Equipment covered by the manual

This manual covers standard drive and provides generic information on the drive. The manual does not claim to cover all variations and details of the drive, nor to consider all eventualities that may arise during installation, commissioning, operation and maintenance of the drive.

If the drive is adapted to specific customer needs or applications, and handling, installation, and operation of the drive are affected by these modifications, information on these modifications is provided in the appropriate documentation (e.g., layout drawings, wiring diagrams, project-specific data, engineering notes).

If information is required beyond the instructions in this manual, refer the matter to ABB.
Target groups and required qualifications

The drive presented in this manual is part of an industrial environment where voltages are present that contain a potential hazard of electric shock and/or burn. For this reason, only personnel who have a thorough knowledge of the drive and the industrial environment and have obtained the required qualification must handle, install, operate, or maintain the drive.

The manual addresses personnel who are responsible for unpacking, transportation, installation, operation and maintenance of the drive. The personnel must carry out the below listed tasks in a manner that does not cause physical harm or danger, and to ensure the safe and reliable functioning of the drive.

**Commissioning of the drive must only be performed by qualified and certified ABB personnel.**

**Handling**
The personnel must be skilled and experienced in unpacking and transporting heavy equipment.

**Mechanical installation**
The personnel must be qualified to prepare the installation site according to the site and equipment requirements and to perform the installation accordingly.

**Electrical installation**
The personnel must have a sound knowledge of the relevant electrical codes and specifications covering low and medium voltage equipment, be experienced with electrical wiring principles, and know the electrical symbols typically used in wiring diagrams.

**Operation**
The personnel include all persons who operate the drive from the local operating panel of the drive. The personnel must know the functions of the operating panel, be adequately trained for the drive, and know the driven process. Special knowledge of frequency converter technology is not required.

**Maintenance**
The personnel include all persons who
- are qualified to carry out preventive and corrective maintenance on drive as described in this manual,
- are thoroughly familiar with the drive,
- have a sound knowledge of the relevant electrical codes and specifications covering low and medium voltage equipment,
- are able to assess the hazards associated with the energy sources of the drive system and act correspondingly,
- know the safe shutdown and grounding procedures for the drive system.

Responsibilities of the user

It is the responsibility of those in charge of the drive to ensure that each person involved in the installation, operation or maintenance of the drive has received the appropriate training and has thoroughly read and clearly understood the instructions in this manual and the relevant safety instructions.

Intended use of equipment

Those in charge of the drive must ensure that the drive is only used as specified in the contractual documents, operated under the conditions stipulated in the technical specifications and on the rating plate of the drive, and serviced in the intervals as specified by ABB.

Use of the drive outside the scope of the specifications is not permitted.

Intended equipment use also implies that only spare parts recommended and approved by ABB must be used.

Unauthorized modifications and constructional changes of the drive are not permitted.

ABB and its affiliates are not liable for damages and/or losses related to such security breaches, any unauthorized access, interference, intrusion, leakage and/or theft of data or information.
Quality certificates and applicable standards

The following certificates and conformity declarations are available with ABB:

- ISO 9001 / ISO 14001 certificates stating that ABB Group has implemented and maintains a management system that fulfills the requirements of the normative standards
- EC Conformity Declaration
- List of the standards the drive complies with.

Items covered by delivery

The delivery comprises the following items (see figure below):

- Drive
- Transformer (can be integrated or non-integrated)
- Fan units shipped separately.
- Phase module replacement kit (if selected as additional option).
- Set of door keys
- T handle screwdriver with torx bit T30
- Rating label

For more information on items supplied, see the TIJQQJOHOPUF.
Identifying the delivery
The drive and accessories are identified by the type code printed on the rating label.
The rating label is located on the front of the control compartment door.
The label provides information on the type of drive, the rated voltage, the frequency and the current of the main and the auxiliary power supply.
Terms, abbreviations, trademarks
The following table lists terms and abbreviations you should be familiar with when using the manual. Some of the terms and abbreviations used in the manual are unique to ABB and might differ from the normal usage.

<table>
<thead>
<tr>
<th>Term / Abbreviation</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMC circuit board</td>
<td>Application and Motor Controller. The digital signal processor is the heart of the control system of the drive. A separate AMC circuit board is assigned to the line-side rectifier (AFE) and the motor inverter (INU) of the drive.</td>
</tr>
<tr>
<td>AFE</td>
<td>Active Front End. The AFE, also referred to as ARU (Active Rectifier Unit), is the line-side rectifier of the drive that enables four-quadrant operation and reactive power compensation.</td>
</tr>
<tr>
<td>Converter</td>
<td>Short form for ACS2000 frequency converter</td>
</tr>
<tr>
<td>Cluster</td>
<td>A cluster is a synonym for a group of hardware modules of the drive control system.</td>
</tr>
<tr>
<td>DDCS</td>
<td>Distributed drive control system. DDCS is an acronym for a serial communication protocol designed for data transfer via optical fibers.</td>
</tr>
<tr>
<td>Drive</td>
<td>Short form for ACS2000 frequency converter</td>
</tr>
<tr>
<td>Drive system</td>
<td>The drive system includes all equipment used to convert electrical into mechanical power to give motion to the machine.</td>
</tr>
<tr>
<td>DriveBus</td>
<td>Communication link dedicated for ABB drives</td>
</tr>
<tr>
<td>DriveDebug</td>
<td>DriveDebug is part of ABB’s DriveWare® software tools for drives using the DDCS communications protocol. DriveDebug runs on computers with Windows® operating systems. DriveDebug is a specialist’s tool used to diagnose, tune and troubleshoot ABB drives.</td>
</tr>
<tr>
<td>DriveWindow</td>
<td>DriveWindow is a DriveWare® product. DriveWindow is a 32 bit Windows® application for commissioning and maintaining ABB drives equipped with optical communication links.</td>
</tr>
<tr>
<td>DriveMonitor</td>
<td>DriveMonitor is a monitoring and diagnostics system that allows secure access to the drive via the internet from a remote location. DriveMonitor provides long-term monitoring functions that allow to infer equipment status and improve equipment performance.</td>
</tr>
<tr>
<td>Equipment</td>
<td>Frequency converter and related equipment</td>
</tr>
<tr>
<td>EMC</td>
<td>Electromagnetic compatibility. All measures to suppress electromagnetic disturbances caused by different electrical equipment in the same electromagnetic environment, and to strengthen the immunity of the equipment to such disturbances.</td>
</tr>
<tr>
<td>FE</td>
<td>Functional earth</td>
</tr>
<tr>
<td>Ground</td>
<td>Earth</td>
</tr>
<tr>
<td>To ground</td>
<td>The conducting path (eg, conductor) between the electric equipment (eg, frequency converter) and the earth. The electric equipment is connected to the earth, eg, by a grounding set or a grounding switch.</td>
</tr>
<tr>
<td>GTO</td>
<td>Gate turn-off thyristor</td>
</tr>
<tr>
<td>IGBT</td>
<td>Insulated gate bipolar transistor</td>
</tr>
<tr>
<td>INU</td>
<td>Inverter unit of the drive. The INU converts the DC voltage to the required AC motor voltage and frequency.</td>
</tr>
<tr>
<td>IOEC module</td>
<td>Term of ABB’s S800 I/O system. The I/O module is an active input and output device for digital and analog signals.</td>
</tr>
<tr>
<td>Line voltage</td>
<td>RMS voltage of the main power supply of the drive</td>
</tr>
<tr>
<td>MCB</td>
<td>Main circuit breaker. The MCB is a major protection device of the drive system and connects / disconnects the main power supply to the drive. The MCB is controlled entirely by the drive.</td>
</tr>
<tr>
<td>PCB</td>
<td>Printed circuit board</td>
</tr>
<tr>
<td>PCC</td>
<td>Point of common coupling. The PCC is the point in the electrical power supply system where the responsibility of the utility changes to the industrial customer. The utility is responsible to provide clean voltage and current with respect to harmonic distortion up to the PCC. The industrial customer is responsible not to distort voltage and current by its electrical systems.</td>
</tr>
<tr>
<td>PE</td>
<td>Protective earth</td>
</tr>
<tr>
<td>Phase module</td>
<td>The phase module is a compact assembly of wired components including power semiconductors and circuit boards that serves as a standardized building block for the AFE and INU of the drive.</td>
</tr>
<tr>
<td>PPCS</td>
<td>Power plate communication system. PPCS is an acronym for a serial communication protocol designed for data transfer via optical fibers between AMC circuit board and INTerface circuit boards.</td>
</tr>
<tr>
<td>RTD</td>
<td>Resistance temperature detector or device. The RTD is a temperature sensor where the change in electrical resistance is used to measure the temperature.</td>
</tr>
<tr>
<td>Term / Abbreviation</td>
<td>Meaning</td>

Important note on main circuit breaker
The main circuit breaker (MCB) is a major protection device of the drive. If a serious fault occurs in the drive, the MCB must disconnect the main power supply to the drive immediately. The main power supply must be disconnected without delay on an open or trip command from the drive to prevent hazard to the personnel and further damage to the equipment. The MCB is located on the primary side of the input transformer.

The MCB is defined as a switching device to disconnect the power supply whenever required by the process or when a fault occurs. Typical devices used as MCBs are:
- Vacuum circuit breakers
- SF6 circuit breakers
- Fused contactors or motor control centers

The overcurrent protection relay is part of the switchgear.

0-1
Safetys and protection requirements

For safety and protection reasons, the MCB must meet the stipulated minimum requirements of the specifications of ABB MV Drives. It is the system integrator's responsibility to ensure that the minimum requirements are met. The minimum requirements for the MCB are stated in this note and in the respective MCB specifications, which are available for each medium voltage drive from ABB. The safety requirements for the drive are based on the following standards:

• ISO 13849-1 Safety of machinery - Safety-related parts of control systems - Part 1: General principles for design, section 6.2.6 Category 3
• IEC 60204-1 Safety of machinery - Electrical equipment of machines - Part 1: General requirements

Minimum requirements for MCB and MCB control

- The MCB open and / or trip command has to be wired directly from the drive to the MCB. It is not permitted to wire the trip command through any PLC or DCS system if it is not certified to meet SIL 3 level requirements, and to fulfill the timing requirements outlined below. Opening of the MCB by the drive shall be possible at any time. It is not permitted to interrupt the open and / or trip command, eg, by a local-remote switch in the MCB.
- When the MCB is in service position, the drive must have exclusive control of closing the MCB. Local closing of the MCB is not permitted.
- The maximum opening time of the MCB shall never exceed the product or project-specific maximum time defined in the MCB specifications. Typical maximum values for the drive are defined as follows:
  - Maximum protection trip time: 75 ms
    The maximum protection trip time is the maximum allowed breaking time (open and arcing) of the breaking device after the open command has been initiated to prevent further damage to the drive, eg, diode failures.
  - Maximum safety trip time: 250 ms
    The maximum safety trip time is the maximum allowed time to ensure safe disconnection of the main power supply to prevent any hazard to personnel.

In order to meet the stipulated safety requirements, it is recommended that:
- the MCB is equipped with two independent opening coils,
- the MCB is equipped with one opening coil and an undervoltage coil for monitoring of the control voltage, or
- an upstream protection coordination scheme is provided which uses the "breaker failure" (ANSI 50BF) signal to automatically trip the upstream breaker, in case the MCB does not open. The upstream breaker must open within the maximum safety trip time after a failure has occurred.

![0-2 MCB opening timing diagram](image-url)
--

Maintenance recommendation

The MCB trip circuits should be checked once yearly.
Chapter 1
Safety
1.1 Meaning of safety instructions

Safety instructions are used to highlight a potential hazard when working on the equipment. Safety instructions must be strictly followed! Non-compliance can jeopardize the safety of personnel, the equipment and the environment.

The safety instructions are derived from the following standards:

- ISO 3864-2:2004 (E)
  Graphical symbols – Safety colors and safety signs – Part 2: Design principles for product safety labels

- ANSI Z535.6
  American National Standard for Product Safety Information in Product Manuals, Instructions, and Other Collateral Materials
1.2 General safety information

To maintain safety and minimize hazards observe the following:

- Before the drive is energized, make sure that:
  - all foreign objects are removed from the drive,
  - all internal and external covers are securely fastened and all doors are closed, locked and / or bolted.
- Before starting to work on the drive, make sure that:
  - the main and auxiliary power supply to the drive is switched off, locked out, and tagged out,
  - the drive is dead,
  - safety ground connections are in place,
  - appropriate personal protective equipment is provided and used when required,
  - everyone involved is informed.
- When working near the running drive, wear protective earmuffs.
- Before work is carried out simultaneously on the drive and on other drive system equipment, make sure that:
  - the relevant safety codes and standards are observed,
  - all energy sources of the equipment are turned off,
  - lockout and tagout devices are in place,
  - barriers and appropriate covers are used on equipment which is still live,
  - everyone involved is informed.
- In case of fire in the drive room:
  - Observe the established rules and regulations for fire protection.
  - Only firemen with appropriate protective equipment are allowed to enter the drive room.
1.3 Possible residual risks

The following risks can arise from a drive system and pose a hazard to people. These risks must therefore be taken into account by the system integrator and / or the plant owner when assessing the risks of the machinery.

- Electric power equipment generates electromagnetic fields which can cause a hazard to people with metal implants and / or a pacemaker.
- Drive system components can move unintentionally when being commissioned, operated, or serviced due to, eg:
  - Operation of the equipment outside the scope of the specifications
  - Incorrectly assembled or installed equipment
  - Wrongly connected cables
  - External influence on, or damage of the equipment
  - Wrong parameter settings
  - Software errors
  - Faulty hardware
- Hazardous touch voltages can be present on drive system components caused by, eg:
  - Operation of the equipment outside the scope of the specifications
  - External influence on, or damage of the equipment
  - Induced voltages by external equipment
  - Condensation on equipment components, or pollution
  - Faulty hardware
- High temperatures, noise, particles, or gases can be emitted from drive system components caused by, eg:
  - Operation of the equipment outside the scope of the specifications
  - External influence on, or damage of the equipment
  - Wrong parameter settings
  - Software errors
  - Faulty hardware
- Hazardous substances can be emitted from drive system components due to, eg:
  - Incorrect disposal of components
1.4 Safety labels and signs

1.4.1 Safety labels
Safety labels are attached to the cabinet to alert personnel of potential hazards when working on the equipment. The instructions on the safety labels must always be followed, and the labels must be kept in a perfectly legible condition.
1.5 Cyber Security Requirements

1.5.1 Cyber Security Disclaimer
This product is designed to be connected to and to communicate information and data via a network interface.
It is Customer's sole responsibility to provide and continuously ensure a secure connection between the product and Customer network or any other network (as the case may be). Customer shall establish and maintain any appropriate measures (such as but not limited to the installation of firewalls, application of authentication measures, encryption of data, installation of anti-virus programs, etc) to protect the product, the network, its system and the interface against any kind of security breaches, unauthorized access, interference, intrusion, leakage and/or theft of data or information.
ABB and its affiliates are not liable for damages and/or losses related to such security breaches, any unauthorized access, interference, intrusion, leakage and/or theft of data or information.

1.5.2 User Lock
For better cyber security, it is highly recommended that you set a master pass code to prevent e.g. the changing of parameter values.

⚠️ WARNING ⚠️

To activate the user lock for the first time, enter the default pass code, 358, into 16.02 Passcode. This will make parameters 16.16…16.17 changeable. Then enter the old pass code to 16.16 OldUserPasscode and change user pass code in 16.17 NewUserPasscode. In 16.02 Parameter Lock, the user lock functionality can now be enabled.
Chapter 2
Power electronics and cabinet features
2.1 Overview

The air-cooled ACS2000 is a general purpose frequency converter for the control of standard induction motors.

The following picture provides an overview of the available ACS2000 2MVA AFE drives.

The following sections provide an overview of:
- the available main and auxiliary power configurations,
- the power electronic components of the drive,
- the cooling system,
- cabinet features such as the grounding switch and the electro-mechanical door interlock.

For information on the power and voltage range of the drive, see the UFDIOJDBMTQFD - JGJDBUJPOT and / or the SBUJOHQMBUF of the drive.

- ACS2000 for connection to a non-integrated transformer

- ACS2000 for connection to an integrated transformer (1)

- ACS2000 for direct-to-line connection (みつ)
2.2 Power supply configurations

The drive requires two independent power supplies:

The following drive configurations are described in this user manual:
- Main power supply for the power electronic components
- Auxiliary power supply for the control and cooling equipment

2.2.1 Main power supply configurations

Input transformer

The main power is fed to the drive by the input isolation transformer which adapts the line voltage to the required voltage for the drive. The input isolation transformer is always part of the drive system. Two installation solutions are available for the transformer:
- Integrated
  The transformer is placed on the left side of the drive. The length of the cabinet depends on drive power. For the integrated configuration, a dry-type transformer is used.
- Non-integrated
  The transformer is external to the drive. The transformer can either be an oil-immersed or dry-type device. The distance between drive and transformer is determined by the maximum possible cable length for the transformer secondary cables. Drives with a non-integrated transformer are equipped with a common mode choke.

Direct-to-line connection

For applications where the line voltage corresponds to the motor nominal voltage, the drive can be connected direct-to-line by employing input reactors instead of an input transformer. The direct-to-line (DTL) configuration is used for 6 to 6.9 KV line voltages.
2.2.2 Auxiliary power supply configurations

The drive needs auxiliary power for:
• the cooling system and a short-time power demand for the charging unit of the drive
  The power is fed by a three-phase power supply.
• the control hardware
  The power is fed by one single-phase power supply.

The drive can be equipped with the following power supply options:
• Standard power supply
  The drive is equipped for one three-phase power supply that provides the total auxiliary power.
• Optional power supplies
  To accommodate requirements for safe operation if the auxiliary power fails, the drive can be furnished with one three-phase power supply and one single-phase power supply.

Independent of the power supply scheme, the drive provides an internal back-up supply for 100 ms. This safety feature enables the control system to shut down the drive in a controlled manner if the auxiliary power fails.

Optionally the drive can be equipped with an additional battery. The battery supports 15 minutes ride-through operation of the control system.

The power feed for the auxiliary supply must be protected with a suitable circuit protection rated for the inrush current. For information, see utility consumption list of the drive.

For information on the configuration of the auxiliary power interface in the drive, see #QXFOEJY%y8JSJOHEJBHSBNT.
2.3 Drive topology

This section describes the main design features and introduces the major power electronics components of a typical ACS2000.

9. Charging transformer
2.3.1 IFU - Input filter unit

The IFU is located between the input transformer and the AFE. The IFU is a tuned filter that reduces harmonic voltages injected to the supply network.

2.3.2 DTL compartment

The DTL compartment is present in drives configured for direct-to-line connection. The functions of the compartment are twofold:

- It smoothes the current harmonics in the power supply.
- It decouples the common mode voltages of the drive from the network.
2.3.3 AFE - Active front end

The active front end of the drive consists of an active rectifier for four-quadrant operation. The AFE features the same electrical design as the INU of the drive. The AFE rectifies the AC voltage of the main power supply and connects its output to the minus, neutral point, and plus side of the DC link. The AFE maintains the DC-link voltage at the required level and provides the desired input power factor at the point of common coupling (PCC). The input power factor is adjusted by the AFE to near unity.

References

1 Phase module 1
2 Phase module 2
3 Phase module 3
4 Extracted phase module
Phase module

The AFE consists of three identical phase modules each housing the series-connected IGBT semiconductors, the phase capacitor, the gate drivers, and the interface circuit board for communication with the main control circuit board (AMC circuit board) of the AFE.

The high voltage IGBT is a power semiconductor switching device specially developed for medium voltage drives. The device is based on well-established transistor technology and combines high speed switching capabilities with high blocking voltage and low conduction losses as known from GTOs.
2.3.4 DC link

The DC link consists of the charging unit, the capacitors, and the grounding switch.

Charging unit

Charging

The unit charges the DC link capacitor and the phase capacitors before the MCB is closed to connect the drive to the main power supply. Thus, excessive inrush currents are prevented.

The charging unit is fed from the auxiliary power supply and charges the DC link and the phase capacitors to 90% of the steady-state voltages.

The charging sequence is started by pressing the SUPPLY ON push-button on the control compartment door. After the charging sequence has finished, the charging unit is disconnected from the medium voltage circuit, the MCB is closed, and the DC link will reach its nominal level.

Stand-by mode

Once the DC link is charged, it is possible to keep the drive in this state to facilitate a more rapid start-up procedure. The losses during stand-by mode are approx. 1% of the nominal power and are caused from small losses from the AFE, the INU, and the auxiliaries.

Discharging

Discharging is initiated by pressing the SUPPLY OFF pushbutton on the control compartment door. The DC link capacitors will then discharge via the IFU. The energy stored in the DC link is dissipated in the parasitic resistors of the power part of the drive. When the DC link voltage has decreased below a quarter of the DC link voltage, the capacitors in the phase modules start to discharge as well.

References

— 2-8 DC link
Grounding switch

The grounding switch is a safety device that enables safe access to the AFE-INU compartment of the drive.

When the switch is in position grounded, input filter AFE, DC link INU and output filter of the drive are connected to the PE ground bus.

The switch is electromechanically interlocked with a discharge monitoring circuit that prevents closing of the switch while the DC link capacitor is still charged.

Grounding the drive is only possible after the main power supply has been disconnected and the DC link has discharged. When the voltage is below 50 V (DC), press the pushbutton Grounding Switch Unlocked located on the control compartment door (the pushbutton lights up) and at the same time - turn the grounding switch to the position grounded.

When the grounding switch is in position grounded, the door safety switch of the AFE-INU compartment will be released and the door can be opened.
2.3.5 INU - Inverter unit

The INU converts the DC voltage to the required AC motor voltage and frequency.

Like the AFE, the INU is an active 3-phase unit with the same electrical configuration. The unit is designed as a self-commutated, 5-level voltage source inverter. As a result of the multi-level topology, the drive produces an optimum number of switching levels - nine levels, phase to phase.

The resulting waveforms permits the application of standard motors.

The INU is composed of three identical phase modules (see Phase module). The phase modules can be extracted from the cabinet to facilitate maintenance and service on the INU.
2.3.6 EMC filter

The INU includes a three-phase du/dt filter connected to its AC output. The filter chokes, resistors, and capacitors protect the motor against excessive voltage slopes (du/dt is limited to 500 V/s).
2.4 Terminal compartment

The terminal compartment provides the terminals for the feeder and motor cables and the ground bus for the termination of the ground cable and the cable screens.

The cable entry is prepared in the factory for to the cable entry configuration ordered:
- Top or bottom cable entry
- Type of entry plate

- For information on the type of cable entry in the drive, see "QQFOEJY$y.FDIBOJDBMESBXJOHT".
- For further information, see "Cable entries."
2.5 Cabinet design

The riveted and folded cabinet construction of the drive ensures a strong, flexible and self-supporting framework. The construction avoids the need for additional skeletal support and provides effective protection against electromagnetic emissions.

EMC has been achieved by applying a cabinet design consisting of folded, galvanized sheet metal plates (approximately 2 mm thick) and minimizing the space between the rivets. The inside walls of the cabinet are not painted, because paint tends to reduce the effectiveness of metallic bonding which is important for successful EMC. Accordingly, only the front of the cabinet is painted while all other walls are galvanized. However, the cabinet can be ordered optionally with the whole of the outside painted. EMC performance is further enhanced by the use of metal cable ducts.
### 2.6 Door locking system

To ensure safety and to prevent the doors being opened unintentionally, all doors are lockable, and the doors of compartments where medium voltages are present during operation (1, 3, 4, 5) are bolted or electromechanically secured.

Additionally, the doors of the medium voltage compartments have locks with different inserts than the control compartment door. The different lock inserts ensure that these doors can only be opened by personnel authorized to do so. The covers of the integrated transformer are bolted.

1. Door of DTL compartment: bolted
2. Door of control compartment: lockable
3. Door of medium voltage compartment: electromechanically locked
   Door cannot be opened when the drive is energized.
4. Door of medium voltage compartment: electromechanically locked
   Door cannot be opened when the drive is energized.
5. Door of medium voltage compartment: electromechanically locked
   Door cannot be opened when the drive is energized.
2.7 Cooling system

The drive and the integrated transformer are each equipped with fan units.

2.7.1 Fan unit configurations

Optionally, the drive and the integrated transformer can have a redundant fan configuration, ensuring full operation in the event of fan failure. The drive can be equipped with fan units of the following types:
2.7.2 Function

Fan groups
For control reasons, the fan unit(s) of the drive and the integrated transformer are combined to groups, for example:

- Fan unit 1 of the drive and fan unit 1 of the integrated transformer belong to group 1.
- Fan unit 2 of the drive and fan unit 2 of the integrated transformer belong to group 2.

The fan units of a group are always switched on and off together.

Starting, stopping
The standard fan group 1 is switched on by the control system of the drive when charging of the DC link is initiated. When the drive is stopped, the fan group continues to run for a preset time after the main power has been switched off and the DC-link voltage has decreased below a preset value.

Operating intervals
Parameter setting allows to run one of the two fans continuously, or to run the fans alternately in adjustable intervals. The intervals are set with parameters.

For further information on settings for the cooling system, see TJHOBMBOE, section BVUPNBUJDDPO-WFSUFSGBODIBOHFPWFS.

Air flow inside the drive
The fan group of the cabinet feeds the cooling air to the main power electronic components and transfers the heat to the outside of the cabinet.

---

2-17 Example for the operating time of the fan units
2-18 Air flow inside the cabinet

---

2-17

---

2-18
Air flow monitoring

Air pressure switches monitor the air flow through the cabinet of the integrated transformer and the cabinet of the drive.

Separate air pressure switches in each cabinet monitor the air flow through the filter mats and the air flow through the cabinets.

When the filter mats are clogged and the pressure drop reaches the specified final pressure loss, the message `Conv1CoolAirFilter` is displayed on the CDP control panel and the alarm-fault lamp lights up on the control compartment door.

When a fan of the drive or a fan of the integrated transformer fails, the control system of the drive switches on the stand-by fan automatically. The failure of a fan is indicated on the CDP control panel of the drive as follows:

- `CoolCircuit1Alm` if a fan of the drive fails
- `CoolCircuit2Alm` if a fan of the integrated transformer fails
- The alarm fault lamp starts to flash.
Chapter 3
Control system
3.1 Control unit

The control compartment incorporates the hardware for the control, monitoring and protection functions of the drive, and the communication interfaces to the local control panel and to the remote control devices. Depending on the control concept of the drive system, the remote control devices include a higher-level control system and/or remote operator stations.

2 Local control panel
3.2.1 Main components of the control compartment

For information on the devices present in the control compartment of the drive, see [3-3 Control compartment details].

For 24 V circuits the ATO style blade fuses rated 3 A, 32 V are used.

3.2.2 Local control panel

The local control panel on the door of the control compartment serves as the basic user interface for monitoring, control, operation of the drive, and setting of parameters.

For further information, see [3-4 AMC circuit-board location].

3.2.3 AMC circuit board

Overview

The AMC circuit board is the major component of the control system of the drive and performs general drive, motor control, and closed loop functions. The main internal control devices and the peripheral input and output interfaces to the customer communicate with the AMC circuit board via optical fibers.

The circuit board is fitted with a Motorola DSP processor and features two PPCS and eight DDCS communication channels. The communication channels are used for high speed data transfer via the INT circuit boards to the Phase-INT circuit boards inside the phase modules.

AFE and INU have their own AMC circuit board.
1. AMC and main INTerface circuit board of the INU
2. AMC and main INTerface circuit board of the AFE
3. INTerface circuit board
4. AMC circuit board
Control tasks
Each AMC circuit board has specific control and closed-loop tasks assigned to it.
- The AMC circuit board of the AFE handles all rectifier and line-related functions of the drive.
- The AMC circuit board of the INU processes drive and status information, performs the speed and torque control tasks, and monitors the operation of the drive.

The AMC circuit board continuously monitors all relevant drive variables (e.g., speed, torque, current, voltage). Pre-programmed protection functions ensure that these variables remain within certain limits in order to maintain safe operation of the drive. These internal functions are not programmable by the user.

Optionally, the AMC circuit board can monitor signals from external equipment. These can be activated and adjusted with Parameters. Other general control, protection, and monitoring tasks regarding the whole drive include control and monitoring of:
- Main circuit breaker
- ... other tasks...

These tasks are implemented in the AMC circuit board of the INU.

Parameters
The control system is configured, customized, and tuned with a set of application parameters. The application parameters are organized in functional groups and have factory-set default values. The default parameter values are adjusted during commissioning to the specific application of the drive to activate the specific control, monitoring, and protection functions for the driven process, and to define the signals and data to be transferred between drive and external equipment.

The parameters and parameter groups referred to in the signal allocation tables in this chapter are valid for drives with software version LDO16xxx revision "-" and later versions.

Main circuit breaker

The main circuit breaker (MCB) is an important switching and protection device of the drive system. Therefore it must only be controlled and monitored by the drive.

For further information, see:
- ... references...
Direct torque control
The speed and torque of the motor is controlled by DTC (Direct Torque Control). DTC provides accurate speed and torque control, and high dynamic speed response.
Switching of the semiconductors in the INU is directly controlled in accordance with the motor core variables flux and torque.
The measured motor currents and DC link voltages are inputs to an adaptive motor model. The model produces exact values of torque and flux every 25 microseconds. Motor torque and flux comparators compare the actual values to reference values which are produced by the torque and flux reference controllers.
Depending on the outputs from the hysteresis controllers, the switching logic directly determines the optimum switch positions every 50 microseconds and initiates switching whenever required.

Peripheral I/ O devices
The peripheral input and output devices connected to the AMC circuit board of the INU include:
- Local CDP control panel
- I/O interfaces for parallel signal transfer to external devices
- Optional fieldbus adapters for serial data transfer to a higher-level control system
- PC-based service tools comprising:
  - DriveWare® software tools
    DriveWare® includes software tools such as the commissioning and maintenance tools DriveWindow and DriveDebug, and DriveOPC for data transfer between ABB drives and Windows®-based applications.
  - RCM tool (Option): Tool for Remote Condition Monitoring.
3.3 I/O interfaces

3.3.1 IOEC I/O modules

Overview
Internal and external, analog and binary I/O signals are connected to the control system by IOEC modules.

The standard I/O includes one external module (IOEC 2) and one module that is internal to the drive operation (IOEC 1). The standard I/O provides standard control and supervision functionalities sufficient for most applications.

The drive can include optional expansion I/O that includes an external module (IOEC 4) and an internal module (IOEC 3). These expansion modules provide extra inputs and outputs for control and supervision as may be required by ABB or the customer to support various control options.

1. Standard internal IOEC 1 (A3401)
2. Standard external IOEC 2 (A3411)
3. Optional internal IOEC 3 (A3421)
4. Optional external IOEC 4 (A3431)
IOEC module configuration
Each IOEC module is configured with both analog and digital inputs and outputs as shown in Table 3-1.

24 V internal voltage supply
One isolated DC/DC converter supplies an overload protected voltage of 24 V (DC) to operate digital inputs from passive contacts. The output is protected by a PTC-resistor against short-circuit and external applied overvoltages.

Table 3-2  24 V internal voltage supply

I/O device identification

The I/O modules are identified on the part with an identification label in the wiring diagram, and in the software by the wiring diagram identification number.

The way the identification number is built directly corresponds to the wiring diagram as can be seen in the wiring diagram. The letter A represents the kind of part, an assembly, the next three digits are the page number the part is located on, page 340, and the last digit, 1, means that the part is the first assembly on the page. This identification label number is the key to track electrical devices throughout the drive and in ABB documentation.

The designation for each IOEC module is shown in Table 3-3.

3.3.5 Fieldbus communication interfaces (option)

Overview

Fieldbus communication interfaces are used for the bidirectional communication between the drive and a higher-level process control system. Typically, operational commands, status messages of the drive, speed or torque reference values, and actual values are transmitted.

Available fieldbuses

For further information on data transmission and on data and signal allocation to the transmitted datasets, see:

- \( \text{DFHJHBOEQBSBNFUFSUBCMF} \)
- \( \text{JOTUBMMBUJPOBOETUBSUVQHVJEF} \)
- \( \text{FOHFOFFSJOHEPDVNFOUT} \)

</tr>
</tbody>
</table>
Communication with AMC circuit board
The fieldbus adapter is connected to channel 0 of the AMC circuit board via optical fibers.
Location
The fieldbus adapter is DIN rail-mounted inside the control compartment.
The indicated mounting position may vary depending on the number of optional devices present on the swing frame.

3.3.6 Pulse encoder interface NTAC (option)
Overview
The pulse encoder is required for constant torque applications.

<table>
<thead>
<tr>
<th>Terminals X1</th>
<th>Terminals X2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 A+ Channel A</td>
<td>1 -V 0 V</td>

</tr>
<tr>
<td>8 SH</td>
<td>8 +24 V</td>
</tr>
</tbody>
</table>

Communication with AMC circuit board
The NTAC module communicates with the AMC circuit board of the INU via a fast optical link using the standard DDCS protocol. The optical fibers are connected to channel 1 of the AMC circuit board.

Location
The NTAC interface is DIN rail-mounted inside the control compartment.
The indicated mounting position may vary depending on the number of optional devices present on the swing frame.
3.3.7 Motor temperature supervision
Motor temperature supervision is accomplished via optional PT100 input modules. These modules are suitable for connection of PT100 resistance thermometers in accordance with IEC60751 in 2, 3 or 4 conductor systems.
Chapter 4
Transportation, storage and disposal
4.1 Safety

The drive must only be handled by personnel who are skilled and experienced in unpacking and transporting heavy equipment.
4.2 Transport conditions

The transport conditions for the drive are based on IEC 60721-3-2 'Classification of environmental conditions: Classification of groups of environmental parameters and their severities; Transportation'.

<table>
<thead>
<tr>
<th>2K12 Climatic conditions</th>

</tbody>
</table>
4.3 Unpacking and inspection

Recommended steps for inspecting the drive after delivery.

1. Remove all packaging material carefully.
2. Check the drive and accompanying equipment for damages.
3. Compare the complete delivery with the purchase order and the packing list.
4. If parts are missing or damaged, immediately inform the shipping company and the ABB service organization.
   It is recommended to photograph the damages and send the photographs to ABB.
4.4 Lifting and transportation

The following instructions should be observed at all times during transportation of the drive.

It is recommended to have the following information at hand before transporting the cabinet:

- **QQFOEJY$y.FDIBOJDBMESBXJOHT** provides details on dimensions, weight, and of the center of gravity of the cabinet.
- **$IBQUFS1PXFSFMFDUSPOJDTBOE DBCJOFUGFBUVSFT** provides instructions if the door of the AFE INU compartment cannot be opened.

### 4.4.1 General notes on transportation

Observe the following points when transporting the cabinet:

- The cabinet can be transported by crane, or by pallet trucks.
- Drive components can be damaged during transportation. Therefore, the cabinet must be transported in an upright position.
- When transporting the cabinet, ensure that no dirt enters. Keep the doors closed. Metallic dust in particular may cause damage and lead to malfunction when the cabinet is powered up.
4.4.2 Using a crane

Observe the following points when using a crane:

- Use lifting equipment (e.g., web slings, chain slings, round slings, safety hooks, shackles) that corresponds to the weight of the cabinet.
- Attach a sling to the outer holes of the rails. The holes are marked with a chain and an arrow.

The rails can be removed after the cabinet has been installed at its final location.

- Do not pass a sling through the hole. Use appropriate safety hooks or shackles to attach a sling.
- Verify that the slope angle (θ) is appropriate to the weight of the cabinet.

- Observe the center of gravity.
- Lift the cabinet slowly and steadily to the required clearance height maintaining the cabinet in upright position.
- Check the horizontal position of the cabinet. Reposition the slings if necessary.
4.4.3 Using hand pallet trucks

Observe the following points when transporting the cabinet:

- Place a pallet truck on the left and on the right of the cabinet.

Capacity and fork length for pallet trucks:

<table>
<thead>
<tr>
<th>Pallet Truck</th>
<th>1</th>
<th>2, 3, 4</th>
</tr>
</thead>
<tbody>
<tr>
<td>Capacity</td>
<td>3000 kg</td>
<td>2000 – 2200 kg</td>
</tr>
<tr>
<td>Fork length</td>
<td>2 m</td>
<td>1 m</td>
</tr>
</tbody>
</table>

- Insert the forks fully to transport the cabinet.
- Make sure that the forks are on the same height.
4.5 Storage

The drive can be stored for up to one year in the original packaging as long as it is not damaged or opened. For information on longer storage periods, contact the ABB service organization.

4.5.1 Storage conditions

The minimum requirements for storage are based on IEC 60721-3-1 'Classification of environmental conditions: Classification of groups of environmental parameters and their severities; Storage'.

Table 4-2 Storage conditions

<table>
<thead>
<tr>
<th>1K22 Climatic conditions</th>
</tr>
</thead>
</table>
| Air temperature | -25 – +55 °C (drive)  
| Relative humidity | 10 – 100%  
| Absolute humidity | 0.5 – 29%  
| 123 Special climatic conditions |  
| Movement of surrounding air | 30 m/s  
| 1B1 Biological conditions |  
| Flora | Negligible  
| Fauna | Negligible  
| 1M12 Mechanical conditions |  
| Vibration | 0.1 m/s² (5 – 200 Hz)  

4.5.2 Storage

If the drive is taken out of service for a longer time, proceed as follows:

1. Cover all cable inlets and ventilation slots with an impermeable plastic or aluminum foil and a wooden panel.
2. Add a desiccant of the appropriate quality:
   - 1 unit desiccant (30 g) absorbs 6 g water vapor.
   - The following quantity is needed when using a polyethylene foil:
     - 10 units/m² foil
3. Close and lock the doors of the cabinet.
4. Use polyethylene or equivalent for packaging:
   - 0.3 g/m²/24h water vapor diffusion
5. Attach humidity indicators to the packaging.

The storage conditions and the packaging should be checked regularly. Any damages that occur during the storage period should be repaired immediately.
4.6 Storage of spare parts

The following instructions should be observed at all times in order to store and maintain the spare parts in good condition.

4.6.1 Storage place conditions
- Temperature range: -5 °C – + 55 °C
- Free of vibration and shock.
- Protected against dust, sand, vermin and insects.
- Free of corrosive gases, salt or other impurities that could damage electronic equipment.
- Dry; no condensation
  Relative air humidity: 5 – 85%
  If in doubt whether the maximum allowed humidity is exceeded, protect the spare parts by an external heater.

4.6.2 Handling precautions

NOTICE

To maintain spare parts in good condition and to keep the warranty valid during the warranty period, observe the following:
- Check the spare parts immediately after receipt for damages. Report any damage to the shipping company and the ABB service organization.
- Keep spare parts in their original packaging.
- Store printed circuit boards in antistatic bags or boxes.
- Ground yourself with a wrist strap before touching a component.
- Hold the component only at the edge.
- Put the component on a grounded working surface protected against electrostatic discharges.
4.7 Disposal of packaging materials and components

Dispose of the packaging materials and the components at the end of the life time of the drive according to local regulations.
Chapter 5
Mechanical installation
5.1 Safety

All installation work must be carried out by qualified personnel according to the site and equipment requirements and in compliance with local regulations.
5.2 Overview on installation work

The installation includes the following work:

- Preparing the floor
- Fixing the cabinet to the floor
- Installing fan units
5.3 General notes on installation

NOTICE

5.3.1 Dimensions, clearances
For information on cabinet dimensions, clearances to be observed and mounting hole sizes, see “Installation and Commissioning”.  

5.3.2 Cabinet roof
The cabinet roof is not designed as a mounting base for foreign devices, cable ducts etc. Therefore, it is not permitted to install any foreign device on the roof.  

5.3.3 Fire protection
Suitable fire protection measures should be applied to prevent fire spreading into the drive.  

5.3.4 Cable duct material
Cable ducts should be of non-flammable material with a non-abrasive surface. All cable entries and exits should be protected to prevent dust, humidity and animals entering the drive.  

5.3.5 Preparing the floor
Condition of the floor
- Must support the weight of the cabinet
- Overall incline across 5 m must not exceed 5 mm
- Even
- Non-flammable, smooth and non-abrasive
- Protected against humidity diffusion
5.4 Fixing the cabinet to the floor

The cabinet provides a hole in each corner of the base for floor fixings.

References
5-1 Fixing the base to the floor

The holes are accessible from the outside (A). Floor fixings are not supplied. Anchor bolts as illustrated (B), or screws and nuts of size M20 are recommended.
5.5 Installing fan units

The fans are always shipped separately from the drive.

Installation
1. Lift the fan unit onto the roof by means of a forklift or a crane (if using a crane, employ the lifting eyes in the fan roof).

Additional fan unit supplied with DTL (direct-to-line) drives

~94 kg

For information on the number of fan units to be installed and their location on the cabinet roof, see the technical manual.

Note: The mounting position can be identified by the cutouts in the drive roof.

2. Use the supplied screws to fasten the fan unit(s) to the fan mounting plate(s) on the cabinet roof.

Additional fan unit supplied with DTL (direct-to-line) drives

~17 kg

Redundant DTL fan configurations
Redundant DTL fan configurations require prior installation of the appropriate redundancy adaptor box on the cabinet roof.

Adaptor box for redundant DTL fan units

~17 kg

For information on the electrical installation, see Control and power supply cables for fan units.
Chapter 6
Electrical installation
6.1 Safety

⚠️ WARNING ⚠️

A DANGEROUS SITUATION
A dangerous situation has been identified that could cause severe injury or death.

Identifying and overcoming electrical hazards are critical. It is essential to take the necessary precautions to prevent accidents and injuries.

The use of protective devices is mandatory. Failure to use these devices may lead to severe injuries or death.

Always ensure that the electrical system is properly insulated and grounded. Improper insulation can cause severe electrical shock or fire.

Understanding the risks associated with electrical work is crucial. Lack of knowledge can result in severe injuries or death.

Always follow the manufacturer's instructions and guidelines when using electrical equipment. Incorrect use can lead to severe injuries or death.

Taking the necessary precautions is essential to ensure the safety of everyone involved. Neglecting these precautions can result in severe injuries or death.
6.2 Overview of installation work

The electrical installation includes the following wire and cable connections:

- Cables between integrated transformer and drive
- Power cables, ground cables, equipotential bonding conductor
- Auxiliary power, control and serial communication cables
- Control and power supply cables for fan units
6.3 Cable requirements

Cables are used for the connection of the power to the input transformer, from the transformer to the converter and from the converter to the motor.
6.4 Parallel routing of power cables

Independent of the distance between the non-integrated transformer and the drive, and the drive and the motor, one single-core cable per each phase must be used. The current carrying capacity must not be increased by laying cables in parallel.
6.5 Terminal sizes

The auxiliary power and I/O module terminals are described below.

---

Table 6-1 Auxiliary power terminal sizes

For information on the auxiliary supply voltage, see the SBUJOHMBCFMPGUIFESJWF.
6.6 Ground cable and cable shield connections

The cabinet is equipped with a ground busbar (marked PE, Protective Earth) for grounding the armor and shields of the cables, and for the connection of the ground cable.

References

6-1 Grounding drive system and integrated transformer

To identify the ground busbar, see [QQFOEJY$y.FDIBOJDBMESBXJOHT].
References

6-2 Grounding drive system and non-integrated transformer
6.7 Cables between integrated transformer and drive

Cabling of a drive with an integrated transformer includes the following connections:

- Transformer primary and secondary cables
- Temperature sensor cables
- Three-phase power supply and control cables to each of the transformer fan units
- Air filter and pressure monitoring cable
- Heating cable (option)
- Optical fiber and power supply for primary current measurement

The cables are identified by their specific number and are labeled with the designation of the terminal where they are connected to.

The cables are prepared for connection. Power cables are rolled up in the transformer cabinet, control cables in the drive cabinet.

For further information, see the applicable 8JSJOHEJBHSBNT.
6.7.1 Heating cable (optional)

This section applies to drives that are delivered in several transport units and are equipped with a heating cable.

1. Connect the power supply of the heating cable.

For further information on power supply connections, see the applicable 8JSJOH EJBHSBNT.

2. Connect the heating cables of two adjoining transport units with each other.
3. Fasten the connectors with cable ties.
6.8 Cable entries

The drive is prepared for top or bottom cable entry with one or a combination of the following cable entries:

- Cable entry with EMC plates
- Cable entry with sealing modules, type 1

For further information, eg, location and dimensions, see the applicable <image>

6.8.1 Cable entry with EMC plates

**Usage**
Power cables, ground cables, bonding conductors
Auxiliary power cables, control cables

**Included in delivery**
Galvanized plate with net-like EMC sleeves and sealing grommets

Example

EMC cushions on the underside of the EMC plate if the cable entry is used for control cables.

6.8.2 Cable entry with sealing modules, type 1

**Usage**
Power cables, ground cables, bonding conductors

**Included in delivery**
Cable entry frame

6.8.3 Cable entry with sealing modules, type 2

**Usage**
Auxiliary power cables, control cables

**Included in delivery**
Frame, EMC sealing inserts

**Supplier**
Roxtec AB (www.roxtec.com)

**Not included in delivery**
Sealing modules, accessories, tools

**Not included in delivery**
Installation tools and accessories

Example
6.9 Power cables, ground cables, equipotential bonding conductor

The method to prepare the cables for connection to their corresponding busbars is described below.

6.9.1 Further information

See the following sections for information on:

- Project-specific cable entry
- Distance between the point of cable entry and the termination bars
- Busbar and fastening hole dimensions
- Busbar designations

See the following sections for information on:

- Conventions for cross-references and device identification

6.9.2 Preparing the cable entry and the cables

NOTICE

Determining the cable length
1. Determine the required length of a cable between the point of entry and the connection point inside the cabinet.
2. Cut the cable to the required length before connection.
Preparing cables for EMC plates

The orientation of the EMC plates is the same for top and bottom cable entry: the sealing grommets face always upwards.

1. Remove the grommets.
2. To ensure proper sealing, cut along the marking that corresponds to the cable diameter.

3. Slide the grommet onto the cable. The grommet must fit tightly to prevent water entering the cabinet.
4. If necessary, remove the entry plate and push the cable through the entry holes.
5. Prepare the cables as illustrated in A and B:
   - Conductors extended for EMC bonding with the metal enclosure of the cabinet.
   - Conductors extended without an outer screen or shield.

References

- 6-5 Preparing power cables for EMC plates
Preparing cables for cable entries with sealing modules

- Prepare the cable entries for EMC bonding with the metal enclosure of the cabinet.
- Install the sealing modules according to the instructions of the sealing module supplier (Roxtec AB).

6.9.3 Connecting the cables

### Checking the cable insulation

- Measure the insulation of each cable before connection and verify that the results are within the specification of the cable manufacturer.
- Leave the cable conductors unconnected at both ends until the commissioning engineer has given permission.

---

**NOTICE**

- Prepare the cable entries for EMC bonding with the metal enclosure of the cabinet.
- Install the sealing modules according to the instructions of the sealing module supplier (Roxtec AB).

---

**References**

— 6-6 Preparing power cables for sealing modules

### Diagram

1. Outer cable sheath
2. Sealing module
3. Frame
4. Conductive foil of sealing module
5. Cable sheath removed to expose cable shield
6. Cable clamp
7. Shrinkable sheath seal
8. Shield extension to be connected to PG busbar
9. Conductor screen extension to be connected to the PG busbar
10. Heat-shrinkable termination
11. Cable lug as specified by the cable supplier and suitable for M12 bolt
Connections
Connect the cables to their corresponding busbars:
- the feeder cable conductors to busbars U1, V1, W1,
- the motor cables to busbars U2, V2, W2,
- the screen ends of all conductors and the shields of all cables to the PE ground bus,
- the ground cable to the PE ground bus,
- the equipotential bonding conductor to the PE ground bus.
Bolted connections

**Material requirements**
- Use stainless steel bolts and nuts with the appropriate steel grade and property class for the connection (recommended: A2-70 [designation according to ISO 3506]).
- Nuts with bonded coating can be used as an alternative to uncoated stainless steel nuts.

**Connection type**
The following connection type is recommended when a cable lug is connected to a busbar:
- Spring washer and flat washer on each side of the busbar
  Other washers can be used, provided they maintain the required contact pressure.
- Cable lugs suitable for M12 bolts.

**Lubrication**
- If stainless steel bolts and nuts are used, lubricate the thread and head contact surface of the bolt using recommended pastes, eg, Molykote D paste
- If a coated nut (eg, with bonded molybdenum-disulfide [MoS₂] coating) is used, the connection does not have to be lubricated.

**Tightening torque**
- Tighten bolted connections with bolts of sizes M10 and greater with the recommended nominal torque for the bolt size used.
6.10 Auxiliary power, control and serial communication cables

The method to prepare the auxiliary power and control cables for connection is described below.

6.10.1 Further information

See Layout drawing in [Diagram] for information on:

- Project-specific cable entry
- Dimensions between point of cable entry and terminals

See [Diagram] for information on:

- Conventions for cross-references and device identification
- Terminal designations

The power feed for the auxiliary supply must be protected with a suitable circuit protection rated for the inrush current. For information, see [Drive list of the drive].

6.10.2 Preparing the cable entry and the cables

Determining the cable length

1. Determine the required length of a cable between the point of entry and the connection point inside the cabinet.
2. Cut the cable to the required length before connection.
Routing the cables
Top and bottom entry
- Rout the cables as illustrated to the customer terminals in the control compartment.

Preparing cables for EMC plates
Top or bottom entry
1. Remove the grommets.
2. To ensure proper sealing, cut along the marking that corresponds to the cable diameter.
3. Slide the grommet onto the cable. The grommet must fit tightly to prevent water entering the cabinet.
4. If necessary, remove the entry plate and the cable through the entry holes.
5. Loosen all screws of the EMC cushion brackets and push the cushions apart.
6. Remove the cable insulation at the point of entry.
   If the outer cable screen is non-conductive, cut open the cable screen in the middle of the stripped area. To turn the conductive side inside out, pull the cable screen ends over the cable insulation. Connect the screens ends with a continuous conducting foil.

7. Pull the cables through the EMC cushions.
8. Push the cushions together so they fit tightly around the bare screen and tighten the screws.
Preparing cables for cable entries with sealing modules

Top or bottom entry

1. Unscrew the frame and remove the sealing modules.

2. For EMC bonding with the metal enclosure of the cabinet.

---

---

1. Sealing module
2. Conductive foil
3. Cable sheath removed to expose cable shield
4. Conductor screen extension to be connected to PE terminal
Preparing cables for cable entries with cable glands

- On the length of cable which passes through the conductive part of the cable gland, remove the outer cable sheath to bring the conductive foil of the sealing module in contact with the cable shield.

---

References

6-12 Preparing control cables for cable glands

1. Outer cable sheath
2. Cable gland
3. Conductor insulation removed to expose cable shield
4. Plate
5. Conductor screen extension to be connected to PE terminal
6.10.3 Connecting the cables

IOEC modules

- Connect the cables for digital and analog input and output signals to the IOEC modules.

Conductors

- If a twisted pair cable is used, leave the unshielded cable ends twisted until they reach the terminals.
- Leave unshielded conductor ends as short as possible (not longer than 50 mm).

Cable shields

1. Connect the shield of serial communications cables to the fieldbus adapter.
2. Connect the overall shield and the individual shields of the encoder cable to the separate shield grounding bracket. Do not connect the shields directly to the encoder adapter. To accommodate encoder cables of different diameters, ground clamps of different sizes are supplied.

References

6-13 Shield grounding point for encoder cable
6.11 Control and power supply cables for fan units

The control and power supply cables are already prepared in the factory for connection.

**DTL fan units**
*(In drives with DTL operation only)*
Connect the power supply cable to the fan unit to the terminals inside the corresponding terminal box (see picture below).

**Standard fan units**
1. Pull the control and power supply cables through the rear cable entry located in the floor of the fan unit (see picture below).
2. Route the cables through the fan cable entry on the cabinet roof and connect them to the appropriate terminals inside the cabinet.

For information on connection details, see the applicable [document name].
References

6-14 Connecting the fan units

1. DTL fan unit
2. Standard fan unit
3. Power supply cable
4. Terminal box
5. Front cable entry
6. Rear cable entry
7. Fan cable entries on cabinet roof
6.12 Final checks

Check that the entry plates are properly fastened.

If EMC entry plates with grommets are used, check that the grommets fit tightly to prevent water entering the cabinet. If necessary, seal gaps with silicone.
Chapter 7
Commissioning
7.1 Required qualification

Commissioning, parameter adjustments and functional tests of the drive must be carried out only by commissioning personnel certified by ABB.
7.2 Commissioning procedure

Information on the commissioning procedure and the start conditions for commissioning can be obtained from ABB. To contact the ABB service organization, see Contact information.
7.3 Commissioning check list

In order to ensure uncomplicated and speedy commissioning, it is important that drive and associated equipment are ready for commissioning. Reviewing and completing the items in the check list before the commissioning personnel arrive on site will help to achieve this.
7.4 Customer assistance

During the commissioning period, the customer is requested to provide qualified personnel for assistance, who are:

- experienced with medium and low voltage equipment and with the local safety regulations,
- familiar with the driven process,
- authorized to operate associated medium and low voltage equipment (e.g., main circuit breaker, other low and medium voltage switchgear),
- authorized to operate the driven process for functional tests.
7.5 Customer acceptance

When commissioning has been completed, the commissioning report is signed by the responsible commissioning personnel and by the customer as a sign of acceptance. A copy of the report and a copy of the actual parameter settings are handed out to the customer.
Commissioning check list
### Mechanical installation

1. Drive installed according to the instructions in the VTFSNBOVBM
2. Drive securely fastened to the floor (if applicable)
3. Fan unit or fan units installed
4. Visual inspection:
   - no badly affixed or damaged components
   - no foreign objects inside cabinet
   - no dirt, dust and humidity inside cabinet

### Electrical installation

1. Types and cross sections of control cables suitable for the signal type and signal level
2. Types and cross sections of power cables selected according to the QPXFSDBCMFTQFDJGJDBUJPO
3. Pulse encoder cable screens connected to screen grounding point and not connected directly to the pulse encoder interface (only applicable for drives with pulse encoder interface)
4. Cable entry prepared according to the instructions in the VTFSNBOVBM
5. All control cable screens and conductors are connected according to the instructions of the VTFSNBOVBM, appropriately labeled, and the customer-side connections are completed
6. Heating cable (if supplied) installed according to the instructions in the VTFSNBOVBM
7. Ground cable of drive securely connected at both ends
8. Input transformer and motor cables not connected at both ends (cables and drive must be meggered before connection)
Main circuit breaker (MCB)

1. Type of MCB selected as per design specifications
2. High voltage connections completed
3. MCB ready to be tested with drive
4. MCB protection relay settings tested
5. Safety devices (eg, door locks) tested and in operation

Input transformer (if applicable)

1. Ground connection completed
2. Transformer auxiliaries (eg, dehydrating breathers, cooling, protection devices) ready
3. Safety devices (eg, door locks) tested and in operation

Motor

1. Motor installed, aligned, and alignment protocol available
2. Motor not coupled to driven load
3. Ground connection completed
4. Motor auxiliaries (eg, bearing lubrication, heater cooling) ready
Insulation tests

1. All power cables to input transformer, between input transformer and drive, and from drive to motor measured, measured values within the required limits.

2. Test report of the megger test available

If the test is carried out by the commissioning engineer of the drive, an additional day per drive motor combination needs to be reserved. After the test, the feeder cables can be connected, except at the drive end. The test must comply with the specification.

Power supply

1. Medium voltage available for the start-up of the drive

2. Low voltage auxiliary power available for the start-up of the drive

Miscellaneous

1. Sufficient number and correct type of spare parts are available

2. Air conditioning of drive room ready for the load run of drive

3. Optional equipment ready
Chapter 8
Operation
8.1 Ambient operation conditions

The operating conditions for the drive are according to IEC 60721-3-3 ‘Stationary use at weather-protected locations’ (unless indicated otherwise).

</table>

If the operating conditions are not within the specifications, contact ABB.

For the maximum ambient temperature, see the [SBUJOHMBCFM](#) of the drive.
8.2 Safety

The drive must only be operated by qualified and authorized personnel, ie, personnel who are familiar with the operation of the drive and the hazards involved.
8.3 Overview

The chapter outlines the local operation of the drive.

Control of the drive via a PLC or a higher-level control system is not described in this chapter. If the drive is controlled from remote, see the appropriate manuals for information.

The panel messages and parameter settings used in this chapter are typical examples to illustrate the related instructions and display functions and may therefore differ from the actual messages and parameter settings in the drive.
8.4 Overview of local operator panel

The operator panel on the control compartment door enables the operator to control the drive without restrictions provided that all requirements for normal operation are met.

The functions of the operator panel include:
- Connecting / disconnecting the main power supply
- Setting the reference value
- Starting, stopping the drive
- Displaying:
  - Actual values
  - Status messages
  - Alarm and fault messages
- Viewing, setting parameters
- Resetting alarm and fault messages
- Activating the emergency-off circuit
- Testing the bulbs of lamps and illuminated pushbuttons

1. CDP control panel
   Main functions:
   - Starts and stops the motor
   - Displays status messages
   - Displays alarm and fault messages of the drive and monitored foreign equipment
   - Resets alarm and fault messages

2. Supply ON
   Illuminated pushbutton. When pressed, it lights up and turns the main power supply on (the main circuit breaker closes and the DC link charges).

3. Supply OFF
   Illuminated pushbutton. When pressed, it lights up and turns the main power supply off (the main circuit breaker opens and the DC link discharges).

4. Alarm / Fault lamp
   - Fault: permanent light
   - Alarm: flashing light

5. Grounding Switch Unlocked
   Illuminated pushbutton. It lights up if the grounding-switch can be released by pushing the Grounding Switch Unlocked pushbutton. Keep this pushbutton pressed to turn the grounding switch to the grounded or ungrounded position.
   Note: This pushbutton also works as a test lamp. To test its functionality, press it and verify that it lights up.

6. Emergency Reset pushbutton (option)
   Resets the emergency-off relay of the drive control system
   Flashes when the auxiliary voltage is switched on, or when an emergency-off switch is pressed

7. Emergency Off
   Latching pushbutton. When pressed during operation of the drive, the main circuit breaker opens immediately and the DC link discharges.
   When pressed at standstill of the drive, it prevents the drive from starting.
For further information on the CDP control panel, see [CDP control panel](#).

### 8.4.1 Lamp-test

The lamp test is activated via the CDP control panel by setting parameter 16.7 to LAMP TEST. The lamp-test function resets itself after a set time.
8.5 Status messages

The following section lists the status messages of the main operating states of the drive.

### 8.5.1 Overview on status messages

The following section lists the status messages of the main operating states of the drive, the drive passes through, when it is put into operation (see section Start sequence of the drive), when it is stopped (see section Stop sequence of the drive), or when a fault condition has occurred. The status messages are sent to the higher-level control system and are displayed on the CDP control panel of the drive.

- **NotReadyOn**: means that the DC link cannot be charged and the drive cannot be connected to the main power supply, i.e., the main circuit breaker cannot be closed. The status message is displayed, e.g., when the doors of medium voltage compartments are still open, the grounding switch of the drive is in the grounded position, or the motor starter of the fan unit is switched off.

- **Ready on**: The status message signals that the drive is healthy and ready for the ON command. The ON command initiates charging of the DC link capacitors and closing of the main circuit breaker of the drive. Depending on the control place, the command can either be sent from the higher-level control system to the drive or be initiated by pressing the SUPPLY ON pushbutton on the control compartment door.

- **Charging**: The status message changes to Charging when the DC link capacitors of the drive are being charged.

- **Stopping**: Indicates that the drive has received a stop command and that a ramp or coast stop has been initiated. The stopping mode depends on the parameter setting. The status message changes to **Ready Run** when the zero speed threshold is reached. When a start command is given while the drive is stopping, the drive resumes operation and the status message changes to **Ready Ref** again.

- **Tripped**: The status message indicates that a fault condition has occurred that requires a shutdown of the drive. During shutdown, the status message is alternating between **Tripped** and the specific fault message.

For information on other status messages, such as fault status messages in particular, see the status words in the Appendix G – Signal and parameter table of the drive.
8.5.2 Start sequence of the drive

**AFE Ready on**

- AFE Ready on
- Ready on
- Charging
- DC link charges
  - Fan switches on
  - MCB closes
- AFE Ready ref
  - Start command
  - INU starts to modulate
  - Ready ref
  - Operation

**Ready on conditions:**
- Auxiliary supply on
- AFE - INU door closed and locked
- Drive not grounded
- No emergency off
- No fault

On command

Start sequence:
- Not ready on
- **Ready on**
- **Charging**
- **AFE Ready ref**
- **Ready run**
- **Start command**
- **Operation**
8.5.3 Stop sequence of the drive

Operation

Ready ref

Stop command

Stopping

Speed ramps down
INU stops to modulate

Ready run

Stop command to AFE

Off command

MCB opens
DC link discharges
Fan switches off after a delay

AFE Ready on

Actions:
Drive is grounded
AFE-INU door is released for opening
Auxiliary supply is switched off

Ready on

Not ready on
8.5.4 Emergency-off sequence of the drive

For the sake of simplicity, the flow diagrams of the AFE were omitted in the above diagrams.
8.6 Starting the drive

The procedure to start the drive is described below.

8.6.1 Checks before starting the drive

It is recommended to have the following documents at hand when starting the drive locally for the first time after commissioning:

- Identify the circuit breakers to be switched on.
- CDP control panel for information on functions and features of the CDP control panel.

8.6.2 Starting the drive from remote

When the drive is operated from remote through a higher-level control system or an operator control desk, follow the instructions in the appropriate manuals.

8.6.3 Starting the drive locally

The motor is controlled by the INU of the drive. For this reason, the CDP control panel must be connected to the INU to be able to start up the drive locally. The CDP control panel is only connected to the AFE if it is required to view status and fault messages of the AFE.

When the drive is running, the CDP control panel can be connected back and forth without interrupting the operation of the drive. However, to stop the drive, the CDP control panel must be connected to the INU. Switching the CDP control panel from the INU to the AFE and back is done with the drive selection mode.

For further information, see Drive selection mode.

1. Check that the CDP control panel is connected to the INU.
2. Enable the local control mode of the CDP control panel.
3. If the EMERGENCY RESET pushbutton (option) is flashing, press the EMERGENCY RESET pushbutton to cancel flashing.

This step only applies to drives which are equipped with the optional safety relay.
Each time the auxiliary voltage is switched off and on again, the emergency-off safety relay of the drive is actuated and lets the EMERGENCY RESET pushbutton flashes. The EMERGENCY RESET pushbutton also flashes if the EMERGENCY OFF pushbutton on the control compartment door, or any other emergency-off switch linked to the drive, is pressed. If the EMERGENCY RESET pushbutton continuous flashing, verify that there is no emergency-off command active.

For further information, see Emergency-off.

4. Check that no alarm or fault messages are displayed on the CDP control panel. When a fault message is displayed on the CDP control panel, reset the fault.

If a fault cannot be reset, it must be rectified by the responsible personnel.

See Alarm / fault indications for further information.

When no alarms and faults are present and the drive is ready, the CDP control panel displays ReadyOn.

5. Press the on the control compartment door to close the MCB and charge the DC link. The status line of the CDP control panel alternates between Charging and AuxiliaryOn.

After charging has been finished, if the CDP control panel was switched to the AFE, you would first see the message Modulating and then after a short instant the message ReadyRef in the status line of the display.

When the AFE is in ReadyRef state, the state of the INU changes to ReadyRun and the motor can be started.

6. Enter the reference value.

For further information, see Entering a reference value

7. Start the motor.

After the motor has been magnetized, the motor speed ramps up to the reference value. While the motor is accelerating, the run status message on the display blinks. When the motor speed has reached the reference value, the run status message lights up permanently.

To indicate that the drive is operating, the display shows ReadyRef:
8.7 Stopping the drive

The procedure to stop the drive is described below.

Press the STOP key on the CDP control panel. The motor stops according to the preset stop function and the drive stops modulating. While the motor stops, the status line of the display shows ReadyRef. The run status message blinks during the stop sequence.

As long as the stop sequence is in progress, the drive can always be restarted by pressing the START key on the CDP control panel.

Just before the motor will come to a standstill, the CDP control panel displays shortly the message Stopping.

When the drive has stopped modulating, the CDP control panel displays ReadyRun.

As long as the MCB has not been opened, the motor can be started again.
8.8 Emergency-off

The procedure to perform an emergency shut-down is described below.

8.8.1 Function
The drive is equipped with a hard-wired emergency-off circuit. When an emergency situation occurs during operation, this safety feature ensures that the drive can be disconnected without delay from the main power supply. When the EMERGENCY OFF pushbutton has been pressed while the drive is at standstill, the main power supply cannot be connected to the drive, hence the drive cannot be started up.

The EMERGENCY OFF pushbutton of the drive is part of the operator control panel and features a latching switch action.

Pressing the EMERGENCY OFF pushbutton does not disconnect the auxiliary power supply from the drive.

8.8.2 Initiating an emergency-off
An emergency-off is initiated by pressing the EMERGENCY OFF pushbutton on the control compartment door or an external EMERGENCY OFF pushbutton (if present) linked to the emergency-off circuit.

When an emergency-off is initiated during drive operation, the following takes place:
- The MCB opens.
- The drive coasts down.
- The DC link of the drive discharges.
- The status line of the CDP control panel alternates between the message EmergencyOff, NotReadyOn.
- The EMERGENCY RESET pushbutton flashes.
- The SUPPLY OFF pushbutton flashes.

8.8.3 Starting the drive after an emergency-off
1. To start the drive after an emergency-off reference value, unlatch the EMERGENCY OFF pushbutton.
2. Turn the EMERGENCY OFF pushbutton into the direction indicated by the arrows on the pushbutton to return the pushbutton to its initial position.
3. Press the RESET key on the CDP control panel to cancel the emergency-off message on the display.
4. To reset the emergency-off safety relay of the drive, press the EMERGENCY RESET pushbutton.

After resetting, the status message of the drive changes to ReadyOn.

The main power supply can be connected to the drive again and the drive can be started up.
Chapter 9
CDP control panel
9.1 Overview

The panel messages and parameter settings used in this chapter are typical examples to illustrate the related instructions and display functions and may therefore differ from the actual messages and parameter settings in the drive.

9.1.1 Display and keypad

The CDP control panel features a 4-line LCD display and a 16-key keypad. The keys are identified in the diagram below:

1. Display
2. Keypad
3. Mode selection keys
4. Fast navigation keys, select and / or change a value fast
5. Slow navigation keys, select and / or change a value slowly
6. Enter key, terminates a procedure
7. Local / remote selection key
8. Reset key
9. Reference key
10. Start key
11. Forward key
12. Reverse key
13. Stop key
9.2 CDP control panel functions

The CDP control panel serves as the basic user interface for operating and monitoring the drive when the local operating mode has been selected.

The CDP control panel can be attached to or detached from the drive without having to switch off the auxiliary power supply first. Using the CDP control panel, it is possible:

• to enter start-up data,
• to control the drive with a reference value, and start, stop and direction commands,
• to display actual values (three values can be read simultaneously),
• to display and adjust parameters,
• to display information on the most recent forty fault events,
9.3 CDP control panel modes

The CDP control panel provides the following modes:

- Identification mode
  - Actual signals mode
  - Parameter mode
  - Function mode
  - Drive selection mode
9.4 Identification mode

The identification mode informs the user about the CDP control panel version and the ID number of the drive.

The information appears on the display when:
- the power supply is switched on, or
- the CDP control panel is connected to the drive and the auxiliary voltage has been switched on already.

When the CDP control panel is initialized as described before, the display changes as follows:

After 2-3 seconds, information on the drive, the application software in use, and the drive identification is displayed.

After another few seconds.

After another few seconds, the display changes to the actual signals mode. The status line of the display alternates between DCGnd NOpen, NotReadyOn.
9.5 Actual signals mode

Two displays can be selected in the actual signals mode:

9.5.1 Overview
Two kinds of displays can be selected in the actual signals mode:
- Actual signals display
- Fault history display

The actual signals display appears first when the actual signals display mode has been selected. However, when the drive is in a fault condition, the fault display will be shown instead.

The actual signals display is used to monitor the drive without interfering its operation. Three selectable actual values are shown continuously on the display.

The CDP control panel will automatically return to the actual signals mode from other modes within one minute when no keys are pressed (exceptions: status display and common reference display when in drive selection and fault display mode).

Actual values

<table>
<thead>

</tbody>
</table>

For the complete list of selectable actual signals, see 4JHOBMBOEQBSBNFUFSUBCMF.

Fault memory
The fault memory includes information on the 64 most recent fault events that occurred in the drive. The name of the fault and the actual time are displayed. The procedure for selecting and clearing the fault history is described in section Displaying and resetting an active fault.

When a fault or warning is generated in the drive, the message will be displayed immediately, except when in drive selection mode.

Changing from the fault display mode to other display modes is possible without resetting the fault first. When no keys are pressed, the fault or warning text is displayed as long as the fault is pending.

Control panel overview

9.5.2 Selecting the actual signals display
To open the actual signals display, press the ACT key.
9.5.3 Toggle between actual signals display and fault history

To toggle between actual signals display and fault history display, press a fast navigation key.

9.5.4 Displaying three actual signals

1. To display the full name of three actual signals, press and hold the ACT key.

2. To return to the actual signals display, release the ACT key.

9.5.5 Selecting actual signals

1. To select the actual signals display, press the ACT key.

2. To select a row where the actual signal is to be displayed, press the corresponding slow navigation key. A blinking cursor indicates the selected line.

3. To enter the actual signal selection function, press the ENTER key.

4. To select a parameter group, press the corresponding fast navigation key.

5. To select an actual signal, press the corresponding slow navigation key.

6. To accept the selection and to return to the actual signals mode, press the ENTER key.

7. To cancel the selection and keep the original selection, press any of the mode selection keys. The selected CDP control panel mode is entered.
9.5.6 Displaying a fault and resetting the fault history

1. To enter the actual signals mode, press the ACT key.

2. To change to the fault memory display, press a fast navigation key.

3. To display a specific fault, press the slow navigation keys. The UP key selects the previous, the DOWN key the next fault.

4. To clear the fault history, press the RESET key.

5. To return to the actual signals mode, press a fast navigation key.

9.5.7 Displaying and resetting an active fault

1. To display an active fault, press the ACT key.

2. To reset the fault, press the RESET key.
9.6 Parameter mode

Running a drive with the correct settings is essential for the proper operation, efficiency and safety of the system.

Parameters allow the drive to be configured and set-up specifically for an application. Parameters are organized in functional groups. All control functions are represented by a parameter group and can be activated and set-up individually by the parameter mode.

<table>
<thead>

</table>

For further information on the parameters, their settings and functions, see Signal and parameter table.

When the parameter mode is entered for the first time after the auxiliary voltage of the drive has been switched on, the display will show the first parameter of parameter group 11. The next time the parameter mode is entered, the previously selected parameter is shown.

Some parameter values cannot be changed while the drive is running. If tried, the following warning will be displayed:
Control panel overview

1. Status line
2. Group number and name
3. Parameter number and name
4. Parameter value
5. Selects the parameter mode
6. Selects the parameter number and name
7. Selects the parameter value
8. Enters change mode
   Acknowledges the selection

9.6.1 Selecting and changing parameters
1. To enter the parameter mode, press the PAR key.
2. To select a different group, press a fast navigation key.
3. To select a parameter, press a slow navigation key.
4. To enter the parameter setting function, press the ENTER key.
5. To change the parameter value, press:
   - the corresponding slow navigation key for numbers and text,
   - the corresponding fast navigation key for numbers only.
6. To confirm the selection and to return to the actual signals mode, press the ENTER key.
7. To cancel the setting and keep the original selection, press any of the mode selection keys.
   The selected keypad mode is entered.
9.6.2 Enabling / unlocking a parameter lock
Unwanted parameter entry can be prevented by activating the parameter lock function. The corresponding parameters are 16.02 PARAMETER LOCK and 16.03 PASSCODE and belong to parameter group 16 SYSTEM CTRL INPUTS.

Enabling the parameter lock
1. Select parameter 16.02 PARAMETER LOCK.
2. Set parameter 16.02 to LOCKED.
3. Save the setting and exit the parameter mode.

Unlocking the parameter lock
1. Select parameter 16.03 PASSCODE.
2. Set the correct pass code.
3. Save the setting and exit the parameter mode.

For further information, see Signal and parameter table.
9.7 Function mode

The functions mode is used to set the display contrast.

9.7.1 Overview
The function mode is used to set the display contrast.

1. Status line
2. Selectable functions
3. Selects the function mode
4. Selects the line
5. Acknowledges the selection

9.7.2 Adjusting the display contrast
1. To enter the function mode, press the FUNC key.
2. To select the contrast adjustment function, press the slow navigation keys until the blinking cursor reaches the CONTRAST line.
3. To enter the contrast setting function, press the ENTER key.
4. To change the contrast value, press a slow navigation key.
5. To confirm the selection and to return to the actual signals mode, press the ENTER key.
6. To cancel the setting and keep the original setting, press any of the mode selection keys. The selected keypad mode is entered.
9.7.3 Upload and Download functions
The Upload and download functions of the CDP are not supported in ACS2000
9.8 Drive selection mode

The local / remote feature of the CDP control panel allows selecting the control location of the drive.

9.8.1 Overview
The drive selection mode is used to connect the CDP control panel either to the AMC circuit board of the AFE, or the INU of the drive.

In this context, the AMC circuit board of the AFE and INU is referred to as a drive that is identified in the control system by its ID number:

- ID number of INU: 1
- ID number of AFE: 2.

9.8.2 Selecting an AMC circuit board
It is assumed in the following example that the CDP control panel is connected to the INU.

1. To enter the drive mode, press the DRIVE key.

2. To select the ID number of the AFE and to connect the CDP control panel to the AFE, press any of the slow navigation keys.

If none of the keys is pressed, the display automatically returns to the actual signals display after a while.

If the ID number of the AFE or INU is changed by accident (e.g., to 3) and the ENTER key has been pressed, the new number is saved in the memory. The display still shows the old number. Only when the auxiliary voltage has been switched off and on again, the new number is shown on the display.

If the ID number is changed by accident, simply change the ID number back and press the ENTER key. The ID number is restored when the auxiliary power is switched off and on the next time.
Do not select LOCAL by pressing the LOC-REM key (BSSPX) when the CDP control panel is connected to the AFE.

If the drive is in operation, the AFE will stop modulating and the drive will shutdown. If the drive is stopped and the CDP control panel is set to LOCAL, the drive cannot be started up.
9.9 Local and remote control

The local / remote feature of the CDP control panel allows selecting the control location of the drive.

There are two possibilities:
- Local control
- Remote control
The control location is selected by pressing the LOC-REM key on the CDP control panel.

In this context, remote control is not necessarily equivalent to higher-level control. For further information, see Remote control.

9.9.1 Local control
In local control mode, full operational control of the drive is enabled from the local operator panel. Commands from remote have no effect.
To enter the local control mode, press the LOC-REM key. Local control is indicated by the letter L.

9.9.2 Remote control
In remote control mode, operational commands or reference values usually come from a higher-level control system via fieldbus or remote I/O. However, with the following parameter settings it is possible to start and stop the drive, to set the motor’s direction of rotation, and to enter reference values from the CDP control panel.
- 11.01 EXT1 START/STOP/DIR = 10 (KEYPAD) or 12.03 EXT REF1 SELECT = 1 (KEYPAD) and 12.02 EXT1/EXT2 SELECT = 1 (EXT1)
- 11.02 EXT2 START/STOP/DIR = 10 (KEYPAD) or 12.06 EXT REF2 SELECT = 1 (KEYPAD) and 12.02 EXT1/EXT2 SELECT = 2 (EXT2)
To enter remote control, press the LOC-REM key.
- Full remote control from a higher-level control system is indicated by a blank space.
Partial remote control (some commands enabled locally) is indicated by the letter R.

9.9.3 Disabling / enabling local lock function
Accidental switching from remote control to local control can be prevented with the lock function of parameter 16.04. The corresponding parameter is 16.04 LOCAL LOCK and belongs to the parameter group 16 SYSTEM CTRL INPUTS.

Enabling the local lock
To enable the local lock, set parameter 16.04 to 2 (LOCKED).
With this parameter setting, local control (including the LOC-REM key) is disabled.
If the CDP control panel or a DriveWindow PC is in local control mode at the time that the local lock is enabled, they remain in local control mode until they are switched to remote control mode. This means that the CDP control panel displays the letter L until you press the LOC-REM key.

Disabling the local lock
To disable the local lock, set parameter 16.04 to 1 (OPEN). With this parameter setting, switching between remote and local control is enabled.
9.10 Operational commands

For instructions on how to start and stop the drive system from the CDP control panel, see 4UBSUJOHUIFESJWF and 4UPQQJOHUIFESJWF.

9.10.1 Setting the direction of rotation
Setting the direction of rotation from the CDP control panel is possible in:
- Local control mode L
- Remote control mode R

The arrow on the display indicates the direction of rotation:
- When the motor is running, the arrow indicates the actual direction.
- When the motor is not running, the arrow indicates the preselected direction.

To set the direction of rotation, press the forward or backward key.

If you change the direction while the motor is running, the motor automatically ramps down to zero speed and re-accelerates in the opposite direction to the preset speed. The arrow changes at zero speed.

9.10.2 Entering a reference value
Entering a reference value from the CDP control panel is possible in:
- Local control mode L
- Remote control mode R

1. Press a mode selection key.
2. To enter the reference value input mode press the REF key.
3. To enter / change the reference value, press the corresponding fast or slow navigation key.
4. To exit the reference value input mode, press a mode selection key.
Chapter 10
Preventive and corrective maintenance
10.1 General information

During the warranty period of the drive, any maintenance must be carried out exclusively by ABB service personnel.

10.1.1 Required qualification
After the warranty period, maintenance must only be carried out by certified personnel.
To maintain safe and reliable operation of the drive, ABB recommends taking out a service contract with the ABB service organization.
To contact the ABB service organization, see $PO-
UBDUJOGPSNBUJPO.

10.1.2 Maintenance schedule
Carry out all maintenance tasks according to the maintenance schedule on time and at the stated intervals in the “ACS2000 Preventive maintenance schedule”.

10.1.3 Logbook
It is recommended to record all maintenance activities in the maintenance logbook including:
• Date and time
• Detailed description

10.1.4 Spare parts
To ensure safe and reliable operation of the drive, use only spare parts recommended and approved by ABB.

For information on types and identification codes, see $PO-
UBDUJOGPSNBUJPO.
10.2 Identifying electrical equipment

Electrical identification is done in accordance with IEC 81346-1.

10.2.1 Device designation
To facilitate the identification in wiring diagrams and parts lists, all devices are labeled in accordance with IEC 81346-1.

10.2.2 Identifying cables and wires
Cables and wires in the drive are equipped with marker sleeves which carry the same identification number as in the wiring diagrams.

10.2.3 Understanding the wiring diagrams
For information on item designation and cross-reference conventions, see [Reference].
10.3 Alarm / fault indications

When ACS2000 senses a fault condition in the system, it logs the fault, generates an alarm and if necessary shuts down the drive.

10.3.1 Messages
When a failure occurs in the drive or in the equipment monitored by the drive (e.g., main circuit breaker, transformer, cooling system), the CDP control panel displays a corresponding alarm or fault message and the alarm / fault lamp on the control compartment door lights up:
- **Alarm**: flashing light
- **Fault**: permanent light

The message can be saved and viewed in the fault history of the drive when a PC with DriveWindow, DriveDebug or DriveMonitor is connected to the drive. The fault history can also be called up on the CDP control panel.

10.3.2 Error message levels
Two error message levels are used in the drive:

**Alarm**
An alarm does not shut down the drive. If the condition causing the alarm is not corrected, a persisting alarm can often lead to a fault. An alarm cannot be reset manually. The alarm message is deleted from the display as soon as the alarm condition has been corrected.

**Fault**
A fault shuts down the drive. The type of shutdown depends on the origin of the fault. Depending on the type of fault, the drive opens the main circuit breaker (MCB) or keeps it closed:
- Class 1 faults (FC 1) open the MCB
- Class 2 faults (FC 2) do not open the MCB

Since the MCB is controlled and monitored entirely by the drive, no external opening command must be given to the MCB when a fault condition occurs. A fault condition must be corrected and the fault be manually reset before the drive can be started again.

Alarm / fault messages
If an alarm or a fault occurs, a specific message is saved in the fault buffer of the drive. Information on the 64 most recent fault and alarm events are saved.
10.3.3 Fault handling

The faults are entered into the fault buffer as they occur and are numbered:

- The last fault entered has number 1.
- The first fault entered has the highest number.

Information of the fault classification (e.g., FC 1 or FC 2) is also saved when the first fault of the fault class is active. Date and time stamps facilitate fault tracing, especially when a fault leads to several subsequent faults.

Example:

2. +Fault PPCS Communication 2008-01-08 16:58:24.3760
3. +Fault AMC: Fault Class 1 2008-01-08 16:56:02.1170
4. +Fault DC Undervoltage 2008-01-08 16:56:02.1170

In the above example,

- 4. +Fault DC Undervoltage is the reason for the failure of the drive system as it occurred first.
- 3. +Fault AMC: Fault Class 1 classifies the fault.
- 2. +Fault PPCS Communication represents a subsequent fault that occurred 2 min. 22 s than the first fault.
- 1. +Fault AMC: Fault Class 2 classifies the fault.

10.3.4 Troubleshooting procedure

If a fault shuts down the drive, proceed as follows:

1. Do not switch off the auxiliary power supply or try to reset a fault message before all information at the time of the occurrence of the fault condition has been saved.
2. Select the Fault History Display on the CDP control panel.
3. Do not clear the fault buffer of the drive now!
4. Select the Fault History Display on the CDP control panel.
   For further information, see $IBQUFS$%1 DPOUSPMQBOFM.
   Do not clear the fault buffer of the drive now!
3. Identify the fault and make a logbook entry.
4. Save the content of the data logger when a PC is available that has the DriveWindow or Drive-Debug tool installed.
   The data logger provides information (e.g., waveforms of voltage, current, torque) for efficient troubleshooting.
5. Contact ABB service if a fault cannot be rectified.

When calling ABB service, it is recommended to have the following data available at the time when the fault occurred:
- Operating, ambient and load conditions
- Unusual events

After the fault has been rectified, start the drive as described in $IBQUFS0QFSBUJPO$.

For further information on alarms and faults, see $QQFOEJY(y4JHOBMBOE QBSBNFUFSUBCMF$.
10.4 Removing the CDP control panel

When the CDP control panel must be removed from its mounting cradle, follow the instructions below.

1. When the panel is removed while the drive is in operation, check the setting of parameter 31.01 PANEL LOSS SUPERVISION first. If the parameter is set to NOT USED, the panel can be removed without interrupting drive operation.

2. To remove the panel, proceed as illustrated.

---

For information on setting parameters, see "QQFOEJY(y4JHOBMBOEQBSBNFUFSUBCMF.

Meaning of the LEDs
The green LED signals that the control voltage has been switched on.

Communication with AMC circuit board
The CDP control panel is connected to the AMC circuit board of the INU and the AFE via an RS485-Interface.
## 10.5 LEDs and switches on printed circuit boards and I/O devices

The following section provides an overview on the meaning of LEDs and switches of the main circuit boards and I/O devices.

The LEDs presented in the following section can be checked easily while the auxiliary voltage is switched on without having to remove covers first. The LEDs provide information on the status of the devices and can be used for diagnostic purposes.

### 10.5.1 AMC circuit board

The LEDs of the AMC board are identified in the table below:

<table>

10.5.2 IOEC I/O modules

LEDs

Cluster address
Each IOEC module has a unique cluster address that identifies the module in the software and links it to a parameter. The address is set with the rotary switch on the module. The factory set value must not be changed.

For information on IOEC switch settings, see "QQFOEJY%y8JSJOHEJBHSBNT.

10.6 Corrective maintenance

The following section describes how to de-energize the drive using the local operator panel of the drive.

10.6.1 Overview on maintenance tasks
- Visual checks on the drive.
- Cleaning
- Checking wire and cable connections
- Replacing the filter mats.
- Replacing a phase module.
- Replacing a fan.

10.6.2 Safety

DANGER
- Work always with the drive de-energized.
- Never work with the power connection to the drive while it is energized.
- Do not touch any live parts.
- Never work on the drive when it is energized.
- Always work on the drive with the power supply disconnected.
- Never work on the drive when it is energized.
- Always work on the drive with the power supply disconnected.

NOTICE
- Always stop the drive before performing any maintenance.

10.6.3 De-energizing the drive locally

If the drive is controlled from remote, follow the established shutdown procedures.

Stopping the motor
1. Check that the CDP control panel is connected to the INU.
2. Enable the local control mode of the CDP control panel.

For further information, see "Remote control of the drive".
3. Stop the motor.

When the motor has reached zero speed, the display shows ReadyRun.

De-energizing the drive
4. To disconnect the drive from the main power supply, press the SUPPLY OFF pushbutton. The following takes place:
   - The MCB opens.
- The DC link discharges. While the DC link discharges, the display shows \textit{OffSeqOn}.

When the DC link has discharged completely, the status line displays \textit{ReadyOn} and the \textsc{SUPPLY OFF} pushbutton changes to a permanent light.

5. Rack-out, lock-out, ground and tag-out the main power feeder.

6. Wait until the yellow lamp \textsc{GROUNDING SWITCH UNLOCKED} lights up. The lamp lights up when cooling of the drive has stopped. Cooling is stopped after a delay time (default setting: 10 min.) has elapsed. The delay time is triggered, when the main power feeder is disconnected.

7. If the yellow lamp \textsc{GROUNDING SWITCH UNLOCKED} is on, turn the grounding switch to the grounded position. When the grounding switch is in the grounded position, the CDP control panel shows the following:

8. If necessary, open the doors of medium voltage compartments.

To open the AFE-INU compartment door, auxiliary voltage is required.

9. Switch off and lockout all auxiliary voltages from external sources.

10. Verify that the drive system is de-energized.

11. To connect a grounding set, continue with ~Connecting a grounding set.~

\textbf{10.6.4 Grounding switch is not released}

When the DC link of the drive has been discharged, the lamp \textsc{GROUNDING SWITCH UNLOCKED} lights up to indicate that the grounding switch is released and can be turned to the grounded position. If the lamp does not light up, proceed as follows:

1. Do not force the grounding switch in any direction.

2. To test the lamp \textsc{GROUNDING SWITCH UNLOCKED}, activate the lamp test with parameter 16.7. (For information on setting parameters, see 1BSBNFUFSNPEF).
   - If the lamp does not light up, replace it.
   - If the lamp lights up after it was replaced, continue with step 3.

3. Verify that the MCB (main circuit breaker) is open.
   - If the MCB is open, check that it is locked out.
   - Check that the \textsc{SUPPLY OFF} lamp is lit. If the lamp is lit, the feedback signal “main circuit breaker open” is present (digital input DI09 of I/O module A3411).
4. Check if the LED of digital output DO03 (I/O module A3401) is lit. If the LED is lit, the grounding switch is released.

5. Check the discharging level of the DC link. If the value of parameter 2.01 DC VOLTAGE is below 50 V, the DC link is discharged. If the DC link is discharged, the message **ReadyOn** is displayed on the CDP control panel.

6. Verify that hazardous voltages from the motor cannot be fed into the drive.

7. Carefully turn the grounding switch to the grounded position if it has been verified:
   - that hazardous voltages cannot be fed into the drive from the main power supply or the motor,
   - that the DC link is discharged,
   - that the grounding switch is released (DO07 is energized),
   - that the drive status is **ReadyOn**.
   If you cannot turn the grounding switch, continue with **Unlocking doors of medium voltage compartments**.

8. Switch off and lockout all auxiliary voltages from external sources.

9. Verify that the drive system is de-energized.

10. Ground the drive with a grounding set (option).

---

**References**

10-9 Four-way grounding set

---

1 Telescopic insulating pole
2 Enclosure ground clamp
3 Busbar ground clamps
10.6.5 Connecting a grounding set

1. Connect the enclosure ground clamp to the ground ball stud of the cabinet’s grounding frame.

2. Use the telescopic insulating pole to connect the busbar ground clamps to the ground ball studs of the busbars, and to tighten each connection.

   Connect the inner most busbar first, then the middle busbar, and then the outer busbar.

The drive is now dead, and safe access is possible.
10.6.6 Unlocking doors of medium voltage compartments

The doors of medium voltage compartments are tied into an interlocking circuit that operates in conjunction with the grounding switch and the interlocks from the main circuit breaker of the drive.

The interlocking system ensures that:
• the main power cannot be connected to the drive unless the doors are securely closed and the grounding switch is in position not grounded, and the safety switch is in position locked.
• the doors can only be opened if the main circuit breaker is open, the DC-link capacitors have been discharged, and the grounding switch is in position grounded.

The doors of medium voltage compartments can also not be opened if the drive is disconnected from the auxiliary power.

If the auxiliary voltage is switched off and the doors are locked and cannot be opened, unlock the doors as described in the following section.

DANGER

Do the following to release the doors of the medium voltage compartments:
1. Open the door of the control compartment.
2. Open the swing frame.
3. To release the grounding switch, pull the yellow wire.
4. Put the grounding switch to position grounded.
5. Open the door.
10.6.7 Service covers

**CAUTION**

The service covers on the back of the cabinet do not have to be removed for servicing the drive. All components inside the cabinet are accessible through the front of the cabinet.

10.6.8 Visual checks on the drive

Check the drive and its immediate vicinity visually at the intervals stated on the maintenance schedule and pay attention to the following items:

- Humidity inside the drive
- Permitted range of ambient air temperature and humidity of the drive
- Dust built-up inside the drive
- Appropriate fastening of cables and wires and connections of cable shields and screens
- Integrity of cable insulation
- Signs for overheated components, wires, cables or busbars
- Corrosion on electronic circuit boards, connectors or busbars
- Correct type of signal and power supply cables

For information, see the applicable cable specifications.

10.6.9 Cleaning

**NOTICE**

When cleaning the drive cabinet, mind the following:

- To prevent dirt falling into equipment, cover the equipment.
- The drive contains components which are sensitive to electrostatic discharge. Therefore, take electrostatic-sensitive precautions and use suitable tools.
- Clean circuit boards with special care. To prevent the components being damaged, use antistatic brushes and a vacuum cleaner with a soft nozzle.
- Remove dust on assemblies and busbars inside the cabinet with a vacuum cleaner and lint-free cleaning cloths.
- Remove water, oily or greasy deposits on assemblies, components and busbars with water- and oil-absorbing microfibers such as "3M Scotch Brite".
- Use a nylon brush or a vacuum cleaner for removing dust or deposits from recesses.
- Clean the outside of the cabinet with a vacuum cleaner and cleaning cloths.
10.6.10 Checking wire and cable connections
Vibration can loosen electrical connections and cause equipment failure.
Check all power and control cable connections. Tighten them if necessary. Check that all plugs and connectors are tight.

NOTICE

10.6.11 Replacing the filter mats
To replace a filter mat:
1. Unfasten the air intake panel upper supports
2. Remove the air intake panel
3. Remove the filter mat and clean it by using compressed air or a vacuum cleaner. Perform this operation away from the drive to prevent dust from entering.

For information on replacement intervals, see the "Filter class (EN779 classification)"

Tools
Phase module replacement kit
The following parts are required for the maintenance of the phase modules. The parts can be ordered as a kit (standard option), or separately.

Other tools
The tools below are not included in the scope of supply.

1. 10, 13, 17 mm
2. 225 mm
3. 3x M8x13

References
10-16 Phase module replacement kit
Replacing a phase module
1. Disconnect all power supplies to the drive and ground the drive.
   For further information, see De-energizing the drive locally.

⚠️ DANGER

⚠️ Note: When working on the AFE, pull out the air pressure tube at the bottom of the panel.

2. Install the cantilever on the cabinet roof; attach the lifting hoist and lifting brackets (see).
3. Remove the acrylic cover.
4. Remove the screws on each side of the phase module.
5. (If using module rails) Slide the rails under the phase module.
   (If using a module tray) Anchor the tray to the phase module. To do it:
   - Holding the tray at an angle, insert the hook-shaped ends of the tray behind the two brackets of the phase module.
   - Then lower the tray to engage the hooks with the brackets.

CAUTION
6. Holding the phase module at the handles, pull it out carefully.

7. Disconnect all cables from the Phase-INT circuit board that are going into the cabinet:
   - Auxiliary power supply cable
   - Two optical fibers
     The cables are partly concealed by the grounding strap.
   - Current-transformer cable
     This cable is only present in phase modules of the AFE.

8. Detach the cable chain on the side of the phase module.

   Pull down the end of the chain a little and then pull it into the direction of the arrow to disengage the chain from the mounting bracket.

9. Fasten the bolt eyes to the phase module.

10. Connect the lifting brackets to the bolt eyes and lift the phase module using the hoist.

11. Put the new phase module back into the cabinet.
12. When reconnecting the optical fibers, pay attention to connect them to their corresponding receptacles (BSSPXT).

13. When all cables have been reconnected, check that the drive control system and the phase module communicate with each other. Switch on the auxiliary power supply. Check that the LEDs on the Phase-INT circuit board of the phase module are on (CPYJOUIF QJDUVSFCFMPX).

14. Push the phase module back into the rack as far as it goes and tighten the fastening bolt on each side.

15. Remove the rails and reinstall the acrylic panel.

16. Switch on all miniature circuit breakers in the control compartment.

The work is now completed, and the drive can be started again. For further information, see 4UBSUJOHUIFESJWF.

10.6.13 Replacing a fan

The fan housing can stay on the roof when only the impeller is replaced,

1. Disconnect all power supplies to the drive and ground the drive. For further information, see 4UBSUJOHUIFESJWF De-energizing the drive locally. To isolate the fan unit from the auxiliary power supply, switch off the motor starter of the fan unit.

To identify the motor starter, see the "QQFOEJY%y8JSJOHEJBHSBNT.

2. Continue with Standard fan units or DTL fan units as applicable. Standard fan units

3. Remove the cover from the fan housing.

4. Disconnect the control and power supply cables of the fan.

5. Remove the fastening screws from the support plate and the duct ring.

To identify the motor starter, see the "QQFOEJY%y8JSJOHEJBHSBNT.

6. Unscrew the support plate from the fan

7. Replace the fan and re-assemble in reverse order of removal.
DTL fan units
8. Disconnect the power supply cable at the entry of the terminal box.
9. Unscrew the cover from the fan housing.

10. Lift off the cover and the fan attached to it.

11. Disconnect the cable at the exit of the terminal box, unscrew the locknut of the cable gland, unscrew the cover from the fan.

12. Replace the fan and re-assemble in reverse order of removal.
