1 Preface

1.1 Documentation guide

Where to find information about:

- PLC system
  - Chapter 4.1 “System overview” on page 85
  - Chapter 3 “Getting started with example projects” on page 16
  - Starter kit: Introduction to PLC programming and visualization, including all needed hardware components
  - Safety user manual for safety PLCs
- Devices
  - Data sheets
  - Installation instructions
  - Chapter 5.2 “Device specifications” on page 175
  - Safety user manual for safety PLCs
  - Control panels
- Software and programming
  - Chapter 6 “Configuration and programming” on page 1339
  - Programming examples available for download
  - Programming examples available in the engineering suite: Open Automation Builder menu “Help ➔ Project examples”
  - Application descriptions for specific features and use cases
  - Release notes for the latest version of the engineering suite Automation Builder

1.2 Do I use AC500 V2 or AC500 V3?

This document describes AC500 V3 products.

We offer different ranges of the processor modules (V2, V3). You can easily find out which ones are used in your system. Either have a look at your used modules or your configuration.

![Fig. 1: Hardware: Processor modules](image)

<table>

<td>AC500 V3 (this manual)</td>
</tr>
</tbody>
</table>
### 1.3 Your tasks - documentation from the user’s point of view

All information about AC500, AC500-XC and AC500-eCo is available in this manual.

All information about AC500-S and AC500-S-XC is available online in the safety user manual.

#### As a specialist for PLCs, new to AC500 PLC

### 1.4 Regulations

**Planning and installation of the electrical system**

The planning and installation of the electrical system must be carried out in compliance with the applicable regulations and standards. Hazards due to malfunctions must be prevented by taking appropriate measures.

The suitability of the products for the respective application is proven by declarations of conformity and certificates.

The PLC Automation catalog contains an overview of the available declarations of conformity and certificates.

**Qualified personnel**

Both the AC500 control system and other components in the vicinity are operated with dangerous touch voltages. Touching live components can lead to serious health implications or even death.

To avoid such risks and the occurrence of property damage, persons involved in the installation, commissioning and maintenance must have relevant knowledge about:

- Automation technology
- Handling of hazardous voltages
- Application of relevant standards and regulations, accident prevention regulations and regulations on special environmental conditions (e.g., hazardous areas due to explosive substances, heavy soiling or corrosive influences).
1.5 Older revisions of this document

You can always find all revisions of our documents on our website.

AC500 V3 (online)

1.6 Structure of safety notices

Throughout the documentation we use the following types of safety and information notices. They make you aware of safety considerations or give advice on AC500 products usage.

1 Safety alert symbol indicates the danger.
2 Signal word classifies the danger.
3 Type and source of the risk are mentioned and possible consequences are described.
4 Measures to avoid these consequences (enumerations).

Signal words

DANGER!

DANGER indicates a hazardous situation which, if not avoided, will result in death or serious injury.

Ensure to take measures to prevent the described impending danger.
WARNING!
WARNING indicates a hazardous situation which, if not avoided, could result in death or serious injury.
Ensure to take measures to prevent the described dangerous situation.

CAUTION!
CAUTION indicates a hazardous situation which, if not avoided, could result in minor or moderate injury.
Ensure to take measures to prevent the described dangerous situation.

NOTICE!
NOTICE is used to address practices not related to physical injury but might lead to property damage for example damage of the product.
Ensure to take measures to prevent the described dangerous situation.

NOTE provides additional information on the product, e.g., advices for configuration or best practice scenarios.
2 Safety instructions

Relevant standards and regulations, accident prevention regulations and regulations on special environmental conditions must be observed (e.g., hazardous areas due to explosive substances, heavy soiling or corrosive influences).

The devices must be handled and operated within the specified technical data and system data. The devices contain no serviceable parts and must not be opened. Removable covers must be closed during operation unless otherwise specified. Any liability for the consequences of incorrect use or unauthorized repairs is rejected.

Qualified personnel

Both the AC500 control system and other components in the vicinity are operated with dangerous touch voltages. Touching live components can lead to serious health implications or even death.

To avoid such risks and the occurrence of property damage, persons involved in the installation, commissioning and maintenance must have relevant knowledge about:

- Automation technology
- Handling of hazardous voltages
- Application of relevant standards and regulations, accident prevention regulations and regulations on special environmental conditions (e.g., hazardous areas due to explosive substances, heavy soiling or corrosive influences).

Functional safety

The AC500-S safety user manual must be read and understood before using the safety configuration and programming tools of Automation Builder/PS501 Control Builder Plus. Only qualified personnel are permitted to work with AC500-S safety PLCs.

General information

The examples and diagrams in this manual are included solely for illustrative purposes. Because of the many variants and requirements associated with any particular installation, ABB cannot assume responsibility or liability for actual use based on the examples and diagrams.

The PLC was developed according to the relevant standards. Any module-specific measures are described in the individual descriptions of the modules.

PLC-specific safety notices

The product family AC500 control system is designed according to the EN 61131-2 and IEC 61131-2 standards. Any data that differs from IEC 61131-2, is due to the higher requirements of Maritime Services. Other differences are described in the technical data description of the devices.

NOTICE!

Avoidance of electrostatic charging

PLC devices and equipment are sensitive to electrostatic discharge, which can cause internal damage and affect normal operation. Observe the following rules when handling the system:

- Touch a grounded object to discharge potential static.
- Wear an approved grounding wrist strap.
- Do not touch connectors or pins on component boards.
- Do not touch circuit components inside the equipment.
- If available, use a static-safe workstation.
- When not in use, store the equipment in appropriate static-safe packaging.
NOTICE!

Use of suitable enclosure
The devices must be mounted in a control cabinet that ensures compliance with the specified environmental conditions.

Cleaning instructions
Do not use cleaning agent for cleaning the device.
Use a damp cloth instead.

Connection plans and a user program must be created so that no dangerous situations can occur during normal operation or failure.
The application must be tested to ensure that no dangerous situations can occur during operation.

Do not operate devices outside of the specified, technical data!
Trouble-free functioning cannot be ensured outside of the specified data.

NOTICE!

PLC damage due to missing grounding
- Make sure to ground the devices.
- The grounding (switch cabinet grounding) is supplied both by the mains connection (or 24 V supply voltage) and via the DIN rail. The DIN rail must be connected to ground before power is supplied to the device. The grounding may be removed only if it is certain that no more power is being supplied to the control system.
- In case of screw mounting, use metal screws for grounding.

CAUTION!

Do not obstruct the ventilation for cooling!
The ventilation slots on the upper and lower sides of the devices must not be covered.

CAUTION!

Run signal and power wiring separately!
Signal and supply lines (power cables) must be laid out so that no malfunctions due to capacitive and inductive interference can occur (EMC).

WARNING!

Warning sign on the module!
This indicates that dangerous voltages may be present or that surfaces may have dangerous temperatures.
WARNING!
Splaying of strands can cause hazards!
Avoid splayed strands when wiring terminals with stranded conductors.
– Ferrules can be used to prevent splaying.

WARNING!
Removal/Insertion under power
Removal or insertion under power is permissible only if all conditions for hot swapping are fulfilled.

CDF Chapter 4.9.3 “Replace an I/O module with hot swap” on page 153

The devices are not designed for removal or insertion under power when the conditions for hot swap do not apply. Because of unforeseeable consequences, it is not allowed to plug in or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while they are energized in a hazardous location could result in an electric arc, which could create an ignition source resulting in fire or explosion.

Prior to proceeding, make sure that power is been disconnected and that the area has been thoroughly checked to ensure that flammable materials are not present.

The devices must not be opened when in operation. The same applies to the network interfaces.

CAUTION!
Use only ABB approved lithium battery modules!
At the end of the battery’s lifetime, always replace it only with a genuine battery module.

CAUTION!
Risk of explosion!
Do not open, re-charge or disassemble lithium batteries. Attempting to charge lithium batteries will lead to overheating and can cause explosions.

Protect them from heat and fire and store them in a dry place.

Never short-circuit or operate lithium batteries with the polarities reversed. The batteries are likely to overheat and explode. Avoid unintentional short circuiting do not store batteries in metal containers and do not place them on metallic surfaces. Escaping lithium is a health hazard.
**Environment considerations**

Recycle exhausted batteries. Dispose of batteries in an environmentally conscious manner in accordance with regulations issued by the local authorities.
3 Getting started with example projects

3.1 Introduction

This document gives an overview of the steps for the first use of a PLC with AC500 V3 processor module and describes:

- installation of the engineering software © Chapter 3.2 “Engineering software Automation Builder” on page 16
- hardware needed for example projects © Chapter 3.3 “Hardware AC500 V3” on page 21
- setting up a first, simple project for a stand-alone CPU with central I/O expansion, including visualization and web visualization © Chapter 3.4 “Example project for central I/O expansion” on page 24
- commissioning a project for remote I/O expansion with PROFINET © Chapter 3.5 “Example project for remote I/O expansion with PROFINET” on page 71

3.2 Engineering software Automation Builder

3.2.1 Purpose

For configuring and programming of any AC500 CPU you need the engineering software suite Automation Builder. Automation Builder is available for download.

© Further information on page 16

3.2.2 Installation of the Automation Builder

Preconditions You must have administrator rights on your PC to install Automation Builder.

In case of an update installation:

Create a project archive before upgrading Automation Builder. Project archives contain all project data, including data that is not stored with a *.project file, e.g. device description files for third party devices.

© Chapter 6.3.1.8.2 “Creation of an archive ” on page 1408

Installation

1. Go to abb.com/automationbuilder to access the homepage of Automation Builder.
2. In the “Downloads” section, select “Download Automation Builder”.
3. In the “Latest Automation Builder” section, select “Automation Builder x.x. Download” (x.x = latest version). This downloads the installer on your PC.
4. Open the downloaded installer and follow the instructions of the installation manager.
5. Keep the default type of installation to “Premium Edition” if available.
6. Select software packages to be installed:
   Enable the check box “PLC - AC500 V3” to activate installation of all options for AC500 V3.
7. Click “Download and install” and follow the instructions of the setup.

3.2.3 Licensing procedure

When you start Automation Builder software for the first time, you will be asked to choose a license option.

See also:

- Details about the license model, the features of the editions and the latest license information
- Detailed description of the installation and the licensing possibilities of Automation Builder

Activate a trial license

- Automation Builder software must be installed successfully.
- PC is connected to the internet.

   - A licensing wizard starts and guides you through the licensing procedure.
2. Enter user information.
   - In case of future support requests, your registration details enable ABB support team to handle your questions quickly.
3. Select “OK”.

- 2024/01/05
- 3ADR010583, 1, en_US
4. Enable the trial license.

5. Select “Next”.

6. Enable the single PC license and select “Next”.

![Image of Automation Builder](image1.png)

![Image of ABB License Manager](image2.png)
7. Enable online activation and select “Next”.
   ⇒ License activation procedure starts. A successfully ended licensing procedure ends with a success message.
8. Select “OK” to end the wizard.
   ⇒ Automation Builder license is activated and starts.

### 3.2.4 Setting up of communication parameters in Windows

**Setting up of communication parameters**

To set up the communication between the PC and the PLC, e.g., for downloading the compiled program, you have to set up the communication parameters.

- The IP address of your PC must be in the same class as the IP address of the CPU.
- The factory setting of the IP address of the CPU is 192.168.0.10.
- The IP address of your PC should be 192.168.0.X. Avoid X = 10 in order to prevent an IP conflict with the CPU.
- Subnet mask should be 255.255.255.0.

**Changing of the IP address**

1. Open Windows control panel. Click “Network and Internet” ➔ “Network and Sharing Center”.
2. Click “Change adapter settings”.
   ⇒ **If using existing network with several devices, please pay attention on given network rules or contact your system administrator.**
3. Right-click “Local Area Connection (Ethernet)” and select [Properties].
5. Enter your desired IP address and subnet mask.

3.3 Hardware AC500 V3

3.3.1 Configuration for example projects

The example projects require a small PLC configuration with I/O devices, e.g., as available in the training case TA5450-CASE.

Table 1: Modules for example projects to get started with AC500 V3 PLC

<table>
<thead>
<tr>

Connections

Fig. 3: Training case TA5450

In the training case, the control panel CP6607 is included. A control panel is not needed for the example projects.

For testing the example project some inputs require to be connected as follows:
3.3.2 System assembly, construction and connection

**NOTICE!**

Avoidance of electrostatic charging

PLC devices and equipment are sensitive to electrostatic discharge, which can cause internal damage and affect normal operation. Observe the following rules when handling the system:

- Touch a grounded object to discharge potential static.
- Wear an approved grounding wrist strap.
- Do not touch connectors or pins on component boards.
- Do not touch circuit components inside the equipment.
- If available, use a static-safe workstation.
- When not in use, store the equipment in appropriate static-safe packaging.

You can mount AC500 PLC either to DIN rail or to a metal plate. Here, we recommend to mount on DIN rail.

1. Snap the terminal base onto DIN rail.
2. Snap the additional terminal units for I/O modules onto DIN rail.
3. Make the sensor/actuator wire connections according to the dedicated electronic module you want to use. Provide external process power supply as required.
4. If required, make the fieldbus connections according to the dedicated master communication module you want to use.
5. Plug the appropriate electronic and I/O modules in the correct locations (processor module, communication modules on terminal base, and eventually also communication interface modules and I/O modules onto dedicated terminal units).

6. Connect a programming cable (Ethernet cable between ETH port of CPU and PC with engineering software).

3.4 Example project for central I/O expansion

3.4.1 Purpose

The following steps show how to set-up an application project and configure the hardware. A simple logic is used as example to introduce in programming and commissioning of the PLC. The workflow for creation of a visualization is explained, as well as how to set-up a web server for visualization.

3.4.2 Preconditions

- Automation Builder is installed and licensed as, at least, basic edition \( \text{Chapter 6.2.4 “Managing your licenses” on page 1350}. \)
- AC500 V3 CPU is assembled and connected to the PC \( \text{Chapter 3.3 “Hardware AC500 V3” on page 21}. \)

3.4.3 Creation, setting up and saving of your AC500 V3 project

3.4.3.1 Creation of a project

1. Launch Automation Builder either out of the desktop icon or out of the Windows menu.

2. Select “New Project” or go to menu “File ➔ New Project”.
3. Select “Projects”.
4. Select “AC500 project”.
5. Fill in project name.
6. Choose a location to save the project to.
7. Select [OK].
8. Select “PLC - AC500 V3”.
9. Select the CPU according to your hardware set-up.
10. Select [Add PLC] to add the CPU to your application.
3.4.3.2 Configuration of your processor module

1. Double-click “PLC_AC500_V3”.
   ⇒ A tab opens in the editor view.
2. Select “CPU Parameters”.
3. Under parameter “Check battery”, choose the value “Off” since there is no battery present inside the CPU module.
4. Keep the default values for all other parameters.

3.4.3.3 Creation of folders in the device tree

To optimize the project readability, you will create different folders to group similar objects. The folder names are exemplary. Because the device tree view follows an alphabetical order, we use number prefixes to determine the order.
1. Right-click “Application”.
2. Select “Add Folder”.
3. Type in "10 POUs". This is a name example. Here, the intention is to see this folder as a last one.

   The folder "10 POUs" is for program organization units (POU). POUs are objects of type program, function or function block that are used to create a user program.
3.4.3.4 Saving the project

Select menu “File ➔ Save Project”.

Alternatively, select the save icon in the tool bar.

Alternatively, press [Ctrl] + [S].

3.4.4 Configuration of the I/O module

3.4.4.1 General

- The types and order of modules in the Automation Builder project must match the real hardware configuration.
- The position of the modules in the device tree can be changed by drag and drop.
3.4.4.2 Adding an I/O bus module

1. Right-click “IO_Bus” in the device tree.
2. Select “Add object”.

Diagram showing the device tree with “IO_Bus” selected and the context menu open with “Add object” highlighted.
3. Select “S500 I/O modules”.
5. Select [Add object] to add the module to the I/O bus.
3.4.4.3 Variable mapping of the DA501

1. Double-click “DA501” in the device tree.
   ⇐ A tab opens in the editor view.

2. Select “DA501 I/O Mapping”
   ⇐ Here, you will map variable names (symbols) for the channels you will need in the program.

The suggested name convention is based on "Hungarian notation". A name prefix is describing variable type; e.g., "x" = variable of type BOOL, "w" = WORD, "i" = INT (integer) etc. This increases the code readability and is helpful for program analysis.

3.4.4.4 Handling the digital input variables

1. Open the list of the digital inputs.

2. Fill in the variable names:

<table>
<thead>
<tr>
<th>Channel</th>
<th>Type</th>
<th>Variable</th>
</tr>
</thead>
<tbody>
<tr>
<td>Digital input DI8</td>
<td>BOOL</td>
<td>xDI_08_DA501_I1</td>
</tr>
</tbody>
</table>
3.4.4.5 Handling the digital output variables

1. Open the list of the digital outputs.
2. Fill in the variable names:

<table>
<thead>
<tr>
<th>Channel</th>
<th>Type</th>
<th>Variable</th>
</tr>
</thead>
<tbody>
<tr>
<td>Digital output DC16</td>
<td>BOOL</td>
<td>xStartDrilling1</td>
</tr>
</tbody>
</table>

3.4.5 Programming and compilation

3.4.5.1 Task configuration

A task is a time unit in the processing of a user program (IEC application), which defines by parameters the way and the speed the CPU is executing the user program.

For this project you will use only one cycling task.

In the device tree, you see the objects “Task configuration” and “Task”. Both created automatically with the project.

For this project you will use only one cycling task.

> Double-click “Task” in the device tree.

⇒ A tab opens in the editor view.

For this project you will use only one cyclic task. Keep the default settings for the task.

<table>
<thead>
<tr>
<th>Priority</th>
<th>This is how the CPU prioritizes the task, when more than one task is defined. Priority 0 ... 15 = real time tasks, priority 16 = non-real time task.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>In the CPU you can run tasks dependent on the demands of the process.</td>
</tr>
<tr>
<td>Interval</td>
<td>For cyclic tasks you can set the cyclical execution time. It is usually set in milliseconds with IEC time syntax</td>
</tr>
<tr>
<td>Watchdog</td>
<td>To keep track of the time it takes to complete the task.</td>
</tr>
<tr>
<td>Calls</td>
<td>You can call in one or more program POUs in one single task</td>
</tr>
</tbody>
</table>
3.4.5.2 Main program PLC_PRG

In the default task configuration, there is one call of a POU (program organization unit) i.e. "PLC_PRG" (shown in chapter 3.4.5.1 Task configuration on page 33).

In your project the "PLC_PRG" will become a main program containing calls to other programs (POUs) which you will create one by one.

![Diagram of PLC_PRG POU]

The PLC_PRG POU has been defined by default in ST (Structured Text) editor. Keep this setting because of good visibility of the instructions at a glance and good handling for troubleshooting.

To optimize the project readability, you will work with the previously created folder "10 POUs" and add the created subroutines (POUs) to this folder. The subroutines will be created in FBD (Function Block Diagram) editor.

3.4.5.3 Boolean logic "NOT"

3.4.5.3.1 Application example "driller"

Recognizing of a driller by a photo sensor. "TRUE" input signal from sensor indicates that a driller is broken. If driller has been found correct, then start drilling.

![Diagram of driller]

<table>
<thead>
<tr>
<th>Signal from photo sensor</th>
<th>Required signal of motor ON</th>
</tr>
</thead>
<tbody>
<tr>
<td>FALSE</td>
<td>TRUE</td>
</tr>
<tr>
<td>TRUE</td>
<td>FALSE</td>
</tr>
</tbody>
</table>

Table 2: Required behavior
Table 3: Hardware set-up

<table>
<thead>
<tr>
<th>Element</th>
<th>HW channel</th>
<th>Symbol</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch I1</td>
<td>DA501 DI8</td>
<td>xDI_08_DA501_I1</td>
<td>Photo sensor</td>
</tr>
<tr>
<td>LED output DC16</td>
<td>DA501 DC16</td>
<td>xStartDrilling1</td>
<td>Motor on</td>
</tr>
</tbody>
</table>

3.4.5.3.2 Implementation

Creation of a new program POU in the project

1. Right-click “10 POU’s”.
2. Select “Add object”.
3. Select “POU”.
4. Select [Add object].
5. Enter “_01_Assignment_NOT”.
6. Select “Program”.
7. Select “Function Block Diagram (FBD)”.
8. Select [Add].

⇒ POU has been added.
Assigning the hardware DI signals to local variables

1. Double-click POU “_01_Assignment_NOT” in the device tree.

2. Select “Assignment” from the ToolBox.

3. Drag and drop “Assignment” into the “Start here” field in network “1”.

4. Select “???” on the left side of the assignment, then select “… ”

5. Open the “Io Config_Globals_Mapping” mapping list and select “xDI_08_DA501_I1”.

6. Select [OK] to add this variable to the left side of the assignment connector.
7. Select “???” on the right side of the assignment connector and mark the “???”.
8. Create a new local variable by typing in "xDrillerBroken1" which will replace the “???”.
9. Press [Enter].
   “Auto Declare” opens.
   You see the written variable name and the data type BOOL. The scope is "VAR". It means it is a local variable within this POU.
10. Select [OK] to accept the entries.

11. Drag and drop “Network” from the ToolBox to the down-arrow of network 1.

   ⇒ You added a network “2” below network 1.

Adding assignments and a Boolean NOT to the DO signals

1. Add an assingment from the ToolBox.
2. Type in or copy & paste "xDrillerBroken1" to the left side of the instruction line.
3. Select “???” on the right side of the instruction line, then select “...”.

   ⇒ “Input Assistant” opens.
4. In the “IoConfig_Globals_Mapping” variable list, select “xStartDrilling1”.

5. Select [OK] to close the dialog.
6. Right-click the center of assignment PIN.
7. Select “Negation” to add a negation to the assignment.

Calling the POU in the PLC_PRG

1. Double-click “PLC_PRG”.
2. Select the first line in “PLC_PRG” and press [F2].
   ⇒ “Input Assistant” opens.
3. Select “Module Calls”.
4. Open “Application”.
5. Open “10 POUs” and select “_01_Assignment_NOT”.
6. Select [OK] to close the dialog.
3.4.5.3.3 Compilation of the project

Before logging-in to the CPU, you need to compile the complete code without any errors.

Select menu “Build ➔ Generate code”.

The result of the compiling is shown in the “Messages” field at the bottom of the screen.

If you skip the compiling and select “Login”, the Automation Builder will automatically trigger compiling in advance to logging-in.

3.4.5.3.4 Saving the project

Select menu “File ➔ Save Project”.

Alternatively, select the save icon in the tool bar.

Alternatively, press [Ctrl] + [S].

3.4.6 Setting up the communication gateway

Setting up of communication parameters

To set up the communication between the PC and the PLC, e.g., for downloading the compiled program, you have to set up the communication parameters.

The IP address of your PC must be in the same class as the IP address of the CPU.

The factory setting of the IP address of the CPU is 192.168.0.10.
The IP address of your PC should be 192.168.0.X. Avoid X = 10 in order to prevent an IP conflict with the CPU.

Subnet mask should be 255.255.255.0.

**Changing of the IP address**

1. Open Windows control panel. Click “Network and Internet ➔ Network and Sharing Center”.

2. Click “Change adapter settings”.

   > If using existing network with several devices, please pay attention on given network rules or contact your system administrator.

3. Right-click “Local Area Connection (Ethernet)” and select [Properties].

5. Enter your desired IP address and subnet mask.
CPU and PC are connected with an Ethernet cable.

1. In the Automation Builder device tree right-click “PLC_AC500_V3”.
2. Select “Communication Settings”.
3. Keep the default value in the IP address of the CPU or type in the current IP address, if differs.

   The standard (default) IP address of the port ETH1 is: 192.168.0.10

4. Select [OK] to implement the IP address.

**Network scan**

If you need to scan the network for the CPU or if you have multiple CPUs on the same network.

1. Right-click “PLC_AC500_V3” in the device tree.
2. Select “Communication Settings”.

3. Select “...”.  
   “Pick IP Address for PLC_AC500_V3” opens.

   The automatic scan runs.  
   The results will appear in this field.

4. Select the CPU in the field and select [OK] to implement the needed communications gateway.

   Checking the communication settings
   If you need to check the communications settings or if you want to see more information about
   the current selected CPU.

1. Double-click “PLC_AC500_V3” in the device tree.
2. Select “Communication Settings”.
   ⇒ The selected IP address is shown.
3. If the IP address is not visible, enter the IP address manually.
4. To test the connection and/or to see the CPU information press [Enter] or click on the black dot next to the PLC figure.

### 3.4.7 Installation and update of the AC500 V3 firmware

The multi download tool can be used to update multiple PLCs with firmware or an application at the same time.

⇒ Chapter 6.6.4 “Multi download tool” on page 4306

#### Firmware update with activated user management

The PLC user management will remain also after a firmware update or downgrade.

Due to a structural change in the PLC user management in firmware version 3.5 there are some limitations when updating the PLC firmware from a version 3.4 or lower to 3.5 or higher with activated user management.

If you update the PLC firmware from version 3.4 or lower to version 3.6 or higher this must be done in two steps. First an update to 3.5 must be done via Automation Builder. Afterwards the firmware can be updated to any later firmware version – either via Automation Builder or via memory card.

The PLC firmware can be updated via Automation Builder.

This is also necessary for commissioning V3 CPUs.

A very new CPU has no pre-installed firmware. To guarantee the authenticity of delivered AC500 firmware, V3 CPUs are delivered with a boot loader only. You need to download a valid firmware to the CPU. After download, the functionality of the CPU is given.

- An Automation Builder project with an AC500 V3 CPU is open.
- CPU is in "stop" mode or shows uPdAtE (update) on the display.
- After update the CPU shows either donE or StoP on the display
For new modules: IP address is set. (The default IP address is 192.168.0.10)

1. Double-click CPU “PLC_AC500_V3”.
2. Select “Version information”.

3. Select “Update Firmware”.
   - While the update process is running, the RUN and ERR LEDs are toggling, i.e., they are flashing alternating.
4. Wait for the PLC to finish the update.

Firmware updates that include “UpdateFW” changes must be performed in two steps:

First, the “UpdateFW” is updated, and once this is done click the update button again to execute the “SystemFW” update.

Note: Firmware updates via memory card automatically cover both updates in one step.

A completed update is indicated by a message on the display. Either done, or Stop.

NOTICE!
Do not disconnect the power supply during the update process! The PLC could be damaged.

→ Stop indicates a restart has been performed by the CPU. When done is displayed sometimes it is necessary to re-boot the CPU manually, e.g., by powering-off. Manual re-boot might be, e.g., for some older CPU versions or if downgrading to an older firmware version according to application settings.

The CPU display shows Stop after re-boot. The update process is finished.
5. If necessary, refresh the version information by switching to another tab and back.

- Successful firmware update:

![Image of PM5650 PLC](image)

**Behavior of LEDs during firmware update**

<table>
<thead>
<tr>
<th>LED</th>
<th>LED flashes</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>RUN and ERR</td>
<td>Toggling</td>
<td>Update pending</td>
</tr>
<tr>
<td>RUN</td>
<td>Flashing slow</td>
<td>Done successful</td>
</tr>
<tr>
<td>ERR</td>
<td>Flashing slow</td>
<td>Done failed</td>
</tr>
</tbody>
</table>

### 3.4.8 Logging in to CPU and downloading the program

Logging-in to the CPU will load the project into the AC500 V3 CPU. The first log-in will also load the hardware set-up.
1. In the Automation Builder menu select “Online ➔ Login [PLC_AC500_V3]”.  
   ⇒ A pop-up will appear.

2. Select [Yes] to download the application to the AC500V3 CPU.

   ⇒ PLC is in "stop" mode.

3. Start the PLC ➔ Chapter 3.4.9.1 “Starting the program execution” on page 51.

   Generally, if the CPU is in RUN mode, i.e. in program execution mode, a download will always cause the mode change to "stop". In stop mode the CPU is not controlling the system!

   Always, after selecting the "Login" command, read carefully the dialog box text to ensure that you are aware of the CPU's behavior after the command confirmation.

By default, a download generates following actions in the CPU:

- The project is stored in the RAM memory.
- The project is stored in the flash EEPROM, if boot application was created.

### 3.4.9 Testing the program

#### 3.4.9.1 Starting the program execution

- You are logged in the CPU.
- An executable project is loaded to the CPU.
The CPU is in "stop" mode.

- Select menu “Debug ➔ Start [PLC_AC500_V3]”. Alternatively, select the "start" icon in the tool bar. Alternatively, press [F5].

3.4.9.2 Testing the function

- Operate the switch I1 and observe:
  - The LEDs of the relevant DA501 inputs and outputs.
  - The online status of inputs and outputs within the POU.

3.4.9.3 Stopping the program execution

- You are logged in the CPU.
- An executable project is loaded to the CPU.
The CPU is in RUN mode.

Select menu “Debug → Stop [PLC_AC500_V3]”
Alternatively, select the “stop” icon in the tool bar.
Alternatively, press [Shift] + [F8].

3.4.10 Setting up a visualization
3.4.10.1 General
If you are not yet familiar with CODESYS visualization, we recommend you to start with the application example First steps with CODESYS visualization. The example demonstrates the main features of visualization and provides insights into possible use cases.

To use the Edge browser for CODESYS visualization of AC500 PLCs, follow the steps described in the application note Usage in the Edge browser.

3.4.10.2 Adding the VisualizationManager

1. Right-click “Application” in the device tree.
2. Select “Add object”.
3. Select “VisualizationManager”.
4. Select [Add object] to add the VisualizationManager to the project.
   ⇒ Dialog “Add Visualization Manager” opens.

5. Select [Add].

⇒ You added the objects “VisualizationManager” and “VISU-TASK” to the device tree.
3.4.10.3 Settin up the VisualizationManager

1. Double-click VisualizationManager in the device tree.

⇒ A tab opens in the editor view.
2. Select “Settings”.
3. Open the drop-down menu “Selected style”.
4. Select “Default, x.x.x” (exemplary).
5. Open the drop-down menu “Selected language”.
8. Keep the file transfer to enable the visualization on the PLC (mandatory for web server function) ◄ Chapter 3.4.12 “Enabling a web visualization” on page 65.

3.4.10.4 Saving the project

Select menu “File ➔ Save Project”.
Alternatively, select the save icon ![save icon] in the tool bar.
Alternatively, press [Ctrl] + [S].
3.4.11 Creation of a visualization

3.4.11.1 General

If you are not yet familiar with CODESYS visualization, we recommend you to start with the application example First steps with CODESYS visualization. The example demonstrates the main features of visualization and provides insights into possible use cases.

To use the Edge browser for CODESYS visualization of AC500 PLCs, follow the steps described in the application note Usage in the Edge browser.

3.4.11.2 Adding a folder for visualization screens

1. Right-click “Application” in the device tree.
2. Select “Add Folder”.
3. Type in "02 VISUs".
4. Select [OK] to add the folder.
3.4.11.3 Adding a screen for "_01_Assignment_NOT" POU

1. Right-click "02 VISUs".
2. Select "Add object".
3. Select object "Visualization".
4. Select [OK].
5. Type in "PLC_VISU".
6. Select [Add].

⇒ A tab opens in the editor view.

*Fig. 5: PLC_VISU_tab*
The name "PLC_VISU" has been chosen, because it is the default name for a home screen in a web visualization.

If you have more than one visualization object in your project, it will be useful to choose another name, e.g., "_01_Assignment_NOT_v". And to choose "PLC_VISU" as a home screen to access all available visualization screens.

The name of a visualization object can be modified afterwards.

3.4.11.4 Creation and configuration of a visualization

3.4.11.4.1 Changing the background color

1. Double-click “PLC_VISU” in the device tree.
   ⇒ A tab opens in the editor view.

2. Right-click anywhere on the "PLC_VISU" editor page.

3. Select “Background”.

4. Enable the check box “Use Color”.
   ⇒ This enables the drop-down menu.

5. Select a color, e.g., “Lightgray”.

6. Select [OK] to add the color to "PLC_VISU".
### 3.4.11.4.2 Adding a screen title

1. Double-click on “PLC_VISU” in the device tree.

![Adding a screen title](image1)

2. Select “ToolBox”.

3. Select “Common controls”.

4. Drag and drop “Label” to the page.

![Adding a screen title](image2)

5. Type in "Start drilling condition”.

### 3.4.11.4.3 Further lines and labels

1. Double-click on “PLC_VISU” in the device tree.

![Further lines and labels](image3)

2. Select “ToolBox”.

3. Select “Basic”.

4. Drag and drop the line. Then drag the line to the needed length.
5. Follow the same procedure to create the other shapes and labels.

### 3.4.11.4.4 Lamp element for signal indication

1. Double-click on “PLC_VISU” in the device tree.

2. Select “ToolBox”.
3. Select “Lamps/Switches/Bitmaps”.
4. Drag and drop “Lamp” to the screen.
5. Adapt the size, if required.

![Diagram of lamp element for signal indication](image-url)
7. Double-click on “Variable” and select “… ” to select a variable from the list.

8. Under “IoConfig_Globals_Mapping”, select “xStartDrilling1”.

9. Select [OK].

3.4.11.4.5 Compilation of the project

Before logging-in to the CPU, you need to compile the complete code without any errors.
Select menu “Build ➔ Generate code”. The result of the compiling is shown in the “Messages” field at the bottom of the screen.

If you skip the compiling and select “Login”, the Automation Builder will automatically trigger compiling in advance to logging-in.

### 3.4.11.4.6 Saving the project

Select menu “File ➔ Save Project”. Alternatively, select the save icon in the tool bar. Alternatively, press [Ctrl] + [S].

### 3.4.11.5 Loading the project to the CPU

1. Download the project to the CPU as described in Chapter 3.4.8, on page 50.
2. Check the notification window at the end of the download. In case of message "Boot parameters were changed. These changes will be applied after reboot", a reboot of the CPU is required after creation of the boot project.
3.4.11.6 Testing the program

Operate the switches and observe the visualization screen.

3.4.12 Enabling a web visualization

3.4.12.1 Adding a web server object to the device tree

Ethernet ports can be configured for web server protocol. This description deals with ETH1 configuration for the web server.

1. Right-click “ETH1” in the device tree.
2. Select “Add object”.
3. Select “Web Server”.

![Automation Builder interface](image)
4. Select [Add object].
   ⇒ You added and activated a web server on Ethernet port 1 on the AC500 V3 CPU.

### 3.4.12.2 Setting up the web server

1. Double-click “WebVisu” in the device tree.

2. Under “Start Visualization”, select “…”.
   ⇒ A list opens.

3. Select the “PLC_VISU” screen from the list.

4. Keep all further settings with default values.
5. Select the link “Show used visualizations”.

The VisualizationManager editor and there the tab “Visualizations” opens. All screens and dialog elements created in the project are visible.

Here, you can select which screens are enabled or disabled for web visualization.

If you want to select another screen as a start visualization, you must modify the adequate parameter in the webvisu.htm file: `<param name="STARTVISU" value="PLC_VISU">`

3.4.12.3 Compilation of the project

Before logging-in to the CPU, you need to compile the complete code without any errors.
Select menu “Build ➔ Generate code”. The result of the compiling is shown in the “Messages” field at the bottom of the screen.

If you skip the compiling and select “Login”, the Automation Builder will automatically trigger compiling in advance to logging-in.

### 3.4.12.4 Saving the project

Select menu “File ➔ Save Project”. Alternatively, select the save icon in the tool bar.
Alternatively, press \[Ctrl\] + \[S\].

### 3.4.12.5 Loading the project to the CPU

1. Download the project to the CPU as described in Chapter 3.4.8, on page 50.
2. Check the notification window at the end of the download. In case of message "Boot parameters were changed. These changes will be applied after reboot", a reboot of the CPU is required after creation of the boot project.
3.4.12.6 Creation of a boot project
By default, after project download, the boot project is created automatically.

3.4.12.7 Reboot of the CPU
Reboot the CPU by switching OFF and ON the power supply. (The parameter for web server activation is a boot parameter which is loaded during boot of the CPU)

3.4.12.8 Testing the web visualization

- You have downloaded the project and created the boot project.
- The CPU has been rebooted.
- You are logged in.
- CPU is in "stop" mode.

1. Start the project execution, e.g., from the tool bar.
2. Launch an internet browser.
   192.168.0.10 is the IP address of CPU's ETH1 port.
   /webvisu.htm is the default htm file.
   ⇒ Web visualization will be loaded.
   The start screen “PLC_VISU” is displayed in a responsive view.

4. Test the function by operating switch I1.
5. Test the results for responsive view by changing the web browser window size.
3.4.13 Reset the CPU

**Reset values and parameters**  In some cases, it could be required to do a CPU reset, e.g., for resetting of counter values, parameters etc.

![Reset commands in "Online" menu](image_url)

**Fig. 6: Reset commands in “Online” menu**

**Complete reset of the CPU**  To do a complete reset of the CPU thereby erasing the application from the RAM and flash EEPROM do the following.
1. Right-click the station object “PLC_AC500_V3” in the device tree.

2. Select “Reset origin device [station name]”.
   ⇒ The application is completely erased from the CPU (complete project from all memory areas).

### 3.5 Example project for remote I/O expansion with PROFINET

#### 3.5.1 Purpose

This example introduces the configuration of the PLC with remote I/O. The use of I/O channels in a program and commissioning of the configuration is shown.

#### 3.5.2 Preconditions

- Automation Builder is installed and licensed as, at least, standard edition © Chapter 6.2.4 “Managing your licenses” on page 1350.
- AC500 V3 CPU is assembled and connected to the PC © Chapter 3.3 “Hardware AC500 V3” on page 21.
- Configuration and programming of this example project will be made in the existing example project for central I/O expansion © Chapter 3.4 “Example project for central I/O expansion” on page 24.
- CM579-PNIO communication module is inserted in terminal base and connected to the PLC © Chapter 3.3 “Hardware AC500 V3” on page 21.
- CI502-PNIO communication interface module is inserted in terminal unit and connected to the PLC © Chapter 3.3 “Hardware AC500 V3” on page 21.
3.5.3 Set-up PROFINET controller

3.5.3.1 Add the CM579-PNIO to the device tree

1. In the Automation Builder device tree under “Extension_Bus”, right-click “Slot_1”.
2. Select “Add object”.
3. Select “CM579-PNIO”.
4. Select [Replace object] to add the CM579-PNIO.

3.5.3.2 Set-up the general behavior

   A tab opens in the editor view.
2. Select “CM579-PNIO Parameters”.

Run on configuration fault
Bus behavior
This parameter will prohibit the PLC from running if the CM579-PNIO has a configuration error.
This parameter sets how the data from the bus flows in/out of the CM579-PNIO.

3. Select “Status”.
   ⇒ This opens the bus controller status and gives a basic status overview.

4. Select “Information”.
   ⇒ This page contains general information about the CM579-PNIO.

5. For the example project, you can keep the default settings.

3.5.3.3 Set-up the PROFINET IO controller

To edit settings for the controller, you must not be logged-in to the PLC.

   ⇒ A tab opens in the editor view.

2. Select “PROFINET IO CONTROLLER”
3. Select “General”.

4. Here, you can set-up the way, IP addresses are distributed out to the industrial bus network. You can even set, what IP-address and DNS name (station name) the PROFINET controller has.

   For the example project, keep the default settings.

### 3.5.4 Set-up PROFINET device

#### 3.5.4.1 Hardware preparation

1. Switch off the power supply of your PLC.

2. Use a screw driver to set the CI502 module address to "02" by positioning of the upper rotary switch to "0" and lower switch to "2". Note, that the numbers have hexadecimal format.

3. Switch on the power supply.

#### 3.5.4.2 Add the CI502-PNIO to the device tree

1. Right-click “PNIO_Controller” in the device tree.

2. Select “Add object”.

3. Select “CI502-PNIO-Device”.

4. Select [Add object] to add the device.

3.5.4.3 Configure the CI502-PNIO device

3.5.4.3.1 Configure the CI502-PNIO PROFINET IO device

1. Double-click “CI502_PNIO_Device”.
   - A tab opens in the editor view.
2. Select “General”.

3. Set station name to e.g. “ci502-pn-0b” according to hardware settings.

The last two values of the node’s “Station Name” in Automation Builder correspond to the position of module’s rotary switches (hexadecimal values): e.g., “ci502-pn-0a” or “ci502-pn-10”.

- Use small letters for the station name and not large ones.

4. Leave the default settings for “IP Parameter”.

5. Adjust the communication time settings to get a Watchdog (ms) 24:
   - “Send clock (ms)”: 4
   - “Reduction ratio”: 2
   - “Phase”: 1

6. Leave the default settings for “VLAN ID”.

7. Leave the default settings for “RT Class”.
If the node has the same device address (the last two digits of the device name) as set by means of the rotary switches on the module, all the node parameters will be loaded automatically upon initialization scan of the CI50x module. This allows, e.g., the module exchange without an engineering tool.

3.5.4.3.2 Create CI502-PNIO I/O mapping to symbols

1. Double-click “CI502_IO”.

2. Select “PNIO Module I/O Mapping”.

3. Fill in the variable names:

<table>
<thead>
<tr>
<th>Element</th>
<th>Hardware channel</th>
<th>Symbol</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch I5</td>
<td>CI502 DI8</td>
<td>xDI_08_CI502_I5</td>
</tr>
<tr>
<td>LED output DO8</td>
<td>CI502 DO 8</td>
<td>xDO_08_CI502</td>
</tr>
</tbody>
</table>
3.5.5 Add remote I/O expansion to project

3.5.5.1 Add a program POU to the project

1. Right-click “01 - POUs” in the device tree.
2. Select “Add object”.
3. Select “POU”.
4. Select [Add object].

5. Fill in "_30_PNIO_test".
6. Select “Program”.
7. Select “Function Block Diagram”.

---

Getting started with example projects
Example project for remote I/O expansion with PROFINET > Add remote I/O expansion to project
8. Select [Add] to add the POU.

### 3.5.5.2 Create a POU logic

1. Double-click “30_PNIO_test” in the device tree.

2. In the ToolBox, select “Assignment”.

3. Drag and drop “Assignment” into the "Start here" field in network "1".

4. Select “???” on the left side of the assignment, then select “...”.

5. In “IoConfig_Globals_Mapping” list, select “xDI_08_CI502_15”.

6. Select [OK] to add this variable to the left side of the assignment connector.
7. Select “???” on the right side of the assignment, then select “...”.
8. In “IoConfig_Globals_Mapping” list, select “xDO_08_CI502”.
9. Select [OK].

3.5.5.3 Call the POU in PLC_PRG
1. Double-click “PLC_PRG”.
2. Select the next free line in “PLC_PRG” and press [F2].
   ⇒ “Input Assistent” opens.
3. Select “Module Calls”.
4. Open “Application”.
5. Open “10 POUs” and select “_30_PNIO test”.
6. Select [OK] to close the dialog.

3.5.5.4 Compilation of the project
Before logging-in to the CPU, you need to compile the complete code without any errors.
Select menu “Build ➔ Generate code”. The result of the compiling is shown in the “Messages” field at the bottom of the screen.

If you skip the compiling and select “Login”, the Automation Builder will automatically trigger compiling in advance to logging-in.

3.5.5.5 Saving the project

Select menu “File ➔ Save Project”. Alternatively, select the save icon in the tool bar. Alternatively, press [Ctrl] + [S].

3.5.5.6 Loading the project to the CPU

1. Download the project to the CPU as described in Chapter 3.4.8, on page 50.
2. Check the notification window at the end of the download. In case of message "Boot parameters were changed. These changes will be applied after reboot", a reboot of the CPU is required after creation of the boot project.
3.5.6 Test the program

3.5.6.1 Starting the program execution

- You are logged in the CPU.
- An executable project is loaded to the CPU.
- The CPU is in "stop" mode.

Select menu “Debug ➔ Start [PLC_AC500_V3]”. Alternatively, select the "start" icon in the tool bar. Alternatively, press [F5].

3.5.6.2 Test the function

- Operate the switch I5 and observe:
  - The LEDs of the relevant CI502 inputs and outputs.
  - The online status of inputs and outputs within the POU.
3.5.7 Reset the CPU

**Reset values and parameters** In some cases, it could be required to do a CPU reset, e.g., for resetting of counter values, parameters etc.

![Reset commands in "Online" menu](image)

**Fig. 7: Reset commands in "Online" menu**

- **Reset warm**
  All variables are reset, except RETAIN PERSISTENT variables.

- **Reset cold**
  Causes initialization of all variables, except PERSISTENT variables. By recommended creation of remanent variables always with both properties: PERSISTENT and RETAIN, this command resets all variables, except PERSISTENT RETAIN variables.

- **Reset origin**
  All variables and the application project are reset.

**Table 5: Behavior of variables of type VAR (local or global) and variables of type PERSISTENT RETAIN**

<table>
<thead>
<tr>
<th></th>
<th>VAR</th>
<th>VAR PERSISTENT RETAIN</th>

</tr>
</tbody>
</table>

**Complete reset of the CPU**

To do a complete reset of the CPU thereby erasing the application from the RAM and flash EEPROM do the following.
1. Right-click the station object “PLC_AC500_V3” in the device tree.
2. Select “Reset origin device [station name]”.
   ⇒ The application is completely erased from the CPU (complete project from all memory areas).
4 System overview, planning and operation

4.1 System overview

4.1.1 AC500 PLC product family

AC500 programmable logic controllers (PLCs)

The AC500 (Standard), AC500-eCo, AC500-S and AC500-XC scalable PLC ranges provide solutions for small, medium and high-end applications. Our AC500 platform offers different performance levels and is the ideal choice for high availability, extreme environments or safety solutions. Our AC500 PLC platform offers interoperability and compatibility in hardware and software from compact PLCs up to high-end and safety PLCs.

Due to the flexible combinations of AC500 devices and components, AC500 PLCs can be used for controlling a wide variety of applications to fulfill your automation needs.

Features of AC500 PLCs

- Scalable and consistently expandable system
- Different performance classes of processor modules (CPUs) available
- Several fieldbusses available
- Parallel connection to several fieldbusses which can be combined arbitrarily

The AC500 product family consists of the product groups:

- AC500 (Standard): AC500 standard PLCs offer a wide range of performance levels and scalability. The PLCs are highly capable of communication and extension for flexible application.
- AC500-eCo: AC500-eCo PLCs are cost-effective, high-performance compact PLCs that offer total interoperability with the core AC500 range and provide battery-free buffering of remanent data. All I/O modules can be freely connected in a simple, stable and reliable manner.
- AC500-S: AC500-S PLCs are designed for safety applications in factory, process or machine automation.
- AC500-XC: AC500 (Standard) and AC500-S provide devices with -XC extension as a product variant. These variants operate according to their product group and can, in addition, be operated under extreme conditions. AC500-XC PLCs can be used at high altitudes, extended operating temperature and in humid conditions. The devices also provide a high level of resistance to vibration and corrosive gases. The AC500-XC series is consistent with standard devices concerning the overall dimensions, the control function and the software compatibility.

Chapter 5.1.3 “System data AC500-XC” on page 169.
The AC500 product family is characterized by functional modularity. As the complete AC500 product family shares the same hardware platform and programming software tool, the devices of the AC500 product groups can be flexibly combined.

S500 devices represent the I/O modules of the product group AC500 (Standard), whereas S500-eCo devices represent the I/O modules of the product group AC500-eCo. Both S500 and S500-eCo devices can be flexibly combined with devices of the AC500 product family.

4.1.2 AC500/S500 system structure

The AC500 product family provides a variety of modules and pluggable components for expanding the capabilities of the processor module with additional I/Os or other communication protocols. Depending on the features and functions of the processor module (CPU) compatible components can be added to a complete AC500 PLC system.

Centralized I/O extension

- Terminal base for processor module and 0 to 6 communication modules, with serial and Ethernet interfaces
- Communication module for, e.g., PROFIBUS, EtherCAT, and for support of safety solution
- Processor module with integrated communication
- I/O module, up to 10 I/O modules can be connected
- Terminal unit for I/O modules, also for decentralized extension
Decentralized I/O extension

1 Terminal unit for communication interface modules
2 Communication interface module with up to 24 integrated I/Os
3 I/O bus
4 Terminal unit for I/O modules, with screw or spring connection
5 Terminal unit for hot swap of I/O modules to exchange of I/O modules while the system is running
6 S500 I/O modules with up to 32 channels for analog and/or digital signals
7 Compact S500-eCo I/O modules with up to 16 channels for analog and/or digital signals
8 Removable terminal blocks

4.1.3 AC500-eCo/S500-eCo system structure

AC500-eCo/S500-eCo series is compatible with AC500/S500.

The compact AC500-eCo processor module can be used for small applications with the integrated I/O channels.

The functionality of the processor modules can be extended with option boards, e.g., for additional I/O channels.

For larger applications, I/O modules can be connected centralized or decentralized.
1 AC500-eCo processor module with option boards, different memory sizes, inputs and outputs available
2 S500-eCo I/O module, up to 10 I/O modules can be connected, also for decentralized extension
3 Terminal blocks in different variants available

Centralized I/O extension
Processor modules with an I/O bus interface on the right side can be expanded by up to 10 I/O modules to increase the number of the I/O channels.

Decentralized I/O extension
Up to 10 I/O modules can be connected remotely with the onboard Ethernet interface. Usually, a Modbus/TCP communication interface module or a processor module is used for the decentralized I/O extension.

Fig. 8: I/O modules (S500-eCo) directly connected to an AC500-eCo processor module
4.1.4 AC500/S500: Short description hardware

Processor modules

AC500 processor modules contain the CPU with the core component of the PLC. The CPU is connected with the user memory, input and output module, communication port and other units via the system bus and performs tasks by means of system programs preset in the system memory. The CPU adopts the function preset by the application program to command the PLC for operation.

It has the following functions:

- To receive user programs and data entered
- To diagnose work faults of the power supply and PLC circuit as well as syntax errors in programming
- To receive the state or data of the site via the input interface and save it into the shadow register or data register
- To read the user programs in the memory one by one and execute them after interpretation
- To updating the state of the associated flag bits and the contents of the shadow register according to the execution results and providing output control using the output unit.

Processor modules are available in different performance classes. Only one processor module is required for a valid system architecture.

There are different types of processor module available that differ in the features and functions they provide, e.g. performance, LED display etc.

If required, processor modules are also available with an integrated Ethernet communication module (TCP/IP).

Communication modules
AC500 communication modules are required for
- a connection to standard fieldbus systems and
- for integration into existing networks.

AC500 communication modules
- enable communication on different fieldbuses.
- are mounted on the left side of the processor module on the same terminal base.
- are directly powered via the internal communication module bus of the terminal base.
  A separate voltage source is not required.

Terminal bases

The terminal base is needed for mounting and connecting the processor module and the communication modules. The modules are plugged on the terminal base.
I/O modules

The I/O modules are the input/output unit which connects the PLC with the process. The PLC can detect controlled object data via the input interface and the data is taken as the basis for PLC control on the controlled object. In addition, the PLC sends processing results via the output interface to the controlled object to execute the control.

External input equipment and output equipment needs various signal levels whereas the information processed by the processor module in the PLC can only be the standard level. In order to perform this conversion, the I/O interface generally uses optical isolation and filtering to improve the interference immunity of the PLC. In addition, the I/O interface can generally indicate the working state to facilitate maintenance.

The PLC provides multiple I/O interfaces for operation level and drive capability to users for selection such as digital input, digital output, analog input, analog output, etc. I/O interfaces of the PLC interpret the number of input/output signals as the number of PLC I/O points. The number of I/O points is an important basis for PLC selection. If the system has insufficient I/O points, it can be expanded via the I/O extension interface of the PLC.

The I/O modules for digital and/or analog inputs and outputs are available in different versions and allow flexible use thanks to configurable channels.

The modules can be simply plugged onto a terminal unit for a centralized or decentralized I/O extension via communication interface modules.

Terminal units

I/O modules and function modules are plugged on a terminal unit.

Terminal units enable simple prewiring without electronics and are available for 24 V DC and 120/230 V AC, optionally for spring or screw-type terminals.
Communication interface modules are used to build decentralized I/O stations in decentralized systems. They contain the fieldbus interface and a set of onboard I/O channels. Additional I/O modules can be attached to build larger decentralized I/O stations. A communication interface module is mounted on a terminal unit.

Function modules extend the PLC system to perform special task control. These modules often provide independent components such as a CPU, system programs, memory and interfaces connected with the PLC system bus.

Function modules are connected with the PLC via the I/O bus to exchange data and independently work under cooperative management of the PLC.

Memory

In the PLC, the memory is mainly used for saving system programs, user programs and work data. There are two types of memory:

- Volatile memory:
  All saved data will be lost after power failure of the memory but the memory can provide a high access rate and unlimited programming cycles. Common volatile memories mainly include SRAM and DRAM (including common memories such as SDRAM).

- Nonvolatile memory:
  All saved data will not be lost after power failure of the memory, but the memory is subject to a low read-write rate and limited rewrite cycles. Common nonvolatile memories mainly include NORflash, NANDflash, EEPROM, memory card, etc.

AC500 PLCs store all user programs in the nonvolatile memory to protect them from power failure. The programs are exported to the volatile memory during operation of the PLC to ensure high-speed and efficient operation. If user program debugging is finished, the programs can be fixed in the nonvolatile memory when they need no change. The work data is subject to frequent change and access during the PLC operation. It is saved in the volatile memory to meet the requirements for random access.

The work data memory of the PLC has the memory area for input and output relay, auxiliary relay, timer, counter and other logic devices. The state of these devices depends on initial setting and operation of the user programs. Some data maintains its existing state by using built-in supercapacitors or backup batteries in the event of a power failure. The memory area for data saving in the event of a power failure is called the data retention area.

Power supply

The PLC is equipped with a switching power supply for the internal supply. In comparison with an ordinary power supply, the switching power supply has a higher stability and a higher noise immunity.

Some modules include a stabilized power supply for the supply of external sensors.
4.1.5 AC500-eCo/S500-eCo: Short description hardware

Processor modules

AC500-eCo processor modules contain the CPU with the core microprocessor of the PLC. It is integrated with power supply, onboard I/Os and communication interface.

Functions:
- To download user programs
- To run the CPU
- To execute user programs in loops
- To monitor program input and output devices.

Processor modules are available in different performance classes and provide different numbers of onboard I/Os.

Only one processor module is required for a valid system architecture.

Option boards

AC500-eCo processor modules can be extended with option boards. Option boards provide specific functionality. According to the processor module type, up to three option board slots are available for extension. Each option board slot supports most existing types of option board module. The option board modules provide the following functionality for processor module extension:
- Serial interface RS232 (isolated) or RS485 (isolated or not isolated)
- Digital I/O channels extension (digital inputs, digital outputs, or mixed type)
- Analog I/O channels extension (analog inputs, analog outputs) for standard signal voltage or current, but also temperature measurement with RTD/NTC or thermocouple sensors
- RTC real-time clock board for processor module PM5012 (other processor modules include RTC functionality)
- Configuration address switch board for KNX protocol, only for processor modules PM5072 and PM5082
If the number of onboard I/Os provided on the processor module is insufficient for a certain use case, the PLC can be expanded with I/O modules to meet the control requirements.

Memory

In the PLC, the memory is mainly used for saving system programs, user programs and work data. There are two types of memory:

- **Volatile memory:**
  All saved data will be lost after power failure of the memory but the memory can provide a high access rate and unlimited programming cycles. Common volatile memories mainly include SRAM and DRAM (including common memories such as SDRAM).

- **Nonvolatile memory:**
  All saved data will not be lost after power failure of the memory, but the memory is subject to a low read-write rate and limited rewrite cycles. Common nonvolatile memories mainly include NORflash, NANDflash, EEPROM, memory card, etc.

AC500 PLCs store all user programs in the nonvolatile memory to protect them from power failure. The programs are exported to the volatile memory during PLC operation to ensure high-speed and efficient operation. If user program debugging is finished, the programs can be fixed in the nonvolatile memory when they need no change. The work data is subject to frequent change and access during PLC operation. It is saved in the volatile memory to meet the requirements for random access.

The work data memory of the PLC has the memory area for input and output relay, auxiliary relay, timer, counter and other logic devices. The state of these devices depends on initial setting and operation of the user programs. Some data maintains its existing state by using built-in supercapacitors or backup batteries in the event of a power failure. The memory area for data saving in the event of a power failure is called the data retention area.

Power supply

The PLC is equipped with a switching power supply for the internal supply. In comparison with an ordinary power supply, the switching power supply has a higher stability and a higher noise immunity.

Some modules include a stabilized power supply for the supply of external sensors.

4.1.6 AC500-S

The **AC500-S safety user manual** must be read and understood before using the safety configuration and programming tools of Automation Builder/PS501 Control Builder Plus. Only qualified personnel are permitted to work with AC500-S safety PLCs.

The AC500-S safety PLC includes the following safety-relevant hardware components.

- SM560-S/SM560-S-FD-1/SM560-S-FD-4
- DI581-S
4.1.7 CP600 control panels

The CP600-eCo, CP600 and CP600-Pro control panels offer a wide range of features and functionalities for tailor-made visualization. Our CP600 platform offers different performance levels including control panels for economic applications, robust standard operator panels, high end multi-touch human machine interfaces (HMIs).

The easy to use engineering tool PB610 Panel Builder 600, part of Automation Builder, ensures easy scalability on the CP600 platform.

- CP600-eCo: The economical CP600-eCo control panel, with screen sizes from 4.3” to 10.1” widescreen, is aimed for standard functions and high usability for clear interaction with the operation process.
- CP600: The robust CP600 HMI, with screen sizes from 7” to 15” provides up-to-date visualization performance, versatile communication and representative design for machines and systems.
- CP600-Pro: The CP600-Pro HMI, with screen sizes from 5” to 21.5” widescreen, comes with high end visualization performance, multi-touch operation and versatile communication options.

Further information on page 6

4.1.8 Automation Builder: Short description engineering software

Details about the Automation Builder license model, the features of the editions and the latest license information

Configuration and programming of all AC500 control systems (processor modules) is done by using Automation Builder software.

Features:

- Standardized programming according to IEC 61131-3, five programming languages (Structured Text (ST), Function Block Diagram (FBD), Instruction List (IL), Ladder Diagram (LD), Sequential Function Chart (SFC)), Continuous Function Chart (CFC), debugging functions for program test
- Online diagnosis
- Debugging functions for the program test: Single step, single cycle, breakpoint
- Offline simulation - simulate commands without PLC being connected
- Sampling trace - timing diagrams for process variables
- Recipe management and watch lists
- Visualization
- Configuration of the communication interface modules (for PROFINET, PROFIBUS, EtherCAT, CANopen, Ethernet, Modbus)
- Programming - serial or via Ethernet networks
- Comprehensive libraries
- Export and import interfaces for devices, signals, applications, visualization, etc.
- Multi-user support and project compare
- Project scripting

IEC 61131-3 commands can be simulated without a PLC being connected, including the relevant malfunctions. After the program test, the application can be downloaded to the control system.

Timing diagrams for process variables and storage of data in a circular buffer with event trigger.

Values of selected variables are displayed. Pre-defined values can be assigned to variables which can then be downloaded to the control system all at once ("Write recipe"). Actual values from the control system can also be pre-assigned for reading into the Watch and Recipe Manager, and stored in memory there ("Read recipe"). These functions are also helpful, for example, for setting and entering control parameters.

Includes color change, moving elements, bitmaps, text display, allows input of setpoint values and display of process variables read from the PLC, dynamic bar diagrams, alarm and event management, function keys and ActiveX elements.

The Ethernet interface of the processor modules is used to connect to the engineering software for programming, debugging and diagnosis.

Provides access from the programming system to an external project database in which the program source code of one or several automation projects is managed. Optionally, a version control system can be used in order to ensure data consistency of the program code for several different users and projects.
4.2 Application planning

4.2.1 Safety instructions

NOTICE!
Wiring diagrams and user programs must be designed to prevent hazardous situations from occurring during normal operation or in the event of a malfunction.

4.2.2 Processor module and I/O selection

How to select modules for your automation task: In our main catalog we offer a CPU selector and several comparative tables to find the modules for your application.

4.2.3 I/O bus - Communication within the PLC

The synchronized I/O bus is the I/O data bus for the I/O modules connected with the processor modules or communication interface modules. Through this bus, I/O and diagnosis data are transferred.

With its fast data transmission, the I/O bus obtains very low reaction times.

Up to 10 I/O terminal units (for one I/O module each) can be added to one terminal base or to one AC500-eCo processor module. The I/O terminal units and the AC500-eCo I/O modules, have a bus input at the left side and a bus output at the right side. Thus the length of the I/O bus increases with the number of attached I/O modules. Table 119 “Maximum number of I/O devices which can be connected to the I/O bus” on page 389.

1 I/O bus connection

The connection of the I/O bus is performed automatically by telescoping the modules on the DIN rail. The I/O bus provides the following signals:

- Supply voltage of 3.3 V DC for feeding the electronic interface components
- 3 data lines for the synchronized serial data exchange
- several control signals
NOTICE!
Except when using hot swap terminal units, the I/O bus is not designed for pulling and plugging modules during operation. If a module is pulled or plugged on a terminal unit that is not hot swap capable while the bus is running, the following consequences are possible
- reset of the station or of the processor module
- system lockup
- damage of the module

WARNING!
Removal/Insertion under power
Removal or insertion under power is permissible only if all conditions for hot swapping are fulfilled.

☞ Chapter 4.9.3 “Replace an I/O module with hot swap” on page 153

The devices are not designed for removal or insertion under power when the conditions for hot swap do not apply. Because of unforeseeable consequences, it is not allowed to plug in or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while they are energized in a hazardous location could result in an electric arc, which could create an ignition source resulting in fire or explosion.

Prior to proceeding, make sure that power is been disconnected and that the area has been thoroughly checked to ensure that flammable materials are not present.

The devices must not be opened when in operation. The same applies to the network interfaces.

Profibus (master and slave) and CM589-PNIO are available since version 2.5.0 of the Automation Builder.

4.2.4 Fieldbus connectivity options

The PLC and control panel portfolio offers a wide range of scalable products, communication protocols and connectivity options, from the field level to the management and visualization levels.

An overview of the different connectivity options can be found below.

4.2.5 Power supply dimensioning

4.2.5.1 General

The power consumption of a complete station consists of the sum of all individual consumptions.

The two supply voltages with 24 V DC are distinguished in the AC500 platform:

- Supply of the internal logic via terminals L+ and M on the CPU module, or an the AC500 terminal base for: CPU, communication module(s) and I/O bus.
- Supply of the process-side input/output circuits for analog signals and 24 V DC digital signals via the ZP and UP terminals of the S500 terminal units.

The two supply voltages can be provided by the same power supply unit. The CPU and the I/O modules should, however, be fused separately. Of course also separate power supplies are possible.
4.2.5.2 Calculation of the total current consumption

Example

In the example, the AC500 control system consists of the following devices:

- AC500 CPU with Ethernet interface
- 4 communication modules
- 7 I/O modules (digital and analog)
- As well as the required terminal bases and terminal units

Because of the high total current consumption of the digital I/O modules (from \( UP = 24 \text{ V DC} \)), the supply is divided up into several electric circuits fused separately.

The maximum permitted total current over the supply terminals of the I/O terminal units is 8 A.

The total current can be calculated as follows:

\[
I_{\text{Total}} = I_{L^+} + I_{UP}
\]

with the assumptions

\[
I_{L^+} = I_{\text{CPU}} + I_{I/O \text{ bus}} + I_{C_1} + I_{C_2} + I_{C_3} + I_{C_4} \quad \text{(CPU + communication modules + I/O bus)}
\]

\[
I_{I/O \text{ bus}} = \text{Number of expansion modules} \times \text{Current consumption through the I/O bus per module}
\]

and

\[
I_{UP} = I_{UP1} + I_{LOAD1} + I_{UP2} + I_{LOAD2} + I_{UP3} + I_{LOAD3} + I_{UP4} + I_{LOAD4} + I_{UP5} + I_{LOAD5} + I_{UP6} + I_{LOAD6} + I_{UP7} + I_{LOAD7}
\]
If one assumes that all outputs are switched on and are operated with their maximum permitted load currents (under compliance with the maximum permitted currents at the supply terminals), then the following values are the result for an example shown above:

<table>
<thead>
<tr>
<th>CPU/communication module part</th>
<th>(I_{CPU} ) (*)</th>
<th>(I_{Cx} ) (*)</th>
<th>(I_{IO _bus} ) (*)</th>
<th>(I_{UPx} ) (*)</th>

4.2.6 Libraries, software packages and licensed features

Many applications are included in the Automation Builder. However, there are some that need to be purchased additionally. The applications are briefly introduced here. If applicable, links lead to further information depending on the version.

**HA-Modbus TCP library**
Library package adds High Availability System functionality for redundant hot standby over Ethernet field network via HA-Modbus TCP.

☞ Chapter 6.5.9.1 “HA-Modbus TCP - System technology” on page 3859

**61850 protocol**
Adds engineering tool and library for 61850 Ed.1 MMS server and GOOSE publish and subscribe functionalities.

☞ Chapter 6.3.4.2 “IEC 61850 Server” on page 1671

**KNX protocol**
Engineering and protocol package that seamlessly integrates ETS and Automation Builder.

☞ Chapter 6.3.4.8 “KNX configurator” on page 1730

**BACnet-BC protocol**
BACnet is a standardized data communication protocol for building automation and control networks as defined in the ANSI/ASHRAE standard 135 and ISO 16484-5.

☞ Chapter 6.3.4.9 “BACnet-BC” on page 1733

**Data logger library**
The data logging function block library ("DataLogger" and "DataLoggerEco") contains 5 function blocks for the purpose of advanced time-stamped data logging for different use cases.

☞ Chapter 6.5.8 “Data Logger Library” on page 3849

**Motion control library**
Library package for decentralized, centralized and coordinated motion according to the PLCopen standard.

☞ Chapter 6.5.10.3 “Motion control library” on page 3958

**EtherNet/IP**
EtherNet/IP is used to connect any number of different terminals in a network, using a scanner-adapter relationship.

☞ Chapter 6.4.2.5.1 “Introduction” on page 2816

</tr>
</tbody>
</table>

For using runtime licensed features one license per CPU is required. The license has to be installed on the AC500 V3 CPU either by connecting it to Automation Builder or via memory card that has been prepared by Automation Builder for license activation.

The licenses can be transferred between AC500 V3 CPUs unlimited times.

* Chapter 6.3.2.2.2 “PLC runtime licensing” on page 1446

**Activating a runtime license**

The linked application note provides step-by-step instructions on how to activate the runtime license for the PLC.

**AC500 V3 Activating a runtime license**

Additional libraries and software packages for specific use cases are available to reduce the programming effort and implement quickly your application. In our main catalog we offer an overview of the available libraries and software packages.

* Chapter 6.5 “Libraries and solutions” on page 3773

### 4.3 Mechanical planning and installation

#### 4.3.1 Control cabinet assembly (indoor use)
NOTICE!
PLC damage due to incorrect housing
Due to their construction (degree of protection IP 20 according to EN 60529) and their connection technology, the devices are only suitable for operation in closed control cabinets.

The cabinet must be suitable to protect the equipment from the following:
- unauthorized access,
- dusting and contamination,
- humidity and moisture and
- mechanical damage,

The equipment must be operated within the specified mechanical and environmental conditions.

Maintain spacing from:
- enclosure walls
- wireways
- adjacent equipment

Allow a minimum of 20 mm clearance on all sides. This provides ventilation and galvanic isolation.

It is recommended to mount the modules on an grounded mounting plate, or an grounded DIN rail, independent of the mounting location.

Fig. 11: Exemplary figure: left side AC500, right side AC500-eCO
1 Cable duct
2 Distance from cable duct ≥20 mm
3 Mounting plate, grounded
4 Screw end-stop clamps recommended to avoid movement of the modules on the DIN rail
NOTICE!
Horizontal mounting is highly recommended.
Vertical mounting is possible, then derating must be considered to avoid overheating due to poor air circulation. See Chapter 5.1.2.1 “Environmental conditions” on page 166.

When horizontal mounted, end-stop clamps are recommended to secure the modules in case of shock or vibration.
When vertically mounted, always place an end-stop clamps on the bottom and on the top of the modules to properly secure the modules.

4.3.2 Mounting and demounting - general information

The control system is designed to be mounted to a well-grounded mounting surface such as a metal panel. Additional grounding connections from the mounting tabs or DIN rail (if used), are not required unless the mounting surface cannot be grounded.

During panel or DIN rail mounting of all devices, be sure that all debris (metal chips, wire strands, etc.) is kept from falling into the controller. Debris that falls into the controller could cause damage while the controller is energized.

All devices are grounded through the DIN rail to chassis ground. Use zinc plated yellow-chromate steel DIN rail to assure proper grounding. The use of other DIN rail materials (e.g. aluminium, plastic, etc.) that can corrode, oxidize, or are poor conductors, can result in improper or intermittent grounding.

Consider the safety instructions
In the description, special attention must be paid to designs using galvanic isolation, grounding and EMC measures for the reasons stated. Consider the safety instructions for AC500 product family.
4.3.3 Mounting and demounting the terminal base

Mounting and demounting on DIN rail

1. Mount DIN rail 7.5 mm or 15 mm.
2. Mount the terminal base/function module terminal base:

   - The terminal base is put on the DIN rail above and then snapped-in below.

3. The demounting is carried out in a reversed order.

Mounting with screws

If the terminal base should be mounted with screws, wall mounting accessories TA526 must be inserted at the rear side first. Chapter 5.2.8.2.5 “TA526 - Wall mounting accessory” on page 1324. These plastic parts prevent bending of the terminal base while screwing on. TB560x and TB561x need one TA526, TB562x, TB564x and TB566x need two TA526.
By wall mounting, the terminal base is grounded through the screws. It is necessary that
- the screws have a conductive surface (e.g. steel zinc-plated or brass nickel-plated)
- the mounting plate is grounded
- the screws have a good electrical contact to the mounting plate

**Practical tip**

The following procedure allows you to use the mounted modules as a template for drilling holes in the panel. Due to module mounting hole tolerance, it is important to follow these procedures:

1. On a clean work surface, mount no more than 3 modules (e.g. one terminal base and two terminal units).
2. Using the mounted modules as a template, carefully mark the center of all module-mounting holes on the panel.
3. Return the mounted modules to the clean work surface, including any previously mounted modules.
4. Drill and tap the mounting holes for the screws (M4 or #8 recommended).
5. Place the modules back on the panel and check for proper hole alignment.
6. Attach the modules to the panel using the mounting screws.

If mounting more modules, mount only the last one of this group and put the others aside. This reduces remounting time during drilling and tapping of the next group.

7. Repeat the steps for all remaining modules.
4.3.4 Mounting and demounting the AC500 processor module

1. After mounting the terminal base on the DIN rail, mount the processor module.

2. Press the processor module into the terminal base until it locks in place.

3. The demounting is carried out in a reversed order. Press above and below, then remove the processor module.

4.3.5 Mounting and demounting the communication module

Communication modules are mounted on the left side of the processor module on the same terminal base. The connection is established automatically when mounting the communication module.
NOTICE!
Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.
- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

After mounting the terminal base, mount the communication modules.

1. First insert the bottom nose of the communication module into the dedicated holes of the terminal base. Then, rotate the communication module on the dedicated terminal base slot until it is locked in place.

NOTICE!
Risk of malfunctions!
Unused slots for communication modules are not protected against accidental physical contact.
- Unused slots for communication modules must be covered with dummy communication modules to achieve IP20 rating. Chapter 5.2.8.2.4 "TA524 - Dummy communication module" on page 1323.
- I/O bus connectors must not be touched during operation.
2. The demounting is carried out in a reversed order. Press above and below, then rotate the communication module and remove it.

4.3.6 Mounting and demounting the terminal unit

Mounting on DIN rail

1. Mount DIN rail 7.5 mm or 15 mm.
2. Mount the terminal unit.

The terminal unit is snapped into the DIN rail in the same way as the Terminal Base. Once secured to the DIN rail, slide the terminal unit to the left until it fully locks into place creating a solid mechanical and connection.

When attaching the devices, make sure the bus connectors are securely locked together to ensure proper connection. Max. 10 terminal units can be attached.
3. Demounting: A screwdriver is inserted in the indicated place to separate the terminal units.

If the terminal unit should be mounted with screws, wall mounting accessories TA526 must be inserted at the rear side first. Chapter 5.2.8.2.5 “TA526 - Wall mounting accessory” on page 1324. These plastic parts prevent bending of the Terminal Base while screwing on.

Fig. 14: Fastening with screws

By wall mounting, the terminal unit is grounded through the screws. It is necessary that
- the screws have a conductive surface (e.g. steel zinc-plated or brass nickel-plated)
- the mounting plate is grounded
- the screws have a good electrical contact to the mounting plate

Practical tip

The following procedure allows you to use the mounted modules as a template for drilling holes in the panel. Due to module mounting hole tolerance, it is important to follow these procedures:
1. On a clean work surface, mount no more than 3 modules (e.g. one terminal base and two terminal units).
2. Using the mounted modules as a template, carefully mark the center of all module-mounting holes on the panel.
3. Return the mounted modules to the clean work surface, including any previously mounted modules.
4. Drill and tap the mounting holes for the screws (M4 or #8 recommended).
5. Place the modules back on the panel and check for proper hole alignment.
6. Attach the modules to the panel using the mounting screws.

   ![Note]
   If mounting more modules, mount only the last one of this group and put the others aside. This reduces remounting time during drilling and tapping of the next group.

7. Repeat the steps for all remaining modules.

4.3.7 Mounting and demounting the I/O module

After mounting the terminal unit, mount the I/O modules.

1. Press the I/O module into the terminal unit until it locks in place.
2. The demounting is carried out in a reversed order. Press above and below, then remove the module.

4.3.8 Mounting and demounting the AC500-eCo processor module

4.3.8.1 Mounting and demounting the option boards

4.3.8.1.1 Optimized mounting of the option boards

The AC500-eCo processor modules have up to 3 slots for option boards.

Table 7: Option board slots

<table>
<thead>
<tr>
<th>Slot 3</th>
<th>Slot 2</th>
<th>Slot 1</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image1.png" alt="Option board" /></td>
<td><img src="image2.png" alt="Option board" /></td>
<td><img src="image3.png" alt="Option board" /></td>
</tr>
</tbody>
</table>

The best thermal circulation is given on slot 3 (bottom slot), followed by slot 2 (middle slot) and then slot 1 (top slot).

The best mounting position of the option board depends on its power dissipation.

Rules for optimized mounting of the option boards

- The higher the power dissipation of the option board, the lower the mounting position should be selected.
- The TAS126-2AO-UI option board has the highest power dissipation and must always be mounted at the lowest option board slot.

The optimized mounting position can be easily determined with the help of this table.
Table 8: Power dissipation of the option boards

If the option boards to be mounted are in the same power dissipation level, then the slots can be freely selected.

4.3.8.1.2 Inserting the option board

Press the option board TA51xx (or TA5300-CVR) into the slot of the processor module PM50x2 until it locks in place.

The option board must click into the slot of the processor module.
4.3.8.1.3 Removing the option board

1. Push the option board on the side to release the lock.
2. At the same time, pull the option board out of the slot.

**CAUTION!**
Risk of injury and damaging the product!
Always plug in the option board slot cover when the option board is not inserted.
If the option board slot cover is lost, please order the replacement TA5300-CVR (1SAP187500R0001).
Never power up the CPU with uncovered option board slot, otherwise it may cause serious injury and/or damage the product.

4.3.8.2 Mounting and demounting of the terminal blocks

**Intended purpose**
Removable terminal blocks are used for power supply and for I/O connectors on AC500-eCo V3 processor modules PM50x2.
For option boards there are different removable terminal blocks in spring version.
For the AC500-eCo V3 Basic CPUs a 3-pin terminal block for power supply and a 13-pin terminal block for I/O connectors are used.

For the AC500-eCo V3 Standard CPUs and Pro CPUs a 3-pin terminal block for power supply, a 13-pin terminal block and a 12-pin terminal block for I/O connectors are used.

For all CPUs there is a screw and a spring variant available.

<table>

CAUTION!
Risk of injury and damaging the product!
Improper installation and maintenance may result in injury and can damage the product!
- Installation and maintenance have to be performed according to the technical rules, codes and relevant standards, e.g. EN 60204-1.
- Read product documentation carefully before wiring. Improper wiring or wrong terminal block from other devices can damage the product!
- Only by qualified personnel.

CAUTION!
Risk of injury and damaging the module when using unapproved terminal blocks!
Only use terminal blocks approved by ABB to avoid injury and damage to the module.

Terminal block set for PM50x2
Processor modules PM50x2 CPU are not delivered with terminal blocks.
Screw terminal block set:
- TA5211-TSCL-B (1SAP187400R0001) for PM5012-x-ETH
- TA5212-TSCL (1SAP187400R0004) for PM5032-x-ETH, PM5052-x-ETH, PM5072-T-2ETH(W), PM5082-T-2ETH
Spring terminal block set:
- TA5211-TSPF-B (1SAP187400R0002) for PM5012-x-ETH
- TA5212-TSPF (1SAP187400R0005) for PM5032-x-ETH, PM5052-x-ETH, PM5072-T-2ETH(W), PM5082-T-2ETH
4.3.8.3 Mounting a processor module on a DIN rail

NOTICE!
Risk of function faults!

- The processor module is grounded via DIN rail.
- The DIN rail must be included into the grounding conception of the plant.
- Use only metal screws for grounding.

Mount the processor module at the top of the DIN rail, then snap it in below.
4.3.8.4 Demounting a processor module mounted on a DIN rail

1. Remove I/O modules if connected.

2. While pressing down processor module pull it away from DIN rail.

See hardware description of PM50xx for connection.
4.3.8.5 Mounting a processor module on a metal plate

**NOTICE!**
Risk of function faults!
- Missing electrical contact by isolating screws or washers!
- Use metal screws on the metal plate.
- The metal plate must be included into the grounding concept of the plant.
- Do NOT use insulating washers!

---

**One TA543 wall mounting accessory is needed per processor module.**

1. Snap in the TA543 at the back side of the processor module.

2. Fasten the processor module with two screws (diameter: 4 mm) to the metal plate.
4.3.8.6 Demounting a processor module mounted on a metal plate

1. Remove I/O modules if connected.

2. Remove the 2 screws.
4.3.8.7 Mounting of the cable fixing accessory TA5301-CFA

1. TA5301-CFA cable fixing accessory
2. 2 openings on the PM50x2 processor module

Insert the TA5301-CFA cable fixing accessory into the two openings on the PM50x2 processor module marked white in the figure.

4.3.9 Mounting and demounting the S500-eCo I/O module

S500-eCo I/O modules can be mounted either on a DIN rail or with screws on a metal plate.

### NOTICE!

- Risk of function faults!
- The S500-eCo I/O modules are grounded via the DIN rail.
- The DIN rail must be included into the grounding concept of the plant.
- Use only metal screws.

1. Mount I/O module at the top of the DIN rail, then snap it in below.
2. Attach I/O module by hand to another module. The I/O bus is connected automatically.

Demounting I/O modules mounted on a DIN rail

1. Remove I/O module by hand if connected.
1. Remove the 2 screws.

2. While pressing down I/O module pull it away from DIN rail.
2. Remove the I/O module from the connected module by hand.

4.3.10 Accessories for AC500 (Standard)
4.3.10.1 Inserting and removing a memory card

1. MC5141 memory card
2. MC5102 micro memory card
3. Micro memory card adapter
4. Memory card slot
1. Insert the memory card into the memory card slot of the processor module until locked.

**NOTICE!**

**Disturbed PLC operation**

Do not remove the micro memory card when it is working!

Otherwise the micro memory card and/or files on it might get corrupted and/or normal PLC operation might be disturbed.

- AC500 V3: Remove the micro memory card only when no black square (■) is shown next to MC in the display.
- AC500-eCo V3: Remove the micro memory card only when the MC LED is not blinking.

2. To remove the memory card, push on the memory card until it moves forward. By this, the memory card is unlocked and can be removed.

4.3.10.2 Further accessories

This section only describes accessories that are frequently used for system assembly, connection and construction.

*All additional accessories that can be used to supplement the AC500 system*

4.3.11 Accessories for AC500-eCo

4.3.11.1 Mounting and demounting the option boards

4.3.11.1.1 Optimized mounting of the option boards

The AC500-eCo processor modules have up to 3 slots for option boards.

**Table 9: Option board slots**

The best thermal circulation is given on slot 3 (bottom slot), followed by slot 2 (middle slot) and then slot 1 (top slot).

The best mounting position of the option board depends on its power dissipation.

*Rules for optimized mounting of the option boards*

- The higher the power dissipation of the option board, the lower the mounting position should be selected.
- The TA5126-2AO-UI option board has the highest power dissipation and must always be mounted at the lowest option board slot.

The optimized mounting position can be easily determined with the help of this table.

4.3.11.1.2 Inserting the option board

Press the option board TA51xx (or TA5300-CVR) into the slot of the processor module PM50x2 until it locks in place.

The option board must click into the slot of the processor module.
4.3.11.1.3 Removing the option board

1. Push the option board on the side to release the lock.
2. At the same time, pull the option board out of the slot.

CAUTION!
Risk of injury and damaging the product!
Always plug in the option board slot cover when the option board is not inserted.
If the option board slot cover is lost, please order the replacement TA5300-CVR (1SAP187500R0001).
Never power up the CPU with uncovered option board slot, otherwise it may cause serious injury and/or damage the product.

4.3.11.2 Inserting and removing a memory card
AC500-eCo V3

1. Open the micro memory card slot cover by turning it upwards.
2. Carefully insert the micro memory card into the micro memory card slot as far as it will go. Observe orientation of card.
3. Close the micro memory card slot cover by turning it downwards.
AC500-eCo V3

NOTICE!
Disturbed PLC operation
Do not remove the memory card when it is working!
Otherwise the memory card and/or files on it might get corrupted and/or normal PLC operation might be disturbed.
- Remove the memory card only when no black square (■) is shown next to MC in the display.

1 Micro memory card slot cover
2 Micro memory card
3 Micro memory card slot
1. Open the micro memory card slot cover by turning it upwards.
2. Micro memory card can be removed from the micro memory card slot by gripping and pulling with two fingers.
3. Close the micro memory card slot cover by turning it downwards.

4.3.11.3 Further accessories
This section only describes accessories that are frequently used for system assembly, connection and construction.
*All additional accessories that can be used to supplement the AC500 system*

4.3.12 Control panels CP600
Refer to the *installation instructions* delivered with each control panel and to the *operating instructions*.
4.4 Wiring
4.4.1 Grounding concept

NOTICE!
PLC damage due to missing grounding
- Make sure to ground the devices.
- The grounding (switch cabinet grounding) is supplied both by the mains connection (or 24 V supply voltage) and via the DIN rail. The DIN rail must be connected to ground before power is supplied to the device. The grounding may be removed only if it is certain that no more power is being supplied to the control system.
- In case of screw mounting, use metal screws for grounding.

Block diagram:
Digital I/O modules
4.4.2 EMC-conforming assembly and construction

4.4.2.1 General principles

AC500 and AC500-eCo PLC devices are Class II/Class III devices and do not require a Protective Earth (PE) connection.

For proper EMC performance, all metal parts, DIN rails, mounting screws, and cable shield connection terminals are connected to a common ground and provide Functional Earth (FE). This is typically connected to a common reference potential, such as equipotential bonding rails.

Signal Grounds (SGND or GND) are used for signal reference and must not be connected to cable shields, FE or other signals unless otherwise specified in the specific device description.

General considerations

Electric and electronical devices have to work correctly on site. This is also valid when electromagnetic influences affect them in defined and/or expected strength. The devices themselves must not emit electro-magnetic noises.

Advant controller components have a very high noise immunity.
When the wiring and grounding instructions are met, an error-free operation is given. High electro-magnetic noises of nearby mounted applications must be taken in consideration during the planning phase.

An EMC compatible earthing concept will also guarantee an error-free operation here.

In order to prevent operating malfunctions, it is recommended, that the operating personnel discharge themselves prior to touching communication connectors or perform other suitable measures to reduce effects of electrostatic discharges.

There are three important principles to be especially considered:
- Keep all connections as short as possible (in particular the grounding conductors)
- Use large conductor cross sections (in particular for the grounding conductors)
- Create low-impedance, i.e. good and large-sized contacts (in particular for the grounding conductors)

Pay attention to the following:
- Use vibration-resistant connections
- Clean metallic contact areas
- Use solid plug and screw-type connections
- Use earth cable shields with clips on a well-grounded metallic surface
- Do not use aluminium parts
- Do not use sheath wires
- Do not use toothed lock washers under screw connections

Fig. 15: Assembly: wrong

Fig. 16: Assembly: correct

Make a connection between the DIN rails and PE (Protective Earth). For this, use an grounding wire with a minimum conductor cross section of 10 mm². The wire is connected to the DIN rail with an M6 screw.

A large-area contact of the DIN rail with the metallic mounting plate improves the EMC behavior significantly, as the disturbances can be discharged more effective.
4.4.2 Cable routing

- Route cables meeting the standards.
- Sort the cables into cable groups:
  - Power current cables
  - Power supply cables
  - Signal cables
  - Data cables
- Route signal cables and data cables separately from the power cables.
  - Separate cable ducts or cable bundles.
  - The distance should be 20 cm or greater.
- Lay signal and data cables close to earthed surfaces.

4.4.3 Cable shields

- Use only shielded data cables. The shield should be grounded at both ends.
  A cable shield only grounded at one end can only protect from capacitively coupled interference and low-frequency disturbances (50 Hz hum).
- Avoid parasitic currents flowing through the cable shields.
  This can be done by installing current-carrying equipotential bondings.
- Use only cables with braided shields.
  Foil shields are not robust enough, cannot be contacted well and have poor HF properties.
- Use only metallic or [metal]-plated plugs for shielded data cables.
- Use only shielded cables for analog signals.
  For small signals ground the shield only at one end.
- Ground the cable shield directly with a clip when entering the control cabinet.
  Do not cut the shield until the cable reaches the module connected.

![The connection between the PE bar and the shield bar must have a low impedance.]

4.4.4 Control cabinet

- Installation of configurations in shielded cabinet can be required in shipping applications. Follow specific instructions in the applicable type approval certificate.

Available certificates can be found in the internet

1. Open landing page of the product e.g. DO526
2. In the middle of the page, click on [Downloads].
   ⇒ A two-column window opens on the page with all available documents.
3. In the left column of the downloads page click on [Certificate].
   ⇒ All available certificates are listed in the right column.

In the list of certificates, the maritime certificates can be identified by the title. The title consists of the abbreviation of the maritime classification society followed by the words: Type Approval Certificate. E.g. "DNV Type Approval Certificate: ...".
Connections
The connections between the control cabinet, the mounting plates, the PE bar and the shield bar must have a low impedance.

Grounding
Ground the control cabinet doors with short and highly flexible conductors.

Control cabinet lighting
Only use lighting with interference suppression.

For supplying the PC
Use the mains socket which is located inside the control cabinet.

4.4.2.5 Reference potential
- Provide a uniform reference potential in the entire installation and ground all electrical appliances if possible.
- Route your grounding conductors in a star configuration so that no ground loops can occur.

4.4.2.6 Equipotential bonding
The installation of equipotential bondings are necessary if there are present or expected potential differences between parts of your application.

- The impedance of equipotential bonding must be equal or lower than 10% of the shield impedance of the shielded signal cables between the same points.
- The conductor cross section of a equipotential bonding must be 16 mm² to withstand the maximum possible compensating current.
- Equipotential bondings and shielded signal cables should be laid close to each other.
- Equipotential bondings must be connected to PE with low impedance.

4.4.3.1 Safety instructions

NOTICE!
Attention:
The devices should be installed by experts who are trained in wiring electronic devices. In case of bad wiring, the following problems could occur:
- On the terminal base, the terminals L+ and M are doubled. If the power supply is badly connected, a short circuit could happen and lead to a destruction of the power supply or its fuse. If no suitable fuse exists, the terminal base itself might be destroyed.
- The terminal bases and all electronic modules and terminal units are protected against reverse polarity.
- All necessary measures should be carried out to avoid damages to modules and wiring. Notice the wiring plans and connection examples.

NOTICE!
All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and temporary overvoltage up to 30 V DC.

NOTICE!
Attention:
Due to possible loss of communication, the communication cables should be fixed with cable duct or bracket or clamp during application.

4.4.3.2 AC500

4.4.3.2.1 Power supply for AC500 system

The system is powered by two different power circuits:
- The power supply for the processor module is provided through the terminals L+/M.
- The power supply for the I/O modules is provided through the terminals UP/ZP.

The power supply for the processor module is galvanic isolated from the power supply for the I/O modules.

As soon as the power supply for the processor module is present, the processor module starts. The power supply of the processor module and the I/O modules should be powered on the same time, otherwise the processor module will not switch to run mode after startup.

When during operation the power supply falls below the minimum process and supply voltage for more than 10 ms, the processor module switches to safe mode. A restart of the processor module only occurs by switching the power supply off and on again.

If an I/O module is disconnected during operation from the power supply while the processor module is still powered, the processor module will continue its normal operation on all other powered peripherals (other I/O modules, communication modules and communication interfaces), but freezes the input image. After recovery of the power supply of the affected I/O module it will continue normal operation and inputs and outputs will be updated.

☞ Chapter 5.1.2.1 “Environmental conditions” on page 166

As power supply for the AC500 system, the ABB power supplies series CP can be used
☞ Chapter 5.2.8.3.1 “CP-E - Economic range” on page 1325 ☞ Chapter 5.2.8.3.2 “CP-C.1 - High performance range” on page 1327.
### 4.4.3.2 Power supply for processor modules

The supply voltage of 24 V DC is connected to a removable 5-pin terminal block. L+/M exist twice. It is therefore possible to feed e.g. external sensors (up to 8 A max. with 1.5 mm$^2$ conductor) via these terminals.

### 4.4.3.2.3 Connection of wires at the spring terminals

**Connection**

Fig. 18: Connect the wire to the spring terminal (steps 1 ... 3)
Fig. 19: Connect the wire to the spring terminal (steps 4 ... 7)

1. Side view (open terminal drawn for illustration)
2. The top view shows the openings for wire and screwdriver
3. Insert screwdriver (2.5 x 0.4 to 3.5 x 0.5 mm) at an angle, screwdriver must be at least 15 mm free of insulation at the tip
4. While erecting the screwdriver, insert it until the stop (requires a little strength)
5. Screwdriver inserted - terminal open
6. Strip the wire for 7 mm (and put on wire-end ferrule)
7. Insert wire into the open terminal
8. Done

Disconnection

Fig. 20: Disconnect wire from the spring terminal (steps 1 ... 3)
Fig. 21: Disconnect wire from the spring terminal (steps 4 ... 6)

1. Terminal with wire connected
2. Insert screwdriver (2.5 x 0.4 ... 3.5 x 0.5 mm) at an angle, screwdriver must be at least 15 mm free of insulation at the tip
3. While erecting the screwdriver, insert it until the stop (requires a little strength) - terminal is now open
4. Remove wire from the open terminal
5. Done

Cable length restrictions

For the maximum possible cable lengths within an Ethernet network, various factors have to be taken into account. Twisted pair cables (TP cables) are used as transmission medium for 10 Mbit/s Ethernet (10Base-T) as well as for 100 Mbit/s (Fast) Ethernet (100Base-TX). For a transmission rate of 10 Mbit/s, cables of at least category 3 (IEA/TIA 568-A-5 Cat3) or class C (according to European standards) are allowed. For fast Ethernet with a transmission rate of 100 Mbit/s, cables of category 5 (Cat5) or class D or higher have to be used. The maximum length of a segment, which is the maximum distance between two network components, is restricted to 100 m due to the electric properties of the cable.
Furthermore, the length restriction for one collision domain has to be observed. A collision domain is the area within a network which can be affected by a possibly occurring collision (i.e., the area the collision can propagate over). This, however, only applies if the components operate in half-duplex mode since the CSMA/CD access method is only used in this mode. If the components operate in full-duplex mode, no collisions can occur. Reliable operation of the collision detection method is important, which means that it has to be able to detect possible collisions even for the smallest possible frame size of 64 bytes (512 bits). But this is only guaranteed if the first bit of the frame arrives at the most distant subscriber within the collision domain before the last bit has left the transmitting station. Furthermore, the collision must be able to propagate to both directions at the same time. Therefore, the maximum distance between two ends must not be longer than the distance corresponding to the half signal propagation time of 512 bits. Thus, the resulting maximum possible length of the collision domain is 2000 m for a transmission rate of 10 Mbit/s and 200 m for 100 Mbit/s. In addition, the bit delay times caused by the passed network components also have to be considered.

**TP cable**

The TP cable has eight wires arranged in four pairs of twisted wires. Different color codes exist for the coding of the wires, the coding according to EIA/TIA 568, version 1, being the one most commonly used. In this code, the individual pairs are coded with blue, orange, green, and brown color. One wire of a pair is unicolored and the corresponding second wire is striped, the respective color alternating with white. For shielded cables, a distinction is made between cables that have one single shield around all pairs of wires and cables that have an additional individual shield for each pair of wires. The following table shows the different color coding systems for TP cables:

Table 12: Color coding of TP cables:

Two general variants are distinguished for the pin assignment of the normally used RJ45 connectors: EIA/TIA 568 version A and version B. The wiring according to EIA/TIA 568 version B is the one most commonly used.
Cable types

Crossover cable

**Particular use**

Crossover cables are needed only for a direct Ethernet connection without crossover functionality. In particular for AC500 modules in product life cycle phase "Classic".

Crossover cables are for a direct Ethernet connection of two terminal devices as the simplest variant of a network. From transmission lines of the first station to the reception lines of the second station.

---

**Straight-through cable**

For networks with more than two subscribers, hubs or switches have to be used additionally for distribution. These active devices already have the crossover functionality implemented which allows a direct connection of the terminal devices using straight-through cables.

---

**CAUTION!**

Risk of communication faults!

When using inappropriate cables, malfunctions in communication may occur.

Only use network cables of the categories 5 (Cat 5, Cat 5e, Cat 6 or Cat 7) or higher within PROFINET networks.
4.4.3.3 AC500-eCo

4.4.3.3.1 Power supply

The processor modules PM50x2 can be connected to the 24 V DC supply voltage via a removable 3-pin spring terminal block or a 3-pin screw terminal block.

Table 13: Removable terminal block for the supply voltage 24 V DC

<table>
<thead>
<tr>

NOTICE!

Risk of damaging the PLC due to improper voltage levels!

- Never exceed the maximum tolerance values for process and supply voltages.
- Never fall below the minimum tolerance values for process and supply voltages.

Observe the system data and the technical data of the used module. 

Chapter 5.1.1 “System data AC500-eCo” on page 159
4.4.3.3.2 Ethernet

Ethernet interface

Ethernet is also used for Modbus TCP connection.

The Ethernet interface is carried out via a RJ45 jack. The pin assignment of the Ethernet interface:

- Communication via Modbus RTU

4.4.3.4 Control panels CP600

Refer to the installation instructions delivered with each control panel and to the operating instructions.

4.4.4 Connection and wiring of the modules

Specific information about the connections of the modules and the wiring is available in the installation instructions.

- Installation instructions of AC500 PLC product family
- Installation instructions of CP600 control panels

4.5 Configuration and programming

Advanced installation of engineering suite

Programming for PLC system

Detailed information is available in the installation and licensing document.

- Chapter 6.3 “Configuration in Automation Builder for AC500 V3 products” on page 1398
Detailed information is available in the installation and licensing document.

4.6 Commissioning

Commissioning the PLC

Preconditions:
- All PLC modules are installed and wired according to the configuration in Automation Builder.
- The PLC is connected to the power supply.
- The application and the necessary licenses are available.

**WARNING!**

Risk of injury or damage to equipment

To avoid endangering persons or equipment, check before commissioning:
- Mechanical and electrical installation
- Electrical safety of the installation
- Safety functions

1. Switch on the power supply.
   - The green PWR LED goes on.
   - Processor modules with display: Wait until the processor module displays “Update”.

2. Install the firmware and the application on the processor module.

   Installing the firmware and the application on a very new processor module is the same process than updating a firmware and an application on a CPU.

   - Chapter 4.7.4 “PLC firmware/application update” on page 148
   - The PLC starts with the new firmware and the new application.

**WARNING!**

Risk of injury or damage to equipment

To avoid endangering persons or equipment, a functional test of the application must be performed before the final commissioning of the system.

Commissioning the control panel

Preconditions:
- The control panel is installed and wired.
- The control panel is connected to the power supply.
- The project file and the necessary licenses are available.

1. Start the control panel.
2. Set the IP address of the control panel.
3. Download the project file to the control panel.
4. Connect the PLC and the control panel with an Ethernet cable.
Step-by-step instructions using the example of the AC500-eCo starter kit with a control panel included

Protect your data, provide your projects with passwords and access restrictions.
☞ Chapter 6.4.1.6 “Protecting and Saving Projects” on page 1819
☞ Chapter 6.3.1.2.1 “User and access rights” on page 1409

The PLC has an integrated diagnosis system to output diagnosis messages, e.g., parameter setting is wrong or battery low. A diagnosis message is indicated by ERR LED = on.
☞ Chapter 4.8 “Troubleshooting” on page 149

4.7 Operation

4.7.1 Operating modes

The common operating mode is called run mode.

Table 14: Run mode

<table>
<thead>
<tr>
<th>LED</th>
<th>Display</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PWR LED = on</td>
<td><img src="image" alt="PWR LED on" /></td>
<td>Power supply is present. PLC is in run mode.</td>
</tr>
<tr>
<td>RUN LED = on</td>
<td><img src="image" alt="RUN LED on" /></td>
<td></td>
</tr>
<tr>
<td>ERR LED = off</td>
<td><img src="image" alt="ERR LED off" /></td>
<td></td>
</tr>
</tbody>
</table>

If the PLC is connected to the power supply, but does not operate, it is in stop mode. In stop mode, the processor module does not control the system.

Table 15: Stop mode

<table>
<thead>
<tr>
<th>LED</th>
<th>Display</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PWR LED = on</td>
<td><img src="image" alt="PWR LED on" /></td>
<td>E.g., after the download of an application, after a firmware update, an error occurred or the PLC was stopped by the user, etc.</td>
</tr>
<tr>
<td>RUN LED = off</td>
<td><img src="image" alt="RUN LED off" /></td>
<td></td>
</tr>
<tr>
<td>ERR LED = off/on</td>
<td><img src="image" alt="ERR LED off/on" /></td>
<td></td>
</tr>
</tbody>
</table>

4.7.2 Diagnosis system

The PLC has an integrated diagnosis system to output diagnosis messages, e.g., parameter setting is wrong or battery low. A diagnosis message is indicated by ERR LED = on.
☞ Chapter 4.8 “Troubleshooting” on page 149
4.7.3 Status LEDs, display and control elements

Depending on the device type, various operating elements provided on the front panel can be used to control the devices of the PLC system and/or to change the operating mode.

Operating elements:

- **Status LEDs:**
  Indicates the availability of devices and components such as communication modules, communication interface modules or function modules. Functionality and diagnosis of the status LEDs depends on the specific module and is described in the device description of the appropriate module. Possible status: on/off/blinking

- **I/O LEDs:**
  Displays the status of the inputs and outputs.

- **Display:**
  Available for some processor modules. It can be used for simple configurations and for reading out diagnosis information.

- **Function keys and switches:**
  Allows to change the current operating modes/status manually. Refer to the Panel Builder manual for a detailed description.

4.7.4 PLC firmware/application update

During runtime it might be necessary to update the firmware of the modules, e.g., for security reasons.

Updating the firmware and the application on a processor module is the same process than installing a firmware and an application on a very new processor module.

The installation can be performed either via a PC (recommended) or via a memory card.

![Fig. 27: The “Version information” tab of a device in the Automation Builder](image)

4.7.5 Control panel firmware/application update

The system components can be updated via Panel Builder software or via USB flash drive. Refer to the Panel Builder manual for a detailed description.
### 4.7.6 Reset Warm

**PLC**

- PLC is in STOP mode.

1. Press and hold (> 5 sec) [RUN].
   - RUN LED = ON.
   - “Reset” is displayed.

2. Press [OK] to reset the PLC.

**Control panel**

The factory restore of a control panel is described in the *Panel Builder manual*.

---

### 4.8 Troubleshooting

#### 4.8.1 General

Diagnosis messages are shown in the engineering suite Automation Builder. The diagnosis information can be accessed in the IEC application and can be forwarded to, e.g., a web server or a control panel. See *Chapter 6.9.1.5 “Diagnosis in IEC application” on page 4615*

Diagnosis messages can also be read out from the display of the PLC. See *Chapter 6.9.3 “Diagnosis messages” on page 4655*

Some diagnosis messages need to be acknowledged by the user (alarms*), others do not require acknowledgment (events*). The diagnosis system stores alarms and events in a diagnosis history.

Diagnosis messages include the severity of an error. Error severity can be used for defining system behavior, e.g., activating the error LED or stop the PLC.

#### 4.8.2 Possible malfunctions

**Possible malfunctions**

<table>
<thead>
<tr>
<th>Fault description</th>
<th>Cause</th>
<th>Remedy</th>
</tr>
</thead>
<tbody>
<tr>
<td>A processor module, a communication interface module or an I/O module can not be plugged on the corresponding terminal base or terminal unit.</td>
<td>Terminal bases and terminal units have a mechanical encoding. The encoding makes it impossible to insert a module to the wrong place to prevent dangerous voltages or destroyed modules.</td>
<td>Check the given design scheme of your control cabinet. Get in touch with the planner of the design scheme. Check the terminal base compatibility and the terminal unit compatibility.</td>
</tr>
<tr>
<td>An AC500-eCo V3 processor module does not start.</td>
<td>Configuration error due to wrong firmware of the option boards.</td>
<td>Update the option boards TA5141-RS232I, TA5142-RS485I and TA5142-RS485 at least to system firmware 3.5.0_HF-7 and boot firmware 3.5.1 or higher. Use Automation Builder 2.5.2 or higher.</td>
</tr>
<tr>
<td>The module does not respond and is not available for online connection.</td>
<td>Module is not connected to the power supply. Or module is not functional any more.</td>
<td>Check power supply. Replace the module or HMI.</td>
</tr>
<tr>

<tr>
<td>The module does not respond and is not available for online connection.</td>
<td>Module is not connected to the power supply. Or module is not functional any more.</td>
<td>⇢ Chapter 4.9.2 “Replace an AC500 module” on page 152</td>
</tr>
</tbody>
</table>
| I/O module on a hot swap terminal unit does not respond and is not available for online connection. | I/O module is not plugged or damaged. | As soon as the correct and operational I/O module is plugged on the terminal unit, the module is configured and ready to start.  
⇛ Hot swap behavior of I/O modules  
⇛ Hot swap behavior of remote I/O modules |
| After hot swap of a (remote) I/O module, the system and/or I/O module does not start. | Wrong I/O module type plugged. The type must be the same as of the replaced module. | Plug the correct I/O module type. |
| The display of the control panel is black. | Control panel is not connected to the power supply. Or control panel is not functional any more. | Check power supply.  
Replace the control panel. |
| ERR LED of the processor module flashes fast. The display shows “AC500”. | A fatal system error occurred. | Contact ABB technical support |
| ERR LED of the processor module flashes. RUN LED is off. The display shows “FAIL”. | Installation or update of firmware, boot project or application failed. | Restart the device. Perform the installation or update again.  
⇛ Chapter 4.7.4 “PLC firmware/application update” on page 148 |
| ERR LED is on. | PLC with event* or unacknowledged alarm*. | ● Use Automation Builder, IEC application or other external access available in your project, e.g., a control panel, to read out and acknowledge the diagnosis messages.  
In Automation Builder, double-click on a device and select the “Diagnosis” tab to access the diagnosis messages.  
Or:  
● Read out the diagnosis data on the display of the processor module.  
⇛ Chapter 6.9.3 “Diagnosis messages” on page 4655 |
| The display of the processor module shows “Demo” for 5 min at every license check. (For processor modules without display only visible when logged in with Automation Builder.) | PLC runs in demo mode because at least one feature license is missing. The demo license is valid for 10 days PLC in run. After this time, PLC will go to stop mode. | You can buy the missing license or extend the demo license via Automation Builder. The PLC will not switch back to run mode until a new license is activated or the licensed features are removed from the PLC application.  
⇛ Chapter 6.2.4 “Managing your licenses” on page 1350  
⇛ Chapter 6.3.2.2.2 “PLC runtime licensing” on page 1446 |
| Every 10 min, the display of the processor module shows “Grace” for 5 min. | PLC runs in grace mode because at least one feature license which has been available disappeared. If the grace time expires, PLC will go to stop mode. | You need to buy or activate the missing. We recommend to use the Automation Builder for activation. After the PLC is in stop mode, it will not switch back to run mode until a new license is activated or the licensed features are removed from the PLC application.  
⇛ Chapter 6.2.4 “Managing your licenses” on page 1350 |
<table>
<thead>
<tr>
<th>Fault description</th>
<th>Cause</th>
<th>Remedy</th>
</tr>
</thead>
<tbody>
<tr>
<td>Every 10 min, the display of the processor module shows “Grace” for 5 min.</td>

</tr>
<tr>
<td>The CPU displays “noConn” (no connection).</td>
<td>No communication between CPU and display is possible due do very high CPU load (e.g., endless loop in user program and not activated task watchdog).</td>
<td>Check the application for loops and operations they need time. For example file handling. Wait for response from other device who will block the execution from other code.</td>
</tr>
</tbody>
</table>

If a problem persists, contact ABB technical support. In order to be able to solve your problem as soon as possible, please provide the affected Automation Builder project or Panel Builder project, the log files and the firmware versions. How to read out log files is described in the application note How to get log information.

### 4.8.3 Execution of a hotfix

Updates (also hotfixes) are displayed at every system start, if available. § Chapter 6.2.2 “Automation Builder updates” on page 1350

Hotfixes can be in different files - *.exe, *.package or Linux (for communication interface modules).

**Hotfix file via memory card**

A hotfix PLC firmware file (*.exe) can be installed via a memory card. § Chapter 6.3.1.4.5.2.3 “Execution of update via memory card” on page 1430

**Communication interface (CI) module firmware**

The firmware of AC500 communication interface modules can be updated with the IP configuration tool.

**Advanced: Manual installation in Automation Builder**

1. Download the current firmware hotfix from the PLC website.
2. Save and unpack the .zip file at any location of your hard disc.
3. Save and close open projects in Automation Builder.
4. In the menu bar of the Automation Builder open the “Package Manager”. “Tools ➔ Package Manager”
   - The “Package Manager” opens.
5. Follow the instructions. § Chapter 6.4.1.21.3.9.4 “Command 'Package Manager’” on page 2655
4.9 Maintenance

4.9.1 Maintenance intervals

<table>
<thead>
<tr>
<th>Interval</th>
<th>Maintenance work</th>
</tr>
</thead>
<tbody>
<tr>
<td>After 3 years of utilisation or as soon as possible after the PLC diagnosis message &quot;low battery warning&quot;</td>
<td>Replace battery of the CPU.</td>
</tr>
<tr>
<td>Regularly or when the faceplate of the control panel is dusty.</td>
<td>Keep the faceplate of the control panel clean.</td>
</tr>
<tr>
<td></td>
<td>Refer to the panel's operating instruction.</td>
</tr>
</tbody>
</table>

4.9.2 Replace an AC500 module

CAUTION!
Risk of injury and damaging the product!
Improper installation and maintenance may result in injury and can damage the product!
- Installation and maintenance have to be performed according to the technical rules, codes and relevant standards, e.g. EN 60204-1.
- Only by qualified personnel.

WARNING!
Removal/Insertion under power
The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

All modules of the AC500 range are maintenance free. Spare parts are not available and repair is not allowed. If a module is not functional any more, you have to replace the whole module.

If an I/O module is installed on a hot swap terminal unit, it is possible to replace it with the same type during runtime.

☞ Chapter 4.9.3 “Replace an I/O module with hot swap” on page 153

If an I/O module is installed on a terminal unit that does not support hot swap and for all other AC500 modules, proceed as follows.

1. Disconnect the power supply.
2. For processor modules, insert the memory card into the new module.
For communication modules, adjust the position of the rotary switches on the new module.

For terminal units and terminal bases, disconnect the connectors from the old module.

Demount the module to be replaced as described in the installation instructions.

Mount the new module as described in the installation instructions.

For terminal units and terminal bases, connect the connectors.

Reconnect the power supply.

System boots up again.

If necessary, update module firmware. Chapter 4.7.4 “PLC firmware/application update” on page 148.

If a processor module is replaced, you must install the firmware, the application, the licenses, passwords and the certificates on the new processor module.

Chapter 6.3.1.4.2.2 “CPU firmware” on page 1419

Chapter 4.7.4 “PLC firmware/application update” on page 148

Chapter 6.3.2.2.2 “PLC runtime licensing” on page 1446

Chapter 6.6.2.2 “Encrypted Communication with Devices via Controller Certificates” on page 4201

Chapter 6.4.1.6 “Protecting and Saving Projects” on page 1819

Chapter 6.4.1.11 “Downloading an Application to the PLC” on page 1965

If a problem persists, contact ABB technical support.

4.9.3 Replace an I/O module with hot swap

4.9.3.1 Preconditions for using hot swap

Conditions for hot swapping

- Digital outputs are not under load.
- Input/output voltages above safety extra low voltage/protective extra low voltages (SELV/PELV) are switched off.
- Modules are completely plugged on the terminal unit with both snap fit engaged before switching on loads or input/output voltage.

WARNING!
Risk of explosion or fire in hazardous environments during hot swapping!

Hot swap must not be performed in flammable environments to avoid life-threatening injury and property damage resulting from fire or explosion.
WARNING!
Electric shock due to negligent behavior during hot swapping!
To avoid electric shock:
- Make sure the following conditions apply:
  - Digital outputs are not under load.
  - Input/output voltages above safety extra low voltage/protective extra low voltage (SELV/PELV) are switched off.
  - Modules are fully interlocked with the terminal unit with both snap-fits engaged before switching on loads or input/output voltage.
  - Never touch exposed contacts (dangerous voltages).
  - Stay away from electrical contacts to avoid arc discharge.
  - Do not operate a mechanical installation improperly.

NOTICE!
Risk of damage to I/O modules!
Hot swapping is only allowed for I/O modules.
Processor modules and communication interface modules must not be removed or inserted during operation.

H = Hot swap

Hot swap
System requirements for hot swapping of I/O modules:
- Types of terminal units that support hot swapping of I/O modules have the appendix TU5xx-H.
- I/O modules as of index F0.
The following I/O bus masters support hot swapping of attached I/O modules:
- Communication interface modules CI5xx as of index F0.
- Processor modules PM56xx-2ETH with firmware version as of V3.2.0.

Hot swap is not supported by AC500-eCo V3 CPU!
The index of the module is in the right corner of the label.

**NOTICE!**
**Risk of damage to I/O modules!**
Modules with index below F0 can be damaged when inserted or removed from the terminal unit in a powered system.

**NOTICE!**
**Risk of damage to I/O modules!**
Do not perform hot swapping if any I/O module with firmware version lower than 3.0.14 is part of the I/O configuration.

For min. required device index see table below.

<table>

### 4.9.3.3 Hot swap behavior

<table>
<thead>
<tr>
<th>Hot swap behavior</th>
<th>Central I/O on V3 CPU</th>
</tr>
</thead>
</table>
| Start-up behavior with unplugged or damaged I/O module on hot swap terminal unit TU5xx-H | System and I/O modules attached to the CPU are starting (except unplugged or damaged module when plugged on hot swap terminal unit).  
As soon as the correct and operational I/O module is plugged on the terminal unit, the module is configured and ready to start.  
No specific setting needed. |
| Start-up behavior with wrong I/O module type on any terminal unit | System and I/O modules are not starting                                              |
| Diagnosis of presence of hot swap terminal unit        | Diagnosis using PLC browser command "io-bus desc" in Automation Builder V3.         |
|                                                      | The PLC browser then provides an overview of the modules on the I/O bus including the position of hot swap terminal units in the I/O bus. |
|                                                      | In the application program this can be detected with a function block "IoModuleHotSwapInfo" (Library: AC500_Io/Function Blocks/I/O-Bus). |
|                                                      | One instance of function block is needed per terminal unit on the I/O bus. The function block provides five outputs delivering information about slot number, hot swap capability and plugged/unplugged state of the I/O module |
| Diagnosis while hot swap module is pulled or module (mounted on hot swap terminal unit) has stopped working | If module is pulled then diagnosis Err 9480 "Module removed from Hot Swap Terminal Unit" is generated |
| Diagnosis after plugging the I/O module on the hot swap terminal unit | Diagnosis Err 9480 is automatically acknowledged |

### 4.9.4 Replace a CP600 control panel

Control panels are maintenance free. Spare parts are not available and repair is not permitted. If a control panel becomes inoperable, it must be replaced. An operation manual is included with the new unit.

For instructions on how to transfer the runtime to a new control panel and how to load projects to a new control panel, refer to the Panel Builder manual.

The procedure for changing from a CP600 device to a CP600 device of the 2nd generation is described in the application example Converting a CP600 project. A description of the differences between both device variants can also be found in this application example.

### 4.10 Decommissioning

1. Delete the runtime licenses from the device by returning the licenses.
   ¶ Chapter 6.3.2.2.2.5 “Returning a license” on page 1452
2. Delete certificates available on the CPU.
   ⇤ Chapter 6.6.2.4.1 “View ’Security Screen’ - ’Devices’” on page 4205
3. Delete applications.
   ⇤ Chapter 6.4.1.21.3.7.12 “Command ’Reset Origin’” on page 2635
   ⇤ Chapter 6.4.1.21.3.7.13 “Command ’Reset Origin Device’” on page 2636
4. Delete applications from memory card, if available.
   ⇤ Chapter 6.4.1.15 “Copying files to/from PLC” on page 2027
5. If available, remove memory card and battery from CPU.
6. Delete all user accounts and user data.
   ⇤ “Tab ’User’” on page 2593
7. Demount and dispose the hardware modules.
   ⇤ Demount AC500, AC500-XC and AC500-S
   ⇤ Chapter 4.11 “Recycling” on page 158

If you cannot access the data stored in the CPU, e.g., because the CPU is not functional any more, then physically destroy the device.

This ensures that the credentials that are stored in the device, cannot be misused.

4.11 Recycling

Disposal and recycling information
This symbol on the product (and on its packaging) is in accordance with the European Union’s Waste Electrical and Electronic Equipment (WEEE) Directive.

The symbol indicates that this product must be recycled/disposed of separately from other household waste.

It is the end user’s responsibility to dispose of this product by taking it to a designated WEEE collection facility for the proper collection and recycling of the waste equipment.

The separate collection and recycling of waste equipment will help to conserve natural resources and protect human health and the environment.

For more information about recycling, please contact your local environmental office, an electrical/electronic waste disposal company or the store where you purchased the product.

Allowed interruptions of power supply, according to EN 61131-2

| DC supply                     | Interruption < 10 ms, time between 2 interruptions > 1 s, PS2 |
| DC supply (only for analog option boards TA512x) | Interruption < 1 ms, time between 2 interruptions > 1 s, PS1 |

---

**NOTICE!**

Risk of damaging the PLC due to improper voltage levels!

- Never exceed the maximum tolerance values for process and supply voltages.
- Never fall below the minimum tolerance values for process and supply voltages.

Observe the system data and the technical data of the used module.

☞ Chapter 5.1.1 “System data AC500-eCo” on page 159

---

**NOTICE!**

Improper voltage level or frequency range which cause damage of AC inputs:

- AC voltage above 264 V
- Frequency below 47 Hz or above 62.4 Hz

---

**NOTICE!**

Improper connection leads cause overtemperature on terminals.

PLC modules may be destroyed by using wrong cable type, wire size and cable temperature classification.

### 5.1.1.2 Creepage distances and clearances

The creepage distances and clearances meet the requirements of the overvoltage category II, pollution degree 2.

### 5.1.1.3 Power supply units

AC500 and AC500-eCo PLC devices are Class II/Class III devices and do not require a Protective Earth (PE) connection.

For proper EMC performance, all metal parts, DIN rails, mounting screws, and cable shield connection terminals are connected to a common ground and provide Functional Earth (FE). This is typically connected to a common reference potential, such as equipotential bonding rails.

Signal Grounds (SGND or GND) are used for signal reference and must not be connected to cable shields, FE or other signals unless otherwise specified in the specific device description.

For the supply of the modules, power supply units according to SELV or PELV specifications must be used.
Safety Extra Low Voltage (SELV) and Protective Extra Low Voltage (PELV)

To ensure electrical safety of AC500/AC500-eCo extra low voltage circuits, 24 V DC supply, communication interfaces, I/O circuits, and all connected devices must be powered from sources meeting requirements of SELV, PELV, class 2, limited voltage or limited power according to applicable standards.

WARNING!
Improper installation can lead to death by touching hazardous voltages!
To avoid personal injury, safe separation, double or reinforced insulation and separation of the primary and secondary circuit must be observed and implemented during installation.

- Only use power converters for safety extra-low voltages (SELV) with safe galvanic separation of the primary and secondary circuit.
- Safe separation means that the primary circuit of mains transformers must be separated from the secondary circuit by double or reinforced insulation. The protective extra-low voltage (PELV) offers protection against electric shock.

**NOTICE!**

Risk of damaging the PLC due to improper voltage levels!

- Never exceed the maximum tolerance values for process and supply voltages.
- Never fall below the minimum tolerance values for process and supply voltages.

Observe the system data Chapter 5.1.2 “System data AC500” on page 166 and the technical data of the module used.

**NOTICE!**

Improper voltage level or frequency range which cause damage of AC inputs:

- AC voltage above 264 V
- Frequency below 47 Hz or above 62.4 Hz

**NOTICE!**

Improper connection leads cause overtemperature on terminals.

PLC modules may be destroyed by using wrong cable type, wire size and cable temperature classification.

### 5.1.2.2 Creepage distances and clearances
The creepage distances and clearances meet the requirements of the overvoltage category II, pollution degree 2.

### 5.1.2.3 Power supply units

AC500 and AC500-eCo PLC devices are Class II/Class III devices and do not require a Protective Earth (PE) connection.

For proper EMC performance, all metal parts, DIN rails, mounting screws, and cable shield connection terminals are connected to a common ground and provide Functional Earth (FE). This is typically connected to a common reference potential, such as equipotential bonding rails.

Signal Grounds (SGND or GND) are used for signal reference and must not be connected to cable shields, FE or other signals unless otherwise specified in the specific device description.

For the supply of the modules, power supply units according to SELV or PELV specifications must be used.

### Safety Extra Low Voltage (SELV) and Protective Extra Low Voltage (PELV)
To ensure electrical safety of AC500/AC500-eCo extra low voltage circuits, 24 V DC supply, communication interfaces, I/O circuits, and all connected devices must be powered from sources meeting requirements of SELV, PELV, class 2, limited voltage or limited power according to applicable standards.

### WARNING!
Improper installation can lead to death by touching hazardous voltages!
To avoid personal injury, safe separation, double or reinforced insulation and separation of the primary and secondary circuit must be observed and implemented during installation.

- Only use power converters for safety extra-low voltages (SELV) with safe galvanic separation of the primary and secondary circuit.
- Safe separation means that the primary circuit of mains transformers must be separated from the secondary circuit by double or reinforced insulation. The protective extra-low voltage (PELV) offers protection against electric shock.
### Electromagnetic compatibility

**NOTICE!**

Risks of damaging the PLC due to improper voltage levels:
- Never exceed the maximum tolerance values for process and supply voltages.
- Never fall below the minimum tolerance values for process and supply voltages.

Observe the system data Chapter 5.1.2 “System data AC500” on page 166 and the technical data of the module used.

**NOTICE!**

Improper voltage level or frequency range which cause damage of AC inputs:
- AC voltage above 264 V
- Frequency below 47 Hz or above 62.4 Hz

**NOTICE!**

Improper connection leads cause overtemperature on terminals.
PLC modules may be destroyed by using wrong cable type, wire size and cable temperature classification.

</table>

**NOTICE!**

**Risk of corrosion!**

Unused connectors and slots may corrode if XC devices are used in salt-mist environments.

Protect unused connectors and slots with TA535 protective caps for XC devices.

☞ Chapter 5.2.8.3.6 “TA535 - Protective caps for XC devices” on page 1332.

**NOTICE!**

**Risk of malfunctions!**

Unused slots for communication modules are not protected against accidental physical contact.

- Unused slots for communication modules must be covered with dummy communication modules to achieve IP20 rating.

☞ Chapter 5.2.8.2.4 “TA524 - Dummy communication module” on page 1323.

- I/O bus connectors must not be touched during operation.

### 5.1.3.2 Creepage distances and clearances

The creepage distances and clearances meet the requirements of the overvoltage category II, pollution degree 2.
5.1.3.3 Power supply units

AC500 and AC500-eCo PLC devices are Class II/Class III devices and do not require a Protective Earth (PE) connection.

For proper EMC performance, all metal parts, DIN rails, mounting screws, and cable shield connection terminals are connected to a common ground and provide Functional Earth (FE). This is typically connected to a common reference potential, such as equipotential bonding rails.

Signal Grounds (SGND or GND) are used for signal reference and must not be connected to cable shields, FE or other signals unless otherwise specified in the specific device description.

#### 5.1.3.6 Approvals and certifications
The PLC Automation catalog contains an overview of the available approvals and certifications.

#### 5.1.4 AC500-S
**Functional safety**
The AC500-S safety user manual must be read and understood before using the safety configuration and programming tools of Automation Builder/PS501 Control Builder Plus. Only qualified personnel are permitted to work with AC500-S safety PLCs.

The AC500-S safety PLC includes the following safety-relevant hardware components.
- SM560-S/SM560-S-FD-1/SM560-S-FD-4
- DI581-S
- DX581-S
- AI581-S
- TU582-S

#### 5.1.5 CP600
The technical data of the CP600 control panels are included in the CP600 data sheets.
5.2 Device specifications
5.2.1 Processor modules
5.2.1.1 AC500-eCo
5.2.1.1.1 PM50x2

Features

Fig. 28: Example: PM5072-T-2ETH

1. Micro memory card slot
2. 5 LEDs to display the states of the processor module (Power, Error, Run, MC, MOD1)
3. RUN button
4. RJ45 female connector for Ethernet1 connection
5. RJ45 female connector for Ethernet2 connection (available for PM50x2-T-2ETH)
6. 3-pin terminal block for power supply 24 V DC
7. 2 holes for screw mounting
8. Option board slot cover for option board slot (the number of available slots varies according to the CPU type)
9. Cable fixing
10. 13-pin terminal block for onboard I/Os
11. 12-pin terminal block for onboard I/Os (not available on PM5012-x-ETH)
12. 12 LEDs to display the states of the signals
13. 10 LEDs to display the states of the signals
14. Cable fixing accessory TA5301-CFA on the top of the housing (optional)

The processor module is shown with pluggable terminal blocks. These terminal blocks must be ordered separately.
The cable fixing accessory on the top of the housing is optional.

Please use TA5301-CFA cable fixing accessory to provide strain relief.

It can also be used for AC500-eCo I/O modules.

The PM50x2 processor modules are supplied with option board slot covers as standard.

There are various TA51xx option boards for the processor modules that can be ordered separately.

Which and how many option boards can be plugged, depends on the respective processor module.

### Short description

The processor modules PM50x2 series are the central units of AC500-eCo V3 PLC. Their main characteristics are:

- Power supply 24 V DC
- I/O bus (not for PM5012-x-ETH)
- Real-time clock (PM5012-x-ETH needs additional RTC option board)
- Option board slots for extension on the CPU (1 for PM5012-x-ETH, 2 for PM5032-x-ETH, 3 for PM5052-x-ETH and PM50x2-T-2ETH)
- 6 digital inputs (PM5012-x-ETH), 12 digital inputs (PM5032-x-ETH, PM5052-x-ETH, PM50x2-T-2ETH)
- 4 transistor outputs (PM5012-T-ETH), 8 transistor outputs (PM5032-T-ETH, PM5052-T-ETH, PM50x2-T-2ETH)
- 4 relay outputs (PM5012-R-ETH), 6 relay outputs (PM5032-R-ETH, PM5052-R-ETH)
- 2 configurable digital inputs/outputs (not for PM5012-x-ETH)

The various processor module variants differ in the following characteristics:
- Type of the digital outputs (transistor or relays)
- Ethernet interface one or two independent interfaces

All processor module variants include a micro memory card slot.

Details and technical data are provided in the technical data section "Technical data" on page 188.

### Connections and interfaces

#### General

The I/O bus is the I/O data bus for the I/O modules. Through this bus, I/O and diagnosis data are transferred between the processor module and the I/O modules. Up to 10 I/O modules for PM5032-x-ETH (but with a limit of 128 Bytes input/ 128 Bytes output variables) and 10 I/O modules for PM5052-x-ETH and PM50x2-T-2ETH can be added.

#### I/O bus

The I/O bus is not available for PM5012-T-ETH and PM5012-R-ETH. I/O channel extension using option board slot only.

#### Option board slot interface

Depending on the processor module variants, an additional option board can be connected to the option board slot to extend the feature of the processor module.

* Chapter 5.2.1.1.3 “Option boards” on page 218

#### Serial interface

- RS-232 communication interface is available by using option board:
  - TA5141-RS232 (isolated)
    - *Chapter 5.2.1.1.3.9 “TA5141-RS232 - Option board for COMx serial communication” on page 285*

- RS-485 communication interface is available by using option boards:
  - TA5142-RS485 (isolated)
    - *Chapter 5.2.1.1.3.10 “TA5142-RS485 - Option board for COMx serial communication” on page 289*
  - TA5142-RS485 (non isolated)
    - *Chapter 5.2.1.1.3.11 “TA5142-RS485 - Option board for COMx serial communication” on page 296*
The Ethernet interface is carried out via a RJ45 jack.

The processor modules PM50x2 have onboard I/Os which provide several functionalities. According to the CPU type, the number or the functionality of the onboard I/Os can be different. See Chapter 5.2.1.2 “Onboard I/Os in processor module PM50x2” on page 196.

**Modbus RTU connection details**

The Modbus RTU protocol is implemented in the AC500 processor modules. Modbus is a master-slave (client-server) protocol. The client sends a request to the server(s) and receives the response(s).

Available serial interfaces can work as Modbus interfaces simultaneously.

The Modbus client operating mode of an interface is set with the function block COM_MOD_MAST.

**Technical data**

### Bus topology

Point-to-point with RS-232 or bus topology with RS-485. Modbus is a master-slave protocol.  
`Chapter 6.8.2.9 “Communication with Modbus RTU” on page 4506`

### Power supply

The processor modules PM50x2 can be connected to the 24 V DC supply voltage via a removable 3-pin spring terminal block or a 3-pin screw terminal block.

**Table 30: Removable terminal block for the supply voltage 24 V DC**

<table>
<thead>
<tr>
<th>3-pin spring terminal block</th>
<th>3-pin screw terminal block</th>
</tr>
</thead>
</table>

The terminal block is available as a set for AC500-eCo V3 processor modules.

**Basic CPU (PM5012)**  
**Standard CPUs (PM5032, PM5052) and Pro CPUs (PM5072, PM5082)**

`Further information on power supply and onboard inputs/outputs of the terminal blocks`
**NOTICE!**
Risk of damaging the PLC due to improper voltage levels!

- Never exceed the maximum tolerance values for process and supply voltages.
- Never fall below the minimum tolerance values for process and supply voltages.

Observe the system data and the technical data of the used module.

---

State LEDs and operating elements

**RUN/STOP button**
The processor modules, PM50xx series, have a RUN/STOP button. By pressing the RUN/STOP button, the processor modules switch between RUN mode and STOP mode. By long-pressing RUN/STOP button during the processor module power on phase, the processor module will be in MOD1.

**State LEDs**
The processor modules PM50xx indicate their states of operation via 5 LEDs located on the upper left side of the processor module.

<table>

</tr>
</tbody>
</table>
### User configurable LEDs

The AC500-eCo V3 processor module also provides 2 LEDs below the state LEDs which can be used by user and driven by an application.

The LEDs can be used into a project and controlled using special function blocks which are contained in the PM AC500 library. The POU is PmLedSet located in folder LED control.

### I/O LEDs

The processor module provides up to 10 LEDs (PM5012-x-ETH), 20 LEDs (PM5032-R-ETH, PM5052-R-ETH), or 22 LEDs (PM5032-T-ETH, PM5052-T-ETH, PM5072-T-2ETH(W), PM5082-T-2ETH) to display the states of the inputs and outputs.

### Diagnosis

The AC500 processor module can display various errors according to the error classes. The following error classes are possible. The reaction of the processor module is different for each type of error.

<table>
<thead>
<tr>
<th>Error class</th>
<th>Type</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>E1</td>
<td>Fatal error</td>
<td>A safe function of the operating system is no longer guaranteed.</td>
<td>Checksum error in the system Flash or RAM error</td>
</tr>
<tr>
<td>E2</td>
<td>Severe error</td>
<td>The operating system is functioning without problems, but the error-free processing of the user program is no longer guaranteed.</td>
<td>Checksum error in the user Flash, independent of the task duration</td>
</tr>
<tr>
<td>E3</td>
<td>Light error</td>
<td>It depends on the application if the user program should be stopped by the operating system or not. The user should determine which reaction is necessary.</td>
<td>Flash could not be programmed, I/O module has failed</td>
</tr>
<tr>
<td>E4</td>
<td>Warning</td>
<td>Error in the periphery (e.g. I/O) which may show an impact in the future. The user should determine which reaction is necessary.</td>
<td>Short-circuit at an I/O module, the battery is run down or not inserted</td>
</tr>
</tbody>
</table>

*) The behaviour if the ERR-LED lights up at error classes E3 or E4 is configurable.

Occurred errors can be displayed with the commands diagshow all in the PLC-Browser of Automation Builder software.
The system data of AC500-eCo V3 apply Chapter 5.1.1 “System data AC500-eCo” on page 159

Only additional details are therefore documented below.

Processor modules for AC500-eCo V3 products

To enable better product availability into the production and to provide some new features, a revision of the existing AC500-eCo V3 processor module was necessary. The existing AC500-eCo V3 processor module with rubric R007x will move to classic and will be replaced by compatible new AC500-eCo V3 processor module revision 1 with rubric R017x.

For example: The processor module revision 1 PM5012-T-ETH (1SAP122 600 R0172) replaces the existing processor module PM5012-T-ETH (1SAP 122 600 R0072) and provides the same features or functionality of the previous ones.

Following points must be considered with the processor module revision 1:

- The processor module revision 1 (R017x) requires a new BootFW / CPUFW from V3.6.x and higher.
- It cannot be downgraded and used with lower FW versions than V3.6.0.
- The processor module revision 1 (R017x) provides the same features as the processor module (R007x) existing today and is fully compatible.
- An existing application using a processor module (R007x) built with Automation Builder < 2.6 can run on a processor module revision 1 (R017x) but the application must be upgraded to at least AB 2.6.0 or higher.
What must be done using a new processor module revision 1 (R017x)?

- On a new application?
  - Just use the processor module revision 1 (R017x)
  - Use the latest Automation Builder Software from 2.6.0 or higher.

- On an existing application using an Automation Builder software version smaller than 2.6.0?
  - To use a processor module revision 1 in an existing application (e.g., replacement of the processor module), the application must be upgraded to at least AB 2.6.0 or higher.
  - If several processor module (revision 1 and revision 0) are used within the same project, all the processor modules used in the same application must be upgraded to the FW Version V3.6.x and higher.

---

5.2.1.1.2 **Onboard I/Os in processor module PM50x2**

**Functionality**

The AC500-eCo V3 processor modules PM50x2 have onboard I/Os which provide several functionalities. According to the CPU type, the number or the functionality of the onboard I/Os can be different.

With the processor modules revision 1 (rubric R017x), the fast output channels provides up to 4 PTO pulse/direction with up to 200 kHz (rubric R007x, only 100 kHz). The processor modules revision 1 are supported from AB 2.6.0 and the AB software automatically recognizes the used processor module.

**Connections**

**General**

**WARNING!**
Risk of death by electric shock!
Hazardous voltages can be present at the terminals of the module.
Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.

**NOTICE!**
Risk of damaging the PLC modules!
The PLC modules must not be removed while the plant is connected to a power supply.
Make sure that all voltage sources (supply and process voltage) are switched off before you:
- connect or disconnect any signal or terminal block
- remove or replace a module.

**NOTICE!**
Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.
- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

*When replacing a processor module, it is recommended to mark each wire connected to the onboard I/O terminal block before disconnecting it. This should make sure that the wires can be reconnected in the same order.*

The connection is carried out by using removable 12-pin and 13-pin terminal blocks.

Connection of the digital inputs

The digital inputs can be used as source inputs or as sink inputs.

**NOTICE!**
Risk of malfunctions in the plant!

A ground fault, e.g. caused by a damaged cable insulation, can bridge switches accidentally.

Use sink inputs when possible or make sure that, in case of error, there will be no risks to persons or plant.

Table 39: Connection of the digital inputs to the PM50x2 processor modules

Connection of the digital transistor outputs (PM50xx-T-xETH only)

Fig. 29: Connection of digital transistor outputs and configurable digital inputs/outputs

C12 used as configurable digital input
C13 used as configurable digital transistor output

CAUTION!
Risk of damaging the processor module!
The outputs are not protected against short circuit and overload.
- Never short-circuit or overload the outputs.
- Never connect the outputs to other voltages.
- Use an external fuse for each output.

The configurable digital channels (C12 and C13) used as digital inputs have the same electrical characteristics as standard digital inputs.
The configurable digital channels (C12 and C13) used as digital transistor outputs have the same electrical characteristics as standard digital outputs.
Connection of the digital relay outputs (PM50xx-R-ETH only)

![Diagram showing connection of digital relay outputs and configurable digital inputs/outputs]

C12 used as configurable digital input
C13 used as configurable digital transistor output

**WARNING!**
Risk of death by electric shock!

Hazardous voltages can be present at the terminals of the module.
Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.

**CAUTION!**
Risk of damaging the processor module!

- Never short-circuit or overload the outputs.
- Never connect inductive loads without an external suppression against voltage peaks due to inductive kickback.
- Never connect voltages > 240 V. All outputs must be fed from the same phase.
- Use an external fuse for each output.
The configurable digital channels (C12 and C13) used as digital inputs have the same electrical characteristics as standard digital inputs.

The configurable digital channels (C12 and C13) used as digital transistor outputs have the same electrical characteristics as standard digital outputs.

I/O configuration

The configuration data of the onboard I/Os is stored in the processor modules PM50x2.

«Chapter 6.3.2.5 “Configure the onboard I/O channel” on page 1483

Parameterization

For information about parameterization, refer to the configuration description for onboard I/Os for processor modules PM50x2.

«“Basic CPU: PM5012-x-ETH” on page 1484
«“Standard CPU: PM5032-x-ETH, PM5052-x-ETH Pro CPU: PM5072-T-2ETH, PM5082-T-2ETH” on page 1486

Diagnosis

No diagnosis is generated for the onboard I/O.
There is only an error message if the configuration does not work. A log entry is generated. The Automation Builder already prevents faulty values from being entered in the configuration.
If the configuration does not work, there is a system error, if e.g. faulty software or wrong versions are installed.
Otherwise there are error messages from the blocks for the individual functions.

**Technical data of the fast counter inputs**

*For AC500 devices the function "fast counter" is available in S500 I/O modules as of firmware version V1.3.*

*For AC500-eCo V3 devices the function "fast counter" is available in onboard I/Os of PM50xx.*

The AC500-eCo V3 processor modules with onboard I/Os provide some special functionality on the digital inputs or digital outputs. Fast counter, encoder inputs, interrupt inputs or PWM/PTO outputs are available depending on the device used.

The fast counter functionality can be activated within the onboard I/O configuration.

The fast counter can work in pulse/direction mode or A/B track counter mode.

☞ Further information about the operating modes of the fast counter
☞ Further information about the configuration of the fast counter

As AC500-eCo V3 PLCs provide the fast counters via their onboard I/Os not only the correct power distribution to the PLC has to be made, but also the correct wiring to the signal wires. How to connect and use fast counters in AC500-eCo V3 PLCs is described in an application example.

The pulse/direction counter detects the rising edge of the counter input. It will increase or decrease the count value (depending on the direction input) at every rising edge.

The A/B track counter is used to count the signal from an encoder.
The counter can count with quad phases. In the following the behavior of the A/B track counter is described.

<td></td>
<td></td>
<td>O4 … O7 as 4 PTO up to 200 kHz Pulse outputs / Direction using fast output 5kHz O0...O3 2)</td>
<td></td>
</tr>
</tbody>
</table>

1) If the load is less than 100 mA it is strongly recommended to connect an additional load resistor (240 Ω/5 W or 270 Ω/5 W) to the output to improve the pulse signal.

2) With the processor modules revision 1 (rubric R017x), the fast output provides then 200 kHz PTO Pulse output instead of 100 kHz. The processor modules revision 1 needs at least AB 2.6.0 and higher.

5.2.1.3 Option boards

TA5101-4DI - Digital input option board

Features

- 4 digital inputs 24 V DC (I0 to I3) in 1 group
- Module-wise galvanically isolated
- W variant available for use in extended (wide) temperature range

1 4 yellow LEDs to display the signal states at the digital inputs I0 to I3
2 Allocation of signal name
3 5-pin terminal block for input signals

NOTICE!
Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.
Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.

Intended purpose

The device is used as an optional I/O extension module for AC500-eCo V3 CPUs (PM50x2). The inputs/outputs are group-wise galvanically isolated from each other. All other circuitry of the module is galvanically isolated from the inputs/outputs.

Functionality

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>LED displays</td>
<td>For signal states</td>
</tr>
<tr>
<td>Internal power supply</td>
<td>Via internal CPU connection</td>
</tr>
<tr>
<td>External power supply</td>
<td>Not necessary</td>
</tr>
</tbody>
</table>
Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the system assembly chapter.

The connection is carried out by using a removable 5-pin terminal block. For more information, please refer to the chapter terminal blocks for AC500-eCo V3 system. The terminal blocks are included in the module’s scope of delivery and additional terminal blocks as spare parts can be ordered separately.

![Diagram of terminal block connections]

**Table 47: Assignment of the terminals:**

<table>
<thead>
<tr>

<tr>
<td>4</td>
<td>I2</td>
<td>Input signal I2</td>
</tr>
<tr>
<td>5</td>
<td>I3</td>
<td>Input signal I3</td>
</tr>
</tbody>
</table>

The internal power supply voltage for the module’s circuitry is carried out via the connection to CPU. Thus, the current consumption from 24 V DC power supply at the terminals L+ and M of the CPU module increases by 10 mA per TA5101-4DI.

An external power supply connection is not needed.

**WARNING!**

**Removal/Insertion under power**

The option boards are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug option boards with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace an option board.

Disconnecting any powered option board while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.
NOTICE!
Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.
Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.

The digital inputs can be used as source inputs or as sink inputs.

NOTICE!
Risk of malfunctions in the plant!
A ground fault, e. g. caused by a damaged cable insulation, can bridge switches accidentally.
Use sink inputs when possible or make sure that, in case of error, there will be no risks to persons or plant.

Table 48: Connection of the option board for digital I/O extension TA5101-4DI

</table>

The module provides several diagnosis functions “Diagnosis” on page 221.
The meaning of the LEDs is described in the section ‘State LEDs’ “State LEDs” on page 221.

I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the CPU module during power-up of the system.
Hence, replacing optional modules is possible without any re-parameterization via software.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software.
1. In the device tree, double-click the desired option board.
2. Select the “TA51xx Parameters” tab to edit the parameterization of the desired option board.
1. In the device tree, double-click the desired option board.
2. Select the “Diagnosis” tab to view the diagnosis messages of the desired option board.

The internal power supply voltage for the module's circuitry is carried out via the connection to CPU. Thus, the current consumption from 24 V DC power supply at the terminals L+ and M of the CPU module increases by 10 mA per TA5105-4DOT.

The external power supply connection is carried out via the UP (+24 V DC) and ZP (0 V DC) terminals.
WARNING!
Removal/Insertion under power
The option boards are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug option boards with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
– connect or disconnect any signal or terminal block
– remove, mount or replace an option board.

Disconnecting any powered option board while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

NOTICE!
Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.

Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.

Fig. 33: Connection of the option board for digital I/O extension TA5105-4DOT

NOTICE!
Risk of malfunctions in the plant!
Only if L+/M of the CPU is available and the outputs are already configured in the AB program, the outputs will switch on as soon as the UP/ZP is available.

This must be considered in the application planning.
NOTICE!
Risk of damaging the I/O module!
The outputs are not protected against short circuits and overload.
- Never short-circuit or overload the outputs.
- Never connect the outputs to other voltages.
- Use an external fuse for the outputs.

The module provides several diagnosis functions. Further information on page 227. The meaning of the LEDs is described in the section State LEDs “State LEDs” on page 228.

I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the CPU module during power-up of the system.
Hence, replacing optional modules is possible without any re-parameterization via software.

**) The needed spring terminal block is always delivered with the option board. The terminal block listed in the table is for spare part only if needed.

TA5110-2DI2DOT - Digital I/O option board

Features

- 2 digital inputs 24 V DC (I0 to I1) in 1 group
- 2 digital transistor outputs 24 V DC (O0 to O1) in 1 group
- Group-wise galvanically isolated
- W variant available for use in extended (wide) temperature range
1 2 yellow LEDs to display the signal states at the digital outputs O0 to O1
2 2 yellow LEDs to display the signal states at the digital inputs I0 to I1
3 Allocation of signal name
4 7-pin terminal block for input/output signals

**NOTICE!**
Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.
Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.

**Intended purpose**

The device is used as an optional I/O extension module for AC500-eCo V3 CPUs (PM50x2). The inputs/outputs are group-wise galvanically isolated from each other. All other circuitry of the module is galvanically isolated from the inputs/outputs.

**Functionality**

</tbody>
</table>

**Connections**

*For a detailed description of the mounting, disassembly and connection of the module, please refer to the system assembly chapter.*
The connection is carried out by using a removable 7-pin terminal block. For more information, please refer to the chapter terminal blocks for AC500-eCo V3 system. The terminal blocks are included in the module’s scope of delivery and additional terminal blocks as spare parts can be ordered separately.

![Terminal Block Diagram]

</tbody>
</table>

The internal power supply voltage for the module’s circuitry is carried out via the connection to CPU. Thus, the current consumption from 24 V DC power supply at the terminals L+ and M of the CPU module increases by 10 mA per TA5110-2DI2DOT.

The external power supply connection is carried out via the UP (+24 V DC) and ZP (0 V DC) terminals.

**WARNING!**

**Removal/Insertion under power**

The option boards are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug option boards with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove, mount or replace an option board.

Disconnecting any powered option board while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.
NOTICE!
Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.
Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.

The digital inputs can be used as source inputs or as sink inputs.

NOTICE!
Risk of malfunctions in the plant!
A ground fault, e.g. caused by a damaged cable insulation, can bridge switches accidentally.
Use sink inputs when possible or make sure that, in case of error, there will be no risks to persons or plant.

Table 55: Connection for inputs of the option board for digital I/O extension TA5110-2DI2DOT

![Table image]

Fig. 35: Connection for outputs of the option board for digital I/O extension TA5110-2DI2DOT

NOTICE!
Risk of malfunctions in the plant!
Only if L+/M of the CPU is available and the outputs are already configured in the AB program, the outputs will switch on as soon as the UP/ZP is available.
This must be considered in the application planning.
NOTICE!
Risk of damaging the I/O module!
The outputs are not protected against short circuits and overload.
– Never short-circuit or overload the outputs.
– Never connect the outputs to other voltages.
– Use an external fuse for the outputs.

The module provides several diagnosis functions Further information on page 236.
The meaning of the LEDs is described in the section State LEDs “State LEDs” on page 236.

I/O configurations
The module itself does not store configuration data. It receives its parameterization data from the CPU module during power-up of the system.
Hence, replacing optional modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization
The arrangement of the parameter data is performed with Automation Builder software.
1. In the device tree, double-click the desired option board.
2. Select the “TA51xx Parameters” tab to edit the parameterization of the desired option board.
Diagnosis

1. In the device tree, double-click the desired option board.
2. Select the “Diagnosis” tab to view the diagnosis messages of the desired option board.

### TA5120-2AI-UI - Analog input option board

#### Features

- 2 configurable analog inputs (I0 and I1) in 1 group
  - Resolution 12 bits including sign
- Option board is galvanically isolated
- W variant available for use in extended (wide) temperature range
## Intended purpose

The option board is used as analog input extension module for AC500-eCo V3 CPUs (PM50xx).

> The analog option boards TA5120-2AI-UI and TA5126-2AO-UI can only be used from AB 2.5.2, SystemFW 3.5.0_HF-7, BootFW 3.5.1 and higher.

> Using the option boards with lower versions will create a configuration error and the CPU will not start.

## Functionality

2 analog inputs, individually configurable for
- Unused (default setting)
- 0 V ... 10 V
- 0 mA ... 20 mA
- 4 mA ... 20 mA

### Parameter | Value
--- | ---
Resolution of the analog channels | 12 bits
Voltage 0 V ... 10 V | 12 bits
Current 0 mA ... 20 mA | 12 bits
Current 4 mA ... 20 mA | 12 bits
LED displays | 2 LEDs for signals I0 and I1
Internal power supply | Via the CPU PM50xx
External power supply | Via the terminals UP and ZP (process voltage 24 V DC)
Required CPU | PM50xx
Connection

**WARNING!**
Removal/Insertion under power
The option boards are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug option boards with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
– connect or disconnect any signal or terminal block
– remove, mount or replace an option board.

Disconnecting any powered option board while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The option board TA5120-2AI-UI for analog input extension is plugged into an AC500-eCo V3 processor module PM50xx.

*i Chapter 4.3.11.1 “Mounting and demounting the option boards” on page 127*

The electrical connection is made via a removable 6-pin terminal block.

*The terminal block is included in the scope of delivery of the option board. Further terminal blocks can be ordered separately as spare parts.*

*i Chapter 5.2.8.1.2 “TA52xx(-x) - Terminal block sets” on page 1292*

**Table 59: Assignment of the terminals:**

<table>
<thead>
<tr>

<td>UP</td>
<td>Process voltage UP = +24 V DC</td>
</tr>
<tr>
<td>6</td>
<td>ZP</td>
<td>Process voltage ZP = 0 V DC</td>
</tr>
</tbody>
</table>

**CAUTION!**
The negative terminal of the analog inputs (voltage 0 V...10 V) are connected internally and form an internal analog ground (AGND). This analog ground is connected to ZP via a PTC resistor. There is no galvanic isolation between the analog circuitry and ZP/UP. Hence, analog inputs can not be connected in series.

The internal power supply of the circuits of the module takes place via the connection to the CPU. Thus, the current consumption from 24 V DC power supply at the terminals L+ and M of the CPU module increases by << 1 mA per TA5120-2AI-UI.

The external power supply is connected via the terminals UP (+24 V DC) and ZP (0 V DC).
NOTICE!
Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.

Generally, analog signals must be laid in shielded cables. The cable shields must be grounded at both sides of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.

The following figure shows the connection of the module:

![Fig. 36: Internal construction of the analog inputs](image)

CAUTION!
By installing equipotential bonding conductors between the different parts of the system, it must be ensured that the potential difference between ZP and AGND never can exceed 1 V.

CAUTION!
The process supply voltage must be included in the grounding concept (e.g. grounding of the negative terminal).

The option board provides several diagnosis functions.

*Chapter 5.2.1.3.4.8 “Diagnosis” on page 248*
By connecting the sensor's negative terminal of the output voltage to AGND, the galvanically isolated voltage source of the sensor is referred to ZP.

Table 60: Configurable measuring ranges for TA5120-2AI-UI

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>

</tr>
</thead>
<tbody>
<tr>
<td>Channel configuration</td>
<td>0 mA...+20 mA</td>
</tr>
<tr>
<td></td>
<td>or</td>
</tr>
<tr>
<td></td>
<td>+4 mA...+20 mA</td>
</tr>
</tbody>
</table>

Connection of active-type analog sensors (Current) with galvanically isolated power supply

Connection of active-type analog sensors (Voltage) with no galvanically isolated power supply
### CAUTION!

The potential difference between AGND and ZP at the module must not be greater than 1V, not even in case of long lines.

If AGND does not get connected to ZP, the sensor supply current flows to ZP via the AGND line. This current will distort the measuring signal, as a very small current flows through the AGND line. ZP connection should be close to the sensor. The total current through the PTC should not exceed 50 mA. This measuring method is therefore only suitable for short lines and small compensation currents via the AGND line.

### Connection of passive-type analog sensors (current)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Channel configuration</td>
<td>0 V...+10 V</td>
</tr>
</tbody>
</table>

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "not used".

### Parameter Value

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Channel configuration</td>
<td>0 mA...+20 mA</td>
</tr>
<tr>
<td>or</td>
<td>+4 mA...+20 mA</td>
</tr>
</tbody>
</table>

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "not used".
CAUTION!

If, during initialization, an analog current sensor supplies more than 25 mA for more than 1 second to an analog input, this input is switched off by the module (input protection). In such cases, it is recommended to protect the analog input by a 10-Volt Zener diode (in parallel to I+ and I-). But, in general, sensors with fast initialization or without current peaks higher than 25 mA are preferrable.

I/O configuration

The option board itself does not store configuration data. It receives its parameterization from the CPU module during power-up of the system.

Hence, replacing option boards is possible without any re-parameterization via software.

Firmware update via memory card

The following steps describe the procedure for updating the firmware for the analog option boards using a memory card. Prerequisite is the previous download of the current firmware to the memory card either from the Automation Builder or as online download from ABB.

Direct from ABB Software.

Click this link and on the next web page find the relevant firmware package and download it.

- Unpack this .zip archive file at any location of your hard disc
- Insert empty formatted (FAT16 / FAT32) memory card in the PC card reader
- Execute the unpacked *.exe file
- Select PC card reader as the final destination and confirm.

All directories, files and SDCARD.INI file will be automatically created on memory card and properly configured. After the process is complete, one has the prepared memory card with relevant updates.

Firmware update

☑️ Precondition: Prepared memory card with boot project and firmware "Preparation of memory card" on page 1427.

1. Switch off the device.
2. Insert the memory card.
3. Switch on the device.
   - The alternate flashing of the RUN and the ERR LED indicates the running update process.
   
   At the end of the update process a reboot is executed and the system firmware is started for the finishing of the update process.
   
   If RUN LED blinks (ERR LED is off), the update was successful and the display shows done.
   
   If ERR LED blinks (RUN LED is off), the update failed and the display shows FAIL.
   
   The text file “SDCARD.RDY” includes the results of the different updates. If the update fails, the file contains the reasons for the abort. Based on this, further steps can be taken to fix the problem.

4. Switch off the device.
5. Remove the memory card.
6. Switch on the device.
   - The system starts with the new firmware.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

1. In the device tree, double-click the desired option board.
2. Select the “TA5120-2AI-UI Parameters” tab to edit the parameterization of the desired option board.

Diagnosis

1. In the device tree, double-click the desired option board.
2. Select the “Diagnosis” tab to view the diagnosis messages of the desired option board.

</tbody>
</table>
*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

**) The needed spring terminal block is always delivered with the option board. The terminal block listed in the table is for spare part only if needed.

** TA5123-2AI-RTD - Analog input option board**

**Features**

- 2 configurable analog inputs (I0 and I1) in 1 group
  - Resolution 16 bits including sign
- Option board is galvanically isolated
- W variant available for use in extended (wide) temperature range

**Intended purpose**

The option board is used as analog input extension module for AC500-eCo V3 CPUs (PM50xx).

*The analog option board TA5123-2AI-RTD can only be used from AB 2.6.0, SystemFW 3.6.0, BootFW 3.6 and higher. Using the option board with lower versions will create a configuration error and the CPU will not start.*
In the first 5 seconds after power on, the analog option board TA5123-2AI-RTD is in self-calibration mode, so the measured values may not be accurate.

**Functionality**

2 analog inputs, individually configurable for
- Unused (default setting)
- Pt100, -50 °C...+400 °C (2-wire)
- Pt100, -50 °C...+400 °C (3-wire)
- Pt100, -50 °C...+130 °C (2-wire)
- Pt100, -50 °C...+130 °C (3-wire)
- Pt1000, -50 °C...+400 °C (2-wire)
- Pt1000, -50 °C...+400 °C (3-wire)
- Ni1000, -50 °C...+150 °C (2-wire)
- Ni1000, -50 °C...+150 °C (3-wire)
- NTC (2-wire)

**Connections**

**WARNING!**

**Removal/Insertion under power**

The option boards are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug option boards with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove, mount or replace an option board.

Disconnecting any powered option board while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The option board TA5123-2AI-RTD for analog input extension is plugged into an AC500-eCo V3 CPU PM50x2.
Insert the module and press it until it locks into place.

A detailed description of the assembly and disassembly of the module can be found in the chapter Mounting and demounting option boards.

Chapter 4.3.11.1 “Mounting and demounting the option boards” on page 127

The electrical connection is made via a removable 8-pin terminal block. For more information, please refer to the chapter TA52xx(-x) - Terminal block sets.

The terminal block is included in the scope of delivery of the option board. Further terminal blocks can be ordered separately as spare parts.

Table 64: Assignment of the terminals:

<table>
<thead>
<tr>

<tr>
<td>7</td>
<td>UP</td>
<td>Process voltage UP = +24 VDC</td>
</tr>
<tr>
<td>8</td>
<td>ZP</td>
<td>Process voltage ZP = 0 V</td>
</tr>
</tbody>
</table>

CAUTION!
The negative terminal of the analog inputs are connected internally and form an internal analog ground (AGND). This analog ground is connected to ZP via a PTC resistor. There is no galvanic isolation between the analog circuitry and ZP/UP. Hence, analog inputs can not be connected in series.

The internal power supply of the circuits of the module takes place via the connection to the CPU. Thus, the current consumption from 24 VDC power supply at the terminals L+ and M of the CPU module increases by << 1 mA per TA5123-2AI-RTD.

The external power supply is connected via the UP (+24 VDC) and the ZP (0 VDC) terminals.

NOTICE!
Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.

Generally, analog signals must be laid in shielded cables. The cable shields must be grounded at both sides of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.
The following block diagram shows the internal construction of the analog inputs:

![Block Diagram](image_url)

**CAUTION!**
By installing equipotential bonding conductors between the different parts of the system, it must be ensured that the potential difference between ZP and AGND never can exceed 1 V.

**CAUTION!**
The process supply voltage must be included in the grounding concept (e.g., grounding of the negative terminal).

The module provides several diagnosis functions, see section Diagnosis.

The meaning of the LEDs is described in the section State LEDs.

---

**Connection of resistance thermometers in 2-wire configuration**

![Connection Diagram](image_url)

*Fig. 37: Connection example*

The following measuring ranges can be configured in Chapter 5.2.4.4.2.3.7 “Parameterization” on page 749:
### Parameter Resistance thermometers Value

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Resistance thermometers</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Channel configuration</td>
<td>Pt100</td>
<td>-50 °C...+400 °C</td>
</tr>
<tr>
<td></td>
<td></td>
<td>-50 °C...+130 °C</td>
</tr>
<tr>
<td></td>
<td>Pt1000</td>
<td>-50 °C...+400 °C</td>
</tr>
<tr>
<td></td>
<td>Ni1000</td>
<td>-50 °C...+150 °C</td>
</tr>
<tr>
<td></td>
<td>NTC</td>
<td>803 Ω...100 kΩ</td>
</tr>
</tbody>
</table>

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "not used".

#### Connection of resistance thermometers in 3-wire configuration

![Connection example](image)

**Fig. 38: Connection example**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Resistance thermometers</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Channel configuration</td>
<td>Pt100</td>
<td>-50 °C...+400 °C</td>
</tr>
<tr>
<td></td>
<td></td>
<td>-50 °C...+130 °C</td>
</tr>
<tr>
<td></td>
<td>Pt1000</td>
<td>-50 °C...+400 °C</td>
</tr>
<tr>
<td></td>
<td>Ni1000</td>
<td>-50 °C...+150 °C</td>
</tr>
</tbody>
</table>

The module linearizes the resistance thermometer characteristics. In order to keep measuring errors as small as possible, it is necessary by all means to have all the involved conductors in the same cable. All the conductors must have the same cross section.

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "not used".

#### I/O configuration

The option board itself does not store configuration data. It receives its parameterization data from the CPU module during power-up of the system.

Hence, replacing option boards is possible without any re-parameterization via software.

⇔ *Further information to the option board.*
Firmware update via memory card

The following steps describe the procedure for updating the firmware for the analog option boards using a memory card. Prerequisite is the previous download of the current firmware to the memory card either from the Automation Builder or as online download from ABB. Direct from ABB Software.

Click this link and on the next web page find the relevant firmware package and download it.

- Unpack this .zip archive file at any location of your hard disc
- Insert empty formatted (FAT16 / FAT32) memory card in the PC card reader
- Execute the unpacked *.exe file
- Select PC card reader as the final destination and confirm.

All directories, files and SDCARD.INI file will be automatically created on memory card and properly configured. After the process is complete, one has the prepared memory card with relevant updates.

Precondition: Prepared memory card with boot project and firmware. Chapter 6.3.1.4.5.2.2 “Preparation of memory card” on page 1427.

1. Switch off the device.
2. Insert the memory card.
3. Switch on the device.
   - The alternate flashing of the RUN and the ERR LED indicates the running update process.
   - At the end of the update process a reboot is executed and the system firmware is started for the finishing of the update process.
   - If RUN LED blinks (ERR LED is off), the update was successful and the display shows done.
   - If ERR LED blinks (RUN LED is off), the update failed and the display shows FAIL.
   - The text file “SDCARD.RDY” includes the results of the different updates. If the update fails, the file contains the reasons for the abort. Based on this, further steps can be taken to fix the problem.
4. Switch off the device.
5. Remove the memory card.
6. Switch on the device.
   - The system starts with the new firmware.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

1. In the device tree, double-click the desired option board.
2. Select the “TA5123-2AI-RTD Parameters” tab to edit the parameterization of the desired option board.
1. The two inputs are set to “Not used” by default. Select your 2 individually configurable analog inputs.
2. If you select Pt100 (2-wire), PT100 (3-wire), Pt100 (2-wire), PT100 (3-wire), NI1000 (2-wire) or NI1000 (3-wire) by double-clicking, parameterization is completed.
   If you select NTC (2-wire) by double-clicking, you still have to make further entries.
3. The following steps are only required for the NTC (2-wire) selection.
   If you have selected NTC (2-wire) on input 0 (1), a folder Input 0 (1) - R, T, B configuration appears.

   Data sheet of used NTC
   Take the following values from the data sheet of the NTC used.
   - Resistance at temperature T [Ω]
   - Temperature at resistance R [°C] (the reference temperature is usually 25 °C)
   - B [K] - The shape of the curve, represents the relationship between the resistance and the temperature of a particular thermistor.

4. Enter these values in the column “Value” in the respective cells R, T and B. Observe the correct units in the note.
   When you have entered the 3 values with double-click, the parameterization is completed.

   Table 68 “Measuring range: NTC” on page 265

Diagnosis

1. In the device tree, double-click the desired option board.
2. Select the “Diagnosis” tab to view the diagnosis messages of the desired option board.

The following table shows the diagnosis messages.
<table>
<thead>
<tr>
<th>Severity</th>
<th>Error</th>

Variable measuring range

With the NTC, a resistance is measured. Depending on the values $R$, $T$ and $B$ a temperature value can be calculated, from which the digital values (dec. and hex.) are derived.

The following table shows an example with the default value:

- $R = 10000 \, \Omega$
- $T = 25 \, ^\circ C$
- $B = 3435 \, K$

<table>
<thead>
<tr>

</tbody>
</table>

Values written in italics

Values written in italics are variable and depend on the parameters $R$, $T$ and $B$. Here, the default values are used ($R$: 10000 $\Omega$, $T$: 25 °C, $B$: 3435 K)

Technical data

The system data of AC500-eCo V3 apply to Chapter 5.1.1 “System data AC500-eCo” on page 159

Only additional details are therefore documented below.
### Technical data of the analog inputs

**NOTICE!**
All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and temporary overvoltage up to 30 V DC.

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

**) The needed spring terminal block is always delivered with the option board. The terminal block listed in the table is for spare part only if needed.

** TA5126-2AO-UI - Analog output option board

Features

- 2 configurable analog outputs (O0 and O1) in 1 group
  Resolution 12 bits
- Option board is galvanically isolated
- W variant available for use in extended (wide) temperature range

1 Allocation of signal name
2 2 yellow LEDs to display the signal states at the analog outputs O0 and O1
3 6-pin terminal block for analog output signals and power supply (UP, ZP)
4 Output connection diagram for U and I

Intended purpose

The option board is used as analog output extension module for AC500-eCo V3 CPUs (PM50xx).

The analog option boards TA5120-2AI-UI and TA5126-2AO-UI can only be used from AB 2.5.2, SystemFW 3.5.0_HF-7, BootFW 3.5.1 and higher.

Using the option boards with lower versions will create a configuration error and the CPU will not start.
### Functionality

2 analog outputs, individually configurable for
- Not used (default setting)
- 0 V...10 V
- 0 mA...20 mA
- 4 mA...20 mA

<table>

</tbody>
</table>

### Connections

**WARNING!**

**Removal/Insertion under power**

The option boards are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug option boards with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove, mount or replace an option board.

Disconnecting any powered option board while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The option board TA5126-2AO-UI for analog output extension is plugged into an AC500-eCo V3 CPU PM50xx.

*Chapter 4.3.11.1 “Mounting and demounting the option boards” on page 127*

The electrical connection is made via a removable 6-pin terminal block.

The terminal block is included in the scope of delivery of the option board. Further terminal blocks can be ordered separately as spare parts

*Chapter 5.2.8.1.2 “TA52xx(-x) - Terminal block sets” on page 1292*
Table 69: Assignment of the terminals:

<table>
<thead>
<tr>
<th>Terminal</th>
<th>Signal</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>

</tr>
<tr>
<td>5</td>
<td>UP</td>
<td>Process voltage UP = +24 V DC</td>
</tr>
<tr>
<td>6</td>
<td>ZP</td>
<td>Process voltage ZP = 0 V DC</td>
</tr>
</tbody>
</table>

**CAUTION!**

The negative terminal of the analog outputs (voltage 0 V…10 V) are connected internally and form an internal analog ground (AGND). This analog ground is connected to ZP via a PTC resistor. There is no galvanic isolation between the analog circuitry and ZP/UP.

The internal power supply voltage for the module’s circuitry is carried out via the connection to CPU. Thus, the current consumption from 24 V DC power supply at the terminals L+ and M of the CPU module increases by $\ll 1$ mA per TA5126-2AO-UI.

The external power supply connection is carried out via the terminals UP (+24 V DC) and ZP (0 V DC).

**NOTICE!**

Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

Generally, analog signals must be laid in shielded cables. The cable shields must be grounded at both sides of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.

The following figure shows the connection of the module:

![Fig. 39: Internal construction of the analog outputs](image-url)
**CAUTION!**

By installing equipotential bonding conductors between the different parts of the system, it must be ensured that the potential difference between ZP and AGND never can exceed 1 V.

**CAUTION!**

The process supply voltage must be included in the grounding concept (e.g. grounding of the negative terminal).

The module provides several diagnosis functions

☞ Chapter 5.2.1.3.6.8 "Diagnosis" on page 274

---

**Connection of analog output loads (Voltage, current)**

![Connection diagram](image)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Channel configuration</td>
<td>0 V...+10 V</td>
</tr>
<tr>
<td></td>
<td>0 mA...20 mA</td>
</tr>
<tr>
<td></td>
<td>4 mA...20 mA</td>
</tr>
</tbody>
</table>

In order to avoid error messages or long processing times, it is useful to configure unused analog output channels as "not used".

**I/O configuration**

The option board itself does not store configuration data. It receives its parameterization from the CPU module during power-up of the system.

Hence, replacing optional modules is possible without any re-parameterization via software.
The following steps describe the procedure for updating the firmware for the analog option boards using a memory card. Prerequisite is the previous download of the current firmware to the memory card either from the Automation Builder or as online download from ABB.

Direct from ABB Software.

Click this link and on the next web page find the relevant firmware package and download it.

- Unpack this .zip archive file at any location of your hard disc
- Insert empty formatted (FAT16 / FAT32) memory card in the PC card reader
- Execute the unpacked *.exe file
- Select PC card reader as the final destination and confirm.

All directories, files and SDCARD.INI file will be automatically created on memory card and properly configured. After the process is complete, one has the prepared memory card with relevant updates.

Precondition: Prepared memory card with boot project and firmware

The text file “SDCARD.RDY” includes the results of the different updates. If the update fails, the file contains the reasons for the abort. Based on this, further steps can be taken to fix the problem.

1. Switch off the device.
2. Insert the memory card.
3. Switch on the device.
   - The alternate flashing of the RUN and the ERR LED indicates the running update process.
   - At the end of the update process a reboot is executed and the system firmware is started for the finishing of the update process.
   - If RUN LED blinks (ERR LED is off), the update was successful and the display shows done.
   - If ERR LED blinks (RUN LED is off), the update failed and the display shows FAIL.

The system starts with the new firmware.
**Parameterization**

The arrangement of the parameter data is performed with Automation Builder software.

1. In the device tree, double-click the desired option board.
2. Select the “TA5126-2AO-UI Parameters” tab to edit the parameterization of the desired option board.

**Diagnosis**

1. In the device tree, double-click the desired option board.
2. Select the “Diagnosis” tab to view the diagnosis messages of the desired option board.

Remarks:

1) If no other error occurs, the programs are not identical and the parameter is set to report an error in this case.

2) Do not remove the power supply from the option board during the firmware update.

3) In this case, output will be switched ON/OFF with a 10 sec cycle

4) in this case, if the output is configured as voltage output, the output will be switched ON/OFF with a 10 sec cycle
### Measuring ranges

#### Measuring ranges - Output ranges of voltage and current

The represented resolution corresponds to 12 bits.

### Technical data of the analog outputs

#### Parameter  | Value
--- | ---
Mounting position | Horizontal or vertical with derating (output load reduced to 50 % at +40 °C per group)
Cooling | The natural convection cooling must not be hindered by cable ducts or other parts in the control cabinet.

#### NOTICE!
All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and temporary overvoltage up to 30 V DC.

TA5130-KNXPB - Option board KNX address push button

Features

- W variant available for use in extended (wide) temperature range

1 State LED
2 Allocation of signal name
3 Connector
Intended purpose

This option board is only intended to be used with PM5072-T-2ETH(W) and PM5082-T-2ETH.
This option board can only be used once on one slot at a time!
The option board is not supported by other AC500-eCo V3 PLCs.

Information about the interface to KNX

Parameterization

The arrangement of the parameter data is performed with Automation Builder software.
1. In the device tree, double-click the desired option board.
2. Select the “TA51xx Parameters” tab to edit the parameterization of the desired option board.

TA5141-RS232I - Option board for COMx serial communication

Features

- W variant available for use in extended (wide) temperature range

1. 2 LEDs for communication state display (TxD and RxD)
2. Allocation of signal name
3. 5-pin terminal block for communication interface

Option board for COMx serial communication TA5141-RS232I(W) is equipped with 1 RS-232 serial interface with handshake.

The serial interface option boards TA5141-RS232I(W), TA5142-RS485I(W) and TA5142-RS485(W) produced from 2023 can only be used from AB 2.5.2, SystemFW 3.5.0_HF-7, BootFW 3.5.1 and higher. These new produced option boards can be recognized with the Date/Code printed on the sticker or also on the product packaging, the date code looks like 2xx3, where 2 and 3 are for the year and the xx for the production week.

Using the option boards with lower versions will create a configuration error and the CPU will not start.

These new produced option boards cannot be used with lower Automation Builder Version and the CPU BootFW/FW and the application must be upgraded to AB 2.5.2 HF8 or higher.

Application note AC500-eCo V3 - FAQ
Connections

Serial interfaces

NOTICE!
Damage to the serial communication interface by using 5-pin terminal block of the TA5101-4DI!

If the 5-pin terminal block of the TA5101-4DI option board is plugged into a option board for COMx serial communication TA5141-RS232I, TA5142-RS485I or TA5142-RS485, the communication interface will be damaged by the 24 V.

Please do not confuse the 5-pin terminal block of the TA5101-4DI with the 5-pin terminal block for serial communication interface of TA5141-RS232I, TA5142-RS485I or TA5142-RS485.

### Bus termination

The line ends of the bus segment must be equipped with bus terminating resistors. These resistors are integrated in the module TA5142-RS485I. The pull-up and pull-down settings must also be made on the circuit board of the module.

**Parameterization**

The arrangement of the parameter data is performed with Automation Builder software.
In the device tree, double-click the desired option board.

Select the “TA51xx Parameters” tab to edit the parameterization of the desired option board.

<td>Active</td>
</tr>
</tbody>
</table>
*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

**) The needed spring terminal block is always delivered with the option board. The terminal block listed in the table is for spare part only if needed.

**TA5142-RS485 - Option board for COMx serial communication**

**Features**

- W variant available for use in extended (wide) temperature range

1. 2 LEDs for communication state display (TxD and RxD)
2. 2 LEDs for termination state display
3. Allocation of signal name
4. 5-pin terminal block for communication interface

Option boards for COMx serial communication TA5142-RS485I(W) and TA5142-RS485(W) are equipped with 1 RS-485 (2-wire half-duplex) serial interface which can be used for communication via Modbus RTU or CAA SerialCom.

Bus terminations are built-in and configurable.
The serial interface option boards TA5141-RS232I(W), TA5142-RS485I(W) and TA5142-RS485(W) produced from 2023 can only be used from AB 2.5.2, SystemFW 3.5.0_HF-7, BootFW 3.5.1 and higher. These new produced option boards can be recognized with the Date/Code printed on the sticker or also on the product packaging, the date code looks like 2xx3, where 2 and 3 are for the year and the xx for the production week.

Using the option boards with lower versions will create a configuration error and the CPU will not start.

These new produced option boards cannot be used with lower Automation Builder Version and the CPU BootFW/FW and the application must be upgraded to AB 2.5.2 HF8 or higher.

Connections
Serial interfaces

![Notices]

NOTICE!

Damage to the serial communication interface by using 5-pin terminal block of the TA5101-4DI!

If the 5-pin terminal block of the TA5101-4DI option board is plugged into a option board for COMx serial communication TA5141-RS232I, TA5142-RS485I or TA5142-RS485, the communication interface will be damaged by the 24 V.

Please do not confuse the 5-pin terminal block of the TA5101-4DI with the 5-pin terminal block for serial communication interface of TA5141-RS232I, TA5142-RS485I or TA5142-RS485.

<td>&lt; 55 nF/km (if higher, the max. bus length must be reduced)</td>
</tr>
<tr>
<td>Terminating resistors</td>
<td>120 Ω ¼ W at both line ends</td>
</tr>
<tr>
<td>Remarks</td>
<td>Commonly used telephone cables with PE insulation and a core diameter of &gt; 0.8 mm are usually sufficient. Cables with PVC core insulation and core diameter of 0.8 mm can be used up to a length of approx. 250 m. In this case, the bus terminating resistor is approx. 100 Ω.</td>
</tr>
</tbody>
</table>

**Cable length**

The maximum possible cable length of a serial connection subnet within a segment depends on the transmission rate.

**RS-485 for point-to-point or bus connection:**

FAQs

Frequently asked and important questions about the AC500-eCo V3 serial communication option boards from 2023 are collected and answered in the application note. AC500 V3-eCo FAQ - TA514X-RSXXX Serial Option Boards.

5.2.1.2 AC500 and AC500-XC

5.2.1.2.1 Product overview and comparison

Comparison of AC500 V3 terminal bases

With the latest Automation Builder version the following terminal bases are compatible with the AC500 V3 processor modules:

<table>
<thead>
<tr>
<th>Terminal base compatibility</th>
<th>PM5630</th>
<th>PM5650</th>
<th>PM5670</th>
<th>PM5675</th>
</tr>
</thead>
<tbody>
<tr>
<td>TB5600</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>TB5610</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>TB5620</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>TB5640</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>TB5660</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The number of slots that are available on a terminal base for connecting communication modules or AC500-S modules differs within the terminal base range.

Table 80: Combination of TB56xx-2ETH(-XC) and PM56xx(-XC)

<table>
<thead>
<tr>
<th>Processor module</th>
<th>PM5630</th>
<th>PM5650</th>
<th>PM5670</th>

<td>-</td>
<td>6 slots</td>
<td>6 slots</td>
</tr>
</tbody>
</table>

Remarks:
The slots can be used for connecting communication modules or AC500-S modules. Note that only one AC500-S module can be connected at one terminal base.

1) PM567x must have an index $\geq C0$. 

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

**) The needed spring terminal block is always delivered with the option board. The terminal block listed in the table is for spare part only if needed.
Supported devices

The AC500 V3 terminal bases can be equipped with the following supported devices:

Ethernet protocols and ports for AC500 V3 products

General

The communication module CM5640-2ETH acts as a port extender of the used AC500 V3 CPU. It is not offloading the CPU for the protocols.
- the stacks are still executed in CPU.
- the performance is slightly lower or the load is slightly higher than directly from the main CPU, because each communication module and the communication module bus must also be handled.

Each CM5640-2ETH provides:
- 2 additional independent onboard Ethernet interfaces controlled by the CPU and not switched.
- all Ethernet ports, wherever located - on the communication module or on the CPU - must be in different subnets.
  Addressing is not done via slot numbers but via IP addresses.
The Ethernet limitations of the CPU used together with CM5640-2ETH apply to all onboard and additional interfaces.

All interfaces of the onboard and CM5640-2ETH modules need to be in different subnets. Overlapping of subnets must be avoided. The selection of the used interface (ETH port) is done automatically according the match of the IP-address of the server and the subnet of the interfaces.

Default open Ethernet ports of PM56xx-2ETH

After startup without a PLC project the PM56xx-2ETH contains the following Ethernet ports and sockets:

<table>
<thead>
<tr>
<th>Protocol</th>
<th>Port</th>
</tr>
</thead>
<tbody>
<tr>
<td>ABB NetConfig ¹)</td>
<td>UDP 24576</td>
</tr>
<tr>
<td>Online access with driver 3S Tcp/Ip BlkDrvTcp (no scan)</td>
<td>TCP 11740</td>
</tr>
</tbody>
</table>
### Protocol Port

<table>
<thead>
<tr>
<th>Protocol</th>
<th>Port</th>
</tr>
</thead>
<tbody>
<tr>
<td>OPC UA server</td>
<td>TCP 4840</td>
</tr>
</tbody>
</table>

### Remarks:

1): The port 24576 for ABB NetConfig protocol can be disabled via PLC configuration by deleting the protocol node from configuration tree of Ethernet interfaces ETH1 and ETH2.

2): The port 4840 for OPC UA server is closed by default as of SystemFW V3.6.0.

All other ports are closed by default.

</tr>
</tbody>
</table>
Changing the IP addresses using the Automation Builder

Changing the IP addresses using the CFG key

**Online access**

3S TCP/IP block driver. This driver requires at least 2 sockets:

- 1x driver “BlkDrvTcp” on port 11740
- 1x listen on port 11740 if PLC has established online connection

<table>
<thead>
<tr>
<th>Online access can be established from:</th>
</tr>
</thead>
<tbody>
<tr>
<td>– Automation Builder command ‘Login’</td>
</tr>
<tr>
<td>– Chapter 6.4.1.21.3.7.2 “Command</td>
</tr>
<tr>
<td>‘Login’” on page 2624</td>
</tr>
<tr>
<td>– CODESYS OPC DA server</td>
</tr>
<tr>
<td>– Panel CP600 series</td>
</tr>
</tbody>
</table>

Each established connection needs one socket. In addition one socket on port 11740 is listening.

1. Startup the PLC.
   - One socket on port 11740 (listen).
2. Login from Automation Builder via driver “BlkDrvTcp”.
   - 2 sockets on port 11740 (1x online, 1x listen)
3. Additional login out of OPC server with the same driver.
   - 3 sockets on port 11740 (2x online, 1x listen)
4. Additional connect CP600 via driver “BlkDrvTcp”.
   - 4 sockets on port 11740 (3x online, 1x listen)

**5.2.1.2.2 PM56xx-2ETH for AC500 V3 products**

**Features**

Processor modules with onboard interfaces:

- PM5630-2ETH: processor module, memory 8 MB, with Ethernet support (onboard Ethernet) – 2 network interfaces RJ45, CAN and COM1 on the terminal base.
- PM5650-2ETH: processor module, memory 80 MB, with Ethernet support (onboard Ethernet) – 2 network interfaces RJ45, CAN and COM1 on the terminal base.
- PM5670-2ETH: processor module, memory 160 MB, with Ethernet support (onboard Ethernet) – 2 network interfaces RJ45, CAN and COM1 on the terminal base.
- PM5675-2ETH: processor module, 160 MB, 8 GB flash disk, with Ethernet support (onboard Ethernet) – 2 network interfaces RJ45, CAN and COM1 on the terminal base.
- XC version for use in extreme ambient conditions available
Short description

The processor modules are the central units of the control system AC500. The types differ in their performance (memory size, speed etc.). Each processor module must be mounted on a suitable terminal base.

The terminal base type (TB56xx) depends on the number of communication modules which are used together with the processor module.

All terminal bases (TB56xx) provide the same communication interfaces (ETH1, ETH2, CAN and COM1) \( \checkmark \) Chapter 5.2.3.1.4 “Technical data” on page 383.

All other V3 processor modules can operate multiple communication modules via their communication module interface.

The communication modules are mounted on the left side of the processor module on the same terminal base.

On the right side of the processor module, up to 10 digital or analog I/O expansion modules can be connected to the I/O bus. Each I/O module requires a suitable terminal unit depending on the module type.

Terminal bases, terminal units, I/O modules, communication modules and accessories have their own technical descriptions.

Each processor module can be used as:
- Stand-alone processor module
- Stand-alone processor module with local I/Os
- Remote IO server
- Remote IO client

The processor modules are powered with 24 V DC.
WARNING!
Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

Connections

All terminals for connection are available on the terminal base. For information on connection and available interfaces see the descriptions for
- Chapter 5.2.3.1 “TB56xx for AC500 V3 products” on page 377.

Processor modules PM56xx-2ETH can only be used with TB56xx-2ETH terminal bases.

</tr>
</tbody>
</table>

Remarks:
The slots can be used for connecting communication modules or AC500-S modules. Note that only one AC500-S module can be connected at one terminal base.

1) PM567x must have an index ≥ C0.

Storage elements

Lithium battery

The processor modules are supplied without lithium battery. It must be ordered separately. The TA521 lithium battery is used for data (SRAM) and RTC buffering while the processor module is not powered.

Chapter 6.8.2.3.2 “AC500 battery” on page 4445
The CPU monitors the discharge degree of the battery. A warning is issued before the battery condition becomes critical (about 2 weeks before). Once the warning message appears, the battery should be replaced as soon as possible.

The technical data, handling instructions and the insertion/replacement of the battery is described in detail in the chapter TA521 lithium battery § Chapter 5.2.8.2.3 "TA521 - Battery" on page 1319.

**Memory card**

AC500 processor modules are supplied without memory card. It must be ordered separately.

The memory card can be used
- to read and write user files,
- to download a user program,
- for firmware updates,
- for program source code storage.

AC500 processor modules can be operated with and without memory cards. The processor module uses a standard file system (FAT). This allows standard card readers to read and write the memory cards.

§ Further information

**LEDs, display and function keys on the front panel**

![Diagram of AC500 processor module front panel]

§ Detailed information on using the LEDs, display and the function keys such as startup procedure and error coding

**Technical data**

The system data of AC500 and S500 are applicable to the standard version. § Chapter 5.1.2 "System data AC500" on page 166
The system data of AC500-XC are applicable to the XC version. "Chapter 5.1.3 “System data AC500-XC” on page 169"

Only additional details are therefore documented below. The technical data are also applicable to the XC version.

Ordering data

Processor modules for AC500 (Standard) V3 products

To enable better product availability into the production and to provide some new features, a revision 3 of the existing AC500 V3 processor module was necessary. The existing AC500 V3 processor module revision 2 with rubric R0278 will move to classic and will be replaced by compatible new AC500 V3 processor module revision 3 with rubric R0378.

For example:
The processor module revision 3 PM5630-2ETH (1SAP131 000 R0378) replaces the existing processor module revision 2 PM5630-2ETH (1SAP 131 000 R0278) and provides the same features or functionality of the previous ones.

Following points must be considered with the processor module revision 3:

- The processor module revision 3 (R037x) requires a new BootFW / CPUFW from V3.6.x and higher.
- It cannot be downgraded and used with lower FW versions than V3.6.0.
- The processor module revision 3 (R037x) provides the same features as the processor module revision 2 (R027x) existing today and is fully compatible.
- An existing application using a processor module revision 2 (R027x) built with Automation Builder < 2.6 can run on a processor module revision 3 (R037x) but the application must be upgraded to at least AB 2.6.0 or higher.

What must be done using a new processor module revision 3 (R037x)?

- On a new application?
  - Just use the new processor module revision 3 (R037x)
  - Use the latest Automation Builder software from 2.6.0 or higher.

- On an existing application using an Automation Builder software version smaller than 2.6.0?
  - To use a new processor module revision 3 in an existing application (e.g., replacement of the processor module revision 2), the application must be upgraded to at least AB 2.6.0 or higher.
  - If several processor module (revision 3 and revision 2) are used within the same project, all the processor modules used in the same application must be upgraded to the FW Version V3.6.x and higher.

5.2.2 Communication modules for AC500(-XC) processor modules

5.2.2.1 Features

AC500 communication modules are required for

- a connection to standard fieldbus systems and
- for integration into existing networks.

AC500 communication modules

- enable communication on different fieldbuses.
- are mounted on the left side of the processor module on the same terminal base.
- are directly powered via the internal communication module bus of the terminal base.

A separate voltage source is not required.
WARNING!

Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

The communication between the processor module and the communication modules takes place via the communication module bus, which is integrated in the terminal base. Depending on the used terminal base up to 6 communication modules can be connected.

- Chapter 5.2.3.1 “TB56xx for AC500 V3 products” on page 377

There are no restrictions concerning which communication modules can be arranged for a processor module.

Within the AC500 control system, the communication modules can be used as

- bus master or
- slave.

It depends on the

- selected protocol,
- the functionality of the communication module and
- the several field buses and networks.

The following name extensions of the device names describe the supported field bus/protocol:

- CM5640-2ETH: Ethernet
- CM5x2-DP: PROFIBUS
- CM5x9-PNIO: PROFINET
- CM579-ETHCAT: EtherCAT
- CM598-CN: CANopen
- CM5610-2RS: 2 serial interfaces (COM1/COM2)

If a XC version of the device is available, for use in extreme ambient conditions (e.g. wider temperature and humidity range), this is indicated with a snowflake sign.
5.2.2.2 Compatibility of communication modules and communication interface modules

5.2.2.4 Serial

5.2.2.4.1 CM5610-2RS with 2 serial interfaces

Features

1. 5 LEDs for state display
2. 2 rotary switches for address setting
3. Label
4. 2 serial interfaces: COM1 and COM2

CAUTION!
Risk of injury and damaging the module when using unapproved terminal blocks!
Only use terminal blocks approved by ABB to avoid injury and damage to the module.

The communication modules with 2 serial interfaces are delivered with two 9-pin terminal blocks TA532 (1SAP 182 000 R0001).
The terminal block listed in the ordering data is for spare part only if needed.
Purpose

Communication module CM5610-2RS is equipped with 2 serial interfaces (COM1 and COM2) which can be used as serial interface extension of the processor module or for communication e.g. for communication via Modbus or ASCII.

Depending on the connection, the physical interface of COM1 and COM2 is either RS-232 or RS-485.

Bus cable for RS-485

Bus cable

- **Bus line**
  - Construction: 2 cores, twisted, with common shield
  - Conductor cross section: > 0.22 mm² (24 AWG)
  - Twisting rate: > 10 per meter (symmetrically twisted)
  - Core insulation: Polyethylene (PE)
  - Resistance per core: < 100 Ω/km
  - Characteristic impedance: ca. 120 Ω (100 Ω ... 150 Ω)
  - Capacitance between the cores: < 55 nF/km (if higher, the max. bus length must be reduced)
  - Terminating resistors: 120 Ω ¼ W at both line ends

Remarks

- Commonly used telephone cables with PE insulation and a core diameter of > 0.8 mm are usually sufficient.
- Cables with PVC core insulation and core diameter of 0.8 mm can be used up to a length of approx. 250 m. In this case, the bus terminating resistor is approx. 100 Ω.

Cable lengths

The maximum possible cable length of a serial connection subnet within a segment depends on the transmission rate.

RS-232 (for point-to-point connection):
### Parameter | Value
---|---
Transmission rate | 9.6 kbit/s to 115.2 kbit/s
Maximum cable length | On request

RS-485 (for point-to-point or bus connection):

### Parameter | Value
---|---
Transmission rate | 9.6 kbit/s to 115.2 kbit/s
Maximum cable length | On request

**Bus termination (RS-485 only)**

The line ends of the bus segment must be equipped with bus terminating resistors. Normally, these resistors are integrated in the interface connectors.

1 Term. P
2 RxD/TxD-P
3 RxD/TxD-N
4 Term. N
A Master at the bus line end, pull-up resistor and pull-down resistor activated, bus terminating resistor 120 Ω
B Slave within the bus line
C Slave at the bus line end, bus terminating resistor 120 Ω

**Technical data**

The system data of AC500 and S500 are applicable to the standard version *Chapter 5.1.2 “System data AC500” on page 166.*

The system data of AC500-XC are applicable to the XC version *Chapter 5.1.3 “System data AC500-XC” on page 169.*

Only additional details are therefore documented below.
The technical data are also applicable to the XC version.

The terminal block listed in the ordering data is for spare part only if needed.

5.2.2.5 CANopen

5.2.2.5.1 CM598-CN - CANopen master

Features

- CANopen master 1 Mbit/s
- XC version for use in extreme ambient conditions available
Purpose

Communication module CM598-CN enables communication over the CANopen field bus. For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

The AC500 V3 CPUs only support CAN 2A/2B protocol on the communication module CM598-CAN. Support of CANopen protocol is in preparation.
Connections

Field bus interface

<table>
<thead>
<tr>
<th>Interface socket</th>
<th>5-pin COMBICON</th>
</tr>
</thead>
<tbody>
<tr>
<td>Transmission standard</td>
<td>ISO 11898, potential-free</td>
</tr>
<tr>
<td>Transmission protocol</td>
<td>CANopen (CAN), 1 Mbaud max.</td>
</tr>
<tr>
<td>Transfer rate (transmission rate)</td>
<td>10 kbit/s, 20 kbit/s, 50 kbit/s, 100 kbit/s, 125 kbit/s, 250 kbit/s, 500 kbit/s, 800 kbit/s and 1 Mbit/s,</td>
</tr>
</tbody>
</table>

Pin assignment

Table 99: Pin assignment of the CANopen connector

<table>
<thead>
<tr>
<th>Interface</th>
<th>PIN</th>
<th>Signal</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CAN</td>

<td></td>
</tr>
<tr>
<td></td>
<td>NC</td>
<td>Not connected</td>
<td></td>
</tr>
</tbody>
</table>

NOTICE!

Unused connector!

Make sure that the terminal block is always connected to the terminal base or communication module, even if you do not use the interface.

Bus length

The maximum possible bus length of a CAN network depends on bit rate (transmission rate) and cable type. The sum of all bus segments must not exceed the maximum bus length

<table>
<thead>
<tr>
<th>Bit Rate (speed)</th>
<th>Bus Length</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 Mbit/s</td>
<td>40 m</td>
</tr>
<tr>
<td>800 kbit/s</td>
<td>50 m</td>
</tr>
<tr>
<td>500 kbit/s</td>
<td>100 m</td>
</tr>
<tr>
<td>250 kbit/s</td>
<td>250 m</td>
</tr>
<tr>
<td>125 kbit/s</td>
<td>500 m</td>
</tr>
<tr>
<td>50 kbit/s</td>
<td>1000 m</td>
</tr>
</tbody>
</table>

Types of bus cables

For CANopen, only bus cables with characteristics as recommended in ISO 11898 are to be used. The requirements for the bus cables depend on the length of the bus segment. Regarding this, the following recommendations are given by ISO 11898:
<table>
<thead>
<tr>
<th>Length of segment [m]</th>
<th>Bus cable (shielded, twisted pair)</th>
<th>Max. transmission rate [kbit/s]</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Conductor cross section [mm²]</td>
<td>Line resistance [Ω/km]</td>
</tr>
<tr>
<td>0...40</td>
<td>0.25 ... 0.34 / AWG23, AWG22</td>
<td>70</td>
</tr>
<tr>
<td>40...300</td>
<td>0.34 ... 0.60 / AWG22, AWG20</td>
<td>&lt; 60</td>
</tr>
<tr>
<td>300...600</td>
<td>0.50 ... 0.60 / AWG20</td>
<td>&lt; 40</td>
</tr>
<tr>
<td>600...1000</td>
<td>0.75 ... 0.80 / AWG18</td>
<td>&lt; 26</td>
</tr>
</tbody>
</table>

**Bus terminating resistors**  
The ends of the data lines have to be terminated with a 120 Ω bus terminating resistor. The bus terminating resistor is usually installed directly at the bus connector.

![Diagram of CANopen interface, bus terminating resistors connected to the line ends](image)

5.2.2.6 EtherCAT

Two alternatives are available for using EtherCAT:
- Onboard EtherCAT for the AC500-eCo
- EtherCAT for the AC500 with the CM579 communication module

Further information can be found here:
- Onboard EtherCAT
  - EtherCAT configurator
  - Communication schema onboard Ethernet/EtherCAT
  - Motion Control
- EtherCAT
  - CM579-ETHCAT
  - Communication schema onboard Ethernet/EtherCAT
  - Motion Control
5.2.2.6.1 CM579-ETHCAT - EtherCAT master

Features

1. 5 LEDs for state display
2. 2 rotary switches for address setting (not used)
3. Label
4. 2 communication interfaces RJ45 (ETHCAT1 and ETHCAT2)

Intended purpose

Communication module CM579-ETHCAT is for EtherCAT communication.

The communication module is configured via the dual-port memory by means of a system configurator. The configuration is saved on a non-volatile Flash EPROM memory.

Chapter 6.9.3.6.2 "CM579-ETHCAT" on page 4665

Connections

Field bus interfaces

The EtherCAT communication module provides 2 RJ45 interfaces with the following pin assignment. The pin assignment is used for the EtherCAT slaves (communication interface modules CI5xy-ETHCAT) as well.
<table>
<thead>
<tr>

</tr>
</tbody>
</table>

In corrosive environment, please protect unused connectors using the TA535 accessory.

Not supplied with this device.

Further information about wiring and cable types

The EtherCAT network differentiates between input-connectors (IN) and output-connectors (OUT):

At the EtherCAT slaves (communication interface modules), the ETH1-connector is IN and the ETH2-connector is OUT.

At the EtherCAT master (communication module), the ETHCAT1 connector has to be used. The ETHCAT2 connector is reserved for future extensions.
State LEDs

The EtherCAT state is shown by the EtherCAT communication module's LEDs. Some LEDs are two-colored.

### 5.2.2.7 Ethernet

#### 5.2.2.7.1 CM5640-2ETH - Communication module Ethernet

**Features**

- TCP/IP with 2 independent channels
- XC version for use in extreme ambient conditions available
The communication module provides additional communication ports for the CPU. The Ethernet communication module is a port extender that provides two additional, separate, non-programmable Ethernet interfaces for the CPU processor module used.

Each communication module and port used results in a slightly higher CPU load on the CPU compared to using the same protocol via the onboard port, since the communication module and the transmission of the communication packets must be additionally processed by the CPU. The complete TCP/IP protocol and the application layers are supported.

- Each communication module port must be addressed via its IP address (not slot no.) and must be in a different subnet than the port(s) of the CPU.
- Each used communication module and port causes a slightly higher CPU load compared to using the same protocol onboard.
It is not possible to close a RSTP ring by using the two ports of the communication module.

Applications:
- TCP/IP for PC/Automation Builder (programming)
- UDP functions using SysSocket or NetBaseServices libraries
- Modbus on TCP/IP (Modbus on TCP/IP, client and server and all standard protocols from the PLC)

For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

Connections

Field bus interfaces

### 5.2.2.8 PROFIBUS

#### 5.2.2.8.1 CM582-DP - PROFIBUS DP slave

**Features**

- PROFIBUS DP slave 12 Mbit/s
- Compatible with Automation Builder version starting from V2.0.2, and with CPU firmware version starting from V2.6
- XC version for use in extreme ambient conditions available

![CM582-DP Diagram](image)

1. 5 LEDs for state display
2. Label
3. Communication interface PROFIBUS DP D-sub, 9-pin, female
   - Sign for XC version

**Purpose**

Communication module CM582-DP enables communication over the PROFIBUS DP field bus. For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.
The PROFIBUS DP connector (9-pin, female) has the following pin assignment:

### Bus cable

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Twisted pair (shielded)</td>
</tr>
<tr>
<td>Characteristic impedance</td>
<td>135 Ω ... 165 Ω</td>
</tr>
<tr>
<td>Cable capacitance</td>
<td>&lt; 30 pF/m</td>
</tr>
<tr>
<td>Conductor diameter of the cores</td>
<td>≥ 0.64 mm</td>
</tr>
<tr>
<td>Conductor cross section of the cores</td>
<td>≥ 0.34 mm²</td>
</tr>
<tr>
<td>Cable resistance per core</td>
<td>≤ 55 Ω/km</td>
</tr>
<tr>
<td>Loop resistance (resistance of two cores)</td>
<td>≤ 110 Ω/km</td>
</tr>
</tbody>
</table>

### Cable lengths

The maximum possible cable length of a PROFIBUS subnet within a segment depends on the transmission rate (baud rate).

<table>
<thead>
<tr>
<th>Transmission Rate</th>
<th>Maximum Cable Length</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.6 / 19.2 / 93.75 kBaud</td>
<td>1200 m</td>
</tr>
<tr>
<td>187.5 kBaud</td>
<td>1000 m</td>
</tr>
<tr>
<td>500 kBaud</td>
<td>400 m</td>
</tr>
<tr>
<td>1.5 MBaud</td>
<td>200 m</td>
</tr>
<tr>
<td>3 MBaud to 12 MBaud</td>
<td>100 m</td>
</tr>
</tbody>
</table>

Branch lines are generally permissible for transmission rates of up to 1500 kbit/s. But in fact they should be avoided for transmission rates higher than 500 kbit/s.

### Bus terminating resistors

The line ends (of the bus segments) have to be terminated using bus terminating resistors according to the drawing below. The bus terminating resistors are usually placed inside the bus connector.
Repeater

One bus segment can have up to 32 subscribers. Using repeaters a system can be expanded to up to 126 subscribers. Repeaters are also required for longer transfer lines. Please note that a repeater's load to the bus segment is the same as the load of a normal bus subscriber. The sum of normal bus subscribers and repeaters in one bus segment must not exceed 32.

Station 1

Station 31

Station 32

Station 61

Bus segment 1:
max. 31 stations
+ 1 repeater

Bus segment 2:
max. 30 stations
+ 2 repeaters

Fig. 42: Principle example for a PROFIBUS-DP system with repeaters (1500 kbit/s baud rate)

5.2.2.9 PROFINET

5.2.2.9.1 CM579-PNIO - PROFINET IO RT controller

Features

- PROFINET IO controller
- Integrated 2-port switch
- XC version for use in extreme ambient conditions available
1 5 LEDs for state display
2 2 rotary switches for address setting (not used)
3 Label
4 2 communication interfaces RJ45 (PNIO1 and PNIO2)
5 Sign for XC version

Intended purpose

The communication module is for PROFINET RT communication.

The PROFINET communication module includes an internal Ethernet switch. The connection to the Ethernet can be established directly to the communication module. An additional switch is not necessary.

The communication module is configured via the dual-port memory by means of a system configurator. The configuration is saved on a non-volatile Flash EPROM memory.

For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

5.2.2.9.2 CM589-PNIO(-4) - PROFINET IO RT with 4 devices

Features

- PROFINET IO device
- Integrated 2-port switch
- XC version for use in extreme ambient conditions available
The communication module is for PROFINET RT communication.
The PROFINET communication module includes an internal Ethernet switch. The connection to the Ethernet can be established directly to the communication module. An additional switch is not necessary.

The communication module is configured via the dual-port memory by means of a system configurator. The configuration is saved on a non-volatile Flash EPROM memory.

For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

**CM589-PNIO(-4)**

CM589-PNIO supports one application relation to communicate to one single PROFINET IO controller.

CM589-PNIO-4 supports 4 application relations to communicate to up to 4 PROFINET IO controllers in parallel using PROFINET Shared Device technology.

5.2.3 Terminal bases for AC500(-XC) processor modules and communication modules

5.2.3.1 TB56xx for AC500 V3 products

5.2.3.1.1 Features

- TB5600-2ETH: 1 processor module, with network interface 2 Ethernet RJ45, 1 CAN and 1 COM1
- TB5610-2ETH: 1 processor module, 1 communication module, with network interface 2 Ethernet RJ45, 1 CAN and 1 COM1
- TB5620-2ETH: 1 processor module, 2 communication modules, with network interface 2 Ethernet RJ45, 1 CAN and 1 COM1
- TB5640-2ETH: 1 processor module, 4 communication modules, with network interface 2 Ethernet RJ45, 1 CAN and 1 COM1
- TB5660-2ETH: 1 processor module, 6 communication modules, with network interface 2 Ethernet RJ45, 1 CAN and 1 COM1
- XC version for use in extreme ambient conditions available

Terminal bases TB56xx-2ETH can only be used with processor modules PM56xx-2ETH.

Table 113: Combination of TB56xx-2ETH(-XC) and PM56xx(-XC)

<td>6 slots</td>
</tr>
</tbody>
</table>

Remarks:

The slots can be used for connecting communication modules or AC500-S modules. Note that only one AC500-S module can be connected at one terminal base.

1) PM567x must have an index ≥ C0.

The following figure shows the TB5620-2ETH as example.
1 I/O bus (10-pin, female) to connect the I/O terminal units
2 One available slot for the processor module
3 Slots for communication modules
4 Interface for CAN (5-pin terminal block, removable)
5 Power supply (5-pin terminal block, removable)
6 Serial interface COM1 (9-pin terminal block, removable)
7 RJ45 female connector for Ethernet connection
8 Holes for screw mounting

**XC version**  
**XC = eXtreme Conditions**

Extreme conditions
Terminal bases for use in extreme ambient conditions have no sign for XC version.
The figure 3 in the Part no. 1SAP3... (label) identifies the XC version.

### 5.2.3.1.2 Short description

Terminal bases TB56xx are used as sockets for processor modules PM56xx and communication modules.

Up to 10 I/O terminal units for I/O expansion modules can be added to these terminal bases.

The terminal bases have slots for one processor module and for communication modules as well as terminals and interfaces for power supply, expansion and networking.

</tr>
</tbody>
</table>

Remarks:
The slots can be used for connecting communication modules or AC500-S modules. Note that only one AC500-S module can be connected at one terminal base.

1) PM567x must have an index $\geq C0$.

### NOTICE!
Risk of malfunctions!
- Unused slots for communication modules are not protected against accidental physical contact.
  - Unused slots for communication modules must be covered with dummy communication modules to achieve IP20 rating. Chapter 5.2.8.2.4 “TA524 - Dummy communication module” on page 1323.
  - I/O bus connectors must not be touched during operation.

#### 5.2.3.1.3 Connections

**I/O bus**

The I/O bus is the I/O data bus for the I/O modules. Through this bus, I/O and diagnosis data are transferred between the processor module and the I/O modules. Up to 10 I/O modules can be added.

- Chapter 4.2.3 “I/O bus - Communication within the PLC” on page 97
- Chapter 5.2.4.2 “I/O bus - Data transfer” on page 387

**Power supply**

The supply voltage of 24 V DC is connected to a removable 5-pin terminal block. L+/M exist twice. It is therefore possible to feed e.g. external sensors (up to 8 A max. with 1.5 mm² conductor) via these terminals, when the ambient temperature never exceeds +60 °C.

#### Pin assignment

<table>
<thead>
<tr>
<th>Pin Assignment</th>
<th>Label</th>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Terminal block removed</td>
<td>L+</td>
<td>+24 V DC</td>
<td>Positive pin of the power supply voltage</td>

</tr>
<tr>
<td>Terminal block inserted</td>
<td>M</td>
<td>0 V</td>
<td>Negative pin of the power supply voltage</td>
</tr>
<tr>
<td>Terminal block inserted</td>
<td>FE</td>
<td></td>
<td>Functional earth</td>
</tr>
</tbody>
</table>
NOTICE!
Risk of damaging the PLC due to improper voltage levels!
- Never exceed the maximum tolerance values for process and supply voltages.
- Never fall below the minimum tolerance values for process and supply voltages.
Observe the system data Chapter 5.1.2 “System data AC500” on page 166 and the technical data of the module used.

NOTICE!
Risk of malfunction!
To ensure reliability and proper functionality of processor modules below index C0, the supply voltage must ramp-up from 0 V to 24 V within max. 2.5 s.

NOTICE!
Risk of damaging the terminal base and power supply!
Short circuits might damage the terminal base and power supply.
Make sure that the four clamps L+ and M (two of each) are not wrongly connected (e. g. +/- of power supply is connected to both L+/L+ or both M/M).

NOTICE!
Risk of damaging the terminal base!
Terminal base can be damaged by connecting the power supply terminal block (L+/M) to COM1.
Make sure that the COM1 terminal block is always connected to the terminal base even if you do not use COM1 to prevent this.

NOTICE!
Risk of damaging the terminal base!
Excessive current might damage the clamp and terminal base.
Make sure that the current flowing through the removable clamps never exceeds 8 A (with 1.5 mm² conductor).

NOTICE!
For applications using XC versions!
To ensure reliability and proper function, make sure the ambient temperature never exceeds +60 °C when the current flowing through the removable clamps is 8 A (with 1.5 mm² conductor).

Serial interface COM1
The serial interface COM1 is connected to a removable 9-pin terminal block.
From firmware version V3.1 it is configurable for RS-232 or RS-485 (V3.0 RS-232 only).
## Ethernet interface

This interface is the connection to a processor module with onboard Ethernet e.g. PM56xx-2ETH.

*TB56xx-2ETH for processor modules PM56xx-2ETH provide 2 independent Ethernet interfaces. The two Ethernet interfaces can be configured as independent interfaces or with switch functionality. In case of two independent interfaces they must be configured to different subnets.*

*For structured Ethernet cabling only use cables according to TIA/EIA-568-A, ISO/IEC 11801 or EN 50173.*

<td>Not connected</td>
</tr>
</tbody>
</table>

![NOTICE!](image)

Unused connector!
Make sure that the terminal block is always connected to the terminal base or communication module, even if you do not use the interface.
Bus length

The maximum possible bus length of a CAN network depends on bit rate (transmission rate) and cable type. The sum of all bus segments must not exceed the maximum bus length.

<table>
<thead>
<tr>
<th>Bit Rate (speed)</th>
<th>Bus Length</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 Mbit/s</td>
<td>40 m</td>
</tr>
<tr>
<td>800 kbit/s</td>

</tr>
<tr>
<td>125 kbit/s</td>
<td>500 m</td>
</tr>
<tr>
<td>50 kbit/s</td>
<td>1000 m</td>
</tr>
</tbody>
</table>

Types of bus cables

Only bus cables with characteristics as recommended in ISO 11898 are to be used. The requirements for the bus cables depend on the length of the bus segment.

Bus terminating resistors

Both ends of the CAN bus have to be terminated with a 120 $\Omega$ ($\geq 1/4$ W, $\leq 5\%$) bus terminating resistor, to minimize signal reflection. The bus terminating resistor should be connected directly at the bus connector between the CAN signals (CAN_H and CAN_L).

5.2.3.1.4 Technical data

The system data of AC500 and S500 are applicable to the standard version. $\odot$ Chapter 5.1.2 "System data AC500" on page 166

The system data of AC500-XC are applicable to the XC version. $\odot$ Chapter 5.1.3 "System data AC500-XC" on page 169

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.

5.2.4 I/O modules

5.2.4.1 Safety instructions

**Hot swap**

System requirements for hot swapping of I/O modules:

- Types of terminal units that support hot swapping of I/O modules have the appendix TU5xx-H.
- I/O modules as of index F0.

The following I/O bus masters support hot swapping of attached I/O modules:

- Communication interface modules CI5xx as of index F0.
- Processor modules PM56xx-2ETH with firmware version as of V3.2.0.

**NOTICE!**

Risk of damage to I/O modules!

Hot swapping is only allowed for I/O modules.

Processor modules and communication interface modules must not be removed or inserted during operation.

**Conditions for hot swapping**

- Digital outputs are not under load.
- Input/output voltages above safety extra low voltage/protective extra low voltages (SELV/PELV) are switched off.
- Modules are completely plugged on the terminal unit with both snap fit engaged before switching on loads or input/output voltage.

Further information about hot swap.

5.2.4.2 I/O bus - Data transfer

The I/O bus is the I/O data bus for the I/O modules. Through this bus, I/O and diagnosis data are transferred between the processor module and the I/O modules. Up to 10 I/O modules can be added.

- Chapter 4.2.3 “I/O bus - Communication within the PLC” on page 97
- Chapter 5.2.4.2 “I/O bus - Data transfer” on page 387

The synchronized I/O bus is the I/O data bus for the I/O modules connected with the processor modules or communication interface modules. Through this bus, I/O and diagnosis data are transferred.

With its fast data transmission, the I/O bus obtains very low reaction times.

Up to 10 I/O terminal units (for one I/O module each) can be added to one terminal base or to one AC500-eCo processor module. The I/O terminal units and the AC500-eCo I/O modules, have a bus input at the left side and a bus output at the right side. Thus the length of the I/O bus increases with the number of attached I/O modules.

- Table 119 “Maximum number of I/O devices which can be connected to the I/O bus” on page 389.
1 I/O bus connection

The connection of the I/O bus is performed automatically by telescoping the modules on the DIN rail. The I/O bus provides the following signals:

- Supply voltage of 3.3 V DC for feeding the electronic interface components
- 3 data lines for the synchronized serial data exchange
- Several control signals

NOTICE!

Except when using hot swap terminal units, the I/O bus is not designed for pulling and plugging modules during operation. If a module is pulled or plugged on a terminal unit that is not hot swap capable while the bus is running, the following consequences are possible:

- Reset of the station or of the processor module
- System lockup
- Damage of the module
WARNING!
Removal/Insertion under power

Removal or insertion under power is permissible only if all conditions for hot swapping are fulfilled.

☞ Chapter 4.9.3 “Replace an I/O module with hot swap” on page 153

The devices are not designed for removal or insertion under power when the conditions for hot swap do not apply. Because of unforeseeable consequences, it is not allowed to plug in or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while they are energized in a hazardous location could result in an electric arc, which could create an ignition source resulting in fire or explosion.

Prior to proceeding, make sure that power is been disconnected and that the area has been thoroughly checked to ensure that flammable materials are not present.

The devices must not be opened when in operation. The same applies to the network interfaces.

Profibus (master and slave) and CM589-PNIO are available since version 2.5.0 of the Automation Builder.

### Table 119: Maximum number of I/O devices which can be connected to the I/O bus

#### 5.2.4.3 Digital I/O modules

**5.2.4.3.1 S500-eCo**

**DC562 - Digital input/output module**

**Features**

- 16 configurable digital inputs/outputs in 1 group, 24 V DC
- Module-wise galvanically isolated
Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The inputs/outputs are group-wise galvanically isolated from each other.
All other circuitry of the module is galvanically isolated from the inputs/outputs.

The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA communication interface modules.
**Functionality**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>LED displays</td>
<td>For signal states</td>
</tr>
<tr>
<td>Internal power supply</td>
<td>Via I/O bus</td>
</tr>
<tr>
<td>External power supply</td>
<td>Via the terminals ZP and UP (process voltage 24 V DC)</td>
</tr>
</tbody>
</table>

**Connections**

*For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.*

The connection is carried out by using a removable 9-pin and 11-pin terminal block. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

<tr>
<td>20</td>
<td>ZP</td>
<td>Process voltage ZP 0 V DC</td>
</tr>
</tbody>
</table>

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 10 mA per DC562.

The external power supply connection is carried out via the UP (+24 V DC) and ZP (0 V DC) terminals.

---

**WARNING!**

Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

---

**NOTICE!**

Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.
Process supply voltage must be connected to UP/ZP of the module. The inputs and UP/ZP must use the same power supply.

**Fig. 44:** Connection of the digital input/output module DC562

In this connection example, the inputs/outputs C0 ... C7 are connected as inputs and the inputs/outputs C8 ... C15 are connected as outputs.

The module provides several diagnosis functions \( \Rightarrow \) Chapter 5.2.4.3.1.1.7 “Diagnosis” on page 397.

The meaning of the LEDs is described in the section State LEDs \( \Rightarrow \) Chapter 5.2.4.3.1.1.8 “State LEDs” on page 397.
I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

### Remarks:

1) In AC500 the following interface identifier applies:
   14 = I/O bus, 11 = COM1 (e.g. CS31-Bus), 12 = COM2.
   The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   31 = Module itself, 1...10 = expansion module 1 ... 10, ADR = hardware address (e.g. of the DC551-CS31)

3) With "Module" the following allocation applies depending on the master:
   Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1 ... 10 = expansion 1 ... 10
   Channel error: I/O bus or PNIO = module type (4 = DC); COM1/COM2: 1 ... 10 = expansion 1 ... 10

4) In case of module errors, with channel "31 = Module itself" is output.

No effects of multiple overloads

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an external fuse.

**DI561 - Digital input module**

**Features**

- 8 digital inputs 24 V DC / 24 V AC (I₀ ... I₇) in 1 group
- Module-wise galvanically isolated

---

1. I/O bus
2. 8 yellow LEDs to display the signal states of the inputs I₀ to I₇
3. Terminal number
4. Allocation of signal name
5. Terminal block for input signals (9-pin)
6. 2 holes for wall-mounting with screws
7. DIN rail
Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e.g., CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The inputs are group-wise galvanically isolated from each other.
All other circuitry of the module is galvanically isolated from the inputs.

The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA communication interface modules.

Functionality

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>LED displays</td>
<td>For signal states</td>
</tr>
<tr>
<td>Internal power supply</td>
<td>Via I/O bus</td>
</tr>
<tr>
<td>External power supply</td>
<td>Not necessary</td>
</tr>
</tbody>
</table>

Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

The connection is carried out by using a removable 9-pin terminal block. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module’s scope of delivery and must be ordered separately.

Fig. 45: Internal construction of the digital inputs

</tr>
</tbody>
</table>

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 10 mA per DI561.

An external power supply connection is not needed.

**WARNING!**

**Removal/Insertion under power**

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

- Make sure that all voltage sources (supply and process voltage) are switched off before you
  - connect or disconnect any signal or terminal block
  - remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

**NOTICE!**

**Risk of damaging the PLC modules!**

- Overvoltages and short circuits might damage the PLC modules.
  - Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
  - Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The digital inputs can be used as source inputs or as sink inputs.
**NOTICE!**

Risk of malfunctions in the plant!

A ground fault, e.g. caused by a damaged cable insulation, can bridge switches accidentally.

Use sink inputs when possible or make sure that, in case of error, there will be no risks to persons or plant.

---

</tbody>
</table>

**Connection of DI561 - sink inputs**

The module provides several diagnosis functions (see Chapter 5.2.4.3.1.2.7 “Diagnosis” on page 406).

The meaning of the LEDs is described in the section State LEDs (see Chapter 5.2.4.3.1.2.8 “State LEDs” on page 407).

---

**I/O Configuration**

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

---

**Parameterization**

The arrangement of the parameter data is performed with Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

</tbody>
</table>

Remarks:
1) In AC500 the following interface identifier applies:
   14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
   The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   31 = module itself,
   1 ... 10 = decentralized communication interface module 1 ... 10,
   ADR = hardware address (e.g. of the DC551-CS31)

3) With "Module" the following allocation applies depending on the master:
   Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1 ... 10 = expansion 1 ... 10

4) In case of module errors, with channel "31 = module itself" is output.

The internal power supply voltage for the module’s circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 10 mA per DI562.

An external power supply connection is not needed.

---

### WARNING!

**Removal/Insertion under power**

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.
NOTICE!
Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.
- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The module provides several diagnosis functions \(\text{§}\) Chapter 5.2.4.3.1.3.7 "Diagnosis" on page 415.

The digital inputs can be used as source inputs or as sink inputs.

NOTICE!
Risk of malfunctions in the plant!
A ground fault, e.g. caused by a damaged cable insulation, can bridge switches accidentally.

Use sink inputs when possible or make sure that, in case of error, there will be no risks to persons or plant.

---

Table 126: Connection of the digital input module DI562

Connection of DI562 - sink inputs

Connection of DI562 - source inputs
The meaning of the LEDs is described in section State LEDs ‡ Chapter 5.2.4.3.1.3.8 “State LEDs” on page 415.

I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

DI571 - Digital input module

Features

- 8 digital inputs 100 ... 240 V AC (I0 ... I7) in 8 groups
- Module-wise galvanically isolated
1 I/O bus
2 8 yellow LEDs to display the signal states of the inputs I0 ... I7
3 Terminal number
4 Allocation of signal name
5 Terminal block for input signals (9-pin)
6 Terminal block for input signals (11-pin)
7 2 holes for wall-mounting with screws
8 DIN rail

**Intended purpose**

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The inputs are group-wise galvanically isolated from each other.
All other circuitry of the module is galvanically isolated from the inputs.

*The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA communication interface modules.*
### Functionality

### Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

The connection is carried out by using removable 9-pin and 11-pin terminal blocks. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 10 mA per DI571.

An external power supply connection is not needed.

**WARNING!**

**Risk of death by electric shock!**

Hazardous voltages can be present at the terminals of the module.

Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.

**WARNING!**

**Removal/Insertion under power**

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

**NOTICE!**

**Risk of damaging the PLC modules!**

Overvoltages and short circuits might damage the PLC modules.

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

**NOTICE!**

Risk of damaging the PLC modules!
The PLC modules will be irreparably damaged if a voltage > 240 V is connected.

Make sure that all inputs are fed from the same phase. The module must not be connected to a 400 V voltage.

The module provides several diagnosis functions  ⇨ Chapter 5.2.4.3.1.4.8 "Diagnosis" on page 425.

The meaning of the LEDs is described in the section State LEDs  ⇨ Chapter 5.2.4.3.1.4.9 “State LEDs” on page 425.

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

**DI572 - Digital input module**

**Features**

- 16 digital inputs 100 ... 240 V AC (I0 ... I15) in 2 groups
- Module-wise galvanically isolated

![DI572 - Digital input module diagram](image)

1 I/O bus
2 16 yellow LEDs to display the signal states of the inputs I0 ... I15
3 Terminal number
4 Allocation of signal name
5 Terminal block for input signals (9-pin)
6 Terminal block for input signals (11-pin)
7 2 holes for wall-mounting with screws
8 DIN rail

Intended purpose
The device can be used as a decentralized I/O extension module for S500 communication interface modules (e.g., CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The inputs are group-wise galvanically isolated from each other.
All other circuitry of the module is galvanically isolated from the inputs.

The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA communication interface modules.

Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

The connection is carried out by using removable 9-pin and 11-pin terminal blocks. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

16 | I14 | Input signal I14
17 | I15 | Input signal I15
18 | N8 ... 15 | Neutral conductor for the input signals I8 ... I15
19 | --- | Reserved
20 | --- | Reserved

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 10 mA per DI572.

An external power supply connection is not needed.

**WARNING!**
Risk of death by electric shock!
Hazardous voltages can be present at the terminals of the module. Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.

**WARNING!**
Removal/Insertion under power
The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

**NOTICE!**
Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.
NOTICE!

Risk of damaging the PLC modules!

The PLC modules will be irreparably damaged if a voltage > 240 V is connected.

Make sure that all inputs are fed from the same phase. The module must not be connected to a 400 V voltage.

The module provides several diagnosis functions \( \text{\textcopyright} \) Chapter 5.2.4.3.1.5.7 “Diagnosis” on page 434.

I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.
Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software. The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

</thead>
<tbody>
<tr>
<td>1)</td>
<td>2)</td>
<td>3)</td>
<td>4)</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Remarks:

1) In AC500 the following interface identifier applies:
   - 14 = I/O bus, 11 = COM1 (e.g. CS31-Bus), 12 = COM2.
   - The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   - 31 = module itself, 1 ... 10 = decentralized communication interface module 1 ... 10, ADR = hardware address (e.g. of the DC551-CS31)

3) With "Module" the following allocation applies depending on the master:
   - module error: I/O bus or PNIO: 31 = module itself, COM1/COM2: 1 ... 10 = expansion 1 ... 10

4) In case of module errors, with channel "31 = module itself" is output.

### Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

The connection is carried out by using removable 9-pin and 11-pin terminal blocks. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 10 mA per DOS61.

The external power supply connection is carried out via the UP (+24 V DC) and ZP (0 V DC) terminals.

---

**WARNING!**

**Removal/Insertion under power**

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

---

**NOTICE!**

**Risk of damaging the PLC modules!**

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.
NOTICE!
Risk of malfunctions in the plant!
The outputs may switch on for a period of 10 to 50 µs if the process supply voltage UP/ZP is switched on.
This must be considered in the planning of the application.

NOTICE!
Risk of damaging the I/O module!
The outputs are not protected against short circuits and overload.
- Never short-circuit or overload the outputs.
- Never connect the outputs to other voltages.
- Use an external 3 A fast-protection fuse for the outputs.

The module provides several diagnosis functions "Chapter 5.2.4.3.1.6.7 “Diagnosis” on page 442.
The meaning of the LEDs is described in the section State LEDs "Chapter 5.2.4.3.1.6.8 “State LEDs” on page 443.

I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.
Hence, replacing I/O modules is possible without any re-parameterization via software.
If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software. The parameter data directly influences the functionality of modules. For non-standard applications, it is necessary to adapt the parameters to your system configuration.

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.
DO562 - Digital output module

Features

- 16 digital outputs 24 V DC (O0 ... O15) in 1 group
- Module-wise galvanically isolated

Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e.g., CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The outputs are group-wise galvanically isolated from each other.
All other circuitry of the module is galvanically isolated from the outputs.

The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA communication interface modules.

Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

The connection is carried out by using removable 9-pin and 11-pin terminal blocks. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

</tbody>
</table>

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 10 mA per DO562.

The external power supply connection is carried out via the UP (+24 V DC) and ZP (0 V DC) terminals.

---

### WARNING!

**Removal/Insertion under power**

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

---

### NOTICE!

**Risk of damaging the PLC modules!**

Overvoltages and short circuits might damage the PLC modules.
- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.
**NOTICE!**

**Risk of malfunctions in the plant!**

The outputs may switch on for a period of 10 to 50 $\mu$s if the process supply voltage UP/ZP is switched on.

This must be considered in the planning of the application.
NOTICE!
Risk of damaging the I/O module!
The outputs are not protected against short circuits and overload.
- Never short-circuit or overload the outputs.
- Never connect the outputs to other voltages.
- Use an external 3 A fast-protection fuse for the outputs.

The module provides several diagnosis functions © Chapter 5.2.4.3.1.7.7 “Diagnosis” on page 453.
The meaning of the LEDs is described in the section Status LEDs © Chapter 5.2.4.3.1.7.8 “State LEDs” on page 453.

I/O configuration
The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.
Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization
The arrangement of the parameter data is performed with Automation Builder software.
The parameter data directly influences the functionality of modules.
For non-standard applications, it is necessary to adapt the parameters to your system configuration.

### Module error

| 3 | 14 | 1 ... 10 | 31 | 31 | 19 | Checksum error in the I/O module | Replace I/O module |
| 11 / 12 | ADR | 1 ... 10 |     |     |     |                                      |                    |
| 3 | 14 | 1 ... 10 | 31 | 31 | 43 | Internal error in the module | Replace I/O module |
| 11 / 12 | ADR | 1 ... 10 |     |     |     |                                      |                    |
| 3 | 14 | 1 ... 10 | 31 | 31 | 9 | Overflow diagnosis buffer | Restart |
| 11 / 12 | ADR | 1 ... 10 |     |     |     |                                      |                    |
| 3 | 14 | 1 ... 10 | 31 | 31 | 26 | Parameter error | Check master |
| 11 / 12 | ADR | 1 ... 10 |     |     |     |                                      |                    |

Remarks:

1) In AC500 the following interface identifier applies:
   14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
   The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   31 = module itself, 1 ... 10 = decentralized communication interface module 1 ... 10,
   ADR = hardware address (e.g. of the DC551-CS31)

3) With "Module" the following allocation depends on the master:
   Module error: I/O bus or PNIO: 31 = Module itself; COM1/COM2: 1 ... 10 = expansion 1 ... 10
   Channel error: I/O bus or PNIO = module type (2 = DO); COM1/COM2: 1 ... 10 = expansion 1 ... 10

4) In case of module errors, with channel "31 = Module itself" is output.

DO571 - Digital output module

Features

- 8 digital normally open relay outputs 24 V DC / 24 V AC or 100 V AC ... 240 V AC, 2 A max. (NO0 ... NO7) in 2 groups
- Group-wise galvanically isolated

1 I/O bus
2 8 yellow LEDs to display the signal states of the outputs O0 … O7
3 Terminal number
4 Allocation of signal name
5 Terminal block for output signals (11-pin)
6 2 holes for wall-mounting with screws
7 DIN rail
Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e.g., CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The outputs are group-wise galvanically isolated from each other.

All other circuitry of the module is galvanically isolated from the outputs.

![The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA communication interface modules.]

</tr>
</tbody>
</table>

Connections

![For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.]

The connection is carried out by using removable 9-pin and 11-pin terminal blocks. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module’s scope of delivery and must be ordered separately.

<tr>
<td>20</td>
<td>L+</td>
<td>Process voltage L+ +24 V DC</td>
</tr>
</tbody>
</table>

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 5 mA per DO571.

The external power supply connection is carried out via the L+ (+24 V DC) terminal. The negative pole of the external power supply is realized via the I/O bus. Therefore, the CPU/communication interface module and the DO571 must have a common power supply.

**WARNING!**

**Risk of death by electric shock!**

Hazardous voltages can be present at the terminals of the module.

Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.

For screw-type terminals only:
WARNING!

For screw terminals only: Danger of death by electric shock!
The IP 20 protection degree is only provided if all terminal screws are tightened.
Tighten all screws of unused load terminals of relay outputs if voltages > 24 V are connected to the relay group.

WARNING!

Removal/Insertion under power
The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.
Make sure that all voltage sources (supply and process voltage) are switched off before you
– connect or disconnect any signal or terminal block
– remove, mount or replace a module.
Disconnected any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.
Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.
The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!

Risk of damaging the PLC modules!
– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

NOTICE!

Risk of damaging the PLC modules!
The PLC modules can be damaged by overload.
Make sure that the total current of each output common terminal (R0 ... R3 and R4 ... R7) does not exceed 8 A.
Never connect total currents > 8 A per group.
If the group fuse protection is not sufficient, then individual fuse protection of the outputs should be used.

Connection of the module:
Fig. 55: Connection of 24 V DC actuators

Fig. 56: Connection of 24 V AC or 100 V AC ... 240 V AC actuators
NOTICE!
Risk of damaging the I/O module!
The outputs are not protected against short circuit and overload.
- Never short-circuit or overload the outputs.
- Never connect inductive loads without an external suppression against voltage peaks due to inductive kickback.
- Never connect voltages > 240 V. All outputs must be supplied from the same phase.
- Use an external 5 A fast protection fuse for the outputs.

Fig. 57: Power supply - the negative connection is realized via the I/O bus
1 CPU or communication interface module
2 I/O bus
3 DO571

The L+ connection of the DO571 and the 24 V supply of the CPU/communication interface module must be connected to the same 24 V power supply.

The module provides several diagnosis functions © Chapter 5.2.4.3.1.8.7 “Diagnosis” on page 464.
The meaning of the LEDs is described in the section Status LEDs © Chapter 5.2.4.3.1.8.8 “State LEDs” on page 465.

I/O configuration
The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.
Hence, replacing I/O modules is possible without any re-parameterization via software.

*If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.*

### Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

### Remarks:

1) In AC500 the following interface identifier applies:
   - 14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
   - The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   - 31 = module itself, 1 ... 10 = decentralized communication interface module 1 ... 10, ADR = Hardware address (e.g. of the DC551-CS31)

3) With "Module" the following allocation applies depending on the master:
   - Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1 ... 10 = expansion 1 ... 10
   - Channel error: I/O bus or PNIO = module type (2 = DO); COM1/COM2: 1 ... 10 = expansion 1 ... 10

4) In case of module errors, with channel "31 = Module itself" is output.

DO572 - Digital output module

Features

- 8 digital triac outputs (O0 ... O7) in 8 groups
- 120/240 V AC
- Module-wise galvanically isolated

1 I/O bus
2 8 yellow LEDs to display the signal states of the outputs O0 ... O7
3 Terminal number
4 Allocation of signal name
5 Terminal block for output signals (9-pin)
6 Terminal block for output signals (11-pin)
7 2 holes for wall-mounting with screws
8 DIN rail

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.
Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e.g., CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The outputs are group-wise galvanically isolated from each other.
All other circuitry of the module is galvanically isolated from the outputs.

The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA communication interface modules.

The internal power supply voltage for the module’s circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 10 mA per DO572.

An external power supply connection is not needed.

**WARNING!**

Risk of death by electric shock!

Hazardous voltages can be present at the terminals of the module.

Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.

**WARNING!**

Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.
NOTICE!
Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

---

Fig. 59: Connection of the module
NOTICE!
Risk of damaging the PLC modules!
The PLC modules will be irreparably damaged if a voltage > 240 V is con-
nected.
Make sure that all inputs are fed from the same phase. The module must not be
connected to a 400 V voltage.

The module provides several diagnosis functions \( \odot \) Chapter 5.2.4.3.1.9.7 “Diagnosis”
on page 474.

The meaning of the LEDs is described in the section State LEDs \( \odot \) Chapter 5.2.4.3.1.9.8 “State
LEDs” on page 475.

I/O configuration

The module itself does not store configuration data. It receives its parameterization data from
the master device of the I/O bus (CPU or communication interface module) during power-up of
the system.
Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module
loses its configuration data. The whole station has to be switched off and on
again to re-configure the module.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software.
The parameter data directly influences the functionality of modules.
For non-standard applications, it is necessary to adapt the parameters to your system configura-
tion.

Remarks:

1) In AC500 the following interface identifier applies:
   14 = I/O bus, 11 = COM1 (e.g. CS31-Bus), 12 = COM2.
   The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   31 = module itself, 1 ... 10 = decentralized communication interface module 1 ... 10,
   ADR = hardware address (e.g. of the DC551-CS31)

3) With "Module" the following allocation applies depending on the master:
   Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1 ... 10 = expansion 1 ... 10
   Channel error: I/O bus or PNIO = module type (2 = DO); COM1/COM2: 1 ... 10 = expansion 1 ... 10

4) In case of module errors, with channel "31 = Module itself" is output.

DO573 - Digital output module

Features

- 16 digital normally open relay outputs 24 V DC or 100 V AC ... 240 V AC (NO0 ... NO15) in 2 groups, 2 A max.
- Group-wise galvanically isolated

1. I/O bus
2. 16 yellow LEDs to display the signal states of the outputs O0 ... O15
3. Terminal number
4. Allocation of signal name
5. Terminal block for output signals (9-pin)
6. Terminal block for output signals (11-pin)
7. 2 holes for wall-mounting with screws
8. DIN rail
Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The outputs are group-wise galvanically isolated from each other.

All other circuitry of the module is galvanically isolated from the outputs.

The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA communication interface modules.

Functionality

Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

The connection is carried out by using removable 9-pin and 11-pin terminal blocks. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

Terminal | Signal | Description
--- | --- | ---
14 | NO12 | Normally-open contact of the output NO12
15 | NO13 | Normally-open contact of the output NO13
16 | NO14 | Normally-open contact of the output NO14
17 | NO15 | Normally-open contact of the output NO15
18 | R8 ... 15 | Output common for signals NO8 to NO15
19 | L+ | Process voltage L+ (24 V DC)
20 | M | Process voltage M (0 V DC)

The internal power supply voltage for the module’s circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 5 mA per DO573.

The external power supply connection is carried out via the L+ (+24 V DC) and the M (0 V DC) terminals. The M terminal is electrically interconnected to the M/ZP terminal of the CPU/communication interface module.

**WARNING!**
Risk of death by electric shock!
Hazardous voltages can be present at the terminals of the module.
Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.

For screw-type terminals only:

**WARNING!**
For screw terminals only: Danger of death by electric shock!
The IP 20 protection degree is only provided if all terminal screws are tightened.
Tighten all screws of unused load terminals of relay outputs if voltages > 24 V are connected to the relay group.

**WARNING!**
Removal/Insertion under power
The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.
Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.
Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.
The devices must not be opened when in operation. The same applies to the network interfaces.
NOTICE!

Risk of damaging the I/O module!
The outputs are not protected against short circuit and overload.
- Never short-circuit or overload the outputs.
- Never connect inductive loads without an external suppression against voltage peaks due to inductive kickback.
- Never connect voltages > 240 V. All outputs must be supplied from the same phase.
- Use an external 5 A fast protection fuse for the outputs.

NOTICE!

Risk of damaging the PLC modules!
The PLC modules can be damaged by overload.

Make sure that the total current of each output common terminal (R0..7 and R8..15) does not exceed 10 A.

Never connect total currents > 10 A per group.

If the group fuse protection is not sufficient, then individual fuse protection of the outputs should be used.

The following figure shows the connection of the module:
Fig. 61: Connection of 24 V DC actuators
The module provides several diagnosis functions.

The meaning of the LEDs is described in the section State LEDs in Chapter 5.2.4.3.1.9.8 “State LEDs” on page 475.
Fig. 63: Power supply - the negative connection is realized via the I/O bus

The L+ connection of the DO573 and the 24 V supply of the CPU/communication interface module must be connected to the same 24 V power supply.

I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

</tbody>
</table>

Remarks:

1) In AC500 the following interface identifier applies:
   14 = I/O bus, 11 = COM1 (e.g. CS31-Bus), 12 = COM2.
   The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   31 = Module itself, 1 ... 10 = decentralized communication interface module 1 ... 10,
   ADR = Hardware address (e.g. of the DC551-CS31)

3) With "Module" the following allocation applies depending on the master:
   Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1 ... 10 = expansion 1 ... 10
   Channel error: I/O bus or PNIO = module type (2 = DO); COM1/COM2: 1 ... 10 = expansion 1 ... 10

4) In case of module errors, with channel "31 = Module itself" is output.

**State LEDs**

DX561 - Digital input/output module

Features

- 8 digital inputs 24 V DC (I0 ... I7) in 1 group
- 8 digital transistor outputs 24 V DC (O0 ... O7) in 1 group
- Group-wise galvanically isolated

![DX561 Diagram]

1. I/O bus
2. 8 yellow LEDs to display the signal states of the inputs I0 ... I7
3. 8 yellow LEDs to display the signal states of the outputs O0 ... O7
4. Terminal number
5. Allocation of signal name
6. Terminal block for input signals (9-pin)
7. Terminal block for output signals (11-pin)
8. 2 holes for wall-mounting with screws
9. DIN rail
**Intended purpose**

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e.g., CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The inputs and outputs are group-wise galvanically isolated from each other.

All other circuitry of the module is galvanically isolated from the inputs.

```
The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA communication interface modules.
```

**Functionality**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>LED displays</td>
<td>For signal states</td>
</tr>
<tr>
<td>Internal power supply</td>
<td>Via I/O bus</td>
</tr>
<tr>
<td>External power supply</td>
<td>Via the terminals ZP and UP (process voltage 24 V DC)</td>
</tr>
</tbody>
</table>

**Connections**

```
For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.
```

The connection is carried out by using removable 9-pin and 11-pin terminal blocks. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

</tbody>
</table>

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 10 mA per DX561.

The external power supply connection is carried out via the UP (+24 V DC) and ZP (0 V DC) terminals.

---

**WARNING!**
**Removal/Insertion under power**

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

---

**NOTICE!**
**Risk of damaging the PLC modules!**

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

---

The digital inputs can be used as source inputs or as sink inputs.

---

**NOTICE!**
**Risk of malfunctions in the plant!**

A ground fault, e. g. caused by a damaged cable insulation, can bridge switches accidentally.

Use sink inputs when possible or make sure that, in case of error, there will be no risks to persons or plant.
Fig. 65: Connection of inputs to the digital input/output module - sink inputs

Fig. 66: Connection of inputs to the digital input/output module - source inputs
NOTICE!
Risk of malfunctions in the plant!
The outputs may switch on for a period of 10 to 50 µs if the process supply voltage UP/ZP is switched on.
This must be considered in the planning of the application.

NOTICE!
Risk of damaging the I/O module!
The outputs are not protected against short circuits and overload.
- Never short-circuit or overload the outputs.
- Never connect the outputs to other voltages.
- Use an external 3 A fast-protection fuse for the outputs.

The module provides several diagnosis functions © Chapter 5.2.4.3.1.11.7 “Diagnosis” on page 498.
The meaning of the LEDs is described in the Displays section © Chapter 5.2.4.3.1.11.8 “State LEDs” on page 499 chapter.

I/O configuration
The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.
Hence, replacing I/O modules is possible without any re-parameterization via software.
Parameterization

The arrangement of the parameter data is performed with Automation Builder software. The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

### Remarks:

1) In AC500 the following interface identifier applies:
   - 14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
   - The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   - 31 = module itself,
   - 1 ... 10 = decentralized communication interface module 1 ... 10,
   - ADR = hardware address (e.g. of the DC551-CS31)

3) With "Module" the following allocation applies depending on the master:
   - Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1 ... 10 = expansion 1 ... 10
   - Channel error: I/O bus or PNIO = module type (2 = DO); COM1/COM2: 1 ... 10 = expansion 1 ... 10

4) In case of module errors, with channel "31 = module itself" is output.

DX571 - Digital input/output module

Features

- 8 digital inputs 24 V DC / 24 V AC (I0 ... I7) in 1 group
- 8 digital normally open relay outputs 24 V DC / 24 V AC or 100 V AC ... 240 V AC, 2 A max. (NO0 ... NO7) in 2 groups
- Group-wise galvanically isolated

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.
7 Terminal block for output signals (11-pin)
8 2 holes for wall-mounting with screws
9 DIN rail

**Intended purpose**

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The inputs and outputs are group-wise galvanically isolated from each other. All other circuitry of the module is galvanically isolated from the inputs.

*The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA communication interface modules.*

**Functionality**

</tr>
</tbody>
</table>

**Connections**

*For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.*

The connection is carried out by using removable 9-pin and 11-pin terminal blocks. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

</tbody>
</table>

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 5 mA per DX571.

The external power supply connection is carried out via the L+ (+24 V DC) terminal. The negative pole of the external power supply is realized via the I/O bus. Therefore, the CPU/communication interface module and the DX571 must have a common power supply.

---

**WARNING!**

**Removal/Insertion under power**

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.
**NOTICE!**

Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

**NOTICE!**

Risk of damaging the PLC modules!

The PLC modules can be damaged by overload.

Make sure that the total current of each output common terminal (R0 ... 3 and R4 ... 7) does not exceed 8 A.

Never connect total currents > 8 A per group.

If the group fuse protection is not sufficient, then individual fuse protection of the outputs should be used.

The module provides several diagnosis functions (see Diagnosis Chapter 5.2.4.3.1.12.7 “Diagnosis” on page 511).

The digital inputs can be used as source inputs or as sink inputs.

**NOTICE!**

Risk of malfunctions in the plant!

A ground fault, e.g. caused by a damaged cable insulation, can bridge switches accidentally.

Use sink inputs when possible or make sure that, in case of error, there will be no risks to persons or plant.

![Connection of inputs to the digital input/output module DX571 - sink inputs](image)

*Fig. 69: Connection of inputs to the digital input/output module DX571 - sink inputs*
Fig. 70: Connection of inputs to the digital input/output module DX571 - source inputs

The following figures show the connection of the outputs to the module:

Fig. 71: Connection of 24 V DC actuators
The L+ connection of the DX571 and the 24 V supply of the CPU/communication interface module must be connected to the same 24 V power supply.

Fig. 73: Power supply - the minus connection is realized via the I/O bus
1. CPU or communication interface module
2. I/O bus
3. DX571
WARNING!
Risk of death by electric shock!
Hazardous voltages can be present at the terminals of the module.
Make sure that all voltage sources (supply voltage and process supply voltage)
are switched off before you begin with operations on the system.

For screw-type terminals only:

WARNING!
For screw terminals only: Danger of death by electric shock!
The IP 20 protection degree is only provided if all terminal screws are tightened.
Tighten all screws of unused load terminals of relay outputs if voltages > 24 V
are connected to the relay group.

NOTICE!
Risk of damaging the I/O module!
The outputs are not protected against short circuit and overload.
– Never short-circuit or overload the outputs.
– Never connect inductive loads without an external suppression against
  voltage peaks due to inductive kickback.
– Never connect voltages > 240 V. All outputs must be supplied from the
  same phase.
– Use an external 5 A fast protection fuse for the outputs.

The meaning of the LEDs is described in the Displays section Chapter 5.2.4.3.1.12.8 “State
LEDs” on page 512.

I/O configuration

The module itself does not store configuration data. It receives its parameterization data from
the master device of the I/O bus (CPU or communication interface module) during power-up of
the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module
loses its configuration data. The whole station has to be switched off and on
again to re-configure the module.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software.
The parameter data directly influences the functionality of modules.
For non-standard applications, it is necessary to adapt the parameters to your system configura-
tion.

---

**GSD file:**

```
Ext_User_Prm_Data_Len = 0x04
Ext_User_Prm_Data_Const(0) = (0x00)
```
Remarks:

1) In AC500 the following interface identifier applies:
   14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
   The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   31 = Module itself,
   1 ... 10 = decentralized communication interface module 1 ... 10,
   ADR = hardware address (e.g. of the DC551-CS31)

3) With "Module" the following allocation applies depending on the master:
   Module error: I/O bus or PNIO: 31 = Module itself; COM1/COM2: 1 ... 10 = expansion 1 ... 10
   Channel error: I/O bus or PNIO = Module type (2 = DO); COM1/COM2: 1 ... 10 = expansion 1 ... 10

4) In case of module errors, with channel "31 = module itself" is output.

State LEDs

<table>
<thead>
<tr>
<th>LED</th>
<th>State</th>
<th>Color</th>
<th>LED = OFF</th>
<th>LED = ON</th>

5.2.4.3.2 S500 and S500-XC

DC522 - Digital input/output module

Features

- 16 configurable digital inputs/outputs
- Module-wise galvanically isolated
- Fast counter
- XC version for use in extreme ambient conditions available

Hardware descriptions
Device specifications > I/O modules

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.
**Intended purpose**

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

Digital configurable input/output unit.

- 2 sensor supply voltages 24 V DC, 0.5 A, with short-circuit and overload protection
- 16 digital configurable inputs/outputs 24 V DC (C0 ... C15) in 1 group (2.0 ... 2.7 and 4.0 ... 4.7), each of which can be used
  - as an input,
  - as a transistor output with short-circuit and overload protection, 0.5 A rated current or
  - as a re-readable output (combined input/output) with the technical data of the digital inputs and outputs.
- Optional with fast counter

The configuration is performed by software. The modules are supplied with a process supply voltage of 24 V DC.

All available inputs/outputs are galvanically isolated from all other circuitry of the module. There is no potential separation between the channels within the same group.

For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

**Functionality**

<table>
<thead>

</tr>
<tr>
<td>Effect of incorrect input terminal connection</td>
<td>Wrong or no signal detected, no damage up to 35 V</td>
</tr>
</tbody>
</table>

The device is plugged on a terminal unit [Chapter 5.2.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 938]. Position the module properly and press until it locks in place. The terminal unit is either mounted on a DIN rail or to the wall using 2 screws plus the additional accessory for wall mounting [Chapter 5.2.8.2.5 “TA526 - Wall mounting accessory” on page 1324].
Connections

The connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 1.8... 4.8 and 1.9 ... 4.9 are electrically interconnected within the I/O terminal unit and always have the same assignment, irrespective of the inserted module:

Terminals 1.8 ... 4.8: process voltage UP = +24 V DC
Terminals 1.9 ... 4.9: process voltage ZP = 0 V DC

The assignment of the other terminals:

1  I/O bus
2  4.0 ... 4.7: Connected with UP (switch) -> Input;
   Connected with ZP (load) -> Output
3  Control cabinet earth

The assignment of the other terminals:

</tbody>
</table>

### CAUTION!
The process supply voltage must be included in the grounding concept (e.g. grounding of the negative terminal).

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per DC522.

The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.

### WARNING!
Removal/Insertion under power

Removal or insertion under power is permissible only if all conditions for hot swapping are fulfilled.

 ço Chapter 4.9.3 “Replace an I/O module with hot swap” on page 153

The devices are not designed for removal or insertion under power when the conditions for hot swap do not apply. Because of unforeseeable consequences, it is not allowed to plug in or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while they are energized in a hazardous location could result in an electric arc, which could create an ignition source resulting in fire or explosion.

Prior to proceeding, make sure that power is been disconnected and that the area has been thoroughly checked to ensure that flammable materials are not present.

The devices must not be opened when in operation. The same applies to the network interfaces.
NOTICE!
Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.
– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

NOTICE!
Risk of influences to the connected sensors!
Some sensors may be influenced by the deactivated module outputs of DC522.
Connect a 470 Ω / 1 W resistor in series to inputs C8/C9 if they are used as fast counter inputs to avoid any influences.

The modules provide several diagnosis functions.

### Internal data exchange

<table>
<thead>
<tr>
<th></th>
<th>Without the fast counter</th>
<th>With the fast counter (only with AC500)</th>
</tr>
</thead>
<tbody>
<tr>

<td>0</td>
<td>4</td>
</tr>
<tr>
<td>Counter output data (words)</td>
<td>0</td>
<td>8</td>
</tr>
</tbody>
</table>

### I/O Configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

*If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.*

### Parameterization

<table>
<thead>
<tr>
<th>Firmware version</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Firmware version &gt; V2.0.0</td>
<td>The arrangement of the parameter data is performed by Control Builder Plus/ Automation Builder software.</td>
</tr>
</tbody>
</table>

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Technical data

Technical data of the module

The system data of AC500 and S500 are applicable to the standard version  “Chapter 5.1.2 “System data AC500” on page 166.

The system data of AC500-XC are applicable to the XC version  “Chapter 5.1.3 “System data AC500-XC” on page 169.

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.

**Multiple overloads**

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

**NOTICE!**

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and temporary overvoltage up to 30 V DC.
Technical data of the configurable digital inputs/outputs

Each of the configurable I/O channels is defined as input or output by the user program. This is done by interrogating or allocating the corresponding channel.

</tbody>
</table>
*) Due to the direct connection to the output, the demagnetizing varistor is also effective at the input (see figure) above. This is why the difference between UPx and the input signal may not exceed the clamp voltage of the varistor. The varistor limits the voltage to approx. 36 V. Consequently, the input voltage must range -12 V ... +30 V when UPx = 24 V and -6 V ... +30 V when UPx = 30 V.

DC523 - Digital input/output module

Features

- 24 configurable digital inputs/outputs
- Module-wise galvanically isolated
- Fast counter
- XC version for use in extreme ambient conditions available

![Diagram of DC523 module]

[Intended purpose]

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

1 I/O bus
2 Allocation between terminal number and signal name
3 Sensor power supply 24 V DC / 0.5 A
4 24 yellow LEDs to display the signal states at the digital inputs/outputs (C0 ... C23)
5 1 green LED to display the status of the process supply voltage UP
6 4 red LEDs to display errors
7 Label
8 Terminal unit
9 DIN rail
\(^*\) Sign for XC version
Digital configurable input/output unit.

- 1 sensor supply voltage 24 V DC, 0.5 A, with short circuit and overload protection
- 24 digital configurable inputs/outputs 24 V DC (C0 ... C23) in 1 group (2.0 ... 2.7, 3.0 ... 3.7 and 4.0 ... 4.7), of which each can be used
  - as an input,
  - as a transistor output with short circuit and overload protection, 0.5 A rated current or
  - as a re-readable output (combined input/output) with the technical data of the digital inputs and outputs.
- Optional with fast counter

The configuration is performed by software. The modules are supplied with a process supply voltage of 24 V DC.

All available inputs/outputs are galvanically isolated from all other circuitry of the module. There is no potential separation between the channels within the same group.

For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

**Functionality**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fast counter</td>
<td>Integrated, many configurable operating modes (only with AC500)</td>

</tr>
<tr>
<td>Effect of incorrect input terminal connection</td>
<td>Wrong or no signal detected, no damage up to 35 V</td>
</tr>
</tbody>
</table>

**NOTICE!**

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and temporary overvoltage up to 30 V DC.

The device is plugged on a terminal unit † Chapter 5.2.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 938. Position the module properly and press until it locks in place. The terminal unit is either mounted on a DIN rail or to the wall using 2 screws plus the additional accessory for wall mounting † Chapter 5.2.8.2.5 “TA526 - Wall mounting accessory” on page 1324.

**Connections**

The connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 1.8 ... 4.8 and 1.9 ... 4.9 are electrically interconnected within the I/O terminal unit and always have the same assignment, irrespective of the inserted module:

Terminals 1.8 ... 4.8: process voltage UP = +24 V DC
Terminals 1.9 ... 4.9: process voltage ZP = 0 V DC

The assignment of the other terminals:

<td>C16 ... C23</td>
<td>8 digital inputs/outputs</td>
</tr>
</tbody>
</table>
CAUTION!
The process supply voltage must be included in the grounding concept (e.g. grounding of the negative terminal).

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per DC523.

The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.

WARNING!
Removal/Insertion under power
Removal or insertion under power is permissible only if all conditions for hot swapping are fulfilled.

☞ Chapter 4.9.3 "Replace an I/O module with hot swap" on page 153

The devices are not designed for removal or insertion under power when the conditions for hot swap do not apply. Because of unforeseeable consequences, it is not allowed to plug in or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while they are energized in a hazardous location could result in an electric arc, which could create an ignition source resulting in fire or explosion.

Prior to proceeding, make sure that power has been disconnected and that the area has been thoroughly checked to ensure that flammable materials are not present.

The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!
Risk of damaging the PLC modules!
- Overvoltages and short circuits might damage the PLC modules.
  - Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
  - Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

NOTICE!
Risk of influences to the connected sensors!
Some sensors may be influenced by the deactivated module outputs of DC523.

Connect a 470 Ω / 1 W resistor in series to inputs C16/C17 if they are used as fast counter inputs to avoid any influences.

The modules provide several diagnosis functions.
Internal data exchange

</tbody>
</table>

I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

> If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

<table>
<thead>
<tr>
<th>Firmware version</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Firmware version &gt; V2.0.0</td>
<td>The arrangement of the parameter data is performed by Control Builder Plus/ Automation Builder software.</td>
</tr>
</tbody>
</table>

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

1) Indication LED is ON even if an input signal is applied to the channel and the supply voltage is off. In this case the module is not operating and does not generate an input signal.

2) All of the LEDs CH-ERR1 to CH-ERR4 light up together

Technical data

Technical data of the module

The system data of AC500 and S500 are applicable to the standard version “Chapter 5.1.2 “System data AC500” on page 166.”

The system data of AC500-XC are applicable to the XC version “Chapter 5.1.3 “System data AC500-XC” on page 169.”

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.

### Parameter | Value
--- | ---
From 24 V DC power supply at the terminals UP/L+ and ZP/M of the CPU/communication interface module | Ca. 2 mA
From UP at normal operation / with outputs | 0.1 A + max. 0.5 A per output
Inrush current from UP (at power up) | 0.008 A\(^2\)s
Max. power dissipation within the module | 6 W (outputs unloaded)
Sensor power supply | 
Connections | Terminals 1.0 ... 1.3 = +24 V, 1.4 ... 1.7 = 0 V
Voltage | 24 V DC with short circuit and overload protection
Loadability | Terminals 1.0 ... 1.3, in total max. 0.5 A
Weight (without terminal unit) | Ca. 125 g
Mounting position | Horizontal
Or vertical with derating (output load reduced to 50 % at +40 °C per group)
Cooling | The natural convection cooling must not be hindered by cable ducts or other parts in the control cabinet.

**NOTICE!**

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and temporary overvoltage up to 30 V DC.

### Technical data of the configurable digital inputs/outputs

Each of the configurable I/O channels is defined as input or output by the user program. This is done by interrogating or allocating the corresponding channel.

### Parameter | Value
--- | ---
Number of channels per module | 24 inputs/outputs (with transistors)
Distribution of the channels into groups | 1 group of 24 channels
If the channels are used as inputs | 
Channels C0 ... C7 | Terminals 2.0 ... 2.7
Channels C8 ... C15 | Terminals 3.0 ... 3.7
Channels C16 ... C23 | Terminals 4.0 ... 4.7
If the channels are used as outputs | 
Channels C0 ... C7 | Terminals 2.0 ... 2.7

**Multiple overloads**

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.
### Technical data of the digital inputs/outputs if used as inputs

*) Due to the direct connection to the output, the demagnetizing varistor is also effective at the input (see figure) above. This is why the difference between UPx and the input signal must not exceed the clamp voltage of the varistor. The varistor limits the clamp voltage to approx. 36 V. Consequently, the input voltage must range from -12 V ... +30 V when UPx = 24 V and from -6 V ... +30 V when UPx = 30 V.

</tr>
</tbody>
</table>

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.
**DC532 - Digital input/output module**

**Features**

- 16 digital inputs 24 V DC, 16 configurable digital inputs/outputs
- Module-wise galvanically isolated
- Fast counter
- XC version for use in extreme ambient conditions available

**Intended purpose**

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.
Digital configurable input / output unit.

- 16 digital inputs 24 V DC in 2 groups (1.0 ... 1.7 and 2.0 ... 2.7)
- 16 digital configurable inputs/outputs 24 V DC (C16 ... C31) in 1 group (3.0 ... 3.7 and 4.0 ... 4.7), of which each can be used
  - as an input,
  - as a transistor output with short circuit and overload protection, 0.5 A rated current or
  - as a re-readable output (combined input/output) with the technical data of the digital
    inputs and outputs.
- Optional with fast counter

The configuration is performed by software. The modules are supplied with a process supply voltage of 24 V DC.

All available inputs/outputs are galvanically isolated from all other circuitry of the module. There is no potential separation between the channels within the same group.

For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

### Functionality

<table>

<tr>
<td>Effect of incorrect input terminal connection</td>
<td>Wrong or no signal detected, no damage up to 35 V</td>
</tr>
</tbody>
</table>

The device is plugged on a terminal unit © Chapter 5.2.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 938. Position the module properly and press until it locks in place. The terminal unit is either mounted on a DIN rail or to the wall using 2 screws plus the additional accessory for wall mounting © Chapter 5.2.8.2.5 “TA526 - Wall mounting accessory” on page 1324.

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.
Connections

The connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 1.8 ... 4.8 and 1.9 ... 4.9 are electrically interconnected within the I/O terminal unit and always have the same assignment, irrespective of the inserted module:

Terminals 1.8 ... 4.8: process voltage UP = +24 V DC
Terminals 1.9 ... 4.9: process voltage ZP = 0 V DC

1 I/O bus
2 4.0 ... 4.7: Connected with UP (switch) -> Input;
   Connected with ZP (load) -> Output
3 Control cabinet earth

The assignment of the other terminals:
<table>
<thead>
<tr>
<th>Terminals</th>
<th>Signal</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.0 ... 1.7</td>

</tr>
<tr>
<td>4.0 ... 4.7</td>
<td>C24 ... C31</td>
<td>8 digital inputs/outputs</td>
</tr>
</tbody>
</table>

**CAUTION!**
The process supply voltage must be included in the grounding concept (e.g. grounding of the negative terminal).

The internal power supply voltage for the module’s circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per DC532.

The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.

**WARNING!**
Removal/Insertion under power
Removal or insertion under power is permissible only if all conditions for hot swapping are fulfilled.

* Chapter 4.9.3 “Replace an I/O module with hot swap” on page 153

The devices are not designed for removal or insertion under power when the conditions for hot swap do not apply. Because of unforeseeable consequences, it is not allowed to plug in or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while they are energized in a hazardous location could result in an electric arc, which could create an ignition source resulting in fire or explosion.

Prior to proceeding, make sure that power is been disconnected and that the area has been thoroughly checked to ensure that flammable materials are not present.

The devices must not be opened when in operation. The same applies to the network interfaces.

**NOTICE!**
Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.
- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.
NOTICE!
Risk of influences to the connected sensors!
Some sensors may be influenced by the deactivated module outputs of DC532. 
Connect a 470 Ω / 1 W resistor in series to inputs C24/C25 if using them as fast counter inputs to avoid any influences.

The module provides several diagnosis functions.

### Internal data exchange

<table>
<thead>
<tr>

<td>8</td>
</tr>
</tbody>
</table>

### I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

*If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.*

### Parameterization

<table>
<thead>
<tr>
<th>Firmware version</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Firmware version &gt; V2.0.0</td>
<td>The arrangement of the parameter data is performed by Control Builder Plus/ Automation Builder software.</td>
</tr>
</tbody>
</table>

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

¹) Indication LED is ON even if an input signal is applied to the channel and the supply voltage is off. In this case the module is not operating and does not generate an input signal.

²) All of the LEDs CH-ERR1 to CH-ERR4 light up together

### Technical data

#### Technical data of the module

The system data of AC500 and S500 are applicable to the standard version "Chapter 5.1.2 "System data AC500" on page 166.

The system data of AC500-XC are applicable to the XC version "Chapter 5.1.3 "System data AC500-XC" on page 169.

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.
### Parameter Value

**Process supply voltage UP**

| Connections | Terminals 1.8, 2.8, 3.8 and 4.8 for +24 V (UP) as well as 1.9, 2.9, 3.9 and 4.9 for 0 V (ZP) |
| Rated value | 24 V DC |
| Max. ripple | 5 % |
| Protection against reversed voltage | Yes |
| Rated protection fuse on UP | 10 A fast |
| Galvanic isolation | Yes, per module |

**Current consumption**

| From 24 V DC power supply at the terminals UP/L+ and ZP/M of the CPU/communication interface module | Ca. 2 mA |
| From UP at normal operation / with outputs | 0.15 A + max. 0.5 A per output |
| Inrush current from UP (at power up) | 0.007 A²s |
| Max. power dissipation within the module | 6 W (outputs unloaded) |
| Weight (without terminal unit) | ca. 125 g |
| Mounting position | Horizontal |
| | Or vertical with derating (output load reduced to 50 % at +40 °C per group) |
| Cooling | The natural convection cooling must not be hindered by cable ducts or other parts in the control cabinet. |

**NOTICE!**

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and temporary overvoltage up to 30 V DC.

**Multiple overloads**

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

</tbody>
</table>

*) Due to the direct connection to the output, the demagnetizing varistor is also effective at the input (see figure) above. This is why the difference between UPx and the input signal must not exceed the clamp voltage of the varistor. The varistor limits the clamp voltage to approx. 36 V. Consequently, the input voltage must range from -12 V ... +30 V when UPx = 24 V and from -6 V ... +30 V when UPx = 30 V.

</tr>
</tbody>
</table>

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.
DI524 - Digital input module

Features

- 32 digital inputs 24 V DC in 4 groups (1.0 ... 1.7, 2.0 ... 2.7, 3.0 ... 3.7 and 4.0 ... 4.7)
- Fast counter
- Module-wise galvanically isolated
- XC version for use in extreme ambient conditions available

Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.
The configuration is performed by software. The modules are supplied with a process supply voltage of 24 V DC.

All available inputs/outputs are galvanically isolated from all other circuitry of the module. There is no potential separation between the channels within the same group.

For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

### Functionality

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fast counter</td>
<td>Integrated, many configurable operating modes (only with AC500)</td>
</tr>
<tr>
<td>LED displays</td>
<td>For signal states, errors and supply voltage</td>
</tr>
<tr>
<td>Internal power supply</td>
<td>Via the I/O bus interface (I/O bus)</td>

<tr>
<td>Required terminal units</td>
<td>TU515 or TU516 [Chapter 5.2.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 938]</td>
</tr>
<tr>
<td>Effect of incorrect input terminal connection</td>
<td>Wrong or no signal detected, no damage up to 35 V</td>
</tr>
</tbody>
</table>

The device is plugged on a terminal unit [Chapter 5.2.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 938]. Position the module properly and press until it locks in place. The terminal unit is either mounted on a DIN rail or to the wall using 2 screws plus the additional accessory for wall mounting [Chapter 5.2.8.2.5 “TA526 - Wall mounting accessory” on page 1324].

### Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

The connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 1.8 ... 4.8 and 1.9 ... 4.9 are electrically interconnected within the I/O terminal unit and have always the same assignment, irrespective of the inserted module:

- Terminals 1.8 ... 4.8: process voltage UP = +24 V DC
- Terminals 1.9 ... 4.9: process voltage ZP = 0 V DC

**Table 136: Assignment of the other terminals:**

<table>
<thead>
<tr>
<th>Terminals</th>
<th>Signal</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.0 ... 1.7</td>
<td>I0 ... I7</td>
<td>8 digital inputs</td>
</tr>
<tr>
<td>2.0 ... 2.7</td>
<td>I8 ... I15</td>
<td>8 digital inputs</td>
</tr>
<tr>
<td>3.0 ... 3.7</td>
<td>I16 ... I23</td>
<td>8 digital inputs</td>
</tr>
<tr>
<td>4.0 ... 4.7</td>
<td>I24 ... I31</td>
<td>8 digital inputs</td>
</tr>
</tbody>
</table>
The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per DI524.

The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.

**WARNING!**

**Removal/Insertion under power**

Removal or insertion under power is permissible only if all conditions for hot swapping are fulfilled.

☞ Chapter 4.9.3 "Replace an I/O module with hot swap" on page 153

The devices are not designed for removal or insertion under power when the conditions for hot swap do not apply. Because of unforeseeable consequences, it is not allowed to plug in or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while they are energized in a hazardous location could result in an electric arc, which could create an ignition source resulting in fire or explosion.

Prior to proceeding, make sure that power has been disconnected and that the area has been thoroughly checked to ensure that flammable materials are not present.

The devices must not be opened when in operation. The same applies to the network interfaces.

**NOTICE!**

**Risk of damaging the PLC modules!**

- Overvoltages and short circuits might damage the PLC modules.
  - Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
  - Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.
1 I/O bus
2 Control cabinet earth

**CAUTION!**
The process supply voltage must be included in the grounding concept (e.g., grounding of the negative terminal).

The module provides several diagnosis functions.

**Internal data exchange**

</tr>
</tbody>
</table>

**Intended purpose**

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e.g., CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The outputs are galvanically isolated from all other circuitry of the module. There is no potential separation between the channels.
### Functionality

<table>
<thead>
<tr>

</tr>
<tr>
<td>Required terminal unit</td>
<td>TU515 or TU516 [Chapter 5.2.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 938]</td>
</tr>
</tbody>
</table>

The device is plugged on a terminal unit [Chapter 5.2.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 938]. Position the module properly and press until it locks in place. The terminal unit is either mounted on a DIN rail or to the wall using 2 screws plus the additional accessory for wall mounting [Chapter 5.2.8.2.5 “TA526 - Wall mounting accessory” on page 1324].

#### Multiple overloads

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

### Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

The connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units. The terminals 1.8 ... 4.8 and 1.9 ... 4.9 are electrically interconnected within the I/O terminal unit and have always the same assignment, independent of the inserted module:

- Terminals 1.8 ... 4.8: process voltage UP = +24 V DC
- Terminals 1.9 ... 4.9: process voltage ZP = 0 V DC

The assignment of the other terminals:

<table>
<thead>
<tr>
<th>Terminals</th>
<th>Signal</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.0 ... 1.7</td>
<td>O0 ... O7</td>
<td>8 digital outputs</td>
</tr>
<tr>
<td>2.0 ... 2.7</td>
<td>O8 ... O15</td>
<td>8 digital outputs</td>
</tr>
<tr>
<td>3.0 ... 3.7</td>
<td>O16 ... O23</td>
<td>8 digital outputs</td>
</tr>
<tr>
<td>4.0 ... 4.7</td>
<td>O24 ... O31</td>
<td>8 digital outputs</td>
</tr>
</tbody>
</table>

The internal power supply voltage for the module’s circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per DO524. The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.
**WARNING!**

Removal/Insertion under power

Removal or insertion under power is permissible only if all conditions for hot swapping are fulfilled.

> Chapter 4.9.3 “Replace an I/O module with hot swap” on page 153

The devices are not designed for removal or insertion under power when the conditions for hot swap do not apply. Because of unforeseeable consequences, it is not allowed to plug in or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while they are energized in a hazardous location could result in an electric arc, which could create an ignition source resulting in fire or explosion.

Prior to proceeding, make sure that power is been disconnected and that the area has been thoroughly checked to ensure that flammable materials are not present.

The devices must not be opened when in operation. The same applies to the network interfaces.

---

**NOTICE!**

Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

---

**Fig. 77: Internal construction of the digital outputs**

The module provides several diagnosis functions.
Internal data exchange

<table>
<thead>
<tr>

<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Digital inputs (bytes)</td>
<td>0</td>
</tr>
<tr>
<td>Digital outputs (bytes)</td>
<td>4</td>
</tr>
</tbody>
</table>

I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

<table>
<thead>
<tr>
<th>Firmware version</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Firmware version &gt; V2.0.0</td>
<td>The arrangement of the parameter data is performed by Control Builder Plus/ Automation Builder software.</td>
</tr>
</tbody>
</table>

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

</tbody>
</table>

The connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 1.8 ... 2.8 and 1.9 ... 2.9 are electrically interconnected within the I/O terminal unit and always have the same assignment, irrespective of the inserted module:

<table>
<thead>
<tr>
<th>Terminals 3.0, 3.1, 3.4, 3.5</th>
<th>Signal</th>
</tr>
</thead>
<tbody>
<tr>
<td>O0 ... O3</td>

<tbody>
<tr>
<td>O4 ... O7</td>
<td>4 digital outputs</td>
</tr>
</tbody>
</table>

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per DO526.

The external power supply connection is carried out via the UP, UP3, UP4 (+24 V DC) and the ZP, ZP3, ZP4 (0 V DC) terminals.
NOTICE!
Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.
– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

Fig. 78: Internal construction of the digital outputs
1 I/O bus
2 4.0 ... 4.7: Connected with UP (switch) -> Input;
   Connected with ZP (load) -> Output
3 Control cabinet earth

CAUTION!
The process supply voltage must be included in the grounding concept (e. g. grounding of the negative terminal).

The module provides several diagnosis functions.
Internal data exchange

</tbody>
</table>

I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software, versions \( \geq 1.2.3 \).

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

**Technical data**

**Technical data of the module**

The system data of AC500 and S500 are applicable to the standard version "Chapter 5.1.2 "System data AC500" on page 166."

The system data of AC500-XC are applicable to the XC version "Chapter 5.1.3 "System data AC500-XC" on page 169."

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.

</tbody>
</table>
### Parameter | Value
--- | ---
Inrush current from UP3 or UP4 (at power up) | 0.005 A²s (without output load)
Max. power dissipation within the module | 6 W
Weight (without terminal unit) | Ca. 135 g
Mounting position | Horizontal
Or vertical with derating (output load reduced to 50 % at +40 °C per group)
Cooling | The natural convection cooling must not be hindered by cable ducts or other parts in the control cabinet.

**NOTICE!**  
**Attention:**  
All I/O channels (digital and analog) are protected against reverse polarity, reverse supply and continuous overvoltage up to 30 V DC.

---

**No effects of multiple overloads**  
No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an external fuse.

#### Technical data of the digital outputs

| Parameter | Value |
--- | --- |
Number of channels per module | 8 outputs (with transistors, non-latching type) |
Distribution of the channels into groups | 2 groups of 4 channels |
Connection of the channels | |
O0 ... O3 | Terminals 3.0, 3.1, 3.4, 3.5 |
O4 ... O7 | Terminals 4.0, 4.1, 4.4, 4.5 |
Indication of the output signals | 1 yellow LED per channel, the LED is ON if the output signal is high (signal 1) |
Power supply voltage for the module | Terminals 1.8 and 2.8 (positive pole of the process supply voltage, signal name UP) |
Reference potential for module power supply | Terminals 1.9 and 2.9 (negative pole of the process supply voltage, signal name ZP) |
Power supply voltage for the outputs O0 to O3 | Terminal 3.8 (positive pole of the process supply voltage, signal name UP3) |
Reference potential for the outputs O0 to O3 | Terminal 3.9 (negative pole of the process supply voltage, signal name ZP3) |
Power supply voltage for the outputs O4 to O7 | Terminal 4.8 (positive pole of the process supply voltage, signal name UP4) |
Reference potential for the outputs O4 to O7 | Terminal 4.9 (negative pole of the process supply voltage, signal name ZP4) |
Output voltage for signal 1 | UP (-0.4 V) |
Output delay (0->1 or 1->0) | On request |
Output current | |
Rated value, per channel | 2 A at UP3 or UP4 = 24 V |

DX522 - Digital input/output module

Features

- 8 digital inputs 24 V DC, module-wise galvanically isolated
- 8 relay outputs
- Fast counter
- XC version for use in extreme ambient conditions available
1 I/O bus
2 Allocation between terminal number and signal name
3 8 yellow LEDs to display the signal states at the digital inputs (I0 ... I7)
4 8 yellow LEDs to display the signal states at the digital relay outputs (R0 ... R7)
5 1 green LED to display the state of the process supply voltage UP
6 2 red LEDs to display errors
7 Label
8 Terminal unit
9 DIN rail
\$\text{Sign for XC version}\$

**Intended purpose**

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

Digital configurable input/output unit.
- 8 digital inputs 24 V DC in 1 group (1.0...1.7)
- 8 digital relay outputs with one change-over contact each (R0...R7). All output channels are galvanically isolated from each other.
- Fast counter
The configuration is performed by software. The modules are supplied with a process supply voltage of 24 V DC.

All available inputs/outputs are galvanically isolated from all other circuitry of the module. There is no potential separation between the channels within the same group.

For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

Functionality

<table>
<thead>

The device is plugged on a terminal unit © Chapter 5.2.5.3 “TU531 and TU532 for I/O modules” on page 945. Position the module properly and press until it locks in place. The terminal unit is either mounted on a DIN rail or to the wall using 2 screws plus the additional accessory for wall mounting © Chapter 5.2.8.2.5 “TA526 - Wall mounting accessory” on page 1324.

Connections

**WARNING!**
Risk of death by electric shock!
Hazardous voltages can be present at the terminals of the module.

Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

The connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 1.8 ... 4.8 and 1.9 ... 4.9 are electrically interconnected within the I/O terminal unit and have always the same assignment, irrespective of the inserted module:

- Terminals 1.8 ... 4.8: process supply voltage UP = +24 V DC
- Terminals 1.9 ... 4.9: process supply voltage ZP = 0 V DC
Table 137: Assignment of the other terminals:

</tbody>
</table>

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per DX522.

The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.
WARNING!
Removal/Insertion under power
Removal or insertion under power is permissible only if all conditions for hot swapping are fulfilled.

Chapter 4.9.3 “Replace an I/O module with hot swap” on page 153

The devices are not designed for removal or insertion under power when the conditions for hot swap do not apply. Because of unforeseeable consequences, it is not allowed to plug in or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while they are energized in a hazardous location could result in an electric arc, which could create an ignition source resulting in fire or explosion.

Prior to proceeding, make sure that power is been disconnected and that the area has been thoroughly checked to ensure that flammable materials are not present.

The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!
Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The module provides several diagnosis functions.
Fig. 79: Connection of the digital input/output module DX522

1  I/O bus
2  Control cabinet earth

**NOTICE!**
- If the relay outputs have to switch inductive **DC loads**, free-wheeling diodes must be circuited in parallel to these loads.
- If the relay outputs have to switch inductive **AC loads**, spark suppressors are required.

**CAUTION!**
The process supply voltage must be included in the grounding concept (e.g. grounding of the negative terminal).
NOTICE!
Risk of damaging the PLC module!
The following has to be considered when connecting input and output voltages to the module:

– All 230 V AC feeds must be single-phase from the same supply system.
– Connection of 2 or more relay contacts in series is possible; however, voltages above 230 V AC and 3-phase loads are not allowed.
– The 8 change-over contacts of the relays are galvanically isolated from channel to channel. This allows to connect loads of 24 V DC and 120/230 V AC to relay outputs of the same module. In such cases it is necessary that both supply voltages are grounded to prevent unsafe floating grounds.

NOTICE!
Risk of damaging the PLC module!
There is no internal short-circuit or overload protection for the relay outputs. Protect the relay contacts by back-up fuses of 6 A max. (characteristic gG/gL). Depending on the application, fuses can be used for single channels or module-wise.

¹) Indication LED is ON even if an input signal is applied to the channel and the supply voltage is off. In this case the module is not operating and does not generate an input signal.

²) All of the LEDs CH-ERR1 to CH-ERR2 light up together

Technical data

Technical data of the module

The system data of AC500 and S500 are applicable to the standard version "System data AC500" on page 166.

The system data of AC500-XC are applicable to the XC version "System data AC500-XC" on page 169.

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.

**NOTICE!**
All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and temporary overvoltage up to 30 V DC.

**No effects of multiple overloads**
No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an external fuse.

</tr>
</tbody>
</table>

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.
DX531 - Digital input/output module

Features

- 8 digital inputs 120/230 V AC
- 4 relay outputs with one change-over contacts each
- Module-wise galvanically isolated

Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.
Digital configurable input / output unit.

- 8 digital inputs 120/230 V AC in 1 group (2.0 ... 2.3 and 3.0 ... 3.3)
- 4 digital relay outputs with one change-over contact each (R0 ... R3). All output channels are galvanically isolated from each other.

The configuration is performed by software. The modules are supplied with a process supply voltage of 24 V DC.

All available inputs/outputs are galvanically isolated from all other circuitry of the module. There is no potential separation between the channels within the same group.

For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

Functionality

<table>
<thead>
<tr>

<tr>
<td>Required terminal units</td>
<td>TU531 or TU532 ☞ Chapter 5.2.5.3 “TU531 and TU532 for I/O modules” on page 945</td>
</tr>
</tbody>
</table>

The device is plugged on a terminal unit ☞ Chapter 5.2.5.3 “TU531 and TU532 for I/O modules” on page 945. Position the module properly and press until it locks in place. The terminal unit is either mounted on a DIN rail or to the wall using 2 screws plus the additional accessory for wall mounting ☞ Chapter 5.2.8.2.5 “TA526 - Wall mounting accessory” on page 1324.

Connections

**WARNING!**

Risk of death by electric shock!

Hazardous voltages can be present at the terminals of the module.

Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

The connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 1.8 ... 4.8 and 1.9 ... 4.9 are electrically interconnected within the I/O terminal unit and always have the same assignment, irrespective of the inserted module:
- Terminals 1.8 ... 4.8: process supply voltage UP = +24 V DC
- Terminals 1.9 ... 4.9: process supply voltage ZP = 0 V DC

Table 138: Assignment of the other terminals

</tbody>
</table>
Fig. 80: Internal construction

The internal power supply voltage for the module’s circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per DX531. The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.
WARNING!
Removal/Insertion under power
Removal or insertion under power is permissible only if all conditions for hot swapping are fulfilled.

☞ Chapter 4.9.3 “Replace an I/O module with hot swap” on page 153

The devices are not designed for removal or insertion under power when the conditions for hot swap do not apply. Because of unforeseeable consequences, it is not allowed to plug in or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while they are energized in a hazardous location could result in an electric arc, which could create an ignition source resulting in fire or explosion.

Prior to proceeding, make sure that power is been disconnected and that the area has been thoroughly checked to ensure that flammable materials are not present.

The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!
Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.
Fig. 81: Connection of the module

1. I/O bus
2. Control cabinet earth

**NOTICE!**
- If the relay outputs have to switch inductive **DC loads**, free-wheeling diodes must be circuited in parallel to these loads.
- If the relay outputs have to switch inductive **AC loads**, spark suppressors are required.

**CAUTION!**
The process supply voltage must be included in the grounding concept (e.g. grounding of the negative terminal).
NOTICE!
Risk of damaging the PLC module!
The following has to be considered when connecting input and output voltages to the module:

- All 230 V AC feeds must be single phase from the same supply system.
- Connection of 2 or more relay contacts in series is possible; however, voltages above 230 V AC and 3-phase loads are not allowed.
- The 4 change-over contacts of the relays are galvanically isolated from channel to channel. This allows to connect loads of 24 V DC and 120/230 V AC to relay outputs of the same module. In such cases it is necessary that both supply voltages are grounded to prevent unsafe floating grounds.
- All input signals must come from the same phase of the same supply system (together with the used neutral conductor). The module is designed for 120/230 V AC max., not for 400 V AC, not even between two input terminals.
- All neutral conductor connections must be common to the same supply system, since the terminals 4.0 ... 4.3 are interconnected within the module. Otherwise, accidental energization could occur.

NOTICE!
Risk of damaging the PLC module!
There is no internal short-circuit or overload protection for the relay outputs.
Protect the relay contacts by back-up fuses of 6 A max. (characteristic gG/gL). Depending on the application, fuses can be used for single channels or module-wise.

The module provides several diagnosis functions.

**Internal data exchange**

<table>
<thead>
<tr>
<th>Digital inputs (bytes)</th>
<th>1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Digital outputs (bytes)</td>
<td>1</td>
</tr>
<tr>
<td>Counter input data (words)</td>
<td>0</td>
</tr>
<tr>
<td>Counter output data (words)</td>
<td>0</td>
</tr>
</tbody>
</table>

**I/O configuration**

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

*If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.*
Parameterization

<table>
<thead>
<tr>
<th>Firmware version</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Firmware version &gt; V2.0.0</td>
<td>The arrangement of the parameter data is performed by Control Builder Plus/ Automation Builder software.</td>
</tr>
</tbody>
</table>

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.
Fast counter

More information can be found in the Automation Builder chapter, **"Fast counters in AC500 devices"**.

☞ Chapter 6.8.2.12 "Fast counters in AC500 devices" on page 4536

5.2.4.4 Analog I/O modules

5.2.4.4.1 S500-eCo

AI561 - Analog input module

Features

- 4 configurable analog inputs (I0 ... I3) in 1 group
- Resolution: 12 bits including sign

![Diagram of AI561 Analog Input Module]

1. I/O bus
2. 1 green LED to display power supply, 1 red LED to display error
3. Terminal number
4. Allocation of signal name
5. Terminal block for input signals (9-pin)
6. Terminal block for input signals (11-pin)
7. 2 holes for wall-mounting with screws
8. DIN rail
Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e.g., CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The inputs are not galvanically isolated from each other.

All other circuitry of the module is not galvanically isolated from the inputs or from the I/O bus.

![The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA communication interface modules.]

Functionality

4 analog inputs, individually configurable for

- Not used (default setting)
- -2.5 V ... +2.5 V
- -5 V ... +5 V
- 0 V ... +5 V
- 0 V ... +10 V
- 0 mA ... 20 mA
- 4 mA ... 20 mA

<table>

</tr>
</tbody>
</table>

Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

The connection is carried out by using a removable 9-pin and 11-pin terminal block. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.
The assignment of the terminals:

<table>

*Fig. 82: Internal construction of the analog inputs*
Terminal | Signal | Description
--- | --- | ---
11 | I3+ | Positive pole of input signal 3
12 | I3- | Negative pole of input signal 3
13 | --- | Reserved
14 | --- | Reserved
15 | --- | Reserved
16 | --- | Reserved
17 | --- | Reserved
18 | SG | Shield grounding
19 | L+ | Process voltage L+ (24 V DC)
20 | M | Process voltage M (0 V DC)

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 10 mA per AI561.

The external power supply connection is carried out via the L+ (+24 V DC) and the M (0 V DC) terminals. The M terminal is interconnected to the M/ZP terminal of the CPU/communication interface module.

**NOTICE!**

Risk of imprecise and faulty measurements!

Analog signals may be distorted seriously by external electromagnetic influences.

Use shielded wires when wiring analog signal sources. The cable shield must be grounded at both ends of the cable. Provide a potential equalisation of a low resistance to avoid high potential differences between different parts of the plant.

**NOTICE!**

Risk of damaging the PLC modules!

The PLC modules must not be removed while the plant is connected to a power supply.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove or replace a module.

**NOTICE!**

Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The module provides several diagnosis functions  

Chapter 5.2.4.4.1.1.7 “Diagnosis” on page 615.
The following figure is an example of the internal construction of the analog input AI0. The analog inputs AI1 ... AI3 are designed in the same way.

![Diagram](image)

**CAUTION!**

**Risk of damaging the analog input!**

The 250 Ω input resistor can be damaged by overcurrent.

Make sure that the current through the resistor never exceeds 30 mA.
Table 139: Example of the connection of analog sensors (voltage) to the input I0 of the analog input module AI561 (Proceed with the inputs I1 ... I3 in the same way)

The meaning of the LEDs is described in the Displays section of Chapter 5.2.4.1.8 “State LEDs” on page 616.

**I/O configuration**

The analog input module AI561 does not store configuration data itself.

**Parameterization**

The arrangement of the parameter data is performed with Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

**Remarks:**

1) In AC500, the following interface identifier applies:
   - 14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
   - The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   - 31 = module itself, 1 ... 10 = expansion module 1 ... 10, ADR = hardware address (e.g. of the DC551-CS31)

3) With "Module" the following allocation applies depending on the master:
   - Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1 ... 10 = expansion 1 ... 10
   - Channel error: I/O bus or PNIO = module type (1 = AI); COM1/COM2: 1 ... 10 = expansion 1 ... 10

4) In case of module errors, with channel "31 = Module itself" is output.

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.
AI562 - Analog input module

Features

- 2 configurable analog resistance temperature detector (RTD) inputs (I0 and I1) in 1 group
- Resolution: 16 bits including sign

Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e.g., CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The inputs are not galvanically isolated from each other.

All other circuitry of the module is galvanically isolated from the inputs.
The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA communication interface modules.

Functionality

2 analog RTD-inputs, individually configurable for

- Not used (default)
- Pt100, -50 °C ... +400 °C, 2-wire
- Pt100, -50 °C ... +400 °C, 3-wire
- Pt1000, -50 °C ... +400 °C, 2-wire
- Pt1000, -50 °C ... +400 °C, 3-wire
- Ni1000, -50 °C ... +150 °C, 2-wire
- Ni1000, -50 °C ... +150 °C, 3-wire
- Ni100, -50 °C ... +150 °C, 2-wire
- Ni100, -50 °C ... +150 °C, 3-wire
- Analog input resistance 0 Ω ... 150 Ω
- Analog input resistance 0 Ω ... 300 Ω

</tr>
</tbody>
</table>

Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

The connection is carried out by using a removable 9-pin and 11-pin terminal block. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module’s scope of delivery and must be ordered separately.
Fig. 83: Internal construction of the analog inputs

<td>ZP</td>
<td>Process voltage ZP (0 V DC)</td>
</tr>
</tbody>
</table>

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 5 mA per AI562.

The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.

**NOTICE!**

Risk of imprecise and faulty measurements!

Analog signals may be distorted seriously by external electromagnetic influences.

Use shielded wires when wiring analog signal sources. The cable shield must be grounded at both ends of the cable. Provide a potential equalisation of a low resistance to avoid high potential differences between different parts of the plant.
Notice!
Risk of damaging the PLC modules!
The PLC modules must not be removed while the plant is connected to a power supply.
Make sure that all voltage sources (supply and process voltage) are switched off before you
– connect or disconnect any signal or terminal block
– remove or replace a module.

Notice!
Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.
– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The module provides several diagnosis functions ☞ Chapter 5.2.4.1.2.7 “Diagnosis” on page 626.

With 2-wires connection, the resistance of the connection wires influences the accuracy of the measured value. Use 3-wires connection to achieve the guaranteed measuring accuracy.

The meaning of the LEDs is described in the Displays section ☞ Chapter 5.2.4.1.2.8 “State LEDs” on page 627.

I/O configuration
The analog input module AI562 does not store configuration data itself.
Parameterization

The arrangement of the parameter data is performed with Automation Builder software. The parameter data directly influences the functionality of modules. For non-standard applications, it is necessary to adapt the parameters to your system configuration.

</tbody>
</table>

Remarks:
1) In AC500 the following interface identifier applies:
   14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
   The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   31 = module itself, 1 ... 10 = expansion module 1 ... 10, ADR = hardware
   address (e.g. of the DC551-CS31)

3) With "Module" the following allocation applies dependent of the master:
   Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1 ... 10 =
   expansion 1...10
   Channel error: I/O bus or PNIO = module type (1 = AI); COM1/COM2: 1 ... 10
   = expansion 1 ... 10

4) In case of module errors, with channel "31 = Module itself" is output.

Measuring ranges

Risk of invalid analog input values!
The analog input values may be invalid if the measuring range of the inputs is exceeded.
Make sure that the analog signal at the connection terminals is always within the signal range.

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.
AI563 - Analog input module

Features

- 4 configurable thermocouple (TC) / -80 mV ... +80 mV inputs (I0 ... I3) in 1 group
- Resolution: 16 bits including sign

Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e.g., CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The inputs are group-wise galvanically isolated from each other.
The other electronic circuitry of the module is galvanically isolated from the inputs.

The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA communication interface modules.

Functionality

4 analog TC inputs, individually configurable for
- Not used (default)
- Voltage -80 mV ... + 80 mV
- Thermocouple J-type -210 °C ... +1200 °C
- Thermocouple K-type -270 °C ... +1372 °C
- Thermocouple R-type -50 °C ... +1768 °C
- Thermocouple S-type -50 °C ... +1768 °C
- Thermocouple T-type -270 °C ... +400 °C
- Thermocouple E-type -270 °C ... +1000 °C
- Thermocouple N-type -270 °C ... +1300 °C

</tbody>
</table>

Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

After powering up the system, input channels, which are configured will have undefined values/diagnosis message for typically 45 seconds, if the wires of all configured channels are broken.

If the AI563 is connected to a PROFINET communication interface module, the firmware version of PROFINET communication interface module must be 1.2 or above.

The connection is carried out by using a removable 9-pin and 11-pin terminal block. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

</tbody>
</table>
The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals UP/L+ and ZP/M of the CPU/communication interface module increases by 5 mA per AI563.

The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.

NOTICE!
Risk of imprecise and faulty measurements!
Analog signals may be distorted seriously by external electromagnetic influences.
Use shielded wires when wiring analog signal sources. The cable shield must be grounded at both ends of the cable. Provide a potential equalisation of a low resistance to avoid high potential differences between different parts of the plant.

NOTICE!
Risk of damaging the PLC modules!
The PLC modules must not be removed while the plant is connected to a power supply.
Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove or replace a module.

NOTICE!
Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.
- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The module provides several diagnosis functions § Chapter 5.2.4.4.1.3.7 “Diagnosis” on page 638.

The following figure shows the connection of thermocouples to the inputs of the module:
Fig. 85: Connection of thermocouples to the inputs of the module

The meaning of the LEDs is described in Displays chapter % Chapter 5.2.4.4.1.3.8 “State LEDs” on page 639.

I/O configuration

The analog input module AI563 does not store configuration data itself.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

#### Remarks:

1) In AC500 the following interface identifier applies:
   - 14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
   - The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   - 31 = module itself, 1 ... 10 = expansion module 1...10, ADR = hardware address (e.g. of the DC551-CS31)

3) With "Module" the following allocation applies dependent of the master:
   - Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1 ... 10 = expansion 1 ... 10
   - Channel error: I/O bus or PNIO = module type (1 = AI); COM1/COM2: 1 ... 10 = expansion 1 ... 10

4) In case of module errors, with channel "31 = Module itself" is output.

Measuring ranges

AI563 needs typ. 6 to 8 seconds for initialization after applying the process supply voltage to clamp UP/ZP. During this time, the accuracy of the measurement values is not within specification. After that, valid measurement values are provided by the module. After that, valid measurement values are provided by the module.

After an interruption of the process supply voltage > 10 ms, a re-initialization is performed by AI563.

Risk of invalid analog input values!
The analog input values may be invalid if the measuring range of the inputs is exceeded.

Make sure that the analog signal at the connection terminals is always within the signal range.

When a wire break occurs on a sensor wire, the temperature measurement value of the corresponding channel changes to Overflow (Hexadecimal 7FFF).

### Technical data
### Technical data of the module

The system data of AC500-eCo apply.

* Chapter 5.1.1 “System data AC500-eCo” on page 159

Only additional details are therefore documented below.
Parameter | Value
---|---
Process supply voltage UP | 24 V DC
Connections | Terminal 19 for UP (+24 V DC) and terminal 20 for ZP (0 V)
Rated value | 24 V DC
Current consumption | 0.10 A
Inrush current (at power-up) | 0.07 A\textsuperscript{s}
Max. ripple | 5 %
Protection against reversed voltage | Yes
Rated protection fuse for UP | Not necessary
Current consumption from 24 V DC power supply at the terminals UP/L+ and ZP/M of the CPU/communication interface module | Ca. 5 mA
Galvanic isolation | Yes, between the channels and the rest of the module
Isolated groups | 1 (4 channels per group)
Surge-voltage (max.) | 35 V DC for 0.5 s
Max. power dissipation within the module | 2.6 W
Weight | Ca. 120 g
Mounting position | Horizontal or vertical
Cooling | The natural convection cooling must not be hindered by cable ducts or other parts in the control cabinet.

**NOTICE!**
All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and temporary overvoltage up to 30 V DC.

AO561 - Analog output module

Features

- 2 configurable analog outputs (O0 ... O1) in 1 group
- Resolution: 12 bits including sign

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.
1 I/O bus
2 1 green LED to display power supply, 1 red LED to display error
3 Terminal number
4 Allocation of signal name
5 Terminal block for output signals (11-pin)
6 2 holes for wall-mounting with screws
7 DIN rail

Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e.g., CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The outputs are not galvanically isolated from each other.

The other electronic circuitry of the module is not galvanically isolated from the outputs or from the I/O bus.

The I/O module must not be used as communication interface module at CI590-CS31-HA bus modules.
**Functionality**

2 analog outputs, individually configurable for:
- Not used (default setting)
- \(-10 \text{ V} \ldots +10 \text{ V}\)
- \(0 \text{ mA} \ldots 20 \text{ mA}\)
- \(4 \text{ mA} \ldots 20 \text{ mA}\)

</tr>
</tbody>
</table>

**Connections**

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

If the output is configured as not used, the voltage and current output signals are undefined and must not be connected.

The connection is carried out by using a removable 9-pin and 11-pin terminal block. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.
The assignment of the terminals:

<table>

<td>20</td>
<td>M</td>
<td>Process voltage M (0 V DC)</td>
</tr>
</tbody>
</table>

The internal power supply voltage for the module’s circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals UP/L+ and ZP/M of the CPU/communication interface module increases by 5 mA per AO561.

The external power supply connection is carried out via the L+ (+24 V DC) and the M (0 V DC) terminals. The M terminal is electrically interconnected to the M/ZP terminal of the CPU/communication interface module.

NOTICE!

Risk of imprecise and faulty measurements!

Analog signals may be distorted seriously by external electromagnetic influences.

Use shielded wires when wiring analog signal sources. The cable shield must be grounded at both ends of the cable. Provide a potential equalisation of a low resistance to avoid high potential differences between different parts of the plant.
NOTICE!

Risk of damaging the PLC modules!
The PLC modules must not be removed while the plant is connected to a power supply.
Make sure that all voltage sources (supply and process voltage) are switched off before you
– connect or disconnect any signal or terminal block
– remove or replace a module.

NOTICE!

Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.
– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with →). Reserved terminals may carry internal voltages.

The module provides several diagnosis functions \( \text{\textcopyright \ Chapter 5.2.4.1.4.7 “Diagnosis” on page 650.} \)

Table 146: Connection of analog actuators to the analog output module AO561

Connection of analog voltage actuators

\[
\begin{array}{ccccccc}
24 \text{ VDC} & 10 & 11 & 12 & 13 & 14 & 15 & 16 & 17 & 18 & 19 & 20 \\
& & & & \text{O0U+} & \text{O0I+} & \text{O1U+} & \text{O1I+} & \text{O01-} & \text{SG} & \text{L+} & \text{M} \\
\end{array}
\]

Connection of analog current actuators

\[
\begin{array}{ccccccc}
24 \text{ VDC} & 10 & 11 & 12 & 13 & 14 & 15 & 16 & 17 & 18 & 19 & 20 \\
& & & & \text{O0U+} & \text{O0I+} & \text{O1U+} & \text{O1I+} & \text{O01-} & \text{SG} & \text{L+} & \text{M} \\
\end{array}
\]

The output signal is undefined if the supply voltage at the L+ terminal is below 10 V. This can, for example, occur if the supply voltage has a slow ramp-up / ramp-down behavior and must be foreseen when planning the installation.

If the output is configured in current mode, the voltage output signal is undefined and must not be connected.
If the output is configured in voltage mode, the current output signal is undefined and must not be connected.
I/O configuration

The analog output module AO561 does not store configuration data itself.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software. The parameter data directly influences the functionality of modules. For non-standard applications, it is necessary to adapt the parameters to your system configuration.

*Remarks:*

Hardware descriptions
Device specifications > I/O modules

ADR010583, 1, en_US
650
2024/01/05
1) In AC500 the following interface identifier applies:
14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
31 = module itself, 1 ... 10 = expansion module 1 ... 10, ADR = hardware
address (e.g. of the DC551-CS31)

3) With "Module" the following allocation applies depending on the master:
Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1 ... 10 =
exansion 1 ... 10
Channel error: I/O bus or PNIO = module type (3 = AO); COM1/COM2: 1 ... 10 =
exansion 1 ... 10

4) In case of module errors, with channel "31 = Module itself" is output.

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.
AX561 - Analog input/output module

Features

- 4 configurable analog inputs (I0 ... I3) in 1 group
- 2 configurable analog outputs (O0 and O1) in 1 group
- Resolution: 12 bits including sign

Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e.g., CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.
The inputs are not galvanically isolated from each other.
The outputs are not galvanically isolated from each other.
All other circuitry of the module is not galvanically isolated from the inputs/outputs or from the I/O bus.

The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA communication interface modules.

**Functionality**

4 analog inputs, individually configurable for
- Not used (default)
- -2.5 V ... +2.5 V
- -5 V ... + 5 V
- 0 V ... +5 V
- 0 V ... +10 V
- 0 mA ... 20 mA
- 4 mA ... 20 mA

2 analog outputs, individually configurable for
- Not used (default)
- -10 V ... +10 V
- 0 mA ... 20 mA
- 4 mA ... 20 mA

**Parameter** | **Value**
--- | ---
Resolution of the analog channels | 12 bits including sign
Voltage bipolar (-2.5 V ... +2.5 V; -5 V ... +5 V) | 12 bits including sign
Voltage unipolar (0 V ... 5 V; 0 V ... 10 V) | 12 bits
Current (0 mA ... 20 mA; 4 mA ... 20 mA) | 12 bits
LED displays | 2 LEDs for process voltage and error messages
Internal supply | Via I/O bus
External supply | Via the terminals L+ (process voltage 24 V DC) and M (0 V DC); the M terminal is connected to the M terminal of the CPU via the I/O bus

**Connections**

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.
If the output is configured as not used, the voltage and current output signals are undefined and must not be connected.

The connection is carried out by using a removable 9-pin and 11-pin terminal block. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module’s scope of delivery and must be ordered separately.

![Terminal block diagram]

</table>

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals UP/L+ and ZP/M of the CPU/communication interface module increases by 5 mA per AX561.

The external power supply connection is carried out via the L+ (+24 V DC) and the M (0 V DC) terminals. The M terminal is interconnected to the M/ZP terminal of the CPU/communication interface module.

---

### NOTICE!

**Risk of imprecise and faulty measurements!**

Analog signals may be distorted seriously by external electromagnetic influences.

Use shielded wires when wiring analog signal sources. The cable shield must be grounded at both ends of the cable. Provide a potential equalisation of a low resistance to avoid high potential differences between different parts of the plant.

---
WARNING!

Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!

Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.
– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The module provides several diagnosis functions *Chapter 5.2.4.4.1.5.7 “Diagnosis” on page 665.*

![Fig. 88: Example of the internal construction of the analog input AI0 (analog inputs AI1 ... AI3 are designed in the same way)](image)

CAUTION!

Risk of damaging the analog input!

The 250 Ω input resistor can be damaged by overcurrent.

Make sure that the current through the resistor never exceeds 30 mA.

The following figures are an example of the connection of analog sensors (voltage) to the input I0 of the analog input/output module AX561. Proceed with the inputs I1 ... I3 in the same way.

Table 151: Example of the connection of analog actuators to the analog input/output module AX561

The output signal is undefined if the supply voltage at the L+ terminal is below 10 V. This can, for example, occur if the supply voltage has a slow ramp-up / ramp-down behavior and must be foreseen when planning the installation.

If the output is configured in current mode, the voltage output signal is undefined and must not be connected.

If the output is configured in voltage mode, the current output signal is undefined and must not be connected.

The meaning of the LEDs is described in the displays chapter “Chapter 5.2.4.4.1.5.8 “State LEDs” on page 666.

I/O configuration

The I/O module does not store configuration data itself.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

**Remarks:**

1) In AC500 the following interface identifier applies:

14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.

The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:

31 = module itself, 1 ... 10 = expansion module 1 ... 10, ADR = hardware address (e.g. of the DC551-CS31)

3) With "Module" the following allocation applies dependent of the master:

Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1 ... 10 = expansion 1 ... 10

Channel error: I/O bus or PNIO = module type (1 = AI, 3 = AO); COM1/COM2: 1 ... 10 = expansion 1 ... 10

4) In case of module errors, with channel "31 = Module itself" is output.

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

5.2.4.4.2 S500 and S500-XC
AC522 - Analog input/output module

Features

- 8 channels configurable as analog inputs/outputs in one group (2.0 ... 2.7 and 3.0 ... 3.7)
- Resolution 12 bits including sign
- Module-wise galvanically isolated
- XC version for use in extreme ambient conditions available
Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e.g., CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The configuration is performed by software. The modules are supplied with a process voltage of 24 V DC.

The inputs and outputs are galvanically isolated from all other circuitry of the module.

Functionality

8 channels configurable as analog inputs/outputs
If used as inputs, the following signal ranges are individually configurable:

- Unused (default setting)
- 0 V ... 10 V
- -10 V ... +10 V
- 0 mA ... 20 mA
- 4 mA ... 20 mA
- Pt100, -50 °C ... +400 °C (2-wire)
- Pt100, -50 °C ... +400 °C (3-wire), requires 2 channels
- Pt100, -50 °C ... +70 °C (2-wire)
- Pt100, -50 °C ... +70 °C (3-wire), requires 2 channels
- Pt1000, -50 °C ... +400 °C (2-wire)
- Pt1000, -50 °C ... +400 °C (3-wire), requires 2 channels
- Ni1000, -50 °C ... +150 °C (2-wire)
- Ni1000, -50 °C ... +150 °C (3-wire), requires 2 channels
- 0 V ... 10 V with differential inputs, requires 2 channels
- -10 V ... +10 V with differential inputs, requires 2 channels
- Digital signals (digital input)

</tr>
</tbody>
</table>

Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

The modules are plugged on an I/O terminal unit ☏ Chapter 5.2.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 938. Properly position the modules and press until they lock in place. The terminal units are mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting ☏ Chapter 5.2.8.2.5 “TA526 - Wall mounting accessory” on page 1324.

The connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.
The terminals 1.8, 2.8, 3.8 and 4.8 as well as 1.9, 2.9, 3.9 and 4.9 are electrically interconnected within the I/O terminal units and always have the same assignment, independent of the inserted module:

Terminals 1.8, 2.8, 3.8 and 4.8: process voltage \(UP = +24\ \text{V DC}\)

Terminals 1.9, 2.9, 3.9 and 4.9: process voltage \(ZP = 0\ \text{V DC}\)

The assignment of the other terminals:

<table>

<td>Unused</td>
</tr>
</tbody>
</table>

The negative poles of the analog inputs are connected to each other to form an "Analog Ground" signal for the module.

The negative poles of the analog outputs are connected to each other to form an "Analog Ground" signal for the module.

There is no galvanic isolation between the analog circuitry and ZP/UP. Therefore, the analog sensors must be galvanically isolated in order to avoid loops via the ground potential or the supply voltage.

Because of their common reference potential, analog current inputs cannot be circuited in series, neither within the module nor with channels of other modules.

For the open-circuit detection (wire break), each analog input channel is pulled up to "plus" by a high-resistance resistor. If nothing is connected, the maximum voltage will be read in then.

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per I/O module. The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.
WARNING!
Removal/Insertion under power
Removal or insertion under power is permissible only if all conditions for hot swapping are fulfilled.

"Chapter 4.9.3 “Replace an I/O module with hot swap” on page 153"

The devices are not designed for removal or insertion under power when the conditions for hot swap do not apply. Because of unforeseeable consequences, it is not allowed to plug in or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while they are energized in a hazardous location could result in an electric arc, which could create an ignition source resulting in fire or explosion.

Prior to proceeding, make sure that power is been disconnected and that the area has been thoroughly checked to ensure that flammable materials are not present.

The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!
Risk of damaging the PLC modules!

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

Generally, analog signals must be laid in shielded cables. The cable shields must be grounded at both sides of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.
Fig. 89: Connection of the I/O module

1 4 analog I/O channels
   as inputs for 0 V ... 10 V, -10 V ... +10 V, 0 mA ... 20 mA, 4 mA ... 20 mA, Pt100/Pt1000/Ni1000 digital signals
   as outputs for -10 V ... +10 V, 0 mA ... 20 mA, 4 mA ... 20 mA

2 4 analog I/O channels
   as inputs for 0 V ... 10 V, -10 V ... +10 V, 0 mA ... 20 mA, 4 mA ... 20 mA, Pt100/Pt1000/Ni1000 digital signals
   as outputs for -10 V ... +10 V

The process voltage must be included in the grounding concept of the control system (e.g. grounding the negative pole).

By installing equipotential bonding conductors between the different parts of the system, it must be made ensured that the potential difference between ZP and AGND never exceeds 1 V.

Connection of resistance thermometers in 2-wire configuration

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the I/O module provides a constant current source which is multiplexed over the 8 analog channels.
Connection of resistance thermometers in 3-wire configuration

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the I/O module provides a constant current source which is multiplexed over the max. 8 (depending on the configuration) analog channels.
1 Return line
2 Twisted pair within the cable

If several measuring points are adjacent to each other, only one return line is necessary. This saves wiring costs.

With the 3-wire configuration, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1).

The constant current of one channel flows through the resistance thermometer. The constant current of the other channel flows through one of the cores. The module calculates the measured value from the two voltage drops and stores it under the input with the higher channel number (e.g. C1).

In order to keep measuring errors as small as possible, it is necessary to have all the involved conductors in the same cable. All the conductors must have the same cross section.

<table>
<thead>
<tr>
<th>Resistance</th>
<th>Temperature Range</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pt100</td>
<td>-50 °C ... +70 °C</td>
<td>3-wire configuration, two channels used</td>

<td>-50 °C ... +150 °C</td>
<td>3-wire configuration, two channels used</td>
</tr>
</tbody>
</table>

The I/O module performs a linearization of the resistance characteristic.

In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".
Connection of active-type analog sensors (Voltage) with galvanically isolated power supply

By connecting the sensor's negative pole of the output voltage to AGND, the galvanically isolated voltage source of the sensor is referred to ZP.

By connecting to AGND the galvanically isolated voltage source of the sensor is referred to ZP. The following measuring ranges can be configured:

<table>
<thead>
<tr>
<th>Voltage</th>
<th>Range</th>
<th>Channels used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>0 V ... 10 V</td>
<td>1 channel used</td>
</tr>
<tr>
<td>Voltage</td>
<td>-10 V ... +10 V</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

Connection of active-type analog sensors (Current) with galvanically isolated power supply
The following measuring ranges can be configured:

<table>
<thead>
<tr>
<th>Current</th>
<th>0 mA ... 20 mA</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current</td>
<td>4 mA ... 20 mA</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

Unused input channels can be left open-circuited, because they are of low resistance.

Connection of active-type analog sensors (Voltage) with no galvanically isolated power supply

![Diagram of connection](image)

**CAUTION!**
The potential difference between AGND and ZP at the module must not be greater than 1V, not even in case of long lines (see figure Terminal Assignment).

*If AGND does not get connected to ZP, the sensor current flows to ZP via the AGND line. The measuring signal is distorted, as a very small current flows through the voltage line. The total current through the PTC should not exceed 50 mA. This measuring method is therefore only suitable for short lines and small sensor currents. If there are bigger distances, the difference measuring method should be applied.*

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0 V ... 10 V</th>

<td>1 channel used</td>
</tr>
</tbody>
</table>

*) if the sensor can provide this signal range

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".
Connection of passive-type analog sensors (Current)

<table>
<thead>
<tr>
<th>Current</th>
<th>4 mA ... 20 mA</th>
<th>1 channel used</th>
</tr>
</thead>
</table>

**CAUTION!**
If, during initialization, an analog current sensor supplies more than 25 mA for more than 1 second to an analog input, this input is switched off by the module (input protection). In such cases, it is recommended to protect the analog input by a 10-volt Zener diode (in parallel to I+ and ZP). But, in general, sensors with fast initialization or without current peaks higher than 25 mA are preferrable.

Unused input channels can be left open-circuited because they are of low resistance.

Connection of active-type analog sensors (Voltage) to differential inputs

Differential inputs are very useful if analog sensors are used which are remotely non-isolated (e.g. the minus terminal is remotely grounded).

The use of differential inputs helps to considerably increase the measuring accuracy and to avoid ground loops.

With differential input configurations, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

The analog value is calculated by subtraction of the input value with the higher address from the input value of the lower address.

The converted analog value is available at the odd channel (higher address).

**CAUTION!**
The ground potential at the sensors must not have too large a potential difference with respect to ZP (max. ± 1 V within the full signal range). Otherwise, problems may occur concerning the common-mode input voltages of the involved analog inputs.
The negative pole of the sensor must be grounded next to the sensor.

<table>
<thead>

I/O configuration

The module does not store configuration data itself. The 8 configurable analog channels are defined as inputs or outputs by the configuration, i.e. each of the configurable channels can used as input or output (or re-readable output in case of voltage input/output).

When a channel is used as input, the corresponding output must be configured unused.
When a channel is used as output, the corresponding input must be configured unused.

**Remarks:**

1) In AC500, the following interface identifier applies:

   14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.

   The FBP diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:

   31 = module itself, 1 ... 10 = expansion module 1 ... 10, ADR = hardware address (e.g. of the DC551)

3) With "Module" the following allocation applies depending on the master:

   Module error: I/O bus or FBP: 31 = module itself; COM1/COM2: 1 ... 10 = expansion 1 ... 10

   Channel error: I/O bus or FBP = module type (1 = AI, 3 = AO); COM1/COM2: 1 ... 10 = expansion 1 ... 10

4) In case of module errors, with channel "31 = Module itself" is output.

---

**State LEDs**

During the power ON procedure, the module initializes automatically. All LEDs (except the channel LEDs) are ON during this time.

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

AI523 - Analog input module

Features

- 16 configurable analog inputs (I0 ... I15) in 2 groups (1.0 ... 2.7 and 3.0 ... 4.7)
  Resolution 12 bits including sign
- Module-wise galvanically isolated
- XC version for use in extreme ambient conditions available
1 I/O bus
2 Allocation between terminal number and signal name
3 16 yellow LEDs to display the signal states at the analog inputs (I0 ... I15)
4 1 green LED to display the state of the process supply voltage UP
5 2 red LEDs to display errors
6 Label
7 Terminal unit
8 DIN rail

Sign for XC version

Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e.g., CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

Functionality

16 analog inputs, individually configurable for
- Unused (default setting)
- 0 V ... 10 V
- -10 V ... +10 V
- 0 mA ... 20 mA
- 4 mA ... 20 mA
- Pt100, -50 °C ... +400 °C (2-wire)
- Pt100, -50 °C ... +400 °C (3-wire), requires 2 channels
- Pt100, -50 °C ... +70 °C (2-wire)
- Pt100, -50 °C ... +70 °C (3-wire), requires 2 channels
- Pt1000, -50 °C ... +400 °C (2-wire)
- Pt1000, -50 °C ... +400 °C (3-wire), requires 2 channels
- Ni1000, -50 °C ... +150 °C (2-wire)
- Ni1000, -50 °C ... +150 °C (3-wire), requires 2 channels
- 0 V ... 10 V with differential inputs, requires 2 channels
- -10 V ... +10 V with differential inputs, requires 2 channels
- Digital signals (digital input)

### Connections

The modules are plugged on an I/O terminal unit. Properly position the modules and press until they lock in place. The terminal units are mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting. The connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

The terminals 1.8 ... 4.8 and 1.9 ... 4.9 are electrically interconnected within the I/O terminal units and have always the same assignment, independent of the inserted module:

- Terminals 1.8 ... 4.8: process voltage UP = +24 V DC
- Terminals 1.9 ... 4.9: process voltage ZP = 0 V

The assignment of the other terminals:

</tr>
<tr>
<td>4.0 ... 4.7</td>
<td>I8+ ... I15+</td>
<td>Positive poles of the following 8 analog inputs</td>
</tr>
</tbody>
</table>

**CAUTION!**
The negative poles of the analog inputs are galvanically connected to each other. They form an "Analog Ground" signal for the module. The negative poles of the analog outputs are also galvanically connected to each other to form an "Analog Ground" signal.

**CAUTION!**
There is no galvanic isolation between the analog circuitry and ZP/UP. Therefore, the analog sensors must be galvanically isolated in order to avoid loops via the ground potential or the supply voltage.

**CAUTION!**
Because of their common reference potential, analog current inputs cannot be circuited in series, neither within the module nor with channels of other modules.

*For the open-circuit detection (wire break), each analog input channel is pulled up to "plus" by a high-resistance resistor. If nothing is connected, the maximum voltage will be read in then.*

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per AI523.

The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.
WARNING!
Removal/Insertion under power
Removal or insertion under power is permissible only if all conditions for hot swapping are fullfilled.

☞ Chapter 4.9.3 “Replace an I/O module with hot swap” on page 153

The devices are not designed for removal or insertion under power when the conditions for hot swap do not apply. Because of unforeseeable consequences, it is not allowed to plug in or unplug devices with the power being ON.
Make sure that all voltage sources (supply and process voltage) are switched off before you
– connect or disconnect any signal or terminal block
– remove, mount or replace a module.
Disconnecting any powered devices while they are energized in a hazardous location could result in an electric arc, which could create an ignition source resulting in fire or explosion.
Prior to proceeding, make sure that power is been disconnected and that the area has been thoroughly checked to ensure that flammable materials are not present.
The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!
Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.
– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

Generally, analog signals must be laid in shielded cables. The cable shields must be grounded at both sides of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.

The following figure shows the connection of the module:
CAUTION!
By installing equipotential bonding conductors between the different parts of the system, it must be ensured that the potential difference between ZP and AGND never can exceed 1 V.

CAUTION!
The process supply voltage must be included in the grounding concept (e.g. grounding of the negative terminal).

The modules provide several diagnosis functions § Chapter 5.2.4.4.2.8 “Diagnosis” on page 717.
Connection of resistance thermometers in 2-wire configuration

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module AI523 provides a constant current source which is multiplexed over the 8 analog channels.

![Connection example](image)

**Fig. 91: Connection example**

The following measuring ranges can be configured

<table>
<thead>
<tr>
<th>Thermometer</th>
<th>Measuring Range</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pt100</td>

</tr>
</tbody>
</table>

The function of the LEDs is described under Displays

The module AI523 performs a linearization of the resistance characteristic.

In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".

Connection of resistance thermometers in 3-wire configuration

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module AI523 provides a constant current source which is multiplexed over the max. 8 (depending on the configuration) analog channels.
With 3-wire configuration, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1).

The constant current of one channel flows through the resistance thermometer. The constant current of the other channel flows through one of the cores. The module calculates the measured value from the two voltage drops and stores it under the input with the higher channel number (e.g. I1).

In order to keep measuring errors as small as possible, it is necessary to have all the involved conductors in the same cable. All the conductors must have the same cross section.

The following measuring ranges can be configured \( \text{Chapter 5.2.4.4.2.2.7 “Parameterization” on page 714} \)

<table>
<thead>
<tr>

<td>4 mA ... 20 mA</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

The function of the LEDs is described under Displays Chapter 5.2.4.4.2.2.8 “Diagnosis” on page 717.

Unused input channels can be left open-circuited, because they are of low resistance.
Connection of active-type analog sensors (Voltage) with no galvanically isolated power supply

Fig. 95: Connection example
**CAUTION!**
The potential difference between AGND and ZP at the module must not be greater than 1 V, not even in case of long lines. Chapter 5.2.4.4.2.2 “AI523 - Analog input module” on page 698.

If AGND does not get connected to ZP, the sensor current flows to ZP via the AGND line. The measuring signal is distorted, as a very low current flows over the voltage line. The total current through the PTC should not exceed 50 mA. This measuring method is therefore only suitable for short lines and small sensor currents. If there are bigger distances, the difference measuring method has to be preferred.

The following measuring ranges can be configured. Chapter 5.2.4.4.2.10 “Measuring ranges” on page 719

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0 V ... 10 V</th>

| *) if the sensor can provide this signal range

The function of the LEDs is described under Displays. Chapter 5.2.4.4.2.8 “Diagnosis” on page 717.

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".
Connection of passive-type analog sensors (Current)

![Connection diagram]

**Fig. 96: Connection example**

The following measuring ranges can be configured © Chapter 5.2.4.4.2.2.7 “Parameterization” on page 714 © Chapter 5.2.4.4.2.2.10 “Measuring ranges” on page 719
The function of the LEDs is described under Displays Chapter 5.2.4.4.2.2.8 “Diagnosis” on page 717.

CAUTION!

If, during initialization, an analog current sensor supplies more than 25 mA for more than 1 second into an analog input, this input is switched off by the module (input protection). In such cases, it is recommended to protect the analog input by a 10-volt Zener diode (in parallel to \( I^+ \) and \( \text{ZP} \)). But, in general, it is a better solution to use sensors with fast initialization or without current peaks higher than 25 mA.

Unused input channels can be left open-circuited, because they are of low resistance.

Connection of active-type analog sensors (Voltage) to differential inputs

Differential inputs are very useful if analog sensors which are remotely non-isolated (e.g. the negative terminal is remotely grounded) are used.

The evaluation using differential inputs helps to considerably increase the measuring accuracy and to avoid ground loops.

With differential input configurations, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

The analog value is calculated by subtraction of the input value with the higher address from the input value of the lower address.

The converted analog value is available at the odd channel (higher address).

CAUTION!

The ground potential at the sensors must not have too big a potential difference with respect to \( \text{ZP} \) (max. \( \pm 1 \) V within the full signal range). Otherwise problems can occur concerning the common-mode input voltages of the involved analog inputs.
Fig. 97: Connection example
The negative pole of the sensor must be grounded next to the sensor.

The following measuring ranges can be configured:

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0 V ... 10 V</th>
<th>with differential inputs, 2 channels used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V ... +10 V</td>
<td>with differential inputs, 2 channels used</td>
</tr>
</tbody>
</table>

The function of the LEDs is described under Displays.

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

**Use of analog inputs as digital inputs**

Several (or all) analog inputs can be configured as digital inputs. The inputs are not galvanically isolated against the other analog channels.

**Fig. 98: Connection example**

The following operating mode can be configured:

<table>
<thead>
<tr>

I/O configuration

The module does not store configuration data itself. It gets its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

That means replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

<table>
<thead>
<tr>
<th>Firmware version</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Firmware version &gt; V2.0.0</td>
<td>The arrangement of the parameter data is performed by Control Builder Plus/ Automation Builder software.</td>
</tr>
</tbody>
</table>

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Remarks:

1) In AC500, the following interface identifier applies:
   14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
   The FBP diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   31 = module itself, 1 ... 10 = expansion module 1 ... 10, ADR = hardware address (e.g. of the DC551)
With "Module" the following allocation applies depending on the master:

Module error: I/O bus or FBP: 31 = module itself; COM1/COM2: 1 ... 10 = expansion 1 ... 10

Channel error: I/O bus or FBP = module type (1 = AI); COM1/COM2: 1 ... 10 = expansion 1 ... 10

In case of module errors, with channel "31 = Module itself" is output.

State LEDs

During the power ON procedure, the module initializes automatically. All LEDs (except the channel LEDs) are ON during this time.

**Technical data**

**Technical data of the module**

The system data of AC500 and S500 are applicable to the standard version Chapter 5.1.2 “System data AC500” on page 166.

The system data of AC500-XC are applicable to the XC version Chapter 5.1.3 “System data AC500-XC” on page 169.

Only additional details are therefore documented below. The technical data are also applicable to the XC version.

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.
**AI531 - Analog input module**

**Features**

- 8 configurable analog inputs (I0 ... I7) in 2 groups (1.0 ... 1.7 and 2.0 ... 2.7 as well as 3.0 ... 3.7 and 4.0 ... 4.7)
  - Resolution 16 bits including sign
- Module-wise galvanically isolated
- XC version for use in extreme ambient conditions available

6. 2 red LEDs to display errors (CH-ERR2 and CH-ERR4)
7. Label
8. Terminal unit
9. DIN rail

*: Sign for XC version

**Intended purpose**

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.
Functionality

8 analog inputs, individually configurable for

- Unused (default setting)
- 0 V ... 5 V, 0 V ... 10 V
- -50 mV ... +50 mV, -500 mV ... +500 mV
- -1 V ... +1 V, -5 V ... +5 V, -10 V ... +10 V
- 0 mA ... 20 mA
- 4 mA ... 20 mA
- -20 mA ... 20 mA
- Pt100, -50 °C ... +70 °C or +400 °C (2-, 3- and 4-wire)
- Pt100, -200 °C ... +850 °C (2-, 3- and 4-wire)
- Pt1000, -50 °C ... +400 °C (2-, 3- and 4-wire)
- Ni1000, -50 °C ... +150 °C (2-, 3- and 4-wire)
- Cu50 (1.426): -50 °C ... +200 °C (2-, 3- and 4-wire)
- Cu50 (1.428): -200 °C ... +200 °C (2-, 3- and 4-wire)
- 0 Ω ... 50 kΩ
- Thermocouples of types J, K, T, N, S
- Resistance measuring bridge
- Digital signals (digital input)

Connections

The modules are plugged on an I/O terminal unit ❆ Chapter 5.2.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 938. Properly position the modules and press until they lock in place. The terminal units are mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting ❆ Chapter 5.2.8.2.5 “TA526 - Wall mounting accessory” on page 1324.

The connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 1.8, 2.8, 3.8, 4.8, 1.9, 2.9, 3.9 and 4.9 are electrically interconnected within the I/O terminal units and always have the same assignment, independent of the inserted module:
Terminals 1.8, 2.8, 3.8 and 4.8: process voltage UP = +24 V DC
Terminals 1.9, 2.9, 3.9 and 4.9: process voltage ZP = 0 V

The assignment of the other terminals:

</tr>
</tbody>
</table>

**CAUTION!**
Analog sensors must be galvanically isolated against the ground. In order to avoid inaccuracy with the measuring results, the analog sensors should also be isolated against the power supply.

The "IxB" clamps (x=0 ... 7) of the analog inputs are galvanically connected to each other. They form an "Analog Ground Signal" (AGND) for the module.

The negative poles of the analog inputs Ix- may accept a potential difference up to ±20 V DC with regard to the common reference potential IxB (AGND, ZP). Observing this maximum voltage difference, analog current inputs of one module can be switched in series to each other and also with current inputs of other modules.

For the open-circuit detection (wire break), each positive analog input channel Ix+ is pulled up to "plus" by a high-resistance resistor and each negative analog input channel Ix- is pulled down to "minus" by a resistor. If wire break occurs, a maximum voltage (overflow or underflow) will be read in then.

The internal power supply voltage for the module’s circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per AI531.
The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.

**WARNING!**
Removal/Insertion under power

Removal or insertion under power is permissible only if all conditions for hot swapping are fulfilled.

☞ Chapter 4.9.3 “Replace an I/O module with hot swap” on page 153

The devices are not designed for removal or insertion under power when the conditions for hot swap do not apply. Because of unforeseeable consequences, it is not allowed to plug in or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconencting any powered devices while they are energized in a hazardous location could result in an electric arc, which could create an ignition source resulting in fire or explosion.

Prior to proceeding, make sure that power is been disconnected and that the area has been thoroughly checked to ensure that flammable materials are not present.

The devices must not be opened when in operation. The same applies to the network interfaces.

**NOTICE!**
Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

Generally, analog signals must be laid in shielded cables. The cable shields must be grounded at both sides of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.
Fig. 99: 8 analog inputs in two groups, individually configurable

CAUTION!
By installing equipotential bonding conductors between the different parts of the system, it must be ensured that the potential difference between ZP and AGND never can exceed 1 V.

CAUTION!
The process supply voltage must be included in the grounding concept (e.g. grounding of the negative terminal).

The module provides several diagnosis functions

Chapter 5.2.4.4.2.3.3 “Functionality” on page 726

Chapter 5.2.4.4.2.3.8 “Diagnosis” on page 753.
Connection of active-type analog sensors (Voltage) with galvanically isolated power supply

Standard ranges

---

**Fig. 115: Connection example**

The following measuring ranges can be configured on page 749:
For a description of the function of the LEDs, please refer to diagnosis and displays/displays
© Chapter 5.2.4.4.2.3.8 “Diagnosis” on page 753.

The module linearizes the thermocouple characteristics. It supports the following possibilities of
temperature compensation and handling with cold junctions:

Internal compensation

An internal temperature sensor which is located next to the terminal unit is used to detect the
temperature of the cold junction. So the compensating cables must be connected directly to the
terminal unit, where the cold junction is located.

The setting “Internal compensation (default)” for the parameter “Compensation channel” should
be selected.

To get more precise temperature measurements, the use of an external com-
pensation method is recommended.

External compensation with temperature input

The temperature for the cold junction can be determinated externally.

A measured or known temperature value (e.g. ambient temperature in the cabinet) is transferred
to the module via the output data word to all required channels. The possible temperature range
is -25 °C ... +60 °C and is monitored by the AI531.

The setting “External with temperature value” for the parameter “Compensation channel” should
be selected.

External compensation with compensation box

A compensation box balances the temperature difference between the cold junction and the
reference temperature by generating a bridge voltage. The reference temperature is transferred
via the output data word.

The compensation box must fit to the type of thermocouple and is located at the end of the
compensating cables, where the cold junction is located. The cabling to the AI531 can be
carried out with normal cables. The operating manual of the compensation box also has to be
considered.

The setting “External with temperature value” for the parameter “Compensation channel” should
be selected.

External compensation with flanking channel

A flanking channel of the same input group can be used for compensation, e. g. for channel
3, the channels 0, 1 and 2 can be selected as reference channels. The type of sensor for the
reference channel can be selected in the parameters for the flanking channel. For example, a
RTD sensor which is located next to the thermocouple terminal can be used as reference point
for other channels.

The setting “Channel x” for the parameter “Compensation channel” should be selected. Refer
to ‘Channel configuration’ for possible settings © Chapter 5.2.4.4.2.3.7 “Parameterization”
on page 749.

In order to avoid error messages from unused analog input channels, it is useful to configure
them as “unused”.

I/O configuration

The module does not store configuration data itself. It gets its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

This means that replacing I/O modules is possible without any re-parameterization via software.

*If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.*

Parameterization

<table>

**Remarks:**

1) In AC500, the following interface identifier applies:
   - 14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
   - The FBP diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   - 31 = module itself, 1 ... 10 expansion module 1 ... 10, ADR = hardware address (e.g. of the DC551)

3) With "Module" the following allocation applies dependent of the master:
   - Module error: I/O bus or FBP: 31 = module itself; COM1/COM2: 1 ... 10 = expansion 1 ... 10
   - Channel error: I/O bus or FBP = module type (1 = AI); COM1/COM2: 1 ... 10 = expansion 1 ... 10

4) In case of module errors, with channel "31 = Module itself" is output.

**State LEDs**

During the power ON procedure, the module initializes automatically. All LEDs (except the channel LEDs) are ON during this time.

States of the LEDs (see also section diagnosis LEDs in the S500 system data):
### Measuring ranges

**Voltage input ranges**

**Bipolar voltage input range, measuring bridge**

Technical data

Technical data of the module

The system data of AC500 and S500 are applicable to the standard version \(\text{Chapter 5.1.2 "System data AC500" on page 166.}\)

The system data of AC500-XC are applicable to the XC version \(\text{Chapter 5.1.3 "System data AC500-XC" on page 169.}\)

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.

</tr>
<tr>
<td>Maximum permanent allowed overload (no damage)</td>
<td></td>
</tr>
</tbody>
</table>
When the input current exceeds the overflow value of the measurement range, the input impedance is switched to high impedance for protection. The maximum allowed overload is then 30 V. The digital value corresponds to the overflow value. Periodically, the input impedance is switched to the normal value and the input current is measured. If the input current is within the measurement range, the input impedance remains at the normal level and the digital value corresponds to the measured current.

</tbody>
</table>

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.
AO523 - Analog output module

**Features**

- Module-wise galvanically isolated
- XC version for use in extreme ambient conditions available

---

1. I/O bus
2. Allocation between terminal number and signal name
3. 16 yellow LEDs to display the signal states at the analog outputs (O0 ... O15)
4. 1 green LED to display the state of the process supply voltage UP
5. 2 red LEDs to display errors
6. Label
7. Terminal unit
8. DIN rail
   - Sign for XC version

---

**Intended purpose**

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.
### Functionality

- 16 analog outputs in two groups:
  - 8 channels configurable for voltage or current output (O0...O3 / O8...O11)
  - 8 channels for voltage output (O4...O7 / O12...O15)

Resolution 12 bits including sign

<table>
<thead>
<tr>

<tr>
<td>Required terminal unit</td>
<td>TU515 or TU516 “Chapter 5.2.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 938</td>
</tr>
</tbody>
</table>

### Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

The modules are plugged on an I/O terminal unit “Chapter 5.2.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 938. Properly position the modules and press until they lock in place. The terminal units are mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting “Chapter 5.2.8.2.5 “TA526 - Wall mounting accessory” on page 1324.

The connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 1.8 ... 4.8 and 1.9 ... 4.9 are electrically interconnected within the I/O terminal units and have always the same assignment, independent of the inserted module:

- Terminals 1.8 ... 4.8: process voltage UP = +24 V DC
- Terminals 1.9 ... 4.9: process voltage ZP = 0 V DC

The assignment of the other terminals:

<table>
<thead>
<tr>
<th>Terminals</th>
<th>Signal</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.0 ... 1.7</td>
<td>O0- ... O7-</td>
<td>Negative poles of the first 8 analog outputs</td>
</tr>
<tr>
<td>2.0 ... 2.7</td>
<td>O0+ ... O7+</td>
<td>Positive poles of the first 8 analog outputs</td>
</tr>
</tbody>
</table>
The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per AO523.

The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.

### WARNING!

**Removal/Insertion under power**

Removal or insertion under power is permissible only if all conditions for hot swapping are fulfilled.

- Chapter 4.9.3 “Replace an I/O module with hot swap” on page 153

The devices are not designed for removal or insertion under power when the conditions for hot swap do not apply. Because of unforeseeable consequences, it is not allowed to plug in or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while they are energized in a hazardous location could result in an electric arc, which could create an ignition source resulting in fire or explosion.

Prior to proceeding, make sure that power is been disconnected and that the area has been thoroughly checked to ensure that flammable materials are not present.

The devices must not be opened when in operation. The same applies to the network interfaces.

### NOTICE!

**Risk of damaging the PLC modules!**

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

Generally, analog signals must be laid in shielded cables. The cable shields must be grounded at both sides of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.
Fig. 116: Connection of the module: 16 analog outputs in two groups  Chapter 5.2.4.4.2.4.3 “Functionality” on page 765

CAUTION!
By installing equipotential bonding conductors between the different parts of the system, it must be ensured that the potential difference between ZP and AGND never can exceed 1 V.

CAUTION!
The process supply voltage must be included in the grounding concept (e.g. grounding of the negative terminal).

The modules provide several diagnosis functions  Chapter 5.2.4.4.2.4.8 “Diagnosis” on page 774.
Connection of analog output loads (Voltage, current)

Fig. 117: Connection example

The following measuring ranges can be configured \(\text{Chapter 5.2.4.4.2.4.7 “Parameterization” on page 769:}\)
Voltage | -10 V ... +10 V | Load max. ± 10 mA | 1 channel used  
Current | 0 mA ... 20 mA | Load 0 Ω ... 500 Ω | 1 channel used  
Current | 4 mA ... 20 mA | Load 0 Ω ... 500 Ω | 1 channel used  

Only the channels 0 ... 3 and 8 ... 11 can be configured as current output (0 mA ... 20 mA or 4 mA ... 20 mA).

The function of the LEDs is described under Displays.
Unused analog outputs can be left open-circuited.

Internal data exchange

<table>
<thead>
<tr>
<th>Digital inputs (bytes)</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Digital outputs (bytes)</td>
<td>0</td>
</tr>
<tr>
<td>Analog inputs (words)</td>
<td>0</td>
</tr>
<tr>
<td>Analog outputs (words)</td>
<td>16</td>
</tr>
</tbody>
</table>

I/O configuration

The module does not store configuration data itself. It gets its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

That means replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

<table>
<thead>
<tr>
<th>Firmware version</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Firmware version &gt; V2.0.0</td>
<td>The arrangement of the parameter data is performed by Control Builder Plus/ Automation Builder software.</td>
</tr>
</tbody>
</table>

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

**Remarks:**

1) In AC500, the following interface identifier applies:
   - 14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
   - The FBP diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   - 31 = module itself, 1 ... 10 = expansion module 1 ... 10, ADR = hardware address (e.g. of the DC551)

3) With "Module" the following allocation applies dependent of the master:
   - Module error: I/O bus or FBP: 31 = module itself; COM1/COM2: 1 ... 10 = expansion 1 ... 10
   - Channel error: I/O bus or FBP = module type (3 = AO); COM1/COM2: 1 ... 10 = expansion 1 ... 10

4) In case of module errors, with channel "31 = Module itself" is output.

**State LEDs**

During the power ON procedure, the module initializes automatically. All LEDs (except the channel LEDs) are ON during this time.
### Outputs

<table>
<thead>

### Technical data

#### Technical data of the module

The system data of AC500 and S500 are applicable to the standard version “System data AC500” on page 166.

The system data of AC500-XC are applicable to the XC version “System data AC500-XC” on page 169.

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.
AX521 - Analog input/output module

Features

- 4 configurable analog inputs (I0 ... I3) in 1 group (1.0 ... 2.3)
  Resolution 12 bits including sign
- 4 configurable analog outputs (O0 ... O3) in 1 group (3.0 ... 4.3)
  Resolution 12 bits including sign
- Module-wise galvanically isolated
- XC version for use in extreme ambient conditions available

1 I/O bus
2 Allocation between terminal number and signal name
3 4 yellow LEDs to display the signal states at the analog inputs (I0 ... I3)
4 4 yellow LEDs to display the signal states at the analog outputs (O0 ... O3)
5 1 green LED to display the state of the process supply voltage UP
6 2 red LEDs to display errors
7 Label
8 Terminal unit
9 DIN rail
10 Sign for XC version
**Intended purpose**

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e.g., CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

**Functionality**

**AX521**

4 analog inputs (channel 0…channel 3), individually configurable for:

- Unused (default setting)
- 0 V ... 10 V
- -10 V ... +10 V
- 0 mA ... 20 mA
- 4 mA ... 20 mA
- Pt100, -50 °C ... +400 °C (2-wire)
- Pt100, -50 °C ... +400 °C (3-wire), requires 2 channels
- Pt100, -50 °C ... +70 °C (2-wire)
- Pt100, -50 °C ... +70 °C (3-wire), requires 2 channels
- Pt1000, -50 °C ... +400 °C (2-wire)
- Pt1000, -50 °C ... +400 °C (3-wire), requires 2 channels
- Pt1000, -50 °C ... +150 °C (2-wire)
- Pt1000, -50 °C ... +150 °C (3-wire), requires 2 channels
- 0 V ... 10 V with differential inputs, requires 2 channels
- -10 V ... +10 V with differential inputs, requires 2 channels
- Digital signals (digital input)

4 analog outputs (channel 0 … channel 3), individually configurable for:

- Unused (default setting)
- -10 V ... +10 V
- 0 mA ... 20 mA
- 4 mA ... 20 mA

Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

The modules are plugged on an I/O terminal unit. Chapter 5.2.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 938. Properly position the modules and press until they lock in place. The terminal units are mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting. Chapter 5.2.8.2.5 “TA526 - Wall mounting accessory” on page 1324.

The connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 1.8, 2.8, 3.8 and 4.8 as well as 1.9, 2.9, 3.9 and 4.9 are electrically interconnected within the I/O terminal units and have always the same assignment, irrespective of the inserted module:

Terminals 1.8, 2.8, 3.8 and 4.8: process voltage UP = +24 V DC
Terminals 1.9, 2.9, 3.9 and 4.9: process voltage ZP = 0 V DC

Table 175: Assignment of the other terminals

<table>
<thead>
<tr>
<th>Terminals</th>

</tbody>
</table>

The negative poles of the analog inputs are connected to each other to form an "Analog Ground" signal for the module.

The negative poles of the analog outputs are connected to each other to form an "Analog Ground" signal for the module.

There is no galvanic isolation between the analog circuitry and ZP/UP. Therefore, the analog sensors must be galvanically isolated in order to avoid loops via the ground potential or the supply voltage.

Hardware descriptions
Device specifications > I/O modules
Because of their common reference potential, analog current inputs cannot be circuited in series, neither within the module nor with channels of other modules.

For the open-circuit detection (wire break), each analog input channel is pulled up to "plus" by a high-resistance resistor. If nothing is connected, the maximum voltage will be read in then.

The internal power supply voltage for the module’s circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per I/O module.

The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.

**WARNING!**

**Removal/Insertion under power**

Removal or insertion under power is permissible only if all conditions for hot swapping are fullfilled.

* Chapter 4.9.3 “Replace an I/O module with hot swap” on page 153

The devices are not designed for removal or insertion under power when the conditions for hot swap do not apply. Because of unforeseeable consequences, it is not allowed to plug in or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while they are energized in a hazardous location could result in an electric arc, which could create an ignition source resulting in fire or explosion.

Prior to proceeding, make sure that power is been disconnected and that the area has been thoroughly checked to ensure that flammable materials are not present.

The devices must not be opened when in operation. The same applies to the network interfaces.

**NOTICE!**

**Risk of damaging the PLC modules!**

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.
Generally, analog signals must be laid in shielded cables. The cable shields must be grounded at both sides of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.

![Connection of the I/O module: 4 analog inputs and 4 analog outputs, individually configurable](image)

**CAUTION!**
By installing equipotential bonding conductors between the different parts of the system, it must be ensured that the potential difference between ZP and AGND never can exceed 1 V.

**CAUTION!**
The process supply voltage must be included in the grounding concept (e.g. grounding of the negative terminal).

**Connection of resistance thermometers in 2-wire configuration**
When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the I/O module provides a constant current source which is multiplexed over the 8 analog channels.
Fig. 119: Connection example

<table>
<thead>
<tr>
<th>Resistance Thermometer</th>
<th>Temperature Range</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pt100</td>
<td>-50 °C ... +70 °C</td>
<td>2-wire config, one channel used</td>
</tr>
<tr>
<td>Pt100</td>
<td>-50 °C ... +400 °C</td>
<td>2-wire config, one channel used</td>
</tr>
<tr>
<td>Pt1000</td>
<td>-50 °C ... +400 °C</td>
<td>2-wire config, one channel used</td>
</tr>
<tr>
<td>Ni1000</td>
<td>-50 °C ... +150 °C</td>
<td>2-wire config, one channel used</td>
</tr>
</tbody>
</table>

The I/O module performs a linearization of the resistance characteristic.

In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".

**Connection of resistance thermometers in 3-wire configuration**

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the I/O module provides a constant current source which is multiplexed over the max. 8 (depending on the configuration) analog channels.

Fig. 120: Connection example
If several measuring points are adjacent to each other, only one return line is necessary. This saves wiring costs.

With the 3-wire configuration, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1).

The constant current of one channel flows through the resistance thermometer. The constant current of the other channel flows through one of the cores. The module calculates the measured value from the two voltage drops and stores it under the input with the higher channel number (e.g. I1).

In order to keep measuring errors as small as possible, it is necessary to have all the involved conductors in the same cable. All the conductors must have the same cross section.

<table>
<thead>
<tr>
<th>Material</th>
<th>Temperature Range</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pt100</td>
<td>-50 °C ... +70 °C</td>
<td>3-wire configuration, two channels used</td>
</tr>

<tr>
<td>Ni1000</td>
<td>-50 °C ... +150 °C</td>
<td>3-wire configuration, two channels used</td>
</tr>
</tbody>
</table>

The I/O module performs a linearization of the resistance characteristic.

In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".
Connection of active-type analog sensors (Voltage) with galvanically isolated power supply

Fig. 121: Connection example
By connecting the sensor's negative pole of the output voltage to AGND, the galvanically isolated voltage source of the sensor is referred to ZP.

The following measuring ranges can be configured for AX521, Chapter 5.2.4.4.2.5.7 “Parameterization” on page 796 and for AX522, Chapter 5.2.4.4.2.6.7 “Parameterization” on page 826:

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0 V ... 10 V</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V ... +10 V</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

Connection of active-type analog sensors (Current) with galvanically isolated power supply

Fig. 122: Connection example

<table>
<thead>
<tr>
<th>Current</th>
<th>0 mA ... 20 mA</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current</td>
<td>4 mA ... 20 mA</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

Unused input channels can be left open-circuited, because they are of low resistance.
Connection of active-type analog sensors (Voltage) with no galvanically isolated power supply

Fig. 123: Connection example
CAUTION!
The potential difference between AGND and ZP at the module must not be
greater than 1V, not even in case of long lines (see figure Terminal Assignment).

If AGND does not get connected to ZP, the sensor current flows to ZP via the
AGND line. The measuring signal is distorted, as a very small current flows
through the voltage line. The total current through the PTC should not exceed
50 mA. This measuring method is therefore only suitable for short lines and
small sensor currents. If there are bigger distances, the difference measuring
method should be applied.

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0 V ... 10 V</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V ... +10 V *)</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

*) if the sensor can provide this signal range

In order to avoid error messages or long processing times, it is useful to configure unused
analog input channels as "unused".
Connection of passive-type analog sensors (Current)

Fig. 124: Connection example
| Current | 4 mA ... 20 mA | 1 channel used |

**CAUTION!**
If, during initialization, an analog current sensor supplies more than 25 mA for more than 1 second to an analog input, this input is switched off by the module (input protection). In such cases, it is recommended to protect the analog input by a 10-volt Zener diode (in parallel to I+ and ZP). But, in general, sensors with fast initialization or without current peaks higher than 25 mA are preferrable.

Unused input channels can be left open-circuited because they are of low resistance.

**Connection of active-type analog sensors (Voltage) to differential inputs**

Differential inputs are very useful if analog sensors are used which are remotely non-isolated (e.g. the minus terminal is remotely grounded).

The use of differential inputs helps to considerably increase the measuring accuracy and to avoid ground loops.

With differential input configurations, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

The analog value is calculated by subtraction of the input value with the higher address from the input value of the lower address.

The converted analog value is available at the odd channel (higher address).

**CAUTION!**
The ground potential at the sensors must not have too large a potential difference with respect to ZP (max. ±1 V within the full signal range). Otherwise, problems may occur concerning the common-mode input voltages of the involved analog inputs.
Fig. 125: Connection example
The negative pole of the sensor must be grounded next to the sensor.

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0 V ... 10 V</th>
<th>with differential inputs, 2 channels used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V ... +10 V</td>
<td>with differential inputs, 2 channels used</td>
</tr>
</tbody>
</table>

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

Use of analog inputs as digital inputs

Several (or all) analog inputs can be configured as digital inputs. The inputs are not galvanically isolated against the other analog channels.

Digital input | 24 V | 1 channel used |
---------------|------|----------------|
Effect of incorrect input terminal connection | Wrong or no signal detected, no damage up to 35 V |
Connection of analog output loads (Voltage, current)

Fig. 127: Connection example
Voltage | -10 V ... +10 V | Load max. ± 10 mA | 1 channel used
---|---|---|---
Current | 0 mA ... 20 mA | Load 0 Ω ... 500 Ω | 1 channel used
Current | 4 mA ... 20 mA | Load 0 Ω ... 500 Ω | 1 channel used

Only the channels 0 ... 3 can be configured as current output (0 mA ... 20 mA or 4 mA ... 20 mA).
Unused analog outputs can be left open-circuited.

Internal data exchange

| Digital inputs (bytes) | 0 |
| Digital outputs (bytes) | 0 |
| Counter input data (words) | 4 |
| Counter output data (words) | 4 |

I/O configuration

The module does not store configuration data itself. It gets its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.
Hence, replacing I/O modules is possible without any re-parameterization via software.

Parameterization

<table>
<thead>
<tr>
<th>Firmware version</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Firmware version &gt; V2.0.0</td>
<td>The arrangement of the parameter data is performed by Control Builder Plus/ Automation Builder software.</td>
</tr>
</tbody>
</table>

The parameter data directly influences the functionality of modules.
For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Remarks:
1) In AC500, the following interface identifier applies:
14 = I/O bus,  11 = COM1 (e.g. CS31 bus), 12 = COM2.
The FBP diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
31 = module itself, 1 ... 10 = expansion module 1 ... 10, ADR = hardware address (e.g. of the DC551)

3) With "Module" the following allocation applies depending on the master:
Module error: I/O bus or FBP: 31 = module itself; COM1/COM2: 1 ... 10 = expansion 1 ... 10
Channel error: I/O bus or FBP = module type (1 = AI, 3 = AO); COM1/COM2: 1 ... 10 = expansion 1 ... 10

4) In case of module errors, with channel "31 = Module itself" is output.

State LEDs

During the power ON procedure, the module initializes automatically. All LEDs (except the channel LEDs) are ON during this time.

Technical data

Technical data of the module

The system data of AC500 and S500 are applicable to the standard version “Chapter 5.1.2 “System data AC500” on page 166.

The system data of AC500-XC are applicable to the XC version “Chapter 5.1.3 “System data AC500-XC” on page 169.

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.

### Hardware descriptions

#### Device specifications > I/O modules

- Connections of the channels I0+ ... I3+
  Terminals 2.0 ... 2.3

- Input type
  Bipolar (not with current or Pt100/Pt1000/Ni1000)

- Galvanic isolation
  Against internal supply and other modules

- Configurability
  0 V ... 10 V, -10 V ... +10 V, 0 mA ... 20 mA, 4 mA ... 20 mA, Pt100/1000, Ni1000 (each input can be configured individually)

- Channel input resistance
  Voltage: > 100 kΩ
  Current: ca. 330 Ω

- Time constant of the input filter
  Voltage: 100 µs
  Current: 100 µs

- Indication of the input signals
  One LED per channel

- Conversion cycle
  2 ms (for 8 inputs + 8 outputs), with Pt/Ni... 1 s

- Resolution
  Range 0 V ... 10 V: 12 bits
  Range -10 V ... +10 V: 12 bits including sign
  Range 0 mA ... 20 mA: 12 bits
  Range 4 mA ... 20 mA: 12 bits

- Conversion error of the analog values caused by non-linearity, adjustment error at factory and resolution within the normal range
  Typ. ± 0.5 % of full scale at 25 °C
  Max. ± 1 % of full scale (all ranges) at 0 °C ... 60 °C or EMC disturbance

- Relationship between input signal and hex code
  Chapter 5.2.4.4.2.5.10.2 “Input ranges resistance temperature detector” on page 804

- Unused voltage inputs
  Are configured as "unused"

- Unused current inputs
  Have a low resistance, can be left open-circuited

- Overvoltage protection
  Yes

</tbody>
</table>

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.
AX522 - Analog input/output module

Features

- 8 configurable analog inputs (I0 ... I7) in 1 group (1.0 ... 2.7)
  Resolution 12 bits including sign
- 8 configurable analog outputs (O0 ... O7) in 1 group (3.0 ... 4.7)
  Resolution 12 bits including sign
- Module-wise galvanically isolated
- XC version for use in extreme ambient conditions available

1 I/O bus
2 Allocation between terminal number and signal name
3 8 yellow LEDs to display the signal states at the analog inputs (I0 ... I7)
4 8 yellow LEDs to display the signal states at the analog outputs (O0 ... O7)
5 1 green LED to display the state of the process supply voltage UP
6 2 red LEDs to display errors
7 Label
8 Terminal unit
9 DIN rail
$^*$ Sign for XC version
Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e.g., CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

Functionality

8 analog inputs (channel 0 ... channel 7), individually configurable

- Unused (default setting)
- 0 V ... 10 V
- -10 V ... +10 V
- 0 mA ... 20 mA
- 4 mA ... 20 mA
- Pt100, -50 °C ... +400 °C (2-wire)
- Pt100, -50 °C ... +400 °C (3-wire), requires 2 channels
- Pt100, -50 °C ... +70 °C (2-wire)
- Pt100, -50 °C ... +70 °C (3-wire), requires 2 channels
- Pt1000, -50 °C ... +400 °C (2-wire)
- Pt1000, -50 °C ... +400 °C (3-wire), requires 2 channels
- Pt1000, -50 °C ... +150 °C (2-wire)
- Pt1000, -50 °C ... +150 °C (3-wire), requires 2 channels
- 0 V ... 10 V with differential inputs, requires 2 channels
- -10 V ... +10 V with differential inputs, requires 2 channels
- Digital signals (digital input)

Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.
The modules are plugged on an I/O terminal unit. Chapter 5.2.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 938. Properly position the modules and press until they lock in place. The terminal units are mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting. Chapter 5.2.8.2.5 “TA526 - Wall mounting accessory” on page 1324.

The connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 1.8, 2.8, 3.8 and 4.8 as well as 1.9, 2.9, 3.9 and 4.9 are electrically interconnected within the I/O terminal units and always have the same assignment, independent of the inserted module:

Terminals 1.8, 2.8, 3.8 and 4.8: process voltage UP = +24 V DC
Terminals 1.9, 2.9, 3.9 and 4.9: process voltage ZP = 0 V DC

The assignment of the other terminals:

<table>
<thead>
<tr>
<th>Terminals</th>

</tbody>
</table>

The negative poles of the analog inputs are connected to each other to form an "Analog Ground" signal for the module.

The negative poles of the analog outputs are connected to each other to form an "Analog Ground" signal for the module.

There is no galvanic isolation between the analog circuitry and ZP/UP. Therefore, the analog sensors must be galvanically isolated in order to avoid loops via the ground potential or the supply voltage.

Because of their common reference potential, analog current inputs cannot be circuited in series, neither within the module nor with channels of other modules.

For the open-circuit detection (wire break), each analog input channel is pulled up to "plus" by a high-resistance resistor. If nothing is connected, the maximum voltage will be read in then.
The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per I/O module. The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.

**WARNING!**

**Removal/Insertion under power**

Removal or insertion under power is permissible only if all conditions for hot swapping are fullfilled.

* Chapter 4.9.3 “Replace an I/O module with hot swap” on page 153

The devices are not designed for removal or insertion under power when the conditions for hot swap do not apply. Because of unforeseeable consequences, it is not allowed to plug in or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while they are energized in a hazardous location could result in an electric arc, which could create an ignition source resulting in fire or explosion.

Prior to proceeding, make sure that power is been disconnected and that the area has been thoroughly checked to ensure that flammable materials are not present.

The devices must not be opened when in operation. The same applies to the network interfaces.

**NOTICE!**

**Risk of damaging the PLC modules!**

- Overvoltages and short circuits might damage the PLC modules.
  - Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
  - Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

**Generally, analog signals must be laid in shielded cables. The cable shields must be grounded at both sides of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.**
Fig. 128: Connection of the I/O module: 8 analog inputs and 8 analog outputs, individually configurable. Chapter 5.2.4.4.2.6.3 “Functionality” on page 811

**CAUTION!**
By installing equipotential bonding conductors between the different parts of the system, it must be ensured that the potential difference between ZP and AGND never can exceed 1 V.

**CAUTION!**
The process supply voltage must be included in the grounding concept (e.g. grounding of the negative terminal).

Connection of resistance thermometers in 2-wire configuration

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the I/O module provides a constant current source which is multiplexed over the 8 analog channels.
The I/O module performs a linearization of the resistance characteristic. In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".

Connection of resistance thermometers in 3-wire configuration

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the I/O module provides a constant current source which is multiplexed over the max. 8 (depending on the configuration) analog channels.
If several measuring points are adjacent to each other, only one return line is necessary. This saves wiring costs.

With the 3-wire configuration, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1).

The constant current of one channel flows through the resistance thermometer. The constant current of the other channel flows through one of the cores. The module calculates the measured value from the two voltage drops and stores it under the input with the higher channel number (e.g. I1).

In order to keep measuring errors as small as possible, it is necessary to have all the involved conductors in the same cable. All the conductors must have the same cross section.

<table>
<thead>
<tr>
<th></th>
<th>Temperature Range</th>

</tr>
</tbody>
</table>

The I/O module performs a linearization of the resistance characteristic.

In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".
Connection of active-type analog sensors (Voltage) with galvanically isolated power supply

Fig. 131: Connection example
By connecting the sensor’s negative pole of the output voltage to AGND, the galvanically isolated voltage source of the sensor is referred to ZP.

The following measuring ranges can be configured for AX521 *Chapter 5.2.4.4.2.5.7 “Parameterization” on page 796* and for AX522 *Chapter 5.2.4.4.2.6.7 “Parameterization” on page 826*:

<table>
<thead>
<tr>

</thead>
<tbody>
<tr>
<td>Current</td>
<td>0 mA ... 20 mA</td>
<td>1 channel</td>
</tr>
<tr>
<td>Current</td>
<td>4 mA ... 20 mA</td>
<td>1 channel</td>
</tr>
</tbody>
</table>

Unused input channels can be left open-circuited, because they are of low resistance.
Connection of active-type analog sensors (Voltage) with no galvanically isolated power supply

Fig. 133: Connection example
CAUTION!
The potential difference between AGND and ZP at the module must not be greater than 1V, not even in case of long lines (see figure Terminal Assignment).

If AGND does not get connected to ZP, the sensor current flows to ZP via the AGND line. The measuring signal is distorted, as a very small current flows through the voltage line. The total current through the PTC should not exceed 50 mA. This measuring method is therefore only suitable for short lines and small sensor currents. If there are bigger distances, the difference measuring method should be applied.

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0 V ... 10 V</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V ... +10 V *)</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

*) if the sensor can provide this signal range

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".
Connection of passive-type analog sensors (Current)

Fig. 134: Connection example
CAUTION!
If, during initialization, an analog current sensor supplies more than 25 mA for more than 1 second to an analog input, this input is switched off by the module (input protection). In such cases, it is recommended to protect the analog input by a 10-volt Zener diode (in parallel to I+ and ZP). But, in general, sensors with fast initialization or without current peaks higher than 25 mA are preferrable.

Unused input channels can be left open-circuited because they are of low resistance.

Connection of active-type analog sensors (Voltage) to differential inputs

Differential inputs are very useful if analog sensors are used which are remotely non-isolated (e.g. the minus terminal is remotely grounded).

The use of differential inputs helps to considerably increase the measuring accuracy and to avoid ground loops.

With differential input configurations, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

The analog value is calculated by subtraction of the input value with the higher address from the input value of the lower address.

The converted analog value is available at the odd channel (higher address).

CAUTION!
The ground potential at the sensors must not have too large a potential difference with respect to ZP (max. ±1 V within the full signal range). Otherwise, problems may occur concerning the common-mode input voltages of the involved analog inputs.
Fig. 135: Connection example
The negative pole of the sensor must be grounded next to the sensor.

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0 V ... 10 V</th>
<th>with differential inputs, 2 channels used</th>

</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V ... +10 V</td>
<td>with differential inputs, 2 channels used</td>
</tr>
</tbody>
</table>

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

Use of analog inputs as digital inputs

Several (or all) analog inputs can be configured as digital inputs. The inputs are not galvanically isolated against the other analog channels.

![Connection example](image_url)

**Fig. 136: Connection example**

<table>
<thead>
<tr>
<th>Digital input</th>
<th>24 V</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Effect of incorrect input terminal connection</td>
<td>Wrong or no signal detected, no damage up to 35 V</td>
<td></td>
</tr>
</tbody>
</table>
Connection of analog output loads (Voltage, current)

Fig. 137: Connection example
Voltage
-10 V ... +10 V
Load max. ± 10 mA
1 channel used

Current
0 mA ... 20 mA
Load 0 Ω ... 500 Ω
1 channel used

Current
4 mA ... 20 mA
Load 0 Ω ... 500 Ω
1 channel used

Only the channels 0 ... 3 can be configured as current output (0 mA ... 20 mA or 4 mA ... 20 mA).
Unused analog outputs can be left open-circuited.

Internal data exchange

<table>
<thead>
<tr>
<th>Digital inputs (bytes)</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Digital outputs (bytes)</td>
<td>0</td>
</tr>
<tr>
<td>Counter input data (words)</td>
<td>8</td>
</tr>
<tr>
<td>Counter output data (words)</td>
<td>8</td>
</tr>
</tbody>
</table>

I/O configuration

The module does not store configuration data itself. It gets its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

Parameterization

<table>
<thead>
<tr>
<th>Firmware version</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Firmware version &gt; V2.0.0</td>
<td>The arrangement of the parameter data is performed by Control Builder Plus/ Automation Builder software.</td>
</tr>
</tbody>
</table>

The parameter data directly influences the functionality of modules.
For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Module: Module slot address: Y = 1 ... 10

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Remarks:

1) In AC500, the following interface identifier applies:
   14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
   The FBP diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   31 = module itself, 1 ... 10 = expansion module 1 ... 10, ADR = hardware address (e.g. of the DC551)

3) With "Module" the following allocation applies depending on the master:
   Module error: I/O bus or FBP: 31 = module itself; COM1/C0M2: 1 ... 10 = expansion 1 ... 10
   Channel error: I/O bus or FBP = module type (1 = AI, 3 = AO); COM1/C0M2: 1 ... 10 = expansion 1 ... 10

4) In case of module errors, with channel "31 = Module itself" is output.

State LEDs

During the power ON procedure, the module initializes automatically. All LEDs (except the channel LEDs) are ON during this time.

Technical data

Technical data of the module

The system data of AC500 and S500 are applicable to the standard version “Chapter 5.1.2 “System data AC500” on page 166.”

The system data of AC500-XC are applicable to the XC version “Chapter 5.1.3 “System data AC500-XC” on page 169.”

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.

### Parameter
**From 24 V DC power supply at the terminals UP/L+ and ZP/M of the CPU/communication interface module**  
Ca. 2 mA

**From UP at normal operation**  
0.15 A + output loads

**Inrush current from UP (at power up)**  
0.020 A²s

**Max. length of analog cables, conductor cross section > 0.14 mm²**  
100 m

**Weight**  
300 g

**Mounting position**  
Horizontal or vertical with derating (output load reduced to 50% at 40 °C per group)

**Cooling**  
The natural convection cooling must not be hindered by cable ducts or other parts in the control cabinet.

---

**NOTICE!**

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and temporary overvoltage up to 30 V DC.

---

5.2.4.5 Digital/Analog I/O modules
5.2.4.5.1 S500 and S500-XC
DA501 - Digital/Analog input/output module

Features

- 16 digital inputs 24 V DC
- 8 configurable digital inputs/outputs 24 V DC, 0.5 A max.
- 4 analog inputs, voltage, current and RTD.
  Resolution 12 bits including sign
- 2 analog outputs, voltage and current
  Resolution 12 bits including sign
- Fast counter

- Module-wise galvanically isolated
- XC version for use in extreme ambient conditions available
Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e.g., CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

Functionality

- 16 digital inputs 24 V DC
- 8 configurable digital inputs/outputs 24 V DC, 0.5 A max.
- 4 analog inputs, voltage, current and RTD. 
  Resolution 12 bits including sign
- 2 analog outputs, voltage and current 
  Resolution 12 bits including sign
- Fast counter

Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

The connection is carried out by using the 40 terminals of the terminal unit TU515/TU516 © Chapter 5.2.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 938.

The assignment of the terminals:

</tbody>
</table>

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per DA501.

The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.
WARNING!
Removal/Insertion under power
Removal or insertion under power is permissible only if all conditions for hot swapping are fulfilled.

Chapter 4.9.3 “Replace an I/O module with hot swap” on page 153

The devices are not designed for removal or insertion under power when the conditions for hot swap do not apply. Because of unforeseeable consequences, it is not allowed to plug in or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while they are energized in a hazardous location could result in an electric arc, which could create an ignition source resulting in fire or explosion.

Prior to proceeding, make sure that power is been disconnected and that the area has been thoroughly checked to ensure that flammable materials are not present.

The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!
Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.
- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

NOTICE!
Risk of damaging the PLC modules!
The PLC modules must not be removed while the plant is connected to a power supply.
Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove or replace a module.

CAUTION!
Risk of imprecise and faulty measurements!
Analog signals may be distorted seriously by external electromagnetic influences.
Use shielded wires when wiring analog signal sources. The cable shield must be grounded at both ends of the cable. Provide a potential equalization of a low resistance to avoid high potential differences between different parts of the plant.
Connection of the digital inputs

The following figure shows the connection of the digital input DI0. Proceed with the digital inputs DI1 ... DI15 in the same way.

Fig. 139: Connection of the module

The meaning of the LEDs is described in the Displays chapter Chapter 5.2.4.5.1.9 “State LEDs” on page 863.
Connection of the configurable digital inputs/outputs

![Diagram showing connection of configurable digital inputs/outputs](image)

**Fig. 140: Connection of configurable digital inputs/outputs to the module (DC16 ... DC23) (DC16 as an input, DC17 as an output)**

**CAUTION!**

Risk of influences to the connected sensors!
Some sensors may be influenced by the deactivated module outputs of DA501. If the inputs are used as fast counter inputs, connect a 470 Ω / 1 W resistor in series to inputs DC16/DC17.

Connection of resistance thermometers in 2-wire configuration to the analog inputs

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module DA501 provides a constant current source which is multiplexed over the max. 4 analog input channels.
The following measuring ranges can be configured on page 856:

<table>
<thead>
<tr>
<th>Thermometer</th>
<th>Temperature Range</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pt100</td>
<td>-50 °C ... +400 °C</td>
<td>2-wire, 1 channel used</td>
</tr>
<tr>
<td>Pt1000</td>
<td>-50 °C ... +400 °C</td>
<td>2-wire, 1 channel used</td>
</tr>
<tr>
<td>Ni1000</td>
<td>-50 °C ... +150 °C</td>
<td>2-wire, 1 channel used</td>
</tr>
</tbody>
</table>

The function of the LEDs is described under Diagnosis and displays / Displays on page 863.

The module DA501 performs a linearization of the resistance characteristic.

To avoid error messages from unused analog input channels, configure them as "unused".

**Connection of resistance thermometers in 3-wire configuration to the analog inputs**

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module DA501 provides a constant current source which is multiplexed over the max. 4 analog input channels.
With 3-wire configuration, 2 adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1).

The constant current of one channel flows through the resistance thermometer. The constant current of the other channel flows through one of the cores. The module calculates the measured value from the two voltage drops and stores it under the input with the higher channel number (e.g. I1).

In order to keep measuring errors as small as possible, it is necessary to have all the involved conductors in the same cable. All the conductors must have the same cross section.

The following measuring ranges can be configured: Chapter 5.2.4.5.1.1.7 “Parameterization” on page 856:

<table>
<thead>
<tr>
<th>Thermometer</th>
<th>Temperature Range</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pt100</td>
<td>-50 °C ... +400 °C</td>
<td>3-wire config.</td>
</tr>
<tr>
<td>Pt1000</td>
<td>-50 °C ... +400 °C</td>
<td>3-wire config.</td>
</tr>
<tr>
<td>Ni1000</td>
<td>-50 °C ... +150 °C</td>
<td>3-wire config.</td>
</tr>
</tbody>
</table>

The function of the LEDs is described under Diagnosis and displays / Displays: Chapter 5.2.4.5.1.1.8 “Diagnosis” on page 861.

The module DA501 performs a linearization of the resistance characteristic.

To avoid error messages from unused analog input channels, configure them as "unused".

![Connection diagram of resistance thermometers in 3-wire configuration to the analog inputs (AI0 ... AI3)](image-url)
Connection of active-type analog sensors (Voltage) with galvanically isolated power supply to the analog inputs

Fig. 143: Connection of active-type analog sensors (voltage) with galvanically isolated power supply to the analog inputs (AI0 ... AI3)

The following measuring ranges can be configured "Parameterization" on page 856:

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0 V ... 10 V</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V ... +10 V</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

The function of the LEDs is described under Diagnosis and displays / Displays "State LEDs" on page 863.

To avoid error messages from unused analog input channels, configure them as "unused".
Connection of active-type analog sensors (Current) with galvanically isolated power supply to the analog inputs

Fig. 144: Connection of active-type analog sensors (current) with galvanically isolated power supply to the analog inputs (AI0 ... AI3)

The following measuring ranges can be configured

<table>
<thead>
<tr>
<th>Current</th>
<th>0 mA ... 20 mA</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current</td>
<td>4 mA ... 20 mA</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

The function of the LEDs is described under Diagnosis and displays / Displays

Unused input channels can be left open-circuited, because they are of low resistance.
Connection of active-type analog sensors (Voltage) with no galvanically isolated power supply to the analog inputs

![Connection Diagram](image)

**Fig. 145:** Connection of active-type sensors (voltage) with no galvanically isolated power supply to the analog inputs (AI0 ... AI3)

**CAUTION!**

Risk of faulty measurements!

The negative pole at the sensors must not have too big a potential difference with respect to ZP (max. ± 1 V within the full signal range).

Make sure that the potential difference never exceeds ± 1 V.

The following measuring ranges can be configured [Chapter 5.2.4.5.1.1.7 “Parameterization” on page 856]:

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0 V ... 10 V</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V ... +10 V</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

For a description of the function of the LEDs, please refer to the Diagnosis and displays / Displays chapter [Chapter 5.2.4.5.1.1.9 “State LEDs” on page 863].

To avoid error messages from unused analog input channels, configure them as "unused".
Connection of passive-type analog sensors (Current) to the analog inputs

The following measuring ranges can be configured: Chapter 5.2.4.5.1.7 “Parameterization” on page 856:

<table>
<thead>
<tr>
<th>Current</th>
<th>4 mA ... 20 mA</th>
<th>1 channel used</th>
</tr>
</thead>
</table>

For a description of function of the LEDs, please refer to the Diagnosis and displays / Displays chapter: Chapter 5.2.4.5.1.9 “State LEDs” on page 863.

**CAUTION!**

**Risk of overloading the analog input!**

If an analog current sensor supplies more than 25 mA for more than 1 second during initialization, this input is switched off by the module (input protection).

Only use sensors with fast initialization or without current peaks higher than 25 mA. If not possible, connect a 10-volt Zener diode in parallel to I+ and ZP.

Unused input channels can be left open-circuited, because they are of low resistance.

Connection of active-type analog sensors (Voltage) to differential analog inputs

Differential inputs are very useful if analog sensors which are remotely non-isolated (e.g. the negative terminal is remotely grounded) are used.

Using differential inputs helps to considerably increase the measuring accuracy and to avoid ground loops.

With differential input configurations, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

The analog value is calculated by subtraction of the input value with the higher address from the input value of the lower address.
The converted analog value is available at the odd channel (higher address).

**CAUTION!**
Risk of faulty measurements!
The negative pole at the sensors must not have too large a potential difference with respect to ZP (max. ± 1 V within the full signal range).
Make sure that the potential difference never exceeds ± 1 V.

The following figure shows the connection of active-type analog sensors (voltage) to differential analog inputs AI0 and AI1. Proceed with AI2 and AI3 in the same way.

![Connection diagram](image)

**Fig. 147: Connection of active-type analog sensors (voltage) to differential analog inputs (AI0 ... AI3)**

The following measuring ranges can be configured [Chapter 5.2.4.5.1.1.7 "Parameterization" on page 856]:

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0 V ... 10 V</th>
<th>with differential inputs, 2 channels used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V ... +10 V</td>
<td>with differential inputs, 2 channels used</td>
</tr>
</tbody>
</table>

For a description of the function of the LEDs, please refer to the Diagnosis and displays / Displays chapter [Chapter 5.2.4.5.1.1.9 “State LEDs” on page 863].

To avoid error messages from unused analog input channels, configure them as "unused".

**Use of analog inputs as digital inputs**

Several (or all) analog inputs can be configured as digital inputs. The inputs are not galvanically isolated against the other analog channels.
The following measuring ranges can be configured in Chapter 5.2.4.5.1.1.7 "Parameterization" on page 856:

<table>
<thead>
<tr>
<th>Digital input</th>
<th>24 V DC</th>
<th>1 channel used</th>
</tr>
</thead>
</table>

For a description of the function of the LEDs, please refer to the Diagnosis and displays / Displays chapter in Chapter 5.2.4.5.1.1.9 "State LEDs" on page 863.

**Connection of analog output loads (Voltage)**

Fig. 149: Connection of analog output loads (voltage) to the analog outputs (AO0 and AO1)
The following measuring ranges can be configured in Chapter 5.2.4.5.1.1.7 “Parameterization” on page 856:

<table>
<thead>
<tr>
<th>Voltage</th>
<th>-10 V ... +10 V</th>
<th>Load ± 10 mA max.</th>
<th>1 channel used</th>
</tr>
</thead>
</table>

For a description of the function of the LEDs, please refer to the Diagnosis and displays / Displays chapter in Chapter 5.2.4.5.1.1.9 “State LEDs” on page 863.

Unused analog outputs can be left open-circuited.

Connection of analog output loads (Current)

![Connection diagram](image)

*Fig. 150: Connection of analog output loads (current) to the analog outputs (AO0 and AO1)*

The following measuring ranges can be configured in Chapter 5.2.4.5.1.1.7 “Parameterization” on page 856:

<table>
<thead>
<tr>
<th>Current</th>
<th>0 mA ... 20 mA</th>
<th>Load 0 Ω ... 500 Ω</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current</td>
<td>4 mA ... 20 mA</td>
<td>Load 0 Ω ... 500 Ω</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

For a description of the function of the LEDs, please refer to the Diagnosis and displays / Displays chapter in Chapter 5.2.4.5.1.1.9 “State LEDs” on page 863.

Unused analog outputs can be left open-circuited.

Internal data exchange

<table>
<thead>
<tr>
<th></th>

<td>8</td>
</tr>
</tbody>
</table>

**I/O configuration**

The module does not store configuration data itself. It gets its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

**Parameterization**

<table>
<thead>
<tr>
<th>Firmware version</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Firmware version &gt; V2.0.0</td>
<td>The arrangement of the parameter data is performed by Control Builder Plus/ Automation Builder software.</td>
</tr>
</tbody>
</table>

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

</tr>
<tr>
<td>Off by E3 + Failsafe</td>
<td>Error LED lights up at errors of error classes E1 and E2, Failsafe mode on *)</td>
</tr>
</tbody>
</table>

Remarks:

1) With a faulty ID, the Modules reports a “parameter error” and does not perform cyclic process data transmission

2) Not for FBP

3) With FBP or CS31 without the parameter “Fast Counter”

---

*The fast counter of the module does not work if the module is connected to an FBP interface module or CS31 bus module.*

4) For counter operating modes, please refer to the description of the fast counter % Chapter 5.2.4.3.2.9 “Fast counter” on page 606

5) The parameter Behavior outputs at comm. error is only analyzed if the Failsafe-mode is ON.

Diagnosis

In cases of short circuit or overload, the digital outputs are turned off. The module performs reactivation automatically. Thus an acknowledgement of the errors is not necessary. The error message is stored via the LED.

Remarks:
1) In AC500, the following interface identifier applies:
14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
The FBP diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
31 = module itself,
1 ... 10 = communication interface module 1 ... 10,
ADR = hardware address (e.g. of the DC551)

3) With "Module" the following allocation applies depending on the master:
Module error: I/O bus or FBP: 31 = module itself; COM1/COM2: 1 ... 10 = expansion 1 ... 10
Channel error: I/O bus or FBP = module type (1 = AI, 3 = AO, 4 = DC); COM1/COM2: 1 ... 10 = expansion 1 ... 10

4) In case of module errors, with channel "31 = module itself" is output.

5) Ch = 22 ... 29 indicates the digital inputs/outputs DC16 ... DC23

6) Ch = 16 ... 19 indicates the analog inputs AI0 ... AI3

7) Ch = 20 ... 21 indicates the analog outputs AO0 ... AO1

</tbody>
</table>

1) Indication LED is ON even if an input signal is applied to the channel and the supply voltage is off. In this case the module is not operating and does not generate an input signal.

2) Brightness depends on the value of the analog signal

3) All of the LEDs CH-ERR1 to CH-ERR4 light up together
### Measuring ranges

### Technical data

#### Technical data of the module

The system data of AC500 and S500 are applicable to the standard version & Chapter 5.1.2 “System data AC500” on page 166.
The system data of AC500-XC are applicable to the XC version. Chapter 5.1.3 "System data AC500-XC" on page 169.

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.

NOTICE!

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and temporary overvoltage up to 30 V DC.

Multiple overloads

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

**Technical data of the configurable digital inputs/outputs**

Each of the configurable digital I/O channels can be defined as input or output by the user program. This is done by interrogating or allocating the corresponding channel.

* Due to the direct connection to the output, the demagnetizing varistor is also effective at the input (see figure) above. This is why the difference between UPx and the input signal must not exceed the clamp voltage of the varistor. The varistor limits the clamp voltage to approx. 36 V. Consequently, the input voltage must range from -12 V ... +30 V when UPx = 24 V and from -6 V ... +30 V when UPx = 30 V.

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

DA502 - Digital/Analog input/output module

Features

- 16 digital outputs, 24 V DC, 0.5 A max.
- 8 configurable digital inputs/outputs 24 V DC, 0.5 A max.
- 4 analog inputs, voltage, current and RTD, resolution 12 bits including sign
- 2 analog outputs, voltage and current, resolution 12 bits including sign
- Fast counter
- Module-wise galvanically isolated
- XC version for use in extreme ambient conditions available
1 I/O bus
2 Allocation between terminal number and signal name
3 16 yellow LEDs to display the signal states of the digital outputs DO0 ... DO15
4 4 yellow LEDs to display the signal states of the analog inputs AI0 ... AI3
5 2 yellow LEDs to display the signal states of the analog outputs AO0 ... AO1
6 8 yellow LEDs to display the signal states of the configurable digital inputs/outputs DC16 ... DC23
7 1 green LED to display the state of the process supply voltage UP
8 4 red LEDs to display errors
9 Label
10 Terminal unit
11 DIN rail
\*\* Sign for XC version

**Intended purpose**

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e.g., CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

</table>

The internal power supply voltage for the module’s circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per DA502.

The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.
WARNING!
Removal/Insertion under power
Removal or insertion under power is permissible only if all conditions for hot swapping are fulfilled.

Chapter 4.9.3 “Replace an I/O module with hot swap” on page 153

The devices are not designed for removal or insertion under power when the conditions for hot swap do not apply. Because of unforeseeable consequences, it is not allowed to plug in or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while they are energized in a hazardous location could result in an electric arc, which could create an ignition source resulting in fire or explosion.

Prior to proceeding, make sure that power is been disconnected and that the area has been thoroughly checked to ensure that flammable materials are not present.

The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!
Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.
– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

NOTICE!
Risk of damaging the PLC modules!
The PLC modules must not be removed while the plant is connected to a power supply.

Make sure that all voltage sources (supply and process voltage) are switched off before you
– connect or disconnect any signal or terminal block
– remove or replace a module.

CAUTION!
Risk of imprecise and faulty measurements!
Analog signals may be distorted seriously by external electromagnetic influences.

Use shielded wires when wiring analog signal sources. The cable shield must be grounded at both ends of the cable. Provide a potential equalization of a low resistance to avoid high potential differences between different parts of the plant.
Fig. 152: Terminal assignment of the module

The module provides several diagnosis functions "Diagnosis" on page 895.

Connection of the digital outputs

Fig. 153: Connection of the digital outputs (DO0 ... DO15)

For a description of the meaning of the LEDs, please refer to the Displays chapter "State LEDs" on page 897.
Connection of the configurable digital inputs/outputs

![Diagram of configurable digital inputs/outputs](Image)

Fig. 154: Connection of the configurable digital input/outputs (DC16 ... DC23) (DC16 as an input, DC17 as an output)

**NOTICE!**

Risk of influences to the connected sensors!

- Some sensors may be influenced by the deactivated module outputs of DA502.
- Connect a 470 Ω / 1 W resistor in series to inputs DC16/DC17 if they are used as fast counter inputs to avoid any influences.

For a description of the meaning of the LEDs, please refer to the Displays Chapter 5.2.4.5.1.2.9 “State LEDs” on page 897 chapter.

Connection of resistance thermometers in 2-wire configuration to the analog inputs

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module DA502 provides a constant current source which is multiplexed over max. 4 analog input channels.
The following measuring ranges can be configured:

- Pt100: -50 °C ... +400 °C, 2-wire configuration, 1 channel used
- Pt1000: -50 °C ... +400 °C, 2-wire configuration, 1 channel used
- Ni1000: -50 °C ... +150 °C, 2-wire configuration, 1 channel used

For a description of the function of the LEDs, please refer to Diagnosis and displays / Displays on page 897.

The module DA502 performs a linearization of the resistance characteristic.

To avoid error messages from unused analog input channels, configure them as "unused".

Connection of resistance thermometers in 3-wire configuration to the analog inputs

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module DA502 provides a constant current source which is multiplexed over max. 4 analog input channels.
Fig. 156: Connection of resistance thermometers in 3-wire configuration to the analog inputs (AI0 ... AI3)

With 3-wire configuration, 2 adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1).

The constant current of one channel flows through the resistance thermometer. The constant current of the other channel flows through one of the cores. The module calculates the measured value from the two voltage drops and stores it under the input with the higher channel number (e.g. I1).

In order to keep measuring errors as small as possible, it is necessary to have all the involved conductors in the same cable. All the conductors must have the same cross section.

The following measuring ranges can be configured "Parameterization on page 890 "Measuring ranges" on page 898:

<table>
<thead>
<tr>
<th>Temperature Range</th>
<th>Configuration</th>
</tr>

<td>3-wire configuration, 2 channels used</td>
</tr>
<tr>
<td>Ni1000 -50 °C ... +150 °C</td>
<td>3-wire configuration, 2 channels used</td>
</tr>
</tbody>
</table>

For a description of the function of the LEDs, please refer to Diagnosis and displays / Displays "State LEDs" on page 897.

The module DA502 performs a linearization of the resistance characteristic.

To avoid error messages from unused analog input channels, configure them as "unused".
Connection of active-type analog sensors (Voltage) with galvanically isolated power supply to the analog inputs

Fig. 157: Connection of active-type analog sensors (voltage) with galvanically isolated power supply to the analog inputs (AI0 ... AI3)

The following measuring ranges can be configured

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0 V ... 10 V</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V ... +10 V</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

For a description of the function of the LEDs, please refer to Diagnosis and displays / Displays

Chapter 5.2.4.5.1.2.9 “State LEDs” on page 897.

To avoid error messages from unused analog input channels, configure them as "unused".
Connection of active-type analog sensors (Current) with galvanically isolated power supply to the analog inputs

![Diagram of connection]

**Fig. 158: Connection of active-type analog sensors (current) with galvanically isolated power supply to the analog inputs (AI0 ... AI3)**

The following measuring ranges can be configured:

- **Current** 0 mA ... 20 mA 1 channel used
- **Current** 4 mA ... 20 mA 1 channel used

For a description of the function of the LEDs, please refer to Diagnosis and displays / Displays  
Chapter 5.2.4.5.1.2.9 “State LEDs” on page 897.

Unused input channels can be left open-circuited, because they are of low resistance.
Connection of active-type analog sensors (Voltage) with no galvanically isolated power supply to the analog inputs

Fig. 159: Connection of active-type sensors (voltage) with no galvanically isolated power supply to the analog inputs (AI0 ... AI3)

CAUTION!
Risk of faulty measurements!
The negative pole at the sensors must not have too large a potential difference with respect to ZP (max. ±1 V within the full signal range).
Make sure that the potential difference never exceeds ±1 V.

The following measuring ranges can be configured: Chapter 5.2.4.5.1.2.7 “Parameterization” on page 890, Chapter 5.2.4.5.1.2.10 “Measuring ranges” on page 898:

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0 V ... 10 V</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V ... +10 V</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

For a description of the function of the LEDs, please refer to Diagnosis and displays / Displays Chapter 5.2.4.5.1.2.9 “State LEDs” on page 897.
To avoid error messages from unused analog input channels, configure them as "unused".

2024/01/05 3ADR010583, 1, en_US 885
Connection of passive-type analog sensors (Current) to the analog inputs

![Diagram of connection of passive-type analog sensors (current) to the analog inputs (AI0 ... AI3)](image)

The following measuring ranges can be configured on page 890 and Chapter 5.2.4.5.1.2.10 “Measuring ranges” on page 898:

<table>
<thead>
<tr>
<th>Current</th>
<th>4 mA ... 20 mA</th>
<th>1 channel used</th>
</tr>
</thead>
</table>

For a description of the function of the LEDs, please refer to Diagnosis and displays / Displays “State LEDs” on page 897.

**NOTICE!**

**Risk of overloading the analog input!**

If an analog current sensor supplies more than 25 mA for more than 1 second during initialization, this input is switched off by the module (input protection).

Use only sensors with fast initialization or without current peaks higher than 25 mA. If not possible, connect a 10-volt Zener diode in parallel to I+ and ZP.

Unused input channels can be left open-circuited, because they are of low resistance.

Connection of active-type analog sensors (Voltage) to differential analog inputs

Differential inputs are very useful if analog sensors which are remotely non-isolated (e.g. the negative terminal is remotely grounded) are used.

Using differential inputs helps to considerably increase the measuring accuracy and to avoid ground loops.

With differential input configurations, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

The analog value is calculated by subtraction of the input value with the higher address from the input value of the lower address.
The converted analog value is available at the odd channel (higher address).

**CAUTION!**
Risk of faulty measurements!
The negative pole at the sensors must not have too large a potential difference with respect to ZP (max. ±1 V within the full signal range).
Make sure that the potential difference never exceeds ±1 V.

![Diagram of active-type analog sensors (voltage) to differential analog inputs (AI0 ... AI3)](image)

Fig. 161: Connection of active-type analog sensors (voltage) to differential analog inputs (AI0 ... AI3)

The following measuring ranges can be configured:

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0 V ... 10 V with differential inputs, 2 channels used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V ... +10 V with differential inputs, 2 channels used</td>
</tr>
</tbody>
</table>

For a description of the function of the LEDs, please refer to Diagnosis and displays / Displays "State LEDs" on page 897.
To avoid error messages from unused analog input channels, configure them as "unused".

**Use of analog inputs as digital inputs**
Several (or all) analog inputs can be configured as digital inputs. The inputs are not galvanically isolated against the other analog channels.
The following measuring ranges can be configured on page 890 and Chapter 5.2.4.5.1.2.10 “Measuring ranges” on page 898:

<table>
<thead>
<tr>
<th>Digital input</th>
<th>24 V</th>
<th>1 channel used</th>
</tr>
</thead>
</table>

For a description of the function of the LEDs, please refer to Diagnosis and displays / Displays on page 897.

**Connection of analog output loads (Voltage)**

For a description of the function of the LEDs, please refer to Diagnosis and displays / Displays on page 897.
The following measuring ranges can be configured \(\text{Chapter 5.2.4.5.1.2.7 “Parameterization” on page 890} \) \(\text{Chapter 5.2.4.5.1.2.10 “Measuring ranges” on page 898}\):

<table>
<thead>
<tr>
<th>Voltage</th>
<th>-10 V ... +10 V</th>
<th>Load ± 10 mA max.</th>
<th>1 channel used</th>
</tr>
</thead>
</table>

For a description of the function of the LEDs, please refer to Diagnosis and displays / Displays \(\text{Chapter 5.2.4.5.1.2.9 “State LEDs” on page 897}\).

Unused analog outputs can be left open-circuited.

**Connection of analog output loads (Current)**

![Connection diagram](image)

*Fig. 164: Connection of analog output loads (current) to the analog outputs (AO0 ... AO1)*

The following measuring ranges can be configured \(\text{Chapter 5.2.4.5.1.2.7 “Parameterization” on page 890} \) \(\text{Chapter 5.2.4.5.1.2.10 “Measuring ranges” on page 898}\):

I/O configuration

The module itself does not store configuration data. It draws its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

<table>
<thead>
<tr>
<th>Firmware version</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Firmware version &gt; V2.0.0</td>
<td>The arrangement of the parameter data is performed by Control Builder Plus/ Automation Builder software.</td>
</tr>
</tbody>
</table>

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

</tbody>
</table>

1) With a faulty ID, the module reports a "parameter error" and does not perform cyclic process data transmission

2) For a description of the counter operating modes, please refer to the 'Fast Counter' section 5 Chapter 5.2.4.3.2.9 "Fast counter" on page 606

3) With CS31 without the parameter "Fast Counter"

The fast counter of the module does not work if the module is connected to a CS31 bus module.

5) The parameter Behavior outputs at comm. error is only analyzed if the Failsafe mode is ON.

### Diagnosis

In cases of short circuit or overload, the digital outputs are turned off. The module performs reactivation automatically. Thus, an acknowledgement of the errors is not necessary. The error message is stored via the LED.

1) In AC500, the following interface identifier applies:
   14 = I/O bus,  11 = COM1 (e.g. CS31 bus),  12 = COM2.

2) With "Device" the following allocation applies:
   31 = module itself,
   1 ... 10 = communication interface module 1 ... 10,
   ADR = hardware address (e.g. of the DC551)

3) With "Module" the following allocation applies depending on the master:
   Module error: I/O bus: 31 = Module itself; COM1/COM2: 1 ... 10 = expansion
   Channel error: I/O bus = module type (1 = AI, 3 = AO, 4 = DC); COM1/COM2:
   1 ... 10 = expansion 1 ... 10

4) In case of module errors, with channel "31 = module itself" is output.

5) Ch = 22 ... 29 indicate the digital inputs/outputs DC16 ... DC23

6) Ch = 16 ... 19 indicates the analog inputs AI0 ... AI3

7) Ch = 20 ... 21 indicates the analog outputs AO0 ... AO1

Technical data

Technical data of the module

The system data of AC500 and S500 are applicable to the standard version “Chapter 5.1.2 ‘System data AC500’ on page 166.”

The system data of AC500-XC are applicable to the XC version “Chapter 5.1.3 ‘System data AC500-XC’ on page 169.”

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.

**NOTICE!**

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and temporary overvoltage up to 30 V DC.

**Multiple overloads**

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

* Due to the direct connection to the output, the demagnetizing varistor is also effective at the input (see figure) above. This is why the difference between UPx and the input signal must not exceed the clamp voltage of the varistor. The varistor limits the clamp voltage to approx. 36 V. Consequently, the input voltage must range from -12 V ... +30 V when UPx = 24 V and from -6 V ... +30 V when UPx = 30 V.

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

---

### 5.2.4.6 Function modules

#### 5.2.4.6.1 S500 and S500-XC

**CD522 - Encoder, counter and PWM module**

**Features**

- 2 encoder inputs with 2 integrated 5-V-power-supplies for the encoders
- 2 PWM outputs - 2 digital inputs 24 V DC
- 8 configurable digital inputs/outputs 24 V DC
- Fast counter
- Module-wise galvanically isolated
- XC version for use in extreme ambient conditions available
1 I/O bus
2 Allocation of terminal No. and signal name
3 3 yellow LEDs to display the signal states of the encoder 0 input
4 3 yellow LEDs to display the signal states of the encoder 1 input
5 2 green LEDs to display the 5-V-power-supply states
6 2 yellow LEDs to display the signal state of the digital input I3 and I11
7 8 yellow LEDs to display the input/output signal states
8 2 yellow LEDs to display the signal states of the PWM/pulse outputs
9 1 green LED to display the process voltage UP
10 3 red LEDs to display errors
11 Label
12 Terminal unit
13 DIN rail
14 Sign for XC version

**Intended purpose**

The encoder and PWM module CD522 can be used at the following devices:

- Communication interface modules (e.g. CI501-PNIO, CI541-DP)
- Processor modules

**Features:**

- 2 independent counting functions with up to 12 configurable modes (including incremental position encoder and frequency input up to 300 kHz)
- 2 independent PWM (pulse-width modulator) or pulse outputs with push-pull driver
- Dedicated inputs/outputs for specific counting functions (e.g. touch, set, reset)
- All unused inputs/outputs can be used with the specifications of standard inputs/outputs range

For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

Depending on the configuration used, some inputs and outputs are dedicated to specific counting functions (touch, set, reset...). All unused inputs and outputs can be used with the specification of standard inputs/outputs range.

**Functionality**

<table>
<thead>
<tr>
<th>Digital inputs/outputs</th>
<th>24 V DC, dedicated inputs/outputs can be used for specific counting functions:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>- Catch/touch operation, counter value stored in separate variable on external event (rising or falling edge)</td>
</tr>
<tr>
<td></td>
<td>- Set input to preset counter register with predefined value</td>
</tr>
<tr>
<td></td>
<td>- Set input to reset counter register</td>
</tr>
<tr>
<td></td>
<td>- End value output; the output is set when predefined value is reached</td>
</tr>
<tr>
<td></td>
<td>- Reference point initialization (RPI) input for incremental encoder initialization</td>
</tr>
</tbody>
</table>

All unused inputs/outputs can be used with the specification of standard input/output range.

Effect of incorrect input terminal connection: Wrong or no signal detected, no damage up to 35 V.

<table>
<thead>
<tr>
<th>Fast counter/encoder</th>
<th>integrated, 2 counters (hardware interface with +24 V DC, +5 V DC, differential and 1 Vpp sinus input) with up to 12 configurable operation modes:</th>

<td>- Time frequency meter</td>
</tr>
<tr>
<td></td>
<td>- Frequency input up to 300 kHz</td>
</tr>
</tbody>
</table>
PWM/pulse outputs 2 pulse-width-modulators or pulse outputs

Output specification
- Push-pull output: 24 V DC, 100 mA max.
- Current limitation (thermal and over current)

PWM specification
- Frequency from 1 Hz to 100 kHz
- Value from 0 to 100 %

Pulse specification
- Frequency from 1 Hz to 15 kHz
- Pulse emission from 1 to 65535 pulses
- Number of pulses emitted indicator (0 to 100 %)

Frequency specification
- Frequency output = 100 kHz when duty cycle set to 50 %

Power supply for encoders 2 5V power supplies, max. 100 mA

LED displays For signal states, errors and supply voltage

Internal power supply Via I/O bus

External power supply Via the terminals UP (process voltage 24 V DC) and ZP (0 V DC)

Required terminal unit TU515 or TU516 & Chapter 5.2.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 938

How to prepare a device as fast counter and how to connect it to the PLC is described in an application example.

Connections

The function module CD522 can be connected to the following devices via the I/O bus connector:
- CS31 bus module DC551-CS31
- AC500 CPU
- Other AC500 I/O devices.

The connection is carried out by using the 40 terminals of the terminal unit TU515/TU516 & Chapter 5.2.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 938.

</table>

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a processor module). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per CD522.

The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.
**WARNING!**

**Removal/Insertion under power**

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

**NOTICE!**

**Risk of damaging the PLC modules!**

Overvoltages and short circuits might damage the PLC modules.

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

**Connection of encoders with differential RS-422 signal**

The encoder is powered by the 5 V power supply which is integrated in CD522.

![Diagram of encoder connection](image-url)
The encoder is powered by the 5 V power supply which is integrated in the CD522.

Connection of encoders with 5 V TTL signal

Connection of encoders with 24 V totem pole signal
The wires A, B and Z need not to be connected to the module. They are left open.

When using different power supplies for the encoder device and the CD522, make sure that the reference potentials of both power supplies are interconnected.

Connection of encoders with 1 Vpp sine signal

The encoder is powered through the 5 V power supply which is integrated in the CD522.

Connection of absolute encoders with SSI interface and differential RS-422 signal

The encoder is powered by the 5 V power supply which is integrated in the CD522.
Connection of absolute encoders with an SSI interface and an optocoupler interface at CLK input

The encoder can optionally be powered by the 5 V power supply which is integrated in the CD522.
Connection of output loads to the PWM/Pulse outputs

Notice!
Risk of damaging the module
The PWM outputs have no protection against reverse polarity.

Connection of standard inputs/outputs
Proceed with the inputs/outputs I11 and C12 ... C15 in the same way.

Connection of sensors with frequency outputs
Proceed with the A0, B0, A1, B1 and Z1 in the same way.
Fig. 166: Example of the connection of sensors with frequency outputs to the input Z0 of the CD522

NOTICE!
Risk of malfunctions!
The edges of a signal must be strong enough (0.4 V/µs) to be recognized correctly by the module.
Put a 1 kΩ resistor between 0 V and the Z terminal when using a standard output as time generator.

Connection of sensors to the 5 V power supply

Proceed with the 5 V power supply 1 in the same way.

Each 5-V-power supply provides a current of 100 mA max. It is possible to parallel both integrated power supplies. In this case, the max. current is 200 mA.
NOTICE!
Risk of damaging the module
The integrated 2 A fuse cannot be replaced. If it blows, the module must be replaced.
Ensure that the current per 0 V connection does not exceed 0.5 A.

NOTICE!
Risk of damaging the module
The two 5 V outputs have no protection against reverse polarity.

Internal data exchange

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Digital inputs (bytes)</td>
<td>0</td>
</tr>
<tr>
<td>Digital outputs (bytes)</td>
<td>0</td>
</tr>
<tr>
<td>Analog inputs (words)</td>
<td>12</td>
</tr>
<tr>
<td>Analog outputs (words)</td>
<td>16</td>
</tr>
</tbody>
</table>

The data will be transferred in 16-bit words and not in bytes. Two bytes are packed into one 16-bit word.
The bit strings are transmitted in big-endian byte order, so the bytes within the word are swapped. If several bytes are considered, the first byte (lowest address) is the largest (High Byte).

If used with AC500 please check the chapter how to configure CD522 within Automation Builder and use the CD522 library.

The types “structCD522In” and “structCD522Out” can be added in Automation Builder by using the command “Generate DUT” via the context menu of the CD522 device.
To use CD522 with CI50x-PNIO or CI54x-DP as unbundled IOs with other PLCs find the meaning of the IO-Data in following tables below:

</table>
**I/O configuration**

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

*If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.*

**Parameterization**

<table>
<thead>
<tr>
<th>Firmware version</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Firmware version &gt; V2.0.0</td>
<td>The arrangement of the parameter data is performed by Control Builder Plus/Automation Builder software.</td>
</tr>
</tbody>
</table>

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Remarks:

1) In AC500, the following interface identifier applies:
   14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
   The FBP diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   31 = module itself, 1...10 = decentralized communication interface module 1...10,
   ADR = hardware address (e.g. of the DC551)

3) With "Module" the following allocation applies depending on the master:
   Module error: I/O bus or FBP: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10
   Channel error: I/O bus or FBP = module type (2 = DO); COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = Module itself" is output.

State LEDs

During the power-on procedure, the module initializes automatically. All LEDs (except the LEDs for the signal states) are on during the initialization.
### Technical data

The system data of AC500 and S500 are applicable to the standard version \textcopyright{Chapter 5.1.2 “System data AC500” on page 166.}

**NOTICE!**

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and temporary overvoltage up to 30 V DC.

**Multiple overloads**

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

* Due to the direct connection to the output, the demagnetizing varistor is also effective at the input (see figure) above. This is why the difference between UPx and the input signal must not exceed the clamp voltage of the varistor. The varistor limits the clamp voltage to approx. 36 V. Consequently, the input voltage must range from -12 V ... +30 V when UPx = 24 V and from -6 V ... +30 V when UPx = 30 V.

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.
5.2.5 Terminal units for S500(-XC) I/O modules

5.2.5.1 Safety instructions

Hot swap

System requirements for hot swapping of I/O modules:

- Types of terminal units that support hot swapping of I/O modules have the appendix TU5xx-H.
- I/O modules as of index F0.

The following I/O bus masters support hot swapping of attached I/O modules:

- Communication interface modules CI5xx as of index F0.
- Processor modules PM56xx-2ETH with firmware version as of V3.2.0.

NOTICE!

Risk of damage to I/O modules!

Hot swapping is only allowed for I/O modules. Processor modules and communication interface modules must not be removed or inserted during operation.

Conditions for hot swapping

- Digital outputs are not under load.
- Input/output voltages above safety extra low voltage/protective extra low voltages (SELV/PELV) are switched off.
- Modules are completely plugged on the terminal unit with both snap fit engaged before switching on loads or input/output voltage.

Further information about hot swap.

5.2.5.2 TU515, TU516, TU541 and TU542 for I/O modules

5.2.5.2.1 Features

- TU515, I/O terminal unit, 24 V DC, screw terminals
- TU516, I/O terminal unit, 24 V DC, spring terminals
- TU516-XC, I/O terminal unit, 24 V DC, spring terminals, XC version
- TU516-H, I/O terminal unit, hot swap, 24 V DC, spring terminals
- TU516-H-XC, I/O terminal unit, hot swap, 24 V DC, spring terminals, XC version
- TU541, I/O terminal unit, 24 V DC, screw terminals
- TU542, I/O terminal unit, 24 V DC, spring terminals
- TU542-XC, I/O terminal unit, 24 V DC, spring terminals, XC version
- TU542-H, I/O terminal unit, hot swap, 24 V DC, spring terminals
- TU542-H-XC, I/O terminal unit, hot swap, 24 V DC, spring terminals, XC version

The input/output modules plug into the I/O terminal unit. When properly seated, they are secured with two mechanical locks. All the connections are established via the terminal unit, which allows removal and replacement of the I/O modules without disturbing the wiring at the terminal unit.
1 I/O bus (10 pins, male) to connect the previous terminal unit, the CPU terminal base or the communication interface module to the terminal unit
2 I/O bus (10 pins, female) to connect other terminal units
3a Plug (2 x 25 pins) to connect the inserted I/O modules
3b Plug (2 x 19 pins) to connect the inserted I/O modules
4 With a screwdriver inserted in this place, the terminal unit and the adjacent terminal unit can be shoved from each other
5 Holes for screw mounting
6 40 terminals for signals and process supply voltage
7 DIN rail
8 White border signifies hot swap capability of the terminal unit

**XC version**  
**XC = eXtreme Conditions**

---

**Extreme conditions**

Terminal units for use in extreme ambient conditions have no sign for XC version.

*The figure 4 in the Part no. 1SAP4... (table) identifies the XC version.*
The following terminals are used for connection of the process supply voltage.

<table>
<thead>
<tr>
<th>Terminals</th>
<th>Screw terminals</th>
<th>Spring terminals</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
</tbody>
</table>

The assignment of the other terminals depends on the inserted communication interface module (see the description of the respective module used).

### 5.2.5.2.2 Technical data

The system data of AC500 and S500 are applicable to the standard version ☞ *Chapter 5.1.2 “System data AC500” on page 166.*

The system data of AC500-XC are applicable to the XC version ☞ *Chapter 5.1.3 “System data AC500-XC” on page 169.*

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.

<table>

### 5.2.5.2.3 Hot swap

#### Hot swap

**WARNING!**
Risk of explosion or fire in hazardous environments during hot swapping!

Hot swap must not be performed in flammable environments to avoid life-threatening injury and property damage resulting from fire or explosion.

---

**WARNING!**
Electric shock due to negligent behavior during hot swapping!

To avoid electric shock:
- make sure the following conditions apply:
  - Digital outputs are not under load.
  - Input/output voltages above safety extra low voltage/protective extra low voltage (SELV/PELV) are switched off.
  - Modules are fully interlocked with the terminal unit with both snap-fits engaged before switching on loads or input/output voltage.
- Never touch exposed contacts (dangerous voltages).
- Stay away from electrical contacts to avoid arc discharge.
- Do not operate a mechanical installation improperly.

---

**NOTICE!**
Risk of damage to I/O modules!

Hot swapping is only allowed for I/O modules. Processor modules and communication interface modules must not be removed or inserted during operation.

H = Hot swap
Hot swap
System requirements for hot swapping of I/O modules:
– Types of terminal units that support hot swapping of I/O modules have the appendix TU5xx-H.
– I/O modules as of index F0.

The following I/O bus masters support hot swapping of attached I/O modules:
– Communication interface modules CI5xx as of index F0.
– Processor modules PM56xx-2ETH with firmware version as of V3.2.0.

Hot swap is not supported by AC500-eCo V3 CPU!

The index of the module is in the right corner of the label.

NOTICE!
Risk of damage to I/O modules!
Modules with index below F0 can be damaged when inserted or removed from the terminal unit in a powered system.

NOTICE!
Risk of damage to I/O modules!
Do not perform hot swapping if any I/O module with firmware version lower than 3.0.14 is part of the I/O configuration.
For min. required device index see table below.

- TU532-H, I/O terminal unit, hot swap, 120/230 V AC, spring terminals
- TU532-H-XC, I/O terminal unit, hot swap, 120/230 V AC, spring terminals, XC version

1  I/O bus (10 pins, male) to connect the previous terminal unit, the CPU terminal base or the communication interface module to the terminal unit
2  I/O bus (10 pins, female) to connect other terminal units
3a Plug (2 x 25 pins) to connect the inserted I/O modules
3b Plug (3 x 19 pins) to connect the inserted I/O modules
4  With a screwdriver inserted in this place, the terminal unit and the adjacent I/O terminal unit can be shoved from each other
5  Holes for screw mounting
6  40 terminals for signals and process supply voltage
7  DIN rail
8  White border signifies hot swap capability of the terminal unit
The input/output modules (I/O modules) plug into the I/O terminal unit. When properly plugged-in, they are secured with two mechanical locks. All the connections are established via the terminal unit, which allows removal and replacement of the I/O modules without disturbing the wiring at the terminal unit.

The terminal units TU531 and TU532 are specifically designed for use with AC500/S500 I/O modules that incorporate 115 V AC ... 230 V AC inputs and/or 120/230 V AC relay outputs.

**XC version**  
XC = eXtreme Conditions

**Extreme conditions**  
Terminal units for use in extreme ambient conditions have no eXtreme sign for XC version.

The figure 4 in the Part no. 1SAP4... (label) identifies the XC version.

### Terminals

<td><strong>Screwdriver</strong></td>
</tr>
<tr>
<td></td>
<td>(opens terminal)</td>
</tr>
</tbody>
</table>

The terminals 1.8 ... 4.8 and 1.9 ... 4.9 are electrically interconnected within the terminal unit and always have the same assignment, independent of the inserted module:

- Terminals 1.8 ... 4.8: process supply voltage UP = +24 V DC
- Terminals 1.9 ... 4.9: process supply voltage ZP = 0 V

The assignment of the other terminals depends on the inserted communication interface module (see the description of the respective module used).

The supply voltage of 24 V DC for the module's circuitry comes from the I/O expansion bus (I/O bus).

### 5.2.5.3.2 Technical data

The system data of AC500 and S500 are applicable to the standard version ☞ Chapter 5.1.2 “System data AC500” on page 166.

The system data of AC500-XC are applicable to the XC version ☞ Chapter 5.1.3 “System data AC500-XC” on page 169.
Only additional details are therefore documented below.
The technical data are also applicable to the XC version.

¹) Only when the voltage is not limited by the specification of the I/O channel or the supply input which is internally connected to the terminal.

²) The terminals are connected to the electronic module via internal connectors (X22 (or 3b), X23 (or 3b), X32, X33 and X34). The current per terminal is limited by the permitted current of these connectors.

### 5.2.5.3.3 Hot swap

**Hot swap**

**WARNING!**
Risk of explosion or fire in hazardous environments during hot swapping!
Hot swap must not be performed in flammable environments to avoid life-threatening injury and property damage resulting from fire or explosion.
WARNING!
Electric shock due to negligent behavior during hot swapping!
To avoid electric shock
– make sure the following conditions apply:
  – Digital outputs are not under load.
  – Input/output voltages above safety extra low voltage/protective extra low voltage (SELV/PELV) are switched off.
  – Modules are fully interlocked with the terminal unit with both snap-fits engaged before switching on loads or input/output voltage.
  – Never touch exposed contacts (dangerous voltages).
  – Stay away from electrical contacts to avoid arc discharge.
  – Do not operate a mechanical installation improperly.

NOTICE!
Risk of damage to I/O modules!
Hot swapping is only allowed for I/O modules.
Processor modules and communication interface modules must not be removed or inserted during operation.

H = Hot swap

Hot swap
System requirements for hot swapping of I/O modules:
– Types of terminal units that support hot swapping of I/O modules have the appendix TU5xx-H.
– I/O modules as of index F0.
The following I/O bus masters support hot swapping of attached I/O modules:
– Communication interface modules CI5xx as of index F0.
– Processor modules PM56xx-2ETH with firmware version as of V3.2.0.

Hot swap is not supported by AC500-eCo V3 CPU!
**NOTICE!**
**Risk of damage to I/O modules!**
Modules with index below F0 can be damaged when inserted or removed from the terminal unit in a powered system.

**NOTICE!**
**Risk of damage to I/O modules!**
Do not perform hot swapping if any I/O module with firmware version lower than 3.0.14 is part of the I/O configuration.
For min. required device index see table below.

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

5.2.6 Communication interface modules

5.2.6.1 Safety instructions

**Hot swap**

System requirements for hot swapping of I/O modules:

- Types of terminal units that support hot swapping of I/O modules have the appendix TU5xx-H.
- I/O modules as of index F0.

The following I/O bus masters support hot swapping of attached I/O modules:

- Communication interface modules CI5xx as of index F0.
- Processor modules PM56xx-2ETH with firmware version as of V3.2.0.

**NOTICE!**

Risk of damage to I/O modules!

Hot swapping is only allowed for I/O modules.

Processor modules and communication interface modules must not be removed or inserted during operation.

**Conditions for hot swapping**

- Digital outputs are not under load.
- Input/output voltages above safety extra low voltage/protective extra low voltages (SELV/PELV) are switched off.
- Modules are completely plugged on the terminal unit with both snap fit engaged before switching on loads or input/output voltage.

*Further information about hot swap.*

Intended purpose

The CANopen communication interface module CI581-CN is used as decentralized I/O module in CANopen networks. Depending on the used terminal unit the network connection is performed either via 9-pin female D-sub or via 10 terminals (screw or spring terminals) which are integrated in the terminal unit. The communication interface module contains 22 I/O channels with the following properties:

- 4 analog inputs (2.0 ... 2.3)
- 2 analog outputs (2.5 ... 2.6)
- 8 digital inputs 24 V DC in 1 group (3.0 ... 3.7)
- 8 digital outputs 24 V DC in 1 group (4.0 ... 4.7)

The inputs/outputs are galvanically isolated from the CANopen network. There is no potential separation between the channels. The configuration of the analog inputs/outputs is performed by software.

For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

### Connections

#### General

The CANopen communication interface module is plugged on the I/O terminal units TU517
\[6\] Chapter 5.2.7.4 “TU517 and TU518 for communication interface modules” on page 1278 or TU518 \[6\] Chapter 5.2.7.4 “TU517 and TU518 for communication interface modules” on page 1278 and accordingly TU509 or TU510. Properly position the module and press until it locks in place.

The connection of the I/O channels is established using the 30 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 2.8, 3.8, 2.9, 3.9 and 4.9 are electrically interconnected within the terminal unit and always have the same assignment, irrespective of the inserted module:

- Terminals 2.8 and 3.8: process supply voltage UP = +24 V DC
- Terminal 4.8: process supply voltage UP3 = +24 V DC
- Terminals 2.9, 3.9 and 4.9: process supply voltage ZP = 0 V

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

With a separate UP3 power supply, the digital outputs can be switched off externally. This way, an emergency-off functionality can be realized.
Do not connect any voltages externally to the digital outputs!
Reason: External voltages at an output or several outputs may cause other outputs to be supplied via that voltage instead of voltage UP3 (reverse voltage). This is not the intended use.

CAUTION!
Risk of malfunctions by unintended use!
If the function cut-off of the digital outputs is to be used by deactivation of the supply voltage UP3, be sure that no external voltage is connected at the outputs DO0 ... DO7 and DC0 ... DC7.

Shield: Cable shield, Functional earth

Bus terminating resistors
The ends of the data lines have to be terminated with a 120 Ω bus terminating resistor. The bus terminating resistor is usually installed directly at the bus connector.

</tbody>
</table>

At the line ends of a bus segment, terminating resistors must be connected. If TU517 or TU518 is used, the bus terminating resistors can be enabled by connecting the terminals Term+ and Term- to the data lines CAN+ and CAN- (no external terminating resistors are required, see figure below).

The following figures show the different connection options for the CANopen communication interface module:
In the case of TU517/TU518, the terminating resistors are not located inside the TU but inside the communication interface module CI581-CN. Hence, when removing the device from the TU, the bus terminating resistors are no longer connected to the bus. The bus itself will not be disconnected if a device is removed.

The grounding of the shield should take place at the control cabinet. Please refer to the AC500 System-Data Chapter 5.1.2 "System data AC500" on page 166.

**WARNING!**

**Removal/Insertion under power**

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

---

**NOTICE!**

**Risk of damaging the PLC modules!**

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ```--`). Reserved terminals may carry internal voltages.
For the open-circuit detection (wire break), each analog input channel is pulled up to "plus" by a high-resistance resistor. If nothing is connected, the maximum voltage will be read in then.

Generally, analog signals must be laid in shielded cables. The cable shields must be grounded at both sides of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.

For the measuring ranges that can be configured, please refer to the sections Measuring Ranges on page 984 and Parameterization on page 974.

The meaning of the LEDs is described in the section for the state LEDs on page 982.

The maximum possible bus length of a CAN network depends on bit rate (transmission rate) and cable type. The sum of all bus segments must not exceed the maximum bus length.

<table>

For the measuring ranges that can be configured, please refer to sections Measuring Ranges "Chapter 5.2.6.3.2.11 “Measuring ranges” on page 984 and Parameterization "Chapter 5.2.6.3.2.8 “Parameterization” on page 974."

The module CI581-CN performs a linearization of the resistance characteristic.

To avoid error messages, configure unused analog input channels as "unused".

Connection of resistance thermometers in 3-wire configuration to the analog inputs

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module CI581-CN provides a constant current source which is multiplexed over the max. 4 analog input channels.
With 3-wire configuration, 2 adjacent analog channels belong together (e. g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1).

The constant current of one channel flows through the resistance thermometer. The constant current of the other channel flows through one of the cores. The module calculates the measured value from the two voltage drops and stores it under the input with the higher channel number (e. g. I1).

In order to keep measuring errors as small as possible, it is necessary to have all the involved conductors in the same cable. All the conductors must have the same cross section.

For the measuring ranges that can be configured, please refer to the sections Measuring Ranges \(\text{Chapter 5.2.6.3.2.11 "Measuring ranges" on page 984}\) and Parameterization \(\text{Chapter 5.2.6.3.2.8 "Parameterization" on page 974}\).

The module CI581-CN performs a linearization of the resistance characteristic.

To avoid error messages, configure unused analog input channels as "unused".
Connection of active-type analog sensors (Voltage) with galvanically isolated power supply to the analog inputs

Fig. 175: Connection of active-type analog sensors (Voltage) with galvanically isolated power supply to the analog inputs

<table>
<thead>

<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 ... 20 mA</td>
<td></td>
<td></td>
</tr>
<tr>
<td>4 ... 20 mA</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

For the measuring ranges that can be configured, please refer to the sections Measuring Ranges "Chapter 5.2.6.3.2.11 "Measuring ranges" on page 984 and Parameterization "Chapter 5.2.6.3.2.8 "Parameterization" on page 974.

Unused input channels can be left open-circuited, because they are of low resistance.
Connection of active-type analog sensors (Voltage) with no galvanically isolated power supply to the analog inputs

Fig. 177: Connection of active-type sensors (voltage) with no galvanically isolated power supply to the analog inputs (AO ... AI3)

**NOTICE!**
**Risk of faulty measurements!**

The negative pole/ground potential at the sensors must not have too large a potential difference with respect to ZP (max. ± 1 V within the full signal range).

Make sure that the potential difference never exceeds ± 1 V.

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0 ... 10 V</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V ... +10 V</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

For the measuring ranges that can be configured, please refer to the sections Measuring Ranges \(\text{Chapter 5.2.6.3.2.11 “Measuring ranges” on page 984 and Parameterization \(\text{Chapter 5.2.6.3.2.8 “Parameterization” on page 974.}}

To avoid error messages, configure unused analog input channels as "unused".
Connection of passive-type analog sensors (Current) to the analog inputs

![Connection diagram]

Fig. 178: Connection of passive-type analog sensors (current) to the analog inputs (A0 ... A3)

<table>
<thead>
<tr>
<th>Current</th>
<th>4 ... 20 mA</th>
<th>1 channel used</th>
</tr>
</thead>
</table>

CAUTION!
Risk of overloading the analog input!

If an analog current sensor supplies more than 25 mA for more than 1 second during initialization, this input is switched off by the module (input protection).

Only use sensors with fast initialization or without current peaks higher than 25 mA. If not possible, connect a 10-volt Zener diode in parallel to I+ and I-.

Unused input channels can be left open-circuited, because they are of low resistance.

Connection of active-type analog sensors (Voltage) to differential analog inputs

Differential inputs are very useful if analog sensors which are remotely non-isolated (e.g. the negative terminal is remotely grounded) are used.

Using differential inputs helps to considerably increase the measuring accuracy and to avoid ground loops.

With differential input configurations, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

The analog value is calculated by subtraction of the input value with the higher address from the input value of the lower address.

The converted analog value is available at the odd channel (higher address).
**NOTICE!**

Risk of faulty measurements!

The negative pole/ground potential at the sensors must not have too large a potential difference with respect to ZP (max. ± 1 V within the full signal range). Make sure that the potential difference never exceeds ± 1 V.

![Diagram](image)

Addressing

A detailed description concerning addressing can be found in the documentation of ABB Control Builder Plus Software.

The CANopen communication interface module reads the position of the rotary switches only during power-up, i.e. changes of the switch position during operation will have no effect until the next module initialization.

The range of permitted CANopen slave addresses is 1 to 127. Setting a higher address (> 128) does not lead to an error response, but results in a special mode (DS401). In this special mode, the device creates the node address by subtracting the value 128 from the address switch’s value.

I/O configuration

The CI582-CN CANopen bus configuration is handled by CANopen master with the exception of the slave node ID (via rotary switches) and the transmission rate (automatic detection).

The digital I/O channels and the fast counter are configured via software.

*) In the operating modes with 3-wire configuration or with differential inputs, two adjacent analog inputs belong together (e.g. the channels 0 and 1). In these cases, both channels are configured in the desired operating mode. The lower address must be the even address (channel 0). The next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

</table>

1) The parameter Behavior digital outputs at communication error is only analyzed if the failsafe mode is ON.

2) The state "externally voltage detected" appears if the output of a channel DC0 ... DC7 is to be switched on while an external voltage is connected to Chapter 5.2.6.3.2.4 “Connections” on page 957. In this case, the start-up is disabled as long as the external voltage is connected. The monitoring of this state and the resulting diagnosis message can be disabled by setting the parameters to "OFF".
In cases of short circuit or overload, the digital outputs are turned off. The module performs reactivation automatically. Thus, an acknowledgement of the errors is not necessary. The error message is stored via the LED.

In cases of short circuit or overload, the digital outputs are turned off. The module performs reactivation automatically. Thus, an acknowledgement of the errors is not necessary. The error message is stored via the LED.

Remarks:
1) In AC500, the following interface identifier applies:
   "-" = Diagnosis via bus-specific function blocks; 0 ... 4 or 10 = position of the
   communication module; 14 = I/O bus; 31 = module itself
   The identifier is not contained in the CI541-DP diagnosis block.

2) With "Device" the following allocation applies: 31 = module itself; 1 ... 10 =
   decentralized communication interface module

3) With "Module" the following allocation applies:
   31 = module itself
   Channel error: module type (1 = AI, 2 = DO, 3 = AO)

4) This message appears if external voltages at one or more terminals DO0 ... DO7
   cause other digital outputs to be fed by that voltage "Connections" on page 957. All outputs of the digital output groups will be turned off for 5 seconds. The diagnosis message appears for the whole output group.

5) The voltage on digital outputs DO0 ... DO7 has overrun the process supply voltage UP3 "Connections" on page 957. Diagnosis message appears for the whole module.

6) This message appears if the output of a channel DO0 ... DO7 is to be switched on while an external voltage is connected. In this case, start-up is disabled while the external voltage is connected. Otherwise, this could produce reverse voltage flowing from this output to other digital outputs. This diagnosis message appears for each channel.

7) Short circuit: After a short circuit has been detected, the output is deactivated for 100ms seconds. Subsequently, a new start-up will be executed. This diagnosis message appears for each channel.

---

State LEDs

The state LEDs are located at the front of module. There are 2 different groups:
- The 5 system LEDs (PWR, CN-RUN, CN-ERR, S-ERR and I/O bus) show the operation states of the module and display possible errors.
- The 27 process LEDs (UP, UP3, inputs, outputs, CH-ERR1 to CH-ERR3) show the process supply voltage and the states of the inputs and outputs and display possible errors.

Technical data

Technical data of the module

The system data of AC500 and S500 are applicable to the standard version "Chapter 5.1.2 “System data AC500” on page 166.

The system data of AC500-XC are applicable to the XC version "Chapter 5.1.3 “System data AC500-XC” on page 169.

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.

Multiple overloads

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

### Parameter | Value
---|---
Max. load for the terminals | 10 A
Protection against reversed voltage | Yes
Rated protection fuse on UP/UP3 | 10 A fast
Galvanic isolation | CANopen interface against the rest of the module
Inrush current from UP (at power up) | On request
Current consumption via UP (normal operation) | 0.2 A
Current consumption via UP3 | 0.06 A + 0.5 A max. per output
Connections | Terminals 2.8 and 3.8 for +24 V (UP)
| Terminal 4.8 for +24 V (UP3)
| Terminals 2.9, 3.9 and 4.9 for 0 V (ZP)
Max. power dissipation within the module | 6 W
Reference potential for all digital inputs and outputs | Negative pole of the supply voltage, signal name ZP
Setting of the CANopen Node ID identifier | With 2 rotary switches at the front side of the module
Mounting position | Horizontal
| Or vertical with derating (output load reduced to 50 % at +40 °C per group)
Cooling | The natural convection cooling must not be hindered by cable ducts or other parts in the control cabinet.
Effect of incorrect input terminal connection | Wrong or no signal detected, no damage up to 35 V
Required terminal unit | TU509, TU510, TU517 or TU518

*All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 V DC.*

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.
5.2.6.3.3 CI582-CN

Features

- 8 digital inputs 24 V DC
- 8 digital outputs 24 V DC, 0.5 A max.
- 8 configurable digital inputs/outputs 24 V DC, 0.5 A max.
- Module-wise galvanically isolated
- Fast counter
- XC version for use in extreme ambient conditions available

Hardware descriptions
Device specifications > Communication interface modules
Intended purpose

The CANopen communication interface module CI582-CN is used as decentralized I/O module in CANopen networks. Depending on the terminal unit used, the network connection is performed either via a female 9-pin D-sub connector or via 10 terminals (screw or spring terminals) which are integrated in the terminal unit. The communication interface module contains 24 I/O channels with the following properties:
- 8 digital configurable inputs/outputs in 1 group (1.0 ... 1.7)
- 8 digital inputs 24 V DC in 1 group (2.0 ... 2.7)
- 8 digital outputs 24 V DC in 1 group (3.0 ... 3.7)

The inputs/outputs are galvanically isolated from the CANopen network. There is no potential separation between the channels. The configuration of the analog inputs/outputs is performed by software.

For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

### Parameter Value

**Process supply voltages UP/UP3**
- **Rated value**: 24 V DC (for inputs and outputs)
- **Max. load for the terminals**: 10 A
- **Protection against reversed voltage**: Yes
- **Rated protection fuse on UP/UP3**: 10 A fast

**Galvanic isolation**
- CANopen interface against the rest of the module

**Inrush current from UP (at power up)**
- On request

**Current consumption via UP (normal operation)**
- 0.2 A

**Current consumption via UP3**
- 0.06 A + 0.5 A max. per output

**Connections**
- Terminals 2.8 and 3.8 for +24 V (UP)
- Terminal 4.8 for +24 V (UP3)
- Terminals 2.9, 3.9 and 4.9 for 0 V (ZP)

**Max. power dissipation within the module**
- 6 W

**Reference potential for all digital inputs and outputs**
- Negative pole of the supply voltage, signal name ZP

**Setting of the CANopen Node ID identifier**
- With 2 rotary switches at the front side of the module

**Mounting position**
- Horizontal
  - Or vertical with derating (output load reduced to 50 % at +40 °C per group)

**Cooling**
- The natural convection cooling must not be hindered by cable ducts or other parts in the control cabinet.

**Effect of incorrect input terminal connection**
- Wrong or no signal detected, no damage up to 35 V

**Required terminal unit**
- TU509, TU510, TU517 or TU518
  - Chapter 5.2.7.4 “TU517 and TU518 for communication interface modules” on page 1278

*All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 V DC.*
Connections

General

The CANopen communication interface module is plugged on the I/O terminal units TU517 or TU518. Chapter 5.2.7.4 “TU517 and TU518 for communication interface modules” on page 1278 or TU518 Chapter 5.2.7.4 “TU517 and TU518 for communication interface modules” on page 1278 and accordingly TU509 or TU510. Properly position the module and press until it locks in place.

The connection of the I/O channels is established using the 30 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 2.8, 3.8, 2.9, 3.9 and 4.9 are electrically interconnected within the terminal unit and always have the same assignment, irrespective of the inserted module:

Terminals 2.8 and 3.8: process supply voltage UP = +24 V DC
Terminal 4.8: process supply voltage UP3 = +24 V DC
Terminals 2.9, 3.9 and 4.9: process supply voltage ZP = 0 V

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

With a separate UP3 power supply, the digital outputs can be switched off externally. This way, an emergency-off functionality can be realized.

Possibilities of connection

Mounting on terminal units

TU509 or TU510

Bus terminating resistors

The ends of the data lines have to be terminated with a 120 Ω bus terminating resistor. The bus terminating resistor is usually installed directly at the bus connector.

</tbody>
</table>

At the line ends of a bus segment, terminating resistors must be connected. If TU517 or TU518 is used, the bus terminating resistors can be enabled by connecting the terminals Term+ and Term- to the data lines CAN+ and CAN- (no external terminating resistors are required, see figure below).

The following figures show the different connection options for the CANopen communication interface module:
In the case of TU517/TU518, the terminating resistors are not located inside the TU but inside the communication interface module CI581-CN. Hence, when removing the device from the TU, the bus terminating resistors are no longer connected to the bus. The bus itself will not be disconnected if a device is removed.

The grounding of the shield should take place at the control cabinet. Please refer to the AC500 System-Data Chapter 5.1.2 “System data AC500” on page 166.

WARNING!
Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
  – connect or disconnect any signal or terminal block
  – remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!
Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

  – Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
  – Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

---

Fig. 186: Connection of the communication interface module CI582-CN

For a description of the meaning of the LEDs, please refer to the section for the state LEDs ∘ Chapter 5.2.6.3.10 “State LEDs” on page 1010.
**Bus length**

The maximum possible bus length of a CAN network depends on bit rate (transmission rate) and cable type. The sum of all bus segments must not exceed the maximum bus length.

<table>
<thead>
<tr>
<th>Bit Rate (speed)</th>
<th>Bus Length</th>
</tr>
</thead>

Addressing

A detailed description concerning addressing can be found in the documentation of ABB Control Builder Plus Software.

> The CANopen communication interface module reads the position of the rotary switches only during power-up, i.e. changes of the switch position during operation will have no effect until the next module initialization.

> The range of permitted CANopen slave addresses is 1 to 127. Setting a higher address (> 128) does not lead to an error response, but results in a special mode (DS401). In this special mode, the device creates the node address by subtracting the value 128 from the address switch's value.

I/O configuration

The CI582-CN CANopen bus configuration is handled by CANopen master with the exception of the slave node ID (via rotary switches) and the transmission rate (automatic detection).

The digital I/O channels and the fast counter are configured via software.

Parameterization

Parameters of the module

<table>
<thead>
<tr>

<td></td>
<td></td>
</tr>
</tbody>
</table>
1) With a faulty ID, the module reports a "parameter error" and does not perform cyclic process data transmission.

2) For a description of the counter operating modes, please refer to the 'Fast Counter' section Chapter 5.2.4.3.2.9 “Fast counter” on page 606.

<td>BYTE</td>
<td>Off</td>
</tr>
<tr>
<td></td>
<td>On</td>
<td>1</td>
<td></td>
<td>0x00</td>
</tr>
</tbody>
</table>

Remarks:

1) The parameter Behavior DO at comm. error is applied to DC and DO channels and only analyzed if the failsafe mode is ON.

2) The state "externally voltage detected" appears if the output of a channel DC0 ... DC7 is to be switched on while an external voltage is connected. In this case, start-up is disabled while the externally voltage is connected. The monitoring of this state and the resulting diagnosis message can be disabled by setting the parameters to "OFF".

3) The error state "voltage overflow at outputs" appears if external voltage at digital outputs DC0 ... DC7 and DO0 ... DO7 has exceeded the process supply voltage UP3. The according diagnosis message "Voltage overflow on outputs" can be disabled by setting the parameters to "OFF". This parameter should only be disabled in exceptional cases as voltage overflow may produce reverse voltage.

**Diagnosis**

<table>
<thead>
<tr>
<th>Byte Number</th>
<th>Description</th>
<th>Possible Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Diagnosis byte, slot number</td>
<td>31 = CI582-CN (e. g. error at integrated 8 DI / 8 DO)</td>
</tr>
<tr>
<td></td>
<td></td>

</tr>
<tr>
<td>3</td>
<td>Diagnosis byte, channel</td>
<td>According to the I/O bus specification passed on by modules to the fieldbus master</td>
</tr>
</tbody>
</table>
In cases of short circuit or overload, the digital outputs are turned off. The module performs reactivation automatically. Thus, an acknowledgement of the errors is not necessary. The error message is stored via the LED.

Remarks:

1) In AC500, the following interface identifier applies:
   *"* = Diagnosis via bus-specific function blocks; 0 ... 4 or 10 = position of the communication module; 14 = I/O bus; 31 = module itself
   The identifier is not contained in the CI542-DP diagnosis block.

2) With "Device" the following allocation applies: 31 = module itself, 1..10 = expansion module

3) With "Module" the following allocation applies depending on the master:
   Module error: 31 = module itself
   Channel error: module type (1 = AI, 2 = DO, 3 = AO)
4) This message appears if external voltages at one or more terminals DC0 ... DC7 or DO0 ... DO7 cause other digital outputs to be supplied by that voltage. All outputs of the digital output groups will be turned off for 5 seconds. The diagnosis message appears for the whole output group.

5) The voltage at digital outputs DC0 ... DC7 and DO0 ... DO7 has exceeded the process supply voltage UP3. A diagnosis message appears for the whole module.

6) This message appears if the output of a channel DC0 ... DC7 or DO0 ... DO7 should be switched on while an external voltage is connected. In this case the start-up is disabled while the external voltage is connected. Otherwise, this could produce reverse voltage flowing from this output to other digital outputs. This diagnosis message appears for each channel.

7) Short circuit: After a short circuit has been detected, the output is deactivated for 100ms. Subsequently, a new start-up will be executed. This diagnosis message appears for each channel.

State LEDs

The LEDs are located at the front of the module. There are 2 different groups:

- The 5 system LEDs (PWR, CN-RUN, CN-ERR, S-ERR and I/O bus) show the operation states of the module and display possible errors.
- The 29 process LEDs (UP, UP3, inputs, outputs, CH-ERR1 to CH-ERR3) show the process supply voltage and the states of the inputs and outputs and display possible errors.

### Technical data

**Technical data of the module**

The system data of AC500 and S500 are applicable to the standard version "Chapter 5.1.2 "System data AC500" on page 166."

The system data of AC500-XC are applicable to the XC version "Chapter 5.1.3 "System data AC500-XC" on page 169."

Only additional details are therefore documented below.
The technical data are also applicable to the XC version.

---

**Multiple overloads**

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

Technical data of the digital inputs/outputs if used as inputs

Terminals of the channels DC0 to DC7: Terminals 2.0 to 2.7

Due to the direct connection to the output, the demagnetizing varistor is also effective at the input. This is why the difference between UPx and the input signal must not exceed the clamp voltage of the varistor. The varistor limits the clamp voltage to approx. 36 V. Consequently, the input voltage must range from -12 V to +30 V when UPx = 24 V and from -6 V to +30 V when UPx = 30 V.

5.2.6.4 EtherCAT
5.2.6.4.1 CI511-ETHCAT

Features

- 4 analog inputs (resolution 12 bits including sign)
- 2 analog outputs (resolution 12 bits including sign)
- 8 digital inputs 24 V DC
- 8 digital outputs 24 V DC, 0.5 A max.
- Cam switch functionality (see also Extended Cam Switch Library)
- Extended Cam switch functionality *) (see also Extended Cam Switch Library)
- Module-wise galvanically isolated - Expandability with up to 10 S500 I/O Modules *)

*) Applicable for device index C0 and above.

1. I/O bus
2. Allocation between terminal number and signal name
3. 6 yellow LEDs to display the signal states of the analog inputs/outputs (AI0 ... AI3, AO0 ... AO1)
4. 8 yellow LEDs to display the signal states of the digital inputs (DI0 ... DI7)
5. 8 yellow LEDs to display the signal states of the digital outputs (DO0 ... DO7)
6. 2 green LEDs to display the supply voltage UP and UP3
7. 3 red LEDs to display errors (CH-ERR1, CH-ERR2, CH-ERR3)
8. 5 system LEDs: PWR/RUN, NET, DC, S-ERR, I/O-Bus
9. 2 rotary switches (reserved for future extensions)
10. Label
11 Ethernet interfaces (ETH1, ETH2) on the terminal unit
12 Terminal unit
13 DIN rail

Intended purpose

The EtherCAT communication interface module CI511-ETHCAT is used as decentralized I/O module in EtherCAT networks. The network connection is performed via 2 RJ45 connectors which are integrated in the terminal unit. The communication interface module contains 22 I/O channels with the following properties:

- 4 analog inputs (1.0 ... 1.3)
- 2 analog outputs (1.5 ... 1.6)
- 8 digital inputs 24 V DC in 1 group (2.0 ... 2.7)
- 8 digital outputs 24 V DC in 1 group (3.0 ... 3.7)
- Cam switch functionality

The inputs/outputs are galvanically isolated from the Ethernet network. There is no potential separation between the channels. The configuration of the analog inputs/outputs is performed by software.

Connections

General

The Ethernet communication interface module CI51-ETHCAT is plugged on the I/O terminal unit TU507-ETH or TU508-ETH. Properly seat the module and press until it locks in place. The terminal unit is mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting (TA526).

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

The connection of the I/O channels is carried out using the 30 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 1.8 and 2.8 as well as 1.9, 2.9 and 3.9 are electrically interconnected within the terminal unit and have always the same assignment, independent of the inserted module:

Terminals 1.8 and 2.8: Process supply voltage UP = +24 V DC
Terminal 3.8: Process supply voltage UP3 = +24 V DC
Terminals 1.9, 2.9 and 3.9: Process supply voltage ZP = 0 V

With a separate UP3 power supply, the digital outputs can be switched off externally. This way, an emergency-off functionality can be realized.

The assignment of the other terminals:

WARNING!

Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

CAUTION!

There is no galvanic isolation between the analog circuitry and ZP/UP. Therefore, the analog sensors must be galvanically isolated in order to avoid loops via the ground potential or the supply voltage.

CAUTION!

Because of their common reference potential, analog current inputs cannot be circuited in series, neither within the module nor with channels of other modules.

For the open-circuit detection (wire break), each channel is pulled up to "plus" by a high-resistance resistor. If nothing is connected, the maximum voltage will be read in then.

Analog signals are always laid in shielded cables. The cable shields are grounded at both ends of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.

For simple applications (low disturbances, no high requirement on precision), the shielding can also be omitted.
Fig. 192: Connection of the communication interface module CI511-ETHCAT

1 4 analog inputs, configurable for 0 ... 10 V, -10 ... +10 V, 0/4 ... 20 mA, Pt100/Pt1000, Ni1000 and digital signals
2 2 analog outputs, configurable for -10 ... +10 V, 0/4 ... 20 mA
3 8 digital inputs 24 V DC
4 8 digital outputs 24 V DC, 0.5 A max.

In case of voltage feedback, 2 cases are distinguished:

1. The outputs are already active
   The output group will be switched off. A diagnosis message will appear. After 5 seconds, the module tries automatic reactivation.

2. The outputs are not active
   Only the output with voltage feedback will not be set to active. A diagnosis message will appear.

NOTICE!
Risk of faulty measurements!
The negative pole/ground potential at the sensors must not have too large a potential difference with respect to ZP (max. ± 1 V within the full signal range).
Make sure that the potential difference never exceeds ± 1 V.

CAUTION!
The process supply voltage must be included within the grounding concept of the plant (e.g. grounding of the negative pole).

The module provide several diagnosis functions § Chapter 5.2.6.4.1.9 “Diagnosis” on page 1039.
The measuring ranges are described in the section Measuring Ranges § Chapter 5.2.6.4.1.11 “Measuring ranges” on page 1042.
The function of the LEDs is described in the section State LEDs Chapter 5.2.6.4.1.9 “Diagnosis” on page 1039.

Connection of resistance thermometers in 2-wire configuration

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module CI511-ETHCAT provides a constant current source which is multiplexed over the max. 4 analog input channels.

![Connection of resistance thermometers in 2-wire configuration](image)

**Fig. 193: Connection of resistance thermometers in 2-wire configuration**

1. Pt100 (2-wire), Pt1000 (2-wire), Ni1000 (2-wire); 1 analog sensor requires 1 channel

<table>

The measuring ranges are described in the section Measuring Ranges Chapter 5.2.6.4.1.8 “Parameterization” on page 1033 Chapter 5.2.6.4.1.11 “Measuring ranges” on page 1042.

The module CI511-ETHCAT performs a linearization of the resistance characteristic.

In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".

Connection of resistance thermometers in 3-wire configuration

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module CI511-ETHCAT provides a constant current source which is multiplexed over the max. 4 analog input channels.
Fig. 194: Connection of resistance thermometers in 3-wire configuration

1. Pt100 (3-wire), Pt1000 (3-wire), Ni1000 (3-wire); 1 analog sensor requires 2 channels
2. Twisted pair within the cable
3. Return line: The return line is only needed once if measuring points are adjacent to each other. This saves wiring costs.

With 3-wire configuration, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1).

The constant current of one channel flows through the resistance thermometer. The constant current of the other channel flows through one of the cores. The module calculates the measured value from the two voltage drops and stores it under the input with the higher channel number (e.g. I1).

In order to keep measuring errors as small as possible, it is necessary, to have all the involved conductors in the same cable. All the conductors must have the same cross section.

<th>4 ... 20 mA</th>
<th>1 channel used</th>
</tr>
</thead>
</table>

The measuring ranges are described in the section Measuring Ranges "Parameterization" on page 1033 "Measuring ranges" on page 1042.

**CAUTION!**

If, during initialization, an analog current sensor supplies more than 25 mA for more than 1 second into an analog input, this input is switched off by the module (input protection). In such cases, it is recommended, to protect the analog input by a 10-volt Zener diode (in parallel to I+ and ZP). But, in general, it is a better solution to prefer sensors with fast initialization or without current peaks higher than 25 mA.

Unused input channels can be left open-circuited, because they are of low resistance.

Connection of active-type analog sensors (Voltage) to differential inputs

Differential inputs are very useful, if analog sensors are used which are remotely non-isolated (e.g. the minus terminal is remotely grounded).

The evaluation using differential inputs helps to considerably increase the measuring accuracy and to avoid ground loops.

With differential input configurations, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

The analog value is calculated by subtraction of the input value with the higher address from the input value of the lower address.
The converted analog value is available at the odd channel (higher address).

Important: The ground potential at the sensors must not have a too big potential difference with respect to ZP (max. ±1 V within the full signal range). Otherwise problems can occur concerning the common-mode input voltages of the involved analog inputs.

In corrosive environment, please protect unused connectors using the TA535 accessory.

Not supplied with this device.

**Further information about wiring and cable types**

The EtherCAT network differentiates between input-connectors (IN) and output-connectors (OUT):

- At the EtherCAT slaves (communication interface modules), the ETH1-connector is IN and the ETH2-connector is OUT.
- At the EtherCAT master (communication module), the ETHCAT1 connector has to be used. The ETHCAT2 connector is reserved for future extensions.

**Internal data exchange**

<table>

**Addressing**

The Ethernet bus module CI511-ETHCAT does not consider the position of the rotary switches at the front side of the module. The function of the rotary switches is reserved for future expansions.
I/O configuration

In order to be able to use the CI51X-ETHCAT with device index C0 or above properly, please download the corresponding device description (.xml-)files from http://www.abb.com/plc and install them to the device repository of your Automation Builder. This will allow you to use up to 10 Expandable S500 I/O modules as well as the Extended Cam Switch Library with your CI51X-ETHCAT device.

The CI511-ETHCAT does not store configuration data itself.
The analog I/O channels are configured via software.

1) The parameter numOfUsedCams defines the interrupt cycle time (Therefore, it takes effect to the accuracy of the track) and the behavior of the module if the DC information is lost.

<table>
<thead>
<tr>
<th>Parameter setting for numOfUsedCams</th>
<th>Number of cams used</th>
<th>Interrupt cycle time</th>

<td></td>
</tr>
<tr>
<td>145 ... 170</td>
<td>17 ... 32</td>
<td>200 µs</td>
<td></td>
</tr>
</tbody>
</table>

2) The parameter resolution defines the angle resolution of the track. The value gives the number of increments related to 360°; e.g. the value 36,000 corresponds to an angle resolution of 0.01°.

3) The parameter zeroShift defines the zero shift. With it the encoder can be adjusted to the mounting position. The value of zeroShift is set in encoder-increments. It is not assigned to the parameter resolution of the cam switch.

4) The parameter EncoderBitResolution defines the resolution of the used encoder (in bits), e.g. with the default setting 18 bits the encoder has 196,608 divisions.
Channel parameters for the cam switch (max. 32x)

<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
<th>Internal value</th>
<th>Internal value, type</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>camToTrack0</td>
<td>Digital Output 0 ... 7, none</td>

<td>FF</td>
</tr>
<tr>
<td>camToTrack31</td>
<td>Digital Output 0 ... 7, none</td>
<td>0 ... 7, FF</td>
<td>BYTE</td>
<td>FF</td>
</tr>
</tbody>
</table>

*) The value of the parameter camToTrack# defines which DO (digital output) is assigned to the track. camToTrack0 = 3 for example means that track 0 is assigned to the digital output 3. If the value FFh is set to a track, no digital output is assigned to it.

<table>

</tr>
</tbody>
</table>

1) camType additionally to camToTrack identifies the type of each cam switch and enables the use of a specific function block from the Extended Cam Switch Library.

2) camType parameters and the Extended Camswitch Library are only available for CI511-ETHCAT and CI512-ETHCAT with device index C0 and above.

*) The parameter behaviourDOatCommunicationFault is only analyzed if the Failsafe-mode is ON.
Diagnosis

In cases of short circuit or overload, the digital outputs are turned off. The modules performs reactivation automatically. Thus an acknowledgement of the errors is not necessary. The error message is stored via the LED.

**Remarks:**

1) In AC500 the following interface identifier applies:
   
   ".-" = Diagnosis via bus-specific function blocks; 0 ... 4 or 10 = Position of the Communication Module; 14 = I/O bus; 31 = Module itself
   
   The identifier is not contained in the CI511-ETHCAT diagnosis block.

2) With "Device" the following allocation applies:
   
   31 = Module itself or ADR = Hardware address (e. g. of the DC551)
3) With "Module" the following allocation applies dependent of the master:
31 = Module itself (Module error) or Module type (1=AI, 2=DO, 3=AO; channel error)

4) Diagnosis message appears for the whole output group and not per channel. The message occurs if the output channel is already active.

5) Diagnosis message appears per channel. The message occurs if the output channel is not active.

State LEDs

The LEDs are located at the front of module. There are 2 different groups:
- The 5 system LEDs (PWR, NET, DC, S-ERR and I/O-Bus) show the operation state of the module and display possible errors.
- The 27 process LEDs (UP, UP3, inputs, outputs, CH-ERR1 to CH-ERR3) show the process supply voltage and the states of the inputs and outputs and display possible errors.

Technical data

Technical data of the module

The system data of AC500 and S500 are applicable to the standard version "Chapter 5.1.2 “System data AC500” on page 166.

The system data of AC500-XC are applicable to the XC version "Chapter 5.1.3 “System data AC500-XC” on page 169.

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.

**Parameter** | **Value**  
--- | ---  
Number of analog outputs | 2  
Reference potential for all digital inputs and outputs | Negative pole of the supply voltage, signal name ZP  
Diagnosis | See Diagnosis and Displays * Chapter 5.2.6.4.1.9 “Diagnosis” on page 1039  
Operation and error displays | 32 LEDs (totally)  
Weight (without terminal unit) | ca. 125 g  
Mounting position | Horizontal  
Or vertical with derating (output load reduced to 50 % at +40 °C per group)  
Cooling | The natural convection cooling must not be hindered by cable ducts or other parts in the control cabinet.  

**NOTICE!**  
All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and temporary overvoltage up to 30 V DC.

**Multiple overloads**  
No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

5.2.6.4.2 CI512-ETHCAT

Features

- 8 digital inputs 24 V DC
- 8 digital outputs 24 V DC, 0.5 A max.
- 8 configurable digital inputs/outputs 24 V DC, 0.5 A max.
- Cam switch functionality (see also Extended Cam Switch Library)
- Extended Cam switch functionality *)
  (see also Extended Cam Switch Library)
- Module-wise galvanically isolated
- Expandability with up to 10 S500 I/O modules *)

*) Applicable for device index C0 and above.
1 I/O bus
2 Allocation between terminal number and signal name
3 8 yellow LEDs to display the signal states of the digital configurable inputs/outputs (DC0 ... DC7)
4 8 yellow LEDs to display the signal states of the digital inputs (DI0 ... DI7)
5 8 yellow LEDs to display the signal states of the digital outputs (DO0 ... DO7)
6 2 green LEDs to display the supply voltage UP and UP3
7 3 red LEDs to display errors (CH-ERR1, CH-ERR2, CH-ERR3)
8 5 System LEDs: PWR/RUN, NET, DC, S-ERR, I/O-Bus
9 2 rotary switches (reserved for future extensions)
10 Label
11 Ethernet interfaces (ETH1, ETH2) on the terminal unit
12 Terminal unit
13 DIN rail

**Intended purpose**

The EtherCAT communication interface module CI512-ETHCAT is used as decentralized I/O module in EtherCAT networks. The network connection is performed via 2 RJ45 connectors which are integrated in the terminal unit. The communication interface module contains 24 I/O channels with the following properties:

- 8 digital configurable inputs/outputs in 1 group (1.0 ... 1.7)
- 8 digital inputs 24 V DC in 1 group (2.0 ... 2.7)
- 8 digital outputs 24 V DC in 1 group (3.0 ... 3.7)
- Cam switch functionality
The inputs/outputs are galvanically isolated from the Ethernet network. There is no potential separation between the channels. The configuration of the configurable digital inputs/outputs is performed by software.

### Connections

The Ethernet communication interface module CI512-ETHCAT is plugged on the I/O terminal unit TU507-ETH or TU508-ETH. Properly seat the module and press until it locks in place. The terminal unit is mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting (TA526).

The connection of the I/O channels is carried out using the 30 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

*For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.*

The terminals 1.8 and 2.8 as well as 1.9, 2.9 and 3.9 are electrically interconnected within the terminal unit and have always the same assignment, independent of the inserted module:

- Terminals 1.8 and 2.8: Process supply voltage UP = +24 V DC
- Terminal 3.8: Process supply voltage UP3 = +24 V DC
- Terminals 1.9, 2.9 and 3.9: Process supply voltage ZP = 0 V
With a separate UP3 power supply, the digital outputs can be switched off externally. This way, an emergency-off functionality can be realized.

The assignment of the other terminals:

<table>

**WARNING!**

**Removal/Insertion under power**

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

**NOTICE!**

**Risk of damaging the PLC modules!**

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.
Fig. 203: Connection of the communication interface module CI512-ETHCAT

1 8 digital configurable inputs/outputs 24 V DC
2 8 digital inputs 24 V DC
3 8 digital outputs 24 V DC

In case of voltage feedback, 2 cases are distinguished:

1. The outputs are already active
   The output group will be switched off. A diagnosis message will appear. After 5 seconds, the module tries automatic reactivation.

2. The outputs are not active
   Only the output with voltage feedback will not be set to active. A diagnosis message will appear.

CAUTION!
The process supply voltage must be included within the grounding concept of the plant (e.g. grounding of the negative pole).

The module provides several diagnosis functions Chapter 5.2.6.4.2.10 “Diagnosis” on page 1060.

Assignment of the Ethernet ports

The terminal unit for the communication interface module provides two Ethernet interfaces with the following pin assignment. The pin assignment is used for the EtherCAT master (communication module CM5xy-ETHCAT) as well.
## Pin assignment

</tbody>
</table>

In corrosive environment, please protect unused connectors using the TA535 accessory.

Not supplied with this device.

## Further information about wiring and cable types

The EtherCAT network differentiates between input-connectors (IN) and output-connectors (OUT):

At the EtherCAT slaves (communication interface modules), the ETH1-connector is IN and the ETH2-connector is OUT.

At the EtherCAT master (communication module), the ETHCAT1 connector has to be used. The ETHCAT2 connector is reserved for future extensions.

## Internal data exchange

</tbody>
</table>

## Addressing

The Ethernet communication interface module CI512-ETHCAT does not consider the position of the rotary switches at the front side of the module. The function of the rotary switches is reserved for future expansions.
I/O configuration

In order to be able to use the CI51X-ETHCAT with device index C0 or above properly, please download the corresponding device description (.xml-)files from http://www.abb.com/plc and install them to the device repository of your Automation Builder. This will allow you to use up to 10 Expandable S500 I/O modules as well as the Extended Cam Switch Library with your CI51X-ETHCAT device.

The CI512-ETHCAT does not store configuration data itself. The analog I/O channels are configured via software.

</tbody>
</table>

Remarks:

¹) The parameter numOfUsedCams defines the interrupt cycle time (Therefore, it takes effect to the accuracy of the track) and the behavior of the module if the DC information is lost.

²) The parameter resolution defines the angle resolution of the track. The value gives the number of increments related to 360°; e.g. the value 36,000 corresponds to an angle resolution of 0.01°.

³) The parameter zeroShift defines the zero shift. With it the encoder can be adjusted to the mounting position. The value of zeroShift is set in encoder-increments. It is not assigned to the parameter resolution of the cam switch.

⁴) The parameter EncoderBitResolution defines the resolution of the used encoder (in bits), e.g. with the default setting 18 bits the encoder has 196,608 divisions.

*) The parameter behaviourDOatCommunicationFault is only analyzed if the Failsafe-mode is ON.

### Diagnosis

In cases of short circuit or overload, the digital outputs are turned off. The modules performs reactivation automatically. Thus an acknowledgement of the errors is not necessary. The error message is stored via the LED.

**Remarks:**

1) In AC500 the following interface identifier applies:
   "." = Diagnosis via bus-specific function blocks; 0 ... 4 or 10 = Position of the Communication Module; 14 = I/O bus; 31 = Module itself
   The identifier is not contained in the CI512-ETHCAT diagnosis block.

2) With "Device" the following allocation applies:
   31 = Module itself or ADR = Hardware address (e.g. of the DC551)

3) With "Module" the following allocation applies dependent of the master:
   31 = Module itself (Module error) or Module type (1=AI, 2=DO, 3=AO; channel error)

4) Diagnosis message appears for the whole output group and not per channel. The message occurs if the output channel is already active.

5) Diagnosis message appears per channel. The message occurs if the output channel is not active.
State LEDs

The LEDs are located at the front of module. There are 2 different groups:

- The 5 system LEDs (PWR, NET, DC, S-ERR and I/O-Bus) show the operation state of the module and display possible errors.
- The 29 process LEDs (UP, UP3, inputs, outputs, CH-ERR1 to CH-ERR3) show the process supply voltage and the states of the inputs and outputs and display possible errors.

### Technical data

#### Technical data of the module

The system data of AC500 and S500 are applicable to the standard version "Chapter 5.1.2 "System data AC500" on page 166."

The system data of AC500-XC are applicable to the XC version "Chapter 5.1.3 "System data AC500-XC" on page 169."

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.

NOTICE!
All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and temporary overvoltage up to 30 V DC.

Multiple overloads
No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

*) Due to the direct connection to the output, the demagnetizing varistor is also effective at
the input (see figure) above. This is why the difference between UPx and the input signal may
not exceed the clamp voltage of the varistor. The varistor limits the voltage to approx. 36 V.
Following this, the input voltage must range from -12 V ... +30 V when UPx = 24 V and from
-6 V ... +30 V when UPx = 30 V.

5.2.6.5 Modbus

5.2.6.5.1 CI521-MODTCP

Features

- 4 analog inputs (resolution 12 bits including sign)
- 2 analog outputs (resolution 12 bits including sign)
- 8 digital inputs 24 V DC
- 8 digital outputs 24 V DC, 0.5 A max.
- Module-wise galvanically isolated
- Fast counter
- XC version for usage in extreme ambient conditions available
1 I/O bus
2 Allocation between terminal number and signal name
3 6 yellow LEDs to display the signal states of the analog inputs/outputs (AI0 ... AI3, AO0 ... AO1)
4 8 yellow LEDs to display the signal states of the digital inputs (DI0 ... DI7)
5 8 yellow LEDs to display the signal states of the digital outputs (DO0 ... DO7)
6 2 green LEDs to display the process supply voltage UP and UP3
7 3 red LEDs to display errors (CH-ERR1, CH-ERR2, CH-ERR3)
8 5 system LEDs: PWR/RUN, STA1 ETH, STA2 ETH, S-ERR, I/O-Bus
9 Label
10 2 rotary switches for setting the IP address
11 Ethernet interfaces (ETH1, ETH2) on the terminal unit
12 Terminal unit
13 DIN rail
*: Sign for XC version
Intended purpose

The Modbus TCP communication interface module CI521-MODTCP is used as decentralized I/O module in Modbus TCP networks. The network connection is performed via 2 RJ45 connectors which are integrated in the terminal unit. The communication interface module contains 22 I/O channels with the following properties:

- 4 analog inputs (1.0 ... 1.3)
- 2 analog outputs (1.5 ... 1.6)
- 8 digital inputs 24 V DC in 1 group (2.0 ... 2.7)
- 8 digital outputs 24 V DC in 1 group (3.0 ... 3.7)

The inputs/outputs are galvanically isolated from the Ethernet network. There is no potential separation between the channels. The configuration of the analog inputs/outputs is performed by software.

For usage in enhanced ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

</tbody>
</table>

Connections

General

The Ethernet communication interface module CI521-MODTCP is plugged on the I/O terminal unit TU507-ETH or TU508-ETH  \( \copyright \) Chapter 5.2.7.2 “TU507-ETH and TU508-ETH for Ethernet communication interface modules” on page 1270. Properly seat the module and press until it locks in place. The terminal unit is mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting  \( \copyright \) Chapter 5.2.8.2.5 “TA526 - Wall mounting accessory” on page 1324.

The connection of the I/O channels is carried out using the 30 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.
For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

The terminals 1.8 and 2.8 as well as 1.9, 2.9 and 3.9 are electrically interconnected within the terminal unit and have always the same assignment, independent of the inserted module:

Terminals 1.8 and 2.8: Process supply voltage UP = +24 V DC
Terminal 3.8: Process supply voltage UP3 = +24 V DC
Terminals 1.9, 2.9 and 3.9: Process supply voltage ZP = 0 V

With a separate UP3 power supply, the digital outputs can be switched off externally. This way, an emergency-off functionality can be realized.

Conditions for undisturbed operating with older I/O expansion modules

All I/O expansion modules that are attached to the CI52x-MODTCP must be powered up together with the CI52x-MODTCP if the firmware version of these I/O expansion modules is V1.9 or lower.

The firmware version is related to the index. The index is printed on the module type label on the right side.

Modules as of index listed in the following table can be powered up independently.

<table>

</table>
Do not connect any voltages externally to digital outputs!
Reason: Externally voltages at an output or several outputs may cause that other outputs are supplied through that voltage instead of voltage UP3 (reverse voltage). This is not intended usage.

**CAUTION!**
Risk of malfunction by unintended usage!
If the function cut-off of the digital outputs is to be used by deactivation of the supply voltage UP3, be sure that no external voltage is connected at the outputs DO0..DO7.

**WARNING!**

Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

**NOTICE!**

Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with `---`). Reserved terminals may carry internal voltages.

For the open-circuit detection (wire break), each analog input channel is pulled up to "plus" by a high-resistance resistor. If nothing is connected, the maximum voltage will be read in then.
Generally, analog signals must be laid in shielded cables. The cable shields must be grounded at both sides of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.

Connection of the digital inputs

Fig. 207: Connection of the digital inputs (DO0 ... DO7) to the module CI521-MODTCP

The meaning of the LEDs is described in Displays Chapter 5.2.6.5.1.10 “State LEDs” on page 1101.
Connection of the digital outputs

![Diagram showing the connection of digital outputs DO0 to DO7 to the module CI521-MODTCP.]

Fig. 208: Connection of configurable digital inputs/outputs (DO0 ... DO7) to the module CI521-MODTCP

The meaning of the LEDs is described in Displays 5.2.6.5.1.10 “State LEDs” on page 1101.

Connection of resistance thermometers in 2-wire configuration to the analog inputs

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module CI521-MODTCP provides a constant current source which is multiplexed over the max. 4 analog input channels.
Fig. 209: Connection of resistance thermometers in 2-wire configuration to the analog inputs (AI0 ... AI3)

The following measuring ranges can be configured § Chapter 5.2.6.5.1.8 "Parameterization" on page 1090 § Chapter 5.2.6.5.1.11 "Measuring ranges" on page 1102:

<table>
<thead>
<tr>
<th>Thermometer</th>
<th>Range</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pt100</td>
<td>-50 °C ... +70 °C</td>
<td>2-wire configuration, 1 channel used</td>

</tr>
<tr>
<td>Ni1000</td>
<td>-50 °C ... +150 °C</td>
<td>2-wire configuration, 1 channel used</td>
</tr>
</tbody>
</table>

The function of the LEDs is described under Diagnosis and displays / Displays § Chapter 5.2.6.5.1.9 "Diagnosis" on page 1096.

The module CI521-MODTCP performs a linearization of the resistance characteristic.

To avoid error messages from unused analog input channels, configure them as "unused".

Connection of resistance thermometers in 3-wire configuration to the analog inputs

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module CI521-MODTCP provides a constant current source which is multiplexed over the max. 4 analog input channels.
Fig. 210: Connection of resistance thermometers in 3-wire configuration to the analog inputs (AI0 ... AI3)

With 3-wire configuration, 2 adjacent analog channels belong together (e. g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1).

The constant current of one channel flows through the resistance thermometer. The constant current of the other channel flows through one of the cores. The module calculates the measured value from the two voltage drops and stores it under the input with the higher channel number (e. g. I1).

In order to keep measuring errors as small as possible, it is necessary to have all the involved conductors in the same cable. All the conductors must have the same cross section.

The following measuring ranges can be configured: Chapter 5.2.6.5.1.8 "Parameterization" on page 1090 and Chapter 5.2.6.5.1.11 "Measuring ranges" on page 1102:

<table>

</tbody>
</table>

The function of the LEDs is described under Diagnosis and displays / Displays Chapter 5.2.6.5.1.9 "Diagnosis" on page 1096.

The module CI521-MODTCP performs a linearization of the resistance characteristic.
To avoid error messages from unused analog input channels, configure them as "unused".
Connection of active-type analog sensors (voltage) with galvanically isolated power supply to the analog inputs

![Connection diagram](image)

Fig. 211: Connection of active-type analog sensors (voltage) with galvanically isolated power supply to the analog inputs (AI0 ... AI3)

The following measuring ranges can be configured 

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0 ... 10 V</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V ... +10 V</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

The function of the LEDs is described under Diagnosis and displays / Displays 

Chapter 5.2.6.5.1.9 “Diagnosis” on page 1096.

To avoid error messages from unused analog input channels, configure them as "unused".
Connection of active-type analog sensors (Current) with galvanically isolated power supply to the analog inputs

Fig. 212: Connection of active-type analog sensors (current) with galvanically isolated power supply to the analog inputs (AI0 ... AI3)

The following measuring ranges can be configured § Chapter 5.2.6.5.1.8 “Parameterization” on page 1090 § Chapter 5.2.6.5.1.11 “Measuring ranges” on page 1102:

<table>
<thead>
<tr>
<th>Current</th>
<th>0 mA ... 20 mA</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current</td>
<td>4 mA ... 20 mA</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

The function of the LEDs is described under Diagnosis and displays / Displays § Chapter 5.2.6.5.1.9 “Diagnosis” on page 1096.

Unused input channels can be left open-circuited, because they are of low resistance.

To avoid error messages through unused analog input channels in measuring range 4 mA ... 20 mA, these channels should be configured as "Not used".
Connection of active-type analog sensors (Voltage) with no galvanically isolated power supply to the analog inputs

**Fig. 213: Connection of active-type sensors (voltage) with no galvanically isolated power supply to the analog inputs (AI0 ... AI3)**

**CAUTION!**
Risk of faulty measurements!
The negative pole at the sensors must not have too big a potential difference with respect to ZP (max. ± 1 V).
Make sure that the potential difference never exceeds ± 1 V (also not with long cable lengths).

The following measuring ranges can be configured:

- **Chapter 5.2.6.5.1.8 “Parameterization” on page 1090**
- **Chapter 5.2.6.5.1.11 “Measuring ranges” on page 1102.**

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0 ... 10 V</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V ... +10 V</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

The function of the LEDs is described under Diagnosis and displays / Displays:

**Chapter 5.2.6.5.1.9 “Diagnosis” on page 1096.**

To avoid error messages from unused analog input channels, configure them as "unused".

Connection of passive-type analog sensors (Current) to the analog inputs

The following figure shows the connection of passive-type analog sensors (current) to the analog input AI0. Proceed with the analog inputs AI1 ... AI3 in the same way.
The function of the LEDs is described under Diagnosis and displays (Chapter 5.2.6.5.1.9 “Diagnosis” on page 1096).

**CAUTION!**
**Risk of overloading the analog input!**
If an analog current sensor supplies more than 25 mA for more than 1 second during initialization, this input is switched off by the module (input protection).

Use only sensors with fast initialization or without current peaks higher than 25 mA. If not possible, connect a 10-volt Zener diode in parallel to AIx+ and ZP.

Unused input channels can be left open-circuited, because they are of low resistance.

To avoid error messages through unused analog input channels in measuring range 4 mA ... 20 mA, these channels should be configured as "Not used".

**Connection of active-type analog sensors (Voltage) to differential analog inputs**

Differential inputs are very useful, if analog sensors are used which are remotely non-isolated (e.g. the minus terminal is remotely grounded).

The evaluation using differential inputs helps to considerably increase the measuring accuracy and to avoid ground loops.
With differential input configurations, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

The analog value is calculated by subtraction of the input value with the higher address from the input value of the lower address.

The converted analog value is available at the odd channel (higher address).

**CAUTION!**

Risk of faulty measurements!

The negative pole at the sensors must not have too big a potential difference with respect to ZP (max. ±1 V).

Make sure that the potential difference never exceeds ±1 V.

The following figure shows the connection of active-type analog sensors (voltage) to differential analog inputs AI0 and AI1. Proceed with AI2 and AI3 in the same way.

**Fig. 215: Connection of active-type analog sensors (voltage) to differential analog inputs (AI0 ... AI3)**

The following measuring ranges can be configured: Chapter 5.2.6.5.1.8 "Parameterization" on page 1090 Chapter 5.2.6.5.1.11 "Measuring ranges" on page 1102:

<table>
<thead>
<tr>
<th>Voltage</th>

Replacement of a Modbus TCP communication interface module:
The module must be powered off before it is replaced. If the configuration data is stored in the module, then the configuration data must be downloaded into the new module, either by using Modbus communication or by using the Modbus configurator which is contained in the Automation Builder distribution.

Chapter 6.3.2.12.2 “Unbundled Cl52x-MODTCP configuration” on page 1565

Addressing

The module reads the position of the rotary switches only during power-up, i.e., changes of the switch position during operation will have no effect until the next module initialization.

The IP address of the Cl521-MODTCP Module can be set with the “ABB IP Configuration Tool”.

Chapter 6.3.2.4.3 “Configuration of the IP settings with the IP configuration tool” on page 1457.

If the last byte of the IP is set to 0, the address switch will be used instead.
Address switch position 255 is mapped to fixed IP 192.168.0.254 independent of other stored settings. This is a backup so the module can always get a valid IP address and can be configured by the “ABB IP Configuration Tool”.
Address switch position 0 is mapped to last byte equal 1 and DHCP enabled.
The factory setting for the IP is 192.168.0.x (last byte is address switch).

### I/O configuration

The CI521-MODTCP stores configuration parameters (IP address configuration, module parameters).

The analog/digital I/O channels are configured via software.

Details about configuration are described in Parameterization &gt; Chapter 5.2.6.5.1.8 “Parameterization” on page 1090.

</tbody>
</table>

1) With a faulty ID, the Modules reports a "parameter error" and does not perform cyclic process data transmission.

2) Counter operating modes ⇣ Chapter 6.8.2.12 "Fast counters in AC500 devices" on page 4536.

3) Fixed Mapping means each module has its own Modbus registers for data transfer independent of the IO bus constellation ⇣ Chapter 6.8.4.1.2 “Modbus TCP registers" on page 4570.

Dynamic mapping means the structure of the IO Date is dependent on the I/O bus constellation. Each I/O bus expansion module starts directly after the module before on the next Word address.

4) If none of the parameters is set all masters / clients in the network have read and write rights on the CI52x-MODTCP device and its connected expansion modules.

If at least one parameter is set only the configured masters / clients have write rights on the CI52x-MODTCP device, all other masters / clients still have read access to the CI52x-MODTCP device.

</tr>
</tbody>
</table>

In cases of short circuit or overload, the digital outputs are turned off. The modules performs reactivation automatically. Thus an acknowledgement of the errors is not necessary. The error message is stored via the LED.

*For diagnosis firmware version ≥ 3.2.6 is required.*

### Remarks:

1) In AC500 the following interface identifier applies:
   
   "-" = Diagnosis via bus-specific function blocks; 0 ... 4 or 10 = Position of the Communication Module; 14 = I/O bus; 31 = Module itself
   
The identifier is not contained in the CI521-MODTCP diagnosis block.

2) With "Device" the following allocation applies: 31 = Module itself; 1..10 = Expansion module

3) With "Module" the following allocation applies:
   
   31 = Module itself
   
   Module type (1 = AI, 2 = DO, 3 = AO)

4) This message appears, if externally voltages at one or more terminals DO0...DO7 cause that other digital outputs are supplied through that voltage.

   *Chapter 5.2.6.5.1.4 “Connections” on page 1072.* All outputs of the apply digital output groups will be turned off for 5 seconds. The diagnosis message appears for the whole output group.

5) The voltage on digital outputs DO0...DO7 has overrun the process supply voltage UP3.

   *Chapter 5.2.6.5.1.4 “Connections” on page 1072.* Diagnosis message appears for the whole module.

6) This message appears, if the output of a channel DO0...DO7 should be switched on while an externally voltage is connected. In this case the start up is disabled, as long as the externally voltage is connected. Otherwise this could produce reverse voltage from this output to other digital outputs. This diagnosis message appears per channel.

7) Short circuit: After a detected short circuit, the output is deactivated for 100ms. Then a new start up will be executed. This diagnosis message appears per channel.
State LEDs

The LEDs are located at the front of module. There are 2 different groups:

- The 5 system LEDs (PWR, STA1 ETH, STA2 ETH, S-ERR and I/O-Bus) show the operation state of the module and display possible errors.
- The 27 process LEDs (UP, UP3, inputs, outputs, CH-ERR1 to CH-ERR3) show the process supply voltage and the states of the inputs and outputs and display possible errors.

Technical data

Technical data of the module

The system data of AC500 and S500 are applicable to the standard version “System data AC500” on page 166.

The system data of AC500-XC are applicable to the XC version “System data AC500-XC” on page 169.

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.

5.2.6.5.2 CI522-MODTCP

Features

- 8 digital inputs 24 V DC
- 8 digital outputs 24 V DC, 0.5 A max.
- 8 configurable digital inputs/outputs 24 V DC, 0.5 A max.
- Module-wise galvanically isolated
- Fast counter
- XC version for usage in extreme ambient conditions available

Device specifications > Communication interface modules
10 2 rotary switches for setting the IP address
11 Ethernet interfaces (ETH1, ETH2) on the terminal unit
12 Terminal unit
13 DIN rail
\*: Sign for XC version

### Intended purpose

Modbus TCP communication interface module CJ522-MODTCP is used as decentralized I/O module in Modbus TCP networks. The network connection is performed via 2 RJ45 connectors which are integrated in the terminal unit. The communication interface module contains 24 I/O channels with the following properties:

- 8 digital configurable inputs/outputs in 1 group (1.0 ... 1.7)
- 8 digital inputs 24 V DC in 1 group (2.0 ... 2.7)
- 8 digital outputs 24 V DC in 1 group (3.0 ... 3.7)

The inputs/outputs are galvanically isolated from the Ethernet network. There is no potential separation between the channels. The configuration of the configurable digital inputs/outputs is performed by software.

For usage in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

### Functionality

</tbody>
</table>
Connections

General

The Ethernet communication interface module CI522-MODTCP is plugged on the I/O terminal unit TU507-ETH. Chapter 5.2.7.2 “TU507-ETH and TU508-ETH for Ethernet communication interface modules” on page 1270 or TU508-ETH. Chapter 5.2.7.2 “TU507-ETH and TU508-ETH for Ethernet communication interface modules” on page 1270. Properly seat the module and press until it locks in place. The terminal unit is mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting. Chapter 5.2.8.2.5 “TA526 - Wall mounting accessory” on page 1324.

The connection of the I/O channels is carried out using the 30 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

The terminals 1.8 and 2.8 as well as 1.9, 2.9 and 3.9 are electrically interconnected within the terminal unit and have always the same assignment, independent of the inserted module:

Terminals 1.8 and 2.8: Process supply voltage UP = +24 V DC
Terminal 3.8: Process supply voltage UP3 = +24 V DC
Terminals 1.9, 2.9 and 3.9: Process supply voltage ZP = 0 V

With a separate UP3 power supply, the digital outputs can be switched off externally. This way, an emergency-off functionality can be realized.

Conditions for undisturbed operating with older I/O expansion modules

All I/O expansion modules that are attached to the CI52x-MODTCP must be powered up together with the CI52x-MODTCP if the firmware version of these I/O expansion modules is V1.9 or lower.

The firmware version is related to the index. The index is printed on the module type label on the right side.

Modules as of index listed in the following table can be powered up independently.

<table>
<thead>
<tr>

</tbody>
</table>
Do not connect any voltages externally to digital outputs!

This ist not intended usage.

Reason: Externally voltages at one or more terminals DC0 ... DC7 or DO8 ... DO15 may cause that other digital outputs are supplied through that voltage instead of voltage UP3 (reverse voltage).

This is also possible, if DC channels are used as inputs. For this, the source for the input signals should be the impressed UP3 of the device.

This limitation does not apply for the input channels DI0 ... DI7.

CAUTION!
Risk of malfunction by unintended usage!

If the function cut-off of the digital outputs is to be used by deactivation of the supply voltage UP3, be sure that no external voltage is connected at the outputs DO8 ... DO15 and DC0 ... DC7.

The assignment of the other terminals:

WARNING!
Removal/Insertion under power
The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!
Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

Replacement of a Modbus TCP communication interface module:

The module must be powered off before it is replaced. If the configuration data is stored in the module, then the configuration data must be downloaded into the new module, either by using Modbus communication or by using the Modbus configurator which is contained in the Automation Builder distribution.

* Chapter 6.3.2.12.2 “Unbundled CI52x-MODTCP configuration” on page 1565

Addressing

The IP address of the CI5221-MODTCP Module can be set with the “ABB IP Configuration Tool” * Chapter 6.3.2.2.4.3 “Configuration of the IP settings with the IP configuration tool” on page 1457.

If the last byte of the IP is set to 0, the address switch will be used instead.

Address switch position 255 is mapped to fixed IP 192.168.0.254 independent of other stored settings. This is a backup so the module can always get a valid IP address and can be configured by the “ABB IP Configuration Tool”.

Address switch position 0 is mapped to last byte equal 1 and DHCP enabled.

The factory setting for the IP is 192.168.0.x (last byte is address switch).

The module reads the position of the rotary switches only during power-up, i.e. changes of the switch position during operation will have no effect until the next module initialization.

I/O configuration

The CI522-MODTCP stores configuration parameters (IP address configuration, module parameters).

The digital I/O channels are configured via software.

Details about configuration are described in Parameterization * Chapter 5.2.6.5.2.8 “Parameterization” on page 1120.

</tbody>
</table>

Remarks:
With a faulty ID, the module reports a "parameter error" and does not perform cyclic process data transmission.

Counter operating modes \(\text{\textcopyright Chapter 5.2.4.3.2.9 "Fast counter" on page 606}\) 

Fixed Mapping means each module has its own Modbus registers for data transfer independent of the I/O bus constellation description \(\text{\textcopyright Chapter 6.8.4.1.2 "Modbus TCP registers" on page 4570}\). Dynamic mapping means the structure of the IO Date is dependent on the I/O bus constellation. Each I/O bus expansion module starts directly after the module before on the next Word address.

If none of the parameters is set all masters / clients in the network have read and write rights on the CI52x-MODTCP device and its connected expansion modules.

If at least one parameter is set only the configured masters / clients have write rights on the CI52x-MODTCP device, all other masters / clients still have read access to the CI52x-MODTCP device.

0 = E1
1 = E2
2 = E3
3 = E4
Bit 0 to bit 5, coded error description |
| 5           | Diagnosis Byte, flags        | According to the I/O bus specification
Bit 7: 1 = coming error
Bit 6: 1 = leaving error |
| 6           | Reserved                      | 0                                                                                                                                                |

In cases of short circuit or overload, the digital outputs are turned off. The modules performs reactivation automatically. Thus an acknowledgement of the errors is not necessary. The error message is stored via the LED.

For diagnosis firmware version \( \geq 3.2.6 \) is required.

### Channel error digital

| 4     | -         | 31     | 2      | 8...15   | 46               | Externally voltage detected at digital output DO8...DO15 6) | Check terminals |
| 4     | -         | 31     | 4      | 0...7    | 46               | Externally voltage detected at digital output DC0...DC7 6) | Check terminals |
| 4     | -         | 31     | 4      | 0...7    | 47               | Short circuit at digital output DC0...DC7 7) | Check terminals |
| 4     | -         | 31     | 2      | 8...15   | 47               | Short circuit at digital output DO8...DO15 7) | Check terminals |

Remarks:
1) In AC500 the following interface identifier applies:
"." = Diagnosis via bus-specific function blocks; 0 ... 4 or 10 = Position of the Communication Module; 14 = I/O bus; 31 = Module itself

The identifier is not contained in the CI502-PNIO diagnosis block.

2) With "Device" the following allocation applies: 31 = Module itself, 1..10 = Expansion module

3) With "Module" the following allocation applies dependent of the master:
Module error: 31 = Module itself
Channel error: Module type (1 = AI, 2 = DO, 3 = AO)

4) This message appears, if externally voltages at one or more terminals DC0 ... DC7 oder DO8 ... DO15 cause that other digital outputs are supplied through that voltage (voltage feedback, see description in 'Connections' Chapter 5.2.6.5.2.4 "Connections" on page 1113. All outputs of the apply digital output groups will be turned off for 5 seconds. The diagnosis message appears for the whole output group.

5) The voltage at digital outputs DC0 ... DC7 and accordingly DO8 ... DO15 has exceeded the process supply voltage UP3 Chapter 5.2.6.5.2.4 "Connections" on page 1113. Diagnosis message appears for the whole module.

6) This message appears, if the output of a channel DC0 ... DC7 or DO8 ... DO15 should be switched on while an externally voltage is connected. In this case the start up is disabled, as long as the externally voltage is connected. Otherwise this could produce reverse voltage from this output to other digital outputs. This diagnosis message appears per channel.

7) Short circuit: After a detected short circuit, the output is deactivated for 2000ms. Then a new start up will be executed. This diagnosis message appears per channel.

8) In case of an I/O module doesn't support hot swapping, do not perform any hot swap operations (also not on any other terminal units (slots)) as modules may be damaged or I/O bus communication may be disturbed.

9) Diagnosis for hot swap available as of version index F0.

State LEDs

The LEDs are located at the front of module. There are 2 different groups:

- The 5 system LEDs (PWR, STA1 ETH, STA2 ETH, S-ERR and I/O-Bus) show the operation state of the module and display possible errors.
- The 29 process LEDs (UP, UP3, inputs, outputs, CH-ERR1 to CH-ERR3) show the process supply voltage and the states of the inputs and outputs and display possible errors.

Technical data

Technical data of the module

The system data of AC500 and S500 are applicable to the standard version "Chapter 5.1.2 "System data AC500" on page 166."

The system data of AC500-XC are applicable to the XC version "Chapter 5.1.3 "System data AC500-XC" on page 169."

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.

NOTICE!
All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and temporary overvoltage up to 30 V DC.

Multiple overloads
No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

The following drawing shows the circuitry of a digital input/output with the varistors for demagnetization when inductive loads are switched off.

![Circuit Diagram](image.png)

**Fig. 223: Digital input/output (circuit diagram)**
1. Digital output
2. Varistors for demagnetization when inductive loads are turned off

**Technical data of the configurable digital inputs/outputs**
Each of the configurable I/O channels is defined as input or output by the user program. This is done by interrogating or allocating the corresponding channel.
Parameter | Value
---|---
Number of channels per module | 8 inputs/outputs (with transistors)
Distribution of the channels into groups | 1 group for 8 channels
If the channels are used as inputs | 
Channels DC0 ... DC7 | Terminals 1.0 ... 1.7
If the channels are used as outputs | 
Channels DC0 ... DC7 | Terminals 1.0 ... 1.7
Indication of the input/output signals | 1 yellow LED per channel, the LED is ON when the input/output signal is high (signal 1)
Galvanic isolation | From the Ethernet network

Technical data of the digital inputs/outputs if used as inputs

Parameter | Value
---|---
Number of channels per module | 8
Distribution of the channels into groups | 1 group of 8 channels
Terminals of the channels DC0 ... DC7 | Terminals 1.0 ... 1.7
Reference potential for all inputs | Terminals 1.9 ... 3.9 (negative pole of the supply voltage, signal name ZP)
Indication of the input signals | 1 yellow LED per channel, the LED is ON when the input signal is high (signal 1)
Input type (according EN 61131-2) | Type 1
Input delay (0->1 or 1->0) | Typ. 0.1 ms, configurable from 0.1 ms ... 32 ms
Input signal voltage | 24 V DC
Signal 0 | -3 V ... +5 V *)
Undefined Signal | > +5 V ... < +15 V
Signal 1 | +15 V ... +30 V
Ripple with signal 0 | Within -3 V ... +5 V *)
Ripple with signal 1 | Within +15 V ... +30 V
Input current per channel | 
Input voltage +24 V | Typ. 5 mA
Input voltage +5 V | > 1 mA
Input voltage +15 V | > 2 mA
Input voltage +30 V | < 8 mA
Max. cable length | 
Shielded | 1000 m
Unshielded | 600 m

*) Due to the direct connection to the output, the demagnetizing varistor is also effective at the input (see figure) above. This is why the difference between UPx and the input signal may not exceed the clamp voltage of the varistor. The varistor limits the voltage to approx. 36 V. Following this, the input voltage must range from -12 V ... +30 V when UPx = 24 V and from -6 V ... +30 V when UPx = 30 V.
Technical data of the digital inputs/outputs if used as outputs

## 5.2.6.6 PROFIBUS

### 5.2.6.6.1 CI541-DP

**Features**

- 4 configurable analog inputs (2-wire/single-ended) or 2 configurable analog inputs (3-wire/differential)
  - Resolution 12 bits including sign
- 2 analog outputs
  - Resolution 12 bits including sign
- 8 digital inputs 24 V DC in 1 group
- 8 digital outputs 24 V DC in 1 group, 0.5 A max.
- Fast counter
- Module-wise galvanically isolated
- XC version for usage in extreme ambient conditions available
1 I/O bus
2 Allocation between terminal number and signal name
3 6 yellow LEDs to display the signal states of the analog inputs/outputs (AI0 ... AI3, AO0 ... AO1)
4 8 yellow LEDs to display the signal states of the digital inputs (DI0 ... DI7)
5 8 yellow LEDs to display the signal states of the digital outputs (DO0 ... DO7)
6 2 green LEDs to display the process supply voltage UP and UP3
7 3 red LEDs to display errors (CH-ERR1, CH-ERR2, CH-ERR3)
8 5 system LEDs: PWR/RUN, STA1 DP, STA2 DP, S-ERR, I/O-Bus
9 Label
10 2 rotary switches for setting the PROFIBUS ID
11 9-pin D-SUB connector to connect the PROFIBUS DP signals
12 Terminal unit
13 DIN rail
$^{*}$ Sign for XC version

**Intended purpose**

The PROFIBUS DP communication interface module is used as decentralized I/O module in PROFIBUS DP networks. Depending on the used terminal unit the network connection is performed either via 9-pole female D-sub or via 10 terminals (screw-type or spring terminals) which are integrated in the terminal unit. The communication interface module contains 22 I/O channels.

The inputs/outputs are galvanically isolated from the PROFIBUS DP network. There is no potential separation between the channels. The configuration of the analog inputs/outputs is performed by software.

For usage in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.
- 4 configurable analog inputs (2-wire/single-ended) or 2 configurable analog inputs (3-wire/differential)
  Resolution 12 bits including sign
- 2 analog outputs
  Resolution 12 bits including sign
- 8 digital inputs 24 V DC in 1 group
- 8 digital outputs 24 V DC in 1 group, 0.5 A max.
- Fast counter
- Module-wise galvanically isolated
- XC version for usage in extreme ambient conditions available

Diagnosis settings

The current CI54x does not run in combination with a V3 PLC if in the “General” tab the parameter “Diagnosis behavior” is set to “AC500 V3 compatible”. How to change the setting in your AB project is described below.

1. Double click in the “Device” tree on “CI541_IO”.
   ⇒ The tab for the various settings opens.
2. Double click on the “General” tab.
3. Double click on the “Value” of the parameter “Diagnosis behavior”.
4. Click on the small arrow.
   ⇒ A submenu with two values opens.
5. Click on “AC500 V2 compatible” as setting.
6. Close the tab.

After changing the parameter to “AC500 V2 compatible” the CI54x get in “RUN”.

If the CI54x indicates a S500 diagnosis message, following AC500 diagnosis entry (“655374 CI54x communication interface module is sending not supported diagnosis format - Check configuration and FW revision of communication interface module”) is shown in the diagnosis editor and history. This diagnosis message does not have impact to cyclic data exchange between the master and the CI54x.

In case of a parameter change from V2 to V3 the parameter at the CI54x of V3 has the same value than at the CI54x below V2 (that means AC500 V2 compatible).

</tr>
</tbody>
</table>

**Connections**

**General**

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

The PROFIBUS DP communication interface module CI541-DP is plugged on the I/O terminal units TU509 \( \in \) Chapter 5.2.7.3 “TU509 and TU510 for communication interface modules” on page 1274 or TU510 \( \in \) Chapter 5.2.7.3 “TU509 and TU510 for communication interface modules” on page 1274 and accordingly TU517 \( \in \) Chapter 5.2.7.4 “TU517 and TU518 for communication interface modules” on page 1278 or TU518 \( \in \) Chapter 5.2.7.4 “TU517 and TU518 for communication interface modules” on page 1278. Properly seat the module and press until it locks in place. The terminal unit is mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting \( \in \) Chapter 5.2.8.2.5 “TA526 - Wall mounting accessory” on page 1324.

The connection of the I/O channels is carried out using the 30 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 2.8 and 3.8 as well as 2.9, 3.9 and 4.9 are interconnected within the terminal unit and have always the same assignment, independent of the inserted module:

- Terminals 2.8 and 3.8: Process supply voltage UP = +24 V DC
- Terminal 4.8: Process supply voltage UP3 = +24 V DC
- Terminals 2.9, 3.9 and 4.9: Process supply voltage ZP = 0 V

With a separate UP3 power supply, the digital outputs can be switched off externally. This way, an emergency-off functionality can be realized.
Do not connect any voltages externally to digital outputs!

Reason: Externally voltages at an output or several outputs may cause that other outputs are supplied through that voltage instead of voltage UP3 (reverse voltage). This is not intended usage.

CAUTION!
Risk of malfunction by unintended usage!
If the function cut-off of the digital outputs is to be used by deactivation of the supply voltage UP3, be sure that no external voltage is connected at the outputs DO0 ... DO7.

Possibilities of connection
Connection on terminal units TU509 or TU510

The assignment of the 9-pole female D-sub for the PROFIBUS signals:

<table>
<thead>
<tr>
<th>1</th>
<th>---</th>
<th>Reserved</th>
</tr>

<td>DGND</td>
<td>Reference potential for data transmission</td>
</tr>
<tr>
<td>1.9</td>
<td>DGND</td>
<td>Reference potential for data transmission</td>
</tr>
</tbody>
</table>

At the line ends of a bus segment, terminating resistors must be connected. If using TU517/TU518, the bus terminating resistors can be enabled by connecting the terminals TermA and TermB to the data lines A and B (no external terminating resistors are required, see figure below).
If using TU517/TU518, note that the terminating resistors are not located inside the TU, but inside the communication interface module CI541-DP. I.e. when removing the device from the TU, the bus terminating resistors are not connected to the bus any more. The bus itself will not be disconnected if a device is removed.

If using TU517/TU518 the max. permitted transmission rate is limited to 1.5 MBaud.

The grounding of the shield should take place at the control cabinet "Chapter 5.1.2 “System data AC500” on page 166."

**Technical data bus cable**

WARNING!

Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!

Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

For the open-circuit detection (cut wire), each channel is pulled up to "plus" by a high-resistance resistor. If nothing is connected, the maximum voltage will be read in then.

Analog signals are always laid in shielded cables. The cable shields are grounded at both ends of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.

For simple applications (low electromagnetic disturbances, no high requirement on precision), the shielding can also be omitted.
Connection of the digital inputs

Fig. 225: Connection of the PROFIBUS DP communication interface module CI541-DP

Fig. 226: Connection of the digital input DI0 (Proceed with the digital inputs DI1 ... DI7 in the same way)

The meaning of the LEDs is described in Displays § Chapter 5.2.6.6.1.11 “State LEDs” on page 1165.
Connection of the digital outputs

![Diagram of digital outputs connection]

**Fig. 227: Connection of the digital output DO0 (Proceed with the digital outputs DO1 ... DO7 in the same way)**

The meaning of the LEDs is described in Displays § Chapter 5.2.6.6.1.11 “State LEDs” on page 1165.

Connection of resistance thermometers in 2-wire configuration to the analog inputs

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module CI541-DP provides a constant current source which is multiplexed over the max. 4 analog input channels.

![Diagram of resistance thermometers connection]

**Fig. 228: Connection of resistance thermometers in 2-wire configuration to the analog input AI0 (Proceed with the analog inputs AI1 ... AI3 in the same way)**
The following measuring ranges can be configured:

<table>
<thead>
<tr>
<th>Sensor</th>
<th>Temperature Range</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pt100</td>
<td>-50 °C ... +400 °C</td>
<td>2-wire configuration, 1 channel used</td>
</tr>
<tr>
<td>Pt1000</td>
<td>-50 °C ... +400 °C</td>
<td>2-wire configuration, 1 channel used</td>
</tr>
<tr>
<td>Ni1000</td>
<td>-50 °C ... +150 °C</td>
<td>2-wire configuration, 1 channel used</td>
</tr>
</tbody>
</table>

The function of the LEDs is described under Diagnosis and displays / Displays:

The module CI541-DP performs a linearization of the resistance characteristic.

To avoid error messages from unused analog input channels, configure them as "unused".

**Connection of resistance thermometers in 3-wire configuration to the analog inputs**

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module CI541-DP provides a constant current source which is multiplexed over the max. 4 analog input channels.

![Diagram of connection](image)

**Fig. 229: Connection of resistance thermometers in 3-wire configuration to the analog inputs AI0 and AI1 (Proceed with the analog inputs AI2 and AI3 in the same way)**

With 3-wire configuration, 2 adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1).

The constant current of one channel flows through the resistance thermometer. The constant current of the other channel flows through one of the cores. The module calculates the measured value from the two voltage drops and stores it under the input with the higher channel number (e.g. I1).

In order to keep measuring errors as small as possible, it is necessary to have all the involved conductors in the same cable. All the conductors must have the same cross section.
The following measuring ranges can be configured "Parameterization" on page 1155 "Measuring ranges" on page 1166:

<table>
<thead>
<tr>
<th>Sensor</th>
<th>Range</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pt100</td>
<td>-50 °C ... +400 °C</td>
<td>3-wire configuration, 2 channels used</td>
</tr>
<tr>
<td>Pt1000</td>
<td>-50 °C ... +400 °C</td>
<td>3-wire configuration, 2 channels used</td>
</tr>
<tr>
<td>Ni1000</td>
<td>-50 °C ... +150 °C</td>
<td>3-wire configuration, 2 channels used</td>
</tr>
</tbody>
</table>

The function of the LEDs is described under Diagnosis and displays / Displays "State LEDs" on page 1165.

To avoid error messages from unused analog input channels, configure them as "unused".

Connection of active-type analog sensors (Voltage) with galvanically isolated power supply to the analog inputs

![Connection diagram](image)

**Fig. 230: Connection of active-type analog sensors (voltage) with galvanically isolated power supply to the analog input AI0 (Proceed with the analog inputs AI1 ... AI3 in the same way)**

The following measuring ranges can be configured "Parameterization" on page 1155 "Measuring ranges" on page 1166:

<table>
<thead>
<tr>
<th>Signal</th>
<th>Range</th>
<th>Channels used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>0 V ... 10 V</td>
<td>1 channel used</td>
</tr>
<tr>
<td>Voltage</td>
<td>-10 V ... +10 V</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

The function of the LEDs is described under Diagnosis and displays / Displays "State LEDs" on page 1165.

To avoid error messages from unused analog input channels, configure them as "unused".
Connection of active-type analog sensors (Current) with galvanically isolated power supply to the analog inputs

The following measuring ranges can be configured:

<table>
<thead>
<tr>
<th>Current</th>
<th>0 mA ... 20 mA</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current</td>
<td>4 mA ... 20 mA</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

The function of the LEDs is described under ‘State LEDs’.

Unused input channels can be left open-circuited, because they are of low resistance.
To avoid error messages through unused analog input channels in measuring range 4 ... 20 mA, these channels should be configured as “Not used”.

Connection of active-type analog sensors (Voltage) with no galvanically isolated power supply to the analog inputs

The following figure shows the connection of active-type analog sensors (voltage) with no galvanically isolated power supply to the analog input AI0. Proceed with the analog inputs AI1 ... AI3 in the same way.

Fig. 231: Connection of active-type analog sensors (current) with galvanically isolated power supply to the analog input AI0 (Proceed with the analog inputs AI1 ... AI3 in the same way)

The following measuring ranges can be configured:

- Chapter 5.2.6.6.1.9 “Parameterization” on page 1155
- Chapter 5.2.6.6.1.12 “Measuring ranges” on page 1166:

<table>
<thead>
<tr>
<th>Current</th>
<th>0 mA ... 20 mA</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current</td>
<td>4 mA ... 20 mA</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

The function of the LEDs is described under ‘State LEDs’.

Unused input channels can be left open-circuited, because they are of low resistance.
To avoid error messages through unused analog input channels in measuring range 4 ... 20 mA, these channels should be configured as “Not used”.

Connection of active-type analog sensors (Voltage) with no galvanically isolated power supply to the analog inputs

The following figure shows the connection of active-type analog sensors (voltage) with no galvanically isolated power supply to the analog input AI0. Proceed with the analog inputs AI1 ... AI3 in the same way.
Fig. 232: Connection of active-type analog sensors (voltage) with no galvanically isolated power supply to the analog input AI0 (Proceed with the analog inputs AI1 ... AI3 in the same way)

CAUTION!
Risk of faulty measurements!
The negative pole at the sensors must not have too big a potential difference with respect to ZP (max. ± 1 V).
Make sure that the potential difference never exceeds ± 1 V (also not with long cable lengths).

The following measuring ranges can be configured § Chapter 5.2.6.6.1.9 “Parameterization” on page 1155 § Chapter 5.2.6.6.1.12 “Measuring ranges” on page 1166:

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0 V ... 10 V</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V ... +10 V</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

The function of the LEDs is described under Diagnosis and displays / Displays § Chapter 5.2.6.6.1.11 “State LEDs” on page 1165.

To avoid error messages from unused analog input channels, configure them as "unused".
Connection of passive-type analog sensors (Current) to the analog inputs

![Diagram of passive-type analog sensors connection]

Fig. 233: Connection of passive-type analog sensors (current) to the analog input AI0 (Proceed with the analog inputs AI1 ... AI3 in the same way)

The following measuring ranges can be configured:

- **Current**: 4 mA ... 20 mA, 1 channel used

The function of the LEDs is described under Diagnosis and displays / Displays.

**CAUTION! Risk of overloading the analog input!**

If an analog current sensor supplies more than 25 mA for more than 1 second during initialization, this input is switched off by the module (input protection).

Use only sensors with fast initialization or without current peaks higher than 25 mA. If not possible, connect a 10-volt Zener diode in parallel to AIx+ and ZP.

Unused input channels can be left open-circuited, because they are of low resistance.

To avoid error messages through unused analog input channels in measuring range 4 mA ... 20 mA, these channels should be configured as "Not used".

Connection of active-type analog sensors (Voltage) to differential analog inputs

Differential inputs are very useful, if analog sensors are used which are remotely non-isolated (e.g. the minus terminal is remotely grounded).

The evaluation using differential inputs helps to considerably increase the measuring accuracy and to avoid ground loops.

With differential input configurations, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).
The analog value is calculated by subtraction of the input value with the higher address from the input value of the lower address.

The converted analog value is available at the odd channel (higher address).

**CAUTION!**

Risk of faulty measurements!

The negative pole at the sensors must not have too big a potential difference with respect to ZP (max. ±1 V).

Make sure that the potential difference never exceeds ±1 V.

---

**Fig. 234:** Connection of active-type analog sensors (voltage) to differential analog inputs AI0 and AI1 (Proceed with AI2 and AI3 in the same way)

The following measuring ranges can be configured:

- **Voltage 0 V ... 10 V with differential inputs, 2 channels used**
- **Voltage -10 V ... +10 V with differential inputs, 2 channels used**

The function of the LEDs is described under Diagnosis and displays / Displays.

To avoid error messages from unused analog input channels, configure them as "unused".

**Use of analog inputs as digital inputs**

Several (or all) analog inputs can be configured as digital inputs. The inputs are not galvanically isolated against the other analog channels.
Fig. 235: Connection of digital sensors to the analog input AI0 (Proceed with the analog inputs AI1 ... AI3 in the same way)

The following measuring ranges can be configured \( \text{Chapter 5.2.6.6.1.9 "Parameterization" on page 1155} \) \( \text{Chapter 5.2.6.6.1.12 "Measuring ranges" on page 1166} \):

<table>
<thead>
<tr>
<th>Digital input</th>
<th>24 V</th>
<th>1 channel used</th>
</tr>
</thead>
</table>

The function of the LEDs is described under Diagnosis and displays / Displays \( \text{Chapter 5.2.6.6.1.11 "State LEDs" on page 1165} \).

Connection of analog output loads (Voltage)

Fig. 236: Connection of analog output loads (voltage) to the analog output AO0 (Proceed with the analog output AO1 in the same way)
The following measuring ranges can be configured: "Parameterization" on page 1155 and "Measuring ranges" on page 1166:

<table>
<thead>
<tr>
<th>Voltage</th>
<th>-10 V ... +10 V</th>
<th>Load ± 10 mA max.</th>
<th>1 channel used</th>
</tr>
</thead>
</table>

The function of the LEDs is described under Diagnosis and displays / Displays: "State LEDs" on page 1165.

Unused analog outputs can be left open-circuited.

**Connection of analog output loads (Current)**

![Connection diagram]

*Fig. 237: Connection of analog output loads (current) to the analog output AO0 (Proceed with the analog output AO1 in the same way)*

The following measuring ranges can be configured: "Parameterization" on page 1155 and "Measuring ranges" on page 1166:

<table>
<thead>
<tr>
<th>Current</th>
<th>0 mA ... 20 mA</th>
<th>Load 0 Ω ... 500 Ω</th>
<th>1 channel used</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Current</th>
<th>4 mA ... 20 mA</th>
<th>Load 0 Ω ... 500 Ω</th>
<th>1 channel used</th>
</tr>
</thead>
</table>

The function of the LEDs is described under Diagnosis and displays / Displays: "Diagnosis" on page 1160.

Unused analog outputs can be left open-circuited.

Counter input data (words) | 4 |
Counter output data (words) | 8 |

**Addressing**

The module reads the position of the rotary switches only during power-up, i.e. changes of the switch position during operation will have no effect until the next module initialization.

**I/O configuration**

The CI541-DP PROFIBUS DP bus configuration is handled by PROFIBUS DP master with the exception of the slave bus ID (via rotary switches) and the transmission rate (automatic detection).

The analog/digital I/O channels and the fast counter are configured via software.

Details about configuration are described in Parameterization © Chapter 5.2.6.1.9 “Parameterization” on page 1155.

</table>

1) The parameters Behaviour digital outputs at communication error is only analyzed if the Failsafe-mode is ON.

2) The state "externally voltage detected" appears, if the output of a channel DC0 ... DC7 should be switched on while an externally voltage is connected. In this case the start up is disabled, as long as the externally voltage is connected. The monitoring of this state and the resulting diagnosis message can be disabled by setting the parameters to "OFF".

### Byte Number Description Possible Values

| 6 | Diagnosis Byte, error code | According to the I/O bus specification  
|   | Bit 7 and bit 6, coded error class  
|   | 0 = E1  
|   | 1 = E2  
|   | 2 = E3  
|   | 3 = E4  
|   | Bit 0 to bit 5, coded error description |

| 7 | Diagnosis Byte, flags | According to the I/O bus specification  
|   | Bit 7: 1 = coming error  
|   | Bit 6: 1 = leaving error |

In cases of short circuit or overload, the digital outputs are turned off. The modules performs reactivation automatically. Thus an acknowledgement of the errors is not necessary. The error message is stored via the LED.

#### Class Interface Device Module Channel Error-Identifier Error message Remedy

#### Channel error digital

| 4 |-| 31 | 2 | 0...7 | 46 | Externally voltage detected on digital output DO0...DO7 6) | Check terminals |
| 4 |-| 31 | 2 | 0...7 | 47 | Short circuit at digital output 7) | Check terminals |

#### Channel error analog

| 4 |-| 31 | 1 | 0...3 | 48 | Analog value overflow or broken wire at an analog input | Check value or check terminals |
| 4 |-| 31 | 1 | 0...3 | 7 | Analog value underflow at an analog input | Check value |
| 4 |-| 31 | 1 | 0...3 | 47 | Short-circuit at an analog input | Check terminals |
| 4 |-| 31 | 1 | 0...1 | 4 | Analog value overflow at an analog output | Check output value |
| 4 |-| 31 | 1 | 0...1 | 7 | Analog value underflow at an analog output | Check output value |

#### Remarks:

1) In AC500 the following interface identifier applies:
   "=" = Diagnosis via bus-specific function blocks; 0...4 or 10 = Position of the Communication Module; 14 = I/O bus; 31 = Module itself
   The identifier is not contained in the CI541-DP diagnosis block.

2) With "Device" the following allocation applies: 31 = Module itself; 1...10 = Expansion module

3) With "Module" the following allocation applies:
   31 = Module itself
   Channel error: Module type (1 = AI, 2 = DO, 3 = AO)
This message appears, if externally voltages at one or more terminals DO0...DO7 cause that other digital outputs are supplied through that voltage (voltage feedback, see description in section 'Connection' Chapter 5.2.6.6.1.5 “Connections” on page 1139). All outputs of the apply digital output groups will be turned off for 5 seconds. The diagnosis message appears for the whole output group.

The voltage on digital outputs DO0 ... DO7 has overrun the process supply voltage UP3 (see description in section 'Connection' Chapter 5.2.6.6.1.5 “Connections” on page 1139). Diagnosis message appears for the whole module.

This message appears, if the output of a channel DO0 ... DO7 should be switched on while an externally voltage is connected. In this case the start up is disabled, as long as the externally voltage is connected. Otherwise this could produce reverse voltage from this output to other digital outputs. This diagnosis message appears per channel.

Short circuit: After a detected short circuit, the output is deactivated for 100ms. Then a new start up will be executed. This diagnosis message appears per channel.

In case of an I/O module doesn’t support hot swapping, do not perform any hot swap operations (also not on any other terminal units (slots)) as modules may be damaged or I/O bus communication may be disturbed.

Diagnosis for hot swap available as of version index F0.

**State LEDs**

The LEDs are located at the front of module. There are 2 different groups:

- The 5 system LEDs (PWR, STA1-DP, STA2-DP, S-ERR and I/O-Bus) show the operation state of the module and display possible errors.
- The 27 process LEDs (UP, UP3, inputs, outputs, CH-ERR1 to CH-ERR3) show the process supply voltage and the states of the inputs and outputs and display possible errors.

**Table 259: States of the 5 system LEDs:**

Technical data

Technical data of the module

The system data of AC500 and S500 are applicable to the standard version “System data AC500” on page 166.

The system data of AC500-XC are applicable to the XC version “System data AC500-XC” on page 169.

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.

**NOTICE!**

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and temporary overvoltage up to 30 V DC.

**Multiple overloads**

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.
5.2.6.6.2 CI542-DP

Features

- 8 digital inputs 24 V DC
- 8 digital outputs 24 V DC, 0.5 A max.
- 8 configurable digital inputs/outputs 24 V DC, 0.5 A max.
- Module-wise galvanically isolated
- Fast counter
- XC version for usage in extreme ambient conditions available
Intended purpose

The PROFIBUS DP communication interface module is used as decentralized I/O module in PROFIBUS networks. Depending on the used terminal unit the network connection is performed either via 9-pole female D-sub or via 10 terminals (screw-type or spring terminals) which are integrated in the terminal unit.

The inputs/outputs are galvanically isolated from the PROFIBUS network. There is no potential separation between the channels. The configuration of the configurable digital inputs/outputs is performed by software.

For usage in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

Diagnosis settings

The current CI54x does not run in combination with a V3 PLC if in the “General” tab the parameter “Diagnosis behavior” is set to “AC500 V3 compatible”. How to change the setting in your AB project is described below.

1. Double click in the “Device” tree on “CI541_IO”.
   ⇒ The tab for the various settings opens.
2. Double click on the “General” tab.
3. Double click on the “Value” of the parameter “Diagnosis behavior”.
4. Click on the small arrow.
   ⇒ A submenu with two values opens.
5. Click on “AC500 V2 compatible” as setting.
6. Close the tab.

After changing the parameter to “AC500 V2 compatible” the CI54x get in “RUN”.

If the CI54x indicates a S500 diagnosis message, following AC500 diagnosis entry (“655374 CI54x communication interface module is sending not supported diagnosis format - Check configuration and FW revision of communication interface module”) is shown in the diagnosis editor and history. This diagnosis message does not have impact to cyclic data exchange between the master and the CI54x.

In case of a parameter change from V2 to V3 the parameter at the CI54x of V3 has the same value than at the CI54x below V2 (that means AC500 V2 compatible).
Connections
General

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

The PROFIBUS DP communication interface module CI542-DP is plugged on the I/O terminal units TU509 \(\text{\&} \) Chapter 5.2.7.3 “TU509 and TU510 for communication interface modules” on page 1274 or TU510 \(\text{\&} \) Chapter 5.2.7.3 “TU509 and TU510 for communication interface modules” on page 1274 and accordingly TU517 \(\text{\&} \) Chapter 5.2.7.4 “TU517 and TU518 for communication interface modules” on page 1278 or TU518 \(\text{\&} \) Chapter 5.2.7.4 “TU517 and TU518 for communication interface modules” on page 1278. Properly seat the module and press until it locks in place. The terminal unit is mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting \(\text{\&} \) Chapter 5.2.8.2.5 “TA526 - Wall mounting accessory” on page 1324.

The connection of the I/O channels is carried out using the 30 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 2.8 and 3.8 as well as 2.9, 3.9 and 4.9 are electrically interconnected within the terminal unit and have always the same assignment, independent of the inserted module:

Terminals 2.8 and 3.8: Process supply voltage UP = +24 V DC
Terminal 4.8: Process supply voltage UP3 = +24 V DC
Terminals 2.9, 3.9 and 4.9: Process supply voltage ZP = 0 V

With a separate UP3 power supply, the digital outputs can be switched off externally. This way, an emergency-off functionality can be realized.

Do not connect any voltages externally to digital outputs!
This is not intended usage.
Reason: Externally voltages at one or more terminals DC0...DC7 or DO0...DO7 may cause that other digital outputs are supplied through that voltage instead of voltage UP3 (reverse voltage).
This is also possible, if DC channels are used as inputs. For this, the source for the input signals should be the impressed UP3 of the device.
This limitation does not apply for the input channels DI0...DI7.

CAUTION!
Risk of malfunction by unintended usage!
If the function cut-off of the digital outputs is to be used by deactivation of the supply voltage UP3, be sure that no external voltage is connected at the outputs DO0...DO7 and DC0...DC7.

Possibilities of connection
Assignment

Mounting on terminal units TU509 or TU510:
The assignment of the 9-pole female D-sub for the PROFIBUS DP signals.
### Serial Interface

<table>
<thead>
<tr>

### Bus termination

The line ends of the bus segment must be equipped with bus terminating resistors. Normally, these resistors are integrated in the interface connectors.

- VP (+5 V) 6 390 Ohms
- Data Line B RxD/TxD-P 3 220 Ohms
- Data Line A RxD/TxD-N 8 390 Ohms
- GND (0 V) 5

*The grounding of the shield should take place at the control cabinet, see System-Data AC500 % Chapter 5.1.2 “System data AC500” on page 166.*

Mounting on terminal units TU517 or TU518:

The assignment of the terminals 1.0 - 1.9:

<table>
<thead>
<tr>

<tr>
<td>1.8</td>
<td>DGND</td>
<td>Reference potential for data transmission</td>
</tr>
<tr>
<td>1.9</td>
<td>DGND</td>
<td>Reference potential for data transmission</td>
</tr>
</tbody>
</table>

At the line ends of a bus segment, terminating resistors must be connected. If using TU517/TU518, the bus terminating resistors can be enabled by connecting the terminals TermA and TermB to the data lines A and B (no external terminating resistors are required, see figure below).
If using TU517/TU518, note that the terminating resistors are not located inside the TU, but inside the communication interface module CI541-DP. I. e. when removing the device from the TU, the bus terminating resistors are not connected to the bus any more. The bus itself will not be disconnected if a device is removed.

If using TU517/TU518 the max. permitted transmission rate is limited to 1.5 MBaud.

Technical data bus cable

#### WARNING!

**Removal/Insertion under power**

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.
**NOTICE!**

**Risk of damaging the PLC modules!**

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

---

Addressing

The module reads the position of the rotary switches only during power-up, i.e. changes of the switch position during operation will have no effect until the next module initialization.
I/O configuration

The CI542-DP PROFIBUS DP bus configuration is handled by PROFIBUS DP master with the exception of the slave bus ID (via rotary switches) and the transmission rate (automatic detection).

The digital I/O channels and the fast counter are configured via software. Details about configuration are described in Parameterization.

</table>

Remarks:
1) The parameter Behaviour DO at comm. error is apply to DC and DO channels and only analyzed if the Failsafe-mode is ON.

2) The state "externally voltage detected" appears, if the output of a channel DC0 ... DC7 should be switched on while an externally voltage is connected. In this case the start up is disabled, as long as the externally voltage is connected. The monitoring of this state and the resulting diagnosis message can be disabled by setting the parameters to "OFF".

3) The error state "voltage overflow at outputs" appears, if externally voltage at digital outputs DC0 ... DC7 and accordingly DO0 ... DO7 has exceeded the process supply voltage UP3. The according diagnosis message "Voltage overflow on outputs " can be disabled by setting the parameters on "OFF". This parameter should only be disabled in exceptional cases for voltage overflow may produce reverse voltage.

### Diagnosis

Structure of the diagnosis block via DPM_SLV_DIAG function block.

<table>

<td>Bit 7: 1 = coming error</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Bit 6: 1 = leaving error</td>
</tr>
</tbody>
</table>

In cases of short circuit or overload, the digital outputs are turned off. The modules performs reactivation automatically. Thus an acknowledgement of the errors is not necessary. The error message is stored via the LED.

Remarks:
In AC500 the following interface identifier applies:

- \(".\) = Diagnosis via bus-specific function blocks; 0 ... 4 or 10 = Position of the Communication Module; 14 = I/O bus; 31 = Module itself

The identifier is not contained in the CI542-DP diagnosis block.

With "Device" the following allocation applies: 31 = Module itself, 1..10 = expansion module

With "Module" the following allocation applies dependent of the master:

Module error: 31 = Module itself
Channel error: Module type (1 = AI, 2 = DO, 3 = AO)

This message appears, if externally voltages at one or more terminals DC0 ... DC7 oder DO0 ... DO7 cause that other digital outputs are supplied through that voltage.

All outputs of the apply digital output groups will be turned off for 5 seconds. The diagnosis message appears for the whole output group.

The voltage at digital outputs DC0 .. DC7 and accordingly DO0 ... DO7 has exceeded the process supply voltage UP3. Diagnosis message appears for the whole module.

This message appears, if the output of a channel DC0 ... DC7 or DO0 ... DO7 should be switched on while an externally voltage is connected. In this case the start up is disabled, as long as the externally voltage is connected. Otherwise this could produce reverse voltage from this output to other digital outputs. This diagnosis message appears per channel.

Short circuit: After a detected short circuit, the output is deactivated for 100ms. Then a new start up will be executed. This diagnosis message appears per channel.

In case of an I/O module doesn’t support hot swapping, do not perform any hot swap operations (also not on any other terminal units (slots)) as modules may be damaged or I/O bus communication may be disturbed.

Diagnosis for hot swap available as of version index F0.

---

### State LEDs

The LEDs are located at the front of module. There are 2 different groups:

- The 5 system LEDs (PWR, STA1 DP, STA2 DP, S-ERR and I/O-Bus) show the operation state of the module and display possible errors.
- The 29 process LEDs (UP, UP3, inputs, outputs, CH-ERR1 to CH-ERR3) show the process supply voltage and the states of the inputs and outputs and display possible errors.

Technical data

Technical data of the module

The system data of AC500 and S500 are applicable to the standard version Chapter 5.1.2 “System data AC500” on page 166.

The system data of AC500-XC are applicable to the XC version Chapter 5.1.3 “System data AC500-XC” on page 169.

Only additional details are therefore documented below.
The technical data are also applicable to the XC version.

| Operation and error displays | 34 LEDs (totally) |
| Weight (without terminal unit) | Ca. 125 g |
| Mounting position | Horizontal  
Or vertical with derating (output load reduced to 50 % at +40 °C per group) |
| Cooling | The natural convection cooling must not be hindered by cable ducts or other parts in the control cabinet. |

### NOTICE!
All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and temporary overvoltage up to 30 V DC.

### Multiple overloads
No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

*) Due to the direct connection to the output, the demagnetizing varistor is also effective at the input (see figure) above. This is why the difference between UPx and the input signal may not exceed the clamp voltage of the varistor. The varistor limits the voltage to approx. 36 V. Following this, the input voltage must range from -12 V ... +30 V when UPx = 24 V and from -6 V ... +30 V when UPx = 30 V.

5.2.6.7 PROFINET

5.2.6.7.1 Comparison of the CI5xx-PNIO modules

The PROFINET IO devices combine the advantages of decentralized I/O modules with the reaction time of AC500 mounted central I/O modules. The devices for PROFINET provide the extension -PNIO in the device name.

The communication module CM579-PNIO acts as I/O controller in a PROFINET network. It is connected to the processor module via an internal communication bus. Depending on the terminal base, several communication modules can be used for one processor module.

The communication interface modules CI5xx-PNIO act as I/O devices in a PROFINET network. Additionally the communication module CM589-PNIO(-4) can be used to setup a AC500 PLC to act as I/O module in a PROFINET network.

The difference of the CI5xx-PNIO devices can be found in their input and output characteristics Chapter 5.2.6.7.1.1 “Characteristics of CI50x-PNIO” on page 1201.

### Input/Output characteristics of CI501-PNIO

The PROFINET communication interface module CI501-PNIO is used as decentralized I/O module in PROFINET networks. The network connection is performed via 2 RJ45 connectors which are integrated in the terminal unit. The communication interface module contains 22 I/O channels with the following properties:

- 4 analog inputs (1.0 ... 1.3), configurable as:
  - -10 V ... +10 V
  - 0 V ... +10 V
  - -10 V ... +10 V (differential voltage)
  - 0 mA ... 20 mA
  - 4 mA ... 20 mA
  - Pt100, Pt1000, Ni1000 (for each 2-wire and 3-wire)
  - 24 V digital input function
- 2 analog outputs (1.5 ... 1.6), configurable as:
  - -10 V ... +10 V
  - 0 mA ... 20 mA
  - 4 mA ... 20 mA
- 8 digital inputs 24 V DC in 1 group (2.0 ... 2.7)
- 8 digital transistor outputs 24 V DC (0.5 A max.) in 1 group (3.0 ... 3.7)
- Resolution of the analog channels: 12 bits

The inputs/outputs are galvanically isolated from the Ethernet network. There is no potential separation between the channels. The configuration of the analog inputs/outputs is performed by software.

For usage in enhanced ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

### Input/Output characteristics of CI502-PNIO

- 8 digital inputs 24 V DC
- 8 digital transistor outputs 24 V DC, 0.5 A max.
- 8 configurable digital inputs/outputs 24 V DC, 0.5 A max.
- Module-wise galvanically isolated
- XC version for usage in extreme ambient conditions available

5.2.6.7.2 CI501-PNIO

Features

- 4 analog inputs, 2 analog outputs, 8 digital inputs, 8 digital outputs
- Resolution 12 bits including sign
- Module-wise galvanically isolated
- Fast counter
- XC version for usage in extreme ambient conditions available
1 I/O bus
2 Allocation between terminal number and signal name
3 6 yellow LEDs to display the signal states of the analog inputs/outputs (AI0 ... AI3, AO0 ... AO1)
4 8 yellow LEDs to display the signal states of the digital inputs (DI0 ... DI7)
5 8 yellow LEDs to display the signal states of the digital outputs (DO0 ... DO7)
6 2 green LEDs to display the process supply voltage UP and UP3
7 3 red LEDs to display errors (CH-ERR1, CH-ERR2, CH-ERR3)
8 5 system LEDs: PWR/RUN, STA1 ETH, STA2 ETH, S-ERR, I/O-Bus
9 Label
10 2 rotary switches for setting the I/O device identifier
11 Ethernet interfaces (ETH1, ETH2) on the terminal unit
12 Terminal unit
13 DIN rail
* Sign for XC version
Intended purpose

The PROFINET communication interface modules CI501-PNIO and CI502-PNIO are used as communication interface modules in PROFINET networks. The network connection is performed by Ethernet cables which are inserted in the RJ45 connectors in the terminal unit. An Ethernet switch in the communication interface module allows daisy chaining of the network.

For usage in enhanced ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

Functionality

The communication interface module contains 22 I/O channels with the following properties:

- 4 configurable analog inputs (2-wire / single-ended) or 2 configurable analog inputs (3-wire / differential) (1.0 ... 1.3)
- 2 analog outputs (1.5 ... 1.6)
- 8 digital inputs 24 V DC in 1 group (2.0 ... 2.7)
- 8 digital outputs 24 V DC, 0.5 A max. in 1 group (3.0 ... 3.7)

The inputs/outputs are galvanically isolated from the PROFINET network. There is no potential separation between the channels. The configuration of the analog inputs/outputs is performed by software.

</table>

Connections

General

The Ethernet communication interface module CI501-PNIO is plugged on the I/O terminal unit TU507-ETH or TU508-ETH  \( \text{ Chapter 5.2.7.2 "TU507-ETH and TU508-ETH for Ethernet communication interface modules" on page 1270} \). Properly seat the module and press until it locks in place. The terminal unit is mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting  \( \text{ Chapter 5.2.8.2.5 "TA526 - Wall mounting accessory" on page 1324} \).

The connection of the I/O channels is carried out using the 30 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.
For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

The terminals 1.8 and 2.8 as well as 1.9, 2.9 and 3.9 are electrically interconnected within the terminal unit and have always the same assignment, independent of the inserted module:

Terminals 1.8 and 2.8: Process supply voltage UP = +24 V DC
Terminal 3.8: Process supply voltage UP3 = +24 V DC
Terminals 1.9, 2.9 and 3.9: Process supply voltage ZP = 0 V

With a separate UP3 power supply, the digital outputs can be switched off externally. This way, an emergency-off functionality can be realized.

Do not connect any voltages externally to digital outputs!
Reason: External voltages at an output or several outputs may cause that other outputs are supplied through that voltage instead of voltage UP3 (reverse voltage). This is unintended usage.

CAUTION!
Risk of malfunction by unintended usage!
If the function cut-off of the digital outputs is to be used by deactivation of the supply voltage UP3, be sure that no external voltage is connected at the outputs DO0 ... DO7.

**WARNING!**
Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

**NOTICE!**
Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.
– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

*For the open-circuit detection (wire break), each analog input channel is pulled up to “plus” by a high-resistance resistor. If nothing is connected, the maximum voltage will be read in then.*
Generally, analog signals must be laid in shielded cables. The cable shields must be grounded at both sides of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.

Connection of resistance thermometers in 2-wire configuration to the analog inputs

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module CI501-PNIO provides a constant current source which is multiplexed over the max. 4 analog input channels.
Fig. 245: Connection of resistance thermometers in 2-wire configuration to the analog inputs (AI0 ... AI3)

*Chapter 5.2.6.7.2.9 “Diagnosis” on page 1228

The module CI501-PNIO performs a linearization of the resistance characteristic.
To avoid error messages from unused analog input channels, configure them as "unused".

**Connection of resistance thermometers in 3-wire configuration to the analog inputs**

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module CI501-PNIO provides a constant current source which is multiplexed over the max. 4 analog input channels.
With 3-wire configuration, 2 adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1).

The constant current of one channel flows through the resistance thermometer. The constant current of the other channel flows through one of the cores. The module calculates the measured value from the two voltage drops and stores it under the input with the higher channel number (e.g. I1).

In order to keep measuring errors as small as possible, it is necessary to have all the involved conductors in the same cable. All the conductors must have the same cross section.

Unused input channels can be left open-circuited, because they are of low resistance.

To avoid error messages through unused analog input channels in measuring range 4 mA ... 20 mA, these channels should be configured as "Not used".
Connection of active-type analog sensors (Voltage) with no galvanically isolated power supply to the analog inputs

**CAUTION!**
Risk of faulty measurements!
The negative pin at the sensors must not have too big a potential difference with respect to ZP (max. ± 1 V).
Make sure that the potential difference never exceeds ± 1 V (also not with long cable lengths).

Table 269: Configurable measuring ranges

Connection of passive-type analog sensors (Current) to the analog inputs

![Connection diagram](image)

Fig. 250: Connection of passive-type analog sensors (current) to the analog inputs (AI0 ... AI3)

### Table 270: Configurable measuring ranges

<table>
<thead>
<tr>
<th>Current</th>
<th>4 mA ... 20 mA</th>
<th>1 channel used</th>
</tr>
</thead>
</table>

- Chapter 5.2.6.7.2.8 “Parameterization” on page 1222
- Chapter 5.2.6.7.2.9 “Diagnosis” on page 1228

**CAUTION!**

Risk of overloading the analog input!

If an analog current sensor supplies more than 25 mA for more than 1 second during initialization, this input is switched off by the module (input protection).

Use only sensors with fast initialization or without current peaks higher than 25 mA. If not possible, connect a 10-volt zener diode in parallel to AIx+ and ZP.

Unused input channels can be left open-circuited, because they are of low resistance.

To avoid error messages through unused analog input channels in measuring range 4 mA ... 20 mA, these channels should be configured as “Not used”.

Connection of active-type analog sensors (Voltage) to differential analog inputs

Differential inputs are very useful, if analog sensors are used which are remotely non-isolated (e.g. the minus terminal is remotely grounded).

The evaluation using differential inputs helps to considerably increase the measuring accuracy and to avoid ground loops.
With differential input configurations, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

The analog value is calculated by subtraction of the input value with the higher address from the input value of the lower address.

The converted analog value is available at the odd channel (higher address).

**CAUTION!**
Risk of faulty measurements!
The negative pin at the sensors must not have too big a potential difference with respect to ZP (max. ± 1 V).

Make sure that the potential difference never exceeds ± 1 V.

#### Addressing

The module has 2 rotary switches to set an explicit name to the PROFINET IO device before commissioning. No engineering tool is needed in this case.

The device gets its name (including the fixed part of the device name) with the switch settings (01h...FFh). This name can be used directly within the device configuration: “CI5xx-pn-yy”

- “CI5xx-pn-yy” xx is the fixed part of the device name (e.g. CI501) and yy represents the position of the rotary switch (0..FFh). The rotary switch values must be entered in hexadecimal format. For example, to set the name to “CI5xx-pn-08”, set the upper rotary switch to “0” and the lower switch to “8”.

- The module reads the position of the rotary switches only during power-up, i.e. changes of the switch position during operation will have no effect until the next module initialization.

#### I/O configuration

The CI501-PNIO stores some PROFINET configuration parameters (I/O device identifier, I/O device type and IP address configuration). No more configuration data is stored.

The analog/digital I/O channels are configured via software.

- Chapter 5.2.6.7.2.8 “Parameterization” on page 1222
## Parameterization

### Parameters of the module

<table>

</tbody>
</table>

Remarks:

1) With a faulty ID, the module reports a "parameter error" and does not perform cyclic process data transmission.

2) As for device index C0, the parameter is no longer evaluated.

3) Counter operating modes, see description of the Fast counter "Fast counter on page 606.

Table 275: Error LED / Failsafe function

</tr>
</tbody>
</table>

*) The parameters Behaviour AO at comm. error and Behaviour DO at comm. error are only analyzed if the Failsafe-mode is ON.
IO-BUS reset after PROFINET reconnection controls the behavior of PROFINET CI modules in relation to connected I/O modules (both safety and non-safety I/O modules).

- **IO-BUS reset after PROFINET reconnection = “On”** resets and, thus, re-parameterizes all attached I/O modules. All internal I/O modules states are reset, including the related diagnosis information.
  
  Note that if the parameter is set to “On” then:
  - The bumpless re-start of non-safety I/O modules will not be supported. It means, for example, that non-safety output channels will go from fail-safe values to “0” values during the re-connection and re-parameterization time and after that go to new output values.
  - Safety I/O modules will be re-parameterized and re-started as newly started modules, which may not require their PROFIsafe reintegration, depending on safety CPU state, in the safety application.

- **IO-BUS reset after PROFINET reconnection = “Off”** will not reset all attached I/O modules. It will re-parameterize I/O modules only if parameter change is detected during the reconnection. All internal I/O modules states are not reset, including the related diagnosis information.
  
  Note that if the parameter is set to “Off” then:
  - The bumpless re-start of non-safety I/O modules is supported (if no parameters are changed). It means, for example, that non-safety output channels will not go from fail-safe values to “0” values during the re-connection and re-parameterization time, but directly from fail-safe values to new output values.
