Transmit windpower from plains to cities?

Absolutely.

Renewable energy isn’t always found in the areas where we need it most. Transmission lines crossing time zones and substations covering acres of land are needed to interconnect into the grid. Large transmission substations require a portfolio of high voltage products and an expertise in substation design and project management. As an OEM EPC provider, ABB has the unique capability to combine our quality high voltage products with our proven technical abilities in substation engineering, procurement, and construction management services. Use our turnkey approach to deliver renewable energy to your customers on-schedule, under-budget, and lower risk with an innovative, reliable, optimized substation solution from ABB.
