The Dodge Torque-Arm speed reducers surpass all other reducers on the market because of its industry proven design and patented features. This powerful line of shaft mounted speed reducers – in 14 case sizes through 700 (Hp) – offers unparalleled torque ratings and is quickly becoming the new industry standard.

Improved features and capabilities include:
• Fourteen reducer sizes with shaft mount accessories
• Seven reducer sizes with screw conveyor accessories
• Meets or exceeds AGMA design standards including 5,000 hour L-10 bearing life, 25,000 average life
• Patented harsh duty oil seals with filter breather
• Numerous steel motor mounts available for most configurations, positions, and motor heights
• Standard product offerings of 5, 9, 15, and 25:1 ratios
• Patented twin tapered bushing systems to accommodate shafts from 1 inch through 10 inches
• Reducers available for shaft mounted, screw conveyor, vertical and flange mounted, and hydraulic applications

Dodge® twin tapered bushings have provided customers over forty years of reliable and proven service. This exclusive feature revolutionized the shaft mount reducer concept and insured that Torque-Arm speed reducers would not seize to the customer’s driven shaft.

Torque-Arm speed reducers provide positive, easy-on, easy-off mounting for all reducer sizes from fractional to 700 hp.

A tapered bore in both sides of the reducer’s output hub snugs up against a matching taper on the outer surface of the bushing - “twin tapered”.

Bushing mounting screws pass through the bushing flange into a mounting collar on the hub. As the screws are tightened, the bushing moves inward, gripping the driven machine’s input shaft tightly and evenly around every point on its circumference.

TXT reducers incorporate standard Dodge features
• Ratios up to 210:1.
• Capacities fractional to 700 Hp
• Output speeds through 400 RPM
• Trouble-free maintenance
• Up-front installation savings
• Quality proven design
• Easier, more accurate drive alignment

Rugged, cast iron housing
Cast, corrosion-resistant gray and ductile iron housings are precision machined for positive gear alignment. Rugged housing construction provides strong, rigid support for bearings and gearing.

Efficient helical gear tooth design
produces an efficiency rating of 98.5% per gear set. Gear teeth feature a softer core to resist shock loads, combined with a case carburized surface for maximum wear resistance.

Lip seals
Metal cased lip seals keep lubricating oil in, lock dirt and contaminants out. A garter spring exerts a constant, gentle pressure at every point around the circumference of the shaft to insure a positive seal. All seals ride on precision ground surfaces for maximum life.

Dependable performance
All Dodge Torque-Arm speed reducers are 100% factory noise and leak tested to assure long life and trouble-free service.

Dodge has a Torque-Arm reducer for every application.

It’s easy to see why Dodge Torque-Arm is America’s number one shaft mounted speed reducer.
Features and Benefits
Torque-Arm shaft mount speed reducers

Dodge® Torque-Arm

1. Precision high quality gearing
   • Computer designed helical gears
   • 98.5% efficiency per gear stage
   • Case carburized for long life
   • Strong alloy materials for high load capacity
   • Ground gear tooth profile for even load distribution
   • Smooth quiet operation with several teeth in mesh
   • Designed in conformance with AGMA

2. Maximum capacity housing design
   • Rugged cast iron and ductile iron
   • Rigid bearing support and positive gear alignment
   • High corrosion resistance
   • Excellent vibration dampening and shock resistance features

3. Reliable anti-friction bearings
   • Anti-friction bearing manufacturers association bearing ratings
   • Combination ball and tapered roller designs
   • Straddle mounted gears for optimum support
   • High thrust capacity screw conveyor drive bearings

4. Strong shafts for support
   • Precision-machined and hardened for maximum load
   • High alloy steel for maximum torsional loads
   • Generous size shaft keys for shock loading
   • Press or heat-shrunk design for total reliability

5. Proven seals keep oil in and contaminants out
   • Lip spring-loaded construction
   • Metal reinforcement for strength
   • Broad operating range of -20°F to 225°F
   • 100% factory-tested before shipment
   • Smooth ground shaft surfaces for maximum life
   • Seal kits available for all reducer sizes

6. Efficient splash lubrication system
   • Generous oil sump for lubricating all gears and bearings
   • Standard gear petroleum lubricants are suitable
   • Multiple oil plugs for total mounting flexibility
   • New breather with baffle and filter
   • Magnetic drain plug for protection

Dodge Torque-Arm is America’s leading shaft-mount reducer because:

• Experience – over 2,000,000 sold
• Delivery – nearly 5,000 reducers and 20,000 accessories in stock
• Quality – warranties of less than 1/2% of sales
• Customer preferred – proven experience since 1949
• Twin tapered bushings – reliable installation and removal
• Performance capability – applications through 700 Hp
• Product configurations – Torque-Arm, screw conveyor, and Hydroil
• Accessory package – motor mount, backstop, bushings and auxiliary seals

Features and Benefits
Torque-Arm shaft mount speed reducers
Application flexibility

Vertical shaft application
Dodge® Torque-Arm
twin tapered bushed vertical speed reducer

TDT1530T
Application: 200 Hp, Class III service on vertical shaft mixer application. This TDT 1530 vertical tapered bushed speed reducer with shock absorbing DYNA-V belt drive package replaced an expensive, hard-to-replace, open gear drive system. Torque-Arm reducers can mount in many positions, such as vertical shaft applications simply by repositioning the breather and drain plug for lubrication purposes. Another standard feature of compact and highly efficient Torque-Arm reducers.

Flange mounted application
Dodge Torque-Arm flange mounted vertical
twin tapered bushed speed reducer

TDT625T
Application: 15 Hp, Class II service, on vertical agitator shaft in cement mixing system. This rugged reducer is rigidly mounted via the flange mounting pads which are standard on all Torque-Arm reducers. This no-charge, flange drilling option allows the reducer to support the agitator shaft and any thrust loads imposed. Flange mounted reducers do not require Torque-Arm rod assemblies.

Horizontal shaft application
Standard Dodge Torque-Arm
twin tapered bushed speed reducer

TXT725T x 3-15/16"
Application: 40 Hp drive, Class II service, on main conveyor drive. Standard Tapered

Bushed TXT 725 x 3-15/16" speed reducer package offers long life and dependability. Other user benefits on this horizontal shaft application include compactness, off-the-shelf components, flexible motor mount arrangement, and reliable easy-on, easy-off tapered bushings. The lowest cost installed system for moving bulk materials.

Hydraulic reducer application
Dodge Hydrol Torque-Arm
twin tapered bushed speed reducer

HXT525T with B30 motor
Application: Variable speed Dodge Hydrol speed reducer with hydraulic power is another example of Torque-Arm reducer flexibility. This version powers a rugged, mobile brand of road construction equipment. Simply regulating the pressure and volume of fluid to the motor provides variable speed, variable torque, and even direction of rotation change.
Features and Benefits
Torque-Arm shaft mount speed reducers
Dodge screw conveyor drives

Dodge quality designed with the screw conveyor industry in mind

The dependable Dodge screw conveyor drives provide a rugged, competitively priced, application-engineered drive for standard CEMA screw conveyors. And the screw conveyor drive incorporates the proven reliability you have come to expect from the Dodge Torque-Arm reducer line.

Tapered roller bearings within the drive eliminate the need for an external thrust bearing. The bearings take thrust from the screw conveyor and make external thrust bearings unnecessary.

Dodge screw conveyor drives are available in 5:1, 9:1, 15:1 and 25:1 ratios and the durable drives include:

- A compact design reducer with increased torque ratings.
- The CEMA standard drive shaft
- A standard trough end mounting adapter with CEMA four-bolt mounting
- Standard adapter for use with choice of lip, braided or waste pack seals
- Optional adjustable packing adapter kit.

The Dodge complete, rugged, highly developed, screw conveyor drive mounts on the trough end of your screw conveyor. Tapered roller bearings in the reducer take the thrust from the screw conveyor. This eliminates the external thrust bearing commonly required. The drives may be mounted in any position on horizontal, inclined, or vertical shafts by relocating breather and drain plugs. For complete drive between trough and motor, specify the screw conveyor drive and the following accessories: trough end plate and motor mount.

Where V-belt drives or electric motors cannot be used, Dodge offers a screw conveyor drive powered by a hydraulic motor.

Note: Guards have been removed for photographic purposes

Features and Benefits
Torque-Arm shaft mount speed reducers
Dodge® Hydroil™ drives

Hydraulically powered Torque-Arm speed reducers with infinitely adjustable speed and torque
This is a modified version of the famous Torque-Arm speed reducer with the same quality features and ease of installation.

A Hydraulic motor powers the Hydroil reducer, greatly expanding its scope of application and versatility. It has proven to be popular for locations remote from the prime mover where shafts or belt and chain drives are impractical or where electric motors are not available. Exceptional flexibility is provided in the control of the driven machine by simply regulating the pressure and volume of fluid fed to the Hydroil motor.

Users can provide flexible control of the Hydroil drive by selecting proper auxiliary equipment. Output speeds of the reducer are infinitely adjustable through the use of regulating valves in the hydraulic circuit. Both speed and torque can be adjusted to meet the requirements of the driven machine which can be inched or jogged. The direction of rotation is reversible.

Where V-belt drives or electric motors cannot be used, Dodge offers a screw conveyor drive powered by a hydraulic motor.

Hydroil vane motors are a superior single stage vane type fluid motor. A series of internal ports admit oil to and carry it from the power element. Complete hydraulic balance of the assembly contributes to the mechanical efficiency and long life of these motors as well as to their unusually quiet operation. Other exclusive features assure a minimum of friction and efficient valving action regardless of operating speeds.
Specifications
Torque-Arm shaft mount speed reducers
General specifications

Torque-Arm speed reducers
The speed reducer shall be a belt driven enclosed shaft mount type unit with a single or double reduction ratio. The reducer shall mount directly on the driven shaft and utilize an adjustable torque arm that attaches from the gear case to the support structure or foundation. Optional all steel motor mount adjusts to various belt center distances and supports the motor.

The reducer housing shall be constructed of two-piece corrosion resistant, class 30 gray iron. All housings shall be doweled and precision machined to assure accurate alignment for all gear sets.

All gearing shall be of helical design, case carburized and precision finished to insure a high surface durability with a resilient tooth core for impact resistance and optimum service life. Gears shall be supported between bearings to maintain proper alignment of gear meshes, to maximize load carrying capabilities, and to eliminate overhung loads imposed on bearings. Design meets or exceeds AGMA standards.

Reducer bearings shall be of the ball or tapered roller type, and provide a 25,000 hour minimum average life, 5,000 L-10 AGMA Class I standard.

Reducer output bearings shall be of the tapered roller type, to absorb thrust loads from the screw conveyor. All bearings shall provide 25,000 hour minimum average life, 5,000 L-10 AGMA Class I standard.

All seals shall be of the lip, spring loaded type, made of a premium harsh duty, heat resistant material.

Reducer installation shall be accomplished by using ductile iron, fully split, two bushing system. Reducer removal shall be accomplished by providing jack screw holes in the bushing flanges to mechanically remove the tapered assembly.

Screw conveyor drives
The drive shall be a belt driven enclosed, adapter mounted unit with a single or double reduction ratio. The drive shall consist of a standard speed reducer; a cast iron, bolt on, four bolt mounting adapter with double lip seals on both ends, an optional bolt on adjustable packing kit, and a drive shaft machined from a high quality alloy steel. The drive shall conform to Conveyor Equipment Manufacturers Association (CEMA) standards. Optional all steel motor mount adjusts to various belt center distances and supports the motor.

The reducer housing shall be constructed of two-piece corrosion resistant, class 30 gray iron. All housings shall be doweled and precision machined to assure accurate alignment of all gear sets.

All gearing shall be of helical design, case carburized and precision finished to insure a high surface durability with a resilient tooth core for impact resistance and optimum service life. Gears shall be supported between bearings to maintain proper alignment of gear meshes, to maximize load carrying capabilities, and to eliminate overhung loads imposed on bearings. Design meets or exceeds AGMA standards.

Reducer output bearings shall be of the tapered roller type, to absorb thrust loads from the screw conveyor. All bearings shall provide 25,000 hour minimum average life, 5,000 L-10 AGMA Class I standard.

All seals shall be of the lip, spring loaded type, made of a premium harsh duty, heat resistant material.

Hydroil drives
The speed reducer shall be a hydraulically powered enclosed shaft mount type unit with a single or double reduction ratio. The reducer shall mount directly on the driven shaft and utilize an adjustable torque arm that attaches from the gear case to the support structure or foundation.

The reducer shall be powered using a Hydroil single stage vane type fluid motor. The reducer shall be provided with a cast iron SAE mounting flange adaptor and splined input shaft to allow an integral fit with the splined hydraulic motor shaft.

The reducer housing shall be constructed of two-piece corrosion resistant, class 30 gray iron. All housings shall be doweled and precision machined to assure accurate alignment for all gear sets.

All gearing shall be of helical design, case carburized and precision finished to insure a high surface durability with a resilient tooth core for impact resistance and optimum service life. Gears shall be supported between bearings to maintain proper alignment of gear meshes, to maximize load carrying capabilities, and to eliminate overhung loads imposed on bearings. Design meets or exceeds AGMA standards.

Reducer bearings shall be of the ball or tapered roller type and provide a 25,000 hour minimum average life, 5,000 L-10 AGMA Class I standard.

All seals shall be of the lip, spring loaded type, made of nitrile rubber or HNBR.

Reducer installation shall be accomplished by using ductile iron, fully split, two bushing system. Reducer removal shall be accomplished by providing jack screw holes in the bushing flanges to mechanically remove the tapered assembly.

### Nomenclature example: Torque-Arm reducers

- **TXT - 6 - 25 - T - x - 3-7/16"**  
  Standard Torque-Arm shaft mount reducer  
  Case size 6  
  25:1 Ratio, double reduction  
  Twin taper bushed reducer  
  Twin tapered bushing assembly with bore to fit 3-7/16" diameter driven shaft

- **TXT - 2 - 05 - S - x - 1-15/16"**  
  Standard Torque-Arm shaft mount reducer  
  Case size 2  
  5:1 Ratio, single reduction  
  Straight bore reducer  
  1-15/16" is maximum bore for TXT2 straight bore reducer; no bushing required

- **HXT - 1 - 25 - T - x - 1-7/16"**  
  Hydroil shaft mount reducer  
  Case size 1  
  25:1 Ratio, double reduction  
  Twin taper bushed reducer  
  Twin tapered bushing assembly with bore to fit 1-7/16" diameter driven shaft

*Note: "A", "B" or "C" in nomenclature after ratio denotes latest reducer design*
Nomenclature
Torque-Arm shaft mount speed reducers
Nomenclature: Screw conveyor drive reducers

```
SCXT  7  25  -  x  -  3-7/16"  -  C  -  M724L
```

SCXT - 7 25 - x - 3-7/16" - C - M724L
Screw conveyor drive reducer
Case Size 7
25:1 Ratio, double reduction
3-7/16" diameter drive shaft
Standard CEMA 4-bolt adapter
Long motor mount for 24" screw

```
SCXT  5  25  -  x  -  2-7/16"  -  C  -  M518
```

SCXT - 5 25 - x - 2-7/16" - C - M518
Screw conveyor drive reducer
Case size 5
25:1 Ratio, double reduction
2-7/16" diameter drive shaft
Standard CEMA 4-bolt adapter
Standard motor mount for 12" screw

```
HSCXT  2  05  -  x  -  1-1/2"  -  AC
```

HSCXT - 2 05 - x - 1-1/2" - AC
Hydroll screw conveyor drive reducer
Case - Size 2
5:1 Ratio, single reduction
C Adapter with adjustable packing kit
1-1/2" Diameter drive shaft

* Note: “A”, “B” or “C” in nomenclature after ratio denotes latest reducer design
Selection
Torque-Arm shaft mount speed reducers

When to use Easy Selection
The Easy Selection tables for TXT Shaft Mount reducers are for electric motor selections up to 700 horsepower with output speeds up to 400 RPM, using AGMA recommended application class numbers. For extreme shock or high energy loads which must be absorbed, as when stalling; for power source other than an electric motor; or for extreme ambient temperatures, or oversized equipment, consult Dodge Application Engineering, (864) 284-5700.

How to select
· Step 1: Determine class of service – See “Application Classification” table, page G1-6, to determine load classification for applications under normal conditions. Find the type application and duty cycle that most closely matches your specific application.
  - Class I Steady load not exceeding motor Hp rating and light shock loads during 10 hours a day. Moderate shock loads are allowable if operation is intermittent.
  - For Class I applications, the maximum value of starting and momentary peak loads should not exceed 2 x motor Hp rating. If it exceeds this amount it should be divided by 2 and the result used in the selection table instead of the motor Hp rating.
  - Class II Steady load not exceeding motor Hp rating for over 10 hours a day. Moderate shock loads are allowable during 10 hours a day.
  - For Class II applications, the maximum value of starting and momentary peak loads should not exceed 2.8 x motor Hp rating. If it exceeds this amount it should be divided by 2.8 and the result used in the selection table instead of the motor Hp rating.
  - Class III Moderate shock loads for over 10 hours a day. Heavy shock loads are allowable during 10 hours a day.
  - For Class III applications, the maximum value of starting and momentary peak loads should not exceed 4 x motor Hp rating. If it exceeds this amount it should be divided by 4 and the result used in the selection table instead of the motor Hp rating.

· Step 2: Determine reducer size – See the Easy Selection tables, pages G3-18 thru G3-29. Class I, II or III selection tables, read the reducer size for the application horsepower and output speed. Note: For applications where fan cooling is unacceptable use the Easy Selection tables with an increased class number. Where more than one reducer selection is listed, the most economical ratio is generally listed first. See table on page G3-173 for maximum input and output speeds.

· Step 3: Compare hollow shaft bore with the size of the driven shaft. All Dodge Torque-Arm Taper Bushed reducers require bushings. Refer to reducer pages for available bushings. If the driven shaft is larger than the bore of the selected reducer, the shaft must be machined to the proper size, or select a larger reducer. Check driven shaft and key for strength.

· Step 4: Check dimensions – See “Selection and Dimensions” section, pages G3-24 thru G3-65 for reducer dimensions, weights and part numbers. See “Engineering and Technical” section, page G3-166 for reducer mounting positions. For optional Torque-Arm rod mounting positions, see page G3-170.

Step 5: Select a belt drive arrangement – From the Sheave Ratio table, pages G3-158 through G3-160, select the required sheave ratio for the belt drive. Be careful to select the belt drive so that the sheave mounted on the reducer shaft is not smaller than the minimum sheave diameter shown in the NEMA motor information table on page G3-57. Note: Mount the sheave as close as possible to the reducer to minimize the effect of overhung load on the reducer.

Step 6: Select accessories – See “Modifications and Accessories” section, pages G3-73 thru G3-81, for description, dimensions, weights, and part numbers for accessories available for the Torque-Arm reducer selected:
  - Motor mounts
  - Backstop assemblies
  - Belt guards
  - Cooling fans
  - Auxiliary seal kits
  - Filter breathers
  - Auxiliary end covers

Note: A Torque-Arm rod assembly is furnished with all TXT and HXT reducers, except for those factory-prepared for flange mounting. Torque-Arm reducers are shipped without oil.
Selection
Torque-Arm shaft mount speed reducers

Examples: Easy selection method – TXT Torque-Arm reducers

A 10 Hp 1750 RPM motor is used to drive a uniformly loaded belt conveyor moving sand at 70 RPM, operating 16 hours per day. Head pulley shaft diameter is 2-7/16". Spec calls for a means of holding the conveyor from moving backwards. User needs immediately so does not have time to build his own motor mount or belt guard.

Step 1: Determine class of service – From “Application Classification” table, page G1-6, locate “belt conveyors, uniformly loaded or fed” for over 10 hours per day. This load is classified as a Class II application.

Step 2: Determine reducer size – From Class II Application table, page G3-20, find the column for 10 Hp and read down to 70 RPM. A TXT425 reducer is the correct selection.

Step 3: Compare hollow shaft bore of TXT425 with the application driven shaft diameter. Per page G3-37, 2-7/16” is the maximum bore available for this size reducer, so it will work in this application. Be sure to check driven shaft and key for strength.

Step 4: Check dimensions and weights – See “Selection and Dimensions” section, for reducer dimensions, weights, part numbers and other pertinent drive dimensions. See “Engineering and Technical” section, for information on mounting positions.

Step 5: Select a belt drive arrangement – From the sheave ratio table on page G3-164, select a V-drive ratio for the conveyor speed of 70 RPM. With this information, select a belt drive that meets your customer’s needs i.e. belt style preference, service factor requirements, taper lock or QD mounting, etc. Sheave diameter must not be less than minimum diameters shown in the sheave diameters table on page G3-163.

Step 6: Select accessories – See “Modifications and Accessories” section of catalog to pick out accessories for this application:
- TXT4 Backstop assembly – to hold conveyor from moving backwards when shutdown
- TXT4 Auxiliary seal kit – extra help to keep sand out of the TXT425 reducer
- TA4M Motor mount – to mount motor to top of TXT425 reducer
- TXT4D Belt guard – to cover and protect the rotating belt drive
Selection
Torque-Arm shaft mount speed reducers
Selection guide: TXT Torque-Arm shaft mount reducers

This is a reference sheet for quick selection and specification of Dodge Torque-Arm shaft mount reducers. Use it to identify information needed to make an accurate selection with a step-by-step selection format for choosing reducers, accessories and belt drive.

Name ___________________________ Company name ___________________________
Phone no. ___________________________ Fax no. ___________________________

Application data
Type of driven equipment__________________________
Hours of service per day ___________________________ Class of service ___________________________
Type of load Uniform ___________ Moderate _________ Shock ___________________________
Motor type Hp ___________ RPM _________ Frame size ___________ Shaft size ___________
RPM of driven equipment ___________ Driven shaft size ___________
Type of reducer mounting Horizontal ___________ Vertical: Input up ___________
Input down Incline (degree of) ___________ Flange ___________
Unusual ambient temperature ___________________________
Other pertinent application characteristics (i.e., dusty environment, reversing duty, start/stop cycles, etc.) ___________________________

Reducer drive selection
Step 1 – Determine class of service ___________________________

Step 2 – From appropriate service class table, select reducer size and ration that meets application Hp and driven RPM requirements:

Twin taper bushed ___________________________ Straight bore ___________________________

Step 3 – Select reducer accessories required for application backstop

Motor mount Standard ___________ Long _________ Bottom ___________________________
Belt guard Standard ___________ Long _________ Cooling fan ___________________________
Auxiliary seal kit ___________________________
Other ___________________________

Sheave ___________________________ Sheave ___________________________
Bushing ___________________________ Bushing ___________________________
Belts Size ___________________________ Quantity ___________________________
**Selection**
Torque-Arm shaft mount speed reducers
Application classification and class, and Torque-Arm family breather technology

For Application class and service, please see G1-6 – G1-12.

**Torque-Arm family breather technology**

1. **Standard breather** is a filter breather
   - Cotton filter media
   - Screen to support filter
   - Chamber to allow oil to collect and return to reducer
   - Non captured filter (should not clog and block air exit)

2. **Hydra-Lock desiccant breather**
   - Built in standpipe
   - 3 micron filter media top and bottom
   - Desiccant material changes color from blue (good) to pink (replace)
   - Check valve system, so breather is only open to atmosphere under pressure or vacuum. Closed when not running.

3. **Fully enclosed canister breather**
   - Allows no outside air
   - Excellent protections for extreme wet environments

♦ Made to order
† Shaft key furnished.
▲ Check the driven shaft and key for strength.
♣ Preferred bore. No bushing required for this bore size.
○ Stock TXT Reducers are drilled for vertical mounting.
◆ Dodge standard belt guards will not fit this motor mount.
■ See pages G3-168 and G3-169 for reducer part numbers and drill and tap dimensions for flange mount TXT reducers. Available only as special factory order.
● Taper bushed reducers require bushing for all bore sizes.
♥ Use with taper bushed reducer only. See pages G3-171 and G3-172 for drill and tap information required to mount to reducer.

* Made to order
† Shaft key furnished.
▲ Check the driven shaft and key for strength.
● Taper bushed reducers require bushing for all bore sizes.
❖ Reducers are supplied already drilled and tapped for vertical mounting and flange mounting.
See pages G3-171 and G3-172 for Flange Mounting dimensions.

Modifications and Accessories
Torque-Arm shaft mount speed reducers
Motor mounts

TA Motor mounts
The TA Motor Mount is a rugged all steel unit which requires no drilling and no foundation. It bolts directly to the top of the Torque-Arm reducer and can be located in any position around the shaft. It permits easy belt tensioning.

Each motor mount accommodates a wide variety of NEMA motor frames - see table below.

All motor mount fasteners are supplied with zinc-plated finish as standard. Bolt hole configuration will also allow this mount to fasten to the top of a screw conveyor drive reducer of equivalent size.

♣ Made to order
▲ Made to order belt guards required for these motor mounts. Consult Dodge.
● Provides for V-belt adjustment
◆ Can be used with any ratio Torque-Arm reducer (5, 9, 15, 25)
◆ Necessary mounting bolts are included
Modifications and Accessories
Torque-Arm shaft mount speed reducers

TAML Long motor mounts
The TAML motor mount has longer support brackets, which allows for more clearance between the conveyor pulley and the bottom plate of the motor mount. (Reference table below for clearance dimensions.) The motor mount is a rugged all steel unit which requires no drilling and no foundation. It bolts directly to the top of the Torque-Arm reducer and can be located in any position around the shaft. It permits easy belt tensioning and accommodates a wide variety of NEMA motor frames.

All motor mount fasteners are supplied with zinc-plated finish as standard.

Bolt hole configuration will also allow this mount to fasten to the top of a screw conveyor drive reducer of equivalent size.

* Made to order
† Consult Dodge for Long Motor Mounts for reducers TXT8A and larger.
▲ Made to order belt guards required for these motor mounts. Consult Dodge.
◆ Provides for V-belt adjustment
■ Can be used with any ratio Torque-Arm Reducer (5, 9, 15, 25)
● Necessary mounting bolts are included

(1) Distance from centerline of head shaft (reducer bore) and lowest component of motor mount hardware extending over top of conveyor
Modifications and Accessories

Torque-Arm shaft mount speed reducers

TAB Bottom motor mounts

For those applications where space constraints do not allow a Dodge Torque-Arm motor mount to be mounted from the top end of the reducer with our standard Torque-Arm motor mounts, TAB Bottom motor mounts are available. The TAB motor mount is a rugged all-steel unit which requires no drilling or foundation. It bolts directly to the bottom of a Torque-Arm reducer housing and also serves as a support member for the Torque-Arm rod assembly. Each mount accommodates a wide variety of NEMA AC motor frames. For initial belt installation, the adjusting screws can be set at a minimum position which offers adequate future V-belt adjustment.

### Torque-Arm bottom motor mounts - TAB 1 thru TAB 10 ▲

| Motor mount no. | Part number | Reducer size | Nominal ratio | NEMA motor frame | A | B | C | D | E | G | H | J | K |

### Modifications and Accessories

**Torque-Arm shaft mount speed reducers**

**Belt guards**

**Slotted metal panel belt guard**

Belt guards with mounting straps for TXT Reducers will fit standard TA motor mounts. The belt guards are designed to fit most common sheave diameters. They mount easily with no machining required.

Modifications and Accessories
Torque-Arm shaft mount speed reducers

Backstops

Backstops are offered for service conditions that require the prevention of reverse direction. They can be quickly installed by removing cover plate and slipping the backstop over the input shaft. After cover is replaced, backstop becomes completely sealed inside the reducer case. Since the reducer lubricates the backstop, no additional lubrication is required.

When ordering backstops, specify by reducer size and ratio. Keys are included in each backstop assembly.

Warning: Backstops are not recommended for applications involving energy absorption and shock or torque loads in excess of reducer ratings or on applications such as chair lifts, amusement rides, etc., where the safety of persons or property is dependent on their function. On such applications, other safety devices should be provided. Not for use with lubricants containing EP additives.

■ See pages G3-184 and G3-185 for complete listing of Backstop assemblies for all generations of Dodge TXT Torque-Arm reducers.
An auxiliary seal kit consists of two output seals and one input seal with necessary mounting hardware. Seal rings are equipped with a standard grease fitting and a large cavity which permits grease purging of the seal in severe applications, such as taconite mining, rock processing, fertilizer processing, etc. Reducer housings, sizes 1 thru 5, must be drilled and tapped to accommodate seal. On sizes 6 and larger, the auxiliary seal bolts to the existing seal carrier, with the longer bolts supplied with the kit. A filter breather is included with each auxiliary seal kit.

- ♦ Made to order
- ■ See pages G3-171 and G3-172 for dimensions to drill and tap reducer housing for mounting of auxiliary seal kit. Dodge will install upon request.
- ● Input auxiliary seal can not be used on same input shaft with a cooling fan
- ★ For taper bushed reducers only
### Modifications and Accessories

**Torque-Arm shaft mount speed reducers**

**Cooling fan assemblies**

When the thermal capacity of a Torque-Arm reducer is exceeded, cooling fans provide an optional, inexpensive way of lowering the oil temperature, thus increasing the thermal horsepower capacity of the reducer. Selection tables indicate when a cooling fan is required.

Installation is accomplished simply by attaching formed steel mounting straps to the reducer input shaft seal carrier. The fan assembly, which fastens to the input shaft, is compact enough to allow installation of the originally designed for the reducer.

The fan housing is attached to the outer edges of the straps, which are spaced to allow free circulation of air at the back of the housing as well as through the front of the unit. The fan blade offers a radial streamline air flow which means smaller fans yet a more efficient movement of air.

For thermal capacities beyond the range of cooling fans, heat exchangers may be used—see below.

: See page G3-173 for maximum input shaft speeds

`Made to order`

#### Reducer heat exchanger cooling package

For thermal capacities beyond the range of cooling fans, an optional heat exchanger cooling package is available to prevent overheating the reducer and allow the use of full mechanical Hp rating by lowering the oil temperature to an acceptable level.

Specifications for the heat exchange motor are as follows:

- 1/2 Hp, 60 Hz, 3 Ph, 230/460 volt, TEFC, 56 frame
- Minimum coolant (water) flow is 3 G.P.M. based upon a maximum water temperature of 80°F. Minimum oil temperature for operation is 60°F
