Oil and gas operators are poised to reap the benefits of advances in field devices and back-end analytics

Introduction
Using Internet of Things and related technologies, operators in the oil and gas industry have an opportunity to extract substantial value from the data flowing from wellheads by digitizing them. Cost reduction leads the list of expected benefits of remote monitoring and analytics.
Conclusion

Companies that embrace digitalization will position themselves to uncover value, without needing to initiate large capex projects to do so. The challenge will be making sure every development dollar spent generates real ROI. Given the rapid pace of innovation in the areas of analytics, cloud services and field devices, more options for wellhead digitalization are likely to emerge over the coming years.
