Control terminal

REC 561*2.3

1MRK 511 120-BEN
Page 1
Revision: -
Issued: March 2003
Data subject to change without notice

Features

- Open terminal with extensive configuration possibilities and expandable hardware design to meet specific user requirements
- Line impedance
  - Pole slip protection (PSP)
- Current
  - Instantaneous overcurrent protection (IOC)
  - Time delayed overcurrent protection (TOC)
  - Two step time delayed phase overcurrent protection (TOC2)
  - Two step time delayed directional phase overcurrent protection (TOC3)
  - Thermal overload protection (THOL)
  - Breaker failure protection (BFP)
  - Definite and inverse time-delayed residual overcurrent protection (TEF)
  - Scheme communication logic for residual overcurrent protection (EFC)
  - Current reversal and weak end infeed logic for residual overcurrent protection (EFCA)
- Voltage
  - Time delayed undervoltage protection (TUV)
  - Time delayed overvoltge protection (TOV)
- Power system supervision
  - Loss of voltage check (LOV)
  - Dead line detection (DLD)
- Secondary system supervision
  - Fuse failure supervision (FUSE)
  - Voltage transformer supervision (TCT)
- Control
  - Synchrocheck (SYN)
  - Automatic reclosing function (AR)
  - Single command (CD)
  - Multiple command (CM)
- Apparatus control
  - BAYCON
  - COMCON
  - SWICON
  - BLKCON
- Interlocking
  - Interlocking, common
  - Interlocking for line bay (ABC_LINE)
  - Interlocking for bus coupler bay (ABC_BC)
  - Interlocking for transformer bay (AB_TRAFO)
  - Interlocking for bus-section breaker (A1A2_BS)
  - Interlocking for bus-section disconnector (A1A2_DC)
  - Interlocking for busbar earthing switch (BB_ES)
  - Interlocking for double CB bay (DB_)
  - Interlocking for 1 1/2 CB diameter (BH_)
- Logic
  - Trip logic (TR)
- Binary signal transfer to remote end (RTC)
- Serial communication
  - Simultaneous dual protocol serial communication facilities
- Metering capabilities
  - Pulse counting (PC)
  - Event counting (CN)

- Monitoring
  - LED indication function (HL, HLED)
  - Local Human Machine Interface (HMI)
  - Disturbance report (DRP)
  - Indications
  - Disturbance recorder
  - Event recorder
  - Trip value recorder
  - Monitoring of AC analogue measurements
  - Monitoring of DC analogue measurements
  - Increased measuring accuracy
- Additional logic function blocks
- Hardware
  - 18 LEDs for extended indication capabiliteis
- Several input/output module options including measuring mA input module (for transducers)
- Versatile local human-machine interface (HMI)
- Extensive self-supervision with internal event recorder
- Time synchronization with 1 ms resolution
- Four independent groups of complete setting parameters
- Powerful software PC ‘tool-box’ for monitoring, evalution and user configuration

Design

Type tested software and hardware that comply with international standards and ABB´s internal design rules together with extensive self monitoring functionality, ensure high reliability of the complete terminal.

The terminal’s closed and partly welded steel case makes it possible to fulfill the stringent EMC requirements.

All serial data communication is via optical connections to ensure immunity against disturbances.

An extensive library of protection, control and monitoring functions is available. This library of functions, together with the flexible hardware design, allows this terminal to be configured to each user´s own specific requirements. This wide application flexibility makes this product an excellent choice for both new installations and the refurbishment of existing installations.

Platform

Application

The platform hardware and common software functions are included for all REx 5xx terminals. It is the foundation on which all terminals are built. Application specific modules and functions are added to create a specific terminal type or family.

Design

The REx 5xx platform consists of a case, hardware modules and a set of basic functions.

The closed and partly welded steel case makes it possible to fulfill stringent EMC requirements. For case size 1/1x19” IP 30 applies for the top and bottom part. IP 54 can be obtained for the front area in flush applications. Mounting kits are available for rack, flush or wall mounting.

All connections are made on the rear of the case. Screw compression type terminal blocks are used for electrical connections. Serial communication connections are made by optical fibre connectors type Hewlett Packard (HFBR) for plastic fibres or bayonet type ST for glass fibres.

A set of hardware modules are always included in a terminal. Application specific modules are added to create a specific terminal type or family.

The basic functions provide a terminal with basic functionality such as self supervision, I/O-system configurator, real time clock and other functions to support the protection and control system of a terminal.

Common functions

Description

Common functions are the software functions that always are included in the terminals.

Time synchronisation (TIME)

Application

Use the time synchronization source selector to select a common source of absolute time for the terminal when it is a part of a protection system. This makes comparison of events and disturbance data between all terminals in a system possible.

Functionality

Two main alternatives of external time synchronization are available. Either the synchronization message is applied via any of the communication ports of the terminal as a telegram message including date and time, or as a minute pulse, connected to a binary input. The minute pulse is used to fine tune already existing time in the terminals.

The REx 5xx terminal has its own internal clock with date, hour, minute, second and millisecond. It has a resolution of 1 ms.

The clock has a built-in calendar that handles leap years through 2098. Any change between summer and winter time must be handled manually or through external time synchronization. The clock is powered by a capacitor, to bridge interruptions in power supply without malfunction.

The internal clock is used for time-tagging disturbances, events in Substation monitoring system (SMS) and Substation control system (SCS), and internal events.

Setting group selection (GRP)

Application

Use the four sets of settings to optimize the terminals operation for different system conditions. By creating and switching between fine tuned setting sets, either from the human-machine interface or configurable binary inputs, results in a highly adaptable terminal that can cope with a variety of system scenarios.

Functionality

The GRP function block has four functional inputs, each corresponding to one of the setting groups stored within the terminal. Activation of any of these inputs changes the active setting group. Four functional output signals are available for configuration purposes, so that continuous information on active setting group is available.

Setting lockout (HMI)

Application

Unpermitted or uncoordinated changes by unauthorized personnel may cause severe damage to primary and secondary power circuits. Use the setting lockout function to prevent unauthorized setting changes and to control when setting changes are allowed.

By adding a key switch connected to a binary input a simple setting change control circuit can be built simply allowing only authorized keyholders to make setting changes from the built-in HMI.

Functionality

Activating the setting restriction prevents unauthorized personell to purposely or by mistake change terminal settings.

The HMI--BLOCKSET functional input is configurable only to one of the available binary inputs of a REx 5xx terminal. For this reason, the terminal is delivered with the default configuration, where the HMI--BLOCKSET signal is connected to NONE-NOSIGNAL.

The function permits remote changes of settings and reconfiguration through the serial communication ports. The setting restrictions from remote can be activated only from the local HMI.

All other functions of the local human-machine communication remain intact. This means that an operator can read all disturbance reports and other information and setting values for different protection parameters and the configuration of different logic circuits.

I/O system configurator with internal event recorder (IOP)

Application

The I/O system configurator must be used in order for the terminal’s software to recognize added modules and to create internal address mappings between modules and protections and other functions.

Self supervision (INT)

Application

Use the local HMI, SMS or SCS to view the status of the self-supervision function. The self-supervision operates continuously and includes:

- Normal micro-processor watchdog function
- Checking of digitized measuring signals
- Checksum verification of PROM contents and all types of signal communication

Logic function blocks

Application

The user can with the available logic function blocks build logic functions and configure the terminal to meet application specific requirements.

Different protection, control, and monitoring functions within the REx 5xx terminals are quite independent as far as their configuration in the terminal is concerned. The user can not change the basic algorithms for different functions. But these functions combined with the logic function blocks can be used to create application specific functionality.

With additional configurable logic means that an extended number of logic circuits are available. Also Move function blocks (MOF, MOL), used for synchronization of boolean signals sent between logics with slow and fast execution, are among the additional configurable logic circuits.

Functionality

The functionality of the additional logic function blocks are the same as for the basic logic functions, but with an extended number of blocks.

Invert function block (INV)

The inverter function block INV has one input and one output, where the output is in inverse ratio to the input.

OR function block (OR)

The OR function is used to form general combinatory expressions with boolean variables. The OR function block has six inputs and two outputs. One of the outputs is inverted.

AND function block (AND)

The AND function is used to form general combinatory expressions with boolean variables.The AND function block has four inputs and two outputs. One of the inputs and one of the outputs are inverted.

Timer function block (TM)

The function block TM timer has drop-out and pick-up delayed outputs related to the input signal. The timer has a settable time delay (parameter T).

Timer long fuction block (TL)

The function block TL timer with extended maximum time delay at pick-up and at drop-out, is identical with the TM timer. The difference is the longer time delay.

Pulse timer function block (TP)

The pulse function can be used, for example, for pulse extensions or limiting of operation of outputs. The pulse timer TP has a settable length.

Extended length pulse function block (TQ)

The function block TQ pulse timer with extended maximum pulse length, is identical with the TP pulse timer. The difference is the longer pulse length.

Exclusive OR function block (XOR)

The exclusive OR function XOR is used to generate combinatory expressions with boolean variables. The function block XOR has two inputs and two outputs. One of the outputs is inverted. The output signal is 1 if the input signals are different and 0 if they are equal.

Set-reset with memory function block (SR)

The Set-Reset (SR) function is a flip-flop that can set or reset an output from two inputs respectively. Each SR function block has two outputs, where one is inverted.

Set-reset with memory function block (SM)

The Set-Reset function SM is a flip-flop with memory that can set or reset an output from two inputs respectively. Each SM function block has two outputs, where one is inverted. The memory setting controls if the flip-flop after a power interruption will return the state it had before or if it will be reset.

Controllable gate function block (GT)

The GT function block is used for controlling if a signal should be able to pass from the input to the output or not depending on a setting.

Settable timer function block (TS)
The function block TS timer has outputs for delayed input signal at drop-out and at pick-up. The timer has a settable time delay. It also has an Operation setting On, Off that controls the operation of the timer.

Move first function (MOF)
The Move function block MOF is put first in the slow logic and is used for signals coming from fast logic into the slow logic. The MOF function block is only a temporary storage for the signals and does not change any value between input and output.

Move last function block (MOL)
The Move function block MOL is put last in the slow logic and is used for signals going out from the slow logic to the fast logic. The MOL function block is only a temporary storage for the signals and does not change any value between input and output.

Blocking of signals during test

Application
The protection and control terminals have a complex configuration with many included functions. To make the testing procedure easier, the terminals include the feature to individually block a single, several or all functions.

This means that it is possible to see when a function is activated or trips. It also enables the user to follow the operation of several related functions to check correct functionality and to check parts of the configuration etc.

Line impedance

Pole slip protection (PSP)

Application
Sudden events in an electrical power system such as large jumps in load, fault occurrence or fault clearance, can cause oscillations referred to as power swings. In a recoverable situation, the power swings will decay and stable operation will be resumed; in a non-recoverable situation, the power swings become so severe that the synchronism is lost, a condition referred to as pole slipping. The main purpose of the PSP pole slip protection is to detect, evaluate, and take the required action for pole slipping occurrences in the power system.

Functionality
The PSP function comprises an inner and an outer quadrilateral measurement characteristic. It detects oscillations in the power system by measuring the time it takes the transient impedance to pass through the impedance area between the outer and the inner characteristics. Oscillations are identified by transition times longer than timer settings. The impedance measuring principle is the same as that used for the distance protection zones. The impedance and the transient impedance time are measured in all three phases separately. One-out-of-three or two-out-of-three operating modes can be selected permanently or adaptively according to the specific system operating conditions.

Oscillations with an oscillation period as low as 200 ms (i.e. with a slip frequency as high as 10% of the rated frequency on a 50 Hz basis) can be detected for normal system operating conditions, as well as during the dead time of a single-pole automatic reclosing cycle. Different timers are used for initial and consecutive pole slips, securing a high degree of differentiation between oscillation and fault conditions.

It is possible to inhibit the ocsillation detected output on detection of earth fault current. This can be used to release the operation of the distance protection function for earth faults during power oscillation conditions.

The PSP function has two tripping areas. These are located within the operating area, which is located within the inner characteristic. On detection of a new oscillation, the activation of a trip output will depend on the applied settings. These determine the direction of the transition for which tripping is permitted, whether tripping will occur on entry of the measured impedance into a tripping area, or on its exit from the tripping area, and through which tripping area the transition must be measured for tripping to occur. The applied settings also determine the number of pole slips required before the trip output is issued.

Current

Instantaneous overcurrent protection (IOC)

Application

Different system conditions, such as source impedance and the position of the faults on long transmission lines influence the fault currents to a great extent. An instantaneous phase overcurrent protection with short operate time and low transient overreach of the measuring elements can be used to clear close-in faults on long power lines, where short fault clearing time is extremely important to maintain system stability.

The instantaneous residual overcurrent protection can be used in a number of applications. Below some examples of applications are given.

- Fast back-up earth fault protection for faults close to the line end.
- Enables fast fault clearance for close in earth faults even if the distance protection or the directional residual current protection is blocked from the fuse supervision function.

Functionality

The current measuring element continuously measures the current in all three phases and compares it to the set operate value IP>>. A filter ensures immunity to disturbances and dc components and minimizes the transient overreach. If any phase current is above the set value IP>>, the phase overcurrent trip signal TRP is activated. Separate trip signal for the actual phase(s) is also activated. The input signal BLOCK blocks all functions in the current function block.

The current measuring element continuously measures the residual current and compares it to the set operate value IN>>. A filter ensures immunity to disturbances and dc components and minimizes the transient overreach. If the residual current is above the set value IN>>, the residual overcurrent trip signal TRN is activated. The general trip signal TRIP is activated as well. The input signal BLOCK blocks the complete function.

Time delayed overcurrent protection (TOC)

Application

The time delayed overcurrent protection, TOC, operates at different system conditions for currents exceeding the preset value and which remains high for longer than the delay time set on the corresponding timer. The function can also be used for supervision and fault detector for some other protection functions, to increase the security of a complete protection system. It can serve as a reserve function for the line distance protection, if activated under fuse failure conditions which has disabled the operation of the line distance protection.

The time delayed residual overcurrent protection is intended to be used in solidly and low resistance earthed systems. The time delayed residual overcurrent protection is suitable as back-up protection for phase to earth faults, normally tripped by operation of the distance protection. The protection function can also serve as protection for high resistive phase to earth faults.

Functionality

The current measuring element continuously measures the current in all three phases and compares it to the set operate value IP>. A filter ensures immunity to disturbances and dc components and minimizes the transient overreach. If the current in any of the three phases is above the set value IP>, a common start signal STP and a start signal for the actual phase(s) are activated. The timer tP is activated and the phase overcurrent trip signal TRP is activated after set time. The general trip signal TRIP is activated as well.

The input signal BLOCK blocks the function. The input signal BLKTR blocks both trip signals TRP and TRIP.

The residual current measuring element continuously measures the residual current and compares it with the set operate value IN>. A filter ensures immunity to disturbances and dc components and minimizes the transient overreach. If the measured current is above the set value IN>, a start signal STN is activated. The timer tN is activated and the residual overcurrent trip signal TRN is activated after set time. The general trip signal TRIP is activated as well. The input signal BLOCK blocks the function. The input signal BLKTR blocks both trip signals TRN and TRIP.

Two step time delayed phase overcurrent protection (TOC2)

Application

The two current/time stages of overcurrent protection TOC2 improve the possibility to get fast operation for nearby faults by using a high set current stage with short time delay. The low current stage is set with appropriate time delay to get selectivity with the adjacent relays in the system. In networks with inverse time delayed relays, selectivity is generally best obtained by using the same type of inverse time characteristic for all overcurrent relays.

Functionality

The current measuring element continuously measures the current in all phases and compares it to the set operate value for the two current stages. A filter ensures immunity to disturbances and dc components and minimizes the transient overreach. If the current in any of the three phases is above the set value I>Low, the start signal for the low current stage is activated. With setting Characteristic = Def, the timer tLow is activated and the trip signal TRLS is activated after set time. If inverse time delay is selected, the timer tMinInv starts when the current is above the set value I>Low. If the current also is above the set value I>Inv, the inverse time evaluation starts. When both time circuits operate, the definite time circuit tLow is activated and the trip signal TRLS is activated after the additional time tLow. If the current is above the set value I>High, the timer tHigh is activated and the trip signal TRHS is activated after set time.

The input signal BLOCK blocks all functions. Each current stage can also be individually blocked.

Two step time deleyed directional phase overcurrent protection (TOC3)

Application

The two current/time stages of the TOC3 overcurrent protection, both with optional directional (Forward release or Reverse block) or non-directional function, improve the possibility to obtain selective function of the overcurrent protection relative other relays even in meshed networks. It must be realized, however, that the setting of a phase overcurrent protection system in a meshed network can be very complicated and a large number of fault current calculations are needed. In some cases, it is not possible to obtain selectivity even when using directional overcurrent protection. In such cases it is suggested to use line differential protection or distance protection function.

Functionality

The current measuring element continuously measures the current in all three phases and compares it to the set operate value for the two current stages. A filter ensures immunity to disturbances and dc components and minimizes the transient overreach. If the current in any of the three phases is above the set value I>Low, the start signal for the low current stage is activated. With setting Characteristic = Def, the timer tLow is activated and the trip signal TRLS is activated after set time. If inverse time delay is selected, the timer tMinInv starts when the current is above the set value I>Low. If the current also is above the set value I>Inv, the inverse time evaluation starts. When both time circuits operate, the definite time circuit tLow is activated and the trip signal TRLS is activated after set time.

If the current is above the set value I>High, the timer tHigh is activated and the trip signal TRHS is activated after set time.The low and the high set current stages can individually be set directional or non-directional. Directional information is calculated from positive sequence polarization voltages and the phase currents. The polarization voltage contains memory voltage to ensure directional function at close-in three-phase faults. The directional element relay characteristic angle (RCA) and operate angle are settable in wide ranges.

The input signal BLOCK blocks all functions. Trip from each current stage can also be individually blocked.

Thermal overload protection (THOL)

Appliction

Load currents that exceed the permissible continuous value may cause damage to the conductors and isolation due to overheating. The permissible load current will vary with the ambient temperature.

The THOL thermal overcurrent function supervises the phase currents and provides a reliable protection against damage caused by excessive currents. The temperature compensation gives a reliable thermal protection even when the ambient temperature has large variations.

Functionality

The final temperature rise of an object relative the ambient temperature is proportional to the square of the current. The rate of temperature rise is determined by the magnitude of the current and the thermal time constant of the object. The same time constant determines the rate of temperature decrease when the current is decreased.

The thermal overload function uses the highest phase current. The temperature change is continuously calculated and added to the figure for the temperature stored in the thermal memory. When temperature compensation is used, the ambient temperature is added to the calculated temperature rise. If no compensation is used, 20^{o} C is added as a fixed value. The calculated temperature of the object is then compared to the set values for alarm and trip.

The information on the ambient temperature is received via a transducer input with for example 0 - 10 mA or 4 - 20 mA.

The output signal THOL--TRIP has a duration of 50 ms. The output signal THOL--START remains activated as long as the calculated temperature is higher than the set trip value minus a settable temperature difference TdReset (hysteresis). The output signal THOL--ALARM has a fixed hysteresis of 5^{o} C.

Breaker failure protection (BFP)

Application

In many protection applications local redundancy is used. One part of the fault clearance system is however never duplicated, namely the circuit breaker. Therefore a breaker failure protection can be used.

The breaker failure protection is initiated by trip signals from different protection functions within or outside the protection terminal. When a trip signal is sent to the breaker failure protection first, with no or a very short delay, a re-trip signal can be sent to the protected breaker. If fault current is flowing through the breaker still after a setting time a back-up trip signal is sent to the adjacent breakers. This will ensure fault clearance also if the circuit breaker is out of order.

Functionality

Breaker failure protection, BFP, provides backup protection for the primary circuit breaker if it fails to clear a system fault. It is obtained by checking that fault current persists after a brief time from the operation of the object protection and issuing then a three phase trip command to the adjacent circuit breakers (back-up trip).

Correct operation at evolving faults is ensured by phase segregated starting command, phase segregated current check and phase segregated settable timers.

Additionally, the retrip of the faulty circuit breaker after a settable time is possible. The retrip can be controlled by current check or carried out as direct retrip.

Definite and inverse time-delayed residual overcurrent protection (TEF)

Application

Use the dependent and independent time delayed residual overcurrent functions in solidly earthed systems to get a sensitive and fast fault clearance of phase to earth faults.

The nondirectional protection can be used when high sensitivity for earth fault protection is required. It offers also a very fast back-up earth fault protection for the part of a transmission line, closest to the substation with the protection.

The nondirectional residual overcurrent protection can be given a relatively low current pick-up setting. Thus the protection will be sensitive, in order to detect high resistive phase to earth faults.

The directional residual overcurrent protection can be used in a number of applications:

1. Main protection for phase to earth faults on the radial lines in solidly earthed systems. Selectivity is achieved by using time delayed function according to practices in the system (independent time delay or some type of dependent time characteristic).
2. Main protection for phase to earth faults on lines in a meshed solidly earthed system. The directional function can be used in an permissive overreach communication scheme or a blocking scheme. In this application the directional residual overcurrent function is used together with the communication logic for residual overcurrent protection.
3. Back-up protection for phase to earth faults for lines in solidly earthed systems. By using the directional residual protection as back-up function, the back-up fault clearance time can be kept relatively short together with the maintained selectivity.
4. Etc.

Functionality

The residual overcurrent protection (TEF) measures the residual current of the protected line. This current is compared to the current settings of the function. If the residual current is larger than the setting value a trip signal will be sent to the output after a set delay time. The time delay can be selected between the independent or dependent possibility.

In order to avoid unwanted trip for transformer inrush currents, the function is blocked if the second harmonic content of the residual current is larger than 20% of the measured residual current.

As an option the residual overcurrent protection can have directional function. The residual voltage is used as a polarizing quantity. This voltage is either derived as the vectorial sum of inputs U1+U2+U3 or as the input U4. The fault is defined to be in the forward direction if the residual current component in the characteristic angle 65° (residual current lagging the reference voltage, -3U0), is larger than the set operating current in forward direction. The same kind of measurement is performed also in the reverse direction.

Scheme communication logic for residual overcurrent protection

Application

The EFC directional comparison function contains logic for blocking overreaching and permissive overreaching schemes. The function is applicable together with TEF time delayed directional residual overcurrent protection in order to decrease the total operate time of a complete scheme.

One communication channel, which can transmit an on / off signal, is required in each direction. It is recommended to use the complementary additional communication logic EFCA, if the weak infeed and/or current reversal conditions are expected together with permissive overreaching scheme.

Functionality

The communication logic for residual overcurrent protection contains logics for blocking overreach and permissive overreach schemes.

In the blocking scheme a signal is sent to the remote end of the line if the directional element, in the directional residual overcurrent protection (sending end), detects the fault in the reverse direction. If no blocking signal is received and the directional element, in the directional residual overcurrent protection (receiving end), detects the fault in the forward direction, a trip signal will be sent after a settable time delay.

In the permissive overreach scheme a signal is sent to the remote end of the line if the directional element, in the directional residual overcurrent protection (sending end), detects the fault in the forward direction. If an acceleration signal is received and the directional element, in the directional residual overcurrent protection (receiving end), detects the fault in the forward direction, a trip signal will be sent, normally with no time delay. In case of risk for fault current reversal or weak end infeed, an additional logic can be used to take care of this.

Current reversal and weak end infeed logic for residual overcurrent protection (EFCA)

Application
The EFCA additional communication logic is a supplement to the EFC scheme communication logic for the residual overcurrent protection.

To achieve fast fault clearing for all earth faults on the line, the TEF earth-fault protection function can be supported with logic, that uses communication channels. REx 5xx terminals have for this reason available additions to scheme communication logic.

If parallel lines are connected to common busbars at both terminals, overreaching permissive communication schemes can trip unselectively due to fault current reversal. This unwanted tripping affects the healthy line when a fault is cleared on the other line. This lack of security can result in a total loss of interconnection between the two buses.To avoid this type of disturbance, a fault current-reversal logic (transient blocking logic) can be used.

Permissive communication schemes for residual overcurrent protection, can basically operate only when the protection in the remote terminal can detect the fault. The detection requires a sufficient minimum residual fault current, out from this terminal. The fault current can be too low due to an opened breaker or high positive and/or zero sequence source impedance behind this terminal. To overcome these conditions, weak end infeed (WEI) echo logic is used.

Functionality
The reverse directed signal from the directional residual overcurrent function, starts the operation of a current reversal logic. The output signal, from the logic, will be activated, if the fault has been detected in reverse direction for more than the tPickUp time set on the corresponding timers. The tDelay timer delays the reset of the output signal. The signal blocks the operation of the overreach permissive scheme for residual current, and thus prevents unwanted operation due to fault current reversal.

The weak end infeed logic uses normally a forward and reverse signal from the directional residual overcurrent function. The weak end infeed logic echoes back the received permissive signal, if none of the directional measuring elements have been activated during the last 200 ms. Further, it can be set to give signal to trip the breaker if the echo conditions are fulfilled and the residual voltage is above the set operate value for $3U_0$>.

Voltage

Time delayed undervoltage protection (TUV)

Application
The time delayed undervoltage protection function, TUV, is applicable in all situations, where reliable detection of low phase voltages is necessary. The function can also be used as a supervision and fault detection function for some other protection functions, to increase the security of a complete protection system.

Time delayed overvoltage protection (TOV)

Application
The time delayed phase overvoltage protection is used to protect the electrical equipment and its insulation against overvoltage by measuring three phase voltages. In this way, it prevents the damage to the exposed primary and secondary equipment in the power systems.

The residual overvoltage protection function is mainly used in distribution networks, mainly as a backup protection for the residual overcurrent protection in the line feeders, to secure the disconnection of earth-faults.

Functionality
The phase overvoltage protection function continuously measures the three phase voltages and initiates the corresponding output signals if the measured phase voltages exceed the preset value (starting) and remain high longer than the time delay setting on the timers (trip). This function also detects the phases which caused the operation.

The residual overvoltage protection function calculates the residual voltage (3U0) from the measuring three phase voltages and initiates the corresponding output signals if the residual voltage is larger than the preset value (starting) and remains high longer than the time delay setting (trip).

Power system supervision

Loss of voltage check (LOV)

Application

The loss of voltage detection, LOV, is suitable for use in networks with an automatic restoration function. The LOV function issues a three-pole trip command to the circuit breaker, if all three phase voltages fall below the set value for a time longer than 7 seconds, and the circuit breaker remains closed.

Functionality

The operation of LOV function is based on line voltage measurement. The function is provided with a logic, which automatically recognises if the line was restored for at least three seconds before starting the seven seconds timer. Additionally, the function is automatically blocked if only one or two phase voltages have been detected low for more than 10 seconds. The LOV function operates again only if the line has been fully energised.

Operation of LOV function is also inhibited by fuse failure and open circuit breaker information signals, by their connection to dedicated inputs of the function block.

The operation of the function is supervised by the fuse-failure function and the information about the closed position of the associated circuit breaker.

Dead line detection (DLD)

Application

The main purpose of the dead line detection is to provide different protection, control and monitoring functions with the status of the line, i.e whether or not it is connected to the rest of the power system.

Functionality

The dead line detection function continuously measures all three phase currents and phase voltages of a protected power line. The line is declared as dead (not energized) if all three measured currents and voltages fall below the preset values for more than 200 ms.

Secondary system supervision

Fuse failure supervision (FUSE)

Application

The fuse failure supervision function, FUSE, continuously supervises the ac voltage circuits between the voltage instrument transformers and the terminal. Different output signals can be used to block, in case of faults in the ac voltage secondary circuits, the operation of the distance protection and other voltage-dependent functions, such as the synchro-check function, undervoltage protection, etc.

Different measurement principles are available for the fuse failure supervision function.

The FUSE function based on zero sequence measurement principle, is recommended in directly or low impedance earthed systems.

The FUSE function based on the negative sequence measurement principle is recommended in isolated or high impedance earthed systems.

A criterion based on delta current and delta voltage measurements can be added to the FUSE function in order to detect a three phase fuse failure, which in practice is more associated with voltage transformer switching during station operations.

Functionality

The FUSE function based on the negative sequence measurement principle continuously measures the negative sequence voltage and current in all three phases. It operates if the measured negative sequence voltage increases over the preset operating value, and if the measured negative sequence current remains below the preset operating value.

The FUSE function based on the zero sequence measurement principle continuously measures the zero sequence current and voltage in all three phases. It operates if the measured zero sequence voltage increases over preset operating value, and if the measured zero sequence current remains below the preset operating value.

The $\Delta I/\Delta t$ and $\Delta U/\Delta t$ algorithm, detects a fuse failure if a sufficient negative change in voltage amplitude without a sufficient change in current amplitude is detected in each phase separately. This check is performed if the circuit breaker is closed. Information about the circuit breaker position is brought to the function input CBCLOSED through a binary input of the terminal.

Three output signals are available. The first depends directly on the voltage and current measurement. The second depends on the operation of the dead line detection function, to prevent unwanted operation of the distance protection if the line has been deenergised and energised under fuse failure conditions. The third depends on the loss of all three measured voltages. A special function input serves the connection to the auxiliary contact of a miniature circuit breaker, MCB (if used), to secure correct operation of the function on simultaneous interruption of all three measured phase voltages also when the additional delta current and delta voltage algorithm is not present in the function block.

Voltage transformer supervision (TCT)

Application

The main purpose of the voltage transformer supervision function is to indicate failure in the measuring voltage from a capacitive voltage transformer.

Functionality

The voltage transformer supervision function checks all of the three phase-phase voltages and the residual voltage. If the residual voltage exceeds the setpoint value and any of the phase-phase voltages is higher than 80% of the rated phase-phase voltage the output is activated after a settable time delay.

Control

Synchrocheck (SYN)

Application

The main purpose of the synchrocheck function is to provide controlled closing of circuit breakers in interconnected networks.

The main purpose of the energizing check function is to facilitate the controlled reconnection of a disconnected line or bus to, respectively, an energized bus or line.

The main purpose of the phasing function is to provide controlled closing of circuit breakers when two asynchronous systems are going to be connected. It is used for slip frequencies that are larger than those for synchrocheck.

The phasing function is only available together with the synchrocheck and energizing check functions.

To meet the different application arrangements, a number of identical SYN function blocks may be provided within a single terminal. The number of these function blocks that may be included within any given terminal depends on the type of terminal. Therefore, the specific circuit breaker arrangements that can be catered for, or the number of bays of a specific arrangement that can be catered for, depends on the type of terminal.

Functionality

The synchrocheck function measures the conditions across the circuit breaker and compares them to set limits. The output is only given when all measured conditions are simultaneously within their set limits.

The energizing check function measures the bus and line voltages and compares them to both high and low threshold detectors. The output is only given when the actual measured conditions match the set conditions.

The phasing function measures the conditions across the circuit breaker, and also determines the angle change during the closing delay of the circuit breaker from the measured slip frequency. The output is only given when all measured conditions are simultaneously within their set limits. The issue of the output is timed to give closure at the optimal time.

For single circuit breaker and 1 1/2 circuit breaker arrangements, the SYN function blocks have the capability to make the necessary voltage selection. For single circuit breaker arrangements, selection of the correct voltage is made using auxiliary contacts of the bus disconnectors. For 1 1/2 circuit breaker arrangements, correct voltage selection is made using auxiliary contacts of the bus disconnectors as well as the circuit breakers (as well as binary output signals from the other terminals in the same diameter for 1 1/2 circuit breaker applications with a separate terminal per circuit breaker).

Automatic reclosing function (AR)

Application

The majority of power line faults are transient in nature, i.e. they do not recur when the line is re-energized following disconnection. The main purpose of the AR automatic reclosing function is to automatically return power lines to service following their disconnection for fault conditions.

Especially at higher voltages, the majority of line faults are single-phase-to-earth. Faults involving all three phases are rare. The main purpose of the single- and two-pole automatic reclosing function, operating in conjunction with a single- and two-pole tripping capability, is to limit the effect to the system of faults involving less than all three phases. This is particularly valuable for maintaining system stability in systems with limited meshing or parallel routing.

Functionality

The AR function is a logical function built up from logical elements. It operates in conjunction with the trip output signals from the line protection functions, the OK to close output signals from the synchrocheck and energizing check function, and binary input signals. The binary input signals can be for circuit breaker position/status or from other external protection functions.

Of the six reclosing programs, one provides for three-pole reclosing only, while the others provide for single- and two-pole reclosing as well. For the latter, only the first shot may be single- or two-pole. All subsequent shots up to the maximum number will be three-pole. For some of the programs, depending on the initial trip, no shot, or only one shot, will be permitted irrespective of the number of shots selected.

Single command (CD)

Application

The terminals may be provided with a function to receive signals either from a substation automation system (SMS and/or SCS) or from the local human-machine interface, HMI. That receiving function block has 16 outputs that can be used, for example, to control high voltage apparatuses in switchyards. For local control functions, the local HMI can also be used. Together with the configuration logic circuits, the user can govern pulses or steady output signals for control purposes within the terminal or via binary outputs.

Functionality

The single command function consists of a function block CD for 16 binary output signals.

The output signals can be of the types Off, Steady, or Pulse. The setting is done on the MODE input, common for the whole block, from the CAP 531 configuration tool.

The outputs can be individually controlled from the operator station, remote-control gateway, or from the local HMI. Each output signal can be given a name with a maximum of 13 characters from the CAP 531 configuration tool.

The output signals, here OUT1 to OUT16, are then available for configuration to built-in functions or via the configuration logic circuits to the binary outputs of the terminal.

Multiple command (CM)

Application

The terminals may be provided with a function to receive signals either from a substation automation system or from other terminals via the interbay bus. That receiving function block has 16 outputs that can be used, together with the configuration logic circuits, for control purposes within the terminal or via binary outputs. When it is used to communicate with other terminals, these terminals must have a corresponding event function block to send the information.

Functionality

One multiple command function block CM01 with fast execution time also named *Binary signal interbay communication, high speed* and/or 79 multiple command function blocks CM02-CM80 with slower execution time are available in the REx 5xx terminals as options.

The output signals can be of the types Off, Steady, or Pulse. The setting is done on the MODE input, common for the whole block, from the CAP 531 configuration tool.

The multiple command function block has 16 outputs combined in one block, which can be controlled from the operator station or from other terminals. One common name for the block, with a maximum of 19 characters, is set from the configuration tool CAP 531.

The output signals, here OUT1 to OUT16, are then available for configuration to built-in functions or via the configuration logic circuits to the binary outputs of the terminal.

The command function also has a supervision function, which sets the output VALID to 0 if the block did not receive data within a configured INTERVAL time.

Apparatus control

Application, common

The complete apparatus control function handles open and close commands of high voltage apparatuses and their status indications in a bay. Permission to operate is granted after that several conditions are evaluated, such as interlocking status, synchro-check, operator mode or other external conditions.

Design, common

The apparatus control function consists of totally four main types of standardized function blocks BAYCON, COMCON, SWICON and BLKCON, all to be configured to reflect the switchyard arrangement. The number and type of blocks used in the terminal depends on the number and type of apparatuses to control.

Application, BAYCON

The purpose of this function block BAYCON is to handle bay-oriented functions such as reservation, operator place selection, and supervision of select relays. The reservation function is primarily used to transfer interlocking information between bays in a safe way and to prevent double operation in a bay, switchgear, or complete substation.

Design, BAYCON

This main type BAYCON is used one per bay and is available in four variants:

BAYCONA: The normal variant to be used.

BAYCONB: The same as A, but used when more than eight apparatuses are included in one bay.

BAYCONE: Is used when external selection relays with individual feedback signals are used.

BAYCONF: The same as E, but used when more than eight apparatuses are included in one bay.

Application, COMCON

The purpose of this function block COMCON is to handle commands coming from different operator places.

Design, COMCON

This main type COMCON is used one per apparatus and has no variants.

Application, SWICON

The purpose of this function block SWICON is to handle and supervise select-before-execute commands and be an interface to the process.

Design, SWICON

This main type SWICON is used one per apparatus and is available in three variants:

SWICONA: Used for connection to an internal synchro-check function and position indications for three poles. Normally used for circuit breakers.

SWICONB: Used for connection to an external synchro-check function and position indications for three poles. Normally used for circuit breakers.

SWICONC: Used for position indication of a single pole. Normally used for disconnectors and earthing switches.

Application, BLKCON

The purpose of this function block BLKCON is to be used for different kinds of blockings. The status of the function will return after a power interruption to the state it had before.

Desgin, BLKCON

This main type BLKCON is available in two variants:

BLKCONK: Normally used per bay.

BLKCONL: Normally used per apparatus.

Interlocking, common

Appliction

The interlocking function blocks the possibility to operate high voltage switching devices, for instance when a disconnector is under load, in order to prevent material damage and/or accidental human injury.

Each control terminal has interlocking functions for different switchyard arrangements, each handling interlocking of one bay. The function is distributed to each control terminal and not dependent on any central function. For the station-wide interlocking, the control terminals communicate via the system-wide interbay bus or by using hardwired binary inputs/outputs.

The interlocking conditions depend on the circuit configuration and status of the installation at any given time.

Design
For easy and safe implementation of the interlocking function, the control terminal is delivered with standardized and tested software interlocking modules containing logic for the interlocking conditions. The interlocking conditions can be altered, to meet the customer's specific requirements, by adding configurable logic by means of the graphical configuration tool CAP 531.

The input signals EXDU_xxx shall be set to true if there is no transmission error at transfer of information from another bay. The signal is generated from the data valid output in the command function block, that receives the transferred information.

The input signals EXVVA_xx are always set to true, because the interlocking software is always running in our applications.

The inputs QxEXy are used for delivery specific conditions to be added to the standard modules if required.

Required signals with designations ended with TR are intended to be transferred to other bays.

Interlocking for line bay (ABC_LINE)

Application
The interlocking module ABC_LINE is used for a line connected to a double busbar arrangement with a transfer busbar according to figure 1. The module can also be used for a double busbar arrangement without transfer busbar or a single busbar arrangement with/without transfer busbar.

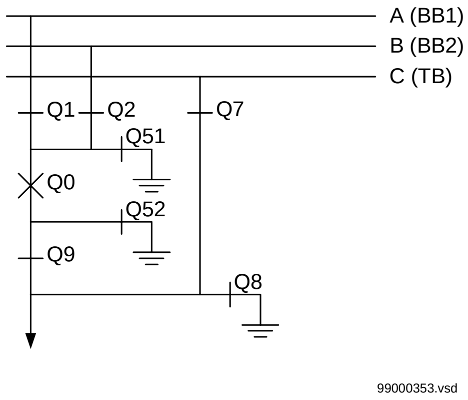

Figure 1: Switchyard layout ABC_LINE

Design
The figure "Switchyard layout ABC_LINE" shows the designations of the apparatuses that can be dealt with by the ABC_LINE.

Interlocking for bus coupler bay (ABC_BC)

Appliction
The interlocking module ABC_BC is used for a bus-coupler bay connected to a double busbar arrangement according to figure 2. The module can also be used for a single busbar arrangement with transfer busbar or double busbar arrangement without transfer busbar.

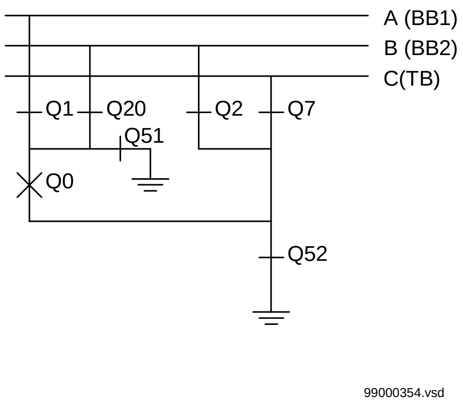

Figure 2: Switchyard layout ABC_BC

Design
The figure "Switchyard layout ABC_BC" shows the designations of the apparatuses that can be dealt with by the ABC_BC.

Interlocking for transformer bay (AB_TRAFO)

The interlocking module AB_TRAFO is used for a transformer bay connected to a double busbar arrangement according to figure 3.

The module is used when there is no disconnector between circuit breaker and transformer. Otherwise, the module ABC_LINE can be used. This module can also be used for a single busbar arrangement.

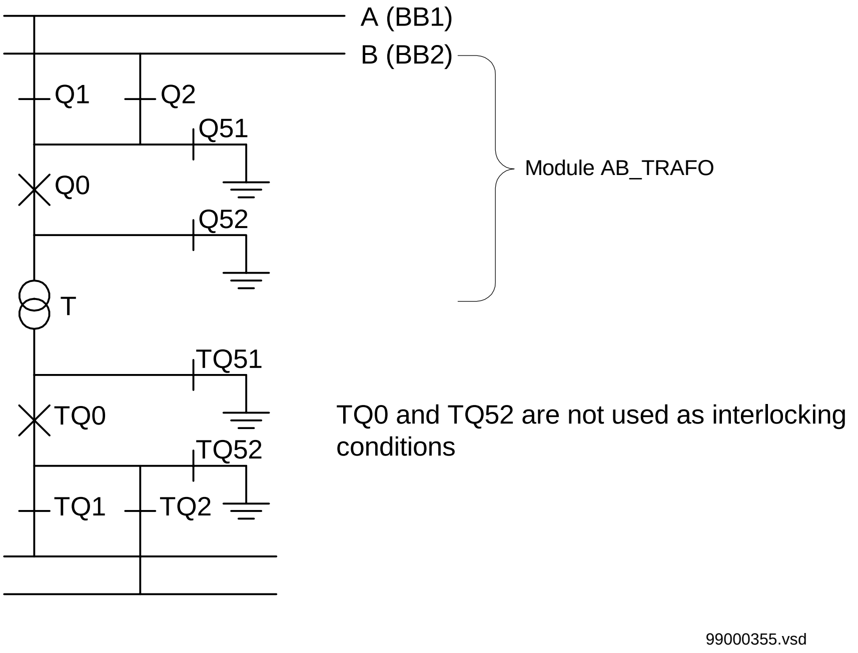

Figure 3: Switchyard layout AB_TRAFO

Interlocking for bus-section breaker (A1A2_BS)

Application

The interlocking module A1A2_BS is used for one bus-section circuit breaker between section A1 and A2 according to figure 4. The module can be used for different busbars, which includes a bus-section circuit breaker, that is, not only busbar A.

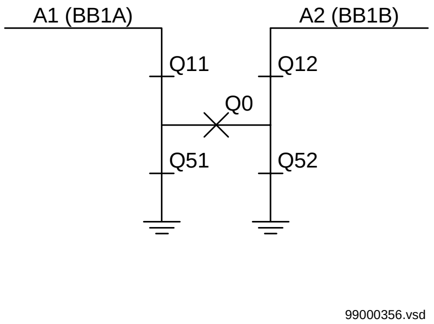

Figure 4: Switchyard layout A1A2_BS

Design

The figure “Switchyard layout A1A2_BS” shows the designations of the apparatuses that can be dealt with by the A1A2_BS.

Interlocking for bus-section desconnector (A1A2_DC)

Application

The interlocking module A1A2_DC is used for one bus-section disconnector between section A1 and A2 according to figure 5. The module can be used for different busbars, which includes a bus-section disconnector, that is, not only busbar A.

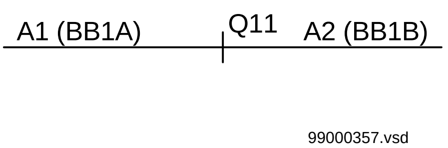

Figure 5: Switchyard layout A1A2_DC

Design
The figure “Switchyard layout A1A2_DC” shows the designations of the apparatuses that can be dealt with by the A1A2_DC.

Interlocking for busbar earthing switch (BB_ES)

Application
The interlocking module BB_ES is used for one busbar earthing switch on any busbar parts according to figure 6.

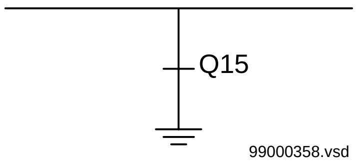

Figure 6: Switchyard layout BB_ES

Design
The figure “Switchyard layout BB_ES” shows the designation of the apparatus that can be dealt with by the BB_ES.

Interlocking for double CB bay (DB)

Application
The interlocking modules DB_BUS_A, DB_LINE and DB_BUS_B are used for a line connected to a double circuit breaker arrangement according to figure 7.

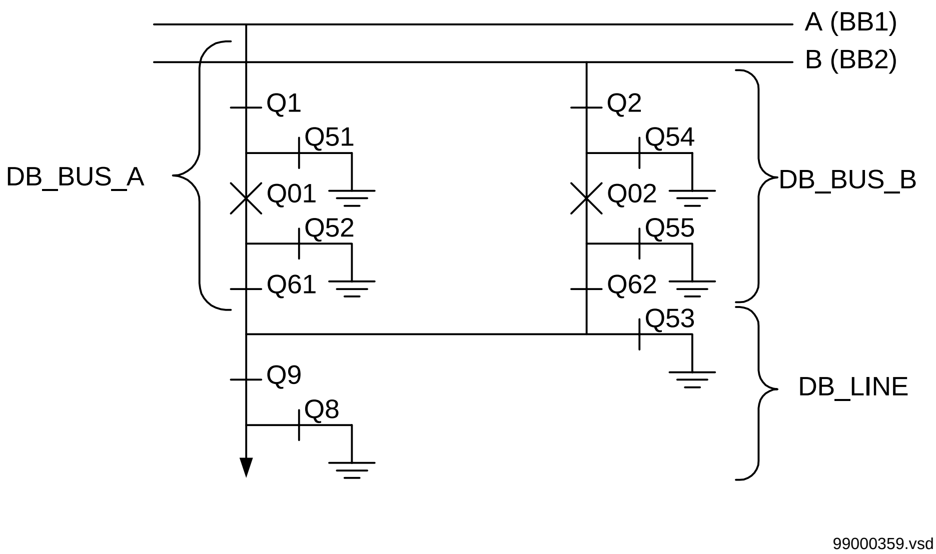

Figure 7: Switchyard layout double circuit breaker

Design
Two types of interlocking modules per double circuit breaker bay are defined. DB_LINE is the connection from the line to the circuit breaker parts that are connected to the busbar. DB_BUS_A/B is the connection from DB_LINE to one busbar and is used for each busbar. The figure “Switchyard layout double circuit breaker” shows the designations of the apparatuses that can be dealt with by these modules.

Interlocking for 1 1/2 CB diameter (HB_)

Application
The interlocking modules BH_LINE_A, BH_CONN and BH_LINE_B are used for lines connected to a breaker-and-a-half diameter according to figure 8.

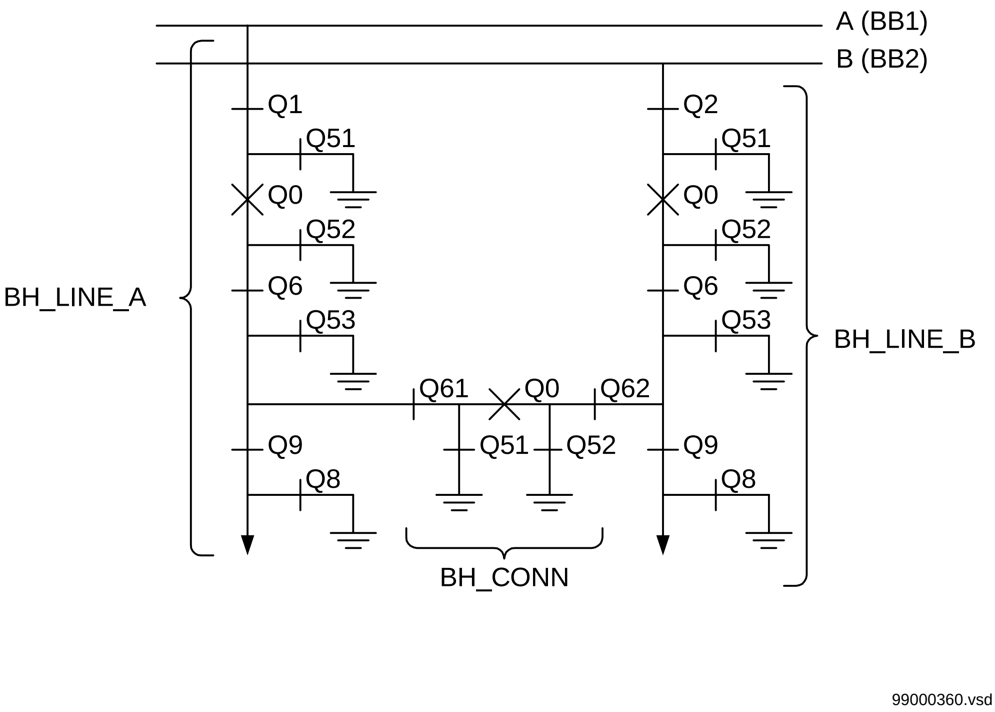

Figure 8: Switchyard layout breaker-and-a-half

Design
Two types of interlocking modules per diameter are defined. BH_LINE_A/B is the connection from one line to the busbar and is used twice per diameter. BH_CONN is the connection between the two lines of the diameter. The figure “Switchyard layout breaker-and-a-half” shows the designations of the apparatuses that can be dealt with by these modules.

Logic

Trip logic (TR)

Application
The main purpose of the TR trip logic function is to serve as a single node through which all tripping for the entire terminal is routed.

The main purpose of the single- and two-pole extension to the basic three-pole tripping function is to cater for applications where, for reasons of system stability, single-pole tripping is required for single-phase faults, and/or two-pole tripping is required for two-phase faults, e.g. on double circuit parallel lines.

Functionality
The minimum duration of a trip output signal from the TR function is settable.

The TR function has a single input through which all trip output signals from the protection functions within the terminal, or from external protection functions via one or more of the terminal’s binary inputs, are routed. It has a single trip output for connection to one or more of the terminal’s binary outputs, as well as to other functions within the terminal requiring this signal.

The expanded TR function for single- and two-pole tripping has additional phase segregated inputs for this, as well as inputs for faulted phase selection. The latter inputs enable single- and two-pole tripping for those functions which do not have their own phase selection capability, and therefore which have just a single trip output and not phase segregated trip outputs for routing through the phase segregated trip inputs of the expanded TR function. The expanded TR function has two inputs for these functions, one for impedance tripping (e.g. carrier-aided tripping commands from the scheme communication logic), and one for earth fault tripping (e.g. tripping output from a residual overcurrent protection). Additional logic secures a three-pole final trip command for these protection functions in the absence of the required phase selection signals.

The expanded TR function has three trip outputs, one per phase, for connection to one or more of the terminal's binary outputs, as well as to other functions within the terminal requiring these signals.

The expanded TR function is equipped with logic which secures correct operation for evolving faults as well as for reclosing on to persistent faults. A special input is also provided which disables single- and two-pole tripping, forcing all tripping to be three-pole.

Pole discordance protection (PD)

Application
Breaker pole position discordance can occur on the operation of a breaker with independent operating gears for the three poles. The reason may be an interruption in the closing or trip coil circuit, or a mechanical failure resulting in a stuck breaker pole. A pole discordance can be tolerated for a limited time, for instance during a single-phase trip-reclose cycle. The pole discordance function detects a breaker pole discordancy not generated by auto-reclose cycle and issues a trip signal for the circuit breaker.

Functionality
The operation of the pole discordance logic, PD, is based on checking the position of the breaker auxiliary contacts. Three parallel normally open contacts in series with three normally closed contacts in parallel of the respective breaker poles form a condition of pole discordance, connected to a binary input dedicated for the purpose.

In addition, there is an automatic detection criterion based on comparison of currents in the breaker poles. This function is enabled for just a few seconds after close or trip commands to the breaker in order to avoid unwanted operation in unsymmetrical load conditions.

Binary signal transfer to remote end (RTC)

General
In this function, there are two function blocks, RTC1-, and RTC2-. They are identical in all aspects.

Application
The main purpose of the RTC binary signal transfer to remote end function is the exchange of communication scheme related signals, trip signals and/or other binary signals between opposite ends of the line.

Functionality
The RTC function comprises two identical function blocks, each able to handle up to 16 inputs and 16 outputs, giving a total of 32 signals that can be transmitted in each direction.

The updated status of the selected binary signals is packaged within a data message which is sent once every computation loop.

Serial communication

Application
One or two optional optical serial interfaces, one with LON protocol and the other with SPA or IEC 60870-5-103 protocol, for remote communication, enables the terminal to be part of a Substation Control System (SCS) and/or Substation Monitoring System (SMS). These interfaces are located at the rear of the terminal. The two interfaces can be configured independent of each other, each with different functionalities regarding monitoring and setting of the functions in the terminal.

Serial communication, SPA (SPA-bus V 2.4 protocol)

Application
This communication bus is mainly used for SMS. It can include different numerical relays/terminals with remote communication possibilities. Connection to a personal computer (PC) can be made directly (if the PC is located in the substation) or by telephone modem through a telephone network with CCITT characteristics.

Functionality
When communicating with a PC, using the rear SPA port, the only hardware needed for a station monitoring system is optical fibres and opto/electrical converter for the PC. Remote communication over the telephone network also requires a telephone modem. The software needed in the PC when using SPA, either locally or remotely, is SMS 510 or/and CAP 540.

SPA communication is applied when using the front communication port, but for this purpose, no special serial communication function is required in the terminal. Only the software in the PC and a special cable for front connection is needed.

Serial communication, IEC (IEC 60870-5-103 protocol)

Application

This communication protocol is mainly used when a protection terminal communicates with a third party control system. This system must have a program that can interpret the IEC 60870-5-103 communication messages.

Functionality

As an alternative to the SPA communication the same port can be used for the IEC communication. The IEC 60870-5-103 protocol implementation in REx 5xx consists of these functions:

- Event handling
- Report of analog service values (measurements)
- Fault location
- Command handling
  - Autorecloser ON/OFF
  - Teleprotection ON/OFF
  - Protection ON/OFF
  - LED reset
  - Characteristics 1 - 4 (Setting groups)
- File transfer (disturbance files)
- Time synchronization

The events created in the terminal available for the IEC protocol are based on the event function blocks EV01 - EV06 and disturbance function blocks DRP1 - DRP3. The commands are represented in a dedicated function block ICOM. This block has output signals according to the IEC protocol for all commands.

Serial communication, LON

Application

An optical network can be used within the Substation Automation system. This enables communication with the terminal through the LON bus from the operator's workplace, from the control center and also from other terminals.

Functionality

An optical serial interface with LON protocol enables the terminal to be part of a Substation Control System (SCS) and/or Substation Monitoring System (SMS). This interface is located at the rear of the terminal. The hardware needed for applying LON communication depends on the application, but one very central unit needed is the LON Star Coupler and optic fibres connecting the star coupler to the terminals. To communicate with the terminals from a Personal Computer (PC), the SMS 510, software or/and the application library LIB 520 together with MicroSCADA is needed.

Event function (EV)

Application

When using a Substation Automation system, events can be spontaneously sent or polled from the terminal to the station level. These events are created from any available signal in the terminal that is connected to the event function block. The event function block can also handle double indication, that is normally used to indicate positions of high-voltage apparatuses. With this event function block, data also can be sent to other terminals over the interbay bus.

Functionality

As basic, 12 event function blocks EV01-EV12 running with a fast cyclicity, are available in REx 5xx. When the function Apparatus control is used in the terminal, additional 32 event function blocks EV13-EV44, running with a slower cyclicity, are available.

Each event function block has 16 connectables corresponding to 16 inputs INPUT1 to INPUT16. Every input can be given a name with up to 19 characters from the CAP 540 configuration tool.

The inputs can be used as individual events or can be defined as double indication events.

The inputs can be set individually, from the Parameter Setting Tool (PST) under the Mask-Event function, to create an event at pick-up, drop-out or at both pick-up and drop-out of the signal.

The event function blocks EV01-EV06 have inputs for information numbers and function type, which are used to define the events according to the communication standard IEC 60870-5-103.

Event counter (CN)

Application
The function consists of six counters which are used for storing the number of times each counter has been activated. It is also provided with a common blocking function for all six counters, to be used for example at testing. Every counter can separately be set on or off by a parameter setting.

Functionality
The function block has six inputs for increasing the counter values for each of the six counters respectively. The content of the counters are stepped one step for each positive edge of the input respectively.

The function block also has an input BLOCK. At activation of this input all six counters are blocked.

Monitoring

Led indication function (HL, HLED)

Application
Each LED indication on the HMI LED module can be set individually to operate in six different sequences; two as follow type and four as latch type. Two of the latching types are intended to be used as a protection indication system, either in collecting or re-starting mode, with reset functionality. The other two are intended to be used as a signaling system in collecting mode with an acknowledgment functionality.

Functionality
The LED indication function consists of one common function block named HLED and one function block for each LED named HL01, HL02,..., HL18.

The color of the LEDs can be selected in the function block to red, yellow or green individually. The input signal for an indication has separate inputs for each color. If more than one color is used at the same time, the following priority order is valid; red, yellow and green, with red as highest priority.

The information on the LEDs is stored at loss of the auxiliary power for the terminal, so that the latest LED picture appears immediately after the terminal has restarted succesfully.

Disturbance report (DRP)

Application
Use the disturbance report to provide the network operator with proper information about disturbances in the primary network. The function comprises several subfunctions enabling different types of users to access relevant information in a structured way.

Select appropriate binary signals to trigger the red HMI LED to indicate trips or other important alerts.

Functionality
The disturbance report collects data from each subsystem for up to ten disturbances. The data is stored in nonvolatile memory, used as a cyclic buffer, always storing the latest occurring disturbances. Data is collected during an adjustable time frame, the collection window. This window allows for data collection before, during and after the fault.

The collection is started by a trigger. Any binary input signal or function block output signal can be used as a trigger. The analog signals can also be set to trigger the data collection. Both over levels and under levels are available. The trigger is common for all subsystems, hence it activates them all simultaneously.

A triggered report cycle is indicated by the yellow HMI LED, which will be lit. Binary signals may also be used to activate the red HMI LED for additional alerting of fault conditions. A disturbance report summary can be viewed on the local HMI.

Indications

Application
Use the indications list to view the state of binary signals during the fault. All binary input signals to the disturbance report function are listed.

Functionality
The indications list tracks zero-to-one changes of binary signals during the fault period of the collection window. This means that constant logic zero, constant logic one or state changes from logic one to logic zero will not be visible in the indications list. Signals are not time tagged. In order to be listed in the indications list the:

1. signal must be connected to the DRP function block.
2. setting parameter, IndicationMask, for the input must be set to Show.

Output signals of other function blocks of the configuration will be listed by the signal name listed in the corresponding signal list. Binary input signals are listed by the name defined in the configuration.

The indications can be viewed on the local HMI and via SMS.

Disturbance recorder

Application

Use the disturbance recorder to record analog and binary signals during fault conditions in order to analyze disturbances. The analysis may include fault severity, fault duration and protection performance. Replay the recorded data in a test set to verify protection performance.

Functionality

The disturbance recorder records both analog and binary signal information.

Analog and digital signals can be used as triggers. A trigger signal does not need to be recorded.

A trigger is generated when the analog signal moves under and/or over set limit values. The trig level is compared to the signal's average peak-to-peak value, making the function insensible to DC offset. The trig condition must occur during at least one full period, that is, 20 ms for a 50 Hz network.

The recorder continuously records data in a cyclic buffer capable of storing the amount of data generated during the set pre-fault time of the collection window. When triggered, the pre-fault data is saved and the data for the fault and post-fault parts of the collection window is recorded.

The RAM area for temporary storage of recorded data is divided into subareas, one for each recording. The size of a subarea depends on the set recording times. There is sufficient memory for four consecutive recordings with a maximum number of analog channels recorded and with maximum time settings. Should no subarea be free at a new disturbance, the oldest recording is overwritten.

When a recording is completed, the post recording process:

- merges the data for analog channels with corresponding data for binary signals stored in an event buffer
- compresses the data without loosing any data accuracy
- stores the compressed data in a non-volatile memory

The disturbance recordings can be viewed via SMS or SCS.

Event recorder

Application

Use the event recorder to obtain a list of binary signal events that occurred during the disturbance.

Functionality

When a trigger condition for the disturbance report is activated, the event recorder collects time tagged events from the 48 binary signals that are connected to disturbance report and lists the changes in status in chronological order. Each list can contain up to 150 time tagged events that can come from both internal logic signals and binary input channels. Events are recorded during the total recording time which depends on the set recording times and the actual fault time.

Events can be viewed via SMS and SCS.

Trip value recorder

Application

Use the trip value recorder to record fault and prefault phasor values of voltages and currents to be used in detailed analysis of the severity of the fault and the phases that are involved. The recorded values can also be used to simulate the fault with a test set.

Functionality

Pre-fault and fault phasors of currents and voltages are filtered from disturbance data stored in digital sample buffers.

When the disturbance report function is triggered, the function looks for non-periodic change in the analog channels. Once the fault interception is found, the function calculates the pre-fault RMS values during one period starting 1,5 period before the fault interception. The fault values are calculated starting a few samples after the fault interception and uses samples during 1/2 - 2 periods depending on the waveform.

If no error sample is found the trigger sample is used as the start sample for the calculations. The estimation is based on samples one period before the trigger sample. In this case the calculated values are used both as pre-fault and fault values.

The recording can be viewed on the local HMI or via SMS.

Monitoring of AC analogue measurements

Application
Use the AC monitoring function to provide three phase or single phase values of voltage and current. At three phase measurement, the values of apparent power, active power, reactive power, frequency and the RMS voltage and current for each phase are calculated. Also the average values of currents and voltages are calculated.

Functionality
Alarm limits can be set and used as triggers, e.g. to generate trip signals.

The software functions to support presentation of measured values are always present in the terminal. In order to retrieve actual values, however, the terminal must be equipped with the appropriate hardware measuring module(s), i.e. Transformer Input Module (TRM) or Optical Receiver Module (ORM).

Monitoring of DC analogue measurements

Application
Use the DC monitoring function to measure and process signals from different measuring transducers. Many devices used in process control uses low currents, usually in the range 4-20 mA or 0-20 mA to represent various parameters such as frequency, temperature and DC battery voltage.

Functionality
Alarm limits can be set and used as triggers, e.g. to generate trip signals.

The software functions to support presentation of measured values are always present in the terminal. In order to retrieve actual values, however, the terminal must be equipped with the mA Input Module (MIM).

Increased measuring accuracy

Application
Select the increased accuracy option to increase the measuring accuracy of analog input channels, thus also increasing the accuracy of calculated quantities such as frequency, active and reactive power.

Functionality
The increased accuracy is reached by a factory calibration of the hardware. Calibration factors are stored in the terminal. If the transformer input module, A/D conversion module or the main processing module is replaced, the terminal must be factory calibrated again to retain the increased accuracy.

Metering

Pulse counter logic (PC)

Application
The pulse counter logic function counts externally generated binary pulses, for instance pulses coming from an external energy meter, for calculation of energy consumption values. The pulses are captured by the binary input module and then read by the pulse counter function. The number of pulses in the counter is then reported via LON to the station control system or read via SPA from the station monitoring system as a service value.

Functionality
Up to 12 inputs located on binary input modules can be used for counting of pulses with a frequency of up to 40 Hz. The registration of pulses is done for positive transitions (0 to 1) on any of the 16 binary input channels on the input module.

Pulse counter values are read from the operator workplace with predefined cyclicity without reset. The integration time period can be set in the range from 30 seconds to 60 minutes and is synchronized with absolute system time.

The counter value is a 32-bit, signed integer with a range 0...+2147483647. The reported value over the communication bus contains Identity, Value, Time and Pulse Counter Quality.

Hardware modules

Modules

Modules

Table 1: Basic, always included, modules

Module	Description
Backplane module	The size of the module depends on the size of the case.
Power supply module (PSM)	Available in two different versions, each including a regulated DC/DC converter that supplies auxiliary voltage to all static circuits. • For case size 1/2x19" and 3/4x19" a version with four binary inputs and four binary outputs are used. An internal fail alarm output is also available. • For case size 1/1x19" a version without binary I/O:s and increased output power is used.
Main processing module (MPM)	Module for overall application control. All information is processed or passed through this module, such as configuration, settings and communication.
Human machine interface (LCD-HMI)	The module consist of LED:s, a LCD, push buttons and an optical connector for a front connected PC

Table 2: Application specific modules

Module	Description
Signal processing module (SPM)	Module for protection algorithm processing. Carries up to 12 digital signal processors, performing all measuring functions.
Milliampere input module (MIM)	Analog input module with 6 independent, galvanically separated channels.
Binary input module (BIM)	Module with 16 optically isolated binary inputs
Binary output module (BOM)	Module with 24 single outputs or 12 double-pole command outputs including supervision function
Binary I/O module (IOM)	Module with 8 optically isolated binary inputs, 10 outputs and 2 fast signalling outputs.
Data communication modules (DCMs)	Modules used for digital communication to remote terminal.
Transformer input module (TRM)	Used for galvanic separation of voltage and/or current process signals and the internal circuitry.
A/D conversion module (ADM)	Used for analog to digital conversion of analog process signals galvanically separated by the TRM.

Module	Description
Optical receiver module (ORM)	Used to interface process signals from optical instrument transformers.
Serial communication module (SCM)	Used for SPA/LON/IEC communication
LED module (LED-HMI)	Module with 18 user configurable LEDs for indication purposes

Transformer input module (TRM)

Functionality

A transformer input module can have up to 10 input transformers. The actual number depends on the type of terminal. Terminals including only current measuring functions only have current inputs. Fully equipped the transformer module consists of:

- Five voltage transformers
- Five current transformers

The inputs are mainly used for:

- Phase currents
- Residual current of the protected line
- Residual current of the parallel circuit (if any) for compensation of the effect of the zero sequence mutual impedance on the fault locator measurement or residual current of the protected line but from a parallel core used for CT circuit supervision function or independent earth fault function.
- Phase voltages
- Open delta voltage for the protected line (for an optional directional earth-fault protection)
- Phase voltage for an optional synchronism and energizing check.

A/D-conversion module (ADM)

Functionality

The inputs of the A/D-conversion module (ADM) are fed with voltage and current signals from the transformer module. The current signals are adapted to the electronic voltage level with shunts. To gain dynamic range for the current inputs, two shunts with separate A/D channels are used for each input current. By that a 16-bit dynamic range is obtained with a 12 bits A/D converter.

The input signals passes an anti aliasing filter with a cut-off frequency of 500 Hz.

Each input signal (5 voltages and 5 currents) is sampled with a sampling frequency of 2 kHz.

The A/D-converted signals are low-pass filtered with a cut-off frequency of 250 Hz and down-sampled to 1 kHz in a digital signal processor (DSP) before transmitted to the main processing module.

Binary I/O capabilities

Application

Input channels with high EMI immunity can be used as binary input signals to any function. Signals can also be used in disturbance or event recording. This enables extensive monitoring and evaluation of the operation of the terminal and associated electrical circuits.

Functionality

Inputs are designed to allow oxide burn-off from connected contacts, and increase the disturbance immunity during normal protection operate times. This is achieved with a high peak inrush current while having a low steady-state current. Inputs are debounced by software.

Well defined input high and input low voltages ensures normal operation at battery supply earth faults.

The voltage level of the inputs is selected when ordering.

I/O events are time stamped locally on each module for minimum time deviance and stored by the event recorder if present.

Binary input module (BIM)

Application

Use the binary input module, BIM, when a large amount of inputs are needed. The BIM is available in two versions, one standard and one with enhanced pulse counting inputs to be used with the pulse counter function.

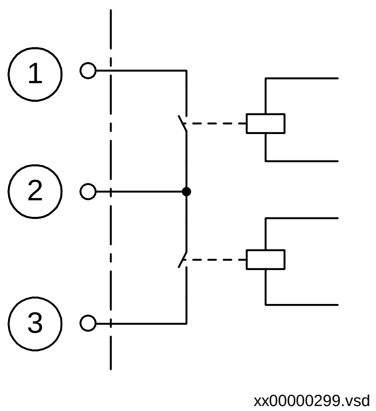
Functionality
The binary input module, BIM, has 16 optically isolated binary inputs.

A signal discriminator detects and blocks oscillating signals. When blocked, a hysteresis function may be set to release the input at a chosen frequency, making it possible to use the input for pulse counting. The blocking frequency may also be set.

Binary output module (BOM)

Application
Use the binary output module, BOM, for trip output or any signalling purpose when a large amount of outputs is needed.

Functionality
The binary output module, BOM, has 24 software supervised output relays, pairwise connected to be used as single-output channels with a common or as command output channels.



1	Output connection from relay 1
2	Common input connection
3	Output connection from relay 2

Figure 9: Relay pair example

I/O module (IOM)

Application
Use the binary I/O module, IOM, when few input and output channels are needed. The ten output channels are used for trip output or any signalling purpose. The two high speed signal output channels are used for applications where short operating time is essential, for example time synchronization.

Functionality
The binary I/O module, IOM, has eight optically isolated inputs and ten output relays. One of the outputs has a change-over contact. The nine remaining output contacts are connected in two groups. One group has five contacts with a common and the other group has four contacts with a common, to be used as single-output channels.

The binary I/O module also has two high speed output channels where a reed relay is connected in parallel to the standard output relay.

Note: The making capacity of the reed relays are limited.

mA input module (MIM)

Application
Use the milliampere input module, MIM, to interface transducer signals in the +/-20 mA range from for example temperature and pressure transducers.

Functionality
The milliampere input module has six input channels, each with a separate protection and filter circuit, A/D converter and optically isolated connection to the backplane.

The digital filter circuits have individually programmable cut-off frequencies, and all parameters for filtering and calibration are stored in a nonvolatile memory on the module. The calibration circuitry monitors the module temperature and commences an automatical calibration procedure if the temperature drift increase outside the allowed range. The module uses the serial CAN bus for backplane communication.

Signal events are time stamped locally for minimum time deviance and stored by the event recorder if present.

Power supply module (PSM)

Application
The 20 W power supply module, PSM, with built in binary I/O is used in 1/2 and 3/4 of full width 19” units. It has four optically isolated binary inputs and five binary outputs, out of which one binary output is dedicated for internal fail.

The 30 W power supply module, PSM, is used to provide power for the extended number of modules in a full width 19” unit. It has one binary output dedicated to internal fail.

Functionality

The power supply modules contain a built-in, self-regulated DC/DC converter that provides full isolation between the terminal and the battery system.

The 20 W power supply module, PSM, has four optically isolated binary inputs and four output relays.

Human machine interface module (HMI)

Application

The human machine interface is used to monitor and in certain aspects affect the way the product operates. The configuration designer can add functions for alerting in case of important events that needs special attention from you as an operator.

Use the terminals built-in communication functionality to establish SMS communication with a PC with suitable software tool.

Connect the PC to the optical connector on the local HMI with the special front communication cable including an opto-electrical converter for disturbance free and safe communication.

LED Indication module (HMI-LED)

Application

The LED indication module is an additional feature for the REx 5xx terminals for protection and control and consists totally of 18 LEDs (Light Emitting Diodes). The main purpose is to present on site an immediate visual information such as protection indications or alarm signals. It is located on the front of the protection and control terminals.

Functionality

The human-machine interface consists of:

- the human-machine interface (HMI) module.
- the LED module.

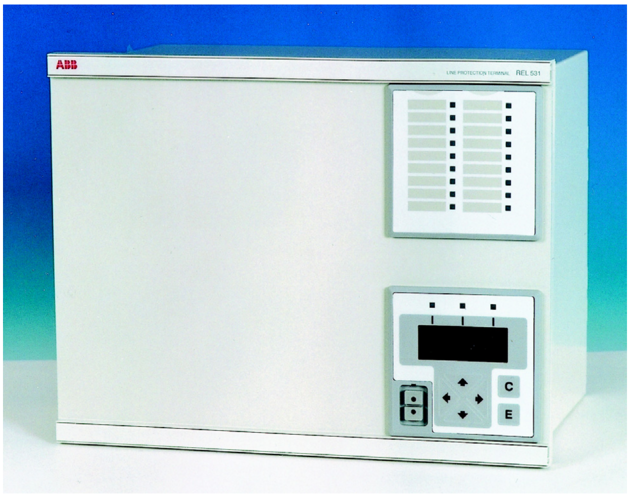


Figure 10: The figure shows the LED (upper) and the HMI (lower).

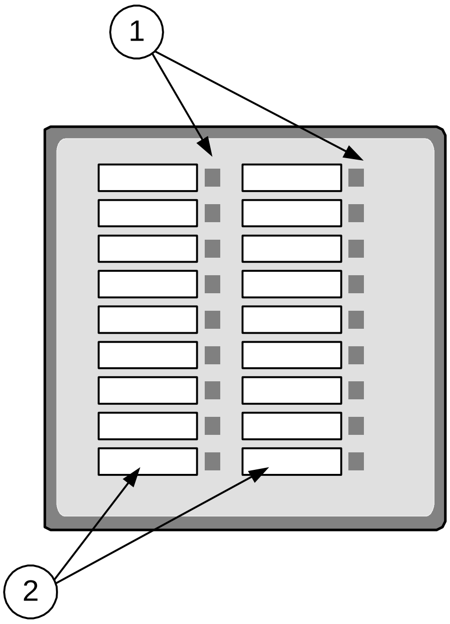
The LED indication module is equipped with 18 LEDs, which can light or flash in either red, yellow or green color. A description text can be added for each of the LEDs.

See LED indication function (HL, HLED) for details on application and functionality.



1	Three-color LEDs
2	Descriptive label, user exchangeable

Figure 11: The LED module

Optical receiver module (ORM)

Application

The optical receiver module (ORM) is used to interface signals from optical instrument transformers (OITP) to the terminal. The ORM module can replace the conventional analog input modules. Either 50 or 60 Hz signals is handled by the module. Only one of the frequencies must be selected and used for all inputs.

Functionality

The optical receiver module has four optical input channels that handles data from optical instrument transformers (OITP). It converts the OITP data to a format used in the terminal. The received data is processed in different ways depending on the setting of the eight pole dip-switch of the module.

Serial communication modules (SCM)

Functionality, SPA/IEC

The serial communication module for SPA/IEC is placed in a slot at the rear part of the main processing module. The serial communication module can have connectors for two plastic fibre cables or two glass fibre cables.The incoming optical fibre is connected to the RX receiver input and the outgoing optical fibre to the TX transmitter output. When the fibre optic cables are laid out, pay special attention to the instructions concerning the handling, connection, etc. of the optical fibres. The module is identified with a number on the label on the module.

Functionality, LON

The serial communication module for LON is placed in a slot at the rear part of the Main processing module. The serial communication module can have connectors for two plastic fibre cables or two glass fibre cables The incoming optical fibre is connected to the RX receiver input and the outgoing optical fibre to the TX transmitter output. Pay special attention to the instructions concerning the handling, connection, etc. of the optical fibres. The module is identified with a number on the label on the module.

Data communication modules

Application

The remote terminal communication modules are used both for differential line protection applications and for binary transfer of up to 32 signals to remote end (RTC), for example for distance protections. The following hardware modules are available:

- V.36
- X.21
- RS530
- G.703
- Short-range galvanic module
- Fibre optical communication module
- Short-range fibre optical module

The galvanic data communication modules according to V.36, X.21 and RS530 can be used for galvanic short range communication covering distances up to 100 m in low noise environment. Only contra-directional operation is recommended in order to get best system performance.These modules are designed for 64 kbit/s operation but can also be used at 56 kbit/s.

The galvanic data communication module according to G.703 is not recomended for distances above 10 m. Special attention must be paid to avoid problems due to noise interference. This module is designed only for 64 kbit/s operation.

The short-range galvanic module can be used for communication over galvanic pilot wires and can operate up to distances between 0,5 and 4 km depending on pilot wire cable. Twisted-pair, double-screened cable is recommended.

The fibre optical communication module can be used both with multi-mode and single-mode fibres.The communication distance can typically be up to 30 km for single mode fibre, with high quality fibres even longer. This interface can also be used for direct connection to communication equipment of type FOX from ABB.

The short-range fibre optical module can only be used with multi-mode fibre .The communication distance can normally be up to 5 km. This module can also be used for direct connection to communication equipments of type 21-15xx and 21-16xx from FIBERDATA

Front communication

Application

The special front connection cable is used to connect a PC COM-port to to the optical contact on the left side of the local HMI.

Functionality

The cable includes an optical contact, an opto/electrical converter and an electrical cable with a standard 9-pole D-sub contact. This ensures a disturbance immune and safe communication with the terminal.

Technical data

General

Definitions

Reference value:

The specified value of an influencing factor to which are referred the characteristics of the equipment.

Nominal range:

The range of values of an influencing quantity (factor) whithin which, under specified conditions, the equipment meets the specified requirements.

Operative range:

The range of values of a given energizing quantity for which the equipment, under specified conditions, is able to perform its intended functions according to the specified requirements.

Temp. corresponding to the MI11-1_Min setting MI11-MinValue	-1000 - 1000° C in steps of 1 °C	+/- 1% of set value +/- 1°C

Table 26: BFP - Breaker failure protection

Parameter	Setting range	Accuracy
Operate current (one measuring element per phase)	5-200% of I1b in steps of 1%	+/-2.5% of I_r at $I \leq I_r$ +/-2.5% of I at $I > I_r$
Retrip time delay t1	0.000-60.000 s in steps of 1 ms	+/-0.5% +/-10 ms
Back-up trip time delay t2	0.000-60.000 s in steps of 1 ms	+/-0.5% +/-10 ms

Parameter	Value
Trip operate time	Max 18 ms
Reset time	Max 10 ms

Table 27: TEF - Independent and dependent time delayed residual protection function

Parameter		Setting range	Accuracy
Start current, definite time or inverse time delay I_N		5-300% of I_r in steps of 1%	+/-5% of set value
Operate value for directional current measurement	Forward I_N at φ=65 degrees	5-35% of I_r in steps of 1%	+/-1.5% of I_r
	Reverse	60% of the setting for forward operation	+/-1.5% of I_r
Definite time delay		0.000 - 60.000 s in steps of 1ms	+/- 0.5 % +/-10 ms
Time multiplier for inverse time delay k		0.05-1.10 in steps of 0.01	According to IEC 60255-3
Normal inverse characteristic $I = I_{meas}/I_{set}$		$t = \frac{0.14}{I^{0.02} - 1} \cdot k$	IEC 60255-3 class 5 +/- 60 ms
Very inverse characteristic		$t = \frac{13.5}{I - 1} \cdot k$	IEC 60255-3 class 7.5 +/- 60 ms

Parameter	Setting range	Accuracy
Extremely inverse characteristic	$t = \frac{80}{I^2 - 1} \cdot k$	IEC 60255-3 class 7.5 +/- 60 ms
Min. operate current for dependent characteristic	100-400% of IN in steps of 1%	+/-5% of I_{set}
Minimum operate time	0.000-60.000 s in steps of 1 ms	+/- 0.5 % +/-10 ms
Characteristic angles	65 degrees lagging	+/-5 degrees at 20 V and I_{set}=35% of I_r
Logarithmic characteristic	$t = 5.8\text{-}1.35 \cdot \ln I$	+/- 5 % of t at $I = (1.3\text{-}29) \times 3I_0$
Minimum polarising voltage	1 % of U_r	At 50 Hz: 1% of U_r +/-5% At 60 Hz: 1% of U_r -15% to -5%
Reset time	<70 ms	-

Table 28: EFC - Scheme communication logic for residual overcurrent protection

Parameter	Setting range	Accuracy
Coordination timer	0.000-60.000 s in steps of 1 ms	+/-0.5% +/-10 ms

Table 29: Current reversal and weak end infeed logic for residual overcurrent protection (EFCA)

Parameter	Setting range	Accuracy
Operate voltage for WEI trip	5-70 % of U1b in steps of 1%	+/-5% of U_r
Current reversal pickup timer	0.000-60.000 s in steps of 1 ms	+/-0.5% +/-10 ms
Current reversal delay timer	0.000-60.000 s in steps of 1 ms	+/-0.5% +/-10 ms

Voltage

Table 30: TUV - Time delayed undervoltage protection

Function	Setting range	Accuracy
Operate voltage UPE<	(10-100) % of U1b in steps of 1%	+/- 2.5 % of U_r
Time delay	(0.000-60.000) s in steps of 1ms	+/- 0.5 % +/- 10 ms

Table 31: TOV - Time delayed overvoltage protection

Function		Setting range	Accuracy
Operate voltage U>	Phase measuring elements	(50-200)% of U1b in steps of 1%	+/- 2.5 % of U_r at U U_r +/- 2.5 % of U at U > U_r
Time delay	Phase measuring elements	(0.000-60.000) s in steps of 1ms	+/- 0.5 % +/- 10 ms
Operate voltage 3U0>	Residual measuring elements	(5-100)% of U1b in steps of 1%	+/- 2.5 % of U_r at U ≤ U_r +/- 2.5 % of U at U > U_r
Time delay	Residual measuring elements	(0.000-60.000) s in steps of 1ms	+/- 0.5 % +/- 10 ms

Power system supervision

Table 32: Loss of voltage check

Parameter	Setting range	Accuracy
Operate voltage, U<	10-100% of U1b in steps of 1%	+/-2.5% of U_r

Table 33: DLD - Dead line detection

Function		Setting range	Accuracy
Automatic check of dead line condition	Operate phase current	(5-100) % of I1b in steps of 1%	+/- 2.5 % of I_r
	Operate phase voltage	(10-100) % of U1b in steps of 1%	+/- 2.5 % of U_r

Secondary system supervision

Table 34: FUSE - Fuse failure supervision function

Function		Setting range	Accuracy
Negative-sequence quantities:	Operate voltage $3U_2$	(10 - 50)% of U1b in steps of 1%	+/- 2.5 % of U_r
	Operate current $3I_2$	(10 - 50)% of I1b in steps of 1%	+/- 2.5 % of I_r

Table 35: FUSE - Fuse failure supervision function

Function		Setting range	Accuracy
Zero-sequence quantities:	Operate voltage $3U_0$	(10-50)% of U1b in steps of 1%	+/- 2.5 % of U_r
	Operate current $3I_0$	(10-50)% of I1b in steps of 1%	+/- 2.5 % of I_r

Table 36: Fuse failure supervision function

Function	Setting range	Accuracy
Operate voltage change level	(50-90)% of U1b in steps of 1%	+/-2.5% of Ur
Operate current change level	(10-50)% of I1b in steps of 1%	+/- 2.5% of Ir

Table 37: Voltage transformer supervision

Parameter	Setting range	Accuracy
Residual overvoltage limit, UN>	1.0-80.0% of U1b in steps of 0.1%	+/- 2.5% of U_r
Time delayed operation for start signal, tDelay	0.000-300.000 s in steps of 1 ms	+/- 0.5% +/- 10 ms

Control

Table 38: Phasing check option (specific parameters)

Parameter	Setting range	Accuracy
Frequency difference limit	50-500 mHz in steps of 10 mHz	≤20 mHz
Circuit breaker closing pulse duration	0.000-60.000 s in steps of 1 ms	+/-0.5% +/-10 ms
Circuit breaker closing time	0.000-60.000 s in steps of 1 ms	+/-0.5% +/-10 ms

Parameter	Value
Bus / line voltage frequency range limit	+/-5 Hz from f_r
Bus / line voltage frequency rate of change limit	<0.21 Hz/s

Table 39: AR - Automatic reclosing function

Parameter	Setting range	Accuracy
Automatic reclosing open time:		
shot 1 - t1 1ph	0.000-60.000 s in steps of 1 ms	+/- 0.5% +/- 10 ms
shot 1 - t1 2ph	0.000-60.000 s in steps of 1 ms	+/- 0.5% +/- 10 ms
shot 1 - t1 3ph	0.000-60.000 s in steps of 1 ms	+/- 0.5% +/- 10 ms
shot 2 - t2 3ph	0-90000.0 s in steps of 0.1 s	+/- 0.5% +/- 10 ms
shot 3 - t3 3ph	0-90000.0 s in steps of 0.1 s	+/- 0.5% +/- 10 ms
shot 4 - t4 3ph	0-90000.0 s in steps of 0.1 s	+/- 0.5% +/- 10 ms

Parameter	Setting range	Accuracy
Maximum wait time for OK to close from synchronizing function tSync	0-90000.0 s in steps of 0.1 s	+/- 0.5% +/- 10 ms
Duration of close pulse to circuit breaker tPulse	0.000-60.000 s in steps of 1 ms	+/- 0.5% +/- 10 ms
Duration of reclaim time tReclaim	0-90000.0 s in steps of 0.1 s	+/- 0.5% +/- 10 ms
Inhibit reclosing reset time tInhibit	0.000-60.000 s in steps of 1 ms	+/- 0.5% +/- 10 ms
Maximum trip pulse duration tTrip (longer trip pulse durations will either extend the dead time or interrupt the reclosing sequence)	0.000-60.000 s in steps of 1 ms	+/- 0.5% +/- 10 ms
Maximum wait time for release from Master tWaitForMaster	0-9000.0 s in steps of 0.1 s	+/- 0.5% +/- 10 ms
Wait time following close command before continuing with further reclosing attempts without new start signal if circuit breaker does not close tAutoWait	0.000-60.000 s in steps of 1 ms	+/- 0.5% +/- 10 ms
Time delay before indicating reclosing unsuccessful tUnsuc	0-9000.0 s in steps of 0.1 s	+/- 0.5% +/- 10 ms
Time CB must be closed before AR becomes ready for a reclosing cycle tCBClosed	0.000-60.000 s in steps of 1 ms	+/- 0.5% +/- 10 ms

Table 40: Automatic reclosing function

Parameter	Value
Reclosing shots	1-4
Programs	Three pole trip: 1 Single, two and three pole trip: 6
Number of instances	Up to six depending on terminal type (different terminal types support different CB arrangements and numbers of bays)
Breaker closed before start	5 s

Logic

Table 41: TR - Trip logic

Parameter	Value	Accuracy
Setting for the minimum trip pulse length, tTripMin	0.000 - 60.000 s in steps of 0.001 s	+/-0.5% +/-10 ms

Table 42: PD - Pole discordance, contact and current based

Function	Setting range	Accuracy
Auxiliary-contact-based function - time delay	(0.000-60.000) s in steps of 1 ms	+/- 0.5% +/- 10 ms
Operate current	10% of I1b	+/- 2.5 % of I_r
Time delay	(0.000-60.000) s in steps of 1 ms	+/- 0.5 % +/- 10 ms

Table 43: Serial communication (SPA)

Function	Value
Protocol	SPA
Communication speed	300, 1200, 2400, 4800, 9600, 19200 or 38400 bit/s
Slave number	1 to 899
Remote change of active group allowed	yes/no
Remote change of settings allowed	yes/no
Connectors and optical fibres	glass or plastic

Table 44: Serial communication (LON)

Function	Value
Protocol	LON
Communication speed	1.25 Mbit/s
Connectors and optical fibres	glass or plastic

Table 45: Serial communication (IEC 60870-5-103)

Function	Value
Protocol	IEC 60870-5-103
Communication speed	9600, 19200 bit/s
Connectors and optical fibres	glass or plastic

Table 46: CN - Event counter function

Function	Value
Counter value	0-10000
Max. count up speed	10 pulses/s

Monitoring

Table 47: Disturbance report setting performance

Data	Setting range
Pre-fault time	50-300 ms in steps of 10 ms
Post-fault time	100-5000 ms in steps of 100 ms
Limit time	500-6000 ms in steps of 100 ms
Number of recorded disturbances	Max. 10

Table 48: Disturbance recorder setting performance

Function	Setting range
Overcurrent triggering	0-5000% of Inb in steps of 1%
Undercurrent triggering	0-200% of Inb in steps of 1%
Overvoltage triggering	0-200% of Unb in steps of 1% at 100 V sec.
Undervoltage triggering	0-110% of Unb in steps of 1%

Table 49: Disturbance recorder performance

Data			Value
Number of binary signals			48
Number of analog signals			10
Sampling rate			2 kHz
Recording bandwidth			5-250 Hz
Total recording time with ten analog and 48 binary signals recorded. (The amount of harmonics can affect the maximum storage time)			40 s typically
Voltage channels	Dynamic range		(0.01-2.0) x U_r at 100/200 V sec.
	Resolution		0.1% of U_r
	Accuracy at rated frequency	$U \leq U_r$	2.5% of U_r
		$U > U_r$	2.5% of U
Current channels	Dynamic range	Without DC off-set	$(0.01\text{-}110) \times I_r$
		With full DC off-set	$(0.01\text{-}60) \times I_r$
	Resolution		0.5 % of I_r
	Accuracy at rated frequency	$I \leq I_r$	+/-2.5 % of I_r
		$I > I_r$	+/-2.5 % of I

Table 50: Event recorder

Function		Value
Event buffering capacity	Max. number of events/disturbance report	150
	Max. number of disturbance reports	10

Table 51: Mean values (AC-monitoring)

Function	Nominal range	Accuracy
Frequency	(0.95 - 1.05) x f_r	+/- 0.2 Hz
Voltage (RMS) Ph-Ph	(0.1 - 1.5) x U_r	+/- 2.5% of U_r, at $U \leq U_r$ +/- 2.5% of U, at $U > U_r$
Current (RMS)	(0.2 - 4) x I_r	+/- 2.5% of I_r, at $I \leq I_r$ +/- 2.5% of I, at $I > I_r$
Active power*)	at $\lvert\cos\varphi\rvert \geq 0.9$	+/- 5%
Reactive power*)	at $\lvert\cos\varphi\rvert \leq 0.8$	+/- 7.5%
*) Measured at U_r and 20% of I_r		

Table 52: MIM - mA measuring function

Function	Setting range	Accuracy
mA measuring function	+/- 5, +/- 10, +/- 20 mA 0-5, 0-10, 0-20, 4-20 mA	+/- 0.1 % of set value +/-0.005 mA
Max current of transducer to input	(-25.00 to +25.00) mA in steps of 0.01	
Min current of transducer to input	(-25.00 to +25.00) mA in steps of 0.01	
High alarm level for input	(-25.00 to +25.00) mA in steps of 0.01	
High warning level for input	(-25.00 to +25.00) mA in steps of 0.01	
Low warning level for input	(-25.00 to +25.00) mA in steps of 0.01	
Low alarm level for input	(-25.00 to +25.00) mA in steps of 0.01	
Alarm hysteresis for input	(0-20) mA in steps of 1	
Amplitude dead band for input	(0-20) mA in steps of 1	
Integrating dead band for input	(0.00-1000.00) mA in steps of 0.01	

Table 53: Mean values with increased accuracy (AC-monitoring)

Function	Nominal range	Accuracy
Frequency	(0.95 - 1.05) x f_r	+/- 0.2 Hz
Voltage (RMS) Ph-Ph	(0.8 - 1.2) x U_r	+/- 0.25% of U_r, at U<= U_r +/- 0.25% of U, at U> U_r
Current (RMS)	(0.2 - 2) x I_r	+/- 0.25% of I_r, at I<= I_r +/- 0.25% of I, at I> I_r
Active power	0.8 x U_r < U < 1.2 x U_r 0.2 x I_r < I < 2 x I_r Active power, $\lvert\cos\varphi\rvert$>= 0.9	+/- 0.5% of P_r at P <= P_r *), +/- 0.5% of P at P > P_r *),
*) P_r: Active power at U = U_r , I = Ir and $\lvert\cos\varphi\rvert$= 1		

Metering

Table 54: PC - Pulse counter logic function

Function	Setting range	Accuracy
Input frequency	See Binary Input Module (BIM)	-
Cycle time for pulse counter	30 s, 1 min, 1 min 30 s, 2 min, 2 min 30 s, 3 min, 4 min, 5 min, 6 min, 7 min 30s, 10 min, 12 min, 15 min, 20 min, 30 min, 60 min	+/- 0,1% of set value

Hardware modules

Table 55: Binary inputs

Inputs	RL24	RL48	RL110	RL220
Binary inputs	BIM: 16, IOM: 8, PSM: 4			
Debounce frequency	5 Hz (BIM), 1 Hz (IOM)			
Oscillating signal discriminator.*	Blocking and release settable between 1-40 Hz			
Binary input voltage RL	24/30 VDC +/-20%	48/60 VDC +/-20%	110/125 VDC +/-20%	220/250 VDC +/-20%
Power consumption (max.)	0.05 W/input	0.1 W/input	0.2 W/input	0.4 W/input
*) Only available for BIM				

Table 56: Binary outputs

Function or quantity		Trip and Signal relays	Fast signal relays
Binary outputs		BOM: 24, IOM: 10, PSM: 4	IOM: 2
Max system voltage		250 V AC, DC	250 V AC, DC
Test voltage across open contact, 1 min		1000 V rms	800 V DC
Current carrying capacity	Continuous	8 A	8 A
	1 s	10 A	10 A
Making capacity at inductive load with L/R>10 ms	0.2 s	30 A	0.4 A
	1.0 s	10 A	0.4 A
Breaking capacity for AC, cos φ>0.4		250 V/8.0 A	250 V/8.0 A
Breaking capacity for DC with L/R<40ms		48 V/1 A	48 V/1 A
		110 V/0.4 A	110 V/0.4 A
		220 V/0.2 A	220 V/0.2 A
		250 V/0.15 A	250 V/0.15 A
Maximum capacitive load		-	10 nF

Table 57: MIM - Energizing quantities, rated values and limits

Quantity			Rated value	Nominal range
mA input module	input range		+/- 20 mA	-
	input resistance		R_{in} = 194 ohm	-
	power consumption	each mA-module	≤ 4 W	-
		each mA-input	≤ 0.1 W	-

Table 58: SMS communication via front

Function	Value
Protocol	SPA
Communication speed for the terminals	300, 1200, 2400, 4800, 9600 Kbaud
Slave number	1 to 899
Change of active group allowed	Yes
Change of settings allowed	Yes

Table 59: Optical receiver module, ORM

Function	Type
Optical connector	Type ST

Table 60: Cable connection requirements for SPA/IEC connection

	Glass fibre	Plastic fibre
Cable connector	ST connector	HFBR, Snap-in connector
Fibre diameter	62.5/125 μm 50/125 μm	1 mm
Max. cable length	500 m	30 m

Table 61: LON - Cable connection requirements for LON bus connection

	Glass fibre	Plastic fibre
Cable connector	ST-connector	HFBR, Snap-in connector
Fibre diameter	62.5/125 μm 50/125 μm	1 mm
Max. cable length	1000 m	30 m

Table 62: Galvanic data communication module

Interface type	According to standard	Connector type
V.36/V11 Co-directional (on request)	ITU (CCITT)	D-sub 25 pins
V.36/V11 Contra-directional	ITU (CCITT)	D-sub 25 pins
X.21/X27	ITU (CCITT)	D-sub 15 pins
RS530/RS422 Co-directional (on request)	EIA	D-sub 25 pins
RS530/RS422 Contra-directional	EIA	D-sub 25 pins
G.703 Co-directional	ITU (CCITT)	Screw

Table 63: Short-range galvanic module

Data transmission	Synchronous, full duplex
Transmission rate	64 kbit/s (256 kBaud; code transparent)
Clock source	Internal or derived from received signal
Range	max 4 km
Line interface	Balanced symmetrical three-state current loop (4 wires)
Connector	5-pin divisible connector with screw connection
Insulation	2,5 kV 1 min. Opto couplers and insulating DC/DC-converter
	15 kV with additional insulating transformer

Table 64: Fibre optical communication module

Optical interface		
Type of fibre	Graded-index multimode 50/125µm or 62,5/125µm	Single mode 9/125 µm
Wave length	1300 nm	1300 nm
Optical transmitter injected power	LED -17 dBm	LED -22 dBm
Optical receiver sensitivity	PIN diode -38 dBm	PIN diode -38 dBm
Optical budget	21 dB	16 dB
Transmission distance	typical 15-20 km [a)]	typical 30-70 km [a)]
Optical connector	Type FC-PC	Type FC-PC
Protocol	ABB specific	ABB specific
Data transmission	Synchronous, full duplex	Synchronous, full duplex
Transmission rate	64 kbit/s	64 kbit/s
Clock source	Internal or derived from received signal	Internal or derived from received signal
[a)] depending on optical budget calculation		

Table 65: Short-range fibre optical module

Data transmission	Synchronous, full duplex
Transmission rate	64 kbit/s
Clock source	Internal or derived from received signal
Optical fibre	Graded-index multimode 50/125µm or 62,5/125µm
Wave length	850 nm
Optical connectors	ST
Optical budget	15 dB
Transmission distance	max 3,5 km
Protocol	FIBERDATA specific

Ordering

Guidelines

Carefully read and follow the set of rules to ensure problem-free order management. Be aware that certain functions can only be ordered in combination with other functions and that some functions require specific hardware selections.

Basic hardware and functions

Platform and basic functionality

Basic REx 5xx platform and common functions housed in selected casing

Manuals on CD

Operator’s manual (English)

Installation and commissioning manual (English)

Technical reference manual (English)

Application manual (English)

SMS and SCS communication capabilities

LON based SCS communication with glass fibers

Single bay control

Apparatus control

For 14 apparatuses

Interlocking

For double busbar with single or double CBs

Single command *(CD)*

11 command function blocks (16 signals)

Logic

Trip logic *(TR)*

Single, two and/or three pole trip

Additional logic function blocks

Additional gates, pulse timers and registers

Interbay communication capabilities

Binary signal interbay communication *(CM)*

79 medium speed communication block instances

Monitoring

Event recorder

Product specification

REC 561	Quantity:	☐	1MRK 002 598-AC

Default:

The terminal is delivered without loaded configuration.

Use the configuration and programming tool (CAP 540) to build a configuration from start or to make an example configuration complete.

Option:

Customer specific configuration	On request

Rule: Select only one alternative (for casing 3/4 x 19” and 1/2 x 19” only).

Energizing quantities for binary inputs on power supply module	24/30 V	☐	1MRK 002 238-AA
	48/60 V	☐	1MRK 002 238-BA
	110/125 V	☐	1MRK 002 238-CA
	220/250 V	☐	1MRK 002 238-DA

Note: Auxiliary dc voltage EL is (48-250)V.

Optional functions

Line impedance

Pole slip protection *(PSP)*	☐	1MRK 001 457-SA

Current

Instantaneous overcurrent protection *(IOC)*		
Phase element	☐	1MRK 001 457-AA
Residual element	☐	1MRK 001 456-VA
Two step time delayed phase overcurrent protection *(TOC2)*	☐	1MRK 001 459-LA
Two step time delayed directional phase overcurrent protection *(TOC3)*	☐	1MRK 001 457-CA
Thermal phase overload protection *(THOL)*	☐	1MRK 001 457-DA
Pole discordance protection (current and contact based) *(PD)*	☐	1 MRK 001 456-PA
Breaker failure protection *(BFP)*	☐	1MRK 001 458-AA
Time delayed overcurrent protection *(TOC)*		
Phase element	☐	1MRK 001 457-BA
Residual element	☐	1MRK 001 456-XA
Definite and inverse time delayed residual overcurrent protection *(TEF)*		

Rule: If Scheme communication logic (EFC) or Current reversal and weak end infeed logic for residual overcurrent protection (EFCA) is to be used, only the directional element may be selected		
Nondirectional element	☐	1MRK 001 456-YA
Directional element	☐	1MRK 001 459-ZA
Scheme communication logic *(EFC)*	☐	1MRK 001 455-UA
Current reversal and weak end infeed logic for residual overcurrent protection *(EFCA)*	☐	1MRK 001 455-VA

Voltage

Time delayed phase undervoltage protection *(TUV)*	☐	1MRK 001 457-RA
Time delayed overvoltage protection *(TOV)*		
Phase element	☐	1MRK 001 457-GA
Residual element	☐	1MRK 001 459-FA

Power system supervision

Loss of voltage check *(LOV)*	☐	1MRK 001 457-VA
Rule: If Switch onto fault logic (SOTF) and/or Fuse failure (FUSE) are selected, Dead line detection (DLD) is automatically included in the terminal		
Dead line detection *(DLD)*	☐	1MRK 001 455-LA

Secondary system supervision

Fuse failure *(FUSE)*		
Rule: If du/dt and di/dt based option is selected Negative or Zero sequence option must be ordered		
Negative sequence	☐	1MRK 001 457-YA
Zero sequence	☐	1MRK 001 457-ZA
du/dt and di/dt based	☐	1MRK 001 459-YA
Voltage transformer supervision *(TCT)*	☐	1MRK 001455-TA

Single bay control

Synchrocheck *(SYN)*		
For single CB, including energizing check	☐	1MRK 001 458-GA
For double CBs, including energizing check	☐	1MRK 001 458-FA
For 1 1/2 breaker arrangements, including energizing check	☐	1MRK 001 458-HA
For double CBs, including phasing and energizing check	☐	1MRK 001 457-HA
For single CB, including phasing and energizing check	☐	1MRK 001 458-KA
Automatic reclosing function *(AR)*		
For single CB, one and/or three phase reclosing	☐	1MRK 001 458-LA

For double CBs, one and/or three phase reclosing	☐	1MRK 001 457-KA
For single CB, three phase reclosing	☐	1MRK 001 458-MA
For double CBs, three phase reclosing	☐	1MRK 001 457-LA

Multiple bay control

Apparatus control for up to 24 apparatuses

For three single CB bays, or two double CB bays, or one 1 1/2 CB arrangement, all including interlocking	☐	1MRK 001 455-AA
For 12 bays, no interlocking, or two 1 1/2 CB arrangements including interlocking	☐	1MRK 001 455-GA

Synchrocheck *(SYN)*

Rule: Synchrocheck for multiple bays cannot be selected If apparatus control for 12 bays where selected

For three bays and single CBs, including energizing check	☐	1MRK 001 455-CA
For two bays and double CBs, including energizing check	☐	1MRK 001 455-BA
For 1 1/2 breaker arrangements, including energizing check and voltage selection for diameter	☐	1MRK 001 455-DA

Note: Use single bay/single CB synchrocheck and external voltage selection circuitry when multiple breaker synchrocheck is needed. Contact your nearest ABB representative for construction details.

Automatic reclosing function *(AR)*

For three CBs, three phase reclosing	☐	1MRK 001 455-FA
For three CBs, one and/or three phase reclosing	☐	1MRK 001 455-EA
For six CBs, three phase reclosing	☐	1MRK 001 455-KA
For six CBs, one and/or three phase reclosing	☐	1MRK 001 455-HA

Logic

One additional trip logic function block *(TR)*

Single, two and/or three pole tripping	☐	1MRK 001 459-XA

Measuring capabilities

Add measuring capabilities by selecting input energizing options from the following tables.

Rule: If optical measuring transformers is used and connected to an OITP (Optical Instrument Transformer Platform), omit the steps where measuring input energizing quantities are selected.

Optical receiver module (ORM)	☐	1MRK 002 216-AA

Rule: Select only one alternative. If sensitive earth fault functionality should be used, select from next table.

Rated measuring input energizing quantities	1 A, 110 V	1MRK 000 157-MB
	1 A, 220 V	1MRK 000 157-VB
	5 A, 110 V	1MRK 000 157-NB
	5 A, 220 V	1MRK 000 157-WB

Monitoring

Disturbance recorder *(DRP)*	☐	1MRK 001 458-NA
Trip value recorder	☐	1MRK 001 458-SA
Increased analog accuracy	☐	1MRK 000 597-PA

Metering capabilities

Note: The binary input module (BIM) with enhanced pulse counting capabilities is needed for pulse counting

Pulse counting	☐	1MRK 001 458-TA
Event counting	☐	1MRK 001 445-CA

Additional HMI language

Note: Only one alternative is possible

Second language beside English	German	☐	1MRK 001 459-AA
	Russian	☐	1MRK 001 459-BA
	French	☐	1MRK 001 459-CA
	Spanish	☐	1MRK 001 459-DA
	Italian	☐	1MRK 001 459-EA
Customer specific language	Contact your local ABB representative for availability		

Interbay communication capabilities

Note: The LON based SCS communication capability option is necessary

Binary signal interbay communication *(CM)*

One fast communication block (16 signals)	☐	1MRK 001 455-RA

Communication functions for remote terminal communication

Rule: If Binary signal transfer to remote end (RTC) is selected Communication interfaces for remote terminal communication must be ordered

Binary signal transfer to remote end	☐	1MRK 001 458-ZA

Hardware

Extended indication capabilities

LED indication module (18 LEDs)	☐	1MRK 000 008-DA

Communication interfaces for remote terminal communication

Rule: If Communication interfaces for remote terminal communication is selected Binary signal transfer to remote end (RTC) must be ordered.

Co-directional V.36/V.35 galvanic interface	☐	On request
Contra-directional V.36/V.35 galvanic interface	☐	1MRK 000 185-BA
Co-directional RS530/RS422 galvanic interface	☐	On request
X.21 galvanic interface	☐	1MRK 000 185-CA
Contra-directional RS530/RS422 galvanic interface	☐	1MRK 000 185-EA
Fiber optical modem	☐	1MRK 000 195-AA
Short range galvanic modem	☐	1MRK 001 370-AA
Short range fiber optical modem	☐	1MRK 001 370-DA
Co-directional G.703 galvanic interface	☐	1MRK 001 370-CA

Additional binary I/O capabilities

Rule: The number of binary I/O modules (IOM) and binary output modules (BOM) together in a terminal may not exceed a total of 6.

Binary I/O module, IOM (8 inputs, 10 outputs, 2 high-speed outputs)

24/30 V	Quantity:	☐	1MRK 000 173-GB
48/60 V	Quantity:	☐	1MRK 000 173-AC
110/125 V	Quantity:	☐	1MRK 000 173-BC
220/250 V	Quantity:	☐	1MRK 000 173-CC

Binary input module, BIM (16 inputs)

24/30 V	Quantity:	☐	1MRK 000 508-DB
48/60 V	Quantity:	☐	1MRK 000 508-AB
110/125 V	Quantity:	☐	1MRK 000 508-BB
220/250 V	Quantity:	☐	1MRK 000 508-CB

Binary input module, BIM, with enhanced pulse counting capabilities (16 inputs)

Rule: Can only be ordered together with the pulse counter logic (PC) optional function

24/30 V	Quantity:	☐	1MRK 000 508-HA
48/60 V	Quantity:	☐	1MRK 000 508-EA
110/125 V	Quantity:	☐	1MRK 000 508-FA
220/250 V	Quantity:	☐	1MRK 000 508-GA

Rule: The number of binary output modules (BOM) and binary I/O modules (IOM) together in a terminal may not exceed a total of 6.

Binary output module, BOM (24 outputs in 12 groups)	Quantity:	☐	1MRK 000 614-AB
Milliampere input module *(MIM)*	Quantity:	☐	1MRK 000 284-AB

Case size

Compare the sum of the ordered quantities of I/O modules with the table below and select the case size which has the larger or equal number of slots available.

Seen from the front of the terminal the I/O modules will be placed from left to right in the order BIM, BOM, IOM, MIM, Communication interface.

Table 66: Maximum hardware configurations for I/O modules

Maximum number of modules	Case size		
	1/1 x 19” 1MRK 000 151-HC ☐	3/4 x 19” 1MRK 000 151-GC ☐	1/2 x 19” 1MRK 000 151-FC ☐
Binary input modules (BIM)	13	8	3
Binary input/output (IOM) and output (BOM) modules	6	4	3
mA input modules (MIM)	6	1	1
Communication interface for remote terminal communication	1	1	1
Total in case	*13*	*8*	*3*

SCS and SMS communication capabilities

SMS communication, only one alternative can be selected

SPA/IEC 60870-5-103 interface	Plastic fibers	☐	1MRK 000 168-FA
	Glass fibers	☐	1MRK 000 168-DA
LON interface	Plastic fibers	☐	1MRK 000 168-EA

replacing the default LON based SCS communication with glass fibers

Test switch

Test switch module RTXP 24 mounted side-by-side to the terminal in RHGS case		☐	1MRK 000 371-CA
	With internal earthing	☐	RK 926 215-BB
	With external earthing	☐	RK 926 215-BC
On/off switch for the DC-supply		☐	RK 795 017-AA

Protection cover

Cover for rear area including fixing screws and assembly instruction	6U, 1/1 x 19”	☐	1MRK 000 020-AA
	6U, 3/4 x 19”	☐	1MRK 000 020-AB
	6U, 1/2 x 19”	☐	1MRK 000 020-AC

Mounting accessories

19” rack mounting kit	☐	1MRK 000 020-BR
Wall mounting kit	☐	1MRK 000 020-DA
Flush mounting kit	☐	1MRK 000 020-Y
Semiflush mounting kit	☐	1MRK 000 020-BS
Additional mounting seal for IP54 protection of flush and semiflush mounted terminals	☐	1MKC 980 001-2
Side-by-side mounting kit	☐	1MRK 000 020-Z

Accessories

Converters

V.36 to G.703 converter with 48 VDC power supply	☐	1MRK 001 295-AA
V.35/V.36 converter for short range fiber optical modem	☐	1MRK 001 295-CA
X.21/G.703 converter for short range fiber optical modem	☐	1MRK 001 295-DA

Key switch

Key switch for setting lockout	Quantity:	☐	1MRK 000 611-A

Front communication cable

Front connection cable for PC (Opto/9-pole D-sub)	Quantity:	☐	1MKC 950 001-2

Manuals

One CD with Operator's manual, Technical reference manual, Installation and commissioning manual and Application manual is always included for each terminal.

Rule: Specify the number of extra CD's requested

CD with all manuals	Quantity:		1MRK 002 241-AA

Rule: Specify the number of printed manuals requested

Operator's manual	Quantity:		1MRK 511 091-UEN
Technical reference manual	Quantity:		1MRK 511 092-UEN
Installation and commissioning manual	Quantity:		1MRK 511 093-UEN
Application manual	Quantity:		1MRK 511 101-UEN

Customer feedback

For our reference and statistics we would be pleased to be provided with the following application data:

Country: End user:

Station name: Voltage level: kV
