Possible error cause: VAR_STAT and CONSTANT declarations are used together in a function block declaration. The Replaces constants compile option is disabled.
The Replace constants compile option is disabled.

```plaintext
VAR CONSTANT
  iMaxInst : INT := 2;
END_VAR
VAR_STAT
  iIDs : INT := iMaxInst - 1;
END_VAR
```

Message: C0549: Initialization of the static variable 'iIDs' is not constant, or replaced constants is disabled.

Error correction: In Project → Project Settings, on the “Compile Options” tab, enable the ‘Replace constants’ compile option.

Compiler Error C0550

**Message:** Attribute 'pack_mode' for 'FUNCTION' ( 'METHOD') not allowed

**Possible error cause:** Functions or methods which are attributed with the pragma {attribute 'pack_mode' := ' <pack mode value>'}

**Example**

```plaintext
{attribute 'pack_mode' := '2'}
METHOD METH : INT
  VAR_INPUT
  END_VAR
{attribute 'pack_mode' := '1'}
FUNCTION FunPacked : DINT
  VAR_INPUT
    by1: BYTE;
  END_VAR
  VAR
    by2: BYTE;
  END_VAR
```

**Message:**

C0550: Attribute 'pack_mode' for 'METHOD' not allowed
C0550: Attribute 'pack_mode' for 'FUNCTION' not allowed

Error correction: Delete the attribute pragma.

Compiler Error C0554

**Message:** No explicit calls of '<FB name>' allowed. <value of attribute 'no_explicit_call'>

**Possible error cause:** A function block with the no_explicit_call attribute has been called.
Configuration and programming
Programming with CODESYS > CODESYS Development System

Example
{attribute 'no_explicit_call' := 'Call of this FB is not allowed'}
FUNCTION_BLOCK FB1
VAR_INPUT
END_VAR
VAR_OUTPUT
END_VAR
VAR
END_VAR
PROGRAM PLC_PRG
VAR
myFB: FB1;
END_VAR
myFB();
Message:
C0554: No explicit calls of 'FB1' allowed. Call of this FB is not allowed.
Error correction: Delete the attribute pragma.

Compiler Error C0555
Message: The string literal <literal> contains characters that cannot be displayed. The project
option 'UTF-8 encoding for STRING' could be used.
Possible error cause: Input of unknown characters which cannot be transformed to Latin-1.

Example
PROGRAM PLC_PRG
VAR
str1: STRING(200);
str2: STRING := '1 €';
str3: STRING(200) := ' !$"#$$%&$'()*+,-./0123456789:;<=>?
@ABCDEFGHIJKLMNOPQRSTUVWXYZ[\]^_`abcdefghijklmnopqrstuvwxyz{|}~';
END_VAR
str1 := '你好,世界';
str1 := 'ABC abc 123 äöü ß#~=" §% /(!)[]{}\ ´`^*~°€µ *_-.; 中文字
Ω �';
str1 := '1 £';
str1 := '1 €';
str1 := ' !$"#$$%&$'()*+,-./0123456789:;<=>?
@ABCDEFGHIJKLMNOPQRSTUVWXYZ[\]^_`abcdefghijklmnopqrstuvwxyz{|}~';
Message:
C0555: The string literal '你好,世界' contains characters that cannot be displayed. The project
option 'UTF-8 Encoding for STRING' could be used.
Error correction: Select the option.

6.4.1.21.1  Notifications

Notifications inform you about important information, such as available updates or security notices.

To open the “Notifications” view, click the icon in the upper right corner of the frame window of CODESYS. All received notifications are displayed in this view. Notifications marked as “read” are deleted from the list the next time CODESYS is started.

The red icon \(^3\) indicates that new notifications are available, as well as how many.
6.4.1.21.2 Objects

General

Objects in CODESYS provide special functionalities to create applications. Examples: Application, program, function, Library Manager, devices, image pool. Objects are managed in tree structures in the views “Devices”, “POUs” and “Modules”.

You can add an object to the belonging "tree" by use of the command “Project ➔ Add Object”. The possible insert positions depends on the position within the tree.

Each object provides properties, which can be viewed and accessed with the command from the context menu of the object.

See also
- Chapter 6.4.1.21.3.4.22 “Command 'Properties'” on page 2597
Object 'Application'

Symbol: 🚀

The object is displayed as a node in the device tree. It comprises the objects which are required for a controller program to run.

You can insert an application object below a “PLC Logic” node (below a programmable device) or as a child application below an existing application (parent application).

Below each application, there has to be a “Task Configuration” where you configure which program of the application will be called by which task and using which settings.

Furthermore, you insert the POU\s of your controller program below an application, for example POU\s, global variables lists, and the Library Manager. These POU\s are available only for this application and its child applications.

In addition, the application can also use instances of project-global POU\s. You manage project-global POU\s in the “POUs” view. The use of these kinds of instances follows the thinking behind object-oriented programming.

Multiple applications can be inserted below a PLC device object. To do this, they have to have unique names.

![Diagram of PLC device object with applications](image)

**NOTICE!**

An online change after a changing the parent application will remove the child application from the PLC.

When multiple applications are directly below a device object, for the I/O handling of the device you have to define the application whose variables CODESYS should use for communication with the target system. The settings are configured on the “PLC Settings” tab of the device editor.

The application that you want to work with in online mode has to be set as the "active application" (see “App2” in the figure above).

You can set special properties for an application on the “Application Build Options” tab of the “Properties” dialog of the application object. Example: Activation of dynamic memory allocation.

When downloading the application to the PLC, you can include information about the application contents. This is also a setting on the “Application Build Options” tab. Then later you can compare the application on the controller with the active application in CODESYS.
If you want to add individual information about the author, version, and an individual short description, you can modify the information in the general "Project Information" on the "Information" tab of the "Properties" dialog.

When you want to log in to the target system (PLC or simulation) with an application, it will first be checked which applications are currently on the PLC and whether or not the application parameters on the controller match those in the project configuration. Corresponding messages will notify you about mismatches and possible options for further action. In this step, you can also delete applications from the PLC.

On the "Application" tab of the device editor, you can see which applications currently exist on the device. There you can also delete applications from the target system. It is possible that you also see additional applications which are not represented by a separate object in the device tree, for example the `<application>_symbols.app`, which contains a symbol list created for the application (see "Symbol Configuration").

Object 'POU Locations'

This object is available only for specific controllers. It is displayed automatically in the device tree. The object cannot be added or removed manually. The object can be used for mapping the executable code of an application in different code areas on the controller. Specifically small controllers often have limited internal code areas (flash memory). If one or more additional code areas (for example, external flash memory) are available on the controller, then the location of the code POUs of an application can be changed specifically.

If there are no specific requirements, then the code POUs are stored sequentially in the code areas (“default”). This means that the next code POUs are stored in the next areas only when the first code area is filled. In the "POU Locations" editor, you will see the current location of the POUs in the memory areas and you can change them specifically.

Editor 'POU Locations'

Double-clicking the "POU Locations’" object in the device tree of the controller opens the editor. Then it receives the entry `<application>`. After a code generation, all program blocks of the application are displayed with the respective object type, current location in the memory, and code size.

In the “Configured Location” column, you can set one of the memory areas other than the “Current Location” for each POU or library.

In order to move the POUs to the recently configured memory locations, you first have to “Clean” and then “Generate Code” again.

Make sure to pay attention to the messages in the category “POU Locations”. This also shows when a code POU cannot be moved as expected.
**“Clean”**
Deletion of the compile information for the application. Corresponds to the menu command “Build ➔ Clean”. Requirement for moving the POUs to the configured memory locations.

**“Generate code”**
Starting of the code generation for the application. Corresponds to the menu command “Build ➔ Generate Code”. Requirement for moving the POUs to the configured memory locations.

**“Objects”**
Objects of the application, including the objects from the referenced libraries

**“Type”**
Object type; examples: “Function block”, “Method”, “Library”

**“Current location”**
Current memory location of the POU: area_<n>.

**“Configured location”**
Configured memory location where the POU is moved at the next code generation. Possible values:
- “default”: Automatically assigned area.
- “area_<n>”: Explicitly assigned memory area (n=number)

**“Code size”**
Code size of the POU (in bytes)

<tbody>
<tr>
<td>“Select data source type”</td>
<td>Data source type that matches the controller configuration in order to establish communication.</td>
</tr>
<tr>
<td>● “CODESYS Symbolic”:</td>
<td>Requirement: The local device is a CODESYS HMI. The data is transmitted by means of symbolic monitoring. This requires that symbols are configured in the symbol configuration of the remote PLC application. Note: As long as the symbol configuration is not impacted by an application change, you have the advantage that the application in the local device does not have to be updated. Hint: Use this communication connection unless there are no resources available in the remote PLC for a symbol configuration.</td>
</tr>
<tr>
<td>● “CODESYS ApplicationV3”:</td>
<td>The data is transmitted via the CODESYS address protocol. This requires that the address information between the remote PLC and the local device match. Otherwise a connection cannot be established. Advantage: A symbol configuration is not required in the remote application. Note: For changes to the remote application, the local application has to be updated (for example, the HMI application). Hint: Use this communication for embedded or mini PLCs when there are no available resources for the symbol configuration.</td>
</tr>
<tr>
<td>● “OPC UA Server”:</td>
<td>Data is transferred from an OPC UA server to the local controller via a TCP connection.</td>
</tr>
<tr>
<td>“Add”</td>
<td>Opens the “Initialize Data Source - Provider settings” dialog. The contents of the dialog depend on the selected data source type.</td>
</tr>
</tbody>
</table>

**NOTICE!**

The remote PLC should be running and the remote PLC application loaded and started.

Dialog 'Initialize Data Source Wizard - Provider settings' (for 'CODESYS ApplicationV3')

The settings of this dialog are described in the following chapter: Object 'Data Source' - Tab 'Communication'.

The dialog is used to configure the connection initially when you have selected “CODESYS ApplicationV3” as the data source type. The communication is done by means of address monitoring.

See also

- Chapter 6.4.1.21.2.6.5 “Tab 'Communication' via CODESYS ApplicationV3” on page 2422

Dialog 'Initialize Data Source Wizard - Provider settings' (for 'OPC UA Server')

The settings of this dialog are described in the following chapter: Object 'Data Source' - Tab 'Communication'.

The dialog is used to configure the connection initially when you have selected “OPC UA Server” as the data source type. The communication takes place over a TCP connection.

See also

- Chapter 6.4.1.21.2.6.6 “Tab 'Communication' via OPC UA Server” on page 2424

Dialog 'Initialize Data Source Wizard - Browse data items'

The settings of this dialog are described in the following chapter: Object 'Data Source' - Dialog 'Choose Variables'.

Function: You can select the variables for data transmission from the variables of the remote PLC. By clicking “Finish”, the data source is initialized and the data types and variables (data interface) are declared below the folder “DataSources_Objects”. You can modify the settings in the editor of the data source object.

Call: Automatic

See also

- “Dialog 'Choose Variables” on page 2416

Object 'Data Source'

General

Symbol: 

In the editor (object type “Data Source”), the access to the data of a remote device is managed on the “Variables”, “Type Mappings”, “Communication”, and “General and Diagnosis” tabs.

Status bar

The status bar which is always visible notifies you about the data source type and the most important communication settings. When the communication is established by means of the data source type CODESYS Symbolic, the name of the data source type, the connection type, and the network name of the remote device are displayed. When the communication is established by means of data source type CODESYS ApplicationV3, then the name of the data source type, the location of the remote project, and the instance name of the remote application.

Example:

CODESYS Symbolic (CODESYS V3): PLC_Name
Tab 'Variables'

The variables for the data originating from the remote source are declared in the global variable list <name of data source>. The global variable list acts as a data interface to the remote PLC. The object is located below the application and below the “DataSources_Objects” folder.

|“Update variables”| Establishes a connection to the remote device and opens the “Choose Variables” dialog. |
|“Local variable”| Variable in the local application. Contains the remote data. |
|“Access rights”| Access rights of the variables. The respective remote variable has the same access rights. |
| | ● : Write access. Every time the values changes, the variable is updated on the controller. |
| | ● : Read access. Every time the values changes on the controller, the variable is updated in the application. |
| | ● : Read/Write access |
| | Note: If you change the access rights, then a download is required for the change to go into effect. |
|“Update always”| The controller data is updated automatically (via the data source). A variable is updated automatically if it is used in the visualization, trend, recipe, or as an alarm. |
| | Note: This is the recommended setting type. |
| | : The variable is updated in each cycle. |
| | Note: Select the option only when the variable is used exclusively in IEC code. If a variable is used in the visualization code, then it is updated automatically. |
| | Note: When an instance of a function block or a data type is updated in this way, the instance is always transferred completely. |
|“Create or map”| Mapping type for how the remote variable is mapped to the local variable. |
| | ● : Mapping to a specific created variable with the data type of the remote variable. The control data is mapped 1:1. That is the recommended mapping type. The variable is declared in the GVL <name of data source>. |
| | ● : Mapping to an existing variable. This requires that the existing variable has the same data type. |
| | ● : Mapping to a specific created variable with type-conforming data type to the remote data type: remote and local data types are not the same, but compatible. For example, a type-conforming data type can be available in a library. The variable is declared in the GVL <name of data source>. |
|“Type mapping”| Data type of the remote variable. If the variable is not a scalar type, then the type is listed on the “Type Mappings” tab. |
|“Remote variable”| Variable in the remote PLC |
Dialog 'Choose Variables'

Symbol: 🔄

**Function:** The dialog lists the remote variables that are accessed by means of the configured connection.

**Call:** "Update variables" command on the "Variables" tab.

**Requirement:** The remote PLC is running. The control application is downloaded.

**"Variables"**
The remote variables are listed in the tree view. The top node is identified by the remote application name. Its variables are listed below that. Structured data is listed with all of its subordinate elements.

**Example:** appControl_A

☑️: The variable is selected for transferring to the local device. When the variable is structured, it is applied with all subelements. If the variables themselves are subelements, then only this subelement is applied without accepting the structure completely.

Red font: When a variable is displayed in a red font, the variable is not available (anymore) in the remote PLC.

Note: You can click "Uncheck unavailable variables" to remove the variable from the list.

☐: The variable is not selected for the transfer.

+ The variable has expandable elements. By clicking the symbol, the variable is extended by their elements.

**"Insert the items structured"**

☑️: The selected variables are transferred with this structure if they are structured.

☐: The variable is transferred unstructured with a scalar data type.

**"Uncheck unavailable variables"**

Requirement: The link is visible when previously are no longer available in the variable available on the remote PLC. These variables are marked in red in the window above. The symbol configuration or the application presumably changed in the remote PLC.

By clicking the command, the red variables are removed from the list box.

Tab 'Type Mappings'
The tab lists the non-scalar data types as they are currently available in the "DataSources_Objects" folder. You can edit or delete the data type declaration by selecting a data type and then the declared elements in the lower window. Moreover, you can modify the name, reset access rights, map another type, or select another remote variable.

Tab 'Type Mappings'

<table>
<thead>
<tr>
<th>&quot;Local type&quot;</th>
<th>Data type in the local application</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Create or map&quot;</td>
<td></td>
</tr>
<tr>
<td>☑️: Mapping to a new created data type. Declared in the &quot;DataSources_Objects&quot; folder.</td>
<td></td>
</tr>
<tr>
<td>☐: Mapping to an existing data type</td>
<td></td>
</tr>
<tr>
<td>☀️: Mapping to a type-conforming data type. Declared in the &quot;DataSources_Objects&quot; folder.</td>
<td></td>
</tr>
</tbody>
</table>

| "Mapping name" | Name of the data type |
| "Remote type" | Data type of the remote PLC |
List with the subordinate elements of the selected data type.

<table>
<thead>
<tr>
<th>Element Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Local variable&quot;</td>
<td>Local variable name of the element of the selected data type</td>
</tr>
<tr>
<td>&quot;Access right&quot;</td>
<td>Access rights to the element</td>
</tr>
<tr>
<td>&quot;Type mapping&quot;</td>
<td>Data type of the element</td>
</tr>
<tr>
<td>&quot;Remote variable&quot;</td>
<td>Remote variable name of the element of the selected data type</td>
</tr>
</tbody>
</table>

[Del] Removes the selected element

See also
- Chapter 6.4.1.10.6.3 “Editing data source variables” on page 1954

Tab 'Communication' via CODESYS Symbolic

The tab includes the communication settings via CODESYS Symbolic for the remote data source.

When initially adding a data source, you have selected the “CODESYS Symbolic” data source type, and depending on that the communication settings to the data source were configured. Afterwards, the communication settings are outdated on this tab. You can only initially set the “Data source type” setting.

CODESYS Symbolic means that in the case of an active connection the communication is done via symbolic monitoring. This kind of symbolic access is possibly for CODESYS V2 and CODESYS V3 controller variants. In addition, the runtime system has to support the symbol configuration.

You can develop a local application offline based on the symbol information without a connection to the data source. To do this, you refer to a symbol file in the configuration settings in which all required variable information has been stored. Then no active connection is established.
“Variable information”  
Source of the variable information

- “From connection settings”
  A connection is established actively according to the communication settings specified below (“Connection type” and “Connection Settings”). The variable information is read from the remote controller application.

- “<device name>.<application name>.symbol configuration”
  The variable information is read from the symbol configuration. The symbol configuration is part of the active project and located in the device tree at the object of the remote controller below the application. An active connection is not established to the controller.

- “From symbol file”
  The variable information is read from a symbol configuration file that is stored on the development system. In the “Choose symbol file” field, specify this data. An active connection is not established to the controller.

“Choose symbol file”  
The path of the symbol file for the “Variable information” selection is “From symbol file”.

The symbol file is stored on the development system and contains the required variable information. By default, a symbol file path is created in the project directory in the following structure: <project folder>\<project name>\<device name>\<application name>.xml.

Example:
D:\Projects\Project_A\VisualizeWithHMI.Device.Application.xml

Note: If the “Alarm Table” element or “Trend” element is used in the visualization, then the symbol file required for symbolic access and the respective project must both be saved in the same folder. The project contains the configuration for the alarm table element or the trend recording for the trend element. This is the default case for automatically generated symbol files.

Example: D:\Projects\Project_A\VisualizeWithHMI.project

“Connection type”  
Connection type between the remote PLC and the local device.

Depending on the selected connection type, the following settings below change.

Note: Whenever possible, avoid a direct connection without a gateway.

- “CODESYS V2”
  The devices exist in the same network. The V2 runtime on the remote PLC provides a communication interface.

- “CODESYS V2 (Via gateway)”
  The devices do not exist in the same network. They are connected via a V2 gateway.

- “CODESYS V3”
  The devices exist in the same network. The V3 runtime on the remote PLC provides a communication interface.

- “CODESYS V3 (Via gateway)”
  The devices do not exist in the same network. They are connected via a V3 gateway.
### PLC Settings

#### “PLC”

#### “Driver type”
- “Tcp/Ip (Level 2 Route)”
- “Tcp/Ip (Level 2)”
- “Tcp/Ip”

#### “Address”
Example: localhost (for the currently used system on your computer)

#### “Port”
Example: 1200

#### “Block size”
Example: 128
Requirement: The driver type is “Tcp/Ip (Level 2)”.

#### “Target ID”
Example: 0
Requirement: The driver type is “Tcp/Ip (Level 2 Route)”.

#### “Motorola byte order”
☑: Byte order on the PLC in big endian (Motorola format)
☐: Byte order in little endian (Intel format)

### Connection settings for connection type 'CODESYS V2 (Via gateway)'

#### “Gateway”
The gateway settings are configured in addition to the PLC settings.
Note: For this connection, a “CoDeSys V2.3 Gateway Server” (V2 Gateway) also has to be installed on the development computer where CODESYS V3 is running.

#### “IP address”
Example: localhost

#### “Port”
Example: 1217

### Connection settings for connection type 'CODESYS V3'

#### “PLC”

#### “Name or address of device”
The setting that you make here varies according to the selection in the “Type of name or address” list box. For options that are derived automatically, you do not have to specify the setting here. The setting can remain empty.
Example: Nothing specified for “...(automatically derived)”
Example: PLC_A for “Node name”
Example: [ABCD] for “Node address”
Example: 192.168.1.5:11741 for “IP address”
Example: POU.dssCommVar with data type DatasourceSym.ConnectionSetup for “Dynamic from variable”

Hint: ☑: Opens the input to select the program variables for dynamic configuration. This variable has to be the data type DatasourceSym.ConnectionSetup.
"Type of name or address"

- "Node name (automatically derived)"
- "Node address (automatically derived)"
- "IP address (automatically derived)"
- "Node name"
- "Node address"
- "IP address"
- "Dynamic from variable"

"Dynamic from variable"

The device name or address is configured dynamically at runtime by means of an IEC variable of data type `DatasourceSym.ConnectionSetup`. The data type `DatasourceSym.ConnectionSetup` (STRUCT) is defined in the Datasource Symbolic Access library. For the configuration, the structure member `xDDataValid` first has to be set to `FALSE`. If the address data has been specified, then `xDDataValid` has to be set back to `TRUE`.

Use case: The device name or address is not available when a project is being created.

The dynamic configuration can also be used to change the settings at runtime without restarting the HMI application.

Note: For this connection type, the connection is also not done dynamically via gateway.

---

Connection settings for connection type 'CODESYS V3 (Via gateway)'

| "Gateway" | The gateway settings are configured in addition to the PLC settings. |
| "IP address" | Example: localhost |
| "Port" | Example: 1217 |

Extending the communication settings for the PLCHandler interface

**NOTICE!**

It is not recommended to configure the PLCHandler manually.

The connection to the controller is established via the CODESYS PLCHandler communication interface. In this case, the configuration is performed in the PLCHandler INI format and allows for advanced parameterization.

| "Advanced" |
| "Used as" |
| "Don't use" |
| Recommended setting |
| The "INI content" property as well as any specified configuration settings there are ignored. |
| "Extend the configuration by the following content" |
| As a rule, the configuration settings are used which are specified in the "Connection Settings for CODESYS V3 (Via gateway)" property. Moreover, the configuration settings are used in the "INI content" property. |
| "Configure completely with the following content" |
| The configuration settings of the "Configuration Settings for CODESYS V3 (Via gateway)" property are ignored. Instead, only the configuration settings are used in the "INI content" property. |
**“INI content”**

Requirement: “Used as” is set to “Extend the configuration by the following content”.

Example:

```
loqfilter=16#000000FF
```

Example:

```
parameter0=EncryptCommunication
value0=1
```

Note: If the parameters are generic, then they can be specified as 0-based (parameter0 and value0). When extending, the numbering is automatically adjusted so that the extended parameters connect to the existing ones. The number of parameters (parameters=<n>) is also set to the correct value.

**“INI content”**

Requirement: “Used as” is set to “Configure completely with the following content”.

Example:

```
[PLC:PLC_IdArti]
interfacetype=ARTI
active=1
logevents=1
motorola=0
nologin=0
timeout=10000
precheckidentity=0
tries=3
waittime=12
reconnecttime=10
buffersize=0
device=Tcp/Ip (Level 2 Route)
instance=PLCWinNT_TCP1P_L2Route
parameters=4
parameter0=Address
value0=localhost
parameter1=Port
value1=1200
parameter2=TargetId
value2=0
parameter3=Motorola byteorder
value3=No
```

---

**Communication settings for controllers with visualization user management**

**“Login Configuration”**

If a visualization user management is configured on the remote device, then valid credentials are required at login.

**“Type”**

Defines how the visualization user management gets credentials

- **“Login using the following credentials”**
  The credentials are hard-coded into the “User name” and “Password” settings. They are used each time a connection is attempted.

- **“Login using the credentials determined at runtime”**
  At runtime, a dialog opens and prompts the user to specify a user name and password. Hard-coded credentials, which have nonetheless been specified in “User name” and “Password”, are ignored.
**User name**  
Example: max.smith

**Password**  
Example: ···

### Tab 'Communication' via CODESYS ApplicationV3

The tab includes the communication settings for a remote data source.

When initially adding a data source, you have selected the CODESYS ApplicationV3 data source type, and depending on that the communication settings to the data source were configured. Afterwards, the communication settings are outdated on this tab. You can only initially set the “Data source type” and “Select the project type” settings.

CODESYS ApplicationV3 means that in the case of an active connection the communication is done via address monitoring. In this case, the remote PLC is configured by directly specifying the device address or automatically via network scan.

### Tab 'Communication' via CODESYS ApplicationV3

<table>
<thead>
<tr>
<th><strong>“Select the project type”</strong></th>
<th>The project type indicates where the controller is configured: in the same project as the HMI application or in a separate project.</th>
</tr>
</thead>
</table>
|                             | - “Current project”  
|                             | The control application is part of the currently open project. The communication settings can be updated automatically or manually. |
|                             | - “Other Project”  
|                             | The control application is part of a separate project whose location is specified in “Choose file”. The communication settings are done manually. |

In the initial setting of the data source object, this option is fixed and influences which settings are available for “Target device”.

| **“Choose file”** | Name and path of the project that contains the control application (source project)  
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong> D:\PLCs\PLC_A.project</td>
<td>Requirement: The “Select the project type” is “Other Project”.</td>
</tr>
</tbody>
</table>

| Window area for controllers of the project | Controllers and their subordinate applications, read from the selected project  
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
</tbody>
</table>
**"Target device"**

Note: The following settings are available when “Select the project type” is set to “Current project”.

**"Automatic configuration"**

- The configuration is read automatically from the source project. This is the recommended setting.
  
  Example: “[DEVICE_A]”

  Example: “[undetermined]”: No configuration can be read.

  Note: Make sure that the application is running on the controller and the network path is active. The communication settings of the controller are applied only then. These are the communication settings that were configured in the source project in the device editor on the "Communication Settings" tab.

**"Manual configuration"**

- More configuration settings are displayed.

  See "Manual configuration" below.

---

**Settings for ‘Select the project type’ == ‘Other Project’**

The communication setting is done only manually.

See "Manual configuration" below.

**Manual configuration**

**"Dynamic from variable"**

- The communication parameters are configured at application runtime by means of an IEC variable of data type DatasourceAppV3.ConnectionSetup.

  - Opens the input for selecting the IEC variables for a dynamic configuration.

  The data type DatasourceAppV3.ConnectionSetup (STRUCT) is defined in the Datasource ApplicationV3 Access library. For the configuration, the structure member xDataValid first has to be set to FALSE. If the address data has been specified, then xDataValid has to be set back to TRUE.

  Use case: The communication parameters are not available yet when a project is being created.

**"Use device address"**

- The communication is done via the address specified here.

  Example: 0101

  Hint: Click “From device” for an automatic address setting.

**"From device"**

The data of the currently connected data source device is read automatically and specified in “Use device address”. The address corresponds to the setting of the device in the device editor in “Communication Settings”.

**"Search for the target device using the network scan"**

- The data source manager starts the network scan for devices in the network. The scan is successfully when controllers are found whose communication settings match the selected search criteria. The result is displayed in the input fields.

**"Node name"**

- Search for the specified node name

  Example: WST06

**"Target type"**

- Search for the specified target type

  Example: 4096

**"Target ID"**

- Search for the specified target ID

  Example: 0000 0001

**"Target version"**

- Search for the specified target version

  Example: 1.0.0.0
### Network location
- **Direct child of the data sources PLC**: The scanned remote PLC has an address that is running with the address of the local controller (of the data source manager).
  - Example: Data sources PLC: 0000.0001; remote source PLC: 0000.0001.0001
- **Direct child of node with address**: Specify the address of the parent node
- **Direct child of the data source PLC or of the node with address**: Combination of both options above.

### Search type
- **First found device**: The first controller in the device tree is selected that fulfills the specified criteria.
- **Exactly found device**: The controller is selected that fulfills the specified criteria exactly.

Note: The data source manager waits until the network scan is complete. This usually takes about 10 seconds.

---

### Communication settings for controllers with visualization user management

<table>
<thead>
<tr>
<th><strong>Login Configuration</strong></th>
<th>If a visualization user management is configured on the remote device, then valid credentials are required at login.</th>
</tr>
</thead>
</table>
| **Type**               | Defines how the visualization user management gets credentials | **Login using the following credentials**  
The credentials are hard-coded into the “User name” and “Password” settings. They are used each time a connection is attempted.  
**Login using the credentials determined at runtime**  
At runtime, a dialog opens and prompts the user to specify a user name and password. Hard-coded credentials, which have nonetheless been specified in “User name” and “Password”, are ignored. |
| **User name**          | Example: max.smith |
| **Password**           | Example: ⋯ |

### Specific settings of the communication buffer

<table>
<thead>
<tr>
<th><strong>Advanced</strong></th>
<th>☑: The subsequent settings are changed.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Default communication buffer size</strong></td>
<td>Default setting: 50000</td>
</tr>
</tbody>
</table>

### Tab 'Communication' via OPC UA Server

<table>
<thead>
<tr>
<th><strong>Where to find the server layout</strong></th>
<th>The client connects to the server and detects the existing variables and types.</th>
</tr>
</thead>
</table>
### From Information Model

The client reads the data structure (layout) of the OPC UA Server from the information model set here and as a result receives the information about available variables and types. A connection to the server is not required.

The list box contains the information models installed in the OPC UA Information Model Repository.

[Chapter 6.4.1.21.3.9.12 “Command ‘OPC UA Information Model Repository’” on page 2665](#)

### Read Connection Settings from IEC Variable

 Begins: The connection settings used by the device are not read here from the dialog, but at runtime from the IEC variable specified here.

For this possibility, see: Using a Dynamic Connection to an OPC UA Server

[Chapter 6.4.1.10.6.7 “Data Source OPC UA Client” on page 1960](#)

### Connection Type

**“Server URI”**

URI of the OPC UA Server; editable

**“Show All Endpoints”**

The button opens the “Available Endpoints” dialog with the end points available on the OPC UA Server. An “endpoint” is a combination of security settings.

The lower part of the dialog displays the available user tokens: “PolicyId, TokenId”, and “SecurityPolicy”.

For the selected end point, clicking “Apply” will apply the security settings “SecurityMode” and “SecurityPolicy” on the “Communication” tab in the “Security” section.

### Security

**“Messages Security Mode”**

Type of encryption

- **“None”**: No encryption and no signing
  
  Note: if you select this option, there can be no guarantee who receives the data. Therefore, “None” should be used exclusively in closed networks.

- **“Sign and Encrypt”**: The transferred data will be signed and encrypted.
  
  Signing makes sure that the data is not manipulated and the receiver is correct.

- **“Sign”**: The transferred data will be signed.

  Signing and encryption work only for certificates.

**“Security Policy”**

List box for the encryption method to be used:

- Basic256sha256

Requirement: Either “Sign and Encrypt” or “Sign” was selected for “Messages Security Mode”.

**“Client certificate”**

Here you can specify a certificate for an encrypted signed access to the OPC UA Server for the purpose of browsing.

Note: The access which is safeguarded in this way is ONLY for browsing the server (see above, “Browse Live Server” option). For encrypted data exchange between the server and client in online mode, a separate certificate is required, which can be created in the security screen. For more information see: OPC UA Server, Creating a certificate of the CODESYS OPC UA Server.

In case a certificate is not available for selection, you can click the button to open the “Create Self-Signed Certificate” dialog. Here you define a password for your private key and a file name for the certificate. When you click [OK], the certificate files .cer and .pfx are created in the project directory and the certificate is automatically registered in the certificate manager.
## Authentication

<table>
<thead>
<tr>
<th>Access</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Anonymous</td>
<td>Access without authentication. Permission for this can be granted for compatibility reasons in the “Change Communication Policy” dialog on the “Communication Settings” tab of the device editor.</td>
</tr>
<tr>
<td>User name</td>
<td>Access to the OPC UA Server requires the entry of a user name and password. You can programmatically set up how the transfer of this authentication data should be done: To help with the creation of a POU for this purpose in the project, you can click the “Create Authentication Provider” button to create a program template Datasource_OPCUA_Initializer and program it accordingly.</td>
</tr>
</tbody>
</table>

---

### Tab 'General and Diagnosis'

The “General and Diagnosis” tab provides information about the status of the data source communication.

<table>
<thead>
<tr>
<th>Access</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Update Configuration</td>
<td></td>
</tr>
<tr>
<td>Update rate (ms)</td>
<td>Example: 200</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Access</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection Information</td>
<td></td>
</tr>
<tr>
<td>Connection status</td>
<td>Example: online</td>
</tr>
<tr>
<td>Error information</td>
<td>Example: OK</td>
</tr>
</tbody>
</table>

### Object 'DeviceTrace'

Symbol: 📈

A “DeviceTrace” object shows trace data in one or more diagrams, as does a “Trace” object.

The difference is that a “DeviceTrace” directly accesses traces that are running on the controller. The object is inserted below the device in the device tree. Therefore there is no immediate dependency on the applications in the CODESYS project.

- You can use the DeviceTrace for visualizing the processor load of a multicore controller.

For more information about the editor and its operation, refer to the help page for the “Trace” object.

See also:

- Chapter 6.4.1.21.2.31 “Object 'Trace’” on page 2541
- “Runtime system component CmpTraceMgr, “Trace manager”” on page 2008
- Chapter 6.4.1.13.3.5 “Accessing All Traces on the Controller” on page 2014
Object 'Device' and Generic Device Editor

General

Symbol: 

A device object represents a type of hardware: examples: control device, fieldbus node, bus node, drive, I/O module, monitor. The arrangement of the device objects in the device tree, that is the view "Devices" in CODESYS, maps the hardware structure. In the device object configuration editors inter alia you connect the controller I/Os with project variables.

Use command "Add Device" or "Insert Device" to insert a device object in the device tree. Depending on the insert position CODESYS always offers the currently matching devices.

A double-click on a device object in the device tree opens the associated device editor. The editor provides generic and device-specific tabs for the device configuration.

See also

- Chapter 6.4.1.21.2.8.2 "Generic device editor" on page 2427

Generic device editor

The generic device editor contains tabs for the configuration of a PLC device in CODESYS. Additionally there are device-specific tabs, so that the configuration editor consists of many different dialogs, depending on the device.

The editor opens after a double-click the device object in the device tree ("Devices" view).

You can make general settings for a device editor in the CODESYS "Options" in the "Device Editor" category. For example, you can show and hide the tabs of the generic device editor.

A device editor is given the name of the device. The following tabs of the generic device editor can be included:

- "Communication": Configuration of the connection between the development system and a programmable device (PLC). Not available in the case of pure I/O devices.
- "Applications": List of the applications on the controller.
- "<device> Parameters": Display and configuration of device parameters.
- "Files": Configuration of the file transfers between a host file system and the device.
- "Log": Display of the PLC log file.
- "PLC Settings": Configuration of the handling of the I/Os: which application, behavior in the stop state, updating, bus cycle options, etc.
- "PLC Shell": Text-based control monitor for interrogating certain information from the controller.
- "Users and Groups": User management with regard to the device at runtime.
- "Access Rights": Rights for access to objects and files on the device.
- "Symbol Rights": Access rights of individual user groups to symbols (symbol sets) on the device.
- "Task List": Overview of all inputs and outputs, which are assigned to tasks – useful for troubleshooting.
- "Status": Device-specific status and diagnostic messages.
- "Information": General information about the device (name, vendor, version etc.)

See also

- Chapter 6.4.1.8 "Configuring I/O Links" on page 1835

Tab 'Communication Settings'

On this tab of the generic device editor, you define the connection between CODESYS and the device on which your application(s) should run. This includes security settings such as encrypted communication and signing.
If you prefer the classic mode of display for the dialog, then select it in the CODESYS “Options” in the “Device editor” category.

You select a gateway and a target device from the list boxes. The possible selections depend on the entries in the “Manage Gateways” and “Manage Favorite Devices” dialogs (see the “Gateway” menu).

You can also specify the target directly with the IP address (example: “192.168.101.109”), device address (example: “[056D]”), or device name (example: “MyDevice”). After the device is entered, CODESYS searches for the device in the network of the gateway.

The solid circle on the lower right corner of the gateway symbol provides information about the connection status:

- Red: CODESYS cannot establish the connection.
- Green: The connection is established.
- Black: The connection status is unknown.

Some communication protocols allow regular checking of the gateway so that the status cannot be displayed.

Clicking the solid circle of the target device starts a network scan for the device. This works only if the network is not already being scanned.
“Scan Network” This button opens the “Select Device” dialog. It lists all configured gateways with the associated devices. You can select one target device from this list. If the name of the selected device is unique, then the name will be used in the connection settings. Otherwise, the unique device address is applied.

For details about this dialog, see the description of the classic view below.

Option: **Hide non-matching devices, filter by Target ID:**

- : The display is limited on the devices that have the same target ID as the current device configured in the project.
- : All available devices in the network are displayed. Double-clicking the entry of a device, which has a different target system ID than the device configured in the project, opens a dialog box. This dialog box allows you to update the device description of the device in the project to the one matching the selected device.

**Note:** This kind of update is possible only with devices which have different IDs, not for those which only have different versions. The update also requires that the device description is already installed in the repository.

“Gateway” This menu includes the following commands:

- **“Add New Gateway”**: Opens the “Gateway” dialog for defining a new gateway channel.
- **“Manage Gateways”**: Opens the “Manage Gateways” dialog with an overview of all gateways. You can add or delete entries here or change their order.
- **“Configure Local Gateway”**: Opens the “Gateway Configuration” dialog. You can configure the block drivers for the local gateway.

“Device” This menu includes the following commands:

- Options:
  - **“Add Current Device to Favorites”**: Adds the currently set device to the list of favorite devices.
  - **“Manage Favorite Devices”**: Opens the favorites dialog with a list of all preferred devices. In this dialog, you can add or delete entries or change their order. The top device is the default.
  - **“Confirmed Online Mode”**: For security reasons, CODESYS requires you to confirm the following when calling the following online commands: **Force Values**, **Write Values**, **Multiple Loading**, **Release Force List**, **Single Cycle**, **Start**, **Stop**.
  - **“Store Communication Settings in Project”**: CODESYS saves the communication settings in the project for reuse on the same computer.

  **Note:** If you use the project on another computer, then you have to reset the active path.

  CODESYS saves the communication settings in the options of the local installation for reuse on the same computer.

  **Note:** When using CODESYS SVN, the option should be cleared in order to prevent blocking the device object.

- **“Rename Active Device”**: Opens a dialog for changing the device name.
- **“Wink Active Device”**: Devices that support this function react by blinking.
- **“Send Echo Service”**: CODESYS sends five echo services to the controller. These are used to test the network connection, similar to the ping function. The services are sent first without a payload and then with a payload. The scope of the payload depends on the communication buffer of the PLC. A message view opens with information about the average echo service delay and the scope of the sent payload.
- **“Encrypted Communication”**: The communication to this controller is encrypted. A certificate of the controller is required in order to log in to the controller. If the certificate is not available, then an error message opens prompting whether or not the certificate should be displayed and installed.
If the “Enforce encrypted communication” option is selected as “Security level” in the “Security Screen” view, then the “Encrypted Communication” command is disabled here.

- “Change Runtime Security Policy”
  Opens the “Change Runtime Security Policy” dialog for changing the device setting for the encryption of communication.
- “Change Runtime Password Policy”
  Opens the “Change Runtime Password Policy” dialog to change the settings for the password policy and the login lock.
- “Security Settings”: This command is available only if CODESYS Security Agent >= 1.3.0.0 is installed. It opens the “Device Security Settings” dialog. The current security settings on the connected device are displayed. You can change the settings in the “Value” column and click “OK” to write them to the device.
- “Filter Network Scans by Target ID”:
  The display is limited on the devices that have the same target ID as the current device configured in the project.

Communication Settings - Classic Mode

In the CODESYS options, you can activate the classic mode of the dialog (”Tools ➔ Options”, “Device Editor” category).

<table>
<thead>
<tr>
<th>“Select the network path to the controller”</th>
<th>Gateway channel for the connection.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Select the channel from the lower part of the view.</td>
</tr>
</tbody>
</table>
Table 404: “View displaying configured gateway channels and network devices”

Left side of view

Tree structure of the configured gateway channels with the connected devices in the local network:

Note: CODESYS saves these entries on the local system, not in the project.

The device entries are preceded by a device symbol ( ). Entries with a target ID that are different from those currently configured in the project are displayed in gray.

Click “Scan Network” to refresh the list.

Note: If you created the first project on the local system, then the local gateway is listed as an entry in the tree by default. CODESYS starts this gateway automatically on system boot.

The solid circle on the lower right corner of the gateway symbol provides information about the connection status:

- Red: CODESYS Development System cannot establish the connection.
- Green: The connection is established.
- Black: The connection status is unknown.

Note: Some communication protocols allow regular checking of the gateway so that the status cannot be displayed.

Each of the device entries in the tree consists of a symbol followed by the “Device name” > “[Device address]”. On the right side of the view, you also see the “Target ID”, “Target Name”, “Target Type, Target Vendor”, and “Target Version”.

Right side of view

Information about the gateway channel of device selected on the left side of the view.

When a gateway channel is selected in the left view, the following information is displayed: “Device name”, “IP address”, “Port”, “Driver”.

When a device is selected in the left view, the following information is displayed (depending on the device): “Device name”, “Device address”, “Number of channels”, “Block driver”, “Serial number”, “Encrypted communication”, “Target vendor”, “Target ID”, “Target name”, “Target type”, “Target version”.

Table 405: “Filter and sorting functions on the right side of the dialog”

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| “Don’t store communication settings in project” | - [ ]: CODESYS saves the communication settings in the options of the local installation for reuse on the same computer. Note: When using CODESYS SVN, the option should be selected in order to prevent blocking the device object.  
  - [ ]: CODESYS saves the communication settings in the project for reuse on the same computer. Note: If you use the project on another computer, then you have to reset the active path. |
| “Confirmed Online Mode”             | [ ]: For security reasons, CODESYS requires you to confirm the following when calling the following online commands: “Force Values”, “Write Values”, “Multiple Loading”, “Release Force List”, “Single Cycle”, “Start”, “Stop”. |

Tab ‘Parameters’

This dialog is intended for test purposes. Its values should be changed only by experts.

The device-specific parameters are displayed in a table on this tab of the generic device editor. The device description defines which parameters you can edit in this dialog.

You can sort the entries in alphabetically ascending or descending order or in the default order by clicking the column header.

<table>
<thead>
<tr>
<th>“Parameter”</th>
<th>Parameter name, not editable</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Type”</td>
<td>Data type of the parameter, not editable</td>
</tr>
<tr>
<td><strong>“Value”</strong></td>
<td>Initially displays the default value of the parameter, directly or the corresponding symbol name. Non-editable parameters are displayed in light-gray. If the parameter is editable you can open an input field, a drop-down list or a file selection dialog with a double-click the table field and use it to change the value.</td>
</tr>
<tr>
<td><strong>“Default value”</strong></td>
<td>Default value of the parameter defined by the device description, not editable</td>
</tr>
<tr>
<td><strong>“Unit”</strong></td>
<td>Unit of measure for the value (example: &quot;ms&quot; for milliseconds; not editable)</td>
</tr>
<tr>
<td><strong>“Description”</strong></td>
<td>Short description of the parameter specified by the device description, not editable</td>
</tr>
</tbody>
</table>

### Tab 'Applications'

On this tab of the generic device editor you can see which applications exist on the device. Depending on the system you can delete the applications from the device or retrieve detailed information about the application.

| **“Applications on the PLC”** | List of the applications found via “Refresh list” during the last scan of the control device. |
| **“Delete”** | Deletes the application selected in the list or all listed applications on the controller |
| **“Delete All”** | Note: If a safety controller is inserted below a PLC, then this command can permanently interrupt the communication links of the safety controller to other safety controllers (via safety network variables), to field devices, and to the development system. The safe field devices and the other safety controller can enter the safe state as a reaction. The connection to the development system is affected only in the case of a safety controller that is connected to the main controller via a fieldbus. For more information, refer to the section "Subordinate Safety Controller". |
| **“Details”** | Opens the dialog box “Details”. It displays information defined for the application on the “Information” tab of the dialog box “Properties”. |
| **“Contents”** | Requirement: The “Download the application info” option is activated in the “Properties” of the application object on the “Application generation options” tab. This causes information about the contents of the application to be additionally loaded to the PLC. The “Contents” button opens a dialog box with additional information about the differences between the latest generated code and the application code that exists on the controller. The different modules are displayed in a comparison view. |
| **“Refresh List”** | The controller is scanned for applications and the list is refreshed accordingly |

You can configure the commands “Remove Application from Device” and “Remove Applications from Device” by means of the dialog box form “Tools → Customize”. These commands correspond to the “Delete” and “Delete All” buttons.

Tab 'Backup and Restore'

In this tabbed page of the generic device editor, you can backup and restore the application-specific file on the PLC by saving and reading a zip archive.

Requirement: The communication settings are correct for connection to the device. The application for backup is available on the PLC.

Table 409: Menu Bar

Tab 'Synchronized Files'

The tab of the generic device editor lists the files that are downloaded to the PLC when the application is downloaded. For example, these are external files that were added to an application.

Implicit files, such as the source code archive file, are displayed here only if their time of download is configured for this and the “Show implicit files for application download on the editor of a PLC” option is activated in the CODESYS options (“Device Editor” category).

| “Refresh” | Refreshes the view |
| “Download 'on-demand' files” | For internal use only. |
| “File Name” | Name of the file below the application, or direct name of the implicitly transferred file (example: archive.prj). Double-click the file name to open the file. |
| “Host Path” | Location or original location of the file (example: D:\Proj1\Files). Double-click the path to open the directory in the file explorer. |
| “Timing” | Time interval of the file update on the PLC (example: “After application download/online change”). |
| “Information” | Object-dependent additional information (example: “Object: External File”). |
| “Provider” | General origin type of the file (example: “External File Objects”, “Source code download provider”). |

Tab 'Files'

In this tab of the generic device editor, you can transfer files between CODESYS (host) and the PLC. If the communication settings are correct and the PLC is online, then CODESYS establishes the connection automatically to the PLC for the duration of the file transfer.

<table>
<thead>
<tr>
<th>Table 413: “Host” / “Runtime”</th>
</tr>
</thead>
<tbody>
<tr>
<td>Access to the file system of the host with the functionalities of a standard file manager</td>

Tab 'Log'

You can view the PLC log on this tab of the generic device editor. It lists the events that were recorded on the target system. This concerns the following:
- Events during the startup and shutdown of the system (components loaded, with version)
- Application download and loading of the boot application
- Custom entries
- Log entries from I/O drivers
- Log entries from data sources

The “Log” tab also opens when you click “Open Log Page”. You can configure this as a menu command in the “Customize” dialog.

<table>
<thead>
<tr>
<th>Table 414: Menu bar</th>
</tr>
</thead>
<tbody>
<tr>
<td>Refreshes the list of log events for all runtime system component</td>
</tr>
</tbody>
</table>
“Components” Filters the display of log events by the runtime system components selected in the list box
Example:
CmpApp displays all events which occur in these components, for example
"Application [ <name> ] loaded via [OnlineChange]."
"<all components>“: Displays the reported events of all components

 Loads the next page with newer log messages
 Loads the previous page with older log messages
 Loads the page with the newest log entries and enables automatic scrolling
 Indicates that there are new log messages which have not been displayed yet.
 Hint: This is also displayed on the status bar as “Auto-Scroll: ON”.
 Loads the page with oldest log messages
 Filters events with the severity “Warning” and notifies about how many
 Blue-outlined button: Warnings are displayed.
 Filters events with the severity “Error” and notifies about how many
 Blue-outlined button: Errors are displayed.
 Filters events with the severity “Exception” and notifies about how many
 Blue-outlined button: Exceptions are displayed.
 Filters events with the severity “Information” and notifies about how many
 Blue-outlined button: Information is displayed.
 Filters events with the severity “Debug” and notifies about how many
 Blue-outlined button: Debug messages are displayed.

Logger Enables a logger for displaying its recorded events
By default, the <default logger> defined by the system is set. For example, that is the logger PlcLog for a CODESYS Control Win V3 runtime system.

“UTC time” Converts the times displayed below “Timestamp” to the local time of the development system. The conversion is based on the time zone of the operating system where the CODESYS is running. (default setting)
 Displays the original time stamp of the runtime system
 If you change the option, then the displayed time stamp is converted automatically.

 Exports the list contents to an xml file. You can select the file name and location.
 Imports an XML file with log messages stored in the file system. A separate window opens to display the log messages.

Table 415: Display window with log file
Tabular display of the log messages
Ten thousand log messages are displayed per page.

“Severity”

<table>
<thead>
<tr>
<th>Severity</th>
<th>Icon</th>
</tr>
</thead>
<tbody>
<tr>
<td>Warning</td>
<td>![Warning Icon]</td>
</tr>
<tr>
<td>Error</td>
<td>![Error Icon]</td>
</tr>
<tr>
<td>Exception</td>
<td>![Exception Icon]</td>
</tr>
<tr>
<td>Information</td>
<td>![Information Icon]</td>
</tr>
<tr>
<td>Debug message</td>
<td>![Debug Icon]</td>
</tr>
</tbody>
</table>
Table 416: Status bar

| “Auto-Scroll” | Displays whether auto-scrolling is enabled (“ON”) or disabled (“OFF”).
| | Hint: Click the button to enable “Auto-Scroll”.
| | ● “ON”: The log list is refreshed automatically when changes occur.
| | ● “OFF”: When a new log event occurs, it is displayed next to “Off”. Moreover, the button is decorated on the menu bar.

Note for error checking

For exceptions with the description *SOURCEPOSITION*, the affected function opens in the editor by double-clicking it or by means of the “Display Source Code in Editor” command in the context menu. The cursor jumps to the line that is causing the error. You can also perform this diagnosis when you have the CODESYS project archive, including the download information files and the exported log file. When the affected function is protected, then the following message appears: “The source code is not available for <function name>”.

If a VendorException is reported, then a manufacturer-specific exception error has occurred in the CODESYS runtime. Contact the PLC manufacturer for more information.

Tab 'PLC Settings'

On this tab of the generic device editor you make the basic settings for the configuration of the PLC, for example the handling of inputs and outputs and the bus cycle task.

| “Application for I/O handling” | Application that is responsible for the I/O handling.
Table 417: “PLC Settings”

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Refresh I/Os in stop</td>
<td>The values of the input and output channels are also refreshed when the PLC is in STOP mode. If the watchdog detects a malfunction, the outputs are set to the predefined default values.</td>
</tr>
</tbody>
</table>
| Behavior of the outputs at stop | Handling of the output channels when the controller enters the stop state:  
  - “Retain values”: The current values are retained.  
  - “All outputs to default value”: The default values resulting from the I/O mapping are assigned.  
  - “Execute program”: You can control the handling of the output values via a program contained in the project, which CODESYS executes at “STOP”. Enter the name of the program in the field on the right. |
| Always update variables  | Global setting that defines whether or not CODESYS updates the I/O variables in the bus cycle task. This setting is effective for I/O variables of the slaves and modules only if 'deactivated' is defined in their update settings.  
  - Deactivated (update only if used in a task): The I/O variables are updated only if they are used in a task.  
  - “Enabled 1 (use bus cycle task if not used in any task)”: CODESYS updates the I/O variables in the bus cycle task if they are not used in any other task.  
  - “Enabled 2 (always in bus cycle task)”: CODESYS updates all variables in each cycle of the bus cycle task, regardless of whether they are used and whether they are mapped to an input or output channel. |

Table 418: “Bus Cycle Options”

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
</table>
| Bus cycle task           | Task that controls the bus cycle. By default the task defined by the device description is entered.  
  By default the bus cycle setting of the superordinate bus device (use cycle settings of the superordinate bus) applies, i.e. the device tree is scanned upwards for the next valid bus cycle task definition. |

NOTICE!

Before you select the “<unspecified>” setting for the bus cycle task, you should be aware that “<unspecified>” means that the default setting given in the device description goes into effects. You should therefore check this description. Use of the task with the shortest cycle time may be defined as the default there, but use of the task with the longest cycle time could equally well be defined!

NOTICE!

For fieldbuses, a fixed cycle matrix is necessary to assure a determined behavior. Therefore, do not use the type 'freewheeling' for a bus cycle task.
Table 419: "Additional Settings"

```
<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Force variables for the I/O mapping&quot;</td>
<td>This setting is available only if it is supported by the device.</td>
</tr>
<tr>
<td></td>
<td>☑: When compiling the application CODESYS creates two global variables for each I/O channel that is mapped to a variable in the dialog &quot;I/O Mapping&quot;. You can use these variables for the forcing of the input or output value on this channel, for example via an HMI visualization.</td>
</tr>
<tr>
<td>&quot;Activate diagnostics for devices&quot;</td>
<td>☑: The CAA Device Diagnosis library is integrated in the project. An implicit function block is generated for each device. If there is already a function block for the device, then either an extended function block is generated (example: EtherCAT) or another function block instance is added. This then contains a general implementation of the device diagnostics. By means of the function block instances you can determine the status of all devices in the application and evaluate errors. In addition, the library contains functions for the programmatic editing of the device tree. Example: Scanning of all children of a bus system, jumping to the parent element.</td>
</tr>
<tr>
<td>&quot;Create additional parameters&quot;</td>
<td>This setting is available only if it is supported by the device.</td>
</tr>
<tr>
<td></td>
<td>Create additional parameters.</td>
</tr>
<tr>
<td>&quot;Display I/O warnings as errors&quot;</td>
<td>Warnings concerning the I/O configuration are displayed as errors.</td>
</tr>
<tr>
<td>&quot;Enable symbolic access for I/Os&quot;</td>
<td>☑: Input and output variables (VAR_INPUT and VAR_OUTPUT) are automatically created for the I/O channels of the device. For this purpose, an extended function block is created for each slave. The basis is the existing function block of the slave. This kind of automatically generated function block can be accessed directly in the application code. This symbolic access works in parallel to the I/O mapping which was set up manually. ☑: Access to I/O channels is not supported. It is necessary to manually set up a mapping and specifically assign new or existing variables per I/O channel.</td>
</tr>
</tbody>
</table>

- Chapter 6.4.1.21.3.5.13 “Command ‘Project information’” on page 2604

### Tab ‘<device name> I/O Mapping’

#### Devices with I/O channels

This tab is displayed in device editors for devices with I/O channels. It shows the available channels and allows for the mapping of input, output, and memory addresses of the controller to variables or entire function blocks of the application. In this way, you create the ‘I/O Mapping’.

The application that is to take care of the I/O handling is defined on the “PLC Settings” tab.

You can use the "Online Configuration Mode" if the device supports it. In this mode, you can access the I/Os of the hardware without having to download an actual application to the device beforehand.

You can also create the I/O mapping in the “Edit I/O Mapping” dialog. Here you get a mapping list with search and filter functions for an entire device tree.

**NOTICE!**

Mapping 'too large' data types

If a variable of a data type that is larger than a byte is mapped to a byte address, the value of the variable will be truncated to byte size there. For monitoring the variable value in the “I/O Mapping” dialog, this means that, in the root element of the address, the value is displayed which the variable currently has in the project. The current individual bit values of the byte are displayed in succession in the bit elements below that, but this may not be sufficient for the entire variable value.

Example of the “<device name> I/O Mapping” tab for a CAN bus slave:
The tab contains a table for editing the I/O mapping. The information displayed for the inputs and outputs originates from the device description.

| “Find” (1) | Input field for a search string for the mapping table. The search results are marked in yellow. |
| “Filter” (2) | List box with filters for the I/O mappings displayed in the mapping table:  
  ● “Show all”  
  ● “Show only outputs”  
  ● “Show only inputs”  
  ● “Show only unmapped variables”  
  ● “Show only mapped variables”  
  ● “Show only mapping to existing variables”  
  ● “Show only mapping to new variables” |
| “Add FB for IO channel” (11) | Depending on the device, available if the channel entry is selected in the mapping table. Opens the “Select Function Block” dialog for selecting the function block that should be linked directly to the channel. |
| “Go to instance” (12) | Available if the entry is selected in the mapping table. Jumps to the corresponding entry on the “<device name> IEC Objects” tab. |
### “Variable”

Depending on the device, the inputs and outputs of the device are displayed as nodes and below them, indented, the associated channels or, depending on the device, only the implicitly created device instance.

The symbol indicates the type of channel:

- 🕵️: Input
- 🕵️️: Output

Double-click the cell to open an input field.

- Option 1: The variable already exists; specify complete path: `<application name>.<module name>.<variable name>`; example: `app1.plc_prd.ivar`; input assistance via [x].
- Option 2: The variable does not exist yet; enter a simple name; automatically created internally as a global variable.

Depending on the device, inputs or outputs can be linked directly to a function block. In this case, the 🕵️ “Add FB for IO channel” button can be clicked. See above.

### “Mapping” (3)

Type of mapping:

- 🕵️: Existing variable
- 🕵️️: New variable
- 🕵️️️: Mapping to function block instance

### “Channel” (4)

Symbolic name of the channel.

### “Address” (5)

Address of the channel (example: `%IW0`).

Address strikethrough: Indicates that you should not assign any more variables to this address. Reason: Although the variable specified here is managed – as an existing variable – at a different memory location, ambiguity could result when the values are written, particularly with outputs.

- 🕵️: Indicates that this address has been edited and fixed. If the arrangement of the device objects in the device tree changes, then CODESYS does not adapt this address automatically.

### “Type” (6)

Data type of the channel (example: `BOOL`).

Structures or bit fields defined in the device description are displayed only if they are part of the IEC standard and are identified as IEC data types in the device description. Otherwise the table cell remains empty.

When mapping structured variables, the editor prevents you from specifying both the structure variable (example: `%QB0`) and individual structure elements (example: `%QB0.1` and `%QB0.2`). Therefore, if there is a main entry with a subtree of bit channel entries in the mapping table, then the following applies: You can input a variable either into the line of the main entry, or into the lines of the subelements (bit channels), but not into both.

### “Default value”

Default value of the parameter that applies to the channel: Appears only if the option “Set all outputs to default” is selected in the “PLC Settings” for the behavior of the outputs at stop.

Note: For compiler version V3.5 SP11 and higher, the initialization value of the variables is used automatically as the default value when mapping to an existing variable. You can edit the “Default value” field only if you map to a new created variable or if no mapping is specified. In older versions, users had to specify explicitly that the default value and initialization value were identical.

### “Unit” (7)

Unit for the parameter value (example: `ms` for milliseconds).

### “Description” (8)

Short description of the parameter.

### “Current value”

Actual value of the parameter applied to the channel; displayed in online mode only.
The change of the default value by an online change is allowed, however the value is applied only after a "Reset cold" or "Reset warm".

<table>
<thead>
<tr>
<th>“Reset Mapping” (9)</th>
<th>CODESYS resets the mapping settings to the default values as defined in the device description file.</th>
</tr>
</thead>
</table>
| “Always update variables” (10) | Definition for the device object about updating I/O variables. The default value is defined in the device description:  
   - “Use parent device setting”: Update according to the setting of the superordinate device.  
   - “Enabled 1 (use bus cycle task if not used in any task)”: CODESYS updates the I/O variables in the bus cycle task if they are not used in any other task.  
   - “Enabled 2 (always in bus cycle task)”: CODESYS updates all variables in each cycle of the bus cycle task, regardless of whether they are used and whether they are mapped to an input or output channel. |

If a UNION is represented by I/O channels in the mapping dialog, it depends on the device whether mapping to the root element is also possible.

Devices with I/O drivers  
For devices with I/O drivers, you can set the bus cycle task here in the “I/O Mapping” tab if the general settings should not be used (“PLC Settings” tab).

Table 421: Bus Cycle Options

| “Bus Cycle Task” | The list box provides all tasks which are defined in the task configuration of the active application (example: “MainTask”. In case of “Use parent bus cycle setting”, the settings of the parent node will be used. |

General information about the bus cycle task  
Generally, for each IEC task, the used input data is read at the start of each task (1) and the written output data is transferred to the I/O driver at the end of the task (3). The implementation in the I/O driver is decisive for additional transfer of the I/O data. It is responsible for the time frame and time point that the actual transfer to the corresponding bus system occurs.

The bus cycle task of the PLC can be defined globally for all fieldbuses in the PLC settings. For some fieldbuses, however, you can change this independent of the global setting. The task with the shortest cycle time is used as the bus cycle task (setting: “unspecified” in the PLC settings). The messages are normally sent on the bus in this task.

Other tasks copy only the I/O data from an internal buffer that is exchanged only with the physical hardware in the bus cycle task.
Task usage

The “Task Deployment” tab provides an overview of used I/O channels, the set bus cycle task, and the usage of channels.

WARNING!

If an output is written in various tasks, then the status is undefined, as this can be overwritten in each case.

If the same inputs are used in various tasks, then it is possible for the input to change during the processing of a task. This happens when the task is interrupted by a task with a higher priority and causes the process image to be read again. Solution: At the beginning of the IEC task, copy the input variables to variables and then work only with the local variables in the rest of the code.

Conclusion: Using the same inputs and outputs in several tasks does not make any sense and can lead to unexpected reactions in some cases.

Tab '<device name> IEC Objects'

NOTICE!
Please note that manually creating another instance of the device object can lead to malfunctions.

In this tab of the generic device editor, "objects" are listed that allow for access to the device from the IEC application. In online mode, this is used as the monitoring view.

For devices for which a function block instance is created implicitly, at least this instance is listed as an object here in the table. This instance can be used, for example, in order to restart a bus or to query information from the application. The device type determines whether this kind of device instance is available and which access options it has. Please refer to the help for the special device configuration.

Instances of function blocks that are linked with inputs or outputs of the device are also displayed here. The mapping of a function block to a channel is defined in the "<device name> I/O Mapping" tab. The "Go to Instance" command takes you directly to the affected object from there.

In addition, you can create more objects in the table here that are not yet linked with a device channel.

In online mode, you can use the table of IEC objects as a monitoring view. It also shows the current value, the address, and the comment for the function block variable at the channel. Finally, it provides the capability of writing and forcing values.

<table>
<thead>
<tr>
<th>“Add”</th>
<th>“Edit”</th>
</tr>
</thead>
<tbody>
<tr>
<td>Opens the “Select Function Block” dialog for creating a new instance or for editing the instance selected in the table.</td>
<td></td>
</tr>
</tbody>
</table>

| “Delete” |
| Deletes the selected entry. |

| “Go to Variable” |
| Jumps from the selected entry directly to the corresponding mapping in the "<device name> I/O Mapping" tab. |

| “Variable” |
| The object name comprises the device name and the function block name. Example: EL2004_Relay. Changing the device name has an immediate effect. The part of the name after the device name is editable here. |

| “Mapping” |
| Mapping type, as in the "<device name> I/O Mapping" tab |

| “Type” |
| Data type: Here it is the name of the function block. |

| “Value” |
| "Prepared value” |
| “Address” |
| “Comment” |
| In online mode only: Display of the current value, the address, and the comment for the variable at the channel. Moreover, the option of specifying a value for writing or forcing the variable. |

Tab 'Users and Groups'

**NOTICE!**

**Recommendations regarding data security**

In order to minimize the risk of data security violations, we recommend the following organizational and technical actions for the system where your applications are running. Whenever possible, avoid exposing the PLC and control networks to open networks and the Internet. Use additional data link layers for protection, such as a VPN for teleaccess, and install firewall mechanisms. Restrict access to authorized persons only, and change any existing default passwords during the initial commissioning, and change them regularly.

On this tab of the generic device editor, you edit the device user management of the PLC. Depending on how it is supported by the device, you can define user accounts and user groups. In combination with the configuration on the "Access Rights" tab, you thus control access to control objects and files at runtime.

Requirements: The controller has a user management and allows it to be edited. You have login data in order to be able to log in to the controller.

It is possible to apply user account definitions from the project user management into the device user management (see below: “Import” button).
Table 422: Toolbar of the tab

- **Synchronization**: Switches on and off the synchronization between the editor and the user management on the device.
  - If the button is not pressed, then the editor is blank or it contains a configuration that you loaded from the hard disk.
  - When the button is pressed, CODESYS synchronizes the display in the editor continuously with the current user management on the connected device.
  - When you enable the synchronization while the editor contains a user configuration that is not synchronized with the device yet, you are prompted what should happen to the editor contents. Options:
    - **“Upload from the device and overwrite the editor content”**: The configuration on the device is loaded into the editor, overwriting the current contents.
    - **“Download the editor content to the device and overwrite the user management there”**: The configuration in the editor is transferred to the device and applied there.

- **Import from disk**: CAUTION: The import of a device user management by means of a *.dum2 file completely overwrites the existing user management on the device. In order to log in to the device again afterwards, you need authentication data from the new user management. This means that you have to log in as a user from the imported user management after the import.
  - When you click the button on the “Users and Groups” tab to import a “Device user management file *.dum2”, the default dialog for selecting a file opens to select a device user management file from the hard drive. After you select the file, the “Enter Password” dialog opens. You have to specify the password that was assigned when the file was exported. Then the user management is enabled.
  - Note: Before V3.5 SP16, the “Device user management files (*.dum)” file type was used which did not require any encryption.

- **Export to disk**: When you click the button on the “Users and Groups” tab, first the “Enter Password” dialog opens for assigning a password to the device user management file. Note: This password has to be repeated later when this file is imported to enable this user management on the controller.
  - After the password assignment dialog is closed, the default dialog for selecting and importing a user management configuration from the hard drive opens. In this case, the file type is “Device user management files (*.dum)”. Note: Before V3.5 SP16, the “Device user management files (*.dum)” file type was used which did not require any encryption.
  - When you click the button on the “Access Rights” tab, the file type is “Device rights management files (*.drm)”. In this case, a password does not have to be assigned for the file before saving.

Table 423: “User”

- **Add**: Opens the “Add User” dialog for creating a new user account.
- **Import**: Opens the “Import User” dialog. It displays all the user accounts defined in the project user management.
  - Select the desired entries and click “OK” in order to import them into the device user management. CAUTION: The passwords are NOT applied.
<table>
<thead>

Tab 'Access Rights'

NOTICE!
Recommendations regarding data security
- In order to minimize the risk of data security violations, we recommend the following organizational and technical actions for the system where your applications are running. Whenever possible, avoid exposing the PLC and control networks to open networks and the Internet. Use additional data link layers for protection, such as a VPN for teleaccess, and install firewall mechanisms. Restrict access to authorized persons only, and change any existing default passwords during the initial commissioning, and change them regularly.

NOTICE!
Detailed information on the concept and use of device user management is provided in "Handling of Device User Management". There you will also find the following instructions on how to use the editor:
- First-time login to the controller for editing and viewing its user management
- Setting up a new user in the user management of the controller
- Changing of access rights to controller objects in the user management of the controller
- Loading user management from a *.dum file, modifying it, and downloading it to the controller in offline mode

On this tab of the device editor, you define the device access rights of device users to objects on the controller. As in the project user management, users must be members of at least one user group and only user groups can be granted certain access rights.

Requirements for the “Access Rights” tab to be displayed:
- In the CODESYS options, in the "Device Editor" category, the "Show access rights page" option has to be selected.
  Note that this CODESYS option can be overwritten by the device description.

Requirements for the access rights to be granted to user groups
- A component for the user management has to be available on the controller. That is the primary requirement.
- Users and user groups have to be configured on the "Users and Groups" tab.
### Table 426: Toolbar of the tab

<table>
<thead>
<tr>
<th>Button</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Synchronization" /></td>
<td>Switches on and off the synchronization between the editor and the user management on the device. If the button is not pressed, then the editor is blank or it contains a configuration that you loaded from the hard disk. When the button is pressed, CODESYS synchronizes the display in the editor continuously with the current user management on the connected device. When you enable the synchronization while the editor contains a user configuration that is not synchronized with the device yet, you are prompted what should happen to the editor contents. Options:</td>
</tr>
<tr>
<td><img src="image" alt="Import from disk" /></td>
<td>CAUTION: The import of a device user management by means of a *.dum2 file completely overwrites the existing user management on the device. In order to log in to the device again afterwards, you need authentication data from the new user management. This means that you have to log in as a user from the imported user management after the import.</td>
</tr>
<tr>
<td><img src="image" alt="Export to disk" /></td>
<td></td>
</tr>
<tr>
<td><img src="image" alt="Device user" /></td>
<td>User name of the user currently logged in on the device</td>
</tr>
</tbody>
</table>

- **“Upload from the device and overwrite the editor content”**: The configuration on the device is loaded into the editor, overwriting the current contents.
- **“Download the editor content to the device and overwrite the user management there”**: The configuration in the editor is transferred to the device and applied there.

CAUTION: The import of a device user management by means of a *.dum2 file completely overwrites the existing user management on the device. In order to log in to the device again afterwards, you need authentication data from the new user management. This means that you have to log in as a user from the imported user management after the import.

- When you click the button on the “Users and Groups” tab to import a “Device user management file *.dum2”, the default dialog for selecting a file opens to select a device user management file from the hard drive. After you select the file, the “Enter Password” dialog opens. You have to specify the password that was assigned when the file was exported. Then the user management is enabled.
  
  Note: Before V3.5 SP16, the “Device user management files (*.dum)” file type was used which did not require any encryption.

- When you click the button on the “Access Rights” tab to import a “Device rights management file *.drm”, the default dialog for selecting a file opens to select a corresponding file from the hard drive. The existing configuration in the dialog is overwritten by the imported file.

- When you click the button on the “Users and Groups” tab, first the “Enter Password” dialog opens for assigning a password to the device user management file. Note: This password has to be repeated later when this file is imported to enable this user management on the controller. After the password assignment dialog is closed, the default dialog for selecting and importing a user management configuration from the hard disk opens. In this case, the file type is “Device user management files (*.dum2)”. Note: Before V3.5 SP16, the “Device user management files (*.dum)” file type was used which did not require any encryption.

- When you click the button on the “Access Rights” tab, the file type is “Device rights management files (*.drm)”. In this case, a password does not have to be assigned for the file before saving.
Table 427: “Objects”

In the tree structure, the objects are listed to which actions can be executed at runtime. The objects are each assigned by their object source and partially sorted in object groups. In the “Rights” view, you can configure the access options for a user group to a selected object.

<table>
<thead>
<tr>
<th>Object source (root node)</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>“File system objects → Device”: In these objects, the rights can be granted to folders of the current execution directory of the controller.</td>
<td></td>
</tr>
<tr>
<td>“Runtime objects → /”: In these objects, all objects are managed that have online access in the controller and therefore have to control the access rights.</td>
<td></td>
</tr>
</tbody>
</table>

A description of the objects is located in the table. “Overview of the objects” on page 2457

<table>
<thead>
<tr>
<th>Object groups and objects (indented)</th>
</tr>
</thead>
</table>
In general, the access rights are inherited from the root object (also “Device” or “/”) to the subobjects. This means that if a permission of a user group is denied or explicitly granted to a parent object, then this first affects all child objects.

The table applies for the object that is currently selected in the tree. For every user group, it shows the rights currently configured for the possible actions on this object.

Possible actions on the object:

- “Add/Remove”
- “Modify”
- “View”
- “Execute”

When an object is clicked, a table on the right side shows the access rights of the available user groups for the selected object.

This allows you to quickly see:

- Which access rights are evaluated by an object
- Which user group has which effective rights to which object

Meanings of the symbols

- : Access right granted explicitly
- : Access right denied explicitly
- : Access right granted through inheritance
- : Access right denied through inheritance
- : The access right was not granted or denied explicitly and also not inherited by the parent object. Access is not possible.
- No symbol: Multiple objects are selected that have different access rights.

Change the permission by clicking the symbol.
The "Logger" object on the "Access Rights" tab was created by the "Logger" component and controls its access rights. It is located directly below the "Device" runtime object.

The possible access rights for this object can be granted only for the "View" action.

Initially, each object has a read access. This means that every user can read the "Logger" of a controller. If this access right should be denied for a single user group ("Service" in the example), then the read access to the logger object has to be denied explicitly.

Example

<table>
<thead>
<tr>
<th>&quot;Runtime objects&quot;</th>
<th>&quot;Device&quot;</th>
<th>&quot;Add/Remove&quot;</th>
<th>&quot;Modify&quot;</th>
<th>&quot;View&quot;</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Logger&quot;</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>&quot;PlcLogic&quot;</td>
<td>All IEC applications are inserted here automatically as child objects during download. When an application is deleted, it is removed automatically. This allows specific control of online access to the application. Access rights can be assigned centrally over all applications in the &quot;PlcLogic.&quot; The &quot;Administrator&quot; and &quot;Developer&quot; user groups have full access to the IEC applications. The &quot;Service&quot; and &quot;Watch&quot; user groups only have read access (for example for read-only monitoring of values).</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The following table shows which action is affected in particular when a specific access right is granted for an IEC application.

<table>
<thead>
<tr>
<th>&quot;Application&quot;</th>
<th>&quot;Operation&quot;</th>
<th>&quot;Add/ Remove&quot;</th>
<th>&quot;Execute&quot;</th>
<th>&quot;Modify&quot;</th>

</tr>
</tbody>
</table>

"PlcShell" Only the “Modify” permission is evaluated at this time. This means that only when the “Modify” permission has been granted to a user group can PLC shell commands also be evaluated.

"RemoteConnections" Additional external connections to the controller can be configured below this node. Currently, access to the CODESYS OPC UA server can be configured here.

"Settings" This is the online access to the configuration settings of a controller. By default, access to “Modify” is granted only to the administrator.

"UserManagement" This is the online access to the user management of a controller. By default, read/write access is granted only to the administrator.

"X509" This controls the online access to the X.509 certificates. Two types of access are distinguished here:
- Read (“View”)
- Write (“Modify”)
Every operation is assigned to one of these two access rights. Each operation is inserted as a child object below X509. Therefore, access per operation can now be fine-tuned even more.

"File system objects ➔ /")
All folders from the execution path of the controller are inserted below the ""/"" file system object. This allows you to grant specific rights to each folder of the file system.

- Chapter 6.4.1.21.2.8.2 "Generic device editor" on page 2427
- Chapter 6.4.1.21.2.8.14 "Tab 'Users and Groups'" on page 2450

Tab 'Symbol Rights'
In this tab of the generic device editor, you define the access rights of different user groups (clients) to the individual symbol sets available on the controller.
Requirement: User management must be set up on the PLC. An application was downloaded to the controller for which symbol sets were defined in the CODESYS project. They have access data for logging in to the controller.

In the “Symbol Sets” view, all symbol sets are listed below the “Application” node whose definition was downloaded with the application to the controller.

In the “Rights” view, the user groups defined in the user management of the controller are listed in a table. When a symbol set is selected, you see the access rights of the corresponding user group to the symbols of this set. Access granted; Access not granted. You can change the access rights by double-clicking the symbol.

Click the button to save the current access configuration to an XML file The file type is “Device symbol management files (*.dsm)”. Click the button to read a file like this from the hard drive.

Tab 'Licensed Software Metrics'

The tab of the device editor displays the code sizes of the applications of the open project in a tree structure. The display is refreshed when you click "Build ➔ Generate Code" or "Online ➔ Login" for the active application. When the compile information is deleted, the displayed code size of the corresponding application is reset.

<table>
<thead>
<tr>
<th>Metric</th>
<th>Applications of the open project</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Size”</td>
<td>“Size of User Code”: Sum of the displayed code sizes of the applications listed below</td>
</tr>
<tr>
<td></td>
<td>Code size of the respective application</td>
</tr>
<tr>
<td>“Unit”</td>
<td>Unit in which the “Size” is displayed</td>
</tr>
<tr>
<td>“Max. Allowed”</td>
<td>Not implemented yet</td>
</tr>
</tbody>
</table>

Tab 'Task deployment'

This sub-dialog box of the device editor displays a table of inputs and outputs as well as their assignment to the defined tasks.

The information only becomes visible after code has been generated for the application. It is used for troubleshooting, because it shows where inputs or outputs are used in several tasks with different priorities. Multiple use can lead to undefined values through overwriting.
Table 429: “I/O Deployment for Tasks” (1)

<table>
<thead>
<tr>
<th>I/O Channels” (2)</th>
<th>All inputs and outputs of the linked devices. The display corresponds to that in the dialog box “I/O Mapping” of the device editor. By double-clicking on an input or output you can open the associated I/O mapping editor.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“&lt;task name&gt;” (3)</td>
<td>A column appears for every task defined in the task configuration. The title contains the task name and priority. The priority of the tasks decreases from first to the last column. A red cross appears in the box for inputs and outputs that are written or read by a task: [X]. In addition, the task defined as a “Bus cycle task” in the “PLC Settings” of the device editor is marked at these points with a blue double arrow symbol [ ]. Following a mouse-click on the title cell, only the I/Os assigned to this task are displayed. Following a mouse-click on the “I/O Channels” cell, all channels are shown again.</td>
</tr>
</tbody>
</table>

Tab 'Status'

This tab of the generic device editor displays status information, for example 'Running' or 'Stopped', and specific diagnostic messages from the respective device, also information about the card used and the internal bus system.

See also
- Chapter 6.4.1.21.2.8.2 “Generic device editor” on page 2427

Tab 'Information'

This tab of the generic device editor displays general information that originates from the device description file: name, vendor, categories, version, order number, description, if necessary an illustration.
Object 'DUT'

Symbol:

- 🎨 for a DUT without text list support
- 📚 for an enumeration data type with text list support

A DUT (Data Unit Type) declares a user-specific data type. You can add this kind of object below the application or in the “POUs” view. When the object is created, the “Add DUT” dialog opens. There you select among the “Structure”, “Enumeration”, “Alias”, or “Union” data types.

Moreover, enumerations can have a text list stored to localize the enumeration values. Then the object also has a localization view.

Syntax

```
TYPE <identifier> : <data type declaration with optional initialization>
END_TYPE
```

How the data type declaration has to be done syntactically depends in detail on the selected data type.
Examples

**Declaration of a structure**

```plaintext
TYPE S_POLYGONLINE :
  STRUCT
    aiStart : ARRAY[1..2] OF INT := [-99, -99];
    aiPoint1 : ARRAY[1..2] OF INT;
    aiPoint2 : ARRAY[1..2] OF INT;
    aiPoint3 : ARRAY[1..2] OF INT;
    aiPoint4 : ARRAY[1..2] OF INT;
    aiEnd : ARRAY[1..2] OF INT := [99, 99];
  END_STRUCT
END_TYPE
```

**Extension of a structure**

```plaintext
TYPE S_PENTAGON EXTENDS S_POLYGONLINE :
  STRUCT
    aiPoint5 : ARRAY[1..2] OF INT;
  END_STRUCT
END_TYPE
```

**Declaration of an enumeration**

```plaintext
{attribute 'qualified_only'}
{attribute 'strict'}
TYPE E_TRAFFICSIGNAL :
{eRed,
  eYellow,
  eGreen := 10
};
END_TYPE
```

**Enumeration with text list support in the localization view**

The "Textual View" and "Localization View" buttons are located on the right edge of the editor. Click the buttons to toggle between the views.

**Declaration of an alias**

```plaintext
TYPE A_MESSAGE : STRING[50];
END_TYPE
```

**Declaration of a union of components with different data types**

```plaintext
TYPE U_DATA :
  UNION
    lrA : LREAL;
    liA : LINT;
    dwA : DWORD;
  END_UNION
END_TYPE
```

**Dialog 'Add DUT' Function:** The dialog is used to configure a new DUT (Data Unit Type).

**Call:** Menu bar: "Project ➔ Add Object ➔ DUT"; context menu of the application object.
| **Name** | Name of the new DUT data type  
**Example**: S_POLYGONLINE |
|---|---|

**Table 430: “Type”**

| **Structure** | Creates an object which declares a structure that combines multiple variables with different data types into a logical unit. The variables declared within the structure are called members.  
**Example**: S_POLYGONLINE |
| **Extends** | ☑: Extends an existing structure by more members. In the input field, specify an existing structure. The members of the existing structure are automatically available in the new structure.  
**Example**: S_PENTAGON |
| **Enumeration** | Creates an object which declares an enumeration that combines multiple integer constants into a logical unit. The constants declared within an enumeration are also called enumeration values.  
**Example**: E_TRAFFICSIGNAL |
| **Add Text List Support** | ☐: Enumeration that does not have any text list support  
☑: Enumeration with additionally stored text list for the enumeration values. The text list allows you to localize the names of the enumeration values.  
**Example**: ETL_TRAFFICSIGNAL |

Note: In the case of an existing enumeration type, text list support can be added or removed at any time. As a result, the “Add Text List Support” and “Remove Text List Support” commands are provided in the context menu of the object.

Hint: The localized texts can be displayed, for example, in a visualization. In this case, the text output of a visualization element displays the symbolic enumeration values in the current language instead of the numeric enumeration values. When an enumeration with text list support is specified in the “Text variable” property of a visualization element, it gets the additional property `<<enumeration name>> >`.  
**Example**: In a visualization, you use the variable PLC_PRG.eTrafficLight of type ETL_TRAFFICSIGNAL. ETL_TRAFFICSIGNAL is an enumeration with text list support. Then the entry in the properties editor of the visualization element looks like this: PLC_PRG.eTrafficLight <ETL_TRAFFICSIGNAL>.  
Hint: When you edit the enumeration type in the application, a prompt opens when you close the application and asks whether the affected visualizations should be updated automatically.  
See also: Help for "Enumerations" with information about the declaration syntax |

| **Alias** | Creates an object which declares an alias with which an alternative name is declared for a base type, data type, or function block |
| **Union** | Creates an object which declares a union that combines multiple members with mostly different data types into a logical unit.  
All members have the same offset so that they are occupy the same memory. The memory requirement of a union is determined by the memory requirement of its “largest” component. |
| **Add** | Closes the dialog and creates the new object  
The object is displayed with the symbol in the device tree or in the “POUs” view. When a text list is also stored for the object, the symbol is displayed. |
Object 'External File'

An “External File” is any file that you add to the project in the “POUs” view or “Devices” view. Click “Project → Add Object” to open the “Add External File” dialog and define how the file belongs to the project.

An external file which was inserted in the “POUs” view is never downloaded to the controller.

An external file which was added in the “Devices” view is always downloaded to the controller when an online change or a download is performed due to an IEC code change.

When an external file is downloaded to the controller, it is not updated in the project.

Dialog 'Add External File'

| “File path” | The button opens a dialog for selecting a file in the local file system. |
| “Name” | Object name for the file in CODESYS. If you do not type anything, the file will have its previous name. |

Table 431: “File Handling”

| “Remember the link” | The file is available in the project only as long as it exists in the defined file path. |
| “Remember the link and embed into project” | CODESYS saves an internal copy of the file in the project, as well as the link to the defined file path. The update option selected below applies as long as the external file exists there. Otherwise CODESYS uses the version saved in the project. |
| “Embed into project” | CODESYS saves only one copy of the file in the project. There is no longer a link to the external file. |

Table 432: “Change Tracking”

| “Reload the file automatically” | If the external file changes, then CODESYS updates the file in the project. |
| “Prompt whether to reload the file” | If the external file changes, then a dialog prompt opens whether CODESYS should also update the file in the project. |
| “Do nothing” | The file remains unchanged in the project, even if the external file changes. |

| “Display File Properties” | Clicking this button opens the default “Properties of <file name>” dialog, which you can also open in the Windows file system by right-clicking the file. |
| “Open” | The file object is inserted into the device tree (“Devices” or “POUs” view) and opened in the editor for the matching file format. |
Object 'GlobalTextList'

Symbol: 

This object is for the management and translation of texts that are written as static text in visualizations in the project. It contains a table with these texts. If you write a text in a visualization in an element under the property "Texts", CODESYS automatically adds a line in the table. You cannot write any new text here, you can only edit an existing text.

In addition CODESYS makes the following commands available, in order to consolidate the "GlobalTextList":

- "Check Visualization Text IDs"
- "Update Visualization Text IDs"
- "Remove Unused Text List Entries"

The object is located in the POUs view and exists once at the most

<table>
<thead>
<tr>
<th>&quot;ID&quot;</th>
<th>Unambiguous identifier of the text</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Default&quot;</td>
<td>Source text as a character string with one formatting specification at the most, for example Information A: %i possibilities. If no translation is written under a language column, CODESYS uses this text. Double-click in the field in order to edit the text.</td>
</tr>
<tr>
<td>&quot;&lt;Language code&gt;&quot;</td>
<td>Name of the language as a language code, for example en-US. This column contains the translation of the text that is written under &quot;Standard&quot;. If the language code is selected as a language in the visualization manager, a visualization displays the translation during operation. A running visualization can switch over during operation to another language at the request of a user. Double-click in the field in order to edit the text.</td>
</tr>
</tbody>
</table>

Object 'GVL' - Global Variable List

Symbol: 

A global variable list is used for the declaration, editing and display of global variables.

A GVL is added to the application or the project with the command “Project ➔ Add Object ➔ Global Variable List”.

If you insert a GVL under an application in the Device tree, the variables are valid within this application. If you add a GVL in the POU view, the variables are valid for the entire project.

You can apply settings for the editor of the object in the dialog “Tools ➔ Options” in the categories “Declaration Editor” and “Text Editor”.

If the target system supports network functionality, you can convert the variables of a GVL into network variables and thus use them for data exchange with other devices in the network. To do this you must define corresponding properties for the GVL in the “Network Variables” tab of the “Properties” dialog.

Object ‘GVL’ - Global Variable List (task-local)

Symbol: 📚

A global variable list (task-local) is used for the declaration, editing and display of global variables. For this special global variable list, the declared variables in the list can be written by one task only. All other tasks have only read-only access. This makes sure that the values of these variables are always consistent, even for multicore projects.

The object is available for compiler version 3.5.13.0 with the corresponding device description.

| "Task with write access" | Task that has exclusive write access to the variables. |

Object: IEC Symbol Publishing

The “IEC Symbol Publishing” object contains an editor for configuring variables and IEC data types from the project for publishing via an OPC UA Server. A group of symbols can be compiled and configured for each created object.

The editor is a newer alternative to the already known editor for the Symbol Configuration.

Use the Add Object dialog to attach one or more IEC Symbol Publishing objects below an OPC UA Server object below the Communication Manager. You can change the object name, for example to webvisu, if the symbols are to be used for exchange with a web visualization.

Editor: IEC Symbol Publishing

Function: Configuration of a symbol set for exchange via OPC UA

Call: Double click or [Edit Object] command on the desired “<name of IEC symbol publishing>” object in the device tree.

The editor consists of two tabs: On the “IEC Symbol Editor” tab, you configure the symbol set to be published from individual variables from the project. On the “Symbol Type Editor” tab, you work with whole data types, such as GVL and FB.
Note that the editor works with variables and types from the precompile state of the project. If changes are made to variables or types in the project, then it can create inconsistencies with the current configuration in the symbol publishing editor. They are indicated at the relevant places in the editor by icons of the error, warning, or information. A tooltip on the icon provides more information about the inconsistency and a possible fix. The tooltip contains at least the message text, which also appears in the message window in the “IEC Symbol Publishing” category.

| “Refresh” | Refreshes the display in the editor according to the current situation in the project |
| “Use access rights defined in the user management” | ☑ The access rights to the symbol set are taken from the current settings in the user management of the controller. |

On this tab of the editor, you configure individual variables from the application as symbols to be published. You do this by dragging the desired variables from the “Precompile Sets” from the left part of the tab to the right part, where the symbols can then be configured.

| “Precompile Sets” | The tree structure shows all variables which are already available for publication in the project before compilation. To do this, the project scans the following: |
| | ● “<device>.<application>”: Project POUs below the device application |
| | ● “Libraries”: Integrated libraries |
| | ● “Pool”: Project POUs in the “POUs” view |
| | A list of excluded types can be found in the tooltip after the icon. |

| D Sync | This button is operable as long as there are inconsistencies between the current symbol configuration and the project. In this case you will see icons of the type error, warning, or information. After correcting the inconsistencies, synchronize the editor with the project again. |

| | The display of information about the configured symbols can be filtered. In the list after the icon, you select which table columns are to be displayed. When you enter a string in the search field, the search hits are highlighted in yellow in the table. |

| Table of configured symbols | Information about the individual symbols, depending on the set filter: |
| | ● Symbol: Variable name (example: iVar) |
| | ● Path: Variable path (example: PLC_PRG.iVar, PLC_PRG.fb1_inst) |
| | ● IEC type: IEC data type of the variable (example: INT, FB1) |
| | ● Symbol Type (Exported Type Name): Name of the symbol under which it will appear after export. In the case of structured types, the instance can be selected here. |
| | ● Access Rights: Permissions to the symbol. Example: Read/Write |
| | ● Comment: Comment stored in the application code |
On this tab of the editor, you configure entire “symbol types” for publishing. To do this, you drag the desired “IEC Data Types” from the left part of the window to the right side into the configuration table. Then there you can configure for each symbol type in detail which of its components should be exported with which access rights and with which name.

You can also filter the display in this table via ✓ and search for strings.

<table>
<thead>
<tr>
<th>Symbol Type (Exported Type Name)</th>
<th>The name of the symbol type dragged from IEC data types can be edited. It is used after export as defined here.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Members</td>
<td>The [ ] button opens the Data type members of &lt;symbol type&gt; dialog (see above).</td>
</tr>
<tr>
<td>IEC Type</td>
<td>IEC data type as defined in the project (example: Color)</td>
</tr>
</tbody>
</table>

Dialog: Data type members of <symbol type>.

Call: [ ] button on the “IEC Symbol Type Editor” tab in the “Members”

In this dialog, you select which members of the symbol type in question should be exported as symbols. You can define a name for each member under which it will be exported, including the access rights.

<table>
<thead>
<tr>
<th>Export</th>
<th>✓: The member is exported as a symbol.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Exported Name</td>
<td>Default: Member name (IEC Name) from the project; can be edited</td>
</tr>
<tr>
<td>IEC Name</td>
<td>Member name from the project</td>
</tr>
<tr>
<td>IEC Type</td>
<td>IEC data type of the member (example: INT)</td>
</tr>
<tr>
<td>Symbol Type (Exported Type Name)</td>
<td>Name of the data type to which the member belongs (example: Color)</td>
</tr>
<tr>
<td>Access Rights</td>
<td>Access right to the symbol (Read, Write, Read/Write)</td>
</tr>
</tbody>
</table>

Above the table, there are filter and search options, just like on the editor tabs described above.

Object 'Image Pool'

The “Image Pool” object contains a table with image ID assignments.

<table>
<thead>
<tr>
<th>“ID”</th>
<th>ID of the image; you reference this ID, for example in the visualization of the image.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“File name”</td>
<td>File path of the image; if you click for more settings ( ), the “Select Image” dialog box opens.</td>
</tr>
<tr>
<td>“Image”</td>
<td>Show a thumbnail of the image.</td>
</tr>
<tr>
<td>“Link type”</td>
<td>Opens the “Select Image” dialog box, where you define the link type.</td>
</tr>
</tbody>
</table>
**Dialog box 'Select Image'**

| “Image file” | Name and directory of the image file (example: "C:\Programme\images\logo.bmp") CODESYS supports the following image formats: BMP, EMF, GIF, ICO, JPG, PNG, SVG, and TIFF. Please note that a controller may not support all formats. Whether or not you can use images formatted as scalable vector graphics (*.svg) depends on the operating system. Any necessary information is located in the device description of the hardware vendor. |

**Table 433: “File Handling”**

| “Remember the link” | CODESYS saves only the link. CODESYS automatically updates any changes to an image file in the image pool. You must ensure that the path of the image file does not change. When saving the project as an archive, CODESYS embeds the image file in the project archive. |
| “Remember the link and embed into project” | CODESYS copies the image to the image pool and the link information is retained. In this way, CODESYS recognizes any changes to the image file and then update the image pool can as needed. This behavior is controlled with the options in the next table. Embedded image files increase the memory requirement of the project. |
| “Embed into project” | CODESYS copies the image to the image pool. If the image file is changed again afterwards, then it is not updated in the project. For libraries, you must embed the image in the project. Embedded image files increase the memory requirement of the project. |

**Table 434: “Change Tracking”**

These options are available only if you have selected the “Remember the link and embed into project” check box as described above.

| “Reload the file automatically” | CODESYS automatically updates the image file in the project without prompting. |
| “Prompt whether to reload the file” | If the image file has changed, you may be prompted whether or not the image file should be updated. |
| “Do nothing” | CODESYS does not update the image file in the image pool. |

See also

- Chapter 6.4.1.9.11 “Using image pools” on page 1899

**Object 'Library Manager'**

Symbol: 📖

The Library Manager lists all libraries that were integrated in the project for creating applications. It provides information about the type of library, its properties, and its contents.

You can expand or collapse the list of integrated libraries, as well as edit library properties for non-dependent libraries.

The Library Manager consists of three views:

- Upper view: List of integrated libraries
- Lower left view: Tree structure with all modules of the library selected in the upper view
- Lower right view: Documentation for the module selected in the tree
List of integrated libraries

<table>
<thead>
<tr>
<th>Displayed in gray fonts</th>
<th>The library was added to the project automatically by means of a plug-in.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Displayed in black fonts</td>
<td>The library was added to the project automatically by means of the “Add Library” command.</td>
</tr>
</tbody>
</table>

**“Name”**

Display of the integrated library in the following syntax:

```
<placeholder name> = <library name>, <version> (<company>)
```

- `<placeholder name>`: If it is a placeholder library for a library, then the placeholder name is before a `="`.  
- `<library name>`: Name of the library that is used for management in the library repository.  
- `<version>`: Version that was referenced at the first time it was integrated.  
- `(<company>)`: Vendor (optional)

**“Namespace”**

Namespace for unique access to the contents of the library.  
It is prepended to a module identifier for this purpose:  

```
<namespace>.<library module identifier>
```

The namespace usually coincides with the library name.  

**Note:** If the library has the property `LanguageModelAttribute "qualified-access-only"`, then you **must** access the library module in the application code by means of the namespace. Qualified (unique) access is enforced.  

You can modify the standard namespace for local use (within the project) in the “Properties” dialog.

**“Effective version”**

Version of the library after the resolution. This version is used in the project.  

**Requirement:** The Library Manager exists in the “Devices” view and a placeholder library is selected.  

**Example:** 3.5.10.0  
A placeholder library that is integrated below an application is resolved by assigning a special resolution to the placeholder library in the “Placeholders” dialog. Then the selected library is loaded. Other resolutions are ignored. If no special resolution is given, then a check is performed as to whether or not a resolution is specified in the device description and library profile of the application. The first detected resolution is used.  

If you have assigned a special resolution to the placeholder library in the “Placeholders” dialog, then this will **always be ignored**. The result is shown in the tooltip of the ⚠ symbol.
Library that is signed with a trusted certificate (compatible with CODESYS >= V3 SP15)

Library that is signed with a trusted certificate, but references at least one unsigned library

Library that is signed with a private key and token (compatible with CODESYS < V3 SP15)

Library that is not signed, or signed with an untrusted or expired certificate. In the case of an untrusted certificate, the “Trust Certificate” command is provided in the context menu.

Library that is defined as optional and not currently available

Library whose status is being determined

Licensed library for which no valid license is currently available

Library symbol for a library that cannot be loaded because its signature (encryption) could not be verified

Table 435: Commands in the Library Manager

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Add Library”</td>
<td>Opens the dialog for selecting a library. All libraries installed in the library repository are offered.</td>
</tr>
<tr>
<td>“Delete Library”</td>
<td>Removes the presently selected library from the project</td>
</tr>
<tr>
<td>“Properties”</td>
<td>Opens the dialog for the display and editing of the properties of the presently selected library</td>
</tr>
<tr>
<td>“Details”</td>
<td>Opens a dialog with details for the presently selected library (general information, contents, properties, license information)</td>
</tr>
<tr>
<td>“Try to Reload Library”</td>
<td>If you select a library marked as not found, you can attempt to load it into the project again using this command.</td>
</tr>
<tr>
<td>“Download Missing Libraries”</td>
<td>CODESYS scans for the missing libraries in the download servers specified in the project options. After that you can download and install the library.</td>
</tr>
<tr>
<td>“Placeholders”</td>
<td>The “Placeholders” dialog opens. The current resolution is displayed there and you can edit it.</td>
</tr>
<tr>
<td>“Library Repository”</td>
<td>Opens the “Library Repository” dialog for installing and uninstalling libraries and for defining library locations</td>
</tr>
<tr>
<td>“Icon legend”</td>
<td>Opens the “Information” dialog with a legend of the icons that display the current status of a library in the list of integrated libraries (see above)</td>
</tr>
<tr>
<td>“Summary”</td>
<td>Opens the “Library Summary” dialog. All libraries referenced in the project are displayed in a tree structure in the dialog, and those libraries which reference these libraries.</td>
</tr>
<tr>
<td></td>
<td>• Command “Display all occurrences in library hierarchy and close dialog”: In the editor of the Library Manager, the libraries in the open tree structure are marked which reference or use this library. Requirement: A library is selected. The “Information” dialog is then closed. This command is also executed when you double-click a library.</td>
</tr>
<tr>
<td></td>
<td>Display of the libraries</td>
</tr>
<tr>
<td></td>
<td>• “Managed Library”: Name and version of the library</td>
</tr>
<tr>
<td></td>
<td>• “Number of Occurrences”: Number of locations where this library is referenced by other libraries.</td>
</tr>
<tr>
<td></td>
<td>When you click “*” for a library, the libraries, which reference this library, are displayed in the next level down.</td>
</tr>
</tbody>
</table>
"Trust Certificate" Only in the context menu of a library selected in the Library Manager, in which the library has been signed with an untrusted certificate. The command turns the untrusted certificate into a trusted certificate and the prepended icon changes from 🟢 to 🟢.

"Export Library" Only in the context menu of a library selected in the Library Manager: Opens the default dialog for saving the library file in the file system.

Object ‘OPC UA Information Model’

Symbol: ☁️

The “OPC UA Information Model” object is added to the “Communication Manager” in the application. When added, an OPC UA publishing object ☁️ and below that an information model object ☁️ as a child object are also added.

In the “Add OPC UA Information Model” dialog, specify a name for the information model and select the OPC UA information model. The selection includes the OPC UA information models which are installed in the “OPC UA Information Model Repository”.

</table>

<table>
<thead>
<tr>
<th>“Modelling Rule”</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>● “Mandatory”: For the corresponding OPC UA type, the respective members are generated in the project when the “Generate IEC declarations” command is executed. In the right area, the “Generate member” field is activated and cannot be deactivated.</td>
</tr>
<tr>
<td></td>
<td>● “Optional”: Generating an IEC member for this OPC UA type is optional.</td>
</tr>
<tr>
<td></td>
<td>● “Optional placeholder”: in the right, you can drag another IEC type for this placeholder. For an example as a screenshot, see the chapter “Using OPC UA Companion Information Models”.</td>
</tr>
</tbody>
</table>

| Right area: Object types and data types of the OPC UA information model which are mapped to IEC types |
### “Name”
Name of the IEC POU or data type in the project
By default, the name of the type is displayed in the OPC UA information model. OPC UA also supports names which are invalid in IEC. In these cases, CODESYS automatically generates a valid IEC name.
You can change the name.

### “IEC Type”
IEC type to which the OPC UA type was mapped (example: BOOL, “Method”).

### “OPC UA Type”
Corresponds to the “Element Type” displayed in the left area

### “Generate member”
- ✓ When the “Generate IEC declarations” command is executed, a corresponding member or a placeholder is generated in the project. Only the interfaces are automatically generated here. The implementation still has to be manually created later in a POU.
  - When the “Modelling Rule” is “Mandatory” for the OPC UA type in the right area, this option cannot be deactivated.
- □ When the “Generate IEC declarations” command is executed, a corresponding member is not generated in the project. Click this option to activate it.

---

### OPC UA publishing editor
Symbol: ☁
In the editor, the instances (OPC UA objects) of the OPC UA types are configured which should be available to the OPC UA Clients via the controller

### “Search for Mapped Instances”
Searches in GVLs and PRGs below the current application for instances of the mapped OPC UA types which have already been declared. The search result is displayed in the list.
Note: Instances in the “POUs” view and in libraries are not taken into consideration.

### “Create New Instance”
Opens the “Create New Instance” dialog to select the IEC type for which a new instance should be generated.
Instances can be generated for the POUs which have been created in the OPC UA information model editor from OPC UA types. These instances can be used in POUs in the application.
Requirement: In the OPC UA information model editor, the “Generate IEC declarations” command has been executed after mapping the OPC UA types to the IEC types.

### “Root Node”
Selection of directories or the object instance of the server which is displayed on the OPC UA Client for publishing the instances. The list box depends on the applied OPC UA companion specification.

### Tabular list of generated instances:

<table>
<thead>
<tr>
<th>“OPC UA Variable”</th>
<th>Variable which has been generated as an instance of an OPC UA type. This variable can be published in an OPC UA Client. You can edit the displayed name.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“OPC UA Type”</td>
<td>OPC UA type of the “OPC UA Variable”</td>
</tr>
</tbody>
</table>
| “Map or Generate”  | - ✓: The “OPC UA Variable” has been mapped to an existing variable.  
- □: The “OPC UA Variable” has been generated as a new instance.                                                                                                                                       |
| “IEC Variable”     | Full variable name                                                                                                                                                                                 |
| “IEC Type”         | IEC type of the IEC variable                                                                                                                                                                        |
“Access Rights” | Note that an OPC UA Client may have read/write access the OPC UA variable. In the function blocks, the access rights to the variables can be changed by attributes which can also be read from the XML file if necessary. Reading and writing

Object ‘Network Variable List (Sender)’

Symbol: 🌐

A network variable list (sender) is used for declaring and listing global variables that should be sent to network variable lists (receiver) of other devices or network projects.

You add the object to the device tree by clicking “Add Object ➔ Network Variable List (Sender)” of an application.

You can configure the protocol and transfer parameters in the “Add Network Variable List (Sender)” dialog box or “Properties” dialog box of the object in the “Network Variables” tab.

**Dialog Box ‘Add Network Variable List (Sender)’**

**Function:** This dialog box defines the network properties for the sender NVL. When you close the dialog box, CODESYS adds the sender NVL of the application to the device tree.

**Call:** Main menu “Project ➔ Add Object ➔ Network Variable List (Sender)” while the application is selected in the device tree.

This dialog box corresponds to the “Network Variables” tab in the “Properties” of the network variable list object.

See also

- Chapter 6.4.1.21.4.11.12 “Dialog ‘Properties’ - ‘Network Variables’” on page 2760
- Chapter 6.4.1.21.2.19 “Object ‘Network Variable List (Receiver)’” on page 2475

Object ‘Network Variable List (Receiver)’

Symbol: 🌐

The object is used for listing the received network variables and displaying the information: network and transmit information and sender.

You add the object to an application by clicking “Add Object ➔ Network Variable List (Receiver)”.

The network variable list (receiver) shows the received network variables, which were declared in network variable list (sender) of another device or project. You cannot change the network variables in the object editor.

The object editor consists of two parts:

- Information about the sender and transfer log of the list
- List of declarations of network variables

**Dialog Box ‘Add Network Variable List (Receiver)’**

**Function:** This dialog box defines the receiver NVL to a sender NVL and adds the receiver NVL to the application object in the device tree.

**Call:** Main menu “Project ➔ Add Object ➔ Network Variable List (Receiver)” (when the application object is selected).
### `Task`

Task of the current application that controls the variables to be received.

### `Sender`

Drop-down list

- Available sender NVLs of another device in the project
- "Import from file": Required if the necessary sender NVL is defined in another project. For this, the necessary sender NVL must have been generated in another project as "GVL export file *.gvl" in the properties dialog of the NVL in the "Link To File" tab.

### `Import from file`

File name in "GVL export file *.gvl" format if you have selected "Import from file" for "Sender".

See also

- Chapter 6.4.1.21.2.18 “Object ‘Network Variable List (Sender)’” on page 2475

### Object ‘Persistent variable list’

**Symbol:** 🏛

The object contains the declaration of global persistent variables in the declaration section `VAR_GLOBAL PERSISTENT RETAIN .. END_VAR`. The variables are stored in special non-volatile memory.

The persistence editor shows the variables as a list in the usual way. The displayed list does not influence the persistence behavior of the variables, but only the list stored internally in the process image. The list there contains all variables ever declared in chronological order. Variables that you have removed are marked with a placeholder and continue to exist as a gap.

The declaration section can also contain instance paths, which refer to locally declared persistent variables and were created with the command "Declarations ➤ Add All Instance Paths".

**NOTICE!**

Before you decide how to set up persistence for an application, it would be helpful for you to be familiar with the use cases described in the "Data Persistence" section. Moreover, it is helpful if you can differentiate between the mechanisms of persistent variables, retain variables, variables of the Persistence Manager, and recipe variables.

### Commands

The following commands are provided in the persistence editor:

- Command "Declarations ➤ Add All Instance Paths"
- Command "Declarations ➤ Reorder List and Clear Gaps"

Object 'POU'

General

Symbol: 🛠️

An object of the type “POU” is a Program Organization Unit in a CODESYS project. You write source code for your controller program in POUs.

There are the following types of POUs:

- Program
- Function
- Function block

A “POU” object is inserted by using the command “Project ➔ Add Object” in the Device tree or in the “POUs” view. When adding a POU you define the POU type and the implementation language.

You can also add other programming objects (method, action, etc.) to these objects.

Calling POUs

Certain POUs can call other POUs. Recursions are not permitted.

When calling POUs via the namespace, CODESYS browses the project for the POU to be called in accordance with the following order:

1. Current application
2. “Library Manager” of the current application
3. “POUs” view
4. “Library Manager” in the “POUs” view

If you want to call a POU that exists with the same name in a library used in the application and as an object in the “POUs” view, note the following: There is no syntax that allows you to call the POU in the “POUs” view only by its name. In this case you must shift the library from the application's library manager to the project's library manager (in the “POUs” view). After that you can call the POU object in the “POUs” view purely by its name. If you add the namespace to the library, you can call the POU of the library.

The term “POU” is also used in CODESYS for the “POUs” view in which CODESYS manages the global objects in the project.

---

**Object ‘Program’**

A program is a POU that supplies one or more values during execution. After execution of the program, all values are retained until the next execution. The order of calling the programs within an application is defined in task objects.

A program is added to the application or the project using the command “Project ➔ Add Object ➔ POU”. In the Device tree and in the “POUs” view the program POUs have the suffix “(PRG)”.

The editor of a program consists of the declaration part and the implementation part.

The uppermost line of the declaration part contains the following declaration:

```plaintext
PROGRAM <program>
```
Calling a program

Programs and function blocks can call a program. A program call is not permitted in a function. There are no instances of programs.

If a POU calls a program and values of the program change as a result, these changes are retained until the next program call. The values of the program are also retained even if the repeat call takes place by another POU. This differs from the call of a function block. When calling a function block only the values of the respective instance of the function block change. The changes only need to be observed if a POU calls the same instance again.

You can also set the input or output parameters for a program directly when calling.

Syntax: `<program>(<input variable> := <value>, <output value> => <value>):`

If you insert a program call via the input assistant and the “Insert with arguments” option in the input assistant is activated at the same time, CODESYS adds input and/or output parameters to the program call in accordance with the syntax.

Calls:

IL:

```
CAL

PLC_PRG()

in1:= 2

LD

PLC_PRG.out2

ST

erg
```

With assignment of the parameters:

```
CAL

PLC_PRG(

in1:= 2,

out2=> erg)
```

ST:

```
PLC_PRG()

erg := PLC_PRG.out2;
```

With assignment of the parameters:

```
PLC_PRG(in1:=2, out1=>erg);
```

See also

- "Chapter 6.4.1.21.2.21 “Object 'POU’” on page 2477"
- "Chapter 6.4.1.9.17 “Task Configuration” on page 1914"

Object 'Function Block'

A function block is a POU that yields one or more values when executed.

The object is added to the application or the project by clicking “Project ➔ Add Object ➔ POU”. In the device tree or in the “POUs” view, function block POU’s have the “(FB)” suffix.

It always calls a function block by means of an instance that is a copy of the function block.
The editor of a function block consists of the declaration part and the implementation part.
The values of the output variables and the internal variables remain unchanged after execution
until the next execution. This means that the function block does not necessarily return the
same output values for multiple calls with the same input variables.

In addition to the functionality described in IEC 61131-3, you can also use function blocks in
CODESYS for the following functionalities of object-oriented programming:

- Extension of a function block
- Implementation of interfaces
- Methods
- Properties

The top line of the declaration part contains the following declaration:

\[
\text{FUNCTION BLOCK} \ <\text{access specifier}> \ <\text{function block}> \ | \ \text{EXTENDS} \ <\text{function block}> \ | \ \text{IMPLEMENTS} \ <\text{comma-separated list of interfaces}>
\]

Calling a function block

The call is always made by means of an instance of the function block. When a function block is
called, only the values of the respective instance change.

Declaration of the instance:

\[
<\text{instance}> \ : \ <\text{function block}>;
\]

You access a variable of the function block in the implementation part as follows:

\[
<\text{instance}> \ . \ <\text{variable}>
\]

NOTICE!

Note the following:

- You can access only input and output variables of a function block from
  outside the function block instance, not the internal variables.
- Access to a function block instance is restricted to the POU in which the
  instance is declared, unless you have declared the instance globally.
- You can assign the desired values to the function block variables when you
  call the instance.
Access to function block variables:
The function block FB1 has the input variable iVar1 of type INT and the output variable out1. In the following, the variable iVar1 is called from the program Prog.

PROGRAM Prog
VAR
   inst1:FB1;
END_VAR

   inst1.iVar1 := 33; (* FB1 is called and the value 33 is assigned to the variable iVar1 *)
   inst1(); (* FB1 is called, that's necessary for the following access to the output variable *)
   ires := inst1.out1 (* the output variable out1 of the FB1 is read *)

In FBD:

Assigning variable values when calling:
In the textual languages IL and ST, you can assign values directly to input and/or output variables when you call the function block.

A value is assigned to an input variable with := .
A value is assigned to an output variable with => .

Example in IL:
The instance CMD_TMR of the timer function block is called with assignments for the input variables IN and PT. Then the output variable Q of the timer is assigned to the variable A.

PROGRAM PLC_PRG
VAR
   CMD_TMR : TOF;
END_VAR

   CMD_TMR(IN := %IX5.1, PT := T#100MS);
   A := CMD_TMR.Q;

i

  When you insert a function block instance by means of the “Input Assistant” and select the “Insert with arguments” option in the “Input Assistant” dialog, CODESYS inserts the call with all input and output variables. Then you only have to insert the desired value assignment. In the example above, CODESYS inserts the call as follows: CMD_TMR(IN:= ,PT:= , Q=> ).

i

  You can use the attribute 'is_connected' and a local variable to determine at the time of the call in the function block instance whether or not a specific input receives an external assignment.
See also

- Chapter 6.4.1.21.2.21 “Object ‘POU’” on page 2477

- Chapter 6.4.1.21.2.21.9 “Object ‘Property’” on page 2493
- Chapter 6.4.1.20.6.3.24 “Attribute ‘is_connected’” on page 2293

**Object ‘Function’**

A function is a POU that supplies precisely one data element when executed and whose call in textual languages can occur as an operator in expressions. The data element can also be an array or a structure.

The object is added to the application or the project by clicking “Project ➔ Add Object ➔ POU”.

In the device tree or in the “POUs” view, function POUs have the “(FUN)” suffix.

**NOTICE!**

Functions have no internal status information, which means that functions do not save the values of their variables until the next call. Calls of a function with the same input variable values always supply the same output value. Therefore, functions must not use global variables and addresses!

The editor of a function consists of the declaration part and the implementation part.

The top line of the declaration part contains the following declaration:

FUNCTION <function> : <data type>

Below that, you declare the input and function variables.

The output variable of a function is the function name.

**NOTICE!**

If you declare a local variable in a function as RETAIN, this has no effect. In this case, CODESYS issues a compiler error.

**NOTICE!**

You cannot mix explicit and implicit parameter assignments in function calls in CODESYS V3. This means that you have to use either only explicit or only implicit parameter assignments in function calls. The order of the parameter assignments when calling a function is arbitrary.

**Calling a function**

In ST, you can use the call of a function as an operand in expressions.

In SFC, you can use a function call only within step actions or transitions.
According to the IEC 61131-3 standard, functions can have additional outputs. You declare the additional outputs in the function between the keywords `VAR_OUTPUT` and `END_VAR`. The function is called according to the following syntax:

```
<function> (<function output variable1> => <output variable 1>,
<function output variable n> => <output variable n>)
```

Example

The `fun` function is defined with two input variables `in1` and `in2`. The output variable of the `fun` function is written to the locally declared output variables `loc1` and `loc2`.

```
fun(in1 := 1, in2 := 2, out1 => loc1, out2 => loc2);
```
Object 'Interface'

Symbol:  

**Keyword:** INTERFACE

An interface is a means of object-oriented programming. The object ITF describes a set of method and property prototypes. In this context, prototype means that the methods and properties contain only declarations and no implementation.

This allows different function blocks having common properties to be used in the same way. An object “ITF” is added to the application or the project with the command “Project ➔ Add Object ➔ Interface”.

Table 437: “Adding an interface”

<table>
<thead>
<tr>
<th>“Inheritance”</th>
<th>Interface name</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Name”</td>
<td>Interface name</td>
</tr>
<tr>
<td>“Extends”</td>
<td>✓: Extends the interface that you enter in the input field or via the input assistant ... This means that all methods of the interface that extend the new interface are also available in the new interface.</td>
</tr>
</tbody>
</table>

You can add the objects “Interface property” and “Interface Method” to the object “ITF”. Interface methods may contain only the declarations of input, output and input/output variables, but no implementation.

So that you can also use an interface in the program, there must be a function block that implements this interface.

This means:

- the function block contains the interface in its IMPLEMENTS list in its declaration part
- the function block contains an implementation for all methods and property prototypes of the interface

A function block can implement one or more interfaces. You can use the same method with identical parameters, but different implementation code in different function blocks.

Please note the following:

- You may not define variables within an interface. An interface has no implementation part and no actions. Only a collection of methods is defined, in which you may define only input, output and input/output variables.
- CODESYS always treats variables declared with the type of an interface as references.
- A function block that implements an interface must contain implementation code for the methods of the interface. You have named the methods exactly as in the interface and the methods contain the same input, output and input/output variables as in the interface.
NOTICE!

Interface references and online change

The following can happen with a compiler version < 3.4.1.0: if a function block changes its data because variables are added or deleted, or because the type of variables changes, then CODESYS copies all instances of the function block to a new memory location. In this case, however, an interface reference refers not to the new memory location, but still to the old one.

In case of compiler versions >= 3.4.1.0, CODESYS automatically re-addresses the interface references so that CODESYS also references the correct interface in case of an online change. CODESYS requires additional code and more time for this, so that jitter problems can occur depending on the number of objects concerned. Therefore, CODESYS displays the number of variables and interface references concerned before the execution of the online change and you can then decide whether the online change should be executed or aborted.

Example

Definition of an interface and its use in a function block

You have inserted the interface “ITF” below the application. The interface contains the methods “Method1” and “Method2”. “ITF”, “Method1” and “Method2” contain no implementation code. You insert the required variable declarations only in the declaration part of the methods.

If you subsequently insert a function block in the device tree that implements the interface “ITF”, CODESYS automatically also inserts the methods “Method1” and “Method2” under the function block. Here you can implement function-block-specific code in the methods.

- Chapter 6.4.1.9.22.3 “Implementing interfaces” on page 1931
- Chapter 6.4.1.9.22.4 “Extending interfaces” on page 1933

Object ‘Method’

Symbol: METHOD

Keyword: METHOD
Methods are an extension of the IEC 61131-3 standard and a tool for object-oriented programming which is used for data encapsulation. A method contains a declaration and an implementation. However, unlike a function, a method is not an independent POU, and it is subordinated to a function block or program. A method can access all valid variables of the superordinate POU. 

You can use interfaces for the organization of methods. 

You can add a method below a program or a function block. Click “Project ➔ Add Object ➔ Method” to open the “Add Method” dialog.

### Declaration
- The variables of a method contain temporary data that are valid only during the execution of the method (stack variables). All variables that are declared and implemented in a method are reinitialized each time the method is called.
- Like functions, methods can have additional outputs. You have to assign these additional outputs in the method call.
- Depending on the declared access specifier, a method can be called only within its own namespace (INTERNAL), only within its own POU and its derivatives (PROTECTED), or only within its own POU (PRIVATE). For PUBLIC, the method can be called from anywhere.

Interface methods can have declared input, output, and VAR_IN_OUT variables, but do not contain an implementation.

See also
- § Chapter 6.4.1.21.2.21.7 “Object 'Interface Method’” on page 2490

### Implementation
- Access to function block instances or program variables is allowed in the implementation of the method.
- The THIS pointer allows for access to its own function block instance. Therefore, the pointer is allowed only in methods that are assigned to a function block.
- A method cannot access VAR_TEMP variables of the function block.
- A method can call itself recursively.

### Calling a method

Syntax for calls:

```
<return value variable> := <POU name> . <method name> ( <method input name> := <variable name> (, <further method input name> := <variable name> )* );
```

For the method call, you assign transfer parameters to the input variables of the method. Respect the declaration when doing this. It is enough to specify the names of the input variables without paying attention to their order in the declaration.
METHOD PUBLIC DoIt : BOOL
VAR_INPUT
   iInput_1 : DWORD;
   iInput_2 : DWORD;
   sInput_3 : STRING(12);
END_VAR

bFinishedMethod := fbInstance.DoIt(sInput_3 := 'Hello World ',
iInput_2 := 16#FFFF, iInput_1 := 16);

When the method is called, the return value of the method is assigned, for example, to variables declared locally. When you omit the names of the input variables, you have to pay attention to the declaration order.

Example

Declaration
METHOD PUBLIC DoIt : BOOL
VAR_INPUT
   iInput_1 : DWORD;
   iInput_2 : DWORD;
   sInput_3 : STRING(12);
END_VAR

Call
bFinishedMethod := fbInstance.DoIt(16, 16#FFFF,'Hello World ');

Recursive method call
Within the implementation, a method can call itself, either directly by means of the THIS pointer, or by means of a local variable for the assigned function block.

● THIS^. <method name> ( <parameter transfer of all input and output variables> )
   Direct call of the relevant function block instance with the THIS pointer

● VAR fb_Temp : <function block name>; END_VAR
   Call by means of a local variable of the method that temporarily instantiates the relevant function block

A compiler warning is issued for a recursive call. If the method is provided with the pragma \{attribute 'estimated-stack-usage' := '<estimated_stack_size_in_bytes>'\}, then the compiler warning is suppressed. For an implementation example, see the "Attribute ‘estimated-stack-usage’" chapter.

To call methods recursively, it is not enough to specify only the method name. If only the method name is specified, then a compiler error is issued: “Program name, function or function block instance expected instead of”

● § Chapter 6.4.1.20.2.16 “THIS” on page 2126

Special methods of a function block
<table>
<thead>
<tr>
<th>Declaration</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FB_Init</td>
<td>Declarations automatically implicit, but explicit declaration also possible. Contains initialization code for the function block, as is defined in the declaration part of the function block.</td>
</tr>
<tr>
<td>FB_Reinit</td>
<td>Explicit declaration is necessary. Call after the instance of the function block was copied (as during an online change). It reinitializes the new instance module.</td>
</tr>
<tr>
<td>FB.Exit</td>
<td>Explicit declaration is necessary. Call for each instance of the function block before a new download or a reset or during an online change for all shifted or deleted instances.</td>
</tr>
</tbody>
</table>

**Properties**

- Provides `Set` and/or `Get` accessor methods.

**See also**

- Chapter 6.4.1.20.10 “Methods ‘FB_Init’, ‘FB_Reinit’, and ‘FB_Exit’” on page 2336
- Chapter 6.4.1.21.2.21.9 “Object ‘Property’” on page 2493

<td>- “PUBLIC” or not specified: Access is not restricted.</td>
</tr>
<tr>
<td></td>
<td>- “PRIVATE”: Access is restricted to the program, function block, or GVL.</td>
</tr>
<tr>
<td></td>
<td>The object is marked as (private) in the POU or device view. The declaration contains the keyword <code>PRIVATE</code>.</td>
</tr>
<tr>
<td></td>
<td>- “PROTECTED”: Access is restricted to the program, function block, or GVL</td>
</tr>
<tr>
<td></td>
<td>with its derivations. The declaration contains the keyword <code>PROTECTED</code>.</td>
</tr>
<tr>
<td></td>
<td>The object is marked as (protected) in the POU or device view.</td>
</tr>
<tr>
<td></td>
<td>- “INTERNAL”: Access to the method is restricted to the namespace (library).</td>
</tr>
<tr>
<td></td>
<td>The object is marked as (internal) in the POU or device view. The declaration contains the keyword <code>INTERNAL</code>.</td>
</tr>
<tr>
<td>“Abstract”</td>
<td>☑: Identifies that the method does not have an implementation and the implementation is provided by the derived FB</td>
</tr>
<tr>
<td>“Add”</td>
<td>Adds a new method below the selected object.</td>
</tr>
</tbody>
</table>
When you doing object-oriented programming and using the inheritance (keyword `EXTENDS`) of POUs, you can get support as follows:

When you insert an action, a property, a method, or a transition below a POU derived from a base POU, the “Add ...” dialog opens. Then the input field for the name extends to a list box. The list box contains a valid selection from the actions, properties, methods, or transitions available in the base POU. Now you can, for example, easily accept a method of the base POU and then adapt it to the derived function of the POU.

Methods and properties with the access modifier `PRIVATE` are not listed here because they are also not inherited. Methods and properties with the access modifier `PUBLIC` automatically get a blank access modifier field when accepting into the derived POU, which means the same thing functionally.

Example

Object 'Interface Method''

Symbol: 

This object is used for object-oriented programming.

The object “Interface Method” is added to an interface via the command “Project ➔ Add Object”.

If a method is inserted underneath an interface, you can add and instance only variable declarations (input, output and input/output variables) in this method.

You can only add program code to the method if a function block 'implements' the interface to which the method belongs. CODESYS then inserts the method underneath the function block.

See also
- Chapter 6.4.1.21.2.21.5 “Object 'Interface’” on page 2484

- Chapter 6.4.1.9.22.3 “Implementing interfaces” on page 1931

Object 'Interface Property''

Symbol: 

Interface properties are an extension of the IEC 61131-3 standard and a tool for object-oriented programming. An interface property declares the accessor methods Get and Set (no implementation code). Therefore, a function block that implements an interface also inherits their interface properties.

You can add an interface property to the device tree for an interface. Then an interface is extended with the accessor methods Get and Set. The Get accessor is for read access. The Set accessor is for write access. You can delete an unneeded accessor. Click “Project ➔ Add Object ➔ Interface Property” to add an accessor. The “Add Interface Property” dialog opens.

See also
- Chapter 6.4.1.21.2.21.5 “Object 'Interface’” on page 2484
- Chapter 6.4.1.21.2.21.9 “Object 'Property’” on page 2493
This interface \texttt{itf\_A} has the property \texttt{Literal\_A} with the accessor methods \texttt{Get} and \texttt{Set}. The function blocks \texttt{fb\_A1} and \texttt{fb\_A2} implement the interface \texttt{itf\_A} and therefore inherit its interface property. Each FB has its own implementation.

\begin{verbatim}
INTERFACE itf_A
VAR
PROPERTY Literal_A : STRING
END_VAR

FUNCTION_BLOCK fb_A1 IMPLEMENTS itf_A
VAR
    str_1 : STRING;
    str_2 : STRING;
    iCnt : INT;
END_VAR
    iCnt := iCnt + 1;
    str_1 := 'Function block A1';
\end{verbatim}
VAR
END_VAR
Literal_A := CONCAT (str_1,' and property.');

VAR
END_VAR
str_2 := Literal_A;

FUNCTION_BLOCK fb_A2 IMPLEMENTS itf_A
VAR
str_1 : STRING;
str_2 : STRING;
iCnt : INT;
END_VAR

iCnt := iCnt + 1;
str_1 := 'Function block A2';

VAR
END_VAR
str_1 := 'Function block A1';

VAR
END_VAR
str_1 := str_1;

VAR
END_VAR
str_2 := Literal_A;

PROGRAM PLC_PRG
VAR
iCnt : INT;
my_1 : fb_A1;
my_2 : fb_A2;
strName_1 : STRING;
strName_2: STRING;
END_VAR

iCnt := iCnt + 1;
my_1();
my_2();
strName_1:= my_1.Literal_A;
strName_2:= my_2.Literal_A;
my_1.Literal_A := 'Hello 1';
my_2.Literal_A := 'World 2';

This leads to the following monitoring of PLC_PRG when the application is in runtime mode:
Object 'Property'

Symbol: Property

Keyword: PROPERTY

Properties are an extension of the IEC 61131-3 standard and a tool for object-oriented programming.

Properties are used for data encapsulation because they allow for external access to data and act as filters at the same time. For this purpose, a property provides the accessor methods Get and Set which allows for read and write access to the data of the instance below the property.

You can add a property with accessor methods below a program, a function block, or a global variable list. Click “Project ➔ Add Object ➔ Property” to open the “Add Property” dialog.

You can add an interface property below an interface.

When you copy a property that is inserted below a POU and add it below an interface, or if you move the property there, the included implementations are removed automatically.

<td>Adds a new property below the selected object and below that the accessor methods Get and Set Note: When you select a property, you can also add a previously removed accessor explicitly by clicking “Add Object”.</td>
</tr>
</tbody>
</table>

**Editor 'Property'**

You can program the data access in the editor. The code can contain additional local variables. However, it must not contain any additional input variables or (as opposed to a function or method) output variables.
FUNCTION_BLOCK FB_A
VAR_INPUT
END_VAR
VAR_OUTPUT
END_VAR
VAR
iA : INT;
END_VAR
iA := iA + 1;
PROPERTY PUBLIC prop_iA : INT
prop_iA := iA;
iA := prop_iA;
PROGRAM PLC_PRG
VAR
fbA : FB_A;
iVar: INT;
END_VAR
fbA();
IF fbA.prop_iA > 500 THEN
  fbA.prop_iA := 0;
END_IF
iVar := fbA.prop_iA;

Get and Set accessors

The call of the Set accessor is written to the property. Then it is used in the same way as an input parameter. When the Get accessor is called, the property is read. It is used in the same way as an output parameter. Access is restricted in each case by means of access modifiers (qualifiers). As a result, the objects are identified accordingly.

When a property is accessed as read only or write only, you can delete the unneeded accessors.

You can add accessors explicitly by selecting a property and clicking “Add Object”. A dialog opens, either “Add Get accessor” or “Add Set accessor”. There you can set the implementation language and the access.

Table 438: Dialog “Add Get (Set) Accessor”

<th>Access specifier</th>
<th>Qualifier for the declaration part</th>
</tr>
</thead>
<tbody>
<tr>
<td>PUBLIC or unspecified</td>
<td>Access is not restricted.</td>
</tr>
<tr>
<td>PRIVATE</td>
<td>Access is restricted to the program, function block, or GVL. The object is marked as (private) in the POU or device view. The declaration contains the keyword.</td>
</tr>
<tr>
<td>PROTECTED</td>
<td>Access to the property is restricted to the program, function block, or GVL and its derivations. The declaration contains the keyword. The object is marked as (protected) in the POU or device view.</td>
</tr>
<tr>
<td>INTERNAL</td>
<td>Access to the method is restricted to the namespace (the library). The object is marked as (internal) in the POU or device view. The declaration contains the keyword.</td>
</tr>
</tbody>
</table>

### “Add”

Adds the accessor methods `Get` or `Set` below the selected property.

### Monitoring of properties in online mode

The following pragmas are provided for the monitoring of properties in online mode. You insert them at the top position of the property definition:

- `{attribute 'monitoring' := 'variable'}`
  - Each time the property is accessed, CODESYS saves the actual value to a variable and displays the value of this variable. This value can become outdated if no more access to the property takes place in the code.
- `{attribute 'monitoring' := 'call'}`
  - Each time the value is displayed, CODESYS calls the code of the `Get` accessor. If this code contains a side effect, then the monitoring executes the side effect.

You can monitor a property with the help of the following functions:

- Inline monitoring
  - Requirement: The “Enable inline monitoring” option is selected in the “Text Editor” category of the “Options” dialog.
- Watch List

See also

- Chapter 6.4.1.20.6.3.26 “Attribute ‘monitoring’” on page 2295

### Input support when generating inheriting POU

When you doing object-oriented programming and using the inheritance (keyword `EXTENDS`) of POU, you can get support as follows:

When you insert an action, a property, a method, or a transition below a POU derived from a base POU, the “Add …” dialog opens. Then the input field for the name extends to a list box. The list box contains a valid selection from the actions, properties, methods, or transitions available in the base POU. Now you can, for example, easily accept a method of the base POU and then adapt it to the derived function of the POU.

Methods and properties with the access modifier `PRIVATE` are not listed here because they are also not inherited. Methods and properties with the access modifier `PUBLIC` automatically get a blank access modifier field when accepting into the derived POU, which means the same thing functionally.
Object ‘Action’

Symbol: 

Implement more program code in an action. You can implement this program code as the base implementation in another language. The base implementation is a function block or a program where you inserted the action.

An action does not have its own declaration and it works with the data from the base implementation. This means that the action uses the input and output variables and the local variables from its base implementation.

Add an “Action” to a function block or program by clicking “Project ➔ Add Object ➔ Action”.

- Chapter 6.4.1.21.2.21.11 “Object ‘Transition’” on page 2499
Calling an action

Syntax:

<program>.<action> or <FB instance>.<action>

To call an action from only within the base implementation, you only have to provide the action name.

Examples

Calling a “Reset” action from another POU

The call is not executed from the base implementation.

Declaration:

PROGRAM PLC_PRG
VAR
    Inst : Counter;
END_VAR

Calling a “Reset” action from an IL POU

CAL Inst.Reset(In := FALSE)
LD Inst.Out
ST ERG

Calling a “Reset” action from an ST POU

Inst.Reset(In := FALSE);
Erg := Inst.out;

Calling a “Reset” action from an FBD POU

Examples

Actions are used frequently in the SFC implementation language.

See also

● § Chapter 6.4.1.20.1.5.8.2 “SFC Element 'Action’” on page 2075

Object 'Transition'

Symbol: 

The object can be used as a transition element in a program block implemented in SFC.

See also

### Object 'POUs for Implicit Checks'

#### General

You can add these special POUs to an application to equip them with implicit monitoring functions. At runtime, these functions check the limits of arrays or subrange types, the validity of pointer addresses, and division by zero. Please note: This option can be disabled for devices that are already equipped with these kinds of monitoring blocks by a special implicit library.

The command “Add Object ➔ POU for Implicit Checks” is used for adding to the application. The command opens the “Add POU for Implicit Checks” dialog where you can select a monitoring function type (see table below). Depending on the monitoring function, you have to adapt the implementation code or create it yourself from scratch.
To prevent multiple inclusions, monitoring functions that have already been inserted are disabled in the “Add POU for Implicit Checks” dialog.

**NOTICE!**

To get the feature for monitoring functions, do not edit their declaration part. However, you are permitted to add local variables.

After removing an implicit monitoring function (example: Check Bounds) from the project, only a download is possible, not an online change. A corresponding message is issued.

By default, CODESYS does not run implicit checks for function blocks from libraries used in the application. However, you can extend the check to the libraries by opening the “Properties” dialog of the application and specifying the compiler definition `checks_in_libs` in the “Compiler-Defines” field in the “Build” tab. This definition affects implementation libraries (*.library) only, not protected libraries (*.compiled-library).

You can use the “no_check” attribute to deactivate the check for special POUs in the project.

POU 'CheckBounds'

Functions for Bound Checks: CheckBounds

The task of this monitoring function is to handle bound violations appropriately. Examples of reactions to violations include setting error flags and changing the value of the array index. The check is performed only for one variable array index. An incorrect constant array index causes a compiler error. CODESYS calls the function implicitly when values are assigned to an ARRAY variable.

After inserting the function, you receive automatically generated code in the declaration and implementation parts. See below.

CAUTION!
To obtain the feature for monitoring functions, do not edit the declaration part. However, you are permitted to add local variables.

Declaration part

// Automatically generated code: DO NOT EDIT
FUNCTION CheckBounds : DINT
VAR_INPUT
index, lower, upper: DINT;
END_VAR

Implementation

// This automatically generated code is a suggested implementation.
IF index < lower THEN
  CheckBounds := lower;
ELSIF index > upper THEN
  CheckBounds := upper;
ELSE
  CheckBounds := index;
END_IF

(* It is also possible to set a breakpoint, log messages or e.g. to halt on an exception: Add CmpApp.library, SysExcept.library and SysTypes2_Itf as newest.
Declaration:
VAR
  _pApp : POINTER TO CmpApp.APPLICATION;
  _result   : SysTypes.RTS_IEC_RESULT;
END_VAR

Implementation:
  _pApp := AppGetCurrent(pResult:=_result);
  IF index < lower THEN
    CheckBounds := lower;
    IF _pApp <> 0 THEN
      AppGenerateException(pApp:=_pApp,
        ulException:=RtsExceptions.RTSEXCPT_ARRAYBOUNDS);
    END_IF
  ELSIF index > upper THEN
    CheckBounds := upper;
    IF _pApp <> 0 THEN
      AppGenerateException(pApp:=_pApp,
When the “CheckBounds” function is called, it receives the following input parameters:

- **index**: Index of the array element
- **lower**: Lower limit of the array range
- **upper**: Upper limit of the array range

The return value is the index of the array element, as long as it is within a valid range. If not, then the CODESYS returns either the upper or lower limit, depending on which threshold was violated.

### Example: Correction of the access to an array outside the defined array bounds

In the sample program below, the index falls short of the defined lower limit of the `a` array.

```plaintext
PROGRAM PLC_PRG
VAR
  a: ARRAY[0..7] OF BOOL;
  b: INT:=10;
END_VAR
  a[b]:=TRUE;
```

In this example, the `CheckBounds` function causes `a` to change the upper limit of the array range index to 10. The value `TRUE` is assigned then to the element `a[7]`. In this way, the function corrects array access outside of the valid array range.
Add the following libraries in the library manager of the application:

- CmpApp.library and SysExcept.library as placeholder libraries
- SysTypes2.Itfs.library with “Newest version always”

Add a “CheckBounds” object below the application and modify the specified code as shown below.

**FUNCTION CheckBounds : DINT**
**VAR_INPUT**
  - index, lower, upper: DINT;
**END_VAR**
**VAR**
  - _pApp : POINTER TO CmpApp.APPLICATION;
  - _Result : ISystypes2.RTS_IEC_RESULT;
**END_VAR**

```
// This automatically generated code is a suggested implementation.
_pApp := AppGetCurrent(pResult := _Result);
IF index < lower THEN
  CheckBounds := lower;
IF _pApp <> 0 THEN
  AppGenerateException(pApp := _pApp, ulException := RtsExceptions.RTSEXCPT_ARRAYBOUNDS);
END_IF
ELSIF index > upper THEN
  CheckBounds := upper;
IF _pApp <> 0 THEN
  AppGenerateException(pApp:=_pApp,
                       ulException:=RtsExceptions.RTSEXCPT_ARRAYBOUNDS);
END_IF
ELSE
  CheckBounds := index;
END_IF
```

**Program a “MAIN_PRG” object below the application with the contents shown below.**

**PROGRAM MAIN_PRG**
**VAR**
  - xInit : BOOL;
  - arData : ARRAY[0..7] OF BYTE;
  - i : INT;
  - dwAdr : DWORD;
**END_VAR**

```
IF NOT xInit THEN
  // Required for CheckBounds
  xInit := TRUE;
END_IF

// Set i to a value > 7 or < 0
// Generates an exception in CheckBounds, user-defined
arData[i] := 11;
```

When you load and start this application, an exception will be thrown when array bounds are violated. Processing stops in “CheckBounds” so that the type of error can be detected.

- § Chapter 6.4.1.21.2.8.9 “Tab ‘Log’” on page 2437
POU 'CheckDivInt'

Functions for preventing division by zero: CheckDivInt, CheckDivLint, CheckDivReal, and CheckDivLReal. To prevent division by zero, you can use the functions CheckDivInt, CheckDivLint, CheckDivReal, and CheckDivLReal. If you include these functions in the application, then they are called before each division operation in the code.

CAUTION!
To obtain the feature for monitoring functions, do not edit the declaration section. However, you are permitted to add local variables.

The declaration section:

```c
// This is automatically generated code: DO NOT EDIT
FUNCTION CheckDivReal : REAL
VAR_INPUT
    divisor:REAL;
END_VAR
```

The implementation section:

```c
// This automatically generated code is a suggested implementation.
IF divisor = 0 THEN
    CheckDivReal:=1;
ELSE
    CheckDivReal:=divisor;
END_IF;
```

The DIV operator uses the output of the CheckDivReal function as a divisor. In the sample program below, CheckDivReal prevents division by 0 by changing the implicit value of the divisor d from "0" to 1 before the division operation is executed. Therefore, the division result is 799.

```c
PROGRAM PLC_PRG
VAR
    erg:REAL;
    v1:REAL:=799;
    d:REAL:=0;
END_VAR
erg:= v1 / d;
```

See also
- Chapter 6.4.1.9.21 “Using POU for implicit checks” on page 1928

POU 'CheckDivLInt'

Functions for preventing division by zero: CheckDivInt, CheckDivLint, CheckDivReal, and CheckDivLReal. To prevent division by zero, you can use the functions CheckDivInt, CheckDivLint, CheckDivReal, and CheckDivLReal. If you include these functions in the application, then they are called before each division operation in the code.
CAUTION!
To obtain the feature for monitoring functions, do not edit the declaration section. However, you are permitted to add local variables.

**The default implementation of CheckDivReal:**

Declaration section:

```plaintext
// This is automatically generated code: DO NOT EDIT
FUNCTION CheckDivReal : REAL
VAR_INPUT
    divisor: REAL;
END_VAR
```

Implementation section:

```plaintext
// This automatically generated code is a suggested implementation.
IF divisor = 0 THEN
    CheckDivReal := 1;
ELSE
    CheckDivReal := divisor;
END_IF;
```

The **DIV** operator uses the output of the **CheckDivReal** function as a divisor. In the sample program below, **CheckDivReal** prevents division by 0 by changing the implicit value of the divisor `d` from "0" to 1 before the division operation is executed. Therefore, the division result is 799.

```plaintext
PROGRAM PLC_PRG
VAR
    erg: REAL;
    v1: REAL := 799;
    d: REAL := 0;
END_VAR

erg := v1 / d;
```

**POU 'CheckDivReal'**

Functions for preventing division by zero: **CheckDivInt**, **CheckDivLint**, **CheckDivReal**, and **CheckDivLReal**

To prevent division by zero, you can use the functions **CheckDivInt**, **CheckDivLint**, **CheckDivReal**, and **CheckDivLReal**. If you include these functions in the application, then they are called before each division operation in the code.

CAUTION!
To obtain the feature for monitoring functions, do not edit the declaration section. However, you are permitted to add local variables.
The default implementation of CheckDivReal:

```plaintext
// This is automatically generated code: DO NOT EDIT
FUNCTION CheckDivReal : REAL
VAR_INPUT
  divisor:REAL;
END_VAR

Implementation section:

// This automatically generated code is a suggested implementation.
IF divisor = 0 THEN
  CheckDivReal:=1;
ELSE
  CheckDivReal:=divisor;
END_IF;
```

The DIV operator uses the output of the CheckDivReal function as a divisor. In the sample program below, CheckDivReal prevents division by 0 by changing the implicit value of the divisor d from "0" to 1 before the division operation is executed. Therefore, the division result is 799.

```plaintext
PROGRAM PLC_PRG
VAR
  erg:REAL;
  v1:REAL:=799;
  d:REAL:=0;
END_VAR
  erg:= v1 / d;
```

- § Chapter 6.4.1.9.21 “Using POU for implicit checks” on page 1928

**POU 'CheckRangeSigned'**

Function for monitoring the range limits of a subrange type of type DINT.

This monitoring function is responsible for the appropriate handling violations to range limits. Examples of reactions to violations include setting error flags and changing values. The functions are called implicitly when a value is assigned to a subrange type variable.

**CAUTION!**

To obtain the feature for monitoring functions, do not edit the declaration section. However, you are permitted to add local variables.

When the function is called, it receives the following input parameters:

- **value**: Value that should be assigned to the subrange type variables
- **lower**: Lower range limit
- **upper**: Upper range limit

The return value is the assignment value as long as it is within the valid range. If not, then either the upper or lower limit is returned, depending on which threshold was violated.

For example, the assignment `i := 10*y` is replaced implicitly by `i := CheckRangeSigned(10*y, -4095, 4095);`
If \( y \) is "1000", then "10*1000=10000" is not assigned to \( i \) like in the original code. Instead, the upper range limit of "4095" is assigned.

The same is true for \texttt{CheckRangeUnsigned} function.

\begin{center}

\textbf{NOTICE!}

If functions are not available, then the subrange is not checked for the respective variables at runtime. In this case, you can assign any value between -2147483648 and +2147483648 (or between 0 and 4294967295) to a variable of subrange type \texttt{DINT/UDINT}. You can assign any value between -9223372036854775808 and +9223372036854775807 (or between 0 and 18446744073709551615) to a variable of a subrange type \texttt{LINT/ULINT}.

\end{center}

\begin{center}

\textbf{CAUTION!}

Linking area monitoring functions can lead to endless loops. For example, an endless loop can occur if the counter variable of a FOR loop is a subrange type and the counting range for the loop exits the defined subrange.

\end{center}

\begin{center}

\textbf{Example of an endless loop:}

\texttt{VAR}
\begin{Verbatim}
ui : UINT (0..10000);
...
END_VAR

FOR ui:=0 TO 10000 DO
... END_FOR
\end{Verbatim}

The program never exits the FOR loop because the \texttt{CheckRangeSigned} monitoring function prevents \( ui \) from being set to a value greater than 10000.

\end{center}

\begin{center}

\textbf{Example for \texttt{CheckRangeSigned}}

The assignment of a value to a \texttt{DINT} variable of a signed subrange type is a condition for automatically calling the \texttt{CheckRangeSigned}. This function restricts the assignment value to the subrange as defined in the variables declaration. The default implementation of the function in \texttt{ST} is as follows:

\texttt{Declaration section:}

\begin{Verbatim}
// This is automatically generated code: DO NOT EDIT
FUNCTION CheckRangeSigned : DINT
VAR_INPUT
    value, lower, upper: DINT;
END_VAR

\end{Verbatim}

\texttt{Implementation:}

\begin{Verbatim}
// This automatically generated code is a suggested implementation.
IF (value < lower) THEN
    CheckRangeSigned := lower;
ELSEIF (value > upper) THEN
    CheckRangeSigned := upper;
ELSE
    CheckRangeSigned := value;
END_VAR
\end{Verbatim}

\end{center}
POU 'CheckLRangeSigned'

Function for monitoring the range limits of a subrange type of type LINT.

For an implementation example of range monitoring, refer to the help page for the CheckRangeSigned function.

This monitoring function is responsible for the appropriate handling violations to range limits. Examples of reactions to violations include setting error flags and changing values. The functions are called implicitly when a value is assigned to a subrange type variable.

CAUTION!
To obtain the feature for monitoring functions, do not edit the declaration section. However, you are permitted to add local variables.

When the function is called, it receives the following input parameters:

- **value**: Value that should be assigned to the subrange type variables
- **lower**: Lower range limit
- **upper**: Upper range limit

The return value is the assignment value as long as it is within the valid range. If not, then either the upper or lower limit is returned, depending on which threshold was violated.

For example, the assignment `i := 10*y` is replaced implicitly by `i := CheckRangeSigned(10*y, -4095, 4095);`

If `y` is "1000", then "10*1000=10000" is not assigned to `i` like in the original code. Instead, the upper range limit of "4095" is assigned.

The same is true for CheckRangeUnsigned function.

NOTICE!
If functions are not available, then the subrange is not checked for the respective variables at runtime. In this case, you can assign any value between -2147483648 and +2147483648 (or between 0 and 4294967295) to a variable of subrange type DINT/UDINT. You can assign any value between -9223372036854775808 and +9223372036854775807 (or between 0 and 18446744073709551615) to a variable of a subrange type LINT/ULINT.

CAUTION!
Linking area monitoring functions can lead to endless loops. For example, an endless loop can occur if the counter variable of a FOR loop is a subrange type and the counting range for the loop exits the defined subrange.
Example of an endless loop:

```plaintext
VAR
  ui : UINT (0..10000);
...
END_VAR

FOR ui:=0 TO 10000 DO
  ...
END_FOR
```

The program never exits the FOR loop because the `CheckRangeSigned` monitoring function prevents `ui` from being set to a value greater than 10000.

POU 'CheckPointer'

Monitoring function for pointers (Checkpointer)

Use this function to monitor the memory access of pointers in runtime mode. As opposed to other monitoring functions, a standard suggestion does not exist for the implementation of CheckPointer. You must define an implementation according to your own requirements.

The CheckPointer function should check whether the returned pointer references a valid memory address; monitors whether the orientation of the referenced memory range matches the variable type that the pointer refers to. If both conditions are fulfilled, then the pointer is returned. If not, then the function should complete an appropriate error handling.

CAUTION!
To obtain the feature for monitoring functions, do not edit the declaration section. However, you are permitted to add local variables.

NOTICE!
An implicit monitoring function call does not occur for THIS pointer and SUPER pointer.
NOTICE!

For compiler version 3.5.7.40 and later, the implicit check function "Checkpointer" also acts on REFERENCE variables in the same way as on pointer variables.

FUNCTION CheckPointer : POINTER TO BYTE
VAR_INPUT
   ptToTest : POINTER TO BYTE;
   iSize : DINT;
   iGran : DINT;
   bWrite: BOOL;
END_VAR

// Not a standard implementation. Please add your own code here.
CheckPointer := ptToTest;

When the function is called, CODESYS provides the following input parameters:

- `ptToTest`: Target address of the pointer
- `iSize`: Size of the referenced variable; the data type of `iSize` must be compatible with INT and cover the dimensional scope of the variables.
- `iGran`: Granularity of the referenced size; this is the largest non-structured data type contained in the referenced variables; the data type of `iGran` must be compatible with INT
- `bWrite`: Access type (TRUE = write access, FALSE = read access); the data type of `bWrite` must be BOOL

When the result of the check is positive, the unchanged pointer is returned (`ptToTest`).

Object 'Project Settings'

Symbol: 

Function: This object contains the configuration of the project.

Call:
- “Project ➔ Project Settings”
- Double-click on the object in the device tree

CODESYS saves the project settings directly in the project. If, for example, you transfer a project to another system, the "Project Settings" object is also transferred with it without a project archive being required.

The project settings are valid project-wide and offer setting possibilities for various categories such as "AS" or "Users and Groups". The available categories vary, depending on which software packages you have installed via the package manager.

See also
- Chapter 6.4.1.3.4.3 “Making project settings” on page 1814
- Chapter 6.4.1.21.3.9.4 “Command ‘Package Manager’” on page 2655

- Chapter 6.4.1.21.4.12.3 “Dialog ‘Project Settings’ - ‘Users and Groups’” on page 2768
- Chapter 6.4.1.21.4.12.4 “Dialog Box ‘Project Settings’ - ‘Compileoptions’” on page 2769
Object 'Project Information'

Symbol: €

Function: The object contains the properties, meta-information, and project information. With this, you can check the authorship and integrity of the project.

Call
- Double-click the object in the device tree
- Menu bar: “Project ➔ Project Information”

Requirement: CODESYS creates the object when you click “Project ➔ Project Information”, and the dialog opens.

CODESYS saves the project information directly in the project. For example, if you transfer a project to another system, then the “Project Information” object is also transferred. You do not need a project archive.

Tab 'File'

The tab displays the properties of the project file and their attributes. You cannot edit these attributes. They correspond to the file properties of Windows Explorer.

Tab 'Summary'

The tab contains general information and meta-information of the project file. CODESYS uses this information to create keys on the “Properties” tab. For example, if the name Company_A is specified in “Company”, then the Company key with the value Company_A is provided on the “Properties” tab.

NOTICE!
If you save your project as a library project, then you should pay attention to the guidelines for library developers (Library Development Summary).

For a library project, a “Company”, a “Title”, and a “Version” must be specified to install the library.

<table>
<thead>
<tr>
<th>“Company”</th>
<th>Name of the company (example: Company_A).</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Title”</td>
<td>Title of the project (example Automation_A).</td>
</tr>
<tr>
<td>“Version”</td>
<td>Version of the project (example: 0.0.0.1).</td>
</tr>
<tr>
<td>“Released”</td>
<td>☑: Activates protection from modification. Result: If you edit the project now, then a dialog prompt opens to confirm whether you really want to change the project. If you reply to this prompt one time by clicking “Yes”, then no additional prompts appear for more editing actions.</td>
</tr>
</tbody>
</table>
Categories of the library project, according to which you can sort in the “Library Repository” dialog. If no category is specified, then the category “Other” is assigned to the library.

The categories originate from one or more external description files in XML format. However, they can also originate from a library project that has already been created.

Requirement: The project is a library project.

The “Library Categories” dialog opens where you can add library categories.

Default namespace
If you do not define a standard namespace here, then the name of the library file is applied automatically as the namespace.

Author
Author of the project (example: Arnold Best).

Description
Example: For internal use only

- § Chapter 6.4.1.21.3.2.7 “Command ’Save Project as Compiled Library’” on page 2556
- § Chapter 6.4.1.17.3 “Information for Library Developers” on page 2035

Table 441: Dialog “Library Categories”

<table>
<thead>
<tr>
<th>List of categories</th>
<th>The list of the categories that are assigned to the library project. They can originate from several sources. After you specify all desired categories, click “OK” to confirm.</th>
</tr>
</thead>
</table>

| Button “Add” | The “From Description File” and “From Other Library” commands appear. |
| Button “Remove” | CODESYS removes the selected category. |
| Command “From Description File” | The “Select Description File” dialog opens for you to select a description file (*.libcat.xml). The file contains command categories. When you click “Open”, CODESYS accepts the categories. |
| Command “From Other Library” | The “Select Library” dialog opens, where you select a library with command categories to be accepted. When you click “Open”, CODESYS accepts the categories. |
| Button “OK” | CODESYS provides the categories as project information and displays it in the “Library Categories” field. |

See also
- § Chapter 6.4.4.2 “Guidelines for creating libraries” on page 2852
- § Chapter 6.4.1.21.3.9.5 “Command ’Library Repository’” on page 2657

Tab ‘Properties’
On this tab, you can define keys that you can control externally from user-specific programs.

NOTICE!
If you have opened a library project, then note the description of the relevant keys in the guidelines for library developers (Library Development Summary).

- If you have opened a symbol library as a project, then the key **VisuSymbolLibrary = TRUE** must be defined. It identifies the library as a symbol library.

| “Key” | Name of the key. Specify any string of text for the new key, or select an existing key from the “Properties” table. |
| “Type” | Data type of the key. Possible types: “Text”, “Date”, “Number”, “Boolean”, “Version”. |
“Value” Value of the key in permitted format
- “Text”: Any character string
- “Date”: Example: Friday, January 1, 2016 00:00:00. Minimum entry for the date: 1.1
- “Number”: Integer in Integer32 format with or without a sign (example: -32500).
- “Boolean”: True or False, capitalization irrelevant.
- “Version”: Examples: 1.1, 1.0.1.0, maximum four figures.

“Add” Adds the new defined key to the “Properties” table.

“Modify” Saves the change made for the key selected in the “Properties” table.

“Remove” Removes the key selected in the “Properties” table.

“Properties” List of the properties that are defined as keys. CODESYS creates keys automatically for the information in the “Summary” tab.

Click a key to edit it in the input fields above the list.

- Chapter 6.4.4.2 “Guidelines for creating libraries” on page 2852

Tab ‘Signing’ This tab is displayed only for existing libraries whose signing has been created with this tab. This tab is no longer visible for newly generated libraries.

When a certificate-signed library is created (possible as of CODESYS V3 SP15) and library compatibility with CODESYS < V3 SP15 is not set, the settings on this tab are disabled. In this case, the signing is done by means of a certificate that has to be assigned to the user profile in the security screen.
One method, which is not recommended but may be necessary in some case for compatibility with versions < V3 SP15, is the less secure signing of a library by means of a vendor-specific, one-time key in this dialog. Requirement: This key is available as a private key file (*.libpk) with an associated token. The user of the library also has to obtain this key in order to be able to check whether the last signing was actually performed by the library vendor.

| “Activate signing” | CODESYS signs the library project with a single-use, manufacturer-specific key. |
| “Private key file” | Location of the private key file *.libpk (example: D:\for lib developers only\mycomp_libkey.libpk). |
| “Public key token” | Example: 427A5701DA3CF3CF Requirement: A private key file is specified, and CODESYS has read and entered the token. |
| “Create Private Key File” | CODESYS creates a new private key file. |

Options for creating blocks for accessing project information

| “Automatically generate ‘Project Information’ POU”s” | Note: The functions that are created with this option can be used only if the runtime supports the WSTRING data type. If this is not the case, then you can use the functions that were created automatically for the with the individual items of the project information, at least in the application for accessing properties. These functions are not registered in the runtime. CODESYS creates POU of the FUNCTION type in the “POUs” view, allowing programmatic access to the project properties in the application. The function blocks GetCompany, GetTitle and GetVersion are created for the properties “Company”, “Title” and “Version”.

The following function blocks are available for user-defined properties:
● GetBooleanProperty: BOOL (TRUE/FALSE)
● GetNumberProperty: DINT (numeric value)
● GetTextProperty: WSTRING (character string)
● GetTextProperty2: POINTER TO WSTRING (unlimited length)
● GetVersionProperty: VERSION (version number as character string)

Note: Do not activate this option for standard libraries, because this can cause problems on smaller systems due to the additional memory requirements.

Note: If a library also contains this project information POU, then you should use the operator _POO to make sure that this POU is accessed. |

| “Automatically generate ‘Library Information’ POU”s” | CODESYS creates POU of the FUNCTION type in the “POUs” view, allowing programmatic access to the project properties in the application. For the “Version” and “Released” properties, the following functions are created: GetLibVersion (version number as character string), GetLibVersionNumber (version number as numeric value), and IsLibReleased (TRUE/FALSE). Note: These functions are not registered in the runtime. The option is available as an alternative solution is the runtime does not support the WSTRING data type, therefore not permitting you to use the functions created with the “Automatically generate ‘Project Information’ POU” option. |
Object 'Recipe Manager'

Tab 'Storage'  The recipe manager provides functions for maintaining user-defined variable lists, known as recipe definitions. The recipe definitions can be stored in recipe files on the PLC.

| **“Storage Type”** | “Textual”: CODESYS saves the recipe in a readable Format with the configured columns and delimiters.  
“Binary”: CODESYS saves the recipe in a non-readable binary format. This format requires less storage space.  
Note: You can read binary recipes again only if you have not changed the variable lists. |
|-------------------|--------------------------------------------------------------------------------------------------|
| **“File path”**   | <directory name>\  
Example: AllRecipes\  
Path on the runtime system  
Notes:  
• The path has to end with a backslash ("\").  
• The path is usually a relative path on the target system in the directory of the runtime files (PlcLogic).  
• Access to paths outside of the directory PlcLogic is not permitted on every controller. An absolute path for Windows systems can be selected by pressing the [ ] button.  
Example of the file path in the runtime system: PlcLogic/AllRecipes  
CODESYS saves a file in this directory for each recipe when downloading to the PLC. The requirement is that you select the “Recipe management in the PLC” option.  
The files are loaded to the recipe manager each time the application is restarted. |
| **“File extension”** | File extension for the recipe file in the format .<file extension>  
The resulting default name for recipe files is in the form <recipe>.<recipe definition>.<file extension>. |
| **“Separator”**   | Delimiters between the individual values in the saved file |
| **“Available Columns”** | Defines the information that is saved and in which order in the recipe file |
| **“Selected Columns”** | |
| **“Save as Default”** | CODESYS uses the settings on the tab throughout the entire project for all other recipe managers. |

Tab 'General'

| **“Recipe management in the PLC”** | ☑: Has to be selected for the user program or visualization elements to load recipes at runtime. If you transfer recipes to the PLC exclusively via the CODESYS program interface, then you can clear this option. |
Table 443: “Save Recipe”

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Save recipe changes to recipe files automatically”</td>
<td>When “Recipe management in the PLC” is selected, there is the following option for saving the recipe:</td>
</tr>
<tr>
<td></td>
<td>✔️: We recommend this option because it helps the recipe manager operate “normally”. The recipe files on the PLC are updated automatically at runtime whenever a recipe is changed.</td>
</tr>
</tbody>
</table>

Table 444: “Load Recipe”

When “Recipe management in the PLC” is selected, there are the following two options for downloading from the PLC:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Download only for exact match of the variable list”</td>
<td>✔️: The recipe is only downloaded if the file on the PLC contains all variables from the variable list of the recipe definition of the application and these are sorted in the same order. Additional entries at the end are ignored. If the required match does not exist, then the error status ERR_RECIPE_MISMATCH is set (RecipeManCommands.GetLastError).</td>
</tr>
<tr>
<td>“Download variables with matching names”</td>
<td>✔️: The recipe values are downloaded only for those variables that have the same name in the recipe definition of the application as in the recipe file on the PLC. If the variable lists differ in composition and sorting, then no error status is set. In this way, recipe files can also be downloaded if variables in the file or in the recipe definition have been deleted.</td>
</tr>
<tr>
<td>“Overwrite existing recipes on download”</td>
<td>✔️: If recipe files with the same name exist on the controller, then they are overwritten with the configured values from the project when the application is started. If the values from the existing recipe files should be loaded instead, then this option has to be disabled. Requirement: The “Storage Type” is “Textual” and the “Save recipe changes to recipe files automatically” option is selected.</td>
</tr>
</tbody>
</table>

Table 445: “Write Recipe”

The following options are available for writing recipe values to the variables on the PLC:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Limit the variable to min/max when recipe value is out of the range”</td>
<td>✔️: If the recipe contains a value that is outside of the range of values specified in the definition, then the defined minimum or maximum value is written to the PLC variable instead of this value.</td>
</tr>
<tr>
<td>“Do not write to a variable when the recipe value is out of the min/max range”</td>
<td>✔️: If the recipe contains a value that is outside of the range of values specified in the definition, then no value is written to the PLC variable. It retains its current value.</td>
</tr>
</tbody>
</table>
Table 446: “Read Recipe”

The following option is available for reading recipe values from the PLC into the recipe in the project:

| “Check recipe for changes” | Always use the function block RecipeManCommands from RecipeManagement.library to read recipes. Never call the method cyclically. This is because each call can be written to the file system, which is time-intensive and burdens the controller. For example, a Raspberry protocol interpreter has a limited number of write cycles.

☑️: With each method call, the current PLC variable values are first read into the recipe. Then the system checks whether the values have changed. Only if the values have changed is the recipe saved. This means that the recipe file is overwritten with the current recipes.

☐☐: With each method call, the current PLC variable values are first read into the recipe. Then the recipe is written to the recipe file in the local file system.

The option can be used in order to update the recipe file in the local file system only if recipe values have changed on the PLC. However, it affects performance because it generates additional code for checking.

Note: As the file system is written to each call, the controller can be very burdened.

Table 447: Option “Save recipe changes to recipe files automatically” is selected.

<table>
<thead>
<tr>
<th>Menu commands</th>
<th>Behavior of the recipes defined in the project</th>
<th>Behavior of the defined recipes at runtime</th>
</tr>

- Method Calls of the ’Recipe Management’ Library

## Object ’Recipe Definition’

In the recipe definition (1), you define different data sets for the variables, which are termed recipes (2).

You can toggle the display of the recipe definition between the flat list view (3) and the structured view (4). In the structured view, CODESYS groups variables according to structure.

<table>
<thead>
<tr>
<th>“Type”</th>
<th>Entered automatically</th>
</tr>

Object 'Symbol Configuration'

You can use the symbol configuration for creating symbol descriptions for project variables. Click “Project ➔ Add Object” to add a symbol configuration object to the device tree. Then define specific presets. See dialog below: “Add Symbol Configuration”.

Double-click the “Symbol Configuration” object to open the symbol configuration editor.

Dialog 'Add Symbol Configuration'

Function: This dialog is used to define the defaults for a “Symbol Configuration” object.

Call: “Project ➔ Add Object ➔ Symbol Configuration” menu; context menu of the application object.

<table>
<thead>
<tr>
<th>“Include comments in XML”</th>
<th>Exports the symbol file with the comments assigned to the variables.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Support OPC UA features”</td>
<td>Note: Availability and editability of this option depend on the device.</td>
</tr>
<tr>
<td>[ ]</td>
<td>When downloading the symbol configuration, additional information is also downloaded to the controller. The information below is necessary for operating the OPC UA server.</td>
</tr>
<tr>
<td></td>
<td>● Base types of inherited function blocks</td>
</tr>
<tr>
<td></td>
<td>● Contents of attributes that were assigned via compiler pragmas</td>
</tr>
<tr>
<td></td>
<td>● Scopes (example: VAR_INPUT, VAR_OUTPUT, VAR_IN_OUT)</td>
</tr>
</tbody>
</table>

Table 450: “Client-Side Data Layout”

<table>
<thead>
<tr>
<th>“Compatibility layout”</th>
<th>This setting is used for the compatibility of old projects. The data layout created for the client is matched as much as possible to the layout created internally by the compiler.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Optimized layout”</td>
<td>Recommended for new projects. Calculates the output layout in optimized form detached from the internal compiler layout. Does not generate any gaps for unpublished elements and strictly fulfills the requirements for memory alignment of the data types. Requires compiler version 3.5.7.0 or higher.</td>
</tr>
</tbody>
</table>

Symbol configuration editor

The editor includes a table with selected variables and a menu bar for editing.

Table 451: Menu bar

<table>
<thead>
<tr>
<th>“View”</th>
<th>You can use this button for activating and deactivating the following categories of variables used in the configuration editor:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>● “Unconfigured from Project”: Variables that have not been added to the symbol configuration, but are provided in the project.</td>
</tr>
<tr>
<td></td>
<td>● “Unconfigured from Libraries”: Variables that have not been added to the symbol configuration, but are provided in the project.</td>
</tr>
<tr>
<td></td>
<td>● { Symbols Exported via Attribute}: This filter also lists the variables that have already been marked for export in the symbol file by means of the {attribute 'symbol' := 'read'} pragma. These symbols are displayed in gray. The “Attribute” column shows which access rights are set by the pragma.</td>
</tr>
</tbody>
</table>

| “Build” | Compiles the project. Requirement for current preparation of variables in the configuration editor. |
### “Settings”

- **“Support OPC UA features”:**
  - Note: Availability and editability of this option depend on the device.
  - When downloading the symbol configuration, additional information is also downloaded to the controller. The information below is necessary for operating the OPC UA server. This currently includes the following information:
    - Base types of inherited function blocks
    - Contents of attributes that were assigned via compiler pragmas
    - Scopes (example: VAR_INPUT, VAR_OUTPUT, VAR_IN_OUT)

- **<!> “ Include comments in XML”**
  - Exports the symbol file with the comments assigned to the variables.

- **“Include Node Flags in XML”**
  - The namespace node flags provide additional information about the origin of a node in the namespace. The node flags always in the symbol table when OPC UA is activated. However, its inclusion in the XML file can be deactivated as some defective parsers have problems with it.

- **“Configure Comments and Attributes”**
  - Opens the “Comments and Attributes” dialog. Here you configure the details of what should be included in the symbol configuration and XML file with respect to comments and attributes.

- **“Configure synchronization with IEC tasks”:**
  - Opens the “Properties - <device name>” dialog, “Options” tab.
  - This setting allows for the symbolic clients (e.g. visualizations or database links based on the PLC_HANDLER) to have consistent read/write access synchronized with the IEC tasks. For a detailed description of this setting, see the "Setting: Configure synchronization with IEC tasks" section below.

- **“Use Empty Namespaces by Default (V2 Compatibility)”**
  - Required when using a CODESYS V2-compatible OPC server configuration.

<table>
<thead>
<tr>
<th>Data Layout Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Optimized layout</strong></td>
<td>Recommend for new projects. Calculates the output layout in optimized form detached from the internal compiler layout. Does not generate any gaps for unpublished elements and strictly fulfills the requirements for memory alignment of the data types. Requires compiler version 3.5.7.0 or higher.</td>
</tr>
<tr>
<td><strong>Compatibility layout</strong></td>
<td>This setting is used for the compatibility of old projects. The data layout created for the client is matched as much as possible to the layout created internally by the compiler. Due to the configuration possibilities of the symbol configuration which have grown over time, problematic offsets can still result. Causes of offsets Memory gaps due to internal pointers or references in function blocks and structure components that are not released for symbol configuration. Memory gaps that occur differently in 32-bit and 64-bit systems depending on the data type, such as __XINT / __XWORD. Fields that are at uneven addresses. Some clients are not set up for this. Unintentional memory misalignment, which occurs when using the attributes 'pack_mode' or 'relative_offset'.</td>
</tr>
</tbody>
</table>

- **“Use Empty Namespaces by Default (V2 Compatibility)”**:
  - Required when using a CODESYS V2-compatible OPC server configuration.
  - Behavior same as in CODESYS V2.3.
  - Program variables are exported without an application name
    
  - Global variables are exported additionally without the GVL name
    
  - Behavior same as in CODESYS V2.3.
  - Program variables are exported without an application name
    
  - Global variables are exported additionally without the GVL name
- **“Enable Direct I/O Access”**: This feature is potentially dangerous and **not intended for operation in production**. Activate only for error checking and tests, or when commissioning the machinery (for example, for checking cables connections).
  - ✔️ In the symbol configuration, you can also use access to direct I/O addresses that correspond to IEC syntax (for example, “%IX0.0”). Access to input addresses (I) is read-only*. Access to output addresses (Q) and memory addresses (M) can be read-write.
  - *Information: In simulation mode, write access to symbols is also possible for input addresses.

Because external clients for protocols such as OPC or OPC UA do not always support IEC syntax for direct addresses, access is also provided using an array syntax in the namespace __MIO of the implicit code. For example, you can also access __MIO.MIO_IX[2].x3 instead of %IX2.3.

However, the symbols for array access are hidden in browsers because some clients cannot handle the large number of nodes (several thousand depending on the size of the I/O ranges).

- **“Support Calls of Functions, FBs, Methods, and Programs”**: Note: Availability and editability of this option depend on the device.
  - ✔️ The access rights “execute” can be set in the symbol table for symbols of POUs of type function, function block, method, or program. The “Support OPC UA features” option also has to be selected in the “Settings”.

- **“Include Call information in XML”**: ✔️ The information about called functions, function blocks, methods, or programs is also listed in the XML file of the symbol configuration. The option is enabled only if the “Support calls of functions, FBs, methods, and programs” option is supported by the device.

- **“Enable Symbol Sets”**: ✔️ A toolbar with buttons and a list box is displayed above the symbol table. You can use this to configure symbol sets for client-specific assignment of access rights to the controller. See “Toolbar for symbol set configuration” below.

### “Download”

If you use a device that supports its own application file for the symbol configuration, then this button is also available in the toolbar. If you change the symbol configuration in online mode, then you can load the new `<application name>._symbols` file immediately to the PLC.

### “Tools”

- **“Save XSD Scheme File”**: This command opens the standard dialog for saving a file in the file system. With this command, you can prepare the XSD format of the symbol file, for example for use in external programs.

---

**Table 452: Symbol table**

<td>Requirements for the assignment: The device provides the “Support calls of functions, FBs, methods, and programs” and “Support OPC UA features” options. Both options are activated in the “Settings”.</td>
</tr>
<tr>
<td></td>
<td>Note: In case the controller has a user management, you can use symbol sets to define client-specific access rights to the same symbols.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Maximal”</th>
<th>Maximum access rights for this symbol</th>
</tr>
</thead>
</table>
“Attribute”  If the access right was assigned by attribute, then a corresponding icon is displayed here.

“Type”  Alias data types are also displayed in CODESYS V3.5 SP6 and higher. Example: MY_INT : INT for a variable declared with the data type MY_INT (type INT).

“Members”  You can add variables of a structured data type also by selecting a check box for symbol configuration in the “Symbols” column. This causes CODESYS to export all member variable symbols. However, in the “Members” column, you can click the ellipsis button (…) to select only specific structural components. Note: This selection applies to all instances of this data type for which symbols are exported. If a member of a structured type cannot be selected, then an asterisk (☆) is displayed in the check boxes of the members to indicate that all exportable members of that type are exported.

Table 453: Toolbar for symbol set configuration

Dialog 'Comments and Attributes’

Table 454: “Symbol Table Contents”

| “Enable extended OPC UA information” | Note: Availability and editability of this option depend on the device.  
|-------------------------------------|-------------------------------------------------------------------------|
|                                     | ☑: Additional information that can be evaluated by OPC UA servers is included in the symbol table. This includes inheritance information of user-defined data types and the namespace node flags. Additional information, such as comments and attributes, can also be included if the OPC UA setting is active.  
|                                     | When the OPC UA setting is enabled, attributes are included in the symbol table according to the following rule:  
|                                     | - In compiler versions V3.5.5.0 to V3.5.7.X, all attributes are included according to the “Match simple identifiers” setting.  
|                                     | - In compiler version V3.5.8.X, all attributes are included according to the setting “Include all attributes”.  
|                                     | - In compiler version V3.5.9.0 and higher, you can customize the attributes that are included. |
| “Include comments” | Requirement: “Enable extended OPC UA information” is activated.  
|                      | ☑: Comments and attributes are also saved in the symbol table. |
"Include attributes"

"Also include comments and attributes for type nodes" Requirement: "Include comments" is activated.
- The information for type nodes is also included (user-defined types, such as `STRUCT` and `ENUM` elements).
- Only directly exported variables have comments and attributes.

Table 455: “XML symbol file contents”

| "Include namespace node flags" | The namespace node flags provide additional information about the origin of a node in the namespace. The node flags always in the symbol table when OPC UA is activated. However, its inclusion in the XML file can be deactivated as some defective parsers have problems with it. |
| "Include comments" | Comments can also be saved in the XML file. In compiler versions V3.5.5.x to V3.5.8.0, this includes the setting “Prefer docu-comments”. |
| "Include attributes" | Attributes can also be saved in the symbol file. |
| "Also include comments and attributes for type nodes" | Requirement: "Include comments" is activated. The information for type nodes is also included (user-defined types, such as `STRUCT` and `ENUM` elements). Only directly exported variables have comments and attributes. |

Table 456: “Select Comments”

Requirement: "Include comments" is activated.

| "Include docu comments" "Include normal comments " "Always include both types of comments" "Prefer docu comments, fallback to normal ones" "Prefer normal comments, fallback to docu comments" | The options determines the comments that are saved in the symbol configuration. |

Table 457: “Filter Attributes (Case-Insensitive)”

Requirement: "Include attributes" is activated.

| "Include all attributes" "Include attributes starting with" "Filter attributes with regular expression" | Defines the attributes that are saved in the symbol configuration. |
| "Match simple identifiers" | Exists primarily due to the backward compatibility to older versions in order to emulate the old behavior. |

Setting: Configure synchronization with IEC tasks

For synchronously consistent access, the symbolic client waits in the runtime when processing a read or write request until a time is found when no IEC task is executed. When this gap is detected, restarting the IEC tasks is prevented until all values of the variable list have been copied. Then the IEC tasks are planned again as usual. Synchronized access can cause a delayed starting of IEC tasks, which is shown as increased jitter. As all applications in the runtime are managed by a common scheduler, this potential impairment of the real-time behavior...
affects all applications on the device. All applications of the device are affected, regardless of whether or not they include a symbol configuration or they have been downloaded to the controller from one or more CODESYS projects. Therefore, the runtime permits synchronized consist access only if this it allows all applications that are downloaded to the controller at the time of access.

The setting is located in the editor of the symbol configuration of the “Settings” menu. In addition, the setting is also located in the context menu of the controller when you click the “Properties” command and then select the “Options” tab in the opened dialog.

For applications without symbol configuration, the setting can only be found in the properties dialog.

**NOTICE!**

After changing the setting, all applications downloaded to the device by means of a download or online change have to be reloaded and all boot applications updated.

**In which cases is synchronized consistent access necessary?**

As a rule, there is no need for consistent values for displayed values because it is mostly irrelevant from which IEC task cycle the changed values originate. It is completely irrelevant for seldom changed values. Even when writing there are almost no hard consistency demands because typically the machine must be in a kind of standby mode (for example when writing recipes) in which there is no direct access to the values written as recipes.

In contrast, consistent values are particularly necessary for database links to save production data. For clocked machines, however, these values must be synchronous with the production timing (one value set per produced product) and not consistent with reference to one or more IEC tasks. With reference to the machine clocking, the consistency must be already ensured by the IEC application. For this purpose, the values that arise during a production cycle are typically collected in a global variable list. At the end of the cycle, the symbolic client is notified by means of an additional variable (BOOL or counter) that the machine cycle has ended and the values are valid. Now the client has the chance to archive the values from the production cycle. Depending on necessity, the successful reading can also be displayed in the opposite direction by means of a released variable, so that the production can also be halted in case the production data cannot be archived. Synchronized consistent access is not necessary and helpful for this use case because the synchronization takes place at the application level.

In contrast, synchronized consistent access by symbolic clients is typically applied in the process industry with continuously running systems without production clocking when, for example when process values are written consistently and cyclically in a fixed time frame of 60s. This can take place either by synchronization on the application level similar to clocked machines (see above) or by synchronization of the synchronized consistent symbolic access. The advantage of the latter is that no logic has to be implemented in the IEC program and access is controlled entirely by the client.

**CAUTION!**

Due to the increased jitter, the synchronized consistent monitoring is not suitable for motion or real-time critical applications. For these reasons, synchronized consistent access should be released and used only if it is absolutely necessary.

If a client uses synchronous consistent access released by this setting, then it has and effect on the client. Depending on the scheduler of the runtime, the response time can jitter more here for read/write access because the system might still have to wait for an execution gap of the IEC tasks. Read and/or write access can still fail when IEC tasks run for a long time (in the range of several 100 ms) or the CPU load is close to 100% for an extended period of time with one or more IEC tasks (in the range of several 100 ms). Therefore, the availability of the values also depends on the load of the controller by the IEC application.
Moreover, the client can minimize the effects on itself and on the runtime if it observes the following in the definition of the variable lists to be read or written:

- Synchronized consistent access only to those variables that are absolutely and consistently required.
- Separate variable lists for variables that have to be consistent and for variables that could be inconsistent.
- Divide variable lists with several consistent variables into several smaller lists.
- Select read intervals for cyclic reading of values as large as possible.

Entries marked in red in the symbol table show variables that they are configured for export to the symbol file but are currently invalid in the application. The cause for this can be that the declaration has been removed from the block.

In version 3.5.8.0 and higher, a warning appears in the editor if variables that have configured symbols are not used in the IEC code or are not mapped in the case of I/O variables. In addition, the compiler indicates variables that are referenced from outdated library versions in the symbol configuration.

**NOTICE!**

Object variables that are not used in the program code remain uncompiled by default and are therefore not available in the symbol configuration.

However, CODESYS provides variables from uncompiled objects in the symbol configuration when one of the following conditions is met:

- The “Link always” POU property is selected.
- The `{attribute 'linkalways'}` pragma is used.

- Chapter 6.4.1.20.6.3.46 “Effects of Pragmas on Symbols” on page 2315
The following examples from an IEC application will show how gaps can result in the client-side memory layout caused by unpublished symbols, internal "invisible" pointers, or a "pack mode" definition in the device description. With the "Optimized layout" setting, the gaps are avoided. The symbol file contains different information about the size and offset of memory locations, depending on the selected layout setting.

Example:
Large structure

```plaintext
// Example of a big structure, where not all members get published:
STRUCT
   {attribute 'symbol':='readwrite'}
   PublicNumber : INT;

   {attribute 'symbol':='none'}
   InternalData : ARRAY[0..100] OF BYTE;

   {attribute 'symbol':='readwrite'}
   SecondNumber : INT;

   {attribute 'symbol':='none'}
   MoreData : ARRAY[0..100] OF BYTE;
END_STRUCT
END_TYPE
```

Resulting entries in the symbol file; pay attention to "size" and "byteoffset":

- Symbol file, large structure, compatibility layout option
  ```plaintext
  <TypeUserDef name="T_LargeStructure" size="208" nativesize="208" typeclass="Userdef" pouclass="STRUCTURE" iecname="LargeStructure">
    <UserDefElement iecname="PublicNumber" type="T_INT" byteoffset="0" vartype="VAR" />
  </TypeUserDef>
  <TypeUserDef name="T_LargeStructure" size="4" nativesize="208" typeclass="Userdef" pouclass="STRUCTURE" iecname="LargeStructure">
    <UserDefElement iecname="PublicNumber" type="T_INT" byteoffset="2" vartype="VAR" />
  </TypeUserDef>
  ```

- Symbol file, large structure, optimized layout option
  ```plaintext
  <TypeUserDef name="T_LargeStructure" size="4" nativesize="208" typeclass="Userdef" pouclass="STRUCTURE" iecname="LargeStructure">
    <UserDefElement iecname="PublicNumber" type="T_INT" byteoffset="0" vartype="VAR" />
  </TypeUserDef>
  ```

Example:
Structure with uneven addresses

```plaintext
// The following mechanisms can cause memory misalignment:
// - {attribute 'relative_offset':='...'} at a member
// - {attribute 'pack_mode':='...'} at a structure declaration
// - target setting 'memory-layout\pack-mode' in the device description

{attribute 'pack_mode':='1'}
TYPE UnevenAddresses:
STRUCT
   {attribute 'relative_offset':='3'}
   {attribute 'symbol':='readwrite'}
   PublicNumber : INT;
```

Configuration and programming
Programming with CODESYS > CODESYS Development System

2024/01/05
ADR010583, 1, en_US
Resulting entries in the symbol file; pay attention to "size" and "byteoffset":

```
<TypeUserDef name="T_UnevenAddresses" size="13" nativesize="13"
typeclass="Userdef" pouclass="STRUCTURE" iecname="UnevenAddresses">
  <UserDefElement iecname="PublicNumber" type="T_INT" byteoffset="3"
   vartype="VAR" />
  <UserDefElement iecname="PublicValue" type="T_LREAL" byteoffset="5"
   vartype="VAR" />
</TypeUserDef>

<TypeUserDef name="T_UnevenAddresses" size="16" nativesize="13"
typeclass="Userdef" pouclass="STRUCTURE" iecname="UnevenAddresses">
  <UserDefElement iecname="PublicNumber" type="T_INT" byteoffset="0"
   vartype="VAR" />
  <UserDefElement iecname="PublicValue" type="T_LREAL" byteoffset="8"
   vartype="VAR" />
</TypeUserDef>
```

// Each POU contains some implicit variables, which do not get published. Depending on the
data type these might cause memory gaps of different sizes.
FUNCTION_BLOCK POU IMPLEMENTS SomeInterface
VAR_INPUT
  in : INT;
END_VAR
VAR_OUTPUT
  out : INT;
END_VAR

Each POU contains some implicit variables, which do not get published. If it is a data type
such as __XWORD, then different sizes of memory gaps result in the client-side data layout,
depending on whether the system is 64-bit or 32-bit.

Resulting entries in the symbol file for 64-bit and 32-bit; pay attention to "size" and "byteoffset":

```
<TypeUserDef name="T_POU" size="24" nativesize="24"
typeclass="Userdef" pouclass="FUNCTION_BLOCK" iecname="POU">
  <UserDefElement iecname="in" type="T_INT" byteoffset="16"
   vartype="VAR_INPUT" />
  <UserDefElement iecname="out" type="T_INT" byteoffset="18"
   vartype="VAR_OUTPUT" />
</TypeUserDef>

<TypeUserDef name="T_POU" size="4" nativesize="24"
typeclass="Userdef" pouclass="FUNCTION_BLOCK" iecname="POU">
  <UserDefElement iecname="in" type="T_INT" byteoffset="0"
   vartype="VAR_INPUT" />
</TypeUserDef>
```

Object 'Text List'

Symbol: 

This object is used to create, manage, and translate texts. It contains a table with texts where you can add new texts. You can select a text which you have composed here can be selected in a visualization in the “Dynamic texts” property of an element. In runtime mode, the visualization displays this text dynamically in the selected language.

When the object is assigned to an alarm group and is located below the “Alarm Configuration” object, CODESYS adds the texts of the alarm group to the table. You can also add texts.

<table>
<thead>
<tr>
<th>&quot;ID&quot;</th>
<th>Unique identifier of the text</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Standard&quot;</td>
<td>Source text as character string (example: Information A: %i options). Use the keyboard shortcut [Ctrl]+[Enter] to add a line break. Double-click in the field to edit the text.</td>
</tr>
<tr>
<td>&quot;&lt;language code&gt;&quot;</td>
<td>Name of the language as a language code. Example: en-US. This column contains the translation of the text which is composed under “Standard”. Under the condition that the language code is selected as the language in the visualization manager, a visualization displays the translated text in runtime mode. If a translation has not been composed, then CODESYS uses the text under “Standard”. A visualization in runtime mode can also change the language if requested by a user.</td>
</tr>
<tr>
<td>Blank line</td>
<td>Edit the line to add your own text.</td>
</tr>
</tbody>
</table>
Object 'Task Configuration'

General

Symbol: 

The object is used to define and display the basic settings for the task configuration. The "Task Configuration" object must be included exactly one time in each application.

"Task Configuration" tabs and functions

- "Properties": Display of the basic settings
- "System Events": Linking of POU calls with system events
- "Monitor": Display of the status and current statistics for the cycles times in online mode
- "Variable Usage": Overview of the tasks that access the variables and how they do it
- "Task Groups": Definitions of the tasks groups and their assignment to CPUs
- "CPU Load": Graphical representation of the CPU load in online mode

- For descriptions about alarm management and alarm visualization, see the help for CODESYS Visualization.

Tab 'Properties'

Object: “Task Configuration”

In this tab, you define the basic settings of the task configuration as predefined by the target system, such as the maximum values for tasks and watchdog parameters.

Tab 'System Events'

Object: “Task Configuration”

On the “System Events” tab, you define which event calls which function and whether or not the configuration is currently activated. You use this tab when a system event (instead of a task) should call a project function.

| "Add Event Handler" | Opens the “Add Event Handler” dialog |
| "Remove Event Handler" | Deletes the selected list assignment |
| "Event Info" | Shows information from the corresponding event library |
**Open Event Function**
Opens the editor of the new function for the selected assignment. You have selected the implementation language of the new function in the “Add Event Handler” dialog.

Assignment of functions to call for events with: "Name", "Description", "Function to call", and "Active" (activate/deactivate configuration).

---

**Table 458: “Add Event Handler”**

Event Description Task Debugging
---
PrepareExitComm Event is sent during download before exiting the communica-
tion server. Runtime main loop No
PrepareExitTasks Event is sent during download before exiting all tasks. Runtime main loop No

Tab 'Monitor'

Object: “Task Configuration”

In online mode, the tab shows the status of the tasks of the task configuration, as well as some current measurements of the cycles and cycle times. CODESYS updates the values in the same time interval as for the monitoring of values from the PLC.

The displayed values can be reset to 0 by means of the “Reset” context menu command.

<table>
<thead>
<tr>
<th>“Task”</th>
<th>Task name (as defined in the task configuration)</th>
</tr>
</thead>
</table>
| “Status”       | • “Not created”: The task has not been started since the last update (especially for event tasks).  
                  • “Generated”: The task is recognized in the runtime system, but not yet in opera-
                  tion.  
                  • “Valid”: The task is operating normally.  
                  • “Exception”: The task has produced an exception status. |
| “IEC-Cycle Count” | Number of cycles executed since starting the application where the IEC code was executed (0 if the target system does not support the counter function) |
| “Cycle Count”   | Number of executed cycles since logging in to the PLC.  
                  It depends on the target system whether cycles are also counted where the application is not running. In these cases, the “Cycle Count” may be greater than the “IEC-Cycle Count”. |
| “Last Cycle Time (µs)” | Last measured cycle time [µs] |
| “Average Cycle Time (µs)” | Average cycle time over all cycles [µs] |
| “Max. Cycle Time (µs)” | Maximum measured cycle time over all cycles [µs] |
| “Min. Cycle Time (µs)” | Minimum measured cycle time over all cycles [µs] |
| “Jitter (µs)”    | Current value of the periodic jitter [µs]  
                  Note: From CODESYS 3.5 SP11 to SP15, the peak-peak value of the periodic jitter is displayed. In earlier versions and in SP16 and later, the current value of the periodic jitter is displayed. |
| “Min. Jitter (µs)” | Minimum measured periodic jitter [µs] |
| “Max. Jitter (µs)” | Maximum measured periodic jitter [µs] |
| “Core”          | Number of the processor core where the task is currently running  
                  Example: 2  
                  Requirement: The controller is equipped with a multicore processor.  
                  If the CPU is not a multicore CPU, then the value –1 is displayed here. |

- § Chapter 6.4.1.9.17 “Task Configuration” on page 1914
Tab 'Variable Usage'

Object: “Task Configuration”

The “Variable Usage” tab provides an overview of all variables and their usage. There you can see the tasks where variables are accessed.

When using multicore, write access (w) to a variable should take place only in a task because otherwise it can cause inconsistencies.

In the context menu, you can hide individual tasks and show the cross-reference list to variables.

<table>
<thead>
<tr>
<th>“Variables”</th>
<th>Name of the variable</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Type”</td>
<td>Data type</td>
</tr>
<tr>
<td>“Number”</td>
<td>Number of tasks that access these variables.</td>
</tr>
<tr>
<td>“&lt;task name&gt;”</td>
<td>Access to the variable (r: read, w: write, rw: read/write)</td>
</tr>
</tbody>
</table>

See also
- Chapter 6.4.1.9.17 “Task Configuration” on page 1914

Tab 'Task Groups'

Object: “Task Configuration”

You define task groups on the “Task Groups” tab. Task groups can be distributed over the individual processor cores in multicore systems. The tasks of a task group are bound to the processor cores according to the strategy defined in the “Core” field.

<table>
<thead>
<tr>
<th>“Add Group”</th>
<th>The button adds a new task group named NewGroup_&lt;no&gt;.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Remove Group”</td>
<td>Deletes the selected task group.</td>
</tr>
<tr>
<td>“Group Name”</td>
<td>The name can be changed by double-clicking in the field.</td>
</tr>
<tr>
<td>“Core”</td>
<td>Determines the processor core for process the tasks of this group.</td>
</tr>
<tr>
<td></td>
<td>- “Free floating”: All tasks are bound dynamically to different processor cores. The user does not have any influence over this. The operating system is responsible for the distribution.</td>
</tr>
<tr>
<td></td>
<td>- “Sequentially pinned”: All tasks are bound and fixed to different processor cores. The user does not have any influence over this.</td>
</tr>
<tr>
<td></td>
<td>- “Fixed pinned”: All tasks are bound to one processor core. By default, the runtime system determines the processor core.</td>
</tr>
<tr>
<td></td>
<td>- “&lt;core number&gt;”: Fixed defined processor core. If the processor core is not available, then an error message is issued.</td>
</tr>
</tbody>
</table>

Tab 'CPU Load'

Object: “Task Configuration”

The “CPU Load” tab is available in online mode for multicore devices only. The load of the individual CPUs is presented in the trace editor.

You open the trace configuration by double-clicking the legend in the window on the right side. Adding more variables is not possible here.
Mapping of Task Priorities on a Linux System

Dependencies between IEC task priorities and Linux priorities

When the target system is running in Linux, specific priorities of the IEC tasks are mapped to specific priorities and scheduling policies. Depending on the priority, the scheduling policy SCHED_FIFO or SCHED_OTHER is displayed as in the table.

<table>
<thead>
<tr>
<th>IEC Task Priority</th>
<th>Linux Priority Linux (Default)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 (highest real-time priority)</td>
<td>56 (SCHED_FIFO)</td>
</tr>
<tr>
<td>15 (lowest real-time priority)</td>
<td>41 (SCHED_OTHER)</td>
</tr>
<tr>
<td>16 (no real-time priority)</td>
<td>0 (SCHED_OTHER)</td>
</tr>
<tr>
<td>31 (no real-time priority)</td>
<td>0 (SCHED_OTHER)</td>
</tr>
</tbody>
</table>

Object 'Task'

General

Symbol: 🙋

In this object, you define the conditions for starting and calling the task.

You insert the object below “Task Configuration” in the device tree.

Tab 'Configuration'

Object: “Task”

<table>
<thead>
<tr>
<th>“Priority”</th>
<th>Possible values: 0..31, where 0 is the highest priority</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Task group”</td>
<td>Assigned task groups which can be assigned to specific processor cores in multicore</td>
</tr>
</tbody>
</table>

Example:

IEC Tasks Note: The task group is shown in brackets after the task in the device tree.

When using a runtime system in Linux, there exist fixed dependencies between task groups and priorities. For more information, see: ☞ Chapter 6.4.1.21.2.29.8 “Mapping of Task Priorities on a Linux System” on page 2538
### Table 459: “Type”

<table>
<thead>
<tr>
<th>Type</th>
<th>Processing of the task is done cyclically.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Input field “Interval”</strong></td>
<td>Required&lt;br&gt;Time span after which the task is restarted (task cycle time)&lt;br&gt;● As a time definition in the format TIME&lt;br&gt;   Example: #200ms&lt;br&gt;● As a number&lt;br&gt;   Example: 200 Hint: the number is displayed automatically in the format TIME when the input field is in focus again.&lt;br&gt;Note: Deviations of the task from this desired task cycle time are displayed at runtime as periodic jitter on the Watchdog tab.</td>
</tr>
<tr>
<td><strong>Time unit of the interval</strong></td>
<td>If only a number and not a time definition is specified in the Interval input field, then the unit selected here determines the time dimensions.&lt;br&gt;Example: ms&lt;br&gt;Note: A task cycle time in µs is always displayed as a number.</td>
</tr>
<tr>
<td><strong>Type “Event”</strong></td>
<td>Processing of the task starts event-controlled on the rising edge of the event variable.</td>
</tr>
<tr>
<td><strong>Input field “Event”</strong></td>
<td>Global variable (Boolean type)&lt;br&gt;The task starts as soon as the variable value switches from 0 to 1.</td>
</tr>
<tr>
<td><strong>Type “External”</strong></td>
<td>Processing of the task starts event-controlled on the rising edge of the event variable.</td>
</tr>
<tr>
<td><strong>List box “Event”</strong></td>
<td>List with target system-dependent events (Boolean type)&lt;br&gt;Note: The target system determines which events are supported and offered in the list box.&lt;br&gt;Hint: Not to be confused with system events</td>
</tr>
<tr>
<td><strong>“Interval”</strong></td>
<td>Time definition in TIME format or as a number with a time unit Note: Only available when the event requires a time definition</td>
</tr>
<tr>
<td><strong>“Freewheeling”</strong></td>
<td>Processing of the task starts automatically in a continuous loop at program start and at the end of a complete pass&lt;br&gt;Note: A cycle time is not defined.</td>
</tr>
<tr>
<td><strong>“Status”</strong></td>
<td>Processing of the task starts state-triggered by the event variables</td>
</tr>
<tr>
<td><strong>Input field “Event”</strong></td>
<td>Global variable (Boolean type) When the variable has the state TRUE hat, the task starts.</td>
</tr>
</tbody>
</table>

---

**NOTICE!**

For fieldbuses, a fixed cycle matrix is necessary to assure a determined behavior. Therefore, you should not use TypeFreewheeling for a bus cycle task.

---

**NOTICE!**

Note the following difference between the processing types Status and Event. If the given event yields TRUE, then the start condition of a task of type Status is fulfilled. In contrast, the start of a task of type Event requires a switch of the event from FALSE to TRUE. If the sampling rate of the task scheduler is too low, then the rising edge of the event can remain unnoticed.
NOTICE!
When setting the task cycle time, you have to identify which bus system is currently being used. For example, the task cycle time in a CAN bus system must match the currently set baud rate and the number of frames used in the bus. In addition, the times set for heartbeat, node guarding, and sync should always be a multiple of the task cycle time. If not, then CAN frames can be lost.

Table 460: “Watchdog”

Defines the time monitoring for a task. If the target system supports an advanced watchdog configuration, then the following settings may be predefined in the device description.

- Upper and lower limit
- Default watchdog time
- Time specified as percentage

The default watchdog settings depend on the device.

<table>
<thead>
<tr>
<th>“Enable”</th>
<th>The watchdog is active.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>If the task exceeds the currently set “Time” of the watchdog, then the task is halted with an error status (exception). The application in whose task the error occurred and its child applications are also halted. In this way, all tasks of the affected applications are also halted. Then the currently defined “Sensitivity” is also taken into account. If you activate the option “Update I/Os” in the “PLC Settings” of the PLC, then CODESYS resets the outputs to the defined default values. Possible cases:</td>
</tr>
<tr>
<td></td>
<td>● Multiple consecutive timeouts:</td>
</tr>
<tr>
<td></td>
<td>Sensitivity: 0, 1 - exception in cycle 1</td>
</tr>
<tr>
<td></td>
<td>Sensitivity: 2 - exception in cycle 2</td>
</tr>
<tr>
<td></td>
<td>Sensitivity: n - exception in cycle n</td>
</tr>
<tr>
<td></td>
<td>● Single timeout: Exception if the cycle time of the current cycle is longer than (time * sensitivity). Example: Time=t#10ms, Sensitivity=5 (i.e., exception as soon as the one-time task runs longer than 50 ms)</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Time (e.g. t#200ms)”</th>
<th>Watchdog time</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Defines (together with “Sensitivity”) the watchdog for a task; description as for “Enable”. Depending on the target system, the monitoring time span is given as a percentage of the task interval if possible. In this case, the list box for the unit is disabled and displays “%”.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Sensitivity”</th>
<th>Number</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Defines (together with the watchdog) the watchdog for a task; description as for “Enable”.</td>
</tr>
</tbody>
</table>

Using the functions from the library CmpIecTask.library, you can deactivate a watchdog for specific PLC cycles. This is useful for cycles that demand more time due to initialization.
Deactivating/reactivating the watchdog:

```c
hIecTask := RTS_IEC_HANDLE //Declaration of the variable hIecTask
hIecTask := IecTaskGetCurrent(0);
IecTaskDisableWatchdog(hIecTask); // Watchdog disabled
...
IecTaskEnableWatchdog(hIecTask); Watchdog enabled
```

List of “POU”s that the task calls

The calling order corresponds to the POU order in the list (from top to bottom).

| “Add Call” | Defines a new program call |
| “Open POU” | Opens the selected POU |
| “Move Up” | Changes the calling order |
| “Move Down” | |

The normal watchdog of an IEC task is triggered when the execution time of the IEC task exceeds the watchdog time. The “Omitted Cycle” watchdog is triggered when the task does not start at all. This is the case when the task does not execute any cycle at all within the maximum of \(<\text{Time} \times \text{Sensitivity}\rangle\) or \(<2 \times \text{Interval}\rangle\). The cause could be crowding by other tasks or a failure in the scheduler; which no longer enables the task.

Object ‘Trace’

Symbol: ☑

An object of type “Trace” is used for configuring and displaying application-specific trace data in one or more charts. At application runtime, value curves of trace variables, which you can monitor in the trace editor in CODESYS, are recorded on the controller. Requirements are that a trace configuration has been configured transferred to the controller, and the trace recording has been started. The recorded data is transferred to the development system and displayed in diagrams according to the configuration. You can navigate through the data when tracing.

If the controller supports a Trace Manager, then you can use the 'DeviceTrace' object type in the Trace Manager to access all traces that are running on the controller.

Double clicking the trace object opens the trace editor. The corresponding toolbar contains the most important trace commands. The trace variable list shows the variable whose value curve is recorded.
At application runtime, the runtime system buffer of the trace component is filled with the recorded samples. The data is transferred to the development system and stored in its trace editor buffer. The trace editor accesses this data and displays it in diagrams as a graph over time. When you close the trace editor, the trace editor buffer will be freed.

Use menu commands for controlling the trace. In addition, you can use menu commands, keyboard shortcuts, and mouse input for navigating through the data.

Trace variable list

The trace variable list provides an overview of the current trace configuration. In the list, all charts with the respective trace variables are displayed in a table. When you double-click a trace variable, the “Trace Configuration” dialog also opens with the variable settings.

<table>
<thead>
<tr>
<th>“Hide Instance Paths”</th>
<th>Display of the variable name in the list</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>•  Example: PLC_PRG.iCounter</td>
</tr>
</tbody>
</table>

Table 461: Charts

<table>
<thead>
<tr>
<th>“Name”</th>
<th>Tabular display of the charts:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>List of charts with the respective variables</td>
</tr>
<tr>
<td></td>
<td>• “Chart &lt;n&gt;” The chart is displayed.</td>
</tr>
<tr>
<td></td>
<td>The chart name can be changed by clicking the selected name.</td>
</tr>
<tr>
<td></td>
<td>• “&lt;variable&gt;” The variable is displayed.</td>
</tr>
<tr>
<td></td>
<td>The variable name can be changed by clicking the selected name in the line editor.</td>
</tr>
<tr>
<td></td>
<td>When you select a “Chart &lt;n&gt;” in the table, the corresponding chart is also selected in the editor. This also works the other way around.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Cursor &lt;n&gt;”</th>
<th>Y-value at the cursor position</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Delta”</td>
<td>Delta of the Y-value from “Cursor 2” to “Cursor 1”</td>
</tr>
</tbody>
</table>

Multiselection

With multiselection, you can use the numpad keys * and / to expand and collapse selected charts.

You can drag the charts and variables to sort them or move them to other diagrams. When the [Ctrl] key is pressed, the variable is copied. This is also possible in online mode.

Table 462: Context menu in the trace variable list

| “Add Variable” | Adds a new trace variable and opens the “Trace Configuration” dialog with its variable settings. Select a variable in the input field of the “Variable” setting to trace its value curve. |
| “Visible”      | Toggles the visibility of the graph (value curve or trace variable) in the corresponding diagrams: |
|                | • Visible. |
|                | • Invisible. |
|                | When multiple charts or variables are selected in the trace variable list by multiselection, the visibility can be toggled for these graphs. |
| “Display Mode” | Opens the “Trace Configuration” dialog. Select a configuration item in the “Trace Record” tree view or “Presentation (Diagrams)”. |
| “Configuration”| Opens the “Trace Configuration” dialog. The “Variable Settings” are displayed on the right. |

Object ‘Trend Recording Manager’

Symbol

A “Trend Recording Manager” object makes it possible to save data at runtime in a database for a long period of time. This data is recorded with the “CmpTraceMgr” runtime system component. In the device tree, this object is used as a node for trend recordings that are created below an application. It is available below an application only one time.

See also
- Chapter 6.4.1.13.4 “Data Recording with Trend” on page 2016
- Chapter 6.4.1.21.3.5.1 “Command ‘Add Object’” on page 2598
- Chapter 6.4.1.21.2.33 “Object ‘Trend Recording’” on page 2545

Object ‘Trend Recording’

Symbol

A “Trend Recording” object is always located below a “Trend Recording Manager” and enables editing of the trace configuration. At runtime, CODESYS transfers the configuration that is available to the runtime system component CmpTraceMgr. You can configure an application with any number of trend recordings.

NOTICE!

Timeout for trend recording

During a trend recording, it can happen that the application task triggers a timeout that is caught with an exception when transitioning from “Running” to “Stop”. Causes can be that file operations with the SQLite database are taking too long or that too many variables are being recorded. This usually happens on a target device with weak performance.

You can avoid the occurrence of an exception:
- Configure the trend recording with less memory demand so that the amount of data that is stored is adapted to the target system.
- Reduce the number of variables.

The editor includes the configuration for trend recording. The tree view shows the trend configuration and enables navigation there.
The top entry contains the trend name. When this entry is selected, the “Record Settings” are displayed next to it. An entry is located here for each variable whose data was recorded continuously. When a variable is selected, the “Variable Settings” are displayed next to it.

<table>
<thead>
<tr>
<th>“Add Variable”</th>
<th>When you click the link, a new entry is displayed in the trend configuration with its blank configuration below the “Variable Settings” group.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Delete Variable”</td>
<td>The selected variable is removed. Requirement: A variable is selected.</td>
</tr>
</tbody>
</table>

See also

- Command 'Edit Trend Recording'

'Recording Settings'
The data is recorded in the runtime system component by means of the functionality which is also used for the trace. The settings that appear here are the same. The options that are not required here are deactivated.

| “Task” | Task where data was recorded. Click to open a list box with all tasks available in the project. In general, the trend recording runs in the same task as the main program. For example: MainTask |
| “Recording condition” | Condition under which the application records data: |
| | - IEC variable of type INT. The condition is fulfilled for TRUE. |
| | - Bit access to an integer variable. The condition is fulfilled for 1. As read access to a property. |
| | The contents of a pointer are not permitted. |
| | Note: If no condition is defined, then the recording starts automatically. |
| “Comment” | Comment (example: Data recording of sensor A) |
| “Resolution” | Resolution that the application saves the time stamp |
| | Note: If the task where the trend object is executed has a cycle time of 1 ms or less, then you should set the resolution of the time stamp to “1 µs”. |
| “Trend Storage” | The “Trend Storage” dialog opens. |
| “Advanced” | The “Advanced Trend Settings” dialog opens. |

See also

- Chapter 6.4.1.21.4.17 “Dialog Box ‘Trend storage’” on page 2809

### Variable Settings

| **“Variable”** | Variable for recorded value. |
|               | - IEC variable with valid data type |
|               | - Property |
|               | - Reference |
|               | - Contents of the pointer |
|               | - Array element of a valid data type |
|               | - Enumeration of a valid data type |
|               | Valid data types are all standard types, except STRING, WSTRING, and ARRAY. |

| **“Parameter”** | Parameter for the recorded value |
|                | The “Input Assistant” dialog lists all valid system parameters in the “Parameters” category of the “Categories” tab. |

| **“Recording condition”** | Condition under which the application records the data of these “Variables”: |
|                         | - IEC variable of type INT. The condition is fulfilled for TRUE. |
|                         | - Bit access to an integer variable. The condition is fulfilled for 1. |
|                         | As read access to a property |
|                         | The contents of a pointer are not permitted. |
|                         | Note: If no condition is defined, then the recording starts automatically. |

| **“Attached y axis”** | Y-axis of the trend diagram that displays the “Variable”. The list box provides the standard Y-axis and the configured Y-axes. |
|                      | Requirement: This option is visible only when the “Trend” visualization element has configured additional Y-axes in the “Edit Display Settings” dialog. |

| **“Display variable name”** | : The visualization shows the name of the IEC variable in the trend diagram at runtime. Either alone or in parentheses after the “Description” |
|                           | : The name of the IEC variable is shown and does not appear in parentheses after the “Description”. |
|                           | Requirement: If any text is typed in “Description”, then you can disable the option. |

| **“Description”** | Text for the tooltip (example: Sensor A): When a visualization user focuses on the variable in the trend diagram, the visualization shows the text as a tooltip. The text is typed into the “GlobalTextList” object and can be localized there. |
|                  | When the “Display Variable Name” property is activated, then the text is supplemented with the variable name in parentheses. Example: Sensor A (PLC_PRG.iSensor_A) |
|                  | If “Description” does not contain any text, then “Display Variable Name” is enabled. The name is then alone without parentheses (for example, PLC_PRG.iSensor_A). |
|                  | If a legend is assigned to the trend, then the trend variable is labeled in the legend and shown like the trend is configured here. |

| **“Curve type”** | |
|                 | - “Line” |
|                 | - “Area”: |

| **“Graph color”** | Color of the curve in the trend diagram |

| **“Line type”** | |
|                | - “Line”: Values are linked to form a line. |
|                | - “Step”: Values are linked in the form of steps. |
|                | - “None”: Values are not linked. |
|                | Requirement: The “Curve type” is “Line”. |
**Filling type**
- "No filling"
- "Plain color"
- "Gradient"

Requirement: The “Curve type” is “Area”.

**Filling color**
- [ ] The area is filled with the selected color.

Requirement: The “Curve type” is “Area”.

**Transparency**
Value (0 to 255) for defining the transparency of the selected color

Example 255: The color is opaque. 0: The color is completely transparent

Requirement: The “Curve type” is “Area”.

**Line width**
Value (in pixels)

Example: 1

**Line style**
The display of the line is solid, dash, dot, dash-dot, or dash-dot-dot.

**Point type**
Display as scatter chart
- "Dot": Value as a dot.
- "Cross": Value as a cross.
- "None": No dot display

Hint: Select “None” for larger size data.

**Activate minimum warning**
- [ ] Warning when below the lower limit.

**Critical lower limit**
If the variable value is below the limit, then the variables are displayed with the alert color in the trend diagram.

**Color**
Warning color on falling below the limit

**Activate maximum warning**
- [ ] A warning is issued if the upper limit is exceeded.

**Critical upper limit**
If the variable value exceeds the limit, then the variables are displayed with the alert color in the trend diagram.

**Color**
Warning color on exceeding the limit

### Object 'Trend Recording Task'

**Symbol** 🔄

If you design a visualization with a “Trend” element, then CODESYS automatically extends the “Task Configuration” with a “Trend Recording Task”. The task is below an application one time at most and calls the VisuTrendStorageAccess.GlobalInstances.g_TrendRecordingManager.CyclicCall program to run the trend recording manager.

Object 'Unit Conversion'

Symbol 🡣

A "Unit Conversion" object is used to define a conversion rule. The following table lists all defined conversion rules. You can edit a conversion rule in the input fields listed below the table.

Table of conversion rules

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Name</code></td>
<td><code>&lt;name&gt;</code> : <code>&lt;name&gt;_Impl</code> is the name of the conversion rule. CODESYS automatically implements the entry as a function block <code>&lt;name&gt;_Impl</code> and instances it as <code>&lt;name&gt;</code>.</td>
</tr>
<tr>
<td><code>Type</code></td>
<td>Type of conversion rule</td>
</tr>
<tr>
<td>------------</td>
<td>----------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><code>Single scaling (offset)</code></td>
<td>Adds an offset to the input variable. Result := Input + Offset.</td>
</tr>
<tr>
<td><code>Single scaling (factor)</code></td>
<td>Multiplies the input variable by a factor. Result := Input * Factor.</td>
</tr>
<tr>
<td><code>Linear scaling 1 (factor and offset)</code></td>
<td>Converts the input variable with a factor and offset. Result := Input * Factor + Offset.</td>
</tr>
<tr>
<td><code>Linear scaling 2 (Base and target range)</code></td>
<td>Converts the input variable for the output value to be within a target range. CODESYS calculates the functional linear equation internally.</td>
</tr>
<tr>
<td><code>User defined conversion</code></td>
<td>Configures a user-defined conversion rule with IEC operators. The input variable is <code>rValue</code>.</td>
</tr>
<tr>
<td><code>Switchable conversion</code></td>
<td>Defines a conversion rule that CODESYS executes independent of any specified language or variable.</td>
</tr>
<tr>
<td><code>Setting</code></td>
<td>Displays the configured conversion rule.</td>
</tr>
<tr>
<td><code>Condition</code></td>
<td>True: CODESYS always executes the conversion. Language: If the language in the visualization is the language defined here, then CODESYS executes the conversion. The current visualization language is located in the <code>VisuElems.CurrentLanguage</code> variable. Variable: If the comparison is TRUE, then CODESYS executes the conversion rule. CODESYS can pass the comparison for a constant, variable, or IEC expression.</td>
</tr>
<tr>
<td><code>Condition Setting</code></td>
<td>If you select &quot;TRUE&quot; as the &quot;Condition&quot;, then the field is hidden. If you configure &quot;Language&quot; as the &quot;Condition&quot;, then the field shows the current configuration, for example en, de. If you select &quot;Variable&quot; as the &quot;Condition&quot;, then the field shows the current configuration, for example <code>PLC_PRG.bActual=PLC_PRG.bSet</code>. You can edit the current condition setting below the table in the &quot;Condition Setting&quot;.</td>
</tr>
</tbody>
</table>

Input field 'Single scaling (offset)'

The input variable is added with an offset.

<table>
<thead>
<tr>
<th>Offset</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>● as a number, including REAL</td>
</tr>
<tr>
<td></td>
<td>● as an IEC variable</td>
</tr>
</tbody>
</table>

Input field 'Single scaling (factor)'

The input variable is multiplied by the factor.
Input field 'Linear scaling 1 (factor and offset)'

The input variable is converted with the linear equation defined below.

| "Factor" | ● as a number, including REAL  
|          | ● as an IEC variable |
| "Offset" | ● as a number, including REAL  
|          | ● as an IEC variable |

Input field 'Linear scaling 2 (Base and target range)'

The input variable is converted to be within a target range. CODESYS internally creates a linear equation from the following input values.

| "Base start value" | Lowest possible value for the input variable.  
|                    | ● as a number, including REAL  
|                    | ● as an IEC variable |
| "Base end value"   | Highest possible value for the input variable.  
|                    | ● as a number, including REAL  
|                    | ● as an IEC variable |
| "Target start value" | Lowest possible value for the output variable.  
|                    | ● as a number, including REAL  
|                    | ● as an IEC variable |
| "Target end value" | Highest possible value for the output variable.  
|                    | ● as a number, including REAL  
|                    | ● as an IEC variable |

Example

Conversion of electric current from a 10-bit input signal to an amperage range of 4-20 mA

| "Base start value" | 0 |
| "Base end value"   | 1024 |
| "Target start value" | 4.0 |
| "Target end value" | 20.0 |

Input field 'User defined conversion'

| "Convert :=" | Conversion rule as mathematical function of rValue The input variable is rValue. |
| "Reverse :=" | Reverse function of the function defined in "Convert" |
**Input field**

Use this conversion rule when you want to apply a conversion that is language-specific or variable-dependent.

<table>
<thead>
<tr>
<th>“Switchable conversion name”</th>
<th>Selected from a list of predefined conversion rules. Double-click directly into the field for editing.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Condition setting”</td>
<td>Configured condition. Click into the input fields in “Condition setting” to edit the condition.</td>
</tr>
</tbody>
</table>

**Example**

The `Conv_A_LanguageDependent` conversion rule that defines which conversion rule is executed for the English or German language.

<table>
<thead>
<tr>
<th>“Name”</th>
<th>“Type”</th>
<th>“Setting”</th>
<th>“Condition”</th>
<th>“Condition setting”</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Conv_A_LanguageDependent</code></td>
<td>“Switchable conversion”</td>
<td><code>Conv_AInInch</code>, <code>Conv_AInMM</code></td>
<td>“Language”</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Switchable conversion name”</th>
<th>“Condition setting”</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Conv_AInInch</code></td>
<td>en</td>
</tr>
<tr>
<td><code>Conv_AInMM</code></td>
<td>de</td>
</tr>
</tbody>
</table>

Command ‘New Project’

Symbol: ☑, Shortcut: [Ctrl] + [N]

Function: This command opens the “New Project” dialog box for the creation of a new project file.

Call: “File” menu

'New Project' dialog box

Function: Selection of a project category and a project template.

Call: “File ➔ New Project”

Depending on the template, you obtain a project that is automatically equipped with a certain range of objects.

Table 465: “Categories”

<table>
<thead>
<tr>
<th>Libraries</th>
<th>Projects</th>
</tr>
</thead>
</table>

Table 466: “Templates”

<table>
<thead>
<tr>
<th>Projects” category:</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Empty project”</td>
<td>Contains only the “Project Settings” object</td>
</tr>
<tr>
<td>“Standard project”</td>
<td>Contains a basic range of objects and libraries. A wizard assists with the creation – see below.</td>
</tr>
<tr>
<td>“Standard project with Application Composer”</td>
<td>Contains a basic range of objects and libraries for working with the Application Composer. A wizard assists with the creation.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Libraries” category:</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“CODESYS container library”</td>
<td>Library that contains only further libraries, but no function blocks of its own.</td>
</tr>
<tr>
<td>“CODESYS interface library”</td>
<td>Library only for the definition of the interface of a software component. Thus contains only objects that do not generate any code (constants, structures, interfaces, etc.).</td>
</tr>
<tr>
<td>“Empty library”</td>
<td>Contains only the “Project Settings” object</td>
</tr>
</tbody>
</table>
**“External CODESYS library”**
Target-system-specific library which is implemented as part of the runtime system (in ANSI C or C++).

**“Name”**
Name of the project to be created. Depending on the template, a standard name appears. The numerical suffix ensures the uniqueness of the name in the file system.
You can change the file name, taking into consideration the file path conventions of the operating system. Periods are not permitted in names.
CODESYS automatically adds the appropriate file extension to the selected template.

**“Location”**
Location for the new project file.
[...]
opens a dialog box for browsing the file system.

displays the history of previously entered paths

**“OK”**
CODESYS opens a new project. An error symbol next to the input field draws attention to missing specifications. If you place the mouse pointer on it, a tooltip appears, informing you what to do.

---

**“Standard Project” dialog box**

**Function:** Wizard for the creation of a standard project.

**Call:** Command “File → New Project”; in the “New Project” dialog box, select the “Projects” category and the “Standard project” template and click on “OK”.

---

**“Device”**
Selection list with PLC devices. The selected device is inserted as an object in the Devices view below the root node

**“PLC_PRG in”**
Selection list with the programming languages. The automatically inserted program PLC_PRG is created in the selected language.

---

**Command ‘Open Project’**

Symbol: 🖼; shortcut: [Ctrl]+[O]

**Function:** The command opens the default dialog for loading a project. You can search for a CODESYS project in the file system and open it in the development system.

**Call:** Menu bar: “File”

---

**Dialog ‘Open Project’**

**“File type”**
Type of the CODESYS project to be loaded to the development system

**“All supported files”**
Filters by all projects which CODESYS can load

Hint: For example, you can select PRO projects which have been created with CoDeSys V2.3. These kinds of projects are also converted.

**File extension**

**project**
Filters by projects which have been created with CODESYS V3

**projectarchive**
Filters by project archives which have been created with CODESYS V3
<table>

- § Chapter 6.4.1.3.3 “Opening a V2.3 project” on page 1809

Command ‘Close Project’

Function: This command closes the currently opened project. CODESYS remains opened.

Call: “File” menu. In addition implicitly when opening a new/other project, while another project is still open.

If the project contains unsaved changes, a query appears, asking whether the project should be saved.

If you have not yet explicitly saved the project, a query appears asking whether you wish to delete the project files.

Command 'Save project'

Symbol: ⽔, shortcut [Ctrl] + [S]

Function: this command saves the project file.

Call: “File” menu

This command saves the project file with the current project name, which appears in the title bar of the main window. If the project has been changed since it was last saved, the project name is given an asterisk.

The command is not available if the project is read-only.

Write protection exists if

- the project is identified in the project information (summary) as 'Released'
- the option “Open read-only” was selected in the dialog box “Open Project” when opening the project

Write protection is indicated by a line in the top right corner of the main window. A mouse-click on this line brings up a menu with commands for the possible actions:

- “Save project under a different file name on the disk”: a mouse-click on this option leads to 'Save file as…'
- “Exit read-only mode”: appears only if the option “Open read-only” was selected when opening the project.
- “Remove read-only attribute from the project on the disk”: appears only if the project file had been provided with the property 'Read-only' on the disk at the time of opening.
- “Remove identification 'Released in the project information'”: appears only if this attribute is currently set.

Backup copy

Optionally a backup copy of the project file can be created. If the option “Create backup copy” is activated in the option dialog box 'Load and Save', the project is additionally copied to a file <projectname.backup> each time the project is saved.

- Chapter 6.4.1.6.9 “Saving the Project” on page 1831
- Chapter 6.4.1.21.4.14.17 “Dialog ‘Options’ – ‘Load and Save’” on page 2791

Command ‘Save Project as’

This command opens the standard Windows dialog box for saving a file. The project can be stored with the desired location and file type.

---

**“File type”**

For both normal projects and library projects, this drop-down list contains the respective versions of the development system for which the project can be saved. If the current project contains add-ons that are not available in the selected memory format (profile), then the “Extend Profile” dialog box opens.

- **“Project files (CODESYS v<version>) (*.project)”**: The project is saved as a CODESYS project file “<project name>.project” for the currently used or selected version of the development system.
- **“Library files (CODESYS v<version>) (*.library)”**: The project is saved as a CODESYS library file “<project name>.library” for the currently used or selected version of the development system.

If the project should be opened later in an older version, then it makes sense to save for precisely this version, as you will then be informed immediately about possible data loss.

---

**Before saving a project as a library:**

- Make sure that the rules for creating libraries have been followed.
- If it is to be possible to configure global constants provided by the library at a later time in an application, then you must define them in a parameter list. A parameter list is a special type of global variable list.
- When saving the project, no automatic check for errors is performed.
- Unlike CoDeSys V2.3, there is no distinction between 'external' and 'internal' libraries. Now you can define in the properties of each individual project object whether or not it should be treated as 'external'.
- Consider whether the library created is to be installed in the system library repository immediately. If so, then use the command ‘Save project and install in the library repository’.
- If you want to protect the library project from later changes, then set the “Released” attribute in the “Project Information” dialog box. At the next attempt to save the project, a corresponding message will be displayed and the user must respond to the write protection with deliberate actions.
- If you save the project as a version of the development system other than the one currently in use, then you will be informed first about possible data loss.

---

**Dialog box ‘Extend Profile’**

In this dialog box, the selected profile (memory format) can be extended by the add-ons that are contained in the current project. The profile is saved temporarily and then deleted after being saved or exported.

---

**“Add to profile”**

- The current profile is extended by the add-on so that the add-on data of the current project is also saved.

**“Add-on”**

- The add-on of the current project that is not contained in the selected memory format.

**“Version”**

- Version of the “Add-on” included in the current profile.
  - If several versions are installed, then the version can be selected.
“Save profile” Opens the “Enter Profile Name” dialog box. In this dialog box, specify the name for the new profile. The new profile is saved permanently at $ProgramData$/PRODUCT$/CustomInformationalProfiles.

“Use saved profile” The profile which was permanently saved in “Save profile” is used for saving or exporting the current project.

- Chapter 6.4.1.17.3 “Information for Library Developers” on page 2035
- Chapter 6.4.1.21.3.2.6 “Command ‘Save Project and Install into Library Repository’” on page 2556

Command ‘Save Project and Install into Library Repository’

Function: this command saves the project as a library in the 'system' library repository.

Call: Main menu “File”.

With this command CODESYS saves the project as a library in the 'system' library repository. This is an extension to the saving of a project as a library file using the “Save Project as” command. The library is installed on the local system and is immediately available for insertion into a project.

See also
- Chapter 6.4.1.21.3.2.5 “Command ‘Save Project as’” on page 2555

Command ‘Save Project as Compiled Library’

Function: The command saves a library project in encrypted form.

Call: Menu bar: “File”

The command opens the default dialog for saving a file in the file system. The “Compiled CODESYS Libraries” file type is already preset. The file extension is .compiled-library-v3 or .compiled-library (CODESYS < SP15). In this format, then source code of the library POU is not visible when the library is used in a project.

If the “Enforce signing of compiled libraries” option is selected in the “Security Screen” view on the “User” tab, then a library project has to be provided with a digital certificate-based signature when being saved. When a suitable certificate is available, it is provided in the “Security Screen” on the “User” tab in the “Digital Signature” section. In the “Project Information”, on the “Summary” tab, a “Library compatibility” with a CODESYS version >= V3 SP15 is set by default. In this case, the project file is stored with the file extension .compiled-library-v3 when being saved as a compiled and signed library. If you still have not specified a suitable valid certificate for your user profile in the “Security Screen”, then a dialog prompt opens next for you to do this. Afterwards, you can execute the save command again.

In all other respects, compiled library files behave just like *.library files, and therefore they can be installed and referenced with the same steps.

We recommend the use of compiled libraries signed with certificates. Besides the protection of the source code and the unauthorized use of a library, less memory is also used which therefore results in shorter loading times.
If you have the corresponding help files with translations, then as of CODESYS V3 SP15 you can extend the library documentation with the translation into other languages. This is done as follows:

Place the files created for the new languages \_lmd\_<language>.aux in a directory <library name>\_lmd parallel to the library project <library name>\_compiled-library-v3. If the files are correct, then they are included in the compiled library file when saving the library project by means of the “Save Project as Compiled Library” command.

Example: The directory standard.lmd is exists parallel to the library file standard\_compiled-library-v3 and contains the file \_lmd\_fr.aux with the French translation of the library documentation. After the compiled library is saved, the French version of the documentation is also available in the Library Manager.

Command ‘Save/Send Archive’

Function: This command opens the dialog “Project Archive” for the configuration of project archives.

Call: Menu bar: “File ➔ Project Archive”

An archive file (*.projectarchive) contains all files contained and referenced in the currently opened project. It can either be saved or dispatched as an e-mail attachment. The dispatch by email is very helpful for providing an employee with all project-relevant files. The file can be simply unpacked again with the command “Extract Archive”.

Notice!
The archiving function is not intended for the storage of a project, but rather for the simple summarizing of all project-relevant files.

- Chapter 6.4.1.6.10 “Saving/Sending the project archive” on page 1832
- Chapter 6.4.1.21.3.2.9 “Command ‘Extract Archive’” on page 2558

Dialog ‘Project Archive’
The dialog displays all the categories that can be added to the project archive. In this dialog, complete categories or individual objects from the categories can be added to the project archive by setting a check mark (✓).

Entries that are displayed as red in the list require your attention. Move the mouse pointer over this library for more information.
**“Additional Files”**
Opens the dialog “Additional Files”. Here, further files can be added to the archive with the “Add” button.

**“Comment”**
Opens the “Comment” dialog. Here, comments can be added to the archive.

**“Save”**
Creates the archive file and saves it. The storage location and the archive name are specified in the subsequent dialog.

**“Send”**
Creates a temporary archive file that is attached to an empty e-mail. A correct installation of the MAPI (Messaging Application Programming Interface) is required for the successful execution of this operation. Failure is documented by the display of a corresponding error message. The temporary archive is automatically deleted after sending the e-mail.

### Command 'Extract Archive'

**Function:** The command extracts a project archive, that was created with the command “Save/Send Archive”. You have to configure which objects of the archive CODESYS shall extract and in which directory of the file system they will be copied.

**Call:** Main menu “File ➔ Project Archive”

The file extension of an archive is `.projectarchive`.

After the archive is selected, the dialog “Extract Project Archive” opens to configure the extract parameters.

#### Dialog Box 'Extract Project Archive'

This dialog box shows the contents of the project archive. You can exclude complete categories or single objects from categories by clearing the check boxes (☑) from the extraction.

<table>
<thead>
<tr>
<th>Table 467: “Locations”</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Extract into the same folder where the archive is located”</td>
</tr>
<tr>
<td>“Extract into the following folder”</td>
</tr>
<tr>
<td>“Advanced”</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>

Command 'Source Upload'

**Function:** This command loads the project source code (as project archive) from the controller.

**Call:** Main menu “File”.

**Requirement:** The network path for the controller must be configured.

After you execute the command, an overview opens with all devices in the network. Select a controller from this overview. The dialog box “Extract Project Archive” then opens with export settings.

</tr>
</tbody>
</table>
**Command 'Source Download'**

**Function:** This command loads the project source code (as project archive) to the controller.

**Call:** Main menu “File”.

**Requirement:** The network path for the controller must be configured.

After you execute the command, an overview opens with all devices in the network. Select a controller from this overview. Then the Archiv.prj project archive is downloaded to this controller. You can click “Source Upload” to upload the complete source code to the CODESYS development system at a later time.

If you are already connected to a controller (in online mode), then the “Source Download to Connected Device” command is also available for this process.

### Standard Commands

CODESYS provides the following standard commands:
Command 'Find', 'Find in Project'

Symbol ⇤: keyboard shortcut: [Ctrl]+[F]
Symbol ⇧: keyboard shortcut [Ctrl]+[Shift]+[F]

Function: These commands scan the project or parts of it for a specified character string.

Call: Menu bar: “Edit ➔ Find Replace”

This command opens the “Find” dialog where the searched character string is specified and the search options are defined.

Dialog 'Find'

| “Search for” | Character string to be searched. |
| “Match case”: | ✓: The search considers uppercase and lowercase. |
| “Match whole word”: | ✓: Only character strings are found that exact matches. |
| “Search up”: | ✓: The specified search range runs upwards. |
| “Use regular expressions”: | Use the button to receive support when specifying regular expressions. |
| “Search in” | ✓: Drop-down list with the areas of the project to be searched: |
| | ● “Active editor” |
| | ● “All open editors” |
| | ● “Selected objects & Subobjects” |
| | ● “Entire project” |
| | ● “Entire project & Uncompiled libraries” |
| | ● “Selection only” |
| | Opens a dialog where you set the areas of the project to be searched (see below) |
| “Find next” | Start the search |
| “Find all” | All search results are listed in the message view with their object path, project name, object name, and object position. Possible additional information for position: “(Decl)” = Declaration part of the object; “(Impl)” = Implementation part of the object |
| | Double-clicking the entry in the list opens the match position in the respective object editor. |
| “Replace” | Switches to the “Replace” dialog |
The color of the search result markings can be customized in the options of the text editor. This is done by means of the parameter “Selection color” - “Inactive” in the “Text Area” tab.

### Command ‘Replace’, ‘Replace in Project’

Symbol ⋆; keyboard shortcut: [Ctrl]+[H]
Symbol ⋆, keyboard shortcut [Ctrl]+[Shift]+[H]

**Function:** These commands scan the project or parts of it for a specified character string and replaces it.

**Call:** Menu bar: “Edit ➤ Find Replace”

**Requirement:** The application is in online mode.

This command opens the “Replace” dialog where the search and replace character strings are specified and the search options are defined.

### Table 473: In addition to the options of the “Search” dialog, the following settings are still possible:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Replace with”</td>
<td>Input field for the new character string.</td>
</tr>
<tr>
<td>“Replace”</td>
<td>Each next found string is highlighted in the editor and replaced (step-by-step replace).</td>
</tr>
</tbody>
</table>
**Replace all**

All found strings are replaced at one time without them being displayed in the editors.

**“Leave changed objects open after "Replace all"”**

The editors of the found objects remain open.

---

Replacement in referenced libraries is not possible.

---

**Command ‘Find Next (Selection)’**

Keyboard shortcut [Ctrl] + [F3]

**Function:** The command searches the project for the next string matching the string which is currently selected or in which you have currently placed the cursor.

**Call:** Menu “Edit ➤ Find Replace”

**Requirement:** You have the cursor placed in an editable string in your project, or you have selected an editable string.

Command 'Insert File as Text'

**Function:** This command copies the contents of a text file to the active editor as the current cursor position.

**Call:** The command is not in any menu by default. You can add it to a menu by using the dialog box from “Tools ➤ Customize” (command category “Text Editor”).

**Requirement:** The file must have the extension .txt. The command is available in a text editor only.

Many development environments and text processing applications provide the option of exporting code and text as a plain text file. This command can copy the contents of this file to the editor.

See also
- Chapter 6.4.1.21.4.14.26 “Dialog 'Options' - 'Text Editor’” on page 2798

Command 'Overwrite Mode'

**Shortcut:** [Insert]

**Function:** This command activates the overwrite mode.

**Call:** Menu “Edit ➤ Advanced”

**Requirement:** A text editor is opened.

If the overwrite mode is activated, characters in front of the cursor are overwritten when entering new characters. If the overwrite mode is deactivated, characters are inserted and existing characters in front of the cursor are retained.

See also
- Chapter 6.4.1.21.4.14.26 “Dialog 'Options' - 'Text Editor’” on page 2798

Command 'View Whitespace'

**Symbol:**  

2566
**Function:** This command causes control characters for spaces and tabs to be shown.

**Call:** Menu “Edit ➔ Advanced”

**Requirement:** A text editor is opened.

CODESYS visualizes spaces by a period and tabs by an arrow.

See also
- Chapter 6.4.1.21.4.14.26 “Dialog ‘Options’ - ‘Text Editor’” on page 2798

---

Command **'View Indentation Guides'**

**Function:** This command activates the indentation help lines.

**Call:** Menu “Edit ➔ Extended”

**Requirement:** A text editor is opened.

If the indentation help lines are activated, a broken line is inserted for each manual indentation in the code. This facilitates the overview of the different levels in the code. You can insert manual indentations with the [Tab] key.

See also
- Chapter 6.4.1.21.4.14.26 “Dialog ‘Options’ - ‘Text Editor’” on page 2798

---

Command **'Go to Line'**

**Function:** With this command the cursor jumps to a defined line in the code.

**Call:** Menu “Edit ➔ Extended”

**Requirement:** A text editor is opened.

This command opens a dialog box with an input field “Line number”.

See also
- Chapter 6.4.1.21.4.14.26 “Dialog ‘Options’ - ‘Text Editor’” on page 2798

---

Command **'Make Uppercase'**

**Shortcut:** [Ctrl]+[Shift]+[U]

**Function:** This command converts all lowercase letters in the selected code into uppercase letters.

**Call:** Menu “Edit ➔ Advanced”

**Requirement:** A text editor is opened and code is selected, or the declaration editor is opened and variable declarations are selected.

See also
- Chapter 6.4.1.21.4.14.26 “Dialog ‘Options’ - ‘Text Editor’” on page 2798

---

Command **'Make Lowercase'**

**Shortcut:** [Ctrl]+[U]

**Function:** This command converts all uppercase letters in the selected code into lowercase letters.

**Call:** Menu “Edit ➔ Advanced”
**Requirement:** a text editor is opened and code is selected, or the declaration editor is opened and variable declarations are selected.

See also

- Chapter 6.4.1.21.4.14.26 “Dialog ‘Options’ - ‘Text Editor” on page 2798

**Command ‘Go to Matching Bracket’**

**Function:** This command makes the cursor jump to the other part of the selected code parenthesis.

**Call:** Menu “Edit ➔ Advanced”

**Requirement:** A text editor is opened and the cursor is positioned at an opening or closing code parenthesis. If you position the cursor at a code parenthesis, CODESYS displays the corresponding parenthesis in color, provided you have activated the option “Associated parentheses” in the CODESYS options in the “Text Editor” category, “Text Area” tab.

See also

- “Tab ‘Text Area” on page 2799

**Command ‘Select to Matching Bracket’**

**Function:** This command selects the entire code section within the currently selected code parentheses.

**Call:** Menu “Edit ➔ Extended”

**Requirement:** A text editor is opened and the cursor is positioned at an opening or closing code parenthesis. If you position the cursor at a code parenthesis, CODESYS displays the corresponding parenthesis in color, provided you have activated the option “Associated parentheses” in the project options in the “Text Editor” category, “Text Area” tab.

See also

- Chapter 6.4.1.21.4.14.26 “Dialog ‘Options’ - ‘Text Editor” on page 2798

**Command ‘Expand All Folds’**

**Function:** This command expands all collapsed code segments in the textual editor or result locations in the cross-reference list so that the code and all search locations are displayed in full again.

**Requirement:** A textual editor is active and indentation is activated in the “Options” (“Text Editor” category); or the cross-reference list is active.

**Call:** Textual editors: main menu “Edit ➔ Advanced”, or right-click. In the cross-reference list: right-click.

See also

- Chapter 6.4.1.21.4.14.26 “Dialog ‘Options’ - ‘Text Editor” on page 2798
- Chapter 6.4.1.21.3.3.18 “Command ‘Collapse All Folds’” on page 2568
- “Right-click commands in the cross-reference list” on page 2589

**Command ‘Collapse All Folds’**

**Function:** This command collapses all expanded code segments in the textual editor or result locations in the cross-reference list. In this way, only the uppermost level of code and only the root node of the result locations displayed.
**Requirement:** A textual editor is active and indentation is activated in the “Options” (“Text Editor” category); or the cross-reference list is active.

**Call:** In textual editors: main menu “Edit ➔ Advanced”, or right-click. In the cross-reference list: right-click.

Command 'Comment Out Selected Lines'

Symbol //; keyboard shortcut: [Ctrl]+[O]

**Function:** The command inserts comment marks ('//') at the beginning of the selected lines.

**Call:** Menu bar: “Edit ➔ Advanced”; context menu

**Requirement:** In the ST editor, either the cursor is located in a line of the implementation or multiple lines are selected.

See also

- % Chapter 6.4.1.21.3.3.20 “Command ‘Uncomment Selected Lines’” on page 2569

Command 'Uncomment Selected Lines'

Symbol ///; keyboard shortcut: [Ctrl]+[I]

**Function:** The command removes any comment marks ('//') at the beginning of the selected lines.

**Call:** Menu bar: “Edit ➔ Advanced”; context menu

**Requirement:** In the ST editor, either the cursor is located in a line of the implementation or multiple lines are selected.

See also

- % Chapter 6.4.1.21.3.3.19 “Command ‘Comment Out Selected Lines’” on page 2569

Command 'Enable Inline Monitoring'

**Function:** This command enables or disables the inline monitoring function. This works the same way as the check box with the same name in the CODESYS options (“Text Editor” category).

**Requirement:** A text editor is active.

**Call:** Context menu of the text editor in the “Advanced” submenu.

Command 'Toggle Bookmark'

Symbol [], keyboard shortcut [Ctrl]+[F12]

**Function:** The command sets or removes a bookmark at the current position.

**Call:** Menu bar: “Edit ➔ Bookmarks”
Requirement: A POU is open in the editor and the cursor is at a program line.
See also
- Chapter 6.4.1.9.14.3 “Setting and using bookmarks” on page 1908

Command 'Next Bookmark (Active Editor)'
Symbol: ; keyboard shortcut: [F12]
Function: The command jumps to the next bookmark in the active editor.
Call: Menu bar: “Edit ➞ Bookmarks”
Requirement: A POU is open in the editor and the cursor is positioned in the POU.
See also
- Chapter 6.4.1.21.3.3.24 “Command ‘Next Bookmark’” on page 2570
- Chapter 6.4.1.9.14.3 “Setting and using bookmarks” on page 1908

Command 'Next Bookmark'
Symbol: 
Function: The command jumps to the next bookmark in the “Bookmarks” view and in the project, and opens the respective POU. The order of jumping to bookmarks corresponds to the order of bookmarks in the table of the “Bookmarks” view.
Call:
- “Next Bookmark” button in the “Bookmarks” view
- The command is not in any menu by default. You can add it to a menu by using the dialog from “Tools ➞ Customize” (command category “Bookmarks”).
Requirement:
- A project is open.
- The “Bookmarks” view is open.
See also
- Chapter 6.4.1.21.3.3.23 “Command ‘Next Bookmark (Active Editor)’” on page 2570

Command 'Previous Bookmark (Active Editor)'
Symbol: ; keyboard shortcut: [Shift]+[F12]
Function: The command jumps to the previous bookmark in the active editor.
Call: Menu bar: “Edit ➞ Bookmarks”
A POU is open in the editor and the cursor is positioned in the POU.
See also
- Chapter 6.4.1.21.3.3.26 “Command ‘Previous Bookmark’” on page 2570
- Chapter 6.4.1.9.14.3 “Setting and using bookmarks” on page 1908

Command 'Previous Bookmark'
Symbol: 
Function: The command jumps to the previous bookmark in the “Bookmarks” view and in the project, and opens the respective POU. The order of jumping to bookmarks corresponds to the order of bookmarks in the table of the “Bookmarks” view.
Call:

- "Next Bookmark" button in the "Bookmarks" view
- The command is not in any menu by default. You can add it to a menu by using the dialog from "Tools ➔ Customize" (command category "Bookmarks").

Requirement:

- A project is open.
- The "Bookmarks" view is open.

Command 'Clear All Bookmarks (Active Editor)'

Symbol: 📌

Function: The command deletes all bookmarks in the active editor.

Call: Menu bar: "Bookmarks"

Requirement: A POU is open in the editor and the cursor is positioned in the POU.

See also

- ☞ Chapter 6.4.1.21.3.3.28 “Command 'Clear All Bookmarks'” on page 2571
- ☞ Chapter 6.4.1.9.14.3 “Setting and using bookmarks” on page 1908

Command 'Clear All Bookmarks'

Symbol: 📌

Function: The command deletes all bookmarks in the open project.

Call: The command is not in any menu by default. You can add it to a menu by using the dialog from "Tools ➔ Customize" (command category "Bookmarks").

Requirement: A POU is open in the editor and the cursor is positioned in the POU.

See also

- ☞ Chapter 6.4.1.21.3.3.27 “Command 'Clear All Bookmarks (Active Editor)’” on page 2571
- ☞ Chapter 6.4.1.9.14.3 “Setting and using bookmarks” on page 1908

Command 'Browse Cross References'

Symbol: 📊

Function: The command shows all occurrences of a variable in the "Cross Reference List" view.

Call: Menu bar: "Edit ➔ Browse”; cross reference view: toolbar

Requirement: A POU is open in the editor and the cursor is set at a variable. Or the "Cross Reference List" view is open and a variable is specified in the "Name" field.

See also

- ☞ Chapter 6.4.1.21.3.3.30 “Command 'Browse Global Cross References’” on page 2571

Command 'Browse Global Cross References'

Symbol: 📊
**Function:** The command shows all occurrences of all variables with the same name in the “Cross Reference List” view. In contrast to the “Browse Cross References” command, these can be different variables.

**Call:** Menu bar: “Edit ➤ Browse”; cross reference view: toolbar

**Requirement:** A POU is open in the editor and the cursor is set at a variable. Or the “Cross Reference List” view is open and a variable is specified in the “Name” field.

See also
- § Chapter 6.4.1.9.14.1 “Using the cross-reference list to find occurrences” on page 1906
- § Chapter 6.4.1.21.3.3.29 “Command ‘Browse Cross References’” on page 2571

---

**Command 'Browse Call Tree’**

Symbol:  

**Function:** The command opens the view “Call Tree”, which displays the calls of a module and also its callers.

**Call:**
- Menu “Edit ➤ Browse”
- Context menu, see below: Requirement

**Requirement:** A module is opened in the editor and the cursor is placed in a variable, or a module is selected in the “Devices” view or in the “POUs” view.

See also
- § Chapter 6.4.1.21.3.4.16 “Command ‘Call tree’” on page 2590

---

**Command 'Auto Declare'**

Keyboard shortcut: [Shift]+[F2]

**Function:** The command opens the “Auto Declare” dialog, which supports the declaration of a variable.

**Call:** Menu bar: “Edit”

**Requirement:** An object or a device of the project is opened in the editor.

With the auto-declaration function, the “Auto Declare” dialog also appears when the cursor is located in the implementation part of a POU in a line containing the name of an undeclared variable. The requirement for this is that you must have clicked “Tools ➤ Options” and enabled the “Declare unknown variables automatically (AutoDeclare)” option in the “SmartCoding” category.

With the smart tag function, the “Auto Declare” command also appears when you place the cursor over an undeclared variable in the implementation part of the ST editor and then click ![tag].

---

**Dialog 'Auto Declare’**

<table>
<thead>
<tr>
<th>“Scope”</th>
<th>Scope of the variable that is not declared yet.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Example: VAR (default setting for local variables)</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Name”</th>
<th>Variable name not declared yet</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Example: bIsValid</td>
</tr>
</tbody>
</table>

---

2572 3ADR010583, 1, en_US 2024/01/05
| **“Type”** | Example: BOOL  
- glVertex: Lists the standard data types.  
- &lt; Input Assistant &gt;: Opens the “Input Assistant” dialog  
- &lt; Array Assistant &gt;: Opens the “Array” dialog |
| **“Object”** | Object where the new variable is declared. By default, the object that you are editing now.  
Example: fbA  
- &: Lists that objects where the variable can be declared.  
If no objects are available for the selected “Scope”, the entry “<create object>” appears. When you select the “<create object>” entry, the “Add Object” dialog opens for generating a suitable object. |
| **“Initialization”** | Example: FALSE  
If you do not specify an initialization value, then the variable is initialized automatically.  
- &gt;: Opens the “Initialization Value” dialog. This procedure is helpful for the initialization of structured variables. |
| **“Address”** | Memory address of the application for the variable that is not declared yet.  
Example: %IX1.0  
Note:  
Possible only for the following scopes:  
- Local variable (VAR)  
- Global variable (VAR_GLOBAL)  
- Or for a persistent variable (PERSISTENT). |
| **“Flags”** | Attribute keywords  
- CONSTANT: Keyword for a constant.  
- RETAIN: Keyword for a remanent variable.  
- PERSISTENT: Keyword for a persistent variable (stricter than RETAIN).  
The selected attribute keyword is added to the variable declaration. |
| **“Comment”** | Example: New input In1  
In the tabular declaration editor, the comment entered is displayed in the “Comment” column, while in the textual declaration editor it is displayed above the variable declaration. |
| **“Apply changes using refactoring”** | &gt;: When you exit the dialog, the variable is not declared yet, but then it opens the “Refactoring” dialog. You can continue editing your changes here.  
The option appears for the following scopes:  
- Input variable (VAR_INPUT)  
- Output variable (VAR_OUTPUT)  
- VAR_IN_OUT variables (input variable and output variable) |
| **“OK”** | The variable is declared and appears in the declaration.  
Example:  
```
VAR RETAIN  
// New input In1  
xIn1 AT %IX1.0: BOOL := FALSE;  
END_VAR
``` |
Dialog 'Array'

| "Ranks and base type specification" | Definition of the field sizes ("Dimension") by entering the lower and upper limits and the "Base type" of the array. You can enter the basic type directly or with the help of the "Input Assistant" or "Array" dialogs when you click the button. |
| "Result" | Display of the defined array |

NOTICE!
CODESYS reinitializes variables only if you have modified the initialization values of the variables.

Dialog 'Initialization Value'

| List of the variables with name ("Expression"), "Initialization Value" and "Data Type". Modified initialization values are displayed in bold fonts. |
| Input field below the list | Input of an initialization value for the selected variable(s) |
| "Apply value to selected lines" | Change of the initialization value of the selected line(s) according to the value of the input field |
| "Reset selected lines to default values" | Resets the default initialization values |
| "OK" | CODESYS applies the initialization values in the "Auto Declare" dialog. |

In the case that the variable to be initialized by means of this dialog is a function block instance with an extended FB_Init method, an additional table is displayed above the "Initialization Value" table. The additional FB_Init parameters are listed in this table. The meaning and operation essentially correspond to the lower table with the following differences:

- All variables have to be assigned with initialization values. Otherwise "OK" remains disabled.
- For complex data types (structures, arrays), no components contained within are displayed (type cannot be expanded). In this case, the complex type has to be initialized with a corresponding variable.

For FB_Init parameters configure this way, a corresponding symbol is displayed after the initialization value in the "Auto Declare" dialog.

- Chapter 6.4.1.21.4.14.22 “Dialog 'Options' - 'Refactoring’” on page 2794
- Chapter 6.4.1.20.1.4.1 “ST Editor” on page 2049

Command 'Input Assistant'

Symbol:  
keyboard shortcut: [F2]

Function: This command opens the “Input Assistant” dialog which helps you to select one of the possible programming elements at the current cursor position.

Call: Menu bar: "Edit", context menu.

Requirement: A POU is open in the editor and the cursor is at a program line.
The input assistant provides all program elements that you can insert at the current cursor position in the editor.

The elements are sorted by “Categories”. In the category “Variables”, you can also set a “Filter” for the scope, for example “Local variables”, “Global variables”, or “Constants”.

"Structured view"  
☑️: The elements are displayed in a structure tree. You can show/hide the columns “Type”, “Address”, and “Origin” by right-clicking the column title and selecting/clearing the column name in the dropdown list.  
☐: The elements are displayed in a flat structure.

"Show documentation"  
☑️: The dialog is extended with the “Documentation” field.

"Insert with arguments"  
☑️: Elements that include arguments (for example, functions) also insert with these arguments at the cursor position.  
Example: If you insert the function block fb1, which contains an input variable fb1_in and an output variable fb1_out, “with arguments”, then this appears in the editor as follows: fb1(fb1_in:= , fb1_out=> ).

"Insert with namespace prefix"  
☑️: Inserts the selected element with the appended namespace. In the case of library modules, the check box remains disabled if the requirement for a namespace has been defined in the library properties.

If you create objects with the same name in the same category, whether globally (“POUs” view) or assigned to an application (“Devices” view), then only one entry appears in the input assistant. The usage conforms to the usual call priority (application assigned before global).

This tab allows you to search for specific objects. When you begin typing a search string into the search field, the names of all objects are listed whose names include the search string. Double-click an object to insert it at the current cursor position in the editor.

"Filters"  
Limits the search to a specific variable category

Command 'Next Message'  
Keyboard shortcut: [F4]  
**Function:** This command selects the next message in the messages view.  
**Call:** Main menu “Edit”.  
If the last message in the list has been reached, then the marking jumps to the beginning.  
See also  
●  Chapter 6.4.1.21.3.3.36 “Command 'Previous Message’” on page 2576  

Command 'Previous Message'  
Keyboard shortcut: [Shift]+[F4]  
**Function:** This command selects the previous message in the messages view.  
**Call:** Main menu “Edit”  
If the first message in the list has been reached, then the marking jumps to the end.  
See also  
●  Chapter 6.4.1.21.3.3.35 “Command 'Next Message’” on page 2576  

Command 'Go to Definition'  
**Symbol:**  
**Function:** This command shows the definition locations of a variable or function.  
**Call:** Main menu “Edit ➔ Browse”  
**Requirement:** A POU is open in the editor and the cursor is at a variable or function.  
See also  
●  Chapter 6.4.1.9.14.2 “Finding declarations” on page 1908  

Command 'Go To Reference'  
**Symbol:**  
**Function:** The command opens the declaration location of the variable that is referenced by the pointer currently in focus in online mode.  
**Call:**  
●  Context menu in the declaration part or implementation code  
●  Menu bar: “Edit ➔ Browse”  
**Requirement:** Online mode. A POU is open in the editor and the cursor is at a pointer. The referenced variable is stored in static memory.  

If the pointer does not point exactly to the beginning of the variable, then a corresponding message is displayed when you switch to the variable declaration.  

See also  
●  Chapter 6.4.1.20.5.13 “Pointers” on page 2243
Command 'Go to Instance'

Symbol: *\rightarrow*

**Function:** This command opens the instance of a function block in a new window.

**Call:** Menu bar: “Edit \rightarrow Browse for Symbol”

**Requirement:** The application is in online mode. A POU is open in the editor and the cursor is at an instance of a function block.

The command is not available for temporary instances or instances from compiled libraries.

Command 'Refactoring' - 'Rename <...>''

**Function:** This command opens a dialog box for renaming an object or variable across the project.

**Call:** Main menu “Edit \rightarrow Refactoring” or right-click.

**Requirement:** An object is selected in the device tree or in the “POUs” view, or the cursor is placed before or on a variable identifier in the declaration section of a programming object.

You can rename the following:
- Variables
- POU
- GVLs
- Methods
- Properties
- Devices
- Variables and unit conversions in the unit conversion edit

Dialog box 'Rename'

<table>
<thead>
<tr>
<th>“Current name”</th>
<th>Name of the object or variable</th>
</tr>
</thead>
<tbody>
<tr>
<td>“New name”</td>
<td>Input field for a new name.</td>
</tr>
<tr>
<td></td>
<td>If the name already exists, then CODESYS reports this directly below this input field.</td>
</tr>
<tr>
<td>“OK”</td>
<td>Can be activated if you have typed a valid name in “New name”.</td>
</tr>
<tr>
<td></td>
<td>Opens the “Refactoring” dialog box.</td>
</tr>
<tr>
<td></td>
<td>The affected objects and occurrences are highlighted in both views.</td>
</tr>
<tr>
<td></td>
<td>You can determine how to handle the occurrences in each view by right-clicking the occurrences and clicking the available commands.</td>
</tr>
</tbody>
</table>

Dialog box 'Refactoring'

This dialog box displays all occurrences in the project.

The affected objects and occurrences are highlighted in both views.

| Right view | Displays the occurrence within an object where “Current name” occurs. |
| Left view  | Device tree of the project with the object. |
You can determine how to handle the occurrences in each view by right-clicking the occurrences and clicking the available commands.

- Chapter 6.4.1.9.16 “Refactoring” on page 1910

**Command 'Refactoring' - 'Update Referenced Pins'**

**NOTICE!**
Currently, this command applies only to the CFC, FBD, LD, and IL editors. It is a combination of the “Reset Pins” and “Update Parameters” commands.

**Function:** This command modifies the pins according to the latest block declaration in all affected occurrences of the block.

**Call:** Main menu “Edit ➔ Refactoring” or right-click.

**Requirement:** The cursor is placed in the name of the block in the first line of the block declaration or in the device tree.

See also

- Chapter 6.4.1.9.16 “Refactoring” on page 1910
- Chapter 6.4.1.21.3.13.24 “Command 'Reset Pins’” on page 2694
- Chapter 6.4.1.21.3.14.38 “Command 'Update Parameters’” on page 2710

**Command 'Refactoring' - 'Add Variable’**

**Symbol:** ![add-variable]

**Function:** This command enables the declaration of variables in a POU, as well as the automatic update to the occurrence of the POU.

**Call:** Main menu “Edit ➔ Refactoring”, or right-click.

**Requirements:** The declaration part is in focus.

The command opens the default dialog box for declaring variables.

See also

- “Dialog 'Auto Declare’” on page 2572

**Dialog box 'Re-factorizing'**

After clicking “OK” to close the declaration dialog, the “Refactoring” dialog box opens with two frames.
## Refactoring

**Right dialog frame**  Declaration part and implementation of the POU where the variable is added. Colored highlighting of changed locations: New added declarations have a blue font and are highlighted in yellow (1).

**Left dialog frame**  Device tree or POUs tree of the project. Colored highlighting of blocks where the POU is used: red font and yellow highlight (2). After you double-click the POU object, the detail view opens.

Before you decide which changes to accept at which locations, select the required option from the drop-down list (3) at the upper right part of the window:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Add inputs with placeholder text</strong></td>
<td>Default placeholder text: <code>_REFACTOR_</code>; editable</td>
</tr>
<tr>
<td></td>
<td>The placeholder text defined here is used at the occurrence locations of the new added variables in the implementation code. This is used for searching for the affected locations.</td>
</tr>
<tr>
<td><strong>Add inputs with the following value</strong></td>
<td>Initialization value for the new variable.</td>
</tr>
</tbody>
</table>

You can accept or reject changes by right-clicking the changed locations or by executing commands in the left or right area of the dialog box. Refer to the description of the “Refactoring ➔ Rename” command.
1. By refactoring, the `fun` block receives a new input variable `input3` with the initialization value 1. The change has the following effect:

Before:
```plaintext```
fun(a + b, 3, TRUE);
fun(input1 := a + b , input2 := 3 , inputx := TRUE);
```plaintext```

After:
```plaintext```
fun(a + b, 3, 1, TRUE);
fun(input1 := a + b , input2 := 3 , _REFACTOR_, inputx := TRUE);
```plaintext```

2. By refactoring, the "fun" block receives a new input variable `input3` with the placeholder text "_REFACTOR_":

Before:
```plaintext```
inst(input1 := a + b, input2 := 3, inputx := TRUE);
fun(a + b, 3, TRUE);
```plaintext```

After:
```plaintext```
inst(input1 := a + b, input2 := 3, input3 := _REFACTOR_, inputx := TRUE);
fun(a + b, 3, _REFACTOR_, TRUE);
```plaintext```

---

**Examples**

See also

- § Chapter 6.4.1.9.16 “Refactoring” on page 1910
- § Chapter 6.4.1.21.3.3.40 “Command 'Refactoring' - 'Rename <...>’” on page 2577

---

**Command 'Refactoring' - 'Remove <variable>’**

**Symbol:**

**Function:** This command removes an input or output variable from the POU and all occurrences of the POU.

**Call:** Main menu “Edit ➔ Refactoring”, or right-click.

**Requirements:** In the declaration part of the POU, the cursor is located in the identifier of the variable to be removed.

Then, the command opens a dialog box with information about the removal. After you confirm this, the “Refactoring” dialog box opens. For a description of the “Refactoring” dialog box, refer to the “Edit ➔ Refactoring ➔ Rename” help page.

When you accept the changes in the “Refactoring” dialog box, the respective input and output parameters are deleted at the occurrence locations of the affected POU.

**In CFC, only the connection is removed between the removed input or output to the block. The input or output itself remains in the chart.**

---

**Example in ST**

In a POU, refactoring removes the `input4` input variable. The occurrences are updated automatically:

Before removal:
```plaintext```
inst(input1 := a + b, input2 := 3, input4 := 1, input5 := TRUE);
fun(a + b, 3, 1, TRUE);
```plaintext```

After removal:
```plaintext```
inst(input1 := a + b, input2 := 3, input5 := TRUE);
fun(a + b, 3, TRUE);
```plaintext```
Command 'Refactoring' - 'Reorder Variables'

Symbol: \[\text{\textbullet}\]

Function: This command allows changing the order of variables in the declaration editor for the selected scope: VAR_INPUT, VAR_OUTPUT, or VAR_IN_OUT.

Call: “Edit \rightarrow Refactoring”; context menu of the focused scope in the declaration editor.

Requirement: One of the above scopes is selected in the declaration, and more than one variable is declared in it.

The command opens the “Reorder” dialog box with a list of all declarations of the selected scope. You can drag a selected declaration up or down to another position.

See also
- Chapter 6.4.1.9.16 “Refactoring” on page 1910

Command 'Advanced' - 'Format Document'

Symbol: \[\text{\textbullet}\]

Function: The command starts an automatic formatting of the code in the open ST editor.

Call: Menu bar: “Edit \rightarrow Advanced”; context menu of the window in focus in the ST editor

Requirement: The focus is in the ST editor. The syntax of the ST code does not contain any errors.

The following formatting is performed automatically:
- Keywords are converted to uppercase letters.
- Spacing is standardized.
- Indentations are changed according to syntax.
- Long lines are wrapped in sensible places.

Standard Menu in View 'Devices', 'POUs', 'Modules'

The views “Devices”, “POUs” and “Modules” provide the button ☐ in the top right corner to open a menu with the following commands:

- “Open in editor”: Opens the selected object in the corresponding editor.
- “Find object”: Opens the dialog “Find Object” for the object tree. Starting to enter a search string all matching objects will be displayed with their path. Use the button “Open” to open the selected search result in the editor.
- “Sort by type”: Sorts the objects in the view alphabetic by type.
- “Sort by name”: Sorts the objects in the view alphabetic by name.
- “Sort ascending”: Displays the chosen sorting in ascending order.
- “Sort descending”: Displays the chosen sorting in descending order.
- “Track active editor”: CODESYS selects the object, that is opened in the active editor, in the device tree of the view.

Command 'Devices'

Symbol: ☐ view: [Alt] + [0]

Function: The command opens the view “Devices” in the CODESYS main window. The view contains the project's "device tree", where you configure your applications

Button ☐ opens the standard menu for navigating in the tree view.

Call: Menu “View”
Command ‘POUs’

Symbol: [POU]. Shortcut: [Alt] + [1]

Function: This command opens the “POUs” view in the CODESYS main window. POUs located here are available in the entire project.

Call: Menu “View”

See also
● Chapter 6.4.1.21.3.4.1 “Standard Menu in View ‘Devices’, ‘POUs’, ‘Modules’” on page 2582

Command ‘Modules’

Symbol: [Module]

Function: This command opens the “Modules” view and shows the modules of the application composer in a tree structure.

Call: Main menu “View”

See also
● Chapter 6.4.1.21.3.4.1 “Standard Menu in View ‘Devices’, ‘POUs’, ‘Modules’” on page 2582

Command ‘Messages’

Symbol: [Message]

Function: This command opens the “Messages” view.

Call: Menu bar: “View”.

View ‘Messages’

<table>
<thead>
<tr>
<th>Message category</th>
<th>The messages are categorized by component or functionality for selection from a drop-down list. Filter the message display by selecting a category.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Message type</td>
<td>Click the symbol of the message type to show or hide messages. CODESYS displays the number of messages next to each symbol.</td>
</tr>
<tr>
<td></td>
<td>● [Error]</td>

<td>Message text with the reported object and the location in the object.</td>
</tr>
<tr>
<td>“Project”</td>
<td>Double-click a message in the table to jump to the source text location.</td>
</tr>
</tbody>
</table>
Table 474: “Commands in the context menu”

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Next Message”</td>
<td>The source text position of the next message is displayed.</td>
</tr>
<tr>
<td>“Previous Message”</td>
<td>The source text position of the previous message is displayed.</td>
</tr>
<tr>
<td>“Go to Source Position”</td>
<td>The source position of the selected message is displayed.</td>
</tr>
</tbody>
</table>

Command 'Element properties'

Symbol: 

**Function:** This command opens the “Element Properties” view.

**Call:** Main menu “View”

This command opens the properties view for the open object. This view is available only for a few objects, for example visualization and POU (SFC).

The properties are displayed in a structured table. You change the property values by clicking into the value fields. You can filter or sort the properties view.

Command 'ToolBox'

Symbol: 

**Function:** This command opens the “ToolBox” view.

**Call:** Main menu “View”

This command opens the toolbox view for the open object. By default, this view is available for graphical editors and visualizations. It includes the graphical programming elements that you can drag into the editor.

Command 'Watch' - 'Watch <n>,'

Symbol: 

**Function:** This command opens the "Watch <n>" view. You can populate a watchlist with variables from your project in order to monitor, force, or write these variable values in an individual view in online mode. The value "n" can be 1, 2, 3, or 4 for a total of up to four watchlists.

**Call:** Main menu “View”

See also

●  Chapter 6.4.1.13.2.3 “Using watch lists” on page 2002

Command 'Watch' - 'Watch All Forces'

Symbol: 

**Function:** The command opens the “Watch All Forces” view, which is a special kind of watch list.

**Call:** Menu bar: “View ➔ Watch ➔ Watch All Forces”

**Requirement:** A project is in offline mode or online mode.

The view contains all variables currently prepared for forcing, and all forced variables of the application in one list. Actions are possible in the list which are also possible in other watch lists. Moreover, the following commands are available in the “Unforce” list box of the view:
Table 475: “Watch All Forces”

<table>
<thead>
<tr>
<th>“Expression”</th>
<th>Variable name</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Data Type”</td>
<td>Data type of the variable</td>
</tr>
<tr>
<td>“Value”</td>
<td>Currently forced value of the variable</td>
</tr>
<tr>
<td>“Prepared Value”</td>
<td>Value prepared for forcing</td>
</tr>
<tr>
<td>“Overwritten value at start of cycle”</td>
<td>For inputs, the actual value is already overwritten by the force value before the application code is executed. As a result, this is the forced value. For outputs, this is the forced value.</td>
</tr>
<tr>
<td>“Overwritten value at end of cycle”</td>
<td>For outputs, this is the value which is calculated in the cycle. However, this value is overwritten by the force value at the end of the cycle. For inputs, this is the forced value.</td>
</tr>
</tbody>
</table>

- “Unforce and Keep All Selected Values”: For all selected entries in the list, the variables will be set to the forced value and the forcing will be lifted
- “Unforce and Restore All Selected Values”: For all selected entries in the list, the variables will be reset to the values they had before they were forced, and the forcing will be lifted.

- Chapter 6.4.1.12.5 “Forcing and Writing of Variables” on page 1987
- Chapter 6.4.1.13.2.3 “Using watch lists” on page 2002

Command 'Add All Forces to Watchlist'

**Function:** The command adds all variables of the active application, which are currently prepared for forcing, or which are already forced, to the watchlist. Please regard, that this works only for docked watch list views.

**Call:** Context menu of view “Watch”

**Requirement:** Online mode, a watch list view is active.

There is a special watch list: “Watch All Forces”. This view shows automatically all variables currently prepared for forcing or already being forced. It provides additional commands for releasing any forces.

- Chapter 6.4.1.21.3.4.9 “Command 'Watch' - 'Watch All Forces’” on page 2584
- Chapter 6.4.1.12.5 “Forcing and Writing of Variables” on page 1987

Command 'Bookmarks'

**Symbol:** 📌

**Function:** This command opens the “Bookmarks” view.

**Call:** Menu bar: “View”.
“Previous Bookmark” Jumps to the bookmark that above the selected bookmark in the table and opens the respective POU in the editor.

“Next Bookmark” Jumps to the bookmark that below the selected bookmark in the table and opens the respective POU in the editor.

Deletes the selected bookmark from the table and in the respective POU.

List of bookmarks in the project with the following information: “Bookmark”, “Object”, and “Position”.

You can edit the bookmark order per drag&drop.

When you double-click a row, CODESYS opens the respective “Object” in the editor and jumps to this bookmark.

“Bookmark” Name of the bookmark as assigned by CODESYS in ascending numerical order: “Bookmark_0”, “Bookmark_2” etc.

If the bookmark is selected and you click in the field, then it is editable and you can modify the bookmark name.

“Object” Name and project path of the POU where the bookmark is set

Example: POU_Add [PLC_1: SPS-Logic: Application]

“Position” Position of the bookmark in the POU

Example: Row 3, Column 1 (Impl)

(Impl): in the implementation part of the POU

(Decl): in the declaration part of the POU

Command 'Breakpoints'

Symbol: 

Function: This command opens the “Breakpoints” view.

Call: Menu bar: “View”.

This view shows an overview of all defined breakpoints for an application. You have access to all breakpoint commands within this view.

Table 476: Table of current breakpoints

| “Application” | Select the required application from the list. |
| “POU” | Name of the function block that will receive the breakpoint |
| “Location” | Location of the breakpoint in the POU |
| “Instance Path” | Complete object path of the breakpoint location. |
| “Tasks” | Names of tasks that will be effective when the breakpoint is executed. If there are no restrictions, then "(all)" is displayed here. |
“Condition”
- “Break always”: No additional enable condition defined; the breakpoint is always enabled.
- Boolean expression. The expression must yield TRUE for the breakpoint to be enabled.

“Hit Count Condition”
When the breakpoint should be in effect (depending on the hit count)

“Current Hit Count”
How often the breakpoint has already been reached up to now during the execution

Table 477: Toolbar

Command 'Cross Reference List'

Symbol: ☰

Function: This command opens the “Cross Reference List” view.
Call: Menu bar: “View”, or “Edit  Browse  Browse Cross References”.

This view shows a list of cross-references for a symbol in the project. The symbol can be a variable, a POU (program, function block, function), or a user-specific data type (DUT). The cross-reference list offer two basic types of searches:

- Text search: By specifying a symbol name, the cross-references of all symbols in the project are displayed with their names. If multiple symbols with the same are found, then the display can be limited to individual declarations by means of the context menu.
- Declaration search: The symbol can be selected by means of the input assistant or by specifying a qualified path (for example, Device.Application.PLCPRG.i or __POOL.POU.a). Then only the occurrence locations of this symbol are displayed, even if there exist other symbols with the same name.

<table>
<thead>
<tr>
<th>Input field</th>
<th>Symbol name (variable name, POU name, DUT name). Input options:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>● Selection of a declared symbol by means of the input assistant (button).</td>
</tr>
<tr>
<td></td>
<td>● Manual input of the symbol name. Triggering of the search by pressing the button or the [Enter] key.</td>
</tr>
<tr>
<td></td>
<td>For the text search, you can use the placeholders &quot;*&quot; (any number of characters) or ”?” (exactly any one character) in combination with a partial string of a variable identifier.</td>
</tr>
<tr>
<td></td>
<td>Use the percent sign &quot;%&quot; to search for IEC addresses. Examples: &quot;%MW8&quot;, &quot;%M&quot;.</td>
</tr>
</tbody>
</table>

More options outside of cross-reference list view:

- Use the command “Browse for Symbol  Browse Cross References” if the name of a declared symbol is selected in an editor, or if the cursor is in the name field. A search is also possible if the object is selected in the device tree or POU pool.
- Automatic if the name of a declared symbol is selected in an editor, or if the cursor is in the name field. A automatic search is also possible if the object is selected in the device tree or POU pool.

Requirement: CODESYS option “Automatically list selection in cross reference view” is activated (category “SmartCoding”).

The following input is valid:

- Variable name, simple or qualified. Examples: "iVar", "PLC_PRC.iVar".
- POU name: Examples: "PLC_PRC", "myFB".
- DUT name: Example: "mySTRUCT".
- Strings combined with placeholders: asterisk (*) for any character or question mark (?) for exactly one characters).
  Example: "iVar*" applies to iVar1, iVar_glob2, iVar45, etc.
  "iVar?" refers to iVar1, iVar2, iVarX, and so on, but not iVar_glob2, iVar45 and so on...
- "<IEC address>": CODESYS searches for variables that are assigned to this address and direct memory access. Example: "%QB0", %Q0 := 2.

Open input assistant for selecting a symbol
Perform a search
Define columns to search for the string.

Input field String that is searched for in the selected columns. The result locations are marked in yellow. Cross references without this string are hidden.

Show source position of previous cross-reference, [Shift]+[F4]
Show source position of next cross-reference, [F4]
Limit results to current declaration: Available if multiple declarations are found for a symbol. Limits the display to the declaration that you have selected in the list.
Show source position of selected cross-reference: The focus jumps to the occurrence location of the symbol.

Print cross-reference list: The default dialog opens for setting up a print job.

The cross references are displayed with the following information:

<table>
<thead>
<tr>
<th>“Symbol”</th>
<th>The result locations for the symbols (variables, POU’s, or DUTs) are grouped by declaration. The declaration occurrence comprises the root node and the occurrence locations in the project are indented below. The precise expression is displayed that has the symbol at the occurrence location. Example: If there is a global variable i in the project and a local declared variable i in a POU, then two root node entries will be listed after a text search for cross-references with the occurrences of the variable i below each.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“POU”</td>
<td>Block name; also a task name if a block call in the task configuration.</td>
</tr>
<tr>
<td>“Variable”</td>
<td>Only the variable name (for example, iVar)</td>
</tr>
<tr>
<td>“Access”</td>
<td>Type of access to the variable at the occurrence location: “Declaration” / “Read” / “Write” / “Call”. Special case for pointers: An assignment type p := ADR(var1) is displayed as write</td>
</tr>
<tr>
<td>“Type”</td>
<td>Data type of the variable</td>
</tr>
<tr>
<td>“Address”</td>
<td>IEC address if variables are assigned Example: &quot;AT %QB0&quot;.</td>
</tr>
<tr>
<td>“Position”</td>
<td>Location of the occurrence in the POU editor, for example line number, network number, declaration part, or implementation part. Example: “line 1, column 1 (Impl)”.</td>
</tr>
<tr>
<td>“Object”</td>
<td>POU name plus complete path of the occurrence location in brackets (if this is found in the “Devices” view). Example: &quot;PLC_PRG [Device:Plc Logic:Application]&quot;</td>
</tr>
<tr>
<td>“Comment”</td>
<td>Comments if available in the declaration of the variable</td>
</tr>
</tbody>
</table>

The search yields all result locations in the project and in included, uncompiled libraries.

Right-click commands in the cross-reference list

“Show source position”: Opens the respective POU and marks the occurrence: for root entries, the declaration, and for subordinate entries, the respective occurrence location. As an alternative, you can double-click a line.

“Limit Results to Selected Declaration”: Limits the display of results to the selected symbol declaration if multiple declarations are found.

“Expand All”: In the list, every single result location is shown.

“Collapse All”: In the list, only the root nodes of the result locations are shown.

Command 'Browse Cross References in Classic View'

Symbol 🗿
Function: This command opens the “Classic Cross Reference List” view.

Call: The command is not in any menu by default. You can add it to a menu by using the dialog box from “Tools → Customize” (command category “Browse Project”).

The view corresponds to the “Cross Reference List” view before CODESYS V3.5 SP6.

Command 'Call Stack'

Symbol: 

Function: This command opens the “Call Stack” view.

Call: Main menu “Debug”.

This view is very useful when you want to step into programs. It shows the current location with the complete call path.

| “Application” | Name of the active application that controls the current POU |
| “Task” | Name of the task that controls the current POU |
| “POU” | Name of the POU where program execution has halted |
| “Location” | Position within the POU where program execution has halted |
| ● Line and column numbers for textual editors |
| ● Network or element numbers for graphical editors |
| “Instance path” | Instance where program execution has halted |

The call stack is also available in offline mode and normal online mode when you are not currently using any debugging functions. In this case, it receives the last displayed location during a stepped execution, but it is displayed in gray.

The “Call Tree” view, in contrast to the “Call Stack”, at any time provides information on the calls of a POU.

● Chapter 6.4.1.21.3.4.16 “Command ‘Call tree’” on page 2590

Command 'Call tree'

Symbol: 

Function: This command opens the “Call Tree” view.

Call:

● “View” menu
● Context menu of a callable block in the “Devices” or “POUs” view.
The call tree is available at all times, even before compiling the application. It is a static representation of the caller and the calls of the block that you specify explicitly. Therefore, the tree always contains two root nodes above the respective call order is displayed as successive indented entries. Recursive calls are detected quickly in this tree representation.

Example of a call tree (1) for the (2) PLC_PRG block:

- (3) Node “<block name> is called by:”
- (4) Node “<block name> calls:”

<table>
<thead>
<tr>
<th>“Block name”</th>
<th>Name of the program block; specified manually, by dragging from another view, or by means of the button. The drop-down list includes the last specified block names.</th>
</tr>
</thead>
</table>

**Toolbar and keyboard usage**

- **Find block** CODESYS searches for the block specified in “Block name” and displays its caller and calls.
- **Use block from the input assistant** The “Input Assistant” dialog box opens for selecting a block call or instance call. The call tree is refreshed automatically after the selection.
- **Show source code position of the selected block** CODESYS jumps to the occurrence location of the block in the source code of the program.
- **[F4]: Show source code position of the next block** The selection in the call tree jumps to the next or previous block in the call structure. At the same time, the associated source code position is opened in the respective editor.
  - Note: Double-clicking an entry in the call tree also opens the associated source code position.
- **[Shift]+[F4]: Show source code position of the previous block**

**Display of the call tree:**

- **“Symbol”** “<block name> is called by”: The call order is displayed for below this node. The bottom entry in this tree structure shows the start of the calls.
  - “<block name> calls”: The calls from this block are displayed below this node. The bottom entry in this tree structure shows the end of the call chain.
- **“Position”** For the root node in the call tree: Line numbers of the declaration (“Decl”) of the block.
  - For the caller or calls below the root node: Line number, column number, and network number of the position, depending on the implementation language.

**Context menu for the entry selected in the tree:**

- **“Collapse All”** The expanded entries in the call tree are collapsed, except for the two root nodes.
“Show Source Position”  CODESYS jumps to the occurrence location of the block in the source code of the program.

“Set as New Root Node”  The entry selected in the call tree is displayed in “Block name”. The tree is refreshed automatically for the new root nodes.

The “Call list” view is provided for immediate information when stepping through a program, as opposed to the static call tree that provides call information about a block. The call list always shows the full call path of the current position that is reached.

Command 'Memory'
Symbol: 📚

Function:  In CODESYS V3.5 version earlier than SP11, the command opens the “Memory” view.

Call:  Menu bar: “View ➤ Memory”.

As of SP11, the command provides the notice that you must install the CODESYS Memory Tools package (available in the CODESYS Store) in order to use the memory view. After installation, you can open the “Memory” view by clicking “View ➤ Show Memory View”.

Command 'Security Screen'
Symbol: 🛡️

Function:  The command opens the “Security Screen” view.

Call:
- “View” menu
- 🛡️ icon or 🗝️ in the status bar
  The icon is displayed in blue when a valid certificate is specified for the digital signature. When only one client certificate is specified for the encrypted communication, the icon remains gray, resulting in the client certificate providing no increased security for the user.

The following security features of CODESYS are configured and displayed in the view:
- Personal user certificate
- Encrypted communication
- Encryption and signatures of IEC projects
- Encryption and signature of download, online change, and boot application
- Security level

NOTICE!
When the “Security Screen” is opened and closed, the current settings are applied in the user options, even when no active changes have been made.
If the CODESYS Security Agent add-on product is installed, then the “Security Screen” view provides an additional “Devices” tab. This allows for the configuration of certificates for the encrypted communication with controllers.

**Tab 'User'**

On this tab, certificates are configured that are required for the encrypted communication and the digital signature of the user. Only certificates with private keys can be specified here. The user profile is saved as an XML file in the user options.

| **“User Profile and Certificate Selection”** | By default, the login name for Windows is specified as the user profile. |
| List box with existing user profiles | ![Opens the “User Profiles” dialog. Here you specify the name for a new user profile.](image) | ![Deletes the selected user profile. This user profile is no longer displayed in the list box.](image) |

| **“Digital Signature”** | ![Opens the “Certificate Selection” dialog for selecting the certificate for the digital signature.](image) | One certificate can be selected. The certificate has to have a private key. |
| ![Deletes the displayed certificate.](image) | One certificate can be selected. The certificate has to have a private key. |

| **“Project File Decryption”** | ![Opens the “Certificate Selection” dialog for selecting the certificate for decrypting project files.](image) | One certificate can be selected. The certificate has to have a private key. |
| ![Deletes the displayed certificate.](image) |

- Chapter 6.4.1.21.4.19 “Dialog ‘Certificate Selection’” on page 2811

**Table 478: “Security Level”**

| **“Activate the Use of Certificates for Enhanced Security”** | |
| **“Enforce encrypted communication”** | ![When the user communicates with the controller, the server certificate of the controller is used for establishing an encrypted connection. Then the entire communication is encrypted.](image) |

| **“Enforce encryption of project files”** | ![All project files of the user are encrypted with a certificate. When the project is saved, it is encrypted with the certificate specified in the project settings (“Project Settings ➔ Security” dialog). The selected certificate is displayed on the “Project” tab in the “Project file encryption” group. To open this project, the certificate to be encrypted has to be specified in “Project file decryption” with a private key.](image) |

| **“Enforce signing of project files”** | ![All project files of the user are signed with a certificate. In “Digital Signature”, a certificate has to be specified with a private key. When a project is saved, a signature file <project name>.project.p7s is generated in the project directory containing the signature.](image) |
"Enforce encryption of downloads, online changes and boot applications"
- The data that is downloaded to the controller has to be encrypted with a controller certificate.
  This certificate is defined directly either in the properties dialog of the application on the "Encryption" tab, or in the security screen, on the "Project" tab, in the "Encryption of Boot Application, Download and Online Change" group.
  Controller certificates are located in the local Windows Certificate Store in the "PLC Certificates" directory. If the certificates of your controller are not available in the directory, then they first have to be loaded from the controller and installed to the directory. For instructions, see the "Controller Certificates" chapter.

"Enforce signing of downloads, online changes and boot applications"
- The online code (downloads, online changes, and boot applications) have to be signed with a certificate with a personal key. The certificate is selected from the "Digital Signature" area.
  Requirement: The "Encryption of boot application, download and online change" option is selected.

"Enforce signing of compiled libraries"
- The "File ➔ Save Project as Compiled Library" command generates a signed library <library name>.compiled-library-v3.
  Requirements
  ● A certificate with a private key that supports code signing is available.
  ● A library compatibility >= CODESYS V3 SP15 is set in the project information.
  "Enforce timestamping of signed compiled libraries": The URL of the time stamp server which created the time stamp has to be entered in the "Timestamping server" field. Example: timestamp.comodoca.com/rfc3161.

- § Chapter 6.4.1.17.3 “Information for Library Developers” on page 2035

Tab 'Project'
All project-specific settings are configured on this tab. These elements are active only when a primary project is loaded.

"Project file encryption"

"Technology"
- Opens the “Project Settings ➔ Security” dialog
  When you select the "Encryption" project setting and then "Certificates" in the dialog, you can choose a corresponding certificate by clicking . For more information, see the description of the "Project Settings: Security" dialog.

"Certificates of Users Sharing this Project"
Area for listing the certificates that encrypt the project file.
"Encryption of Boot Application, Download and Online Change"

| List of the applications of the controller | Double-clicking an application in the list opens the “Properties ➔ Encryption” dialog. Depending on the settings of the “Security Level” on the “User” tab of the “Security Screen”, the following fields are available in the open properties dialog:
  ● “Encryption” tab with active “Certificates” area
  ● “Encryption” tab with “Encryption Technology” list box.
  In the “Properties ➔ Encryption” dialog, click the button to select the controller certificate for “Encryption of Boot Application, Download and Online Change”. For more information, see the description of the “Properties: Encryption” dialog.
  Controller certificates are located in the local Windows Certificate Store in the “PLC Certificates” directory. If the certificates of your controller are not available in the directory, then they first have to be loaded from the controller and installed to the directory. For instructions, see the "Protecting and Saving a Project" - "Encryption with Certificates" chapter.

Tab 'Devices'

This tab is available only after you have installed the CODESYS Security Agent add-on. For a description of this tab, see the help for the CODESYS Security Agent.

Command 'Settings of Memory Reserve for Online Change'

Function: This command opens the “Online Change Memory Reserve” view.
Call: Menu bar: “View”.
In the view, memory reserves are configured for the function blocks during the online change.

"Scan Application"
- Searches the selected application for function blocks and displays them in the “Function blocks” area
- Updates the “Function blocks” area after the application is built again.
- Updates the “Function blocks” area after an online change.

Drop-down list with the applications of the open project
Selection of the application whose function blocks should be displayed and/or edited in this view.

<table>
<thead>
<tr>
<th>Table 479: “Function Blocks”</th>
</tr>
</thead>
<tbody>
<tr>
<td>“All”</td>
</tr>
<tr>
<td>“Pool”</td>
</tr>
<tr>
<td>“No memory-reserve”</td>
</tr>
<tr>
<td>“&lt;memory reserve&gt; bytes”</td>
</tr>
</tbody>
</table>

Information about the function blocks
Multiple selection is also possible when selecting a POU for the configuration of the memory reserve.
<table>
<thead>
<tr>
<th>“Function block”</th>
<th>Name of the function block</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Size”</td>
<td>Size of the function block</td>
</tr>

Command 'Start Page'

Symbol: 🕵

**Function:** This command opens the “Start Page” view.

**Call:** Main menu “View”

The view includes some basic commands and a list of recently opened projects. In addition, the CODESYS homepage is displayed.
If you access the Internet through a proxy, then you can save the authentication data in the project options ("Proxy Settings") so you do not have to provide this data every time you use this command.

By moving the mouse pointer over the list of recently opened projects, you can remove or pin individual projects in the list. Pinned projects remain in this list until you remove the pin.

In the project options ("Load and Save"), you can configure whether this start page should open automatically when you start CODESYS.

See also

**Command 'Full Screen'**

Symbol: ![Full Screen Symbol]

**Function:** This command switches the CODESYS display to full screen mode.

**Call:** Main menu “View”

Choosing this command displays the main window of the CODESYS user interface in full-screen mode. You can return to the previous setting by choosing the command again or with the keyboard shortcut [Ctrl]+[Shift]+[F12].

**Command 'Properties'**

Symbol: ![Properties Symbol]

**Function:** This command opens the properties of the currently selected object in the POU tree or device tree.

**Call:** Main menu “View”
Menu 'Project'

Command ‘Add Object’

Symbol: 

Function: This command opens a submenu with objects that contain all objects that can be inserted, depending on the current position in the "Devices" or "POUs" view.

Call: "Project" menu, context menu in the "Devices" or "POUs" view.
**Requirement:** If CODESYS is to insert the object in the device tree, select an already existing object under which the new one is can be inserted indented. If CODESYS is to insert the object in the POUs tree, set the focus in any free place in the CODESYS window.

**Command ‘Add Folder’**

Symbol: 🗂️

**Function:** This command opens a dialog box for defining a new folder in the Devices or POUs view.

**Call:** “Project” menu, context menu in the Devices or POUs view

You cannot structure the arrangement of device nodes and device objects through folders that you have created yourself.

This command inserts the folder below the object that has just been selected in the tree. If no object is selected, CODESYS inserts the folder right at the top in the tree directly under the root node.

**Command 'Insert Device'**

**Function:** this command opens the dialog box “Add Device” for the selection of a device object that is to be inserted in the device tree below the currently selected object.

**Call:** Context menu of a device object in the device tree.

**Requirement:** An object is selected in the device tree below which a device object can be inserted.

See also

- ☢ Chapter 6.4.1.8 “Configuring I/O Links” on page 1835

**Dialog box 'Add device'**

**Function:** Depending on the currently selected position in the device tree, the dialog box offers a selection of the devices that can be inserted at this point. In addition, it contains the commands also available in the context menu: “Insert Device”, “Add Device”, “Plug Device”, “Update Device”.

**Requirement:** The devices are installed in the device repository on the local system.

If you have opened the dialog box, it always displays the selection to suit the object currently selected in the device tree until you click “Close”.

<table>
<thead>
<tr>
<th>“Name”</th>
<th>Name with which the device is to appear in the device tree. Must be a valid IEC identifier.</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>“Add device”</th>
<th>CODESYS inserts the selected device indented below the selected object in the device tree.</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>“Insert device”</th>
<th>CODESYS inserts the selected device at the same level as the selected object below it in the device tree.</th>
</tr>
</thead>
</table>
"Plug device"  
CODESYS inserts the selected device in the selected slot. If the slot is already occupied, the existing module is replaced by the new one.

"Update device"  
CODESYS replaces the device selected in the device tree by the one selected. Please note: Depending on the device, this may cause the configuration already done in the device editor to be overwritten with the default values!

"String for the full text search"  
This field is editable after clicking in it. For any character string entered, only those devices that include the character string are displayed in the lower view. The matched string is highlighted in yellow for these devices.

"Vendor:"  
Drop-down list with manufacturers whose available devices are displayed.

"Group by category"  
☑: The available devices (newest version) are sorted by category. The category is defined in the device description file.  
☐: The available devices appear flat and alphabetically sorted.

"Display all versions (for experts only)"  
☑: In addition, all other available versions of the devices can also be selected.  
☐: Only the newest version of each device is available for selection

"Display outdated versions"  
☑: In addition, outdated versions of the devices can also be selected. Outdated versions result, for example, from the update of plug-ins.  
☐: Outdated device versions are not displayed.

The information provided by the device description file is displayed:  
device name, vendor, categories, version, order number and a short description, device-specific bitmap.

- ☰ Chapter 6.4.1.21.3.5.6 “Command 'Update Device’” on page 2602

Command 'Plug Device'  

Function: Like the command “Add Device”, this command opens the dialog box “Add Device” for the selection of a device object that is to be inserted in the device tree in the currently selected slot.

Call: Context menu of the slot of a device object in the device tree.

Requirement: The slot of a device object is selected in the device tree.

An empty slot is identified by the symbol • and the entry "<empty> (<empty>)". An occupied slot is given the symbol ✪ and the name of the device.

In the case of an occupied slot, this command replaces the existing module with the new one.

- ☰ Chapter 6.4.1.8 “Configuring I/O Links” on page 1835

Command 'Scan for Devices'  

Function: The command establishes a brief connection to the hardware and determines the devices in the network. Then you can apply the devices found into the device tree of your project.

Call: Menu bar: “Project”; context menu of a device object in the device tree
Requirement: The communication settings to the controller are correct. The gateway and the PLC are started. The device supports the scan function.

The following devices provide the scan function: EtherCAT master, EtherNet/IP Scanner (IEC), Sercos master, CANopen Manager, CANopen Manager SIL2, PROFINET controller and PROFIBUS DP master.

You can perform the device scan immediately if the scan function is permanently implemented in the PLC. When scan function is implemented in a library, you have to log in only one time to download the library to the controller.

The command refers to the master controller selected in the device tree. For example, an already inserted PROFINET IO controller can be selected and the command used to determine the I/O devices and I/O modules assigned to it.

After performing the scan operation, the “Scan Devices” dialog opens and displays the found devices.

**Dialog 'Scan Devices'*

<table>
<thead>
<tr>
<th>Table 484: “Scanned Devices”</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Device name, Device type, Address, Station name, etc.”</strong></td>
</tr>
<tr>
<td><strong>“Show differences to project”</strong></td>
</tr>
<tr>
<td><strong>“Scan for Devices”</strong></td>
</tr>
<tr>
<td><strong>“Copy All Devices to Project”</strong></td>
</tr>
</tbody>
</table>

**NOTICE!**

If you insert devices, which are available in the device tree, to the device tree with “Copy All Devices to Project”, then the following should be noted. The data of the “Process Data” and “<...> I/O Mapping” tabs of the existing devices can be overwritten with the data of the recently inserted devices.
Table 485: “Configured Devices”

This part of the dialog is visible only when you select the “Show differences to project” option.

Differences between the scanned and configured devices are color-coded. Devices displayed in green are identical on both sides. Devices displayed in red are available only in the view of the scanned or configured devices.

<table>
<thead>
<tr>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>![Up Arrow]</td>
<td>If you have selected a device in both views, then the scanned devices are inserted above the selected configured device.</td>
</tr>
<tr>
<td>![Down Arrow]</td>
<td>If you have selected a device in both views, then the scanned devices are inserted below the selected configured device.</td>
</tr>
<tr>
<td>![Reload]</td>
<td>If you have selected a device in both views, then the configured devices are replaced by the selected scanned device.</td>
</tr>
<tr>
<td>![Copy]</td>
<td>All scanned devices are copied to the project.</td>
</tr>
<tr>
<td>![Delete]</td>
<td>Deletes the selected configured device.</td>
</tr>
</tbody>
</table>

The dialogs for the scan differ depending on the type of device. See the help pages for the respective device editor.

Command 'Update Device'

**Function:** Like the command “Add Device”, this command opens the dialog box “Add Device” for the selection of a device object. This object is inserted in the device tree in place of the currently selected object.

**Call:** Context menu of a device object in the device tree.

**Requirement:** An object is selected in the device tree below which a device object can be inserted.

With this command you can insert either a different version of a device or a different type of device in place of the previous one.

The symbolic device name used in the device tree is retained, but the device type specified in parentheses behind it changes if a different type has been selected. Thus if only the device version is changed, the object entry appears unchanged.

If the device type does not change, the configuration tree indented below the device entry concerned is retained. In this case the configuration settings also remain the same. Inconsistencies in the configuration resulting from the device update are reported by CODESYS at the next compilation of the application. This also concerns implicitly inserted libraries, which CODESYS does not remove accordingly during a device update.

- Chapter 6.4.1.8 “Configuring I/O Links” on page 1835
- Chapter 6.4.1.21.3.5.3 “Command 'Insert Device’” on page 2599

Command 'Acknowledge Diagnosis', 'Acknowledge Diagnosis for Subtree'

**Function:** The command acknowledges a diagnosis message.

**Call:** Context menu of a device object in the device tree

**Requirement:** The project is in online mode.
The “Acknowledge diagnosis” command acknowledges the diagnosis messages of an individual device. The “Acknowledge Diagnosis for Subtree” command also acknowledges the diagnosis messages of all subordinate devices. The diagnosis message of a pending malfunction is indicated by a red exclamation mark at the device object. The diagnosis message of a corrected malfunction is indicated by a gray exclamation mark.

Command 'Edit Object'

**Function:** This command opens the object in its editor.

**Call:** Main menu “Project”, context menu.

**Requirement:** An object is selected in the device tree or in the “POUs” view.

Command 'Edit Object with'

**Function:** When multiple objects are available for an object, this command opens a dialog box for selecting an editor. If only one editor is available for an object, then this command opens the object in that editor.

**Call:** Main menu “Project” or shortcut menu (right-click)

**Requirement:** An object is selected in the device tree or in the “POUs” view.

In the standard installation of CODESYS, there is no object that has multiple available editors.

Command 'Check integrity'

**Function:** Automation Builder checks the project integrity for the complete project ("Project integrity" checks if all devices in the device tree are installed in the device repository).

**Call:** Main menu “Project”, Context menu.

**Requirement:** A project is open.

Command 'Edit Object (Offline)'

**Function:** The command opens the object offline in the editor.

**Call:** Main menu “Project”, Context menu

**Requirement:** The application is in online mode. An object is selected in the device tree or in the “POUs” view.

The command allows you to edit objects in online mode. After editing you transfer the changes to the controller by use of the command “Online ➔ Online Change” or “Online ➔ Load”.

- Chapter 6.4.1.21.3.7.6 “Command ‘Online Change’” on page 2629
- Chapter 6.4.1.21.3.7.5 “Command ‘Load’” on page 2628

Command 'Set Active Application'

**Function:** This command sets the selected application as the active application.

**Call:** Main menu “Project”, or right-click the “Application” object.

**Requirement:** The project has at least two applications. The selected application is not active.

Online actions apply only to the active application. The name of an active application is displayed in bold typeface in the device tree.
Command 'Project information'

Symbol: 

**Function:** This command opens the dialog box “Project Information”.

**Call:** Main menu “Project”

When you execute the command in the project for the first time, CODESYS creates the “Project Information” object.

See also

- Chapter 6.4.1.3.4.2 “Retrieving and Editing Project Information” on page 1813

Command 'Project Settings'

Symbol: 

**Function:** This command opens the “Project Settings” dialog box.

**Call:** “Project” menu or double-click on the object “Project Settings” in the “POUs” view

**Requirement:** A project is open.

See also

- Chapter 6.4.1.3.4.3 “Making project settings” on page 1814
- Chapter 6.4.1.21.4.12 “Dialog ‘Project Settings’” on page 2766
- Chapter 6.4.1.21.2.23 “Object ‘Project Settings’” on page 2514

Command 'Project Environment'

**Function:** This command opens the “Project Environment” dialog box.

**Call:** “Project” menu

**Requirement:** A project is open.

this command is for checking the currentness of software and files integrated in the project and enables them to be updated.

Command 'Project Localization' - 'Create Localization Template'

**Function:** This command opens the “Create Localization Template” dialog. Define here which information should be exported from the project to a translation template (*.pot file).

**Call:** Menu bar: “Project ➤ Project Localization”.

**Requirement:** A project is open.
Dialog 'Create Localization Template'

This dialog is used for selecting the textual information that should be used in the localization template.

Table 486: "Include the Following Information"

| "Names" | Texts, such as dialog captions and object names in the device tree |
| "Identifier" | Variable identifier (example: Counter) |
| "Strings" | Example: 'count' in the following declaration: strVar: STRING := 'count'; |
| "Comments" | Comment texts in the POUs |
| "Position information" | Selection of which positions of the selected text categories in the project should be included in the translation file. The position information is located in the first line(s) of a segment for a translation. Example: #: D:\Proj1.project\Project_Settings:1 msgid "Project settings" msgstr "" |
| “All”: All detected positions of the text are listed. |
| “First appearance”: In the translation file, the position is included in the project where the text to be translated appears for the first time. |
| "None" |
| "Generate" | This button opens the dialog for saving a file. The translation template is created in a text file of type *.pot (portable object template). Each further generation creates a completely new template file. |

Command 'Project Localization' - 'Manage Localizations'

Function: This command opens the “Manage localizations” dialog. Select the desired localization language in the dialog or the original version of the project. You can still accept the localization files *.<language>.po into the project or remove them.

Call: Menu bar: “Project → Project localization”.

Requirement: A project is open.

Dialog 'Manage localizations'

| “Available Localizations” | List of the localization files available in the project. Example: proj1-de.po proj1-en.po <original version> |
| “Add” | This button opens the dialog for selecting an additional po file from the file system. |
| “Remove” | This button removes the po file, which is selected on the left side, from the project. |
| “Default localization” | ☑: The selected localization is for the default localization. The entry is displayed in bold. |
Switch Localization

Use this button to switch to the selected localization.

OK

The project is displayed in the language that is provided by the file selected below the files. If you select "<original version>", then the project appears in the editable non-localized version.

See also

● Chapter 6.4.5.8 “Setting Up Multiple Languages” on page 2906

Command 'Project Localization' - 'Toggle Localization'

Symbol: 🔄

Function: This command switches between the currently set project localization and the <original version>.

Call: Menu bar: "Project © Project Localization"; button in the "Manage Localizations" dialog; 🔄 button on the toolbar.

Requirement: A project is open. A default localization for the project is defined in the "Manage Localizations" dialog.

● Help about CODESYS Visualization: Multi-language capability

Command 'Document'

Symbol: 📄

Function: This command opens the "Document Project" dialog box, where you can define the project documentation. This includes the selection of objects in the open project that you want to print.

Call: Main menu "Project"

Table 487: “Document Project” dialog box

<table>

| "OK" | The “Print” dialog box opens. |
Command 'Compare objects'

**Function:** To compare similar objects within a project.

**Call:** Main menu ‘Project’, Context menu.

**Requirement:** Both projects have to be open.

See also:
- Chapter 6.4.1.5 “Comparing projects” on page 1817
- Chapter 6.4.1.21.3.5.22 “Command ‘Commit Accepted Changes’” on page 2611

Command 'Compare'

**Symbol:** ⌜

**Function:** This command opens the “Project Comparison” dialog. In this dialog, you define the reference project to compare with the current project. You configure the comparison process by means of options. When the dialog is exited, the comparison starts and the result is shown in the view “Project Compare - Differences”.

**Call:** Menu bar: “Project ➤ Compare”.

**Requirement:** A project is open.

See also:
- Chapter 6.4.1.21.3.2.12 “Command ‘Print’” on page 2560
- Chapter 6.4.1.21.4.12.7 “Dialog ‘Project Settings’ - ‘Page Setup’” on page 2772

</tbody>
</table>

“Compare options” | Defined comparison options in the “Project Comparison” dialog. |
“Compare statistics” | Number of additions, deletions, and changes in the current project, as compared to the reference project. “Change” means differences of an object available in both projects. |

× The dialog prompt opens: “Do you want to commit the changes which you made in the diff view?” “Yes”: The contents, properties, or access rights of the objects highlighted in yellow are modified in the project. Now they correspond to the reference project. Then the project compare view is closed completely.

View ‘Project Comparison’ - ‘<object name> Differences’ | Function: Detail compare view |
Call in the project compare view: |
● Select an object that is identified as having different contents which you need to view in detail. Click . |
● Double-click the object.

Table 492: Toolbar

Switch back to the project compare view. |
Selects the next line below in the code where differences were detected.
Selects the line above in the code where differences were detected.

“Accept Block”

The block (with all subordinate lines) is selected for acceptance of the reference blocks into the current project.

A block in the detailed compare view consists of the unit where the cursor is located and all corresponding units that have the same difference markers. A unit is a line, network, or element. Subsequent lines of a line are examples of corresponding units.

Repeated clicking of “Accept Block” undoes the effects of its last change.

“Accept Single”

The line is selected in the current object for acceptance of the reference line.

Switches between the default display where different units (lines, networks, elements) are displayed in red and another display: The units are displayed as recently added in the open project. In the reference project, they are displayed as deleted.

Available within the detailed compare view only.

Note: Depending on the display, detected differences in the statistics are counted as changed, inserted, or deleted.

<table>
<thead>
<tr>
<th>Table 493: Display of differences with colors, and symbols</th>
</tr>
</thead>
<tbody>
<tr>
<td>Black font</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Gray highlight + bold blue font</th>
<th>Code is only in the reference project.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gray highlight + bold green font</td>
<td>Code is only in the current project (not in reference project).</td>
</tr>
</tbody>
</table>

| Yellow highlight | The object is activated for acceptance. |

| × | The dialog prompt opens: “Do you want to commit the changes which you made in the diff view?” |

| “Yes” | The code highlighted in yellow is accepted into the project. The code corresponds to the reference project. Then the detailed view is closed and the project view is displayed. You can continue working with project compare. |

Dialog 'Accept'

Table 494: “Which meta data should be accepted?”

| “Access rights” | ☑: Access rights that are selected for acceptance. |

| “Accepted groups” | Grouping with access rights accepted by the reference project. A group is accepted if it is present in both projects with different access rights. |
| Example: Group_A |

| “Unaccepted groups (missing in a project)” | The group is not accepted if it is not present in one of the two projects. |

| “Properties” | ☑: Properties activated for accept |
| Requirement: The properties of the reference object and object are different. |
Command 'Commit Accepted Changes'

Symbole: 

**Function:** This command commits the accepted differences from the project comparison to the current project.

**Call:** “Project ➔ Commit Accepted Changes”.

**Requirement:** Changes from the project comparison have been accepted.

![Information icon]

The changes are only copied to the project. This command does not save them to the hard disk.

- 📚 Chapter 6.4.1.5.3 “Opening the detailed compare view” on page 1818

Command 'Map pool devices'

Symbole: 

**Function:** Maps imported devices from the device pool to already configured devices below a PLC.

**Call:** Main menu “Project”, Context menu.

**Requirement:** A project is open.

📚 Chapter 6.6.1.1.8 “Arrange or map devices imported to the device pool” on page 4194

Command 'Export'

**Function:** This command opens a dialog box for exporting objects from a project to an XML file.

**Call:** Menu bar: “Project”.

**Dialog 'Export'**

This dialog box lists all objects from the device tree, POU tree, and module tree that CODESYS can export.

<table>
<thead>
<tr>
<th>One file per subtree</th>
<th>CODESYS generates a separate export file for each subtree that is located directly under the root node and includes selected files.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>CODESYS generates one export file for all selected objects.</td>
</tr>
</tbody>
</table>

**“Saved version”**

This version should correspond to the target version where the export file will later be imported.

If the current project contains plug-ins or add-ons that are not available in the selected memory format (profile), then the “Extend Profile” dialog box opens. In this dialog box, the selected profile can be extended with the add-ons.

See also
- 📚 Chapter 6.4.1.21.3.2.5 “Command 'Save Project as’” on page 2555
- 📚 Chapter 6.4.1.21.3.5.25 “Command 'Import’” on page 2612
- 📚 Chapter 6.4.1.4.2 “Exporting and importing projects” on page 1815
Command 'Import'

**Function:** This command opens a dialog box for importing objects from an XML file.

**Call:** Menu “Project”

**Requirement:** A project is open.

**Dialog box 'Import'**

The dialog box lists all objects from the export file that CODESYS can import at this point.

<table>
<thead>
<tr>
<th>“Currently selected target objects”</th>
<th>Object that is selected in the Device tree</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Insertable items”</td>
<td>Displays all objects of the export file that CODESYS can insert below the selected object.</td>
</tr>
<tr>
<td>“Show contents”</td>
<td>Displays the contents of the export file in a tree structure</td>
</tr>
</tbody>
</table>

Command 'Export PLCopenXML'

**Function:** This command opens a dialog box for exporting objects from a project into an XML file in the PLCopen format.

**Call:** Menu “Project”

**Dialog box 'Export PLCopenXML'**

The dialog box lists all objects from the Device tree that CODESYS can export into an XML file in accordance with the PLCopen format.

The PLCopenXML scheme does not permit VAR_GLOBAL and VAR_GLOBAL CONSTANT POU's to be in the same variable list. Therefore, if you wish to export both, you must first divide the variables into two separate variable lists.

See also

- ☀ Chapter 6.4.1.21.3.5.27 “Command ‘Import PLCopenXML’” on page 2612

Command 'Import PLCopenXML'

**Function:** This command opens a dialog box for importing objects from an XML file in PLCopen format.

**Call:** Menu “Project”

**Requirement:** A project is open.

**Dialog box 'Import PLCopenXML'**

The dialog box lists all objects from the PLCopen export file that CODESYS can import at this point.

<table>
<thead>
<tr>
<th>“Currently selected target object”</th>
<th>Object that is selected in the Device tree</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Insertable items”</td>
<td>Displays all objects of the export file that CODESYS can insert below the selected object.</td>
</tr>
</tbody>
</table>
The PLCopenXML scheme does not permit VAR_GLOBAL and VAR_GLOBAL CONSTANT POUs to be in the same variable list. Therefore, if you wish to export both, the variables must first be divided into two separate variable lists.

Command 'User management' – 'Log in User'

Symbol: 🪣

This command opens the dialog box “Login”. Here you specify the project that you wish to edit and enter the login data for a user account with the corresponding rights. In addition, you can open the password manager from this dialog box.

The command is available in the menu “Project ➔ User Management”.

See also
● § Chapter 6.4.1.6.7 “Logging in via User Account and Password Manager” on page 1827

Command 'User management' – 'Log out User'

Symbol: ❌

The user currently logged in to the project is logged out again with this command. This takes place without a dialog box or message, unless no user is currently logged in.

The command is available in the menu “Project ➔ User Management”.

If the user is currently logged in to several projects or to libraries integrated in them (it does not have to be the same user account), then the dialog box “Logout” opens, in which the specific project or library project can be selected from which the current user is to be logged out.

The status bar always displays the user who is currently logged into the project.

A double-click on the field “Current user” in the status bar enables quick access to the “Login” or “Logout” dialog box.

See also
● § Chapter 6.4.1.6.7 “Logging in via User Account and Password Manager” on page 1827
● § Chapter 6.4.1.21.3.5.28 “Command 'User management' – 'Log in User'” on page 2613

Command 'User management' – 'Rights…'

This command opens the dialog box “Rights”, in which you define the actions that may be carried out, the user groups that may carry them out and the project objects on which they may be carried out.

The command is available in the menu “Project ➔ User Management”.

See also
● § Chapter 6.4.1.6.6 “Protecting Objects in the Project by Access Rights” on page 1826
Command 'Insert Device'

Function: Like the command “Add Device”, this command opens a dialog box “Insert Device” for the selection of a device object. This object is inserted in the device tree at the same level as the currently selected object.

Call: Context menu of a device object in the device tree.

Requirement: An object is selected in the device tree below which a device object can be inserted at the same level.

See also
- § Chapter 6.4.1.8 “Configuring I/O Links” on page 1835
- § Chapter 6.4.1.21.3.5.3 “Command 'Insert Device'” on page 2599

Command 'Generate EtherCAT XML'

The command is not integrated in the standard main menu. You can add it via the dialog box “Tools ⇒ Customize” from the category “Devices”.

Function: This command opens the standard dialog box for saving a file in the local file system. You can define a name and a storage location for an xml file, in which CODESYS is to store the EtherCAT configuration of the EtherCAT master currently selected in the device tree. This may be necessary in order to operate an external EtherCAT stack.

Call: Context menu of an EtherCAT master device object in the device tree.

See also
- § Chapter 6.4.1.8 “Configuring I/O Links” on page 1835

Command 'Generate Sercos SCI XML'

The command is not integrated in the standard menu. You can add it via the dialog box “Tools ⇒ Customize” from the category “Devices”.

Function: This command opens the standard dialog box for saving a file in the local file system. You can define a name and a location for an xml file in which CODESYS then stores the configuration data of the sercos master currently selected in the device tree. This may be necessary in order to operate an external sercos stack.

Call: Context menu of a sercos master device object in the device tree.

See also
- § Chapter 6.4.1.8 “Configuring I/O Links” on page 1835
- § Chapter 6.4.1.2.2.2 “Customizing menus” on page 1802

Command 'Disable Device’ – ‘Enable Device'

Function: This command switches back and forth between the enabled (activated) and disabled (deactivated) states of a device in the bus system.

Call: Context menu of a device object in the device tree.

Requirement: The project is in offline mode. The bus driver must support the function.
A disabled device is not taken into account and is not addressed. Note that with some bus systems the deactivation of a node can lead to the master stopping.

The entry of a disabled device in the tree appears in light-gray lettering.

See also

- Chapter 6.4.1.8 “Configuring I/O Links” on page 1835

Command 'Edit I/O Mapping'

**Function:** This command opens the “Edit I/O Mapping” dialog box. This displays all I/O mappings of the currently selected device object, including I/O mappings of all additional device objects that are inserted in the device tree below this object.

**Call:** Context menu of a device object in the device tree.

**Dialog box 'Edit I/O mapping'**

You can edit the I/O mapping in this dialog box in exactly the same way as in the dialog box “I/O mapping” of the individual device editors. The respective other dialog boxes are directly updated accordingly.

| “Search” | Input field for a search string for the mapping table. The search results are marked in yellow. |
| “Filter” | Drop-down list for filtering I/O assignments displayed listed in the mapping table: |
| | ● “Show all” |
| | ● “Show outputs only” |
| | ● “Show inputs only” |
| | ● “Show unmapped variables only” |
| | ● “Show mapped variables only” |
| | ● “Show mappings to existing variables only” |
| | ● “Show mappings to new variables only” |

In the context menu you will find among other things the following commands:

- **“Export Mappings to CSV”**: Stores the mappings of a device and its sub-devices in an external file. To do this you select the device in the device tree or in the mapping list.

- **“Import Mappings from CSV”**: Inserts mappings from a file created beforehand by export.

See also

- Chapter 6.4.1.8 “Configuring I/O Links” on page 1835
- Chapter 6.4.1.21.3.5.35 “Command ‘Edit I/O Mapping’” on page 2615
- Chapter 6.4.1.21.3.5.37 “Command ‘Export Mappings to CSV’” on page 2616
- Chapter 6.4.1.21.3.5.36 “Command ‘Import Mappings from CSV’” on page 2615

Command 'Import Mappings from CSV'

**Function:** The command opens the default dialog for opening a file in the local file system. The filter is set to the file format CSV in order to import the I/O mapping configuration of a device from the file which was exported previously by means of the “Export Mappings to CSV” command. CODESYS writes the configuration to the selected device.

**Call:** Context menu of a device object in the “Devices” view.

**Requirement:** A project is open with a device and an I/O mapping configuration. The device matches the exported CSV file.
NOTICE!
I/O mapping configurations are stored in CSV files with the semicolon separator. These files can be edited manually. If the files are edited manually, then it is imperative that this format is retained in order to import successfully. Note: The entries of the file to the I/O mapping of the device are assigned by the device name and the parameter name. Parameter names that are not unique are numbered sequentially in this file (@<n>). Fields without contents in the CSV file are ignored at import. To remove an existing entry in the I/O mapping by importing, you have to add a space in the respective field in the CSV file.

See also
- Chapter 6.4.1.21.3.5.37 “Command 'Export Mappings to CSV'” on page 2616
- Chapter 6.4.1.8.2 “Configuring Devices and I/O Mapping” on page 1836

Command 'Export Mappings to CSV'

Function: The command opens the default dialog for saving a file to the local file system. The filter is set to file format CSV. After specifying a name and a location, CODESYS stores the I/O mapping configuration in a CSV file with the semicolon separator.

Call: Context menu of a device object in the “Devices” view.

Requirement: A device object with an I/O mapping configuration is selected in the device tree.

Parameter names that are not unique are numbered sequentially in this file (@<n>).

See also
- Chapter 6.4.1.21.3.5.36 “Command 'Import Mappings from CSV'” on page 2615
- Chapter 6.4.1.8.2 “Configuring Devices and I/O Mapping” on page 1836

Command 'Read PLC Parameter File to Configuration'

Function: This command reads the configuration file IoConfig.par of the PLC and stores the values in the project. Such a file is created if the parameters of the PLC have been changed by another device, for example via a visualization. Then these parameters are changed only in the memory of the PLC, but not in the configuration of the project.

Call: Context menu of the PLC device object

Requirement: You have made the command available using the dialog in “Tools ➔ Customize”.

Command 'Online Config Mode'

Function: This command is for switching the online configuration mode on and off. At switch-on it establishes a connection to the PLC and loads an implicitly created application “HiddenOnlineConfigModeApp” to the PLC. Depending on the device, CODESYS goes into simple online configuration mode or a dialog box appears for selecting between simple and advanced online configuration mode.

Call: Context menu of the PLC object in the device tree

Requirement: The communication settings for the PLC device are correctly set.
Simple online configuration mode:

This command creates the implicit application HiddenOnlineConfigModeApp and loads it to the controller. The application automatically initializes all inputs and outputs of the controller once. After that you can access the I/Os as follows:

- Read I/Os
- Write outputs
- Diagnosis (in the device tree and on the “Status” tab of the device editor)
- Scan (of the current hardware)
- Interactive online functions, if supported (for example, writing asynchronous messages)

Advanced online configuration mode (parameter mode):

If there are already applications on the PLC and the controller supports it, the command first opens the dialog box “Devices”, which displays the applications existing on the controller. From this dialog you can connect via the button “Parameter mode” to the PLC and then access the values of the device parameters without having to log in with a real application.

**Writing and forcing in the I/O mapping**

In online configuration mode the writing and forcing of values on the “I/O Mapping” tab works differently to the way it works in real online mode. The outputs are written immediately after insertion into the table. There is no “Prepared Value” column; instead, the initial values can be changed directly after a double-click on the column “Current Value”.

---

**Dialog box 'Config application mode'**

This dialog box appears after the command “Online Config Mode” if the device supports the advanced online configuration mode and there are already real applications on the controller.

| Parameter mode | The controller configuration in the project is compared with that on the device. If they correspond, CODESYS establishes a connection to the PLC. Unlike the simple online configuration mode it permits the reading and – if supported by the driver – the writing of parameters in the generic device editor. The applications already loaded to the device remain unchanged in this case! |
| Config application mode | CODESYS switches to the 'simple online configuration mode'. |

**Command 'Runtime licensing'**

**Symbol:** 🧑

**Function:** Management of runtime licenses on the PLC. The use of some libraries and devices require the PLC to have a runtime license.

**Call:** Main menu “Project”, Context menu. Displayed only offline.

**Requirement:** A project is open. Log-in required for managing runtime licenses without need for memory card.

The license status of a PLC can be displayed at any time ➤ Chapter 6.3.2.2.6 “View license information” on page 1453.

Command 'Generate Code'

Symbol 📄; shortcut: [F11]

**Function:** The command starts the code generation for the active application.

**Call:** Menu bar: "Build"

When generating code with this command, code is generated as when downloading the application to the PLC, but the code is not transferred to the PLC. At this time, other source code tests are performed. As a result, you can check the code for bugs that were not detected by the compiler and for fixing any bugs before the code is used in online mode.

See also

- Chapter 6.4.1.11.5 “Generating Application Code” on page 1976

Command 'Clean'

**Function:** This command deletes the build information for the active application.

**Call:** Main menu “Build”.

During the last download, the build information was created and saved to a file (*.compileinfo). After a cleaning process, an online change is no longer possible for the affected application. The application must be fully downloaded to the controller again.

See also

- Chapter 6.4.1.21.3.6.3 “Command 'Clean All'” on page 2618

Command 'Clean All'

**Function:** This command deletes the build information for all applications in the project.

**Call:** Main menu “Build”.

During the last download, the build information was created in the local file system and saved to a file (*.compileinfo).

This command requires a download before another login. An online change is no longer possible. As compared to the “Clean” command (only the active application), CODESYS regenerates the language model for all objects, which is very time-consuming.
NOTICE!
Reconsider carefully whether or not executing this command is really necessary. If you only want to rebuild and download the active application, then execute the “Clean” command.

See also
- § Chapter 6.4.1.21.3.6.2 “Command ‘Clean’” on page 2618

Command ’Build’

Function: The command starts the build operation for the active application.

Call: The command is not in any menu by default. You can add it to a menu by using the dialog from “Tools ➤ Customize” (command category “Build”).

During the build operation, CODESYS performs a syntactic validation of all objects in the application. However, code is not generated like at log in to the target system or download of the application. The build operation is always performed automatically when you log in with a changed program.

When the check is complete, CODESYS displays any error messages or warnings in the message view (‘Build’ category).

If the program has not been changed since it was compiled without errors the last time, then it is not recompiled. The message “The application is current” appears. If the syntactic validation is repeated, then you must execute the “Rebuild” command.

See also
- § Chapter 6.4.1.21.3.6.5 “Command ‘Rebuild’” on page 2619

Command ’Rebuild’

Function: The command starts the build operation for the active application, even if the last build contained errors.

Call: The command is not in any menu by default. You can add it to a menu by using the dialog from “Tools ➤ Customize” (command category “Build”).

See also
- § Chapter 6.4.1.21.3.6.4 “Command ‘Build’” on page 2619

Command ’Generate Runtime System Files’

Function: The command generates a C stub file and an M4 interface file from the current library project. These files are used as the basis for creating an external library file.

Call: Menu bar: “Build”

Requirement: A library project is open.

The command opens the “Generate Files for Runtime System” dialog.

<table>
<thead>
<tr>
<th>“Output directory”</th>
<th>Directory where CODESYS creates the runtime system files. Click the [...] button to open the default dialog for browsing the file system.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Component names”</td>
<td>Name of the library project</td>
</tr>
<tr>
<td>“Which files do you want to create?”</td>
<td></td>
</tr>
</tbody>
</table>
"M4 interface file"

Interface file <project name>Itf.m4 with definitions. Example of m4 file:

```
#include "SysFile"  // Interface file <project name>Itf.m4 with definitions.

/*
   * <project name>Itf.m4
   */

SET_INTERFACE_NAME( "SysFile" )

/*
   * EXTERN LIB SECTION BEGIN */

/*
   * ifndef __cplusplus
   */

extern "C" {

/*
   * ifndef __cplusplus
   */

/*
   * ifndef __cplusplus
   */

typedef enum {
    FS_OK = 0,
    FS_NO_FILE = 1,
    FS_ILLEGAL_POS = 2,
    FS_FULL = 3,
    FS_EMPTY = 4,
    FS_BUFFER_FULL = 5
} filestatus;

/*
   * ifndef __cplusplus
   */

/*
   * ifndef __cplusplus
   */

/*
   * ifndef __cplusplus
   */

typedef enum {
    AM_READ = 0,
    AM_WRITE = 1,
    AM_APPEND = 2
} fileaccess;
```

"C stub file"

Stub file for reprogramming the library in C. Example of stub file:

```
#include "CmpStd.h"
#include "CmpErrors.h"
#include "CmpItf.h"
#include "SysFileDep.h"

void cdecl cdecl_ext sysfilegetpath(sysfilegetpath_struct *p) {
}

void cdecl cdecl_ext sysfilerename(sysfilerename_struct *p) {
}

void cdecl cdecl_ext sysfilewriter(sysfilewriter_struct *p) {
```

"Options"

"Export referenced types included in libraries"

The referenced types are included in the export.

"Use original type names"

The type names of the library project are used.
Command 'Check all Pool Objects'

Symbol 🌱; shortcut: [F11]

Function: The command starts a build operation (a syntax check) for all pool objects that are managed in the POU view and as a result are available throughout the project. First and foremost, this is useful when creating libraries.

Call: Menu bar: "Build"

Requirement: A library project is open.

NOTICE!

The command does not result in code generation. In addition, no file is created in the project directory with information about the build operation.

See also
- ☩ Chapter 6.4.1.21.4.15.2 “Dialog 'Customize’ - 'Menu’” on page 2801
- ☩ Chapter 6.4.1.17.3 “Information for Library Developers” on page 2035

Command 'Generate Code for Active Application'

Function: The command generates the code for the application of a library project.

Call: Menu bar: "Build"

Requirement: The project contains an application.
- A library project is open.
- The library project contains an application.

When generating code with this command, code is generated as when downloading the application to the PLC, but the code is not transferred to the PLC. At this time, other source code tests are performed as a result, you can check the code for bugs that were not detected by the compiler and for fixing any bugs before the code is used in online mode.

See also
- ☩ Chapter 6.4.1.21.3.6.6 “Command ‘Generate Runtime System Files’” on page 2619

Command 'Check All Application Objects'

Function: This command starts a build operation for all objects of the active application, even for the POU that are not used by the application. After the build operation, the errors that were found in the unused objects are also displayed in the message window.

Call: The command is not in any menu by default. You can add it to a menu by using the dialog from “Tools ➤ Customize” (command category “Build”).

Requirement: An application of the open project is active.

NOTICE!

The command does not result in code generation. In addition, no file is created in the project directory with information about the build operation.

See also
- ☩ Chapter 6.4.1.21.4.15.2 “Dialog 'Customize’ - 'Menu’” on page 2801
Command 'Check Library Compatibility'

Function: The command triggers a check whether the currently opened library project is compatible with the last installed version of this library (next lower version number).

Call: By default the command is not available in any menu. You can add it to a menu by using the "Tools ➔ Customize" dialog, command category "Build".

Requirement: A library project is opened.

The check regards differences in the implemented interfaces of a method. So, after the check you will get displayed error messages in the messages window in the following cases:

- Adding or removing inputs or outputs of function blocks, functions or methods
- Changing the data type of inputs or outputs
- Modifying the implemented interfaces of a method

- § Chapter 6.4.1.17.3 “Information for Library Developers” on page 2035

Command 'Generate Disassembly File'

Function: This command generates a disassembly file <project name>.asm from the current project and saves it in the file directory in the project folder.

Call: The command is not in any menu by default. You can add it to a menu by using the dialog box from "Tools ➔ Customize" (command category "Build").

See also

- § Chapter 6.4.1.21.4.15.2 “Dialog 'Customize' - 'Menu’” on page 2801
Command 'Choose Active Application'

Symbol: [App (Device PLC Logic)]

The command is implemented as a list box from which you can set an application active. By default, the list box is located on the toolbar.

Function: The list box displays the currently active application with its device path.

Call: The list box contains all applications that are organized in the "Devices" view. By clicking an entry in the list box, you activate the selected application.

Requirement: The project has multiple applications.
When you call commands in the “Build” oder “Online” menus, these commands are applied to the active application. This is displayed in the list box, and also displayed in bold in the device tree. In particular, this applies to the “Build ➔ Build” and “Online ➔ Login” commands.

You can also access these commands using the command icons on the toolbar where the list box is located. When the command icons are called, they are also applied to the active application.

However, if you call a command from the context menu of a device object in the device tree, then the command is applied to the corresponding object. For example, by calling ☑, you can establish a connection to an application on the device which is not active.

See also
- Chapter 6.4.1.21.3.5.12 “Command ‘Set Active Application’” on page 2603
- Chapter 6.4.1.21.3.6.4 “Command ‘Build’” on page 2619
- Chapter 6.4.1.21.3.7.2 “Command ‘Login’” on page 2624

Command ‘Login’

Symbol: ☑; shortcut: [Alt]+[F8].

Function: The command connects the application to the target system (PLC to simulated device) and starts the online mode.
Call: Menu bar: “Online”; context menu of an “Application” object

Requirement: The application contains no errors and the communication settings are configured.

A dialog prompt opens if the communication settings are incorrect. You can then switch directly to the “Communication Settings” of the PLC.

If you click “Login” from the online menu, then the currently active application is connected to the target system. If you choose this command from the context menu (right-click) while an application is selected in the device tree, then that application is logged in, even if it is not set as the active application.

If an online user management is configured on the target device, then you are prompted for user data when you log in. The “Device User Login” dialog opens for this.

CAUTION!
Check controller accessibility

For security reasons, controllers should not be accessible from the Internet or untrusted Networks under any circumstances! In particular, the TCP/IP programming ports (usually UDP-Ports 1740..1743 and TCP-Ports 1217 + 11740 or the controller specific ports) should not be accessible from the internet without protection. In case Internet access to the controller is needed, using a safe mechanism is absolutely mandatory, such as VPN and password protection of the controller.

© Chapter 6.4.1.11.4 “Handling of Device User Management” on page 1971

NOTICE!

If a safety controller is inserted below a controller, then this command can interrupt the communication connections temporarily.

Connections of the safety controller to other safety controllers (via safety network variables), to field devices, and to the development system are affected.

The safe field devices or other safety controller can enter the safe state as a reaction. The connection to the development system is affected only when a safety controller that is connected to the main controller via a fieldbus.

For more information, see the “Subordinate Safety Controllers” chapter.

Possible situations when logging in:

- A later version of the device description (than in the project) is on the PLC. A warning prompt is displayed with the option to cancel the process.
- The application does not exist on the PLC: You are prompted to confirm the download.
- The application is already on the PLC and has not been changed since the last download. The login continues without any more prompts.
- The application exists on the PLC, but it has been changed since the last download. You are prompted to select one of the following options:
  - Login with online change (Note the information about online changes in the help page “Command ‘Online Change’ ”.)
  - Login with download
  - Login without any change

The position also provides the option of updating the boot application on the PLC.
- An unknown version of the application exists on the PLC. CODESYS prompts you to replace it.
- A version of the application exists on the PLC and is running. CODESYS prompts you to log in anyway and overwrite the currently running application.
- The application on the PLC is currently halted at a breakpoint. You are logged out and the program has been changed: CODESYS prompts you with a warning that the PLC will be stopped completely if an online change or download occurs. This happens also if several tasks exist and the breakpoint affects only one of them.
Click “Details” in the dialogs above to open the “Application Information” dialog.

In CODESYS V3.5 SP17 and higher, only exactly one CODESYS instance can ever be logged in to an application of a controller. If a second CODESYS instance wants to log in to the same application of the same controller, then an error message is displayed.

- ☰ Chapter 6.4.1.21.3.7.6 “Command ‘Online Change’” on page 2629
- ☰ Chapter 6.4.1.10.7 “Subordinate safety controller” on page 1964

Dialog 'Application Information' (Details)
The dialog provides two tabs with comparative information about the application changed in the development system and its previous version currently located on the PLC. There are two tabs:

- “Application information”: The application properties of the “Application in the IDE” (Integrated Development Environment) are compared with those of the “Application in the PLC”. Project name, Last modification, IDE version, Author, Description. In addition, CODESYS shows the objects that have changed since the last download.
- “Application contents”: When the “Download application info” is selected, the contents of the applications on both the (1) development system and (2) PLC can be compared. The “Download application info” option is located on the “Application Build Options” tab of the application properties.

If the code in the development system is not current, then (3) “Application not up to date. Generate code now?” appears at the bottom left of the dialog. Execute this command to update the application source code.

This detailed information can help you to better assess the effects of login in the current situation and to make a decision about downloading the new application.

See also
- ☰ Chapter 6.4.1.21.2.8.5 “Tab ‘Applications’” on page 2434
- ☰ Chapter 6.4.1.5 “Comparing projects” on page 1817
Unknown applications on the PLC

If one or more applications are already on the PLC, but are not in the project, then CODESYS opens a dialog with a list of these applications. You can then define whether an application should be deleted before loading the current application from the PLC. This also applies to child applications that are on the PLC, but have been deleted from the project in the meantime.

Compiling the project before login

If an application program has not been compiled since the last change, then CODESYS compiles the project before login. This operation is the same as the “Generate Code” command when logged out.

If compile errors occur, then a dialog prompt opens. The errors are displayed in the message view in the “Build” category. You can then decide whether or not you log in without downloading the program to the PLC.

See also

- Chapter 6.4.1.21.3.6.4 “Command ‘Build’” on page 2619

Error at login

If an error occurs when logging in to the PLC, then CODESYS cancels the loading operation with an error message. The error dialog gives you the options of showing the error details. If an exception was thrown and the text “SOURCEPOSITION” is included in the log, then you can display the affected function in the editor by clicking “Show in Editor”. The cursor jumps to the line containing the error.

Messages during the download operation

If CODESYS downloads the project to the PLC at login, then the following information is printed to the message view:

- Generated code size
- Size of the global data
- Resulting memory requirement on the PLC
- List of the affected blocks (for online change)

In online mode, you cannot change the settings of the devices or modules. You have to logout of the application for changing device parameters. Depending on the bus system, there may be some special parameters that you can also change in online mode.

CODESYS saves the view configuration separately in online and offline mode. In addition, views are closed that cannot be used in any operating mode. For this reason, the view can change automatically at login.

Command ‘Logout’

Symbol: 📋, keyboard shortcut: [Ctrl]+[F8].

Function: This command disconnects the application from the target system (controller or simulated device) and returns to offline mode.

Call: Main menu “Online”, or context menu of the “Application” object.

Command ‘Create Boot Application’

Function: This command generates a boot application.

Call: Main menu “Online”.
A boot application is the application that is started automatically when the controller is switched on or started.

In offline mode, you can save the boot application in any directory. In online mode, CODESYS save the boot application to the target device. The file name is `<application name>.app`.

See also

- Chapter 6.4.1.11.7 “Generating boot applications” on page 1978
- Chapter 6.4.1.21.2.2 “Object ‘Application’” on page 2410

**Command 'Load'**

**Function:** This command causes a compilation of the active application with subsequent download to the controller.

**Call:** Menu bar: “Online”.

**Requirement:** The application is in online mode.

When you execute this command, CODESYS performs a syntax check and generates the application code. This code is downloaded to the PLC. Furthermore, CODESYS generates the build log `<project name>.<device name>.<application ID>.compile info` in the project directory.

**NOTICE!**

During loading all variables are re-initialized with the exception of persistent variables.

**NOTICE!**

If a safety controller is inserted below a controller, then this command can interrupt the communication connections temporarily.

Connections of the safety controller to other safety controllers (via safety network variables), to field devices, and to the development system are affected. The safe field devices or other safety controller can enter the safe state as a reaction. The connection to the development system is affected only when a safety controller that is connected to the main controller via a fieldbus.

For more information, see the "Subordinate Safety Controllers" chapter.

The description of the “Login” command describes the possible situations when logging in and loading.

If you attempt to download an application when the same version of the application is already on the PLC, then you get the message: "Program is unchanged. Application was not downloaded". CODESYS downloads the application to the PLC.

During loading a record of the actions being executed (generation of code, execution of initialization, etc.) appears in the Message window in the message category “Compile”. Furthermore, information is displayed regarding the memory ranges, the size of the code, the global data and the allocated memory. For the purpose of clarity, as opposed to the online change, the modified function blocks are no longer listed.

See also

- Chapter 6.4.1.21.3.7.2 “Command 'Login’” on page 2624
- Chapter 6.4.1.10.7 “Subordinate safety controller” on page 1964
Command 'Online Change'

**Function:** The command is used for initiating an online change on the current application. When this is done, CODESYS re-downloads only the changed parts of an application that is already running on the PLC.

**Call:** Menu bar: “Online”; context menu of an “Application” object

**Requirement:** The application is in online mode.

The command is available in the context menu if an application is selected in the device tree. In this way, you can perform an online change just for one application, even if that application is not currently active.

---

**CAUTION!**

An online change modifies the running application program and does not cause a restart.

- Make sure that the new application code still has the required effect on the controlled system.
- Depending on the controlled plant, the plant and workpieces may be damaged or the health and life of persons could be endangered.

**NOTICE!**

1. When an online change is performed, the application-specific initializations (example: homing) are not executed because the machine retains its status. For this reason, the new program code may not have the intended effect.

2. Pointer variables retain their value from the last cycle. When a pointer refers to a variable whose value was changed in an online change, the variable no longer yields the correct value. Make sure that the pointers are re-assigned in each cycle.

3. After the parent application has been changed, a child application is removed from the controller when an online change is performed.

---

**NOTICE!**

For compiler version >= 3.5.0.0, a fast online change is performed for minor changes. In this case, only the modified blocks are compiled and downloaded. In particular, no initialization code is generated. This means that also no code is generated when variables with the `init_on_onlchange` attribute are initialized. As a rule, this has no effect because the attribute is used primarily for initializing variables with addresses. However, it cannot happen that a variable changes its address during an online change.

To secure the effect of the `init_on_onlchange` attribute in the entire application code, you must deactivate the fast online change in general for the application by using the compiler definition `no_fast_online_change`. To do this, insert the definition in the application “Properties” ("Build" tab).

---

At the time of download, CODESYS also lists the changed interfaces, affected variables, and all blocks with new generated code in the “Build” category of the message view. If memory locations change, a dialog will inform you of possible problems in conjunction with pointers.

---

*In the “Online Change Memory Reserve” view, memory reserves can be configured for the online change so that instance variables do not have to be moved in the memory when changing a function block in an online change.*
What prevents an online change?

There are actions in CODESYS after which an online change on a controller is no longer possible. Afterwards, the application always has to be completely recompiled. A typical case is the “Clean All” action which deletes the compile information stored at the last download. However, these kind of actions typically generate a warning which you have to acknowledge.

But there are also "normal" editing actions that result in an online change not being possible at the next login. Therefore, pay attention to the following symbol in the status bar when editing in the program POUs: . When this symbol turns red in color, only a full download to the controller can be performed. Double-clicking the symbol opens the “Application Information” dialog with a list of differences to the last download. In the dialog, you also find information about which of the changes prevent an online change.

Actions and changes in different areas of an application that prevent an online change:

Command 'Source Download to Connected Device'

**Function:** This command loads the project source code (as project archive) to the controller currently connected.

**Call:** Main menu “Online”.

**Requirement:** The application is in online mode.

See also
- Chapter 6.4.1.21.3.2.10 “Command ‘Source Upload’” on page 2559
- Chapter 6.4.1.21.3.2.11 “Command ‘Source Download’” on page 2560

Command 'Download Manager'

**Symbol:** 🛠

**Function:** Download or create a boot project from the project devices or update the firmware oft he device.

**Call:** Main menu “Online”, Context menu.

**Requirement:** A project is open.

Command 'Multiple Download'

**Function:** The command causes the code generation of the applications contained in the project as well as the loading of the applications to the corresponding controllers.

**Call:** Menu bar: “Online”
The command opens a dialog with a list of the applications. In this dialog, select the applications that are to be loaded. Then, CODESYS performs the syntax check of these applications and generates the respective code. The code is then downloaded to the respective PLC. For each selected application, CODESYS generates a build log with the name `<project name>.<device name>.<application ID>.compileinfo` in the project directory.

**NOTICE!**
If a safety controller is inserted below a controller, then this command can interrupt the communication connections temporarily.

Connections of the safety controller to other safety controllers (via safety network variables), to field devices, and to the development system are affected. The safe field devices or other safety controller can enter the safe state as a reaction. The connection to the development system is affected only when a safety controller that is connected to the main controller via a fieldbus.

For more information, see the "Subordinate Safety Controllers" chapter.

---

**Dialog 'Multiple Download'**

<table>
<thead>
<tr>
<th><strong>Please select the items to be downloaded</strong></th>
<th>Selection of the applications. The applications are thereby also loaded to different controllers.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Move Up</strong>, <strong>Move Down</strong></td>
<td>Change of the order of download of the applications. The applications are downloaded to the PLCs in the order of this list. By default, this list is alphabetically sorted. Parent-child relationships of applications are thereby taken into account.</td>
</tr>
<tr>
<td><strong>OK</strong></td>
<td>Checks the syntax of all selected applications. Afterwards, the communication with the associated controller is verified for each application before the download takes place.</td>
</tr>
</tbody>
</table>

**Table 495: “Online Change Options”**

If an earlier version already exists on the PLC and is different from the current version, then the following options are provided:

<table>
<thead>
<tr>
<th><strong>“Try to perform an online change. If this is not possible, perform a full download.”</strong></th>
<th>Activated by default. If an online change cannot be executed for one of the applications, then a download is performed.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Force an online change. If this is not possible, cancel the operation.”</strong></td>
<td>If an online change cannot be performed for (at least) one of the applications, then no download is performed and the online change is terminated (for example, if you have executed the command “Clean All” beforehand).</td>
</tr>
<tr>
<td><strong>“Always perform a full download.”</strong></td>
<td>Downloads all parts of the applications to the PLC, regardless of any existing versions.</td>
</tr>
</tbody>
</table>

For selected applications that do not exist on the PLC yet, CODESYS performs a download automatically to the PLC.
Table 496: “Other Options”

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Delete all applications on the PLC which are not part of the project.”</td>
<td>☑️ Corresponding applications are deleted</td>
</tr>
<tr>
<td>“Start all applications after download or online change”</td>
<td>☑️ The applications are started after the download or online change.</td>
</tr>
<tr>
<td>“Do not release forced variables”</td>
<td>☑️ If an application with forced variables exists on the controller, and if the implementation of this application has been changed, then no download is performed for this application. The message “Error: Skipped because one or more variables have been forced” appears for this application in the window “Multiple Download - Result”.</td>
</tr>
</tbody>
</table>

Note that variables with the key attribute `PERSISTENT RETAIN` are not generally initialized. If you change the data layout, however, the persistent variables are automatically re-initialized.

After completion of the download a listing of all selected applications appears in the download order that you configured. In addition, you are shown information on the success of the download for each application in the “Multiple Download - Result” dialog:

- “Created”: A new application has been created and downloaded to the controller.
- “Not changed”: The application which exists on the controller has not been changed.
- “Online changed”: The application which exists on the controller has been modified by an online change.
- “Downloaded”: The application which exists on the controller has been replaced by a new created application.
- “Skipped due to impossible online change”: An online change could not be performed for the application. The application was not changed.
- “Error”: An error has occurred for this application during download. More details may be displayed.
- “Cancelled by user”: The operation has been aborted by the user.

Command 'Reset Cold'

**Function:** The command results in a cold start of the active application on the controller.

**Call:** Menu bar: “Online”

**Requirement:** The application is in online mode.
NOTICE!

If a safety controller is inserted below a controller, then this command can interrupt the communication connections temporarily.

Connections of the safety controller to other safety controllers (via safety network variables), to field devices, and to the development system are affected. The safe field devices or other safety controller can enter the safe state as a reaction. The connection to the development system is affected only when a safety controller that is connected to the main controller via a fieldbus.

For more information, see the "Subordinate Safety Controllers" chapter.

After restarting with "Reset Cold", the following happens:

- Application code is retained on the controller.
- Variables are initialized (with the initialization value or the default initialization value 0), and the previous values are lost.
- Retain variables are initialized, and the previous values are lost.
- Persistent variables are retained with values.
- Breakpoints that were set in the code are retained with their status (for example, activated or deactivated).
- The application goes into the “STOP” state.

You can also select the command while debugging the application when it halts at a breakpoint in the “HALT ON BP” state. Then either the warm start is executed immediately, or the remaining statements of the current cycle are processed. Therefore, a message window opens for you to select the next action. However, the message window opens only if the runtime system is capable of restarting the cycle without terminating it first.

After the reset, you can run the application as usual and, for example, start the execution by clicking “Debug ➔ Start”.

- Chapter 6.4.1.21.3.7.12 “Command 'Reset Origin'” on page 2635

**Command 'Reset Warm'**

**Function:** The command results in a warm start of the active application on the controller.

**Call:** Menu bar: “Online”

**Requirement:** The application is in online mode.
NOTICE!
If a safety controller is inserted below a controller, then this command can interrupt the communication connections temporarily.
Connections of the safety controller to other safety controllers (via safety network variables), to field devices, and to the development system are affected. The safe field devices or other safety controller can enter the safe state as a reaction. The connection to the development system is affected only when a safety controller that is connected to the main controller via a fieldbus.
For more information, see the "Subordinate Safety Controllers" chapter.

After restarting with "Reset Warm", the following happens:
- Application code remains loaded on the controller.
- Variables are initialized (with the initialization value or the default initialization value 0).
- Retain variables are retained with values.
- Persistent variables are retained with values.
- Breakpoints that were set in the code are retained with their status (for example, activated or deactivated).
- The application goes into the “STOP” state.
You can also select the command while debugging the application when it halts at a breakpoint in the “HALT ON BP” state. Then either the warm start is executed immediately, or the remaining statements of the current cycle are processed. Therefore, a message window opens for you to select the next action. However, the message window opens only if the runtime system is capable of restarting the cycle without terminating it first.
After the reset, you can run the application as usual and, for example, start the execution by clicking “Debug ➔ Start”.

- Chapter 6.4.1.21.3.7.12 “Command ‘Reset Origin’” on page 2635

Command 'Reset Origin'

Function: The command results in a reset origin of the active application on the controller.
Call: Menu bar: “Online”
Requirement: The application is in online mode.
NOTICE!
If a safety controller is inserted below a controller, then this command can interrupt the communication connections permanently.

Connections of the safety controller to other safety controllers (via safety network variables), to field devices, and to the development system are affected. The safe field devices or other safety controller can enter the safe state as a reaction. The connection to the development system is affected only when a safety controller that is connected to the main controller via a fieldbus.

For more information, see the "Subordinate Safety Controllers" chapter.

After restarting with “Reset Origin”, the following happens:

- The application code is deleted, and as a result the application has no state.
- Variables are deleted, and the values are lost.
- Retain variables are deleted, and the values are lost.
- Persistent variables are deleted, and the values are lost.
- Breakpoints that were set in the code are lost.

Command 'Reset Origin Device'

**Function:** The command opens a dialog to reset the device to its factory settings. All applications, boot applications, and remanent variables will be deleted from the device. Depending on the version of the device, a selection of the elements to be deleted can be made in this dialog. When these elements are unselected in the dialog, they are not deleted during the reset and remain on the controller. By default, all elements are selected and everything is deleted. Elements that are not available for selection are generally also deleted.

**Call:** Right-click a programmable device in the device tree.

After restarting with “Reset Origin Device”, the following happens:

- All applications are reset as with the “Reset Origin” command.
- All files, which are not deleted by the “Reset Origin” command, are deleted (for example, files from visualization, alarms, and recipes).
- The user management is deleted.
- All certificates which are currently managed by the runtime system are deleted.

<table>
<thead>
<tr>
<th>“Delete”</th>
<th>The object is deleted when the “Reset Origin Device” command is executed.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Object”</td>
<td>Objects that can be excluded from “Delete”. The listed objects depend on the version of the controller. In version 3.5.16.20 and higher, the following objects can be excluded from the delete operation.</td>
</tr>
</tbody>
</table>

- “User Management”
- “PLC Logic”
- “Certificates”

**Note:** When resetting the device, the objects selected in this dialog are also deleted. If not all displayed objects are selected in this dialog, then possibly other objects can no longer be used or they are also deleted.

**Command 'Logoff Current Device User'**

**Symbol:** 🏀

**Function:** This command logs out the user currently logged in to the controller (device). If CODESYS still has a connection to the controller, then it will be disconnected.

**Call:** Main menu “Online”.

**Requirement:** The application is in online mode.

You can manage the device user management in the “Users and Groups” tab and “Access control” of the device editor. The commands in the “Online ➔ Security” menu provide another simple option for protecting access to the target device.

**See also**

- Chapter 6.4.1.21.3.7.12 “Command 'Reset Origin’” on page 2635

- Chapter 6.4.1.10.7 “Subordinate safety controller” on page 1964

**Command 'Download’**

**Function:** This command loads the compiled project in the PLC.

**Call:** Main menu “Online”, Context menu.

**Requirement:** A project is open. Log-in required for download.

**Command 'Add Device User’**

**Symbol:** 🤝

**Function:** This command configures a new device user and adds this user to the administrator group.
Call: Menu bar: “Online ➔ Security”

Requirement: The device supports a device user management. You are logged in to the device as a user.

You can manage the device user management in the “Users and Groups” tab and “Access control” of the device editor. The commands in the “Online ➔ Security” menu provide another simple option for protecting access to the target device.

See also

- Chapter 6.4.1.21.2.8.14 “Tab ‘Users and Groups’” on page 2450
- Chapter 6.4.1.11.4 “Handling of Device User Management” on page 1971

This command opens the “Add Device User” dialog. Here you define the access data of the new user.

The dialog corresponds to the dialog in the “Users and Groups” tab of the device editor for adding a new user.

Please use a strong password as follows:

- Password length >= 8 characters (best >= 12)
- Use uppercase and lowercase
- Include numbers
- Use special characters
- Do not use existing names or sequence of characters that are easy to guess (for example, “123”, “abc”, “qwerty”)

CAUTION!

After performing this action, you can no longer use a blank username and password to log in. You must remember your password.

See also

- Chapter 6.4.1.21.3.7.17 “Command ‘Remove Device User’” on page 2638
- Chapter 6.4.1.21.3.7.18 “Command ‘Change Password Device User’” on page 2639

Command ‘Remove Device User’

Symbol: 🗑️

Function: This command removes a user from the user management on the target system (device).

Call: Menu bar: “Online ➔ Security”

Requirement: You are logged in to the device as a user.

You can manage the device user management in the “Users and Groups” tab and “Access control” of the device editor. The commands in the “Online ➔ Security” menu provide another simple option for protecting access to the target device.
This command opens the "Remove Device User" dialog. Specify the user name and password of the user to be removed and click "OK" to confirm.

CAUTION!
After performing this action, you can no longer use this removed user account to log in. If this user is the only one on the target system, then a dialog prompt notifies you that this user cannot be removed.

Command 'Change Password Device User'
Symbol: ✷
Function: The command changes the password for the user who is currently logged on the PLC.
Call: “Online ➔ Security” menu
Requirement: You are logged in as a user.
The command opens the “Change Password for Device User” dialog for defining a new password. You have to specify the old password again.

NOTICE!
After performing this action, you can no longer use the previous password to log in.

Make sure that you use a strong password. Note the following:
- Password length >= 8 characters (best >= 12)
- Use uppercase and lowercase
- Include numbers
- Use special characters
- Do not use existing names or sequence of characters that are easy to guess (for example, "123", "abc", "qwer")

See also
- Chapter 6.4.1.21.3.7.16 “Command ‘Add Device User’” on page 2637
- Chapter 6.4.1.21.3.7.18 “Command ‘Change Password Device User’” on page 2639

Command 'Stop Execution on Handled Exceptions'
Function: This command halts the application where the error is located despite a programmed exception handling.
Call: This command is not available by default, but it can be configured from the “Tools ➔ Customize”, “Add Command” dialog box (“Online” category).
**Requirement:** The application is in online mode and contains a programmed exception handling with the `__TRY` and `__CATCH` operators.

If you have configured this command from the “Online” menu and you call it from there, then the currently active application is affected. Furthermore, this command can help you to detect errors.

See also
- % Chapter 6.4.1.20.3.62 “Operators ‘__TRY’, ‘__CATCH’, ‘__FINALLY’, ‘__ENDTRY’” on page 2206
- % “Adding commands” on page 1803
- % Chapter 6.4.1.21.3.9.16 “Command ‘Customize’” on page 2667

**Command 'Connect to Device'**

**Function:** The command establishes a connection to the device currently selected in the device tree.

**Call:** Context menu of the device.

**Requirements:** A device is selected in the device tree. The communication settings are configured correctly.

See also
- % Chapter 6.4.1.21.3.7.21 “Command ‘Disconnect from Device’” on page 2640

**Command 'Disconnect from Device'**

**Function:** The command disconnects the connection from a device.

**Call:** Context menu of the device.

**Requirements:** A device is selected in the device tree.

See also
- % Chapter 6.4.1.21.3.7.20 “Command ‘Connect to Device’” on page 2640

**Command 'Wink’**

**Symbol:** 🌟

**Function:** The command causes an LED of a connected controller to blink. As a result, the hardware can be identified clearly.

**Call:** The command is not in any menu by default. You can add it to a menu by means of the “Tools ➤ Customize” dialog, in the “Online” command category.

**Requirement:** The controller supports this function and the connection parameters are configured correctly.

**Command 'Simulation’**

**Function:** The command switches the development system to simulation mode.

**Call:** Menu bar: “Online”
In simulation mode, you can start and debug the active application on a simulated target device. A physical target device is not necessary for testing the online behavior of an application. When logging in for the first time, you are prompted whether the application should be created or loaded. For a simulated device, you do not have to configure the communication settings. In CODESYS simulation mode, the entry of the controller in the device tree is displayed in italics.

**NOTICE!**

**No C code for simulation mode**

In simulation mode, C code is not generated and loaded to the runtime system. To simulate the code contained in the C modules anyway, you can implement it for this purpose in the respective IEC objects of the C code module.

After successful login, the red triangle symbol (△) in the device tree indicates simulation mode. You can use the corresponding online commands for testing the application.

To switch off simulation mode, log out of the controller and execute the “Simulation” command again.

The command affects the active application only.

---

### Differences between simulation mode and operation with a physical controller

<table>
<thead>
<tr>
<th></th>
<th>Simulation</th>
<th>Physical Controller</th>
</tr>
</thead>
</table>
| **Real-time behavior / multicore** | - Runs in the CODESYS process with normal priority  
- Single-core  
-- Worse real-time behavior | - Real-time operating system  
- Single-core or multicore |
| **Architecture scope** | - Simulation 64-bit (depends on the CODESYS installation): -->
Possible compile error in the IEC application if the application has been previously run only as 32-bit (for example, use of DWORD as POINTER) | - Controller 32-bit |
| **FPU (rounding error)** | - Uses FPU of the PC  
- Different configuration of the FPU exceptions | - Uses FPU of the controller or FPU emulation  
- Different configuration of the FPU exceptions |
| **Handling of exceptions** | - Exception handling of the Windows Runtime System | - Exception handling of the controller |
Simulation | Physical Controller
---|---
External libraries (Cmp/Sys/CAA/OEM/…) | ● Only a few external Cmp/SysLibs are physically available. As compared to embedded, more SysLibs could also be available.  
● Other implementation/behavior of the SysLibs (Windows in contrast to the OS of the controller)  
● "Unresolved Reference error" on download is ignored. The application can still be downloaded to the controller and started. If the missing functions are actually called, they return nonsense values. Therefore, an IEC implementation can also be specified for external POUs. This substitute IEC code is then executed in the simulation.  
| ● "Unresolved Reference error" on download when external libraries do not exist in the controller

I/O drivers | ● I/O configuration is generated but not evaluated.  
● Fieldbus stacks are not evaluated.  
● I/O channels are not updated and no bus telegrams are sent.  
| ● Mostly no restriction, but depends on the capabilities of the controller

SoftMotion drivers | ● All SoftMotion axes are set to virtual and therefore simulated.  
| ● Mostly no restriction, but depends on the capabilities of the controller

See also
● “Chapter 6.4.1.12.2 “Testing in simulation mode” on page 1980"

Command 'Operating Mode'

**Function:** The commands set the controller to a state which prevents accidental change to the project.

**Call:** Menu bar: “Online ➔ Operating Mode”

You can use these commands, for example, to lock the state of a controller in order to prevent the controller from switching to another state while you program another controller.

When programming is complete, the controller should then be switched to a defined and externally visible state that is set exactly the same way after restarting.

The , , and symbols in the status bar indicate the current operating mode. Double-clicking one of these symbols opens a help window.
If it supports the controller, then you can switch the controller to the following operating modes:

- **“Debug”:** No restrictions
- **“Locked”:** The current state of debugging is locked on the application. No additional breakpoints can be set and no additional variables can be forced. Writing variables is still possible and breakpoints which are already set remain active. Only the "RUN" state of an application is preserved in “Locked” operating mode even if the controller is restarted.
  
  With this operating mode, a developer can prevent himself or another developer from changing the application on the controller, for example by setting or deleting a breakpoint, by forcing, or by making changes to the file system. This operating mode is helpful to prevent a download to an incorrect controller when, for example, multiple controllers of a plant are programmed.

- **“Operational”:**
  
  This operating mode makes sure that the controller reloads the same applications after a restart and that no debug features are active anymore. The operating mode is set when a controller is completely programmed and should be accepted or already is.

  Conditions for activating the “Operational” mode
  - A boot application for each application has to exist on the controller.
  - There must not be any active breakpoints set.
  - All applications have to be running.
  - There must not exist any forced values.
  - Furthermore, the device can define more of its own restrictions.

  The “Locked” and “Operational” operating modes are different in the use cases and in the requirements for activating the operating mode. However, for both operating modes the runtime system prevents the following actions:

  - Regarding the application
    - Download of an application
    - Online change
    - Force variables
    - Set breakpoints
    - Stop application
    - Reset application
    - Start application
    - Delete application

  - Regarding the file transfer of the controller
    - Download of a file to the controller
    - Delete a file on the controller
    - Rename a file on the controller
    - Create a directory on the controller
    - Delete a directory on the controller
    - Rename a directory on the controller

You cannot switch the operating mode between “Locked” and “Operational”.

**Command 'Virtual mode'**

**Function:** “Virtual Mode” option enables virtual mode for Automation Builder.

**Call:** Main menu “Online”, Context menu

**Requirement:** A project is open. Command is only available, if a license for advanced simulation support is activated.
Command 'Virtual system testing'

**Function:** The "Virtual system testing" editor contains settings for the virtual devices and the simulation set-up and control.

**Call:** Main menu "Online", Context menu

**Requirement:** A project is open. Command is only available, if a license for advanced simulation support is activated.

Command 'Start'

**Symbol:** ⌘; keyboard shortcut: [F5]

**Function:** This command starts the application (status: "RUN").

**Call:** Menu bar: "Debug"; context menu of object: "Application"

**Requirement:** The application is in online mode and its status is "STOP".

Executing this command from the "Debug" menu will affect the application that is currently in focus.

See also

- Chapter 6.4.1.11.6 "Downloading the application code, logging in, and starting the PLC" on page 1977
Command 'Stop'
Symbol: ■; keyboard shortcut: [Shift]+[F8]
**Function:** This command stops the application (status: “STOP”).
**Call:** Menu bar: “Debug”; context menu of object: “Application”
**Requirement:** The application is in offline mode and its status is “RUN”.
Executing this command from the “Debug” menu will affect the application that is currently in focus.

Command 'Single Cycle'
Keyboard shortcut [Ctrl]+[F5]
**Function:** This command executes the active application for one cycle.
**Call:** Main menu “Debug”.
**Requirement:** The application is in online mode and the program is halted at a program step.

Command 'New Breakpoint'
Symbol: ▼, keyboard shortcut [Alt]+[F7].
**Function:** This command opens the “Breakpoint Properties” dialog box.
**Call:** Main menu “Debug”.
**Requirement:** The application must be in online mode.

With the “Toggle Breakpoint” command, you can set a new breakpoint directly at the current cursor position in online mode.

Command 'New Data Breakpoint'
Symbol: ✉
**Function:** The command opens the “New breakpoint” dialog.
**Call:** Menu bar: “Debug”
**Requirement:**
- The application is in online mode.
- The device description file of the target device contains the entries for the "data breakpoints" functionality. Currently, data breakpoints are possible only with the CODESYS Control Win V3.
See also
● ☞ Chapter 6.4.1.21.4.9 “Dialog ‘New Breakpoint’” on page 2750
● ☞ Chapter 6.4.1.12.3 “Using Breakpoints” on page 1981

Command 'Edit Breakpoint'
Symbol: ☑
**Function:** This command opens the “Breakpoint Properties” dialog box.
**Call:** Main menu “Debug”.
**Requirement:** The application is in online mode and the cursor is halted at a breakpoint.
See also
- Chapter 6.4.1.12.3 “Using Breakpoints” on page 1981

---

**Command 'Enable Breakpoint'**

**Function:** This command enables a disabled breakpoint.
**Call:** Main menu “Debug”.
**Requirement:** The application is in online mode and the cursor is halted at a disabled breakpoint.
See also
- Chapter 6.4.1.12.3 “Using Breakpoints” on page 1981

---

**Command 'Disable Breakpoint'**

**Function:** This command disables an enabled breakpoint.
**Call:** Main menu “Debug”.
**Requirement:** The application is in online mode and the cursor is halted at an enabled breakpoint.
See also
- Chapter 6.4.1.12.3 “Using Breakpoints” on page 1981

---

**Command 'Toggle Breakpoint'**

Keyboard shortcut [F9]
**Function:** This command sets a breakpoint or clears an existing breakpoint.
**Call:** Main menu “Debug”.
**Requirement:** The application is in online mode. The cursor is positioned at a breakpoint.
See also
- Chapter 6.4.1.12.3 “Using Breakpoints” on page 1981

---

**Command 'Step Over’**

Symbol [F10]
**Function:** The command executes the statement where the program is currently located and halts before the next statement in the POU.
**Call:** Menu bar: “Debug”
**Requirement:** The application is in online mode and the program is halted at the current break position (debug mode).

If the executed statement contains a call (from a program, function block instance, function, method, or action), then the subordinate POU is processed completely in one step and returned to the call. Then it halts before the next statement (in the next line of code).
**Command 'Step Into'

Symbol ✨, shortcut [F11]

**Function:** The command executes the statement where the program is currently located and halts before the next statement.

**Call:** Menu bar: “Debug”

**Requirement:** The application is in online mode and the program is halted at the current break position (debug mode).

If the executed statement contains a call (from a program, function block instance, function, method, or action), then the program execution jumps to this subordinate POU. Its code opens in a separate editor. The first statement there is executed and the program execution halts before the next statement. The new current breakpoint position is then in the called POU.

**Command 'Step Over'

Symbol ✨, shortcut [Ctrl]+[F11]

**Function:** The command executes the program until the next return and halts afterwards.

**Call:** Menu bar: “Debug”

**Requirement:** The application is in online mode and the program is halted at the current break position (debug mode).

If the current breakpoint position is in a subordinate POU, then this is run through to the end. Then the program execution jumps back to the calling point in the calling POU and halts there (in the line with the call).

If the current breakpoint position is in the main program, then the POU is run through to the end. Then the program execution jumps back to the beginning (to the program start at the first line of code in the POU) and halts there.

Command 'Run to Cursor'

Symbol: 

**Function:** The command executes a program until a specified position as marked by the cursor.

**Call:** Menu bar: “Debug”

**Requirement:** The application is in online mode and the program is halted at the current break position (debug mode). Moreover, you have marked any line of code in any POU with the cursor.

The statements between the current breakpoint position and the cursor position are executed in one step. Then the execution halts at the cursor position, which then becomes the next breakpoint position. Remember that the line of code where you placed the cursor is reached but not executed.

See also
- Chapter 6.4.1.12.4 “Stepping Through a Program” on page 1985

Command 'Set Next Statement'

Symbol: ☰

**Function:** The command determines which statement is executed next.

**Call:** Menu bar: “Debug”

**Requirement:** The application is in online mode and the program is halted at the current break position (debug mode). Moreover, you have marked any line of code in any POU with the cursor.

The line of code marked with the cursor becomes the current breakpoint position without executing the statements in between or the statement that jumped to it.

See also
- Chapter 6.4.1.12.4 “Stepping Through a Program” on page 1985

Command 'Show Next Statement'

Symbol: 

**Function:** The command displays the program statement that is processed in the next step.

**Call:** Menu bar: “Debug”

**Requirement:** The application is in online mode and the program is halted at the current break position (debug mode). The break position is in a line of code that you cannot see.

The command makes the window with the current breakpoint position active (in the code highlighted in yellow and marked with the symbol) and makes the breakpoint position to become visible. This is useful if you have multiple editors open and the breakpoint position is hidden in an inactive editor.

Command 'Force Values'

Keyboard shortcut: [F7]

**Function:** The command sets a permanent predefined value to a variable on the controller.

**Call:** Menu bar: "Debug"

**Requirement:** The application is in online mode.

---

**CAUTION!**
Unusual changes to variable values in an application currently running on the controller can lead to undesired behavior of the controlled machinery. Evaluate possible dangers before forcing variable values. Take the respective safety precautions. Depending on the controlled machinery, the result may lead to damage to machinery and equipment or injury to health and life of personnel.

With this command, CODESYS permanently sets one or more variables of the active application to defined values on the PLC.

A forced value is marked with the forced symbol (\(\mathbf{F}\)).

For more information about the functionality of forcing and the p of values, see the "Forcing and Writing of Variables" help page.

By default, the “Force Values [All Applications]” command, which applies to all application in the project, and is not included in a menu.

---

- § Chapter 6.4.1.21.4.8 "Dialog Box 'Prepare Value'" on page 2749
- § Chapter 6.4.1.21.3.8.18 “Command ‘Unforce Values’” on page 2650

Command 'Write Values'

Keyboard shortcut [Ctrl]-[F7]

**Function:** This command sets a predefined value to a variable on the controller one time.

**Call:** Main menu "Debug".

**Requirement:** The application is in online mode.

---

**CAUTION!**
Unusual changes to variable values in an application currently running on the controller can lead to undesired behavior of the controlled machinery. Evaluate possible dangers before forcing variable values. Take the respective safety precautions. Depending on the controlled machinery, the result may lead to damage to machinery and equipment or injury to health and life of personnel.

With this command, one or more variables of the active application are set to defined values on the controller one time. Writing is done one time at the beginning of the next cycle.

Values are prepared by

- Clicking in the field “Prepared value” in the declaration section
- Clicking in the inline monitoring field in the implementation section
- Clicking in the field “Prepared value” in the watch window
The command “Write Values [All Applications]” affects all application in the project and is not included in a menu by default.

See also

- Chapter 6.4.1.21.3.8.16 “Command ‘Force Values’” on page 2649
- Chapter 6.4.1.12.5 “Forcing and Writing of Variables” on page 1987

Command 'Unforce Values'

Keyboard shortcut [Alt]+[F7]

Function: This command resets the forcing of all variables. The variables receive their current values from the PLC.

Call: “Debug”.

Requirement: The application is in online mode.

The “Remove Force List” command has the same functionality as this command with one difference. If the “Remove Force List” command cannot be executed for all forced values, then no message is displayed.

CAUTION!
Unusual changes to variable values in an application currently running on the PLC can lead to undesired behavior of the controlled machinery.

Evaluate possible dangers before forcing variable values. Take the respective safety precautions. Depending on the controlled system, the result may lead to damage to machinery and equipment or injury to health and life of personnel.

The command “Force Values [All Applications]” affects all application in the project and is not included in a menu by default.

See also

- Chapter 6.4.1.21.3.8.16 “Command ‘Force Values’” on page 2649
- Chapter 6.4.1.12.5 “Forcing and Writing of Variables” on page 1987

Command 'Force All Values from <Device.Application>’

Function: This command resets all values of variables from the selection <Device.Application> to predefined values permanently.

Call:
- Context menu of the application in the device tree
- Context menu in the editor of a POU from the selected application

Requirement: The application is in online mode.
With this command, CODESYS permanently sets one or more variables of the active application to defined values on the PLC. This is done at the beginning and end of a processing cycle. Order of processing: 1) read inputs, 2) force values, 3) process code, 4) force values, 5) write outputs.

You can prepare values as follows:
- Click in the "Prepared value" field in the declaration part and type in the value. For Boolean variables, you change the value by clicking the field.
- Click in the inline monitoring field in the implementation part of the FBD/LD/IL editor
- Click in the "Prepared value" field in the monitoring view and type in the value.

A forced value is marked with the forced symbol (ër).

CODESYS forces the value until you explicitly lift it by
- Clicking "Unforce Values"
- Clicking "Unforce All Values from <Device.Application>"
- Lifting the force in the "Prepare Value" dialog
- Logging out of the application

The command "Force Values [All Applications]" affects all application in the project and is not included in a menu by default.

- § Chapter 6.4.1.21.3.8.21 “Command ‘Unforce All Values from <Device.Application>’” on page 2652

Command 'Write All Values from <Device.Application>'

Function: This command resets all values of variables from the selection <Device.Application> to predefined values one time.

Call:
- Context menu of the application in the device tree
- Context menu in the editor of a POU from the selected application

Requirement: The application is in online mode.

CAUTION!
Unusual changes to variable values in an application currently running on the controller can lead to undesired behavior of the controlled machinery. Evaluate possible dangers before forcing variable values. Take the respective safety precautions. Depending on the controlled machinery, the result may lead to damage to machinery and equipment or injury to health and life of personnel.
With this command, one or more variables of the selected <Device.Application> are set to defined values on the PLC one time. Writing is done one time at the beginning of the next cycle.

You can prepare values as follows:

- Click in the "Prepared value" field in the declaration part and type in the value. For Boolean variables, you change the value by clicking the field.
- Click in the inline monitoring field in the implementation part of the FBD/LD/IL editor
- Click in the "Prepared value" field in the monitoring view and type in the value.

- § Chapter 6.4.1.12.5 “Forcing and Writing of Variables” on page 1987

Command 'Unforce All Values from <Device.Application>’

**Function:** This command resets the forcing of all values of the variables from the selected <Device.Application>. The variables receive their current values from the PLC.

**Call:**

- Context menu of the application in the device tree
- Context menu in the editor of a POU from the selected application

**Requirement:** The application is in online mode.

**CAUTION!**
Unusual changes to variable values in an application currently running on the controller can lead to undesired behavior of the controlled machinery.
Evaluate possible dangers before forcing variable values. Take the respective safety precautions. Depending on the controlled machinery, the result may lead to damage to machinery and equipment or injury to health and life of personnel.

Command 'Flow Control'

**Function:** This command activates and deactivates the flow control.

**Call:** Menu "Debug"

**Requirement:** The application is in online mode.

**NOTICE!**
An active flow control extends application runtime.
When "Confirmed Online Mode" is activated in the communication settings, a dialog prompt appears when switching on the flow control to cancel the process.
When flow control is activated, it is not possible to use breakpoints or step through the program.

- § Chapter 6.4.1.12.7 “Flow Control” on page 1992
Menu 'Core Dump'

6.4.1.21.3.8.23.1  Command 'Load Core Dump'............................................. 2653
6.4.1.21.3.8.23.2  Command 'Create Core Dump'.......................................... 2653
6.4.1.21.3.8.23.3  Command 'Close Core Dump'............................................ 2654
6.4.1.21.3.8.23.4  Command 'Load Device Log from Core Dump'.................. 2654

Command 'Load Core Dump'

**Function:** CODESYS scans the project directory for core dump files. When a new core dump is forced with the "Create Core Dump" command, the dump file is automatically loaded from the controller to the project directory. If multiple core dump files are available, then CODESYS prompts you to choose whether the latest file should be opened in the project. You can also select one of the other files.

When a file is loaded into the project, an online view of the application appears with state of the application at the time when the core dump was generated. You can then view the variable values afterwards. Finally, the call tree is also available.

**Call:** Main menu “Debug ➔ Core Dump”.

**Requirement:** The application is in offline mode.

**NOTICE!**

You can close the core dump view only by clicking “Close Core Dump”. The “Logout” command has no effect in this view.

See also

- § Chapter 6.4.1.21.3.8.23.2 “Command ‘Create Core Dump’” on page 2653
- § Chapter 6.4.1.21.3.8.23.3 “Command ‘Close Core Dump’” on page 2654

Command 'Create Core Dump'

**Function:** This command causes CODESYS to check whether a core dump file is already available on the controller.

If a core dump file is available, then CODESYS prompts you to load this file to the project directory.

With the following requirements, CODESYS generates a new dump file with the current application data:

- A core dump file is still not available or CODESYS has rejected a core dump file from being loaded.
- The application is currently stopped at breakpoint or an exception has occurred.

The generated core dump file is saved directly to the project directory: <project name>.<device name>.<application name>.<application Guid>.core. You can cancel the file generation by clicking the button in the status bar.

The amount of detail in the dump depends on the support from the runtime system. Runtime systems that are appropriate for this purpose generate just one dump in the case of an exception error. The core dump output from clicking “Load Core Dump” can therefore be used for error analysis.

**Call:** Main menu “Debug ➔ Core Dump”.

**Requirement:** The application is in online mode.

See also

- § Chapter 6.4.1.21.3.8.23.1 “Command ‘Load Core Dump’” on page 2653
Command 'Close Core Dump'

**Function:** This command closes the core dump view of the application that is open in the project.

**Call:** Main menu “Debug ➔ Core Dump”.

**Requirement:** The application is in offline mode and you have loaded a core dump file to the project from the controller.

Command 'Load Device Log from Core Dump'

**Function:** This command imports the controller log list that was saved with the last generated core dump. The log list is displayed in the same view as in online mode in the “Log” tab of the device editor.

**Call:** Main menu “Debug ➔ Core Dump”.

**Requirement:** The application is in offline mode and a core dump is open in the project.

Command 'Display Mode' - 'Binary', 'Decimal', 'Hexadecimal'

**Function:** These commands in the “Display Mode” submenu are used for setting the format of values in the display mode when monitoring in online mode.

**Call:** Main menu “Debug”.

**Requirement:** The project is in either online or offline mode.

![Info](The "Binary" and "Hexadecimal" display modes are unsigned, and "Decimal" is signed.)

Command 'IP-Configuration'

Function: Scan the project for IP address, device ID and other informations.

Call: Main menu “Tools”, Context menu

Requirement: -

☞ Chapter 6.3.2.9.2 “Configuration of the IP settings with the IP configuration tool” on page 1506

Command 'Install additional licence'

Function: Installs additional engineering license.

Call: Main menu “Tools”, Context menu

Requirement: -

Command 'Migrate third party devices'

Function: After a selection of a previous version profile, all the third party devices which have been installed inside this version profile are listed and can be migrated.

Call: Main menu “Tools”, Context menu

Requirement: -

☞ Chapter 6.3.1.5 “Migration of third party devices” on page 1439

Command 'Package Manager'

Symbol: 🗂

Function: The command opens the “Package Manager” dialog where you install, uninstall, and manage packages.
You can also call the Package Manager as a standalone application from the command line.

Table 497: “Currently Installed Packages”

<table>
<thead>
<tr>
<th>“Refresh”</th>
<th>Refreshes the list</th>
</tr>
</thead>
</table>
| “Install”       | Opens the standard dialog for finding a file in the file system. By default, the file type is *.package. You can also install two versions of a package. After you select the package, the “Check package signatures” dialog opens.  
  ● In the dialog, the package is displayed with the information about signing. Detailed information about signing is displayed in the tooltip and also in a dialog which opens when you double-click a package.  
  ● “Allow unsigned and self-signed packages”: The package should be installed although it is unsigned or self-signed. After the package is selected, the installation wizard opens with the dialogs:  
    ● “Installation - License Agreement”: In this dialog, CODESYS also displays the “Checksum” of the package. Displayed only when the package has a license agreement.  
    ● “Choose Setup Type”  
      The options are package-dependent.  
      – “Complete setup”: CODESYS installs all components  
      – “Typical setup”: CODESYS installs a standard set of components as defined in the package  
      – “Custom setup”: CODESYS installs those components which are selected in a dialog  
    ● “Installation - Target Versions”: You select which of the existing target versions should be updated by the package installation. You have to select at least one version profile. When this dialog is successfully completed, the selected package is ready for installation. You have to close all CODESYS instances in order for the package installation to be automatically started and run. |
| “Uninstall”   | Uninstalls the selected package  
  ● When the “Display versions” option is not selected, CODESYS uninstalls all versions of the selected package.  
  ● When the “Display versions” option is selected and you have selected a package node on the top level, CODESYS uninstalls all versions of the selected package.  
  ● When the “Display versions” option is selected and you have selected an individual package version, CODESYS uninstalls exactly this version. When this dialog is closed, all CODESYS instances have to be closed in order for the package uninstallation to start. |
**“Details”**

Opens the “Details” dialog for the selected package with the following tabs:
- **“Package Details”**
  - **“Name”**: Package name
  - **“Version”**
  - **“Checksum”**: SHA-1 checksum of the package
  - **“Vendor”**
  - **“Copyright”**
  - **“Description”**
  - **“Installation date”**
- **“License Agreement”**
- **“Installations Log”**

**“Search updates in background”**

☑: CODESYS automatically searches for updates every time the programming system is started and then one time every hour.

**“Display versions”**

☑: Displays all versions of the installed package.

---

You can compare the “Checksum” with the package checksum from the package vendor. CODESYS displays this checksum in the “Details” dialog and in the “Installation - License Agreement” dialog of the installation wizard. You do this to make sure that you have installed an original package.

---

If you have installed a newer version of the programming system in the same installation directory as the previous version, the license information about the previously installed package remains unchanged and CODESYS displays the information in the “Package Manager” dialog.

---

### Table 498: “Updates”

<table>
<thead>
<tr>
<th>“Search Updates”</th>
<th>Searches for the selected package on your system and in the CODESYS Store Updates. CODESYS displays the found updates in the “Update Info” column of the package list.</th>
</tr>
</thead>
<tbody>

**Command 'Library Repository'**

**Symbol:** 📖

**Function:** The command opens the “Library Repository” dialog. In this dialog you define which libraries are installed on the local system and are thus available for your application.

**Call:** Menu bar: “Tools”
Table 500: “Location”
Display of the directory on the local system in which the library files are located. The libraries in this “Location” are listed in the “Installed libraries” area.

<table>
<thead>
<tr>
<th>“Edit Locations”</th>
<th>Opens the “Edit Repository Locations” dialog.</th>
</tr>
</thead>
</table>

- You can only use empty directories for new repositories.
- You can also use existing repositories as locations.
- The “System” repository is not editable; CODESYS indicates this by the italic lettering of the entry.

Table 501: Dialog “Edit Repository Locations”
List of the repositories with “Location” and “Name”

<table>
<thead>
<tr>
<th>“Add”</th>
<th>Creates a new repository. Opens the “Repository Location” dialog. The selected directory (“Location” input field) has to be either empty or an existing valid repository. “Name” is the input field for a symbolic repository name.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Edit”</td>
<td>Opens the “Repository Location” dialog (see “Add”)</td>
</tr>
<tr>
<td>“Remove”</td>
<td>A dialog box open, asking whether only the entry should be removed from the list of repositories, or whether the directory with the library files should be deleted from the file system. If you want to delete the directory, you have to confirm this.</td>
</tr>
</tbody>
</table>

Table 502: “Installed libraries”
List of the libraries in a tree structure. Display of each library with category, name, company and version. The icon to the left of the name indicates whether the library is digitally signed or unsigned.

<table>
<thead>
<tr>
<th>“Company”</th>
<th>List box for filtering the displayed libraries.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Install”</td>
<td>Opens the “Select Library” dialog. Possible filters:</td>
</tr>

<td></td>
<td>“Compiled CODESYS library files (*.compiled-library)”.</td>
</tr>
<tr>
<td></td>
<td>“Compiled CODESYS library files (*.compiled-library-v3)” ab V3 SP15</td>
</tr>
<tr>
<td></td>
<td>“Library files (*.library)” for still uncompiled library projects</td>
</tr>
<tr>
<td></td>
<td>“All files (<em>.</em>)”</td>
</tr>
<tr>
<td>“Uninstall”</td>
<td>Uninstalls the selected library.</td>
</tr>
<tr>
<td>“Export”</td>
<td>Opens the default dialog for saving the library project to the local file system. The file type is Library files (<em>.library), Compiled library files (</em>.compiled-library), or Compiled library files (*.compiled-library-v3).</td>
</tr>
<tr>
<td>“Find”</td>
<td>Searches for libraries and function blocks. Opens the “Find Library” dialog. When you enter a string in the input field, CODESYS displays the libraries that it finds with a corresponding string.</td>
</tr>
<tr>
<td>“Details”</td>
<td>Opens the “Details” dialog with details from the project information of the library for the selected version of a library. You find the following information by clicking “More” in the “Details” dialog:</td>
</tr>
<tr>
<td></td>
<td>“Size”: Specified in bytes</td>
</tr>
<tr>
<td></td>
<td>“Created”: Creation date</td>
</tr>
<tr>
<td></td>
<td>“Changed”: Date of the last change</td>
</tr>
<tr>
<td></td>
<td>“Last access”: Date</td>
</tr>
<tr>
<td></td>
<td>“Attributes”</td>
</tr>
<tr>
<td></td>
<td>“Properties”</td>
</tr>
</tbody>
</table>
“Dependencies”  
For the selected library, the “Dependencies” dialog opens, showing the dependencies on other libraries. “Title”, “Version” and “Company” are shown for each library reference. References that function via placeholders are displayed according to the syntax: #<placeholder name>.

“Group by category”  
- ✔ Grouping by library category
- □ Alphabetical sorting

The categories are defined by external description files *.libcat.xml*.

Table 503: “Library Profiles”  
A library profile defines the library version with which CODESYS resolves a library placeholder if a certain compiler version is set in the project.

“Import”  
Imports a *.libraryprofile file.

If the import already contains existing placeholder entries, a query appears asking whether CODESYS should overwrite it.

“Export”  
Exports an xml file with the extension *.libraryprofile with the assignments of the selected placeholder entries; you can only select a single entry of a “Compiler version”.

Placeholder resolutions can also be defined in the target device currently in use and even by a specific local specification in the Placeholders dialog in the Library Manager.

Command ‘License Manager’

Symbol: ✚

Function: This command opens the wizard for configuring licenses for CODESYS add-on products. The wizard starts with the “License Manager - Select target” dialog.

Call: Menu bar: “Tools”.

The License Manager can handle licenses for CODESYS add-on products on the local computer, as well as licenses for RTS add-on products on devices. It supports both the installation in a soft container and on a dongle.

Dialog ‘License Manager - Select Target’

This is the start dialog of the License Manager wizard. Here you decide where the license will be installed.

“Workstation”  
Local computer

“Device”  
Controller. The connection to this device must be configured correctly in order to license (“Communication Settings” tab of the device editor).

After clicking “Next”, you decide the container where you want to manage the licenses.
**Dialog 'License Manager - Select container'**

<table>
<thead>
<tr>
<th>“Dongle”</th>
<th>A corresponding dongle must be connected to the computer or device. Not all devices support dongles.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Soft container”</td>
<td>CODESYS Security Key. A corresponding soft container must be registered in the CodeMeter Control Center. The CODESYS installation provides an existing soft container.</td>
</tr>
</tbody>
</table>

If you are installing a product on your local computer ("Workstation"), then the “License Manager” opens immediately for the specific selection of the dongle or soft container, and the next actions. This happens after you choose the container type and click “Next >”.

If you are licensing the add-on product for a controller, then first the dialog opens for selecting the device in the network after you click “Next >”. This dialog corresponds to the classic view of the “Communication Settings” tab of the device editor.

**Dialog 'License Manager'**

<table>
<thead>
<tr>
<th>“Container”</th>
<th>Depending on whether “Dongle” or “Soft container” was selected: Drop-down list of all CODESYS dongles or soft containers that were found on the computer or device.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Products”</td>
<td>List of all installed products that are subject to licensing. A prepended symbol indicates the existence and validity of the license. On the right side of the window, the following information is displayed for the selected product and corresponding licenses: “Name”, “Company”, “Unit counter”, “License quantity”, “Usage period”, “Feature map”, “Activation time”, “Expiration time”, “Firm code”, “Product code”, “Description”</td>
</tr>
</tbody>
</table>

**“Install Licenses”** Opens the dialog “Install licenses on <computer> - Select Operation”:
- “Activate license”: Opens the dialog “Install licenses on <computer> - Activate License” (see more below)
- “Request license”: Opens the dialog “Install licenses on <computer> - Request License” (see more below)
- “Install license”: Opens the dialog “Install licenses on <computer> - Install License” (see more below)

**“Additional Functions”** Opens the menu with the following actions:
- “Return license”: Opens the “Return Licenses” (see more below)
- “Restore license”: This function is available in the case of device licensing only. Opens the “Restore Licenses” dialog (see more below)
Table 504: “Install Licenses on <computer> - Activate License”

This is the recommended way to activate a license available via the License Server when you have an Internet connection. Requirement: The computer has an Internet connection.

| “Ticket ID” | Input field for the ticket ID that you received from the software vendor. The ticket ID consists of five sets of five alphanumerical characters (for example: LYSQ3-ZU93K-24LWC-XGWJ8-5AY7H). |
| “License server” | Drop-down list of the license server that provides the license for activating the product. You receive the server URL from the software vendor. |
| “Select Ticket from Repository” | Opens the “License Repository” dialog. |
| “Next” | CODESYS connects to the license server. ● If the specified ticket contains only one license, then a dialog opens to confirm the successful activation after completion of the server action. ● If the specified ticket contains multiple licenses, then the dialog “Install licenses - Select Licenses” opens with a list of these licenses (see description below). |

Table 505: “Install Licenses - Select Licenses”

Selection of the licenses to be activated for the ticket which you specified in the dialog “Install Licenses - Activate License”.

| “Name” | Product name |
| “Available” | Number of available licenses |
| “Used” | Number of used licenses |
| Total | Sum of all used and available licenses |

Next

CODESYS connects to the license server. After successful completion of the server action, a dialog opens with the confirmation of the activation.

Table 506: “Install Licenses on <computer> - Request License”

If the computer does not have an Internet connection, then you can generate a context file from this dialog. The file “WibuCmRaC” is then transmitted to the license server via an Internet-enabled computer. When activation is complete, a license update file “WibuCmRaU” is provided for download.

| “Software vendor” | Input field for firm codes from the software vendor that provided the license for activating the product. As an alternative, you can select the software vendor from the drop-down list. |
| “Context file” | Location and name |

Table 507: “Install Licenses on <computer> - Install License”

If you downloaded a license update file from the Internet during software activation, then you can use this dialog to install the license on your dongle. To do this, specify the path of the license update file in the input field.

Table 508: “Return License”

If the license permits, you can return it in order to reactivate it later on another computer.

| “Ticket ID” | Field for specifying the ticket ID that was used for licensing. |
| “License server” | Drop-down list for selecting the license server that provides the license for activating the product. You receive the server URL from the software vendor. |
| “Load License(s)” | Button for showing all current licenses installed for the given ticket ID on the server in the “Licenses” window. |
“Licenses” | List of licenses available on the server for the given ticket ID. The following information for the selected license is displayed next to the window on the right:
- “Name”
- “Number of activations”
- “Return allowed”
- “Activation type”
- “Activation date”
- “Firm code”
- “Comment”

“Return License(s)” | Button for returning the selected license(s). These can be reactivated later on another system.

<table>
<thead>
<tr>
<th>Table 509: “Install Licenses - Restore Licenses”</th>
</tr>
</thead>
<tbody>
<tr>
<td>When activated, device licenses are saved to a file (*.WibuCmRau) on the local computer and in the &quot;CODESYS Central License Server&quot;. If lost, they can be restored from this file to the identical device.</td>
</tr>
<tr>
<td>“Ticket ID”</td>
</tr>
<tr>
<td>“Restore”</td>
</tr>
</tbody>
</table>

**Command ‘License Repository’**

Symbol: ☞

**Function:** This command opens the dialog box “License Repository” for viewing information about the individual licenses.

**Call:** Main menu “Tools”

**Requirements:** CODESYS is in offline or online mode.

In the license repository, after entering the ticket number, you can obtain information about the licenses concerned from the central license server.

To do this you can paste the ticket number(s) from the clipboard or import it/them from a text file.
Table 510: “Tickets”

<table>
<thead>
<tr>
<th>“Licenses”</th>
<th>If you select an entry in the list of tickets, the name and the status of the licensed component are displayed here.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>☑: License available and valid</td>
</tr>
<tr>
<td></td>
<td>☰: License found, but invalid</td>
</tr>
<tr>
<td></td>
<td>☢: License not found</td>
</tr>
<tr>
<td></td>
<td>In the right-hand part of the dialog box you will then receive then the following information about this license:</td>
</tr>
</tbody>
</table>

| “Name”: name of the product to be licensed      |                                                                                                             |
| “Item number”: item number in the license server. |                                                                                                             |
| “Return allowed”: It is possible to have this license deactivated so that it can be re-activated on another system. |                                                                                                             |
| “Can be activated”: you can have the license activated via the license manager. |                                                                                                             |
| “Activation quantity”: number of activations that have taken place so far. |                                                                                                             |
| “Activation date”: date of the current activation |                                                                                                             |
| “Container serial ” |                                                                                                             |
| “Firm codes” |                                                                                                             |
| “Comment” |                                                                                                             |

| “Import Tickets” | The standard dialog box for browsing the local file system appears. If you open a text file containing one or more “tickets”, i.e. license numbers, these are imported into the repository. Alternatively you can also insert the numbers from the clipboard into the list. |

Command ‘Device Repository’

Symbol: ❰

Function: This command opens the “Device Repository” dialog. This dialog is used for managing the devices that are installed on the local system and can be integrated into CODESYS projects.

Call: Menu bar: “Tools”.

Dialog ‘Device Repository’

CAUTION!

Do not change the internal device repository manually. Do not copy any files to or from the repository. Always use the device repository dialog to install or uninstall devices.
### Table 511

<table>
<thead>
<tr>
<th>“Location”</th>
<th>Shows the device repository directory on the local system. The list box shows the currently set save locations. By default, CODESYS creates the system repository during installation. The devices of the selected location are listed in the “Installed device descriptions” field.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Edit Locations”</td>
<td>Opens the “Edit Repository Locations” dialog.</td>
</tr>
</tbody>
</table>

### Table 512: Dialog ‘Edit Repository Locations’

| “Add” | Creates a new repository. Opens the “Repository Location” dialog. The selected directory (“Location” input field) must be empty or it must be a valid repository. |
| “Edit” | Opens the “Repository Location” dialog (see “Add”). |
| “Remove” | A dialog prompt opens for you to decide whether the respective directory should also be deleted from the hard disk. |

### Table 513: “Installed Device Descriptions”

| “String for full-text search in all devices” | This field is editable after clicking in it. For any character string entered, only those devices that include the character string are displayed in the lower view. The matched string is highlighted in yellow for these devices. |
| “Vendor” | Drop-down list with manufacturers whose available devices are displayed. |
| “Install” | Opens the “Install Device Description” dialog. For the default devices with file type "*.devdesc.xml". You can also select manufacturer-specific description files, such as "*.gsd" files for PROFIBUS DP modules, "*.eds" and "*.dcf" files for CAN devices. When you click “OK” to confirm the selection, CODESYS inserts the new device into the device repository. If an error occurs during installation (for example, missing files that are referenced by the device description), then CODESYS reports the error to the lower part of the device repository dialog. |
| “Uninstall” | Removes the selected device. If you delete the device from the device repository, then it is no longer available for use in the programming system. |
| “Renew Device Repository” | Updates all devices in the device repository. When new versions of import plug-ins are available, some device descriptions may be outdated. The affected devices are marked with a warning symbol (⚠️). This command opens a dialog to confirm the update. |
| “Download Missing Device Descriptions” | Opens when you use devices in your project that are not available in the device repository. When you execute this command, a list of missing devices is displayed. There you can select the corresponding devices for download. |
| “Details” | Opens the “Details” dialog for the selected device description. This dialog provides additional information from the device description file. |
NOTICE!
During installation, CODESYS copies the device description files and all additional reference files to an internal location. Therefore, any changes to the original files no longer influence the installed devices. You must reinstall the devices to make any changes effective. We recommended that you change the internal version number of a device description after a modification.

Command 'Create Device list CSV'
Symbol:
Function: MS Excel template of device list for device import is opened.
Call: Main menu “Tools”, Context menu
Requirement: -
See Chapter 6.6.1.3.3 “Creating CSV device list” on page 4198

Command 'Multi Online Change'
Function: The MultiOnlineChange tool/plug-in for Automation Builder enables firmware update, download and online change of the same project to several AC500 V2 PLCs.
Call: Main menu “Tools”, Context menu
Requirement: -

Command 'Device ECAD data'
Function: Automation Builder provides an ECAD interface for exchanging the PLC configuration data with EPLAN Electric P8 and Zuken E3. This feature removes double data entry between electrical engineering in the ECAD tool and the control logic programming in Automation Builder by synchronizing the PLC hardware including topology and I/O signals between these tools.
Call: Main menu “Tools”, Context menu
Requirement: A project is open.
See Chapter 6.6.1.1 “Exporting and importing ECAD data (PBF)” on page 4191

Command 'OPC UA Information Model Repository'
Function: The command opens the “OPC UA Information Model” dialog. The OPC UA information models, which are installed on the local system and can be integrated in CODESYS projects, are managed in the dialog.
Call: Menu bar: “Tools”
| “Location” | Displays the OPC UA information model directories on the local system. The list box shows the currently set locations. By default, CODESYS creates the system repository during installation. The information models of the selected location are listed in the “Installed OPC UA information models” area. |
| “Edit Locations” | Opens the “Edit Repository Locations” dialog. |
| “Installed OPC UA information models” | List of installed information models. Double-click to open installed information model documentation. Note: The information models of this repository can also be added to project archives. |
| “Install” | Opens the “Select Installed OPC UA Information Model(s)” dialog. |
| ● File type: OPC UA Information Models *NodeSet2.xml (example: “Informationmodel.NodeSet2.xml”. When you click “Open”, the selected information model is inserted in the repository. |
| ● File type: All files *.*: You can select an OPC UA documentation, for example, in PDF or Word format. When you click “Open”, the “Assign Documentation OPC UA Information Models” opens. For a description of the dialog, see below. |
| “Uninstall” | Uninstalls the selected OPC UA information model. When you delete the information model from the repository, it is no longer available in the development system for use in the CODESYS Development System. |
| “Details” | Opens the “Details” dialog for the selected information model. The dialog includes additional information about the information model. In “Alias”, you can specify an alias name for the URI. Moreover, information is displayed as to whether or not a documentation for the information model is available. |
| ● “Model URI” |
| ● “Publication date” |
| ● “Publisher” |
| ● “Repository” |
| ● “Alias” |
| ● “Documentation available”: |
| – “Yes”: The “Uninstall documentation” button is available. |
| – “No”: The “Install documentation” button is available. |
| ● “Install documentation”: Opens the “Select OPC UA Information Model Documentation” dialog. The data type OPC UA Information Model Documentation (*.pdf) is set as default in the dialog. |
| “Documentation” | Opens the installed documentation for the selected information model. If no documentation is installed for the selected information model, then the command is disabled. |
| “Display all versions” | All installed versions of the information model are displayed in a tree structure. |

Command 'Scripting' - 'Execute Script File'

Symbol: ☑

Function: This command opens a dialog for selecting and then executing the script file (*.py).

Call: Menu bar: “Tools ➔ Scripting”.

2666
Command 'Scripting' - 'Enable Script Tracing'

Symbol: 📚

**Function**: This command makes CODESYS print all commands from the script file to the message view. Use this command for monitoring and debugging scripts. A blue frame around the symbol indicates that the option is active.

**Call**: Main menu “Tools ➔ Scripting”.

Command 'Scripting' - 'Scripts'

**Function**: This command executes a script that is stored in the ScriptDir folder.

**Call**: Menu bar: “Tools ➔ Scripting ➔ Scripts”.

**Requirement**: The ScriptDir folder exists in the CODESYS installation directory. Python scripts are stored in this folder with the file extension .py.

All scripts that are contained in the ScriptDir folder are executable as menu commands and are sorted alphabetically by file name.

Command 'Customize'

**Function**: This command opens the “Customize” dialog box, where you can customize the menus, toolbars, and keyboard shortcuts according to your individual requirements.

**Call**: Main menu “Tools”

Command 'Options'

**Function**: The command opens the dialog box “Options” for the configuration of the CODESYS options. These options define the behavior and appearance of the CODESYS user interface. CODESYS saves the settings in your current user profile on your local system. The current profile specifies the standard settings.

**Call**: “Tools” menu

Command 'Import and Export Options'

**Function:** This command opens the "Import and Export Options" dialog. Here you can configure the export and import of selected settings of the CODESYS options. The settings are saved to an XML file with the default extension (options.xml).

**Call:** Menu bar: “Tools”.

**Dialog 'Import and Export Options'**

| "Export selected options" | "Select options": In the table, you can select the categories of options, either user-specific or machine-specific (computer), whose current settings are to be exported to the XML file.  
"File": Path of the export file in the local file system. Example: D:\system1.options.xml.  
Button [ ]: Opens the default dialog to search for an existing file in the local file system, or to create one. The "File type" option export (*.options.xml) is preset. |
| "Import selected options" | "File": Path of the options export file whose contents are to be imported.  
Button [ ]: Opens the default dialog to search for an existing file of type option export (*.options.xml) in the local file system.  
After you click “OK” to close the dialog, the settings described in the file are applied to the project. |

Command 'Device Reader'

**Function:** The command opens the standard “Select Device” dialog and reads the license and product information of the selected controller. This license and product information is displayed in the “Device Reader” dialog.

**Call:** Menu bar: “Tools”

**Requirement:** No applications exist on the controller.

> If the command is selected although an application exists on the controller, then a dialog prompts the user whether or not all applications should be removed from the controller. When the user click “No” to this dialog, the “Device Reader” command is aborted.

**Table 515: Dialog “Device Reader”**

| "Status of Available Device Features" | "Product" |
| "Feature" |
| "License Active/Count" |

| "Product" | CODESYS product (example: SoftMotion) |
| "Feature" | Feature of “Product”  
Example: CNC is a “Feature” of SoftMotion. |
| "License Active/Count" | Yes: A license exists for the feature.  
No: A license does not exist for the feature.  
"Count": Number of licenses |

Command 'Next Editor'

Keyboard shortcut: [Ctrl]+[F6]

Function: This command switches focus from the currently active view to the next view. The next view is identified by the tab to the right of the currently active tab.

Call: Main menu “Window”

Requirement: At least one object is open.

See also
• ¤ Chapter 6.4.1.21.3.10.2 “Command 'Previous Editor'” on page 2669

Command 'Previous Editor'

Keyboard shortcut: [Shift]+[Ctrl]+[F6]

Function: This command switches focus from the currently active view to the previous view. The previous view is identified by the tab to the left of the currently active tab.

Call: Main menu “Window”

Requirement: At least one object is open.

See also
• ¤ Chapter 6.4.1.21.3.10.1 “Command 'Next Editor'” on page 2669

Command 'Close All Editors'

Symbol: 🟦

Function: This command closes all currently open editor views.

Call: Main menu “Window”

Requirement: At least one editor is open.
Command 'Close All Editors of Inactive Applications'

**Function:** This command closes all editor views for objects that are located directly below a currently inactive application. Object editors in the POU view remain open.

**Call:** Main menu “Window”

**Requirement:** At least one object of an inactive application is open.

See also
- Chapter 6.4.1.21.3.10.3 “Command ‘Close All Editors’” on page 2669
- Chapter 6.4.1.21.3.10.16 “Command ‘Close All Editors But This’” on page 2673

Command 'Reset Window Layout'

**Function:** This command resets all currently open windows and views to their default positions. You are prompted for a confirmation before the command is executed.

**Call:** Main menu “Tools”

Command 'New Horizontal Tab Group'

**Symbol:** 📖

**Function:** This command moves the currently active view to a new, separate tab group below the existing one.

**Call:** Main menu “Window” or context menu of the tab

**Requirement:** Several editor views are open as tabs next to each other.

If you open another object in the editor, then this is automatically included in the tab group that is currently in focus.

See also
- Chapter 6.4.1.21.3.10.7 “Command ‘New Vertical Tab Group’” on page 2670

Command 'New Vertical Tab Group'

**Symbol:** ✉️

**Function:** This command moves the currently active view to a new, separate tab group to the right of the existing one.

**Call:** Main menu “Window” or context menu of the tab

**Requirement:** Several editor views are open as tabs next to each other.

If you open another object in the editor, then this is automatically included in the tab group that is currently in focus.

See also
- Chapter 6.4.1.21.3.10.6 “Command ‘New Horizontal Tab Group’” on page 2670
Command 'Float'

**Function:** This command releases a docked view from its frame in the user interface and repositions it on the screen as a floating window.

**Call:** Main menu “Window”

**Requirement:** The application is in online mode.

This window can then be positioned outside of the user interface. Use the “Dock” command to return a floating window to the frame of the user interface.

See also
- “Chapter 6.4.1.21.3.10.9 “Command 'Dock'” on page 2671

Command 'Dock'

**Function:** This command returns a floating window, which was released by the “Float” command, to the frame of the user interface.

**Call:** Main menu “Window”

See also
- “Chapter 6.4.1.21.3.10.8 “Command 'Float'” on page 2671

Command 'Auto Hide'

Keyboard shortcut: [F7]

**Function:** This command shows or hides a view.

**Call:** Main menu “Window”

Hide simply means that CODESYS minimizes the view to a tab at the bottom of the user interface which is visible only when you move the mouse over the tab. The command functions like a check box. When a window is hidden, the check box is selected in the menu. When you click the command again, the checkbox is cleared and the window is shown.

Command 'Next Pane'

Keyboard shortcut: [F6]

**Function:** This command sets the focus on the next pane.

**Call:** Main menu “Window”

**Requirement:** An object is open that contains two or more panes.

Example: If an object is open in the ST editor and the cursor is currently in the declaration section, then command sets the focus to implementation section.

See also
- “Chapter 6.4.1.21.3.10.12 “Command 'Previous Pane'” on page 2671

Command 'Previous Pane'

Keyboard shortcut: [Shift]+[F6]

**Function:** This command sets the focus on the previous pane.

**Call:** Main menu “Window”

**Requirement:** An object is open that contains two or more panes.
Example: If an object is open in the ST editor and the cursor is currently in the declaration section, then command sets the focus to implementation section.

See also
- § Chapter 6.4.1.21.3.10.11 “Command 'Next Pane'” on page 2671

**Command 'Toggle First Pane'**

Keyboard shortcut [Alt]+[F6]

**Function:** This command shows and hides the declaration view.

**Call:** “Window”.

**Requirement:** The cursor is positioned in the editor of one of the following objects:
- POU
- Transition
- Method
- Get accessor method of a property
- Set accessor method of a property
- Visualization

You can also toggle the subviews by means of the buttons.

See also
- § Chapter 6.4.1.21.3.10.14 “Command 'Toggle Second Pane'” on page 2672

**Command 'Toggle Second Pane'**

**Function:** This command shows and hides the implementation view.

**Call:** “Window”.

**Requirement:** The cursor is positioned in the editor of one of the following objects:
- POU
- Transition
- Method
- Get accessor method of a property
- Set accessor method of a property
- visualization

You can also toggle the subviews by means of the buttons.

See also
- § Chapter 6.4.1.21.3.10.13 “Command 'Toggle First Pane'” on page 2672

**Command 'Windows'**

**Function:** This command opens the “Windows” dialog box, which lists all open objects. You can then activate or close any of the listed views.
Call: Main menu “Window”

Command 'Close All Editors But This'
Function: This command closes all editor views except the currently open one.
Call: Right-click the tab
Requirement: At least two objects are open.
See also
- Chapter 6.4.1.21.3.10.3 “Command 'Close All Editors’” on page 2669
- Chapter 6.4.1.21.3.10.4 “Command 'Close All Editors of Inactive Applications’” on page 2670

Command 'Select Object in Navigator'
Function: This command selects the object of the active editor in the device tree.
Call: Right-click the tab
Requirement: At least one object is open.
This command is executed automatically when you select the “Track active editor” option for the device tree.
See also
- Chapter 6.4.1.21.3.10.18 “Command 'Select Parent Object in Navigator’” on page 2673

Command 'Select Parent Object in Navigator'
Function: This command selects the parent object in the device tree.
Call: Right-click the tab
Requirement: At least one object is open.
See also
- Chapter 6.4.1.21.3.10.17 “Command 'Select Object in Navigator’” on page 2673

Commands of the Submenu 'Window'
Function: The command activates the selected window.
Call: Main menu “Window”
For each opened editor window the menu “Window” contains a command “<n><object name>”. Choosing this command activates the corresponding window. In offline mode CODESYS adds the extension “(Offline)”. To differentiate between the implementation or the instances of a function block the extension “(Impl)” or “<instance path>” is added.
Menu 'Help'

6.4.1.21.3.11.1 Command 'Contents'............................................................. 2674
6.4.1.21.3.11.2 Command 'Index'................................................................... 2674
6.4.1.21.3.11.3 Command 'Find'..................................................................... 2674
6.4.1.21.3.11.4 Command 'About'.................................................................. 2675

Command 'Contents'

Symbol: ¯; keyboard shortcut: [Ctrl]+[Shift]+[F1]

Function: This command opens the CODESYS help.

Call: Menu bar: “Help”.

Command 'Index'

Symbol: ®; keyboard shortcut: [Ctrl]+[Shift]+[F2]

Function: This command opens the CODESYS help.

Call: Menu bar: “Help”.

An index search is not possible in the online help. The “Index” tab opens in the offline help. All index entries of the help are listed alphabetically in the index view.

<table>
<thead>
<tr>
<th>“Look for”</th>
<th>As you type letters into the input field, CODESYS searches automatically for matches in the index list.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Display”</td>
<td>Opens the help page for the highlighted index entry in the list and displays the title of the help page and location of the help file (*.chm) in the “Index results for &lt;index entry&gt;” view. When several pages are found and then displayed in this view, then you view a specific help page by clicking its entry in the list. Clicking an entry in the index list achieves the same result.</td>
</tr>
</tbody>
</table>

Command 'Find'

Symbol: 📚

Function: This command opens the CODESYS help.

Call: Menu bar: “Help”.

In the online help, you can run a full-text search from the input field on the top right of the help page. The “Find” tab opens in the offline help.

Table 516: Tab ‘Search’

<table>
<thead>
<tr>
<th>“Search for”</th>
<th>Combo box for defining the search term or for selecting the 25 most recent search terms.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Search in titles only”</td>
<td>The search is performed only in the titles of the help pages.</td>
</tr>
<tr>
<td>“Display partial matches”</td>
<td>Displays terms also as search results that include the search term.</td>
</tr>
<tr>
<td>“Limit to .... matches ”</td>
<td>Limits the number of search results. Maximum value: 1000</td>
</tr>
<tr>
<td>“Find”</td>
<td>Starts the full-text search.</td>
</tr>
</tbody>
</table>
Command 'About'

**Function:** This command opens a splash screen with information about the CODESYS version and copyright. In addition, buttons are available for detailed information about the version, license, and acknowledgments.

**Call:** Main menu “Help”.

<table>
<thead>
<tr>
<th>“Version Info”</th>
<th>Opens the “Detailed Version Information” dialog box with a list of CODESYS components and information about the operating system.</th>
</tr>

**Command 'Init Step'**

**Symbol:** 🕵️‍♂️

**Function:** This command converts the selected step into an initial step.

**Call:** Main menu “SFC”
After you choose this command, the borders of the step element change to a double line. The previous initial step is automatically displayed as a normal step with a single-line border.

You can also activate and deactivate the property “Init step” in the properties dialog of a step. However, CODESYS does not automatically adjust the settings of other steps.

This command is useful if you want to convert a diagram. When you create a new SFC object, it automatically includes an initial step followed by a transition (TRUE) and a jump back to the initial step.

Please note: In online mode, it is possible to reset the diagram to the initial step using the $SFCInit and $SFCReset flags.

See also
- Chapter 6.4.1.20.1.5.6 “SFC Flags” on page 2067
- Chapter 6.4.1.20.1.5.8.6 “SFC element properties” on page 2080

Command 'Insert Step'
Symbol: ✍

Function: This command inserts a step before the selected point.
Call: Menu bar “SFC”; context menu in SFC editor
The new step is named $Step<n> by default, where $n is an incremental number starting at 0 for the first step that is inserted in addition to the initial step. The name can be edited by clicking on it.

See also
- Chapter 6.4.1.21.3.12.7 “Command 'Insert Step-Transition After’” on page 2677
- Chapter 6.4.1.21.3.12.1 “Command ‘Init Step’” on page 2675
- Chapter 6.4.1.20.1.5.8.1 “SFC elements ‘Step’ and ‘Transition’” on page 2073

Command 'Insert Step After'
Symbol: ✍

Function: This command inserts a step after the selected point.
Call: Menu bar “SFC”; context menu in SFC editor
The new step is named $Step<n> by default, where $n is an incremental number starting at 0 for the first step that is inserted in addition to the initial step. The name can be edited by clicking on it.

See also
- Chapter 6.4.1.21.3.12.7 “Command 'Insert Step-Transition After’” on page 2677
- Chapter 6.4.1.21.3.12.1 “Command ‘Init Step’” on page 2675
- Chapter 6.4.1.20.1.5.8.1 “SFC elements ‘Step’ and ‘Transition’” on page 2073

Command 'Insert Transition After'
Symbol: ✍

Function: This command inserts a transition after the selected point.
Call: Menu bar “SFC”; context menu in SFC editor
The new transition is named $\text{Trans}<n>$ by default, where $n$ is an incremental number beginning at 0 for the first transition. The name can be edited by clicking on it.

See also
- Chapter 6.4.1.21.3.12.7 “Command ‘Insert Step-Transition After’” on page 2677
- Chapter 6.4.1.20.1.5.8.1 “SFC elements ‘Step’ and ‘Transition’” on page 2073

Command ‘Insert Transition’

Symbol: $\uparrow$

**Function:** This command inserts a transition before the selected point.

**Call:** Menu bar “SFC”; context menu in SFC editor

The new transition is named $\text{Trans}<n>$ by default, where $n$ is an incremental number beginning at 0 for the first transition. The name can be edited by clicking on it.

See also
- Chapter 6.4.1.21.3.12.7 “Command ‘Insert Step-Transition After’” on page 2677
- Chapter 6.4.1.20.1.5.8.1 “SFC elements ‘Step’ and ‘Transition’” on page 2073

Command ‘Insert Step-Transition’

Symbol: $\uparrow$

**Function:** This command inserts a step and a transition before the selected point.

**Call:** Main menu “SFC”

If you have selected a step, then CODESYS inserts a new step-transition combination. If you have selected a transition, then a new transition-step combination is inserted.

The new step is named $\text{Step}<n>$ by default, where $n$ is an incremental number beginning at 0 for the first step that was inserted in addition to the initial step. The new transition is named $\text{Trans}<n>$ by default. You can edit the default names directly by clicking the names.

See also
- Chapter 6.4.1.21.3.12.7 “Command ‘Insert Step-Transition After’” on page 2677
- Chapter 6.4.1.21.3.12.1 “Command ‘Init Step’” on page 2675
- Chapter 6.4.1.20.1.5.8.1 “SFC elements ‘Step’ and ‘Transition’” on page 2073

Command ‘Insert Step-Transition After’

Symbol: $\downarrow$

**Function:** This command inserts a step and a transition after the selected point.

**Call:** Main menu “SFC”

If you have selected a step, then CODESYS inserts a new transition-step combination. If you have selected a transition, then a new step-transition combination is inserted.

The new step is named $\text{Step}<n>$ by default, where $n$ is an incremental number beginning at 0 for the first step that was inserted in addition to the initial step. The new transition is named $\text{Trans}<n>$ by default. You can edit the default names directly by clicking the names.

See also
- Chapter 6.4.1.21.3.12.6 “Command ‘Insert Step-Transition’” on page 2677
Command 'Add Entry Action'

Symbol: 

Function: This command opens the “Add Entry Action” dialog box where you define a new entry action. Depending on the SFC options, a dialog prompt may open for selecting the duplication mode for the new step action.

Call: Menu bar: “SFC”; context menu of the selected step element.

Requirement: A step element in SFC is selected.

The entry action is opened automatically in the ST editor. The step element contains an \( \varepsilon \) in the lower left corner.

Options:
- “Copy reference: A new step will call the same actions”: If the step is copied in SFC, the link to the step action(s) is also copied. The steps copied by each other will therefore call the same actions.
- “Copy implementation: New action objects are created for a new step.”: This means that the step actions for a copied step are embedded. By default, the generated action objects appear below an SFC box in the device tree or “POUs” view. These objects contains a copy of the original implementation code of the respective action. The display of the embedded objects can be activated and deactivated in the tree by means of the “Show Embedded Objects” and “Hide Embedded Objects” commands in the context menu of an SFC object.

See also
- Chapter 6.4.1.21.4.14.23 “Dialog ‘Options’ - ‘SFC Editor’” on page 2795
- Chapter 6.4.1.9.5.5.2 “Programming in SFC” on page 1880

- Chapter 6.4.1.21.3.12.25 “Command ‘Do Not Display Embedded Objects’” on page 2684

Command 'Add Exit Action'

Symbol: 

Function: This command opens the “Add Exit Action” dialog box where you define a new exit action. Depending on the SFC options, a dialog prompt may open for selecting the duplication mode for the new step action. For more information, refer to the help page for the “Add Exit Action” command.

Call: Menu bar: “SFC”; context menu of the selected step element.

Requirement: A step element in SFC is selected.

See also
- Chapter 6.4.1.21.3.12.8 “Command ‘Add Entry Action’” on page 2678
- Chapter 6.4.1.21.4.14.23 “Dialog ‘Options’ - ‘SFC Editor’” on page 2795
- Chapter 6.4.1.9.5.5.2 “Programming in SFC” on page 1880
- Chapter 6.4.1.20.1.5.8.2 “SFC Element ‘Action’” on page 2075
- Chapter 6.4.1.21.3.12.25 “Command ‘Do Not Display Embedded Objects’” on page 2684

Command 'Parallel'

Symbol: 

Function: This command converts the selected alternative branch into a parallel branch.

Call: Main menu “SFC”

Requirement: The horizontal connecting line of a branch is selected.
Please note that after you convert a branch, you must check and modify the layout of the steps and transitions before and after the branch.

See also

- Chapter 6.4.1.21.3.12.11 “Command ‘Alternative’” on page 2679

**Command ‘Alternative’**

Symbol: 🟢

**Function:** This command converts the selected parallel branch into an alternative branch.

**Call:** Main menu “SFC”

**Requirement:** The horizontal connecting line of a branch is selected.

Please note that after you convert a branch, you must check and modify the layout of the steps and transitions before and after the branch.

See also

- Chapter 6.4.1.21.3.12.10 “Command ‘Parallel’” on page 2678
- Chapter 6.4.1.21.3.12.13 “Command ‘Insert Branch Right’” on page 2679

**Command ‘Insert Branch’**

Symbol: 🟢

**Function:** This command inserts a branch to the left of the selected point.

**Call:** Main menu “SFC”

This command functions similar to the “Insert Branch Right” command.

See also

- Chapter 6.4.1.20.1.5.8.3 “SFC element ‘Branch’” on page 2078
- Chapter 6.4.1.21.3.12.13 “Command ‘Insert Branch Right’” on page 2679

**Command ‘Insert Branch Right’**

Symbol: 🟢

**Function:** This command inserts a branch to the right of the selected point.

**Call:** Main menu “SFC”

The type of inserted branch depends on the selected element.

- If the uppermost element of the selected elements is a transition or an alternative branch, then CODESYS inserts an alternative branch.
- If the uppermost element of the selected elements is a step, a macro, a jump, or a parallel branch, then CODESYS inserts a parallel branch with the Branch<\text{\textless}x\text{\textrangle}> jump marker, where \text{\textless}x\text{\textrangle} is an incremental number. You can edit the default name of the jump marker or define the jump marker as a jump destination.
- If a common element of an existing branch (horizontal line) is selected, then CODESYS inserts the new branch line as a branch line on the far right. If an entire branch line of an existing branch is selected, then CODESYS inserts the new branch line directly to the right as a new branch line.

Please note: You can convert a branch into another type with the “Alternative” and “Parallel” commands.
Example of parallel branch

The following image shows a new inserted parallel branch generated by the “Insert Branch Right” command while the Step11 step was selected. CODESYS automatically inserts a step (Step2 in the example).

Processing in online mode: If $t_2$ yields TRUE, then CODESYS executes Step2 immediately after Step11 and before $t_3$ is passed.

Thus, CODESYS processes both branch lines as opposed to alternative branches.

Example of alternative branch

The following image shows a new inserted alternative branch generated by the “Insert Branch Right” command while the $t_4$ transition was selected. CODESYS automatically inserts a step (Step32 in the example), a preceding transition, and a subsequent transition ($t_41$, $t_42$).

Processing in online mode: If Step3 is active, then CODESYS passes the subsequent transitions ($t_4$, $t_41$) from left to right. The first branch line of the main branch with the first transition yielding TRUE is passed. Therefore, only one branch line is processed as opposed to with a parallel branch.

- Chapter 6.4.1.20.1.5.8.3 “SFC element 'Branch'” on page 2078
- Chapter 6.4.1.21.3.12.12 “Command 'Insert Branch'” on page 2679
- Chapter 6.4.1.21.3.12.10 “Command 'Parallel'” on page 2678
- Chapter 6.4.1.21.3.12.11 “Command 'Alternative'” on page 2679

Command 'Insert Action Association'

Symbol: $\text{Insert Action Association}$

**Function:** This command assigns an IEC action to a step.

**Call:** Main menu “SFC”
**Requirement:** A step is selected.

CODESYS inserts the action element to the right of the selected step element.

If you have already assigned one or more actions to the step, they are displayed in an action list. The new action is then inserted as follows:

- If you selected the step element, the action is inserted as the first action of the step at first position of the action list.
- If you selected one of the available actions in the action list, then the action is inserted directly above the selected action.

The left section of the action element includes the qualifier (N by default). You enter the action name in the right section. To set this value, click in the box to obtain an editing frame. You must have already created this action as a POU in the project.

You can also edit the qualifier. Valid qualifiers are described in the chapter “Qualifiers for Actions in SFC”.

See also:
- Chapter 6.4.1.21.3.12.15 “Command 'Insert Action Association After’” on page 2681
- Chapter 6.4.1.20.1.5.4 “Qualifiers for Actions in SFC” on page 2065

**Command 'Insert Action Association After’**

**Symbol:** \( \text{ä} \)

**Function:** This command assigns an IEC action to a step.

**Call:** Main menu “SFC”

**Requirement:** A step is selected.

This command functions similar to the “Insert Action Association” command. The difference between the two commands is that CODESYS inserts the new action in the last position of the action list, not the first position. If you select an action in the action list, then CODESYS inserts the new action at the bottom of the list, not at the top.

See also:
- Chapter 6.4.1.21.3.12.14 “Command 'Insert Action Association’” on page 2680
- Chapter 6.4.1.20.1.5.4 “Qualifiers for Actions in SFC” on page 2065

**Command 'Insert Jump’**

**Symbol:** \( \text{i} \)

**Function:** This command inserts a jump element before the selected element.

**Call:** Main menu “SFC”

**Requirement:** A step is selected.

CODESYS automatically inserts the jump with the Step destination. Then, you still have to replace this jump destination with an actual destination by using the input assistant.

See also:
- Chapter 6.4.1.20.1.5.8.4 “SFC element 'Jump’” on page 2079
- Chapter 6.4.1.21.3.12.17 “Command 'Insert Jump After’” on page 2681

**Command 'Insert Jump After’**

**Symbol:** \( \text{i} \)

**Function:** This command inserts a jump element after the selected element.
Call: Main menu “SFC”
CODESYS automatically inserts the jump with the step destination. Then, you still have to replace this jump destination with an actual destination by using the input assistant.

See also
- § Chapter 6.4.1.20.1.5.8.4 “SFC element ‘Jump’” on page 2079
- § Chapter 6.4.1.21.3.12.16 “Command ‘Insert Jump’” on page 2681

Command 'Insert Macro'
Symbol: 图

Function: This command inserts a macro element before the selected element.

Call: Main menu “SFC”
The new macro is named Macro<x> by default, where x is an incremental number beginning at 0 for the first macro. You can edit the default name directly by clicking the name.

To edit the macro, click “Zoom Into Macro” in the macro editor.

See also
- § Chapter 6.4.1.21.3.12.20 “Command ‘Zoom Into Macro’” on page 2682
- § Chapter 6.4.1.21.3.12.19 “Command ‘Insert Macro After’” on page 2682

Command 'Insert Macro After'
Symbol: 图↓

Function: This command inserts a macro element after the selected element.

Call: Main menu “SFC”
This command functions similar to the “Insert Macro” command.

See also
- § Chapter 6.4.1.21.3.12.20 “Command ‘Zoom Into Macro’” on page 2682
- § Chapter 6.4.1.21.3.12.18 “Command ‘Insert Macro’” on page 2682

Command ‘Zoom Into Macro’
Symbol: 图

Function: This command opens a macro for editing in the macro editor.

Call: Main menu “SFC”
Requirement: A macro is selected.

By choosing this command, CODESYS closes the main view of the SFC editor and opens the macro editor. This is also an SFC editor for editing the section of the SFC diagram that is displayed as a macro box in the main view.

Click “Zoom Out of Macro” to return to the main view.

See also
- § Chapter 6.4.1.21.3.12.21 “Command ‘Zoom Out of Macro’” on page 2682

Command 'Zoom Out of Macro'
Symbol: 图↓
Function: This command closes the macro editor and returns to the main view of the SFC editor.

Call: Main menu “SFC”

Requirement: A macro is open in the macro editor.

See also
● § Chapter 6.4.1.21.3.12.20 “Command ‘Zoom Into Macro’” on page 2682

Command 'Paste After'

Symbol: 

Function: This command pastes the elements from the clipboard after the selected position.

Call: Main menu “SFC”.

Command 'Change Duplication' - 'Set'

Function: This command embeds every step action or transition, which is called by a step or transition in the SFC box, with the caller. In this way, the action or transition object can be called only from exactly this caller (pseudo-embedding). The result is that copying step and transition elements that call actions or transitions automatically creates new action or transition objects. The implementation code is also copied.

Call: Menu bar: “SFC”.

For more details about duplication mode, refer to the help page for the SFC element properties and the instructions for adding step actions.

Pseudo-embedded objects can be hidden in the “Devices” or “POUs” view by means of a command.

See also
● § Chapter 6.4.1.20.1.5.8.6 “SFC element properties” on page 2080
● § Chapter 6.4.1.9.5.5.2 “Programming in SFC” on page 1880

Command 'Change Duplication' - 'Remove'

Function: This command removes the embedding of action, transition, and property objects by a step or transition that calls it for the entire SFC box. In this way, the pseudo-embedding of the action, transition, or property objects is removed. If step or transition elements are copied, which call actions, transitions, or properties, then the copying calls the same actions and transitions as the source.

Call: Menu bar: “SFC”.

For more details about duplication mode, refer to the help page for the SFC element properties and the instructions for adding step actions.

Pseudo-embedded objects can be hidden in the “Devices” or “POUs” view by means of a command.
Command 'Do Not Display Embedded Objects'

**Function:** This command causes action and transition objects, which are embedded in an SFC box by a step or transition, do not appear in the tree.

**Call:** Context menu of an SFC box in the “Devices” or “POUs” view.

**Command 'Edit Worksheet'**

**Function:** This command opens the “Edit Worksheet” dialog box in which you set the size of the worksheet.

**Call:** Main menu “CFC”

**Requirements:** A CFC editor is active.

**Dialog box 'Edit worksheet'**
“Use following dimensions” | Here is where you set the size of the worksheet. Your change is only accepted if the size is sufficient for the existing program.

“Adapt the dimensions automatically” | Automatically adapts the size of the worksheet to the size of your program.

“Move the working sheet origin relatively” | Shifts the worksheet along the x or y axis. The input of negative numbers is permitted.

Command 'Edit Page Size'

**Function**: This command opens the “Edit Page Size” dialog box, in which you change the size of the page-oriented CFC editor.

**Call**: Main menu “CFC”

**Requirements**: A page-oriented CFC editor is active.

Dialog box ‘Edit page size’

| “Width” | Width of the page (minimum 24, maximum 1024). Elements outside of the working area are marked red. |
| “Height” | Height of the page (minimum 24, maximum 1024). Elements outside of the working area are marked red. |
| “Margin width” | Width of the margin (minimum 6, maximum 25% or page width). |
| “Set as standard for new CFC objects” | ✓: The current settings are selected as standard for new CFC objects. |

See also

- Chapter 6.4.1.20.1.7.6.1 “CFC element 'Page’” on page 2109

Command 'Negate'

**Symbol**: -\( \circ \)

**Function**: This command negates the selected function block input or function block output.

**Call**: Main menu “CFC”, context menu

**Requirements**: A CFC editor is active. A function block input or function block output is selected.

Command 'EN/ENO'

**Symbol**: \[\text{EN}\]

**Function**: This command adds a boolean input “EN” (Enable) and a boolean output “ENO” (Enable Out) to the selected function block.

**Call**: Main menu “CFC”, context menu

**Requirements**: A CFC editor is active. A function block is selected.

The added input “EN” activates the function block. The function block is executed only if the input is TRUE. The value of this signal is output at the “ENO” output.
Command 'None'
Symbol: -
keyboard shortcut: [Ctrl]+[M] (to toggle between “S”, “R”, “REF”, and None)

Function: The command removes a Reset (R), Set (S), or REF from the input of the “Output” element.

Call: Menu bar: “CFC ➔ Set/Reset”; context menu: “Set/Reset”

Requirement: A CFC editor is active. The input of an “Output” element is selected.

Command 'R (Reset)'
Symbol: -
keyboard shortcut: [Ctrl]+[M] (to toggle between “S”, “R”, “REF”, and None)

Function: The command adds a Reset to the input of a Boolean “Output” element.

Call: Menu bar: “CFC ➔ Set/Reset”; context menu: “Set/Reset”

Requirement: A CFC editor is active. The input of an “Output” element is selected.

If an “Output” element has a Reset input, then the Boolean output value is set to “FALSE” as soon as the value of the input is “TRUE”. The “FALSE” value at the output is retained, even if the input value changes.

See also
● § Chapter 6.4.1.21.3.13.7 “Command ‘S (Set)’” on page 2687

Command 'S (Set)'
Symbol: -
keyboard shortcut: [Ctrl]+[M] (to toggle between “S”, “R”, “REF”, and None)

Function: The command adds a Set (S) to the input of a Boolean “Output” element.

Call: Menu bar: “CFC ➔ Set/Reset”; context menu: “Set/Reset”

Requirement: A CFC editor is active. The input of an “Output” element is selected.

If an “Output” element has a Set input, then the Boolean output value is set to “TRUE” as soon as the value of the input is “TRUE”. The “TRUE” value at the output is retained, even if the input value changes.

See also
● § Chapter 6.4.1.21.3.13.6 “Command ‘R (Reset)’” on page 2687

Command 'REF= (Reference Assignment)'
Symbol: -
keyboard shortcut: [Ctrl]+[M] (to toggle between “S”, “R”, “REF”, and None)

Function: The command assigns a reference to an “Output” element.

Call: Menu bar: “CFC ➔ Set/Reset”; context menu: “Set/Reset”

Requirements: A CFC editor is active. The input of an “Output” element is selected.

Example:
Declaration:
```
ref_int : REFERENCE TO INT;
a : INT;
```

CFC:
![Diagram of CFC editor with REF and ref_int]

This corresponds to the ST code: `ref_int REF= a;`
Command 'Display Execution Order'

**Function:** The command temporarily shows a numbered tag for all CFC elements of the programming object.

**Call**
- Menu bar: “CFC ➔ Execution Order”
- Context menu in the CFC editor

**Requirement:** A CFC editor is active and the “Auto Data Flow Mode” property is selected.

The numbers represent the automatically determined execution order. The execution order is determined by data flow. In the case of multiple networks, it is determined by their topological position in the editor.

The tags are hidden as soon as you click in the CFC editor.

- Chapter 6.4.1.21.4.11.14 “Dialog ‘Properties’ - ‘CFC Execution Order’” on page 2761

Command 'Set Start of Feedback'

**Symbol:** ➔

**Function:** The command defines the selected element as the starting point within a feedback.

**Call:**
- Menu bar: “CFC ➔ Execution Order”
- Context menu: “Execution Order”

**Requirement:** A CFC editor is active and the “Auto Data Flow Mode” property is selected. Moreover, a network of the CFC POU contains a feedback, and an element within the feedback is selected.

In the CFC editor, the starting point within the feedbacks is decorated with the ➔ symbol. Then the element has the lowest number in the execution order within the feedbacks. At runtime, the processing of the feedback begins with this element.

- Chapter 6.4.1.21.4.11.14 “Dialog ‘Properties’ - ‘CFC Execution Order’” on page 2761

Command 'Send to Front'

**Symbol:** ➔

For more information, see the description for the data type REFERENCE TO.

See also
- Chapter 6.4.1.9.5.3.3 “Programming in the CFC editor” on page 1871
- Chapter 6.4.1.20.5.14 “Reference” on page 2245
**Function:** The command numbers the elements so that the selected elements are located at the front of the execution order.

**Call:** Menu bar: “CFC ➔ Execution Order”; context menu: “Execution Order”

**Requirements:** A CFC editor is active and the “Explicit Execution Order Mode” property is selected. At least one element is selected.

The selected elements get the lowest numbers beginning at 0 while keeping the previous order. The remaining elements are numbered so that their execution order remains the same. The topological positions of the elements are retained anyway.

- Chapter 6.4.1.21.3.13.17 “Command ‘Order by Topology’” on page 2691

**Command 'Send to Back’**

**Symbol:** 🔄

**Function:** The command numbers the elements so that the selected elements are located at the end of the execution order.

**Call:** Menu bar: “CFC ➔ Execution Order”; context menu: “Execution Order”

**Requirements:** A CFC editor is active and the “Explicit Execution Order Mode” property is selected. At least one element is selected.

The selected elements get the highest numbers while keeping the previous order. The remaining elements are numbered so that their execution order remains the same. The topological positions of the elements are retained anyway.

- Chapter 6.4.1.21.3.13.17 “Command ‘Order by Topology’” on page 2691

**Command 'Move Up’**

**Symbol:** ⬆️

**Function:** The command numbers the elements so that the selected elements are located one position forward.

**Call:** Menu bar: “CFC ➔ Execution Order”; context menu: “Execution Order”

**Requirements:** A CFC editor is active and at least one element is selected. The “Explicit Execution Order Mode” property is selected.
The selected elements get a numbering decreased by one while keeping the previous order. The selected elements are processed one position earlier. The remaining elements are numbered so that their execution order remains the same. The topological positions of the elements are retained anyway.

See also

- Chapter 6.4.1.21.3.13.17 “Command ‘Order by Topology’” on page 2691

Command 'Move Down'

Symbol: 📡

**Function:** The command numbers the elements so that the selected elements are located one position backward.

**Call:** Menu bar: “CFC ➔ Execution Order”; context menu: “Execution Order”

**Requirements:** A CFC editor is active and at least one element is selected. The “Explicit Execution Order Mode” property is selected.

The selected elements get a numbering increased by one while keeping the previous order. The elements are processed one position later. The remaining elements are numbered so that their execution order remains the same. The topological positions of the elements are retained anyway.

See also

- Chapter 6.4.1.21.3.13.16 “Command ‘Order by Data Flow’” on page 2691
- Chapter 6.4.1.21.3.13.17 “Command ‘Order by Topology’” on page 2691

Command 'Set Execution Order'

**Function:** The command opens a dialog for setting the number of the selected element to any value.

**Call:** Menu bar: “CFC ➔ Execution Order”; context menu: “Execution Order”

**Requirements:** A CFC editor is active and the “Explicit Execution Order Mode” property is selected. Exactly one element is selected.

The selected element gets the number specified in the dialog. The remaining elements are numbered so that their execution order remains the same. The topological positions of the elements are retained anyway.
Command 'Order by Data Flow'

**Function:** The command numbers the elements in the program by data flow, or in the case of multiple networks by their topological position in the editor.

**Call:** Menu bar: “CFC ➔ Execution Order”; context menu: “Execution Order”

**Requirements:** A CFC editor is active and the “Explicit Execution Order Mode” property is selected.

The command is also available when no element is selected.

The execution order is determined by data flow. In the case of multiple networks, it is determined by their topological position of the networks. All numbered elements of the POU are set accordingly. Afterwards, the execution order is identical to that in auto data flow mode. The topological positions of the elements are retained anyway.

- Chapter 6.4.1.21.3.13.16 “Command ‘Order by Data Flow’” on page 2691
- Chapter 6.4.1.21.3.13.17 “Command ‘Order by Topology’” on page 2691

Command 'Order by Topology'

**Function:** The command orders the execution order of the elements by their topological position from right to left and from top to bottom.

**Call:** Menu bar: “CFC ➔ Execution Order”; context menu: “Execution Order”

**Requirements:** A CFC editor is active and the “Explicit Execution Order Mode” property is selected. At least one element is selected.

The command applies to all elements in the program, even if not all elements are selected when the command is executed. The topological positions of the elements are retained anyway.

See also

- Chapter 6.4.1.9.5.3.2 “Automatic Execution Order by Data Flow” on page 1867

Command 'Edit Parameters'

Function: This command opens the “Edit Parameters” dialog box, where you change the constant input parameters of a function block.

Call: Main menu “CFC ➔ Edit Parameters”, or “Right-Click ➔ Edit Parameters”, click the “Parameter” function block.

Requirements: A CFC editor is active. An instantiated function block has VAR_INPUT CONSTANT variables in its declaration.

This functionality applies only to blocks that are inserted in a CFC with CODESYS >= V3.5 SP4.

CODESYS displays blocks with VAR_INPUT CONSTANT variables by the word “Parameter” in the lower left corner of the block.

### Dialog Box 'Edit Parameters'

<table>
<thead>
<tr>
<th>“Parameters”</th>
<th>Name of the variable</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Type”</td>
<td>Data type of the variables</td>
</tr>
<tr>
<td>“Value”</td>
<td>Click into the field to type a value.</td>
</tr>
<tr>
<td>“Initial Value”</td>
<td>Initialization Value</td>
</tr>
<tr>
<td>“Category”</td>
<td>Additional information about the parameters; these values are defined by attributes and cannot be changed in this dialog box.</td>
</tr>
<tr>
<td>“Unit”</td>
<td>parameterCategory</td>
</tr>
<tr>
<td></td>
<td>parameterMinValue</td>
</tr>
<tr>
<td>“Max”</td>
<td>parameterMaxValue</td>
</tr>
</tbody>
</table>

“Delete Prepared Parameters” This command is active when you write a prepared value (“Debug ➔ Write Value”).

When you exit the field and the dialog box by clicking “OK”, the value changes are applied to the project.

**Example of a block with constant inputs**

```plaintext
FUNCTION_BLOCK FB1
VAR_INPUT CONSTANT
{attribute 'parameterCategory':='General'}
{attribute 'parameterUnit':='m/s'}
{attribute 'parameterMinValue':='0'}
{attribute 'parameterMaxValue':='100'}
{attribute 'parameterMinValue':='100'}

fbin1:INT;
fbin2:DWORD:=24354333;
fbin3:STRING:='abc';
END_VAR
```
This functionality and the declaration of variables with keyword VAR_INPUT CONSTANT applies only to the CFC editor. In the FBD editor, CODESYS always shows all input parameters on the block, regardless of whether or not they are declared as VAR_INPUT or VAR_INPUT CONSTANT. CODESYS also does not make a distinction about this in text editors.

- § Chapter 6.4.1.20.1.7.5 “CFC Editor in Online Mode” on page 2103
- § Chapter 6.4.1.21.3.13.19 “Command 'Save Prepared Parameters to Project’” on page 2693

Command 'Save Prepared Parameters to Project’

Function: This command saves the prepared parameter values to the project.

Call: Main menu “CFC”.

Requirements: A CFC editor is active. Parameter values of function block instances are changed in online mode. You are in offline mode.

If the values of constants on the controller are different from the values in the application, then this is indicated by a red asterisk next to the parameter field. Clicking “Incur Prepared Parameters” saves the controller values to the application.

See also

- § “Changing of constant input parameters of function block instances” on page 2105
- § Chapter 6.4.1.21.3.13.18 “Command 'Edit Parameters’” on page 2692

Command 'Connect Selected Pins’

Symbol: 📛

Function: The command establishes a connection between the selected pins.

Call: Main menu “CFC”, context menu

Requirements: A CFC editor is active. Precisely one output and several inputs are selected.

In order to select the pins you must keep the [CTRL] key pressed while clicking on the pins. Then you execute the command.

See also

- § Chapter 6.4.1.21.3.13.23 “Command 'Select Connected Pins’” on page 2694

Command 'Unlock Connection'

Symbol: 🔐

Function: This command unlocks a disabled connection.

Call: Main menu “CFC ➔ Routing”, context menu “Routing”

Requirements: A CFC editor is active. A connection or a connection mark is selected.

You obtain a disabled connection if you change the connections of the automatic routing. If you wish to carry out automatic routing again, you must first unlock a disabled connection.
With a mouse-click on the icon of a disabled connection you can similarly unlock this connection.

- § Chapter 6.4.1.9.5.3.3 “Programming in the CFC editor” on page 1871
- § Chapter 6.4.1.20.1.7.6.12 “CFC element ‘Connection Mark - Source/Sink’” on page 2112

Command 'Show Next Collision'

**Function:** This command displays the next collision in the editor and marks the place concerned.

**Call:** Menu menu “CFC ➔ Routing”, context menu “Routing”

**Requirements:** A CFC editor is active and at least one connection with a collision is present.

This function is very useful if you operate with large networks and see only one sub-area. A collision is additionally indicated to you by the red bordered symbol in the top right corner of the editor.

Command 'Select Connected Pins'

**Symbol:** ; shortcut: [Ctrl]+[Left Arrow], or [Ctrl]+[Right Arrow]

**Function:** The command selects all pins that are connected to the currently selected line, or connected to the currently selected connection mark in page-oriented CFC.

**Call:** “CFC” menu; context menu

**Requirements:** A CFC editor or a page-oriented CFC editor is active. One line and therefore exactly one connection or exactly one connection mark is selected.

See also

- § Chapter 6.4.1.20.1.7.2 “CFC Editor” on page 2098

- § Chapter 6.4.1.20.1.7.6.12 “CFC element ‘Connection Mark - Source/Sink’” on page 2112

Command 'Reset Pins'

**Symbol:** , [Ctrl]+[U]

**Function:** The command restores the deleted pins of a box.

**Call:** “CFC ➔ Pins” menu; “Pins” in the context menu

**Requirements:** A CFC editor is active and a box is selected.

The command restores all inputs and outputs of the box as they are defined in their implementation.

See also

- § Chapter 6.4.1.21.3.13.25 “Command 'Remove Unused Pins’” on page 2694

Command 'Remove Unused Pins'

**Symbol:** ☑
**Command 'Add Input Pin'**

Symbol: ![Symbol]

**Function:** The command adds a further input to the selected function block.

**Call:** Main menu “CFC ➔ Pins”, context menu “Pins”

**Requirements:** A CFC editor is active. A function block is selected.

See also

- ° Chapter 6.4.1.21.3.13.27 “Command 'Add Output Pin’” on page 2695

**Command 'Add Output Pin'**

Symbol: ![Symbol]

**Function:** The command adds a further output to the selected function block.

**Call:** Main menu “CFC ➔ Pins”, context menu “Pins”

**Requirements:** A CFC editor is active. A suitable function block is selected.

See also

- ° Chapter 6.4.1.21.3.13.26 “Command 'Add Input Pin’” on page 2695

**Command 'Route All Connections'**

Symbol: ![Symbol]

**Function:** This command cancels all manual changes to the connections in the program and re-establishes the original state.

**Call:** Main menu “CFC ➔ Routing”, context menu “Routing”

**Requirements:** A CFC editor is active.

CODESYS cannot automatically route connections that are fixed by control points. You must remove the control points before executing the command. Use the “Remove Control Point” command to do this. Furthermore you must disconnect connections that have been changed manually and are marked by the ![Icon] icon. Use the “Disconnect Connection” command to do this.

See also

- ° Chapter 6.4.1.21.3.13.29 “Command 'Remove Control Point’” on page 2695
- ° Chapter 6.4.1.21.3.13.21 “Command 'Unlock Connection’” on page 2693

**Command 'Remove Control Point'**

**Function:** This command removes a control point.

**Call:** Context menu “Routing”

**Requirements:** A CFC editor is active. You have selected a connecting line.
If you move the mouse pointer over a selected connecting line, the existing control points are displayed with yellow circle symbols. Set the cursor on the control point to be deleted and execute the command from the context menu.

See also
- Chapter 6.4.1.20.1.7.6.2 “CFC element ’Control Point’” on page 2109
- Chapter 6.4.1.21.3.13.30 “Command ’Create Control Point’” on page 2696

Command ’Create Control Point’

Symbol: ▲

Function: The command creates a control point on a connecting line.

Call: Context menu “Routing”

Requirements: A CFC editor is active. The cursor is over a connection.

The control point is created in the position on the connection at which the cursor is located when calling the command. The command corresponds to the “Control Point” element in the “Tools” window.

See also
- Chapter 6.4.1.20.1.7.6.2 “CFC element ’Control Point’” on page 2109
- Chapter 6.4.1.21.3.13.29 “Command ’Remove Control Point’” on page 2695

Command ’Connection Mark’

Symbol: ☀

Function: This command switches the display of the connection between two elements back and forth between a connecting line and the use of connection marks.

Call: Main menu “CFC”, context menu

Requirements: A CFC editor is active. A connection or a connection mark is selected.

If you have selected a connecting line, the command removes this line and adds a “Connection Mark - Source” at the output of one element and a “Connection Mark - Sink” at the input of the other. Both are given the same name by default, “C-<n>”, where n is a sequential number.

If you select a pair of connection marks, the command converts these marks into a connecting line.

See also
- Chapter 6.4.1.20.1.7.6.12 “CFC element ’Connection Mark - Source/Sink’” on page 2112

Command ’Create group’

Symbol: ☀

Function: This command groups the selected elements.

Call: Main menu “CFC ➔ Group”, context menu “Group”

Requirements: A CFC editor is active. Several elements are selected.

Grouped elements can only be moved together. The position of the elements is not affected by the grouping.

See also
- Chapter 6.4.1.21.3.13.33 “Command ’Ungroup’” on page 2697
Command 'Ungroup'

Symbol: 

**Function:** The command undoes a previous grouping.

**Call:** Main menu “CFC ➔ Group”, context menu “Group”

**Requirements:** A CFC editor is active. A grouping is selected.

See also

- % Chapter 6.4.1.21.3.13.32 “Command 'Create group’” on page 2696

Command 'Prepare Box for Forcing'

This command is required when using compiler versions 3.5.11.x and 3.5.12.x. The command is no longer required for compiler versions >= 3.5.13.0.

**Function:** The command activates and deactivates the forceability of the inputs for a function block element.

**Call:**
- CFC
- Context menu

**Requirements:** The CFC editor is in offline mode and a function block element is selected.

After executing the command, the “Force Function Block Input” command is available in online mode to open a dialog for forcing the box input values.

See also

- % Chapter 6.4.1.21.3.13.35 “Command ‘Force Function Block Input’” on page 2697
- % Chapter 6.4.1.20.1.7.2 “CFC Editor” on page 2098
- % Chapter 6.4.1.12.5 “Forcing and Writing of Variables” on page 1987

Command 'Force Function Block Input'

**NOTICE!**

This kind of forcing uses a data breakpoint internally and is therefore different from forcing with the “Force Values” command or [F7].

Values that were forced by the command “Force FB Input” do not respond to the commands “Show All Forces” or “Unforce Values”.

**Function:** The command opens the “Force Value” dialog to force the selected input of a function block. Forcing can be canceled with the same command and dialog.

**Call:**
- CFC
- Context menu

**Requirements:**

- The CFC editor is in online mode and the input of the function block is selected.
- For compiler versions 3.5.11.x and 3.5.12.x, the “forceability” of the function block is enabled by the “Prepare Box for Forcing” command.

In the “Force Value” dialog, you can either specify a value that the input of the function block should be forced, or remove the currently forced value.
After forcing, the input is highlighted in green again. Boolean inputs get a small monitoring view with the forced value. The forced value is displayed in the “Value” column of monitoring views (in the declaration part of the POU or in a watch list).

**Dialog 'Force Value'**

<table>
<thead>
<tr>
<th>“Expression”</th>
<th>Name of the function block input. Example: TON_1.IN.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Type”</td>
<td>Data type of the input</td>
</tr>
</tbody>
</table>

**Table 517: “What do you want to do?”**

| “Set a new value to force” | ☑: You can specify a new value in the input field. The format has to correspond to the data type. |
| “Remove value”             | ☑: Forcing at the input is canceled.                  |

- ☑ Chapter 6.4.1.21.3.13.34 “Command 'Prepare Box for Forcing’” on page 2697

**Command 'Use Attributed Member as Input’**

Symbol: →[1]

**Function:** This command allows for connecting a structure member to a scalar type input.

**Call:** Menu bar: “CFC ➔ Pins”; context menu: “Pins”

**Requirements:** A CFC editor is active and a function block input is selected.

The member of the structure that is connected to the input of the subsequent function block must be provided with the pragma `{attribute 'ProcessValue'}. The data type of the structure member has to be compatible with the data type of the subsequent input. Inputs connected in this way are flagged with the "V" symbol.
Example

TYPE QINT :
STRUCT
   Status : STRING;
   {attribute 'ProcessValue'}
   Value1 : INT;
   Value2 : INT;
END_STRUCT
END_TYPE

PROGRAM PLC_PRG
VAR
   input1: QINT;
   output1: QINT;
   intValue: INT;
END_VAR

If you do not execute the command “Use attributed member as input” for this link, then a compiler error is issued.

Command 'Insert Network'
Symbol: [\[I], shortcut: [Ctrl] + [I]
Function: This command inserts a further network in the FBD/LD/IL editor.
Call: Main menu "FBD, LD, IL", context menu
Requirements: The FBD, LD or IL editor is active. No box is selected.

See also
- Chapter 6.4.1.20.1.6.4.1 “FBD/LD/IL element 'Network’” on page 2091
- Chapter 6.4.1.20.1.6.1 “FBD/LD/IL Editor” on page 2082
- Chapter 6.4.1.21.3.14.2 “Command ‘Insert Network (Below)’” on page 2701

Command 'Insert Network (Below)'
Symbol: [F], shortcut: [Ctrl]+[T]
Function: This command inserts a further network in the FBD/LD/IL editor below the selected network.
Call: Main menu “FBD, LD, IL”, context menu
Requirements: The FBD, LD or IL editor is active. No box is selected.
See also
- Chapter 6.4.1.20.1.6.1 “FBD/LD/IL Editor” on page 2082

Command 'Toggle Network Comment State'
Symbol: [Ctrl]+[O]
Function: The command comments the selected network in or out.
Call: Main menu “FBD, LD, IL”, context menu
Requirements: The FBD, LD or IL editor is active. A network is selected, but no box is selected.
See also
- Chapter 6.4.1.20.1.6.1 “FBD/LD/IL Editor” on page 2082

Command 'Insert Assignment'
Symbol: [Ctrl]+[A]
Function: This command inserts an assignment in the FBD or LD editor.
Call: Main menu “FBD/LD/IL”, context menu
Requirements: The FBD, LD or IL editor is active. A network is selected, but no box is selected.

In IL an assignment is programmed via the operators LD and ST.

See also
- Chapter 6.4.1.20.1.6.1 “FBD/LD/IL Editor” on page 2082

Command 'Insert Box'
Symbol: [Ctrl]+[B]
Function: This command inserts a box that is available in the project at the end of the selected network.
Call: Main menu “FBD, LD, IL”, context menu
Requirements: The FBD, LD or IL editor is active. A network is selected, but no box is selected. If you select this command the input assistant opens, where you can select the desired box.

See also
- Chapter 6.4.1.20.1.6.4.2 “FBD/LD/IL element 'Box'” on page 2092
- Chapter 6.4.1.20.1.6.1 “FBD/LD/IL Editor” on page 2082
- Chapter 6.4.1.9.7 “Using input assistance” on page 1885

Command 'Insert Box with EN/ENO'
Symbol: [ reopened ], shortcut: [Ctrl] + [Shift] + [E]
Function: This command inserts a box with a boolean input “Enable” and a boolean output “Enable Out” at the end of the selected network.
Call: Main menu “FBD, LD, IL”, context menu
Requirements: the FBD, LD or IL editor is active. A network is selected, but no box is selected.
See also
- Chapter 6.4.1.20.1.6.1 “FBD/LD/IL Editor” on page 2082
- Chapter 6.4.1.9.7 “Using input assistance” on page 1885

Command 'Insert Empty Box'
Symbol: opened , shortcut: [Ctrl] + [Shift] + [B]
Function: This command inserts an empty function block at the end of the currently selected network.
Call: Main menu “FBD/LD/IL”, context menu
Requirements: The FBD, LD or IL editor is active. A network is selected, but no box is selected.
See also
- Chapter 6.4.1.20.1.6.1 “FBD/LD/IL Editor” on page 2082

Command 'Insert Empty Box with EN/ENO'
Symbol: reopened
Function: The command inserts an empty box with a Boolean input “Enable” and a Boolean output “Enable Out” at the end of the selected network.
Call: Main menu “FBD/LD/IL”, context menu
Requirements: The FBD editor, the IL editor or the LD editor is active. A network must be selected. No other box may be selected.
If “Enable” has the value FALSE at the time of the function block call, then the operations defined in the FB are not executed. Otherwise, if “Enable” has the value TRUE, these operations are executed. The ENO output acts as a repeater of the EN input.

- Chapter 6.4.1.20.1.6.1 “FBD/LD/IL Editor” on page 2082

Command 'Insert Box Parallel (Below)'
Function: This command inserts an empty box parallel below the selected function block.
Call: Menu bar: “FBD/LD/IL”; context menu.
**Requirements**: A box is selected in the LD editor.

See also

- [Chapter 6.4.1.20.1.6.1 “FBD/LD/IL Editor” on page 2082](#)

**Command 'Insert Jump’**

Symbol ➔, shortcut: [Ctrl]+[L]

**Function**: This command inserts a jump element before the selected element.

**Call**: Main menu “FBD/LD/IL”, context menu

**Requirements**: The FBD, LD or IL editor is active. A connecting line is selected.

See also

- [Chapter 6.4.1.20.1.6.1 “FBD/LD/IL Editor” on page 2082](#)
- [Chapter 6.4.1.20.1.6.4.7 “FBD/LD/IL element ‘Jump’” on page 2093](#)

**Command 'Insert Label’**

Symbol: 

**Function**: This command inserts a jump label into the currently selected network.

**Call**: Main menu “FBD, LD, IL”, context menu

**Requirements**: The FBD, LD or IL editor is active. A network is selected. No jump label is selected.

See also

- [Chapter 6.4.1.20.1.6.1 “FBD/LD/IL Editor” on page 2082](#)

**Command 'Insert Return’**

Symbol: 

**Function**: This command inserts an element “Return” in the selected place.

**Call**: Main menu “FBD/LD/IL”, context menu

**Requirements**: The FBD, LD or IL editor is active. A box output is selected.

If a box is selected, the command “Append Input” is available in the context menu. The input is inserted at the lower end of the box.

See also

- [Chapter 6.4.1.20.1.6.1 “FBD/LD/IL Editor” on page 2082](#)
- [Chapter 6.4.1.20.1.6.4.8 “FBD/LD/IL element 'Return’” on page 2093](#)

**Command 'Insert Input’**

Symbol: 

**Function**: This command adds a further input to an extendable box (ADD, OR, ADD, MUL, SEL) above the selected input.

**Call**: “FBD/LD/IL” menu

**Requirements**: The FBD or LD editor is active. An input of a box is selected.
Command 'Insert Coil'
Symbol: W, shortcut: [Ctrl] + [A]

Function: This command inserts a coil into the network.
Call: Main menu “FBD, LD, IL”, context menu
Requirements: The LD editor is active. A network, a coil or a connecting line is selected, but no box is selected.
See also
- Chapter 6.4.1.20.1.6.1 “FBD/LD/IL Editor” on page 2082
- Chapter 6.4.1.20.1.6.4.12 “LD element ‘Coil’” on page 2095

Command 'Insert Set Coil'
Symbol: ↔
Function: This command inserts a set coil into the network.
Call: Main menu “FBD, LD, IL”, context menu
Requirements: The LD editor is active. A network, a coil or a line is selected, but no box is selected.
See also
- Chapter 6.4.1.20.1.6.1 “FBD/LD/IL Editor” on page 2082

Command 'Insert Reset Coil'
Symbol: ↔
Function: This command inserts a reset coil into the network.
Call: Main menu “FBD, LD, IL”, context menu
Requirements: The LD editor is active. A network, a coil or a line is selected, but no box is selected.
See also
- Chapter 6.4.1.20.1.6.1 “FBD/LD/IL Editor” on page 2082

- “Ladder diagram (LD)” on page 1860

Command 'Insert Contact'
Symbol: ⬤, shortcut: [Ctrl] + [K]
Function: This command inserts a contact to the left of the selected element.
Call: Main menu “FBD/LD/IL”, context menu
Requirements: The LD editor is active. A line or a contact is selected.
See also
- Chapter 6.4.1.20.1.6.1 “FBD/LD/IL Editor” on page 2082
- Chapter 6.4.1.20.1.6.4.11 “LD element ‘Contact’” on page 2094
Command 'Insert Contact (Right)'

Symbol: ☑️, shortcut: [Ctrl] + [D]

Function: This command inserts a contact to the right of the selected element.

Call: Main menu “FBD/LD/IL”, context menu

Requirements: The LD editor is active. A line, a contact or a box is selected.

See also
- Chapter 6.4.1.20.1.6.1 “FBD/LD/IL Editor” on page 2082
- Chapter 6.4.1.20.1.6.4.11 “LD element 'Contact'” on page 2094

Command 'Insert Contact in Parallel (Below)'

Symbol: ☑️; keyboard shortcut: [Ctrl]+[R]

Function: This command inserts a contact with lines in parallel with and below the selected element.

Call: Menu bar: “FBD/LD/IL”; context menu.

Requirements: The LD editor is active. A line or a contact or a box is selected.

You can program closed parallel branches in a LD network as short circuit evaluation (SCE) or OR constructs. SCE branches are displayed with double vertical lines, and OR branches with single lines. Refer to the help page for “Closed branches”.

See also
- Chapter 6.4.1.20.1.6.1 “FBD/LD/IL Editor” on page 2082

- Chapter 6.4.1.20.1.6.4.14 “Closed branch” on page 2096

Command 'Insert Contact in Parallel (Above)'

Symbol: ☑️; keyboard shortcut: [Ctrl]+[P]

Function: This command inserts a contact with lines in parallel with and above the selected element.

Call: Menu bar: “FBD/LD/IL”; context menu.

Requirements: The LD editor is active. A line, a contact or a box is selected.

You can program closed parallel branches in a LD network as short circuit evaluation (SCE) or OR constructs. SCE branches are displayed with double vertical lines, and OR branches with single lines. Refer to the help page for “Closed branches”.
Command 'Toggle Parallel Mode'

**Function:** This command toggles a parallel branch between an OR construct and the Short Circuit Evaluation (SCE).

**Call:** Menu bar: “FBD/LD/IL”; context menu.

**Requirements:** The LD editor is active. A vertical line of a parallel branch is selected.

---

You can program closed parallel branches in a LD network as short circuit evaluation (SCE) or OR constructs. SCE branches are displayed with double vertical lines, and OR branches with single lines. Refer to the help page for “Closed branches”.

---

Command 'Insert Negated Contact'

**Symbol:** ☞, shortcut: [Ctrl] + [K]

**Function:** This command inserts a negated contact to the left of the selected element.

**Call:** Main menu “FBD/LD/IL”, context menu

**Requirements:** The LD editor is active. A line or a contact is selected.

See also

- Chapter 6.4.1.20.1.6.1 “FBD/LD/IL Editor” on page 2082
- Chapter 6.4.1.20.1.6.4.11 “LD element ‘Contact’” on page 2094

Command 'Insert Negated Contact Parallel (Below)'

**Symbol:** ☞

**Function:** The command inserts a negated contact with lines in parallel with and below the selected element.

**Call:** Main menu “FBD/LD/IL”, context menu

**Requirements:** The LD editor is active. A line, a contact or a box is selected.

See also

Command 'Paste Contacts: Paste Below'

Shortcut: [Ctrl] + [F]

Function: This command inserts a previously copied contact with lines below the selected element.

Call: Main menu “FBD/LD/IL ➔ Paste”, context menu

Requirements: the LD editor is active.

See also
- Chapter 6.4.1.20.1.6.1 “FBD/LD/IL Editor” on page 2082
- Chapter 6.4.1.20.1.6.4.11 “LD element ‘Contact’” on page 2094

Command 'Paste Contacts: Paste Above'

Shortcut: [Ctrl] + [F]

Function: This command inserts a previously copied contact with lines above the selected element.

Call: Main menu “FBD/LD/IL ➔ Paste Contacts”, context menu

Requirements: the LD editor is active. A line or a contact is selected.

See also
- Chapter 6.4.1.20.1.6.1 “FBD/LD/IL Editor” on page 2082
- Chapter 6.4.1.20.1.6.4.11 “LD element ‘Contact’” on page 2094

Command 'Paste Contacts: Paste Right (After)'

Shortcut: [Ctrl] + [G]

Function: this command inserts a previously copied contact to the right of the selected element.

Call: Main menu “FBD/LD/IL ➔ Paste Contacts”, context menu

Requirements: The LD editor is active. A line or a contact is selected.

See also
- Chapter 6.4.1.20.1.6.1 “FBD/LD/IL Editor” on page 2082
- Chapter 6.4.1.20.1.6.4.11 “LD element ‘Contact’” on page 2094

Command 'Insert IL Line Below'

Symbol: 

Function: The command inserts an instruction line below the selected line.

Call: Main menu “FBD/LD/IL”, context menu

Requirements: The IL editor is active. A line is selected.

See also
- Chapter 6.4.1.20.1.6.1 “FBD/LD/IL Editor” on page 2082

Command 'Delete IL Line'

Symbol: , shortcut: [Ctrl]+[Del]

Function: This command deletes the selected instruction line.
Command 'Negation'

Symbol: 
, shortcut: [Ctrl] + [N]

Function: This command negates the following elements:

- Input/output of a box
- Jump
- Return
- Coil

Call: Main menu “FBD/LD/IL”, context menu

Requirements: The IL editor is active. A line is selected.

See also

- Chapter 6.4.1.20.1.6.1 “FBD/LD/IL Editor” on page 2082

Command 'Edge Detection'

Symbol FBD: 
, symbol LD: 
, shortcut: [Ctrl] + [N]

Function: This command inserts an edge detector before the selected box input or box output.

Call: Main menu “FBD/LD/IL”, context menu

Requirements: The FBD or LD editor is active. A box input or box output is selected.

See also

- Chapter 6.4.1.20.1.6.1 “FBD/LD/IL Editor” on page 2082

Command 'Set/Reset'

Symbol: 
, shortcut [Ctrl] + [M]

Function: In the case of an element with a boolean output, this command switches between reset, set and no mark.

Call: Main menu “FBD/LD/IL”, context menu

Requirements: The FBD or LD editor is active. An element with a boolean output is selected.

See also

- Chapter 6.4.1.20.1.6.1 “FBD/LD/IL Editor” on page 2082

Command 'Set Output Connection'

Symbol: 
, shortcut [Ctrl] + [W]

Function: This command turns the selected box output into the forwarding box output.

Call: Main menu “FBD/LD/IL”, context menu

Requirements: The FBD or LD editor is active. One of several box outputs is selected.
Command 'Insert Branch'

Symbol: ➔, shortcut [Ctrl] + [Shift] + [V]

Function: This command creates an open line branch on the selected line.

Call: Main menu “FBD/LD/IL”, context menu

Requirements: The FBD or LD editor is active. An input or an output of a box is selected.

See also
- Chapter 6.4.1.20.1.6.1 “FBD/LD/IL Editor” on page 2082

Command 'Insert Branch Above'

Symbol:

Function: This command inserts a line branch above the selected open line branch.

Call: Main menu “FBD/LD/IL”, context menu

Requirements: The FBD or LD editor is active. An open line branch is selected.

See also
- Chapter 6.4.1.20.1.6.1 “FBD/LD/IL Editor” on page 2082
- Chapter 6.4.1.20.1.6.4.9 “FBD/LD/IL element 'Branch'” on page 2093

Command 'Insert Branch Below'

Symbol:

Function: This command inserts a line branch below the selected open line branch.

Call: Main menu “FBD/LD/IL”, context menu

Requirements: The FBD or LD editor is active. An open line branch is selected.

See also
- Chapter 6.4.1.20.1.6.1 “FBD/LD/IL Editor” on page 2082
- Chapter 6.4.1.20.1.6.4.9 “FBD/LD/IL element 'Branch'” on page 2093

Command 'Set Branch Start Point'

Symbol: 

Function: This command sets the starting point of a line branch on the selected line.

Call: Main menu “FBD/LD/IL”, context menu

Requirements: The LD editor is active. A line is selected.

See also
- Chapter 6.4.1.20.1.6.4.14 “Closed branch” on page 2096
- Chapter 6.4.1.20.1.6.1 “FBD/LD/IL Editor” on page 2082
Command 'Set Branch End Point'

Symbol: §

Function: This command sets the end point of a line branch on the selected line.

Call: Main menu “FBD/LD/IL”, context menu

Requirements: The LD editor is active. A line is selected. A starting point of the line branch has been set.

See also
- Chapter 6.4.1.20.1.6.1 “FBD/LD/IL Editor” on page 2082
- Chapter 6.4.1.20.1.6.4.14 “Closed branch” on page 2096

Command 'Update Parameters'

Function: This command enters changes to the declaration of the selected element in the diagram.

Call: Main menu “FBD/LD/IL”, context menu

Requirements: The FBD, LD or CFC editor is active. A box is selected. An extending change has been made to the declaration.

The command checks whether a box and its declaration in the declaration editor correspond. The change is accepted for the box only if the declaration was extended. Deletions and overwrites are not updated.

See also
- Chapter 6.4.1.20.1.6.1 “FBD/LD/IL Editor” on page 2082

Command 'Remove Unused FB Call Parameters'

Symbol: 🌊

Function: This command deletes inputs and outputs of the selected box to which no variable and no value were assigned. However, the default inputs and outputs are always retained.

Call: Main menu “FBD/LD/IL”, context menu

Requirements: The FBD or LD editor is active. A box is selected. The box has interfaces to which no value is assigned.

See also
- Chapter 6.4.1.20.1.6.1 “FBD/LD/IL Editor” on page 2082

Command 'Repair POU'

Symbol: 🧤

Function: This command repairs internal inconsistencies in the selected box.

Call: Main menu “FBD/LD/IL”, context menu

Requirements: The FBD or LD editor is active. The defective box is selected. The editor has found internal inconsistencies in the programming module that can possibly be resolved automatically. CODESYS reports the inconsistencies in the Message window.

This situation is conceivable when editing a project that was created with an older programming system version that did not yet handle the inconsistency concerned as an error.

See also
- Chapter 6.4.1.20.1.6.1 “FBD/LD/IL Editor” on page 2082
Command 'View as Function Block Diagram'

**CAUTION!**

**Loss of data!** An error-free conversion requires syntactically correct code. Otherwise parts of the implementation can be lost.

Shortcut: [Ctrl] + [1]

**Function:** This command converts the active instruction list or the active ladder diagram into the function block diagram.

**Call:** Menu “FBD/LD/IL ➔ View”

**Requirements:** The LD or IL editor is active.

See also

- Chapter 6.4.1.20.1.6.1 "FBD/LD/IL Editor" on page 2082

Command 'View as Ladder Logic'

**CAUTION!**

**Loss of data!** An error-free conversion requires syntactically correct code. Otherwise parts of the implementation can be lost.

Shortcut: [Ctrl] + [2]

**Function:** This command converts the current function block code or the active instruction list into a ladder diagram.

**Call:** Menu “FBD/LD/IL ➔ View”

**Requirements:** The FBD or IL editor is active.

See also

- Chapter 6.4.1.20.1.6.1 "FBD/LD/IL Editor" on page 2082

Command 'View as Instruction List'

If necessary, IL can be activated in the CODESYS options.

**CAUTION!**

**Loss of data!** An error-free conversion requires syntactically correct code. Otherwise parts of the implementation can be lost.

Shortcut: [Ctrl] + [3]

**Function:** This command converts the active function block code or the active ladder diagram into an instruction list.

**Call:** Menu “FBD/LD/IL ➔ View”

**Requirements:** The LD or FBD editor is active.

- ☀ Chapter 6.4.1.20.1.6.1 “FBD/LD/IL Editor” on page 2082

Command 'Go to'

Symbol:

Function: This command allows you to jump to any network.

Call: Main menu “FBD/LD/IL”

Requirements: The LD, FBD or IL editor is active. A network is selected.

This command opens a dialog box with an input field. Enter the number of the desired network in the input field.

- ☀ Chapter 6.4.1.20.1.6.1 “FBD/LD/IL Editor” on page 2082

Menu 'Library'

<table>
<thead>
<tr>
<th>Section</th>
<th>Function</th>
<th>Call</th>
<th>Requirements</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.4.1.21.3.15.1</td>
<td>Command 'Add Library'</td>
<td>Main menu “Libraries”</td>
<td>The Library Manager is open in the editor.</td>
</tr>
<tr>
<td>6.4.1.21.3.15.2</td>
<td>Command 'Try to Reload Library'</td>
<td></td>
<td></td>
</tr>
<tr>
<td>6.4.1.21.3.15.3</td>
<td>Command 'Properties'</td>
<td></td>
<td></td>
</tr>
<tr>
<td>6.4.1.21.3.15.4</td>
<td>Command 'Placeholders'</td>
<td></td>
<td></td>
</tr>
<tr>
<td>6.4.1.21.3.15.5</td>
<td>Command 'Export Library'</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Command 'Add Library'

Function: The command opens the “Add Library” dialog. In this dialog, you can add libraries to the Library Manager and then integrate them in your application.

Call: Menu bar: “Libraries”

Requirement: The Library Manager is open in the editor.

Dialog 'Add Library'

In the line above the library list, you can search for library names or library modules by typing an appropriate string.

<table>
<thead>
<tr>
<th>“Library”</th>
<th>Suitable libraries that are installed in the library repository. For example, the selection of libraries is defined in the device description or by the system integrator. By default, the displayed libraries are grouped into categories.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Company”</td>
<td>Vendor of the library</td>
</tr>
<tr>
<td>“Advanced”</td>
<td>Opens the advanced “Add Library” dialog</td>
</tr>
<tr>
<td></td>
<td>The displayed libraries are grouped into categories.</td>
</tr>
<tr>
<td></td>
<td>The displayed libraries are listed in alphabetical order.</td>
</tr>
<tr>
<td></td>
<td>All available libraries are displayed.</td>
</tr>
</tbody>
</table>

Specific libraries can be blacklisted in a device description. These libraries cannot be added below this device in the Library Manager.
You should use this dialog only if you have expert knowledge of library referencing. Using this dialog, you can link special versions or change placeholder definitions.

We recommend seriously that you follow the guidelines for the creation of libraries when developing and referencing libraries.

Table 518: Tab 'Library'

<table>
<thead>
<tr>
<th>“Company”</th>
<th>Filtering the list according to vendor</th>
</tr>
</thead>
</table>
| “Group by category” | ✅: Display of the libraries in a tree structure grouped in categories.  
                  | ❌: Display of the libraries in alphabetical order in a flat structure. |
| “Display all versions” | ✅: Display of all versions of the libraries. Version specification ‘*’ means the latest version available in the repository.  
                  | ❌: Display of the latest versions of the libraries only. A multiple selection of libraries is possible in this display. To do this, hold down the [Shift] key and select the entries. |
| “Details” | Opens a detailed view with the library modules. |
| “Library Repository” | Opens the “Library Repository” dialog. There you can install more libraries to your local system. |

Table 519: Tab ‘Placeholder’

| “Placeholder name” | The input field provides a combo box for entering the valid placeholder names that are read from the currently accessible device descriptions. You can also enter a new placeholder name in order to define a free placeholder, which is not resolved by the device or by the library profile. |
| “Default library” | CODESYS uses this library when for any reason no device is available that the resolution defines. In this way it is possible to compile the current project without errors. |

Note about placeholder resolution

For compiler version V3.5.8.0 and later, the following statement applies in the case of library placeholders with a resolution in the device description that are located in the Library Manager of the POU pool. This placeholder is always resolved automatically according to the description of the device that compiles the application.

Command ‘Try to Reload Library’

**Function:** This command tries to reload the selected library.

**Call:** Main menu “Library”.

**Requirement:** A library is selected that failed to load.
If for any reason a library is not available in the defined repository location when a project is opened, CODESYS displays a corresponding error message. Once you have rectified the error, i.e. when the library is properly available again, you can reload the library with this command without having to leave the project.

See also

- Chapter 6.4.1.21.3.9.5 “Command 'Library Repository’” on page 2657

Command 'Properties'

**Function:** The command opens the “Properties” dialog for the library selected in the Library Manager.

**Call**

- Menu bar: “Library”
- Context menu of the selected library
- Symbol in the toolbar of the Library Manager

**Requirement:** A library is selected.

**NOTICE!**

This dialog is intended for library developers. Use this only if you have profound knowledge of library referencing. In addition, follow the guidelines for library developers.

See also

- Chapter 6.4.1.17.3 “Information for Library Developers” on page 2035

**Dialog 'Properties’**

**Table 520: “General”**

<table>
<thead>
<tr>
<th>“Namespace”</th>
<th>Namespace of the selected library. By default, this is identical to the library name, unless it was defined explicitly in the project information when the library was created. You can change the namespace for the open project. Example: LA</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>“Default”:</th>
<th>Library that triggers the placeholder when no other trigger is defined or is possible. Requirement: The selected library is a library placeholder, and therefore the setting is available. Note: For compiler version 3.5.8.0 and higher, the following statement applies in the case of library placeholders with a resolution in the device description that are located in the Library Manager of the “POUs” view. This placeholder is always resolved automatically according to the description of the device that compiles the application.</th>
</tr>
</thead>
</table>

**If the selected library is developed in compliance with the “Guidelines for Developing Libraries”, then we do not recommend that you change the following settings.**
Table 521: “Version”

<table>
<thead>
<tr>
<th>Selection of version constraint</th>
<th>Requirement: The settings are available only if the selected library is <strong>not</strong> a library placeholder.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Note:</strong> Container and interface libraries are created automatically with library references with version constraint. As far as possible, do not create libraries that include library references with version constraint. Otherwise, you reference the libraries by placeholders. Edit a placeholder resolution in the “Placeholders” dialog.</td>
<td></td>
</tr>
</tbody>
</table>

| “Exact version” | ☑: (selected from list box) Version is integrated into the project. Note: This option is strongly recommended for container libraries, and it is usually preset for this library type. |
| “Always newest version” | ☑: The library repository is scanned and the latest detected version is integrated. Note: If a newer library version is available, then the library POUs that are actually used can change. This option is strongly recommended for interface libraries, and it is usually preset for this library type. |

Table 522: “Visibility”

| “Allow only qualified access to all identifiers” | ☑: Library POUs (and variables) are called in the project only with prepended namespace paths. |
| “When the current project is referenced as a library in another project” | Note: Changing the following settings makes sense only if you created a library with your project and therefore opened a library project. In this way, the selected library is referenced in the new library. |
| “Make visible all IEC symbols in the project if this reference were directly integrated here.” | ☑: As a container library, the selected library makes the contents of the referenced library visible at the top level (later in a project). Requirement: A container project is created with a library project. A container library does not implement its own POUs, but references other libraries exclusively. It bundles libraries. A container library can be employed sensibly to bundle multiple libraries (in a reference) in a project. This option **must** be activated for each library reference. Symbolic access to library POUs: `<namespace of container library>.<POU name>` |
| | ☐: The contents of the referenced library is accessed uniquely by means of the namespace. The path name consists of the library name and the unique name (library reference), and it is prepended to the POU name. Requirement: **No** container project is created with a library project. |
| “Do not show this reference in the dependency tree.” | ☑: The selected library is not displayed in the Library Manager as a library reference (later in a project). The library is a hidden reference. Warning: If there are compile errors resulting from hidden library errors, then detecting the errors may be difficult. ☐: The selected library is displayed as a library reference (later in a project). |
| “Optional (if the library is missing, no error will be reported).” | ☑: The selected library is treated as optional. When downloading the project that references the library, no error is reported, even if the library is **not** available in the library repository. |

See also
- ☆ Chapter 6.4.1.21.3.15.4 “Command ‘Placeholders’” on page 2716
Command 'Placeholders'

**Function:** This command opens the “Placeholders” dialog box. The dialog shows information on the currently selected placeholder library and allows to assign a project-specific resolution.

**Call:**
- Menu “Libraries”
- Symbol in the symbol bar in the upper part of the Library Manager window.

**Requirement:** A placeholder library is selected in the Library Manager.

A placeholder library, which is included in the “Devices” view, will be resolved as follows:
- If you have assigned a specific resolution to the placeholder library via the dialog “Placeholder”, this will be applied.
- If no specific resolution is defined, it will be checked, whether there is one specified in the device description of the application.
- Afterwards the library profile will be checked for a resolution definition.
- The result is displayed in the Library Manager below the “Effective Version”.

A placeholder library, which is included in the “POUs” view, gets resolved as follows:
- A specific resolution defined in the dialog “Placeholder” will be ignored.
- For the application it will be checked whether there is a resolution defined in the device description.
- Afterwards the library profile will be checked.
- The result is displayed in the tooltip of the symbol.

- Chapter 6.4.1.21.2.16 “Object ‘Library Manager’” on page 2469
- Chapter 6.4.1.17.3 “Information for Library Developers” on page 2035

**Dialog box 'Placeholders’**

<table>
<thead>
<tr>
<th>“Name”</th>
<th>Name of the placeholder.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Library”</td>
<td>Current resolution, valid for the project Double-click on the entry in order to edit the placeholder resolution. A selection list with the available library versions appears. Additionally the command “Other Library” is available.</td>
</tr>
</tbody>
</table>

**Command “Other Library”**

The command opens the dialog box “Bibliothek durchsuchen” for searching and installing libraries. Choose this command, if you do not want to redirect to another version, but on a specific library.

**“Info”**

Type of placeholder resolution:
- Resolved by device description
- Resolved by library profile
- Resolved by <specific library>

Command 'Export Library'

**Function:** This command is used for saving the library file to the hard disk.

**Call:** Context menu of the Library Manager

**Requirement:** A library is selected in the Library Manager.

The command opens the standard dialog for saving a file in the local file system. The library file can have the file type Library files (*.library), Compiled library files (*.compiled-library), or Compiled library files (*.compiled-library-v3).
Menu 'Image Pool'

6.4.1.21.3.16.1  Command 'Insert Image'........................................................ 2717

Command 'Insert Image'

Symbol: 

Function: This command inserts a new line into an image pool.

Call: Main menu “Imagepool”, or right-click.

Requirements: An image pool is active and a line is selected in the image pool.

See also

●  Chapter 6.4.1.21.2.15 “Object 'Image Pool’” on page 2468

Menu 'Declarations'

6.4.1.21.3.17.1  Command 'Insert'............................................................... 2717
6.4.1.21.3.17.2  Command 'Edit Declaration Header'...................................... 2717
6.4.1.21.3.17.3  Command 'Move Down'...................................................... 2718
6.4.1.21.3.17.4  Command 'Move Up'.......................................................... 2718

Command 'Insert'

Symbol: 

Function: This command inserts a new line for a variable declaration in the declaration editor and the input field for the variable name opens.

Call: Context menu in the tabular declaration editor; button in the declaration heading.

To edit the other fields of the declaration lines, double-click the fields and select the data from the drop-down lists or by means of the respective dialogs.

See also

●  Chapter 6.4.1.9.4.2 “Using the declaration editor” on page 1851

Command 'Edit Declaration Header'

Function: The command opens the dialog “Edit Declaration Header”, which serves in the declaration editor for the configuration of a POU header.

Call: Context menu of the tabular declaration editor

Requirements: The tabular declaration editor is the active editor.

See also

●  “Declaring in the tabular declaration editor” on page 1852

Dialog 'Edit Declaration Header'

Function: The dialog is for configuring the declaration part of a POU.

Call: Click on the header bar of the tabular declaration editor, or context menu in the tabular declaration editor.
### “Declaration” Selection list for changing the POU type

- “PROGRAM”
- “FUNCTION_BLOCK”
  - “EXTENDS”: Input field for a basic function block
  - “IMPLEMENTS”: Input field for an interface
- “FUNCTION”
  - “Return type”

Input field with current POU name: you can change the name of the POU

<table>
<thead>
<tr>
<th>“Automatically adapt all references on rename”</th>
<th>☑: Dialog box “Refactoring” opens.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>□: Renaming is only effective in the declaration header of the POU.</td>
</tr>
</tbody>
</table>

- “Attributes”
  The dialog box “Attribute ” opens for the input of attributes and pragmas.

- Chapter 6.4.1.9.16 “Refactoring” on page 1910

---

**Command 'Move Down’**

Symbol: 📈

**Function:** This command shifts a variable declaration downwards by one row.

**Call:** Context menu

**Requirement:** A row with a variable declaration is selected in the tabular declaration editor.

See also

- Chapter 6.4.1.9.4.2 “Using the declaration editor” on page 1851

**Command 'Move Up’**

Symbol: 🔻

**Function:** This command shifts a variable declaration upwards by one row.

**Call:** Context menu

**Requirement:** A row with a variable declaration is selected in the tabular declaration editor.

---

**Menu 'Declarations' (Persistence)**

<table>
<thead>
<tr>
<th></th>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.4.1.21.3.18.1</td>
<td>'Reorder List and Clean Gaps'</td>
</tr>
<tr>
<td>6.4.1.21.3.18.2</td>
<td>'Save Current Values to Recipe'</td>
</tr>
<tr>
<td>6.4.1.21.3.18.3</td>
<td>'Restore Values from Recipe'</td>
</tr>
<tr>
<td>6.4.1.21.3.18.4</td>
<td>'Add all instance paths'</td>
</tr>
</tbody>
</table>
Command 'Reorder List and Clean Gaps'

**Function:** This command cleans the gaps that can result when you make changes to the declaration of persistent variables. The memory requirement is reduced by this cleaning. When the command is executed, CODESYS displays a warning informing the user about the possible loss of data.

**Call:** Main menu “Declarations”, context menu

**Requirement:** The persistence editor (persistent variable list) is active.

Before cleaning you should consider saving the current values of the persistent variables to a recipe (command “Save Current Values to Recipe”). Then you can load the values to the controller again after the next download.

See also
- Chapter 6.4.1.9.19 “Data Persistence” on page 1920
- Chapter 6.4.1.21.3.18.3 “Command ‘Restore Values from Recipe’” on page 2719
- Chapter 6.4.1.21.3.18.2 “Command ‘Save Current Values to Recipe’” on page 2719

Command 'Save Current Values to Recipe'

**Function:** This command creates a new recipe definition in the recipe manager and stores the current values of the persistent variables in it. You should execute this command before the command “Reorder List and Clear Gaps” in order to avoid a possible loss of data. You can subsequently restore the data with the command “Restore Values from Recipe”.

**Call:** Main menu “Deklarationen”

**Requirement:** The application is in online mode and the persistence editor (persistent variable list) is active.

If a list already exists in the recipe manager with the corresponding names when saving a persistent variable list, then the current persistent variables are sorted into the list:

- New persistent variables are added to the list
- Variables, that are not in the list, will be deleted

Therefore, it is possible to add more recipes to the list in the recipe manager and these will be retained. However, if new variables are added to the list, then these are deleted the next time the command “Save Current Values to Recipe” is executed.

See also
- Chapter 6.4.1.9.19 “Data Persistence” on page 1920
- Chapter 6.4.1.21.3.18.1 “Command ‘Reorder List and Clean Gaps’” on page 2719

- Chapter 6.4.1.21.2.20 “Object ‘Persistent variable list’” on page 2476

Command 'Restore Values from Recipe'

**Function:** This command restores the values of the persistent variables that you have stored in a recipe using the command “Save Current Values to Recipe”. You would normally select this command after executing the command “Reorder List and Clear Gaps”.

**Call:** Main menu “Declarations”

**Requirement:** The persistence editor (persistent variable list) is active, the application is in online mode
Command 'Add all instance paths'

Function:
- When you execute the command in the persistence editor, the application is searched for declarations of persistent variables with the PERSISTENT keyword which are outside of the persistence editor. For each declaration found, an instance path of this variable is added in the persistence editor.
- When you execute the command in a variable configuration, an instance path is added for each variable with an incomplete address. All function blocks of the application are considered in this case.

Requirement
- the persistence editor (global persistent variable list) is active or a variable configuration (global variable list with VAR_CONFIG declarations) is opened.
- The application was compiled successfully.

See also
- Chapter 6.4.1.20.2.13 “Persistent Variable - PERSISTENT” on page 2122

Menu 'Device Communication', Gateway

6.4.1.21.3.19.1 Command 'Add New Gateway' ................................................... 2720
6.4.1.21.3.19.2 Command 'Configure the Local Gateway' ................................... 2721

Command 'Add New Gateway'

Function: This command opens the “Gateway” dialog where you can define a gateway channel and add it to the current device configuration.

Call: Menu bar: “Gateway” in the “Communication Settings” dialog of the device editor.

Dialog 'Gateway'

<table>
<thead>
<tr>
<th>“Name”</th>
<th>Name of the gateway.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Driver”</td>
<td>Driver type from a drop-down list.</td>
</tr>
</tbody>
</table>

Driver-specific settings, for example:
- IP address, port: Editable after double-clicking the predefined value. A short description for each parameter is displayed in the lower part of the dialog.
- Note: You can also specify the address of a DNS domain. This has to begin with dns: (example: dns:MyDynDNSAdress).

The dialog is also used for later editing of the gateway entries of your project.

See also
- Chapter 6.4.1.21.2.8.3 “Tab ‘Communication Settings’” on page 2427
Command 'Configure the Local Gateway'

**Function:** The command opens the “Gateway Configuration” dialog where you can configure the block drivers for the local gateway. This is an alternative to manually editing the configuration file `Gateway.cfg`.

**Call:** Context menu when a gateway entry is selected in the device editor in the “Communication Settings” dialog.

---

**NOTICE!**
A correct configuration of the gateway requires detailed knowledge. In case you have any doubts, do not change the default configuration settings.

---

**Dialog 'Gateway Configuration'**
The configuration tree displayed in the dialog corresponds to the description currently valid configuration file `gateway.cfg`. It displays the parameters with the current settings for the interfaces involved. Changes to the configuration in the dialog, confirmed by clicking “OK”, result in the direct update of the configuration file.

**i**
After the gateway configuration file `gateway.cfg` has been changed, the gateway has to be restarted in order for the changes to be applied.

---

<table>
<thead>
<tr>

</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>“Add Interface”: Select an interface for communication via the gateway. It is inserted at the top level of the tree. See the table below for the possible block driver interfaces.</td>
</tr>
<tr>
<td></td>
<td>“Add Configuration Setting”: Select a setting for the selected interface. It is inserted below the interface in the tree. To edit the value of the setting, double-click in the “Setting” column to open an editing field. See the table below for the possible settings per block driver interface.</td>
</tr>
</tbody>
</table>

| “Delete” | Deletes the selected configuration setting |

<p>| “Up”, “Down” | Moves the selected configuration entry one position up or down. |</p>
<table>
<thead>
<tr>
<th>Interface</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;COM Port&quot;</td>
<td>Serial port on the device, for example for data exchange according to the RS-232 standard on a COM port intended for this purpose.</td>
</tr>
<tr>
<td></td>
<td>Possible configuration settings:</td>
</tr>
<tr>
<td></td>
<td>&quot;Name&quot;: Symbolic only</td>
</tr>
<tr>
<td></td>
<td>&quot;Port&quot;: Physical serial port which is used for this interface, for example COM 5 on a Windows computer</td>
</tr>
<tr>
<td></td>
<td>&quot;Baudrate&quot;: 2400, 4800, 9600, 19200, 38400, 57600, 115200</td>
</tr>
<tr>
<td></td>
<td>&quot;Activate auto addressing&quot;: The setting Local address is evaluated. Both devices, which communicate via the serial port, will negotiate their addresses independently before they begin exchanging messages. If the addresses of both devices are the same, then they are negotiated again. This setting is useful when the local addresses cannot be set explicitly, for example for physically separated devices.</td>
</tr>
<tr>
<td></td>
<td>&quot;Local address&quot;: Evaluated only when &quot;Enable auto addressing&quot; is activated. Default = actual value for port</td>
</tr>
<tr>
<td>&quot;Shared Memory&quot;</td>
<td>Shared memory driver</td>
</tr>
<tr>
<td></td>
<td>Possible settings:</td>
</tr>
<tr>
<td></td>
<td>&quot;Name&quot;: Symbolic only</td>
</tr>
<tr>
<td></td>
<td>&quot;Forced address&quot;: Default = -1 (= no forced address); example: 42 means that the driver has to use the fixed address defined here and that addresses are assigned freely in the range 0-255. This setting can be useful when more than one shared memory driver is activated in the configuration.</td>
</tr>
<tr>
<td>&quot;Ethernet UDP/IP&quot;</td>
<td>Ethernet interface for data exchange according to the &quot;user datagram protocol&quot;.</td>
</tr>
<tr>
<td></td>
<td>Possible settings:</td>
</tr>
<tr>
<td></td>
<td>&quot;Name&quot;: Symbolic only</td>
</tr>
<tr>
<td></td>
<td>&quot;Port index&quot;: Port number for the communication. Port indices are in the range 0–3. They are mapped to the following Ethernet port: 1740 to 1743.</td>
</tr>
<tr>
<td></td>
<td>&quot;IP address&quot;: Default = 127.0.0.1. This setting can be useful to explicitly set an interface when the device has several network interfaces. Example: 127.0.0.1 stands for some local network interface, also known as localhost. Every other address (example: 10.27.7.72) represents a real IP address which has to be available on the device.</td>
</tr>
<tr>
<td></td>
<td>&quot;Network mask&quot;: Default = 255.255.255.0; example: 255.255.252.0. This setting can be useful to explicitly set an interface when there are multiple network interfaces on the device.</td>
</tr>
<tr>
<td></td>
<td>&quot;PPP remote address&quot;: Default = 127.0.0.1; example: 10.13.42.240; establishes a logical point-to-point connection between the UDP interface and the node named with the address specified here; has the effect that the UDP interface communicates exclusively with this node and that no broadcasts are sent in the network</td>
</tr>
<tr>
<td>&quot;Ethernet TCP/IP&quot;</td>
<td>Ethernet interface for data exchange according to the &quot;Transmission Control Protocol&quot;.</td>
</tr>
</tbody>
</table>
Possible settings:

"Name", "Port", "IP address": See Ethernet UDP/IP above.

"Inactivity timeout": Default = 0. This setting defines the time span (in seconds) after which the TCP connections are closed when data is no longer exchanged.

6.4.1.21.3.20.9 Command 'Read and Save Recipe'......................................................... 2726
6.4.1.21.3.20.10 Command 'Remove Variables'............................................................... 2726
6.4.1.21.3.20.11 Command 'Load Recipes from Device'.................................................. 2727
6.4.1.21.3.20.12 Command 'Update Structured Variables'................................................ 2727

Command 'Insert Variable'

Symbol: [view]

Function: This command inserts a variable into the currently opened recipe definition before the selected position.

Call: Main menu “Recipes”.

Requirement: You have opened a recipe definition in the editor and selected the normal view.

CODESYS inserts the default text "NewVariable" in the column “Variable”. You must replace this name with the respective variable name. To do this, open the input assistant by clicking or enter the variable name directly into the table element.

Command 'Add a New Recipe'

Symbol: [add]

Function: This command opens a dialog box for adding a new recipe (new column) to the recipe definition.
Call: Main menu “Recipes”.

Requirement: You have opened a recipe definition in the editor.

After choosing the command, a dialog box opens for you to define the name of the new recipe. The dialog box also provides the capability of copying existing recipes into the new recipe.

See also
- Chapter 6.4.1.13.2.4 “Changing Values with Recipes” on page 2003
- Chapter 6.4.1.21.3.20 “Menu ‘Recipes’” on page 2723

Command ‘Remove Recipe’

Symbol: 🗑

Function: This command removes a recipe from the currently opened recipe definition.

Call: Main menu “Recipes”.

Requirement: You have selected a field in the recipe column of a recipe definition.

See also
- Chapter 6.4.1.13.2.4 “Changing Values with Recipes” on page 2003
- Chapter 6.4.1.21.3.20 “Menu ‘Recipes’” on page 2723

Command ‘Load Recipe’

Symbol: ✉

Function: The command loads a recipe from a file.

Call: Menu bar: “Recipes”.

Requirement: You have selected a field in the recipe column of a recipe definition.

This command overwrites the values of the selected recipe of the recipe definition.

If you have selected the option “Recipe Management in the PLC”, please note the following:

If you change recipes in the project by choosing the command “Load Recipe” or “Read Recipe”, then an online change is required when logging in again.

If you want to overwrite only individual recipe variables with new values, then remove the values for the other variables before loading to the recipe file. Entries without value definitions are not read, and therefore updating leaves these variables unchanged on the PLC and in the project.

For values of the data type REAL/LREAL, the hexadecimal value is also written to the recipe file in some cases. This is necessary so that the exact identical value is restored when converting back. In this case, change the decimal value and delete the hexadecimal value.

- Chapter 6.4.1.13.2.4 “Changing Values with Recipes” on page 2003
- Chapter 6.4.1.21.3.20 “Menu ‘Recipes’” on page 2723

Command ‘Save Recipe’

Symbol: ✉
Function: This command saves the variable values of a recipe to a file.

Call: Main menu “Recipes”.

Requirement: You have selected the value of a recipe in the recipe definition.

When you choose this command, CODESYS saves the values of the selected recipe to a file. You can define the format in the settings for the recipe manager in the tab “Storage”.

See also
- § Chapter 6.4.1.13.2.4 “Changing Values with Recipes” on page 2003
- § Chapter 6.4.1.21.3.20 “Menu ‘Recipes’” on page 2723

Command 'Read Recipe'

Symbol: *<p>

Function: This command reads the variable values of a recipe from the controller.

Call: Main menu “Recipes”.

Requirement: The application is in online mode and you have selected the value of a recipe in the recipe definition.

When you choose this command, CODESYS overwrites the values of the selected recipe with the read values from the controller.

If you have selected the option “Recipe Management in the PLC”, please note the following.

If you change recipes in the project by choosing the command “Load Recipe” or “Read Recipe”, then an online change is required when logging in again.

See also
- § Chapter 6.4.1.13.2.4 “Changing Values with Recipes” on page 2003
- § Chapter 6.4.1.21.3 “Menu Commands” on page 2551

Command 'Write Recipe'

Symbol: *

Function: This command writes the values of a recipe to the variables in the controller.

Call: Main menu “Recipes”.

Requirement: The application is in online mode and you have selected the value of a recipe in the recipe definition.

When you choose this command, CODESYS overwrites the values in the controller with the values of the selected recipe.

See also
- § Chapter 6.4.1.13.2.4 “Changing Values with Recipes” on page 2003
- § Chapter 6.4.1.21.3.20 “Menu ‘Recipes’” on page 2723

Command 'Load and Write Recipe'

Symbol: 📊

Function: This command loads a recipe from a file and writes the values to the variables in the PLC.

Call: Menu bar: “Recipes”.
Requirement: The application is in online mode. You have selected the value of a recipe in the recipe definition.

After choosing the command, you are prompted either to write the variable values also to the recipe in the project or only to write them to the PLC. Updating the values in the recipe could require an online change when logging in again.

When you choose this command, CODESYS overwrites the values of the selected recipe of the recipe definition. In addition, these recipe values overwrite the variable values in the PLC.

If you want to overwrite only individual recipe variables with new values, then remove the values for the other variables before loading to the recipe file. Entries without value definitions are not read, and therefore updating leaves these variables unchanged on the PLC and in the project.

For values of the data type REAL/LREAL, the hexadecimal value is also written to the recipe file in some cases. This is necessary so that the exact identical value is restored when converting back. In this case, change the decimal value and delete the hexadecimal value.

Command 'Read and Save Recipe'

Symbol: 📑

Function: This command reads the variable values of a recipe from the controller and saves them to a file.

Call: Main menu “Recipes”.

Requirement: The application is in online mode and you have selected the value of a recipe in the recipe definition.

After choosing the command, you are prompted either to read the variable values to the recipe or only to save them. Updating the values in the recipe could require an online change when logging in again.

The values are saved with the default name for recipe files according to the settings for the recipe manager (tab “Storage”).

- “Chapter 6.4.1.13.2.4 “Changing Values with Recipes” on page 2003
- “Chapter 6.4.1.21.3.20 “Menu ‘Recipes’” on page 2723

Command 'Remove Variables'

Symbol: 🗑️

Function: This command removes the selected variables from a “Recipe Definition”.

Call: The command is not in any menu by default. You can add it to a menu by using the dialog box from “Tools ➔ Customize” (command category “Recipe”).

See also
- “Chapter 6.4.1.13.2.4 “Changing Values with Recipes” on page 2003
- “Chapter 6.4.1.21.3.20 “Menu ‘Recipes’” on page 2723
Command 'Load Recipes from Device'

Symbol: 📋

**Function:** This command initiates the synchronization of the recipes from the open recipe definition in the project and the recipes located on the device in the form of recipe files.

**Call:** Menu bar: “Recipes”.

**Requirement:** The application is in online mode and a recipe definition is open in the editor.

In detail, the synchronization is described as follows:

- The current values for the recipe variables located in the project are overwritten by the values from the recipes on the controller. As a result, there is likely an online change at the next login.
- If recipe variables are defined in the recipe files on the controller, and the recipe variables are missing in the recipe definition of the project, then these variables are ignored when at the time of download. Before that, a message appears for each recipe file regarding the variables in question.
- If recipe variables are missing in the recipe files on the controller, and these recipe variables are included in the recipe definition of the project, then a message appears for each recipe file with the variables in question.
- If more recipes for these variables have been created on the controller, then they are added to the recipe definition in the project.

Command 'Update Structured Variables'

Symbol: ¬

**Function:** This command opens the “Update Structured Variables” dialog box.

**Call:** Main menu “Recipes”.

In this dialog box, you can update recipe definitions if the declaration of a structured variable or a block has changed. For example, if the dimension of an array is changed, then you can automatically add or remove the entries in the recipe definition.

<table>
<thead>
<tr>
<th>Table 524: Dialog Box 'Update Structured Variables'</th>

6.4.1.21.3.21.13 Command 'Remove Text List Support'..................................... 2732

Command 'Add Language'

Symbol: 

Function: This command adds a further language column to the text list.

Call: Main menu “Textlist”, context menu

Requirement: A text list or a global text list is open and active.

In the dialog box “Enter Language”, enter a code for the new language, for example “en-US”. CODESYS inserts the code as column header.

Command 'Create Global Text List'

Symbol: 

Function: This command creates the global text list in the “POUs” view.

Call: “Visualization”, context menu.

Requirements: A visualization is open.

See also
- © Chapter 6.4.1.21.2.11 “Object ‘GlobalTextList’” on page 2465

Command 'Export Everything as Text'

Symbol: 

Function: This command exports all the text lists of the project.

Call: Main menu “Textlist”, context menu

Requirement
- A text list or a global text list is open and active.
- The visualization does not code the characters of the texts in Unicode.

CODESYS creates a file as plain text in the format .txt for each text list. The name of the text list becomes the name of the file. The directory into which the files are exported is set in “Project ➔ Project Settings ➔ Visualization”, category “General” in “Text list files”.

A controller can read and use this format. For example, you can copy the file to a controller and, by means of a configuration in the visualization manager, prevent the text lists from being transmitted again when loading the application.
Command 'Export All Unicode .txt Text List Files' 

Function: This command exports all the text lists of the project.

Call: Main menu “Textlist”, context menu

Requirement

- A text list or a global text list is open and active.
- The visualization codes the characters of the texts in Unicode.
  - The option “Use Unicode strings” in the visualization manager is activated.
  - The compiler instruction VISU_USEWSTRING in the application is set. Check this by selecting the command “Properties” in the context menu of the application. Then select the “Compile” tab. VISU_USEWSTRING must be entered in the input field for “Compiler defines”.

CODESYS creates a file as plain text in the format .txt for each text list. The name of the text list becomes the name of the file. The directory into which the files are exported is set in “Project ➔ Project Settings ➔ Visualization”, category “General” in “Text list files”.

A controller can read and use this format. For example, you can copy the file to a controller and, by means of a configuration in the visualization manager, prevent the text lists from being transmitted again when loading the application.

- Chapter 6.4.1.9.10 “Managing text in text lists” on page 1891

Command 'Insert Text'

Function: This command inserts a new line into the text list above the selected line. An input field under “Standard” opens, in which you input the source text.

Call: Main menu “Textlist ➔ Insert Text”, context menu

Requirement: A text list, not a “GlobalTextList”, is open and active. A field in the table is selected.

See also

- Chapter 6.4.1.9.10 “Managing text in text lists” on page 1891

Command 'Import/Export Text Lists'

Function: This command exports an active text list, imports a file, or matches a text list with a file. The file has the CSV format. The “Import/Export” dialog provides options for this.

Call: Menu bar: “Text List ➔ Import/Export Text Lists”; context menu

Requirement: A text list or global text list is active.

Dialog 'Import/Export'

| “Select File for Import” | File that CODESYS reads. |
| “Select export file” | File that CODESYS writes to. |
Table 525: “Import/Export Type”

| “Import” | Requirement: A file is selected in “Select file for compare or import”. The file can contain text list entries for both the global text list and text lists.  
|          | Global text list  
|          | - CODESYS reads the file, compares the text list entries for the same source text, and accepts differences in the translations. CODESYS overwrites any translations in the project.  
|          | Text lists  
|          | - CODESYS reads the file, compares the text list entries for the same ID, and accepts differences in the source text and translations into the project. CODESYS overwrites any text list entries in the project.  
|          | - If the file contains a new ID, then the text list entry is imported into the text list of the project and the text list is added.  

| “Import replacement file” | Requirement: A replacement file is selected in “Select file for compare or import”. The replacement file contains replacements for the global text list. CODESYS processes the replacement file row by row and performs the specified replacements in the global text list. The structure of the replacement file is described in the section “Managing static text in a global text list”.  

| “Export” | Requirement: The file that CODESYS writes to is selected in “Select export file”. CODESYS exports all texts from all text lists of the current project. All languages available in the project are inserted as columns in the export file. The file can be used for the external translation of the language-dependent texts.  

| “Export text differences only” | Requirement: An import file is selected for the comparison in “Select file for compare or export”, and an export file that CODESYS writes to is selected in “Select export file”. CODESYS reads the import file and then uses that information to compare the rows of the active text list. CODESYS ignores the rows that match. If rows differ, then CODESYS writes the row to the export file and, if necessary, copies translations from the text list. CODESYS accepts the translations from the import file and overwrites them if necessary.

- § “Updating the global text list with a replacement file” on page 1895

Command ‘Remove Language’

Symbol: ![Symbol](image_url)  
Function: Removes the selected language column from the text list.  
Call: Main menu “Textlist”, context menu  
Requirement: A text list or a global text list is open and active. A field is selected in the column of the language that you wish to remove.  
See also  
- § Chapter 6.4.1.9.10 “Managing text in text lists” on page 1891

Command ‘Rename Language’

Symbol: ![Symbol](image_url)
Function: Opens a dialog for specifying a new name for a language that is displayed in the text list as a column heading.

Call: Menu bar: “Text List”, context menu.

Requirement: A text list or global text list is active. A field in the language column to be renamed is selected.

See also
- Chapter 6.4.1.9.10 “Managing text in text lists” on page 1891

Command 'Remove Unused Text List Entries'

Symbol: ✗

Function: This command checks whether a text list entry in the project is used as static text. If not, CODESYS removes it from the text list.

Call: Main menu “Textlist”, context menu

Requirement: The “GlobalTextList” is open and active. A field in the table is selected.

See also
- Chapter 6.4.1.9.10 “Managing text in text lists” on page 1891

Command 'Check Visualization Text IDs'

Symbol: ✗

Function: This command checks whether the ID of a text list entry in the project is correct and reports the result.

Call: Main menu “Textlist”, context menu

Requirement: The “GlobalTextList” is open and active. A field in the table is selected.

If CODESYS finds during checking that the global text list and the static texts of the visualizations do not correspond, this could be because the global text list is or was write protected. The requirement for this is that you have set up a user management system in the project.

See also
- Chapter 6.4.1.9.10 “Managing text in text lists” on page 1891

Command 'Update Visualization Text IDs'

Symbol: ✗

Function: This command updates all inconsistent IDs in a static text list.

Call: Main menu “Textlist ➔ Paste Text”, context menu

Requirement: The “GlobalTextList” is open and active. A field in the table is selected. The object is write protected.

If CODESYS finds during checking that the global text list and the static texts of the visualizations do not correspond, this could be because the global text list is or was write protected. The requirement for this is that you have set up a user management system in the project.

Command 'Add Text List Support'

Symbol: 📚

**Function:** This command adds text list support to the selected DUT object (type: enumeration).

**Call:** Context menu of a standard DUT object (type: enumeration 📚).

Text list support allows the localization of the enumeration component identifier and the display of the symbolic component value in a text output of a visualization.

6.4.1.21.3.22.20 Command 'Statistics'............................................................... 2742

Command 'Add Variable'

**Function:** This command adds a trace variable to the configuration.
Call: Main menu “Trace”.

A new variable is displayed in the tree view of the trace configuration. The associated variables configuration appears to the right in “Variable Settings”.

See also
- % Chapter 6.4.1.21.4.16.2 “Dialog ‘Trace Configuration’” on page 2804
- % Chapter 6.4.1.13.3.3 “Creating trace configuration” on page 2010

Command ‘AutoFit’

Symbol: 🔬

Function: This command scales the y-axis of the trace diagram for optimum display of all graphs, making sure that the y-values fit in the visible region of the diagrams. The command works with both single-channel and multi-channel displays.

Call: Menu bar: “Trace”; context menu.

Trace in a single-channel display

When all trace variables are displayed in one diagram, the trace is in single-channel display.

Trace in a multi-channel display

When the trace variables are displayed in multiple diagrams, the trace is in multi-channel display.

See also
- % Chapter 6.4.1.21.4.16.2 “Dialog ‘Trace Configuration’” on page 2804
- % Chapter 6.4.1.13.3.6 “Navigating into trace data” on page 2015

Command ‘Compress’

Symbol: 📡

Function: This command compresses the trace graph by zooming into the displayed time range by a fixed percentage.

Call: Main menu “Trace”, or context menu.

See also
- % Chapter 6.4.1.21.4.16.2 “Dialog ‘Trace Configuration’” on page 2804
- % Chapter 6.4.1.13.3.6 “Navigating into trace data” on page 2015

Command ‘Configuration’

Function: This command opens the “Trace Configuration” dialog box for enabling the configuration of the data recording.

Call: Main menu “Trace”, or context menu.

See also
- % Chapter 6.4.1.21.4.16.2 “Dialog ‘Trace Configuration’” on page 2804
- % “Subdialog ‘Variable Settings’” on page 2807

Command ‘Cursor’

Symbol: 📋
**Function:** This function
- inserts a trace cursor into the trace diagram when **no** trace cursor is available
- inserts a second trace cursor into the trace diagram when **1** trace cursor is available
- removes the trace cursors when **2** trace cursors are available

**Call:** Menu bar: “Trace”; context menu.

A trace cursor is a small black triangle with a vertical black line running parallel to the y-axis.

**Trace diagram without trace cursors**
In this mode, you can process the trace diagram with the mouse pointer. The x-value that focuses on with the cursor is displayed in the status bar with normal style. Example: “**Time:** 1m23s456ms; **Value:** 1”

**Trace diagram with one trace cursor**
In the status bar and y-value, CODESYS prints the time that was marked by the trace cursor. Example: “**Time:** 1m23s456ms”

**Trace diagram with two trace cursors**
In the status bar, CODESYS prints the two times and the time interval that are marked by the two trace cursors. Example: “**Time:** 1m23s456ms - **Time:** 1m24s456ms (∆ 1s)”.

**User input in the trace diagram**
If one or two trace cursors are available, then you can move them along the x-axis.

- Chapter 6.4.1.13.3.6 “Navigating into trace data” on page 2015

**Command 'Download Trace'**

**Symbol:** [PDF]

**Function:** This command transfers the trace configuration on the controller to the associated application, and starts the data recording. The recorded data is transferred back to the development system. The trace diagram shows the current samples and continues.

**Call:** Menu bar: “Trace”; context menu.

**Requirement:** The command is available when the assigned application is in online mode.

See also
- Chapter 6.4.1.13.3.4 “Operating the data recording” on page 2014
Command 'Export Symbolic Trace Config'

**Function:** This command exports a trace configuration to a `traceconfig` file.

**Call:** Main menu “Trace”, or context menu.

**Requirement:** The origin application includes a symbol configuration that defines the configured trace variables as symbols. Access to the IEC variables where data was recorded is therefore symbolic. Then you can use the trace configuration for various similar applications.

**Using the configuration file**

You can transfer this file to any runtime system. At runtime, its `CmpTraceMgr` runtime system component can access and perform data recording. The configuration file also includes information about the application context in addition to the configuration data.

The configuration file defines the following context:

- Application name
- Trace name
- Task name

The application that is executed at runtime must fulfill the following conditions:

- The application has the same name as the origin application.
- The trace that is configured in the application has the same as the trace that is configured in the origin application.
- The task that is running in the data recording has the same name as the task that is configured in the origin application.

**NOTICE!**

The configuration is not loaded automatically. You must execute the command explicitly.

You can proceed as follows:

- Access the trace manager programmatically via IEC code by using library interfaces.
- Register the configuration file with the trace manager. Then the trace manager loads the configuration file when the application is started.

**For more information about the functionality of the trace manager, refer to “Trace Manager Runtime System Component Description”**.

Command 'Load Trace'

**Function:** This command makes it possible to load a file, which contains the configuration and data, and was saved to the file system of the development system. The "Load Trace" dialog box opens.

**Call:** Main menu “Trace”, or context menu.

### Dialog box “Load Trace”

<table>
<thead>
<tr>
<th>“File name”</th>
<th>Name of the file that is loaded</th>
</tr>
</thead>
<tbody>
<tr>
<td>“File type”</td>
<td>File format</td>
</tr>
<tr>
<td></td>
<td>● *.trace: “Trace file” that includes the trace configuration</td>
</tr>
<tr>
<td></td>
<td>● *.csv: Text file in CSV format that includes a trace configuration</td>
</tr>
</tbody>
</table>

See also

- § Chapter 6.4.1.13.3.7 “Managing trace” on page 2016

Command 'Mouse Zooming'

**Symbol:** (command disabled), (command enabled)

**Function:** This command enables and disables mouse zooming in the trace diagram.

**Call:** Menu bar: “Trace”; context menu.

**User input in the trace diagram** If the command is enabled, then you can stretch a box with the mouse. When you release the mouse button, the display zooms in on the box and the data is enlarged.

See also

- § Chapter 6.4.1.13.3.6 “Navigating into trace data” on page 2015

Command 'Convert to Multi-Channel'

**Function:** This command switches the display in the trace editor from single-channel to multi-channel.

**Call:** Menu bar: “Trace”; context menu.

**Multi-channel display** Multi-channel display means that the trace variables are displayed in multiple diagrams.
Command 'Convert to Single-Channel'

**Function:** This command switches the display in the trace editor from multi-channel to single-channel.

**Call:** Menu bar: “Trace”; context menu.

**Single-channel display**

If a trace is displayed as single-channel, then all trace variables are included in one diagram.
Command 'Online List'

**Function:** This command opens the “Online List” dialog. If the trace editor of a DeviceTrace object is active, then all traces that are running on the controller are displayed in a tree view. If the trace editor of an application-specific trace object is active, then only this trace is displayed if it is running on the controller.

**Call:** Menu bar: “Trace”; context menu of the trace editor.

**Requirement:** The runtime system uses the CmpTraceMgr components. An application belonging to the device is in online mode.
NOTICE!
Closing the DeviceTrace editor terminates the connection to the controller.
Please note that the connections to the controller is also terminated when the last open "DeviceTrace" editor is closed. In order for device traces to be displayed again in the project, you have to reload them into the "DeviceTrace" objects.
At this time, closing the editor is also the recommended procedure for deliberately terminating the connection to the controller. Logging out is not enough for this.

**Dialog 'Online List'**

<table>
<thead>
<tr>
<th>&quot;Delete from runtime&quot;</th>
<th>Stops and removes the selected trace from the running application.</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Upload&quot;</td>
<td>This command is visible when a DeviceTrace is loaded in the trace editor. A DeviceTrace is a trace that runs on the controller: In the device tree, it can be represented with a DeviceTrace object directly below a device. When you execute this command, the trace that is selected in the tree view is loaded from the runtime system into the trace editor. Any existing configuration in the project is overwritten. For example, the device can provide traces for data of the processor load (cpuload, plcload), which then you can track in the trace editor in CODESYS. An individual &quot;DeviceTrace&quot; object is necessary in the device tree for each trace of the device that should be displayed in the project.</td>
</tr>
</tbody>
</table>

**Command 'Reset Trigger'**

Symbol: [ ]

**Function:** This command resets the trace configuration after a triggered data recording. Then the application can record new data and react to a trigger again.

**Call:** Main menu “Trace”, or context menu.

**Requirement:** After triggering, the complete data is in the buffer of the development system.

See also
- ☞ Chapter 6.4.1.13.3.4 “Operating the data recording” on page 2014

**Command 'Reset View'**

Symbol: [ ]

**Function:** This command resets the trace diagram to the default view.

**Call:** Main menu “Trace”, or context menu.
**Requirement:** The display in the trace diagram has been changed by zooming, scrolling, or “AutoFit”.

See also
-  % Chapter 6.4.1.21.3.22.2 “Command ‘AutoFit’” on page 2733
-  % Chapter 6.4.1.13.3.6 “Navigating into trace data” on page 2015

**Command ‘Save Trace’**

**Function:** This command saves the data to a file on the development system. Depending on the file format, the configuration may also be saved. The “Save Trace” dialog box opens.

**Call:** Main menu “Trace”, or right-click.

**Dialog Box ‘Save Trace’**

<table>
<thead>
<tr>
<th>“File name”</th>
<th>Name and location of the trace file</th>
</tr>
</thead>
<tbody>
<tr>
<td>“File type”</td>
<td>File format</td>
</tr>
<tr>
<td></td>
<td>• *.trace:</td>
</tr>
<tr>
<td></td>
<td>“Trace file” contains the data and configuration. You can run the “Load Trace” command to load the file to the trace editor when offline.</td>
</tr>
<tr>
<td></td>
<td>• *.txt:</td>
</tr>
<tr>
<td></td>
<td>“Text file” contains the recorded data. You can load this file type and edit it with tools that support CSV format. It cannot be loaded to the trace editor when offline because the trace editor cannot read this format.</td>
</tr>
<tr>
<td></td>
<td>• *.trace.csv</td>
</tr>
<tr>
<td></td>
<td>“Trace CSV file (data only)” contains the recorded data. Address information is provided for each trace variable. The created file can be read in the runtime system. The data is imported but the trace cannot be started because the variable addresses are not saved.</td>
</tr>
</tbody>
</table>

-  % Chapter 6.4.1.21.3.22.8 “Command ‘Load Trace’” on page 2737
-  % Chapter 6.4.1.13.3.7 “Managing trace” on page 2016

**Command ‘Start Trace’**

**Symbol:** ➤

**Function:** This command starts the data recording on the controller when it is stopped.

**Call:** Main menu “Trace”, or context menu.

**Requirement:** The assigned application on the runtime system is running and a trace configuration is loaded.

See also
-  % Chapter 6.4.1.13.3.4 “Operating the data recording” on page 2014

**Command ‘Stop Trace’**

**Symbol:** ☹️
**Function:** This command stops the data recording of a trace.

**Call:** Main menu “Trace”, or context menu.

**Requirement:** The assigned application on the runtime system is running and executes a trace.

See also
- Chapter 6.4.1.13.3.4 “Operating the data recording” on page 2014

---

**Command 'Stretch’**

Symbol: 📣

**Function:** This command stretches the trace graph by zooming out of the displayed time range by a fixed percentage.

**Call:** Main menu “Trace”, or context menu.

See also
- Chapter 6.4.1.21.3.22.3 “Command 'Compress’” on page 2733
- Chapter 6.4.1.13.3.6 “Navigating into trace data” on page 2015

---

**Command 'Upload Trace'**

**Function:** This command establishes the connection to the PLC device, if not already connected. Then it opens the “Online List” dialog listing the traces running on the controller. Then the selected trace is loaded to the trace editor by means of the “Upload” command in the dialog.

**Call:** Menu bar: “Trace”; context menu of the trace editor.

**Requirement:** The editor of a “DeviceTrace” object is open. The runtime system uses the CmpTraceMgr components (trace manager). At least one application in the runtime system is running. The communication settings for the PLC are configured correctly in the CODESYS project.

---

**NOTICE!**
Closing the DeviceTrace editor terminates the connection to the controller.

Please note that the connections to the controller is also terminated when the last open “DeviceTrace” editor is closed. In order for device traces to be displayed again in the project, you have to reload them into the “DeviceTrace” objects.

At this time, closing the editor is also the recommended procedure for deliberately terminating the connection to the controller. Logging out is not enough for this.

---

**Command 'Statistics’**

**Function:** This command opens the “Trace Statistics” dialog box, which shows statistics about each trace variable.

**Call:** Main menu “Trace”, or right-click.

**Requirement:** The trace editor contains samples.
The analyzed time range and duration are shown in the caption.

The table contains one line per signal.

<table>
<thead>
<tr>
<th>“Signal”</th>
<th>Name of the trace variable (for example, PLC_PRG.S1)</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Index”</td>
<td>0-based index of the signal order</td>
</tr>
<tr>
<td>“N”</td>
<td>Number of measurements for the calculations</td>
</tr>
<tr>
<td>“Min”</td>
<td>Smallest value</td>
</tr>
<tr>
<td>“Avg”</td>
<td>Average</td>
</tr>
<tr>
<td>“Median”</td>
<td>Middle value when the values are ordered by size</td>
</tr>
<tr>
<td>“RMS”</td>
<td>Root mean square</td>
</tr>
<tr>
<td>“StdDev”</td>
<td>Standard deviation</td>
</tr>
<tr>
<td>“Max”</td>
<td>Largest value</td>
</tr>
<tr>
<td>“Integral”</td>
<td>Integral</td>
</tr>
<tr>
<td>“Min Δt [s]”</td>
<td>Smallest change of time intervals for successive values</td>
</tr>
<tr>
<td>“Avg Δt [s]”</td>
<td>Average change of time intervals for successive values</td>
</tr>
<tr>
<td>“Median Δt [s]”</td>
<td>Median change of time intervals for successive values</td>
</tr>
<tr>
<td>“StdDev Δt [s]”</td>
<td>Standard deviation of change of time intervals for successive values</td>
</tr>
<tr>
<td>“Max Δt [s]”</td>
<td>Largest change of time intervals for successive values</td>
</tr>
</tbody>
</table>

Click a column head in the table. CODESYS sorts the table by that column, changing the order from ascending to descending and back.

Default: The table is sorted ascending by the “Index” column. The signals are then sorted in the same order as in the signal tree.

Click in the line. The line is selected. You can select or clear other lines by pressing [Shift]+[arrow] up or down.

[Ctrl]+[C] CODESYS copies the selected lines as text to the clipboard. The values of the individual columns are tab-separated, and the lines are delimited with the control character [CR] or [LF].

Requirement: At least one line is selected.

6.4.1.21.3.23.3 Command ‘Limit Results to Current Declaration’ .................... 2744

Command ‘Add Watch’

Symbol: ⚜

Function: This command adds the variable of the current location of the cursor to a watchlist for the purpose of online monitoring.
Call: Right-click a variable in an editor when the application is in online mode.

This command adds the variable to the currently opened watchlist. If a watchlist is not open, then the variable is added to the “Watch 1” list and that view opens.

See also
- % Chapter 6.4.1.13.2.3 “Using watch lists” on page 2002
- % Chapter 6.4.1.13.2 “Monitoring of Values” on page 1995

Command 'Implement Interfaces'

Function: This command updates the implemented interfaces for a function block.

Call: Context menu of the selected function block (FB) in the device tree.

Requirement: The function block implements an interface that you have modified. For example, an additional method was added to the interface.

In object-oriented programming, if you derive a function block (FB) from a base function block, which implements one or more interfaces, for the purpose of inheritance, then the following applies:

When you execute the “Implement Interfaces” command for the derived FB, all interface methods and interface attributes of the base FB are accepted into the derived FB in the form of stubs (without implementation). Then you are responsible for making sure that an "empty" method/attribute in the derived FB does not conflict with an implemented one in the base FB. The following actions are taken to support you in this case: If there is a base implementation for a method/attribute, then CODESYS adds a pragma attribute {error..} in the first line of the affected derived interface method or interface attribute that will generate the error message. If there is no base implementation for the method/attribute, then there is a pragma attribute entry for a warning. After editing the block, you must remove the error pragma attribute entry explicitly.

- % Chapter 6.4.1.21.2.21.5 “Object 'Interface”’ on page 2484
- % Chapter 6.4.1.9.22.3 “Implementing interfaces” on page 1931

Command 'Limit Results to Current Declaration'

Function: When multiple declarations have been found, this command collapses the display in the cross-reference list. It shows only the results for the declaration that you selected explicitly in the list.

Call: Right-click.

Requirement: The cross-reference list is active. Multiple declarations for the searched symbol are listed as cross-references.

See also
- % Chapter 6.4.1.9.14.1 “Using the cross-reference list to find occurrences” on page 1906

General

The dialogs of the CODESYS user interface basically are described on the help pages for
the CODESYS menu commands or CODESYS objects. The help book "Dialogs" contains only
descriptions of dialogs, which

- appear only after multi-step calls after a certain menu command call or within an object
editor,
- or which are not placed on a help page for a command or for an object because of their
complexity (multiple subdialogs).

Dialog 'Import Assistant'

Function: The dialog allows for the transfer of CODESYS options and package installations
from an older CODESYS installation that was found in the local computer.

Call: The dialog opens when a recently installed CODESYS version is started for the first time
and an older version is installed on the computer.

| "Program settings" | ☑: The user-specific CODESYS options are transferred from the older installa-
|                     | tion to the new installation. |
| "Packages"          | ☑: The packages installed with the older CODESYS version are transferred to
|                     | the Package Manager of the new version. See the list of discovered package
|                     | installations with the "Name", "Version", and "Installation date". |
| "Import"            | The program settings and/or options are transferred to the current CODESYS
|                     | version. |
| "Skip"              | The program settings and/or options are not transferred to the current
|                     | CODESYS version. |

- ☰ Chapter 6.4.1.2.1.1 “Setting CODESYS options” on page 1802
Dialog 'Library Reference Conversion'  

**Function:** The dialog defines how references to libraries that are no longer available are to be handled. Note: The undefined library references can be found in the Global Library Manager located in the "POUs" view.

**Call:** When opening a CoDeSys V2.3 project in V3, the dialog opens when the converter detects a library which cannot be used anymore in the current CODESYS version.

---

A CoDeSys V2.3 project can be converted into a CODESYS V3 project only if the CODESYS V2.3 Converter package is installed in CODESYS V3. The package is available in the CODESYS Store.

---

**Table 526: “What do you want to do?”**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Convert and install the library as well.&quot;</td>
<td>The converter also converts the library file into the new format. It remains referenced in the project. It is installed automatically in the library repository in the &quot;Other&quot; category. If the library does not provide the necessary project information for an installation, then the “Enter Project Information” dialog opens for the information to be added.</td>
</tr>
<tr>
<td>&quot;Use the following library that has already been installed&quot;</td>
<td>The previously used library is replaced by another library. The “Browse” button opens a dialog for selecting from the local library repository.</td>
</tr>
<tr>
<td>&quot;Ignore the library. The reference will not appear in the converted project&quot;</td>
<td>The library reference is removed from the project.</td>
</tr>
</tbody>
</table>

**"Remember this mapping for all future occurrences of that library reference"** 

The settings made here in the dialog are also used for future project conversions.

See also

- ☞ Chapter 6.4.1.3.3 “Opening a V2.3 project” on page 1809
- ☞ Chapter 6.4.1.21.3.9.5 “Command 'Library Repository’” on page 2657

Dialog 'Select Function Block'  

**Function:** The dialog is used for selecting a function block for I/O mapping. The function block should be mapped to the I/O channel selected in the "<device name> I/O Mapping" tab or to the object selected in the "<device name> IEC Objects" tab.

**Call:**

- Tab "<device name> I/O Mapping", command button "Add FB for I/O channel"
- Tab "<device name> IEC Objects", command button "Add"

The dialog provides all function blocks from the active application and the libraries included in the project which fulfill the following:

- The function block has the {attribute 'io_function_block'} attribute.
- The function block contains input or output parameters that match the channel type (input, output, data type) and has the {attribute 'io_function_block_mapping'} attribute.

When a function block is selected that provides multiple matching parameters, only the first one is mapped automatically to the channel. The others can only be assigned manually in the "<device name> I/O Mapping" tab.

After the function block is assigned, the parameter of the function block instance is entered in the “Variable” column of the mapping table. Then the path is composed as follows:
<application name>._<device channel name>_<FB name>._<continuous FB instance number>.<FB parameter name>

**Example:** App1.Out_4_Int_myScale_Output_Int_1.iOutput for the parameter iOutput of the first inserted instance of the function block myScale_Output.

<table>
<thead>
<tr>
<th>“Find”</th>
<th>Input field for searching for function block names</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Type”</td>
<td>Function blocks in the tree structure that match the channel type. Nodes: application, library name(s)</td>
</tr>
<tr>
<td>“Documentation”</td>
<td>Shows the available documentation for the library selected in the tree or the library block.</td>
</tr>
</tbody>
</table>

**See also**
- % Chapter 6.4.1.21.2.8.12 “Tab ‘<device name> I/O Mapping’” on page 2444
- % Chapter 6.4.1.20.6.3.23 “Attribute ‘io_function_block’, ‘io_function_block_mapping’” on page 2293

**Dialog ‘Device Conversion’**

**Function:** The dialog defines how references to devices that are no longer available are to be handled.

**Call:** When opening a CoDeSys V2.3 project in V3, the dialog opens when the converter detects a device reference which cannot be used anymore.

- A CoDeSys V2.3 project can be converted into a CODESYS V3 project only if the CODESYS V2.3 Converter package is installed in CODESYS V3. The package is available in the CODESYS Store.

**Table 527: “What do you want to do?”**

<table>
<thead>
<tr>
<th>Use the following device that has already been installed</th>
<th>CODESYS replaces the previously used device in the device tree with another device. The “Browse” button opens a dialog for selecting from the local device repository.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ignore the device. All device specific objects will not be available in the new project</td>
<td>The device entry with all objects inserted below it is removed from the device tree.</td>
</tr>
</tbody>
</table>

| Remember this mapping for all future occurrences of that device | The settings made here in the dialog are saved in the CODESYS Options, in the “CODESYS V2.3 Converter” category. As a result, they are also valid for future project conversions. |

**See also**
- % Chapter 6.4.1.3.3 “Opening a V2.3 project” on page 1809
- % Chapter 6.4.1.21.3.9.8 “Command ’Device Repository’” on page 2663

**Dialog ‘Breakpoint Properties’**

**Function:** The dialog is used to display or change the properties of the selected breakpoint in the “Breakpoints” view.

**Call:**
● “Breakpoints” view, “Properties” button
● “Breakpoints” view, “New” button, “New Breakpoint” command or “New Data Breakpoint” command

**Requirement:** An entry is selected in the list of breakpoints.

The dialog is identical to the “New Breakpoint” dialog which is opened in the “Debug” menu by means of the respective commands. Therefore, see the description in the help for the “New Breakpoint” dialog.

See also
● ☞ Chapter 6.4.1.21.4.9 “Dialog ‘New Breakpoint’” on page 2750

**Dialog 'Permissions'**

**Function:** The permissions of user groups are defined here with which they can execute specific actions on specific objects in the project.

**Call:** Menu bar: “Project ➔ User Management”.

Every change made in the dialog is applied immediately.

**Actions**

All possible actions on objects of the projects are listed in “Actions”. The actions are divided into four categories and assignments to all current objects of the project are listed below each action. For each “action->object” assignment, you can define the permission for each existing user group.

**Action categories:**

<table>
<thead>
<tr>
<th>“Commands”</th>
<th>Actions regarding the execution of commands</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Users, groups and permissions”</td>
<td>Actions regarding the configuration of user accounts, user groups, and their permissions</td>
</tr>
<tr>
<td>“Object types”</td>
<td>Actions regarding the creation of object types</td>
</tr>
<tr>
<td>“Project objects”</td>
<td>Actions regarding the viewing, modification, removal, and child-object handling of objects of the project</td>
</tr>
</tbody>
</table>

**Actions in detail:**

| “Execute” | Execute a menu command |
| “Create”  | Create a new object in the project |
| “Add or remove children” | Add or remove a child object below an existing object |
| “Modify”  | Modify an object in the editor or modification of user, group, and permission settings in the corresponding editor/dialog |
| “Remove”  | Delete or remove an object |
| “View”    | Open the view of an object in the editor |

Possible target of an action. This can be specific objects of the project, or the user, group, and permission configuration.

**Permissions**

All defined user groups (except the “Owner” group) are listed in “Permissions” with a toolbar for configuring the permissions of a group.
| **Granted** | The action, which is selected in the actions view, on the selected target(s) is **granted** for the selected group. |
| **Denied** | The action, which is selected in the “Actions” view, on the selected target(s) is **denied** for the selected group. |
| **+** | The permission that executes the actions, which are selected in the “Actions” view, on the selected targets has not been defined explicitly. However, the actions are **granted by default**; for example, because the corresponding permissions have been granted to the parent object. Example: The group has the permission for the object "myplc". As a result, it also has the permission by default for the object "myplc.pb_1". |
| **-** | The action, which is expanded in the actions view, on the selected targets has not been denied explicitly. However, it is denied by default; for example, because it has been denied to the parent object. |
| **No symbol** | There are currently multiple actions selected in the Actions view for which the group does not have the same permission. |

**Toolbar:**

| **“Grant”** | The selected action on the selected target object is granted explicitly for the selected group. |
| **“Deny”** | The selected action on the selected target object is denied explicitly for the selected group. |
| **“Clear”** | The permission for the selected action on the selected target object is reset to the default value for the selected group. |

**“Export/Import”**

- **“Export all permissions”**
  - Opens a menu with the commands
  - **“Export all permissions”**
  - **“Export selected permissions”**
  - **“Import permissions”**

  **“Export all permissions”**
  - Exports all actions and their configured access permissions of the current project to a user-specific file of data type *.perms.
  - To do this, the “Export Permissions” dialog opens for you to specify a file name and to select a location in the file directory. The default file type is Permissions (*.perms).

  **“Export selected permissions”**
  - Exports all selected actions and their configured access permissions of the current project to a user-specific file of data type *.perms.
  - To do this, the “Export Permissions” dialog opens for you to specify a file name and to select a location in the file directory. The default file type is Permissions (*.perms).

  **“Import permissions”**
  - The contents of a *.perms file is merged with the actions and permissions of the current project. Groups that are part of the file but not part of the project are ignored. The actions and permissions are aligned by name.
  - To do this, the “Import Permissions” opens for you to select the *.perms file from the file system.

See also

- % Chapter 6.4.1.6.6 “Protecting Objects in the Project by Access Rights” on page 1826

**Dialog Box 'Prepare Value’**

**Function:** This dialog box is used for preparing a value for a forced variable. CODESYS executes the prepared action with the next forcing.
CODESYS opens the dialog box in the following situations:

- When clicking in the field “Prepared value” of a forced variable in the declaration section
- When clicking in the inline monitoring field of a forced variable
- When clicking in the field “Prepared value” of a forced variable in the monitoring window

| “Prepare a new value for the next write or force operation” | Value that CODESYS writes to the variable with the next force operation |
| “Remove a preparation with a value” | CODESYS deletes the prepared value. |
| “Release the force, without modifying the value” | CODESYS retains the forced value and ends forcing. CODESYS marks the variable <Unforce>. |
| “Release the force and restore the variable to the value it had before forcing it” | CODESYS resets the forced value and ends forcing. The variable is marked with <Unforce and restore>. |

- Chapter 6.4.1.21.3.8.16 “Command ‘Force Values’” on page 2649

**Dialog 'New Breakpoint’**

**Function:** In the dialog, you define the settings for a new breakpoint or data breakpoint. It is identical to the “Breakpoint Properties” dialog which is used in the “Breakpoints” view.

**Call:**

- “Debug ➔ New Breakpoint”
- “Debug ➔ New Data Breakpoint”

**Requirement:** The application is in online mode.

**Tab 'Condition’**

The dialog defines the requirements for which program processing should halt at a breakpoint.

---

**NOTICE!**

Using conditional breakpoints slows down code execution, even when the condition does not yield TRUE.

Conditional breakpoints required a CODESYS runtime >= V3.5.4.0.

---

**Table 528: “Tasks”**

| “Break only when the breakpoint is hit in one of the following tasks” | CODESYS evaluates the breakpoint only if it is reached by specific tasks. The required tasks must be activated. For example, you can define a single debug task and also prevent other tasks that use the same block from being affected when debugging. |
Table 529: “Hit Count”

| “Hit Count”          | “Break always”: The program always halts at this breakpoint. Alternative: The program halts at the breakpoint when the breakpoint has been hit as often as defined in the following (type in the required hit count or select it from the number list): ● “Break when the hit count is equal to” ● “Break when the hit count is a multiple of ” ● “Break when the hit count is greater than or equal to” |

Table 530: “Condition”

| “Break, when true”                      | CODESYS evaluates the specified condition and halts the program at the breakpoint only when the result yields TRUE. You can define a condition as a valid Boolean expression. Examples: $x>100$, $x[y]=z$, $a \text{ AND } b$, boolVar. |

Tab 'Data'

Requirement: This is used for the properties of a data breakpoint.

The function of data breakpoints depends on the target system. Currently, data breakpoints are possible only with the CODESYS Control Win V3.

On the tab, the variable or memory address is specified for which the data breakpoint is set or will be set.

| “Break execution when the value of the variable or address changes” | ● Input of a qualified variable name ● Selection of a variable in the “Input Assistant” dialog, in the “Watch Variables” category Examples: variable: PLC_PRG.fb_DoSth.dwVariable; address: 16#12A, 0x12A, 129 |

| “Size” | Number of bytes of the specified variable or memory address above which should be monitored for changes. When a new variable or memory address is specified, a value that matches the data type or memory is set automatically at first. Note: The “Size” and quantity depend on the target system. For the CODESYS Control Win V3, a maximum of four data breakpoints with a maximum size of 8 bytes can be defined. Example: 2 for data type DWORD Example: 4 for data type DWORD: Only the two first bytes of the variable are monitored. |

Tab 'Execution Point Settings'

Here, an existing breakpoint or data breakpoint can be converted into an execution point.
**Execution point (execution does not stop at breakpoint)**
- The breakpoint becomes an execution point. Processing does not halt at this point and the given code is executed.
  - Execution point of a breakpoint: activated: ✔; deactivated: ✗
  - Execution point of a data breakpoint: activated: ✔; deactivated: ✗

**Execute the following code**
- Code that is executed when the execution point is reached.
- Looped structures (For, While) and IF or CASE expressions are not possible.

**Print a message in the device log**
- This option is available only when you select the “Enable logging in breakpoints” option in “Project Settings ➔ Compile Options”.
- CODESYS can print variables with the placeholder {variable name} in the message text.

---

**Tab 'Location'**
Requirement: The command “New breakpoint” was selected.

<table>
<thead>
<tr>
<th><strong>POU</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>POU of the active application where the breakpoint is placed.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Position</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Position of the breakpoint in the POU. Entry as row and column numbers (text editor) or as network or element numbers.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Instances</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>In the case of function blocks, you have to define whether the breakpoint should be set in the implementation or in an instance.</td>
</tr>
</tbody>
</table>

**Enable breakpoint immediately**
- The breakpoint is activated.
- The breakpoint is not activated. To activate later, click the button in the “Breakpoints” view.

---

**Dialog 'Monitoring Range'**

**Function:** This dialog restricts the range of array elements whose values are displayed during monitoring.

**Call:** Click in the column field “Data Type” that belongs to the array variable.

**Requirement:** A POU is in online mode and is being monitored. In addition, a variable of the POU has the data type “ARRAY”.

<table>
<thead>
<tr>
<th><strong>Valid range</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>The validity range of the array elements that are monitored.</td>
</tr>
<tr>
<td>Example of a three-dimensional array: [1..10][-3..3][-10..10]</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Maximum number of array elements</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of elements of the array variables</td>
</tr>
<tr>
<td>Example: 1470</td>
</tr>
</tbody>
</table>

When you edit one of the settings “Start”, “End”, or “Scroll range of 1000 elements”, both of the other settings are adapted automatically.

General

This dialog box is for the configuration of the properties of an object in CODESYS. In addition, depending on the object, it contains different tabs that each handle a category of properties.

Call: Menu “View”, context menu of the object in the “Devices”, “POUs” or “Modules” view.

Dialog Box 'Properties' - 'Common'

Function: This dialog box shows common information about the selected object.

Call: Main menu “View ➔ Properties”, or context menu of the object (“Common”).

Requirement: An object is selected in the device tree or POUs view.
Table 531

<table>
<thead>
<tr>
<th>“Name”</th>
<th>Object name as shown in the device tree or POUs view</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Object type”</td>
<td>Type of object (for example, POU, application, or interface)</td>
</tr>
<tr>
<td>“Open with”</td>
<td>Type of editor to display or edit the object</td>
</tr>
</tbody>
</table>

**Dialog 'Properties' - 'Boot Application'**

**Function:** The settings on this tab define when and how a boot application is created from the application.

**Requirement:** The device supports the settings.

**Call:** Select the application object; context menu: “Properties”; menu bar: “View ➔ Properties”, “Boot Application” category

| “Create implicit boot application on download” | A boot application is created automatically when downloading the application. |
| “Create implicit boot application on Online Change” | A boot application is created automatically when for an online change. |
| “Remind boot application on project close” | Before closing the project, CODESYS prompts to create the boot application. |
| “Verify boot application after creation” | After the boot application is created, an independent service checks whether or not the boot application has been created correctly. |

Regardless of the presets defined here, you are always able to create a boot application explicitly when you login.

See also
- ¶ Chapter 6.4.1.11.7 “Generating boot applications” on page 1978
- ¶ Chapter 6.4.1.21.3.7.6 “Command ‘Online Change’” on page 2629

**Dialog: Properties: Security**

**Function:** The dialog contains the properties of the application for encryption. If the CODESYS Security Agent is installed, then you can start a wizard for the encryption of downloads, online changes, and boot applications.

**Call:**
- Menu bar: “View ➔ Properties”
- Context menu of an application object

Table 532: “Encryption Technology”

If the “Enforce encryption of downloads, online changes and boot applications” option is selected in the “Security Screen” view in the “Security level” group, then the encryption technology is set to “Encryption with certificates” and cannot be changed in this dialog.

“No Encryption”
### “Simple Encryption”
You can download the boot application to the controller only when the defined dongle (license key) is connected to the computer. The dongle is provided by ABB AG or by the respective hardware manufacturer. The firmcode is displayed. Type in the delivered product code.

### “Encryption with license management”
You can download the boot application to the controller only after you have specified the product code and firmcode, and the respective dongle is connected to both the development computer and the controller. You receive the codes from the vendor that manages the licenses.

### “Encryption with certificates”
You can download the boot application to the controller only when a valid certificate exists for it. The “Certificates” group is enabled. See the description below. The option is already selected if the “Enforce encryption of downloads, online changes and boot applications” option is selected on the “User” tab of the “Security Screen” view.

You can also select the “Digitally sign application code” option.

<table>
<thead>
<tr>
<th>Table 533: “Certificates”</th>
</tr>
</thead>
<tbody>
<tr>
<td>Note: If the “Enforce encryption of downloads, online changes and boot applications” option is selected in the “Security Screen” view in the “Security Level” group, then the encryption technology is set to “Encryption with certificates” and cannot be changed in the “Properties” dialog.</td>
</tr>
<tr>
<td>The “Certificate Selection” dialog opens. Here you can select previously installed certificates of devices for which the encryption of download, online change, and boot application is enabled. The list can contain several entries if several devices are authorized to run this application.</td>
</tr>
<tr>
<td>“Digitally sign application code” The application is signed with a digital signature. The certificate for the digital signature is specified in the “Security Screen” view on the “User” tab.</td>
</tr>
</tbody>
</table>

### Information per certificate:
- “Issued for”
- “Issued by”
- “Valid from”
- “Valid until”
- “Thumbprint”

### “Encryption Wizard”
This button is available only if the CODESYS Security Agent is installed. It starts the wizard with the same name. See the help for CODESYS Security Agent in this case.

### Dialog 'Properties' - 'Build'

**Symbol:** 📋

**Function:** The dialog contains options for building (build operation) the object.

**Call:** Menu bar: “View ➔ Properties”; context menu of the object in the device tree
**Name** | **Description**
--- | ---
"Exclude from build" | ☑: This object and recursively its child objects are not considered for the next compile process. The object entry is displayed in green fonts in the “Devices” or “POUs” view.

"External implementation" "(Late link in the runtime system) " | ☑: CODESYS does not generate any code for this object when compiling the project. The object is linked as soon as the project is running on the target system, provided it is available there (for example, in a library). The object name is postfixed with (EXT) in “Devices” or “POUs” view.

"Enable system call" | ☑: A system call (runtime system) for functions is possible. Background: As opposed to CoDeSys V2.3, the ADR operator in V3 can be used with function names, program names, function block names, and method names. It replaces the INSTANCE_OF operator. BUT: It is not possible to call function pointers from within CODESYS.

"Link always" | ☑: The object is marked by the compiler and therefore always included in the compile information. This means that it is always compiled and downloaded to the PLC. Note: The pragma `{attribute 'linkalways'}` can also be used to instruct the compiler to always include an object.

"Compiler defines" | Here you can specify defines or conditions for compiling the object (conditional compile). You can also type in the expression `expr`, which is used in these kinds of pragmas. Multiple entries are possible as a comma-separated list (see `{define} statements`).
Example: `hello, test:= '1'`

"Additional compiler definitions from the device description" |

"Defined in device" | List of compiler definitions that originate from the device description. These compiler definitions are used in the build if they are not listed in the “Ignored definitions” field.

"Ignored definitions" | List of compiler definitions from the device description that are not used in the build.

Copies the selected compiler definition from the “Defined in device” field to the “Ignored definitions” field.

Moves the selected compiler definition from the “Ignored definitions” field to the “Defined in device” field. The compiler definition is used in the build.

See also
- § Chapter 6.4.1.20.6.4 “Conditional Pragmas” on page 2318
- § Chapter 6.4.1.20.6.3.25 “Attribute ‘linkalways’” on page 2294

**Dialog 'Properties' – 'Build' (C-integration)**

**Function:** In this dialog, you configure the build environment and the necessary data for the integration of the C development environment.

**Call:** Main menu “View”, context menu of the object “C Code Module”

**Requirement:** The object “C Code Module” is selected in the device tree.
NOTICE!
The dialog in this form is valid only for CODESYS Control Win V3 and Visual Studio. For other environments, the dialog can look different or may not even be available at all.

| “Visual Studio location” | Installation path of Visual Studio on the hard disk
You can also select the path with the input assistant or search for it with the magnifying glass. |
|--------------------------|--------------------------------------------------------------------------------------------------|
| “Windows SDK location”   | Installation path of Windows SDK on the hard disk
You can also select the path with the input assistant or search for it with the magnifying glass. |
| “Temporary build folder Location” | Path on the hard disk for the temporary build files |

See also

Dialog 'Properties' - ‘Access Control’

Function: The dialog defines the access rights of user groups for objects.

Call: Main menu “View ➔ Properties”, context menu of an object in the view “Device” or “POUs”.

Requirement: An object is selected in the view “Device” or in the view “POUs”.

| “Groups, actions and permissions” | A table which displays the following user groups access rights on objects:
- “View”
- “Modify”
- “Remove”
- “Add/remove children”
Perform a double click on the access right symbol to open the drop down list with the available rights. |

See also

- Chapter 6.4.1.6.6 “Protecting Objects in the Project by Access Rights” on page 1826
- Chapter 6.4.1.21.4.7 “Dialog ‘Permissions’” on page 2748

Dialog 'Properties' - ‘External file’

Function: The dialog is used to view and edit the properties of the external file. The properties were defined when the object was created. Changed properties are saved by pressing the “OK” button.

Call: Menu bar: “View ➔ Properties”; context menu of the object

Requirement: The object of the external file is selected in the “Devices” view or the “POUs” view.
Table 534

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Remember the link”</td>
<td>The file is available in the project only as long as it exists in the defined file path.</td>
</tr>
<tr>
<td>“Remember the link and embed into project”</td>
<td>CODESYS saves an internal copy of the file in the project, as well as the link to the defined file path. The update option selected below applies as long as the external file exists there. Otherwise CODESYS uses the version saved in the project.</td>
</tr>
<tr>
<td>“Embed into project”</td>
<td>CODESYS saves only one copy of the file in the project. There is no longer a link to the external file.</td>
</tr>
</tbody>
</table>

Table 535: “When the external file changes, then”

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Reload the file automatically”</td>
<td>If the external file changes, then CODESYS updates the file in the project.</td>
</tr>
<tr>
<td>“Prompt whether to reload the file”</td>
<td>If the external file changes, then a dialog prompt opens whether CODESYS should also update the file in the project.</td>
</tr>
<tr>
<td>“Do nothing”</td>
<td>The file remains unchanged in the project, even if the external file changes.</td>
</tr>
</tbody>
</table>

Table 536: “Linked File”

Requirement: Either the “Remember the link” option or the “Remember the link and embed into project” option is selected.

The following information about the linked file is displayed: “Name”, “Location”, “Size”, “Changed”.

“Display File Properties” Clicking this button opens the default “Properties of <file name>” dialog, which you can also open in the Windows file system by right-clicking the file.

Table 537: “Embedded file”

Requirement: Either the “Remember the link and embed into project” option or the “Embed into project” option is selected.

Display of the following information about the embedded file: “Size” and “Changed”.

“Update the embedded file” If the external file that was added to the project is changed in the specified file path, then CODESYS updates the embedded file in the project.

See also
- Chapter 6.4.1.21.2.10 “Object ‘External File’” on page 2464

Dialog Box ‘Properties’ - ‘Bitmap’

**Function:** The dialog is for assigning a bitmap file to the object. The image will be used in the graphic view of the Library Manager and in the Toolbox view of the FBD/LD/IL editor.

**Call:** Main menu “View ➔ Properties”, context menu of the object

**Requirement:** The object is selected in the view “Devices” or in the view “POUs”

“Render pixels of this color transparently:” The selected color will be displayed transparently.
Dialog 'Properties - Application Build Options'

**Function:** The dialog includes settings that CODESYS uses for creating a boot application for the controller.

**Call:** Menu bar: “View ➤ Properties”; context menu of an application object

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Download application info** | This feature requires compiler version >=3.5.0.0, runtime version >= 3.5.0.0.  
The information about the application contents is also downloaded to the PLC. We recommend that you keep this option enabled because it allows for a difference check between the current application and the application on the PLC. This compares the number of blocks, data, and memory locations.  
To get the information about the differences, click “Details” in the “Applications” tab of the device editor. This is also in the message view that opens when you are downloading an application to the PLC when it is different from the one already on the PLC. |
| **Stop parent application in case of exception** | Available for applications with a parent application. |
| **Dynamic memory settings** | Memory is allocated dynamically for the application, for example when using the operator __NEW. In this case, define the “Maximum size of memory (bytes)”.  
Caution: The entire memory is not available for creating objects dynamically. Instead, the system always uses part of it for management information. |

- % Chapter 6.4.1.21.2.2 “Object ‘Application’” on page 2410

Dialog 'Properties' - 'Target memory settings'

**Function:** The dialog allows for changing the memory settings of the target device.

**Call:** Menu bar: “View ➤ Properties”; context menu of the application

**Requirement:** The application is selected in the “Devices” view.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Override target memory settings** | ✓: The memory settings stored in the device description are overridden by the values specified in “Input size”, “Output size”, and “Memory size”.  
Note: If the memory settings of the target device are changed, then it is no longer possible to log in to an existing application on the target device, nor is it possible to perform an online change. |
| **Input size** | Input fields for the memory sizes used to override the values "memory-layout\input-size", "memory-layout\output-size", and "memory-layout\memory-size" stored in the device description.  
Requirement: The “Override target memory settings” option is selected. |
| **Output size** |
| **Memory size** |

- % Chapter 6.4.1.21.2.2 “Object ‘Application’” on page 2410
Dialog 'Properties' - 'Network Variables'

Symbol: ⌒

**Function:** In this dialog, you define network properties for the variable list that is selected in the device tree. Furthermore, any variables in it that are declared as network variables are also available.

**Call:** “Context menu of variable list in device tree → Properties”, “Network Variables” tab

<table>
<thead>
<tr>
<th><strong>“Network type”</strong></th>
<th>UDP</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Task”</strong></td>
<td>Task of the current application that controls the variables to be sent. CODESYS always sends the variables at the end of a task cycle.</td>
</tr>
<tr>
<td><strong>“List identifier”</strong></td>
<td>Used to identify the network variable list. Must be unique</td>
</tr>
<tr>
<td><strong>“Pack variables”</strong></td>
<td>The size of the packages (telegrams) that are transmitted depends on the network type. In the case of “UDP”, a package is 256 bytes. ✓ CODESYS bundles the variables for sending in packages in order to reduce as much as possible the number of packages to send. In the case of variables of type array or structured data types, this can lead to the splitting of the variables into multiple telegrams. As a result, data inconsistencies are possible within these variables, even if the variable size is smaller than the package size.</td>
</tr>
<tr>
<td><strong>“Transmit checksum”</strong></td>
<td>✓ A checksum is provided for each variable package. The receiver checks the checksum to make sure that the variable definitions match from the sender and receiver. A package with non-matching checksums is not accepted.</td>
</tr>
<tr>
<td><strong>“Acknowledgement”</strong></td>
<td>✓ CODESYS sends an acknowledgement message for each received data package. If the sender does not receive a confirmation before it sends again, then an error is written to the diagnostic structure. Note: For the NetVarUdp library version 3.5.7.0 and later, a receiver channel is no longer assigned when confirmed transfer is not selected. In this way, network variable exchange is also possible between two controllers on one hardware device.</td>
</tr>
<tr>
<td><strong>“Cyclic transmission”, “Interval”</strong></td>
<td>CODESYS sends the variables within the defined interval. Example for time definition: “T#70ms”.</td>
</tr>
<tr>
<td><strong>“Transmit on change”, “Minimum gap”</strong></td>
<td>✓ CODESYS sends the variables only if their values have changed. You can use “minimum gap” to define the least amount of time between two transmissions.</td>
</tr>
</tbody>
</table>
**“Transmit on event”, “Variable”**

- **CODESYS** sends the variables as soon as the defined variable yields **TRUE**.

**“Settings”**

- Protocol-specific settings; possible entries depend on the network library.
- **“Port”**: Number of the port that CODESYS uses for data exchange with other network units. The “Default value” is “1202”. You can change the current value in the “Value” field at any time. Select the field, press the [Space Bar], and type the value.
- **Caution**: The other nodes in the network must define the same port. If more than one UDP connection is defined in the project, then the port numbers in all configurations are adapted to this value.
- **“Broadcast Adr.”**: The “Default value” is 255.255.255.255, which means that data exchange will take place with all network units. You can change the current value in the “Value” field, press the [space bar], and type the address or address range of a subnetwork (for example, 197.200.100.255 when communication should be with all nodes that have an IP address in the range 197.200.100.x).

See also

- ☼ Chapter 6.4.1.10.5 “Network Variables” on page 1946
- ☼ Chapter 6.4.1.21.2.19 “Object 'Network Variable List (Receiver)’” on page 2475
- ☼ Chapter 6.4.1.21.2.18 “Object 'Network Variable List (Sender)’” on page 2475

**Dialog 'Properties' - 'Network Settings’**

If the device supports the network functionality, then the current network settings for a GNVL (global network variable list) can be displayed and changed in the “Properties” dialog of the object. These are the settings that were used when adding the GNVL in the “Add Network Variable List (Receiver)” dialog.

See also

- ☼ “Dialog Box 'Add Network Variable List (Receiver)’” on page 2475

**Dialog 'Properties' - 'CFC Execution Order’**

**Function**: The tab switches the mode of the execution order for CFC objects.

**Call**: Context menu: “Properties” of a CFC object in the “Devices” view or “POUs” view

**Tab 'CFC Execution Order’**
"Execution order" | In the CFC editor, you position the elements and therefore also the networks freely. Two modes are available to prevent the execution order in the CFC POU from being undefined.

"Auto Data Flow Mode" | In this mode, the execution order is determined automatically by data flow, or in case of ambiguity, by network topology. The POUs and the outputs are numbered internally. The networks are executed from top to bottom and left to right.

Advantage: The automatically defined execution order is optimized by time and by cycle. You do not need any information about the internally managed execution order during the development process.

The following commands are provided afterwards in the “CFC ➔ Execution Order” menu:
- “Display Execution Order”
- “Set Start of Feedback”

The elements in the CFC editor are displayed without markers and without numbering. It is not possible to change the execution order manually. For networks with feedback, you can also set a starting point.

"Explicit Execution Order Mode" | In this mode, you can define the execution order explicitly. To do this, the elements are displayed in the CFC editor with markers and numbering, and menu commands are provided for defining the order.

The following commands are provided in the “CFC ➔ Execution Order” menu:
- “Send to Front”
- “Send to Back”
- “Move Up”
- “Move Down”
- “Set Execution Order”
- “Order by Data Flow”
- “Order by Topology”

Note: Up to CODESYS V3.5 SP1, this was the usual behavior of CFC POUs. Pay attention that it is your responsibility to adapt the execution order and assess the consequences and impacts. This is another reason why the execution order is always displayed.

"Apply to All CFCs" | Changes the mode for all other CFC objects in the project to the mode selected in the list.

- Chapter 6.4.1.21.3.13.17 “Command ‘Order by Topology’” on page 2691

Dialog 'Properties' - 'SFC Settings'

Function: The dialog defines the default settings for all POUs used in the project, which are programmed in SFC.

Call: Main menu “View ➔ Properties”, context menu of a SFC POU in the view “Device” or “POUs”.

Configuration and programming
Programming with CODESYS > CODESYS Development System

2762 3ADR010583, 1, en_US 2024/01/05
Flag

<table>
<thead>
<tr>
<th>List of all possible SFC flags</th>
<th>“Use” [✓]: The SFC flag is activated and will be considered in the program execution.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>“Declare” [✓]: The SFC flag is declared automatically.</td>
</tr>
<tr>
<td></td>
<td>If “Declare” is activated, but “Use” is not activated, the variable will be declared but the flag has no effect in the program execution.</td>
</tr>
<tr>
<td></td>
<td>Hint: If you have manually declared a SFC variable you have to disable the declaration of this flag in the “SFC Settings”. Otherwise the automatically generated flag will overwrite the manually declared flag.</td>
</tr>
<tr>
<td></td>
<td>Hint: A automatically declared flag variable is only visible in the online mode in the declaration part of the SFC editor.</td>
</tr>
</tbody>
</table>

“Use defaults” [✓]: The settings of this dialog overwrites the “SFC settings” of the single POUs.

Build

Table 538: “Code generation”

| “Calculate active transitions only” | [✓]: CODESYS generates code for the currently active transition only. |

Dialog 'Properties' – 'Link to File'

**Function:** The dialog defines the link of an external file with the contents of the global variable list (GVL). You can either export the GVL to an external file or import it from an external file.

**Call:** Menu bar: “View ➔ Properties”; context menu of an object of type “Global Variable List”

<table>
<thead>
<tr>
<th>“File name”</th>
<th>Input field of the file path</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Export before compile”</td>
<td>[✓]: Before each compile of the project (for example with [F11]), CODESYS saves a file with the extension gvl in the path, which is specified in the “File name” field.</td>
</tr>
<tr>
<td>“Import before compile”</td>
<td>[✓]: The export file which is specified in the “File name” field is read automatically before each project compile. Therefore you can import a GVL which was exported from another project, for example to set up a communication by means of network variables.</td>
</tr>
</tbody>
</table>

- linetarget [_cds_configuring_network_variables_exchange] doesn't exist but @y.link.required='true'

Dialog 'Properties' - 'Cam'

**Function:** Use this dialog to define the global variables of the cam.
Table 539: “Dimensions”

| Master start/end position | The start and end positions of the master define the range of the master values and therefore the scale of the horizontal axis of the cam. The default settings are given in angular degrees with 0 and 360 as limiting values. |
| Slave start/end position | The associated slave positions are determined by the graph type that is defined for the cam. However, the segment depicted by the curves (this is also the scale of the vertical axis) can be defined by the slave start and end positions given here. |

Table 540: “Period”

These settings affect the work in the cam editor and cam table. Depending on these parameters, the slave start point is adjusted automatically when the end point is changed, as well as the other way around. This adjustment optimizes the period transition to be as smooth and jerk-free as possible.

| Smooth transition | The values for position, velocity, and acceleration are adjusted automatically. |
| Slave period | Indicates when the slave period is repeated mechanically. The slave position at the start and end of the master period may then be in an interval of a whole number multiple of this value. This value is effective only if the “Smooth transition” check box is selected. |

Table 541: “Continuity Requirements”

Activation of these options for the continuity of the curve does not have any effect when editing the cam. It does, however, prompt a continuity check, which reports any violations to the message view (CAM). It is not possible to edit jumps in the position curve. The default setting also requires the continuity of velocity and acceleration. You can clear these options, for example in the special case of a curve that consists of only linear segments. However, this will lead to kinks in the position curve. By default, the jerk (3rd derivative) is not tested for jumps.

| Position | ✔: The entire curve is tested for jumps. |
| Velocity | ✔: The entire curve is tested for jumps. |
| Acceleration | ✔: The entire curve is tested for jumps. |
| Jerk | ✔: The entire curve is tested for jumps. |

Table 542: “Compile Format”

When compiling, _MC_CAM_REF_ structure variables are generated. A cam is described according to the following options:

| Polynomial (XYVA) | Polynomial description of the individual points consisting of the master position, slave position, slave velocity, and slave acceleration. |

Dialog 'Properties' - 'Image Pool'

**Function:** The dialog allows for setting the basic properties of the selected image pool.

**Call:** “View ➔ Properties” of an “Image Pool” object type; context menu of an “Image Pool” object type.

| Download only used images | ✔: Instead of loading all images from the image pool, CODESYS loads only the images that are actually used in the application on the PLC. |
| Download by visualization | ✔: The image pool is downloaded with the visualization to the controller. |
| Internal | ✔: CODESYS does not provide the image pool in the “ToolBox” view. You cannot drag these images to the visualization. |
Table 543: “Symbol library settings”

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Mark library as symbol library”</td>
<td>Marks the image pool as a symbol library for use in a visualization. The symbol library receives the key <code>VisuSymbolLibrary = TRUE</code> as file property in the project information. The <code>VisuElements</code> library is inserted automatically as a placeholder library in the “POUs” pool of the Library Manager. Requirement: A library project is open. CODESYS displays symbol libraries that are installed in the repository in the “Project Settings” (“Visualization” category, “Symbol Libraries” tab).</td>
</tr>
<tr>
<td>“Textlist for symbol translation”</td>
<td>Select the text list from the drop-down list that contains the translated texts for the image pool.</td>
</tr>
</tbody>
</table>

Dialog ‘Properties’ - ‘Options’

**Options (Controller)**

**Function:** This dialog provides the settings for monitoring an login for objects of type device. The availability of the options depends on the device description.

**Call:** Context menu of the device, or main menu “View ➔ Properties”, if the device is selected.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Monitoring interval (ms)”</td>
<td>Interval of the monitoring (10 ms - 1000 ms)</td>
</tr>
</tbody>
</table>

Table 544: “Interactive Login Mode”

This mode is used to prevent an accidentally login to a different controller.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“None”</td>
<td>No interaction with the user during login. Corresponds to the behavior of previous versions.</td>
</tr>
<tr>
<td>“Enter ID”</td>
<td>During login CODESYS asks to enter an ID. The ID is stored in the controller. Without a valid ID no login is possible. When login a second time, CODESYS does not ask again for the ID if the computer name, the user name, the device name and the device address have not changed. The information is saved in the project options.</td>
</tr>
</tbody>
</table>
**“Press key”**
During login a dialog prompts and requests the user to press a key on the controller. The timeout for this action is saved in the device description.

**“Wink (= blink an LED)”**
During login a led blinks on the connected controller.

### Table 545: “Symbol Configuration”

| **Access variables in sync with IEC tasks** | ☐ | Default setting, consistent access is not permitted |
| ☑ | Consistent access is permitted |
| The setting only will take effect when all applications and boot applications are re-downloaded to the controller. |
| Note: If the option is activated, then the jitter for all IEC applications may increase on this device! The consistent access can disturb the real-time capability. |

### Dialog 'Properties' - 'Monitoring'

**Function:** The tab contains options for the monitoring of transitions in SFC.

**Call:** Select transition object, click “Properties”; menu bar: “View ➔ Properties”.

| **Enable monitoring** | ☑ | An implicit variable is created for the transition, which is then always given the current property value when the application calls the Transition method. The value stored last in this variable is displayed in the monitoring. |
| **Monitoring using call** | ☑ | The transition to be monitored is read by directly calling the transition. Note: When you activate this option, you have to consider possible side effects. These kinds of side effects can occur if additional operations are implemented in the transition. |

General

Symbol: 

**Function:** The object contains the basic configuration of the project. In the “Project Settings” dialogs the configuration can be adjusted.

**Call:** Double click on the “Project Settings” object in the device tree, or main menu “Project ➔ Project Settings”.

CODESYS saves the project settings directly in the project. If a project is transferred to another system for example the “Project Settings” object is transferred as well without the need of a project archive.

The project settings are valid project wide. Dependent on the installed packages the dialogs provide settings for several categories, as for example “SFC” or “User and Groups”.

See also

- [Chapter 6.4.1.21.3.9.4 “Command ‘Package Manager’”](#) on page 2655

Dialog 'Project Settings' - 'SFC'

Symbol: 

**Function:** This dialog is used for configuring the settings of SFC objects. The properties of each new SFC object automatically have the configured settings.

**Call:** Menu bar: “Project ➔ Project Settings” (“SFC”).

**Requirement:** A project is open.

**Tab 'Flags'**

Implicitly generated variables for checking and monitoring the processing in an SFC diagram

| “Active” | ✅: The corresponding variable is used. |
| “Declare” | ✅: The corresponding variable is created automatically. Otherwise, you have to declare the variable explicitly if you intend to use it (“Use” is selected). |

| “Apply to all” | In this dialog, CODESYS applies changes to existing SFC objects. CODESYS selects the “Use defaults” check box in the properties of the SFC POUs. |

**NOTICE!**

Automatically declared variables are visible in the declaration part of the SFC editor only in online mode.

**Tab 'Build'**

Table 546: “Code Generation”

| “Calculate active transitions only” | ✅: CODESYS generates code only for currently active transitions. |
This part of the dialog is available only for compiler versions < 3.4.1.0.

| “Company” | Defines the SFC library that CODESYS uses by default. |
| “Title”   | Enables unique references to libraries. Required when various versions of the library are available on the system. Please make sure that there are no discrepancies between the namespace defined in the library manager and the namespace defined for the individual object. The SfcIec.library data is used for the default settings that CODESYS provides with the default profile. |
| “Version” | |

Each SFC block stores the information via the library version that applied when you added the block. This can cause you to use multiple library versions within the same project. In order to prevent this, you are prevented from defining specific versions of IecSfc.library (as of compiler version 3.4.1.0). The library version, which you use for all SFC blocks in the project, is defined with a placeholder. CODESYS resolves the placeholder depending on the compiler version in use. The allocation of the library version to the compiler version is defined in the library profile.

Dialog 'Project Settings' - 'Users and Groups'

Symbol: 🌐

Function: This dialog is for the configuration of the user management for the current project.

Call: Menu “Project ➔ Project Settings”, category “Users and Groups”

Tab 'User'

Displays the users and their memberships in groups

| “Add”       | Opens the “Add User” dialog. |
| “Edit”      | Opens the “Edit User” dialog. |
| “Delete”    | An error message appears if you attempt to delete the last user of a group, since a group must have at least one member. |

Table 548: “Add User / Edit User”

Input fields for setting up a new user account or changing an existing one

| “Active” | ☑: You may use the user account, default
|          | ☐: The user cannot log in. If he attempts to login again with incorrect login data, this can result in automatic deactivation of the account; see below: Settings. |
| “Memberships” | List of all user groups that you have defined in addition to the group “Everyone” (to which each new user automatically belongs).
|           | ☑<group name>: the new user belongs to the group. |
Table 549: “Export/Import”

<table>
<thead>
<tr>
<th>“Export Users and Groups”</th>
<th>The command opens the standard dialog for saving a file in the local file system. You can store the users and groups definitions of the project in a file *.users in xml format.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Import Users and Groups”</td>
<td>Export users and groups opens the standard dialog for browsing the local file system for a file. Search for a file with extension *.users in order to import the users and groups definitions, stored in this file, into the project.</td>
</tr>
</tbody>
</table>

Tab 'Groups'

Display of the groups and their members. A group can also be a member of a group.

<table>
<thead>
<tr>
<th>“Add”</th>
<th>Opens the “Add Group” dialog.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Edit”</td>

<tbody>
<tr>
<td>“Implicitly at program download and online change”</td>
<td>Each time an application is loaded or an online change is made, CODESYS additionally loads the project archive to the target device(s) with no further prompt.</td>
</tr>
<tr>
<td>“Implicitly at creating boot project”</td>
<td>Each time a boot application is created, CODESYS additionally loads the project archive to the target device(s) with no further prompt.</td>
</tr>
<tr>
<td>“Implicitly at creating boot project, download and online change”</td>
<td>Each time a boot application is created, an application is loaded or an online change is made, CODESYS additionally loads the project archive to the target device(s) with no further prompt.</td>
</tr>
<tr>
<td>“Prompt at program download and online change”</td>
<td>Each time an application is loaded or an online change is made, CODESYS opens a prompt, where you can select whether CODESYS should load the project archive to the controller.</td>
</tr>
<tr>
<td>“Only on demand”</td>
<td>A prompt opens only if the command “Online ➔ Load source code to connected controller” is called. There you can select whether CODESYS should load the project archive to the controller.</td>
</tr>
</tbody>
</table>
Dialog 'Project Settings' - 'Page Setup'

Symbol:  

**Function:** This dialog defines the layout for the print version of the project contents. This layout is used for the printout of the project information by clicking “File ➤ Print” and the printout of the project documentation by clicking “Project ➤ Document”.

**Call:** Main menu “Project ➤ Project Settings” (“Page Setup”)

You can change settings the following:

- “Paper”
- “Margins”
- “Header and Footer”
- “Document”
- “Title Page”

**Table 556: “Edit Header, Edit Footer”**

<p>| | |</p>
<table>
<thead>

Dialog 'Project Settings' - 'Security'

Symbol:  

**Function:** this dialog is for the configuration of the project protection by a password, a dongle, or a certificate.

**Call:** Menu bar: “Project ➤ Project Settings” (category “Security”).

**NOTICE!**

If the encryption password is lost you can no longer open the project. You can also no longer restore it.
### No protection

- The project file is not protected from unauthorized access and data manipulation.

Note: We strongly recommend that you use security functionality.

- The "Password", "Dongle", and "Certificates" options cannot be selected.

### Integrity check

When you create a new project, this option is enabled by default.

- The project file is stored in a proprietary format and its integrity is checked each time the project is loaded. The file may be incompatible with older versions of the development system.

Please note that the project file is not encrypted. To better protect your data, activate one of the encryption functions.

### Encryption

- The "Password", "Dongle", and "Certificates" encryption functions can be selected.

### Password

Entering, changing and confirming the encryption password.

If you save the project with these settings you must enter the password later in order to open the project again, even if it is to be loaded as a library reference.

### Dongle

Requirement: you have connected the CODESYS security key (dongle) to the computer.

- "Add": The dialog "Add Registered Dongle" opens.

### Registered dongles

Drop-down list of the registered dongles.

### Certificates

Certificates are used for the encryption of contents of the open project file.

Requirement: The certificates for all users who share the project must be installed in the local memory.

- The "Certificate selection" dialog opens.

---

**Table 557: Adding a registered dongle**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Dongle&quot;</td>
<td>Drop-down list of all connected dongles.</td>
</tr>
<tr>
<td>&quot;Update&quot;</td>
<td>CODESYS refreshes the drop-down list.</td>
</tr>
<tr>
<td>&quot;Flash&quot;</td>
<td>The LEDs of the currently selected dongle flash for two seconds (if it supports this function).</td>
</tr>
</tbody>
</table>

The dongle must be connected to the computer when CODESYS loads the project, even if it is loaded as a library reference.

---

**Dialog 'Project Settings' - 'Static Analysis Light'**

**Symbol:** §

**Function:** This dialog activates the tests that the light version of CODESYS Static Analysis performs each time code is generated.

**Call:** Menu bar: “Project ➔ Project Settings” (“Static Analysis Light” category).
You can exclude lines of code from the static code analysis by marking
the code with the pragma `{analysis ...}` or the pragma `{attribute
'analysis' := '...'}`.

### Additional compile tests

<table>
<thead>
<tr>
<th>Rule ID</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>SA0033: Unused variables</strong></td>
<td>Finds variables that are declared, but not used within the compiled program code. For GVL variables: If there are multiple applications in one project, then only the objects under the currently active application are affected. If there is only one application, then the objects in the POU's view are also affected.</td>
</tr>
</tbody>
</table>
| **SA0028: Overlapping memory areas** | Detects the locations where two or more variables reserve the same storage space. For example, this occurs for the following declarations:
```
var1 AT %QB21: INT
and
var2 AT %QD5: DWORD.
```
In this case, both variables use byte 21, which means that the memory range of the variables overlap. |
| **SA0006: Write access from multiple tasks** | Detects variables that are written by more than one task. |
| **SA0004 “Multiple write access on output”** | Detects outputs that are written to more than one location. Note: No error is reported when an output variable (VAR_IN_OUT) is written in different branches of IF and CASE statements. Note: A pragma cannot deactivate this rule. |
| **SA0027: Multiple use of identifiers** | Detects multiple uses of a name/identifier for a variable or an object (POU) within the scope of a project. The following cases are detected:
- The name of an enumeration constant is the same as in another enumeration in the application or used in an included library.
- The name of a variable is the same as an object in the application or an included library.
- The name of a variable is the same as for an enumeration constant in an enumeration in the application or an included library.
- The name of an object is the same as another object in the application.
- The name of a variable is the same as the name of a method.
- The name of an object is the same as the name of a superordinate object ("parent object"). |
| **SA0167: Temporary function block instances** | The test detects function block instances that are declared as temporary variables. This concerns instances that are declared in a method or in a function or as VAR_TEMP, and therefore are reinitialized in each processing cycle and for each POU call. |
Examples

SA0003: Empty statements

; (* Comment *); iVar;

SA0006: Concurrent access

FUNCTION_BLOCK ADD_FB
  g_iTemp1 := g_iTemp1 + INT#1;
PROGRAM PLC_PRG //controlled by MainTask
  g_iTemp1 := g_iTemp1 + INT#2;
  g_xTemp2 := g_iTemp1 > INT#10;
PROGRAM PLC_PRG_1 //controlled by SubTask
  g_iTemp1 := g_iTemp1 - INT#3;
  g_xTemp2 := g_iTemp1 < INT#-10;

SA0004 Multiple write access on output

VAR_GLOBAL
  g_xVar AT %QX0.0 : BOOL ;
  g_iTest AT %QW0 : INT ;
END_VAR

PROGRAM PLC_PRG
IF iCondition < INT#0 THEN
  g_xVar := TRUE;
  g_iTest := INT#12;
END_IF
CASE iCondition OF
  INT#1:
    g_xVar := FALSE;
  INT#2:
    g_iTest := INT#11;
ELSE
    g_xVar := TRUE;
    g_iTest := INT#9;
END_CASE

SA0006: Write access from multiple tasks

FUNCTION_BLOCK ADD_FB
  g_iTemp1 := g_iTemp1 + INT#1;
PROGRAM PLC_PRG // Controlled by MainTask
  g_iTemp1 := g_iTemp1 + INT#2;
  g_xTemp2 := g_iTemp1 > INT#10;
PROGRAM PLC_PRG_1 //Controlled by SubTask
  g_iTemp1 := g_iTemp1 - INT#3;
  g_xTemp2 := g_iTemp1 < INT#-10;

SA0027: Multiple use of name

PROGRAM PLC_PRG
VAR
  ton : INT;     // error SA0027
END_VAR

SA0029: Different notation in implementation and declaration

The PLC_PRG POU and a fnc function POU are in the device tree.
PROGRAM PLC_PRG
VAR
  iVar: INT;
  _123test_var_: INT;
END_VAR
ivar := iVar + 1; // notation different to that in the declaration part -> SA0029
_123TEST_var_ := _123test_var_INT; // notation different to that in the declaration part -> SA0029
Fnc(); // notation different to that in the devices tree -> SA0029
END_VAR

SA0167: Temporary function block instances
PROGRAM PLC_PRG
VAR
END_VAR
VAR_TEMP
  yafb: AFB;
END_VAR
FUNCTION Fun : INT
VAR_INPUT
END_VAR
VAR
  funafb: AFB;
END_VAR
METHOD METH: INT
VAR_INPUT
END_VAR
VAR
  methafb: AFB;
END_VAR

Dialog 'Project Settings' - 'Visualization'

Symbol: 🎨

Function: The dialog is used to configure the project-wide settings for objects of type “Visualization”.

Call: Menu bar: “Project ➔ Project Settings”, “Visualization” category

Requirement: A project is open.
Tab 'General'

Table 558: “Visualization Directories”

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Text list files”</td>
<td>Directory which contains text lists that are available in the project to configure texts for different languages. CODESYS uses the directory, for example to import or export text lists. After clicking , the “Select Directory” dialog opens which allows for the selection of a directory in the file system.</td>
</tr>
<tr>
<td>“Image files”</td>
<td>Directory which contains image files that are available in the project. Multiple folders are separated with a semicolon. CODESYS uses the directory, for example to import or export image files. After clicking , the “Select Directory” dialog opens which allows for the selection of a directory in the file system.</td>
</tr>
</tbody>
</table>

Table 559: “Advanced”

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
</table>
| “Activate property handling in all element properties” | You can also configure a visualization element with a property in those of its properties in which you select an IEC variable. Then CODESYS creates additional code for the property handling when a visualization is compiled. Requirement: Its IEC code contains at least an object of type “Interface property” (a property).
|                                      | Requirement: “Visible” is selected.                                                                                                         |
| “Enable implicit checks for visualization POUs” | The implicit check is also performed for visualization POUs. As a result, additional code is generated, which increases memory usage. When memory is limited, this option should be disabled. |

**Dialog 'Project Environment’**

| 6.4.1.21.4.13.1 | General......................................................................................................................... 2778 |
| 6.4.1.21.4.13.2 | Dialog ‘Project Environment’ – ‘Library Versions’.......................... 2778 |
| 6.4.1.21.4.13.3 | Dialog ‘Project Environment’ - ‘Compiler Version’......................... 2778 |
| 6.4.1.21.4.13.4 | Dialog 'Project Environment' - 'Device Versions'................................. 2779 |
| 6.4.1.21.4.13.5 | Dialog 'Project Environment' – ‘Visualization Profile’.................... 2779 |
| 6.4.1.21.4.13.6 | Dialog ‘Project Environment’ – ‘Visualization Styles’............. 2780 |
| 6.4.1.21.4.13.7 | Dialog ‘Project Environment’ – ‘Visualization Symbols’........ 2780 |

**General**

**Function:** You use this dialog for checking the actuality of the software and of the files, which are included in the project. CODESYS checks for example the selected compiler and finds out if there is a newer version. In such a case you can update the affected components.

**Call:** Main menu “Project”

**Dialog 'Project Environment’ – ‘Library Versions’**

**Function:** This dialog displays the libraries of the opened project for which newer versions are available.

**Call:** Main menu “Project ➔ Project Environment”, tab “Library Version ”

This dialog opens automatically when you open a project containing outdated libraries.

**Table 562**

<table>
<thead>
<tr>
<th>“Action”</th>
<th>Double-click inside the field to select the desired actions.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Check for updates when loading this project”</td>
<td>✔: Checking takes place each time the project is opened. ☐: Checking takes place once only.</td>
</tr>
<tr>
<td>“Set all to newest”</td>
<td>CODESYS uses the newest available version of the library.</td>
</tr>
<tr>
<td>“OK”</td>
<td>CODESYS performs the selected action(s).</td>
</tr>
</tbody>
</table>

**Dialog 'Project Environment' - ‘Compiler Version’**

**Function:** This dialog shows the current compiler version of the project and provides the capability of updating.

**Call:** Main menu “Project ➔ Project Environment” (“Compiler Version” tab).
Table 563

<table>
<thead>
<tr>
<th>“Current compiler version in project”</th>
<th>Shows the set compiler version for the open project.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Recommended, newest version”</td>
<td>Shows the latest version.</td>
</tr>
</tbody>
</table>
| “Action”                            | ● “Do not update”: The compiler version of the project remains the same.  
                                       | ● “Update to x.x.x.x”: The selected compiler version is set for the project. |
| “Check for updates when loading this project” | ☑: CODESYS checks for new versions each time the project is opened. If there is a new version, then the respective update dialog opens automatically.  
                                           | ☐: The compiler version is not checked. The update dialogs do not open automatically. |
| “Set all to newest”                 | The compiler version is set to the latest version. |

Dialog 'Project Environment' - 'Device Versions'

Function: This dialog shows the devices of the open project in which there are new versions available.

Call: Main menu “Project ➔ Project Environment” (“Device Versions” tab)

This dialog opens automatically when you open a project that contains an outdated device.

Table 564

<table>
<thead>
<tr>
<th>“Action”</th>
<th>Double-click in the field to select the required actions.</th>
</tr>
</thead>
</table>
| “Check for updates when loading this project” | ☑: The check is performed when the project is opened.  
                                           | ☐: The check is performed one time only. |
| “Set all to newest” | CODESYS uses the latest library version. |
| “OK” | CODESYS executes the selected actions. |

Dialog 'Project Environment' – 'Visualization Profile'

Function: This dialog shows the current visualization profile of the project. The profile can be updated here.

Call: Menu bar: “Project ➔ Project Environment” (“Visualization Profile” tab).

<table>
<thead>
<tr>
<th>“Current visualization profile in the project”</th>
<th>The set visualization profile of the open project.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Recommended, newest profile”</td>
<td>The newest version.</td>
</tr>
</tbody>
</table>
| “Action”                                      | ● “Do not update”: The visualization profile of the project remains unchanged.  
                                           | ● “Update to x.x.x.x”: CODESYS updates the project to the selected visualization profile. |
| “Check for updates when loading this project” | ☑: CODESYS checks for new profiles each time the project is opened. If there is a new version, then the respective update dialog opens automatically.  
                                           | ☐: Not test of the profile when opening the project. The update dialogs do not open automatically. |
| “Set all to newest”                           | CODESYS updates the . |

- Help about visualization

Dialog 'Project Environment' – 'Visualization Styles'

**Function:** This dialog shows the current visualization style of the project and provides the capability of updating it.

**Call:** Menu bar: “Project ➔ Project Environment” (“Visualization Styles” tab).

**Table 565:** “Newer versions are available for the following visualization styles currently in use”

<table>
<thead>
<tr>
<th>“Visualization style”</th>
<th>Version of the set visualization style in the open project</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Current”</td>
<td>Current version of the visualization style (example: 3.5.6.0)</td>
</tr>
<tr>
<td>“Recommended”</td>
<td>Recommended version of the visualization style (example: 3.5.7.0)</td>
</tr>
</tbody>
</table>
| “Action”              | ● “Do not update”: The visualization style of the project remains unchanged.  
                         | ● “Update to x.x.x.x”: CODESYS updates the project to the version of the selected visualization style. |
| “Check for updates when loading this project” | ☑: CODESYS checks for new versions each time the project is opened. If there is a new version, then the respective update dialog opens automatically.  
                         | ☐: The version is not checked. The update dialogs do not open automatically. |
| “Set all to newest”   | CODESYS updates the version. |

Dialog 'Project Environment' – 'Visualization Symbols'

**Function:** The dialog lists installed symbol libraries and allows for you to assign symbol libraries to a project.

**Call:** Menu bar: “Project ➔ Project Environment”, “Visualization Symbols” tab

**Requirement:** The open project contains a visualization and has been saved with a compiler version < 3.5.7.0. CODESYS recognizes symbol libraries in compiler version 3.5.7.0 and higher.

<table>
<thead>
<tr>
<th>“Symbol library”</th>
<th>List of all installed symbol libraries</th>
</tr>
</thead>
</table>
| “Active”         | ☑: Symbol library is selected for the project. CODESYS provides its symbols in the “Visualization Toolbox” view.  
                         | ☐: Symbol library has been previously installed only in the library repository. |

Dialog 'Options' - 'CFC Editor'

Symbol: [image]

Function: This dialog is for the configuration of the settings for editing and printing in the CFC editor.

Call: menu “Tools ➔ Options”, category “CFC Editor”

Tab 'General'

| “Enable AutoConnect” | ☑: If you drag a CFC element onto the work area of the editor and insert it, CODESYS automatically connects together unconnected pins that 'touch' one another. Make sure that you do not create unwanted connections when shifting elements! |

| “Prepare values in implementation part” | ☑: In online mode you can also prepare variable values for writing and forcing in the implementation part of the CFC module. In addition, CODESYS displays the values you have just prepared in the inline monitoring box of the variable in angle brackets. |

Tab 'View'

| “Display grid points” | ☑: Grid points at which you can position the elements are visible in the editor. |

| “Show box icon” | ☑: Existing function blocks that are linked with a bitmap are displayed by CODESYS in the CFC editor as symbols. Requirement: You have either created the link for a function block or a function in the object properties or loaded it via a library. |

| “Edit Line Colors” | Opens the “Edit Line Colors” dialog for the definition of the colors of the connecting lines, depending on the data type applied. The lines appear in offline and online mode in these colors, unless CODESYS paints over them with the thick black and blue lines used to display the boolean data flow.

- “Add Type”: Adds a data type to the list.
- “Delete Type” |

| “Font” | Display of the font and button for changing the font. |

Dialog ‘Options’ – 'Declaration Editor'

Symbol: 

Function: This dialog is for the configuration of the display settings for the declaration editor.

Call: Main menu “Tools ➔ Options”, category “Declaration Editor”

<table>
<thead>
<tr>
<th>“Textual only”</th>
<th>Textual view of the declaration editor</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Tabular only”</td>
<td>Tabular view of the declaration editor</td>
</tr>
<tr>
<td>“Switchable between textual and tabular”</td>
<td>The declaration editor offers two buttons for switching between the textual and tabular views:</td>
</tr>
<tr>
<td>: textual view</td>
<td>: tabular view</td>
</tr>
<tr>
<td>The following option defines the view that appears by default when opening a programming object:</td>
<td></td>
</tr>
<tr>
<td>● “Always textual”</td>
<td>● “Always tabular”</td>
</tr>
<tr>
<td>● “Remember recent setting (per object)”</td>
<td>● “Remember recent setting (global)”</td>
</tr>
</tbody>
</table>

Dialog ‘Options’ – 'Device Description Download'

Symbol: 

Function: This dialog is for the configuration of addresses of download servers for device descriptions.

Call: Menu “Tools ➔ Options”, category “Download the Device Descriptions”.

See also

- Chapter 6.4.1.18 “Managing devices” on page 2038

Table 566: “Download server”

| List of download servers containing device descriptions. By default 'https://store.codesys.com/CODESYSDevs' is entered as the download server. |
| If you select the button “Download Missing Device Descriptions” in the “Device Repository” dialog, CODESYS uses the servers entered here and uses the set login data for the proxy server. |
| Double-click on “(Enter new download server here...)” | An input field opens in which you can enter the URL address of a server. |
| [Del] | Deletes the selected download server. |

**Dialog 'Options' - 'Device Editor'**

Symbol: 

**Function:** This dialog includes settings for displaying the device editor.

**Call:** Menu bar: “Tools ➤ Options”; category: “Device Editor”.

**Tab 'View'**

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Show generic device configuration views&quot;</td>
<td>This tab with the list of device parameters is available in the device editors of parameterizable devices.</td>
</tr>
<tr>
<td>&quot;Create cross references for IEC addresses (clean necessary)&quot;</td>
<td>CODESYS creates the cross-references for unmapped I/Os.</td>
</tr>
</tbody>
</table>
| "Communication page"                                                   | - "Classic mode": The “Communication” tab of the device editors appears as a split window with the left side showing the current configured gateway channels in a tree structure and the right side showing the associated data and information.
  - "Simple mode": The “Communication” tab appears as described in the corresponding section in the help. Additional modes may also be available from customer-specific extensions. |
| "Show implicit files for application download on the editor of a PLC"   | The tab for synchronized files is available in the device editors. Synchronized files are downloaded to the PLC at the time of application download. These can be external files that were added to the application, or implicit files such as a source code archive. |
| "Show access rights page"                                              | The “Access Rights” tab is available in the device editors. Note: Depending on the device, the device description may overwrite this setting.                                                                     |

</table>

| "Restore defaults"    | Resets the custom settings to default. |

*The modified settings will be valid after restart of Automation Builder.*

### Dialog 'Options' - 'FBD, LD, and IL'

**Symbol:** 🏒

**Function:** This dialog is used for configuring the display options for the FBD/LD/IL editor.

**Call:** "Tools ➔ Options" (category “FBD, LD, and IL”).

### Tab 'General'

#### Table 568: “View”

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Show network title&quot;</td>
<td>The network title is displayed in the upper left corner of the network.</td>
</tr>
<tr>
<td>&quot;Show network comment&quot;</td>
<td>The network comment is displayed in the upper left corner of the network. When the network title is also shown in CODESYS, the comment is shown in the line below.</td>
</tr>
<tr>
<td>&quot;Show box icon&quot;</td>
<td>The block symbol is displayed in the block element in the FBD and LD editor. The standard operators also have symbols.</td>
</tr>
<tr>
<td>&quot;Show operand comment&quot;</td>
<td>CODESYS shows the comment that you indicated for a variable in the implement-</td>
</tr>
<tr>
<td></td>
<td>ation part. The operand comment refers to the local occurrence of the variable only, as opposed to the symbol comment.</td>
</tr>
<tr>
<td></td>
<td>This comment is truncated automatically depending on available space.</td>
</tr>
<tr>
<td></td>
<td>You can limit the comment to a defined width by activating the option “Fixed size for operand fields”.</td>
</tr>
<tr>
<td>&quot;Show symbol comment&quot;</td>
<td>The comment that you indicated for a variable or symbol in the declaration is displayed in CODESYS above the variable name. You can also assign a local operand comment in addition to or instead of the symbol comment.</td>
</tr>
<tr>
<td>&quot;Show symbol address&quot;</td>
<td>If an address is assigned to a symbol (variable), then this address is displayed above the variable name.</td>
</tr>
<tr>
<td>&quot;Show network separators&quot;</td>
<td>A separator is displayed between the individual networks.</td>
</tr>
</tbody>
</table>
Table 569: “Behavior”

| Placeholder for new operands | The operand field of pins for the new function block is left blank (instead of "???"). |
| Empty operands for function block pins | Adds blank operands instead of ???.

Table 570: “Font”

Click the input field to open the “Font” dialog.

| Fixed size for operand fields | ☑: “Edit operand sizes” can be enabled. |
| Edit operand sizes | The “Operand Sizes” dialog opens for setting the number of characters and lines.

Table 571: “View”

| Networks with line breaks | ☑: Display of the network with line breaks so that CODESYS can show as many blocks as possible in the current width of the window. |
| Connect boxes with straight line | ☑: The length of the lines between the elements are fixed and short. |

Table 572: “Behavior”

| Default network content | Drop-down list: Contents of a new network |
| After insertion select | Drop-down list: Element that CODESYS selects after inserting a new network |

Table 573: “View”

| Networks with line breaks | ☑: Display of the network with line breaks so that CODESYS can show as many blocks as possible in the current width of the window. |

Table 574: “Behavior”

| Default network content | Drop-down list: Contents of a new network |
| After insertion select | Drop-down list: Element that CODESYS selects after inserting a new network |

Table 575: “View”

| Enable IL | The IL implementation language is available in the development system. |

Table 576: “Behavior”

| Default network content | Drop-down list: Contents of a new network |
| After insertion select | Drop-down list: Element that CODESYS selects after inserting a new network |

Tab 'Print'
Table 577: “Layout Options”

<table>
<thead>
<tr>
<th>“Fit method”</th>
<th>Drop-down list for resizing.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Avoid cutting of elements”</td>
<td>Elements that do not fit on the page are printed on the next page.</td>
</tr>
<tr>
<td>“Mark connections on adjacent pages”</td>
<td>Enabled for selection when “Avoid cutting of elements” is selected.</td>
</tr>
</tbody>
</table>

Dialog 'Options' - 'Help'

Symbol: 📚

Function: This dialog defines whether CODESYS Online Help or CODESYS Offline Help opens when help is called.

Call: Menu bar: “Tools ➔ Options”; category: “Help”.

- CODESYS Online Help opens when CODESYS Help is called. This is the default setting.
- CODESYS Offline Help opens when CODESYS Help is called.

Dialog 'Options' - 'IEC 60870-5-104'

Symbol: 🌐

Function: In this dialog you can set this notation of the “Address format”.

Call: menu “Tools ➔ Options”, category “IEC 60870-5-104”

Tab 'Address format'

- 1.2.3 (separated by dots)
- 1-2-3 (separated by hyphens)
- 66051 (decimal number, big endian --> 0x10203)
- 197121 (decimal number, little endian --> 0x30201)
Dialog 'Options' – 'International Settings'

Symbol: 🌐

Function: This dialog is for the setting of the language in the user interface and in the help.

Call: Menu bar: “Tools ➤ Options”, category “International Settings”.

Dialog 'Options' – 'Libraries'

Symbol: 📚

Function: This dialog helps you to manage the mappings of library references that CODESYS uses during the conversion of an old project. If you have not yet stored any mapping for a certain library, you must redefine the mapping each time when opening an old project in which this library is integrated.

A mapping defines what a library reference looks like following the conversion of the project to the current format. There are three possibilities:

- You retain the reference. This means that CODESYS similarly converts the library into the current format (*.library) and installs it in the local library repository.
- You replace a reference with another reference. This means that one of the installed libraries replaces the library that was integrated until now.
- You delete the reference. This means that the converted project no longer integrates the library.

CODESYS applies all the listed mappings to the library references of an old project the next time it is converted. Hence, you must repeat the mapping definition if the same library is integrated again in a project that is to be converted. You can enter a new mapping in the last line.

<table>
<thead>
<tr>
<th>“Source Library”</th>
<th>Path of the library that is integrated in the project before the conversion. A double-click an entry makes the field editable and the button for the input assistance appears.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Target Library”</td>
<td>Name and location of the library that is to be integrated in the project after the conversion. A double-click an entry opens the dialog “Set target system library”.</td>
</tr>
</tbody>
</table>

Table 578: “Set target system library”

<table>
<thead>
<tr>
<th>“Scan”</th>
<th>The “Select Library” dialog opens. You can select a library from the library repository here. The dialog corresponds to the dialog in the library repository.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Ignore”</td>
<td>When CODESYS converts the project, CODESYS always removes the existing source library from the project.</td>
</tr>
</tbody>
</table>

Dialog 'Options' – 'Library Download'

Symbol 🌐

Function: This dialog is for the setting of download servers.

Call: menu “Tools ➤ Options”, “Library Download” category
If you click on the button “Download Missing Libraries” in the library manager, CODESYS browses these download servers for libraries marked as missing in the library manager and uses the set login details for the proxy server.

<table>
<thead>
<tr>
<th>“Download servers”</th>
<th>URL of a server containing library files</th>
</tr>
</thead>
<tbody>
<tr>
<td>Double-click on “(Enter new download server here)”</td>
<td>An input field opens in which you can enter the URL address of a server.</td>
</tr>
</tbody>
</table>

**Dialog ‘Options’ – ‘Load and Save’**

**Symbol:** 🚀

**Function:** The dialog contains settings for the behavior of CODESYS when loading and saving a project.

**Call:** Menu bar: “Tools ➔ Options”, “Load and Save” category

<table>
<thead>
<tr>
<th>“Create backup files”</th>
<th>✓ Each time the project is saved, CODESYS also saves the project as the file <code>&lt;project name&gt;.project</code> in addition to the file <code>&lt;project name&gt;.backup</code>. You can rename the backup file and open it in the programming system.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Automatically save every … minutes”</td>
<td>✓ CODESYS automatically saves the project at the specified time intervals in a file <code>&lt;project name&gt;.autosave</code>, which you can reload following non-regular closing of the programming system. CODESYS deletes the <code>.autosave</code> file whenever the project is closed or saved regularly. CODESYS retains the <code>.autosave</code> file in the case of an irregular termination. When you open a project for which there is an associated autosave file, the “Auto Save Backup” dialog opens. In this dialog you select whether the <code>.autosave</code> file or the version of the project last saved by the user should be opened.</td>
</tr>
<tr>
<td>“Save before build”</td>
<td>CODESYS saves the project automatically before each build operation.</td>
</tr>
<tr>
<td>“Create project recovery information”</td>
<td>Requirement: The “No protection” option is selected in the project settings in the “Security” category. This means that the project is not protected against unauthorized access and data manipulation, and there is no integrity check when the project is loaded. ✓ If a project crashes during editing, then the next time the project is opened, a prompt is displayed asking whether or not you want to restore the unsaved data and create a new project file. If you click “Yes”, then another dialog opens. In this dialog, you can select whether you want to open the restored project or open the project comparison. This project comparison displays the differences between the last saved project and the restored project. Note: The project restore records every change on the hard disk when the change is made. If a power failure or hard disk error occurs on the hard disk during this operation, then the last change may be lost.</td>
</tr>
<tr>
<td>“Advanced Settings”</td>
<td>The “Advanced Settings” dialog opens.</td>
</tr>
</tbody>
</table>
“At startup”

List box for the startup screen of CODESYS:

- “Show start page”: The start page of CODESYS is shown.
- “Load last loaded project”
- “Show "Open Project" dialog”
- “Show "New Project" dialog”
- “Show empty environment”

“News page”

URL that is opened by means of the command “Help ➔ CODESYS CODESYS Homepage”.
By default, this page is http://www.codesys.com/startpage.

Table 579: Dialog “Advanced Settings”

<table>
<thead>
<tr>
<th>“Project compression”</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Level”</strong></td>
</tr>
<tr>
<td>Requirement: The “No protection” option is selected in the project settings in the “Security” category. This means that the project is not protected against unauthorized access and data manipulation, and there is no integrity check when the project is loaded.</td>
</tr>
<tr>
<td>List box for the compression level that is used when saving the project.</td>
</tr>
<tr>
<td>- “Least compression - best speed (recommended)”</td>
</tr>
<tr>
<td>- “Medium compression - medium speed”</td>
</tr>
<tr>
<td>- “Most compression - worst speed”</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Load Behavior”</th>
</tr>
</thead>
<tbody>
<tr>
<td>Libraries and compilation information are loaded in the background while you edit the project.</td>
</tr>
</tbody>
</table>

Dialog ‘Options’ - ‘Message View’

Symbol: 📡

Function: In this dialog the number of messages can be determined.
Call: menu “Tools ➔ Options”, category “Message View”

<table>
<thead>
<tr>
<th>“Maximum numer of messages” xxx</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default, 500, max. 9999, min. 20</td>
</tr>
</tbody>
</table>

Dialog ‘Options’ - ‘Monitoring’

Symbol: 🌐

Function: This dialog includes settings for displaying the variable values in monitoring.
Call: Menu bar: “Tools ➔ Options”; category: “Monitoring”
Table 580: “Display Mode for Integer Variables”

- **“Binary”**: The value of the variable is displayed in the corresponding format in online mode.
- **“Decimal”**: This option corresponds to the setting of the command “Debug
  ➔ Display Mode”.
- **“Hexadecimal”**

Table 581: “Floating Point Variables”

- **“Number of displayed digits”**: Decimal places that are represented in online mode when REAL values are displayed.
  
  Note: The settings apply to the watch list, the monitoring of the declaration editor and the trace editor. The configuration for inline monitoring of the editor is set in the text editor options.

See also
- ¶ “Tab ‘Monitoring’” on page 2800

Dialog 'Options' - 'PLCopenXML'

Symbol: 📜

**Function**: This dialog contains settings for the behavior of CODESYS when exporting or importing PLCopenXML.

**Call**: Main menu “Tools ➔ Options”, category “PLCopenXML”

Table 582: “PLCopenXML Export Settings”

- **“Additionally export declarations as plain text”**: By default, CODESYS splits the declaration parts in accordance with the PLCopenXML scheme into individual variables and thus loses the formatting and some comment information.
  
  ☑: Formatting and comments are retained. CODESYS additionally writes the plain text of the exported declaration part into the PLCopenXML file and thus extends the PLCopenXML scheme.

- **“Export Folder Structure”**: CODESYS also exports the folders if they contain one of the selected objects. That is a CODESYS-specific extension to the PLCopenXML scheme.

Table 583: “PLCopenXML Import Settings”

- **“Import folder structure”**: If the import file contains information about the folder structure of the objects, CODESYS also imports this structure.
  
  ☐: CODESYS imports objects without structure.

Dialog 'Options' - 'SFC Editor'
Symbol: 

Function: This dialog is used for configuring the settings for the SFC editor.

Call: Menu bar: “Tools ➔ Options” (“SFC Editor” category).

See also
- Chapter 6.4.1.9.5.5.2 “Programming in SFC” on page 1880
- Chapter 6.4.1.21.3.12 “Menu ‘SFC’” on page 2675
- Chapter 6.4.1.20.1.5.1 “SFC editor” on page 2062

Tab 'Layout'

Table 584: “Elements”
This defines the dimensions of the SFC elements: step, action, qualifier, property. The values are given in matrix units, where one matrix unit equals the font size that you set in the text editor options (text area / font). The settings are always active immediately in all open SFC editor views.

<table>
<thead>
<tr>
<th>Element</th>
<th>Possible values</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Step height”</td>
<td>1-100</td>
</tr>
<tr>
<td>“Step width”</td>
<td>2-100</td>
</tr>
<tr>
<td>“Action width”</td>
<td>2-100</td>
</tr>
<tr>
<td>“Qualifier width”</td>
<td>2-100</td>
</tr>
<tr>
<td>“Property width”</td>
<td>2-100</td>
</tr>
</tbody>
</table>

Table 585: “Font”
The example text shows the current font. Click it to change the font.
### Table 586: “Step Actions”

| “Default insertion method” | “Copy reference”: The reference to the action objects that call the step are also copied when the step is copied. The copied step and new step call the same action.  
| | “Duplicate implementation”: The reference to the action objects that call the step are linked to this step. When copying the step element, new action objects are created for the new step, and the implementation is duplicated.  
| | “Always ask”: When inserting a step action, you are always prompted whether the actions of a step element should be duplicated when it is copied, or whether the reference to the existing action should be applied.  
| Note: If a step already contains an embedded action, then new inserted actions of this step are also embedded. Likewise, new inserted actions are not embedded when the step already contains a non-embedded action. In these cases, you are no longer prompted for a duplication mode. |

### Table 587: “Embedded Objects”

| “Show action and transition objects in the navigator” | ✓: Action and transition objects that are embedded in the SFC box by a step are displayed in the “Devices” or “POUs” tree view. |

### Table 588: “Property Visibility”

| “Property” | Defines the element properties displayed next to the element in the SFC diagram.  
| “Value” | ✓: Display of the property value.  
| “With Name” | ✓: Display of the property value including name. |

### Table 589: “Online”

| “Show step time” | ✓: In online mode, CODESYS displays the step time to the right of the steps. |

### Dialog 'Options' - ‘SmartCoding’

**Symbol:** ☰

**Function:** This dialog is for configuring the settings for easier coding.

**Call:** Menu bar: “Tools ➔ Options”, “SmartCoding” category

| “Declare unknown variables automatically (AutoDeclare)” | ✓: The “Declare Variable” dialog opens when you type an undeclared identifier into an implementation language editor and then click away from the input line.  
| In order for the AutoDeclare function to be available in the ST editor as well, the “Enable for ST editor” option also has to be selected. |

| “Enable for ST editor” | Requirement: The “Declare unknown variables automatically (AutoDeclare)” option is selected.  
| ✓: The AutoDeclare function is also available in the ST editor.  
| ☐: The AutoDeclare function is not available in the ST editor. |
"Show all instance variables in Input Assistant"  
- The "List components" function also lets you select the local variables of a function block instance.  
- The "List components" function lets select only the input variables and output variables of a function block instance.

"Show symbols from system libraries in Input Assistant"  
- System libraries are inserted in the library manager automatically and displayed in light gray.  
- Symbols, such as global variables, data types, and function blocks, are offered in the Input Assistant.  
- The symbols of the system libraries are not available in the Input Assistant.

"List components after typing a dot (.)"  
- Activates the "List components" function. When you type a dot (.) at a location where CODESYS expects an identifier, a list box appears with possible code.

"List components immediately when typing"  
- Requirement: The "List components after typing a dot (.)" check box is selected.  
- While you type code, a list box appears with possible identifiers and operators.

"Insert with namespace"  
- CODESYS adds the namespace before the identifier.

"Convert keywords to uppercase automatically (AutoFormat)"  
- CODESYS displays all keywords in uppercase.

"Automatically list selection in cross-reference view"  
- The cross-reference list automatically shows the references of variables, POU's, and DUT's that are currently selected or where the cursor is waiting.

"Underline errors in the editor"  
- Incorrect or unknown program code is underlined.

"Highlight symbols"  
- All occurrences of a symbol where the cursor is positioned are highlighted in color within the editor. In this way, cross-references within the editor are quickly detected.

"Max. degree of parallelism"  
- List box for the number of parallel threads that can be used for the precompile processing. CODESYS detects the displayed number of threads from the number of CPU cores. This default number should be changed only in exceptional cases.

Dialog 'Options' - 'Startup settings'

Symbol: "*"  

Function: In this dialog the “Version profile” and the “License” are set.  

Call: menu “Tools ➔ Options”, category “Startup settings”

<table>
<thead>
<tr>
<th>&quot;Version profil:&quot;</th>
<th>Automation Builder 2.5</th>
</tr>
</thead>
<tbody>
<tr>
<td>§ &quot;Display selected dialog at each start&quot;: Refers to the version of the AB to be displayed&quot;</td>
<td></td>
</tr>
</tbody>
</table>
Dialog 'Options' - 'Text Editor'

Symbol: 🏷️

Function: The dialog contains settings for displaying and working in a text editor.

Call: Menu bar: “Tools ➔ Options”, “Text Editor” category

Tab 'Theme'

On this tab, you set the desired theme in the interface design of the ST editor.

<table>
<thead>
<tr>
<th>“Theme”</th>
<th>Color theme for the text editor. The selected theme is shown in the “Preview” window. The available color schemes are stored in the installation directory in the Themes folder.</th>
</tr>
</thead>
</table>
Tab 'Editing'

<table>
<thead>
<tr>
<th>“Number of undos”</th>
<th>Maximum number of editing steps that you can apply the “Edit ➔ Undo” command to.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Folding”</td>
<td>Defines the structuring of the code by indentation. When you select an indentation, you can expand or collapse the indentation section by means of a plus and minus sign in front of the first line of each section.</td>
</tr>
<tr>
<td></td>
<td>● “Indent”: CODESYS combines all lines that are indented in relation to the preceding line into one indentation unit.</td>
</tr>
<tr>
<td></td>
<td>● “Explicit”: You mark the code segment explicitly with comments that should be combined in one indentation unit: a comment with three opening braces “{“ has to be before the segment, and a comment with three closing braces ”}” has to be after the segment. The comments can contain additional text. Example:</td>
</tr>
<tr>
<td></td>
<td><img src="image" alt="Example Code" /></td>
</tr>
<tr>
<td>“Word wrap”</td>
<td>● “Soft”: The line break occurs at the edge of the editor window when 0 is specified for “Wrap margin”.</td>
</tr>
<tr>
<td></td>
<td>● “Hard”: The line break occurs after the number of characters specified for “Wrap margin”.</td>
</tr>
<tr>
<td>“Tab width”</td>
<td>Number of characters</td>
</tr>
<tr>
<td>“Keep tabs”</td>
<td>CODESYS does not break up the space you have inserted with the [Tab] key into individual spaces afterwards.</td>
</tr>
<tr>
<td>“Indent width”</td>
<td>If you have selected “Smart” or “Smart with code completion” for the “AutoIndent” option, then CODESYS inserts the number of spaces at the beginning of the line.</td>
</tr>
<tr>
<td>“AutoIndent”</td>
<td>● “None”</td>
</tr>
<tr>
<td></td>
<td>● “Block”: A new line automatically applies the indentation of the previous line.</td>
</tr>
<tr>
<td></td>
<td>● “Smart”: Lines that follow a line which contains a keyword (for example, VAR) indent automatically by the specified Indent width.</td>
</tr>
<tr>
<td></td>
<td>● “Smart with code completion”: Indentation as in the case of the “Intelligent ” option, but CODESYS also inserts the closing keyword (for example, END_VAR).</td>
</tr>
</tbody>
</table>

Tab 'Text Area'

| “Highlight current line” | ☑: The line where the cursor is located is highlighted. |
| “Matching brackets”      | ☑: When the cursor is positioned before or after a bracket within a line of code, the corresponding closing or opening bracket is marked by a frame. |
**“End of line markers”**  
☑️: The end of each editor line is marked by a small dash after the last character (including spaces) of the line.

**“Wrap guide”**  
☑️: When a soft or hard line break is activated, the defined line break position is displayed with a vertical line.

**“Font”**  
Clicking the field opens the default dialog for configuring the font.

### Tab 'Margin'
Settings for the left margin of the text editor window, which is separated from the input area by a vertical line:

**“Line numbering”**  
☑️: The declaration and implementation parts of the editor are numbered on the left, each beginning with 1.

**“Highlight current line”**  
☑️: The line number of the line where the cursor is located is highlighted.

**“Show bracket scope”**  
☑️: Brackets include the lines between the keywords that open and close a construct (for example, `IF` and `END_IF`). When the option is enabled and the cursor is positioned before, after, or in one of the keywords of a construct, the bracket area is displayed with a square bracket in the margin.

**“Mouse Actions”**  
You can assign one of the following actions to each of the specified mouse actions or mouse-keyboard combinations. CODESYS performs the selected action when you move the mouse to the plus or minus sign in front of the header of a bracketed area:
- **“None”**: The mouse action does not trigger an action.
- **“Select fold”**: CODESYS selects all lines of the bracketed area.
- **“Toggle fold”**: CODESYS opens or closes the bracketed area, or if there are nested brackets, the first level of the bracketed area.
- **“Toggle fold fully”**: CODESYS opens or closes all levels of a nested bracketed area.

### Tab 'Monitoring'
Settings for displaying the monitoring fields

**“Enable inline monitoring”**  
☑️: Display of the monitoring fields behind the variables in online mode

**“Number of displayed digits”**  
Number of comma places in the monitoring field

**“String length”**  
Maximum length of string variable values in the monitoring field

<tr>
<td></td>
<td>6.4.121.4.15.4</td>
</tr>
<tr>
<td></td>
<td>6.4.121.4.15.5</td>
</tr>
</tbody>
</table>

### General
The dialog contains the tabs to configure the user interface.

You can reset the CODESYS settings to default by use of the “Reset” button.
Dialog 'Customize' - 'Menu'

**Function:** With this dialog, you define the structure and contents of the user interface.

**Call:** Main menu “Tools ➔ Customize” (“Menu”).

When you click “OK” to close the dialog, the changes are visible in the menu bar of the CODESYS user interface.

<table>
<thead>
<tr>
<th>Table 590: “Menu”</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display of currently defined menus, submenus, and included commands. In CODESYS, a menu or submenu caption is identified by the caption symbol ( ). The layout from top to bottom corresponds to the layout displayed later in the CODESYS menu.</td>
</tr>
</tbody>
</table>

| “Add Command” | Enabled when a command is selected. Adds a command above the selected command. Opens the “Add Command” dialog. Use the “Add Command” dialog for selecting one or more commands. Left part: List of categories. Right part: List of commands in the selected category. |
| “Add Separator” | Adds a separator above the selected command. |
| “Add Popup Menu” | Adds a popup menu above the selected menu, submenu, or command. Opens the “Add Popup Menu” dialog. |
| “Edit Popup Menu” | Opens the “Edit Popup Menu” dialog. |
| “Reset” | Resets the default settings of the entire menu. |
| “Load” | Loads the settings from a stored file (<file name>.opt.menu). |

<table>
<thead>
<tr>
<th>Table 591: “Add Popup Menu”</th>
</tr>
</thead>
<tbody>
<tr>
<td>In CODESYS, a new menu is shown in the menu bar only when the menu contains at least one command.</td>
</tr>
</tbody>
</table>

| “Default text” | Select this check box when localization is available. |
| “Localized Texts” | List: Languages and localized texts. |
| “Add Language” | Opens a drop-down list of available languages. In CODESYS, the selected language is displayed in the area “Localized Texts”. Use the “Text” column for typing the localized texts. |

Dialog 'Customize' - 'Command Icons'

**Function:** This dialog defines the icons of the menu commands.

**Call:** Menu bar: “Tools ➔ Customize” (“Command Icons”).

<table>
<thead>
<tr>
<th>Table 592: “Command icon”</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Assign”</td>
</tr>
<tr>
<td>“Remove”</td>
</tr>
<tr>
<td>“Reset”</td>
</tr>
<tr>
<td>“Load”</td>
</tr>
<tr>
<td>“Save”</td>
</tr>
</tbody>
</table>
Dialog 'Customize' - 'Toolbars'

**Function:** Use this dialog for generating new toolbars or customizing existing toolbars.

**Call:** Main menu “Tools ➔ Customize” (“Toolbars”).

When you click “OK” to close the dialog, the changes are visible in the menu bar of the CODESYS user interface.

<table>
<thead>
<tr>
<th>Table 593: “Toolbars”</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display of currently defined toolbars. In CODESYS, the associated commands are listed below each toolbar in the order they will appear in the toolbar.</td>
</tr>
<tr>
<td>Double-clicking a toolbar in the list switches to editing mode.</td>
</tr>
</tbody>
</table>

| “Add Toolbar” | Enabled when a toolbar is selected. |
|---------------------------------------------------------------|
| In CODESYS, this adds a toolbar above the selected toolbar and places the cursor in the name field of the new toolbar. |

| “Add Command” | Enabled when you select a command or blank command entry below a toolbar. |
|---------------------------------------------------------------|
| Adds a command above the selected command. Opens the “Add Command” dialog. |
| Use the “Add Command” dialog to select one or more commands. Left part: List of categories. Right part: List of commands in the selected category. |

| “Add Separator” | Adds a separator above the selected command. |
|---------------------------------------------------------------|
| “Hide” | Hide the selected toolbar from the user interface. |
| “Show” | Shows the selected hidden toolbar in the CODESYS user interface. |
| “Reset” | Resets the default settings of the toolbars. |
| “Load” | Loads the settings from a stored file (<file name>.opt.tbar). |

</tbody>
</table>
### Dialog 'Trace Configuration'

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.4.1.21.4.16.1</td>
<td>Dialog 'Advanced Trace Settings'................................. 2803</td>
</tr>
<tr>
<td>6.4.1.21.4.16.2</td>
<td>Dialog 'Trace Configuration'.......................................... 2804</td>
</tr>
</tbody>
</table>

### Dialog 'Advanced Trace Settings'

**Function:** This dialog provides extended settings for recording data.

**Call:** “Advanced” button in “Trace Configuration” dialog, "Record Settings" subdialog

**Requirement:** The trace editor is open and active. The dialog “Trace configuration” is open and the top node of the trace record tree is selected so that the subdialog “Record settings” is available.

---

The buffer size is defined as "number of samples". CODESYS calculates the time intervals that corresponds to this number and displays the result in normal fonts on the right outside the table (for example, “1h1m1s1ms”). The calculation is possible only with the help of the task configuration settings and when the task cycle time is known.

<table>
<thead>
<tr>
<th>&quot;Measurement in every n-th cycle&quot;</th>
<th>Data sampling in every n task cycle</th>
<th>Sampling interval which is automatically calculated from the value specified in the Measurement in every n-th cycle option</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default: 1; then the application performs the data sampling in each task cycle.</td>
<td></td>
<td>Example: 100ms</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>&quot;Recommended runtime buffer size (samples)&quot;</th>
<th>Calculated automatically and therefore recommended number of samples which the application can store per trace variable at runtime</th>
<th>Maximum length of the time interval during which the application samples data on the runtime system</th>
</tr>
</thead>
<tbody>
<tr>
<td>This value determines the maximum ring buffer size in the runtime system. This buffer size is automatically calculated from the task cycle time and the value in the “Measure in every n-th cycle” option, and the displayed.</td>
<td>Example: 2s</td>
<td>Note: The calculation is possible only when the settings of the trace configuration are set in the “Trace Configuration” dialog and therefore the task cycle time is known.</td>
</tr>
<tr>
<td>This buffer size is used when the “Override runtime buffer size” option is disabled.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
**“Override runtime buffer size”**

- Enables the input field for you to specify your own defined buffer size. At runtime, the value which you have specified here is used, not the value displayed in the Recommended runtime buffer size (samples) option.
- Example: 100
- At least 10
- The application uses this value, not the value calculated by CODESYS from the Recommended runtime buffer size (samples) option.
- Example: 6s

**“Trace editor buffer size per variable (samples)”**

- Number of values that can be stored per variable in the trace editor.
- Example: 10000

Maximum length of the time interval during which the application samples data on the runtime system without overwriting it.

- Example: 6s

The maximum time period for the display in the trace editor results from the maximum number and the sampling interval of the data sampling. You can scroll back a maximum of this time in the trace editor.

**Example**

Column (1) notifies you about the number of samples.

Column (2) next to it displays the calculated time intervals which result.

- The information displayed in the example means that one sample is taken per task cycle in the runtime system and continuously cached in a ring buffer, which can hold a maximum of 201 samples. The enabled “Override runtime buffer size” option has the effect that, due to the ring buffer, the first cached values are first overwritten after 100 samples. During this time, 10000 samples are continuously displayed in the trace editor so that a value curve can be displayed over an interval of 1 minute and almost 40 seconds.

**Tree view ‘Trace Record’**

The tree view lists the variables that are traced and allows for access to the variable settings.
Selected trace name  The “Record Settings” subdialog is displayed on the right.
Selected trace variable  The “Variable Settings” subdialog is displayed on the right.

Table 595: Context menu commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>+ “Add Variable”</td>
<td>Adds a new trace variable. The “Variable Settings” subdialog opens on the right and is partially configured. Select a variable in the input field of the “Variable” setting to trace its value curve.</td>
</tr>
<tr>
<td>“Assign to Diagram”</td>
<td>Lists the diagrams (in the submenu on the right) where the selected variable is not currently displayed. Select a diagram to display the variable there. The command is available when a variable is selected in the tree view. Hint: When the command is deactivated, the variable is already displayed in all diagrams.</td>
</tr>
<tr>
<td>“Enabled”</td>
<td>Selected by default Disabled variables are displayed as disabled. They are neither displayed nor recorded.</td>
</tr>
</tbody>
</table>

Tree view ‘Presentation (Diagrams)’  The tree view lists the diagrams that are displayed in the trace editor and allows for access to their display mode.

<table>
<thead>
<tr>
<th>Selected node “Time axis”</th>
<th>The “Display Mode” subdialog for the time axis is displayed on the right. You can specify the time axis display. See below.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Selected diagram name</td>
<td>The settings for the coordinate system of the diagram and a preview are displayed on the right. See below.</td>
</tr>
<tr>
<td>Selected node “Y-axis”</td>
<td>The “Display Mode” subdialog is displayed on the right. You can specify the axis display. See below.</td>
</tr>
<tr>
<td>“Show variables”</td>
<td></td>
</tr>
<tr>
<td>Selected trace variable</td>
<td>The “Variable Settings” subdialog is displayed on the right. You can configure the trace variable. See below. Note: These are the same settings that can be accessed in the “Trace Record” tree view.</td>
</tr>
</tbody>
</table>

Table 596: Context menu commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>+ “Add Diagram”</td>
<td>Adds a new diagram below and displays it in the tree view “Presentation (Diagrams)”.</td>
</tr>
<tr>
<td>+ “Add New Variable”</td>
<td>Adds a new trace variable. The “Variable Settings” subdialog opens on the right and it is partially configured. Select a variable in the input field of the “Variable” setting to trace its value curve. Specify its display. In addition, the variable is assigned to the selected diagram.</td>
</tr>
<tr>
<td>“Add Existing Variable”</td>
<td>Lists all trace variables (in the submenu on the right) where the selected diagram is not currently displayed. Select a variable in order to display it in the selected diagram. Hint: When the command is deactivated, all trace variables are already displayed in the selected diagram.</td>
</tr>
</tbody>
</table>

Subdialog ‘Record Settings’  Requirement: The top node is selected in the “Trace Record” tree view.
**“Enable trigger”**

☑️: Triggering is enabled. The trace data is buffered at runtime only when a trigger signal has been sent. You determine how the trigger signal is sent in the “Trigger variable”, “Trigger parameter”, “Trigger edge”, “Post-trigger (Samples)”, and “Trigger level” settings.

☐: Continuous display of current records

**“Trigger variable”**

Signal that is used as a trigger. A complete instance path is required.

A valid trigger signal is an IEC variable, a property, a reference, a pointer, an array element of the application, or an expression. Allowed types are all IEC-based types except STRING, WSTRING, and ARRAY. Enumerations are allowed when the base type is not STRING, WSTRING, or ARRAY. The contents of a pointer are not a valid signal.

When the runtime system uses the CmpTraceMgr component, a property that is linked to the 'monitoring' attribute can then be recorded as a variable.

**“Trigger parameter”**

System parameter that is used as a trigger

The “Input Assistant” dialog lists all valid system parameters in the “Parameters” category of the “Categories” tab.

Allows the selection of “Trigger variable” or “Trigger parameter”

**“Trigger edge”**

Defined the edge detection for triggering:

- **positive**
  - For Boolean trigger variables, triggering occurs when the values change from FALSE to TRUE.
  - For analog trigger variables, triggering occurs when the value as defined in “Trigger level” is reached from below.
- **negative**
  - For Boolean trigger variables, triggering occurs when the values change from TRUE to FALSE.
  - For analog trigger variables, triggering occurs when the value as defined in “Trigger level” is reached from above.
- **both**
  - For Boolean trigger variables, triggering occurs when the values change.
  - For analog trigger variables, triggering occurs when the value as defined in “Trigger level” is reached.

**“Post trigger (samples)”**

Number of records per trace variable that are buffered after triggering. Default: 50; value range: 0 to \(2^{32}-1\)

**“Trigger level”**

Value that is reached to start the triggering

**“Task”**

Task in which the data is recorded.

**“Recording condition”**

At runtime, the application checks the recording condition. If it is fulfilled, then the trace data is buffered.

Record condition for data recording with CmpTraceMgr runtime system component:

- As an expression that includes only permitted operators and operands.
  - Allowed operators that can also be nested: (logical) AND, NOT, OR, comparison operators <, <=, >, >=, =, <>
  - Allowed operands: Variables that are valid for trace.
- As a variable.
  - Allowed type: BOOL, bit access, property. The condition is fulfilled for TRUE or 1. The contents of a pointer are not permitted.

Recording condition for a data recording with IEC code:

- As an expression that returns a Boolean value.

**“Comment”**

Comment (for example, from the recording condition)
"Resolution"  Unit of measure for the time stamp that is recorded per data set

- "ms": Time stamp (in milliseconds).
- "µs": Time stamp (in microseconds) for a task cycle time of 1 ms or less

"Automatic restart"  Persistently saves the trace configuration and the last contents of the RTS buffer to the target device. After the device has been restarted, the trace is started automatically if the trigger has not occurred yet.

"Advanced"  Opens the "Advanced Trace Settings" dialog.

See also
- Chapter 6.4.1.21.4.16.1 “Dialog ‘Advanced Trace Settings’” on page 2803

Subdialog 'Variable Settings'

Requirement: A trace variable is selected in the "Trace Record" or "Display (Diagrams)" tree view.

<table>
<thead>
<tr>
<th>&quot;Variable&quot;</th>
<th>Valid variable Variable; value recorded with full instance path. Valid:</th>
</tr>
</thead>
<tbody>

<tr>
<td>Array element</td>
<td></td>
</tr>
<tr>
<td>Allowed data type</td>
<td></td>
</tr>
<tr>
<td>IEC-based type except STRING, WSTRING, or ARRAY</td>
<td></td>
</tr>
<tr>
<td>Enumeration when the base type is not STRING, WSTRING, or ARRAY</td>
<td></td>
</tr>
<tr>
<td>When the runtime system uses the CmpTraceMgr component, a property that is linked to the 'monitoring' attribute can then be recorded as a variable.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>&quot;Parameter&quot;</th>
<th>Parameter whose data is recorded. Requirement: Runtime system with CmpTraceMgr component</th>
</tr>
</thead>
<tbody>
<tr>
<td>The “Input Assistant” dialog lists all valid system parameters in the “Parameters” category of the “Categories” tab.</td>
<td></td>
</tr>
</tbody>
</table>

| "Color" | Color of the variable in the trace diagram |

<table>
<thead>
<tr>
<th>&quot;Line type&quot;</th>
<th>Display as line chart</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Line&quot;: Values are linked to form a line.</td>
<td></td>
</tr>
<tr>
<td>&quot;Step&quot;: Values are linked in the form of steps</td>
<td></td>
</tr>
<tr>
<td>&quot;None&quot;: Values are not linked</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>&quot;Point type&quot;</th>
<th>Display as scatter chart</th>
</tr>
</thead>
<tbody>

<tr>
<td>&quot;Cross&quot;: Value is displayed as a cross.</td>
<td></td>
</tr>
<tr>
<td>&quot;None&quot;: value is not displayed</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>&quot;Activate minimum warning&quot;</th>
<th>Warning when less than the lower limit</th>
</tr>
</thead>
</table>

| "Critical lower limit" | If the value of the trace variable falls below the limit, the variable is displayed in the warning color. |

| "Color" | Warning color on falling below the limit |

| "Activate maximum warning" | Warning when exceeding the upper limit |

### Notes
- A trace variable is selected in the "Trace Record" or "Display (Diagrams)" tree view.
- The "Input Assistant" dialog lists all valid system parameters in the “Parameters” category of the “Categories” tab.
- The runtime system with CmpTraceMgr component enables recording variables linked to the 'monitoring' attribute.
- Parameters are displayed as line or scatter charts, with options for line types "Line", "Step", or "None" and point types "Dot", "Cross", or "None".
- Minimum and maximum warnings are configurable.

---

2024/01/05  3ADR010583, 1, en_US  2807
**Subdialog 'Display Mode'**

</thead>
<tbody>
<tr>
<td>“Distance”</td>
<td>Distance between tick marks</td>
</tr>
<tr>
<td>“Subdivisions”</td>
<td>Number of subdivisions between two tick marks</td>
</tr>
</tbody>
</table>

**Link “Preview”** Displays the preview of the diagram.
**Dialog Box 'Trend storage'**

**Function:** This dialog box includes the configuration for buffering the trend data of a trend recording.

**Call:** “Trend Storage” button in the editor of a trend recording.
### Maximum number of variables

Maximum number of trend variables that can be managed in the database. If you increase this value afterwards, then will CODESYS perform a download and reconfigure the database.

### Store every N milliseconds

Time interval (in ms) when the CmpTraceMgr runtime system component buffers the recorded data before storing it persistently in the database. The application calculates internally the number of task cycles from the time interval. The duration of a task cycle is defined in the task configuration.

A high value results in better runtime performance. The disadvantage is the increased risk of losing data if the controller crashes or shuts down. A low value reduces this risk. The disadvantage is the slower control over a trend visualization with large amounts of data.

### Limit

- **Limit:** Limit the recording
  - **No Limit**: Unlimited number of data records (not recommended)
  - **Maximum number of records**: Maximum number of data records that are stored in the database. A data record consists of time stamp and the values of the trend variables at this time.
  - **Maximum storage size**: Maximum size of the trend storage. The application calculates internally the number of data records.

Clicking the "down" symbol (▼) of the drop-down list will set the units to kilobytes (KB), megabytes (MB), or gigabytes (GB).

### Additional Runtime Buffer for

Length of the time interval when the runtime system can record more data (for example, 1000 ms).

If a delay occurs when writing data in the runtime system component, then there is a risk of data loss due to overwriting. In this case, the runtime system uses the addition buffer.

### Dialog Box 'Advanced Trend Settings'

**Function:** This dialog box provides more settings for configuring trend recording.

**Call:** Click “Advanced” in the editor of a “TrendRecording” object.

**See also**

- Chapter 6.4.1.13.4.2 “Getting started with trend recording” on page 2017
- Chapter 6.4.1.13.4.3 “Configuring trend recording” on page 2018
Dialog 'Certificate Selection'

**Symbol:**

**Function:** This dialog is used for selecting the certificates for encryption, decryption, and digital signatures.

**Call:**
- "Security Screen" view, "User" tab
- Main menu: "View ➔ Properties", "Security" tab when the "Application" is selected in the device tree.
- Main menu: "Project ➔ Project Settings", category "Security"

Dialog 'Certificate selection'

The purpose of the certificate that is selected in the dialog depends on the call location:

- Call location: "Security screen" view, "User" tab
  - Certificate for digital signatures
  - Certificate for the decryption of project files
  - Certificate for encrypted communication
- Call: "View ➔ Properties" of the application
  - "Certificates of devices that share the encrypted download and the boot application"
- Call location: "Project ➔ Project settings", category "Security"
  - "Certificate for project encryption"

<table>

6.4.2 Fieldbus Support

6.4.2.1 Device Diagnosis

CODESYS provides general and fieldbus-specific function blocks for performing a diagnosis on the connected devices.

General diagnosis

You can perform a diagnosis on devices regardless of the fieldbus. The function blocks from the CAA Device Diagnosis library are provided for this purpose.

Before you can work with these function blocks, you have to select the “Enable diagnosis for devices” option in the PLC settings. This causes CODESYS to create instances of the diagnosis functions blocks automatically. These function blocks can be used for your diagnosis.

Work exclusively with the automatically generated instances of the diagnosis function blocks. Do not create your own instances.

● Library CAA DeviceDiagnosis

Bus-specific diagnosis

For bus-specific diagnosis options, see the diagnosis chapters of the individual fieldbuses.

6.4.2.2 Fieldbus Devices and I/O Drivers

The technical basis for each fieldbus device, which is configured in the device tree, is the CODESYS I/O driver.

The I/O driver is the link between the fieldbus stack, the IEC application, and the CODESYS IDE. The driver configures the fieldbus stack from the data of the device configuration. It shows the diagnosis, provides an API for the IEC application, and is responsible for the I/O mapping (see chapter "I/O Mapping").

This chapter provides a brief overview of the basic functionality of CODESYS I/O driver devices, without discussing the details of specific bus systems. In addition, some recommendations for the configuration are provided.

Bus cycle task

The bus cycle task is the IEC task in whose context the I/O driver is executed. Some I/O drivers use multiple tasks: usually one real-time critical task (with high priority), which is used for the transfer of I/O data, and another task with low priority for tasks such as evaluating diagnostics and executing acyclic services of the bus system.

With real-time critical bus systems, it has to be ensured that no operations are executed in the context of this bus task that would interrupt the bus clock due to the execution time.

The bus task can be configured in the I/O mapping dialog of the I/O driver device. Note that the settings of the parent device are inherited by default. If this device is the PLC, then its PLC setting applies in the bus cycle task.
NOTICE!
If this above setting is not set, then the task with the shortest cycle time is used. In this way, a non-real-time I/O driver can be executed unintentionally in the task context of a real-time critical driver, thus interrupting its communication. To diagnose these communication problems, it is recommended to check the task monitoring.

See also
● § Table 418 “Bus Cycle Options” on page 2440

I/O mapping
An essential function of an CODESYS I/O driver is to update the I/O mapping. This means the mapping of the I/O data of the bus system to variables of the IEC application (and vice versa).

The input/output data is mapped cyclically by copy and conversion operations in both directions from the internal memory image of the bus system to IEC variables assigned to %I and %Q addresses.

For the I/O driver, there is no internal difference whether symbolic names or "direct" access to the %I and %Q addresses are used for this I/O mapping. For the maintainability of the application, it is recommended to always use descriptive variable names (example: variable "TemperatureReactor" instead of "%IW117" access).

The updating of the I/O mapping can be set with “Always update variables” (globally in the “PLC Settings” or individually for each device in the I/O mapping dialog):

● Disabled:
  Only I/O data used in the application is mapped.
  This may improve performance by avoiding the copy operations, but may cause confusion if the I/O data in the I/O mapping dialog is not updated (the values are then grayed out). This setting is recommended for an application whose development has been completed.

● Enabled 1:
  All data is updated.

● Enabled 2:
  Caution: For productive use in special cases only.
  As a result, inconsistent I/O data may occur, because the bus cycle task reads/writes this data while the application code uses it in other tasks.
  See „Consistency of I/O data“.

See also
● § Chapter 6.4.1.21.2.8.12 “Tab '<device name> I/O Mapping’” on page 2444

Consistency of I/O data
The CODESYS programming system allows the IEC application to use multiple tasks executed in parallel (for visualization, field buses, or other POU's). The application code can access I/O data from the context of these tasks via the mapped IEC variables. By accessing the same data from different tasks, inconsistent or corrupt data could occur (for example, due to interrupted write access).

The I/O driver ensures data consistency by providing each task executing a task cycle with a consistent mapping – a snapshot, so to speak – of all I/O data used.

So a code like in the following example cannot cause problems: (Note "DIV by ZERO")

```plaintext
IF(inputData <> 0) THEN
  x := y / inputData;  // inputData is mapped to %I
END_IF
```

```
DIV_BY_ZERO Exception
```

```
// inputData is not updated by bus cycle during execution of POU
```
NOTICE!
With the "Always update variables" option set to "Enabled 2 – always in bus cycle task", this mechanism is overridden. Accordingly, the application code has to take this into account.

Services
In addition to the basic functionality, some I/O drivers provide services that can be called from the CODESYS IDE, such as the device scan function or the setting of device addresses.

General recommendations
Settings:
- "PLC Settings": [ ] I/O updates in stop:
  The bus cycle continues even when the application is stopped, for example when the application is on a debug breakpoint. In this way, communication with the field devices is maintained and can be continued immediately without interruption.
- "PLC Settings": "Always update variables" is set to "Enabled 1 – use bus cycle task if not used in any task":
  During the development of the application, it is useful to see the values of all I/O data.

Task configuration:
- Especially for real-time critical fieldbus systems such as Profinet, EtherCAT, or CAN, which depend on maintaining an exact send/receive clock, it is recommended to use a separate bus cycle task with high priority. For less real-time-critical tasks (for example, visualization) a significantly lower priority should be selected than for the bus cycle task.
- In order to achieve maximum I/O throughput with as little offset as possible, separate POU's can be executed in the bus task of the fieldbus system. However, these then have to meet the real-time requirements: for example, no file access or blocking socket functions may be executed, but for example only the calculation of the output data.

Multiple I/O drivers and tasks (troubleshooting)
If consistent access to I/O data from multiple tasks and possibly across multiple I/O driver instances has to be synchronized, then undesired reciprocal interference between the bus and application task may occur under certain circumstances.

This is the case, for example, when the general system load is high or when the I/O data of the real-time critical fieldbus system is used together with I/O data of a slow and blocking local bus system in the same task.

In case of unexpected interference of the communication, with the particularly real-time-critical fieldbuses (EtherCAT, Profinet, CAN), the task monitoring should therefore first be examined for very large jitter or outliers in the cycle time (maximum value compared to average value). The task list provides detailed information about the use of I/O data in different tasks.

It may be possible to avoid using I/O data from different bus systems in one and the same task or to reduce the number of I/O tasks.

See also
- Chapter 6.4.1.21.2.8.18 “Tab ‘Task deployment’” on page 2459

6.4.2.3 Bus Cycle Task
Generally, for each IEC task, the used input data is read at the start of each task (1) and the written output data is transferred to the I/O driver at the end of the task (3). The implementation in the I/O driver is decisive for additional transfer of the I/O data. It is responsible for the time frame and time point that the actual transfer to the corresponding bus system occurs.

The bus cycle task of the PLC can be defined globally for all fieldbuses in the PLC settings. For some fieldbuses, however, you can change this independent of the global setting. The task with the shortest cycle time is used as the bus cycle task (setting: "unspecified" in the PLC settings). The messages are normally sent on the bus in this task.
Other tasks copy only the I/O data from an internal buffer that is exchanged only with the physical hardware in the bus cycle task.

(1) Read inputs from input buffer          (2) IEC task
(3) Write outputs to output buffer       (4) Bus cycle
(5) Input buffer                                    (6) Output buffer
(7) Copy data to/from bus
(9) Bus cycle task, priority 1, 1 ms
(10) Bus cycle task, priority 5
(11) Bus cycle task, priority 10, interrupted by task 5

**Task usage**

The "Task Deployment" tab provides an overview of used I/O channels, the set bus cycle task, and the usage of channels.

**WARNING!**

If an output is written in various tasks, then the status is undefined, as this can be overwritten in each case.

If the same inputs are used in various tasks, then it is possible for the input to change during the processing of a task. This happens when the task is interrupted by a task with a higher priority and causes the process image to be read again. Solution: At the beginning of the IEC task, copy the input variables to variables and then work only with the local variables in the rest of the code.

Conclusion: Using the same inputs and outputs in several tasks does not make any sense and can lead to unexpected reactions in some cases.

### 6.4.2.4 Symbolic Access to I/O Channels

#### 6.4.2.4.1 General

You get direct access to the I/O channels of your device by means of specially generated function blocks, without having to actively set up a mapping manually for each device and for each channel.

**Automated generation**

- The inputs and outputs are combined into a function block under the name of the I/O channel. If possible, the basic block defined in the device description is extended.
- The channel name corresponds to the name as specified in the device editor on the I/O Mapping tab in the "Channel" column.
- The input and output variables created in this way are also displayed in the Input Assistant.
If the I/O channels are structured or enumerations, then their function blocks are also structured accordingly. As such, the generated function blocks contain structured inputs and outputs or enumerations.

- For channels with identical names, the suffix \_<X> is appended to the input or output of the function block.
- If a device does not have its own I/O channels (example: EK1100 Slave), then no function block is created.

### 6.4.2.4 Enable automatic mapping

1. In the **Devices** view, open the top device. In the device editor, select the **PLC Settings** tab.
   
   Under **Additional Settings**, there is the **Enable symbolic access for I/Os** option.

2. **Select the check box**.
   
   The generated function block instance is displayed on the **IEC Objects** tab of the device.
   
   For each I/O channel, a (usually extended) function block is now automatically created and instantiated. This provides you with direct access immediately. You can access the I/O channel by means of the variables of the function block.

**Example:** EtherCAT Slave

The new function block extends the existing function block. The EL1008 function block instance is listed in the device editor below the **EtherCAT IEC Objects** tab.

Function block: EL1008\_FB

The DrvEthercatLib.ETCSlave_Diag function block is extended to EL1008\_FB and gets the output variables Input\_<n>.

**Example:** CANopen

If no function block is defined in the device description which can be extended, then a new function block is generated. For example, the Generic\_XN1AI function block instance is listed in the device editor below the **IEC Objects** tab.

**Example:** CANopen

The BK5120\_FB function block, which extends the existing _3SCOS.CANRemoteDevice function block according to the device description, is generated. The BK5120 function block instance is listed in the device editor on the **CANopen IEC Objects** tab.

### 6.4.2.3 Online Mode

In online mode, the data is updated by means of the existing functions. However, only those of the generated variables which are actually used are updated. Or if the **Always update variables** option is enabled.

If a channel is simultaneously accessed symbolically and via I/O mapping, then compiler warnings are issued.

### 6.4.2.5 EtherNet/IP

#### 6.4.2.5.1 Introduction

EtherNet/IP is used to connect any number of different terminals in a network, using a scanner-adapter relationship. The scanner can be thought of as a teacher and the adapter as a student. The scanner gives commands to the adapter in the form of input data and the adapter responds to the request with output data. For example, a PLC might send input to a motor to determine the speed of the machine. The motor, acting as an adapter, would respond with an output containing the speed of the machine.
The difference of EtherNet/IP from other protocols, is that the adapters can accept connections from more than one scanner. With other protocols, such as Modbus RTU, slave devices can only connect to a master device. A scanner can connect to any number of adapters and access their data. However, only one scanner can control the outputs of an adapter. Other scanners can monitor the output of an adapter.

Chapter 6.8.2.6.1.2 "Ethernet protocols and ports for AC500 V3 products" on page 4480

“Pin assignment” on page 381

6.4.2.5.2 Configuration EtherNet/IP adapter

Setting up the communication gateway

To set up the communication between the PC and the PLC, e.g., for downloading the compiled program, you have to set up the communication parameters.

The IP address of your PC must be in the same class as the IP address of the CPU.

The factory setting of the IP address of the CPU is 192.168.0.10.

The IP address of your PC should be 192.168.0.X. Avoid X = 10 in order to prevent an IP conflict with the CPU.

Subnet mask should be 255.255.255.0.

Changing of the IP address

1. Open Windows control panel. Click “Network and Internet > Network and Sharing Center”.
2. Click “Change adapter settings”.

   If using existing network with several devices, please pay attention on given network rules or contact your system administrator.

3. Right-click “Local Area Connection (Ethernet)” and select [Properties].
5. Enter your desired IP address and subnet mask.
Setting up the communication gateway

- CPU and PC are connected with an Ethernet cable.

1. In the Automation Builder device tree right-click “PLC_AC500_V3”.
2. Select “Communication Settings”.

---

Configuration and programming
Programming with CODESYS > Fieldbus Support

ADR010583, 1, en_US

2820

3ADR010583, 1, en_US
2024/01/05
3. Keep the default value in the IP address of the CPU or type in the current IP address, if differs.

   The standard (default) IP address of the port ETH1 is: 192.168.0.10

4. Select [OK] to implement the IP address.

**Network scan**  
If you need to scan the network for the CPU or if you have multiple CPUs on the same network.
1. Right-click “PLC_AC500_V3” in the device tree.
2. Select “Communication Settings”.

![Communication Settings for PLC_AC500_V3](image)
3. Select “…”

⇒ “Pick IP Address for PLC_AC500_V3” opens.

The automatic scan runs.
The results will appear in this field.

4. Select the CPU in the field and select [OK] to implement the needed communications gateway.

**Checking the communication settings**

If you need to check the communications settings or if you want to see more information about the current selected CPU.

1. Double-click “PLC_AC500_V3” in the device tree.
2. Select “Communication Settings”.
   ⇒ The selected IP address is shown.

3. If the IP address is not visible, enter the IP address manually.

4. To test the connection and/or to see the CPU information press [Enter] or click on the black dot next to the PLC figure.

### 6.4.2.5.3 EtherNet/IP - Bus Cycle Task

**General information**

The term "bus" includes all fieldbuses as well as the ☰ I/O bus. Consider that there is no bus cycle task for Modbus as Modbus does not provide I/O mapping and is controlled by POUs.

It's recommended to define a dedicated bus cycle task for each fieldbus configured in the project. It's strongly recommended not to use "unspecified" in the "PLC Settings" to avoid unexpected behavior. The task defined in "PLC Settings" determines the bus cycle task of I/O bus and, depending on the configuration, of the additional fieldbuses (the setting is by default inherited).

Especially in case of EtherCAT, a dedicated bus cycle task should be used which is not shared with other fieldbuses. If [unspecified] is set in the "PLC Settings", the EtherCAT task might be automatically used by other fieldbuses, potentially causing the EtherCAT task processing to fail. This should be avoided by specifying a task different to the EtherCAT task in the "PLC Settings".

As a rule, for each IEC task the used input data is read at the start of each task and the written output data is transferred to the I/O driver at the end of the task. The implementation in the I/O driver is decisive for further transfer of the I/O data. The implementation is therefore responsible for the timeframe and the specific time when the actual transmission occurs on the respective bus system.

Other tasks copy only the I/O data from an internal buffer that is exchanged only with the physical hardware in the bus cycle task.

<table>

**Using tasks**

The "Task Deployment" provides an overview of used I/O channels, the set bus cycle task, and the usage of channels.
6.4.2.5.4 Tabs EtherNet/IP Scanner

Tab EtherNet/IP Scanner - “General”

This tab in the configurator of the EtherNet/IP scanner includes the basic settings. The network interface used by the scanner is configured in the settings of the Ethernet adapter.

Table 598: Options

| Auto-reestablish of connections | ☑: The scanner always attempts to automatically reestablish an interrupted connection. 
For example, if a timeout is detected for UDP I/O messages or the TCP connection to the adapter is interrupted. If the option is activated, then the scanner reconnects to the adapters with the lost connection. |

Tab “NetX Configuration”

This tab is only displayed if Ethernet communication modules (e.g. CI50x-PNIO) based on the highly integrated netX100 microcontroller is used.

As an alternative to the general EtherNet/IP node in case of a NetX field bus the EtherNet/IP node (NetX) can be added to the device tree. This node provides the additional NetX configuration dialog to select the NetX chip (slot for the card) and the communication channel of this chip. The name of the setting used in the dialog and the possible settings provided by the selection lists are defined by the device description.

Table 599: NetX settings

| Slot | Slot to be used. In case of PCI cards with NetX chip, the slot numbers usually correspond to the PCI card numbers. |
| NetX Com channel | Channel on the card to be used for the communication. A NetX board may have up to four communication channels for different fieldbuses. |
| Auto-initialize bus | ☑ The user is asked to determine if the bus should be reinitialized when downloading or when resetting the application. A new initialization will interrupt the bus and may lead to unwanted behavior of the machine. |
Tab EtherNet/IP Scanner NetX - “General”

This tab in the configurator of the EtherNet/IP scanner contains the basic settings for communication in the network.

Table 600: Address Settings

<table>
<thead>
<tr>

</tbody>
</table>
Enable ACD  ☑ Enables the ACD functionality (Address Conflict Detection) for the EtherNet/IP adapter.

Note: The ACD functionality is normally applied by the operating system. Therefore, the user should only use this function very conscientiously. By enabling ACD, complications can result between the controller and the operating system. ACD is a mechanism that EtherNet/IP devices can use to detect and respond to IPv4 address conflicts. The ACD mechanism used in EtherNet/IP complies with the IETF RFC 5227 standard.

Install to Device Repository  If a device with the same device identification has already been installed, then you are asked whether the device should be overwritten. If the device is inserted as a remote adapter below an EtherNet/IP scanner, then you will be asked to automatically update the device.

Export EDS File  The EDS file is created and stored on the local computer. In this way, the EDS file can be used in an external configuration file.

Tab EtherNet/IP Adapter - “Connections”

The upper part of this tab displays a list of all configured connections. When there is an “Exclusive owner” connection in the EDS file, it is inserted automatically when adding the adapter. The configuration data for these connections can be changed in the lower part of the dialog.

The configuration data is defined in the EDS file. The data is transmitted when the connection to the adapter is established.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

Table 604: “Configuration Data”

The table shows the connections with the configuration parameters from the EDS file. The connections are divided into configuration groups.

<table>
<thead>
<tr>
<th>Raw data values</th>
<th>If the scaling parameters are defined in the EDS file for the data, then you can show the values as raw data or converted data.</th>
</tr>
</thead>
<tbody>
<tr>
<td>☑</td>
<td>The data is displayed without conversion. In the case of enum data types, the index of the enumeration value is shown.</td>
</tr>
<tr>
<td>☐</td>
<td>The data is displayed with conversion. In the case of enum data types, the enumeration value is shown.</td>
</tr>
<tr>
<td>Show parameter groups</td>
<td>☑ If groups are defined in the EDS file, then the parameters that are defined in these groups are displayed in a sorted list.</td>
</tr>
</tbody>
</table>
Defaults | Resets to the default values
--- | ---
Value | Double-click to change the value. Depending of the data type, you can specify the value directly in the input field or select from a list box.

In the case of bit field data types and deactivated raw data values, a dialog opens for you to choose the individual bits. Only those can be selected which fall within defined minimum and maximum values. If bit field data types contain enumerations in the associated EDS file, then only these enumerations are shown with the associated bit positions.

If a connection contains a parameterizable connection path in the EDS file, then here you can modify the different parameters of the respective connection.

### Dialog “New Connection”

**Generic connection (freely configurable)**

The dialog contains the parameters for the new connection.

<tr>
<td>Timeout multiplier</td>
<td>In case of device failure, there is a time delay (RPI * Timeout multiplier) before the device state switches to “Error”.</td>
</tr>
</tbody>
</table>

**Predefined connection (EDS file)**

Use this option to employ existing connections from an EDS file. The data that can be changed are defined in the EDS file.
Table 607: Scanner to Target (Output)

<table>
<thead>
<tr>
<th>O--&gt;T size (bytes)</th>
<th>Amount of data from scanner to adapter</th>
</tr>
</thead>
<tbody>
<tr>
<td>Proxy config size (bytes)</td>
<td>Size of proxy configuration data</td>
</tr>
<tr>
<td>Target config size (bytes)</td>
<td>Size of adapter configuration data</td>
</tr>
</tbody>
</table>

Connection type
- **“Multicast”**: A network connection is established. The connection data can be received by multiple consumers.
- **“Point to Point”**: A network connection is established. The connection data can be received by exactly one consumer.
- **“Null”**: A network connection is not established.

Connection Priority
Two scanners using different priorities to one adapter can cause conflicts. Adapting the connection priority solves this problem.

Fixed/Variable
See the specifications CIP volume 1 and volume 2 for details of the parameters.

Transfer format

Inhibit time (ms)

Heartbeat multiplier
Requirement: The “Transfer format” is “Heartbeat”.
Extends the interval at which the scanner sends heartbeat messages to the adapter. This value is multiplied by the “RPI” value.
Example: “RPI” = 10ms and “Heartbeat multiplier” = 10 causes a message to be sent every 100ms.

Table 608: Target to Scanner (Input)

<table>
<thead>
<tr>
<th>T--&gt;O size (bytes)</th>
<th>See description for “Scanner to Target”</th>
</tr>
</thead>
</table>

Connection type

Connection Priority

Inhibit time (ms)

Tab EtherNet/IP Adapter - “Assemblies”
The upper part of this tab displays a list of all configured connections. When a connection is selected, the associated assemblies in the lower area of the tab are displayed.

Table 609: Connections
A description of the columns is found on the “Connections” tab.

Table 610: Consuming Assembly O-->T, Producing Assembly T-->O

<table>
<thead>
<tr>
<th>Add</th>
<th>Opens the “Select Parameters” dialog.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Delete</td>
<td>Deletes all selected parameters.</td>
</tr>
<tr>
<td>Move Up</td>
<td>Moves the selected parameter within the list. The order in the list determines the order in the I/O mapping.</td>
</tr>
<tr>
<td>Move Down</td>
<td></td>
</tr>
</tbody>
</table>
You can double-click in the text field to edit the values.

- **Show filling bytes of assemblies**: The filling bytes of the assemblies are shown in the I/O mapping. This can be helpful in case the parameter layout of the assemblies is not mapped correctly in the EDS file.

### Dialog Select Parameters

- **Display parameter groups**: The dialog displays all parameters from the EDS file by group.
  - The dialog displays all parameters from the EDS file in a flat structure.
  
  Individual parameters from this list can be selected and added to the list of assemblies by clicking “OK”.

- **Generic parameters**: You can add generic parameters. Individual values of the parameter can be edited.

### Tab EtherNet/IP Adapter - “User-Defined Parameters”

The tab displays all additional parameters that are transmitted once only into the bus system during the phase of the starting procedure allotted to this.

**NOTICE!**

The user parameters are also transmitted again when a connection is reestablished, for example after the failure of a remote adapter.

- **New**: Opens the “Select Parameters” dialog for adding a new parameter. The new parameter is inserted before the selected line.
- **Edit**: Opens the “Select Parameters” dialog for changing an existing parameter.
- **Delete**: Delete the marked lines.
- **Move Up, Move Down**: Changes the order of the user parameters. The order of the parameters in the list corresponds to the order at the initialization.

<table>
<thead>
<tr>
<th>Line</th>
<th>Number of the line</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the parameter</td>
</tr>
<tr>
<td>Value</td>
<td>The value of the respective parameter can be changed directly by double-clicking the value. If applicable, a list box opens containing possible values.</td>
</tr>
<tr>
<td>Unit</td>
<td>Unit</td>
</tr>
<tr>
<td>Bit Length</td>
<td>Length of the bit</td>
</tr>
</tbody>
</table>

**Abort on Error**: In case of error, the entire transmission of the parameters is aborted.

**Jump to Line on Error**: In case of error, the program resumes with the line specified in the “Next Line” column. In this way, an entire block can be skipped during the initialization, or a return can be defined.

**Note**: A return can lead to an infinite loop if it is never possible to write a certain parameter.
Dialog “Select Parameters”

The dialog contains a list of the parameters that are defined in the EDS file. You can define your own generic parameters in addition to the specified parameters.

The values of the selected parameter are displayed in the lower section of the dialog. They can be changed there.

<table>
<thead>
<tr>
<th>Show parameter groups</th>
<th>☑: Display of the parameters sorted by parameter groups</th>
</tr>
</thead>
<tbody>
<tr>
<td>Generic parameter</td>
<td>☑: Enables the creation of generic parameters</td>
</tr>
<tr>
<td>Name</td>
<td>Name of the generic parameter</td>
</tr>
<tr>
<td>Class</td>
<td>Each object class that can be addressed by the network is identified by an integer value.</td>
</tr>
<tr>
<td></td>
<td><img src="image" alt="Object class #5" /></td>
</tr>
<tr>
<td>Instance</td>
<td>Integer value for the unique identification of an object instance within a class. Example of an object instance:</td>
</tr>
<tr>
<td></td>
<td><img src="image" alt="Object class #5, Instance #2" /></td>
</tr>
<tr>
<td></td>
<td>If the value 0 is assigned to the instance, then the class itself is referenced by this special instance. Example – object instance 0:</td>
</tr>
<tr>
<td></td>
<td><img src="image" alt="Object class #5, Instance #0" /></td>
</tr>
</tbody>
</table>
Attribute: Integer value that can belong to a certain class or instance.
Example attribute:

Object class #5, Instance #2, Attribute #

Data type: Different data types (e.g. BOOL, UDINT, WORD, DWORD...)
Bit length: 8, 16, 32
Value: Input of different values in different output formats.

---

The values for “Class”, “Instance”, and “Attribute” are defined in the “CIP Networks Library” (Vol. 1 and 2) or in the manual of the device manufacturer.

---

CAUTION!
When individual values are entered, a plausibility check is not performed. Any errors are identified only when the bus is started and they are reported with a message in the log file.

---

Tab EtherNet/IP Adapter - “General”, local
The tab in the device editor of the EtherNet/IP adapter contains the basic settings for network communication.

**Table 611: Address Settings**

<table>
<thead>
<tr>
<th>IP address</th>
<th>Address for the identification of the EtherNet/IP adapter device.</th>
</tr>
</thead>
</table>

**Table 612: BOOTP**
Bootstrap Protocol
This option is available only for adapters under the NetX scanner.

<table>
<thead>
<tr>
<th>MAC address</th>
<th>Device-specific MAC address of the slave.</th>
</tr>
</thead>
</table>

| Save IP address | : The address of the slave is saved. The requirement, however, is that the slave supports this function. This option is only available for the CIFX scanner. |
Table 613: Electronic Keying

<table>

</tbody>
</table>

If the check fails, then an I/O connection is not established to the device and an error message is issued to the status page.

Restore Default Values For generic devices only.

6.4.2.5.6 Application notes

Application example

How to set up an EtherNet/IP connection and use a PLC as a scanner and set it up with another PLC as adapter is described in detail in the application example. AC500 V3 EtherNet/IP - AC500 as scanner connected to another AC500 as adapter.

Application example

How to set up an EtherNet/IP connection and use a PLC as a scanner and set it up with a drive is described in detail in the application example. AC500 V3 EtherNet/IP - AC500 as scanner connected to a drive.

6.4.2.5.7 Command EtherNet/IP - “Scan for Devices”

Function: The command establishes a brief connection to the hardware and determines the devices in the network. Then you can apply the devices found into the device tree of your project.

Call: Menu bar: “Project”; context menu of a device object in the device tree

Requirement: The communication settings to the controller are correct. The gateway and the PLC are started. The device supports the scan function.

The following devices provide the scan function: EtherCAT master, EtherNet/IP Scanner (IEC), Sercos master, CANopen Manager, CANopen Manager SIL2, PROFINET controller and PROFIBUS DP master.

You can perform the device scan immediately if the scan function is permanently implemented in the PLC. When scan function is implemented in a library, you have to log in only one time to download the library to the controller.

The command refers to the master controller selected in the device tree. For example, an already inserted PROFINET IO controller can be selected and the command used to determine the I/O devices and I/O modules assigned to it.

After performing the scan operation, the “Scan Devices” dialog opens and displays the found devices.
Table 614: “Scanned Devices”

| “Device name, Device type, Address, Station name, etc.” | Data about the scanned device depending on network type. When you change a value in the list of scanned devices, the value is shown in italics. This indicates that the new value has been changed in the editor in CODESYS, but not in the device. When you download the value to the device, it is shown normally. Value that indicate differences between the project and the scanned device are shown in orange. If multiple device descriptions are available for the scanned device, then the name is displayed in bold. The selection of the matching device description is resolved differently for different fieldbuses. For more detailed information, see the corresponding fieldbus chapters. If a device description cannot be found, then the following message is shown: "Attention! The device was not found in the repository." Depending on the bus system, additional information is displayed, such as manufacturer number and product number. The device cannot be inserted into the project without the installed device description. |
|——|——|
| “Show differences to project” | ☑: The table in the dialog also shows additional configured devices (in the device tree of the project). ☐: The table shows all scanned devices. The configured devices are not shown. |
| “Scan for Devices” | Starts a new search. |
| “Copy All Devices to Project” | The device that is selected in the table is inserted into the device tree in the project. If nothing is selected, then all scanned devices are shown. |

**NOTICE!**
If you insert devices, which are available in the device tree, to the device tree with “Copy All Devices to Project”, then the following should be noted. The data of the “Process Data” and “<...> I/O Mapping” tabs of the existing devices can be overwritten with the data of the recently inserted devices.

Table 615: “Configured Devices”

This part of the dialog is visible only when you select the “Show differences to project” option.

Differences between the scanned and configured devices are color-coded. Devices displayed in green are identical on both sides. Devices displayed in red are available only in the view of the scanned or configured devices.

| | If you have selected a device in both views, then the scanned devices are inserted above the selected configured device. |
| | If you have selected a device in both views, then the scanned devices are inserted below the selected configured device. |
| | If you have selected a device in both views, then the configured devices are replaced by the selected scanned device. |
| | All scanned devices are copied to the project. |
| | Deletes the selected configured device. |
Scanning an adapter can fail if the PLC is in RUN mode and a connection already exists from the scanning controller to the adapter. Then the scanning causes another connection to be established to the adapter, which interrupts the existing connection in some adapters. Then the scanner restarts the connection to the adapter, which causes the adapter to interrupt the connection to the scanning controller.

For this reason, it makes sense to perform a network scan in STOP mode after a "Reset". If RUN mode cannot be interrupted, then scanning is possible without an projected remote adapter (EtherNet/IP scanners in the device tree only).

For experts

When accepting the remote adapter by means of the “Copy to Project” command, the I/O dimensions with which the adapter responded are set for the first "exclusive owner" connection. In order to log all of the detected assembly instances after scanning, the definition IODRVETHERNETIP_PRINT_SCAN_RESULT must be set. By default, it is scanned by the instance ID 100–199. This can be adapted by means of the library parameters ParamScanStartOfInstanceAssem and ParamScanLastOfInstanceAssem from the library IoDrvEtherNetIP Library. This might be necessary, for example to scan in another manufacturer-specific range (assembly instance ID ranges).

6.4.3 Runtime systems, OPC UA server

6.4.3.1 OPC UA server for AC500 V3 products

6.4.3.1.1 General

OPC UA server can be added as an object below the Ethernet interfaces ETH1 or ETH2. The user can access the variable interface of the PLC via a client. At the same time, communication can be protected by means of encryption.

The CODESYS OPC UA server supports the following features:

- Browsing of data types and variables
- Standard read/write services
- Notification for value changes: subscription and monitored item services
- Encrypted communication according to "OPC UA standard (profile: Basic256SHA256)"
- Imaging of the IEC application according to "OPC UA Information Model for IEC 61131-3"
- Supported profile: Micro Embedded Device server Profile
- By default, there is no restriction in the number of sessions, monitored items, and subscriptions. The number depends on the performance of the respective platform.
- Sending of events according to the OPC UA standard.

Application note

How to install and configure an OPC V2 or OPC V3 server and how to use it for AC500 PLCs is described in the application note How to use OPC server.

Application example

The application example How to use OPC server V3 - for DA and UA is available to gain a deeper understanding of the OPC protocol and to configure AC500 V3 accordingly.

6.4.3.1.2 Creating a project for OPC UA access

1. Click “File ➔ New Project ➔ AC500 project” in Automation Builder 2.1 or newer.
2. Choose a PLC - AC500 V3 and click [Add object].
3. Right-click on node ETH1 or ETH2 and “Add object”.
4. Choose OPC UA Server in the dialog and click [Add object].
5. Declare some variables of different types in the program.

6. Right-click “Application ➔ Add object”. Choose “Symbol configuration” and click [Add object].

7. Enable checkbox “Support OPC UA Features” in the dialog “Add symbol configuration”.

8. Double-click “Symbol configuration” in the Devices tree to open the editor “Symbol configuration”.

9. Click [Build].

   ⇒ The variables are displayed in a tree structure.

10. Activate the variables that you want to publish to an OPC UA client. Specify the access rights.

11. Download the project to the PLC.

### 6.4.3.1.3 Use node name

1. Double-click node “OPC_UA_Server”.

2. Set parameter “Use node name” to TRUE.

3. Double-click node “PLC_AC500_V3 <...>”.

4. Click “Device” and “Rename active device...”

5. Enter new device name in the following dialog and click [OK].

### 6.4.3.1.4 Use UaExpert client

The OPC UA client UaExpert is available for download from the Unified Automation website and can be used free of charge (freeware license).

Using this client, you can connect to the AC500 OPC UA server.

The following description refers to this program. Other OPC UA clients work in a similar way.
1. Start the *UaExpert* program.

2. Click on the “blue cross symbol”.

4. Enter URL and click [OK].
   - The URL appears in the “Add Server” dialog.

5. Select “Advanced” tab and click [OK].

6. Click [Connect].
7. Expand the project tree in the "Address Space" window.

8. Drag and drop the needed symbols to "Data Access View".

### 6.4.3.1.5 Working with encryption

#### Creating a certificate for the OPC UA server

- Prerequisite: A battery is inserted and the clock is set to actual time.

2. Select the "Devices" tab.
   - The certificate information opens.
3. Select the PLC in the left "Information" view.
   - All services of the PLC that require a certificate are displayed in the right Information view.
4. Select the service "OPC UA Server".
5. Click the icon to create a new certificate for the device.
   - "Certificate Settings" dialog appears.
6. Define the certificate parameters according to the figure above and click [OK].
   \[\Rightarrow\] The certificate is created on the PLC.

7. Upload the certificate to your PC.
8. Restart the runtime system.

For further information see Chapter 6.3.4.7.3.4 “OPC UA secure” on page 1728.

Encrypted connection with UaExpert client

1. Start the UaExpert program.

2. Click on the “blue cross symbol”.

4. Enter URL and click [OK].
   \[\Rightarrow\] The URL appears in the “Add Server” dialog.
5. Select “Advanced” tab.

6. Choose option “Basic256Sha256” of drop-down list “Security Policy” and “Sign & Encrypt” of drop-down list “Message Security Mode” and click [OK].
7. Click menu “Settings” and “Manage Certificates”

8. Click [Create new Application Certificate...].
   Dialog “New Application Instance Certificate” opens.
9. Enter the required informations and click [OK].
   ⇒ Dialog “Manage Certificates” opens

10. Click [Copy Application Certificate To...] your PC.

11. Download the certificate to AC500 via the “Security Screen” view.

Dialog “Certificate Validation” opens.

Working with a trusted certificate will avoid this error message.

14. Enable checkbox Accept the server certificate temporarily for this session and click [Continue].

Dialog “Connect Error” opens
15. Click [Ignore]

16. Check settings in dialog “Manage Certificates”.

6.4.3.1.6 Changing variables via UaExpert client

1. Expand in view “Address Space“ “Objects ➔ DeviceSet ➔ PM5670 ➔ Resources ➔ Application ➔ PLC_PRG”.

   ▶ The variables of the global variable list are visible.
2. Drag and drop the variables to the Data Access View.
3. Change values in the column Value.

6.4.3.1.7 Configuring OPC UA client

Operating modes

Polling
- Objects will be continuously updated in a defined interval
- Create higher load than Subscription
- Is recommended only for a few Symbols

Pub/Sub
Not yet supported

Subscription (recommended mode)
- Updated objects depending on the publishing interval and filters
- Method to reduce load
- Different intervals
- Filter possible (coming in AC500)

<table>
<thead>
<tr>
<th>Client defines a group of symbols with</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Publishing interval</td>
<td>Interval, in which server publish data to client</td>
</tr>
<tr>
<td>Sampling interval</td>
<td>Interval for sampling and storing data at server and send in each publishing interval</td>
</tr>
<tr>
<td>Queue size</td>
<td>Array of data to save data if sampling Interval is faster than publishing Interval (At AC500 in the moment only 1)</td>
</tr>
</tbody>
</table>
| Data change filter                   | Can be used to reduce traffic from server to client. Criteria:  
  - Change of data,  
  - Change of status  
  - Change of time stamp  
  AC500 is fix configured for change of data and change of status. |

![Diagram of OPC UA client configuration](image)
Using OPC UA with subscription mode

**Recommendations:**

- Define only variables you need as symbols
- Do not configure publishing intervals to short (increase load)
- Use different subscriptions with different publishing intervals in order to decrease load
- Do not use sampling intervals faster than publishing intervals as long as AC500 OPC UA server don’t support Queue Size different from 1
- Be careful: Setting “0” at sampling Interval at client will be interpreted in server as „as fast as possible”, which is 100ms at AC500 and create a high load.

Publishing and sampling intervals in UaExpert
1. Right-Click on an Item in “Data Access View” and click “Subscription Settings”.

2. Set the recommended values.
   
   **Life Time Count**: Number of publishing intervals in which client has to send publish requests to the server. After this period without request from client, subscription in server will be deleted.
   
   **Max Keep Alive Count**: If there are no new data to send, server can skip a publishing interval. After the alive count, server has to send, even if there are no new data.
   
   Click [OK].

3. Right-Click on an Item in “Data Access View” and click “Monitored Item Settings”.

4. Set the recommended values.

6.4.3.2 Using OPC UA Information Models

The OPC UA information models provide plant information according to the OPC UA standard. This plant data contains both data and metadata, such as data origin, data quality, and data cross-connections. OPC UA-based plants can therefore be connected and analyzed faster.

In plant and mechanical construction, there are several sector-specific OPC UA information models. For example, the Companion Specification EUROMAP77 is an information model for plastics and rubber machinery.

An information model consists of different objects that contain meta-information, runtime information, and user data, such as process variables.
Requirements:
- A CODESYS project is open.
- A controller with integrated OPC UA server functionality has been added to the project.

1. Click “Tools ➔ OPC UA Information Model Repository”.
   - The “OPC UA Information Model” dialog opens.

2. To install the OPC UA information model that you need in your project, select it and click “Install”.

3. In the “Select OPC UA Information Model” dialog, select the information model file *NodeSet2.xml* from the file directory and click “Open”.
   - Now the selected OPC UA information model is displayed in the “OPC UA Information Model Repository”.

4. Add a “Communication Manager” object to the application of your CODESYS project.

5. Add an “OPC UA Information Model” object to the “Communication Manager”.

6. In the “Add OPC UA Information Model” dialog, specify a name for the information model according to IEC 61131-3 and select the desired information model in the “Information Model URI” list box. The list box shows all OPC UA information models from the OPC UA information model repository. Then click “Add”.
   - The publishing object for which you specified a name in the last step is inserted in the “Devices” view with the selected “Information Model” inserted below it.

7. In the next steps, select those objects and data types from the OPC UA information model which you want to use in your CODESYS application. To do this, first open the “Information Model” in the editor.
   - The type declarations of the OPC UA information model are displayed on the left side.

8. Add the OPC UA type declarations desired for your CODESYS application by dragging them from the left area to the right area. For all types with the “Modelling Rule” as “Mandatory”, a corresponding IEC member is generated for the application later when the IEC declarations are generated. For the “Modelling Rule” as “Optional”, in the right area you can activate an IEC member to be generated for this type as well.

9. For OPC UA types with the modelling rule as “Optional Placeholder”, in the right area you can drag and drop another corresponding IEC type to insert it.
   - Example:
6.4.3.3 Mapping of OPC UA Types to IEC Types

<table>
<thead>
<tr>
<th>OPC UA</th>
<th>IEC</th>

<td></td>
</tr>
<tr>
<td>UtcTime</td>
<td>LTIME</td>
<td></td>
</tr>
<tr>
<td>String</td>
<td>STRING</td>
<td></td>
</tr>
</tbody>
</table>

| Special types (examples: NodeId, Bytestring) | Not currently supported | The special data types are ignored when generating the IEC mappings. Members are not generated. |

| Inheritance | Inheritance is allowed for all OPC UA types. For example, new types can also be derived from String and Int32. |

### Table 617: Object types

<table>
<thead>
<tr>
<th>OPC UA</th>
<th>IEC</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OPC UA object types</td>
<td>Function blocks</td>
<td></td>
</tr>
<tr>
<td>Interfaces and add-ins</td>
<td>Function block. The members of the interface are members of the function block. Example:</td>
<td></td>
</tr>
</tbody>
</table>

**Mapping of object types**

All declarations are declared altogether as local variables between VAR and END_VAR. The user can change the declarations as needed in VAR_INPUT and VAR_OUTPUT.
**OPC UA** | **IEC** | **Description**
--- | --- | ---
Inheritance | Instead of generating multiple function blocks with "Extends", a flat hierarchy is generated. Example: ![OPC UA Typespace](image)

| **Folder** | A separate type for each instance of a folder in an OPC UA object type. The user may add the instances on his own by editing the declaration of the IEC POUs. However, function blocks have to be used which originate from an OPC UA companion. All instances of function blocks below the folder are exported. Semantic checks based on NodeSet2.xml are not possible. | Initially, a folder is set as an object type in OPC UA. However, it is not enough to generate a folder type. The user is responsible for adding appropriate elements to the folder. ![Folder Typespace](image)

**Table 619: OPC UA reference types**

<table>
<thead>
<tr>
<th>OPC UA</th>
<th>Meaning in OPC UA</th>
<th>Mapping in IEC</th>
</tr>
</thead>
<tbody>
<tr>
<td>Organizes</td>
<td></td>
<td>Normally only the derivations of this type are relevant. The exception is when folders are mapped directly to IEC. See Chapter 6.4.3.3 “Mapping of OPC UA Types to IEC Types” on page 2848</td>
</tr>
<tr>
<td>HasSubtype</td>
<td></td>
<td>See Chapter 6.4.3.3 “Mapping of OPC UA Types to IEC Types” on page 2848</td>
</tr>
<tr>
<td>OPC UA</td>
<td>Meaning in OPC UA</td>
<td>Mapping in IEC</td>
</tr>
<tr>
<td>------------------------</td>
<td>----------------------------------------------------------------------------------</td>
<td>-------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>HasTypeDefinition</td>
<td>• Used to collect all elements of a type when the UA types are compiled according to IEC.</td>
<td>• Declarations of instances in IEC are then referenced again by the OPC UA Server with this reference to the type in the information model.</td>
</tr>
<tr>
<td></td>
<td>• Declarations of instances in IEC are then referenced again by the OPC UA Server with this reference to the type in the information model.</td>
<td>• HasTypeDefinition for OPC UA variables is currently supported only for the special case when the variable type has the same members as the data type. Then the single access to the individual variables of the DUT instance is allowed in IEC.</td>
</tr>
<tr>
<td>HasComponent</td>
<td>Variables and objects are mapped in IEC as variables. Therefore, each HasComponent reference becomes an variable declaration in IEC. Methods also become methods of the function block in IEC. The user has to apply the modelling rules in the information model editor before the IEC POUs are generated. Optional members can be selected or deselected and concrete members can be generated for placeholders.</td>
<td></td>
</tr>
<tr>
<td>HasProperty</td>
<td>In OPC UA, properties have the character of additional meta-information for process data. They can be of static nature, for example engineering units. But they can also change when the server is running.</td>
<td>In IEC, this reference is handled exactly like HasComponent. As a result, variables are also created for this at the function block. An unresolved issue is the handling of properties at variables in UA (by means of the detour of HasTypeDefinition and VariableType). In IEC, the variable of type INT would have to be structured once again and have children. Currently, properties at variables in OPC UA are ignored and cannot be reached from IEC.</td>
</tr>
</tbody>
</table>

6.4.4 Libraries

6.4.4.1 General

Libraries are used for preparing POU's and functions for use in CODESYS applications. In addition to the descriptions presented here in the help, always see the documentation included in the library as well.

For using libraries in your CODESYS project, see the "Managing Libraries" chapter.

To create your own CODESYS libraries, follow the guidelines for library developers.

☞ Chapter 6.4.1.17 “Using Libraries” on page 2034

6.4.4.2 Guidelines for creating libraries

Libraries must be created according to specific rules to avoid compatibility issues.

The main items include the following:

- Select a meaningful library name (required)
- Use templates to ensure consistency (optional)
- Use a familiar and uniform project structure, when possible (optional)
- Register a unique library namespace (required)
- Enter all project information (required)
- Apply the correct method for referencing other libraries correctly (required)
- Design smart external and internal interfaces (required)
- Implement a user-friendly error handling (required)
- Apply the correct method (protection) for deployment (required)
- Apply a consistent naming convention to get clean code (optional)
- When revising an existing library, consider the interface compatibility with previous versions.

Please follow these guidelines when developing libraries in CODESYS: "Library Development Summary". You will find this document as a CHM file (LibDevSummary.chm) in the installation directory of CODESYS, or in the online help.

6.4.5 CODESYS Visualization

6.4.5.1 Introduction

Everything in one project

In the same CODESYS project, you use CODESYS Visualization to create the suitable user interface for your application. You link the visualization to the application variables and in this way they can animate and display data. When creating a visualization and an application, you use common functions, for example, as library and source code management or find/replace throughout the project.

Overview of functionality

- Display variant depending on the target platform
  You can execute the same visualization on various target platforms. Possible display variants are CODESYS WebVisu, CODESYS TargetVisu. In addition, there is a display integrated in the development system.

- Visualization editor
  In the graphic editor you design the desired user interface from visualization elements. The visualization elements are provided via libraries in a "ToolBox". You drag them into the editor area and adapt them with the help of a property configurator.
- **Referenceable visualizations**
  A visualization can be referenced in other visualizations. This enables the creation of user interfaces with a complex structure. For this purpose CODESYS Visualization also provides predefined visualizations, e.g. for dialogs.

- **Simple design change**
  The simple change of the look & feel of a visualization is possible in one place by creating a different visualization style.

- **Multilingualism**
  You can conveniently prepare visualization texts in several languages with the help of text lists. You can configure a user input element for switching to a different language in online mode.

- **User management**
  You can set up the visualization's own user management for access control up to individual element level.

- **Other useful features**
  Function block instances of visualizations, array accesses to the visualization, real-time data logging, extendability of the pool of visualization elements, provision of graphic objects via symbol libraries, calls of PLC functions from the visualization, reusability of visualizations by depositing them in libraries.

---

**Table 620: Overview of the objects, editors, repositories, etc. relevant for the visualization in the CODESYS Development System**

<table>
<thead>
<tr>
<th>Object Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Visualization</td>
<td>Object below an application in the device tree or in the POUs pool that contains a visualization image. A visualization can reference other visualizations.</td>
</tr>
<tr>
<td>Visualization editor and addi-</td>
<td>In this IEC 61131-3-compliant editor you can create the desired graphical user interfaces, panels, dialogs, etc. from visualization elements. The editor is made up of the following components:</td>
</tr>
</tbody>
</table>
|    tional views              |   - Graphic editor area for arranging the elements  
|                              |     - "Interface Editor": for the parameterization of the visualization  
|                              |     - "Hotkey Configuration": editor for defining keys for online operation  
|                              |     - "Elementlist": overview of all visualization elements used, editor for the position of the elements on the z-axis  
|                              | The following views are also available:  
|                              |     - "ToolBox": view for the provision of visualization elements  
|                              |     - "Properties": view with editor for the configuration of the element that currently has the focus in the graphic editor  
| Visualization element        | Ready-to-use elements from the visualization libraries are available in the Tools view of the visualization editor for insertion.                   |
| Visualization profile        | The profile defines which visualization elements are available. Each project that contains a visualization is based on such a profile (project settings). |
| Visualization Styles         | The selected style determines the "look & feel" of the elements. It is set application-wide in the visualization manager. Ready-to-use styles are provided and you can also create your own. |
Visualization Manager

Each application has a visualization manager of its own for its visualizations with various settings such as user management, style, language, input type, etc. The “Visualization Manager” object is suspended in the device tree below the application.

Display variant

A visualization can be displayed in online mode in the following variants, which are created as objects under the visualization manager:
- CODESYS TargetVisu (target visualization and remote target visualization on PLC devices)
- CODESYS WebVisu (web visualization via a web browser)
- Visualization integrated in the development system

Visualization library

Collection of visualization elements that are provided in the toolbox.

Symbol library

Collection of images and graphics that you can use in visualizations. When inserting a visualization object you can choose whether the installed system libraries should be available in the project.

Visualization Element Repository

Repository for the management of the visualization profiles and the visualization element libraries.

Visualization Styles Repository

Repository for the management of visualization styles.

VISU_TASK

This task is automatically present as an object in the task configuration of an application as long as an object for a display variant of the type WebVisu or TargetVisu is also inserted under the Visualization Manager.

The user interfaces created in CODESYS can be used in different display variants, depending on which ones the controller employed supports.

The display variants

- **Visualization (“diagnostic visualization”) integrated in the CODESYS Development System:**
  The integrated visualization in the development system is ideal for application tests, service or diagnostic purposes and for the commissioning of a system. As soon as a connection to the controller has been established, the visualization editor switches over and animates the elements displayed. This variant is part of the free CODESYS Development System and can always be used, irrespective of the controller employed.

- **CODESYS WebVisu:**
  This variant means web-based display of the user interface in a standard browser (PCs, tablets, smartphones), enabling remote access, remote monitoring and service and diagnosis of a system via the Internet. A standard web browser communicates by JavaScript (optionally with SSL encryption) with the web server in the controller and displays the visualization by means of HTML5. This technology is supported by virtually all browsers and is thus also available on terminal devices with iOS or Android.

- **CODESYS TargetVisu:**
  This variant runs independent of the platform on control systems with an integrated display. Logic application and user interface run on the same device; the user interface is displayed directly on the controller. This variant is suitable for the operation and monitoring of machines and plants. An optional extension of the runtime system is required for the use of CODESYS TargetVisu.
6.4.5.2 Tutorial

6.4.5.2.1 CODESYS visualization - Getting started

If you are not yet familiar with CODESYS visualization, we recommend you to start with the application example First steps with CODESYS visualization. The example demonstrates the main features of visualization and provides insights into possible use cases.

To use the Edge browser for CODESYS visualization of AC500 PLCs, follow the steps described in the application note Usage in the Edge browser.

Visualization basics

More examples and step by step instructions are available in the Automation Builder.

- Chapter 3.4.10 “Setting up a visualization” on page 53
- Chapter 3.4.11 “Creation of a visualization” on page 57
- Chapter 3.4.12 “Enabling a web visualization” on page 65

6.4.5.2.2 Show instance names

For complex visualizations, it can be helpful if the instance names are displayed within the visualization. How to show instance names is described in the application example Visualization - Instance names.

6.4.5.2.3 Visualizing a Refrigerator Controller

This tutorial demonstrates how to add visualizations to the project and link the elements of the visualization to the variables of the control program.

Preparation

This tutorial is based on the sample program RefrigeratorControl, which was created in the "Your First Program in CODESYS" chapter. The finished program can also be found in the installation directory of CODESYS, in the "Projects" subfolder.

See also
- Your First CODESYS Program

Creating the visualizations

The visualization consists of the following three visualization screens:

- **Visualization**: Control elements and display of the refrigerator
- **Diagnosis**: History of the set and actual temperature, parameter settings
- **Live Visu**: Animation with refrigerator

1. Select the “Application” object in the device tree.
2. Click “Project ➔ Add Object ➔ Visualization”.
3. Specify Live_Visu as the name.
4. Create two more visualizations with the names Diagnosis and Visualization.

Structure of the visualization

This screen consists of control and display elements that control the refrigerator.
1. Open the visualization `Visualization` in the editor.
2. Drag a “Rectangle” visualization element to the editor. Change the following properties:
   - “Texts” ➔ Text: Actual temperature: %2.1f °C
   - “Text variables” ➔ Text variable: `Glob_Var.rTempActual`
3. Drag a “Meter 180°” visualization element to the editor. Change the following properties:
   - “Value”: `Glob_Var.rTempActual`
   - “Scale ➔ Scale end”: 20
   - “Scale ➔ Main scale”: 5
   - “Scale ➔ Subscale”: 1
4. Drag a “Rectangle” visualization element to the editor. Change the following properties:
   - “Texts” ➔ Text: Temperature presetting: %.1f °C
   - “Text variables” ➔ Text variable: `Glob_Var.rTempSet`
5. Drag a “Potentiometer” visualization element to the editor.
   Change the following properties
   - “Variable”: Glob_Var.rTempSet
   - “Background ➔ Background color”: “yellow”
   - “Pointer ➔ Color”: “red”
   - “Scale ➔ Subscale position”: “Outward”
   - “Scale ➔ Scale start”: 3
   - “Scale ➔ Scale end”: 13
   - “Scale ➔ Subscale”: 1
   - “Scale ➔ Main scale”: 1
   - “Label ➔ Unit”: “°C”
   - “Label ➔ Scale format (C syntax)”: %.0f
   - “Label ➔ Max. text width of labels”: 21
   - “Label ➔ Height of labels”: 15

6. Drag a “Label” visualization element to the editor.
   Change the following properties
   - “Texts ➔ Text”: Cooling compressor

7. Drag a “Lamp” visualization element to the editor. Position it behind the text Cooling compressor.
   Change the following properties
   - “Variable”: Glob_Var.bCompressor

8. Drag a “Label” visualization element to the editor.
   Change the following properties
   - “Texts ➔ Text”: Signal (beep)

9. Drag a “Lamp” visualization element to the editor. Position it behind the text “Signal (beep)”.
   Change the following properties
   - “Variable”: Glob_Var.bSignal
   - “Background ➔ Image”: Red

10. Drag a “Rectangle” visualization element to the editor.
    Change the following properties
    - “Texts ➔ Text”: Door open

11. Drag a “Rocker Switch” visualization element to the editor.
    Change the following properties
    - “Variable”: Glob_Var.rDoorOpen

Structure of the visualization
Diagnosis

In this screen, you can monitor the temperature curve and optimize the parameters.
1. Open the visualization Diagnosis in the editor.
2. Drag a “Label” visualization element to the editor.
   Change the following properties
   - “Text” : Refrigerator Diagnosis & Service Menu
   - “Text properties” : Arial, Standard, 18
3. Drag a “Trace” visualization element to the editor.
4. Click the Diagnosis_Trace1 value of the “Trace” property.
   The “Trace Configuration” dialog opens.
5. Select the “MainTask” in “Task”.
6. Click the “Add Variable” link.
   A variable is added to the trace. The variable settings are displayed in the dialog.
7. Select Glob_Var.bCompressor for the variable.
8. Add the Glob_Var.rTempSet and Glob_Var.rTempActual variables to the trace. For the other settings, you can use the default values.
9. Click “OK” to exit the dialog.
10. Drag a “Rectangle” visualization element to the editor. Position it on the right next to the trace element.
    Change the following properties
    - “Text” : %s
    - “Text variables” : PLC_PRG.rHysteresis
11. Configure the “OnMouseDown” input configuration of the element. Click “Input configuration ➔ OnMouseDown ➔ Configure”.
    The “Input Configuration” dialog opens.
12. Assign the “Write Variable” command to the action. Accept the default values and click “OK”.
13. Drag a “Label” visualization element to the editor. Position it over the first rectangle.
    Change the following properties
    - “Text” : Hysteresis Regulator
14. Adjust the size and position of both elements.
15. Select both of the “Rectangle” and “Label” elements and duplicate them by means of copy and paste.
16. Adjust the labels and variables of the copied elements.
   - “Text”: Compressor Efficiency, “Text variable”: Simulation.P_Cooling
   - “Text”: Time until Beep for DoorOpen, “Text variable”: Glob_Var.timDoorOpenThreshold
   - “Text”: Time until Beep for Compressor On, “Text variable”: Glob_Var.timAlarmThreshold

See also
- Chapter 6.4.5.21.3.6 “Dialog ‘Input Configuration’” on page 3370

Structure of the visualization ‘Live Visu’

This screen includes the representation of a refrigerator. The refrigerator consists of several polygon type visualization elements. The doors of the refrigerator are drawn in both the closed and open states. Both doors consist of a group of single elements.

1. Open the Live_Visu visualization in the editor.
2. Select the “Polygon” visualization element in the “Visualization Toolbox” view.
3. Click several times in the editor to create a surface. Right-click to stop adding corner marks.

4. Move the corner marks to the required position so that the element (1) is formed.

5. Select the element.

   Change the following properties:
   - “Colors ➔ Use gradient color”:
   - “Appearance ➔ Line style”. “Invisible”

6. Click the “Colors ➔ Use gradient color” property.

7. Select the color “Gray” for “Color 1” in the “Gradient Editor” dialog.

8. Create all other elements with the “Polygon” visualization element.

9. Group the elements of the closed doors (2+3+4) and the open doors (5+6+7+8). To do this, press the [Shift] key and click “Visualization ➔ Group” to select the elements.

10. Move the elements together so that the completed refrigerator is formed. Position the open doors precisely on the closed doors.

11. Select the “Open doors” group.

12. In the properties, double-click the input field “State variable ➔ Invisible”.

14. Select the rDoorOpen variable in the “Variables” category (below “Application ➔ Glob_Var”).

15. Negate the variable with NOT (→ NOT Glob_Var.rDoorOpen).

   ➔ If the rDoorOpen variable is FALSE (door is closed), then the element is invisible. Then the underlying doors are visible.

16. Copy the following elements from the Visualization screen:
   - Potentiometer for setting the temperature
   - Rectangle for displaying the set temperature
   - Door open switch
   - Cooling compressor lamp
   - Signal (beep) lamp

17. Insert the elements from the clipboard to the Live_Visu visualization screen.
18. Reduce the elements and position them on the refrigerator.

**Visualization in online mode (simulation)**

When the visualization is complete, test it in simulation mode.

1. Click “Online ➔ Simulation”.
2. Click “Online ➔ Login”.
   - A dialog opens and prompts you to create and download the application.
3. Click “Yes” to confirm the dialog.
4. Click “Debug ➔ Start”.
5. Open the visualization Live_Visu in the editor.
   - The refrigerator is in online mode.
6. Open the doors with the switch and monitor the temperature and the alarms. Change the parameters in the screen Diagnosis and watch the reaction in the temperature curve.
6.4.5.2.4 Displaying Array Data in a Histogram

Setting element properties for the histogram

Requirements

- A project contains a visualization object and a program.
- A one-dimensional array is declared in the program (example: `histogram : ARRAY[1..10] OF INT;`).
- In the program, `histogram` data is assigned to the array (example: within the range from 0 to 50).

1. Double-click the “Visualization” object in the device tree.
2. In the “Visualization Toolbox” view, click “Measurement Controls” and drag the “Histogram” element to the visualization editor.
3. In the visualization editor, click the inserted “Histogram”. The “Properties” view opens.
4. In the “Properties” view, double-click the “Value” input field in the “Data array” element property. Then click.
5. In the “Input Assistant” dialog in the “Variables” category of the “PLC (PRG)” program, select the array (example here: `histogram : ARRAY[1..10] OF INT;`) and click “OK”.
6. To display only part of the array as a histogram, activate the “Use subrange” option and specify the index values of the array in “Start index” and “End index” to define the subrange.
7. Select the “Display type” (example: “Bar”).
8. Specify a value between 1 and 100 (example: 30) for the “Relative bar width”.
9. Click the histogram in the visualization editor and change the size and position as desired. The “Position” property changes its values accordingly.
10. Specify the values for the “Scale” element property. Select the values for “Scale start” and “Scale end” so that the array is displayed completely. For the example: “Scale start” 0, “Scale end” 50.
    For the distance between values on the main scale, specify the value 10, for example, in “Main scale”.
11. In the “Label” element property, specify the “Unit” for the display values.
12. Click “Build ➔ Generate Code”.

Configuration and programming
Programming with CODESYS > CODESYS Visualization

2024/01/05  ADR010583, 1, en_US
13. If the project has been compiled without errors, then click “Online ➔ Login” and click “Debug ➔ Start” to start the application.

- The histogram is displayed in the visualization as follows:

```
<table>
<thead>
<tr>
<th>Value</th>
<th>Count</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>5</td>
</tr>
<tr>
<td>10</td>
<td>4</td>
</tr>
<tr>
<td>20</td>
<td>3</td>
</tr>
<tr>
<td>30</td>
<td>2</td>
</tr>
<tr>
<td>40</td>
<td>1</td>
</tr>
</tbody>
</table>
```

Defining alarm colors for the histogram

- The visualization displays a histogram with bars all the same color (example: green). Now you want the bars with values less than 30, for example, to be displayed in another color (example: red).

1. Click the element property “Colors ➔ Alarm color”.
2. Specify the limiting value in “Alarm value” above or below which the bars should be displayed in another color.
3. Select “More” from the list box in “Alarm condition” if all values greater than the “Alarm value” should be displayed in another color. Otherwise, select “Less”.
4. Select an “Alarm color” (example: “Red”).
5. Click “Build ➔ Generate Code”.

Defining alarm colors for the histogram
6. If the project has been compiled without errors, then click “Online ➔ Login” and click “Debug ➔ Start” to start the application.

In the example histogram, all bars with values greater than 30 are displayed in red.

See also

- Chapter 6.4.5.20.1.29 “Visualization Element 'Histogram’” on page 3216

### 6.4.5.2.5 Displaying Array Variables in Tables

A frequently required function of a user interface is the display of data arrays. CODESYS Visualization provides the element “Table” for this.

In the configuration of the element “Table”, enter an array variable in the property “Data array”. The array components are displayed in the rows and columns of the table.

Subsequent instructions describe an example of how an array of a structure is displayed in a table. As a preparation, create the MYSTRUCT DUT and the declarations in the PLC_PRG program.

```plaintext
TYPE MYSTRUCT :
  STRUCT
    iNo : INT;
    bOnStock : BOOL;
    strPartNumber : STRING;
  END_STRUCT
END_TYPE

PROGRAM PLC_PRG
VAR
  arrStruct : ARRAY[0..6] OF MYSTRUCT;
  iSelectedColumn : INT;
END_VAR
```
1. Drag the “Table” visualization element to the visualization editor.

2. Assign the array variable `arrStruct` to the “Data array” property.
   ⇨ The structure members are displayed as column headings and the array index as row headings.

3. Change the “Columns ➔ Column ➔ [0] ➔ Column header” property to an informative heading (example: Number).

5. Assign a color to the “Selection ➔ Selection color” property.

6. Define the “Selection ➔ Selection type” property as Row selection.

7. In the “Selection ➔ Variable for selected row” property, define the `PLC_PRG.iSelectedColumn` variable.
   ⇨ The following display results in online mode:

<table>
<thead>
<tr>
<th>Number</th>
<th>in Stock</th>
<th>Part Number</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td>FALSE</td>
</tr>
<tr>
<td>1</td>
<td>0</td>
<td>FALSE</td>
</tr>
<tr>
<td>2</td>
<td>0</td>
<td>FALSE</td>
</tr>
<tr>
<td>3</td>
<td>0</td>
<td>FALSE</td>
</tr>
</tbody>
</table>

- ☑ Chapter 6.4.5.20.1.13 “Visualization Element ‘Table’” on page 3106

### 6.4.5.2.6 Displaying Web Contents

Displaying websites in a visualization

☑️ Requirement: A visualization open in a CODESYS project. The “Visualization Toolbox” and “Properties” views of the visualization are also open.

1. Drag the “Web Browser” element from “Special Controls” to the visualization editor.

2. Select the element in the editor.
   ⇨ In the “Properties” view, the element properties are listed for the “Web Browser” element.

3. In the “Position” property, specify the size (in pixels) for the “Width” and the “Height” (example: 600).

4. In “Control variables ➔ URL”, specify the URL for the website (example: 'http://de.wikipedia.org'). You can also specify a variable here (STRING or WSTRING) where the URL is assigned in the project.

5. In “Control variables ➔ Display”, specify a Boolean variable (example: `bSetURL`).
   ⇨ If the variable `bSetURL` has the value TRUE, then the website 'http://en.wikipedia.org' is displayed at runtime.
Configuring the buttons for forward and back navigation of the website

☑ Requirement: The “Web Browser” element of your visualization is configured as described above.

1. In a POU, declare both Boolean variables bGoBack and bGoForward.
2. In the visualization editor, click the “Web browser”.
3. For the property “Control variables ➤ Back”, select the variable bGoBack from the Input Assistant. For the property “Control variables ➤ Forward”, select the variable bGoForward.
4. In “General Controls”, add the “Button” element to your visualization two times.
5. Click a “Button” in the visualization editor and drag the “Button” to the required position (for example above the “Web Browser” element).
6. In the property “Texts ➤ Text”, specify the character >. In “Text properties ➤ Font”, select a font from the Input Assistant (example: Arial, Bold, 14).
7. Configure the property “Input configuration ➤ OnMouseClick” so that the variable bGoForward switches.
8. Configure the second button for back navigation in the same way as described in Steps 5 to 7.

⇒ If the variable bSetURL has the value TRUE, then the website 'http://de.wikipedia.org' is displayed with the forward and back buttons. When you click the buttons, navigation to the previous and next websites is successful.

Chapter 6.4.5.20.1.38 “Visualization Element ‘Web Browser’” on page 3262
⇒ “Input action ‘Toggle Variable’” on page 3379

6.4.5.2.7 Using Client Animation

The example shows a visualization with 3 screens. A menu controls the navigation of the screens. The menu is hidden until it moves into view by means of a hamburger button. During the movement, the transparency of the menu is changed. After the screen is selected, the menu moves back out of view. The animation is computed entirely on the target system. The CODESYS visualization only defines the target values (positions, transparency).

1. Preparation

1. Create a new standard project with the CODESYS Control Win V3 controller.
2. Add a “Visualization” object below the “Application”. Choose the name Visu_Main.
3. Open the Visualization Manager in the editor and select the “Support client animations and overlay of native elements” option.

2. Creating the PLC_PRG program

The program checks whether the menu button has been pressed. If the menu bar is not visible (position –300), then the position is moved to the visible area (0). If the menu bar is already visible (position 0), then the position is moved to the hidden area.
1. Open the “PLC_PRG” program in the editor.
2. Input the following code into the declaration editor:

```plaintext
PROGRAM PLC_PRG
VAR
  iSelection : INT;                  // to switch the
  xVisible: BOOL;                    // auxiliary variable to
toggle the menu bar
  iMenuPos : INT := -300;            // position of the menu bar
  xToggle: BOOL;                     // button variable to
toggle the menu bar
END_VAR

3. Input the following code into the implementation:

```plaintext
IF xToggle THEN
  xToggle := FALSE;
IF xVisible THEN
  xVisible := FALSE;
  iMenuPos := -300;
ELSE
  xVisible := TRUE;
  iMenuPos := 0;
END_IF
```

3. Creating the menu bar

The menu bar has 3 menu items. A visualization screen is displayed by clicking the corresponding menu item.

1. Insert a “Visu_Menu” visualization below the application.
2. Open the object properties. In the “Visualization” tab, set the “Visualization size” to a “Width” of 300 and a “Height” of 180.
3. Open the visualization in the editor.
4. Select the “Advanced” option in the “Properties” view.
5. In the upper left corner, add a button with a “Width” of 300 and a “Height” of 60.
6. Label the button as “Visu 1”. Set the font size to 24.
7. Open the “Input configuration ➔ OnMouseClick” property.
8. Select the “Execute ST code” action.
9. Input the following ST code:

```plaintext
PLC_PRG.iSelection := 0;
PLC_PRG.xToggle := TRUE;
```
10. Set the “Button state variable ➔ Digital variable” property to PLC_PRG.iSelection=0
11. Add two more buttons named “Visu 2” and “Visu 3”.
12. Edit the button properties of "Visu2" (PLC_PRG.iSelection = 1) and "Visu3" (PLC_PRG.iSelection = 2).

Result:

4. Creating more visualization screens

1. Insert the "Visu1" visualization below the application.
2. Open the object properties. In the "Visualization" tab, set the "Visualization size" to a "Width" of 800 and a "Height" of 600.
3. Change the background color of the screen (for example, light gray).
4. Insert a "Label" object into the visualization screen and name the element (example: "Visu 1").
5. Insert two more visualizations "Visu2" and "Visu3" below the application. Edit the properties in the same way as for "Visu1".

5. Creating the main visualization screen

On this screen, you can see the menu bar and a button to show or hide the menu bar. The different visualization screens are navigated in a "Frame" visualization element.

1. Open the properties of the "Visu_Main" visualization. In the "Visualization" tab, set the "Visualization size" to a "Width" of 800 and a "Height" of 600.
2. Open the visualization in the editor.
3. Insert a "Frame" element into the visualization.
   ⇒ The "Frame Configuration" dialog opens.
4. Add the "Visu1" (Index 0), "Visu2" (Index 1), and "Visu3" (Index 2) visualizations.
5. Set the property values of "Position" as follows: "X" = 0, "Y" = 0, "Width" = 800, and "Height" = 600.
6. Set the property value of "Switch frame variable ⇒ Variable" to PLC_PRG.iSelection.
7. Insert a "Button" element into the visualization.
8. Set the property values of "Position" as follows: "X" = 0, "Y" = 0, "Width" = 800, and "Height" = 600.
9. Set the property value of "Texts ⇒ Text" to =.
10. Set the property value of "Text properties ⇒ Font" to Arial; 36.
11. Open the "Input configuration ⇒ OnMouseClick" property.
12. Select the “Execute ST code” action.
13. Input the following ST code:
   ```
   PLC_PRG.xToggle := TRUE;
   ```
14. Set the property value of “Button state variable ➔ Digital variable” to PLC_PRG.xVisible.
15. Insert the “Visu_Menu” visualization element from the “Current Project” category into the visualization.
16. Set the property values of “Position” as follows: “X” = 0, “Y” = 0, “Width” = 300, and “Height” = 180.
17. Set the property value “Absolute movement ➔ Movement ➔ X” to PLC_PRG.iMenuPos.
18. Set the property value of “State variables ➔ Invisible” to not(PLC_PRG.xVisible).
19. Set the property value of “Animation duration” to 2000.

⇒ Result:

![Visualization screenshot]

### 6. Downloading the project to the controller and starting the WebVisu

1. Build the project and download it to the PLC.
2. Start the project.
3. In the browser, connect to the visualization (http://localhost:8080).
   ⇒ The WebVisu connects to the controller and the visualization opens.
4. In the visualization, click the menu button.
   ⇒ The menu moves into view.
5. Select a menu item.
   ⇒ The visualization screen is selected and the menu moves back out of view.

### 6.4.5.3 Preparing CODESYS and projects

The following provides details of the presets that exist for visualizations and the steps that are necessary for creating a visualization in a project.

#### Presets

When you create a visualization in a project, you should know that the following presets apply:

<table>
<thead>
<tr>
<th>Scope</th>
<th>Location</th>
<th>Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Throughout CODESYS</td>
<td>“Tools → Options” Categories “Visualization” and “Visualization styles”</td>
<td>● Visualization editor: display, handlingternal text and image files</td>
</tr>
<tr>
<td></td>
<td></td>
<td>● Paths of the basic text and image files</td>
</tr>
<tr>
<td></td>
<td></td>
<td>● Visualization styles</td>
</tr>
<tr>
<td>Throughout the project</td>
<td>“Project → Project settings” Categories “Visualization” and “Visualization profiles”</td>
<td>● “Properties handling” for the visualization elements</td>
</tr>
<tr>
<td></td>
<td></td>
<td>● Paths of the basic text and image files</td>
</tr>
<tr>
<td></td>
<td></td>
<td>● Symbol libraries with ready content</td>
</tr>
<tr>
<td></td>
<td></td>
<td>● Visualization profile</td>
</tr>
<tr>
<td>Throughout the application</td>
<td>“Visualization Manager”:</td>
<td>● Unicode, CurrentVisu variable, multitouch, semi-transparency, memory size, data transmission, number of clients</td>
</tr>
<tr>
<td></td>
<td></td>
<td>● Visualization styles</td>
</tr>
<tr>
<td></td>
<td></td>
<td>● Language setting, language-specific font</td>
</tr>
<tr>
<td></td>
<td></td>
<td>● Default keyboard configuration</td>
</tr>
<tr>
<td></td>
<td></td>
<td>● Visualizations and visualization references</td>
</tr>
<tr>
<td></td>
<td></td>
<td>● Font for each language</td>
</tr>
<tr>
<td></td>
<td></td>
<td>● User management</td>
</tr>
<tr>
<td>Single visualization</td>
<td>“Properties” of the visualization object Category “Visualization”</td>
<td>● Purpose and scope of use</td>
</tr>
<tr>
<td>Display variant of a single visualization</td>
<td>Editor of the WebVisu or TargetVisu object</td>
<td>● Size definition</td>
</tr>
<tr>
<td></td>
<td></td>
<td>● Start visualization, refresh rate, buffer size, html file name</td>
</tr>
<tr>
<td></td>
<td></td>
<td>● Scaling options</td>
</tr>
<tr>
<td></td>
<td></td>
<td>● Display options</td>
</tr>
<tr>
<td></td>
<td></td>
<td>● Default text input</td>
</tr>
</tbody>
</table>

Project-specific updates of the visualization profile, the visualization styles, and the visualization symbol libraries are possible in “Project → Project environment” of the respective tabs.

Customization of the visualization menu is performed in “Tools → Customize”.

- © Chapter 6.4.5.21.3.11 “Dialog ‘Project Environment’ - ‘Visualization Styles’” on page 3386
For each visualization, you insert a "Visualization" object into your project like any other object. This also applies to visualizations that should be used later only within other visualizations. You can insert the new visualization object directly below an application, or below the root node of the "Devices" view (for availability throughout the entire project).

The required base libraries and other objects, such as the Visualization Manager, are inserted automatically. When you insert the visualization object below an application, the subordinate objects for the display variants supported by the device are also displayed.

Every visualization object can be edited separately in the visualization editor.

The following steps describe a simply example for creating an object for an application-specific visualization.

Requirement: A project is open. An application is created in the device tree.

1. Select the application in the device tree. Click "Add object ➔ Visualization" in the context menu.
   - The "Add visualization" dialog box opens. In the "Symbol libraries" table, there is at least the standard entry "VisuSymbols Vx.x.x. (System)", and possibly other installed symbol libraries.

2. Accept the default name Visualization. Activate the "VisuSymbols" option. Then the visualization symbols (graphical objects) are contained in the library in the visualization project. Click "Add" to close the dialog box.
   - In the device tree, the "Visualization manager" and "Visualization" objects are inserted below the application. Depending on the device in use, the "TargetVisu" and/or "WebVisu" objects are also created below the visualization manager.
     
If a "TargetVisu" object or "WebVisu" object is created, then a "VISU_TASK" object is also created below the task configuration with an implicit program call.

The required visualization libraries are added automatically in the "Library Manager" of the application.

The visualization editor opens with the "Visualization" editor window and the "ToolBox" and "Properties" views.

   - In the "ToolBox" view, there is a "Symbols" button for viewing the symbols from the library VisuSymbols.library.

3. Now you can create the required visualization in the visualization editor.

4. Note: You can create structured visualizations by using a frame element to reference one visualization in another visualization. Dialog visualizations are a special option for this. In this case, the input configuration of a visualization element is used for referencing.

For creating an application-dependent visualization, insert the visualization object directly below the root node of the device tree. This corresponds to insertion in the "POUs" view. In this case, the visualization manager is not created with objects for the display variants.

- Chapter 6.4.5.21.3.7 “Dialog ‘Options’ - ‘Visualization Styles’” on page 3382
- Chapter 6.4.5.21.3.13 “Dialog ‘Project Settings’ - ‘Visualization’” on page 3387
- Chapter 6.4.5.21.3.15 “Dialog ‘Properties’ of Visualization Objects” on page 3388
6.4.5.4 Limitation of the number of usable web pages on AC500 V3 PLCs

Automation Builder will get all the available visualizations in the project and count those reachable from the visualization client objects (WebVisu and RemoteTargetVisualization).

In case the predefined number of visualizations is exceeded an error is shown in the message window, preventing the user from compiling the project.

The error will be shown under “Build” category when the user executes the build command. The PLC program won’t download to the PLC until this error is solved (like with any other build errors). In the image below, there are 5 visualizations being used (3 of them added directly into the Automation Builder project and the other 2 referenced from a library that was added to the project).

The error will look like this when build command is executed:

If the visualizations are in the project but not being referenced (e.g. not reachable from the “Start Visualization” in the WebVisu) they are not taken into account for this limitation. If the error condition is solved, the error will disappear when the user executes the build command again.

6.4.5.5 Designing a visualization with elements

6.4.5.5.1 General

The visualization editor provides the visualization elements for designing a user interface in the “Visualization Toolbox” view.
Drag the desired element into the editor view and adapt it in the “Properties” view: purely visual design, labeling, display of data, reaction to user inputs, possibility to input values, etc.

Static or dynamic configuration of the properties is possible. This means the assignment of fixed values or the assignment of application variables. A dynamic configuration allows for an animation which is executed at runtime.

See also
- Chapter 6.4.5.21.1.1 “Visualization Editor” on page 3393
- Chapter 6.4.5.10 “Animating visualization elements” on page 2912

6.4.5.5.2 Select Element

The “Visualization Toolbox” view provides the following elements for selection:
- All visualization elements which the set visualization profile defines.
- Image elements for all images of the project from the integrated libraries or symbol libraries.
- Frame elements for all visualizations of the project or from the libraries.

See the “Project Settings” for the currently set visualization profile and the currently used symbol libraries.

The elements are combined into specific categories, each of which has its own button in the “Visualization Toolbox” view. You can create new categories and assign its elements.

The elements of the categories are displayed in the “Visualization Toolbox” view as preview images. It is also possible to search for an element name.

Simply drag the preview image of the element to the desired position in the editor window. Then the configurable properties of the element are displayed automatically in the “Properties” view of the visualization editor.

- Chapter 6.4.5.21.1.1 “Visualization Editor” on page 3393
- Chapter 6.4.5.21.1.2 “View ’Visualization Toolbox‘” on page 3394
- Chapter 6.4.5.20.1.5 “Visualization Element ’Image‘” on page 3038
- Chapter 6.4.5.20.1.6 “Visualization Element ’Frame‘” on page 3053

Create or remove new element category

Requirement: The visualization editor is open.

1. In the “Visualization Toolbox” view, click the button.
   - the “Configure Categories and Items” dialog opens.
2. In the dialog, click the + symbol to open the “Add Category” dialog. Note: Click the - symbol or press the [Del] key to delete the definition of a category.
3. In the “Name” field, specify a name (example: tagA) and click “OK” to close the dialog.
   - In the “Configure Categories and Items” dialog, the new custom category tagA is inserted below in the tree view. It is provided with the symbol.
4. Click the “Enable” option for the new category, and click “OK” to close the dialog.
   - CODESYS adds a “tagA” button in the “Visualization Toolbox” view. When you click the button, all elements that are assigned to this category are displayed.

- Chapter 6.4.5.21.3.4 “Dialog ’Configure Categories and Items‘” on page 3368
Assigning a visualization element of an element category

Requirement: The visualization editor is open. You have already created a custom category `tagA`. A button labeled `tagA` is visible in the "Visualization Toolbox" view.

1. In the "Visualization Toolbox" view, right-click an element to open its context menu.
   - A context menu opens. It contains the “Add Item to Category 'tagA'” and “Add to Categories” commands.
2. Click “Add to Category 'tagA'” and click "OK" to close the dialog.
3. Click the “tagA” button.
   - All elements are displayed which are assigned to this category, below it also the currently assigned element.

Chapter 6.4.5.21.4.1.2 “View 'Visualization Toolbox'” on page 3394

6.4.5.3 Positioning the Element, Adapting Size and Layer

A visualization is a raster image in pixels. The pixel position is specified in X/Y-coordinates. The origin (0,0) is located at the upper left corner of the window. The positive X-values run to the right, and the positive Y-values run downwards. The position of an element on the Z-axis of the visualization is controlled by the position in the element list (see below).

Configuring the size and position in the editor

The size and position of an element are specified as pixel coordinates in the "Properties" view. These settings are displayed graphically in the editor view at the same time.

When you drag a visualization element from the "Visualization Toolbox" view to the editor view, it is shown as selected, as in the following example of a rectangle element:

The possible positions depend on the set grid. You can change its settings CODESYS options. Commands in the context menu are available for alignment and grouping.

Now you can move or resize the element directly in the editor. As an alternative, you configure the “Position” property in the properties editor, which opens automatically for the selected element. See the description for this, for example in the help page for the “Button” element. The changes are also updated in the other editor.

Changing the element size and position in the editor

1. Focus the element so that the shape of the mouse pointer indicates movement (example: 

2. Drag the element to any position.
   - The position of the element is also updated in the properties “Position ➔ X” and “Position ➔ Y”.
3. Focus on a blue box.
   - The shape of the mouse pointer is a double arrow that indicates the direction you can drag the box in order to resize the box: 🔄.
4. Drag the blue box to resize the element.
   - The position of the element is also updated in the properties “Position ➔ X” and “Position ➔ Y”.

Moreover, you can rotate the “Rectangle”, “Line”, “Polygon”, and “Pie” elements.
1. Select the element for static rotation. Example: Rectangle
   - The rectangle is displayed with a handle next to the movable position boxes.

   (1) Handle

2. Drag the mouse pointer over the handle.
   - The cursor is displayed as a rotating arrow.

3. Rotate the element to any position.
   - In the property “Position → Angle”, the set angle is displayed in degrees.

ₐ Chapter 6.4.5.10.2 “Configuring rotations and offsets” on page 2912

Moving the visualization element forward and back

Each visualization element is in its own layer of the visualization (Z-axis). It can be hidden by other elements in the foreground and hide other elements in the background. The order of layers is visible on the “Element List” tab above the editor view. The order of elements from front to back specifies the order of visualization layers from back to front.

Use the commands from the “Order” context menu to move a selected element.

Example of an element list (1):
You configure the color of a visualization element either statically by means of the “Color” property, or dynamically by assigning an application variable by means of the “Color variables” property. Depending on the element, color assignments are also available in other properties. For example, for the font color, this is provided in the “Text” property of a labeled element.

For the static assignment of a color value, you can always use the color dialog in the properties editor, which provides color palettes to choose from.

You can specify the color as a style color. Style colors are color names for color definitions from the actively applied style. When configuring an corresponding property, you are provided with a list of available style colors. **We recommend that you use style colors** because then you can change colors centrally by means of a style selection or a style customization. You can also open the “Color” dialog to select a value from color palettes.

In addition, you can define the fill color of an element as a “Gradient”. Then the color changes linearly, radially, or axially from the initial color to the final color. You configure the “Gradient setting” in the “Gradient Editor” dialog.
Designing a visualization element with a style color or a fixed color value

**NOTICE!**
A color assignment with style color allows for easy global color changes.

1. **Requirement:** The visualization editor is open.
2. **Insert some** Rectangle elements.
3. **Select an element.**
   - The “Properties” view is active.
4. **Click in the** “Colors ➔ Normal state ➔ Fill color” property.
   - A list box and the button appear.
5. **Assign a style color** to the rectangle. For example, select “Elementfillcolor” from the list box.
6. **Define the degree of transparency** in the “Colors ➔ Normal state ➔ Fill color ➔ Transparency” property. Use the slider to select the value “136”.
7. **Select another rectangle.** Click in the “Colors ➔ Normal state ➔ Fill color” property.
   - A list box and the button appear.
8. **Assign a fixed color value** to the rectangle. Click to do this.
   - The “Color” dialog opens.
9. **Select a standard color or “Define Custom Colors”** to fine-tune your selection. Then click “OK”.
   - The color is set as a fixed value. The color is displayed as a small rectangle. The RGB values are also indicated next to it.
10. **Click in the** “Colors ➔ Normal state ➔ Fill color ➔ Transparency” property.
11. **Use the slider to select the value “136”.**
   - The color is semitransparent.

Designing a visualization element with a color gradient

1. **Requirement:** The visualization editor is open.
2. **Drag a** Rectangle element to the visualization.
3. **Select the** “Colors ➔ Use gradient color” property.
4. **Click in the** “Colors ➔ Gradient setting” property.
   - The “Gradient Editor” dialog opens.
4. Define the color gradient for the element:
   - “Gradient type”: “Radial”
   - “Standard radial”: “Center”
   - The fill color of the element changes radially from white to black.

   ![Color Gradient](image.png)

   Chapter 6.4.5.21.3.5 “Dialog ‘Gradient Editor’” on page 3369

Configuring a visualization element for color animation

The “Color variables” property, which certain elements may have, is used for the color animation of the element. If you assign a variable there, then you can program color changes in the application code or configure a user input that results in a color change.

You can see an example in the "Animating Visualization Elements" chapter.

   Chapter 6.4.5.10 “Animating visualization elements” on page 2912
   Chapter 6.4.5.21.4.2 “Object ‘Visualization manager’” on page 3398
   Chapter 6.4.5.19 “Applying Visualization Styles” on page 2979
   Chapter 6.4.5.10.4 “Animating a color display” on page 2914

6.4.5.5 Using texts

You can get displayed text in an element by assigning a string in the element property “Texts ➔ Text”. For example all base elements have this property. Also, you can get displayed a text as a tooltip (element property “Texts ➔ Tooltip”). Texts assigned in this way are static. They are managed in the object “GlobalTextList” in view “POUs” and they cannot be modified during runtime, neither programmatically nor via an user input.

However, you can extend a static text by (exactly) 1 placeholder containing a formatting specification, in order to output the content of a variable at this place. At runtime the current value of the variable, which you have assigned to the element via property “Textvariable”, will be output.

On the possible formatting specifications please see: Chapter 6.4.5.20.2 “Placeholders with Format Definition in the Output Text” on page 3329

By dynamic configuration you can animate the optical representation of the text.

You can localize the static texts, if you have set up multilingualism in your project.

See some examples for the text configuration of visualization elements in the following chapters.

   Chapter 6.4.5.20.2 “Placeholders with Format Definition in the Output Text” on page 3329
   Chapter 6.4.5.8 “Setting Up Multiple Languages” on page 2906

Labeling an image element with a static text

- Precondition: A project containing a visualization is opened. You have an image file representing a stop symbol.
  1. Below the Application object insert an object “Image Pool” named ImagePool_A.
  2. In the image pool ImagePool_A add your stop symbol image file with ID Stop.

   ![Image Pool](image.png)
   ![Stop Symbol](image.png)
3. Open the visualization and from the ToolBox draw an element “Image” into the editor.
   ⇒ The input assistant opens. In tab Category you see the image pool ImagePool_A.
4. Select the image Stop and close the dialog with “OK”.
5. Configure the property “Text” of the image: ImagePool_A, Stop
6. Configure the property “Text properties ➔ Horizontal alignment”: Left.
7. Configure the property “Text properties ➔ Vertical alignment”: Bottom.

Precondition: A project containing a visualization is opened.
1. Open the visualization and insert a “Button” element.
   ⇒ The “Properties” view opens for the new element.
2. Configure property “Text”: Number of clicks: %I
   ⇒ The string contains the placeholder %I.
3. In POU PLC_PRG of the application declare a type-conform variable: iClicks : INT;
4. Configure the property “Text variable” of the button element with PLC_PRG.iClicks.
   ⇒ At runtime the variable value will be output instead of the placeholder.
5. Below property “Inputconfiguration”, in the cell containing the input event OnMouseClick, click on “Configure”.
6. From the list of possible actions choose Execute ST-Code.
7. Enter the code for the action in the editor “Execute ST-Code”:
   PLC_PRG.iClicks := PLC_PRG.iClicks + 1;
8. Close the dialog with “OK”.
   ⇒ The user input is configured.
9. Build, download and start the application.
   ⇒ The application is running. The visualization opens. The element is labeled and the number of clicks will be output. If you as user click on the button, the number will be increased.
Using the “Text field” element you can produce a dynamic text output. The text output can be effected via an user input or via the application program.

1. Open the visualization and insert a “Text field” element. The “Properties” view shows the configuration of the element.
2. Below the application add a Text List with the following entries: Textlist_A.

3. In POU PLC_PRG of the application declare the text variable: strTextID : STRING := '0';
4. Also declare the variable strTooltipID : STRING := '0';
5. Also declare the variable iText : INT;
6. Configure the property “Dynamic texts ➞ Text List” with 'Textlist_A'.
7. Configure the property “Dynamic texts ➞ Text index” with PLC_PRG.strTextID.
8. Configure the property “Dynamic texts ➞ Tooltip index” with PLC_PRG.strTooltipID.
9. In POU PLC_PRG implement the CASE instruction as shown below.
   v The variables in property “Dynamic Texts” are programmed.
10. Configure the property “Inputconfiguration ➞ OnMouseclick” for Execute ST-Code with PLC_PRG.iText := (PLC_PRG.iText + 1) MOD 4;
   v For element “Text field” an user input is configured.
11. Build, download and start the application.
   v The application is running. The visualization opens. In the text field the text None is output. When you as user click on the element, the text changes to Dynamic File_A. And the matching tooltip is available: Information A. With each click the text changes according to the CASE instruction.
CASE instruction

```c
CASE iText OF
  0:    strTextID := '0';
        strToolTipID := '0';
  1:    strTextID := '1';
        strToolTipID := '4';
  2:    strTextID := '2';
        strToolTipID := '5';
  3:    strTextID := '3';
        strToolTipID := '6';
ELSE
  END_CASE;
```

Text output: Configuring a static + dynamic text output
In property “Texts ➔ Text” you can define a text in order to get a static text output. A text in “Texts ➔ Tooltip” will be displayed as tooltip. You can configure the text in a way, that the content of a variable is additionally output.

You can extend a static text by (exactly) 1 placeholder including a formatting definition, in order to output the content of a variable at this place at runtime. The variable must be assigned in property “Text variable”. When the variable value changes in the application code, then at the same time the output in the visualization changes.

- Precondition: A project containing a visualization is opened.
1. Open the visualization and insert an element “Text field”.
   ⇒ The “Properties” view shows the element configuration.
2. Configure the property “Text ➔ Text”: File name: %s
   ⇒ The text contains the placeholder %s.
3. In POU PLC_PRG of the application declare a type-conform variable strFileName : STRING := 'File_A';
4. Configure the property “Text variable” of the text field with PLC_PRG.strFileName.
   ⇒ At runtime the variable value will be output instead of the placeholder.
5. Build, download and start the application.
   ⇒ The application is running. The visualization opens. The text field element displays the text: File name: File_A

▷ Chapter 6.4.5.20.2 “Placeholders with Format Definition in the Output Text” on page 3329

Configuring text input in a text field
You can use the “Text field” element in order to output the text given by a variable, or to provide a place, where the user can give input on the variable.

Additionally you can configure a text input. In this case on an user input an input field in the element “Text field” will appear. As a precondition you must have configured an user input action in the property “Inputconfiguration”.

▷ Chapter 6.4.5.8 “Setting Up Multiple Languages” on page 2906
Showing text as a tooltip

- Precondition: A project containing a visualization is opened.
  1. Open the visualization and insert an element “Text field”.
     - The “Properties” view shows the element configuration.
  2. Configure the property “Texts ➔ Text”: File name: %s
     - The text contains the placeholder %s
  3. Configure the property “Texts ➔ Tooltip”: Storage location: %s
  4. In POU PLC_PRG of the application declare a type-conform variable strFileName : STRING := 'File_A';
  5. In POU PLC_PRG of the application declare also the variable strFileDir : STRING := 'D:/Data';
  6. Configure the property “Text variable” of the text field with PLC_PRG.strFileName.
    - At runtime the variable value will be output instead of the placeholder.
  7. Configure the property “Tooltip” of the text field with PLC_PRG.strFileDir.
  8. Build, download and start the application.
    - The application is running. The visualization opens. The text field element shows the text File name: File_A. When the mouse cursor is moved above the text field, the tooltip will be displayed: Storage location : D/Data.

.chapter 6.4.5.20.2 “Placeholders with Format Definition in the Output Text” on page 3329

Configuring element “Text field” for text input

- Precondition: A project containing a visualization is opened.
  1. In POU PLC_PRG of the application declare a string variable: strInput : STRING;
  2. Open the visualization and insert an element “Text field”.
    - The “Properties” view shows the configuration of the element.
  3. In property “Texts ➔ Text” enter Input: %s.
  4. In property “Inputconfiguration” for mouse action “OnMouseClick” click on “Configure” to open the “Input Configuration” dialog box. There choose action “Write a Variable” and activate option “Use text output variable”. Close with “OK”.
  5. In the element property “Text variables ➔ Text variable” assign the text output variable PLC_PRG.strInput.
6. Build, download and start the application.

The application is running. The visualization opens. The element outputs the text:

```
Input: Click in the element to open an input field, where you can enter a string.
After having terminated the input by [Enter], the text will be adopted.
```

### Animating the text display

Configure the property “Font variables” in order to animate the display of a text. All base elements have this property, additionally the table, scrollbar and text field element.

* Chapter 6.4.5.10.3 “Animating a text display” on page 2914

### Configuring the ‘Label’ element

- Precondition: A project containing a visualization is opened.
- 1. Open a visualization and insert an element “Label”.
  - The “Properties” view with the pre-set property configuration opens.
- 2. Configure the property “Texts ➔ Text” Visualization A.

### Making an element invisible

You can configure the property “State variables ➔ Invisible” in order to hide an element in the visualization.

- Precondition: In the visualization you have configured a text field, which gets visible only, if a certain application variable gets TRUE. For example in order to show certain instructions or descriptions only in a certain state of the machine.
- 1. For the text field element configure the property “Texts ➔ Text” with Error detected: Do the following...
  - Configure the property “Text properties ➔ Font color” with “dark red”.
- 2. In PLC_PRG declare the variable bIsInvisible : BOOL : TRUE; (this is the initialization for the current example; normally the variable should be set to TRUE by the application program under certain conditions.
- 3. Configure the property “State variables ➔ Invisible” with PLC_PRG.bIsInvisible.
- 4. Build, download and start the application.
  - The application is running. The visualization opens and the text field is not visible. When you set bIsInvisible to TRUE, the textfield will be displayed.

#### 6.4.5.5.6 How to display variable values in the visualization

There are simple to very specialized visualization elements for displaying data from a running application.

Examples:

- Simple output of variable values: For example, you can configure a purely formatting specification for a “Rectangle” element in the “Text” property and the variable whose value is to be displayed in the element in the “Text variable” property.
- Display of structured variable values (structure, array, function block): You use the “Table” element and specify an array variable in its configuration in the “Data array” property whose values are to be displayed in the table. One-dimensional arrays can also be displayed in a “Histogram”.
● Display of values by image switching. Example: A specific screen is displayed depending on the error message that occurs. You do this by configuring an “Image” element with a variable for the “Bitmap ID variable” property.
● Display a variable value as a bar or with a pointer on a scale: You specify a variable in the “Value” property of the “Bar Display” element or “Meter” element to display its value as a bar on a horizontal or circular scale.
● Display of alarms: The alarms configured in the alarm management of the application can be made visible by means of the “Alarm Table” and “Alarm Banner” elements in the user interface.
● “Trace” and “Trend”: For graphical recording of variable values over a period of time.
For details, see the descriptions of the element properties.

● Chapter 6.4.5.5.5 “Using texts” on page 2878
● Chapter 6.4.5.2.4 “Displaying Array Data in a Histogram” on page 2862

6.4.5.5.7 How to Change Variable Values via the Visualization
In addition to displaying values from the controller, a user interface is also used to enter and change values.
In general, you can configure user input for each element in its “Input configuration” properties. Moreover, elements have been developed especially for specific input.
Examples:
● A “Button” element (or “Rectangle” element, and so on) that is clicked to open a predefined dialog visualization for easily specifying a value.
● A “Slider” element for changing the value of a variable by moving visual element parts, for example with the mouse. In the case of the slider: The element adjusts the value of a variable, depending on the position of the slider within the slider. You define the value range of the slider bar by means of the scale start and scale end.
● A switch element (example; “Power Switch”) for setting a Boolean value.
● A “Spin Box” element for incrementing or decrementing the value of a variable in defined intervals.
● A “Button” element for writing a recipe, executing a specific ST code, writing a specific variable, and so on (definition in the input configuration).
See also
● Chapter 6.4.5.21.5 “Visualization Elements” on page 3412
● Chapter 6.4.5.6 “Configuring user inputs” on page 2885

6.4.5.5.8 Designing a background
You can design the background of your visualization in color or with an image. To do this, use the command “Visualization ➔ Background”.
See also
● Chapter 6.4.5.21.2.10 “Command ‘Background’” on page 3349
● Chapter 6.4.5.21.3.15 “Dialog ‘Properties’ of Visualization Objects” on page 3388

Configuring an image as a background
In addition, you can use the property “Integrate background” in the dialog “Properties” of a visualization object to specify whether the background image should always be displayed in its entirety or whether it should be truncated.
Requirement: A project with a visualization is open.
1. Open the visualization and select the command “Visualization ➔ Background”.
2. Activate the option “Image” and open the input assistant.
3. Select an image in the dialog “Input Assistant”.
   ⇒ The image serves as a background image.

See also
● Chapter 6.4.5.21.3.15 “Dialog 'Properties' of Visualization Objects” on page 3388

### Configuring a colored background

Requirement: A project with a visualization is open.
1. Open the visualization and select the command “Visualization ➔ Background”.
2. Activate the option “Color”.
3. Select a style color such as “Element background color” from the selection list.
   ⇒ The background of the visualization is colored.

### 6.4.5.6 Configuring user inputs

#### 6.4.5.6.1 General

User inputs for a visualization are configured in order to operate the visualization. For this purpose, you configure input events on visualization elements where follow-up actions are triggered. The combination of user inputs and follow-up actions are defined in the “Input configuration” of an element. For example, you can select a mouse click on an element as the input event and opening a dialog box as the input action.

Keyboard events can also be configured that trigger actions in a specific visualization window when the events occur. You program this kind of input configuration for a visualization in its “Keyboard configuration” editor.

In addition, keyboard events can be configured that occur in all visualizations programmed in the application. You configure this kind of input configuration per application below the visualization manager in the “Standard keyboard shortcuts” tab.

Input is usually performed with the mouse and keyboard as controlling device. You can also configure a user operation by means of gestures.

If a visualization device is not equipped with a mouse, then you can activate default keyboard usage. Then a user can operate the visualization with the keyboard only by navigating with the arrow keys and triggering events by pressing the [Enter] key.

If a visualization device is not equipped with a keyboard, then you can call a virtual keyboard or a virtual numeric keypad.

**NOTICE!**

Configure keyboard events only for keys that the visualization device supports.

● Chapter 6.4.5.21.2.2 “Command 'Keyboard Configuration’” on page 3341
● Chapter 6.4.5.21.3.6 “Dialog 'Input Configuration’” on page 3370
● Chapter 6.4.5.21.4.3 “Tab 'Visualization Manager’ - 'Default Hotkeys’” on page 3402
1. Event handler of the application. Requirement: The event handler is activated.
2. Events of the default keyboard usage
3. Events of the keyboard usage are configured in the tab “Visualization manager” - “Default hotkeys”.
4. Events of keyboard usage are configured in the tab “Keyboard configuration” for the currently visible visualization.

- Chapter 6.4.5.6.6 “Capturing user input events” on page 2895
- Chapter 6.4.5.21.1 “Keyboard Shortcuts for Default Keyboard Action” on page 3338
- “Tab ‘Keyboard configuration’” on page 3341
- Chapter 6.4.5.21.2.2 “Command ‘Keyboard Configuration’” on page 3341
- Chapter 6.4.5.21.4.3 “Tab ‘Visualization Manager’ - ‘Default Hotkeys’” on page 3402
- Chapter 6.4.5.21.4.3 “Tab ‘Visualization Manager’ - ‘Default Hotkeys’” on page 3402

### 6.4.5.6.2 Configuring user inputs for visualization elements

All base elements and some common control elements have the “Input configuration” property. This is where you can configure a user input for an element. For this purpose, you select an input event and an input action.

#### Configuring user inputs

- Requirement: A project is open with a visualization.
- Open the visualization and added a “Button” element.
  - The “Properties” view opens for the new button.
- Configure the property “Text” with Number of clicks: %i.
- Declare a variable iClicks : INT; in the application in the PLC_PRG POU.
- Configure the “Text variable” property of the button as PLC_PRG.iClicks.
  - At runtime, its variable value will replace the placeholder in the “Text” property.
- In the “Input configuration” property, click the “Configure” button in the OnMouseClick line.
- Select the Execute ST code action from the list of possible actions and click the symbol.
  - The action appears in the list of actions to be executed. The blank implementation of the action appears in the window area to the right of the list.
7. Program the action in the editor at “Execute ST code”:

```plaintext
PLC_PRG.iClicks := PLC_PRG.iClicks + 1;
```

8. Click “OK” to close the dialog box.
   ⇒ The user input is configured.

9. Compile, download, and start the application.
   ⇒ The application runs. The visualization opens. If the user clicks the button, then the
action is executed, the variable `PLC_PRG.iClicks` is incremented, and the number
of clicks is printed.

---

Chapter 6.4.5.21.3.6 “Dialog ’Input Configuration’” on page 3370

6.4.5.6.3 Configuring gesture recognition

You can execute a visualization on a device that is operated by means of gestures. The visualization retains its user input configuration for mouse and keyboard operation and also recognizes gestures and multi-touch events. Gesture events are recognized and interpreted as mouse events.

For this purpose, activate the “Activate multi-touch” setting in the visualization manager.

Elements of the type “Frame” or “Tab control element” display contents that a user should be able to move. Therefore, configure their “Scaling type” property with “Fixed and scrollable”.

Gesture recognition for:

- Tapping
  A quick tap on the element is interpreted as a mouse click.

- Panning
  Pressing, moving, and releasing with one finger in a frame or with a tab control element (in the window area of the element) will move the contents.

- Multi-finger touch detection
  Touching several elements at the same time will input for all elements. These touch events are interpreted as the respective mouse events.

Example:
Two-hand operation in order to trigger an action with two simultaneous inputs on two different elements.
Virtual mixing console where multiple sliders can be operated at the same time.

In addition, the `IGestureEventHandler` interface is available in the `VisuElems.VisuElemBase` library. You can use this to implement application code that recognizes gestures and executes follow-up actions.

The following display variants can execute a visualization on a multi-touch device

- CODESYS WebVisu

“Implementing event handling with multi-touch” on page 2888
Using gestures to control visualizations

☐ Requirement: A project is open with a visualization and a user input configuration. It contains one button. The visualization device is a display with multi-touch support.

1. Double-click the “Visualization manager” object.
   ⇒ The editor opens.
2. Click the “Settings” tab.
3. In the “Additional settings” group, activate the “Activate multi-touch” option.
4. Compile, download, and start the application.
   ⇒ The application runs. The visualization opens. When a user touches the display of the visualization device, the visualization responds. Elements that respond to mouse events also respond to touch events. Several buttons can be pressed at the same time. Scrollable frames or tab control elements are displayed without scrollbars and can be moved by panning.
   Note: The “Scaling type” property of elements type “Frame” or “Tab control element” must be set to “Fixed and scrollable”.

Chapter 6.4.5.20.1.6 “Visualization Element ‘Frame’” on page 3053
Chapter 6.4.5.20.1.10 “Visualization Element ‘Tabs’” on page 3084

Implementing event handling with multi-touch

☐ Requirement: The device is multi-touch capable

1. Implement and register a function block that receives the gesture events.
   ⇒ FUNCTION_BLOCK GesturesHandler IMPLEMENTS VisuElems.VisuElemBase.IGestureEventHandler2
   VisuElems.g_VisuEventManager.SetGestureEventHandler(THIS^);
2. Implement and register a function block that sets the touch areas.
   ⇒ FUNCTION_BLOCK RectProvider IMPLEMENTS VisuElems.VisuElemBase.IApplicationRectangleProvider
   VisuElems.g_VisuRectangleProvider := THIS^;
3. Implement actions as application code that are executed when a gesture event occurs

6.4.5.6 Configuring text input with the virtual keyboard

A visualization is usually configured so that it calls a virtual keyboard for a text input event when an input device is not available. For this purpose, the follow-up action “Write variable” is preset accordingly in the user input: The value “Standard” is selected for the “Input type” setting.

However, you can also configure especially how text is input. For this purpose, more input types are available in the user input, such as Text input or the listed visualizations. These visualizations have the visualization type “Numpad/Keypad” and display virtual keyboards or numeric keypads.

In the “Settings for default text input” setting of the visualization manager, you can preset a keyboard visualization that is called from all visualizations in the application when required. This is possible without having to customize the user inputs of the visualizations.

Chapter 6.4.5.21.3.6 “Dialog ‘Input Configuration’” on page 3370
Configuring text input especially for virtual keyboards

☐ Requirement: A project is open with a visualization.

1. Declare an input variable in the PLC_PRG program.
   `VAR_INPUT stInput : STRING; VAR_END`

2. Add a button to the visualization and select the element.

3. Configure the property “Texts ➔ Text” with Text input: %s.

4. Configure the property “Text variables ➔ Text variable” with PLC_PRG.stInput.

5. Click auf “Configure” in the property “Input configuration ➔ OnMouseClick”.
   ➔ The “Input Configuration” dialog box opens. The selected input event is printed below the caption.

6. Select the “Write variable” action.

7. Select the visualization Visudialogs.Keypad in “Input type” of the implementation of the action.
   ➔ The virtual keyboard Visudialogs.Keypad is selected as the input device.

8. Compile, download, and start the application.
   ➔ The visualization opens.

9. Click the button as a visualization user.
   ➔ The virtual keyboard appears and allows text input by means of the mouse.
Configuration and programming
Programming with CODESYS > CODESYS Visualization

Configuring numeric input especially for virtual numeric keypads

☑ Requirement: A project is open with a visualization.
1. Declare an input variable in the PLC_PRG program.
   ➔ VAR_INPUT iInput : INT; VAR_END
2. Open the visualization and added a “Rectangle” element.
3. Select the element in the editor.
   ➔ The properties are visible in the “Properties” view.
4. Configure the property “Texts ➔ Text” with Number input: %i.
5. Configure the property “Text variables ➔ Text variable” with PLC_PRG.iInput.
6. In the “Input configuration” property, click the “Configure” button in the OnMouseClick line.
   ➔ The “Input Configuration” dialog box opens. The selected input event is printed below the caption.
7. Select the Write variable action from the list of possible actions and click the symbol.
   ➔ The action appears in the list of actions to be executed. The blank implementation of the action appears in the window area to the right of the list.
8. Select the following settings:
   “Input type” set to VisuDialogs.Numpad.
   “Choose variable to edit” set to “Use text output variable”.
   “Dialog title” set to 'My virtual numpad'.
9. Click “OK” to close the dialog box.
   ➔ The user input is configured.
10. Compile, download, and start the application.

⇒ The application runs. The visualization opens. When a user clicks the rectangle, the numeric keypad opens.

![Image of numeric keypad]

**Defining standard text input**

☑ Requirement: A project is open with a visualization and a user input configuration. For all “Write variable” follow-up actions, the value “Default” is selected for the “Input type” setting.

1. Double-click the visualization manager.

2. Click in the default text input in the “Settings” tab (“Default text input” group) and assign visualizations.

⇒ These visualizations are defined as default text input. If a display variant does not have a keyboard, then these visualizations are called without you having to adapt the user input.
6.4.5.6.5 Configuring Keyboard Shortcuts

You can define keyboard shortcuts and assign specific actions to them. At runtime, a visualization detects the keyboard input event and executes the action.

There are different locations where you can configure a keyboard input event.

The options include the following:

- Configure keyboard input for a specific element.
- Configure keyboard input for a specific visualization.
- Configure keyboard input that is valid for all visualizations.
- Select the default hotkeys.

If the visualization integrated in CODESYS is executed, then you can deactivate the keyboard input of the visualization in order to use the keyboard shortcut from CODESYS in this state.

You can define a keyboard shortcut that triggers an action for an element. The element has to be visible and operable. For this purpose, the property “Input configuration ➔ Keyboard shortcuts” is available in the “Properties” view of the visualization editor.

Configuration and programming

Requirement: A CODESYS project is open with the existing visualizations visEllipse and visRectangle.

1. Select the application in the device tree and add a visualization named visMain.
   ➔ The visualization editor opens.
2. In the “Visualization Toolbox” view, select and drag the “Frame” element to the editor.
   ➔ The “Configuration of Frame Visualizations” dialog opens.
3. Double-click in succession the visEllipse and visRectangle visualizations in “Available Visualizations”.
   ➔ The visualizations appear in “Selected Visualizations”.
4. Click “OK” to exit the dialog.
   ➔ The visualization contains a new element type “Frame”. The 2 selected visualizations appear under its property “References”.
   In the editor, the frame shows the visualization with the index 0.
5. Add a button and configure its properties:
Select Rectangle in the property “Texts ➔ Text”.
In the “Input configuration ➔ OnMouseDown” property, select “Toggle frame visualization” for the visualization visRectangle.
Specify the value R in the property “Input configuration ➔ Keyboard shortcuts ➔ Key”.
➔ The button has a user input and a keyboard shortcut.
6. Add a button and configure its properties:
Select Ellipse in the property “Texts ➔ Text”.
In the “Input configuration ➔ OnMouseDown” property, select “Toggle frame visualization” for the visualization visEllipse.
Specify the value E in the property “Input configuration ➔ Keyboard shortcuts ➔ Key”.
➔ The button has a user input and a keyboard shortcut.
7. Click “Online ➔ Login” for the device and start the application.

   ➔ The visualization starts. It has a frame where one of the referenced visualizations runs. Focus on the visEllipse visualization and press [E]. The visualization switches the contents in the frame to the visEllipse visualization. When you press [R], the visualization switches the contents in the frame to the visRectangle visualization.

---

### Configuring keyboard shortcuts for a specific visualization

You can define keyboard shortcuts that trigger an input action on a specific visualization. The “Keyboard Configuration” tab in the editor of the visualization is used for this purpose.

- **Requirement:** A CODESYS project is open with the visualizations visEllipse and visRectangle.

1. Open the CODESYS TargetVisu object and select visEllipse as the start visualization.
2. Open the visEllipse visualization and click the “Keyboard Configuration” tab.
3. Click “Visualizations ➔ Keyboard Configuration”.
   ➔ The “Keyboard Configuration” tab opens.
4. Select the value C in the “Key” column.
5. Activate the “Press key” option.
6. Select the “Change shown visualization” value in the “Action Type” column.
7. Select visRectangle in the “Action” column.
   ➔ The user input is configured for [C].
8. Open the visRectangle visualization and click the “Keyboard Configuration” tab.
9. Select the value C in the “Key” column.
10. Activate the “Press key” option.
11. Select the “Change shown visualization” value in the “Action Type” column.
12. Select visEllipse in the “Action” column.
   ➔ The user input for [C] is also configured for this visualization.
13. Build the application.
14. Click “Online ➔ Login” for the device and start the application.

⇒ The visualization starts and displays an ellipse. Focus on the visEllipse visualization and press [C]. The visRectangle visualization is displayed. Focus on the visualization and press [C] again. Now the visualization is switched again to visRectangle.

⇒ “Tab ‘Keyboard configuration’” on page 3341
⇒ “Input action ‘Change Shown Visualization’” on page 3373

**Configuring keyboard shortcuts for all visualizations in the application**

You can define keyboard shortcuts that trigger the same input action for all visualizations of the application. The “Default Hotkeys” tab in the Visualization Manager is available for this purpose.

☐ Requirement: A project is open with a visualization.

1. Open the visualization.
2. Add a rectangle.
3. Configure the property “Texts ➔ Text” with Keyboard shortcut.
4. Double-click the “GlobalTextList” object.
5. Click in the table, “Add Language”, and then specify de.

⇒ The language de is configured.
6. Click in the table, “Add Language”, and then specify en.

⇒ The language en is configured.
7. Configure translations for de and en for the text Keyboard shortcut.

⇒ Hotkey Keyboard Shortcut Hotkey
8. Open the Visualization Manager and select the “Default Hotkeys” tab.
9. Specify D in the “Key” column.
10. Activate the “Press key” option.
11. Select the “Change language” value in the “Action Type” column.
12. Select the language de in the “Action” column.

⇒ The keyboard event for [D] is configured.
13. Specify D in the “Key” column.
15. Select the “Alt” option.
16. Select the “Change language” value in the “Action Type” column.
17. Select the language en in the “Action” column.

⇒ The keyboard event for [Alt]+[D] is configured.
18. Compile, download, and start the application.
   ➔ The visualization opens.

19. As the visualization user, press [D].
   ➔ The text is displayed in the language de.

- Chapter 6.4.5.21.4.3 “Tab ‘Visualization Manager’ - ‘Default Hotkeys’” on page 3402
- “Input action ‘Change Language’” on page 3372

### Activating standard keyboard handling

When you activate the universal keyboard shortcuts for standard keyboard handling, the user can operate the visualization without a mouse. Elements that respond to user input can process a keyboard event instead of a mouse event without adapting its input configuration.

- Requirement: A project with a visualization is open.
- 1. Click the “Visualization Manager” object.
- 2. Activate the “Activate standard keyboard handling” option.
   ➔ The universal keyboard shortcuts are activated.
- 3. Download the application to a device and start the application.
   ➔ The visualization starts. Now operation can proceed without the mouse. You can navigate in the window by means of the [Arrow] and [Tab] keys and press [Enter] instead of the mouse button.

- Chapter 6.4.5.21.1 “Keyboard Shortcuts for Default Keyboard Action” on page 3338

### Activating and deactivating keyboard shortcuts for integrated visualizations

If you execute the visualization as an integrated visualization, then the “Visualization ➔ Activate Keyboard Usage” command is available in order to deactivate the capturing of keyboard events. It is actually possible for the same keyboard shortcuts to be defined in the visualization and in CODESYS.

When you activate the command, the visualization executes the configured keyboard events.

When you deactivate the command, CODESYS executes the keyboard events. Capturing keyboard events is then deactivated for the visualization.

- Chapter 6.4.5.21.2.4 “Command ‘Activate Keyboard Usage’” on page 3343

### 6.4.5.6.6 Capturing user input events

You can capture user input events in the application. For this purpose, you can implement a function block that is executed when user events occur.

### Capturing the writing of variables

When the user completes the input of a value (in an input field), an edit control event is closed. You can capture this event in the application as follows.

- 1. Create a function block that implements the VisuElems.IEditBoxInputHandler interface from the VisuElemBase library.
- 2. Pass the instance to the global event manager VisuElems.Visu_Globalis.g_VisuEventManager by calling the SetEditBoxEventHandler method.
A visualization has two input fields for `iInput_A` and `rInput_B` and one text output element. The input fields are rectangles that the user is prompted to click in order to input text.

The text output element is a rectangle where the contents of the text variable `PLC_PRG.stInfo` are printed. The text variable contains the last input by a user in one of the input fields and the additional information that was added.

```
PROGRAM PLC_PRG
VAR_INPUT
  iInput_A:INT; (* Used in the visualization as user input variable*)
  rInput_B:REAL; (* Used in the visualization as user input variable*)
  stInfo : STRING; (* Informs about the user input via the edit *n)
```
control field;
    String gets composed by method 'VariableWritten;
    Result is displayed in the lower rectangle of the
visualization *)
END_VAR
VAR
  inst : POU;
  bFirst : BOOL := TRUE;
END_VAR

IF bFirst THEN
  bFirst := FALSE;
  VisuElems.Visu_Globals.g_VisuEventManager.SetEditBoxEventHandler(inst);
  (* Call of method VariableWritten *)
END_IF

FUNCTION_BLOCK POU IMPLEMENTS VisuElems.IEditBoxInputHandler
(* no further declarations, no implementation code *)
METHOD VariableWritten : BOOL
(* provides some information always when an edit control field is
closed in the visualization, that is a variable gets written by
user input in one of the upper rectangles *)
VAR_INPUT
  pVar : POINTER TO BYTE;
  varType : VisuElems.Visu_Types;
  iMaxSize : INT;
  pClient : POINTER TO VisuElems.VisuStructClientData;
END_VAR

  // String stInfo, which will be displayed in the lower rectangle,
  // is composed here
  PLC_PRG.stInfo := 'Variable written; type: ';
  PLC_PRG.stInfo := CONCAT(PLC_PRG.stInfo, INT_TO_STRING(varType));
  PLC_PRG.stInfo := CONCAT(PLC_PRG.stInfo, ', adr: ');
  PLC_PRG.stInfo := CONCAT(PLC_PRG.stInfo, DWORD_TO_STRING(pVar));
  PLC_PRG.stInfo := CONCAT(PLC_PRG.stInfo, ', by: ');
  PLC_PRG.stInfo := CONCAT(PLC_PRG.stInfo,
    SELECT(pClient^.globaldata.clienttype =
    VisuElems.Visu_ClientType.TargetVisualization,'other visu','
    targetvisu'));

Capturing keyboard events

When the user presses and releases the key, a keyboard event is triggered in the visualization. You can capture this event in the application as follows.

1. Create a function block that implements VisuElems.IVisuUserEventManager from the VisuElemBase library.

2. Pass the instance to the global event manager VisuElems.Visu_Globals.g_VisuEventManager by calling the SetKeyEventHandler method.
A visualization has one text output element. The text output element is a rectangle where the contents of the text variable PLC_PRG.stInfo are printed. The text variable contains information about the last key pressed by the user.

Properties of the rectangle for the text output

<table>
<thead>
<tr>
<th>Texts ➔ Text</th>
<th>%s</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Text variables ➔ Text variable&quot;</td>
<td>PLC_PRG.stInfo</td>
</tr>
</tbody>
</table>

**Implementation of the PLC_PRG program**

```plaintext
PROGRAM PLC_PRG
VAR_INPUT
  stInfo : STRING;
END_VAR
VAR
  inst : POU;
  bFirst : BOOL := TRUE;
END_VAR

IF bFirst THEN
  bFirst := FALSE;
  VisuElems.Visu_Globals.g_VisuEventManager.SetKeyEventHandler(inst);
END_IF
```

**Implementation of the POU function block**

```plaintext
FUNCTION_BLOCK POU IMPLEMENTS VisuElems.IKeyEventHandler
(* no further declarations, no implementation code *)

/// This method will be called after a key event is released.
/// RETURN:
/// TRUE - When the handler has handled this event and it should not be handled by someone else
/// FALSE - When the event is not handled by this handler
METHOD HandleKeyEvent : BOOL
VAR_INPUT
  /// Event type. The value is true if a key-up event was released.
  bKeyUpEvent : BOOL;
  /// Key code
  dwKey : DWORD;
  /// Modifier. Possible values:
  /// VISU_KEYMOD_SHIFT : DWORD := 1;
  /// VISU_KEYMOD_ALT : DWORD := 2;
  /// VISU_KEYMOD_CTRL : DWORD := 4;
  dwModifiers : DWORD;
  /// Pointer to the client structure were the event was released
  pClient : POINTER TO VisuStructClientData;
END_VAR
VAR
END_VAR

PLC_PRG.stInfo := 'KeyEvent up: ';
PLC_PRG.stInfo := CONCAT(PLC_PRG.stInfo, BOOL_TO_STRING(bKeyUpEvent));
PLC_PRG.stInfo := CONCAT(PLC_PRG.stInfo, ', key: ');
PLC_PRG.stInfo := CONCAT(PLC_PRG.stInfo, DWORD_TO_STRING(dwKey));
PLC_PRG.stInfo := CONCAT(PLC_PRG.stInfo, ', modifier: ');
PLC_PRG.stInfo := CONCAT(PLC_PRG.stInfo, DWORD_TO_STRING(dwModifiers));
PLC_PRG.stInfo := CONCAT(PLC_PRG.stInfo, ', by: ');
PLC_PRG.stInfo := CONCAT(PLC_PRG.stInfo, ', by: ');
```

**Example Implementation of the PLC_PRG program**

```plaintext
PROGRAM PLC_PRG
VAR_INPUT
  stInfo : STRING;
END_VAR
VAR
  inst : POU;
  bFirst : BOOL := TRUE;
END_VAR

IF bFirst THEN
  bFirst := FALSE;
  VisuElems.Visu_Globals.g_VisuEventManager.SetKeyEventHandler(inst);
END_IF
```

**Implementation of the POU function block**

```plaintext
METHOD HandleKeyEvent : BOOL
```

**Implementation of the VariableWriter method of the POU function block**

```plaintext
/// Event type. The value is true if a key-up event was released.
/// RETURN:
/// TRUE - When the handler has handled this event and it should not be handled by someone else
/// FALSE - When the event is not handled by this handler
```
SEL(pClient^.globaldata.clienttype = 
VisuElems.Visu_ClientType.Targetvisualization,
'other visu',
'targetvisu'));

1. Implement a function block (example: POU) that implements the IValueChangedListener interface.

   FUNCTION_BLOCK POU IMPLEMENTS VisuElems.IValueChangedListener
   
   In the device tree, the “ValueChanged” method is inserted below the function block.

2. In a program (example: “PLC_PRG”), implement the IEC code that registers the interface.

   VisuElems.g_itfValueChangedListenerManager.AddValueChangedListener(itfValueChangedListener)

   “PLC_PRG” receives all value changes by means of the “ValueChanged” method.

   Now you can record and process the value changes.

### 6.4.5.7.1 General

If you want to deploy a web visualization and securely protect it from third-party access, it is advantageous to set up runtime-based user management for it.

Runtime-based user management makes sure that users will log in securely with current technology. The credentials are managed using standard web technologies. In addition, user accounts can be created at runtime via secure channels, user credentials can be managed, and user permissions can be restricted according to the role of the user.

For this, it is necessary that the visualization user management is coupled with the device user management. You need to map the groups with their rights in the visualization to the groups in the device. You configure the user accounts centrally on the “Users and Groups” tab of the device editor.

If you do not want this because you value independent user management for your visualization and accept the outdated technology for this, then you can alternatively switch to legacy user management. This is not recommended if your controller supports runtime-based user management.

◇ Chapter 6.4.11.4 “Handling of Device User Management” on page 1971
◇ Chapter 6.4.1.6.5 “Setting up a user management” on page 1825
User management linked to device user management for higher security.

Whenever possible, always use runtime-based user management.

If you want to convert to your existing user management, then open the “User Management -> Groups” tab in the “Visualization Manager” and click the “Convert to Runtime-Based” button. At this time, the user groups are taken over. The credentials of the users will be lost because these then have to be set up in the controller.

The users are configured in the device user management on the “Users and Groups” tab of the device editor. If you want a user to have access only to a visualization but not to any device, then assign them a group membership and restrict the group permissions so that they are only allowed access to a visualization but not to any other device functionality.

Chapter 6.4.5.7.2 “Creating runtime-based user management initially” on page 2900

Legacy User Management

Deprecated but still available user management.

Legacy user management runs independently of device user management.

In the deprecated visualization user management, you define user groups and visualization users in the “Visualization Manager”. In the user management dialogs, which request the credentials at runtime, authorized users log in to their visualization with their group permissions. In the visualization, elements can have group-dependent permissions and therefore be visible only to the group, for example.

In a project with several applications, you can configure user management for each application.

NOTICE!

When a visualization user management exists, an unregistered user automatically receives the access rights from the None group.

“Tab ‘Groups’” on page 3404

Login operation on the display variants

The login operation is always the same for all display variants. This means it is independent of which user management is set up.

Login operation on the display variants:

- The integrated display ignores the user management functionality and starts with the user who logged in to the controller using CODESYS.
- When a TargetVisu is started, no user is initially logged in and the operator then has to log in if this is required by the designed visualization.
- When starting a remote TargetVisu, the user from the communication settings of the remote TargetVisu itself is initially logged in. This can be changed via a new login within the visualization.
- Web visualizations start with the secure login operation of runtime-based user management.

6.4.5.7.2 Creating runtime-based user management initially

Whenever possible, use a runtime version >= 3.5 SP18 Patch 1 and CODESYS Visualization version >= 4.2.0.0 for a new project with a visualization.
**With standard groups**

The default groups are “Administrator”, “Service”, and “Operator”.

Requirement: You have inserted a “WebVisu” below the “Visualization Manager”. You want to create a runtime-based user management with standard groups.

**With standard groups**

1. Double-click the “Visualization Manager” object in the device tree.
2. Select the “User Management” tab.
3. Click the [Create Runtime Based User Management with Default Groups] button.
   - The “Groups” and “Settings” tabs are displayed on the “User Management” tab.
   - The “Administrator”, “Service”, and “Operator” groups are configured on the “Groups” tab.
4. If necessary, to create new user groups, click in the empty field in the “Group Name” column and specify the name of the new group.
5. Connect the application to the controller and click the [Upload device groups names] button.
   - The user groups of the device user management are uploaded and are now selectable in the “Mapping in Runtime Group” column.
6. For the user groups of the visualization of the “Group Name” column, select a group of the device user management from the list box in the “Mapping in Runtime Group” column to which the user group of the visualization should be assigned.
   - By assigning the visualization user groups to the device user groups, the visualization groups get the same permissions on the controller as the respective groups of the device user management.

The visualization user management is now coupled with the device user management. The visualization user groups are now mapped to the device user management groups and get their group rights.

To configure the login operation, see: ☞ Chapter 6.4.5.7.5 “Setting up access control and login operation” on page 2903

**Empty with None group**

First create an empty user management if you want new created groups with self-determined permissions.

Requirement: You have inserted a WebVisu below the Visualization Manager.

1. Double-click the “Visualization Manager” object in the device tree.
2. Select the “User Management” tab.
3. Click the [Create Runtime Based Empty User Management] button.
   - The “Groups” and “Settings” tabs are displayed.
   - The “Group” tab is open.
4. To create new user groups, click in the empty field in the “Group Name” column and specify the name of the new group.
5. Connect the application to the controller and click the [Upload device groups names] button.
   - The user groups of the device user management are uploaded and are now selectable in the “Mapping in Runtime Group” column.
6. On the “User Management” tab: For the user groups of the visualization of the “Group Name” column, select a group of the device user management from the list box in the “Mapping in Runtime Group” column to which the user group of the visualization should be assigned.

By assigning the visualization user groups to the device user groups, the visualization groups get the same permissions on the controller as the respective groups of the device user management.

The newly created user management groups are now coupled with the device user management and are mapped to the device user management groups. You get their group permissions.

To configure the login operation, see: Chapter 6.4.5.7.5 “Setting up access control and login operation” on page 2903

6.4.5.7.3 Switch to legacy user management

Whenever possible, use a runtime version >= 3.5 SP18 Patch 1 and CODESYS Visualization version >= 4.2.0.0 for a new project with a visualization.

You have initially created a runtime-based user management. Now you want to decouple this from the device user management and have a separate management only for the visualization users.

1. In the Visualization Manager, open the “User Management” tab and click the “Groups” tab.
2. Click the [Convert to Legacy] button.

User management is decoupled from device user management and converted to legacy. The “Users” tab opens.

6.4.5.7.4 Creating a group with administrator rights for visualizations

Only with runtime-based user management.

Configuration of user groups with restricted administrator permissions for the visualization.

Typically, operators of the visualization are a separate user group from application developers. Therefore, the following steps can also be used to configure an administrator for the visualization, who has access only to the groups of the visualization.

This configuration is possible with runtime version 3.5.18.10 and higher.

For detailed information about CODESYS device user management and its operation, see: Handling of Device User Management.

Chapter 6.4.1.11.4 “Handling of Device User Management” on page 1971

Requirement: A visualization group (example: VISU_ADMIN) has been assigned to a runtime group (example: RTS_GRP_RESTR) in the Visualization Manager on the User Management tab. In the device user management, the User_Restr user has been assigned to the RTS_GRP_RESTR group. The RTS_GRP_RESTR group has full View permissions for the controller.
1. In the device user management, on the “Access Rights” tab, grant the “View” permission for the “UserManagement” object to the “RTS_GRP_RESTR” group. To do this, select the “UserManagement” object, and in the “Rights” area on the right side, double-click the “View” field of the “RTS_GRP_RESTR” group. This opens a dialog prompting whether or not the changed permissions should also be changed for all child objects. Click [No] to refuse this action. Double-click the field again and click [No] again in the next dialog.

   ➔ The symbol is displayed for the View permission. For all other groups (except Administrator), the permission should have the symbol.

2. To the “RTS_GRP_RESTR” group, grant the “View” and “Modify” permissions for the “UserManagement → Users” object.

   ➔ The symbol is displayed for both permissions.

3. To the “RTS_GRP_RESTR” group, grant the “View” and “Modify” permissions for those objects of the “UserManagement → Groups” object which are relevant for the visualization.

   ➔ Access to the groups which are relevant for the visualization is granted to the RTS_GRP_RESTR group. For the respective objects, the symbol is displayed for both permissions.

4. For the “RTS_GRP_RESTR” group, deny the “View” permission to the “Administrator” group. As a result, users of the “RTS_GRP_RESTR” group cannot extend their permissions.

   Moreover, select the “UserManagement → Groups → Administrator” object and deny the “View” permission to the “RTS_GRP_RESTR” group.

   ➔ The symbol is displayed.

   ➔ Now when you are logged in as a user with restricted administrator permissions on the application, you can create new users or modify existing users for the visualization, but not for groups with additional permissions on the controller.

### 6.4.5.7.5 Setting up access control and login operation

In the user management dialogs, you define the login, logout, changing of the user password, and editing of the user management in the visualization at runtime.

#### Editing and Selecting User Management Dialogs

**NOTICE!**

If you create your own dialog as a user management dialog, then you should use the visualizations from the included library project `VisuUserMgmtDialogs` as the basis, because it uses the required interfaces. Your own user management dialog is listed then in “Visualization Manager → Settings”, “Settings for User Management Dialogs”.

*For information about the login visualization in runtime-based user management, see: “Creating runtime-based user management initially”.*

[Chapter 6.4.5.7.2 “Creating runtime-based user management initially” on page 2900](#)

### Creating Login Pages

1. If you do not want to configure your own login page, then a preconfigured login page from a library is automatically used when logging in to the visualization. This visualization is automatically entered in the editor of the “WebVisu” as the “Login visualization” when the user administration is created, but it can be changed if necessary.

2. If you want to create your own login page, then follow the steps below:
3. Add a "Visualization" object (for example, named "Login_Visu") to the application.
4. In the context menu of this object, click "Properties". In the properties dialog, open the "Visualization" tab.
5. In the context menu of this object, click "Properties". In the properties dialog, open the "Visualization" tab.
6. Open the "Login_Visu" visualization and design your login page with the input fields for user name, password, and buttons for logging in and canceling the dialog.
7. To do this, only certain visualization elements are available to you. In these visualization elements, you can use placeholders to configure the input fields for the user name and password, as well as the buttons for logging in and canceling the dialog.
8. Compile the application and perform a download to the controller. When you open the web visualization, the login page which you created for the visualization opens. Type in your user name and the password for the controller which you have stored in the device user management and click the [LOGIN] button.

**Editing user management dialogs**

Requirement: The library project `VisuUserMgmtDialogs.library` exists in the installation directory.

1. Click "File → Open Project".
2. Select the project `VisuUserMgmtDialogs.library` from the Projects folder of the installation directory.
3. Click "View → POU"s.
   - In the "POU" view, the project is displayed with the visualizations "UserMgmtChangePassword", "UserMgmtConfig", and `UserMgmtChangePassword`.
4. Double-click a visualization (example: "UserMgmtLogin").
5. Change the visualization as you like and save the project.
6. Then, reinstall the library and add it to the "Library Manager" of your application.

**Selecting user management dialogs**

A user management already exists in your application in the "Visualization Manager" object on the "User Management" tab.

The "VisuUserManagement" library is in the "Library Manager".

1. In the device tree, click the "Visualization Manager" object.
2. Select the "Dialog Settings" tab.
3. In "Settings for User Management Dialogs", select the dialogs for "Login dialog", "Change password dialog", and "Change configuration dialog".

If no entries can be seen in "Settings for User Management Dialogs" in the dialog lists, then close the "Visualization Manager" and reopen it.

**Customizing the dialogs of the user management**

You configure the visualization buttons for the login, logout, change password, and user management dialogs as follows:

Requirement: A visualization is open.

1. Drag a "Button" element from the "Visualization Toolbox" view ("Common Controls" category) to the visualization.
2. In the "Properties" view, click the "Input configuration" node.
3. In the “Input Configuration ➔ OnMouseClick” property, click “Configure”.

4. In the “Input Configuration” dialog, click “User management” and  
   ➤ The following “Dialogs and actions” are listed on the right: “Login, Logout, Change User Password”, and “Open User Configuration”.

5. Elect the dialog or action to assign to the button and click [OK].
   ➤ When the button is clicked at runtime, the selected dialog opens or the selected action is executed.

| If you want to open and edit the user management in the visualization at runtime, you have to be a member of a group that has permission to Change User Data. |

6.4.5.7.6 Group-dependent restriction of functionality

Configuring permissions for an element of the visualization

Permissions for visualization-elements are not granted to individual users, but to groups with assigned users.

Requirement: A “Visualization” object is open with at least one inserted visualization element.

1. Click a visualization element in the editor.
2. Click the “Value” field of the “Permissions” element property in the “Properties” view.
   ➤ The “Permissions” dialog opens.
3. Select the permissions that the respective user group should have for the visualization element.

| If the option “Group hierarchy is used” is activated, the groups lower in the hierarchy cannot be granted more permissions than groups higher in the hierarchy. |

In the “Visualization Element List” of a visualization, the “Permissions” column shows the element permissions granted to groups.

➤ Chapter 6.4.5.21.2.3 “Command ‘Visualization Element List’” on page 3342

Updating groups and group permissions

In the project below the application, a visualization is stored which has at least one element with restricted permissions.

1. Open the Visualization Manager and click the “User Management” tab.
2. Click the “List Usage of Groups” button.
   ➤ In “Messages”, all elements with restricted permissions are listed which exist in the visualizations that are used across the application. This will give you an overview of functional limitations.
3. Click the [Update Visualizations/Hotkeys] button.

 The “Update Visualizations and Hotkeys” dialog opens. Here you can centrally rename groups, delete groups, or change group permissions. The affected visualization elements are updated. This means that the “Access Rights” property is updated for each of the affected elements: There, the group names are removed or renamed or the permissions are reset.

6.4.5.8 Setting Up Multiple Languages

Texts and tooltip texts for visualizations are managed in text lists and can be displayed in different languages. To switch a visualization between the available languages, configure a visualization element with the corresponding input configuration for changing the language.

There are static texts that are managed in “GlobalTextList” (generated automatically) and dynamic texts from created text lists. A dynamic text can be changed at runtime with a variable that defines the index of the text list entry. Static texts are fixed labels within a visualization; dynamic texts are often used for displaying variable values or error messages.

For creating and using text lists, see: Chapter 6.4.1.9.10 “Managing text in text lists” on page 1891.

You can modify the appearance and formatting of texts and tooltips with the element properties “Text properties” and “Font variables”.

See also
- Chapter 6.4.5.20.2 “Placeholders with Format Definition in the Output Text” on page 3329
- Chapter 6.4.5.21.3.6 “Dialog ‘Input Configuration’” on page 3370

Configuration language switching for texts from text lists

Requirement: An empty visualization object is inserted into the project and it is open for editing in the visualization editor. There is also a “Visualization Manager” object. User management is not created for the visualization.

The following instructions provide a simplified example:

- By means of two buttons, the user should be able to toggle the visualization texts between English and German.
- Static texts in the visualization include the labels “State, Machine 01”, “State, Machine 02”, “English”, and “German”. These texts are located in the “GlobalTextList” in English and German.
- Dynamic texts will describe the state of both machines. The texts are provided in the text list “Status_Texts” in English (en) and German (de).

1. Drag a “Text Field” from the “Visualization Toolbox” view (“Common Controls” category) to the editor view. Specify the value State, Machine M01 in the properties editor for the element property “Texts ➔ Text”.
2. Copy the element and change the copy label to State, Machine M02.
3. See also the figure in step 14 for the following steps.

Insert two elements of type “Button” from the “Visualization Toolbox” view (“Common Controls” category) in the visualization editor. With these elements, the user should be able to toggle the language of the visualization. Specify the text German or English in the properties editor for element property “Texts ➔ Text” (4).

4. Double-click and open “GlobalTextList” in the “POUs” view.

 The texts are entered in the “Standard” (1) column, and the “ID”s 0 and 1 are assigned automatically as additional information.
5. Add the languages “de” and “en” with the texts shown in the following figure.

![GlobalTextList](image)

6. Close the “GlobalTextList”.

7. Add two elements of type “Rectangle” from the “Visualization Toolbox” view (“Basic” category) in the visualization editor. The current state of each machine should be displayed.

8. For managing the texts for describing the states, add an object of type “Text List” below the application. Name the list Status_Texts.

9. Specify the texts shown in the figure for the standard language (1) and the target languages “en” and “de” in the editor of “Status_Texts”.

![Status_Texts](image)

10. Close the text list “Status_Texts”.

11. Select the rectangle element for displaying the state of machine M01. Select the text list Status_Texts from the combo box in the properties editor (2) for the “Dynamic texts” element property (5). Specify an application variable for “Text index” that shows the appropriate text index for the state of the machine at runtime. Example: PLC_PRG.ivar_status_m01.

12. Now configure the user input for both buttons for toggling the language in the visualization. Select the “German” button. Double-click “Configure” of the property “Input configuration” (6), “OnMouseClick”.

   The “Input configuration / OnMouseClick” dialog opens.

13. Select “Change the language” on the left. Click the arrows to accept the setting to the right. Select “de” in “Language” to the right of the dialog in the input assistance. Click “OK” to confirm.
14. In the same way, configure the entry for the second button: English: "Text list": Status_Texts, "Text index": 3, "Change the language": English).

⇒ The following figure shows the performed properties configurations for the four visualization elements.

15. When the application is compiled without errors, you can test the visualization in simulation mode. Activate the option "Online ➔ Simulation". Click "Online ➔ Login".

⇒ The visualization appears in the visualization editor view in online mode:

16. Click the “German” button.

⇒ The language changes to German:

⇒ “Input action ‘Change Language’“ on page 3372
Setting up fonts for a language

The font for a visualization element is defined in the properties editor. If a language switch is provided, you can overwrite this basic font with another font for each language in the visualization manager.

Requirement: A visualization is set up with at least one language in addition to the default language.

Example

1. Double-click and open the “Visualization Manager” object and select the “Font” tab.
2. Double-click the field in the “Font” line for a particular language. Select a font from the combo box.
3. In the “Font size” line, replace the value 1 with a value greater than 1 (example: 2) in order to increase the size of the font as defined by the visualization style; or replace it with a value less than 1 in order to decrease it (example: 0.5).
   ⇒ In online mode, the font changes depending on the set language.

6.4.5.9 Visualizing alarm management

In CODESYS, the alarm management is a powerful object for creating and managing alarms. You can group alarms and set the acknowledgement behavior individually. The alarm display in the visualization can also be customized.

The “Alarm Table” and “Alarm Banner” visualization elements are available for displaying and processing alarms. The alarm table lists the alarm texts. The alarm banner is a simplified version of the alarm table. It visualizes a single alarm only. However, by adding scroll elements you can allow for switching the display from one active alarm to another active alarm.

Creating an alarm table

Requirement: In your project, alarms are defined in alarm groups and they are assigned to an alarm class. The following instructions are based on the example that is described in the “Configuring alarm management” chapter.

1. Open the visualization editor.
2. Drag the “Alarm Table” element from the “Alarm Manager” group to the visualization editor.
   ⇒ The “Alarm Table” visualization element is visible in the editor.
3. In the “Alarm configuration” / “Alarm groups” property, define the alarm groups that you want to visualize. Click into the value field.
   ⇒ The “Select Alarm Group” dialog opens.
4. Clear the “All” check box and select the “PartsDeficit” alarm group. Add the group to the selected alarm groups by clicking the button.
5. In the “Alarm configuration” / “Alarm classes” property, define the alarm classes that you want to visualize. Click into the value field.
   ⇒ The “Select Alarm Class” dialog opens.
6. Clear the “All” check box and select the “PartsDeficit” alarm class. Add the alarm class to the selected alarm classes by clicking the button.
7. Add an additional column. Click the “Columns” / “Create New” button.
   ⇒ CODESYS adds the column “[2]” to the properties. The “Symbol” column is added to the table.
8. Select data type “State” for column [2].
   ⇓ The default column heading “State” is shown in the table.

9. Name the “Column heading” column “Status”.

10. Specify the appearance of the selected table cell. Set the “Selection” / “Selection color” to “Green”.

11. In the “Control variables” / “Confirm selection” property, specify the variable bQuitAlarm for confirming messages.

12. Adjust the other properties to your requirements. See the “Alarm table” visualization element for a complete description of the properties.

   Chapter 6.4.5.20.1.22 “Visualization Element ‘Alarm Table’” on page 3166

Inserting elements for acknowledging alarms

In CODESYS, predefined buttons are available for controlling the alarms in an alarm table.

Requirement: An “Alarm table” element exists in the visualization.

1. Select the visualization element in the editor.

2. Click “Visualization è Insert elements for acknowledging alarms”.
   ⇓ The “Alarm Table Wizard” dialog opens.

3. Click “OK” to accept all settings.
   ⇓ Four buttons are added for controlling the alarm table.

Creating an alarm banner

Requirement: In your project, alarms are defined in alarm groups and they are assigned to an alarm class. The following statement is based on the example that is described in the “Configuring alarm management” chapter.

The alarm banner displays an active alarm in online mode. If there are multiple active alarms, filtering takes place by means of the filter criteria set in the alarm banner (newest for filter criterion "Priority" and most important for filter criterion "Newest"). See the instructions below for adding scroll elements in order to switch the display between multiple alarms.

1. Open the visualization editor.

2. Drag the “Alarm banner” element from the “Alarm manager” group to the visualization editor.
   ⇓ The “Alarm banner” visualization element is visible in the editor.

3. In the “Alarm configuration” / “Alarm groups” property, define the alarm groups that you want to visualize. Click into the value field.
   ⇓ The “Select Alarm Group” dialog opens.

   Chapter 6.4.5.20.1.22 “Visualization Element ‘Alarm Table’” on page 3166
4. Clear the “All” check box and select the “PartsDeficit” alarm group. Add the group to the selected alarm groups by clicking the button.

5. In the “Alarm configuration” / “Alarm classes” property, define the alarm classes that you want to visualize. Click into the value field.
   ⇨ The “Select Alarm Class” dialog opens.

6. Clear the “All” check box and select the “PartsDeficit” alarm class. Add the alarm class to the selected alarm classes by clicking the button.

7. Set the “Alarm configuration” / “Filter criterion” property to “Newest”.
   ⇨ In online mode, the newest alarm message is always shown.

8. Add an additional column. Click the “Columns” / “Create new” button.
   ⇨ CODESYS adds the column “[2]” to the properties. The “Symbol” column is added to the table.

9. Select data type “State” for column [2].
   ⇨ The default column heading “State” is shown in the table.

10. In the “Confirmation variable” property, specify the variable bQuitAlarm for confirming messages.

Chapter 6.4.5.20.1.23 “Visualization Element ‘Alarm Banner’” on page 3175

Adding elements for scrolling the active alarms

Elements can be added to an alarm banner for switching the display between the individual active alarms. You can control the scrolling with visu-local variables or application variables.

1. Select the added “Alarm banner” visualization element. Click “Insert Elements for Scrolling Alarms” in the context menu.
   ⇨ The “Alarm Banner Wizard” opens.

2. Select the element type for the scroll elements: “Button” or “Rectangle”.

3. Activate the action(s) for which a control should be inserted: “Scroll to next alarm”, “Scroll to previous alarm”.

4. Specify a Boolean variable that gets the value TRUE when multiple active alarms are present. If you have already configured a project variable in the element properties, then it is also specified here in the wizard. Otherwise CODESYS automatically creates the visu-local variable “xMultipleAlarmsActive”.

5. In the next step, check the configuration of the element properties of the extended alarm banner.

6. Select the alarm banner element and look at the section “Handling of multiple active alarms” in the “Properties” view. You have two options:

7. Option 1: The display should switch automatically. Activate the “Switch automatically” property.
   ⇨ Now, in “Every N seconds” you define the time interval after which the display in the alarm banner in online mode should switch to the next alarm.

8. Option 2: The display should be controlled by means of the application. Deactivate the “Switch automatically” property.
   ⇨ Switching between the active alarms can be controlled by two variables. By default, xNext and xPrev are created for scrolling to the next or previous alarm. You can replace these variables with custom your own defined application variables.

2024/01/05 3ADR010583, 1, en_US 2911
Filtering by the contents of a latch variable can be useful when there are a lot of alarm events displayed. If the latch variable assigned to an alarm in the alarm group definition contains, for example, the error number or the name of a device instance, then you can filter the alarms in the visualization by it.

For this purpose, you configure an input option in the alarm visualization for the contents of the latch variable to be filtered by. For example, insert an input field which writes to the variable that is specified in the “Alarm configuration” - “Filter by latch 1” - “Filter variable” property of the configuration of the “Alarm table” element or “Alarm banner” element.

In addition, you configure an input option for the type of filtering. The type determines whether a numeric value (typed literal, LINT literal) or the string value of the latch variable is used for filtering. Filtering can also be switched off by means of type setting 0. For example, in the visualization, insert another input field which writes to the variable that is specified in the “Filter type” property of the configuration of the alarm table or alarm banner.

For more information, see the "Alarm Filter Latch Example" sample project in the CODESYS Store.

### 6.4.5.10 Animating visualization elements

<td>2914</td>
</tr>
</tbody>
</table>

#### 6.4.5.10.1 General

The animation of a visualization element at runtime can serve to visualize value curves in addition to serving purely visual purposes. Animation is possible through a dynamic configuration of certain element properties, i.e. by controlling these properties with a variable. See the following examples of possible animations.

#### 6.4.5.10.2 Configuring rotations and offsets

You can animate a visualization element and have it shifted or rotated at runtime. To do this you assign variables in its property “Absolute movement” and then program the animation in the application code.

**Configuring an offset**

You can configure an offset of the element by programming the variables in “Absolute movement ➔ Movement”.

- Requirement: A project with a visualization is open.
- 1. Open the visualization and add an element “Rectangle”.
  - The view “Properties” displays the configuration of the element.
- 2. In the application in the POU PLC_PRG, declare type-compliant variables: diOffsetX : DINT; and diOffsetY : DINT;
- 3. Configure the property “Absolute movement ➔ Movement ➔ X” with PLC_PRG.diOffsetX and “Y” with PLC_PRG.diOffsetY.
- 4. Implement a shift of the element, for example by means of a modulo division of the value: 
  
  diOffsetX := diOffsetX MOD 100;
  
  diOffsetY := diOffsetY MOD 100;
- 5. Compile, load and start the application.
  - The application runs. The visualization opens. The rectangle moves.

---

Configuration and programming
Programming with CODESYS > CODESYS Visualization
When an element rotates, then the center point of the element rotates precisely around its center. The center is defined in the property “Center”. The center point of an element is calculated internally. If the center point and center coincide, then there is no rotation.

You can configure a clockwise rotation of the element by increasing the value of the variable “Absolute movement → Rotation”.

☐ Requirement: A project with a visualization is open.
1. Open the visualization and add an element “Rectangle”.
   ⇒ The view “Properties” displays the configuration of the element.
2. In the application in the POU PLC_PRG, declare a type-compliant variable:

   rValue : REAL;

3. Configure the property “Absolute movement → Rotation” with PLC_PRG.rValue.
4. Implement the clockwise rotation of the element by increasing the value of the variable:

   rValue := rValue + 0.1;
5. Compile, load and start the application.
   ⇒ The application runs. The visualization opens. The rectangle rotates about the center. The alignment of the element with respect to the coordinate system is fixed.

When an element performs an inner rotation and rotates, then the center point of the element rotates precisely around its center. This is the point defined in the property “Center”. The alignment of the element also rotates relative to the coordinate system. If the center point of the element and the center coincide, this produces a rotation on the spot.

You can configure a clockwise rotation of the element by increasing the value of the variable “Absolute movement → Inner rotation”.

If the visualization is in runtime, you can see that the element rotates (also relative to the coordinate system of the visualization).

☐ Requirement: A project with a visualization is open.
1. Open the visualization and add an element “Polygon”, which you form into a pointer.
   ⇒ The view “Properties” displays the configuration of the element.
2. Drag the center point of the element to the base of the pointer.
3. In the application in the POU PLC_PRG, declare a type-compliant variable:

   rValue : REAL;

4. Configure the property “Absolute movement → Inner rotation” with PLC_PRG.rValue.
5. Implement the clockwise rotation of the element by increasing the value of the variable:

   rValue := rValue + 0.1;
6. Compile, load and start the application.

⇒ The application runs. The visualization opens. The pointer rotates about its base.

### 6.4.5.10.3 Animating a text display

An animation of the text display can be configured in the property “Font variables”. All basic elements have this property as well as tables, scrollbars and text fields.

- Requirement: A project with a visualization is open.
- 1. Open the visualization and add an element “Rectangle”.

⇒ The view “Properties” displays the configuration of the element.
- 2. Configure the property “Texts ⇒ Text” with Important:
- 3. In the application in the POU PLC_PRG, declare a type-compliant variable:

⇒ iFontHeight : INT;
- 4. Configure the property “Font variables ⇒ Size” with PLC_PRG.iFontHeight.
- 5. Implement a change of the font size.

⇒ iFontHeight := iFontHeight + 1) MOD 20;
- 6. Compile, load and start the application.

⇒ The application runs. The visualization opens. The rectangle is labelled with Important. The font size grows from 1 to 20.

See also
- Chapter 6.4.5.20.1.1 “Visualization Element 'Rectangle', 'Rounded Rectangle', 'Ellipse'” on page 2988

### 6.4.5.10.4 Animating a color display

The colors of an element are specified in the “Colors” properties of the element properties. There you can select either a predefined style color from the selection list or a color in the color dialog.

The “Color variables” element property is used for the color animation of the element. If you pass variables to the properties, then you can program color changes in the application code or configure a user input that results in a color change. A color constant or color variable in the code has the data type DWORD and is encoded according to the RGB color space or RGBA extension.
NOTICE!
The "Activate semi-transparent drawing" option is provided in the Visualization Manager. This option is enabled by default so that the "Transparency" property is available for all color definitions. With programmatic color definition, the leading byte is interpreted as an alpha channel and therefore used as the transparency value of the color. When the option is cleared, the "Transparency" property is not available and the leading byte is ignored in color literals.

Color information in the code is specified as DWORD literals. The value is in the RGBA color space and is usually shown as a hexadecimal number. The value is coded with additive portions of red, green, and blue. It is appended with the alpha channel which determines the transparency of the color.

\[\text{16#<TT><RR><GG><BB>}\]

\(<\text{TT}>\) : 00 - FF     // Transparency in 256 levels  
\(<\text{RR}>\) : 00 - FF     // Red in 256 levels  
\(<\text{GG}>\) : 00 - FF     // Green in 256 levels  
\(<\text{BB}>\) : 00 - FF     // Blue in 256 levels

The graduation value for transparency is \text{16#FF} for opaque and \text{16#00} for transparent. For each color portion, one byte is reserved for 256 color graduations \text{16#FF} to \text{16#00}. \text{16#FF} means 100% color portion and \text{16#00} means 0% color portion.

<table>
<thead>
<tr>
<th>Byte order of a color literal</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>(&lt;\text{TT}&gt;)</td>
<td>Byte for the transparent graduation of 00-FF</td>
</tr>
<tr>
<td>(&lt;\text{RR}&gt;)</td>
<td>Byte for the red portion of 00-FF</td>
</tr>
<tr>
<td>(&lt;\text{GG}&gt;)</td>
<td>Byte for the green portion of 00-FF</td>
</tr>
<tr>
<td>(&lt;\text{BB}&gt;)</td>
<td>Byte for the blue portion of 00-FF</td>
</tr>
</tbody>
</table>

Table 621: Color literal

<table>
<thead>
<tr>
<th>Color Literal</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>\text{16#FF0000FF}</td>
<td>Blue, opaque</td>
</tr>
<tr>
<td>\text{16#FF00FF00}</td>
<td>Green, opaque</td>
</tr>
<tr>
<td>\text{16#FFFF00FF}</td>
<td>Yellow, opaque</td>
</tr>
<tr>
<td>\text{16#88888888}</td>
<td>Gray, semitransparent</td>
</tr>
<tr>
<td>\text{16#88000000}</td>
<td>Black, semitransparent</td>
</tr>
<tr>
<td>\text{16#FFFF0000}</td>
<td>Red, opaque</td>
</tr>
</tbody>
</table>

Example

Global declaration of color constants

\[\begin{align*}
\text{VAR\_GLOBAL\_CONSTANT} \\
\quad \text{c\_dwBLUE} & : \text{DWORD} := \text{16#FF0000FF}; \quad \text{// Highly opaque} \\
\quad \text{c\_dwGREEN} & : \text{DWORD} := \text{16#FF00FF00}; \quad \text{// Highly opaque} \\
\quad \text{c\_dwYELLOW} & : \text{DWORD} := \text{16#FFFF00FF}; \quad \text{// Highly opaque} \\
\quad \text{c\_dwGREY} & : \text{DWORD} := \text{16#88888888}; \quad \text{// Semitransparent} \\
\quad \text{c\_dwBLACK} & : \text{DWORD} := \text{16#88000000}; \quad \text{// Semitransparent} \\
\quad \text{c\_dwRED} & : \text{DWORD} := \text{16#FFFF0000}; \quad \text{// Highly opaque} \\
\end{align*}\]
Animating a visualization element in color

1. Create a standard project in CODESYS.
2. Declare global color constants in the POU tree.
   
   ```plaintext
   {attribute 'qualified_only'}
   VAR_GLOBAL CONSTANT
   gc_dwRed : DWORD := 16#FFFF0000;
   gc_dwGreen: DWORD := 16#FF00FF00;
   gc_dwYellow: DWORD := 16#FFFFFF00;
   gc_dwBlue: DWORD := 16#FF0000FF; // Highly opaque
   gc_dwBlack : DWORD := 16#88000000; // Semitransparent
   END_VAR
   
   3. In the device tree, declare local color variables in PLC_PRG.
      
      ```plaintext
      VAR
dwFillColor: DWORD := GVL.gc_dwGreen;
dwFrameColor : DWORD := GVL.gc_dwBlack;
dwAlarmColor : DWORD := GVL.gc_dwRed;
END_VAR
   
   4. Declare a control variable.
      
      ```plaintext
      bChangeColor : BOOL;
   
   5. Declare an input variable in PLC_PRG.
      
      ```plaintext
      bInput : BOOL;
   
   6. Enable the visualization editor.
   
7. Drag a “Rectangle” element to the visualization editor.
   
   ```plaintext
   The “Properties” view of the element opens.
   
   8. Configure the properties of the rectangle as follows:
   
   ● Property “Color variables”, “Normal state”, “Filling color”: PLC_PRG.dwFillColor
   ● Property “Color variables”, “Normal state”, “Frame color”: PLC_PRG.dwFrameColor
   ● Property “Color variables”, “Alarm state”, “Filling color”: PLC_PRG.dwAlarmColor
   ● Property “Color variables”, “Toggle color”: <toggle/tap variable>
   ● Property “Input configuration”, “Toggle”, “Variable”: PLC_PRG.bInput
9. Program the variables as follows:

PROGRAM PLC_PRG
VAR
  dwFillColor: DWORD := GVL.gc_dwGreen;
  dwFrameColor : DWORD := GVL.gc_dwBlack;
  dwAlarmColor : DWORD := GVL.gc_dwRed;
  bChangeColor : BOOL;
  bInput : BOOL;
END_VAR

IF bChangeColor = TRUE THEN
  dwFillColor := GVL.gc_dwYellow;
  dwFrameColor := GVL.gc_dwBlue;
ELSE
  dwFillColor:= GVL.gc_dwGreen;
  dwFrameColor := GVL.gc_dwBlack;
END_IF

The colors are initialized at runtime. If the variable bChangeColor is then forced to TRUE, the color display of the rectangle changes. When the rectangle is clicked in the visualization, the rectangle is displayed in alarm colors.

6.4.5.11 Displaying data arrays in tables

6.4.5.11.1 General
A frequently required function of a user interface is the display of data arrays. CODESYS Visualization provides the element “Table” for this.
In the configuration of the element “Table”, enter an array variable in the property “Data array”. The array components are displayed in the rows and columns of the table.
A table for displaying data arrays can also be created in the following way. You duplicate a single element having at least one property that is described by a structured variable. The single element is configured as a “template” for this and duplicated with a command.

6.4.5.11.2 Displaying Array Variables in Tables
A frequently required function of a user interface is the display of data arrays. CODESYS Visualization provides the element “Table” for this.
In the configuration of the element “Table”, enter an array variable in the property “Data array”. The array components are displayed in the rows and columns of the table.
Subsequent instructions describe an example of how an array of a structure is displayed in a table. As a preparation, create the MYSTRUCT DUT and the declarations in the PLC_PRG program.

```plaintext
TYPE MYSTRUCT :
  STRUCT
    iNo : INT;
    bOnStock : BOOL;
    strPartNumber : STRING;
  END_STRUCT
END_TYPE

PROGRAM PLC_PRG
VAR
  arrStruct : ARRAY[0..6] OF MYSTRUCT;
  iSelectedColumn : INT;
END_VAR

1. Drag the “Table” visualization element to the visualization editor.
2. Assign the array variable arrStruct to the “Data array” property.
   ⇒ The structure members are displayed as column headings and the array index as row headings.
3. Change the “Columns ➔ Column ➔ [0] ➔ Column header” property to an informative heading (example: Number).
5. Assign a color to the “Selection ➔ Selection color” property.
6. Define the “Selection ➔ Selection type” property as Row selection.
7. In the “Selection ➔ Variable for selected row” property, define the PLC_PRG.iSelectedColumn variable.
   ⇒ The following display results in online mode:

<table>
<thead>
<tr>
<th>Number</th>
<th>in Stock</th>
<th>Part Number</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td>FALSE</td>
</tr>
<tr>
<td>1</td>
<td>0</td>
<td>FALSE</td>
</tr>
<tr>
<td>2</td>
<td>0</td>
<td>FALSE</td>
</tr>
<tr>
<td>3</td>
<td>0</td>
<td>FALSE</td>
</tr>
</tbody>
</table>

● Chapter 6.4.5.20.1.13 “Visualization Element ‘Table’” on page 3106

6.4.5.11.3 Configuring and Multiplying Visualization Elements as Templates

A table can also be created to display data arrays in the following way. You multiply a single element that has at least one property which is described by a structured variable. To do this, the single element is configured as a "template" and multiplied by means of a command.
You can use the “Visualization ➔ Multiply Visu Element” command to display array data in a visualization. The command multiplies a template element to create an element of the same type for each array component. The layout of the new elements in the visualization is one-dimensional as a row or column, or two-dimensional as a table.

To do this, drag an applicable element into the visualization editor. Then configure the properties of the element with array variables and specify the index access placeholder \$FIRSTDIM\$ as component access. If you have declared a multidimensional array, then you can use the second index access placeholder \$SECONDDIM\$ for the additional dimension. Configure the remaining properties as usual with the typical values. The purpose is to create a valid template element. Then execute the “Multiply Visu Element” command on the template element. Now the dialog with the same name opens. There you define in detail how many elements should be created and where they should be located.

After multiplying, the visualization contains as many of the same elements as are indexed using placeholders. In doing so, the settings in the “Multiply Visu Element” dialog are taken into consideration. All new elements in the properties that were preset with placeholders have these replaced with precise indexes. The remaining properties have been applied and copied without changes.

For example, you can have a layout of nine buttons as 3x3 tables, which are all the same size or the same color, but vary in the labeling. The labels are declared as a string array (nine components) and are passed as a value to the “Texts” ➔ “Text” property.

Valid template element:

- Declaration of array variables
  Example: asText: ARRAY[1..3, 1..3] OF STRING;
- Element with applicable element type
- Configuration of at least one property of the applicable element with array variables with index access placeholders
  Example: Property “Texts”, “Text” = PLC_PRG.asText\[$FIRSTDIM\$, \$SECONDDIM\$]
  This is possible for all properties that permit a variable as a value (for example, also properties from the “Animation” or “Input” categories. To configure multiple properties for an element with arrays and index access placeholders, all arrays must have the same structure with the same dimension. The declarations have to be compatible.
- Configuration of properties that do not vary (and are therefore the same for all generated elements) with the usual values without index access placeholders
  Example:
  sButtonTip : STRING := 'This element is created by multiplication'
  Property “Texts”, “Tooltip” = \%
  Property “Text variables”, “Tooltip variable” = sButtonTip

You can still use the placeholder \% as usual for the text display of variable values in the properties in “Texts”.

Applicable visualization elements

Visualization elements that can be multiplied:

- “Rectangle”
- “Rounded Rectangle”
- “Ellipse”
- “Line”
- “Polygon”
- “Polyline”
- “Bézier Curve”
- “Image”
- “Frame”
- “Button”
- “Pie”
1. Create a new standard project.
   ➔ A CODESYS Control Win V3 is configured as the device. The **MainTask** calls **PLC_PRG**. The implementation language is ST.

2. In **PLC_PRG** in the program code, declare array variables with basic data type **STRING**.
   ➔
   ```
   PROGRAM PLC_PRG
   VAR
       axLampIsOn: ARRAY[1..2,1..3] OF BOOL;  // For lamp, property 'variable' and button, user input
       asButtonText: ARRAY[1..2,1..3] OF STRING := // Output text
       for button, property 'text variables''text variable'
       [  '1A Lamp', '2A Lamp',
         '1B Lamp', '2B Lamp',
         '1C Lamp', '2C Lamp'
       ];
   END_VAR
   ```

3. Select the application in the device tree and click “Add Object ➔ Visualization”.

4. In the “Add Visualization” dialog, specify the name **VisuMain** and click “Add” to close the dialog.

5. Drag a “Lamp” element from the “Visualization Toolbox” view to the visualization.
6. Configure the fixed property values.

7. Double-click the value field of the “Variable” property.
   ⇒ The line editor opens.

8. Click \[\text{...}\].
   ⇒ The Input Assistant opens.

9. Select the array variable PLC_PRG.axLampIsOn from the variable tree.

10. Extend the string at the end, for example with ",s".
    ⇒ If you have activated SmartCoding (“Options” dialog, “SmartCoding” category, “List components immediately when typing” option), then the current variable list appears with the placeholders:

    ![Variable List](image)

11. Select the placeholder $\$FIRSTDIM$\$ for the first dimension and confirm the selection.

12. Extend the string at the end, for example with ",s".
    ⇒ The variable list appears again.

13. Select the placeholder $\$SECONDDIM$\$ for the second dimension and confirm the selection.

14. Complete the string with a closing bracket.
    ⇒ PLC_PRG.axLampIsOn[$\$FIRSTDIM$, $\$SECONDDIM$]

    The lamp is configured as a template.
15. Click “Visualization ➔ Multiply Visu Element”.
   ➞ The “Multiply Visu Element” dialog opens. The default values are derived from the array declarations.
   
   “Total number of elements”, “Horizontal” = 2
   “Total number of elements”, “Vertical” = 3

16. Declare the distance between the new elements.
   ➞ “Offset between elements”, “Horizontal” = 3
   “Offset between elements”, “Vertical” = 3

17. Check the advanced settings.

18. Click “OK” to confirm the selection.
   ➞ The new elements appear in the visualization editor. All properties are configured with a precise index and the array variables are indexed.

19. In the “Visualization Toolbox”, in the “Common Controls” category, drag the “Button” element to the visualization editor.
   ➞ The “Properties” view of the element opens.

20. Configure the fixed property values.
   ➤ PLC_PRG.asButtonText[\$FIRSTDIM\$, \$SECONDDIM\$]

   ➤ PLC_PRG.axLampIsOn[\$FIRSTDIM\$, \$SECONDDIM\$]

   The button is configured as a template.

23. Click “Visualization ➔ Multiply Visu Element”.
   ➤ The “Multiply Visu Element” dialog opens. The default values are derived from the array declarations.
   “Total number of elements”, “Horizontal” = 2
   “Total number of elements”, “Vertical” = 3

24. Declare the distance between the new elements.
   ➤ “Offset between elements”, “Horizontal” = 3
    “Offset between elements”, “Vertical” = 3

25. Check the advanced settings.

26. Click “OK” to confirm the selection.
   ➤ The new elements appear in the visualization editor. All properties are configured with a precise index and the array variables are indexed.
27. Build, start, and download the application.

 designate Visualization at runtime:

You can also configure the template element with array variables that have more than two dimensions, but you can only assign placeholders to a maximum of two of the dimensions. In the additional dimensions, the indexes are fixed.

**Declaration**

```
PROGRAM PLC_PRG
VAR
  asText: ARRAY[1..2, 1..3, 1..6, 1..2] OF STRING;
END_VAR
```

**Example**

```
Configure the “Text variables”, “Tooltip variable” property for the template element:
PLC_PRG.asText[2, $FIRSTDIM$, $SECONDDIM$, 2]
```
You can configure the template element with a one-dimensional array by means of the index access placeholder $FIRSTDIM$. If the number of new elements to be created is greater than five, then a tabular layout is preset in the "Multiply Visu Element" dialog. The layout of the new elements is as quadratic as possible.

**Example**

```plaintext
PROGRAM PLC_PRG
VAR
  asText: ARRAY[1..100] OF STRING;
END_VAR
```

The default setting in the "Multiply Visu Element" dialog allows for a layout of 100 new elements in a 10x10 field.

- Options for SmartCoding

### 6.4.5.12 Displaying data curve with trace
#### 6.4.5.12.1 General

With this element, you can integrate a trace graph in the visualization that monitors and displays variable values permanently. You configure the displayed trace graph in the element properties. In addition, you can add control elements that control the trace functionality. This is done manually or by using the “Insert Elements for Controlling Trace” command.

*Configurations for the 'Trace' visualization element can be taken from the 'Trace' object.*
See also

- Chapter 6.4.5.12.2 “Getting started with trace” on page 2926
- Chapter 6.4.5.21.2.15 “Command 'Insert Elements for Controlling Trace’” on page 3358
- Chapter 6.4.1.13.3 “Data Recording with Trace” on page 2007

### 6.4.5.12.2 Getting started with trace

Create a project with the following program PLC_PRG:

```plaintext
PROGRAM PLC_PRG
VAR
    iVar : INT;
    rSin : REAL;
    rVar : REAL;
END_VAR

iVar := iVar + 1;
iVar := iVar MOD 33;

rVar := rVar + 0.1;
rSin := 30 * SIN(rVar);
```

1. In the device tree, select the application and add a new visualization by clicking “Project ➔ Add Object ➔ Visualization”.
   ➔ The respective visualization editor opens.

2. Add the “Visualization” object to the device tree below “Application”.
   ➔ An empty visualization appears.

3. Open “Toolbox ➔ Special Controls”.

4. Drag the “Trace” element to the visualization editor.
   ➔ The element properties are displayed on the right side.
5. Click the symbol in the “Trace” property.  
   ⇒ The “Trace Configuration” dialog opens.

6. Click “Add Variable” to add an entry to the tree view of the trace configuration and select a project variable (for example, PLC_PRG.rSin).

7. Click the top node of the trace configuration.  
   ⇒ The group “Record Settings” is shown on the right.

8. Select the MainTask option for the “Task” setting.  
   Tip: The trace recording and the corresponding program should be executed in the same task.

9. Click “OK”.  
   ⇒ The task configuration is applied.

10. Select the trace element and click “Visualization ⇒ Add Elements for Trace Control”  
   ⇒ The “Trace Wizard” dialog opens. By default, all control elements are activated there.

11. Click “OK” to close the dialog.  
   ⇒ The control elements are added to the visualization and the control variables are declared. Then the control elements and the trace element are configured with the control variables.

12. Download the application to the controller and start it.

Example

The PLC_PRG program is running on the PLC. When you follow the "Getting Started" instructions, the following interface is displayed:

You can control the trace recording by clicking the buttons.
6.4.5.13 Displaying data curve with trend

6.4.5.13.1 General

A trend visualizes data that is used in the database of a trend recording. In contrast to the trace element, the trend element is particularly appropriate for long-term data recording.

The visualization of a trend encompasses the Trend element and the control elements. The three possible control elements can be seen in the illustration.

- Legend ①: Outputs the trend variables with values.
- Time range picker ②: Provides buttons for selecting predefined time ranges.
- Date range picker ③: encompasses control elements for navigation and zooming in the historical and current data on basis of the set date range.

A cursor is optionally available that enables the reading of a value at a certain time.

You can execute a trend visualization in the following clients:

- Target visualization
- Integrated visualization

See also

- Chapter 6.4.5.21.2.13 “Command 'Configure Trace'” on page 3355
- Chapter 6.4.5.21.3.19 “Dialog 'Display Settings'” on page 3391
- Chapter 6.4.5.20.1.34 “Visualization Element 'Trace'” on page 3240

6.4.5.13.2 Getting Started with Trend Visualization

When you execute a Trend, it is best to proceed with user guidance and the help of the trend wizard.
Development of a visualization with trend

1. Create an empty standard project and program at least one variable into PLC_PRG.
   - PLC_PRG is declared and implemented

2. Add the "Visualization" object to the device tree below "Application".
   - An empty visualization appears.

3. Open "Toolbox ➔ Special Control".

4. Drag the "Trend" element to the visualization
   - The "Trend Recording" dialog opens with the "Recording Settings".

5. Select the task in which the trend recording will be executed.
   - In general the trend recording runs in the same task as the main program, i.e. PLC_PRG.
   - Therefore, select MainTask.

6. Add a trend variable with "Add Variable" and assign an IEC variable from PLC_PRG to the trend variable.

7. Click "OK" to close "Trend Configuration".
   - There is a newly created object of the type Trend recording under "Trend Recording Manager". The active visualization contains a "Trend" element that is selected.

8. Click "Visualization ➔ Insert Elements for Controlling Trend Elements".
   - The "Trend Wizard" dialog box opens.

9. By default, all three control elements are activated in the dialog. Click "OK" to close the dialog box.
   - The active visualization contains a "Trend" with control elements.

10. Set the application containing the trend objects to active.

11. Compile the application with [F11].

12. Click "Online ➔ Login".

13. Start the application with [F5].
   - The target visualization appears. The visualization contains the trend diagram with the value curve of the variable. The control elements enable user inputs.

Example: Visualization of the sinusoidal trend of an IEC variable.

The following objects are implemented in the project:
- PLC_PRG
- Visualization_Trend1
- VisuWithTrend

Chapter 6.4.5.13.3 "Programming a Trend Visualization" on page 2931
Chapter 6.4.5.21.2.18 "Command 'Insert Elements for Controlling the Trend'" on page 3360
PLC_PRG runs as part of the application on the controller.

```plaintext
PROGRAM PLC_PRG
VAR
  iVar : INT;
  rSin : REAL;
  rVar : REAL;
END_VAR

iVar := iVar + 1;
iVar := iVar MOD 33;

rVar := rVar + 0.1;
rSin := 30 * SIN(rVar);
```

Visualization_Trend1 is the object that contains the configuration of the trend recording.
**VisuWithTrend** is the object that visualizes the trend.

The visualization contains four elements: one “Trend” and three control elements. The properties of the trend are defined as follows.

<table>
<thead>
<tr>
<th>Properties</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Trend recording”</td>
<td>Visualization_Trend1</td>
</tr>
<tr>
<td>“Display cursor”</td>
<td>![Checkmark]</td>
</tr>
<tr>
<td>“Display tool tip”</td>
<td>![Checkmark]</td>
</tr>
<tr>
<td>“Show frame”</td>
<td>![Checkmark]</td>
</tr>
<tr>
<td>“Date Range Picker”</td>
<td>Trend1DateRangeSelector</td>
</tr>
<tr>
<td>“Time Picker”</td>
<td>Trend1TimeSelector</td>
</tr>
<tr>
<td>“Legend”</td>
<td>Trend1Legend</td>
</tr>
</tbody>
</table>

**VisuWithTrend at runtime**

![Trend Visualization Image]

---

**6.4.5.13.3 Programming a Trend Visualization**

To display a trend recording in the visualization, you define which application provides which trend recording. You define the display by means of the “Properties” of the trend element and the controls used.
Defining the application and data source

The visualization task and the trend recording task generally run under the same application. If this is not the case, then the application containing the visualization task requires a data source manager.

1. Select a trend element in the active visualization editor.
   ⇒ The properties of the trend element are displayed on the right side.
2. Double-click the value field “Properties ➔ Application”.
3. Use the Input Assistant (assistant) to select the application. You can also specify the name of the application directly.

See also

● Trend Recording
● Data Source Manager

Adding a control

1. Select a trend element in the active visualization editor.
2. Click “Visualization ➔ Insert Elements for Trend Controlling”.
   ⇒ The “Trend Wizard” dialog opens.
   ⇒ The selected controls are inserted for the trend element. You can move them to any position you like. In the “Properties” of the trend element, the controls are shown below “Assigned controls”.

See also

● Chapter 6.4.5.21.2.18 “Command ‘Insert Elements for Controlling the Trend’” on page 3360

Defining the trend recording to visualize

1. Select a trend element in the active visualization editor.
   ⇒ The properties of the trend element are displayed on the right side.
2. Click the value field of “Properties ➔ Trend recording”
   ⇒ “Select trend recording” is displayed. The trend recordings available application-wide are listed under “Available trend recordings”.
3. Select a trend record below “Available trend recordings”.
4. Click .
   ⇒ The trend recording is located under “Selected trend recording”.
5. Click “OK” to confirm the entry.
   ⇒ The selected trend recording is listed in “Values” in “Properties ➔ Trend recording”.

See also

● Trend Recording
Removing a control

A control that was added with the help of the “Trend Wizard” cannot be deleted via the Trend wizard dialog.

1. Select a control of a trend in the active visualization editor.
2. Press [Del] or “Delete” to delete the element.
3. Select the trend in the active visualization editor.
4. Delete the assigned value in “Properties ➔ Assigned controls ➔ <control>”.

**NOTICE!**
It is absolutely necessary to delete this reference manually. The property is not deleted automatically by deleting the control.

Configuring the coordinate system of the trend diagram

1. Select a trend in the active visualization editor.
2. Use the “Visualization ➔ Configure Trend Display Settings” command.
   ⇒ The “Display Settings” dialog opens.
3. Adapt the settings as needed.

See also
- Chapter 6.4.5.21.2.18 “Command 'Insert Elements for Controlling the Trend’” on page 3360

Reading a trend value at runtime

1. Open “View ➔ Element Properties”.
2. Select a trend element in your visualization.
   ⇒ The properties of the trend element are displayed on the right side.
3. Select the “Properties ➔ Show cursor” option and “Show tooltip”.
   ⇒ A cursor is drawn in the coordinate system.
4. Select the “Properties ➔ Show tooltip” option.
5. Download the application to the controller and start the application.
6. If the diagram "runs", then the date range has been placed in such a way that its end time is the current time.

Select the date range so that the diagram does not run. If necessary, drag the scroll bar to an earlier date range.
⇒ A cursor is available. The tooltip of the cursor informs you of the trend values. For each trend variable, the legend displays the value at the point in time at which the cursor is positioned.
Deleting the trend recording history

You can insert an input element in the visualization which the operator can use to delete the previous value recording in the trend visualization at runtime. The curve displayed until then is removed and the display starts over.

1. In the application (example: in the program PLC_PRG), implement the following code:

   ```
   itfTrendRecording : ITrendRecording;
   itfTrendStorageWriter : ITrendStorageWriter;
   itfTrendStorageWriter3 : ITrendStorageWriter3;
   sTrendRecordingName : STRING := 'TrendRecording';
   itfTrendRecording :=
   GlobalInstances.g_TrendRecordingManager.FindTrendRecording(ADR(sTrendRecordingName));
   xClearHistoryTrend: BOOL;

   IF xClearHistoryTrend THEN
     itfTrendRecording :=
     GlobalInstances.g_TrendRecordingManager.FindTrendRecording(ADR(sTrendRecordingName));
     IF itfTrendRecording <> 0 THEN
       itfTrendStorageWriter :=
       itfTrendRecording.GetTrendStorageWriter();
       IF __QUERYINTERFACE(itfTrendStorageWriter, itfTrendStorageWriter3) THEN
         itfTrendStorageWriter3.ClearHistory();
         END_IF
     END_IF
   END_IF
   ```

2. In the visualization of the trend recording, add a button for deleting the previous curve. Configure its "Toggle" property with the variable PLC_PRG.xClearHistoryTrend.

   ➔ When xClearHistoryTrend is set to TRUE, the previously recorded curve is deleted. The recording immediately starts again.

6.4.5.14 Displaying and Editing Text Files

6.4.5.14.1 General.......................................................................................... 2934
6.4.5.14.2 Configuring the Display of a Text File............................................ 2934
6.4.5.14.3 Configuring the Editing of a Text File............................................. 2937

6.4.5.14.1 General

With the help of the element “Text Editor” you can display a text file in the user interface and optionally also enable the user to edit the file.

6.4.5.14.2 Configuring the Display of a Text File

In order to display a text file that is located on the controller, you need not only the element “Text Editor”, but also control elements for selecting, opening and closing the file. Optionally a text search function can be set up in the file with further control elements.

Example:
1. Drag an element “Text Editor” into the visualization editor.
2. Declare the control variables for the element, for example as global variables in the GVL object.
   ⇒ Refer to the declaration of the control variables for this.
3. For the “Text Editor”, configure the property “Editing mode” with “Read only”.
4. Also configure the property “Control variables”.
   Assign the following variables there:
   - “Control variables ➔ File ➔ Variable” with g_sFileName
   - “Control variables ➔ File ➔ Open” with g_bFileOpen
   - “Control variables ➔ File ➔ Close” with g_bFileClose
   - “Control variables ➔ File ➔ New ➔ Variable” with g_bFileNew
   - “Control variables ➔ File ➔ Save ➔ Variable” with g_bFileSave
   - “Control variables ➔ Edit ➔ Variable” with g_sEditSearchFor
   - “Control variables ➔ Edit ➔ Find” with g_bEditFind
   - “Control variables ➔ Edit ➔ Find next occurrence” with g_bEditFindNext
VAR_GLOBAL

VAR_GLOBAL

g_sFileName: STRING := 'Readme.txt';
g_bFileOpen : BOOL;
g_bFileClose: BOOL;
g_bFileNew: BOOL;
g_bFileSave: BOOL;
g_sEditSearchFor : STRING;
g_bEditFind : BOOL;
g_bEditFindNext : BOOL;

END_VAR

Configuring control elements for the file selection

1. Add an element “Label”.
2. Configure the property “Texts ➔ Text” with File:
3. Add an element “Rectangle” next to it, in which the user can then enter the file name:
4. Configure the property “Texts ➔ Text” with %s:
5. Configure the property “Texts ➔ Text variable” with g_sFileName.
6. Configure the property “Input configuration ➔ OnMouseclick” with “Write a variable”. In the dialog “Input Configuration”, select “Text input” as the “Input type”. Activate the option “Use text output variable”.
   ⇒ The rectangle for the input of the file name is configured.
7. Add an element “Button” for opening the file.
8. Configure the property “Texts ➔ Text” with Open:
9. Configure the property “Input configuration ➔ OnMouseclick” with “Toggle a variable”.
   Assign g_bFileOpen as a variable.
   ⇒ The button Open is configured.
10. Add a further element “Button” for closing the file.
11. Configure the property “Texts ➔ Text” with Close:
12. Configure the property “Input configuration ➔ OnMouseclick” with “Toggle a variable”.
   Assign g_bEditFile as a variable.
   ⇒ The button Close is configured.

Control elements for searching for a text.

1. Add an element “Label”.
2. Configure the property “Texts ➔ Text” with Text:
3. Alongside it, add an element “Rectangle” for the input of the text to be found.
4. Configure the property “Texts ➔ Text” with %s:
5. Configure the property “Texts ➔ Text variable” with g_sEditSearchFor.
6. Configure the property “Input configuration ➔ OnMouseclick” with “Write a variable”. In the dialog “Input Configuration”, select “Text input” as the “Input type”. Activate the option “Use text output variable”.
   ⇒ The rectangle is configured.
7. Add an element “Button” for starting the search.
8. Configure its property “Texts ➔ Text” with Find.
9. Configure the property “Input configuration ➔ OnMouseclick” with “Toggle a variable”.
Assign g_bEditFind as a variable.

10. Also add the action “Execute ST-Code”.
Program the action with: g_bEditFind := FALSE;
⇒ The button is configured.

11. Add a further element “Button”.

12. Configure the property “Texts ➔ Text” with “Find next”.

13. Configure the property “Input Configuration ➔ OnMouseclick” with “Toggle a variable”.
Assign g_bEditFind as a variable.

14. Also add the action “Execute ST code”.
Program: g_bEditFindNext := TRUE;
⇒ The button is configured.

6.4.5.14.3 Configuring the Editing of a Text File

In order to be able to create a new text file or edit an existing one on the controller with the “Text Editor” in the user interface, you need not only the element “Text Editor”, but also control elements for selecting, opening, closing, saving and creating a file.

Example:

1. Drag an element “Text Editor” into the visualization editor.
2. Declare the control variables for the element, for example as global variables in the GVL object.
⇒ Refer below to the declaration of the control variables for this.
3. For the “Text Editor”, configure the property “Editing mode” with “Read/Write”.
4. Also configure the property “Control variables”.
Assign the following variables there:
- “Control variables ➔ File ➔ Variable” with g_sFileName
- “Control variables ➔ File ➔ Open” with g_bFileOpen
- “Control variables ➔ File ➔ Close” with g_bFileClose
- “Control variables ➔ File ➔ Save” with g_bFileSave
- “Control variables ➔ File ➔ New” with g_FileNew

VAR_GLOBAL

<table>
<thead>
<tr>
<th>Variable</th>

Configuring control elements for file selection

1. Add an element “Label”.
2. Configure it in the property “Texts ➔ Text” with File:
3. Add an element “Rectangle” next to it.
4. Configure its property “Texts ➔ Text” with %s.
5. Configure its property “Texts ➔ Text variable” with g_sFileName.
6. Configure the property “Input configuration ➔ OnMouseclick” with “Write a variable”.
   In the dialog “Input Configuration”, select “Text input” as the “Input type”.
   Activate the option “Use text output variable”.
   ➔ The rectangle for the input of the file name is configured.
7. Add an element “Button”.
9. Configure the property “Input configuration ➔ OnMouseclick” with “Toggle a variable”.
    Assign g_bFileNew as a variable.
   ➔ The button New is configured.
10. Add a further element “Button”.
11. Configure the property “Texts ➔ Text” with Open:
12. Configure the property “Input configuration ➔ OnMouseclick” with “Toggle a variable”.
    Assign g_bFileOpen as a variable.
   ➔ The button Open is configured.
13. Add a further element “Button”.
15. Configure the property “Input configuration ➔ OnMouseclick” with “Toggle a variable”.
    Assign g_bFileSave as a variable.
   ➔ The button Save is configured.
16. Add a further element “Button”.
17. Configure its property “Texts ➔ Text” with Close.
18. Configure the property “Input configuration ➔ OnMouseclick” with “Toggle a variable”.
   Assign g_bEditFile as a variable.
   ⇒ The button Close is configured.

See also
- Chapter 6.4.5.20.1.41 “Visualization Element ‘Text Editor’” on page 3274

6.4.5.15 Configuring a variable assignment with unit conversion

A variable that was assigned in a visualization can be linked with a unit conversion. This causes the variable value to be converted according to a predefined rule and the result is edited in the visualization.

You have already configured the conversion rules in the editor of an object of the type “Unit Conversion”.

See also

- Requirement: A project with a visualization is open. In addition, the application contains the object UnitConversion with the rule convert_A.

1. Select an element.
   ⇒ The view “Properties” opens.

2. When assigning a variable, link the variable iVar_A with a rule of the unit conversion:
   convert_A.convert(iVar_A)

3. Compile, load and start the application.
   ⇒ The application runs. The visualization opens. The unit conversion is applied.

6.4.5.16 Using recipes in visualization elements

You can manage and use the recipes created in CODESYS by means of a visualization. For this purpose, the input configuration of a visualization element provides the following commands:

- “Read Recipe”
- “Write Recipe”
- “Load Recipe from File”
- “Save Recipe to File”
- “Create Recipe”
- “Delete Recipe”

See also

- Chapter 6.4.1.13.2.4 “Changing Values with Recipes” on page 2003
- Chapter 6.4.5.21.3.6 “Dialog ‘Input Configuration’” on page 3370
Example: Loading recipes by means of visualization elements

Requirement: The “Visualization” object is added to the project.

1. Create a recipe according to the instructions in the section "Changing Values with Recipes - Creating Recipes".
   Assign the following names:
   - Recipe definition: "Recipes"
   - Recipes: "Recipe1" and "Recipe2"
   - Variables: iValue1 and iValue2
   Type in different variable values of both recipes.

2. Open the “Visualization” object in the editor.

3. Drag a “Button” element to the visualization. Label it "Load Recipe 1". You can specify the text by double-clicking the element or in the “Texts ➔ Text” property.

4. Click the value field of the “Input configuration”: “OnMouseDown” property.
   ➔ The “Input Configuration” dialog box opens.

5. Select “Execute command” in the left of the left side and click the button ➔ The configuration of the “Internal command” opens on the right side of the dialog.

6. Select the “Write Recipe” command from the drop-down list.

7. Click the button.
   ➔ The “WriteRecipe” command is added to the list.

8. Specify the first parameter as Recipes and the second parameter as Recipe1.

9. Click “OK” to close the dialog box.

10. Drag a second button to the visualization, name it "Load Recipe 2", and repeat steps 4 to 8. For step 7, specify Recipe2 as the second parameter.

11. Load the program to the controller and start it Click the “Load Recipe 1” and “Load Recipe 2”, and monitor the variables iValue1 and iValue2.

   The other recipe commands are assigned to visualization elements as described in this example. Refer to the help page of the input configuration for a description of the internal commands.

6.4.5.17 Creating a structured user interface

6.4.5.17.1 General

You can reference visualizations that are available or exist in the project in another visualization and thus reuse them. You obtain a structured user interface that consists of several visualizations. In principle you have the following possibilities to reference visualizations.

On the one hand you can display visualizations within a main visualization and toggle between them. The element “Frame” or “Tabs” serves here as a window area element that defines the display area for the referenced visualizations.

On the other hand you can configure a user input for a visualization that causes another visualization to open as a dialog. The requirements for this is that it has the visualization type “Dialog”. A dialog is used to collect inputs from the user.

In addition, you can declare an interface for a visualization that is to be referenced in order to vary the display of the visualization at runtime. A visualization is thereby instanced with different data and executed.
6.4.5.17.2 Displaying Multiple Visualizations in One Visualization

You can reference other visualizations within a main visualization either in a “Frame” or a “Tabs” element, and then display them in the window pane of the element.

In the case of the “Frame” element, you can freely program which of the visualizations is displayed at which time. One option is to use the switch frame variable of the “Frame” element, which automatically triggers a switch according to its value. You can also program additional controls which, after user input, trigger input actions that result in switching a visualization.

NOTICE!

Visualizations can be nested at any depth by means of “Frame” elements. In order to use the “Switch to any visualization” frame selection type without any problems, a “Frame” must not contain more than 21 referenced visualizations.

For more information, see also the description for the “Input configuration” of an element: Action “Switch frame visualization”.

Moreover, you can use the “Tabs” to reference visualizations. It is easy and advantageous that the “Tabs” element provides preconfigured control of the visualization switch.

In CODESYS Forge, you will find the sample project "Visualization Switching". There you will see a visualization that displays other visualizations in a frame area one after another at runtime. The visualization switch is controlled either by the user, programmatically, or via the FrameManager.

<td>⇒ In addition to the main visualization, there are three more visualization objects.</td>
<td>In addition to the main visualization, there are three more visualization objects.</td>
</tr>
<tr>
<td>10. Open the Visu1 object.</td>
<td>10. Open the Visu1 object.</td>
</tr>
</tbody>
</table>
11. In the “Visualization Toolbox”, in the “Basic” category, select and drag the “Radio Buttons” element to the visualization editor.
   ⇒ The “Properties” view of the element opens.

12. Configure the properties of the rectangle as follows:
   - Property “Texts”, “Text” = Visu1
   - Property “Text properties”, “Font” = “Title”
   - Property “Colors”, “Normal state”, “Fill color” = “Light gray”

13. Program the object Visu2 accordingly.
   Properties of the rectangle:
   - Property “Texts”, “Text” = Visu2
   - Property “Text properties”, “Font” = “Title”
   - Property “Colors”, “Normal state”, “Fill color” = “Gray”

14. Program the object Visu3 accordingly.
   Properties of the rectangle:
   - Property “Texts”, “Text” = Visu3
   - Property “Text properties”, “Font” = “Title”
   - Property “Colors”, “Normal state”, “Fill color” = “Dark gray”

15. Open the VisuMain object.

16. In the “Visualization Toolbox”, in the “Basic” category, select and drag the “Frame” element to the visualization editor.
   ⇒ The “Frame Configuration” dialog opens.

17. In the “Available Visualizations” window area, on the “By Visualization Name” tab, select the object Visu1. In “Selected Visualizations”, click “Add”.

18. Then select the object Visu2 and click “Add” in “Selected Visualizations”.

19. Then select the object Visu3 and click “Add” in “Selected Visualizations”.
20. Click “OK” to exit the dialog.

Now the “Frame” element references the three selected visualizations. The references (1) are listed in the “References” property in the element properties of the “Frame” element. In addition to the visualization name, the corresponding index value (2) is also displayed.

Note: You can open the dialog when you click the “Configure” button in the value field of the “References” property. See (3). You can influence the index by means of the visualization order in the “Selected Visualizations” list.

21. In the “Visualization Toolbox”, in the “Common Controls” category, drag the “Radio Buttons” element to the visualization editor.

The “Properties” view of the element opens.

22. In the “Radio button settings”, “Radio button”, click the “Create new” button.

This element has three switches to select from.
23. Configure the properties of the radio button as follows:
   - Property “Radio button settings”, “Areas”, “[0]”, “Text” = Visu1
   - Property “Radio button settings”, “Areas”, “[1]”, “Text” = Visu2
   - Property “Radio button settings”, “Areas”, “[2]”, “Text” = Visu3

24. In the PLC_PRG program, declare a local variable for the number of the visualization that is active.

   ```
   VAR
       iActiveVisu : INT; // Index of visu activated by the user
   END_VAR
   ```

25. Select the “Radio Buttons” element. In the value field of the “Variable” property, click [ ].

26. In the “Input Assistant” dialog, select the recently declared variable. Then exit the dialog.

   - Property of the “Radio Buttons” element:
     - Property “Variable” = PLC_PRG.iActiveVisu

27. Select the “Frame” element. Click in the value field of the “Switch frame variable”, “Variable” property. Specify the recently declared variable here as well.

   - Property of the “Frame” element:
     - Property “Switch frame variable”, “Variable” = PLC_PRG.iActiveVisu

   The control variable of the “Radio Buttons” element is also the switch frame variable of the “Frame” element. User input for the “Radio Buttons” element switches the frame visualization.

28. Click “Build ➔ Generate Code”.
29. Click “Online ➔ Login” and start the application.

- The visualization starts. One of the referenced visualizations is running in the frame. When you click an unselected option of the “Radio Buttons” element, the visualization switches the contents in the frame to the desired visualization.

In the example, the switch frame variable is connected to an input variable. Instead, you can also set the switch frame variable programmatically in the IEC code.

### Switching frame visualizations by means of a follow-up action

- In the main visualization, the “Frame” element displays one of the frame visualizations at runtime. The user can use buttons to control the display in the frame. The user input triggers the “Switch frame visualization” input action.

### Programming a visualization

1. Create a new standard project in CODESYS.
2. Select the application in the device tree and click “Add Object ➔ Visualization”.
3. In the “Add Visualization” dialog, specify the name VisuMain and click “Add” to close the dialog.
4. Select the application in the device tree and click “Add Object ➔ Visualization”.
5. In the “Add Visualization” dialog, specify the name Visu1 and click “Add” to close the dialog.
6. Select the application in the device tree and click “Add Object ➔ Visualization”.

---
7. In the “Add Visualization” dialog, specify the name Visu2 and click “Add” to close the dialog.

8. Select the application in the device tree and click “Add Object ➔ Visualization”.

9. In the “Add Visualization” dialog, specify the name Visu3 and click “Add” to close the dialog.
   ⇒ In addition to the main visualization, there are three more visualization objects.

10. Open the Visu1 object.

11. In the “Visualization Toolbox”, in the “Basic” category, select and drag the “Rectangle” element to the visualization editor.
   ⇒ The “Properties” view of the element opens.

12. Configure the properties of the rectangle as follows:
   ● Property “Texts”, “Text” = Visu1
   ● Property “Text properties”, “Font” = “Title”
   ● Property “Colors”, “Normal state”, “Fill color” = “Light gray”

13. Program the object Visu2 accordingly.
   ⇒ Properties of the rectangle:
   ● Property “Texts”, “Text” = Visu2
   ● Property “Text properties”, “Font” = “Title”
   ● Property “Colors”, “Normal state”, “Fill color” = “Gray”

14. Program the object Visu3 accordingly.
   ⇒ Properties of the rectangle:
   ● Property “Texts”, “Text” = Visu3
   ● Property “Text properties”, “Font” = “Title”
   ● Property “Colors”, “Normal state”, “Fill color” = “Dark gray”

15. Open the VisuMain object.

16. In the “Visualization Toolbox”, in the “Basic” category, select and drag the “Frame” element to the visualization editor.
   ⇒ The “Frame Configuration” dialog opens.

17. In the “Available Visualizations” window area, on the “By Visualization Name” tab, select the object Visu1. In “Selected Visualizations”, click “Add”.

18. Then select the object Visu2 and click “Add” in “Selected Visualizations”.

19. Then select the object Visu3 and click “Add” in “Selected Visualizations”.

Configuration and programming
Programming with CODESYS ➔ CODESYS Visualization
20. Click “OK” to exit the dialog.

⇒ Now the “Frame” element references the three selected visualizations. The references (1) are listed in the “References” property in the element properties of the “Frame” element. In addition to the visualization name, the corresponding index value (2) is also displayed.

![Frame element references three visualizations](image)

Note: You can open the dialog independently when you click the “Configure” button in the value field of the “References” property. See (3). You can influence the index by means of the visualization order in the “Selected Visualizations” list.

21. In the “Visualization Toolbox”, in the “Common Controls” category, drag the “Button” element to the visualization editor.

⇒ The element is selected and its properties are visible in the “Properties” view.

23. In the “Input configuration” “OnMouseDown” property, click “Configure”.

⇒ The “Input Configuration” dialog opens.

24. Select the “Switch frame visualization” action and click .

⇒ The action is displayed in the window on the right.

25. Configure the action:

- Select the “Switch local visualization” option.
- Set the “Visualization selection” to Visu1.
- Click “OK” to exit the dialog.

⇒ The follow-up action is configured in the “Input configuration” property.

Property “Input configuration”, “OnMouseDown”, “Switch frame visualization” = 0
26. Drag another “Button” element to the visualization editor. Configure the button accordingly.
   ➔ Properties of the button:
   ● Property “Texts”, “Text” = Visu2
   ● Property “Input configuration”, “OnMouseDown”, “Switch frame visualization” = 1

27. Drag another “Button” element to the visualization editor. Configure the button accordingly.
   ➔ Properties of the button:
   ● Property “Texts”, “Text” = Visu3
   ● Property “Input configuration”, “OnMouseDown”, “Switch frame visualization” = 2

28. Click “Build ➔ Generate Code”.

29. Click “Online ➔ Login” for the device and start the application.
   ➔ The visualization starts. One of the referenced visualizations is running in the frame. When you click one of the buttons, the visualization switches the contents in the frame to the respective visualization.

For the “Tabs”, the navigation of the referenced visualizations is provided automatically. The first of the referenced visualizations is in the foreground, while the others are hidden behind it. The user can navigate between them by means of the tabs which are provided automatically.

1. Create a new standard project in CODESYS.
2. Select the application in the device tree and click “Add Object ➔ Visualization”.

Displaying visualizations on a tabs element
Configuring a tabs element
3. In the “Add Visualization” dialog, specify the name VisuMain and click “Add” to close the dialog.
4. Select the application in the device tree and click “Add Object ➔ Visualization”.
5. In the “Add Visualization” dialog, specify the name Visu1 and click “Add” to close the dialog.
6. Select the application in the device tree and click “Add Object ➔ Visualization”.
7. In the “Add Visualization” dialog, specify the name Visu2 and click “Add” to close the dialog.
8. Select the application in the device tree and click “Add Object ➔ Visualization”.
9. In the “Add Visualization” dialog, specify the name Visu3 and click “Add” to close the dialog.

In addition to the main visualization, there are three more visualization objects.

10. Open the Visu1 object.
11. Drag a “Rectangle” element to the visualization editor.

The “Properties” view of the element opens.

12. Configure the properties of the rectangle as follows:
   - Property “Texts”, “Text” = Visu1
   - Property “Text properties”, “Font” = “Title”
   - Property “Colors”, “Normal state”, “Fill color” = “Light gray”

13. Program the object Visu2 accordingly.

   Properties of the rectangle:
   - Property “Texts”, “Text” = Visu2
   - Property “Text properties”, “Font” = “Title”
   - Property “Colors”, “Normal state”, “Fill color” = “Gray”

14. Program the object Visu3 accordingly.

   Properties of the rectangle:
   - Property “Texts”, “Text” = Visu3
   - Property “Text properties”, “Font” = “Title”
   - Property “Colors”, “Normal state”, “Fill color” = “Dark gray”

15. Open the VisuMain object.
16. In the “Visualization Toolbox”, in the “Basic” category, select and drag the “Frame” element to the visualization editor.

   The “Frame Configuration” dialog opens.
17. In the “Available Visualizations” window area, on the “By Visualization Name” tab, select the object Visu1. In “Selected Visualizations”, click “Add”.

18. Then select the object Visu2 and click “Add” in “Selected Visualizations”.

19. Then select the object Visu3 and click “Add” in “Selected Visualizations”.

20. Click “OK” to exit the dialog.

Now the “Tabs” element references the three selected visualizations. The references (1) are listed in the “References” property in the element properties of the “Frame” element. In addition to the visualization name, the corresponding index value (2) is also displayed.

Note: You can open the dialog “Frame Configuration” dialog independently when you click the “Configure” button in the value field of the “References” property. See (3). You can influence the index by means of the visualization order in the “Selected Visualizations” list.

21. In the “Visualization Toolbox”, in the “Common Controls” category, drag the “Tabs” element to the visualization editor.

The “Properties” view of the element opens.
22. Configure the properties of the tab as follows:

- Property “Tab width”: 40
- Property “References”, Visu1, “Header” = Visu1
- Property “References”, Visu2, “Header” = Visu2
- Property “References”, Visu3, “Header” = Visu3

23. Click “Build ➔ Generate Code”.

24. Click “Online ➔ Login” for the device and start the application.

→ The visualization starts. One of the referenced visualizations is running in the “Tabs” element. Click the tab to switch to the respective visualization.

6.4.5.17.3 Calling a Visualization with an Interface

You can declare an interface for parameters for a visualization that is to be referenced. The actual parameters are passed to the interface (similar as in the case of a function block) when the visualization is called at runtime.
First of all, declare the interface variables in the visualization interface editor. Then configure the parameters that are transferred to the interface by assigning a data-type-compliant application variable to each interface variable. The assignment is configured in the “References” property in the case of a “Frame” or a “Tabs”.

Depending on the display variant, the parameter transfer of local variables (with the VAR scope) is limited. If you execute the visualization as an integrated visualization, you can only transfer local variables having a basic data type as parameters. If the visualization is called as CODESYS TargetVisu or CODESYS WebVisu, then you can also transfer parameters with a user-defined data type.

### User-controlled update of the transfer parameters

If you have configured visualization references and then save a change to the variable declaration for one of these visualizations in an interface editor, then the “Updating the Frame Parameters” dialog appears automatically. The dialog prompts you to edit the references. A list of all the visualizations affected is displayed there, so that the parameter transfers can be reassigned at the changed interface.

When the dialog is closed, the changes are accepted and the elements affected are displayed in the “References” property.

### Calling visualization with interface (VAR_IN_OUT)

- Requirement: The project contains a visualization and a main visualization. The main visualization contains an element that the visualization references.

1. Open the visualization.
2. Click “Visualization ➔ Interface Editor”.
3. Declare a variable in the interface editor.
   - The visualization has an interface and the “Updating the Frame Parameters” dialog appears.
4. Assign a type-compliant transfer parameter to the interface variables in all calls by entering an application variable in “Value”. Close the dialog.
   - A transfer parameter is assigned at the points where the visualization is to be referenced. These now appear in the main visualization in the “References” property.
The `visPie` visualization contains an animated, colored pie. The `visMain` main visualization calls the `visPie` visualization multiple times in a “Tabs” control. Color information, angle information, and label are transferred via the `pieToDisplay` interface variable. The pies vary at runtime.

Visualization `visPie`:

```
Table 622: Properties of the “Pie” element:

| “Variable for begin”      | pieToDisplay.iStart          |
| “Variable for end”        | pieToDisplay.iEnd            |
| “Texts ➔ Text”            | %s                           |
| “Text variables ➔ Text variable” | pieToDisplay.sLabel      |
| “Color variable ➔ Normal state” | pieToDisplay.dwColor |

VAR_IN_OUT
pieToDisplay : DATAPIE;
END_VAR
```

Main visualization `visMain`:

  c_dwYELLOW : DWORD := 16#FFFF0000; // Highly opaque
  c_dwGREY : DWORD := 16#88888888; // Semitransparent
  c_dwBLACK : DWORD := 16#00000000; // Highly opaque
  c_dwRED : DWORD := 16#FFFF0000; // Highly opaque
END_VAR

PLC_PRG PROGRAM PLC_PRG
VAR
  iInit: BOOL := TRUE;
  pieA : DATAPIE; // Used as argument when visPie is called
  pieB : DATAPIE;
  pieC : DATAPIE;
  iDegree : INT; // Variable center angle for the pie element
  used for animation
END_VAR

IF iInit = TRUE THEN
  pieA.dwColor := GVL.c_dwBLUE;
  pieA.iStart := 0;
  pieA.sLabel := 'Blue';
  pieB.dwColor := GVL.c_dwGREEN;
  pieB.iStart := 22;
  pieB.sLabel := 'Green';
  pieC.dwColor := GVL.c_dwYELLOW;
  pieC.iStart := 45;
  pieC.sLabel := 'Yellow';
  iInit := FALSE;
END_IF

iDegree := (iDegree + 1) MOD 360;

pieA.iEnd := iDegree;
pieB.iEnd := iDegree;
pieC.iEnd := iDegree;

Main visualization visMain at runtime:
Printing the instance name of a transfer parameter

In order to obtain and output the instance name of a transfer parameter, you can implement an interface variable (data type STRING) with the pragma {attribute 'parameterstringof'} in the VAR_INPUT scope.

The project contains a visualization and a main visualization. The main visualization contains elements that the visualization references.

1. Open the visualization.
2. Click “Visualization ➔ Interface Editor”.
3. Declare an interface variable (VAR_IN_OUT).
   pieToDisplay : DATAPIE;
4. In the interface editor, declare a variable (VAR_INPUT) with attribute {attribute 'parameterstringof'}.
   {attribute 'parameterstringof' := 'pieToDisplay'}
   sNameToDisplay : STRING;
5. Save the changes.
   The “Updating the Frame Parameters” dialog does not open.
6. Insert a “Text Field” element.
7. In the “Texts”, “Text” property, assign an output text to the text field.
   Visualization of %s
8. In the “Text variables” “Text variable” property, assign the interface variable to the text field.
   sNameToDisplay
   visPie has a heading.
The **visPie** visualization consists of one pie until now. The **visMain** main visualization calls **visPie** in a “Tabs” control three times with different transfer parameters.

The **visPie** is extended with a text field that outputs the name of the parameters actually passed to the visualization. For this, the interface of **visPie** is extended with a string variable that contains the instance name of the specified transfer parameter. At runtime, each pie is overwritten.

**Table 624: Properties of the “Text field” element:**

<table>
<thead>
<tr>
<th>“Texts”, “Text”</th>
<th>Visualization of %s</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Text variables”, “Text variable”</td>
<td>sNameToDisplay</td>
</tr>
</tbody>
</table>

**Interface of the ‘visPie’ visualization:**

```plaintext
VAR_INPUT
  {attribute 'parameterstringof' := 'pieToDisplay'}
  sNameToDisplay : STRING;
END_VAR
VAR_IN_OUT
  pieToDisplay : DATAPIE;
END_VAR
```

**Main visualization **visMain** at runtime:**

![Visualization of PLC_PRG.pieA, Visualization of PLC_PRG.pieB, Visualization of PLC_PRG.pieC]
6.4.5.17.4 Calling a dialog in a visualization

You can configure a user input for a visualization that causes a referenced visualization to open as a dialog. For example, a user clicks on a button, whereupon a dialog opens requesting the input of values. A dialog is used to collect user inputs and, if it is modal, it can lead to inputs outside the dialog being blocked.

Only visualizations with the visualization type “Dialog” can be opened as dialog. The visualization type is configured in the dialog “Properties” of a visualization object.

**Basic procedure:**

- **Requirement:** The project contains a main visualization and a dialog.

- **1.** Configure a user input for the main visualization with the action “OpenDialog” for the dialog.
  - The opening of the dialog is configured.

- **2.** Configure a user input for an element of the dialog with the action “CloseDialog”.
  - Hint: in the case of non-modal dialogs you can also configure the user input for closing outside the dialog.
  - The closing of the dialog is configured.

You can also use dialogs from the library instead of self-made dialogs. For example, if the library VisuDialogs is integrated in the project, you can use the dialogs VisuDialogs.Login or VisuDialogs.FileOpenSave contained in it.

- Chapter 6.4.5.6 “Configuring user inputs” on page 2885
- Chapter 6.4.5.21.3.6 “Dialog ‘Input Configuration’” on page 3370
- Chapter 6.4.5.21.3.15 “Dialog ‘Properties’ of Visualization Objects” on page 3388

### Configuring a visualization object as a dialog

1. Select the object in the view “Devices”, open the context menu and select the command “Properties”.
2. Select the tab “Visualization”.
3. Activate the option “Dialog” and close the dialog with “OK”.
   - The visualization has the visualization type “Dialog” and can be called as such.

### Configuring a dialog call

When calling a dialog, a user normally clicks on a button, whereupon a dialog opens requesting an input.

In the following example, a dialog representing a calendar enables a date to be entered.
Requirement: The project contains the visualizations visMain and dlgCalender.

1. Set the visualization type of dlgCalender to Dialog.
2. Drag a rectangle into the visualization visMain.
3. Configure the property “Texts ➔ Text” with the text due Date: %t[yyyy-MM-dd].
   Configure the property “Text variables ➔ Text variable” with PLC_PRG.dateDue.
4. Drag a button into the visualization.
5. Configure the property “Texts ➔ Text” with the text Open dialog.
   Configure the property “Input configuration ➔ OnMouseClick” for the action “Open Dialog” with dlgCalender.
   ➤ The user input for the opening of the dialog is configured.
6. Double-click on the dialog dlgCalender.
7. Drag the element “Date picker” into the visualization editor.
8. Configure the property “Texts ➔ Text” with Due Date: %t[yyyy-MM-dd].
   Configure the property “Variable” with PLC_PRG.dateCalender.
   ➤ The element is configured.
9. Drag a button into the visualization editor.
10. Configure the property “Texts ➔ Text” with OK.
11. Configure the property “Input configuration ➔ OnMouseClick” for the action “Close Dialog” with dlgCalender, Result: OK.
12. Configure a further property “Input configuration ➔ OnMouseClick” for the action “Execute ST-Code” with PLC_PRG.dateDue := PLC_PRG.dateCalendar;
   ➤ The user input for the closing of the dialog is configured.
13. Drag a further button into the visualization editor.
14. Configure the property “Texts ➔ Text” with Cancel.
15. Configure the property “Input configuration ➔ OnMouseClick” for the action “Close Dialog” with dlgCalender, Result: Cancel.
   ➤ The user input for the cancellation of the dialog is configured.
17. Compile, load and start the application.

Variable declaration:

```
PROGRAM PLC_PRG
VAR
  dateDue : DATE := DATE#2000-01-01;
  dateCalendar : DATE;
END_VAR
```

Opening a dialog globally

Normally a dialog appears only on the display variant on which the user has executed the triggering event. However, you can configure the opening of the dialog in such a way that the dialog appears simultaneously on all active display variants configured under the visualization manager. This way, for example, an input request can appear simultaneously on all display variants although a user only entered something on the CODESYS TargetVisu.

If a user closes the dialog on a CODESYS TargetVisu display variant, it will be closed on all display variants.
You can open and close a global dialog with the functions `OpenDialog3` and `CloseDialog2` from the library `VisuElems`.

In the application code you can implement the access to a dialog that is managed in the dialog manager. The dialog manager automatically instances and manages all visualizations of the type "Dialog". The access takes place via the internal visualization manager.

First of all, implement the access to the dialog manager by calling the `GetDialogManager()` method of the internal visualization manager. You can then use the methods of the dialog manager to program the program sequence of a dialog.

In the following example a button is configured so that it opens the preconfigured dialog `Login` when clicked. The user can enter a name and a password in the dialog. The dialog `Login` is contained in the library `VisuDialogs`. You can also call a self-made dialog in the same way.

- **Requirement:** The library `VisuDialogs` is integrated in the project.

1. Insert a new visualization `visMain` under the application.
   - The visualization editor opens.
2. Drag a button into the visualization editor.
3. Enter in its property "Text" `Login`.
   - The button is labelled.
4. Click on "Configure" in the property "Input configuration => OnMouseDown".
5. Select the input action "Execute ST-Code" and click on ☑.
6. Enter the following function call in the ST editor: `OpenLoginDialog(pClientData);`
   - The main visualization contains a button. If a user clicks on the button, the dialog `Login` opens and the function `OpenLoginDialog()` is called.
7. Click on "Configure" in the property "Input configuration => OnDialogClosed".
8. Select the input action "Execute ST-Code" and click on ☑.
9. Enter the following function call in the ST editor: `OnLoginDialogClosed(pClientData);`
   - If a user closes the dialog, the function `OnLoginDialogClosed()` is called.

```st
FUNCTION OpenLoginDialog : BOOL
VAR_INPUT
  pClientData : POINTER TO VisuStructClientData;
END_VAR

VAR
  dialogMan : IDialogManager;
```
LoginDialog : IVisualisationDialog;
pLoginInfo : POINTER TO Login_VISU_STRUCT; // Login_VISU_STRUCT contains the parameters defined in the interface of visualization "Login".
result : Visu_DialogResult;
stTitle : STRING := 'Login ...';
stPasswordLabelText : STRING;
stUserLabelText : STRING;
stUsername : STRING;
END_VAR

dialogMan := g_VisuManager.GetDialogManager(); // The DialogManager is provided via the implicitly available VisuManager
IF dialogMan <> 0 AND pClientData <> 0 THEN
  loginDialog :=
  dialogMan.GetDialog('VisuDialogs.Login'); // Dialog to be opened is specified
  IF loginDialog <> 0 THEN
    pLoginInfo :=
    dialogMan.GetClientInterface(loginDialog, pClientData);
    IF pLoginInfo <> 0 THEN
      // In the following the parameters of the login dialog in the Login_VISU_STRUCT will be read
      pLoginInfo^.stTitle := stTitle;
      pLoginInfo^.stPasswordLabelTxt := stPasswordLabelText;
      pLoginInfo^.stUserLabelText := stUserLabelText;
      dialogMan.OpenDialog(loginDialog, pClientData, TRUE, 0);
    END_IF
  END_IF
END_IF

OnLoginDialogClosed() defines the reaction to the closing of a dialog.

FUNCTION OnLoginDialogClosed : BOOL
  VAR_INPUT
    pClientData : POINTER TO VisuStructClientData;
  END_VAR

  VAR
    dialogMan : IDialogManager;
    loginDialog : IVisualisationDialog;
    pLoginInfo : POINTER TO Login_VISU_STRUCT;
    result : Visu_DialogResult;
    stPassword : STRING;
    stUsername : STRING;
  END_VAR

  dialogMan := g_VisuManager.GetDialogManager(); // The DialogManager is provided via the implicitly available VisuManager
  IF dialogMan <> 0 AND pVisuClient <> 0 THEN
    loginDialog :=
    dialogMan.GetDialog('VisuDialogs/Login'); // Gets the login dialog
    IF loginDialog <> 0 THEN
      result := loginDialog.GetResult(); // Gets the result (OK, Cancel) of the dialog
      IF result = Visu_DialogResult.OK THEN
        loginDialog.SetResult(Visu_DialogResult.None); // Reset to default (none)
        pLoginInfo :=
        dialogMan.GetClientInterface(loginDialog, pVisuClient); // Structure Login_VISU_STRUCT gets read;
        // In the following the structure parameters can be set
        IF pLoginInfo <> 0 THEN
          stPassword :=
LoginInfo^.stPassword := ''; // Reset the password
    stUsername := pLoginInfo^.stUsername;
    END_IF
ELSIF result = Visu_DialogResult.Cancel THEN
    loginDialog.SetResult(Visu_DialogResult.None); // React on 'Cancel'
    ELSE
        // nothing to do
    END_IF
    END_IF
    END_IF

6.4.5.17.5 Calling a Dialog with an Interface
You can define an interface for a visualization that is called as a dialog.
Create a visualization for this with visualization type “Dialog” and declare an interface for the dialog. The reference the visualization in a primary visualization by means of a user input and transfer the parameters to the interface.
If you call the visualization as an integrated visualization, then the parameter that are transferred must be variables of a basic data type. If the visualization is called as CODESYS TargetVisu or CODESYS WebVisu, then the parameters can have user-defined data types as well.
See also
●  "Scopes” on page 3340
●  "Chapter 6.4.5.21.3.15 “Dialog ’Properties’ of Visualization Objects” on page 3388

Main procedure
1. Set the visualization types of the visualization to dialog.
2. Declare variables in the interface editor of the dialog.
   ➞ The dialog has an interface. You can transfer parameters when calling the dialog.
3. Configure the elements of the dialog and use the interface variables.
4. Select an element in another visualization (usually the main visualization) for configuring how the dialog opens.
5. Click “Configure” in the property “Input configuration ➞ OnMouseDown”.
   ➞ The “Input Configuration” dialog box opens.
6. Select “Open dialog” in the list of selected input actions.
7. Select one from the “Dialog” drop-down list.
   ➞ If the selected dialog has an interface, then the interface variables are listed below.
8. Assign a transfer parameter to the interface variables in the “Value” column.
9. Select the result for which the parameters were updated in the list “Update” ➞ “and” ➞ “Parameter in case of results”.
10. Activate the option “Open dialog modal”. Click “OK” to close the dialog box.
   ➞ The dialog opening is configured.
Executing a dialog several times at the same time requires multiple instances of the dialog. These must have already been downloaded to the visualization device when downloading the application. For this purpose, set the number of instances to download in the visualization manager (“Visualizations” tab).

<table>
<thead>
<tr>
<th>“Value”</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“OK”</td>
<td>activated</td>
</tr>
</tbody>
</table>

“Open in dialog mode” activated input outside of the dialog is not possible.

**Application code PLC_PRG:**

```plaintext
PROGRAM PLC_PRG
VAR
  iLevel: INT;
  sPwd: STRING;
END_VAR
```
After clicking the button, the dialog opens and permits input. If the specified text agrees with the stored text, then “OK” is enabled:

After clicking “OK”, the selection is applied.

The example shows the procedure for multiple return values. However, the password can be returned more easily with a local variable in the dialog.
Accessing parameters programmatically

The variables declared in the interface of a visualization are available automatically as structure variables. They are identified by `<Name of visualization>_VISU_STRUCT`. Therefore, you can access the interface variables of visualizations that appear as a dialog. Normally you use the structure in the application code of a function that is called by a user input.

Passing pointers as parameters

To pass a complex data structure, you can flag an interface variable of type VAR_IN_OUT with the pragma attribute VAR_IN_OUT_AS_POINTER and pass a pointer or reference to it as a parameter.

Procedure for using references

1. Declare the user data object (DUT).
2. In the interface editor of a dialog, declare an interface variable (VAR_IN_OUT) as a reference to the data object by assigning the attribute 'VAR_IN_OUT_AS_POINTER' to the variable.
3. Program the user interface: use the dialog in a visualization or assign the dialog in the input configuration of a visualization element. Then access to the referenced data is possible.
Example:
Using an interface with the pragma "VAR_IN_OUT_AS_POINTER"

```plaintext
FUNCTION_BLOCK ControlFB
  VAR
    bOk : BOOL := TRUE;
    nCounter : INT;
    nValue : INT;
  END_VAR
  nCounter := nCounter + 1;
END_FUNCTION_BLOCK
```

Declaration of an interface variable with VAR_IN_OUT_AS_POINTER
User interface: dialog opens:

```plaintext
VAR_INPUT
    nValueIn: INT;
END_VAR
VAR_IN_OUT
    {attribute 'VAR_IN_OUT_AS_POINTER'}
    controller: ControlFB;
END_VAR
VAR_OUTPUT
    nValueOut: INT;
END_VAR

%s
Controller Counter: %s
Controller Value: %s
```
Configuring and executing display variants

6.4.5.18 General

You can select from different variants for displaying your visualization created in CODESYS. An advantage is that you can have not only one, but multiple display variants running at the same time. During this time, the contents of the visualization are the same for all variants. This also applies to the integrated visualization: when the visualization editor is open in CODESYS, the visualization is also displayed there with the same active contents.

The following object types are available:

- **“TargetVisu”**
  The display as a variant of CODESYS TargetVisu is possible one time. You can insert an object of this type below the Visualization Manager.

- **“WebVisu”**
  The display as a variant of CODESYS WebVisu is possible any number of times. You can insert any number of objects.

- **“Remote TargetVisu”**
  The display as a variant of CODESYS TargetVisu is possible any number of times. You can insert any number of objects.

When you insert a variant below the Visualization Manager, the task configuration is extended by the visualization task `VISU_TASK` (the flow unit of the visualizations). The task is automatically deleted when no more objects exist below the Visualization Manager or the objects below are excluded from compiling. You can set this in the “Properties” dialog of an object, on the “Compile” tab.
Exception handling at runtime

If an error or an exception occurs in a visualization at runtime, the execution of the visualization is stopped without stopping the execution of the application. An error screen appears informing you of this. In addition, the error screen (usually) enables you to restart the visualization. This exception handling takes place from visualization profile CODESYS V3.5 SP7, compiler version 3.5.7.0 and a runtime system from version 3.5.7.0.

Select the command “Stop Execution at Handled Exceptions” in order to investigate the cause of the occurrence of exceptions and the error position.

See also
- Chapter 6.4.1.21.3.7.19 “Command ‘Stop Execution on Handled Exceptions’” on page 2639

Identifying display variants

In order to programmatically identify a display variant, the VisuFbClientTagDataHelper library module from the VisuElemBase library is available to you. The library itself is referenced in VisuElems. The library module is typically called with VisuElems.VisuFbClientTagDataHelper.

Further information on this library module can be found in its documentation in the library manager.

See also
- Chapter 6.4.1.9.9 “Using Library POUs” on page 1890

6.4.5.18.2 Executing as CODESYS WebVisu

NOTICE!

Recommendations for data security

In order to minimize the risk of breaches of data security, we recommend the following organizational and technical measures for the system on which your applications run:

As far as possible, avoid exposing the PLC and control networks to open networks and the Internet. For protection, use additional data-link layers such as a VPN for remote access and install firewall mechanisms. Limit access to authorized persons, change any existing standard passwords during the initial commissioning and continue to change them regularly.

If you nevertheless wish to publish your web visualization, it is urgently recommended that you provide it at least with simple password protection in order to prevent anyone accessing your control functionality over the Internet. (See an example in the project SimpleWebvisuLogin.project, which is provided with the standard installation of the development system).

Use the latest versions of the gateway server and the web server.

You can execute a visualization as CODESYS WebVisu.
The requirement for this is that the runtime system contains a web server with WebVisu support. This enables communication between target system and web browser. The web server on the target system is started as soon as an application with WebVisu configuration is started and runs until all applications with WebVisu are ended. The device can then display visualizations in connected HTML5-capable web browsers.

The web-based display variant of the CODESYS Visualization enables remote access to a plant as well as its remote monitoring, service and diagnosis over the Internet. A web browser communicates by Java Script (optionally with SSL encryption) with the web server in the controller and displays the visualization by means of HTML5. This technology is supported by virtually all browsers and is thus also available on terminal devices with iOS or Android.

### Configuring and starting display variants

- An executable visualization `visMain` exists in the project.
- Select the object “Visualization manager” and select the command “Add object”.
- Select the object “WebVisu” and enter the name `WebVisu_A`.
  - There is a new object in the device tree underneath the object “Visualization Manager”. The associated editor opens.
  - The visualization task `VISU_TASK` is automatically added under the task configuration.
- Select the visualization `visMain` in the “Start Visualization”.
- In “Name of .htm file”, enter the name `webvisuA`.
- Click on “Show used visualizations” and check whether the selected visualization is activated for a download to the associated device.
  - The visualization is configured. The settings under “Scaling options” determine the window size and the scaling.
- Start a suitable runtime system with web server and WebVisu support.
  - The runtime system runs.
- Compile, load and start the application.
  - The application and the web server run.
- Start a web browser with the following address: `http://localhost:8080/webvisuA.htm`
  - The page is displayed and you can see the data of the application and operate the application.

See also

- Chapter 6.4.5.21.4.7 “Object ‘TargetVisu’” on page 3408
Calling a page in the web server

☐ Requirement: A visualization with WebVisu is started.
1. Start a current browser with JavaScript and support of HTML5-Canvas, e.g. Firefox, Chrome, IE>=9.
2. Enter the following address in the web browser:
   http://localhost:8080/webvisu.htm
   Formal: http://<IP address of webserver>:<port of webserver>/<name of HTM-file>
   <name of HTM-file> is the HTML start page of the visualization defined in the object “WebVisu”.
   ⇨ The page is displayed and you can see the data of the application and operate the application.

Identifying WebVisu

In order to be able to identify a WebVisu with the help of the library block VisuFbClientTagDataHelper, the WebVisu needs a name. In order to be able to specifically address it in the application, expand the URL call by the parameter ClientName=<Name>.

See also
● § Chapter 6.4.5.21.4.8 “Object 'WebVisu'” on page 3409

6.4.5.18.3 Executing as an Integrated Visualization

You can execute the visualization as an integrated visualization. In this case a display variant of the visualization runs on the development system without the visualization code being loaded to the controller.

Use the integrated visualization for the testing and diagnosis of your application, or for the service and commissioning of a plant.

The requirement for this is that there are no objects under the visualization manager. Alternatively, any objects located there can be excluded from compilation. You can configure an individual object accordingly in its dialog “Properties” on the tab “Compile”.

See also
● § Chapter 6.4.5.21.3.15 “Dialog 'Properties' of Visualization Objects” on page 3388

Configuring and starting display variants

☐ A visualization project is open.
1. Remove all objects from underneath the visualization manager or exclude the objects from compilation.
   ⇨ The VISU_TASK has been removed from under the task configuration.
2. Load the application to the controller.
   ⇨ Now no visualization code will be transferred on loading the application.
3. Start the application.
   ⇒ The visualization in the visualization editor is being executed. You can operate your
   application.

Use the command “Activate keyboard usage” in order to toggle between the keyboard usage of the integrated visualization and the keyboard usage of CODESYS.

See also
- Chapter 6.4.5.21.2.4 “Command 'Activate Keyboard Usage’” on page 3343
- Chapter 6.4.5.21.1 “Keyboard Shortcuts for Default Keyboard Action” on page 3338

Restrictions in the variable output

Numerical variable values, which are output within a text in an integrated visualization, are displayed according to the current display format. You can select the display format with the command “Debug ➔ Display”.

See also
- Chapter 6.4.1.21.3.8.24 “Command 'Display Mode’ - 'Binary’, 'Decimal’, 'Hexadecimal’” on page 2654

Data server restrictions

A variable value that is transferred via the data server is not output. The integrated visualization only outputs the initialization or the last transferred value.

The integrated visualization thus only enables a passive observation of the application.

Restrictions in variable types

VAR_INPUT variables behave like integrated visualizations such as VAR_IN_OUT variables during execution.

Restrictions in expressions and monitoring

Only the following expressions, which are also used in the monitoring mechanism of the development system, are supported in an integrated visualization.

Variable access:
- Example: PLC_PRG.myPou.nCounter

Array access:
- Access to an array of scalar data types, where a variable is used as an index
  Example: a[i]
- Access to an array of complex data types (structure, function block, array), where a variable is used as an index
  Example: a[i].x
- Access to a multidimensional array of all kinds of data types with one or more variable indices
  Example: a[i, 1, j].x
- Access to an array with constant index
  Example: a[3]
- Accesses like those described above in which simple operators are used for the calculations inside the index brackets.
  Example: a[i+3]
- Nested combinations of the complex expressions listed above
  Example: a[i + 4 * j].aInner[j * 3].x

Operators in index calculations:
- +, −, *, /, MOD
Pointer monitoring:

- Example: p^.x

Methods and function calls are not supported with the exception of the following:

- Standard string functions
- Type conversion functions
  
  Example: INT_TO_DWORD
- Operators such as SEL, MIN, etc.

Restrictions in the input action “Execute ST-Code”

When the input action “Execute ST-Code” is called, only a list of assignments is supported. If a list of assignments is used, the value of the left-hand side is not assigned until the next cycle. Processing in the next row immediately afterwards is not possible.

Example

```plaintext
PLC_PRG.n := 20 * PLC_PRG.m; // Don't use this!
IF PLC_PRG.n < MAX_COUNT THEN
  PLC_PRG.n := PLC_PRG.n + 1;
END_IF
// Use the following!
PLC_PRG.n := MIN(MAX_COUNT, PLC_PRG.n + 1);
```

Restrictions in the interface of a visualization

No interface (INTERFACE) may be declared in the interface editor of a visualization.

6.4.5.18.4 Configure File Transfer Mode

When downloading, usually files required by the visualization for displaying, are transmitted to the respective display unit. These are especially image files or text list files.

Alternatively, you can configure, that the visualization accesses local files. So no files are transferred with a download.

The following configuration is required to allow the visualization access to local files:

- The file paths for image files or text files lists are relative.
- The link type for image files is “Link to file”.

Using local visualization files

☐ Requirement: You have opened a visualization project with an image pool.
1. Open the image pool.
2. Select for each image under “Link Type” the setting “Link to file”.
   ⇒ The image is linked.
3. Select the command “Project ➔ Project Setting” and select the category “Visualization”.
4. Insert in tab “General” in “Image files” the local paths of the image files with relative path names.
   ⇒ Example: \.;\.;\.;\images\ 
   
   Note: When no path is specified, the setting in dialog box “Options”, category “Visualization”, tab “File Options” setting “Image files” is used.
5. Open the visualization manager.
6. Activate under “Extended settings” the option “Visible”.
7. Activate under “File Transfer Mode” the option “Use local visualization files”.
   ⇒ When downloading, no files are transferred. When displaying the visualization, the
local files are used.

- Chapter 6.4.5.21.3.9 “Dialog Box ’Options’ - ’Visualization’” on page 3384

6.4.19 Applying Visualization Styles

6.4.19.1 General

A visualization style is a collection of colors, fonts, images, and any values that are defined as
style properties. When designing a visualization element, you can use these style properties
only. The you have a uniform, style-dependent appearance.

An element that applies style colors and style fonts behaves according to the selected style
design in each selected style. In this way, a style property, such as Element basic color,
can be blue in one style and gray in another style. In contrast, if the color of an element has a
fixed value, this color is fixed even when the style is switched.

All applicable styles are consistent because they define a fixed set of style properties. There-
fore, you can switch smoothly between styles in order to customize your visualization. You can
preview a style to get an impression of how it behaves.

CODESYS provides different styles, for example the styles Flat style and White Style.

These provided styles are installed in the visualization style repository.

The selected style that applies to all visualizations in the application is set in the “Visualization
Manager” object (“Settings” tab, “Style Settings” group, “Selected style”). In addition, the
“Properties” view provides its style properties when designing an element. For each element,
you can assign these styles instead of fixed values.

The style is applied to all visualizations that are below an application. The settings of the
“Options - Visualization Styles” dialog are also considered for a library visualization or a visuali-
zation in the POUs view.

See also
- Chapter 6.4.5.21.3.11 “Dialog ’Project Environment’ - ’Visualization Styles’”
on page 3386
- Chapter 6.4.5.21.3.7 “Dialog ’Options’ - ’Visualization Styles’” on page 3382
- Chapter 6.4.5.21.4.2 “Object ’Visualization manager’” on page 3398

Designing visualization elements with style properties

The set style includes style properties. These are provided in the “Properties” view of an
element in the drop-down list of the “Value” column. It is checked which style properties are
appropriate for which property. For example, only style properties with color definitions are
available for a color assignment.

A style can have directly defined visualization element properties. If this style is
used in the project, then these properties are not configurable anymore.

☑ Requirement: A project is open with a visualization.
1. Double-click the visualization.
2. Select an element.
3. Choose “View ➔ Element Properties”.
4. Click in the input field of a color in the window “Properties” (category “Colors”).
   ➔ The list box opens with style properties. The style colors are based on the currently selected style.
5. Select a style property.
   ➔ The visualization shows the element according to the style.

**Example**

A visualization uses the style CompanyStyle8, which defines the colors CompanyRed, CompanyBlue, and CompanyGreen. An element is selected in the visualization. By clicking into the value field of the “Color” property, you receive a drop-down list with the entries CompanyRed, CompanyBlue, and CompanyGreen.

**Switching visualization styles**

When setting a style in the visualization manager, all complete styles in the repository are available for selection. It does not matter and it is not evident if a style have been derived from another style.

You can preview a style to get an impression of how it behaves.

How a visualization implements a style at runtime also depends on the display variant. For example, if a font that is defined in the style is not available, the display variant shows the visualization with a preset font.

☐ Requirement: A project is open with a visualization.
1. Double-click the “Visualization Manager” object in the device tree.
   ➔ The editor opens.
2. Click in the input field of “Selected style” (“Settings” tab, “Style Settings” group).
   ➔ All styles that are installed in the repository are listed.
3. Mouse over a style.
   ➔ A preview of how the style is displayed appears in a new window.
4. Select a style.
   ➔ The style is applied. The preview in “Style Settings” shows the new setting.
5. Double-click a visualization.
   ➔ The visualization appears in the new style.

**Updating versions**

☐ Requirement: A project is open with a visualization.
1. Click “Project ➔ Project Environment”, “Visualization Styles” tab.
   ➔ CODESYS lists all new versions of the currently used styles.
2. Click “Set All to Newest”.
   ➔ The style is updated. Visualizations and their elements apply the new style.

**6.4.5.19.2 Editing visualization styles in the visualization style editor**

A style is an XML file with the file extension *.visustyle.xml. It contains a specific set of style properties. CODESYS checks the style properties in the consistency check.
You can create a new style or customize an existing style. The visualization style editor is available for this.

If you customize a style, then a new style is created as a hierarchy of styles. A hierarchy consists of at least two styles based on each other. The nesting depth is unrestricted. A hierarchy is identified simply with its top derived style. You can derive multiple different styles from one base style by extending the styles by differing style properties. This save memory and therefore should be your preferred method.

A base style does not have to be consistent for itself. Instead, you must identify it as an incomplete style. Only the top derived style must be consistent.
In a partial style, you can combine any style properties to form efficient hierarchies without having to worry about consistency. For example, you can collect all image references into one partial style. Then you derive the style and define more style properties for colors. This style is also incomplete. You derive the style again and define more style properties for its fonts. The top style is now completely.

Style Petrostyle

(1): `CompanyImg` is a partial style defining image references.
(2): `CompanyColor` is a partial, derived style based on `CompanyImg` and also defines colors.
(3): `PetrolStyle` is a complete, derived style based on `CompanyColor` and also defines a special color.
(4): The hierarchy of styles comprises `PetrolStyle, CompanyColor, and CompanyImg`.

Example of a style hierarchy

Configuration and programming
Programming with CODESYS > CODESYS Visualization
In the visualization style editor, you can open a style, define its style properties, and localize its name. If the style is consistent, then you can install it in the visualization style repository. The editor is not integrated in CODESYS. However, you can start the editor in CODESYS.

Names for style properties

A style property is an entry for a specific color, a specific font, or a specific image reference. If this name contains a dash, then the Visualization Style Editor can sort the style properties by the prefixed terms before the dash and display them in a hierarchy. Otherwise the names can be sorted in alphabetical order or sequential order or in sequential order (as saved in the XML file). CODESYS displays the style properties in the order of names actually saved in the XML file for the style.

Example: Element-Alarm-Fill-Color

See also

● Chapter 6.4.5.22.3 “Editor 'Visualization Style Editor'” on page 3750

Starting the editor in CODESYS

1. Double-click the “Visualization Manager” object. ⇒ The editor opens.
2. Click the symbol ("Settings" tab, "Style Settings" group).
3. Click “Open Style Editor” from the drop-down list. ⇒ The “Visualization Style Editor” opens.

Starting the editor independent of CODESYS

Choose “Visualization Styles Editor” from the CODESYS install folder in the Start menu. If you have a standard installation, then this link is located in CODESYS (the program folder for CODESYS). ⇒ The visualization style editor opens.

Deriving visualization styles

This is the recommended way to create a style that combines existing style properties with new ones.

Starting the editor in CODESYS and deriving styles

Requirement: CODESYS is open with a project containing a visualization.
1. Double-click the “Visualization Manager” object in the device tree. ⇒ The editor opens.
2. Click the symbol ("Settings" tab, "Style Settings" group). ⇒ A list of commands opens.
3. Choose “Create and Edit Derived Style”. ⇒ The visualization style editor starts and the “Create a New Visualization Style” dialog box opens.
4. Type a name.
5. Select a directory.
6. Select a base style. The default style is set in CODESYS. You can also select a style from the repository.
   ⇒ The new style appears in the visualization style editor. The style properties from the base style are displayed yellow.
7. Add a new style property or modify an existing value.
8. Provide a version for the style and click “File ➔ Save and Install”.
   ⇒ The style is installed in the repository. The memory requirement is low because only the style property added in step 7 is saved.

Copying visualization styles

- Requirement: CODESYS is open with a project containing a visualization.
  1. Double-click the “Visualization Manager” object in the device tree.
     ⇒ The editor opens.
  2. Click the symbol (”Settings” tab, “Style Settings” group).
     ⇒ A list of commands opens.
  3. Choose “Copy and Edit Style”.
     ⇒ The visualization style editor starts and the “Open Existing Style as a Copy” dialog box opens.
  4. Select which style should be copied (“Style”).
  5. Type a directory in “Destination” and click “OK”.
     ⇒ The new style appears in the visualization style editor. All style properties are identical to those in the copied style.
  6. Type a name.
  7. Add a new style property or modify the value of an existing style property.
  8. Provide a version for the style and click “File ➔ Save and Install”.
     ⇒ The style is installed in the repository and the style properties are identical to the added style property, except for the style property added in step 8. The memory requirement is high because the common style properties are defined in both styles.

Creating new visualization styles

- Requirement: CODESYS is open with a project containing a visualization.
  1. Double-click the “Visualization Manager” object in the device tree.
     ⇒ The editor opens.
  2. Click the symbol (”Settings” tab, “Style Settings” group).
     ⇒ A list of commands opens.
  3. Click “Open Style Editor”.
     ⇒ The visualization style editor opens.
  4. Click “File ➔ New Style”.
     ⇒ The “Create a New Visualization Style” dialog box opens.
  5. Type a name. Specify a base style.
6. Specify a directory and click “OK” to close the dialog box. 
   ⇒ The new style appears in the visualization style editor.
7. Add a new style property.
8. Provide a version for the style and click “File ➔ Save and Install”.
   ⇒ The style is installed in the Visualization Styles Repository with the version number.

**Adding a style property**

Using the visualization style editor, you can edit a style to save and install as a new version.

☑ Requirement: The visualization style editor is open with a style.
1. Select a style property and click “Styles ➔ New Style (Afterwards)” in the “Style Properties” tab.
   ⇒ A new style property is added.
2. In the “General” tab, type a new version number in the “Version” setting.
3. Choose “File ➔ Save and Install”.
   ⇒ The changes are saved and the style is installed in the repository as the new version.

**Localizing style properties**

You can assign a language-dependent name to a style property. CODESYS displays a style property by its localized name, depending on the language settings in category “International Settings” (menu “Tools ➔ Options”).

☑ Requirement: The visualization style editor is open with a style.
1. Translate the name of the style property into the localized language in the “Localization” tab.
2. Provide a version for the file in the “General” tab.
3. Choose “Save and Install”.
   ⇒ The edited style is installed in the repository currently selected in CODESYS.
4. Update the style.
5. Set the language settings in CODESYS to the localized language.
6. Open a visualization and select an element. The style settings in its properties are displayed in the localized language.

**6.4.5.19.3 Managing visualization styles in repositories**

The styles that are listed in CODESYS in the drop-down lists of different dialogs and editors are all checked for consistency and installed in the visualization style repository. For derived styles, the hierarchy is checked completely and all styles of the hierarchy are installed. The repository is a version control system within the development system.

You can open a style as write-protected from the visualization style repository in the visualization style editor. The “Save” and “Save and Install” commands are not available there for read-only files. However, you can derive it as the basis for a new style or as a copy.

See also

- ☺ Chapter 6.4.5.21.2.20 “Command ‘Visualization Style Repository’” on page 3363
- ☺ Chapter 6.4.5.22.3 “Editor ‘Visualization Style Editor’” on page 3750
Installing styles to repositories

1. Click “Tools ➔ Visualization Style Repository”.
   ➔ The “Visualization Styles” dialog box opens.
2. Select the “System” repository in the drop-down list of “Storage location”.
   ➔ All versions of the installed styles are listed in “Installed Visualization Styles”.
3. Click on the “Install” button.
   ➔ The “Select Visualization style(s)” dialog box opens.
4. Select a style file and click “Open” to close the dialog box.
   ➔ The style is installed in the “System” repository. It appears now in the tree view below “Installed Visualization Styles”.

Uninstalling styles

1. Click “Tools ➔ Visualization Style Repository”.
   ➔ The “Visualization Styles” dialog box opens.
2. Select a repository in the drop-down list of “Storage location”.
   ➔ All versions of the installed styles are listed in “Installed Visualization Styles”.
3. Select a style there.
4. Click the “Uninstall” button.
   ➔ The “Select Visualization Style(s)” dialog box opens.

Managing repositories

1. Click “Tools ➔ Visualization Style Repository”.
   ➔ The “Visualization Styles” dialog box opens.
2. Click on the “Edit Locations” button.
   ➔ The dialog makes it possible to manage other repositories.

Visualization Element 'Rectangle', 'Rounded Rectangle', 'Ellipse'

Symbol:

Category: “Basic”

The “Rectangle”, “Rounded Rectangle”, and “Ellipse” are the same type of element. They can be converted into another element type by changing the “Element type” property.

**Element properties**

<table>
<thead>
<tr>
<th>“Element name”</th>
<th>Optional</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: Werkstueck_3</td>
<td>Hint: Assign individual names for elements so that they are found faster in the element list.</td>
</tr>
</tbody>
</table>

| “Type of element”    | “Rectangle”, “Rounded Rectangle”, “Ellipse” |

**Element property 'Position'**

The position defines the location and size of the element in the visualization window. This is based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

<table>
<thead>
<tr>
<th>“X”</th>
<th>The x-coordinate of the upper left corner of the element</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specified in pixels</td>
<td>Example: 10</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Y”</th>
<th>The y-coordinate of the upper left corner of the element</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specified in pixels</td>
<td>Example: 10</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Width”</th>
<th>Specified in pixels</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: 150</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Height”</th>
<th>Specified in pixels</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: 30</td>
<td></td>
</tr>
</tbody>
</table>

Tip: You can change the values in “X”, “Y”, “Width”, and “Height” by dragging the corresponding symbols to another position in the editor.
**“Angle”**

Static angle of rotation (in degrees)

Example: 35

The element is displayed rotated in the editor. The point of rotation is the center of the element. A positive value rotates clockwise.

Tip: You can change the value in the editor by focusing the element to the handle. When the cursor is displayed as a rotating arrow, you can rotate the element about its center as a handle.

(1): Handle

Note: If a dynamic angle of rotation is also configured in the property “Absolute movement → Internal rotation”, then the static and dynamic angles of rotation are added in runtime mode. The static angle of rotation acts as an offset.

See also

- ☞ Chapter 6.4.5.5.3 “Positioning the Element, Adapting Size and Layer” on page 2874

**Radius setting**

Visible only when “Rounded Rectangle” is selected in the “Type of element” property.

<table>
<thead>
<tr>
<th>“Radius”</th>
<th>Rounding of the corners.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“From style”</td>
<td></td>
</tr>
<tr>
<td>“Relative to the element size”</td>
<td></td>
</tr>
<tr>
<td>“Explicit”: Allows for specifying a custom value in the “Value” setting.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Value”</th>
<th>Radius of the rounded corners (in pixels)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: 5</td>
<td></td>
</tr>
<tr>
<td>Requirement: “Explicit” is selected in the “Radius” setting.</td>
<td></td>
</tr>
</tbody>
</table>

**Element property ‘Center’**

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

<table>
<thead>
<tr>
<th>“X”</th>
<th>X-coordinate of the point of rotation</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Y”</td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the symbols ( Audience ) to other positions in the editor.

**Element property ‘Colors’**
### Normal state
The normal state is in effect if the variable in “Color variables ➤ Toggle color” is not defined or it has the value FALSE.

### Frame color
Frame and fill color for the corresponding state of the variable.

### Fill color

### Transparency
Transparency value (0 to 255) for defining the transparency of the selected color.
Example: 255: The color is opaque. 0: The color is completely transparent.

### Alarm state
The alarm state is in effect if the variable in “Color variables ➤ Toggle color” has the value TRUE.

### Use gradient color
☑: The element is displayed with a gradient of two colors.

### Gradient setting
The “Gradient editor” dialog box opens.

### Element property 'Appearance'
The properties contain fixed values for setting the look of the element.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Line width</strong></td>
<td>Value in pixels</td>
</tr>
<tr>
<td></td>
<td>Example: 2</td>
</tr>
<tr>
<td></td>
<td>Note: The values 0 and 1 both result in a line weight of 1 pixel. If no line should be displayed, then the “Line style” property must be set to the option “Invisible”.</td>
</tr>
<tr>
<td><strong>Fill attributes</strong></td>
<td>The way in which the element is filled.</td>
</tr>
<tr>
<td></td>
<td>● “Filled”: The element is filled with the color from property “Colors ➤ Fill color”.</td>
</tr>
<tr>
<td></td>
<td>● “Invisible”: The fill color is invisible.</td>
</tr>
<tr>
<td><strong>Line style</strong></td>
<td>Type of line representation</td>
</tr>
<tr>
<td></td>
<td>● “Solid”</td>
</tr>
<tr>
<td></td>
<td>● “Dashes”</td>
</tr>
<tr>
<td></td>
<td>● “Dots”</td>
</tr>
<tr>
<td></td>
<td>● “Dash Dot”</td>
</tr>
<tr>
<td></td>
<td>● “Dash Dot Dot”</td>
</tr>
<tr>
<td></td>
<td>● “not visible”</td>
</tr>
</tbody>
</table>

You can assign variables in the “Appearance variables” property for controlling the appearance dynamically. The fixed values here are overwritten.

See also
- § Chapter 6.4.5.21.3.5 “Dialog ‘Gradient Editor” on page 3369

### Element property 'Texts'
The properties contains character strings for labeling the element. The character string can also contain a placeholder with a format definition. In runtime mode, the placeholder is replaced by the current value in the specified format.
CODESYS accepts the specified texts automatically into the “GlobalTextList” text list. Therefore, these texts can be localized.

See also
- § “Element property 'Appearance variables” on page 3051
### Text

Character string (without single straight quotation marks) for the labeling the element. Add a line break by pressing the keyboard shortcut [Ctrl] + [Enter].

**Example:** Accesses: %i

The variable that contains the current value for the placeholder is specified in the property “Text variable ➤ Text”.

### Tooltip

Character string (without single straight quotation marks) that is displayed as the tooltip of an element.

**Example:** Number of valid accesses.

The variable that contains the current value for the placeholder is specified in the property “Text variable ➤ Tooltip”.

- ☑ Chapter 6.4.5.20.2 “Placeholders with Format Definition in the Output Text” on page 3329

### Element property ‘Text properties’

The properties contain fixed values for the text properties.

<table>
<thead>
<tr>
<th>“Horizontal alignment”</th>
<th>Horizontal alignment of the text within the element.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Vertical alignment”</td>
<td>Vertical alignment of the text within the element.</td>
</tr>
<tr>
<td>“Text format”</td>
<td>Definition for displaying texts that are too long</td>
</tr>
<tr>
<td></td>
<td>● “Default”: The long text is truncated.</td>
</tr>
<tr>
<td></td>
<td>● “Line break”: The text is split into parts.</td>
</tr>
<tr>
<td></td>
<td>● “Ellipsis”: The visible text ends with “...” indicating that it is not complete.</td>
</tr>
</tbody>
</table>

| “Font”                 | Example: “Default”                                   |
|                       | ☑: The “Font” dialog box opens.                      |
|                       | ☑: Drop-down list with style fonts.                  |

| “Font color”           | Example: “Black”                                     |
|                       | ☑: The “Color” dialog box opens.                     |
|                       | ☑: Drop-down list with style colors.                 |

| “Transparency”         | Whole number (value range from 0 to 255). This determines the transparency of the respective color. |
|                       | Example: 255: The color is opaque.                   |
|                       | 0: The color is completely transparent.              |

Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

### Element property ‘Absolute movement’

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

<table>
<thead>
<tr>
<th>“Movement”</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>“X”</td>
<td>Variable (numeric data type). Defines the X position (in pixels).</td>
</tr>
<tr>
<td></td>
<td>Example: PLC_PRG.iPos_X.</td>
</tr>
<tr>
<td></td>
<td>Increasing this value in runtime mode moves the element to the right.</td>
</tr>
</tbody>
</table>
| **“Y”** | Variable (numeric data type). Defines the Y position (in pixels).  
Example: PLC_PRG.iPos_Y.  
Increasing this value in runtime mode moves the element downwards. |
| **“Rotation”** | Variable (numeric data type). Defines the angle of rotation (in degrees).  
Example: PLC_PRG.iAngle1.  
The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.  
In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right. |
| **“Scaling”** | Variable (integer data type). Causes centric stretching.  
Example: PLC_PRG.iScaling.  
The reference point is the “Center” property.  
The value 1 shrinks the element by a factor of 0.001. The value 1000 returns the element to its original size. |
| **“Interior rotation”** | Variable (numeric data type). Defines the angle of rotation (in degrees).  
Example: PLC_PRG.iAngle2.  
In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.  
The rotation point is shown as the symbol.  
Note: If a static angle of rotation is specified in the property “Position ➔ Angle”, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed. |
| **“Use REAL values”** | Note: Only available if the device supports the use of REAL coordinates.  
☑️ The properties of the absolute movement are interpreted as REAL values. The values are not rounded.  
The option allows for the individual fine-tuning of drawing the element, for example for the visualization of a smoother rotation.  
Hint: If a horizontal or vertical line is drawn blurry on a specific visualization platform, then this can be corrected by an offset of 0.5px in the direction of the line thickness. |

You can link the variables to a unit conversion.
The properties “X”, “Y”, “Rotation”, and “Interior rotation” are supported by the “Client Animation” functionality.

See also

- “Element property ‘Absolute movement’” on page 2991

**Element property ‘Relative movement’**

The properties contain variables for moving the element. The reference point is the position of the element (“Position” property). The shape of the element can change.

<table>
<thead>
<tr>
<th>“Movement top-left”</th>
<th>Variable (integer data type). It contains the number (in pixels) that the left edge is moved horizontally. Incrementing the value moves the element to the right. Example: PLC_PRG.iDeltaX</th>
</tr>
</thead>
<tbody>
<tr>
<td>“X”</td>
<td>Variable (integer data type). It contains the number (in pixels) that the top edge is moved vertically. Incrementing the value moves the element to the down. Example: PLC_PRG.iDeltaY</td>
</tr>
<tr>
<td>“Y”</td>
<td>Variable (integer data type). It contains the number (in pixels) that the right edge is moved horizontally. Incrementing the value moves the element to the right. Example: PLC_PRG.iDeltaWidth</td>
</tr>
<tr>
<td>“Movement bottom-right”</td>
<td>Variable (integer data type). It contains the number (in pixels) that the bottom edge is moved vertically. Incrementing the value moves the element to the down. Example: PLC_PRG.iDeltaHeight</td>
</tr>
</tbody>
</table>

See also

- “Element property ‘Absolute movement’” on page 2991

**Element property ‘Text variables’**

These properties are variables with contents that replace a format definition.

<table>
<thead>
<tr>
<th>“Text variable”</th>
<th>Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. Example: PLC_PRG.iAccesses</th>
</tr>
</thead>
<tbody>
<tr>
<td>Note: The format definition is part of the text in the property “Texts ➔ Text”. Note: If you specify a variable of type enumeration with text list support, then the name of the enumeration data type is added automatically in angle brackets after the variable name. Example: PLC_PRG.enVar &lt;enumeration name&gt;. Then the symbolic value of the enumeration component is printed instead of the numeric value when text is printed. Refer to the help page for the enumerations.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Tooltip variable”</th>
<th>Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. Example: PLC_PRG.iAccessesInTooltip</th>
</tr>
</thead>
<tbody>
<tr>
<td>Note: The format definition is part of the text in the property “Texts ➔ Tooltip”.</td>
<td></td>
</tr>
</tbody>
</table>
Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.

<table>
<thead>
<tr>
<th><strong>Text list</strong></th>
<th>Variable (string) or name of the text list as a fixed string in single straight quotation marks.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example</td>
<td>'Errorlist'</td>
</tr>
<tr>
<td></td>
<td>▼: Drop-down list with the dialogs available in the text lists.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Text index</strong></th>
<th>Text list ID. This refers to the desired output text.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example</td>
<td>'1'</td>
</tr>
<tr>
<td></td>
<td>As a variable (STRING) for dynamically controlling the text output.</td>
</tr>
<tr>
<td>Sample assignment</td>
<td>PLC_PRG.strTextID := '1';</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Tooltip index</strong></th>
<th>Text list ID. This refers to the desired output text.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example</td>
<td>'2'</td>
</tr>
<tr>
<td></td>
<td>As a variable (STRING) for dynamically controlling the text output.</td>
</tr>
<tr>
<td>Sample assignment</td>
<td>PLC_PRG.strToolTipID := '2';</td>
</tr>
</tbody>
</table>

See also
- % Chapter 6.4.5.20.2 “Placeholders with Format Definition in the Output Text” on page 3329
- % “Element property ‘Texts’” on page 2990
- % Chapter 6.4.1.20.5.18 “Enumerations” on page 2263

The variables allow for dynamic control of the text display.

Element property 'Font variables'
### “Font name”
Variable (STRING). Includes the font of the text.
Example: PLC_PRG.stFontVar := 'Arial';
The selection of fonts corresponds to the default “Font” dialog.

### “Size”
Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name.
- **<pt>**: Points (default)
  Example: PLC_PRG.iFontHeight <pt>
  Code: iFontHeight : INT := 12;
- **<px>**: Pixels
  Example: PLC_PRG.iFontHeight <px>
  Code: iFontHeight : INT := 19;

If you click in the value field, a drop-down list opens on the right for setting the unit.
Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property “Text property → Font”.

### “Flags”
Variable (DWORD). Contains the flags for displaying fonts.
Flags:
- **1**: Italics
- **2**: Bold
- **4**: Underline
- **8**: Strikethrough
Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: PLC_PRG.dwFontType := 6;

### “Character set”
Variable (DWORD). Contains a character set number for the font.
The selection of character set numbers corresponds to the “Script” setting of the standard “Font” dialog.

### “Color”
Variable (DWORD). Includes the color of the text.
Example: PLC_PRG.dwColorFont := 16#FF000000;

### “Flags for text alignment”
Variable (integer data type). Contains the coding for text alignment.
Example: PLC_PRG.dwTextAlignment.
Coding:
- **0**: Top left
- **1**: Horizontal center
- **2**: Right
- **4**: Vertical center
- **8**: Bottom
Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: PLC_PRG.dwFontType := 5;
## Element property 'Color variables'

The Element property is used as an interface for project variables to dynamically control colors at runtime.

### “Toggle color”

The property controls the toggled color at runtime.

**Value assignment:**
- **FALSE:** The element is displayed with the color specified in the “Color” property.
- **TRUE:** The element is displayed with the color specified in the “Alarm color” property.

**Assignment options:**
- Placeholder for the user input variable
  - `<toggle/tap variable>`
  - `<NOT toggle/tap variable>`

  The color change is not controlled by its own variable, but by a user input variable.

  **Note:** Specify a variable for the mouse events “Tap” or “Toggle” in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both “Toggle” and “Tap”, then the variable specified in “Tap” is used.

  **Hint:** Click the symbol to insert the placeholder `<toggle/tap variable>` . When you activate the “Inputconfiguration”, “Tap FALSE” property, then the “<NOT toggle/tap variable>” placeholder is displayed.

- Instance path of a project variable (BOOL)
  
  **Example:** PLC_PRG.xColorIsToggeled

  **Note:** In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.

### “Normal state”

### “Alarm state”

The properties listed below control the color depending on the state. The normal state is in effect if the variable in “Color variables”, “Toggle color” is not defined or it has the value FALSE. The alarm state is in effect if the variable in “Color variables”, “Toggle color” has the value TRUE.

### “Frame color”

**Assignment options:**
- Variable (DWORD) for the frame color
  
  **Example:** PLC_PRG.dwBorderColor

- Color literal
  
  **Example of green and opaque:** 16#FF00FF00

### “Filling color”

**Assignment options:**
- Variable (DWORD) for the fill color
  
  **Example:** PLC_PRG.dwFillColor

- Color literal
  
  **Example of gray and opaque:** 16#FF888888
The transparency part of the color value is evaluated only if the "Activate semi-transparent drawing" option of the visualization manager is selected.

Select the "Advanced" option in the toolbar of the properties view. Then all element properties are visible.

See also
- Chapter 6.4.5.10.4 “Animating a color display” on page 2914

The properties contain IEC variables for controlling the appearance of the element dynamically.

### Element property 'Appearance variables'

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Line width&quot;</td>
<td>Variable (integer data type). Contains the line weight (in pixels).</td>
</tr>
<tr>
<td>&quot;Fill attributes&quot;</td>
<td>Variable (DWORD). Controls whether the fill color of the element is visible.</td>
</tr>
<tr>
<td></td>
<td>- Variable value = 0: Filled</td>
</tr>
<tr>
<td></td>
<td>- Variable value &gt; 0: Invisible; no fill color</td>
</tr>
<tr>
<td>&quot;Line style&quot;</td>
<td>Variable (DWORD). Controls the line style.</td>
</tr>
<tr>
<td></td>
<td>Coding:</td>
</tr>
<tr>
<td></td>
<td>- 0: Solid line</td>
</tr>
<tr>
<td></td>
<td>- 1: Dashed line</td>
</tr>
<tr>
<td></td>
<td>- 2: Dotted line</td>
</tr>
<tr>
<td></td>
<td>- 3: Line type &quot;Dash Dot&quot;</td>
</tr>
<tr>
<td></td>
<td>- 3: Line type &quot;Dash Dot Dot&quot;</td>
</tr>
<tr>
<td></td>
<td>- 8: Invisible; no line</td>
</tr>
</tbody>
</table>

Fixed values can be set in the "Appearance" property. These values can be overwritten by dynamic variables at runtime.

See also
- “Element property ‘Appearance’” on page 3002

### Element property 'State variables'

The variables control the element behavior dynamically.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Invisible&quot;</td>
<td>Variable (BOOL). Toggles the visibility of the element.</td>
</tr>
<tr>
<td></td>
<td>TRUE: The element is not visible at runtime.</td>
</tr>
<tr>
<td></td>
<td>Example: bIsVisible with VAR bIsVisible : BOOL := FALSE; END_VAR</td>
</tr>
<tr>
<td>&quot;Deactivate inputs&quot;</td>
<td>Variable (BOOL). Toggles the operability of the element.</td>
</tr>
<tr>
<td></td>
<td>TRUE: User inputs do not have any effect in runtime more. The element is</td>
</tr>
<tr>
<td></td>
<td>shown as deactivated.</td>
</tr>
</tbody>
</table>
The “Invisible” property is supported by the “Client Animation” functionality.

These properties are available only when you have selected the “Support client animations and overlay of native elements” option in the Visualization Manager.

<table>
<thead>
<tr>
<th>“Animation duration”</th>
<th>Defines the duration (in milliseconds) in which the element runs an animation</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• Variable (integer value)</td>
</tr>
<tr>
<td></td>
<td>Example: Menu.tContent with VAR tContent : INT := 500; END_VAR</td>
</tr>
<tr>
<td></td>
<td>• Integer literal</td>
</tr>
<tr>
<td></td>
<td>Example: 500</td>
</tr>
</tbody>
</table>

**Animatable properties**

- “Absolute movement”, “Movement”, “X”, “Y”
- “Absolute movement”, “Rotation”
- “Absolute movement”, “Interior rotation”
- “Absolute movement”, “Exterior rotation”

The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.

<table>
<thead>
<tr>
<th>“Move to foreground”</th>
<th>Moves the visualization element to the foreground</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Variable (BOOL)</td>
</tr>
<tr>
<td></td>
<td>Example: bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR</td>
</tr>
<tr>
<td>TRUE: At runtime, the visualization element is displayed in the foreground.</td>
<td></td>
</tr>
<tr>
<td>FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.</td>
<td></td>
</tr>
</tbody>
</table>

## Element property 'Input configuration'

The properties contain the configurations for the user input when using the mouse or keyboard. A user input defines an event and one or more actions that are executed when an event occurs.

The “Configure” button opens the “Input Configuration” dialog. There you can create or edit user inputs. Configured user inputs are listed below the events. They each include the action that is triggered and the setting in short form.

**Example:** "Execute ST Code": PLC_PRG.i_x := 0;

<table>
<thead>
<tr>
<th>Event</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;OnDialogClosed&quot;</td>
<td>Input event: The user closes the dialog.</td>
</tr>
<tr>
<td>&quot;OnMouseClick&quot;</td>
<td>Input event: The user clicks the mouse button completely in the element area. The mouse button is clicked and released.</td>
</tr>
<tr>
<td>&quot;OnMouseDown&quot;</td>
<td>Input event: The user clicks down on the mouse button.</td>
</tr>
<tr>
<td>&quot;OnMouseEnter&quot;</td>
<td>Input event: The user drags the mouse pointer to the element.</td>
</tr>
<tr>
<td>&quot;OnMouseLeave&quot;</td>
<td>Input event: The user drags the mouse pointer away from the element.</td>
</tr>
</tbody>
</table>
### “OnMouseMove”
Input event: The user moves the mouse pointer over the element area.

### “OnMouseUp”
Input events:
- The user releases the mouse button within the element area. It is irrelevant whether the user has previously pressed the mouse button inside or outside the element area.
- The user presses the mouse button within the element area, leaves the element area, and then releases the mouse button.

Note: This CODESYS-specific triggering behavior guarantees that actions for key elements are completed. A key element starts an action for “OnMouseDown” and ends the action for “OnMouseUp”.

Example: A visualization user presses the mouse button within the element area of the key element and then moves the cursor position so that it lies outside the element area. The action is ended anyway because “OnMouseUp” is triggered.

### “Tap”
When a mouse click event occurs, the variable defined in “Variable” is described in the application. The coding depends on the “Tap FALSE” and “Tap on enter if captured” options.

### “Variable”
Variable (BOOL) that is set on mouse click event.

**Example:** FLC_PRG.bIsTapped

- **TRUE:** A mouse click event exists. It lasts as long as the user presses the mouse button over the element. It ends when the button is released.
- **FALSE:** A mouse click event does not exist.

**Requirement:** The “Tap FALSE” option is not activated.

### “Tap FALSE”
- **☑:** The mouse click event leads to a complementary value in “Variable”.
- **TRUE:** A mouse click event does not exist.
- **FALSE:** While the mouse click event exists.

### “Tap on enter if captured”
- **☑:** During user input, it is also taken into consideration whether the mouse pointer is dragged within the element area or not while the mouse button is pressed.
- **TRUE:** While the mouse click event exists and the mouse pointer is moved over the element area.
- **FALSE:** A mouse click event does not exist. Or the user moves the mouse pointer outside of the element area while the mouse button is pressed.

The value is **TRUE** again as soon as the user moves the pointer back to the element area. The mouse is then captured.

### “Toggle”
With the onset of a mouse click event, the variable is set; when the mouse click event is completed, the variable is reset.

### “Variable”
Variable (BOOL). Its value toggled when the mouse click event is ended. This is when the user releases the mouse button while the mouse pointer is over the element area.

If the user releases the mouse button while the mouse pointer is outside of the element area, then the mouse click event is not ended and the value is not toggled.

**Hint:** The user can cancel a started toggle input by dragging the mouse pointer out of the element area.

### “Toggle on up if captured”
- **☑:** The value toggles regardless of where the mouse pointer is when the mouse button is released. The mouse is then captured.
### Hotkey

Keyboard shortcut on the element for triggering specific input actions. When the keyboard shortcut event occurs, the input actions in the “Events” property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.

### Key

Key pressed for input action.

Example: \[T\]

Note: The following properties appear when a key is selected.

### Events

- “None”
- “Mouse down”: Pressing the key triggers the input actions that are configured in the “OnMouseDown” property.
- “Mouse up”: Releasing the key triggers the input actions that are configured in the “OnMouseUp” property.
- “Mouse down/up”: Pressing and releasing the key triggers the input actions that are configured in the “OnMouseDown” property and the “OnMouseUp” property.

### Shift

✓: Combination with the Shift key

Example: [Shift]+[T].

### Control

✓: Combination with the Ctrl key

Example: [Ctrl]+[T].

### Alt

✓: Combination with the Alt key

Example: [Alt]+[T].

---

All keyboard shortcuts and their actions that are configured in the visualization are listed on the “Keyboard Configuration” tab.

---

See also

- § Chapter 6.4.5.21.2.2 “Command ‘Keyboard Configuration’” on page 3341
- § Chapter 6.4.5.21.3.6 “Dialog ‘Input Configuration’” on page 3370

---

**Element property ‘Access rights’**

Requirement: User management is set up for the visualization.

### Access rights

Opens the “Access rights” dialog. There you can edit the access privileges for the element.

Status messages:

- “Not set. Full rights.”: Access rights for all user groups: “operable”
- “Rights are set: Limited rights”: Access is restricted for at least one group.

---

See also

- § Chapter 6.4.5.21.3.1 “Dialog ‘Access Rights’” on page 3366

---

See also

- § Chapter 6.4.5.5 “Designing a visualization with elements” on page 2872

---

**Visualization Element ‘Line’**

Symbol:
Category: “Basic”
The element draws a simple line.

**Element properties**

<table>
<thead>
<tr>
<th>“Element name”</th>
<th>Optional.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: Separator_Header</td>
<td></td>
</tr>
<tr>
<td>Hint: Assign individual names for elements so that they are found faster in the element list.</td>
<td></td>
</tr>
</tbody>
</table>

| “Type of element” | “Line” |

**Element property ‘Position’**  
The following properties define the position and length of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

- **“Dots”**
  - “[0]”: Coordinates of the starting point
  - “[1]”: Coordinate of the end point
  
You can also change the values by dragging the box symbols (→) to other positions in the editor.

- **“Angle”**
  
Static angle of rotation (in degrees).

Example: 35

The element is displayed rotated in the editor. The point of rotation is the center of the element. A positive value rotates clockwise.

Tip: You can change the value in the editor by focusing the element to the handle. When the cursor is displayed as a rotating arrow (⟳), you can rotate the element about its center as a handle.

Example:

![Element rotated in editor](image)

(1): Handle

Note: If a dynamic angle of rotation is also configured in the property “Absolute movement ➔ Internal rotation”, then the static and dynamic angles of rotation are added in runtime mode. The static angle of rotation acts as an offset.

See also

- Chapter 6.4.5.5 “Designing a visualization with elements” on page 2872

**Element property ‘Center’**
The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⚫ symbol. The point is used as the center for rotating and scaling.
<table>
<thead>
<tr>
<th><strong>X</strong></th>
<th>X-coordinate of the point of rotation</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Y</strong></td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the symbols (ϕ) to other positions in the editor.

### Element property 'Colors'

The properties contain fixed values for setting colors.

<table>
<thead>
<tr>
<th><strong>Color</strong></th>
<th>Color of the line in normal state.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Please note that the normal state is in effect if the expression in the “Color variables ➔ Toggle color” property is not defined or it has the value FALSE.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Alarm color</strong></th>
<th>Color of the line in alarm state.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Please note that the alarm state is in effect if the expression in the “Color variables ➔ Toggle color” property has the value TRUE.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Transparency</strong></th>
<th>Value (0 to 255) for defining the transparency of the selected color.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Example 255: The color is opaque. 0: The color is completely transparent.</td>
</tr>
</tbody>
</table>

See also
- ☞ Chapter 6.4.5.5 “Designing a visualization with elements” on page 2872

### Element property 'Appearance'

The properties contain fixed values for setting the look of the element.

<table>
<thead>
<tr>
<th><strong>Line width</strong></th>
<th>Value in pixels</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Example: 2</td>
</tr>
</tbody>
</table>

Note: The values 0 and 1 both result in a line weight of one pixel. If no line should be displayed, then the “Line style” property must be set to the option “Invisible”.

<table>
<thead>
<tr>
<th><strong>Line style</strong></th>
<th>Type of line representation</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>“Solid”</td>
</tr>
<tr>
<td></td>
<td>“Dashes”</td>
</tr>
<tr>
<td></td>
<td>“Dots”</td>
</tr>
<tr>
<td></td>
<td>“Dash Dot”</td>
</tr>
<tr>
<td></td>
<td>“Dash Dot Dot”</td>
</tr>
<tr>
<td></td>
<td>“not visible”</td>
</tr>
</tbody>
</table>

You can assign variables in the “Appearance variables” property for controlling the appearance dynamically. The fixed values are defined here.

See also
- ☞ “Element property 'Appearance variables” on page 3051
The properties contain character strings for labeling the element. The character string can also contain a placeholder with a format definition. In runtime mode, the placeholder is replaced by the current value in the specified format.

CODESYS accepts the specified texts automatically into the “GlobalTextList” text list. Therefore, these texts can be localized.

### Element property 'Texts'

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Text&quot;</td>
<td>Character string (without single straight quotation marks) for labeling the element. Add a line break by pressing the keyboard shortcut [Ctrl] + [Enter]. Example: Accesses: %i. The variable that contains the current value for the placeholder is specified in the property “Text variable” ➔ Text.</td>
</tr>
<tr>
<td>&quot;Tooltip&quot;</td>
<td>Character string (without single straight quotation marks) that is displayed as the tooltip of an element. Example: Number of valid accesses. The variable that contains the current value for the placeholder is specified in the property “Text variable” ➔ Tooltip.</td>
</tr>
</tbody>
</table>

- “Element property 'Text variables’” on page 3005
- Chapter 6.4.5.5 “Designing a visualization with elements” on page 2872
- Chapter 6.4.5.20.2 “Placeholders with Format Definition in the Output Text” on page 3329

### Element property 'Text properties'

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Horizontal alignment&quot;</td>
<td>Horizontal alignment of the text within the element.</td>
</tr>
<tr>
<td>&quot;Vertical alignment&quot;</td>
<td>Vertical alignment of the text within the element.</td>
</tr>
<tr>
<td>&quot;Text format&quot;</td>
<td>Definition for displaying texts that are too long</td>
</tr>
<tr>
<td></td>
<td>- “Default”: The long text is truncated.</td>
</tr>
<tr>
<td></td>
<td>- “Line break”: The text is split into parts.</td>
</tr>
<tr>
<td></td>
<td>- “Ellipsis”: The visible text ends with &quot;...&quot; indicating that it is not complete.</td>
</tr>
<tr>
<td>&quot;Font&quot;</td>
<td>Example: “Default”</td>
</tr>
<tr>
<td></td>
<td>➔ The “Font” dialog box opens.</td>
</tr>
<tr>
<td></td>
<td>➔: Drop-down list with style fonts.</td>
</tr>
<tr>
<td>&quot;Font color&quot;</td>
<td>Example: “Black”</td>
</tr>
<tr>
<td></td>
<td>➔ The “Color” dialog box opens.</td>
</tr>
<tr>
<td></td>
<td>➔: Drop-down list with style colors.</td>
</tr>
<tr>
<td>&quot;Transparency&quot;</td>
<td>Whole number (value range from 0 to 255). This determines the transparency of the respective color. Example: 255: The color is opaque. 0: The color is completely transparent. Please note: If the color is a style color and already has a transparency value, then this property is write-protected.</td>
</tr>
</tbody>
</table>

### Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
### Movement

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
<th>Example</th>
<th>Effect</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>X</strong></td>
<td>Variable (numeric data type). Defines the X position (in pixels).</td>
<td>PLC_PRG.iPos_X</td>
<td>Increasing this value in runtime mode moves the element to the right.</td>
</tr>
<tr>
<td><strong>Y</strong></td>
<td>Variable (numeric data type). Defines the Y position (in pixels).</td>
<td>PLC_PRG.iPos_Y</td>
<td>Increasing this value in runtime mode moves the element downwards.</td>
</tr>
</tbody>
</table>

### Rotation

- Variable (numeric data type). Defines the angle of rotation (in degrees).
- Example: PLC_PRG.iAngle1.
- The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.
- In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

### Scaling

- Variable (integer data type). Causes centric stretching.
- Example: PLC_PRG.iScaling.
- The reference point is the “Center” property.
- The value 1 shrinks the element by a factor of 0.001. The value 1000 returns the element to its original size.

### Interior rotation

- Variable (numeric data type). Defines the angle of rotation (in degrees).
- Example: PLC_PRG.iAngle2.
- In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.
- The rotation point is shown as the symbol.
- Note: If a static angle of rotation is specified in the property “Position ➔ Angle”, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

### Use REAL values

- Note: Only available if the device supports the use of REAL coordinates.
- The properties of the absolute movement are interpreted as REAL values. The values are not rounded.
- The option allows for the individual fine-tuning of drawing the element, for example for the visualization of a smoother rotation.
- Hint: If a horizontal or vertical line is drawn blurry on a specific visualization platform, then this can be corrected by an offset of 0.5px in the direction of the line thickness.
You can link the variables to a unit conversion.

The properties “X”, “Y”, “Rotation”, and “Interior rotation” are supported by the “Client Animation” functionality.

See also

Element property ‘Relative movement’

The properties contains variables for moving the element. The reference point is the position of the element (“Position” property). The shape of the element can change.

<table>
<thead>
<tr>
<th>Movement point[0]</th>
<th>Variable (numeric data type). It contains the number (in pixels) that the starting point of the line is moved.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Incrementing the X value moves the element to the right.</td>
</tr>
<tr>
<td></td>
<td>Incrementing the Y value moves the element to the down.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Movement point[1]</th>
<th>Variable (numeric data type). It contains the number (in pixels) that the end point of the line is moved.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Incrementing the X value moves the element to the right.</td>
</tr>
<tr>
<td></td>
<td>Incrementing the Y value moves the element to the down.</td>
</tr>
</tbody>
</table>

See also

- "Element property ‘Absolute movement’" on page 3003

Element property ‘Text variables’

These properties are variables with contents that replace a format definition.

<table>
<thead>
<tr>
<th>Text variable</th>
<th>Variable (data type compliant with the format definition). It contains what is printed instead of the format definition.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Example: PLC_PRG.iAccesses</td>
</tr>
<tr>
<td></td>
<td>Note: The format definition is part of the text in the property “Texts ➔ Text”.</td>
</tr>
<tr>
<td></td>
<td>Note: If you specify a variable of type enumeration with text list support, then the name of the enumeration data type is added automatically in angle brackets after the variable name. Example: PLC_PRG.enVar &lt;enumeration name&gt;. Then the symbolic value of the enumeration component is printed instead of the numeric value when text is printed. Refer to the help page for the enumerations.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Tooltip variable</th>
<th>Variable (data type compliant with the format definition). It contains what is printed instead of the format definition.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Example: PLC_PRG.iAccessesInTooltip</td>
</tr>
<tr>
<td></td>
<td>Note: The format definition is part of the text in the property “Texts ➔ Tooltip”.</td>
</tr>
</tbody>
</table>

See also

- Chapter 6.4.5.20.2 “Placeholders with Format Definition in the Output Text” on page 3329
- “Element property ‘Texts’” on page 3003
- Chapter 6.4.1.20.5.18 “Enumerations” on page 2263
Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.

| Element property 'Dynamic texts' | Variable (string) or name of the text list as a fixed string in single straight quotation marks.
Example: 'Errorlist'
▼: Drop-down list with the dialogs available in the text lists. |
| "Text list" | Text list ID. This refers to the desired output text.
● As fixed string with the ID in single straight quotation marks.
Example: '1'
● As a variable (STRING) for dynamically controlling the text output.
Example: strTextID
Sample assignment: PLC_PRG.strTextID := '1'; |
| "Text index" | Text list ID. This refers to the desired output text.
● As fixed string with the ID in single straight quotation marks.
Example: '2'
● As a variable (STRING) for dynamically controlling the text output.
Example: strToolTipID
Sample assignment: PLC_PRG.strToolTipID := '2'; |
| "Tooltip index" | The variables allow for dynamic control of the text display. |
| "Font name" | Variable (STRING). Includes the font of the text.
Example: PLC_PRG.stFontVar := 'Arial';
The selection of fonts corresponds to the default "Font" dialog. |
| "Size" | Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name.
● <pt>: Points (default)
Example: PLC_PRG.iFontHeight <pt>
Code: iFontHeight : INT := 12;
● <px>: Pixels
Example: PLC_PRG.iFontHeight <px>
Code: iFontHeight : INT := 19;
If you click in the value field, a drop-down list opens on the right for setting the unit.
Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property "Text property ➔ Font". |
### “Flags”

Variable (DWORD). Contains the flags for displaying fonts.

Flags:
- 1: Italics
- 2: Bold
- 4: Underline
- 8: Strikethrough

Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: `PLC_PRG.dwFontType := 6;`

### “Character set”

Variable (DWORD). Contains a character set number for the font.

The selection of character set numbers corresponds to the “Script” setting of the standard “Font” dialog.

### “Color”

Variable (DWORD). Includes the color of the text.

Example: `PLC_PRG.dwColorFont := 16#FF000000;`

### “Flags for text alignment”

Variable (integer data type). Contains the coding for text alignment.

Example: `PLC_PRG.dwTextAlignment.`

Coding:
- 0: Top left
- 1: Horizontal center
- 2: Right
- 4: Vertical center
- 8: Bottom

Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: `PLC_PRG.dwFontType := 5;`

---

**Fixed values for displaying texts are set in "Text properties".**

- "Element property 'Text properties'" on page 3003

Element property 'Color variables'

The Element property is used as an interface for project variables to dynamically control colors at runtime.
<table>
<thead>
<tr>
<th><strong>&quot;Toggle color&quot;</strong></th>
<th>The property controls the toggled color at runtime.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Value assignment:</strong></td>
<td></td>
</tr>
<tr>
<td>● <strong>FALSE:</strong> The element is displayed with the color specified in the “Color” property.</td>
<td></td>
</tr>
<tr>
<td>● <strong>TRUE:</strong> The element is displayed with the color specified in the “Alarm color” property.</td>
<td></td>
</tr>
<tr>
<td><strong>Assigning the property:</strong></td>
<td></td>
</tr>
<tr>
<td>● Placeholder for the user input variable</td>
<td></td>
</tr>
<tr>
<td>– “&lt;toggle/tap variable&gt;”</td>
<td></td>
</tr>
<tr>
<td>– “&lt;NOT toggle/tap variable&gt;”</td>
<td></td>
</tr>
<tr>
<td>The color change is not controlled by its own variable, but by a user input variable.</td>
<td></td>
</tr>
<tr>
<td>Note: Specify a variable for the mouse events “Tap” or “Toggle” in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both “Toggle” and “Tap”, then the variable specified in “Tap” is used.</td>
<td></td>
</tr>
<tr>
<td>Hint: Click the symbol to insert the placeholder “&lt;toggle/tap variable&gt;”. When you activate the “Inputconfiguration”, “Tap FALSE” property, then the “&lt;NOT toggle/tap variable&gt;” placeholder is displayed.</td>
<td></td>
</tr>
<tr>
<td>● Instance path of a project variable (BOOL)</td>
<td></td>
</tr>
<tr>
<td>Example: PLC_PRG.xColorIsToggeled</td>
<td></td>
</tr>
<tr>
<td>Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>&quot;Color&quot;</strong></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Variable (DWORD) for the color</strong></td>
<td></td>
</tr>
<tr>
<td>Example: PLC_PRG.dwColor</td>
<td></td>
</tr>
<tr>
<td><strong>Color literal</strong></td>
<td></td>
</tr>
<tr>
<td>Example of gray and opaque: 16#FF888888</td>
<td></td>
</tr>
<tr>
<td>Please note that the normal state is in effect if the expression in the “Colorvariables ➔ Toggle color” property is not defined or it has the value FALSE.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>&quot;Alarm color&quot;</strong></th>
<th>Color variable in the alarm state</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Variable (DWORD) for the alarm color</strong></td>
<td></td>
</tr>
<tr>
<td>Example: PLC_PRG.dwAlarmColor</td>
<td></td>
</tr>
<tr>
<td><strong>Color literal</strong></td>
<td></td>
</tr>
<tr>
<td>Example of red and opaque: 16#FFFF0000</td>
<td></td>
</tr>
<tr>
<td>Please note that the alarm state is in effect if the expression in the “Colorvariables ➔ Toggle color” property has the value TRUE.</td>
<td></td>
</tr>
</tbody>
</table>

- The transparency part of the color value is evaluated only if the “Activate semi-transparent drawing” option of the visualization manager is selected.

- Select the “Advanced” option in the toolbar of the properties view. Then all element properties are visible.

- § Chapter 6.4.5.21.4.2 “Object 'Visualization manager’” on page 3398
**Element property 'State variables'**

The variables control the element behavior dynamically.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
</table>
| **"Invisible"** | Variable (BOOL). Toggles the visibility of the element.  
  TRUE: The element is not visible at runtime.  
  Example: `bIsVisible with VAR bIsVisible : BOOL := FALSE; END_VAR` |
| **"Deactivate inputs"** | Variable (BOOL). Toggles the operability of the element.  
  TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated. |

The "Invisible" property is supported by the "Client Animation" functionality.

**Element property 'Line width variable'**

Dynamic definition of the weight of a line element using a variable.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
</table>
| **"Integer value "** | Variable (integer data type). Defines the line weight of the element (in pixels).  
  This overwrites the fixed value that is defined in "Appearance ➤ Line weight".  
  Note: The value 0 codes the same as 1 and sets the line weight to one pixel. |

**Element property 'Line style variable'**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
</table>
| **"Integer value "** | Variable (integer data type). Defines the appearance of the line at runtime.  
  - 1: Solid  
  - 2: Dashes  
  - 3: Dots  
  - 4: Dash Dot  
  - 5: Dash Dot Dot  
  - 6: Invisible: The line is not drawn. |

These properties are available only when you have selected the "Support client animations and overlay of native elements" option in the Visualization Manager.
“Animation duration”

Defines the duration (in milliseconds) in which the element runs an animation

- **Variable (integer value)**
  
  Example: Menu.tContent with VAR tContent : INT := 500; END_VAR

- **Integer literal**
  
  Example: 500

**Animatable properties**

- “Absolute movement”, “Movement”, “X”, “Y”
- “Absolute movement”, “Rotation”
- “Absolute movement”, “Interior rotation”
- “Absolute movement”, “Exterior rotation”

The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.

“Move to foreground”

Moves the visualization element to the foreground

**Variable (BOOL)**

Example: bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR

TRUE: At runtime, the visualization element is displayed in the foreground.
FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

**Element property 'Input configuration'**

The properties contain the configurations for the user input when using the mouse or keyboard. A user input defines an event and one or more actions that are executed when an event occurs.

The “Configure” button opens the “Input Configuration” dialog. There you can create or edit user inputs.

Configured user inputs are listed below the events. They each include the action that is triggered and the setting in short form.

**Example: “Execute ST Code”:**

PLC_PRG.i_x := 0;

- **“OnDialogClosed”** Input event: The user closes the dialog.
- **“OnMouseClicked”** Input event: The user clicks the mouse button completely in the element area. The mouse button is clicked and released.
- **“OnMouseDown”** Input event: The user clicks down on the mouse button.
- **“OnMouseEnter”** Input event: The user drags the mouse pointer to the element.
- **“OnMouseLeave”** Input event: The user drags the mouse pointer away from the element.
<table>
<thead>
<tr>
<th>Event</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“OnMouseMove”</strong></td>
<td>Input event: The user moves the mouse pointer over the element area.</td>
</tr>
<tr>
<td><strong>“OnMouseUp”</strong></td>
<td>Input events:</td>
</tr>
<tr>
<td></td>
<td>● The user releases the mouse button within the element area. It is irrelevant whether the user has previously pressed the mouse button inside or outside the element area.</td>
</tr>
<tr>
<td></td>
<td>● The user presses the mouse button within the element area, leaves the element area, and then releases the mouse button.</td>
</tr>
<tr>
<td></td>
<td>Note: This CODESYS-specific triggering behavior guarantees that actions for key elements are completed. A key element starts an action for “OnMouseDown” and ends the action for “OnMouseUp”.</td>
</tr>
<tr>
<td></td>
<td>Example: A visualization user presses the mouse button within the element area of the key element and then moves the cursor position so that it lies outside the element area. The action is ended anyway because “OnMouseUp” is triggered.</td>
</tr>
<tr>
<td><strong>“Tap”</strong></td>
<td>When a mouse click event occurs, the variable defined in “Variable” is described in the application. The coding depends on the “Tap FALSE” and “Tap on enter if captured” options.</td>
</tr>
<tr>
<td><strong>“Variable”</strong></td>
<td>Variable (BOOL) that is set on mouse click event.</td>
</tr>
<tr>
<td></td>
<td>Example: PLC_PRG.bIsTapped</td>
</tr>
<tr>
<td></td>
<td>TRUE: A mouse click event exists. It lasts as long as the user presses the mouse button over the element. It ends when the button is released.</td>
</tr>
<tr>
<td></td>
<td>FALSE: A mouse click event does not exist.</td>
</tr>
<tr>
<td></td>
<td>Requirement: The “Tap FALSE” option is not activated.</td>
</tr>
<tr>
<td><strong>“Tap FALSE”</strong></td>
<td>If: The mouse click event leads to a complementary value in “Variable”.</td>
</tr>
<tr>
<td></td>
<td>TRUE: A mouse click event does not exist.</td>
</tr>
<tr>
<td></td>
<td>FALSE: While the mouse click event exists.</td>
</tr>
<tr>
<td><strong>“Tap on enter if captured”</strong></td>
<td>During user input, it is also taken into consideration whether the mouse pointer is dragged within the element area or not while the mouse button is pressed.</td>
</tr>
<tr>
<td></td>
<td>TRUE: While the mouse click event exists and the mouse pointer is moved over the element area.</td>
</tr>
<tr>
<td></td>
<td>FALSE: A mouse click event does not exist. Or the user moves the mouse pointer outside of the element area while the mouse button is pressed.</td>
</tr>
<tr>
<td></td>
<td>The value is TRUE again as soon as the user moves the pointer back to the element area. The mouse is then captured.</td>
</tr>
<tr>
<td><strong>“Toggle”</strong></td>
<td>With the onset of a mouse click event, the variable is set; when the mouse click event is completed, the variable is reset.</td>
</tr>
<tr>
<td><strong>“Variable”</strong></td>
<td>Variable (BOOL). Its value toggled when the mouse click event is ended. This is when the user releases the mouse button while the mouse pointer is over the element area.</td>
</tr>
<tr>
<td></td>
<td>If the user releases the mouse button while the mouse pointer is outside of the element area, then the mouse click event is not ended and the value is not toggled.</td>
</tr>
<tr>
<td></td>
<td>Hint: The user can cancel a started toggle input by dragging the mouse pointer out of the element area.</td>
</tr>
<tr>
<td><strong>“Toggle on up if captured”</strong></td>
<td>The value toggles regardless of where the mouse pointer is when the mouse button is released. The mouse is then captured.</td>
</tr>
</tbody>
</table>
**“Hotkey”**  
Keyboard shortcut on the element for triggering specific input actions.  
When the keyboard shortcut event occurs, the input actions in the “Events” property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.

**“Key”**  
Key pressed for input action.  
Example: [T]  
Note: The following properties appear when a key is selected.

**“Events”**  
- “None”  
- “Mouse down”: Pressing the key triggers the input actions that are configured in the “OnMouseDown” property.  
- “Mouse up”: Releasing the key triggers the input actions that are configured in the “OnMouseUp” property.  
- “Mouse down/up”: Pressing and releasing the key triggers the input actions that are configured in the “OnMouseDown” property and the “OnMouseUp” property.

**“Shift”**  
☑: Combination with the Shift key  
Example: [Shift]+[T].

**“Control”**  
☑: Combination with the Ctrl key  
Example: [Ctrl]+[T].

**“Alt”**  
☑: Combination with the Alt key  
Example: [Alt]+[T].

All keyboard shortcuts and their actions that are configured in the visualization are listed on the “Keyboard Configuration” tab.

See also  
- § Chapter 6.4.5.21.2.2 “Command 'Keyboard Configuration’” on page 3341  
- § Chapter 6.4.5.21.3.6 “Dialog 'Input Configuration’” on page 3370

**Element property 'Access rights'**  
Requirement: User management is set up for the visualization.

**“Access rights”**  
Opens the “Access rights” dialog. There you can edit the access privileges for the element.  
Status messages:  
- “Not set. Full rights.”: Access rights for all user groups : “operable”  
- “Rights are set: Limited rights”: Access is restricted for at least one group.

See also  
- § Chapter 6.4.5.21.3.1 “Dialog 'Access Rights’” on page 3366

See also  
- § Chapter 6.4.5.5 “Designing a visualization with elements” on page 2872

**Visualization Element 'Polygon', 'Polyline', 'Bézier Curve'**  
Symbol:
Category: “Basic”

The “Polygon”, “Polyline”, and “Bézier Curve” are the same element type. They can be converted into another type by changing the “Element type” property.

Elements can be dragged to the editor. The element is then drawn with five points: [0] to [4].

Other positions are added as follows: Move the mouse pointer over a corner point; the mouse pointer changes shape. Now if you press and hold [Ctrl] and click the left mouse button, another point is created. You can delete a point by pressing and holding [Shift]+[Ctrl] and click the selected point.

As an alternative, you can select the element in the toolbox area and in the editor click multiple times. At the same time, a connecting line is drawn from one point to the other. End by double-clicking the element or right-clicking it one time.

**Element properties**

| “Element name” | Optional.  
|----------------|---------------------------------------------------|
| Hint: Assign individual names for elements so that they are found faster in the element list.  
| Example: Werkstueck_1 |
| “Type of element” |  
| ● “Polygon”  
| ● “Polyline”  
| ● “Bézier Curve” |

**Element property ‘Position’**

The following properties define the position of the corner points in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.
### “Dots”

[0..n]: Coordinates of the corner points

Specified in pixels

You can also change the values by dragging the box symbols (✓) to other positions in the editor.

### “Angle”

Static angle of rotation (in degrees).

**Example:** 35

The element is displayed rotated in the editor. The point of rotation is the center of the element. A positive value rotates clockwise.

**Tip:** You can change the value in the editor by focusing the element to the handle. When the cursor is displayed as a rotating arrow (✓), you can rotate the element about its center as a handle.

(1): Handle

Note: If a dynamic angle of rotation is also configured in the property “Absolute movement → Internal rotation”, then the static and dynamic angles of rotation are added in runtime mode. The static angle of rotation acts as an offset.

---

### Element property ‘Center’

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ✗ symbol. The point is used as the center for rotating and scaling.

<table>
<thead>
<tr>
<th>“X”</th>
<th>X-coordinate of the point of rotation</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Y”</td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the symbols (✓) to other positions in the editor.

---

### Element property ‘Colors’

| “Normal state” | The normal state is in effect if the variable in “Color variables → Toggle color” is not defined or it has the value FALSE. |
| “Frame color”  | Frame and fill color for the corresponding state of the variable. |
| “Fill color”   | |
| “Transparency” | Transparency value (0 to 255) for defining the transparency of the selected color. Example: 255: The color is opaque. 0: The color is completely transparent. |
| “Alarm state”  | The alarm state is in effect if the variable in “Color variables → Toggle color” has the value TRUE. |
“Use gradient color”  The element is displayed with a gradient of two colors.

“Gradient setting”  The “Gradient editor” dialog box opens.

| Element property 'Appearance'
<table>
<thead>
<tr>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>“Line width”</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td>“Fill attributes”</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
</tbody>
</table>

“Line style”  Type of line representation  
- “Solid”  
- “Dashes”  
- “Dots”  
- “Dash Dot”  
- “Dash Dot Dot”  
- “not visible”  

You can assign variables in the “Appearance variables” property for controlling the appearance dynamically. The fixed values here are overwritten.

<tr>
<td>&quot;Font color&quot;</td>
<td>Example: “Black”</td>
</tr>
<tr>
<td></td>
<td>- The “Color” dialog box opens.</td>
</tr>
<tr>
<td></td>
<td>- ▼: Drop-down list with style colors.</td>
</tr>
<tr>
<td>&quot;Transparency&quot;</td>
<td>Whole number (value range from 0 to 255). This determines the transparency of the respective color.</td>
</tr>
<tr>
<td></td>
<td>Example: 255: The color is opaque.</td>
</tr>
<tr>
<td></td>
<td>0: The color is completely transparent.</td>
</tr>
<tr>
<td></td>
<td>Please note: If the color is a style color and already has a transparency value, then this property is write-protected.</td>
</tr>
</tbody>
</table>

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Movement&quot;</td>
<td></td>
</tr>
<tr>
<td>&quot;X&quot;</td>
<td>Variable (numeric data type). Defines the X position (in pixels).</td>
</tr>
<tr>
<td>Example: PLC_PRG.iPos_X.</td>
<td>Increasing this value in runtime mode moves the element to the right.</td>
</tr>
<tr>
<td>&quot;Y&quot;</td>
<td>Variable (numeric data type). Defines the Y position (in pixels).</td>
</tr>
<tr>
<td>Example: PLC_PRG.iPos_Y.</td>
<td>Increasing this value in runtime mode moves the element downwards.</td>
</tr>
</tbody>
</table>
| **“Rotation”** | Variable (numeric data type). Defines the angle of rotation (in degrees).  
  **Example:** PLC_PRG.iAngle1.  
  The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.  
  In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right. |
| **“Scaling”** | Variable (integer data type). Causes centric stretching.  
  **Example:** PLC_PRG.iScaling.  
  The reference point is the “Center” property.  
  The value 1 shrinks the element by a factor of 0.001. The value 1000 returns the element to its original size. |
| **“Interior rotation”** | Variable (numeric data type). Defines the angle of rotation (in degrees).  
  **Example:** PLC_PRG.iAngle2.  
  In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.  
  The rotation point is shown as the symbol.  
  Note: If a static angle of rotation is specified in the property “Position – Angle”, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed. |
| **“Use REAL values”** | Note: Only available if the device supports the use of REAL coordinates.  
  - The properties of the absolute movement are interpreted as REAL values. The values are not rounded.  
  - The option allows for the individual fine-tuning of drawing the element, for example for the visualization of a smoother rotation.  
  - Hint: If a horizontal or vertical line is drawn blurry on a specific visualization platform, then this can be corrected by an offset of 0.5px in the direction of the line thickness. |

You can link the variables to a unit conversion.
The properties “X”, “Y”, “Rotation”, and “Interior rotation” are supported by the “Client Animation” functionality.

See also

- Chapter 6.4.5.20.2 “Placeholders with Format Definition in the Output Text” on page 3329
- “Element property ‘Texts’” on page 3015
- Chapter 6.4.1.20.5.18 “Enumerations” on page 2263

## Element property ‘Dynamic points’

### “Array of points”

Variable (POINTER TO). Points to an array of the structure VisuElems.VisuStructPoint. The elements iX and iY of VisuStructPoint contain the xy-coordinates of a point. The current number of array elements implicitly contains the variable in the property “Number of points”.

The variable that is assigned to the property “Number of points” contains the number of array elements and therefore the number of corner points.

**Example:**

```pPoints : POINTER TO ARRAY[0..100] OF VisuElems.VisuStructPoint;
```

### “Number of points”

Variable (integer data type): Contains the number of array elements and therefore the number of corner points for displaying the element.

**Example:**

```PLC_PRG.iNumberOfPoints := 24;
```

In the example, the element has 24 points. This definition is necessary because the individual points are defined by a pointer and this does not allow control over the number of points.

Note: In this way, it is possible to adapt the display of the element dynamically by updating the number of corner points.

## Element property ‘Text variables’

These properties are variables with contents that replace a format definition.

### “Text variable”

Variable (data type compliant with the format definition). It contains what is printed instead of the format definition.

**Example:**

```PLC_PRG.iAccesses
```

Note: The format definition is part of the text in the property “Texts ➔ Text”.

Note: If you specify a variable of type enumeration with text list support, then the name of the enumeration data type is added automatically in angle brackets after the variable name. Example: `PLC_PRG.enVar <enumeration name>`. Then the symbolic value of the enumeration component is printed instead of the numeric value when text is printed. Refer to the help page for the enumerations.

### “Tooltip variable”

Variable (data type compliant with the format definition). It contains what is printed instead of the format definition.

**Example:**

```PLC_PRG.iAccessesInTooltip
```

Note: The format definition is part of the text in the property “Texts ➔ Tooltip”.

See also

- “Element property ‘Texts’” on page 3015
- Chapter 6.4.1.20.5.18 “Enumerations” on page 2263
**Element property 'Dynamic texts'**

Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.

| **“Text list”** | Variable (string) or name of the text list as a fixed string in single straight quotation marks.  
Example: 'Errorlist'  
▼: Drop-down list with the dialogs available in the text lists. |
|-----------------|-------------------------------------------------------------------------------------------------------------|

| **“Text index”** | Text list ID. This refers to the desired output text.  
● As fixed string with the ID in single straight quotation marks.  
Example: '1'  
● As a variable (STRING) for dynamically controlling the text output.  
Example: strTextID  
Sample assignment: PLC_PRG.strTextID := '1'; |
|-----------------|-------------------------------------------------------------------------------------------------------------|

| **“Tooltip index”** | Text list ID. This refers to the desired output text.  
● As fixed string with the ID in single straight quotation marks.  
Example: '2'  
● As a variable (STRING) for dynamically controlling the text output.  
Example: strToolTipID  
Sample assignment: PLC_PRG.strToolTipID := '2'; |
|-----------------|-------------------------------------------------------------------------------------------------------------|

**See also**

- § Chapter 6.4.1.21.2.28 “Object 'Text List’” on page 2532

**Element property 'Font variables’**

The variables allow for dynamic control of the text display.

| **“Font name”** | Variable (STRING). Includes the font of the text.  
Example: PLC_PRG.stFontVar := 'Arial';  
The selection of fonts corresponds to the default “Font” dialog. |
|-----------------|-------------------------------------------------------------------------------------------------------------|

| **“Size”** | Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name.  
● <pt>: Points (default)  
Example: PLC_PRG.iFontHeight <pt>  
Code: iFontHeight : INT := 12;  
● <px>: Pixels  
Example: PLC_PRG.iFontHeight <px>  
Code: iFontHeight : INT := 19; |
|-----------------|-------------------------------------------------------------------------------------------------------------|

If you click in the value field, a drop-down list opens on the right for setting the unit.

Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property “Text property ➔ Font”.

---

2024/01/05 3ADR010583, 1, en_US 3019
**“Flags”**

Variable (DWORD). Contains the flags for displaying fonts.

Flags:
- 1: Italics
- 2: Bold
- 4: Underline
- 8: Strikethrough

Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: `PLC_PRG.dwFontType := 6;`

**“Character set”**

Variable (DWORD). Contains a character set number for the font.

The selection of character set numbers corresponds to the “Script” setting of the standard “Font” dialog.

**“Color”**

Variable (DWORD). Includes the color of the text.

Example: `PLC_PRG.dwColorFont := 16#FF000000;`

**“Flags for text alignment”**

Variable (integer data type). Contains the coding for text alignment.

Example: `PLC_PRG.dwTextAlignment`

Coding:
- 0: Top left
- 1: Horizontal center
- 2: Right
- 4: Vertical center
- 8: Bottom

Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: `PLC_PRG.dwFontType := 5;`

---

Fixed values for displaying texts are set in “Text properties”.

See also

- § “Element property ‘Text properties’” on page 3016

Element property ‘Color variables’

The Element property is used as an interface for project variables to dynamically control colors at runtime.
The property controls the toggled color at runtime.

**Value assignment:**
- **FALSE:** The element is displayed with the color specified in the “Color” property.
- **TRUE:** The element is displayed with the color specified in the “Alarm color” property.

**Assignment options:**
- Placeholder for the user input variable
  - “<toggle/tap variable>”
  - “<NOT toggle/tap variable>”
  
  The color change is not controlled by its own variable, but by a user input variable.

  Note: Specify a variable for the mouse events “Tap” or “Toggle” in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both “Toggle” and “Tap”, then the variable specified in “Tap” is used.

  Hint: Click the symbol < to insert the placeholder “<toggle/tap variable>”. When you activate the “Input configuration”, “Tap FALSE” property, then the “<NOT toggle/tap variable>” placeholder is displayed.

- Instance path of a project variable (BOOL)
  
  Example: PLC_PRG.xColorIsToggled

  Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.

---

**“Normal state”**

**“Alarm state”**

The properties listed below control the color depending on the state. The normal state is in effect if the variable in “Color variables”, “Toggle color” is not defined or it has the value **FALSE**. The alarm state is in effect if the variable in “Color variables”, “Toggle color” has the value **TRUE**.

**“Frame color”**

**Assignment options:**
- Variable (DWORD) for the frame color
  
  Example: PLC_PRG.dwBorderColor

- Color literal
  
  Example of green and opaque: 16#FF00FF00

**“Filling color”**

**Assignment options:**
- Variable (DWORD) for the fill color
  
  Example: PLC_PRG.dwFillColor

- Color literal
  
  Example of gray and opaque: 16#FF888888

---

The transparency part of the color value is evaluated only if the “Activate semi-transparent drawing” option of the visualization manager is selected.

Select the “Advanced” option in the toolbar of the properties view. Then all element properties are visible.

See also
- Chapter 6.4.5.10.4 “Animating a color display” on page 2914
The properties contain IEC variables for controlling the appearance of the element dynamically.

<table>
<thead>
<tr>
<th><strong>Element property 'Appearance variables'</strong></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>&quot;Line width&quot;</strong></td>
<td>Variable (integer data type). Contains the line weight (in pixels).</td>
</tr>
</tbody>
</table>
| **"Fill attributes"** | Variable (DWORD). Controls whether the fill color of the element is visible.  
  - Variable value = 0: Filled  
  - Variable value > 0: Invisible; no fill color |
| **"Line style"** | Variable (DWORD). Controls the line style.  
  - Coding:  
    - 0: Solid line  
    - 1: Dashed line  
    - 2: Dotted line  
    - 3: Line type "Dash Dot"  
    - 3: Line type "Dash Dot Dot"  
    - 8: Invisible; no line |

Fixed values can be set in the "Appearance" property. These values can be overwritten by dynamic variables at runtime.

See also
- § “Element property ‘Appearance’” on page 3043

The variables control the element behavior dynamically.

<table>
<thead>
<tr>
<th><strong>Element property 'State variables'</strong></th>
<th></th>
</tr>
</thead>
</table>
| **"Invisible"** | Variable (BOOL). Toggles the visibility of the element.  
  TRUE: The element is not visible at runtime.  
  Example: bIsVisible with VAR bIsVisible : BOOL := FALSE; END_VAR |
| **"Deactivate inputs"** | Variable (BOOL). Toggles the operability of the element.  
  TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated. |

The "Invisible" property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the “Support client animations and overlay of native elements” option in the Visualization Manager.
**“Animation duration”**

Defines the duration (in milliseconds) in which the element runs an animation

- **Variable (integer value)**
  
  **Example:**
  ```
  Menu.tContent with VAR tContent : INT := 500;
  END_VAR
  ```

- **Integer literal**
  
  **Example:** 500

**Animatable properties**

- “Absolute movement”, “Movement”, “X”, “Y”
- “Absolute movement”, “Rotation”
- “Absolute movement”, “Interior rotation”
- “Absolute movement”, “Exterior rotation”

The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.

**“Move to foreground”**

Moves the visualization element to the foreground

**Variable (BOOL)**

**Example:**
```
VAR bIsInForeground : BOOL := FALSE;
END_VAR
```

**TRUE:** At runtime, the visualization element is displayed in the foreground.

**FALSE:** At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

---

**Element property 'Input configuration'**

The properties contain the configurations for the user input when using the mouse or keyboard. A user input defines an event and one or more actions that are executed when an event occurs.

The “Configure” button opens the “Input Configuration” dialog. There you can create or edit user inputs.

Configured user inputs are listed below the events. They each include the action that is triggered and the setting in short form.

**Example:** “Execute ST Code”:
```
PLC_PRG.i_x := 0;
```

<table>
<thead>
<tr>
<th>Event</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“OnDialogClosed”</strong></td>
<td>Input event: The user closes the dialog.</td>
</tr>
<tr>
<td><strong>“OnMouseClick”</strong></td>
<td>Input event: The user clicks the mouse button completely in the element area.</td>
</tr>
<tr>
<td></td>
<td>The mouse button is clicked and released.</td>
</tr>
<tr>
<td><strong>“OnMouseDown”</strong></td>
<td>Input event: The user clicks down on the mouse button.</td>
</tr>
<tr>
<td><strong>“OnMouseEnter”</strong></td>
<td>Input event: The user drags the mouse pointer to the element.</td>
</tr>
<tr>
<td><strong>“OnMouseLeave”</strong></td>
<td>Input event: The user drags the mouse pointer away from the element.</td>
</tr>
</tbody>
</table>
### “OnMouseMove”
Input event: The user moves the mouse pointer over the element area.

### “OnMouseUp”
Input events:
- The user releases the mouse button within the element area. It is irrelevant whether the user has previously pressed the mouse button inside or outside the element area.
- The user presses the mouse button within the element area, leaves the element area, and then releases the mouse button.

Note: This CODESYS-specific triggering behavior guarantees that actions for key elements are completed. A key element starts an action for “OnMouseDown” and ends the action for “OnMouseUp”.

Example: A visualization user presses the mouse button within the element area of the key element and then moves the cursor position so that it lies outside the element area. The action is ended anyway because “OnMouseUp” is triggered.

### “Tap”
When a mouse click event occurs, the variable defined in “Variable” is described in the application. The coding depends on the “Tap FALSE” and “Tap on enter if captured” options.

### “Variable”
Variable (BOOL) that is set on mouse click event.

Example: PLC PRG.bIsTapped

- TRUE: A mouse click event exists. It lasts as long as the user presses the mouse button over the element. It ends when the button is released.
- FALSE: A mouse click event does not exist.

Requirement: The “Tap FALSE” option is not activated.

### “Tap FALSE”
- ✔: The mouse click event leads to a complementary value in “Variable”.
- TRUE: A mouse click event does not exist.
- FALSE: While the mouse click event exists.

### “Tap on enter if captured”
- ✔: During user input, it is also taken into consideration whether the mouse pointer is dragged within the element area or not while the mouse button is pressed.
- TRUE: While the mouse click event exists and the mouse pointer is moved over the element area.
- FALSE: A mouse click event does not exist. Or the user moves the mouse pointer outside of the element area while the mouse button is pressed.

The value is TRUE again as soon as the user moves the pointer back to the element area. The mouse is then captured.

### “Toggle”
With the onset of a mouse click event, the variable is set; when the mouse click event is completed, the variable is reset.

### “Variable”
Variable (BOOL). Its value toggled when the mouse click event is ended. This is when the user releases the mouse button while the mouse pointer is over the element area.

If the user releases the mouse button while the mouse pointer is outside of the element area, then the mouse click event is not ended and the value is not toggled.

Hint: The user can cancel a started toggle input by dragging the mouse pointer out of the element area.

### “Toggle on up if captured”
- ✔: The value toggles regardless of where the mouse pointer is when the mouse button is released. The mouse is then captured.
“Hotkey”  
Keyboard shortcut on the element for triggering specific input actions.  
When the keyboard shortcut event occurs, the input actions in the “Events” property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.

“Key”  
Key pressed for input action.  
Example: [T]  
Note: The following properties appear when a key is selected.

“Events”  
- “None”  
- “Mouse down”: Pressing the key triggers the input actions that are configured in the “OnMouseDown” property.  
- “Mouse up”: Releasing the key triggers the input actions that are configured in the “OnMouseUp” property.  
- “Mouse down/up”: Pressing and releasing the key triggers the input actions that are configured in the “OnMouseDown” property and the “OnMouseUp” property.

“Shift”  
☑: Combination with the Shift key  
Example: [Shift]+[T].

“Control”  
☑: Combination with the Ctrl key  
Example: [Ctrl]+[T].

“Alt”  
☑: Combination with the Alt key  
Example: [Alt]+[T].

All keyboard shortcuts and their actions that are configured in the visualization are listed on the “Keyboard Configuration” tab.

- Chapter 6.4.5.21.2.2 “Command ‘Keyboard Configuration’” on page 3341
- Chapter 6.4.5.21.3.6 “Dialog ‘Input Configuration’” on page 3370

Element property ‘Access rights’  
Requirement: User management is set up for the visualization.

“Access rights”  
Opens the “Access rights” dialog. There you can edit the access privileges for the element.  
Status messages:  
- “Not set. Full rights.”: Access rights for all user groups: “operable”  
- “Rights are set: Limited rights”: Access is restricted for at least one group.

See also
- Chapter 6.4.5.21.3.1 “Dialog ‘Access Rights’” on page 3366

See also
- Chapter 6.4.5.5 “Designing a visualization with elements” on page 2872

Visualization Element ‘Pie’  
Symbol:
Category: “Basic”
The element draws a pie of any angle.

**Element properties**

<table>
<thead>
<tr>
<th>“Element name”</th>
<th>Example: Error_rate_part_1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Optional</td>
<td></td>
</tr>
<tr>
<td>Hint: Assign individual names for elements so that they are found faster in the element list.</td>
<td></td>
</tr>
</tbody>
</table>

| “Type of element” | “Pie” |

**Element property 'Position'**
The position defines the location and size of the element in the visualization window. This is based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

<table>
<thead>
<tr>
<th>“X”</th>
<th>The x-coordinate of the upper left corner of the element</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Specified in pixels</td>
</tr>
<tr>
<td></td>
<td>Example: 10</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Y”</th>
<th>The y-coordinate of the upper left corner of the element</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Specified in pixels</td>
</tr>
<tr>
<td></td>
<td>Example: 10</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Width”</th>
<th>Specified in pixels</th>
<th>Example: 150</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>“Height”</th>
<th>Specified in pixels</th>
<th>Example: 30</th>
</tr>
</thead>
</table>

Tip: You can change the values in “X”, “Y”, “Width”, and “Height” by dragging the corresponding symbols to another position in the editor.
**“Angle”**

Static angle of rotation (in degrees).

Example: 35

The element is displayed rotated in the editor. The point of rotation is the center of the element. A positive value rotates clockwise.

Tip: You can change the value in the editor by focusing the element to the handle. When the cursor is displayed as a rotating arrow, you can rotate the element about its center as a handle.

(1): Handle

Note: If a dynamic angle of rotation is also configured in the property “Absolute movement → Internal rotation”, then the static and dynamic angles of rotation are added in runtime mode. The static angle of rotation acts as an offset.

See also

- Chapter 6.4.5.5.3 “Positioning the Element, Adapting Size and Layer” on page 2874

---

**“Begin”**

Start angle of the pie. If you also define a variable for the start, then the start angle is calculated from the sum of the values for “Begin” and “Variable for begin”.

Example:

- “Begin”: 330
- “End”: 90

---

**“End”**

End angle of the pie. If you also define a variable for the end, then the end angle is calculated from the sum of the values for “End” and “Variable for end”.

The pie is drawn clockwise from the start angle to the end angle.

---

**“Variable for begin”**

The start of the sector is defined dynamically by a variable.

**“Variable for end”**

The end of the sector is defined dynamically by a variable.

**“Only show circle line”**

✓ The pie is drawn without the radius line or filling color.

---

Element property ‘Center’
Display of the center coordinates. You cannot modify these values here in the properties.

If the Pie is selected in the editor, then the center of the Pie (as well as the center of the enveloping box) is visualized with the symbol ✶. Moreover, the element is decorated with a position, begin, and end boxes that you can move.

The center coordinates change when you move the center symbol ✶ in the editor. This also changes the size of the Pie so that the position box ✕ retains its position and the center remains in the middle of the element.

**Element property 'Colors'**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Normal state”</td>
<td>The normal state is in effect if the variable in “Color variables ➔ Toggle color” is not defined or it has the value FALSE.</td>
</tr>
<tr>
<td>“Frame color”</td>
<td>Frame and fill color for the corresponding state of the variable.</td>
</tr>
<tr>
<td>“Fill color”</td>
<td></td>
</tr>
<tr>
<td>“Transparency”</td>
<td>Transparency value (0 to 255) for defining the transparency of the selected color. Example: 255: The color is opaque. 0: The color is completely transparent.</td>
</tr>
<tr>
<td>“Alarm state”</td>
<td>The alarm state is in effect if the variable in “Color variables ➔ Toggle color” has the value TRUE.</td>
</tr>
<tr>
<td>“Use gradient color”</td>
<td>✔: The element is displayed with a gradient of two colors.</td>
</tr>
<tr>
<td>“Gradient setting”</td>
<td>The “Gradient editor” dialog box opens.</td>
</tr>
</tbody>
</table>

See also
- ☑ Chapter 6.4.5.21.3.5 “Dialog ‘Gradient Editor’” on page 3369

**Element property 'Appearance'**

The properties contain fixed values for setting the look of the element.
"Line width"  Value in pixels  
Example: 2  

Note: The values 0 and 1 both result in a line weight of 1 pixel. If no line should be displayed, then the “Line style” property must be set to the option “Invisible”.

"Fill attributes"  The way in which the element is filled.  
- "Filled": The element is filled with the color from property “Colors ➔ Fill color”.  
- "Invisible": The fill color is invisible.

"Line style"  Type of line representation  
- “Solid”  
- “Dashes”  
- “Dots”  
- “Dash Dot”  
- “Dash Dot Dot”  
- “not visible”

You can assign variables in the “Appearance variables” property for controlling the appearance dynamically. The fixed values here are overwritten.

See also  
- § “Element property ‘Appearance variables’” on page 3051

Element property ‘Texts’  The properties contain character strings for labeling the element. The character string can also contain a placeholder with a format definition. In runtime mode, the placeholder is replaced by the current value in the specified format.  
CODESYS accepts the specified texts automatically into the “GlobalTextList” text list. Therefore, these texts can be localized.

"Text"  Character string (without single straight quotation marks) for the labeling the element. Add a line break by pressing the keyboard shortcut [Ctrl] + [Enter].  
Example: Accesess: %i  
The variable that contains the current value for the placeholder is specified in the property “Text variable ➔ Text”.

"Tooltip"  Character string (without single straight quotation marks) that is displayed as the tooltip of an element.  
Example: Number of valid accesses.  
The variable that contains the current value for the placeholder is specified in the property “Text variable ➔ Tooltip”.

See also  
- § “Element property ‘Text variables’” on page 3031  
- § Chapter 6.4.5.5 “Designing a visualization with elements” on page 2872  
- § Chapter 6.4.5.20.2 “Placeholders with Format Definition in the Output Text” on page 3329

Element property ‘Text properties’  The properties contain fixed values for the text properties.
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Horizontal alignment</strong></td>
<td>Horizontal alignment of the text within the element.</td>
</tr>
<tr>
<td><strong>Vertical alignment</strong></td>
<td>Vertical alignment of the text within the element.</td>
</tr>
<tr>
<td><strong>Text format</strong></td>
<td>Definition for displaying texts that are too long</td>
</tr>
<tr>
<td></td>
<td>- &quot;Default&quot;: The long text is truncated.</td>
</tr>
<tr>
<td></td>
<td>- &quot;Line break&quot;: The text is split into parts.</td>
</tr>
<tr>
<td></td>
<td>- &quot;Ellipsis&quot;: The visible text ends with &quot;...&quot; indicating that it is not complete.</td>
</tr>
<tr>
<td><strong>Font</strong></td>
<td>Example: &quot;Default&quot;</td>
</tr>
<tr>
<td></td>
<td>- The “Font” dialog box opens.</td>
</tr>
<tr>
<td></td>
<td>- ▼: Drop-down list with style fonts.</td>
</tr>
<tr>
<td><strong>Font color</strong></td>
<td>Example: &quot;Black&quot;</td>
</tr>
<tr>
<td></td>
<td>- The “Color” dialog box opens.</td>
</tr>
<tr>
<td></td>
<td>- ▼: Drop-down list with style colors.</td>
</tr>
<tr>
<td><strong>Transparency</strong></td>
<td>Whole number (value range from 0 to 255). This determines the transparency of the respective color.</td>
</tr>
<tr>
<td></td>
<td>Example: 255: The color is opaque.</td>
</tr>
<tr>
<td></td>
<td>0: The color is completely transparent.</td>
</tr>
<tr>
<td></td>
<td>Please note: If the color is a style color and already has a transparency value, then this property is write-protected.</td>
</tr>
</tbody>
</table>

**Element property 'Absolute movement'**

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Movement</strong></td>
<td></td>
</tr>
<tr>
<td><strong>X</strong></td>
<td>Variable (integer data type). Defines the X position (in pixels).</td>
</tr>
<tr>
<td></td>
<td>Example: PLC_PRG.iPos_X.</td>
</tr>
<tr>
<td></td>
<td>Increasing this value in runtime mode moves the element to the right.</td>
</tr>
<tr>
<td><strong>Y</strong></td>
<td>Variable (integer data type). Defines the Y position (in pixels).</td>
</tr>
<tr>
<td></td>
<td>Example: PLC_PRG.iPos_Y.</td>
</tr>
<tr>
<td></td>
<td>Increasing this value in runtime mode moves the element downwards.</td>
</tr>
<tr>
<td><strong>Scaling</strong></td>
<td>Variable (integer data type). Causes centric stretching.</td>
</tr>
<tr>
<td></td>
<td>Example: PLC_PRG.iScaling.</td>
</tr>
<tr>
<td></td>
<td>The reference point is the “Center” property.</td>
</tr>
<tr>
<td></td>
<td>The value 1 shrinks the element by a factor of 0.001. The value 1000 returns the element to its original size.</td>
</tr>
</tbody>
</table>
"Interior rotation" variable (integer data type). Defines the angle of rotation (in degrees).

Example: PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the \( \oplus \) symbol.

If a static angle of rotation is specified in “Position \( \Rightarrow \) Angle”, then the static angle of rotation and the angle of rotation are added.

You can link the variables to a unit conversion.

The “X”, “Y”, and “Interior rotation” properties are supported by the “Client Animation” functionality.

- Chapter 6.4.5.20.2 “Placeholders with Format Definition in the Output Text” on page 3329
- “Element property ‘Texts’” on page 3029
- Chapter 6.4.1.20.5.18 “Enumerations” on page 2263

Element property ‘Text variables’

These properties are variables with contents that replace a format definition.

“Text variable” variable (data type compliant with the format definition). It contains what is printed instead of the format definition.

Example: PLC_PRG.iAccesses

Note: The format definition is part of the text in the property “Texts \( \Rightarrow \) Text”.

Note: If you specify a variable of type enumeration with text list support, then the name of the enumeration data type is added automatically in angle brackets after the variable name. Example: PLC_PRG.enVar <enumeration name>.

Then the symbolic value of the enumeration component is printed instead of the numeric value when text is printed. Refer to the help page for the enumerations.

“Tooltip variable” variable (data type compliant with the format definition). It contains what is printed instead of the format definition.

Example: PLC_PRG.iAccessesInTooltip

Note: The format definition is part of the text in the property “Texts \( \Rightarrow \) Tooltip”.

- “Element property ‘Texts’” on page 3029
- Chapter 6.4.1.20.5.18 “Enumerations” on page 2263
**Element property 'Dynamic texts'**

Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.

<table>
<thead>
<tr>
<th><strong>&quot;Text list&quot;</strong></th>
<th>Variable (string) or name of the text list as a fixed string in single straight quotation marks.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td>'Errorlist'</td>
</tr>
<tr>
<td><strong>▼:</strong></td>
<td>Drop-down list with the dialogs available in the text lists.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>&quot;Text index&quot;</strong></th>
<th>Text list ID. This refers to the desired output text.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>● As fixed string with the ID in single straight quotation marks.</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>'1'</td>
</tr>
<tr>
<td><strong>● As a variable (STRING) for dynamically controlling the text output.</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>strTextID</td>
</tr>
<tr>
<td><strong>Sample assignment:</strong></td>
<td>PLC_PRG.strTextID := '1';</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>&quot;Tooltip index&quot;</strong></th>
<th>Text list ID. This refers to the desired output text.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>● As fixed string with the ID in single straight quotation marks.</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>'2'</td>
</tr>
<tr>
<td><strong>● As a variable (STRING) for dynamically controlling the text output.</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>strToolTipID</td>
</tr>
<tr>
<td><strong>Sample assignment:</strong></td>
<td>PLC_PRG.strToolTipID := '2';</td>
</tr>
</tbody>
</table>

See also

- % Chapter 6.4.1.21.2.28 “Object 'Text List'” on page 2532

**Element property 'Font variables'**

The variables allow for dynamic control of the text display.

<table>
<thead>
<tr>
<th><strong>&quot;Font name&quot;</strong></th>
<th>Variable (STRING). Includes the font of the text.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td>PLC_PRG.stFontVar := 'Arial';</td>
</tr>
<tr>
<td><strong>The selection of fonts corresponds to the default “Font” dialog.</strong></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>&quot;Size&quot;</strong></th>
<th>Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>● &lt;pt&gt;: Points (default)</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>PLC_PRG.iFontHeight &lt;pt&gt;</td>
</tr>
<tr>
<td><strong>Code:</strong></td>
<td>iFontHeight := INT := 12;</td>
</tr>
<tr>
<td><strong>● &lt;px&gt;: Pixels</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>PLC_PRG.iFontHeight &lt;px&gt;</td>
</tr>
<tr>
<td><strong>Code:</strong></td>
<td>iFontHeight := INT := 19;</td>
</tr>
</tbody>
</table>

If you click in the value field, a drop-down list opens on the right for setting the unit.

**Hint:** The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property "Text property ➤ Font".
**“Flags”**

Variable (DWORD). Contains the flags for displaying fonts.

Flags:
- 1: Italics
- 2: Bold
- 4: Underline
- 8: Strikethrough

Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text:

```plaintext
PLC_PRG.dwFontType := 6;
```

---

**“Character set”**

Variable (DWORD). Contains a character set number for the font.

The selection of character set numbers corresponds to the “Script” setting of the standard “Font” dialog.

---

**“Color”**

Variable (DWORD). Includes the color of the text.

Example:

```plaintext
PLC_PRG.dwColorFont := 16#FF000000;
```

---

**“Flags for text alignment”**

Variable (integer data type). Contains the coding for text alignment.

Example:

```plaintext
PLC_PRG.dwTextAlignment := 5;
```

Coding:
- 0: Top left
- 1: Horizontal center
- 2: Right
- 4: Vertical center
- 8: Bottom

Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text:

```plaintext
PLC_PRG.dwFontType := 5;
```

---

Fixed values for displaying texts are set in “Text properties”.

See also

- \$ “Element property ‘Text properties’” on page 3029

---

**Element property ‘Color variables’**

The Element property is used as an interface for project variables to dynamically control colors at runtime.
### "Toggle color"

The property controls the toggled color at runtime.

**Value assignment:**

- **FALSE:** The element is displayed with the color specified in the “Color” property.
- **TRUE:** The element is displayed with the color specified in the “Alarm color” property.

**Assignment options:**

- Placeholder for the user input variable
  - "<toggle/tap variable>"
  - "<NOT toggle/tap variable>"

The color change is not controlled by its own variable, but by a user input variable.

- Note: Specify a variable for the mouse events “Tap” or “Toggle” in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both “Toggle” and “Tap”, then the variable specified in “Tap” is used.

  - Hint: Click the symbol to insert the placeholder "<toggle/tap variable>". When you activate the “Input configuration”, “Tap FALSE” property, then the “<NOT toggle/tap variable>” placeholder is displayed.

- Instance path of a project variable (BOOL)
  - Example: PLC_PRG.xColorIsToggled

  - Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.

### "Normal state"

### "Alarm state"

The properties listed below control the color depending on the state. The normal state is in effect if the variable in “Color variables”, “Toggle color” is not defined or it has the value FALSE. The alarm state is in effect if the variable in “Color variables”, “Toggle color” has the value TRUE.

### "Frame color"

**Assignment options:**

- Variable (DWORD) for the frame color
  - Example: PLC_PRG.dwBorderColor
- Color literal
  - Example of green and opaque: 16#FF00FF00

### "Filling color"

**Assignment options:**

- Variable (DWORD) for the fill color
  - Example: PLC_PRG.dwFillColor
- Color literal
  - Example of gray and opaque: 16#FF888888

---

The transparency part of the color value is evaluated only if the “Activate semi-transparent drawing” option of the visualization manager is selected.

Select the “Advanced” option in the toolbar of the properties view. Then all element properties are visible.

---

See also

- Chapter 6.4.5.10.4 “Animating a color display” on page 2914
The properties contain IEC variables for controlling the appearance of the element dynamically.

### “Line width”
Variable (integer data type). Contains the line weight (in pixels).

### “Fill attributes”
Variable (DWORD). Controls whether the fill color of the element is visible.
- Variable value = 0: Filled
- Variable value > 0: Invisible; no fill color

### “Line style”
Variable (DWORD). Controls the line style.

<table>
<thead>
<tr>
<th>Coding</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Solid line</td>
</tr>
<tr>
<td>1</td>
<td>Dashed line</td>
</tr>
<tr>
<td>2</td>
<td>Dotted line</td>
</tr>
<tr>
<td>3</td>
<td>Line type &quot;Dash Dot&quot;</td>
</tr>
<tr>
<td>3</td>
<td>Line type &quot;Dash Dot Dot&quot;</td>
</tr>
<tr>
<td>8</td>
<td>Invisible; no line</td>
</tr>
</tbody>
</table>

Fixed values can be set in the “Appearance” property. These values can be overwritten by dynamic variables at runtime.

See also
-  "Element property 'Appearance'" on page 3043

The variables control the element behavior dynamically.

### “Invisible”
Variable (BOOL). Toggles the visibility of the element.

```plaintext
Example: bIsVisible with VAR bIsVisible : BOOL := FALSE;
        END_VAR
```

### “Deactivate inputs”
Variable (BOOL). Toggles the operability of the element.

```plaintext
Example: bIsDeactivated with VAR bIsDeactivated : BOOL := FALSE;
         END_VAR
```

The “Invisible” property is supported by the “Client Animation” functionality.

These properties are available only when you have selected the “Support client animations and overlay of native elements” option in the Visualization Manager.
“Animation duration”

Defines the duration (in milliseconds) in which the element runs an animation

- **Variable (integer value)**
  
  **Example:** `Menu.tContent with VAR tContent : INT := 500; END_VAR`

- **Integer literal**
  
  **Example:** `500`

**Animatable properties**

- “Absolute movement”, “Movement”, “X”, “Y”
- “Absolute movement”, “Rotation”
- “Absolute movement”, “Interior rotation”
- “Absolute movement”, “Exterior rotation”

The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.

“Move to foreground”

Moves the visualization element to the foreground

**Variable (BOOL)**

**Example:** `bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR`

**TRUE:** At runtime, the visualization element is displayed in the foreground.

**FALSE:** At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Input configuration'

The properties contain the configurations for the user input when using the mouse or keyboard. A user input defines an event and one or more actions that are executed when an event occurs.

The “Configure” button opens the “Input Configuration” dialog. There you can create or edit user inputs. Configured user inputs are listed below the events. They each include the action that is triggered and the setting in short form.

**Example:** “Execute ST Code”: `PLC_PRG.i_x := 0;`

<table>
<thead>
<tr>
<th>Event</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“OnDialogClosed”</td>
<td>Input event: The user closes the dialog.</td>
</tr>
<tr>
<td>“OnMouseClick”</td>
<td>Input event: The user clicks the mouse button completely in the element area. The mouse button is clicked and released.</td>
</tr>
<tr>
<td>“OnMouseDown”</td>
<td>Input event: The user clicks down on the mouse button.</td>
</tr>
<tr>
<td>“OnMouseEnter”</td>
<td>Input event: The user drags the mouse pointer to the element.</td>
</tr>
<tr>
<td>“OnMouseLeave”</td>
<td>Input event: The user drags the mouse pointer away from the element.</td>
</tr>
</tbody>
</table>
### “OnMouseMove”
Input event: The user moves the mouse pointer over the element area.

### “OnMouseUp”
Input events:
- The user releases the mouse button within the element area. It is irrelevant whether the user has previously pressed the mouse button inside or outside the element area.
- The user presses the mouse button within the element area, leaves the element area, and then releases the mouse button.

Note: This CODESYS-specific triggering behavior guarantees that actions for key elements are completed. A key element starts an action for “OnMouseDown” and ends the action for “OnMouseUp”.

Example: A visualization user presses the mouse button within the element area of the key element and then moves the cursor position so that it lies outside the element area. The action is ended anyway because “OnMouseUp” is triggered.

### “Tap”
When a mouse click event occurs, the variable defined in “Variable” is described in the application. The coding depends on the “Tap FALSE” and “Tap on enter if captured” options.

### “Variable”
Variable (BOOL) that is set on mouse click event.

Example: PLC_PRG.bIsTapped
- TRUE: A mouse click event exists. It lasts as long as the user presses the mouse button over the element. It ends when the button is released.
- FALSE: A mouse click event does not exist.

Requirement: The “Tap FALSE” option is not activated.

### “Tap FALSE”
- TRUE: The mouse click event leads to a complementary value in “Variable”.
- TRUE: A mouse click event does not exist.
- FALSE: While the mouse click event exists.

### “Tap on enter if captured”
- TRUE: During user input, it is also taken into consideration whether the mouse pointer is dragged within the element area or not while the mouse button is pressed.
- TRUE: While the mouse click event exists and the mouse pointer is moved over the element area.
- FALSE: A mouse click event does not exist. Or the user moves the mouse pointer outside of the element area while the mouse button is pressed.

The value is TRUE again as soon as the user moves the pointer back to the element area. The mouse is then captured.

### “Toggle”
With the onset of a mouse click event, the variable is set; when the mouse click event is completed, the variable is reset.

### “Variable”
Variable (BOOL). Its value toggled when the mouse click event is ended. This is when the user releases the mouse button while the mouse pointer is over the element area.

If the user releases the mouse button while the mouse pointer is outside of the element area, then the mouse click event is not ended and the value is not toggled.

Hint: The user can cancel a started toggle input by dragging the mouse pointer out of the element area.

### “Toggle on up if captured”
- TRUE: The value toggles regardless of where the mouse pointer is when the mouse button is released. The mouse is then captured.
“Hotkey”
Keyboard shortcut on the element for triggering specific input actions. When the keyboard shortcut event occurs, the input actions in the “Events” property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.

“Key”
Key pressed for input action.
Example: [T]
Note: The following properties appear when a key is selected.

“Events”
- “None”
- “Mouse down”: Pressing the key triggers the input actions that are configured in the “OnMouseDown” property.
- “Mouse up”: Releasing the key triggers the input actions that are configured in the “OnMouseUp” property.
- “Mouse down/up”: Pressing and releasing the key triggers the input actions that are configured in the “OnMouseDown” property and the “OnMouseUp” property.

“Shift”
☑: Combination with the Shift key
Example: [Shift]+[T].

“Control”
☑: Combination with the Ctrl key
Example: [Ctrl]+[T].

“Alt”
☑: Combination with the Alt key
Example: [Alt]+[T].

All keyboard shortcuts and their actions that are configured in the visualization are listed on the “Keyboard Configuration” tab.

See also
- % Chapter 6.4.5.21.2.2 “Command ‘Keyboard Configuration’” on page 3341
- % Chapter 6.4.5.21.3.6 “Dialog ‘Input Configuration’” on page 3370

Requirement: User management is set up for the visualization.

Element property ‘Access rights’
Opens the “Access rights” dialog. There you can edit the access privileges for the element.

Status messages:
- “Not set. Full rights.”: Access rights for all user groups: “operable”
- “Rights are set: Limited rights”: Access is restricted for at least one group.

See also
- % Chapter 6.4.5.21.3.1 “Dialog ‘Access Rights’” on page 3366

Visualization Element ‘Image’
Symbol:

Category: “Basic”
The element adds an image to the visualization. The displayed image is managed in the image pool and referenced in the visualization element by means of a static ID. You can also change the displayed image dynamically by using a variable instead of the static ID.

With the “Background” command, you can define a background for the entire visualization.

Directories that contain the images for use in visualizations can be defined in the project settings (category “Visualization”).

**Element properties**

<table>
<thead>
<tr>
<th>Property</th>
<th>Example</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Element name”</td>
<td>Status bar</td>
<td>Optional. Hint: Assign individual names for elements so that they are found faster in the element list.</td>
</tr>
<tr>
<td>“Type of element”</td>
<td>“Image”</td>
<td></td>
</tr>
<tr>
<td>“Static ID”</td>
<td>Identifier of the image file for a static assignment</td>
<td>ID of the image file on, as it is defined in the corresponding image pool. If the image is not included in the global image pool in the POU view, then the instance path must be specified. Then the name of the image pool is preceded to make the entry unique. Example: imagepool2.button_image. When a new ID is specified, a file selection dialog opens. The selected file is saved to the “GlobalImagePool”. See also: Help for the “Image Pool” object.</td>
</tr>
<tr>
<td>“Show frame”</td>
<td>☑️: The image file is displayed with a frame.</td>
<td></td>
</tr>
<tr>
<td>“Clipping”</td>
<td>☑️: Only part of the visualization is displayed that fits in the element frame.</td>
<td>Requirement: The “Scaling type” property is “Fixed”.</td>
</tr>
<tr>
<td>“Transparent”</td>
<td>☑️: The image pixels that have the “Transparent color” are displayed as transparent.</td>
<td></td>
</tr>
<tr>
<td>“Transparent color”</td>
<td>Effective only if the “Transparent” option is activated.</td>
<td>The button opens the color selection dialog. This is where you select the transparent color.</td>
</tr>
</tbody>
</table>
### Scaling type
Definition of how an image fits in the element frame.
- **Isotropic**: The entire image is displayed in the element frame, either larger or smaller. As a result, the proportion of height and width are retained.
  
If the alignment of the elements to each other should also be retained within a scaled frame element, then note the following. Unwanted horizontal or vertical offsets can be prevented by setting the properties “Horizontal alignment” and “Vertical alignment” to “Centered”. The alignment of the elements is retained and there are no resulting horizontal or vertical offsets.
  
Example: A lamp is centered above a switch. The lamp should remain in the horizontally centered position, even if the frame is resized.
- **Anisotropic**: The image resizes automatically to the dimensions of the element frame, filling the entire element frame. As a result, the proportions are not retained.
- **Fixed**: The image retains its original size, even if the element frame is resized. Note also that the “Clipping” option is selected.
  
For each reassignment of an image ID, the element size is adapted automatically to the image size.

### Horizontal alignment
Horizontal alignment of the element within the element frame:
- “Left”
- “Centered”
- “Right”

Requirement: The scaling type of the image is “Isotropic” or “Fixed”.

Note: If the visualization is referenced, then the horizontal alignment takes effect within the frame position.

> The “Variable” property is shown below this.

### Variable
Enumeration variable (ENUM VisuElemBase.VisuEnumHorizontalAlignment). Contains the horizontal alignment.

Example: PLC_PRG.eHorizontalAlignment

### Vertical alignment
Vertical alignment of the element within the element frame:
- “Top”
- “Centered”
- “Bottom”

Requirement: The scaling type of the image is “Isotropic” or “Fixed”.

Note: If the visualization is referenced, then the horizontal alignment takes effect within the frame position.

> The “Variable” property is shown below this.

### Variable
Enumeration variable (ENUM VisuElemBase.VisuEnumVerticalAlignment). Contains the vertical alignment.

Example: PLC_PRG.eVerticalAlignment
A valid declaration is required for the variables used as an example in the table above.

### Enumeration

```plaintext
TYPE VisuElemBase.VisuEnumHorizontalAlignment
  LEFT
  HCENTER
  RIGHT
END_TYPE

TYPE VisuElemBase.VisuEnumVerticalAlignment
  DOWN
  VCENTER
  BOTTOM
END_TYPE
```

### Declaration

```plaintext
PROGRAM PLC_PRG
VAR
  eHorizontalAlignment : VisuElemBase.VisuEnumHorizontalAlignment := VisuElemBase.VisuEnumHorizontalAlignment.HCENTER;
END_VAR
```

See also

- **Object 'Image Pool'**

### Element property 'Position'

The position defines the location and size of the element in the visualization window. This is based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“X”</strong></td>
<td>The x-coordinate of the upper left corner of the element&lt;br&gt;Specified in pixels&lt;br&gt;Example: 10</td>
</tr>
<tr>
<td><strong>“Y”</strong></td>
<td>The y-coordinate of the upper left corner of the element&lt;br&gt;Specified in pixels&lt;br&gt;Example: 10</td>
</tr>
<tr>
<td><strong>“Width”</strong></td>
<td>Specified in pixels&lt;br&gt;Example: 150</td>
</tr>
<tr>
<td><strong>“Height”</strong></td>
<td>Specified in pixels&lt;br&gt;Example: 30</td>
</tr>
</tbody>
</table>

Tip: You can change the values in “X”, “Y”, “Width”, and “Height” by dragging the corresponding symbols to another position in the editor.
"Angle"  
Static angle of rotation (in degrees).  
Example: 35  
The element is displayed rotated in the editor. The point of rotation is the center of the element. A positive value rotates clockwise.  
Tip: You can change the value in the editor by focusing the element to the handle. When the cursor is displayed as a rotating arrow, you can rotate the element about its center as a handle.

(1): Handle  
Note: If a dynamic angle of rotation is also configured in the property "Absolute movement ➔ Internal rotation", then the static and dynamic angles of rotation are added in runtime mode. The static angle of rotation acts as an offset.

See also  
- ☞ Chapter 6.4.5.5.3 “Positioning the Element, Adapting Size and Layer” on page 2874

Element property 'Center'  
The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“X”</td>
<td>X-coordinate of the point of rotation</td>
</tr>
<tr>
<td>“Y”</td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the symbols (1) to other positions in the editor.

Element property 'Colors'  
The properties contain fixed values for setting colors.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| “Color”     | Color for the frame  
Requirement: “Show frame” property is activated.  
Please note that the normal state is in effect if the expression in the “Color variables ➔ Toggle color” property is not defined or it has the value FALSE. |
| “Alarm color” | Color for the frame in alarm state  
Requirement: “Show frame” property is activated.  
Please note that the alarm state is in effect if the expression in the “Color variables ➔ Toggle color” property has the value TRUE. |
| “Transparency” | Value (0 to 255) for defining the transparency of the selected color.  
Example 255: The color is opaque. 0: The color is completely transparent. |
### Element property 'Appearance'

The properties contain fixed values for setting the look of the element.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Line width&quot;</td>
<td>Value in pixels</td>
</tr>
<tr>
<td></td>
<td>Example: 2</td>
</tr>
<tr>
<td></td>
<td>Note: The values 0 and 1 both result in a line weight of one pixel. If no line should be displayed, then the &quot;Line style&quot; property must be set to the option &quot;Invisible&quot;.</td>
</tr>
<tr>
<td>&quot;Line style&quot;</td>
<td>Type of line representation</td>
</tr>
<tr>
<td></td>
<td>● &quot;Solid&quot;</td>
</tr>
<tr>
<td></td>
<td>● &quot;Dashes&quot;</td>
</tr>
<tr>
<td></td>
<td>● &quot;Dots&quot;</td>
</tr>
<tr>
<td></td>
<td>● &quot;Dash Dot&quot;</td>
</tr>
<tr>
<td></td>
<td>● &quot;Dash Dot Dot&quot;</td>
</tr>
<tr>
<td></td>
<td>● &quot;not visible&quot;</td>
</tr>
</tbody>
</table>

You can assign variables in the "Appearance variables" property for controlling the appearance dynamically. The fixed values are defined here.

### Element property 'Texts'

The properties contain character strings for labeling the element. The character string can also contain a placeholder with a format definition. In runtime mode, the placeholder is replaced by the current value in the specified format.

CODESYS accepts the specified texts automatically into the "GlobalTextList" text list. Therefore, these texts can be localized.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Text&quot;</td>
<td>Character string (without single straight quotation marks) for the labeling the element. Add a line break by pressing the keyboard shortcut [Ctrl] + [Enter].</td>
</tr>
<tr>
<td></td>
<td>Example: Accesses: %i</td>
</tr>
<tr>
<td></td>
<td>The variable that contains the current value for the placeholder is specified in the property &quot;Text variable ➔ Text&quot;.</td>
</tr>
<tr>
<td>&quot;Tooltip&quot;</td>
<td>Character string (without single straight quotation marks) that is displayed as the tooltip of an element.</td>
</tr>
<tr>
<td></td>
<td>Example: Number of valid accesses.</td>
</tr>
<tr>
<td></td>
<td>The variable that contains the current value for the placeholder is specified in the property &quot;Text variable ➔ Tooltip&quot;.</td>
</tr>
</tbody>
</table>

### Element property 'Text properties'

The properties contain fixed values for the text properties.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Horizontal alignment&quot;</td>
<td>Horizontal alignment of the text within the element.</td>
</tr>
<tr>
<td>&quot;Vertical alignment&quot;</td>
<td>Vertical alignment of the text within the element.</td>
</tr>
<tr>
<td>&quot;Text format&quot;</td>
<td>Definition for displaying texts that are too long</td>
</tr>
<tr>
<td></td>
<td>● &quot;Default&quot;: The long text is truncated.</td>
</tr>
<tr>
<td></td>
<td>● &quot;Line break&quot;: The text is split into parts.</td>
</tr>
<tr>
<td></td>
<td>● &quot;Ellipsis&quot;: The visible text ends with &quot;...&quot; indicating that it is not complete.</td>
</tr>
<tr>
<td>&quot;Font&quot;</td>
<td>Example: &quot;Default&quot;</td>
</tr>
<tr>
<td></td>
<td>▲: The &quot;Font&quot; dialog box opens.</td>
</tr>
<tr>
<td></td>
<td>▼: Drop-down list with style fonts.</td>
</tr>
<tr>
<td>&quot;Font color&quot;</td>
<td>Example: &quot;Black&quot;</td>
</tr>
<tr>
<td></td>
<td>▲: The &quot;Color&quot; dialog box opens.</td>
</tr>
<tr>
<td></td>
<td>▼: Drop-down list with style colors.</td>
</tr>
<tr>
<td>&quot;Transparency&quot;</td>
<td>Whole number (value range from 0 to 255). This determines the transparency of the respective color.</td>
</tr>
<tr>
<td></td>
<td>Example: 255: The color is opaque.</td>
</tr>
<tr>
<td></td>
<td>0: The color is completely transparent.</td>
</tr>
<tr>
<td></td>
<td>Please note: If the color is a style color and already has a transparency value, then this property is write-protected.</td>
</tr>
</tbody>
</table>

### Element property 'Image ID variable'

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Image ID&quot;</td>
<td>Variable (STRING). Contains the image ID. The contents of the string corresponds to the description of the &quot;Static ID&quot; property.</td>
</tr>
<tr>
<td></td>
<td>Example: PLC_PRG.stImageID := 'ImagePool_A.Image3';</td>
</tr>
</tbody>
</table>

See also

- Chapter 6.4.5.21.5.5 "Visualization Element 'Image'" on page 3463
- Chapter 6.4.1.21.2.15 "Object 'Image Pool'" on page 2468

### Element property 'Dynamic image'

You can use this element property for animating a series of image files.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Bitmap version&quot;</td>
<td>Variable (integer data type). Contains the version of the image.</td>
</tr>
<tr>
<td></td>
<td>If the variable changes, then the visualization re-reads the image referenced in the &quot;Image ID&quot; property and displays it.</td>
</tr>
<tr>
<td></td>
<td>The visualization displays animations when the image file on the controller is updated continuously, thus incrementing the version variable. The application must be programmed for this.</td>
</tr>
<tr>
<td></td>
<td>Possible applications</td>
</tr>
<tr>
<td></td>
<td>● Displaying graphics that are generated by the application</td>
</tr>
<tr>
<td></td>
<td>● Displaying images that are refreshed by a camera</td>
</tr>
</tbody>
</table>
**Element property 'Absolute movement'**

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

<table>
<thead>
<tr>
<th>“Movement”</th>
<th></th>
</tr>
</thead>
</table>
| **“X”** | Variable (numeric data type). Defines the X position (in pixels).  
*Example*: PLC_PRG.iPos_X.  
Increasing this value in runtime mode moves the element to the right. |
| **“Y”** | Variable (numeric data type). Defines the Y position (in pixels).  
*Example*: PLC_PRG.iPos_Y.  
Increasing this value in runtime mode moves the element downwards. |

<table>
<thead>
<tr>
<th><strong>“Rotation”</strong></th>
<th></th>
</tr>
</thead>
</table>
| Variable (numeric data type). Defines the angle of rotation (in degrees).  
*Example*: PLC_PRG.iAngle1.  
The midpoint of the element rotates at the “Center” point. This rotation point is shown as the + symbol.  
In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right. |

<table>
<thead>
<tr>
<th><strong>“Scaling”</strong></th>
<th></th>
</tr>
</thead>
</table>
| Variable (integer data type). Causes centric stretching.  
*Example*: PLC_PRG.iScaling.  
The reference point is the “Center” property.  
The value 1 shrinks the element by a factor of 0.001. The value 1000 returns the element to its original size. |

<table>
<thead>
<tr>
<th><strong>“Interior rotation”</strong></th>
<th></th>
</tr>
</thead>
</table>
| Variable (numeric data type). Defines the angle of rotation (in degrees).  
*Example*: PLC_PRG.iAngle2.  
In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.  
The rotation point is shown as the + symbol.  
Note: If a static angle of rotation is specified in the property “Position ➔ Angle”, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed. |

You can link the variables to a unit conversion.
The properties “X”, “Y”, “Rotation”, and “Interior rotation” are supported by the "Client Animation" functionality.

See also

- Element property 'Relative movement'

The properties contains variables for moving the element. The reference point is the position of the element (“Position” property). The shape of the element can change.

<table>
<thead>
<tr>
<th>&quot;Movement top-left&quot;</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>“X”</td>
<td>Variable (integer data type). It contains the number (in pixels) that the left edge is moved horizontally. Incrementing the value moves the element to the right. Example: PLC_PRG.iDeltaX</td>
</tr>
<tr>
<td>“Y”</td>
<td>Variable (integer data type). It contains the number (in pixels) that the top edge is moved vertically. Incrementing the value moves the element to the down. Example: PLC_PRG.iDeltaY</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>&quot;Movement bottom-right&quot;</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>“X”</td>
<td>Variable (integer data type). It contains the number (in pixels) that the right edge is moved horizontally. Incrementing the value moves the element to the right. Example: PLC_PRG.iDeltaWidth</td>
</tr>
<tr>
<td>“Y”</td>
<td>Variable (integer data type). It contains the number (in pixels) that the bottom edge is moved vertically. Incrementing the value moves the element to the down. Example: PLC_PRG.iDeltaHeight</td>
</tr>
</tbody>
</table>

See also

- “Element property 'Absolute movement'” on page 3016

Element property 'Text variables'

These properties are variables with contents that replace a format definition.

<table>
<thead>
<tr>
<th>&quot;Text variable&quot;</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. Example: PLC_PRG.iAccesses</td>
<td></td>
</tr>
</tbody>
</table>

Note: The format definition is part of the text in the property “Texts ➔ Text”.

Note: If you specify a variable of type enumeration with text list support, then the name of the enumeration data type is added automatically in angle brackets after the variable name. Example: PLC_PRG.enVar <enumeration name>. Then the symbolic value of the enumeration component is printed instead of the numeric value when text is printed. Refer to the help page for the enumerations.

<table>
<thead>
<tr>
<th>&quot;Tooltip variable&quot;</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. Example: PLC_PRG.iAccessesInTooltip</td>
<td></td>
</tr>
</tbody>
</table>

Note: The format definition is part of the text in the property “Texts ➔ Tooltip”.

See also

- Chapter 6.4.5.20.2 “Placeholders with Format Definition in the Output Text” on page 3329
- “Element property 'Texts’” on page 3043
- Chapter 6.4.1.20.5.18 “Enumerations” on page 2263

Element property 'Dynamic texts’

Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.

<table>
<thead>
<tr>
<th>“Text list”</th>
<th>Variable (string) or name of the text list as a fixed string in single straight quotation marks.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Example: 'Errorlist' \n\nDROP: Drop-down list with the dialogs available in the text lists.</td>
</tr>
<tr>
<td>“Text index”</td>
<td>Text list ID. This refers to the desired output text. \n\n• As fixed string with the ID in single straight quotation marks. \n  Example: '1' \n\n• As a variable (STRING) for dynamically controlling the text output. \n  Example: strTextID \n  Sample assignment: PLC_PRG.strTextID := '1';</td>
</tr>
<tr>
<td>“Tooltip index”</td>
<td>Text list ID. This refers to the desired output text. \n\n• As fixed string with the ID in single straight quotation marks. \n  Example: '2' \n\n• As a variable (STRING) for dynamically controlling the text output. \n  Example: strToolTipID \n  Sample assignment: PLC_PRG.strToolTipID := '2';</td>
</tr>
</tbody>
</table>

See also

- Chapter 6.4.1.21.2.28 “Object 'Text List’” on page 2532

Element property 'Font variables’

The variables allow for dynamic control of the text display.
### Font name

Variable (STRING). Includes the font of the text.

Example: `PLC_PRG.stFontVar := 'Arial';`

The selection of fonts corresponds to the default “Font” dialog.

### Size

Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name.

- `<pt>`: Points (default)
  
  Example: `PLC_PRG.iFontHeight <pt>`

  Code: `iFontHeight : INT := 12;`

- `<px>`: Pixels
  
  Example: `PLC_PRG.iFontHeight <px>`

  Code: `iFontHeight : INT := 19;`

If you click in the value field, a drop-down list opens on the right for setting the unit.

Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property “Text property ➤ Font”.

### Flags

Variable (DWORD). Contains the flags for displaying fonts.

Flags:

- 1: Italic
- 2: Bold
- 4: Underline
- 8: Strikethrough

Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: `PLC_PRG.dwFontType := 6;`

### Character set

Variable (DWORD). Contains a character set number for the font.

The selection of character set numbers corresponds to the “Script” setting of the standard “Font” dialog.

### Color

Variable (DWORD). Includes the color of the text.

Example: `PLC_PRG.dwColorFont := 16#FF000000;`

### Flags for text alignment

Variable (integer data type). Contains the coding for text alignment.

Example: `PLC_PRG.dwTextAlignment`.

Coding:

- 0: Top left
- 1: Horizontal center
- 2: Right
- 4: Vertical center
- 8: Bottom

Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: `PLC_PRG.dwFontType := 5;`
Fixed values for displaying texts are set in “Text properties”.

See also

- "Element property 'Text properties'" on page 3044

**Element property 'Color variables'**

The Element property is used as an interface for project variables to dynamically control colors at runtime.
### “Toggle color”

The property controls the toggled color at runtime.

**Value assignment:**
- **FALSE:** The element is displayed with the color specified in the “Color” property.
- **TRUE:** The element is displayed with the color specified in the “Alarm color” property.

**Assigning the property:**
- Placeholder for the user input variable
  - “<toggle/tap variable>”
  - “<NOT toggle/tap variable>”

The color change is not controlled by its own variable, but by a user input variable.

- Instance path of a project variable (BOOL)
  - Example: PLC_PRG.xColorIsToggled

Note: Specify a variable for the mouse events “Tap” or “Toggle” in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both “Toggle” and “Tap”, then the variable specified in “Tap” is used.

**Hint:** Click the symbol to insert the placeholder “<toggle/tap variable>”. When you activate the “Inputconfiguration”, “Tap FALSE” property, then the “<NOT toggle/tap variable>” placeholder is displayed.

**Instance path of a project variable (BOOL)**
  - Example: PLC_PRG.xColorIsToggled

Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.

### “Color”

Color variable for the frame

- Variable (DWORD) for the color
  - Example: PLC_PRG.dwColor

- Color literal
  - Example of gray and opaque: 16#FF888888

**Requirement:** “Show frame” property is activated.

Please note that the normal state is in effect if the expression in the “Colorvariables ➔ Toggle color” property is not defined or it has the value FALSE.

### “Alarm color”

Color variable for the frame in alarm state

- Variable (DWORD) for the alarm color
  - Example: PLC_PRG.dwAlarmColor

- Color literal
  - Example of red and opaque: 16#FFFF0000

Please note that the alarm state is in effect if the expression in the “Colorvariables ➔ Toggle color” property has the value TRUE.

---

**The transparency part of the color value is evaluated only if the “Activate semi-transparent drawing” option of the visualization manager is selected.**

**Select the “Advanced” option in the toolbar of the properties view. Then all element properties are visible.**
The properties contain variables for controlling the appearance of the element dynamically.

**Element property 'Appearance variables'**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>&quot;Line width&quot;</strong></td>
<td>Variable (integer data type). Contains the line weight (in pixels). Note: The values 0 and 1 both result in a line weight of one pixel. If no line should be displayed, then the &quot;Line style&quot; property must be set to the option &quot;Invisible&quot;.</td>
</tr>
</tbody>
</table>
| **"Line style"** | Variable (DWORD). Controls the line style. Coding:  
- 0: Solid line  
- 1: Dashed line  
- 2: Dotted line  
- 3: Line type "Dash Dot"  
- 3: Line type "Dash Dot Dot"  
- 8: Invisible: The line is not drawn. |

*Fixed values can be set in the "Appearance" property. These values can be overwritten by dynamic variables at runtime.*

See also
- § "Element property 'Appearance'" on page 3043

**Element property 'State variables'**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
</table>
| **"Invisible"** | Variable (BOOL). Toggles the visibility of the element. 
**TRUE**: The element is not visible at runtime. 
**Example**: bIsVisible with VAR bIsVisible : BOOL := FALSE; END_VAR |
| **"Deactivate inputs"** | Variable (BOOL). Toggles the operability of the element. 
**TRUE**: User inputs do not have any effect in runtime more. The element is shown as deactivated. |

*The "Invisible" property is supported by the "Client Animation" functionality.*

These properties are available only when you have selected the “Support client animations and overlay of native elements” option in the Visualization Manager.
**Animation duration**

Defines the duration (in milliseconds) in which the element runs an animation

- Variable (integer value)
  
  **Example:**
  ```
  Menu.tContent with VAR tContent : INT := 500;
  END_VAR
  ```

- Integer literal
  
  **Example:** 500

**Animatable properties**

- "Absolute movement", "Movement", "X", "Y"
- "Absolute movement", "Rotation"
- "Absolute movement", "Interior rotation"
- "Absolute movement", "Exterior rotation"

The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.

**Move to foreground**

Moves the visualization element to the foreground

Variable (BOOL)

**Example:**
```
bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR
```  

**TRUE:** At runtime, the visualization element is displayed in the foreground.

**FALSE:** At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

---

**Element property 'Input configuration'**

The properties contain the configurations for the user input when using the mouse or keyboard.

User input is a user event from the perspective of the element.

The "Configure" button opens the "Input configuration" dialog box for creating or modifying a user input configuration.

A configuration contains one or more input actions for the respective input event. Existing input actions are displayed below it.

**Example:** "Execute ST code": #PLC_PRG.i_x := 0;

- **OnDialogClosed** Input event: The user closes the dialog box.
- **OnMouseClick** Input event: A user clicks the element completely. The mouse button is clicked and released.
- **OnMouseDown** Input event: A user clicks down on the element only.
- **OnMouseEnter** Input event: A user drags the mouse pointer to the element.
- **OnMouseMove** Input event: A user moves the mouse pointer over the element area.
- **OnMouseUp** Input event: The user releases the mouse button over the element area.

<table>
<thead>
<tr>
<th><strong>Hotkeys</strong></th>
<th>Keyboard shortcut on the element for triggering specific input actions. When the keyboard shortcut event occurs, the input actions in the “Event(s)” property are triggered.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Key</strong></td>
<td>Key pressed for input action. Example: [T]</td>
</tr>
<tr>
<td><strong>Event(s)</strong></td>
<td></td>
</tr>
</tbody>
</table>
- “None”
- “Mouse down”: Pressing the key triggers the input actions that are configured in the “OnMouseDown” property.
- “Mouse up”: Releasing the key triggers the input actions that are configured in the “OnMouseUp” property.
- “Mouse down/up”: Pressing and releasing the key triggers the input actions that are configured in the “OnMouseDown” property and the “OnMouseUp” property. |
| **Shift** | ☑: Combination with the Shift key Example: [Shift]+[T]. |
| **Control** | ☑: Combination with the Ctrl key Example: [Ctrl]+[T]. |
| **Alt** | ☑: Combination with the Alt key Example: [Alt]+[T]. |

All keyboard shortcuts and their actions that are configured in the visualization are listed in the “Keyboard configuration” tab.

See also
- Chapter 6.4.5.21.2.2 “Command ‘Keyboard Configuration’” on page 3341

**Element property 'Access rights’**

Requirement: User management is set up for the visualization.

| **Access rights** | Opens the “Access rights” dialog. There you can edit the access privileges for the element. Status messages:
- “Not set. Full rights.”: Access rights for all user groups: “operable”
- “Rights are set: Limited rights”: Access is restricted for at least one group. |

**Visualization Element 'Frame’**

Symbol:
Category: “Basic”

The element serves as a frame in which to display one or more already existing visualizations. You get a structured user interface. The size of the frame can be fixed or scaled. The display area of the referenced visualization then adapts itself to the frame size.

Element properties

<table>
<thead>
<tr>
<th>“Element name”</th>
<th>Example: refVisUserInfo</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Type of element”</td>
<td>“Frame”</td>
</tr>
<tr>
<td>“Clipping”</td>
<td>Fixed size. Only that part of the referenced visualization that fits inside the frame is displayed. Requirement: The “Scaling type” property is “Fixed”.</td>
</tr>
<tr>
<td>“Show frame”</td>
<td>Displays the frame</td>
</tr>
<tr>
<td></td>
<td>● “No frame”: The displayed area of the frame does not have borders.</td>
</tr>
<tr>
<td></td>
<td>● “Frame”: The displayed area of the frame has borders.</td>
</tr>
<tr>
<td></td>
<td>● “No frame with offset”: The displayed area of the frame does not have a border and the displayed area of the referenced visualization is reduced inwards by one pixel as compared to the frame area. The gap prevents the referenced visualization from touching any adjacent elements.</td>
</tr>
<tr>
<td>“Scaling type”</td>
<td>The method with which the height and width of the referenced visualization are scaled.</td>
</tr>
<tr>
<td></td>
<td>● “Isotropic”: The visualization is scaled to the size of the element. The visualization retains its proportions with a fixed height/width ratio.</td>
</tr>
<tr>
<td></td>
<td>● “Anisotropic”: The visualization is scaled to the size of the element. The height and width are adapted to the element independently of each other.</td>
</tr>
<tr>
<td></td>
<td>● “Fixed”: the visualization is displayed in its original size without taking into account the size of the element.</td>
</tr>
<tr>
<td></td>
<td>● “Fixed and scrollable”: The visualization is displayed fixed in the element. If it is larger than the element, the element will be provided with scrollbars. Please note: assign variables to the properties “Scroll position variable horizontal” or “Scroll position variable vertical”. You can then edit the data of the scrollbar position in the application.</td>
</tr>
</tbody>
</table>

Element properties 'Scrollbar settings'

The properties contain variables for the position of the scrollboxes in the scrollbars. You can then edit the data of the scrollbox position in the application.
### Requirement
The property “Scaling type” is “fixed and scrollable”.

**“Scroll position variable horizontal”**
Variable (integer data type, also as array). Contains the position of the horizontal or vertical scrollbar. The array contains the position for every display variant. If the visualization runs on several display variants, then the position changes are decoupled from each other.

Example:
```
PLC_PRG.iScrollHor[CURRENTCLIENTID]
PLC_PRG.iScrollVer[CURRENTCLIENTID]
```

The variable is declared as an array in the example.

```
iScrollHor: ARRAY[0..20] OF INT;
iScrollVer: ARRAY[0..20] OF INT;
CURRENTCLIENTID indexes the current display variant.
```

You can combine the variables with a unit conversion.

See also
- [Unit conversion](#)

**“Scroll position variable vertical”**

You can combine the variables with a unit conversion.

See also
- [Unit conversion](#)

**“Deactivation of the background character”**

- The background is drawn. The non-animated element of the referenced visualization is drawn as a background bitmap in order to optimize the performance of the visualization.
- Consequence: Elements can be displayed in an unexpected order at runtime. For example, an animated element can push itself behind the Frame at runtime.

- Background character is deactivated in order to avoid the behavior described above.

**Element property 'References’**

Contains the currently configured visualization references as a subnode

**“References”**
Clicking “Configure” opens the “Frame Configuration” dialog. This is used to manage the referenced visualizations.

Caution: Visualizations can be nested at any depth by means of Frame elements. In order to use the “Switch to any visualization” Frame selection type without any problems, a Frame must not contain more than 21 referenced visualizations. For more information, see also the description for the “Input configuration” of an element: Action “Switch Frame visualization”.

List of the currently referenced visualizations
Visualizations that have a button also have this displayed as a subnode. Each interface variable is listed with the currently assigned transfer parameters.

Example:
```
vis_FormA
- iDataToDisplay_1: PLC_PRG.iVar1
- iDataToDisplay_2: PLC_PRG.iVar2
```

Hint: You can change the assignment of the variables to an interface variable here and edit the value field. Or click the “Configure” button instead.
See also
- § Chapter 6.4.5.21.2.1 “Command 'Interface Editor’” on page 3340
- § Chapter 6.4.5.17 “Creating a structured user interface” on page 2940
- § “Input action 'Switch Frame Visualization” on page 3377

**Element property 'Position'**

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| “X”      | X coordinate of the upper left corner of the element  
Specified in pixels.  
Example: 10. |
| “Y”      | Y coordinate of the upper left corner of the element  
Specified in pixels.  
Example: 10. |
| “Width”  | Specified in pixels.  
Example: 150 |
| “Height” | Specified in pixels.  
Example: 30 |

You can also change the values by dragging the box symbols ( marginBottom) to other positions in the editor.

See also
- § Chapter 6.4.5.5.3 “Positioning the Element, Adapting Size and Layer” on page 2874

**Element property 'Center'**

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“X”</td>
<td>X-coordinate of the point of rotation</td>
</tr>
<tr>
<td>“Y”</td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the symbols (margin) to other positions in the editor.

**Element property 'Colors'**

The properties contain fixed values for the colors.
### "Color"

Color of the frame

- Selection list with style colors appears
- Standard dialog "Color" opens for selecting a color.

Please note: the normal state is when the boolean variable in the property "Color variables ➔ Toggle color" is not defined or its value is **FALSE**.

### "Alarm color"

Color with which the element is filled during the alarm state.

Please note: Alarm state is when the value of the boolean variable in the property "Color variables ➔ Toggle color" is **FALSE**.

### "Transparency"

Integer number (value range from 255 to 0). Specifies the transparency of the associated color.

- 255: The color is opaque.
- 0: The color is fully transparent.

Please note: If the color is a style color and already contains a transparency value, then this property is write-protected.

See also
- ☰ Chapter 6.4.5.5.4 “Assigning a color” on page 2876

### Element property 'Appearance'

The properties contain fixed values for setting the look of the element.

<table>
<thead>
<tr>
<th>&quot;Line width&quot;</th>
<th>Value in pixels</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: 2</td>
<td></td>
</tr>
</tbody>
</table>

Note: The values 0 and 1 both result in a line weight of one pixel. If no line should be displayed, then the "Line style" property must be set to the option "Invisible".

<table>
<thead>
<tr>
<th>&quot;Line style&quot;</th>
<th>Type of line representation</th>
</tr>
</thead>
<tbody>
<tr>
<td>● “Solid”</td>
<td></td>
</tr>
<tr>
<td>● “Dashes”</td>
<td></td>
</tr>
<tr>
<td>● “Dots”</td>
<td></td>
</tr>
<tr>
<td>● “Dash Dot”</td>
<td></td>
</tr>
<tr>
<td>● “Dash Dot Dot”</td>
<td></td>
</tr>
<tr>
<td>● “not visible”</td>
<td></td>
</tr>
</tbody>
</table>

You can assign variables in the “Appearance variables” property for controlling the appearance dynamically. The fixed values are defined here.

See also
- ☰ “Element property 'Appearance variables’” on page 3064

### Element property 'Texts'

The properties contains character strings for labeling the element. The character string can also contain a placeholder with a format definition. In runtime mode, the placeholder is replaced by the current value in the specified format.

CODESYS accepts the specified texts automatically into the “GlobalTextList” text list. Therefore, these texts can be localized.
### “Text”
Character string (without single straight quotation marks) for the labeling the element. Add a line break by pressing the keyboard shortcut [Ctrl] + [Enter].

**Example:** `Accesses: %i`

The variable that contains the current value for the placeholder is specified in the property “Text variable ➔ Text”.

### “Tooltip”
Character string (without single straight quotation marks) that is displayed as the tooltip of an element.

**Example:** `Number of valid accesses`.

The variable that contains the current value for the placeholder is specified in the property “Text variable ➔ Tooltip”.

---

### Element property 'Text properties'
The properties contain fixed values for the text properties.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Horizontal alignment”</td>
<td>Horizontal alignment of the text within the element.</td>
</tr>
<tr>
<td>“Vertical alignment”</td>
<td>Vertical alignment of the text within the element.</td>
</tr>
<tr>
<td>“Text format”</td>
<td>Definition for displaying texts that are too long</td>
</tr>
<tr>
<td></td>
<td>- <strong>“Default”</strong>: The long text is truncated.</td>
</tr>
<tr>
<td></td>
<td>- <strong>“Line break”</strong>: The text is split into parts.</td>
</tr>
<tr>
<td></td>
<td>- <strong>“Ellipsis”</strong>: The visible text ends with &quot;...&quot; indicating that it is not complete.</td>
</tr>
<tr>
<td>“Font”</td>
<td><strong>Example:</strong> “Default”</td>
</tr>
<tr>
<td></td>
<td>- The “Font” dialog box opens.</td>
</tr>
<tr>
<td></td>
<td>- ▼: Drop-down list with style fonts.</td>
</tr>
<tr>
<td>“Font color”</td>
<td><strong>Example:</strong> “Black”</td>
</tr>
<tr>
<td></td>
<td>- The “Color” dialog box opens.</td>
</tr>
<tr>
<td></td>
<td>- ▼: Drop-down list with style colors.</td>
</tr>
<tr>
<td>“Transparency”</td>
<td>Whole number (value range from 0 to 255). This determines the transparency of the respective color.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> 255: The color is opaque.</td>
</tr>
<tr>
<td></td>
<td>0: The color is completely transparent.</td>
</tr>
<tr>
<td></td>
<td>Please note: If the color is a style color and already has a transparency value, then this property is write-protected.</td>
</tr>
</tbody>
</table>

---

### Element property 'Absolute movement'
The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Movement”</td>
<td></td>
</tr>
<tr>
<td>“X”</td>
<td>Variable (numeric data type). Defines the X position (in pixels).</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> PLC_PRG.iPos_X.</td>
</tr>
<tr>
<td></td>
<td>Increasing this value in runtime mode moves the element to the right.</td>
</tr>
</tbody>
</table>
“Y” Variable (numeric data type). Defines the Y position (in pixels).
Example: PLC_PRG.iPos_Y.
Increasing this value in runtime mode moves the element downwards.

“Rotation” Variable (numeric data type). Defines the angle of rotation (in degrees).
Example: PLC_PRG.iAngle1.
The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.
In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

“Scaling” Variable (integer data type). Causes centric stretching.
Example: PLC_PRG.iScaling.
The reference point is the “Center” property.
The value 1 shrinks the element by a factor of 0.001. The value 1000 returns the element to its original size.

You can link the variables to a unit conversion.

The properties “X”, “Y”, “Rotation”, and “Interior rotation” are supported by the “Client Animation” functionality.

Element property 'Relative movement' The properties contain variables for moving the element. The reference point is the position of the element ("Position" property). The shape of the element can change.

“Movement top-left”

“X” Variable (integer data type). It contains the number (in pixels) that the left edge is moved horizontally. Incrementing the value moves the element to the right.
Example: PLC_PRG.iDeltaX

“Y” Variable (integer data type). It contains the number (in pixels) that the top edge is moved vertically. Incrementing the value moves the element to the down.
Example: PLC_PRG.iDeltaY

“Movement bottom-right”
| **“X”** | Variable (integer data type). It contains the number (in pixels) that the **right** edge is moved horizontally. Incrementing the value moves the element to the right.  
*Example:* PLC_PRG.iDeltaWidth |
| **“Y”** | Variable (integer data type). It contains the number (in pixels) that the **bottom** edge is moved vertically. Incrementing the value moves the element to the down.  
*Example:* PLC_PRG.iDeltaHeight |

**Element property ‘Text variables’**  
These properties are variables with contents that replace a format definition.

| **“Text variable”** | Variable (data type compliant with the format definition). It contains what is printed instead of the format definition.  
*Example:* PLC_PRG.iAccesses  
*Note:* The format definition is part of the text in the property “Texts ➔ Text”.  
*Note:* If you specify a variable of type enumeration with text list support, then the name of the enumeration data type is added automatically in angle brackets after the variable name. Example: PLC_PRG.enVar <enumeration name>. Then the symbolic value of the enumeration component is printed instead of the numeric value when text is printed. Refer to the help page for the enumerations. |
| **“Tooltip variable”** | Variable (data type compliant with the format definition). It contains what is printed instead of the format definition.  
*Example:* PLC_PRG.iAccessesInTooltip  
*Note:* The format definition is part of the text in the property “Texts ➔ Tooltip”. |

**Element property ‘Dynamic texts’**  
Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.
"Text list"  
Variable (string) or name of the text list as a fixed string in single straight quotation marks.  
Example: 'Errorlist'  
▼: Drop-down list with the dialogs available in the text lists.

"Text index"  
Text list ID. This refers to the desired output text.  
- As fixed string with the ID in single straight quotation marks.  
  Example: '1'  
- As a variable (STRING) for dynamically controlling the text output.  
  Example: strTextID  
  Sample assignment: PLC_PRG.strTextID := '1';

"Tooltip index"  
Text list ID. This refers to the desired output text.  
- As fixed string with the ID in single straight quotation marks.  
  Example: '2'  
- As a variable (STRING) for dynamically controlling the text output.  
  Example: strToolTipID  
  Sample assignment: PLC_PRG.strToolTipID := '2';

See also  
- \( \approx \) Chapter 6.4.1.21.2.28 “Object 'Text List'” on page 2532

Element property 'Font variables'  
The variables allow for dynamic control of the text display.

"Font name"  
Variable (STRING). Includes the font of the text.  
Example: PLC_PRG.stFontVar := 'Arial';  
The selection of fonts corresponds to the default “Font” dialog.

"Size"  
Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name.  
- \(<\text{pt}\rangle\): Points (default)  
  Example: PLC_PRG.iFontHeight <pt>  
  Code: iFontHeight : INT := 12;  
- \(<\text{px}\rangle\): Pixels  
  Example: PLC_PRG.iFontHeight <px>  
  Code: iFontHeight : INT := 19;

If you click in the value field, a drop-down list opens on the right for setting the unit.  

Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property “Text property \( \rightarrow \) Font”.
### Flags

Variable (DWORD). Contains the flags for displaying fonts.

Flags:
- 1: Italics
- 2: Bold
- 4: Underline
- 8: Strikethrough

Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: PLC_PRG.dwFontType := 6;

### Character set

Variable (DWORD). Contains a character set number for the font.

The selection of character set numbers corresponds to the "Script" setting of the standard "Font" dialog.

### Color

Variable (DWORD). Includes the color of the text.

Example: PLC_PRG.dwColorFont := 16#FF000000;

### Flags for text alignment

Variable (integer data type). Contains the coding for text alignment.

Example: PLC_PRG.dwTextAlignment.

Coding:
- 0: Top left
- 1: Horizontal center
- 2: Right
- 4: Vertical center
- 8: Bottom

Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: PLC_PRG.dwFontType := 5;

---

**Fixed values for displaying texts are set in "Text properties".**

See also

- ¶ "Element property 'Text properties'" on page 3058

**Element property 'Color variables'**

The Element property is used as an interface for project variables to dynamically control colors at runtime.
**“Toggle color”**
The property controls the toggled color at runtime.

**Value assignment:**
- **FALSE**: The element is displayed with the color specified in the “Color” property.
- **TRUE**: The element is displayed with the color specified in the “Alarm color” property.

**Assigning the property:**
- Placeholder for the user input variable
  - “<toggle/tap variable>”
  - “<NOT toggle/tap variable>”

  The color change is not controlled by its own variable, but by a user input variable.

  **Note:** Specify a variable for the mouse events “Tap” or “Toggle” in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both “Toggle” and “Tap”, then the variable specified in “Tap” is used.

  **Hint:** Click the symbol to insert the placeholder “<toggle/tap variable>”. When you activate the “Input configuration”, “Tap FALSE” property, then the “<NOT toggle/tap variable>” placeholder is displayed.

- Instance path of a project variable (BOOL)
  Example: PLC_PRG.xColorIsToggled

  **Note:** In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.

---

**“Color”**
Color variable for the Frame

- **Variable (DWORD) for the color**
  Example: PLC_PRG.dwColor

- **Color literal**
  Example of gray and opaque: 16#FF888888

  **Requirement:** “Show Frame” property is activated.

  Please note that the normal state is in effect if the expression in the “Colorvariables ➔ Toggle color” property is not defined or it has the value FALSE.

---

**“Alarm color”**
Color variable for the Frame in alarm state

- **Variable (DWORD) for the alarm color**
  Example: PLC_PRG.dwAlarmColor

- **Color literal**
  Example of red and opaque: 16#FFFF0000

  Please note that the alarm state is in effect if the expression in the “Colorvariables ➔ Toggle color” property has the value TRUE.

---

The transparency part of the color value is evaluated only if the “Activate semi-transparent drawing” option of the visualization manager is selected.

---

Select the “Advanced” option in the toolbar of the properties view. Then all element properties are visible.
The properties contain variables for controlling the appearance of the element dynamically.

### Element property 'Appearance variables'

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Line width”</strong></td>
<td>Variable (integer data type). Contains the line weight (in pixels). Note: The values 0 and 1 both result in a line weight of one pixel. If no line should be displayed, then the “Line style” property must be set to the option “Invisible”.</td>
</tr>
<tr>
<td><strong>“Line style”</strong></td>
<td>Variable (DWORD). Controls the line style. Coding:</td>
</tr>
<tr>
<td></td>
<td>● 0: Solid line</td>
</tr>
<tr>
<td></td>
<td>● 1: Dashed line</td>
</tr>
<tr>
<td></td>
<td>● 2: Dotted line</td>
</tr>
<tr>
<td></td>
<td>● 3: Line type &quot;Dash Dot&quot;</td>
</tr>
<tr>
<td></td>
<td>● 3: Line type &quot;Dash Dot Dot&quot;</td>
</tr>
<tr>
<td></td>
<td>● 8: Invisible: The line is not drawn.</td>
</tr>
</tbody>
</table>

*Fixed values can be set in the “Appearance” property. These values can be overwritten by dynamic variables at runtime.*

### Element property 'Switch frame variable'

The variable controls the switching of the referenced visualizations. This variable indexes one of the referenced frame visualizations and this is displayed in the frame. When the value of the variable changes, it switches to the recently indexed visualization.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Variable”</strong></td>
<td>Variable (integer data type) that contains the index of the active visualization Example: PLC_PRG.uiIndexVisu</td>
</tr>
<tr>
<td></td>
<td>Hint: The “Frame Configuration” dialog includes a list of referenced visualizations. The visualizations are automatically numerically indexed via the order in the list. Note: This variant of switching usually affects all connected display variants.</td>
</tr>
<tr>
<td></td>
<td>Array element (integer data type) for index access via CURRENTCLIENTID Example: PLC_PRG.aIndexVisu[CURRENTCLIENTID]</td>
</tr>
<tr>
<td></td>
<td>Note: This variant of switching applies to the current client only, and therefore only on one display variant. That is the display variant where the value change was triggered (for example, by means of user input).</td>
</tr>
</tbody>
</table>

### Element property 'State variables'

The variables control the element behavior dynamically.
**“Invisible”**

Variable (BOOL). Toggles the visibility of the element.

**TRUE**: The element is not visible at runtime.

**Example**:
```
bIsVisible with VAR bIsVisible : BOOL := FALSE; END_VAR
```

**“Deactivate inputs”**

Variable (BOOL). Toggles the operability of the element.

**TRUE**: User inputs do not have any effect in runtime more. The element is shown as deactivated.

> The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the “Support client animations and overlay of native elements” option in the Visualization Manager.

**“Animation duration”**

Defines the duration (in milliseconds) in which the element runs an animation

- **Variable (integer value)**
  ```
  Menu.tContent with VAR tContent : INT := 500; END_VAR
  ```

- **Integer literal**
  ```
  Example: 500
  ```

**Animatable properties**

- “Absolute movement”, “Movement”, “X”, “Y”
- “Absolute movement”, “Rotation”
- “Absolute movement”, “Interior rotation”
- “Absolute movement”, “Exterior rotation”

The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.

**“Move to foreground”**

Moves the visualization element to the foreground

**Variable (BOOL)**

**Example**:
```
bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR
```

**TRUE**: At runtime, the visualization element is displayed in the foreground.

**FALSE**: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

**Element property 'Input configuration'**

The properties contain the configurations for the user input when using the mouse or keyboard. A user input defines an event and one or more actions that are executed when an event occurs.
The “Configure” button opens the “Input Configuration” dialog. There you can create or edit user inputs. Configured user inputs are listed below the events. They each include the action that is triggered and the setting in short form.

Example: “Execute ST Code”:

```
PLC_PRG.i_x := 0;
```

“OnDialogClosed” Input event: The user closes the dialog.

“OnMouseClick” Input event: The user clicks the mouse button completely in the element area. The mouse button is clicked and released.

“OnMouseDown” Input event: The user clicks down on the mouse button.

“OnMouseEnter” Input event: The user drags the mouse pointer to the element.

“OnMouseLeave” Input event: The user drags the mouse pointer away from the element.

“OnMouseMove” Input event: The user moves the mouse pointer over the element area.

“OnMouseUp” Input events:

- The user releases the mouse button within the element area. It is irrelevant whether the user has previously pressed the mouse button inside or outside the element area.
- The user presses the mouse button within the element area, leaves the element area, and then releases the mouse button.

Note: This CODESYS-specific triggering behavior guarantees that actions for key elements are completed. A key element starts an action for “OnMouseDown” and ends the action for “OnMouseUp”.

Example: A visualization user presses the mouse button within the element area of the key element and then moves the cursor position so that it lies outside the element area. The action is ended anyway because “OnMouseUp” is triggered.

“Tap” When a mouse click event occurs, the variable defined in “Variable” is described in the application. The coding depends on the “Tap FALSE” and “Tap on enter if captured” options.

“Variable” Variable (BOOL) that is set on mouse click event.

Example: PLC_PRG.bIsTapped

TRUE: A mouse click event exists. It lasts as long as the user presses the mouse button over the element. It ends when the button is released.

FALSE: A mouse click event does not exist.

Requirement: The “Tap FALSE” option is not activated.

“Tap FALSE” [✓]: The mouse click event leads to a complementary value in “Variable”.

TRUE: A mouse click event does not exist.

FALSE: While the mouse click event exists.

“Tap on enter if captured” [✓]: During user input, it is also taken into consideration whether the mouse pointer is dragged within the element area or not while the mouse button is pressed.

TRUE: While the mouse click event exists and the mouse pointer is moved over the element area.

FALSE: A mouse click event does not exist. Or the user moves the mouse pointer outside of the element area while the mouse button is pressed.

The value is TRUE again as soon as the user moves the pointer back to the element area. The mouse is then captured.
“Toggle” | With the onset of a mouse click event, the variable is set; when the mouse click event is completed, the variable is reset.

“Variable” | Variable (BOOL). Its value toggled when the mouse click event is ended. This is when the user releases the mouse button while the mouse pointer is over the element area. If the user releases the mouse button while the mouse pointer is outside of the element area, then the mouse click event is not ended and the value is not toggled. Hint: The user can cancel a started toggle input by dragging the mouse pointer out of the element area.

“Toggle on up if captured” | ☑: The value toggles regardless of where the mouse pointer is when the mouse button is released. The mouse is then captured.

“Hotkey” | Keyboard shortcut on the element for triggering specific input actions. When the keyboard shortcut event occurs, the input actions in the “Events” property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.

“Key” | Key pressed for input action. Example: [T]

“Events” | ● “None”
● “Mouse down”: Pressing the key triggers the input actions that are configured in the “OnMouseDown” property.
● “Mouse up”: Releasing the key triggers the input actions that are configured in the “OnMouseUp” property.
● “Mouse down/up”: Pressing and releasing the key triggers the input actions that are configured in the “OnMouseDown” property and the “OnMouseUp” property.

“Shift” | ☑: Combination with the Shift key Example: [Shift]+[T].

“Control” | ☑: Combination with the Ctrl key Example: [Ctrl]+[T].

“Alt” | ☑: Combination with the Alt key Example: [Alt]+[T].

All keyboard shortcuts and their actions that are configured in the visualization are listed on the “Keyboard Configuration” tab.

● § Chapter 6.4.5.21.3.6 “Dialog ‘Input Configuration’” on page 3370

Element property 'Access rights' | Requirement: User management is set up for the visualization.
“Access rights”
Opens the “Access rights” dialog. There you can edit the access privileges for the element.

Status messages:
- “Not set. Full rights.”: Access rights for all user groups: “operable”
- “Rights are set: Limited rights”: Access is restricted for at least one group.

See also
- § Chapter 6.4.5.21.3.1 “Dialog ‘Access Rights’” on page 3366

Visualization Element ‘Label’
Symbol:

Category: “Common Controls”
The element is used to label visualizations.

Element properties

<table>
<thead>
<tr>
<th>“Element name”</th>
<th>Optional</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hint: Assign individual names for elements so that they are found faster in the element list.</td>
<td></td>
</tr>
<tr>
<td>Example: Header_Parameter</td>
<td></td>
</tr>
</tbody>
</table>

| “Type of element” | “Label” |

Element property ‘Texts’
The property requires a character string.
This text is entered automatically into the GlobalTextList text list and can be localized there.

<table>
<thead>
<tr>
<th>“Text”</th>
<th>Character string (without single straight quotation marks)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: Main page</td>
<td></td>
</tr>
</tbody>
</table>

See also
- § Chapter 6.4.5.5 “Designing a visualization with elements” on page 2872
- § Chapter 6.4.5.20.2 “Placeholders with Format Definition in the Output Text” on page 3329

Element property ‘Position’
The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.
### "X"
- X coordinate of the upper left corner of the element
- Specified in pixels.
- Example: 10.

### "Y"
- Y coordinate of the upper left corner of the element
- Specified in pixels.
- Example: 10.

### "Width"
- Specified in pixels.
- Example: 150

### "Height"
- Specified in pixels.
- Example: 30

You can also change the values by dragging the box symbols (_draging_image_ ) to other positions in the editor.

See also
- Chapter 6.4.5.3 "Positioning the Element, Adapting Size and Layer" on page 2874

#### Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the _rotation_symbol_ symbol. The point is used as the center for rotating and scaling.

<table>
<thead>
<tr>
<th>&quot;X&quot;</th>
<th>X-coordinate of the point of rotation</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Y&quot;</td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the symbols (_rotation_symbol_ ) to other positions in the editor.

#### Element property 'Text properties'

The properties contain fixed values for the text properties.

<table>
<thead>
<tr>
<th>&quot;Horizontal alignment&quot;</th>
<th>Horizontal alignment of the text within the element.</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Vertical alignment&quot;</td>
<td>Vertical alignment of the text within the element.</td>
</tr>
<tr>
<td>&quot;Text format&quot;</td>
<td>Definition for displaying texts that are too long</td>
</tr>
<tr>
<td></td>
<td>• &quot;Default&quot;: The long text is truncated.</td>
</tr>
<tr>
<td></td>
<td>• &quot;Line break&quot;: The text is split into parts.</td>
</tr>
<tr>
<td></td>
<td>• &quot;Ellipsis&quot;: The visible text ends with &quot;...&quot; indicating that it is not complete.</td>
</tr>
<tr>
<td>&quot;Font&quot;</td>
<td>Example: &quot;Default&quot;</td>
</tr>
<tr>
<td></td>
<td>✉: The &quot;Font&quot; dialog box opens.</td>
</tr>
<tr>
<td></td>
<td>▼: Drop-down list with style fonts.</td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Font color</strong></td>
<td>Example: “Black”&lt;br&gt;Ʉ: The “Color” dialog box opens.&lt;br&gt;▼: Drop-down list with style colors.</td>
</tr>
<tr>
<td><strong>Transparency</strong></td>
<td>Whole number (value range from 0 to 255). This determines the transparency of the respective color.&lt;br&gt;Example: 255: The color is opaque.&lt;br&gt;0: The color is completely transparent.&lt;br&gt;Please note: If the color is a style color and already has a transparency value, then this property is write-protected.</td>
</tr>
</tbody>
</table>

**Element property ‘Absolute movement’**<br>The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

<table>
<thead>
<tr>
<th><strong>Movement</strong></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>X</strong></td>
<td>Variable (numeric data type). Defines the X position (in pixels).&lt;br&gt;Example: PLC_PRG.iPos_X.&lt;br&gt;Increasing this value in runtime mode moves the element to the right.</td>
</tr>
<tr>
<td><strong>Y</strong></td>
<td>Variable (numeric data type). Defines the Y position (in pixels).&lt;br&gt;Example: PLC_PRG.iPos_Y.&lt;br&gt;Increasing this value in runtime mode moves the element downwards.</td>
</tr>
<tr>
<td><strong>Rotation</strong></td>
<td>Variable (numeric data type). Defines the angle of rotation (in degrees).&lt;br&gt;Example: PLC_PRG.iAngle1.&lt;br&gt;The midpoint of the element rotates at the “Center” point. This rotation point is shown as the ⚫ symbol.&lt;br&gt;In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.</td>
</tr>
<tr>
<td><strong>Interior rotation</strong></td>
<td>Variable (numeric data type). Defines the angle of rotation (in degrees).&lt;br&gt;Example: PLC_PRG.iAngle2.&lt;br&gt;In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.&lt;br&gt;The rotation point is shown as the ⚫ symbol.&lt;br&gt;Note: If a static angle of rotation is specified in the “Position Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.</td>
</tr>
</tbody>
</table>
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.

See also

- Element property 'State variables'

The variables control the element behavior dynamically.

<table>
<thead>
<tr>
<th>“Invisible”</th>
<th>Variable (BOOL). Toggles the visibility of the element.</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRUE:</td>
<td>The element is not visible at runtime.</td>
</tr>
</tbody>
</table>

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the “Support client animations and overlay of native elements” option in the Visualization Manager.
**Animation duration**
Defines the duration (in milliseconds) in which the element runs an animation

- Variable (integer value)
  Example: `Menu.tContent with VAR tContent : INT := 500; END_VAR`
- Integer literal
  Example: `500`

**Animatable properties**
- "Absolute movement", "Movement", "X", "Y"
- "Absolute movement", "Rotation"
- "Absolute movement", "Interior rotation"
- "Absolute movement", "Exterior rotation"

The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.

**Move to foreground**
Moves the visualization element to the foreground

Variable (BOOL)

Example: `bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR`

**TRUE**: At runtime, the visualization element is displayed in the foreground.

**FALSE**: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

**Element property 'Access rights'**
Requirement: User management is set up for the visualization.

**Access rights**
Opens the "Access rights" dialog. There you can edit the access privileges for the element.

Status messages:
- "Not set. Full rights.": Access rights for all user groups: "operable"
- "Rights are set: Limited rights": Access is restricted for at least one group.

See also
- ☞ Chapter 6.4.5.21.3.1 "Dialog 'Access Rights'" on page 3366

See also

**Visualization Element 'Combo Box, Integer'**

Symbol:

**Category: “Common Controls”**
The element shows values as a list box. When the user clicks an entry, the ID of the entry is written to an integer variable. The entries in the list box can be from a list and contain images from an image pool.
### Element properties

<table>
<thead>
<tr>
<th>“Element name”</th>
<th>Example: List of product numbers</th>
</tr>
</thead>
<tbody>
<tr>
<td>Optional</td>
<td>Hint: Assign individual names for elements so that they are found faster in the element list.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Type of element”</th>
<th>“Combo Box, Integer”</th>
</tr>
</thead>
</table>

### Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

<table>
<thead>
<tr>
<th>“X”</th>
<th>X coordinate of the upper left corner of the element</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Specified in pixels.</td>
</tr>
<tr>
<td></td>
<td>Example: 10.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Y”</th>
<th>Y coordinate of the upper left corner of the element</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Specified in pixels.</td>
</tr>
<tr>
<td></td>
<td>Example: 10.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Width”</th>
<th>Specified in pixels.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Example: 150</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Height”</th>
<th>Specified in pixels.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Example: 30</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the box symbols ( sprawl) to other positions in the editor.

See also

- Chapter 6.4.5.3 “Positioning the Element, Adapting Size and Layer” on page 2874

### Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

<table>
<thead>
<tr>
<th>“X”</th>
<th>X-coordinate of the point of rotation</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Y”</th>
<th>Y-coordinate of the point of rotation</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

You can also change the values by dragging the symbols ( sprawl) to other positions in the editor.
**“Variable”**

At runtime, the text list ID of the list entry that the user clicks is saved at runtime. If only one image pool is displayed, then the image ID is saved.

Property value

- Variable (integer data type)
  - Example: PLC_PRG.iIDComboboxEntry
- Enumeration variable with text list support
  - Example: PLC_PRG.eMyCombobox<COMBO>

**“Text List”**

Displayed as a combo box. Every text list entry becomes a combo box entry.

Note: A maximum of 32766 entries can be displayed.

Transfer value

- Text list identifier as string
  - Example: 'TextList_A'
  - Note: The IDs of the text list have to be within the range of values of DWORD or DINT.
- Blank
  - When an enumeration variable with text list support is specified in the “Variable” property
  - When only one image pool is displayed

**“Image Pool”**

Displayed as a combo box. Every image in the image pool becomes a combo box entry.

Example: 'ImagePool_A'

See also

- Enumerations
- § Chapter 6.4.5.8 “Setting Up Multiple Languages” on page 2906

**Element property 'Settings of the list'**

Displayed list that expands when a visualization user clicks into the element.

| **“Number of rows setting”** | **“From style”:**
| --- | ---
| “Explicit”: Then the “Number of visible rows” property appears below it. |

| **“Number of visible rows”** | Number of visible lines of the combo box drop-down list defined here
| --- | ---
| Integer literal
  - Example: 5 |
| Variable (integer data type)
  - Example: PLC_PRG.iNumberOfVisibleRows |
| Note: The property is available when the “Number of rows setting” property is set to “Explicit”. |

| **“Row height”** | **“From style”:**
| --- | ---
| Literal
  - Example: 20 |

| **“Height of image”** | Image height (in pixels) of the image displayed in the drop-down list entry
| --- | ---
| **“From style”:**
| Integer literal
  - Example: 30 |
<p>| Note: Images are displayed only when a value is specified in the “Image pool” property. |</p>
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Width of image”</td>
<td>Image width (in pixels) of the image displayed in the drop-down list entry</td>
</tr>
<tr>
<td>• “From style”:</td>
<td>• Literal</td>
</tr>
<tr>
<td></td>
<td>Example: 30</td>
</tr>
<tr>
<td>Note:</td>
<td>Images are displayed only when a value is specified in the “Image pool”</td>
</tr>
<tr>
<td>“Offset of image”</td>
<td>Makes the images in the selection list appear offset (in pixels) from the left margin. An offset of 0 means that the images are displayed directly on the margin.</td>
</tr>
<tr>
<td>• “From style”:</td>
<td>• Literal</td>
</tr>
<tr>
<td></td>
<td>Example: 4</td>
</tr>
<tr>
<td>Note:</td>
<td>Images are displayed only when a value is specified in the “Image pool”</td>
</tr>
<tr>
<td>“Scrollbar size”</td>
<td>Size of the scrollbar (in pixels). The scrollbar is displayed when more entries are specified in the drop-down list than in “Number of visible rows”.</td>
</tr>
<tr>
<td></td>
<td>Default: 20</td>
</tr>
</tbody>
</table>

Element property "Texts"

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Tooltip”</td>
<td>Character string (without single straight quotation marks) that is displayed as the tooltip of an element in runtime mode</td>
</tr>
<tr>
<td></td>
<td>Example: Products of customer A</td>
</tr>
<tr>
<td>Hint:</td>
<td>The text is accepted automatically into the “GlobalTextList” text list and can be localized there.</td>
</tr>
</tbody>
</table>

See also

- Chapter 6.4.5.5 “Designing a visualization with elements” on page 2872

Element property 'Value range'

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Limit valuerange”</td>
<td>Limits the text list to one subrange. This subrange is displayed by the combo box.</td>
</tr>
<tr>
<td>Requirement:</td>
<td>A value is specified in the “Text list” property.</td>
</tr>
<tr>
<td>✓: Only the subrange that is defined by the “Minimum value” “Maximum value” properties is displayed as a drop-down list.</td>
<td></td>
</tr>
<tr>
<td>“Minimum value”</td>
<td>ID of the text list entry from which a combo box entry is displayed</td>
</tr>
<tr>
<td>• Literal (ANY_NUM)</td>
<td>Example: 5</td>
</tr>
<tr>
<td>• Variable (integer data type)</td>
<td>Example: PLC_PRG.iFirstEntry</td>
</tr>
</tbody>
</table>
### Maximum value

ID of the text list entry up to which combo box entries are displayed

- **Literal** *(ANY_NUM)*
  
  - **Example:** 10

- **Variable** (integer data type)
  
  - **Example:** PLC_PRG.iLastEntry

### Filter missing textentries

☑️ Text list is refreshed and any unused texts (IDs) are removed.

**Requirement:** A value is specified in the “Text list” property.

### Element property 'Text properties'

The properties contain fixed values for the text properties.

| “Usage of” | • “Default style values”: The values of the visualization style are used.  
  | • “Individual settings”: The ”Individual text properties” property group is shown  
  | The values can be customized here. |

| “Individual text properties” | Requirement: The “Individual settings” text property is defined. |

| “Horizontal alignment” | Horizontal alignment of the text within the element. |

| “Vertical alignment” | Vertical alignment of the text within the element. |

| “Font” | Example: “Default”  
  | ✓: The “Font” dialog box opens.  
  | ✴: Drop-down list with style fonts. |

| “Font color” | Example: “Black”  
  | ✓: The “Color” dialog box opens.  
  | ✴: Drop-down list with style colors. |

| “Transparency” | Whole number (value range from 0 to 255). This determines the transparency of the respective color.  
  | Example: 255: The color is opaque.  
  | 0: The color is completely transparent.  
  | Please note: If the color is a style color and already has a transparency value, then this property is write-protected. |

### Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

| “Movement” | |

| “X” | Variable (numeric data type). Defines the X position (in pixels).  
  | **Example:** PLC_PRG.iPos_X.  
  | Increasing this value in runtime mode moves the element to the right. |

| “Y” | Variable (numeric data type). Defines the Y position (in pixels).  
  | **Example:** PLC_PRG.iPos_Y.  
  | Increasing this value in runtime mode moves the element downwards. |
### "Rotation"

Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle1.

The midpoint of the element rotates at the "Center" point. This rotation point is shown as the symbol.

In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

### "Interior rotation"

Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in "Center" according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol.

Note: If a static angle of rotation is specified in the "Position Angle" property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

---

You can link the variables to a unit conversion.

The "X", "Y", "Rotation", and "Interior rotation" properties are supported by the "Client Animation" functionality.

See also

- Element property 'State variables'

The variables control the element behavior dynamically.

### "Invisible"

Variable (BOOL). Toggles the visibility of the element.

**TRUE:** The element is not visible at runtime.

**Example:** bIsVisible with VAR bIsVisible : BOOL := FALSE;

### "Deactivate inputs"

Variable (BOOL). Toggles the operability of the element.

**TRUE:** User inputs do not have any effect in runtime more. The element is shown as deactivated.
The “Invisible” property is supported by the “Client Animation” functionality.

These properties are available only when you have selected the “Support client animations and overlay of native elements” option in the Visualization Manager.

<table>
<thead>
<tr>
<th>“Animation duration”</th>
<th>Defines the duration (in milliseconds) in which the element runs an animation</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• Variable (integer value)</td>
</tr>
<tr>
<td></td>
<td>Example: Menu.tContent with VAR tContent : INT := 500; END_VAR</td>
</tr>
<tr>
<td></td>
<td>• Integer literal</td>
</tr>
<tr>
<td></td>
<td>Example: 500</td>
</tr>
</tbody>
</table>

Animatable properties

- “Absolute movement”, “Movement”, “X”, “Y”
- “Absolute movement”, “Rotation”
- “Absolute movement”, “Interior rotation”
- “Absolute movement”, “Exterior rotation”

The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.

<table>
<thead>
<tr>
<th>“Move to foreground”</th>
<th>Moves the visualization element to the foreground</th>

Visualization Element ‘Combo Box, Array’

Symbol:

Category: “Common Controls”
The element shows values of an array as a list box. When the visualization user clicks an entry, the array index of the entry is written to an integer variable.

Element properties

<table>
<thead>
<tr>
<th>“Element name”</th>
<th>Optional</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Hint: Assign individual names for elements so that they are found faster in the element list.</td>
</tr>
<tr>
<td></td>
<td>Example: List_Product_Number</td>
</tr>
</tbody>
</table>

| “Type of element”    | “Combo Box, Array” |

Element property 'Position'
The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

<table>
<thead>
<tr>
<th>“X”</th>
<th>X coordinate of the upper left corner of the element</th>

</tr>
</tbody>
</table>

You can also change the values by dragging the box symbols (®) to other positions in the editor.

See also

- Chapter 6.4.5.5.3 “Positioning the Element, Adapting Size and Layer” on page 2874

Element property 'Center'
The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the 🈞️ symbol. The point is used as the center for rotating and scaling.
| "X" | X-coordinate of the point of rotation |
| "Y" | Y-coordinate of the point of rotation |

You can also change the values by dragging the symbols (บางคน) to other positions in the editor.

<table>
<thead>
<tr>
<th>&quot;Variable&quot;</th>
<th>The array index of the list entry that the user clicks is saved at runtime.</th>
</tr>
</thead>
</table>

- **Property value**
  - Variable (integer data type)
    
    Example: PLC_PRG.iIndexComboboxEntry
  - Enumeration variable with text list support
    
    Example: PLC_PRG.eMyCombobox<COMBO>
    
    Note: Value range of the enumeration value that lies within the DWORD or DINT value range

<table>
<thead>
<tr>
<th>&quot;Data array&quot;</th>
<th>Displayed as a combo box. Every array component becomes a combo box entry.</th>
</tr>
</thead>
</table>

- **Property value**
  - Array variable (ARRAY[... OF])
    
    Example: PLC_PRG.astrCombobox
    

See also
- **Enumerations**
- © Chapter 6.4.5.8 “Setting Up Multiple Languages” on page 2906

**Element property 'Columns'**

The "Combo box – Array" element visualizes an array variable or structure variable in a tabular view. The index of array elements or structure members is shown in a column or row. Two-dimensional arrays or structure arrays are shown in several columns. You specify the visualized variable in the "Data array" property. If a variable is assigned there, then you can specify the display of the table columns where the array elements are shown. You can customize each column that is assigned to an index [<n>].

<table>
<thead>
<tr>
<th>&quot;Columns&quot;</th>
<th>Due to the structure of the variable that is defined in &quot;Data array&quot;, CODESYS determines the number of columns and defines them with the index &lt;n&gt;.</th>
</tr>
</thead>
</table>

- **[<n>]**
  
  Example: StringTable : ARRAY [0..2, 0..4] OF STRING := ['BMW','Audi','Mercedes','VW','Fiat', '150','150','150','150','100','blue','gray','silver','blue', 'red'];: three columns are formed [0], [1] and [2].

| "Max. array index" | Optional. Variable (integer data type) or value. Defines up to which array index the data is displayed. |
| "Row height" | Height of the rows (in pixels). |
| "Number visible rows" | Optional. If the array is larger than the number of visible rows, then a scrollbar is included. |
| "Scrollbar size" | Width of the vertical scrollbar (in pixels). |
### Table 629: “Element property ‘Columns: Column [<n>]’”

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Width”</td>
<td>Column width (in pixels).</td>
</tr>
<tr>
<td>“Image column”</td>
<td>Images can be displayed in the column. Images are used from the global image pool or user-defined image pools. The image IDs are shown in the cells of the table as defined in the image pool.</td>
</tr>
<tr>
<td>“Image configuration”</td>
<td></td>
</tr>
<tr>
<td>“Fill mode”</td>
<td></td>
</tr>
<tr>
<td></td>
<td>● “Fill cell” The image resizes to the dimensions of the cell without fixing the height/width ratio.</td>
</tr>
<tr>
<td></td>
<td>● “Centered” The image is centered in the cell and retains its proportions (height-width ratio).</td>
</tr>
<tr>
<td>“Transparency”</td>
<td>The color that is specified in “Transparent color” is displayed as transparent.</td>
</tr>
<tr>
<td>“Transparent color”</td>
<td>When the “Transparent” property is enabled, the color specified here is not displayed. Pixels with this color are transparent.</td>
</tr>
<tr>
<td>“Text alignment in column”</td>
<td></td>
</tr>
<tr>
<td></td>
<td>● “Left”</td>
</tr>
<tr>
<td></td>
<td>● “Centered”</td>
</tr>
<tr>
<td></td>
<td>● “Right”</td>
</tr>
</tbody>
</table>

### Element property 'Texts'

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Tooltip”</td>
<td>Character string (without single straight quotation marks) that is displayed as the tooltip of an element in runtime mode</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> Products of customer A</td>
</tr>
<tr>
<td></td>
<td>Hint: The text is accepted automatically into the “GlobalTextList” text list and can be localized there.</td>
</tr>
</tbody>
</table>

See also

- § Chapter 6.4.5.5 “Designing a visualization with elements” on page 2872

### Element property 'Text properties'

The properties contain fixed values for the text properties.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Usage of”</td>
<td></td>
</tr>
<tr>
<td></td>
<td>● “Default style values”: The values of the visualization style are used.</td>
</tr>
<tr>
<td></td>
<td>● “Individual settings”: The &quot;Individual text properties&quot; property group is shown The values can be customized here.</td>
</tr>
<tr>
<td>“Individual text properties”</td>
<td>Requirement: The “Individual settings” text property is defined.</td>
</tr>
<tr>
<td>“Font”</td>
<td>Example: “Default”</td>
</tr>
<tr>
<td></td>
<td><img src="image" alt="The “Font” dialog opens." /></td>
</tr>
<tr>
<td></td>
<td><img src="image" alt="List box with style fonts" /></td>
</tr>
</tbody>
</table>
**“Font color”**

Example: “Black”
- The “Color” dialog opens.
- ▼: List box with style colors

**“Transparency”**

Integer (value range from 0 to 255). This determines the transparency of the respective color.
- 255: The color is opaque.
- 0: The color is completely transparent.

Note: If the color is a style color and already has a transparency value, then this property is write-protected.

---

**Element property 'Absolute movement’**

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

---

**“Movement”**

<table>
<thead>
<tr>
<th>“X”</th>
<th>Variable (numeric data type). Defines the X position (in pixels).</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: PLC_PRG.iPos_X.</td>
<td>Increasing this value in runtime mode moves the element to the right.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Y”</th>
<th>Variable (numeric data type). Defines the Y position (in pixels).</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: PLC_PRG.iPos_Y.</td>
<td>Increasing this value in runtime mode moves the element downwards.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Rotation”</th>
<th>Variable (numeric data type). Defines the angle of rotation (in degrees).</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: PLC_PRG.iAngle1.</td>
<td>The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.</td>
</tr>
<tr>
<td></td>
<td>In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Interior rotation”</th>
<th>Variable (numeric data type). Defines the angle of rotation (in degrees).</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: PLC_PRG.iAngle2.</td>
<td>In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.</td>
</tr>
<tr>
<td></td>
<td>The rotation point is shown as the symbol.</td>
</tr>
<tr>
<td>Note: If a static angle of rotation is specified in the “Position ➔ Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.</td>
<td></td>
</tr>
</tbody>
</table>
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.

See also

The variables control the element behavior dynamically.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Invisible”</td>
<td>Variable (BOOL). Toggles the visibility of the element. TRUE: The element is not visible at runtime. Example: <code>bIsVisible := FALSE;</code></td>
</tr>
<tr>
<td>“Deactivate inputs”</td>
<td>Variable (BOOL). Toggles the operability of the element. TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated.</td>
</tr>
</tbody>
</table>

The “Invisible” property is supported by the “Client Animation” functionality.

These properties are available only when you have selected the “Support client animations and overlay of native elements” option in the Visualization Manager.
### “Animation duration”

Defines the duration (in milliseconds) in which the element runs an animation

- **Variable (integer value)**
  
  **Example:**
  ```plaintext
  Menu.tContent with VAR tContent : INT := 500;
  END_VAR
  ```

- **Integer literal**
  
  **Example:**
  500

**Animatable properties**

- “Absolute movement”, “Movement”, “X”, “Y”
- “Absolute movement”, “Rotation”
- “Absolute movement”, “Interior rotation”
- “Absolute movement”, “Exterior rotation”

The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.

### “Move to foreground”

Moves the visualization element to the foreground

**Variable (BOOL)**

**Example:**
```plaintext
bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR
```

**TRUE:** At runtime, the visualization element is displayed in the foreground.

**FALSE:** At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

- ☞ Chapter 6.4.5.5 “Designing a visualization with elements” on page 2872

---

**Visualization Element ‘Tabs’**

**Symbol:**

![Tabs symbol]

**Category:** “Common Controls”

The element displays selected visualizations in tabs. The tabs can be used by means of the tab header without having to configure an input configuration. A visualization user switches between visualizations by clicking the tab header.

**Element properties**

<table>
<thead>
<tr>
<th>“Element name”</th>
<th>Example: Assembly A</th>
</tr>
</thead>
<tbody>
<tr>
<td>Optional</td>
<td></td>
</tr>
<tr>
<td>Hint: Assign individual names for elements so that they are found faster in the element list.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Type of element”</th>
<th>“Tabs”</th>
</tr>
</thead>
</table>
"Tab width" Width of the tab (in pixels). If there is not space for all tab headers, then a scroll bar is added.
Example: 30

"Tab height" Height of the tab (in pixels)
- Integer literal
  Example: 15
- "From style"

"Scaling type" The method with which the height and width of the referenced visualization are scaled.
- "Isotropic": The visualization is scaled to the size of the element. The visualization retains its proportions with a fixed height/width ratio.
- "Anisotropic": The visualization is scaled to the size of the element. The height and width are adapted to the element independently of each other.
- "Fixed": The visualization is displayed in its original size without taking into account the size of the element.
- "Fixed and scrollable": The visualization is displayed fixed in the element. If it is larger than the element, the element will be provided with scrollbars.

Please note: assign variables to the properties "Scroll position variable horizontal" or "Scroll position variable vertical". You can then edit the data of the scrollbar position in the application.

"Deactivate background drawing" ☐: The non-animated elements of the referenced visualization are displayed as background images in order to optimize the performance of the visualization.
Result: At runtime, the elements can be displayed in any order, for example when an element moves behind the frame at runtime.
☑: Deactivates the background display in order to prevent the behavior described above

The property is not available for the following settings:
- The "Scaling type" property is set to "Fixed and scrollable"
- The client animation functionality is enabled.

Element property 'Scroll bar settings' The properties include variables for the position of the scroll boxes in the scroll bars. You can process the data for the scroll box position in the application.

Requirement: The "Scaling type" property is "Fixed and scrollable".

"Scroll position variable horizontal" Variable (integer data type, also array). Includes the position of the horizontal or vertical scroll box. The array contains the position for each display variant. If the visualization is running on multiple display variants, then the position changes are disconnected from each other.
Example:
PLC_PRG.iScrollHor[CURRENTCLIENTID]
PLC_PRG.iScrollVer[CURRENTCLIENTID]

In this example, the variable is declared as an array:
iScrollHor: ARRAY[0..20] OF INT;
iScrollVer: ARRAY[0..20] OF INT;
CURRENTCLIENTID indicates the current display variant.
Element property 'References'

<table>
<thead>
<tr>
<th>References</th>
<th>Clicking &quot;Configure&quot; opens the &quot;Frame Configuration&quot; dialog. You can select an existing visualization there. Selected visualization references are shown in the properties. Selected visualization references are listed here as subordinate properties.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name of the visualization reference (example: PLC_PRG.S1)</td>
<td></td>
</tr>
<tr>
<td>&quot;Heading&quot;</td>
<td>Tab caption (example: Panel)</td>
</tr>
<tr>
<td>&quot;Image ID&quot;</td>
<td>Image ID in the theme &lt;image pool name&gt;.&lt;ID&gt; Example: Imagepool_A.1 for the image with ID 1 in Imagepool_A</td>
</tr>
</tbody>
</table>

Interface parameter of the visualization reference

| Example: ix | If the visualization has an interface, then their parameters are displayed here as subordinate properties. Variable (data type conforms to data type of the interface parameter). Includes the initialization value for the instantiation of the visualization. |

- ☞ Chapter 6.4.5.21.2.1 “Command 'Interface Editor'” on page 3340
- ☞ Chapter 6.4.5.21.2.9 “Command 'Frame Selection'” on page 3348

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

| "X" | X coordinate of the upper left corner of the element Specified in pixels. Example: 10. |
| "Y" | Y coordinate of the upper left corner of the element Specified in pixels. Example: 10. |
| "Width" | Specified in pixels. Example: 150 |
| "Height" | Specified in pixels. Example: 30 |

You can also change the values by dragging the box symbols (_drag-) to other positions in the editor.
See also

- Chapter 6.4.5.3 “Positioning the Element, Adapting Size and Layer” on page 2874

**Element property ‘Center’**

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

<table>
<thead>
<tr>
<th>“X”</th>
<th>X-coordinate of the point of rotation</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Y”</td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the symbols to other positions in the editor.

**Element property ‘Switch frame variable’**

| “Variable” | Variable (integer data type). Specifies the index of the active visualization. Example: PLC_PRG.uiActiveVisuID. Tip: The “Frame Configuration” dialog box includes a list of selected visualizations. The visualizations are ordered automatically in numeric order in the list. |

See also

- Chapter 6.4.5.21.2.9 “Command ‘Frame Selection’” on page 3348

**Element property ‘Absolute movement’**

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

<table>
<thead>
<tr>
<th>“Movement”</th>
<th>Variable (numeric data type). Defines the X position (in pixels). Example: PLC_PRG.iPos_X. Increasing this value in runtime mode moves the element to the right.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“X”</td>
<td>Variable (numeric data type). Defines the Y position (in pixels). Example: PLC_PRG.iPos_Y. Increasing this value in runtime mode moves the element downwards.</td>
</tr>
</tbody>
</table>
### "Rotation"

Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle1.

The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.

In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

### "Interior rotation"

Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol.

Note: If a static angle of rotation is specified in the “Position ➔ Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

---

You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.

See also

- The variables control the element behavior dynamically.

### "Invisible"

Variable (BOOL). Toggles the visibility of the element.

**Example:**

```plaintext
VAR bIsVisible : BOOL := FALSE;
END_VAR
```

TRUE: The element is not visible at runtime.

### "Deactivate inputs"

Variable (BOOL). Toggles the operability of the element.

TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated.
The "Invisible" property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the “Support client animations and overlay of native elements” option in the Visualization Manager.

<table>
<thead>
<tr>
<th>&quot;Animation duration&quot;</th>
<th>Defines the duration (in milliseconds) in which the element runs an animation</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>● Variable (integer value)</td>
</tr>
<tr>
<td></td>
<td>Example: Menu.tContent with VAR tContent : INT := 500; END_VAR</td>

- Chapter 6.4.5.5 “Designing a visualization with elements” on page 2872

**Visualization Element 'Button'**

Symbol:

Category: “Common Controls”

The element triggers an action, such as setting a variable.
**Element property 'Position'**

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>X</strong></td>
<td>X coordinate of the upper left corner of the element</td>
</tr>
<tr>
<td></td>
<td>Specified in pixels.</td>
</tr>
<tr>
<td></td>
<td>Example: 10.</td>
</tr>
<tr>
<td><strong>Y</strong></td>
<td>Y coordinate of the upper left corner of the element</td>
</tr>
<tr>
<td></td>
<td>Specified in pixels.</td>
</tr>
<tr>
<td></td>
<td>Example: 10.</td>
</tr>
<tr>
<td><strong>Width</strong></td>

<tr>
<td><strong>Y</strong></td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the symbols (_rotation_symbol_) to other positions in the editor.

**Element property 'Colors'**

The properties contain fixed values for setting colors.
### “Color”
Color for the element in its normal state. Please note that the normal state is in effect if the expression in the “Color variables ➔ Toggle color” property is not defined or it has the value `FALSE`.

### “Alarm color”
Color for the element in alarm state. Please note that the alarm state is in effect if the expression in the “Color variables ➔ Toggle color” property has the value `TRUE`.

### “Transparency”
Value (0 to 255) for defining the transparency of the selected color. Example 255: The color is opaque. 0: The color is completely transparent.

### “Use gradient color”
[ ]: The element is displayed with a color gradient.

### “Gradient setting”
The “Color gradient editor” dialog box opens.

---

#### See also

### Element property ‘Image’

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Static ID”</td>
<td>Reference to an image in an image pool of the format <code>&lt;name of image pool&gt;_&lt;image ID&gt;</code> (example: <code>image_pool.GreenButton</code>). If the image is from the “GlobalImagePool”, then you can omit the name of the image pool because CODESYS always searches this pool first. The “Input Assistant” dialog box opens and lists all available image pools and images in the entire project.</td>
</tr>
<tr>
<td>“Scale type”</td>
<td>Behavior of the image when resizing the button.</td>
</tr>
<tr>
<td></td>
<td>● “Isotropic”: The image retains its proportions. The ratio of height to width is retained, even if you change the height or width of the button separately.</td>
</tr>
<tr>
<td></td>
<td>● “Anisotropic”: The image resizes to the dimensions of the button.</td>
</tr>
<tr>
<td></td>
<td>● “Fixed”: The image retains its original size, even if you change the size of the button.</td>
</tr>
<tr>
<td>“Transparency”</td>
<td>The visualization displays the image with the transparency color that is selected in “Transparency color”.</td>
</tr>
<tr>
<td>“Transparency color”</td>
<td>Color that is transparent in the image (example: “White”). If the image background that is reference by “Static ID” is white, then this background is displayed transparent. Clicking opens a color selection dialog. Requirement: The “Transparency” option is activated.</td>
</tr>
<tr>
<td>“Horizontal alignment”</td>
<td>Horizontal alignment of the image</td>
</tr>
<tr>
<td></td>
<td>● “Left”</td>
</tr>
<tr>
<td></td>
<td>● “Centered”</td>
</tr>
<tr>
<td></td>
<td>● “Right”</td>
</tr>
<tr>
<td>“Vertical alignment”</td>
<td>Vertical alignment of the image</td>
</tr>
<tr>
<td></td>
<td>● “Top”</td>
</tr>
<tr>
<td></td>
<td>● “Centered”</td>
</tr>
<tr>
<td></td>
<td>● “Bottom”</td>
</tr>
</tbody>
</table>

---

### Element property ‘Texts’
The properties contains character strings for labeling the element. The character string can also contain a placeholder with a format definition. In runtime mode, the placeholder is replaced by the current value in the specified format.
CODESYS accepts the specified texts automatically into the “GlobalTextList” text list. Therefore, these texts can be localized.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Text”</td>
<td>Character string (without single straight quotation marks) for the labeling the element. Add a line break by pressing the keyboard shortcut [Ctrl] + [Enter]. Example: Accesses: %i. The variable that contains the current value for the placeholder is specified in the property “Text variable ➤ Text”.</td>
</tr>
<tr>
<td>“Tooltip”</td>
<td>Character string (without single straight quotation marks) that is displayed as the tooltip of an element. Example: Number of valid accesses. The variable that contains the current value for the placeholder is specified in the property “Text variable ➤ Tooltip”.</td>
</tr>
</tbody>
</table>

See also
- “Element property ‘Text variables’” on page 3094
- Chapter 6.4.5.5 “Designing a visualization with elements” on page 2872
- Chapter 6.4.5.20.2 “Placeholders with Format Definition in the Output Text” on page 3329

**Element property ‘Text properties’**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Horizontal alignment”</td>
<td>Horizontal alignment of the text within the element.</td>
</tr>
<tr>
<td>“Vertical alignment”</td>
<td>Vertical alignment of the text within the element.</td>
</tr>
</tbody>
</table>
| “Text format” | Definition for displaying texts that are too long  
  - “Default”: The long text is truncated.  
  - “Line break”: The text is split into parts.  
  - “Ellipsis”: The visible text ends with “...” indicating that it is not complete. |
| “Font” | Example: “Default”  
  - The “Font” dialog box opens.  
  - ▼: Drop-down list with style fonts. |
| “Font color” | Example: “Black”  
  - The “Color” dialog box opens.  
  - ▼: Drop-down list with style colors. |
| “Transparency” | Whole number (value range from 0 to 255). This determines the transparency of the respective color.  
  Example: 255: The color is opaque.  
  0: The color is completely transparent.  
  Please note: If the color is a style color and already has a transparency value, then this property is write-protected. |

**Element property ‘Absolute movement’**

The properties contain fixed values for the text properties.
### "Movement"

| **“X”** | Variable (numeric data type). Defines the X position (in pixels).  
Example: PLC_PRG.iPos_X.  
Increasing this value in runtime mode moves the element to the right. |
|---|---|
| **“Y”** | Variable (numeric data type). Defines the Y position (in pixels).  
Example: PLC_PRG.iPos_Y.  
Increasing this value in runtime mode moves the element downwards. |
| **“Rotation”** | Variable (numeric data type). Defines the angle of rotation (in degrees).  
Example: PLC_PRG.iAngle1.  
The midpoint of the element rotates at the “Center” point. This rotation point is shown as the \( + \) symbol.  
In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right. |
| **“Scaling”** | Variable (integer data type). Causes centric stretching.  
Example: PLC_PRG.iScaling.  
The reference point is the “Center” property.  
The value 1 shrinks the element by a factor of 0.001. The value 1000 returns the element to its original size. |

You can link the variables to a unit conversion.

The properties “X”, “Y”, “Rotation”, and “Interior rotation” are supported by the "Client Animation" functionality.

See also

- 

**Element property 'Relative movement'**

The properties contain variables for moving the element. The reference point is the position of the element ("Position" property). The shape of the element can change.

### "Movement top-left"

| **“X”** | Variable (integer data type). It contains the number (in pixels) that the left edge is moved horizontally. Incrementing the value moves the element to the right.  
Example: PLC_PRG.iDeltaX |
|---|---|
**“Y”**  
Variable (integer data type). It contains the number (in pixels) that the top edge is moved vertically. Incrementing the value moves the element to the down.  
Example: PLC_PRG.iDeltaY

**“Movement bottom-right”**

**“X”**  
Variable (integer data type). It contains the number (in pixels) that the right edge is moved horizontally. Incrementing the value moves the element to the right.  
Example: PLC_PRG.iDeltaWidth

**“Y”**  
Variable (integer data type). It contains the number (in pixels) that the bottom edge is moved vertically. Incrementing the value moves the element to the down.  
Example: PLC_PRG.iDeltaHeight

See also  
- “Element property ‘Absolute movement’” on page 3016

**Element property ’Text variables’**  
These properties are variables with contents that replace a format definition.

**“Text variable”**  
Variable (data type compliant with the format definition). It contains what is printed instead of the format definition.  
Example: PLC_PRG.iAccesses  
Note: The format definition is part of the text in the property “Texts ➔ Text”.  
Note: If you specify a variable of type enumeration with text list support, then the name of the enumeration data type is added automatically in angle brackets after the variable name. Example: PLC_PRG.enVar <enumeration name>. Then the symbolic value of the enumeration component is printed instead of the numeric value when text is printed. Refer to the help page for the enumerations.

**“Tooltip variable”**  
Variable (data type compliant with the format definition). It contains what is printed instead of the format definition.  
Example: PLC_PRG.iAccessesInTooltip  
Note: The format definition is part of the text in the property “Texts ➔ Tooltip”.

See also

- “Element property ‘Texts’” on page 3091  
- Chapter 6.4.1.20.5.18 “Enumerations” on page 2263

**Element property ’Dynamic texts’**  
Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.
**“Text list”**

<table>
<thead>
<tr>
<th>Variable (string) or name of the text list as a fixed string in single straight quotation marks.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: ‘Errorlist’</td>
</tr>
<tr>
<td>▼: Drop-down list with the dialogs available in the text lists.</td>
</tr>
</tbody>
</table>

**“Text index”**

<table>
<thead>
<tr>
<th>Text list ID. This refers to the desired output text.</th>
</tr>
</thead>
<tbody>
<tr>
<td>● As fixed string with the ID in single straight quotation marks.</td>
</tr>
<tr>
<td>Example: ‘1’</td>
</tr>
<tr>
<td>● As a variable (STRING) for dynamically controlling the text output.</td>
</tr>
<tr>
<td>Example: strTextID</td>
</tr>
<tr>
<td>Sample assignment: PLC_PRG.strTextID := '1';</td>
</tr>
</tbody>
</table>

**“Tooltip index”**

<table>
<thead>
<tr>
<th>Text list ID. This refers to the desired output text.</th>
</tr>
</thead>
<tbody>
<tr>
<td>● As fixed string with the ID in single straight quotation marks.</td>
</tr>
<tr>
<td>Example: ‘2’</td>
</tr>
<tr>
<td>● As a variable (STRING) for dynamically controlling the text output.</td>
</tr>
<tr>
<td>Example: strToolTipID</td>
</tr>
<tr>
<td>Sample assignment: PLC_PRG.strToolTipID := '2';</td>
</tr>
</tbody>
</table>

See also
- % Chapter 6.4.1.21.2.28 “Object 'Text List’” on page 2532

**Element property 'Font variables’**

<table>
<thead>
<tr>
<th>Variable (STRING). Includes the font of the text.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: PLC_PRG.stFontVar := 'Arial';</td>
</tr>
<tr>
<td>The selection of fonts corresponds to the default “Font” dialog.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name.</th>
</tr>
</thead>
<tbody>
<tr>
<td>● &lt;pt&gt;: Points (default)</td>
</tr>
<tr>
<td>Example: PLC_PRG.iFontHeight &lt;pt&gt; Code: iFontHeight : INT := 12;</td>
</tr>
<tr>
<td>● &lt;px&gt;: Pixels</td>
</tr>
<tr>
<td>Example: PLC_PRG.iFontHeight &lt;px&gt; Code: iFontHeight : INT := 19;</td>
</tr>
</tbody>
</table>

If you click in the value field, a drop-down list opens on the right for setting the unit.

Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property “Text property ➔ Font”. 
### Flags
Variable (DWORD). Contains the flags for displaying fonts.

- 1: Italics
- 2: Bold
- 4: Underline
- 8: Strikethrough

Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: `PLC_PRG.dwFontType := 6;`

### Character set
Variable (DWORD). Contains a character set number for the font.

The selection of character set numbers corresponds to the “Script” setting of the standard “Font” dialog.

### Color
Variable (DWORD). Includes the color of the text.

Example: `PLC_PRG.dwColorFont := 16#FF000000;`

### Flags for text alignment
Variable (integer data type). Contains the coding for text alignment.

- 0: Top left
- 1: Horizontal center
- 2: Right
- 4: Vertical center
- 8: Bottom

Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: `PLC_PRG.dwFontType := 5;`

---

Fixed values for displaying texts are set in "Text properties".

See also

- § “Element property 'Text properties'” on page 3092

Element property 'Color variables'

The Element property is used as an interface for project variables to dynamically control colors at runtime.
### "Toggle color"

The property controls the toggled color at runtime.

**Value assignment:**
- **FALSE**: The element is displayed with the color specified in the "Color" property.
- **TRUE**: The element is displayed with the color specified in the "Alarm color" property.

**Assigning the property:**
- Placeholder for the user input variable
  - "<toggle/tap variable>"
  - "<NOT toggle/tap variable>"

The color change is not controlled by its own variable, but by a user input variable.

**Note:** Specify a variable for the mouse events "Tap" or "Toggle" in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both "Toggle" and "Tap", then the variable specified in "Tap" is used.

**Hint:** Click the symbol to insert the placeholder "<toggle/tap variable>". When you activate the "Input configuration", "Tap FALSE" property, then the "<NOT toggle/tap variable>" placeholder is displayed.

**Instance path of a project variable (BOOL)**

Example: PLC_PRG.xColorIsToggeled

**Note:** In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.

### "Color"

Color variable for the Frame

- **Variable (DWORD) for the color**
  - Example: PLC_PRG.dwColor
- **Color literal**
  - Example of gray and opaque: 16#FF888888

**Requirement:** "Show Frame" property is activated.

Please note that the normal state is in effect if the expression in the "Colorvariables → Toggle color" property is not defined or it has the value FALSE.

### "Alarm color"

Color variable for the Frame in alarm state

- **Variable (DWORD) for the alarm color**
  - Example: PLC_PRG.dwAlarmColor
- **Color literal**
  - Example of red and opaque: 16#FFFF0000

Please note that the alarm state is in effect if the expression in the "Colorvariables → Toggle color" property has the value TRUE.

---

**The transparency part of the color value is evaluated only if the "Activate semi-transparent drawing" option of the visualization manager is selected.**

**Select the “Advanced” option in the toolbar of the properties view. Then all element properties are visible.**
The variables control the element behavior dynamically.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Invisible&quot;</td>
<td>Variable (BOOL). Toggles the visibility of the element.</td>
</tr>
<tr>
<td></td>
<td>TRUE: The element is not visible at runtime.</td>
</tr>
<tr>
<td>Example: bIsVisible with var bIsVisible : BOOL := FALSE; end_var</td>
<td></td>
</tr>
<tr>
<td>&quot;Deactivate inputs&quot;</td>
<td>Variable (BOOL). Toggles the operability of the element.</td>
</tr>
<tr>
<td></td>
<td>TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated.</td>
</tr>
</tbody>
</table>

The "Invisible" property is supported by the "Client Animation" functionality.

**Element property 'State variables'**

- **"Digital variable"**
  - At runtime, the property controls whether the Button is displayed as pressed or not.
  - Values:
    - FALSE: The Button is displayed as not pressed.
    - TRUE: The Button is displayed as pressed.
  - Argument passed to the property:
    - Placeholder for the user input variable to couple the representation of the Button with the input variable.
      - "<toggle/tap variable>"
      - "<NOT toggle/tap variable>"
    - Note: Specify a variable for the mouse events "Tap" or "Toggle" in the input configuration of the Button. Only then is the placeholder set. If you configure a variable in both "Toggle" and "Tap", then the variable specified in "Tap" is used.
    - Hint: Click the symbol to insert the placeholder "<toggle/tap variable>". When you activate the "Inputconfiguration", "Tap FALSE" property, then the "<NOT toggle/tap variable>" placeholder is displayed.
    - Instance path of a project variable (BOOL)
      - Example: prgA.xButtonState
      - Note: Implement a value assignment in the code for the variable specified here.

**Element property 'Image ID variable'**
"Image ID"  
Variable (STRING). Contains the image ID. The contents of the string corresponds to the description of the "Static ID" property.
Example: PLC_PRG.stImageID := 'ImagePool_A.Image3';

See also
- Chapter 6.4.5.20.1.5 “Visualization Element 'Image’” on page 3038
- Chapter 6.4.1.21.2.15 “Object 'Image Pool’” on page 2468

These properties are available only when you have selected the “Support client animations and overlay of native elements” option in the Visualization Manager.

"Animation duration"  
Defines the duration (in milliseconds) in which the element runs an animation
- Variable (integer value)
  Example: Menu.tContent with VAR tContent : INT := 500; END_VAR
- Integer literal
  Example: 500

Animatable properties
- “Absolute movement”, “Movement”, “X”, “Y”
- “Absolute movement”, “Rotation”
- “Absolute movement”, “Interior rotation”
- “Absolute movement”, “Exterior rotation”
The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.

"Move to foreground"  
Moves the visualization element to the foreground
Variable (BOOL)
Example: bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR
TRUE: At runtime, the visualization element is displayed in the foreground.
FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Input configuration'
The properties contain the configurations for the user input when using the mouse or keyboard. A user input defines an event and one or more actions that are executed when an event occurs.
The “Configure” button opens the “Input Configuration” dialog. There you can create or edit user inputs. Configured user inputs are listed below the events. They each include the action that is triggered and the setting in short form.
Example: “Execute ST Code”: PLC_PRG.i_x := 0;

"OnDialogClosed"  
Input event: The user closes the dialog.

"OnMouseClicked"  
Input event: The user clicks the mouse button completely in the element area. The mouse button is clicked and released.

"OnMouseDown"  
Input event: The user clicks down on the mouse button.

"OnMouseEnter"  
Input event: The user drags the mouse pointer to the element.

"OnMouseLeave"  
Input event: The user drags the mouse pointer away from the element.
<table>
<thead>
<tr>
<th>“OnMouseMove”</th>
<th>Input event: The user moves the mouse pointer over the element area.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“OnMouseUp”</td>
<td>Input events:</td>
</tr>
<tr>
<td></td>
<td>● The user releases the mouse button within the element area. It is irrelevant whether the user has previously pressed the mouse button inside or outside the element area.</td>
</tr>
<tr>
<td></td>
<td>● The user presses the mouse button within the element area, leaves the element area, and then releases the mouse button.</td>
</tr>
<tr>
<td></td>
<td>Note: This CODESYS-specific triggering behavior guarantees that actions for key elements are completed. A key element starts an action for “OnMouseDown” and ends the action for “OnMouseUp”.</td>
</tr>
<tr>
<td></td>
<td>Example: A visualization user presses the mouse button within the element area of the key element and then moves the cursor position so that it lies outside the element area. The action is ended anyway because “OnMouseUp” is triggered.</td>
</tr>
</tbody>
</table>

| “Tap” | When a mouse click event occurs, the variable defined in “Variable” is described in the application. The coding depends on the “Tap FALSE” and “Tap on enter if captured” options. |
| “Variable” | Variable (BOOL) that is set on mouse click event. |
| Example: FLC_PRG.bIsTapped | TRUE: A mouse click event exists. It lasts as long as the user presses the mouse button over the element. It ends when the button is released. |
| | FALSE: A mouse click event does not exist. |
| Requirement: The “Tap FALSE” option is not activated. |

| “Tap FALSE” | ☑: The mouse click event leads to a complementary value in “Variable”. |
| | TRUE: A mouse click event does not exist. |
| | FALSE: While the mouse click event exists. |

| “Tap on enter if captured” | ☑: During user input, it is also taken into consideration whether the mouse pointer is dragged within the element area or not while the mouse button is pressed. |
| | TRUE: While the mouse click event exists and the mouse pointer is moved over the element area. |
| | FALSE: A mouse click event does not exist. Or the user moves the mouse pointer outside of the element area while the mouse button is pressed. |
| | The value is TRUE again as soon as the user moves the pointer back to the element area. The mouse is then captured. |

| “Toggle” | With the onset of a mouse click event, the variable is set; when the mouse click event is completed, the variable is reset. |
| “Variable” | Variable (BOOL). Its value toggled when the mouse click event is ended. This is when the user releases the mouse button while the mouse pointer is over the element area. |
| If the user releases the mouse button while the mouse pointer is outside of the element area, then the mouse click event is not ended and the value is not toggled. |
| Hint: The user can cancel a started toggle input by dragging the mouse pointer out of the element area. |

| “Toggle on up if captured” | ☑: The value toggles regardless of where the mouse pointer is when the mouse button is released. The mouse is then captured. |
**“Hotkey”**
Keyboard shortcut on the element for triggering specific input actions.
When the keyboard shortcut event occurs, the input actions in the “Events” property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.

**“Key”**
Key pressed for input action.
Example: [T]
Note: The following properties appear when a key is selected.

**“Events”**
- “None”
- “Mouse down”: Pressing the key triggers the input actions that are configured in the “OnMouseDown” property.
- “Mouse up”: Releasing the key triggers the input actions that are configured in the “OnMouseUp” property.
- “Mouse down/up”: Pressing and releasing the key triggers the input actions that are configured in the “OnMouseDown” property and the “OnMouseUp” property.

**“Shift”**
☑: Combination with the Shift key
Example: [Shift]+[T].

**“Control”**
☑: Combination with the Ctrl key
Example: [Ctrl]+[T].

**“Alt”**
☑: Combination with the Alt key
Example: [Alt]+[T].

All keyboard shortcuts and their actions that are configured in the visualization are listed on the “Keyboard Configuration” tab.

- ☼ Chapter 6.4.5.21.2.2 “Command ‘Keyboard Configuration’” on page 3341
- ☼ Chapter 6.4.5.21.3.6 “Dialog ‘Input Configuration’” on page 3370

**Element property ‘Access rights’**
Requirement: User management is set up for the visualization.

**“Access rights”**
Opens the “Access rights” dialog. There you can edit the access privileges for the element.
Status messages:
- “Not set. Full rights.”: Access rights for all user groups: “operable”
- “Rights are set: Limited rights”: Access is restricted for at least one group.

See also
- ☼ Chapter 6.4.5.21.3.1 “Dialog ‘Access Rights’” on page 3366

**Visualization Element ‘Group Box’**
Symbol:
Category: “Common Controls”

The element provides a visual grouping of visualization elements. The group box can have multiple levels of nesting.

You can also use drag&drop to add elements to a “Group Box”. To do this, drag the element to the window area of the “Group Box”. The appearance of the cursor changes (a small plus sign is displayed). When you click the [Shift] key at the same time, the element is not added.

You can remove elements from the “Group Box” by dragging them out of the window area.

Element properties

<table>
<thead>
<tr>
<th>“Element name”</th>
<th>Example: Parameter axis 1</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Optional</td>
</tr>
<tr>
<td></td>
<td>Hint: Assign individual names for elements so that they are found faster in the element list.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Type of element”</th>
<th>“Group Box”</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Clipping”</td>
<td>[ ]: Elements that protrude beyond the size of the group box are clipped.</td>
</tr>
</tbody>
</table>

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

| “X”                     | X coordinate of the upper left corner of the element |
|                        | Specified in pixels.  |
|                        | Example: 10.          |

| “Y”                     | Y coordinate of the upper left corner of the element |
|                        | Specified in pixels.  |
|                        | Example: 10.          |

| “Width”                 | Specified in pixels.  |
|                        | Example: 150          |

| “Height”                | Specified in pixels.  |
|                        | Example: 30           |

You can also change the values by dragging the box symbols (mouseover) to other positions in the editor.

See also

- Chapter 6.4.5.5.3 “Positioning the Element, Adapting Size and Layer” on page 2874

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.
The properties contain character strings for labeling the element.

CODESYS accepts the specified texts automatically into the “GlobalTextList” text list. Therefore, these texts can be localized.

**Element property 'Texts'**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Text”</td>
<td>Character string (without single straight quotation marks) for labeling the element. Example: Axis 1.</td>
</tr>
<tr>
<td>“Tooltip”</td>
<td>Character string (without single straight quotation marks) that is displayed as the tooltip of an element. Example: Parameters of Axis 1.</td>
</tr>
</tbody>
</table>

See also

- Chapter 6.4.5.5 “Designing a visualization with elements” on page 2872

The properties contain fixed values for the text properties.

**Element property 'Text properties'**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| “Font”    | Example: “Default”

- The “Font” dialog box opens.
- ▼: Drop-down list with style fonts.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| “Font color” | Example: “Black”

- The “Color” dialog box opens.
- ▼: Drop-down list with style colors.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| “Transparency” | Whole number (value range from 0 to 255). This determines the transparency of the respective color.

- Example: 255: The color is opaque.
- 0: The color is completely transparent.

Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
"Movement"

- **X** variable (numeric data type). Defines the X position (in pixels).

  Example: PLC_PRG.iPos_X.

  Increasing this value in runtime mode moves the element to the right.

- **Y** variable (numeric data type). Defines the Y position (in pixels).

  Example: PLC_PRG.iPos_Y.

  Increasing this value in runtime mode moves the element downwards.

- **Rotation** variable (numeric data type). Defines the angle of rotation (in degrees).

  Example: PLC_PRG.iAngle1.

  The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.

  In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

- **Scaling** variable (integer data type). Causes centric stretching.

  Example: PLC_PRG.iScaling.

  The reference point is the “Center” property.

  The value 1 shrinks the element by a factor of 0.001. The value 1000 returns the element to its original size.

- **Interior rotation** variable (numeric data type). Defines the angle of rotation (in degrees).

  Example: PLC_PRG.iAngle2.

  In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

  The rotation point is shown as the symbol.

  Note: If a static angle of rotation is specified in the property “Position Angle”, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

You can link the variables to a unit conversion.

The properties “X”, “Y”, “Rotation”, and “Interior rotation” are supported by the "Client Animation" functionality.
### Element property 'State variables'

The variables control the element behavior dynamically.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
</table>
| **"Invisible"** | Variable (BOOL). Toggles the visibility of the element.  
**Example:** bIsVisible with VAR bIsVisible : BOOL := FALSE; END_VAR  
**TRUE:** The element is not visible at runtime.  
**Example:** TRUE  
**FALSE:** The element is visible at runtime. |
| **"Deactivate inputs"** | Variable (BOOL). Toggles the operability of the element.  
**Example:** FALSE  
**TRUE:** User inputs do not have any effect in runtime more. The element is shown as deactivated. |

The ‘Invisible’ property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the “Support client animations and overlay of native elements” option in the Visualization Manager.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| **"Animation duration"** | Defines the duration (in milliseconds) in which the element runs an animation  
**Variable (integer value)**  
**Example:** Menu.tContent with VAR tContent : INT := 500; END_VAR  
**Integer literal**  
**Example:** 500  
Animatable properties  
• “Absolute movement”, “Movement”, “X”, “Y”  
• “Absolute movement”, “Rotation”  
• “Absolute movement”, “Interior rotation”  
• “Absolute movement”, “Exterior rotation”  
The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth. |
| **"Move to foreground"** | Moves the visualization element to the foreground  
**Variable (BOOL)**  
**Example:** bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR  
**TRUE:** At runtime, the visualization element is displayed in the foreground.  
**FALSE:** At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor. |

- Chapter 6.4.5.5 “Designing a visualization with elements” on page 2872
**Visualization Element 'Table'**

Symbol: ![Table symbol]

Category: “Common Controls”

The element displays data that can be represented as an array in a table. Therefore, the data type of the visualizing variable can be 1) a one-dimensional array, 2) a maximum two-dimensional array, 3) an array of an array, 4) an array of structures, or 5) an array of a function block.

### Element properties

<table>
<thead>
<tr>
<th><strong>“Element name”</strong></th>
<th>Example: Data set component 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Optional</td>
<td>Hint: Assign individual names for elements so that they are found faster in the element list.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>“Type of element”</strong></th>
<th>Table</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Array whose data is visualized as a table</td>
</tr>
</tbody>
</table>

**“Data array”**

Variable (ARRAY) whose data type determines the number of columns and rows in the table

**Array types**

- One-dimensional array: The table has one column.
- Two-dimensional array: The second dimension determines the number of columns.
- Array of an array: The number of array elements of the back array determines the number of columns.
- Array of a structure: The number of structure members determines the number of columns.
- Array of a function block: The number of local variables determines the number of columns.

**Example:**

```plaintext
PLC_PRG.aiTable

Declaration: aiTable : ARRAY[0..3, 0..4] OF INT := [4(1, 2, 3, 4, 5)];
```

**Hint:** If the declaration of the array changes, then the table can be refreshed by placing the cursor in the data array value field and pressing the [Enter] key.

<table>
<thead>
<tr>
<th><strong>“Max. array index”</strong></th>
<th>Top index limit for the displayed table. Limits the number of displayed rows. The index begins at 0.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Variable (integer data type)</td>
</tr>
<tr>
<td></td>
<td>Example: PLC_PRG.iUpperIndexBoundToDisplay</td>
</tr>
<tr>
<td></td>
<td>Integer literal</td>
</tr>
<tr>
<td></td>
<td>Example: 4 is displayed as 5 in the row of the table.</td>
</tr>
</tbody>
</table>

See also

- **Data Type ‘ARRAY’**
The "Table" element shows the values of a variable in a tabular view. The array elements of structure members are shown in a column or in a row. Two-dimensional arrays or arrays of a structure are shown in multiple columns. The visualized variable is defined in the "Data array" property. When a variable is assigned there, you can specify the display of the Table columns where the array elements are shown. An individual configuration is possible for each column that is assigned to an index [<n>].

<table>
<thead>
<tr>
<th>Configuration</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Show row header&quot;</td>
<td>The row header is visible. Example: For an array, the index of the array element is displayed in the header.</td>
</tr>
<tr>
<td>&quot;Show column header&quot;</td>
<td>The column label is visible.</td>
</tr>
<tr>
<td>&quot;Row height&quot;</td>
<td>Height of the rows (in pixels)</td>
</tr>
<tr>
<td>&quot;Row header width&quot;</td>
<td>Width of the row label</td>
</tr>
<tr>
<td>&quot;Scroll bar size&quot;</td>
<td>Size of the scroll bar (in pixels)</td>
</tr>
</tbody>
</table>

Table 630: "Element property 'Columns: Column [<n>]'

<table>
<thead>
<tr>
<th>Configuration</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Column header&quot;</td>
<td>By default, the name of the array or structure is applied as the heading with the index or structure member for the column. If an array of a function block has been selected for &quot;Data array&quot;, then the name of the array is applied to the column header with the local variables of the function block that belong to the column. The column label can be changed here by specifying a new title.</td>
</tr>
<tr>
<td>&quot;Width&quot;</td>
<td>Column width (in pixels)</td>
</tr>
<tr>
<td>&quot;Image column&quot;</td>
<td>Images can be displayed in the column. Images are used from the global image pool or custom image pools. The image IDs are shown in the cells of the Table as they are defined in the image pool.</td>
</tr>
<tr>
<td>&quot;Image configuration&quot;</td>
<td></td>
</tr>
<tr>
<td>&quot;Fill mode&quot;</td>
<td>● Fill cell: The image resizes to the dimensions of the cell without fixing the height/width ratio. ● Centered: The image is centered in the cell and retains its proportions (height/width ratio).</td>
</tr>
<tr>
<td>&quot;Transparency&quot;</td>
<td>The color which is specified in &quot;Transparent color&quot; is displayed as transparent.</td>
</tr>
<tr>
<td>&quot;Transparent color&quot;</td>
<td>This color is displayed as transparent. Requirement: The &quot;Transparency&quot; property is activated.</td>
</tr>
<tr>
<td>&quot;Text alignment of header&quot;</td>
<td>Alignment of the column header: ● Left ● Centered ● Right</td>
</tr>
<tr>
<td>&quot;Use template&quot;</td>
<td>Another visualization element (type &quot;Rectangle&quot;, &quot;Rounded Rectangle&quot;, or &quot;Ellipse&quot;) is inserted into each line of this Table column. The properties list is extended automatically with the properties of this element in &quot;Template&quot;.</td>
</tr>
<tr>
<td>&quot;Text alignment of the headline from the template&quot;</td>
<td>Requirement: The &quot;Use template&quot; property is activated.</td>
</tr>
</tbody>
</table>
| "Template" | Requirement: The "Use template" property is activated. The properties of all elements assigned to the column are listed in "Template". They can be modified there as described in "Rectangle", "Rounded Rectangle", and "Ellipse"."
The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

**Element property 'Position'**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>X</td>
<td>X coordinate of the upper left corner of the element</td>
<td>10</td>
</tr>
<tr>
<td>Y</td>
<td>Y coordinate of the upper left corner of the element</td>
<td>10</td>
</tr>
<tr>
<td>Width</td>
<td>Specified in pixels.</td>
<td>150</td>
</tr>
<tr>
<td>Height</td>
<td>Specified in pixels.</td>
<td>30</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the box symbols ([]) to other positions in the editor.

**Element property 'Center'**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>X</td>
<td>X-coordinate of the point of rotation</td>
</tr>
<tr>
<td>Y</td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the symbols (ø) to other positions in the editor.

**Element property 'Text properties'**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Horizontal alignment</td>
<td>Horizontal alignment of the text within the element.</td>
</tr>
<tr>
<td>Vertical alignment</td>
<td>Vertical alignment of the text within the element.</td>
</tr>
</tbody>
</table>
### “Font”

<table>
<thead>
<tr>
<th>Example: “Default”</th>
</tr>
</thead>
<tbody>
<tr>
<td>The “Font” dialog box opens.</td>
</tr>
<tr>
<td>▼: Drop-down list with style fonts.</td>
</tr>
</tbody>
</table>

### “Font color”

<table>
<thead>
<tr>
<th>Example: “Black”</th>
</tr>
</thead>
<tbody>
<tr>
<td>The “Color” dialog box opens.</td>
</tr>
<tr>
<td>▼: Drop-down list with style colors.</td>
</tr>
</tbody>
</table>

### “Transparency”

Whole number (value range from 0 to 255). This determines the transparency of the respective color.

| Example: 255: The color is opaque. |
| 0: The color is completely transparent. |

Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

#### Element property 'Dynamic texts'

Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.

### “Text list”

| Variable (string) or name of the text list as a fixed string in single straight quotation marks. |
| Example: 'Errorlist' |
| ▼: Drop-down list with the dialogs available in the text lists. |

### “Text index”

Text list ID. This refers to the desired output text.

- As fixed string with the ID in single straight quotation marks.
  - Example: '1' |
- As a variable (STRING) for dynamically controlling the text output.
  - Example: strTextID |
  - Sample assignment: PLC_PRG.strTextID := '1'; |

### “Tooltip index”

Text list ID. This refers to the desired output text.

- As fixed string with the ID in single straight quotation marks.
  - Example: '2' |
- As a variable (STRING) for dynamically controlling the text output.
  - Example: strToolTipID |
  - Sample assignment: PLC_PRG.strToolTipID := '2'; |

### Element property 'Font variables'

The variables enable dynamic control of the text display.

### “Font name”

| Variable (STRING). Includes the font of the text. |
| Example: PLC_PRG.stFontVar := 'Arial'; |

The selection of fonts corresponds to the default “Font” dialog box.

### “Size”

| Variable (integer data type). Contains the font size (in pixels). |
| Example: PLC_PRG.iFontHeight := 16; |

The selection of font sizes corresponds to the default “Font” dialog box.
### “Flags”

Variable (DWORD). Contains the flags for displaying fonts.

**Flags:**
- 1: Italics
- 2: Bold
- 4: Underline
- 8: Strikethrough

Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: `PLC_PRG.dwFontType := 6;`

### “Charset”

Variable (DWORD). Contains a character set number for the font.

The selection of character set numbers corresponds to the “Script” setting of the standard “Font” dialog box.

### “Color”

Variable (DWORD). Includes the color of the text.

Example: `PLC_PRG.dwColorFont := 16#FF000000;`

### “Flags for text alignment”

Variable (integer data type). Contains the coding for text alignment.

Example: `PLC_PRG.dwTextAlignment.

Coded:
- 0: Top left
- 1: Horizontal center
- 2: Right
- 4: Vertical center
- 8: Bottom

Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: `PLC_PRG.dwFontType := 5;`

---

**Fixed values for displaying texts are set in “Text properties”.

See also
- "Element property ‘Text properties’” on page 3116

**Element property ‘Absolute movement’**

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

### “Movement”

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>X</td>
<td>Variable (numeric data type). Defines the X position (in pixels). Example: <code>PLC_PRG.iPos_X</code>. Increasing this value in runtime mode moves the element to the right.</td>
</tr>
<tr>
<td>Y</td>
<td>Variable (numeric data type). Defines the Y position (in pixels). Example: <code>PLC_PRG.iPos_Y</code>. Increasing this value in runtime mode moves the element downwards.</td>
</tr>
</tbody>
</table>
| **“Rotation”** | Variable (numeric data type). Defines the angle of rotation (in degrees).  
**Example:** `PLC_PRG.iAngle1`.  
The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.  
In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right. |
| --- | --- |

| **“Interior rotation”** | Variable (numeric data type). Defines the angle of rotation (in degrees).  
**Example:** `PLC_PRG.iAngle2`.  
In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.  
The rotation point is shown as the symbol.  
**Note:** If a static angle of rotation is specified in the “Position Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed. |
| --- | --- |

You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.

Element property 'State variables'

| **“Invisible”** | Variable (BOOL). Toggles the visibility of the element.  
**TRUE:** The element is not visible at runtime.  
**Example:**  
`bIsVisible with VAR bIsVisible : BOOL := FALSE;`  
`END_VAR` |
| --- | --- |

| **“Deactivate inputs”** | Variable (BOOL). Toggles the operability of the element.  
**TRUE:** User inputs do not have any effect in runtime more. The element is shown as deactivated. |
Element property ‘Selection’

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Background color on selection”</td>
<td>Fill color of the selected row.</td>
</tr>
<tr>
<td>“Selection font color”</td>
<td>Font color of the selected row.</td>
</tr>
<tr>
<td>“Selection type”</td>
<td>Selection when clicking the table row.</td>
</tr>
<tr>
<td></td>
<td>- No selection: <strong>No selection</strong></td>
</tr>
<tr>
<td></td>
<td>- Cell selection: <strong>The clicked cell only</strong></td>
</tr>
<tr>
<td></td>
<td>- Row selection: <strong>Row of the clicked cell</strong></td>
</tr>
<tr>
<td></td>
<td>- Column selection: <strong>Column of the clicked cell</strong></td>
</tr>
<tr>
<td></td>
<td>- Row and column selection: <strong>Row and column of the clicked cell</strong></td>
</tr>
<tr>
<td>“Frame around selected cells”</td>
<td>☑: A frame is drawn around the selected cells.</td>
</tr>
<tr>
<td>“Variable for selected column”</td>
<td>Variable (INT). Contains the array index of the “Column” of the selected cell. If the data array points to a structure, then the structure components are indexed, starting at 0. Warning: This index represents the correct position in the array only if no columns have been removed from the table in the display.</td>
</tr>
<tr>
<td>“Variable for selected row”</td>
<td>Variable (INT). Contains the array index of the “Row” of the selected cell.</td>
</tr>
<tr>
<td>“Variable for valid column selection”</td>
<td>Variable (BOOL). TRUE: The “Variable for selected column” variable contains a valid value.</td>
</tr>
</tbody>
</table>

These properties are available only when you have selected the “Support client animations and overlay of native elements” option in the Visualization Manager.
### “Animation duration”
Defines the duration (in milliseconds) in which the element runs an animation

- **Variable (integer value)**
  - **Example:** Menu.tContent with
    ```
    VAR tContent : INT := 500;
    END_VAR
    ```
- **Integer literal**
  - **Example:** 500

#### Animatable properties
- “Absolute movement”, “Movement”, “X”, “Y”
- “Absolute movement”, “Rotation”
- “Absolute movement”, “Interior rotation”
- “Absolute movement”, “Exterior rotation”

The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.

### “Move to foreground”
Moves the visualization element to the foreground

**Variable (BOOL)**

**Example:** bIsInForeground with
```
VAR bIsInForeground : BOOL := FALSE; END_VAR
```

- **TRUE:** At runtime, the visualization element is displayed in the foreground.
- **FALSE:** At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

#### Element property 'Access rights'

**Requirement:** User management is set up for the visualization.

### “Access rights”
Opens the “Access rights” dialog. There you can edit the access privileges for the element.

**Status messages:**
- “Not set. Full rights.”: Access rights for all user groups: “operable”
- “Rights are set: Limited rights”: Access is restricted for at least one group.

See also
- % Chapter 6.4.5.5 “Designing a visualization with elements” on page 2872
- % Chapter 6.4.5.11.2 “Displaying Array Variables in Tables” on page 2917
- Data Type 'ARRAY'

#### Visualization Element 'Text Field'

**Symbol:**

**Category:** “Common Controls”
The element is used for the following purposes:

- Static output of text. The contents of a variable can be part of the text.
- Showing a tooltip. The text is managed as static text and can also be defined so that the contents of a variable are also displayed.
- Dynamic output of text. Texts of a text list are displayed dynamically.
- Input of text. For example, a user can input a number or a text literal.

**Element properties**

<table>
<thead>
<tr>
<th>“Element name”</th>
<th>Optional</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: FileName_A</td>
<td>Hint: Assign individual names for elements so that they are found faster in the element list.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Type of element”</th>
<th>“Text Field”</th>
</tr>
</thead>
</table>

**Element property 'Position'**

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

<table>
<thead>
<tr>
<th>“X”</th>
<th>X coordinate of the upper left corner of the element</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Specified in pixels.</td>
</tr>
<tr>
<td>Example: 10</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Y”</th>
<th>Y coordinate of the upper left corner of the element</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Specified in pixels.</td>
</tr>
<tr>
<td>Example: 10</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Width”</th>
<th>Specified in pixels.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Example: 150</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Height”</th>
<th>Specified in pixels.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Example: 30</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the box symbols (_drag_2) to other positions in the editor.

**Element property 'Colors'**

<table>
<thead>
<tr>
<th>“Normal state”</th>
<th>The normal state is in effect if the variable in “Color variables ➔ Toggle color” is not defined or it has the value FALSE.</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>“Frame color”</th>
<th>Frame and fill color for the corresponding state of the variable.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>“Fill color”</td>
<td>Transparency value (0 to 255) for defining the transparency of the selected color. Example: 255: The color is opaque. 0: The color is completely transparent.</td>
</tr>
<tr>
<td>“Transparency”</td>
<td>Transparency value (0 to 255) for defining the transparency of the selected color. Example: 255: The color is opaque. 0: The color is completely transparent.</td>
</tr>
<tr>
<td>“Alarm state”</td>
<td>The alarm state is in effect if the variable in “Color variables” has the value TRUE.</td>
</tr>
</tbody>
</table>

### Element property 'Appearance'

The properties contain fixed values for setting the look of the element.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| “Line width”      | Value in pixels  
Example: 2  
Note: The values 0 and 1 both result in a line weight of 1 pixel. If no line should be displayed, then the “Line style” property must be set to the option “Invisible”. |
| “Fill attributes” | The way in which the element is filled.  
- “Filled”: The element is filled with the color from property “Colors”  
- “Invisible”: The fill color is invisible. |
| “Line style”      | Type of line representation  
- “Solid”  
- “Dashes”  
- “Dots”  
- “Dash Dot”  
- “Dash Dot Dot”  
- “not visible” |

You can assign variables in the “Appearance variables” property for controlling the appearance dynamically. The fixed values here are overwritten.

See also
- [“Element property 'Appearance variables’” on page 3064](#)

### Element property 'Texts'

The properties contain character strings for labeling the element. The character string can also contain a placeholder with a format definition. In runtime mode, the placeholder is replaced by the current value in the specified format.

CODESYS accepts the specified texts automatically into the “GlobalTextList” text list. Therefore, these texts can be localized.
### Element property 'Text variable'

- **Text**
  - Character string (without single straight quotation marks) for the labeling the element. Add a line break by pressing the keyboard shortcut [Ctrl] + [Enter].
  - **Example:** `Accesses: %i`

- **Tooltip**
  - Character string (without single straight quotation marks) that is displayed as the tooltip of an element.
  - **Example:** `Number of valid accesses`

</tr>
<tr>
<td></td>
<td><img src="#" alt="Font" /> Drop-down list with style colors.</td>
</tr>
<tr>
<td><strong>Transparency</strong></td>
<td>Whole number (value range from 0 to 255). This determines the transparency of the respective color.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> 255: The color is opaque.</td>
</tr>
<tr>
<td></td>
<td>0: The color is completely transparent.</td>
</tr>
<tr>
<td></td>
<td>Please note: If the color is a style color and already has a transparency value, then this property is write-protected.</td>
</tr>
</tbody>
</table>

### Element property 'Text variables'

These properties are variables with contents that replace a format definition.
"Text variable" | Variable (data type compliant with the format definition). It contains what is printed instead of the format definition.  
| Example: PLC_PRG.iAccesses  
| Note: The format definition is part of the text in the property “Texts ➔ Text”.  
| Note: If you specify a variable of type enumeration with text list support, then the name of the enumeration data type is added automatically in angle brackets after the variable name. Example: PLC_PRG.enVar <enumeration name>. Then the symbolic value of the enumeration component is printed instead of the numeric value when text is printed. Refer to the help page for the enumerations.  

"Tooltip variable" | Variable (data type compliant with the format definition). It contains what is printed instead of the format definition.  
| Example: PLC_PRG.iAccessesInTooltip  
| Note: The format definition is part of the text in the property “Texts ➔ Tooltip”.  

**See also**  
- `% Chapter 6.4.5.20.2 “Placeholders with Format Definition in the Output Text” on page 3329`  
- `% “Element property ‘Texts’” on page 3115`  
- `% Chapter 6.4.1.20.5.18 “Enumerations” on page 2263`  

**Element property ‘Dynamic texts’**  
Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.  

| "Text list" | Variable (string) or name of the text list as a fixed string in single straight quotation marks.  
| Example: 'Errorlist'  
| ▼: Drop-down list with the dialogs available in the text lists.  

| "Text index" | Text list ID. This refers to the desired output text.  
| As fixed string with the ID in single straight quotation marks.  
| Example: '1'  
| As a variable (STRING) for dynamically controlling the text output.  
| Example: strTextID  
| Sample assignment: PLC_PRG.strTextID := '1';  

| "Tooltip index" | Text list ID. This refers to the desired output text.  
| As fixed string with the ID in single straight quotation marks.  
| Example: '2'  
| As a variable (STRING) for dynamically controlling the text output.  
| Example: strToolTipID  
| Sample assignment: PLC_PRG.strToolTipID := '2';  

**See also**  
- `% Chapter 6.4.1.21.2.28 “Object ‘Text List’” on page 2532`  

**Element property ‘Font variables’**  
The variables allow for dynamic control of the text display.
### Font Name

Variable (STRING). Includes the font of the text.

Example: `PLC_PRG.stFontVar := 'Arial';`

The selection of fonts corresponds to the default "Font" dialog.

### Size

Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name.

- `<pt>`: Points (default)
  
  Example: `PLC_PRG.iFontHeight <pt>
  
  Code: `iFontHeight : INT := 12;`

- `<px>`: Pixels
  
  Example: `PLC_PRG.iFontHeight <px>
  
  Code: `iFontHeight : INT := 19;`

If you click in the value field, a drop-down list opens on the right for setting the unit.

Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property "Text property ➔ Font".

### Flags

Variable (DWORD). Contains the flags for displaying fonts.

Flags:

- 1: Italics
- 2: Bold
- 4: Underline
- 8: Strikethrough

Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: `PLC_PRG.dwFontType := 6;`

### Character set

Variable (DWORD). Contains a character set number for the font.

The selection of character set numbers corresponds to the "Script" setting of the standard "Font" dialog.

### Color

Variable (DWORD). Includes the color of the text.

Example: `PLC_PRG.dwColorFont := 16#FF000000;`

### Flags for text alignment

Variable (integer data type). Contains the coding for text alignment.

Example: `PLC_PRG.dwTextAlignment`

Coding:

- 0: Top left
- 1: Horizontal center
- 2: Right
- 4: Vertical center
- 8: Bottom

Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: `PLC_PRG.dwFontType := 5;`
**Fixed values for displaying texts are set in “Text properties”**.

See also

- “Element property 'Text properties’” on page 3116

**Element property 'Color variables’**

The Element property is used as an interface for project variables to dynamically control colors at runtime.

<table>
<thead>
<tr>
<th><strong>“Toggle color”</strong></th>
<th>The property controls the toggled color at runtime.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Value assignment:</strong></td>
<td><strong>FALSE</strong>: The element is displayed with the color specified in the “Color” property.</td>
</tr>
<tr>
<td></td>
<td><strong>TRUE</strong>: The element is displayed with the color specified in the “Alarm color” property.</td>
</tr>
<tr>
<td><strong>Assignment options:</strong></td>
<td><strong>Placeholder for the user input variable</strong></td>
</tr>
<tr>
<td></td>
<td>- “&lt;toggle/tap variable&gt;”</td>
</tr>
<tr>
<td></td>
<td>- “&lt;NOT toggle/tap variable&gt;”</td>
</tr>
<tr>
<td></td>
<td>The color change is not controlled by its own variable, but by a user input variable.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Specify a variable for the mouse events “Tap” or “Toggle” in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both “Toggle” and “Tap”, then the variable specified in “Tap” is used.</td>
</tr>
<tr>
<td></td>
<td><strong>Hint:</strong> Click the symbol to insert the placeholder “&lt;toggle/tap variable&gt;”. When you activate the “Inputconfiguration”, “Tap FALSE” property, then the “&lt;NOT toggle/tap variable&gt;” placeholder is displayed.</td>
</tr>
<tr>
<td></td>
<td><strong>Instance path of a project variable (BOOL)</strong></td>
</tr>
<tr>
<td></td>
<td>Example: PLC_PRG.xColorIsToggeled</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.</td>
</tr>
</tbody>
</table>

| **“Normal state”**                  | The properties listed below control the color depending on the state. The normal state is in effect if the variable in “Color variables”, “Toggle color” is not defined or it has the value FALSE. |
| **“Alarm state”**                   | The alarm state is in effect if the variable in “Color variables”, “Toggle color” has the value TRUE.                                                                   |

| **“Frame color”**                   | Assignment options:                                                                                                                                                        |
|                                     | **Variable (DWORD) for the frame color**                                                                                                                                     |
|                                     | Example: PLC_PRG.dwBorderColor                                                                                                                                              |
|                                     | **Color literal**                                                                                                                                                           |
|                                     | Example of green and opaque: 16#FF00FF00                                                                                                                                       |

| **“Filling color”**                 | Assignment options:                                                                                                                                                         |
|                                     | **Variable (DWORD) for the fill color**                                                                                                                                      |
|                                     | Example: PLC_PRG.dwFillColor                                                                                                                                                |
|                                     | **Color literal**                                                                                                                                                           |
|                                     | Example of gray and opaque: 16#FF888888                                                                                                                                      |
The transparency part of the color value is evaluated only if the “Activate semi-transparent drawing” option of the visualization manager is selected.

Select the “Advanced” option in the toolbar of the properties view. Then all element properties are visible.

●  Chapter 6.4.5.10.4 “Animating a color display” on page 2914

Element property 'Absolute movement'
The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

<table>
<thead>
<tr>
<th>“Movement”</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>“X”</td>
<td>Variable (numeric data type). Defines the X position (in pixels).</td>
</tr>
<tr>
<td>Example: PLC_PRG.iPos_X.</td>
<td>Increasing this value in runtime mode moves the element to the right.</td>
</tr>
<tr>
<td>“Y”</td>
<td>Variable (numeric data type). Defines the Y position (in pixels).</td>
</tr>
<tr>
<td>Example: PLC_PRG.iPos_Y.</td>
<td>Increasing this value in runtime mode moves the element downwards.</td>
</tr>
<tr>
<td>“Rotation”</td>
<td>Variable (numeric data type). Defines the angle of rotation (in degrees).</td>
</tr>
<tr>
<td>Example: PLC_PRG.iAngle1.</td>
<td>The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.</td>
</tr>
<tr>
<td></td>
<td>In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.</td>
</tr>
</tbody>
</table>
"Interior rotation" Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in "Center" according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol.  

Note: If a static angle of rotation is specified in the "Position ➔ Angle" property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

---

You can link the variables to a unit conversion.

---

The "X", "Y", "Rotation", and "Interior rotation" properties are supported by the "Client Animation" functionality.

---

**Element property ‘State variables’**

The variables control the element behavior dynamically.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Invisible&quot;</td>
<td>Variable (BOOL). Toggles the visibility of the element. True: The element is not visible at runtime. <strong>Example:</strong> bIsVisible with VAR bIsVisible : BOOL := FALSE; END_VAR</td>
</tr>
<tr>
<td>&quot;Deactivate inputs&quot;</td>
<td>Variable (BOOL). Toggles the operability of the element. True: User inputs do not have any effect in runtime more. The element is shown as deactivated.</td>
</tr>
</tbody>
</table>

---

The "Invisible" property is supported by the "Client Animation" functionality.

---

**Element property ‘Selection and caret configuration’**

The variables allow for controlling the caret position and the selection of the text.
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Caret position”</td>
<td>Variable (integer data type). Contains the position of the cursor.</td>
</tr>
<tr>
<td>“Selection start”</td>
<td>Variable (integer data type). Contains the position of the first selected character. Example: PLC_PRG.iSelStart</td>
</tr>
<tr>
<td>“Selection end”</td>
<td>Variable (integer data type). Contains the position of the last selected character. Example: PLC_PRG.iSelEnd</td>
</tr>
<tr>
<td>“All selected”</td>
<td>Variable (BOOL). Toggles the selection of the entered text. TRUE: The text in the text field is selected. FALSE: The selection starts with the value in “Selection start” and ends with “Selection end”</td>
</tr>
</tbody>
</table>

These properties are available only when you have selected the “Support client animations and overlay of native elements” option in the Visualization Manager.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Animation duration”</td>
<td>Defines the duration (in milliseconds) in which the element runs an animation&lt;br&gt; • Variable (integer value)&lt;br&gt; Example: Menu.tContent with VAR tContent : INT := 500; END_VAR&lt;br&gt; • Integer literal&lt;br&gt; Example: 500&lt;br&gt; Animatable properties&lt;br&gt; • “Absolute movement”, “Movement”, “X”, “Y”&lt;br&gt; • “Absolute movement”, “Rotation”&lt;br&gt; • “Absolute movement”, “Interior rotation”&lt;br&gt; • “Absolute movement”, “Exterior rotation”&lt;br&gt; The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.</td>
</tr>
<tr>
<td>“Move to foreground”</td>
<td>Moves the visualization element to the foreground&lt;br&gt; Variable (BOOL)&lt;br&gt; Example: bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR&lt;br&gt; TRUE: At runtime, the visualization element is displayed in the foreground.&lt;br&gt; FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.</td>
</tr>
</tbody>
</table>

**Element property 'Input configuration'**

The properties contain the configurations for the user input when using the mouse or keyboard. A user input defines an event and one or more actions that are executed when an event occurs.

The “Configure” button opens the “Input Configuration” dialog. There you can create or edit user inputs.

Configured user inputs are listed below the events. They each include the action that is triggered and the setting in short form.

Example: “Execute ST Code”: fPLC_PRG.i_x := 0;

“OnDialogClosed” Input event: The user closes the dialog.
### OnMouseClick
Input event: The user clicks the mouse button completely in the element area. The mouse button is clicked and released.

### OnMouseDown
Input event: The user clicks down on the mouse button.

### OnMouseEnter
Input event: The user drags the mouse pointer to the element.

### OnMouseLeave
Input event: The user drags the mouse pointer away from the element.

### OnMouseMove
Input event: The user moves the mouse pointer over the element area.

### OnMouseUp
Input events:
- The user releases the mouse button within the element area. It is irrelevant whether the user has previously pressed the mouse button inside or outside the element area.
- The user presses the mouse button within the element area, leaves the element area, and then releases the mouse button.

Note: This CODESYS-specific triggering behavior guarantees that actions for key elements are completed. A key element starts an action for “OnMouseDown” and ends the action for “OnMouseUp”.

Example: A visualization user presses the mouse button within the element area of the key element and then moves the cursor position so that it lies outside the element area. The action is ended anyway because “OnMouseUp” is triggered.

### Tap
When a mouse click event occurs, the variable defined in “Variable” is described in the application. The coding depends on the “Tap FALSE” and “Tap on enter if captured” options.

### Variable
Variable (BOOL) that is set on mouse click event.

Example: PLC_PRG.bIsTapped

TRUE: A mouse click event exists. It lasts as long as the user presses the mouse button over the element. It ends when the button is released.

FALSE: A mouse click event does not exist.

Requirement: The “Tap FALSE” option is not activated.

### Tap FALSE
☑: The mouse click event leads to a complementary value in “Variable”.

TRUE: A mouse click event does not exist.

FALSE: While the mouse click event exists.

### Tap on enter if captured
☑: During user input, it is also taken into consideration whether the mouse pointer is dragged within the element area or not while the mouse button is pressed.

TRUE: While the mouse click event exists and the mouse pointer is moved over the element area.

FALSE: A mouse click event does not exist. Or the user moves the mouse pointer outside of the element area while the mouse button is pressed.

The value is TRUE again as soon as the user moves the pointer back to the element area. The mouse is then captured.
<table>
<thead>
<tr>
<th><strong>Toggle</strong></th>
<th>With the onset of a mouse click event, the variable is set; when the mouse click event is completed, the variable is reset.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Variable</strong></td>
<td>Variable (BOOL). Its value toggled when the mouse click event is ended. This is when the user releases the mouse button while the mouse pointer is over the element area. If the user releases the mouse button while the mouse pointer is outside of the element area, then the mouse click event is not ended and the value is not toggled. Hint: The user can cancel a started toggle input by dragging the mouse pointer out of the element area.</td>
</tr>
<tr>
<td><strong>Toggle on up if captured</strong></td>
<td>☑️: The value toggles regardless of where the mouse pointer is when the mouse button is released. The mouse is then captured.</td>
</tr>
</tbody>
</table>

| **Hotkey** | Keyboard shortcut on the element for triggering specific input actions. When the keyboard shortcut event occurs, the input actions in the “Events” property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action. |
| **Key** | Key pressed for input action. Example: [T] Note: The following properties appear when a key is selected. |
| **Events** | ● “None” ● “Mouse down”: Pressing the key triggers the input actions that are configured in the “OnMouseDown” property. ● “Mouse up”: Releasing the key triggers the input actions that are configured in the “OnMouseUp” property. ● “Mouse down/up”: Pressing and releasing the key triggers the input actions that are configured in the “OnMouseDown” property and the “OnMouseUp” property. |
| **Shift** | ☑️: Combination with the Shift key Example: [Shift]+[T]. |
| **Control** | ☑️: Combination with the Ctrl key Example: [Ctrl]+[T]. |
| **Alt** | ☑️: Combination with the Alt key Example: [Alt]+[T]. |

All keyboard shortcuts and their actions that are configured in the visualization are listed on the “Keyboard Configuration” tab.

Element property 'Access rights'

Requirement: User management is set up for the visualization.
“Access rights” dialog. There you can edit the access privileges for the element.

Status messages:
- “Not set. Full rights.”: Access rights for all user groups: “operable”
- “Rights are set: Limited rights”: Access is restricted for at least one group.

See also
- ⚫ Chapter 6.4.5.21.3.1 “Dialog ‘Access Rights’” on page 3366

Visualization Element ‘Scroll Bar’

Symbol:

Category: “Common Controls”

The element sets the value of a variable, depending on the position of the scroll bar.

Element properties

<table>
<thead>
<tr>
<th>“Element name”</th>
<th>Example: Speed Conveyor Belt 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Optional</td>
<td>Hint: Assign individual names for elements so that they are found faster in the element list.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Type of element”</th>
<th>“Scroll Bar”</th>
</tr>
</thead>
</table>

Element property ‘Center’

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

<table>
<thead>
<tr>
<th>“X”</th>
<th>X-coordinate of the point of rotation</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Y”</td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the symbols (noinspection) to other positions in the editor.

<table>
<thead>
<tr>
<th>“Value”</th>
<th>Variable as type integer that includes the position of the scroll bar.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Minimum value”</td>
<td>Smallest value of the scroll bar (fixed value or variable).</td>
</tr>
<tr>
<td>“Maximum value”</td>
<td>Largest value of the scroll bar (fixed value or variable).</td>
</tr>
</tbody>
</table>
"Page size"

<table>
<thead>
<tr>
<th>Page size</th>
</tr>
</thead>
<tbody>
<tr>
<td>● As a fixed value, for example 10</td>
</tr>
<tr>
<td>● As a variable of data type integer</td>
</tr>
</tbody>
</table>

Requirement: Visible when the "Move to click" property is **not** selected.

"Move to click"

<table>
<thead>
<tr>
<th>Behavior of the scroll bar at visualization runtime when it is clicked:</th>
</tr>
</thead>
<tbody>
<tr>
<td>✔: The scrollbar moves to the clicked position.</td>
</tr>
<tr>
<td>☐: The scrollbar moves to one “Page size” in the direction of the click.</td>
</tr>
</tbody>
</table>

**Element property 'Position'**

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

<table>
<thead>
<tr>
<th>&quot;X&quot;</th>
</tr>
</thead>
<tbody>
<tr>
<td>X coordinate of the upper left corner of the element</td>
</tr>
<tr>
<td>Specified in pixels.</td>
</tr>
<tr>
<td>Example: 10.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>&quot;Y&quot;</th>
</tr>
</thead>
<tbody>
<tr>
<td>Y coordinate of the upper left corner of the element</td>
</tr>
<tr>
<td>Specified in pixels.</td>
</tr>
<tr>
<td>Example: 10.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>&quot;Width&quot;</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specified in pixels.</td>
</tr>
<tr>
<td>Example: 150</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>&quot;Height&quot;</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specified in pixels.</td>
</tr>
<tr>
<td>Example: 30</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the box symbols (⿱) to other positions in the editor.

See also

- Chapter 6.4.5.3 “Positioning the Element, Adapting Size and Layer” on page 2874

**Element property 'Bar'**

The property defines the representation of scaling and direction of travel.
### “Orientation”
Alignment of the slider; defined by the ratio of width to height.
- “Horizontal”
- “Vertical”

You can modify the alignment in the visualization editor by using the pointing device to adjust the width and height of the Scroll Bar.

### “Running direction”
The drop-down list varies depending on the alignment of the slider.

**Horizontal**
- “Left to right”: Scale starts at the left.
- “Right to left”: Scale starts at the right.

**Vertical**
- “Bottom to top”: Scale starts at the bottom.
- “Top to bottom”: Scale starts at the top.

---

#### Element property ‘Colors’
The properties contain fixed values for setting colors.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Color”</td>
<td>Color for the element in its normal state.</td>
</tr>
<tr>
<td></td>
<td>Please note that the normal state is in effect if the expression in the</td>
</tr>
<tr>
<td></td>
<td>“Color variables ➔ Toggle color” property is not defined or it has the value</td>
</tr>
<tr>
<td></td>
<td>FALSE.</td>
</tr>
<tr>
<td>“Alarm color”</td>
<td>Color for the element in alarm state.</td>
</tr>
<tr>
<td></td>
<td>Please note that the alarm state is in effect if the expression in the</td>
</tr>
<tr>
<td></td>
<td>“Color variables ➔ Toggle color” property has the value TRUE.</td>
</tr>
<tr>
<td>“Transparency”</td>
<td>Value (0 to 255) for defining the transparency of the selected color.</td>
</tr>
<tr>
<td></td>
<td>Example 255: The color is opaque. 0: The color is completely transparent.</td>
</tr>
</tbody>
</table>

See also
- § Chapter 6.4.5.5 “Designing a visualization with elements” on page 2872

#### Element property ‘Texts’
The properties contains character strings for labeling the element. The character string can also contain a placeholder with a format definition. In runtime mode, the placeholder is replaced by the current value in the specified format.

CODESYS accepts the specified texts automatically into the “GlobalTextList” text list. Therefore, these texts can be localized.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Text”</td>
<td>Character string (without single straight quotation marks) for the labeling</td>
</tr>
<tr>
<td></td>
<td>the element. Add a line break by pressing the keyboard shortcut [Ctrl] + [Enter].</td>
</tr>
<tr>
<td></td>
<td>Example: Accesses: %i</td>
</tr>
<tr>
<td></td>
<td>The variable that contains the current value for the placeholder is specified in the property “Text variable ➔ Text”.</td>
</tr>
<tr>
<td>“Tooltip”</td>
<td>Character string (without single straight quotation marks) that is displayed as the tooltip of an element.</td>
</tr>
<tr>
<td></td>
<td>Example: Number of valid accesses.</td>
</tr>
<tr>
<td></td>
<td>The variable that contains the current value for the placeholder is specified in the property “Text variable ➔ Tooltip”.</td>
</tr>
</tbody>
</table>

Element property 'Text properties’

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Horizontal alignment”</td>
<td>Horizontal alignment of the text within the element.</td>
</tr>
<tr>
<td>“Vertical alignment”</td>
<td>Vertical alignment of the text within the element.</td>
</tr>
<tr>
<td>“Font”</td>
<td>Example: “Default”&lt;br&gt;<img src="image" alt="The “Font” dialog box opens." /> ◀: Drop-down list with style fonts.</td>
</tr>
<tr>
<td>“Font color”</td>
<td>Example: “Black”&lt;br&gt;<img src="image" alt="The “Color” dialog box opens." /> ◀: Drop-down list with style colors.</td>
</tr>
<tr>
<td>“Transparency”</td>
<td>Whole number (value range from 0 to 255). This determines the transparency of the respective color. &lt;br&gt;Example: 255: The color is opaque. &lt;br&gt;0: The color is completely transparent. &lt;br&gt;Please note: If the color is a style color and already has a transparency value, then this property is write-protected.</td>
</tr>
</tbody>
</table>

Element property 'Text variables’

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Text variable”</td>
<td>Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. &lt;br&gt;Example: PLC_PRG.iAccesses &lt;br&gt;Note: The format definition is part of the text in the property “Texts ➔ Text”. &lt;br&gt;Note: If you specify a variable of type enumeration with text list support, then the name of the enumeration data type is added automatically in angle brackets after the variable name. Example: PLC_PRG.enVar &lt;enumeration name&gt;. Then the symbolic value of the enumeration component is printed instead of the numeric value when text is printed. Refer to the help page for the enumerations.</td>
</tr>
<tr>
<td>“Tooltip variable”</td>
<td>Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. &lt;br&gt;Example: PLC_PRG.iAccessesInTooltip &lt;br&gt;Note: The format definition is part of the text in the property “Texts ➔ Tooltip”.</td>
</tr>
</tbody>
</table>

See also

- Chapter 6.4.5.20.2 “Placeholders with Format Definition in the Output Text” on page 3329
- “Element property ‘Texts’” on page 3127
- Chapter 6.4.1.20.5.18 “Enumerations” on page 2263
Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.

<table>
<thead>
<tr>
<th>&quot;Text list&quot;</th>
<th>Variable (string) or name of the text list as a fixed string in single straight quotation marks.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Example: 'Errorlist' ▼: Drop-down list with the dialogs available in the text lists.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>&quot;Text index&quot;</th>
<th>Text list ID. This refers to the desired output text.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>● As fixed string with the ID in single straight quotation marks.</td>
</tr>
<tr>
<td></td>
<td>Example: '1'</td>
</tr>
<tr>
<td></td>
<td>● As a variable (STRING) for dynamically controlling the text output.</td>
</tr>
<tr>
<td></td>
<td>Example: strTextID</td>
</tr>
<tr>
<td></td>
<td>Sample assignment: PLC_PRG.strTextID := '1';</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>&quot;Tooltip index&quot;</th>
<th>Text list ID. This refers to the desired output text.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>● As fixed string with the ID in single straight quotation marks.</td>
</tr>
<tr>
<td></td>
<td>Example: '2'</td>
</tr>
<tr>
<td></td>
<td>● As a variable (STRING) for dynamically controlling the text output.</td>
</tr>
<tr>
<td></td>
<td>Example: strToolTipID</td>
</tr>
<tr>
<td></td>
<td>Sample assignment: PLC_PRG.strToolTipID := '2';</td>
</tr>
</tbody>
</table>

See also

- ☰ Chapter 6.4.1.21.2.28 “Object ‘Text List’” on page 2532

The variables allow for dynamic control of the text display.

<table>
<thead>
<tr>
<th>&quot;Font name&quot;</th>
<th>Variable (STRING). Includes the font of the text.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Example: PLC_PRG.stFontVar := 'Arial';</td>
</tr>
<tr>
<td></td>
<td>The selection of fonts corresponds to the default “Font” dialog.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>&quot;Size&quot;</th>
<th>Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>● &lt;pt&gt;: Points (default)</td>
</tr>
<tr>
<td></td>
<td>Example: PLC_PRG.iFontHeight &lt;pt&gt;</td>
</tr>
<tr>
<td></td>
<td>Code: iFontHeight := INT := 12;</td>
</tr>
<tr>
<td></td>
<td>● &lt;px&gt;: Pixels</td>
</tr>
<tr>
<td></td>
<td>Example: PLC_PRG.iFontHeight &lt;px&gt;</td>
</tr>
<tr>
<td></td>
<td>Code: iFontHeight := INT := 19;</td>
</tr>
</tbody>
</table>

If you click in the value field, a drop-down list opens on the right for setting the unit.

Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property “Text property ➔ Font”.
### Flags
Variable (DWORD). Contains the flags for displaying fonts.

Flags:
- 1: Italics
- 2: Bold
- 4: Underline
- 8: Strikethrough

Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: `PLC_PRG.dwFontType := 6;`

### Character set
Variable (DWORD). Contains a character set number for the font.

The selection of character set numbers corresponds to the “Script” setting of the standard “Font” dialog.

### Color
Variable (DWORD). Includes the color of the text.

Example: `PLC_PRG.dwColorFont := 16#FF000000;`

### Flags for text alignment
Variable (integer data type). Contains the coding for text alignment.

Example: `PLC_PRG.dwTextAlignment`.

Coding:
- 0: Top left
- 1: Horizontal center
- 2: Right
- 4: Vertical center
- 8: Bottom

Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: `PLC_PRG.dwFontType := 5;`

---

---

Fixed values for displaying texts are set in “Text properties”.

- “Element property ‘Text properties’” on page 3116

Element property 'Color variables'

The Element property is used as an interface for project variables to dynamically control colors at runtime.
<table>
<thead>
<tr>
<th>&quot;Toggle color&quot;</th>
<th>The property controls the toggled color at runtime.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Value assignment:</td>
<td></td>
</tr>
<tr>
<td>● FALSE: The element is displayed with the color specified in the &quot;Color&quot; property.</td>
<td></td>
</tr>
<tr>
<td>● TRUE: The element is displayed with the color specified in the &quot;Alarm color&quot; property.</td>
<td></td>
</tr>
<tr>
<td>Assignment options:</td>
<td></td>
</tr>
<tr>
<td>● Placeholder for the user input variable</td>
<td></td>
</tr>
<tr>
<td>– &quot;&lt;toggle/tap variable&gt;&quot;</td>
<td></td>
</tr>
<tr>
<td>– &quot;&lt;NOT toggle/tap variable&gt;&quot;</td>
<td></td>
</tr>
<tr>
<td>The color change is not controlled by its own variable, but by a user input variable.</td>
<td></td>
</tr>
<tr>
<td>Note: Specify a variable for the mouse events &quot;Tap&quot; or &quot;Toggle&quot; in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both &quot;Toggle&quot; and &quot;Tap&quot;, then the variable specified in &quot;Tap&quot; is used.</td>
<td></td>
</tr>
<tr>
<td>Hint: Click the symbol □ to insert the placeholder &quot;&lt;toggle/tap variable&gt;&quot;. When you activate the &quot;Inputconfiguration&quot; &quot;Tap FALSE&quot; property, then the &quot;&lt;NOT toggle/tap variable&gt;&quot; placeholder is displayed.</td>
<td></td>
</tr>
<tr>
<td>● Instance path of a project variable (BOOL)</td>
<td></td>

● Chapter 6.4.5.10.4 “Animating a color display” on page 2914
The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

**"Movement"**

**"X"**
Variable (numeric data type). Defines the X position (in pixels).
Example: PLC_PRG.iPos_X.
Increasing this value in runtime mode moves the element to the right.

**"Y"**
Variable (numeric data type). Defines the Y position (in pixels).
Example: PLC_PRG.iPos_Y.
Increasing this value in runtime mode moves the element downwards.

**"Rotation"**
Variable (numeric data type). Defines the angle of rotation (in degrees).
Example: PLC_PRG.iAngle1.
The midpoint of the element rotates at the "Center" point. This rotation point is shown as the symbol.
In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

**"Interior rotation"**
Variable (numeric data type). Defines the angle of rotation (in degrees).
Example: PLC_PRG.iAngle2.
In runtime mode, the element rotates about the point of rotation specified in "Center" according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.
The rotation point is shown as the symbol.
Note: If a static angle of rotation is specified in the "Position ➔ Angle" property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

You can link the variables to a unit conversion.

The "X", "Y", "Rotation", and "Interior rotation" properties are supported by the "Client Animation" functionality.

See also

•
The variables control the element behavior dynamically.

**“Invisible”**  
Variable (BOOL). Toggles the visibility of the element.  
TRUE: The element is not visible at runtime.  
Example: `bIsVisible with VAR bIsVisible : BOOL := FALSE; END_VAR`

**“Deactivate inputs”**  
Variable (BOOL). Toggles the operability of the element.  
TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated.

The “Invisible” property is supported by the “Client Animation” functionality.

These properties are available only when you have selected the “Support client animations and overlay of native elements” option in the Visualization Manager.

**“Animation duration”**  
Defines the duration (in milliseconds) in which the element runs an animation  
- Variable (integer value)  
  Example: `Menu.tContent with VAR tContent : INT := 500; END_VAR`  
- Integer literal  
  Example: 500  

Animatable properties  
- “Absolute movement”, “Movement”, “X”, “Y”  
- “Absolute movement”, “Rotation”  
- “Absolute movement”, “Interior rotation”  
- “Absolute movement”, “Exterior rotation”  
The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.

**“Move to foreground”**  
Moves the visualization element to the foreground  
Variable (BOOL)  
Example: `bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR`  
TRUE: At runtime, the visualization element is displayed in the foreground.  
FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Requirement: User management is set up for the visualization.
“Access rights”

Opens the “Access rights” dialog. There you can edit the access privileges for the element.

Status messages:
- “Not set. Full rights.”: Access rights for all user groups: “operable”
- “Rights are set: Limited rights”: Access is restricted for at least one group.

Visualization Element ‘Slider’

Symbol:

Category: “Common Controls”

The element changes the value of a variable, depending on the position of the slider within the slider bar. You define the value range of the slider bar by means of the scale start and scale end.

Element properties

<table>
<thead>
<tr>
<th>“Element name”</th>
<th>Example: Speed controller conveyor belt 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Optional</td>
<td>Optional</td>
</tr>
<tr>
<td>Hint: Assign individual names for elements so that they are found faster in the element list.</td>
<td></td>
</tr>
</tbody>
</table>

| “Type of element” | “Slider” |

Element property ‘Position’

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

<table>
<thead>
<tr>
<th>“X”</th>
<th>X coordinate of the upper left corner of the element Specified in pixels. Example: 10.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Y”</td>
<td>Y coordinate of the upper left corner of the element Specified in pixels. Example: 10.</td>
</tr>
<tr>
<td>“Width”</td>
<td>Specified in pixels. Example: 150</td>
</tr>
<tr>
<td>“Height”</td>
<td>Specified in pixels. Example: 30</td>
</tr>
</tbody>
</table>
You can also change the values by dragging the box symbols ( draggable) to other positions in the editor.

<td></td>
<td>Vertical</td>
</tr>
<tr>
<td></td>
<td>- &quot;Bottom to top&quot;: Scale starts at the bottom.</td>
</tr>
<tr>
<td></td>
<td>- &quot;Top to bottom&quot;: Scale starts at the top.</td>
</tr>
</tbody>
</table>

### Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

<table>
<thead>
<tr>
<th><strong>Movement</strong></th>
<th>Variable (numeric data type). Defines the X position (in pixels).</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;X&quot;</td>
<td>Example: PLC_PRG.iPos_X.</td>
</tr>
<tr>
<td></td>
<td>Increasing this value in runtime mode moves the element to the right.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>&quot;Y&quot;</th>
<th>Variable (numeric data type). Defines the Y position (in pixels).</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Example: PLC_PRG.iPos_Y.</td>
</tr>
<tr>
<td></td>
<td>Increasing this value in runtime mode moves the element downwards.</td>
</tr>
</tbody>
</table>
“Rotation” | Variable (numeric data type). Defines the angle of rotation (in degrees).

Example: PLC_PRG.iAngle1.

The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.

In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

“Interior rotation” | Variable (numeric data type). Defines the angle of rotation (in degrees).

Example: PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol.

Note: If a static angle of rotation is specified in the “Position Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.

See also

Element property ‘State variables’

The variables control the element behavior dynamically.

“Invisible” | Variable (BOOL). Toggles the visibility of the element.

TRUE: The element is not visible at runtime.

Example: bIsVisible with VAR bIsVisible : BOOL := FALSE;
END_VAR

“Deactivate inputs” | Variable (BOOL). Toggles the operability of the element.

TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated.
The "Invisible" property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the “Support client animations and overlay of native elements” option in the Visualization Manager.

<table>
<thead>
<tr>
<th>“Animation duration”</th>
<th>Defines the duration (in milliseconds) in which the element runs an animation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable (integer value)</td>
<td>Example: Menu.tContent with VAR tContent : INT := 500; END_VAR</td>
</tr>
<tr>
<td>Integer literal</td>
<td>Example: 500</td>
</tr>
</tbody>
</table>

Animatable properties
- “Absolute movement”, “Movement”, “X”, “Y”
- “Absolute movement”, “Rotation”
- “Absolute movement”, “Interior rotation”
- “Absolute movement”, “Exterior rotation”

The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.

<table>
<thead>
<tr>
<th>“Move to foreground”</th>
<th>Moves the visualization element to the foreground</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable (BOOL)</td>
<td>Example: bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR</td>
</tr>
<tr>
<td>TRUE: At runtime, the visualization element is displayed in the foreground.</td>
<td></td>
</tr>
<tr>
<td>FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.</td>
<td></td>
</tr>
</tbody>
</table>

Element property ‘Access rights’

Requirement: User management is set up for the visualization.

<table>
<thead>
<tr>
<th>“Access rights”</th>
<th>Opens the “Access rights” dialog. There you can edit the access privileges for the element.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status messages:</td>
<td>• “Not set. Full rights.”: Access rights for all user groups : “operable”</td>
</tr>
<tr>
<td></td>
<td>• “Rights are set: Limited rights”: Access is restricted for at least one group.</td>
</tr>
</tbody>
</table>

</tr>
<tr>
<td></td>
<td>• The “Font” dialog box opens.</td>
</tr>
<tr>
<td></td>
<td>• Drop-down list with style fonts.</td>
</tr>
<tr>
<td>“Font color”</td>
<td>Example: “Black”</td>
</tr>
<tr>
<td></td>
<td>• The “Color” dialog box opens.</td>
</tr>
<tr>
<td></td>
<td>• Drop-down list with style colors.</td>
</tr>
<tr>
<td>“Transparency”</td>
<td>Whole number (value range from 0 to 255). This determines the transparency of the respective color.</td>
</tr>
<tr>
<td></td>
<td>Example: 255: The color is opaque.</td>
</tr>
<tr>
<td></td>
<td>0: The color is completely transparent.</td>
</tr>
<tr>
<td></td>
<td>Please note: If the color is a style color and already has a transparency value, then this property is write-protected.</td>
</tr>
</tbody>
</table>
The Element property is used as an interface for project variables to dynamically control colors at runtime.

**“Toggle color”**

The property controls the toggled color at runtime. 

Value assignment:

- **FALSE**: The element is displayed with the color specified in the “Color” property.
- **TRUE**: The element is displayed with the color specified in the “Alarm color” property.

Assigning the property:

- Placeholder for the user input variable
  - "<toggle/tap variable>"
  - "<NOT toggle/tap variable>"

The color change is not controlled by its own variable, but by a user input variable.

Note: Specify a variable for the mouse events “Tap” or “Toggle” in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both “Toggle” and “Tap”, then the variable specified in “Tap” is used.

Hint: Click the symbol ≦ to insert the placeholder “<toggle/tap variable>". When you activate the “Inputconfiguration”, “Tap FALSE” property, then the “<NOT toggle/tap variable>” placeholder is displayed.

- Instance path of a project variable (BOOL)
  
  Example: PLC_PRG.xColorIsToggled

Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.

---

The transparency part of the color value is evaluated only if the “Activate semi-transparent drawing” option of the visualization manager is selected.

Select the “Advanced” option in the toolbar of the properties view. Then all element properties are visible.

See also

- Chapter 6.4.5.10.4 “Animating a color display” on page 2914

---

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

**“Movement”**

**“X”**

Variable (numeric data type). Defines the X position (in pixels).

Example: PLC_PRG.iPos_X.

Increasing this value in runtime mode moves the element to the right.
<table>
<thead>
<tr>
<th>“Y”</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable (numeric data type). Defines the Y position (in pixels).</td>
</tr>
<tr>
<td>Example: PLC_PRG.iPos_Y.</td>
</tr>
<tr>
<td>Increasing this value in runtime mode moves the element downwards.</td>

</tbody>
</table>

<table>
<thead>
<tr>
<th>“Rotation”</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable (numeric data type). Defines the angle of rotation (in degrees).</td>
</tr>
<tr>
<td>Example: PLC_PRG.iAngle1.</td>
</tr>
<tr>
<td>The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.</td>
</tr>
<tr>
<td>In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Interior rotation”</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable (numeric data type). Defines the angle of rotation (in degrees).</td>
</tr>
<tr>
<td>Example: PLC_PRG.iAngle2.</td>
</tr>
<tr>
<td>In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.</td>
</tr>
<tr>
<td>The rotation point is shown as the symbol.</td>
</tr>
<tr>
<td>Note: If a static angle of rotation is specified in the “Position ➔ Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.</td>
</tr>
</tbody>
</table>

You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.

See also

- Element property 'State variables'

The variables control the element behavior dynamically.
### "Invisible"
| Variable (BOOL). Toggles the visibility of the element. |
| TRUE: The element is not visible at runtime. |
| **Example:** `bIsVisible with VAR bIsVisible : BOOL := FALSE; END_VAR` |

### "Deactivate inputs"
| Variable (BOOL). Toggles the operability of the element. |
| TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated. |

---

The "Invisible" property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the “Support client animations and overlay of native elements” option in the Visualization Manager.

---

### "Animation duration"
| Defines the duration (in milliseconds) in which the element runs an animation |
| - Variable (integer value) |
|  **Example:** `Menu.tContent with VAR tContent : INT := 500; END_VAR` |
| - Integer literal |
|  **Example:** 500 |

- Animatable properties
  - “Absolute movement”, “Movement”, “X”, “Y”
  - “Absolute movement”, “Rotation”
  - “Absolute movement”, “Interior rotation”
  - “Absolute movement”, “Exterior rotation”

The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.

---

### "Move to foreground"
| Moves the visualization element to the foreground |
| Variable (BOOL) |
| **Example:** `bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR` |
| TRUE: At runtime, the visualization element is displayed in the foreground. |
| FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor. |

---

Element property 'Input configuration'  The properties contain the configurations for the user input when using the mouse or keyboard. User input is a user event from the perspective of the element.

- The input configuration refers to the text area of the element only, not the two buttons.
The “Configure” button opens the “Input configuration” dialog box for creating or modifying a user input configuration.

A configuration contains one or more input actions for the respective input event. Existing input actions are displayed below it.

Example: “Execute ST code”: 

```plaintext
PLC_PRG.i_x := 0;
```

<table>
<thead>
<tr>
<th>Event</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“OnDialogClosed”</td>
<td>Input event: The user closes the dialog box.</td>
</tr>
<tr>
<td>“On_MouseClick”</td>
<td>Input event: The user clicks the element completely. The mouse button is clicked and released.</td>
</tr>
<tr>
<td>“OnMouseDown”</td>
<td>Input event: The user clicks down on the element only.</td>
</tr>
<tr>
<td>“OnMouseEnter”</td>
<td>Input event: The user drags the mouse pointer to the element.</td>
</tr>
<tr>
<td>“OnMouseLeave”</td>
<td>Input event: The user drags the mouse pointer away from the element.</td>
</tr>
<tr>
<td>“OnMouseMove”</td>
<td>Input event: The user moves the mouse pointer over the element area.</td>
</tr>
<tr>
<td>“OnMouseUp”</td>
<td>Input event: The user releases the mouse button over the element area.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Event</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Tap”</td>
<td>When a mouse click event occurs, the variable defined in “Variable” is described in the application. The coding depends on the options “Tap FALSE” and “Tap on enter if captured”.</td>
</tr>
<tr>
<td>“Variable”</td>
<td>Variable (BOOL). Contains the information whether a mouse click event exists.</td>
</tr>
<tr>
<td>Example: PLC_PRG.bIsTapped</td>
<td></td>
</tr>
<tr>
<td>TRUE:</td>
<td>A mouse click event exists. It lasts while the user presses the mouse button over the element. It ends when the button is released.</td>
</tr>
<tr>
<td>FALSE:</td>
<td>A mouse click event does not exist.</td>
</tr>
<tr>
<td>Requirement:</td>
<td>The “Tap FALSE” option is not activated.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Event</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Tap FALSE”</td>
<td>☑: The mouse click event leads to a complementary value in “Variable”.</td>
</tr>
<tr>
<td>TRUE:</td>
<td>A mouse click event does not exist.</td>
</tr>
<tr>
<td>FALSE:</td>
<td>While the mouse click event exists.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Event</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Tap on enter if captured”</td>
<td>☑: During user input, it is also taken into consideration whether the mouse pointer is dragged within the element area or not while the mouse button is pressed.</td>
</tr>
<tr>
<td>TRUE:</td>
<td>While the mouse click event exists and the mouse pointer is moved over the element area.</td>
</tr>
<tr>
<td>FALSE:</td>
<td>A mouse click event does not exist. Or the user moves the mouse pointer outside of the element area while the mouse button is pressed. The value is TRUE again as soon as the user moves the pointer back to the element area. The mouse is then captured.</td>
</tr>
</tbody>
</table>
**“Shift”**  
When a mouse click event occurs, the variable here is described in the application. When the mouse click event ends, its value is toggled with the “Toggle on up if captured” option.

**“Variable”**  
Variable (BOOL). Its value toggled when the mouse click event is ended. This is when the user releases the mouse button while the mouse pointer is over the element area.  
If the user releases the mouse button while the mouse pointer is outside of the element area, then the mouse click event is not ended and the value is not toggled.  
Tip: The user can cancel a started toggle input by dragging the mouse pointer out of the element area.

**“Toggle on up if captured”**  
☑️: The value toggles regardless of where the mouse pointer is when the mouse button is released. The mouse is then captured.

**“Hotkeys”**  
Keyboard shortcut on the element for triggering specific input actions.  
When the keyboard shortcut event occurs, the input actions in the “Event(s)” property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.

**“Key”**  
Key pressed for input action.  
Example: [T]  
Note: The following properties appear when a key is selected.

**“Event(s)”**  
- “None”  
- “Mouse down”: Pressing the key triggers the input actions that are configured in the “OnMouseDown” property.  
- “Mouse up”: Releasing the key triggers the input actions that are configured in the “OnMouseUp” property.  
- “Mouse down/up”: Pressing and releasing the key triggers the input actions that are configured in the “OnMouseDown” property and the “OnMouseUp” property.

**“Shift”**  
☑️: Combination with the Shift key  
Example: [Shift]+[T].

**“Control”**  
☑️: Combination with the Ctrl key  
Example: [Ctrl]+[T].

**“Alt”**  
☑️: Combination with the Alt key  
Example: [Alt]+[T].

All keyboard shortcuts and their actions that are configured in the visualization are listed in the “Keyboard configuration” tab.

**Element property 'Access rights'**  
Requirement: User management is set up for the visualization.
“Access rights”

Opens the “Access rights” dialog. There you can edit the access privileges for the element.

Status messages:
- “Not set. Full rights.”: Access rights for all user groups: “operable”
- “Rights are set: Limited rights”: Access is restricted for at least one group.

Visualization Element 'Invisible Input'

Symbol:

Category: “Common Controls”

This element is displayed in the editor with a dashed line which is not visible in online mode.

You define the behavior of the el in the input configuration.

Element properties

<table>
<thead>
<tr>
<th>“Element name”</th>
<th>Optional</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hint: Assign individual names for elements so that they are found faster in the element list.</td>
<td></td>
</tr>
<tr>
<td>Example: Unsichtbare_Eingabe_1</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Type of element”</th>
<th>“Invisible Input”</th>
</tr>
</thead>
</table>

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

<table>
<thead>
<tr>
<th>“X”</th>
<th>X coordinate of the upper left corner of the element</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specified in pixels.</td>
<td>Example: 10.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Y”</th>
<th>Y coordinate of the upper left corner of the element</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specified in pixels.</td>
<td>Example: 10.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Width”</th>
<th>Specified in pixels.</th>
</tr>

<tbody>
<tr>
<td>Example: 150</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Height”</th>
<th>Specified in pixels.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: 30</td>
<td></td>
</tr>
</tbody>
</table>
You can also change the values by dragging the box symbols ( kvinnor) to other positions in the editor.

See also

- Chapter 6.4.5.5.3 “Positioning the Element, Adapting Size and Layer” on page 2874

**Element property ‘Center’**

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>“X”</td>
<td>X-coordinate of the point of rotation</td>
</tr>
<tr>
<td>“Y”</td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the symbols ( kvinnor) to other positions in the editor.

**Element property ‘Absolute movement’**

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>“Movement”</td>
<td></td>
</tr>
<tr>
<td>“X”</td>
<td>Variable (numeric data type). Defines the X position (in pixels). Example: PLC_PRG.iPos_X. Increasing this value in runtime mode moves the element to the right.</td>
</tr>
<tr>
<td>“Y”</td>
<td>Variable (numeric data type). Defines the Y position (in pixels). Example: PLC_PRG.iPos_Y. Increasing this value in runtime mode moves the element downwards.</td>
</tr>
<tr>
<td>“Rotation”</td>
<td>Variable (numeric data type). Defines the angle of rotation (in degrees). Example: PLC_PRG.iAngle1. The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.</td>
</tr>
</tbody>
</table>
“Interior rotation”
Variable (numeric data type). Defines the angle of rotation (in degrees).

Example: PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the 👀 symbol.

Note: If a static angle of rotation is specified in the “Position ➔ Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.

See also

Element property ‘State variables’

“Deactivate inputs”
Variable (BOOL). Toggles the operability of the element.

TRUE: User inputs do not have any effect in runtime mode. The element is shown as deactivated.

These properties are available only when you have selected the “Support client animations and overlay of native elements” option in the Visualization Manager.
“Animation duration”

Defines the duration (in milliseconds) in which the element runs an animation

- **Variable (integer value)**
  
  **Example:**
  ```
  Menu.tContent with VAR tContent : INT := 500;
  END_VAR
  ```

- **Integer literal**
  
  **Example:** 500

**Animatable properties**

- “Absolute movement”, “Movement”, “X”, “Y”
- “Absolute movement”, “Rotation”
- “Absolute movement”, “Interior rotation”
- “Absolute movement”, “Exterior rotation”

The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.

“Move to foreground”

Moves the visualization element to the foreground

**Variable (BOOL)**

**Example:**
```
VAR bIsInForeground : BOOL := FALSE;
END_VAR
```

**Example:**
```
TRUE: At runtime, the visualization element is displayed in the foreground.
```
```
FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.
```

**Element property 'Input configuration'**

The properties contain the configurations for the user input when using the mouse or keyboard. A user input defines an event and one or more actions that are executed when an event occurs.

The “Configure” button opens the “Input Configuration” dialog. There you can create or edit user inputs. Configured user inputs are listed below the events. They each include the action that is triggered and the setting in short form.

**Example:**
```
“Execute ST Code”:
```
```
PLC_PRG.i_x := 0;
```

```
“OnDialogClosed”
```

Input event: The user closes the dialog.

```
“OnMouseClick”
```

Input event: The user clicks the mouse button completely in the element area. The mouse button is clicked and released.

```
“OnMouseDown”
```

Input event: The user clicks down on the mouse button.

```
“OnMouseEnter”
```

Input event: The user drags the mouse pointer to the element.

```
“OnMouseLeave”
```

Input event: The user drags the mouse pointer away from the element.
<table>
<thead>
<tr>
<th><strong>“OnMouseMove”</strong></th>
<th>Input event: The user moves the mouse pointer over the element area.</th>
</tr>
</thead>
</table>
| **“OnMouseUp”** | Input events:  
  - The user releases the mouse button within the element area. It is irrelevant whether the user has previously pressed the mouse button inside or outside the element area.  
  - The user presses the mouse button within the element area, leaves the element area, and then releases the mouse button.  
  
  Note: This CODESYS-specific triggering behavior guarantees that actions for key elements are completed. A key element starts an action for “OnMouseDown” and ends the action for “OnMouseUp”.  
  
  Example: A visualization user presses the mouse button within the element area of the key element and then moves the cursor position so that it lies outside the element area. The action is ended anyway because “OnMouseUp” is triggered. |
| **“Tap”** | When a mouse click event occurs, the variable defined in “Variable” is described in the application. The coding depends on the “Tap FALSE” and “Tap on enter if captured” options. |
| **“Variable”** | Variable (BOOL) that is set on mouse click event.  
  **Example:** FLC_PRG.bIsTapped  
  **TRUE:** A mouse click event exists. It lasts as long as the user presses the mouse button over the element. It ends when the button is released.  
  **FALSE:** A mouse click event does not exist.  
  **Requirement:** The “Tap FALSE” option is not activated. |
| **“Tap FALSE”** |  
  - **☑:** The mouse click event leads to a complementary value in “Variable”.  
    **TRUE:** A mouse click event does not exist.  
    **FALSE:** While the mouse click event exists. |
| **“Tap on enter if captured”** |  
  - **☑:** During user input, it is also taken into consideration whether the mouse pointer is dragged within the element area or not while the mouse button is pressed.  
    **TRUE:** While the mouse click event exists and the mouse pointer is moved over the element area.  
    **FALSE:** A mouse click event does not exist. Or the user moves the mouse pointer outside of the element area while the mouse button is pressed.  
    The value is **TRUE** again as soon as the user moves the pointer back to the element area. The mouse is then captured. |
| **“Toggle”** | With the onset of a mouse click event, the variable is set; when the mouse click event is completed, the variable is reset. |
| **“Variable”** | Variable (BOOL). Its value toggled when the mouse click event is ended. This is when the user releases the mouse button while the mouse pointer is over the element area.  
  If the user releases the mouse button while the mouse pointer is outside of the element area, then the mouse click event is not ended and the value is not toggled.  
  **Hint:** The user can cancel a started toggle input by dragging the mouse pointer out of the element area. |
| **“Toggle on up if captured”** |  
  - **☑:** The value toggles regardless of where the mouse pointer is when the mouse button is released. The mouse is then captured. |
| **Hotkey** | Keyboard shortcut on the element for triggering specific input actions. When the keyboard shortcut event occurs, the input actions in the “Events” property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action. |
| **Key** | Key pressed for input action. Example: [T] Note: The following properties appear when a key is selected. |
| **Events** | ● “None” ● “Mouse down”: Pressing the key triggers the input actions that are configured in the “OnMouseDown” property. ● “Mouse up”: Releasing the key triggers the input actions that are configured in the “OnMouseUp” property. ● “Mouse down/up”: Pressing and releasing the key triggers the input actions that are configured in the “OnMouseDown” property and the “OnMouseUp” property. |
| **Shift** | : Combination with the Shift key Example: [Shift]+[T]. |
| **Control** | : Combination with the Ctrl key Example: [Ctrl]+[T]. |
| **Alt** | : Combination with the Alt key Example: [Alt]+[T]. |

All keyboard shortcuts and their actions that are configured in the visualization are listed on the “Keyboard Configuration” tab.

**Visualization Element ‘Progress Bar’**

Symbol:
Category: “Common Controls”

The element displays the value of a variable as a progress bar.

**Element properties**

<table>
<thead>
<tr>
<th>“Element name”</th>
<th>Optional</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hint: Assign individual names for elements so that they are found faster in the element list.</td>
<td></td>
</tr>
<tr>
<td>Example: Progress_Data_Transfer</td>
<td></td>
</tr>
</tbody>
</table>

| “Type of element” | “Progress Bar” |

| “Text ID” | ID of the global text list |
| Requirement: Text is configured in the property “Texts → Text”. |

| “Variable” | Variable (numeric data type). Represents the length of the progress bar. |

| “Minimum value” | Value range of the variable |

| “Maximum value” | |

| “Style” | ● “Blocks” |
| ● “Bar” |

**Element property 'Position'**

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

| “X” | X coordinate of the upper left corner of the element |
| Specified in pixels. |
| Example: 10. |

| “Y” | Y coordinate of the upper left corner of the element |
| Specified in pixels. |
| Example: 10. |

| “Width” | Specified in pixels. |
| Example: 150 |

| “Height” | Specified in pixels. |
| Example: 30 |

You can also change the values by dragging the box symbols (Moving Box) to other positions in the editor.

**Element property 'Center'**

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;X&quot;</td>
<td>X-coordinate of the point of rotation</td>
</tr>
<tr>
<td>&quot;Y&quot;</td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the symbols to other positions in the editor.

**Element property 'Texts'**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Text&quot;</td>
<td>String label for the element. Example: Zoom</td>
</tr>
</tbody>
</table>

**Element property 'Absolute movement'**

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Movement&quot;</td>
<td>Variable (numeric data type). Defines the X position (in pixels). Example: PLC_PRG.iPos_X. Increasing this value in runtime mode moves the element to the right.</td>
</tr>
<tr>
<td>&quot;Y&quot;</td>
<td>Variable (numeric data type). Defines the Y position (in pixels). Example: PLC_PRG.iPos_Y. Increasing this value in runtime mode moves the element downwards.</td>
</tr>
<tr>
<td>&quot;Rotation&quot;</td>
<td>Variable (numeric data type). Defines the angle of rotation (in degrees). Example: PLC_PRG.iAngle1. The midpoint of the element rotates at the &quot;Center&quot; point. This rotation point is shown as the symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.</td>
</tr>
</tbody>
</table>
**“Interior rotation”**

Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol.

Note: If a static angle of rotation is specified in the “Position ➔ Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

---

You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.

See also

- 

**Element property ‘State variables’**

The variables control the element behavior dynamically.

**“Invisible”**

Variable (BOOL). Toggles the visibility of the element.

TRUE: The element is not visible at runtime.

The “Invisible” property is supported by the “Client Animation” functionality.

These properties are available only when you have selected the “Support client animations and overlay of native elements” option in the Visualization Manager.
**Animation duration**

Defines the duration (in milliseconds) in which the element runs an animation

- **Variable (integer value)**
  
  Example: `Menu.tContent with VAR tContent : INT := 500; END_VAR`

- **Integer literal**
  
  Example: `500`

**Animatable properties**

- “Absolute movement”, “Movement”, “X”, “Y”
- “Absolute movement”, “Rotation”
- “Absolute movement”, “Interior rotation”
- “Absolute movement”, “Exterior rotation”

The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.

**Move to foreground**

Moves the visualization element to the foreground

Variable (BOOL)

Example: `bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR`

**TRUE:** At runtime, the visualization element is displayed in the foreground.

**FALSE:** At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

**Element property 'Access rights'**

Requirement: User management is set up for the visualization.

**Access rights**

Opens the “Access rights” dialog. There you can edit the access privileges for the element.

Status messages:

- **“Not set. Full rights.”:** Access rights for all user groups: “operable”
- **“Rights are set: Limited rights.”:** Access is restricted for at least one group.

<thead>
<tr>
<th>Example: “Black”</th>
</tr>
</thead>
<tbody>
<tr>
<td>▶: The “Color” dialog box opens.</td>
</tr>
<tr>
<td>▼: Drop-down list with style colors.</td>
</tr>
</tbody>
</table>

### "Transparency"

Whole number (value range from 0 to 255). This determines the transparency of the respective color.

| Example: 255: The color is opaque. |
| 0: The color is completely transparent. |

Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

---

**Element property 'Absolute movement'**

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

<table>
<thead>
<tr>
<th>&quot;Movement&quot;</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>&quot;X&quot;</strong> Variable (numeric data type). Defines the X position (in pixels).</td>
</tr>
<tr>
<td>Example: PLC_PRG.iPos_X.</td>
</tr>
<tr>
<td>Increasing this value in runtime mode moves the element to the right.</td>
</tr>
<tr>
<td><strong>&quot;Y&quot;</strong> Variable (numeric data type). Defines the Y position (in pixels).</td>
</tr>
<tr>
<td>Example: PLC_PRG.iPos_Y.</td>
</tr>
<tr>
<td>Increasing this value in runtime mode moves the element downwards.</td>
</tr>
<tr>
<td><strong>&quot;Rotation&quot;</strong> Variable (numeric data type). Defines the angle of rotation (in degrees).</td>
</tr>
<tr>
<td>Example: PLC_PRG.iAngle1.</td>
</tr>
<tr>
<td>The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.</td>
</tr>
<tr>
<td>In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.</td>
</tr>
<tr>
<td><strong>&quot;Interior rotation&quot;</strong> Variable (numeric data type). Defines the angle of rotation (in degrees).</td>
</tr>
<tr>
<td>Example: PLC_PRG.iAngle2.</td>
</tr>
<tr>
<td>In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.</td>
</tr>
<tr>
<td>The rotation point is shown as the symbol.</td>
</tr>
<tr>
<td>Note: If a static angle of rotation is specified in the “Position ➔ Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.</td>
</tr>
</tbody>
</table>
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.

See also

The variables control the element behavior dynamically.

<table>
<thead>
<tr>
<th>Property</th>

**Visualization Element 'Radio Buttons'**

**Symbol:**

Category: “Common Controls”

The element provides a series of radios buttons with an unlimited number of options.
### Element properties

<table>
<thead>
<tr>
<th>&quot;Element name&quot;</th>
<th>Optional</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hint: Assign individual names for elements so that they are found faster in the element list.</td>
<td></td>
</tr>
<tr>
<td>Example: Morning Shift</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>&quot;Type of element&quot;</th>
<th>&quot;Radio Buttons&quot;</th>
</tr>
</thead>
</table>

### Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

<table>
<thead>
<tr>
<th>&quot;X&quot;</th>
<th>X coordinate of the upper left corner of the element</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Specified in pixels.</td>
</tr>
<tr>

</tbody>
</table>

<table>
<thead>
<tr>
<th>&quot;Transparency&quot;</th>
</tr>
</thead>
<tbody>
<tr>
<td>Whole number (value range from 0 to 255). This determines the transparency of the respective color.</td>
</tr>
<tr>
<td>Example: 255: The color is opaque.</td>
</tr>
<tr>
<td>0: The color is completely transparent.</td>
</tr>
</tbody>
</table>

Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

<table>
<thead>
<tr>
<th>&quot;Movement&quot;</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable (numeric data type). Defines the X position (in pixels).</td>
</tr>
<tr>
<td>Example: PLC_PRG.iPos_X.</td>
</tr>
<tr>
<td>Increasing this value in runtime mode moves the element to the right.</td>
</tr>
</tbody>
</table>

| "Y" |
| Variable (numeric data type). Defines the Y position (in pixels). |
| Example: PLC_PRG.iPos_Y. |
| Increasing this value in runtime mode moves the element downwards. |
### “Rotation”

Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle1.

The midpoint of the element rotates at the “Center” point. This rotation point is shown as the + symbol.

In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

### “Interior rotation”

Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the + symbol.

Note: If a static angle of rotation is specified in the “Position ➔ Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

---

You can link the variables to a unit conversion.

---

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.

### Element property 'State variables'

The variables control the element behavior dynamically.

<table>
<thead>
<tr>
<th>Variable (BOOL)</th>
<th>Toggles the visibility of the element.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Invisible”</strong></td>
<td>TRUE: The element is not visible at runtime.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>VAR bIsVisible : BOOL := FALSE;</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Variable (BOOL)</th>
<th>Toggles the operability of the element.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Deactivate inputs”</strong></td>
<td>TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated.</td>
</tr>
</tbody>
</table>
The “Invisible” property is supported by the “Client Animation” functionality.

<table>
<thead>
<tr>
<th>Element property 'Radio button settings'</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>“Radio button”</td>
<td>“Create new”: Clicking this button creates a new selection button in the editor and lists an additional area in the properties editor. For each radio button, an area is visible that records the settings.</td>
</tr>
</tbody>
</table>
| • “Areas”                                 | • [<n>]: This number indicates the area. Clicking “Delete” will delete the associated radio button with its settings “Text”, “Tooltip”, and “Line spacing (in pixels)”.
|   – “[<n>]”                               | |
| Areas: [<n>]                              | |
| “Text”                                   | The button name is specified here. Default value: “Radio_button” |
| “Tooltip”                                 | Text is specified here that is displayed in a tooltip. |
| “Line spacing (in pixels)”               | The distance (in pixels) to the upper button can be specified here. |

These properties are available only when you have selected the “Support client animations and overlay of native elements” option in the Visualization Manager.

<table>
<thead>
<tr>
<th>“Animation duration”</th>
<th>Defines the duration (in milliseconds) in which the element runs an animation</th>

- Chapter 6.4.5.5 “Designing a visualization with elements” on page 2872

Visualization Element 'Alarm Table'
Symbol:

Category: “Alarm Manager”
The element displays alarms in a list. In the element properties, you specify which information is shown. You define the appearance of the element and the variables that control the element behavior.

In online mode, you can sort an alarm table by a specific column – even in the classic view. Click into the column header. A small triangle indicates the current sort order (ascending, descending). Clicking the symbol reverses the order.

Sorting inside the column depends on the type of the contained information. The "Priority" column is sorted numerically, and the "Message" and "Class" columns alphabetically. The "Value" and "Latch" columns may contain different value types. In this case, sorting is first by type (blank, Boolean, numeric value, character string) and then either numerically or alphabetically depending on the type.

If an alarm history has been created, then you can programmatically delete it at runtime. The recording starts again from the time of deletion. See the help page for “Visualizing Alarm Management”.

Element properties
<table>
<thead>
<tr>
<th><strong>Element name</strong></th>
<th>Example: GenElemInst_1</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type of element</strong></td>
<td>“Alarm Table”</td>
</tr>
</tbody>
</table>
| **Data source** | Selection of the device and the application where the data to be visualized and the alarms are generated  
- Remote data source which accesses a remote device, accesses a remote application, and then transfers the data to the alarm configuration  
Example: ![DataSource_A](image)
  
Below the (now visible) “Application” property, the remote application is displayed as configured in the data source.  
Example: ![App_A](image)
  
Note: If the data source is accessed symbolically by means of a symbol file (CODESYS symbolic), then the required symbol file and the corresponding project have to be saved in the same folder.  
- Local application below which the alarm configuration is located  
Example: ![<local application>](image) |

- **Object 'Data Source'**

**Element property 'Alarm configuration'**

<table>
<thead>
<tr>
<th><strong>Alarm groups</strong></th>
<th>Opens the “Select Alarm Group” dialog where you define the alarm groups that you want to display.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Priority from</strong></td>
<td>Least priority for alarm display. (0 to 255).</td>
</tr>
<tr>
<td><strong>Priority to</strong></td>
<td>Greatest priority for alarm display. (0 to 255).</td>
</tr>
<tr>
<td><strong>Alarm classes</strong></td>
<td>Opens the “Select Class Group” dialog where you define the alarm classes that you want to display.</td>
</tr>
</tbody>
</table>
| **Filter criterion** | For the “Alarm Banner” element only  
- “Most important”: The alarm with the highest priority (lowest value) is displayed.  
- “Newest”: The most recent alarm is displayed. |
**Filter by latch 1**

The generated alarms (previous and current) can be filtered by the contents of "Latch variable 1", which is specified in the configuration of the alarm group. In "Filter type", you define whether or not the filtering is performed by a string value or a numerical value.

- **Filter variable**: Indicates what the alarms are filtered by. Possible entries: Application variable of data type STRING or WSTRING, or a literal value directly. Examples: PLC_PRG.strFilterVariable, 'STRING'.
- **Filter type**: Integer value that determines by which criteria the latch variable value is used for filtering. Possible entries: Numerical variable from the application (example: PLC_PRG.diFilterType, or a value directly (example: 2).

Possible values:
- 0: No filtering
- 1: Filter by alarms whose latch variable 1 contains the string specified in "Filter variable". Example: The filter variable contains 'Error 1' which is the latch variable 1 of different alarms of type STRING and has the value 'Error 1' ->. Only these alarms are displayed.
- 2: Filter by alarms whose latch variable 1 contains the typed literal specified in "Filter variable" according to IEC 61131-3. Examples: T#1h2s, DINT#15, REAL#1.5, FALSE
- 3: Filter by alarms whose latch variable 1 contains the LINT literal value specified in "Filter variable". Therefore, the value of the latch variables has to be in the range of 9,223,372,036,854,775,808 to 9,223,372,036,854,775,807.
- All other values: The behavior is not defined and can change in the future.

**Filter by time range**

The generated alarms (remote, historical, local) can be displayed for a specified time range. You use the "Filter type" to define whether filtering by time range is enabled or disabled.

- **Filter variable, from**: Variable of data type DT or DATE_AND_TIME (example: PLC_PRG.filterTimeFrom) for the start time that the alarms are displayed.
- **Filter variable, to**: Variable of data type DT or DATE_AND_TIME (example: PLC_PRG.filterTimeTo) for the end time that the alarms are displayed.
- **Filter type**: Variable of integer data type that determines whether "Filter by time range" is enabled or disabled.

Possible values:
- 1: Filtering is enabled
- 0: Filtering is disabled

**Element property 'General table configuration'**

- **Show row header**: Display of the row number at the beginning of the row.
- **Show column header**: Display of the column heading as defined in “Column heading”.
- **Row height**: Height of the table rows (in pixels).
- **Row header width**: Width of the line header (in pixels).
### "Scrollbar size"

Width of the scrollbar when it runs vertically. Width of the scrollbar when it runs horizontally. Specified in pixels.

### "Automatic line break for alarm message"

- ✓: The message text is truncated at the end of the line.
- ☐: The message text is truncated at the end of the column, if the text is too long.

---

**Element property 'Columns: Column [<>]':**

By default, columns [0] and [1] are configured: “Time stamp” and “Message text”. You can create more columns by clicking the “Create new”, and remove columns by clicking “Delete”. Animations (dynamic text, font variables), text, and tooltip are not supported.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Column header&quot;</td>
<td>The standard header is set and changed here by specifying a new text.</td>
</tr>
</tbody>
</table>
| "Use text alignment in title" | ✓: The text in the column header is aligned according to the current definition in "Text alignment".  
  ☐: The text in the column header is centered.                               |
| "Width"             | Width of the column (in pixels).                                            |
| "Data type"         | Notice about time stamps: For use in a TargetVisu or WebVisu, you can control the date and time format with the help of the global string variables from the library Alarmmanager.library: AlarmGlobals.g_sDateFormat (example: AlarmGlobals.g_sDateFormat := 'MM.yyyy') and AlarmGlobals.g_sTimeFormat (example: AlarmGlobals.g_sTimeFormat := 'HH:mm'). Define the information to be displayed in the column. |
| - "Symbol"          | Date and time of the last status change of the alarm.                      |

| - "Time stamp active"| Date and time of the last deactivation of the alarm.                       |
| - "Time stamp inactive" | Date and time of the last deactivation of the alarm.                      |
| - "Time stamp acknowledge" | Date and time of the last acknowledgment.                                |
| - "Value"           | Current value of the printout                                             |
| - "Message text"    | Output of the message text                                                |
| - "Priority"        | Alarm priority                                                             |
| - "Class"           | Alarm class                                                                |
| - "State"           | Alarm state                                                                |
| - "Latch Variable <n>" | Value of the selected latch variables                                     |
| "Text alignment"    | Alignment of the text in this column                                       |
| - "Left"            |                                                                             |
| - "Centered"        |                                                                             |
| - "Right"           |                                                                             |
| "Color settings"    |                                                                             |
| - "Activate color settings": Boolean variable for activating and deactivating the color settings defined here. Example: PLC_PRG.bColorSettings  |
| - "Cell fill color": Variable for the cell fill color, example: dwCellColor (hexadecimal color definition: 16#TTRRGGBB) |
| - "Use color also for column header": ✓: The color defined via "Color variable" is used in the column header as well. |
| - "Text color":     |                                                                             |
| - "Color variable": Variable for the definition of the text color in the column, example: dwTextColor (hexadecimal color definition: 16#TTRRGGBB) |
| - "Use color also for column header": ☐: The color defined via "Color variable" is used in the column header as well. |

Element property 'Position' The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>X</td>
<td>X coordinate of the upper left corner of the element Specified in pixels. Example: 10.</td>
</tr>
<tr>
<td>Y</td>

### Element property 'Control variables'

Boolean variables are defined here for executing specific actions in the table can be executed at runtime.

<table>
<thead>
<tr>
<th>Variable Name</th>
<th>Data Type</th>
<th>Example</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Acknowledge selected”</td>
<td>BOOL</td>
<td>PLC_PRG.bAckSelectedAlarms</td>
<td>If the assigned variable is TRUE, then the selected alarm is acknowledged.</td>
</tr>
<tr>
<td>“Acknowledge all visible”</td>
<td>BOOL</td>
<td>PLC_PRG.bAckVisibleAlarms</td>
<td>If the assigned variable is TRUE, then all alarms are acknowledged that are visible in the alarm table.</td>
</tr>
<tr>
<td>“History”</td>
<td>BOOL</td>
<td>PLC_PRG.bShowHistory</td>
<td>If the assigned variable is TRUE, then the history alarms are displayed in addition to the active alarms. In the classic view, the same sort options apply as in normal mode. Note: Acknowledgment is not possible in this view.</td>
</tr>
<tr>
<td>“Freeze scroll position”</td>
<td>BOOL</td>
<td>PLC_PRG.bFreezeScrollPosition</td>
<td>If the assigned variable is TRUE, then the scroll position set in the “History” view is retained, even if a new alarm is active. If not, then the scroll position jumps to the first table row (the newest alarm).</td>
</tr>
<tr>
<td>“Count alarms”</td>
<td>integer</td>
<td>PLC_PRG.iNumberOfAlarms</td>
<td>Number of alarms that are currently displayed in the alarm table. Defined by the alarm table.</td>
</tr>
<tr>
<td>“Count visible rows”</td>
<td>integer</td>
<td>PLC_PRG.iNumberVisibleLines</td>
<td>Number of alarms that can be displayed on one page of the alarm table. Defined by the alarm table.</td>
</tr>
<tr>
<td>“Current scroll index”</td>
<td>integer</td>
<td>PLC_PRG.iScrollIndex</td>
<td>The index of the first visible row if the alarm table (0-based). The variable can be read and written.</td>
</tr>
<tr>
<td>“Current column sorting”</td>
<td>integer</td>
<td>PLC_PRG.iColSort</td>
<td>The variable contains a value of the enumeration &quot;VisuElemsAlarm.VisuEnumAlarmDataType&quot;. This value determines the column that sorts the alarm table.</td>
</tr>
<tr>
<td>“Variable for sorting direction”</td>
<td>BOOL</td>
<td>PLC_PRG.xSortAscending</td>
<td>The variable determines the sort order for the entries in the alarm table (TRUE: ascending; FALSE: descending).</td>
</tr>
</tbody>
</table>

You can also use the “Insert Elements for Acknowledging Alarms” command to define buttons with predefined control variables.
The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

## "Movement"

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>X</td>
<td>X position (in pixels)</td>
<td>PLC_PRG.iPos_X. Increasing this value in runtime mode moves the element to the right.</td>
</tr>
<tr>
<td>Y</td>
<td>Y position (in pixels)</td>
<td>PLC_PRG.iPos_Y. Increasing this value in runtime mode moves the element downwards.</td>
</tr>
</tbody>
</table>

## "Rotation"

Variable (numeric data type). Defines the angle of rotation (in degrees).

Example: PLC_PRG.iAngle1.

The midpoint of the element rotates at the “Center” point. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

## "Interior rotation"

Variable (numeric data type). Defines the angle of rotation (in degrees).

Example: PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in "Center" according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the symbol.

Note: If a static angle of rotation is specified in the "Position ➔ Angle" property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

You can link the variables to a unit conversion.
The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.

See also

- Element property ‘State variables’

The variables control the element behavior dynamically.

<table>
<thead>
<tr>
<th>“Invisible”</th>
<th>Variable (BOOL). Toggles the visibility of the element.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>TRUE: The element is not visible at runtime.</td>
</tr>
</tbody>
</table>

The “Invisible” property is supported by the “Client Animation” functionality.

These properties are available only when you have selected the “Support client animations and overlay of native elements” option in the Visualization Manager.

<table>
<thead>
<tr>
<th>“Animation duration”</th>
<th>Defines the duration (in milliseconds) in which the element runs an animation</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>- Variable (integer value)</td>
</tr>
<tr>
<td></td>
<td>Example: Menu.tContent with VAR tContent : INT := 500; END_VAR</td>
</tr>
<tr>
<td></td>
<td>- Integer literal</td>
</tr>
<tr>
<td></td>
<td>Example: 500</td>
</tr>
</tbody>
</table>

- Animatable properties

- “Absolute movement”, “Movement”, “X”, “Y”
- “Absolute movement”, “Rotation”
- “Absolute movement”, “Interior rotation”
- “Absolute movement”, “Exterior rotation”

The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.

<table>
<thead>
<tr>
<th>“Move to foreground”</th>
<th>Moves the visualization element to the foreground</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Variable (BOOL)</td>
</tr>
<tr>
<td></td>
<td>Example: bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR</td>
</tr>
<tr>
<td></td>
<td>TRUE: At runtime, the visualization element is displayed in the foreground.</td>
</tr>
<tr>
<td></td>
<td>FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.</td>
</tr>
</tbody>
</table>

Element property ‘Access rights’

Requirement: User management is set up for the visualization.
**“Access rights”**

Opens the “Access rights” dialog. There you can edit the access privileges for the element.

Status messages:
- “Not set. Full rights.”: Access rights for all user groups: “operable”
- “Rights are set: Limited rights”: Access is restricted for at least one group.

See also
- ∙ Chapter 6.4.5.21.3.1 “Dialog ‘Access Rights’” on page 3366

**Visualization Element ‘Alarm Banner’**

Symbol:

Category: “Alarm Manager”

The element is a simplified version of the alarm table. It visualizes a single alarm only. In the element properties, you specify which information is shown. You define the appearance of the element and the variables that control the element behavior.

> The alarm banner displays active alarms only. If the alarm is acknowledged, then it disappears from the alarm banner.

**Element properties**

<table>
<thead>
<tr>
<th>“Element name”</th>
<th>Example: GenElemInst_1</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Type of element”</td>
<td>“Alarm Banner”</td>
</tr>
<tr>
<td>“Data source”</td>
<td>If you intend to use a remote alarm configuration, then you have to specify the name of the remote application here. If you do not specify anything, the alarm configuration will be located locally.</td>
</tr>
</tbody>
</table>

**Element property 'Alarm configuration'**

| “Alarm groups” | Opens the “Select Alarm Group” dialog where you define the alarm groups that you want to display. |
| “Priority from” | Least priority for alarm display. (0 to 255). |
| “Priority to” | Greatest priority for alarm display. (0 to 255). |
| “Alarm classes” | Opens the “Select Class Group” dialog where you define the alarm classes that you want to display. |
| “Filter criterion” | For the “Alarm Banner” element only |
| | ● “Most important”: The alarm with the highest priority (lowest value) is displayed. |
| | ● “Newest”: The most recent alarm is displayed. |
### "Filter by latch 1"

The generated alarms (previous and current) can be filtered by the contents of "Latch variable 1", which is specified in the configuration of the alarm group. In "Filter type", you define whether or not the filtering is performed by a string value or a numerical value.

- **"Filter variable"**: Indicates what the alarms are filtered by. Possible entries:
  - Application variable of data type STRING or WSTRING, or a literal value directly. Examples: PLC_PRG.strFilterVariable, 'STRING'.
  - Integer value that determines by which criteria the latch variable value is used for filtering. Possible entries: Numerical variable from the application (example: PLC_PRG.diFilterType), or a value directly (example: 2).

  Possible values:
  - 0: No filtering
  - 1: Filter by alarms whose latch variable 1 contains the string specified in "Filter variable". Example: The filter variable contains 'Error 1' which is the latch variable 1 of different alarms of type STRING and has the value 'Error 1' ->. Only these alarms are displayed.
  - 2: Filter by alarms whose latch variable 1 contains the typed literal specified in "Filter variable" according to IEC 61131-3. Examples: T#1h2s, DINT#15, REAL#1.5, FALSE
  - 3: Filter by alarms whose latch variable 1 contains the LINT literal value specified in "Filter variable". Therefore, the value of the latch variables has to be in the range of 9,223,372,036,854,775,808 to 9,223,372,036,854,775,807.
  - All other values: The behavior is not defined and can change in the future.

### "Filter by time range"

The generated alarms (remote, historical, local) can be displayed for a specified time range. You use the "Filter type" to define whether filtering by time range is enabled or disabled.

- **"Filter variable, from"**: Variable of data type DT or DATE_AND_TIME (example: PLC_PRG.filterTimeFrom) for the start time that the alarms are displayed.
- **"Filter variable, to"**: Variable of data type DT or DATE_AND_TIME (example: PLC_PRG.filterTimeTo) for the end time that the alarms are displayed.
- **"Filter type"**: Variable of integer data type that determines whether "Filter by time range" is enabled or disabled.

Possible values:
- 1: Filtering is enabled
- 0: Filtering is disabled

See also
- § Chapter 6.4.5.21.3.17 "Dialog 'Selected Alarm Group'" on page 3390
- § Chapter 6.4.5.21.3.16 "Dialog 'Selected Alarm Class'" on page 3389

### Element property 'Columns: Column [<n>]'

By default, columns [0] and [1] are preconfigured: "Time stamp" and "Message text". You create more columns by clicking "Create new". You remove columns by clicking "Delete".

Animations (dynamic text, font variables), texts, and tooltips are not supported.
**“Width”** | Width of the column (in pixels)  
---|---  
**“Type of data”** | About time stamps: When used in a TargetVisu or WebVisu, you can control the date and time format by means of the global string variables from the library `Alarmmanager.library`: `AlarmGlobals.g_sDateFormat := 'MM.yyyy')` and `AlarmGlobals.g_sTimeFormat` (example: `AlarmGlobals.g_sTimeFormat := 'HH:mm'`).  
Here you define the information to be displayed in the column.  
- “Bitmap”  
- “Time stamp”: Date and time of the last status change of the alarm  
- “Time stamp active”: Date and time of the last activation of the alarm  
- “Time stamp inactive”: Date and time of the last deactivation of the alarm  
- “Time stamp acknowledge”: Date and time of the last acknowledgement  
- “Value”: Actual value of the expression  
- “Message”: Output of the message text  
- “Priority”: Alarm priority  
- “Class”: Alarm class  
- “State”: Alarm state  
- “Latch Variable <n>”: Value of the selected latch variables  

**“Text alignment”** | Alignment of the contents in the column  
---|---  
- “Left”  
- “Centered”  
- “Right”  

**Element property 'Position’**  
The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

| “X” | X coordinate of the upper left corner of the element  
|---|---  
| Specified in pixels.  
| Example: 10.  
| “Y” | Y coordinate of the upper left corner of the element  
|---|---  
| Specified in pixels.  
| Example: 10.  
| “Width” | Specified in pixels.  
|---|---  
| Example: 150  
| “Height” | Specified in pixels.  
|---|---  
| Example: 30

You can also change the values by dragging the box symbols (🖼) to other positions in the editor.

See also  
- § Chapter 6.4.5.5.3 “Positioning the Element, Adapting Size and Layer” on page 2874
The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

<table>
<thead>
<tr>
<th>“X”</th>
<th>X-coordinate of the point of rotation</th>

</tr>
<tr>
<td></td>
<td>In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.</td>
<td><img src="image" alt="Image of interior rotation" /></td>
</tr>
<tr>
<td></td>
<td>The rotation point is shown as the symbol.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Note: If a static angle of rotation is specified in the “Position ➔ Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.</td>
<td></td>
</tr>
</tbody>
</table>

You can link the variables to a unit conversion.

The "X", "Y", "Rotation", and "Interior rotation" properties are supported by the "Client Animation" functionality.

See also

- The variables control the element behavior dynamically.
**“Invisible”**

Variable (BOOL). Toggles the visibility of the element.

**TRUE:** The element is not visible at runtime.

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the “Support client animations and overlay of native elements” option in the Visualization Manager.

---

**“Animation duration”**

Defines the duration (in milliseconds) in which the element runs an animation

- **Variable (integer value)**
  
  Example: Menu.tContent with VAR tContent : INT := 500; END_VAR

- **Integer literal**
  
  Example: 500

**Animatable properties**

- “Absolute movement”, “Movement”, “X”, “Y”
- “Absolute movement”, “Rotation”
- “Absolute movement”, “Interior rotation”
- “Absolute movement”, “Exterior rotation”

The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.

**“Move to foreground”**

Moves the visualization element to the foreground

**Variable (BOOL)**

Example: bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR

**TRUE:** At runtime, the visualization element is displayed in the foreground.

**FALSE:** At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

---

**Element property ‘Access rights’**

Requirement: User management is set up for the visualization.

**“Access rights”**

Opens the “Access rights” dialog. There you can edit the access privileges for the element.

Status messages:

- “Not set. Full rights.”: Access rights for all user groups : “operable”
- “Rights are set: Limited rights”: Access is restricted for at least one group.

</table>

Element property ‘Center’

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

| “X” | X-coordinate of the point of rotation |
| “Y” | Y-coordinate of the point of rotation |

You can also change the values by dragging the symbols (_symbol) to other positions in the editor.

These properties are available only when you have selected the “Support client animations and overlay of native elements” option in the Visualization Manager.
**“Animation duration”**

Defines the duration (in milliseconds) in which the element runs an animation

- **Variable (integer value)**
  
  **Example:**
  ```
  Menu.tContent with VAR tContent : INT := 500; END_VAR
  ```

- **Integer literal**
  
  **Example:** 500

**Animatable properties**

- “Absolute movement”, “Movement”, “X”, “Y”
- “Absolute movement”, “Rotation”
- “Absolute movement”, “Interior rotation”
- “Absolute movement”, “Exterior rotation”

The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.

**“Move to foreground”**

Moves the visualization element to the foreground

Variable (BOOL)

**Example:**
```
VAR bIsInForeground : BOOL := FALSE; END_VAR
```

**TRUE:** At runtime, the visualization element is displayed in the foreground.

**FALSE:** At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

**Element property ‘Position’**

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>X</strong></td>
<td>X coordinate of the upper left corner of the element. Specified in pixels. <strong>Example:</strong> 10.</td>
</tr>
<tr>
<td><strong>Y</strong></td>
<td>Y coordinate of the upper left corner of the element. Specified in pixels. <strong>Example:</strong> 10.</td>
</tr>
<tr>
<td><strong>Width</strong></td>
<td>Specified in pixels. <strong>Example:</strong> 150</td>
</tr>
<tr>
<td><strong>Height</strong></td>
<td>Specified in pixels. <strong>Example:</strong> 30</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the box symbols ((locations) to other positions in the editor.

See also

Element property 'Background'

“Background color” Drop-down list with background colors
Note: This property depends on the style. For example, there are no heterochromatic background images for “FlatStyle” and “WhiteStyle”.

“Own image”
- “image”: Image ID of the background image. You select the background image from an image pool by clicking the symbol.
  Info: If you specify the “<default>” value or select the image from the “Default” category in the input assistant, then the original element background image is used.
- “Transparent color”: Color of pixels that are displayed as transparent.
  Selection from drop-down list or input assistant.

“Optimized drawing”
- The background image is drawn one time. If there is a change in the foreground, then only the affected part of the image is redrawn.
- The background image is redrawn in cycles.
  Note: Deactivating this option is sensible only in certain exceptional cases.

Element property 'Bar'

“Diagram type” Position of the scale
- “Scale besides bar”
- “Scale in bar”
- “Bar in scale”
- “No scale”

“Orientation” Orientation depending on the ratio of width to height of the Bar Display:
- “Horizontal”
- “Vertical”

“Running direction” Direction the values are increased.
Drop-down list for “Orientation Horizontal”:
- “Left to right”
- “Right to left”
Drop-down list for “Orientation Vertical”:
- “Bottom to top”
- “Top to bottom”

“Optimum size for bar” The bar width requires the majority of the element surface.
Note: This property depends on the style. It is not provided for “FlatStyle” or “WhiteStyle”.

Element property 'Scale'
| **Scale start** | Least value of the scale and the lower limit of the value range for the element.  
Example: 0  
📍: The property “Variable” is shown below. |
| **Variable** | Variable (integer data type). Contains the scale start.  
Example: PLC_PRG.iScaleStart  
Declaration: |
| **Scale end** | Greatest value of the scale and the upper limit of the value range for the element.  
Example: 100  
📍: The property “Variable” is shown below. |
| **Variable** | Variable (integer data type). Contains the scale end.  
Example: PLC_PRG.iScaleEnd  
Declaration: |
| **Main scale** | Distance between 2 values on the rough scale.  
Example: 10  
📍: The property “Variable” is shown below. |
| **Variable** | Variable (integer data type). Contains the distance.  
Example: PLC_PRG.iMainScale  
Declaration: |
| **Subscale** | Distance between 2 values on the fine scale.  
You can hide the fine scale by setting the value to 0.  
Example: 2  
📍: The property “Variable” is shown below. |
| **Variable** | Variable (integer data type). Contains the spacing.  
Example: PLC_PRG.iSubScale  
Declaration: |
“Scale line width” Specified in pixels.
Example: 3

“Scale color” Color of scale lines
- ▼: The “Color” dialog box opens.
- ▼: A drop-down list with color names opens.

“Scale in 3D” ✔: Tick marks are displayed with slight 3D shadowing.
Note: This property depends on the style. Not available for “FlatStyle”.

“Element frame” ✔: A frame is drawn around the element.

Element property 'Label'

“Unit” Text that is displayed in the element.
Example: Units displayed in m/s.

“Font” Font for labels (example: scale numbering).
Selection from the drop-down list or by clicking the ▼ button.

“Scale format (C Syntax)” Values scaled in "printf" syntax
Examples: %d, %.2f

“Max. text width of labels” (optional) Value that redefines the maximum width of the scale label. The correct value is normally set automatically.
Note: Change this value only if the automatic adjustment does not yield the expected result.

“Text height of labels” (optional) Value that redefines the maximum height of the scale label. The correct value is normally set automatically.
Note: Change this value only if the automatic adjustment does not yield the expected result.

“Font color” Selection from the drop-down list or by clicking the ▼ button.

Element property 'Positioning'

“Horizontal offset” Distance from the scale (bar) to the horizontal element frame
Specified in pixels.
Used for achieving the exact position relative to the background image.

“Vertical offset” Distance from the scale (bar) to the vertical element frame
Specified in pixels.
Used for achieving the exact position relative to the background image.

“Horizontal scaling” Horizontal division of the scale
Specified in pixels.
Used for achieving the exact positioning relative to the background image.

“Vertical scaling” Vertical division of the scale
Specified in pixels.
Used for achieving the exact positioning relative to the background image.
Element property 'Colors'

<table>

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;X&quot;</td>
<td>Variable (numeric data type). Defines the X position (in pixels).</td>
</tr>
<tr>
<td></td>
<td>Example: PLC_PRG.iPos_X.</td>
</tr>
<tr>
<td></td>
<td>Increasing this value in runtime mode moves the element to the right.</td>
</tr>
<tr>
<td>&quot;Y&quot;</td>
<td>Variable (numeric data type). Defines the Y position (in pixels).</td>
</tr>
<tr>
<td></td>
<td>Example: PLC_PRG.iPos_Y.</td>
</tr>
<tr>
<td></td>
<td>Increasing this value in runtime mode moves the element downwards.</td>
</tr>
<tr>
<td>&quot;Rotation&quot;</td>
<td>Variable (numeric data type). Defines the angle of rotation (in degrees).</td>
</tr>
<tr>
<td></td>
<td>Example: PLC_PRG.iAngle1.</td>
</tr>
<tr>
<td></td>
<td>The midpoint of the element rotates at the &quot;Center&quot; point. This rotation point is shown as the symbol.</td>
</tr>
<tr>
<td></td>
<td>In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.</td>
</tr>
</tbody>
</table>
"Interior rotation" Variable (numeric data type). Defines the angle of rotation (in degrees).

Example: PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in "Center" according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol.

Note: If a static angle of rotation is specified in the "Position & Angle" property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

You can link the variables to a unit conversion.

The "X", "Y", "Rotation", and "Interior rotation" properties are supported by the "Client Animation" functionality.

See also

Element property 'State variables'

"Deactivate inputs" Variable (BOOL). Toggles the operability of the element.

TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated.

Requirement: User management is set up for the visualization.

Element property 'Access rights'

"Access rights" Opens the "Access rights" dialog. There you can edit the access privileges for the element.

Status messages:
- "Not set. Full rights.": Access rights for all user groups: "operable"
- "Rights are set: Limited rights": Access is restricted for at least one group.

See also

- Chapter 6.4.5.21.3.1 "Dialog 'Access Rights'" on page 3366

Visualization Element 'Meter 90°'

Symbol:
**Category:** “Measurement Controls”

The element displays the value of a variable. The needle is positioned according to the value of the assigned variable. A meter is used to represent a tachometer, for example.

### Element properties

<table>
<thead>
<tr>
<th><strong>“Element name”</strong></th>
<th>Example: GenElemInst_1</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Type of element”</strong></td>
<td>“Meter 90°”</td>
</tr>
<tr>
<td><strong>“Value”</strong></td>
<td>Variable (numeric data type)</td>
</tr>
</tbody>
</table>

The variable value determines the pointer direction of the element.

These properties are available only when you have selected the “Support client animations and overlay of native elements” option in the Visualization Manager.

<table>
<thead>
<tr>
<th><strong>“Animation duration”</strong></th>
<th>Defines the duration (in milliseconds) in which the element runs an animation</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• Variable (integer value)</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> Menu.tContent with VAR tContent : INT := 500; END_VAR</td>
</tr>
<tr>
<td></td>
<td>• Integer literal</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> 500</td>
</tr>
</tbody>
</table>

**Animatable properties**

- “Absolute movement”, “Movement”, “X”, “Y”
- “Absolute movement”, “Rotation”
- “Absolute movement”, “Interior rotation”
- “Absolute movement”, “Exterior rotation”

The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.

<table>
<thead>
<tr>
<th><strong>“Move to foreground”</strong></th>
<th>Moves the visualization element to the foreground</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><strong>Variable (BOOL)</strong></td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR</td>
</tr>
<tr>
<td></td>
<td><strong>TRUE:</strong> At runtime, the visualization element is displayed in the foreground.</td>
</tr>
<tr>
<td></td>
<td><strong>FALSE:</strong> At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.</td>
</tr>
</tbody>
</table>

### Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.
### Element property 'Background'

<table>
<thead>
<tr>
<th><strong>“Image color”</strong></th>
<th>List box containing background colors</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Own image”</strong></td>
<td></td>
</tr>
<tr>
<td>- “Image”: ID of the background image. You select the background image from an image pool by clicking <img src="image" alt="image pool" />. Info: If you specify the value &quot;&lt;default&gt;&quot; or select the image from the “Default” category in the Input Assistant, then the original element background image is used.</td>
<td></td>
</tr>
<tr>
<td>- “Transparency color”: Selection from list box or Input Assistant.</td>
<td></td>
</tr>
</tbody>
</table>

### Element property 'Arrow'

<table>
<thead>
<tr>
<th><strong>“Hand style”</strong></th>
<th>Drop-down list with different arrow types</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Color”</strong></td>
<td><img src="color" alt="color" /> The “Color” dialog box opens.</td>
</tr>
<tr>
<td>![drop-down list](drop-down list) Drop-down list with color names</td>
<td></td>

### “Sub scale position”
- **“Outside”**: The subscale is displayed on the outer scale ring. ("Frame outside")
- **“Inside”**: The subscale is displayed on the inner scale ring. ("Frame inside")

### “Scale type”
Type of scale
- **“Lines”**
- **“Dots”**
- **“Squares”**

### “Scale start”
Least value of the scale and the lower limit of the value range for the element
Example: 0
*: The “Variable” property is displayed in the line below this.

### “Variable”
Variable (integer data type). Contains the scale start
Example: PLC_PRG.iScaleStart
Declarations:

```plaintext
PROGRAM PLC_PRG
VAR
  iScaleStart : INT := 0;
END_VAR
```

### “Scale end”
Greatest value of the scale and the upper limit of the value range for the element
Example: 100
*: The “Variable” property is shown below this.

### “Variable”
Variable (integer data type). Contains the scale end
Example: PLC_PRG.iScaleEnd
Declarations:

```plaintext
PROGRAM PLC_PRG
VAR
  iScaleEnd : INT := 120;
END_VAR
```

### “Main scale”
Distance between two values on the main scale
Example: 10
*: The “Variable” property is shown below.

### “Variable”
Variable (integer data type) Contains the distance between two values on the main scale
Example: PLC_PRG.iMainScale
Declarations:

```plaintext
PROGRAM PLC_PRG
VAR
  iMainScale : INT := 20;
END_VAR
```

### “Sub scale”
Distance between two values on the fine scale
You can hide the fine scale by setting the value to 0.
Example: 2
*: The “Variable” property is shown below this.
"Variable"

Variable (integer data type) Contains the distance between two values on the fine scale

Example: PLC_PRG.iSubScale

Declaration:

```plaintext
PROGRAM PLC_PRG
VAR
  iSubScale : INT := 5;
END_VAR
```

"Scale line width"

Specified in pixels

Example: 3

"Scale color"

Color of scale lines

- [ ]: The “Color” dialog opens.
- [ ]: A list box with style colors opens.

"Scale in 3D"

[ ]: Scale lines are displayed with soft 3D shadowing.

Note: This property is not displayed in “FlatStyle”.

"Show scale"

[ ]: The scale is displayed.

"Frame inside"

[ ]: A frame is drawn at the inner end of the scale.

"Frame outside"

[ ]: A frame is drawn at the outer end of the scale.

**Element property 'Label'**

"Label"

Selection list

- "Outside": Scale values are placed outside of the scale.
- "Inside": Scale values are placed inside of the scale.

"Unit"

Text that is displayed in the element.

Example: Units displayed in m/s.

"Font"

Font for labels (example: scale numbering).

Selection from the drop-down list or by clicking the ![image](button.png) button.

"Scale format (C Syntax)"

Values scaled in "printf" syntax

Examples: %d, %5.2f

"Max. text width of labels"

(optional) Value that redefines the maximum width of the scale label. The correct value is normally set automatically.

Note: Change this value only if the automatic adjustment does not yield the expected result.

"Text height of labels"

(optional) Value that redefines the maximum height of the scale label. The correct value is normally set automatically.

Note: Change this value only if the automatic adjustment does not yield the expected result.

"Font color"

Selection from the drop-down list or by clicking the ![image](button.png) button.
### “Usage of”
- **“Preset style values”**: Values from the current style
- **“User-defined settings”**: The subnode “Positioning” appears.

### “Positioning”
Requirement: “User-defined settings” is selected as “Usage of”.
The displayed positioning settings depend on the type of needle instrument and Potentiometer, and partially on whether a custom background image is selected. The following settings are used for achieving the exact position relative to the background image.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Needle movement”</strong></td>
<td>Length of the needle (in pixels)</td>
</tr>
<tr>
<td><strong>“Scale movement”</strong></td>
<td>Distance from the tick marks to the center (in pixels)</td>
</tr>
<tr>
<td></td>
<td>Requirement: A customer image is selected as “Background”</td>
</tr>
<tr>
<td><strong>“Scale length”</strong></td>
<td>Length of the tick marks (in pixels)</td>
</tr>
<tr>
<td></td>
<td>Requirement: A customer image is selected as “Background”</td>
</tr>
<tr>
<td><strong>“Label offset”</strong></td>
<td>Distance from the labels to the tick marks (in pixels)</td>
</tr>
<tr>
<td><strong>“Unit offset”</strong></td>
<td>Distance of the unit text “Label ➔ Unit” from the upper scale edge (in pixels)</td>
</tr>
<tr>
<td><strong>“Origin offset”</strong></td>
<td>Offset of the element (in pixels)</td>
</tr>
<tr>
<td></td>
<td>Requirement: For the elements “Meter 180°” and “Meter 90°”, this property is displayed only if a custom image is selected as “Background”</td>
</tr>
</tbody>
</table>

### Element property ‘Colors’

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Color areas”</strong></td>
<td></td>
</tr>
<tr>
<td><strong>“Durable color areas”</strong></td>
<td>![checkbox] All color areas are visible, regardless of the current value.</td>
</tr>
<tr>
<td></td>
<td>![checkbox] Only the color area is visible that includes the current value.</td>
</tr>
<tr>
<td><strong>“Use colors for scale”</strong></td>
<td>![checkbox] Colors in the color area are used only for the scale and frame.</td>
</tr>
<tr>
<td><strong>“Color areas”</strong></td>
<td></td>
</tr>
<tr>
<td><strong>“Create new”</strong></td>
<td>A new color area is added to the “Elements” view.</td>
</tr>
<tr>
<td><strong>“Delete”</strong></td>
<td>The color area is removed from the list and the list is refreshed.</td>
</tr>
<tr>
<td><strong>“Begin of area”</strong></td>
<td>Start value of the color area</td>
</tr>
<tr>
<td></td>
<td>Example: 20</td>
</tr>
<tr>
<td></td>
<td>![checkbox] The property “Variable” is shown below.</td>
</tr>
<tr>
<td><strong>“Variable”</strong></td>
<td>Variable (integer data type). Contains the start value.</td>
</tr>
<tr>
<td></td>
<td>Example: PLC_PRG.iColorAreaStart0</td>
</tr>
<tr>
<td></td>
<td>Declaration:</td>
</tr>
<tr>
<td></td>
<td>PROGRAM PLC_PRG</td>
</tr>
<tr>
<td></td>
<td>VAR</td>
</tr>
<tr>
<td></td>
<td>iColorAreaStart0 : INT := 80;</td>
</tr>
<tr>
<td></td>
<td>END_VAR</td>
</tr>
<tr>
<td><strong>“End of area”</strong></td>
<td>End value of the color area</td>
</tr>
<tr>
<td></td>
<td>Example: 120</td>
</tr>
<tr>
<td></td>
<td>![checkbox] The property “Variable” is shown below.</td>
</tr>
</tbody>
</table>
### Variable

Variable (integer data type). Contains the end value.

**Example:** iColorAreaEnd0

**Declaration:**

```plaintext
PROGRAM PLC_PRG
VAR
    iColorAreaEnd0 : INT := 100;
END_VAR
```

### Color

Color that is used for displaying the area.

### Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

### Movement

#### X

Variable (numeric data type). Defines the X position (in pixels).

**Example:** PLC_PRG.iPos_X.

Increasing this value in runtime mode moves the element to the right.

#### Y

Variable (numeric data type). Defines the Y position (in pixels).

**Example:** PLC_PRG.iPos_Y.

Increasing this value in runtime mode moves the element downwards.

#### Rotation

Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle1.

The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.

In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

#### Interior rotation

Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol.

Note: If a static angle of rotation is specified in the “Position ➔ Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.

Visualization Element 'Meter 180°'

Symbol:

Category: “Measurement Controls”

The element displays the value of a variable. The needle is positioned according to the value of the assigned variable on a scale. A meter is used to represent a tachometer, for example.

Element properties

| “Element name” | Example: GenElemInst_1 |
| “Type of element” | “Meter 180°” |
| “Value” | Variable (numeric data type) |

The variable value determines the pointer direction of the element.

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.
<table>
<thead>
<tr>
<th>“X”</th>
<th>X-coordinate of the point of rotation</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Y”</td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the symbols (usahaan) to other positions in the editor.

These properties are available only when you have selected the “Support client animations and overlay of native elements” option in the Visualization Manager.

**“Animation duration”**

Defines the duration (in milliseconds) in which the element runs an animation

- **Variable (integer value)**
  - Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR`
- **Integer literal**
  - Example: 500

**Animatable properties**

- “Absolute movement”, “Movement”, “X”, “Y”
- “Absolute movement”, “Rotation”
- “Absolute movement”, “Interior rotation”
- “Absolute movement”, “Exterior rotation”

The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.

**“Move to foreground”**

Moves the visualization element to the foreground

**Variable (BOOL)**

- Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR`
- **TRUE**: At runtime, the visualization element is displayed in the foreground.
- **FALSE**: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

**Element property ‘Position’**

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

<table>
<thead>
<tr>
<th>“X”</th>
<th>X coordinate of the upper left corner of the element</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Specified in pixels.</td>
</tr>
<tr>
<td></td>
<td>Example: 10.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Y”</th>
<th>Y coordinate of the upper left corner of the element</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Specified in pixels.</td>
</tr>
<tr>
<td></td>
<td>Example: 10.</td>
</tr>
</tbody>
</table>
“Width”
Specified in pixels.
Example: 150

“Height”
Specified in pixels.
Example: 30

You can also change the values by dragging the box symbols (_drag_box) to other positions in the editor.

Example: PLC_PRG.iScaleStart |
|----------------|---------------------------------------------------------------------|
| **Declaration** | PROGRAM PLC_PRG  
VAR  
  iScaleStart : INT := 0;  
END_VAR |

| **“Scale end”** | Greatest value of the scale and the upper limit of the value range for the element  
Example: 100 |
| **Description** | The “**Variable**” property is shown below this. |

| **“Variable”** | Variable (integer data type). Contains the scale end  
Example: PLC_PRG.iScaleEnd |
|----------------|---------------------------------------------------------------------|
| **Declaration** | PROGRAM PLC_PRG  
VAR  
  iScaleEnd : INT := 120;  
END_VAR |

| **“Main scale”** | Distance between two values on the main scale  
Example: 10 |
| **Description** | The “**Variable**” property is shown below. |

| **“Variable”** | Variable (integer data type) Contains the distance between two values on the main scale  
Example: PLC_PRG.iMainScale |
|----------------|---------------------------------------------------------------------|
| **Declaration** | PROGRAM PLC_PRG  
VAR  
  iMainScale : INT := 20;  
END_VAR |

| **“Sub scale”** | Distance between two values on the fine scale  
You can hide the fine scale by setting the value to 0.  
Example: 2 |
| **Description** | The “**Variable**” property is shown below this. |

| **“Variable”** | Variable (integer data type) Contains the distance between two values on the fine scale  
Example: PLC_PRG.iSubScale |
|----------------|---------------------------------------------------------------------|
| **Declaration** | PROGRAM PLC_PRG  
VAR  
  iSubScale : INT := 5;  
END_VAR |

| **“Scale line width”** | Specified in pixels  
Example: 3 |
## Scale color

Color of scale lines
- [ ] The “Color” dialog opens.
- ▼: A list box with style colors opens.

## Scale in 3D

☑️: Scale lines are displayed with soft 3D shadowing.
Note: This property is not displayed in “FlatStyle”.

## Show scale

☑️: The scale is displayed.

## Frame inside

☑️: A frame is drawn at the inner end of the scale.

## Frame outside

☑️: A frame is drawn at the outer end of the scale.

### Element property 'Label'

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Label”</strong></td>
<td>Selection list</td>
</tr>
<tr>
<td></td>
<td>• “Outside”: Scale values are placed outside of the scale.</td>
</tr>
<tr>
<td></td>
<td>• “Inside”: Scale values are placed inside of the scale.</td>
</tr>
<tr>
<td><strong>“Unit”</strong></td>
<td>Text that is displayed in the element. Units displayed in m/s.</td>
</tr>
<tr>
<td><strong>“Font”</strong></td>
<td>Font for labels (example: scale numbering).</td>
</tr>
<tr>
<td></td>
<td>Selection from the drop-down list or by clicking the “” button.</td>
</tr>
<tr>
<td><strong>Scale format (C Syntax)”</strong></td>
<td>Values scaled in &quot;printf&quot; syntax</td>

</table>

**Element property ‘Absolute movement’**

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
### Movement

<table>
<thead>
<tr>
<th><strong>“X”</strong></th>
<th>Variable (numeric data type). Defines the X position (in pixels).</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Example: PLC_PRG.iPos_X.</td>
</tr>
<tr>
<td></td>
<td>Increasing this value in runtime mode moves the element to the right.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>“Y”</strong></th>
<th>Variable (numeric data type). Defines the Y position (in pixels).</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Example: PLC_PRG.iPos_Y.</td>
</tr>
<tr>
<td></td>
<td>Increasing this value in runtime mode moves the element downwards.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>“Rotation”</strong></th>
<th>Variable (numeric data type). Defines the angle of rotation (in degrees).</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Example: PLC_PRG.iAngle1.</td>
</tr>
<tr>
<td></td>
<td>The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.</td>
</tr>
<tr>
<td></td>
<td>In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>“Interior rotation”</strong></th>
<th>Variable (numeric data type). Defines the angle of rotation (in degrees).</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Example: PLC_PRG.iAngle2.</td>
</tr>
<tr>
<td></td>
<td>In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.</td>
</tr>
<tr>
<td></td>
<td>The rotation point is shown as the symbol.</td>
</tr>
<tr>
<td></td>
<td>Note: If a static angle of rotation is specified in the “Position ➔ Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.</td>
</tr>
</tbody>
</table>

You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.

See also

- The variables control the element behavior dynamically.
**“Invisible”**
Variable (BOOL). Toggles the visibility of the element. 
**TRUE:** The element is not visible at runtime.

The “Invisible” property is supported by the "Client Animation" functionality.

**Element property ‘Access rights’**
Requirement: User management is set up for the visualization.

**“Access rights”**
Opens the “Access rights” dialog. There you can edit the access privileges for the element.
Status messages:
- **“Not set. Full rights.”**: Access rights for all user groups: “operable”
- **“Rights are set: Limited rights”**: Access is restricted for at least one group.

- ☞ Chapter 6.4.5.5 “Designing a visualization with elements” on page 2872

**Visualization Element ‘Meter’**
Symbol:

Category: “Measurement Controls”
The element displays the value of a variable. The needle is positioned according to the value of the assigned variable. A meter is used to represent a tachometer, for example.

**Element properties**

<table>
<thead>
<tr>
<th>“Element name”</th>
<th>Example: GenElemInst_1</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Type of element”</td>
<td>“Meter”</td>
</tr>
</tbody>
</table>
| “Value”              | Variable (numeric data type). 
The variable value determines the pointer direction of the element. |

**Element property ‘Center’**
The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

<table>
<thead>
<tr>
<th>“X”</th>
<th>X-coordinate of the point of rotation</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Y”</td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>
You can also change the values by dragging the symbols ( draggable) to other positions in the editor.

These properties are available only when you have selected the “Support client animations and overlay of native elements” option in the Visualization Manager.

<table>
<thead>
<tr>
<th>“Animation duration”</th>
<th>Defines the duration (in milliseconds) in which the element runs an animation</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• Variable (integer value)</td>
</tr>
<tr>
<td></td>
<td>Example: Menu.tContent with VAR tContent : INT := 500; END_VAR</td>
</tr>
<tr>
<td></td>
<td>• Integer literal</td>
</tr>
<tr>
<td></td>
<td>Example: 500</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Animatable properties</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Absolute movement”, “Movement”, “X”, “Y”</td>
</tr>
<tr>
<td>“Absolute movement”, “Rotation”</td>
</tr>
<tr>
<td>“Absolute movement”, “Interior rotation”</td>
</tr>
<tr>
<td>“Absolute movement”, “Exterior rotation”</td>
</tr>
</tbody>
</table>

The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.

<table>
<thead>
<tr>

<td>✔: Colors in the color area are used only for the scale and frame.</td>
</tr>
</tbody>
</table>

**Create new**

A new color area is added to the “Elements” view.

**Delete**

The color area is removed from the list and the list is refreshed.

**Begin of area**

Start value of the color area

Example: 20

◆: The property “Variable” is shown below.

**Variable**

Variable (integer data type). Contains the start value.

Example: PLC_PRG.iColorAreaStart0

Declaration:

```plaintext
PROGRAM PLC_PRG
VAR
  iColorAreaStart0 : INT := 80;
END_VAR
```

**End of area**

End value of the color area

Example: 120

◆: The property “Variable” is shown below.

**Variable**

Variable (integer data type). Contains the end value.

Example: iColorAreaEnd0

Declaration:

```plaintext
PROGRAM PLC_PRG
VAR
  iColorAreaEnd0 : INT := 100;
END_VAR
```

**Color**

Color that is used for displaying the area.

---

**Element property 'Absolute movement'**

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
### Movement

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
<th>Example</th>
<th>Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>X</strong></td>
<td>Variable (numeric data type). Defines the X position (in pixels).</td>
<td><code>PLC_PRG.iPos_X</code></td>
<td>Increasing this value in runtime mode moves the element to the right.</td>
</tr>
<tr>
<td><strong>Y</strong></td>
<td>Variable (numeric data type). Defines the Y position (in pixels).</td>
<td><code>PLC_PRG.iPos_Y</code></td>
<td>Increasing this value in runtime mode moves the element downwards.</td>
</tr>
<tr>
<td><strong>Rotation</strong></td>
<td>Variable (numeric data type). Defines the angle of rotation (in degrees).</td>
<td><code>PLC_PRG.iAngle1</code></td>
<td>The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.</td>
</tr>
<tr>
<td><strong>Interior rotation</strong></td>
<td>Variable (numeric data type). Defines the angle of rotation (in degrees).</td>
<td><code>PLC_PRG.iAngle2</code></td>
<td>In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the symbol. Note: If a static angle of rotation is specified in the “Position ➔ Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.</td>
</tr>
</tbody>
</table>

You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

See also

- Element property 'State variables'

The variables control the element behavior dynamically.
### "Invisible"

<table>
<thead>
<tr>
<th>Variable (BOOL)</th>
<th>Toggles the visibility of the element.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>TRUE</strong>: The element is not visible at runtime.</td>
<td></td>
</tr>
</tbody>
</table>

The "Invisible" property is supported by the "Client Animation" functionality.

---

#### Element property 'Access rights'

**Requirement**: User management is set up for the visualization.

<table>
<thead>
<tr>
<th>&quot;Access rights&quot;</th>
<th>Opens the &quot;Access rights&quot; dialog. There you can edit the access privileges for the element.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status messages:</td>
<td>&quot;Not set. Full rights.&quot;: Access rights for all user groups: &quot;operable&quot;</td>
</tr>
<tr>
<td></td>
<td>&quot;Rights are set: Limited rights&quot;: Access is restricted for at least one group.</td>
</tr>
</tbody>
</table>

- % Chapter 6.4.5.21.3.1 "Dialog 'Access Rights'" on page 3366

See also
- % Chapter 6.4.5.5 "Designing a visualization with elements" on page 2872

---

#### Visualization Element 'Potentiometer'

**Symbol:**

Category: "Measurement Controls"

The element displays the value of a variable as a setting on the potentiometer. A visualization user can modify the value by dragging the pointer to another position.

See also
- % Chapter 6.4.5.5 "Designing a visualization with elements" on page 2872

---

#### Element properties

<table>
<thead>
<tr>
<th>&quot;Element name&quot;</th>
<th>Example: GenElemInst_1</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Type of element&quot;</td>
<td>&quot;Potentiometer&quot;</td>
</tr>
<tr>
<td>&quot;Variable&quot;</td>
<td>Variable (numeric data type). Contains the position of the pointer for the potentiometer.</td>
</tr>
<tr>
<td></td>
<td>A visualization user can modify the value by dragging the pointer to another position.</td>
</tr>
</tbody>
</table>
The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>X</td>
<td>X-coordinate of the point of rotation</td>
</tr>
<tr>
<td>Y</td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the symbols to other positions in the editor.

These properties are available only when you have selected the “Support client animations and overlay of native elements” option in the Visualization Manager.

**Animation duration**

Defines the duration (in milliseconds) in which the element runs an animation.

- **Variable (integer value)**
  
  Example: `Menu.tContent with VAR tContent : INT := 500; END_VAR`

- **Integer literal**
  
  Example: 500

**Animatable properties**

- “Absolute movement”, “Movement”, “X”, “Y”
- “Absolute movement”, “Rotation”
- “Absolute movement”, “Interior rotation”
- “Absolute movement”, “Exterior rotation”

The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.

**Move to foreground**

Moves the visualization element to the foreground.

Variable (BOOL)

Example: `bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR`

- TRUE: At runtime, the visualization element is displayed in the foreground.
- FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.
<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;X&quot;</td>
<td>X coordinate of the upper left corner of the element. Specified in pixels. Example: 10.</td>

### Element property ‘Background’

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Image color&quot;</td>
<td>List box containing background colors</td>
</tr>
<tr>
<td>&quot;Own image&quot;</td>
<td>- &quot;Image&quot;: ID of the background image. You select the background image from an image pool by clicking 📛. Info: If you specify the value &quot;&lt;default&gt;&quot; or select the image from the &quot;Default&quot; category in the Input Assistant, then the original element background image is used. - &quot;Transparency color&quot;: Selection from list box or Input Assistant.</td>
</tr>
</tbody>
</table>

### Element property ‘Arrow’

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Hand style&quot;</td>
<td>Drop-down list with different arrow types</td>
</tr>
<tr>
<td>&quot;Color&quot;</td>
<td>- 🎨: The “Color” dialog box opens. - ▼: Drop-down list with color names</td>
</tr>
<tr>
<td>&quot;Arrow start&quot;</td>
<td>Angle (in degrees) between the left edge of the element and the horizontal axis</td>
</tr>
<tr>
<td>&quot;Arrow end&quot;</td>
<td>Angle (in degrees) between the right edge of the element and the horizontal axis</td>
</tr>
</tbody>
</table>
### Sub scale position
- **Outside**: The subscale is displayed on the outer scale ring. ("Frame outside")
- **Inside**: The subscale is displayed on the inner scale ring. ("Frame inside")

### Scale type
Type of scale
- **Lines**
- **Dots**
- **Squares**

### Scale start
Least value of the scale and the lower limit of the value range for the element
Example: 0
❖: The "Variable" property is displayed in the line below this.

### Variable
Variable (integer data type). Contains the scale start
Example: PLC_PRG.iScaleStart
Declaration:
```plaintext
PROGRAM PLC_PRG
VAR
  iScaleStart : INT := 0;
END_VAR
```

### Scale end
Greatest value of the scale and the upper limit of the value range for the element
Example: 100
❖: The "Variable" property is shown below this.

### Variable
Variable (integer data type). Contains the scale end
Example: PLC_PRG.iScaleEnd
Declaration:
```plaintext
PROGRAM PLC_PRG
VAR
  iScaleEnd : INT := 120;
END_VAR
```

### Main scale
Distance between two values on the main scale
Example: 10
❖: The "Variable" property is shown below.

### Variable
Variable (integer data type) Contains the distance between two values on the main scale
Example: PLC_PRG.iMainScale
Declaration:
```plaintext
PROGRAM PLC_PRG
VAR
  iMainScale : INT := 20;
END_VAR
```

### Sub scale
Distance between two values on the fine scale
You can hide the fine scale by setting the value to 0.
Example: 2
❖: The "Variable" property is shown below this.
## Variable

Variable (integer data type) Contains the distance between two values on the fine scale

**Example:** PLC_PRG.iSubScale  

**Declaration:**

```plaintext
PROGRAM PLC_PRG  
VAR  
iSubScale : INT := 5;  
END_VAR
```

## Scale line width

Specified in pixels  
**Example:** 3

## Scale color

Color of scale lines  
- ![icon] The “Color” dialog opens.  
- ![icon] A list box with style colors opens.

## Scale in 3D

- [ ] Scale lines are displayed with soft 3D shadowing.  
**Note:** This property is not displayed in “FlatStyle”.

## Show scale

- [ ] The scale is displayed.

## Frame inside

- [ ] A frame is drawn at the inner end of the scale.

## Frame outside

- [ ] A frame is drawn at the outer end of the scale.

---

### Element property 'Label'

#### “Label”

Selection list  
- “Outside”: Scale values are placed outside of the scale.  
- “Inside”: Scale values are placed inside of the scale.

#### “Unit”

Text that is displayed in the element.  
**Example:** Units displayed in m/s.

#### “Font”

Font for labels (example: scale numbering).  
Selection from the drop-down list or by clicking the ![icon] button.

#### “Scale format (C Syntax)”

Values scaled in “printf” syntax  
**Examples:** %d, %.2f

#### “Max. text width of labels”

(optional) Value that redefines the maximum width of the scale label. The correct value is normally set automatically.  
**Note:** Change this value only if the automatic adjustment does not yield the expected result.

#### “Text height of labels”

(optional) Value that redefines the maximum height of the scale label. The correct value is normally set automatically.  
**Note:** Change this value only if the automatic adjustment does not yield the expected result.

#### “Font color”

Selection from the drop-down list or by clicking the ![icon] button.
**“Usage of”**
- “Preset style values”: Values from the current style
- “User-defined settings”: The subnode “Positioning” appears.

**“Positioning”**
Requirement: “User-defined settings” is selected as “Usage of”.
The displayed positioning settings depend on the type of needle instrument and Potentiometer, and partially on whether a custom background image is selected. The following settings are used for achieving the exact position relative to the background image.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Needle movement”</strong></td>
<td>Length of the needle (in pixels)</td>
</tr>
<tr>
<td><strong>“Scale movement”</strong></td>
<td>Distance from the tick marks to the center (in pixels)</td>
</tr>
<tr>
<td>Requirement:</td>
<td>A customer image is selected as “Background”.</td>
</tr>
<tr>

<td>Distance from the labels to the tick marks (in pixels)</td>
</tr>
<tr>
<td><strong>“Unit offset”</strong>:</td>
<td>Distance of the unit text “Label ➔ Unit” from the upper scale edge (in pixels)</td>
</tr>
<tr>
<td><strong>“Origin offset”</strong></td>
<td>Offset of the element (in pixels)</td>
</tr>
<tr>
<td>Requirement:</td>
<td>For the elements “Meter 180°” and “Meter 90°”, this property is displayed only if a custom image is selected as “Background”.</td>
</tr>
</tbody>
</table>

**Element property ‘Colors’**

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Color areas”</strong></td>
<td></td>
</tr>
<tr>
<td><strong>“Durable color areas”</strong></td>
<td>□: All color areas are visible, regardless of the current value.</td>
</tr>
<tr>
<td></td>
<td>✓: Only the color area is visible that includes the current value.</td>
</tr>
<tr>
<td><strong>“Use colors for scale”</strong></td>
<td>✓: Colors in the color area are used only for the scale and frame.</td>
</tr>
<tr>
<td><strong>“Color areas”</strong></td>
<td></td>
</tr>
<tr>
<td><strong>“Create new”</strong></td>
<td>A new color area is added to the “Elements” view.</td>
</tr>
<tr>
<td><strong>“Delete”</strong></td>
<td>The color area is removed from the list and the list is refreshed.</td>
</tr>
<tr>
<td><strong>“Begin of area”</strong></td>
<td>Start value of the color area</td>
</tr>
<tr>
<td>Example:</td>
<td>20</td>
</tr>
<tr>
<td>♦: The property “Variable” is shown below.</td>
<td></td>
</tr>
<tr>
<td><strong>“Variable”</strong></td>
<td>Variable (integer data type). Contains the start value.</td>
</tr>
<tr>
<td>Example:</td>
<td>PLC_PRG.iColorAreaStart0</td>
</tr>
<tr>
<td>Declaration:</td>
<td></td>
</tr>
<tr>
<td>PROGRAM PLC_PRG</td>
<td></td>
</tr>
<tr>
<td>VAR</td>
<td></td>
</tr>
<tr>
<td>iColorAreaStart0 : INT := 80;</td>
<td></td>
</tr>
<tr>
<td>END_VAR</td>
<td></td>
</tr>
<tr>
<td><strong>“End of area”</strong></td>
<td>End value of the color area</td>
</tr>
<tr>
<td>Example:</td>
<td>120</td>
</tr>
<tr>
<td>♦: The property “Variable” is shown below.</td>
<td></td>
</tr>
</tbody>
</table>
**Variable**

Variable (integer data type). Contains the end value.

Example: `iColorAreaEnd0`

Declaration:

```plaintext
PROGRAM PLC_PRG
VAR
  iColorAreaEnd0 : INT := 100;
END_VAR
```

**Color**

Color that is used for displaying the area.

**Element property 'State variables'**

The variables control the element behavior dynamically.

<table>
<thead>
<tr>
<th>“Invisible”</th>
<th>Variable (BOOL). Toggles the visibility of the element. TRUE: The element is not visible at runtime. Example: <code>bIsVisible with VAR bIsVisible : BOOL := FALSE; END_VAR</code></th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>“Deactivate inputs”</th>
<th>Variable (BOOL). Toggles the operability of the element. TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated.</th>
</tr>
</thead>
</table>

The “Invisible” property is supported by the “Client Animation” functionality.

**Element property 'Absolute movement'**

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

<table>
<thead>
<tr>
<th>“Movement”</th>
<th>Variable (numeric data type). Defines the X position (in pixels). Example: <code>PLC_PRG.iPos_X</code>. Increasing this value in runtime mode moves the element to the right.</th>
</tr>
</thead>
</table>

| “Y”                 | Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards. |
**“Rotation”**  
Variable (numeric data type). Defines the angle of rotation (in degrees).  
**Example:** PLC_PRG.iAngle1.  
The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.  
In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

**“Interior rotation”**  
Variable (numeric data type). Defines the angle of rotation (in degrees).  
**Example:** PLC_PRG.iAngle2.  
In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.  
The rotation point is shown as the symbol.  
Note: If a static angle of rotation is specified in the “Position ➔ Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.

-  

Element property ‘Access rights’  
Requirement: User management is set up for the visualization.

**“Access rights”**  
Opens the “Access rights” dialog. There you can edit the access privileges for the element.  
Status messages:  
- “Not set. Full rights.”: Access rights for all user groups: “operable”  
- “Rights are set: Limited rights”: Access is restricted for at least one group.

- ☞ Chapter 6.4.5.21.3.1 “Dialog ‘Access Rights’” on page 3366
Visualization Element 'Histogram'

Symbol:

Category: “Measurement Controls”
The element displays the data of a one-dimensional array as a histogram. You can define specific colors for certain value ranges.

See also
● Chapter 6.4.5.2.4 “Displaying Array Data in a Histogram” on page 2862

Element properties

<table>
<thead>
<tr>
<th>&quot;Element name&quot;</th>
<th>Example: GenElemInst_35</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Type of element&quot;</td>
<td>&quot;Histogram&quot;</td>
</tr>
<tr>
<td>&quot;Data array&quot;</td>
<td>One-dimensional array with data displayed in this histogram. Example: PLC_PRG.arr1</td>
</tr>
</tbody>
</table>

Element property 'Subrange of array'

| "Use subrange" | ☑: Only part of the array is displayed in the histogram. |
| "Start index"  | First array index with a displayed value. Requirement: "Use subrange" is activated. |
| "End index"    | Last array index with a displayed value. Requirement: "Use subrange" is activated. |

| "Display type" | ● "Bars": Data is displayed as bars. ● "Lines": Data is displayed as lines. ● "Curve": Interpolation of data into a curve. |
| "Line width"   | Specified in pixels Requirement: "Curve" is selected as the "Display type". |
| "Show horizontal lines" | ☑: Horizontal lines are drawn on the main scale. Note: Not all visualization styles have this property. This element property is not available for visualization styles that have striped backgrounds (example: “Flat style”). |
| "Relative bar width" | Integer value between 1 and 100 ● 1: The bars are drawn as lines. ● 100: The entire width of the histogram is filled with the bars. |

Element property 'Position'
The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>X</code></td>
<td>X coordinate of the upper left corner of the element. Specified in pixels. Example: 10.</td>
</tr>
<tr>
<td><code>Y</code></td>
<td>Y coordinate of the upper left corner of the element. Specified in pixels. Example: 10.</td>
</tr>
<tr>
<td><code>Width</code></td>
<td>Specified in pixels. Example: 150</td>
</tr>
<tr>
<td><code>Height</code></td>
<td>Specified in pixels. Example: 30</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the box symbols (_epi) to other positions in the editor.

See also

- Chapter 6.4.5.3 “Positioning the Element, Adapting Size and Layer” on page 2874

**Element property 'Center'**

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the  symbol. The point is used as the center for rotating and scaling.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>X</code></td>
<td>X-coordinate of the point of rotation</td>
</tr>
<tr>
<td><code>Y</code></td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the symbols (_epi) to other positions in the editor.

**Element property 'Scale'**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Scale start</code></td>
<td>Least value of the scale and the lower limit of the value range for the element. Example: 0</td>
</tr>
<tr>
<td><code>Variable</code></td>
<td>Variable (integer data type). Contains the scale start. Example: PLC_PRG.iScaleStart</td>
</tr>
<tr>
<td><code>Scale end</code></td>
<td>Greatest value of the scale and the upper limit of the value range for the element. Example: 100</td>
</tr>
<tr>
<td><code>Variable</code></td>
<td>Variable (integer data type). Contains the scale end. Example: PLC_PRG.iScaleEnd</td>
</tr>
</tbody>
</table>
| **Main scale** | Distance between 2 values on the rough scale.  
Example: 10  
 ADVISED: The property “Variable” is shown below. |
| **Variable** | Variable (integer data type). Contains the distance.  
Example: PLC_PRG.iMainScale |
| **Subscale** | Distance between 2 values on the fine scale.  
You can hide the fine scale by setting the value to 0.  
Example: 2  
 ADVISED: The property “Variable” is shown below. |
| **Variable** | Variable (integer data type). Contains the spacing.  
Example: PLC_PRG.iSubScale |
| **Scale color** | Color of scale lines  
- ☑️: The “Color” dialog box opens.  
- ➡️: A drop-down list with color names opens. |
| **Base line** | Value of the main scale where the horizontal base line of the Histogram is located.  
The drawing of the bar starts at the base line. |

**Example**
A valid declaration is required for the variables used as an example in the table above.

```plaintext
PROGRAM PLC_PRG
VAR
  iScaleStart : INT := 0;
  iScaleEnd : INT := 120;
  iMainScale : INT := 20;
  iSubScale : INT := 5;
END_VAR
```

**Element property ‘Label’**

| **“Unit”** | Text that is displayed in the element.  
Example: Units displayed in m/s. |
| **“Font”** | Font for labels (example: scale numbering).  
Selection from the drop-down list or by clicking the “…” button. |
| **Scale format (C Syntax)”** | Values scaled in “printf” syntax  
Examples: %d, %5.2f |
| **Max. text width of labels”** | Optional value that defines the maximum width of the scale label.  
Note: Change this value only if the automatic adjustment does not yield the expected result. |
| **Text height of labels”** | Optional value that defines the maximum height of the scale label.  
Note: Change this value only if the automatic adjustment does not yield the expected result. |
| **“Font color”** | Selection from the drop-down list or by clicking the “…” button. |
**Element property 'Colors'**

<td>The midpoint of the element rotates at the &quot;Center&quot; point. This rotation point is shown as the symbol.</td>
</tr>
<tr>
<td></td>
<td>In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.</td>
</tr>
</tbody>
</table>
**“Interior rotation”**

Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol.

Note: If a static angle of rotation is specified in the “Position ➔ Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

---

You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.

See also

- 

These properties are available only when you have selected the “Support client animations and overlay of native elements” option in the Visualization Manager.
"Animation duration" defines the duration (in milliseconds) in which the element runs an animation.

- Variable (integer value)
  Example: Menu.tContent with VAR tContent : INT := 500; END_VAR
- Integer literal
  Example: 500

Animatable properties:
- "Absolute movement", "Movement", "X", "Y"
- "Absolute movement", "Rotation"
- "Absolute movement", "Interior rotation"
- "Absolute movement", "Exterior rotation"

The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.

"Move to foreground" moves the visualization element to the foreground.

- Variable (BOOL)
  Example: bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR
  TRUE: At runtime, the visualization element is displayed in the foreground.
  FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

"Access rights" opens the "Access rights" dialog. There you can edit the access privileges for the element.

Status messages:
- "Not set. Full rights.": Access rights for all user groups: "operable"
- "Rights are set: Limited rights": Access is restricted for at least one group.

See also:
- § Chapter 6.4.5.21.3.1 "Dialog 'Access Rights'" on page 3366

Visualization Element 'Image Switcher'

Symbol:

Category: "Lamps/Switches/Bitmaps"

The element displays one of three referenced images. Mouse actions change the displayed image. The images are defined in the "Image settings" element properties. The effects of mouse clicks are defined in the "Element behavior" property.
**Element name**
Optional

Hint: Assign individual names for elements so that they are found faster in the element list.

Example: ImageSwitcher_1

**Type of element**
"Image Switcher"

---

**Element property 'Position'**
The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

<table>
<thead>

</tbody>
</table>
**"Transparency"**<br>[☑]: The "Transparent color" is selected.

**"Transparent color"**<br>The image pixels that have the transparent color are displayed as transparent.

Requirement: "Transparency" is activated.
- [☑]: The "Color" dialog box opens.
- [çiler]: A drop-down list with color names opens.

**"Scaling type"**<br>Defines how an image fits in the element frame.
- "Fixed": The original size of the image is retained, regardless of the dimensions of the element.
- "Isotropic": The entire image is shown in the element frame, either larger or smaller. As a result, the proportion of height and width are retained.
- "Anisotropic": The image resizes automatically to the dimensions of the element frame, filling the entire element frame. As a result, the proportions are not retained.

**"Horizontal alignment"**<br>Horizontal alignment of the image within the element frame or element
- Left
- Centered
- Right

Requirement: "Scaling type" is "Isotropic".

**"Vertical alignment"**<br>Vertical alignment of the image within the element frame or element
- Top
- Centered
- Bottom

Requirement: "Scaling type" is "Isotropic".

**"Element behavior"**
- "Image toggler": Every mouse click switches the image.
- "Image tapper": While a visualization user holds down the mouse button, the image of the "Image on" property is displayed. At the same time, the value TRUE is assigned to the "Variable" property.

**"Tap FALSE"**<br>[☑]: While the mouse button is pressed, the image of the "Image" property is displayed and the "Variable" property gets the value FALSE instead of the value TRUE, and back.

Requirement: "Image tapper" is selected in the "Element behavior" property.

**Element property 'Center'**<br>The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⬤ symbol. The point is used as the center for rotating and scaling.

| “X” | X-coordinate of the point of rotation |
| “Y” | Y-coordinate of the point of rotation |

You can also change the values by dragging the symbols (⬤) to other positions in the editor.

**Element property 'Texts'**
**“Tooltip”**

String display as tooltip for the element

*Example:* Valid access.

---

**Element property 'Absolute movement'*
The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

---

<table>
<thead>
<tr>
<th><strong>“Movement”</strong></th>
<th></th>
</tr>
</thead>
</table>
| **“X”** | Variable (numeric data type). Defines the X position (in pixels).  
*Example:* PLC_PRG.iPos_X.  
Increasing this value in runtime mode moves the element to the right. |
| **“Y”** | Variable (numeric data type). Defines the Y position (in pixels).  
*Example:* PLC_PRG.iPos_Y.  
Increasing this value in runtime mode moves the element downwards. |

---

<table>
<thead>
<tr>
<th><strong>“Rotation”</strong></th>
<th></th>
</tr>
</thead>
</table>
| **“Rotation”** | Variable (numeric data type). Defines the angle of rotation (in degrees).  
*Example:* PLC_PRG.iAngle1.  
The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.  
In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right. |

---

<table>
<thead>
<tr>
<th><strong>“Interior rotation”</strong></th>
<th></th>
</tr>
</thead>
</table>
| **“Interior rotation”** | Variable (numeric data type). Defines the angle of rotation (in degrees).  
*Example:* PLC_PRG.iAngle2.  
In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.  
The rotation point is shown as the symbol.  
Note: If a static angle of rotation is specified in the “Position ➔ Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed. |

---

You can link the variables to a unit conversion.
The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.

- 

**Element property 'State variables'**

The variables control the element behavior dynamically.

<table>
<thead>
<tr>
<th>Property</th>
<th>Variable (BOOL). Toggles the visibility of the element.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Invisible”</td>
<td>TRUE: The element is not visible at runtime.</td>
</tr>
<tr>
<td></td>
<td>Example: bIsVisible with VAR bIsVisible : BOOL := FALSE;</td>
</tr>
<tr>
<td></td>
<td>END_VAR</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Property</th>
<th>Variable (BOOL). Toggles the operability of the element.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Deactivate inputs”</td>
<td>TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated.</td>
</tr>
</tbody>
</table>

The “Invisible” property is supported by the “Client Animation” functionality.

These properties are available only when you have selected the “Support client animations and overlay of native elements” option in the Visualization Manager.
**“Animation duration”**

Defines the duration (in milliseconds) in which the element runs an animation.

- **Variable (integer value)**
  
  **Example:**
  ```
  Menu.tContent with VAR tContent : INT := 500;
  END_VAR
  ```

- **Integer literal**
  
  **Example:** 500

**Animatable properties**

- “Absolute movement”, “Movement”, “X”, “Y”
- “Absolute movement”, “Rotation”
- “Absolute movement”, “Interior rotation”
- “Absolute movement”, “Exterior rotation”

The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.

**“Move to foreground”**

Moves the visualization element to the foreground.

**Variable (BOOL)**

**Example:**
```
VAR bIsInForeground : BOOL := FALSE; END_VAR
```

**TRUE:** At runtime, the visualization element is displayed in the foreground.

**FALSE:** At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

**Element property ‘Access rights’**

Requirement: User management is set up for the visualization.

**“Access rights”**

Opens the “Access rights” dialog. There you can edit the access privileges for the element.

**Status messages:**

- “Not set. Full rights.”: Access rights for all user groups: “operable”
- “Rights are set: Limited rights”: Access is restricted for at least one group.

**Visualization Element ‘Lamp’**

**Symbol:**

![Symbol](image)

**Category: “Lamps/Switches/Bitmaps”**

The element shows the value of a variable, and the element is displayed as illuminated or not.
Element properties

<table>
<thead>
<tr>
<th>“Element name”</th>
<th>Optional</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hint: Assign individual names for elements so that they are found faster in the element list.</td>
<td></td>

<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Y”</td>
<td>Variable (numeric data type). Defines the Y position (in pixels).</td>
</tr>
<tr>
<td>Example: PLC_PRG.iPos_Y.</td>
<td></td>
</tr>
<tr>
<td>Increasing this value in runtime mode moves the element downwards.</td>
<td></td>
</tr>
</tbody>
</table>
"Rotation" Variable (numeric data type). Defines the angle of rotation (in degrees).

Example: PLC_PRG.iAngle1.

The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.

In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

"Interior rotation" Variable (numeric data type). Defines the angle of rotation (in degrees).

Example: PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol.

Note: If a static angle of rotation is specified in the “Position Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

See also

The variables control the element behavior dynamically.

"Invisible" Variable (BOOL). Toggles the visibility of the element.

TRUE: The element is not visible at runtime.

The “Invisible” property is supported by the "Client Animation" functionality.
These properties are available only when you have selected the “Support client animations and overlay of native elements” option in the Visualization Manager.

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the “Support client animations and overlay of native elements” option in the Visualization Manager.
**“Animation duration”**
Defines the duration (in milliseconds) in which the element runs an animation

- **Variable (integer value)**
  
  *Example:* `Menu.tContent with VAR tContent : INT := 500; END_VAR`

- **Integer literal**
  *Example:* `500`

**Animatable properties**

- “Absolute movement”, “Movement”, “X”, “Y”
- “Absolute movement”, “Rotation”
- “Absolute movement”, “Interior rotation”
- “Absolute movement”, “Exterior rotation”

The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.

**“Move to foreground”**
Moves the visualization element to the foreground

**Variable (BOOLEAN)**

*Example:* `bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR`

TRUE: At runtime, the visualization element is displayed in the foreground.
FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

**Element property 'Background'**

**“Image”**
Drop-down list with background colors

Depends on the visualization style

**Element property 'Access rights'**

Requirement: User management is set up for the visualization.

**“Access rights”**
Opens the “Access rights” dialog. There you can edit the access privileges for the element.

Status messages:

- “Not set. Full rights.”: Access rights for all user groups: “operable”
- “Rights are set: Limited rights”: Access is restricted for at least one group.

Image settings
"Transparency"  ☑: The "Transparent color" property is selected.

"Transparent color"  
Pixels in this color are displayed as transparent.
Requirement: "Transparency" is activated.
- ☑: The "Color" dialog box opens.
- ▼: A drop-down list with style colors opens.

"Scaling type"  
Reaction of the element when the dimension of the "Frame" element is changed:
- "Isotropic": The height and width of the image are resized proportionally to the "Frame".
  Please note: To retain the alignment of elements also within a scaled "Frame" element, define the "Horizontal alignment" or "Vertical alignment" explicitly with "Centered".
- "Anisotropic": The image fills the entire "Frame" regardless of its proportions.

"Horizontal alignment"  
Horizontal alignment of the image within the element frame or element
- Left
- Centered
- Right
Requirement: "Scaling type" is "Isotropic".

"Vertical alignment"  
Vertical alignment of the image within the element frame or element
- Top
- Centered
- Bottom
Requirement: "Scaling type" is "Isotropic".

"Element behavior"  
- "Image toggler": Every mouse click changes the switch and the "Variable" value.
- "Image tapper": The switch is "on" and the "Variable" value is TRUE while the mouse button is pressed.

"Orientation"  
- "At top": The rotary switch turns from the top right to the top left.
- "At side": The rotary switch turns from the top right to the bottom right.

"Color change"  ☑: The element changes in color when "Variable" is TRUE.

**Element property ‘Center’**  
The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

<table>
<thead>
<tr>
<th>&quot;X&quot;</th>
<th>X-coordinate of the point of rotation</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Y&quot;</td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the symbols to other positions in the editor.

**Element property ‘Texts’**
**Tooltip**

String display as tooltip for the element

**Example:** Valid access.

---

**Element property 'Absolute movement'**

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

---

**“Movement”**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“X”</strong></td>
<td>Variable (numeric data type). Defines the X position (in pixels). Increasing this value in runtime mode moves the element to the right.</td>
<td>PLC_PRG.iPos_X.</td>
</tr>
<tr>
<td><strong>“Y”</strong></td>
<td>Variable (numeric data type). Defines the Y position (in pixels). Increasing this value in runtime mode moves the element downwards.</td>
<td>PLC_PRG.iPos_Y.</td>
</tr>
</tbody>
</table>

---

**“Rotation”**

Variable (numeric data type). Defines the angle of rotation (in degrees). The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.

In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

**“Interior rotation”**

Variable (numeric data type). Defines the angle of rotation (in degrees).

Example: PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol.

Note: If a static angle of rotation is specified in the “Position ➔ Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

---

You can link the variables to a unit conversion.
The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.

See also

- 

**Element property 'State variables'**

The variables control the element behavior dynamically.

<table>
<thead>
<tr>
<th>Variable (BOOL)</th>
<th>Toggles the visibility of the element.</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRUE: The element is not visible at runtime.</td>
<td></td>
</tr>
<tr>
<td>Example: bIsVisible with VAR bIsVisible : BOOL := FALSE; END_VAR</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Variable (BOOL)</th>
<th>Toggles the operability of the element.</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated.</td>
<td></td>
</tr>
</tbody>
</table>

The “Invisible” property is supported by the “Client Animation” functionality.

These properties are available only when you have selected the “Support client animations and overlay of native elements” option in the Visualization Manager.
“Animation duration”

Defines the duration (in milliseconds) in which the element runs an animation

- Variable (integer value)
  Example: Menu.tContent with
  ```
  VAR tContent : INT := 500;
  END_VAR
  ```

- Integer literal
  Example: 500

Animatable properties

- “Absolute movement”, “Movement”, “X”, “Y”
- “Absolute movement”, “Rotation”
- “Absolute movement”, “Interior rotation”
- “Absolute movement”, “Exterior rotation”

The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.

“Move to foreground”

Moves the visualization element to the foreground

Variable (BOOL)

Example: bIsInForeground with
```
VAR bIsInForeground : BOOL := FALSE; END_VAR
```

TRUE: At runtime, the visualization element is displayed in the foreground.
FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Background'

“Image”

Drop-down list with background colors

Depends on the visualization style

Element property 'Access rights'

Requirement: User management is set up for the visualization.

“Access rights”

Opens the “Access rights” dialog. There you can edit the access privileges for the element.

Status messages:

- “Not set. Full rights.”: Access rights for all user groups: “operable”
- “Rights are set: Limited rights”: Access is restricted for at least one group.

See also

- ¶ Chapter 6.4.5.21.3.1 “Dialog ‘Access Rights’” on page 3366

See also

- ¶ Chapter 6.4.5.5 “Designing a visualization with elements” on page 2872

Visualization Element 'Trace'

Symbol:
Category: “Special Controls”

The element displays the graphical curve of variable values. In addition, variables can be configured to control the view.

See also
- § Chapter 6.4.5.12 “Displaying data curve with trace” on page 2925
- § “Dialog box 'Trace Configuration’” on page 3355

### Element properties

<table>
<thead>
<tr>
<th><strong>“Element name”</strong></th>
<th><strong>Example:</strong> Velocity</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Data Source”</strong></td>
<td>Location where the trace data is buffered.</td>
</tr>
<tr>
<td></td>
<td>- “&lt;local application&gt;”*: The trace record is listed below the local application. The visualization that contains the trace is located below this application. When the application is downloaded, the trace configuration is downloaded to the local device. During execution, the data is stored locally in the trace buffer.</td>
</tr>
<tr>
<td></td>
<td>- “&lt;data source name&gt;”*: Data source that identifies the remote device where the trace record is created. When the local application is downloaded with the visualization, the trace configuration is downloaded to the remote device. During execution, the trace buffer is filled, and the trace data is transferred and then displayed in the local visualization as HMI. Example: DataSoure_PLC_A Note: The trace buffer is filled only if the remote application is being executed. The data recording is started when the local visualization is started.</td>
</tr>
</tbody>
</table>

| **“Application”** | Application where data was recorded. |
|                  | - : Lists all applications that are present below the data source. |
|                  | Requirement: A remote data source (not “<local application>”) is referenced in the “Data source” property. |
| **“Type of element”** | “Trace” |
| **“Trace”** | “<name of trace configuration>”\*: Opens the “Trace Configuration” dialog where you can modify the trace configuration. |

See also
- § “Dialog box ‘Trace Configuration’” on page 3355
- **Data Source Manager**

### Element property ‘Position’

The position defines the location and size of the element in the visualization window. This is based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.
### Properties of the Element

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>X</strong></td>
<td>The x-coordinate of the upper left corner of the element. Specified in pixels. Example: 10</td>
</tr>
<tr>
<td><strong>Y</strong></td>
<td>The y-coordinate of the upper left corner of the element. Specified in pixels. Example: 10</td>
</tr>
<tr>
<td><strong>Width</strong></td>
<td>Specified in pixels. Example: 150</td>
</tr>
<tr>
<td><strong>Height</strong></td>
<td>Specified in pixels. Example: 30</td>
</tr>
<tr>
<td><strong>Angle</strong></td>
<td>Static angle of rotation (in degrees). Example: 35</td>
</tr>
</tbody>
</table>

**Tip:** You can change the values in “X”, “Y”, “Width”, and “Height” by dragging the corresponding symbols to another position in the editor.

**Angle**

The element is displayed rotated in the editor. The point of rotation is the center of the element. A positive value rotates clockwise.

**Tip:** You can change the value in the editor by focusing the element to the handle. When the cursor is displayed as a rotating arrow, you can rotate the element about its center as a handle.

![Diagram of handle](image)

(1): Handle

Note: If a dynamic angle of rotation is also configured in the property “Absolute movement → Internal rotation”, then the static and dynamic angles of rotation are added in runtime mode. The static angle of rotation acts as an offset.

---

### Additional Properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Show cursor</strong></td>
<td>A cursor (vertical line) is displayed at the mouse position.</td>
</tr>
<tr>
<td><strong>Overwrite existing trace on PLC</strong></td>
<td>If a trace with the same name is on the PLC, then it is overwritten at download with the configuration that is defined here.</td>
</tr>
<tr>
<td><strong>Number format</strong></td>
<td>Number format of values in the tooltip in printf syntax (example: %d, %.2f).</td>
</tr>
</tbody>
</table>

---

**Element property 'Control variables'**

The control variables are assigned automatically when you click “Insert elements for controlling Trace”.

---

See also

- Chapter 6.4.5.5.3 “Positioning the Element, Adapting Size and Layer” on page 2874
"Reset Trigger" Variable (BOOL).
Standard control variable: bResetTrigger
TRUE: Resets the triggering. After the action is executed, the variable is set automatically to FALSE.

"Start Trace" Variable (BOOL).
Standard control variable: bStart
TRUE: Starts the Trace. After the action is executed, the variable is set automatically to FALSE.

"Stop Trace" Variable (BOOL).
Standard control variable: bStop
TRUE: Stops the Trace. After the action is executed, the variable is set automatically to FALSE.

"Save Trace to a file"

"Save Trace" Variable (BOOL).
Standard control variable: bStore
TRUE: Saves the current trace configuration and the data that is stored in the development system to a file. When the action is ended, the variable is set automatically to FALSE.

"File name" Variable (STRING) that contains the file name of the file to be saved.
Standard control variable: sStoreFilename

"Load trace from file"

"Load Trace" Variable (BOOL).
Standard control variable: bRestore
TRUE: Reads the file specified below and loads its contents into the trace editor. The file contains a trace configuration and possibly also trace data. To do this, the stored trace configuration must match the application where the trace configuration is located. When the action is ended, the variable is set automatically to FALSE.

Note: A trace configuration can be loaded from a file only under special circumstances. The file must have been created with exactly the same (running) application with which it will then be loaded. The consequence of changing the running application (for example by downloading again) is that a file which was previously created from the application cannot no longer be read into the application. Even external manual changes to the file can cause this. You should edit only those configuration settings that have an effect on displaying the variables. If you change variable definitions directly in the file (for example by replacing variable x with v y), then the file cannot be loaded.

"File name" Variable (STRING) that contains the file name of the file to be read.
Standard variable: sRestoreFilename

<td>X-coordinate of the point of rotation</td>
</tr>
<tr>
<td><strong>“Y”</strong></td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

---

**“Movement”**

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
</table>
| **“X”** | Variable (numeric data type). Defines the X position (in pixels).  
**Example:** PLC_PRG.iPos_X.  
Increasing this value in runtime mode moves the element to the right. |
| **“Y”** | Variable (numeric data type). Defines the Y position (in pixels).  
**Example:** PLC_PRG.iPos_Y.  
Increasing this value in runtime mode moves the element downwards. |

**“Rotation”**

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
</table>
| **“X”** | Variable (numeric data type). Defines the angle of rotation (in degrees).  
**Example:** PLC_PRG.iAngle1.  
The midpoint of the element rotates at the “Center” point. This rotation point is shown as the ⊕ symbol.  
In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right. |

**“Interior rotation”**

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
</table>
| **“X”** | Variable (numeric data type). Defines the angle of rotation (in degrees).  
**Example:** PLC_PRG.iAngle2.  
In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.  
The rotation point is shown as the ⊕ symbol.  
Note: If a static angle of rotation is specified in the “Position ➔ Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed. |
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.

See also

- The variables control the element behavior dynamically.

**Element property 'State variables'**

<table>
<thead>
<tr>
<th>Variable (BOOL)</th>
<th>Toggles the visibility of the element.</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Invisible&quot;</td>
<td>TRUE: The element is not visible at runtime.</td>
</tr>
</tbody>
</table>

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the “Support client animations and overlay of native elements” option in the Visualization Manager.
“Animation duration”
Defines the duration (in milliseconds) in which the element runs an animation

- Variable (integer value)
  Example: Menu.tContent with VAR tContent : INT := 500; END_VAR
- Integer literal
  Example: 500

Animatable properties
- “Absolute movement”, “Movement”, “X”, “Y”
- “Absolute movement”, “Rotation”
- “Absolute movement”, “Interior rotation”
- “Absolute movement”, “Exterior rotation”

The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.

“Move to foreground”
Moves the visualization element to the foreground

Variable (BOOL)
Example: bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR
TRUE: At runtime, the visualization element is displayed in the foreground.
FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Access rights'
Requirement: User management is set up for the visualization.

“Access rights”
Opens the “Access rights” dialog. There you can edit the access privileges for the element.

Status messages:
- “Not set. Full rights.”: Access rights for all user groups: “operable”
- “Rights are set: Limited rights”: Access is restricted for at least one group.

See also
- Chapter 6.4.5.21.3.1 “Dialog ‘Access Rights’” on page 3366

Visualization Element ‘Trend’

Symbol:

Category: “Special Controls”
The element displays the curve of variable values as a trend diagram. The trend diagram is suitable for representing a long-term data curve because the data is read from a trend recording and hence from a database. Moreover, you can run the “Trend” element together with the “Date Range Picker”, “Legend”, and “Time Range Picker” operating elements so that the user can navigate conveniently in the diagram.
You can programmatically delete the recorded trend curve at runtime. The recording starts again from the time of deletion. See the help page for "Programming a Trend Visualization".

**Element properties**

<table>
<thead>
<tr>
<th>&quot;Element name&quot;</th>
<th>Example: Velocity</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Data source&quot;</td>
<td>Data source for the connection via the device and the application to the &quot;Trend Recording&quot; object where the trend data that you want to show was saved.</td>
</tr>
<tr>
<td></td>
<td>If the &quot;Trend Recording&quot; object is on the local device, then it is sufficient when you specify the respective application. If the trend recording is on a remote device, then you need to specify the data source connection to this device.</td>
</tr>
<tr>
<td></td>
<td>● “&lt;local application&gt;” The &quot;Trend Recording&quot; object is located on the local device in the local application.</td>
</tr>
<tr>
<td></td>
<td>● &lt;device name&gt; . &lt;application name&gt; Example: Device_A.App_A The &quot;Trend Recording&quot; object is located on the local device Device_A below the application App_A.</td>
</tr>
<tr>
<td></td>
<td>● &lt;data source name&gt; Example: DataSource_B The &quot;Trend Recording&quot; object is located on a remote device that is connected via the data source DataSource_B. Below the (now visible) &quot;Application&quot; property, the remote application is displayed as configured in the data source. Example: App_B Note: If the data source is accessed symbolically by means of a symbol file (CODESYS symbolic), then the required symbol file and the corresponding project have to be saved in the same folder.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>&quot;Type of element&quot;</th>
<th>&quot;Trend&quot;</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Trend recording&quot;</td>
<td>📊: Trend recording whose data is displayed as a diagram</td>
</tr>
<tr>
<td></td>
<td>The trend recording is located on the device specified in the &quot;Data source&quot; property.</td>
</tr>
</tbody>
</table>

| "Display Mode" | 📊: Opens the "Display Settings" dialog. |

- Object ‘Data Source’

**Element property ‘Position’**

The position defines the location and size of the element in the visualization window. This is based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.
| **“X”** | The x-coordinate of the upper left corner of the element  
Specified in pixels  
Example: 10 |
| **“Y”** | The y-coordinate of the upper left corner of the element  
Specified in pixels  
Example: 10 |
| **“Width”** | Specified in pixels  
Example: 150 |
| **“Height”** | Specified in pixels  
Example: 30 |
| **“Angle”** | Static angle of rotation (in degrees)  
Example: 35  
The element is displayed rotated in the editor. The point of rotation is the center of the element. A positive value rotates clockwise.  
Tip: You can change the value in the editor by focusing the element to the handle. When the cursor is displayed as a rotating arrow, you can rotate the element about its center as a handle. |

(1): Handle  
Note: If a dynamic angle of rotation is also configured in the property “Absolute movement ➔ Internal rotation”, then the static and dynamic angles of rotation are added in runtime mode. The static angle of rotation acts as an offset.

See also

- Chapter 6.4.5.5.3 “Positioning the Element, Adapting Size and Layer” on page 2874
### “Show cursor”
A cursor (black triangle with vertical line) is shown in the trend diagram.

**Behavior at runtime:** As soon as the graph is drawn, the user can move the cursor along the time axis in order to mark a specific time. Then the variable value belonging to the cursor position is displayed in the legend above the graph.

![Trend diagram with cursor](image)

### “Show tooltip”
Requirement: “Show cursor” is activated.

- A tooltip opens at the cursor.

**Behavior at runtime:** The variable value belonging to the cursor position is displayed as a tooltip.

### “Show frame”
- The trend diagram is drawn with a frame.

### “Number format”
- Format specification in printf syntax, which determines how the values are displayed in the tooltip and in the legend

Example: `%d` (integer variable) or `%5.2f` (floating-point number)

---

**Element property 'Tick mark labels'**

The time stored in the trend recording are in the UTC time zone. If the time is displayed in the trend of the visualization element, then the time stamps are converted to the local time zone of the operating system of the PLC.

Change the time zone in the operating system if the times in the trend diagram are not in the zone that you need.
### “Time stamps”

<table>
<thead>
<tr>
<th>X-value of the trend diagram</th>
<th>“Absolute time stamps”</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>The absolute time with date and time is displayed at each tick mark on the time axis.</td>
</tr>
<tr>
<td>Example:</td>
<td>03/18/2016 12h30m50s</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Relative time stamps”</th>
</tr>
</thead>
<tbody>
<tr>
<td>The time period from the start of the recording (=0) is displayed at each tick mark.</td>
</tr>
<tr>
<td>Example:</td>
</tr>
</tbody>
</table>

### “Draw labels on two lines”

| ☑: The time stamps are displayed on two lines (for example, the date is displayed on the first line and the time on the second line). |
| ☐: The time stamp is displayed on one line. Example: 2019-11-01-12:30:50. |

### “Omit irrelevant information in timestamps”

| ☑: The time stamps are displayed in a truncated form (without insignificant information). For example, the date is displayed at the first tick mark, and only the time is displayed at the following tick marks. The “Internationalization (format strings)” property is not visible and is ignored. |
| ☐: The time stamps are displayed with all information. This takes into consideration the “Internationalization (format strings)” property which contains the format specification for the date and time display. |

### “Internationalization (format strings)”

Format specification for the date and time display of the time stamp (when it is displayed in full)

Note: The property is visible only if the “Omit irrelevant information in timestamps” option is **not** selected.
### "Date"

Format string that returns the date display according to the defined format. The operating system locale is used as the default setting.

Defined format strings for the date:
- **Year**: yyyy, yy, y
- **Month**: MM, M
- **Day**: dd, d
- **Recommended separator**: - . /

Example:
- yyyy-MM-d displays 2019-10-25
- yyyy-MM-dd displays 2019-10-25
- dd.MM.yyyy displays 25.10.2019
- dd/MM/yyyy displays 25/10/2019

### "Time"

Format string that returns the time (or time of day) display according to the defined format. The operating system locale is used as the default setting.

Defined format strings for the time:
- **24-hour time definition**: HH, H
- **12-hour time definition**: hh, h
- **AM/PM for 12-hour time definition**: tt
- **Minutes**: mm, m
- **Seconds**: ss, s
- **Milliseconds**: ms
- **Microseconds**: us
- **Recommended separator**: : or space character

Example:
- HH:mm:ss:ms displays 15:30:59:123
- h:mm:ss tt displays 3:30:59 PM

See also
- Chapter 6.4.5.20.2 “Placeholders with Format Definition in the Output Text” on page 3329

### Element property 'Assigned control elements'

These elements are created automatically when the control elements are added with the command “Insert elements for controlling Trend”.

<table>
<thead>
<tr>
<th>&quot;Date Range Picker&quot;</th>
<th>Control element for changing the date and time of the displayed data sets. With [xxx], all elements are provided that have implemented the interface IDateRangeSelector. By default, instances of the &quot;Date Range Picker&quot; visualization element are available.</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Time Range Picker&quot;</td>
<td>Control element for changing the time of the displayed data sets. With [xxx], all elements are provided that have implemented the interface ITimeSelector. By default, instances of the &quot;Time Range Picker&quot; visualization element are available.</td>
</tr>
<tr>
<td>&quot;Legend&quot;</td>
<td>Control element for displaying a legend for the graphs. With [xxx], all elements are provided that have implemented the interface ILegendDisplayer.</td>
</tr>
</tbody>
</table>

See also
- Chapter 6.4.5.21.2.18 “Command 'Insert Elements for Controlling the Trend’” on page 3360
Element property 'Center'  
The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>X</td>
<td>X-coordinate of the point of rotation</td>
</tr>
<tr>
<td>Y</td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the symbols (symbol) to other positions in the editor.

Element property 'Absolute movement'  
The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

**“Movement”**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| X        | Variable (numeric data type). Defines the X position (in pixels).  
Example: PLC_PRG.iPos_X.  
Increasing this value in runtime mode moves the element to the right. |
| Y        | Variable (numeric data type). Defines the Y position (in pixels).  
Example: PLC_PRG.iPos_Y.  
Increasing this value in runtime mode moves the element downwards. |

**“Rotation”**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| X        | Variable (numeric data type). Defines the angle of rotation (in degrees).  
Example: PLC_PRG.iAngle1.  
The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.  
In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right. |

**“Interior rotation”**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| X        | Variable (numeric data type). Defines the angle of rotation (in degrees).  
Example: PLC_PRG.iAngle2.  
In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.  
The rotation point is shown as the symbol.  
Note: If a static angle of rotation is specified in the “Position ➔ Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed. |
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.

See also

- The variables control the element behavior dynamically.

**Element property ‘State variables’**

<table>
<thead>
<tr>
<th>“Invisible”</th>
<th>Variable (BOOL). Toggles the visibility of the element.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><strong>TRUE</strong>: The element is not visible at runtime.</td>
</tr>
</tbody>
</table>

The “Invisible” property is supported by the “Client Animation” functionality.

These properties are available only when you have selected the “Support client animations and overlay of native elements” option in the Visualization Manager.
**“Animation duration”**

Defines the duration (in milliseconds) in which the element runs an animation

- **Variable (integer value)**
  
  **Example:**
  ```
  Menu.tContent with VAR tContent : INT := 500;
  END_VAR
  ```

- **Integer literal**
  
  **Example:** 500

**Animatable properties**

- “Absolute movement”, “Movement”, “X”, “Y”
- “Absolute movement”, “Rotation”
- “Absolute movement”, “Interior rotation”
- “Absolute movement”, “Exterior rotation”

The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.

**“Move to foreground”**

Moves the visualization element to the foreground

**Variable (BOOL)**

**Example:**

```
VAR bIsInForeground : BOOL := FALSE; END_VAR
```

**TRUE:** At runtime, the visualization element is displayed in the foreground.

**FALSE:** At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

---

**Element property ‘Access rights’**

Requirement: User management is set up for the visualization.

**“Access rights”**

Opens the “Access rights” dialog. There you can edit the access privileges for the element.

**Status messages:**

- “Not set. Full rights.”: Access rights for all user groups: “operable”
- “Rights are set: Limited rights”: Access is restricted for at least one group.

- § Chapter 6.4.5.21.3.1 “Dialog ‘Access Rights’” on page 3366

See also

- § Chapter 6.4.5.13 “Displaying data curve with trend” on page 2928
- § Chapter 6.4.5.13.2 “Getting Started with Trend Visualization” on page 2928
- § Chapter 6.4.5.13.3 “Programming a Trend Visualization” on page 2931
- **Object ‘Trend Recording’**

---

**Visualization Element ‘Legend’**

**Symbol:**

![Symbol](image)

**Category:** “Special Controls”
The element is used as a legend for another element (for example, a trend). The legend is assigned in the properties of the other element.

See also
- Chapter 6.4.5.13 “Displaying data curve with trend” on page 2928

### Element properties

<table>
<thead>
<tr>
<th>“Element name”</th>
<th>Example: LegendOfTrendA</th>
</tr>
</thead>
</table>

**Optional**

Hint: Assign individual names for elements so that they are found faster in the element list.

<table>
<thead>
<tr>
<th>“Type of element”</th>
<th>“Legend”</th>
</tr>
</thead>
</table>

### Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

| “X” | X coordinate of the upper left corner of the element  
Specified in pixels.  
Example: 10. |
|------|--------------------------------------------------|

| “Y” | Y coordinate of the upper left corner of the element  
Specified in pixels.  
Example: 10. |
|------|--------------------------------------------------|

| “Width” | Specified in pixels.  
Example: 150 |
|---------|--------------------------------------------------|

| “Height” | Specified in pixels.  
Example: 30 |
|----------|--------------------------------------------------|

You can also change the values by dragging the box symbols (🧱) to other positions in the editor.

See also
- Chapter 6.4.5.5.3 “Positioning the Element, Adapting Size and Layer” on page 2874

### Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⌀ symbol. The point is used as the center for rotating and scaling.

<table>
<thead>
<tr>
<th>“X”</th>
<th>X-coordinate of the point of rotation</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>“Y”</th>
<th>Y-coordinate of the point of rotation</th>
</tr>
</thead>
</table>
You can also change the values by dragging the symbols (¶) to other positions in the editor.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Orientation”</td>
<td>Orientation of the element. The value is configured in the assigned element.</td>
</tr>
<tr>
<td></td>
<td>- “Horizontal”</td>
</tr>
<tr>
<td></td>
<td>- “Vertical”</td>
</tr>
<tr>
<td>“Attached element instance”</td>
<td>Example: Element_A</td>
</tr>
<tr>
<td>“Show frame”</td>
<td>☑: The element is displayed with frames.</td>
</tr>
<tr>
<td>“Number format”</td>
<td>The format of the value in printf syntax (example: %d, %5.2f)</td>
</tr>
</tbody>
</table>

### Element Property 'Layout'

Defines how many variables can be displayed at a maximum and is calculated from the row and column number.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Max. number of rows”</td>
<td>Example: 3</td>
</tr>
<tr>
<td>“Max. number of columns”</td>
<td>Example: 2</td>
</tr>
</tbody>
</table>

### Element Property 'Text properties'

The property affects the text configured in the associated element.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Text format”</td>
<td>“Default”: The text will be cut and displayed in only the part that fits into the visualization element.</td>
</tr>
<tr>
<td></td>
<td>“Linebreak”: The text will be wrapped in rows.</td>
</tr>
<tr>
<td></td>
<td>“Ellipsis”: The text is cut and ellipsis ... are added to indicate that something is missing.</td>
</tr>
<tr>
<td>“Font”</td>
<td>Font of the text. The entries of the selection list are defined in the visualization style.</td>
</tr>
<tr>
<td>“Font color”</td>
<td>Text color, for example Grey. The entries of the selection list are defined in the visualization style.</td>
</tr>
<tr>
<td>“Transparency”</td>
<td>Transparency value (255 to 0), which defines the transparency of the corresponding color. Example: 255: The color is opaque. 0: The color is fully transparent.</td>
</tr>
</tbody>
</table>

### Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Movement”</td>
<td></td>
</tr>
<tr>
<td>“X”</td>
<td>Variable (numeric data type). Defines the X position (in pixels). Example: PLC_PRG.iPos_X.</td>
</tr>
<tr>
<td></td>
<td>Increasing this value in runtime mode moves the element to the right.</td>
</tr>
</tbody>
</table>
### “Y”
Variable (numeric data type). Defines the Y position (in pixels).

**Example:** PLC_PRG.iPos_Y.

Increasing this value in runtime mode moves the element downwards.

### “Rotation”
Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle1.

The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.

In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

### “Interior rotation”
Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol.

Note: If a static angle of rotation is specified in the “Position ➔ Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

---

You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.

See also

- 

These properties are available only when you have selected the “Support client animations and overlay of native elements” option in the Visualization Manager.
<table>
<thead>
<tr>
<th><strong>“Animation duration”</strong></th>
<th>Defines the duration (in milliseconds) in which the element runs an animation</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Variable (integer value)</td>
<td>Example: <code>Menu.tContent with VAR tContent : INT := 500; END_VAR</code></td>
</tr>
<tr>
<td>• Integer literal</td>
<td>Example: 500</td>
</tr>
</tbody>
</table>

**Animatable properties**

- “Absolute movement”, “Movement”, “X”, “Y”
- “Absolute movement”, “Rotation”
- “Absolute movement”, “Interior rotation”
- “Absolute movement”, “Exterior rotation”

The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.

<table>
<thead>
<tr>
<th><strong>“Move to foreground”</strong></th>
<th>Moves the visualization element to the foreground</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable (BOOL)</td>
<td>Example: <code>bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR</code></td>
</tr>
<tr>
<td>TRUE: At runtime, the visualization element is displayed in the foreground.</td>
<td></td>
</tr>
<tr>
<td>FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.</td>
<td></td>
</tr>
</tbody>
</table>

**Element property 'Access rights'**

Requirement: User management is set up for the visualization.

<table>
<thead>
<tr>
<th><strong>“Access rights”</strong></th>
<th>Opens the “Access rights” dialog. There you can edit the access privileges for the element.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status messages:</td>
<td><strong>“Not set. Full rights.”</strong>: Access rights for all user groups: “operable”</td>
</tr>
<tr>
<td></td>
<td><strong>“Rights are set: Limited rights”</strong>: Access is restricted for at least one group.</td>
</tr>
</tbody>
</table>

**Visualization Element 'ActiveX’**

Symbol:

![ActiveX Symbol]

Category: “Special Controls”

The element is used to link an existing ActiveX control in the visualization. You can configure the method calls and their parameters in the element properties of the “ActiveX” element.

**Element properties**
<table>
<thead>
<tr>
<th>“Element name”</th>
<th>Example: GenElemInst_1</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Type of element”</td>
<td>“ActiveX”</td>
</tr>
<tr>
<td>“Element”</td>
<td>Installed ActiveX component that is linked to the visualization. Hint: To avoid typing errors, select the required ActiveX component by means of the Input Assistant.</td>
</tr>
</tbody>
</table>

**Element property 'Position'**

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

<table>
<thead>
<tr>
<th>“X”</th>
<th>X coordinate of the upper left corner of the element Specified in pixels. Example: 10.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Y”</td>
<td>Y coordinate of the upper left corner of the element Specified in pixels. Example: 10.</td>
</tr>
<tr>
<td>“Width”</td>
<td>Specified in pixels. Example: 150</td>
</tr>
<tr>
<td>“Height”</td>
<td>Specified in pixels. Example: 30</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the box symbols (🧩) to other positions in the editor.

See also

- ☝️ Chapter 6.4.5.5.3 “Positioning the Element, Adapting Size and Layer” on page 2874

**Element property 'Center'**

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⚪ symbol. The point is used as the center for rotating and scaling.

<table>
<thead>
<tr>
<th>“X”</th>
<th>X-coordinate of the point of rotation</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Y”</td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the symbols (🧩) to other positions in the editor.

**Element property 'Absolute movement'**

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

2024/01/05 3ADR010583, 1, en_US 3259
### Movement

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>X</td>
<td>Defines the X position (in pixels).</td>
<td>PLC_PRG.iPos_X. Increasing this value in runtime mode moves the element to the right.</td>
</tr>
<tr>
<td>Y</td>
<td>Defines the Y position (in pixels).</td>
<td>PLC_PRG.iPos_Y. Increasing this value in runtime mode moves the element downwards.</td>
</tr>
</tbody>
</table>

#### Rotation

Variable (numeric data type). Defines the angle of rotation (in degrees).

Example: PLC_PRG.iAngle1.

The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.

In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

#### Scaling

Variable (integer data type). Causes centric stretching.

Example: PLC_PRG.iScaling.

The reference point is the “Center” property.

The value 1 shrinks the element by a factor of 0.001. The value 1000 returns the element to its original size.

#### Interior rotation

Variable (numeric data type). Defines the angle of rotation (in degrees).

Example: PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol.

Note: If a static angle of rotation is specified in the property “Position → Angle”, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

---

You can link the variables to a unit conversion.

The properties “X”, “Y”, “Rotation”, and “Interior rotation” are supported by the “Client Animation” functionality.
The variables control the element behavior dynamically.

**State variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Invisible&quot;</td>
<td>Variable (BOOL). Toggles the visibility of the element. TRUE: The element is not visible at runtime.</td>
</tr>
</tbody>
</table>

The "Invisible" property is supported by the "Client Animation" functionality.

**Initial calls**

These method calls are executed during initialization. They are executed in the first cycle only.

| Method calls | "Create new" | Creates a subnode below "Methods" with parameters for the method call. |
| "Methods" | [<number>] | |
| | "Method": Name of the method |
| | "Parameter": Parameter passed at the method call |
| | "Result parameter": Optional variable for the return value of the method |

**Cyclic calls**

These method calls are executed in every cycle. They are executed in the refresh rate of the visualization.

| Method calls | "Create new" | Creates a subnode below "Methods" for a method call and its parameters. |
| "Methods" | [<number>] | |
| | "Method": Name of the method |
| | "Parameter": Parameter passed at the method call |
| | "Result parameter": Optional variable for the return value of the method |

**Conditional calls**

These method calls are executed in the refresh rate of the visualization. You define the call condition in the property "Methods ➔ [<number>] ➔ Call condition".

| Method calls | "Create new" | Creates a subnode below "Methods" with a call condition and parameters for the method call. |
| "Methods" | [<number>] | |
| | "Method": Name of the method |
| | "Call condition": Variable (BOOL). A rising edge of this variable triggers the call of this method. |
| | "Parameter": Parameter passed at the method call |
| | "Result parameter": Optional variable for the return value of the method |
These properties are available only when you have selected the “Support client animations and overlay of native elements” option in the Visualization Manager.

| “Animation duration” | Defines the duration (in milliseconds) in which the element runs an animation
|----------------------|--------------------------------------------------------------------------------
|                      | • Variable (integer value)
|                      |   Example: Menu.tContent with VAR tContent : INT := 500;
|                      |     END_VAR
|                      | • Integer literal
|                      |   Example: 500

Animatable properties

• “Absolute movement”, “Movement”, “X”, “Y”
• “Absolute movement”, “Rotation”
• “Absolute movement”, “Interior rotation”
• “Absolute movement”, “Exterior rotation”

The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.

| “Move to foreground” | Moves the visualization element to the foreground
|----------------------|--------------------------------------------------------------------------------
|                      | Variable (BOOL)
|                      | Example: bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR
|                      | TRUE: At runtime, the visualization element is displayed in the foreground.
|                      | FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

| “Access rights” | Opens the “Access rights” dialog. There you can edit the access privileges for the element.
|-----------------|--------------------------------------------------------------------------------
|                 | Status messages:
|                 | • “Not set. Full rights.”: Access rights for all user groups: “operable”
|                 | • “Rights are set: Limited rights”: Access is restricted for at least one group.

Visualization Element 'Web Browser’

Symbol:

Category: “Special Controls”

The element shows a website, PDF file, or video that has a URL.
NOTICE!
The display options of the "Web Browser" element depend on the operating system and the display variant of the visualization.

Requirement: The software components of the web browser are available in the runtime and configured accordingly (example: videos to be shown on Linux).

<td>PLC_PRG.iAngle2</td>
</tr>
</tbody>
</table>
You can link the variables to a unit conversion.

The properties “X”, “Y”, “Rotation”, and “Interior rotation” are supported by the “Client Animation” functionality.

See also

Element property ‘State variables’

The variables control the element behavior dynamically.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Invisible”</td>
<td>Variable (BOOL). Toggles the visibility of the element. TRUE: The element is not visible at runtime.</td>
</tr>
</tbody>
</table>

The “Invisible” property is supported by the “Client Animation” functionality.

Element property ‘Control variables’

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“URL”</td>
<td>URL of the web page that is displayed in the visualization.</td>
</tr>
<tr>
<td>Variable (STRING or WSTRING)</td>
<td>Example: PLC_PRG.stURL</td>
</tr>
<tr>
<td>Literal in single straight quotation marks</td>
<td>Example: '<a href="http://de.wikipedia.org">http://de.wikipedia.org</a>'</td>
</tr>
<tr>
<td>“Show”</td>
<td>Variable (BOOL). Example: PLC_PRG.bSetURL</td>
</tr>
<tr>
<td>Controls the display of the “Web browser” element. If the variable contains a rising edge, then the visualization calls the web page given in “URL” and displays its contents in the ‘Web browser’ visualization element.</td>
<td></td>
</tr>
<tr>
<td>“Back”</td>
<td>Variable (BOOL). Example: PLC_PRG.bGoBack</td>
</tr>
<tr>
<td>Controls the back navigation in the “Web browser”. If the variable has a rising edge, then the visualization displays the contents of the previously displayed page.</td>
<td></td>
</tr>
<tr>
<td>“Forward”</td>
<td>Variable (BOOL). Example: PLC_PRG.bGoForward</td>
</tr>
<tr>
<td>Controls the forward navigation in the “Web browser”. If the variable has a rising edge, then the visualization displays the contents of the previously displayed page.</td>
<td></td>
</tr>
</tbody>
</table>
These properties are available only when you have selected the “Support client animations and overlay of native elements” option in the Visualization Manager.

### “Animation duration”
Defines the duration (in milliseconds) in which the element runs an animation

- **Variable** (integer value)
  
  **Example:**
  ```
  Menu.tContent with
  VAR tContent : INT := 500;
  END_VAR
  ```

- **Integer literal**
  
  **Example:**
  500

**Animatable properties**

- “Absolute movement”, “Movement”, “X”, “Y”
- “Absolute movement”, “Rotation”
- “Absolute movement”, “Interior rotation”
- “Absolute movement”, “Exterior rotation”

The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.

### “Move to foreground”
Moves the visualization element to the foreground

**Variable** (**BOOL**)

**Example:**
```
VAR bIsInForeground : BOOL := FALSE; END_VAR
```

**TRUE:** At runtime, the visualization element is displayed in the foreground.

**FALSE:** At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

---

**Element property 'Access rights'**

**Requirement:** User management is set up for the visualization.

### “Access rights”
Opens the “Access rights” dialog. There you can edit the access privileges for the element.

**Status messages:**

- “Not set. Full rights.”: Access rights for all user groups: “operable”
- “Rights are set: Limited rights”: Access is restricted for at least one group.

See also

- § Chapter 6.4.5.21.3.1 “Dialog 'Access Rights'” on page 3366

**Visualization Element 'Busy Symbol, Cube'**

**Symbol:**

- **Category:** “Special Controls”

At runtime, this element indicates automatically that the runtime is busy or waiting for data.
Element properties

<table>
<thead>
<tr>
<th>“Element name”</th>
<th>Example: Data_Transfer</th>
</tr>
</thead>
</table>

Optional

Hint: Assign individual names for elements so that they are found faster in the element list.

| “Type of element” | “Busy Symbol, Cube” |

Element property ‘Position’

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

<table>
<thead>

<tr>
<td><strong>Rotation</strong></td>
<td>Variable (numeric data type). Defines the angle of rotation (in degrees).</td>
<td>PLC_PRG.iAngle1.</td>
<td>The midpoint of the element rotates at the &quot;Center&quot; point. This rotation point is shown as the symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.</td>
</tr>
<tr>
<td><strong>Interior rotation</strong></td>
<td>Variable (numeric data type). Defines the angle of rotation (in degrees).</td>
<td>PLC_PRG.iAngle2.</td>
<td>In runtime mode, the element rotates about the point of rotation specified in &quot;Center&quot; according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the symbol. Note: If a static angle of rotation is specified in the &quot;Position ➔ Angle&quot; property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.</td>
</tr>
</tbody>
</table>

You can link the variables to a unit conversion.

The "X", "Y", "Rotation", and "Interior rotation" properties are supported by the "Client Animation" functionality.

See also

- **Element property 'State variables'**
  The variables control the element behavior dynamically.
"Invisible" Variable (BOOL). Toggles the visibility of the element.
TRUE: The element is not visible at runtime.

The "Invisible" property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the “Support client animations and overlay of native elements” option in the Visualization Manager.

"Animation duration" Defines the duration (in milliseconds) in which the element runs an animation
- Variable (integer value)
  Example: Menu.tContent with VAR tContent : INT := 500; END_VAR
- Integer literal
  Example: 500

Animatable properties
- "Absolute movement", "Movement", “X”, “Y"
- "Absolute movement", "Rotation"
- "Absolute movement", "Interior rotation"
- "Absolute movement", "Exterior rotation"

The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.

"Move to foreground" Moves the visualization element to the foreground
Variable (BOOL)
Example: bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR
TRUE: At runtime, the visualization element is displayed in the foreground.
FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

"Access rights" Opens the “Access rights” dialog. There you can edit the access privileges for the element.
Status messages:
- "Not set. Full rights.
- "Rights are set: Limited rights": Access is restricted for at least one group.

Visualization Element 'Busy Symbol, Flower'

Symbol:

Category: “Special Controls”
The element indicates that the system is busy or waiting for data.

<table>
<thead>
<tr>
<th>Element properties</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Element name&quot;</td>
<td>Data_Transfer</td>
</tr>
<tr>
<td>Optional</td>
<td></td>
</tr>
<tr>
<td>Hint:</td>
<td></td>
</tr>
<tr>
<td>&quot;Type of element&quot;</td>
<td>&quot;Busy Symbol, Flower&quot;</td>
</tr>
</tbody>
</table>

Element property 'Position'
The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

You can also change the values by dragging the box symbols (_drag) to other positions in the editor.

See also
• Chapter 6.4.5.5 “Designing a visualization with elements” on page 2872

See also
• Chapter 6.4.5.3 “Positioning the Element, Adapting Size and Layer” on page 2874
Element property 'Center'
The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the \( \phi \) symbol. The point is used as the center for rotating and scaling.

<table>
<thead>
<tr>
<th>“X”</th>
<th>X-coordinate of the point of rotation</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Y”</td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the symbols (\( \phi \)) to other positions in the editor.

Element property 'Colors'
The properties contain fixed values for setting colors.

<table>
<thead>
<tr>
<th>“Frame color”</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>“Fill color”</td>
<td></td>
</tr>
<tr>
<td>“Transparency”</td>
<td>Value (0 to 255) for defining the transparency of the selected color. Example 255: The color is opaque. 0: The color is completely transparent.</td>
</tr>
</tbody>
</table>

See also
- \( \$ \) Chapter 6.4.5.21.3.5 “Dialog ‘Gradient Editor’” on page 3369
- \( \$ \) Chapter 6.4.5.5 “Designing a visualization with elements” on page 2872

Element property 'Appearance'
The properties contain fixed values for setting the look of the element.

| “Line width” | Value in pixels
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: 2</td>
<td></td>
</tr>
</tbody>
</table>

Note: The values 0 and 1 both result in a line weight of 1 pixel. If no line should be displayed, then the “Line style” property must be set to the option “Invisible”.

<table>
<thead>
<tr>
<th>“Fill attributes”</th>
<th>The way in which the element is filled.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Filled”</td>
<td>The element is filled with the color from property “Colors ➔ Fill color”.</td>
</tr>
<tr>
<td>“Invisible”</td>
<td>The fill color is invisible.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Line style”</th>
<th>Type of line representation</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Solid”</td>
<td></td>
</tr>
<tr>
<td>“Dashes”</td>
<td></td>
</tr>
<tr>

<table>
<thead>
<tr>
<th><strong>Symbol color</strong></th>
<th>Selection of a color for the flower symbol.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Line</strong></td>
<td>Stroke width of the lines (in pixels).</td>
</tr>
</tbody>
</table>

**Element property 'Absolute movement'**

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

### Movement

| **X** | Variable (numeric data type). Defines the X position (in pixels).  
Example: PLC_PRG.iPos_X.  
Increasing this value in runtime mode moves the element to the right. |
|-------|---------------------------------------------------------------------|
| **Y** | Variable (numeric data type). Defines the Y position (in pixels).  
Example: PLC_PRG.iPos_Y.  
Increasing this value in runtime mode moves the element downwards. |

**Rotation**

Variable (numeric data type). Defines the angle of rotation (in degrees).

Example: PLC_PRG.iAngle1.

The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.

In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

| **Interior rotation** | Variable (numeric data type). Defines the angle of rotation (in degrees).  
Example: PLC_PRG.iAngle2.  
In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.  
The rotation point is shown as the symbol.  
Note: If a static angle of rotation is specified in the “Position ➔ Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed. |

You can link the variables to a unit conversion.
The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.

<td></td>
</tr>
</tbody>
</table>

### Table 634: Element property “Control variables --> Selection”

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Start position”</td>
<td>Output variable (integer data type). Shows the absolute position for starting the text selection</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Example: <code>iPosSelection: INT;</code></td>
<td></td>
</tr>
<tr>
<td>“End position”</td>
<td>Output variable (integer data type). Shows the absolute position for ending the text selection</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Example: <code>iPosEndSelection: INT;</code></td>
<td></td>
</tr>
<tr>
<td>“Start line number”</td>
<td>Output variable (integer data type). Shows the line where the text selection begins</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Example: <code>iRowSelection: INT;</code></td>
<td></td>
</tr>
<tr>
<td>“Start column index”</td>
<td>Output variable (integer data type). Shows the column where the text selection begins</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Example: <code>iColumnSelection: INT;</code></td>
<td></td>
</tr>
<tr>
<td>“End line number”</td>
<td>Output variable (integer data type). Shows the line where the text selection ends</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Example: <code>iRowEndSelection: INT;</code></td>
<td></td>
</tr>
<tr>
<td><strong>“End column index”</strong></td>
<td>Output variable (integer data type). Shows the column where the text selection ends.</td>
<td><strong>Example:</strong> <code>iColumnEndSelection: INT;</code></td>
</tr>
<tr>
<td>------------------------</td>
<td>---------------------------------------------------------------------------------</td>
<td>---------------------------------</td>
</tr>
<tr>
<td><strong>“Line to select”</strong></td>
<td>Variable (integer data type). Contains the line number that is selected. Note: The selection is controlled by the variables in the “Trigger selection” property.</td>
<td></td>
</tr>
<tr>
<td><strong>“Set selection”</strong></td>
<td>Variable (BOOL). Controls the selection of a line. Example: <code>bSetSelection: BOOL;</code> TRUE: The line from the “Line to select” property is selected and highlighted in the Text Editor. if the line is not in the current text segment of the Text Editor, then the text segment is moved to this line. Note: The variable is used as the control variable for an input event triggered by a visualization user. The control variable is not reset automatically. You are responsible for this to occur in the visualization.</td>
<td></td>
</tr>
</tbody>
</table>

Table 635: Element property “Control variables --> Error handling”

| **“Variable for error code”** | Variable (integer data type). Contains the error code when an error occurs. Example: `iError: INT;` The error codes are declared in `GVL_ErrorCodes` in the `VisuElemTextEditor` library. To display the error text, the `VisuFctTextEditorGetErrorText()` function of the library must be called. |
|-----------------------------|---------------------------------------------------------------------------------|---------------------------------|
| **“Variable for content changed”** | Variable (BOOL). Shows whether the contents have changed. Example: `bIsContentEdited: BOOL;` TRUE: The contents of the Text Editor have changed. |
| **“Variable for access mode”** | Variable (BOOL). Controls the access privileges to the file. Example: `bIsReadOnly: BOOL;` TRUE: A visualization user has read-only permission. At runtime, the file contents are highlighted in gray in the Text Editor. FALSE: A visualization user has read/write permission. Note: The variable overwrites the setting in the “Editor mode” property. |

<table>
<thead>
<tr>
<th><strong>“Maximum line length”</strong></th>
<th>Maximum number of characters per line</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Editor mode”</strong></td>
<td>•  “Read-only”: A visualization user has read-only permissions to the file. At runtime, the file contents are highlighted in gray in the text editor.  •  “Read/write”: A visualization user has read-write permissions.</td>
</tr>
</tbody>
</table>

Element property 'New files'
**“Encoding”**

Character encoding of the new file:
- “ASCII”
- “Unicode (Little endian)”
- “Unicode (Big endian)”

**“New line character sequence”**

End of line character of the new file:
- “CR/LF”: Normal for Windows systems
- “LF”: Normal for UNIX systems

Please note: When a visualization user opens an existing file, the end-of-line character of the file is detected and used automatically.

These properties are available only when you have selected the “Support client animations and overlay of native elements” option in the Visualization Manager.

**“Animation duration”**

Defines the duration (in milliseconds) in which the element runs an animation
- Variable (integer value)
  - Example: Menu.tContent with VAR tContent : INT := 500; END_VAR
- Integer literal
  - Example: 500

Animatable properties
- “Absolute movement”, “Movement”, “X”, “Y”
- “Absolute movement”, “Rotation”
- “Absolute movement”, “Interior rotation”
- “Absolute movement”, “Exterior rotation”

The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.

**“Move to foreground”**

Moves the visualization element to the foreground
- Variable (BOOL)
- Example: bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR
  - TRUE: At runtime, the visualization element is displayed in the foreground.
  - FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

**Element property ‘Access rights’**

Requirement: User management is set up for the visualization.

**“Access rights”**

Opens the “Access rights” dialog. There you can edit the access privileges for the element.

Status messages:
- “Not set. Full rights.”: Access rights for all user groups: “operable”
- “Rights are set: Limited rights”: Access is restricted for at least one group.

See also
- “Chapter 6.4.5.21.3.1 “Dialog ‘Access Rights’” on page 3366”
Visualization Element 'Path3D'

Symbol:

Category: “Special Controls”

The "Path3D" visualization element graphically displays the curves of two independent records as a 3D path. It is specially designed for use with Motion Solution CNC in order to display the trajectory of a machine tool or a robot. The programmed path (path) and the path actually traveled (track) is displayed.

Although the visualization element is designed for use with Motion Solution CNC, it can also be used to display any other record. In this case the application has to provide the path data. The sample application 3D Path Generator, which is available in CODESYS Forge, shows how these data can be generated.

If the element is used together with SoftMotion CNC, then function blocks from the library SM3_CNC_Visu help to generate the data from the path and track. These function blocks are used by the sample project CNC_File_3DPath, which is stored in the installation directory of CODESYS.

- SMC_PathCopier
- SMC_PathCopierCompleteQueue
- SMC_PathCopierFile
- SMC_PositionTracker

A description of the function blocks can be found in the Library Manager in the library SM3_CNC_Visu.

The element does not work with the CODESYS HMI display variant.

See also

- CNC Example 6: Using Path3D with SoftMotion CNC
- Sample project in CODESYS Forge

**Element properties**

<table>
<thead>
<tr>
<th>&quot;Element name&quot;</th>
<th>Example: GenElemInst_1</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Type of element&quot;</td>
<td>&quot;Path3D&quot;</td>
</tr>
</tbody>
</table>

**Element property 'Position'**

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.
| **“X”** | X coordinate of the upper left corner of the element  
Specified in pixels.  
Example: 10. |
| --- | --- |
| **“Y”** | Y coordinate of the upper left corner of the element  
Specified in pixels.  
Example: 10. |
| **“Width”** | Specified in pixels.  
Example: 150 |
| **“Height”** | Specified in pixels.  
Example: 30 |

You can also change the values by dragging the box symbols (揹) to other positions in the editor.

### Path description

**“Path data (VisuStruct3DTrack)”**

Variable of the type VisuStruct3DTrack, which is declared in the IEC code.  
Example: PLC_PRG.pc.vs3dt. A description of the structure can be found in the library manager in the library VisuElem3DPath.library.  

The data structure describes a path or track through a certain number of points. The points are determined and buffered by the application. The track typically displays the last n positions, so that only a certain part of them is ever displayed at any one time. VisuStruct3DTrack.pProjection is a variable that is set by the visualization element and contains information about the path/track projection. It can be read (only) by the application. In addition, the methods Projection.Apply or ApplyV can be used in order to see whether the transformed position lies inside or outside the visualization display area, which is defined by Projection.ElementRect.

**“Path color”**  
Color of the path drawn

**“Path line width”**  
Path line width in pixels, e.g.: "2"

**“Style of boundary points”**  
Display of the points between two successive objects in the path
- End points are not displayed
- End points are marked with a circle
- End points are marked with a cross
- End points are marked with a plus

### Track description

The track data are structured in exactly the same way as the path data: VisuStruct3DTrack

**“Track data (VisuStruct3DTrack)”**

Variable of the type VisuStruct3DTrack, which is declared in the IEC code.  
Example: PLC_PRG.pc.vs3dt. A description of the structure can be found in the library manager in the library VisuElem3DPath.library.

**“Track color”**  
Color of the track drawn

**“Track line width”**  
Track line width in pixels, e.g.: "2"
Camera control  
The camera position for the 3D mode is controlled with a reference to the external data structure. This structure allows the following operations:

- Shifting to the left/to the right/upwards/downwards
- Rotation around the X/Y/Z axis
- Resetting of the view at X/Y, Y/Z or Z/X level, so that the path and the track are completely visible.

<table>
<thead>
<tr>
<th>“Control data (VisuStruct3DControl)”</th>
<th>Variable of the type VisuStruct3DControl, which is declared in the IEC code. Example: PLC_PRG.pc.vs3dc.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>A description of the structure can be found in the library manager in the library VisuElem3DPath.</td>
</tr>
<tr>
<td></td>
<td>The values can be set via the application itself or via the visualization element “ControlPanel”. The library VisuElem3DPath contains ready-to-use visualization frames that provide a possible user interface for these data.</td>
</tr>
</tbody>
</table>

Additional aspects

| “Coordinate system” | [✓]: The coordinate system is displayed |
| “Grid”              | [✓]: Grid lines are displayed |
| “Grid color”        | Color of the grid lines |

Highlighting  
Individual parts of the path can be visually highlighted. This is typically used to mark the already processed part of a track with a different color. Each point in the path is given a unique ID, which in the case of a CNC editor is linked with the object ID on which the point lies. This ID ("highlight ID") can be specified via the application so that dynamic elements/parts of the track can be highlighted.

<table>
<thead>
<tr>
<th>Highlight mode</th>
<th>Select one of the following highlight modes:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>● Only the element whose ID corresponds to the value of the variable is highlighted.</td>
</tr>
<tr>
<td></td>
<td>● All elements whose ID (linked with the object ID in the case of a CNC editor) is smaller than or equal to the value in Variable are highlighted.</td>
</tr>
</tbody>
</table>

| Variable       | Project variable that specifies the ID of an element. Example: PLC_PRG.iVarElementID. This "highlight ID" is taken into account for the setting of the highlight mode. The variable must be set in the IEC application. |

| Highlight color | |

Element look

| “Frame line width” | Width of the frame around the element, in pixels, for example: "1" |
| “Frame line style” | Select one of these style types for the frame line: |
|                   | ● Solid |
|                   | ● Dashes |
|                   | ● Dots |
|                   | ● Dash Dot |
|                   | ● Dash Dot Dot |
|                   | ● Hollow |
| **"Transparent background"** | - The background of the element is displayed transparently.  
- The background of the element is displayed in the defined background color. |

| **"Background color"** |

These properties are available only when you have selected the “Support client animations and overlay of native elements” option in the Visualization Manager.

| **"Animation duration"** | Defines the duration (in milliseconds) in which the element runs an animation  
- Variable (integer value)  
  Example: Menu.tContent with VAR tContent : INT := 500; END_VAR  
- Integer literal  
  Example: 500  

**Animatable properties**  
- “Absolute movement”, “Movement”, “X”, “Y”  
- “Absolute movement”, “Rotation”  
- “Absolute movement”, “Interior rotation”  
- “Absolute movement”, “Exterior rotation”  

The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.

| **"Move to foreground"** | Moves the visualization element to the foreground  
Variable (BOOL)  
Example: bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR  
TRUE: At runtime, the visualization element is displayed in the foreground.  
FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor. |

**Element property 'Access rights'**  
**Requirement:** User management is set up for the visualization.

| **"Access rights"** | Opens the “Access rights” dialog. There you can edit the access privileges for the element.  
**Status messages:**  
- “Not set. Full rights.”: Access rights for all user groups: “operable”  
- "Rights are set: Limited rights": Access is restricted for at least one group. |

See also  
- § Chapter 6.4.5.21.3.1 “Dialog ‘Access Rights’” on page 3366

**Visualization Element 'Control Panel'**  
Symbol:
Category: “Special Controls”

This visualization element is used in connection with the “Path3D” visualization element. It is used for changing the position and orientation to the CNC path shown with “Path3D”.

See also

- Chapter 6.4.5.20.1.42 “Visualization Element ‘Path3D’” on page 3279

Element properties

| “Element name” | Optional.  
|---------------|-------------
| Hint: Assign individual names for elements so that they are found faster in the element list.  
| Example: Camera_Path_1 |

| “Type of element” | “Frame” |

| “Clipping” | ☑: If you have set the “Scaling type” to “Fixed”, then only that part of the visualization is displayed that fits in the frame. |

| “Show frame” | Displays the frame  
|---------------|-------------
| • “No frame”: The displayed area of the frame does not have borders.  
| • “Frame”: The displayed area of the frame has borders.  
| • “No frame with offset”: The displayed area of the frame does not have a border and the displayed area of the referenced visualization is reduced inwards by one pixel as compared to the frame area.  
| The resulting gap prevents the referenced visualization from touching any adjacent elements. |

| “Scaling type” | Describes how the frame reacts when the visualization is resized:  
|---------------|-------------
| • “Isotropic”: The frame retains its proportions. This allows the ratio of height to width to be preserved, even if the height and width of the visualization have been changed separately.  
| • “Anisotropic”: The frame depends on the size of the visualization, so that height and width of the referenced visualization can be changed separately.  
| • “Fixed”: The original size of the frame is retained, regardless of the visualization size. If you have also selected the “Clipping” option, then only the fitting part is displayed.  
| • “Fixed and scrollable”: The referenced visualization is displayed without scaling. If the value is greater than the window area of the frame, then scrollbars are added to the frame. To set the position of the scroll bar with a variable, use the “Scroll position variable horizontal” or “Scroll position variable vertical” property. |

| “Deactivation of the background drawing” | ☐: To optimize the performance of the visualization, the non-animated elements of the frame element are drawn as a background bitmap. This could result in the elements not being displayed in the expected order.  
| ☑: Deactivation of the background drawing. This can prevent the behavior described above. |

Element property ‘References’  
Contains the currently configured visualization references as a subnode.
Clicking "Configure" opens the "Frame Configuration" dialog. This is used to manage the referenced visualizations.

Caution: Visualizations can be nested at any depth by means of Frame elements. In order to use the "Switch to any visualization" Frame selection type without any problems, a Frame must not contain more than 21 referenced visualizations. For more information, see also the description for the "Input configuration" of an element: Action "Switch Frame visualization".

<table>
<thead>
<tr>
<th>List of the currently referenced visualizations</th>
</tr>
</thead>
<tbody>
<tr>
<td>Visualizations that have a button also have this displayed as a subnode. Each interface variable is listed with the currently assigned transfer parameters.</td>
</tr>
<tr>
<td>Example:</td>
</tr>
<tr>
<td>vis_FormA</td>
</tr>
<tr>
<td>• iDataToDisplay_1: PLC_PRG.iVar1</td>
</tr>
<tr>
<td>• iDataToDisplay_2: PLC_PRG.iVar2</td>
</tr>
</tbody>
</table>

Hint: You can change the assignment of the variables to an interface variable here and edit the value field. Or click the "Configure" button instead.

### Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

<table>
<thead>
<tr>
<th>“X”</th>
</tr>
</thead>
<tbody>
<tr>
<td>X coordinate of the upper left corner of the element</td>
</tr>
<tr>
<td>Specified in pixels.</td>
</tr>
<tr>
<td>Example: 10.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Y”</th>
</tr>
</thead>
<tbody>
<tr>
<td>Y coordinate of the upper left corner of the element</td>
</tr>
<tr>
<td>Specified in pixels.</td>
</tr>
<tr>
<td>Example: 10.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Width”</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specified in pixels.</td>
</tr>
<tr>
<td>Example: 150</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Height”</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specified in pixels.</td>
</tr>
<tr>
<td>Example: 30</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the box symbols ( draggable ) to other positions in the editor.

See also
- § Chapter 6.4.5.5.3 “Positioning the Element, Adapting Size and Layer” on page 2874

### Element property ‘Center’

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“X”</td>
<td>X-coordinate of the point of rotation</td>
</tr>
<tr>
<td>“Y”</td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the symbols ( Biol) to other positions in the editor.

**Element property 'Colors'**

The properties contain fixed values for setting colors.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Color”</td>
<td>Color for the element in its normal state. Please note that the normal state is in effect if the expression in the “Color variables ➔ Toggle color” property is not defined or it has the value FALSE.</td>
</tr>
<tr>
<td>“Alarm color”</td>
<td>Color for the element in alarm state. Please note that the alarm state is in effect if the expression in the “Color variables ➔ Toggle color” property has the value TRUE.</td>
</tr>
<tr>
<td>“Transparency”</td>
<td>Value (0 to 255) for defining the transparency of the selected color. Example 255: The color is opaque. 0: The color is completely transparent.</td>
</tr>
<tr>
<td>“Use gradient color”</td>
<td>☑: The element is displayed with a color gradient.</td>
</tr>
<tr>
<td>“Gradient setting”</td>
<td>The “Color gradient editor” dialog box opens.</td>
</tr>
<tr>
<td>“Frame color”</td>
<td>Example: “Black”</td>
</tr>
<tr>
<td>“Fill color”</td>
<td>Example: “Light gray”</td>
</tr>
</tbody>
</table>

- ☰ Chapter 6.4.5.21.3.5 “Dialog ‘Gradient Editor’” on page 3369
- ●

**Element property 'Appearance'**

The properties contain fixed values for setting the look of the element.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Line width”</td>
<td>Value in pixels Example: 2 Note: The values 0 and 1 both result in a line weight of one pixel. If no line should be displayed, then the “Line style” property must be set to the option “Invisible”.</td>
</tr>
</tbody>
</table>
| “Line style”  | Type of line representation  
  - “Solid”  
  - “Dashes”  
  - “Dots”  
  - “Dash Dot”  
  - “Dash Dot Dot”  
  - “not visible” |
You can assign variables in the “Appearance variables” property for controlling the appearance dynamically. The fixed values are defined here.

See also
- “Element property ‘Appearance variables’” on page 3292

Element property ‘Texts’
The properties contain character strings for labeling the element. The character string can also contain a placeholder with a format definition. In runtime mode, the placeholder is replaced by the current value in the specified format.

CODESYS accepts the specified texts automatically into the “GlobalTextList” text list. Therefore, these texts can be localized.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Text”</td>
<td>Character string (without single straight quotation marks) for the labeling the element. Add a line break by pressing the keyboard shortcut [Ctrl] + [Enter].</td>
</tr>
<tr>
<td></td>
<td>Example: Accesses: %i</td>
</tr>
<tr>
<td></td>
<td>The variable that contains the current value for the placeholder is specified in the property “Text variable ➔ Text”.</td>
</tr>
<tr>
<td>“Tooltip”</td>
<td>Character string (without single straight quotation marks) that is displayed as the tooltip of an element.</td>
</tr>
<tr>
<td></td>
<td>Example: Number of valid accesses.</td>
</tr>
<tr>
<td></td>
<td>The variable that contains the current value for the placeholder is specified in the property “Text variable ➔ Tooltip”.</td>
</tr>
</tbody>
</table>

See also
- “Element property ‘Text variables’” on page 3289
- Chapter 6.4.5.5 “Designing a visualization with elements” on page 2872
- Chapter 6.4.5.20.2 “Placeholders with Format Definition in the Output Text” on page 3329

Element property ‘Text properties’
The properties contain fixed values for the text properties.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Horizontal alignment”</td>
<td>Horizontal alignment of the text within the element.</td>
</tr>
<tr>
<td>“Vertical alignment”</td>
<td>Vertical alignment of the text within the element.</td>
</tr>
<tr>
<td>“Text format”</td>
<td>Definition for displaying texts that are too long</td>
</tr>
<tr>
<td></td>
<td>- “Default”: The long text is truncated.</td>
</tr>
<tr>
<td></td>
<td>- “Line break”: The text is split into parts.</td>
</tr>
<tr>
<td></td>
<td>- “Ellipsis”: The visible text ends with “...” indicating that it is not complete.</td>
</tr>
<tr>
<td>“Font”</td>
<td>Example: “Default”</td>
</tr>
<tr>
<td></td>
<td>- The “Font” dialog box opens.</td>
</tr>
<tr>
<td></td>
<td>- Drop-down list with style fonts.</td>
</tr>
</tbody>
</table>
### "Font color"

<table>
<thead>
<tr>
<th>Example: “Black”</th>
</tr>
</thead>
<tbody>
<tr>
<td>: The “Color” dialog box opens.</td>
</tr>
<tr>
<td>▼: Drop-down list with style colors.</td>
</tr>
</tbody>
</table>

### "Transparency"

| Whole number (value range from 0 to 255). This determines the transparency of the respective color. |
| Example: 255: The color is opaque. |
| 0: The color is completely transparent. |

Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

### Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

<table>
<thead>
<tr>
<th>&quot;Movement&quot;</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>X</strong></td>
</tr>
<tr>
<td>Example: PLC_PRG.iPos_X.</td>
</tr>
<tr>
<td>Increasing this value in runtime mode moves the element to the right.</td>
</tr>
</tbody>
</table>

| **Y** | Variable (numeric data type). Defines the Y position (in pixels). |
| Example: PLC_PRG.iPos_Y. |
| Increasing this value in runtime mode moves the element downwards. |

| **Rotation** | Variable (numeric data type). Defines the angle of rotation (in degrees). |
| Example: PLC_PRG.iAngle1. |
| The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol. |
| In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right. |

| **Scaling** | Variable (integer data type). Causes centric stretching. |
| Example: PLC_PRG.iScaling. |
| The reference point is the “Center” property. |
| The value 1 shrinks the element by a factor of 0.001. The value 1000 returns the element to its original size. |
**“Interior rotation”**

Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol.

Note: If a static angle of rotation is specified in the property “Position ➔ Angle”, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

---

You can link the variables to a unit conversion.

---

The properties “X”, “Y”, “Rotation”, and “Interior rotation” are supported by the "Client Animation" functionality.

---

**Element property 'Relative movement'**

The properties contains variables for moving the element. The reference point is the position of the element (“Position” property). The shape of the element can change.

<table>
<thead>
<tr>
<th>“Movement top-left”</th>
<th>Variable (integer data type). It contains the number (in pixels) that the left edge is moved horizontally. Incrementing the value moves the element to the right. <strong>Example:</strong> PLC_PRG.iDeltaX</th>
</tr>
</thead>
<tbody>
<tr>
<td>“X”</td>
<td></td>
</tr>
<tr>
<td>“Y”</td>
<td>Variable (integer data type). It contains the number (in pixels) that the top edge is moved vertically. Incrementing the value moves the element to the down. <strong>Example:</strong> PLC_PRG.iDeltaY</td>
</tr>
<tr>
<td>“Movement bottom-right”</td>
<td>Variable (integer data type). It contains the number (in pixels) that the right edge is moved horizontally. Incrementing the value moves the element to the right. <strong>Example:</strong> PLC_PRG.iDeltaWidth</td>
</tr>
<tr>
<td>“X”</td>
<td></td>
</tr>
<tr>
<td>“Y”</td>
<td>Variable (integer data type). It contains the number (in pixels) that the bottom edge is moved vertically. Incrementing the value moves the element to the down. <strong>Example:</strong> PLC_PRG.iDeltaHeight</td>
</tr>
</tbody>
</table>

---

See also

- “Element property ‘Absolute movement’” on page 3319
**Element property 'Text variables'**

These properties are variables with contents that replace a format definition.

<table>
<thead>
<tr>
<th>“Text variable”</th>
<th>Variable (data type compliant with the format definition). It contains what is printed instead of the format definition.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>PLC_PRG.iAccesses</td>
</tr>
<tr>
<td>Note:</td>
<td>The format definition is part of the text in the property “Texts ➔ Text”.</td>
</tr>
<tr>
<td>Note:</td>
<td>If you specify a variable of type enumeration with text list support, then the name of the enumeration data type is added automatically in angle brackets after the variable name. Example: PLC_PRG.enVar &lt;enumeration name&gt;. Then the symbolic value of the enumeration component is printed instead of the numeric value when text is printed. Refer to the help page for the enumerations.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Tooltip variable”</th>
<th>Variable (data type compliant with the format definition). It contains what is printed instead of the format definition.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>PLC_PRG.iAccessesInTooltip</td>
</tr>
<tr>
<td>Note:</td>
<td>The format definition is part of the text in the property “Texts ➔ Tooltip”.</td>
</tr>
</tbody>
</table>

**Element property 'Dynamic texts'**

Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.

<table>
<thead>
<tr>
<th>“Text list”</th>
<th>Variable (string) or name of the text list as a fixed string in single straight quotation marks.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>'Errorlist'</td>
</tr>
<tr>
<td></td>
<td>➔: Drop-down list with the dialogs available in the text lists.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Text index”</th>
<th>Text list ID. This refers to the desired output text.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• As fixed string with the ID in single straight quotation marks.</td>
</tr>
<tr>
<td></td>
<td>Example: '1'</td>
</tr>
<tr>
<td></td>
<td>• As a variable (STRING) for dynamically controlling the text output.</td>
</tr>
<tr>
<td></td>
<td>Example: strTextID</td>
</tr>
<tr>
<td></td>
<td>Sample assignment: PLC_PRG.strTextID := '1';</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Tooltip index”</th>
<th>Text list ID. This refers to the desired output text.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• As fixed string with the ID in single straight quotation marks.</td>
</tr>
<tr>
<td></td>
<td>Example: '2'</td>
</tr>
<tr>
<td></td>
<td>• As a variable (STRING) for dynamically controlling the text output.</td>
</tr>
<tr>
<td></td>
<td>Example: strToolTipID</td>
</tr>
<tr>
<td></td>
<td>Sample assignment: PLC_PRG.strToolTipID := '2';</td>
</tr>
</tbody>
</table>

See also

- ☰ Chapter 6.4.1.21.2.28 “Object 'Text List’” on page 2532

**Element property 'Font variables'**

The variables allow for dynamic control of the text display.
### Font name

Variable (STRING). Includes the font of the text.  
Example: `PLC_PRG.stFontVar := 'Arial';`

The selection of fonts corresponds to the default “Font” dialog.

### Size

Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name.  
- `<pt>`: Points (default)  
  Example: `PLC_PRG.iFontHeight <pt>`  
  Code: `iFontHeight : INT := 12;`
- `<px>`: Pixels  
  Example: `PLC_PRG.iFontHeight <px>`  
  Code: `iFontHeight : INT := 19;`

If you click in the value field, a drop-down list opens on the right for setting the unit.  
Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property “Text property → Font”.

### Flags

Variable (DWORD). Contains the flags for displaying fonts.  
Flags:  
- 1: Italics  
- 2: Bold  
- 4: Underline  
- 8: Strikethrough  

Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: `PLC_PRG.dwFontType := 6;`

### Character set

Variable (DWORD). Contains a character set number for the font.  
The selection of character set numbers corresponds to the “Script” setting of the standard “Font” dialog.

### Color

Variable (DWORD). Includes the color of the text.  
Example: `PLC_PRG.dwColorFont:= 16#FF000000;`

### Flags for text alignment

Variable (integer data type). Contains the coding for text alignment.  
Example: `PLC_PRG.dwTextAlignment.`  
Coding:  
- 0: Top left  
- 1: Horizontal center  
- 2: Right  
- 4: Vertical center  
- 8: Bottom  

Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: `PLC_PRG.dwFontType := 5;`
Fixed values for displaying texts are set in “Text properties”.

See also
● “Element property ‘Text properties’” on page 3286

The Element property is used as an interface for project variables to dynamically control colors at runtime.

<table>
<thead>
<tr>
<th>“Toggle color”</th>
<th>The property controls the toggled color at runtime.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Value assignment:</td>
<td></td>
</tr>
<tr>
<td>● FALSE: The element is displayed with the color specified in the “Color” property.</td>
<td></td>
</tr>
<tr>
<td>● TRUE: The element is displayed with the color specified in the “Alarm color” property.</td>
<td></td>
</tr>
<tr>
<td>Assignment options:</td>
<td></td>
</tr>
<tr>
<td>● Placeholder for the user input variable</td>
<td></td>
</tr>
<tr>
<td>– “&lt;toggle/tap variable&gt;”</td>
<td></td>
</tr>
<tr>
<td>– “&lt;NOT toggle/tap variable&gt;”</td>
<td></td>
</tr>
<tr>
<td>The color change is not controlled by its own variable, but by a user input variable.</td>
<td></td>
</tr>
<tr>
<td>Note: Specify a variable for the mouse events “Tap” or “Toggle” in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both “Toggle” and “Tap”, then the variable specified in “Tap” is used.</td>
<td></td>
</tr>
<tr>
<td>Hint: Click the symbol to insert the placeholder “&lt;toggle/tap variable&gt;”. When you activate the “Inputconfiguration”, “Tap FALSE” property, then the “&lt;NOT toggle/tap variable&gt;” placeholder is displayed.</td>
<td></td>
</tr>
<tr>
<td>● Instance path of a project variable (BOOL)</td>
<td></td>
</tr>
<tr>
<td>Example: PLC_PRG.xColorIsToggled</td>
<td></td>
</tr>
<tr>
<td>Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.</td>
<td></td>
</tr>
</tbody>
</table>

| “Normal state” | The properties listed below control the color depending on the state. The normal state is in effect if the variable in “Color variables”, “Toggle color” is not defined or it has the value FALSE. The alarm state is in effect if the variable in “Colorvariables”, “Toggle color” has the value TRUE. |
| “Alarm state” | |

<table>
<thead>
<tr>
<th>“Frame color”</th>
<th>Assignment options:</th>
</tr>
</thead>
<tbody>
<tr>
<td>● Variable (DWORD) for the frame color</td>
<td></td>
</tr>
<tr>
<td>Example: PLC_PRG.dwBorderColor</td>
<td></td>
</tr>
<tr>
<td>● Color literal</td>
<td></td>
</tr>
<tr>
<td>Example of green and opaque: (16\text{#FF00FF00})</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Filling color”</th>
<th>Assignment options:</th>
</tr>
</thead>
<tbody>
<tr>
<td>● Variable (DWORD) for the fill color</td>
<td></td>
</tr>
<tr>
<td>Example: PLC_PRG.dwFillColor</td>
<td></td>
</tr>
<tr>
<td>● Color literal</td>
<td></td>
</tr>
<tr>
<td>Example of gray and opaque: (16\text{#FF888888})</td>
<td></td>
</tr>
</tbody>
</table>
The transparency part of the color value is evaluated only if the "Activate semi-transparent drawing" option of the visualization manager is selected.

Select the "Advanced" option in the toolbar of the properties view. Then all element properties are visible.

See also
- Chapter 6.4.5.10.4 "Animating a color display" on page 2914

**Element property 'Appearance variables'**

The properties contain variables for controlling the appearance of the element dynamically.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Line width&quot;</td>
<td>Variable (integer data type). Contains the line weight (in pixels). Note: The values 0 and 1 both result in a line weight of one pixel. If no line should be displayed, then the &quot;Line style&quot; property must be set to the option &quot;Invisible&quot;.</td>
</tr>
</tbody>
</table>
| "Line style" | Variable (DWORD). Controls the line style. Coding:  
  - 0: Solid line  
  - 1: Dashed line  
  - 2: Dotted line  
  - 3: Line type "Dash Dot"  
  - 3: Line type "Dash Dot Dot"  
  - 8: Invisible: The line is not drawn. |

Fixed values can be set in the "Appearance" property. These values can be overwritten by dynamic variables at runtime.

See also
- "Element property 'Appearance'" on page 3285

**Element property 'Switch frame variable'**

The variable controls the switching of the referenced visualizations. This variable indexes one of the referenced frame visualizations and this is displayed in the frame. When the value of the variable changes, it switches to the recently indexed visualization.
**“Variable”**

- Variable (integer data type) that contains the index of the active visualization
  
  **Example:** PLC_PRG.uiIndexVisu

  **Hint:** The “Frame Configuration” dialog includes a list of referenced visualizations. The visualizations are automatically numerically indexed via the order in the list.

  **Note:** This variant of switching usually affects all connected display variants.

- Array element (integer data type) for index access via CURRENTCLIENTID
  
  **Example:** PLC_PRG.aIndexVisu[CURRENTCLIENTID]

  **Note:** This variant of switching applies to the current client only, and therefore only on one display variant. That is the display variant where the value change was triggered (for example, by means of user input).

---

**See also**

- § Chapter 6.4.5.21.2.9 “Command ‘Frame Selection’” on page 3348

---

**Element property ‘State variables’**

The variables control the element behavior dynamically.

<table>
<thead>
<tr>
<th>“Invisible”</th>
<th>Variable (BOOL). Toggles the visibility of the element.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>TRUE: The element is not visible at runtime.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> bIsVisible with VAR bIsVisible : BOOL := FALSE; END_VAR</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Deactivate inputs”</th>
<th>Variable (BOOL). Toggles the operability of the element.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated.</td>
</tr>
</tbody>
</table>

---

The “Invisible” property is supported by the "Client Animation" functionality.

---

These properties are available only when you have selected the “Support client animations and overlay of native elements” option in the Visualization Manager.
“Animation duration” Defines the duration (in milliseconds) in which the element runs an animation
- Variable (integer value)
  Example: Menu.tContent with VAR tContent : INT := 500; END_VAR
- Integer literal
  Example: 500

Animatable properties
- “Absolute movement”, “Movement”, “X”, “Y”
- “Absolute movement”, “Rotation”
- “Absolute movement”, “Interior rotation”
- “Absolute movement”, “Exterior rotation”

The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.

“Move to foreground” Moves the visualization element to the foreground
Variable (BOOL)
Example: bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR
TRUE: At runtime, the visualization element is displayed in the foreground.
FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Input configuration' The properties contain the configurations for the user input when using the mouse or keyboard. A user input defines an event and one or more actions that are executed when an event occurs.

The “Configure” button opens the “Input Configuration” dialog. There you can create or edit user inputs. Configured user inputs are listed below the events. They each include the action that is triggered and the setting in short form.

Example: “Execute ST Code”: PLC_PRG.i_x := 0;

<table>
<thead>
<tr>
<th>Event</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“OnDialogClosed”</td>
<td>Input event: The user closes the dialog.</td>
</tr>
<tr>
<td>“OnMouseClick”</td>
<td>Input event: The user clicks the mouse button completely in the element area. The mouse button is clicked and released.</td>
</tr>
<tr>
<td>“OnMouseDown”</td>
<td>Input event: The user clicks down on the mouse button.</td>
</tr>
<tr>
<td>“OnMouseEnter”</td>
<td>Input event: The user drags the mouse pointer to the element.</td>
</tr>
<tr>
<td>“OnMouseLeave”</td>
<td>Input event: The user drags the mouse pointer away from the element.</td>
</tr>
<tr>
<td><strong>OnMouseMove</strong></td>
<td>Input event: The user moves the mouse pointer over the element area.</td>
</tr>
<tr>
<td>----------------</td>
<td>-------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| **OnMouseUp**  | Input events:  
|                | - The user releases the mouse button within the element area. It is irrelevant whether the user has previously pressed the mouse button inside or outside the element area.  
|                | - The user presses the mouse button within the element area, leaves the element area, and then releases the mouse button.  
|                | Note: This CODESYS-specific triggering behavior guarantees that actions for key elements are completed. A key element starts an action for “OnMouseDown” and ends the action for “OnMouseUp”.  
|                | Example: A visualization user presses the mouse button within the element area of the key element and then moves the cursor position so that it lies outside the element area. The action is ended anyway because “OnMouseUp” is triggered. |

<table>
<thead>
<tr>
<th><strong>Tap</strong></th>
<th>When a mouse click event occurs, the variable defined in “Variable” is described in the application. The coding depends on the “Tap FALSE” and “Tap on enter if captured” options.</th>
</tr>
</thead>
</table>
| **Variable**   | Variable (BOOL) that is set on mouse click event.  
|                | Example: PLC_PRG.bIsTapped  
|                | TRUE: A mouse click event exists. It lasts as long as the user presses the mouse button over the element. It ends when the button is released.  
|                | FALSE: A mouse click event does not exist.  
|                | Requirement: The “Tap FALSE” option is not activated. |
| **Tap FALSE**  | ☑: The mouse click event leads to a complementary value in “Variable”.  
|                | TRUE: A mouse click event does not exist.  
|                | FALSE: While the mouse click event exists. |
| **Tap on enter if captured** | ☑: During user input, it is also taken into consideration whether the mouse pointer is dragged within the element area or not while the mouse button is pressed.  
|                | TRUE: While the mouse click event exists and the mouse pointer is moved over the element area.  
|                | FALSE: A mouse click event does not exist. Or the user moves the mouse pointer outside of the element area while the mouse button is pressed.  
|                | The value is TRUE again as soon as the user moves the pointer back to the element area. The mouse is then captured. |

<table>
<thead>
<tr>
<th><strong>Toggle</strong></th>
<th>With the onset of a mouse click event, the variable is set; when the mouse click event is completed, the variable is reset.</th>
</tr>
</thead>
</table>
| **Variable**   | Variable (BOOL). Its value toggled when the mouse click event is ended. This is when the user releases the mouse button while the mouse pointer is over the element area.  
|                | If the user releases the mouse button while the mouse pointer outside of the element area, then the mouse click event is not ended and the value is not toggled.  
|                | Hint: The user can cancel a started toggle input by dragging the mouse pointer out of the element area.  
| **Toggle on up if captured** | ☑: The value toggles regardless of where the mouse pointer is when the mouse button is released. The mouse is then captured. |
## Hotkey

Keyboard shortcut on the element for triggering specific input actions. When the keyboard shortcut event occurs, the input actions in the “Events” property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.

### Key

Key pressed for input action.

Example: `[T]`

Note: The following properties appear when a key is selected.

## Events

- **“None”**
- **“Mouse down”:** Pressing the key triggers the input actions that are configured in the “OnMouseDown” property.
- **“Mouse up”:** Releasing the key triggers the input actions that are configured in the “OnMouseUp” property.
- **“Mouse down/up”:** Pressing and releasing the key triggers the input actions that are configured in the “OnMouseDown” property and the “OnMouseUp” property.

## Shift

☑️ Combination with the Shift key

Example: `[Shift]+[T]`.

## Control

☑️ Combination with the Ctrl key

Example: `[Ctrl]+[T]`.

## Alt

☑️ Combination with the Alt key

Example: `[Alt]+[T]`.

---

All keyboard shortcuts and their actions that are configured in the visualization are listed on the “Keyboard Configuration” tab.

**Visualization Element 'Cartesian XY Chart'**

Symbol:

![Cartesian XY Chart](image)

Category: “Special Controls”

The element displays the curve of array values graphically as a line or bar chart in the Cartesian coordinate system. The chart can display multiple curves at one time.
NOTICE!

Constraint
The element can be used with controller with V3.5 SP11 and higher.

in CODESYS Forge, you will find a sample project for using “Cartesian XY Chart” elements in visualizations.

See also
- Sample project in CODESYS Forge

Element properties

<table>
<thead>
<tr>
<th>“Element name”</th>
<th>Example: Velocity chart</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Type of element”</td>
<td>“Cartesian XY Chart”</td>
</tr>
<tr>
<td>“Cartesian XY Chart”</td>
<td>XYChart: Opens the “XY Chart Configuration” dialog. This is where the chart is configured.</td>
</tr>
</tbody>
</table>

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

<table>
<thead>
<tr>
<th>“X”</th>
<th>X coordinate of the upper left corner of the element</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Specified in pixels.</td>
</tr>
<tr>
<td>Example: 10.</td>
<td></td>
</tr>
<tr>
<td>“Y”</td>
<td>Y coordinate of the upper left corner of the element</td>
</tr>
<tr>
<td></td>
<td>Specified in pixels.</td>
</tr>
<tr>
<td>Example: 10.</td>
<td></td>
</tr>
<tr>
<td>“Width”</td>
<td>Specified in pixels.</td>

<tr>
<td>Example: 150</td>
<td></td>
</tr>
<tr>
<td>“Height”</td>
<td>Specified in pixels.</td>
</tr>
<tr>
<td>Example: 30</td>
<td></td>
</tr>
</tbody>
</table>

You can also change the values by dragging the box symbols (drag) to other positions in the editor.

See also
- Chapter 6.4.5.5.3 “Positioning the Element, Adapting Size and Layer” on page 2874

Element property 'Element look'

The properties contain fixed values for defining the look of the element.
“Border line width”  Value (in pixels)
Example: 2
Note: The values 0 and 1 both result in a line weight of one pixel. If no line should be displayed, then the “Border line style” property must be set to the option “Invisible”.

“Border line style”
- “Solid”
- “Dash”
- “Dots”
- “Dash Dot”
- “Dash Dot Dot”
- “Invisible”

“Frame line color”
- Style color from the list box. Example: Black
- Fixed value that is selected in the color dialog. Example: 0; 0; 0

Element property ‘Axis font’

“Font”
Example: “Default”
- [ ] Opens the “Font” dialog.
- [ ] List box with style fonts

Element property ‘Control variables’

Table 636: “Zoom”

Zooming the displayed curve is done by means of the mouse, or the pinch gesture on a multitouch device. It also applies to all axes.

At runtime when “Enable” is TRUE, you can draw a box with the mouse by holding down the left mouse button. When you release the mouse button, the display zooms in on the box and the curve is magnified. To zoom in and out on a multitouch device, move two fingers together or away from each other, respectively.

Zooming and panning can work together.

“Enable”
Variable (BOOL) that enables or disables zooming.
- TRUE: Enables zooming
Example: PLC_PRG.xZoomEnable

“Home”
Variable (BOOL)
Rising edge: Reset the displayed curve to the initial state after the display has changed due to zooming.
Example: PLC_PRG.xZoomHome
**“Undo”**

Variable (BOOL)

Rising edge: Reset the displayed curve to the previous position after the display has changed due to zooming.

Example: PLC_PRG.xZoomUndo

**“Is zoomed”**

Variable (BOOL) that indicates whether or not the displayed curve was modified due to zooming.

TRUE: Curve setting was zoomed.

Example: PLC_PRG.xIsZoomed

**Table 637: “Pan”**

Panning the displayed curve is done by means of the mouse or the pinch gesture on a multitouch device. It also applies to all axes.

At runtime if “Enable” is TRUE, then you can drag the displayed curve to another position by holding down the left mouse button. To pan the displayed curve on a multitouch device, drag it with one finger to another position.

**“Enable”**

Variable (BOOL) to enable or disable panning.

TRUE: Enables panning

Example: PLC_PRG.xPanEnable

**“Home”**

Variable (BOOL)

Rising edge: Reset the displayed curve to the initial position after the display has changed due to panning.

Example: PLC_PRG.xPanHome

**“Is panned”**

Variable (BOOL) whose state indicates whether or not the displayed curve was modified due to zooming.

TRUE: Curve setting was panned.

Example: PLC_PRG.xIsPanned

**Element property ‘Absolute movement’**

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

**“Movement”**

**“X”**

Variable (numeric data type). Defines the X position (in pixels).

Example: PLC_PRG.iPos_X.

Increasing this value in runtime mode moves the element to the right.

**“Y”**

Variable (numeric data type). Defines the Y position (in pixels).

Example: PLC_PRG.iPos_Y.

Increasing this value in runtime mode moves the element downwards.
“Rotation” Variable (numeric data type). Defines the angle of rotation (in degrees).

Example: PLC_PRG.iAngle1.

The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.

In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

“Interior rotation” Variable (numeric data type). Defines the angle of rotation (in degrees).

Example: PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol.

Note: If a static angle of rotation is specified in the “Position Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.

See also

- The variables control the element behavior dynamically.

Element prop-
erty 'State vari-
ables'

“Invisible” Variable (BOOL). Toggles the visibility of the element.

TRUE: The element is not visible at runtime.

Example: bIsVisible with VAR bIsVisible : BOOL := FALSE;

“Deactivate inputs” Variable (BOOL). Toggles the operability of the element.

TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated.
The “Invisible” property is supported by the “Client Animation” functionality.

These properties are available only when you have selected the “Support client animations and overlay of native elements” option in the Visualization Manager.

<table>
<thead>
<tr>

Visualization Element 'Date Range Picker'

Symbol:
Category: “Date/Time Controls”

The element provides the capability of selecting the date and time range of a saved data set. The element is used with the “Trend” visualization element.

### Element properties

<table>
<thead>
<tr>
<th>“Element name”</th>
<th>Example: DateTrend1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Optional</td>
<td>Hint: Assign individual names for elements so that they are found faster in the element list.</td>
</tr>
</tbody>
</table>

| “Type of element” | “Date Range Picker” |

#### Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

| “X”      | X coordinate of the upper left corner of the element Specified in pixels. Example: 10. |
| “Y”      | Y coordinate of the upper left corner of the element Specified in pixels. Example: 10. |
| “Width”  | Specified in pixels. Example: 150 |
| “Height” | Specified in pixels. Example: 30 |

You can also change the values by dragging the box symbols (□) to other positions in the editor.

See also

- Chapter 6.4.5.5.3 “Positioning the Element, Adapting Size and Layer” on page 2874

#### Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

| “X” | X-coordinate of the point of rotation |
| “Y” | Y-coordinate of the point of rotation |
You can also change the values by dragging the symbols (_bold) to other positions in the editor.

<table>
<thead>
<tr>
<th>Property</th>

<td>The element can be assigned to a “Trend” visualization element. As a result, the time range of the trend element can be changed. The available visual elements are selected with the help of the Input Assistant ( azt).</td>
</tr>
</tbody>
</table>

**Element property 'Tick mark labels'**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Two-line labelling”</strong></td>
<td>□: The time stamps are displayed in two lines. The date is displayed in the first line and the time is displayed in the second line. □: Time stamp is displayed in one line. The date and time can also be displayed in one line depending on the formatting.</td>
</tr>
<tr>
<td><strong>“Omit irrelevant information in time stamp”</strong></td>
<td>□: The time stamp has a shorter form. For example, the date is displayed only for the first tick mark, and only the time for the following tick marks. The settings in “Internationalization (format strings)” are ignored for this setting. □: All information is displayed for all time stamps.</td>
</tr>
<tr>
<td><strong>“Internationalization (format strings)”</strong></td>
<td>Only active when the parameter “Omit irrelevant information in timestamps” is deactivated.</td>
</tr>
<tr>
<td><strong>“Date”</strong></td>
<td>Definition of the date format. The default setting is taken from the Windows control panel.</td>
</tr>
<tr>
<td><strong>“Time”</strong></td>
<td>Definition of the time format. The default setting is taken from the Windows control panel.</td>
</tr>
</tbody>
</table>

**Element property 'Text properties'**

The properties contain fixed values for the text properties.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Horizontal alignment”</strong></td>
<td>Horizontal alignment of the text within the element.</td>
</tr>
<tr>
<td><strong>“Vertical alignment”</strong></td>
<td>Vertical alignment of the text within the element.</td>
</tr>
<tr>
<td><strong>“Font color”</strong></td>
<td>Example: “Black” □: The “Color” dialog box opens. ▼: Drop-down list with style colors.</td>
</tr>
<tr>
<td><strong>“Transparency”</strong></td>
<td>Whole number (value range from 0 to 255). This determines the transparency of the respective color. Example: 255: The color is opaque. 0: The color is completely transparent. Please note: If the color is a style color and already has a transparency value, then this property is write-protected.</td>
</tr>
</tbody>
</table>
Element property 'Additional buttons'

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Jump to the largest possible time stamp&quot;</td>
<td>An additional button (X) is displayed for jumping to the last time stamp.</td>
</tr>
<tr>
<td>&quot;Jump to the smallest possible time stamp&quot;</td>
<td>An additional button (x) is displayed for jumping to the first time stamp.</td>
</tr>
<tr>
<td>&quot;Zoom out&quot;</td>
<td>An additional button (X) is displayed for setting the current min./max. range to the maximum range. The selected range is left.</td>
</tr>
</tbody>
</table>

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>X</td>
<td>Variable (numeric data type). Defines the X position (in pixels). Example: PLC_PRG.iPos_X. Increasing this value in runtime mode moves the element to the right.</td>
</tr>
<tr>
<td>Y</td>
<td>Variable (numeric data type). Defines the Y position (in pixels). Example: PLC_PRG.iPos_Y. Increasing this value in runtime mode moves the element downwards.</td>
</tr>
</tbody>
</table>

"Rotation"

- The midpoint of the element rotates at the "Center" point. This rotation point is shown as the + symbol.
- In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

"Interior rotation"

- In runtime mode, the element rotates about the point of rotation specified in "Center" according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.
- The rotation point is shown as the + symbol.
- Note: If a static angle of rotation is specified in the "Position ➔ Angle" property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

</tbody>
</table>

Property 'Times'

In "Times", the buttons that the element provides at runtime are defined and configured in an array.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Provide &quot;All&quot; selection&quot;</td>
<td>Time Range Picker bar extended by &quot;All&quot; button. The diagram represents a time interval that covers all time stamps.</td>
</tr>
<tr>
<td>&quot;Times&quot;</td>
<td>Adds another button to the Time Range Picker bar and increases the array by one entry. An additional index is present in the property &quot;Times -&gt; Times &lt;[&lt;new&gt;]&quot;. &quot;Time&quot; is located under this index. The configuration of the button is to be entered there.</td>
</tr>
<tr>
<td>&quot;Times&quot;</td>
<td>Array of all buttons in the time selection bar. Index corresponds to the number of buttons. The associated button is removed from the Time Range Picker bar. The configuration entry is deleted from the &quot;Times&quot; property list.</td>
</tr>
<tr>
<td>&quot;Time&quot;</td>
<td>Time interval in standardized notation. Example: 3M for 3 months; 30m for 30 minutes. If a time interval is indicated in the field, then the button is labelled with it. If a user clicks on the button at runtime, the command is executed to switch the diagram to this time interval. The default is empty.</td>
</tr>
</tbody>
</table>

Element property 'Control variables'

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Time&quot;</td>
<td>Displays which time is currently selected.</td>
</tr>
<tr>
<td>Variable (STRING)</td>
<td>Example: PLC_PRG.strSelcetedTime</td>
</tr>
<tr>
<td>&quot;All&quot; selected</td>
<td>Displays the state of the &quot;All&quot; button</td>
</tr>
<tr>
<td>Variable (BOOL)</td>
<td>Example: PLC_PRG.AllTimesAreSelected</td>
</tr>
</tbody>
</table>
The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

### "Movement"

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Example</th>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;X&quot;</td>
<td>Variable (numeric data type). Defines the X position (in pixels).</td>
<td>PLC_PRG.iPos_X</td>
<td>Increasing this value in runtime mode moves the element to the right.</td>
</tr>
<tr>
<td>&quot;Y&quot;</td>
<td>Variable (numeric data type). Defines the Y position (in pixels).</td>
<td>PLC_PRG.iPos_Y</td>
<td>Increasing this value in runtime mode moves the element downwards.</td>
</tr>
<tr>
<td>&quot;Rotation&quot;</td>
<td>Variable (numeric data type). Defines the angle of rotation (in degrees).</td>
<td>PLC_PRG.iAngle1</td>
<td>The midpoint of the element rotates at the &quot;Center&quot; point. This rotation point is shown as the ◆ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.</td>
</tr>
<tr>
<td>&quot;Interior rotation&quot;</td>
<td>Variable (numeric data type). Defines the angle of rotation (in degrees).</td>
<td>PLC_PRG.iAngle2</td>
<td>In runtime mode, the element rotates about the point of rotation specified in &quot;Center&quot; according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ◆ symbol. Note: If a static angle of rotation is specified in the &quot;Position ➔ Angle&quot; property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.</td>
</tr>
</tbody>
</table>

You can link the variables to a unit conversion.

The "X", "Y", "Rotation", and "Interior rotation" properties are supported by the "Client Animation" functionality.

The variables control the element behavior dynamically.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Invisible”</td>
<td>Variable (BOOL). Toggles the visibility of the element. TRUE: The element is not visible at runtime.</td>
</tr>
</tbody>
</table>

The “Invisible” property is supported by the “Client Animation” functionality.

These properties are available only when you have selected the “Support client animations and overlay of native elements” option in the Visualization Manager.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| “Animation duration” | Defines the duration (in milliseconds) in which the element runs an animation.  
- Variable (integer value)  
  Example: Menu.tContent with VAR tContent : INT := 500; END_VAR  
- Integer literal  
  Example: 500  
  Animatable properties  
  - “Absolute movement”, “Movement”, “X”, “Y”  
  - “Absolute movement”, “Rotation”  
  - “Absolute movement”, “Interior rotation”  
  - “Absolute movement”, “Exterior rotation”  
  The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth. |
| “Move to foreground” | Moves the visualization element to the foreground.  
Variable (BOOL)  
Example: bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR  
TRUE: At runtime, the visualization element is displayed in the foreground.  
FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor. |

- Chapter 6.4.5.21.3.1 “Dialog ‘Access Rights’” on page 3366
Visualization Element 'Date Picker'

Symbol:

Category: “Date/Time Controls”

The element is a calendar that displays the current date. A user can click a day to select a date, which is saved to a variable. In addition, it can customize the time interval that the calendar displays. Clicking the calendar header changes the year. Clicking the arrows in the calendar header changes the month.

Language-dependent texts of the element

The element contains language-dependent texts that are managed in the System text list. This deals with the names of the month and the days of the week written out completely or abbreviated. When the date picker is added to a visualization, CODESYS generates the text list automatically below the POU view. The IDs correspond to the standard text and therefore English terms. The text list makes it possible to translate these texts.

<tbody>
<tr>
<td>“Type of element”</td>
<td>“Date Picker”</td>
</tr>
</tbody>
</table>

Element property 'Position'  The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

<table>
<thead>
<tr>
<th>“X”</th>
<th>X coordinate of the upper left corner of the element</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specified in pixels.</td>
<td>Example: 10.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Y”</th>
<th>Y coordinate of the upper left corner of the element</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specified in pixels.</td>
<td>Example: 10.</td>
</tr>
</tbody>
</table>
“Width”  Specified in pixels.  
Example: 150

“Height”  Specified in pixels.  
Example: 30

You can also change the values by dragging the box symbols (🪐) to other positions in the editor.

See also
● § Chapter 6.4.5.5.3 “Positioning the Element, Adapting Size and Layer” on page 2874

Element property ‘Center’  The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the 🎭 symbol. The point is used as the center for rotating and scaling.

“X”  X-coordinate of the point of rotation

“Y”  Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (🪐) to other positions in the editor.

“Variable”  Input variable (DATE). Contains the date that a user selects in the calendar.  
Example: PLC_PRG.dtDueDate

“Design”  ● “From style”: All settings are preconfigured according to the style.  
● “Explicit”: The “Design settings” property is available. You can customize the calendar here.

Design settings  Requirement: This property is visible only if the “Design” property is set to “Explicit”.  
The values of the property can be predefined in the style. Then they are available in the drop-down list.

<tr>
<td></td>
<td>In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.</td>
</tr>
</tbody>
</table>
### “Interior rotation”

Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol.

Note: If a static angle of rotation is specified in the “Position ➔ Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

---

You can link the variables to a unit conversion.

---

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.

---

**Element property 'State variables’**

The variables control the element behavior dynamically.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Invisible”</strong></td>
<td>Variable (BOOL). Toggles the visibility of the element.</td>
<td><code>bIsVisible</code> with <code>VAR bIsVisible : BOOL := FALSE; END_VAR</code></td>
</tr>
<tr>
<td><strong>“Deactivate inputs”</strong></td>
<td>Variable (BOOL). Toggles the operability of the element.</td>
<td>TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated.</td>
</tr>
</tbody>
</table>

---

The “Invisible” property is supported by the “Client Animation” functionality.

---

These properties are available only when you have selected the “Support client animations and overlay of native elements” option in the Visualization Manager.
"Animation duration" | Defines the duration (in milliseconds) in which the element runs an animation  
---|---  
- **Variable (integer value)**  
  **Example:** Menu.tContent with \[ \text{VAR} \ tContent \ : \ \text{INT} := 500; \ \text{END_VAR} \]  
- **Integer literal**  
  **Example:** 500  

Animatable properties  
- "Absolute movement", "Movement", "X", "Y"  
- "Absolute movement", "Rotation"  
- "Absolute movement", "Interior rotation"  
- "Absolute movement", "Exterior rotation"  

The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.

"Move to foreground" | Moves the visualization element to the foreground  
---|---  
**Variable** (BOOL)  
**Example:** bIsInForeground with \[ \text{VAR} \ bIsInForeground \ : \ \text{BOOL} := \text{FALSE}; \ \text{END_VAR} \]  
**TRUE:** At runtime, the visualization element is displayed in the foreground.  
**FALSE:** At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

**Element property 'Access rights'**  
Requirement: User management is set up for the visualization.

"Access rights" | Opens the "Access rights" dialog. There you can edit the access privileges for the element.  
---|---  
**Status messages:**  
- "Not set. Full rights.": Access rights for all user groups: "operable"  
- "Rights are set: Limited rights": Access is restricted for at least one group.

<td>Example: PLC_PRG.iAngle1.</td>
</tr>
<tr>
<td></td>
<td>The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.</td>
</tr>
<tr>
<td></td>
<td>In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.</td>
</tr>
</tbody>
</table>

### “Scaling”

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>“Scaling”</td>
<td>Variable (integer data type). Causes centric stretching.</td>
</tr>
<tr>
<td></td>
<td>Example: PLC_PRG.iScaling.</td>
</tr>
<tr>
<td></td>
<td>The reference point is the “Center” property.</td>
</tr>
<tr>
<td></td>
<td>The value 1 shrinks the element by a factor of 0.001. The value 1000 returns the element to its original size.</td>
</tr>
</tbody>
</table>
### “Interior rotation”

Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the 🔄 symbol.

Note: If a static angle of rotation is specified in the property “Position ➔ Angle”, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

### “Use REAL values”

Note: Only available if the device supports the use of REAL coordinates.

- The properties of the absolute movement are interpreted as REAL values. The values are not rounded.

The option allows for the individual fine-tuning of drawing the element, for example for the visualization of a smoother rotation.

Hint: If a horizontal or vertical line is drawn blurry on a specific visualization platform, then this can be corrected by an offset of 0.5px in the direction of the line thickness.

---

You can link the variables to a unit conversion.

The properties “X”, “Y”, “Rotation”, and “Interior rotation” are supported by the “Client Animation” functionality.

| “Positioning”                    | Requirement: Visible when the “Usage or” property is set to “Individual settings”.

2024/01/05
**“Numerics movement”**
Value (in pixels) for shifting the digits.
Example: 80

**“Line movement”**
Value (in pixels) for shifting the hour lines.
Example: 100

**“Hands scaling”**
Factor for scaling the length of the hour hand. You can customize the exact position of the hour hand relative to the background image.
Example: 100

**“Scaling type”**
Defines the scaling of the height and width of the element.
- “Anisotropic”: The background image is scaled to the size of the element. The height and width are scaled independently of each other.
- “Isotropic”: The background image is scaled to the size of the element, retaining its proportion. The proportion of height and width is fixed.

**“Optimized drawing”**
[☑]: The background image is drawn one time. When the hour hand moves, only the affected part of the image is redrawn.
[☐]: The background image is redrawn in cycles.
Hint: Disable this option only for extreme exceptions.

---

**Element property 'Absolute movement'**
The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

**“Movement”**

**“X”**
Variable (numeric data type). Defines the X position (in pixels).
Example: PLC_PRG.iPos_X.
Increasing this value in runtime mode moves the element to the right.

**“Y”**
Variable (numeric data type). Defines the Y position (in pixels).
Example: PLC_PRG.iPos_Y.
Increasing this value in runtime mode moves the element downwards.

**“Rotation”**
Variable (numeric data type). Defines the angle of rotation (in degrees).
Example: PLC_PRG.iAngle1.
The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.
In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.
"Interior rotation" Variable (numeric data type). Defines the angle of rotation (in degrees).

Example: PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in "Center" according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol.

Note: If a static angle of rotation is specified in the "Position ➔ Angle" property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

See also

- The variables control the element behavior dynamically.

Element property 'State variables'

"Invisible" Variable (BOOL). Toggles the visibility of the element.

TRUE: The element is not visible at runtime.

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the “Support client animations and overlay of native elements” option in the Visualization Manager.
**“Animation duration”**

Defines the duration (in milliseconds) in which the element runs an animation

- **Variable (integer value)**
  
  **Example:** Menu.tContent

  ```
  VAR tContent : INT := 500;
  END_VAR
  ```

- **Integer literal**
  
  **Example:** 500

**Animatable properties**

- “Absolute movement”, “Movement”, “X”, “Y”
- “Absolute movement”, “Rotation”
- “Absolute movement”, “Interior rotation”
- “Absolute movement”, “Exterior rotation”

The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.

**“Move to foreground”**

Moves the visualization element to the foreground

**Variable (BOOL)**

**Example:** bIsInForeground

```
VAR bIsInForeground : BOOL := FALSE;
END_VAR
```

**TRUE:** At runtime, the visualization element is displayed in the foreground.

**FALSE:** At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

**Visualization Element ‘Date/Time Picker’**

**Symbol:**

![Date/Time Picker Symbol](image)

**Category:** “Date/Time Controls”

The element provides the capability of selecting the date and time. The value can be changed by means of the arrow keys on the keyboard. The date can be selected from a calendar.

**Element properties**

<table>
<thead>
<tr>
<th>“Element name”</th>
<th>Optional</th>
</tr>

</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Type of element”</th>
<th>“Date/Time Picker”</th>
</tr>
</thead>
</table>
The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

**Element property 'Position'**

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

<table>
<thead>
<tr>
<th>Property</th>

<tr>
<td></td>
<td>Increasing this value in runtime mode moves the element downwards.</td>
</tr>
</tbody>
</table>
| **“Rotation”** | Variable (numeric data type). Defines the angle of rotation (in degrees).  
**Example:** PLC_PRG.iAngle1.  
The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.  
In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right. |
| **“Scaling”** | Variable (integer data type). Causes centric stretching.  
**Example:** PLC_PRG.iScaling.  
The reference point is the “Center” property.  
The value 1 shrinks the element by a factor of 0.001. The value 1000 returns the element to its original size. |
| **“Interior rotation”** | Variable (numeric data type). Defines the angle of rotation (in degrees).  
**Example:** PLC_PRG.iAngle2.  
In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.  
The rotation point is shown as the symbol.  
Note: If a static angle of rotation is specified in the property “Position ➔ Angle”, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed. |

---

You can link the variables to a unit conversion.

The properties “X”, “Y”, “Rotation”, and “Interior rotation” are supported by the “Client Animation” functionality.

See also

- Element property ‘State variables’

The variables control the element behavior dynamically.
“Invisible” Variable (BOOL). Toggles the visibility of the element.

TRUE: The element is not visible at runtime.

Example:
```plaintext
bIsVisible with VAR bIsVisible : BOOL := FALSE;
END_VAR
```

“Deactivate inputs” Variable (BOOL). Toggles the operability of the element.

TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated.

The “Invisible” property is supported by the "Client Animation“ functionality.

These properties are available only when you have selected the “Support client animations and overlay of native elements” option in the Visualization Manager.

“Animation duration” Defines the duration (in milliseconds) in which the element runs an animation

- Variable (integer value)
  Example:
  ```plaintext
  Menu.tContent with VAR tContent : INT := 500;
  END_VAR
  ```
- Integer literal
  Example: 500

Animatable properties

- “Absolute movement”, “Movement”, “X”, “Y”
- “Absolute movement”, “Rotation”
- “Absolute movement”, “Interior rotation”
- “Absolute movement”, “Exterior rotation”

The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.

“Move to foreground” Moves the visualization element to the foreground

Variable (BOOL)

Example:
```plaintext
bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR
```

TRUE: At runtime, the visualization element is displayed in the foreground.

FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

“Access rights” Opens the “Access rights” dialog. There you can edit the access privileges for the element.

Status messages:

- “Not set. Full rights.”: Access rights for all user groups : “operable”
- “Rights are set: Limited rights”: Access is restricted for at least one group.
6.4.5.20.2 Placeholders with Format Definition in the Output Text

A character string which is output in the visualization can include the placeholder % for a variable. At runtime, the placeholder is replaced by the actual value of the variable in the defined format. The data type in the format definition and of the variable have to be identical. A character string can contain a maximum of one placeholder.

Character strings for output are listed in the “Text” property. The assigned variable is listed in the “Text variable” property.

<tr>
<td>Output: Valid until 80%</td>
<td></td>
</tr>
</tbody>
</table>

For the output of the date and time

If the output text in the element “Text” property contains the placeholder “%t”, then a date and/or time is output. If a variable is not specified in the “Text variable” property, then the system time is output; otherwise it is the value of the variable.

By default, the names of the days and months are displayed in English. If localized texts are used, then the text list System has to be supplemented. This text list is created automatically in the “POUs” view when the placeholder %t is used. The English terms have to be used as the ID here. The localization can be done for both the abbreviated names and full names.

Time data types include LTIME, TIME, TIME_OF_DAY, TOD, DATE, DATE_AND_TIME, and DT.

Compatibility Notice

In order to get the usual display, in V3.5 SP17 and higher, as a rule three digits are used for the output of fractions of a second (ms/µs/ns). Example: In %t[dd-HH:mm:ss:ms], ms is specified with three digits for the milliseconds. For this purpose, the two-digit ms number is prepended with a zero. If a two-digit output is desired (like before V3.5 SP17), then a special compiler define has to be set in the compiler properties of the application: VISU_MILLISEC_NOLEADING_ZERO.

<td>Closed at 05:17 P</td>
<td></td>
</tr>
<tr>
<td><code>tClosed : TOD := TOD#17:17:17.17;</code></td>
<td>If the value is a time &lt; 12h, then AM is output; otherwise PM is output.</td>
<td><code>Closed at %t[hh:mm tt]</code></td>
<td><code>%tClosed : PLC_PRG.tClosed</code></td>
<td>Closed at 05:17 PM</td>
<td></td>
</tr>
<tr>
<td><code>%t[&quot;']</code></td>
<td>If character strings should be output which correspond to a format definition, then these have to be represented in single straight quotation marks.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
%t[<f><n>] A number (<n>) which defines the number of decimal places of the time value follows the letters which define the time unit (<f>).

As a result, the hours, minutes, and seconds (for TIME values) and also the microseconds and nanoseconds (for LTIME values) can be specified or displayed as values with decimal places.

Note: Even if a decimal number is not desired for the input or display, at least the number "0" has to be specified to allow for fractional input.

Examples of the formatting
%t[hh4] or %t[HH4]: The time can be specified/displayed with a hour definition of four decimal places.
%t[mm2] or %t[m2]: The time can be specified/displayed with a minute definition of four decimal places. Then for a value of t#1h20m15s, this leads to the following output: 80.25.
%t[ss0]: The time can be specified/displayed with a second definition without decimal places.

The format definitions can be represented in a series.

%t[HH:mm:ss:ms] Output of the time

Code: dwTime : DWORD := 4294967295;
Property "Text": Time: %t[HH:mm:ss:ms]
Property "Text variable": PLC_PRG.dwTime

%t[yyyy-MM-dd dddd] Output of the date and day of the week

Code: dateSet : DATE := DATE#2016-02-12;
Property "Text": Date: %t[yyyy-MM-dd dddd]
Property "Text variable": PLC_PRG.dateSet
Output: Date: 2016-02-12 Friday

### 6.4.5.20.3 Methods of the Dialog Manager

Visualizations that are a “Dialog” visualization type and are used to prompt an input are instantiated automatically and managed by the internal dialog manager.

In the application, the dialog manager can be accessed via the also internal Visualization Manager by calling the method GetDialogManager.

The dialog manager is provided with the following methods for handling a dialog.

**NOTICE!**

You can program the method calls in function blocks or functions which are themselves called from the visualization by the action Execute ST Code.

Moreover, you can program the method calls in the application code. Make sure that the call runs in VISU_TASK. If this is not the case, then the behavior is undefined.
Method 'GetDialog'  Returns the instance (IVisualisationDialog) of the dialog whose name is passed.

Table 646: Inputs (VAR_INPUT)

<table>
<thead>
<tr>
<th>Name</th>
<th>Data Type</th>
<th>Description</th>

6.4.5.20.4 Attribute 'VAR_IN_OUT_AS_POINTER'

Function: The pragma `{attribute 'VAR_IN_OUT_AS_POINTER'}` allows for the passing of a reference to a data object to the interface variable of a visualization.
Requirement: The referenced visualization must be used as a dialog.

Syntax:

```
{attribute 'VAR_IN_OUT AS_POINTER'}
```

**NOTICE!**
Uppercase and lowercase characters must be maintained.

---

### Example: Declaration of an interface

**VAR_IN_OUT**

```
{attribute 'VAR_IN_OUT AS_POINTER'}
  itfController := ControlFB;
END_VAR
```

- § Chapter 6.4.5.17.5 “Calling a Dialog with an Interface” on page 2962
- § Chapter 6.4.5.21.2.1 “Command 'Interface Editor” on page 3340

---

### 6.4.5.20.5 Attribute 'parameterstringof'

The pragma `{attribute 'parameterstringof'}` allows that the instance name of the specified parameter is made accessible for the referenced visualization. An interface variable (STRING) will contain the instance name of the specified parameter. The interface variable is visible within the referenced visualization and can for example be used in a text output.

Syntax:

```
{attribute 'parameterstringof' := '<variable>'}
```

**Example: declaration of an interface**

```
VAR_INPUT
{attribute 'parameterstringof' := 'iftDut_A'}
  sItfNameDut_A: STRING;
END_VAR
```

### 6.4.5.21.1 Keyboard Shortcuts for Default Keyboard Action

Requirement: The “Activate default keyboard handling” option is activated in the “Visualization Manager” object.
The keyboard shortcuts for default keyboard action make it possible for users to operate the visualization with the keyboard only. Elements that respond to user input can process a keyboard event instead of a mouse event. You do not have to change their input configuration for this purpose. The universal keyboard shortcuts are supported by all devices and are available on all display variants when needed.

<td>3365</td>
</tr>
</tbody>
</table>
**Command 'Interface Editor'**

Symbol: ; keyboard shortcut: [Alt]+[F6].

**Function:** The command opens and closes the “Interface Editor” tab above the visualization editor.

**Call:** Menu bar: “Visualization ➔ Interface Editor” Also by clicking on the small down arrow at the top of the visualization editor

---

**Tab 'Interface Editor'**

Symbol: 

The tab contains an editor for the declaration of interface variables. The editor behaves in a similar way to the declaration editor of a function block, however interface variables are not initialized.

**Syntax**

```
<scope>
    {attribute '<attribute name>' ( := '<expression>' )? }?
    <identifier> : <data type>;
END_VAR

<scope> : VAR_INPUT | VAR_OUTPUT | VAR_IN_OUT
// (...)? : Optional
```

**Example**

**Declaration in the interface editor**

```
VAR_INPUT
    {attribute 'parameterstringof'}
    sIdentifier : STRING; // String for instance name
    iCounter : INT;
END_VAR

VAR_IN_OUT
    {attribute 'VAR_IN_OUT_AS_POINTER'}
    fbController: FB_Controller;
END_VAR
```

**Scopes**

Possible scopes for interfaces of visualizations or dialogs

<table>
<thead>
<tr>
<th>Scope</th>
<th>Details</th>
</tr>
</thead>
</table>
| **VAR_IN_OUT** | ● When transferring a structure  
When the visualization is instanced, it gets a reference to the current application data.  
● When transferring a control variable, if the variable is written to when a user input is made. Only then can the visualization write to it.  
Note: In the case of dialogs, the data is written back only when the dialog is closed.  
Hint: We strongly recommend that you use this scope so that the return of values is possible. Moreover, no data needs to be copied. |
| **VAR_IN_OUT** | Pragma {attribute 'VAR_IN_OUT_AS_POINTER'}  
When transferring a pointer to a data object  
In contrast to the VAR_IN_OUT scope (without an attribute), the variable changes are effective immediately and not just when the dialog is closed.  
Note: Use this scope only if the visualization implements a Dialog. |
<table>
<thead>
<tr>
<th>VAR_INPUT</th>
<th>When transferring data that will only be read</th>
</tr>
</thead>
<tbody>
<tr>
<td>Note:</td>
<td>- If the visualization is executed as an integrated visualization, then only input variables of a basic data type (scalar type) are permitted to be transferred.</td>
</tr>
<tr>
<td></td>
<td>- If the visualization is executed as a CODESYS TargetVisu or a CODESYS WebVisu, then input variables of any data type (including POU s) can also be transferred.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>VAR_INPUT</th>
<th>When transferring a variable (data type STRING) for the instance name of the transfer parameter specified in the attribute</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pragma</td>
<td>{attribute 'parameterstringof'}</td>
</tr>
</tbody>
</table>

- § Chapter 6.4.5.21.4.2 “Object ‘Visualization manager’” on page 3398

### Tab ‘Keyboard configuration’

Symbol: ⎢

This tab contains a list of keyboard shortcuts with an editing option.

A keyboard shortcut can refer specifically to an element. Then the configuration appears here and in the “Input configuration” property of the associated element.

A keyboard shortcut can also have several configurations. If a keyboard shortcut has multiple keyboard configurations, then its input actions are executed in the order listed here.

Keyboard shortcuts of the default keyboard action are not listed here.

<table>
<thead>
<tr>
<th>“Key”</th>
<th>Key that a keyboard configuration is defined. Example: [M]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Note</td>
<td>You can combine the key with [Ctrl], [Alt], and/or [Shift].</td>
</tr>
</tbody>
</table>

| “Key down” | | |
|------------|------------------------|
|            | [ ]: The input action is executed when the user presses the key. |
|            | [ ]: The input action is executed when the user releases the key. |
|            | Double-click: Drop-down list of all keys. |
| Note      | If the input action should be executed for both pressing the key (KeyDown) and releasing the key (KeyUp), then you must define a keyboard configuration for both input actions. |

| “Shift” | [ ]: The input event is triggered for [Shift]+[key]. |
**“Ctrl”**  
☑️ The input event is triggered for `[Ctrl]+[key].

**“Alt”**  
☑️ The input event is triggered for `[Alt]+[key].

<table>
<thead>
<tr>
<th><strong>“Action type”</strong></th>
<th>input action</th>
</tr>
</thead>
</table>
| Double-click: Drop-down list of input actions.  
Tip: For a description of input actions, refer to the “Input configuration” dialog box. | |

| **“Action”** | Configuration of the input action that was selected next.  
Double-click: A dialog box opens that varies according to the input action. It allows the user-prompted customization of the settings.  
Tip: For a description of dialog boxes, refer to the “Input configuration” dialog box. The input action is configured in the same way here. | |

| **“Element ID”** | ID of the visualization element where the user can execute the key event. The ID is relevant only if the event is also assigned to an element.  
Tip: The assignment of ID to element name is listed in the “Element list”. | |

| **“Access rights”** | Access privileges of the action per user group  
Requirement: The visualization has a user management. | |

| ✷ | Clicking the symbol on the right of the list moves the selected row one line down. |
| ✦ | Clicking the symbol on the right of the list moves the selected row one line up. |

Blank line Allows adding a new keyboard configuration.

---

**Command ‘Visualization Element List’**

Symbol: 📚

**Function:** The command opens the “Visualization Element List” tab for the current visualization. It is displayed in the upper part of the visualization editor.

**Call:** Menu bar: “Visualization”

**Requirement:** A visualization is open in the editor.

---

**Tab ‘Visualization Element List’**

This view contains a list of the visualization elements in the open visualization. Grouped elements are displayed in a tree structure and have their own order within the group (other hierarchy level).

The current selection in the list is always synchronized with the selection in the main window of the editor.

The order in the element list from top to bottom describes the order of the elements on the display layers of the visualization from back to front. When you insert elements consecutively, they are arranged starting from the back (position 0) on one layer forward. When you use the commands in the menu “Visualization ➔ Order” to move an element from front to back in the editor window, the element list refreshes accordingly.
| **“Type”** | Element type and symbol, as used in the “Visualization Toolbox” view, as well as the element number that specifies the display layer. #0 = layer furthest back. |
| **“X”** | Position of the upper left corner of the element (0,0 = upper left corner of the visualization area). |
| **“Y”** | |
| **“Width”** | Dimensions of the element (in pixels). |
| **“Height”** | |
| **“ID”** | Internally assigned element identifier |
| **“Name”** | Element name as defined in “Properties ➔ Element name”. |
| **“Access Rights”** | The lock symbol ✜ indicates the restricted behavior of an element for some user groups. |
| **“Tab Order”** | Position within the order in which you can jump from element to element in the editor by means of the tab key when the default keyboard usage is activated. The activation is done in the visualization manager, on the settings tab. Note that elements within a group or group box have their own order (different hierarchy level). The tab order initially corresponds to the order in which the elements are arranged on the layers from back to front (“Type” above). To change the position in the order for an element, you can specify a different number directly in the table field. You can also use the “Move to Position” context menu command to open a dialog for specifying a new position. Bold fonts indicate changed position specifications. By removing the displayed value, you exclude the element from the selection using tab or arrow keys. You can use the “Reset to Default” context menu command to reset a changed position to the original position. This can be done simultaneously for a multiselection of elements when they do not belong to different hierarchy levels (groupings). |

**Command ’Activate Keyboard Usage’**

**Symbol:** ☑

**Function:** This command activates and deactivates the keyboard usage when a visualization is executed in online mode (integrated in CODESYS).

**Call:** Menu bar: “Visualization”; context menu.

**Requirement:** A visualization is open.

When this command is active, the visualization executes the keyboard events that you specified as a visualization user.

When the command is inactive, CODESYS executes the keyboard events that you specify.

- ☞ Chapter 6.4.5.6.5 “Configuring Keyboard Shortcuts” on page 2892
Command 'Order'

**Function:** The command makes further commands available. They are for specifying the order of the elements in levels, since elements in the rear levels are concealed by those in the front levels.

**Call:** Menu “Visualization”, context menu

Requirements: The visualization elements are positioned behind one another.

See also

- Chapter 6.4.5.5.3 “Positioning the Element, Adapting Size and Layer” on page 2874

Command 'Bring to Front'

Symbol: 

**Function:** The command positions the selected visualization element in the front level. The element becomes completely visible.

**Call:** Menu “Visualization ➔ Order”, context menu

Command 'Bring One to Front'

Symbol: 

**Function:** The command positions the selected visualization element one level further forwards.

**Call:** Menu “Visualization ➔ Order”, context menu

Command 'Send to Back'

Symbol: 

**Function:** The command positions the selected visualization element in the back level.

**Call:** Menu “Visualization ➔ Order”, context menu

Command 'Send One to Back'

Symbol: 

**Function:** The command positions the selected visualization element one level further backwards.

**Call:** Menu “Visualization ➔ Order”, context menu

Command 'Alignment'

**Function:** The command makes further commands available. It is used for the alignment of visualization elements in the window area of the visualization.

**Call:** Menu “Visualization”, context menu

See also

- Chapter 6.4.5.5.3 “Positioning the Element, Adapting Size and Layer” on page 2874

Command 'Align Left'

Symbol: 

**Function:** The command aligns the selected visualization elements along a line through the left-hand edge of the element that is positioned furthest left.

**Call:** Menu “Visualization ➔ Alignment”, context menu

Requirements: Several elements are selected.

Command 'Align Top'

Symbol: 

**Function:** The command aligns the selected visualization elements along a line through the upper edge of the element that is positioned highest.
Call: Menu “Visualization ➔ Alignment”, context menu
Requirement: Several elements are selected.

Command 'Align Right'
Symbol: ⚠️
Function: The command aligns the selected visualization elements along a line through the right-hand edge of the element that is positioned furthest right.
Call: Menu “Visualization ➔ Alignment”, context menu
Requirement: Several elements are selected.

Command 'Align Bottom'
Symbol: ⬇️
Function: The command aligns the selected visualization elements along a line through the lower edge of the element that is positioned lowest.
Call: Menu “Visualization ➔ Alignment”, context menu
Requirement: Several elements are selected.

Command 'Align Vertical Center'
Symbol: ✿
Function: The command aligns the selected visualization elements to their common vertical center.
Call: Menu “Visualization ➔ Alignment”, context menu
Requirement: Several elements are selected.

Command 'Align Horizontal Center'
Symbol: ⬊
Function: The command aligns the selected visualization elements to their common horizontal center.
Call: Menu “Visualization ➔ Alignment”, context menu
Requirement: Several elements are selected.

Command 'Make Horizontal Spacing Equal'
Symbol: ⬊
Function: The command aligns the selected visualization elements so that the elements positioned furthest left and furthest right retain their position and the elements between them are positioned with the same horizontal spacing.
Call: Menu “Visualization ➔ Alignment”, context menu
Requirement: 3 or more elements are selected. The first element is blue, while the other elements are displayed in grey.

Command 'Increase Horizontal Spacing'
Symbol: ⬊
Function: The command aligns the selected visualization elements so that the blue element retains its position and the other elements are positioned with a larger horizontal spacing. The spacing increases by 1 pixel each time.
Call: Menu “Visualization ➔ Alignment”, context menu
Requirement: Several elements are selected.

Command 'Decrease Horizontal Spacing'
Symbol: ⬊
**Function:** The command aligns the selected visualization elements so that the blue element retains its position and the other elements are positioned with a smaller horizontal spacing. The spacing decreases by 1 pixel each time.

**Call:** Menu “Visualization → Alignment”, context menu

**Requirement:** Several elements are selected.

**Command 'Remove Horizontal Spacing'**

Symbol: 

**Function:** The command aligns the selected visualization elements so that the blue element retains its position and the other elements are positioned with no horizontal spacing between them.

**Call:** Menu “Visualization → Alignment”, context menu

**Requirement:** Several elements are selected.

**Command 'Make Vertical Spacing Equal'**

Symbol: 

**Function:** The command aligns the selected visualization elements so that the uppermost and lowermost elements retain their position and the elements between them are positioned with the same vertical spacing.

**Call:** Menu “Visualization”, context menu

**Requirement:** 3 or more elements are selected. The first element is blue, while the other elements are displayed in grey.

**Command 'Increase Vertical Spacing'**

Symbol: 

**Function:** The command aligns the selected visualization elements so that the blue element retains its position and the other elements are positioned with a larger vertical spacing. The spacing increases by 1 pixel each time.

**Call:** Menu “Visualization → Alignment”, context menu

**Requirement:** Several elements are selected.

**Command 'Decrease Vertical Spacing'**

Symbol: 

**Function:** The command aligns the selected visualization elements so that the blue element retains its position and the other elements are positioned with a smaller vertical spacing. The spacing decreases by 1 pixel each time.

**Call:** Menu “Visualization → Alignment”, context menu

**Requirement:** Several elements are selected.

**Command 'Remove Vertical Spacing'**

Symbol: 

**Function:** The command aligns the selected visualization elements so that the blue element retains its position and the other elements are positioned with no horizontal spacing between them.

**Call:** Menu “Visualization → Alignment”, context menu

**Requirement:** Several elements are selected.

**Command 'Make Same Width'**

Symbol: 

**Function:** The command makes the width of the selected visualization elements the same as the width of the blue selected element.

**Call:** Menu “Visualization → Alignment”, context menu
**Requirement:** Several elements are selected. The first element is blue, while the other elements are displayed in grey.

*The command does not work with lines or polygons.*

---

**Command 'Make Same Height'**

**Symbol:** 📊

**Function:** The command makes the height of the selected visualization elements the same as the height of the blue selected element.

**Call:** Menu “Visualization ➔ Alignment”, context menu

**Requirement:** Several elements are selected. The first element is blue, while the other elements are displayed in grey.

*The command does not work with lines or polygons.*

---

**Command 'Make Same Size'**

**Symbol:** 📄

**Function:** The command makes the size of the selected visualization elements the same as the size of the blue selected element.

**Call:** Menu “Visualization ➔ Alignment”, context menu

**Requirement:** Several elements are selected. The first element is blue, while the other elements are displayed in grey.

*The command does not work with lines or polygons.*

---

**Command 'Size to Grid'**

**Symbol:** 📆

**Function:** The command aligns the size and position of the selected visualization elements to the grid.

**Call:** Menu “Visualization ➔ Alignment”, context menu

**Requirement:** Several elements are selected.

*The command does not work with lines or polygons.*

---

**Command 'Group'**

**Symbol:** 🎉

**Function:** The command groups the selected visualization elements and displays them as one.

**Call:** Menu “Visualization”, context menu
**Requirement:** At least 2 elements are selected.

To select more elements you can drag a window around the desired elements with the mouse. Alternatively you can click on the desired elements while keeping the [Shift] key pressed.

To select all elements you can open the context menu of the visualization editor and choose the “Select All” command.

You can also drag and drop elements to a group. For that, press the [Shift] key while dragging the element to the group. Meanwhile the cursor changes its appearance (display a small plus sign).

**Command ‘Ungroup’**

Symbol: 🌞

**Function:** The command ungroups elements again.

**Call:** Menu “Visualization”, context menu

**Requirement:** A grouping is selected.

**Command ‘Frame Selection’**

**Function:** The command opens the “Frame Configuration” dialog.

**Call:**
- Menu bar: “Visualization”
- Click the “Configure” button in the “References” property.

**Requirement:** A “Frame” element or “Tabs” element is selected in the editor. The “Element Properties” view is open.

**Dialog ‘Frame Configuration’**

The dialog allows you to select one or more of all available visualizations. The selected visualizations are displayed at runtime in the window area of the “Frame” element or “Tabs” element.

**NOTICE!**

Visualizations can be nested at any depth by means of “Frame” elements. In order to use the “Switch to any visualization” frame selection type without any problems, a “Frame” must not contain more than 21 referenced visualizations.

For more information, see also the description for the “Input configuration” of an element: Action “Switch frame visualization”.

Table 656: “Available Visualizations”

| “By Visualization Name” | The list of available visualizations of the project and libraries is sorted alphabetically. |
| “By Type or Instance” | The list of available visualizations of the project and libraries is sorted by type or instance. |
| Input field for a filter | If a filter text is specified, then only those visualizations whose names contain the filter text are listed. |
| { } | Library with project visualizations below it |

Table 657: “Selected Visualizations”

| “Add” | Click the symbol to add a visualization to the list of selected visualizations. |
| | Requirement: This is selected in “Available Visualizations”. |
| | Hint: To add a visualization, double-click a visualization in “Available Visualizations”. |
| “Delete” | Click the symbol to delete a visualization from the list. |
| | Requirement: This is selected in “Selected Visualizations”. |

The visualizations are automatically numerically indexed via the order in the list. The top visualization has the index 0. The next visualization has the index 1 and so on.

Note: A “Frame” and a “Tabs” element use the variables specified in the index of the “Switch frame variable” property.

| “Move Up” | Click the symbol to move a visualization up in the list. |
| | Requirement: This is selected in “Selected Visualizations”. |
| “Move Down” | Click the symbol to move a visualization down in the list. |
| | Requirement: This is selected in “Selected Visualizations”. |

Command 'Background'

Symbol: 🎨

Function: The dialog “Background” opens. You can define here whether the background of the visualization is colored or displayed with an image.

Call: Menu “Visualization”, context menu
