

Solution Description

ABB Ability™ Terminal Management

ABB T-MAC Plus is a terminal management system that brings together the control system, subsystems and devices into one platform to automate key monitoring and control modules. It includes advanced functionality, such as automatic bay allocation and optimized loading sequence, to reduce loading times and increase the amount of inventory loaded and tracked. This helps ensure terminal operations are efficient, safe and secure.

Benefits

- Accelerates loading time and increases productivity
- Manages all operations carried out in loading terminal, from product delivery to dispatch, as well as product inventory and balance
- Improves and accelerates decision making by providing the right information at the right time to the right people via remote monitoring, e-mail or SMS
- Reduces opex costs by automating key functions and providing the ability to scale to meet business needs
- Enhances personnel and plant safety to ensure reliable operations in hazardous environments
- Saves engineering time by enabling operators to replicate the application in different installations by simply changing settings
