UPS USER MANUAL

MegaFlex

1000 to 1600 kW UL S1
Dear Customer,

We thank you for selecting our products and are pleased to count you amongst our very valued customers at ABB.

We trust that the use of the MegaFlex 1000 to 1600 Uninterruptible Power Supply System, developed and produced to the highest standards of quality, will give you complete satisfaction.

Please read carefully the User Manual, which contains all the necessary information and describes all you need to know about the use of the UPS.

Thank you for choosing ABB!

Start-up and commissioning!
An ABB Global Services Field Engineer must perform start-up and commissioning of the UPS. Please contact ABB Service Center at least two weeks prior to schedule start-up and commissioning at 1-800-292-3739.

Distributed in the USA by

ABB Service Center
To get important information on all equipment warranties, please contact the ABB Service Center or request service follow-up or by scanning the QR code.
Preface

Congratulations on your choice of a MegaFlex 1000 to 1600 Uninterruptible Power Supply (UPS). It will keep you away from any trouble due to unexpected power problems.

This User Manual describes the function of the UPS module, the purpose and location of the switches, the meaning of the system events related to the front panel indication and provides procedures for starting and stopping the equipment.

Please refer to the accompanying Installation Guide, which describes how to prepare the installation site, and it provides weight, dimensions and procedures for moving, installing and connecting the UPS.

While every care has been taken to ensure the completeness and accuracy of this manual, ABB assumes no responsibility or liability for any losses or damages resulting from the use of the information contained in this document.

---

Note!

MegaFlex 1000 to 1600 is a Category C3 UPS Product (according to IEC 62040-2).

This is a product for commercial and industrial application in the second environment – installation restrictions or additional measures may be needed to prevent disturbances.

---

Safety instructions

Carefully read the safety instructions contained on the following page before the installation, start-up and maintenance of the UPS, options and Battery.

Pay attention to the rectangular boxes included in the text:
They contain important information and warning concerning electrical connections and personnel safety.

---

Parallel System secured with “RPA – Redundant Parallel Architecture”

When included in the text, this symbol refers to operation needed only for the RPA Parallel System.

1 Safety rules

Save these instructions!

This manual contains important instructions for models MegaFlex 1000 to 1600 that should be followed during installation and maintenance of the UPS and Battery.

General
- Move the UPS in an upright position in its original package to the final destination room.
- To lift the cabinets, use a forklift or lifting belts with spreader bars.
- Check for sufficient floor and elevator loading capacity.
- Check the integrity of the UPS equipment carefully.
  If you notice visible damage, do not install or start the UPS.
  Contact your ABB Service Center immediately.
- WARNING! RISK OF ELECTRICAL SHOCK!
  Do not remove covers, there are no user serviceable parts inside.
- After switching off takes 5 minutes for the DC capacitors to discharge because a lethally high voltage remains at the terminals of the electrolytic capacitors.
- UPS's and Battery system require a 12 months periodic maintenance to operate reliably and safely.
  This should be performed by qualified service personnel. The UPS contains its own energy source (Battery).
- The field wiring outlets may be electrically live, even when the UPS is disconnected from the Utility.
- Dangerous voltages may be present during Battery operation.
- The Battery must be disconnected during maintenance or service work.
- This UPS contains potentially hazardous voltages.
- Be aware that the Inverter can restart automatically after the Utility voltage is restored.
- End user must follow applicable regional occupational safety codes/regulations during installation, operation and equipment maintenance. This may require additional field marking or labelling defining appropriate level of PPE (Personal Protection Equipment) to reduce the risk of Arc-flash related injuries.
  Contact our ABB Service Center for product specific information.

Installation
- This UPS must be installed and connected only by trained personnel.
- Verify accurately during Commissioning and Maintenance of the UPS, for the following:
  Damaged components, squeezed wires and cables, or not correctly inserted plugs.
- After removing the sidewalls of the UPS, make sure that all earth connections when reassembling, are correctly reattached.
- This UPS is intended for use in a controlled indoor environment free of conductive contaminants and protected against animals intrusion.
- WARNING! HIGH LEAKAGE CURRENT TO GROUND:
  Ground connection is essential before connecting to AC input!
- Switching OFF the Unit does not isolate the UPS from the Utility.
- Do not install the UPS in an excessively humid environment or near water.
- Avoid spilling liquids on or dropping any foreign object into the UPS.
- The Unit must be placed in a sufficiently ventilated area; the ambient temperature should not exceed 104°F (40°C).
- Optimal Battery life is obtained if the ambient temperature does not exceed 77°F (25°C).
- It is important that air can move freely around and through the Unit. Do not block the air vents.
- Avoid locations in direct sunlight or near heat sources.

Storage
- Store the UPS in a dry location; storage temperature must be within -13°F (-25°C) to 131°F (+55°C).
- The optimal temperature for Battery storage is 68°F (20°C) to 77°F (25°C) and shall never exceed the range -4°F (-20°C) to 104°F (40°C).
- If the Unit is stored for a period exceeding 3 months, the Battery must be recharged periodically (time depending on storage temperature).

Battery
- The Battery-voltage is dangerous for person's safety.
- When replacing the Battery, use the same number, voltage (V) and capacity (Ah).
- Proper disposal or recycling of the Battery is required.
  Refer to your local codes for disposal requirements.
- Never dispose of Battery in a fire: they may explode.
- Do not open or mutilate Battery: their contents (electrolyte) may be extremely toxic.
  If exposed to electrolyte, wash immediately with plenty of water.
- Avoid charging in a sealed container.
- Never short-circuit the Batteries.
  When working with Batteries, remove watches, rings or other metal objects and only use insulated tools.
- In case of air shipment, the cables +/- going to the Battery fuses/terminals shall be disconnected and isolated.
Safety instructions when working with Battery

Danger!

External Battery must be installed and connected to the UPS by Qualified Service Personnel. Installation Personnel must read this entire section before handling the UPS and Battery.

Full voltage and current are always present at the Battery terminals.
The Battery used in this system can provide dangerous voltages, extremely high currents and a risk of electric shock.
If the terminals are shorted together or to ground they may cause severe injury.
You must be extremely careful to avoid electric shock and burns caused by contacting Battery terminals or shorting terminals during Battery installation.
Do not touch uninsulated Battery terminals.

A qualified service person, who is familiar with Battery systems and required precautions, must install and service the Battery.
The installation must conform to national and local codes.
Keep unauthorized personnel away from the Battery.

The qualified service person must take these precautions:

1. Wear protective clothing, such as rubber gloves and boots and protective eye wear.
   Battery contain caustic acids and toxic materials and can rupture or leak if mistreated.
   Remove rings and metal wristwatches or other metal objects and jewellery.
   Do not carry metal objects in your pockets where the objects can fall into the Battery cabinet.
   High energy through conductive materials could cause severe burns.

2. Tools must have insulated handles and must be insulated so that they will not short Battery terminals.
   Do not allow a tool to short between individual or separate Battery terminals or to the cabinet or rack.
   Do not lay tools or metal parts on top of the Battery and do not lay them where they could fall onto the Battery or into the cabinet.

3. Disconnect charging source prior to connecting or disconnecting Battery terminals.
   Install the Battery as shown on the drawing provided with the Battery.
   When connecting cables, never allow a cable to short across a Battery’s terminals, the string of Battery, or to the cabinet or rack.

4. Align the cables on the Battery terminals so that the cable lug will not contact any part of the cabinet or rack, even if the Battery is moved.
   Keep the cable away from any sharp metal edges.

5. Install the Battery cables in such a way that the UPS or Battery cabinet doors cannot pinch them.

6. Do not connect the Battery terminal to Ground.
   If any Battery terminal is inadvertently grounded, remove the source of the ground.
   Contacting any part of a grounded Battery can cause a risk of electric shock.

7. Determine if Battery is inadvertently grounded. If inadvertently grounded, remove source from ground.
   The likelihood of such shock can be reduced if such grounds are removed during installation and maintenance.

8. To reduce the risk of fire or electric shock, install the Battery in a temperature and humidity controlled indoor area, free of contaminants.

9. Battery system chassis ground (earth) must be connected to the UPS chassis ground (earth).
   If you use conduits, this ground conductor must be routed in the same conduit as the Battery conductors.

10. Where conductors may be exposed to physical damage, protect the conductors in accordance with all applicable codes.

11. If you are replacing the Battery or repairing Battery connections, shut OFF the UPS and remove the Battery fuses.
1.1 Safety symbols and warnings

Safety warnings

The text of this manual contains some warnings to avoid risk to the persons and to avoid damages to the UPS system and the supplied critical loads.

The non-observance of the warnings reminding hazardous situations could result in human injury and equipment damages.

Please pay attention to the meaning of the following warnings and symbols.

Throughout this manual the following symbols are defined:

- **Warning**, if instruction is not followed injury or serious equipment damage may occur!

- **Caution**, internal parts have dangerous voltage present.
  Risk of electric shock!

- **PE (Earth) – GND (Ground)**
  Protective Grounding terminal:
  A terminal which must be connected to earth ground prior to making any other connection to the equipment.

- **A terminal to which or from which an alternating (sine wave) current or voltage may be applied or supplied.**

- **A terminal to which or from which a direct current or voltage may be applied or supplied.**

- **This symbol indicated the word “phase”.**

- **This symbol indicates the principal ON/OFF switch in the on position.**

- **This symbol indicates the principal ON/OFF switch in the off position.**
1.2 Cyber security

UPS must be protected in a Security Restricted Area.

UPS must be installed in a location/room with mechanical lock.

Limit access to authorized personnel only and it shall stay under Authorized Personnel Operator to manage the accesses.

The UPS products are designed to be connected and to communicate information and data via a network interface through the optional SNMP card, which should be connected to a secure network. It is customer sole responsibility to provide and continuously ensure a secure connection between the product and customer network or any other network and to establish and maintain appropriate measures (such as but not limited to the installation of firewalls, application of authentication measures, encryption of data, installation of antivirus programs, etc.) to protect the UPS product, the network, its system and interfaces against any kind of security breaches, unauthorized access, interference, intrusion, leakage and/or theft of data or information.

ABB Ltd and its affiliates are not liable for damages and/or losses related to such security breaches, unauthorized access, interference, intrusion, leakage and/or theft of data or information. Although ABB provides functionality testing on the products and updates that we release, you should institute your own testing program for any product updates or other major system updates (to include but not limited to code changes, configuration file changes, third party software updates or patches, hardware change out, etc.) to ensure that the security measures that you have implemented have not been compromised and system functionality in your environment is as expected.

3 Introduction

The MegaFlex 1000 to 1600 Uninterruptible Power Supply (UPS) provides the energy supply for critical loads which need a reliable, continuous free from voltage disturbances and frequency fluctuations supply.

In case the power provided by the Utility Fails, or exceeds the permitted tolerances, the power to supply the Load is provided by the Battery for the specified time at the rated Load (or longer at a reduced Load) or until the Utility power returns.

MegaFlex 1000 to 1600 is a truly VFI double conversion Uninterruptible Power Supply (UPS), equipped with automatic bypass, where the Load is normally supplied by the Inverter.

If the Inverter is not able to supply the required Output Voltage, or when overload or short-circuit on the output occur, the Load is instantly transferred to the Utility via the Automatic Bypass.

The UPS automatically returns to normal mode when the failure condition is restored.

MegaFlex 1000 to 1600 can be configured, if chosen, for the eBoost™ Operation Mode (Option - High efficiency: up to 99.0% / Fast power transfer: <2ms) permitting maximum energy saving.

Key features of the MegaFlex 1000 to 1600

More Critical equipment supported
Rated at 1 Power Factor, MegaFlex 1000 to 1600 delivers more real power than other UPS in the market.

With today's trend toward power factor corrected loads, MegaFlex 1000 to 1600 can support more total Load than any other UPS available, allowing you to support a greater number of today's enterprise computing Power Factor Corrected (PFC) equipment.

High Efficiency
Thanks to type Advanced Neutral Point Clamped three level IGBT technology, MegaFlex 1000 to 1600 guarantees a high overall performance.

Intelligent Energy Management (IEM) combined with RPA, results in the most cost efficient and reliable UPS solution in the industry.

Fully digital
Digital Signal Processor (DSP), Flash memory and Advanced Neutral Point Clamped are the technology cornerstones of a new age of power quality and power reliability.

RPA™ - Redundant Parallel Architecture™ Parallel System
ABB provides a unique technology called Redundant Parallel Architecture™ (RPA™) that can parallel Uninterruptible Power Supply (UPS) modules with true redundancy.

With RPA™, there is no need for external electronics or switches to control the UPS modules in the parallel system. One of the UPS modules in the system arbitrarily takes a leadership role, while the other UPS modules have access to all control parameters.

If one UPS fails to operate, the load is automatically redistributed among the others.

If the lead UPS fails to operate then a different UPS automatically takes on the leadership role.

The RPA™ systems are designed to have no single points of failure, ensuring the highest level of power protection for critical loads.

Extremely flexible
Tailor made power protection to meet your individual installation requirements; MegaFlex 1000 to 1600 offers various options like EMC filter and our comprehensive software for mission control and data protection to cover all your application needs.
4 Description

MegaFlex 1000 to 1600 is one of the best performing and most reliable three-phase UPS systems providing critical power protection for a wide range of applications.

Every MegaFlex 1000 to 1600 system operates in VFI mode (Voltage Frequency Independent) yielding the maximum levels of power reliability for all mission-critical processes.

With proven technology the MegaFlex 1000 to 1600 UPS provides top class reliability and performance.

With Back-feed Protection and compliance to EMC standards the MegaFlex 1000 to 1600 complies to current standards.

Reliability can be further increased by paralleling up to six UPS units utilizing ABB’s unique RPA™ technology (Redundant Parallel Architecture).

With RPA every UPS is controlled in a true peer-to-peer configuration with redundancy in all critical elements and functions, eliminating all single points of failure.

The decentralized bypass offers great flexibility to up or down grade the system in case future needs might change.

MegaFlex 1000 to 1600, best in class efficiency

- High efficiency in double conversion mode up to 96.0/96.3% and eBoost™ operation mode up to 99.0%.
- High efficiency at partial and reduced loads for cost benefits in operating conditions.
- Higher efficiency at partial load in RPA Systems with adaptive capacity control.
- MegaFlex 1000 to 1600 products designed in compliance with UL 1779 standard, C3 level for immunity, i.e. can withstand possible disturbances and noise without affecting standard operating conditions.
- Advanced User Interface with touch screen display guided menu.
- Reduced energy consumption costs.
- Reduced size and costs of the air conditioning system.
- Compact design, saving installation space.

Note!

Through their complete life cycle, all ABB UPS Systems are fully supported by service teams which provide world-class, 24x7 preventive and corrective services, training and application expertise.
### 4.1 Block diagram and main elements

![Block Diagram MegaFlex 1000 to 1600](image)

Fig. 4.1-1  Block Diagram MegaFlex 1000 to 1600

The MegaFlex 1000 to 1600 system can be divided into the following main elements:

**Control System**
MegaFlex 1000 to 1600 is designed with microprocessor-controlled signal processing circuits. The interface between the operator and the unit is provided by the monitoring system on the front panel. This monitoring system consists of an active mimic diagram, a keyboard and a backlit display.

**Rectifier**
The Active IGBT Rectifier converts the 3-phase utility voltage into a controlled and regulated DC-voltage, supplying the Inverter and to charge the Battery through the Battery-charger. Thanks to modulation strategy applied to IGBT Bridge, the rectifier provides clean input power in terms of low THDi and unity power factor.

**Inverter**
The Inverter converts the DC voltage into a three-phase AC-voltage with constant amplitude and frequency, which is completely independent and isolated from the AC-input voltage.

**Automatic Bypass**
The Automatic Bypass consists of a static semiconductor-switch (SSM: Static Switch Module), used to provide an uninterrupted transfer of the Load from Inverter to Utility.

**Back-feed Protection**
MegaFlex 1000 to 1600 UPS is equipped with an automatic system for the protection against voltage back feeding towards Utility, through the Bypass (UL 1778 and CSA C22.2 no. 107.3). This protection works automatically by opening contactor K6 (in series with the thyristors of the static switch).

**Battery**
The Battery supplies the DC power to the Inverter when the Utility is out of acceptable tolerances.
4.2 Operation modes

This section describes the different possible operation modes of the UPS explaining the function of the main modules of the UPS.

4.2.1 Normal VFI Operation Mode (Voltage Frequency Independent)

Under normal conditions the Load is permanently powered by the Inverter with constant amplitude and frequency.

The Rectifier, powered by the Utility, supplies the Inverter and the Battery-charger keeps the Battery fully charged.

The Inverter converts the DC voltage in a new AC sine wave voltage with constant amplitude and frequency independently from the input Utility Power.

![Fig. 4.2.1-1 Block diagram normal operation mode](image)

4.2.2 eBoost™ Operation Mode (option)

**eBoost™**

- **e** High efficiency (up to 99.0%)
- **Boost** Fast power transfer (< 2ms)

When the eBoost™ Operation Mode is selected, and the Utility Power is available, the Load is normally powered through the Automatic Bypass.

When the Utility Voltage is detected out of the prescribed tolerances, the Load is automatically transferred to the Inverter.

![Fig. 4.2.2-1 Energy flow in eBoost™ Operation Mode](image)

When the Utility recovers, the Load returns to the Automatic Bypass after a variable time defined by the control unit.

The eBoost™ Operation Mode can be used for single units or the RPA Parallel System, for up to 6 UPS modules, with all units individually able to supply power through a redundant communication bus.

The eBoost™ Operation Mode can be configured directly by the user for higher efficiency, considering the Utility reliability and criticality of the Load.

The selection between the two operation modes “VFI mode and eBoost™ Operation Mode”, or switching between operation modes at required time, can be done through the UPS Control Panel (see Section 6.4 / eBoost).

**Note!**

The eBoost™ Operation Mode is available only if enabled at the factory by an ABB Service Technician.
4.2.3 Utility Failure Operation

When the Utility is no longer within acceptable tolerances, the Battery will provide the DC power to the Inverter.

The Inverter will maintain continuous AC power to the Load until the Battery Voltage reaches the lower limit of the Inverter operation capability.

During the discharge, the LCD screen displays the estimated time the Battery can support the critical load. Prior to the Battery completely discharging, the “stop operation” alarm (shut-down imminent) warns the operator that the Battery is almost discharged and the UPS is about to shut-down.

Fig. 4.2.3-1  Block diagram Utility Failure operation

In case of RPA Parallel System

With a Parallel System for Power Capacity (see Section 4.3)

• With the Bypass Utility power available, a “Battery low” warning on any unit will cause the Load to be transferred to Utility (after a selectable time delay).

• With Bypass Utility power not available, a “Battery low” warning on any unit will start the “stop operation” timer (adjustable).

  The Load will shut down at the end of the “stop operation” time period.

With a Parallel System for Redundancy (RPA - see Section 4.3)

• When a Battery low warning occurs on a unit not necessary to support the present Load, this unit will shut down after a timeout period (selectable).

  The Load is shared between the other units.

• As the warning occurs on one unit necessary to support the present Load, the system starts the “stop operation” timeout (selectable).

  The Load will shut down at the end of the “stop operation” time period.

4.2.4 Utility Recovery Operation

As soon as the AC input power recovers, the Rectifier will start automatically, supplying DC power to the Inverter and recharging the Battery.

If the Inverter was previously shut-down due to low Battery, the Load will be initially powered by Utility through the Automatic Bypass.

When the Battery is recharged enough to ensure a minimum time of operation with the present load, the Inverter will start automatically and the Load will be transferred back to the Inverter.

Fig. 4.2.4-1  Block diagram Utility recovery operation

In case of RPA Parallel System

When the AC input power recovers, the Rectifiers will start-up sequentially, according to their number in the RPA Parallel System. This minimizes the initial inrush current.

The Inverters will start-up automatically, but only when the Battery has been sufficiently recharged for a minimum runtime with the present Load.

When enough Inverters to supply the Load have been restarted, the Load will be transferred from the Automatic Bypass back to the Inverter output.
4.2.5 Automatic Bypass

In normal operation, the Load is supplied by the Inverter.

When the control system detects a fault in the Inverter, an overload condition or a short-circuit condition, the Automatic Bypass will transfer the critical Load to the Utility without interruption.

When the Inverter recovers, or the overload or short-circuit condition is corrected, the Load will be automatically transferred back to the Inverter.

If the UPS is unable to return to normal mode following an automatic transfer to Bypass mode, an alarm condition will be initiated.

---

In case of RPA Parallel System

Each unit has its own internal Static Bypass.

These units are continuously exchanging information, enabling all of the internal Bypass circuits in an RPA Parallel System to operate simultaneously.

If the Inverter of a unit fails, its Bypass circuit remains available to the RPA Parallel System.

It is excluded only if the unit is separated from the common bus by opening its “Q1 – External UPS Output Circuit Breaker”.

---
4.3 RPA Parallel System operation

4.3.1 Introduction to the RPA Parallel System

Fig. 4.3.1-1  Block diagram RPA Parallel System operation

Two or more equal power Units can be paralleled to increase the output power (Paralleling for Capacity) or to improve the overall reliability of an UPS system (Paralleling for Redundancy).

The outputs of Parallel Units are connected to a common power bus, and in normal operation the Units connected on the Parallel Bus share the Load equally.

The modular concept of MegaFlex 1000 to 1600 allows parallel operation of up to 6 Units, without using paralleling switchgear, external bypass circuits or common control circuitry (see Fig. 4.3.1-1).

Parallel Units for Power Capacity

Several Units can be paralleled in order to achieve output power greater than the maximum power of a Single Unit.

The maximum total power shared between the Paralleled Units is equal to the total installed nominal power.

In the event of a failure of one Unit, the power supplied by the UPS system becomes insufficient and the Load will be transferred to the Utility Bypass source.

Parallel Units for Redundancy

The nominal power rating of the n out of n+1 Redundant Paralleled Modules must be equal to or higher than the required Load power.

The Load will be equally shared by the n+1 Units connected on the output bus.

Should one of the n+1 Paralleled Units trip Off-line, the remaining (n) Modules will supply the Load, maintaining conditioned power to the critical Load.

From this result higher reliability and security for the Load plus a higher MTBF (Mean Time Between Failures).
4.3.2 Features of RPA Parallel System

MegaFlex 1000 to 1600 RPA Parallel System is designed to provide a complete Redundant Parallel Architecture and is free from common equipment. Not only the Inverters but also the Bypass functions are redundant.

When one UPS needs maintenance or service, the Load is powered by the other Units.

The redundant communication bus to which all Units are connected keeps each Unit informed about the status of all the other Units.

The Control Panel located on each Unit allows controlling and monitoring the status of this Unit.

4.3.3 System control

A High-Speed Redundant Communication guarantees the exchange of data and thus the communication between the CPU's of each Unit.

Each Module controls its own function and operational status and communicates with all other Modules, in order to act or react if necessary, adapting to the new conditions.

4.3.4 Synchronization

All Units are identical, but one Unit is arbitrarily selected as the reference and all the other Units synchronize to this Unit, which in turn synchronizes to the Utility Bypass voltage, as long as the latter is within tolerances.

In case of reference failure, another Unit in the RPA Parallel System is automatically chosen to take over the reference role.

The Bypass Input for all the Units of the RPA Parallel System must be supplied from the same AC source (no phase shift allowed between them).

4.3.5 Load sharing

On each Unit of the RPA Parallel System, Inverter Output Voltage and Current are measured and applied to a Load sharing bus.

An eventual difference between the Units is therefore automatically equalized.

---

**Note!**

As indicated in this manual, the “Q1 - External UPS Output Circuit Breaker” with dedicated Auxiliary Contact to be connected to the UPS is required. See Section 4.11.2 of the Installation Guide.

It is strongly recommended that no Transformers, Automatic Circuit Breakers or Fuses should be installed between the Units Output and the Load Common Bus Bars, except the “Q1 - External UPS Output Circuit Breaker” as mentioned above.
4.4 Service and technical support

For any request of technical support please contact your local ABB Service Center.

The requested data permitting to identify your UPS are marked on the identification label fixed on the front of the cabinet, behind the lower front door.

For fast and efficient technical support please mention the data marked on the identification label.

4.5 Warranty

ABB, operating through its authorized agents, warrants that the standard products will be free of defects in materials and workmanship for a period as per contract specifications.

**Note!**

This warranty does not cover failures of the product which result from incorrect installation, misuse, alterations by persons other than authorized agents, or abnormal working conditions.
4.6 Recycling instructions

Note!
This product has been designed to respect the environment, using materials and components respecting eco-design rules.
It does not contain CFCs (Carbon Fluor Chlorid) or HCFCs (Halogen Carbon Fluor Chlorid).

Packing material recycling!
ABB, in compliance with environment protection, uses only environmentally friendly material at the end of its service life, must be recovered conforming to the local applicable regulations.
UPS packing materials must be recycled in compliance with all applicable regulations.

Recycling at the end of service life!
ABB, in compliance with environment protection recommends to the User that the UPS equipment, at the end of its service life, must be recovered conforming to the local applicable regulations.

Battery disposal!
Leads contained in the Batteries is a dangerous substance for the environment, therefore it must be correctly recycled by specialized companies.
5 Control Panel

5.1 Control Panel

The Control Panel, positioned on the UPS front door, acts as the UPS user interface.

Main features:

- LCD Touch screen color graphic display. See Chapter 6.
  - Multilanguage communication interface:
    - English, German, Italian, Spanish, French, Finnish, Polish, Portuguese, Czech, Slovenian, Chinese, Swedish, Russian and Dutch.
    - Synoptic diagram indicating UPS status.
- Command keys and parameters setting.
- UPS status control LED.
6 LCD screen

Composed of an LCD color “Touch Screen” which provides the following information to users:

- Synoptic diagram indicating UPS status.
- UPS operating, AC and DC metering information.
- History of events (alarms and messages).
- Functionality can be programmed to meet customer needs by changing parameters.
- Operation commands of the UPS.

6.1 Home screen

The LCD screen, after 5 minutes of inactivity, shuts down the backlight. To reactivate it, it is sufficient to press any keys mentioned to Section 6.1.1.

If the keypad remains inactive for 5 minutes or longer, during the viewing of a screen such as MEASURES, EVENTS, SETUP, RPA Parallel System or COMMANDS, the LCD screen returns automatically to the main screen.

Pressing the key “UPS status” for a few seconds automatically sets the “ENGLISH” language on the LCD screen.
6.1.1 Description of the selection keys

- **MEASURES**: Shows electric parameters values and statistics of use. See Section 6.2.

- **EVENTS**: Shows in chronological order, all the events occurred (alarms, messages, commands, handling, etc.). See Section 6.3.

- **SETUP**: Allows the user to customize some UPS functions to specific requirements and to view UPS identification data. See Section 6.4.

- **COMMANDS**: Allows the user to execute UPS operation commands. See Section 6.5.

- **RPA Parallel System**: Shows the status of operation of the RPA Parallel System. See Section 6.6.

- **MUTE**: Key to reset general alarm and buzzer.
6.1.2 Description of the signaling LEDs

**Service Key (yellow color)**

Key for enabling service procedure executed only by ABB Service Center. When ON, indicates the service access is enabled (only by ABB Service Center).

The key is automatically generated by a dedicated ABB software and is based on the UPS serial number. Once generated can be inserted through the Control Panel in the UPS.

- The key is automatically entered via the ABB Service Software (only for ABB Service Center).
- Alternatively, an externally generated key can be entered via the Control Panel.

The service key allows the ABB Service Technician to access the list of parameters of the product. The service access will be disabled when the service software is closed or after 360 minutes if the software is disconnected unexpectedly or the key was entered manually.
LEDS UPS STATUS

**LOAD PROTECTED**

LED LOAD PROTECTED (green color)

When lit, indicates that the UPS is functioning correctly and the Load is system protected (Load supplied either from Inverter or from Automatic Bypass in case of eBoost™ Operation Mode).

When blinking, indicates that a regular maintenance service is needed (SERVICE REQUIRED). May be reset by an ABB Service Technician only. See Section 9 – Maintenance – Service check.

The LED is OFF when “Q1 – External UPS Output Circuit Breaker” is open, indicating that the Inverter is in service mode, not supplying the Load.

**ALARM**

LED ALARM (yellow color)

It blinks when one or more alarm is activated. The internal Buzzer is ON.

The LED remains blinking (with the alarm condition still present) and the buzzer stops when the key “MUTE” is pressed.

The LED ALARM is also lighted when the Load is not protected by UPS or in case “Q1 - External UPS Output Circuit Breaker” is open.

**STOP OPERATION**

LED STOP OPERATION (red color)

It warns about the imminent Inverter stop (default parameter = 3 min.) and the consequent Load shut-down as result of:
- The Battery is fully discharged and the Load cannot be transferred on Utility.
- Overtemperature or overload condition (>102%) and the Load cannot be transferred on Utility.

**Bypass**

Data regarding Bypass. See Section 6.2.

**Rectifier**

Data regarding Rectifier. See Section 6.2.

**Load output**

Data regarding Load. See Section 6.2.

**Battery**

Data regarding Battery. See Section 6.2.

- Green color: indicates Battery charged.
- Yellow color: indicates STOP OPERATION status.
- Red color: indicates low Battery.
LEDs on Synoptic Diagram

LED 1  Rectifier
LED 2  Inverter
LED 3  Booster/Battery charger
LED 4  Automatic Bypass
LED 5  LOAD

Examples of typical scenarios in the Synoptic Diagram:

- **Load supplied by Inverter**

- **Load supplied by Automatic Bypass**

- **eBoost Operation Mode**

- **Load supplied by Battery**
6.2 Measures

The MEASURES mode is entered any time the "MEASURES" key is pressed.

The LCD screen will indicate a series of screenshots showing the measures of all electric parameters showing like AC, DC and various statistics.

In this mode the keys perform the following functions:

- **Return to HOME screen.**
- **Shows the main screen EVENTS.** See Section 6.3.
- **Shows the main screen SETUP.** See Section 6.4.
- **Shows the main screen COMMANDS.** See Section 6.5.
- **Shows the operating status of the RPA PARALLEL SYSTEM.** See Section 6.6.
- **Key to reset general alarm and buzzer.**
- **Shows the screen Battery.**
- **Shows the screen Rectifier.**
- **Shows the screen Bypass.**
- **Shows the screen Inverter.**
- **Shows the screen Load.**
- **Shows the screen Booster.**
Battery screen

Voltage
The Battery voltage.

Current
The Battery current (negative values correspond to the discharge of the Battery).

Temperature
The temperature of the Battery (“XXX” indicates sensor disabled).

Autonomy
The estimated backup time with the present Load.

Note: The backup time is computed given the unit load. Therefore, during Battery operation every unit shows the true Battery autonomy.

Charge level
The Battery charge level.

On battery time
Total operating time of the UPS on Battery (in hours).

BATTERY DISCHARGE COUNTER / Residual Charge Level
The number of discharges combined with the percentage of the available residual Battery capacity at the time utility power is restored.

Battery charger status
Battery charge status (Off / Float / Boost).

Rectifier screen

Frequency
The input frequency of the Rectifier.

Voltage L12 / Voltage L23 / Voltage L31
3-phase Utility voltage PHASE / PHASE.

Voltage DC-link 1
DC-Link 1 voltage (positive).

Voltage DC-link 2
DC-Link 2 voltage (negative).

Main failure count
Total number of times a gap of utility in the Rectifier has been reordered.

Temperature
Rectifier inlet L1 Coil temperature (Normal / Alarm).

Temperature a / b / c / d
a- Temperature of the Rectifier bridge (module A).
b- Temperature of the Rectifier bridge (module B).
c- Temperature of the Rectifier bridge (module C).
d- Temperature of the Rectifier bridge (module D).
**Bypass screen**

**Frequency**
The frequency of the input Utility.

**Voltage L12 / Voltage L23 / Voltage L31**
3-phase Utility voltage PHASE/PHASE.

**Current L12 / Current L23 / Current L31**
Input Utility current for the 3-phases.

**Main failure count**
The total number of minor Utility faults (Bypass Utility out of tolerance faults).

**Number of fast transients**
The number of fast transients occurred on the bypass utility on the last seven days.

**Bypass quality index**
The statistic evaluation in % (100= good; 0= bad) of the Bypass utility.

**Temperature**
The temperature of the SSM - Static Switch Module (°C/ Alarm).

**Status**
Bypass status: free / blocked.

---

**Inverter screen**

**Frequency**
The output frequency of the Inverter.

**Voltage L12 / Voltage L23 / Voltage L31**
3-phase output voltage PHASE/PHASE.

**Status**
The synchronization status of the Inverter with respect to Utility:
- Synchronized.
- Not synchronized.

**Temperature**
“XXX” indicates disabled function.

**Temperature a**
The temperature of the Inverter bridge (module A).

**Temperature b**
The temperature of the Inverter bridge (module B).

**Temperature c**
The temperature of the Inverter bridge (module C).

**Temperature d**
The temperature of the Inverter bridge (module D).
LOAD screen

Voltage L12 / L23 / L31
Output voltage PHASE/ PHASE for each phase.

Current L1 / L2 / L3
The output current as RMS values for each phase.

Percent load L1 / L2 / L3
The output Load as percentage for each phase.

Apparent power
Total apparent Load power (kVA).

Active power
Total effective Load power (kW).

Power factor
Load power factor: + inductive load / - capacitive load

Status
Source of the power supplied to the Load.

Overload counter
Total number of detected output overloads.

Inverter operating time
Total operating time for the Inverter (in hours).

UPS operation time
Total operating time for the UPS (in hours).

eBoost operation time
Total operating time for the UPS in eBoost™ Operation Mode (in hours). This counter is displayed only when eBoost™ Operation Mode is available (option).

Booster screen

Battery voltage
The Battery voltage.

Battery current
The Battery current (negative values correspond to the discharge of the Battery).

Voltage DC-link 1
DC-link 1 voltage (positive).

Voltage DC-link 2
DC-link 2 voltage (negative).

Status
Booster status (Off / Booster / Charger).

Temperature
4th leg temperature.

Temperature a / b / c / d
a- Booster temperature (module A).
b- Booster temperature (module B).
c- Booster temperature (module C).
d- Booster temperature (module D).
6.3 Events

The EVENTS mode is entered any time the “EVENTS” key is pressed.

The LCD will display a series of screens corresponding to the last 511 events (User Log).

In this mode the keys perform the following functions:

- Shows the main screen MEASURES. See Section 6.2.
- Return to HOME screen.
- Shows the main screen SETUP. See Section 6.4.
- Shows the main screen COMMANDS. See Section 6.5.
- Shows the operating status of the RPA PARALLEL SYSTEM. See Section 6.6.
- Key to reset general alarm and buzzer.
- Shows the screen User Events.
- Shows the screen Service Events. Reserved for the ABB Service Center.
- Shows the previous 50 events.
- Shows the previous 5 events.
- Shows the next 5 events.
- Shows the next 50 events.
Screen Active Alarms

Shows active events with their ABB standard code and a text describing the event in the selected language.

Screen User Log

User Log

Chronologically view 5 events per screenshot.

Event characteristic:
- Number chronologically assigned to an event (Nr. 511 is the more recent, Nr. 1 is the first).
- Data (MM/DD/YYYY).
- Exact hour of the moment when the event occurred (HH/MM/SS/ thousandth).
- Number of standard ABB code of the event.
- Explicit text describing the event in the selected language.

Screen Service Log

Service Log

Chronologically view 5 events per screenshot with service related info.

Event characteristic:
- Number chronologically assigned to an event (Nr. 1022 is the more recent, Nr. 1 is the first).
- Data (MM/DD/YYYY).
- Exact hour of the moment when the event occurred (HH/MM/SS/ thousandth).
- Number of standard ABB code of the event.
6.3.1 Events (alarms and messages)

Each of the following listed events, alarm or message, can be displayed on the LCD screen, on a PC with the software "Data Protection" installed or with the monitoring system "iUPSGuard".

Alarms and Messages are differently specified because the **alarms** are indicating an abnormal functioning of the UPS (which are additionally signaled with the **LED ALARM** and acoustically with the **buzzer**), while the **messages** indicate the various states of operation of the UPS (stored in the events list, but not activating the LED ALARM and the acoustical alarm).

### 6.3.2 Alarms list

<table>
<thead>
<tr>
<th>Code</th>
<th>Alarm</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>4000</td>
<td>SETUP VALUES LOST</td>
<td>Parameters are lost and have been replaced with default values. Please contact your ABB Service Center for intervention.</td>
</tr>
<tr>
<td>4001</td>
<td>REGULATION BOARD FAILURE</td>
<td>A blocked DSP on the Control board causes this alarm and consequently the shut-down of Rectifier and Inverter and the opening of K3.</td>
</tr>
<tr>
<td>4004</td>
<td>UPS FAILURE ON PARALLEL SYSTEM</td>
<td>The master unit detected the slave unit missing on the communication bus even though &quot;Q1 – External UPS Output Circuit Breaker&quot; is still closed.</td>
</tr>
<tr>
<td>4006</td>
<td>BUS JA CRC FAILURE</td>
<td>The parallel communication bus system is subject to high errors rate on channel JA.</td>
</tr>
<tr>
<td>4007</td>
<td>BUS JB CRC FAILURE</td>
<td>The parallel communication bus system is subject to high errors rate on channel JB.</td>
</tr>
<tr>
<td>4008</td>
<td>BUS JA FAILURE</td>
<td>There is an interruption in the channel JA of the parallel communication bus system.</td>
</tr>
<tr>
<td>4009</td>
<td>BUS JB FAILURE</td>
<td>There is an interruption in the channel JB of the parallel communication bus system.</td>
</tr>
<tr>
<td>4010</td>
<td>CONNECTIVITY BUS FAILURE</td>
<td>The connectivity communication bus is faulty or interrupted.</td>
</tr>
<tr>
<td>4011</td>
<td>EARTH LEAKAGE CURRENT</td>
<td>The unit has detected an earth leakage current above a configured threshold (typically 5% of the maximum rated input current). Applicable to 3-wire (3ph+PE) distribution only.</td>
</tr>
<tr>
<td>4012</td>
<td>LOAD GROUND FAULT</td>
<td>The unit has detected load ground current above a configured threshold. Applicable to 3-wire (3ph+PE) distribution only.</td>
</tr>
<tr>
<td>4013</td>
<td>CAN BUS FAILURE</td>
<td>The Control Panel communication bus is faulty or interrupted.</td>
</tr>
<tr>
<td>4016</td>
<td>AC GROUND FAULT</td>
<td>For HRG systems only: an AC ground fault has been detected either on the Input Utility or on the Load. Detection is based on voltage RMS at the fundamental frequency of the UPS internal mid-point (to ground). In RPA systems, each UPS activates the alarm independently, based on its own mid-point to ground voltage.</td>
</tr>
<tr>
<td>4017</td>
<td>DC GROUND FAULT</td>
<td>For HRG systems only: a DC ground fault has been detected on the UPS internal DC-link. Detection is based on average (DC) voltage of the UPS internal mid-point (to ground). Default system reaction: transfer to Bypass, switch Rectifier and Inverter off, open K4 and K7. Once on Bypass, if alarm resets within a given timeout, Rectifier and Inverter will be restarted automatically, otherwise Booster and 4th leg will also be permanently switched off (manual intervention required to restart the unit). In RPA systems, each UPS activates the alarm independently, based on its own mid-point to ground voltage (anyway, expect to be the very same for all the units); system reaction will be consistent in any case, based on a majority decision; converters re-start following alarm reset is controlled by each unit independently.</td>
</tr>
<tr>
<td>4020</td>
<td>ELECTRONIC MODULE FRAME UNLOCKED (SAFETY)</td>
<td>The &quot;electronic module frame&quot; is open. Unit start-up is prevented in such condition.</td>
</tr>
<tr>
<td>Code</td>
<td>Alarm</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>------------------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>4021</td>
<td>Q1 HAS BEEN CLOSED PRESS [CONFIRM]</td>
<td>For safety reasons, when the auxiliary contact of the “Q1 – External UPS Output Circuit Breaker” indicates that it has been closed, this alarm is activated. This operation must be confirmed by pressing the “Q1 status CONFIRM” key in the “Commands 3” of the Control Panel display page. In an RPA System, if conditions allow it, the unit will follow the working mode of the other units defined by the master.</td>
</tr>
<tr>
<td>4100</td>
<td>RECTIFIER FUSES FAILURE</td>
<td>The u-switch mounted on the Rectifier input fuses indicates a blown fuse and consequently it is shut down. Clearance of this condition allows you to restart the Rectifier.</td>
</tr>
<tr>
<td>4102</td>
<td>K4 CLOSING FAILURE</td>
<td>K4 not closed despite a closing command being issued. Signaled by auxiliary contact. Rectifier cannot start.</td>
</tr>
<tr>
<td>4103</td>
<td>K4 OPENING FAILURE</td>
<td>K4 not open despite an opening command being issued. Signaled by auxiliary contact. Utility remains connected to Rectifier bridge.</td>
</tr>
<tr>
<td>4104</td>
<td>BATTERY FUSES FAILURE</td>
<td>This function, when enabled on input programmable relays (“Service Code” required), warns the user about the external Battery Fuses failure or MCB opening, signaled by NO free contact.</td>
</tr>
<tr>
<td>4105</td>
<td>RECTIFIER OVERTEMPERATURE</td>
<td>Temperature sensor indicates a situation of overtemperature on the Rectifier bridge. Only the alarm is given. The Rectifier, when in an Off state, cannot start as long as this condition persists.</td>
</tr>
<tr>
<td>4106</td>
<td>RECTIFIER TRANSFORMER OVERTEMPERATURE</td>
<td>The temperature sensor inside the input transformer winding indicates overtemperature. Only the alarm is given. The Rectifier, when in an Off state, cannot start as long as this condition persists.</td>
</tr>
<tr>
<td>4110</td>
<td>RECTIFIER UTILITY OUT OF TOLERANCE</td>
<td>Rectifier Input Utility is out of tolerance (voltage, frequency or phase sequence).</td>
</tr>
<tr>
<td>4115</td>
<td>LOW BATTERY VOLTAGE</td>
<td>The Battery has been discharged and reached “stop operation” time-out (default 3 minutes) and the Inverter will be shut down. It will restart automatically only when the Battery has recharged enough for a minimum runtime.</td>
</tr>
<tr>
<td>4116</td>
<td>HIGH BATTERY VOLTAGE</td>
<td>Dangerous high DC Voltage caused Inverter shut-down. Inverter restarts automatically after Battery returns to floating voltage.</td>
</tr>
<tr>
<td>4117</td>
<td>BATTERY EARTH FAULT</td>
<td>A leakage current to earth has been detected on the DC circuit.</td>
</tr>
<tr>
<td>4118</td>
<td>BATTERY FAULT</td>
<td>During Battery test the voltage falls under the critical level (depending setting parameters). Battery test is stopped.</td>
</tr>
<tr>
<td>4120</td>
<td>HIGH DC RIPPLE</td>
<td>A high ripple is present in the Battery voltage.</td>
</tr>
<tr>
<td>4125</td>
<td>HIGH DC-LINK VOLTAGE</td>
<td>Detection of high voltage on the DC-link. The Rectifier, Booster and Inverter will switch off for protection purposes. The Rectifier may only be switched on again if the DC-link’s voltage value falls below 430Vdc.</td>
</tr>
<tr>
<td>4126</td>
<td>4th LEG CONTROL SATURATION (I_max)</td>
<td>The current in the fourth leg has reached its highest value.</td>
</tr>
<tr>
<td>4130</td>
<td>TURN ON RECT. OR SHUTDOWN UPS</td>
<td>Rectifier and Inverter are OFF. The DC power supply is discharging the Battery. Rectifier must be restarted, or the Battery must be disconnected in order to avoid damage.</td>
</tr>
<tr>
<td>4140</td>
<td>RECTIFIER CONTROL FAILURE</td>
<td>Rectifier Voltage hasn’t reached the set value (probably fault on regulation loop). LED Rectifier on Control Panel is blinking.</td>
</tr>
<tr>
<td>4141</td>
<td>ISMAX DETECTION RECTIFIER</td>
<td>After 3 IS-Max condition within the time frame specified in respective parameter, the Rectifier remains shut-down.</td>
</tr>
<tr>
<td>4142</td>
<td>RECTIFIER CURRENT MAX</td>
<td>Will cause immediate shut-down of the Rectifier. Based on the value inserted in the respective parameter.</td>
</tr>
<tr>
<td>4143</td>
<td>BOOSTER/BATTERY CHARGER CURRENT MAX</td>
<td>Detection of maximum current in the Booster/Battery charger. The Booster/Battery charger and Inverter will switch off for protection purposes.</td>
</tr>
<tr>
<td>Code</td>
<td>Alarm</td>
<td>Description</td>
</tr>
<tr>
<td>--------</td>
<td>--------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>4146</td>
<td>4TH LEG DRIVER FAILURE</td>
<td>The Booster’s driver indicates the presence of a defect which switches the power off.</td>
</tr>
<tr>
<td>4147</td>
<td>BATTERY CHARGER DRIVER FAILURE</td>
<td>The Battery charger driver indicates a defect, switching it off.</td>
</tr>
<tr>
<td>4150</td>
<td>BOOSTER OVERTEMPERATURE</td>
<td>The temperature of the Booster bridge exceeds the machine’s set limit or the coil's sensor is on.</td>
</tr>
<tr>
<td>4151</td>
<td>4TH LEG OVERTEMPERATURE</td>
<td>The temperature of the 4th leg's bridge exceeds the machine's set limit.</td>
</tr>
<tr>
<td>4301</td>
<td>INVERTER FUSES</td>
<td>The alarm signals an Inverter outlet fuses fault, causing it to switch off immediately. It may only be manually switched on after the alarm has ceased.</td>
</tr>
<tr>
<td>4304</td>
<td>K7 CLOSING FAILURE</td>
<td>K7 not closed despite a closing command. Signaled by auxiliary contact. Load will be supplied by Utility.</td>
</tr>
<tr>
<td>4305</td>
<td>K7 OPENING FAILURE</td>
<td>K7 not open despite an opening command. Signaled by auxiliary contact. Load will be supplied by Utility.</td>
</tr>
<tr>
<td>4307</td>
<td>INVERTER TRANSFORMER OVERTEMPERATURE</td>
<td>The temperature sensor of the Inverter Transformer indicates overtemperature. Elapsed “stop operation” time, Inverter shut-down. With Utility OK, Load is transferred on Utility.</td>
</tr>
<tr>
<td>4308</td>
<td>DC FUSES FAILURE</td>
<td>Blown input DC fuse(s) F1 of the Inverter. Inverter cannot be started as long as present.</td>
</tr>
<tr>
<td>4309</td>
<td>DRIVER FAILURE</td>
<td>An abnormal condition has been detected on one or more power modules of the Inverter (temperature or overcurrent). Inverter shut-down and cannot be started as long as the alarm is present.</td>
</tr>
<tr>
<td>4310</td>
<td>IGBT RECTIFIER DRIVER FAILURE</td>
<td>Indicates a failure on the driver board or the Rectifier IGBT bridge. The Rectifier is shut-down.</td>
</tr>
<tr>
<td>4311</td>
<td>BOOSTER DRIVER FAILURE</td>
<td>Driver Booster error signal.</td>
</tr>
<tr>
<td>4312</td>
<td>INVERTER VOLTAGE OUT OF TOLERANCE</td>
<td>Inverter Output Voltage is out of the tolerances (±10%). Inverter is switched OFF.</td>
</tr>
<tr>
<td>4320</td>
<td>ISMAX DETECTION</td>
<td>Detection of Inverter Bridge (Ib) current limit causing the Inverter OFF and automatic re-start. After 3 times the Inverter switches-Off and it can be restarted manually.</td>
</tr>
<tr>
<td>4321</td>
<td>HIGH CURRENT SHARING</td>
<td>A high exchange current value is detected between the UPS of the RPA Parallel System.</td>
</tr>
<tr>
<td>4340</td>
<td>INVERTER CONTROL FAILURE</td>
<td>The &quot;Slave&quot; oscillator is not in synchronized with the Master; thus, causing the shut-down of its Inverter. If after a restart the condition remains, the LED inside the Inverter symbol on the panel will not light up, indicating that this Inverter cannot supply the Load anymore.</td>
</tr>
<tr>
<td>4400</td>
<td>BYPASS FUSES FAILURE</td>
<td>Auxiliary contact signal (normally closed) indicates that one fuse of the Bypass Utility (F16/17/18) is open.</td>
</tr>
<tr>
<td>4404</td>
<td>K6 CLOSING FAILURE</td>
<td>K6 open despite a closing command being issued. Signaled by auxiliary contact. The Load cannot be supplied by Automatic Bypass.</td>
</tr>
<tr>
<td>4405</td>
<td>K6 OPENING FAILURE</td>
<td>K6 closed despite an opening command being issued. Signaled by auxiliary contact.</td>
</tr>
<tr>
<td>4406</td>
<td>SSM FAILURE</td>
<td>A faulty current has been detected in the static-switch causing the opening of the contactor K6 for 10 seconds. After 3 times K6 remains definitively open. Only an ABB Service Technician can reset the alarm.</td>
</tr>
<tr>
<td>4410</td>
<td>BYPASS UTILITY OUT OF TOLERANCE</td>
<td>The Utility Bypass Voltage is out of the tolerances (±10%). K6 opens, synchronization with Utility is inhibited and transfer to Utility is blocked.</td>
</tr>
<tr>
<td>4420</td>
<td>K3 CLOSING FAILURE</td>
<td>K3 open despite a closing command. Inverter is switched OFF. It can be restarted manually after recovery of the alarm condition.</td>
</tr>
<tr>
<td>Code</td>
<td>Alarm</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>--------------------------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>4421</td>
<td>K3 OPENING FAILURE</td>
<td>K3 not open despite an opening command. Be aware the DC Capacitors could remain charged.</td>
</tr>
<tr>
<td>4520</td>
<td>NO INVERTER POWER</td>
<td>The Load supplied by Utility exceeds the Inverter power. The Load remains supplied by Utility until the alarm stays ON.</td>
</tr>
<tr>
<td>4522</td>
<td>FAN FAILURE</td>
<td>The Fan Control Board indicates a malfunction of one or more ventilators.</td>
</tr>
<tr>
<td>4530</td>
<td>LOAD LOCKED ON UTILITY</td>
<td>Load is locked on Utility because 3 transfers on Utility have been detected in a short time (default 30 sec.). The transfer will be free after a time defined in parameter (default 30 sec.).</td>
</tr>
<tr>
<td>4531</td>
<td>LOAD ON UTILITY BY ERROR DETECTOR</td>
<td>Load is transferred to Utility because the error detector detected a disturbance on the output voltage.</td>
</tr>
<tr>
<td>4563</td>
<td>EMERGENCY OFF ACTIVATED</td>
<td>Alarm after detection of an EPO (Emergency Power Off) from an external safety device connected on Customer Interface Board. Consequently K4, K6, K7 open, Rectifier, Inverter and SSM are switched Off.</td>
</tr>
<tr>
<td>4570</td>
<td>OVERLOAD</td>
<td>The UPS system is in an overload condition &gt;105% on Inverter, or &gt;150% on Utility. With Utility unavailable, a sequence of &quot;stop operation&quot; starts. Time out depends on degree of overload.</td>
</tr>
<tr>
<td>4571</td>
<td>OVERLOAD: LOAD ON UTILITY</td>
<td>With Utility Bypass supply available and Load &gt;115%, the Load is transferred on Utility. Load will be transferred again automatically on Inverter when Load &lt;100%.</td>
</tr>
<tr>
<td>4581</td>

6.4 Setup

The SETUP mode is entered any time the “SETUP” key is pressed.

This screen allows the user to modify some parameters permitting to adapt some functions of the UPS to his/her needs, described as follows.

The LCD will display a series of screens containing the user parameters, accessible without password protection.

In this mode the keys perform the following functions:

- Shows the main screen MEASURES. See Section 6.2.
- Shows the main screen EVENTS. See Section 6.3.
- Return to HOME screen.
- Shows the main screen COMMANDS. See Section 6.5.
- Shows the operating status of the RPA PARALLEL SYSTEM. See Section 6.6.
- Key to reset general alarm and buzzer.
- Shows the screen User.
- Shows the screen Service Full. Reserved for the ABB Service Center, at this level the parameters access is protected by a “Service Code”.
- Shows the screen Service Full. Reserved for the ABB Service Center, at this level the parameters access is protected by a “Service Code”.

![SETUP Mode](image-url)
The UPS is capable of communicating to a serial printer, to printout disparate information. Please be sure to have a serial printer with a serial RS232 interface. This is the only printer-interface supported by the UPS.

**Baudrate**
This parameter controls the baud rate used for data transmission.

**Parity**
This parameter controls the parity used for data transmission. odd / even / None can be selected. In case “None” has been set, automatically the parameter “Data bits = 8” is used, independently of the value of “Data Bits” set.

**Data bits**
This parameter controls the length of the data word on the serial line during data transmission.

**Stop bit**
Parameter not programmable.

**Handshake**
This parameter is used to determine the communication protocol used when printing. Valid values are “XON” standing for the XON/XOFF protocol or “None” standing for any protocol.

**PRINTER COMMANDS**
By using the keys MEASURES / ALARMS / PARAMETERS / ALL it is possible to print selected data

---

**Note!**
Please configure your printer with the following parameters:
115200/None/8/2/None (115200 Bauds/sec, No Parity, 8 Data Bits, 2 Stop bit, No Handshake).

---

**Display screen**

**Date**
You can adjust the date of the real time clock existing in the UPS by the means of this parameter (“mm-month, dd-day, yyyy-year”). The value you enter is thoroughly checked to be a correct date in the format “MM/DD/YYYY”.

**Time**
You can adjust the time of the real time clock existing in the UPS by means of this parameter. The value you enter is thoroughly checked to be a correct time in the format “HH:MM:SS”. The time is specified in AM/PM format.

**Language**
This parameter allows the choice of language used to display the information. Valid choices are: English, German, Italian, Spanish, French, Finnish, Polish, Portuguese, Czech, Slovenian, Chinese, Swedish, Russian and Dutch.

**UPS name**
The user can choose the name of the UPS model shown on the main screen (max. 20 characters).
### eBoost screen (option)

This screen is displayed only when eBoost™ Operation Mode is available (option).

#### Enabled

This parameter (values Yes/No) enables or disables the eBoost™ Operation Mode. If the value is “Yes” and the current time is in the interval for the current day, the eBoost™ Operation Mode is active.

#### In case of RPA Parallel System

If eBoost™ Operation Mode is currently disabled (No) and the “Q1 – External UPS Output Circuit Breaker” is closed, when programming it to enable (Yes) the selected configuration will automatically be propagated to all units in the RPA Parallel System.

The activation / deactivation of eBoost™ Operation Mode is indicated each time in the event list.

In order to check the Inverter function, at least 1 minute of VFI mode must be programmed during the week (the Yes/No parameter is automatically disabled if this condition is not satisfied).

In case this minimum time in VFI mode is not respected, the eBoost™ Operation Mode will be disabled.

If the value is “No”, the UPS is normally operating in VFI / double conversion mode at all times.

When the UPS is in eBoost™ Operating Mode the eBoost LED is ON (green light).

---

![eBoost Control](image)

**Note!**
The configuration of the activation schedule can only be updated when eBoost™ Operation Mode is disabled (Enabled: No).

### Day

For the weekdays from “Monday to Sunday”, the edit mode (edit day) allows to define time intervals when the UPS is operating in eBoost™ Operation Mode. The hour is given in 24-hour format. These intervals are defined by:

- **Start Time**: The hour of the day after which the eBoost™ Operation Mode is enabled. The eBoost™ Operation Mode is enabled until the following “Stop Time” time is reached (the “Stop Time” time of the same day if this is later than the “Start Time” time, the “Stop Time” time of the following day otherwise).

- **Stop Time**: The hour of the day before which the eBoost™ Operation Mode is enabled.

The eBoost™ Operation Mode is enabled starting from the preceding “Start Time” time (the “Start Time” time of the same day if this is earlier than the “Stop Time” time, the “Start Time” time of the previous day otherwise).

Identical times for “Start Time” and “Stop Time” maintain the existing mode only in case the previous command was “Start Time” and the following command will be “Stop Time”.

---

*Note: Actual interface and screen may vary.*
Hours/Day
The number of eBoost™ Operation Mode hours per weekday “Monday to Sunday” is displayed in the operation mode parameter window (ceiling value).

---

Note!
To avoid undesired eBoost™ Operation Mode, verify:
- Date and Time.
- eBoost™ screen how many hours of eBoost™ Operation Mode have been selected for each day of the week.

---

Note!
The eBoost™ Operation Mode will become active only if the Load is supplied from the Inverter. eBoost™ Operation Mode is only possible if the UPS load exceeds a minimum threshold (default 10% of the rated capacity).
In case no-load conditions, or anyway below said threshold, the UPS operates in VFI mode.

---

**SETUP - USER**

- Default touch calibration
- Press Calibrate to process calibration
- Touch Screen
- Save
- Calibrate

---

**Touch screen**
This screen permits the adjustment (“Calibrate” key) of the LCD’s “Touch Screen” sensitivity.

---

**SETUP**

**Identification**
- ID: UPS 0
- Model: MegaFlex 1600 S1 UL
- S/N: BX1600-21220-6001x
- Display SW version: Vxx

**Identification screen**

**ID**
Number of UPS in the RPA Parallel System (0 for single unit).

**Model**
UPS model, power range and series number.

**S/N**
The UPS serial number.

**UPS SW version**
The UPS software version.

**Display SW version**
The LCD display software version.
6.5 Commands

The COMMANDS mode is entered any time the “COMMANDS” key is pressed.

Allows the user to execute UPS operation commands.

In this mode the keys perform the following functions:

- Shows the main screen MEASURES. See Section 6.2.
- Shows the main screen EVENTS. See Section 6.3.
- Shows the main screen SETUP. See Section 6.4.
- Return to HOME screen.
- Shows the operating status of the RPA PARALLEL SYSTEM. See Section 6.6.
- Key to reset general alarm and buzzer.
- Shows the next screen Commands (2 or 3).
- Shows the previous screen Commands (1 or 2).
Commands 1 screen

Allows the user to execute UPS operation commands.

---

**Rectifier**

- **Rectifier ON**
  - Rectifier switching ON command.

- **Rectifier RESET**
  - Rectifier restore command.
  - Reserved for the ABB Service Center.

- **Led Rectifier status**
  - Indicates the Rectifier’s status: ON = lit OFF = turned Off

---

**Inverter**

- **Inverter ON**
  - Inverter switching ON command.

- **Inverter OFF**
  - Inverter switching OFF command.
  - This command is also used as EPO (Emergency Power Off) reset after the contact closing.

---

**Note!**

When eBoost™ Operation Mode is enabled, control of Inverter status and selection of the feed path is done autonomously by the UPS control logic.

Therefore, Inverter ON / Inverter OFF commands are disabled when eBoost™ Operation Mode is enabled.

---

**Note!**

Inverter OFF command is disabled when eBoost™ Operation Mode is enabled.

- **Led Inverter status**
  - It indicates the Inverter status: ON / OFF / Pre-charge / Pre-charge completed / Soft-start.
## Module shutdown

<table>
<thead>
<tr>
<th>Module shutdown</th>
<th>SHUTDOWN</th>
<th>RESET</th>
<th>NOT ACTIVE</th>
</tr>
</thead>
</table>

Module shutdown
Load Off command for a single UPS.

**Attention!**
This command will immediately disconnect the load!
“Module shutdown” cannot disconnect the UPS from the Load with “External Manual Bypass Breaker” closed.

### For the RPA Parallel System

In an RPA Parallel System, the “Module shutdown” command disconnects the Load to the selected unit only (“Q1 – External UPS Output Circuit Breaker” closed)!

<table>
<thead>
<tr>
<th>Module shutdown</th>
<th>RESET</th>
<th>“Module shutdown” restore command for an individual UPS.</th>
</tr>
</thead>
</table>

**Led Module shutdown status**
Shows the “Module shutdown” status: ACTIVE / NOT ACTIVE.

## System shutdown

<table>
<thead>
<tr>
<th>Module shutdown</th>
<th>SHUTDOWN</th>
<th>RESET</th>
<th>NOT ACTIVE</th>
</tr>
</thead>
</table>

System shutdown
Load Off command for an RPA Parallel System.

**Attention!**
This command will immediately disconnect the load!
“System shutdown” cannot disconnect the RPA Parallel System from the Load with “External Manual Bypass Breaker” closed!

### For the RPA Parallel System

If “System shutdown” is pressed on one unit connected to the Parallel Bus “Q1 – External UPS Output Circuit Breaker” closed), all the Units are separated from the Load!

<table>
<thead>
<tr>
<th>System shutdown</th>
<th>RESET</th>
<th>“System shutdown” restore command for an RPA Parallel System.</th>
</tr>
</thead>
</table>

**Led System shutdown status**
Shows the “System shutdown” status: ACTIVE / NOT ACTIVE.

### Booster

| Booster | ON | RESET | OFF |

Only for ABB Service Center.
Commands 2 screen
Allows the user to execute UPS operation commands.

Buzzer TEST
Acoustical alarm test (acoustical alarm should be always activated).

Module shutdown procedure
Guides through the procedures to shutdown a single UPS or an RPA Parallel System unit.
Attention! For a single UPS this implies the load disconnection.

Module start-up procedure
Guides through the procedures to start-up the UPS.

System on Bypass
Function not enabled.

Battery Charger
Function not enabled.
### Commands 3 screen

Allows the user to execute UPS operation commands.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Q1 status</strong></td>
<td>Indicates the “Q1 – External UPS Output Circuit Breaker” status: OPEN.</td>
</tr>
<tr>
<td><strong>Q1 CONFIRM</strong></td>
<td>Command to confirm that the “Q1 – External UPS Output Circuit Breaker” has been closed.</td>
</tr>
<tr>
<td>Touch ESC</td>
<td>Touch confirm</td>
</tr>
<tr>
<td><strong>Q1 STATUS</strong></td>
<td>Indicates the “Q1 – External UPS Output Circuit Breaker” status: CLOSED.</td>
</tr>
</tbody>
</table>

### Working mode

Indicates the UPS working mode

<table>
<thead>
<tr>
<th>Mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>SERVICE</strong></td>
<td>In “SERVICE mode” the “Q1 – External UPS Output Circuit Breaker” is open.</td>
</tr>
<tr>
<td><strong>NORMAL</strong></td>
<td>Indicates the UPS working in NORMAL mode.</td>
</tr>
<tr>
<td>Touch ESC</td>
<td>Touch confirm</td>
</tr>
<tr>
<td><strong>SERVICE</strong></td>
<td>In “NORMAL mode” the “Q1 – External UPS Output Circuit Breaker” is closed.</td>
</tr>
</tbody>
</table>
6.6 RPA Parallel System

In this mode the keys perform the following functions:

- Shows the main screen MEASURES. See Section 6.2.
- Not available
- Not available
- Not available
- Return to HOME screen.
- Key to reset general alarm and buzzer.
- Shows the screen for the next RPA Parallel System units
- Shows the screen of the previous RPA Parallel System units.

The RPA PARALLEL SYSTEM is entered any time the "RPA" key is pressed.

This screen is only displayed when the RPA Parallel System is available (option).

The LCD screen will provide some information on the RPA Parallel System.
Description of the RPA Parallel System screen's main elements

- **RECT** Rectifier
  - green color = On / grey color = Off
- **CHRG / BST** Battery Charger / Booster
  - green color = On / grey color = Off
- **INV** Inverter
  - green color = On / grey color = Off
- **BYP** Automatic Bypass
  - green color = On / grey color = Off
- **UPS1-6** Number of UPS in the RPA Parallel System
- **M** Master unit of the RPA System Parallel

Input Utility status (for RECT – Rectifier and BYP – Bypass)
Battery status (for CHRG – Battery Charger)
Green color = On / Grey color = Off

**Q1** External UPS Output Circuit Breaker

**External Manual Bypass Breaker**

Examples of the main RPA Parallel System unit status situations

- **UPS with Load supplied by Inverter**
- **UPS with Load supplied by Automatic Bypass**
- **UPS with Load supplied by Battery**
- **UPS in stand-by in an Redundant RPA Parallel System**
- **UPS in eBoost Operation Mode**
- **UPS with Load supplied by Manual Bypass (only if provided by customer)**
### RPA screen

**Voltage L12 / L23 / L31**
Output voltage PHASE/PHASE for each phase.

**Current L1 / L2 / L3**
The output current as RMS values for each phase.

**Percent load L1 / L2 / L3**
The output Load as percentage for each phase.

<table>
<thead>
<tr>
<th></th>
<th>L1</th>
<th>L2</th>
<th>L3</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>480 V</td>
<td>480 V</td>
<td>480 V</td>
</tr>
<tr>
<td>Current</td>
<td>960.0 A</td>
<td>770.0 A</td>
<td>570.0 A</td>
</tr>
<tr>
<td>Percent load</td>
<td>50 %</td>
<td>40 %</td>
<td>30 %</td>
</tr>
</tbody>
</table>

**Apparent power**
Total apparent Load power (kVA).

**Active power**
Total effective Load power (KW).

**Power factor**
Load power factor: + inductive load / - capacitive load

**Status**
Source of the power supplied to the Load.

In this mode the keys perform the following functions:

- ![Left Arrow](left-arrow.png)
  Shows the previous screen of the RPA PARALLEL SYSTEM.

- ![Warning](warning.png)
  Not available

- ![Wrench](wrench.png)
  Not available

- ![Gear](gear.png)
  Not available

- ![Home](home.png)
  Return to HOME screen.

- ![Buzzer](buzzer.png)
  Key to reset general alarm and buzzer.
7 Operation

Note!
MegaFlex 1000 to 1600 requires the introduction of a “START-UP KEY” code to perform the first commissioning.

The “START-UP KEY” code can be introduced by an ABB Service Technician only.

The introduction of the “START-UP KEY” code is mandatory to proceed to the first start-up of the UPS.

Warning!
Verify that the input/output connections have been performed by Qualified Personnel before connecting Utility input voltage and verify that the equipment is correctly grounded.

Open only the front door, do not remove any panels.

Now you can initiate the start-up procedure of the UPS system.
There is no need for specific knowledge if you follow carefully the step-by-step instructions given below.
However, we recommend that at least the initial procedure should be performed by an instructed person.

Check after every step for correct reaction of the UPS (LEDs on the panel) and correct voltage and current measurements, before you proceed to the next step.
If you encounter any problems during the following procedures, you should not continue, but contact your ABB Service Center.

This symbol refers to the operations of an RPA Parallel System.

Note!
eBoost™ Operation Mode must be disabled prior to performing any operation, including start-up, shut-down, removing/adding a unit from/to an RPA Parallel System.

Find on the following pages the descriptions of the various procedures of start-up and shut-down for single and parallel UPSs, divided into the following principal chapters:

8.1 Procedures for single MegaFlex 1000 to 1600
8.2 Procedures for single MegaFlex 1000 to 1600 functioning as Frequency Converter
8.3 Procedures for MegaFlex 1000 to 1600 RPA Parallel System
7.1 Procedures for single MegaFlex 1000 to 1600

7.1.1 Initial start-up of the MegaFlex 1000 to 1600

Warning!
Before proceeding to turn ON the UPS system, ensure that the AC and DC external isolators are OFF and prevent their inadvertent operation.
Ensure that the Output Load distribution can be powered and all the Output Isolators are open.

This procedure must be performed for the first start-up following the installation, with the UPS completely switched Off and not powered.

Open the front door and make sure that:
- All the connections to the input/output terminals or bus bars of the UPS have been made correctly.
- The safety screens are fixed in their position.
- The “Q1 – External UPS Output Circuit Breaker” and the “External Battery Breaker” must be open (Pos. O).

1. **Switch-ON** the Utility voltage from the input distribution (both Rectifier and Bypass if separated).

   The UPS performs a “Self-test”.
   A successful termination of the tests will be indicated with Overall test results “OK”.
   Commissioning cannot be continued should one or more tests result to be negative. Please contact in this case your ABB Service Center.

   At this stage the Electronic Power Supply and Control Panel are switched ON and the Buzzer sounds.

   Press “MUTE” key to reset Acoustical Alarm.
   LED ALARM remains lit.
During the first commissioning MegaFlex 1000 to 1600 requests a set-up of the UPS configuration parameters presented in the following "Power-Up" screen.

Without such configuration it is not possible to continue with the commissioning procedure.

---

### Warning!
The set-up of the UPS configuration parameters must be done only by an ABB Service Technician!
The set-up of mistaken values could compromise the integrity and reliability of the UPS!

---

#### Power-Up

**UPS**

- **Language**
  - This parameter allows the choice of language used to display the information.

- **Date (dd.mm.yyyy)**
  - You can adjust the date of the real time clock existing in the UPS by the means of this parameter.
  - The value you enter is thoroughly checked to be a correct date in the format “dd.mm.yyyy”.

- **Time (24h)**
  - You can adjust the time of the real time clock existing in the UPS by means of this parameter.
  - The value you enter is thoroughly checked to be a correct time in the format “hh.mm.ss”.
  - The time is specified in 24-hour format.

- **Input Frequency**
  - Frequency value of the Rectifier input Utility (50 Hz / 60Hz).

- **Output Frequency**
  - Inverter output frequency value (50 Hz / 60Hz).

- **Inverter Voltage**
  - Output voltage PHASE/PHASE of the Inverter (480V).
### Battery

#### Capacity
Ah capacity of the Battery.

#### Recharge Mode
Recharge type of the Battery
- **Normal**
  - Valve Regulated Lead Acid Battery (VRLA), NiCd without boost-charge and Flooded Lead Acid Battery without boost-charge.
- **NiCd boost**
  - Nickel Cadmium Battery with boost-charge.
- **Wet lead acid boost**
  - Flooded Lead Acid Battery with boost-charge.
- **Flywheel**
  - Flywheel System.
- **Li-Ion LGG**
  - Lithium Battery by LG brand.
- **Li-Ion SDI**
  - Lithium Battery by Samsung brand.

### Float Voltage
Voltage to maintain Battery Charging.
*Float voltage = Number of Battery cells × Battery float voltage per cell.*

Typical Battery float voltage per cell (ask the Battery manufacturer for confirmation):

<table>
<thead>
<tr>
<th>Battery Type</th>
<th>Voltage per Cell</th>
<th>Example Calculation</th>
</tr>
</thead>
<tbody>

<td>1.41 (1.55 boost-charge) Vdc</td>
<td>281 cells × 1.41Vdc = 397 (436) Vdc</td>
</tr>
<tr>
<td>Flooded Lead Acid Battery without boost-charge</td>
<td>2.23Vdc</td>
<td>180÷195 cells × 2.23Vdc = 402 (423) ÷ 435 Vdc</td>
</tr>
<tr>
<td>Flooded Lead Acid Battery with boost-charge</td>
<td>2.23 (2.35 boost-charge) Vdc</td>
<td>180÷185 cells × 2.23Vdc = 402 (423) ÷ 413 (435) Vdc</td>
</tr>
</tbody>
</table>

### Recharge Current
Maximum Battery Recharge Current.
Max 20% of Battery capacity (Ah).
Example: 1000Ah – max. recharging current 200A.

### Stop Operation Time
Residual Battery Autonomy time before UPS forced shut-down.
Standard set 3 minutes.
Settable from 1 minute to autonomy time in minutes.

### Cells
Number of cells of the Battery, see “Float voltage”.
Example: 240 Battery cells
- 40 blocks / 12Vdc Battery
- 80 blocks / 6Vdc Battery
- 240 blocks / 2Vdc Battery

---

**Note!**
The values indicated above, must be considered as standard values.
The actual programmed values must be the ones defined from the Battery Manufacturer.
2. Close the “Q1 – External UPS Output Circuit Breaker” (Pos. I).
   • LED ALARM and Acoustical Alarm are activated.

3. Confirm the closure of the “Q1 – External UPS Output Circuit Breaker” (Pos. I).
   Perform the “Q1 Status CONFIRM” command from the screen:
   Commands 3 / Q1 status / CONFIRM.
   Touch confirm
   • LED ALARM and Acoustical Alarm turn OFF.
   • The Load is supplied by the Utility through the Automatic Bypass.
   • Rectifier starts automatically. LED 1 (Rectifier) blinking, indicates Soft-start.
   • At the end of Rectifier Soft-start the LED 1 (Rectifier) remains lit.

   The Synoptic Diagram must display the status
   “Load supplied by Automatic Bypass”.

   Note!
   Ensure the LED 1 (Rectifier) is lit before carrying out this procedure (4).
   It indicates that the DC-link 1 and DC-link 2 has reached 400Vdc (see screen MEASURES / Rectifier)!
   Verify the right DC polarities on both side of the switch/fuse holder!

4. Connect the Battery to the UPS by closing the “External Battery Breaker” (Pos. I).
   Note!
   Before performing the next procedure (5) make sure that the LED 3 (Booster/Battery charger) is lit.

5. Insert the Inverter performing the command "Inverter ON".
   Perform the “Inverter ON” command from the screen:
   Commands 1 / Inverter / ON.
   • Soft-start of the Inverter indicated with blinking LED 2 (Inverter).
   • At the end of Inverter Soft-start the LED 2 (Inverter) remains lit.
   • The Load is automatically transferred from Automatic Bypass to Inverter.
   • LED ALARM turns OFF and the LED LOAD PROTECTED must be lit.

   The Synoptic Diagram must display the status
   “Load supplied by Inverter”.

6. Operation mode selection.
   MegaFlex 1000 to 1600 is delivered normally selected for permanent VFI operation.
   If available, the eBoost™ Operation Mode (option) can be enabled and the eBoost Start Time & eBoost Stop Time can be programmed for each day of the week (see Section 6.4 SETUP / eBoost).

   End of Procedure

   Note!
   The Battery must be charged for at least 10 hours, in order to ensure the full backup runtime in case of a Utility Failure.
### 7.1.2 Complete UPS shut-down

**Note!**
Follow this procedure only in case the UPS system and the Load must be completely powered-down.
If eBoost™ option is available, make sure that eBoost™ Operation Mode is disabled before starting this procedure.

**Initial status:**
Load supplied by Inverter.

1. **Perform the command “System shutdown”.**
   Perform the command “System shutdown” through the screen: Commands 1 / System shutdown / SHUTDOWN.
   - Load is disconnected from UPS.
   - Rectifier and Inverter are shut down and all contactors are opened.
   - LED 1 (Rectifier) and LED 2 (Inverter) are OFF.
   - LED ALARM is lit.

2. **Open the “Q1 – External UPS Output Circuit Breaker” (Pos. O).**

3. **Disconnect the Battery from the UPS by opening the “External Battery Breaker” (Pos. O).**
   - **Note!**
     Before performing the next procedure (4) wait 5 minutes for DC-link Capacitors discharge.
     Use the MEASURES/Rectifier screen to ensure that the DC-link 1 and DC-link 2 voltage has reached 10Vdc.
   - Press “MUTE” key to reset Acoustical Alarm. LED ALARM remains lit.

4. **Disconnect the Utility from the input distribution.**

**End of Procedure**

**Danger!**
It will take 5 minutes for the DC capacitors to discharge.
Open only the front door, do not open any other part of the UPS.
7.1.3 Restore to normal operation after “System shutdown” with Load not supplied

Warning!
Please check and ensure the conditions of the connected load are safe before proceeding, as this procedure will result in the connection of power to the load circuit(s).

Note!
Before performing this operation, make sure that the UPS is in the following status:
- “Q1 – External UPS Output Circuit Breaker” must be closed (Pos. I).
- “External Battery Breaker” must be open (Pos. O).

If eBoost™ option is available, make sure that eBoost™ Operation Mode is disabled before starting this procedure.

View of the Synoptic Diagram after performed the command “System shutdown” with load not supplied.

1. **Restore the command “System shutdown”**.
   Restore the command “System shutdown” through the screen:
   Commands 1 / System shutdown / RESET.
   - The Load is supplied by the Utility through the Automatic Bypass.
   - Rectifier starts automatically. LED 1 (Rectifier) blinking, indicates Soft-start.
   - At the end of Rectifier Soft-start the LED 1 (Rectifier) remains lit.

   The Synoptic Diagram must display the status “Load supplied by Automatic Bypass”.

   Note!
   Ensure the LED 1 (Rectifier) is lit before carrying out this procedure (2). It indicates that the DC-link 1 and DC-link 2 has reached 400Vdc (see screen MEASURES / Rectifier)!

2. **Connect the Battery to the UPS by closing the “External Battery Breaker” (Pos. I).**

   Note!
   Before performing this procedure (3) make sure that the LED 3 (Booster/Battery charger) is lit.

3. **Insert the Inverter performing the command “Inverter ON”**.
   Perform the “Inverter ON” command from the screen:
   Commands 1 / Inverter / ON.
   - Soft-start of the Inverter indicated with blinking LED 2 (Inverter).
   - At the end of Inverter Soft-start the LED 2 (Inverter) remains lit.
   - The Load is automatically transferred from Automatic Bypass to Inverter.
   - LED ALARM turns OFF and the LED LOAD PROTECTED must be lit.

   The Synoptic Diagram must display the status “Load supplied by Inverter”.

End of Procedure
7.1.4 Restore to normal operation after “EPO - Emergency Power Off” with Load not supplied

Warning!
Please check and ensure the conditions of the connected load are safe before proceeding, as this procedure will result in the connection of power to the load circuit(s).

Note!
Before performing this operation, make sure that the UPS is in the following status:
- “Q1 – External UPS Output Circuit Breaker” must be closed (Pos. I).
- “External Battery Breaker” must be open (Pos. O).

If eBoost™ option is available, make sure that eBoost™ Operation Mode is disabled before starting this procedure.

View of the Synoptic Diagram after performed the command “EPO - Emergency Power Off” with load not supplied.

1. Restore the “EPO -Emergency Power Off” button.
   - Press “MUTE” key to reset Alarm and Acoustical Alarm. LED ALARM remains lit.

2. Perform the “Inverter OFF” command.
   Perform the “Inverter OFF” command from the screen: Commands 1 / Inverter / OFF.
   - The Load is transferred to Utility by Automatic Bypass.
   - Rectifier starts automatically. LED 1 (Rectifier) blinking, indicates Soft-start.
   - At the end of Rectifier Soft-start the LED 1 (Rectifier) remains lit.

   The Synoptic Diagram must display the status “Load supplied by Automatic Bypass”.

   Note!
   Ensure the LED 1 (Rectifier) is lit before carrying out this procedure (3). It indicates that the DC-link 1 and DC-link 2 has reached 400Vdc (see screen MEASURES / Rectifier).

3. Connect the Battery to the UPS by closing the “External Battery Breaker” (Pos. I).

   Note!
   Before performing the next procedure (4) make sure that the LED 3 (Booster/Battery charger) is lit.

4. Insert the Inverter performing the command “Inverter ON”.
   Perform the “Inverter ON” command from the screen: Commands 1 / Inverter / ON.
   - Soft-start of the Inverter indicated with blinking LED 2 (Inverter).
   - At the end of Inverter Soft-start the LED 2 (Inverter) remains lit.
   - The Load is automatically transferred from Automatic Bypass to Inverter.
   - LED ALARM turns OFF and the LED LOAD PROTECTED must be lit.

   The Synoptic Diagram must display the status “Load supplied by inverter”.

End of Procedure
7.2 Procedures single MegaFlex 1000 to 1600 functioning as Frequency Converter

When the MegaFlex 1000 to 1600 functions as a Frequency Converter, the Automatic Bypass function is disabled. Therefore, the Load cannot be transferred to Utility in case of overload, short circuit, or Inverter failure. In situations where the UPS needs to be shut-down for maintenance purposes, also the Load must be shut-down or disconnected.

7.2.1 Initial Start-up of the MegaFlex 1000 to 1600 as frequency converter

Warning!
Before proceeding to turn ON the UPS system, ensure that the AC and DC external isolators are OFF and prevent their inadvertent operation.
Ensure that the Output Load distribution can be powered and all the Output Isolators are open.

This procedure must be performed for the first start-up following the installation, with the UPS completely switched Off and not powered.

Open the front door and make sure that:
- All the connections to the input/output terminals or bus bars of the UPS have been made correctly.
- The safety screens are fixed in their position.
- The “Q1 – External UPS Output Circuit Breaker” and the “External Battery Breaker” must be open (Pos. O).

LEDs on Synoptic Diagram
- LED 1 Rectifier
- LED 2 Inverter
- LED 3 Booster / Battery charger
- LED 4 Automatic Bypass
- LED 5 LOAD on UPS
- LED ALARM
- LED LOAD PROTECTED

1. Switch-ON the Utility voltage from the input distribution.
The UPS performs a “Self-test”.
A successful termination of the tests will be indicated with Overall test results “OK”.
Commissioning cannot be continued should one or more tests result to be negative. Please contact in this case your ABB Service Center.

At this stage the Electronic Power Supply and Control Panel are switched ON and the Buzzer sounds.

Press “MUTE” key to reset Acoustical Alarm. LED ALARM remains lit.
During the first commissioning MegaFlex 1000 to 1600 requests a set-up of the UPS configuration parameters presented in the following "Power-Up" screen.

Without such configuration it is not possible to continue with the commissioning procedure.

---

**Warning!**

The set-up of the UPS configuration parameters must be done only by an ABB Service Technician!

The set-up of mistaken values could compromise the integrity and reliability of the UPS!

---

### UPS

**Language**

This parameter allows the choice of language used to display the information.

**Date (dd.mm.yyyy)**

You can adjust the date of the real time clock existing in the UPS by the means of this parameter. The value you enter is thoroughly checked to be a correct date in the format “dd.mm.yyyy”.

**Time (24h)**

You can adjust the time of the real time clock existing in the UPS by means of this parameter. The value you enter is thoroughly checked to be a correct time in the format “hh.mm.ss”. The time is specified in 24-hour format.

**Input Frequency**

Frequency value of the Rectifier input Utility (50 Hz / 60Hz).

**Output Frequency**

Inverter output frequency value (50 Hz / 60Hz).

**Inverter Voltage**

Output voltage PHASE/PHASE of the Inverter (480V).

---

Continue →
Battery

Capacity  Ah capacity of the Battery.

Recharge Mode  Recharge type of the Battery
- Normal  Valve Regulated Lead Acid Battery (VRLA), NiCd without boost-charge and Flooded Lead Acid Battery without boost-charge.
- NiCd boost  Nickel Cadmium Battery with boost-charge.
- Wet lead acid boost  Flooded Lead Acid Battery with boost-charge.
- Flywheel  Flywheel System.
- Li-Ion LGG  Lithium Battery by LG brand.
- Li-Ion SDI  Lithium Battery by Samsung brand.

Float Voltage  Voltage to maintain Battery Charging.
Float voltage = Number of Battery cells \times Battery float voltage per cell.
Typical Battery float voltage per cell (ask the Battery manufacturer for confirmation):
Valve Regulated Lead Acid Battery (VRLA):
2.27Vdc for cell
240 cells \times 2.27Vdc = 545Vdc
NiCd Battery without boost-charge:
1.41Vdc for cell
284÷309 cells \times 1.41Vdc = 401÷436Vdc
NiCd Battery with boost-charge:
1.41 (1.55 boost-charge) Vdc for cell
281 cells \times 1.41Vdc = 397 (436) Vdc
Flooded Lead Acid Battery without boost-charge:
2.23Vdc for cell
180÷195 cells \times 2.23Vdc = 402÷423 (435) Vdc
Flooded Lead Acid Battery with boost-charge:
2.23 (2.35 boost-charge) Vdc for cell
180÷185 cells \times 2.23Vdc = 402 (423) \div 413 (435) Vdc

Recharge Current  Maximum Battery Recharge Current.
Max 20\% of Battery capacity (Ah).
Example: 1000Ah – max. recharging current 200A.

Stop Operation Time  Residual Battery Autonomy time before UPS forced shut-down.
Standard set 3 minutes.
Settable from 1 minute to autonomy time in minutes.

Cells  Number of cells of the Battery, see “Float voltage”.
Example: 240 Battery cells
- 40 blocks / 12Vdc Battery
- 80 blocks / 6Vdc Battery
- 240 blocks / 2Vdc Battery

Note!
The values indicated above, must be considered as standard values.
The actual programmed values must be the ones defined from the Battery Manufacturer.
2. Close the “Q1 – External UPS Output Circuit Breaker” (Pos. I).
   • LED ALARM and Acoustical Alarm are activated.

3. Confirm the closure of the “Q1 – External UPS Output Circuit Breaker” (Pos. I).
   Perform the “Q1 Status CONFIRM” command from the screen:
   Commands 3 / Q1 status / CONFIRM.

   Touch confirm
   • LED ALARM and Acoustical Alarm turn OFF.
   • Rectifier starts automatically. LED 1 (Rectifier) blinking, indicates Soft-start.
   • At the end of Rectifier Soft-start the LED 1 (Rectifier) remains lit.

   The Synoptic Diagram must display the status
   “Load supplied by Automatic Bypass”.

   Note!
   Ensure the LED 1 (Rectifier) is lit before carrying out this procedure (4).
   It indicates that the DC-link 1 and DC-link 2 has reached 400Vdc (see screen MEASURES / Rectifier).
   Verify the right DC polarities on both side of the switch/fuse holder!

4. Connect the Battery to the UPS by closing the “External Battery Breaker” (Pos. I).

   Note!
   Before performing the next procedure (5) make sure that the LED 1 (Rectifier) and LED 3 (Booster/Battery charger) is lit.

5. Insert the Inverter performing the command "Inverter ON".
   Before performing this procedure (5) make sure that the LED 1 (Rectifier) and LED 3 (Booster/Battery charger) are lit.

   Perform the "Inverter ON" command from the screen:
   Commands 1 / Inverter / ON.
   • Soft-start of the Inverter indicated with blinking LED 2 (Inverter).
   • At the end of Inverter Soft-start the LED 2 (Inverter) remains lit.
   • Load is now supplied from Inverter.
   • LED ALARM turns OFF and the LED LOAD PROTECTED must be lit.

   The Synoptic Diagram must display the status
   “Load supplied by Inverter”.

   End of Procedure

   Note!
   The Battery must be charged for at least 10 hours, in order to ensure the full backup runtime in case of a Utility Failure.
7.2.2 Complete shut-down of the MegaFlex 1000 to 1600 as frequency converter

**Note!**
Follow this procedure only in case the UPS system and the Load must be completely powered-down.

---

**Initial status:**
Load supplied by Inverter.

---

1. **Perform the command “System shutdown”**.
   Perform the command “System shutdown” through the screen: Commands 1 / System shutdown / SHUTDOWN.
   - Load is disconnected from UPS.
   - Rectifier and Inverter are shut down and all contactors are opened.
   - LED 1 (Rectifier) and LED 2 (Inverter) are OFF.
   - LED ALARM is lit.

2. **Open the “Q1 – External UPS Output Circuit Breaker” (Pos. O).**

3. **Disconnect the Battery from the UPS by opening the “External Battery Breaker” (Pos. O).**
   - **Note!**
   - Before performing the next procedure (4) wait 5 minutes for DC-link Capacitors discharge.
   - Use the MEASURES/Rectifier screen to ensure that the DC-link 1 and DC-link 2 voltage has reached 10Vdc.
   - Press “MUTE” key to reset Acoustical Alarm. LED ALARM remains lit.

4. **Disconnect the Utility from the input distribution.**

---

**End of Procedure**

---

**Danger!**
It will take 5 minutes for the DC capacitors to discharge.
Open only the front door, do not open any other part of the UPS.
7.2.3 Restore to normal operation after “System shutdown” with Load not supplied

**Warning!**
Please check and ensure the conditions of the connected load are safe before proceeding, as this procedure will result in the connection of power to the load circuit(s).

**Note!**
Before performing this operation, make sure that the UPS is in the following status:
- “Q1 – External UPS Output Circuit Breaker” must be closed (Pos. I).
- “External Battery Breaker” must be open (Pos. O).

View of the Synoptic Diagram after performed the command “System shutdown” with load not supplied.

1. **Restore the command “System shutdown”**.
   Restore the command “System shutdown” through the screen:
   Commands 1 / System shutdown / RESET.

   **Note!**
   Ensure the LED 1 (Rectifier) is lit before carrying out this procedure (2).
   It indicates that the DC-link 1 and DC-link 2 has reached 400Vdc (see screen MEASURES / Rectifier)!

2. **Connect the Battery to the UPS by closing the “External Battery Breaker” (Pos. I).**
   **Note!**
   Before performing next procedure (3) make sure that the LED 3 (Booster/Battery charger) is lit.

3. **Insert the Inverter performing the command “Inverter ON”.**
   Perform the “Inverter ON” command from the screen:
   Commands 1 / Inverter / ON.
   - Soft-start of the Inverter indicated with blinking LED 2 (Inverter).
   - At the end of Inverter Soft-start the LED 2 (Inverter) remains lit.
   - Load is now supplied from Inverter.
   - LED ALARM turns OFF and the LED LOAD PROTECTED must be lit.

   The Synoptic Diagram must display the status
   “Load supplied by Inverter”.

End of Procedure
7.2.4 Restore to normal operation after “EPO - Emergency Power Off” with Load not supplied

**Warning!**
Please check and ensure the conditions of the connected load are safe before proceeding, as this procedure will result in the connection of power to the load circuit(s).

**Note!**
Before performing this operation, make sure that the UPS is in the following status:
- External “Q1 - UPS Output switch” must be closed (Pos. I).
- “External Battery Breaker” must be open (Pos. O).

View of the Synoptic Diagram after performed the command “EPO - Emergency Power Off” with load not supplied.

1. **Restore the “EPO -Emergency Power Off” button.**
   - Press “MUTE” key to reset Alarm and Acoustical Alarm. LED ALARM remains lit.

2. **Perform the “Inverter OFF” command.**
   - Perform the "Inverter OFF" command from the screen: Commands 1 / Inverter / OFF.
     - Rectifier starts automatically. LED 1 (Rectifier) blinking, indicates Soft-start.
     - At the end of Rectifier Soft-start the LED 1 (Rectifier) remains lit.

   **Note!**
   Ensure the LED 1 (Rectifier) is lit before carrying out this procedure (3).
   It indicates that the DC-link 1 and DC-link 2 has reached 400Vdc (see screen MEASURES / Rectifier).

3. **Connect the Battery to the UPS by closing the “External Battery Breaker” (Pos. I).**

   **Note!**
   Before performing the next procedure (4) make sure that the LED 3 (Booster/Battery charger) is lit.

4. **Insert the Inverter performing the command “Inverter ON”.**
   - Perform the "Inverter ON" command from the screen: Commands 1 / Inverter / ON.
     - Soft-start of the Inverter indicated with blinking LED 2 (Inverter).
     - At the end of Inverter Soft-start the LED 2 (Inverter) remains lit.
     - Load is now supplied from Inverter.
     - LED ALARM turns OFF and the LED LOAD PROTECTED must be lit.

   The Synoptic Diagram must display the status “Load supplied by Inverter”.

End of Procedure
7.3 Procedures for MegaFlex 1000 to 1600 RPA Parallel System

7.3.1 MegaFlex 1000 to 1600 RPA Parallel System start-up

Warning!

Before proceeding to turn ON the UPS system, ensure that the AC and DC external isolators are OFF and prevent their inadvertent operation.

Ensure that the Output Load distribution can be powered and all the Output Isolators are open.

This procedure must be performed for the first start-up following the installation, with the RPA Parallel System completely switched Off and not powered.

Open the front door on all UPS units and make sure that:

• All the connections to the input/output terminals or bus bars of the UPS have been made correctly.
• The safety screens are fixed in their position.
• The “Q1 – External UPS Output Circuit Breaker” and the “External Battery Breaker” must be open (Pos. O).

Q1 External UPS Output Circuit Breaker” with dedicated Auxiliary Contact to be connected to the UPS is required. See Section 4.11.2 of the Installation Guide.

Frequency value of the Rectifier input Utility (50 Hz / 60Hz).

**Output Frequency**

Inverter output frequency value (50 Hz / 60Hz).

**Inverter Voltage**

Output voltage PHASE/PHASE of the Inverter (480V).
Battery

Capacity

Ah capacity of the Battery.

Recharge Mode

Recharge type of the Battery
- Normal Valve Regulated Lead Acid Battery (VRLA), NiCd without boost-charge and Flooded Lead Acid Battery without boost-charge.
- NiCd boost Nickel Cadmium Battery with boost-charge.
- Wet lead acid boost Flooded Lead Acid Battery with boost-charge.
- Flywheel Flywheel System.
- Li-Ion LGG Lithium Battery by LG brand.
- Li-Ion SDI Lithium Battery by Samsung brand.

Float Voltage

Voltage to maintain Battery Charging.

\[
\text{Float voltage} = \text{Number of Battery cells} \times \text{Battery float voltage per cell}.
\]

Typical Battery float voltage per cell (ask the Battery manufacturer for confirmation):

- Valve Regulated Lead Acid Battery (VRLA):
  
  \[2.27 \text{Vdc for cell}\]
  
  \[240 \text{ cells} \times 2.27 \text{Vdc} = 545 \text{Vdc}\]

- NiCd Battery without boost-charge:
  
  \[1.41 \text{Vdc for cell}\]
  
  \[284 \text{÷} 309 \text{ cells} \times 1.41 \text{Vdc} = 401 \div 436 \text{Vdc}\]

- NiCd Battery with boost-charge:
  
  \[1.41 (1.55 \text{boost-charge}) \text{Vdc for cell}\]
  
  \[281 \text{ cells} \times 1.41 \text{Vdc} = 402 (436) \text{Vdc}\]

- Flooded Lead Acid Battery without boost-charge:
  
  \[2.23 \text{Vdc for cell}\]
  
  \[180 \div 195 \text{ cells} \times 2.23 \text{Vdc} = 402 \div 413 (435) \text{Vdc}\]

- Flooded Lead Acid Battery with boost-charge:
  
  \[2.23 (2.35 \text{boost-charge}) \text{Vdc for cell}\]
  
  \[180 \div 185 \text{ cells} \times 2.23 \text{Vdc} = 402 (423) \div 413 (435) \text{Vdc}\]

Recharge Current

Maximum Battery Recharge Current.
Max 20% of Battery capacity (Ah).
Example: 1000Ah – max. recharging current 200A.

Stop Operation Time

Residual Battery Autonomy time before UPS forced shut-down.
Standard set 3 minutes.
Settable from 1 minute to autonomy time in minutes.

Cells

Number of cells of the Battery, see “Float voltage”.
Example: 240 Battery cells
- 40 blocks / 12Vdc Battery
- 80 blocks / 6Vdc Battery
- 240 blocks / 2Vdc Battery

Note!

The values indicated above, must be considered as standard values.
The actual programmed values must be the ones defined from the Battery Manufacturer.
2. Close the “Q1 – External UPS Output Circuit Breaker” (Pos. I) on all Units.
   - LED ALARM and Acoustical Alarm are activated.

3. Confirm the closure of the “Q1 – External UPS Output Circuit Breaker” (Pos. I) on all Units.

Perform the “Q1 Status CONFIRM” command from the screen:
Commands 3 / Q1 status / CONFIRM.

Touch confirm

- LED ALARM and Acoustical Alarm turn OFF.
- When confirm the closing “Q1 – External UPS Output Circuit Breaker” on the last unit of the RPA Parallel System, the Automatic Bypass of all Units connects to the Load.
- Rectifiers start automatically, blinking LED 1 (Rectifier) indicates Soft-start.
- At the end of Rectifier Soft-start, the LED 1 (Rectifier) remains lit.

The Synoptic Diagram, on all UPS units, must display the status “Load supplied by Automatic Bypass”.

![Synoptic Diagram of first unit](image1)
![Synoptic Diagram of other units](image2)

Note!
Ensure the LED 1 (Rectifier) is lit before carrying out this procedure (3). It indicates that the DC-link 1 and DC-link 2 has reached 400Vdc (see screen MEASURES / Rectifier)!
Verify the right DC polarities on both side of the switch/fuse holder!

4. Connect the Battery to all Units by closing the “External Battery Breaker” (Pos. I).

![Synoptic Diagram of first unit](image3)
![Synoptic Diagram of other units](image4)

Note!
Before performing the next procedure (5) make sure that the LED 3 (Booster/Battery charger) is lit.
5. **Insert the Inverter performing the “Inverter ON” command on first unit.**

   Perform the “Inverter ON” command from the screen:
   Commands 1 / INVERTER / ON.

   • Soft-start of the Inverter indicated with blinking LED 2 (Inverter).
   • At the end of Inverter Soft-start the LED 2 (Inverter) remains lit.
   • In case of sufficient output power, the output will transfer to Inverter.
   • LED ALARM turns OFF and the LED LOAD PROTECTED must be lit.

![Synoptic Diagram of first unit](image1)

![Synoptic Diagram of other units](image2)

6. **Insert the Inverter performing the “Inverter ON” command on all other units.**

   Do not start the next Inverter until the sequence of the previous ends.

   Perform the “Inverter ON” command from the screen:
   Commands 1 / INVERTER / ON.

   • Soft-start of the Inverter indicated with blinking LED 2 (Inverter).
   • At the end of Inverter Soft-start the LED 2 (Inverter) remains lit.
   • As soon as the output power of the Inverters is sufficient to supply the Load, the output of the units with running Inverter will transfer to Inverter.
   • LED ALARM turns OFF and the LED LOAD PROTECTED must be lit.

   The Synoptic Diagram, on all UPS units, must display the status **“Load supplied by Inverter”**.

![Synoptic Diagram of first unit](image3)

![Synoptic Diagram of other units](image4)

7. **Operation mode selection.**

   MegaFlex 1000 to 1600 is delivered normally selected for permanent VFI operation.

   If available, the eBoost™ Operation Mode (option) can be enabled and the eBoost Start Time & eBoost Stop Time can be programmed for each day of the week (see Section 6.4 SETUP / eBoost).

---

**End of Procedure**

---

**Note!**

The Battery must be charged for at least 10 hours, in order to ensure the full backup runtime in case of a Utility Failure.
7.3.2 Separate a UPS unit from the RPA Parallel System (System Redundancy)

Note!
If eBoost™ option is available, make sure that eBoost™ Operation Mode is disabled before starting this procedure.

The Load is powered by the UPS Redundant RPA Parallel System. One UPS unit of the RPA Parallel System has to be turned OFF, while the Load is shared between the other units supplying the Parallel Bus.

The control bus cable connecting J1A - J2A and J1B - J2B cannot be connected or disconnected after the system has been powered ON.

Initial status:
Load supplied by all Inverters of the RPA Parallel System.

1. Disconnect the Inverter performing the “Inverter OFF” command on the Unit to separate.
   1 - Perform the “Inverter OFF” command from the screen:
      Commands 1 / Inverter / OFF.
   2 - Repeat the “Inverter OFF” command from the screen:
      Commands 1 / Inverter / OFF.

With Redundant System, performing the “Inverter OFF” command the Inverter shuts down and it will stay OFF. Performing the “Inverter OFF” command the Load is transferred to the Utility and the Inverter remains operating, it means the system is not redundant.

In this case is not possible to switch-OFF one unit without transferring the Load on Mains.
• Load supplied by Inverter(s) of the other Unit(s) of the RPA Parallel System.

2. Open the “Q1 – External UPS Output Circuit Breaker” (Pos. O) on the Unit to separate.
   • LED ALARM is lit.

Continue →
3. Perform the command “Module shutdown” on the Unit to separate only when the symbol Q1 in the Synoptic Diagram is shown open.

Perform the command “Module shutdown” through the screen:
Commands 1 / Module shutdown / SHUTDOWN.

4. Disconnect the Battery to the Unit to separate by opening the “External Battery Breaker” (Pos. O).
Press “MUTE” key to reset Acoustical Alarm. LED ALARM remains lit.

Note!
Before performing the next procedure (5) wait 5 minutes for DC-link Capacitors discharge.
Use the MEASURES/Rectifier screen to ensure that the DC-link 1 and DC-link 2 voltage has reached 10Vdc.

5. Disconnect the Utility supply on the Unit to separate.

End of Procedure

Danger!
It will take 5 minutes for the DC capacitors to discharge.
Open only the front door, do not open any other part of the UPS.

Note!
For any further intervention contact your ABB Service Center.
7.3.3 Reconnect a UPS unit to RPA Parallel System

Note!
The Load is still powered by the other units supplying the Parallel Bus.
This UPS unit will be powered on and connected to the Parallel Bus in order to share the Load with each other's.

⚠️ The high-speed bus cable connecting J1A - J2A and J1B - J2B in any case cannot be connected or disconnected after the system has been powered on.
The bus terminals must be properly connected before powering the additional unit.

If eBoost™ option is available, make sure that eBoost™ Operation Mode is disabled before starting this procedure.

Open the front door, of the Unit to reconnect and make sure that:
- All the connections to the input/output terminals or bus bars of the UPS have been made correctly.
- The protection panels are fastened in their correct position.
- The “Q1 – External UPS Output Circuit Breaker” and the “External Battery Breaker” must be open (Pos. O).

1. Switch-ON the Utility voltage, on the Unit to reconnect, from the input distribution (both Rectifier and Bypass if separated).

At this stage the Electronic Power Supply and Control Panel are switched ON and the Buzzer sounds.
Press “MUTE” key to reset Acoustical Alarm.
LED ALARM remains lit.

2. Close the “Q1 – External UPS Output Circuit Breaker” (Pos. I) on the Unit to reconnect.

- Rectifier starts automatically.
  LED 1 (Rectifier) blinking, indicates Soft-start.
- At the end of Rectifier Soft-start the LED 1 (Rectifier) remains lit.
Note!
Ensure the LED 1 (Rectifier) is lit before carrying out this procedure (3).
It indicates that the DC-link 1 and DC-link 2 has reached 400Vdc (see screen MEASURES / Rectifier)!

3. Connect the Battery to the Unit to reconnect by closing the “External Battery Breaker” (Pos. I).

Note!
Before performing the next procedure (4) make sure that the LED 3 (Booster/Battery charger) is lit.

4. Insert the Inverter performing the command “Inverter ON” on the Unit to reconnect.

Perform the “Inverter ON” command from the screen:
Commands 1 / Inverter / ON.

- After Soft-start of the Inverter the Inverter connects automatically to the other Units of the RPA Parallel System.
- LED ALARM turns OFF and the LED LOAD PROTECTED must be lit.

The Synoptic Diagram, on all UPS units, must display the status “Load supplied by Inverter”.

End of Procedure
7.3.4 Complete RPA Parallel System shut-down

Note!
The UPS RPA Parallel System and the Load have to be completely powered down.
If eBoost™ option is available, make sure that eBoost™ Operation Mode is disabled before starting this procedure.

Initial status:
Load supplied by all Inverters of the RPA Parallel System.

1. Perform the command “System shutdown” on anyone of the units.
   Perform the command “System shutdown” through the screen:
   Commands 1 / System shutdown / SHUTDOWN.
   • Load is disconnected from UPS RPA Parallel System.
   • Rectifiers and Inverters are shut down and all Contactors are opened.
   • LED ALARM is lit.

2. Open the “Q1 – External UPS Output Circuit Breaker” (Pos. O) on all Units.

3. Disconnect on all Units the Battery from the UPS by opening the “External Battery Breaker” (Pos. O).
   Press “MUTE” key to reset Acoustical Alarm. LED ALARM remains lit.
   • Wait 5 minutes for DC-link Capacitors discharge. Use the MEASURES/Rectifier screen to ensure that the DC-link 1 and DC-link 2 voltage has reached 10Vdc.

4. Disconnect the Utility supply on all Units.

End of Procedure

Danger!
It will take 5 minutes for the DC capacitors to discharge.
Open only the front door, do not open any other part of the UPS.
7.3.5 Restore to normal operation after “System shutdown” with Load not supplied

**Warning!**
Please check and ensure the conditions of the connected load are safe before proceeding, as this procedure will result in the connection of power to the load circuit(s).

**Note!**
Before performing this operation, make sure that all units of the RPA Parallel System are in the following status:
- “Q1 – External UPS Output Circuit Breaker” must be closed (Pos. I).
- “External Battery Breaker” must be open (Pos. O).

If eBoost™ option is available, make sure that eBoost™ Operation Mode is disabled before starting this procedure.

---

**View of the Synoptic Diagram, on all UPS units, after performed the command “System shutdown” with load not supplied.**

**1. Restore the command “System shutdown” of the RPA Parallel System.**

Restore the command “System shutdown”, on anyone of the parallel units, through the screen:
Commands 1 / System shutdown / **RESET**.

- The Load is supplied by the Utility through the Automatic Bypass of all Units.
- Rectifiers start automatically, blinking LED 1 (Rectifier) indicates Soft-start.
- At the end of Rectifier Soft-start, the LED 1 (Rectifier) remains lit.
- LED ALARM are lit.

The Synoptic Diagram, on all UPS units, must display the status “Load supplied by Automatic Bypass”.

```
Continue ➜
```
Note!
Ensure the LED 1 (Rectifier) is lit before carrying out this procedure. It indicates that the DC-link 1 and DC-link 2 has reached 400Vdc (see screen MEASURES / Rectifier).

2. Connect the Battery to all Units by closing the “External Battery Breaker” (Pos. I).

Note!
Before performing the next procedure (3) make sure that the LED 3 (Booster/Battery charger) is lit.

3. Insert the Inverter performing the “Inverter ON” command on first unit.
   Perform the “Inverter ON” command from the screen:
   Commands 1 / Inverter / ON.
   - Soft-start of the Inverter indicated with blinking LED 2 (Inverter).
   - At the end of Inverter Soft-start the LED 2 (Inverter) remains lit.
   - In case of sufficient output power, the output will transfer to Inverter.

4. Insert the Inverter performing the “Inverter ON” command on all other units.
   Do not start the next Inverter until the sequence of the previous ends.
   Perform the “Inverter ON” command from the screen:
   Commands 1 / Inverter / ON.
   - Soft-start of the Inverter indicated with blinking LED 2 (Inverter).
   - At the end of Inverter Soft-start the LED 2 (Inverter) remains lit.
   - As soon as the output power of the Inverters is sufficient to supply the Load, the output of the units with running Inverter will transfer to Inverter.
   - LED ALARM turns OFF and the LED LOAD PROTECTED must be lit.
   The Synoptic Diagram, on all UPS units, must display the status “Load supplied by Inverter”.

End of Procedure
7.3.6 Restore to normal operation after “EPO - Emergency Power Off” with Load not supplied

**Warning!**
Please check and ensure the conditions of the connected load are safe before proceeding, as this procedure will result in the connection of power to the load circuit(s).

**Note!**
Before performing this operation, make sure that all units of the RPA Parallel System are in the following status:
- “Q1 – External UPS Output Circuit Breaker” must be closed (Pos. I).
- “External Battery Breaker” must be open (Pos. O).

If eBoost™ option is available, make sure that eBoost™ Operation Mode is disabled before starting this procedure.

View of the Synoptic Diagram, on all UPS units, after performed the command “EPO - Emergency Power Off” with load not supplied.

1. **Restore the EPO (Emergency Power Off) button.**
   - Press “MUTE” key to reset Alarm and Acoustical Alarm.
   - LED ALARM remain lit.

2. **Perform the “Inverter OFF” command on all Units.**
   Perform the "Inverter OFF" command from the screen: Commands 1 / Inverter / OFF.
   - Rectifiers start automatically.
   - LEDs 1 (Rectifier) blinking, indicates Soft-start.
   - After performed the "Inverter OFF" command on the last unit of the RPA Parallel System, the output of all Units connect to Automatic Bypass.

The Synoptic Diagram, on all UPS units, must display the status “Load supplied by Automatic Bypass”.

Synoptic diagram of first unit

Synoptic diagram of other units
Note!
Ensure the LED 1 (Rectifier) is lit before carrying out this procedure (3). It indicates that the DC-link 1 and DC-link 2 has reached 400Vdc (see screen MEASURES / Rectifier).

3. Connect the Battery to all Units by closing the “External Battery Breaker” (Pos. I).

Note!
Before performing the next procedure (4) make sure that the LED 3 (Booster/Battery charger) is lit.

4. Insert the Inverter performing the “Inverter ON” command on first unit.

Perform the “Inverter ON” command from the screen: Commands 1 / Inverter / ON.

- Soft-start of the Inverter indicated with blinking LED 2 (Inverter).
- At the end of Inverter Soft-start the LED 2 (Inverter) remains lit.
- In case of sufficient output power, the output will transfer to Inverter.

5. Insert the Inverter performing the “Inverter ON” command on all other units.

Do not start the next Inverter until the sequence of the previous ends.

Perform the “Inverter ON” command from the screen: Commands 1 / Inverter / ON.

- Soft-start of the Inverter indicated with blinking LED 2 (Inverter).
- At the end of Inverter Soft-start the LED 2 (Inverter) remains lit.
- As soon as the output power of the Inverters is sufficient to supply the Load, the output of the units with running Inverter will transfer to Inverter.
- LED ALARM turns OFF and the LED LOAD PROTECTED must be lit.

The Synoptic Diagram, on all UPS units, must display the status “Load supplied by Inverter”.

End of Procedure
8 Options

8.1 Connectivity options

Additional Customer Interface Board
The Customer Interface allows the client the exchange of information (monitoring and control) with the following interfaces:
- Connector RJ45 for a serial port RS232 / sub DB9 connection.
- 6 programmable output channels.
- 2 programmable input channels, of which one for GEN-ON.
- EPO (Emergency Power Off).

3-ph SNMP/WEB plug-in adapter
SNMP - Simple Network Management Protocol
The 3-ph SNMP/WEB plug-in adapter is an interface to the Ethernet Network and provides UPS information via the standard SNMP Protocol (UPS-MIB (RFC-1628); Single MIB; Parallel MIB).

The UPS can therefore be managed by a Network Management System (NMS) or by our applications (for instance iUPSGuard or Data Protection), which uses this information to determine the state of the UPS in order to guarantee safe and orderly shut-down of the server, when needed.

iUPSGuard
iUPSGuard is a remote monitoring solution for UPS, providing status monitoring and alarm notification that supports all ABB UPS product lines, anytime, anywhere.
iUPSGuard provides current and detailed information about UPS operation, including its configuration, internal alarms and operating conditions over web.
iUPSGuard notifies personnel of critical alarms and events via email or SMS, allowing a user or ABB Technician to make timely decisions on critical conditions.
In addition, comprehensive data collection and analysis improves diagnostics capability and enhances response time.
Continuous monitoring and ongoing maintenance help ensure maximum performance of your UPS equipment as it protects business critical applications.

Data Protection
Data Protection software can communicate with the UPS over RS-232, USB or SNMP to receive status information and measurement values of the UPS. In case of a critical condition (time on Battery, remaining Battery autonomy time or low Battery) for the Load, the software starts a controlled shut-down.
An enhanced alarm management system provides the possibility to start applications, send messages and send e-mails for every upcoming or disappearing alarm.

8.2 Options in UPS cabinet

eBoost™ Operation Mode
High efficiency operating mode, where the load is supplied directly by Utility and automatically transferred to Inverter if the voltage is out of prescribed tolerances.

RPA Kit
Redundant Parallel Architecture
Allows extending the unit to a parallel system with 2, 3, 4, 5 or 6 units connected on the same bus, which ensure the highest reliability rate and increase the power availability without prior investments.
9 Maintenance

Note!
All maintenance and service works must be performed by an ABB Service Technician only!

9.1 Maintenance

A UPS system, like other electrical equipment, needs periodic preventive maintenance. A regular maintenance check of your installation guarantees higher reliability of your safe power supply.

ABB recommends to perform the first service within 12 months from the commissioning date or within 18 months from delivery date. Subsequent services to perform every 12 months.

Preventive maintenance work on the UPS can be done only by an ABB Service Technician.

We therefore recommend you sign a Maintenance and Service contract with the local ABB Service Center organization.

9.1.1 Service check

If this lamp lights up during normal operation, the Unit has not been serviced for the last 20,000 hours by an ABB Service Technician. Some components of the UPS which need periodic maintenance, if not replaced, could cause a reliability reduction of the supply system. We highly recommend that you contact your ABB Service Center for preventive maintenance work.

Note!
Never ignore a Service Check alarm!
Failure to perform mandatory preventative maintenance on components documented in the UPS product manual may result in thermal damage to the equipment, its surroundings and an increased risk of personnel injury.
Refer to Section 9.1.2 to 9.1.6 for this important detail.

9.1.2 Fans and ventilation

We recommend a periodic cleaning of the ventilation channels and grids on the UPS system, in order to guarantee proper air circulation in the Unit and in the Battery.

The fans eventually wear out and must be substituted when a UPS alarm is triggered, in order to ensure the reliability of the UPS.

9.1.3 Other components with limited lifetime

Various components, such as the DC and AC filter capacitors and the lithium Battery on the “Control board” (memory saving), must be systematically replaced in order to maintain the UPS’S reliability. The substitution of these components is Signaled by a UPS alarm going off.
9.1.4 Battery

Note!
Perform mandatory Battery maintenance per Battery’s manufacturer product manual. This includes electrical and thermal measurements, inspection, cleaning, replacement and re-torque of connections.

Failure to perform proper maintenance on the Battery, per the Battery manufacturer’s recommendation, including scheduled Battery replacement, may result in thermal damage to the equipment and an increased risk of personnel injury.

ABB declines any responsibility for any damage to the system and the surrounding caused by Battery when the Battery maintenance program is provided by other than ABB itself and ABB authorized partners.

We recommend a periodic Manual Battery Test, especially if the Automatic Battery Test is disabled, in order to verify if the Battery can provide the expected backup time in case of Utility Failure.

We recommend that this test is performed at least every 3 months, especially if the Battery is not sufficiently discharged during normal operation.
The discharge time you use should be at least half of the Battery runtime.

For Battery Test setting, a “Service Code” is required to enter user set-up parameters.
The start-up technician has access to this “Service Code” and can program this feature during start-up.

Please consider that, if you did a full Battery Test to verify the full runtime of the Battery, the charger needs at least 8 hours to recharge the Battery up to 90% of its capacity.

Long shut-down periods of the UPS system
To guarantee that the Battery is fully charged, the UPS system should be in operation for at least 12 hours every 3 months. If not, the Battery may be permanently damaged.

9.1.5 UPS room conditions and temperature
The UPS room and the Battery Room must be maintained clean and free from dust.
A high temperature of the UPS room and of the Battery Room affect the lifetime of several components inside the equipment.
The Battery is very sensitive to room temperatures above 77°F (25°C).

9.1.6 Preventive maintenance program
a) Cleaning, a visual inspection and a mechanical inspection of the UPS Modules.
b) Replacement of defective parts or the preventive replacement of parts with a defined lifetime.
c) “Updating” of the equipment (technical improvements subsequent to the delivery).
d) Check the calibration of DC voltage and Inverter Output Voltage and Frequency.
e) Check of the settings of the electronic regulation, the control and the alarm circuits of the Rectifier(s) and Inverter(s).
f) Functional checks on Thyristors, Diodes, Transformers, Filter Components, e.g. to ensure that they are operating within the specified design parameters.
g) Overall performance test including a Utility Failure simulation with and without the Load.
h) Monitoring Battery operation in discharge and recharge mode including any boost charge duties.

Note!
Ask to your local ABB Service Center to submit the form of Preventive Maintenance Contract suitable for your specific needs.
# Notes

## 10.1 Notes Form

It is recommended to note in this section **Notes**, with date and short description all the operations performed on the UPS, as: maintenance, components replacement, abnormal situations, etc.
