New Emax.
The evolution continues.

The new Emax air circuit-breakers are the result of ABB SACE's constant commitment to look for new solutions, and of the know-how it has developed over the years. This is an incredibly innovative high quality circuit-breakers range, designed to satisfy all application requirements. The innovation of the new Emax is really outstanding from all points of view: completely re-engineered releases fitted with latest generation electronics, improved performances with the same dimensions and new applications to fulfil the latest market needs. The new electronics open a window on a world of extraordinary solutions, with connectivity options never before seen in the market. Discover the great advantages of ABB SACE's new Emax. The evolution has been going on since 1942.

New Emax.
Lively performances.

Continuing the tradition of ABB SACE, the new Emax range offers performances at the top of its category. The Emax range offers you a great advantage: with the increased performances, you can use the smaller circuit-breaker frames, obtaining considerable savings both in economic terms and in physical space within the switchgear. Emax E1 now offers current ratings up to 1600A, whilst Emax E3 is enhanced by version V with top of the range performances. Always aware of the rapid changes in the market, ABB SACE has made some specific versions to cover new applications and simplify retrofitting operations.

New Emax.

Brilliant intelligence.

The new Emax range shines like a light from within: the new generation of protection releases is fitted with the latest advances in electronics, offering individual bespoke solutions for control and protection. The new releases, which are amazingly versatile and simple to use, offer important innovations, such as the brand-new intuitive operator interface allowing complete control of the system with just a few simple keystrokes. Furthermore, there are new protections, new alarms and connection to handheld and laptop PCs using Bluetooth technology. The re-engineered hardware architecture allows flexible and precise configuration. With the new Emax it is no longer necessary to completely replace the release - simply add the module which satisfies your requirements: a great advantage, both in terms of flexibility and customisation.

New Emax. Ensured reliability.

The new Emax have received innumerable international certifications and approval by the major shipping registers.

Careful selection of materials, meticulous assembly and a rigorous testing stage make the new Emax an extremely reliable and sturdy product, able to withstand high dynamic and thermal stresses for longer than any other circuit-breaker in its category. With the new standardised system of accessories studied and made for the new Emax, work becomes easier, convenient, safe and rapid. Furthermore, ABB SACE puts a highly specialised and rapid customer assistance service at your disposal. The new Emax give you that pleasant feeling of security which only such a reliable product is able to do.

Construction characteristics

Structure of the circuit-breakers

The sheet steel structure of the Emax air circuit-breaker is extremely compact, considerably reducing overall dimensions.

Safety is improved by using double insulation of the live parts and total segregation between phases.

The sizes have the same height and depth for all the circuit-breakers in each version.

The depth of the withdrawable version is suitable for installation in switchgear 500 mm deep.

The width of 324 mm (up to 2000 A) in the withdrawable version allows the apparatus to be used in switchgear compartments 400 mm wide. Their compact dimensions also mean they can replace air circuit-breakers of any size from earlier series.

1

Construction characteristics

Operating mechanism

The operating mechanism is of the stored energy type, operated using pre-charged springs.

The springs are charged manually by operating the front lever or using a geared motor, supplied on request.

The opening springs are charged automatically during the closing operation.

With the operating mechanism fitted with shunt closing and opening releases and the geared motor for charging the springs, the circuit-breaker can be operated by remote control and, if required, co-ordinated by a supervision and control system.

1

The following operating cycles are possible without recharging the springs:

- starting with the circuit-breaker open (0) and the springs charged:
closing-opening
- starting with the circuit-breaker closed (I) and the springs charged:
opening-closing-opening.

The same operating mechanism is used for the entire series and is fitted with a mechanical and electrical anti-pumping device.

Withdrawable version

Note:

"Racked-in" refers to the position in which both the power contacts and auxiliary contacts are connected; "racked-out" is the position in which both the power contacts and auxiliary contacts are disconnected; "test isolated" is the position in which the power contacts are disconnected, whereas the auxiliary contacts are connected.

Construction characteristics

Fixed parts of withdrawable circuit-breakers

The fixed parts of withdrawable circuit-breakers have shutters for segregating the fixed contacts when the circuit-breaker is withdrawn from the compartment. These can be locked in their closed position using padlock devices.

Utilization category

1

Selective and current-limiting circuit-breakers

Selective (non current-limiting) **circuit-breakers** are classified in class B (according to the IEC 60947-2 Standard). It is important to know their I_{cw} values in relation to any possible delayed trips in the event of short-circuits.

The **current-limiting circuit-breakers** E2L and E3L belong to class A. The short-time withstand current I_{cw} is not very important for these circuit-breakers, and is necessarily low due to the operating principle on which they are based. The fact that they belong to class A does not preclude the possibility of obtaining the necessary selectivity (e.g. current-type or time-type selectivity).

The special advantages of current-limiting circuit-breakers should also be underlined. In fact, they make it possible to:

- significantly reduce the peak current in relation to the prospective value;
- drastically limit specific let-through energy.

The resulting benefits include:

- reduced electrodynamic stresses;
- reduced thermal stresses;
- savings on the sizing of cables and busbars;
- the possibility of coordinating with other circuit-breakers in the series for back-up or discrimination.

Versions and connections

All the circuit-breakers are available in fixed and withdrawable, three-pole or four-pole versions.

Each series of circuit-breakers offers terminals made of silver-plated copper bars, with the same dimensions, regardless of the rated currents of the circuit-breakers.

The fixed parts for withdrawable circuit-breakers are common to each model, regardless of the rated current and breaking capacity of the relative moving parts, except for the E2S circuit-breaker which requires a specific fixed part.

A version with gold-plated terminals is available for special requirements, linked to use of the circuit-breakers in corrosive environments.

The availability of various types of terminals makes it possible to build wall-mounted switchgear, or switchgear to be accessed from behind with rear connections.

For special installation needs, the circuit-breakers can be fitted with various combinations of top and bottom terminals.

Furthermore new dedicated terminal conversion kits give Emax maximum flexibility, allowing horizontal terminals to be changed to vertical or front ones and vice versa.

Electronic releases

General characteristics

The overcurrent protection for AC installations uses three types of electronic release series: PR121, PR122 and PR123.

The basic series, PR121, offers the whole set of standard protection functions, complete with a user-friendly interface.

It allows discrimination of which fault caused the trip by means of the new led indications.

PR122 and PR123 releases are of new concept modular architecture. It is now possible to have a complete series of protections, accurate measurements, signalling or dialogue functions, designed and customisable for all application requirements.

The protection system is made up of:

- 3 or 4 new generation current sensors (Rogowsky coil);
- external current sensors (i.e. for external neutral, residual current or source ground return protection);
- a protection unit selected among PR121/P, PR122/P or PR123/P with optional communication module via Modbus or Fieldbus plug network (PR122/P and PR123/P only), as well as via a wireless connection;
- an opening solenoid, which acts directly on the circuit-breaker operating mechanism (supplied with the protection unit).

1

1SDC20034R0001

General specifications of the electronic releases include:

- operation without the need for an external power supply
- microprocessor technology
- high precision
- sensitivity to the true R.M.S. value of the current
- trip cause indication and trip data recording
- interchangeability among all types of releases
- setting for neutral configurable:
 - OFF-50%-100%-200% of phase setting for circuit-breakers E1, E2, E3 and E4/f, E6/f full-size versions, and E4-E6 with external neutral protection;
 - OFF-50% for standard E4 and E6.

The main performance features of the releases are listed below.

Compliance with Standards

Standards, approvals and certifications

SACE Emax circuit-breakers and their accessories conform to the international IEC 60947, EN 60947 (harmonized in 28 CENELEC countries), CEI EN 60947 and IEC 61000 Standards, and comply with following EC directives:

- “Low Voltage Directive” (LVD) n° 73/23 EEC
- “Electromagnetic Compatibility Directive” (EMC) nr. 89/336 EEC.

The main versions of the apparatus are approved by the following Shipping Registers:

- RINA (Italian Naval Register)
- Det Norske Veritas
- Bureau Veritas
- Germanischer Lloyd
- Loyd's Register of Shipping
- Polskj Rejestr Statkow
- ABS (American Bureau of Shipping)
- RMRS (Russian Maritime Register of Shipping)
- NK (Nippon Kaiji Kyokai)

The Emax series also has a range which has undergone certification according to the severe American UL 1066 Standards. Furthermore, the Emax series is certified by the Russian GOST (Russia Certificate of Conformity) certification organization, and is certified by China CCC (China Compulsory Certification)

Certification of conformity with the aforementioned product Standards is carried out in compliance with European Standard EN 45011 by the Italian certification body ACAE (Associazione per la Certificazione delle Apparecchiature Elettriche - Association for Certification of Electrical Apparatus), recognized by the European organization LOVAG (Low Voltage Agreement Group).

Note: Contact ABB SACE for a list of approved types of circuit-breakers, approved performance data and the corresponding validity

Compliance with Standards

A design dedicated to Quality and respect for the environment

Quality, environment, health and safety have always been ABB SACE's major commitment. This commitment involves every function of the company, and has allowed us to achieve prestigious recognition internationally.

The company's quality management system is certified by RINA, one of the most prestigious international certification boards, and complies with ISO 9001-2000 Standards; the ABB SACE test facility is accredited by SINAL; the plants in Frosinone, Patrica, Vituone and Garbagnate Monastero are also certified in compliance with ISO 14001 and OHSAS 18001 standards for health and safety in the workplace.

ABB SACE, Italy's first industrial company in the electro-mechanical sector to achieve this, has been able to reduce its raw material consumption and machining scrap by 20% thanks to an ecology-centred revision of its manufacturing process. All of the company's Divisions are involved in streamlining raw material and energy consumption, preventing pollution, limiting noise pollution and reducing scrap resulting from manufacturing processes, as well as in carrying out periodic environmental audits of leading suppliers.

ABB SACE is committed to environmental protection, as is also evidenced by the Life Cycle Assessments (LCA) of products carried out at the Research Centre: this means that assessments and improvements of the environmental performance of products throughout their life cycle are included right from the initial engineering stage. The materials, processes and packaging used are chosen with a view to optimising the actual environmental impact of each product, including its energy efficiency and recyclability.

Automatic circuit-breakers with full-size neutral conductor

The Emax range of automatic circuit-breakers with full-size neutral conductor is used in special applications where the presence of third harmonics on individual phases can lead to a very high current on the neutral conductor.

Typical applications include installations with loads having high harmonics distortion (computers and electronic devices in general), lighting systems with a large number of fluorescent lamps, systems with inverters and rectifiers, UPS, and systems for adjusting the speed of electric motors.

This range includes standard circuit-breakers with full-size neutral conductor in sizes E1, E2, E3. Models E4 and E6 are available in the "Full size" version up to rated currents of 6300A.

Models E4/f and E6/f are available in fixed and withdrawable four-pole versions. These models can all be fitted with all accessories available for the Emax range, with the exception, on the E6/f model, of the mechanical interlocks made using flexible wires and 15 external auxiliary contacts, which are therefore incompatible.

All the models can be fitted with all the available versions of electronic protection relays, in the standard version.

Switch-disconnectors

The switch-disconnectors are derived from the corresponding circuit-breakers, of which they maintain the overall dimensions and the possibility of mounting accessories.

This version only differs from the circuit-breakers in the absence of overcurrent releases.

The circuit-breaker is available in both fixed and withdrawable, three-pole and four-pole versions. The switch-disconnectors, identified by the letters "/MS", can be used according to category of use AC-23A (switching motor loads or other highly inductive loads) in accordance with the IEC 60947-3 Standard. The electrical specifications of the switch-disconnectors are listed in the table below.

Note: the breaking capacity I_{cu} , at the maximum rated use voltage, by means of external protection relay, with 500 ms maximum timing, is equal to the value of I_{cw} (1s), except:

(1) $I_{cu} = 50\text{kA} @ 690\text{V}$

(2) $I_{cu} = 85\text{kA} @ 690\text{V}$

Automatic circuit-breakers for applications up to 1150V AC

SACE Emax circuit-breakers can be supplied in a special version for rated service voltages up to 1150 V in AC.

Circuit-breakers in this version are identified by the letters of the standard range (rated service voltage up to 690 V AC) plus "/E", and are derived from the corresponding standard SACE Emax circuit-breakers. They offer the same versions and accessories as the latter. The SACE Emax range of circuit-breakers for applications up to 1150V in AC can be either fixed and withdrawable, in both three-pole and four-pole versions. SACE Emax/E circuit-breakers are especially suitable for installation in mines, oil and chemical plants, and for traction. This range of Emax was tested at a voltage of 1250VAC.

The table below shows the electrical specifications of the range.

Switch-disconnectors for applications up to 1150V AC

The switch-disconnectors complete the range of apparatus for applications at 1150V in alternating current (AC). These circuit-breakers conform with the IEC 60947-3 Standards.

Circuit-breakers in this version are identified by the letters of the standard range, where the rated service voltage is up to 690 V AC, plus "/E", thus becoming SACE Emax/E MS. They are derived from the corresponding standard SACE Emax switch-disconnectors.

They are available in the three-pole and four-pole, fixed and withdrawable versions in the same sizes, with accessory options and installations as per the corresponding standard circuit-breakers. All the accessories available for the SACE Emax range can be used. Standard fixed parts may also be used for circuit-breakers in the withdrawable version. As per the corresponding automatic version, this range of Emax was tested at a voltage of 1250VAC.

Rated making capacity I_{cm} 1150V AC (peak value)	[kA]	40	63	63 ⁽²⁾	143	143

Note: The breaking capacity **I_{cu}**, by means of external protection relay, with 500 ms maximum timing, is equal to the value of **I_{cw}** (1s).

(1) The performance at 1000V is 50 kA.

(2) The performance at 1000V is 105 kA.

Switch-disconnectors for applications up to 1000V DC

ABB SACE has developed the SACE Emax/E MS range of switch-disconnectors for applications in direct current up to 1000V in compliance with the international IEC 60947-3 Standard. These non-automatic circuit-breakers are especially suitable for use as bus ties or main isolators in direct current systems, such as in applications involving electric traction.

The range covers all installation needs up to 1000V DC / 6300A.

They are available in fixed and withdrawable, three-pole and four-pole versions.

By connecting three breaking poles in series, it is possible to achieve a rated insulation voltage of 750V DC, while with four poles in series the limit rises to 1000V DC.

The switch-disconnectors of the SACE Emax/E MS range maintain the overall dimensions and fixing points of the standard range circuit-breakers. They can be fitted with the various terminal kits and all the accessories common to the SACE Emax range. They cannot, of course, be associated with the electronic releases, CSs and accessories for determining currents and for AC applications.

The withdrawable circuit-breakers should be used together with the special version fixed parts for applications at 750/1000V DC.

ISDC2006-110001

	1000V DC		–	20	–	25	–	40	–	65	–

Note: The breaking capacity I_{cu} , by means of external protection relay, with 500 ms maximum timing, is equal to the value of I_{cw} (1s).

(1) The performances at 750 V are:

- for E1B/E MS I_{cw} = 25 kA,
- for E2N/E MS I_{cw} = 40 kA and
- for E3H/E MS I_{cw} = 50 kA.

Sectionalizing truck

Sectionalizing truck - CS

This version is derived from the corresponding withdrawable circuit-breaker, with replacement of all the breaking parts and the operating mechanism with simple connections between the top and bottom isolating contacts.

It is used as a no load isolator where this is required by the system.

Earthing switch with making capacity

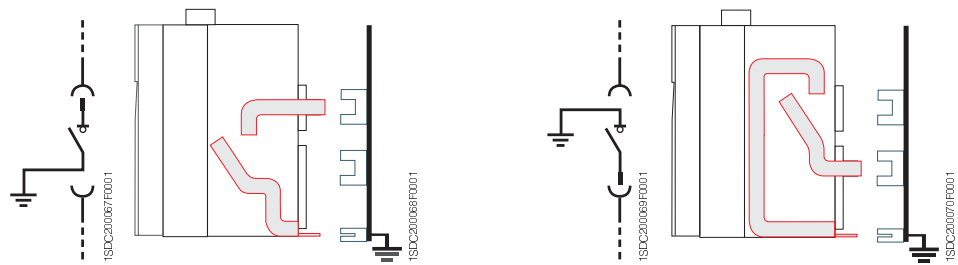

2

Earthing switch with making capacity - MTP

This version is based on the moving part of the corresponding withdrawable circuit-breaker (without overcurrent releases) and the top or bottom isolating contacts, which are replaced with connections that short circuit the phases to earth through the circuit-breaker. The earthing switch is available with top or bottom isolating contacts.

The earthing circuit is dimensioned for a short-time withstand current equal to 60% of the maximum I_{cw} of the circuit-breaker from which it is derived (IEC 60439-1).

The earthing switch is inserted in the fixed part of a withdrawable circuit-breaker to earth the top or bottom terminals before carrying out inspection or maintenance operations in safe conditions on the external circuit. It should be used in cases where residual or recovery voltages can occur in the installations to be earthed.

Earthing truck

Other versions

Earthing truck- MT

This version is similar to the sectionalizing truck, but with the bottom or top isolating contacts replaced by short-circuited, earthed connections. The earthing truck is available with bottom or top isolating contacts, suitable for the fixed part of the size.

The earthing circuit is dimensioned for a short-time withstand current equal to 60% of the maximum Icw of the circuit-breaker from which it is derived (IEC 60439-1).

The truck is temporarily racked into the fixed part of a withdrawable circuit-breaker to earth the top or bottom terminals before carrying out maintenance operations on the external circuit when no residual voltages are expected to occur.

Other versions

On request, SACE Emax circuit-breakers can be built in special versions designed for particularly aggressive environments ($\text{SO}_2/\text{H}_2\text{S}$), for seismic installations or with the neutral pole on the right side.

Installation in switchgear

Modular design

The circuit-breakers in the SACE Emax series have been built according to modular design criteria for easier installation and integration in low voltage electrical switchgear, thanks to their having the same depth and height for all the sizes, as well as a significant reduction in their overall installation dimensions.

The front shield of the circuit-breaker is also identical for the entire series. This simplifies construction of the switchgear doors since only one type of drilling is required and makes the front of the switchgear the same for all sizes.

SACE Emax circuit-breakers are suitable for Power Center switchgear and make it easy to comply with the segregation requirements of the IEC 60439-1 Standards.

3

Installation in switchgear

Choosing the type of circuit-breaker

Number of poles

The choice of the number of poles for circuit-breakers that simultaneously provide switching, protection and isolation functions in three-phase installations depends on the type of electrical system (TT, TN-S, TN-C, IT) and the type of user or, more generally, whether it features a distributed or non-distributed neutral.

Three-pole circuit breakers

For TN-C systems (the neutral cannot be interrupted because it also acts as the protection conductor).

For users that do not use the neutral (e.g.: asynchronous motors) and, for systems with undistributed neutral in general.

Four-pole circuit breakers

In all other instances, with exceptions for the IT system (see CEI 64-8/473.3.2.2 Standards).

Three-pole circuit breakers with external neutral

Current transformers can be installed on the external neutral of five-wire systems (TN-S) with 3-pole circuit-breakers.

Fixed or withdrawable version

The fixed version of the circuit-breaker is more compact in size than the withdrawable version. It is recommended for installations that can tolerate service interruptions in the event of faults or programmed maintenance.

The withdrawable version of the circuit-breaker is recommended for:

- applications that can only tolerate brief interruptions due to faults or programmed maintenance;
- dual lines, one of which is a standby for the other, with a single circuit-breaker for each pair.

Installation in switchgear

Choosing the type of circuit-breaker

Connecting the main circuit-breaker circuits

When designing switchgear, one must always bear in mind the problem of making the most rational connections between the circuit-breaker and main busbar system and from the busbars to the users. The SACE Emax series offers switchgear manufacturers a range of options to satisfy different circuit-breaker connection requirements.

The figures below give some indications for terminal selection.

Horizontal rear terminals

For switchgear with access from the rear

Vertical rear terminals

For switchgear with access from the rear

Front terminals

For wall-mounted switchgear, with access from the front only

Flat rear terminals

(withdrawable version only) For switchgear with access from the rear

3

Degrees of protection

A number of solutions have been adopted on SACE Emax circuit-breakers to achieve IP22 degree of protection for fixed or withdrawable circuit-breakers, excluding the terminals, and IP30 for their front parts using a flange. Automatic shutters have been designed for the fixed parts of withdrawable circuit-breakers which can be locked using padlock devices to allow maintenance on the load side or on the power-supply side of the fixed part.

A transparent protective cover is also available on request, to completely segregate the front of the circuit-breaker, reaching IP54 degree of protection. In any case, the front panel and protection release with the relative indications remain completely visible.

IP22 Fixed or withdrawable version circuit-breaker, excluding the terminals.

IP30 Front parts of the circuit-breakers (using a flange).

IP54 Fixed or withdrawable version circuit-breaker, fitted with transparent protective cover to be fixed onto the front of the switchgear (on request).

1SDC200088P001

Power losses

The IEC 439-1 and CEI EN 60439-1 Standards prescribe calculations for determining the heat dissipation of ANS type switchgear (non-standard), for which the following must be taken into consideration:

- the overall dimensions
- the rated current of the bus-bars and connections and the relative dissipation
- the dissipated power of the apparatus mounted in the switchgear.

For this point, the table beside provides information on the circuit-breakers. For other apparatus, please consult the catalogues of the relative manufacturers.

Power losses

Note

The table values refer to balanced loads, a current flow of Iu, and automatic circuit-breakers.

1SDC20009R0001

Note

The same standards prescribe type tests for AS switchboards (standard factory-manufactured switchgear), including those for maximum temperature rise.

Installation in switchgear

Current-carrying capacity in switchgear

As an example, the following table shows the continuous current carrying capacity for circuit-breakers installed in a switchgear with the dimensions indicated below.

These values refer to withdrawable version circuit-breaker installed in non-segregated switchgear with a degree of protection up to IP31, and the following dimensions:

2300x800x900 (HxLxD) for E1 - E2 - E3;

2300x1400x1500 (HxLxD) for E4 - E6.

The values refer to a maximum temperature at the terminals of 120°C.

For withdrawable circuit-breakers with a rated current of 6300A, the use of vertical rear terminals is recommended.

Note:

The tables should be used solely as a general guideline for selecting products. Due to the extensive variety of switchgear construction shapes and conditions that can affect the behavior of the apparatus, the solution used must always be verified.

Changing the rated uninterrupted current in relation to the temperature

Temperature derating

The circuit-breakers can operate at higher temperatures than their reference temperature (40 °C) under certain installation conditions. In these cases the current-carrying capacity of the switchgear should be reduced.

The SACE Emax series of air circuit-breakers uses electronic releases which offer the benefit of great operating stability when subjected to temperature changes.

The tables below show the current-carrying capacities of the circuit breakers (as absolute values and percentage values) in relation to their rated values at T = 40 °C.

70	100	3200	100	4000	94	4720	92	5600

Derating at different altitudes

SACE Emax air circuit-breakers do not undergo any changes in their rated performance up to an altitude of 2000 meters.

As the altitude increases the atmospheric properties alter in terms of composition, dielectric capacity, cooling power and pressure.

The performance of the circuit-breakers therefore undergoes derating which can be measured through the variation in significant parameters such as the maximum operating voltage and the rated uninterrupted current.

The table below shows these values in relation to altitude.

Altitude	H [m]	<2000	3000	4000	5000
Rated service voltage	U_e [V]	690	600	500	440
Rated current	I_n [A]	I _n	0.98xI _n	0.93xI _n	0.90xI _n

Current-limiting and specific let-through energy curves for E2L and E3L circuit-breakers

The current-limiting capacity of a current-limiting circuit-breaker indicates its greater or lesser capacity, under short-circuit conditions, to let through or make a current lower than the prospective fault current. This characteristic is shown by two different curves which indicate the following, respectively:

- the value of the specific energy " I^2t " (in A^2s) let through by the circuit-breaker in relation to the uninterrupted symmetrical short-circuit current.
- the peak value (in kA) of the limited current in relation to the uninterrupted symmetrical short-circuit current.

The graph shown at the side schematically indicates the trend of the uninterrupted current, with the relative established peak (curve B), and the trend of the limited current with the lowest peak value (curve A).

Comparing the areas beneath the two curves shows how the specific let-through energy is reduced as a result of the limiting effects of the circuit breaker.

Protection releases and trip curves

PR121/P

Characteristics

PR121/P is the new basic and complete release for the Emax series. The complete range of protection functions together with the wide combination of thresholds and trip times offered make it suitable for protecting a wide range of alternating current installation. In addition to protection functions the unit is provided with multifunction LED indicators. Furthermore, PR121/P allows connection to external devices enhancing its advanced characteristics like remote signalling and monitoring, or remote supervision display.

Operation and protection functions

Protection functions

The PR121 release offers the following protection functions:

- overload (L)
- selective short-circuit (S)
- instantaneous short-circuit (I)
- earth fault (G).

Overload (L)

The inverse long time-delay trip overload protection L is type $I^2t = k$; 25 current thresholds and 8 curves are available. Each curve is identified by the trip time in relation to the current $I = 3 \times I_n$ (I_n = set threshold).

Selective short-circuit (S)

The selective short-circuit protection S can be set with two different types of curves with a trip time independent of the current ($t = k$) or with a constant specific let-through energy ($t = k/I^2$).

15 current thresholds and 8 curves are available, allowing a fine setting. Each curve is identified as follows:

- for curves $t = k$ by the trip time for $I > I_2$
- for curves $t = k/I^2$ by the trip time for $I = 10 \times I_n$ (I_n = rated current of the circuit-breaker).

The function can be excluded by setting the DIP switches to the combination labelled "OFF".

Adjustable instantaneous short-circuit (I)

The protection I offers 15 trip thresholds and can be excluded (dip switches in "OFF" position).

Earth fault (G)

The earth fault protection G (which can be excluded) offers 7 current thresholds and

4 curves. Each curve is identified by the time t_4 in relation to current I_4 . As per S protection the trip time can be chosen independent of the current ($t = k$) or with a constant specific let-through energy ($t = k/I^2$).

Note: the current values above which G is disabled are indicated in the installation manual.

Protection releases and trip curves

PR121/P

User interface

The user communicates directly with the release in the trip parameter preparation stage by means of the dip switches.

Up to four LEDs (according to the version) are also available for signalling.

These LEDs (one for each protection) are active when:

- a protection is timing. For protection L the prealarm status is also shown;
- a protection has tripped (the corresponding LED is activated by pressing the "Info/Test" pushbutton);
- a failure in connection of a current sensor or in the opening solenoid is detected. The indication is active when the unit is powered (through current sensors or an auxiliary power supply)
- wrong rating plug for the circuit-breaker.

The protection tripped indication works even with the circuit-breaker open, without the need for any internal or external auxiliary power supply. This information is available for 48 hours of inactivity after the trip and is still available after reclosing. If the query is made more than 48 hours later it is sufficient to connect a PR030/B battery unit, PR010/T, or a BT030 wireless communication unit.

Communication

By means of the BT030 wireless communication unit, PR121/P can be connected to a pocket PC (PDA) or to a personal computer, extending the range of information available for the user. In fact, by means of ABB SACE's SD-Pocket communication software, it is possible to read the values of the currents flowing through the circuit-breaker, the value of the last 20 interrupted currents, and the protection settings.

PR121 can also be connected to the optional external PR021/K signalling unit, for the remote signalling of protections alarms and trips, and to HMI030, for the remote user interfacing.

Setting the neutral

Protection of the neutral can be set at 50%, 100% or 200% of the phase currents. Settings above 50% can be selected for E1-E2-E3-E4/f and E6/f. In particular, setting the neutral at 200% of phase current requires protection L to be set at $0.5I_n$ in order to respect the current-carrying capacity of the circuit-breaker. The user can also switch the neutral protection OFF. When three-poles circuit-breakers with external neutral current sensor are used, a setting above 100% for the neutral does not require any reduction in the L setting.

Test Function

The Test function is carried out by means of the info/Test pushbutton and the PR030/B battery unit (or BT030) fitted with a polarized connector housed on the bottom of the box, which allows the device to be connected to the test connector on the front of PR121/P releases.

The PR121/P electronic release can be tested by using the SACE PR010/T test and configuration unit by connecting it to the TEST connector.

Tolerance ⁽²⁾	± 7%	± 15%		
Earth fault protection	I4 = 0.2 - 0.3 - 0.4 - 0.6 - 0.8 - 0.9 - 1 x I _n	With current $I > I4$ t4 = 0.1 - 0.2 - 0.4 - 0.8 s	■	$t=k$
Tolerance ⁽²⁾	± 7%	The better of the two figures: ± 10% or ± 40 ms		

(1) The minimum trip time is 1 s, regardless of the type of curve set (self-protection)

(2) These tolerances are valid in the following conditions:
 - self-supplied release at full power (without start-up)
 - two- or three-phase power supply
 - trip time set ≥ 100 ms

The following tolerance values apply in all cases not covered by the above:

	Trip threshold	Trip time
L	Release between 1.05 and 1.25 x I1	± 20%
S	± 10%	± 20%
I	± 15%	≤ 60ms
G	± 15%	± 20%

Power supply

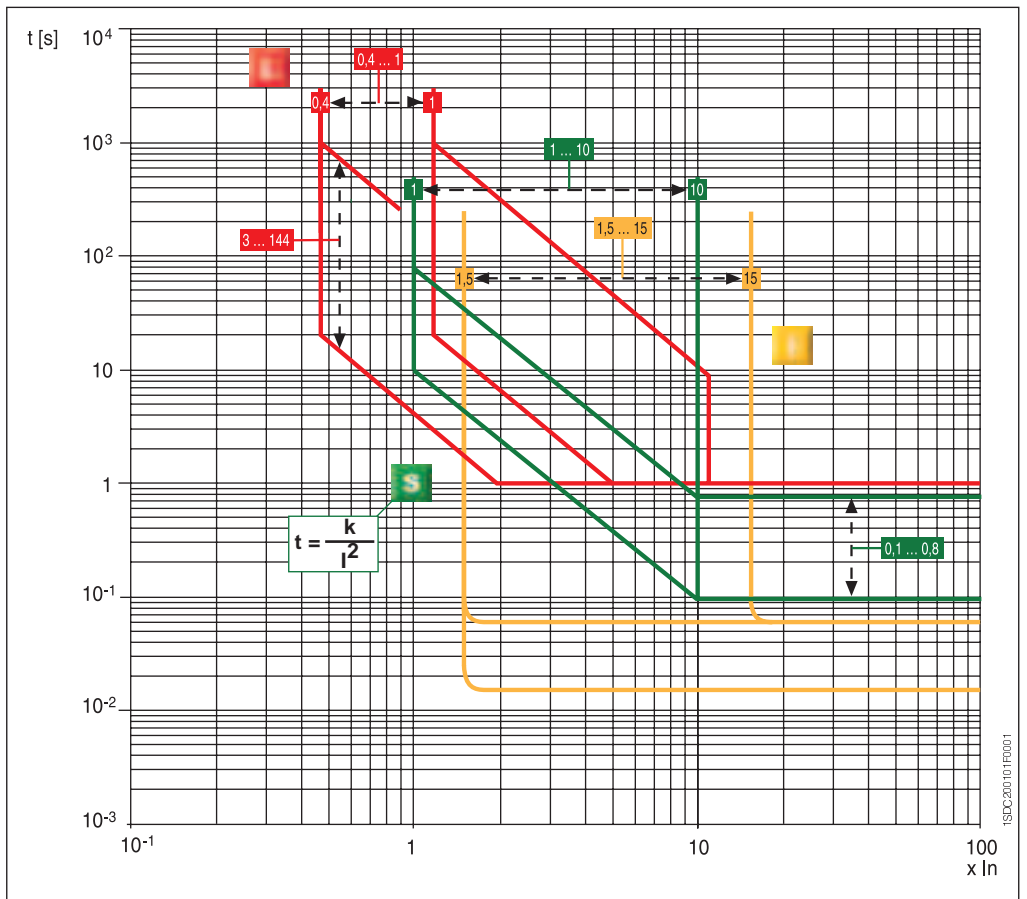

The unit does not require an external power supply either for protection functions or for alarm signalling functions. It is self-supplied by means of the current sensors installed on the circuit-breaker. For it to operate, it is sufficient for at least one phase to be loaded at 100A. An external power supply can be connected in order to activate additional features, and in particular for connection to external devices: HMI030, and PR021/K.

PR121/P	
Auxiliary power supply (galvanically insulated)	24 V DC ± 20%
Maximum ripple	5%
Inrush current @ 24V	~10 A for 5 ms
Rated power @ 24V	~2 W

PR122/P

Characteristics

The SACE PR122 release is a sophisticated and flexible protection system based on a state-of-the-art microprocessor and DSP technology. Fitted with the optional internal PR120/D-M dialogue unit, PR122/P turns into an intelligent protection, measurement and communication device, based on the Modbus® protocol. By means of the PR120/D-M, PR122/P can also be connected to the ABB EP010 Fieldbus plug adapter, which makes it possible to choose among several different networks, such as Profibus and DeviceNet.

The new PR122/P is the result of ABB SACE's experience in designing protection releases. The exhaustive range of settings makes this protection unit ideal for general use in any type of installation, from distribution to the protection of motors, transformers, drives and generators. Access to information and programming using a keyboard and graphic liquid crystal display is extremely simple and intuitive. The interface is now common to PR122/P and PR123/P in order to give to the user maximum ease of use.

An integrated ammeter and many other additional features are provided over and above the protection functions. These additional functions can be further increased with addition on board of the dialogue, signalling, measurement, and wireless communication units.

Functions S and G can operate with a time delay independent of the current ($t = k$) or with an inverse time delay (constant specific let-through energy: $I^2t = k$), as required.

Protection against earth faults can also be obtained by connecting the PR122 release to an external toroid located on the conductor that connects the transformer star centre to earth (homopolar toroid).

All the thresholds and trip curve delays of the protection functions are stored in special memories which retain the information even when no power is supplied.

Protection releases and trip curves

PR122/P

Operation, protection functions and self-test

Basic Protection functions

The PR122 release offers the following protection functions (according to the version):

- overload (L)
- selective short-circuit (S)
- instantaneous short-circuit (I)
- earth fault (G)⁽²⁾
- phase unbalance (U)
- self-protection against over-temperature (OT)
- thermal memory for functions L and S
- zone selectivity for functions S and G
- residual current (Rc) with external toroid
- source ground return with external toroid

sion. The neutral protection can be excluded or set to 100% for E1, E2, E3, E4/f and E6/f. In installations where very high harmonics occur, the resulting current at the neutral can be higher than that of the phases. Therefore it is possible to set the neutral protection at 150% or 200% of the value set for the phases. In this case it is necessary to reduce the setting of protection L accordingly⁽¹⁾.

The table below lists the neutral settings for the various possible combinations between type of circuit-breaker and the threshold I1 setting.

avoids untimely tripping caused by the high inrush currents of certain loads (motors, transformers, lamps).

The start-up phase lasts from 100 ms to 1.5 s, in steps of 0.05 s. It is automatically recognized by the PR122 release as follows:

- when the circuit-breaker closes with the release self-supplied;
- when the peak value of the maximum current exceeds $0.1 \times I_n$. A new start-up becomes possible after the current has fallen below the threshold of $0.1 \times I_n$, if the release is supplied from an external source.

Setting the neutral

In PR122/P, and PR123/P as well, the neutral protection is 50% of the value set for phase protection in the standard ver-

Start-up function

The start-up function allows protections S, I and G to operate with higher trip thresholds during the start-up phase. This

Adjustable neutral protection settings

Circuit-breaker model	Threshold I1 settings (overload protection)		
	$0.4 \leq I1 \leq 0.5$	$0.5 < I1 \leq 0.66$	$0.66 < I1 \leq 1(*)$
E1B-N	0-50-100-150-200%	0-50-100-150%	0-50-100%
E2B-N-S-L	0-50-100-150-200%	0-50-100-150%	0-50-100%
E3N-S-H-V-L	0-50-100-150-200%	0-50-100-150%	0-50-100%
E4S-H-V	0-50-100%	0-50%	0-50%
E4S/f-H/f	0-50-100-150-200%	0-50-100-150%	0-50-100%
E6H-V	0-50-100%	0-50%	0-50%
E6H/f	50-100-150-200%	0-50-100-150%	0-50-100%

(*) The setting $I1 = 1$ indicates the maximum overload protection setting. The actual maximum setting allowable must take into account any derating based on temperature, the terminals used and the altitude (see the "Installations" chapter)

(1) When three-pole circuit-breakers with external neutral current sensor are used, a setting above 100% for the neutral does not require any reduction in the L setting up to I_n .

(2) The current values above which G is disabled are indicated in the installation manual.

Phase unbalance protection U

Protection function U against phase unbalance is used in those situations requiring particularly precise control over missing and/or unbalanced phase currents, only giving the pre-alarm signal. This function can be excluded.

Protection against overtemperature

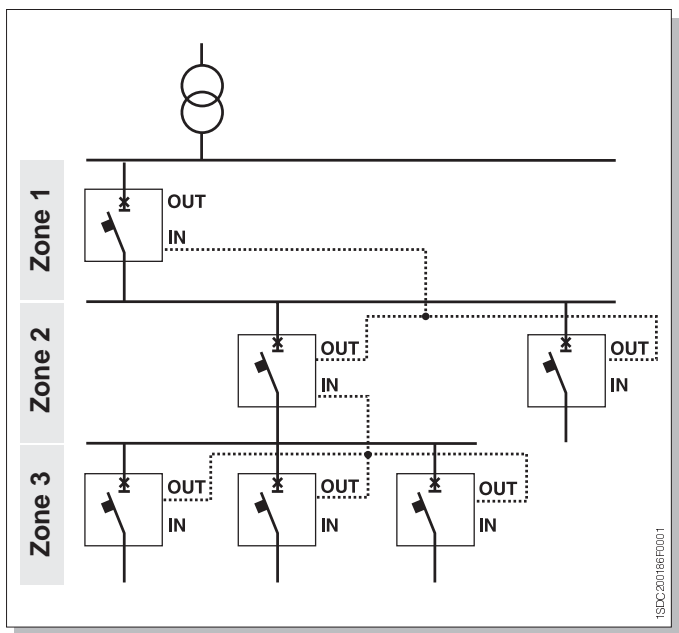

The range of SACE PR122 releases allows the presence of abnormal temperatures, which could cause temporary or continuous malfunctions of the microprocessor, to be signalled to the user.

The user has the following signals or commands available:

- lighting up of the “Warning” LED when the temperature is higher than 70 °C (temperature at which the microprocessor is still able to operate correctly)
- lighting up of the “Alarm” LED when the temperature is higher than 85 °C (temperature above which the microprocessor can no longer guarantee correct operation) and, when decided during the unit configuration stage, simultaneous opening of the circuit-breaker with indication of the trip directly on the display, as for the other protections.

Zone selectivity for protections S and G

Zone selectivity is one of the most advanced methods for making co-ordination of the protections: by using this protection philosophy, it is possible to reduce the trip times of the protection closest to the fault in relation to the times foreseen by time selectivity, of which zone selectivity is an evolution.

Zone selectivity is applicable to protection functions S and G, even contemporarily and is available as standard on the PR122. The word zone is used to refer to the part of an installation between two circuit-breakers in series (see picture beside). Protection is provided by connecting all of the zone selectivity outputs of the releases belonging to the same zone together and taking this signal to the zone selectivity input of the release immediately to the supply side.

Each circuit-breaker that detects a fault communicates this to the circuit-breaker on the supply side using a simple connection wire. Therefore the fault zone is the zone immediately to the load side of the circuit-breaker that detects the fault, but does not receive any communication from those on the load side. This circuit-breaker opens without waiting for the set time-delay.

ABB SACE provides important calculation tools to facilitate the work of designers in coordinating protection devices, including the Slide rule kits, DOCWin and CAT software packages and updated coordination charts.

The zone selectivity function S and G can be activated or deactivated using the keyboard.

Protection releases and trip curves

PR122/P

Self-diagnosis

The PR122 range of releases contains an electronic circuit which periodically checks the continuity of internal connections (opening solenoid or each current sensor, including the Source Ground Return when present).

In the case of a malfunction an alarm message appears directly on the display. The Alarm is highlighted by the Alarm LED as well.

Residual Current

Different solutions are available for integrated residual current protection. The basic choice is PR122/P-LSIRc, which has all the characteristics of PR122/P-LSI and residual current protection as well. When additional features are required, the solution is PR122/P LSIG with an additional PR120/V module (see next paragraph). Using this configuration, residual current protection is added to a unit, having the features of PR122/P-LSI and all the add-ons described for the PR120/V module, such as voltage protection and advanced measurement functions.

Residual current protection acts by measuring the current from the external dedicated toroid.

Test Functions

Once enabled from the menu, the “info/Test” pushbutton on the front of the release allows correct operation of the chain consisting of the microprocessor, opening solenoid and circuit-breaker tripping mechanism to be checked.

The control menu also includes the option of testing correct operation of the display, signalling LEDs, and electrical contacts of the PR120/K release.

When the auxiliary power supply is not present, the PR030/B unit can perform the trip test.

By means of the front multi-pin connector it is possible to apply a SACE PR010/T Test unit which allows the functions of the PR121, PR122 and PR123 ranges of releases to be tested and checked.

User interface

The human-machine interface (HMI) of the device is made up of a wide graphic display, LEDs, and browsing pushbuttons. The interface is designed to provide maximum simplicity.

The language can be selected from among five available options: Italian, English, German, French and Spanish.

As in the previous generation of releases, a password system is used to manage the “Read” or “Edit” modes. The default password, 0001, can be modified by the user.

The protection parameters (curves and trip thresholds) can be set directly via the HMI of the device. The parameters can only be changed when the release is operating in “Edit” mode, but the information available and the parameter settings can be checked at any time in “Read” mode.

When a communication device (internal PR120/D-M and PR120/D-BT modules or external BT030 device) is connected, it is possible to set parameters simply by downloading them into the unit (over the network for PR120/D-M, by using the SD-Pocket software and a PDA or a notebook for PR120/D-BT and BT030). Parameterisation can then be carried out quickly and automatically in an error-free way by transferring data directly from DocWin.

Indicator LEDs

LEDs on the front panel of the release are used to indicate all the pre-alarms (“WARNING”) and alarms (“ALARM”). A message on the display always explicitly indicates the type of event concerned.

Example of events indicated by the “WARNING” LED:

- unbalance between phases;
- pre-alarm for overload ($L1 > 90\%$);
- first temperature threshold exceeded (70 °C);
- contact wear beyond 80%;
- phase rotation reversed (with optional PR120/V)

Example of events indicated by the "ALARM" LED:

- overload (may begin from $1.05 \times I_1 < I < 1.3 \times I_1$, in accordance with the standard IEC 60947-2);
- timing of function L;
- timing of function S;
- timing of function G;
- second temperature threshold exceeded (85 °C);
- contact wear 100%;
- timing of Reverse Power flow protection (with optional PR120/V);

Data logger

By default PR122/P, as well as PR123/P, is provided with the Data Logger function, that automatically records in a wide memory buffer the instantaneous values of all the currents and voltages. Data can be easily downloaded from the unit by means of SD-Pocket or TestBus2 applications using a Bluetooth port and can be transferred to any personal computer for elaboration. The function freezes the recording whenever a trip occurs, so that a detailed analysis of faults can be easily performed. SD-Pocket and TestBus2 allow also reading and downloading of all the others trip information.

- Number of channels: 8
- Maximum sampling rate: 4800 Hz
- Maximum sampling time: 27 s (@ sampling rate 600 Hz)
- 64 events tracking

Trip information and opening data

In case a trip occurs PR122/P and PR123/P store all the needed information:

- Protection tripped
- Opening data (current)
- Time stamp (guaranteed with auxiliary supply or self-supply with power failure no longer than 48h)

By pushing the "info/Test" pushbutton the release shows all these data directly on display.

No auxiliary power supply is needed. The information is available to user for 48 hours with the circuit breaker open or without current flowing.

The information of the latest 20 trips are stored in memory.

If the information can be furthermore retrieved more than 48 hours later, it is sufficient to connect a PR030/B battery unit or a BT030 wireless communication unit.

Load control

Load control makes it possible to engage/disengage individual loads on the load side before the overload protection L is tripped, thereby avoiding unnecessary trips of the circuit-breaker on the supply side. This is done by means of contactors or switch-disconnectors (externally wired to the release), controlled by the PR122/P by PR120/K internal contacts, or by PR021/K unit.

Two different Load Control schemes can be implemented:

- disconnection of two separate loads, with different current thresholds
- connection and disconnection of a load, with hysteresis

Current thresholds and trip times are smaller than those available for selection with protection L, so that load control can be used to prevent overload tripping.

Internal PR120/K or external PR021/K accessory unit is required for Load Control. The function is only active when an auxiliary power supply is present.

Protection releases and trip curves

PR122/P

PR120/V Measurement Module

This optional internal module, installed in PR122 (standard in PR123), allows the release to measure the phase and neutral voltages and to process them in order to achieve a series of features, in terms of protection and measurement.

PR120/V does not normally require any external connection or Voltage Transformer, since it is connected internally to the lower terminals of Emax. When necessary, the connection of voltage pick-ups can be moved to any other points (i.e. upper terminals), by using the alternative connection located in the terminal box. The module is provided with a sealable switch-disconnector for the dielectric test. PR120/V is able to energize the PR122 while line voltage input is above 85V. The use of Voltage Transformers is mandatory for rated voltages higher than 690V. Voltage transformers shall have burdens equal to 10VA and accuracy class 0.5 or better.

Additional Protections with PR120/V:

- UnderVoltage (UV) protection
- Overvoltage (OV) protection
- Residual voltage (RV) protection
- Reverse power (RP) protection
- Underfrequency (UF) protection
- Overfrequency (OF) protection
- Phase sequence (alarm only)

All the above indicated protections can be excluded, although it is possible to leave only the alarm active when required.

With the circuit-breaker closed, these protections also operate when the release is self-supplied. With the circuit-breaker open, they operate when the auxiliary power supply (24V DC or PR120/V) is present: in this case the release will indicate the “ALARM” status.

Voltage protections UV, OV, RV

With the PR120/V module, the PR122/P release is able to provide the undervoltage and overvoltage protection (UV, OV) and the residual voltage protection (RV). The residual voltage protection RV identifies interruptions of the neutral (or of the earthing conductor in systems with earthed neutral) and faults that shift the star centre in systems with insulated neutral (e.g. large earth faults). The star centre shift is calculated as a vectorial sum of the phase voltages.

Reverse power protection RP

Reverse power protection is especially suitable for protecting large machines such as motors and generators. The PR122 with the PR120/V module can analyse the direction of the active power and open the circuit-breaker if the direction is opposite to that of normal operation. The reverse power threshold and the trip time are adjustable.

Frequency protections UF, OF

The frequency protections detect the variation of network frequency above adjustable thresholds, generating an alarm or opening the circuit-breaker. It is a protection typically needed in an isolated network, i.e. powered by a genset.

Measurement function

The current measurement function (ammeter) is present on all versions of the SACE PR122 unit. The display shows histograms showing the currents of the three phases and neutral on the main page. Furthermore, the most loaded phase current is indicated in numerical format. Earth fault current, where applicable, is shown on a dedicated page.

The latter current value takes on two different meanings depending on whether the external toroidal transformer for the “Source Ground Return” function or the internal transformer (residual type) is connected.

The ammeter can operate either with self-supply or with an auxiliary power supply voltage. In the latter case the display is rear-lit and the ammeter is active even at current levels lower than 160A. Accuracy of the ammeter measurement chain (current sensor plus ammeter) is no more than 1.5% in the 30% - 120% current interval of I_n .

- Currents: three phases (L1, L2, L3), neutral (Ne) and earth fault;
- Instantaneous values of currents during a period of time (data logger);
- Maintenance: number of operations, percentage of contact wear, opening data storage (last 20 trips and 20 events).

When the optional PR120/V is connected the following additional measurement function are present:

- Voltage: phase-phase, phase-neutral and residual voltage
- Instantaneous values of voltages during a period of time (data logger);
- Power: active, reactive and apparent
- Power factor
- Frequency and peak factor
- Energy: active, reactive, apparent, counter

(1) These tolerances are valid in the following conditions:
 - self-supplied release at full power and/or auxiliary power supply (without start-up)
 - two- or three-phase power supply

Power supply

The PR122 release does not normally require any external power supplies, being self-supplied from the current sensors (CS): a three-phase 70 A current is sufficient to activate the protection functions and the ammeter, whereas three-phase 160 A are required to turn the display on. Once the display is turned on, the minimum current for visualisation is $I > 5\%$ of the rating plug. The unit ensures fully self-supplied operation. When an auxiliary power supply is present, it is also possible to use the unit with the circuit-breaker either open or closed with very low current flowing through.

It is also possible to use an auxiliary power supply provided by the PR030/B portable battery unit (always supplied), which allows the protection functions to be set when the release is not self-supplied.

PR122/P stores and shows all the information needed after a trip (protection tripped, trip current, time, date). No auxiliary supply is required for this functionality.

	PR122/P	PR120/D-M	PR120/K	PR120/D-BT
Auxiliary power supply (galvanically insulated)	24 V DC $\pm 20\%$	from PR122/PR123	from PR122/PR123	from PR122/PR123
Maximum ripple	5%			
Inrush current @ 24V	~10 A for 5 ms			
Rated power @ 24V	~3 W	+1 W	+1 W	+1 W

(*) PR120/V can give power supply to the release when at least one line voltage is equal or higher to 85V RMS.

Protection releases and trip curves

PR123/P

Characteristics

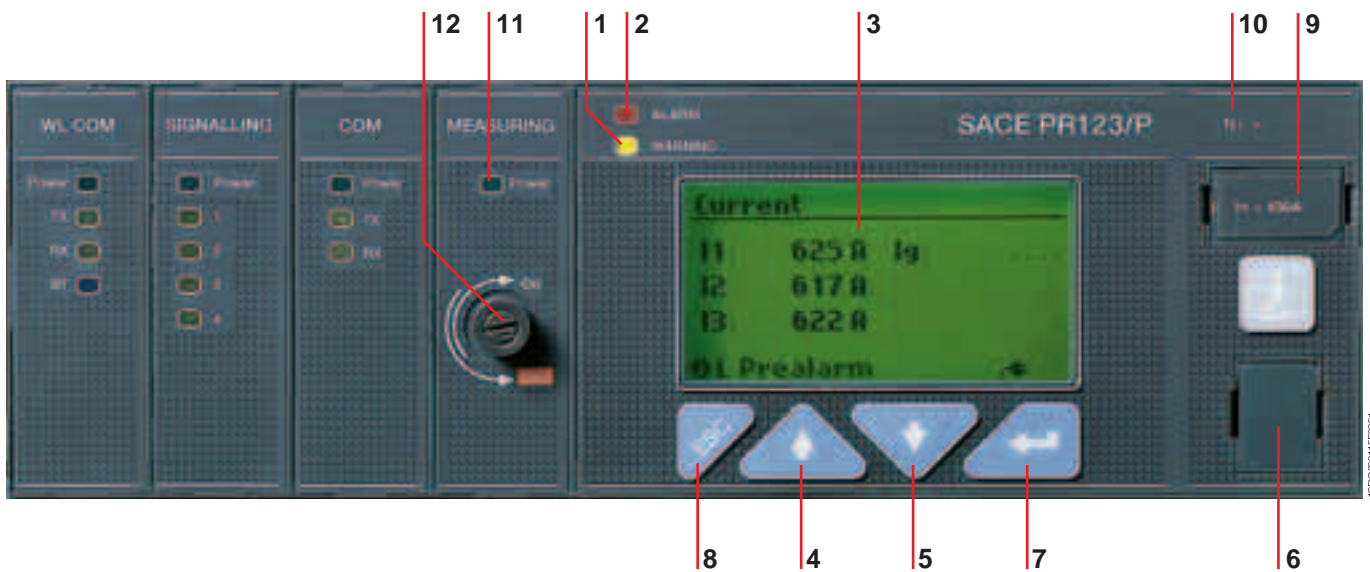

The PR123 protection release completes the range of releases available for the Emax family of circuit-breakers.

It is a high-performance and extraordinarily versatile release, capable of offering a complete set of functions for protection, measurement, signalling, data storage and control of the circuit-breaker, and it represents the benchmark in low voltage protection units for circuit-breakers.

The front interface of the unit, common to PR122/P, is extremely simple thanks to the aid of the liquid crystal graphics display. It can show diagrams, bar graphs, measurements and sine curves for the various electrical values.

PR123 integrates all the features offered by PR122/P plus a series of evolute functionalities. As well as PR122 it can be integrated with the additional features provided by internal modules and external accessories.

Protection functions

The PR123 release offers the following protection functions:

- overload (L) ⁽¹⁾,
- selective short-circuit (S),
- instantaneous short-circuit (I),
- earth fault with adjustable delay (G) ⁽²⁾,
- directional short-circuit with adjustable delay (D),
- phase unbalance (U),
- protection against overtemperature (OT),
- load control (K),
- undervoltage (UV),
- overvoltage (OV),
- residual voltage (RV),
- reverse power (RP),
- underfrequency (UF),
- overfrequency (OF),
- phase sequence (alarm only).

Notes:

(1) In accordance also with IEC 60255-3 Standard.

(2) The current values above which G is disabled are indicated in the installation manual.

In addition to PR122/P features, the following improvements are available:

Double selective short-circuit protection S

In addition to the standard S protection, PR123/P makes contemporarily available a second time-constant S protection (excludible) that allows two thresholds to be set independently achieving an accurate selectivity even under highly critical conditions.

Double earth fault protection G

While in PR122/P the user must choose among the implementation of G protection through internal current sensors (calculating the vectorial sum of currents) or external toroid (direct earth fault current measuring), PR123/P offers the exclusive feature of the contemporaneous management of both the configuration, by means of two independent earth fault protection curves. The main application of this characteristic is simultaneous activation of restricted and unrestricted earth fault protection. See chapter 6 for details.

Directional short-circuit protection with adjustable delay D

The protection works in a similar way to the fixed-time protection “S”, with the added ability to recognize the direction of the phases current during the fault period.

The current direction makes it possible to determine whether the fault is on the supply or load side of the circuit-breaker. Particularly in ring distribution systems, this makes it possible to identify and disconnect the distribution segment where the fault has occurred, whilst keeping the rest of the installation running. If multiple PR122 or PR123 releases are used, this protection can be associated with zone selectivity.

Protection releases and trip curves

PR123/P

Dual setting of protections

PR123/P can store an alternative set of all the protection parameters. This second set (set B) can replace, when needed, the default set (set A) by means of an external command. The command can be given typically when network configuration is modified, like when a parallel of incoming lines is closed or when an emergency source is present in the system, changing load capability and short-circuit levels.

The set B can be activated by:

- digital input provided with PR120/K module. For example It can be connected to an auxiliary contact of a bus-tie
- communication network, through PR120/D-M (i.e. when the changeover is scheduled);
- directly from user interface of PR123/P
- an adjustable time interval after closing of the circuit-breaker.

Notes:

The directional short-circuit protection can be disabled for an adjustable set time ($t = k$), and can either be self-supplied or use the auxiliary power supply. Directional protection is not available on 400A rating.

Zone selectivity function

The zone selectivity function allows the fault area to be insulated by segregating the system very rapidly only at the level closest to the fault, whilst leaving the rest of the installation running.

This is done by connecting the releases together: the release nearest the fault is tripped instantly, sending a block signal to the other releases affected by the same fault

The zone selectivity function can be enabled if the fixed-time curve has been selected and an auxiliary power supply is present.

Zone selectivity can be applied with protections S and G or, alternatively, with protection D.

Measurement functions

The PR123 release provides a complete set of measurements:

- Currents: three phases (L1, L2, L3), neutral (Ne) and earth fault
- Voltage: phase-phase, phase-neutral and residual voltage
- Power: active, reactive and apparent
- Power factor
- Frequency and peak factor, $\left(\frac{I_p}{I_{rms}}\right)$
- Energy: active, reactive, apparent, counter
- Harmonics calculation: up to the 40th harmonic (waveform and module of the harmonics displayed); up to the 35th for frequency $f = 60\text{Hz}$
- Maintenance: number of operations, percentage of contact wear, opening data storage.

The PR123 unit is able to provide the pattern of measurements for some values over an adjustable period of time P, such as: mean active power, maximum active power, maximum current, maximum voltage and minimum voltage. The last 24 P periods (adjustable from 5 to 120 min.) are stored in a non-volatile memory and displayed in a bar graph.

Other Functions

PR123/P integrates all the features (in terms of protection, measurement, signaling and communication) described for PR122/P equipped with PR120/V.

(1) The minimum trip value is 1 s, regardless of the type of curve set (self-protection)
 (2) These tolerances hold in the following conditions:
 - self-powered relay at full power and/or auxiliary power supply (without start-up)
 - two- or three-phase power supply
 - trip time set ≥ 100 ms
 (3) Non intervention time
 (4) In accordance with IEC 60255-3
 (5) $t = \frac{(3^\alpha - 1)}{(I/I1)^\alpha - 1} \cdot t1$
 (6) The minimum trip threshold for the G ext protection with SRG toroid is 0,1 In.

The following tolerance values apply in all cases not covered by the above:

Trip threshold	Trip time
L Release between 1.05 and 1.25 x I1	± 20%
S ± 10%	± 20%
I ± 15%	≤ 60ms
G ± 15%	± 20%
Others	± 20%

Protection releases and trip curves

PR123/P

Power supply

The PR123 release does not normally require any external power supplies, being self-supplied from the current sensors (CS); a three-phase 70 A current is sufficient to activate the protection functions and the ammeter, whereas three-phase 160 A are required to turn the display on. Once the display is turned on, the minimum current for visualisation is $I > 5\%$ of the rating plug. The unit ensures fully self-supplied operation. When an auxiliary power supply is present, it is also possible to use the unit with the circuit-breaker either open or closed with very low current flowing through.

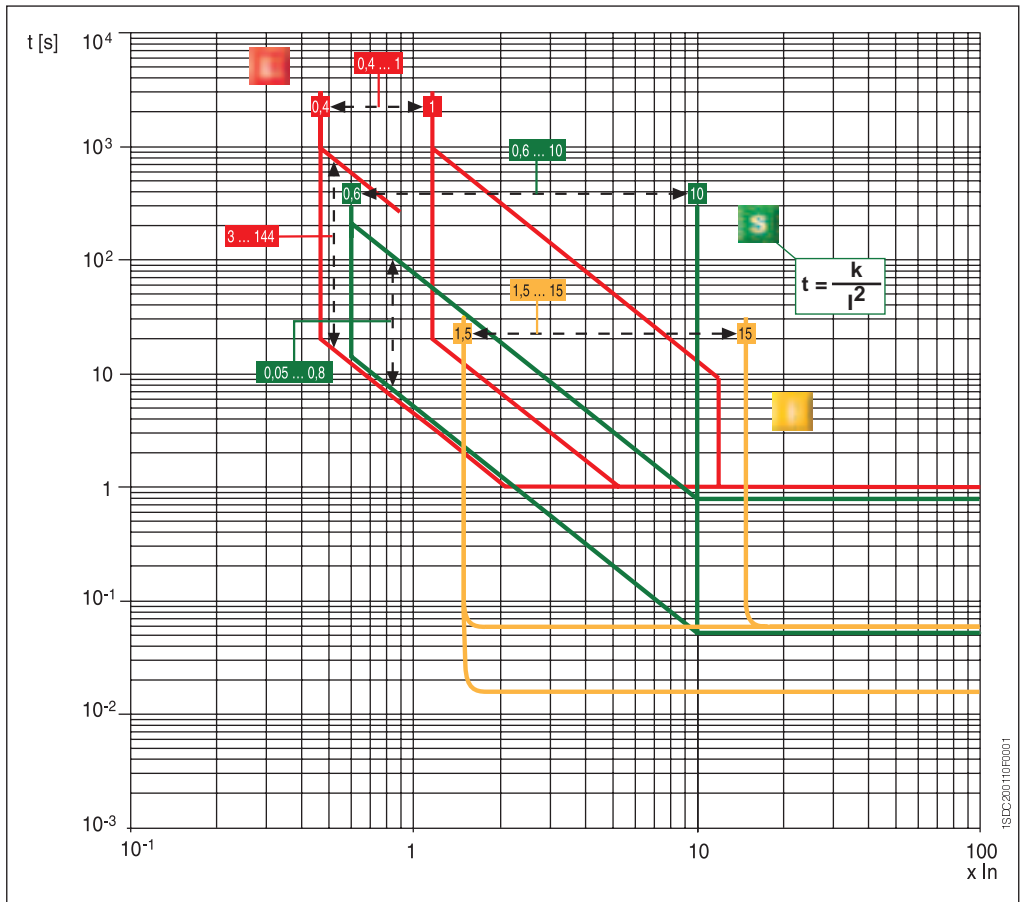

It is also possible to use an auxiliary power supply provided by the PR030/B portable battery unit (always supplied), which allows the protection functions to be set when the release is not self-supplied.

PR123/P stores and shows all the information needed after a trip (protection tripped, trip current, time, date). No auxiliary supply is required for this functionality.

	PR123/P	PR120/D-M	PR120/K	PR120/D-BT
Auxiliary power supply (galvanically insulated)	24 V DC \pm 20%	from PR122/PR123	from PR122/PR123	from PR122/PR123
Maximum ripple	5%

Accessories for protection releases

Optional modules

PR122 and PR123 can be enriched with additional internal modules, increasing the capacity of the release and making these units highly versatile.

Electrical signalling contacts: PR120/K Internal Module

This unit, internally connected to PR122/P and PR123/P, allows the remote signalling of alarms and trips of the circuit breaker.

Four independent power relays provided on the PR120/K release enable electrical signalling of the following:

- timing for protections L, S, G (and UV, OV, RV, RP, D, U, OF, UF where applicable);
- protections L, S, I, G, OT, (and UV, OV, RV, RP, D, U, OF, UF where applicable) tripped and other events;
- in addition, by using an external device (PR010/T, BT030, PR120/D-BT), the contacts can be freely configured in association with any possible event or alarm.

PR120/K can also be used as actuator for the Load control function.

In addition the unit can be provided with a digital input signal, enabling the following functions:

- activation of alternative set of parameter (PR123/P only);
- external trip command
- trip reset of the release
- reset of PR120/K power relays

When the digital input is required the power relays have a common connection (see circuit diagrams Chapter 8).

This latest kind of connection must be specified in the order when required together with the circuit breaker. When PR120/K is ordered as loose accessory both of the configurations are possible.

The auxiliary 24VDC power supply is needed for the unit (shown by a green Power LED). Four yellow LEDs show the status of each output relay.

The use of Voltage Transformers is mandatory for rated voltages higher than 690V.

1SDD20000P0001

Specifications of the signalling relays	
Type	Monostable STDP
Maximum switching power (resistive load)	100 W/1250 VA
Maximum switching voltage	130 V DC/250 V AC
Maximum switching current	5 A
Breaking capacity (resistive load)	
	@ 30V DC 3.3 A
	@ 250V AC 5 A
Contact/coil insulation	2000 V eff (1 min@ 50 Hz)

PR120/V Measurement Module

This optional internal module can be added to PR122, and it is supplied as standard in PR123. It measures and processes the phase and neutral voltages, are transferring these values to the protection release by means of its internal bus in order to achieve a series of protection and measurement features.

It can be connected at any time to PR122/P, which recognizes it automatically without the need of any configuration.

PR122 does not normally require any external connection or Voltage Transformer, since it is connected internally to the lower terminals of Emax. When necessary, the connection of voltage pick-ups can be moved to any other points (i.e. upper terminals), by using the alternative connection located in the terminal box.

When ordered as a loose accessory, PR122 is provided with all the possible connections, internal or through the terminal box.

The module is provided with a Power LED and a sealable switch-disconnector for the dielectric test.

1SDD20011P0001

Accessories for protection releases

PR120/D-M Communication Module

PR120/D-M communication module is the solution for connecting Emax to a Modbus network, allowing the remote supervision and control of the circuit-breaker.

It is suitable for PR122/P and PR123/P releases. As for PR120/V this module can be added at any time to the protection release and its presence is automatically recognized. When ordered separately from the circuit-breakers it is supplied complete of all the accessories needed for its installation, such as precabled auxiliary switches and cables for signalling the circuit-breaker status (springs, position inserted). Refer to circuit diagram page 8/8 for details about connections.

The list of available functions can be found on page 4/42.

It is provided with three LEDs on the front side:

- Power LED
- Rx/Tx LEDs

PR120/D-BT Wireless Communication Module

PR120/D-BT is the innovative wireless communication module, based on Bluetooth standard. It allows the communication among the PR122/P and PR123/P Protection releases and a PDA or a Notebook with a Bluetooth port. This device is dedicated to the use with SD-Pocket application (see in the following the features of this application).

The module can be powered by means of the 24V DC auxiliary supply or by means of PR130/B battery unit.

It is provided with four LEDs on the front side:

- Power LED
- Rx/Tx LEDs
- Bluetooth LED, showing the activity of Bluetooth communication

PR120/D-BT can be connected at any time to the protection release.

BT030 Communication unit

BT030 is a device to be connected on Test connector of PR121/P, PR122/P and PR123/P. It allows Bluetooth communication among the Protection release and a PDA or a Notebook with a Bluetooth port. BT030 can also be used with Tmax circuit breakers equipped with PR222DS/PD. This device is dedicated to the use with SD-Pocket application.

BT030 can provide the power supply needed to energize itself and the protection release by means of a Li-ion rechargeable battery.

PR030/B power supply unit

This accessory, always supplied with the PR122 and PR123 range of releases, makes it possible to read and configure the parameters of the unit whatever the status of the circuit-breaker (open-closed, in test isolated or racked-in position, with/without auxiliary power supply). PR030/B is also needed for reading trip data if the trip occurred more than 48 hours earlier and the release was no longer powered.

An internal electronic circuit supplies the unit for approximately 3 consecutive hours for the sole purpose of reading and configuring data.

In relation to the amount of use, battery life decreases if the SACE PR030/B accessory is also used to perform the Trip test & Auto test.

Interface from front of HMI030 panel

This accessory, suitable for all protection releases, is designed for the installation on the front side of the switchboard. It consists of a graphic display where all the measurements and alarms/events of the release are shown. The user can browse the measurements by using the navigation pushbuttons, similarly to PR122/P and PR123/P. Thanks to the high precision level, the same of the protection releases, the device can replace the traditional instrumentation, without the need for current/voltage transformers. The unit requires only a 24 V DC power supply. In fact HMI030 is connected directly to the protection release via a serial line.

1SC030128P0001

SACE PR010/T configuration test unit

The SACE PR010/T unit is an instrument capable of performing the functions of testing, programming and reading parameters for the protection units equipping SACE Emax low-voltage air circuit-breakers.

In particular, the test function involves the following units:

- PR121 (all versions)
- PR122 (all versions)
- PR123 (all versions)

whereas the parameter programming and reading functions regard the range of PR122 and PR123 releases.

All of the functions mentioned can be carried out “on board” by connecting the SACE PR010/T unit to the front multi-pin connector on the various protection units. Special interfacing cables supplied with the unit must be used for this connection.

The human-machine interface takes the form of a touchpad and multi-line alphanumeric display. The unit also has two LEDs to indicate, respectively:

- POWER-ON and STAND BY
- battery charge state.

Two different types of test are available: automatic (for PR121, PR122 and PR123) and manual. By connection to a PC (using the floppy-disc supplied by ABB SACE), it is also possible to upgrade the software of the SACE PR010/T unit and adapt the test unit to the development of new products.

It is also possible to store the most important test results in the unit itself, and to send a report to the personal computer with the following information:

- type of protection tested
- threshold selected
- curve selected
- phase tested
- test current
- estimated trip time
- measured trip time
- test results.

At least 5 complete tests can be stored in the memory. The report downloaded onto a PC allows creation of an archive of tests carried out on the installation.

In automatic mode, the SACE PR010/T unit is capable of testing the following with the PR122 range:

- protection functions L, S, I,
- G protection function with internal transformer,
- G protection function with toroid on the transformer star centre,
- monitoring of correct microprocessor operation.

The unit can also test the following protections of PR122 equipped with PR120/V:

- overvoltage protection function OV,
- undervoltage protection function UV,
- residual voltage protection function RV,
- phase unbalance protection function U.

The SACE PR010/T unit is portable and runs on rechargeable batteries and/or with an external power supply (always supplied) with a rated voltage of 100-240V AC/12V DC.

The standard version of the SACE PR010/T unit includes:

- SACE PR010/T test unit complete with rechargeable batteries
- SACE TT1 test unit
- 100 - 240V AC/12V DC external power supply with cord
- cables to connect the unit and connector
- cable to connect the unit and computer (RS232 serial)
- user manual and floppy-disc containing application software
- plastic bag.

Accessories for protection releases

SACE PR021/K signalling unit

The SACE PR021/K signalling unit can convert the digital signals supplied by the PR121, PR122 and PR123 protection unit into electrical signals, via normally open electrical contacts (potential free).

The unit is connected to the protection release by means of a dedicated serial line through which all of the information about the activation status of the protection functions flows. The corresponding power contacts are closed based on this information.

The following signals/contacts are available:

- overload pre-alarm L (the alarm signal remains active throughout the overload, until the release is tripped)
- timing and tripping of any protections (the trip signals of the protections remain active during the timing phase, and after the release has tripped)
- protection I tripped
- timing and overtemperature threshold exceeded ($T > 85\text{ °C}$)
- two load control contacts (connection and disconnection of a load, or disconnection of two loads)
- release tripped
- dialogue fault on a serial line (connecting the protection and signalling units)
- phase unbalance.

Setting a dip-switch allows up to seven signal contacts to be freely configured in PR122-PR123, including: directional protection D tripped, under- and overvoltage UV and OV tripped, reverse power RP tripped, and others.

Two contacts available on the SACE PR021/K unit (load control) can pilot a circuit-breaker shunt opening or closing release. These contacts allow various applications, including load control, alarms, signals and electrical locks.

Pressing the Reset pushbutton resets the status of all signals.

The unit also contains ten LEDs to visually signal the following information:

- “Power ON”: auxiliary power supply present
- “TX (Int Bus)”: flashing synchronized with dialogue with the Internal Bus
- eight LEDs associated with the signalling contacts.

The table below lists the characteristics of the signalling contacts available in the SACE PR021/K unit.

Auxiliary power supply	24 V DC \pm 20%
Maximum ripple	5%
Rated power @ 24 V	4.4 W

Specifications of the signalling relays	
Type	Monostable STDP
Maximum switching power (resistive load)	100 W/1250 VA
Maximum switching voltage	130 V DC/250 V AC
Maximum switching current	5 A
Breaking capacity (resistive load)	
	@ 30V DC 3.3 A
	@ 250V AC 5 A
Contact/coil insulation	2000 V eff (1 min@ 50 Hz)

Communication devices and systems

Industrial networking and ABB SACE Emax

In addition to providing flexible and safe protection of power installations, ABB SACE Emax electronic releases have an extended range of communication features, which opens the way for connection of circuit-breakers to the world of industrial communication.

PR122 and PR123 electronic releases can be fitted with communication modules, which make it possible to exchange data and information with other industrial electronic devices by means of a network.

The basic communication protocol implemented is Modbus RTU, a well-known standard of widespread use in industrial automation and power distribution equipment. A Modbus RTU communication interface can be connected immediately and exchange data with the wide range of industrial devices featuring the same protocol.

ABB products featuring the Modbus RTU protocol include:

- low voltage circuit breakers such as Emax,
- Medium Voltage protection devices
- sensors,
- automation I/O systems,
- power meters and other measurement devices,
- intelligent devices such as PLCs,
- operator interfaces
- supervision and control systems.

And if other communication protocols are required, the ABB Fieldbus Plug system is also available: intelligent field bus protocols such as Profibus-DP and DeviceNet thus become immediately available.

The power of industrial networking

The communication network can be used to read all information available in the protection release, from any location connected to the bus and in real time:

- circuit-breaker status: closed, open, opened by protection release trip
- all values measured by the protection release: RMS currents, voltages, power, power factor and so on
- alarms and prealarms from protection release, e.g., overload protection alarm (timing to trip or prealarm warning)
- fault currents in case of circuit-breaker opening on a protection trip
- number of operations performed by the circuit-breaker, with indication of the number of trips per protection type (short-circuit, overload, etc.)
- complete settings of the protection release
- estimate of the residual life of circuit-breaker contacts, calculated on the basis of interrupted currents

Remote control of circuit-breakers is possible: commands to open, close and reset alarms can be issued to the circuit-breaker and protection release. Close commands are executed only after a security check (e.g., that there are no diagnostic alarms active on the release).

It is also possible to change the settings of the protection release remotely by means of the communication bus.

All remote commands can be disabled by a "local" configuration feature, for safety of operators and installation.

TSCC200608F0001

Communication devices and systems

Circuit-breakers with communication can easily be integrated with automation and supervision systems. Typical applications include:

- supervision of the installation with continuous data logging (values of currents, voltage, power) and event logging (alarms, faults, trip logs). Supervision can be limited to low voltage devices or include medium voltage and possibly other kinds of industrial apparatus
- predictive maintenance, based on number of operations of each circuit-breaker, interrupted currents and estimate of residual equipment life
- load shedding and demand side management under control of PLC, DCS or computers.

Communication products for ABB SACE Emax

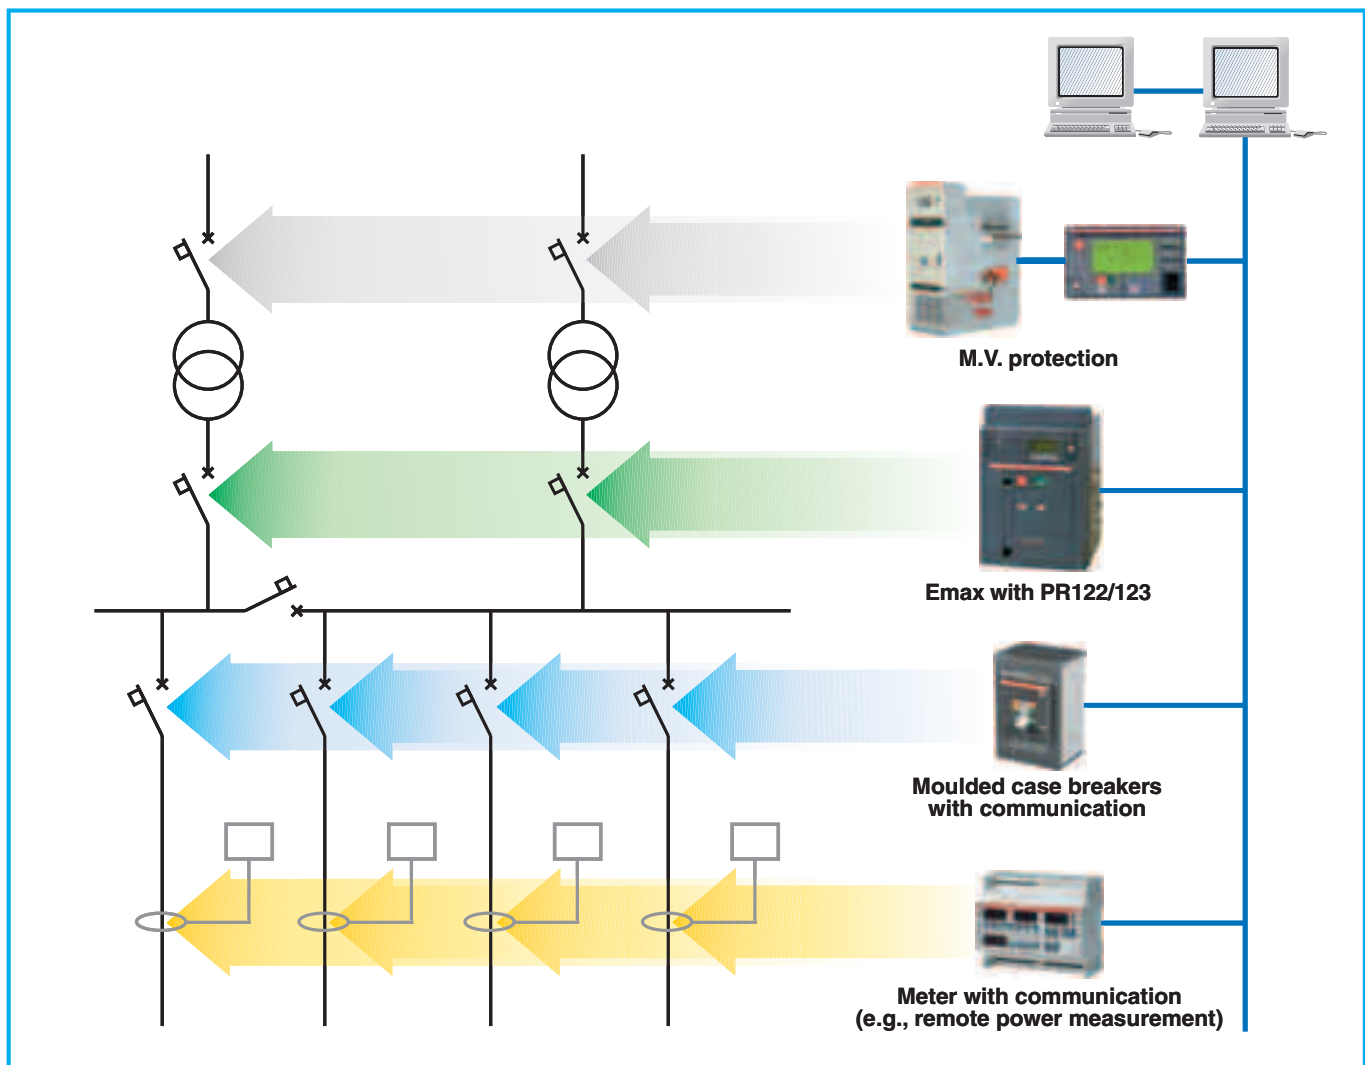

ABB SACE has developed a complete series of accessories for the Emax family of electronic releases:

- PR120/D-M communication module
- EP010 – FBP.

Furthermore, a new generation of software dedicated to installation, configuration, supervision and control of protection releases and circuit-breakers is now available:

- SDView 2000
- SD-Pocket
- TestBus2.

System architecture for plant supervision and control

1SDC210304F0001

PR120/D-M

PR120/D-M is the new communication module for PR122/P and PR123/P protection releases. It is designed to allow easy integration of the Emax circuit-breakers in a Modbus network. The Modbus RTU protocol is of widespread use in the power as well as the automation industry. It is based on a master/slave architecture, with a bandwidth of up to 19200 Kbytes/sec. A standard Modbus network is easily wired up and configured by means of an RS485 physical layer. ABB SACE releases work as slaves in the field bus network. All information required for simple integration of PR120/D-M in an industrial communication system are available on the ABB Web page.

BT030

BT030 is a device to be connected to the Test connector of PR121/P, PR122/P and PR123/P. It allows Bluetooth communication between the Protection release and a PDA or a Notebook with a Bluetooth port.

BT030 can also be used with Tmax circuit-breakers equipped with PR222DS/PD. This device is dedicated to use with the Sd-Pocket application.

It can provide the auxiliary supply needed to energize the protection release by means of rechargeable batteries.

1SDC210304F0001

EP 010 - FBP

EP 010 – FBP is the Fieldbus Plug interface between the Emax protection releases and the ABB Fieldbus Plug system, allowing connection of Emax Circuit-breakers to a Profibus, DeviceNet, or AS-I field bus network.

EP 010 – FBP can be connected to the new Emax PR122 and PR123 protection releases (the PR120/D dialogue module is required).

The ABB Fieldbus Plug concept is the latest development in industrial communication systems. All devices feature a standard connection socket, to which a set of interchangeable “smart” connectors can be plugged. Each connector is fitted with advanced electronics implementing the communication interface towards the selected field bus. Selecting a communication system is made as easy as selecting and connecting a plug. Communication systems currently available are Profibus-DP, DeviceNet and AS-i. More are being developed.

Communication devices and systems

Measurement, signalling and available data functions

Details about functions available on PR122/P, PR123/P releases with PR120/D-M and EP010 – FBP are listed in the table below:

	PR122/P + PR120/D-M	PR123/P + PR120/D-M	PR122/P-PR123/P + PR120/D-M and EP 010

(1) with PR120/V

(2) please ask ABB for further details

SD-View 2000

SD-View 2000 is a "ready-to-use" system, consisting of software for personal computers, in standard configuration, which allows complete control of the low voltage electrical installation.

Putting the SD-View 2000 system into operation is quick and easy. In fact, the software itself guides the user in recognising and configuring the protection units.

The user only needs knowledge of the installation (such as how many circuit-breakers are installed and how they are connected to each other). No engineering work on the supervision system is required, since all the pages displayed are already configured in the system, ready to be used.

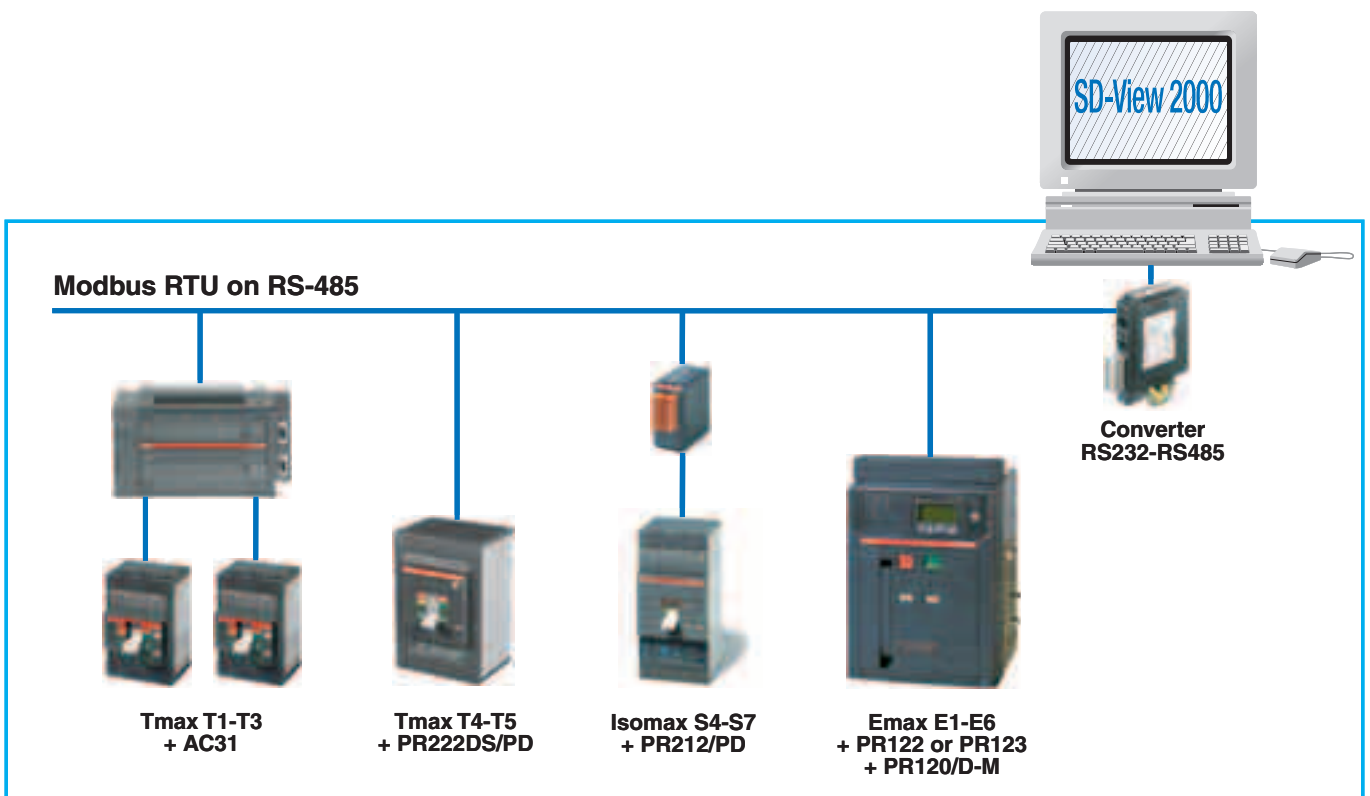

Usage of the software is intuitive and easy to learn for the operator: SD-View 2000 has graphic pages based on Internet Explorer, which make the system as simple to manage as surfing on the Internet.

System architecture

System architecture is based on the latest developments in personal computer and industrial communication network technology.

The ABB SACE devices are connected to the serial bus RS485 Modbus. A maximum of 31 devices can be connected to a bus. A maximum of 4 serial bus can lines be connected to a personal computer which works as data server, reading and storing the data received from the devices. The server is also used as the operator station, from where the data can be displayed and printed, commands can be sent to the devices, and all the operations needed to manage the installation can be carried out.

The server can be connected to a local network together with other personal computers which work as additional operator stations (clients). In this way, installation supervision and control can be carried out with total reliability from any station connected to the network on which SD-View 2000 is installed.

Communication devices and systems

Complete control of the installation

SD-View 2000 is the ideal tool available to managers, in order to have the situation of the installations under control at all times and to be able to control all the functions easily and in real time.

The SD-View 2000 operator station (personal computer) allows information from the installation to be received and to control the circuit-breakers and relative releases. In particular, it is possible to:

- Send opening and closing commands to the circuit-breakers
- Read the electrical installation values (current, voltage, power factor, etc.)
- Read and modify the trip characteristics of the protection units
- Determine the status of the apparatus (open, closed, number of operations, trip for fault, etc.)
- Determine abnormal operating situations (e.g. Overload) and, in the case of the releases tripping, the type of fault (short-circuit, earth fault, value of the uninterrupted currents, etc.)
- Log the history of the installation (energy consumption, most highly loaded phase, any warnings of anomalies or faults, etc.)

- Show the temporal evolution of the installation by means of graphs.
- Access to the various system functions can be enabled by means of secret codes or passwords with different levels of authorisation.

Usage of the system is really simple thanks to the user interface based on Internet explorer. The graphic pages relative to each circuit-breaker are particularly intuitive and easy to use.

Devices which can be connected

The circuit-breakers with electronic releases which can be interfaced with SD-View 2000 are:

- Emax LV air circuit-breakers from E1 to E6 fitted with PR122/P or PR123/P releases with Modbus RTU PR120/D-M communication unit
- Emax LV air circuit-breakers from E1 to E6 fitted with PR112/PD or PR113/PD Modbus releases
- Tmax LV moulded-case circuit-breakers T4 and T5 fitted with PR222/PD release
- Isomax LV circuit-breakers from S4 to S7 fitted with PR212/P release with Modbus RTU PR212/D-M communication unit.

In addition, SD-View 2000 can acquire current, voltage and power measurements in real time from the MTME-485 multimeters with Modbus communication

Furthermore, it is possible to interface any air or moulded-case circuit-breaker or switch-disconnector, not fitted with electronics, with SD-View 2000 by using a PLC AC31 unit as the communication module. For the circuit-breakers or switch-disconnectors connected in this way, SD-View 2000 shows the conditions of the apparatus (open, closed, tripped, racked-in or racked-out) in real time and allows it to be operated remotely.

All the characteristics of the devices listed are preconfigured in the SD-View 2000 system. The user does not therefore have to carry out any detailed configuration (i.e. insert tables with data to be displayed for each release, or draft ad hoc graphic pages): simply enter the list of devices connected into the system.

Technical characteristics

Up to 4 serial ports
Up to 31 ABB SACE devices for each serial port
9600 or 19200 baud
Modbus® RTU Protocol

Personal computer requirements

Pentium 1 GHz, 256 MB RAM (512 MB recommended), 20 GB hard disk, Windows 2000, Internet Explorer 6, Ethernet card, Printer (optional)

SD-Pocket

SD-Pocket is an application designed to connect the new protection releases to a PDA or to a personal computer. This means it is now possible to use wireless communication to:

- configure the protection threshold function
- monitor measurement functions, including reading of data recorded in data logger (PR122/PR123)
- verify the status of the circuit-breaker (i.e. number of operations, trip data, according to the release connected).

SD-Pocket application scenarios include:

- during start-up of switchgear, with rapid and error-free transfer of the protection parameters to the releases (also using the dedicated exchange file directly from Docwin);
- during normal installation service, gathering information on the circuit-breaker and load conditions (last trip information, runtime currents, and other information).

To use all these functions, it is sufficient to have a PDA with MS Windows Mobile 2003 and BT interface or a personal computer with MS Windows2000 OS and new PR120/D-BT or PR030 Bluetooth interface devices.

SD-Pocket is freeware and it can be downloaded from the BOL website (<http://bol.it.abb.com>). Its use does not require the presence of dialogue units for the releases.

Communication devices and systems

TestBus2

TestBus2 is the ABB SACE commissioning and diagnostic software for all Modbus RTU devices. It can be used during system startup, or to troubleshoot an installed network.

TestBus2 automatically scans the RS-485 bus, detects all connected devices and checks their communication settings. All possible combination of device address, parity and baud rate are checked.

A click on “scan” is enough to spot devices which are not responding, wrong addresses, misconfigured parity bits, and so on. This function is not limited to ABB SACE devices: all standard Modbus RTU devices are detected and their configuration is displayed.

After the scan, the software displays warning messages about potential problems and configuration errors, allowing complete diagnosis of a field bus network.

When ABB SACE circuit breakers are detected, additional functions can be used to check wirings, send open/close/reset commands, and retrieve diagnostic information. This user-friendly tool makes commissioning of Modbus networks a breeze. TestBus2 is freeware and can be downloaded from the BOL website (<http://bol.it.abb.com>).

Functions of the accessories

The table below lists a few functions that can be obtained by selecting the appropriate accessories from among those provided. Several of the functions listed may be needed at the same time, depending on how the circuit-breaker is used. See the relative section for a detailed description of the individual accessories.

Function	Components
Remote control	<ul style="list-style-type: none"> • Opening release • Closing release • Geared motor for automatic charging of the closing springs
Remote signalling or actuation of automatic functions depending on the state (open-closed-tripped) or position (<i>racked-in, test isolated, racked-out</i>) of the circuit-breaker.	<ul style="list-style-type: none"> • Circuit-breaker open-closed auxiliary contacts • Circuit-breaker <i>racked-in, test isolated, racked-out</i> auxiliary contacts (withdrawable circuit-breaker only) • Contact for electrical signalling of overcurrent releases tripped • Contact for signalling undervoltage release de-energized • Contact for signalling springs charged
Remote opening for various needs, including: <ul style="list-style-type: none"> – manual emergency control – opening dependent on tripping of other interruption devices or system automation needs ⁽¹⁾. 	<ul style="list-style-type: none"> • Opening or undervoltage release
Automatic opening of the circuit-breaker for undervoltage (for example, when operating asynchronous motors)	<ul style="list-style-type: none"> • Instantaneous or time delay undervoltage release ⁽²⁾ • Contact for signalling undervoltage release energized
Increased degree of protection	<ul style="list-style-type: none"> • IP54 door protection
Mechanical safety locks for maintenance or functional requirements for interlocking two or more circuit-breakers	<ul style="list-style-type: none"> • Key lock in open position • Padlock device in open position • Key lock and padlocks in <i>racked-in, test isolated, racked-out</i> position
Automatic switching of power supplies	<ul style="list-style-type: none"> • Mechanical interlock between two or three circuit-breakers • Automatic transfer switch - ATS010

(1) Examples:
 – circuit-breakers on Low Voltage side of parallel transformers that must open automatically when the Medium Voltage side device opens.
 – automatic opening for control by external relay (undervoltage, residual current, etc.).

(2) The time-delay device is recommended when unwanted operation due to temporary voltage drops, is to be avoided (for functional or safety reasons).

Accessories supplied as standard

The following standard accessories are supplied depending on the circuit-breaker version:

Fixed circuit-breaker:

- flange for switchgear compartment door (IP30)
- support for service releases
- four auxiliary contacts for electrical signalling of circuit-breaker open/closed (for automatic circuit-breakers only)
- terminal box for connecting outgoing auxiliaries
- mechanical signalling of overcurrent release tripped (*)
- horizontal rear terminals
- lifting plate

Note:

(*) Not supplied with the switch disconnector.

Withdrawable circuit-breaker:

- flange for switchgear compartment door
- support for service releases
- four auxiliary contacts for electrical signalling of circuit-breaker open/closed (for automatic circuit-breakers only)
- sliding contacts for connecting outgoing auxiliaries
- mechanical signalling of overcurrent release tripped (*)
- horizontal rear terminals
- anti-insertion lock for circuit-breakers with different rated currents
- racking-out crank handle
- lifting plate

Note:

(*) Not supplied with the switch disconnector.

- Accessory on request for fixed part
- Accessory on request for moving part

Shunt opening and closing releases

1a) Shunt opening and closing release (YO/YC) and second opening release (YO2)

(1) The minimum impulse current duration time in instantaneous service must be 100 ms

(2) If the opening release is permanently connected to the power supply, wait at least 30 ms before sending the command to the shunt closing release.

Allows remote control opening or closing of the apparatus, depending on the installation position and connection of the releases on the support. The release can, in fact, be used for either of these two applications. Given the characteristics of the circuit-breaker operating mechanism, opening (with the circuit-breaker closed) is always possible, whereas closing is only possible when the closing springs are charged. The release can operate with direct current or alternating current. This release provides instantaneous operation ⁽¹⁾, but can be powered permanently ⁽²⁾. Some installations require very high safety in controlling circuit-breaker opening remotely. In particular, the control and opening release circuits must be duplicated. To meet these needs, SACE Emax circuit-breakers can be equipped with a second shunt opening release, fitted with a special support to hold it, that can house the standard shunt closing and opening releases. The seat of the second shunt opening release is that of the undervoltage release, which is therefore incompatible with this type of installation. The special support, including the second shunt opening release, is installed in place of the standard support. The technical specifications of the second shunt opening release remain identical to those of the standard shunt opening release.

When used as a permanently powered closing release, it is necessary to momentarily de-energize the shunt closing release in order to close the circuit-breaker again after opening (the circuit-breaker operating mechanism has an anti-pumping device).

Closing time (YC):	(max) 80 ms	
Insulation voltage:	2500 V 50 Hz (for 1 min)	

1SDC2015R0001

1b) SOR Test Unit

The SOR control and monitoring Test Unit helps ensure that the various versions of SACE Emax opening releases are running smoothly, to guarantee a high level of reliability in controlling circuit-breaker opening.

Under particularly severe operating conditions or simply for remote control of the circuit-breaker, the opening release is widely used as an accessory for the SACE Emax series of air circuit-breakers.

Keeping all the functions of this accessory is a necessary condition to guarantee a high level of safety in the installation: it is therefore necessary to have a device available which cyclically checks correct operation of the release, signalling any malfunctions.

The SOR control and monitoring Test Unit ensures the continuity of opening releases with a rated operating voltage between 24 V and 250 V (AC and DC), as well as the functions of the opening coil electronic circuit are verified.

Continuity is checked cyclically with an interval of 20s between tests.

The unit has optic signals via LEDs on the front, which provide the following information in particular:

- POWER ON: power supply present
- YO TESTING: test in progress
- TEST FAILED: signal following a failed test or lack of auxiliary power supply
- ALARM: signal given following three failed tests.

Two relays with one change-over are also available on board the unit, which allow remote signalling of the following two events:

- failure of a test - resetting takes place automatically when the alarm stops)
- failure of three tests - resetting occurs only by pressing the manual RESET on the front of the unit)

There is also a manual RESET button on the front of the unit.

Reference figure in electrical circuit diagrams: AY (61)

Characteristics	
Auxiliary power supply	24 V ... 250 V AC/DC
Maximum interrupted current	6 A
Maximum interrupted voltage	250V AC

Undervoltage release

2a) Undervoltage release (YU)

The undervoltage release opens the circuit-breaker when there is a significant voltage drop or power failure. It can be used for remote release (using normally-closed pushbuttons), for a lock on closing or for monitoring the voltage in the primary and secondary circuits. The power supply for the release is therefore obtained on the supply side of the circuit-breaker or from an independent source. The circuit-breaker can only be closed when the release is powered (closing is mechanically locked). The release can operate with direct current or alternating current.

The circuit-breaker is opened with release power supply voltages of 35-70% U_n .

The circuit-breaker can be closed with a release power supply voltage of 85-110% U_n .

It can be fitted with a contact to signal when the undervoltage release is energized (C. aux YU) (see accessory 5e).

Reference figure in electrical circuit diagrams: YU (6)

1SDC200136F0001

Characteristics		
Power supply (U_n):	24 V DC	120-127 V AC/DC
	30 V AC/DC	220-240 V AC/DC
	48 V AC/DC	240-250 V AC
	60 V AC/DC	380-400 V AC
	110-120 V AC/DC	440 V AC
Operating limits:	CEI EN 60947-2 Standards	
Inrush power (P_s):	DC = 200 W	
	AC = 200 VA	
Continuous power (P_c):	DC = 5 W	
	AC = 5 VA	
Opening time (YU):	30 ms	
Insulation voltage:	2500 V 50 Hz (for 1 min)	

1SDC200137F0001

2b) Time-delay device for undervoltage release (D)

The undervoltage release can be combined with an electronic time-delay device for installation outside the circuit-breaker, allowing delayed release tripping with adjustable preset times. Use of the delayed undervoltage release is recommended to prevent tripping when the power supply network for the release is subject to brief voltage drops or power supply failures. Circuit-breaker closing is inhibited when it is not powered. The time-delay device must be used with an undervoltage release with the same voltage.

Reference figure in electrical circuit diagrams: YU +D (7)

Characteristics	
Power supply (D):	24-30 V DC
	48 V AC/DC
	60 V AC/DC
	110-127 V AC/DC
	220-250 V AC/DC
Adjustable opening time (YU+D):	0.5-1-1.5-2-3 s

Geared motor for the automatic charging of the closing springs

3) Geared motor for the automatic charging of the closing springs (M)

This automatically charges the closing springs of the circuit-breaker operating mechanism. After circuit-breaker closing, the geared motor immediately recharges the closing springs. The closing springs can, however, be charged manually (using the relative operating mechanism lever) in the event of a power supply failure or during maintenance work.

It is always supplied with a limit contact and microswitch for signalling that the closing springs are charged (see accessory 5d).

Reference figure in electrical circuit diagrams: M (1)

Characteristics	
Power supply	24-30 V AC/DC
	48-60 V AC/DC
	100-130 V AC/DC
	220-250 V AC/DC
Operating limits:	85%...110% U_n (CEI EN 60947-2 Standards)
Inrush power (Ps):	DC = 500 W
	AC = 500 VA
Rated power (Pn):	DC = 200 W
	AC = 200 VA
Inrush time	0.2 s
Charging time:	4-5 s
Insulation voltage:	2500 V 50 Hz (for 1 min)

Signal for overcurrent releases tripped

4) Electrical signalling of electronic releases tripped

The following signals are available after the electronic release has tripped:

4a) Electrical signalling of electronic releases tripped

This allows visual signalling on the operating mechanism (mechanical) and remote signalling (electrical using switch) that the circuit-breaker is open following operation of the overcurrent releases. The mechanical signalling pushbutton must be rearmed to reset the circuit-breaker.

Reference figure in electrical circuit diagrams: S51 (13)

4b) Electrical signalling of electronic releases tripped with remote reset command

This allows visual signalling on the operating mechanism (mechanical) and remote signalling (electrical using switch) that the circuit-breaker is open following operation of the overcurrent releases. With this accessory, it is possible to reset the mechanical signalling pushbutton via an electrical coil from a remote command, which also allows the circuit-breaker to be reset.

Available reset coils

- 24-30 V AC/DC
- 220-240 V AC/DC
- 110-130 V AC/DC

5

Reference figure in electrical circuit diagrams: S51 (14)

Auxiliary Contacts

5) Auxiliary contacts

Auxiliary contacts are available installed on the circuit-breaker, which enable signalling of the circuit-breaker status. The auxiliary contacts are also available in a special version for application with rated voltages $U_n < 24\text{ V}$ (digital signals).

Characteristics		
U_n	$I_n\text{ max}$	T
125 V DC	0.3 A	10 ms
250 V DC	0.15 A	
U_n	$I_n\text{ max}$	$\cos\phi$
250 V AC	15 A	0,3

The versions available are as follows:

5a-5b) Electrical signalling of circuit-breaker open/closed

It is possible to have electrical signalling of the status (open/closed) of the circuit-breaker using 4, 10 or 15 auxiliary contacts.

The auxiliary contacts have the following configurations:

- 4 open/closed contacts for PR121 (2 normally open + 2 normally closed)
- 4 open/closed contacts for PR122/PR123 (2 normally open + 2 normally closed + 2 dedicated to release)
- 10 open/closed contacts for PR121 (5 normally open + 5 normally closed)
- 10 open/closed contacts for PR122/PR123 (5 normally open + 5 normally closed + 2 dedicated to release)
- 15 supplementary open/closed contacts for installation outside the circuit-breaker.

The basic configuration described above can be modified by the user for normally open or normally closed indication by repositioning the faston connector on the microswitch.

When 10 open/closed contacts for PR122/PR123 are required, the zone selectivity and PR120/K unit are not available.

Reference figure in electrical circuit diagrams: Q/1÷10 (21-22)

1SBC200148F0001

1SBC200148F0001

5c) Electrical signalling of circuit-breaker racked-in/test isolated/racked out

1SBC20146FD001

In addition to mechanical signalling of the circuit-breaker position, it is also possible to obtain electrical signalling using 5 or 10 auxiliary contacts which are installed on the fixed part.

It is only available for withdrawable circuit-breakers, for installation on the fixed part.

The auxiliary contacts take on the following configurations:

- 5 contacts; set comprising 2 contacts for racked-in signal, 2 contacts for racked-out signal, and 1 contact to signal the test isolated position (main pliers isolated, but sliding contacts connected).
- 10 contacts; set comprising 4 contacts for racked-in signal, 4 contacts for racked-out signal, and 2 contacts to signal the test isolated position (main pliers isolated, but sliding contacts connected).

Auxiliary Contacts

1SDC200148F0001

5d) Contact for signalling closing springs charged

This is made up of a microswitch which allows remote signalling of the state of the circuit-breaker operating mechanism closing springs (always supplied with the spring charging geared motor).

Reference figure in electrical circuit diagrams: S33 M/2 (11)

1SDC200165F0001

5

1SDC200151F0001

5e) Contact signalling undervoltage release de-energized (C.aux YU)

The undervoltage releases can be fitted with a contact (normally closed or open, as preferred) for signalling undervoltage release energized, to remotely signal the state of the undervoltage release.

Reference figure in electrical circuit diagrams: (12)

1SDC200152F0001

Transformers and operation counters

6a) Current sensor for neutral conductor outside circuit-breaker

1SDC20153F0001

For three-pole circuit-breakers only, this allows protection of the neutral by connecting it to the overcurrent release. Supplied on request.

Reference figure in electrical circuit diagrams: UI/N (page 8/8)

6b) Homopolar toroid for the main power supply earthing conductor (star centre of the transformer)

1SDC20154F0001

SACE PR122 and PR123 electronic releases can be used in combination with an external toroid located on the conductor, which connects the star centre of the MV/LV transformer (homopolar transformer) to earth. In this case, the earth protection is defined as Source Ground Return. Through two different combinations of connection of its terminals (see chapter 8), the I_n of the same toroid can be set at 100 A, 250 A, 400 A, 800 A.

6c) Homopolar toroid for residual current protection

Characteristics	
Rated current	0.3 - 30A

5

SACE PR122/P LSIRc, PR122/P LSIG (with PR120V) and PR123/P may be also used in combination with this accessory, enabling residual current protection. The toroid is provided with a dip-switch multiplier selector to be set according to the desired sensitivity (up to 3A or up to 30A). This accessory is designed to be mounted on the busbar and is available in different sizes: up to 3200A for 3/4 poles circuit-breakers, up to 4000A for 3 poles circuit-breakers.

7) Mechanical operation counter

1SDC20166F0001

This is connected to the operating mechanism by means of a simple lever mechanism, and indicates the number of mechanical operations carried out by the circuit-breaker.

The count is shown on the front of the circuit-breaker.

1SDC20166F0001

Mechanical safety locks

8) Mechanical safety locks

8a-8b) Lock in open position

Several different mechanisms are available which allow the circuit-breaker to be locked in the open position.

These devices can be controlled by:

- Key (8a): a special circular lock with different keys (for a single circuit-breaker) or the same keys (for several circuit-breakers). In the latter case, up to four different key numbers are available.
- Padlocks (8b): up to 3 padlocks (not supplied): \varnothing 4 mm.

1SDC200159FR001

1SDC200159FR001

1SDC200159FR001

8c) Circuit-breaker lock in racked-in/test isolated/racked-out position

This device can be controlled by a special circular key lock with different keys (for a single circuit-breaker) or the same keys (for several circuit-breakers - up to four different key numbers available) and padlocks (up to 3 padlocks, not supplied - \varnothing 4 mm).

It is only available for withdrawable circuit-breakers, to be installed on the moving part.

1SDC200160FR001

1SDC200160FR001

8d) Accessories for lock in test isolated/racked-out position

In addition to the circuit-breaker lock in the racked-in/test isolated/racked-out position, this only allows the circuit-breaker to be locked in the racked-out or test isolated positions.

It is only available for withdrawable circuit-breakers, to be installed on the moving part.

1SDC200162FR001

5

8e) Accessory for shutter padlock device

This allows the shutters (installed on the fixed part) to be padlocked in their closed position.

It is only available for withdrawable circuit-breakers, to be installed on the fixed part.

8f) Mechanical lock for compartment door

This stops the compartment door from being opened when the circuit-breaker is closed (and circuit-breaker racked in for withdrawable circuit-breakers) and prevents the circuit-breaker from being closed when the compartment door is open.

Transparent protective covers

9) Transparent protective covers

9a) Protective cover for opening and closing pushbuttons

These protections are fitted over the opening and closing pushbuttons, preventing the relative circuit-breaker operations unless a special tool is used.

1SDC200166R0001

1SDC200167R0001

9b) IP54 door protection

This is a transparent plastic protective cover which completely protects the front panel of the circuit-breaker, with a protection rating of IP54. Mounted on hinges, it is fitted with a key lock.

1SDC200166R0001

1SDC200166R0001

5

Interlock between circuit-breakers

10) Mechanical interlock

This mechanism creates a mechanical interlock between two or three circuit-breakers (even different models and different versions, fixed/withdrawable) using a flexible cable. The circuit diagram for electrical switching using a relay (to be installed by the customer) is supplied with the mechanical interlock. The circuit-breakers can be installed vertically or horizontally.

Four types of mechanical interlocks are available:

- Type A:** between 2 circuit-breakers (power supply + emergency power supply)
- Type B:** between 3 circuit-breakers (2 power supplies + emergency power supply)
- Type C:** between 3 circuit-breakers (2 power supplies + bus-tie)
- Type D:** between 3 circuit-breakers (3 power supplies / one single closed CB)

Note:
See the "Overall dimensions" and "Electrical circuit diagrams" chapters for information about dimensions (fixed and withdrawable versions) and settings.

Vertical interlock

Horizontal interlock

Interlock between circuit-breakers

The mechanical interlocks possible are shown below, depending on whether 2 or 3 circuit-breakers (any model and in any version) are used in the switching system.

Type of interlock	Typical circuit	Possible interlocks																								
Type A Between two circuit-breakers One normal power supply and one emergency power supply	<p>O = Circuit-breaker open I = Circuit-breaker closed</p>	Circuit-breaker 1 can only be closed if 2 is open, and vice-versa. <table border="1"> <thead> <tr> <th>1</th> <th>2</th> </tr> </thead> <tbody> <tr> <td>O</td> <td>O</td> </tr> <tr> <td>I</td> <td>O</td> </tr> <tr> <td>O</td> <td>I</td> </tr> </tbody> </table>	1	2	O	O	I	O	O	I

5

The emergency power supply is usually provided to take over from the normal power supply in two instances:

- to power health and safety services (e.g. hospital installations);
- to power parts of installations which are essential for requirements other than safety (e.g. continuous cycle industrial plants).

The range of accessories for SACE Emax circuit-breakers includes solutions for a wide variety of different plant engineering requirements.

See the specific regulations regarding protections against overcurrents, direct and indirect contacts, and provisions to improve the reliability and safety of emergency circuits.

Switching from the normal to the emergency power supply can either be carried out manually (locally or by remote control) or automatically.

To this end, the circuit-breakers used for switching must be fitted with the accessories required to allow electric remote control and provide the electrical and mechanical interlocks required by the switching logic.

These include:

- the shunt opening release
- the shunt closing release
- the motor operator
- the auxiliary contacts.

Switching can be automated by means of a special electronically-controlled relay circuit, installed by the customer (diagrams provided by ABB SACE).

Mechanical interlocks between two or three circuit-breakers are made by using cables which can be used both for circuit-breakers side by side or superimposed.

Automatic transfer switch - ATS010

15CC20177F001

11) Automatic transfer switch - ATS010

The ATS010 switching unit (Automatic transfer switch) is the new network-generator switching device offered by ABB SACE. It is based on electronic technology conforming with the major electromagnetic compatibility and environmental Standards (EN 50178, EN 50081-2, EN 50082-2, IEC 68-2-1, IEC 68-2-2, IEC 68-2-3).

The device is able to manage the entire switching procedure between the normal and emergency line circuit-breakers automatically, allowing great flexibility of adjustment.

In case of an anomaly in the normal line voltage, in accordance with the delays set, the normal line circuit-breaker is opened, the generator started and the emergency line circuit-breaker closed. Similarly, when the normal line returns, the reverse switching procedure is automatically controlled.

It is especially suitable for use in all emergency power supply systems requiring a solution that is ready to install, easy to use and reliable.

Some of the main applications include: power supply for UPS (Uninterrupted Power Supply) units, operating rooms and primary hospital services, emergency power supply for civilian buildings, airports, hotels, data banks and telecommunications systems and power supply of industrial lines for continuous processes.

The switching system consists of the ATS010 unit connected to two motor-driven and mechanically interlocked circuit-breakers. All the circuit-breakers in the SACE Emax series can be used. The network sensor built into the SACE ATS010 device makes it possible to detect errors in the network voltage. The three inputs can be directly connected to the three phases of the normal power supply line for networks with rated voltage up to 500V AC. Networks with a higher voltage require insertion of voltage transformers (TV), setting a rated voltage for the device that matches their secondary voltage (typically 100V).

Two changeover contacts for each circuit-breaker allow direct connection to the shunt opening and closing releases. The circuit-breaker connection is completed by wiring the status contacts: Open/Closed, Release tripped, Racked-in (for withdrawable/plug-in circuit-breakers).

That is why the following are included on every circuit-breaker connected to the ATS010 unit, in addition to the mechanical interlock accessories:

- spring charging motor,
- opening and closing coil,
- open/closed contact,
- racked-in contact (for withdrawable versions),
- signal and mechanical lock for protection release tripped.

The ATS010 device is designed to ensure extremely high reliability for the system it controls. It contains various safety systems intrinsically related to software and hardware operation.

For software safety, a special logic prevents unwarranted operations, while a constantly operational watchdog system signals any microprocessor malfunctions via a LED on the front of the device.

Hardware safety allows integration of an electrical interlock via a power relay, so that there is no need to use an external electrical interlock system. The manual selector on the front of the device can also control the entire switching procedure, even in the event of a microprocessor fault, by working electromechanically on the control releases.

General specifications	
Rated supply voltage (galvanically insulated from earth)	24V DC ± 20% 48V DC ± 10% (maximum ripple ± 5%)
Maximum power consumption	5W at 24V DC 10W at 48V DC
Rated power (network present and circuit-breakers not controlled)	1.8W a 24V DC 4.5W at 48V DC
Operating temperature	-25 °C...+70 °C
Maximum humidity	90% without condensation
Storage temperature	-25 °C...+80 °C
Degree of protection	IP54 (front panel)
Dimensions [mm]	144 x 144 x 85
Weight [kg]	0.8

Setting range for thresholds and times		
Minimum voltage	Un Min	-5%...-30% Un
Maximum voltage	Un Max	+5%...+30% Un
Fixed frequency thresholds		10%...+10% fn
t1: opening delay of the normal line circuit-breaker due to network anomaly (CB-N)		0...32s
t2: generator start-up delay due to network anomaly		0...32s
t3: stopping delay of the generator		0...254s
t4: switching delay due to network re-entry		0...254s
t5: closing delay of the emergency line circuit-breaker after detecting the generator voltage (CB-E)		0...32s

Rated voltages settings available	100, 115, 120, 208, 220, 230, 240, 277, 347, 380, 400, 415, 440, 480, 500 V

Spare parts and retrofitting

Spare parts

The following spare parts are available:

- front metal shields and escutcheon plate
- opening solenoid for PR121, PR122 and PR123 overcurrent release
- arcing chamber
- closing springs
- jaw-type isolating contact for the fixed part of the withdrawable circuit-breaker
- earthing sliding contact (for withdrawable version)
- shutters for fixed part
- complete pole
- operating mechanism
- connection cables for releases and current sensors
- transparent protective cover for releases
- SACE PR030/B power supply unit
- toolbox
- battery for SACE PR030/B power supply unit
- front escutcheon plate for Ronis key lock

For further details, please request a copy of the ABB SACE spare parts catalogue.

Retrofitting Kits

Special kits have been prepared to replace old SACE Otomax and SACE Novomax G30 circuit-breakers. The kits include SACE Emax circuit-breakers that take advantage of all the components of the existing switchgear. Installing a new circuit-breaker in old switchgear, offers definite technical and economic benefits, and is extremely rapid as there is no need to redo the main switchgear connections.

Selective protection

Selectivity is normally actuated for tripping overcurrent protection devices in civil and industrial installations to isolate the part affected by a fault from the system, causing only the circuit-breaker immediately on the supply side of the fault to trip. The example in the figure highlights the need to coordinate tripping between the two circuit-breakers A and B so that only circuit-breaker B is tripped in the event of a fault in C, ensuring continuity of service for the rest of the system supplied by circuit-breaker A.

Whereas natural selectivity within the overload current range is normally found due to the difference between the rated currents of the load protection circuit-breaker and the main circuit-breaker on the supply side, selectivity can be obtained in the short-circuit current range by differentiating the current values and, if necessary, the trip times.

Selectivity can be total or partial:

- total selectivity: only circuit-breaker B opens for all current values lesser than or equal to the maximum short-circuit current in C;
- partial selectivity: only circuit-breaker B opens for fault currents below a certain value; A and B are both tripped for greater or equal values.

In principle, the following types of selectivity are possible:

Current selectivity, obtained by setting the instantaneous trip currents of the circuit-breaker chain to different values (higher settings for the circuit-breakers on the supply side). This often results in partial selectivity.

Time selectivity, obtained by intentionally incorporating increasing time-delays in the trip times of the circuit-breakers furthest to the supply side in the chain.

To guarantee selectivity for Emax circuit-breakers, equipped with electronic PR121, PR122 and PR123 type releases, the following conditions must be verified:

- that there is no intersection between the time-current curves of the two circuit-breakers, tolerances included
- the minimum difference between the trip time t_2 of the circuit-breaker on the supply side and the time t_2 of the circuit-breaker on the load side, whenever it is an Emax circuit-breaker, must be:
 - t_2 supply side $>$ t_2 load side + 100 ms* t = cost
 - t_2 supply side $>$ t_2 load side + 100 ms $i^2t = cost (<400 \text{ ms})$
 - t_2 supply side $>$ t_2 load side + 200 ms $i^2t = cost (>400 \text{ ms})$

* in auxiliary power supply or in self-supply at full power, it is reduced to 70ms.

When the above conditions are met:

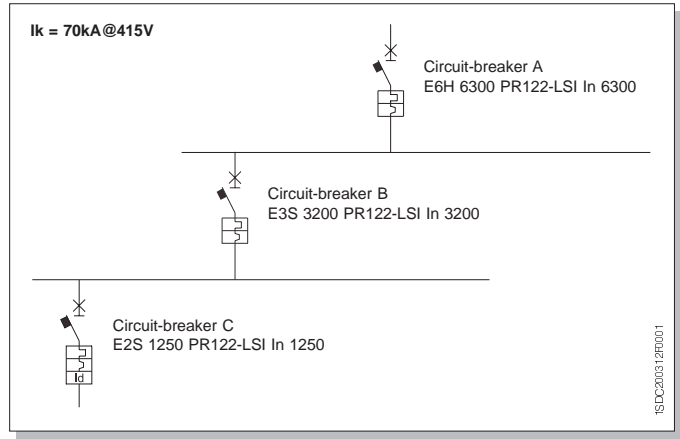

- if function I is active ($I_3 = \text{on}$), the maximum short-circuit current guaranteeing selectivity is equal to the setting value I_3 (minus the tolerances)
- if function I is disabled ($I_3 = \text{off}$), the maximum short-circuit current for which selectivity is guaranteed must be equal to:
 - the value indicated in the table on page 6/12, if the circuit-breaker on the load side is a moulded-case circuit-breaker (MCCB)
 - the minimum value between the I_{cw} of the circuit-breaker on the supply side and the I_{cu} of the circuit-breaker on the load side, when both the circuit-breakers are Emax type.

Primary and secondary distribution

Selective protection

Here is an example of total selectivity between three Emax circuit-breakers in series in a system with 415 V rated voltage and 70 kA prospective short-circuit current.

Circuit-breakers			L		S (t=cost)		I	
Name	Type	Icu@415V	Icw	I1	t1	I2	t2	I3
A	E6H 63	100 kA	100 kA	1	108	10	0,25	off
B	E3S 32	75 kA	75 kA	1	108	10	0,15	off
C	E2S 12	85 kA	65 kA	1	108	10	0,05	off

As shown in the figure below, with the above-mentioned setting there is no intersection between the time-current curves of the different circuit-breakers and the minimum delay of 70 ms defined for the trip thresholds of protection S. Furthermore, exclusion of protection I ($I_3=off$) guarantees selectivity as follows:

- up to 75 kA between A and B
- up to 75 kA between B and C.

So, since the maximum prospective short-circuit current of the system is 70 kA, it is possible to talk of total selectivity.

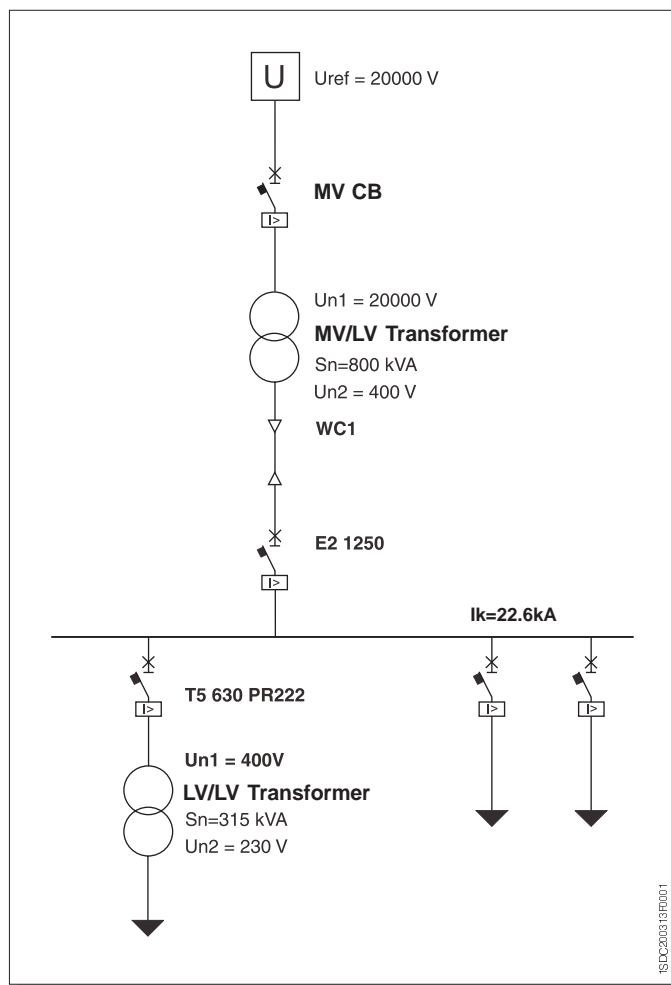

Double S

Thanks to the new PR123 release, which allows two thresholds of protection function S to be set independently and be activated simultaneously, selectivity can also be achieved under highly critical conditions.

Here is an example of how, by using the new release, it is possible to obtain a better selectivity level compared with the use of a release without “double S”.

This is the wiring diagram of the system under examination; in particular, attention must be focussed on:

- the presence, on the supply side, of a MV circuit-breaker, which, for selectivity reasons, imposes low setting values for the Emax circuit-breaker on the LV side
- the presence of a MV/LV transformer which, due to the inrush currents, imposes high setting values for the circuit-breakers on its primary side.

Primary and secondary distribution

Selective protection

Solution with a release without "double S"

MV CB (PR521)		
50 (I>):	50 A	t=0.5s
51 (I>>):	500 A	t=0s

		E2N 1250 PR122 LSIG R1250	T5V 630 PR222DS/P LSIG R630
L	Setting	0.8	0.74
	Curve	108s	12s
S t=constant	Setting	3.5	4.2
	Curve	0.5s	0.25s
I	Setting	OFF	7

In the case of a short-circuit, the Emax E2 circuit-breaker and the MV circuit-breaker will open simultaneously with this solution. Attention must be paid to the fact that, owing to the value I_k , function I of the E2 circuit-breaker has to be disabled ($I_3=OFF$) so that selectivity with the T5 on the load side is granted.

Solution with the PR123 release with "double S"

MV CB (PR521)

50 (I _{>}): 50 A	t=0.5s
51 (I _{>>}): 500 A	t=0s

		E2N 1250 PR123 LSIG R1250	T5V 630 PR222DS/P LSIG R630
L	Setting	0.8	0.74
	Curve	108s	12s
S t=constant	Setting	-	4.2
	Curve	-	0.25s
S1 t=constant	Setting	3.5	-
	Curve	0.5s	-
S2 t=constant	Setting	5	-
	Curve	0.05s	-
I	Setting	OFF	7

As is evident, by means of the "double S" function, selectivity can be achieved both with the T5 circuit-breaker on the load side as well as with the MV circuit-breaker on the supply side. A further advantage obtained by using the "double S" function is the reduction in the time of permanence of high current values under short-circuit conditions, which results in lower thermal and dynamic stresses on the busbars and on the other installation components.

Primary and secondary distribution

Selective protection

Dual Setting

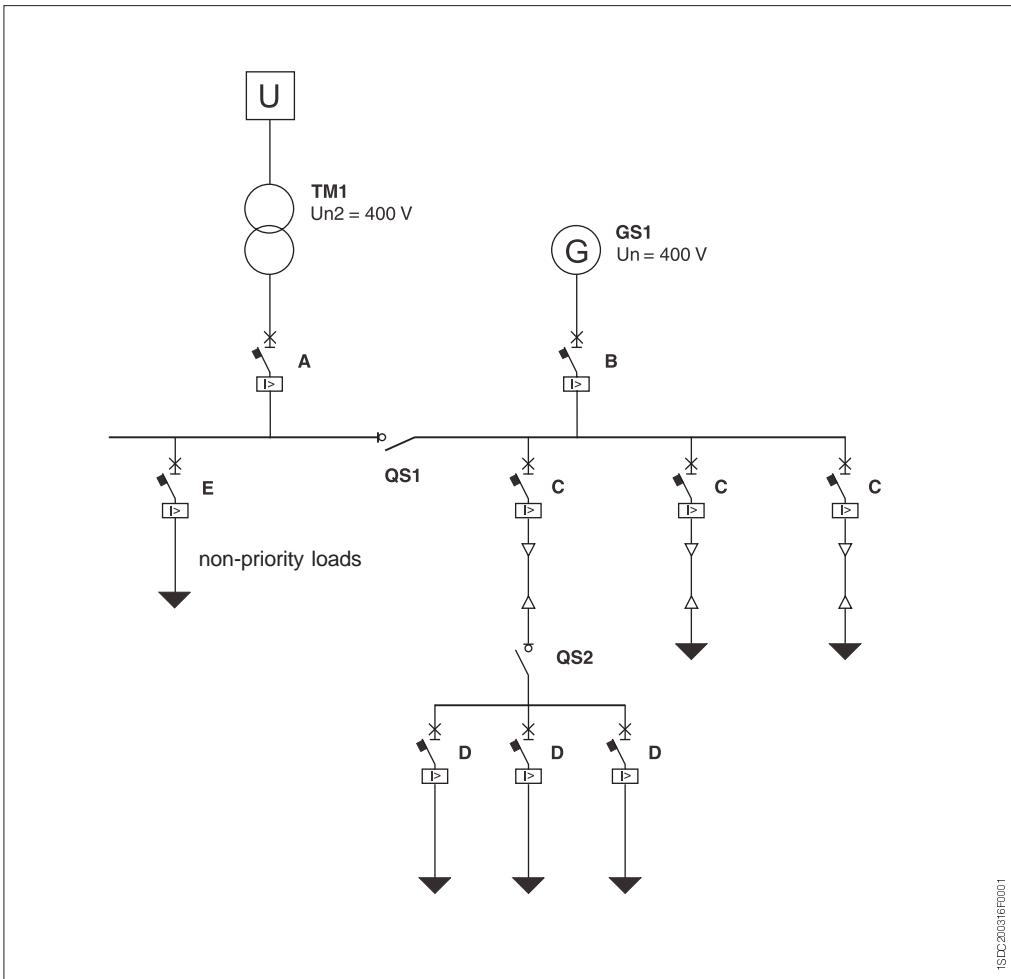

Thanks to the new PR123 release, it is also possible to program two different sets of parameters and, through an external command, to switch from one set to the other.

This function is useful when there is an emergency source (generator) in the system, only supplying voltage in the case of a power loss on the network side.

In the system described below, in the case of a loss of the normal supply on the network side, by means of the ABB SACE ATS010 automatic transfer switch, it is possible to switch the supply from the network to the emergency power unit and to disconnect the non-primary loads by opening the QS1 switch-disconnector.

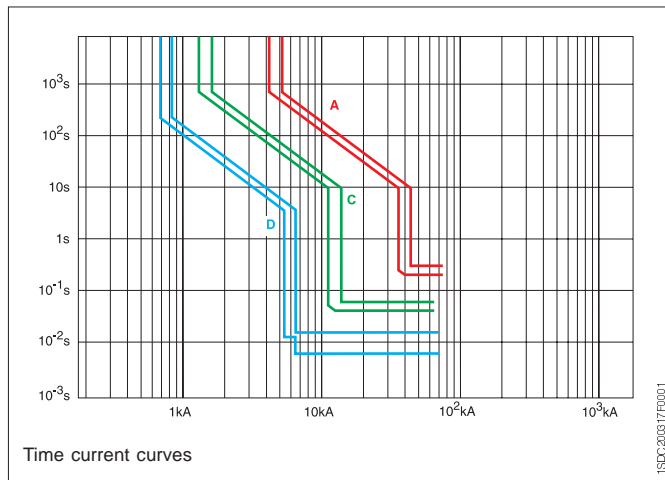

Under normal service conditions of the installation, the circuit-breakers C are set in order to be selective with both circuit-breaker A, on the supply side, as well as with circuit-breakers D on the load side. By switching from the network to the emergency power unit, circuit-breaker B becomes the reference circuit-breaker on the supply side of circuit-breakers C. This circuit-breaker, being the protection of a generator, must be set to trip times shorter than A and therefore the setting values of the circuit-breakers on the load side might not guarantee the selectivity with B.

By means of the "dual setting" function of the PR123 release, it is possible to switch circuit-breakers C from a parameter set which guarantees selectivity with A, to another set which makes them selective with B. However, these new settings could make the combination between circuit-breakers C and the circuit-breakers on the load side non-selective.

1SDC200316R0001

The figure at the side shows the time-current curves of the installation under normal service conditions. The values set allow no intersection of the curves.

The figure at the side shows the situation in which, after switching, the power is supplied by the power unit through circuit-breaker B. If the settings of circuit-breakers C are not modified, there will be no selectivity with the main circuit-breaker B.

This last figure shows how it is possible to switch to a set of parameters which guarantees selectivity of circuit-breakers C with B by means of the “dual setting” function.

Primary and secondary distribution

Selective protection

Zone selectivity

The **zone selectivity**, which is applicable to protection functions S and G, can be enabled in the case where the curve with fixed time is selected and the auxiliary power supply is present. This type of selectivity allows shorter trip times for the circuit-breaker closest to the fault than in the case of time-selectivity. It is a type of selectivity suitable for radial nets.

The word zone is used to refer to the part of an installation between two circuit-breakers in series. The fault zone is the zone immediately on the load side of the circuit-breaker that detects the fault. Each circuit-breaker that detects a fault communicates this to the circuit-breaker on the supply side by using a simple communication wire. The circuit-breaker that does not receive any communication from those on the load side will launch the opening command within the set selectivity time (40÷200ms).

We have to consider that the circuit-breakers receiving a signal from another release will operate according to the set time t_2 .

If, for any reason, after the selectivity time, the circuit-breaker due to trip has not opened yet, it lets the "block signal" fall on the other circuit-breaker, which will trip.

To realize correctly the zone selectivity the following settings are suggested:

S	$t_2 \geq \text{selectivity time} + t_{\text{opening}}^*$
I	I3 = OFF
G	$t_4 \geq \text{selectivity time} + t_{\text{opening}}^*$
Selectivity time	same setting for each circuit-breaker

* Trip duration for I < I_{cw} (max) = 70 ms.

To carry out the cabling, a shielded twisted pair cable (not supplied; ask ABB for information) can be used. The shield should only be earthed on the release of the circuit-breaker on the supply side.

The maximum length of the cabling for zone selectivity, between two units, is 300 meters.

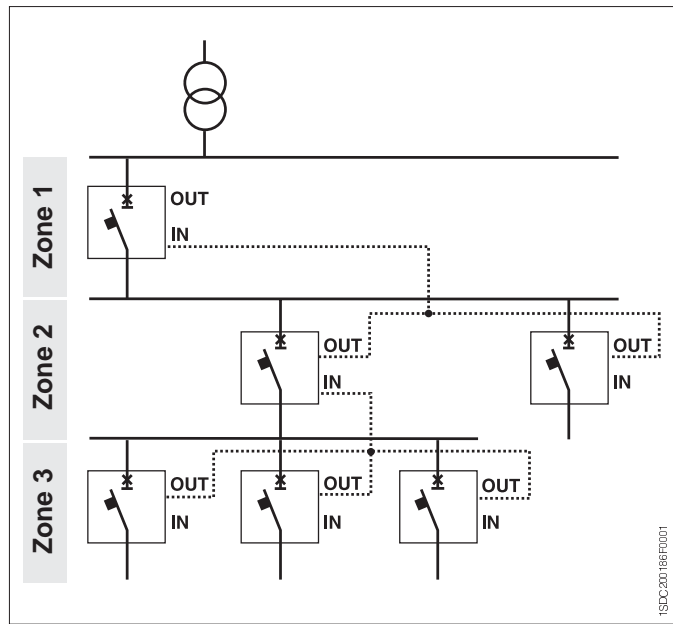

The maximum number of the circuit-breakers which can be connected to the outputs (Z out) of a release is 3.

The maximum numbers of the circuit-breakers which can be connected to the inputs (Z in) of a release is 20.

All Emax circuit-breakers in versions B-N-S-H-V fitted with PR122 and PR123 releases allow zone selectivity to be realised.

Note

With regard to selectivity in the case of earth faults with circuit-breakers in series, see page 6/20.

Primary and secondary distribution

Back-up protection

Back-up protection is required by the IEC 60364-4-43 Standards and Annex A of the IEC 60947-2 Standard, which allow the use of a protection device with breaking capacity lower than the prospective short-circuit current at the points where it is installed, provided that there is another protection device on the supply side with the necessary breaking capacity. In this case, the characteristics of the two devices must be coordinated in such a way that the specific energy let through by the combination is not higher than that which can be withstood without damage by the device on the load side, and by the protected conductors. In the diagram in the figure, circuit-breaker B, located on the load side of circuit-breaker A, can have a lower breaking capacity than the prospective short-circuit current in the event of a fault in "C", if circuit-breaker A is able to satisfy both of the following conditions:

- it has a suitable breaking capacity (higher than or equal to the prospective short-circuit current at its point of installation and obviously higher than the short-circuit current in "C")
- in the event of a fault in "C" with short-circuit values higher than the breaking capacity of circuit-breaker B, circuit-breaker A must provide a specific let-through energy limiting function, limiting it to a value that can be withstood by circuit-breaker B and by the protected conductors.

A fault in "C" can therefore cause a double interruption, however the back-up protection must ensure that B always trips within the limits of its breaking capacity.

It is necessary to choose switchgear combinations that have been verified by laboratory tests for this type of protection. The possible combinations are specified in ABB SACE documents and PC programs (Slide rule kits, DOCWin, etc.) and shown here for SACE Emax circuit-breakers.

Back-up protection is used in electrical installations in which there is no essential need for continuous operation: when the supply-side circuit-breaker opens, it also excludes loads that are not affected by the fault. Furthermore, the use of this type of coordination limits the size of the installation and consequently reduces costs.

Note

Back-up protection can also be implemented on more than two levels: the figure above shows an example of coordination on three levels. In this case, the choices are correct if at least one of the two situations below is satisfied:

- the circuit-breaker furthest on the supply side A is coordinated with both circuit-breakers B and C (coordination between circuit-breakers B and C is not necessary);
- each circuit-breaker is coordinated with the circuit-breaker immediately to the load side of it, i.e. the circuit-breaker furthest to the supply side A is coordinated with the next one B, which is in turn coordinated with circuit-breaker C.

Table showing coordination for back-up protection	
Supply-side circuit-breaker	Breaking capacity
E2L - E3L	130 [kA] (at 380/415 V)
Load-side circuit-breaker	Back-up value
T4N	65 [kA]
T4S - T5N - S6N - E1B - E2B	85 [kA]
T4H - T5S/H - S6S/H - S7S/H - E1N - E2N	100 [kA]
T4L - T5L	130 [kA]

Directional protection

Directional protection is based on the ability to correlate the circuit-breaker's behavior with the direction of the fault current.

Two different trip times can be set on the PR123 release depending on the current direction:

- a time (t_{7Fw}) for a direction of current concordant (Fw) with the reference direction set;
- a time (t_{7Bw}) for a direction of current discordant (Bw) with the reference direction set.

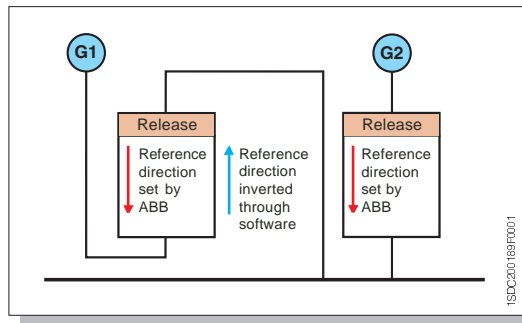

A current threshold only (I_7) can be set on the PR123 release.

If the fault current is discordant (Bw) with the reference direction, the protection shall intervene when the threshold I_7 is reached within the set time t_{7Bw} (provided that the functions S and I have not been set as to intervene before function D).

If the fault current is concordant (Fw) with the reference direction, the protection shall intervene when the threshold I_7 is reached within the set time t_{7Fw} (provided that the functions S and I have not been set as to intervene before function D).

Moreover, if function I is active and the short-circuit current exceeds the set value I_3 , the circuit-breaker will trip instantaneously independently of the direction of the current.

The reference direction set by ABB is from the top of the circuit-breaker (the zone where the release is located) towards the bottom.

The figure above shows the actual configuration the circuit-breakers have in the system. The red arrow shows the reference direction set by default on the circuit-breaker.

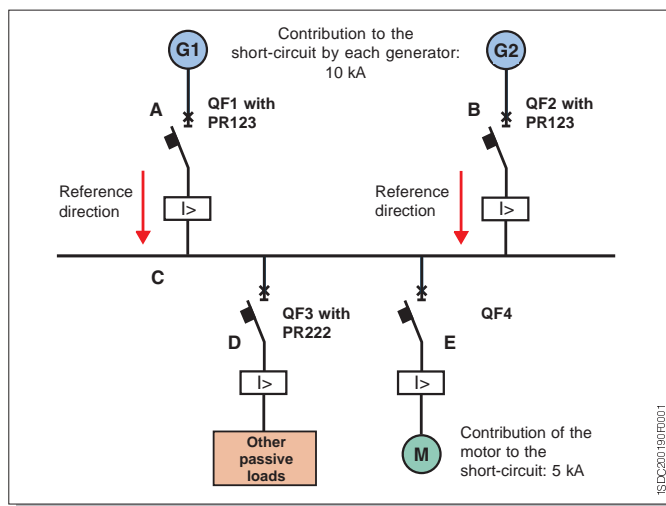

If the power supply direction of the circuit-breaker is from top to bottom (supply from G2), the reference direction must remain the one set by ABB.

If the power supply direction of the circuit-breaker is from bottom to top (supply from G1), the new PR123 release allows the default setting to be inverted by operating on its software.

6

In this way, all the quantities measured by the PR123 release can be evaluated as they actually flow through the installation. Furthermore, in the wiring diagram of the system, the reference direction to carry out a selectivity study and consider the tripping directions Bw or Fw correctly still remains from top to bottom.

In the following wiring diagram the reference directions are shown in red. By considering the circuit-breakers supplied as in the figure above, it can be seen that for QF2 this is the default direction, whereas for QF1 the direction has been inverted by means of the software.

By assuming some numerical values for the short-circuit currents, and considering some fault points, the following is the result.

For circuit breaker QF1, if a fault occurs at point B, the current will flow in direction A-B concordant to the reference direction or similarly, for a fault in A, the current direction will be B-A in discordance with the reference direction.

The different configurations can be resumed in the following table:

Circuit-breaker	Location of fault	Measured current [kA]	Direction	Tripping time
QF1	A	15	Discordant	t7Bw
	B, C, D, E	10	Concordant	t7Fw
QF2	B	15	Discordant	t7Bw
	A, C, D, E	10	Concordant	t7Fw

This installation aims at selectivity between QF1, QF2, QF3 and QF4.

On examining the table, we see that the only instance in which the fault current direction is discordant with that set for the circuit-breaker QF1 occurs in case of a fault in point A. The circuit-breaker QF1 must trip more quickly than the other circuit-breakers, since it is the one nearest to the fault. To this purpose, the trip time t7Bw of QF1 must be set at:

- a value below the time t7Fw of the circuit-breaker QF2, since the fault current is concordant with QF2 reference direction
- a value lower than the time “t2” of protection “S”, if available, for the release of the moulded-case circuit-breaker QF4. The instantaneous protection of QF4 shall be set in OFF or shall have a setting value I3 higher of the contribution given by the motor to the short-circuit current.

Moreover, the functions S and I of both QF1 and QF2 have been set so as not to intervene before function D.

Similarly to the process described for circuit-breaker QF1, to ensure selectivity, circuit-breaker QF2 must trip first in the case of a fault in B, and then with a delayed trip in the case of faults anywhere else in the system.

The settings available for directional protection D, both for Fw and Bw, are the following:

$I_{\gamma}=0.6...10xI_n$	(tolerance $\pm 10\%$)	step $0.1xI_n$
$t_{\gamma}=0.20s...0.8s$	(tolerance $\pm 20\%$)	step $0.01s$

Directional protection

Zone selectivity D (Directional Zone Selectivity)

Thanks to this function, it is also possible to obtain selectivity in meshed and ring networks. By means of zone selectivity with function D "Zone selectivity D", which can only be set to [On] when zone selectivity "S" and "G" are set to [Off] and there is an auxiliary power supply, it is possible to coordinate the behaviour of the various PR123 devices, by cabling the release buses in a suitable way.

In fact, each release has 4 signals available:

- two input signals (one in a concordant and one in a discordant direction) by means of which the release receives the "block" signal from other releases
- two output signals (one in a concordant and one in a discordant direction) by means of which the release sends a "block" signal to other releases.

The circuit-breakers which do not receive a "block" signal (coordinated in the direction of the current) will send the opening command within a time equal to t_{sel} .

The circuit-breakers which receive the "block" signal will open within the backward or forward time according to the direction of the current.

If function I is activated and the short-circuit current exceeds the set value (I_3), the circuit-breaker will open instantaneously and independently of the directions and of the signals received.

For safety reasons, the maximum duration of the "block" signal is 200ms.

If, after this time and for any reason, the circuit-breakers due to trip have not yet opened, the "block" signal falls on the other circuit-breakers which will command immediate opening. This operation therefore occurs after a maximum time of 200ms.

A shielded twisted pair cable (not supplied; ask ABB for information) can be used to carry out the cabling. The shield should only be earthed on the release of the circuit-breaker on the supply side.

- The maximum length of the cabling for zone direction selectivity, between two units, is 300 metres.
- A maximum number of 3 circuit-breakers can be connected to the outputs (OUT Bw or OUT Fw) of a release.
- A maximum number of 20 circuit-breakers can be connected to the inputs (IN Bw or IN Fw) of a release.

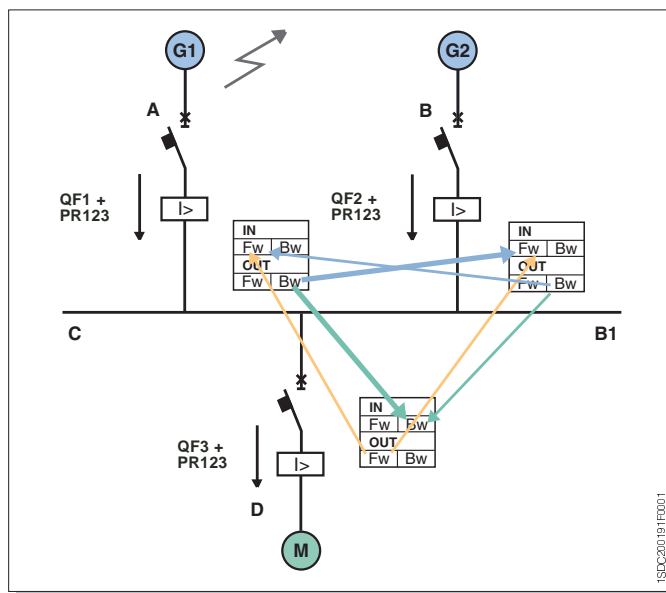

The figure below shows the connections necessary to activate the "blocks" between the various releases. In particular:

- 1) in the case of a fault in A, circuit-breaker QF1 is passed through by a current from busbar B1; this current flows in a direction discordant with the one set. The OUT Bw bus of QF1 "blocks" the IN Fw bus of circuit-breaker QF2 and the IN Bw bus of circuit-breaker QF3: in fact, the

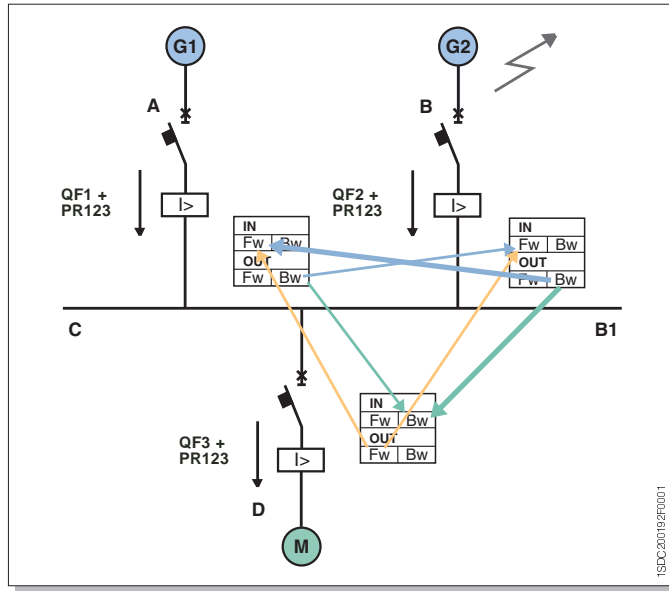

current flows through QF2 in the same direction as the setting, whereas QF3 is passed through by a current discordant with the setting (the active "block" signals are indicated by wider arrows).

Direction (OUT-IN)	Arrow
Bw → Bw	
Bw → Fw	
Fw → Fw	

Reference Direction

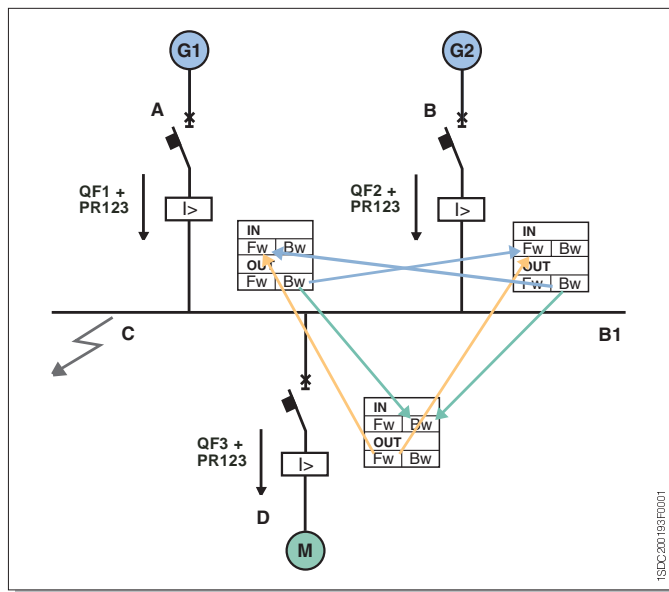

2) in the case of a fault in B, circuit-breaker QF2 is passed through by a current from busbar B1; this current flows in a direction discordant with the one set. The OUT Bw bus of QF2 “blocks” the IN Fw bus of circuit-breaker QF1 and the IN Bw bus of circuit-breaker QF3: in fact, the current flows through QF1 in the same direction as the setting, whereas QF3 is passed through by a current discordant with the setting (the active “block” signals are indicated by wider arrows).

the current flows through QF1 in the same direction as the setting, whereas QF3 is passed through by a current discordant with the setting (the active “block” signals are indicated by wider arrows).

3) in case of a fault in C, circuit-breakers QF1 and QF2 are passed through by a current flowing in the same direction as the one set, whereas QF3 is passed through by a current with discordant direction. No circuit-breaker is “blocked” and consequently all the circuit-breakers affected by the fault will trip according to the time settings of protections “S” and/or “I”.

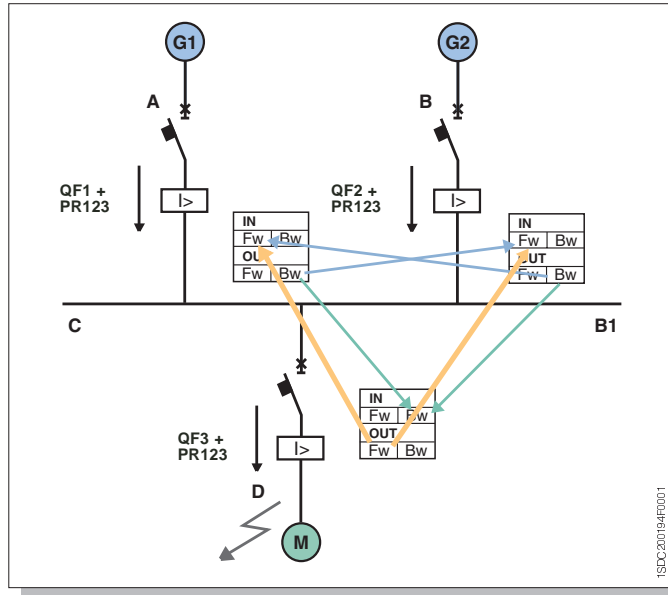

No circuit-breaker is “blocked” and consequently all the circuit-breakers affected by the fault will trip according to the time settings of protections “S” and/or “I”.

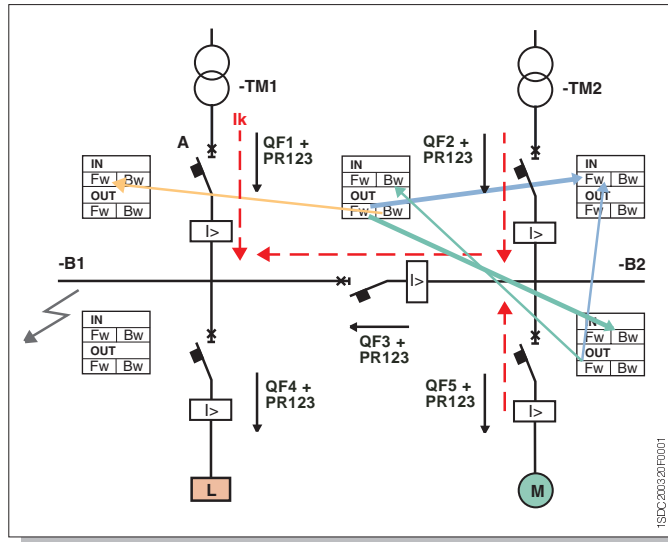

Directional protection

4) in the case of a fault in D, circuit-breaker QF3 is passed through by a current from busbar B1; this current flows in the same direction as the one set. The OUT Fw bus of QF3 "blocks" the IN Fw bus of circuit-breakers QF1 and QF2: in fact, both circuit-breakers are passed through by fault currents concordant with the direction set (the active "block" signals are indicated by wider arrows).

The following example analyses a network with a bus-tie and takes the behavior of the protection devices in the presence of faults into consideration:

1) Fault in B1 with the bus-tie closed: only circuit-breakers QF1 and QF3 must interrupt the fault: in particular, circuit-breaker QF3 is passed through by a current from busbar B2 (therefore in the same direction as the one set); the OUT Fw bus sends a "block" signal to the IN Fw bus of circuit-breaker QF2 (passed through by a current flowing from transformer TM2 and consequently in a direction concordant with the one set), and to the IN Bw bus of circuit-breaker QF5 (passed through from a current flowing from the motor and consequently in a direction discordant with the one set).

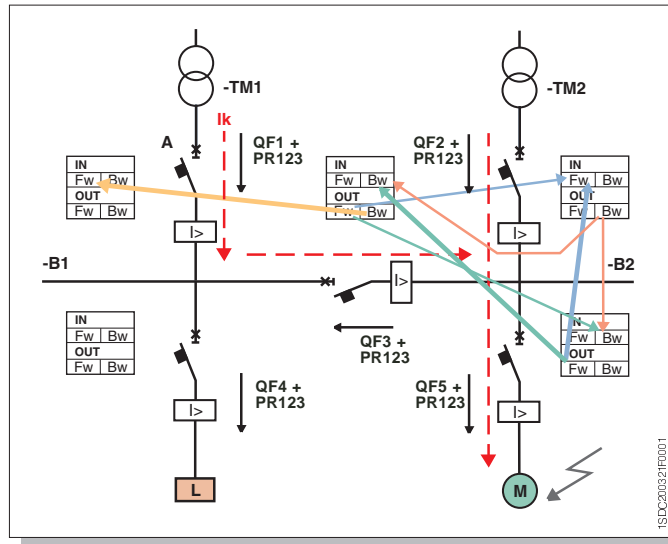

6

2) Fault in the motor: in this case, only circuit-breaker QF5 must interrupt the fault. Circuit-breaker QF5 is passed through by a current flowing from busbars B1 and B2, in a direction concordant with the one set; therefore, the OUT Fw bus of QF5 “blocks” both the IN Fw bus of QF2 (passed through by a current flowing from TM2 and consequently in a direction concordant with the one set) as well as the IN Bw bus of QF3 (which is passed through by a current flowing from TM1 and consequently in a direction discordant with the one set). Similarly,

circuit-breaker QF3 is also passed through by a current flowing from TM1 in a direction discordant with the one set: consequently, the OUT Bw bus of QF3 “blocks” the IN Fw bus of QF1 (passed through by a current flowing from TM1 and therefore in a direction concordant with the setting).

Direction (OUT-IN)	Arrow
Fw → Fw	
Fw → Bw	
Bw → Bw	
Bw → Fw	

Reference Direction

3) Fault on the supply side of transformer TM2: in this case, only circuit-breaker QF2 must interrupt the fault. Circuit-breaker QF2 is passed through by a current flowing from TM1 and from the motor, in a direction discordant with the one set; as a consequence the OUT Bw bus of QF2 “blocks”:

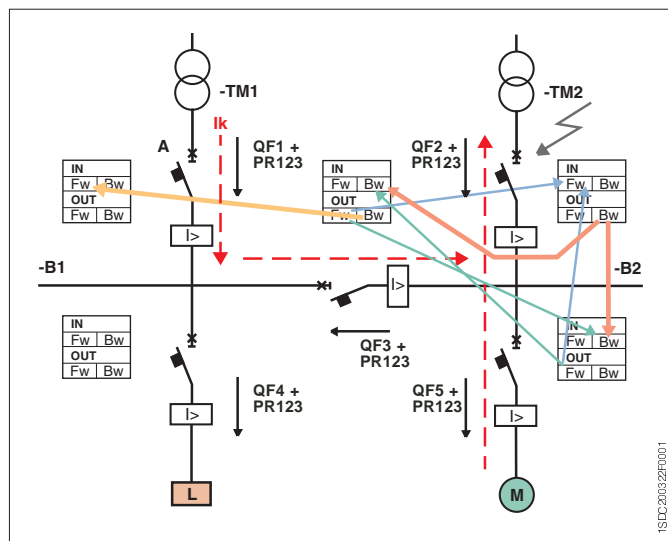

- the IN Bw bus of QF5 (passed through by a current flowing from the motor and consequently in a direction discordant with the one set)
- the IN Bw bus of QF3 (passed through by a current flowing from TM1 and consequently in a direction discordant with the one set)

Similarly, circuit-breaker QF3 is also passed through by a current flowing from TM1 in a direction discordant with the one set.

Similarly, circuit-breaker QF3 is also passed through by a current flowing from TM1 in a direction discordant with the one set; therefore its OUT Bw bus “blocks” the IN Fw bus of QF1 (passed through by a current flowing from TM1 and therefore in a direction concordant with the one set).

Earth fault protection

Circuit-breakers with protection G

Circuit-breakers fitted with releases offering earth fault protection function G are usually used in MV/LV distribution substations to protect both the transformers and the distribution lines.

Protection function G calculates the vectorial sum of the currents detected by the current transformers on the phases and on the neutral conductor. In a sound circuit, this sum, which is called residual current, is equal to zero, whereas in the presence of an earth fault it has a value depending on the fault ring involved.

Function G is effectively used in TT, IT, and TN-S electrical installations and, limited to the section of the installation with a neutral conductor (N) branched and separated from the conductor PE, in TN-CS systems as well (for the TN-S area only).

Function G is not used in TN-C systems, since these provide the neutral and protection functions using a single conductor.

The protection device thresholds and trip times can be selected from a wide range, also making it easy to achieve selectivity for this type of fault with

regard to the protection devices installed on the load side. Selectivity is therefore ensured regarding the residual-current releases located on the load side.

Function G of the PR121, PR122 and PR123 releases is provided with specific let-through energy curves ($I^2t=k$) and with independent time-current curves ($t=k$).

The figure in the following page shows an example of one possible choice of earth fault protection devices and their possible settings.

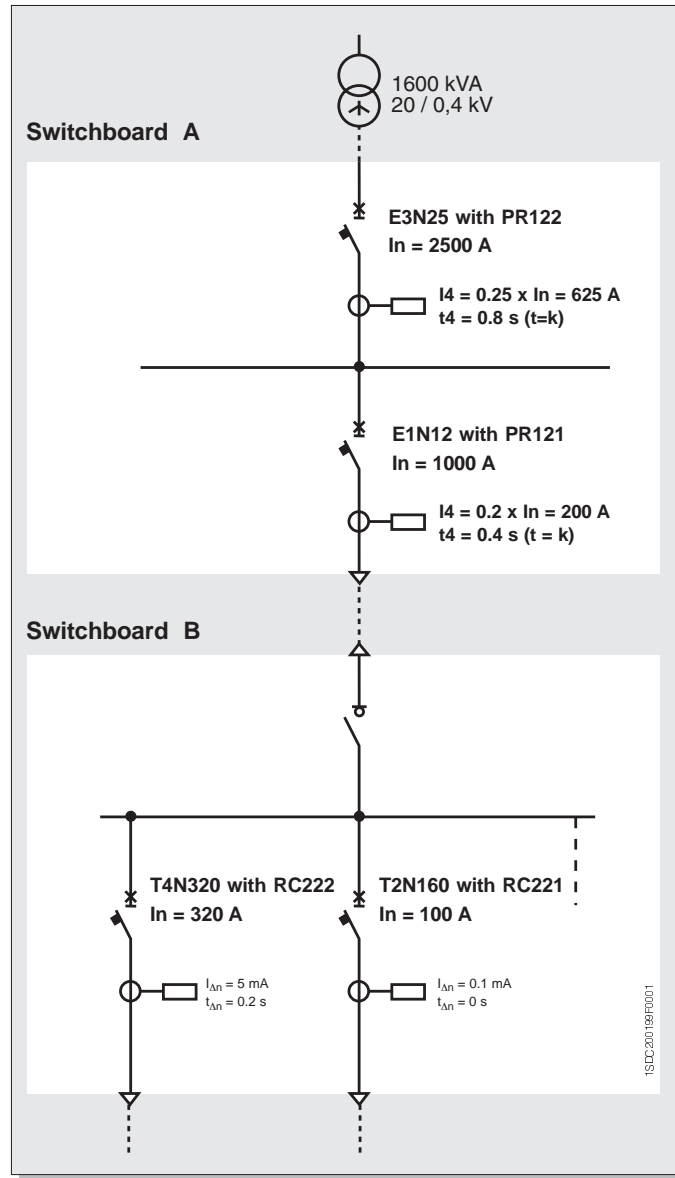

Protection functions G of the circuit-breakers on the main switchboard A serve to enable them to trip selectively, in relation to each other and to the residual-current protection devices located on the loads of the distribution switchboard B.

absence of fault	fault	trip within t_4
$I_d = I_{L1} + I_{L2} + I_{L3} + I_N = 0$	$I_d = I_{L1} + I_{L2} + I_{L3} + I_N \neq 0$	$I_d \geq I_4$

6

Example of selection of earth fault protection devices and their relevant settings.

Earth fault protection

Use of the toroid on the star center of the transformer

In the case of circuit-breakers to protect MV/LV transformers, it is possible to install a toroid on the conductor connecting the star centre of the transformer to earth (application allowed with the SACE Emax series fitted with the PR122 and PR123 electronic releases. This detects the earth fault current. The figure beside shows the operating principle of the toroid installed on the star centre of the transformer.

The use of this accessory allows the protection threshold against earth fault (function G) to be independent of the size of the primary current transformers installed on the circuit-breaker phases. For the technical characteristics of the toroid see the table at page 6/24.

Double G

The Emax type circuit-breakers, equipped with the PR123 electronic release, allow two independent curves for protection G: one for the internal protection (function G without external toroid) and one for the external protection (function G with external toroid, as described in the above paragraph).

A typical application of function double G consists in simultaneous protection both against earth fault of the secondary of the transformer and of its connection cables to the circuit-breaker terminals (restricted earth fault protection), as well as against earth faults on the load side of the circuit-breaker (outside the restricted earth fault protection).

Example

Figure 1 shows a fault on the load side of an Emax circuit-breaker: the fault current flows through one phase only and, if the vectorial sum of the currents detected by the four current transformers (CTs) is to be higher than the set threshold, the electronic release activates function G (and the circuit-breaker trips).

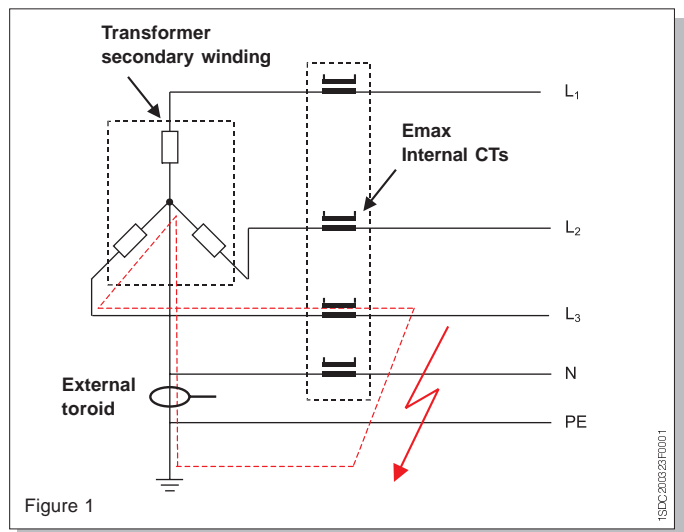

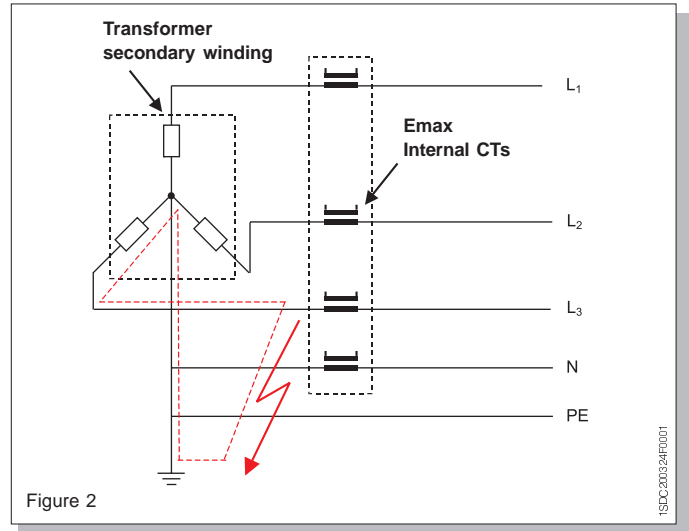

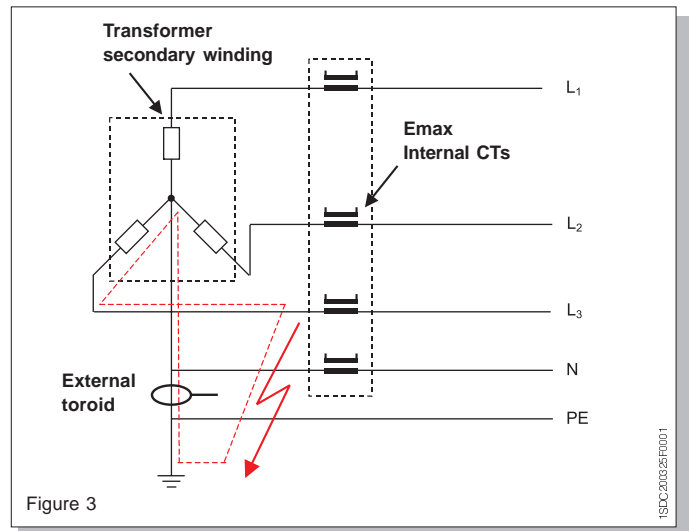

Figure 1

With the same configuration, a fault on the supply side of the circuit-breaker (Figure 2) does not cause intervention of function G since the fault current does not affect either the CT of the phase or that of the neutral.

The use of function “double G” allows installation of an external toroid, as shown in Figure 3, so that earth faults on the supply side of Emax CB can be detected as well. In this case, the alarm contact of the second G is exploited in order to trip the circuit-breaker installed on the primary and to ensure fault disconnection.

Earth fault protection

If, with the same configuration as Figure 3, the fault occurs on the load side of the Emax circuit-breaker, the fault current would affect both the toroid as well as the current transformers on the phases. To define which circuit-breaker is to trip (MV or LV circuit-breaker), suitable coordination of the trip times is required: in particular, it is necessary to set the times so that the LV circuit-breaker opening due to internal function G is faster than realization of the alarm signal coming from the external toroid. Therefore, thanks to the time-current discrimination between the two G protection functions, before the MV circuit-breaker on the primary of the transformer receives the trip command, the circuit-breaker on the LV side is able to eliminate the earth fault. Obviously, if the fault occurred on the supply side of the LV circuit-breaker, only the circuit-breaker on the MV side would trip.

The table shows the main characteristics of the range of toroids (available only in the closed version).

Characteristics of the toroid ranges

Rated current	up to 2000 A
Outer dimensions of the toroid	
	D = 400 mm
	W = 198 mm
	H = 51 mm

Residual current protection

Emax air circuit-breakers can be equipped with a toroid fitted on the back of the circuit-breaker so as to ensure protection against earth faults.

In particular, the electronic release types able to perform this function are:

- PR122/P L – S – I – Rc
- PR122/P L – S – I – G - with “Measuring” module
- PR123/P L – S – I – G

which can all be provided for the following types of circuit-breakers: E2 and E3, both three and four pole versions, and E4 (three pole version).

Thanks to the wide range of settings, the above mentioned electronic releases with the residual current function are suitable for applications where a residual current protection system coordinated with the various distribution levels is to be constructed from the main switchboards to the final load.

It is particularly suitable where low-sensitivity residual current protection is required, for example in both partial (current-type) or total (time-type) selectivity chains, and for high-sensitivity applications to protect people against indirect contact.

These electronic releases with residual current protection are suitable for use in the presence of:

- alternating earth current (Type AC)
- alternating and/or pulsating current with continuous components (Type A)

The table below shows the main technical characteristics of the residual current protection:

Sensitivity $I_{\Delta n}$	[A] 3-5-7-10-20-30 (dip in position 1)
Tripping time	[s] 0.06-0.1-0.2-0.3-0.4-0.5-0.8
Type	AC and A

Using the SACE RCQ switchboard electronic residual current relays

The family of SACE Emax circuit-breakers with a rated current up to 2000A can be combined, if fitted with a shunt opening release, with the SACE RCQ residual current relay for switchboard with a separate toroidal transformer (for installation outside on the line conductors) thereby enabling earth leakage currents to be determined for values between 0.03 and 30A.

Thanks to the wide range of settings, the SACE RCQ switchboard relay is suitable for applications where a residual current protection system coordinated with the various distribution levels is to be constructed from the main switchgear to the final load.

It is particularly suitable, for example, where low-sensitivity residual current protection is required in both partial (current-type) and total (time-type) selective chains, and for high-sensitivity applications to protect people against indirect contact.

When the auxiliary power supply voltage drops, the opening command intervenes after a minimum time of 100ms and after the time set above 100ms.

The SACE RCQ relay is only suitable for use in the presence of alternating earth current (Type AC), for alternating and/or pulsating current with continuous components (Type A), and is suitable for achieving residual current selectivity.

The SACE RCQ relay acts indirectly, and works on the release mechanism of the circuit-breaker by means of the circuit-breaker shunt opening release (to be ordered by the customer) to be housed in the circuit-breaker itself.

The table below shows the main characteristics of the SACE RCQ relay.

SACE RCQ residual current switchboard relay			
Power supply voltage	AC	[V]	80 ... 500
	DC	[V]	48 ... 125
Tripping threshold setting	I Δ n		
- 1 st setting range	[A]	0.03 - 0.05 - 0.1 - 0.3 - 0.5	
- 2 nd setting range	[A]	1 - 3 - 5 - 10 - 30	
Trip time settings 1 st range	[s]	0 - 0.05 - 0.1 - 0.25	
Trip time settings 2 nd range	[s]	0.5 - 1 - 2.5 - 5	
Range of use of closed transformers			
- Toroidal transformer \varnothing 60mm	[A]	0.03 ... 30	
- Toroidal transformer \varnothing 110mm	[A]	0.03 ... 30	
Range of use of transformers that can be opened			
- Toroidal transformer \varnothing 110mm	[A]	0.3 ... 30	
- Toroidal transformer \varnothing 180mm	[A]	0.1 ... 30	
- Toroidal transformer \varnothing 230mm	[A]	0.1 ... 30	
Dimensions (D x H x W)	[mm]	96 x 96 x 131.5	
Drilling for assembly on door	[mm]	92 x 92	

Dimensions of the external toroid for SACE RCQ

Outer dimensions of the toroid		Closed		Openable		
	D [mm]	94	165	166	241	297
	W [mm]	118	160	200	236	292
	H [mm]	81	40	81	81	81
Internal diameter \varnothing [mm]		60	110	110	180	230

Switching and protection of transformers

General information

When choosing circuit-breakers to protect the LV side of MV/LV transformers, the following must basically be taken into account:

- the rated current of the protected transformer on the LV side, on which the circuit-breaker capacity and protection settings both depend;
- the maximum short-circuit current at the point of installation, which determines the minimum breaking capacity that must be offered by the protection device.

MV-LV substation with a single transformer

The rated current of the transformer, LV side, is determined by the following equation

$$I_n = \frac{S_n \times 10^3}{\sqrt{3} \times U_{20}}$$

where

S_n = rated power of the transformer, in kVA

U_{20} = rated secondary voltage (no load) of the transformer, in V

I_n = rated current of the transformer, LV side, in A (rms value)

The three-phase short-circuit current at full voltage, right at the LV terminals of the transformer, can be expressed by the following equation (assuming infinite short-circuit power at the primary):

$$I_k = \frac{I_n \times 100}{U_k\%}$$

where:

$U_k\%$ = short-circuit voltage of the transformer, in %

I_n = rated current, LV side, in A (rms value)

I_k = rated three-phase short-circuit current, LV side, in A (rms value)

If the circuit-breaker is installed some distance away from the transformer by using a cable or a bus duct connection, the short-circuit current decreases, as a function of the impedance of the connection, in comparison with the values obtained by the equation above.

In practice, the short-circuit value provided by the transformer is also affected by the short-circuit power of the S_k network to which the transformer is connected.

WARNING!

The table refers to the conditions specified on the previous page. The information for selecting the circuit-breakers is provided only in relation to the operating current and prospective short-circuit current. To make the correct selection, other factors such as selectivity, back-up protection, the decision to use current-limiting circuit-breakers, etc. have to be considered. It is therefore essential for designers to carry out precise verification.

The types of circuit-breakers proposed are all from the SACE Emax series. Positions marked by an asterisk (*) are suitable for other possible selections from the Tmax or Isomax series of moulded-case circuit-breakers. One also needs to bear in mind that the short-circuit currents shown in the table have been calculated on the assumption of 750MVA power on the supply side of the transformers and without taking into account the impedances of the busbars and of the connections to the circuit-breakers.

WARNING!

The table refers to the conditions specified on the previous page. The information for selecting the circuit-breakers is provided only in relation to the operating current and prospective short-circuit current. To make the correct selection, other factors such as selectivity, back-up protection, the decision to use current-limiting circuit-breakers, etc. have to be considered. It is therefore essential for designers to carry out precise verification.

The types of circuit-breakers proposed are all from the SACE Emax series. Positions marked by an asterisk (*) are suitable for other possible selections from the Tmax or Isomax series of moulded-case circuit-breakers. One also needs to bear in mind that the short-circuit currents shown in the table have been calculated on the assumption of 750MVA power on the supply side of the transformers and without taking into account the impedances of the busbars and of the connections to the circuit-breakers.

Line protection

The following main parameters must be known in order to make the correct choice of circuit-breakers for line operation and protection:

- operating current of the line I_b
- permanent current-carrying capacity of the conductor I_z
- section S and cable insulation material, with relative constant K
- short-circuit current I_k at the point of installation of the circuit-breaker.

The protection device selected must offer a breaking capacity (I_{cu} or I_{cs} at the system voltage) higher than or equal to the short-circuit value at the application point. The operating characteristics of the device selected must also meet the following conditions:

Overload protection

$$I_b \leq I_n \leq I_z$$

$$I_f \leq 1.45 I_z$$

where

- I_b is the operating current of the circuit;
- I_z is the permanent current-carrying capacity of the conductor;
- I_n is the adjusted rated current of the protection device;
- I_f is the current that ensures effective operation of the protection device.

The above inequalities are easily respected thanks to the wide setting ranges offered by the PR121-PR122-PR123 releases.

Short-circuit protection

Assuming that a conductor overheats adiabatically during the passage of the short-circuit current, the following formula must be verified:

$$(I^2t)_{\text{circuit-breaker}} \leq (K^2S^2)_{\text{cable}}$$

therefore the specific let-through energy (I^2t) of the circuit-breaker must be lower than or equal to the specific let-through energy (K^2S^2) withstood by the cable.

Also make sure that the circuit-breaker trips within the limits prescribed by the international standards regarding the minimum value of the short-circuit current at the end of the line.

The minimum short-circuit current is the current which corresponds to a short-circuit occurring between phase and neutral (or between phase and phase if the neutral conductor is not distributed) at the farthest point of the conductor.

Protection against indirect contacts

In the event of a fault involving a phase and a part of the installation that is not normally live, it is best to make sure that the circuit-breaker trips within the times prescribed by the international standards for current values lower than or equal to the fault current.

Based on the value of this current, it is possible to intervene using function I of the release, function G or, for extremely low values, the RCQ device.

The figure shows which function of the electronic release or device to use on the basis of the fault current.

Note

With regard to the verification required by the IEC 60364-4-43 Standards, which prescribe that the overload protection must have a trip current I_z ensuring effective operation of the device at a value lower than $1.45 I_z$ ($I_z < 1.45 I_b$), this is always satisfied since SACE Emax circuit-breakers comply with the CEI EN 60947-2 Standards and this value is $1.3 I_z$.

Example:

In an installation with $U_n=400V$ and $I_k=45kA$, a load with $I_b=1102A$ is supplied with 4 cables in parallel, insulated in EPR of $300mm^2$ and $I_z=1193A$

With appropriate settings, the E2N2000 $I_n=2000A$ circuit-breaker fitted with the PR122 electronic protection release, protects the cable in accordance with the above conditions, as illustrated in the following graphs.

Note

For protection against indirect contacts, it may be necessary to link the setting of the short-circuit protection to the length of the line protected. See the *Slide rule kit* and *DOCwin* software package for the calculation procedures required. Special attention must be paid to the selective coordination of circuit-breakers in series, to limit disservice in the event of faults to a minimum.

Switching and protection of generators

Emax circuit-breakers are suitable for use with low-voltage generators employed in the following applications:

- A - back-up generators for primary loads
- B - generators disconnected from the supply network
- C - generators for small power stations connected in parallel with other generators and, possibly, with the power supply network.

In cases A and B, the generator does not operate in parallel with the power supply network: the short-circuit current therefore depends on the generator itself and, possibly, on the connected loads.

In case C, the breaking capacity must be determined by assessing the short-circuit current imposed by the network at the point of circuit-breaker installation.

The main points to check for generator protection are:

- the short-circuit current delivered by the generator; this can only be assessed if one is familiar with the machine's typical reactance and time constants. Here one can simply note that low short-circuit protection device settings are normally required (2-4 times I_n);
- the thermal overload limit of the machine. According to the IEC 60034-1 Standard, this value is set at $1.5 \times I_n$ for a period of 30 seconds.

For a detailed assessment, see the DOCWin program or specialized books on the topic.

The wide range of settings offered by electronic releases:

PR121 Threshold I (1.5 to 15) x I_n Threshold S (1 to 10) x I_n

PR122 Threshold I (1.5 to 15) x I_n Threshold S (0.6 to 10) x I_n

PR123 Threshold I (1.5 to 15) x I_n Threshold S (0.6 to 10) x I_n

makes SACE Emax circuit-breakers perfectly suitable for protecting large generators against short-circuit currents and against thermal overloads.

Table for selecting circuit-breakers to protect generators

The table shows the rated currents of the circuit-breakers, based on the electrical specifications of the generators. The breaking capacity required by the application must be defined in order to select the appropriate circuit-breaker.

The electronic protection releases available are suitable for all requirements.

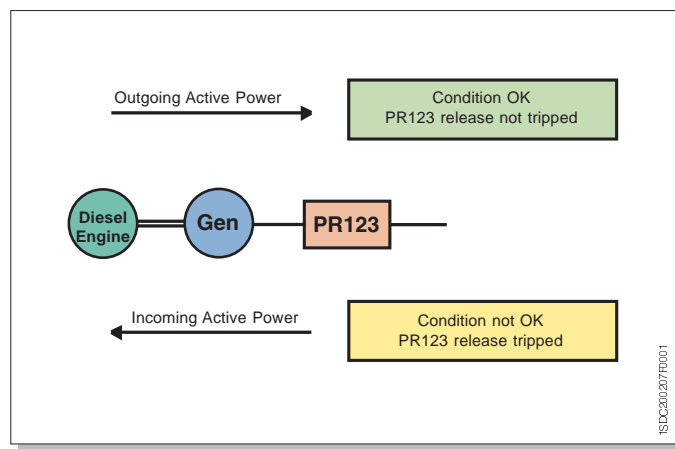

Frequency 50 Hz - Voltage 400 V			Frequency 60 Hz - Voltage 450 V

Switching and protection of generators

Reverse power protection RP

The reverse power protection is tripped when active power is incoming to the generator rather than outgoing as it is under normal conditions. Power reversal takes place if the mechanical power supplied by the main motor driving the generator drops sharply. In this condition, the generator acts as a motor, and can cause serious damage to the prime movers, such as overheating in steam turbines, cavitation in hydraulic turbines, or explosions of uncombusted diesel fuel in diesel engines.

When the power measured by the release falls below zero, the PR123 release trips, opening the circuit-breaker and thereby preventing any damage.

Switching and protection of asynchronous motors

A low voltage automatic air circuit-breaker can, by itself, guarantee the following functions in power supply circuits of three-phase asynchronous motors:

- switching
- overload protection
- short-circuit protection.

Trend of current values in the starting phase of a three-phase asynchronous motor.

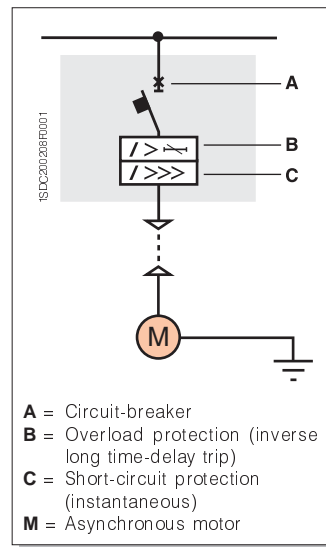

Diagram showing direct starting of an asynchronous motor using just the circuit-breaker fitted with an electronic overcurrent release.

This solution is particularly suitable if the switching frequency is not high, as it is normally the case for large motors. In this case, using only the circuit-breaker for motor switching and protection represents a highly advantageous solution thanks to its competitive cost-efficiency, reliability, ease of installation and maintenance, and compact overall dimensions.

The circuit-breakers in the SACE Emax selective (not current-limiting) series are able to provide the motor switching and protection function by virtue of their high breaking capacities and the wide range of possible settings offered by the electronic releases.

SACE Emax circuit-breakers are suitable for use with motors with rated powers within the range between 355 kW and 630 kW. For power ratings up to 355 kW, the moulded-case circuit-breakers in the SACE Isomax and Tmax range are also available. Medium voltage power supplies are normally used for powers above 630 kW.

Switching and protection of asynchronous motors

The switching of three-phase asynchronous motors demands considerable attention to the starting operation, since the current during this phase follows the typical behaviour shown in the figure, which must be taken into account when selecting the protection devices.

It is essential to calculate the typical values of the times and currents indicated in the figure in order to select the correct switching and protection devices for the motor. These data are normally provided by the motor manufacturer.

The following ratios generally apply:

- $I_a = 6-10 I_e$ (I_a and I_e : rms values)
- $I_p = 8-15 I_e$ (I_p and I_e : rms values).

The protection releases must be adjusted so as to:

- prevent unwanted tripping
- ensure that the installation is protected against the overcurrents which might occur at any point on the load side of the circuit-breaker (including internal motor faults).

The inverse long time-delay trip protection and instantaneous short-circuit protection must be set as close as possible to the motor starting curve without, however, interfering with it.

Note

The IEC 60947-4-1 Standard covers motor starters. The following classes are considered for overload protection:

Operating class	Trip time t (s) for $I = 7.2 \times I_1$ (I_1 = release setting current)
10A	$2 < t \leq 10$
10	$4 < t \leq 10$
20	$6 < t \leq 20$
30	$9 < t \leq 30$

The table specifies that the protection device must trip in a time t within the limits for its class when the current flowing through the device to be protected is 7.2 times the release setting current (assumed to be equal to the rated current of the motor).

The overload devices are divided into classes in a manner closely linked to the motor starting time: for example, a motor with a starting time of 5 seconds requires a protection device in class 20.

The same standards provide specific prescriptions for the protection device in cases of three-phase operation or with the loss of a phase.

Warning

The curves of the motor and releases are not directly comparable, since they both express time-current links, but have conceptually different meanings:

- the motor starting curve represents the values taken by the starting current instant by instant;
- the release curve represents the currents and corresponding trip times for the protection device.

The overload trip curve is set correctly when it is immediately above point A (figure below), which identifies the top of the rectangle with sides formed by the starting time “ t_a ” and the current “ I_a ” thermally equivalent to the variable starting current respectively.

Three-phase operation

The overload protection device at 1.05 times the setting current shall not trip in less than 2 hours starting from the cold state. When the current is 1.2 times the setting current, the tripping shall occur in less than 2 hours, as indicated in the table which follows (page 6/39)

Switching and protection of asynchronous motors

Operation with the loss of a phase

The IEC 60947-4-1 Standard prescribes that a release, with compensated temperature and sensitive to phase losses, must:

- not trip in less than two hours at 20°C, when one phase carries 90% of I_n and the other two carry 100% of I_n
- trip in less than two hours at 20°C, in the event of the loss of a phase when the current in the energized poles reaches 1.15 times the rated current I_n .

With the PR122 and PR123 releases by activating the Unbalance function it is possible to check the losses of phase.

Selecting the circuit-breakers to be used for motor protection

The tables in the next pages show the rated characteristics for large motors, from 355 to 630 kW, with circuit-breakers in the SACE Emax series for switching and protecting motors in category AC-3 at 415/690 V - 50 Hz.

The tables show the choice of current transformers able to ensure a sufficiently high value for the instantaneous trip threshold setting (I): in the absence of experimental data, it is advisable to verify that the ratio between the threshold of protection device I (I3) and the threshold of protection device L (I1) is:

$$I3/I1 = 12 \dots 15.$$

The PR122 and PR123 electronic releases conform to the international IEC 60947-4-1 Standard. In particular, the devices ensure protection of class 10A, 10, 20 and 30 of motors. PR122 and PR123 protection releases are compensated in temperature, and their operation is not negatively affected by the loss of a phase.

Advantages of earth fault protection G

The earth fault protection (G) is recommended in order to:

- improve safety against fire hazards
- improve protection of motors and personnel in the event of machine faults.

Advantages of thermal memory

The advisability of enabling the thermal memory (option offered by PR122 and PR123 releases) must be evaluated in relation to the type of load. Enabling the thermal memory (which makes the electronic protection similar to the one provided by a thermomagnetic device) increases the protection level of the motor when restarting after tripping due to an overload.

Undervoltage protection

The undervoltage protection device in control systems for asynchronous motors demands special attention, performing, amongst other things, two important functions:

- it prevents simultaneous restarting of all the motors on return of the power supply, with the risk of making the entire installation go out of service by tripping the main circuit-breaker overcurrent protection devices
- it prevents the motor from restarting without a control signal, which could be a hazard for maintenance personnel or could damage the processing cycle.

This protection can be carried out by:

- undervoltage release,
- protection function UV (undervoltage) on the PR123 release.

Switching and protection of capacitors

Operating conditions of circuit-breakers during continuous service for capacitor banks

According to the IEC 60831-1 and 60931-1 Standards, capacitors must be able to operate in service conditions with a rated rms current of up to 1.3 times the rated current I_{cn} of the capacitor. This prescription is due to the possible presence of harmonics in the mains voltage.

It should also be kept in mind that a tolerance of +15% is admissible for the capacitance value corresponding to its rated power, so that the circuit-breakers for switching capacitor banks must be selected to permanently carry a maximum current equal to:

$$I_n = 1.3 \times 1.15 \times I_{cn} = 1.5 \times I_{cn}$$

Current for connecting capacitor banks

Connection of a capacitor bank can be compared to a closing operation under short-circuit conditions, where the transient making capacity I_p takes on high peak values, above all when capacitor banks are connected in parallel with others that are already powered. The value of I_p needs to be calculated for each individual situation because it depends on the individual circuit conditions and can in certain cases even have a peak value equal to 100-200 $\times I_{cn}$ for a duration of 1-2 ms.

This fact must be taken into account when selecting the circuit-breaker, which must have a suitable making capacity, and when setting the overcurrent release, which must not cause unwanted trips when the bank is connected.

Selecting the circuit-breaker

Using the information on the rating plate of the three-phase capacitor bank

Q_n = rated power in kvar

U_n = rated voltage in V

the rated current of the capacitor bank is determined as follows:

$$I_{cn} = \frac{Q_n \times 10^3}{\sqrt{3} \times U_n} \quad , \text{ in A.}$$

The following conditions must be verified for the circuit-breaker:

Rated current $I_n > 1.5 I_{cn}$

Overload protection setting $I_1 = 1.5 \times I_{cn}$

Short-circuit protection setting $I_3 = \text{OFF}$

Breaking capacity $I_{cu} \geq I_k$, at the point of installation.

Switching and protection of capacitors

Table for selecting the protection and switching circuit-breakers for capacitors

The breaking capacity of the circuit-breaker must take into account the prospective short-circuit current at the point of installation. The available sizes are shown in the table.

Maximum power of the capacitor bank at 50Hz [kvar]				Circuit-breaker Type	Rated current of the current transformer In [A]	Rated current of the capacitor bank Inc [A]	Overload protection setting I1 [A]	Short-circuit protection setting I3 [A]

Horizontal interlocks

Maximum distance between two interlocks 1200 mm from one interlock to the other. The cables pass under the fixed parts, following the same connection layout shown for vertical circuit-breakers.

Notes

When fitting interlocks between two circuit-breakers, it is necessary to make suitable holes (through the switchboard) in the mounting surface for fixed circuit-breakers or for the fixed part of withdrawable circuit-breakers in order to pass through the flexible cables, observing the measurements shown in the figures on pages 7/7 and 7/14. For vertical interlocks, align the right-hand sides vertically and reduce the bends in the flexible cables to a minimum (radius R. 70 mm). All the angle values of the bends which the cable passes through added together must not exceed 720°.

Take up the excess cable by making it go through one complete turn only or an omega as shown in the figure.

Circuit diagrams

Reading information - circuit-breakers

Warning

Before installing the circuit-breaker, carefully read notes F and O on the circuit diagrams.

Operating status shown

The circuit diagram is for the following conditions:

- withdrawable circuit-breaker, open and racked-in
- circuits de-energised
- releases not tripped
- motor operating mechanism with springs discharged.

Versions

Though the diagram shows a circuit-breaker in withdrawable version, it can be applied to a fixed version circuit-breaker as well.

Fixed version

The control circuits are fitted between terminals XV (connector X is not supplied).
With this version, the applications indicated in figures 31 and 32 cannot be provided.

Withdrawable version

The control circuits are fitted between the poles of connector X (terminal box XV is not supplied).

Version without overcurrent release

With this version, the applications indicated in figures 13, 14, 41, 42, 43, 44, 45, 46, 47 cannot be provided.

Version with PR121/P electronic release

With this version, the applications indicated in figures 42, 43, 44, 45, 46, 47 cannot be provided.

Version with PR122/P electronic release

With this version, the applications indicated in figure 41 cannot be provided.

Version with PR123/P electronic release

With this version, the applications indicated in figure 41 cannot be provided.

Fig. 61 = SOR TEST UNIT Test/monitoring unit (see note R).
Fig. 62 = Circuits of the PR021/K signalling module.

Incompatibilities

The circuits indicated in the following figures cannot be supplied simultaneously on the same circuit-breaker:

- 6 - 7 - 8
13 - 14
22 - 46 - 47
43 - 44

Notes

- A) The circuit-breaker is only fitted with the accessories specified in the ABB SACE order acknowledgement. Consult this catalogue for information on how to make out an order.
- B) The undervoltage release is supplied for operation using a power supply branched on the supply side of the circuit-breaker or from an independent source. The circuit-breaker can only close when the release is energized (there is a mechanical lock on closing).
If the same power supply is used for the closing and undervoltage releases and the circuit-breaker is required to close automatically when the auxiliary power supply comes back on, a 30 ms delay must be introduced between the undervoltage release accept signal and the energizing of the closing release. This may be achieved using an external circuit comprising a permanent make contact, the contact shown in fig. 12 and a time-delay relay.
- E) For the EIA RS485 serial interface connection see document ITSCE - RH0298 regarding MODBUS communication
- F) The auxiliary voltage U_{aux} allows actuation of all operations of the PR121/P, PR122/P and PR123/P releases. Having requested a U_{aux} insulated from earth, one must use "galvanically separated converters" in compliance with IEC 60950 (UL 1950) or equivalent standards that ensure a common mode current or leakage current (see IEC 478/1, CEI 22/3) not greater than 3,5 mA, IEC 60364-41 and CEI 64-8.
- G) Earth fault protection is available with the PR122/P and PR123/P releases by means of a current sensor located on the conductor connecting to earth the star center of the MV/LV transformer.
The connections between terminals 1 and 2 (or 3) of current transformer U/I/O and poles T7 and T8 of the X (or XV) connector must be made with a two-pole shielded and stranded cable (see user manual), no more than 15 m long. The shield must be earthed on the circuit-breaker side and current sensor side.
- N) With PR122/P and PR123/P releases, the connections to the zone selectivity inputs and outputs must be made with a two-pole shielded and stranded cable (see user manual), no more than 300 m long. The shield must be earthed on the selectivity input side.
- O) Systems with rated voltage of less than 100V or greater than 690V require the use of an insulation voltage transformer to connect to the busbars (connect according to the insertion diagrams provided in the manual).
- P) With PR122/P and PR123/P releases with communication module PR120/D-M, the power supply for coils YO and YC must not be taken from the main power supply. The coils can be controlled directly from contacts K51/YO and K51/YC with maximum voltages of 110-120 V DC and 240-250 V AC.
- Q) The second opening release may be installed as an alternative to the undervoltage release.
- R) The SACE SOR TEST UNIT + opening release (YO) is guaranteed to operate starting at 75% of the U_{aux} of the opening release itself.
While the YO power supply contact is closing (short-circuit on terminals 4 and 5), the SACE SOR TEST UNIT is unable to detect the opening coil status. Consequently:
- For continuously powered opening coil, the TEST FAILED and ALARM signals will be activated
- If the coil opening command is of the pulsing type, the TEST FAILED signal may appear at the same time. In this case, the TEST FAILED signal is actually an alarm signal only if it remains lit for more than 20s.
- S) Also available in the version with normally-closed contact
- T) The connection between pin 1 of the connector XK5 to the internal neutral conductor is provided by four-pole circuit-breakers, while pin 1 of the connector XK5 is connected to pin T1 of the connector X (or XV) by means of three-pole circuit-breakers.
- U) The measuring module PR120/V is always supplied with relay PR123/P.
- V) If fig. 22 is present (second set of auxiliary contacts) simultaneously as PR122/P or PR123/P release, the contacts for the zone selectivity in fig. 42 (K51/Zin, K51/Zout, K51/Gzin and K51/Gzout) are not wired. In addition, the indicator module PR120/K in figures 46 and 47 cannot be supplied.

Circuit diagrams

Reading information - Automatic transfer switch ATS010

Operating status shown of the automatic transfer switch ATS010

The circuit diagram is for the following conditions:

- circuit-breakers open and racked-in #
- generator not in alarm
- closing springs discharged
- overcurrent relays not tripped *
- ATS010 not powered
- generator in automatic mode and not started
- generator switching enabled
- circuits de-energised
- logic enabled via input provided (terminal 47).

The present diagram shows withdrawable circuit-breakers, but is also valid for fixed circuit-breakers: the auxiliary circuits of the circuit-breakers do not connect to connector X but to terminal box XV; also connect terminal 17 to 20 and terminal 35 to 38 on the ATS010 device.

* The present diagram shows circuit-breakers with overcurrent relays, but is also valid for circuit-breakers without overcurrent relays: connect terminal 18 to 20 and terminal 35 to 37 of the ATS010 device.

@The present diagram shows four-pole circuit-breakers but is also valid for two-pole circuit-breakers: use only terminals 26 and 24 (phase and neutral) for the voltage connection of the normal power supply to the ATS010 device; also use the Q61/2 two-pole rather than four-pole auxiliary protection circuit-breaker.

General information

Abbreviations used in switchgear descriptions

- F** Fixed
- W** Withdrawable
- MP** Moving part for withdrawable circuit-breakers
- FP** Fixed part for withdrawable circuit-breakers

- PR121/P** PR121/P Electronic release (LI, LSI, LSIG functions)
- PR122/P** PR122/P Electronic release (LSI, LSIG, LSIRc functions)
- PR123/P** PR123/P Electronic release (LSIG functions)

Functions:

- L** Protection against overload with long inverse time-delay trip
- S** Selective protection against short-circuit with short inverse or definite time-delay trip
- I** Protection against instantaneous short-circuit with adjustable trip current threshold
- G** Protection against earth faults
- Rc** Protection against residual current earth faults

- Iu** Rated uninterrupted current of the circuit-breaker
- In** Rated current of the electronic release current transformers
- Icu** Rated ultimate short-circuit breaking capacity
- Icw** Rated short-time withstand current
- AC** AC applications
- DC** DC applications

- /MS** Switch-disconnector
- /E** Automatic circuit-breaker for applications up to 1150 V
- /E MS** Switch-disconnector for applications up to 1150 V AC and 1000 V DC
- CS** Sectionalizing truck
- MTP** Earthing switch
- MT** Earthing truck

Ordering codes

Order examples

1) Extra codes

Instructions for ordering

Standard version Emax series circuit-breakers are identified by means of commercial codes that can be altered by adding the following variables:

- **Codes for Terminal Kits for fixed circuit-breakers (other than horizontal rear)**
- **Extra codes for Current Transformer Settings (for current values below rated)**
- **Extra codes for special Version for rated service voltages up to 1150V AC**

The above types of variables can also be requested simultaneously on the same circuit-breaker. The "Extra codes" indicate variables that are not in addition to, but in replacement of the those found in the basic circuit-breaker.

For this reason, these commercial codes can only be ordered installed on the circuit-breaker and not as loose parts.

For releases (which already include the Dialogue Unit) and Current Transformers for supplies as spare parts for replacement by the customer, please see the coding section "Protection Releases and Current Transformers which can be supplied separately".

Numerical examples

- **Terminal Kit Codes for fixed circuit-breaker (other than horizontal rear)**

The codes indicate 3 or 4 pieces (for mounting on top or bottom terminals).

To convert a complete circuit-breaker, in the order specify 2 identical kits or 2 different kits for mixed terminals.

For mixed solutions, the first code indicates the 3 or 4 terminals to be mounted above, while the second indicates the 3 or 4 terminals to be mounted below.

Example no. 1

Emax E3N 3 poles fixed with Vertical Rear terminals (VR)	
1SDA056148R1	E3N 3200 PR122/P-LSI-In=3200A 3p F HR
1SDA038054R1	KIT 1/2 3p F HR>F VR E3
1SDA038054R1	KIT 1/2 3p F HR>F VR E3

Example no. 2

Emax E3N 3 poles fixed with top Vertical Rear (VR) and bottom Front (F) terminals	
1SDA056148R1	E3N 3200 PR122/P-LSI-In=3200A 3p F HR
1SDA038055R1	KIT 1/2 3p F HR>F VR E4
1SDA038064R1	KIT 1/2 3p F HR>F F E3

- **Extra codes for Current Transformer Settings (for current values below rated)**

Example no. 3

Emax E3N 3200 3 poles fixed In=2000A	
1SDA056148R1	E3N 3200 PR122/P-LSI-In=3200A 3p F HR
1SDA058242R1	rating plug In=2000A E2-4IEC E3-4UL EX.C

- **Extra codes for Special Version for rated service voltages up to 1150V AC**

Example no. 4

Emax E3H/E 2000 3 poles fixed (version up to 1150V AC)	
1SDA056432R1	E3H 2000 PR121/P-LI-In=2000A 3p F HR
1SDA048534R1	Special 1150V AC version Emax E3H/E20 circuit-breaker

2) Mechanical

interlocks

Instructions for ordering

All the mechanical interlocks for any type of SACE Emax circuit-breaker consist of various components, each of which has been coded to ensure the greatest possible flexibility of the accessory.

The accessory components are described below

- **Cables for interlock** (Ref. 10.1 page 9/59)

One type of cable must be ordered for each interlock.

Flexible cables must be fixed to the fixed circuit-breakers and to the switchgear structures using self-adhesive plates and self-locking bands.

- **Interlock for fixed circuit-breaker/withdrawable circuit-breaker moving part** (Ref. 10.2 page 9/59)

This is the accessory which must be installed on the moving part of the withdrawable circuit-breaker or on the side of the fixed circuit-breaker.

This accessory must be ordered for each fixed circuit-breaker and for each moving part of the withdrawable circuit-breaker.

- **Interlock for fixed circuit-breaker/ withdrawable circuit-breaker fixed part** (Ref. 10.3 page 9/59)

This is the accessory which must be installed on the fixed part of the withdrawable circuit-breaker or on the interlock plate of the fixed circuit-breaker (which simulates the fixed part of the withdrawable circuit-breaker).

This accessory must be ordered for each fixed circuit-breaker and for each fixed part of the withdrawable circuit-breaker.

- **Interlock plate for fixed circuit-breaker** (Ref. 10.4 page 9/59)

This must be requested for each fixed circuit-breaker present in the interlock.

For each circuit-breaker used in the interlock, depending on the type of circuit-breaker, the accessories listed in the figures below must be ordered (see page 9/55).

A single group of cables ("Cables for interlock" ref. 10.1) must be ordered **for each interlock**.

In particular, either on a fixed circuit-breaker or on one of the fixed parts must be specified.

The examples beside show a general guide to the types of accessories that must be ordered for the various versions of circuit-breakers and type of interlock:

1. Interlock between two fixed circuit-breakers

3. Interlock between three fixed circuit-breakers

2. Interlock between two withdrawable circuit-breakers

4. Interlock between three withdrawable circuit-breakers

Guide to ordering

Order examples

Numerical examples

Example no. 5

An interlock is to be made between two type A circuit-breakers. In particular, the following are to be interlocked:

- a SACE E3 3-pole fixed circuit-breaker
 - with a SACE E4 4-pole withdrawable circuit-breaker;
- the circuit-breakers are placed horizontally in the switchboard.

The codes to be used when ordering are listed below:

Pos	Code	Description
100	SACE E3 fixed circuit-breaker	
	1SDA038329R1	Type A interlock cables for fixed circuit-breakers or fixed parts - horizontal E1/6
	1SDA038367R1	Interlock for fixed circuit-breaker/moving part of withdrawable circuit-breaker E3
	1SDA038364R1	Interlock for fixed circuit-breaker/fixed part of withdrawable circuit-breaker Interlock typeA / B / D E1/6
	1SDA038358R1	Interlock plate for fixed circuit-breaker E1/6
200	SACE E4 moving part of withdrawable circuit-breaker	
	1SDA043466R1	Interlock for fixed circuit-breaker/moving part of withdrawable circuit-breaker 4p E4 / 3p E6
300	Fixed part SACE E4	
	1SDA038364R1	Interlock for fixed circuit-breaker/fixed part of withdrawable circuit-breaker Interlock TypeA / B / D E1/6

Example no. 6

Here an interlock is to be made between three Type C vertical circuit-breakers with the following circuit-breakers:

- SACE E2 3-pole withdrawable circuit-breaker
- SACE E3 3-pole fixed circuit-breaker
- SACE E6 4-pole fixed circuit-breaker.

Pos	Code	Description
100	SACE E2 Moving Part of withdrawable circuit-breaker	
	1SDA038366R1	Interlock for fixed circuit-breaker/moving part of withdrawable circuit-breaker E1-E2
200	SACE E2 Fixed part	
	1SDA038335R1	Type C interlock cables for fixed circuit-breakers or fixed parts - vertical E1/6
	1SDA038365R1	Interlock for fixed circuit-breaker/fixed part of withdrawable circuit-breaker Type C Interlock E1/6
300	SACE E3 Fixed circuit-breaker	
	1SDA038367R1	Interlock for fixed circuit-breaker/moving part of withdrawable circuit-breaker Interlock E3
	1SDA038365R1	Interlock for fixed circuit-breaker/fixed part of withdrawable circuit-breaker Type C Interlock E1/6
	1SDA038358R1	Interlock plate for fixed circuit-breaker E1/6
400	SACE E6 Fixed circuit-breaker	
	1SDA038369R1	Interlock for fixed circuit-breaker/moving part of withdrawable circuit-breaker Interlock 4p E6
	1SDA038365R1	Interlock for fixed circuit-breaker/fixed part of withdrawable circuit-breaker Type C Interlock E1/6
	1SDA038358R1	Interlock plate for fixed circuit-breaker E1/6
