1/64 Limiting curves
Installation environment

Temperature

The Tmax XT circuit-breakers can be used in environmental conditions where the ambient air temperature varies between -25°C and +70°C, and can be stored at temperatures between -40 °C and +70 °C. Circuit-breakers fitted with thermomagnetic trip units have their thermal element set for a reference temperature. For temperatures other than the reference, a trip threshold variation must be taken into account. Electronic trip units do not undergo any variations in performance as the temperature varies, but, in the case of temperatures exceeding +40°C, the maximum setting for protection L (protection against overloads) must be reduced, as indicated in the derating graph, to take into account the heating phenomena which occur in the copper parts of the circuit-breaker which the phase current passes through. For temperatures above +70°C the circuit-breaker performances are not guaranteed.

Environmental conditions

The Tmax XT circuit-breakers are designed to operate in environments with a pollution degree of 3 according to the IEC 60947-2 Standard classification.

Altitude

Up to an altitude of 2000m, the Tmax XT circuit-breakers do not undergo any alteration in their rated performances. As the altitude increases, the atmospheric properties are altered in terms of composition, dielectric resistance, cooling capacity and pressure. Therefore, some performance aspects of the circuit-breaker (e.g. the maximum rated operating voltage and the rated uninterrupted current) undergo derating.

Shocks and vibrations

The Tmax XT circuit-breakers are unaffected by vibrations generated mechanically and due to electromagnetic effects, in compliance with the IEC 60068-2-6 Standards and the regulations of the major shipping registers including:
- RINA
- Det Norske Veritas
- Bureau Veritas
- Lloyd’s Register of Shipping
- Germanischer Lloyd
- ABS
- Russian Maritime Register of Shipping
- Nippon Kaiji Kyokai.

The Tmax XT circuit-breakers are also tested according to the IEC 60068-2-27 Standard to resist shocks up to 15g for 11 ms.

Electromagnetic compatibility

Protection is guaranteed in the presence of interference caused by electronic apparatus, atmospheric disturbances or electrical discharges by using the electronic trip units and the electronic residual current releases. No interference with other electronic apparatus near the place of installation is generated either. This is in compliance with the IEC 60947-2 Annex B + Annex F Standards and European Directive No. 2014/30/EC regarding EMC - electromagnetic compatibility.
### Degrees of protection

The IP degree of the circuit-breaker can vary depending on the area considered and on the presence of accessories such as a motor or terminal cover.

The following table indicates the degrees of protection guaranteed by Tmax XT circuit-breakers according to the prescriptions of the IEC 60529 Standard, in the different configurations. Furthermore, special kits are available to achieve IP54 with the MOE or RHD installed on the XT5, XT6 and XT7.

### Installation position

It is possible to mount circuit-breakers in the fixed version in horizontal, vertical or lying down positions without any derating of the rated characteristics.
### Temperature performance

Circuit-breakers with thermal-magnetic trip units

The circuit-breakers fitted with thermal-magnetic trip units have the thermal element set for a reference temperature of +40°C. With the same setting, for temperatures other than +40°C there is a variation in the thermal trip threshold as indicated in the tables below.

## Temperature performance

Circuit-breaker with magnetic only or electronic trip units and switch-disconnectors

The electronic overcurrent trip units do not undergo any variations in performance as the temperature varies. However, even though heating does not affect the trip thresholds of the electronic trip units, in the case of temperatures exceeding +40°C it is advisable to reduce the maximum L (protection against overloads) setting to protect the copper parts of the circuit-breaker against high temperatures.

The same considerations can be made for the switch-disconnectors and magnetic only circuit-breakers. The table below shows the maximum value at which the threshold of I1 of the overcurrent protection (L) must be set according to the ambient temperature and for the type of terminals used.

<table>
<thead>
<tr>
<th>Circuit Breaker</th>
<th>Terminal</th>
<th>Trip Unit</th>
<th>I&lt;sub&gt;max&lt;/sub&gt; at 40°C</th>
<th>I&lt;sub&gt;max&lt;/sub&gt; at 45°C</th>
<th>I&lt;sub&gt;max&lt;/sub&gt; at 50°C</th>
<th>I&lt;sub&gt;max&lt;/sub&gt; at 55°C</th>
<th>I&lt;sub&gt;max&lt;/sub&gt; at 60°C</th>
<th>I&lt;sub&gt;max&lt;/sub&gt; at 65°C</th>
<th>I&lt;sub&gt;max&lt;/sub&gt; at 70°C</th>
</tr>

**Temperature performance**

Power losses
To ensure service continuity of the plants, careful assessment of how to keep temperatures within acceptable levels is necessary to guarantee operation of all devices (e.g. by using forced ventilation in switchboards and installation rooms).

The table below shows the dissipated power values per single pole at the rated current In for each circuit-breaker used. The total maximum dissipated power for a circuit-breaker used at 50/60Hz is equal to the power per single pole multiplied by the number of poles.

</table>
Power losses gives indication of the heat generated under specified conditions. Measurement of power losses are performed on new samples in free air (according to Annex G of IEC). The measurement of resistance cannot be directly related to the power loss of the device and is not enough to ascertain the quality of the contacts.

Clearances for installation in metallic cubicles

This section provides the compliance clearances for the installation of the circuit-breaker inside a metal cubicle. The cubicle is the reference for the metallic parts of the switchgear assembly adjacent to the circuit-breaker and is used as a reference to define the clearances to be observed to permit the free evacuation of ionized gases and metal vapors and to prevent the ignition of adjacent parts. The clearances refer to the tests carried out in compliance with the IEC 60947-2 Standard. The installation modality in relation to the type of circuit-breaker and the compulsory protections that must be used depending on the connection terminals is summarized in the tables below. For further details about installation, please see the related instructions provided with the circuit-breaker.

Insulation distances

Minimum clearance between two side by side circuit-breakers

This section gives the clearances to be observed for side by side installation of SACE Tmax XT circuit-breakers in plants with voltages up to 690V AC.

The following table show the minimum center distance between two circuit-breaker side by side. When side by side breakers are different in size, the larger reference clearance should be considered.

In case of Tmax XT1 up to XT5 (1), the values are valid only when they have an HTC or a phase separator is inserted in the slot formed when placing the two fixed circuit-breakers side by side (see Fig.1 and Fig.2). For further details about installation, please see the related instructions provided with the circuit-breaker.

- Circuit-breakers with front extended spread terminals ES
- Circuit-breakers with front extended terminals EF

![Diagrams showing installation options](image-url)
Minimum clearance between two superimposed circuit-breakers

This section gives the clearances $H$ to meet for superimposed mounting of the SACE Tmax XT circuit-breakers in installations with voltages up to 690Vac. Verify that the bare bars or connection cables do not reduce the recommended clearances.

The distances given in the table refer to the maximum overall dimensions of the circuit-breakers in the different versions (F/W/P), with terminals and metallic lugs of insulated cables included, for example. When superimposed circuit-breakers are different in size, the larger reference clearance should be considered.

<table>

In case of cables with metallic lugs, an insulating screen behind the metallic lugs (on the rear of the circuit-breaker) or high terminal covers is mandatory.
The first insulated anchor

For the Tmax XT molded-case circuit-breakers, the figure below gives an example of the maximum recommended distance (in mm) within which the first insulated anchor should be positioned according to the highest admissible peak current value of the circuit-breaker and according to the cross-sectional area of the cable.

The maximum recommended distance is also valid for busbar connections. For further information and details circuit-breaker instruction manuals should be consulted.
Insulation distances

For the moulded-case circuit-breakers SACE Tmax XT1, XT2, XT3 and XT4, the figure below gives an example of the maximum recommended distance (in mm) within which the first insulated anchor shall be positioned according to the highest admissible peak current value of the circuit-breaker and to the cross-sectional area of the cable. The maximum recommended distance is valid also with busbar connections. For further information and details reference must be made to the circuit-breaker technical catalogues and instruction manuals.

(*) Value valid also with rear terminals
Use of direct current apparatus

Variation in magnetic tripping

The thermal-magnetic trip units of the SACE Tmax XT circuit-breakers are suitable for use in direct current applications. For the protection thresholds against short-circuits, correction values (Km) must be used, according to the type of distribution network and to the number of poles to be connected in series (the thermal threshold does not undergo any alteration). The correction value to be used can be found in the following tables.

Characteristic curves

Example of curves reading

Example 1 - XT3N 250
Trip curves for distribution - (thermal magnetic trip unit)

These curves provide information about the tripping time of
the thermal magnetic trip units. The red band indicates the
hot trip times, that is with the breaker already loaded with
its rated current once the overload has occurred.
The blue band gives the cold trip times, that is with no cur-
rent flowing into the breaker before the fault.
The curves are assumed at reference air ambient tempera-
ture of 40°C and considering three phase overload with
symmetrical and equilibrated currents.
Let us consider an XT3N 250 TMD In=250 A circuit-breaker.
The trip time of the thermal protection varies considerably
depending on the conditions when the overload occurs, i.e.
whether the circuit-breakers is at the thermal regime (either
cold or hot trip conditions). For example, for an overload
current 3xI1, the trip time ranges from 107.9 s to 31.5 s for
cold tripping and from 31.5 s to 7.0 s for hot tripping. For
fault current values higher than 2500 A, the circuit-breaker
trips with the instantaneous magnetic protection I3.

Example 2 - XT2N 160
Specific let-through energy curves

The following figure shows an example of the graph of the
specific let-through energy of the XT2N 160 In=160A cir-
cuit-breaker at 220/230V. The prospective symmetrical
short-circuit current is indicated on the x-axis, whereas the
values of the specific let-through energy expressed in A²s
are shown on the y-axis.
The circuit-breaker lets through a value of I²t equal to 0.76 ·
10^6 · A²s in correspondence with a short-circuit current of
20 kA.
Characteristic curves
Example of curves reading

Example 3 - XT2N 160
Limitation curves
The figure below gives the trend of the limitation curves of the XT2N 160 In=160 A circuit-breaker. The effective value of the prospective symmetrical short-circuit current is given on the x-axis of the graph, whereas the peak value of the short-circuit current is indicated on the y-axis.
The limiting effect can be evaluated by comparing the peak value corresponding to the prospective short-circuit current (curve A) with the peak limited value (curve B), at the same value of symmetrical short-circuit current.

For a fault current of 20 kA, the XT2N 160 circuit-breaker with a thermal magnetic trip unit In =160 A limits the peak prospective short-circuit current to 13.5 kA at a voltage of 500 V, with a reduction of 36.5 kA in relation to the peak value of the prospective short-circuit current.
Example 4 - XT4N 250 Ekip M-LIU
Cold trip / hot trip curves
The first curve shows the time of intervention of the trip unit in case of fault under cold conditions. Each curve is related to a single operating class defined by Standard IEC 60947-4-1 (3E, 5E, 10E or 10E). The second curve, hot trip, must be read in relation to the previous one. Considering the time the circuit-breaker has remained open after the first trip (t-off on the x-axis), the t-hot/t-cold ratio can be identified on the y-axis.

Once the cold trip time has been identified on the first graph in relation to a fault current, the hot trip time can be calculated on the second graph, based on t-off and class of intervention. For a XT4N 250 In=200A in the operating class 10E, given a fault current of 0.8kA (4xIn), the cold trip time for intervention is 7s. If we consider a t_off = 90s, t-hot/t-cold = 0.4, the hot trip time results 2.8s.

Graphical symbols for electrical diagrams
(60617 IEC STANDARDS)

Graphical symbols for electrical diagrams (Standards IEC 60617)

- Thermal effect
- Electromagnetic effect
- Timing
- Mechanical connection
- Manual mechanical operating mechanism (general case)
- Rotary handle operating mechanism
- Pushbutton operating mechanism
- Converter separated galvanically
- Conductors in shielded cable (example two conductors)
- Watt-hour meter
- Conductors with cored cables (example two conductors)
- Key operating mechanism
- Cam operating mechanism
- Ground (general symbol)
- Connection of conductors
- Terminal or clamp
- Socket and plug (female and male)
- Resistor (general symbol)
- Resistor dependent on the temperature
- Motor (general symbol)
- Three-phase asynchronous motor, with short-circuited rotor (cage)
- Current transformer
- Current transformer with primary consisting of 4 passing conductors and with wound secondary, with socket
- Closing contact
- Voltmeter
- Opening contact
- Changeover contact with momentary break
- Closing position contact (limit switch)
- Opening position contact (limit switch)
- Changeover contact with momentary break (limit switch)
Overcurrent release for earth fault with short inverse time characteristic

Current relay for unbalance between phases

Residual current release

Relay for detecting blocked rotor by means of current measurement

Motor with excitation in series

Primary cell, secondary cell, battery of primary cell or secondary cell
Reading information
Information on how to read the diagrams

State of operation shown
The diagrams are shown in the following conditions:
• fixed version circuit-breaker, open;
• withdrawable or plug-in version circuit-breaker, open and connected;
• contactor for starting the motor open;
• circuits de-energised;
• trip units not tripped;
• motor operator with springs charged.

Key XT1...XT4
* = See note indicated by the letter
A12 = Ekip Com type interface unit
A13 = Ekip Signaling 10K type signaling unit
A14 = MOE-E type stored energy motor operator actuating unit
A15 = Ekip Multimeter type measurement unit
A16 = Ekip Micro Module I/O type interface unit
A17 = MOE type stored energy motor operator actuating unit
BUS1 = Redundant interface with external bus
BUS2 = Redundant serial interface with external bus
LINK BUS = Interface with external Link bus
D 2 = Electronic time-delay device for undervoltage release coil YU, outside circuit-breaker (only for voltage up to 250 V)
H2 = Signaling lamp for stored energy motor operator blocked
I 11...32 = Programmable digital inputs
| 41...43 | 51...53 = Analog inputs from temperature sensor
| 44-54 | Pt1OO = Analog input from Pt100 temperature sensor of motor
I reset = Digital input for resetting tripped motor starting contactor operating unit
J... = Connectors for auxiliary circuits of withdrawable circuit-breaker. Withdrawal of connectors occurs at the same time as that of circuit-breaker
K = Motor starting contactor
KS1 = Ekip type electronic relay for overcurrent protection
KS1/Cl = Motor starting contactor operator module
KS1/COM = Communication module
KS1/MEAS = Measurement module
KS1/SIGN = Signaling module
KS1/SUPPLY = Auxiliary supply module (110-240VAC/DC and 24-48VDC)
KS1/SYNC = Synchronizing module
KS1/TEMP = Temperature monitoring module
K87 = Residual current relay
M = Motor with energizing in series for circuit-breaker opening and closing (Fig. 21)
M = Motor for opening circuit-breaker and loading the closing springs (Fig. 22-54-55-56-57)
M1 = Three-phase asynchronous motor
0 11...32 = Programmable signaling contacts
OCI = Contact for motor starting contactor operating mechanism
O SC = Synchronism monitoring contact
Q = Main circuit-breaker
Q/O...7 = Auxiliary contacts of the circuit-breaker open/closed
R-R1 = Resistor
R2 = Pt100 temperature sensor of motor
81 = Contact controlled by the motor operator cam
82 = Contact controlled by the key lock of the direct action motor operator
83/1-2 = Contacts operated by Auto/Manual selector switch and by key lock of the stored energy motor operator
S4 = Contact operated by direct action motor operator cam
S4/1-2 = Early auxiliary contacts operated by circuit-breaker mounted crank handle
851 = Contact for signaling circuit-breaker open due to tripped thermomagnetic overcurrent protection release or electronic relay
86/1-2 = Contacts controlled by Auto/Manual selector switch of direct action motor operator
S75E/1-2 = Contacts for signaling circuit-breaker in withdrawn position (only applicable to withdrawable circuit-breaker versions)
S75I/1-2-5 = Contacts for signaling circuit-breaker in racked-in position (only applicable to withdrawable or plug-in circuit-breaker versions)
S87/1 = Contact for electrical signaling of residual current relay prealarm
S87/2 = Contact for electrical signaling of residual current relay alarm
S87/3 = Contact for electrical signaling of circuit-breaker open due to residual current relay trip
SC = Pushbutton or contact for closing the circuit-breaker
SC3 = Motor start pushbutton
SD = Residual current relay supply disconnector
SO = Pushbutton or contact for opening circuit-breaker
SO3 = Motor stop pushbutton
SR = Electrical reset pushbutton or contact
SY/1...3 = Contacts for signaling circuit-breaker open due to tripped overcurrent protection relay, thermomagnetic release and coils Y0, YO1, YO2, YU (tripped position)
TI = Toroidal current transformer
TI/L1-L2-L3 = L1-L2-L3 phase current transformer
TI/N = Current transformer on neutral
TU2 = Insulation voltage transformer (outside circuit-breaker)
Uaux = Auxiliary supply voltage
V1 = Circuit-breaker applications
V2 = Motor operator applications
V4 = Indicative switchgear and connections for operation and signaling, outside circuit-breaker
V5 = Ekip DIN Rail Cartridge Basic or Ekip DIN Rail Cartridge applications
W2 = Serial interface with internal bus (local bus)
W9...14 = Connector RJ45 for interface unit and for communication modules
W9R...12R = Connector RJ45 for redundant communication modules
X3-X4-X8 = Protection relay connectors
X41 = Connector of current circuit for external neutral
X8.. = Three-way connector for auxiliary circuits of plug-in circuit-breaker
XC.. = Six-way connector for auxiliary circuits of plug-in circuit-breaker
XC2-3 = Six-way connector for auxiliary circuits of plug-in circuit-breaker for voltage up to 400V
XCT1-2 = Terminal box of Ekip DIN Rail Cartridge Basic or Ekip DIN Rail Cartridge
XD.. = Nine-way connector for auxiliary circuits of plug-in circuit-breaker
XE.. = Fifteen-way connector for auxiliary circuits of plug-in circuit-breaker
XF.. = Ekip Com type interface unit connector
XG = Protection relay connector
XH1 = Protection relay connector
XX7 = Connector of contact S75I/5
XO = MOE-E actuator unit connector
XV = Terminal box of circuit-breaker applications
Y = Closing coil of stored energy motor operator
YO = Opening coil
YO1 = Coil for opening due to overcurrent
YO2 = Opening coil of residual current relay
YU = Undervoltage coil
**Reading information**
Information on how to read the diagrams

**Notes XT1...XT4**
A) The presence of an auxiliary supply is required for the local bus and zone selectivity functions (see Fig. 51-81).
B) The undervoltage coil is provided for power supply branched on the supply side of the circuit-breaker or from an independent source: circuit-breaker can only close when coil is energized (closing lock is obtained mechanically).
C) Contacts 84/1 and 84/2 of Fig. 7-8 open circuit when circuit-breaker is open and close it again when a manual closing command is imparted with means of the rotary handle, in accordance with the Standards governing machine tools (however, circuit-breaker will not close if under-voltage release is not being supplied).
D) If the application in Fig. 21 and the contacts in Fig. 31 must be installed at the same time, contact 0/2 must be installed in the adjacent slot (marked 0/1).
E) R= Additional external undervoltage resistor supplied at 380/440 VAC and 480/525 VAC.
F= Additional external resistor for stored energy motor operator or direct action motor operator supplied at 480/525VAC.
G) If a three-pole fixed circuit-breaker with current transformer on the neutral conductor outside the circuit-breaker is used, the terminals of the T1/N transformer must be short-circuited when the circuit-breaker must be removed.
H) "Galvanically separated converters" conforming to standards IEC 60950 (UL 1950) or equivalent must be used since an earthed Uaux is required.
I) Mandatory in the presence of any sort of Ekip module.
J) Only one application among Fig. 83...97-131-132 can be supplied in the case of Ekip DIN Rail Cartridge Basic. In the case of Ekip DIN Rail Cartridge, up to three applications can be supplied among Fig. 83...97-131-132, taken once only. In addition, the Ekip Com module (if chosen) can be duplicated by choosing among Fig. 110...116.
K) To ensure correct operation, at least one module must always be present.
L) BELDEN 3105A cables or an equivalent type must be used.
M) When there are several Ekip Com modules with withdrawable circuit-breakers, contact S75I/5 must be connected once only to one single module.
N) Auxiliary voltage Uaux allows all the functions of EKIP electronic protection relays to be activated. "Galvanically separated converters" conforming to standards IEC 60950 (UL 1950) or equivalent must be used since an earthed Uaux is required.
O) BELDEN 3105A cables or an equivalent type must be used. Maximum length 15 m.
P) Recommended RJ45 cable: CAT6 STP.
Q) BELDEN 3105A cables or an equivalent type must be used. Maximum length 15 m.
R) When there are several Ekip Com modules with withdrawable circuit-breakers, contact S75I/5 must be connected once only to one single module.
T) Short-circuit terminals 1200 on to install a termination resistor on the Local Bus.
U) Use Belden 3079A cables or equivalent. Consult White Paper 1SDCO0741ZGO201 "Communication with SACE Emax 2 circuit-breakers" for further details.
V) Use Belden 3084A cables or equivalent. Consult White Paper 1SDC007412G0201 "Communication with SACE Emax 2 circuit-breakers" for further details.
W) Ekip Supply cannot be used to energize the electronic relay via terminals K1 and K2.
AA) Consult Fig. 51 or 81 for the connection of W3 and W4.
AB) Use two-pole shielded cable type BELDEN 8762/8772 or equivalent. The shield must be earthed on the selectivity input side (for zone selectivity) or on both sides (for other applications).
AC) The rated maximum secondary voltage is 120V.
AD) Use insulated cables for thermocouples such as PENTRONIC TEC/SITW-24F (Type TX) or equivalent. Maximum length 3 m.
AE) Use suitable cables up to 3 meters in length compatible with the workplace in which the 4-20mA current sensor is used.

Notes XT5-XT6
A) The presence of an auxiliary supply is required for the local bus and zone selectivity functions (see Fig. 41-78).
B) The undervoltage coil is provided for power supply branched on the supply side of the circuit-breaker or from an independent source: circuit-breaker can only close when coil is energized (closing lock is obtained mechanically).
C) Contacts S4/1 and S4/2 of Fig. 7-10-15 open circuit when circuit-breaker is open and close it again when a manual closing command is imparted by means of the rotary handle, in accordance with the Standards governing machine tools (however, circuit-breaker will not close if undervoltage release is not being supplied).
D) Only for XT5 F-P.
E) Only for XT5.
G) If a three-pole fixed circuit-breaker with current transformer on the neutral conductor outside the circuit-breaker is used, the terminals of the Ti/N transformer must be short-circuited when the circuit-breaker must be removed.
H) "Galvanically separated converters" conforming to standards IEC 60950 (UL 1950) or equivalent must be used since an earthed Uaux is required.
I) Mandatory in the presence of any sort of Ekip module.
L) Only one application among Fig. 79...93-131-132 can be supplied in the case of Ekip DIN Rail Cartridge Basic. In the case of Ekip DIN Rail Cartridge, up to three applications can be supplied among Fig. 79...93-131-132, taken once only. In addition, the Ekip Com module (if chosen) can be duplicated by choosing among Fig. 110...116.
M) To ensure correct operation, the Ekip Supply module and at least one module must always be present.
N) BELDEN 3105A cables or an equivalent type must be used.
O) When there are several Ekip Com modules with withdrawable circuit-breakers, contact 5751/2 must be connected once only to one single module.
P) Auxiliary voltage Uaux allows all the functions of EKIP electronic protection relays to be activated. "Galvanically separated converters" conforming to standards IEC 60950 (UL 1950) or equivalent must be used since an earthed Uaux is required.
Q) BELDEN 3105A cables or an equivalent type must be used. Maximum length 15 m.
R) Recommended RJ45 cable: CAT6 STP.
T) Short-circuit terminals 1200 on to install a termination resistor on the Local Bus.
U) Use Belden 3079A cables or equivalent. Consult White Paper 1SDC007412G0201 “Communication with SACE Emax 2 circuit-breakers" for further details.
V) Use Belden 3084A cables or equivalent. Consult White Paper 1SDC007412G0201 “Communication with SACE Emax 2 circuit-breakers" for further details.
Z) Ekip Supply cannot be used to energize the electronic relay via terminals K1 and K2.
AA) Consult Fig. 78 for the connection of W3 and W4.
AB) Use two-pole shielded cable type BELDEN 8762/8772 or equivalent. The shield must be earthed on the selectivity input side (for zone selectivity) or on both sides (for other applications).
AC) The rated maximum secondary voltage is 120V.
AD) Use insulated cables for thermocouples such as PENTRONIC TEC/SITW-24F (Type TX) or equivalent. Maximum length 3 m.
AE) Use suitable cables up to 3 meters in length compatible with the workplace in which the 4-20mA current sensor is used
AG) Relay type TMG for XT5 only
AH) Designation Connector X .. -> X3 for XT5; X4 for XT6

YR = Coil for electrical resetting of trip contact S51
YU = Undervoltage coil

Notes XT7-XT7M
A) Auxiliary power supply must be present for zone selectivity and local bus functions (consult Fig. 31-32).
B) When there are mixed auxiliary contacts, 01 and 02 are 400V, while 03-04 are 24V.
C) Always supplied with Ekip Com module.
D) Always supplied with motor for loading closing springs in Fig. 13.
E) A voltage transformer is mandatory in the case of external sockets. External sockets are mandatory for systems for over 690V rated voltage. Admissible maximum rated secondary voltage is 230V.
F) Connections between RC residual current protection sensor and poles of connector X (or XV) of the circuit-breaker must be made of 4-pole shielded cable with paired braided conductors (BELDEN 9696 paired type or equivalent) no more than 10 m in length.
G) Earth fault protection (Gext) by means of a current sensor on the neutral point of the MV/LV transformer is available with all electronic protection releases equipped with display interface with LSIG protections. The connection between terminals 1 and 2 of the UI/O current transformer and Ge+ and Ge- poles of connector X (or XV) must be made of shielded and stranded 2-pole cable (BELDEN 8841 or equivalent) no more than 15 m in length.
H) Use the supplied cable to make the connection. There must be no break in the cable. Use of other cables or extensions using intermediate terminal boxes is not allowed. With a circuit-breaker, poles Ne+ and Ne- of connector X (or XV) are short-circuited unless the external neutral is present: enable short-circuit if connection is absent.
I) Mandatory if any Ekip module is present.
L) Up to two applications between Fig. 41...59 taken only once can be supplied. The Ekip Com module selected can be duplicated by choosing between Fig. 61...67.
Reading information
Information on how to read the diagrams

M) Opening and closing commands from Ekip Actuator can be obtained with Y0 and Y0 coils, with 110-120VDC and 240-250VAC maximum voltage values.

N) Use BELDEN 3105A cables or equivalent.

O) Contact 8751/5 should be connected once only to a single module when there are several Ekip Com modules with withdrawable circuit-breakers.

P) Auxiliary voltage Uaux. Enables all the functions of the EKIP electronic protection releases to be activated. “Galvanically separated convertors” conforming to standard IEC 60950 (UL 1950) or equivalent must be used since an earthed Uaux is required.

Q) Use BELDEN 3105A cables or equivalent not more than 15m in length.

R) Recommended RJ45 cable: CAT6 STP.

T) Short-circuit terminals 1200 on if a terminating resistor must be connected to the Local Bus.

U) Use Belden 3079A cables or equivalent. For further details see White Paper 1SDCO0741200201 “Communication with SACE Emax 2 Circuit-Breakers”.

V) Use Belden 3084A cables or equivalent. For further details see White Paper 18DC007412G0201 “Communication with SACE Emax 2 Circuit-Breakers”.

W) Contacts S4/1 and S4/2 in Fig. 17 can be used to open the undervoltage coil circuit shown in Fig. 73-74 when the circuit-breaker is open and to close it again in the presence of a closing command, in compliance with the Standard governing machine tools.

X) Contact S52 signals the state of the Y02 / YU opening coils. For coil Y02, the contact connected to poles 25-28 of connector X (or XV) is closed with Y02 energized (circuit-breaker opening activated), contact 25-26 is closed with Y02 de-energized. For coil YU, the contact connected to poles 25-28 of connector X (or XV) is closed with YU de-energized (circuit-breaker opening activated), contact 25-26 is closed with YU energized.

Z) Ekip Supply cannot be used for direct supply to the electronic release by means of terminals K1 and K2.

AA) See Fig. 31 and 32 for connection of W3 and W4.

AB) Use BELDEN 8762/8722 two-pole shielded cable or equivalent. The shield must be earthed on the selectivity input side (for zone selectivity) or on both sides (for other applications).

AC) Admissible maximum rated secondary voltage is 120V.

AD) Use PENTRONIC TEC/SITW-24F (type TX) insulated cables for thermocouples or equivalent, no more than 1m in length.

AE) Use appropriate cables compatible with the workplace in which the 4-20mA current sensor is used and not more than 3 m in length.

Three-pole fixed version circuit-breaker with Ekip Touch trip unit with current sensor on the neutral conductor outside the circuit-breaker

Diagram recommended for three-pole plug-in or withdrawable version circuit-breakers with Ekip Dip trip unit with current sensor on the neutral conductor outside the circuit-breaker

Recommended diagram for plug-in or withdrawable version three-pole circuit-breakers with Ekip Dip trip unit, current transformer and voltage connection on neutral conductor, external to circuit-breaker
1) Shunt opening release.
2) Supplementary shunt opening release (only for four-pole circuit-breakers).
4) Supplementary permanent shunt opening release (only for four-pole circuit-breakers).
5) Instantaneous undervoltage release (see Notes B and F).
6) Undervoltage release with electronic time delay device outside the circuit-breaker, see note B.)
7) Instantaneous undervoltage release in the version for machine tools with one contact in series (see notes B, C and F).

8) Instantaneous undervoltage release in the version for machine tools with two contacts in series (see Notes B, C and F).

9) First auxiliary early contact operated by the crank handle.

10) Second auxiliary early contact operated by the crank handle.

11) One changeover contact for electrical signaling of circuit-breaker open due to tripping of the residual current release type RC Inst, RC Sel, RC B Type or RC Sel 200.

12) Residual current release circuits type RC Sel, RC B Type or RC Sel 200.

13) Two contacts for electrical signaling of residual current release pre-alarm and alarm type RC Sel, RC B Type or RC Sel 200.
Motor operator

21) Direct control motor operator (MOD) (only for XT1 and XT3 fixed or plug-in circuit-breakers) (see note I).
22) Motor operator with stored energy (MOE) (only for circuit-breakers XT2 and XT4).
23) A contact for electrical signaling of stored energy motor operator that can be operated remotely.
Signaling contacts

31) One changeover contact for electrical signaling of circuit-breaker open or closed and one changeover contact for electrical signaling of circuit-breaker open due to tripping of the magnetic, thermal magnetic or electronic trip units, YO, YO1, YO2, YU (tripped position) (only for voltages up to 250V) (see notes E and I).

32) Two changeover contacts for electrical signaling of circuit-breaker open or closed, two change over contacts for electrical signaling of circuit-breaker open due to tripping of the magnetic, thermal magnetic or electronic trip units, YO, YO1, YO2, YU (tripped position) and one changeover contact for electrical signaling of circuit-breaker open due to tripping of the ther momagnetic or electronic trip unit (only for voltages up to 250V).

33) Three changeover contacts for electrical signaling of circuit-breaker open or closed and two changeover contacts for electrical signaling of circuit-breaker open due to tripping of the magnetic, thermal magnetic or electronic trip units, YO, YO1, YO2, YU (tripped position) (only for voltages up to 250V).
Signaling contacts

34) Three changeover contacts for electrical signaling of circuit-breaker open and one changeover contact for electrical signaling of circuit-breaker open due to tripping of the magnetic, thermal-magnetic or electronic trip units, YO, YO1, YO2, YU (tripped position) (only for voltages up to 250V).

35) One changeover contact for electrical signaling of circuit-breaker open due to tripping of the thermal magnetic electronic trip unit (only for voltages up to 250V).

36) Two changeover contacts for electrical signaling of circuit-breaker open or closed and one changeover contact for electrical signaling of circuit-breaker open due to tripping of the magnetic, thermal magnetic or electronic trip units, YO, YO1, YO2, YU (tripped position) (only for voltages up to 250V).

37) One changeover contact for electrical signaling of circuit-breaker open or closed and one changeover contact for electrical signaling of circuit-breaker open due to tripping of the magnetic, thermal magnetic or electronic trip units, YO, YO1, YO2, YU (tripped position) (only for voltage up to 400V).

38) Two changeover contacts for electrical signaling of circuit-breaker open or closed (only for voltage up to 400V).
39) Three supplementary changeover contacts for electrical signaling of circuit-breaker open or closed (only for fixed or plug-in version circuit-breakers).
41) First changeover position contact of the circuit-breaker, for electrical signaling of connected (only for plug-in or withdrawable version circuit-breakers).
42) Second changeover position contact of the circuit-breaker, for electrical signaling of connected (only for plug-in or withdrawable version circuit-breakers).
43) Third changeover position contact of the circuit-breaker, for electrical signaling of connected (only for plug-in or withdrawable version circuit-breakers).
44) Fourth changeover position contact of the circuit-breaker, for electrical signaling of connected (only for plug-in or withdrawable version circuit-breakers).
45) First changeover position contact of the circuit-breaker, for electrical signaling of isolated (only for withdrawable version circuit-breakers).
46) Second changeover position contact of the circuit-breaker, for electrical signaling of isolated (only for withdrawable version circuit-breakers).
48) Auxiliary circuits of the 24V auxiliary power supply unit and of the HMI030 type interface unit (see note E).
Signaling contacts

104) Auxiliary circuits of Ekip Com or Kit of 24V DC auxiliary voltage for electronic trip units and of Ekip Multimeter display.
Electronic trip unit Ekip E-LSIG connected with Ekip Display or Ekip LED Meter

50) Auxiliary circuits of the Ekip E-LSIG microprocessor-based release connected to the Ekip Display (display) or Ekip LED Meter (current display) display unit.
Electronic trip unit Ekip LSI, Ekip LSIG, Ekip M-LRIU connected with Ekip Display or Ekip LED Meter

51) Auxiliary circuits of the electronic trip unit type Ekip LSI, Ekip LSIG or Ekip MLRIU connected to display unit type Ekip Display (display) or Ekip LED Meter (current display).

Instructions for resetting the circuit-breaker after tripping

Selection of the type of circuit-breaker resetting depends on design requirements and on service conditions.
Resetting can take place following tripping of the following releases:
- overcurrent;
- undervoltage;
- shunt opening.

The following three possibilities are suggested (see diagrams in the following page):

1. Only manual resetting
   To be wired (by the customer): contact SO1, contact SY/1 and the auxiliary relay KO (only for MOD).
   Opening is prevented until the circuit-breaker is in the tripped position.
   To reset the circuit-breaker it is necessary to activate the special lever on the front of the motor until the circuit-breaker goes into the open position.

2. Electrical resetting under the operator’s responsibility
   To be wired (by the customer): contact SO1, SO2, contact SY/1 and the auxiliary relay KO (only for MOD).
   Opening of the circuit-breaker is allowed by means of the contact SO2. Such contact shall be protected to avoid unwanted activation and can be used only if the information received by the operator make it possible to exclude tripping due to a short-circuit, or if the causes of the short-circuit have been removed.

3. Electrical resetting always allowed
   To be wired (by the customer): contact SO1, SO2, contact SY/1 and the auxiliary relay KO (only for MOD).
   Opening is always allowed by means of contact SO2.

NB: If the magnetic, thermal magnetic or electronic trip unit is present, it is necessary to find the causes which led to the circuit-breaker being in the tripped position so as to prevent reclosing under short-circuit conditions. In all cases, manual resetting is always allowed.
