What's new?

New feature: automatic dismissal of alarm/alert events

Users can now choose a time period for automatic dismissal of events that were not handled in the defined time period. Users can set this time period in the Smart Sensor portal by selecting the Organization Management menu and navigating to the Settings tab. There are multiple selections available for the feature as shown below.

Language selection improvements

Japanese language is now available in the Smart Sensor portal and the mobile app. Also, users can now change the language in the Powertrain portal.
Navigation improvements in the portal

Users can now access the Asset Details page for each asset from the Condition Indexes tab by clicking the expansion symbol as shown below.

Instant reports

In the last release, the raw data collection feature was introduced. The collected raw data is used to generate an instant asset report. The instant asset report provides a more detailed insight of the asset’s condition. It contains the plots available in the portal and provides an overall equipment view, which reflects the asset’s performance, frequency domain signals, time domain signals, statistical values, envelope analysis, and anomaly detection. Data from the past two weeks is used in the instant report. The report is available in the Reports tab in the web portal.

Minor fixes for the texts and pop-ups and improvements for the usability

A few small changes that make the user experience smoother.
