac Increased engineering efficiency

- Introduction
- Features
- Benefits
- Requirements

# 33 years of robotized machining

"The world's first electrical robot sold in 1974 was for grinding and polishing of stainless steel tubes."

ABB was an innovator and has become #1 in robotized finishing

We intend to stay as the leader

IRB 6 sold by ABB in 1974 to Magnusson in Genarp, Sweden

# Why is machining not fully robotized?

- Programming time has been far too long to permit frequent product changeovers
  - Only large batch sizes have been feasible
- Difficult application with many parameters affecting the process result
- Industry tradition to use other machining methods
- Robot arms have not been suitable for all applications

DEFINITION

Machining includes: Grinding Deburring Polishing & Linishing Buffing Milling Sawing Deflashing Sanding Etc.

# Industry with changing values and demands

#### End of an era - Manual Machining

- Inconsistent part quality, high scrap and reclaim rates
- Hazardous, dirty work environment
- High injury rate and long-term health problems
- Low availability
- Difficult to recruit personnel
- Low status
- Labor intensive and expensive operation

- Beginning of an era Robot Machining
  - Consistent high product quality
  - Reduced tooling costs
  - High availability
  - Safe environment with less injuries
  - Safe environment
  - Attractive & rewarding workplace
  - Positive, high-tech image
  - Improved recruitment possibilities
  - Long-term profitability

## **Challenges for robotized machining**

- Short production batches
  - Quick change over time is required
- Traditional programming is time consuming
- Many parameters affecting the process result
- Accuracy requirements in the process

- Software for off-line programming of machining applications
- Contains functionality for
  - Automatic path generation on surfaces or edges
  - Path and target optimization
  - CAD import and processing
  - Experience sharing
  - Work object calibration
  - Force controlled machining

- Reduce programming time
  - Create thousands of robot targets in seconds
  - Path and target optimization
  - Create program from CAD model
- Control of process parameters
  - Robot speed and arm configuration
  - Tool compensation and tool machining angles
  - Force control settings
- High accuracy of created path in relation to CAD model

- Introduction
- Features
- Benefits
- Requirements

# **Supported Features**

- Path programming wizard
  - Create/select surface or edge to be machined
  - Set machining process parameters
  - Pre-defined path generation patterns
  - Set path and target parameters
- Path and target optimization
- Path and target modification
- Path simulation
- Program export as RAPID or RW Machining FC
- Calibration
- Pre-defined and configurable machining templates
- Check/heal CAD models

## **Programming wizard**

## **Programming wizard**

# **Target and Path optimization**

#### Without Target Orientation Optimization

#### With Target Orientation Optimization

Greatly reduce the rotation of robot itselfImprove the reachability of robot target

Robotics

0

# **Reduce programming time**

- Wizard based programming to set process parameters
  - Automatic path configuration and path optimization
- CAD model used as base to create path
  - Select surfaces and/or edges in a 3D view
- Easy to modify and optimize path through "Path view"
- Seamless integrated to RobotStudio
- Functions facilitating knowledge sharing
- Simulation that verify program

# In control of the process parameters

- Templates for different machining processes
  - Including templates for force controlled machining
- Optimization of speed within given range
- Supporting both face- and side working tools
  - Automatic calculation of spin angle and tool compensation of tool radius
- Pre-defined path generation patterns supporting all possible machining types
- Easy creation and modification of path and target parameters

# Improved path accuracy

- High path accuracy in relation to CAD model
  - Automatic calculation of tolerance and deviation angle
- Calibration function allow easy way to calibrate work object
  - All robot targets are relative to the work object.

## Seamless integration with RobotWare

 Export path(s) as RAPID program

- Export paths(s) as RW Machining FC
  - Force controlled machining
  - Interface file created

Machining		>	<
FC ProcessType	PressureProcess		
Status	The all of solutions created support 'Normal Process' and 'Pressure Process', it's recommended to convert them to 'Pressure Process'.		
Path	C:\RWMDefault		
Program	RWM_MPP511Demo_1_T_R0B1		
	ОК	Cancel	

# **Summary benefits**

- Reduce programming time
  - Engineering and commissioning efficiency
  - More cost efficient handling of short batches
- In control of the process parameters
  - Easy to create and modify robot parameters
- Improved path accuracy
- Seamless integration with RobotWare

# Power and productivity for a better world<sup>™</sup>
