A complete range of standardized cells

FlexiCell is a range of modular spot welding cells dedicated to the car body sub-assemblies and the preparation of body components.

A cell is composed of an electrical cabinet including API, a supply panel, two fixed tables for parts fixture, one spot welding dressed robot, a safety fence and the man/machine interface.

All these equipment are installed on a metallic platform integrating all cables to allow this cell to be transportable after tests without being dismounted.

Composed with modular equipment, the production cells FlexiCell can be used independently or combined together to form an assembly line, mini-assembly zones or a complete workshop.

Advantages

• **Capacity investment**

As it is made of modular equipment, more than 60% of your FlexiCell investment can be re-used for another part production.

The solution can also be used for batches production due to the quick tooling change fixture (less than 5 min)

• **High level of reliability**

All equipment used to build a FlexiCell has been 100% tested in our workshop.

Using the complete capacity of our robots in spot welding and material handling, the solutions only include reliable and non expensive peripheral equipments.

• **Time reduction**

The pre-studied cells decrease the time dedicated to assembly line design and mechanical & automation studies. Working with a modular concept, the basic and specific equipment of the project can be realized in the same time to reduce the manufacturing delay.

The on-site installation and start of production are completed done in some days, thanks to the metallic platform on which all equipment are fixed.
Production cell with 3 ABB robots IRB 6600, geometrical tooling on a turntable and one fixed station for finishing application.

**DESCRIPTION OF BASIC FlexiCell Sub 3R2C1F**

- 1 platform with fluid supply
- 1 electrical cabinet with API
- 2 supply panels
- 3 IRB 6600 robots
- 1 man/machine interface with operator panel
- 3 robot controllers
- 2 spot welding guns fixed on robots' wrist
- 1 spot welding gun fixed on the platform
- 1 gripper for the finishing robot
- 3 tip dressers
- 2 geometrical tools
- 1 turntable
- 1 conveyor for parts extraction (not included in the cell)
- safety device for operation in front of the turntable
- safety fence

**TECHNICAL DATA FlexiCell Sub 3R2C1F**

- Tooling dimension: Diameter < 1400 mm
- Production capacity: 3000 spots/h
- Weight: 16 tons
- Type of produced parts: 1 / batch

**TYPES OF TOOLING POSITIONING**

For the two versions, ABB proposes a quick tooling change

Version 1: Horizontal tooling
Version 2: Tooling with 30% inclination

**PRODUCTION CYCLE DESCRIPTION**

The operator unloads and loads on one tooling while the robots weld on the second tooling and vice versa, at the end of the cycle. After the operator's validation, the turntable makes a 180° rotation for a new cycle. The third robot is equipped with a gripper to take the part from the turntable and presents it to the fixed gun to finalize the welding operation. At the end, the robot puts the part on the conveyor to take it out of the cell. The operator safety is ensured by a laser radar or through other safety devices.

Load cycle
