Ultralow back scatter
- very accurate readings as only light scattering due to turbidity is measured.

Dry secondary standards supplied for zero and span verification
- accurate, repeatable, simple; eliminates the need for formazine solutions

Ultra-stable electronics
- practically no drift
- infrequent calibration required

Auto-clean systems
- optimizes performance and reduces maintenance on low and high turbidity samples

On-line diagnostics
- provides assurance of performance of the auto-clean function

Flow and dip systems
- versatile design
- satisfies a wide range of applications

Bubble rejection function
- compensation for erroneous readings due to degassing

Long-term, reliable performance turbidity systems with low cost of ownership
4670 Series Turbidity Systems

An ABB turbidity system comprises a 4670 wall-mounting, or 4675 panel-mounting, analyzer together with one of four sensor types designed to meet specific applications.

Turbidity Sensors

The sensors are available in flow and dip versions and, where appropriate, are supplied with auto-cleaning to minimize maintenance to overcome optical fouling and optimize performance.

Model 7997-202 (used on 4670/221 & 4675/221)
A flow-through system, utilizing the 90 ° scattered light principle. It is designed specifically for monitoring final-treated potable water and filtered water where accurate results below 0.1 NTU are demanded. The unit operates over the range 0...30 NTU with a minimum operating range of 0...1 NTU.

High stability is the key to the virtual lifetime zero and the ultra-low backscatter permits the unit to be used with full confidence below 0.1 NTU.

Model 7997-201 (used on 4670/211 & 4675/211)
A flow-through system utilizing the 90 ° scattered light principle, designed to operate over the range 0...30 NTU with a minimum operating range of 0...1 NTU. It is the ideal solution for clean water applications. Auto-cleaning is a standard feature, together with on-line diagnostics.

Model 7997-200 (used on 4670/201 & 4675/201)
A flow-through system, utilizing the 90 ° scattered light principle, designed to operate over the range 0...250 NTU. It is ideal for monitoring raw water on potable water treatment plants.

Incorporates auto-cleaning as standard and, used with the 4670 or 4675 Analyzers, operates from 0...25 NTU; up to 250 NTU, by programming the 4600 Series to the required range.

Model 7997-300 (used on 4670/301 & 4678/301)
A flow-through system designed for high levels of turbidity and utilizes the absorption principal of measurement. It operates over the range of 0...500 FTU with a minimum range of 0...100 FTU.

This model incorporates auto-cleaning as standard and is used primarily for effluent discharge monitoring and on water intakes where the river water can become very turbid. It is also used extensively on Filter Backwash applications.

7997-4XX Series

Three dip versions are available. All three operate over the range of 0...2000FTU with an increased accuracy specification when used over the range of 0...1000FTU (the minimum range is 0...100FTU). These systems are completely unaffected by ambient light:

7997/400 (used on 4670/401 & 4675/401) Dip stem length of 1 m (39.3 in.) Designed primarily for use in open channels and tanks.

7997/401 (used on 4670/411 & 4675/411) Dip stem length of 2 m (78.7 in.) Designed primarily for use in open channels and tanks.

7997/450 (used on 4670/450 & 4675/450) Flow-through system designed for water applications that have high turbidity values.

Wiper Cleaning Module
Dry Secondary Calibration Standard
A key feature of the system is the dry secondary calibration standard, which simplifies routine calibration and virtually eliminates the need for chemical standards...a major safety factor.

This is available for all models, including the dip system, and provides a very convenient, repeatable and safe calibration technique.

Ease of Maintenance
As with all analyzers, the key to success is the reliability of the sensing device coupled with simple maintenance procedures. The sensing systems are very easy to maintain and can be site-serviced without the need of a skilled technician.

Automatic Cleaning
Automatic cleaning is an essential feature which overcomes the problem of optical fouling and ensures that performance is maintained for long periods (up to 6 months) without the need for manual intervention. This feature has proven invaluable even on apparently 'clean' water samples where small amounts of iron/ manganese can cause fouling problems.

Confidence in Service
To complement the system’s well proven design, unrivalled accuracy and reliability in service, the entire sensing loop is regularly self-monitored to ensure the light source is operating within specification, thereby eliminating the risk of electrical drift. In addition, the function of the wiper module is continuously validated by the processor, thereby assuring the correct performance of the cleaning function.

Ease of Calibration
Calibration can be carried out using Formazine standard or by using the optional secondary calibration device, which can be ordered separately.

This enables both zero and span checks to be carried out.

Bubble Rejection
Readings are often affected by short-term spikes, usually due to the effect of degassing. These occur even though the sample is passed through a debubbler.

The transmitter can be programmed for bubble rejection by taking several readings in short succession and rejecting any spurious high readings. An average is taken to give a steady result.
Practical On-line Systems

Turbidity sensors are roughly divided into two main types:

a. Nephelometers, which measure the proportion of light scattered at a specific angle, that is, 90° from the incident beam. For example, 4670/211 and 4670/201

b. Absorptiometers, which depend upon the measurement of the absorption (or attenuation) of a light beam passing through the sample. For example, 4670/300 and 4670/400.

Nephelometers

This type of turbidity meter detects light scattered by the suspended particles in the sample.

The most widely used optical arrangement for scattered-light turbidity meters is the 90° Nephelometer design. This must not be confused with instruments that are based on forward or backwards light scatter. Nephelometers overcome many problems such as colour and lack of sensitivity.

Absorptiometers

This is probably the most straightforward method of measuring turbidity. A light beam is transmitted through the sample, the intensities of which are measured by a photodetector in line with the light source.

The measurement of turbidity using Absorptiometers can be affected by the presence of dissolved colour. However, such effects are minimized by performing the measurement at a wavelength of 880 nm which is in the infrared region.

The system can also be insensitive because changes in turbidity at low levels only give a very small change in output from the detector which is difficult to resolve. At medium and high levels of turbidity this is usually not a problem, so this technique provides a reliable method for many applications.
Applications of Turbidity Measurement

The majority of turbidity monitor installations in the water industry are in potable water treatment plants, although some turbidity measurements are carried out on sewage/waste water treatment plants.

Normally, the instruments used for sewage/waste water treatments plants are calibrated to find suspended solids, that is, mg/l rather than turbidity.

In potable water treatment there is an increasing requirement for turbidity measurement in raw water abstraction, through the water treatment process, and finally the treated water quality.

Choice of System

The range of ABB turbidity systems include sensors based on both Absorption and Nephelometric techniques. The choice of a suitable system to use for a given application depends on the application itself and is generally dependent on two factors:

- **Measurement Range**
  
  As a general guide turbidities below 100 would use a Nephelometric type sensor; above 100 an Absorption type sensor would be more appropriate.

- **Independent site laboratory method or standard**
  
  If the above criteria was strictly followed there could be a situation where the level of turbidity is low, such as 10 NTU, but an Absorption instrument is used in the independent laboratory or reference method. Conversely, a Nephelometric instrument in the laboratory could be used on samples at 200 NTU.

Both Absorptiometers and Nephelometers are calibrated against formazine suspensions. They will, therefore, give good agreement on different formazine values. It must be noted that the results provided by any two different turbidity methods, calibrated on formazine, generally differ when used on samples. Exactly what happens to the light beam when it encounters a particle depends upon many parameters, such as the wavelength of the light source, particle size and shape and the refractive index of the particle.
Electrical Connections

4670 Panel-mount Version for use with 7997 200 Series and 300 Sensors

4675 Panel-mount Version for use with 7997 400 Series and 410 Sensors
4670/500 Wall-mounting Version for use with 7997-202, 7997-201 and 7997-200 series, 7997-300 and 7997-410 Sensors

Specification

7997-200 Turbidity Sensor

Range
Programmable 0...25 NTU to 0...250 NTU and 0...500 mg/l (or p.p.m.)

Note. The maximum range for suspended solids measurement is dependent upon the coefficient value of the sample.

Measurement Principle
90 ° scattered light measurement. Compliant to ISO7027

Measurement Characteristic
Linear based on Formazine

Resolution
0.1 NTU

Repeatability
Better than 1 % of span

Accuracy
±2 % of reading (limited by uncertainty in Formazine standards)
from 0...100 NTU
±5 % from 100...250 NTU

Temperature drift
0.005 NTU/10 °C (0.003 NTU/10 ºF)

Response time
Varies with flow rate, typically 90 % step change in 2 minutes at 1 l/min

Flow rate
0.5...1.5 l/min

Integral wiper cleaning system
Programmable operational frequency every 0.25 hour, 0.5 hour, 0.75 hour or in multiples of 1 hour up to 24 hours

Sample operating temperature
0...50 °C (32...122 °F)

Sample Pressure
Up to 3 bar (43.5 psi)

7997-201 & 7997-202 Turbidity Sensors

Range
Programmable 0...1 NTU to 0...30 NTU

Measurement Principle
90 ° scattered light measurement. Compliant to ISO7027

Measurement Characteristic
Linear based on Formazine

Resolution
0.01 NTU

Repeatability
Better than 1 % of span

Accuracy
±2 % of reading (limited by uncertainty in Formazine standards)

Temperature drift
0.005 NTU/10 °C (0.003 NTU/10 ºF)

Response time
Varies with flow rate, typically 90 % step change in less than 45 s at 1 l/min

Flow rate
0.5...1.5 l/min

Integral wiper cleaning system (7997-201 only)
Programmable operational frequency every 0.25 hour, 0.5 hour, 0.75 hour or in multiples of 1 hour up to 24 hours

Sample operating temperature
0...50 °C (32...122 °F)

Sample Pressure
Up to 3 bar (43.5 psi)
7997-300 Turbidity Sensor

Range
Programmable 0...100 FTU to 0...500 FTU and 0...1000 mg/l (or ppm)

Note. The maximum range for suspended solids measurement is dependent upon the coefficient value of the sample.

Measurement Principle
Transmitted light

Measurement Characteristic
Logarithmic based on Formazine

Resolution
1 FTU

Repeatability
Better than 1 % of span

Accuracy
±2 % of FSD
(limited by uncertainty in Formazine standards)

Temperature drift
0.2 FTU/°C (0.1 FTU/°F)

Response time
Varies with flow rate, typically 90 % step change in 2 minutes at 1 l/min⁻¹

Flow rate
0.5...1.5 l/min⁻¹

Integral wiper cleaning system
Programmable operational frequency every 0.25 hour, 0.5 hour, 0.75 hour or in multiples of 1 hour up to 24 hours

Sample operating temperature
0...50 °C (32...122 °F)

Pressure
Up to 3 bar (43.5 psi)

7997-400, 7997-401 Dip & 7997-405 Flow Turbidity Sensors

Range
Programmable 0...100 to 0...1000 FTU and 0...2000 mg/l

Extended Range
0...2000 FTU

Measurement Principle
Transmitted light

Measurement Characteristic
Logarithmic, based on Formazine

Resolution
1 FTU

Repeatability
Better than 1 % of span

Accuracy (0 to 1000 FTU)
±2 % FSD
(limited by the uncertainty of Formazine)

Accuracy (0 to 2000 FTU)
Better than ±10 % of span

Temperature drift
0.2 FTU/°C (0.1 FTU/°F)

Flow rate (7997-405 only)
0.5...2 l/min⁻¹

Integral wiper cleaning system
Programmable operational frequency every 0.25 hour, 0.5 hour, 0.75 hour or in multiples of 1 hour up to 24 hours

Sample operating temperature
0...50 °C (32...122 °F)

Dip stem length
7997-400 1 m (3.3 ft)
7997-401 2 m (6.6 ft)

Pressure (7997-405 only)
Up to 3 bar (43.5 psi)
4670-5/500 Analyzer Models Display

Measured value
5-digit x 7-segment backlit LCD

Information
16-character, single line, dot matrix, backlit LCD

Ranges
- Used with 7997-202/201: 0...1 to 0...30 NTU
- Used with 7997-200: 0...25 to 0...250 NTU
- Used with 7997-300: 0...100 to 0...500 FTU and 0...1000 mg/l
- Used with 7997-400/401/405: 0...100 to 0...1000* FTU and 0...2000 mg/l

* 0...2000 FTU with reduced accuracy

Units of measurement
- NTU and FTU all models
- mg/l on models 7997-300 and 7997-400

Accuracy
±0.2 % of reading, ±1 digit

Linearity
±0.1 % FSD

Auto-clean timing
Programmable 15 min, 30 min, 45 min or 1 hour up to 24 hours in 1 hour increments

Environmental Data

Operating temperature limits
-20...55 °C (–4...131 °F)

Storage temperature limits
-25...55 °C (–13...131 °F)

Operating humidity limits
Up to 95 % RH non-condensing

Power Supply

Voltage requirements
100...130 V, 200...260 V, 50/60 Hz

Power consumption
< 6 VA AC

Error due to power supply variation
Less than 0.1 % for +6 % ~20 % variation from nominal supply

Insulation
Mains to earth (line to ground) 2 kV RMS

Relay Outputs and Set Points

No. of relays
Two

Relay contacts
- Single pole changeover
  - Rating 250 V AC 250 V DC max.
  - 3 A AC, 3 A DC max.
  - Loading (non-inductive) 750 VA 30 W max.
  - (inductive) 750 VA 3 W max.

Insulation
2 kV RMS contacts to earth (ground)

No. of set points
Two

Set point adjustment
Programmable

Set point hysteresis
±1 % fixed

Local set point annunciation
Red LED

Retransmission

No. of retransmission signals
- One fully isolated programmable 0...10 mA, 0...20 mA or 4...20 mA
- Optional second current output

Accuracy
±0.25 % FSD ±0.5 % reading

Resolution
0.1 % at 10 A, 0.05 % at 20 mA

Max. load resistance
750 Ω (20 A max.)
