5 Slot - Commands

The parameter of converters can be divided into three groups:

unsigned char-Variablen

Parameter of Menues with selective lists will be saved as "unsigned char", e.g. language:

German = 0

English = 1

unsigned int-Variables

Some figures which only show up integral will be saved as "unsigned int", e.g. model number

float-Variables

The remaining figures are saved as float (IEEE 754), e.g. damping

Following see each of the reading- and writing command and the table with the appropriate parameter of the three groups:

5.1 Unsigned-char-Variables

5.1.1 HART-Command 128 : Read unsigned-char-Variable		Revision

		Lesen	Schreiben		
Low Alarm	float	132	133	26	
High Alarm	float	132	133	27	

Remarks:

1. Additionally to the „normal“ dependency (width -> OmaxDN etc) at changes of pulse width or pulse factor both parameter must be read once again to receive the values stored in the converter
2. To change the output range the service code has to be entered.

7 Error Diagnostic at Hart

If HART-Communication does not work following items should be checked:

1. The converter has to be equipped with a HART-capable power outlet module .
2. The apparant ohmic resistance at power outlet must be between 250 and 500 ohm.

If all this is correct and the HART-communication still does not work the reception can be checked next. In sub-menu "Function Test" there is an item "HART-Command":

```
HART-Command
128 Slot 20 *
```

Flashing shortly at each received command
Only shows at Slot-Commands 128-133 , decimal.
Number of Commands, decimal.

If nothing shows up here already the reception does not work. In this case you should check with an oscilloscope whether any HART-signal reaches the converter. The signal level is typical 1 mA_{pp} so one e.g. has a 500 apparent ohm resistance $1 \text{ mA}_{pp} * 500 \text{ Ohm} = 500 \text{ mV}_{pp}$ signal.

If the signal comes up and the converter does not realize it is probably the fault of bad signal quality. In this case the test should be repeated under better conditions.

If the converter receives the HART-commands and the opposite side (e.g. Hand-heldcommunicator) still shows error the sending of the converter should be checked with an oscilloscope. This can be done with the test "HART-Transmitter":

```
HART-Transmitter
0
```

After call the converter sends logical 0 (=2200Hz) and after key stroke logical 1 (=1200Hz)
Furthermore should be checked with the oscilloscope whether the converter is answering to this command.
