  - Safety I/O modules will not be re-parameterized (if no parameters are changed). Thus, they may continue their operation, which may require their PROFIsafe reintegration in the safety application on the safety CPU, e.g., if PROFIsafe watchdog time for this safety I/O module has expired. Any reintegration of such safety I/O modules will be not only application specific but also PROFIsafe specific and depend on the safety I/O handling in the safety application.

Internal value | Operating modes of the analog inputs, individually configurable
---|---
19 | 3-wire Ni1000 -50 °C ... +150 °C *)

*) In the operating modes with 3-wire configuration or with differential inputs, two adjacent analog inputs belong together (e.g. the channels 0 and 1). In these cases, both channels are configured in the desired operating mode. The lower address must be the even address (channel 0). The next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

**Remarks:**

- Hardware descriptions
- Device specifications > Communication interface modules
In AC500 the following interface identifier applies:
"-" = Diagnosis via bus-specific function blocks; 0 ... 4 or 10 = Position of the
communication module; 14 = I/O bus; 31 = Module itself
The identifier is not contained in the CI501-PNIO diagnosis block.

With "Device" the following allocation applies: 31 = Module itself; 1 ... 10 =
Expansion module

With "Module" the following allocation applies:
31 = Module itself
Module type (1 = AI, 2 = DO, 3 = AO)

This message appears, if externally voltages at one or more terminals
DO0 ... DO7 cause that other digital outputs are supplied through that
voltage © Chapter 5.2.6.7.2.4 "Connections" on page 1205. All outputs of
the apply digital output groups will be turned off for 5 seconds. The diagnosis
message appears for the whole output group.

The voltage on digital outputs DO0 ... DO7 has overrun the process supply
voltage UP3 © Chapter 5.2.6.7.2.4 "Connections" on page 1205. Diagnosis
message appears for the whole module.

This message appears, if the output of a channel DO0 ... DO7 should be
switched on while an externally voltage is connected. In this case the start
up is disabled, as long as the externally voltage is connected. Otherwise this
could produce reverse voltage from this output to other digital outputs. This
diagnosis message appears per channel.

Short circuit: After a detected short circuit, the output is deactivated for
100 ms. Then a new start up will be executed. This diagnosis message
appears per channel.

In case of an I/O module doesn’t support hot swapping, do not perform any
hot swap operations (also not on any other terminal units (slots)) as modules
may be damaged or I/O bus communication may be disturbed.

Diagnosis for hot swap available as of version index F0.

State LEDs

The LEDs are located at the front of module. There are 2 different groups:

- The 5 system LEDs (PWR, STA1 ETH, STA2 ETH, S-ERR and I/O-Bus) show the operation
  state of the module and display possible errors.
- The 27 process LEDs (UP, UP3, inputs, outputs, CH-ERR1 to CH-ERR3) show the process
  supply voltage and the states of the inputs and outputs and display possible errors.

Technical data

Technical data of the module

The system data of AC500 and S500 are applicable to the standard version “System data AC500” on page 166.

The system data of AC500-XC are applicable to the XC version “System data AC500-XC” on page 169.

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.

**NOTICE!**

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and temporary overvoltage up to 30 V DC.

---

**Multiple overloads**

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.
5.2.6.7.3 CI502-PNIO

Features

- 8 digital inputs 24 V DC
- 8 digital outputs 24 V DC, 0.5 A max.
- 8 configurable digital inputs/outputs 24 V DC, 0.5 A max.
- Module-wise galvanically isolated
- Fast counter
- XC version for usage in extreme ambient conditions available
### Intended purpose

The PROFINET communication interface module CI502-PNIO is used as communication interface module in PROFINET networks. The network connection is performed via 2 RJ45 connectors which are integrated in the terminal unit.

For usage in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

### Functionality

The CI502 communication interface module contains 24 I/O channels with the following properties:

- 8 digital configurable inputs/outputs
- 8 digital inputs: 24 V DC
- 8 digital outputs: 24 V DC, 0.5 A max.

The inputs/outputs are galvanically isolated from the Ethernet network. There is no potential separation between the channels. The configuration of the analog inputs/outputs is performed by software.

Connections

General

The Ethernet communication interface module CI502-PNIO is plugged on the I/O terminal unit TU507-ETH or TU508-ETH. Properly seat the module and press until it locks in place. The terminal unit is mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting.

The connection of the I/O channels is carried out using the 30 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

The terminals 1.8 and 2.8 as well as 1.9, 2.9 and 3.9 are electrically interconnected within the terminal unit and have always the same assignment, independent of the inserted module:

- Terminals 1.8 and 2.8: Process supply voltage UP = +24 V DC
- Terminal 3.8: Process supply voltage UP3 = +24 V DC
- Terminals 1.9, 2.9 and 3.9: Process supply voltage ZP = 0 V.

The assignment of the other terminals:

With a separate UP3 power supply, the digital outputs can be switched off externally. This way, an emergency-off functionality can be realized.

Do not connect any voltages externally to digital outputs!

This ist not intended usage.

Reason: Externally voltages at one or more terminals DC0 ... DC7 or DO0 ... DO7 may cause that other digital outputs are supplied through that voltage instead of voltage UP3 (reverse voltage).

This is also possible, if DC channels are used as inputs. For this, the source for the input signals should be the impressed UP3 of the device.

This limitation does not apply for the input channels DI0 ... DI7.

CAUTION!
Risk of malfunction by unintended usage!

If the function cut-off of the digital outputs is to be used by deactivation of the supply voltage UP3, be sure that no external voltage is connected at the outputs DO0 ... DO7 and DC0 ... DC7.

WARNING!
Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
  – connect or disconnect any signal or terminal block
  – remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!
Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

  – Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
  – Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

</tbody>
</table>

### Addressing

The module has 2 rotary switches to set an explicit name to the PROFINET IO device before commissioning. No engineering tool is needed in this case.

The device gets its name (including the fixed part of the device name) with the switch settings (01h...FFh). This name can be used directly within the device configuration: “CI5xx-pn-yy”

"CI5xx-pn-yy" xx is the fixed part of the device name (e.g. CI501) and yy represents the position of the rotary switch (0..FFh). The rotary switch values must be entered in hexadecimal format. For example, to set the name to “CI5xx-pn-08”, set the upper rotary switch to “0” and the lower switch to “8”.

The module reads the position of the rotary switches only during power-up, i.e. changes of the switch position during operation will have no effect until the next module initialization.

### I/O configuration

The CI502-PNIO stores some PROFINET configuration parameters (I/O device identifier, I/O device type and IP address configuration). No more configuration data is stored.

The digital I/O channels are configured via software.

Details about configuration are described in 'Parameterization' Chapter 5.2.6.7.3.8 “Parameterization” on page 1253.

</tr>
<tr>
<td>Off by E3 + Failsafe</td>
<td>Error LED (S-ERR) lights up at errors of error classes E1 and E2, Failsafe-mode on *)</td>
</tr>
</tbody>
</table>

*) The parameter Behaviour DO at comm. error is only analyzed if the Failsafe-mode is ON.

**IO-BUS reset after PROFINET reconnection**

IO-BUS reset after PROFINET reconnection controls the behavior of PROFINET CI modules in relation to connected I/O modules (both safety and non-safety I/O modules).
• IO-BUS reset after PROFINET reconnection = “On” resets and, thus, re-parameterizes all attached I/O modules. All internal I/O modules states are reset, including the related diagnosis information.
  Note that if the parameter is set to “On” then:
  – The bumpless re-start of non-safety I/O modules will not be supported. It means, for example, that non-safety output channels will go from fail-safe values to “0” values during the re-connection and re-parameterization time and after that go to new output values.
  – Safety I/O modules will be re-parameterized and re-started as newly started modules, which may not require their PROFIsafe reintegration, depending on safety CPU state, in the safety application.
• IO-BUS reset after PROFINET reconnection = “Off” will not reset all attached I/O modules. It will re-parameterize I/O modules only if parameter change is detected during the reconnection. All internal I/O modules states are not reset, including the related diagnosis information.
  Note that if the parameter is set to “Off” then:
  – The bumpless re-start of non-safety I/O modules is supported (if no parameters are changed). It means, for example, that non-safety output channels will not go from fail-safe values to “0” values during the re-connection and re-parameterization time, but directly from fail-safe values to new output values.
  – Safety I/O modules will not be re-parameterized (if no parameters are changed). Thus, they may continue their operation, which may require their PROFIsafe reintegration in the safety application on the safety CPU, e.g., if PROFIsafe watchdog time for this safety I/O module has expired. Any reintegration of such safety I/O modules will be not only application specific but also PROFIsafe specific and depend on the safety I/O handling in the safety application.

<td>BYTE</td>
<td>Off</td>
<td>0x00</td>
</tr>
</tbody>
</table>

**Remarks:**

1) The parameter Behaviour DO at comm. error is apply to DC and DO channels and only analyzed if the Failsafe-mode is ON.

2) The state "externally voltage detected" appears, if the output of a channel DC0 ... DC7 should be switched on while an externally voltage is connected. In this case the start up is disabled, as long as the externally voltage is connected. The monitoring of this state and the resulting diagnosis message can be disabled by setting the parameters to "OFF".

3) The error state "voltage overflow at outputs" appears, if externally voltage at digital outputs DC0 ... DC7 and accordingly DO0 ... DO7 has exceeded the process supply voltage UP3. The according diagnosis message "Voltage overflow on outputs " can be disabled by setting the parameters on "OFF". This parameter should only be disabled in exceptional cases for voltage overflow may produce reverse voltage.

### Diagnosis

Structure of the Diagnosis Block via function block PNIO_DEV_ALARM.

Remarks:

1) In AC500 the following interface identifier applies: "-" = Diagnosis via bus-specific function blocks; 0 ... 4 or 10 = Position of the Communication Module; 14 = I/O-Bus; 31 = Module itself
The identifier is not contained in the CI502-PNIO diagnosis block.

2) With "Device" the following allocation applies: 31 = Module itself, 1 ... 10 = Expansion module

3) With "Module" the following allocation applies dependent of the master:
Module error: 31 = Module itself
Channel error: Module type (1 = AI, 2 = DO, 3 = AO)
This message appears, if externally voltages at one or more terminals DC0 ... DC7 oder DO0 ... DO7 cause that other digital outputs are supplied through that voltage (voltage feedback, see description in 'Connections' Chapter 5.2.6.7.3.4 “Connections” on page 1246. All outputs of the apply digital output groups will be turned off for 5 seconds. The diagnosis message appears for the whole output group.

The voltage at digital outputs DC0 ... DC7 and accordingly DO0 ... DO7 has exceeded the process supply voltage UP3 (see Chapter 5.2.6.7.3.4 “Connections” on page 1246. Diagnosis message appears for the whole module.

This message appears, if the output of a channel DC0 ... DC7 or DO0 ... DO7 should be switched on while an externally voltage is connected. In this case the start up is disabled, as long as the externally voltage is connected. Otherwise this could produce reverse voltage from this output to other digital outputs. This diagnosis message appears per channel.

Short circuit: After a detected short circuit, the output is deactivated for 2000 ms. Then a new start up will be executed. This diagnosis message appears per channel.

In case of an I/O module doesn’t support hot swapping, do not perform any hot swap operations (also not on any other terminal units (slots)) as modules may be damaged or I/O bus communication may be disturbed.

Diagnosis for hot swap available as of version index F0.

State LEDs

The LEDs are located at the front of module. There are 2 different groups:

- The 5 system LEDs (PWR, STA1 ETH, STA2 ETH, S-ERR and I/O-Bus) show the operation state of the module and display possible errors.
- The 29 process LEDs (UP, UP3, inputs, outputs, CH-ERR1 to CH-ERR3) show the process supply voltage and the states of the inputs and outputs and display possible errors.

**Technical data**

**Technical data of the module**

The system data of AC500 and S500 are applicable to the standard version “Chapter 5.1.2 ‘System data AC500’ on page 166.”

The system data of AC500-XC are applicable to the XC version “Chapter 5.1.3 ‘System data AC500-XC’ on page 169.”

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.
### Parameter | Value
---|---
Process supply voltages UP/UP3 |  
Rated value | 24 V DC (for inputs and outputs)
Max. load for the terminals | 10 A
Protection against reversed voltage | Yes
Rated protection fuse on UP/UP3 | 10 A fast
Galvanic isolation | Ethernet interface against the rest of the module
Inrush current from UP (at power up) | On request
Current consumption via UP (normal operation) | 0.15 A
Current consumption via UP3 | 0.06 A + 0.5 A max. per output
Connections | Terminals 1.8 and 2.8 for +24 V (UP)
| Terminal 3.8 for +24 V (UP3)
| Terminals 1.9, 2.9 and 3.9 for 0 V (ZP)
Max. power dissipation within the module | 6 W
Number of digital inputs | 8
Number of digital outputs | 8
Number of configurable digital inputs/outputs | 8
Input data length | 12 bytes
Output data length | 20 bytes
Reference potential for all digital inputs and outputs | Negative terminal of the supply voltage, signal name ZP
Setting of the I/O device identifier | With 2 rotary switches at the front side of the module
Diagnosis | See Diagnosis and Displays \( \text{\textcopyright Chapter 5.2.6.7.3.9} \) “Diagnosis” on page 1256
Operation and error displays | 34 LEDs (totally)
Weight (without terminal unit) | Ca. 125 g
Mounting position | Horizontal or vertical with derating (output load reduced to 50 % at +40 °C per group)
Extended ambient temperature (XC version) | > +60 °C on request
Cooling | The natural convection cooling must not be hindered by cable ducts or other parts in the control cabinet.

**NOTICE!**
All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and temporary overvoltage up to 30 V DC.

**Multiple overloads**
No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

</tbody>
</table>

*) Due to the direct connection to the output, the demagnetizing varistor is also effective at the input (see figure) above. This is why the difference between UPx and the input signal may not exceed the clamp voltage of the varistor. The varistor limits the voltage to approx. 36 V. Following this, the input voltage must range from -12 V ... +30 V when UPx = 24 V and from -6 V ... +30 V when UPx = 30 V.

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.
5.2.7 Terminal units for communication interface modules

5.2.7.1 Safety instructions

**Hot swap**

System requirements for hot swapping of I/O modules:
- Types of terminal units that support hot swapping of I/O modules have the appendix TU5xx-H.
- I/O modules as of index F0.

The following I/O bus masters support hot swapping of attached I/O modules:
- Communication interface modules CI5xx as of index F0.
- Processor modules PM56xx-2ETH with firmware version as of V3.2.0.

---

**NOTICE!**

Risk of damage to I/O modules!

- Hot swapping is only allowed for I/O modules.
- Processor modules and communication interface modules must not be removed or inserted during operation.

---

**Conditions for hot swapping**

- Digital outputs are not under load.
- Input/output voltages above safety extra low voltage/protective extra low voltages (SELV/PELV) are switched off.
- Modules are completely plugged on the terminal unit with both snap fit engaged before switching on loads or input/output voltage.

Further information about hot swap.

5.2.7.2 TU507-ETH and TU508-ETH for Ethernet communication interface modules

5.2.7.2.1 Features

- TU507-ETH, Ethernet terminal unit, 24 V DC, screw terminals
- TU508-ETH, Ethernet terminal unit, 24 V DC, spring terminals
- TU508-ETH-XC, Ethernet terminal unit, 24 V DC, spring terminals, XC version
1 I/O bus (10 pins, female) to connect the first terminal unit
2a Plug (2x 25 pins) to connect the inserted Ethernet communication interface module
2b Plug (3x 19 pins) to connect the inserted Ethernet communication interface module
3 With a screwdriver, inserted in this place, the terminal unit and the adjacent terminal unit can be shoved from each other
4 2 holes for wall mounting
5 2 RJ45 interfaces with indication LEDs for connection with the Ethernet network
6 30 terminals for signals and process supply voltages (UP and UP3)
7 DIN rail

The Ethernet communication interface modules plug into the Ethernet terminal unit. When properly seated, they are secured with two mechanical locks. All the connections are made through the Ethernet terminal unit, which allows removal and replacement of the Ethernet communication interface modules without disturbing the wiring at the Ethernet terminal unit.

The Ethernet terminal units TU507-ETH and TU508-ETH are specifically designed for use with AC500/S500 Ethernet communication interface modules (e.g. CI501-PNIO).
**Extreme conditions**

Terminal units for use in extreme ambient conditions have no sign for XC version.

The figure 4 in the Part no. 1SAP4... (label) identifies the XC version.

### Terminals

<table>
<thead>
<tr>
<th>Screw terminals</th>
<th>Spring terminals</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Conductor</strong></td>
<td><strong>Conductor</strong></td>
</tr>
<tr>
<td>1.5</td>
<td>1.5</td>
</tr>
<tr>

<td>1.9</td>
</tr>
<tr>
<td><strong>Screwdriver</strong></td>
<td><strong>Screwdriver</strong></td>
</tr>
<tr>
<td>(opens terminal)</td>
<td>(opens terminal)</td>
</tr>
</tbody>
</table>

The terminals 1.8 and 2.8 as well as 1.9, 2.9 and 3.9 are electrically interconnected within the terminal unit and have always the same assignment, independent of the inserted module:

- Terminals 1.8 and 2.8: Process supply voltage $UP = +24 \, V \, DC$
- Terminal 3.8: Process supply voltage $UP3 = +24 \, V \, DC$
- Terminals 1.9, 2.9 and 3.9: Process supply voltage $ZP = 0 \, V$

The assignment of the other terminals is dependent on the inserted communication interface module.

**NOTICE!**

Risk of corrosion!

Unused connectors and slots may corrode if XC devices are used in salt-mist environments.

Protect unused connectors and slots with TA535 protective caps for XC devices

*Chapter 5.2.8.3.6 “TA535 - Protective caps for XC devices” on page 1332.*

### 5.2.7.2 Technical data

The system data of AC500 and S500 are applicable to the standard version

*Chapter 5.1.2 “System data AC500” on page 166.*
The system data of AC500-XC are applicable to the XC version. Chapter 5.1.3 “System data AC500-XC” on page 169.

Only additional details are therefore documented below. The technical data are also applicable to the XC version.

5.2.7.3 TU509 and TU510 for communication interface modules

5.2.7.3.1 Features

- TU509, terminal unit, 24 V DC, screw terminals
- TU510, terminal unit, 24 V DC, spring terminals
- TU510-XC, terminal unit, 24 V DC, spring terminals, XC version
1 I/O bus (10 pins, female) to connect the first terminal unit
2a Plug (2 25 pins) to connect the inserted communication interface module
2b Plug (3 19 pins) to connect the inserted communication interface module
3 With a screwdriver, inserted in this place, the terminal unit and the adjacent terminal unit can be shoved from each other
4 2 holes for wall mounting
5 D-sub 9 (female) for connection with the PROFIBUS network
6 30 terminals for signals and process supply voltages (UP and UP3)
7 DIN rail

The communication interface modules plug into the terminal unit. When properly plugged-in, they are secured with two mechanical locks. All the connections are established via the terminal unit, which allows removal and replacement of the communication interface modules without disturbing the wiring at the terminal unit.

The terminal units TU509 and TU510 are specifically designed for use with AC500/S500 communication interface modules (e.g. CI451-DP).

The terminals 2.8, 3.8, 2.9, 3.9 and 4.9 are electrically interconnected within the terminal unit and always have the same assignment, irrespective of the inserted module:

- Terminals 2.8 and 3.8: process supply voltage UP = +24 V DC
- Terminal 4.8: process supply voltage UP = +24 V DC
- Terminals 2.9, 3.9 and 4.9: process supply voltage ZP = 0 V

The assignment of the other terminals depends on the inserted communication interface module (see communication interface modules for CANopen and PROFIBUS).

**NOTICE!**

Risk of corrosion!

- Unused connectors and slots may corrode if XC devices are used in salt-mist environments.

Protect unused connectors and slots with TA535 protective caps for XC devices 

Chapter 5.2.8.3.6 “TA535 - Protective caps for XC devices” on page 1332.

5.2.7.4 TU517 and TU518 for communication interface modules

5.2.7.4.1 Features

- TU517, terminal unit, 24 V DC, screw terminals
- TU518, terminal unit, 24 V DC, spring terminals
- TU518-XC, terminal unit, 24 V DC, spring terminals, XC version
1  I/O bus (10 pins, female) to connect the first terminal unit
2a Plug (2 25 pins) to connect the inserted communication interface module
2b Plug (2 19 pins) to connect the inserted communication interface module
3  With a screwdriver, inserted in this place, the terminal unit and the adjacent I/O terminal unit can be shoved from each other
4  2 holes for wall mounting
5  10 terminals for connection with the bus system
6  30 terminals for signals and process supply voltages (UP and UP3)
7  DIN rail

The communication interface modules plug into the terminal unit. When properly plugged-in, they are secured with two mechanical locks. All the connections are established via the terminal unit, which allows removal and replacement of the communication interface modules without disturbing the wiring at the terminal unit.

The terminal units TU517 and TU518 are specifically designed for use with AC500/SS500 communication interface modules (e.g. CI581-CN, CI541-DP):

- CANopen communication interface modules
- DeviceNet modules
- PROFIBUS DP communication interface modules
**Extreme conditions**

Terminal units for use in extreme ambient conditions have no sign for XC version. The figure 4 in the Part no. 1SAP4... (label) identifies the XC version.

5.2.7.5 TU520-ETH for PROFINET communication interface modules

5.2.7.5.1 Features

- TU520-ETH, 2 RJ45 interfaces for connection to PROFIBUS network, 3 removable connectors for bus systems
- TU520-ETH-XC, 2 RJ45 interfaces for connection to PROFIBUS network, 3 removable connectors for bus systems, XC version
The PROFINET communication interface modules plug into the PROFINET IO terminal unit. When properly plugged-in, they are secured with two mechanical locks. All the connections are established via the PROFINET IO terminal unit, which allows removal and replacement of the communication interface modules without disturbing the wiring at the PROFINET IO terminal unit.

The PROFINET IO terminal unit TU520-ETH are specifically designed for use with AC500/S500 PROFINET communication interface modules (e. g. CI504-PNIO, CI506-PNIO).
**Extreme conditions**

Terminal units for use in extreme ambient conditions have no sign for XC version.

*The figure 4 in the Part no. 1SAP4... (label) identifies the XC version.*

---

**NOTICE!**

Risk of corrosion!

- Unused connectors and slots may corrode if XC devices are used in salt-mist environments.

Protect unused connectors and slots with TA535 protective caps for XC devices

☞ Chapter 5.2.8.3.6 “TA535 - Protective caps for XC devices” on page 1332.

5.2.8 Accessories

5.2.8.1 AC500-eCo

5.2.8.1.1 MC5102 - Micro memory card with adapter
- Solid state flash memory storage

Memory card type | AC500 V2 | AC500-XC V2 | AC500 V3 | AC500-XC V3 | AC500-eCo V3 |
---|---|---|---|---|---|
MC5141 | x | x | x | x | - |
MC5102 with TA5350-AD micro memory card adapter | x 1) | x 1) 2) | x | x 2) | - |
MC5102 without TA5350-AD micro memory card adapter | - | - | - | - | x |

1) As of firmware 2.5.x
2) Temporary use of MC5102 is possible under normal environmental conditions, but MC5141 should be preferred.

The use of other micro memory cards is prohibited. ABB is not responsible nor liable for consequences resulting from use of unapproved memory cards.

**Purpose**

Processor modules can be operated with and without (micro) memory card. Processor modules are supplied without (micro) memory card. It must be ordered separately.

The micro memory card is used to store or backup application data and/or application programs or project source codes as well as to update the internal CPU firmware.

The micro memory card can only be used temporarily in standard and XC applications.

The memory card can be read/written on a PC with a SDHC compatible memory card reader when using TA5350-AD micro memory card adapter.

*Further information on using the micro memory card in AC500 PLCs*

**Dimensions**

**Micro memory card**

The dimensions are in mm and in brackets in inch.
Insert the micro memory card

AC500 V3

Fig. 259: Insert micro memory card into PM56xx

1. Unpack the micro memory card and insert it into the supplied micro memory card adapter.
2. Insert the micro memory card adapter with integrated micro memory card into the memory card slot of the processor module until locked.
AC500-eCo V3

1. Open the micro memory card slot cover by turning it upwards.
2. Carefully insert the micro memory card into the micro memory card slot as far as it will go. Observe orientation of card.
3. Close the micro memory card slot cover by turning it downwards.

NOTICE!

Disturbed PLC operation

Do not remove the micro memory card when it is working!
Otherwise the micro memory card and/or files on it might get corrupted and/or normal PLC operation might be disturbed.

- AC500 V3: Remove the micro memory card only when no black square (■) is shown next to MC in the display.
- AC500-eCo V3: Remove the micro memory card only when the MC LED is not blinking.
Fig. 260: Remove micro memory card from PM56xx

1. To remove the micro memory card adapter with the integrated micro memory card, push on the micro memory card adapter until it moves forward.
2. By this, the micro memory card adapter is unlocked and can be removed.
NOTICE!
Disturbed PLC operation
Do not remove the memory card when it is working!
Otherwise the memory card and/or files on it might get corrupted and/or normal PLC operation might be disturbed.

- Remove the memory card only when no black square ( ) is shown next to MC in the display.

1. Open the micro memory card slot cover by turning it upwards.
2. Micro memory card can be removed from the micro memory card slot by gripping and pulling with two fingers.
3. Close the micro memory card slot cover by turning it downwards.

5.2.8.1.2 TA52xx(-x) - Terminal block sets

**Intended purpose**

Removable terminal blocks are used for power supply and for I/O connectors on AC500-eCo V3 processor modules PM50x2.

For option boards there are different removable terminal blocks in spring version.

For the AC500-eCo V3 Basic CPUs a 3-pin terminal block for power supply and a 13-pin terminal block for I/O connectors are used.

For the AC500-eCo V3 Standard CPUs and Pro CPUs a 3-pin terminal block for power supply, a 13-pin terminal block and a 12-pin terminal block for I/O connectors are used.

For all CPUs there is a screw and a spring variant available.

<table>
<thead>

**CAUTION!**
Risk of injury and damaging the product!
Improper installation and maintenance may result in injury and can damage the product!
- Installation and maintenance have to be performed according to the technical rules, codes and relevant standards, e.g. EN 60204-1.
- Read product documentation carefully before wiring. Improper wiring or wrong terminal block from other devices can damage the product!
- Only by qualified personnel.

**CAUTION!**
Risk of injury and damaging the module when using unapproved terminal blocks!
Only use terminal blocks approved by ABB to avoid injury and damage to the module.

**Terminal block set for PM50x2**
Processor modules PM50x2 CPU are not delivered with terminal blocks.
Screw terminal block set:
- TA5211-TSCL-B (1SAP187400R0001) for PM5012-x-ETH
- TA5212-TSCL (1SAP187400R0004) for PM5032-x-ETH, PM5052-x-ETH, PM5072-T-2ETH(W), PM5082-T-2ETH

Spring terminal block set:
- TA5211-TSPF-B (1SAP187400R0002) for PM5012-x-ETH
- TA5212-TSPF (1SAP187400R0005) for PM5032-x-ETH, PM5052-x-ETH, PM5072-T-2ETH(W), PM5082-T-2ETH

5.2.8.1.3 TA5300-CVR - Option board slot cover

**Intended purpose**
TA5300-CVR option board slot covers for PM50xx processor modules are necessary to protect not used option board slots.

---

**CAUTION!**
Risk of injury and damaging the product!
Always plug in the option board slot cover when the option board is not inserted.
If the option board slot cover is lost, please order the replacement TA5300-CVR (1SAP187500R0001).
Never power up the CPU with uncovered option board slot, otherwise it may cause serious injury and/or damage the product.

---

*The AC500-eCo V3 processor modules are delivered with option board slot cover(s).*

*The option board slot cover has to be removed before inserting an option board.*

*The TA5300-CVR option board slot covers are available as spare parts.*

---

**Dimensions**

*The dimensions are in mm and in brackets in inch.*
1. Press on the option board slot cover to insert it in the not used option board slot of the processor module PM50xx.

2. The option board slot cover must click into the not used option board slot.

1. Press the side of the inserted option board slot cover.

2. At the same time, pull the option board slot cover out of the option board slot of the processor module PM50xx.

The system data of AC500-eCo V3 apply to Chapter 5.1.1 “System data AC500-eCo” on page 159

Only additional details are therefore documented below.

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.
5.2.8.1.4 TA5400-SIM - Input simulator

- TA5400-SIM input simulator for 6 digital inputs 24 V DC
- For usage with AC500-eCo V3 processor modules

1. Contacts for connecting the input simulator to the terminal block for I/O connectors
2. 6 switches for the digital inputs DI0 ... DI5 (0 means opened switch, 1 means closed switch)
3. Screw terminal block for power supply
4. Screw terminal block(s) for I/O connectors

**Intended purpose**

**TA5400-SIM**

The TA5400-SIM input simulator is only intended for testing and training purposes for AC500-eCo V3 processor modules PM50x2.

Continuous operation in a productive system is not permitted.

The TA5400-SIM input simulator may only be used with screw-type terminal blocks.

The TA5400-SIM input simulator must not be used with spring-type terminal blocks.
**Environmental conditions for testing and training purposes**

In order not to impair the functionality of the product, avoid any kind of disturbing environmental influences:

- mechanical disturbances
- climatic influences

Make sure that the parameters are within the normal range:

- temperature
- air pressure
- humidity
- altitude

The TA5400-SIM input simulator can simulate 6 digital 24 V DC input signals to the digital inputs I0 ... I5 of onboard I/Os.

With the TA5400-SIM input simulator, the digital 24 V DC inputs I0 ... I5 can be turned OFF and ON separately:

- If the lever of the switch is on the right side (1), the input is ON.
- If the lever of the switch is on the left side (0), the input is OFF.

**Dimensions**

The dimensions are in mm and in brackets in inch.

**Electrical diagram**

The diagram below shows the connection of the TA5400-SIM input simulator.
NOTICE!
Risk of damage to the TA5400-SIM input simulator!
- Do not remove the terminal block while the TA5400-SIM input simulator is connected.
- Do not apply mechanical forces to the input simulator when it is connected to the terminal block.
- In both cases the input simulator could be damaged.

Assembly

Insertion of the input simulator
1. Make sure that the power supply of the processor module is turned off.

CAUTION!
Risk of damaging the PLC modules!
The PLC modules can be damaged by overvoltages and short circuits.
- Make sure, that all voltage sources (supply and process voltage) are switched off before you start working on the system.
- Never connect voltages > 24 V DC to the terminal block of the TA5400-SIM input simulator.

CAUTION!
Risk of damaging the input simulator and/or PLC modules!
The TA5400-SIM input simulator may only be used with AC500-eCo V3 processor modules PM50x2.
- Never use the input simulator with other devices.
- The input simulator may only be used with screw-type terminal blocks.
- The input simulator is only intended for testing and training purposes.
- Never use it within productive systems.
2. Make sure that all clamps of the onboard I/Os are totally open.
3. Insert the TA5400-SIM input simulator into the screw terminal block as shown in the figure.

4. Tighten all screws of the onboard I/O clamps.
5. Make sure all switches are in OFF state (0).
6. Connect 24 V DC to the power supply of the TA5400-SIM (L+ and M). Tighten the screws.
7. Connect the processor module power supply wires (24 V DC) “Pin assignment” on page 184.

Disassembly

Removal of the input simulator
1. Make sure that the power supply of the processor module is turned off.

   CAUTION!
   Risk of damaging the PLC modules!
   The PLC modules can be damaged by overvoltages and short circuits.
   Make sure that all voltage sources (supply and process voltage) are switched off before you start working on the system.

2. Disconnect the TA5400-SIM power supply wires (24 V DC) with a flat-blade screwdriver from the terminal block for power supply (L+ and M).
3. Loosen all screws of the onboard I/Os.
4. Remove the input simulator by pulling it to the left side.

5.2.8.2 AC500 and AC500-XC

5.2.8.2.1 MC5102 - Micro memory card with adapter

- Solid state flash memory storage

1 Micro memory card
2 TA5350-AD micro memory card adapter, necessary for use in AC500 processor modules

The MC5102 micro memory card has no write protect switch.
The TA5350-AD micro memory card adapter has a write protect switch.
In the position "LOCK", the inserted micro memory card can only be read.
Memory card type | AC500 V2 | AC500-XC V2 | AC500 V3 | AC500-XC V3 | AC500-eCo V3
---|---|---|---|---|---
MC5141 | x | x | x | x | -
MC5102 with TA5350-AD micro memory card adapter | x 1) | x 1) 2) | x | x 2) | -
MC5102 without TA5350-AD micro memory card adapter | - | - | - | - | x

1) As of firmware 2.5.x
2) Temporary use of MC5102 is possible under normal environmental conditions, but MC5141 should be preferred.

**Purpose**

Processor modules can be operated with and without (micro) memory card. Processor modules are supplied without (micro) memory card. It must be ordered separately.

The micro memory card is used to store or backup application data and/or application programs or project source codes as well as to update the internal CPU firmware.

The micro memory card can only be used temporarily in standard and XC applications.

The memory card can be read/written on a PC with a SDHC compatible memory card reader when using TA5350-AD micro memory card adapter.

Further information on using the micro memory card in AC500 PLCs

**Dimensions**

**Micro memory card**

The dimensions are in mm and in brackets in inch.
1. Unpack the micro memory card and insert it into the supplied micro memory card adapter.
2. Insert the micro memory card adapter with integrated micro memory card into the memory card slot of the processor module until locked.

Fig. 261: Insert micro memory card into PM56xx

1. Micro memory card
2. TA5350-AD micro memory card adapter
3. Memory card slot

The dimensions are in mm and in brackets in inch.
1. Open the micro memory card slot cover by turning it upwards.
2. Carefully insert the micro memory card into the micro memory card slot as far as it will go. Observe orientation of card.
3. Close the micro memory card slot cover by turning it downwards.

**NOTICE!**

**Disturbed PLC operation**

Do not remove the micro memory card when it is working!

Otherwise the micro memory card and/or files on it might get corrupted and/or normal PLC operation might be disturbed.

- AC500 V3: Remove the micro memory card only when no black square (□) is shown next to MC in the display.
- AC500-eCo V3: Remove the micro memory card only when the MC LED is not blinking.
Fig. 262: Remove micro memory card from PM56xx

1. To remove the micro memory card adapter with the integrated micro memory card, push on the micro memory card adapter until it moves forward.

2. By this, the micro memory card adapter is unlocked and can be removed.
AC500-eCo V3

NOTICE!

Disturbed PLC operation
Do not remove the memory card when it is working!
Otherwise the memory card and/or files on it might get corrupted and/or normal PLC operation might be disturbed.
- Remove the memory card only when no black square (■) is shown next to MC in the display.

1 Micro memory card slot cover
2 Micro memory card
3 Micro memory card slot

1. Open the micro memory card slot cover by turning it upwards.
2. Micro memory card can be removed from the micro memory card slot by gripping and pulling with two fingers.
3. Close the micro memory card slot cover by turning it downwards.

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.
5.2.8.2.3 TA521 - Battery

- Manganese dioxide lithium battery, 3 V, 560 mAh
- Non-rechargeable

The TA521 battery is the only applicable battery for the AC500 processor modules. It cannot be recharged.

The processor modules are supplied without lithium battery. It must be ordered separately. The TA521 lithium battery is used for data (SRAM) and RTC buffering while the processor module is not powered.

The CPU monitors the discharge degree of the battery. A warning is issued before the battery condition becomes critical (about 2 weeks before). Once the warning message appears, the battery should be replaced as soon as possible.

Handling instructions

- Do not short-circuit or re-charge the battery! It can cause excessive heating and explosion.
- Do not disassemble the battery!
- Do not heat up the battery and not put into fire! Risk of explosion.
- Store the battery in a dry place.
- Replace the battery with supply voltage ON in order not to risk data being lost.
- Recycle exhausted batteries meeting the environmental standards.

Battery lifetime

The battery lifetime is the time, the battery can store data while the processor module is not powered. As long as the processor module is powered, the battery will only be discharged by its own leakage current.

To avoid a short battery discharge, the battery should always be inserted or replaced while the process module is under power, then the battery is correctly recognized and will not shortly discharged.

Insertion

To ensure proper operation and to prevent data loss, the battery insertion or replacement must be always done with the system under power. Without battery and power supply there is no data buffering possible.
WARNING!
Risk of fire or explosion!
Use of incorrect Battery may cause fire or explosion.

1. Open the battery compartment with the small locking mechanism, press it down and slip down the door. The door is attached to the front face of the processor module and cannot be removed.

2. Remove the TA521 battery from its package and hold it by the small cable. Remove then the small connector from the socket, do this best by lifting it out with a screwdriver.

3. Insert the battery connector into the small connector port of the compartment. The connector is keyed to find the correct polarity (red = positive pole = above).

4. Insert first the cable and then the battery into the compartment, push it until it reaches the bottom of the compartment.

5. Arrange the cable in order not to inhibit the door to close.

6. Pull-up the door and press until the locking mechanism snaps.

In order to prevent data losses or problems, the battery should be replaced after 3 years of utilisation or at least as soon as possible after receiving the "low battery warning" indication.

Do not use a battery older than 3 years for replacement, do not keep batteries too long in stock.

Replacement of the battery

To ensure proper operation and to prevent data loss, the battery insertion or replacement must be always done with the system under power. Without battery and power supply there is no data buffering possible.
1. Open the battery compartment with the small locking mechanism, press it down and slip down the door. The door is attached to the front view of the processor module and cannot be removed.

2. Remove the old TA521 battery from the battery compartment by pulling it by the small cable. Remove then the small connector from the socket, do this best by lifting it out with a screwdriver.

3. Follow the previous instructions to insert a new battery.

---

**CAUTION!**

Risk of explosion!

Do not open, re-charge or disassemble lithium batteries. Attempting to charge lithium batteries will lead to overheating and can cause explosions.

Protect them from heat and fire and store them in a dry place.

Never short-circuit or operate lithium batteries with the polarities reversed. The batteries are likely to overheat and explode. Avoid unintentional short circuiting do not store batteries in metal containers and do not place them on metallic surfaces. Escaping lithium is a health hazard.

---

In order to prevent data losses or problems, the battery should be replaced after 3 years of utilisation or at least as soon as possible after receiving the "low battery warning" indication.

Do not use a battery older than 3 years for replacement, do not keep batteries too long in stock.

---

5.2.8.3 S500 and S500-XC

5.2.8.3.1 CP-E - Economic range

The power supplies feature series and parallel connection as well as a true redundant setup via a redundancy module.

- Wide-range input voltage
- Mounting on DIN rail
- High efficiency of up to 90 %
- Low power dissipation and low heating
- Wide ambient temperature range from -40 °C ... +70 °C
- No-load-proof, overload-proof, continuous short-circuit-proof
- Power factor correction (depending on the type)
- Approved in accordance with all relevant international standards

</table>
The power supplies feature series and parallel connection as well as a true redundant setup via a redundancy module.

The CP-C.1 power supplies are ABB’s high performance and most advanced range. With excellent efficiency, high reliability and innovative functionality it is prepared for the most demanding industrial applications. These power supplies have a 50 % integrated power reserve and operate at an efficiency of up to 94 %. They are equipped with overheat protection and active power factor correction. Combined with a broad AC and DC input range and extensive worldwide approvals the CP-C.1 power supplies are the preferred choice for professional DC applications.

- Typical efficiency of up to 94 %
- Power reserve design delivers up to 150 % of the nominal output current
- Signaling outputs for DC OK and power reserve mode
- High power density leads to very compact and small devices
- No-load-proof, overload-proof, continuous short-circuit-proof
- Active power factor correction (PFC)

#### 5.2.8.3.3 TA523 - Pluggable label mounting

For labelling the channels of S500 I/O modules.
1 Pluggable label mounting TA523
2 Plastic labels to be inserted into the holder

Purpose
The pluggable label mounting is used to hold 4 plastic labels, on which the meaning of the I/O channels of I/O modules can be written down. The holder is transparent so that after snapping it onto the module the LEDs shine through.

Handling instructions
The plastic labels can be printed out from TA523.doc.

### 5.2.8.3.4 TA525 - Plastic labels

Accessory to label AC500 and S500 modules.

**Purpose**

The plastic labels are suitable for labelling AC500 and S500 modules (CPUs, communication modules and I/O modules). The small plastic parts can be written on with a standard waterproof pen.

**Handling instructions**

The plastic labels are inserted under a slight pressure. For disassembly, a small screwdriver is inserted at the lower edge of the module.

### 5.2.8.3.5 TA526 - Wall mounting accessory

#### Purpose

If a terminal base or a terminal unit should be mounted with screws, the wall mounting accesso-
ries TA526 must be inserted at the rear side first. This plastic parts prevent bending of terminal
bases and terminal units while screwing up.

- Handling of the wall mounting accessory with terminal units
- Handling of the wall mounting accessory with terminal bases

5.2.8.3.6 TA535 - Protective caps for XC devices

**Purpose**
Accessory to cover unused connectors of XC devices in salt mist environments.
One TA535 package includes different cap types for the following connectors:
- RJ45 connectors
- 9-pole D-sub connector
- FieldBusPlug connector
Protection should be done for all unused slots of -XC devices.

Files via FTP server |
|                 | V3.1.0             | Save persistent data  
Boot project (size depends on PLC type) |

*) Examples for the filename with path (sFileName for FILE.Open) specified by the user ('mydir' is optional, but must be an existing directory):

- 'userdisk/myfile.txt'
- 'sdcard/mydir/myfile.txt'
- 'flashdisk/myfile.txt'

The maximum number of files opened at the same time is limited to 1007.
The max. length of the user string (path and filename) is 241 characters.

Unlike the PLC's memory areas like %M or Retain, where 1 byte actually consumes 1 byte, all storage device utilize a file system.

That means there is a difference between a files size and its size on the disk.

On disks the files are stored in so-called clusters which are a group of disk sectors. "Size on disk" refers to the amount of cluster(s) a file is taking up, while "file size" is an actual byte count of the file data. So you will usually find that the size on disk is larger than the file size. This is not an error, but a result of the disk organization via a file system. Since sector and cluster sizes vary depending on a disk's size and the used file system, the ratios between the size on disk and the file size also vary between the various storage devices.

</tr>
</tbody>
</table>

It is not possible to use 100 % of a device’s memory space. About 10 % of the total available space must remain unused at any time to maintain normal device operation.

5.2.9.4 Storage device details

5.2.9.4.1 SRAM

The SRAM is a battery-buffered, nonvolatile RAM and is used for the retain/persistent and the %M variables. If a battery is inserted into the processor module, the data stored in the SRAM will not get lost during a power-down cycle.

During PLC startup, the SRAM will be deleted automatically if no or an empty battery is inserted into the processor module. In this case the information

ABBInitSram_SetupMemory : SRAM cleared

and the warning

Retain size in config changed, or retain area got corrupted

are written into the log file.

Chapter 6.8.2.1 “Handling of remanent variables for AC500 V3 products” on page 4412

5.2.9.4.2 Flash disk

The flash disk is an internal persistent mass storage device and can be used for any application purpose.

It has a memory capacity of 8 GB (preformatted).

The flash disk is capable of high data throughput, however, the actual values to be achieved depend on the use cases. If the performance seems to get insufficient, check the following:

- If the PLCs CPU load is high, reduce overall CPU load of the PLC to have more performance for file operations.
- If the device has low free space, cleanup the disk.

Please consider the cluster size of 4 kB in your application design to achieve optimal usage of the flash disks space and access performance. For example, 10 files with 10 byte each require 10*4 kB disk space, while 1 file with 100 byte requires only 4 kB.

Number of max. write cycles

Technically, the flash chip used in the V3 flash disk has 20000 erase cycles (Write cycles).
Due to the produced write overhead, the optimum achievable number of write cycles is 10000 (for typical payload sizes of 256 kB).

**Example**

The write overhead is indicated by the *write amplification factor (WAF)*.

\[ WAF = \frac{\text{Flash Write (in Bytes)}}{\text{Host Write (in Bytes)}} \]

<table>

</tbody>
</table>

*Table 299: Rule of thumb for assessing the flash lifetime for an application:*

For monitoring the status

*It is recommended to use the respective function blocks to monitor the status of the flash disk.*

Since FW version 3.3.0, there is also a diagnosis event supported when the user flash memory reaches the end of its life cycle.

Lifetime of flash disk will also depend on the operating environment.

*E.g. high ambient temperatures will impose stress on the user flash memory and reduce the total overwrites achievable.*

- Max. write speed is 20 MB/s (continuous write of sequential data)
- Read cycles are unlimited.

### 5.2.9.4.3 Memory card

The memory card is a removable persistent mass storage device and can be used for any application purpose. Both firmware updates and boot project updates can be run from the memory card.

*Chapter 6.3.1.4.5 “Firmware installation and update with memory card” on page 1426*

### 5.2.9.4.4 Further information

*Further details on the storage device sizes*
5.3 Status LEDs, display and control elements

Depending on the device type, various operating elements provided on the front panel can be used to control the devices of the PLC system and/or to change the operating mode.

Operating elements:

- Status LEDs:
  Indicates the availability of devices and components such as communication modules, communication interface modules or function modules. Functionality and diagnosis of the status LEDs depends on the specific module and is described in the device description of the appropriate module. Possible status: on/off/blinking

- I/O LEDs:
  Displays the status of the inputs and outputs.

- Display:
  Available for some processor modules. It can be used for simple configurations and for reading out diagnosis information.
  - Chapter 6.8.2.5 “Display, LEDs and function keys on the front panel” on page 4452
  - Chapter 6.9.1.3 “Diagnosis in CPU display” on page 4607
  - Chapter 4.8 “Troubleshooting” on page 149

- Function keys and switches:
  Allows to change the current operating modes/status manually
  - Chapter 6.8.2.5.5 “Description of the function keys” on page 4457.
6 Configuration and programming
6.1 Cyber security

6.1.1 General

**Cyber security disclaimer**

This product is designed to be connected to and to communicate information and data via a network interface. It is your sole responsibility to provide and continuously ensure a secure connection between the product and your network or any other network (as the case may be). You shall establish and maintain any appropriate measures (such as but not limited to the installation of firewalls, application of authentication measures, encryption of data, installation of anti-virus programs, etc.) to protect the product, the network, its system and the interface against any kind of security breaches, unauthorized access, interference, intrusion, leakage and/or theft of data or information. ABB Ltd and its affiliates are not liable for damages and/or losses related to such security breaches, any unauthorized access, interference, intrusion, leakage and/or theft of data or information.

Although ABB provides functionality testing on the products and updates that we release, you should institute your own testing program for any product updates or other major system updates (to include but not limited to code changes, configuration file changes, third party software updates or patches, hardware exchanges, etc.) to ensure that the security measures that you have implemented have not been compromised and system functionality in your environment is as expected. This also applies to the operating system. Security measures (such as but not limited to the installation of latest patches, installation of firewalls, application of authentication measures, installation of anti-virus programs, etc.) are in your responsibility. You have to be aware that operating systems provide a considerable number of open ports that should be monitored carefully for any threats.

It has to be considered that online connections to any devices are not secured. It is your responsibility to assure that connections are established to the correct device (and e.g. not to an unknown device pretending to be a known device type). Furthermore you have to take care that confidential data exchanged with the PLC is either compiled or encrypted.

**Security related deployment guidelines for industrial automation**

Security details for industrial automation is provided on ABB website in a whitepaper.

**Signed firmware updates**

The firmware update files for the AC500 V3 PLC are digitally signed releases by ABB. During the update process, these signatures are validated by a hardware security component in the PLC. This way, the AC500 V3 PLC will only update with valid, authentic firmware, signed by ABB.

**Open ports and services**

As part of the ABB security concept the AC500 V3 PLC comes with minimal services opened by default. Only the services needed for initial setup and programming are open before any user application is downloaded. Chapter 5.2.1.2.1.3 “Ethernet protocols and ports for AC500 V3 products” on page 307.

Only used services/ports should be enabled (e.g. to enable the functionality of an FTPS server).

**Encrypted and signed applications**

An application can be encrypted and signed in order to protect a running application in an AC500 V3 PLC and to protect a configured project. How to set-up the user management, the communication and the boot application in order to prevent unauthorized access is explained in the application note AC500 V3 - Encrypt and sign your application.

**Secure communication**

Whenever possible, use an encrypted communication between AC500 V3 devices and third party devices, such as HMI devices. This is necessary to protect passwords and other data.
Secure shell access for ABB service

The AC500 V3 PLC contains a secure shell service to access core logging data in case of problems which need a deeper analysis. This service is inactive by default, which means that no one can access this privileged shell in the normal operating state.

To activate this service, local access to the PLC is necessary and activation is only valid until the next power cycle of the PLC. Once activated, the service run on TCP port 22. Each PLC also protects the secure shell access by an individual password.

Frequently asked questions

For more information around cyber security please see our AC500 cyber security FAQ.

6.1.2 Defense in depth

The defense in depth approach implements multi-layer IT security measures. Each layer provides its special security measures. All deployed security mechanisms in the system must be updated regularly. It is also important to follow the system vendor’s recommendations on how to configure and use these mechanisms. As a basis, the components must include security functions such as:

- Virus protection
- Firewall protection
- Strong and regularly changed passwords
- User management
- Using VPN tunnels for connections between networks

Additional security components such as routers and switches with integrated firewalls should be available. A defined user and rights concept managing access to the controllers and their networks is mandatory. Finally, the manufacturer of the components should be able to quickly discover weaknesses and provide patches.

References: CODESYS Security Whitepaper

Security zones

IT resources vary in the extent to which they can be trusted. A common security architecture is therefore based on a layered approach that uses zones of trust to provide increasing levels of security according to increasing security needs. Less-trusted zones contain more-trusted zones and connections between the zones are only possible through secure interconnections such as firewalls Fig. 265. All resources in the same zone must have the same minimum level of trust. The inner layers, where communication interaction needs to flow freely between nodes, must have the highest level of trust. This is the approach described in the IEC 62443 series of standards.

Firewalls, gateways, and proxies are used to control network traffic between zones of different security levels, and to filter out any undesirable or dangerous material. Traffic that is allowed to pass between zones should be limited to what is absolutely necessary because each type of service call or information exchange translates into a possible route that an intruder may be able to exploit. Different types of services represent different risks. Internet access, incoming e-mail and instant messaging, for example, represent very high risks.
Fig. 265: Security zones

Fig. 265 shows three safety zones, but the number of zones is not necessarily decisive, there can also be more or less - depending on the safety requirement. The use of multiple zones allows access between zones of different trust levels to be controlled to protect a trusted resource from attack by a less trusted one.

High-security zones should be kept small and independent. They need to be physically protected, i.e. physical access to computers, network equipment and network cables must be limited by physical means to authorized persons only. A high-security zone should obviously not depend on resources in a less secure zone for its security. Therefore, it should form its own domain that is administered from the inside, and not depend on, e.g., a domain controller in a less secure network.

Even if a network zone is regarded as trusted, an attack is still possible: by a user or compromised resource that is inside the trusted zone, or by an outside user or resource that succeeds to penetrate the secure interconnection. Trust therefore depends also upon the types of measures taken to detect and prevent compromise of resources and violation of the security policy.

References: *Security for industrial automation and control systems*

### 6.1.3 Secure operation

The controller must be located in a protected environment in order to avoid accidental or intended access to the controller or the application.

A protected environment can be:

- Locked control cabinets without connection from outside
- No direct internet connection
- Use firewalls and VPN to separate different networks
- Separate different production areas with different access controls

To increase security, physical access protection measures such as fences, turnstiles, cameras or card readers can be added.

Follow these rules for the protected environment:

- Keep the trusted network as small as possible and independent from other networks.
- Protect the cross-communication of controllers and the communication between controllers and field devices via standard communication protocols (fieldbus systems) using appropriate measures.
- Protect such networks from unauthorized physical access.
- Use fieldbus systems only in protected environments. They are not protected by additional measures, such as encryption. Open physical or data access to fieldbus systems and their components is a serious security risk.
Physically protect all equipment, i.e., ensure that physical access to computers, network equipment and cables, controllers, I/O systems, power supplies, etc., is limited to authorized persons.

When connecting a trusted network zone to outer networks, make sure that all connections are through properly configured secure interconnections only, such as a firewall or a system of firewalls, which is configured for “deny by default”, i.e., blocks everything except traffic that is explicitly needed to fulfill operational requirements.

Allow only authorized users to log on to the system, and enforce strong passwords that are changed regularly.

Continuously maintain the definitions of authorized users, user groups, and access rights, to properly reflect the current authorities and responsibilities of all individuals at all times. Users should not have more privileges than they need to do their job.

Do not use the system for e-mail, instant messaging, or internet browsing. Use separate computers and networks for these functions if they are needed.

Do not allow installation of any unauthorized software in the system.

Restrict temporary connection of portable computers, USB memory sticks and other removable data carriers. Computers that can be physically accessed by regular users should have ports for removable data carriers disabled.

If portable computers need to be connected, e.g., for service or maintenance purposes, they should be carefully scanned for viruses immediately before connection.

All CDs, DVDs, USB memory sticks and other removable data carriers, and files with software or software updates, should also be checked for viruses before being introduced into the trusted zone.

Continuously monitor the system for intrusion attempts.

Define and maintain plans for incident response, including how to recover from potential disasters.

Regularly review the organization as well as technical systems and installations with respect to compliance with security policies, procedures and practices.

A protected local control cabinet could look like in figure 266, page 1343. This network is not connected to any external network. Security is primarily a matter of physically protecting the automation system and preventing unauthorized users from accessing the system and from connecting or installing unauthorized hardware and software.

**Fig. 266: Isolated automation system**

Servers and workplaces that are not directly involved in the control and monitoring of the process should preferably be connected to a subnet that is separated from the automation system network by means of a router/firewall. This makes it possible to better control the network load and to limit access to certain servers on the automation system network. Note that servers and workplaces on this subnet are part of the trusted zone and thus need to be subject to the same security precautions as the nodes on the automation system network.
For the purposes of process control security, a general-purpose information system (IS) network should not be considered a trusted network, not the least since such networks are normally further connected to the Internet or other external networks. The IS network is therefore a different lower-security zone, and it should be separated from the automation system by means of a firewall. The IS and automation system networks should form separate domains.

Fig. 267: Plant information network connected to an automation system
6.1.4 Hardening

System hardening means to eliminate as many security risks as possible. Hardening your system is an important step to protect your personal data and information. This process intends to eliminate attacks by patching vulnerabilities and turning off inessential services. Hardening a system involves several steps to form layers of protection.

Commissioning phase
- Protect the hardware from unauthorized access
- Be sure the hardware is based on a secure environment
- Disable unused software and services (network ports)
- Install firewalls
- Disallow file sharing among programs

Fig. 268: Automation system and IS network
- Install virus and spyware protection
- Use containers or virtual machines
- Create strong passwords by applying a strong password policy
- Create and keep backups
- Use encryption when possible
- Disable weak encryption algorithms
- Separate data and programs
- Enable and use disk quotas
- Strong logical access control
- Adjust default settings, especially passwords

Verification phase
- Verification of antivirus - Check antivirus is active and updated
- Verification of the identification - Check that test and unauthorized accounts are removed
- Verification of intrusion detection systems - Check malicious traffic is blocked
- Verification of audit logging - Check audit log is enabled
- You can use the checklist out of the cyber security white paper

Operation phase
- Keep software up-to-date, especially by applying security patches
- Keep antivirus up and running
- Keep antivirus definitions up-to-date
- Delete unused user accounts
- Lock an active session whenever it is unattended, e.g., lock the screen of the PC or of the control panel (HMI)

Decommissioning phase
- Delete all credentials stored in the device like certificates and user data  

6.1.5 Certificates factory default - no encryption

As of Automation Builder Release 2.6.0, the encryption of the AC500 communication policy is set to "No encryption" by default. The reason for that is that the PLC clock defaults to 01/01/1970 when shipped from the factory, any pre-installed certificate would already be expired when the user attempts to connect.

Preliminary work
- Connection of the PLC to the Automation Builder and internet access.
- The PLC must be equipped with a battery to keep the date in case of power off.  
- The PLC must be set to the current date and time.  

1. If necessary reboot the PLC.
2. Connect the PLC to the Automation Builder again.

Create an CA-signed certificate

The basis for an official trusted signed certificate is the creation of a Certificate Signing Request.  

As an example, the creation of a certificate for a FTP server is described.
1. Double-click to the PLC main node and select the “PLC Shell” tab. Command line input is on the bottom. Find the index number for the FTP server and type `[cert-getapplist]` in the below command line.

2. Type `[cert-createcsr <index number> encoding=Base64]` in the command line e.g. here: `[cert-createcsr 1 encoding=Base64]` and press [ENTER].

   For some users it may be necessary to swap “Base64” for “ASN1” if the user’s PKI needs this format.

3. Change to the “Log” tab.
4. Click the refresh button.
   → Wait until the log entry of CSR file created pops up.

5. Change to the “Files” tab.
6. Click the refresh button.
7. Open the “cert” folder in the PLC.
8. Open the “export” folder.
9. Copy the certificate request file `[1_IoDrvFTPServer.csr]` to any folder on your PC.

10. This file, here `[1_IoDrvFTPServer.csr]` must then be signed by your Public Key Infrastructure (PKI).

   The signing process itself is outside the scope of this documentation. There are sufficient sources on the internet for building your own PKI (e.g. PKI tutorial) - or get in touch with your IT department.

**Integrate a certificate**

After the signed certificate comes back from the PKI and is stored on the PC, it has to be imported into the controller.
Be sure to import into the “Own Certificates” folder.

1. Change to the “Security Screen”.
2. Select tab “Devices”, the folder “Own Certificates” and press the import button.

3. Select the certificate (f1_IoDrvFTPServer.cer) to be imported in the opening file manager.
4. Press the “Open” button.
   ⇨ The new certificate will be shown as “IoDrvFTPServer” in the information column. The previous self-signed certificate will lose its name and is therefore not valid anymore.

   DON’T delete any of the installed certificates.

5. Check the validation and “Issued by” of the new certificate by activating the top PLC branch.
6. Download and reboot the PLC (repower or use “PLC Shell” and command [reboot].)

   We recommend changing the communication policy accordingly so that only encrypted connections are allowed.

---

**Encrypted and signed applications**

An application can be encrypted and signed in order to protect a running application in an AC500 V3 PLC and to protect a configured project. How to set-up the user management, the communication and the boot application in order to prevent unauthorized access is explained in the application note **AC500 V3 - Encrypt and sign your application**.

**Enforced signing**

As of Automation Builder 2.6.0 there is also the possibility to activate the “Enforced signing” mode in the “Change Runtime Security Policy”. Then the controller accepts ONLY signed downloads.

“Tab Communication Settings ➔ Device ➔ Change Runtime Security Policy... ➔ Code Signing ➔ New policy ➔ Enforced signing”
More information about certificates and cyber security can be found in the white paper AC500 cyber security.

6.1.6 Open Ports and Services

6.1.6.1 Default open Ethernet ports of AC500 V3 and AC500-eCo V3 CPUs

<table>
<thead>
<tr>
<th>Protocol</th>
<th>Port</th>
</tr>
</thead>
<tbody>
<tr>
<td>ABB NetConfig 1)</td>
<td>UDP 24576</td>
</tr>
<tr>
<td>Online access with driver 3S Tcp/Ip BlkDrvTcp (no scan)</td>
<td>TCP 11740</td>
</tr>
<tr>
<td>OPC UA server 2)</td>
<td>TCP 4840</td>
</tr>
</tbody>
</table>

Remarks:
1): The port 24576 for ABB NetConfig protocol can be disabled via PLC configuration by deleting the protocol node from configuration tree of Ethernet interfaces ETH1 and ETH2.
2): The port 4840 for OPC UA server is closed by default as of SystemFW V3.1.0.

6.1.6.2 Open ports and services of the Automation Builder (Engineering PC)

### 6.2 Engineering software Automation Builder

#### 6.2.1 Introduction

ABB Automation Builder is the integrated software suite for machine builders and system integrators wanting to automate their machines and systems in a productive way. Combining the tools required for configuring, programming, debugging and maintaining automation projects from a common intuitive interface, Automation Builder addresses the largest single cost element of most of today’s industrial automation projects: software. ABB Automation Builder covers the engineering of ABB PLCs, Safety PLCs, control panels, drives, motion and robots.

```
Before starting Automation Builder configuration read the version specific information provided in the Automation Builder readme file. It describes new features and functions as well as workarounds on known problems. The readme file is stored in the installation directory of Automation Builder, however can be downloaded as well from ABB website http://new.abb.com/plc/automationbuilder.
```

#### 6.2.2 Automation Builder updates

An update notification dialog will be shown during Automation Builder startup in case there are any updates available for the installed version.

The user has the possibility to check for updates manually: “Help → Check for Updates”

☞ Chapter 4.8.3 “Execution of a hotfix” on page 151

#### 6.2.3 Use of open source components

ABB Automation Builder and AC500 V3 firmware are using open source components. A detailed overview of these open source components and the corresponding licenses are available from Automation Builder via “Help → About… → License Terms”.

There are separate lists available for Automation Builder and AC500 V3 firmware.

#### 6.2.4 Managing your licenses

##### 6.2.4.1 Identifying the installed license

The title bar of the Automation Builder shows the version and the license information (Basic, Standard or Premium).

Be aware of the following rule for this information:

The info in the title bar is taken in this order from the first found license.
- local licenses (on PC)
- on a dongle (USB key)
- network licenses

So if a local license is only basic and a dongle with premium license is inserted the functionality is premium (the highest available) but the information in the title bar is basic.

To check your installed licenses, the CodeMeter Control Center tool can be used.

\[\text{Chapter 6.2.4.3 “Checking licenses with “CodeMeter Control Center” on page 1352}\]

### 6.2.4.2 Selecting the license used on Automation Builder startup

You can select, which license the Automation Builder should use on startup.

To select which license should be used:

1. In the Automation Builder menu select “Tools ➔ Options”.
   - The “Options” window is opened.
2. In “Startup settings” under “License” select which license should be used.
   - Default: The most comprehensive available license will be selected
   - Use only local license: Network licenses will never be selected
   - Display licenses selection dialog if shared licenses are available: On every Automation Builder startup, you will be asked to select a license
3. To apply the setting select [OK].
6.2.4.3 Checking licenses with “CodeMeter Control Center”

1. Open the “CodeMeter Control Center” via the “Windows start menu ➔ CodeMeter ➔ CodeMeter Control Center”.

2. In the “CodeMeter Control Center” window you can see the different license “tickets” / “CmContainers” that are installed on your PC.

   To see more details, open the “CodeMeter WebAdmin” by selecting [WebAdmin]
3. Select “Container ➔ All Container”

⇒ Here the details of the license containers can be checked.

6.2.4.4 Setting dedicated network servers in search list

In case of a new installation CodeMeter will check for licenses also in the network. If there is a run-out or wrongly installed license found, the service is closed without any further hint. This looks like Automation Builder starts and closes after a few moments.

To set the search for licenses to your local machine only follow these steps:

1. Open the CodeMeter Control Center ➔ Chapter 6.2.4.3 “Checking licenses with “CodeMeter Control Center” on page 1352.

2. Open the CodeMeter WebAdmin by selecting [WebAdmin]

2024/01/05 3ADR010583, 1, en_US 1353
3. Select “Configuration ➔ Basic ➔ Server Search List”

4. Select “add new Server”
5. Enter "localhost" in the Server's names field
6. Select [Add]
7. Confirm by selecting [Apply]
   The "localhost" is added to the Server Search List

8. Restart the license check
9. Add more servers to the search list by entering the IP address or name of the license servers you know.

### 6.2.4.5 Restarting license check with a dongle bound license

In case of using a dongle bound license it might be necessary to restart the check for license on the PC, e.g. if the dongle was removed and reinserted.
1. Open the CodeMeter Control Center
   Chapter 6.2.4.3 “Checking licenses with “CodeMeter Control Center” on page 1352.

2. Select “Process ➔ Restart CodeMeter Service”

6.2.4.6 Removing trial license to remove expiring message

If an unlimited license is installed after having a trial license activated, the warning message for expiring date of the trial license still pops up at the Startup of the Automation Builder.

To avoid this message the trial license can be removed.

CAUTION!

– If you remove a license from your PC it will be permanently lost.
– Be aware that the trial license includes all premium functionalities, which will not be available any more if your unlimited license is not a premium license, e.g. standard.
1. Check for the Trial CmContainer number in CodeMeter WebAdmin Interface

2. Search CmContainer number in CodeMeter Control Center

3. Remove this selected license in CodeMeter Control Center

6.2.4.7 Network licenses

6.2.4.7.1 General

It allows sharing of licenses between team members, easy switchover between several workstations with a single license and allows centralized administration (ordering, registration, activation).

The Automation Builder License Manager and CodeMeter need to be used to configure the network server.

- In a typical office LAN (Local Area Network) setup on Client side the default settings of the Automation Builder (and CodeMeter) are sufficient to get the Network Licenses working.
- If an opened Automation Builder is losing contact to the network server (e.g. due to network problems) Automation Builder will prompt the user to restore the network. After 30 minutes without connection to the network server Automation Builder will fall back to basic edition. Opened editors for non-basic features stay open and usable. So your work will not be lost in case of troubles with the network.

Information on how to borrow and return a network license.

The network licenses can be used as of Automation Builder 1.2.0.

6.2.4.7.2 Setting up a network license

General

The following setup works in typical environments.
Configuring a network license server

- Network license must be registered.
- Automation Builder license must be activated.

1. Launch CodeMeter WebAdmin as described in chapter 'Managing your licenses' & Chapter 6.2.4 “Managing your licenses” on page 1350
2. Select “Configuration ➔ Server ➔ Server Access”

3. Enable Network Server
   Keep the default port settings. These should work in most cases.
4. Select [Apply]

5. For the changes to take effect, restart CodeMeter Control Center & Chapter 6.2.4.5 “Restarting license check with a dongle bound license” on page 1355
NOTICE!

- In case you want to control usage of network licenses please refer to chapter "View network server license usage" on page 1360.
- Activation keys for network licenses are valid for one network license each. This one license can be shared among many people but only one Automation Builder instance at the same time. If you want to run more than one Automation Builder instance at the same time you have to activate more than one network license. This means you have to purchase and enter more than one activation key (one per license).

Configuring the client side

The default settings of Automation Builder and the CodeMeter (on client side) are sufficient in most cases to get the network licenses working. In case of problems accessing the network license, please set the server search list on the client side.

6.2.4.7.3 View network server licenses

On the Network Server side you can find information on existing network licenses and their current allocation.
1. Launch CodeMeter WebAdmin ➔ Chapter 6.2.4.3 “Checking licenses with “CodeMeter Control Center”” on page 1352.

2. Select “License Monitoring ➔ All Licenses”

### Available Licenses on 'OVAEXPWIN10'

6.2.4.7.5 Controlling network server license usage

On the Network Server side you can define settings managing the client access to CodeMeter License Server on a network.

1. Launch CodeMeter WebAdmin \(\rightarrow\) Chapter 6.2.4.3 “Checking licenses with “CodeMeter Control Center”’ on page 1352.

2. Select “Configuration \(\rightarrow\) Server \(\rightarrow\) Server Access”

3. Add entries of PCs you want to share licenses with by adding client computers and IP addresses for accessing CodeMeter License Server on a network.
6.2.4.8 License borrowing manager

6.2.4.8.1 Introduction

The license borrowing manager allows you to borrow a network license for offline use and return it.

The license borrowing manager is not part of the default software distribution, but will be handed out on request.

The license borrowing manager is supported as of Automation Builder 2.2.3.

6.2.4.8.2 Borrowing a network license

- Network access to the license server required.
- Opened the license borrowing manager.

1. Select the license you want to borrow.

2. Select [Borrow License].

3. Select the target CmContainer.

   Alternatively a new CmContainer can be created.

4. Select the end of the borrowing period.
5. Select [Ok].

- The license has successfully been borrowed.
- The list of available licenses has been updated.

6.2.4.8.3 Returning a network license

Automatic return of a license

Network licenses will be returned automatically after the expiration of the maximum borrowing period. No licenses server access is required.
Manual return of a network license

- Network access to the license server required.
- Opened the license borrowing manager.
  1. Select a borrowed license.

2. Select [Return License]
   - The license has successfully been returned.

6.2.4.9 Transferring an Automation Builder license

6.2.4.9.1 General

- It is possible to transfer normal licenses from a PC to another PC or dongle (DM-Key).
- This is not possible for ABB internal or temporary licenses, e.g. the 30 day Trial license.
- The process consists of two main steps:
  1. Return the actual license from the actual PC
  2. Reactivate the license on the new PC

6.2.4.9.2 Getting activation code

- For all license transfer processes the activation code is required. It is available from the license paper from purchasing the license.
- For Automation Builder licenses purchased April 2020 or later, the activation code is available from the activated license:
1. Open CodeMeter Control Center and navigate to the [WebAdmin].

2. Identify the right product code.
   Automation Builder editions consist of multiple product codes. The activation ID is available from the product code containing the edition name, e.g. "Automation Builder Standard".

3. Select product code to access the product code details. Under “License Information” you can find the activation code.
6.2.4.9.3 Returning an Automation Builder license

- You need the License Activation code of the license you want to return.
- Go to the following website: http://lc.codemeter.com/32838/depot-return/index.php

  The website is also available through the Automation Builder menu under "Help ➔ Return of Automation Builder license".

- Insert your Activation code in the field "Ticket"
- Select [Next]
4. Select [Re-Host License]

If the CmContainer is found, continue with Online licenses transfer  Chapter 6.2.4.9.4 “Online license transfer” on page 1367

If the CmContainer is not found, continue with Offline license transfer  Chapter 6.2.4.9.5 “Offline license transfer” on page 1369

6.2.4.9.4 Online license transfer

- Wait till the CmContainer is found, then select [Deactivate Selected License Now]
Re-Hostable Licenses

To re-host licenses from one CrmContainer to another CrmContainer:
1. Make sure that the CrmContainer with Serial 128-1765656 is connected to the computer. If this CrmContainer is not connected to the computer, connect it now and click "Reassign to CrmContainer".
2. Select the licenses you want to re-host.
3. Click "Deactivate Selected Licenses Now".
4. After the successful deactivation of the selected licenses, you can activate them again in another CrmContainer.

<table>
<thead>
<tr>
<th>Name</th>
<th>Activated On</th>
<th>CrmContainer</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>CMGO01-TOOL – Standard license</td>
<td>2021-06-28 14:32:30</td>

</tr>
</tbody>
</table>

Deactivate Selected Licenses Now

Online License Transfer

Starting license transfer.
Creating license request.
Downloading license update.
Importing license update to CrmContainer.
Creating receipt.
Uploading receipt.

License transfer completed successfully!

OK
6.2.4.9.5 Offline license transfer

If the CmContainer is not found on this PC, select “file-based license transfer” workflow.

The following dialog opens

The instructions will lead you through the main steps of the offline license transfer:
1. On the offline PC open the CodeMeter Control Center.
2. Select [License Update].

The CmFAS Assistant opens.

3. Select “Create a license request file”.
4. Select a location to store the license request file.
5. Transfer the license request file from the offline PC to an online PC.

Please select the desired action

- **Create license request**: Choose this option if you want to create a license request file in order to send it to the vendor of the software.
- **Import license update**: Choose this option if you received a license update file from the software vendor and want to import this file.
- **Create receipt**: Choose this option if you want to confirm the successful import of a license update file for the software vendor.
6. On the online PC choose the license request file and select [Upload Request And Continue Now].

7. Select [Download License Update File Now].
8. Save the license update file to a location on your computer.
9. Transfer the license update file from the online PC to the offline PC.
10. On the offline PC open the CmFAS Assistant.
11. Select "Import license update".
12. Select the license update file, to import the new license to the offline PC.
13. To confirm a successful license transfer return to the online PC and select [Next].

14. On the offline PC open the CmFAS Assistant.

15. Select “Create receipt”.

The last dialog is opened.
16. Choose a location to save the license receipt file.

17. Transfer the license receipt file from the offline PC to the online PC.
18. On the online PC choose the license receipt file and select [Upload Receipt Now].

After a successful license transfer you will receive the following message:

6.2.4.9.6 Return of unconfirmed license

If customers do not complete the offline activation process by uploading the receipt file, they won't be able to return the license. However, working with Automation Builder is possible. When the customer tries to return the license, they will see that the license is available, but they won't be able to rehost the license because the button is not visible. The only way to proceed here is to either create a receipt file from “CodeMeter” and upload it, or contact ABB Support who will manually confirm the activation after reviewing the “CmDust”.

Below are the steps to enable the “Re-Host” button again.

Initial situation: No [Re-Host Licenses] button is visible in the “CodeMeter License Central WebDepot”.
1. Open the “CodeMeter Control Center” on the PC.
2. Select the correct container under the “License” tab so that it is grayed out.
3. Click the [License Update] button.

! The “CmFAS Assistant” opens.

4. Click the [Next >] button.
5. In the window which appears, select the option [Create receipt].

6. Click the [Next >] button.

7. Select a file name for storing the receipt file.
8. Click the [Commit] button.

9. Click the [Finish] button.

10. Open the CodeMeter License Central WebDepot

11. Click on the [Upload activation receipt] button.
12. Click the [Choose File] button and select the receipt file that has just been created by “CodeMeter”. A new window will open.

13. Click the [Upload activation receipt] button and wait for the success message.
14. Go again to the return WebDepot and try to return license. Now the [Re-Host Licenses] button is visible.

6.2.4.10 Generating license information file for support
To create a license information file which includes all license information for the support:
1. Select “Windows start menu ➔ CodeMeter ➔ Tools ➔ CmDust”.
   ➔ The explorer window opens and shows the folder where the created log file CmDust-Result.log is stored.
2. Please attach this file to any support request regarding your licenses.

6.2.4.11 Generating log files for support
Sometimes more detailed log files are needed to analyse a situation.
Then please also zip the following folder and attach it to your support request.
C:\ProgramData\CodeMeter\Logs
This folder includes
- CmActDiagLogyyyy-mm-dd-hhmmss.log
- CodeMeteryyyy-mm-dd-hhmmss.log
To make it easier to distinguish when the files were created, they are named as follows:
- yyyy – year, mm – month, hh – hour; mm – minutes, ss – seconds.

6.2.4.12 Further information
For more information about the installation and activation of the Automation Builder see:
Automation Builder Installation and Activation

6.2.5 Setting up of communication parameters in Windows
Setting up of communication parameters
To set up the communication between the PC and the PLC, e.g., for downloading the compiled program, you have to set up the communication parameters.
The IP address of your PC must be in the same class as the IP address of the CPU.
The factory setting of the IP address of the CPU is 192.168.0.10.
The IP address of your PC should be 192.168.0.X. Avoid X = 10 in order to prevent an IP conflict with the CPU.
Subnet mask should be 255.255.255.0.
Changing of the IP address

1. Open Windows control panel. Click “Network and Internet ➔ Network and Sharing Center”.
2. Click “Change adapter settings”.
   
   If using existing network with several devices, please pay attention on given network rules or contact your system administrator.

3. Right-click “Local Area Connection (Ethernet)” and select [Properties].

5. Enter your desired IP address and subnet mask.

6.2.6 **Version information**

Information on the installed Automation Builder version such as installed packages or license terms can be found in menu “Help ➤ About”.
6.2.7 PLC runtime and demo licensing

The use of some libraries and devices require the PLC to have a runtime license. Further it is possible to try out device features or library features by using a demo license © Chapter 6.3.2.2.2 “PLC runtime licensing” on page 1446.

6.2.8 Create log files for support

If a problem persists, contact ABB technical support. In order to be able to solve your problem as soon as possible, please provide the affected Automation Builder project or Panel Builder project, the log files and the firmware versions. How to read out log files is described in the application note How to get log information.
6.2.9 Menues, views, windows

6.2.9.1 Display settings

Ensure the full display of Automation Builder editors by choosing the option “Smaller - 100 % (default)” in “Start ➔ Control Panel ➔ Appearance and Personalization ➔ Display”.

6.2.9.2 Start page and menus

After start-up of Automation Builder software the start page is displayed.

All items of the Automation Builder user interface are described in the CODESYS documentation:
6.2.9.3 “All Messages” window

Errors, warning and success messages are written to the “All messages” window:

![Image of the "All Messages" window]

6.2.10 Device repository

The Device Repository of Automation Builder manages the pool of devices that can be used in the PLC configuration.

You install or uninstall devices in the “Device Repository” dialog box. The system installs a device by reading the device description files, which define the device properties for configurability, programmability, and possible connections to other devices.

You can use the devices provided in the device repository by adding them to the device tree of your project.
1. Click “Tools ➔ Device Repository”.
   ⇨ The “Device Repository” dialog box opens.

[Edit Locations]: Changes the default repository location. The devices can be managed at different locations.

[Install] / [Uninstall]: Installs or uninstalls devices.

[Renew device repository]: Updates the device list, e.g. after uninstallation of a device.

[Details]: Provides technical details on the selected device.

2. Select the install location. “System Repository” is set by default.
1. Click [Install] and select the appropriate file format.
   ⇒ The “Install Device Description” dialog box opens.

2. Select the file path of the device description.

3. Select the file type filter of the required device description.
   ⇒ All device descriptions of the selected file type are listed.

4. Select the required device description and click [Open].
   ⇒ Automation Builder adds the device description to the matching category of your device repository.
      If errors occur during installation (for example, missing files that are referenced by the device description), then Automation Builder displays them in the lower part of the “Device Repository” dialog box.

During the installation the device description files and all additional files referenced by that description will be copied to an internal location. Altering the original files will have no further effects to an internal location.

The changes take only effect after reinstalling the corresponding device(s). The version number shown in the information section of the device should be verified.

Uninstalling devices
Select the device you want to remove and click [Uninstall].
The device is removed from the list.

Uninstalled devices which are used in existing projects are indicated by the symbol 🚨. The device will not be configured properly.
### 6.2.11 Creating and configuring projects

#### What is a project?

- A project contains the objects which are necessary to create a controller program ("application"):
  - Pure POUs, for example programs, function blocks, functions, and GVLs.
  - Objects that are also required to be able to run the application on a PLC. For example, task configuration, Library Manager, symbol configuration, device configuration, visualizations, and external files.
- In a project, you can program multiple applications and connect multiple controller devices.
- CODESYS manages device-specific and application-specific POUs in the "Devices" view ("device tree") and project-wide POUs in the "POUs" view.
- For the creation of projects, there are templates that already contain certain objects.
- Basic configurations and information for the project are defined in the "Project Settings" and "Project Information". For example:
  - Compiler settings
  - User management
  - Author
  - Data about the project file

There are settings for the version compatibility of the project in the configuration dialogs in the "Project Environment".
- You save a project as a file in the file system. As an option, you can pack it together with project-relevant files and information into a project archive. It is also possible to save files in a source code management system such as SVN.
- Each project contains the information about the CODESYS version with which it was created. When you open it in another version, CODESYS will notify you about possible or necessary updates regarding file format, library versions, etc.
- You can compare, import/export projects, and create documentation for them.
- You can protect a project from being changed, or even completely protect it from being read. By using user management, you can selectively control the access to the project and even to individual objects in the project.

- Chapter 6.4.1.21.2.2 “Object ‘Application’” on page 2410
- Chapter 6.4.1.21.2 “Objects” on page 2409
- Chapter 6.4.1.21.4 “Dialogs” on page 2745
- Chapter 6.4.1.21.3.5.13 “Command ‘Project information’” on page 2604
- Chapter 6.4.1.6 “Protecting and Saving Projects” on page 1819

#### Auto generated files

When creating, saving or exporting, files may be created and their extensions are briefly listed here for better understanding. Some of the files are generated when you login for the first time to the PLC and the boot application is created. The list does not claim to be complete.

<table>
<thead>
<tr>
<th>File extension</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>*.opt</td>
<td>Project specific options.</td>
</tr>
<tr>
<td>*.bootinfo</td>
<td>Will be created during boot project creation.</td>
</tr>
<tr>
<td>*.bootinfo_guids</td>
<td>Contains the CRC of the bootinfo.</td>
</tr>
<tr>
<td>*.crc</td>
<td>Checksum of the boot application.</td>
</tr>
</tbody>
</table>
Handling of AC500 projects such as project creation, export/import, comparison of projects etc. is described in the sections for AC500 V3 products.

☞ Chapter 6.3.1.1 “Project handling” on page 1398

### 6.2.12 Handling of AC500 projects

Handling of AC500 projects such as project creation, export/import, comparison of projects etc. is described in the sections for AC500 V3 products.

☞ Chapter 6.3.1.1 “Project handling” on page 1398

Copy-and-paste from one project to another project in two different Automation Builder instances is possible. After copying parts of a project to a higher Automation Builder version the copied components have to be updated.

- It is not possible to downgrade a project to an earlier Automation Builder version.
- Import of export files is only allowed in the same profile version.
- Copy-and-paste of configurations must not be used to copy objects to an earlier version.
- Automation Builder performs an integrity check for the PLC configuration before generating the configuration.

### Project archive

Automation Builder supports the creation and the import of project archive files. Archive files contain all relevant project data including the PLC configuration, the CODESYS project files and all device descriptions. This allows exchanging Automation Builder projects without taking care of the target environment General Settings.

☞ Chapter 6.3.1 “General settings” on page 1398
User and access rights of a project

The 'User Management' provides functions for defining user accounts and configure the access rights within a project. The rights to access project objects via specified actions are assigned only to user groups, not to a single user account. So each user must be member of a group General Settings.  

6.2.13 Connection of devices

6.2.13.1 Configuring devices

All installed devices that are available in Automation Builder are listed in the device repository.

Modify your Automation Builder project by adding device objects. Preset items can be replaced in the same way.

1. In the device tree, right-click an item node. Select [Add object].

2. Select the desired object and click [Add object].

3. Double-click the new object in the device tree to configure the device settings. Depending on the selected item different configuration tabs are available.
6.2.13.2 Symbolic names for variables, inputs and outputs

The IEC naming rules are not checked during input in Automation Builder.

Input and output mapping

Devices with I/Os provide an “I/O Mapping” tab in their configuration editor where the available I/O channels can directly be mapped to a global variable.

The corresponding variable declarations are automatically available in the project.

All available I/O channels can easily be assigned to a variable.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Mapping</th>
<th>Channel</th>
<th>Address</th>
<th>Type</th>
<th>Default Value</th>
<th>Unit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>b_Input_1B0</td>
<td></td>
<td>Digital inputs 10 - 17</td>
<td>%I0</td>
<td>BYTE</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>x_Input1B0</td>
<td></td>
<td>Digital input 10</td>
<td>%D0,0</td>
<td>BOOL</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>x_Input1B1</td>
<td></td>
<td>Digital input 11</td>
<td>%D0,1</td>
<td>BOOL</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>x_Input1B2</td>
<td></td>
<td>Digital input 12</td>
<td>%D0,2</td>
<td>BOOL</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>x_Input1B3</td>
<td></td>
<td>Digital input 13</td>
<td>%D0,3</td>
<td>BOOL</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>x_Input1B4</td>
<td></td>
<td>Digital input 14</td>
<td>%D0,4</td>
<td>BOOL</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>x_Input1B5</td>
<td></td>
<td>Digital input 15</td>
<td>%D0,5</td>
<td>BOOL</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>x_Input1B6</td>
<td></td>
<td>Digital input 16</td>
<td>%D0,6</td>
<td>BOOL</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>x_Input1B7</td>
<td></td>
<td>Digital input 17</td>
<td>%D0,7</td>
<td>BOOL</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Fast counter</td>
<td></td>
<td>Digital inputs 18 - 115</td>
<td>%I81</td>
<td>BYTE</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Digital inputs 116 - 125</td>
<td>%I82</td>
<td>BYTE</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Digital inputs 124 - 131</td>
<td>%I83</td>
<td>BYTE</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

AC500 uses Intel Byte Order (Little Endian).

Only entries with a data type set in column “Type” can be mapped. These entries can be expanded to show the available I/O channels.

If the project has been imported from a previous Automation Builder version, all variables should be checked to avoid inconsistencies concerning the I/O mapping.

6.2.13.3 Update of AC500 devices

Perform a firmware update to update AC500 V3 devices. ⇕ Chapter 6.3.1.4.3 “Installation and update of the AC500 V3 firmware” on page 1422

6.2.13.4 Comparing objects

To compare similar objects within a project (such as the project configuration) select both objects. Right-click and select “Compare Objects” to see the differences.
6.2.14 Connection of serial interfaces

Depending on the device type, the configuration of serial interfaces is different.

☞ Chapter 6.3.2.14 “Serial interface” on page 1586

6.2.15 Converting an AC500 V2 project to an AC500 V3 project

Application example

A project that has been configured for an AC500 V2 PLC can be converted to a project for an AC500 V3 PLC. Essentially, the conversion is done in Automation Builder, however, some additional actions have to be executed manually. The complete conversion procedure of a V2 project to a V3 project is described in the application note Converting an AC500 V2 project to an AC500 V3 project.
6.2.16 Automation Builder installation manager

6.2.16.1 Introduction

Automation Builder installation manager allows you to install customer specific software packages, modify the existing installation, update installation information and to uninstall Automation Builder software packages in a comfortable and flexible way.

You can launch installation manager from the main menu of Automation Builder, “Tools → Installation Manager”, or from Windows start menu.

Installation manager starts.

Uninstall all Uninstalls the currently installed Automation Builder software. ✓ Chapter 6.2.16.5 “Uninstalling Automation Builder” on page 1397
Install Package Installs customer specific software packages. ✓ Chapter 6.2.16.2 “Installing customer specific package” on page 1395
Modify Adds or removes installed software packages. ✓ Chapter 6.2.16.3 “Adding or removing installed software packages” on page 1396
Info Export Exports detailed information of installed packages in a notepad.
Check for new service release Checks if your installed version of Automation Builder is up to date and checks for updates. ✓ Chapter 6.2.16.4 “Checking for updates” on page 1396

6.2.16.2 Installing customer specific package

Installation manager allows you to install customer specific software packages (CABPKG files). These packages are separately distributed to the customer based on the customer requirement.
1. In the installation manager, click **[Install Package]**.
2. Select the package to be installed (.cabpkg file) from the file system.
3. Select the components to be installed.
4. Click **[Install]**.
   - Data installation starts.
5. Successfully installed components are indicated with ![Check](https://example.com/check.png).
   Errors during data download are indicated with ![Error](https://example.com/error.png). Errors during download of any package component aborts the installation. In this case click “Show Log” and save the log data. Send the log file to ABB support team.
   Click **[Finish]** to end the wizard.

### 6.2.16.3 Adding or removing installed software packages

1. In the installation manager, click “**Modify**”.
   - The selection page opens.
   - The selected software packages are installed already.
   - The not selected software packages are not installed.
2. Select the software packages you want to install.
   Unselect the software packages you want to uninstall.
   ```
   You cannot unselect the main Automation Builder software package.
   ```
3. Click “**Continue**”.
   - First, the unselected software packages will uninstall.
   - Afterwards, the new selected software packages will be downloaded and installed.
4. Successfully downloaded components are indicated with ![Check](https://example.com/check.png).
   Errors during data download are indicated with ![Error](https://example.com/error.png). Errors during download of any package component aborts the installation. In this case click “Show Log” and save the log data. Send the log file to ABB support team.
   Click **[Finish]** to end the wizard.

### 6.2.16.4 Checking for updates

- In the installation manager, click “**Check for new service release**”.
- If a newer Automation Builder version is available, you will get an option to download and install the new version.

Create a project archive before upgrading Automation Builder. Project archives contain all project data, including data that is not stored with a *.project file, e.g. device description files for third party devices.

[Chapter 6.3.1.1.8.2 “Creation of an archive” on page 1408](#)
6.2.16.5 Uninstalling Automation Builder

Installation manager offers a comfortable way to uninstall the Automation Builder software. This will uninstall all related packages of Automation Builder platform as well, such as Mint Plug-in, Automation Builder Extensions, Drive Manager etc.

1. In the installation manager, click [Uninstall all].
   - A warning message is displayed to uninstall Automation Builder software.
     Click [Yes] to continue.

2. If Automation Builder instances are running, a warning message is displayed.
   Close running instances of Automation Builder and click [Retry] to continue uninstallation.
   With [Abort] uninstallation of the current package is stopped. Uninstallation is continued with the next package. With [Ignore], uninstallation is forced. As this can lead to an erroneous uninstallation, we recommend you, not to use this option.

3. If installation manager was launched with “Tools ➤ Installation Manager”, the following message is displayed as Automation Builder is still running:
   With [Yes] Automation Builder software is closed to continue uninstallation procedure.
   With [No] uninstallation of the current package is stopped. Uninstallation is continued with the next package.

4. For each of the packages being uninstalled, system may prompt to continue uninstallation.
5. Successfully uninstalled components are indicated with ![Icon](image).
   Errors during uninstallation are indicated with ![Icon](image). Errors during uninstallation of any package component aborts the uninstallation. In this case click “Show Log” and save the log data. Send the log file to ABB support team.
   Click [Finish] to end the wizard.
6.3 Configuration in Automation Builder for AC500 V3 products

6.3.1 General settings

6.3.1.1 Project handling

6.3.1.1.1 General

What is a project?

- A project contains the objects which are necessary to create a controller program ("application"): 
  - Pure POUs, for example programs, function blocks, functions, and GVLs.
  - Objects that are also required to be able to run the application on a PLC. For example, task configuration, Library Manager, symbol configuration, device configuration, visualizations, and external files.
- In a project, you can program multiple applications and connect multiple controller devices.
- CODESYS manages device-specific and application-specific POUs in the “Devices” view (“device tree”) and project-wide POUs in the “POUs” view.
- For the creation of projects, there are templates that already contain certain objects.
- Basic configurations and information for the project are defined in the “Project Settings” and “Project Information”. For example:
  - Compiler settings
  - User management
  - Author
  - Data about the project file

There are settings for the version compatibility of the project in the configuration dialogs in the “Project Environment”.

- You save a project as a file in the file system. As an option, you can pack it together with project-relevant files and information into a project archive. It is also possible to save files in a source code management system such as SVN.
- Each project contains the information about the CODESYS version with which it was created. When you open it in another version, CODESYS will notify you about possible or necessary updates regarding file format, library versions, etc.
- You can compare, import/export projects, and create documentation for them.
- You can protect a project from being changed, or even completely protect it from being read. By using user management, you can selectively control the access to the project and even to individual objects in the project.

Additional information:

- Chapter 6.4.1.21.2.2 “Object ‘Application’” on page 2410
- Chapter 6.4.1.21.2 “Objects” on page 2409
- Chapter 6.4.1.21.4 “Dialogs” on page 2745
- Chapter 6.4.1.21.3.5.13 “Command ‘Project information’” on page 2604
- Chapter 6.4.1.6 “Protecting and Saving Projects” on page 1819

6.3.1.2 Creating a new project

1. Select “File ➔ New Project”.
2. Select “AC500 project”, enter a project name and specify the storage location for the new project.

   With “Empty project” a project without a PLC is created.
3. Select the device type for the new project and click [Add object].

A new project is created and can be configured.

6.3.1.3 Opening an existing project

**NOTICE!**
Risk of damaging Automation Builder projects!
Projects created with Automation Builder are incompatible with CODESYS V2.3.9.x. Do not open projects with CODESYS V2.3.9.x as this can cause corrupted Automation Builder projects.

Automation Builder performs an integrity check for the PLC configuration before generating the configuration.
Opening a project

1. Select “File ➔ Open Project”.
   ➔ The “Open Project” dialog appears.
2. Select a previously saved project from the file system.
   ➔ Automation Builder switches to the version of the project and opens the project.

6.3.1.1.4 Exporting and importing a project

Configuration of a complete PLC or of single devices can be reused within the same project by copy-and-paste the desired nodes in the device tree.

In order to reuse a PLC configuration cross-over projects, the project configuration can be exported and imported afterwards into another project.

An exported project configuration can only be imported to a project with the same Automation Builder version. If the versions are not the same, the import fails with an error message.

Automation Builder performs an integrity check for the PLC configuration before generating the configuration.

Project export

From the menu, select “Project ➔ Export ➔ Project”. Select the objects to be exported. The configuration of the selected items will be added to an export file (*.export).

“One file per subtree”: If this option is activated, all objects belonging to the same subtree will be exported into the same export file, otherwise a separate file will be created for each particular object.
**Project import**

For importing a project a basic and an advanced function is available.

*“Basic project import”:* Users with a basic or a standard Automation Builder license can perform a basic project import. Command: *“Project ➔ Import ➔ Project”.*

A previously exported project configuration is imported into the current project. With this, the current project configuration is overwritten.

In order to supplement the current project with the project configuration of a previously exported project, use the compare function. Command: *“Project ➔ Compare”.*

☞ Chapter 6.3.1.1.7 “Comparing projects” on page 1405

*“Advanced project import”:* Users with a premium Automation Builder license can perform an advanced project import. Command: *“Project ➔ Import ➔ Project with compare”*. This command allows to compare two projects, to check on differences and to adapt single parts of the project configuration easily.

**Basic project import**

1. From the menu, select *“Project ➔ Import ➔ Project”*.  

A previously exported project configuration is imported into the current project. With this, the current project configuration is overwritten.

In order to supplement the current project with the project configuration of a previously exported project, use the compare function. Command: *“Project ➔ Compare”*.  

☞ Chapter 6.3.1.1.7 “Comparing projects” on page 1405

2. Select the export file from the file system and click *[Open]* to import the project configuration.

*An exported project configuration can only be imported to a project with the same Automation Builder version. If the versions are not the same, the import fails with an error message.*

**Advanced project import**

Perform an advanced project import in order to compare two projects, to check on differences and to adapt single parts of a previously exported project configuration easily.

1. From the menu, select *“Project ➔ Import ➔ Project with compare”*.  

2. Select the export file from the file system and click *[Open]* to import the project configuration.  

☞ The project import is started.
3. Once the project file is imported, a compare view is displayed. The left pane represents the current project, the right pane represents the imported project.

Differences between the current project and the imported project are highlighted in red color.

Additional modules in the current project that are not available in the imported project are highlighted in green color.

Additional modules in the the imported project or deleted modules in the current project are highlighted in blue color.

A summary of all differences within the projects is given in the “Comparison statistics” under the device tree.

4. Every highlighted item of both projects can be handled individually and can either be transferred to the current project or skipped.

- **[Accept Block]**: All items of the selected node are transferred to the current project with one click. Use this function for example to copy all nodes of a PLC configuration from the imported project to the current project (select “I/O_Bus” node).

- **[Accept Single]**: Only a single item from a node is transferred to the current project. Use this function for example to copy certain I/O modules from the imported project to the current project.

All accepted items are highlighted in the current project in yellow color.

To undo a selection, again, click [Accept Block] or [Accept Single].

To accept all changes on the current project, close the “Project Comparison - Differences” tab and confirm the prompted dialog.
5. If in the import project the PLC contains an AC500-S safety module, a security check is performed which requires user authentication:

![Logon window](image)

6. After a successful user authentication the AC500-S safety modules are added to the compare view and can be imported to the current project.

![AC500-S safety modules](image)

### 6.3.1.1.5 Upgrade a project to a new Automation Builder version or profile

With the Automation Builder version 2.6.0 a side-by-side installation is possible, i.e. any Automation Builder versions can be installed in parallel.

Automation Builder 2.5 or a lower version can be installed for access to all required previous versions.

When updating the Automation Builder version, a previously configured project must be converted in order to be used in a new Automation Builder version.

1. Create a project archive before upgrading Automation Builder. Project archives contain all project data, including data that is not stored with a ".project" file, e.g. device description files for third party devices.

   Chapter 6.3.1.1.8.2 “Creation of an archive” on page 1408

   “File ➔ Project Archive ➔ Save/Send Archive...”
2. Use the Automation Builder update notification to initiate the software update.
   \(\Rightarrow\) Chapter 6.2.2 “Automation Builder updates” on page 1350
   or:

3. Download the file from the PLC website - all versions of the Automation Builder are available.

4. Install the new Automation Builder and follow the instructions.

5. Open a previously configured project.
   \(\Rightarrow\) Automation Builder performs an integrity check for the PLC configuration before generating the configuration.
   Automatically a window appears with the request to upgrade the project.

6. Click the [OK] button.
   \(\Rightarrow\) During the project upgrade, an option for migration of third party devices can be selected.
7. Click the [OK] button to upgrade third party devices. If this option was not selected during the upgrade procedure, migration can be initiated manually after an Automation Builder upgrade in order to migrate all third party devices to the project.

☞ Chapter 6.3.1.5 “Migration of third party devices” on page 1439

8. The firmware of the communication interface modules will not automatically be upgraded. You can do this with the IP configuration tool. For this, the IP configuration tool must be used as stand-alone variant.

Follow the instructions for the firmware upgrade for communication interface modules.

☞ Chapter 6.3.2.4.3.2 “Stand-alone installation” on page 1457

**Application example**

A project that has been configured for an AC500 V2 PLC can be converted to a project for an AC500 V3 PLC. Essentially, the conversion is done in Automation Builder, however, some additional actions have to be executed manually. The complete conversion procedure of a V2 project to a V3 project is described in the application note

_Converting an AC500 V2 project to an AC500 V3 project_.

---

It is not possible to downgrade a project to an earlier Automation Builder version.

### 6.3.1.6 I/O mapping export and import

**Export I/O mapping**

To exchange information on I/O mapping only, data can be exported as .csv file. This allows maintenance of I/O data outside Automation Builder, e.g. in MS Excel.

Right-click the “Processor Module” node or “I/O_Bus” node in the device tree and select “Export -> I/O mapping”. To export the I/O Mapping for the complete project, e.g. with more than one configured processor modules, I/O data of the complete project can be exported “Project -> Export -> I/O mapping”.

**Import I/O mapping**

A previously exported .csv file can be imported to the project: “Project -> Import -> I/O mapping”.

### 6.3.1.7 Comparing projects

**Introduction**

You can compare the currently open project with another project – a reference project. The differences in contents, properties, or access rights are detected and shown in a comparison view.

**Application example**

_How to compare Automation Builder projects for an AC500 V3 PLC is described in the application note Project Comparison - Compare AC500 Projects and Integrate the Differences._
Clicking “Project ➔ Compare” opens the “Project Compare” dialog for you to configure and run the comparison. Then the result is shown in the comparison view “Project Compare – Differences” where the objects are aligned in a tree structure. Objects that indicate differences from the respective reference object are identified by colors and symbols. This is how you detect whether or not the contents, properties, or access rights are different.

For differences in the contents, you can also open the detailed compare view “Project Compare - <object name> Differences” in order to zoom into the object. In the detailed compare view, the contents of the object and reference object are displayed or their source code aligned. The detected differences are marked. Previously opened views are not closed. In this way, you can have any number of comparison views open and read them, in addition to the project compare view.

You can accept the detected differences from the reference project into the current project. This is possible only from the reference project into the open project. To do this, you activate differences (for example in the code) that should be accepted in the current project with the commands ✅, ✗, or ✖ in the active comparison view for accepting. These positions are highlighted in yellow. Make sure that any other open compare views are inactive (write-protected, read-only). Therefore, you can activate differences to be accepted in exactly one comparison view only. When exiting the active compare view, if you confirm that the differences that are activated for acceptance are actually accepted into the current project, then the current project is modified.

In order to exit the project comparison completely, close the project compare view.

Creating a comparison view

Requirement: You have made changes in your current project and wish, for example, to compare it with the last-saved version. In the meantime, for example, you have added further POUs, removed a POU, changed single lines of code or the object properties in function blocks.

1. Select the command “Project ➔ Compare”.
   ➔ The “Project Comparison” dialog box opens.
2. Enter the path to the reference project, for example the path to the last-saved version of your current project.
3. Leave the activation of the comparison option “Ignore Spaces” as it is.
4. Click on “OK”.
   ➔ The comparison view opens. Title: “Project Comparison – Differences”. The Device trees of the current project and the reference project are displayed alongside each other and the changed objects are marked in color.
5. Select an object marked in blue in the tree of the reference project (right). The current project no longer contains this object.
   Click on ✅ “Accept Single”
   ➔ The object is added to the tree of the current project (left). The line has a yellow background. ✅ appears in the middle column.
6. Select an object marked in green in the tree of the current project (left). The reference project does not contain this object.
   Click on ✗ “Accept Single”
   ➔ The object is removed again from the tree of the current project (left). The line has a yellow background. ❌ appears in the middle column.
7. If changes are detected in the content of an object that is contained in both the current project and the reference project, this is indicated by red lettering. You can then switch to the detailed comparison view for the object by double-clicking on the object.
8. Close the comparison view and answer the query whether the changes made are to be saved with “Yes”.
   ➔ The changes become effective in the project.
Opening the detailed compare view

Requirement: For example, a user modified the code in a POU of the current project. You have performed the project comparison by clicking “Project ➔ Compare”. The project compare view shows this POU highlighted in red in the aligned in the project tree.

1. Double-click the line of the aligned POU versions.
   ⇒ The compare view switches to the detailed compare view of the POU. The modified code lines are highlighted in gray and written in red.
2. Click .
   ⇒ Code lines with changes (red) are extended by two lines: an line with insert (left, green) and a line with delete (right, blue).
3. Click  again.
   ⇒ The code line is marked again as modified.
4. Move the mouse pointer to the code line marked as modified and click “Accept Single”.
   ⇒ The code line from the reference project is activated for acceptance into the current project.
5. Click .
   ⇒ The project compare view opens for the entire project. It is write-protected (read-only) to prevent you from activating differences for acceptance. The link highlighted in yellow above the tree view also indicates this.
6. Click the link: “Project compare view is read only because there are uncommitted changes in another view. Click here to switch to the modified view.”
   ⇒ The detailed compare view opens again. The unconfirmed changes are highlighted in yellow.
7. Click  in the tab of the view and confirm that the changes should be saved.
   ⇒ The detail project view is closed and the POU is overwritten. Now it corresponds to the POU of the reference project. The project view is active again so that you can continue working with project compare.

If you do not click the link, but click  instead to close the editor of the project compare view, then you will also confirm the acceptance of changes into the current project. The detail changes are accepted and then the project compare is closed completely.

6.3.1.1.8 Project archive

General

Automation Builder supports the creation and the import of project archive files. Archive files contain all relevant project data including the PLC configuration, the project files of the CODESYS and all device descriptions. This allows exchanging Automation Builder projects without taking care of the target environment.
Creation of an archive

The following steps describe the creation archive file from an Automation Builder project:

1. Select “File ➔ Project Archive ➔ Save/Send Archive”.
2. Select the information which should be included in the archive file from the list box.

<table>
<thead>
<tr>
<th>Section/Control</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Information selection list box</td>
<td>Options</td>
<td>Not supported</td>
</tr>
<tr>
<td>Referred devices</td>
<td>Referenced devices</td>
<td>The referenced devices can be selected by expanding the &quot;Referenced devices&quot; item of the list box. It is strongly recommended to include all devices in the project archive to maintain consistency.</td>
</tr>
<tr>
<td>Additional files</td>
<td>-</td>
<td>Not supported</td>
</tr>
<tr>
<td>Comment</td>
<td>-</td>
<td>Opening a control window which allows the input of a comment to the project archive.</td>

</tr>
<tr>
<td>Send</td>
<td>-</td>
<td>Not supported</td>
</tr>
<tr>
<td>Cancel</td>
<td>-</td>
<td>Canceling the operation and closing the dialog window.</td>
</tr>
</tbody>
</table>

With [Comment] additional information can be added to the project archive, for example to add a brief description or some information concerning the project.

3. Proceed with [Save...].

It is strongly recommended to keep the default settings.

Section “Options” of the list box is not support. Do not enable this option.

Extraction of an archive

The currently loaded project will be closed automatically when extracting the selected project archive. It is recommended to open a new instance of Automation Builder before starting the extraction process.
The following steps describe the extraction of an archive file and the import to Automation Builder.

1. Select “File ➔ Project Archive ➔ Extract Archive”.
2. Select the desired project file and click [Open].

<table>
<thead>
<tr>
<th>Section/Control</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Locations</td>
<td>Extract into the same folder where the archive is located</td>
<td>The project archive will be extracted to the same path where the archive is located.</td>
</tr>
<tr>

<td>Extract</td>
<td>Triggering the extraction process. Automation Builder extracts the archive and creates a project from out the archive. After creating the project Automation Builder checks the version of the project. If the project version and the activated Automation Builder version is not identical the workflow is the same as described in &quot;Opening an Existing Project&quot;.</td>
</tr>
<tr>
<td></td>
<td>Cancel</td>
<td>Closing the Extract Project Archive dialog and canceling the extraction process.</td>
</tr>
</tbody>
</table>

6.3.1.2 User and access rights management
6.3.1.2.1 User and access rights

General

The “User Management” provide functions for defining user accounts and configure the access rights within a project. The rights to access project objects via specified actions are assigned only to user groups, not to a single user account. So each user must be member of a group.

User management

With the help of the integrated user management, user groups with different access rights and authorizations can be defined. Configuration and handling of the user management in Automation Builder and a AC500 V3 is decribed in the application note User Management with V3 - Configuration and Handling.
NOTICE!
For security reasons we recommend activating the user administration for the PLC (and the Visualization).

Please note that when user management for the PLC is enabled, the username and password are always required to connect to the PLC.

If you have lost the administrator password, there is no way to recover it and the PLC must be sent in for reset!

Chapter 6.1 “Cyber security” on page 1340

Before setting up users and user groups, notice the following: The configuration of users and groups is done in the Project Settings dialog.

Chapter 6.3.1.2.3 “Project Settings - Users and groups” on page 1413

- Automatically there is always a group "Everyone" and by default primarily each defined user or other groups are members of this group. Thus each user account at least automatically is provided with defined default settings. Group "Everyone" cannot be deleted, just renamed, and no members can be removed from this group.
- Also automatically there is always a group "Owner" containing one user "Owner". Users can be added to or removed from this group, but at least one user must remain. This group also cannot be deleted and always has all access rights. Thus it is not possible to make a project unusable by denying the respective rights to all groups. Both group and user "owner" might be renamed.
- When starting the programming system resp. a project, primarily no user is logged on the project. But then the user optionally might log on via a defined user account with user name and password in order to have a special set of access rights.

Notice that each project has its own user management!

So, for example to get a special set of access rights for a library included in a project, the user must separately log on to this library. Also users and groups, set up in different projects, are not identical even if they have identical names.

CAUTION!
The user passwords are stored irreversibly!
If a password gets lost, the respective user account gets unusable. If the "Owner"-password gets lost, the entire project might get unusable!

Access right management
User management in a project is only useful in combination with the access right management. Notice the following:

- In a new project basically all rights are not yet defined explicitly but set to a default value. This default value usually is: "granted".
- In the further run of working on the project each right can be explicitly granted or denied resp. set back to default. The access right management of a project is done in the Permissions dialog “Permissions” on page 1411.
- Access rights on objects get "inherited". If an object has a "father" object (example: if an action is assigned to a program object, that is inserted in the structure tree below the program, then the program is the "father" of the action object), the current rights of the father automatically will become the default settings of the child. Father-child relations of objects concerning the access rights usually correspond with the relations shown in the POU or Devices tree and are indicated in the Permissions dialog by the syntax "<father object>.<child object>".
Example

Action ACT is assigned to POU object PLC_PRG. So in the POUs window ACT is shown in the objects tree indented below PLC_PRG. In the Permissions dialog ACT is represented by "PLC_PRG.ACT" indicating that PLC_PRG is the "father" of ACT. If the "modify" right would be denied explicitly for PLC_PRG and a certain user group, the default value of the "modify" right for ACT automatically also would be "denied".

6.3.1.2.2 User management commands

The 'User Management UI' plug-in provides commands for command category 'User Management'.

These are used for:

- Configuration of access rights on the project objects
- Logging on or off to/from the project via a defined user account in order to get the access rights which are associated to this account

The configuration of user accounts and groups is done in the “Project Settings” subdialog “User Management” & Chapter 6.3.1.2.3 “Project Settings - Users and groups” on page 1413.

By default the following commands are part of submenu “User Management” in the “Project” menu: “Logon”, “Logoff”, “Permissions”.

Logon

Symbol: ⏩

This command opens the “Logon” dialog for logging on to a project or library via a defined user account.

Logging on with a certain user account means to log on with those object access rights which are granted to the group which the user belongs to. The configuration of user accounts and groups is done in the “Project Settings” subdialog “User Management”.

To log on select the project or an included library from the selection list in the Project/Library field. Enter User name and Password of a valid user account, noticing that each project or library has its own user and access rights management. Log on with OK.

If already another user is logged on the project, this one will be logged out automatically by the new log-on action.

When you are logged on to a project or library and try to perform an action for which you have no right, automatically a Logon dialog will be opened, giving the possibility to log on with another user account provided with the appropriate rights.

The status bar always displays which user currently is logged on the project.

Logoff

Symbol: ⏭

This command logs off the currently logged on user. If no user had been logged on to the currently opened project or to a referenced library an appropriate message will appear when trying to log off.

If the user currently is logged on to more than one project or referenced library (not necessarily with the same user account) a “Logoff” dialog will appear when trying to log off.

From the Project/Library selection list choose those project/library for which you want to log off. The name of the current user is displayed just for information.

The status bar always displays which user currently is logged on the project.

Permissions

This command opens the “Permissions” dialog, where the rights to work on objects or to perform commands in the current project can be configured.
Any changes made in this dialog will be applied immediately.

The Actions window displays all possible rights, that is all actions which might be performed on any object of the current project.

The tree is structured in the following way:

- Top-level see the names of some categories, which have been set up just for the purpose of optical structuring the rights management.
  They are grouping concerning the execution of commands, the configuration of User accounts and Groups, the creation of Object Types, the viewing, editing, removing and handling of child objects of Project Objects.

- Below each category node there are nodes for the particular actions which might be performed on the command, user account, group, object type or project object. These nodes also only have optical function. Possible Actions:
  - execute (execution of a menu command)
  - create (creating a new object in the current project)
  - add or remove children (adding or removing of "child" objects to an existing object)
  - modify (editing an object in an editor)
  - remove (deleting or cutting an object)
  - view (viewing an object in an editor)

Below each action node find the possible targets, that is project objects, of the respective action.

The Permissions window provides a list of all currently available user groups (except the "Owner" group) and a toolbar for configuring rights to a group.

Select the group and configure it’s permissions.

Left to each group name one of the following icons indicates the currently assigned permission concerning the target which is currently selected in the Actions window:

- The action(s) for the target(s) currently selected in the Actions window are granted for the selected group.
- The action(s) for the target(s) currently selected in the Actions window are denied for the selected group.
The right to perform the action(s) which are currently selected for the selected target(s) in the Actions window, has not been granted explicitly, but is granted by default, for example because the corresponding right has been granted to the "father" object. (Example: The group has got the right for object "myplc", thus it by default it also has got it for object "myplc.pb_1". ) Basically this is the default setting for all rights which not explicitly have been configured.

The right to perform the action(s) which are currently selected for the selected target(s) in the Actions window, has not been denied explicitly, but is denied by default, for example in case because the corresponding right has been assigned to the "father" object.

If currently multiple actions are selected in the Actions window, which do not have unique settings referring to the currently selected group, no icon will be displayed.

To configure the rights for a group select the desired action(s) and target in the Actions window and the desired group in the Permissions window. Then use the appropriate button in the toolbar of the Permissions window:

- **Grant**: Explicit granting.
- **Deny**: Explicit denying.
- **Clear**: The currently granted right for the action(s) currently selected in the Actions window will be deleted, that is set back to the default.

### 6.3.1.2.3 Project Settings - Users and groups

#### General

The “Project Settings” dialog in category “Users and Groups” provides three subdialogs for the user management for the current project: Users, Groups, Settings.

- **General description on users and access rights management**

#### Users dialog

The currently registered users are listed in a tree structure. The ownerships of each user is displayed and each user is a member of a group by default.

- **Chapter 6.3.1.2.1 “User and access rights” on page 1409**

#### Define a new user account

1. Click “Add” to open the “Add User” dialog.
2. Define the user credentials and click [OK] to set up the new user. If there are incorrect entries (no login name, password mismatch, user already existing) you will get an appropriate error message.

#### Modify a user account

Click “Edit” to open the “Edit User” dialog. The entry fields are the same as in the “Add User” dialog. The password fields however - for security reasons - will show 32 * characters. After having modified the desired entries close the dialog with [OK] to get applied the new settings.

#### Remove user accounts

Enable the entries to be removed in the Users list and click “Remove”. Note that you will get no further inquiry! An error message appears if you try to delete all users from a group. At least one entry must remain.
Groups dialog

Add a group  The currently available groups are displayed in a tree structure. A member also might be a group.

1. Click “Add” to open the “Add Group” dialog.
2. Define a name for the new group and enable all entries (single users or groups) which should be members of the new group.
3. Click [OK] to set up the new group. If there are incorrect entries (no name defined, group already existing, in Members having selected a group which would cause a "group cycle", you will get an appropriate error message.

Modify a group  Click “Edit” to open the “Edit User” dialog. The entry fields are the same as in the “Add Group” dialog (see above). After having modified the desired entries close the dialog with [OK] to get applied the new settings.

Remove groups  Enable the entries to be removed in the groups tree and click “Remove”. Note that you will get no further inquiry! The members of the deleted groups will remain unmodified. An error message appears if you try to delete the groups “Everyone” and/or “Owner”.

Settings dialog

The following basic options and settings concerning the user accounts can be made:

- “Maximum number of authentication trials”: If activated, the user account will be set invalid after the specified number of trials to log in with a wrong password. If not activated, the number of erroneous trials is unlimited. Default: option activated, number of trials: 3; permissible values: 1-10.
- “Automatically log out after time of inactivity”: If activated, the user account will be logged out automatically after the specified number of minutes of inactivity (no user actions via mouse or keyboard registered in the programming system). Default: option activated, time: 10 minutes; permissible time values: 1-180 minutes.

6.3.1.3 Later change-over of a target system

6.3.1.3.1 Changing the processor module type

General

In a project, you can change the target system by changing the type of processor module or terminal base type. If possible, the device configuration of fieldbuses and interfaces is kept and switched over to the device configuration of the new module.

Target change options:

- between platforms: from V2 platform to V3 platform (and vice versa)
- between module types: from AC500 (standard) to AC500-eCo (and vice versa)
- a combination of changed platform and changed module type

Target change from a V2 processor module to a V3 processor module

Target change options:

- AC500 V2 processor module to AC500 V3 processor module
- AC500 V2 processor module to AC500-eCo V3 processor module
- AC500-eCo V2 processor module to AC500-eCo V3 processor module
- AC500-eCo V2 processor module to AC500 V3 processor module
Procedure:

1. Close CODESYS.

2. Double-click the “PLC_AC500_V2 <...>” node and open the “PM5<...> Hardware” tab.

3. Enable “Change to AC500 V3 PLC” and select the desired V3 processor module from the “PM5xx Type” drop-down list.

4. Click [Create V3 PLC].
   - The new V3 processor module is displayed in the navigation tree.
   - Change the node name of the processor module, if desired.

In case of a target change from AC500-eCo V2 to AC500-eCo V3, the I/O bus and Ethernet configuration is kept.

Target change from a V3 processor module to another V3 processor module

Target change options:
- AC500 V3 processor module to AC500 V3 processor module
- AC500 V3 processor module to AC500-eCo V3 processor module
- AC500-eCo V3 processor module to AC500 V3 processor module
- AC500-eCo V3 processor module to AC500-eCo V3 processor module

Procedure:

1. Close CODESYS.

2. Double-click the “PLC_AC500_V3 <...>” node and open the “PM5<...> Hardware” tab.
3. Select the desired V3 processor module from the “PM5xx Type” drop-down list.

Fig. 269: Change_Hardware_V3
4. Ensure the correct “Terminal Base Type” is selected and click [Change PM / TB type].
   ➜ If possible, the device configurations from the previous processor module will be kept and switched over to the new processor module.

   The device configurations that cannot be kept are listed in a prompted information dialog.

   By default, all device configurations which cannot be switched over will be copied to a “device pool” section in the navigation tree (option “Copy all objects that cannot be added to the new PLC into a device pool for further access”). If required, this backed-up configuration can be used in another project or in another processor module configuration.

   If the checkbox is deactivated all device configurations that cannot be switched will be lost after the execution of the target change.

   **Target change from AC500-eCo V3 to AC500 V3**

   The configuration of the onboard I/Os, the option board slots and the onboard RTC cannot be changed-over to the new module.

   **Target change from AC500 V3 to AC500-eCo V3**

   The configuration of COM1, CAN and the I/O bus cannot be changed-over to the new module. Depending on the selected target, also the I/O bus configuration and ETH2 configuration cannot be switched.

   ETH1 configuration is kept even if the configured protocols are not allowed for the selected AC500-eCo V3 PLC. In this case error messages are displayed in the messages window.
Libraries which are not used anymore are not deleted with the target change. Libraries of option boards are kept in the Library Manager even if no longer available at the target module.

6.3.1.3.2 Customer libraries

CODESYS for AC500 V2 products contains different types of libraries:
- Standard CODESYS libraries
- Specific AC500 libraries
- Customer libraries

In general, the Standard CODESYS libraries and the AC500 libraries are automatically converted during a target change from AC500 V2 to AC500 V3. Those libraries that cannot be converted (e.g. because there is no matching in V3) are created automatically in the V3 Library Manager and must be manually deleted by the user after the target change.

The customer libraries have to be converted manually using the Library Converter integrated into the Automation Builder installation:

1. In Automation Builder click “File ➔ Open project”.
2. Select the CODESYS library for AC500 V2 products which has to be converted.
3. After conversion of the library, open the view POUs in the device navigator and double-click “Project Information”.
4. To have the library automatically available in the V3 project, enter “Company”, “Title” and “Version” in the specific fields of the dialog.

Then, open the “Properties” tab. For the target change the new “Key” “CoDeSysV2Library” has to be added. Under “value”, enter the name of the CODESYS library and click the “Add” button.

![Project Information](image)
Click “File ➔ Save project” and install into the library repository.

6.3.1.4 Firmware identification and update

6.3.1.4.1 General information

Without direct access to the internet, a firmware update with the memory card is also possible.

Chapter 6.3.1.4.5 “Firmware installation and update with memory card” on page 1426

6.3.1.4.2 Device state firmware version

Introduction

As a process participant, whether as a user, machine builder, plant operator or maintenance engineer, it is helpful to be able to see at a glance which component has which firmware version.

If necessary, an error can then be quickly corrected or versions adjusted. The possible ways of displaying the various components are shown below.

- CPU
- Communication modules
- AC500-eCo option boards
- Field devices

CPU firmware

Version query via Automation Builder tab “Version information”

Version information

Information on the firmware versions of the processor modules or communication modules, is provided on the “Version information” tab.

Remarks:

- The “Version information” tab displays the version identified on the device and the version provided with Automation Builder.
- The firmware on the devices must match to the Automation Builder supported versions. It might be required to upgrade or downgrade the current firmware for using the PLC with the current Automation Builder.
- The “Required Version” might contain more than one user selectable version (drop-down list), this is indicated by an asterisk after the file name.
Firmware version on device matches version supplied with Automation Builder.

Firmware version (or type) on device is different from version supplied with Automation Builder. Upgrade/downgrade to version supplied with Automation Builder is recommended.

Only for communication modules if CPU firmware must be updated first. This happens when CPU firmware has version below 2.5.0.0.

Firmware version (or type) on device is different from version supplied with Automation Builder. Upgrade/downgrade to version supplied with Automation Builder is recommended.

Identified device is different from configured device, thus no firmware update is possible. Happens only for Communication Modules.

Firmware of device is not updateable or no newer firmware than the initial version is available.

[Update Firmware] to download the new firmware is only enabled if there is updateable firmware.

Version query via Automation Builder tab “PLC Shell”

The PLC shell is used for requesting specific information from the controller. By entering a device specific command the response is returned in a result window. The PLC shell can be issued without login.

Proceed as follows:
1. Ensure the gateway is configured properly and a connection to the controller can be established.
2. In Automation Builder double-click the PLC node and open the tab “PLC Shell”.
3. Enter versioninfo or rtsinfo in the command line of the tab window. The current firmware versions are listed.

Version query via application

The version information are accessible via the function block PmVersion, production data accessible via function block PmProdReadAsync.

Chapter 6.5.14 “Reference, function blocks” on page 4086
Version query via IP configuration tool

The IP configuration tool is part of Automation Builder and can be called via “Tools → IP-Configuration”.

- Chapter 6.3.2.4.3.2 “Stand-alone installation” on page 1457
- Further information on page 1459

Communication modules

Version query via Automation Builder tab “Version information”

- Chapter 6.3.1.4.2.2.1 “Version query via Automation Builder tab “Version information”” on page 1419

Version query via Automation Builder tab “PLC Shell”

The PLC shell is used for requesting specific information from the controller. By entering a device specific command the response is returned in a result window. The PLC shell can be issued without login.

Proceed as follows:

1. Ensure the gateway is configured properly and a connection to the controller can be established.
2. In Automation Builder double-click the PLC node and open the tab “PLC Shell”.
3. Enter `coupler desc` in the command line of the tab window. The current firmware versions are listed.

Version query via application

The version information are accessible in the property “DeviceInfo” of the module.

AC500-eCo V3 option boards

Version query via Automation Builder tab “Version information”

- Chapter 6.3.1.4.2.2.1 “Version query via Automation Builder tab “Version information”” on page 1419

Version query via Automation Builder tab “PLC Shell”

- Chapter 6.3.1.4.2.2.2 “Version query via Automation Builder tab “PLC Shell”” on page 1420

Version query via application

The version information are accessible in the property “DeviceInfo” of the module.

Field devices

Version query via Automation Builder

The firmware versions of the ABB communication interface devices for PROFINET (CI50x-PNIO) and EtherCAT (CI51x-ETHCAT) is available from the respective editor in online mode in the Automation Builder.
Version query via application

PROFINET, PROFIBUS, EtherCAT, CANopen: According to standard of the corresponding fieldbus protocol.

Version query via IP configuration tool

© Chapter 6.3.1.4.2.2.4 “Version query via IP configuration tool” on page 1421

Only for Ethernet-based fieldbuses!

6.3.1.4.3 Installation and update of the AC500 V3 firmware

The multi download tool can be used to update multiple PLCs with firmware or an application at the same time.

© Chapter 6.6.4 “Multi download tool” on page 4306

Firmware update with activated user management

The PLC user management will remain also after a firmware update or downgrade.

Due to a structural change in the PLC user management in firmware version 3.5 there are some limitations when updating the PLC firmware from a version 3.4 or lower to 3.5 or higher with activated user management.

If you update the PLC firmware from version 3.4 or lower to version 3.6 or higher this must be done in two steps. First an update to 3.5 must be done via Automation Builder. Afterwards the firmware can be updated to any later firmware version – either via Automation Builder or via memory card.

The PLC firmware can be updated via Automation Builder.

This is also necessary for commissioning V3 CPUs.

A very new CPU has no pre-installed firmware. To guarantee the authenticity of delivered AC500 firmware, V3 CPUs are delivered with a boot loader only. You need to download a valid firmware to the CPU. After download, the functionality of the CPU is given.

- An Automation Builder project with an AC500 V3 CPU is open.
- CPU is in "stop" mode or shows uPdAtE (update) on the display.
- After update the CPU shows either donE or StoP on the display.
For new modules: IP address is set. (The default IP address is 192.168.0.10)

1. Double-click CPU “PLC_AC500_V3”.

2. Select “Version information”.

3. Select “Update Firmware”.
   - While the update process is running, the RUN and ERR LEDs are toggling, i.e., they are flashing alternating.

4. Wait for the PLC to finish the update.

---

Firmware updates that include “UpdateFW” changes must be performed in two steps:

First, the “UpdateFW” is updated, and once this is done click the update button again to execute the “SystemFW” update.

Note: Firmware updates via memory card automatically cover both updates in one step.

A completed update is indicated by a message on the display. Either done, or Stop.

---

NOTICE!

Do not disconnect the power supply during the update process! The PLC could be damaged.

- **Stop** indicates a restart has been performed by the CPU. When done is displayed sometimes it is necessary to re-boot the CPU manually, e.g., by powering-off. Manual re-boot might be, e.g., for some older CPU versions or if downgrading to an older firmware version according to application settings.

The CPU display shows **Stop** after re-boot. The update process is finished.
5. If necessary, refresh the version information by switching to another tab and back.

⇒ Successful firmware update:

</table>

6.3.1.4.4 AC500-eCo V3 firmware installation and update

The multi download tool can be used to update multiple PLCs with firmware or an application at the same time.

⇒ Chapter 6.6.4 “Multi download tool” on page 4306
The PLC firmware can be updated via Automation Builder.

This is also necessary for commissioning AC500-eCo V3 CPUs.

A very new CPU has no pre-installed firmware. To guarantee the authenticity of delivered AC500-eCo firmware, V3 CPUs are delivered with a boot loader only. You need to download a valid firmware to the CPU. After download, the functionality of the CPU is given.

- An Automation Builder project with an AC500-eCo V3 CPU is open.
- CPU is in "stop" mode without firmware.
- The power LED is ON.
- For new modules: IP address is set. (The default IP address is 192.168.0.10)

1. Double-click CPU “PLC_AC500_V3”.
2. Select “Version information”.

3. Select [Update Firmware].
   - While the update process is running, the RUN and ERR LEDs are toggling, i.e., they are flashing alternating.
4. Wait for the PLC to finish the update.

NOTICE!
Do not disconnect the power supply during the update process! The PLC could be damaged.
5. If necessary, refresh the version information by switching to another tab and back.

Successful firmware update:

- CPU without firmware, only the power LED is on.
- While the firmware update process is running, the RUN and ERR LEDs are toggling, i.e., they are flashing alternating.

<table>
<thead>
<tr>
<th>LED</th>
<th>LED flashes</th>
<th>Status</th>

<td>Update pending</td>
</tr>
<tr>
<td>RUN</td>
<td>Flashing slow</td>
<td>Done successful</td>
</tr>
<tr>
<td>ERR</td>
<td>Flashing slow</td>
<td>Done failed</td>
</tr>
</tbody>
</table>

- CPU with installed firmware, only the power LED is on.
- If the CPU is running, then the RUN LED is on.
- If the CPU is in STOP mode, the RUN LED is off.

6.3.1.4.5 Firmware installation and update with memory card

General

The memory card is a removable persistent mass storage device and can be used for any application purpose. Both firmware updates and boot project updates can be run from the memory card.

**NOTICE!**

**Removal of the memory card**

Do not remove the memory card when it is working. For memory card activity the black square ( ) is shown on PLC display as long as a file is open on the memory card. Remove the memory card only when no black square ( ) is shown next to memory card in the display. Otherwise the memory card and/or files on it might get corrupted and/or normal PLC operation might be disturbed.
Firmware and/or application installation and update

Notes

ABB recommends that users carry out the firmware update via Automation Builder. Chapter 6.3.1.4 “Firmware identification and update” on page 1419

Not every user has an Automation Builder at his disposal with which a firmware or boot project update can be easily realized. In this case, the user must be provided with a prepared memory card from his client.

It is not possible to update the communication interface modules with a memory card. The firmware of the communication interface modules can only be updated with the IP configuration tool.

Firmware update with activated user management

The PLC user management will remain also after a firmware update or downgrade.

Due to a structural change in the PLC user management in firmware version 3.5 there are some limitations when updating the PLC firmware from a version 3.4 or lower to 3.5 or higher with activated user management.

If you update the PLC firmware from version 3.4 or lower to version 3.5 this must be done via Automation Builder. An update via memory card with activated user management will result in losing all access rights to the PLC.

If you update the PLC firmware from version 3.4 or lower to version 3.6 or higher this must be done in two steps. First an update to 3.5 must be done via Automation Builder. Afterwards the firmware can be updated to any later firmware version – either via Automation Builder or via memory card.

Chapter 6.3.1.4.3 “Installation and update of the AC500 V3 firmware” on page 1422

Preparation of memory card

MC5141 - memory card
MC5102 - micro memory card with adapter

Firmware packages can be downloaded from ABB website or exported from Automation Builder.

In Automation Builder, you can choose if you want to export the firmware only or, in addition, the boot project as well. If the boot project does not exist yet, it will be created automatically.

The memory card will contain the firmware of the PLC, the firmware of the communication modules, the application, the visualizations and all related objects (like text lists).
Fig. 270: Example

1. Right-click “Application” in the device tree.
2. Select “Export ➔ Boot project and firmware” or “Export ➔ Firmware”.
3. Choose a location for the export folder.
   Select [Make New Folder] and type in "MEMORY CARD".
4. Select [OK] to add the folder.
5. Select folder "MEMORY CARD".

The "MEMORY CARD" structure has been created and the firmware and application have been exported.

The created "MEMORY CARD" folder does not contain user data, remanent data, config data, safety PLC power dip data and safety PLC password.

Add this data if required by the used application.

6. Copy all subfolders and files of the "MEMORY CARD" folder to a memory card.

The copy process can be performed with the Automation Builder software with the memory card inserted in the processor module or with the PC with a suitable memory card slot.

1. Insert memory card into the processor module.
2. Connect the PC to the processor module with an Ethernet cable.
3. In Automation Builder, log-in to the processor module.
4. Double-click on the processor module in the device tree and select "Files".
5. On the right side, select and open the folder "sdcard".
6. On the left side, select all the subfolders and files of the MEMORY CARD folder, but not the folder itself.
7. Copy all selected subfolders and files from the left side to the memory card by clicking to the right side.

**Copy process on the PC**

1. Insert the memory card into the PC.

2. Mark all subfolders and files of the "MEMORY CARD" folder, but not the "MEMORY CARD" folder itself, and copy them.

3. Select the memory card and paste the copied subfolders and files.

**Execution of update via memory card**

- **Boot project and firmware update**
  - Precondition: Prepared memory card with boot project and firmware

  1. Switch off the device.
  2. Insert the memory card.
3. Switch on the device.
   ⇨ The alternate flashing of the RUN and the ERR LED indicates the running update process.
   At the end of the update process a reboot is executed and the boot project and system firmware is started for the finishing of the update process.
   If RUN LED blinks (ERR LED is off), the update was successful and the display shows “done”.
   If ERR LED blinks (RUN LED is off), the update failed and the display shows “FAIL”.
   The text file “SDCARD.RDY” includes the results of the different updates. If the update fails, the file contains the reasons for the abort. Based on this, further steps can be taken to fix the problem.

4. Switch off the device.
5. Remove the memory card.
6. Switch on the device.
   ⇨ The system starts with the new boot project and firmware.

Firmware update

 Preconditions: Prepared memory card with boot project and firmware ⇨ Chapter 6.3.1.4.5.2.2 “Preparation of memory card” on page 1427.
1. Switch off the device.
2. Insert the memory card.
3. Switch on the device.
   ⇨ The alternate flashing of the RUN and the ERR LED indicates the running update process.
   At the end of the update process a reboot is executed and the system firmware is started for the finishing of the update process.
   If RUN LED blinks (ERR LED is off), the update was successful and the display shows “done”.
   If ERR LED blinks (RUN LED is off), the update failed and the display shows “FAIL”.
   The text file “SDCARD.RDY” includes the results of the different updates. If the update fails, the file contains the reasons for the abort. Based on this, further steps can be taken to fix the problem.

4. Switch off the device.
5. Remove the memory card.
6. Switch on the device.
   ⇨ The system starts with the new firmware.

Description of LEDs

The LEDs below the display indicate the state of the processor module:
### LED States and Colors

</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>To enforce boot mode 1, keep the RUN function key pressed during the boot procedure. In this case, the Run LED flashes slowly (1 Hz). A subsequent project download (from within Automation Builder) cancels the blinking.</td>
</tr>
<tr>
<td>Error LED (ERR)</td>
<td>Denotes an error</td>
<td>Red</td>
<td>An error has occurred.</td>
<td>No errors or only warnings have occurred.</td>
<td>If the Error LED flashes slowly (1 Hz) a firmware update from the memory card is finished with errors.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>If the Error LED flashes fast with AC500 on display a fatal system error has occurred.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>If the Error LED flashes fast (4 Hz) alternating with a flashing Run LED the firmware is updated.</td>
</tr>
</tbody>
</table>

A running processor module is indicated with the state RUN on the display, a deactivated processor module is indicated with the state STOP. In both cases the display's backlight is off.

### Advanced Memory Card Handling for Firmware/Application Update

**Memory card file content: Firmware version V3.x**

Only advanced users should apply the instructions in this chapter.

### General Update Process

*Chapter 6.3.1.4.3 “Installation and update of the AC500 V3 firmware” on page 1422*

The main components of the V3 CPU firmware are:

- **BootFW** (boot firmware): responsible for the starting of the UpdateFW or the SystemFW
- **UpdateFW** (update firmware): responsible for the update of BootFW, UpdateFW, SystemFW, UpdateHook and boot project
- **SystemFW** (system firmware, CPUFW): Runtime system of the PLC, additionally responsible for the update of the DisplayFW (display firmware) and the firmware of the communication module
- **DisplayFW** (display firmware): Firmware of the display
Additionally the update process includes the following parts:

- Communication module (communication module firmware): Firmware of the different communication module
- UpdateHook: Specific patches for the PLC
- UserProgram: Boot project of the application
- License features: Import and export of license files. The license file for the "ImportLicense" is a Wbb or a WibuCmRaU file. The license file of the "ExportLicense" is a WibuCmRaC file.

The firmware updates are triggered by the command file `SDCARD.INI`. In addition a result file of the firmware update is generated (`SDCARD.RDY`, identical path as `SDCARD.INI`). For the group [FirmwareUpdate] the parameters 0, 11, 12 and 13 are defined. For each firmware update two files are necessary. The firmware file and the corresponding signature file.

For example:

```
AC500_V3_SystemFirmware_V3.0.1.73.tar.bz2
AC500_V3_SystemFirmware_V3.0.1.73.tar.bz2.sig
AC500_V3_DisplayFirmware_V3.0.0.0.app
AC500_V3_DisplayFirmware_V3.0.0.0.app.sig
```

For the user program the application file and the application CRC are necessary. For example:

```
Application.app
Application.crc
```

If the signature file and the firmware file do not match, no update is performed and the correspondent error result is written to the file `SDCARD.RDY`.

If the update firmware is running the display shows the text `update`. The blinking of the RUN and the ERR LED’s indicates the update process.

The file “SDCARD.RDY” includes the results of the different updates. After an update of a communication module CODESYS Control is started in safe mode (no download or starting of the application is possible) and the PLC needs a reboot (power down/up; the display shows please and reboot alternately).

As of system firmware 3.2 the compatibility file "Version.txt" (with the corresponding signature file "Version.txt.sig", identical path as "SDCARD.INI") is necessary for the update process. The update firmware checked the compatibility of the following parts:

- CPUFW (system firmware)
- BootFW (boot firmware)
- UpdateFW (update firmware)
- DisplayFW (display firmware)

A missing "Version.txt" or a missing/corrupt "Version.txt.sig" file is signalled at the component "CPUFW" (file "SDCARD.RDY").

If the update process would result in incompatible parts of firmware no update is performed in the update firmware. After starting of the system firmware the compatibility of the communication module firmware is checked additionally. The check of the compatibility of the firmware is executed always (independent of the parameter for the component). Incompatibility is signalled at the corresponding component (file SDCARD.RDY”).

As of system firmware 3.2 the compatibility file "Version.txt" (with the corresponding signature file "Version.txt.sig", identical path as "SDCARD.INI") is necessary for the update process. The update firmware checked the compatibility of the following parts:

- CPUFW (system firmware)
- BootFW (boot firmware)
- UpdateFW (update firmware)
- DisplayFW (display firmware)

A missing "Version.txt" or a missing/corrupt "Version.txt.sig" file is signalled at the component "CPUFW" (file "SDCARD.RDY").

If the update process would result in incompatible parts of firmware no update is performed in the update firmware. After starting of the system firmware the compatibility of the communication module firmware is checked additionally. The check of the compatibility of the firmware is executed always (independent of the parameter for the component). Incompatibility is signalled at the corresponding component (file SDCARD.RDY”).

If a firmware or boot application update is currently being performed via an memory card, the PLC will wait for the user. To remove the memory card and do a power cycle for completing the update process.

In the case of an unattended remote update via memory card, this is an obstacle because there may be no one on site to perform the power cycle. To avoid this situation, additional options have been added to SDCARD.ini to enable an unattended automatic restart when entering RTS safe mode after a successful firmware or boot project update.

Automated reboot of the PLC

If a firmware or boot application update is currently being performed via an memory card, the PLC will wait for the user. To remove the memory card and do a power cycle for completing the update process.

In the case of an unattended remote update via memory card, this is an obstacle because there may be no one on site to perform the power cycle. To avoid this situation, additional options have been added to SDCARD.ini to enable an unattended automatic restart when entering RTS safe mode after a successful firmware or boot project update.
The changes are an optional behavior that is triggered by the user setting in SDCARD.ini! The default behavior (RTS stays in safe mode until manual power cycle) is maintained!

The “FunctionOfCard” is reset from (4-6) to 0 after the update. Which means after a successful update operation the memory card cannot be used for updating another PLC without manual modification of the “FunctionOfCard”.

The intended use case is for the memory card to always remain in the respective PLC to be used as mass storage and for the unattended update.

In case of changed boot parameters, an additional reboot is required. This additional reboot is never done automatically and therefore it has to be done manually.

Command file SDCARD.ini for AC500 V3 Products

Only advanced users should apply the instructions in this chapter.

6.3.1.4.6 Update CI52x-Modbus firmware

Precondition

Requirement: A firmware update file is available, e.g. AC500_CI52x_Firmware_V3.2.8.bin.

The CI52x Modbus firmware update is only available in the Automation Builder IP Configuration Tool.

Installation of the IP configuration tool

1. In Automation Builder click “Tools ➔ Installation Manager” to start the Installation Manager.
2. Close any other running instances of Automation Builder. Then, click “Modify” in the Installation Manager.
3. Select the option “IP Configuration Tool” from the list and start the installation of the IP Configuration Tool.

Firmware update procedure

1. In the IP Configuration Tool click “Scan” to initialize a device scan.
2. From the list select the CI52x-MODTCP device(s) which shall be updated and click “FW Update”.

2024/01/05 3ADR010583, 1, en_US 1437
3. Select the firmware update file (e.g. AC500_CI52x_Firmware_V3.2.8.bin) to initialize a signature check and start the update procedure.

   *During the firmware update the operation of the device(s) is stopped. After the update, all outputs are set to zero.*

4. After the update, click “Scan” again to retrieve the firmware version of the device.

### Troubleshooting

<td>CI firmware update failed</td>
<td>General hints:</td>
<td>Close all unused applications on the update PC and do not open Automation Builder or any other applications during the firmware update. Stop the communication between AC500 PLC and the CI52x devices and disconnect the Ethernet connection of the update PC and the CI Modbus device(s). Do not close the IP Configuration Tool during a firmware update and do not switch off a CI Modbus device during the firmware update. Locate the PC on which the update is performed as near as possible to the stationed CI Modbus devices. Avoid network switches.</td>
</tr>
<tr>
<td>Error 1: Package Timeout</td>
<td>Due to a primitive firmware update protocol a fast and stable network connection is required. Otherwise the update packages cannot be transferred within the requested time and a timeout occurs.</td>
<td>Locate the PC on which the update is performed as near as possible to the stationed CI Modbus devices. Avoid network switches.</td>
</tr>
<tr>
<td>Error 2: Unable to read device status</td>
<td>After the firmware update the IP Configuration Tool reads out the status of the updated device in order to check if the update was successful.</td>
<td>Rescan and repeat the update. If this doesn’t work, power cycle the device and retry the update.</td>
</tr>
<tr>
<td>Error 3: IP is not unique</td>
<td>If more than one device hold the same IP address, a firmware update is not possible as the update command is IP based.</td>
<td>Correct the IP address, rescan and repeat the update. If this doesn’t work, power cycle the device and retry the update.</td>
</tr>
<tr>
<td>Error 4: Internal Error</td>
<td>An internal error on the CI52x Modbus device occurred during the firmware update.</td>
<td>Rescan and repeat the update. If this doesn’t work, power cycle the device and retry the update.</td>
</tr>
<tr>
<td>Error 5: Cannot connect to device</td>
<td>The TCP communication is not sufficient for a connection. Increase the connection quality.</td>
<td>Locate the PC on which the update is performed as near as possible to the stationed CI Modbus devices. Avoid network switches.</td>
</tr>
<tr>
<td>Signatur check failed</td>
<td>After the selection of the firmware file (*.bin) a signature check is performed. If either the firmware file or the signature file is corrupt, the signature check fails.</td>
<td>Example file names: Name of the firmware file: c:\AC500\AC500_CI52x_Firmware_V3.2.8.bin Correct name of the signature file: c:\AC500\AC500_CI52x_Firmware_V3.2.8.bin.sig Wrong name of the signature file: c:\AC500\AC500_CI52x_Firmware_V3.2.8.sig</td>
</tr>

</table>
### Fault description

<table>
<thead>
<tr>
<th>Fault Description</th>
<th>Cause</th>
<th>Remedy</th>
</tr>
</thead>
</table>
| Indeterminate device firmware version  | If the firmware version of the device cannot be determined, an error occurs. | Example: Result OK  
- PC: 192.168.14.71 / 255.255.255.0  
- Device: 192.168.14.10 / 255.255.255.0  
Example: Result OK  
- PC: 192.168.10.71 / 255.255.0.0  
- Device: 192.168.14.10 / 255.255.0.0  
Example: Result ERROR  
- PC: 192.168.10.71 / 255.255.255.0  
- Device: 192.168.14.10 / 255.255.255.0 |

### 6.3.1.5 Migration of third party devices

After an update of Automation Builder the device repository contains only ABB devices. The third party devices which were installed into previous versions of Automation Builder are not automatically installed in the newest version profile. This has to be triggered by the user.

The feature “Migrate third party devices” is available as of Automation Builder 2.1.1.

1. Click “Tools” in the main menu of Automation Builder.
2. Click “Migrate third party devices” in the drop-down list.
   - The window “Version profile selection” appears.
3. Select a version profile in the drop-down list containing previous Automation Builder / Control Builder Plus profiles. The active profile does not appear in the list.

⇒ After selection of a previous version profile, all the third party devices which have been installed inside this version profile are listed.

It is not possible to select or deselect some third party devices. Importing will affect all the third party devices which are listed in the list view.
4. Select [Import].

During the migration the message window displays success or failure of device migration.

In case of failure during the migration the affected third party device description has to be installed manually via main menu “Tools ➔ Device Repository ➔ Install”.

In the status bar, the third party device which is on “Migrating: <...>” is displayed on the left side.

The import operation can be cancelled by clicking the “Click here to CANCEL this operation” link on the right side of the status bar. This becomes effective when the migration of the just migrating third party device is finished.

5. To close the dialog select the [Close] button of the Version profile selection.

6.3.1.6 Advanced IO device handling

6.3.1.6.1 General

Automation Builder provides the Advanced IO Device Handling feature for configuring identical IO device types at multiple instances.

This feature is supported by the following commands that works with IO devices only.

- Generate DUT
  - Chapter 6.3.1.6.2 “Generating DUT” on page 1442
- Map to Existing DUT
  - Chapter 6.3.1.6.3 “Mapping to existing DUT” on page 1442
- Release DUT mapping
  - Chapter 6.3.1.6.4 “Releasing DUT mapping” on page 1442

These commands work on individual nodes and on CI level nodes.
6.3.1.6.2 Generating DUT
Each device generates two DUTs. One for the input and one for the output. Some devices contain only input or output type. In such cases, the device generates only one DUT of the relevant type.

- Right-click on the desired IO device and select “Generate DUT” to generate a DUT for an IO device.

The following example shows how to generate DUTs at CI level node.

- In the device tree, right-click on a master node such as PNIO_Controller and select “Generate DUT” to create DUTs for the child nodes.
- The DUTs of child nodes are generated in “Application ➔ App ➔ IO_Device_Generated_Items” folder.
- Generated DUT considers channels with BYTE datatype as members. If channels with BYTE datatype are not present in the given hierarchy, it adds the members with another higher datatype.
- Channels with BOOL datatype are not considered.

6.3.1.6.3 Mapping to existing DUT
This command is enabled for the IO device when the IO device is not mapped and when DUTs of matching size (calculated based on device channel list) are available in “Application ➔ App ➔ IO_Device_Generated_Items” folder.

1. Right-click on an IO device and select “Map to Existing DUT”:
   - Enter Instance Name dialog is displayed.
2. Enter the instance name which satisfies IEC naming validations and unique name in global scope.
3. Click [OK] to create a global variable associated with the mappings in DI (PRG).
   - If you want to view mapped instances, double-click “DI (PRG)”.

With the “Map to Existing DUT” command:

- Any device can be mapped only to one input DUT and one output DUT. If you have already mapped an input DUT, only the output DUT is shown in the options list and vice-versa.
- Mapping is also supported at CI level nodes. To create global variables for CI level nodes, the address of the first child is considered.

6.3.1.6.4 Releasing DUT mapping
This command is enabled on an IO device only when an IO device is mapped either to input, output or both DUTs. You can use this command to release (or revert) mappings and to delete global variables created during ’Map to Existing DUT’.

Right-click on an IO device and select “Release DUT Mapping”. The mapped DUT instance is deleted.

6.3.1.6.5 Using DUT variables in CODESYS application
1. In the Automation Builder project, double-click “Application” to launch CODESYS application.
   - CODESYS application is launched. CODESYS application contains mapped DUT instances.
2. Double-click “PLC_PRG” to create DUT variables.
3. Add DUT variables based on mapped DUTs.
For further information on mapping DUTs, see section “Chapter 6.3.1.6.3 ‘Mapping to existing DUT’” on page 1442.

For example, in the PLC_PRG, add analog I/O and digital I/O. If you insert a dot at a position where an identifier should be inserted, then a selection list is open, offering all the input and output variables which are found in the project.

After adding DUT variables, rebuild the program in CODESYS application using “Project ➔ Rebuild”.

6.3.1.6.6 Support for CI level node

The user can create DUTs for the entire hierarchy of CI level node (for example, IO_BUS), by right-clicking on the desired CI level node and by selecting “Generate DUT”. Further, all the DUTs are generated in “Application ➔ App ➔ IO_Device_Generated_Items” folder.

- The command generates DUT for the node itself and also for all child nodes.
- The DUT generated for the CI level node contains generated DUTs for the child nodes as their members.
- For every execution, the command checks, if any new child node is added and generates DUT.

If you delete child nodes in CI level node (for example, IO_BUS), the DUTs generated for these child nodes are not deleted automatically. You should delete the DUTs manually in the “Application ➔ App ➔ IO_Device_Generated_Items” folder if desired.

6.3.1.6.7 Configuration check

Configuration check for size is enabled to ensure that all devices are mapped with DUTs of the correct size. In case of any changes in the mapped DUT, configuration check verifies the size of the DUT. If it fails, an error message is displayed in Automation Builder messages window and does not allow to launch the application. This check can be performed in “Create configuration data”.

6.3.1.6.8 Flexible Configuration

For improved maintenance AC500 V3 PLCs provide the functionality to handle several S500 devices with a flexible configuration. The application example AC500 V3 - Flexible Configuration demonstrates how to configure a flexible configuration scenario in AC500 V3 PLCs.

6.3.2 PLC devices and components

6.3.2.1 Device repository

The Device Repository of Automation Builder manages the pool of devices that can be used in the PLC configuration.

You install or uninstall devices in the “Device Repository” dialog box. The system installs a device by reading the device description files, which define the device properties for configurability, programmability, and possible connections to other devices.

You can use the devices provided in the device repository by adding them to the device tree of your project.
Dialog device repository

1. Click “Tools ➔ Device Repository”.
   ⇒ The “Device Repository” dialog box opens.

   [Edit Locations]: Changes the default repository location. The devices can be managed at different locations.
   [Install] / [Uninstall]: Installs or uninstalls devices.
   [Renew device repository]: Updates the device list, e.g. after uninstallation of a device.
   [Details]: Provides technical details on the selected device.

2. Select the install location. “System Repository” is set by default.

Installing devices

The device repository cannot be changed manually, e.g. by copying or deleting files. Use always the “Device Repository” dialog to add or remove devices.
1. Click [Install] and select the appropriate file format.
   ⇒ The “Install Device Description” dialog box opens.

2. Select the file path of the device description.
3. Select the file type filter of the required device description.
   ⇒ All device descriptions of the selected file type are listed.
4. Select the required device description and click [Open].
   ⇒ Automation Builder adds the device description to the matching category of your device repository.
   If errors occur during installation (for example, missing files that are referenced by the device description), then Automation Builder displays them in the lower part of the “Device Repository” dialog box.

During the installation the device description files and all additional files referenced by that description will be copied to an internal location. Altering the original files will have no further effects to an internal location.

The changes take only effect after reinstalling the corresponding device(s).

The version number shown in the information section of the device should be verified.

Uninstalling devices

Select the device you want to remove and click [Uninstall].
The device is removed from the list.

Uninstalled devices which are used in existing projects are indicated by the symbol 📣. The device will not be configured properly.
6.3.2.2  PLC start-up
6.3.2.2.1  Initialization of AC500 V3 CPU

To initialize an AC500 V3 CPU, you need to download the firmware. A new CPU has no pre-installed firmware, it is delivered with a boot loader only. You need to download a valid firmware to the CPU. See Chapter 6.3.1.4.3 “Installation and update of the AC500 V3 firmware” on page 1422. After download, the functionality of the CPU is given.

6.3.2.2.2  PLC runtime licensing

Introduction

The use of some libraries and devices require the PLC to have a runtime license. If you have purchased such a license, activate the license.

Chapter 6.3.2.2.2.2 “Activating a runtime license via license key” on page 1446

If you want to test device functionality or library features in advance, you can activate a demo license in advance.

Chapter 6.3.2.2.3 “Activating a demo license” on page 1450

The license status of a PLC can be displayed at any time.

Chapter 6.3.2.2.2.6 “View license information” on page 1453

Activating a runtime license

The linked application note provides step-by-step instructions on how to activate the runtime license for the PLC.

AC500 V3 Activating a runtime license

Activating a runtime license via license key

General

The use of some libraries and devices require the PLC to have a runtime license.

☐ PC and PLC are connected. In case of no connection, perform the activation via memory card Chapter 6.3.2.2.2.4 “Licensing via memory card” on page 1450.

☐ There is a connection to the Internet. In case of no connection, perform the activation on another PC with internet connection Chapter 6.3.2.2.2.2 “Activation without internet connection” on page 1447.

1. Right-click on the PLC and select “PLC runtime licensing” from the “Runtime Licensing” menu.
   ➔ A wizard starts. Follow the instructions.

2. Enter the license activation key and select “Next” to finish the licensing procedure.
   ➔ The license is activated on the PLC device.

   If the license shall be used on another PLC device, the installed license can be returned Chapter 6.3.2.2.2.5 “Returning a license” on page 1452.
Activation without internet connection

1. If an error occurs when communicating with the ABB license server, or if Automation Builder is running on a PC without internet connection, then it is possible to manually complete the ABB license server interaction by using another PC (with internet connection).

2. In the error dialog select [Next] and save the license activation request file to a storage location the other PC can access, e.g. a file share.
3. In the dialog the web address of the ABB license server is displayed (http://lc.codemeter.com/32838/depot/index.php). From the PC with internet connection, upload the license activation request file.

4. After the upload, download and save the license activation file from the ABB license server. Transfer this file to the PC without Internet connection.

5. Select [Next] to continue the license activation process. Click [Cancel] to continue the license activation process at a later time. Further information on page 1449.
6. Select [Browse] and select the license activation file (*.WibuCmRaU) from the defined storage location.
   - The license is validated by the ABB license server and afterwards activated on the PLC device.
   - If the license shall be used on another PLC device, the installed license can be returned
     \(\Rightarrow\) Chapter 6.3.2.2.2.5 “Returning a license” on page 1452.

7. To complete the licensing process, a license receipt file must be uploaded to the ABB license server.
   - Save the license receipt file and upload it manually from a PC with internet connection to
     \(\text{http://lc.codemeter.com/32838/depot/index.php}\).
   - A license confirmation is returned.

**Offline activation**

If the runtime licensing process was closed between saving the license activation request file and obtaining the license activation file from the ABB license server, perform an offline activation:

1. Right-click on the PLC node and select “PLC runtime licensing” from the “Runtime Licensing” menu.
   - A wizard starts. Follow the instructions.

2. Select the option “Complete offline licensing process”.

3. Select [Browse] and select the license activation file (*.WibuCmRaU) from the defined storage location.
   - The license is activated on the PLC device.
   - If the license shall be used on another PLC device, the installed license can be returned
     \(\Rightarrow\) Chapter 6.3.2.2.2.5 “Returning a license” on page 1452.

4. To complete the licensing process, a license receipt file must be uploaded to the ABB license server.
   - Save the license receipt file and upload it manually from a PC with internet connection to
     \(\text{http://lc.codemeter.com/32838/depot/index.php}\).
   - A license confirmation is returned.
Activating a demo license

It is possible to try out device features or library features by using a demo license on the PLC. With this, you can use the features for a limited time period.

- PC and PLC device are connected. In case of no connection, perform the activation via memory card ⇒ Chapter 6.3.2.2.4 “Licensing via memory card” on page 1450.
- There is a connection to the Internet. In case of no connection, perform the activation on another PC with Internet connection ⇒ Chapter 6.3.2.2.2.2 “Activation without internet connection” on page 1447.

1. Right-click on the PLC node and select “PLC runtime licensing” from the “Runtime Licensing” menu.
   ⇒ A wizard is started. Follow the instructions.
2. Select the option “Create a demo license” and click [Next] to finish the licensing procedure.
   ⇒ The demo license is validated by the ABB license server and afterwards activated on the PLC device.

The demo license is valid for all licensed features and the duration of the demo license is 10 days PLC in run.

As it is a demo license, there is no grace period after expiration (product licenses do not have an expiration date).

The demo license can be extended any numbers of times. After expiration, the PLC will not switch back to run mode until a new license is activated or the features requiring a runtime license are removed from the PLC application.

For AC500 V3 it is visible on the display, if the PLC is running on demo license.

Licensing via memory card

Wibu memory card

NOTICE!
After removing a Wibu memory card (which holds the AC500 runtime license), the PLC system moves into 'Stop' mode after 24 h.
Ensure to insert the Wibu memory card at the time.

The Wibu memory card is different from the "normal" memory card that is required in the following section. The Wibu memory card is an external product that allows you to use the runtime license on different PLCs if you have several PLCs. Please note the notice at the beginning of the chapter.

When you have no connection between your PC and the PLC device the licensing procedure can be done via a memory card.

On the PC:
Create a license request

- There is a connection to the internet.
- The memory card can be used with AC500 V3 products.
NOTICE!
If a SDCard.ini file is stored on the memory card, the file will be overwritten.

1. Place the memory card in the PC.
2. Right-click on the PLC node and select “Prepare PLC license SD memory card” from the “Runtime Licensing” menu.
3. From the file system select the root folder of the memory card.
   ➨ A success message is displayed when the creation of the memory card files is completed.
   The license request files are stored to the selected folder.

On the PLC:
Transfer the license data

1. Insert the memory card into the PLC device and reboot the PLC.
   ➨ When the license request file is successfully created by the PLC, “done” is shown on the display of the PLC.
2. Remove the memory card from the PLC.

On the PC:
Enter the license activation key

1. Place the memory card into the PC.
2. Open the PLC project in Automation Builder. Ensure the PLC is logged out.
3. Right-click on the PLC node and select “PLC runtime licensing” from the “Runtime Licensing” menu.
   ➨ A wizard is started. Follow the instructions.
4. Enter the license activation key.
5. From the filesystem, select the root folder of the memory card.
   ➨ The previously created license request files are sent to the ABB license server. A license activation is created on the memory card.
6. Remove the memory card from the PC.

On the PLC:
Complete license activation for the PLC

1. Insert the memory card into the PLC device and reboot the PLC.
   ➨ “done” is displayed on the PLC if license activation was successful.
2. Remove the memory card from the PLC.
Trying to activate a runtime license, that has already been activated (e.g. via an online connection), will result in following error in the sdcard.rdy file:

;Result of license file import
ImportLicense=13;Internal Error (1)

For this action, internet connection is required.

To complete the licensing process, the license receipt file must be uploaded to the ABB license server.

1. Place the memory card into the PC.

The license receipt on the memory card is located in the subfolder license

⇒ A license confirmation is returned.

Returning a license

NOTICE!
After returning a AC500 runtime license, the PLC system moves into “Stop” mode after 24 h.

Returning a license without memory card

A license which has been installed on a PLC device can be returned and installed on another PLC device.

☐ PC and PLC device are connected. In case of no connection, perform the activation via memory card ⇒ “Returning a license via memory card” on page 1452.
1. Right-click on the PLC node and select “Return active license” from the “Runtime Licensing” menu.
   ⇒ A wizard is started. Follow the instructions.
2. Enter the license activation key and click “Return license”.
   ⇒ The results of the return process will be displayed in the dialog.
   The license from the PLC device is removed and can be used now for another PLC device.

Returning a license via memory card

When the PLC is not connected to the PC (PLC logged out) it is possible to return a license via memory card.
1. Insert the memory card in the PC and execute “Runtime Licensing ➔ Prepare PLC license SD card” on the PLC node.
2. Place the memory card into the PLC.
3. Perform “power cycle” after a successful update reboot the PLC and connect to the PLC.
   ➔ The License is removed from the PLC.
4. Place the memory card into the PC.
5. Right-click on the PLC node and select “Return active license” from the “Runtime Licensing” menu.
   ➔ A wizard is started. Follow the instructions.
6. Enter the license activation key and click “Return license”.

7. Click [Browse] and select the root folder of the memory card.
   ➔ Returning of the license is started.
8. Place the memory card in the PLC device and reboot the PLC.
   ➔ The license from the PLC device is removed and can be used now for another PLC device.
9. To complete the licensing process, a license receipt file must be uploaded to the ABB license server.
   Save the license receipt file and upload it manually from a PC with internet connection to http://lc.codemeter.com/32838/depot/index.php.
   ➔ A license confirmation is returned.

View license information

To view the license information of AC500 V3 products:
1. In the Automation Builder device tree double-click on the PLC node.  
   ⇒ The PLC tab is opened.

2. In the PLC tab select “License Information”.

   ⇒ The project is scanned for required licenses.
   If you are logged into a PLC, then the licenses available on the PLC are displayed.
   Missing required licenses are highlighted.
6.3.2.2.3 Connection of devices

Configuring devices

All installed devices that are available in Automation Builder are listed in the device repository.  
\(\text{Chapter 6.3.2.1 “Device repository” on page 1443}\)

Modify your Automation Builder project by adding device objects. Preset items can be replaced in the same way.

1. In the device tree, right-click an item node. Select [Add object].

2. Select the desired object and click [Add object].

3. Double-click the new object in the device tree to configure the device settings. Depending on the selected item different configuration tabs are available.

Update of AC500 devices

Perform a firmware update to update AC500 V3 devices.  
\(\text{Chapter 6.3.1.4.3 “Installation and update of the AC500 V3 firmware” on page 1422}\)
Comparing objects

To compare similar objects within a project (such as the project configuration) select both objects. Right-click and select "Compare Objects" to see the differences.

6.3.2.4 IP settings

Configuration of the IP address

The IP address for AC500 devices can be set or changed in Automation Builder using

● the IP configuration tool which is described in the following.
● the Communication Settings. Chapter 6.3.2.4.4 "Configuration of communication via Ethernet (TCP/IP)" on page 1469

As an alternative the IP address can be changed at the hardware device itself. Chapter 6.8.2.5.5 "Description of the function keys" on page 4457

NOTICE!

For any AC500-ETH device where the IP address can be set, the IP: 0.0.0.0 is invalid and should not be set.

This may cause damage to the PLC and/or the communication module.

Configuration of the IP settings with the LED display

The IP settings for the PLC can be set directly on the processor module via keypad and LED display.

Chapter 6.8.2.5.5.5 "CFG - configuration" on page 4462
Configuration of the IP settings with the IP configuration tool

Introduction

The IP configuration tool can be used
● to set or change the IP address of devices.
● to scan the network for available hardware devices.
● to update the firmware of devices.
    This functionality is only supported if the IP configuration tool is used stand-alone.
● to activate certain functionality on hardware devices.
    This feature is only available on AC500 V3 devices.

The IP configuration tool is part of Automation Builder and can be called via “Tools ➔ IP-Configuration”.

Further the IP configuration tool can be used stand-alone without an Automation Builder application running. The stand-alone variant requires a separate installation via the Installation Manager ➔ Chapter 6.3.2.2.4.3.2 “Stand-alone installation” on page 1457.

After the installation, the IP configuration tool is started via .exe file / desktop icon.

Some functionality is only supported if the IP configuration tool is used stand-alone, e.g. for firmware updates for communication interface devices.

Stand-alone installation

The IP configuration tool is part of Automation Builder and can be called via “Tools ➔ IP-Configuration”. A separate installation is only required if the IP configuration tool shall be used stand-alone.
1. Open the Installation Manager in Automation Builder: “Tools ➤ Installation Manager”.

2. Close all other instances of Automation Builder as only one instance of the program can be executed at a time.
3. Click [Modify] and select the “IP Configuration Tool” from the structure tree.

4. Click [Continue] to start the installation.

   ⇒ After a successful installation the IP configuration tool is available as stand-alone tool (.exe).

   ⇒ To start the IP configuration tool, click the new created desktop icon.

**Network scan**

With a network scan all devices that have been found in the network by the scan process are listed, i.e. ABB devices such as AC500 processor modules, AC500 communication interface modules or ABB drives.
1. Start the IP configuration tool in Automation Builder (“Tools ➔ IP-Configuration”) or start it stand-alone (.exe).

2. The “IP-Configuration” dialog opens. Define the device type for the network scan by selecting the desired option under “Scan Protocol”:
   - “ABB Net config protocol”: Use this option for AC500 devices such as processor modules, Cl5xx-Modbus devices or ABB drives. The device(s) to be scanned must be connected to the PC via a direct Ethernet connection.
   - “Profinet Dynamic Configuration Protocol (DCP)”: Use this option for PROFINET communication interface modules. The device(s) to be scanned must be connected to the PC via a direct Ethernet connection (not via CM579). For the scan, a NPcap driver needs to be installed separately.
   - “EtherCAT”: Use this option for EtherCAT communication interface modules. The Ethernet cable must be connected directly to the first EtherCAT slave device of the EtherCAT fieldbus. Ensure that no EtherCAT master device is available on the bus when a scan is performed. “Emergency” option: Enable this option to check on failures in the EtherCAT assembly during the scan process, i.e. a frame loss or interchanged ports. Errors are displayed. For the scan, a NPcap driver needs to be installed separately.

3. Click [Scan] to start the scan process.
4. All devices that have been found in the network are listed including hardware and connection details. The following details can be changed under “IP settings”:
   - “IP Address”: Current IP address of the device.
   - “Conf. IP Address”: Configured IP address of the device. A changed IP address will update this column.
   - “FW Version”: Current installed firmware version of the device. This field is visible not until a first network scan. If this field is still empty after a network scan, check on connection errors.

   The IP address of some devices, e.g. EtherCAT devices cannot be changed.

Changing the IP address

1. In order to change the IP address of devices perform a network scan.
   - Chapter 6.3.2.4.3.3 “Network scan” on page 1459
2. Select a device from the list and select the appropriate protocol under “Scan protocol”.
   - “DHCP” or “BOOTP” option: If required, DHCP or BOOTP can be used to receive the IP address for the device from the server.
   - “IP address”, “subnet mask”, “Std. gateway”: Use these fields to change the IP address settings including the settings for the subnet mask and the standard gateway. Ensure that the combination of connection settings is correct.

   Note for CI52x-Modbus devices
   Consider the behavior of CI52x-Modbus devices if the last number of the IP address is set to “0”.
   - “Check last number of IP address” on page 1462
3. Change the settings for the IP configuration and click [Send settings] to transmit the data to the device.

![IP-Configuration screenshot](image)

**Note for PROFINET devices**

The device name of PROFINET devices can be edited. If changing the name, ensure the following rules apply:
- Labels must be separated by "."
- Total length: 1 to 240
- Label length: 1 to 63
- Labels can consist of characters [a-z] and numbers [0-9]
- Labels are not allowed to start with "-"
- Labels are not allowed to end with "-"

4. In order to keep all IP changes after a power cycle, the settings can be stored permanently. Confirm the prompted message during the scan process.

**Check last number of IP address**

This hint is only valid for CI52x-Modbus devices.

Check the last number of the IP address. If it is set to "0", the IP address setting for this last number will be used from the rotary switches on the hardware device.

**Example:**
## Automation Builder

<table>
<thead>
<tr>
<th>IP address:</th>
<th>192.168.14.0</th>
<th>IP address:</th>
<th>6</th>
</tr>
</thead>
</table>

As a result, in the field “IP Address” the last number is set to “6”:

### Firmware update

The firmware of AC500 communication interface modules can be updated with the IP configuration tool.

For this, the IP configuration tool must be used as stand-alone variant.

☞ Chapter 6.3.2.2.4.3.2 “Stand-alone installation” on page 1457

It is not possible to perform a firmware update out of Automation Builder.

- For PROFINET communication interface modules a firmware update is only supported for devices with firmware version ≥ 3.3.3.
- For EtherCAT communication interface modules a firmware update is only supported for devices with firmware version ≥ 2.1.4.
- For Modbus communication interface modules a firmware update is only supported for devices with firmware version ≥ 3.2.13.

### Requirements:

**Before the firmware update**

- Ensure a fast and stable network connection
- Close all unused applications on the executing PC
- Stop the communication between AC500 PLC and the communication interface module that shall be updated
During the firmware update

- Do not close the IP configuration tool
- Do not open Automation Builder software or any other application
- Do not switch-off the communication interface module that shall be updated
- Do not disconnect the Ethernet connection of a communication interface module or the executing PC

The firmware update will stop the operation of the affected device(s). Hence, the device(s) will become unresponsive for 1 - 2 minutes.

Procedure:

1. Start the IP configuration tool stand-alone (.exe).
2. Perform a network scan.
   - Chapter 6.3.2.2.4.3.3 “Network scan” on page 1459
3. Select the devices that shall be updated from the list and click [Scan] to trigger the scan process.
   A multiple selection of several devices is possible via control key, however, ensure to select only devices of the same protocol at a time. Otherwise the firmware update fails.
4. This step is only required for devices that require an installed NPcap driver. In this case an appropriate message including a download link is prompted in the IP-Configuration dialog:

   - Click on the displayed link https://nmap.org/download.html and download the latest version of the npcap-X.X.exe file.

   - After the download, execute the file as administrator and restart the scan process.
   - The devices that have been scanned are listed.
5. Click [Update Firmware] to start the firmware update for the selected devices.

6. For CI50x, CI51x and CI52x devices a signature check is started. Select the appropriate firmware update file (*.bin) for the device(s). Example: C:\AC500\AC500_CI52x_Firmware_V3.2.8.bin.

After a successful signature check the firmware update file (*.bin) and the respective signature file (*.bin.sig) are transferred to the device. This can last up to 3 minutes.

If the signature check fails, check the availability of the *.bin file and the *.bin.sig file.

7. A status check followed by a device reboot followed by a second status check is performed automatically.

   After the firmware update all outputs of the updated devices are set to '0'.

   ![Image of IP-Configuration interface]
8. After a successful firmware update the update status or the new firmware version is displayed in the “FW Version” field.

If this field is empty, there possibly is a connection error between the device and the executing PC.

Exception: For EtherCAT devices an empty “FW Version” field does not indicate a connection error.

If the firmware update fails

- check the requirements for the update procedure.
  - “Requirements:” on page 1463
- check the hints for trouble-shooting.
- perform a network scan and repeat the update. If the error still persists power cycle the device and try the update again.
**Blink functionality**

This function activates flashing of the backlight of an AC500 LED display.

1. From the menu, select “Tools ➔ IP-Configuration”.
2. Click [Scan] to trigger the scan process for devices in the network.
   - A progress bar shows the progress. The IP settings of a selected device is displayed below the list and can be edited.
3. Adjust your desired time and click [Blink] to activate flashing.

**Troubleshooting for IP configuration tool**

**Firewall exceptions:** On a standard Windows 7 installation without third party firewall or security tools installed the IP configuration tool should work properly.

The Automation Builder setup installs rules or exceptions for the built-in Windows firewall to allow IPConfig to receive the responses for the IPConfig scan.

To check the Windows firewall is set correctly check the firewall settings.

**Windows 7/ Windows 10:** On the network that is used for communication with the PLC, set “Incoming connections” to “Block all connections to programs that are not on the list of allowed programs”.

If a third party firewall is used these exceptions must be configured manually.

Either exceptions for applications can be entered: Automation Builder and IP configuration tool must be added as application.

Or the protocol and the port number must be given (for IPConfig: UDP protocol and port number 24576).

**Configuration of communication via Ethernet (TCP/IP)**

**General**

Programming via Ethernet is only possible on a PC with Ethernet board and installed network. Programming can be done via the internal (onboard) Ethernet communication module.

An application note describes the configuration of an AC500 V3 PLC for **EtherNet/IP communication**.
Enter a known PLC IP address

1. Right-click the top node “PLC_AC500 <...>” and select “Communication Settings” from the context menu.
   ⇒ Dialog box “Communication Settings <...>” appears.

2. Enter your PLC IP Address and click [OK].

Enter PLC IP address by scanning devices

1. Right-click the top node “PLC_AC500 <...>” and select “Communication Settings” from the context menu.
   ⇒ Dialog box “Communication Settings <...>” appears.

2. Click […].
   ⇒ Dialog box “Communication Settings <...>” appears.
3. Click [Scan], select your desired PLC and click [OK].
   ⇒ Entry is transferred to the dialog box “Communication Settings <...>”.
   Click [OK].

4. Click to log in the “PLC_AC500_V3” project.

Enter PLC IP address by [Advanced Settings...]

If a remote gateway instead of a local one has to be used it can be configured in the [Advanced Settings...].

1. Right-click the top node “PLC_AC500 <...>” and select “Communication Settings” from the context menu.
   ⇒ Dialog box “Communication Settings <...>” appears.

2. Enable checkbox “Use advanced settings” and click [Advanced Settings...].
   ⇒ Tab “Communication Settings” opens.

3. Check gateway or change if required.
   ⇒ Successful connection is indicated by green dot on the gateway icon.
4. **Manual entry of the IP address.**

Check IP address or change if required.

5. **Press ENTER to confirm changed IP address.**

   - Successful communication is indicated by green dot on the PLC icon.

6. **Or instead of the last two steps:**

   **Set the IP address via a scan.**

   Click [Scan Network], select your desired PLC and click [OK].

   - Successful connection is indicated by green dot on the gateway icon.

7. Click to log in the “PLC_AC500_V3” project.

**Connect to PLC via hostname**

Automation Builder supports the connection to PLCs via hostname.

To access a V3 PLC via hostname, the user should add the prefix “dns:” in the editor view “Communication Settings” of that PLC.

This enables a login to a V3 PLC via hostname.
Firmware update of a V3 PLC via Automation Builder requires the configuration of the IP-Address in bytes and will not work with any hostname.

6.3.2.5 Online program modification
A fast online program modification of the user program is possible without interrupting the running operation. If data areas should be saved during power OFF/ON, they can be stored in the flash EPROM. An optional battery saves data in the RAM.

6.3.2.3 Processor modules
6.3.2.3.1 Configure a processor module in the device tree

1. Add a processor module to your project. Chapter 6.3.1.2 “Creating a new project” on page 1398
2. Double-click the PLC node in the device tree.
   This will open a new window with tabs for the device configuration:
   - “Communication Settings” Chapter 6.4.1.21.2.8.3 “Tab ‘Communication Settings’” on page 2427
   - “PLC Settings” Chapter 6.4.1.21.2.8.10 “Tab ‘PLC Settings’” on page 2439
   - “Version information” Chapter 6.3.1.4.2.2.1.1 “Version information” on page 1419
   - “Statistics” Chapter 6.9.2.4.2 “Statistics” on page 4646
   - “Files” Chapter 6.4.1.21.2.8.8 “Tab ‘Files’” on page 2437
   - “Log” Chapter 6.9.2.4.3 “Log” on page 4647
   - “PLC Shell” Chapter 6.3.5.6 “PLC shell commands” on page 1756
   - “Users and Groups” Chapter 6.4.1.21.2.8.14 “Tab ‘Users and Groups’” on page 2450
   - “Access Rights” Chapter 6.4.1.21.2.8.15 “Tab ‘Access Rights’” on page 2453
   - “Symbol Rights” Chapter 6.4.1.21.2.8.16 “Tab ‘Symbol Rights’” on page 2458
   - “PM5xxx Hardware” Chapter 6.3.2.3.2 “Changing the processor module type” on page 1475
   - “CPU Parameters” Chapter 6.4.1.21.2.8.4 “Tab ‘Parameters’” on page 2433
   - “IEC Objects” Chapter 6.4.1.21.2.8.13 “Tab ‘<device name> IEC Objects’” on page 2449
   - “I/O mapping list” Chapter 6.3.2.13.8 “I/O mapping list” on page 1572
   - “I/O-Bus I/O Mapping” Chapter 6.9.2.5 “Live values in views with I/O components” on page 4649
   - “Task Deployment” Chapter 6.4.1.21.2.8.18 “Tab ‘Task deployment’” on page 2459
   - “Applications” Chapter 6.4.1.21.2.8.5 “Tab ‘Applications’” on page 2434
   - “Backup and Restore” Chapter 6.4.1.21.2.8.6 “Tab ‘Backup and Restore’” on page 2435
   - “Status” Chapter 6.9.2.4.5 “Status” on page 4648
   - “Diagnosis” Chapter 6.9.1.4.4 “Device diagnosis” on page 4613
   - “Diagnosis History” Chapter 6.9.1.4.5 “Diagnosis history” on page 4614
   - “License Information” Chapter 6.3.2.2.2.6 “View license information” on page 1453
   - “Information” General information about the device (name, vendor, version etc.)
3. Select the “CPU Parameters” tab to configure the parameters for the processor module. Table on page 1555
4. Use the “PM5xxx Hardware” tab for later on changes of “Terminal Base Type” or “Processor Module Type” \( \text{\textcopyright Chapter 6.3.2.3.2 “Changing the processor module type” on page 1475.} \)

5. Select the “I/O mapping list” tab to create mapping variables with better usability support compared to the tree structured view. \( \text{\textcopyright Chapter 6.3.2.13.8 “I/O mapping list” on page 1572.} \)

6. Select the “Backup and Restore” tab to create a backup or restore the project. \( \text{\textcopyright Chapter 6.4.1.21.2.8.6 “Tab ‘Backup and Restore’” on page 2435.} \)

7. Select the “Diagnosis” tab to know what errors have occurred in the project. \( \text{\textcopyright Chapter 6.9.1.4.4 “Device diagnosis” on page 4613.} \)

### 6.3.2.3.2 Changing the processor module type

**General**

In a project, you can change the target system by changing the type of processor module or terminal base type. If possible, the device configuration of fieldbuses and interfaces is kept and switched over to the device configuration of the new module.

Target change options:
- between platforms: from V2 platform to V3 platform (and vice versa)
- between module types: from AC500 (standard) to AC500-eCo (and vice versa)
- a combination of changed platform and changed module type

**Target change from a V2 processor module to a V3 processor module**

Target change options:
- AC500 V2 processor module to AC500 V3 processor module
- AC500 V2 processor module to AC500-eCo V3 processor module
- AC500-eCo V2 processor module to AC500-eCo V3 processor module
- AC500-eCo V2 processor module to AC500 V3 processor module

**Procedure:**

1. Close CODESYS.
2. Double-click the “PLC_AC500_V2 <...>” node and open the “PM<...> Hardware” tab.
3. Enable “Change to AC500 V3 PLC” and select the desired V3 processor module from the “PM5xx Type” drop-down list.

4. Click [Create V3 PLC].
   - The new V3 processor module is displayed in the navigation tree.
   - Change the node name of the processor module, if desired.

In case of a target change from AC500-eCo V2 to AC500-eCo V3, the I/O bus and Ethernet configuration is kept.

Target change from a V3 processor module to another V3 processor module

Target change options:
- AC500 V3 processor module to AC500 V3 processor module
- AC500 V3 processor module to AC500-eCo V3 processor module
- AC500-eCo V3 processor module to AC500 V3 processor module
- AC500-eCo V3 processor module to AC500-eCo V3 processor module

Procedure:
1. Close CODESYS.
2. Double-click the “PLC_AC500_V3 <...>” node and open the “PM5<...> Hardware” tab.
3. Select the desired V3 processor module from the "PMxx Type" drop-down list.

Fig. 271: Change_Hardware_V3
4. Ensure the correct "Terminal Base Type" is selected and click [Change PM / TB type].
   
   - If possible, the device configurations from the previous processor module will be kept and switched over to the new processor module.
   - The device configurations that cannot be kept are listed in a prompted information dialog.

   ![Automation Builder](image)

   By default, all device configurations which cannot be switched over will be copied to a "device pool" section in the navigation tree (option "Copy all objects that cannot be added to the new PLC into a device pool for further access"). If required, this backed-up configuration can be used in another project or in another processor module configuration.

   If the checkbox is deactivated all device configurations that cannot be switched will be lost after the execution of the target change.

   ![Configuration and programming](image)

   **Target change from AC500-eCo V3 to AC500 V3**

   The configuration of the onboard I/Os, the option board slots and the onboard RTC cannot be changed-over to the new module.

   **Target change from AC500 V3 to AC500-eCo V3**

   The configuration of COM1, CAN and the I/O bus cannot be changed-over to the new module. Depending on the selected target, also the I/O bus configuration and ETH2 configuration cannot be switched.

   ETH1 configuration is kept even if the configured protocols are not allowed for the selected AC500-eCo V3 PLC. In this case error messages are displayed in the messages window.
Libraries which are not used anymore are not deleted with the target change. Libraries of option boards are kept in the Library Manager even if no longer available at the target module.

### 6.3.2.3 Changing the processor module type for AC500-eCo V3 CPU

It is not possible to change from an AC500 V3 processor module to an AC500-eCo V3 processor module! Changing an AC500-eCo V3 processor module to another AC500-eCo V3 processor module is possible and the same limitation as listed before are applying, only the available or possible feature from the new processor module will be kept from the old processor module.

- Close CODESYS.

1. Double-click the “PLC_AC500_V3 <...>” node.

2. Open the “PM50xx Hardware” tab and select the new “PM50xx Type” from the drop-down list.

### 6.3.2.3.4 Parameters of the processor module

**Automated reboot after E2 error**

The parameter “Automated reboot after E2 error” allows to set the behavior of the CPU in case of severe errors (class E2).
If the default setting “Off” is used, no automated rebot after an E2 error is performed. If the setting “On” is used, an automated rebot after an E2 error is performed.

PLC behaviour after voltage dip

The parameter “PLC behaviour after voltage dip” allows to set the behavior of the CPU in case of short voltage dips.

If the default setting “Halt” is used, the CPU is changed to STOP mode if a short voltage dip >10 ms occurs. A new powercycle is required. If the setting “Reboot” is used, CPU will reboot after power supply has recovered to nominal value.

Floating point values

A calculation with floating points can lead to the following values:

0 (zero)

If a calculation results in an underrun, the value is set to 0 (result near 0, but not presentable). Depending on the sign bit, it can be a positive zero or a negative zero. The operator “=” of -0 and 0 returns TRUE.

Infinity

If a calculation results in an overrun, the value is set to Infinity (the result is not presentable). Depending on the sign bit, it can be a positive infinity (Infinity) or negative infinity (-Infinity). If Infinity is converted into another data type it results in the maximum value of the other data type (e.g., conversion into DWORD with REAL_TO_DWORD: 16#FFFFFFFF, into DINT with REAL_TO_DINT: 16#7FFFFFFF).

If -Infinity is converted into another data type it results in the maximum value of the other data type (e.g., conversion into DWORD with REAL_TO_DWORD: 16#00000000, into DINT with REAL_TO_DINT: 16#80000000).

Except for:
TRUE := REAL_TO_BOOL(Infinity);
'Inf' := REAL_TO_STRING(Infinity);
'-Inf' := REAL_TO_STRING(-Infinity);
Infinity := 1.0 / 0.0 -Infinity := -1.0 / 0.0
Infinity := Infinity + Infinity -Infinity := -Infinity -Infinity
Infinity := Infinity + 1.0 -Infinity := -Infinity + 1.0
Infinity := LREAL_TO_REAL(Infinity) -Infinity := LREAL_TO_REAL(-Infinity)

Examples:

NaN

If a calculation results in an undefined value the result is set to NaN (Not a Number). The result of each calculation with NaN is NaN. The operators "<", "<=", ">" and ">=" return FALSE if either or both operands are NaN.

Operator "=" returns FALSE if one operand is NaN.
Operator "<>" returns TRUE if one operand is NaN.
If NaN is converted into another data type the result is 0.
Except for:

TRUE := REAL_TO_BOOL(NaN);
'NaN' := REAL_TO_STRING(NaN);

Examples:
NaN := SQRT(-2.0)
NaN := 0.0 / 0.0
NaN := Infinity -Infinity
NaN := 0.0 * Infinity
NaN := Infinity / Infinity

The result of an operation can be checked with the following program parts:

Check for NaN (REAL):

Check for NaN (LREAL):

| rX: REAL; | lrX: LREAL; |
| IF (rX <> rX) THEN | IF (lrX <> lrX) THEN |
| (* rX is a NaN *) | (* lrX is a NaN *) |
| ...; | ...; |
| END_IF; | END_IF; |
### Check for Infinity (REAL):

Infinity is represented with sign bit 0, exponent of all 1s and a fraction of all 0s.

- Infinity is represented with sign bit 1, exponent of all 1s and a fraction of all 0s.

```pascal
rX: REAL;
prX: POINTER TO REAL;
pdwX: POINTER TO DWORD;
prX := ADR(rX);
pdwX := prX;
IF (pdwX^ = 16#7F800000) THEN (* rX is Infinity *)
    ...;
END_IF;
IF (pdwX^ = 16#FF800000) THEN (* rX is -Infinity *)
    ...;
END_IF;
```

```pascal
lrX: LREAL;
plrX: POINTER TO LREAL;
plwX: POINTER TO LWORD;
plrX := ADR(lrX);
plwX := plrX;
IF (plwX^ = 16#7FF0000000000000) THEN (* lrX is Infinity *)
    ...;
END_IF;
IF (plwX^ = 16#FFF0000000000000) THEN (* lrX is -Infinity *)
    ...;
END_IF;
```

### 6.3.2.4 AC500-eCo V3 onboard I/Os

According to the used AC500-eCo V3 processor module, the onboard I/Os are different and the functionality of the I/Os are adapted to the processor module type.

<table>
<thead>
<tr>
<th>Onboard I/O combination</th>

> When debugging AC500-eCo V3 applications and reaching a breakpoint, the onboard outputs are set to zero.

### Basic CPU: PM5012-x-ETH

For all CPU versions the configuration of the input channels is the same. The configuration of the output channels is only available on CPU version with transistor output channels:

![Configuration and programming](image)

Version with relay outputs, same configuration for the input channels, no configuration for the output channels relay:
The following parameter can be configured:

<table>
<thead>
<tr>
<th>Onboard I/O type</th>
<th>Parameter</th>

</tbody>
</table>
6.3.2.6 Mapping of the onboard I/O channels

2. Select “12DI/8DO-T/2DC I/O Mapping”.
   ➤ Here, you will map variable names (symbols) for the channels you will need in the program.

3. Open the list of the digital inputs.
4. Fill in the variable names:

<table>
<thead>
<tr>
<th>Channel</th>
<th>Type</th>
<th>Variable</th>
</tr>
</thead>
<tbody>
<tr>
<td>Digital input DI0</td>
<td>BOOL</td>
<td>xDI_00_OnBoard_IO_I0</td>
</tr>
</tbody>
</table>
5. Open the list of the digital outputs.
6. Fill in the variable names:

<table>
<thead>
<tr>
<th>Channel</th>
<th>Type</th>
<th>Variable</th>
</tr>
</thead>
<tbody>
<tr>
<td>Digital output DO0</td>
<td>BOOL</td>
<td>xStartDrilling1</td>
</tr>
</tbody>
</table>

The suggested name convention is based on the "Hungarian notation". A name prefix is describing variable type: e.g., "x" = variable of type BOOL, "w" = WORD, "i" = INT (integer) etc. This increases the code readability and is helpful for program analysis.

6.3.2.7 Configuration of the onboard I/Os of AC500-eCo V3 PLC
6.3.2.7.1 Digital inputs from the onboard I/Os

Depending on the processor module used, several configurations are possible for the onboard I/Os mostly different per group of channels.

<table>
<thead>
<tr>

**6.3.2.7.2 Fast counters in the onboard I/Os**

- General details on fast counters.
- Details on the configuration of the onboard I/Os channels.

Depending on the configuration for the input channels of the onboard I/O from the processor module different functionality are possible which must be used together with the dedicated function block of the user program.
### Functionality to be realized

<table>
<thead>
<tr>
<th>Processor module type</th>
<th>Digital input channels</th>

6.3.2.7.4 Configuration of interrupt inputs

Depending on the configuration for the input channels of the onboard I/O from the processor module different functionality are possible which must be used together with the dedicated function block of the user program.
### Functionality to be realized

| Processor module type | Digital input channels | Configura- 
<table>
<thead>

### Creating an interrupt task

After configuring the parameter, the user needs to create a new task with the “Type” set to “External” and the “External event” set to “OnBoard_Binary_Input”.
Please see “Use the onboard I/Os as interrupt input with dedicated interrupt task” in the system technology how to use the function. \(\text{\textcopyright} \) Chapter 6.8.2.15.3.4 “Use the onboard I/Os as interrupt input with dedicated interrupt task” on page 4550

### 6.3.2.7.6 Configuration of digital outputs

According to the processor module type, the digital outputs have several functionalities. To use them as digital output and as default configuration the following configuration is needed:

<table>
<thead>
<tr>
<th>Functionality to be realized</th>

### 6.3.2.7.7 Configuration of outputs as limit switch

The AC500-eCo V33 processor modules provide according to the output variants transistor or relay some output which can be used as limit switch. For the process modules with relay outputs, only the digital configurable channels provide this functionality.

<table>

</tr>
</tbody>
</table>
6.3.2.7.8 Operating the limit switch output with user program

The OBIOLimitSwitch function block of the library must be used to operate the outputs with help of user program.

6.3.2.7.9 Configuration of PWM outputs (Pulse Width Modulation)

The AC500-eCo V3 processor modules provide up to 8 PWM output channels with a maximum frequency of 100 kHz ... 200 kHz. The parameter of PWM output channel of onboard I/O must be configured before it can be used. User should take these steps to configure the PWM output function.

NO3 … NO5 |  |  | Not relevant for the functionality |  |  
C12 … C13 |  |  | PWM |  | Up to 2 PWM with 100 kHz only on these channels

### 6.3.2.7.10 Operating the PWM output with user program

The OBIOPwm function block of the library must be used to operate the PWM outputs with help of user program.

### 6.3.2.7.11 Configuration of PTO outputs (HW fast outputs for Pulse Train Output)

The AC500-eCo V3 processor modules provide up to 2 PTO hardware dedicated output channels with a maximum frequency of 200 kHz. The parameter of PTO output channel of onboard I/O must be configured before it can be used. User should takes these steps to configure the PTO output function.

The PTO outputs can be used with 2 different modes either Pulse / Direction or Cc/Ccw mode.

Please refer to the technical data of the onboard I/Os Chapter 5.2.1.1.2.7.8 “Technical data of the PTO outputs” on page 217.

The PTO channels are always requiring 2 consecutive output channels for the function.

### Functionality to be realized | Processor module type | Digital output channels | Configuration of the channel to be selected in Automation Builder | Dedicated function block to be used in the user program | Comments
---|---|---|---|---|---
PTO outputs | PM5012-T-ETH | O0 … O3 | Not possible | - | No PTO available

<td></td>
</tr>
</tbody>
</table>

### 6.3.2.7.12 Operating the PTO hardware output with user program

The OBIOPulseTrainOutput function block of the library can be used to operate the PTO outputs with help of user program. This FB allows to control the output in PTO mode. The OBIOMotionPTO function block is a dedicated Motion control block to realize point-to-point movement or velocity control of a motion axis. 

Chapter 6.8.2.15.3.6 “Use the onboard I/Os as pulse-train output (PTO)” on page 4553.
### 6.3.2.7.13 Configuration of SW PTO (PWM) outputs (HW fast outputs and standard outputs with software dedicated function block)

The AC500-eCo V3 processor modules could also provide up to 4 PTO (PWM) software output channels. To use that mode, the parameter of output channel of onboard I/O must be configured before it can be used. User should take these steps to configure this special PTO output function. The PTO outputs channels can be only used as Pulse / Direction mode. Please refer to the technical data "Chapter 5.2.1.1.2.7.8 “Technical data of the PTO outputs” on page 217" "Chapter 5.2.1.1.2.7.9 “Technical data of the PWM outputs” on page 217."

The PTO channel is using a digital fast output configured as PWM output to generate the Pulse output and a standard digital output to indicate the direction. A dedicated PTO motion block will then control the channel to realize the functionality.

Up to 4 PTO can be then provided each using 2 digital outputs.

A mixed configuration of one HW PTO channel (e.g. Output 04 ... 05) and Pulse/Direction or Cc/Ccw mode together with up to 2 other software PTO Channels (e.g. O6, O7 + dedicated output) and only Pulse/Direction mode is then possible. Please refer to the technical data "Further information on page 217."

To achieve such a software PTO mode the following channel configuration must be done.

<table>
<thead>
<tr>
<th>Functionality to be realized</th>
<th>Processor module type</th>
<th>Digital output channels</th>
<th>Configuration of the channel to be selected in Automation Builder</th>
<th>Dedicated function block to be used in the user program</th>
<th>Comments</th>

---
6.3.2.14 Operating the software PTO output channels with user program

The OBIOMotionPWM function block is a dedicated motion control block to realize point-to-point movement or velocity control of a motion axis. This block will then control the output channels as PTO mode Pulse/Direction only up to 100 kHz. See the dedicated chapter in the system technology "Chapter 6.8.2.15.3.6 "Use the onboard I/Os as pulse-train output (PTO)" on page 4553.

6.3.2.8 Option board for processor modules PM50xx

6.3.2.8.1 Select the option board

Depending on processor module type, up to 3 option board slot are available and for each several option board modules are available.

To add an option board on the processor module, select the desired OptionSlot to be configured and attach the needed option board from the list.
There is no limitation on the number of same option board used on the CPU, no dedicated slot for a specific function and no specific order to place the option board module. Depending on the type of option board selected and attached to the CPU some further configuration of channels or function may be needed.

### 6.3.2.8.2 Attach an option board for digital I/O extension

Just select and attached the module, no other channel configuration is needed. The I/O channels are directly mapped in the I/O mapping and variables can then be defined.

### 6.3.2.8.3 Attach an option board for analog I/O extension

The desired analog I/O option board type for the desired option board slot must be selected and added.

The option board may require some other channel configuration according to your need.

Following example shows how to add a TA5120-2AI-UI analog option board and the desired channel types which can be selected.

### 6.3.2.8.4 Attach an option board for COMx serial communication

The desired serial interface option board type for the desired option board slot must be selected and added.

The option board may require some other channel configuration according to your need.

Following example shows how to add a TA5142-RS485I isolated interface and the desired protocol.
The desired protocol has also to be added according to your needs, e.g. Modbus RTU client:

The parameter for the serial interface can also be adapted like baudrate, data bit, stop bit or parity.

6.3.2.9 Onboard Ethernet configuration

6.3.2.9.1 General

Onboard Ethernet is provided for device types with -ETH extension.

6.3.2.9.2 Configuration of the IP settings with the IP configuration tool

Introduction

The IP configuration tool can be used

- to set or change the IP address of devices.
- to scan the network for available hardware devices.
● to update the firmware of devices.
   This functionality is only supported if the IP configuration tool is used stand-alone.

● to activate certain functionality on hardware devices.
   This feature is only available on AC500 V3 devices.

The IP configuration tool is part of Automation Builder and can be called via “Tools ➔ IP-Configuration”.

Further the IP configuration tool can be used stand-alone without an Automation Builder application running. The stand-alone variant requires a separate installation via the Installation Manager ➔ Chapter 6.3.2.9.2.2 “Stand-alone installation” on page 1507.

After the installation, the IP configuration tool is started via .exe file / desktop icon.

---

**Stand-alone installation**

The IP configuration tool is part of Automation Builder and can be called via “Tools ➔ IP-Configuration”. A separate installation is only required if the IP configuration tool shall be used stand-alone.
1. Open the Installation Manager in Automation Builder: "Tools ➔ Installation Manager".
2. Close all other instances of Automation Builder as only one instance of the program can be executed at a time.
3. Click [Modify] and select the “IP Configuration Tool” from the structure tree.

4. Click [Continue] to start the installation.
   - After a successful installation the IP configuration tool is available as stand-alone tool (.exe).
   - To start the IP configuration tool, click the new created desktop icon.

**Network scan**

With a network scan all devices that have been found in the network by the scan process are listed, i.e. ABB devices such as AC500 processor modules, AC500 communication interface modules or ABB drives.
1. Start the IP configuration tool in Automation Builder ("Tools ➔ IP-Configuration") or start it stand-alone (.exe).

2. The "IP-Configuration" dialog opens. Define the device type for the network scan by selecting the desired option under "Scan Protocol":

   ● "ABB Net config protocol":
     Use this option for AC500 devices such as processor modules, Cl5xx-Modbus devices or ABB drives. The device(s) to be scanned must be connected to the PC via a direct Ethernet connection.

   ● "Profinet Dynamic Configuration Protocol (DCP)":
     Use this option for PROFINET communication interface modules. The device(s) to be scanned must be connected to the PC via a direct Ethernet connection (not via CM579).
     For the scan, a NPcap driver needs to be installed separately.

   ● "EtherCAT":
     Use this option for EtherCAT communication interface modules. The Ethernet cable must be connected directly to the first EtherCAT slave device of the EtherCAT fieldbus. Ensure that no EtherCAT master device is available on the bus when a scan is performed.
     "Emergency" option: Enable this option to check on failures in the EtherCAT assembly during the scan process, i.e. a frame loss or interchanged ports. Errors are displayed.
     For the scan, a NPcap driver needs to be installed separately.

3. Click [Scan] to start the scan process.
4. All devices that have been found in the network are listed including hardware and connection details. The following details can be changed under “IP settings”:

- “IP Address”:
  Current IP address of the device.
- “Conf. IP Address”:
  Configured IP address of the device. A changed IP address will update this column.
- “FW Version”:
  Current installed firmware version of the device. This field is visible not until a first network scan. If this field is still empty after a network scan, check on connection errors.

The IP address of some devices, e.g. EtherCAT devices cannot be changed.

Changing the IP address

1. In order to change the IP address of devices perform a network scan.
   "Chapter 6.3.2.9.2.3 “Network scan” on page 1509"
2. Select a device from the list and select the appropriate protocol under “Scan protocol”.
   “DHCP” or “BOOTP” option: If required, DHCP or BOOTP can be used to receive the IP address for the device from the server.
   “IP address”, “subnet mask”, “Std. gateway”: Use these fields to change the IP address settings including the settings for the subnet mask and the standard gateway. Ensure that the combination of connection settings is correct.

Note for CI52x-Modbus devices

Consider the behavior of CI52x-Modbus devices if the last number of the IP address is set to “0”.

"Check last number of IP address” on page 1512
3. Change the settings for the IP configuration and click [Send settings] to transmit the data to the device.

Note for PROFINET devices
The device name of PROFINET devices can be edited. If changing the name, ensure the following rules apply:
- Labels must be separated by "."
- Total length: 1 to 240
- Label length: 1 to 63
- Labels can consist of characters [a-z] and numbers [0-9]
- Labels are not allowed to start with ":"
- Labels are not allowed to end with ":"

4. In order to keep all IP changes after a power cycle, the settings can be stored permanently. Confirm the prompted message during the scan process.

Check last number of IP address
This hint is only valid for Cl52x-Modbus devices.
Check the last number of the IP address. If it is set to "0", the IP address setting for this last number will be used from the rotary switches on the hardware device.

Example:
**Firmware update**

The firmware of AC500 communication interface modules can be updated with the IP configuration tool.

For this, the IP configuration tool must be used as stand-alone variant.

*Chapter 6.3.2.9.2.2 “Stand-alone installation” on page 1507*

It is not possible to perform a firmware update out of Automation Builder.

- For PROFINET communication interface modules a firmware update is only supported for devices with firmware version ≥ 3.3.3.
- For EtherCAT communication interface modules a firmware update is only supported for devices with firmware version ≥ 2.1.4.
- For Modbus communication interface modules a firmware update is only supported for devices with firmware version ≥ 3.2.13.

**Requirements:** Before the firmware update

- Ensure a fast and stable network connection
- Close all unused applications on the executing PC
- Stop the communication between AC500 PLC and the communication interface module that shall be updated
During the firmware update

- Do not close the IP configuration tool
- Do not open Automation Builder software or any other application
- Do not switch-off the communication interface module that shall be updated
- Do not disconnect the Ethernet connection of a communication interface module or the executing PC

The firmware update will stop the operation of the affected device(s). Hence, the device(s) will become unresponsive for 1 - 2 minutes.

Procedure:

1. Start the IP configuration tool stand-alone (.exe).
2. Perform a network scan.
   - Chapter 6.3.2.9.2.3 “Network scan” on page 1509
3. Select the devices that shall be updated from the list and click [Scan] to trigger the scan process.
   - A multiple selection of several devices is possible via control key, however, ensure to select only devices of the same protocol at a time. Otherwise the firmware update fails.
4. This step is only required for devices that require an installed NPcap driver. In this case an appropriate message including a download link is prompted in the IP-Configuration dialog:

   - Click on the displayed link [https://nmap.org/download.html](https://nmap.org/download.html) and download the latest version of the npcap-X.X.exe file.

   - After the download, execute the file as administrator and restart the scan process.
   - The devices that have been scanned are listed.
5. Click [Update Firmware] to start the firmware update for the selected devices.

6. For CI50x, CI51x and CI52x devices a signature check is started. Select the appropriate firmware update file (*.bin) for the device(s). Example: C:\AC500\AC500_CI52x_Firmware_V3.2.8.bin.

   After a successful signature check the firmware update file (*.bin) and the respective signature file (*.bin.sig) are transferred to the device. This can last up to 3 minutes.

   If the signature check fails, check the availability of the *.bin file and the *.bin.sig file.

7. A status check followed by a device reboot followed by a second status check is performed automatically.

   After the firmware update all outputs of the updated devices are set to '0'.
8. After a successful firmware update the update status or the new firmware version is displayed in the “FW Version” field. If this field is empty, there possibly is a connection error between the device and the executing PC.

Exception: For EtherCAT devices an empty “FW Version” field does not indicate a connection error.

دير If the firmware update fails
  ● check the requirements for the update procedure. **“Requirements:” on page 1513**
  ● check the hints for trouble-shooting.
  ● perform a network scan and repeat the update. If the error still persists power cycle the device and try the update again.
**Blink functionality**

This function activates flashing of the backlight of an AC500 LED display.

1. From the menu, select “Tools ➔ IP-Configuration”.
2. Click [Scan] to trigger the scan process for devices in the network.
   - A progress bar shows the progress. The IP settings of a selected device is displayed below the list and can be edited.
3. Adjust your desired time and click [Blink] to activate flashing.

![Image of IP Configuration tool](image)

**Troubleshooting for IP configuration tool**

**Firewall exceptions:**

On a standard Windows 7 installation without third party firewall or security tools installed the IP configuration tool should work properly.

The Automation Builder setup installs rules or exceptions for the built-in Windows firewall to allow IPConfig to receive the responses for the IPConfig scan.

To check the Windows firewall is set correctly check the firewall settings.

**Windows 7/ Windows 10:**

On the network that is used for communication with the PLC, set “Incoming connections” to “Block all connections to programs that are not on the list of allowed programs”.
If a third party firewall is used these exceptions must be configured manually.

Either exceptions for applications can be entered: Automation Builder and IP configuration tool must be added as application.

Or the protocol and the port number must be given (for IPConfig: UDP protocol and port number 24576).

6.3.2.9.3 Switch functionality of Ethernet interfaces ETH1/ETH2

As of SystemFW 3.1.0 the Ethernet interfaces ETH1/ETH2 can be configured as an Ethernet switch.

The default setting is “Two separate interfaces”.

The change of the PLC Boot parameter ETH1 / ETH2 mode will become active after a PLC reboot.
Create and download a Boot project before rebooting the PLC!

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETH1 / ETH2 mode</td>
<td>Two separate interfaces</td>
<td>Two separate Ethernet interfaces ETH1 and ETH2</td>
</tr>
<tr>
<td>Switch functionality ETH1-ETH2</td>
<td>Switch between ETH1 and ETH2</td>

</tr>
</tbody>
</table>

If the Switch functionality ETH1-ETH2 is active, only the Ethernet interface ETH1 is available (see Chapter 6.8.2.5.5.5 “CFG - configuration” on page 4462). Any protocols configured under Ethernet interface ETH2 must be deleted. Otherwise a compile error will be created.

The setting of ETH1 / ETH2 mode can be checked on LED display with soft key <CFG> (see Chapter 6.8.2.5.5.5 “CFG - configuration” on page 4462).

6.3.2.10 Onboard CAN configuration

AC500 V3 PLCs provide the following methods for CAN integration:

- Onboard CAN interface
- CANopen master-slave arrangement (with CM598-CN as a master device)
Table 300: Differences in supported protocols

<table>
<thead>
<tr>

<td>X</td>
</tr>
<tr>
<td>J1939</td>
<td>X</td>
<td></td>
</tr>
</tbody>
</table>

Onboard CAN interface is not available on AC500-eCo V3!

Supported protocols

Onboard CAN interface supports the following protocols

- CANopen Manager: Connection of CI581 and CI582 without additional I/O modules
- CAN 2A/2B
- J1939

Configuration in Automation Builder is described in chapter 'CANopen' Chapter 6.3.2.11.1.1 “CM598-CAN - CANopen Manager communication module” on page 1521.

Further information can be found in chapter 'CAN onboard' Chapter 6.3.2.16 “CAN onboard” on page 1594

6.3.2.11 Communication modules
6.3.2.11.1 CANopen

CM598-CAN - CANopen Manager communication module

Configuration of the communication module

- Click menu “Tools” Options” and select “Device editor” in the “Options” window.
- Enable first checkbox “Show generic device configuration views” and click [OK].

Append a CM598-CAN

1. Right-click on your desired Slot below node “Extension Bus” and click “Add object”.

Dialog “Replace object:” appears.

2. Click “CM598_CAN” in the list and click [Replace object].

3. Double-click “CM598_CAN (CM598-CAN)” to get the “CM598-CAN Parameters” in the editor window.

The following parameters are available:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default value</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Run on config fault</td>
<td>No</td>
<td>No</td>
<td>In case of a configuration error, the user program is not started.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Yes</td>
<td>The user program is started independent of a faulty configuration of the CM598-CAN communication module.</td>
</tr>
</tbody>
</table>
The tab “CAN Bus” contains the basic settings of the CAN bus and special settings for the CAN 2.0 B protocol.

The settings at “29 Bit COB-ID” are only valid for CAN 2.0 B protocol. Ensure the option “Enable 29 Bit COB-ID” is enabled. Otherwise no CAN 2.0 B frames can be received. With the other parameters at “Enable 29 Bit COB-ID” the receive filter is configured.

SAE J1939 An example project which demonstrates using and handling the SAE J1939 protocol in AC500 V3 PLCs is given in the application example AC500 SAE J1939 protocol.

<td>PDOs are not written and read by the manager automatically.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Enabled</td>
<td>This item selects if the installed PDOs shall be automatically written and read by the “CANopen Manager” directly after the startup once. This ensures that the latest output data which can be found within the “CANopen Manager” output process data area is sent to the remote device and that the latest remote device input data is read from the remote device and be placed into the input process data area.</td>
</tr>
</tbody>
</table>

The tab “CI58x IEC Objects” contains the created instance used for diagnosis access. Only available for CI58x devices.

### Configuration of SYNC task

To create a SYNC task, which is triggered after each SYNC message, several steps are needed:

1. Set CANopen sync mode to “Sync Bus and Task” at CM598 communication module.
2. Enable “SYNC producing” at CANopen manager.
3. Set at least one PDO to transmission type “cyclic synchronous”.
4. Build the project.

   ⇒ A new task is created automatically which is called “ABB SyncTask <slot>” there you can add POUs which should be executed if the task is triggered.

**DO NOT CHANGE task settings!**
Configuration of the protocols CAN 2.0 A / CAN 2.0 B

The communication module CM598-CAN can be used to realize CAN bus based networks in combination with library ABB_CM598Can_AC500.library.

To enable the support for the desired protocol it must be appended to CM598-CAN.

1. Right-click “CM598_CAN (CM598-CAN)” in the device tree and select “Add device” in the context menu.
   - Window “Add object below: CM598_CAN_1” appears.

2. Select “CAN 2.0 A” or “CAN 2.0 B” from the list.

Parameterization

The CAN data transmission requires a buffer for the incoming data that can be read with function blocks of library ABB_CM598Can_AC500.library.

1. Right-click “CAN_2_0A_11_bit_identifier_ (CAN 2.0A)” or “CAN_2_0B_29_bit_identifier_ (CAN 2.0B)” and select “Add object”.

2. Select “Buffer for CAN 2A” for CAN 2.0A. Or select “Buffer for CAN 2B” for CAN 2.0B from the list.

3. Double-click on “Buffer_for_CAN_2A (Buffer for CAN2A)” or “Buffer_for_CAN_2B (Buffer for CAN2B)” in the device tree to open the “Buffer configuration” in the editor window.

The following parameters are available:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default value</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Identifier</td>
<td>0</td>
<td>CAN 2A: 0 ... 2047&lt;br&gt;CAN 2B: 0 ... 53687091</td>
<td>The value of the CAN identifier that is compared with the identifier of the incoming telegrams. The telegrams will be added to the buffer if the identifier matches.</td>
</tr>
<tr>
<td>Number of receive buffers</td>
<td>1</td>
<td>1 ... 16</td>
<td>The size of the buffer in number of telegrams.</td>

<td></td>
<td>Discard</td>
<td>Incoming telegrams are discarded as long as the buffer is full.</td>
</tr>
<tr>
<td>Enable triggering of IEC task</td>
<td>No</td>
<td>No</td>
<td>Disables the triggering of the execution of the related IEC task.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Yes</td>
<td>Enables the triggering of the execution of the related IEC task as soon as a CAN frame with the specified CAN-ID arrives.</td>
</tr>
</tbody>
</table>

Configuration of the CANopen manager

☞ Chapter 6.3.2.16.1.2 “CANopen manager (master)” on page 1594

6.3.2.11.2 PROFINET
CM579-PNIO – PROFINET IO communication module
Configuration of the communication module

Configuration is valid as of Automation Builder 2.2.0 and CPU firmware 3.2.0.

Until Automation Builder 2.5.x and CPU firmware 3.5.x the minimum firmware version 2.8.4.0 is required for communication module CM579-PNIO.

As of Automation Builder 2.6.0 and CPU firmware 3.6.0 the minimum firmware version 3.0.0.21 is required for communication module CM579-PNIO.

☞ Description of configuration with Automation Builder < 2.2.0

As of Automation Builder 2.6.0 some component changes of the PROFINET IO controller stack require a manual upgrade of projects created in Automation Builder versions < 2.6.0. How to perform those steps is described in the application note AC500 V3 - Upgrade of projects with PROFINET.

1. Right-click on your desired Slot below node “Extension_Bus” and click “Add object”.
   ⇒ Dialog “Replace object:” appears.
2. Click “CM579_PNIO” in the list and click [Replace object].
3. Double-click “CM579_PNIO (CM579-PNIO)” to get the “CM579-PNIO Parameters” in the editor window.

The following parameters are available:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Run on config fault</td>
<td>No</td>
<td>No</td>
<td>In case of a configuration error, the user program is not started.</td>
</tr>
<tr>
<td></td>
<td>Yes</td>
<td></td>
<td>The user program is started independent of a faulty configuration of the CM579-PNIO communication module.</td>
</tr>
</tbody>
</table>

4. Click on tab “CM579-PNIO I/O Mapping” to open the “Bus Cycle Options” in the editor window.

The following parameters are available:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bus cycle task</td>
<td>Use parent bus cycle settings</td>
<td>Use parent bus cycle settings</td>
<td>Settings from “PLC Settings” tab are used.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Task</td>
<td>Name of the task that triggers the bus cycle.</td>
</tr>
</tbody>
</table>

In the tab “CM579-PNIO IEC-Objects” the list of used IEC Objects for information instantiated I/O driver function block class is shown.

The library “CM579PROFINET” will be added automatically to “Library Manager” when a CM579-PNIO is appended.

Configuration of the PROFINET IO controller

PROFINET IO controller - Configuration

The PROFINET IO controller node appears automatically below the added communication module CM579-PNIO.

Double-click on “PNIO_Controller” and open the tab “General” in the editor window.

The following parameters are available:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Station name</td>
<td>cm579-pnio</td>
<td>Up to 240 characters</td>
<td>Network name of the PROFINET IO controller station. Must be conform to PROFINET standard.</td>
</tr>
<tr>
<td>IP parameters</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>IP-Address</td>
<td>192.168.0.1</td>
<td>Valid IP address</td>
<td>IP address of the PROFINET IO controller station.</td>
</tr>

<td></td>
<td>The protocol of the fieldbus is stopped. There is no communication between PROFINET controller and devices.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Operation</td>
<td></td>
<td>The protocol of the fieldbus is executed. The communication between PROFINET controller and devices is enabled.</td>
<td></td>
</tr>
</tbody>
</table>

*Use tab “PROFINET-IO-Controller Parameters" only, if you need to change a parameter, which is not visible in other dialogs.*
Activating tab
1. Click “Tools ➔ Options” and select “Device editor”.
   ⇒ The “Device editor” dialog opens.
2. Enable checkbox “Show generic device configuration views” and click [OK]
   ⇒ The tab is now available.

Configuration of PROFINET IO devices
Add PROFINET IO device
1. Right-click on node “PNIO_Controller (PROFINET-IO-controller)” and click “Add object.”
   ⇒ A list with all installed PROFINET IO devices appears.
2. Select the desired device and click [Add object].
   ⇒ The device is added to the PROFINET IO controller in the device tree.

PROFINET IO device - Configuration
Double-click on “PNIO-Device” to open the device configuration in the editor window.
The following parameters are available:

<td>In case of VLAN usage the parameter VLAN ID represents the ID of the virtual network. For VLAN type 802.1Q the range is 0..4095 while VLAN type ISL accepts values from 0 to 32767. The supported type depends on the used device.</td>
<td>Slave parameters -&gt; VLAN ID</td>
</tr>
</tbody>
</table>
PROFINET IO device – PNIO parameters

The tab “PNIO Parameters” is a generic view of all PROFINET IO device parameters. It is normally hidden and is normally not needed for configuration.

Use tab “PNIO Parameters” only, if you need to change a parameter, which is not visible in other dialogs.

Activating tab

1. Click “Tools ➔ Options” and select “Device editor”.
   ⇒ The “Device editor” dialog opens.
2. Enable checkbox “Show generic device configuration views” and click [OK]
   ⇒ The tab is now available.

Configuration of 3rd party PROFINET IO devices

Before a 3rd party PROFINET IO device can be used, the provided GSDML file has to be installed in the “Device Repository”.

Installation

Go to “Tools ➔ Device Repository ➔ Install”.

Configuration

☞ Chapter 6.3.2.11.2.1.3 “Configuration of PROFINET IO devices” on page 1537.

I/O mapping of the PROFINET IO devices

Open I/O mapping list

1. Double-click on the “PNIO_Controller” or below on the “<...>PNIO-Device” or below on the “I/O-Module” in the device tree.

2. Select tab “I/O mapping list” to show the list of I/O channels.

The content of the list depends on the selected node.

For instance:

- When the “PNIO_Controller” node is selected all I/O channels of all configured devices are shown.
- When a “PNIO-Device” is selected all I/O channels of the configured modules are shown.

An IEC variable for an I/O channel that is available in the “Application” can be defined by double-clicking in column “Variable”.

2024/01/05
Provider and consumer status

Provider and consumer status functionality is available as of Automation Builder 2.7.0 and CPU firmware 3.7.0.

The provider and consumer status of a PROFINET submodule is in the I/O editor available. For each submodule 4 additional I/O channels exists that can be used to read or write the provider and consumer status. These channels are updated with the cycle of the specified buscycle task.

<table>
<thead>
<tr>
<th>Channel</th>
<th>Direction</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Input PS” (submodule name)</td>
<td>input</td>
<td>Provider status of the input channels</td>
</tr>
<tr>
<td>“Output CS” (submodule name)</td>
<td>input</td>
<td>Consumer status of output channels</td>
</tr>
<tr>
<td>“Output PS” (submodule name)</td>
<td>output</td>
<td>Provider status of the output channels</td>
</tr>
<tr>
<td>“Input CS” (submodule name)</td>
<td>output</td>
<td>Consumer status of the input channels</td>
</tr>
</tbody>
</table>

The channels “Output PS” and “Input CS” are handled by the IO driver of the communication module CM579-PNIO when no mapping variable is assigned. The status value is set to “Bad_By_Controller” when the PLC is in “Stop” and to “Good” when the PLC is in “Run”.

In case of a mapping variable is assigned the correct status value has to be set in the PLC application.

The channels “Input PS” and “Output CS” contains the status values as received form the PROFINET device. If the Application Relation (AR) between PROFINET device and controller is closed the status is set to “Bad_By_Controller”.

The channels “Output PS” and “Input CS” are handled by the IO driver of the communication module CM579-PNIO when no mapping variable is assigned. The status value is set to “Bad_By_Controller” when the PLC is in “Stop” and to “Good” when the PLC is in “Run”.

In case of a mapping variable is assigned the correct status value has to be set in the PLC application.

The channels “Input PS” and “Output CS” contains the status values as received form the PROFINET device. If the Application Relation (AR) between PROFINET device and controller is closed the status is set to “Bad_By_Controller”.
Remanent data

The remanent data of the communication module CM579-PNIO is stored in the PLC filesystem. It will be read and evaluated by the communication module during configuration.

When a new project is loaded or the communication module is replaced the data is not deleted. It can be deleted either manually in the file browser or in the Automation Builder menu "Online ➔ Reset Origin" command.

Shared device

Shared device functionality is available as of Automation Builder 2.6.0 and CPU firmware 3.6.0.

The shared device functionality allows it to use the same IO device with multiple IO controllers at the same time. The sharing of an IO device is done on submodule level. A submodule of PROFINET IO device must be uniquely assigned to a PROFINET IO controller.

The example below shows the configuration of 2 IO controllers using a CM589-PNIO-4 as shared device. The modules or submodules that are assigned to an IO controller are shown in black style. The unassigned ones are in gray style.
The following workflow applies to an IO device configuration:

1. Add an IO device to an IO controller.
2. Add IO modules and submodules according to IO device hardware.
3. Setup required parameters of IO device.
4. Repeat the IO device configuration in the same way for further IO controllers.
5. Select the assigned IO submodules for each IO controller with disconnect/connect module function in context menu.
6. Define one IO controller to be responsible to connect to DAP.

To disconnect DAP and port submodules from IO controller use option “Shared device”:

1. Double-click on “PNIO-Device” to open the device configuration in the editor window.
2. Select tab “Options” to show option “Shared device”.
### Parameter Default Value Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Shared device</td>
<td>unchecked</td>
<td>unchecked</td>
<td>DAP and Port sub-modules are connected.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>checked</td>
<td>DAP and Port sub-modules are disconnected.</td>
</tr>
</tbody>
</table>

### Rules to be followed on using PROFINET “Shared device” configurations:

- All configurations of the IO device at IO controllers using this IO device have to look the same.
- IP configuration (IP address, subnet mask) have to be the same.
- The station names have to be the same.
- Each IO submodule has to be connected at one single IO controller only.

*Automation Builder is not able to check these details for consistency.*

### CM589-PNIO / CM589-PNIO-4-PROFINET IO device communication module

Configuration is valid as of CPU firmware 3.5.0 (“CM589-PNIO”) respectively CPU firmware 3.6.0 (“CM589-PNIO-4”) and “CM589-PNIO” FW 1.6.2.20.

The configuration of the “CM589-PNIO” PROFINET I/O module has to be done in the following steps:

- Parameterization of the AC500 communication module interface ⇨ “Parameterization - communication module interface” on page 1543
- Parameterization of the PROFINET IO device protocol stack ⇨ “Parameterization - PROFINET I/O stack” on page 1544
- Configuring PROFINET IO device module structure ⇨ “Configuring PROFINET IO structure” on page 1544
- Parameterization of the PROFINET IO device modules ⇨ “Parameterization - PROFINET IO device modules” on page 1545
- Mapping of the I/Os ⇨ “Mapping of the I/Os” on page 1546
- Configuration specific to CM589-PNIO-4 ⇨ “Configuration CM589-PNIO-4” on page 1547

Configuration procedure for “CM589-PNIO” and “CM589-PNIO-4” are basically the same. Thus this description refers to “CM589-PNIO” only. Differences between “CM589-PNIO” and “CM589-PNIO-4” will be highlighted explicitly if necessary!

### Parameterization - communication module interface

For connecting a PLC as “PROFINET-IO-Device”, plug “CM589-PNIO” / “CM589-PNIO-4” at the “Extension_Bus” node.

Double-click on “CM589-PNIO” to open the “CM589-PNIO” configuration in the editor window.

The following parameter is available:
Click on tab “CM589-PNIO I/O Mapping” to get “Bus Cycle Options” in the editor window. The following parameter is available:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
<th>Default Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bus cycle task</td>
<td>Use parent bus cycle settings</td>
<td>Use parent bus cycle settings</td>
<td>Settings from “PLC settings” tab are used. Name of task that triggers the bus cycle.</td>
</tr>
</tbody>
</table>

Click on tab “CM589-PNIO IEC Objects”. Here the IO driver instance of communication module is specified.

**Parameterization - PROFINET I/O stack**

All parameters for “PROFINET-IO-Device” protocol configuration are set automatically by Automation Builder. These parameters are displayed just for information and in read-only mode. Double-click on “PROFINET-IO-Device” in tree view will show the parameter set in tab “PROFINET-IO-Device Parameters”.

- **“Station name”:** The default name is displayed. The real name used on acting at the field bus is combined out of this default name and the used setting of the rotary switches at the CM589 module (“cm589-pnio-00”, “00” will be replaced by rotary switch value) or the name set via PROFINET set name service.
- **Parameter “IP address”, “Subnet Mask”, “Default gateway”:** The default values are displayed here. These values are not used as communication settings. PROFINET IO controller supplies the IO devices with IP settings on communication establishing.

**Configuring PROFINET IO structure**

“CM589-PNIO” provides I/O data as modules with different data types and directions. Create an application specific I/O structure by compiling an appropriate combination of modules.

To assign I/O modules to “PROFINET-IO-Device” node open “Add object” dialog.
The maximum image size available for I/O data depends on “CM589-PNIO” modules firmware revision. If firmware revision run by connected “CM589-PNIO” module does not support the number of I/O data configured, download configuration will fail. Currently see “Calculating size of I/O data” on page 1546 how to calculate number of I/O data occupied by certain configuration.

PROFIsafe modules can only be used if a SM560-S-FD1 (for “CM589-PNIO”) respectively SM560-S-FD4 (for “CM589-PNIO-4”) was configured in project. For details see safety documentation.

**Parameterization - PROFINET IO device modules**

PROFINET IO device modules do not need user configuration. All needed parameters are set automatically by Automation Builder. Double-click on a module node shows the parameter set just for information. This parameter set is identical for all module types and is displayed in read-only mode.
- “API”: Shows the API which is used by the “CM589-PNIO” modules. As API 0 is supported only “CM589-PNIO” modules do not provide configuration capabilities for this parameter.
- “Slot number”, “SubSlot-Number”, “Offset in DPM”, inputs/outputs: Will be set to default values on inserting a module. On creating configuration data Automation Builder calculates real values and overwrites the defaults.
- “Offset IOPS” provider/consumer: Not used and set to 0 values.
- “PROFIsafe module”: “FALSE” if module is not a safety module.

Calculating size of I/O data

PROFINET defines I/O data and status information to be exchanged between IO controller and IO device. The status information is called “Provider Status” and “Consumer Status”. Both (I/O data and status information) have to be considered on calculating allocated memory in input and output image.

- The number of status bytes depends on the type of module used.
- The different types of modules input, output and in/output have to be considered different.
- Some status bytes are reserved for predefined submodules have to be considered additionally.

A configured I/O module allocates memory space at the corresponding I/O image for data and status bytes. Additionally memory is allocated at the opposite directions I/O image to store further status bytes. E.g. an input module allocates memory at the input image but additionally it allocates one byte for status at the output image. Summarized size of input and output data and status has to fit to the corresponding image.

Table 301: Overview of I/O module types and corresponding status bytes

<table>
<thead>
<tr>
<th>Module type</th>
<th>Input data</th>
<th>Output data</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Inputs</td>
<td>Provider status inputs</td>
</tr>
<tr>
<td>Reserved</td>
<td>0 bytes</td>
<td>4 bytes</td>
</tr>
<tr>
<td>Input module</td>
<td>n input bytes</td>
<td>1 byte</td>
</tr>
<tr>
<td>(e.g. 4 byte input)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Output module</td>
<td>0 input bytes</td>
<td>0 bytes</td>
</tr>
<tr>
<td>Input/output module</td>
<td>n input bytes</td>
<td>1 byte</td>
</tr>
</tbody>
</table>

Following expressions calculate allocated sizes of input and output data:

Size input = \( \text{Input} + \text{status} + 4 \text{ bytes (reserved status)} \)

Size output = \( \text{Output} + \text{status} + 4 \text{ bytes (reserved status)} \)

- Input = Summarized number input bytes all modules.
- Output = Summarized number output bytes all modules.
- Status = Count input modules + count output modules + 2 * count input/output modules.

Mapping of the I/Os

Double-click on the desired “PROFINET-IO-Device” module object in the device tree to show current I/O mappings connected to this module.
Symbolic names for variables, inputs and outputs for further details on mapping inputs and outputs.

*Chapter 6.3.2.13.7 “Symbolic names for variables, inputs and outputs” on page 1572*

**Configuration CM589-PNIO-4**

“CM589-PNIO-4” adds PROFINET “Shared Device” feature to already described “CM589-PNIO” device functionality. Thus “CM589-PNIO-4” is able to communicate to 4 different PROFINET IO controllers in parallel.

Shared device usage of a “CM589-PNIO-4” does not need to be considered on doing the configuration of the “CM589-PNIO-4” coupler device itself. It has to be considered only on doing the configuration of “CM589-PNIO-4” as child to the “CM579-PNIO” IO controller. See “CM579-PNIO” configuration for details.

**Diagnosis and debugging for AC500 V3 products**

“CM589-PNIO” – PROFINET device diagnosis

The diagnosis messages of communication module “CM589-PNIO” are displayed in tab “Diagnosis” of node “CM589-PNIO” in device tree of Automation Builder. Within PLC application they can be read with the diagnosis methods of IO driver or function block “Diag”.

*Chapter 6.9.1.5.4.2 “Device state” on page 4629

*Chapter 6.9.1.5.3.3.2 “Method Ack / DiagAck: acknowledgement” on page 4623

In PLC display the diagnosis messages of “CM589-PNIO” are not shown.

*Chapter 6.9.3.6.3 “CM589-PNIO(-4) errors” on page 4688

**CM589-PNIO - PROFINET IO slave**

Configuration in Automation Builder is described in PROFINET IO slave configuration.

*Chapter 6.3.2.18 “PROFINET IO Configurator” on page 1640

**6.3.2.11.3 EtherCAT**

**CM579-ETHCAT - EtherCAT I/O master**

*Configuration in Automation Builder.*

- Double-click on “CM579_ECAT (CM579-ECAT)” to open the CM579-ECAT configuration in the editor window.

The following parameters are available:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default value</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

<td>Extended application time, higher lag (2 bus cycles) between input and output values.</td>
</tr>
<tr>
<td>Optimize I/O update</td>
<td>Off</td>
<td>On</td>
<td>When activated, consecutive I/Os are merged in one block to optimize the performance.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Off</td>
<td></td>
</tr>
</tbody>
</table>

**EtherCAT-Master - ABB functionality for sync units**

With the EtherCAT sync units, several slaves are configured into groups and subdivided into smaller units. For each group, the working counter can be monitored for granular input data validation. As soon as a slave is missing in a sync unit group, the input data of all other slaves in the same group becomes invalid.

Detection occurs immediately in the next bus cycle, as the working counter is continuously checked. Unaffected groups remain operable without any interference.

Right click on the “Application” node and press “Create configuration data”.

Automation Builder creates a set of global variables defining the working counter state of a “SyncUnit” command.

The variables use the following naming scheme:

```
"SLOT_" + "CouplerSlot_" + "SyncUnitName" + "_CMD_" + "LogicalAccess" + "_FRAME_" + "FrameID CouplerSlot".
```

**CouplerSlot**

The communication module slot is the ID of the slot where the communication module is plugged in.

**SyncUnitName**

The sync unit name is as defined in the “Sync Unit Assignment” tab.

**LogicalAccess**

The logical access defines the command List of logical access commands:

- Read = 10;
- Write = 11
- Read/Write = 12

**FrameID**

The frame ID starts with 1 and increments if the cyclic exchanged data is larger than the maximum Ethernet frame boundary.

Values
● FALSE: Working counter is as expected (data from slaves is valid)
● TRUE: Working counter is different to expected value (data from slaves is invalid)

The variables can be used by conditional consumption of slave data in the application:

```plaintext
IF NOT SLOT_1_default_CMD_10_FRAME_1 THEN
  (* Consume SyncUnit default slave data *)
END_IF;
```

**EtherCAT diagnosis**

Automation Builder 2.3 provides an enhanced diagnosis interface for the EtherCAT fieldbus. The user can get EtherCAT diagnosis information from different editor views. All these views are accessible within the EtherCAT master device editor and provide information about the master and all configured or connected slaves. The main diagnosis overview is given in the EtherCAT master view “Diagnostics main”.

“Diagnostics main” shows EtherCAT state “Operate”.

If the EtherCAT bus state shows “Operate”, the user does not need to check for any more information.

If the “Diagnostics main” shows any error, like “Topology mismatch detected”, the user can continue to the next level of information by opening editor view “Master State Control”.

“Diagnostics main” shows EtherCAT state “Topology error”. 
“Master State Control” shows EtherCAT state “Operate”.

In editor view “Master State Control” the user can request a master state change or get information about configured parameters as well as events and latest communication errors. In case of any topology error (e.g. slaves are configured in a different order than they exist in hardware) the Automation Builder shows a hint to the user that it might be helpful to execute a bus scan in editor view “Diagnostics live list” to compare the scan result of the real hardware with the configures slaves in the Automation Builder project.

Bus scan result in editor view “Diagnostics live list” shows the connected hardware.
The bus scan result list shows the following information for each connected slave:

<table>
<thead>
<tr>
<th>ID</th>
<th>Position of the found slave device</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Slave identification (name or Vendor/Device ID number)</td>
</tr>
<tr>
<td>State</td>
<td>The connection/link state of all ports (0-3) of the given slave</td>
</tr>
<tr>
<td></td>
<td>Connected =&gt; Cable is plugged in</td>
</tr>
<tr>
<td></td>
<td>+ Link =&gt; Physically connected to another slave</td>
</tr>
<tr>
<td></td>
<td>+ Communication =&gt; Communication works fine</td>
</tr>
<tr>
<td>Name</td>
<td>Not used for EtherCAT</td>
</tr>
<tr>
<td>Address</td>
<td>Not used for EtherCAT</td>
</tr>
<tr>
<td>Details</td>
<td>E.g. revision number of the slave device</td>
</tr>
</tbody>
</table>

*The bus scan shows information about the real connected hardware.*

*Note that a bus scan will always restart the EtherCAT bus.*

*This should not be a problem during commissioning but it might not be applicable in a running system.*

For runtime diagnosis the Automation Builder provides cyclic information of all configured slaves and their states in the editor view “Slave diagnosis”.

Slave diagnosis information shows that configured slaves are ok.

“Slave diagnosis” view shows wrong slave at position 1.

The editor view “Slave diagnosis” shows information about the configured slaves. If these slaves are found in hardware, the states of all slaves are ok. If there is a mismatch between hardware and configuration the view shows at which position that mismatch was detected.
The “Slave diagnosis” shows the following information for each configured slave:

<table>
<thead>
<tr>
<th>Topology Position</th>
<th>Position of the configured slave device.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configured Station Address</td>
<td>Address that is defined by configuration. This address is not topology dependent.</td>
</tr>
<tr>
<td>Slave Name</td>
<td>Configured name of the slave device.</td>
</tr>
<tr>
<td>Slave State</td>
<td>The state of the slave. Possible slave states are:</td>
</tr>
<tr>
<td></td>
<td>NOT CONNECTED ¹ )</td>
</tr>
<tr>
<td></td>
<td>INIT</td>
</tr>
<tr>
<td></td>
<td>PREOP</td>
</tr>
<tr>
<td></td>
<td>SAFEOP</td>
</tr>
<tr>
<td></td>
<td>OP</td>
</tr>
<tr>
<td></td>
<td>INIT ERR</td>
</tr>
<tr>
<td></td>
<td>PREOP ERR</td>
</tr>
<tr>
<td></td>
<td>SAFEOP ERR</td>
</tr>
<tr>
<td>Port State ² )</td>
<td>The state of all ports (0-3) of the given slave. Shows how many connections this slave has to other slaves and if the connections are working fine:</td>
</tr>
<tr>
<td>Connected</td>
<td>=&gt; Cable is plugged in</td>
</tr>
<tr>
<td>+ Link</td>
<td>=&gt; Physically connected to another slave</td>
</tr>
<tr>
<td>+ Communication</td>
<td>=&gt; Communication works fine</td>
</tr>
<tr>
<td>Last Error</td>
<td>The last error that occurred in this slave. As text, if available, and error number. If this is any topology error, the editor view will show a hint to perform a bus scan.</td>
</tr>
<tr>
<td>Emergency [CAN application protocol over EtherCAT (CoE)]</td>
<td>This column contains up to 5 CoE emergency entries. Each entry has</td>
</tr>
<tr>
<td>Error code</td>
<td></td>
</tr>
<tr>
<td>Address of the error register</td>
<td></td>
</tr>
<tr>
<td>Error data (1 byte)</td>
<td></td>
</tr>
<tr>
<td>If there are more than five emergencies reported by the slave, the columns show a hint that some emergency entries have been lost. The column is empty, if no CoE emergencies exist.</td>
<td></td>
</tr>
</tbody>
</table>

Frame Error Counters ² ) | Counts transmission errors on frame layer, detected by CRC check of frames. Fast growing values show a serious problem. Possible root causes include damaged cables, high electromagnetic noise or misbehavior of EtherCAT slave devices. Four counter values are shown, one for each port 0-3. Column has red background in case of any value other than 0. |

Physical Layer Error Counters ² ) | Counts transmission errors on physical layer. Possible root causes include electromagnetic disturbance or faulty devices. Four counter values are shown, one for each port 0-3. Column has red background in case of any value other than 0. |
Link Lost Counters 2) | Optional feature of EtherCAT slave devices, not supported by every device. Counts loss of physical connection (no link, LED off). Even short interruptions can be detected. Possible root causes include power dips, device reset, poor cables or connectors, loose contact. Four counter values are shown, one for each port 0-3. Column has red background in case of any value other than 0.

1) Note that columns “Port State”, “Frame Error Counters”, “Physical Layer Error Counters” and “Link Lost Counters” show “LLD: Timeout”, if this state is NOT CONNECTED, because this information is not accessible.

2) Note that this column contains “LLD: Timeout”, if slave state is NOT CONNECTED.

General note on the counters

Please note that this kind of errors will be detected by devices when power state changes, e.g. when the device itself or a neighboring device is powered on, caused by switching artifacts on the cable. This does not signal an issue, only counters increasing during normal operation should trigger deeper analysis. Counters can be reset by the PLC program using corresponding function blocks.

6.3.2.11.4 PROFIBUS

General

The fieldbus PROFIBUS is supported in AC500 PLC as master and slave. The communication modules “CM592-DP PROFIBUS DP V0/V1 master module” and “CM582-DP PROFIBUS DP slave module” are provided for these purposes.

Parameterization of the CM592-DP/CM582-DP communication modules

Configuration is valid as of CPU FW 3.5.0.

To append a communication module, add the communication module to the “Extension_Bus” node.

- Right-click the desired slot and select “Add object”.
- Select the communication module from the list and click [Replace object].

- Double-click the new node to open the CM592-DP/CM582-DP PROFIBUS DP configuration in the editor window. Click on tab “CM592-DP/CM582-DP Parameters” if not already opened.

The following parameters are available:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default value</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Run on config fault</td>
<td>No</td>
<td>No</td>
<td>In case of a configuration error, the user program is not started.</td>
</tr>
<tr>
<td></td>
<td>Yes</td>
<td></td>
<td>The user program is started independent of a faulty configuration of the PROFIBUS communication module.</td>
</tr>
</tbody>
</table>
Click on tab “CM592-DP/CM582-DP I/O Mapping” to open the “Bus Cycle Options” in the editor window.

The following parameter is available:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default value</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bus cycle task</td>
<td>Use parent bus cycle settings</td>
<td>Use parent bus cycle</td>
<td>Settings from “PLC settings” tab are used.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>settings</td>
<td>Task</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Name of the task that triggers the bus cycle</td>
</tr>
</tbody>
</table>

Click on tab “CM592-DP/CM582-DP IEC-Objects” to open the list of used IEC Objects. For information instantiated I/O driver function block class is shown.

CM592-DP PROFIBUS DP master communication module

Configuration of a PROFIBUS DP master

Double-click on “Profibus_Master_x (Profibus_Master)” to open the “Profibus_Master” configuration in the editor window:

Click on “General” tab if not already opend.

Most of the parameters are calculated automatically. Uncheck [Use defaults] to enable values to be edited individually. Checking [Use defaults] again will revert all parameters to default values.

All times for the PROFIBUS parameters are given in bit time [tBit]. The bit time is the result of the reciprocal of the transmission rate:

\[ tBit = \frac{1}{\text{transmission rate in [bit/s]}} \]

The conversion from milliseconds into a bit time is shown in following formula:

\[ tBit = \text{Time in [ms]} \times \text{transmission rate in [bit/s]} \]
The following parameters are available:

</tbody>
</table>

Remark 1:
To display the parameters of this column, enable the option “Show generic device configuration views” under “Tools -> Options -> Device editor”.

**Configuration of a PROFIBUS DP slave**

A PROFIBUS DP slave can be added by right-clicking on “Profibus_Master_x (Profibus_Master)” and selecting “Add object”.

If the desired device is not listed it can be installed via the “Device Repository” (menu item “Tools” -> “Device Repository”).

The slave configuration parameters can be edited in slave related editor window. To open this editor window, double-click the corresponding slave in the device tree.

Click on tab “General” if not already opened.
All times for the PROFIBUS parameters are given in bit time \( [t_{\text{Bit}}] \). The bit time is the result of the reciprocal of the transmission rate:

\[
t_{\text{Bit}} = \frac{1}{\text{transmission rate in [bit/s]}}
\]

The conversion from milliseconds into a bit time is shown in following formula:

\[
t_{\text{Bit}} = \frac{\text{Time in [ms]}}{\text{transmission rate in [bit/s]}}
\]

</thead>
</table>

**Remark 1:**

To display the parameters of this column, enable the option "Show generic device configuration views" under "Tools → Options → Device editor".

Click on tab "Check configuration".

Following dialog shows values for input/output/parameter data occupied by your configuration. Here it can be checked how much data is left for further configuration.
CM582-DP PROFIBUS DP slave communication module

Configuration of PROFIBUS DP slave

Double-click on “PROFIBUS_DP_Slave” to open the PROFIBUS slave configuration in the editor window:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default value</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bus address</td>
<td>1</td>
<td>0 ... 126</td>
<td>The bus address is the individual device address of the slave device on the bus.</td>
</tr>
</tbody>
</table>

Configuration of I/O data objects

To append I/O data, add the desired input / output objects to the Communication Module node.

Right-click the Communication Module node and select “Add object”.

Different types of data objects group I/O variables by size and direction. The I/O driver of the PLC firmware copies the amount of data bytes configured by these data objects cyclically.
Select the desired I/O objects from the list and click [Add object].

To keep basic load of PLC low, only configure as much I/O data objects as actually required. If further I/O variables need to be added later, additional data objects can be inserted.

Technical details on the device such as the maximum amount of bytes used for I/O data is described in the device specification for Chapter 5.2.2.8.1 “CM582-DP - PROFIBUS DP slave” on page 354.

Double-click an added I/O object node to open the preset configuration. As the I/O objects do not need user configuration all parameters in the “Parameters” tab are read-only.

Open the “I/O Mapping” tab to configure the mapping configuration for the I/O object.

**Possible inconsistency**

On using CM582-DP slave device configured with modules types combining input and output data the following situation may happen:
Example

CM582-DP communication module configuration uses module type 16 Byte In/Out. The device representation assigned to CM592-DP master uses module types 16 Byte Output and 16 Byte Input at the same place instead.

This mismatch will not be detected; neither by Automation Builder nor by PROFIBUS master and slave. However, the communication will run stable and I/O data exchange is executed successfully.

Reason:
AC500 defines modules combining input and output directions to be split to two separated module configurations internally with output direction first.
Thus in AC500 the PROFIBUS configuration data for one module of type 16 Byte In/Out looks the same as for the combination of module types 16 Byte Output and 16 Byte Input.

Mapping of the I/Os

Double-click on the desired I/O data object in the device tree to show current I/O mapping connected to this data object. See Chapter 6.3.2.13.7 “Symbolic names for variables, inputs and outputs” on page 1572.

6.3.2.11.5 Ethernet

CM5640-2ETH – Ethernet communication module

Configuration is valid as of CPU FW 3.6.0.

Configuration of the communication module

Append a CM5640-2ETH.

All interfaces of the onboard and CM5640-2ETH modules need to be in different subnets. Overlapping of subnets must be avoided. The selection of the used interface (ETH port) is done automatically according the match of the IP-address of the server and the subnet of the interfaces.
1. Right-click on your desired Slot below node “Extension Bus” and click “Add object.”
   ⇒ Dialog “Replace object:” appears.
2. Click “CM5640-2ETH” in the list and click the button [Replace object].

Double-click “CM5640-2ETH (CM5640-2ETH)” to get the “CM5640-2ETH Parameters” in the editor window.

The communication module CM5640-2ETH is a port extender of the processor module used. Each communication module adds 2 additional independent ethernet interfaces. The communication module in the configuration tree is displayed in the same way as the processor module onboard ethernet interfaces.

The configuration of both interfaces is done as for the onboard ethernet interfaces from a processor module.

Double-click “ETH1_1 (IP Setting)” will open the windows to select the possible server protocols and all non-available protocols for that interface are greyed.

The added feature appears below “NetConfig (NetConfig)” for example and the configuration of each feature is done by clicking on the selected feature and opening new windows.

Both interfaces can be independently configured and the available server protocols always displayed when available or greyed when disabled.

Selecting “Protocols_1 (Client Protocols)” and right click and use “Add object”, a new window opens showing the available client protocols.
The configuration of each protocol either server or client is done in the same way as for onboard ethernet of the processor module.

6.3.2.12 Communication interface modules

6.3.2.12.1 Configuration of communication interface modules

Automation Builder can be used to configure the parameters of CI5xx devices.

Configuration of S500 I/O modules can be performed without CI5xx devices connected.

Adding CI5xx device to the device tree

1. Right click in the device tree on the node “Slot1” or “Slot2” of the “Extension_Bus” and click “Add object”.
   ➞ The window “Replace object : Slot <...>” opens.
2. Select your “CM5xx master module” and click [Add object].
   ➞ The “CM5xx master” appears in the Slot.
3. Right click on “CM5xx master module” and click “Add object”.
   ➞ The window “Add object below : <...>_Master” opens.
4. Select your “CI5xx” device and click [Add object].
   ➞ The “CI5xx” device appears in your device tree.
Adding S500 I/O modules

1. Right click on your “CI5xx” device and click [Add object].
   ⇒ The window “Add object below:” opens.
2. Select your I/O module and click [Add object].
   ⇒ The I/O module is added.

Configure parameters

⇒ Double-click the “CI5xx” device to open editors and select the “CI5xx_I/O Parameters” tab.

This editor shows the parameters that can be set for each device , and .

6.3.2.12.2 Unbundled CI52x-MODTCP configuration

Automation Builder can be used to configure the parameters of CI52x-MODTCP devices.

A direct Ethernet connection is required between the PC running Automation Builder and the CI52x-MODTCP module.

Configuration of S500 I/O modules can be performed without CI52x-MODTCPs modules connected.

Start a project from template

1. Select “New Project” in menu item “File”.
   ⇒ The window “New Project” appears.
2. Select the “CI52x-MODTCP Configuration Project” and click “OK”.
   ⇒ The window “Select PLC” opens.
3. Select a “CI52x-MODTCP” device and click “Add device”.
   ⇒ A project is created. More modules can be added.

Add CI52x-MODTCP to a project

1. Right click in the device tree on the root of the “Project” and click “Add object”.
   ⇒ The window “Add object below” opens.
2. Select “Modbus devices” and click “Add object”.
   ⇒ The node “Modbus_devices” appears in your device tree.
3. Right click on the node “Modbus_devices” and click “Add object”.
   ⇒ The window “Select PLC” opens.
4. Select your “CI52x-MODTCP” device and click “Add device”.
   ⇒ The “CI52x-MODTCP” device appears in your device tree.

Add S500 I/O modules

1. “Add object” to your “CI52x-MODTCP” device.
   ⇒ The window “Add object below: CI52x-MODTCP” opens.
2. Select your I/O module and click “Add object”.
   ⇒ The I/O module is added.

Configure parameters

⇒ Double-click the device to open editors and select the “CI52x-MODTCP Parameters” tab.

This editor shows the parameters that can be set for each device. For more information see ☞ Chapter 5.2.6.5.1.8.1 “Parameters of the module” on page 1090 CI521, ☞ Chapter 5.2.6.5.2.8.1 “Parameters of the module” on page 1120 CI522 and .

Connect to device

To read or write parameters, the CI52x-MODTCP module must be connected to the PC with an Ethernet connection.

See ☞ Chapter 5.2.6.5.1.6 “Addressing” on page 1089 CI521 and ☞ Chapter 5.2.6.5.2.6 “Addressing” on page 1120 CI522 of the CI52x-MODTCP hardware documentation for information on configuring the IP address of the device.

On the CI52x-MODTCP device editor, the “Connection Settings” tab allows the IP address of the device to be entered.
Read Reads the parameters from the CI52x-MODTCP and also for the attached S500 I/O modules.

Write Sends the parameters from the editors to the CI52x-MODTCP and also the S500 I/O modules.

**Device checking**  
The CI52x-MODTCP module knows which I/O modules are attached.

While reading and writing parameters, the project must match the physical hardware. Otherwise an error will be given.

Communication errors will also result in error messages.

When the parameters have been read or written correctly, a message is seen in the “All messages” window:

**Attached S500 modules**  
It is possible to read and write parameters when the S500 I/O modules are not attached to the CI52x-MODTCP module.

A warning will be shown if an I/O module is not detected:

When writing parameters, the CI52x-MODTCP configuration is overwritten so the current configuration of missing (unplugged) modules does not matter.

If the I/O modules are attached, then the project must match the hardware, otherwise an error will be given.

**Firmware update**  
As of Automation Builder 2.2.1, the IP Configuration Tool can be used to perform firmware updates for CI52x-MODTCP devices.
6.3.2.13 I/O bus and I/O modules

6.3.2.13.1 Hot swap configuration

Table 302: Parameters for hot swap configuration of I/O extension modules

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Purpose</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hot-swap terminal unit required</td>
<td>To include diagnosis for missing hot-swap terminal unit</td>
<td>Yes: Communication interface provides extended diagnosis for missing hot-swap terminal unit</td>
</tr>
<tr>
<td></td>
<td></td>
<td>No (default): Extended diagnosis not available</td>
</tr>
<tr>
<td>Start-up with missing module on hot-swap terminal unit</td>
<td>Ignore missing module during start-up on hot-swap terminal unit. Incomplete I/O configurations must not prevent the system from starting.</td>
<td>Yes: Module is optional, start-up if there is no module available on hot-swap terminal unit</td>
</tr>
<tr>
<td></td>
<td></td>
<td>No (default): Module is mandatory, start-up only if correct module is available</td>
</tr>
</tbody>
</table>

In the Automation Builder projects for V3 PLCs, hot-swap parameters can be configured from “Module Parameters” tab of respective I/O module.

By default, the “Module Parameters” tab is not visible for parameter configuration.

Follow the below steps to enable this tab:
1. In the Automation Builder menu select “Tools ➔ Options”
2. Select “Device editor” option from “Options” dialog.
3. Enable the option “Show generic device configuration views” (if not already done)
4. To save the settings and close the dialog select [OK]
6.3.13.2 Parameterization of the I/O bus

Double-click the “IO_Bus” node in the device tree to open the I/O bus configuration.

The following parameters are available:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Run on config fault</td>
<td>No</td>
<td>No</td>
<td>In case of configuration fault the user program will not be launched.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Yes</td>
<td>The user program will be also launched in case of configuration error on the I/O Bus.</td>
</tr>
<tr>
<td>Max wait run</td>
<td>3000</td>
<td>0...120000</td>
<td>Maximum waiting time for valid inputs.</td>
</tr>
</tbody>
</table>

In case of a digital I/O Module, the channels are provided as WORD, BYTE and BOOL. Because the analog inputs can also be configured as digital inputs, bit 0 of each channel is also available as BOOL.

The symbolic name of a channel can be entered in front of the string “AT” in the channel declaration.

All channels should have a symbolic name and only symbolic names should be used in the program code. If the hardware configuration has changed or if you want to download the project to a PLC with another hardware configuration and thus the PLC configuration has to be changed, the addresses of the inputs and outputs can change. In case of symbolic programming (i.e., symbolic names are used), the program code does not have to be changed.
6.3.2.13.3 Parameter 'Ignore module'

All I/O devices provide the parameter “Ignore module”. This parameter can be used for simulation purposes and determines whether an I/O device is considered or ignored during a PLC configuration check.

This allows to use an existing Automation Builder project/PLC configuration though some hardware devices are not physically available in a hardware installation.

Example

The Automation Builder project for machine A shall be used for machine B. However, the second DC523 device is missing in the hardware installation of machine B. Hence, for machine B the value for “Ignore module” is set to “YES”.

6.3.2.13.4 I/O bus - Bus cycle task

The term "bus" includes all fieldbuses as well as the I/O bus. Consider that there is no bus cycle task for Modbus as Modbus does not provide I/O mapping and is controlled by POU.s.

It's recommended to define a dedicated bus cycle task for each fieldbus configured in the project. It's strongly recommended not to use "unspecified" in the "PLC Settings" to avoid unexpected behavior. The task defined in "PLC Settings" determines the bus cycle task of I/O bus and, depending on the configuration, of the additional fieldbuses (the setting is by default inherited).

Especially in case of EtherCAT, a dedicated bus cycle task should be used which is not shared with other fieldbuses. If [unspecified] is set in the "PLC Settings", the EtherCAT task might be automatically used by other fieldbuses, potentially causing the EtherCAT task processing to fail. This should be avoided by specifying a task different to the EtherCAT task in the "PLC Settings".

As a rule, for each IEC task the used input data is read at the start of each task and the written output data is transferred to the I/O driver at the end of the task. The implementation in the I/O driver is decisive for further transfer of the I/O data. The implementation is therefore responsible for the timeframe and the specific time when the actual transmission occurs on the respective bus system.

Other tasks copy only the I/O data from an internal buffer that is exchanged only with the physical hardware in the bus cycle task.
Using tasks

The "Task Deployment" provides an overview of used I/O channels, the set bus cycle task, and the usage of channels.

**WARNING!**

If an output is written in various tasks, then the status is undefined, as this can be overwritten in each case.

When the same inputs are used in various tasks, the input could change when a task is processed. This happens if the task is interrupted by a task with a higher priority and causes the process map to be read again. Solution: At the beginning of the IEC task, copy the input variables to variables and then work only with the local variables in the rest of the code.

Conclusion: Using the same inputs and outputs in several tasks does not make any sense and can lead to unexpected reactions in some cases.

### 6.3.2.13.5 Insertion of S500 I/O devices

1. Right-click "IO_Bus" in device tree and select [Add object].
   -> The “Add Device” dialog window where all available S500 I/O devices are listed will open.

2. Append the S500 I/O devices in the same order as they are mounted on the hardware.
   Input and output modules connected to the I/O bus occupy the I/O following area: %IB0 ... %IB999 or %QB0 ... %QB999.

**AC500 (Standard): PM56xx support up to 10 S500 I/O devices.**
6.3.2.13.6 Configuring the input and output modules and channels

The I/O channel configuration depends on the corresponding S500 I/O device. The individual configuration parameters can be opened in the editor window via double-click on the corresponding module and are listed in tab “S500 I/O device name Configuration”.

6.3.2.13.7 Symbolic names for variables, inputs and outputs

The IEC naming rules are not checked during input in Automation Builder.

Input and output mapping

Devices with I/Os provide an “I/O Mapping” tab in their configuration editor where the available I/O channels can directly be mapped to a global variable. The corresponding variable declarations are automatically available in the project. All available I/O channels can easily be assigned to a variable.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Mapping</th>
<th>Channel</th>
<th>Address</th>
<th>Type</th>
<th>Default Value</th>
<th>Unit</th>
<th>Description</th>
</tr>
</thead>
<tbody>

<td></td>
<td>Digital inputs 18 - 23</td>
<td>%IB3</td>
<td>BYTE</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

AC500 uses Intel Byte Order (Little Endian).

Only entries with a data type set in column “Type” can be mapped. These entries can be expanded to show the available I/O channels. If the project has been imported from a previous Automation Builder version, all variables should be checked to avoid inconsistencies concerning the I/O mapping.

6.3.2.13.8 I/O mapping list

Introduction

Automation Builder contains an I/O mapping list feature for creating mapping variables with better usability support compared to the tree structured view.

Details on the tree structured view.
Functionalities of the I/O mapping list:

- Displays I/O mappings for current node and all valid subsequent child nodes.
- Displays channel information with additional columns.
- Supports keyboard functions such as cut, copy, paste, delete, and select all within the editor and within Excel spreadsheet (for bulk editing).
- Contains a toolbar for various actions, e.g. filtering, undo/redo and clear mappings.
- Supports single click edit and easy navigation using arrow keys.
- Improvised error handling:
  - Allows to enter invalid mapping variables. This provides flexibility in bulk editing. Only when saving the project, the errors - according to IEC 61131 standard - are displayed.
  - In the message window, the error log is visible. The user can track the errors to their corresponding channel in the editor.
- Allows multi-selection of rows and columns. (Random selection is not allowed.)

**Editing I/O mapping list**

1. In the device tree, double-click "IO_Bus" to configure entire I/O mapping list of different I/O devices.
2. Enter the variables and descriptions to map the I/O devices.
   
   **Do not start variable names with a number or a special character. When saving the project, this generates an error. Example: 12input3, @input4.**

3. Click “Save Project” to save the I/O mapping changes.

**Configuring I/O mapping list**

Automation Builder supports tree and list based editors for creating I/O mapping variables.

1. From the “Tools” menu, select “Options”.
2. Under Automation Builder, select the “Editors” tab.
3. Choose your desired mapping dialog and click [OK].
   - Choose “tree based” to display the I/O mapping in tree structure.
   - Choose “list based” to display the I/O mapping as list with the functionalities of the ToolBar.
   - Choose “both” to display both the tree structure (“I/O Mapping” tab) and the list view (“I/O mapping list” tab).

**Available channel information**

The I/O mapping list displays the channel information in offline and online mode. In online mode, all columns are read-only. In offline mode, some columns are editable.

The order of the devices in I/O mapping list is synchronized with the order in the device tree.

The channels of a device are ordered by the device description file. If channels have a section, the channel information is represented in a specific format.

Example: Fast counter: Actual value 1. These channels are listed at last position of a device.

**Filtering**

Especially in case of long I/O mapping lists, it might be helpful to filter the I/O mappings. For this, click the “Filter” icon to display all available criteria for filter options.

*When reducing the width of the editor, some filters might be hidden.*

**Undo, redo and clear**

- “Undo”: Cancels the last change.
- “Redo”: Repeats the last change.
- “Clear mappings”: Deletes all variables and descriptions.

### 6.3.2.13.9 Fast counter

#### Configuration for S500 I/O modules

**Configuring the fast counter**

1. In the device tree, add a digital I/O module to the “IO-Bus” node.
2. Double-click the node for the I/O module, open the “Parameters” tab and set the operating mode of the “Fast counter” parameter.

   ≈ Chapter 6.3.2.13.9.1.3 “Operating modes” on page 1577

<table>
<thead>
<tr>
<th>Fast counter</th>
<th>Enumeration of BYTE</th>
<th>0-No counter</th>
<th>0-No counter</th>

<td>Input byte 0</td>
<td>Byte: Bit 0 = CF Bit 1 to Bit 7 free</td>
</tr>
<tr>
<td>Status Byte 1</td>
<td>Input byte 1</td>
<td></td>
</tr>
</tbody>
</table>

### Operating modes

Inputs and outputs which are not used by the counters, are available for other tasks.

Legend:

- A refers to input channel A
- B refers to input channel B
- C refers to output channel C

<table>
<thead>
<tr>
<th>Operating mode</th>
<th>Function</th>
<th>Used inputs and outputs</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>No counter</td>
<td>none</td>
<td>This operating mode is selected if the integrated fast counter is not necessary.</td>
</tr>
<tr>
<td>1</td>
<td>One count up counter</td>
<td>A = Counting input C = End value reached</td>
<td>The counting input and the output &quot;End value reached&quot; are enabled by the bit EN = TRUE within the control byte.</td>
</tr>
<tr>
<td>Operating mode</td>
<td>Function</td>
<td>Used inputs and outputs</td>
<td>Notes</td>
</tr>
<tr>
<td>----------------</td>
<td>----------</td>
<td>-------------------------</td>
<td>-------</td>
</tr>
</tbody>
</table>
| 2              | One count up counter with enable input via terminal | A = Counting input  
B = Enable input  
C = End value reached | The enable input enables the counting input and the output "end value reached". The counter is only enabled if the enable input = TRUE (signal 1) AND the bit EN = TRUE within the control byte. |
| 3              | Two up/down counters | A = Counting input 0  
B = Counting input 1 | With this operating mode, two counters exist, which are independent of each other. The state "End value reached" is only readable from the two status bytes. It is not readable from output terminals. The counting direction is defined by the bit UP/DWN within the control byte. |
| 4              | Two up/down counters (1 counting input inverted) | A = Counting input 0  
B = Counting input 1 | This operating mode equals operating mode 3 with one exception: The counting input B (of counter 1) is inverted. It counts the TRUE/FALSE edges at input B. |
| 5              | One bidirectional counter with a dynamic set input via terminal | A = Counting input  
B = Dynamic set input | With this operating mode, one bidirectional counter is available which has a dynamic set input. Dynamic means that the set operation is performed at the FALSE/TRUE signal edge (0/1 edge) of the set input and not while the signal is TRUE. The state "End value reached" is only readable from the status byte, not from an output terminal. |
| 6              | One bidirectional counter with a dynamic set input via terminal | A = Counting input  
B = Dynamic set input | This operating mode equals operating mode 5 with one exception: The dynamic set input operates at the TRUE/FALSE edge (1-0 edge). |
<table>
<thead>
<tr>
<th>Operating mode</th>
<th>Function</th>
<th>Used inputs and outputs</th>
<th>Notes</th>
</tr>
</thead>
</table>
| 7              | One bidirectional counter for position sensors | A = Trace A of the position sensor  
B = Trace B of the position sensor | With this operating mode, incremental position sensors can be used which interchange their counting signals on tracks A and B in a 90° phase sequence. Depending on the sequence of the signals at A and B, the counter counts up or down. There is no pulse-multiplier function (e.g. x2 or x4). The position sensor must provide 24 V signals. Signals of 5 V sensors must be converted. Zero traces are not processed. The state "End value reached" is only readable from the state byte 0, not from an output terminal. 
The bit UP/DWN within the control byte must be FALSE. Otherwise, a parameter error occurs. In this operating mode, the maximum counting frequency is:  
I/O modules 35 kHz. Communication interface modules 50 kHz. |
<p>| 8              | Reserved |                        |       |</p>
<table>
<thead>
<tr>
<th>Operating mode</th>
<th>Function</th>
<th>Used inputs and outputs</th>
<th>Notes</th>
</tr>
</thead>
</table>
| 9              | One bidirectional counter for position sensors (pulse multiplier x2) | A = Trace A of the position sensor  
B = Trace B of the position sensor | This operating mode equals operating mode 7 with one exception: There is a pulse multiplication x2 with the evaluation of the counting inputs. This means, that the counter counts both the positive edges and the negative edges of trace A. This results in the double number of counting pulses. The precision increases correspondingly. In this operating mode, the maximum counting frequency is:  
I/O modules 30 kHz.  
Communication interface modules 35 kHz. |
| 10             | One bidirectional counter for position sensors (pulse multiplier x4) | A = Trace A of the position sensor  
B = Trace B of the position sensor | This operating mode equals operating mode 7 with one exception: There is a pulse multiplication x4 with the evaluation of the counting inputs. This means, that the counter counts the positive and negative edges of the traces A and B. This results in the fourfold number of counting pulses. The precision increases correspondingly.  
In this operating mode, the maximum counting frequency is:  
I/O modules 15 kHz.  
Communication interface modules 20 kHz. |
Configuration for onboard I/Os

Configuring the fast counter

1. In the device tree, double-click the “Onboard I/O” node (OBIO).
2. In the “Parameters” tab set the counting mode for the fast counter.

☞ Chapter 6.3.2.13.9.2.2 “Counting modes” on page 1582

3. In the “I/O Mapping” tab channel configuration is displayed.

☞ Chapter 6.3.2.13.9.3 “Control of the fast counter” on page 1583

The parameter of the fast counter channels of the Onboard I/O must be configured before they can be used. User should take these steps to configure the fast counter:

<table>
<thead>
<tr>
<th>Channel</th>
<th>Direction</th>
<th>Width</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Actual value X</td>
<td>Input</td>
<td>DWORD</td>
<td>Current value of the fast counter.</td>
</tr>
</tbody>
</table>
| State byte X  | Input     | BYTE  | Bit 0 = CF
If the counter reaches the programmed end value, the counter output is stored permanently as CF = TRUE (end value reached). Only, if the counter is set again (set value), CF is reset to FALSE.

**Bit 1 to Bit 7 free**

<table>
<thead>
<tr>
<th>Start value X</th>
<th>Output</th>
<th>DWORD</th>
<th>Each counter can be set to a start value. Start values are loaded into the counter by the user program. 6.3.2.14   Serial interface
6.3.2.14.1 Setting up a serial interface

General

The configuration for serial interfaces and their protocols is done via two nodes:

- One node represents the common serial parameters related to the hardware port.
- The node below represents the parameterization for the particularly attached protocol.

Supported protocols

- 3S CAA SerialCom (common serial communication, send/receive data)
  - Chapter 6.3.2.14.3 “Configuring CAA SerialCom on serial interface” on page 1590
- Modbus RTU (client & server)
  - Chapter 6.3.2.14.2 “Configuring Modbus RTU on serial interface” on page 1588
  - How to switch between the protocols.

Configuration

The following parameters are available in the configuration view of the COM port node:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value ranges</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Run on config fault</td>
<td>No, Yes</td>
<td>If this parameter is set to “Yes” the IEC application will not be prevented from switching to RUN state, independent from possibly existing configuration errors of the particular COM port.</td>
</tr>
<tr>
<td>Transmission rate</td>
<td>9600 baud/sec</td>
<td>Sets up the transmission rate to use for the COM port.</td>
</tr>
<tr>
<td></td>
<td>19200</td>
<td></td>
</tr>
<tr>
<td></td>
<td>38400</td>
<td></td>
</tr>
<tr>
<td></td>
<td>57600</td>
<td></td>
</tr>
<tr>
<td></td>
<td>115200</td>
<td></td>
</tr>
<tr>
<td>Parity</td>
<td>None, Odd, Even</td>
<td>Sets up the parity to use for the COM port.</td>
</tr>
<tr>
<td>Data bits</td>
<td>5 data bits, 6 data bits, 7 data bits</td>
<td>Sets up the number of data bits to use for the COM port.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Value ranges</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------</td>

</tr>
<tr>
<td></td>
<td>8 data bits</td>
<td></td>
</tr>
<tr>
<td>Stop bits</td>
<td>1 stop bits</td>
<td>Sets up the number of stop bits to use for the COM port.</td>
</tr>
<tr>
<td></td>
<td>2 stop bits</td>
<td></td>
</tr>
<tr>
<td>Flow control</td>
<td>No flow control</td>
<td>Allows to switch between different flow control modes (either RTS/CTS hardware or Xon/Xoff software or none). This setting is only valid for RS-232 serial interface mode. In case RS-485 is used for parameter “Serial interface”, flow control must set to “No flow control”. Otherwise a configuration error is triggered.</td>
</tr>
<tr>
<td></td>
<td>Hardware RTS/CTS</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Software Xon/Xoff</td>
<td></td>
</tr>
<tr>
<td>Boot parameter</td>
<td>RS-232</td>
<td>Allows to switch between RS-232 and RS-485. Due to technical reasons, it’s not possible to dynamically switch between the modes. This means, a reboot (or power cycle) of the PLC is required to activate the particular setting once changed.</td>
</tr>
<tr>
<td>Serial interface</td>
<td>RS-485</td>
<td></td>
</tr>
</tbody>
</table>

**Comparison to AC500 V2 PLCs**

The following table shows the differences between AC500 V2 and V3 PLCs regarding the parameter set for serial interfaces:

<table>
<thead>
<tr>
<th>V2 Parameter</th>
<th>Representation in V3</th>
<th>Remark</th>
</tr>
</thead>
<tbody>
<tr>
<td>Run on config fault</td>
<td>Run on config fault</td>
<td>Exactly the same</td>
</tr>
<tr>
<td>RTS control</td>
<td>Flow control (partially)</td>
<td>Special modes which allow to use PLC as modem and mode implicitly setting RS-485 will not be taken over. Flow control settings will be limited and only support hardware, software or none.</td>
</tr>
<tr>
<td>Transmission rate</td>
<td>Transmission rate</td>
<td>For V3, the transmission rate range will be 9600 to 115200. Low modes will not be supported due to lack of support in Linux. High rates were only realized in V2 to support field bus plug as well as CS31 field bus. Both protocols are not supported anymore in V3, so these transmission rates won’t be available in V3. Approach: Only support most common transmission rates</td>
</tr>
<tr>
<td>Parity</td>
<td>Parity (subset)</td>
<td>AC500 V3 doesn’t allow to configure parity modes “mark” and “space”. This means, only “none”, “odd” and “even” are configurable.</td>
</tr>
<tr>
<td>Data Bits</td>
<td>Data Bits</td>
<td>Exactly the same</td>
</tr>
<tr>
<td>Stop Bits</td>
<td>Stop Bits</td>
<td>Exactly the same</td>
</tr>
</tbody>
</table>

**6.3.2.14.2 Configuring Modbus RTU on serial interface**

**Enable Modbus RTU**

To enable Modbus RTU on a serial interface the protocol setup per default has to be replaced by either Modbus RTU client or server, depending on required operation mode.

A serial interface supports only one protocol/operation mode at once.
1. Right-click node “CAA_SerialCom” and click “Add object”.
2. Select “Modbus RTU Client” or “Modbus RTU Server” and click “Add object”.
  ⇒ “CAA_SerialCom” is replaced by your selection.

**Parameters**

**Serial**

Serial parameters to be set selecting the interfaces node “COM_1”. They are common for both operating modes client and server.

- The parameter “Data bits” always **has to be** set to “8” for Modbus.

**Modbus RTU server**

Server specific parameters to be set selecting the protocol’s node “Modbus_RTU_Server”.

- **Address**
  Bus address of the PLC as Modbus RTU Server on that interface
- **Byte Order**
Format/Endianness for the transmission of WORD values (register) within the request/response telegram (default: Big Endian)

"Disable"

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Disable write to %MB from</td>
<td>0</td>
<td>0 ... 65535 Disable write access starting at %MBx</td>
</tr>
<tr>
<td>Disable write to %MB to</td>
<td>0</td>
<td>0 ... 65535 Disable write access up to %MBx</td>
</tr>
<tr>
<td>Disable read from %MB from</td>
<td>0</td>
<td>0 ... 65535 Disable read access starting at %MBx</td>
</tr>
<tr>
<td>Disable read from %MB to</td>
<td>0</td>
<td>0 ... 65535 Disable read access up at %MBx</td>
</tr>
</tbody>
</table>

It is possible to disable read and/or write access to individual segments. Reading/writing is disabled beginning at the set start address and is valid up to the set end address (inclusive).

Modbus RTU client

"Modbus RTU Client" does not have any protocol parameters.

6.3.2.14.3 Configuring CAA SerialCom on serial interface

Enable CAA_SerialCom

The "CAA SerialCom" protocol is the serial standard protocol from CODESYS. It allows users to implement a custom protocol.

How to implement a serial communication for ASCII code via RS232 or RS485 within a AC500 V3 or AC500-eCo V3 PLC is described in an application example. The described implementation is based on the AC500_Com library which implements the CAA SerialCom library to establish a connection via the COM interfaces.

Default setting

When creating a new project, the protocol "CAA SerialCom" is automatically attached to the "COM_1" port of a V3 PLC.
Right-click on the node attached to “COM_1” node in the device tree and click “Delete”.
⇒ The node is switched back to the “CAA SerialCom” protocol.

Parameters

Since “CAA SerialCom” doesn’t represent a “real” protocol, there are no specific parameters required. All common settings can be found at the “COM_1” tab after double-click on the “COM_1” node.

⇒ Chapter 6.3.2.14.1 “Setting up a serial interface” on page 1587

Activate particular configuration parameters

The parameters set up in the Automation Builder device tree are NOT automatically taken over in the PLC.

It is still required to use the “3S IEC POU”s” to activate the particular configuration parameters.
ABB provides the library AC500_Com ("ABB - AC500 / Use Cases / Serial Communication") which contains a POU called “ComGetCaaSerialComConfig”.

The function block can be used to obtain the configuration data which is set up in Automation Builder to directly pass it to “CAA SerialCom-POU Open”. This avoids manual creation of a parameter list.

The following code snippet shows how the COM port is identified by its node name and how the parameter list for the function block is read from the configuration data of the currently loaded IEC application:

```plaintext
FUNCTION_BLOCK GET_CAA_COM_CFG
VAR_INPUT
END_VAR
VAR_OUTPUT
END_VAR
VAR

6.3.2.15 Gateway configuration

1. In the Automation Builder project, right-click the topmost PLC tree node and select "Communication Settings".
   ⇨ The dialog window "Communication Settings" appears.

2. Click "Advanced Settings" to open the dialog ⇨ Chapter 6.4.1.21.2.8.3 "Tab 'Communication Settings'" on page 2427.
   ⇨ This information will be stored in the project file.
6.3.2.15.1 Gateway settings on windows server

Gateway as a service
To allow multiple concurrent users from different user sessions on the server to connect to PLCs, the user has to run CODESYS gateway as a system service. This is managed by a service called "CoDeSys V2.3 Gateway Service Wrapper". The service starts on system start-up and launch the gateway.

If you want to restart the gateway, use "Services management console" to restart "CoDeSys V2.3 Gateway Service Wrapper".

This executable is installed only on a windows server system and a related service (CoDeSys V2.3 Gateway Service Wrapper) is created and started.

For V3 PLC the V3 gateway always runs as a service on windows servers and also on other Windows OS variants (e.g. Windows 10).

Gateway settings
You can set the communication settings in the Automation Builder project for every PLC. Otherwise, an error message is displayed while trying to open CODESYS.

See the description for Gateway configuration and select "TCP/IP" under "Connection" Chapter 6.3.2.15 "Gateway configuration" on page 1593.

Windows server usage in Automation Builder requires modifications of the system environment and of the settings in Automation Builder, e.g. permissions, licensing, session handling etc. How to setup system and software for Windows server is described in the application note Windows Server 2016 - RDM access.

6.3.2.16 CAN onboard

6.3.2.16.1 CANopen

General
In Automation Builder, a CANopen network consists of one CANopen manager which acts as master device and optional CANopen remote devices which act as slave devices.

CANopen manager (master)
General

Tab 'CANopen Manager - General'

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Node-ID&quot;</td>
<td>The node number identifies the CANopen Manager as unique (range of values: 1...127).</td>
</tr>
<tr>
<td>&quot;Check and Fix Configuration&quot;</td>
<td>Opens the dialog of the same name. See below for details.</td>
</tr>
</tbody>
</table>
“Autostart CANopen Manager”

- The CANopen Manager starts automatically (switches to OPERATIONAL mode) after all required slaves are ready.
- The CANopen Manager has to be started from the application. The function block Cia405.NMT can be used to do this.
  
  Hint: As long as the CANopen Manager is not in OPERATIONAL mode, no PDOs are sent (outputs refreshed).

“Polling of optional slaves”

- When a slave does not respond during the boot sequence, the CANopen Manager interrogates it every second until it does respond.

  Constantly polling the slave increases the bus cycle time, which can interfere with the application (especially motion applications). You can deactivate polling to avoid this behavior. If polling is deactivated, then a slave is detected again when it sends a bootup message.

“Start slaves”

- The CANopen Manager is responsible for starting the slaves.
- You have to start the slaves from the application. Use the Cia405 NMT function block to do this.

“NMT start all (if possible)”

- If the “Start slaves” option is activated, then the CANopen Manager starts all slaves with an "NMT Start All" command. The "NMT Start All" command is not executed as long as optional slaves are not yet ready to be started. In this case, the CANopen Manager starts each slave individually. The "NMT Start All" command can be guaranteed only in a project without optional slaves.

“NMT error behavior”

- "Restart slave". If an error occurs during slave monitoring (NMT Error Event), then the slave is restarted automatically by the stack (NMT Reset + SDO Configuration + NMT Start).
- "Stop slave". If an error occurs during slave monitoring (NMT Error Event), then the slave is stopped. Then you have to reset the slave from the application, using the Cia405 NMT function block.

Table 306: “Guarding”

Working with heartbeat messages is an alternative method of monitoring. It can be executed from both master and slave nodes, as opposed to node guarding. Normally the master sends heartbeat messages to the slaves.

“Enable heartbeat producing”

The master sends heartbeats. They define the time interval in the “Producer time”. When the slaves are provided with the heartbeat function, a heartbeat consuming entry from the slave is created for the master. Then the Node-ID and the 1.5x heartbeat interval of the master are applied.

- Node guarding is enabled for the slaves. The settings from the EDS file of the slaves are used for this. If the values there cannot be used, then default values are used. Note that a CANopen Slave device can also be configured as a heartbeat producer.

“Node-ID”

Unique identification (1-127) of the heartbeat producer on the bus

“Producer time (ms)”

Interval length between successive heartbeats (in milliseconds)

“Redundancy Node-ID”

Requirement: A “Redundancy Configuration” object is inserted below the application.

Unique identification (1-127) of the redundant heartbeat producer on the bus

“Redundancy wait time (µs)”

Requirement: A “Redundancy Configuration” object is inserted below the application.

Duration of how long the passive controller waits for the heartbeat of the active controller. If this time is exceeded, then the passive controller takes on the active role.
Table 307: “SYNC”

<table>
<thead>
<tr>
<th>“Enable SYNC producing”</th>
<th>(disabled by default). The CANopen manager sends SYNC telegrams. The synchronous PDOs are sent directly after the SYNC telegram.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“COB-ID (Hex)”</td>
<td>CAN-ID of the SYNC telegram. Range of possible values: [1...2047].</td>
</tr>
<tr>
<td>“Cycle period (µs)”</td>
<td>Interval length (in microseconds) after which the SYNC telegram is sent.</td>
</tr>
<tr>
<td>“Window length (µs)”</td>
<td>Length of the time frame for synchronous PDOs (in microseconds).</td>
</tr>
<tr>
<td>“Enable SYNC consuming”</td>
<td>(disabled by default). Another device must produce the SYNC telegrams that are received by the CANopen Manager.</td>
</tr>
</tbody>
</table>

NOTICE!
If SYNC producing is enabled for the CANopen manager, then you are not permitted to select the “Enable SYNC producing” option for all other bus devices.

Table 308: “TIME”

<table>
<thead>
<tr>
<th>“Enable TIME producing”</th>
<th>(disabled by default). The CANopen Manager sends TIME messages.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“COB-ID (Hex)”</td>
<td>(Communication Object Identifier): identifies the time stamp of the message. Default values: [0...2047], preset 16#100</td>
</tr>
<tr>
<td>“Producer time (ms)”</td>
<td>Interval (in milliseconds) when the time stamp is sent. This value has to be a multiple of the task cycle time. Possible values [0, 65535]</td>
</tr>
</tbody>
</table>

The run time has to support high resolution timestamps. If not, then an error message is displayed.

- Chapter 6.3.2.16.1.3.2 “Tab 'CANopen Remote Device - General'” on page 1597

Dialog 'Check and Fix Configuration'
If you insert several devices below the CANopen manager, then error messages may report multiple assigned Node-IDs or invalid COB-IDs. The “Check and Fix Configuration” button opens a dialog for solving these conflicts.
For conflicts with Node-IDs or PDO COB-IDs, you can click “Edit Conflicts” to open a dialog with detailed information.

Table 309: “Node-ID and COB-ID conflicts”

<table>
<thead>
<tr>
<th>“Doubled node number”</th>
<th>List of all devices with identical IDs. In the field of the “Node-ID” column, you can enter new node numbers for the affected devices.</th>
</tr>
</thead>
</table>
| “Incorrect and double assignment of PDO COB-IDs” | The COB-IDs that are generated automatically from the device description files may not be permitted. All incorrect entries are listed with the respective device names, Node-IDs, and indexes. There are three options for correcting invalid COB-IDs:
  * Correct the displayed formula for calculating the COB-IDs so that a valid COB-ID results. You can change the formula in the respective table element.
  * Accept the automatic suggestion for the COB-ID by clicking the respective button.
  * Accept all automatic suggestions by clicking the “Use Suggested COB-ID” button. |

Corrected entries are removed from the displayed list automatically.
You can solve timing problems automatically by using the “Automatic Repair”. The command modifies all timing values to compatible values. (The time should be a multiple of the task time.)

CANopen remote device (slave)

General

In CODESYS, a CANopen Remote Device is a slave device that you insert below a CANopen Manager in the device tree of a project. A distinction is made between modular and non-modular slaves:

- **Modular slaves**: You can insert CANopen modules (submodules) below a modular slave. These modules provide a “I/O Mapping” tab to map their inputs and outputs. Modular slaves can also have fixed I/Os. Then these devices also provide the “I/O Mapping” tab. Modular devices provide the “Configure PDO mapping automatically” option, which we recommend for standard applications. You find this option in the “CANopen Remote Device” dialog, on the “General” tab.

- **Non-modular slaves**: You cannot insert additional modules below a non-modular device. The inputs and outputs of these devices are mapped in the “I/O Mapping” dialog. Automatic mapping is not possible here.

- Chapter 6.3.2.16.1.3.2 “Tab ‘CANopen Remote Device - General’” on page 1597

Tab 'CANopen Remote Device - General'

The general settings of the CANopen Slave are defined in this dialog of a CANopen Remote Device (slave).

### Table 310: “General”

<table>
<thead>
<tr>
<th><strong>Node-ID</strong></th>
<th>The node number identifies the CANopen Remote Device uniquely. It corresponds to the number (value between 1 and 127) set on the device (hardware). You have to provide the Node-ID as a decimal.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Expert settings</strong></td>
<td>☑: All settings are displayed that are predefined by the device description (EDS file) for the device.</td>
</tr>
<tr>
<td><strong>SDO channels (...)</strong></td>
<td>Click this button to open a dialog for activating the SDO channels that are predefined in the EDS file. Service data objects (SDOs) allow access to all entries in the CANopen object directory. An SDO creates a peer-to-peer communication channel between two devices (SDO server and client channel).</td>
</tr>
<tr>
<td><strong>Optional device</strong></td>
<td>☑: The slave is optional and not required for starting the CAN network.</td>
</tr>
<tr>
<td><strong>Sync producing</strong></td>
<td>Available only when the “Enable sync producing” option is cleared in the CANopen Manager. ☑: The I/O transmission is synchronized on the bus. The slave works as a sync producer. The parameters of the sync interval are defined in the settings of the CANopen Manager.</td>
</tr>
<tr>
<td><strong>No initialization</strong></td>
<td>This option is for non-configurable slave that already start with a valid configuration. ☑: The master does not send configuration SDOs or NMT start commands to the slave. PDO communication and monitoring (heartbeat, node guarding) are performed when this has been configured in the configurator. If the slave does not start automatically, then the user can use the CiA405 NMT function block to send an NMT start command to the slave.</td>
</tr>
</tbody>
</table>
"Default settings"  The availability of this option depends on the contents of the device description file.

- Activated by default. The slave nodes are reset to the default parameters before the configuration is loaded to the device or always when the slave is configured. Which parameters can be set is device-specific. The concrete task is performed from the subindex of the list box.
  - "Sub:001": All parameters are reset.
  - "Sub:002": Communication parameters (index 1000h - 1FFFh manufacturer-specific communication parameters) are reset.
  - "Sub:003": Application parameters (index 6000h - 9FFFh manufacturer-specific application parameters) are reset.
  - "Sub:004" - "Sub:127": Manufacturer-specific, individual selection of parameters is reset.
  - "Sub:128" - "Sub254": Reserved for future purposes

"Autoconfig PDO mapping"  This option is available for modular devices only.

- PDO mapping is generated automatically from the definitions in the device description and then cannot be changed in the two mapping dialogs. If the automatically generated mapping does not match your application, then you can deactivate the option and configure the mapping manually. We recommend that this option is activated for standard applications.

---

**Table 311: “Node Guarding”**

Node guarding is an outdated monitoring method and should not be used anymore because it uses RTR frames. You should always use heartbeats whenever possible. In some exceptions, such as for older slaves, you can use only node guarding.

- **"Enable node guarding"**  ☑: The CANopen Manager sends a message to the slave in the “Guard time (ms)” interval. If the slave does not respond with the given “Guard COB-ID” (Communication Object Identifier), then the CANopen Manager resends this message as many times as defined in “Lifetime factor” or until the slave responds.

  If the slave does not respond, then it is marked as "unavailable".

- **“Guard time (ms)”**  Interval for sending messages (default: 200 ms)

- **“Lifetime factor”**  When the slave does not respond, a node-guarding error is established according to the “Lifetime factor” time multiplied by the “Guard time”.

- **“Enable heartbeat producing”**  ☑: The module sends heartbeats in the time intervals as given in “Producer time (ms)”.

- **“Producer time (ms)”**:  The default setting is 200 as long as there is no special entry or the entry in the device description file is 0.

- **“Heartbeat consuming (…)”**  Opens a “Heartbeat Consuming Properties” dialog. There you activate the slaves that you want to watch.

  The number of possible slaves to be monitored is defined in the EDS file. To do this, you must select the "Enable" check box and enter the Node-ID of the slave and the required values in the “Heartbeat time” field (in milliseconds). Then the slave monitors the heartbeats that are sent from the affected slaves (defined by the Node-ID). When no more heartbeats are received, the slave switches off the I/Os.

  When a slave is monitoring, a green check mark is displayed on the “Heartbeat Consuming” button.

**Note:** When you insert a device with the heartbeat function, its heartbeat settings are harmonized automatically with the master (CANopen Manager).
**Table 312: “Emergency”**

<table>
<thead>
<tr>
<th>“Activate Emergency”</th>
<th>When internal errors occur, the slave sends emergency messages with a unique COB-ID. You can read these messages by using the function blocks from the library CAA Can Low Level Extern (RECV_EMCY_DEF, RECV_EMCY).</th>
</tr>
</thead>
<tbody>
<tr>
<td>“COB-ID”</td>
<td>CAN ID of the EMCY message. Range of possible values: [1...2047].</td>
</tr>
</tbody>
</table>

**Table 313: “TIME”**

The availability of this function depends on the device description.

| “Enable TIME producing” | ☑: The device sends TIME messages. |
| “COB-ID (Hex)”          | (Communication Object Identifier): identifies the time stamp of the message. |
| “Enable TIME consuming” | ☑: The device processes TIME messages. |

**Table 314: “Checks at Startup”**

The respective information is read from the firmware of the CANopen Slave (0x1018 identity object) and compared to the information from the EDS file. In case of disparities, the configuration is stopped and the slaves are not started.

| “Vendor ID” | ☑: Check of the vendor ID at startup |
| “Product number” | ☑: Check of the product number at startup |
| “Revision number” | ☑: Check of the revision number at startup |

- ☇ Chapter 6.3.2.16 “CAN onboard” on page 1594

**Tab 'CANopen Device - PDOs'**

Object: CANopen Remote Device, CANopen Local Device

This dialog is available only in the device editor of a CANopen Slave of version V3.5.6.0 or higher. It shows all PDOs and their default settings. In this dialog, you can add new objects and delete or edit existing objects.

On the left side, there are the PDOs that the slave receives from the master. On the right side, there are the PDOs that the slave sends to the master.

| “Add PDO” | Opens the “Select PDO” dialog where all available PDOs are displayed. In this dialog, you select the PDOs to be added to “Receive PDOs” or “Transmit PDOs”. |
| “Add Mapping” | Opens the “Select Item from Object Directory” dialog. Objects are listed there that you can add to the PDO mapping. |
| “Edit” | When a PDO is selected, the “PDO Properties” dialog opens. When a PDO mapping is selected, the “Select Item from Object Directory” dialog opens. |
| “Delete” | Deletes the selected objects from the list |
| “Move Up” | Moves the selected object upwards by one line. |
| “Move Down” | Moves the selected object downwards by one line. |

See also
- ☇ Chapter 6.3.2.16 “CAN onboard” on page 1594
Every PDO message must have a COB-ID (Communication Object Identifier). You can input explicit values (example: 16#201) or formulas (example: NODEID+16#200).

Remote Transmission Request. This option is available for transmit PDOs only. You can use an RTR frame for interrogating the PDO externally.

You can edit this field only if the device supports this functionality. The inhibit time is the minimum time between two messages of a specific PDO. You can use this setting for preventing PDOs from being sent too often when their values are edited. Default: "0". Possible values: 0–65535.

- **Acyclic - synchronous**: When a change is made, the PDO is transmitted synchronously, but not periodically. (default)
- **Cyclic - synchronous**: The PDO is transmitted every nth sync.
- **Synchronous – only RTR**: Available for transmit PDOs only. After a synchronization message, the PDO is updated, but not transmitted. Transmission is by explicit request only (Remote Transmission Request).
- **Asynchronous – only RTR**: Available for transmit PDOs only. The PDO is updated and transmitted by explicit request only (Remote Transmission Request).
- **Asynchronous – manufacturer specific**: The PDO is transmitted only after specific events.
- **Asynchronous – device profile**: The PDO is transmitted according to the CiA device profile.

For transmission type "Cyclic - synchronous" only. Indicate the interval for transmitting the PDOs. The value is a multiple of the "Cycle period (µs)" of the CANopen Manager. Default: 1. Possible values: 1–240. Example: Number of syncs = 4, Cycle Period = 1000 µs → transmission interval = 4000 µs

Only for transmission types "Asynchronous - manufacturer specific" and "Asynchronous - device profile".

You can edit this field only if the device supports this functionality. Indicate the time span that should be between two PDO transmissions PDOs (in milliseconds). Default: "0". Possible values: 0–65535.
| “Access type” | ● “RW”: Read/Write  
|               | ● “RO”: Read Only  
|               | ● “WO”: Write Only  
|               | ● “RWW”: Read/Write per SDO; write permission per PDO (==> RxPDO, output from the master viewpoint, input from point of view of the slave).  
|               | ● “RWR”: Read/Write per SDO; read permission per PDO (==> TxPDO, input from the master viewpoint, output from the point of view of the slave).  
|               | ● CONST=constant |

| “Type” | Data type of the object |
| “Default value” | Default value of the object |
| “Bit length” | Length of the object |

Tab 'CANopen Remote Device - SDOs'

During the initialization of the CAN bus, CODESYS transmits the current configuration settings by using SDOs (service data objects).

On this tab, you configure the necessary SDOs. You configure the necessary SDOs and determine the transmission order of the objects and the actions taken in case of a transmission error.

The object order in this list corresponds to the transmission order of SDOs to the module.

**NOTICE!**
If the “Expert settings” option is not activated for the current device, then only the user-defined SDOs are shown here.

| “Add SDO” | Opens the “Select Item from Object Directory” dialog where all available SDOs are displayed. The selected object is inserted after the selected object. |
| “Edit” | Opens the “Select Item from Object Directory” dialog and marks the corresponding object. You can modify the object parameters or replace the object with another one. |
| “Delete” | Deletes the selected objects from the list |
| “Move Up” | Moves the selected object upwards by one line. |
| “Move Down” | Moves the selected object downwards by one line. |
| “Abort on Error” | ☑: If an error is detected for this SDO, then the stack stops the configuration phase of the current slave. The slave remains in PREOPERATIONAL mode. |
| “Jump to Line on Error” | ☑: The transmission is continued with the SDO that you indicated in the “Next Line” column. |
| “Next Line” | Line number where processing continues if there is an error detected |
| “SDO Timeout (ms)” | Timeout for the SDO transmission. If the slave does not respond to the SDO request within this time, then the transmission is canceled with a timeout. |
“Create all SDOs”  
☑: Creates an SDO for all writable objects starting at index 16#2000 for which a default value is given in the EDS. Only experts should use this option. It should be deactivated for standard use.

“Write complete PDO configuration”  
☑: This option forces the writing of all PDO configuration objects. In this way, you make sure that the settings in the project correspond to those of the slave.  
☐: PDOs are not deactivated explicitly. The requirement is that the “Default settings” option is activated in the common settings of the slave and the PDOs are also deactivated in the EDS. If the default values in the EDS do not match the default settings of the slave firmware, then this procedure may cause problems. In this case, you should activate this option.

Dialog ‘Select Item from Object Directory’

The table shows all object directory entries from the device EDS file for each SDO that are writable and not larger than 4 bytes. Before you add an SDO for selection in the SDO dialog, you can modify its parameters in the fields below the table. In this way, you can also created an SDO that is not writable in the EDS file by entering a new index/subindex value.

| “Name” | COB-ID of the PDO or the name of the mapped object as it is used in the device description and in the object directory. |
| “Index” | Index of the object |
| “Subindex” | Subindex of the object |
| “Access type” | ● "RW": Read/Write  
● "WO": Write Only  
● "RWW": Read/Write per SDO; write permission per PDO (==> RPDO, output from the master viewpoint, input from point of view of the slave).  
● "RWR": Read/Write per SDO; read permission per PDO (==> TPDO, input from the master viewpoint, output from the point of view of the slave). |
| “Type” | Data type of the object |
| “Default value” | Default value of the object |
| “Bit length” | Length of the object |
| “Value” | |

CANopen module

CANopen modules are components that you insert below a CANopen remote device.

6.3.2.16.2 J1939

General

J1939 is a CAN-based protocol (CAN stands for "Controller Area Network"). It was developed for serial data transmission between electronic control units (ECU) in heavy goods vehicles. The CODESYS plug-in 'DeviceEditorJ1939' provides dialogs to configure J1939 devices according to SAE J1939 standards.

J1939 manager

General

The J1939 Manager is inserted in the device tree below the CAN bus node. It provides the J1939 parameter groups and signal database. The ECUs are inserted below the J1939 Manager.

The “Scan Devices” command is not available for J1939.

Tab ‘J1939 Manager - General’

In CODESYS version 3.5 SP17 and CODESYS J1939 Manager SL version 4.0.0.0, the J1939 configurator is no longer supplied with a parameter group / signal database. The old database is no longer supported.

However, you can post-install a DBC database in the J1939 Manager. A database can be purchased, for example from CSS Electronics:

If you do not install a database, then you can also configure parameter groups and signals manually on the “User-Defined” tab.

<table>
<thead>
<tr>

Tab ‘J1939 ECU - General’

In this dialog of the J1939 ECU editor, the general parameters of a J1939 ECU can be displayed and modified.

Table 315: “General”

| “Preferred address” | Address of the ECU. If more than one ECU with the same address exists in the network, then all affected ECUs get a new address. The requirement is that the ECUs allow an address change (“Arbitrary Address Capable”). |
| "Local Device"    | ☑ You can configure any number of local ECUs. Then every local ECU is its own ECU instance in the J1939 network. For local devices, an additional “RX Signals (P2P)” dialog is provided to configure received signals. |
Table 316: “ECU NAME”

<table>
<thead>
<tr>
<th><strong>“NAME (64 bit): 16#”</strong></th>
<th>Hexadecimal 64-bit code that contains complete information about the subsequent parameters. Each time this code is modified, the respective parameter is also modified. The same is true for the other direction.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Arbitrary address capable”</strong></td>
<td>If the ECU detects an address conflict, then it tries independently to set another address.</td>
</tr>
<tr>
<td><strong>“Industry group”</strong></td>
<td>List of industry groups according to the definition from SAE J1939.</td>
</tr>
<tr>
<td><strong>“Vehicle system instance”</strong></td>
<td>The parameter depends on the “Vehicle system”. The 4-bit value assigns a number to each instance of the “Vehicle system”.</td>
</tr>
<tr>
<td><strong>“Vehicle system”</strong></td>
<td>The value is defined in the SAE J1939 standard.</td>
</tr>
<tr>
<td><strong>“Reserved”</strong></td>
<td>Always deactivated and reserved for future SAE definitions.</td>
</tr>
<tr>
<td><strong>“Function”</strong></td>
<td>The parameter is defined and assigned by SAE. The range of values is 0...255, but not all values are assigned. The interpretation of values, which are greater than or equal to 127, depends on the “Industry” selection. For example, the value “133” means “Product Flow” in the &quot;Agricultural and Forestry Equipment” industry. If &quot;Construction Equipment&quot; is selected for “Industry”, then the same value means “Land Leveling System Display”. If the value is less than 128 (0 – 127), then there is no dependency to other parameters.</td>
</tr>
<tr>
<td><strong>“Function instance”</strong></td>
<td>The parameter is related to the “Function” field. A J1939 network can consist of multiple ECUs with the same “Function”. The 5-bit “Function instance” assigns a number to each instance of the “Function”, where 0 is assigned to the first instance.</td>
</tr>
<tr>
<td><strong>“ECU instance”</strong></td>
<td>A J1939 network can include multiple ECUs that have the same task. For example, a vehicle can have two identical ECUs, where one measures vehicle speed and the other measures the trailer speed.</td>
</tr>
<tr>
<td><strong>“Manufacturer code”</strong></td>
<td>The 11-bit manufacturer code is assigned by SAE and indicates the company that manufactured the ECU. This code is defined in the SAE J1939 document.</td>
</tr>
<tr>
<td><strong>“Identity number”</strong></td>
<td>The 21-bit identity number is assigned by the manufacturer and should be used for assuring unique names in a product line. The manufacturer can also add more information to the identity number, such as serial number and date of manufacture.</td>

Tab ‘J1939 ECU - TX Signals’

This dialog shows the parameter groups that are transmitted to all other ECUs (broadcast) or to a specific ECU (P2P). In this dialog, you can activate and deactivate individual groups and modify their parameters. You can also add new groups or signals to the list.
“Enable”

- The parameter group is transmitted.
- The parameter group is not transmitted for a local device. For a remote device, the PLC does not process this group.

“Type”

- “Broadcast”: The parameter group is transmitted to all ECUs.
- “Peer-to-Peer P2P”: The parameter group is transmitted to a specific ECU.

“Add PG”

Opens the “Add Parameter Groups” dialog.

“Add Signal”

Opens the “Add Signal” dialog. The button is enabled only if you have selected a parameter group.

Parameter group properties

Table 318: “General”

| “PGN” | The “parameter group number” is a unique number for addressing a parameter group. |
| “Name” | Name of the parameter group |
| “Description” | Description of the parameter group |
| “Length” | The length of the message data (0…1785 bytes). Due to the maximum array length of 8 bytes, messages with over 8 bytes are transmitted as multipackages. |

Table 319: “Transmission settings”

These settings are provided only for the TX parameter groups of local devices.

| “Priority” | Priority of the parameter group (0..7). Priority 0 is the highest and 7 is the lowest. |
| “Target address” | The target address is needed for P2P parameter groups only. |
| “Transmission mode” | Determines the time when a parameter group is transmitted (for local devices). |
| “Mode change” | The PG is transmitted when the value of the signal changes. |
| “Cyclic” | The PG is transmitted after a specified number of PLC cycles (see cycle time factor). |
| “On request” | The PG is transmitted on request of another device. |
| “Application-controlled” | The PG is transmitted when triggered by the application. |
| “Cycle time factor” | Number of PLC cycles after which the parameter group is transmitted. Only applies for cyclic transmission. |

Signal parameters

Table 320: “General”

| “SPN” | Suspect Parameter Number. One of the numbers assigned by the SAE for a specific parameter in a parameter group. |
| “Name” | Name of the parameter |
| “Description” | Description of the parameters |
| “Length (bits)” | Length of the signal (in bits: 1…14280). |
| “Byte position (0..1784)” | Start byte in the parameter group (0…1784). |
| “Bit position (0..7)” | Bit position of the start byte (0..7). |
Table 321: “Conversion”

<table>
<thead>
<tr>
<th>“Conversion”</th>
<th>TRUE: The value is calculated with scaling and offset.</th>

- Æ Chapter 6.3.2.16.2.4.2 “Tab 'J1939 ECU - TX Signals’” on page 1605

6.3.2.16.3 Command ‘Scan for Devices’

Function: The command establishes a brief connection to the hardware and determines the devices in the network. Then you can apply the devices found into the device tree of your project.

Call: Menu bar: “Project”; context menu of a device object in the device tree

Requirement: The communication settings to the controller are correct. The gateway and the PLC are started. The device supports the scan function.

The following devices provide the scan function: EtherCAT master, EtherNet/IP Scanner (IEC), Sercos master, CANopen Manager, CANopen Manager SIL2, PROFINET controller and PROFIBUS DP master.

You can perform the device scan immediately if the scan function is permanently implemented in the PLC. When scan function is implemented in a library, you have to log in only one time to download the library to the controller.

The command refers to the master controller selected in the device tree. For example, an already inserted PROFINET IO controller can be selected and the command used to determine the I/O devices and I/O modules assigned to it.

After performing the scan operation, the “Scan Devices” dialog opens and displays the found devices.
### Dialog 'Scan Devices'

#### Table 322: “Scanned Devices”

<table>
<thead>
<tr>
<th>Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Device name, Device type, Address, Station name, etc.</strong></td>
<td>Data about the scanned device depending on network type.</td>
</tr>
<tr>
<td></td>
<td>When you change a value in the list of scanned devices, the value is shown in italics. This indicates that the new value has been changed in the editor in CODESYS, but not in the device. When you download the value to the device, it is shown normally.</td>
</tr>
<tr>
<td></td>
<td>Value that indicate differences between the project and the scanned device are shown in orange.</td>
</tr>
<tr>
<td></td>
<td>If multiple device descriptions are available for the scanned device, then the name is displayed in bold. The selection of the matching device description is resolved differently for different fieldbuses. For more detailed information, see the corresponding fieldbus chapters.</td>
</tr>
<tr>
<td></td>
<td>If a device description cannot be found, then the following message is shown: “Attention! The device was not found in the repository.” Depending on the bus system, additional information is displayed, such as manufacturer number and product number. The device cannot be inserted into the project without the installed device description.</td>
</tr>
</tbody>
</table>

- **Show differences to project**
  - ✓: The table in the dialog also shows additional configured devices (in the device tree of the project).
  - ☐: The table shows all scanned devices. The configured devices are not shown.

- **Scan for Devices**
  - Starts a new search.

- **Copy All Devices to Project**
  - The device that is selected in the table is inserted into the device tree in the project. If nothing is selected, then all scanned devices are shown.

### NOTICE!

If you insert devices, which are available in the device tree, to the device tree with “Copy All Devices to Project”, then the following should be noted. The data of the “Process Data” and “<...> I/O Mapping” tabs of the existing devices can be overwritten with the data of the recently inserted devices.

### Table 323: “Configured Devices”

This part of the dialog is visible only when you select the “Show differences to project” option.

Differences between the scanned and configured devices are color-coded. Devices displayed in green are identical on both sides. Devices displayed in red are available only in the view of the scanned or configured devices.

- If you have selected a device in both views, then the scanned devices are inserted above the selected configured device.
- If you have selected a device in both views, then the scanned devices are inserted below the selected configured device.
- If you have selected a device in both views, then the configured devices are replaced by the selected scanned device.
- All scanned devices are copied to the project.
- Deletes the selected configured device.
6.3.2.16.4 Tab 'CANbus - General'
Table 324: “General”

| “Network” | Number of the CAN network that is linked via the CAN bus interface. Permitted values: 0 to 100. |
| "Baud rate" | Baud rate (in bits per second) for transmitting data on the bus. The default value is used from the device description file (*.devdesc) of the CAN bus device. You can select the baud rate from the list box or type it directly into the input field. |

6.3.2.17 EtherCAT configurator
6.3.2.17.1 General

Onboard EtherCAT support is currently limited to AC500-eCo PM5072-ETH and PM5082-ETH. It is not supported by any other AC500 PLC.

Two alternatives are available for using EtherCAT:

- Onboard EtherCAT for the AC500-eCo
- EtherCAT for the AC500 with the CM579 communication module

Further information can be found here:
Onboard EtherCAT
§ EtherCAT configurator
§ Communication schema onboard Ethernet/EtherCAT
§ Motion Control

EtherCAT

§ Motion Control
Refer to the general description for information about the following tabs of the device editor.

- Chapter 6.4.1.21.2.8.12 “Tab '<device name> I/O Mapping'” on page 2444
- Chapter 6.4.1.21.2.8.13 “Tab '<device name> IEC Objects'” on page 2449
- Chapter 6.4.1.21.2.8.4 “Tab 'Parameters'” on page 2433
- Chapter 6.4.1.21.2.8.19 “Tab 'Status'” on page 2460
- Chapter 6.4.1.21.2.8.20 “Tab 'Information'” on page 2460

Only in the case of special features is there an additional help page for the specific device editor.

If the "<device name> Parameters" tab is not shown, then select the "Show generic device configuration editors" option in the CODESYS options ("Device Editor" category).

The configuration of EtherCAT modules is based on the device description files for the used master and slave devices employed and can be adapted in the project in configuration dialogs. In order to make sure that the simplest and most error-free use possible, we recommend for standard applications that you enable the option for the "Automatic Configuration" of the master, so that the majority of the configuration settings are done automatically.

Optional devices

The “Optional devices” function can be used for variable hardware configurations. At the start of the stack, the system checks whether optional devices are available. If the devices are not found, then they are deactivated automatically. However, the devices can also be activated at a later date if, for example, it is a device at the end of the network line. On the other hand, if the "Automatically restart slaves" option is selected, then the activated devices are automatically switched to "operational", thereby activating the process data.

The bus cycle task is set in the general PLC settings.

Access to the EtherCAT configuration by the application takes place via instances of the EtherCAT master and EtherCAT slave. If the EtherCAT master or EtherCAT slaves are inserted as objects into a project, instances are automatically created for master and slaves which can be addressed in the application program. For example a restart, a stop or a status check of the EtherCAT device can be performed from the application.

Furthermore, the EtherCAT library offers function blocks for the reading and writing of individual parameters, even during bus operation.

6.3.2.17.2 EtherCAT master

Tab 'EtherCAT Master - General'

Object: EtherCAT Master

The tab is used for the configuration of the basic settings for the EtherCAT Master. The basic settings are preset from the device description file.
NOTICE!
The auto-configuration mode ("Autoconfig master/slaves" option) is selected by default and is adequate for standard applications. If the mode is not selected, then all configuration settings for the master and the slave(s) have to be done manually. Expert knowledge is required to do this. The auto-configuration mode option has to be switched off to configure slave-to-slave communication.

| “Autoconfig master/slaves” | The main part of the master and slave configuration is done automatically, based on the device description file and implicit calculations. The dialog for the FMMU/Sync settings is not available. Even if this option of the master is selected, an expert mode can be enabled explicitly for each individual slave, which allows for manual editing of the automatically generated process data configuration. |

Table 325: “EtherCAT NIC Settings”

| “Target address (MAC)” | MAC address of the device in the EtherCAT network that is to receive the telegrams. |
| “Source address (MAC)” | MAC address of the controller (target system) or network name (name of the adapter or PLC (target system)) |
| “Network name” | Name or MAC of the network, depending on which of the following options is selected: |
| “Select network by MAC” | Yes: The network is specified by the MAC ID. Then the project cannot be used on another device because each network adapter has a unique MAC ID. |
| “Select network by name” | Yes: Network is identified by the network name and the project is device-independent. |
| “Scan” | Scans the network for the MAC IDs or names of the target devices that are currently available. |

Table 326: “Redundancy EtherCAT NIC Settings”

These settings are displayed only when the “Redundancy” option is selected. Here the parameters of the additional device are defined according to the description for “EtherCAT NIC Settings”.
Table 327: “Distributed Clock”

| “Cycle time (µs)” | Time span after which a new data telegram is dispatched on the bus. When the “Distributed Clock” function is enabled in the slave, the master cycle time specified here is transferred to the slave clocks. As a result, a precise synchronization of the data exchange can be achieved. This is particularly important when spatially distributed processes require simultaneous actions. An example of a simultaneous action is applications in which multiple axes have to execute coordinated movements at the same time. A very precise, network-wide-time base with a jitter of considerably less than 1 microsecond can be achieved in this way. |
| “Sync offset” | Parameter for setting the delay time between the DC time base of the EtherCAT Slave and the cycle start of the PLC. The default value is 20%. This time is active at the same time for all slaves with DC. An offset of 20% means that the timer interrupt in the EtherCAT Slave takes place 20% before the next IEC cycle. This means in the case of

- FrameAtTaskStart = FALSE when the EtherCAT data is sent at the end of the PLC cycle:
  The PLC cycle may require 80% of the bus cycle time minus the delay time in the runtime, and this without the master no longer placing the current process data on the bus in time (assuming that the EtherCAT Slave expects the new data exactly with the sync interrupt).
- FrameAtTaskStart = TRUE (default value when using CODESYS SoftMotion):
  For the controller program, nearly 100% of the cycle is always available. Here the “Sync offset” determines only when the EtherCAT data of the master is exchanged to and from the slaves relative to the time base of the EtherCAT Slave.

If DC is active at the corresponding slave, then the default settings come from the respective ESI file. The device manufacturer can define additional offsets here in the form of the Shift time for both Sync 0 and Sync 1 timer interrupts. When the expert setting is enabled at the slave, these times can be changed manually. The Shift time is entered into the register 0x990 as an additional start time. A positive value means that the start takes place later and therefore the sync interrupt is executed later.

IMPORTANT It must be prevented at all costs that the sync interrupt takes place near the time of the IEC cycle because otherwise no data can exist for one cycle and devices go into synchronization error. Both offsets from the master and the individual offset of each slave have to be considered for this. With the normal setting of 20% offset for the master and 0% for the slaves, the jitter of the IEC cycle and the delays of the transmission timing by the system can be a maximum of +80% and –20%.

Table 328: “Options”

| “Use LRW instead of LWR/LRD” | Direct communication from slave to slave is possible. Combined read/write commands (LRW) are used instead of separate read commands (LRD) and write commands (LWR). |
| “Messages per task” | Read and write commands (the handling of the input and output messages) can be controlled by means of various tasks. |
| “Automatically restart slaves” | The master immediately attempts to restart the slaves in the case of a communication breakdown. |
Table 329: “Master Settings”

6.3.2.17.3 EtherCAT slave

Tab 'EtherCAT Slave - General'

Object: EtherCAT Slave

The basic settings for the EtherCAT Slave are configured on this tab. The basic settings are preset from the device description file.
Table 330: "Address"

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;AutoInc address&quot;</td>
<td>Self-incrementing address (16-bit) that results from the position of the slave in the network. The address is used only during the system boot when the master assigns the EtherCAT addresses to its slaves. When the first message runs through all the slaves for this purpose, each slave increments its &quot;AutoInc address&quot; by 1. The slave with address 0 then gets the data. A possible input here is &quot;.-8&quot;.</td>
</tr>
<tr>
<td>&quot;EtherCAT address&quot;</td>
<td>Final address of the slaves, assigned by the master during bootup. The address is independent of the position of the slave in the network.</td>
</tr>
</tbody>

<td></td>
</tr>
<tr>
<td>“Latch unit 0”</td>
<td></td>
</tr>
<tr>
<td>“Latch unit 1”</td>
<td></td>
</tr>
</tbody>
</table>
Table 339: “Watchdog”

| “Set multiplier” | The PDI watchdog and SM watchdog receive their impulses from the local terminal clock divided by the watchdog multiplier. |
| “Set PDI watchdog” | This watchdog triggers when there is no PDI communication with the EtherCAT Slave controller for longer than the PDI (Process Data Interface) watchdog time which has been set and activated. |
| “Set SM watchdog” | This watchdog triggers when there is no EtherCAT process data communication with the terminal for longer than the SM (SyncManager) watchdog time that has been set and activated. |

Table 340: “Identification”

In this section, you set the device identification of the slave. As a result, you can make the address of the slave independent of its position in the bus.

The following options are visible only when the “Activate expert settings” option or “Optional” option is selected.

If you have identified the slave as “Optional”, then you have to assign a unique ID to it.

| “Disabled” | The identification of the slave is not checked. |
| “Configured station alias (ADO 0x0012)” | Address that is stored in the EEPROM of the device. You can change the value in the “Scan Devices” dialog or in online mode. For stock devices, you need to assign this number one time. This means that you have to connect the device one time to an EtherCAT Master and save the number. |
| “Write to EEPROM” | Visible in online mode only for “Configured station alias”. Writes the defined address for “Value” to the EEPROM of the slave. |
| “Explicit device identification (ADO 0x0134)” | The device identification is hard set on the hardware (for example, by DIP switches). It is displayed in “Actual address”. |
| “Data Word (2 Bytes)” | A 2-byte value for the identification is saved in the slave. |
| “Value” | Expected value for the check. If the actual value does not correspond to this setting, then an error is issued. |
| “ADO (hex)” | Initial value from the device description. You can change this value in the “Data word” option. |
| “Actual address” | Visible in online mode only. Displays the address of the slave. You can use this display for checking the success of the “Write to EEPROM” command. |

Tab 'EtherCAT Slave - FMMU/Sync'

Object: EtherCAT Slave

The tab shows the FMMUs and Sync Manager of the EtherCAT Slave as they are defined in the device description file. There is an option to edit the FMMUs and Sync Manager (for example, for the configuration of slave-to-slave communication).

Requirement: The auto-configuration mode in the EtherCAT Master is disabled.

Note that these are expert settings which are not usually required for standard applications.
Table 341: "FMMU"

The table shows the Fieldbus Memory Management Units of the slave, which are used for handling the process data. In each case the allocation of the logical address ("Global Start Address") to a physical address ("Phys. start address") is defined. Bit-by-bit mapping is possible.

- "Edit"
- "Add"

Tab 'EtherCAT Slave - Expert Mode Process Data'

Object: EtherCAT Slave

The tab provides another more detailed view of the process data, which is also displayed in the "Process Data" dialog. Moreover, the download of the PDO assignment and the PDO configuration is enabled here.

Requirement: The expert settings for the slave are selected.
Chapter 6.3.2.17.3.1 "Tab 'EtherCAT Slave - General' " on page 1613

Table 345: “Sync Manager ”
List of the Sync Managers with data size and PDO type

Table 346: “PDO assignment (16#1C12)”
List of the PDOs assigned to the selected “Sync-Manager”.
When a check box is selected, the PDOs are enabled and I/O channels are created. This is similar to the simple PDO configuration view.

Table 347: “PDO list”
List of the PDOs assigned to the selected “Sync-Manager”.
You can add new entries or edit or delete existing entries by executing the respective commands (“Add”, “Delete”, “Edit”) in the command bar or context menu.

Table 348: “Edit PDO list”
<table>
<thead>
<tr>
<th>“Name”</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>“Index”</td>
<td></td>
</tr>
</tbody>
</table>
| “Direction” | ● “TxPDO (input)”: The PDO is transmitted from the master to the slave.  
● “RxPDO (output)”: The PDO is transmitted from the slave to the master. |
| “Flags”  | ● “Required”: The PDO is required and cannot be disabled in the “PDO assignment”.  
● “Windows contents”: The contents of the PDO are fixed and cannot be modified. It is then not possible to add entries in “PDO contents”.
● “Virtual PDO”: Reserved for future use |
| “Exclude PDOs” | It is possible to define an exclusion list. When a PDO is enabled in the “PDO assignment”, others are disabled and cannot be enabled. |
| “Sync unit”  | ID of the Sync Manager to which the PDO is to be assigned |

Table 349: “PDO Contents”
Displays the contents of the PDOs selected in the “PDO list”. You can add new entries or edit or delete existing entries by executing the respective commands (“Add”, “Delete”, “Edit”) in the command bar or context menu. You can change the PDO order by clicking “Move Up” and “Move Down”.

Table 350: “Download”
| “PDO assignment”                          | ✓: Specific CoE commands for initializing the 0x1cxx objects are generated and written to the slave. |
| “PDO configuration”                       | ✓: The CoE commands for 0x16xx or 0x1axx are generated, and then the PDO mapping is downloaded to the slave. Normally, the default values originate from the ESI file and the device has to support this functionality. For example, if a device has a fixed configuration, then these commands are regarded as flawed. |
| “Load PDO info from the device”           | The current PDO configuration is read from the slave and entered into the configuration. The lists in the upper and lower right are then deleted and filled with the read data. This is especially useful when the ESI file is incomplete and the configuration is available only on the slave. |
Tab 'EtherCAT Slave - Process Data'

Object: EtherCAT Slave

The tab of the EtherCAT configurator displays the process data for the inputs and outputs of the slave. The data is preset from the device description file.

Table 351: “Select the Outputs”

The table shows the outputs of the slave defined by “Start address”, “Type”, and “Index”.

If outputs of the device are enabled here (for writing), then these outputs can be assigned to project variables in the “EtherCAT I/O Mapping” dialog.

Table 352: “Select the Inputs”

The table shows the inputs of the slave defined by “Name”, “Type”, and “Index”.

If inputs of the device are enabled here (for reading), then these inputs can be assigned to project variables in the “EtherCAT I/O Mapping” dialog.

Tab 'EtherCAT Slave - Startup Parameters'

Object: EtherCAT Slave

On the tab, the SDOs (service data objects) for 'CAN over EtherCAT' (CoE) or the IDNs (identification numbers) for 'Servodrive over EtherCAT' (SoE) are defined for the current slave. These parameters are determined for the device when the system is started.

The object directory with the required data objects is described in the EtherCAT XML description file or in an EDS file that is referenced in the XML file.

Requirement: The device supports 'CAN over EtherCAT' or 'Servodrive over EtherCAT'.

Some modules that are inserted below a slave have their own startup parameters. These parameters are also displayed in this list but cannot be edited here. The parameters are modified in the editor of the corresponding module.

List of SDOs or IDNs

The order (from top to bottom) specifies the order in which the objects are transferred to the module.

| “Line” | Line number |
| “Index:Subindex” | For CoE only |
| “IDN” | For SoE only |
| Identification number |

Name

| “Bit length” | Bit length of the SDO or IDN |
| “Abort on Error” | In case of error, the transfer is aborted with an error status. |
| “Jump to Line on Error” | In case of error, the transfer is resumed with the SDO or IDN at the specified “Line”. |
**Table 353: “CAN over EtherCAT”**

<table>
<thead>
<tr>
<th>Column “Index:Subindex”</th>
<th>Identifies the entry in the object directory</th>
</tr>
</thead>
<tbody>
<tr>
<td>Column “Name”</td>
<td>Display of access flags: RW (read/write), RO (read only), WO (write only)</td>
</tr>
<tr>
<td>Column “Base Value”</td>
<td>Editable (double-click to open)</td>
</tr>
</tbody>
</table>

**Input fields**

- **“Name”**
  - Input field for displaying and changing the name
- **“Index: 16#”**
  - By specifying new index/subindex entries, a new object can be added to the SDO that is not yet described in the EDS file.
- **“Subindex: 16#”**
  - Range of values of the object
- **“Value”**
  - Each value may be max. one byte (0-255). It can also be a hexadecimal in IEC syntax (for example, 16#ad).
  - If the “Byte array” option is enabled, then the values have to be specified as a comma-separated list (for example, 1,2,3,4).
- **“Full access”**
  - The complete object is written with one access and all subindexes are set at the same time. The time needed for the transfer is reduced because not every subindex has to be transferred individually.
- **“Byte array”**
  - Values can be specified as a comma-separated byte array.

**Table 354: Servodrive over EtherCAT**

<table>
<thead>
<tr>
<th>Column “IDN”</th>
<th>Identification number</th>
</tr>
</thead>
<tbody>
<tr>
<td>Column “Base Value”</td>
<td>Base value of the IDN. Double-click to modify.</td>
</tr>
</tbody>
</table>

**Input fields**

- **“IDN”**
  - Identification number: Composed from the subsequent parameters
    - “S”: Standard data
    - “P”: Product-specific data
    - “PSet”: Parameter set
    - “Offset”
"Bit length" | List box for selecting the bit length
---|---
"Value" | List box for selecting the value
"Channel" | If the object has multiple subobjects, then this list box is displayed automatically.
"As list" | Parameters are loaded as a list. The first four bytes indicate the length. The length is calculated automatically.

Tab 'EtherCAT Slave - Diagnostics History'
Object: EtherCAT Slave
The tab reads the diagnosis data \(0x10f3\) object of the slave and displays it in a tree structure. Moreover, the messages are issued in plain language.

Requirement: The application is in online mode. The attribute \texttt{DiagHistory} in the ESI file is set.

| "Update history" | The data is read again and the view is refreshed. New messages are displayed in the “\texttt{Flags}” column with “\texttt{N}” (New). Acknowledged messages with “\texttt{Q}”. |
| "Auto update" | The data is updated automatically. |
| "New messages only" | Acknowledged messages are not displayed. |
| "Acknowledge messages" | All messages with the “\texttt{N}” flag are acknowledged. Then the flag changes to “\texttt{Q}”. |

</tbody>
</table>

- % Chapter 6.3.2.17.2.1 “Tab 'EtherCAT Master - General' ” on page 1610
- % Chapter 6.3.2.17.3.1 “Tab 'EtherCAT Slave - General' ” on page 1613

Tab 'EtherCAT Slave - CoE Online'

Object: EtherCAT Slave

The tab shows the object directory of the ESI file or the slave.

Requirement: The application is in online mode. The expert settings in the “Slave” dialog have to be enabled and the slave has to support CoE.
**Read objects** The object directory is read one time.

**Auto update** The objects are read in cycles.

**Offline from ESI file** The dialog shows the contents of the object directory from the device description.

**Online from device** The dialog shows the contents of the object directory of the device. **SDOInfo** has to be enabled in the ESI file.

**Flags**
- **“RO”**: The value is write-protected.
- **“RW”**: The value can be modified.

**Type** Data type of the parameter

**Value** You can double-click in the text field to edit this value.

- `% Chapter 6.3.2.17.2.1 “Tab 'EtherCAT Master - General' ” on page 1610
- `% Chapter 6.3.2.17.3.1 “Tab ‘EtherCAT Slave - General’ ” on page 1613

Tab ‘EtherCAT Slave - Parameters’

Object: EtherCAT Slave

The tab contains the slave parameters which are defined in the device description file.

When the auto-configuration mode of the master is selected, the parameters are set here automatically according to the specifications from the description file and the network topology. For standard applications, it is also not normally required to edit them.

**Value** Only a few parameters are editable. A change is effective only when the auto-configuration mode is disabled.

Basically, the user should not modify anything here because doing so could create an invalid configuration, which would prevent the slave from entering into the operational state.

- `% Chapter 6.3.2.17.3.1 “Tab ‘EtherCAT Slave - General’ ” on page 1613

</tr>
<tr>
<td><strong>“DNS name”</strong></td>
<td>Name of the DNS server</td>
</tr>
</tbody>
</table>

6.3.2.17.4 EtherCAT module

Tab 'EtherCAT Module - Startup Parameters'

Object: EtherCAT Module

The SDOs (Service Data Objects) or IDNs that transmit specified parameters to the device at the system start are defined on this tab for the current module.

The object directory with the required data objects is described in the EtherCAT XML description file or in an EDS file that is referenced in the XML file.

Requirement: The device supports CAN over EtherCAT or Servodrive over EtherCAT

Some modules have their own start parameters which are displayed on the tab. The parameters can be modified there. Likewise, the parameters are also displayed in the slave, but they are blocked there.

Table 361: SDO table

<table>
<thead>
<tr>
<th><strong>“Line”</strong></th>
<th>Line number</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Idn”</strong></td>
<td>Bit length of the SDO</td>
</tr>
<tr>
<td><strong>“Bit length”</strong></td>
<td>Bit length of the SDO</td>
</tr>
<tr>
<td><strong>Abort on Error”</strong></td>
<td>In case of error, the transfer is aborted with an error status.</td>
</tr>
<tr>
<td><strong>“Jump to Line on Error”</strong></td>
<td>The transfer is resumed with the SDO at the specified “Line” in case of error.</td>
</tr>
<tr>
<td><strong>“Next Line”</strong></td>
<td>The transfer is resumed with the SDO at the next line.</td>
</tr>
<tr>
<td><strong>“Comment”</strong></td>
<td>Input field for comments</td>
</tr>
<tr>
<td><strong>“Move Up”</strong></td>
<td>Moves the selected line upwards by one line</td>
</tr>
<tr>
<td><strong>“Move Down”</strong></td>
<td>Moves the selected line downwards by one line</td>
</tr>
</tbody>
</table>
“Add” Opens the “Select Item from Object Directory” dialog. In this dialog you can change the parameters of the SDO before the SDO is added to the configuration. By specifying new index/subindex entries, a new object can be added to the SDO that is not yet described in the EDS file. This is useful if only an incomplete object directory or none at all exists.

“Delete” Removes the selected entry.

“Modify” Opens the “Select Item from Object Directory” dialog for changing the parameters of the selected SDO or IDN in the table.

---

Servodrive over EtherCAT

Table 362: “Select Item from Object Directory”

<table>
<thead>
<tr>
<th>Column “Idn”</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Column “Base Value”</td>
<td>Base value of the IDN. Editable (double-click to open)</td>
</tr>
</tbody>
</table>

Input fields

| “IDN” | “S” |
| “P” |

| “PSet” | By specifying new “PSet”/“Offset” entries, a new object can be added to the IDN that is not yet described in the XML file. This is useful if only an incomplete object directory or none at all exists. |

| “Offset” | By specifying new PSet/Offset-entries, a new object can be added to the IDN that is not yet described in the XML file. This is useful if only an incomplete object directory or none at all exists. |

| “Bit length” | List box for selecting the bit length |
| “Value” | List box for selecting the value |
| “Channel” | If the object has multiple subobjects, then this list box is displayed automatically. |
| “As list” | Parameters are loaded as a list. The first four bytes indicate the length. ✓: The length is calculated automatically |

---

“CAN over EtherCAT”

Table 363: “Select Item from Object Directory”

| Column “Flags” | Display of access flags: RW (read/write), RO (read only), WO (write only) |
| Column “Base Value” | Editable (double-click to open) |

Input fields

| “Name” | Input field for displaying and changing the name |
| “Index: 16#” | By specifying new index/subindex entries, a new object can be added to the SDO that is not yet described in the EDS file. |
| “Subindex: 16#” |
| “Bit length” | Range of values of the object |
Each value may be max. one byte (0-255). It can also be a hexadecimal in IEC syntax (for example, 16#ad).

If the “Byte array” option is enabled, then the values have to be specified as a comma-separated list (for example, 1,2,3,4).

The complete object is written with one access and all subindexes are set at the same time. The time needed for the transfer is reduced because not every subindex has to be transferred individually.

Values can be specified as a comma-separated byte array.

6.3.2.17.5 Bus Cycle Task - EtherCAT

The term "bus" includes all fieldbuses as well as the I/O bus. Consider that there is no bus cycle task for Modbus as Modbus does not provide I/O mapping and is controlled by POUs.

It's recommended to define a dedicated bus cycle task for each fieldbus configured in the project. It's strongly recommended not to use "unspecified" in the "PLC Settings" to avoid unexpected behavior. The task defined in "PLC Settings" determines the bus cycle task of I/O bus and, depending on the configuration, of the additional fieldbuses (the setting is by default inherited).

Especially in case of EtherCAT, a dedicated bus cycle task should be used which is not shared with other fieldbuses. If [unspecified] is set in the "PLC Settings", the EtherCAT task might be automatically used by other fieldbuses, potentially causing the EtherCAT task processing to fail. This should be avoided by specifying a task different to the EtherCAT task in the "PLC Settings".

As a rule, for each IEC task the used input data is read at the start of each task and the written output data is transferred to the I/O driver at the end of the task. The implementation in the I/O driver is decisive for further transfer of the I/O data. The implementation is therefore responsible for the timeframe and the specific time when the actual transmission occurs on the respective bus system.

Other tasks copy only the I/O data from an internal buffer that is exchanged only with the physical hardware in the bus cycle task.
(1) Read inputs from input buffer       (2) IEC task
(3) Write outputs to output buffer      (4) Bus cycle
(5) Input buffer                        (6) Output buffer
(7) Copy data to/from bus
(9) Bus cycle task, priority 1, 1 ms
(10) Bus cycle task, priority 5
(11) Bus cycle task, priority 10, interrupted by task 5

Using tasks
The "Task Deployment" provides an overview of used I/O channels, the set bus cycle task, and the usage of channels.

WARNING!
If an output is written in various tasks, then the status is undefined, as this can be overwritten in each case.

When the same inputs are used in various tasks, the input could change when a task is processed. This happens if the task is interrupted by a task with a higher priority and causes the process map to be read again. Solution: At the beginning of the IEC task, copy the input variables to variables and then work only with the local variables in the rest of the code.

Conclusion: Using the same inputs and outputs in several tasks does not make any sense and can lead to unexpected reactions in some cases.

Behavior of the bus cycle for EtherCAT
Before the IEC inputs are copied, the pending network messages of the last cycle are read.

When the "Messages per task" option is enabled in the settings of the EtherCAT Master, additional telegrams are transmitted to the devices employed per task and input or output employed. Channels that are used in a slow task are also transmitted less frequently. As a result, the bus load can be reduced.
6.3.2.17.6 Command 'Scan for Devices'

Function: The command establishes a brief connection to the hardware and determines the devices in the network. Then you can apply the devices found into the device tree of your project.

Call: Menu bar: "Project"; context menu of a device object in the device tree

Requirement: The communication settings to the controller are correct. The gateway and the PLC are started. The device supports the scan function.

The following devices provide the scan function: EtherCAT master, EtherNet/IP Scanner (IEC), Sercos master, CANopen Manager, CANopen Manager SIL2, PROFINET controller and PROFIBUS DP master.

You can perform the device scan immediately if the scan function is permanently implemented in the PLC. When scan function is implemented in a library, you have to log in only one time to download the library to the controller.

The command refers to the master controller selected in the device tree. For example, an already inserted PROFINET IO controller can be selected and the command used to determine the I/O devices and I/O modules assigned to it.

After performing the scan operation, the "Scan Devices" dialog opens and displays the found devices.

Dialog 'Scan Devices'
Table 364: “Scanned Devices”

“Device name, Device type, Address, Station name, etc.”

Data about the scanned device depending on network type.

When you change a value in the list of scanned devices, the value is shown in italics. This indicates that the new value has been changed in the editor in CODESYS, but not in the device. When you download the value to the device, it is shown normally.

Value that indicate differences between the project and the scanned device are shown in orange.

If multiple device descriptions are available for the scanned device, then the name is displayed in bold. The selection of the matching device description is resolved differently for different fieldbuses. For more detailed information, see the corresponding fieldbus chapters.

If a device description cannot be found, then the following message is shown: “Attention! The device was not found in the repository.” Depending on the bus system, additional information is displayed, such as manufacturer number and product number. The device cannot be inserted into the project without the installed device description.

“Show differences to project”

☑: The table in the dialog also shows additional configured devices (in the device tree of the project).

☐: The table shows all scanned devices. The configured devices are not shown.

“Scan for Devices”

Starts a new search.

“Copy All Devices to Project”

The device that is selected in the table is inserted into the device tree in the project. If nothing is selected, then all scanned devices are shown.

NOTICE!

If you insert devices, which are available in the device tree, to the device tree with “Copy All Devices to Project”, then the following should be noted. The data of the “Process Data” and “<...> I/O Mapping” tabs of the existing devices can be overwritten with the data of the recently inserted devices.

Table 365: “Configured Devices”

This part of the dialog is visible only when you select the “Show differences to project” option.

Differences between the scanned and configured devices are color-coded. Devices displayed in green are identical on both sides. Devices displayed in red are available only in the view of the scanned or configured devices.

- If you have selected a device in both views, then the scanned devices are inserted above the selected configured device.
- If you have selected a device in both views, then the scanned devices are inserted below the selected configured device.
- If you have selected a device in both views, then the configured devices are replaced by the selected scanned device.
- All scanned devices are copied to the project.
- Deletes the selected configured device.
6.3.2.17.7 Diagnosis
Diagnosis in the Application
EtherCAT Status

An instance of data type IoDrvEtherCAT is created for each EtherCAT Master that is inserted into the device tree. The name of the instance corresponds to the name of the master in the device tree. The availability of the instance is displayed on the “IEC Objects” tab of the device editor.

An instance of data type ETCSlave is created for each EtherCAT Slave that is inserted into the device tree. The name of the instance corresponds to the name of the slave in the device tree. The availability of the instance is displayed on the “IEC Objects” tab of the device editor. The slave instance is used in the application to query or change the state of the slave at runtime.

If the device diagnosis is enabled in the PLC settings, then the data type is IoDrvEtherCAT_Diag or ETCSlave_Diag.

- FB IoDrvEtherCAT (FB)
- ETCSlave (FB)
- Chapter 6.3.2.17.7.2.9 “Status Page (Master and Slave)” on page 1637

Emergency

When an EtherCAT device supports CoE (CANopen over EtherCAT), emergency messages at the slave instance can be determined with the following properties:
- LastEmergency: Evaluation of the last received message in the application
- ClearEmergency: Deletion of the last received message and resetting of the property LastEmergency

The emergency messages are also recorded in the logger.

Manufacturer-specific error codes need to be checked in the respective documentation from the vendor.

### AL Status

The property `ALStatus` returns any errors at the start of the stack. For example, configuration errors at the slave instance are displayed.

The AL status messages are also recorded in the logger.

**Diagnosis in the User Interface**

**Device Tree**

In online mode, the device tree allows for a pinpointing of a pending diagnosis.

- Green symbol: The device is in the **OPERATIONAL** state.
- Orange triangle: The device is in the **PREOPERATIONAL** state and is configured, and it is still not in the **OPERATIONAL** state.
- Error flag (red triangle): Hard error, such as an incorrect/missing device or connection interruption.
- Diagnosis flag (red exclamation mark): Indicates that a diagnosis entry is currently available for exactly this device. The details are then displayed on the status page of the respective device.
- Error-cleared flag (gray exclamation mark): Indicates that a previously pending error has been corrected.
EtherCAT – General (Master and Slave)

In online mode, the state of the device is displayed on the “General” tab for the EtherCAT Master and Slave.

In the case of the master, any errors or messages are displayed as text as well as the bus load:

- Diagnostics message: startup finished; all slaves in operational!
- Bus load: 0 %

In the case of the slave, the current state of the device is displayed.

- Diagnostics
  - Current State: Operational

</tr>
</tbody>
</table>

### Overview Page in the Master

All slaves and their statuses are displayed together on the “Overview” tab.

Each EtherCAT Slave is listed with its physical address, status, and any error counters. The error counters (CRC) are read from each device for the active connection and also show problems (EMC) with the wiring between the devices.

<table>

</tr>
</tbody>
</table>

CoE Online Display for the Slave

If the “Expert settings” option is selected, then the additional “CoE Online” tab is displayed with all CoE objects and their current values.

Here you can find and directly correct an incorrect parameters.

See also

- Chapter 6.3.2.17.3.7 “Tab ‘EtherCAT Slave - Online’” on page 1621

CoE Online Display for the Slave

If the “Expert settings” option is selected, then the additional “CoE Online” tab is displayed with all CoE objects and their current values.

Here you can find and directly correct an incorrect parameters.
Diagnosis History for the Slave

All messages in the respective slave are displayed on the diagnosis history tab. The visibility of this tab depends on the devices used.

Status Page (Master and Slave)

Different error counters are displayed on the “Status” tab of the master. Normally all counters should be 0.
The different times values indicate the time requirement for sending and receiving the messages. As a result, they display the properties of the respective operating system and network driver.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LostFrameCount</td>
<td>Number of lost packages. This usually indicates connection errors or EMC problems.</td>
</tr>
<tr>
<td>TxErrorCount</td>
<td>Shows the packages that cannot be sent if for example the internal buffer of the operating system is insufficient</td>
</tr>
<tr>
<td>RxErrorCount</td>
<td>Lost or late messages are displayed here if for example the operating system is overloaded and the incoming messages are not forwarded to the EtherCAT stack in time.</td>
</tr>
</tbody>
</table>

A diagnosis message is displayed on the “Status” tab of the slave if errors have occurred. For example, an emergency message is displayed.

6.3.2.18 PROFINET IO Configurator

6.3.2.18.1 General

PROFINET IO (Process Field Network) is an industrial Ethernet standard widely used in the field of manufacturing and process automation. It is managed by the user organization PI (PROFIBUS&PROFINET International) and is considered the successor of PROFIBUS (see https://www.profibus.com/).

6.3.2.18.2 PROFINET IO controller

Controller – General

Object: PROFINET IO Controller

The PROFINET IO controller, like the slaves, is identified by the station name. For AC500 communication modules, you can also configure the IP settings here. Otherwise the settings apply from the superordinate Ethernet node.

<table>
<thead>
<tr>
<th>“Station name”</th>
<th>The station name of the device. It is used for unique identification of the device in the network.</th>
</tr>
</thead>
</table>

Table 367: IP Parameters

| “IP address” | Note: Available for AC500 communication module only. |
| “Subnet mask” | If you insert the controller below an Ethernet adapter, then you have to define the IP parameters in the dialog of the Ethernet adapter. |
| “Default gateway” | |

Table 368: Default Slave IP Parameter

| “First IP address” | Range of IP addresses that CODESYS uses by default when inserting PROFINET IO devices into the device tree. If you use the “Auto-IP” function in the scan dialog, then IP addresses are also used from this range. The next free IP address is selected here. |
| “Last IP address” | |
| “Subnet mask” | |
| “Default gateway” | |

Table 369: IO Provider / Consumer Status

| “Application stop --> Substitute values” | When the user stops the application, the provider state is set to “BAD”. Then the slaves set the inputs and outputs to predefined substitute values. For more information, see “CODESYS default values – PROFINET IO substitute values” at the end of this chapter. |
| “Add to I/O mapping” | ☑: The incoming status information is added to the I/O mapping for all modules; provider state for the input data and consumer state for the output data. |
| “Substitute input data” | ● “Zero” ● “Last valid value” |
Table 370: Port Data

<table>
<thead>
<tr>
<th>“Peer station/port”</th>
<th>Neighboring device with port that is connected to this port. You can accept this setting in the “PROFINET IO Controller Topology” tab.</th>
</tr>
</thead>
<tbody>

<td>Type of network cable</td>
</tr>
</tbody>
</table>

Table 371: Watchdog

<table>
<thead>
<tr>
<th>“Activate”</th>
<th>Note: Available for AC500 communication module only. If the AC500 communication module firmware is not set within the given time (for example, in the case of an exception error in the application), then it is reset. The connection is terminated and the slaves switch to their substitute values. The defaults for the watchdog originate from the device description.</th>
</tr>
</thead>
</table>

PROFINET IO devices set their inputs and outputs to predefined substitute values when there is an interruption. These values are defined in the field device in contrast with default values. These values are usually zero, but specific substitute values can also be configured depending on the device.

The substitute values are set in the following cases:

- The connection is interrupted.
- The controller sets the provider state for the incoming data to "BAD".
- Other interruptions occur (for example, exception in host application, incorrect parameterization)

If the “Application stop --> Substitute values” option is enabled, then the controller sets the provider states to "BAD" at application stop. In this case, the slaves set their substitute values. All incoming data from the controller is ignored (including default values).

If the default values defined in the application should be set for an application stop, then you have to disabled this option. Moreover, you should select the “Update IO while stop” option (in the “PLC Settings”). Otherwise, the CODESYS PROFINET IO controller is stopped.

PROFINET IO Controller - Bus Cycle Task

The term "bus" includes all fieldbuses as well as the I/O bus. Consider that there is no bus cycle task for Modbus as Modbus does not provide I/O mapping and is controlled by POU s.

It's recommended to define a dedicated bus cycle task for each fieldbus configured in the project. It's strongly recommended not to use "unspecified" in the "PLC Settings" to avoid unexpected behavior. The task defined in "PLC Settings" determines the bus cycle task of I/O bus and, depending on the configuration, of the additional fieldbuses (the setting is by default inherited).

Especially in case of EtherCAT, a dedicated bus cycle task should be used which is not shared with other fieldbuses. If [unspecified] is set in the "PLC Settings", the EtherCAT task might be automatically used by other fieldbuses, potentially causing the EtherCAT task processing to fail. This should be avoided by specifying a task different to the EtherCAT task in the "PLC Settings".
As a rule, for each IEC task the used input data is read at the start of each task and the written output data is transferred to the I/O driver at the end of the task. The implementation in the I/O driver is decisive for further transfer of the I/O data. The implementation is therefore responsible for the timeframe and the specific time when the actual transmission occurs on the respective bus system.

Other tasks copy only the I/O data from an internal buffer that is exchanged only with the physical hardware in the bus cycle task.

![Diagram of I/O cycle](image)

(1) Read inputs from input buffer  
(2) IEC task  
(3) Write outputs to output buffer  
(4) Bus cycle  
(5) Input buffer  
(6) Output buffer  
(7) Copy data to/from bus  
(9) Bus cycle task, priority 1, 1 ms  
(10) Bus cycle task, priority 5  
(11) Bus cycle task, priority 10, interrupted by task 5

**Using tasks**

The “*Task Deployment*” provides an overview of used I/O channels, the set bus cycle task, and the usage of channels.

**WARNING!**

If an output is written in various tasks, then the status is undefined, as this can be overwritten in each case.

When the same inputs are used in various tasks, the input could change when a task is processed. This happens if the task is interrupted by a task with a higher priority and causes the process map to be read again. Solution: At the beginning of the IEC task, copy the input variables to variables and then work only with the local variables in the rest of the code.

Conclusion: Using the same inputs and outputs in several tasks does not make any sense and can lead to unexpected reactions in some cases.

**PROFINET IO**

**bus cycle behavior**

PROFINET IO does not provide any additional settings. Its functionality corresponds to the general description.

**PROFINET IO device**

**Device – General**

Object: PROFINET IO Device
In this dialog, you configure a communication link (PROFINET IO: application relation) to a PROFINET IO Field Device.

For all settings in the present dialog, the device description determines if the values here are editable and the values that are predefined or possible.

<table>
<thead>
<tr>
<th>“Station name”</th>
<th>The station name of the device. It is used for unique identification of the device in the network.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Station status”</td>
<td>32-bit error code compliant with the PROFINET IO specification. In case of error, the status is provided here, for example, when establishing a connection fails or a link is interrupted. A description is also displayed.</td>

- § Chapter 6.3.2.18 “PROFINET IO Configurator” on page 1640

6.3.2.18.3 PROFINET IO - Field Device
General

The configuration of the PROFINET IO field device consists of the device itself as well as the modules inserted below.

CODESYS provides two different PROFINET IO field devices:
- A variant especially for Communication Module CM579-PNIO
- A variant which is hardware-independent, the CODESYS PROFINET IO field device This variant runs on any number of Ethernet adapters and is also available in a purely programmatically configurable variant.

When inserting the Ethernet-based CODESYS field device, two tasks are created implicitly that are required by the PROFINET IO communication stack.
- “Profinet_CommunicationTask”: This task includes the acyclic communication services, such as establishing connections and diagnostics. These services are not time-critical due to very weak real-time demands. Therefore the task is low priority.
- “Profinet_IOTask”: This is where the actual PROFINET IO real-time data exchange takes place. Pending I/O data packets are processed in each cycle (see Slave Configurator: “Send clock”). Therefore, a cycle time of 1ms is required (for 1ms send clock).

(6) § Chapter 6.3.2.18.3.3 “Field Device NetX – General” on page 1646
(3) § Chapter 6.3.2.18.2.4.1 “Module – General” on page 1644
(4) Ethernet adapter
(7) § Chapter 6.3.2.18.3.2 “Field Device – General” on page 1645
For maximum IO performance with minimum delay when reading/writing, I/O data can be updated in this task (→ insert own POU that updates IOs in this task). No blocking or persisting operations should be executed in the IO task, such as visualization or file access. If the task is blocked too long, then the watchdog cancels the connection for communicating with the slave (see Slave Configurator: “Watchdog”).

**NOTICE!**

We recommend that you activate the “Refresh I/Os in Stop” option in the PLC settings. Otherwise the communication is canceled when the application stops at a breakpoint.

- ≪ Chapter 6.3.2.18.3.3 “Field Device NetX – General” on page 1646

### Field Device – General

Object: PROFINET IO Field Device

The tab displays the basic communication settings.

According to the PROFINET IO standard, the PROFINET IO device is responsible for the IP settings of the used adapter. It has to save remanent IP settings and be able to reset or modify at the request of the controller (IP=0.0.0.0). Initial state (Reset to factory) is with deactivated IP suite (IP=0.0.0.0).

To allow this full reset of the IP configuration, some settings have to be done on most systems (see chapter ≪ Chapter 6.3.2.18 “PROFINET IO Configurator” on page 1640 ).

However, if the PROFINET IO device is a programmable logic controller and connected with the (CODESYS) programming environment via one and the same Ethernet adapter, then modifying and resetting the IP address is interruptive (connection termination between IDE and PLC). Therefore, one of the modes is provided that deviates from the standard (“Use project parameters”).

#### Table 374: “IP and Name Assignment”

<table>
<thead>
<tr>

Table 375: “IO Provider / Consumer Status”

| “Use incoming” | ☑ The I/O data for the provider and consumer states is generated which is received by the controller. |
| “Use outgoing” | ☑ The I/O data for the provider and consumer states is generated which is sent to the controller. |
| “Substitute values” | The substitute values for the output data become active when the corresponding provider status (Output Data PS) is set to Bad. The output data is sent by the controller and copied to the %I area of the Profinet modules. The following options are available for the substitute values: 
  - “Inactive”: The outputs are set to “inactive” (example: 0).
  - “Last value”: The output data retains the last valid value (provider status = GOOD). The value is retained even if the connection to the controller has been interrupted. |

In online mode, the station name and the IP settings are displayed “Status” tab.

- Chapter 6.3.2.18 “PROFINET IO Configurator” on page 1640

Field Device NetX – General

Object: PROFINET IO Field Device

The tab displays the basic communication settings.

| “Use remanent data” | The IP settings and the station name of the file are used. Initially, the IP address is 0.0.0.0 according to the standard and the station name is blank. When a controller sets these values with the "store remanent" option, then they are stored here. |
| “Use project parameters” | When starting the device, the values defined in the project for IP configuration and station name are always used initially. |
| “Station name” | The name of the device in the network. Note: The station name and the IP settings can deviate from the (default) settings configured in the project. They can be set by the controller in runtime mode and in some cases stored persistently (this means when this is specified for the controller in the Set IP or Set station name commands). After a restart, the device is configured with these values as long as the “Use remanent data” option is set. |
| “IP address” | Initial IP settings |
| “Subnet mask” | Caution: This data can be modified by the PROFINET IO Controller. The remanent data is stored on the file system of the controller. After the controller is restarted, this stored data goes into effect. The settings here are then ignored. |

In online mode, the station name and the IP settings are displayed “Status” tab.

6.3.3 Windows server

Windows server usage in Automation Builder requires modifications of the system environment and of the settings in Automation Builder, e.g. permissions, licensing, session handling etc. How to setup system and software for Windows server is described in the application note *Windows Server 2016 - RDM access*.

6.3.4 Protocols and special servers

6.3.4.1 IEC60870-5-104 (Telecontrol)

6.3.4.1.1 General information IEC 60870

Introduction

The implemented IEC60870-5-104 protocol allows link-ups between AC500 CPUs with onboard Ethernet and external systems. The link-up takes place via the onboard Ethernet interface of the CPU. The telecontrol protocol according to IEC60870-5 is used.

The CPU can work as both control station and substation. In control direction, setpoints and commands can be set; in monitoring direction the substation sends status values, real values and discrete values to the control station. Via general inquiry, the control station requests the substation to send all status values, real values and discrete values. Otherwise, these values are sent by the substation on a change-driven basis, cyclically or when triggered by an application. Status values, real values and discrete values may contain timestamps. These are filled in with the time of the process station when sent. The CPU can time-synchronize the telecontrol link.

A module accepts the configuration of the physical interface (link layer) and the general protocol parts (application layer).

Send and receive blocks are available for data exchange. These blocks exist for the IEC60870-5 data types setpoint value, command value, double command value, status value, double status value, real value and discrete value. The inputs/outputs of the send and receive blocks are combined with the signals to be communicated. See documentation of IEC60870 library for more information.

Limits of supported devices

AC500 V3 (Standard):
- PM5630: Support of 5 control stations and/or substations with 1.000 information objects overall on ETH1 and ETH2.
- PM5650: Support of 10 control stations and/or substations with 5.000 information objects overall on ETH1 and ETH2.
- PM5670: Support of 20 control stations and/or substations with 10.000 information objects overall on ETH1 and ETH2.

AC500-eCo V3:
- PM5012/PM5032/PM5052: no support of IEC60870-5-104 protocol.
- PM5072/PM5082: Support of 5 substations with up to 1.000 information objects overall on ETH1 and ETH2. IEC60870 control stations are not supported.

The S500 I/O modules do not support the functionality to create and transfer a timestamp with an event directly at the I/O channel. A workaround is using SoE logging (Sequence of Event) for a root-cause analysis. For a better understanding on how events are processed on a AC500 V3 PLC, refer to the application example AC500 sequence of events with V3.
Data flow control

Each send or receive block can only process one data message. Ideally, new data are available at each user task run-through or new data can be sent.

If the output OV (send block only) indicates TRUE, the function block computes more quickly than the data can be sent. This can happen if the receive block is not computed quickly enough and has thus not collected all the data.

Alternatively, this block sends either cyclically or if the input value is changed. Ideally, the topical data can be sent via the telecontrol link in connection with every user task run-through.

Data integrity

With IEC60870-5 protocol, a distinction is made between data transmission in the monitoring direction (status values, real values, discrete values) and in the control direction (commands and setpoints).

All data transmissions are acknowledged from the link communication level by the receiver. This acknowledgement is not sent to the sender of the data in every telecontrol link.

For data transmission in control direction, additional acknowledgement (e.g. ACTTERM) is possible. These acknowledgements are not sent by every telecontrol link either. For safe data transmission, it is necessary, in such cases, to configure data readback. The receiver then sends the data received back to the sender via the corresponding send blocks.

Information in the monitoring direction is acknowledged by the receiver on the lowest communication level (link level) when received. This acknowledgement is generated by the telecontrol head itself with some telecontrol heads. In the event of overload/overrun, a data message may be lost. For data in the control direction, so-called ACTTERM acknowledgement can be used. This additional acknowledgement is sent back to the sender when the data have been executed in the process. If data are to be sent in the monitoring direction with guaranteed transmission, it is necessary to read back the sent value via another variable and, after observing a monitoring time, resend in the event of an error.

Data transmission

Send blocks

On the basis of the communication protocol, it is sensible to restrict the data types at one send block to one type. Therefore, there are 5 types of send blocks: send of status values, commands, real values, setpoints and discrete values. These types are mapped to the IEC1131 data types BOOL, REAL and DINT. See documentation of IEC60870 Library for more information.

Operating modes of the send blocks

The send blocks know three operating modes to send their data:

- Caused by request pin (SEND)
- Send in connection with a change of data (AUTO)
- Cyclic send of data (CYCLE)
Send via request pin

The SEND signal is evaluated on the rising edge, the RDY signal remains applied for one computation cycle. If a rising edge is generated again at the SEND signal although no acknowledgement has yet been received from the receiver, the OV pin is set in order to indicate that an overrun has happened. The evaluation of the receive acknowledgement is carried out before the evaluation of whether transmission is to take place. This means, assuming that there is an appropriately fast telecontrol link, that in connection with change-driven and cyclic transmission, a transmission job can be sent in connection with every computation of the block. In connection with send via the request pin it is possible to send only in connection with every second computation (send takes place only with a rising edge).

Change-driven send of data

Data are always sent when the value of the input variables changes. When changes take place, there is an internal simulation that the SEND pin changed from 0 to 1.

In order to prevent unnecessarily frequent send in the event of mild fluctuations in the input value, a threshold value can be configured for real values and setpoints. The input value is not sent until it differs positively or negatively from the value last sent by more than the threshold value.

If the input value changes again although no acknowledgement has yet been received from the receiver, the OV pin is set in exactly the same way as in connection with send via the request pin. If an error occurs during send, the job is automatically retried until the value has been sent without error.

Cyclic send

The data are automatically sent after expiration of a configurable cycle time (SCANDOWN). This cycle time is indicated in multiples of the task cycle time in which the block is computed. In this operating mode, an overrun error can occur if the transmission is faster than the response time of the receiver. For setpoints, it is necessary to ensure that an acknowledgement is generated by the receiver which is not sent until the setpoint is accepted. The send block is not ready for transmission again until after this acknowledgement has been received.

Receive blocks

In receive direction, the jobs enter the device module via the interface. The device module selects the correct receive block using the telecontrol address. To this end, during installation the receive blocks pass their parameterized telecontrol addresses to the device module. The device module stores the data received and the receive blocks make the data available at their output pins in connection with the next computation of the user task.

6.3.4.1.2 Configuration

Configuration changes >= Automation Builder 1.1/CBP 2.4

The IEC 60870 protocol allows link-ups between AC500 CPUs with onboard Ethernet (e.g. PM595-4ETH and PM591-2ETH) and external systems.

The link-up takes place via the onboard Ethernet interface of the CPU. As of Automation Builder Version 1.1 telecontrol is also supported for CPUs that provide more than one Ethernet interface (e.g. PM595-4ETH and PM591-2ETH). This allows to use different Ethernet interfaces for IEC 60870 connections, hence, telecontrol configuration is changed. Further, as of this version terminology is aligned with IEC 60870 standard and provides additional features that are described in this chapter. For a description on principle telecontrol configuration.
For further information on configuration changes, see the following chapters:

Control and Substations ≥ CBP 2.4 "Control station and substation configuration" on page 1650

Import Export ≥ CBP 2.4 "Configuration changes >= Automation Builder 1.1/CBP 2.4" on page 1649

Validity Check of Configuration ≥ CBP 2.4 "Validity check of configuration" on page 1670

Control station and substation configuration

General

The CPU can work as both, control station and substation.

<table>
<thead>
<tr>
<th>Control station</th>
<th>Client, master, controlling station: Synonyms for a higher-level station (central station, monitors other stations)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Control direction</td>
<td>Data transfer direction from the control station to the substation</td>
</tr>
<tr>
<td>Substation</td>
<td>Server, slave, controlled station; synonyms for a subordinate IEC 60870-5-104 telecontrol station (which is monitored)</td>
</tr>
<tr>
<td>Monitoring direction</td>
<td>Data transfer direction from the substation to the controlling station</td>
</tr>
</tbody>
</table>

Configure a control station in the device tree “PLC”---> “Interfaces”---> “Ethernet”---> “Protocols”:

1. Right-click “ETHx” ➔ Add objects”.
2. Select the control station from the list and click “Add object”. Configure substations and further control stations in the same way. As of Automation Builder 1.1 any combination of control stations and substations can be configured, in due consideration of a total number of 10 stations.
3. Double-click the “new control station” node to open parameter configuration. In the “Link Layer” tab access to the Ethernet interface is configured.
As of Automation Builder 2.2.1 the V3 PLC telecontrol station objects from GVL IEC60870_5_104_Connection_GVL can only be used in Structured Text by adding the namespace of the GVL as prefix.

Example:

```
byteValue := IEC60870_5_104_Connection_GVL.IEC_60870_5_104_Control-station.Con;
```

“Link layer” tab

In order to provide flexible usage of control stations and substations as of Automation Builder 1.1 configuration of substations has been changed. As several substations can be operated with several Ethernet interfaces, select the Ethernet interface to be used from the pull-down menu. Enter the IP address to the control station and if required to another control station (redundant connection). If no IP address is defined, the substation accepts connection to any control station.

This field is not available in the “Link Layer” tab of control stations. Selection of ETH interface is only possible for substations. The control station is always configured on both interfaces by default.

**Timeout settings**

T1, T2, T3: The values for the connection control and message replication; timeout1/2/3.

**Buffer settings**

This parameter gives the maximum number of outstanding messages and acknowledgement behavior.

Send buffer (k): Maximum difference receive sequence number to send state variable.

Rec buffer (w): Latest acknowledge after receiving w I format APDUs.
Network settings

Network settings are available for control stations and for substations. The IP address of the control station and if available the IP address of another control station (redundant IP address) can be selected by the user.

For an overview on the configured Ethernet interfaces for the control stations and substations, double-click the “Protocols” node.

“Application layer” tab

Settings

The application layer is the communication layer with which the send and receive blocks work.

![Application layer settings](image)

**Use ACTTERM**
This parameter concerns only setpoints and commands. If this parameter is checked, an acknowledgement with set ‘actterm’ is generated as reason for transmission at the time at which the receive block is computed and outputs its telecontrol data at its output pins. On transmission side, the data block awaits the reception of this ACTTERM acknowledgement and reacts with its corresponding output to the reception of this acknowledgement. For commands with execution time, the acknowledgement is generated when the command is terminated, for commands with continuous execution time and for setpoints, the acknowledgement is generated when the data are output to the output pins.

**Foreign Acknowledgement**
If this option is not enabled (default), a message that was sent is considered as ok as soon as transmission was successful. If you enable this option, a message that was sent is not considered as ok until a success message (foreign acknowledge) is returned from the receiver.

**Application timeout**
This time indicates how long an acknowledgement will be awaited on the application level. An acknowledgement is generated only for commands and setpoints on the application level.

**Station address**
The station address defines which station will be subject to a count query. The values define the 2 bytes for the common telecontrol address (Common addr.). The values concerned are as follows:
0: The station address is not used.
1 ... 254: The count is queried on the station defined by the station address.
255: The count is queried on all accessible stations.

**Timesync**
After each new establishment of a link and once per hour, a ‘coarse time synchronisation’ message is generated. This time synchronisation is only supported from AC500 to external systems. Time synchronisation from an external system to AC500 is not provided! Incoming time synchronisation messages are confirmed by the process station but not executed. Greenwich Mean Time (GMT) is used as the time for the synchronisation.

**Send 'Init end' after reconnection**
After each establishment of a link or only in connection with the first establishment of a link and after reconfiguration, an init end message is generated. After the init end message, there is a general inquiry, if configured.

**General inquiry**
**Activated**
This parameter concerns only real values, discrete values and status values. The device module generates a general inquiry message after each new establishment of a link. The other side then generates a message with the reason for transmission ‘general inquiry’ for every data point and subsequently an init end message. This procedure ensures that, in the event of a new establishment of a link, all data are available on the reception side in topical form.

**With parameters**
If general inquiry is activated the parameter values are sent.

**Without integrated totals**
With a general inquiry no integrated total values are sent.

**Counter interrogation**
**Group**
General, 1 ... 4: The count inquiry is executed for a specific group of counters (1 ... 4). The count inquiry is executed for all groups of counters.

**With reset**
The reset quality bit is sent along with the count inquiry.

**With relocate**
The relocate quality bit is sent along with the count inquiry.

**“Information objects” tab**
**General**
Open the “Information object” tab to configure so called information objects and a common address (known as 'data points' and 'Global address' in former Automation Builder versions). In this tab different information objects and their services for transmission are defined. A data point or information object is identified via a system-wide unambiguous address containing a maximum 5 bytes.

1. Right-click in the empty view and select “Add Information Object with ASDU” to add a data group. Select the desired object from the list (e.g. M_SP_NA_1).
   - An information object with a corresponding ASDU (Application Service Data Unit) is created.
2. Configure the settings in the “Information Object” tab to your convenience.

3. Double-click a table cell to modify pre-set values. For some ASDUs additional sub information objects can be configured. For this, right-click the already existing ASDU and select “Add Information Object” to selected ASDU option. This allows configuration of 16 data points at the most (depending on the ASDU type). With “Remove Information Object” the selected ASDU is deleted.

**Description of the columns**
- ASDU name: node name of the information object (name of the ASDU).
- Data type: Data type of the ASDU.
- ASDU type: Type of ASDU.
- Common addr: Common address of the ASDU (known as ‘Global Address’ in former AB Versions). Byte 1/2 of the common telecontrol address of the block (range: 0 ... 255).
- Info obj addr: Together with common address Info obj addr defines the endpoint (range: 0 ... 255).
- Norm start: Low limit (0 %) of the normalized range for real values and setpoints.
- Norm end: High limit (100 %) of the normalized range for real values and setpoints.
- Threshold: Threshold limit beyond which a change of the input value referred to.
- Description: Table cell for free text. Use this field to describe your configuration settings e.g. differences between configuration variants.

**Format of common addr and info obj addr**

The following address formats of your entries in the columns Common addr and Info obj addr of the “Information Objects” tab are possible:
- 1.2 and 3.4.5 (Default format)
- 1-2 and 3-4-5
- 258 or hex 0x102 and 197637 or hex 0x30405
- 513 or hex 0x201 and 328707 or hex 0x50403

Previously you have to choose your preferred address format:
1. Click “Tools” and then “Options...”
   ⇒ The window “Options” appears

2. Select “IEC 60870-5-104”, make your choice and click [OK].

Import options of information objects
The User can accept the imported IEC60870 information objects as single change or change as block.
IEC60870-5-104 Multiple connections

General

An AC500 with more than one substation connection must be able to identify the corresponding control station clearly. This identification takes place exclusively via the control station’s IP address. In order to make it possible for a non-redundant control station to have redundant access to a substation with 2 Ethernet connections. The local substation address is ignored during connection establishment.

In the following descriptions, the term station must not be confused with the individual connection. One station can have several connections. An IEC60870-5-104 communication always takes place between a control station and a substation. A control station can manage several substations and also simultaneously be a substation for one or several control stations. However, these must then be realized using different stations.

A PLC may **not** be configured for another PLC repeatedly as a substation or a control station unless a disjunctive Ethernet infrastructure is used for this.

Redundant connections must be specified as such in the configuration.

An AC500 can be used only once as control station for another AC500, it makes no sense to use the same AC500 repeatedly as a control station for the same substation. Such a structure is configured as a redundant control station as long as only one AC500 exists as a control station per substation. However, this control station may have 2 IP addresses. Therefore, this configuration must either have the IP address 0.0.0.0 entered on the substation for the control station, meaning that all IP addresses are accepted and no other control station can access this AC500 or alternatively the possible control station addresses must be specified (ETH1 and ETH2).
PM57x/- PM58x/- PM59x-ETH, PM5650-2ETH:

If you plan to control several substations with the AC500, they can be cascaded. This results in a tree structure.

1. 2 control stations
2. Substation and 3 control stations
3. Substation and 3 control stations
4. Substation
5. Substation

In the following, the notation 192.168.1.0/24 is used for TCP/IP networks. Here, the figure /24 specifies the network mask with 255.255.255.0 and 192.168.1.0 describes the network. The valid addresses for this Class C network are 192.168.1.1 to 192.168.1.254! Only the last byte of the address is provided on the respective devices, with e.g. .10. This means that the respective device has the address 192.168.1.10.
Minimal structure

A control station with an Ethernet interface is connected to a substation with an Ethernet interface.

Configuration at control station

PM57x-/ PM58x-/ PM59x-ETH, PM5650-2ETH:
The respective substation IP address must be specified at the control station. For this, in the network settings of the control station (1) enter the IP address of the substation (in the example: 192.168.1.25). Option "Enable redundant connection" must be disabled.

Configuration at substation

PM57x-/ PM58x-/ PM59x-ETH, PM5650-2ETH:
Either the control station IP address or the general address 0.0.0.0 must be specified at the substation (2). For this, in the network settings of the substation enter the IP address of the control station (in the example: 192.168.1.10). Option "Enable redundant connection" must be disabled.

If the general address 0.0.0.0 is used at the substation, no further control station can be configured on this controller for a further substation.
Minimal redundancy structure

The most simple redundant structure with an AC500 consists of a redundant control station (not AC500) which is connected to the AC500 substation with 2 different IP addresses. These redundant control stations must synchronize which control station is active.

Only one control station can be active at any given time.

![Diagram of redundant structure]

(1) Control station 1A (Not AC500)
(2) Control station 1B (Not AC500)
(3) Substation
(4) Redundancy link

**Configuration at control stations**
The respective substation IP address must be specified at the control stations 1 and 2 (not AC500). For this, in the network settings of both control stations enter the IP address of the substation (in the example: 192.168.1.25).

**Configuration at substation**
PM57x-/ PM58x-/ PM59x-ETH, PM5650-2ETH:
Either the control station IP addresses or the general address 0.0.0.0 must be specified at the substation (3). For this, in the network settings of the substation enter the IP addresses of the control station (in the example: 192.168.1.10 and 192.168.1.11). Option “Enable redundant connection” must be enabled.

---

*If the general address 0.0.0.0 is used at the substation, no further control station can be configured on this controller for a further substation.*
Network redundancy

General
For network redundancy a control station can reach a substation via 2 paths.
Both the control station and the substation can have 2 different IP addresses. Without special network routing, 2 separate networks should exist, within which both the substation and the control station each have 2 interfaces.
Possible variants of network redundancy are described in the following.

Network redundancy with 2 separate networks

1. Control station with 2 redundant paths
2. 1 Substation with 2 Ethernet interfaces

Configuration at control stations
PM591-2ETH, PM595-4ETH, PM5650-2ETH:
The substation’s IP addresses must be specified at the control stations (1). For this, in the network settings of the control station enter the IP addresses of the substation (in the example: 192.168.1.25 and 192.168.2.26). Option “Enable redundant connection” must be enabled.

Configuration at substation
PM591-2ETH, PM595-4ETH, PM5650-2ETH:
Either the control station's IP addresses or the general address 0.0.0.0 must be specified at the substation (2). For this, in the network settings of the substation enter the IP addresses of the control station (in the example: 192.168.1.10 and 192.168.2.11). Option “Enable redundant connection” must be enabled.
If the general address 0.0.0.0 is used at the substation, no further control station on another substation can be configured on this controller. Equally, the substation connection must be activated for both interfaces.

Network redundancy with 1 network and 2 Ethernet ports in substation

(1) Control station with 2 paths to reach substation
(2) 1 Substation with 2 Ethernet interfaces

Configuration at control stations PM591-2ETH, PM595-4ETH, PM5650-2ETH:
The substation’s IP addresses must be specified at the control stations (1). For this, in the network settings of the control station enter the IP addresses of the substation (in the example: 192.168.1.25 and 192.168.1.26). Option “Enable redundant connection” must be enabled.

Configuration at substation PM591-2ETH, PM595-4ETH, PM5650-2ETH:
Either the control station's IP addresses or the general address 0.0.0.0 must be specified at the substation (2). For this, in the network settings of the substation enter the IP addresses of the control station (in the example: 192.168.1.10 and 192.168.2.11). Option “Enable redundant connection” must be enabled.
If the general address 0.0.0.0 is used at the substation, no further control station on another substation can be configured on this controller. Equally, the substation connection must be activated for both interfaces.

Network redundancy with 1 network and 1 Ethernet port in substation

- No online redundancy.
- Only one connection will be established.

Configuration at control stations

PM591-2ETH, PM595-4ETH, PM5650-2ETH:

The substation's IP addresses must be specified at the control stations (1). For this, in the network settings of the control station enter the IP addresses of the substation (in the example: 192.168.1.25 and 0.0.0.0). Option “Enable redundant connection” must be disabled.

Configuration at substation

PM591-2ETH, PM595-4ETH, PM5650-2ETH:

Either the control station's IP addresses or the general address 0.0.0.0 must be specified at the substation (2). For this, in the network settings of the substation enter the IP addresses of the control station (in the example: 192.168.1.10 and 192.168.2.11). Option “Enable redundant connection” must be enabled.
If the general address 0.0.0.0 is used at the substation, no further control station on another substation can be configured on this controller. Equally, the substation connection must be activated for both interfaces.

Network redundancy with 2 Ethernet ports in substation

(1) Control station with 2 paths to reach substation
(2) 1 Substation with 2 Ethernet interfaces

Configuration at control stations
PM591-2ETH, PM595-4ETH, PM5650-2ETH:
The substation’s IP addresses must be specified at the control stations (1). For this, in the network settings of the control station enter the IP addresses of the substation (in the example: 192.168.1.25 and 192.168.1.26). Option “Enable redundant connection” must be enabled.

Configuration at substation
PM591-2ETH, PM595-4ETH, PM5650-2ETH:
Either the control station's IP addresses or the general address 0.0.0.0 must be specified at the substation (2). For this, in the network settings of the substation enter the IP addresses of the control station (in the example: 192.168.1.11 and 0.0.0.0). Option “Enable redundant connection” must be disabled.

If the general address 0.0.0.0 is used at the substation, no further control station on another substation can be configured on this controller. Equally, the substation connection must be activated for both interfaces.
Full control station redundancy

A control station can consist of two fully redundant units (not AC500s), which are connected via a redundancy link. These control stations must ensure that only one of them at a time is actively connected to the substation and communicates with it. The inactive control station, however, can establish non-active connection with a substation and monitor it with keep alive packages.

(1) 2 redundant Control stations (Not AC500)
(2) 1 Substation with redundant Control station and 2 Ethernet interfaces (2nd port)
(3) Redundancy link

Configuration at control stations

The substation's IP address must be specified at the control stations (1) (not AC500). For this, in the network settings of the control station enter the IP addresses of the substation (in the example: 192.168.1.25 and 192.168.2.26).

Configuration at substation

PM591-2ETH, PM595-4ETH, PM5650-2ETH:

Either the control station's IP addresses or the general address 0.0.0.0 must be specified at the substation (2). For this, in the network settings of the substation enter the IP addresses of the control station (in the example: 192.168.1.10 and 192.168.2.11). Option "Enable redundant connection" must be enabled.

If the general address 0.0.0.0 is used at the substation, no further control station on another substation can be configured on this controller. Equally, the substation connection must be activated for both interfaces.
Multiple control stations on the same network

As of firmware version 2.4, an AC500 can be used as a substation for several control stations. For this, the control stations must be distinguished by their IP addresses. Should a control station have more than one IP address (redundancy), both possible IP addresses should also be entered for the allocated substation connection. As a result, even despite being equipped with several Ethernet interfaces, a device can only be one allocated control station at a time for a determined substation. Thus, several substations can be configured for different control stations on a AC500.

(1) Control station 1
(2) Control station 2
(3) 2 Substations (IEC60870-5-104 2nd Connection)

**Configuration at control stations**
PM57x/- PM58x/- PM59x-ETH, PM5650-2ETH:
The substation’s IP address must be specified at the control stations. For this, in the network settings of the control station (1 and 2) enter the IP addresses of the substation (in the example: 192.168.1.25). Option “Enable redundant connection” must be disabled.

**Configuration at substations**
PM57x/- PM58x/- PM59x-ETH, PM5650-2ETH:
Both control station’s IP addresses must be specified at the substation (3). For this, in the network settings of the substation enter the IP addresses of the control stations (in the example: 192.168.1.10 and 192.168.1.11). Option “Enable redundant connection” must be disabled.
Multiple control stations on different networks

As of firmware version 2.4, an AC500 can have several local Ethernet interfaces which can be used for separate control station connections. For this, a control station must be identified via its IP address. The substation address used locally is not used to distinguish a connection in order to enable a network and therefore route redundancy. On AC500, the acception of IEC60870-5-104 connections on an interface can only be prevented.

(1) Control station 1
(2) Control station 2
(3) 2 Substations with 2 Ethernet interfaces (2\textsuperscript{nd} port and 2\textsuperscript{nd} connection)

**Configuration at control stations**

PM57x/- PM58x/- PM59x-ETH, PM5650-2ETH:

The substation's IP addresses must be specified at the control stations (1 and 2). For this, in the network settings of the control station enter the IP addresses of the substation (in the example: 192.168.1.25 and 192.168.2.26). Option “Enable redundant connection” must be disabled.

**Configuration at substations**

PM591-ETH, PM595-ETH, PM5650-2ETH:

Both control station's IP addresses must be specified at the substation (3) under both substation connections. For this, in the network settings of the substation enter the IP addresses of the control stations (in the example: 192.168.1.10 and 192.168.2.11). Option “Enable redundant connection” must be disabled.
Double connection

<table>
<thead>
<tr>
<th><img src="image" alt="Diagram" /></th>
</tr>
</thead>
</table>

This configuration does work. 
But it is senseless!

It is possible to configure a double connection between 2 stations using 2 separate networks (at least logically separated sub-networks).

However, such a setup has no advantages via-à-vis the minimal structure right at the start.

For this setup, connection data must be double configured and double resources are also required at the stations, not providing any advantages whatsoever.

Rather the opposite is true, because such configurations are highly prone to errors.

(1) 2 Control stations with 2 Ethernet interfaces  
(2) 2 Substations with 2 Ethernet interfaces
Faulty configuration

This configuration does not work!

If an AC500 is configured as a control station, the interface which is used to reach the substation is not defined.

The decision as to which interface is used for this is taken by TCP/IP when running.

It is also dependent on the current network configuration.

Here, the current link status and the order of link recognition may be decisive for the interface to be used.

Such a scenario would not result in stable communication as both substations cannot clearly distinguish the control stations.

Instead, the connection management for a substation will assume that the control station has lost the connection and then establishes a connection.

(1) 2 Control stations with 2 Ethernet interfaces
(2) 2 Substations with 2 Ethernet interfaces

Export a CSV file

As an alternative many values can be modified at a time by exporting the configuration to a CSV file. After modifying the file data, import the CSV file.

☑ Chapter 6.3.4.1.2.3 “Import/Export functionality” on page 1669
Import/Export functionality

As of Automation Builder 1.1 (CBP >= 2.4) configuration of control stations and substations can be exported/imported via CSV file. Open the CSV file with a spreadsheet software (e.g. Microsoft Excel) and modify the values within the file to your convenience:

1. Export configuration data: right-click the node of the control station or substation to be exported.

2. Click “Export → IEC 60870-5-104 information objects (CSV)” and store the CSV file to a desired directory.

3. Open the CSV file with a spreadsheet software (e.g. Microsoft Excel) and change the values to your convenience. Added table columns are only accepted after the last column.

4. Import configuration data: right-click the node of the control station or substation that has been exported previously.

5. Click “Import → IEC 60870-5-104 information objects (CSV)” and select the CSV file from the file system. Configuration data is imported.

As of Automation Builder 1.1.1 during file import the project data is compared with the project data that is already available. In order to prevent data from being overwritten inadvertently, you can select the data that shall be imported in the “Project Compare - Differences” window:

Data on the left side of the window refers to already available project data. This data is displayed under “Control station → Information objects” tab. Data on the right side of the window refers to new data that can be imported after your confirmation. Decide whether to import (and overwrite) the data or not.
- Data in black color means the existing data and the data to be imported is identical.
- Data in red color means the existing data and the data to be imported differ. Decide whether to import the new data (and to overwrite the existing data) or not.
- Data in blue color means, the data to be imported is new and will be added to the existing data.
- Data that has been confirmed for the import already is displayed in green color (after clicking [Accept Single]).

In order to move data from one side of the window to another, select the data and click [Accept Single]. Data is highlighted in yellow.

To confirm the import of all new data, click the top entry (here: All: ASDU name - ASDU type - Common addr - ...). Then, click [Accept Single].

Close the "Project Compare - Differences" tab, save your project and confirm the message. The changes are displayed in the "Information objects" tab.

Validity check of configuration

We recommend you to verify the IEC configuration of control stations and substations: Right-click a control station or substation -> "Check configuration".
The check will look for the following topics:

- Duplicate addresses.
- Stations without any Information objects.
- ASDU names, which are not unique.

When a check finds errors or incompatibilities this will be reported in a separate messages view at the bottom of the window:

![Messages view](image)

With a double-click on the error line, the part of the configuration with the violation will be opened. Now, you can correct the error.

### 6.3.4.1.3 IEC60870 compatibility list

In order to implement specific telecontrol systems, this companion standard presents sets of parameters and alternatives from which subsets must be selected.

*AC500 – IEC60870-5-104 Protocol Interoperability / Compatibility List*

### 6.3.4.2 IEC 61850 Server

#### 6.3.4.2.1 Introduction to IEC 61850

The IEC 61850 communication protocol standard for electrical substations enables the integration of all protection, control, measurement, and monitoring functions by one common protocol. It provides the means of high-speed substation applications, station wide interlocking and other functions requiring intercommunication between IEDs = blue boxes in the following figure.
The well described data modelling, the specified communication services for the most recent tasks in a station makes the standard to a key element in modern substation systems.

This manual describes mainly how the IEC 61850 standard is applied in AC500. References and brief descriptions of the IEC 61850 standard are also included in this introduction chapter. Anyhow, it is assumed that the reader has basic knowledge about the IEC 61850.

To understand the IEC 61850 standard and to be able to find the related information, the following parts of the standard are important:
IEC 61850-5 explains how substation functions are realized by logical nodes = function blocks which are running in the IEDs. Operating an isolator from station level for example requires the logical nodes: “IHMI”, “CSWI”, “CILO” and “XSWI”.

The logical nodes and their data objects are defined in IEC 61850-7-4, for example “CSWI”, which is an abbreviation for “Switch controller”.

Data attributes can be addressed by their full path, for example “CSWI.Pos.stVal” contains the switch status of a certain isolator and can have the values: on, intermediate-state or off (bad-state only in case of defect auxiliary switches).

---

### Part 7-2: Abstract Communication Service Interface (ACSI)

Abstract communication services between logical nodes are described in IEC 61850-7-2. Following figure shows how a client (e.g. “IHMI”) sends an operate command (“Oper_req”) to a control object (e.g. “CSWI”). The control objects sends a confirmation (“Oper_rsp”) immediately and a report with the updated status (“Report_req”) after the “CSWI.Pos.stVal” has changed to off.

![Diagram](image)

Another service is GOOSE (Generic Object Oriented Substation Event), which is used for fast communication like tripping a circuit breaker or interlocking. GOOSE messages are always retransmitted. Slowly in stable conditions and fast after an event has occurred.

![Diagram](image)

- **T0** Retransmission in stable conditions (no event for a long time).
- **(T0)** Retransmission in stable conditions may be shortened by an event.
- **T1** Shortest retransmission time after the event.
- **T2, T3** Retransmission times until achieving the stable conditions time.
Communication profile (IEC 61850 stack) is described in IEC 61850-8-1. This part of the standard maps the abstract services from IEC 61850-7-2 to concrete communication profiles: While core ASCI services like control and reporting are using MMS and TCP/IP, the fast GOOSE service is working directly on the Ethernet layer.

SCL (Substation Configuration Language) is described in IEC 61850-6. The SCL is an XML based definition of how to describe substation single line, IEDs with logical nodes and their communication through a communication bus. The following types of SCL files are distinguished:

- SSD (System Specification Description), describing the single line and required logical nodes.
- ICD (IED Capability Description), containing the capability (possible logical nodes) of one IED type.
- CID (Configured IED Description), containing the configuration of a concrete IED with instantiated logical nodes, services and communication addresses.
- SCD (Substation Configuration Description), containing description of the complete substation, consisting of single line, communication bus and IEDs with logical nodes, which are linked to the primary equipment in the substation section.

The part IEC 61850-6 also includes the roles of different tools as well as the engineering concepts. It distinguishes between system wide engineering with a system configurator and IED specific engineering with an IED Configurator.
Part 10: Conformance testing

Conformance tests and the basis for conformance documents are handled in IEC 61850-10.

6.3.4.2.2 AC500 and IEC 61850

General

After installation of the IEC 61850 - server package, the AC500 can act as an Intelligent Electronic Device (IED) in an IEC 61850 network. The AC500 IEC 61850 package allows to connect substation automation systems to PLC applications Automation Builder is used as IED configurator tool for modelling IEC 61850 data and communication in AC500.

Capabilities

This IEC 61850 server package 4.x allows the AC500 V3 to act as an IED with IEC61850 server, Edition 1, providing following functionality:
- Configure a data model with logical nodes and map their data attributes to IEC 61131 application.
- Configure data sets to bundle data objects and attributes for publishing them as MMS reports or GOOSE control blocks.
- MMS server for core ASCI services like sending MMS reports over TCP/IP.
- GOOSE Publisher, sending GOOSE control blocks in a very fast way by bypassing TCP/IP layers.
- GOOSE Subscriber, receiving GOOSE reports from other IEDs and map their data attributes to the IEC 61131 application.
- SNPT client or server for time synchronization (included in the standard package of AC500).

To get information and an understanding about the implemented possibilities of IEC 61850 in the AC500, the details are described in the IEC 61850 conformance documents. Conformance documents, which can be found in the example folder.

Example projects for the libraries can be found in the example folder: “Help ➔ Project examples” in the Automation Builder menu.

Prerequisite: Install the related library package with “Automation Builder ➔ Tools ➔ Installation Manager” - [Modify].

- MICS (Modeling Information Conformance Statement), contains the declaration of the used logical node types.
- PICS (Protocol Information Conformance Statement), contains the details and what is supported regarding protocol facilities.
- PIXIT (Protocol Extra Information), contains additional information on how the IEC 61850 is implemented and used.
- TICS (Tissue Information Conformance Statement), contains the supported tissues, which are handled in the tissues process as defined by UCA, Utility Communication Architecture forum. The tissues handling is found in IEC TICS.
The same folder also contains the TÜV certificate for AC500 midrange CPUs: PM5630, PM5650, PM5670 and PM5675. AC500-eCo V3 as released after the certification but is capable of IEC 61850 as well. The certificates can also be accessed online from the UCA database. Search for organization “ABB Automation GmbH”.

Automation Builder is used as IED configurator tool according to IEC 61850-6 for modelling the IEC 61850 data structures and connecting them to the PLC application. It allows import and export of SCL to transfer detailed configuration information between Automation Builder and other IEC 61850 configuration tools:

- .cid file (from another IED) or .scd file (complete substation with several IEDs) can be imported.
- .cid file (AC500 configured as IED) can be exported.

**Limits/technical data**

- Edition 1 of IEC 61850 is supported only.
- MMS server only.
- Data sets for MMS and GOOSE reporting: Max. 20 data sets with max 50 entries each.
- MMS reporting: Max. 5 MMS clients.
- GOOSE Subscriber: Max. 50 Ethernet frames per cycle.
  - If this is not sufficient, the workaround is to reduce the cycle time.
- Not possible to have 2 or more IEC 61850 server in one Automation Builder project.
  - Workaround: Create 2 or more projects.
- Only one logical device per IEC 61850 server.
- Only one report per data set.
- Automation Builder is an IED Configurator but no system configurator tool as defined in IEC 61850-6. It cannot export .ssd or .scd files.

**Installation**

The “IEC 61850 Server (PS5602)” package can be installed with the Automation Builder - Installation Manager.

**Automation Builder Engineering Productivity**

To set the IEC 61850 server into RUN, a runtime license PS5602-61850 per CPU must be purchased through the local sales support.
Engineering workflow

Examples

AC500 as IED can act as IEC 61850 MMS server (Example A) and / or GOOSE Publisher and Subscriber (Example B). Most of the engineering steps are common and are explained in this chapter. The examples projects A and B can be found in the Automation Builder example folder.

Example projects for the libraries can be found in the example folder: “Help → Project examples” in the Automation Builder menu.

Prerequisite: Install the related library package with Automation Builder Installation Manager - [Modify].

Example A

Communicating through MMS server:

A simulated switch in AC500 which can be operated from an operator IED and sends back its status through an MMS report.

Example B

Communication though GOOSE:

AC500 publishes a GOOSE control block (e.g. “ping”) to another IED (for example REF615 or a second AC500), which itself sends back a GOOSE control block (e.g. “pong”), that is subscribed by AC500 IED.
For engineering of the above functionalities, the Automation Builder is acting as IED configurator tool according to IEC 61850-6. The following engineering steps (yellow circles in the figures above) need to be executed:

1. Configure the "IEC 61850 Server" with logical nodes, which are connected to global variables in the IEC 61131 application.
   - Chapter 6.3.4.2.2.5.2 "Configuration of IEC 61850 server with logical nodes" on page 1680

2. Group data objects and attributes of the logical nodes into data sets.
   - Chapter 6.3.4.2.2.5.5 "DataSet" on page 1688

3. Publish data sets as MMS report.
   - Chapter 6.3.4.2.2.5.6 "Report (MMS)" on page 1689

4. Publish data sets as GOOSE Publisher.
   - Chapter 6.3.4.2.2.5.7 "GOOSE Publisher" on page 1691

5. Export server as *.cid file. So that other IEDs can access logical nodes and data sets and subscribe to MMS reports or GOOSE control blocks.
   - Chapter 6.3.4.2.2.5.8 "Export Server " on page 1693

6. Configure GOOSE Subscriber to subscribe GOOSE control blocks from other IEDs after importing *.cid or *.scd files. The control blocks are connected to the "PLC_PRG (PRG)" application.
   - Chapter 6.3.4.2.2.5.9 "GOOSE Subscriber" on page 1694

7. Generate code for IEC 61850 POUs.
   - Chapter 6.3.4.2.2.5.10 "Generate IEC61850 code" on page 1696

8. Generate the application "PLC_PRG (PRG)" including logical node functionality.
   - Chapter 6.3.4.2.2.5.11 "Generate the application" on page 1697

Configuration of IEC 61850 server with logical nodes

The following describes how to create an "IEC 61850 Server" and configure the IEC 61850 data model with logical nodes, data objects and data attributes which can be connected to global variables in the IEC 61131 application. Starting point is a new or existing project with AC500 V3 CPU.

Add IEC 61850 Server

Add an "IEC 61850 Server" object below Ethernet port "ETH1" or "ETH2", depending on which IP address the MMS server should use. The IP addresses of "ETH1" and "ETH2" are configured with the "IP-Configuration" tool.
GOOSE Publisher and Subscriber is independent of the IP address. Instead, the Ethernet MAC addresses must be configured in GOOSE Publisher and/or Subscriber. Even if only GOOSE is configured like in example B, an "IEC 61850 Server" is required, which can be placed below any Ethernet port.

Chapter 6.3.4.2.2.5.7 “GOOSE Publisher” on page 1691

Chapter 6.3.4.2.2.5.9 “GOOSE Subscriber” on page 1694

The properties of the "IEC 61850 Server" can be configured. For basic functionality, the default values can be used.

<table>
<thead>
<tr>

| Time synchronisation  | **Selection:** SNTP  
SNTP (only possible option): (S)NTP time synchronization  
博士学位 Chapter 6.3.4.2.2.7.1 “Time sync” on page 1707  
The following values should only be used if the PLC time is interpreted as UTC time:  
1. **Input field Time zone:** Offset between Greenwich (GMT)- and the local time (for Germany 1 h, for example). The value is limited between -12 and +14.  
2. **Input field: DLS Mode:** Day light saving. Possible values:  
   - 0 = No automatic summertime/wintertime changeover.  
   - 1 = Timeover from wintertime to summertime on last the Sunday in March, changeover from summertime to wintertime on the last Sunday in October. |

| Task Prio I Interval  | Task, which will be generated by Generate IEC 61850 code:  
1. Input field - entry of the priority,  
2. Input field - entry of the interval in ms. |
| TCP KeepAlive [sec]   | The KeepAlive is to check the connection to the client. |
| User application name | Enter the name of the user application for optimized GOOSE performance.  
The IEC 61850 task will execute in the following order:  
1. GOOSE Subscriber  
2. User application  
3. GOOSE Publisher and MMS reporting  
If this field is empty, the user application (step 2) will not be called by the IEC 61850 task, but by the standard task.  
Two tasks are asynchronous and might lead to slower performance.  
博士学位 Chapter 6.3.4.2.2.6.7 “GOOSE performance optimization” on page 1705 |

The server is the root object for creating the IEC 61850 data model consisting of ‘LogicalDevice’, logical nodes, data objects and data attributes.

**Add LogicalDevice**  
Add the “LogicalDevice” by selecting it in the left window and inserting it below the server with the arrow button “>”.

Following properties of the logical device can be configured.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device Name</td>
<td>Name of the LogicalDevice</td>
</tr>
</tbody>
</table>
Two standard logical nodes ("LLN0" and "LPHD1") are added automatically. Further logical nodes (e.g. "XSWI") can be added by selecting them from the left window and inserting them below the logical device with the arrow button "->".

Following properties of the logical device can be configured.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Node prefix</td>
<td>Optional prefix for the selected LNC instance. The prefix is put in front of the LN name in the server tree.</td>
</tr>
<tr>
<td>Logical Node index</td>
<td>Index to differentiate between several instances of the same logical node type. It is assigned automatically with increasing order, starting with 1. If it is changed manually, duplicates should be avoided.</td>
</tr>
</tbody>
</table>

Logical nodes are instantiated with their mandatory data objects "DO". Optional data objects can be added by selecting them in the left window and inserting them below the logical node with the button "->".

Data objects have no properties to be configured.
Data objects are instantiated with their mandatory data attributes "DA". Optional data attributes can be added by selecting them in the left window and inserting them below the data object with the button ">".

Data attributes can be mapped to variables in the IEC 61131 application by the following properties.

<table>
<thead>

</table>

**Monitoring - and control direction, reading and writing**

It may be the case that the IEC 61850 client will read the monitoring variable of an attribute and will write the control variable of the same attribute. Monitoring variable and control variable must not be the same CODESYS variable.

In monitoring direction, the data flow takes place from the “IEC 61850 Server” to the connected IEC 61850 client to read the CODESYS monitoring variable, for example MMS report service.

In control direction the data flow takes place from the connected IEC 61850 client to the “IEC 61850 Server” to write the CODESYS control variable, for example operate service.

The following figure shows an example where the “ctrlModel” can be changed from server side (Monitoring variable “control_model_mon” with initial value 1) or from client side (Control variable “control_model_ctrl”).
In the status bar of the IEC 61850 editor you find object-specific detail information about the selected object.

Only the information “Name” is displayed for the server and the logical device.

**DataSet**

In the tab of the IEC 61850 editor it is possible to create and delete data sets, assign data attributes (DA) and data objects (DO) to a data set and delete existing assignments.

“DataSet” tab with “LLN0.DS1” data set consisting of data objects and data attributes.

**Structure of the tab**

The left window displays the created “IEC 61850 Server”.

- Chapter 6.3.4.2.2.5.2 “Configuration of IEC 61850 server with logical nodes” on page 1680

The right part is for creating, editing and deleting of data sets. In the upper right window data sets are listed. In the lower right window, the attributes and data objects can be inserted by selecting them in the left window and inserting them by the button “>”.

The maximum number of data sets is given in Limits/technical data.

- Chapter 6.3.4.2.2.3 “Limits/technical data” on page 1678

The status bar at the bottom shows more details of the chosen items.
The order of the attributes of a data set is important for the receiving and the sending of GOOSE messages. Type and order of the entries from sender and recipient must be identical for GOOSE communication.

Chapter 6.3.4.2.2.5.9 “GOOSE Subscriber” on page 1694

Buttons:
- **[New]**: Create a new data set. This is displayed in the “DataSets” section and is named “LLN0.DataSet_Suffix”. The suffix is incremented beginning with 0 (1: Data set: LLN0.DataSet_0 ...)
- **[Delete]**: Delete a data set: Select the desired data set in the “DataSets” section and activate the [Delete] button.
- **[>]**: Assign an attribute or a data object to the selected data set. First select the data set in the upper right window then select the attribute or the data object in the left window and activate the “>” button.
- **[<]**: Deletes an element from a data set. First select the data set in the upper right window then select the attribute or the data object in the lower right window and activate the “<” button.
- **↑**: Moves the selected entry one row up.
- **↓**: Moves the selected entry one row down.

Input field:
- **“Name: ”**: Name of the data set can be edited. The name gets the prefix “LLN0.”.

Report (MMS)

In this tab of the IEC 61850 editor it is possible to create and parameterize buffered und unbuffered reports. A report transports the data, that are assigned to it, to the connected client in the event of a trigger. Each report a data set must be assigned to.

In the left part the created report control blocks (RCB) are listed. The following buttons are available:
- **[New]**: Create a new report control block.
- **[Delete]**: Delete the selected report control block.

In the middle part you make general settings for the reporting configuration.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Buffersize</td>
<td>Buffer size of buffered reports (in bytes).</td>
</tr>
<tr>
<td>Name</td>
<td>Unique report block name within the logical node.</td>
</tr>
</tbody>
</table>
### Setting Description

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Description of the report block.</td>
</tr>
<tr>
<td>Integrity Period [ms]</td>
<td>Stealthy general interrogation. After this time the referenced data set will be actuated. Time (ms) between two messages. The messages are transferred cyclic, independent from other events.</td>
</tr>
<tr>
<td>Buffered</td>
<td>Enable / disable the report buffering. A buffered report stores the data, even if there's no connection to the client. In the case of an unbuffered report, the messages will get lost, if there is no connection to the client.</td>
</tr>
<tr>
<td>Buffer Time [ms]</td>
<td>Buffer time is the amount of time that the server waits to transfer a report after a given event occurs. Events that occur during this time period are collected and then transferred as a batch. If the buffer time is 0, the telegram will be sent immediately. For example, if the buffer time 10s the telegram will be sent after this time period or when the value changes the second time.</td>
</tr>
<tr>
<td>Config Revision</td>
<td>Versioning is used to identify whether or not a member was deleted from a data set or whether member order has changed. Such changes cause values to not be transferred, or cause values to be in a different location within the report. Such an event is communicated to the client with a new version number. Since all data sets are firmly defined, this identifier does not apply to the solution described here.</td>
</tr>
<tr>
<td>DataSet</td>
<td>Data set reference.</td>
</tr>
</tbody>
</table>

The right part is for the setting of the following options:

- **“General options”**: Control of the reporting behavior. An activated checkbox means, that the information is transferred by the message.
- **“Buffered specific options”**: can be activated, if the option “Buffered:” is activated.
- **“Trigger options”**: Determining of attributes to select the events which may trigger a message.

If the checkbox is activated the information will be transferred by the message.

<table>
<thead>

<td>Integrity</td>
<td>Enable/disable the cyclic transmission of the report independent of any data changes (Stealthy general interrogation). The time period has to be defined in the “Integrity Period” general setting.</td>
</tr>
</tbody>
</table>

### General Interrogation

1. Activate the [New] button.
2. Select the desired data set from the “DataSet” selection list.

### GOOSE Publisher

In the “GOOSE Publisher” tab of the IEC 61850 editor you create, edit and delete GOOSE messages. If a value changes in the selected data set, a GOOSE message is sent.

**NOTICE!**

The order of the attributes of a “DataSet” is important for the receiving and the sending of GOOSE messages. Type and order of the entries from sender and recipient must be identical for GOOSE communication.

**NOTICE!**

To receive a GOOSE message from an IED, sender and recipient must have the identical settings in the following input fields:
- “APPID”
- “GOOSE ID”
- “DataSet” structure (with regard to order and data type of the attributes).
After the data set is sent, it is sent again after a time interval of 500 ms. The repeat time then doubles and the data set is sent again. The data set is sent repeatedly until the value set in the “Repeat Time” input field is reached. The data set is then sent again at the “Repeat Time” interval.

Sections of the tab:

List of the GOOSE control blocks (GCB) in the left part.

A GOOSE control block is a GOOSE message.

Buttons:

- **[New]**: Create a new GOOSE control block.
- **[Delete]**: Delete the selected GOOSE control block.

General settings in the top right part:

</tr>
<tr>
<td>Min. Time [ms]</td>
<td>Resend-time of first package after change of values. “timeAllowedToLive”&lt;sup&gt;*&lt;/sup&gt; = 2 * resend-time, This value should be greater than the cycle time of the IEC61850 task. &lt;br&gt; ⇨ Chapter 6.3.4.2.6.6 “Resend of GOOSE messages” on page 1704</td>
</tr>
</tbody>
</table>
Setting | Description
--- | ---
VLAN | 'Virtual Local Area Network'
Logical subnet within a physical network. Multicast messages can be passed through and filtered. The configuration is done in managed Ethernet switches.
If the “VLAN” checkbox is activated, values can be entered into the “VLAN-ID” and “VLAN-Priority” input fields, concerning the passed through of messages via switches.

VLAN-ID | A value of 0 is a non-configured “VLAN” in which the switch performs no filtering. This value is recommended when no logical network should be set up.
Valid range of values: 0 … 4095.

VLAN-Priority | Messages within a managed Ethernet switch can be forwarded depending on the priority.
Valid range of values: 0 … 7.
Default value for GOOSE: 4.

Content of the data set assigned to the GOOSE control block in the bottom part.
1. Activate the [New] button.
2. Select the desired data set from the “DataSet” selection list.

Export Server

After configuration of the “IEC 61850 Server” including logical nodes, data sets, MMS reports and GOOSE control blocks the configured IED can be exported as .cid file, by the menu entry “IEC61850 ➔ Export Server”.

You can choose a folder and a filename, for example: IEC61850_ExampleA_AC500.cid. This file is based on XML and can be opened in any text editor:
The extension "*.cid" (Configured IED Description) contains the configuration of a concrete IED with instantiated logical nodes (line 41, 61 and 62), data sets (line 42) services (line 47) and communication addresses (line 8-17).

This file can be imported in other IEC 61850 engineering tools, either system configurator or IED configurator for other IEDs.

The IP address information (line 9-11) is empty, since in AC500 the IP address configuration is decoupled; it is done in the "IP-Configuration" tool, possibly in a later step.

If the correct IP address of the AC500 IED is required by the other IEC 61850 engineering tool, it must be updated in the "*.cid" file, which can be done using any text editor:

```
Chapter 6.3.2.9.2 “Configuration of the IP settings with the IP configuration tool” on page 1506
```

GOOSE Subscriber

In the tab “GOOSE Subscriber” of the IEC 61850 editor you make settings for the receiving of GOOSE messages.
NOTICE!
The order of the attributes of a “DataSet” is important for the receiving and the sending of GOOSE messages. Type and order of the entries from sender and recipient must be identical for GOOSE communication.

NOTICE!
To receive a GOOSE message from an IED, sender and recipient must have the identical settings in the following input fields:
- “APPID”
- “GOOSE ID”
- “DataSet” structure (with regard to order and data type of the attributes).

Sections of this tab:
List of the GOOSE control blocks in the left part.
Buttons:
- [New]: Create a new GOOSE control block.
- [Delete]: Delete the selected GOOSE control block.
- [Import]: Import a GOOSE control block in the SCL format.

General settings in the top middle part:

<table>
<thead>
<tr>

</tbody>
</table>

List to assign GOOSE messages to global variables in the bottom right part.

All attributes within the selected data set are listed in this list. You can assign incoming GOOSE messages to global CODESYS variables. For this, select the desired attribute in the list and edit the name of a global variable in the "Varname" column. If you edit a new variable name a global variable will be created, if you activate the "Use default name" checkbox, a variable name is generated automatically. This variable will be written by incoming GOOSE messages.

The variables will be stored "IEC61850_Generated_GVL" (of the "IEC61850 Generated POUs" folder) after generating the code of the "IEC 61850 Server".

- Chapter 6.3.4.2.2.8.1 “Generate code” on page 1712

### Generate IEC61850 code

When all IEC 61850 related configuration is done according to the previous chapters, it must be translated into IEC 61131 code using the menu entry "IEC61850 ➔ Generate code".

After a few seconds (depending on the IEC 61850 server size), the following IEC 61131 code is generated below "Application" in the "Devices" tree:

- Folder "IEC61850 Generated POUs", containing IEC 61131 code for all IEC 61850 functionality including the global variable list "IEC61850_Generated_GVL", which contains auto generated variables which must be connected to the application "PLC_PRG (PRG)"
- Task "IEC61850Task1", calling the code in a task which is configured in the configuration window of IEC 61850 Server object.

- Chapter 6.3.4.2.2.5.2 “Configuration of IEC 61850 server with logical nodes” on page 1680
Generate the application

Finally, the application (typically “PLC_PRG (PRG)”) including the logical node functionality needs to be configured. The IEC 61850 generated code only contains the logical node interfaces = control and monitoring values.

The “PLC_PRG (PRG)” application consumes the control values which were received by the “IEC 61850 Server” (e.g. Operate) or GOOSE Subscriber and calculates monitoring values which are then sent by the “IEC 61850 Server” (e.g. MMS Report) or GOOSE Publisher.

The following figure shows a simple example of a switch simulation in “PLC_PRG (PRG)”, based on the global variables which were mapped to “XSWI.Pos”.

Chapter 6.3.4.2.5.2 “Configuration of IEC 61850 server with logical nodes” on page 1680

The simulated switch is controlled by the control variable “oper_var_ctrl” and the resulting status (_ON or _OFF) is written to the monitoring variable “status_var_mon”.

Real applications will contain more logic and connections to physical inputs or outputs.

Runtime and diagnosis

General

After the engineering workflow is completed, the resulting code (“IEC 61850 generated POU’s” and “PLC_PRG (PRG)”) can be compiled and downloaded to the CPU.

In the following, the runtime behavior of operate, reporting and GOOSE, as well as possible diagnostic and performance optimizations are described.

Operate and reporting

The following explanation is based on the example A, which was configured according to engineering workflow as MMS server with a switch simulation. The project file of this example can be found in the example folder of Automation Builder - Example A.
Example projects for the libraries can be found in the example folder: “Help ➔ Project examples” in the Automation Builder menu.

Prerequisite: Install the related library package with Automation Builder Installation Manager - [Modify].

First step is to create a physical Ethernet connection between AC500 IED and operator IED = MMS client and configure IP addresses in a common IP address range. Then, both devices can be commissioned.

**AC500 IED**

1. Configure AC500 according to engineering workflow as MMS server with a switch simulation or load the example project “IEC61850_ExampleA_ABxxx.project”.
2. Download program to AC500 and set it to RUN.

   Now the IEC 61850 server is running and ready to operate.

**Operator IED**

Any IEC 61850 MMS client can be used. In this example the Omicron tool “IEDScout” is used. Following figure shows the menu bar.

1. Click on menu button [Discover IED] and enter IP address of AC500.
   “IEDScout” will find the AC500 IED through Ethernet and read its configuration dynamically.
2. Click on the menu button [Open SCL] and browse for the .cid file which was exported in chapter Export Server, for example “IEC61850_ExampleA_AC500_withIpcid”.
   Chapter 6.3.4.2.5.8 “Export Server “ on page 1693

The browser opens and shows the active connection to the AC500, indicated by the green checkmark.
1. Browse to “DataModel ➔ Logical Device ➔ XSW11”

2. Ensure that “Pos.ctrlModel” is set to “direct-with-normal-security”. Otherwise, set the value to “direct-with-normal-security” by clicking the menu button [Write].

3. Click on “XSW11 ➔ .Pos”.

4. Click the menu button [Control] to open the “Control” dialog.

5. Choose the “Value” (false or true) and press the button [Operate] to send this value to AC500 IED.

In AC500 online mode, the control and status variables can be monitored in “IEC61850_Generated_GVL” as well as in the “PLC_PRG” containing the switch simulation.
The Operator IED (Omicron IED Scout), can subscribe (menu button [Enable]) the MMS report "SwitchReport", which contains "XSW11.Pos" including data attributes status ("stVal"), quality ("q") and timestamp ("t").
**MMS diagnosis**

The IEC 61850 generated POUs – “Logical Nodes” contain more details and can be used for diagnosis in online mode. For example, the following property shows, that the MMS report “SwitchReport” was enabled by one MMS client: “IEC61850_LLN0.fbSwitchReport.fbSwitchReport[1].rptEna”.

**GOOSE**

The following explanation is based on the example B, which was configured according to engineering workflow with GOOSE Publisher and Subscriber. The project file of this example can be found in the example folder of Automation Builder: Example B.

First step is to create a physical Ethernet connection between AC500 IED and another IED. Then, both devices can be commissioned.

**AC500 IED**

1. Configure AC500 according to engineering workflow with GOOSE Publisher and GOOSE Subscriber or load the example project “IEC61850_ExampleB1_ABxxx.project”.
2. Ensure that the source MAC address for GOOSE Publisher and GOOSE Subscriber are set correctly.
   - Chapter 6.3.4.2.2.5.7 “GOOSE Publisher” on page 1691
   - Chapter 6.3.4.2.2.5.9 “GOOSE Subscriber” on page 1694
3. After a change of MAC address it is required to generate IEC61850 code again.
   - Chapter 6.3.4.2.2.5.10 “Generate IEC61850 code” on page 1696
4. Download program to AC500 and set it to RUN.  
   ⇒ Now the IEC 61850 server with GOOSE Publisher and Subscriber is running and ready to operate.

Another IED
1. Configure any other IED as bay IED with GOOSE Publisher and GOOSE Subscriber or load the example project “IEC61850_ExampleB2_ABxxx.project”.
2. Set the source MAC addresses correctly.
3. Generate the IEC 61850 code.
4. Download to a second AC500 CPU.

The ping-pong between the two IEDs can be monitored by opening the 2 projects with 2 Automation Builder instances.

GOOSE diagnosis and troubleshooting

The IEC 61850 library has an object “IEC61850_GooseManager” with several variables, which can be accessed for diagnosis of the GOOSE manager. Example B1 contains a “GooseDiagnosis (PRG)”, showing the relevant diagnosis variables.
● “IEC61850_GooseManager.iAdapterCnt”
Number of the Ethernet adapters used for GOOSE Publisher and GOOSE Subscriber, should be at least 1.

● “IEC61850_GooseManager.wRxCounter”
Counter for received GOOSE messages. Should increase continuously, when other IEDs are sending GOOSE, otherwise:
  – Check if the ‘Source Address (MAC)’ is configured correctly in the GOOSE Subscriber.
  – Check with Wireshark if there are GOOSE messages in the network of the configured adapter.

● “IEC61850_GooseManager.wRxCounterSubscribed”
Counter for received GOOSE messages, which are subscribed. Should increase continuously, when other IEDs are sending GOOSE and same GOOSE messages are subscribed in AC500. If not:
  – Check if “IEC61850_GooseManager.wSubscriberCnt” is > 0.
  – Check configuration in GOOSE Subscriber
  – Check further diagnosis properties in “prgIEC61850Subscriber”.

● “IEC61850_GooseManager.wMaxLoopCnt”
Maximum number of received Ethernet packages in one cycle. Maximum value is 50. If the maximum value is reached, reset it by setting “IEC61850_GooseManager.xResetIndications” to TRUE for one cycle. If “wMaxLoopCnt” immediately reaches again the maximum value, the IEC 61850 cycle time is too slow for the high network traffic and GOOSE messages might be lost. Workaround is to reduce the IEC 61850 cycle time to make the GOOSE Subscriber faster.

● “IEC61850_GooseManager.wTxCounter”
Counter for transmitted GOOSE messages. Should increase continuously when GOOSE Publisher is configured. If not:
  – Check GOOSE Publisher.
  – Check “IEC61850_GooseManager.sStatus”.

● “IEC61850_GooseManager.sStatus”
Contains error status of the GOOSE manager and can have the following values:
  – ’.’: empty: → OK.
  – Sending of GOOSE messages failed! Result: 20 (or other results). → Check if the ‘Source Address (MAC)’ is configured correctly in GOOSE Publisher.
  – GOOSE Publisher Eth. frame length ≥ 1500 bytes, reduce DO/DAs in data set. → Reduce the number of data objects and/or data attributes in a data set.
For the GOOSE Subscriber there is an additional possibility for diagnosis. The "prgIEC61850Subscriber" has an array "afbSubscriber", containing one entry for each subscription.

Following properties should be checked in case of problems:

- "dtLastAction" and "wRxCounter":
  Should increase continuously, when other IEDs are sending GOOSE and same GOOSE messages are subscribed in this subscriber.

- "sStatus":
  Should show "GOOSE Block receive <GOOSE ID> successfull".

- "xErrorTimeAllowedToLive":
  Should always be "FALSE". If not, a GOOSE message was received only after the "timeAllowedtoLive" (as indicated in the previous GOOSE message) expired.
  - Decrease cycle time of the IEC 61850 task.
  - Chapter 6.3.4.2.5.2 “Configuration of IEC 61850 server with logical nodes” on page 1680
  - Check Ethernet connection between GOOSE Publisher and GOOSE Subscriber.
  - Check in Wireshark if GOOSE Publisher is sending next packages fast enough. Resend of GOOSE messages shows a correct example where "timeAllowedtoLive" is always double of the resend time, so that the subscriber has enough time to receive it.

Resend of GOOSE messages

Resending of GOOSE is done according to the IEC 61580 specification.

Chapter 6.3.4.2.1 “Introduction to IEC 61850” on page 1671

In example B as described in the previous chapters, there are not resends because the ping-pong values are changing quickly before the configured GOOSE “Publish Min. Time” has expired.

The resend gets visible in Wireshark when the quick value changing is stopped (e.g. by stopping the other IED in the ping-pong example B). The following figure shows an AC500 GOOSE Publisher with max. time = 4000 ms, min. time = 20 ms and configured IEC 61850 task cycle time = 5 ms.
Two phases are visible in the Wireshark screenshot.

1. Slow retransmission in stable conditions (no event for a long time) above the blue line. When the value does not change (column “integer” = pong value = 2):
   - The GOOSE message is resent continuously and slowly.
     - “timeAllowedtoLive” is 4000 ms (= max. time).
     - Message is retransmitted every 2000 ms (half of “timeAllowedtoLive” according to IEC61850-8-1).
     - “sqNum” is increasing, “stNum” is not changing.

2. Change of value and fast retransmission. When the value changes (column integer = pong value was forced from 2 to 3):
   - A new package (“stNum” increased, “sqNum” = 0) is sent immediately (*), see blue line.
     - Same package is resent continuously, starting with a high frequency.
     - The resend time is starting at 20 ms (= configured min. time) and doubled with every resend until it has reached half of the max. time to go back to slow retransmission.
     - The “timeAllowedtoLive” is always double of the next resend time (*).

---

The configured GOOSE min. time should always be higher than the configured IEC 61850 task cycle time!

(*) Sending GOOSE messages is executed in the IEC 61850 task and therefore can be delayed by the configured task cycle time (worst case).

---

GOOSE performance optimization

The automatic generated IEC 61850 task is optimized in such a way, that GOOSE Publisher and GOOSE Subscriber is executed the same task. Anyhow, the example B needs 60 ms for one complete ping-pong procedure. This is plausible and can be explained with the following figure.
Although the application task ("PLC_PRG") could increase the ping or pong every 10 ms, it must wait for the IEC 61850 task (20 ms cycle time) to subscribe or publish the new data from or to the other PLC. In consequence it takes 70-10 = 60 ms for one complete ping-pong.

**Optimization steps**

1. Reduce the cycle time of the IEC 61850 task to 10 ms as well. This would increase the performance, but both tasks are still asynchronous and have to wait for each other.

2. Merge both tasks and by that optimize the execution order according to the IPO principle.
   - Input: GOOSE Subscriber
   - Process: In this example - Increase ping or pong.
   - Output: GOOSE Publisher

This behavior can be achieved by the following configuration in the IEC 61850 editor.
1. Set “Task Prio I Interval” of IEC 61850 task to 10 ms.

2. Enter the “User application name” (was empty before), here: “PLC_PRG”.

3. Since now the “PLC_PRG” is called by the IEC 61850 task, the “normal” task calling the “PLC_PRG” must be deleted (red cross in the figure above).

4. Do the same procedure for example B1.

With these settings the total ping-pong roundtrip time is reduced to 10 ms, which can be observed in Wireshark.

The time format in Wireshark was set to “Seconds since the previous displayed packet”. In this log the ping takes ~ 4.5 ms, the pong takes ~ 5.5 ms ➔ ping-pong = 10 ms.

Depending on the CPU type and the size of the application, the performance can be further improved by reducing the IEC 61850 task interval to less than 10 ms.

**Advanced features**

**Time sync**

If a (S)NTP server (e. g. Meinberg clock) is available in the network, the AC500 should be configured as (S)NTP client in order to receive the correct time information, which is set in the MMS and GOOSE reports along with the correct status bits. This is done in two steps:

1. **Configuration**
   - **Protocol Configuration**
     - Configuration in Automation Builder for AC500 V3 products > Protocols and special servers

2. **Programming**
   - Set the AC500 as (S)NTP client to receive the correct time information.
1. A (S)NTP client node must be added below “Protocols” and the IP address of the (S)NTP server must be entered (192.168.84.250 in this example).

2. Set the time quality bit “ClockNotSynchronized” of the IEC 61850 time correctly. Therefore, the bit must be read from the “fbPmSntpInfo1.SourceInfo1.SrcState” and written to the IEC 61850 variable “IEC61850_SyncClockOnRTC.xClockNotSynchronized”.

Example A contains a program “prgSNTP”, which reads and updates this time quality bit every 30 seconds.

If the SNTP time is working correctly the “ClockNotSynchronized” is false.

If the SNTP server fails or connection is broken, the “ClockNotSynchronized” is true.
Bulk data engineering

When many logical nodes, related data sets and reports need to be created, there are repeating configuration steps for similar modules. Copy and paste of such modules or working with MS Excel is currently not possible, but there is a way to do bulk data engineering via XML file.

1. Create an IEC 61850 configuration by the engineering workflow steps 1 (logical nodes), 2 (DataSets), 3 (Report (MMS)), 4 (GOOSE Publisher).

2. Export the configuration as XML: “Menu ➔ IEC61850 ➔ Export Server” Save as type XML.

   The exported XML file is not according to SCL, but an AC500 propriety format which contains all configurations done in the IEC 61850 editor.
3. Enhance XML file by copying logical nodes, related data sets and reports.

Ensure that new instances have new and unique IDs.

For example, when duplicating logical node “XSWI1”, the new logical node should be renamed to XSWI2 by modifying the tags “NodeText” and “NodeInstanz”.

This step requires some experience with XML and an understanding how the IEC 61850 logical nodes, data sets and reports are represented and related to each other inside this XML.

4. Import the configuration from the enhanced XML: “Menu → IEC61850 → Import Server”, type XML.

⇒ The existing configuration is overwritten by the enhanced configuration.

5. Perform the remaining engineering workflow steps: 5 (Export Server (as .cid)), 6 (GOOSE Subscriber), 7 (Generate IEC61850 code) and 8 (Generate the application).

Additional or new logical node types

Basic logical nodes are defined in IEC 61850, part 8, further logical nodes are defined in related standards, for example IEC 61400-25.

AC500 was certified according to IEC61850 for a subset of logical nodes which is listed in the MICS document.
Documents can be found in the example folder: “Help ➔ Project examples ➔ PS5602-IEC61850 ➔ Datasheets” in the Automation Builder menu.

**Prerequisite:** Install the related library package with Automation Builder Installation Manager - [Modify].

Anyhow, additional logical nodes can be enabled, and even new logical node types can be defined.

Logical nodes for AC500 are defined in the IEC61850 device description file: “C ➔ ProgramData ➔ AutomationBuilder ➔ AB_Devices_2.5 ➔ 512 ➔ 1020 0001 ➔ 4.0.7.2 ➔ IEC61850DeviceDesc.xml”. This file can be edited in order to enable prepared logical nodes or to create new ones.

In this example the “<enable>” of “CSWI” is set from 0 to 1.

After restart of the Automation Builder, the “CSWI” can be chosen.

Limitation of logical nodes which are not enabled by default:

- Their compliance to IEC 61850-7-4 (Ed1) is not fully tested.
- Common Data Classes ("CDC") are not fully implemented.
They are needed by some (not enabled) logical nodes, for example “MHAI”. Enabling such a logical node leads to compilation errors.

Disable GOOSE Publisher

For some applications it might be useful to disable the GOOSE activity, for example for high availability solutions where one of two parallel CPUs should act in standby and not send GOOSE messages.

Since Automation Builder 2.4.0 and “IEC61850_Server” library 4.0.5.7, the “IEC61850_GooseManager” has a new property “xEnable”. This property is “TRUE” by default, but can be set to “FALSE” if required.

Menu Command sorted by Categorie

Generate code

Symbol:

On activating the “Generate code” command of the “IEC61850” category the code generation is started and the generated IEC 61850 code is stored in the folder “IEC61850 Generated POUs” in the device tree.

☞ Chapter 6.3.4.2.2.5.10 “Generate IEC61850 code” on page 1696
Export Server

This command of the “IEC61850” category exports the current configuration. In the “Safe as” dialog select the format filter:

- XML files: For IEC 61850 format with all specific data, variable mapping, for example.
- SCL-Files: For IEC 61850 format to export data to other IEC 61850 tools.

If you have changed the configuration since the latest code generation, you will be asked whether new code should be generated before export.

Import Server

This command of the “IEC61850” category discards the current configuration and imports a new configuration. In the “Save as” dialog select the format filter:

- XML files: For IEC 61850 format with all specific data, variable mapping, for example.
- SCL Files: For IEC 61850 format to import data from other IEC 61850 tools.

Options

The “Options” command of the “IEC61850” category opens a dialog for the setting of different display options for the IEC 61850 configurator.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>

6.3.4.3 Modbus protocol

6.3.4.3.1 Modbus on TCP/IP protocol

Modbus TCP/IP is simply the Modbus RTU protocol with a TCP interface running on Ethernet. The Modbus message structure is the application protocol that defines the rules for organizing and interpreting the data independent of the data transmission medium.

A client is a device that actively polls for data from one or more devices. A server device is the passive component that waits for the client to poll for data in order to actually send it.

☞ Chapter 6.8.2.10.1 “Protocol description” on page 4523
6.3.4.3.2 Configuration of Modbus TCP/IP server

Adding a Modbus TCP/IP server to device tree

A “Modbus TCP/IP Server” instance can be added to any specific Ethernet interface/IP address. Each interface supports max. one instance of “Modbus TCP/IP Server”. Other protocols can be added in parallel.

1. Right click on ETH interface and click “Add object”.
   ➞ The window “Add object below: ETH” appears.
2. Select “Modbus TCP/IP Server” and click “Add object”.
   ➞ The node “Modbus_TCP_IP_Server” is added.

Setting the parameters of Modbus_TCP_IP_Server

**Byte Order**
Format/Endianness for the transmission of WORD values (register) within the request/response telegram (default: “Big Endian”).

**Port**
TCP port on which the server listens.

**Startup Behaviour**
This parameter specifies how the server behaves when configuration data is loaded (e.g. on download). Its default value is “Active”. This means the server is immediately addressable after configuration has been performed. In case the server should be activated later on during runtime by means of function block ModTcpServOnOff this parameter value has to be set to “No activity”. Parameter **Behaviour in state inactive** then specifies the server's behaviour during the inactive phase.

**Behaviour in state inactive**
This parameter specifies how the server behaves in inactive state. This state may be set at the very beginning (parameter *Startup Behaviour* = “No activity”) and/or requested during run time calling function block *ModTcpServOnOff*. It's default value is “No activity”. This means the server is not addressable at all (no listening socket on TCP/IP) when it is inactive. Using this setting, any requests by Modbus TCP clients lead to the result *Failed to connect to Server or Timeout*. All other parameter values make the server respond with an exception code to any requests by Modbus TCP clients.

The presentation of the icon next to the “Modbus TCP/IP Server” in the device tree depends on the state of the server:

### Inactive

![Inactive Icon]

### Active

![Active Icon]

**Attention:**

Exception code 9 is actually not defined by Modbus specification. This may cause problems using a different Modbus TCP client than AC500 V3.

### Disable

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>

</tr>
</tbody>
</table>

It is possible to disable read and/or write access to individual segments. Reading/writing is disabled beginning at the set start address and is valid up to the set end address (inclusive).

*Chapter 6.8.2.10.1 “Protocol description” on page 4523*
6.3.4.3.3 Configuration of Modbus TCP/IP client

Adding a Modbus TCP/IP client to the device tree

The “Modbus_TCP_IP_Client” instance has to be added to the common Ethernet client protocols’ node. This node supports max. one instance of Modbus TCP/IP client. Other protocols can be added in parallel.

1. Right click on the node “Protocols” and click “Add object”.
   ⇨ The window “Add object below: Protocols” appears.
2. Select “Modbus TCP/IP Client” and click “Add object”.
   ⇨ Node “Modbus_TCP_IP_Client” is added.

Depending on a server’s IP address the client sends it’s requests via the Ethernet interfaces available.

☞ Chapter 6.8.2.10.1 “Protocol description” on page 4523

Setting the parameters of Modbus_TCP_IP_Client

Modbus TCP/IP client does not have any parameters.

☞ Chapter 6.8.2.10.1 “Protocol description” on page 4523

6.3.4.4 Modbus on RTU protocol

Protocol description can be found in the chapter for serial interfaces.

☞ Chapter 6.3.2.14.2 “Configuring Modbus RTU on serial interface” on page 1588.
☞ Chapter 6.8.2.9.1 “Protocol description” on page 4506

6.3.4.4 NTP/SNTP protocol

6.3.4.4.1 Introduction of the NTP/SNTP protocol

AC500 V3 support the NTP and the SNTP protocol ((Simple) Network Time Protocol). Compared to SNTP, the NTP protocol achieves higher accuracy in time synchronization, meeting advanced requirements for accuracy and reliability of a PLC solution.

In case a configured NTP protocol cannot be used, SNTP protocol is used as a fallback solution.
The S500 I/O modules do not support the functionality to create and transfer a timestamp with an event directly at the I/O channel. A workaround is using SoE logging (Sequence of Event) for a root-cause analysis. For a better understanding on how events are processed on a AC500 V3 PLC, refer to the application example AC500 sequence of events with V3.

The protocols NTP and SNTP provide the functionality to synchronize the clock of a PLC to an external time source. The application example AC500 V3 - SNTP demonstrates how to synchronize the PLC time with a time server.

A specification of the (S)NTP protocol itself can be found in the document RFC4330.

The following modes are supported by the implementation of the AC500 V3 PLC:

- (S)NTP client
- (S)NTP server
- (S)NTP client and server

The function block PmSntpInfo can be used to read diagnosis information of the protocol. Refer to the documentation of the library ABB_Pm_AC500.lib for further information.

- If a high precision of system time is wanted, use a fully functional NTP server or at least an SNTP server with a high-precision time-source (e.g. DCF-77 receiver). Avoid cascading several levels of (S)NTP server / (S)NTP clients.
- Client requests are normally sent at intervals depending on the frequency tolerance of the client clock and the required accuracy. However, under no conditions requests should be sent at less than one minute intervals (see RFC 4330). Keep that in mind when setting polling-interval of the (S)NTP client, especially if a huge amount of clients use one single server.
- Be sure not to use broadcast or multicast addresses as server or backup-server since current (S)NTP implementation does not support manycast mode.
6.3.4.4.2  (S)NTP client configuration

Implementation of (S)NTP client and (S)NTP server is based on protocol version 4.

For (S)NTP client configuration add a new object “SNTP Client” under “Protocols (Client Protocols)”.

For a PLC only one instance of an (S)NTP client is possible.

The following parameters are available:

Not all parameters are shown in the user interface.

It should not be necessary to change the default values of the other parameters for the most applications.

But there is the possibility to edit them in the generic parameter editor.
### Server 1

</table>

**6.3.4.5 FTP server**

As of SystemFW 3.1.0 the FTP server is listening only on the Ethernet interface, which the protocol is configured on. It is not possible to have an FTP server on both Ethernet interfaces.

AC500 V3 PLCs only support explicit authorization. AC500 V3 PLCs do not support implicit authorization.

1. Under “Ethernet -> ETH [1,2,...]” add a new object and select “FTP Server” from the list.
2. Double-click the “FTP_Server ” item to open FTP server configuration and change the default settings of the parameters, if required.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>

</tbody>
</table>

Passwords

- Set each user’s passwords for login. No entry = no password.

- system - System RAM disk
- sdcard - Inserted memory card.
- userdisk - User section of the flash disk.
- flashdisk - Only available with PM5675-2ETH
6.3.4.6 MQTT client protocol

6.3.4.6.1 System technology

NOTICE!
If the MQTT client protocol is enabled, we recommend using the secure (TLS) variant of the MQTT protocol for protection of information.

> Chapter 6.1 “Cyber security” on page 1340

The MQTT protocol is a lightweight communication protocol which is widely used on the internet to connect embedded device to the cloud.

The MQTT (Message Queuing Telemetry Transport) client library allows to integrate an AC500 processor module to act as a client in the MQTT protocol. Thus, it is possible to exchange data between the AC500 and other devices connected to the MQTT network.

In the figure below, there is an MQTT network with one broker (MQTT broker in the middle) and five clients. The figure shows the main functions of MQTT to send and receive data: publish and subscribe. The clients can publish messages with a specific topic to send data (e.g., the temperature of a connected sensor with a timestamp) to the MQTT broker. For example, the client “AC500_1” publishes a message to topic “topic/2”. On the other hand, clients can also subscribe to topics to receive data. For example, the client “Laptop” has subscribed topic “topic/2”. So all messages with the topic “topic/2” which has been published to the MQTT broker will be sent immediately to the client “Laptop”. This creates a message flow from the client “AC500_1” to the laptop.

![MQTT Network Diagram](image)

To realize the MQTT behavior, there are several function blocks implemented in the > Chapter 6.5.11 “MQTT client library” on page 4048.
Table 376: Function blocks overview

<table>
<thead>
<tr>
<th>Function Block</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MqttConnectWithCertBuffer</td>
<td>Every MQTT use case starts with establishing a connection to an MQTT broker. Therefore, a connection structure needs to be created. The connection structure is used to identify the connection for subsequent operations like publish or subscribe. It is possible to establish an SSL connection. Using an SSL connection, at least a certificate for the server is needed. Certificates can be loaded from a buffer (program variable) or a file which is stored on the PLC.</td>
</tr>
<tr>
<td>MqttConnectWithCertFile</td>
<td></td>
</tr>
<tr>
<td>MqttGetReceivedPacket</td>
<td>These function blocks can be used on an established MQTT connection to realize the desired use case.</td>
</tr>
<tr>
<td>MqttPing</td>
<td></td>
</tr>
<tr>
<td>MqttPublish</td>
<td></td>
</tr>
<tr>
<td>MqttSubscribe</td>
<td></td>
</tr>
<tr>
<td>MqttUnsubscribe</td>
<td></td>
</tr>
<tr>
<td>MqttDisconnect</td>
<td>This function block is the end of each use case.</td>
</tr>
</tbody>
</table>

One MQTT send use case could look like this:

- MqttConnectWithCertBuffer(FB)
- MqttPublish(FB)
- MqttPublish(FB)
- MqttDisconnect(FB)*

* It makes sense for several publish messages in a row (e.g. one message per second) not always open a new connection.

One MQTT receive use case could look like this:

- MqttConnectWithCertBuffer(FB)
- MqttSubscribe(FB)
- MqttGetReceivedPacket(FB)
- MqttGetReceivedPacket(FB)
- MqttUnsubscribe(FB)
- MqttDisconnect(FB)

TLS version

The MQTT client uses the TLS version 1.2.

Configuration in Automation Builder

For the MQTT client no configuration is needed.

Configuration in CODESYS

All function blocks have to be called in tasks with cyclically processing.

You can use the function blocks with:

- PLC_PRG with automatic task configuration or manual task configuration.
- One single program or different programs.
- One single task or different tasks.

With different programs assigned to different tasks you can define different cycle times and priorities.
Limitations

- No persistent session. After an interrupted connection, the client needs to subscribe on topics again in case of reconnect.
- One connection (MQTT_CONNECTION) cannot be shared between multiple tasks. Different connections can be used by different tasks or even within the same task.
- Only one FB can operate on a single connection at the same time. Always wait for the FB to complete before calling the next FB. To use two different FB’s in parallel (like publish and receive) it is necessary to have two different connections, otherwise they must be called one after the other.

Hardware

The MQTT protocol requires AC500 devices with integrated Ethernet.

6.3.4.6.2 Application examples

MQTT can be used with an MQTT client library or JSON. Application examples are available for both methods, which demonstrate the practical implementation:

JSON programming

An introduction to programming with JSON is given in the application example JSON programming.

MS Azure cloud

How to set-up a cloud-based condition monitoring system with AC500 and the MS Azure cloud is described in the application example PLC configuration and MS Azure cloud.

Setting up an MQTT message broker

How to set-up a local MQTT message broker is described in the application example PLC configuration and Mosquitto message broker.

Connecting an MQTT message broker

How to connect an MQTT message broker with an AC500 PLC is described in the application example Connection to Mosquitto message broker.

Use cases and how to handle the function blocks of a certain library is described in sample projects. After the respective library has been installed the corresponding sample projects are available in the default path AutomationBuilder Examples. If the default path is inaccessible, click “Help ➔ Project examples” in the Automation Builder menu.

6.3.4.7 AC500 V3 secure protocols

6.3.4.7.1 Introduction

The following protocols can be secured using certificates:

- Communication between Automation Builder and the PLC (e.g. Programming, Monitoring)
- Communication between the PLC’s webserver and visualization clients (browsers)
- Communication between the PLC’s FTP server and FTP clients
- Communication between the OPC UA server and OPC UA clients

As a prerequisite to enable secure communication on one or more protocols, the required certificates need to be present on the PLC.
6.3.4.7.2 Certificate handling

Automation Builder offers a convenient “Security Screen” to manage certificates on connected PLCs.

It can be accessed through the shield icon on the lower right corner of the main window:

Use the tab “Devices” to manage certificates on the PLC.

It offers to:
- show certificates available on the PLC
- import and export certificates
- create new (self-signed) certificates
- trust or untrust certificates
6.3.4.7.3 Configuring secure protocols

Encrypted communication between Automation Builder and the PLC

Via tab “Communication Settings”

Via “Security Screen” in Automation Builder
Ensure the PLC clock is set to the current time and date when using certificates on the PLC. Otherwise the certificate cannot be used to secure a protocol (see also Chapter 6.8.2.3.2 “AC500 battery” on page 4445 and Chapter 6.3.4.4.2 “(S)NTP client configuration” on page 1718).

When trying to log in or when you set the PLC as active path, there will be a one-time pop-up asking you to add the PLC’s certificate to the trusted certificates:

![Certificate pop-up](image)

After trusting the PLC’s certificate, the communication between the Automation Builder and the PLC is now encrypted.

This is shown by additional yellow lines around the communication path on the “Communication Settings” page.

### Secure web server

**NOTICE!**

We recommend configuring an HTTPS connection (encryption with SSL/TLS) between the visualization clients and the web server to protect the system from unwanted access.

- Chapter 6.1 “Cyber security” on page 1340

1. Generate or import a certificate for the web server

   Ensure the PLC clock is set to the current time and date when using certificates on the PLC. Otherwise the certificate cannot be used to secure a protocol (see also Chapter 6.8.2.3.2 “AC500 battery” on page 4445 and Chapter 6.3.4.4.2 “(S)NTP client configuration” on page 1718).
2. Attach a web server node to either ETH1 or ETH2 or both and configure security mode.
   ⇒ This will automatically insert a visualization into the project.
   
The available modes of operation are:
   ● http only
   ● https only
   ● Both (http and https)
   ● Redirect http to https

3. Download and set the PLC to RUN.

4. Connect to the web server using the configured method: https://<your PLC’s IP address>/webvisu.htm.

   In case you are using a self-signed certificate, your browser will show some warnings.
   
   If you are aware of the risks of self-signed certificates, this can be ignored.
   
   ≈ Further information on page 1724

Secure FTP

1. Import a certificate to the PLC for FTP or create a self-signed certificate.

   Ensure the PLC clock is set to the current time and date when using certificates on the PLC. Otherwise the certificate cannot be used to secure a protocol (see also ≈ Chapter 6.8.2.3.2 “AC500 battery” on page 4445 and ≈ Chapter 6.3.4.4.2 “(S)NTP client configuration” on page 1718).

2. Add an FTP server to either ETH1 or ETH2

3. Set the parameter “Security Mode” to either “BOTH” or “FTPS only”.
   ⇒ You can use any FTP client that supports FTPS explicit mode (FTPES).

   In case you are using a self-signed certificate, the FTP client will show some warnings or notice that it does not know the certificate and wants you to check it.
   
   ≈ Further information on page 1724

OPC UA secure

OPC UA uses mutual authentication, which means that both partners must have their own certificate and know the other’s certificate, before being able to establish a connection!
1. Create a new certificate in your OPC UA client.

   Ensure the PLC clock is set to the current time and date when using certificates on the PLC. Otherwise the certificate cannot be used to secure a protocol (see also Chapter 6.8.2.3.2 “AC500 battery” on page 4445 and Chapter 6.3.4.4.2 “(S)NTP client configuration” on page 1718).

2. Import that certificate to the “Trusted Certificates” in your PLC using the “Security Screen”.
3. Import a certificate for the OPC UA server on the PLC or create a self-signed certificate.
4. Export that cert to the PC and provide it as a trusted certificate to your OPC UA client.
5. Reboot the PLC and check that it is in RUN and both certificates are on the PLC (via the “Security Screen”).
6. Add the PLC as OPC UA server in your OPC UA client.
7. Connect to the OPC UA Server.
   ⇒ You can interact normal with the UA server.

---

In case you are using a self-signed certificate, you will see some warning message (depending on the OPC UA client).

If you are aware of the risks of self-signed certificates, this can be ignored.

Further information on page 1724

The certificate warnings will disappear only when using a certificate from a trusted certification authority or a certificate derived from this by an intermediate certification authority (e.g. a company CA).

That process is done via PLCShell command “cert-createcsr”, then getting the file from the PLC via the filebrowser tab in “cert/export” and getting that signing request turned into a real certificate by a certification authority.

Import the certificate generated by your certification authority using the security screen.
6.3.4.8 KNX configurator

6.3.4.8.1 Introduction

Refer to the general description for information about the following tabs of the device editor:

- Chapter 6.4.1.21.2.8.12 “Tab '<device name> I/O Mapping’” on page 2444
- Chapter 6.4.1.21.2.8.13 “Tab '<device name> IEC Objects’” on page 2449
- Chapter 6.4.1.21.2.8.14 “Tab 'Parameters’” on page 2433
- Chapter 6.4.1.21.2.8.19 “Tab ‘Status’” on page 2460
- Chapter 6.4.1.21.2.8.20 “Tab 'Information’” on page 2460

Only in the case of special features is there an additional help page for the specific device editor.

If the "<device name> Parameters" tab is not shown, then select the “Show generic device configuration editors” option in the CODESYS options (“Device Editor” category).

With the KNX editor from CODESYS, you define the communication objects of your building automation. The communication objects are exported and made available to the ETS5 program. Linking the communication objects to the different KNX devices is performed exclusively in the ETS5 program. Therefore, only the objects are generated in CODESYS. The objects are linked to variables from the PLC program by means of “I/O mapping”.

You add an Ethernet adapter below the controller. Then you add the KNX device below the adapter. You can insert only one KNX device per controller.

See also

- Chapter 6.4.1.21.4.14.7 “Dialog 'Options’ - 'Device Editor’” on page 2786

6.3.4.8.2 ETS5 Software - 'DCA' Plug-In

Linking the communication objects of the different KNX devices is performed exclusively in the ETS5 program. To do this, you need the ETS5 software (light or professional version). You also need the KNX product file available from KNX.
Programming steps

1. Create a project in CODESYS.

2. Download the CODESYS project to the controller.
   ⇒ The checksum (CRC) is also downloaded to the controller.

3. Create an export file in CODESYS.
   ⇒ The checksum (CRC) is also saved in the export file.

4. Read the export file into the configuration of ETS5.

5. Parameterize the objects in ETS5.

6. Start the program on the controller.

7. Transfer the KNX configuration to the controller.
   ⇒ The checksum (CRC) is also transferred. The runtime system checks whether or not both checksums match. When they match, the KNX device is identified as functional by the green arrow. If not, then an error is issued in the logger. In case of error, the process data (inputs/outputs) is not updated.

6.3.4.8.3 Tab 'KNX - General'

Object: KNX

The tab in the configurator of the KNX editor shows an overview of all communication objects. The I/Os of the communication objects are applied automatically to the I/O mapping.

Entries can be edited directly in the table or in the “Communication object” dialog. Existing entries can be copied via copy&paste. The next free channel number is used automatically in this case.

<table>
<thead>

</tr>
<tr>
<td>“Import CSV”</td>
</tr>
<tr>
<td>“Identification”</td>
</tr>
</tbody>
</table>

Dialog 'Communication object'

| “Group Object Number” | Unique channel number. Gaps in the numbering is permitted. If the channel number is already assigned, then an error text is displayed and the “OK” button is disabled. |
| “Type” | Determines whether or not the object in CODESYS is used as “Input” or “Output”. |
| “Data point type” | The data types (DPT = Data Point Types) are specified in the KNX standard. In CODESYS, a selection of the most common data types is available. Only the basic data type can be selected, without units (for example, DPT9.*). |
"Group Object Name" | Any object name. Depending on the data type, a predefined text is automatically added.
---|---
"Group Object Function" | Any function name. Depending on the data type, a predefined text is automatically added.
"Watchdog Timeout" | If a new message has not been received after this elapsed time, then the Timeout status bit is set.

6.3.4.8.4 Tab 'I/O Mapping'

Object: KNX

The I/O channels are generated for each communication object:

Table 378: General I/Os

<table>
<thead>
<tr>
<th>Signal</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Program LED Status&quot;</td>
<td>This input is set by the ETS program. The signal can be used for identifying a special controller when several controllers are used (for example, by switching a LED). The status is also set when the &quot;Program Button&quot; is set to TRUE. Then the device is in programming mode. As soon as ETS5 has successfully set the physical address, this input switches to FALSE.</td>
</tr>
<tr>
<td>&quot;Program Button&quot;</td>
<td>The &quot;Program Button&quot; is needed for assigning the physical address from ETS5. If the output is set to TRUE, then the device is in programming mode and then ETS5 can assign the address specified there to the device.</td>
</tr>
</tbody>
</table>

Table 379: I/O channels of the communication object

<table>
<thead>
<tr>
<th>Signal</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Status byte&quot;</td>
<td>Status byte as defined in the KNX stack. This allows you to determine in the application whether or not data has been received. The status can be reset by means of the ResetStatusFlags method.</td>
</tr>
</tbody>
</table>
| "Trigger/Disable Cyclic, send on change" | Depending on the configuration in the ETS program, this output has the following function:  
  ● If at least one of the options "send on difference", "send on change", or "Cyclic sending" is enabled, then the output is defined as deactivation. If it is set to TRUE, then cyclic sending or send on change is stopped.  
  ● If none of the options "send on difference", "send on change", or "Cyclic sending" is enabled, then sending is triggered by a rising edge. |
| "Trigger Output"               |                                                                                                                |
| "Value"                        | Value for the input or outputs – depending on the corresponding communication object.                           |

6.3.4.8.5 ETS5 - Tab 'Parameter'

The parameter page of the ETS5 configuration software is available only after you have imported the CODESYS configuration file. The parameter page is where you define the sending behavior of the values.
6.3.4.9 BACnet-BC

6.3.4.9.1 Introduction to BACnet

BACnet is a standardized data communication protocol for Building Automation and Control networks as defined in the ANSI/ASHRAE standard 135 and ISO 16484-5.

The advantage is interoperability between devices of different vendors.

The BACnet protocol defines services to allow communication between devices. Examples include 'Who is', 'I am', 'Who has' and 'I have' for device and object search and identification, "Read Property" and "Write Property" for the exchange of data, up to more complex services for alarm and event management, scheduling and trending.

<table>
<thead>
<tr>

</tr>
<tr>
<td>Requirement: “Cyclic sending” is set to “Enable (minutes)”.</td>
</tr>
</tbody>
</table>
The BACnet protocol defines a number of object types on which the services operate. Each object is characterized by its properties.

The BACnet objects are combined in a BACnet device. A BACnet device represents the functionality of a physical device.

More background information and introduction can be found here:
http://www.bacnet.org
http://www.bacnet.org/Bibliography

### 6.3.4.9.2 AC500 and BACnet

A BACnet device can be described by its “BACnet Interoperability Building Blocks” (BIBBs), which are needed to establish services. They are grouped in different areas:

- “Data Sharing” (DS)
- “Alarm and Event Management” (AE)
- “Scheduling” (SCHED)
- “Trending” (T)
- “Device and Network Management” (DM)

“Data Sharing” for example contains two BIBBs which are needed for the “Service Read Property”:

- Client side: DS-RP-A (Data Sharing - Read Property - A)
- Server side: DS-RP-B (Data Sharing - Read Property - B)

The BACnet standard defines profiles by the minimum required BIBBs, see table below. “BACnet Simple Sensor” (B-SS) is the simplest one, only containing one BIBB. More complex devices contain more BIBBs (from right to left).

<table>
<thead>
<tr>
<th>Interoperability Areas (IA)</th>
<th>BACnet Device profiles</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>B-OWS</td>
</tr>
<tr>
<td></td>
<td>DS-V-A</td>
</tr>
<tr>
<td>Scheduling</td>
<td>SCHED-A</td>
</tr>
<tr>
<td></td>
<td>SCHED-1-A</td>
</tr>
<tr>
<td></td>
<td>DM-UTC-A</td>
</tr>
</tbody>
</table>
The AC500 V2 supports BIBBs qualifying it as "BACnet Application Specific Controller" (B-ASC), by installing the BACnet B-ASC library.

AC500 V3 supports many more BIBBs qualifying it as "BACnet Building Controller" (B-BC), which contains a server (all BIBBs ending with -B) and a client (all BIBBs ending with -A). In fact, the AC500 contains some more BIBBs. All BIBBs under B-BC in the table above, plus:

- DS-COV-A, -B (Change of Value-A, -B)
- DS-COV-A, -B (Change of Value of Properties-A, -B)
- AE-N-E-B (Alarm and Event-Notification External-B)
- AE-ASUM-B (Alarm and Event-Alarm Summary-B)
- SCHED-I-B (Scheduling-Internal-B)
- T-VMT-E-B (Viewing and Modifying Trends External-B)
- DM-TS-B (Time Synchronization-B)
- DM-UTC-B (UTC Time Synchronization-B)
- DM-MTS-A (Manual Time Synchronization-A)
- DM-LM-B (List Manipulation-B)
- DM-OCD-B (Object Creation and Deletion-B)
- NM-BBMDC-B (BBMD Configuration-B)

... 

A list with all details can be found in the Automation Builder pdf document ABB-B-BC-PICS-AC500_V3.pdf. Direction: Help/Project examples/Examples.

The figure below shows a typical application for an AC500 V3, acting as B-BC.

A drive with several actuators and sensors is acting as B-ASC, for example providing a temperature value as "Analog Input" (AI) object on the MS/TP network.
AC500 B-BC as client can read this temperature value, perform some processing (scaling, limit check) and on the server side provide the processed value as “Analog Value” (AV) object and as “Trend” object on the IP network. Higher level clients like BACnet Operator Workstation (B-OWS) can access the processed objects “Analog Value” and “Trend” for supervision.

The following chapters describe the possible applications and how to configure an AC500 V3 as B-BC.

**6.3.4.3 AC500 V3 as BACnet Building Controller (B-BC)**

**General**

The BACnet integration into CODESYS implements the ANSI/ASHRAE standard 135-2012 (ISO 16484-5) protocol revision 14 and is based on the AMEV AS-A and AS-B standards. Integration allows access to the properties of BACnet objects and the configuration parameters of a BACnet device by means of an IEC application. You can program a dynamic BACnet configuration and have access to the BACnet functions in the BACnet network by reading and writing BACnet object properties.

**Supported BACnet networks**

BACnet can run on different local area network types. The AC500 B-BC supports the following ones:

- MS/TP (Master Slave / Token Passing), based on serial RS-485
- BACnet IP, based on Ethernet / UDP / IP

Different networks can be combined to one common “BACnet internetwork”. The figure above shows an example of some BACnet devices in one “BACnet internetwork”. Each device has a device ID (10 to 15) which must be unique on application level. Services on application level (e.g. read or write request) are working with these device IDs and need no addressing information of the lower levels.

The example “BACnet internetwork” consists of different BACnet networks:

- BACnet MS/TP network connecting device 10, 11 and 12
- BACnet IP network (UDP port 47808), consisting of one IP subnets with IP range 192.168.0.x, connecting device 12, 13 and 14
- BACnet IP network (UDP port 47809), consisting of one IP subnet with IP range 192.168.2.x, connecting device 14 and 15

Addressing in a BACnet network is done through datalinks which must have a unique BACnet MAC address (which is different to an Ethernet MAC address).

- In a MS/TP network the BACnet MAC address is just one octet (1, 2, 3 in the example).
- In an IP network the BACnet MAC address is the combination of the IP address and the UDP port number (for example 192.168.0.130.47808 for device 13). The following 16 UDP ports are reserved for BACnet: BAC0 (=47808 decimal) to BACF.
To form a common “BACnet internetwork” the single BACnet networks must be combined by BACnet routers. AC500 can act as a BACnet router between BACnet MS/TP and IP networks (device 12 in the figure above) or between two different BACnet IP networks (device 14).

Two IP subnets using the same UDP ports can be combined to one BACnet IP network with an internet router.

The problem is that internet routers block local broadcast messages, which are required for BACnet communication. This can be solved by “Broadcast Management Devices” (BBDM). AC500 V3 can be configured as BBDM. In the figure above the devices 12 and 14 should be configured as BBDM in order to enable the BACnet communication across the internet router.

An alternative is to configure AC500 V3 as foreign BACnet device if an IP subnet contains no BBDM device to pass broadcast messages over internet routers.

Configuring the AC500 as BBDM or foreign device is described in Chapter 6.3.4.9.3.5.5 “Configuration of datalinks” on page 1745.

Supported objects and properties

Communication with BACnet is done through objects and properties.

The AC500 B-BC server of the figure below is represented as a BACnet device object with “ID 12”. The device contains more objects like the Analog Input object, representing the input of a temperature measurement device. An object contains several properties, like “ID, Description, Present Value, Unit” etc.

Further possible objects of an AC500 B-BC are:

- “Binary Input” for example from connected to a switch
- “Analog / Binary Output” for actuators
- “Analog / Binary Values” for local variables
- “Calender”
- “Schedule”
- “Trend Log”
- ...

A list with all details can be found in the Automation Builder pdf document ABB-B-BC-PICS-AC500_V3.pdf. Help/Project examples/.
Supported BIBBs and services

While objects and properties describe which data are communicated, the communication itself is done with services between clients and servers. A certain service can only be executed if client and server have the related BIBBs. The Fig. 273 BACnet objects, properties, services and BIBBs shows a simple “Service Read Property” which is possible because the client on the right supports DS-RP-A and the server on the left supports DS-RP-B. The service is executed in two steps:

1. The client initiates a confirmed request “Read Property”, asking for the present value of the “Analog Input” of object with “ID 1010”.
2. The server answers with an acknowledge, sending the present value which is 21.89°C in the example.

A list of all supported BIBBs and services of AC500 V3 is given in the Automation Builder pdf document ABB-B-BC-PICS-AC500_V3.pdf. Help/Project examples/Examples.

BACnet configuration in Automation Builder

General

To act as a BACnet server or client, the AC500 must be configured accordingly. The figure below shows the basic configuration of a BACnet server (left) and a BACnet server with client functionality (right). It is also possible to have server and client functionality in parallel.
Following objects need to be created:

1. "BACnet Server" root object. This is the root object for the server functionality, as well as for the client functionality. It is mandatory, even if only client functionality is required. Chapter 6.3.4.9.3.5.2 “Configuration of BACnet server root object” on page 1739

2. BACnet server objects, for example "BACnet Analog Input" temperature. The properties of the objects must be controlled (written or read) by the PLC logic. Chapter 6.3.4.9.3.5.3 “Adding BACnet server objects” on page 1741

3. BACnet client objects, represented by a different symbol. For example, "BACnet Client Read Property". The functionality of the client objects must be programmed in the PLC logic. Inserting the client objects below the server is optional. It is also possible to instantiate the objects only in a PLC logic. Chapter 6.3.4.9.3.5.4 “Adding BACnet client functionality” on page 1742

4. Datalink for the physical layer. This object links the physical interface (Ethernet IP or serial MS/TP) to the "BACnet Server" object. In the example above the IP address of ETH1 is automatically retrieved by inserting the "BACnet IP datalink" below the ETH1 port. Configuration of an IP datalink” on page 1746. For MS/TP refer to “Configuration of an MS/TP datalink” on page 1745.

Configuration of BACnet server root object

1. Create an empty project with an AC500 V3 CPU type and call it for example “Device_12”.

2. Insert a “BACnet Server” object below the interfaces object in the device tree.
3. Set the device `InstanceNumber` in the “BACnet Parameters” of the “BACnet Server”, e.g. to 12 and the `InstanceName` to `Device_12` (according to Fig. 273 BACnet objects, properties, services and BIBBs).

4. Add a datalink, IP or MS/TP. In the example an IP datalink is inserted below ETH1. Default parameters are sufficient if only one datalink is used.
   
   “Configuration of an IP datalink” on page 1746

5. Build the project, download to the PLC and set it to [RUN]. The status of the “BACnet Server” should be green (running). If not, please ensure that you have installed the runtime license BACnet Protocol B-BC Runtime, verifiable by right-click on the PLC node and select [Show license information] from the runtime licensing menu. The project is scanned for required licenses. If you are logged in to a PLC, then the licenses available on the PLC are displayed. A missing required license is highlighted.
   
   Chapter 6.3.2.2.2 “PLC runtime licensing” on page 1446
6. Start any BACnet client to find the server, for example Inneasoft BACnet Explorer.

Adding BACnet server objects

Goal is to publish an analog value as BACnet server object. This example is according to Fig. 273 BACnet objects, properties, services and BIBBs, left part containing a temperature value.

1. Configure a “BACnet Server” root object according to Chapter 6.3.4.9.3.5.2 “Configuration of BACnet server root object” on page 1739.

2. Add a “BACnet Analog Input” object below the “BACnet Server”.

3. Rename it to Temperature, adjust the parameters: InstanceNumber: 1010, Description: Temperature, Units: UNIT DEGREES C.
4. The present value of the objects Temperature needs to be fed with the value from the real temperature device. Alternatively, a simple PLC program can simulate this value.

5. Download the program and observe the temperature value in the BACnet client.

Adding BACnet client functionality

Goal is to configure a second AC500 controller as BACnet client which reads an analog value from a server. This example is according to Fig. 273 BACnet objects, properties, services and BIBBs, right part.

1. Add a new controller and configure a “BACnet Server” root object according to Chapter 6.3.4.9.3.5.2 “Configuration of BACnet server root object ” on page 1739.

2. Set InstanceNumber to 14 and InstanceName to Device 14.
3. In addition to BACnet objects, BACnet clients can also be inserted as devices under a “BACnet Server”. Add a “BACnet Client Read Property” below the “BACnet Server” node.

4. The created object “BACnet Client Read Property” generates a function block instance which can be used to program the client read functionality. The figure below shows a simple example.

In line 1-5 of the code part the function block is called with the following parameter:

- Device ID of the server to read from (12) "Chapter 6.3.4.9.3.3 "Supported objects and properties " on page 1737
- Object ID of the object to read from (1010 for the “Analog Input”)
- Object type (“Analog Input”)
- Property to read (“present value”)
- triggerRead to start the read operation

When the user (or another program part) sets the variable triggerRead from FALSE to TRUE the edge triggered function block BACnet_Client_Read_Property starts operation and sends the read request to the server device. After receiving the reply from the Server, the output .xDone gets TRUE (line 8) and the temperature value can be read from the output .result (line 14).
5. Download this program to another AC500 V3 controller, which is in the same IP network as the server. Set it to run and read the temperature value by setting `triggerRead` to `TRUE`. In online mode the read temperature value can be observed in line 14.

**Alternative configuration**

Unlike BACnet objects, a BACnet client does not require a complex (static) configuration, thus a client function block can be used without creating a BACnet client as device.

There is no `BACnet_Client_Read_Property` object created below the “BACnet Server”. Instead a function block `BACnet_Client_Read_Property` must be declared in the PRG (line 6 in the declaration) and initially "connected" to its "BACnet Server" in IEC-code via `RegisterToServer()`, and thus get activated (line 2 in the code) © Chapter 6.5.14 “Reference, function blocks” on page 4086.
Configuration of datalinks

For communication with other BACnet devices AC500 provides two different possibilities: MS/TP and IP.

Chapter 6.3.4.9.3.2 “Supported BACnet networks” on page 1736

For a non-routing device one MS/TP or IP datalink must be configured.

If more than one datalink is configured, routing between the datalinks is automatically enabled.

Configuration of an MS/TP datalink

- Add the “BACnet MS/TP COM” object below the COM port.

In fact the empty COM port is replaced by the “BACnet MS/TP COM”. By that the COM port is configured as RS-485 with fixed settings for MS/TP: No parity, 8 data bits, 1 stop bits.

- Below the “BACnet MS/TP COM” port object an “BACnet MS/TP datalink” is inserted automatically which can be configured according to the requirements.
● NetworkNumber: Use the default value 1 if no routing is required. For routing, use a unique network number in one controller.

● ConnectionType: Use the default value Master if no routing is required. For routing, use “Master – answering always postponed”.

● Baudrate: can be set according to requirements in the range of from 9600 to 38400 bits/s, higher values (57600 and 115200 bits/s) are not recommended.

● DatalayerAddress: This is the MAC address as described in Chapter 6.3.4.9.3.2 “Supported BACnet networks” on page 1736. The MAC address must be unique in the MS/TP network.

● For all other parameters the default values are recommended for typical applications.

Configuration of an IP datalink

● Add a “BACnet_IP_datalink” object below the Ethernet port ETH1 or ETH2.

Configuration of Routing

Routing enables the combination of different BACnet networks to one common “BACnet internetwork”.

Chapter 6.3.4.9.3.2 “Supported BACnet networks” on page 1736
BACnet devices from different BACnet networks can communicate with each other.

If more than one datalink is configured in one CPU, routing between the different networks is automatically enabled. It must only be ensured that the network number is unique in one controller.

Chapter 6.3.4.9.3.2 “Supported BACnet networks” on page 1736
For MS/TP the ConnectionType must be set to “Master – answering always postponed”. An example for routing can be found in the example folder.

Time synchronisation

The BACnet clients expect to receive the local time. Currently the AC500 V3 does not distinguish between UTC time and local time and its time zone is set to 0. This will be improved in the near future. In the meantime, it is recommended to store the local time (green color in the following figure) in the AC500 as a workaround.
Using this workaround, the following time sync mechanisms can be used:

- Set local time from Automation Builder Tab “PLC Shell”:
  Set the time by the command “time hh:mm:ss”

- Read the local time from the Automation Builder Tab “Statistics”:
  “Current PLC Date and time” shows the PLC time as local time without conversion, if the tab “Show PLC time in UTC” is enabled.

For storing the local time in AC500, do not use the button [Set PLC to PC Time] (Tab “Statistics”), since this is always converting from local time to UTC time.
BACnet clients can read local or UTC time, both requests will deliver the same (local) time information, since the timezone is 0.

If an SNTP time sync is required (for example with a Meinberg clock), UTC times are exchanged. For conversion of UTC to local time in AC500 a proprietary STNP client must be programmed.

Please contact the PLC support for more information.

Package content

General

The BACnet package PS5607-BACnet-BC can be installed with the Installation Manager and contains the following components:

- BACnet runtime component, part of AC500 firmware.
- Automation Builder package: CODESYS BACnet
  - BACnet plug-in component
  - Device descriptions for "BACnet Server", BACnet objects, BACnet client and datalinks

幢 Chapter 6.3.4.9.3.6.2 “BACnet libraries" on page 1748

Example folder

BACnet libraries

The IEC library CmpBACnet represents the integration of the BACnet stack into a CODESYS IEC environment and provides the BACnet data types as well as the BACstack methods. The sole use of the IEC library CmpBACnet (without the BACnet and BACnetDefaultImpl libraries) would result in complex and lengthy IEC application code.

The BACnet library simplifies BACnet application development considerably as compared to the sole use of CmpBACnet, especially in the following areas:

- Starting and stopping the BACnet stack
- Using BACnet server objects and their properties
- Triggering asynchronous requests (mainly client service requests) and processing the request transaction
- Processing of callbacks from the BACnet stack (see IBACnetEventConsumer) and distributing the callbacks to multiple receivers in the application

Furthermore, the BACnet library provides a plug-in mechanism (BACnetServerPlugin) for extending certain aspects of the BACnet library. BACnetServerPlugin is the basis for the BACnetDefaultImpl library.

The BACnetDefaultImpl library is used for the additional simplification of BACnet application development. The BACnet standard ASHRAE 135 leaves some aspects of the practical use of BACnet open. The most notable examples include the following:

- Persistence of server objects
- Storage and persistence of Trend Log, Trend Log Multiple, and Event Log entries
- Update of the date/time information of the device object
The IEC library BACnet is intended as a layer over the IEC library CmpBACnet. However, the
layer does not hide the library because this would require the BACnet library to have “facade”
functions for CmpBACnet functions. These facade functions would result in larger application
code and increased runtime requirements. This is difficult for the PLC to accept. For this reason,
it is necessary to know when elements from the BACnet library or CmpBACnet library are to be
used.

General rules:

- **Starting and stopping the BACnet stack**
  Always use BACnetServer.StartBACnetStack and BACnetServer.StopBACnetStack or AutoStart. Never directly use the corresponding functions of the CmpBACnet library, such as CmpBACnet.BACnetServerInit.

- **Using BACnet server objects and their properties**
  Always use the specified function blocks in IEC-lib-BACnet, such as BACnetAnalogValue. Never directly use the corresponding functions of the BACnet library, such as CmpBACnet.BACnetStorePropertyInstance.

- **Triggering of asynchronous requests**
  Always use the specified client function blocks of the BACnet library, such as BACnetClientReadProperty. Never directly use the corresponding functions of the CmpBACnet library, such as CmpBACnet.BACnetReadProperty. All functions of the CmpBACnet library that require a BACnetAsyncTransactionToken belong to this category and should never be used directly.

- **Processing of callbacks from the BACnet stack and distributing the callbacks to multiple receivers in the application**
  Always use IBACnetEventConsumer and BACnetServer.RegisterHook/UnregisterHook/RegisterCallback/UnregisterCallback. Never directly use the corresponding functions of the CmpBACnet library, such as CmpBACnet.BACnetSetHook or CmpBACnet.BACnetSetCallback.

When is it appropriate and safe to directly call the functions of the CmpBACnet library?

Basically, it is only necessary to call functions of CmpBACnet directly when a corresponding functionality is not provided in the BACnet library. Check the BACnet library first before trying to use CmpBACnet directly. It is possible to use blocking functions in CmpBACnet, such as BACnet*CbCompletion, BACnetIam(Ex), or BACnetIHave(Ex), BACnetUnconf*.

Most often, you will use BACnet*CbCompletion to implement your specific IBACnetEventConsumer, BACnetEventCallback. But first check whether or not the BACnetDefaultImpl library already contains an appropriate standard implementation.

**Application examples**

- **AC500_V3_BACnet_B-BC_Example_ABxxx.project** including simple read and write operations between client and server.
  - Use case 1: AC500 as BACnet client, read and write (with priority)
  - Use case 2: AC500 as “BACnet Server”, publish the analog value

- **AC500_V3_BACnet_B-BC_Example_Routing_ABxxx.project**

- **Examples from 3S**, including
  - Read and write operations with more options, notification class, calendar, scheduler, etc.
  - Device discovery
  - BBMD
  - Persistence
  - Logging
  - Routing
6.3.4.10 UDP protocol

6.3.4.10.1 Contents of the UDP protocol configuration

Functionality

UDP and TCP are widely used in network communication. UDP is a connectionless transport protocol. It has a similar task as the connection oriented TCP. This means that the sender does not know whether the data packets it has sent have arrived. While TCP sends acknowledgments when receiving data, UDP does without. This has the advantage that the packet header is much smaller, and the transmission link does not have to transmit acknowledgements.

Typically, UDP is used for DNS requests, VPN connections, audio and video streaming.

UDP in V3 is no longer configured in the hardware tree but only implemented applicatively via a library.

There are two libraries, one that works on the lowest level (SysSocket2, library, to get access to the socket interface for TCP/IP communication on the target.) and a user library (Net Base Services, this library implements a TCP server, TCP client and a UDP peer as a collection of base services for Ethernet).

- Chapter 6.5.3 “Library Manager functionality” on page 3773
- Chapter 5.2.1.2.1.3.3 “Overview of protocols, sockets and ports” on page 310
- Chapter 6.5.14 “Reference, function blocks” on page 4086
- “Data synchronization via UDP” on page 3882
- Chapter 6.3.4.9.3.2 “Supported BACnet networks ” on page 1736

The application example Communication via UDP protocol demonstrates the communication between a AC500 V2 PLC and a AC500 V3 PLCs via UDP protocol.

6.3.4.11 OPC UA

AC500 V3 controllers support the OPC UA protocol - a machine-to-machine communication protocol for industrial automation. For details on installation and configuration of an OPC UA server refer to the OPC UA server description Chapter 6.3.6.2 “OPC UA server for AC500 products” on page 1787.

How to connect robot controllers to OPC UA is described in the ABB News.

Application note

Details on OPC UA communication with an AC500 V3 PLC are given in the application note AC500 V3 and OPC UA.

Application example

The application example How to use OPC server V3 - for DA and UA is available to gain a deeper understanding of the OPC protocol and to configure AC500 V3 accordingly.

6.3.5 Data transfer and programming

6.3.5.1 Data exchange between AC500 V3 PLCs via network variables

Network variables can be used to exchange data between two AC500 V3 PLCs. The variables must be defined in strict and identical lists on both PLCs which are sender and receiver. The lists can be in one or more projects.

A step-by-step description on how to use network variables can be found in the application example.
6.3.5.2 Data exchange between AC500 V3 PLCs via EtherCAT

An EtherCAT bridge can be used to exchange data between two AC500 V3 PLCs in real time. The procedure is described in the *application example* using an EL6695 bridge terminal.

6.3.5.3 Source download/upload

**Source download**

- **Prerequisites**
  - Communication settings are correct
  - Project is saved on PC
  - PLC is connected

1. Login to the PLC.
2. In the menu click "Online ➔ Source download to connected device".
   - Project archive will be downloaded to PLC.
3. To verify download double-click node "PLC_AC500_V3", select view "Files" and double-click folder "PlcLogic" of the Runtime view (if necessary click refresh button of Runtime view).
   - File *Archive.prj* will appear if download was successful.
Source upload  Prerequisite

- Project archive on PLC available (from previous source download)
- PLC is connected

Depending on the used version of Automation Builder, the layout of the opened windows may vary.

1. Open the Automation Builder.
2. In the menu click “File ➔ Source upload...”.
   ⇐ A window “Pick the device from where you want to upload the source archive...” appears.

   If you get an error click [Scan for other devices].

3. Select your PLC with the archive and click [OK].
   ⇐ Dialog “Extract Project Archive” appears.

4. Select your preferred folder and click [Extract].
Then you are prompted to open the project archive.

5. Click [Yes].

⇒ The project opens.

Upload was successful.

### 6.3.5.4 Programming and testing

For information on programming see
- Chapter 6.4.1.9 “Programming of Applications” on page 1844
- Chapter 6.4.1.11.2 “Configuring the Connection to the PLC” on page 1965
- Chapter 6.3.5.5.2 “Enter a known PLC IP address” on page 1754
- Chapter 6.4.1.11 “Downloading an Application to the PLC” on page 1965

For information on testing/debugging see Chapter 6.4.1.12 “Testing and Debugging” on page 1980

### 6.3.5.5 Configuration of communication via Ethernet (TCP/IP)

#### 6.3.5.5.1 General

Programming via Ethernet is only possible on a PC with Ethernet board and installed network. Programming can be done via the internal (onboard) Ethernet communication module.

An application note describes the configuration of an AC500 V3 PLC for **EtherNet/IP communication**.
6.3.5.5.2 Enter a known PLC IP address

1. Right-click the top node “PLC_AC500 <...>” and select “Communication Settings” from the context menu.
   ⇒ Dialog box “Communication Settings <...>” appears.

2. Enter your PLC IP Address and click [OK].

6.3.5.5.3 Enter PLC IP address by scanning devices

1. Right-click the top node “PLC_AC500 <...>” and select “Communication Settings” from the context menu.
   ⇒ Dialog box “Communication Settings <...>” appears.

2. Click […].
   ⇒ Dialog box “Communication Settings <...>” appears.
3. Click [Scan], select your desired PLC and click [OK].
   ⇒ Entry is transferred to the dialog box “Communication Settings <...>”.
   Click [OK].

4. Click to log in the “PLC_AC500_V3” project.

6.3.5.5.4 Enter PLC IP address by [Advanced Settings...]

If a remote gateway instead of a local one has to be used it can be configured in the [Advanced Settings...].

1. Right-click the top node “PLC_AC500 <...>” and select “Communication Settings” from the context menu.
   ⇒ Dialog box “Communication Settings <...>” appears.

2. Enable checkbox “Use advanced settings” and click [Advanced Settings...].
   ⇒ Tab “Communication Settings” opens.

3. Check gateway or change if required.
   ⇒ Successful connection is indicated by green dot on the gateway icon.
4. **Manual entry of the IP address.**

Check IP address or change if required.

5. Press ENTER to confirm changed IP address.
   - Successful communication is indicated by green dot on the PLC icon.

6. Or instead of the last two steps:

   **Set the IP address via a scan.**

   Click [Scan Network], select your desired PLC and click [OK].

   ![Communication Settings](image)

   - Successful connection is indicated by green dot on the gateway icon.

7. Click to log in the “PLC_AC500_V3” project.

### 6.3.5.6 PLC shell commands

The PLC shell is used for requesting specific information from the controller. By entering a device-specific command the response is returned in a result window. The PLC shell can be issued without login.

**Proceed as follows:**

1. Ensure the gateway is configured properly and a connection to the controller can be established.
2. In Automation Builder double-click the PLC node and open the tab “PLC Shell”.
3. Enter “?” in the command line of the tab window. All available PLC commands are listed.

If the gateway is able to establish a connection to the controller, an online connection to the PLC is opened automatically.
The commands listed in online mode can differ from the commands shown when pressing the button [...] as Automation Builder version and firmware version can differ.

- Chapter 6.4.1.21.2.8.11 “Tab 'PLC Shell'” on page 2441
- Chapter 6.2.6 “Version information” on page 1384
- Chapter 6.3.1.4 “Firmware identification and update” on page 1419.

6.3.5.7 Watchlists

- Chapter 6.4.1.13.2.3 “Using watch lists” on page 2002
- Chapter 6.4.1.13.2.4 “Changing Values with Recipes” on page 2003

6.3.5.8 Reference to libraries

Library configuration is described in the chapter.

6.3.5.9 Reference to application libraries

Application libraries can be used in AC500 V3 PLCs. The requirements for the use of the function blocks of the application libraries and information and prerequisites for the general handling of application libraries are described in the application examples:

**HTTP library**
In order to be able to use the PLC as a client for web services, the HTTP function block library can be used. Setup and use of the HTTP library are described in the application example [AC500 Webservices - HTTP Function Block Library](#).

**MySQL library**
With the help of the MySQL function block library, MySQL databases can be used to store and access AC500 V3 data. Setup and use are described in an [application example](#).

**MSSQL library**
With the help of the MSSQL function block library, MSSQL databases can be used to store and access AC500 V3 data. Setup and use are described in an [application example](#).

<tr>
<th>Ensure termination of the following processes:</th>
</tr>
</thead>
<tbody>
<tr>
<td>– Gateway.exe</td>
</tr>
<tr>
<td>– CoDeSysOPC.exe</td>
</tr>
<tr>
<td>– WinCoDeSysOPC.exe</td>
</tr>
<tr>
<td>– OCTsvc.exe</td>
</tr>
</tbody>
</table>

Installing with Automation Builder

2. Click [Latest Automation Builder version (recommended)] and run the installer.

3. Open “Installer Options and Additional Tools” and click [Install Additional Tools].
4. Agree to the “License Terms”.

5. Select “Version 2 and/or 3” and install.
   ☑ All required files are installed for OPC and the OPC server is registered automatically as user application.
Manual registration and unregistration

It is possible to register or to uninstall the OPC server manually either as COM server (user application) or as a service.

Register the OPC server as interactive software in the Windows registry:

**Command for OPC 3:** `WinCoDeSysOPC/RegServer`

Register the OPC server as system service:

**Command for OPC 3:** `WinCoDeSysOPC/Service`

Unregister the OPC server from the Windows registry and from the service entry:

**Command for OPC 3:** `WinCoDeSysOPC/UnRegServer`

Please see REF1 chapter 3 (OPC 3) Table on page 1759 for details.

Example: Register OPC server V3 as a system service

- Prerequisites: All programs, processes and services which connect to the OPC server are closed.
  1. Start the “Command Prompt” with command “cmd” in the “Start → Run...” window.
  2. Go to the CoDeSysOPC V2 installation folder.
  3. Unregister the OPC server with `WinCoDeSysOPC/UnRegServer`.
  4. Register the OPC server as system service with `WinCoDeSysOPC/Service`.

OPC clients for tests

Free of charge test clients can be found in the web:

- [https://industrial.softing.com](https://industrial.softing.com)
Symbol file
Define symbols

1. Right-click on “Application” in CODESYS V3 project and click “Add Object”.

2. Choose “Symbol Configuration” and click [Add object].

3. Select your programs and/or single symbols and click [Build].
   → A symbol file will be automatically downloaded to the PLC with Project Download.

With double-click in the device tree to “Symbol Configuration” you can change the “Symbol Configuration” settings.

To restrict traffic and load, choose only symbols you need.
Configure OPC server

Configure OPC Server V3

2. If the configuration is needed furthermore, save the configuration. The actual configuration at start of OPC server will always be read from \textit{OPCServer.ini}. 

\begin{figure}[h]
\centering
\includegraphics[width=\textwidth]{image}
\caption{Configuration and programming Configuration in Automation Builder for AC500 V3 products > Server installation}
\end{figure}

\begin{itemize}
\item \textbf{Update rate}
\begin{itemize}
\item The “Update Rate” may not be 0 (ms)!
\item The default value of 200 ms is a suitable value of many applications.
\item The adjustment for the “Update Rate” depends on the number of symbols (variables).
\item For a big number of symbols it can be better to increase the “Update Rate”.
\end{itemize}
\item The checkboxes “Sync Init” and “Enable logging (Defaultevents)” must be enabled.
\end{itemize}
3. Select “PLC_FW3”.

- If the *.sdb files should be loaded from the “Gateway Files” directory on PC, the project name must be identical with project name in CODESYS. The extension is not necessary.
- If the symbol information should be loaded from AC500 V2.x, the project name is not required and can also be empty.
- The parameters displayed in the screenshot above are recommended default settings.
- The checkbox “Active” must be enabled.
- Enabled checkbox “Enable logging” allows a later diagnosis.
4. Select "Connection" and click [Edit].

5. Enter the TCP/IP address of the target PLC at "PLC name or address" and enable "Use Tcp/Ip blockdriver".

6. Enter the TCP/IP address of the target PLC at "IP Address of PLC" and click [OK].

7. Click "File ➔ Save" OPCserver.ini and "File ➔ Exit" OPCConfig.

Check OPC function with AC500

Prerequisites

It is urgently recommended to check the function of the configuration steps.

* Chapter 6.3.6.1.2.4.1 "Configure OPC Server V3" on page 1770
Check OPC server V3

1. Start OPCExplorer.exe and connect “CoDeSys.OPC.DA”.

2. Add Group, add Items, select available Items in Server “CoDeSys.OPC.DA”. Add to Tag List, close the Item browser.

→ If anything is right, then “CoDeSys.OPC.DA” is connected, is running and the “Quality” of the items is good.

Check processes with windows task manager

Correct configuration: All processes run with the same “User Name” and with the same “Session ID”.
Test OPC function without AC500

AC500 project

1. Open CoDeSys Application.

2. Collect all OPC variables in a separate “Global Variables” list.
3. Under “Project ➔ Options” select the “Symbol configuration”. Enable checkbox “Dump symbol entries” and click [Configure symbol file].

4. Disable all the checkboxes and confirm twice with [OK].
5. Under “Project ➔ Options” “Symbol configuration” click [Configure symbol file] again.

6. Select the variables which should be communicated as symbol. Enable the following checkboxes:
   - “Export variables of object”
   - “Export structure components”
   - “Export array entries”
   - “Write access”

7. Confirm twice with [OK].

8. Under “Project ➔ Rebuild all” rebuild the project.
9. In the project folder is the subfolder “OPC_test1__AC500_PM573_ETH__OPC_test1”. It contains symbol files *.SYM and *.SDB with the time of the “Rebuild all”. The items in the file *.SYM can be checked with Notepad. The binary file *.SDB contains the items for the OPC server. With <Online> <Login> it will copied in the gateway files directory and optionally on the AC500.

10. The folder “OPC_test1__AC500_PM573_ETH__OPC_test1” is a temporary folder, if the CBP project is opened. For the simulation of the server OPC it is copied *.SDB by hand.
Configure OPC server V3

1. Select “Edit”, append “PLC” and keep the default values.

2. You must specify “Project name” with the “directory name”. Connection settings are not required for the simulation.
Check OPC server with MatrikonOPCExplorer

2. The OPC Server V3 (“CoDeSys.OPC.DA”) is connected, running and the “Quality” is good.
   One OPC client can read / write the values of the items.
3. Similar configuration as above.
   The OPC Server V2 ("CoDeSys.OPC.02") is connected, running and the configured items are found. But the “Quality” is bad. One OPC client can not read / write the values of the items.

Check processes with windows task manager

Correct configuration: All “Processes” run with the same “User Name” and with the same “Session ID”.

Summary

The correct function of OPC Server V2 and V3 can be checked without AC500.

With OPC Server V3 with the configuration “SIMULATION” the Project name with the directory name has to be specified. The values of the items can be read and write by one OPC client.

With OPC Server V2, as well as with OPC Server V3 in configuration “GATEWAY”, only the project name may be specified. The configured items are found, but the quality is bad. The values of the items can not be read and not write by one OPC client.

Refer to REF5 Online Help of PS501 chapter OPC for details © Table on page 1759.

Configure AlarmEvents

Check AlarmEvents

The function of the “AlarmEvents” can be checked with “MatrikonOPC Explorer”.

The “AlarmEvents” can be simulated by writing the value of the Items.

Further information

Refer to REF2 AeConfigurer_UserGuide.pdf for details © Table on page 1759.
Configure user account for OPC server

When running the OPC server V3 on Windows Server 2003/2008/2012/2016 multiple sessions need to be supported. Therefore the installation of the OPC server as service running with a dedicated user account is recommended.

**Configuration steps**

- Create specific user, no administrator account is required
- Register V3 OPC server as service
- Configure V3 OPC server as service

Create specific user

![Create specific user](image1.png)

Registration

![Registration](image2.png)

Register the OPC Server executable as service from the command line.
With command “WinCoDeSysOPC /Service” WinCoDeSysOPC.exe gets installed as system service. Started once, the service will stay “started” until the system gets terminated. The communication to the configured PLCs survives. Also here the service gets installed in the current position of WinCoDeSysOPC.exe.

Configuration

At “Computer Management ➔ Services and Applications ➔ Services” open the “Properties” of the “CoDeSysOPCDAService”.

Complete the Service Configuration
Testing

Check Users and Session during Test Cases

Check the “Session ID” and “User Name” of
Further information

Please refer to REF3 ReadMe.rtf and REF4 ReleaseNotes OPCV3 AE for HA.

Table on page 1759

6.3.6.1.3 Potential issues

Session isolation

Situation
With Windows Server 2003, Windows Server 2008, Windows Server 2016 the Windows 7 services are alone in session 0. User applications run in session 1 (2 and so on).

Services:
A Windows service is a computer program that operates in the background.

Windows services can be configured to start when the operating system is started or can be started manually and run in the background as long as Windows is running. They can operate when a user is not logged on.

Services are:
Windows operating systems include numerous services. OPC client like S+ OPC scanner PGIM, Aspen CIM-IO Manager, ICONICS, .. can also installed as a service.

User applications are:
Microsoft Word, Notepad, MatrikonExplorer, ControlBuilderPlus.exe and Codesys.exe

Problem
Service and user application are isolated in their session. They can not communicate with each other directly.

OPC Server uses, like the CBP and CODESYS, the gateway server from CODESYS (gateway.exe) for the communication with the AC500 and starts the gateway in their session. That creates undefined behavior, if the OPC Server runs as a service. The gateway server is not able to run in multi sessions.

Resolutions
● Install all OPC clients and OPC Server, which use the gateway server, in the same session.
● The OPC Server as a service (session 0) may not be connected at the same time (in parallel) with an OPC server as a user application or CBP or CODESYS (all in session 1) with the AC500. If this function is necessary, different PC or virtual machines must be used.
● Use tools like OPC tunnel. In a DigiVis 500 setup context the OPC server must not be registered as service. The OPC tunnel itself starts the OPC server within its service.

See also
6.3.6.2 OPC UA server for AC500 V3 products

6.3.6.2.1 General

OPC UA server can be added as an object below the Ethernet interfaces ETH1 or ETH2.

The user can access the variable interface of the PLC via a client. At the same time, communication can be protected by means of encryption.

The CODESYS OPC UA server supports the following features:

- Browsing of data types and variables
- Standard read/write services
- Notification for value changes: subscription and monitored item services
- Encrypted communication according to "OPC UA standard (profile: Basic256SHA256)"
- Imaging of the IEC application according to "OPC UA Information Model for IEC 61131-3"
- Supported profile: Micro Embedded Device server Profile
- By default, there is no restriction in the number of sessions, monitored items, and subscriptions. The number depends on the performance of the respective platform.
- Sending of events according to the OPC UA standard.

Application note How to install and configure an OPC V2 or OPC V3 server and how to use it for AC500 PLCs is described in the application note How to use OPC server.

Application example The application example How to use OPC server V3 - for DA and UA is available to gain a deeper understanding of the OPC protocol and to configure AC500 V3 accordingly.

6.3.6.2.2 Creating a project for OPC UA access

1. Click "File ➔ New Project ➔ AC500 project" in Automation Builder 2.1 or newer.
2. Choose a PLC - AC500 V3 and click [Add object].
3. Right-click on node ETH1 or ETH2 and "Add object".
4. Choose OPC UA Server in the dialog and click [Add object].
5. Declare some variables of different types in the program.
6. Right-click "Application ➔ Add object". Choose "Symbol configuration" and click [Add object].
7. Enable checkbox “Support OPC UA Features” in the dialog “Add symbol configuration”.
8. Double-click “Symbol configuration” in the Devices tree to open the editor “Symbol configuration”.
9. Click [Build].
   ◦ The variables are displayed in a tree structure.
10. Activate the variables that you want to publish to an OPC UA client. Specify the access rights.
11. Download the project to the PLC.

6.3.6.2.3 Use node name

1. Double-click node “OPC_UA_Server”.
2. Set parameter “Use node name” to TRUE.
3. Double-click node “PLC_AC500_V3 <...>”.
4. Click “Device” and “Rename active device...”
5. Enter new device name in the following dialog and click [OK].
6.3.6.2.4 Use UaExpert client

The OPC UA client UaExpert is available for download from the Unified Automation website and can be used free of charge (freeware license).

Using this client, you can connect to the AC500 OPC UA server.

The following description refers to this program. Other OPC UA clients work in a similar way.

1. Start the UaExpert program.

2. Click on the “blue cross symbol”.

4. Enter URL and click [OK].
   - The URL appears in the “Add Server” dialog.

5. Select “Advanced” tab and click [OK].

6. Click [Connect].
7. Expand the project tree in the "Address Space" window.

8. Drag and drop the needed symbols to "Data Access View".

### 6.3.6.2.5 Working with encryption

#### Creating a certificate for the OPC UA server

- **Prerequisite:** A battery is inserted and the clock is set to actual time.
- 1. Double-click the Security symbol in the lower right corner of Automation Builder.
- 2. Select the "Devices" tab.
   - The certificate information opens.
- 3. Select the PLC in the left "Information" view.
   - All services of the PLC that require a certificate are displayed in the right Information view.
- 4. Select the service "OPC UA Server".
- 5. Click the icon to create a new certificate for the device.
   - "Certificate Settings" dialog appears.
6. Define the certificate parameters according to the figure above and click [OK].
   ⇒ The certificate is created on the PLC.

7. Upload the certificate to your PC.
8. Restart the runtime system.

For further information see Chapter 6.3.4.7.3.4 “OPC UA secure” on page 1728.

**Encrypted connection with UaExpert client**

1. Start the UaExpert program.

2. Click on the “blue cross symbol”.
4. Enter URL and click [OK].
   ⇒ The URL appears in the “Add Server” dialog.
5. Select “Advanced” tab.

6. Choose option “Basic256ha256” of drop-down list “Security Policy” and “Sign & Encrypt” of drop-down list “Message Security Mode” and click [OK].
7. Click menu “Settings” and “Manage Certificates”

8. Click [Create new Application Certificate...].
   ⇒ Dialog “New Application Instance Certificate” opens.
9. Enter the required informations and click [OK].
   ⇒ Dialog “Manage Certificates” opens

10. Click [Copy Application Certificate To...] your PC.

11. Download the certificate to AC500 via the “Security Screen” view.

Dialog “Certificate Validation” opens.

Working with a trusted certificate will avoid this error message.

14. Enable checkbox Accept the server certificate temporarily for this session and click [Continue].

Dialog “Connect Error” opens.
15. Click [Ignore]

16. Check settings in dialog “Manage Certificates”.

6.3.6.2.6 Changing variables via UaExpert client

1. Expand in view “Address Space” “Objects ➔ DeviceSet ➔ PM5670 ➔ Resources ➔ Application ➔ PLC_PRG”.
   - The variables of the global variable list are visible.
2. Drag and drop the variables to the Data Access View.
3. Change values in the column Value.

6.3.6.2.7 Configuring OPC UA client

Operating modes

Polling
- Objects will be continuously updated in a defined interval
- Create higher load then Subscription
- Is recommended only for a few Symbols

Pub/Sub
Not yet supported

Subscription (recommended mode)
- Updated objects depending on the publishing interval and filters
- Method to reduce load
- Different intervals
- Filter possible (coming in AC500)

<table>
<thead>
<tr>
<th>Client defines a group of symbols with</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Publishing interval</td>
<td>Interval, in which server publish data to client</td>
</tr>
<tr>
<td>Sampling interval</td>
<td>Interval for sampling and storing data at server and send in each publishing interval</td>
</tr>
<tr>
<td>Queue size</td>
<td>Array of data to save data if sampling Interval is faster than publishing Interval (At AC500 in the moment only 1)</td>
</tr>
</tbody>
</table>
| Data change filter                   | Can be used to reduce traffic from server to client. Criteria:  
  - Change of data,  
  - Change of status  
  - Change of time stamp  
  AC500 is fix configured for change of data and change of status. |

![Diagram of OPC UA client interfaces](image-url)
Using OPC UA with subscription mode

Recommendations:
- Define only variables you need as symbols
- Do not configure publishing Intervals to short (increase load)
- Use different subscriptions with different publishing intervals in order to decrease load
- Do not use sampling intervals faster then publishing intervals as long as AC500 OPC UA server don't support Queue Size different from 1
- Be careful: Setting „0“ at sampling Interval at client will be interpreted in server as „as fast as possible“, which is 100ms at AC500 and create a high load.

Publishing and sampling intervals in UaExpert
1. Right-Click on an Item in “Data Access View” and click “Subscription Settings”.

![Subscription Settings](image)

2. Set the recommended values.

   **Life Time Count**: Number of publishing intervals in which client has to send publish requests to the server. After this period without request from client, subscription in server will be deleted.

   **Max Keep Alive Count**: If there are no new data to send, server can skip a publishing interval. After the alive count, server has to send, even if there are no new data.

   Click [OK].

3. Right-Click on an Item in “Data Access View” and click “Monitored Item Settings”.

![Monitored Item Settings](image)

4. Set the recommended values.

6.3.6.3 Web server

**HTTP library**

In order to be able to use the PLC as a client for web services, the HTTP function block library can be used. Setup and use of the HTTP library are described in the application example *AC500 Webservices - HTTP Function Block Library*.
6.3.6.4 Windows server

Windows server usage in Automation Builder requires modifications of the system environment and of the settings in Automation Builder, e.g. permissions, licensing, session handling etc. How to setup system and software for Windows server is described in the application note *Windows Server 2016 - RDM access*.

6.3.7 Converting an AC500 V2 project to an AC500 V3 project

**Application example**

A project that has been configured for an AC500 V2 PLC can be converted to a project for an AC500 V3 PLC. Essentially, the conversion is done in Automation Builder, however, some additional actions have to be executed manually. The complete conversion procedure of a V2 project to a V3 project is described in the application note *Converting an AC500 V2 project to an AC500 V3 project*.
6.4 Programming with CODESYS

6.4.1 CODESYS Development System

6.4.1.1 Introduction

The CODESYS Development System IEC 61131-3 programming tool forms the core of the CODESYS software platform for tasks in industrial automation technology. With additional, integrated solutions for motion control, visualizations, and fieldbus connections, the usual practical requirements are covered in one system.

Features

The free CODESYS Development System is a IEC 61131-3 programming platform for automation devices with control tasks. It provides diverse and comfortable engineering solutions to support you in your developing tasks:

<table>

</tbody>
</table>
### Support of object-oriented programming.
Real object-oriented programming (OOP) fully compliant with the IEC 61131-3 standard in all IEC 61131-3 languages, without any additional tools.
Inheritance of POUS to similar application parts to reduce development time and errors.
Object-orientation is not a must: Functional and object-oriented programming can be used and mixed as required.

### Comprehensive project comparison, also for graphic editors.

### Library concept for an easy reutilization of application.

### Debugging and online features for the fast optimization of the application code and to speed up testing and commissioning.

### Integrated compilers for many different CPU platforms for optimizing the controller performance.

### Security features for the protection of the source code and the operation of the controller.

### Field bus support and programming of devices from different manufacturers.

### Extensibility and adaptability without leaving the framework.

### For this see in this Online Help:

### Additionally:
Many seamlessly integrated tools for different kinds of automation tasks, for example CODESYS Visualization, CODESYS SoftMotion, CODESYS Application Composer.

Please always note the possibility to extend the functionalities by "AddOn"-Packages, provided in the CODESYS Store.

### Customization of the user interface language
In the “Option ➤ International Settings” dialog you can customize the language of the user interface of the development system. This change will take effect the next time you start Automation Builder. You can adjust the help language separately.

If you start Automation Builder from the command line, you can add a parameter to adjust the user interface language.

6.4.1.2 Configuring CODESYS

6.4.1.2.1 Introduction
Setting CODESYS options

You can configure the behavior and appearance of the CODESYS Development System in the different tabs of the "Options" dialog. The dialog opens by clicking "Tools ➔ Options". Here you can configure the default settings for different editors and functionalities. These settings apply throughout CODESYS.

The settings are stored in your current user profile on your local system. For use on other systems, option settings, either user-specific or machine-specific (computer), can be exported to an XML file.

In V3.5 SP13 and later, CODESYS checks whether an older version is already installed when the development system is started for the first time. If this is the case, then the "Import Assistant" dialog opens for transferring the CODESYS options set with the older version.

6.4.1.2.2 Customizing the user interface

Introduction

In CODESYS, you can customize the user interface by changing the window layout as well as the appearance of menus and commands according to your requirements.

Customizing menus

You can customize the menu commands of the CODESYS user interface. In a configuration dialog, you can add or remove menus.

Removing menus and commands

1. Choose the command “Tools ➔ Customize”.
   ⇔ The "Customize" dialog box opens. The "Menu" tab is visible.
2. Select a menu in the menu tree or a command in a menu.
3. Click “Delete”.
   ⇔ The menu or command is deleted from the menu tree.
4. Click “OK”.
   ⇔ The dialog box closes and the menu is customized.
Adding menus

1. Choose the command “Tools ➔ Customize”.
   ⇒ The “Customize” dialog box opens. The “Menu” tab is visible.
2. Scroll to the end of the menu tree.
3. Select the blank symbol ( ).
4. Click “Add Popup Menu”.
   ⇒ The “Add Popup Menu” dialog box opens.
5. Type a name for the new menu in the “Default text” field.
   If localization is unnecessary, then skip to step 9.
6. Click “Add Language”.
   ⇒ A drop-down list opens with available languages.
7. Choose the required language.
   ⇒ The language is added to the list of languages.
8. Click into the “Text” field and type the language-specific text.
9. Click “OK”.
   ⇒ The new menu is added at the bottom of the menu tree.
10. Change the menu order by clicking “Move up” and “Move down”. Click “OK” to close the “Customize” dialog box.

   The new menu is displayed only when it contains a command.

Adding commands

1. Choose the command “Tools ➔ Customize”.
   ⇒ The “Customize” dialog box opens. The “Menu” tab is visible.
2. Expand the branch of the menu where the new command should be added.
3. Select the blank symbol ( ).
4. Click “Add Command”.
   ⇒ The “Add Command” opens dialog box.
   The dialog box lists all commands grouped by category.
5. Select the command to be added. Click “OK”.
   ⇒ The new command is added to the menu tree.
6. Change the menu order by clicking “Move up” and “Move down”. Click “Add separator” to add a border between commands. Click “OK” to close the “Customize” dialog box.
   ⇒ The new command is now available in the menu.

See also

- Chapter 6.4.1.21.4.15.2 “Dialog ’Customize’ - ’Menu’” on page 2801
- Chapter 6.4.1.2.2.3 “Customizing toolbars” on page 1804
Customizing toolbars

You can customize the toolbars of the CODESYS user interface. In a configuration dialog, you can add or remove toolbars.

Removing toolbars and commands

1. Choose the command “Tools ➔ Customize”.
   ⇒ The “Customize” dialog box opens.
2. Choose the “Toolbars” tab.
3. Select a toolbar or a command from a toolbar tree.
4. Click “Delete”.
   ⇒ The toolbar or command is deleted.
5. Click “OK”.
   ⇒ The dialog box closes and the toolbar or command is removed.

Adding toolbars

1. Choose the command “Tools ➔ Customize”.
   ⇒ The “Customize” dialog box opens.
2. Choose the “Toolbars” tab.
3. Select the blank toolbar.
4. Click “Add Toolbar”.
   ⇒ The cursor blinks in the new toolbar.
5. Type a name.
6. Change the toolbar order by clicking “Move up” and “Move down”. Click “OK” to close the “Customize” dialog box.

   CODESYS displays the new toolbar only when it contains a command.

Adding commands

1. Choose the command “Tools ➔ Customize”.
   ⇒ The “Customize” dialog box opens.
2. Choose the “Toolbars” tab.
3. Expand the tree of the toolbar where the new command should be added.
4. Select the blank symbol ( ).
5. Click “Add Command”.
   ⇒ The “Add Command” dialog box opens.
   The dialog box lists all commands grouped by category.
6. Select the command to be added. Click “OK”.
   ⇒ The new command is added to the toolbar tree.
7. Change the toolbar order by clicking “Move up” and “Move down”. Click “Add separator” to add a border between commands. Click “OK” to close the “Customize” dialog box.

⇒ The new command is available in the toolbar.

- § Chapter 6.4.1.2.2.2 “Customizing menus” on page 1802

**Customize command icon**

CODESYS provides the capability of assigning customized icons to commands.

1. Select the command “Tools ➤ Customize”.
⇒ The “Customize” dialog box opens.

2. Click the “Command icons” tab.

3. Select the category “Help” from the list on the left.
⇒ All commands in this category are listed on the right.

4. Select the command “Information”.

5. Click “Assign”.
⇒ A dialog box opens for selecting the icon file (*.ico).

7. Click the “Open” button.
⇒ The icon is assigned to the selected command.

8. Click “OK”.

See also

- § Chapter 6.4.1.21.4.15.3 “Dialog 'Customize' - 'Command Icons' ” on page 2801

**Customizing keyboard shortcuts**

CODESYS provides the capability of executing commands directly via keyboard shortcuts. You can customize or extend predefined keyboard shortcuts.

1. Choose the command “Tools ➤ Customize”.
⇒ The “Customize” dialog box opens.

2. Choose the “Keyboard” tab.

3. Select the category “Help” from the list on the left.
⇒ All commands in this category are listed on the right.

4. Select the command “Search”.

5. Click into the field “Press Shortcut Keys”.

6. Press [Ctrl]+[Shift]+[S].
⇒ CODESYS adds the key combination to the field.
7. Click “Assign”.
   ⇒ The keyboard shortcut is assigned to the command.

8. Click “OK”.
   ⇒ You can call the “Search” command by pressing [Ctrl]+[Shift]+[S].

See also
● Chapter 6.4.1.21.4.15.5 “Dialog Box ‘Customize’ - ‘Keyboard’ ” on page 2802

Changing the window layout

In CODESYS, you can easily customize the layout of different views to your individual needs.

1. Drag the view by the caption bar or by the tab.
   ⇒ Arrows are shown to mark possible destinations. Example: 

2. Drag the view to one of the arrows.
   ⇒ The destination is displayed as a blue-shaded area.

3. Release the left mouse button.
   ⇒ The window is inserted into the selected destination.

   The window can also be placed outside of the CODESYS programming interface.

● Chapter 6.4.1.2.2.8 “Auto-hiding windows” on page 1807
● Chapter 6.4.1.2.2.9 “Switching between windows” on page 1807

Resizing windows

1. Move the mouse pointer over the border between two windows or views.
   ⇒ The cursor becomes a left-right arrow.

2. Drag the border to another position.

   You can resize detached views by moving the frame lines.

● Chapter 6.4.1.2.2.6 “Changing the window layout” on page 1806
● Chapter 6.4.1.2.2.8 “Auto-hiding windows” on page 1807
● Chapter 6.4.1.2.2.9 “Switching between windows” on page 1807
Auto-hiding windows

Hiding windows
When you hide a view, it is minimized to a tab in the frame of the user interface. When you move the pointer over the tab, the window is shown automatically.

1. Click into the window to be hidden.
2. Click “Window ➔ Auto Hide”.
   Or click the PIN symbol (ציג) in the upper right corner of the view.
   ⇒ The window is hidden and only visible by a small tab on the edge of the main window.
3. Move the mouse pointer over the tab.
   ⇒ The window is shown as long as the mouse pointer hovers over the tab.

Showing windows

1. Click the tab of the hidden window.
2. Clear the check box “Window ➔ Auto Hide”.
   Or click the PIN symbol (การออกแบบ) in the upper right corner of the view.
   ⇒ The window is permanently shown.

● § Chapter 6.4.1.2.2.7 “Resizing windows” on page 1806
● § Chapter 6.4.1.2.2.9 “Switching between windows” on page 1807

Switching between windows

It is possible to switch directly between the currently opened views and the editor windows.
1. Press the keystroke combination [Ctrl]+[Tab]. Continue pressing the [Ctrl] key.
   ⇒ An overview opens with all active views and editors.
2. Continue pressing the [Ctrl] key and select a window using the arrow keys.
   ⇒ The selected view or editor is activated.

6.4.1.3 Creating and Configuring a Project

6.4.1.3.1 Introduction

What is a project?

- A project contains the objects which are necessary to create a controller program ("application"):
  - Pure POUs, for example programs, function blocks, functions, and GVLs.
  - Objects that are also required to be able to run the application on a PLC. For example, task configuration, Library Manager, symbol configuration, device configuration, visualizations, and external files.
- In a project, you can program multiple applications and connect multiple controller devices.
- CODESYS manages device-specific and application-specific POUs in the "Devices" view ("device tree") and project-wide POUs in the "POUs" view.
- For the creation of projects, there are templates that already contain certain objects.
- Basic configurations and information for the project are defined in the "Project Settings" and "Project Information". For example:
  - Compiler settings
  - User management
  - Author
  - Data about the project file

There are settings for the version compatibility of the project in the configuration dialogs in the "Project Environment".

- You save a project as a file in the file system. As an option, you can pack it together with project-relevant files and information into a project archive. It is also possible to save files in a source code management system such as SVN.
- Each project contains the information about the CODESYS version with which it was created. When you open it in another version, CODESYS will notify you about possible or necessary updates regarding file format, library versions, etc.
- You can compare, import/export projects, and create documentation for them.
- You can protect a project from being changed, or even completely protect it from being read. By using user management, you can selectively control the access to the project and even to individual objects in the project.

- Chapter 6.4.1.21.2.2 "Object 'Application'" on page 2410
- Chapter 6.4.1.21.2 “Objects” on page 2409

- Chapter 6.4.1.6 “Protecting and Saving Projects” on page 1819

6.4.1.3.2 Opening a V3 Project

You can open projects, library projects, or project archives in CODESYS which have been created with different installations. When a project is opened, it is automatically checked whether or not the active installation is appropriate to load the project. At this time, deficiencies can be detected, such as missing add-ons or deprecated installations. You can correct these deficiencies. Then you can load the project with an appropriate installation.

The following actions are possible to correct deficiencies:

- Update existing add-ons and install missing add-ons
- Start another installation which is appropriate for the project
- Install an additional CODESYS version with the appropriate state

Moreover, you can load and read write-protected projects. You have to specify an appropriate location where you have the necessary write permissions only when you save the file.
Loading a project with access restrictions

You can load restricted projects only if you have the access credentials, such as user name and password.

Loading a project with a security key

You have selected a project which is protected by a security key. If the security key is not plugged into the computer, then you are prompted to plug it in. Otherwise CODESYS opens the project without any information about the protection.

Loading a backup of a project

Backups are created when the “Automatically save” project option is selected. When CODESYS is not ended properly after a change, the project is saved as a backup.

When you have selected a project, the “Auto Save Backup” dialog opens first when loading. There you can handle the backup.

- Help on CODESYS Installer

6.4.1.3.3 Opening a V2.3 project

A CoDeSys V2.3 project can be converted into a CODESYS V3 project only if the CODESYS V2.3 Converter package is installed in CODESYS V3. The package is available in the CODESYS Store.

Requirement: CODESYS is started (or a project is already open). You should be aware of the restrictions described below the following instructions.

1. Click “File ➔ Open Project”.

2. In the “Open Project” dialog, click any CoDeSys V2.3 project or project archive in the file system. For searching, you can set the file filter on the bottom right corner of the dialog.
   - If another project is still open, CODESYS instructs you to close it accordingly. After that the CoDeSys V2.3 converter automatically starts.

3. The V2.3 converter checks that the project can be compiled without errors. If so, then it processes the project automatically.

4. NOTE: If the project contains visualization objects with placeholder variables that the converter cannot resolve, the respective visualizations are shown as a group in place of the visualization references.

5. Device conversion: When a device (target system) is referenced in the project to be opened and no conversion rules are defined for the device, then the “Device Conversion” dialog opens. Specify here whether and how the converter should replace the previous device reference with a current one.
   - For replacement, the converter added the new device in the place of the old one in the device tree of the converted project.
6. **Library conversion**: if a library, for which no conversion rule has so far been defined, is referenced in the project to be opened, then the “Conversion of Library Reference” dialog opens. Specify here whether and how the converter should replace the existing library reference with a current one. If you select a library for which the project information is missing, then the “Enter Project Information” dialog opens in order to specify this information.

⇒ The converter loads the adapted project. Note: The redefined library references are to be found in the global Library Manager in the POUs view.

| **Compilaton** | The project has to be compilable without errors in CoDeSys V2.3. Note: CODESYS stills issues warnings in V3 when compiling. These are caused by implicit conversions, which can lead to a loss of information (for example through sign changes). CODESYS checks "case" statements against the switch variable: CASE USINT OF INT is not checked in CoDeSys V2.3, but it issues an error message when imported into V3. |
| **Controller configuration** | The "Controller Configuration" of a CoDeSys V2.3 project cannot be imported into V3. You have to recreate the device configuration and re-declare the variables used in the controller configuration. |
| **Network variables** | For network variables, CODESYS creates V3 GVL objects and imports the variable declarations. However, the network properties are not imported. See the description of the network variable exchange for this. |
| **Libraries** | All variables and constants that are used in a library also have to be declared in the library. It must be possible to compile the library in CoDeSys V2.3 without errors. |
| **Syntactic and semantic restrictions since CoDeSys V2.3** | ● FUNCTIONBLOCK is not a valid keyword instead of FUNCTION_BLOCK. ● TYPE (declaration of a structure) must be followed by a “:”. ● ARRAY initialization** must have parentheses. ● INIT is no longer supported (you have to replace this in the code by the Init method). ● In function calls it is no longer possible to mix explicit with implicit parameter assignments. Therefore the order of the parameter input assignments can be changed:
  
  ```
  fun(formal1 := actual1, actual2); // -> error message
  fun(formal2 := actual2, formal1 := actual1); // same semantics as the following line:
  fun(formal1 := actual1, formal2 := actual2);
  ```
  ● CoDeSys V2.3 pragmas are not converted. They produce an warning in V3.
  ● The TRUNC operator now converts to the data type DINT instead of INT. CODESYS automatically adds a corresponding type conversion for a CoDeSys V2.3 import. |
<p>| <strong>Visualization</strong> | | | |
| <strong>Placeholders and their replacement</strong> | Placeholders | VAR_INPUT | Usage | Replacement |
| | PLC_PRG.$Local Var$.aArr[0] | localVar: MyStruct; localVar.aArr[0] | localVar := PLC_PRG.myStructVar |</p>
<table>
<thead>
<tr>
<th>$Var$.aArr[0]</th>
<th>Var : MyStruct; Var.aArr[0]</th>
<th>Var := PLC_PRG.myStructVar</th>
</tr>
</thead>
<tbody>
<tr>
<td>PLC_PRG.myStructVar.aArr[$Index$]</td>
<td>Index : INT; PLC_PRG.myStructVar.aArr[Index]</td>
<td>Index := 0</td>
</tr>
</tbody>
</table>

### Problematic placeholders

- **Placeholders within a text:**
  - Text: $axle$-Axis
  - Correction: localVar : STRING;
  - Text: %s-Axis
  - Text variable: localVar

- **Placeholder describes only one part of a variable name:**
  - axis$axis$spur$spur$.fActPosition
  - Correction: Define only one placeholder for the axis$axis$spur$spur$ placeholder. axis_spur : MyFunctionBlock;
  - Then directly transfer the corresponding instance of the function block. axis_spur := PLC_PRG.axis1spur2;

- **Placeholder is replaced by an expression:**
  - $Expression$ -> PLC_PRG.var1 + PLC_PRG.var2
  - Correction: You must transfer the expression to an auxiliary variable and then transfer this auxiliary variable as an instance.

- **The placeholder describes a program name:** $Program$.bToggle -> PLC_PRG.bToggle
  - The converter cannot transfer this form of setting placeholders in V3. However, you will rarely use it in practice.

- **Placeholder is replaced by different types:**
  - $Var$
  - -> replacement 1: PLC_PRG.n (INT)
  - -> replacement 2: PLC_PRG.st (STRING)
  - Correction: Define two different placeholders in the interface for this.

- **The visualization is located in a library. You replace the placeholder later from any desired project when you use the visualization there.**
  - Correction: Here you have to replace the TYPE_NONE data types manually. However, there is also the possibility for you to integrate the library in a project and the placeholder is correctly replaced. If you now import this project, the data type is also determined correctly in the library.

### Non-importable elements:

- Trend, ActiveX – the import is not possible, because the implementation differs a great deal. In V3, a corresponding warning is issued and a corresponding manual reproduction is required.

### Programming languages:

- ST, IL, FBD:
  - No restrictions
LD: CODESYS imports function blocks with parallel branches in such a way that the part before the branch is repeated for each branch. This corresponds to the generated code that CoDeSys V2.3 creates for parallel branches.

SFC: ● Step variables explicitly declared by the user must be declared locally in the SFC editor. You may not declare them as VAR_INPUT, VAR_OUTPUT or VAR_INOUT, because CODESYS cannot automatically adapt the calls. Explanation: Steps no longer use Boolean variables for the management of the internal states in V3, but also structures of the type SFCStepType.
   ● Identifier: the following identifiers may not begin with an underscore character:
     – Names of IEC actions in the tree
     – Variables that are called in an IEC association list
     – Names of transitions that have been programmed out
   Explanation: In V3 the implicit variables that CODESYS creates for actions are given an underscore character as prefix. An invalid identifier with a double underscore character would result.

CFC: ● Large boxes: The layout of large boxes can lose quality due to an import. The boxes may overlap one another too much. (Correction planned).
   ● Macros: Macros cannot be imported. (Correction planned).

Chapter 6.4.1.21.2.24 “Object 'Project Information'” on page 2515
Chapter 6.4.1.21.4.5 “Dialog 'Device Conversion'” on page 2747
Chapter 6.4.1.21.4.3 “Dialog 'Library Reference Conversion'” on page 2746

6.4.1.3.4 Configuring a Project

General

You can configure your project using the following dialogs:

● “Project Settings”: Basic settings on the behaviour of editors and of the compiler, on user management etc.
   % Chapter 6.4.1.21.4.12 “Dialog 'Project Settings’” on page 2766
● “Project Information”: Adding of individual and tagging information to the project
   % Chapter 6.4.1.21.2.24 “Object 'Project Information’” on page 2515
● “Project Environment”: Defining which versions of the external and internal modules should be used, with the aim of achieving up-to-dateness and compatibility with each other.
   % Chapter 6.4.1.21.4.13 “Dialog 'Project Environment'” on page 2778
Retrieving and Editing Project Information

You can use the “Project Information” object to retrieve information about your project and the associated file, and edit certain information.

The object contains information about

- File attributes
- Meta-information, such as manufacturer, title, or author
- Properties with keys
- Statistics
- Licensing
- Signing: This way of signing translated libraries is deprecated, and for security reasons should only be used if compatibility with older versions is required. If this method is used, then later you can use a public key token to verify that the library was last signed by the library vendor. As a library vendor, it is therefore crucial that you make the public key used available to the customer, for example in the documentation.

CODESYS saves the project information as an object within the project. When you transfer a project to another system, the “Project Information” object is transferred with it. There is no need for a project archive.

You can use property keys to access the project information externally via function blocks. For a library project, you can also query information about the licensing.

Editing meta-information

1. Click “Project ➔ Project Information”.
   ⇨ The “Project Information” dialog opens.
2. Click the “Summary” tab.
3. Specify your data in the input fields (example: 0.0.0.1 in the “Version” input field).
   ⇨ CODESYS creates a property with a key for each given value and manages them on the “Properties” tab. For a library project, CODESYS still uses the properties and sorts later in the library repository.
   
   If you select the option for CODESYS to create a functions block for these properties, then you can access the properties programmatically.

Creating functions for accessing properties

1. Click “Project ➔ Project Information”.
   ⇨ The “Project Information” dialog opens.
2. Select the “Automatically generate 'Project Information' POU’s” option.

Example

<table>
<thead>
<tr>
<th>Requirement: The following property is defined.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Key = nProp1</td>
</tr>
<tr>
<td>Type= number</td>
</tr>
<tr>
<td>Value= 333</td>
</tr>
</tbody>
</table>

1. Select the “Automatically generate 'Project Information' POU’s” option.
2. Declare a property of the type DINT, for example showprop : DINT;.
3. Call the function `GetNumberProperty`: `showprop := GetNumberProperty("nProp1");`
   ⇒ You are granted access to the value in the application.

Note: The functions that are created with the “Automatically generate 'Project Information' POUs” option can be used only if the runtime supports the `WSTRING` data type. If this is not the case, then instead you can apply the “Automatically generate 'Library Information' POUs” option. You can use the functions created in this way at least in the application to access properties. These functions are not registered in the runtime.

### Licensing library projects
If your project is a library project, then you can activate the library licensing in use here. The CODESYS Security Key is a dongle.

- Requirement: The project is a library project.
  1. Click “Project ➔ Project Information”.
     ⇒ The “Project Information” dialog opens.
  2. Click the “Licensing” tab.
  3. Select the “Activate dongle licensing” option.
  4. Specify the dongle data in “Firm code”, “Product code”, “Activation URL”, and “Activation mail”.
     ⇒ The library is licensed.

### Creating private key files
1. Click “Project ➔ Project Information”.
2. Click the “Signing” tab.
3. Click the “Create Private Key File” button.
   ⇒ The “Create Private Key File” dialog opens.
4. Select a safe location, e.g. D:\for lib developers only\mycomp_libkey.libpk and exit the dialog with “Save”.

- Chapter 6.4.1.21.2.24 “Object ‘Project Information’” on page 2515

### Making project settings
You can configure settings that affect the behavior of CODESYS and that of certain editors in the “Project Settings” object. The settings are valid throughout the project and are applied immediately for active editors. You can also access the dialog boxes of the object with the command “Project ➔ Project Settings”.

CODESYS saves the project settings as an object directly in the project. If you then transfer a project to another system, the “Project Settings” object is also transferred with it, without a project archive being required.

6.4.1.4 Exporting and Transferring Projects

6.4.1.4.1 General

Export and import functions are available to you for the exchange of the data from CODESYS projects with other programs.

An exchange of CODESYS projects between CODESYS development systems takes place by way of a copy of the project file (*.project) or project archive (*.projectarchive).

See also

- Chapter 6.4.1.4.2 “Exporting and importing projects” on page 1815
- Chapter 6.4.1.4.3 “Transferring Projects” on page 1816

6.4.1.4.2 Exporting and importing projects

CODESYS offers commands for the export and import of objects to and from a file. Two possibilities are available to you here:

- Export to or import from a CODESYS XML file (*.export)
  This format is completely compatible with the CODESYS project format. The objects are saved in a machine-readable XML format.
- Export to or import from an XML file in the PLCopen format (*.xml)
  You can use this format to exchange information with other programs (for example program editors or documentation tools). PLCopen XML defines a subset of the elements known in CODESYS. 100% compatibility is thus not guaranteed.

Exporting projects

Requirement: A project is open in CODESYS.

1. Select the command “Project ➔ Export…” or “Project ➔ Export PLCopenXML”
2. Select the objects that you wish to export in the dialog box “Export” or “Export PLCopenXML”.
3. Click on “OK”.
4. Enter the file name and the location and click on “Save”.

Importing projects

Requirement: A project is open in CODESYS.
1. Select the command “Project ➔ Import…” or “Project ➔ Import PLCopenXML”.
2. In the dialog box “Import” or “Import PLCopenXML”, select the export file that you wish to import.
   ⇒ A dialog box opens and displays the objects in a tree structure, which can be inserted at this point.
3. Select the object in the object tree, under which the objects to be imported are to be inserted.
4. Select the objects and click “OK”.
   ⇒ The objects are added to the existing object tree.

● Chapter 6.4.1.21.3.5.27 “Command ‘Import PLCopenXML’” on page 2612
● Chapter 6.4.1.21.3.5.25 “Command ‘Import’” on page 2612

6.4.1.4.3 Transferring Projects

If you wish to transfer a project to another computer and connect from there to the same PLC, without an online change or download being required, observe the following points.

- Make sure that the project requires only fixed versions of libraries (exception: interface libraries), visualization profile and compiler.
- Make sure that the boot application is up to date.

Then create a project archive, which you unpack on the other computer.

Transferring a project to another system

Requirement: A project is open on computer “PC1” that you transfer to another computer “PC2” and reconnect from there to the same controller.

1. Make sure that only libraries with fixed versions are integrated in the project, with the exception of pure interface libraries. To do this, open the “Library Manager” and check all entries that have a "*" instead of a fixed version specification.
2. Make sure that a fixed compiler version is set in the project settings. To check, select “Project ➔ Project Settings” and the “Compiler Options” category.
3. Make sure that a fixed visualization profile is defined in the project settings. To check, select “Project ➔ Project Settings” and the “Visualization Profile” category.
4. Make sure that the application that is presently open is the same as that which is presently in use on the PLC. This means that the “boot application” must be identical to the project in the programming system. To check, look at the project name in the title bar of the programming system window: If an asterisk is displayed behind the name, this means that the project has been modified, but not yet saved. It is then possible that the application and boot application do not correspond!

In this case, first create a (new) boot application. It depends on the PLC and the application properties, whether this takes place automatically during the download of the application. For explicit creation, select the command “Online ➔ Create boot application”. Then execute a download with the help of the commands “Online ➔ Login” and “Online ➔ Load”.

After that, start the application on the controller with the command “Debug ➔ Start”.

⇒ Now the desired application is running on the PLC, to which you wish to reconnect from the same project later on PC2.
5. Generate a project archive: Select "File ➔ Project Archive ➔ Save/Send Archive". In the "Project Archive" dialog box, also select the following information:

- "Download information files"
- "Library profile"
- "Referenced devices"
- "Referenced libraries"
- "Visualization profile"

Save the project archive in a place that is accessible by PC2.

6. Log out from the controller: To do this, select "Online ➔ Logout". You can stop and restart the PLC without reservations, before you reconnect from PC2.

7. Extract the project archive to PC2: Select "File ➔ Project Archive ➔ Extract Archive" and open the archive saved above. In the "Extract Project Archive" dialog box, activate the same information as described above when generating the archive.

8. Open the project and log in to PLC "xy" again.

⇒ CODESYS does not demand an online change or download; the project runs.

6.4.1.5 Comparing projects
6.4.1.5.1 Introduction

You can compare the currently open project with another project – a reference project. The differences in contents, properties, or access rights are detected and shown in a comparison view.

Application example

How to compare Automation Builder projects for an AC500 V3 PLC is described in the application note Project Comparison - Compare AC500 Projects and Integrate the Differences.

Clicking “Project ➔ Compare” opens the “Project Compare” dialog for you to configure and run the comparison. Then the result is shown in the comparison view “Project Compare - Differences” where the objects are aligned in a tree structure. Objects that indicate differences from the respective reference object are identified by colors and symbols. This is how you detect whether or not the contents, properties, or access rights are different.

For differences in the contents, you can also open the detailed compare view “Project Compare - <object name> Differences” in order to zoom into the object. In the detailed compare view, the contents of the object and reference object are displayed or their source code aligned. The detected differences are marked. Previously opened views are not closed. In this way, you can have any number of comparison views open and read them, in addition to the project compare view.
You can accept the detected differences from the reference project into the current project. This is possible only from the reference project into the open project. To do this, you activate differences (for example in the code) that should be accepted in the current project with the commands \( \checkmark \), \( \checkmark \), or \( \checkmark \) in the active comparison view for accepting. These positions are highlighted in yellow. Make sure that any other open compare views are inactive (write-protected, read-only). Therefore, you can activate differences to be accepted in exactly one comparison view only. When exiting the active compare view, if you confirm that the differences that are activated for acceptance are actually accepted into the current project, then the current project is modified.

In order to exit the project comparison completely, close the project compare view.

### 6.4.1.5.2 Creating a comparison view

**Requirement:** You have made changes in your current project and wish, for example, to compare it with the last-saved version. In the meantime, for example, you have added further POUs, removed a POU, changed single lines of code or the object properties in function blocks.

1. Select the command “Project ➤ Compare”.
   - The “Project Comparison” dialog box opens.
2. Enter the path to the reference project, for example the path to the last-saved version of your current project.
3. Leave the activation of the comparison option “Ignore Spaces” as it is.
4. Click on “OK”.
   - The comparison view opens. Title: “Project Comparison – Differences”. The Device trees of the current project and the reference project are displayed alongside each other and the changed objects are marked in color.
5. Select an object marked in blue in the tree of the reference project (right). The current project no longer contains this object.
   - Click on “Accept Single”.
   - The object is added to the tree of the current project (left). The line has a yellow background. \( \checkmark \) appears in the middle column.
6. Select an object marked in green in the tree of the current project (left). The reference project does not contain this object.
   - Click on “Accept Single”.
   - The object is removed again from the tree of the current project (left). The line has a yellow background. \( \checkmark \) appears in the middle column.
7. If changes are detected in the content of an object that is contained in both the current project and the reference project, this is indicated by red lettering. You can then switch to the detailed comparison view for the object by double-clicking on the object.
8. Close the comparison view and answer the query whether the changes made are to be saved with “Yes”.
   - The changes become effective in the project.

### 6.4.1.5.3 Opening the detailed compare view

**Requirement:** For example, a user modified the code in a POU of the current project. You have performed the project comparison by clicking “Project ➤ Compare”. The project compare view shows this POU highlighted in red in the aligned in the project tree.

1. Double-click the line of the aligned POU versions.
   - The compare view switches to the detailed compare view of the POU. The modified code lines are highlighted in gray and written in red.
2. Click  
   ⇒ Code lines with changes (red) are extended by two lines: an line with insert (left, 
green) and a line with delete (right, blue).
3. Click  
   ⇒ The code line is marked again as modified.
4. Move the mouse pointer to the code line marked as modified and click ✔“Accept Single”.  
   ⇒ The code line from the reference project is activated for acceptance into the current 
project.
5. Click . 
   ⇒ The project compare view opens for the entire project. It is write-protected (read-only) 
to prevent you from activating differences for acceptance. The link highlighted in 
yellow above the tree view also indicates this.
6. Click the link: “Project compare view is read only because there are uncommitted changes 
in another view. Click here to switch to the modified view.” 
   ⇒ The detailed compare view opens again. The unconfirmed changes are highlighted in 
yellow.
7. Click × in the tab of the view and confirm that the changes should be saved.  
   ⇒ The detail project view is closed and the POU is overwritten. Now it corresponds to 
the POU of the reference project. The project view is active again so that you can 
continue working with project compare.

If you do not click the link, but click × instead to close the editor of the project 
compare view, then you will also confirm the acceptance of changes into the current project. The detail changes are accepted and then the project compare 
is closed completely.

6.4.1.6 Protecting and Saving Projects

6.4.1.6.1 Introduction

You can protect a project against unintentional changes by means of access and write protection. You can also provide it with read protection (knowledge protection).

Write protection:
The following options are available for providing the entire project with simple write protection:
- Select the “Open Read-Only” option when opening the project.
- You set the “Released” status in the “Project Information”.
- You select the “read-only” option in the properties of the project file in the local file system.

In order to protect only certain objects in a project against changes, or to allow access only to certain users, you can use a user and access rights management (see below). Some target devices similarly support user and rights management. The access of CODESYS to objects and files of the target device can thus be restricted.

However, write protection and access protection do not serve as protection of expertise of the POUs. Both CODESYS itself, automation platform plug-ins and persons with knowledge of the project file format can view or modify function blocks created with CODESYS.

Knowledge protection:
Knowledge protection of a project is done by encrypting the project file. Either with a project password, the CODESYS Security Key (dongle), or a certificate. We recommend protection by means of the key or the certificate because in this case no secret needs to be shared between authorized users. The desired type of project encryption is enabled in the project settings.

You can attain knowledge protection of a library by providing it as a target-system-independent "protected library" (*.compiled-library, *.compiled-library-v3). The library file no longer contains source code in this format, but only encrypted precompile context. The compiler is still able to interpret these data. Whether access by other CODESYS components or additional plug-ins is possible depends on their functionality and is to be observed in individual cases. Signing can increase protection even more.

Knowledge protection and copy protection of a boot application can be done by means of a runtime system dongle (simple or licensed) or encryption with a certificate. One of these options is enabled in the object properties of the application.

- Chapter 6.4.1.9.18 “Protecting an application” on page 1915

In CODESYS, projects and applications can be encrypted with certificates and signed in order to protect them from unauthorized access.

To do this, you can configure specific security settings for each individual user profile. These settings are always used automatically when the user works with CODESYS projects. Therefore, they do not have to be redone for each project. The general configuration of the security features for a user profile is done in the “Security Screen” view of CODESYS. See the individual instructions below.

You can also encrypt a project file or an application for download or online change directly with a certificate:
- User-independent encryption for the current project is configured in the “Security” category of the “Project Settings”.
- User-independent encryption of the application is configured in the “Properties” dialog of the application object.

**NOTICE!**
When you encrypt a project, an application, or online code with a certificate, you will always require the certificate with a private key in order to open the object again.

*If the CODESYS Security Agent add-on product is installed, then the “Security Screen” view provides an additional tab: “Devices”. This allows for the configuration of certificates for the encrypted communication with controllers.*

**Certificates, Windows Certificate Store**
All available certificates are located in the Windows Certificate Store (“certmgr”) on your computer. There are two types of keys:
- Certificates with private keys
  - for file decryption
  - for digital signatures
- Certificates with public keys
  - for file encryption
  - for verifying digital signatures
The local Windows Certificate Store is usually filled with certificates by the IT administrator of the computer. Certificates are either created using special tools or the creation is requested by a trusted certification authority (CA).

If you receive a certificate file that you need to install yourself in the Windows Certificate Store, then double-click the file in the store directory. Depending on the type (certificate with private or public key only), the appropriate import wizard will appear.

- Chapter 6.4.1.6.8 “Encrypting Projects with Certificates” on page 1829

User accounts with different rights can be managed in CODESYS. For each account you can define the actions with which the user can access a project object.

The user management is configured in the “Project settings” in the category “Users and Groups”.

Before the creation of users and groups, please note the following:

- Rights can only be assigned to user groups. Therefore, you must assign each user to a group.
- There is automatically always a group 'Everyone' and by default every user and every other group is initially a member of this group. Thus each user account is automatically equipped with at least the defined standard rights.
  You cannot delete the group 'Everyone', you can only rename it, and you cannot remove members from this group.
  Caution: by default "Everyone" does not have the right to change the current user, group and rights configuration!
- There is automatically always a group 'Owner' containing a user 'Owner'. From V3.5 only the 'Owner' initially has the right to change the current user, group and rights configuration in a new project! Hence, only 'Owner' can assign this right to another group.
  Initially the 'Owner' can log in with user name 'Owner' and an empty password. You can add further users to the group 'Owner' or remove users from it, but at least one member must be retained. Like 'Everyone', you cannot delete the group 'Owner' and it always possesses all access rights. This prevents a project from being rendered unusable by denying all access rights to all groups.
  You can rename both the group 'Owner' and the user 'Owner'.
- If the programming system or a project is restarted, no user is initially logged in to the project. However, the user can then log in via a certain user account with user name and password in order to obtain the access rights defined for the account.
- Each project has its own user management! Therefore, in order to obtain certain access rights to a library integrated into the project, for example, the user must explicitly log in to the library project.
  Users and groups defined in different projects are not the same, even if they have the same names.
- A user management in a project only makes sense if it is connected with corresponding rights assignment for the access to project and objects. The project rights are generally managed in the dialog box “Rights” of the “User Management”. You can also change the access rights to an individual project object on the “Access control” tab of the “Properties” of the object.
- There are standard menu commands under “Project ➔ User Management” for logging into and out of a project as a defined user. A password manager permits the management of the login data on your computer.

From V3.5 only the 'Owner' initially has the right to change the current user, group and rights configuration in a new project! Hence, only 'Owner' can assign this right to another group.
NOTICE!
CODESYS stores the user passwords inaccessibly. If you forget a password, the user account becomes unusable. If you forget the 'Owner' password, the entire project may become unusable!

Password manager
The password manager enables you to save login data records that you enter during the login procedures for projects. It is accessible via a button in the login dialog box and offers fast access to the login data currently required. This can be helpful, for example, if you are working in parallel on several library projects that are protected by different passwords.

The password manager itself is protected by an individual master password. If you wish to use the password manager for the first time, CODESYS requests you to define this password in the password manager configuration dialog box. CODESYS notes the master password until you terminate the current CODESYS session. You must always input the password when you wish to log in to the password manager for the first time during a new session, or after you have changed it.

- Chapter 6.4.1.6.7 “Logging in via User Account and Password Manager” on page 1827
- Chapter 6.4.1.11.4 “Handling of Device User Management” on page 1971

Rights management
Rights management for access to a project and objects in a project is necessary in order to make a user management meaningful.

The rights for a project are generally managed in the “Rights” editor of the “User Management”. You can also change the access rights to an individual project object on the “Access control” tab of the “Properties” dialog box of the object.

Before assigning rights, please observe the following:
- In a new project CODESYS always sets all rights for the execution of actions on objects with the default value 'allowed' (standard right). The only exception to this is the right to change the current user, group and rights configuration. Initially only the 'Owner' group has this right.
- If you are member of a group that is permitted to change rights, you can do this at any time for each right when working further on a project. You change a right by switching between 'allowed' and 'forbidden' or by resetting to the default.

Filing, saving
Provide the project file with the desired protection before saving it in the file system; see above. For a read-only project file you are given various options so that you can still save the file, depending on the type of write protection.

If the project is to be opened later in an older CODESYS version, it makes sense to save the project for precisely this version (file type), since CODESYS will also inform you immediately about possible losses of data in the course of saving it.

If you wish to save library projects, please observe the rules for the creation of libraries. Also consider the possibility of installing a library directly in a library repository.

If you wish to continue to use a project on another computer, it makes sense not only to save the project file, but also to create a project archive from all relevant auxiliary files.

You can make a setting so that a backup copy of this project is created each time the project is saved. In addition you can configure CODESYS so that projects are generally automatically saved at certain time intervals.

If you wish to keep projects in a source control system, observe the corresponding add-ons for CODESYS. For example, the link to SVN is supported.

6.4.1.6.2 Setting up write protection

A project can be protected against inadvertent changes by means of access and write protection. In addition, however, it can also be provided with read protection (know-how protection).

You have the following options:

Open the project with write protection

Requirement: No project is opened.

1. Select “File → Open Project”.
   - The dialog box “Open project” appears.
2. Select the project.
3. Click on the arrow button next to the “Open” button and select “Open read-only” from the menu.
   - CODESYS opens the project. At the top right in the main window a line appears “Project file cannot be saved...”. You must now select one of the offered options if you wish to save the project file.

- Chapter 6.4.1.3.2 “Opening a V3 Project” on page 1808

Providing projects with the attribute 'Released'

Requirement: project is opened.

1. Select “Project → Project Information”, then the “Summary” tab.
2. Activate the option “Released”, confirm with “OK”.
3. Save the project, for example with [Ctrl]+[S].
4. Open the project again with the command “File → Open Project”.
   - CODESYS opens the project. At the top right in the main window a line appears “Project file cannot be saved...”. You can now directly remove the status “Released” again via the offered option if you wish to save the project file.

- Chapter 6.4.1.21.2.24 “Object ‘Project Information’” on page 2515
Providing a project in the file system with the property 'Read-only'

Provide the project file in its local file system with the property attribute 'Read-only'.

⇒ If you had already opened the project and you now attempt to save it under the same name, a dialog box appears informing you about the existent write protection. This dialog box provides you with the following options:

You can save the project under another name or another path using the button “Save As…”.

You can deliberately save the project under the same name and path and thus overwrite the existing version in the file system using the button “Overwrite”.

You can abort the saving procedure using the “Cancel” button, for example to remove the write protection on the disk.

If you re-open the project, a line appears at the top right in the main window 'The project cannot not be saved...'. You must now select one of the offered options if you wish to save the project file.

● “General information about write and access protection” on page 1819

6.4.1.6.3 Assigning Passwords

Requirement: The project is open.

1. Click “Project ⇒ Project Settings” and then select the “Security” category.

⇒ The dialog “Project Settings / Security” opens.

2. Select the “Encryption” option.

⇒ The option fields “Password”, “Dongle”, and “Certificates” are selectable.

3. Select the option “Password”.

⇒ The input fields for the encryption password appear.

4. Enter the encryption password in the input field “New Password”.

5. Enter the encryption password for confirmation in the input field “Confirm new password”.

6. Click “OK”.

⇒ CODESYS saves the encryption password for the project. You must enter this password in order to be able to open the project again, even if it is to be loaded as a library reference.

CAUTION!

If you no longer know the encryption password, you can no longer open or restore the project!

See also

● “Chapter 6.4.1.6 “Protecting and Saving Projects” on page 1819
6.4.1.6.4 Protecting Projects Using a Dongle

Requirement: The project is opened and you have connected the CODESYS Security Key (dongle) to your computer.

1. Click “Project ➔ Project Settings” and then select the “Security” category.
   ⇨ The dialog “Project Settings / Security” opens.
2. Select the “Encryption” option.
   ⇨ The option fields “Password”, “Dongle”, and “Certificates” are selectable.
3. Select the option “Dongle”.
   ⇨ The dialog with the drop-down list “Registered Dongles” and the buttons “Add”, “Remove”, “Comment” and “Flash” opens.
4. Click “Add”.
   ⇨ The “Add Registered Dongle” dialog opens.
5. Select the CODESYS Security Key (dongle) from the “Dongle” drop-down list and optionally enter a comment.
6. Click “OK”.
   ⇨ The added dongle is listed in the list “Registered Dongles”.
7. Click “OK”.
   ⇨ The dongle is registered for the project. You must connect the dongle to your computer in order to be able to open the project again, even if it is to be loaded as a library reference.

NOTICE!
If the CODESYS Security Key registered for the project is lost, you can no longer open the project or restore it.

See also

- Chapter 6.4.1.6 “Protecting and Saving Projects” on page 1819

6.4.1.6.5 Setting up a user management

With the help of the integrated user management, user groups with different access rights and authorizations can be defined. Configuration and handling of the user management in Automation Builder and a AC500 V3 is described in the application note User Management with V3 - Configuration and Handling.

This concerns a user management for a CODESYS project file. Visualizations and devices can have their own user management.

The following guide describes how you can adapt the user management for the first time in a project. It deals with the definition of a user and a group to which he belongs.

Requirement: the project for which the user management is to be set up is opened. There is no adapted user configuration yet.
1. Select “Project Settings ➔ Users and Groups” and then the “Users” tab. The user Owner is already created by default.

2. Click on “Add”.
   ⇒ The dialog box “Add User” appears.

3. Enter a login name, for example 'Dev1', and a password. Leave the option “Activated” activated. Click on “OK”.
   ⇒ On creating a group for the first time, CODESYS now requests you to authenticate yourself to perform this action.
   
   In this case, enter 'Owner' as the “current user”. Do not enter a “password”, just click on “OK”.
   
   The user Dev1 appears in the list and is automatically a member of the group 'Everyone'.

4. Change to the tab “Groups”, in order to add the user to a new group.
   ⇒ The groups Everyone and Owner have already been created.

5. Click on “Add” in order to open the dialog box “Add Group”.

6. Specify at least one name for the new group, for example 'Developers'. Activate the checkbox next to the entry “User 'Dev1’” in the field “Members”. Click on “OK”.
   ⇒ The group “Developers” now appears with has user member 'Dev1'.

7. Switch to the “Users” tab.
   ⇒ The user “Dev1” now appears as a member of the groups 'Everyone' and 'Developers'.

You can take over the user management configuration from another project by using the “Export/Import” functions in the dialog box “Project Settings”, category “Users and Groups”.

● § Chapter 6.4.1.21.4.12.3 “Dialog ‘Project Settings’ - ‘Users and Groups’” on page 2768
● § Chapter 6.4.1.11.4 “Handling of Device User Management” on page 1971

6.4.1.6.6 Protecting Objects in the Project by Access Rights

Protection of individual objects by setting access rights in the “Rights” editor

1. Select “Project ➔ User Management ➔ Rights”
   ⇒ The window of the “Rights” editor opens. On the left you can see the action categories, on the right the currently existing user groups.

2. Expand the relevant action category and below it the action for which you wish to change a right.

3. Select the goal of the action in the “Actions” window. In the “Rights” window, select the group for which you would like to change the right. Multiple selection is possible.
   ⇒ The buttons in the symbol bar are active.
4. Click on the appropriate button in order to change the right of the group for the action on the target object.

⇒ CODESYS updates the symbol in front of the group according to the new right. The right is immediately effective.

See also
● Chapter 6.4.1.21.4.7 “Dialog ‘Permissions’” on page 2748

Protection of individual objects by setting access rights in the object properties

Here you can configure whether the members of a group have the right to view, edit or remove the object and to add/remove child objects to/from the object.

1. Select the object in the navigator tree.
2. In the context menu, select the command “Properties” and in the dialog box select the category “Access Control”.
3. In the table under “Groups, Actions and Permissions”, double-click on the symbol of the right that you wish to change.

⇒ A selection list of the possible rights appears: “Grant”, “Deny”, “Clear”.
4. Select the desired right and click on “Accept” or “OK”.

⇒ The right is immediately effective for the action and group. The symbol changes accordingly.

See also
● Chapter 6.4.1.21.4.11.7 “Dialog ‘Properties’ - ‘Access Control’” on page 2757

6.4.1.6.7 Logging in via User Account and Password Manager

Logging in to a project without using the password manager functions

Requirement: A project is open. You wish to log in as a defined user for this project or for a library integrated in it in order to edit one or the other with certain rights. You have the required login data for the respective project or the library.

1. Select “Project ➔ User Management ➔ User Logon”.

⇒ The dialog box “Logon” opens.
2. Select the project file from “Project/Library” and enter the required access data “User name” and “Password”.
3. Log in with “OK”.

⇒ If another user is already logged in, this user will automatically be logged out by the new login.

Setting a master password for the password manager

Requirement: A project is open. The dialog box “Login” is open for you to log in as a defined user for a project or for a library integrated in the project. You wish to use the password manager in order to save login data in it.
1. Select “Project ➔ User Management ➔ User Logon”.

2. In the dialog box “Logon”, click on the button [ ].
   - If you are working for the first time with the password manager, the dialog box “Password Manager Configuration” opens.

3. Enter a character string as the future master password. Confirm it in the second line and click on “OK”.
   - CODESYS notes the master password until you terminate the current CODESYS session. You must always input this password when you wish to log in to the password manager for the first time during a new session, or after you have changed it.

**NOTICE!**
If you have forgotten your master password, you no longer have any possibility to access the login data already saved! In this case you can only reset the password manager. After that you must start again to save passwords in the manager!

---

### Saving login data in the password manager

Requirement: A project is open. You wish to log in as a defined user for this project or for a library integrated in it in order to edit one or the other with certain rights. You have the required login data for the respective project or the library. These login data have not yet been saved in the password manager.

1. Select “Project ➔ User Management ➔ User Logon”, in order to open the “Logon” dialog box.

2. Select the project file from “Project/Library”.

3. Enter the user name and password for the project or the library.

4. Click on the button [ ].
   - If you are working for the first time with the password manager, you will be requested to define a master password. Refer to the above guide ‘Setting a master password for the password manager’ for this.

   When you call the password manager for the first time in this CODESYS session, you will be requested to enter the master password.

5. Enter the master password when requested to do so.
   - The password manager menu appears.

6. Select the option “Save the credentials locally on this computer”.
   - The login takes place. The data are saved in the password manager.

### Getting the login data from the password manager

Requirement: A project is open. You wish to log in as a defined user for this project or for a library integrated in it in order to edit one or the other with certain rights. The login data required for this are already saved in the password manager.

1. Select “Project ➔ User Management ➔ User Logon” in order to open the “Logon” dialog box.

2. Click on the button [ ].
   - If you are working for the first time with the password manager, you will be requested to define a master password. Refer to the above guide ‘Setting a master password for the password manager’ for this.

   When you call the password manager for the first time in this CODESYS session, you will be requested to enter the master password.
3. Enter the master password when requested to do so.
   ⇒ The password manager menu appears.

4. Select the appropriate entry “Use the stored credentials for <user name>”.
   ⇒ The login takes place automatically with the data read from the password manager.

Opening the password manager, changing the master password

Requirement: A project is open. You wish to open the password manager in order to view and/or edit the entries or to change the master password. You have already logged in once with the master password.

1. Select “Project ➔ User Management ➔ User Logon”, in order to open the “Logon” dialog box.

2. Click on the button .
   Select “Open the Password Manager”.
   ⇒ The password manager window opens.

3. Click on “Change Master Password” and make the change.

Logging out from the project

Requirement: A project is open. A user is logged in, which is recognizable by a name entry in the field “Current User” in the status bar.

⇒ Select “Project ➔ User Management ➔ User Logoff”. Alternatively, double-click on the field “Current User” in the status bar.

⇒ If the user is logged in to only one project, he will now be logged out without further interaction. “(nobody)” appears again in the field “Current User” in the status bar.

If the user is logged in to several projects, the dialog box “Logoff” opens. There, select the specific project or library project from which the user is to be logged out.

See also
● § “User management and password manager” on page 1821
● § Chapter 6.4.1.21.3.5.28 “Command ‘User management’ – ‘Log in User’” on page 2613
● § Chapter 6.4.1.6.5 “Setting up a user management” on page 1825

6.4.1.6.8 Encrypting Projects with Certificates

Configuring a certificate for project file encryption in a user profile

When a project is encrypted with a certificate, this certificate is needed for decryption to open the project. You can assign this certificate to specific user profiles. To do this, select the certificate from the Windows Certificate Store on the “User” tab of the “Security Screen”.

1. Double-click in the status bar or click “View ➔ Security Screen”.
   ⇒ The “Security Screen” view opens.

2. In the “User” tab, select the user profile for which the communication will be encrypted. By default, the specified user profile is the one you have used on your computer to sign into Windows. You can also create a new user profile with  .

3. Click the button in the “Project file decryption” area.
   ⇒ The “Certificate Selection” dialog opens.

4. Select a certificate with a private key from the list “Available certificates in the local Windows Certificate Store”. Certificates with a private key are identified by the symbol.

5. Click .
6. The certificate is added to the upper part of the dialog.

7. Click “OK” to confirm your selection.
   ⇨ The selected certificate is displayed in the “Security Screen” in the “Project file decryption” area.

Encrypting a project with a certificate

A project encrypted with a certificate in connection with a user management allows you to restrict access to the project.

1. Click “Project ➔ Project Settings” and then select the “Security” category.
   ⇨ The “Project Settings / Security” dialog opens.

2. Select the “Encryption” option.
   ⇨ The option fields “Password”, “Dongle”, and “Certificates” are available.

3. Select the “Encryption” option.
   ⇨ The certificates available for project encryption are listed in the lower part of the dialog. If no certificate has been specified yet, then click to select a relevant certificate in the “Certificate Selection” dialog. Then return to the “Project Settings” dialog. Now the certificate is specified for encryption. Now the project can only be edited on computers of users who also have the certificate for file decryption.

Deleting a certificate in the user profile

You delete the certificate in the “Security Screen” view, either directly on the “User” tab or in the “Certificate Selection” dialog. The deletion will follow in the other dialog.

- Dialog “Security Screen”, tab “User”, “Digital Signature”, or “Project Data Decryption”: Select a certificate and click [X].
- Dialog “Certificate Selection”: in the “Security Screen” dialog, click [X] on the “User” tab. In the upper field of the “Certificate Selection” dialog, select the certificate to be deleted and click [X].

Configuring a certificate for the digital signature in a user profile

To ensure that the project is not only encrypted with a certificate, but also that its authorship and integrity can be verified, you can add a signature to the project:

1. Double-click 📢 in the status bar or click “View ➔ Security Screen”.
   ⇨ The “Security Screen” view opens.

2. In the “User” tab, select the user profile for which the digital signature will be created. By default, the specified user profile is the one you have used on your computer to sign into Windows. You can also create a new user profile with [+].

3. Click the [+] button in the “Digital signature” area.
   ⇨ The “Certificate Selection” dialog opens.

4. Select a certificate with a private key from the list “Available certificates in the local Windows Certificate Store”. Certificates with a private key are identified by the [+] symbol.

5. Click [X].
   ⇨ The certificate is added to the upper part of the dialog.

6. Click “OK” to confirm your selection.
   ⇨ The selected certificate is displayed in the “Security Screen” in the “Digital signature” area.
6.4.1.6.9 Saving the Project

Saving a project under the same name

Requirement: The project is open. The project file is not write-protected.

Select “File ➔ Save”.

CODESYS saves the project file with the current project name, which appears in the title bar of the main window. If the project has been changed since it was last saved, then the project name is provided with an asterisk. If this is set in the CODESYS options in the category “Load and Save”, then a backup copy will also be made.

4. Select add-ons to extend the memory profile in order for the add-on data to be saved.

5. To save the memory profile permanently, click “Save Profile” and specify a name in the “Enter profile name” dialog box.

6. In the “Extend Profile” dialog box, select the “Use saved profile” option and click “Yes”.

CODESYS saves the project with the saved profile.

Saving a project under a different name or format

Requirement: The project is open.

1. Select “File ➔ Save Project as”.

The “Save Project” dialog box opens.

2. Select a storage location in the file system and the desired “File Type” (project file or library file) and the desired storage version. If you want to open the project later in an older version, then it makes sense to save for precisely this version, as you will then be informed immediately in the message window about possible data loss.

If the project file is not write protected, then CODESYS saves it in the selected path. Otherwise you will be informed how to proceed.

3. If the current project contains add-ons that are not available in the selected memory format, then the “Extend Profile” dialog box opens.

4. Select the add-ons to extend the memory profile in order for the add-on data to be saved.

5. To save the memory profile permanently, click “Save Profile” and specify a name in the “Enter profile name” dialog box.

6. In the “Extend Profile” dialog box, select the “Use saved profile” option and click “Yes”.

CODESYS saves the project with the saved profile.

Saving a read-only project

Requirement: A read-only project is open.

Select “File ➔ Save”.

If the write protection was assigned in CODESYS, then it will be displayed by a line in the top right corner of the main window. Depending on the current situation you will be offered one or more of the following actions so that you can still save the project:

- “Save project under a different file name on the disk”: Always appears and continues to the “Save File” dialog box, as for the “Save File as” command
- “Exit read-only mode”: Appears if the “Open read-only” option is selected when opening the project.
“Remove read-only attribute from the project on the disk”: Appears if the project file was provided with the ‘Read-only’ property in the local file system at the time of opening.

“Remove identification ‘Released’ in the project information”: Appears only if this attribute is currently set.

If the write protection was assigned outside of CODESYS in the properties of the project file in the file system, you will be offered the following options when you attempt to save under the same name and path:

1. “Save as”: You can save under a different name as with the “Save Project as” command.
2. “Overwrite”: The write protection is removed from the project file and the file is saved under its existing name.

1. Click on the line in the top right corner of the main window that indicates the write protection.

   ⇒ The current options with which you can still save the project appear in a selection menu.

2. Select one of the options offered and perform any necessary actions.
3. Click “File ⇒ Save” or “File ⇒ Save as”.

   ⇒ The project can be saved.

**Saving of the project automatically; creating a backup copy**

Requirement: The project is open.

1. Click “Tools ⇒ Options” (category “Load and Save”).

   ⇒ The “Load and Save” dialog box opens.

2. Activate the “Create backup files” option.

3. Activate the “Automatically save every … minutes” option and select a time interval.

4. Click “OK” to close the “Options” dialog box.

   ⇒ Each time the project is saved, CODESYS also creates a backup copy <project name>.backup.

   CODESYS saves the project automatically at the specified time interval to a file <project name>.autosave in the project directory. If you open the project again after the development system was closed irregularly, then this file will be offered to you as an alternative to the file last saved by the user.

**6.4.1.6.10 Saving/Sending the project archive**

You can configure a project archive and then save it in the file system or send it directly in an e-mail.

To send, follow the guide below as far as point 9. There, click on the button “Send” instead of “Save” in order to directly open the standard e-mail program, in which a new mail will automatically be created with the project archive file as an attachment.

**Requirement**: A project is opened.

1. Select “File ⇒ Project Archive ⇒ Save/Send Archive”.

   ⇒ The dialog box “Project Archive” appears.
2. Activate the checkbox next to each object that is to be saved in the archive.

In order to guarantee know-how protection, CODESYS will not automatically add unprotected libraries, not available as "compiled-library", to a project archive. If you explicitly select such a library in the list of additional files, you will get an appropriate warning.

3. If you want to pack further files in the archive, click on "Additional Files".
   ⇒ The dialog box "Additional Files" opens.

4. Click on "Add".

5. Select the files and click "Open".
   ⇒ The files are added to the list of additional files.

6. Click on "OK".

7. Click on "Comment".
   ⇒ The dialog box "Comment" opens.

8. Enter a comment and click on "OK".

9. Click on the button "Save".

10. Select a storage location and a file name and click on "Save".
    ⇒ The project archive is saved in the file directory.

6.4.1.6.11 Linking a project to the source control system

To link your CODESYS projects to a source control system, check the following option:

The Professional Version Control add-on provides the capability of directly linking to an SVN database. You can get the package at the CODESYS Store and install it with the help of the Package Manager.

Refer to the corresponding help when using Professional Version Control.

6.4.1.7 Localizing projects

You can display your project in different languages when you create and link localization files. The localization files correspond to those of the GNU gettext system. The format of the localization template files is *.pot (Portable Object Template), from which localization files *.po (Portable Object) are generated after translation.

The project can be localized in different languages. However, editing is possible only in the original version.
You configure which categories of text information are localized in the project. Then you export these texts into a translation template. This template is a file in *.pot format (example: project_1.pot). You produce localization files in the format *.po (example: de.po, en.po, or es.po), either automatically with a corresponding external translation tool or manually with a neutral text editor. You can import the *.po files back into CODESYS and use them for localization.

The commands for using project localization are located in the menu “Project ➔ Project localization”.

See also

● Chapter 6.4.1.21.3.5.16 “Command 'Project Localization' - 'Create Localization Template'” on page 2604

Generating localization templates

Requirement: A project is open.

1. Click “Project ➔ Project Localization ➔ Create Localization Template”.
   ⇨ The “Create Localization Template” dialog box opens.
2. Activate the categories of text information that should be included in the localization template.
3. “Position information” can also be included in the template. For each text to be translated, specify its location in the project. Select the positions to be displayed in the translation template: only the first position found, all positions found, or none.
4. Click the “Generate” button.
   ⇨ The dialog box opens for saving a *.pot file to the file system. Save the localization template. Then you can process the file in a translation tool and generate localization files <language>.po in the required languages.

Format of the localization template: file *.pot

In the first line, the text categories are specified that were selected for the translation when generating the template:
Example: #: Content:Comments|Identifiers|Names|Strings: All four categories were selected.
Then each text to be translated is segmented in the form as in the following example:

Example

```
#: D:\Projects\p1.project\Project_Settings:1
msgid "Project Settings"
msgstr ""
```
Line 1: Position information displayed as source code reference. Displayed only if this has been configured when generating the translation file.
Line 2: Untranslated text as entry msgid (example: msgid "Project settings").
Line 3: Placeholder for the translation: msgstr ". Between the single straight quotation marks, the translation in the *.po file must be inserted in the respective language.

Format of the localization file: *
<language>.po

You can generate a *.po file with a translation tool or create one using a neutral text editor based on the *.pot file. For this purpose, you could change the file extension from *.pot to *.po and edit the according to *.po standard format.

It is imperative to specify the language in the form of the usual culture abbreviation in the metadata of the file (example: "Language: de" for German. Then you insert the translations of the individual texts between the straight quotation marks for the msgstr "" entries.
Example

"Language: de\n"
#: Content:Names
#: D:\projects\pl.project\Project_Settings:1
msgid "Project Settings"
msgstr "Projekteinstellungen"

Importing localization files / localizing projects

Requirement: For your project, localization files (<language>.po) were generated based on the translation template *.pot. The project is open.

1. Click “Project ➔ Project Localization ➔ Manage Localizations”.
2. Click on the “Add” button.
   → The “Open Localization File” dialog box appears for selecting a *.po file from the file system.
3. Select one of the localization files (example: <project name>-de.po).
   → The dialog box closes and the affected texts appear in the project in the respective language. For example, if you specify the translation msgstr "Main program" for the POU name "PLC_PRG" in the English localization file, then the object name "Main program" appears in the device tree.
4. In the same way, you import the localization files for other language targets.

Switching localization, adding and removing localization files

Requirement: All required language are stored in the project by importing the corresponding *.po file. The project is open.

1. Click “Project ➔ Project Localization ➔ Manage Localization”.
   → The “Manage Localization” dialog box opens. All stored localization files *-<language>.po appear in “Files”, as well as the entry “<original version>”.
2. Select the desired language and click the “Switch Localization” button.
   → The project appears in the selected language. When you select “<original version>”, the project is displayed in the original, unlocalized version and it cannot be edited.

Optional: Defining a default localization, toggling localizations

Select one of the available localizations and activate the “Default Localization” option.
→ Click “Project ➔ Project Localization ➔ Toggle Localization” to toggle the localization between the default localization and original version. By default, this command is also available with the button on the toolbar.

▷ Chapter 6.4.1.21.3.5.17 “Command ’Project Localization’ - ’Manage Localizations’” on page 2605
▷ Chapter 6.4.1.21.3.5.18 “Command ’Project Localization’ - ’Toggle Localization’” on page 2606

6.4.1.8 Configuring I/O Links
6.4.1.8.1 General

With the help of device objects you can map hardware to be controlled in a tree structure in your CODESYS project. This makes the linking of hardware and application easy to handle.
In the configuration editors of the device objects, you can configure the settings for the communication between CODESYS and the controller, and above all for I/O mapping. The I/O mapping is the linking of the inputs and outputs of the controller with the variables of your application.

Access to control objects at runtime can be controlled, depending on the device, via an 'online user management', which you can edit – likewise depending on the device – in the CODESYS Development System. Moreover, communication with the controller depends on the current security settings.

See also

- Chapter 6.4.1.8.2 “Configuring Devices and I/O Mapping” on page 1836

- Chapter 6.4.1.11.4 “Handling of Device User Management” on page 1971

6.4.1.8.2 Configuring Devices and I/O Mapping

Configuring devices

You can configure the device objects inserted into the device tree in the associated device editor. The possibilities depend on the device description. The 'generic device editor' provides tabs that are supplemented as necessary by device-specific tabs.

Requirement: You have opened a standard project in whose device tree a standard PLC and below that a fieldbus device object are inserted.

1. Double-click the device object of the standard PLC in the device tree of your project.
   - The "<device name>" editor opens in the CODESYS main window. The "Communication Settings" tab is in the foreground. Change to the other tabs in order to make configuration settings for the controller. See the help pages for the generic device editor.

2. Double-click the fieldbus device object in the device tree of your project.
   - The "<fieldbus device name>" editor opens in the CODESYS main window. Specific tabs are available depending on the device. For the configuration options, see the help pages for the respective device editor. If the "Show generic device configuration views" option is selected in "Tools ➔ Options", in the "Device Editor" category, then see also the tabs contributed by the generic device editor.

- Chapter 6.4.1.21.2.8.2 “Generic device editor” on page 2427

General information about I/O mapping

Whether or not you can configure an I/O mapping to project variables or even to the entire function blocks depends on the type of device. Configuring an I/O map means linking input and output channels of the device with variables of the project. We also use the term 'mapping' for this.

Pay attention in general to the following for the mapping of inputs and outputs of a device to variables in CODESYS:

- You do not have write access to variables that are mapped to an input.
- You can map an existing variable to one input only.
- You can directly generate new global implicit variables in the I/O map and map them to a device channel.
- The memory layout of structures is specified by the device.
- You can change addresses and fix values in the I/O map.
- For each variable that is assigned to an I/O channel in the "I/O Mapping" dialog, you can cause 'force variables' to be generated during the compilation of the application (see further below). Using these variables you can, for example during the commissioning of a plant, force a value on the input or output via a visualization/HMI.
- Changes in the I/O map can be transferred to the controller with an online change.
● If a pointer to a device input is used, the access is considered to be a write access, for example `pTest := ADR(input);`. This leads to a compiler warning when the code is generated: "...invalid assignment target". If you require a construct of this kind, you have to first copy the input value `input` to a variable with write access.

● An I/O address can also be linked with a variable via the 'AT declaration' in the IEC code. Since a device configuration often changes again, however, we recommend that you make the assignments only in the device editor.

If you use the AT declaration, note the following:
- An AT declaration is permissible only with local or global variables, not with input or output variables of function blocks.
- Implicit 'force variables' for I/Os (see below) cannot be generated for AT declarations.
- If you use an AT declaration with structure variables or function block variables, all instances will access the same memory location. This then corresponds to the use of 'static variables' in classic programming languages such as 'C'.

NOTICE!
- If a pointer to a device input is used, then the access (for example, `pTest := ADR(input);`) applies as write access. This leads to a compiler warning when the code is generated: "...invalid assignment target".
- If you require a construct of this kind, you have to first copy the input value (`input`) to a variable with write access.

As an alternative, you can assign a variable to an address in the programming code using the AT declaration. In view of possible changes of the device configuration, however, we recommend that you make the assignments only in the device editor.

You can export the I/O mapping configuration of a device to a csv file or import it from such a file.

- § Chapter 6.4.1.21.3.5.37 “Command ‘Export Mappings to CSV’”” on page 2616
- § “Generating implicit variables for the forcing of I/Os” on page 1843

Linking a device input with an existing project variable ("mapping")

Requirement: A device that supports an I/O mapping configuration in CODESYS is inserted in the device tree of your project. On the "I/O Mapping" tab in the device editor you thus get a tabular display of the input and output channels of the device with specification of the addresses and data types.

NOTICE!
- Mapping 'too large' data types
  - If a variable of a data type that is larger than a byte is mapped to a byte address, the value of the variable will be truncated to byte size there. For monitoring the variable value in the "I/O Mapping" dialog, this means that, in the root element of the address, the value is displayed which the variable currently has in the project. The current individual bit values of the byte are displayed in succession in the bit elements below that, but this may not be sufficient for the entire variable value.
If a UNION is represented by I/O channels in the mapping dialog, it depends on the device whether mapping to the root element is also possible.

1. In a POU, declare, for example, a variable `xBool4` of the type `BOOL` with which you want to access an input of the target device from the application.

2. To open the device editor, double-click the device object in the device tree, and then the “<device name> I/O Mapping” tab.

3. Observe the “Variable” column with the display of the device input channels 🔄 and device output channels 📂, which can still be sorted by organizational nodes 🍃, depending on the device. We assume that there is a device input of the type `BYTE`. It is displayed with its individual bit addresses (bit channels) below the `BYTE` node.

4. Note: When mapping structured variables, the editor prevents you from entering both the structure variable (example: `%QB0`) and individual structure elements (example: `%QB0.1` and `%QB0.2`). Therefore, if there is a main entry with a subtree of bit channel entries in the mapping table, then the following applies: Then you can specify a variable either into the line of the main entry, or into the lines of the subelements (bit channels), but not into both.

You can now occupy either the entire channel with a variable of a suitable type OR its individual bit-channel addresses with suitable variables of the type `BOOL` or `BIT`. First of all, double-click a bit input channel in the “Variables” column.

⁻ An input field opens.

5. In order to place an existing variable on the channel, you have to enter the desired project variable with the complete path. Press 📝 to open the Input Assistant. Select, for example, the variable `Application.PLC_PRG.xBool4` declared in `PLC_PRG`.

⁻ The variable is inserted. The HMI symbol (❖) is displayed in the “Mapping” column. The address is now struck through. That does not mean that the address is no longer available, because values of existing variables are managed at another memory space. But: in order to avoid ambiguities when writing the values, you should nevertheless not occupy the address with a further variable, especially in the case of outputs.

Note: For compiler version V3.5 SP11 and higher, the initialization value of the variables is used automatically as the default value when mapping to an existing variable. You can edit the “Default value” field only if you map to a new created variable or if no mapping is specified. In older versions, users had to specify explicitly that the default value and initialization value were identical.
6. Delete the variable assignment again. Click the root of the channel, the BYTE node. Use the Input Assistant again to select the variable Application.PLC_PRG.byte_gotodevice.

The variable is inserted, all bit addresses of the main channel are struck through and you should not additionally occupy them.

![Image of channels table and device input mapping](image)

See also

- Chapter 6.4.1.21.2.8.12 “Tab '<device name> I/O Mapping’” on page 2444

In the following you will map a device output to a global implicit variable, which you recently create for this purpose directly in the “I/O Mapping” dialog.

The “I/O Mapping” dialog is thus a further place for declaring a global variable.

Requirement: A device that supports an I/O mapping configuration in CODESYS is inserted in the device tree of your project. On the “I/O Mapping” tab in the device editor you will thus see a tabular display of the input and output channels of the device with specification of the addresses and data types.

1. To open the device editor, double-click the device object in the device tree, and then the “<device name> I/O Mapping” tab.
2. Click in the mapping table on a channel entry in the “Variable” column in order to open an input field.
3. Enter a simple name (without '.') for a new variable (for example, myBool).

   → CODESYS creates the variable as an implicit global variable in the project and assigns it directly to the channel address. Therefore in this case the address does not appear struck through as in the case of mappings to existing variables.

   ![Variable Mapping Table]

   Linking a device with a function block instance

   If supported by the device, you can map entire function blocks to an input or output channel. This allows you to count the frequency of signal changes or scale a channel value for maintenance purposes, for example.

   Here you will map a device output channel to a function block. In this example, the block scales the channel output value.

   Requirement: A device with a digital output that supports FB mapping is linked in the project. There is a function block "Scale_Output_Int" with the following implementation. The attributes of the function block itself and before the output parameter with which the channel output is processed are important.

   ```
   {attribute 'io_function_block'}
   FUNCTION_BLOCK Scale_Output_Int
   VAR_INPUT
   iInput : INT;
   iNumerator : INT;
   iDenominator : INT := 1;
   iOffset : INT := 0;
   END_VAR
   VAR_OUTPUT
   {attribute 'io_function_block_mapping'}
   iOutput : INT;
   END_VAR
   VAR
   END_VAR
   IF iDenominator <> 0 THEN
   iOutput := TO_INT(TO_DINT(iInput) * TO_DINT(iNumerator) / TO_DINT(iDenominator)) + iOffset;
   END_IF
   ```

   → After clicking "Ok", the path of the function block parameter iOutput in the "Variable" is entered in the mapping dialog. The path comprises the application name, the device channel name, and the selected FB output (example: Appl.Out_4_Int_myScale_Output_Int_1.iOutput).

   ![Diagram]
3. Select the channel and click "Go to Instance".

⇒ The focus switches to the "<device name> IEC Objects" tab and the created entry for the new IEC object Out_4_Int_myScale_Output_Int_1. In this view in online mode, you see the current value of the parameter iOutput for the channel Out_4_Int scaled by the FB. You can also write and force the value as in other monitoring views.

See also
- Chapter 6.4.1.21.4.4 “Dialog 'Select Function Block’" on page 2746
- Chapter 6.4.1.21.2.8.12 “Tab <device name> I/O Mapping’" on page 2444
- Chapter 6.4.1.21.2.8.13 “Tab <device name> IEC Objects’" on page 2449
- Chapter 6.4.1.20.6.3.23 “Attribute ‘io_function_block’, ‘io_function_block_mapping’" on page 2293

You can change the address value of an entire channel (but not that of an individual subelement of the channel!) in the mapping table of the "<device name> I/O Mapping’" tab. This allows you to adapt the addressing to a specified machine configuration and to retain the address value even if the layout of the modules changes. By default, a change of the layout leads to an automatic adaptation of the address values.

Requirement: Your project has I/O mapping. See the corresponding sections of the help page above.

1. To open the device editor, double-click the device object in the device tree, and then the "<device name> I/O Mapping’" tab.

2. Click in the mapping table on a channel entry in the “Address’" column in order to open an input field. This is only possible for the 'root' address of a channel, not for a particular one of its subelements.

Therefore, change the top address entry of a channel in the table, for example from QB0 to QB1. Exit the input field.

⇒ The address value is changed. The symbol ☰ is displayed before the address. It indicates that the address is fixed. The addresses of the subelements of the channel are also changed accordingly. If you now change the position of the device object inside other device objects with input/output channels in the device tree, CODESYS does not adapt these addresses to the new order as would be the case without fixing.

3. In order to undo the manual change or fixing, open the input field of the address value again, delete the address entry and press the Enter key.

⇒ CODESYS resets the address and the subsequent addresses concerned to the values they had before the change and removes the symbol ☰.

See also
- Chapter 6.4.1.21.2.8.12 “Tab <device name> I/O Mapping’" on page 2444
- Chapter 6.4.1.20.4.12 “Addresses” on page 2231
Depending on the device that you link in the project, CODESYS updates the variables applied to its inputs and outputs in different ways. You can explicitly change the settings for this in the “I/O Mapping” dialog.

See also

- Chapter 6.4.1.21.2.8.12 “Tab ‘<device name> I/O Mapping’” on page 2444

### Configuration of the I/O variable update

**Requirement:** You have compiled an application with a device configuration containing I/O maps without error. The associated hardware and the bus system are running. You have connected to the controller by means of the “Online Login” command and have loaded and started the application.

1. Open the “I/O Mapping” tab of the PLC in the device editor. To open the editor, double-click the device object in the device tree.
   
   The mapping table now additionally contains the “Current Value” and “New Value” columns.

   If a structure variable is mapped to the ‘root’ element of an address\(^1\), CODESYS does not display a value in this line in online mode. If, for example, a DWORD variable is mapped to the address, however, the respective values are monitored both in the ‘root’ line and in the indented bit-channel lines below it.

   As a matter of principle, the field in the ‘root’ line always remains empty if the value would be composed of several subelements.

   \(^1\) ‘root’ = top element of this address in the Mapping dialog

2. Enter a certain variable value for an entry in the column “New value” and press \([F7]\) to force or \([Ctrl]+[F7]\) to write the value.

   As in the case of monitoring in the declaration editor or in watch lists, the forced variable value is displayed in the column “Current Value” with a prefixed red F-symbol or the written value.

### Monitoring of variables in the I/O map in online mode

**NOTICE!**

Inputs and outputs that the PLC code does NOT use are not read by the PLC in online mode, as a result of which the displayed value could be incorrect. The “Current Value” of the variables concerned is displayed with a gray background.

(1) Forced values on the controller
(2) Values not used on the controller, value shown in gray
During the commissioning of a plant or machine it may be necessary to 'force' the values applied at the inputs and outputs. If a device supports this you can cause special 'force variables' to be generated for this purpose and use them, for example, in an HMI visualization.

Requirement: The device supports the functionality. You have a project in which an I/O map is configured for the device and which contains a program object PLC_PRG.

1. Open the device editor, "PLC Settings" tab, by double-clicking the device object in the device tree.
2. Activate the option "Generate force variables for I/O mapping".

⇒ Two variables are created for each I/O channel in accordance with the following syntax, in the process of which spaces in the channel name are replaced by underscores:

```
<device name>_<channel name>_<IEC address>_Force of type BOOL for the activation and deactivation of forces.
<device name>_<channel name>_<IEC address>_Value of the data type of the channel for defining the value that you want to force on the channel.
```

These variables are available in the Input Assistant in the category "Variables"/"IoConfig_Globals_Force_Variables." You can use them in CODESYS in programming objects, in visualizations, in the symbol configuration, etc.

4. Open the function block "PLC_PRG", set the focus in the implementation part and press F2.

⇒ The Input Assistant opens. The variables are available in the category "Variables"/"IoConfig_Globals_Force_Variables" as described above.

A rising edge at the 'Force variable' input activates the forcing of the respective input or output with the value given by the 'Value variable'. A falling edge deactivates the forcing. Deactivation by resetting the 'Force' variable to FALSE is the requirement for being able to force a new value.

Take note of the following restrictions.

- Forcing via the implicit force variables is only possible for channels that are mapped in the "I/O Mapping" of the device to an existing or recently created variable.
- Forcing via the implicit force variables is not possible for unused inputs and outputs or those that are mapped to a variable via an AT declaration in an application program.
- I/O channels that you want to force via the mechanism have to be used by CODESYS in at least one task.
- CODESYS identifies forced inputs in the monitoring by the red Force symbol, but not forced input/outputs. The forced value is used only implicitly by the I/O driver for writing to the device.

I/O mapping in one dialog for multiple devices

There is a table that displays the I/O map of a device plus the I/O maps of all subelements inserted below it in the device tree. There you can edit the I/O maps in exactly the same way as in the individual mapping tables of the respective device editors.

Requirement: In the device tree of your project there are several PLCs inserted that each enable an I/O mapping configuration.

1. Select the root node of the device tree and click "Edit I/O Mapping" in the context menu.

⇒ The "Edit I/O Mapping" dialog opens, in which the I/O mapping configurations of all devices inserted in the project are displayed in a table. You can edit the entries in the same way as in the "I/O Mapping" dialog of the associated device editor.
2. Now select one of the control objects in the device tree and select the “Edit I/O Mapping” command once again in the context menu.
   ⇒ The “Edit I/O Mapping” dialog now shows only the I/O table for the I/O mapping configurations found in and under the selected object.

3. Set a desired “Filter” in the bar above the table or enter a variable name in the “Search for variable” field in order to see the use of this variable in the mapping.
   ⇒ The method of working in this window is the same as that described for the “<device name> I/O Mapping” tab.

6.4.1.9 Programming of Applications

6.4.1.9.1 Introduction
To create an application program which can be run on the controller, you fill POUs with declarations and implementation code (source code), establish the link from the controller I/Os to application variables, and configure the task assignment. After checking and debugging, the CODESYS compiler creates the application code which can be downloaded to the controller.

The programming of the application POUs is supported by the programming language editors and other features such as text lists, image pools, alarm configurations, pragmas, refactoring, and ready-to-use POUs from CODESYS Development System or libraries.

There are features for syntax checking and code analysis, for achieving data persistence, and for encrypting the application code which is downloaded to the controller.

6.4.1.9.2 Designating identifiers
Identifiers are names of variables and programming objects (for example programs, function blocks, and methods) and names of other objects of the application and project. There are rules that you must follow when assigning identifiers. Furthermore, there are also recommendations to help you designate uniform and expressive identifiers.

You designate variables identifiers in the variables declaration. These identifiers can be changed in the declaration section of the programming object. You designate identifiers for programming objects and other objects in the dialog box when adding the object. You can change the identifier of an existing object of the application or of the project in the properties dialog of the object. However, you cannot change the identifiers of objects that can be available only one time per application or project (for example, the “Library Manager” and “ImagePool” identifiers).

- Chapter 6.4.1.20.7 “Identifiers” on page 2327

6.4.1.9.3 UTF-8 Encoding
Basics
Applications in CODESYS can process a wide variety of characters, for example, to output an error message in various languages. Or to display visualizations in a language selected by the user which accepts user input in a wide variety of languages, characters, or symbols. If a comprehensive character set is not necessary, or if a project should not be changed, then strings which are encoded Latin-1 format can still be used.
Table 382: Character set tables

<table>
<thead>
<tr>
<th>Character set</th>
<th>Code page number</th>
<th>Description</th>
<th>Character encoding</th>
</tr>
</thead>
<tbody>
<tr>
<td>ASCII</td>

</tbody>
</table>
UTF-16

- Special Unicode
- Used in some operating systems (Windows, OS X) and programming languages (Java, .NET) for internal character representation.
- It should be noted that different computer architectures encode the 4-byte characters differently. Little endian byte order for UTF-16LE.

UTF-8

- Byte-oriented encoding format of Unicode characters.
- Most widespread
- Used in GNU/Linux and Unix operating systems, and in various Internet services (email, web, browser).
- Compatible with ASCII characters in the first 128 characters (0–127).

UTF-8 encoding is the encoding with the most comprehensive character set. Therefore, it is recommended that you enable UTF-8 encoding for new projects as well as for existing projects to be used in a new context.

Table 383: Project-wide encoding in CODESYS

<table>
<thead>
<tr>
<th>Data type</th>
<th>Compile option: UTF8 Encoding for STRING</th>
<th>Which encoding is used project-wide?</th>
</tr>
</thead>
<tbody>
<tr>
<td>STRING</td>
<td>Enabled</td>
<td>UTF-8</td>
</tr>
<tr>
<td></td>
<td>Disabled</td>
<td>Windows 1252 encoding (default Windows encoding)</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Latin-1</td>
</tr>
<tr>
<td>WSTRING</td>
<td>Enabled</td>
<td>UTF-16</td>
</tr>
<tr>
<td></td>
<td>Disabled</td>
<td>UTF-16</td>
</tr>
</tbody>
</table>

In CODESYS, the “STRING” data type can be encoded in Latin-1 or UTF-8 formats. The “WSTRING” data type always encodes its characters as Unicode in UTF-16.

Encoding a single string literal in UTF-8 format

Even if the project-wide encoding format is set to Latin-1, you can encode a single literal in UTF-8 format. To do this, add the “UTF8#” type prefix to the literal.

```
(attribute 'monitoring_encoding' := 'UTF-8')
strVarUtf8: STRING := UTF8#'你好,世界!ÜüÄäÖö';
```

For more information, see:
Constant: UTF8# String; % Chapter 6.4.1.20.4.6 “Constant: UTF8# String” on page 2222
Pragma Attribute: `monitoring_encoding`

**String conversion for UTF-8 encoding**

If you have enabled UTF-8 encoding project-wide, then you can use the string conversion functions as usual.

**String manipulation**

Use library functions to manipulate your strings.

If “STRING” variables should be manipulated, then an index access to a variable in ASCII format often leads to the desired result. It is better not to use this construct. It is not just a bad programming style. To make matters worse, with UTF-8 encoding, index access leads to unwanted string manipulation.

---

**UTF-8 encoding only for project-wide configuration**

A UTF-8 encoding is used if the project-wide compile option `UTF8 encoding for STRING` is enabled. Library functions and add-ons are then also oriented according to this setting.

If you use single UTF-8 encoded strings, then you have to make sure that they are interpreted correctly wherever they are used. For example, a string variable in the OPC server will be converted to UTF-8 before being transferred to a client if the setting is not selected. Values such as “UTF8#äöü” would then be misinterpreted. Similar problems can arise when outputting strings in the visualization.

---

### 6.4.1.9.4 Declaration of Variables

**General**

**Variable declaration: Where and how?**

You can declare variables at the following locations:

- Declaration part of a POU
  
  The “Declare Variable” dialog helps you with this.
  
  Hint: If you define a variable in the tabular declaration editor, the correct syntax is automatically produced.

- Declaration part of the GVL or NVL editor

- I/O mapping configuration of an I/O device object

**Syntax**

```plaintext
( <pragma> )*
<scope> ( <type qualifier> )?
  <identifier> (AT <address> )? : <data type> ( := <initial value> )? ;
END_VAR
```
### Declaration

See also
- % Chapter 6.4.1.9.4.2 “Using the declaration editor” on page 1851
- % Chapter 6.4.1.9.4.3 “Using the 'Declare variable' dialog box” on page 1852
- % Chapter 6.4.1.21.3.3.32 “Command 'Auto Declare’” on page 2572

### <pragma>

Pragma (none, one, or multiple)

**Note:** By adding a pragma, you can affect the behavior and the properties of one or more variables.

**See also**
- % Chapter 6.4.1.9.8 “Using Pragmas” on page 1888
- % Chapter 6.4.1.20.6 “Pragmas” on page 2269

### <scope>

**Scope**

- VAR
- VAR_CONFIG
  **Note:** If variables with incomplete address information are declared in function blocks (for example, AT %I*), then the variables in the variable declaration VAR_CONFIG have to be completely declared. You can access these variables in a local instance only when this is done.
- VAR_EXTERNAL
- VAR_GLOBAL
- VAR_INPUT
- VAR_INST
- VAR_IN_OUT
- VAR_OUTPUT
- VAR_STAT
- VAR_TEMP

**See also**

### Type Qualifier

<table>
<thead>
<tr>
<th>Type qualifier</th>
<th>See also</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONST</td>
<td>% Chapter 6.4.1.20.2.12 “Constant Variables - ‘CONSTANT’” on page 2121</td>
</tr>
<tr>
<td>RETAIN</td>
<td>% Chapter 6.4.1.20.2.14 “Retain Variable - RETAIN” on page 2124</td>
</tr>
<tr>
<td>PERSISTENT</td>
<td>% Chapter 6.4.1.20.2.13 “Persistent Variable - PERSISTENT” on page 2122</td>
</tr>
</tbody>
</table>

### Identifier

**Note:** The rules listed in the chapter "Identifiers" must be followed without exception when assigning an identifier. In addition, you will find recommendations for uniform naming.

See also

% Chapter 6.4.1.20.7 “Identifiers” on page 2327

### AT Address

Assignment of an address in the input, output, or flag memory range (I, Q, or M)

AT % <memory area prefix> ( <size prefix> )? <memory position>

**Example**

- AT %I* // Incomplete address
- AT %I7.5
- AT %IW0
- AT %QX7.5
- AT %MD48

See also

( ... )? Optional

( ... )* Optional repetition
Example

GVL

VAR_GLOBAL CONSTANT
  g_ciMAX_A : INT := 100;
  g_ciSPECIAL : INT := g_ciMAX_A - 10;
END_VAR

GVL_CONFIG

VAR_CONFIG
  // Generated instance path of variable at incomplete address
  PLC_PRG.fbDoItNow.XLOCINPUT AT %I*: BOOL := TRUE;
END_VAR

FB_DoIt (FB)

METHOD METH_Last : INT
  VAR_INPUT
    iVar : INT;
  END_VAR
  VAR_INST
    iLast : INT := 0;
  END_VAR
  METH_Last := iLast;
iLast := iVar;

FUNCTION_BLOCK FB_DoIt
  VAR_INPUT
    wInput AT %IW0 : WORD; (* Input variable *)
  END_VAR
  VAR_OUTPUT
    wOutput AT %QW0 : WORD; (* Output variable *)
  END_VAR
  VAR_IN_OUT
    aData_A : ARRAY[0..1] OF DATA_A; // Formal variable
  END_VAR
  VAR_EXTERNAL
    GVL.g_ciMAX_A : INT; // Declared in object GVL
  END_VAR
  VAR_STAT
    iNumberFBCalls : INT;
  END_VAR
  VAR
    iCounter: INT;
    xLocInput AT %I* : BOOL := TRUE; // VAR_CONFIG
  END_VAR

  iNumberFBCalls := iNumberFBCalls + 1;

PROGRAM PLC_PRG

VAR
  iLoop: INT;
iTest: INT;
fbDoItNow : FB_DoIt;
iTest_200 : INT;
aData_Now : ARRAY[0..1] OF DATA_A := [
  (iA_1 := 1, iA_2 := 10, dwA_3 := 16#00FF),
  (iA_1 := 2, iA_2 := 20, dwA_3 := 16#FF00)];
END_VAR

iTest := GVL.g_ciMAX_A;
iTest_200 := 2 * GVL.g_ciMAX_A;
fbDoItNow(aData_A := aData_Now);
FOR iLoop := 0 TO GVL.g_ciSPECIAL DO
  END_FOR
Variable initialization

The standard initialization value for all declarations is 0. In the declaration part you can also specify user-defined initialization values for each variable and each data type. The user-defined initialization starts with the assignment operator := and consists of any valid expression of the programming language ST (structured text). You thus define the initialization value with the help of constants, other variables or functions. If you use a variable, you must also initialize it.

Examples

```
VAR
  var1:INT := 12;                 // initialization
  x : INT := 13 + 8;              // initialization
  y : INT := x + fun(4);          // initialization
  z : POINTER TO INT := ADR(y);   // not described in
  // the standard IEC61131-3:
END_VAR
```

Notes on the order of initialization

> From compiler version 3.5.3.40, variables in a function block are initialized in the following order: firstly, all constants in accordance with the order of their declarations, then all other variables in accordance with the order of their declarations.

**NOTICE!**

> From compiler version 3.3.2.0, variables from global variable lists are always initialized before the local variables of a POU.

- § Chapter 6.4.1.20.6.3.16 “Attribute ‘global_init_slot’” on page 2285

Using the declaration editor

The declaration editor is used for declaring variables in the variable lists and POU's.

The declaration editor offers two possible views: textual and tabular.
in the dialog in “Tools ➔ Options ➔ Declaration Editor”, you define whether only the textual view or only the tabular view is available, or whether you can switch between both views by means of the buttons on the right side of the editor view.

If the declaration editor is used in conjunction with a programming language editor, it appears as the declaration part at the top of the window of a POU.

**Declaring in the textual declaration editor**

The behavior and the appearance of the textual editor are configured with the settings in the dialog “Tools ➔ Options ➔ Text Editor”. The settings concern colors, line numbers, tab widths, indentations etc. The usual Windows functions are available, plus the IntelliMouse functions if necessary.

Requirement: You have opened a programming object (POU, GVL or NVL) of a project. The textual declaration editor has the focus.

▷ Enter the variable declarations in correct syntax. With [F2] you can open the dialog “Input Assistant” for the selection of the data type or a keyword.

**Declaring in the tabular declaration editor**

In the tabular declaration editor, you add variable declarations to a table with the following columns: “Scope”, “Name”, “Address”, “Data type”, “Initialization”, “Comment”, and “Attributes” (pragmas).

Requirement: A programming object (POU or GVL) of a project is open. The tabular declaration editor has the focus.

1. Click the button in the declaration header or select the command “Insert” in the context menu.
   ⇒ CODESYS inserts a new row for a variable declaration and the input field for the variable name opens.
2. Specify a valid variable identifier.
3. Open the other fields of the declaration line as required with a double-click and select the desired specifications from the drop-down lists or with the help of the dialogs which appear.

See also
- Chapter 6.4.1.20.1.2 “Declaration Editor” on page 2047
- Chapter 6.4.1.21.3.3.32 “Command ‘Auto Declare’” on page 2572
- Chapter 6.4.1.9.4.3 “Using the 'Declare variable' dialog box” on page 1852
- Chapter 6.4.1.21.3.17.2 “Command ‘Edit Declaration Header’” on page 2717
- “Dialog ‘Input Assistant’ - Tab ’Categories’” on page 2575

**Using the ‘Declare variable’ dialog box**

Requirement: A programming object (POU or GVL) of a project is open.

1. Select the command “Edit ➔ Auto Declare”.
   ⇒ The dialog box “Auto Declare” opens.
2. Select the desired scope for the variable from the selection list “Scope”.
3. Enter a variable name in the input field “Name”.
4. Select the desired data type from the selection list “Type”.
5. If the initialization value deviates from the standard initialization value, enter an initialization value for the variable.
6. Complete your entries with a click on “OK”.
   ⇒ CODESYS lists the newly declared variable in the declaration part of your programming object.
With the help of pragmas in the declaration part you can affect the processing of the declaration by the compiler.

See also

- Chapter 6.4.1.21.3.3.32 “Command ‘Auto Declare” on page 2572
- Chapter 6.4.1.20.5 “Data Types” on page 2234
- Chapter 6.4.1.9.8 “Using Pragmas” on page 1888

Declaring arrays

Requirement: A programming object (POU or GVL) of a project is open.

1. Click “Edit ➔ Declare Variable”.
   ⇒ The “Declare Variable” dialog opens.
2. Select the desired scope for the array from the drop-down list “Scope”.
3. Enter an identifier for the array in the “Name” input field.
4. Click the arrow button (◇) next to the “Data type” input field and select the “Array Assistant” entry from the selection menu.
5. In the input fields “Dimension 1”, type in the lower and upper limit of the first dimension of the array (example: 1 and 3).
   ⇒ The field “Result” displays the 1st dimension of the array (example: ARRAY [1..3] OF ?).
6. In the input field “Basic type”, type in the data type of the array or use the “Input Assistant” (◇) or the “Array Assistant” (example: DINT).
   ⇒ The field “Result” displays the data type of the array now (example: ARRAY [1..3] OF DINT).
7. Define the second and third dimensions of the array according to steps 5 and 6 (example: Dimension 2: 1 and 4, Dimension 3: 1 and 2).
   ⇒ The “Result” field displays the array with the defined dimensions: ARRAY [1..3, 1..4, 1..2] OF DINT. The array consists of 3 * 4 * 2 = 24 elements.

In an array of variable length, declare the dimension limits with an asterisk placeholder (*). Arrays of variable length are permitted to be used only in VAR_IN_OUT declarations of function blocks, methods, or functions.

Example of a 2-dimensional array of variable length:

aiUnknownLengthData : ARRAY [*,*] OF INT;

8. Click “OK”.
   ⇒ In the dialog “Declare Variable” the field “Data type” displays the array.
9. To modify the initialization values of the array, click the arrow button (◇) next to the “Initialization value” input field.
   ⇒ The “Initialization Value” dialog opens.
10. Select the line of the array element whose initialization value you wish to modify. Example: Select array component [1, 1, 1].
11. Enter the desired initialization value in the input field below the list and click button “Use value on selected lines” (example: value 4).
   ⇒ CODESYS displays the changed initialization value of the selected line.
12. Click “OK”.
   ⇒ In the “Initialization value” field of the “Declare Variable” dialog, CODESYS displays the initialization values of the array (example: \{4, 23\(0\)\}).
13. You can optionally enter a “Comment” in the input field.
14. Click “OK” in order to conclude the declaration of the array.
   ⇒ CODESYS adds the declaration of the array to the declaration part of the programming object.

See also
● Chapter 6.4.1.21.3.3.32 “Command ‘Auto Declare’” on page 2572

Declaring global variables

Declaring global variables that are available within the application.

Requirement: A project is open.

1. In the Device tree of your project, select the application in which the global variables are to be valid.
2. Select the context menu command “Add Object ➔ Global Variable List”.
   ⇒ CODESYS inserts the “GVL” in the Device tree under the application and opens it in the editor.
3. Select the menu command “Edit ➔ Auto Declare”.
   ⇒ The dialog box “Auto Declare” opens.
4. In the selection list “Scope”, select the entry “VAR_GLOBAL”.
5. In the field “Name”, enter a name for the global variable.
6. Select a data type from the selection list “Type”.
7. If your variable is to have an initialization value other than the standard initialization value, click on ➔ next to the field “Initialization”.
   ⇒ The dialog box “Initialization Value” opens.
8. Double-click on the cell “Init value” of your variable and enter the desired valid value.
9. Click on “OK”.
   ⇒ The initialization value is displayed in the dialog box “Auto Declare”.
10. Activate one of the “Flags” if necessary.
11. Confirm your entries by clicking on the button “OK”.
   ⇒ CODESYS inserts the declared variable in the GVL.
   The global variable is available in the total application of your project.
Declaring global variables that are available in the entire project.

1. Select the menu command “View ➔ POU”.
   - The “POUs” view opens.
2. In the “POUs” view, select the uppermost node with the project name and select the context menu command “Add Object ➔ Global Variable List”.
   - CODESYS inserts the “GVL” in the “POUs” view and opens it in the editor.
3. Select the menu command “Edit ➔ Auto Declare”.
   - The dialog box “Auto Declare” opens.
4. In the selection list “Scope”, select the entry “VAR_GLOBAL”.
5. In the field “Name”, enter a name for the global variable.
6. Select a data type from the selection list “Type”.
7. If your variable is to have an initialization value other than the standard initialization value, enter it in the column “Initialization”.
8. Activate one of the “Flags” if necessary.
9. Confirm your entries by clicking on the button “OK”.
   - CODESYS inserts the declared variable in the GVL.
   The global variable is now available in the entire project.

- “Chapter 6.4.1.21.3.3.32 “Command ‘Auto Declare’” on page 2572

Using Task-Local Variables

Task-local variables are cycle-consistent. In a task cycle, they are written only by a defined task, while all other tasks have read-only access. It is taken into account that tasks can be interrupted by other tasks or can run simultaneously. The cycle consistency also applies above all if the application is running on a system with a multicore processor.

Therefore, using task local global variable lists is one way to automatically achieve a synchronization (by the compiler) when multiple tasks are processing the same variables. This is not the case when using ordinary GVLs. Multiple tasks can write simultaneously to ordinary GVL variables during a cycle.

However, it is imperative to note: The synchronization of task-local variables requires a relatively large amount of time and memory and is not always the best solution for every application. For this reason, see below for more detailed technical information and best practice guidance to help you make the right decision.

In the CODESYS project, the “Variable List (Task-Local)” object is available for defining task-local variables. Syntactically, it corresponds to a normal GVL, but also contains the information of the task that has write access to the variables. Then all variables in such a GVL are not changed by another task during a cycle of a task.

The next section contains a simple example that demonstrates the principle and functionality of task-local variables. It includes a writing program and a reading program. The programs run in different tasks, but they access the same data that is stored in a task-local global variable list so that they are processed cycle-consistently.
See below for Instructions on reprogramming this sample application.

Sample application

```plaintext
(* task-local GVL, object name: "Tasklocals" *)
VAR_GLOBAL
  g_diaData : ARRAY [0..99] OF DINT;
END_VAR

PROGRAM ReadData
VAR
  diIndex : DINT;
  bTest : BOOL;
  diValue : DINT;
END_VAR
bTest := TRUE;
diValue := TaskLocals.g_diaData[0];
FOR diIndex := 0 TO 99 DO
  bTest := bTest AND (diValue = Tasklocals.g_diaData[diIndex]);
END_FOR

PROGRAM WriteData
VAR
  diIndex : DINT;
  diCounter : DINT;
END_VAR
diCounter := diCounter + 1;
FOR diCounter := 0 TO 99 DO
  Tasklocals.g_diaData[diIndex] := diCounter;
END_FOR
```

The programs “WriteData” and “ReadData” are called by different tasks.

In the program WriteData, the array g_diaData is populated with values. The program ReadData tests whether or not the values of the array are as expected. If so, then the variable bTest yields the result TRUE.

The array data that is tested is declared via the variable g_diaData in the object Tasklocals of type Global Variable List (Task-Local). This synchronizes the data access in the compiler and guarantees cycle consistency, even when the accessing programs are called from different tasks. In the sample program, this means that the variable test is always TRUE in the program ReadData.

If the variable g_diaData were declared only as a global variable list in this example, then the test (the variable test in the program ReadData) would yield FALSE more often. In this case, this is because one of the two tasks in the FOR loop could be interrupted by the other task, or both tasks could run simultaneously (multicore controllers). And therefore the values could be changed by the writer while the reader reads the list.

**Constraints in the declaration**

- **NOTICE!**
  An online change of the application is not possible after changes in declarations in the list of task-local variables.

Note the following when declaring a global task-local variable list:
- Do not assign direct addresses by means of an AT declaration.
- Do not map to task-local variables in the controller configuration.
- Do not declare any pointers.
- Do not declare any references.
Do not instantiate any function blocks.
Do not declare any task-local variables as PERSISTENT and RETAIN at the same time.

The compiler reports write access in a task without write access as an error. However, not all write-access violations can be detected. The compiler can only assign static calls to a task. However, the call of a function block by means of a pointer or an interface is not assigned to a task, for example. As a result, any write access is not recorded there either. Moreover, pointers can point to task-local variables. Therefore, data can be manipulated in a read task. In this case, a runtime error is not issued. However, values that are modified by means of pointer access are not copied back in the shared reference of variables.

The variables are located at a different address in the list for each task. For read access, this means: ADR(variable name) yields a different address in each task.

The synchronization mechanism guarantees the following:

- Cycle consistency
- Freedom from locked states: A task never waits for an action from another task at any time.

With this method, however, no time can be determined when a reading task securely receives a copy of the writing task. Fundamentally, the copies can deviate. In the example above, it cannot be concluded that each written copy is processed one time by the reader. For example, the reading task can edit the same array over multiple cycles, or the contents of the array can skip one or more values between two cycles. Both can occur and have to be considered.

The writing task can be paused for one cycle between two accesses to the shared reference by each reading task. This means that when \( n \) reading tasks exist, the writing task can have \( n \) cycles of delay until the next update of the shared reference.

In each task, the writing task can prevent a reading task from getting a reading copy. As a result, no maximum number of cycles can be specified after which a reading task will definitely receive a copy.

In particular, this can become problematic if very slow running tasks are involved. Assuming a task runs only every hour and cannot access the task-local variables during this time, then the task works with a very old copy of the list. Therefore, it can be useful to insert a time stamp in the task-local variables so that the reading tasks can at least determine whether or not the list is up-to-date. You can set a time stamp as follows: Add a variable of type LTIME to the list of task-local variables and add the following code to the writing task, for example:

```
tasklocal.g_timestamp := LTIME();
```

Task-local variables are designed for the use case "Single writer - multiple readers". When you implement a code that is called by different tasks, using task-local variables is a significant advantage. For example, this is the case for the sample application appTasklocal as described above when it is extended by multiple reading tasks that all access the same array and use the same functions.

Task-local variables are especially useful on multicore systems. On these systems, you cannot synchronize tasks by priority. Then other synchronization mechanisms become necessary.

Do not use task-local variables when a reading task always has to work on the newest copy of the variable. Task-local variables are not suitable for this purpose.

A similar issue is the "Producer - Consumer" dilemma. This happens when a task produces data and another task processes the data. Choose another type of synchronization for this configuration. For example, the producer could use a flag to notify that a new date exists. Then the consumer can use a second flag to notify that it has processed its data and is waiting for new input. In this way, both can work on the same data. This removes the overhead for cyclic copying of data, and the consumer does not lose any data generated by the producer.

At runtime, multiple different copies of the task-local variable list may exist in memory. When monitoring a position, not all values can be displayed. Therefore, the values from the shared reference are displayed for inline monitoring, in the watch list, and in the visualization for a task-local variable.
When you set a breakpoint, the data of the task is displayed that ran to the breakpoint and was halted as a result. Meanwhile, the other tasks continue running. Under certain circumstances, the shared copy can be changed. In the context of the halted task, however, the values remain unchanged and are displayed as they are. You need to be aware of this.

For a list of task-local variables, the compiler creates a copy for each task, as well as a shared reference copy for all tasks. This creates a structure that contains the same variables as the list of task-local variables. Moreover, an array with this structure is created in which an array dimension is created for each task. As a result, an array element is indexed for each task. If a variable in the list is accessed now in the code, then the task-local copy of the list is actually accessed. Furthermore, it is determined in which task the block is currently running and the access is indexed accordingly.

For example, the line of code
```
diValue := TaskLocals.g_diaData[0];
```
from the above example is replaced by:
```
diValue := __TaskLocalVarsArray[__CURRENTTASK.TaskIndex].__g_diarr[0];
```

`__CURRENTTASK` is an operator that is available in CODESYS V3.5 SP13 and later in order to determine the current task index quickly.

At runtime, at the end of the writing task, the contents of the task-local list are written to the global list. For a reading task at the beginning, the contents of the shared reference are copied to the task-local copy. Therefore, for n tasks, there are n+1 copies of the list: One list serves as a shared reference and every task also has its own copy of the list.

A scheduler controls the time-based execution of multiple tasks and therefore also task switching. The strategy, which is tracked by the scheduler in order to control the allocation of the execution time, has the goal of preventing a task from being blocked. The synchronization mechanism is therefore optimized to the properties of task-local variables to prevent blocking states (lock states) and at no time does a task wait for the action of another task.

Synchronization strategy:
- As long as the writing task writes a copy back to the shared reference, none of the reading tasks gets a copy.
- As long as a reading task gets a copy of the common reference, the writing task does not write back a copy.

Aim: With a program `ReadData`, you want to access the same data that is written by a program `WriteData`. Both programs should run in different tasks. You make the data available in a task-local variable list so that it is processed automatically in a cycle-consistent manner.

**Background:**

**Technical implementation**

Instructions for creating the sample application as described above

1. Rename the application from Application to appTasklocal.
2. Below `appTasklocal`, add a program in ST named `ReadData`.
3. Below `appTasklocal`, add another program in ST named `WriteData`.
4. Below the object Task Configuration, rename the default task from MainTask to Read.
5. In the “Configuration” dialog of the task Read, click the “Add Call” button to call the program `ReadData`.
6. Below the “Task Configuration” object, add another task named Write, and add the call of the program `Write` to this task.
7. Select the application `appTasklocal` and add an object of type “Global Variable List (Task-Local)”.

Now there are two tasks `Write` and `Read` in the task configuration which call the programs `WriteData` and `ReadData`, respectively.

The “Add Global Variable List (Task-Local)” dialog opens.
8. Specify the name Tasklocals.
9. Select the Write task from the “Task with write access” list box.

⇒ The object structure for using task-local variables within an application is complete. Now you can code the objects as described in the example above.

6.4.1.9.5 Creating Source Code in IEC

General

Source code:

"Source code" is a term used for the implementation code, which you insert in the programming modules by using the appropriate programming language editors. The following programming module types are available for this purpose: POU (Program, Function, Function Block), Action, Method, Property, Interface.

Programming Language:

When creating a POU, you define, in which programming language the implementation should be inserted. Besides the IEC languages also CFC is available.

Programming Language:Editors:

You get a programming module editable in the corresponding programming language editor on a double-click on the programming module object. So, the module will appear either in the textual ST editor or in one of the graphical editors for FBD/LD/IL or CFC. Each editor consists of two windows: In the upper window you insert the declarations, in textual or tabular form, depending on the setting. In the lower window you insert the implementation code. The display and behaviour of each editor can be configured in the corresponding tab of the CODESYS “Options” dialog.

Regard the possibility to open a programming module for offline-editing even while the application is in online mode.
FBD/LD/IL

General

A combined editor enables programming in the languages FBD (function block diagram), LD (ladder diagram) and IL (instruction list).

The basic unit of the FBD and LD programming is a network. Each network contains a structure that can represent the following: a logical or arithmetic expression, the call of a POU (function, function block, program etc.), a jump or a return instruction. IL actually requires no networks. In CODESYS, however, an IL program also consists of at least one network in order to support conversion to FBD or LD. In view of this you should also divide an IL program meaningfully into networks.

See also

- Chapter 6.4.1.20.1.6.1 “FBD/LD/IL Editor" on page 2082

Function block diagram (FBD)

The function block diagram is a graphically oriented IEC 61131 programming language. It works with a list of networks, where each network contains a structure that can contain logical and arithmetic expressions, calls of function blocks, a jump or a return instruction.

Boxes familiar from boolean algebra are used here. Boxes and variables are connected by connecting lines. The signal flow in the network runs from left to right. The signal flow in the editor runs from top to bottom, starting with network 1.

Example

CFC is also a programming language based on the same principle as FBD, but with the following differences:

- The CFC editor is not network-oriented.
- You can freely place the elements in the CFC editor.
- Direct insertion of feedbacks is possible.
- The order of execution is determined by a list of currently inserted elements, which you can change.

- Chapter 6.4.1.9.5.3 “Continuous Function Chart (CFC)” on page 1866

Ladder diagram (LD)

The ladder diagram (LD) is a graphically oriented programming language that approximates an electrical circuit diagram. On the one hand the ladder diagram is suitable for designing logical switching units, but on the other you can also create networks just as in FBD. Therefore you can use LD very well for controlling calls of other program blocks.
The ladder diagram consists of a series of networks. A network is bounded on the left side by a vertical line (bus bar). A network contains a circuit diagram of contacts, coils, optional boxes (POUs) and connecting lines. On the left side of a network there is a contact or a series of contacts that relay the ON or OFF state, which corresponds to the boolean values `TRUE` and `FALSE`, from left to right. A boolean variable is associated with each contact. If this variable is `TRUE`, the status is relayed from left to right via the connection line. Otherwise OFF is relayed. Thus the coil(s) in the right part of the network receive(s) the value ON and OFF coming from the left and the value `TRUE` or `FALSE` is written accordingly into the boolean variable assigned to them.

If the elements are connected in series, this means an AND operation. If they are connected in parallel, this means an OR operation. A line through an element means a negation of the element. The negation of an input or an output is indicated by a circle symbol.

IEC 61131-3 defines a complete LD command set, consisting of different types of contacts and coils. Contacts conduct the current (according to their type) from left to right. Coils store the incoming value. Contacts and coils are assigned to boolean variables. You can supplement an LD network by jumps, returns, labels and comments.

See also
- Chapter 6.4.1.9.5.2.3 “Programming ladder diagrams (LD)” on page 1864
- Chapter 6.4.1.21.3.14 “Menu ‘FBD/LD/IL’” on page 2700 (Befehle)

The instruction list is an assembler-like IEC 61131-compliant programming language. It supports accumulator-based programming.

An instruction list (IL) consists of a series of instructions. Each instruction starts in a new line and contains an operator and, depending on the type of operation, one or more operands separated by commas. A label, followed by a colon, can be placed in front of an instruction. It serves the identification of the instruction and you can use the label as a jump destination. A comment must be the last element in a line. Empty lines can be inserted between instructions.

All IEC 61131-3 operators are supported, as are multiple inputs, multiple outputs, negations, comments, set/reset of outputs and conditional/unconditional jumps.

Each instruction is based primarily on the loading of values into the accumulator (LD instruction). After that the corresponding operation is executed with the parameter from the accumulator. The result of the operation is written again into the accumulator, from where you should store it purposefully with the help of an ST instruction.

The instruction list supports comparison operators (EQ, GT, LT, GE, LE, NE) and jumps for programming of conditional executions or loops. Jumps can be unconditional (JMP) or conditional (JMPC / JMPCN). In the case of conditional jumps, a check is performed as to whether the value in the accumulator is `TRUE` or `FALSE`.

IEC 61131-3 defines a complete LD command set, consisting of different types of contacts and coils. Contacts conduct the current (according to their type) from left to right. Coils store the incoming value. Contacts and coils are assigned to boolean variables. You can supplement an LD network by jumps, returns, labels and comments.

Programming function block diagrams (FBD)

Creating a POU in the function block diagram (FBD) implementation language

1. Select an application in the device tree.
2. Select the command “Project ➔ Add Object ➔ POU”.
   ➔ The dialog box “Add POU” opens.
3. Enter a name and select the implementation language “Function Block Diagram (FBD)”.
   Click on “Add”.
   ➔ The POU is added to the device tree and opened in the editor. It consists of the declaration editor in the top part and the implementation part with an empty network in the lower part. The view “ToolsBox” is also automatically opened, in which the suitable elements, operators and function blocks for FBD programming are available.

See also

● Chapter 6.4.1.9.5.2.4 “Programming in instruction list (IL)” on page 1865
● Chapter 6.4.1.20.1.6.3 “Modifiers and operators in IL” on page 2087

Programming a network

1. Click inside the automatically inserted empty network in the implementation part.
   ➔ The network is given a yellow background and the area at the left-hand side with the network number is given a red background.
2. Open the context menu with the right mouse button.
   ⇒ You obtain amongst other things the insert commands for the elements that can be inserted at this point.
3. Insert the elements required for your programming using the menu commands or by dragging in the elements from the toolbox.
4. For example, select the command “Insert Assignment”.
   ⇒ An assignment line is inserted. In each case three question marks stand for assignment source and assignment target.
5. Select the question marks and replace them with the desired variable. Input assistance is available for this purpose.
6. Move the cursor over the assignment line.
   ⇒ The possible insertion positions for further elements are displayed as grey diamonds. A click on a diamond selects that position and the suitable insert commands are once again available.
7. Alternatively, you can drag an element with the mouse from the toolbox into the network. For example, click in the tool box on the box element, keep the mouse button pressed and move the cursor over the network.
   ⇒ Each possible insertion position lights up green.
8. Release the mouse button in order to insert the box.
   ⇒ The box is displayed in the network. The type of box on the inside and the instance name above the box, which is required in the case of a function block, are still kept free with three question marks.
9. Select the string ?? inside the box and replace it with the name of the box. Input assistance is available for this purpose.
   ⇒ The inputs and outputs of the selected box are displayed. They are still kept free with question marks, as is the instance name in the case of a function block.

- Chapter 6.4.1.9.5.2 “FBD/LD/IL” on page 1860

Programming line branches (subnetworks)

1. In the implementation part of your POU, insert a new network using the command “FBD/LD/IL Insert network” or drag it in from the tool box.
2. For example, drag an “ADD” operator into the empty network and replace the characters ?? with two variables of the type INT.
3. Drag the element “Branch” from the tool box into your implementation and release the mouse button at the green insertion position directly at the output of the operator.
   ⇒ The line branch splits the processing line at the output of the operator box into 2 subnetworks.
4. Further FBD elements and also further line branches can now be added to each of the two subnetworks.

See also

- Chapter 6.4.1.20.1.6.4.9 “FBD/LD/IL element ‘Branch’” on page 2093

Programming ladder diagrams (LD)

Creating a POU in the ladder diagram (LD) implementation language

1. Select the application in the Device tree.
2. Select the command “Project ➔ Add Object ➔ POU”.
   ⇒ The dialog box “Add POU” opens.
3. Enter a name and select the implementation language “Ladder Diagram (LD)”.
   Click on “Add”.
   ⇒ CODESYS adds the POU to the Device tree and opens it in the editor. An empty network is inserted in the implementation part. The empty network is bounded on the left by a vertical line, which represents a bus bar. The view “ToolBox” is also automatically opened, in which the suitable elements, operators and function blocks for LD programming are available.

Adding a contact and a function block (TON)

☐ Requirement: a POU with the implementation language LD is opened in the editor and an empty network is inserted.

1. Click on the category “Ladder Elements” in the view “ToolBox”
2. Click on the “Contact” element, drag it into your network and release the mouse button at the insertion position “Start here”.
   ⇒ The contact is added on the left in the network directly against the vertical line.
3. Click on ??? and enter the identifier of a boolean variable. The input assistant is also available to you for this.
4. Click on the category “Function Blocks” in the view “ToolBox” and drag the function block “TON” onto an insertion position on the connecting line to the right of the inserted contact.
   ⇒ CODESYS inserts the box “TON” to the right of the contact. The contact is connected with the input IN of the TON box.
5. Enter a time constant at the input PT, for example T#3s.
   ⇒ If the variable of your contact goes TRUE, then the input IN of the TON box also goes TRUE. The TON box forwards the value TRUE to the output Q with a switch-on delay of T#3s, for example.

Inserting a closed line branch

Requirement: a POU with the implementation language LD is opened in the editor and an empty network is inserted.

1. Click inside the empty network and select the command “FBD/LD/IL ➔ Insert Contact”.
2. Select the connecting line to the left of the contact and select the command “FBD/LD/IL ➔ Set Branch Start Point”.
   ⇒ The starting point on the connecting line is marked by a red rectangle. CODESYS marks all possible end points of the branch with a blue rectangle.

See also

- Chapter 6.4.1.20.1.6.1 “FBD/LD/IL Editor” on page 2082
3. Click on a blue rectangle in order to set the end point of your closed line branch.

   CODESYS inserts the line branch between the starting and end points. The program flow will go through both branches up to the end point.

   If you insert the line branch at a box instead of at a contact, the box will only be called if none of the other branches is **TRUE**.

---

**Programming in instruction list (IL)**

```
If necessary, IL can be activated in the CODESYS options.
```

---

**Creating POUs in the instruction list (IL) implementation language**

1. Select the application in the device tree.
2. Click “Project ➔ Add Object ➔ POU”.
   - The “Add POU” dialog opens.
3. Enter a name and select the implementation language “Instruction List (IL)”. Click “Add”.
   - CODESYS adds the POU to the device tree and opens it in the editor. A network is already inserted in the implementation part.

**Programming networks (example: ADD operation)**

Requirement: A POU (IL) is opened in the editor and possesses an empty network.

1. Click the line marked in color in the 1st column and enter the operator **LD**.
2. Press the [Tab] key.
   - The cursor jumps to the 2nd column
3. Enter the first summand of your ADD operation, for example 6.
4. Press [Ctrl]+[Enter] or select the command “FBD/LD/IL ➔ Insert IL Line After”.
   - CODESYS inserts a new instruction line. The first column of this line has the focus.
5. Enter **ADD** and press [Tab].
6. Enter the second summand of your ADD operation, for example 12.
7. Press [Ctrl]+[Enter]
8. Enter the operator **ST** and press [Tab].
9. Specify a variable of the data type INT, for example iVar.
   ⇒ The result – 16 in the example – is stored in the iVar.

Calling function blocks

Requirement: A POU (IL) is opened in the editor and possesses an empty network. A variable of the data type <function block> is declared in the declaration part (example: Cl:CTU;).

1. Click the line marked in color in the 1st column and select the command “FBD/LD/IL è Insert Box”.
   ⇒ The input assistant opens.

2. Select the desired function block in the category “Function Blocks” or “Boxes”, for example the “CTU” counter from the “Standard” library, and click “OK”.
   ⇒ CODESYS inserts the selected function block “CTU” as follows:

3. Replace the strings ??? with the variable name and the values or variables for the inputs/outputs of the function block.

4. As an alternative to inserting the function block via the input assistant, you can directly enter the call in the editor as shown in the picture at step 4.

See also
- Chapter 6.4.1.20.1.6.1 “FBD/LD/IL Editor” on page 2082
- Chapter 6.4.1.20.1.6.3 “Modifiers and operators in IL” on page 2087

Continuous Function Chart (CFC)

General

The “Continuous Function Chart (CFC)” implementation language is a graphical programming language which extends the standard languages of IEC 61131-3.

You can graphically program a system by means of a POU in CFC. You insert elements and position them freely. You insert connections and wire the elements to a network so that a well-structured function block diagram is created. You can also insert feedback. You can read function block diagrams like an circuit diagram or a block diagram.

The execution order of a function block diagram is based on data flow. Moreover, a POU can process multiple data flows. Then the data flows do not have any common data. In the editor, multiple networks do not have any connections to each other.

On the other hand, POUs in FBD, LD, or IL have a network-based execution order.
Unfortunately, it is not possible to switch a POU between the “Continuous Function Chart (CFC) - page-oriented” and “Continuous Function Chart (CFC)” implementation languages.

The "Continuous Function Chart (CFC) - page-oriented" implementation language is a variant of CFC. The difference from simple CFC is that the code can be distributed on any number of "pages" in the editor. In this way, you can create extensive function block diagrams which are still easy to print.

Each page has edge areas where you arrange the connections to the other pages.

- Creating pages
- Setting the page size
- Copying and inserting pages in the page navigator
- Copying the implementation of a POU in the CFC implementation language and inserting into a page
- Well-structured and space-saving arranging of inputs, outputs, and connection marks in the border areas
- Connection over pages with connection marks

▶ Chapter 6.4.1.20.1.7.2 “CFC Editor” on page 2098
▶ Chapter 6.4.1.20.1.7.3 “CFC editor, page-oriented” on page 2101
▶ Chapter 6.4.1.21.3.13 “Menu ‘CFC’” on page 2685
▶ Chapter 6.4.1.21.4.11.14 “Dialog ‘Properties’ - ‘CFC Execution Order’” on page 2761

Automatic Execution Order by Data Flow

The execution order in POUs is uniquely determined in text-based and network-based editors. In the CFC editor, however, you can position the elements freely, so the execution order is initially not unique. For this reason, CODESYS determines the execution order by data flow and, in the case of multiple networks, by the topological position of the elements. The elements are sorted from top to bottom and left to right. Now the execution order is unique and makes sure that the POU is processed while optimized by time and by cycle.

You can get information about the chronological order of the elements in the chart and temporarily display the execution order. When you program networks with feedback you can define an element as the starting point in the feedback loop.

You can also explicitly edit the processing order in a CFC object if necessary. To do this, switch the “Auto Data Flow Mode” property of the CFC object to “Explicit Execution Order Mode”. In this mode, you have the option of editing the execution order by means of menu commands.

Before CODESYS Development System V3.5 SP15, you had to define the execution order explicitly for each POU. The was no mode switching.

Data flow

In general, data flow is described as the chronological order in which data is read or written when and how in which programming objects. A POU can process any number of data flows, which can also be executed independently of each other.

Displaying the execution order

By default, the execution order of a CFC object is determined automatically. The “Auto Data Flow Mode” property is selected for this. You can temporarily display the automatically determined execution order in the CFC editor.
1. Create a new project using the “Standard project” template and specify the name Minimal for example.

2. Extend the application with the function block FB_DoIt in the “ST” implementation language with inputs and outputs.

   ```
   FUNCTION_BLOCK FB_DoIt
   VAR_INPUT
   iAlfa : INT;
   iBravo: INT;
   sCharlie : STRING := 'Charlie';
   xItem : BOOL;
   END_VAR
   VAR_OUTPUT
   iResult : INT;
   sResult : STRING;
   xResult : BOOL;
   END_VAR
   VAR
   END_VAR
   iResult := iAlfa + iBravo;
   IF xItem = TRUE THEN
   xResult := TRUE;
   END_IF
   ```

3. Create the function block ExecuteCFC in the “CFC” implementation language.

   ```
   PROGRAM ExecuteCFC
   VAR
   fb_DoIt_0: FB_DoIt;
   fb_DoIt_1: FB_DoIt;
   iFinal_1: INT;
   iFinal_0: INT;
   xFinal: BOOL;
   END_VAR
   ```

Recently created programming objects in CFC have the Auto Data Flow Mode selected. The execution order of the programming object is optimally defined internally.
4. Click “CFC ➔ Execution Order ➔ Display Execution Order”.
   ⇒ The execution order of the object is shown. The boxes and inputs are numbered accordingly and reflect the chronological processing order. The numbering is hidden as soon as you click again in the CFC editor.

Determining the execution order in feedback networks

1. Create a CFC program with feedback.
   ⇒ The POU `PrgPositiveFeedback` counts.

   ```plaintext
   PROGRAM PrgPositiveFeedback
   VAR
     iResult: INT;
   END_VAR
   ```

2. Select an element within the feedback.
   ⇒ The selected element is highlighted in red.

3. Click “CFC ➔ Execution Order ➔ Set Start of Feedback”.
   ⇒ At run time, this POU is processed first. The start POU of the feedback is defined and decorated with the ▶ symbol. The execution order is resorted and the selected element gets the number 0. (This is the lowest number of the feedback.)

4. Select the start POU again.
5. Click “CFC ➔ Execution Order ➔ Set Start of Feedback”.  
   ⇒ The POU is not selected as the start POU.

   ![Diagram of ADD operation with numbers 1 and 1 connected to iResult]
   The execution order is defined internally.

6. Click “CFC ➔ Execution Order ➔ Display Execution Order”.  
   ⇒ The execution order by data flow is displayed.

   ![Diagram of ADD operation with numbers 0, 1, and 1 connected to iResult]
   The automatically defined execution order by data flow results in time- and cycle-optimized execution of the POU. You do not need any information about the internally managed execution order during the development process.

   In “Explicit Execution Order Mode”, it is your responsibility to adapt the execution order and to assess the consequences and impacts. This is another reason why the execution order is always displayed.

   You can change the automatically defined execution order of a CFC object explicitly when you select the “Explicit Execution Order Mode” option for the object.

   1. In the “Devices” or “POUs” view, select a CFC object.
   2. In the context menu, click “Properties”.
   3. Click the “CFC Execution Order” tab.  
      ⇒ The “Execution order” list box displays the currently selected mode.
   4. In the “Execution order” list box, select “Explicit Execution Order Mode”.
   5. Click “OK” to confirm the dialog.  
      ⇒ The Explicit Execution Order Mode property is selected. The networks are numbered in the CFC editor, and the following commands are provided in the “CFC ➔ Execution Order” menu for editing the execution order.
   6. Open a CFC object.
   7. Select a numbered element and click “CFC ➔ Execution Order ➔ Send to Front”.  
      ⇒ The execution order is resorted and the selected element has the number 0.

   See also
   - “CFC Editor” on page 2098
   - “CFC editor, page-oriented” on page 2101
   - “Menu ‘CFC’” on page 2685
   - “Dialog 'Properties' - 'CFC Execution Order’” on page 2761
Programming in the CFC editor

In the CFC editor, you can wire POUs to each other and create well-structured block diagrams. The editor supports you in the following ways:

- Programming with elements and connecting lines
- Dragging instances and variables to the editing area
- Auto-routing the connecting lines
- Automatic linking
- Fixing of connecting lines by control points
- Collision detection
- Input assistance for connection marks
- Forcing and writing of values in online mode
- Movement of selection using arrow keys
- Reduced display of a POU without disconnected pins

Inserting elements and wiring with connecting lines

1. Drag a “Box” element and an “Output” element into the editor.
2. Click the output of the “Box” element.
   - The output is marked with a red box.
3. Drag a connecting line from the box output of the “Box” element to the box input of the “Output” element.
   - The cursor symbol changes when it reaches the box input.
4. Release the left mouse button.
   - The output pin of the box is wired to the input pin of the output.

![Diagram of a CFC block diagram with an input and output connected by a NOT function.

You can also hold down the [Ctrl] key, select each pin, and then right-click “Connected Selected Pins”.

Calling of instances

1. Create a new project using the standard template and specify the name First for example.
   - The project First.project is created.
2. Extend the application with the function block FB_DoIt in the “ST” implementation language with inputs and outputs.

FUNCTION_BLOCK FB_DoIt
VAR_INPUT
  iAlfa : INT;
  iBravo: INT;
  sCharlie : STRING := 'Charlie';
  xItem : BOOL;
END_VAR
VAR_OUTPUT
  iResult : INT;
  sResult : STRING;
  xResult : BOOL;
END_VAR
VAR
  iResult := iAlfa + iBravo;
  IF xItem = TRUE THEN
    xResult := TRUE;
  END_IF
END_FUNCTION_BLOCK

3. Select the application and click “Add Object ➔ POU” in the context menu. Select the “Continuous Function Chart (CFC)” implementation language and the type Program. Specify the name PrgFirst for example.

Click “OK” to confirm the dialog.

- The program PrgFirst is created and it opens in the editor. It is still empty.

4. Instantiate function blocks and declare variables.

PROGRAM PrgFirst
VAR
  iCounter: INT;
  fbDoIt_1 : FB_DoIt;
  fbDoIt_2 : FB_DoIt;
  iOut : INT;
  sOut: STRING;
  xOut: BOOL;
END_VAR

5. Drag a “Box” element from the “ToolBox” view into the editor.

6. Click the ??? field and type in ADD.

- The box type is ADD. The box acts as an adder.

7. Click line 3 in the declaration editor.

- The declaration line of iCounter is selected.

8. Click in the selection and drag the selected variable into the implementation. Focus there on an input of the ADD box.

- An input has been created, declared, and connected to the box.

9. Click again in the selection and drag the variable to the output of the ADD box.

- An output has been created, declared, and connected to the box.

10. Drag an “Input” element from the “ToolBox” view to the implementation. Click its ??? field and type in 1.
11. Connect the 1 input to an input of the ADD box.
   ➞ A network is programmed. At runtime, the network counts the bus cycles and stores
   the result in iCounter.

12. Click line 5 in the declaration editor.
   ➞ The line is selected.
13. Click in the selection and drag the selected instance into the implementation.

⇒ The instance appears as a POU in the editor. The type, name, and POU pins are displayed accordingly.
14. Drag the fbDoIt_2 instance to the editor. Interconnect the instances to each other and to inputs and outputs.

Example:

A program in ST with the same functionality might look like this:

```st
PROGRAM PrgFirstInSt
VAR
  iCounter: INT;
  fbDoIt_1: FB_DoIt;
  fbDoIt_2: FB_DoIt;
  iOut: INT;
  sOut: STRING;
  xOut: BOOL;
END_VAR

iCounter := iCounter + 1;
fbDoIt_1(iAlfa := 16, iBravo := 32, sCharlie := 'First',
xItem := TRUE, iDelta := 2, iResult => fbDoIt_2.iAlfa, xResult
=> fbDoIt_2.xItem);
fbDoIt_2(iBravo := fbDoIt_1.iResult, sCharlie := 'Second',
iDelta := 2, iResult => iOut, sResult=> sOut, xResult =>
xOut);
```

Creating connection marks

- Requirement: A CFC POU has connected elements.
- 1. Select a connecting line between two elements.
   - The connecting line is displayed as selected. The ends of the connecting line are marked with red boxes (■).
- 2. Click “CFC ➔ Connection Mark”.
   - The connection is separated into a “Connection Mark - Source” and a “Connection Mark - Sink”. The name of the mark is generated automatically.
3. Click in the source connection marks.
   ⇒ You can edit the name.

4. Specify a name `SimpleMark` for the source connection mark.
   ⇒ The source connection mark and sink connection mark have the same name.

The following example shows how to use the “Route All Connections” command with control points.

1. Position the “Input” and “Output” elements. Connect the elements.

2. Position two “Box” elements on the line.
   ⇒ The connecting line and the boxes are marked red because of the collision.

3. Click “CFC ➔ Routing ➔ Route All Connections”.
   ⇒ The collision is resolved.
4. Change the connecting lines gradually.

5. Select the connecting line and click “CFC ➔ Routing ➔ Create Control Point”.

6. Change the connecting line as seen in the following example.

7. In the context menu, click “CFC ➔ Routing ➔ Remove Control Point” to remove the control point.

8. Unlock the connection by clicking “Unlock Connection” or by clicking the lock symbol.

9. Select the connecting line and click “Route All Connections”.

The connecting line has been changed manually and is now blocked for auto-routing. This is shown by a lock symbol at the end of the connection.

You can also drag a control point from the “ToolBox” view to a line.
Reducing the display of a POU

- Requirement: A CFC POU is open. In the editor, its POUs with all declared pins are displayed.

1. Select a POU whose pins are partially disconnected.
   - Example: fb_DoIt_1

   ![Diagram of fb_DoIt_1 POU with all pins displayed]

   The POU needs space for all of the pins.

2. Click “CFC ➔ Pins ➔ Remove Unused Pins”.
   - Now the POU needs less space and is displayed only with the functionally relevant pins.

   ![Diagram of fb_DoIt_1 POU with only functionally relevant pins displayed]

Structured Text (ST), Extended Structured Text (ExST)

General

The ST editor is used for the programming of POUs in the IEC-61131-3 programming language. Structured Text (ST) and Extended Structured Text. The Extended Structured Text offers some additional functions with regard to the IEC 61131-3 standard.
Structured Text is a programming language, comparable with other high-level languages such as C or PASCAL, which permits the development of complex algorithms. The program code consists of a combination of expressions and instructions, which can also be executed conditionally (IF... THEN... ELSE) or in loops (WHILE... DO).

An expression is a construct that returns a value following its evaluation. Expressions are also operators and operands together. You can also use assignments as expressions. An operand can be a constant, a variable, a function call or a further expression.

Instructions control how the expressions are to be processed.

For this text editor you can make various settings with regard to behavior, appearance and menus in the dialog boxes “Options” and “Adapt” in the “Tools” menu. The familiar Windows functions (for example Intellimouse) are also available for this editor.

See also

- Chapter 6.4.1.9.5.4.2 “Programming structured text (ST)” on page 1879

- Chapter 6.4.1.21.4.15.2 “Dialog 'Customize' - 'Menu’” on page 2801

ExST - Extended structured text

Extended Structured Text (ExST) is a CODESYS-specific extension of the IEC 61131-3 standard for Structured Text (ST).

See also

- Chapter 6.4.1.20.1.4.4.4 “ExST assignment ’R’=” on page 2053
- Chapter 6.4.1.20.1.4.4.3 “ExST assignment ’S’=” on page 2052
- Chapter 6.4.1.20.1.4.4.5 “ExST – Assignment as expression” on page 2054

Programming structured text (ST)

Principle

The programming languages 'Structured Text' and 'Extended Structured Text' are programmed in the ST editor. The program code consists of a combination of expressions and instructions, which can also be executed conditionally or in loops. You must conclude each instruction with a semicolon ;.

The variables are declared in the declaration editor.

Creating a POU in the structured text (ST) implementation language

1. Select an application in the device tree.
2. Select the command “Project ➔ Add Object ➔ POU”.
   - The dialog box “Add POU” opens.
3. Enter a name and select the “Implementation language” “Structured Text (ST)”.
   - The POU is added to the device tree and opened in the editor.
   - Now insert the variable declarations in the upper part of the POU and enter the ST program code in the lower part of the POU.

See also

- Chapter 6.4.1.20.1.4.3 “ST expressions” on page 2050
- Chapter 6.4.1.20.1.4 “Structured Text and Extended Structured Text (ExST)” on page 2049
- Chapter 6.4.1.20.1.4.5.10 “ST function block call” on page 2060
Sequential Function Chart (SFC)

General

Use the SFC editor for programming POUs in the IEC 61131-3 compliant SFC implementation language. SFC is a graphical programming language for describing the chronological sequence of individual actions in a program. For this purpose, actions (discrete programming objects) are assigned to step elements. Transition elements control the processing order of steps.

See also

- Chapter 6.4.1.20.1.5.1 “SFC editor” on page 2062

Programming in SFC

Creating a POU in SFC

1. Select an application in the device tree.
2. Click “Project ➔ Add Object ➔ POU”.
   ⇨ The “Add POU” dialog opens.
3. Specify a name and select the “Sequential Function Chart (SFC)” implementation language.
   Click “Add”.
   ⇨ CODESYS adds the POU to the device tree and opens it in the editor.

Adding a step-transition

1. Select the transition after the initial step.
   ⇨ The transition is marked in red.
2. Click “SFC ➔ Insert Step-Transition After”.
   ⇨ CODESYS inserts the “Step0” step and the “Trans0” transition.
3. Select the “Trans0” transition and click “SFC ➔ Insert Step-Transition”.
   ⇨ CODESYS inserts the “Trans1” transition and the “Step1” step before the “Trans0” transition.

You can also drag the “Step” and “Transition” elements into the diagram from the “Toolbox” view.

See also

- Chapter 6.4.1.20.1.5.8.1 “SFC elements 'Step' and 'Transition’” on page 2073
- Chapter 6.4.1.21.3.12.6 “Command 'Insert Step-Transition’” on page 2677
- Chapter 6.4.1.21.3.12.7 “Command 'Insert Step-Transition After’” on page 2677
Adding an entry action

1. Select the “Step0” step.
2. Click “SFC ➔ Add Entry Action”.
   ➞ By default, you are prompted to select the duplication mode for the step actions. You decide whether the reference information about the existing step action objects is copied when the step is copied, or the objects are embedded. Embedding results in new step action objects being created when the step is copied. The duplication mode is defined in the “Duplicate when copying” step property. When this property is deactivated, the copied steps call the same actions as the current step.
   
   You can deactivate the prompt completely in the SFC properties.
   
   The display of embedded objects in the “Devices” and “POUs” views can be deactivated by means of a menu command.

3. For this example, accept the “Copy reference” default setting and click “OK” to confirm.
   ➞ The “Add Entry Action” dialog opens.

4. Enter the name “Step0_entry” and select the “Structured Text (ST)” implementation language. Click “Add”.
   ➞ CODESYS inserts the “Step0_entry” action below the POU in the device tree and opens the action in the editor.
   
   In the Step0_entry entry action, you program statements to be executed one time when the “Step0” step becomes active.

5. Close the editor of Step0_entry.
   ➞ The “Step0” step is now marked with an “E” in the lower left corner. Double-click this marker to open the editor.

   ![Step0 Entry Action](image)

   The entry action Step0_entry is now available in the properties of the step in “Entry action”. Other actions can also be selected there as needed.

6. Select the “Step0” step. Press [Ctrl]+[V] to copy the step.
   ➞ The same entry actions inserted above are available in the inserted copy of the step. The new step then calls the same exact action.

See also

- Chapter 6.4.1.21.3.12.8 “Command ‘Add Entry Action’” on page 2678
- “2. Step actions” on page 2076
- Chapter 6.4.1.21.4.14.23 “Dialog ‘Options’ - ‘SFC Editor’” on page 2795

Adding an exit action

1. Select the “Step0” step.
2. Click “SFC ➔ Insert Exit Action”.
   ➞ By default, you are prompted to select the duplication mode for the step actions of the step. See above for adding an entry action. Then the “Insert Exit Action” dialog opens.
3. Enter the name "Step0_exit" and select the “Structured Text (ST)” implementation language. Click “Add”.
   ⇨ CODESYS inserts the “Step0_exit” action below the POU in the device tree and opens the action in the editor.
   In the Step0_exit exit action, you program statements to be executed one time before the “Step0” step becomes inactive.

4. Close the editor of Step0_exit.
   ⇨ The “Step0” step is now marked with an “X” in the lower right corner. Double-click this marker to open the editor.

You can define the exit action in the properties of the step in “Exit action”. Other actions can also be selected there.

See also
- § 6.4.1.21.3.12.9 “Command ‘Add Exit Action’” on page 2678
- § 2. Step actions” on page 2076

Adding an action

1. Double-click the “Step0” step.
   ⇨ By default, you are prompted to select the duplication mode for the step actions of the step. See above for adding an entry action. The “Add Action” dialog opens.

2. Type in the name “Step0_active” and select the “Structured Text (ST)” implementation language. Click “Add”.
   ⇨ CODESYS inserts the “Step0_active” action below the POU in the device tree and opens the action in the editor.
   In the Step0_active step action, you program statements to be executed as long as the step is active.

3. Close the editor of Step0_active.
   ⇨ The “Step0” step is now marked with a black triangle in the upper right corner.

You can define the action in the properties of the step in “Step action”. Other actions can also be selected there.

See also
- § 2. Step actions” on page 2076
Adding an alternative branch

1. Select the “Step1” step.
2. Click “SFC ➔ Insert Branch Right”.
   ⇒ CODESYS inserts the “Step2” step to the right of “Step1”. The steps are connected as a parallel branch signified by two pairs of double lines.
3. Select one of the double lines.
   ⇒ The double line is marked red.
4. Click “SFC ➔ Alternative”
   ⇒ CODESYS converts the branch into an alternative branch. The double lines change into a single line.

You can click “SFC ➔ Parallel” to convert an alternative branch into a parallel branch.

See also
● § Chapter 6.4.1.20.1.5.8.3 “SFC element ‘Branch’” on page 2078
● § Chapter 6.4.1.21.3.12.10 “Command ‘Parallel’” on page 2678
● § Chapter 6.4.1.21.3.12.12 “Command ‘Insert Branch’” on page 2679
● § Chapter 6.4.1.21.3.12.13 “Command ‘Insert Branch Right’” on page 2679

Adding a jump

1. Select the “Step2” step.
2. Click “SFC ➔ Insert Jump After”.
   ⇒ CODESYS inserts the “Step” jump after the “Step2” step.
3. Select the “Step” jump destination.
   ⇒ You can type the jump destination manually or select it by using the Input Assistant. Select Step0.

See also
● § Chapter 6.4.1.20.1.5.8.4 “SFC element ‘Jump’” on page 2079
● § Chapter 6.4.1.21.3.12.16 “Command ‘Insert Jump’” on page 2681
● § Chapter 6.4.1.21.3.12.17 “Command ‘Insert Jump After’” on page 2681

Adding a macro

1. Select the “Step1” step.
2. Click “SFC ➔ Insert Macro After”.
   ⇒ CODESYS inserts the “Macro0” macro after the “Step1” step.
3. Double-click the "Macro0" element.
   ⇒ The macro opens in the implementation section of the editor. The name "Macro0" is displayed in the caption.

4. Click “SFC ➔ Insert Step-Transition”.
   ⇒ CODESYS inserts a step-transition combination.

5. Click “SFC ➔ Zoom out of Macro”.
   ⇒ The implementation section returns to the main diagram.

See also
- % Chapter 6.4.1.20.1.5.8.5 “SFC element 'Macro'” on page 2079
- % Chapter 6.4.1.21.3.12.18 “Command 'Insert Macro'” on page 2682
- % Chapter 6.4.1.21.3.12.19 “Command 'Insert Macro After'” on page 2682

Adding an association

1. Select the “Step2” step.

2. Click “SFC ➔ Insert Action Association”.
   ⇒ CODESYS inserts an association to the right of the “Step2” step.

3. Click in the left field of the association to select the qualifier.
   ⇒ You can enter the qualifier manually or use the Input Assistant. Select "P".

4. Click in the right field of the association to select the action.
   ⇒ You can type the action or select it by using the Input Assistant.

See also
- % “1. IEC actions” on page 2075
- % Chapter 6.4.1.20.1.5.4 “Qualifiers for Actions in SFC” on page 2065
- % Chapter 6.4.1.21.3.12.14 “Command 'Insert Action Association'” on page 2680
- % Chapter 6.4.1.21.3.12.15 “Command 'Insert Action Association After'” on page 2681

Using the library 'analyzation.library' for the analyzation of expressions

The library analyzation.library allows for the analyzation of expressions. It can be used, for example, in the SFC diagram to examine the result of the flag SFCError. This flag is used to monitor timeouts in the SFC diagram.

See also
- % Chapter 6.4.1.20.1.5.7 “Library "Analyzation"” on page 2072

See also
- % Chapter 6.4.1.20.1.5.1 “SFC editor” on page 2062
6.4.1.9.6 Function block — Calling functions or methods with external implementation

A runtime system can include the implementation of a function block, function, or method (for example, from a library). If you create a POU in your application with the same name by using the “External implementation” without an implementation, then you can execute the existing implementation. Please make sure that you declare local variables only in an external function block. External functions and methods must not contain local variables.

When the application is downloading, CODESYS searches for and links the associated implementation in the runtime system for each external POU.

Objects with the property “External implementation” are postfixed with (EXT) after the object name in the “Devices” or “POUs” view.

See also

● Chapter 6.4.1.21.4.11.5 “Dialog ‘Properties’ - ‘Build’” on page 2755

Creating POUs with external implementation

1. Click “Project ➔ Add Object ➔ POU”.
2. Activate “Function block”, Method, or “Function” and specify the name of the associated implementation of the runtime system. Close the dialog box by clicking “Add”.
   ⇒ The runtime system POU is created in the “POUs” view. The name is postfixed with (EXT).
3. Right-click the POU and select “Properties”.
   ⇒ The dialog box opens.
4. Click the “Build” tab.
5. Select the “External implementation (Late link in the runtime system)” check box.
   ⇒ The POU is declared and you can implement a POU call.

Creating methods with external implementation

1. Select a function block in the device tree or in the POUs view.
2. Select “Add Object ➔ Method” and type the name of the associated implementation of the runtime system. Click “Add” to close the dialog box.
   ⇒ The method is created.
3. Right-click the method and select “Properties”.
   ⇒ The dialog box opens.
4. Click the “Build” tab.
5. Select the “External implementation (Late link in the runtime system)” check box.
   ⇒ The method is declared and you can implement a method call. The method name is postfixed with (EXT) in the “Devices” or “POUs” view.

6.4.1.9.7 Using input assistance

CODESYS provides tools and features to help you code when creating programs.
**Input assistant**

The input assistant provides all program elements that you can insert at the current cursor position. Open the “Input Assistant” dialog by clicking “Edit → Input Assistant” or by pressing 

[F2].

See also

- “Dialog 'Input Assistant' - Tab 'Categories'” on page 2575

**Dialog 'Auto Declare'**

This dialog supports the declaration of variables.

See also

- Chapter 6.4.1.21.3.3.32 “Command 'Auto Declare’” on page 2572

**"List components"**

The "List components" function is an input tool in textual editors to help you input valid identifiers. Activate this function by clicking “Tools → Options” and then the “SmartCoding” category. Select the “List components after typing a dot (.)” check box.

- If you type a dot (.) instead of a global variable, then a drop-down list opens with all available global variables. You insert the selected variable after the dot by double-clicking a variable in the drop-down list or by pressing [Enter].
- If you type a dot (.) instead of a global variable after a function block instance variable or a structure variable, then CODESYS opens a drop-down list with all global variables, all input and output variables for the function block, or all structure members. You insert the selected variable after the dot by double-clicking a variable in the drop-down list or by pressing [Enter].
  
  Note: When you also want to choose from the local variables of function block instances, select the “Show all instance variables in input assistant” option in the CODESYS options (SmartCoding category).
- If a component access (with a dot) for a drop-down list has already happened, then the last selected entry is preselected at the next component access.
- When you type any sequence of characters and then press [Ctrl]+[Space], a drop-down list opens with all available POU and global variables. The first element in this list that starts with the sequence of characters is selected by default and you can insert it by double-clicking it or by pressing [Enter].
  
  Matches with the entered character string are highlighted in yellow in the drop-down list.
  
  If the entered character string is changed, then the displayed drop-down list is refreshed.
- In the ST editor, you can filter the displayed drop-down list by scopes:
  
  Depending on the displayed drop-down list, you can use the [Arrow right] and [Arrow left] keys to toggle between the following drop-down lists:
  
  – “All items”
  – “Keywords”
  – “Global declarations”
  – “Local declarations”
- CODESYS displays a tooltip if you type an opening parenthesis for a POU parameter when calling a function block, a method, or a function. This tooltip includes information about the parameters as they are declared in the POU. The tooltip remains open until you click to close it or you change the focus away from the current view. If you accidentally close the tooltip, then you can reopen it by pressing [Ctrl]+[Shift]+[Space].

You can use the pragma attribute ‘hide’ for excluding variables from the "List components" feature.
Typing structure variables:

- list

Calling a function block:

See also

- Chapter 6.4.1.20.6.3.17 “Attribute ‘hide’” on page 2286

**Short form feature**

The short form feature allows you to type abbreviated forms for variable declarations in the declaration editor and in textual editors where variables declarations are possible. Use this feature by pressing `[Ctrl]+[Enter]` to end a declaration line.

CODESYS supports the following short forms:

- All identifiers become variable identifiers except the last identifier of a line.
- The data type of the declaration is determined by the last identifier of the line. The following applies:
  - `B` or `BOOL` yields `BOOL`
  - `I` or `INT` yields `INT`
  - `R` or `BOOL` yields `BOOL`
  - `S` or `STRING` yields `STRING`
- If a data type is not defined using this rule, then the data type is automatically `BOOL`, and the last identifier is not used as the data type (see Example 1).
- Depending on the type of declaration, every defined constant becomes an initialization or string length definition (see Example 2 and 3).
- An address, such as `%MD12`, is automatically extended with the AT attribute (see Example 4).
- Any text after a semicolon (:) is converted into a comment (see Example 3).
- All other characters in the line are ignored (see exclamation mark in Example 5).

### Examples

<table>
<thead>
<tr>
<th>Example</th>
<th>Short Form</th>
<th>Resulting declaration</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>A</td>
<td>A: BOOL</td>
</tr>
<tr>
<td>2</td>
<td>A B I 2</td>
<td>A, B: INT := 2;</td>
</tr>
<tr>
<td>3</td>
<td>ST S 2; A string</td>
<td>ST:STRING(2); (* A string *)</td>
</tr>
<tr>
<td>4</td>
<td>X %MD12 R 5 Real Number</td>
<td>X AT %MD12: REAL := 5.0;(* Real Number *)</td>
</tr>
<tr>
<td>5</td>
<td>B !</td>
<td>B: BOOL</td>
</tr>
</tbody>
</table>
See also

- Chapter 6.4.1.9.4 “Declaration of Variables” on page 1847

**Smart tag functions**

Smart tags make it easier to write program code by suggest appropriate commands directly at the programming element. When you place the cursor over a programming element that has a smart tag function, the symbol appears. When you click the symbol, the commands that you can choose from are shown. Available smart tags:

- The smart tag function provides the “Declare Variable” command for undeclared variables in the implementation part of the ST editor.

See also

- Chapter 6.4.1.21.3.3.32 “Command ‘Auto Declare’” on page 2572

**6.4.1.9.8 Using Pragmas**

**Pragma in CODESYS**

A pragma is a text in the source code of the application that is enclosed in curly brackets. Pragmas are used to insert special statements in the code, which the compiler can evaluate. This allows a pragma to influence the properties of one or more variables with respect to precompilation or compilation (code generation). Pragmas that the compiler does not recognize are passed over as a comment.

The statement string of a pragma can also extend over multiple lines. For more details about the syntax, see the descriptions of the individual CODESYS pragmas.

There are different pragmas for different purposes (example: initialization of a variable, monitoring of a variable, adding a variable to the symbol configuration, forcing the display of messages during the compilation process, and behavior of a variable under certain conditions).

**NOTICE!**

Uppercase and lowercase characters have to be respected.

**Examples**

```
{warning 'This is not allowed'}

{attribute 'obsolete' := 'datatype fb1 not valid!'}

{attribute 'Test':='TestValue1;
 TestValue2;
 TestValue3'}
```

**Possible insertion positions**

**NOTICE!**

Pragmas in CODESYS are not one-to-one implementations of C preprocessor directives. You have to position a pragma like an ordinary statement. You must not use a pragma within an expression.

A pragma that the CODESYS compiler should evaluate can be inserted at the following positions:
● In the declaration part of a POU:
  – In the textual declaration editor, specify pragmas directly as line(s), either at the beginning of the POU or before a variable declaration.
  – In the tabular editor, you specify pragmas that should be located before the first declaration line in the “Edit Declaration Part” / “Attributes” dialog.
● In a global variable list
● In the implementation part of a POU:
  – The pragma has to be at a "statement position", meaning at the beginning of a POU on a separate line, or after a ";" or END_IF, END WHILE, etc.
  – FBD/LD/IL editor: In networks of the FBD/LD/IL editor, you insert pragmas like a label by means of the “FBD/LD/IL ➔ Insert Label” command. Then, in the text field of the label with the corresponding pragma statement, replace the default text “Label:”. To use a pragma in addition to a label, you specify the pragma first and then the label.

Incorrect and correct positions for a conditional pragma

INCORRECT: 
{IF defined(abc)}
IF x = abc THEN
{ELSE}
IF x = 12 THEN
{END_IF}
y := {IF defined(cde)} 12; {ELSE} 13; {END_IF}
END_IF

CORRECT: 
{IF defined(abc)}
IF x = abc THEN
{IF defined(cde)}
y := 12;
{ELSE}
y := 13;
{END_IF}
END_IF
{ELSE}
IF x = 12 THEN
{IF defined(cde)}
y := 12;
{ELSE}
y := 13;
{END_IF}
END_IF
{END_IF}

In the “Properties” dialog (“Compile” category), you can specify "defines" that can be queried in pragmas.

Scope:
Depending on the type and contents of a pragma, it may influence the following:
● Subsequent declarations
● Exactly the next statement
● All subsequent statements until it is canceled by a corresponding pragma
● All subsequent statements until the same pragma is executed with other parameters or the end of the code is reached. In this context, "code" means the declaration part, implementation part, global variable list, and type declaration. Therefore, a pragma influences the entire object when the pragma is alone on the first line of the declaration part and is not superseded or canceled by another pragma.
The CODESYS pragmas are divided into the following categories:

- Attribute pragmas (influence compiling and precompiling)
- Message pragmas (print user-defined messages when compiling)
- Conditional pragmas (influence code generation)
- User-defined pragmas

### 6.4.1.9.9 Using Library POUs

Libraries are collections of objects that you can link to your application. You can use the objects contained in libraries in exactly the same way as objects that you have defined in the project.

Libraries can contain the following objects:

- POUs (for example function blocks, or functions)
- Interfaces and their methods and attributes
- Data types (for example enumerations, structures, aliases, and unions)
- Global variables, constants, and parameter lists
- Text lists, image pools, visualizations, and visual elements
- External files (for example, documentation)
- Cam plate tables

Libraries in a project are managed in the Library Manager. You use the dialog of the library repository to perform the previous installation of the library on the system.

For "visibility" of library POUs and namespaces of libraries, see also the help page for the library properties.

See also

- Chapter 6.4.1.21.3.15.3 “Command ‘Properties’” on page 2714
- Chapter 6.4.1.17 “Using Libraries” on page 2034
- Chapter 6.4.1.21.3.15.3 “Command ‘Properties’” on page 2714

### Using library POUs

The following instructions describe the example of how to insert the counter POU CTUD from the library Standard into your program.

1. Open a POU in the editor and place the cursor in the declaration part.
2. Specify the name for the function block instance, followed by a colon (example: iCounter1:).
4. In the category “Structured Types”, select the CTUD function block from the Standard library (subfolder “Counter”).
   - Select the “Insert with namespace prefix” option.
5. Click “OK” to exit the dialog.

   The function block is inserted with a namespace prefix into the declaration part: iCounter1:Standard.CTUD.

- Chapter 6.4.1.17 “Using Libraries” on page 2034

### 6.4.1.9.10 Managing text in text lists

#### General

Text lists are used for preparing visualization texts for multiple languages. You can specify the texts in Unicode format so that all languages and characters are possible. You can export text lists and then translate the texts outside of the current project.

CODESYS differentiates between static text (managed in the “GlobalTextList” object) and dynamic text (managed in objects of type “TextList”). Static texts exist in the visualization and can change only the displayed language while in runtime mode. The text ID stays the same. Dynamic texts can be controlled by means of an IEC variable that contains the text ID. In this way, you can display varying text in a visualization element in runtime mode. For example, you can configure a text field so that it shows an error text for an error number.

Both text list types include a table with text entries. An entry consists of an ID for identification, the output text, and its translation. In a text list or global text list, you can translate an output text in any number of languages. The translations are the basis for the language selection and the language switch in visualizations.

#### Adding a language and translating text

**Requirement:** A project is open with a text list or global text.

1. Double-click an object of type “TextList” or “GlobalTextList” in the device tree or POUs view.
   - The “Textlist” menu is shown in the menu bar and the text list opens in the editor.

2. Click “Textlist ➔ Add Language”.

3. Specify a name for the language (example: en-US). Click “OK” to close the dialog.
   - A column is displayed with the heading en-US.

4. Type in the translation of the source text into the column.

You can correct the name of a language in the table by means of the command “Rename Language” in the context menu of the text list.

#### Exporting a text list

**Requirement:** A project is open with a text list or global text.

1. Double-click the object “GlobalTextList” or an object of type “TextList”.
   - The object opens.

2. Click “Textlist ➔ Import/Export Text Lists”.
   - The “Import/Export” dialog opens.

3. At “Choose export file”, click for more (⋮) and select the directory and file name (example: Text_lists_exported).

4. Select the “Export” option.
5. Click “OK” to close the “Import/Export” dialog.

→ CODESYS exports to a file the text list entries of all text lists of the project. The table contains a column with the text list names.

Example

<table>
<thead>
<tr>
<th>TextList</th>
<th>Id</th>
<th>Default</th>
<th>en_US</th>
</tr>
</thead>
<tbody>
<tr>
<td>Text_list_A</td>
<td>A</td>
<td>Information A</td>
<td>Information A en</td>
</tr>
<tr>
<td>Text_list_A</td>
<td>B</td>
<td>Information B: OK</td>
<td>Information B_en: OK</td>
</tr>
<tr>
<td>Text_list_A</td>
<td>C</td>
<td>Information C</td>
<td>Information C en</td>
</tr>
<tr>
<td>Text_list_A</td>
<td>D</td>
<td>Information D</td>
<td>Information D en</td>
</tr>
<tr>
<td>Text_list_A</td>
<td>E</td>
<td>Information E</td>
<td>Information E en</td>
</tr>
<tr>
<td>Text_list_A</td>
<td>F</td>
<td>Information F</td>
<td>Information F en</td>
</tr>
<tr>
<td>AlarmGroup</td>
<td>2</td>
<td>Warning 2</td>
<td></td>
</tr>
<tr>
<td>AlarmGroup</td>
<td>1</td>
<td>Warning 1</td>
<td></td>
</tr>
<tr>
<td>GlobalTextList</td>
<td>1</td>
<td>Information B</td>
<td>Information B en</td>
</tr>
<tr>
<td>GlobalTextList</td>
<td>2</td>
<td>Information A</td>
<td>Information A en</td>
</tr>
<tr>
<td>GlobalTextList</td>
<td>3</td>
<td>Switch</td>
<td>Switch</td>
</tr>
<tr>
<td>GlobalTextList</td>
<td>4</td>
<td>Counter: %i</td>
<td>Counter : %i</td>
</tr>
</tbody>
</table>

Preparing the exported file for input assistance

☑ Requirement: A file is created (example: Text_lists_exported) by means of the command “Import/Export Text Lists”. It contains the texts of the text lists of the project.

2. Click in “Text file for textual “List components” ” and select a file (example: Text_lists_exported). Click “OK” to close the dialog.

→ When you specify a static text in the “Texts” property for an element in a visualization, CODESYS offers the source text of the file as input assistance when typing in the first letter.

(1): “Texts”, “Text"

“List components” on page 1886

Importing files with text list entries

A file to be imported has the .csv format. The first line is a header (example: TextList Id Default en_US). The other lines contain text list entries. You get this kind of file by exporting the text lists of the project to a file. There you can edit the text list entries and then import the file outside of CODESYS. When importing, CODESYS handles the text list entries differently for the GlobalTextList and for dynamic text lists.
GlobalTextList

- CODESYS does not create new text list entries for an unknown ID.
- CODESYS ignores changes that affect the ID or the source text.
- CODESYS accepts changes in the translations.

TextList

- For a new ID, CODESYS supplements the corresponding text list with a text list entry.
- For an existing ID that does not agree in the source text, the source text of the text list is overwritten with the source text of the file.
- CODESYS accepts changes in the translations.

Importing a file

☐ Requirement: A project is open with a text list or global text.

1. Double-click the object “GlobalTextList” or an object of type “TextList”.
   ⊳ The object opens.

2. Click “Textlist ➔ Import/Export Text Lists”.
   ⊳ The “Import/Export” dialog opens.

3. In the “Choose file to compare or to import” input field, click for more (…) and select the directory and file (example: Text_lists_corrected.csv).

4. Select the “Import” option.

5. Click “OK” to close the dialog.
   ⊳ CODESYS imports the text list entries of the file into the respective text lists.

Example

<table>
<thead>
<tr>
<th>Contents of the file</th>
</tr>
</thead>
<tbody>
<tr>
<td>Text_lists_corrected.csv</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>TextList</th>
<th>Id</th>
<th>Default</th>
<th>en_US</th>
</tr>
</thead>
<tbody>
<tr>
<td>Text_list_A</td>
<td>A</td>
<td>Information A</td>
<td>Information A2_en</td>
</tr>
<tr>
<td>Text_list_A</td>
<td>B</td>
<td>Information B: OK</td>
<td>Information B_en: OK</td>
</tr>
<tr>
<td>Text_list_A</td>
<td>C</td>
<td>Information C</td>
<td>Information C_en</td>
</tr>
<tr>
<td>Text_list_A</td>
<td>D</td>
<td>Information D</td>
<td>Information D_en</td>
</tr>
<tr>
<td>Text_list_A</td>
<td>E</td>
<td>Information E</td>
<td>Information E_en</td>
</tr>
<tr>
<td>Text_list_A</td>
<td>F</td>
<td>Information F</td>
<td>Information F_en</td>
</tr>
<tr>
<td>Text_list_A</td>
<td>G</td>
<td>Information G</td>
<td>Information G_en</td>
</tr>
<tr>
<td>AlarmGroup</td>
<td>2</td>
<td>Warning 2</td>
<td></td>
</tr>
<tr>
<td>AlarmGroup</td>
<td>1</td>
<td>Warning 1</td>
<td></td>
</tr>
<tr>
<td>GlobalTextList</td>
<td></td>
<td>Information B</td>
<td>Information B_en</td>
</tr>
<tr>
<td>GlobalTextList</td>
<td></td>
<td>Information A</td>
<td>Information A_en</td>
</tr>
<tr>
<td>GlobalTextList</td>
<td></td>
<td>Switch</td>
<td>Switch</td>
</tr>
<tr>
<td>GlobalTextList</td>
<td></td>
<td>Counter: %i</td>
<td>Counter: %i</td>
</tr>
</tbody>
</table>

These contents are applied to the text lists with the same name in the project.

☞ Chapter 6.4.1.21.3.21.6 “Command ‘Import/Export Text Lists’” on page 2729

Comparing text lists with a file and exporting differences

☐ Requirement: A project is open with a text list or global text.

1. Double-click the object “GlobalTextList” or an object of type “TextList”.
   ⊳ The object opens.

2. Click “Textlist ➔ Import/Export Text Lists” in the context menu.
   ⊳ The “Import/Export” dialog opens.

3. In the “Choose file to compare or to import” input field, click for more (…) and select the directory and file name of the comparison file (example: Text_lists_corrected.csv).
4. For “Choose export file”, click [ ] and select the directory and file that contains the comparison result.
5. Select the “Export only text differences” option.
6. Click “OK” to close the dialog.

⇒ CODESYS reads the import file and compares the text list entries that have the same ID. If they do not agree, then CODESYS writes the text list entries of the text list to the export file.

For the global text list, CODESYS compares the translations of the same source texts. If they do not agree, then CODESYS writes the text list entries to the export file.

Managing static text in global text lists

The global text list is the central location for texts that are displayed in the visualization.

When you configure a text for the first time in visualization element, CODESYS creates the global text list. CODESYS fills in the table as you create more texts. Therefore, the table includes all texts automatically that you create in the project visualizations. CODESYS assigns incremental IDs as integers, beginning at 0.

You can check, update, and compare the global text list with the static texts of the visualization. You cannot edit the source text or the ID directly in the table. However, you can replace a source text with another source text by creating and importing a replacement file. Menu commands are provided for this purpose.

Configuring visualization elements with static text

A text in a “GlobalTextList” can contain a format definition.

☐ Requirement: A project is open with a visualization. The “GlobalTextList” object contains the texts that are defined in the project visualizations.

1. Double-click the visualization.
   ⇒ The editor opens.

2. Select an element with the “Text” property (example: “Text field”).

3. Type in some text in the “Text” property (example: Static Information A).
   ⇒ CODESYS adds the text to the global text list in the POU view.

Checking the global text list

☐ Requirement: A project is open with a visualization. The “GlobalTextList” object contains the texts that are defined in the project visualizations.

1. Double-click the “GlobalTextList” object in the POUs tree.
   ⇒ The table opens with the static texts.
2. Click “Text List ➔ Check Visualization Text IDs”.
   - CODESYS reports when a source text of the text list does not match the static text that is identified by the ID. The source text in the global text list and the text in the visualization with the same ID do not match.

Updating IDs of the global text list

- Requirement: A project is open with a visualization. The “GlobalTextList” object contains the texts that are defined in the project visualizations.
  1. Double-click the “GlobalTextList” object in the POUs tree.
     - The list opens with the text list entries.
  2. Click “Text List ➔ Update Visualization Text IDs”.
     - CODESYS adds text to the global text list when a text in the “Static Text” property does not match the source text in the project visualizations.

Removing the global text list and creating current IDs again

- Requirement: A project is open with a visualization. The “GlobalTextList” object contains the texts that are defined in the project visualizations.
  1. Right-click the “GlobalTextList” object in the POUs tree and select the “Delete” command.
     - The object is removed.
  2. Open a visualization.
  3. Click “Visualization ➔ Create Global Text List”.
     - In the POU view, a new “GlobalTextList” object is created. The global text list contains the static text from the existing project visualizations.

Removing IDs from the global text list

- Requirement: A project is open with a visualization. The “GlobalTextList” object contains the texts that were defined in the project visualizations.
  1. Double-click the “GlobalTextList” object in the POUs tree.
     - The table opens with the texts.
  2. Click “Text List ➔ Remove Unused Text List Entries”.
     - CODESYS removes the text list entries with IDs not referenced in the project visualizations.

Updating the global text list with a replacement file

A replacement file has the CSV format. The first row is a header: defaultold defaultnew REPLACE. The following rows contain the old source texts, the new source texts, and then the REPLACE command. Tabs, commas, and semicolons are permitted separators. A combination of separator characters in a file is not permitted.

Example (tab as separator character)

<table>
<thead>
<tr>
<th>defaultold</th>
<th>defaultnew</th>
<th>REPLACE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Information A</td>
<td>Information A1</td>
<td>REPLACE</td>
</tr>
</tbody>
</table>
When you import a replacement file, CODESYS processes the replacement file row by row and performs the specified replacements in the “GlobalTextList”. In addition, CODESYS replaces the previous text with the replacement text in the visualizations. If the replacement text already exists as static text, then CODESYS recognizes this and harmonizes the static text and leaves only one text list entry.

☑ Requirement: A project is open with a text list or global text.
1. Double-click the “GlobalTextList” object.
   ⇒ The object opens.
2. Click “Text List ➔ Import/Export Text Lists”.
   ⇒ The “Import/Export” dialog opens.
3. At the “Choose file to compare or to import” input field, click for more (…) and select the directory and file (example: ReplaceGlobalTextList.csv).
4. Select the “Import replacement file” check box.
5. Click “OK” to close the dialog.
   ⇒ The texts in the text lists and the visualizations are replaced.
Example

The global text list contains the following source texts:

- GlobalTextList Counter: %i
- GlobalTextList Information A
- GlobalTextList Information Aa
- GlobalTextList Switch

The replacement file contains the following replacements:

- defaultold defaultnew REPLACE
- Counter: %i Counter2: %i REPLACE
- Information A Information A2 REPLACE
- Information a Information A2 REPLACE
- Information Aa Information A2 REPLACE
- Switch Switch2 REPLACE

CODESYS detects duplicate text list entries and removes them. Afterwards, the global text list contains the following source texts:

![Text visualization]

The texts in the visualization have been replaced.

Managing dynamic text in text lists

You can create and translate texts in a text list for dynamic texts in order to show them dynamically in a visualization or in the alarm management. The object of type “Text list” can be located globally in the POUs view or below an application in the device tree. It contains a table with text list entries that you can edit and extend. A text list entry consists of an ID for identification, the output text, and its translation. You can add new text list entries to a text list. Menu commands are provided for this purpose.

Creating text lists for dynamic text output

Requirement: A project is open with a visualization.

1. Select an application in the POUs view or device tree and click “Project ➔ Add Object”.
2. Select “Text list”.
3. Type a name (example: Textliste_A). Click “Add” to close the dialog.
   ➞ An object of type “Text list” is created.
4. Click below the “Default” column and open the input field. Type a text (example: Information).
   ➞ The source text is created. It is used as a key in the table and as a source text for translations.
5. Type any string in the “ID” column (example: A).
   ➞ A text list entry is defined with source text and ID. If you configure the “Dynamic texts” property of an element in a visualization, then you can select the text list Textliste_A and assign the ID A.
6. Double-click in the blank line at the end of the table below “Default” and type in more text list entries.

<table>
<thead>
<tr>
<th>ID</th>
<th>Standard</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>Information A</td>
</tr>
<tr>
<td>B</td>
<td>Information B</td>
</tr>
<tr>
<td>C</td>
<td>Information: OK</td>
</tr>
</tbody>
</table>

Displaying text dynamically

In a visualization, you can configure the dynamic output of texts that were created in a text list by configuring the “Dynamic texts” property of an element. You can directly assign a text list and an ID, as well as IEC variables, where you set the values programmatically.

Requirement: A project with visualization is open and a text list is in the device tree.

1. Open the text list (example: Text_list_A).
2. Double-click the visualization.
   ➞ The editor opens.
3. Drag an element to the visualization (example: a “Text field”).
4. Configure its “Dynamic texts” property by selecting one in the “Text list” property (example: 'Text_list_A') and add an ID from the text list into the “Text index” (example: 'A'). Pay attention to the single straight quotation marks. You can also assign an IEC variable of type STRING for the text list name and ID.

   ⇒ The IEC variables allow for programmatic access to the texts of the text lists.

5. Build the application, download it to the controller, and start it.

   ⇒ The visualization shows the text from the text list in the text field: Information A.

See also
● Chapter 6.4.1.21.2.28 “Object 'Text List’” on page 2532

6.4.1.9.11 Using image pools

An image pool is a table of image files. CODESYS references image files for use in the project (for example, in a visualization) uniquely by the ID and name of the image pool. A project can include several image pools. You can create image pools in the device tree below the application or in the POU pool. In a library project, you can use the object properties of an image pool to turn it into a symbol library for the visualization.

We recommend that you reduce the size of image files as much as possible integrating them. This will optimize the loading time of the visualization in every visualization type: TargetVisu, WebVisu and development system.

If you insert an image element into a visualization and enter an ID (“Static ID”) in the element properties, then CODESYS automatically creates a global image pool. CODESYS uses the default name “GlobalImagePool” for this.

Please note the following when the ID of an image file appears in several image pools.

● Search order: If you selected an image managed in “GlobalImagePool”, then you do not have to enter the name of the image pool. The search order for image files is as follows:
  1. GlobalImagePool
  2. Image pools assigned to the currently active application
  3. Image pools next to the GlobalImagePool in the POU window
  4. Image pools in libraries

● Unique access: You can reference a selected image directly and uniquely by appending the image ID to the name of the image pool in the following syntax:\"<pool name>.<image ID>\".

See also
● Chapter 6.4.1.21.2.15 “Object 'Image Pool’” on page 2468
● Chapter 6.4.1.21.4.11.18 “Dialog 'Properties' - 'Image Pool’” on page 2764

Creating image pools

1. Select the “Application” object in the device tree.
   Click “Project ➔ Add Object ➔ Image Pool”.
   ⇒ The “Add Image Pool” dialog box opens.

2. Type a name for the image pool (for example, "Images1") and click “Add”.
   ⇒ The image pool is added to the device tree.

3. Select the image pool object and open by choosing the command “Project ➔ Edit Object”.
4. Double-click the field in the “ID” column and assign an appropriate ID (for example, “Icon1”).
   You can also add new images to the list by clicking “Imagepool ➔ Add Image File”.
5. Double-click the field in the “File name” column. Click for more settings (…).
   The “Select Image” dialog box opens.
6. Click for more settings (….) and select the image file.
   A thumbnail of the image file is displayed in the field of the column “Image”. The name
   of the file is displayed in the field of the column “File name”.

The image file can be references only by the name Images1.Icon1.

See also
- Chapter 6.4.1.21.3.16.1 “Command ‘Insert Image’” on page 2717

**Using image files in the 'Image' visualization element**

When you insert an image element into a visualization, you can define the image type.
- Static image: Enter the image ID of the image file or the name of the image pool plus the
  image ID into the element configuration (property “Static ID”). Please note the comments for
  the search order and access.
- Dynamic image: Type the variable for defining the image file ID (for example,
  PLC_PRG.imagevar) in the element configuration (“Bitmap ID variable” property). You can
  exchange a dynamic element in online mode depending on a variable.

See also
- Chapter 6.4.5.20.1.5 “Visualization Element 'Image'” on page 3038

**Using image files for the visualization background**

You can set an image in the background definition of a visualization. You can define the
image by the name of the image pool plus the filename, as described above for a visualization
element.

See also
- Chapter 6.4.5.21.2.10 “Command ‘Background’” on page 3349

**6.4.1.9.12 Programmatic Access to I/Os**

**General**

CODESYS provides the following features for mapping project variables to input, output and
memory addresses:
- Assignment of project variables to input, output and memory addresses in the “I/O Mapping”
  tab of the device editor
- Programmed access to I/Os
  - Variables configuration
  - AT declaration

**NOTICE!**

We recommend that you define the mapping of project variables to input, output
and memory addresses in the “I/O Mapping” of the editor of the respective
device.

See also
- Chapter 6.4.1.8.2 “Configuring Devices and I/O Mapping” on page 1836
Variables configuration - VAR_CONFIG

Use the variables configuration for mapping variables of functions blocks to the process map. For declarations in the function block, assign the variables to the device inputs/outputs without providing the full address. Later, the exact address is provided centrally for all function block instances of the application in a global variable list including VAR_CONFIG declarations. This global variables list with the VAR_CONFIG declarations is termed the "variables configuration".

**NOTICE!**
For changes to variables that are assigned to I/O addresses, CODESYS displays them immediately in the process map. For changes to variables that are mapped by a variables configuration, CODESYS displays them not until the end of the responsible task.

Declaration of variables in functions blocks

When declaring variables in a function block, declare the variables between the keywords VAR and END_VAR and assign incomplete addresses to the variables. Mark these incomplete addresses with an asterisk (*).

Syntax:

```
<identifier> AT %<I|Q>*:<data type>;
```

**Example**
Define two local I/O variables: the input variable xLocIn and the output variable xLocOut.

```plaintext
FUNCTION_BLOCK locio
VAR
  xLocIn AT %I*: BOOL := TRUE;
  xLocOut AT %Q*: BOOL;
END_VAR
```

Final definition of addresses in the variables configuration of the global variables list

In the global variables list that you use as the variables configuration, define the variable declarations with the absolute addresses between the keywords VAR_CONFIG and END_VAR.

You must declare the VAR_CONFIG variables with the complete instance path, separating the individual POU and instance name by a dot (.). The declaration must include an address whose class (input/output) agrees with the class of the incomplete address (%I*, %Q*) in the function block. The data type must also agree.

Syntax:

```
<instance variable path> AT %<I|Q><location>: <data type>;
```

If the path instance does not exist, then an error is reported. CODESYS prints an error also if there is not an address configuration available for a variable that you declared with an incomplete address.

**Example**
The locio function block in the example above is used in a program as follows:

```plaintext
PROGRAM PLC_PRG
VAR
  locioVar1: locio;
  locioVar2: locio;
END_VAR
```

A correct variables configuration in a global variable list could then look like this:

```
VAR_CONFIG
  PLC_PRG.locioVar1.xLocIn AT %IX1.0 : BOOL;
  PLC_PRG.locioVar1.xLocOut AT %QX0.0 : BOOL;
  PLC_PRG.locioVar2.xLocIn AT %IX1.0 : BOOL;
  PLC_PRG.locioVar2.xLocOut AT %QX0.3 : BOOL;
END_VAR
```
Creating a variables configuration

Requirement: You have a project open that includes a controller configuration with a field device. The project contains a program (e.g. PLC_PRG) and a function block (e.g. func1). The field device has inputs and outputs. The textual view is selected in the options for the declaration editor.

1. Double-click a function block in the device tree (e.g. func1).
   → The function block editor opens.
2. Type the following between the keywords VAR and END_VAR:
   xLocIn AT %I*: BOOL := TRUE;
   and
   XLocOut AT %Q*:BOOL; in the next line.
   → You have declared an input variable xLocIn and assigned it to the incomplete input address %I* of a field device. You have assigned the declared output variables have to the incomplete output address %Q*.
3. Click the PLC_PRG object in the device tree and add the following to the declaration section of the program between VAR and END_VAR:
   locioVar1: func;
   locioVar2: func;
4. Right-click the “Application” object in the device tree and click “Add Object → Global Variable List” and then click “Add” in the “Add Global Variable List” dialog box.
   → The global variables list is added to the device tree and opens in the editor.
5. Change the keyword VAR_GLOBAL to VAR_CONFIG.
6. Click “Declarations → Add All Instance Paths”.
   → The following instance paths are added:
   PLC_PRG.logioVar1.xLocIn AT %I*;
   PLC_PRG.logioVar2.xLocIn AT %I*;
   PLC_PRG.logioVar1.xLocOut AT %Q*;
   PLC_PRG.logioVar2.xLocOut AT %Q*;
7. Now, replace the incomplete addresses %I* and %Q* with the absolute, complete addresses.

See also
- Chapter 6.4.1.20.2.11 “Configuration variables - VAR_CONFIG” on page 2121
- Chapter 6.4.1.9.12.3 “AT declaration” on page 1902
- Chapter 6.4.1.20.4.12 “Addresses” on page 2231

AT declaration

In the variables declaration, the code AT assigns a project variable to a specific input address, output address, or memory address of the PLC that is configured in the device tree. You can also define the assignment of variables to an address in the “I/O Mapping” dialog of the device in the PLC configuration.

Syntax

<variable name> AT <address> : <data type>;

<address> : %<memory area prefix> ( <size prefix> )? <memory position>
The AT declaration allows you to give the address a meaningful name. You can make any necessary changes for the input or output signals at just one location, for example in the declaration.

### Examples

<table>
<thead>
<tr>
<th>Declaration</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VAR wInput AT %IW0 : WORD; END_VAR</td>
<td>Variable declaration with address information of an input word</td>
</tr>
<tr>
<td>VAR xActuator AT %QW0 : BOOL; END_VAR</td>
<td>Boolean variable declaration</td>
</tr>
<tr>
<td>Note: For Boolean variables, one byte is allocated internally if a single bit address is not specified. A change in the value of \textit{xActuator} affects the range from \textit{QX0.0} to \textit{QX0.7}.</td>
<td></td>
</tr>
<tr>
<td>VAR xSensor AT IX7.5 : BOOL; END_VAR</td>
<td>Boolean variable declaration with explicit specification of a single bit address. On access, only the input bit 7.5 is read.</td>
</tr>
<tr>
<td>VAR xSensor AT IX* : BOOL; END_VAR</td>
<td>For the address specification, the placeholder * is given instead of the memory position. The final address specification is done in the variables configuration.</td>
</tr>
<tr>
<td>Note: This is possible in function blocks.</td>
<td></td>
</tr>
</tbody>
</table>

If you assign a variable to an address, please note the following:

- You cannot write to variables that are placed at inputs. This will cause a compiler error.
- You can perform AT declarations only for local and global variables, not for input/output variables of POU's.
- Furthermore, AT declarations cannot be used in persistent variable lists.
- If you use AT declarations for structure components or function block variables, then all instances use the same memory. This is just like using static variables in classic programming languages, such as C.
- The memory layout of structures also depends on the target system.

**NOTICE!**

If you do not specify a single bit address explicitly, then Boolean variables are allocated byte-by-byte.

**Example**

```plaintext
PROGRAM PLC_PRG
VAR
    xVar AT %QW0 : BOOL;
END_VAR

xVar := TRUE;
```

When the variable \textit{xVar} is written, the output memory range from \textit{QX0.0} to \textit{QX0.7} is affected.

6.4.1.9.13 Checking Syntax and Analyzing Code

General

CODESYS provides useful functions for detecting errors and assisting you while you create programs. The syntax check flags errors and prints them to the message view as early as the programming phase.

The static code analysis in CODESYS also assists you in complying with defined coding guidelines and detecting weak constructs.

See also
- Chapter 6.4.1.9.13.2 “Checking Syntax” on page 1904
- Chapter 6.4.1.9.13.3 “Analyzing code statically” on page 1904

Checking Syntax

When you input code, the precompile in CODESYS already runs some basic checks. Then, wavy underlines appear under buggy code in the editor and an error message is printed to the messages view.

CODESYS automatically generates the application code from the source code that was written in the development system. This is done automatically before downloading the application to the PLC. Before the application code is generated, a test is performed for checking the allocations, the data types, and the availability of libraries. Moreover, the memory addresses are allocated when the application code is generated. You can click "Build ➔ Generate Code" to execute this command explicitly, or press the [F11] key. This is useful for detecting any errors in your source code, even when the PLC is not connected yet.

CODESYS prints all errors and warnings to the "Build" category of the messages view. Double-clicking the error message opens the respective POU in the editor with the buggy code marked. As an alternative, you can also jump to the buggy code by right-clicking the error message.

Note the settings for this in the CODESYS options.

See also
- Chapter 6.4.1.21.4.14.24 “Dialog ‘Options’ - ‘SmartCoding’” on page 2796

Analyzing code statically

You can subject your source code also to static analysis (lint) during the code generation. This determines whether or not your source code complies with the coding guidelines that you defined - according to the idea behind the lint analysis tool.

- You activate the rules to the checked in the “Project Settings” dialog in the “Static Analysis Light” category. The check itself is performed automatically each time code is generated, for example when you click “Build ➔ Generate Code”. If divergence from the rules is determined, then it is reported as an error message in the “Build” category of the message view. The reported errors have the prefix `SA<number>`.

**NOTICE!**

For static code analysis with “Static Analysis Light”, only the application code of the project is checked. Libraries are excluded from the check.

GVL variables in the “POUs” view are not necessarily checked: If you have a project with several applications, then only the objects in the active application are checked. If you have only one application, then the objects in the common POU pool are also checked.
“Static Analysis Light” includes only a reduced set of rules in the default development system. A larger set of rules, additional naming conventions, and metrics are available when you install the CODESYS Static Analysis add-on.

Deactivating lines of code in the implementations with pragmas from the static analysis

By means of the pragma `{analysis ...}`, you can mark code so that the specified rules are not checked. As a result, the marked lines of code are not subjected to static analysis. The marked code is ignored during the check.

Syntax:
```
{analysis <sign><rule number>|,<other combinations of signs and rules, comma-separated>}
```
- `<rule number>`: Deactivate the rule SA<rule number>.
- `<rule number>`: Activate the rule SA<rule number>.

Requirement: Rules are activated in the “Project Settings” dialog.

1. Add the pragma `{analysis -<number>}` above the line of code that contains code not to be checked first of all. For example, for the rule SA0024
   - The line of code is the first line of the code snippet that is not checked with rule 24.
2. Add the pragma `{analysis -<number>}` below the line of code that contains code not to be checked first of all. For example, for the rule SA0024
   - The line of code above is the last line of the code snippet that is not checked with rule 24.

Example:
Ignore untyped literal

```
{analysis -24}
nTest := 99;
iVar := INT#2;
{analysis +24}
```

The rule “SA0024: Untyped literals only” is deactivated for two lines. An error is not issued although the code does not correct to: `nTest := DINT#99;`

Example:
Ignore several rules

```
{analysis -10, -24, -18}
...{analysis +10, +24, +18}
```

“SA0010: Arrays with only one component”
“SA0018: Unusual bit access”
“SA0024: Untyped literals only”

However, you cannot deactivate the rule SA0004: “Multiple Write Access on Output” with a pragma.
Excluding programming objects with pragmas from the static analysis

Syntax:
{attribute 'analysis' := '-<rule number>[,<other negative rule numbers, comma-separated>]'}

When you insert the attribute pragma in the declaration part of a programming object, the specified rules are excluded for the entire programming object. If multiple rules are excluded, then the rules are each comma-separated with a dash and a number. A pragma statement for activation is not required.

Example

```plaintext
{attribute 'analysis' := '-33, -31'}
TYPE LocalData :
  STRUCT
    iLocal : INT;
    uiLocal : UINT;
    udiLocal : UDINT;
  END_STRUCT
END_TYPE
```

The rules SA0033 and SA0031 are ignored for the structure LocalData.

```plaintext
{attribute 'analysis' := '-100'}
big: ARRAY[1..10000] OF DWORD;
```

The rule SA0100 is ignored for the array big.

- Chapter 6.4.1.21.4.12.9 “Dialog ‘Project Settings’ - ‘Static Analysis Light’” on page 2773

6.4.1.9.14 Orientation and Navigation

Using the cross-reference list to find occurrences

The occurrences of symbols of a variable, a POU (program, function block, function), or a DUT can be displayed in a cross-reference list. Then you can jump from the list directly to the corresponding locations in the project.

There are two ways to search for occurrence locations of a symbol:
- Plain text search: You manually specify a text (symbol name, placeholder) in the “Cross-Reference list” view.
- Search for a specific declaration:
  - In the “Cross-Reference List” view, you select the declaration from the input assistant.
  - The focus is on a symbol name in the POU editor and you start the cross-reference search from the context menu.
  - The focus is on a symbol name in the POU editor, the “Cross-Reference List” view is open, and the cross-reference search executes automatically.
  - In the “Cross-Reference List” view which already lists occurrence locations for several declarations, you limit these results to a specific declaration.
Requirement: The “Cross-Reference List” view is open.

1. Specify a string in the field next to the name, for example the identifier of the variable for which you want to find the occurrence location in the project. Example: "iCounter".
   For the text search, you can use the asterisk "*" (for any number of characters) or the question mark "?" (for an exact number of characters) combined with a substring of a variable identifier.
   Use the percent sign "%" to search for IEC addresses. Examples: "%MW8", "%M%".
2. Click the ➡ button to start a text search in the project.
   ➡ The view “Cross-Reference List” opens and displays the occurrence locations for the iCounter variable. The declaration parts are always displayed in the project with the occurrence location indented.
3. Double-click an occurrence location in the cross-reference list.
   ➡ The respective object opens in the editor with the marked occurrence location.

Requirement: A POU is open in the editor.

From the POU editor, with a menu command

1. Set the cursor at the identifier of the symbol (variable, POU) in the declaration part or implementation part.
2. Click “Browse for Symbol ➔ Browse Cross-References” in the context menu or “Edit” menu.
   ➡ The “Cross-Reference List” view opens and shows the occurrence locations of the variables or POU.

If the “Cross-Reference List” view is already open, then you can also search the occurrence locations for a specific result as follows:

From the POU editor, automatic

Select the “Automatically list selection in cross reference view” check box in “Tools ➔ Options” (“SmartCoding” category). Select the name of the symbol in the POU, or set the cursor in the name.
   ➡ Depending on the position of the selection or cursor, the cross-reference list automatically shows the occurrence locations for the respective symbol.

In the cross-reference list view, with input assistance

In the “Cross-Reference List” view, use the input assistant 🔍 to specify a symbol name in the field next to “By declaration”.
   ➡ The cross-reference list displays the occurrence locations for the symbol.

In the cross-reference list view, limited to a specific declaration

If multiple declarations for a symbol are listed in the “Cross-Reference List” view, for example after a text search, then you can reduce the display to one result: Select the line with the desired declaration and click the ➡ button or click “Limit Results to Current Declaration” in the context menu.
   ➡ The cross-reference list includes only the occurrence locations for the selected declaration.
Finding declarations

CODESYS provides the capability of searching the entire project for the definition location of a variable or function. The block that includes the definition opens in the editor with the marked declaration.

Finding the declaration of a variable

Requirement: You have opened a POU in the editor.

1. Set the cursor at an identifier in the implementation section.
2. Click “Edit ➔ Browse ➔ Go to Definition”.

⇒ The POU with the declaration opens in the editor with the variable definition marked. If the definition is located in a compiled library, then the respective block opens in the library manager.

You can execute this command in both online and offline mode.

Examples

The following block includes a function block definition (fbinst), a program call (prog_y()), and a function block call (fbinst.out):

VAR fbinst:fb1; ivar:INT; END_VAR prog_y(); ivar:=prog_y.y;
res1:=fbinst.out;

If the cursor is located at prog_y, then the command opens the program prog_y in the editor.
If the cursor is located at fbinst, then this command focuses in the declaration section at line fbinst:fb1;
If you set the cursor at out, then this command opens the function block fb1 in its editor.

Setting and using bookmarks

Bookmarks are used for easy navigation through long programs. You can use bookmarks in all implementation language editors, except SFC (sequential function chart). Commands help to navigate directly to the marked position in the program.

Setting and deleting bookmarks

Requirement: The POU is open in the editor.
1. Set the cursor at any program line.
2. Click “Edit ➔ Bookmarks ➔ Toggle Bookmark”.
   ⇒ A bookmark is set at this position in the program. This is marked by the bookmark symbol ▶.
3. Set several bookmarks at different places in the program.
4. Set the cursor at a bookmarked program line.
5. Click “Edit ➔ Bookmarks ➔ Toggle Bookmark”.
   ⇒ The bookmark is removed. The bookmark symbol ▶ is deleted.

As an alternative to this, you can delete one or more bookmarks in the “Bookmarks” view by clicking the X button. For this purpose, the corresponding bookmarks have to be selected in the “Bookmarks” view.

Click “Edit ➔ Bookmarks ➔ Clear All Bookmarks (Active Editor)” to remove all bookmarks from the active POU.

In order to delete all bookmarks in a project, click “Clear All Bookmarks”. However, for this command to be available, you first have to add it to a menu by means of the command “Tools ➔ Customize”.

See also
• Chapter 6.4.1.21.3.3.22 “Command ‘Toggle Bookmark’” on page 2569
• Chapter 6.4.1.21.3.3.27 “Command ‘Clear All Bookmarks (Active Editor)’” on page 2571
• Chapter 6.4.1.21.3.3.28 “Command ‘Clear All Bookmarks’” on page 2571

Jumping to bookmarks within a POU

Requirement: The POU is open in the editor. Multiple bookmarks are set.

1. Click “Edit ➔ Bookmarks ➔ Next Bookmark (Active Editor)”.
   ⇒ Depending on the current cursor position, the cursor jumps to the next bookmark (see below).
2. Click “Edit ➔ Bookmarks ➔ Previous Bookmark (Active Editor)”.
   ⇒ Depending on the current cursor position, the cursor jumps to the previous bookmark (see above).

See also
• Chapter 6.4.1.21.3.3.23 “Command ‘Next Bookmark (Active Editor)’” on page 2570
• Chapter 6.4.1.21.3.3.25 “Command ‘Previous Bookmark (Active Editor)’” on page 2570

Jumping to bookmarks of different POUs in a project

A project is open with multiple POUs. Multiple bookmarks are set in different POUs.
1. Click “View ➔ Bookmarks”.  
   ➔ The “Bookmarks” view opens.  
   All bookmarks in the project are listed in a table in the view.
2. Click the “Next Bookmark” button.  
   ➔ In the “Bookmarks” view, the bookmark in the row below the selected bookmark is selected.  
   The POU with the recently selected bookmark in the table opens in the editor and the row with the bookmark is selected in the POU.
3. As in step 2, you can click the “Previous Bookmark” button to jump to the bookmark in the project that is displayed in the row above it in the “Bookmarks” view.

See also
- Chapter 6.4.1.21.3.4.11 “Command 'Bookmarks'” on page 2585
- Chapter 6.4.1.21.3.3.26 “Command 'Previous Bookmark'” on page 2570
- Chapter 6.4.1.21.3.3.24 “Command 'Next Bookmark'” on page 2570

6.4.1.15 Searching and replacing in the entire project
In CODESYS you can search for strings in single objects or project-wide. If required, you can replace the string found.
1. Choose the command “Search” in the main menu “Edit ➔ Search Replace”.  
   ➔ The dialog “Find” opens.
2. Enter the string to be found in the field “Find what”.  
3. Activate the search options  
4. Define the objects to be searched by choosing an entry from the combobox “Search”.  
5. Click on the button “Find Next”.  
   ➔ The first hit is displayed.
6. Click on the button “Replace” to replace the string found by a different one.  
7. Click on the button “Find All” to get a list of all hits.

See also
- Chapter 6.4.1.21.3.3.2 “Command 'Find', 'Find in Project'” on page 2563
- Chapter 6.4.1.21.3.3.3 “Command 'Replace', 'Replace in Project'” on page 2564

6.4.1.16 Refactoring
In general, refactoring is a technique for improving the design of existing software code without changing the way it functions.
In CODESYS, refactoring provides functions for renaming objects and variables and updating referenced pins. You can display all occurrences of renamed objects and variables and then rename them all at once or individually. In “Tools ➔ Options”, you can also configure where CODESYS will prompt you for refactoring.

Renaming global variables
Requirement: A project is open that includes at least a function block “FB” and a global variable list. The global variable list “GVL” is open in the editor and contains a variable declaration (example: iGlobal). “FB” uses iGlobal.
Renaming global variables throughout the project

1. Select the global variable name `iGlobal`.
2. Right-click the variable and click “Refactoring ➔ Rename `iGlobal`”.
3. In the “Rename” dialog, type a name in the “New name” input field, for example `iGlobalOK`, and click “OK”.
   - The “Refactoring” dialog opens. In the device tree view on the left, the “GVL” and “FB” objects are highlighted in red and yellow. In the view on the right, “FB” is in open in its editor and `iGlobal` has already been renamed as `iGlobalOK`.
4. Click “OK”.
   - No global variable `iGlobal` is in your project. Now `iGlobalOK` is everywhere.

Renaming global variables throughout the project (except for a POU)

1. Select the global variable name `iGlobal`.
2. Right-click the variable and click “Refactoring ➔ Rename `iGlobal`”.
3. In the “Rename” dialog, type a name in the “New name” input field, for example `iGlobalTest`, and click “OK”.
   - The “Refactoring” dialog opens. In the device tree view on the left, the “GVL” and “FB” objects are highlighted in red and yellow. In the window on the right, the function block “FB” is open in its editor. `iGlobalTest` is listed instead of `iGlobal`.
4. Right-click in the view on the right.
5. Click “Reject this Object” and click “OK”.
   - The global variable `iGlobal` is available in “FB” in your project. The variable `iGlobalTest` is now specified in the objects where the previous variable occurred.
   - The error message in the message view reports that the `iGlobal` identifier is not defined.

Adding and removing input variables

In the declaration part of blocks, you can add and delete input and output variables by using the refactoring commands. CODESYS performs updates at the occurrence locations and calling locations of the blocks. You can accept or reject these updates individually. The “Refactoring” dialog also opens for this purpose.

Requirement: The FCT (function type) POU is open in the editor. The function already contains the input variables `input1`, `input2`, and `inputx`. They are called in the PLC_PRG and POU programs.

1. Set the focus in the declaration part of the FCT function.
2. Click “Refactoring ➔ Add Variable”.
   - The default dialog opens for declaring variables.
3. Declare the variable `input_3` with the scope of `VAR_INPUT` and data type `INT`. Click “OK” to close the dialog.
   - The “Refactoring” dialog opens (see figure below). The affected locations are marked in yellow. (1)+(2)
4. In the upper right corner, select “Add inputs with placeholder text” from the drop-down list. (3).
5. In the left side of the window, click one of the highlighted objects (for example, PLC_PRG). Right-click and choose the “Accept Whole Project” command to add the new variable at the new location of use in FCT for the entire project.
   - You see the change in the implementation part of PLC_PRG in the view on the right: The placeholder `_REFACTOR_` appears at the location where the new variable was added.
6. Click “OK” to close the “Refactoring” dialog.
7. Click “Edit ➤ Find”. Search the project for "_REFACTOR_" to check and edit the affected locations.

8. Note: As an alternative, you can insert the new variable with another initialization value without working with a placeholder first. In this case, in Step 4 you select "Add inputs with the following value" and type the value in the field on the right side of the drop-down list.

Example of a new variable with placeholder text in a CFC block:

Please note that you can also remove variables with refactoring.

Reordering variables in the declaration

In the declaration part of function blocks, you can change the order of declarations by refactoring. This is possible for declarations with scope VAR_INPUT, VAR_OUTPUT, or VAR_IN_OUT.

Requirement: The declaration part of a POU is open and includes declarations, for example:
VAR_INPUT
  invar2 : INT;
  invar1 : INT;
  in : DUT;
  bvar : BOOL;
  invar3 : INT;
END_VAR

1. Right-click in this declaration block to access the context menu.
2. Click “Refactoring ➔ Reorder Variables”.
   ⇨ The “Reorder” dialog opens with a list of VAR_INPUT variables.
3. Drag the “invar1 : INT;” entry to the position before the “invar2.” entry.
   ⇨ The invar1 declaration is now at the top position.
4. Click “OK” to close the dialog.
   ⇨ The “Refactoring” dialog opens. The affected locations are marked in yellow (see figure above).
5. Click “OK” to accept the new order for the function block.

Changing a variable declaration and applying refactoring automatically

Refactoring helps you in the declaration when renaming variables (by means of "Auto declare").

☐ Requirement: Function block fb_A.
1. Click “Tools ➔ Options”.
   ⇨ The “Options” dialog opens.
2. Select the “Refactoring” category.
3. In “Auto-Declare”, activate the options “On renaming variables” and “On adding or removing variables, or for changing the namespace”.
4. Double-click the function block fb_A.
5. Select a variable in the declaration of fb_A, for example iA. As an alternative, you can set the cursor before or in the variable.
6. Specify “Edit ➔ Declare variable” ([Shift]+[F2]).
   ⇨ The “Declare Variable” dialog opens. The dialog includes the settings of iA.
7. Change the name of iA to iCounter_A.
8. The option “Changes by means of refactoring” appears and is activated.
9. Click “OK”.
   ⇨ The dialog “Refactoring “Renaming from iA to iCounterA” opens. All locations affected by the variable renaming are marked there.
10. Click “OK” to close the dialog.
    ⇨ The changes are applied.

6.4.1.9.17 Task Configuration

General

In the task configuration, you define one or more tasks for controlling and executing the application program in the controller. Each application must include a “Task Configuration” object.

A task is a time-based flow unit of an IEC program. You define a task with a name, a priority, and a type, which determines which condition triggers the start of the task. You can define this condition either by time (cyclic-interval, freewheeling) or by the occurrence of an internal or external event to process the task. Examples of an event are the rising edge of a global project variable or an interrupt event of the controller.

A task calls one or more program blocks (POUs). These programs can be application-specific (objects below the application in the device tree) or project-specific (objects available in the POU window). In the case of a project-specific program, the application instances the project-global program. If CODESYS processes the task in the current cycle, then the programs are executed for the duration of a cycle.

With the combination of priority and condition, you define the order in which the tasks are processed. You can configure a watchdog for each task, and you can link a start, stop, and reset directly to the execution of the project block.

Rules for the processing order of the defined tasks:

- If the task condition is satisfied, then CODESYS processes the task.
- If several tasks satisfy the condition for processing at the same time, then CODESYS processes the tasks with the highest priority first.
- If several tasks with the same priority level satisfy the condition for processing at the same time, then CODESYS processes the longest waiting task first.
- The program calls are processed in the order they appear in the configuration dialog of the task.
- If a called program has the same name in the device tree of the application and in a library or project-global in the POU window, then the application program is used.

Attention

All tasks share one process map. The reason is as follows: When each task has its own individual process map, performance is compromised. However, the process map can be consistent only with one task. When you create a project, you must ensure that the application copies the input and output data to a safe location in case of conflicts. Modules, such as the library SysSem, provide the capability of solving consistency and synchronization problems.

Consistency problems can also occur when accessing other global objects, such as global variables or blocks. Consistency problems always occur if several tasks read and write to one variable. Modules, such as the library SysSem, are available as a solution.

Creating a task configuration

Requirement: The open project includes a program-type POU and a “Task Configuration” with a “Task” object has been inserted below “Application” in the device tree.

1. Double-click the task object below “Task Configuration” in the device tree.
   - The “Configuration” tab of the task object opens.
2. In the “Type” dropdown list, click “Cyclic”.
   - The “Interval (e.g. t#200ms)” input field appears.
3. Enter t#300ms in the “Interval (e.g. t#200ms)” input field.
4. Click “Add Call”.
   - The Input Assistant opens.
5. In “Input Assistant ➔ Categories” ➔ “Programs”, click the desired POU and then click “OK”.

   CODESYS inserts the selected POU into the POU list of the “Configuration” tab and below the task object in the device tree.

   When the application is executed from the controller, CODESYS executes the selected POU in cyclical intervals of 300 ms.

   ● % Chapter 6.4.1.21.2.30.2 “Tab ‘Configuration’” on page 2538

**Definitions of Jitter and Latency**

In the “Task Configuration” object, on the “Watchdog” tab, you can monitor the periodic jitter values of the individual tasks at runtime. The periodic jitter is differentiated from latency-based release jitter. See the following definitions:

**Periodic jitter**

Periodic jitter ($J_{\text{per}}$) is the deviation of the cycle time of a task ($T_{\text{per}}$) from the desired task cycle time ($T_0$).

\[ J_{\text{per}} = T_{\text{per}} - T_0 \]

The desired (ideal) cycle time $T_0$ is specified in the configuration of the task as “Interval”.

You can monitor the current value, as well as the maximum and minimum value of the periodic jitter, on the “Watchdog” tab of the “Task Configuration”.

*If the sum of all negative $J_{\text{per}}$ values and the sum of all positive $J_{\text{per}}$ values do not balance each other, then a drift results.*

**Latency**

Latency is the delay between the invocation of a task and the actual start of its release.

**Release jitter**

The release jitter $J_r$ is the difference between the maximum and the minimum latency ($L$) that has ever occurred.

\[ J_r = L_{\text{max}} - L_{\text{min}} \]

In the case that $L_{\text{max}} = L_{\text{min}}$, a release jitter $J_r$ of 0. results. This corresponds to a plain offset shift.

**6.4.1.9.18 Protecting an application**

You achieve the know-how protection and copy protection of a boot application with the help of PLC-specific license management and its settings in the object properties of the application. The download code and the boot application can be encrypted and signed.
**Encryption with a dongle**

Requirements: You have a project with an application that you want to download to the controller as an encrypted boot application. A security key for license management is connected to your computer.

1. Select the application in the device tree.
2. Select the “Properties” command in the context menu.
   ð The “Properties - <application name>” dialog opens.
3. Click the “Security” tab.
4. For “Encryption Technology”, select the “Simple Encryption” option and type the “Product Code” that you received from the hardware manufacturer for the controller. Depending on the controller, it is protected either by a security key (firmcode is shown automatically) or by an integrated Wibu memory card for example.
5. Click “Online ➔ Login” and download the application.
   ð If the matching security key and/or valid license is available, then you can download the application to the controller. By default, a boot application is automatically created at this time in the controller directory. The default setting is defined in the application “Properties”, in the “Boot Application” category.
6. Logout, change the application, and login again.
   ð You are prompted to perform an online change. The dialog provides the option of updating the boot application on the PLC. If the security key and license match, then you can log in. If not, then you receive a corresponding message.

**Encrypting with certificates**

Requirements: You have a project with an application that you want to download to the controller as an encrypted boot application. In the Windows Certificate Store of your computer, you have a certificate of this controller for encrypting the application. Note: In case you want to download the application to different controllers, you will need the appropriate certificate for each controller.

1. Select the application in the device tree.
2. Select the “Properties” command in the context menu.
   ð The “Properties - <application name>” dialog opens.
3. Click the “Security” tab.
   ð The “Certificates” group is enabled.
5. If there are not any certificates listed in the table, then click the button.
   ð The “Certificate Selection” dialog opens for selecting a certificate from the local Windows Certificate Store.
6. In the lower area, select a certificate and add it to the upper area by clicking the button, Click “OK” to confirm.
   ð The certificate is shown in the “Certificates” group of the “Encryption” dialog.
7. Select the certificate and click “Apply” or “OK”.
   ð The certificate is now used to encrypt the application. It can only be transferred to the controller on computers that have an corresponding key installed in the Windows Certificate Store.

- ☰ Chapter 6.4.1.21.4.11.4 “Dialog: Properties: Security” on page 2754
1. Click in the status bar of CODESYS to open the “Security Screen” view. Then select a certificate with a private key for a user profile for the “Digital signature”. The procedure is described in the instructions "Configuring a certificate for the digital signature in a user profile".

2. Double-click the certificate for the “Digital signature” in the “User” tab.
   - The “Certificate” dialog opens.

3. On the “Details” tab, click “Copy to file”.
   - The “Certificate Export Wizard” starts.

4. In the “Export Private Key” prompt, select the “No, do not export the private key” option.

5. For “Export File Format”, select the “DER encoded binary X.509 (.CER)” option.

6. In the next step, select a file name and the location for the certificate.

7. After the last step “Finish”, a message appears that the export was successful.

8. After successful export to CODESYS, open the device editor by double-clicking the controller in the device tree and selecting the “Files” tab for the file transfer.

9. Select the “Path” cert/import in the right side of the “Runtime” dialog.

10. On the left side of the dialog for “Host”, select the path in the file system where you saved the exported certificate and selected the certificate.

11. Click ➡️.  
   - The certificate is copied to the cert/import folder.

12. Click the “PLC Shell” tab.

13. Type the command cert-import trusted <file name of the certificate.cer> in the input line of the tab and press the [Enter] key. Note that the file name is specified with the extension .cer; otherwise the certificate is not imported successfully.
   - The certificate is created on the controller under trusted. With this certificate, the controller can test the integrity of the boot application.

14. Open the “Security Screen” by double-clicking in the status bar.

15. If you want that downloads, online changes, and boot applications of your project are always encrypted, then select the “Enforce signing of downloads, online changes and boot applications” option in the “Security level” group on the “User” tab. To do this, the “Enforce encryption of downloads, online changes and boot applications” option also has to be selected.

- Chapter 6.4.1.21.4.11.4 “Dialog: Properties: Security” on page 2754

Requirement: The CODESYS Security Agent add-on product is installed.

The “Security Screen” view provides an additional tab: “Devices”. This allows for the configuration of certificates for the encrypted communication with controllers. In this case, see the help for CODESYS Security Agent.

Alternatives:
If you the CODESYS Security Agent is not available to you, then you can proceed as follows by means of the PLC shell of the device editor:

In order to use certificates on the controller for the encryption of downloads, online changes, and boot applications, these certificates first have to be generated on the controller and loaded from the controller and installed in the Windows Certificate Store.

- **Requirement:** You are connected to the controller.

1. **Open the device editor by double-clicking the controller in the device tree, and select the “PLC Shell” tab.**
   - The tab appears with a blank display window. Below that is a command line.
2. **Type ? in the command line and press the [Enter] key.**
   - All commands are listed in the display window.
3. **Type the following command in the command line: cert-getapplist.**
   - All used certificates are listed with information about components and availability with certificates.
4. **If no certificate is available for the CmpApp component, then type the command cert-genselfsigned <Number of the Component in the applist>.**
5. **Click the “Log” tab and then the refresh button (✓).**
   - The display shows whether or not the certificate was generated successfully.
6. **Type in cert-getcertlist and press the [Enter] key.**
   - Your own certificates are listed that can be used for encryption. The information Number and Key usage(s) are useful in the next step.
     - **Number:** The number is specified as a parameter in the next step.
     - **Key usage(s): Data encryption** means that this is a certificate of the controller for a download, online change, and boot application.
7. **Export the required certificate by typing in the command cert-export own 0 and press the [Enter] key.**
   - 0 is the **Number of the certificate with Key usage(s): Data encryption.**
   - The display shows that the certificate has been exported to a cert directory.
8. **Click the “Files” tab of the device editor.**
9. **Click the refresh button (✓) in the right part of the dialog in “Runtime”.**
   - The list of files and directories is refreshed.
10. **Open the “cert” folder in the list and then the “export” subfolder.**
11. **In the left part of the dialog in “Host”, open the directory where the certificate of the controller will be loaded.**
12. **In the right part of the dialog, select the certificate that you have exported and click ➦.**
    - The certificate is copied to the selected directory.
13. **In the file explorer, go to the directory where the certificate was copied and double-click the certificate.**
    - The “Certificate” dialog opens and shows the information about this certificate.
14. **On the “General” tab, click “Install Certificate”.**
    - The “Certificate Import Wizard” starts.
15. **In the “Certificate Storage” dialog, for “Certificate Import Wizard”, select the “Store all certificates in the following store” option and then select the “Controller Certificates” folder.**
    - The controller certificate is imported into the Windows Certificate Store in the “Controller Certificates” folder. Now the certificate is available for the encryption of boot applications, downloads, and online changes.
16. Open the “Security Screen” by double-clicking 📊 in the status bar.

17. If you want that downloads, online changes, and boot applications of your project are always encrypted, then select the “Enforce encryption of downloads, online changes and boot applications” option in the “Security level” group on the “User” tab.

18. Open the “Project” tab and double-click the application in the “Encryption of boot application, download and online change” area.
   ⇒ The properties dialog of the application opens.

19. Click the “Encryption” tab, select “Encryption with certificates” in the “Encryption technology” list box, and click 📊.
   If the “Enforce encryption of downloads, online changes and boot applications” option is selected in the “Security Screen”, then “Encryption with certificates” is already selected.

20. In the “Certificate Selection” dialog, select the respective certificate from the “Controller Certificates” folder and click 📊.

21. Click “OK” to confirm the dialog.
   ⇒ The certificate is displayed in the properties dialog.

22. Confirm the properties dialog of the application.
   ⇒ The certificate is shown on the “Project” tab of the “Security Screen” in the “Encryption of boot application, download and online change” group.

The boot application, download, and online change are encrypted.

### Deleting a certificate for the encryption of boot application, download and, online change

Requirement: The CODESYS Security Agent add-on product is installed. A certificate with the information "Encrypted Application" is already installed on your computer.

1. In the “Security Screen” view, on the “Project” tab, in the bottom view, click the entry for the application.
   ⇒ The “Properties” dialog for the application opens with the “Encryption” tab.

2. For “Encryption Technology”, select “Encryption with certificates”. In the “Certificates” group, click 📊.

3. In the “Certificate Selection” dialog, delete the certificate as described above.

4. Click “OK” to close the “Certificate Selection” dialog.
   ⇒ The certificate is no longer displayed in the “Properties” dialog.

6.4.1.9.19 Data Persistence

General

The lifespan of a variable and its data begins at the time when the variable is created and ends at the time when the variable is deleted and its memory is freed. The time when the variable is created, initialized, or instantiated depends on the declared scope. The time when the memory is freed usually depends on the scope as well. For example, the memory of global variables is freed by exiting the application.

They can retain data longer than usual. The following mechanisms are provided for this purpose.

Mechanisms for data retention

- **(A): Persistent global variable list** with the keyword `PERSISTENT RETAIN`
  Persistent variables retain their values when the application is reloaded. Moreover, the values are restored after a download, warm start, or cold start.

- **(B): Retain variables with the keyword `RETAIN`**
  Retain variables retain their values after a warm start, but not after reloading the application, a download, or a cold start.

- **(C): Variables of the Persistence Manager of the CODESYS Application Composer**
  Variables of the Persistence Manager are stored in an external file.

- **(D): Recipe variables**
  Recipe variables and their values are stored in a recipe file.

Mechanisms in comparison

Which mechanism is suitable for which application? Some common use cases are considered in the table. The specific examples refer to a building control system.
### Table 384: Comparison of mechanisms and use cases

<table>
<thead>
<tr>
<th>Uses case</th>
<th>(A) Persistent variables</th>
<th>(B) Retain variables</th>
<th>(C) Variables of the Persistence Manager</th>
<th>(D) Recipe variables</th>
</tr>
</thead>
</table>
| 1 The application must maintain device settings.  
Example: After a power failure, the building control has to have information available about how long a window blind needs to be raised. | Suitable¹ Preferred use case  
In this case, you can also use retain variables instead of persistent variables. This is advantageous for variables whose declaration is often changed. | Suitable | Suitable²  
This is advantageous for controllers that do not have any hardware support. Special functionalities make this possible, such as double file buffering. | Possible, but very complicated and therefore not recommended. |
| 2 The application must maintain values also after program changes or extensions.  
2a: Rare extensions  
Example: An application programmer extends the program with a new switch and installs a new light. The building control must still have saved values available until then. | Suitable¹ Preferred use case | Suitable | Suitable² | Possible, but complicated. |
| 2b: Unrestricted changes, including deleting or changing the data type of variables  
The building control is running and is persistent. When an application programmer adds a new functionality to the controller and therefore adds another persistent variable to a function block, the values saved up to that point must be retained. For example, the program in an FB is extended with a variable that controls the automatic switching off of a previously uncontrolled lamp after a certain time. The building control must have the times of all controlled lamps available after the extension. | Not suitable | Suitable²  
Data from retain variables are preserved as far as possible after an online change. | Suitable²  
Preferred use case | Possible if textual, but complicated |
<p>| 2c: The application must maintain values after a download. | Suitable | Not suitable | Suitable | Suitable |</p>
<table>
<thead>
<tr>
<th>Uses case</th>
<th>(A) Persistent variables</th>
<th>(B) Retain variables</th>
<th>(C) Variables of the Persistence Manager</th>
<th>(D) Recipe variables</th>
</tr>
</thead>
<tbody>
<tr>
<td>3 The application must be able to use different value sets. Example: The operating settings for summer, winter, and holidays must be saved and imported when needed.</td>
<td>Not suitable</td>
<td>Not suitable</td>
<td>Not suitable</td>
<td>Suitable Preferred use case</td>
</tr>
<tr>
<td>4 The application must be able to use settings from another system. It must be possible to transfer settings to another plant using similar variables.</td>
<td>Not suitable</td>
<td>Not suitable</td>
<td>Suitable²</td>
<td>Suitable³</td>
</tr>
<tr>
<td>5 The application must provide human readable data. The user must be able to read, compare, and edit the data.</td>
<td>Not suitable</td>
<td>Not suitable</td>
<td>Suitable²</td>
<td>Suitable³</td>
</tr>
</tbody>
</table>

¹ Disadvantage: Only possible if the runtime system supports this mechanism and an NVRAM memory or UPS is available. Advantage: Speed; recommended application: 1 and 2a

² Disadvantage: In the case of large variable sets (> 10000), long delays during initialization and shutdown are to be expected. Advantage: No special memory is required; value retention exists even in case of changes, extensions, or deletions.

³ Advantage: Editable remotely, transferable. Disadvantage: Complicated

- % Chapter 6.4.1.21.3.7.5 “Command ‘Load’” on page 2628
Lifespan of variables when downloading a boot project

The values of ordinary variables lose their value and are reinitialized.
The values of persistent variables are protected when:
- The structure of the persistent variable in memory matches the structure in the persistent data list.

The values of retain variables are protected when:
- The structure of the persistent variable in memory matches the structure in the persistent data list.
- The persistent variables match the application (GUID has to agree).

A "Retain mismatch" occurs when the requirements for restoring the values of retain variables and persistent variables are not met when the application is booted. The response to this discrepancy is described in the documentation of the hardware manufacturer.

Note: For the structure of persistent data, refer to the information in "Mechanism for downloading".

See also
- “Mechanism for downloading” on page 1923

Preserving data with persistent variables

Persistent variables retain their values after reloading the application, and after a download, warm start, or cold start.

A special non-volatile memory area on the controller, for example as NVRAM or UPS, is required to extend the lifespan. Securing the data in such a memory does not require any additional time, which is an advantage over data retention with the Persistence Manager. If the controller does not provide hardware support, then the data is usually stored in a file. Then the data will be retained if you shut down the controller correctly. In the event of a power failure or a pulled plug, however, data will be lost.

Behavior

Value retained for
- Uncontrolled exit
- Warm start by calling the “Reset Warm” command
- Cold start by calling the “Reset Cold” command
- Repeated download of the application

Reinitialization for
- Call of the “Reset Origin” command

Therefore, persistent variables are reinitialized only if you reset the controller to the factory settings (for example, when you click “Online ➔ Reset Origin”).

If, on the other hand, you download the application again, the persisted data is retained if possible. That depends on how profound the changes that led to the download were. Changing the application name always leads to a full reinitialization. Changes to the implementations never lead to a reinitialization: the data persistence is completely preserved. Changes to the declarations lead to an initialization of the new variables only if the existing variables are persistent, when you change the declarations so that the persistent variable list remains consistent. This is the case when you add a new variable or delete an existing one. Inconsistencies can occur if you edit and change the identifiers or data types of previously declared persistent variables.

Mechanism for downloading

Editing the variable list in the persistence editor causes the variable list to be edited automatically before it is saved, not to be saved as it is shown in the editor.
During post-processing, a variable that you have removed is replaced by a placeholder variable with the same memory requirement. As a result, the subsequent variables retain their addresses in the process image. Moreover, a variable you add is moved to the end of the list. Post-processing can neutralize changes that would lead to a loss of persistence. But you create gaps that use additional memory.

When downloading, the CRC value of the variable list and the length of the list (number of variables) are stored on the controller. When downloading again, the new test value is compared with the test value currently on the controller. Then the variable list is compared successively up to the specified length. If you have edited a declaration (for example, the name or data type), then the variable is reinitialized. Otherwise its value is retained. When the download is repeated, CODESYS checks whether the variable list declared in the persistence editor is still consistent with the variable list already on the controller.

The mechanism works well when the variables themselves are not modified significantly. Too extensive changes of the identifiers and the data types continue to lead to a reinitialization and the loss of persistence. If you anticipate frequent changes due to your application requirements, then this kind of a list is not recommended. Moreover, in an online change after a data type change, a persistent variable is less robust than a variable with a normal lifespan.

It is good practice to clear any gaps in the variable list after a while (command “Reorder List and Clear Gaps”). After cleaning, however, the list no longer matches the list on the controller and you have triggered an initialization of all persistent variables. The persistence of all variables is lost.

For versions before V3.5 SP1, changes in the persistence editor always lead to reinitialization.

Recovering data with the recipe manager

To clean up the global persistent variable list without losing persistence, you can save the data in a recipe using the Recipe Manager. This creates a list for all variables of the persistent variable list in the recipe manager, and at the same time its current values are stored by the controller as a recipe. Then execute the command “Reorder List and Clear Gaps” and perform a download again. Now when you execute the command “Restore Values from Recipe”, the values saved in the recipe are restored.

Changing an existing declaration in the persistent variable list

if you change the name or data type of a variable, this is interpreted as a new declaration and causes a re-initialization of the variables at the next online change or download. For complex data types, a change occurs when a new component is added, or when you change the type of a variable from INT to UINT in the depth of a used structure used, for example.

Basically, complex user-defined data types are not suitable for administration in a persistent variable list, because even small changes cause the variable to be initialized with all components.

Double allocation of memory in the case of instance paths

You can persist global variables or variables declared locally in a function block or program. To do this, add the keyword PERSISTENT to the declaration. In addition, you insert the instance path to this variable in the persistent global variable list. To do this, execute the “Add All Instance Paths” command in the persistence editor.

Persistence is guaranteed by the following mechanism:

- The cyclic tasks in which the variable is accessed are determined.
- At the end of the first cyclic task (in each cycle), the variable is copied to the persistent global variable list.
- After restarting the controller, the value of the persistent variable is copied to the ordinary variable.
The disadvantage of this mechanism is that memory is allocated both at the place of declaration and at the place of the instance path. This persistent variable has a double memory allocation. Moreover, the data is copied to both places in each cycle. This can be time consuming, especially when large structured values are involved.

**Memory location in the case of persistent function block instances**

A function block instance is always stored completely in memory. This is necessary so that the same code can work on different instances. If only one variable in a function block is marked with `PERSISTENT`, then the function block instance is stored completely with all variables in remanent memory, although only the one variable is treated as persistent. However, non-volatile memory is not available to the same extent as main memory.

A function block with a pointer to an instance in SRAM as a variable is not stored in the protected memory.

**Importing from CoDeSys V2.3 projects**

When you open a CoDeSys V2.3 project to import it into CODESYS V3, the declarations of persistent variables are not preserved. You have to revise the declarations and create then again in a separate persistent global variable list.

See also

- % Chapter 6.4.1.20.2.13 “Persistent Variable - PERSISTENT” on page 2122
- % Chapter 6.4.1.21.3.18.4 “Command ‘Add all instance paths’” on page 2720
- % Chapter 6.4.1.3.3 “Opening a V2.3 project” on page 1809

**Preserving data with retain variables**

Retain variables preserve their values after a warm start. However, the degree of value retention for persistent variables is higher.

A special non-volatile memory area on the controller, for example as NVRAM or UPS, is required to extend the lifespan. Securing the retain variables in such a memory does not require any additional time, which is an advantage over data retention with the Persistence Manager. If the controller does not provide hardware support, then the data is usually stored in a file. Then the data will be retained if you shut down the controller correctly. In the event of a power failure or a pulled plug, however, data will be lost.

**Declaration**

To declare a retain variable, add the `RETAIN` keyword to a variable declaration.

**Behavior**

Value retained for

- Uncontrolled exit
- Call of the “Reset Warm” command

Reinitialization for

- Repeated download of the application
- Call of the “Reset Cold” command (in contrast to persistent variables)
- Call of the “Reset Origin” command

When you restart an application, its variables are usually initialized with an explicitly preset initial value or with a default value. Variables marked with the `RETAIN` keyword are managed in a separate memory area depending on the target system and retain their value. Then the variables are protected from power failure, for example. This means that you can apply retain variables to a parts counter in a production line so that you can continue counting even after a power failure.
Memory location of persistent function block instances

Function block instances are stored as one block in memory. This is necessary so that the same code can work on different instances. If a variable is marked with `RETAIN` in a function block, then each instance of the function block is protected with all variables. This is also true for the variables of the function block that are not marked this way. However, non-volatile memory is not available to the same extent as main memory.

A function block with a pointer to an instance in SRAM as a variable is not stored in the protected memory.

Importing of CoDeSys V2.3 projects

When you open a CoDeSys V2.3 project to import it into CODESYS V3, the declarations of retain variables are preserved and remain effective as before.

Retaining data with variables of the persistence manager

Persistent variables are managed in the Persistence Manager of the CODESYS Application Composer. The functionality of the "Persistence Manager" does not need any special memory on the controller in order to preserve values and data.

Declaration

In the declarations, the variables managed in the Persistence Manager are marked with the `pragma` `{attribute 'acPersist'}`.

The pragma makes sure that the variable with this attribute is managed in the Persistence Manager of the Application Composer. The variable value is retained even if you change the declaration of the variable, delete a variable from the application, or add a new one. The value is retained even if you change the data type and use the appropriate conversions.

Mechanism

The variables of the Persistence Manager are stored with their values in an external archive file in TXT format.

The application code is extended with the code of the Persistence Manager, which leads to a greater memory requirement. This is at the expense of performance. Moreover, reading and especially writing a large number of persistent variables can take a long time. As a result, the executing task also blocks the execution for a long time.

Functionality

- You can load and edit the TXT file in an external editor such as Notepad++.
- You can use the persistent variables of the file in another application.
- You can configure the behavior of persistent variables by defining persistence groups, assigning variables to them, and configuring the groups with their own save and read behavior.

Preserving data with recipes

Variables are managed persistently in the Recipe Manager. The Recipe Manager does not need any special memory on the controller in order to preserve values and data.

Declaration

A recipe definition consists of a set of variables with values and is created and edited in the "Recipe Manager" object and saved to a file.
You can include a variable in multiple recipes, each with different values.

In online mode, you can read in the actual values of the variables from the controller and save them as recipe values (specified value).

You can use the Recipe Management library to programmatically implement the creation and editing of a recipe.

You can save and backup a recipe as a recipe file.

- Chapter 6.4.1.21.2.26 “Object ‘Recipe Definition’” on page 2722

### Declaring VAR PERSISTENT Variables

Below you will declare persistent variables in a persistent variable list and in a POU.

**Requirement:** A project is opened and contains a program POU. You have selected the option for the textual view in the “Declaration Editor” category of the options (menu command in “Tools → Options”).

1. Add the “Persistent Variables” object to the application object with the menu command “Project → Add Object”.

   ➞ CODESYS adds the persistent variable list "PersistentVars" below the application object in the device tree and the editor opens.

2. In the editor, enter a variable declaration, for example `ivarpersist1 : INT;` between `VAR_GLOBAL PERSISTENT RETAIN` and `END_VAR`.

3. Double-click the POU in the device tree.

   ➞ The editor of the POU opens.

4. Specify the following declaration in the declaration part:

   ```
   VAR PERSISTENT RETAIN
   ivarpersist2 : INT;
   END_VAR
   ```

5. Click “Build → Build”.

   ➞ The message view opens. If CODESYS has compiled the application without errors, then close the message window and continue with the next step. Otherwise, correct the error(s) and select the menu command “Build → Build” again.

6. Set the focus in the “PersistentVars” editor. Click “Declarations → Add All Instance Paths”

   ➞ CODESYS adds the persistent variable from the persistent variable list “PersistentVars” to the POU:

   ```
   // instance path of the persistent variables created
   POU.IVARPERSIST2 : INT
   ```

- Chapter 6.4.1.21.2.20 “Object ‘Persistent variable list’” on page 2476
- Chapter 6.4.1.21.3.18.4 “Command ‘Add all instance paths’” on page 2720
Saving the values of a persistent variable list in a recipe

Requirement: a project is opened and a persistent variable list with declarations of persistent variables exists under an application object.

1. Double-click on the controller in the device tree and select the tab “Communication Settings”.
2. Select your gateway and click on the button “Scan Network”.
   ⇒ Your device is shown in bold in the tree view of the gateway.
3. Select your device and click on the button “Set Active Path”.
4. Select your application object in the device tree and select the context menu command “Set Active Application”.
   ⇒ The application object is displayed in bold.
5. Select the menu command “Online ➔ Login”.
   ⇒ Your application is logged in to the controller and the controller and the application object in the device tree have a green background.
6. Double-click on the persistent variable list and select the command “Declarations ➔ Save Current Values to Recipe”.
   ⇒ CODESYS creates the objects “Recipe Manager” and “PersistentVariables” under the application object.
7. Select the menu command “Online ➔ Logout”.
   ⇒ The application is logged out from the controller.

6.4.1.9.20 Alarm Management

For information about alarm management and alarm visualization, see the help for CODESYS Visualization.

6.4.1.9.21 Using POUs for implicit checks

CODESYS provides special POUs that implement implicit monitoring functions. At runtime, these functions check the array limits or subrange types, the validity of pointer addresses, or division by zero.

1. Select the “Application” object in the device tree.
   Click “Project ➔ Add Object ➔ POU for Implicit Checks”
   ⇒ The “Add POU for Implicit Checks” dialog box opens.
2. Select the desired functions.
3. Click “Add”.
   ⇒ The selected POUs are inserted below the “Application” in the device tree.
4. Open the POUs in the editor.
5. Adapt the implementation suggestion to your requirements.

CAUTION!
To obtain the feature for monitoring functions, do not edit the declaration section. However, you are permitted to add local variables.

- Chapter 6.4.1.21.2.21 “Object ‘POU’” on page 2477
- Chapter 6.4.1.21.2.22 “Object ‘POUs for Implicit Checks’” on page 2500

6.4.1.22 Object-Oriented Programming

General

CODESYS supports object oriented programming with function blocks and for this purpose provides the following features and objects:
- Methods
- Interfaces
- Properties
- Inheritance
- Method call, virtual function call
- Definition of function blocks as extensions of other function blocks

Application example
Basic information on dealing with object-oriented programming (OOP) with AC500 V3 PLCs is given in an application example.

Application example
In CODESYS V3, keywords can be used in object-oriented programming (OOP), e.g. to improve the programming style, debugging, etc. The application note OOP keywords explains how these keywords are used.

See also
- Chapter 6.4.1.21.2.21.5 “Object ‘Interface’” on page 2484

Extension of function blocks
The extension of a function block is based on the concept of inheritance in object-oriented programming. A derived function block thereby extends a basic function block and in doing so is given the properties of the basic function block in addition to its own properties.

The extension of a function block means:
• The inherited function block contains all data and methods that are defined by the basic function block. You can use an instance of the basic function block in every context in which CODESYS expects a function block of the type of the basic function block.
• The derived function block can overwrite the methods that you have defined in the base function block. This means that the inherited function block can define a method with the same name, the same inputs and the same output as is defined by the basic function block. Tip: You have the following support when overwriting methods, actions, attributes, and transitions that are inherited by the base block: When you insert a method, action, etc. below an inherited block, the “Add Object” dialog includes a combo box with a list of methods, actions, etc. used in the base block. You can accept these and adapt them accordingly.
• The derived function block may not contain function block variables with the same names as used by the basic function block. The compiler reports this as an error. The only exception: If you have declared a variable in the basic function block as VAR_TEMP, then the inherited function block may define a variable with the same name. In this case, the inherited function block can no longer access the variable of the basic function block.
• You can directly address the variables and methods of the basic function block within the scope of the inherited function block by using the SUPER pointer.

NOTICE!
Multiple inheritance is not permitted.
Exception: A function block can implement multiple interfaces, and an interface can extend other interfaces.

Extension of a basic function block by a new function block

Requirement: the currently opened project possesses a basic function block, for example “POU_1(FB)”, which is to be extended by a new function block.

1. Right-click the “Application” object in the device tree and select “Project ➔ Add Object ➔ POU”.
   ⇔ The “Add POU” dialog opens.
2. Type the name for the new POU in the “Name” input field, for example “POU_Ex”.
3. Select “Function block”.
4. Click “Advanced” and then the more button (°).
5. In the category “Function blocks” under “Application” in the input assistant, select the POU(FB) that is to serve as the basic function block, for example POU_1, and click “OK”.
6. As an option, you can select an “Access modifier” for the new function block from the drop-down list.
7. Select from the “Implementation language” combo box (example: “Structured text (ST)”.
8. Click “Add”.
   ⇔ CODESYS adds the POU_Ex function block to the device tree and opens the editor. The first line contains the text:
   
   FUNCTION_BLOCK POU_Ex EXTENDS POU_1
   
   The function block POU_Ex extends the basic function block POU_1.

Extension of a basic function block by an existing function block

Requirement: The open project possesses a base function block (example: POU_1(FB)) and another function block (example: POU_Ex(FB)). The function block POU_Ex(FB) is also to be given the properties of the basic function block. This means that POU_Ex(FB) should extend POU_1(FB).
1. Double-click the function block `POU_Ex(FB)` in the device tree.
   ⇒ The function block editor opens.

2. Extend the existing entry in the top line `FUNCTION_BLOCK POU_Ex with EXTENDS POU_1`.
   ⇒ The function block `POU_Ex` extends the basic function block `POU_1`.

Implementing interfaces

Implementing interfaces is based on the concept of object-oriented programming. With common interfaces, you can use different but similar function blocks the same way.

A function block that implements an interface has to include all methods and attributes that are defined in that interface (interface methods and interface attributes). This means that the name and the inputs and outputs of the methods or attributes must be exactly the same. When you create a new function block that implements an interface, CODESYS adds all methods and attributes of the interface automatically to the tree below the new function block.

**NOTICE!**

If you add more interface methods afterwards, then CODESYS does not add these methods automatically to the affected function block. To perform this update, you must execute the “Implement Interfaces” command explicitly.

For inherited function blocks, you have to make sure that any methods or attributes that were derived through the inheritance of an interface also receive the appropriate implementation. Otherwise they should be deleted in case the implementation that was provided in the basis should be used. Respective compile error messages or warnings are displayed, prompted automatically by added pragma attributes. For more information, refer to the help page for the “Implementing Interfaces” command.

**NOTICE!**

- You must assign the interface of a function block to a variable of the interface type before a method can be called via the variable.
- A variable of the interface type is always a reference of the assigned function block instance.

A variable of the interface type is a reference to instances of function blocks. This kind of variable can refer to every function block that implements the interface. If there is no assignment to a variable, then the variable in online mode contains the value 0.
The I1 interface contains the GetName method.

METHOD GetName : STRING

The functions blocks A and B implements the interface I1:

FUNCTION_BLOCK A IMPLEMENTS I1
FUNCTION_BLOCK B IMPLEMENTS I1

For this reason, both function blocks must include a method named GetName and the return type STRING. Otherwise the compiler reports an error.

A function includes the declaration of a variable of interface I1 type.

FUNCTION DeliverName : STRING
VAR_INPUT
  l_i : I1;
END_VAR

Function blocks that implement the I1 interface can be assigned to these input variables.

Examples of function calls:

DeliverName(l_i := A_instance); // call with instance of type A
DeliverName(l_i := B_instance); // call with instance of type B

Calling of interface methods:

In this case, it depends on the actual type of l_i whether the application calls A.GetName or B.GetName.

DeliverName := l_i.GetName();

Examples: Chapter 6.4.1.21.3.23.2 "Command 'Implement Interfaces" on page 2744

Implementing an interface in a new function block

- Requirement: The open project has at least one interface object.

1. Right-click "Application" in the device tree and select "Project ➔ Add Object ➔ POU".
   ⇒ The "Add POU" dialog box opens.

2. Type the name for the new POU in the "Name" input field, for example "POU_Im".

3. Select "Function block".

4. Click "Implemented" and then the more button ( ).

5. In the input assistant, select the interface from the category "Interfaces", for example ITF1, and click on "OK".

6. To insert more interfaces, click and select a another interface.

7. As an option, you can select an "Access modifier" for the new function block from the selection list.

8. Select from the "Implementation language" combo box (example: "Structured text (ST)").

9. Click "Add".
   ⇒ CODESYS adds the "POU_Ex" function block to the device tree and opens the editor.
   The first line contains the text:

   FUNCTION_BLOCK POU_Im IMPLEMENTS ITF1

   The interface and its methods and properties are now inserted below the function block in the device tree. Now you can type program code into the implementation part of the interface and its methods.
Implementing an interface in an existing function block

- Requirement: The currently open project has a function block (example: “POU_Im”) and at least one interface object (example: “ITF1”).

1. Double-click the “POU_Ex(FB)” POU in the device tree.
   - The POU editor opens.
2. Extend the existing entry in the uppermost line with `FUNCTION_BLOCK POU_Im with IMPLEMENTS ITF1`.
   - The “POU_Im” function block implements the “ITF1” interface.

See also
- Chapter 6.4.1.21.2.21.3 “Object ‘Function Block’” on page 2479

Extending interfaces

You can extend interfaces just like function blocks. The interface is then also given the interface methods and interface properties of the basic interface in addition to its own.

1. Select the object “Application” in the device tree.
2. Select the command “Project → Add Object → Interface”.
   - The dialog box “Add Interface” opens.
3. Enter a name for the new interface.
4. Activate the option “Extended” and click on the button.
5. The input assistant opens.
6. From the category “Interfaces”, select the interface that is to be extended by the new interface.

- Chapter 6.4.1.21.2.21.5 “Object ‘Interface’” on page 2484

Calling methods

To implement a method call, the actual parameters (arguments) are passed to the interface variables. As an alternative, the parameter names can be omitted.

Depending on the declared access modifier, a method can be called only within its own namespace (INTERNAL), only within its own programming module and its derivatives (PROTECTED), or only within its own programming module (PRIVATE). For PUBLIC, the method can be called from anywhere.

Within the implementation, a method can call itself recursively, either directly by means of the THIS pointer, or by means of a local variable for the assigned function block.

Method call as a virtual function call

Virtual function calls can occur due to inheritance.

Virtual function calls enable one and the same call to call various methods in a program source code during the runtime.
In the following cases the method call is dynamically bound:

- You call a method via a pointer to a function block (for example `pfub^.method`).
  In this situation the pointer can point to instances of the type of the function block and to instances of all derived function blocks.
- You call the method of an interface variable (for example `interface1.method`).
  The interface can refer to all instances of function blocks that implement this interface.
- A method calls another method of the same function block. In this case the method can also call the method of a derived function block with the same name.
- The call of a method takes place by means of a reference to a function block. In this situation the reference can point to instances of the type of the function block and to instances of all derived function blocks.
- You assign `VAR_IN_OUT` variables of a basic function block type to an instance of a derived FB type.
  In this situation the variable can point to instances of the type of the function block and to instances of all derived function blocks.

**Example**

<table>
<thead>
<tr>
<th>Overloading methods</th>
<th>The function blocks <code>fub1</code> and <code>fub2</code> extend the function block <code>fubbase</code> and implement the interface <code>interface1</code>. The methods <code>method1</code> and <code>method2</code> exist.</th>
</tr>
</thead>
</table>
| PROGRAM PLC_PRG     | **VAR_INPUT**  
|                     | `b` : BOOL; |
| END_VAR             | **VAR**  
|                     | `pInst` : POINTER TO `fubbase`;  
|                     | `instBase` : `fubbase`;  
|                     | `inst1` : `fub1`;  
|                     | `inst2` : `fub2`;  
|                     | `instRef` : REFERENCE to `fubbase`;  
| END_VAR             | **IF** `b` **THEN**  
|                     | `instRef` REF= `inst1`;  
|                     | `pInst` := ADR(`instBase`);  
|                     | **ELSE**  
|                     | `instRef` REF= `inst2`;  
|                     | `pInst` := ADR(`inst1`);  
|                     | **END_IF**  
|                     | `pInst^.method1();`;  
|                     | (* If `b` is TRUE, `fubbase.method1` will be called, otherwise `fub1.method1` is called *)  
|                     | `instRef.method1();`;  
|                     | (* If `b` is TRUE, `fub1.method1` will be called, otherwise `fub2.method1` is called *)  

On the assumption that `fubbase` in the above example contains two methods `method1` and `method2`, it overwrites `fub1 method2`, but not `method1`. The call of `method1` takes place as follows:

- `pInst^.method1();`
- If `b` is TRUE, then CODESYS calls `fubbase.method1`. If not, then `fub1.method1` is called.

**Additional outputs**

In accordance with the IEC 61131-3 standard, methods can have additional outputs declared, like normal functions. With the method call, you assign variables to the additional outputs.

Detailed information about this can be found in the topic “Function”.

---

**Note:**

- The use of `VAR_IN_OUT` variables is generally not recommended due to potential side effects and should be used sparingly. The recommended approach is to use instance variables or pass parameters instead.
- The code snippets are illustrative and may need to be adapted to specific use cases. Always ensure that the changes made are compatible with the intended system architecture and requirements.

---

**Configuration and programming**

**Programming with CODESYS > CODESYS Development System**

---

**Example**

<table>
<thead>
<tr>
<th>Overloading methods</th>
<th>The function blocks <code>fub1</code> and <code>fub2</code> extend the function block <code>fubbase</code> and implement the interface <code>interface1</code>. The methods <code>method1</code> and <code>method2</code> exist.</th>
</tr>
</thead>
</table>
| PROGRAM PLC_PRG     | **VAR_INPUT**  
|                     | `b` : BOOL; |
| END_VAR             | **VAR**  
|                     | `pInst` : POINTER TO `fubbase`;  
|                     | `instBase` : `fubbase`;  
|                     | `inst1` : `fub1`;  
|                     | `inst2` : `fub2`;  
|                     | `instRef` : REFERENCE to `fubbase`;  
| END_VAR             | **IF** `b` **THEN**  
|                     | `instRef` REF= `inst1`;  
|                     | `pInst` := ADR(`instBase`);  
|                     | **ELSE**  
|                     | `instRef` REF= `inst2`;  
|                     | `pInst` := ADR(`inst1`);  
|                     | **END_IF**  
|                     | `pInst^.method1();`;  
|                     | (* If `b` is TRUE, `fubbase.method1` will be called, otherwise `fub1.method1` is called *)  
|                     | `instRef.method1();`;  
|                     | (* If `b` is TRUE, `fub1.method1` will be called, otherwise `fub2.method1` is called *)  

On the assumption that `fubbase` in the above example contains two methods `method1` and `method2`, it overwrites `fub1 method2`, but not `method1`. The call of `method1` takes place as follows:

- `pInst^.method1();`
- If `b` is TRUE, then CODESYS calls `fubbase.method1`. If not, then `fub1.method1` is called.
Syntax for the call:

```
<function block name>.<method name>(<first input name> := <value> (, <second input name> := <value> (,... ,<further input assignments>)+ , <first output name> => <first output variable name> (,<further output assignments>)+
```

### Example Declaration

**METHOD PUBLIC DoIt : BOOL**

**VAR_INPUT**

- `iInput_1 : DWORD;
- `iInput_2 : DWORD;

**END_VAR**

**VAR_OUTPUT**

- `iOutput_1 : INT;
- `sOutput_2 : STRING;

**ENDVAR**

**fbInstance.DoIt(iInput_1 := 1, iInput_2 := 2, iOutput_1 => iLocal_1, sOutput_2 => sLocal_2);**

When the method is called, the values of the method outputs are written to the locally declared output variables.

### Calling a method even if the application is in the STOP state

In the device description it is possible to define that a certain function block instance (of a library function block) always calls a certain method in each task cycle. If the method contains the input parameters of the following example, CODESYS processes the method even if the active application is presently in the STOP state:

**Example**

```
VAR_INPUT
- `pTaskInfo : POINTER TO DWORD;
- `pApplicationInfo: POINTER TO _IMPLICIT_APPLICATION_INFO;

**END_VAR**

(*Now the status of the application can be queried via

**pApplicationInfo^..state = RUNNING THEN <instructions> END_IF;**

### Calling methods recursively

Use recursions mainly for processing recursive data types such as linked lists. Generally, we recommend that you be careful when using recursion. An unexpectedly deep recursion can lead to stack overflow and therefore to machine downtime.

Within their implementation, a method can call itself:

- Directly by means of the THIS pointer
- Indirectly by means of a local function block instance of the basic function block

Usually, a compiler warning is issued for such a recursive call. If the method is provided with the pragma `{attribute 'estimated-stack-usage' := '<estimated_stack_size_in_bytes>'}`, then the compiler warning is suppressed. For an implementation example, refer to the section "Attribute 'estimated-stack-usage"."
6.4.1.10 Working with Controller Networks

6.4.1.10.1 General

With the following functionalities, CODESYS supports communication between controllers (PLC) and the insertion of a safety controller below a PLC:

- **Symbol Configuration**: CODESYS creates symbols with certain access rights for the variables in an application. With these symbols, you can access the variables from outside, for example from an OPC server.

- **Data Source Manager**: Manages the connection settings and the data transmission to remote devices (data sources). The transmitted data is mapped in data source variables that are accessed in the visualization or local application. An example of this is a control panel that controls remote devices and displays the state of the device as an HMI application.

- **Network Variables**: Network variables are variables whose values are accessible to different controllers in the network. The variables have to be defined in rigid, identical lists in both the transmitter device and the receiver device. These lists are assigned to applications, but can be located in different projects.

- A safety controller can be inserted below a PLC in the device tree. The communication links of the safety controller to the field devices, controller networks, and development system are routed through this controller.

6.4.1.10.2 Network and Addressing

General

Constructing a control network hierarchically, so that extensive self-configuration is possible.

In CODESYS the network topology is mapped to clear addresses and the routing algorithm is kept simple by structured addresses. There is direct and relative addressing and automatic address determination during the bootup of the system.
Network topology

Information and recommendations for the topology of a control network

It is recommended to set up a network system so that the following are possible:

- Extensive self-configuration (address assignment)
- Transparent support for every communication medium
- Transport of data packets between different networks

The routing mechanism should be so simple that each network node can reroute data packets, even if it has a low memory capacity. Therefore, avoid extensive routing tables, complex calculations or queries at runtime.

Construct the control network hierarchically. Each node may possess a parent node and any number of child nodes. A node without a parent is a "top level" node. Cycles are not permitted, i.e. each control network has the structure of a tree.

Parent-child relationships results from the specification of certain network areas. A network area can be, for example, a local Ethernet or a serial point-to-point connection. We differentiate between the main network (mainnet) and the subnetworks (subnet). Each node belongs at the most to one main network, to which its parent node, if one exists, also belongs. For each node any desired number of subnets can be configured, for which the node acts in each case as a parent.

A network area may have only one parent node. Therefore, a configuration in which a network area is defined at the same time as a subnet of several nodes is invalid.

See also

- Chapter 6.4.1.10.2.2 “Network topology” on page 1937
- Chapter 6.4.1.10.2.3 “Addressing and Routing” on page 1937
- Chapter 6.4.1.10.2.4 “Address Structures” on page 1939

Addressing and Routing

Addressing means: the topology of the control network is mapped to unique addresses.

A node address is composed hierarchically: for each network connection the associated block driver determines a local address, which uniquely identifies the node within the local network. The complete node address is formed as follows: The local address is placed in front of the subnet index of the local network assigned by the parent. In turn, the subnet index is placed in front of the node address of the parent. The length of the subnet index (in bits) is thereby determined by the device. The length of the local address, conversely, is determined by the type of network. A node without a main network is a top level node with address 0. A node with a main network that contains no parent is likewise a top level node. It is given the local address of the main network.

See an example of a control network here:
In the example the addresses of the nodes are represented in hexadecimal notation. The first 4 digits represent the address of the respective parent in the main network, for example 0x007A=122 for PLC1. The next byte (in blue lettering) is reserved for the subnet index and is followed by the local address, for example C=12 for node ID 12. The structuring of the addresses makes a lean routing algorithm possible. Routing tables, for example, are thus unnecessary. Information is queried only locally: via its own address and via the address of the parent node. On this basis a node can correctly process the data packets:

- If the destination address corresponds to the address of the current node, then this is meant to be the receiver.
- If the destination address starts with the address of the current node, then the data packet is either meant directly for a child or for a descendant of the node and must be forwarded.
- In all other cases the receiver is not a descendant of the current node and the data packet must be forwarded to its own parent.

Relative addressing is a special case: relative addresses do not contain the node number of the receiver, but directly describe the path from the sender to the receiver. The principle is similar to the relative path in the file system: the address consists of the number of steps via which the packet must be transported upwards. These are the steps to the corresponding parent and from the subsequent path downwards to the destination node.

The advantage of relative addressing is that two nodes in the same subtree can continue to communicate if the complete subtree is shifted to another place in the entire network. Whereas the absolute node addressing has to be modified due to this shift, the relative addressing is still valid.

Address determination

For a node to know its own address it must either know the address of its parent node or know that it is a top level node. For this purpose the node dispatches a message during the bootup to all network devices for address determination. As long as it receives no response to this message, the node considers itself to be a top level node, but continues to search for a possible parent. A parent node responds by announcing its address. The node will thus independently complete its address and will announce it to the subnets. An address determination can be accomplished during the bootup or at the request of the PC used for programming.
Address Structures

Network addresses

Network addresses represent a mapping of the addresses of the network type (for example IP) to logical addresses within a control network. This mapping is carried out by the corresponding block driver. The first three bytes of the IP address are identical for all network devices within an Ethernet network with "Class C" IP addresses. Consequently, the last 8 bits of the IP address suffice as network address, since they enable unambiguous mapping between the two addresses on the block driver.

A node has a different network address for each network connection. Different network connections can have the same network address, since each address need only be locally unique.

Terminology: the network address in the main network is usually designated as the network address of a node with no specification of the network connection.

The length of a network address is specified in bits and can be chosen by the block driver as required. The same length must be used for all nodes within a network area. A network address is represented by an array of bytes in accordance with the following coding:

- Length of the network address: \( n \) bits
- Necessary bytes: \( b = \frac{n + 7}{8} \)
- The \( (n \mod 8) \) bits of lowest rank of the first byte and all others \( (n \div 8) \) are used for the network address.

Example of network address coding

Length: 11 bit
Address: 111 1000 1100

Node addresses

The node address indicates the absolute address of a node within a control network and is therefore unique within the whole "network tree". The address is composed of up to 15 address components, each of which occupies 2 bytes. The lower a node is located within the network hierarchy, the longer its address.

The complete node address consists of the partial addresses of all preceding nodes and the partial address of the node itself. Each partial address consists of one or more address components. The length is therefore always a multiple of 2 bytes. The partial address of a node is formed from the network address of the node in its main network and the subnet index of the main network in the case of the parent node. The bits required for the subindex are determined by the router of the parent node. Filler bits can be inserted between the subnet index and the network address in order to ensure that the length of the partial address is a multiple of 2 bytes.

Special cases:

- A node without a main network: this means that there is neither a subnet index nor a network address in the main network. In this case the address is set to 0x0000.
- A node in the main network without a parent: In this case a subnet index with the length 0 is assumed. The partial address corresponds to the network address, if necessary extended by filler bits.
The node address is always specified in hexadecimal. The individual address components (two bytes in each case) are separated by a colon "::". Since this represents an array of bytes and not a 16-bit value, the components are not displayed in the Intel format. For manually input addresses, missing parts in an address component are supplemented by leading zeros: "274" = "0274". In order to improve the legibility, the display should also always contain the leading zeros.

**Absolute and relative addresses**

Communication between two nodes can be based on relative or absolute addresses. Absolute addresses are identical to node addresses. Relative addresses specify a path from the sender to the receiver. They consist of an address offset and the descending path to the receiver.

The (negative) address offset describes the number of address components by which a packet must be passed upwards in the tree before it can be passed back down by the common parent node. Since nodes can use partial addresses that consist of more than one component, the number of parent components to be passed is always equal to the address offset. This means that the demarcation between the parent nodes is no longer clear. For that reason the common start of the address of the communication partners is used as the parent address. Each error resulting from this assumption can be detected by the corresponding parent node and must be handled by it accordingly.

After achieving the common parent node the relative path, as an array of address components, is followed downwards as usual. Formal: the node address of the receiver is formed by removing the last address offset components from the node address of the sender and by appending the relative path to the remaining address.
In the following example each address component is represented by a letter; in each case a dot separates nodes from each other. Since a node can carry several address components, there are some in the example that are represented with several letters.

Node A: a.bc.d.ef.g
Node B: a.bc.i.j.kl.m

- Address of the lowest common parent: a.bc
- Relative address from A to B: -4/i.j.kl.m (The number 4 results from the 4 components, d, e, f and g, which must pass on the data packet in the upward direction)

In order to guarantee correct operation of the routing, the relative address must be adapted each time it passes an intermediate node. It is sufficient to adapt the address offset. This is always done by the parent node: If a node receives a data packet from one of its subnets, the address offset is increased by the length of the address component of this subnet.

- If the new address offset is < 0, then the data packet must be passed further upward.
- If the address offset is >= 0, then the data packet must be passed on to the child node whose local address corresponds to the relative path, starting from the address offset. First of all, however, the address offset must be increased by the length of the local address of the child node, so that the child node sees the correct address.

A special situation results if the error mentioned above occurs during the determination of the common parent node. In this case the address offset of the actual parent node is negative, but this value is larger than the length of the partial address of the subnet from which the packet originated. So that the next node sees a correct relative address in this case, the node concerned must do the following: it must discover the error, calculate the local address of the child node on the basis of the address of the predecessor node and the length difference, and adapt the address offset accordingly. In this case, too, the address components as such remain unchanged; only the offset is changed.

---

**Broadcast addresses**

There are two types of broadcast - global and local. A global broadcast is sent to all the nodes in a network. The empty node address with a length of 0 is reserved for this purpose.

Local broadcasts are sent to all the devices in a network area. For this purpose, all the bits of the network address are set to 1. This is permissible both in relative and in absolute addresses.

A block driver must be able to process both kinds of broadcast addresses. This means: empty network addresses as well as network addresses whose bits were all set to 1 must be interpreted and sent to all devices concerned.

---

**6.4.1.10.3 Symbol Configuration**

Use the symbol configuration for preparing symbols with specific access rights for project variables. You can use these symbols to access the variables externally.

For providing symbols to an OPC UA Server, we recommend using the new configuration editor (IEC Symbol Set Configuration) for CODESYS 3.5 SP18 and higher.

☞ Chapter 6.4.1.10.4 “IEC Symbol Set Configuration” on page 1945

When generating code, CODESYS also generates a symbol file (*.xml) which includes the description of the symbols.

The symbol file is stored in the project directory. The name of the symbol file is composed as follows: `<project name>.<device name>.<application name>.xml`

**Example**

proj_xy.PLL1.application.xml
You can also generate the symbol file with the “Generate Code” command. This is very useful when downloading to the PLC is not possible.

The variables that you export as symbols can be bundled in the symbol configuration editor or defined in the variables declaration using the `{attribute 'symbol'}` pragma. Another option is using the element in the SFC editor, where you can define the implicitly generated element variables that should be exported to the symbol configuration.

The name of the symbol is generated in the symbol configuration in the following syntax: `<application name>..<POU name>..<variable name>`. When accessing the variable, you must always provide the complete symbol name in this syntax.

Example

MyApplication.PLC_PRG.a or MyApplication.SymFB.a

As a rule, read-only access applies to symbols for input addresses and for variables that are mapped to input channels. Write access is possible for testing purposes in simulation mode only.

The number of symbols which can be exchanged via OPC UA is limited based on the used AC500 V3 PLC type. OPC UA symbols can be configured via two ways:

- Select the symbols in the “Symbol Configuration” object and enable the flag “Support OPC UA features”. All selected symbols are counted for the OPC UA tag limitation.
- Define the symbols in the “Symbol Set” object(s) below “Communication Manager → OPC UA Server”. All defined symbols are counted for the OPC UA symbol limitation, independently if they are defined in several “Symbol Set” objects.

In case both ways are used in parallel the sum of the symbols is considered for the OPC UA symbols limitation.

The symbol file is downloaded together with the application to the PLC. Depending on the device description, this file can be generated as an additional (child) application. This application is then listed on the “Application” tab of the device editor.

Syntax: `<application name>._symbols`.

The symbol application is regarded as a “normal” application with respect to the maximum number of applications on the PLC.

If your controller has a user management, then you can assign different access rights to a symbol to the individual user groups (clients). To do this, place the same symbol in different symbol sets and allow the individual user groups (clients) either to access a symbol set or not. An on-site operator or an operating data record, for example, receives more information and access to the same symbols as remote maintenance.

NOTICE!

When attribute pragmas are used for POUs and variables, the behavior of these POUs and variables can change with respect to the symbol configuration.

- Chapter 6.4.1.20.6.3.46 “Effects of Pragmas on Symbols ” on page 2315
Creating a symbol configuration

Requirement: The project can be compiled without any errors.

1. Select the “Application” object in the device tree.
2. Click “Project ➔ Add Object ➔ Symbol Configuration”.
   ➔ The “Symbol Configuration” object is added to the device tree and the objects editor opens.
3. Open the “View” menu of the editor and activate the categories of variables that should be provided in the configuration editor. Click “Build” in the symbol configuration editor.
   ➔ All variables (according to the currently defined filter in the “View” menu) are displayed in a tree structure.
4. Select the check boxes of individual variables.
   Note: Pay attention to the current settings (see the “Settings” button in the menu bar of the editor).
   ➔ In the field below the menu bar of the editor, information is provided about the current situation with accompanying instructions, as well as controls for corrective actions.
5. Follow the prompt in the field below the menu bar. In the following case, this should be only the information that the modified symbol configuration is transferred with the next download or online change.
   Click “Build ➔ Generate Code” on the CODESYS menu bar.
   ➔ The <project name>..<device name>..<application name>.xml file is generated in the project directory.

CODESYS transmits the symbol configuration to the PLC for an application download or online change.

- Chapter 6.4.1.21.2.27 “Object ‘Symbol Configuration’” on page 2523

Creating symbol sets with different access rights for different control clients

A symbol set is a defined set of symbols. If supported by the target device, you can combine different symbol sets from the symbols of the application in the symbol configuration editor. The information about the symbol sets is downloaded to the controller. Then you can define the user group that has access to each symbol set. Rights are assigned on the “Symbol Rights” tab of the device editor.

As a result, symbol sets allow different client-specific access rights to a symbol in the controller.

You can download changes to a symbol set definition to the controller in an online change. When the application is deleted on the controller, the symbol sets are also deleted. When building the application, you can create and save a symbol file in XML format for each symbol set.

When symbol sets should be used with OPC UA, it is a requirement that a certificate has to be stored for OPC UA.

As a requirement for creating symbol sets and for granting permissions on the controller, the user management has to be configured both for optional and for forced device user management:
1. In the editor of the controller, open the “Users and Groups” tab and click the button.

2. When the user management is still not enabled, first click [Yes] to acknowledge the prompt about enabling the user management. In the “Add Device User” dialog, specify a new user name and a password for a user of the Administrator group. Then confirm the password and click [OK].

3. In the “Device User Logon” dialog, specify the “User name” and “Password”. Then click [OK]. The user and groups are displayed on the “Users and Groups” tab.

In the following section, you will see an example of steps for creating symbol sets and the assignment of rights on the controller.

Requirements

- The application has a defined symbol configuration in the project.
- A user management is configured for the controller (see above). For the example here, there should be a user group that has the necessary rights for the servicing of the plant. By default, this type of user group, named "Service", is already created.
- The “Enable symbol sets” option is enabled in the settings of the symbol configuration.
- The connection to the controller is configured in the “Communication Settings” of the device editor.

1. Click the button in the editor of the “Symbol Configuration” in order to create a new symbol set. In the “Add New Symbol Set” dialog, specify "Startup" as the name for the group.

2. In the toolbar of the dialog, click the button ([Build]) in order to display all symbols which are available in the project. Select the users who should belong to the group. Save the project.

3. Click Online → Login to connect the application to the controller. Click [Yes] to the prompt of whether or not the application should be downloaded to the device.

4. In the editor of the symbol configuration, click the button ([Configure Symbol Rights]) button. The “Symbol Rights” tab of the device editor opens.

5. Click the button([Synchronization]) to synchronize the display of the symbol sets with the device.

- In “Symbol Sets”, you see all sets that have currently been downloaded for the application (for this example, at least "Startup"). In “Rights”, a table shows the user groups that are created in the user management of the controller. In the example, we assume that the default groups “Administrator” and “Service” have been created. When a symbol set is selected on the left, you see on the right the permissions of the individual user groups to this symbol set (access granted; access denied). The possible type of access is already defined for each symbol in the symbol configuration (read, write, execute).

6. On the left, select the [Startup] symbol set and double-click the preset minus sign for "Administrator" as well as for "Service".

- The symbol changes into a plus sign. The "Administrator" and "Service" groups now have access to the symbols in the [Startup] symbol set.

- Chapter 6.4.1.11.4 “Handling of Device User Management” on page 1971
- Chapter 6.3.6.2.1 “General” on page 1787
The number of symbols which can be exchanged via OPC UA is limited based on the used AG500 V3 PLC type. OPC UA symbols can be configured via two ways:

- Select the symbols in the “Symbol Configuration” object and enable the flag “Support OPC UA features”. All selected symbols are counted for the OPC UA tag limitation.
- Define the symbols in the “Symbol Set” object(s) below “Communication Manager ➔ OPC UA Server”. All defined symbols are counted for the OPC UA symbol limitation, independently if they are defined in several “Symbol Set” objects.

In case both ways are used in parallel the sum of the symbols is considered for the OPC UA symbols limitation.

In addition to the known “Symbol Configuration Editor”, with CODESYS Communication there is also a new editor for configuring IEC symbols for exchanging with other controllers.

Currently, the “IEC Symbol Publishing” object for the publication of symbols via “OPC UA” is available. The object has to be inserted in the device tree below the application below the “Communication Manager” object and there again below an “OPC UA Server” object.

You can insert multiple “IEC Symbol Publishing” type objects to configure different symbol sets for different purposes. Individually assign the object names accordingly. In the OPC UA Client, a separate folder with the assigned name is then created for each symbol set.

The IEC symbol set configuration is based on precompile information. In contrast to the known “Symbol Configuration”, the project does not necessarily have to be in an error-free compilable state to get the variables and types available in the project for a configuration in the editor. Discrepancies between the editor and the project, which may result due to changes in the project, will be brought to your attention and you will be assisted in making corrections.

Chapter 6.4.1.10.3 “Symbol Configuration” on page 1941

Creating and configuring a symbol set

Requirement:

You have a project with IEC variables and IEC data types. You want to exchange a specific set of variables as symbols with other OPC UA Clients via an OPC UA Server. For the following instructions: To control the publication, you have also created a data source of type OPC UA in the project. See here: Establishing the Connection of a Data Source OPC UA Client to an OPC UA Server.

Chapter 6.4.1.10.6.7 “Data Source OPC UA Client” on page 1960

In the following, you create the required symbol configuration for a symbol set in the editor of an object of type “IEC Symbol Publishing”:

Chapter 6.4.1.21.2.14 “Object: IEC Symbol Publishing” on page 2466

1. Click [Add Object] to add a “Communication Manager” below the application.
2. Add an “OPC UA Server” below the communication manager.
3. Add an “IEC Symbol Publishing” object below the “OPC UA Server” and rename the object (for example, "webvisu", or "client xy", depending on the intended use of the symbol set to be configured).
4. Double-click the symbol publishing object to open the editor.
   ⇒ Below “Precompile Sets” in the left part of the window, the variables and types which are currently supported in the project for publishing are listed.
5. Select one or more variables or a POU containing variables and drag the selection to the right part of the window.
   ⇒ The variable(s) are inserted into the table.
6. Configure all desired variables in the table for export as symbols. If necessary, assign a different symbol name and set the access rights. When assigning the access rights, note the "Use access rights defined in the user management" option at the top of the editor. When this option is selected, the rights assigned in the user management of the controller for the symbol set are also considered in addition to the access rights set here in the editor. The stronger restriction is applied.

7. If you have structured data types in the project, then on the "Symbol Type Editor" tab you can make a specific symbol configuration for different variants of the type:

8. For example, on the "Symbol Type Editor" tab, drag a POU of type STRUCT to the table on the right side of the window. Click the button to open the Data type members of <STRUCT> dialog.

9. Select the members of the <STRUCT> POU to be exported as symbols and configure accordingly. Close the dialog.

10. Option: On the "Symbol Type Editor" tab, drag the same POU of type STRUCT to the table a second time and configure it with the corresponding name as a "variant" of the first one.

11. In the project, change something in the declaration of the STRUCT type, for example, add another member. Then click "Refresh" in the symbol editor.

   An icon is displayed at the corresponding entry in the table. In the tooltip of the icon, you will be prompted to click the button to resynchronize between the editor and the project.

12. Click the button.

   The "Data type members of<STRUCT>" dialog opens and by clicking [D] the editor and project are synchronized again. The new member is added to the configuration table.

13. When the symbol configuration is finished, log in to the controller and open the data source object created for OPC UA to check the symbols for publishing.

   On the "Variables" tab, you can see the symbol set(s) with the variables and types you have defined as symbols.

6.4.10.5 Network Variables

Network variables can be used to exchange data between two AC500 V3 PLCs. The variables must be defined in strict and identical lists on both PLCs which are sender and receiver. The lists can be in one or more projects.

A step-by-step description on how to use network variables can be found in the application example.

The network variable list in the sender is a global variable list where specific log and transfer parameters are defined in their object properties. By adding these properties, you create a "network variable list (sender)" from an ordinary "GVL". You can also insert a "Network Variable List (Sender)" object directly into the device tree when this object already has these parameters set.

The network variable list in the receiver is of type "Network Variable List (Receiver)". When creating one, select the respective network variable list of the server. As an alternative, you can read this variable list from an export file that was generated from the sender list. An export file is required anyway for defining the sender list in another project.

The network variables are transmitted as broadcasting in one direction only: sender to receiver. However, it is also possible for a device to contain both sender and receiver lists.

For the NetVarUdp library version 3.5.7.0 and later, a receiver channel is no longer assigned when confirmed transfer is not selected. In this way, network variable exchange is also possible between two controllers on one hardware device.
NOTICE!

- If the exchanging devices should be senders and receivers, then the variable list identifiers must be unique in order to prevent abnormal operation. The variable list identifiers are defined in the “Properties” dialog of an object GVL.
- Data exchange via network variables is not possible when:
  - The device (target system) does not support it.
  - A firewall blocks the communication.
  - Another client or application is using the UDP port that is set in the properties of the network variable list.
  - More than one application per sender device and receiver device use network variable lists.
- Only arrays that have limits defined with a literal or constant are transmitted to the receiver application. Constant expressions are not permitted for this purpose.
  Example: "arrVar : ARRAY[0..g_iArraySize-1] OF INT ;" is not transmitted, but "arrVar : ARRAY[0..10] OF INT ;" is transmitted.
- The maximum size of a network variable is 255 bytes. The possible number of network variables is unlimited.
- If the size of the GVL exceeds the maximum length of the network telegram, then the data is split into multiple telegrams. Depending on the configuration, this can result in data inconsistencies.

6.4.1.10.6 Data Link with Data Sources

General

In order to have read/write access to the remote devices and their running applications, you can add a data source manager to your application with one or more data sources.

The functionality of the data source manager allows for establishing connections and communication to remote devices, and it makes its data available through data source variables. At this time, the partners communicate by means of a point-to-point connection. Depending on the network where the controllers are located, a connection is established via the CODESYS data source types or CODESYS ApplicationV3.

Data source type CODESYS Symbolic

The data source type CODESYS Symbolic is available only together with a CODESYS HMI device. However, then it is advantageous to use this type.

Below a CODESYS HMI device, you can configure the data link either with data source type CODESYS Symbolic or with data source type CODESYS ApplicationV3. We recommend that you select the data source type CODESYS ApplicationV3 only when there are no resources for the symbol configuration available on the remote device. For example, this is the case with embedded or mini PLCs whose applications often do not contain a symbol configuration.

The requirement for a connection setup is that symbols have been configured in the remote device and as a result a symbol file exists. The application in the remote device has a symbol configuration. Then the data link can take place via symbolic monitoring.
In the case of symbolic monitoring, the symbol file on the remote device is read and the stored variable information is used for the data source variables and the data transfer. The advantage is that the application does not have to be updated in the local device when someone modifies the remote application without updating its symbol configuration. If the symbol file is also located on your development system (either a file or a symbol configuration object as part of your project), then the local symbol file can also be read. Then you can work offline during the development phase.

During the development phase, you can create a variable list offline by means of local symbol configuration files. In this way, you can develop a local application offline based on the symbol information without a connection to a data source.

The following connection types are possible:

- **“CODESYS V2”**
  The devices exist in the same network. The V2 runtime on the remote PLC provides a communication interface.

- **“CODESYS V2 (Via gateway)”**
  The devices do not exist in the same network. They are connected via a V2 gateway. Note: For this connection, a “CoDeSys V2.3 Gateway Server” (V2 gateway) has to be installed on the development computer where CODESYS V3 is running.

- **“CODESYS V3”**
  The devices exist in the same network. The V3 runtime on the remote PLC provides a communication interface.

- **“CODESYS V3 (Via gateway)”**
  The devices do not exist in the same network. They are connected via a V3 gateway.

This data source type is available below all device types.

The data link with CODESYS ApplicationV3 data source type is done by means of address monitoring. This requires that the address information between the remote PLC and the local device match. The runtime system of the local application needs valid communication parameters in order to establish the connection.

Disadvantage: If you modify the remote application, then you also have to update the local application afterwards (for example, the HMI application.

The advantage is that a symbol configuration is not required in the remote application.

At runtime of the local application, the data source variables that appear in the data source editor of the “Variables” tab are updated in configurable time intervals. The remote application is also executed at this time. Variables that are configured in the visualization, in the trend, as alarms, or for recipes are transferred and stored automatically. When a variable is accessed in IEC code only, the variable is not updated automatically. In this case, you have to select the “Update always” option in the data source editor of the “Variables” tab.

The data source types support the (read or write) data access to variables of the source PLC for the following data types:

- **Scalar value at top level**
  
  Example: PLC_PRG.hugo

- **Property to a program or GVL by means of a call when it is marked with**
  
  Example: PLC_PRG.PropertyCall

- **Variable which is mapped to bit addresses**
  
  Example: PLC_PRG.x AT %MX0.5 : BOOL;
• Variable (type BIT) in a function block
  Example: Declaration in DUT: x, y : BIT, bit access: PLC_PRG.dutInst.y

• Structured obtainable variable
  Example: PLC_PRG.outerInst.innerInst.dwVar

• Property to POU instance when it is marked with [attribute monitoring := 'call'].
  Example: PLC_PRG.instance.PropertyCall

• Property at top level and to an instance when it is marked with [attribute monitoring := 'variable'].
  Note: This cannot be written by monitoring or by the data sources.

• Array access with literal index
  Example: PLC_PRG.arrOfInts[3], PLC_PRG.inst.arrOfBool[1]

• Nested access (for example, array of structures or structure of arrays)

CAUTION!
Bit access used in visualizations that are transferred via a data source connection function only if they contain literal offset specifications. A visualization cannot process an offset specification by defined constants.

Initially Adding a Data Source

For data exchange between your local device and a remote device, add a “Data Source Manager” object and then a “Data Source” below your application in the device tree. A wizard guides you through the configuration of the data source. Afterwards, you can change the settings at any time in the editor of the object. However, it is not possible to modify the data source type later.

Use the “CODESYS Symbolic” data source type unless there are no resources available in the remote PLC for a symbol configuration. As long as the symbol configuration in the remote device is not impacted by an application change, you have the advantage that the application in the local device does not have to be updated.

When adding a data source, select a data source type. Then specify the connection settings of the point-to-point connection to the remote device. Ideally, the remote device is running during this time and CODESYS can establish the connection to it immediately. Then all available data source variables from the remote PLC are displayed. Select the variables that should be transferred. You can also select all variables. Then the data source is initialized automatically, the data source variables are created below the “DataSources_Objects” folder, and another data source is added below the data source manager.

If the data is transferred using symbolic monitoring and the symbol file is stored on your development system, then you can read the variable information from the symbol file and work offline. The symbol file is stored either as a file on your development system or as a symbol configuration object as part of your project (in CODESYS).

The initial settings can be changed at any time in the data source editor.

• ‡ Chapter 6.4.1.21.2.5 “Object ‘Data Source Manager’” on page 2412
A “CODESYS Control Win V3” is running on the remote device. Moreover, an application is running with a symbol configuration.

1. Below your application in the device tree, insert a “Data Source Manager” object.
2. Select the “Data Source Manager” object and click “Add Object ➤ Data Source”.
   ⇒ The “Add Data Source” dialog opens.
3. In the “Name” field, specify the data source name.
   ⇒ Example: ds_Remote_Device
4. As the data source type, select “CODESYS Symbolic”.
   ⇒ The data transfer is done via symbolic monitoring. The “Initialize Data Source Wizard - Provider settings” dialog opens.
5. As the connection type, select “CODESYS V3”.
6. For “Type of name or address”, select the “Node name” option.
7. In the “Connection Settings” group, specify the connection parameters for configuring the remote device. Example: “[03A7]”
   ⇒ The connection to the remote device is established and the application is read. The “Initialize Data Source Wizard - Browse data items” dialog also opens. The read remote control variables are displayed in the tree view on the “Variables” entry. The top node is the application, which is displayed with its remote application name.
8. In the tree view, select which control variables should be transferred. Then click “Finish”.
   ⇒ The data source is initially configured. The ds_Remote_Device object is added below the “Data Source Manager” node. The object is open, and on the “Variables” tab, the data source variables to be generated are displayed in the tree view. The GVL ds_Remote_Device, where the data source variables are declared, is located below the “DataSource_Objects” folder.

A “CODESYS Control Win V3” is running on the remote device. Moreover, an application is running with a symbol configuration. The remote device exists in another network so that the communication has to be routed via a gateway.

1. Below your application in the device tree, insert a “Data Source Manager” object.
2. Select the “Data Source Manager” object and click “Add Object ➤ Data Source”.
   ⇒ The “Add Data Source” dialog opens.
3. In the “Name” field, specify the data source name.
   ⇒ Example: ds_Remote_Device
4. As the data source type, select “CODESYS Symbolic”.
   ⇒ The data transfer is done via symbolic monitoring. The “Initialize Data Source Wizard - Provider settings” dialog opens.
5. As the connection type, select “CODESYS V3 (Via gateway)”.
   ⇒ You can also specify the communication parameters for the gateway.
6. For “Type of name or address”, select the “Node name” option.
7. In the “Connection Settings” group, specify the connection parameters for configuring the remote device. Example: “[03A7]”
   ⇒ The connection to the remote device is established and the application is read. The “Initialize Data Source Wizard - Browse data items” dialog also opens. The read remote control variables are displayed in the tree view on the “Variables” entry. The top node is the application, which is displayed with its remote application name.
8. In the tree view, select which control variables should be transferred. Then click “Finish”.

The data source is initially configured. The `ds_Remote_Device` object is added below the “Data Source Manager” node. The object is open, and on the “Variables” tab, the data source variables to be generated are displayed in the tree view. The GVL `ds_Remote_Device`, where the data source variables are declared, is located below the “DataSource_Objects” folder.

Initially connecting devices symbolically via 'CODESYS V2’

A “CoDeSys V2.3 SP PLCWinNT V2.4” is running on the remote device. Moreover, an application is running with a symbol configuration.

1. Below your application in the device tree, insert a “Data Source Manager” object.
2. Select the “Data Source Manager” object and click “Add Object  Data Source”.

The “Add Data Source” dialog opens.
3. In the “Name” field, specify the data source name.
   Example: `ds_Remote_Device`
4. As the data source type, select “CODESYS Symbolic”.

The data transfer is done via symbolic monitoring. The “Initialize Data Source Wizard - Provider settings” dialog opens.
5. As the connection type, select “CODESYS V2”.
6. In the “Connection Settings” group, specify the connection parameters for configuring the remote device.
   Example: driver type TCP/IP (Level 2 Route), address localhost, port 1200

The connection to the remote device is established and the application is read. The “Initialize Data Source Wizard - Browse data items” dialog also opens. The read remote control variables are displayed in the tree view on the “Variables” entry.
7. In the tree view, select which control variables should be transferred. Then click “Finish”.

The data source is initially configured. The `ds_Remote_Device` object is added below the “Data Source Manager” node. The object is open, and on the “Variables” tab, the data source variables to be generated are displayed in the tree view. The GVL `ds_Remote_Device`, where the data source variables are declared, is located below the “DataSource_Objects” folder.

Initially connecting devices symbolically via 'CODESYS V2 (Via gateway)’

A “CoDeSys V2.3 SP PLCWinNT V2.4” is running on the remote device. Moreover, an application is running with a symbol configuration. The remote device exists in another network so that the communication has to be routed via a gateway.

1. Below your application in the device tree, insert a “Data Source Manager” object.
2. Select the “Data Source Manager” object and click “Add Object  Data Source”.

The “Add Data Source” dialog opens.
3. In the “Name” field, specify the data source name.
   Example: `ds_Remote_Device`
4. As the data source type, select “CODESYS Symbolic”.

The data transfer is done via symbolic monitoring. The “Initialize Data Source Wizard - Provider settings” dialog opens.
5. As the connection type, select “CODESYS V2 (Via gateway)”. You can also specify the communication parameters for the gateway.
6. In the “Connection Settings” group, specify the connection parameters for both the gateway and the device configuring the remote device.

Example: driver type TCP/IP (Level 2 Route), address localhost, port 1200

⇒ The connection to the remote device is established and the application is read. The “Initialize Data Source Wizard - Browse data items” dialog opens. The remote control variables are displayed in the tree view on the “Variables” entry.

7. In the “Connection Settings” group, specify the connection parameters for configuring the remote device. Example: “[03A7]”

⇒ The connection to the remote device is established and the application is read. The “Initialize Data Source Wizard - Browse data items” dialog opens. The read remote control variables are displayed in the tree view on the “Variables” entry. The top node is the application, which is displayed with its remote application name.

8. In the tree view, select which control variables should be transferred. Then click “Finish”.

⇒ The data source is initially configured. The ds_Remote_Device object is added below the “Data Source Manager” node. The object is open, and on the “Variables” tab, the data source variables to be generated are displayed in the tree view. The GVL ds_Remote_Device, where the data source variables are declared, is located below the “DataSource_Objects” folder.

Initially adding data source variables from a symbol file

Ideally, the same symbol file on the remote device is saved on your development system.

1. Below your application in the device tree, insert a “Data Source Manager” object.

2. Select the “Data Source Manager” object and click “Add Object ➔ Data Source” in the context menu.

⇒ The “Add Data Source” dialog opens.

3. In the “Name” field, specify the data source name.

⇒ Example: ds_Symbols

4. As the data source type, select “CODESYS Symbolic”.

⇒ The data transfer is done via symbolic monitoring. The “Initialize Data Source Wizard - Provider settings” dialog opens.

5. In “Variable information”, click the “From symbol file” entry.

6. In “Select symbol file”, specify the location and the file name of the symbol file. When the code is generated, an XML symbol file is created in the project directory by default.

⇒ Example: D:\Projects\V3.5 SP11\Project_A.Device.Application.xml

Hint: When a symbol file is specified, no additional connection settings have to be configured. A connection is not established. You are working offline. You have to configure the connection settings only when you need current data from the controller which is transferred online. In the “Variable information” settings, select the “From connection settings” option.

7. Click the “Next” button.

⇒ The “Initialize Data Source Wizard - Browse data items” dialog opens. The read symbols are displayed in the tree view on the “Variables” entry.

8. In the tree view, select the symbols to be transferred. Then click “Finish”.

⇒ The data source is initially configured. The ds_Symbols object is added below the “Data Source Manager” node. The object is open, and on the “Variables” tab, the data source variables that were generated based on the symbol file are displayed in the tree view. The GVL ds_Symbols, where the data source variables are declared, is located below the “DataSource_Objects” folder.
Your active project contains the control application for the remove device. The control application includes a symbol configuration with symbols that are added to your local application as data source variables.

1. Below your local application in the device tree, insert the “Data Source Manager” object.
2. Select the “Data Source Manager” object and click “Add Object ➔ Data Source”.
   ➦ The “Add Data Source” dialog opens.
3. In the “Name” field, specify the data source name.
   ➦ Example: ds_Symbols
4. As the data source type, select “CODESYS Symbolic”.
   ➦ The data transfer is done via symbolic monitoring. The “Initialize Data Source Wizard - Provider settings” dialog opens.
5. In “Variable information”, select the “<remote device>.<application>.symbol configuration” entry.
   ➦ Example: Device.Application.Symbol Configuration
   Hint: When a symbol file is specified, no additional connection settings have to be configured. A connection is not established. You are working offline.
6. Click the “Next” button.
   ➦ The “Initialize Data Source Wizard - Browse data items” dialog opens. The read symbols are displayed in the tree view on the “Variables” entry.
7. In the tree view, select the symbols to be transferred. Click “Finish”.
   ➦ The data source is initially configured. The ds_Symbols object is added below the “Data Source Manager” node. The object is open, and on the “Variables” tab, the data source variables that were generated based on the symbol configuration are displayed in the tree view. The GVL ds_Symbols, where the data source variables are declared, is located below the “DataSource_Objects” folder.

A “CODESYS Control Win V3” is running on the remote device. The project of the remote device is located on your development computer. The engineered application there does not contain a symbol configuration.

Use this communication link only if there are no resources available in the remote PLC for a symbol configuration.

1. Below your application in the device tree, insert a “Data Source Manager” object.
2. Select the “Data Source Manager” object and click “Add Object ➔ Data Source”.
   ➦ The “Add Data Source” dialog opens.
3. In the “Name” field, specify the data source name.
   ➦ Example: ds_Remote_Device
4. As the data source type, select “CODESYS ApplicationV3”.
   ➦ The data transfer is done by means of address monitoring. The “Initialize Data Source Wizard - Provider settings” dialog opens.
5. For “Select the project type”, select the “Other Project” option.
6. For “Choose file”, specify the file and location of the project on the remote device. Example: C:\Data\Projects\PLC_A.project.
   The remote device is displayed in the tree view of the window below, and as a result the connection was established.

7. Click the “From device” link.
   The connection parameters to the remote device are read and displayed in the dialog. The connection is configured.

8. Click “Next>”.
   The “Initialize Data Source Wizard - Browse data items” dialog opens. The remote control variables are displayed in the tree view on the “Variables” entry.

9. In the tree view, select which control variables should be transferred. Then click “Finish”.
   The data source is configured. A connection is established. The settings are stored in the object and can be modified in the editor of the object.

   The data source is initially configured. The ds_Remote_Device object is added below the “Data Source Manager” node. The object is open, and on the “Variables” tab, the data source variables to be generated are displayed in the tree view. The GVL ds_Remote_Device, where the data source variables are declared, is located below the “DataSource_Objects” folder.

### Editing data source variables

In runtime mode, the remote data is saved to the data source variables. The data source variables and their mapping to the remote variables are displayed in the data source editor below of the “Variables” tab. If the local and remote variables have the same names and the same data types, then the data is mapped 1:1. The variables and the data types are created automatically. That is the regular procedure.

You can also map to existing variables. This is necessary, for example, if a visualization includes a data type in an interface. Then the same data must be passed to this visualization. In this case, the declared local variable and the remote variable have the same data type, for example from one library. Moreover, you can map a local variable with a conforming data type to a remote variable. The data type can be created in the “Type Mappings” tab.

The specifically created variables and data types are declared in the “DataSource_Objects” folder. For each data source, a global variable list of the same name as the data source is declared there. Moreover, the data source variables usually have the identical or conforming data type as the remote control variable and they are declared as user-defined data types (DUT objects). Considering all data sources, multiple declaration of the same data types is avoided.

Do not edit the data interface in the “DataSource_Objects” folder manually. It is created initially when adding a data source. Changes can be made later in the editor of the data source.

● Appendix A 6.4.1.10.6.5 “Updating data interfaces” on page 1957
● Appendix A 6.4.1.21.2.6.2 “Tab ‘Variables’” on page 2415

### Selecting variables for data transfer

You can edit the selection of the data source variables.
Requirement: The remote device and its application are running. A data source manager is already inserted below the local application with a data source.

1. Open the editor of the data source.
2. Select the “Variables” tab.
3. Click “Update Variables”.
   ⇨ The “Browse Variables” dialog opens.
4. Activate the variables that should be transferred and click “OK” to close the dialog.
   ⇨ The data source variables are modified according to the selection. The declaration of variables and data types is also modified.

   The “Variables” tab shows the modified selection. Moreover, the mapped remote variable is listed in the “Remote variable” column.

- "Chapter 6.4.1.21.2.6.2 “Tab Variables” on page 2415"

### Mapping remote variables to a new variables

You need to map a remote variable to a global implicit variable that is created new. That is the regular procedure for transposing data source to 1:1.

Requirement: A project is open. A data source manager and a data source below it are located in the device tree of the local application.

1. Open the editor of the data source.
2. Select the “Variables” tab.
   ⇨ The data source variables are listed.
3. Select a variable and click the symbol in the “Create or map” column.
4. Specify a name in “Local variable”.
   ⇨ A variable is declared automatically and it contains the same value as the mapped remote variable.

### Mapping remote variables to an existing variables

You need to map a remote variable to an existing variable.

Requirement: A data source manager and a data source below it are located in the device tree of the local application. The remote data that should be transferred is displayed in the editor of the data source in the “Variables” tab

1. Open the editor of the data source.
2. Select the “Variables” tab.
3. Select a variable and click the symbol in the “Create or map” column.
   ⇨ A variable contains the same value as the mapped remote variable.
First, create a conforming data type and then use it for a variable.

- **Requirement:** A data source manager and a data source below it are located in the device tree of the local application. The remote data that should be transferred is displayed in the editor of the data source in the “Variable” tab.

  1. Open the editor of the data source.
  2. Select the “Type Mappings” tab.
  3. Select the data type in the list that you want to edit.
     - The elements of the data type are listed in the window below the data type list.
  4. Specify a name for the data type. Example: `DataType_A`. Select the name for the remote data types to which the local type should conform. Example: `Library1.DataType_A`.
  5. Modify it in the window below the data type list and remove the elements that are not necessary for the data transfer.
  6. Select the symbol for this data type in the “Create or map” column.
     - The data type `DataType_A` is declared in the “DataSources_Objects” folder.
  7. Select the “Variables” tab.
  8. Specify a name in the “Local variable” column. Example: `Var_A`.
  9. Select the symbol in the “Create or map” column.
  10. Specify the data type `DataType_A` in the “Mapping type” column.
  11. Select the remote variable with the data that should be transferred. Example: `appPLC_A.Data_A`. Use the input assistance for this.
     - A variable `Var_A` is declared automatically with the user-defined data type `DataType_A`. During data transfer, it receives the data of the mapped remote variables.
The example demonstrates how variables of the data source are created. At this time, new variables are created, data is mapped to existing data types and their variables, and new data types are created with type-conforming mapping.

The remote PLC uses POU instances from the **SnakeUtil** library and the HMI device visualizes these POU instances. This is why the HMI application requires a variable in the operating interface that has a data type appropriate for a visualization template. As a result, the **SnakeUtil** library is linked integrated into the HMI application and the HMI variables instantiate the **SnakeUtil.SnakeVisu** visualization function block.

The following library function blocks from the **SnakeUtil** library are used in the remote PLC.

- Function block **SnakeUtil.Snake**: Equipped with much logic and calling from external functions.
- **DUT**: **SnakeUtil.PositionInfo**: Two values (of the variables x and y)
- **DUT**: **SnakeUtil.DrawingInfo**: Image ID
- The **SnakeUtil.SnakeVisu** visualization function block with transfer parameter **SnakeUtil.Snake** visualizes the **Snake** function block.

The following settings are entered in the editor of the “Type Mappings” tab:

In the visualization, a frame is inserted with a reference to **SnakeUtil.SnakeVisu**. This expects to have the type **SnakeUtil.Snake**.

The data types **SnakeUtil.PositionInfo** and **SnakeUtil.DrawingInfo** are mapped to existing data types (symbol in the “Create or map” column). The data types are small and contain data only.

The **SnakeUtil.Snake** function block is very complex and calls external functions that are not available in the HMI visualization. The function block with code is not required in the visualization. You need a less extensive but compatible and conforming type in the HMI visualization. Therefore, do not create the original data type directly. Instead, first modify the original data type and remove the unnecessary elements. Then create the new data type **Snake** by selecting the symbol in the “Create or map” column.

**Editing Communication**

You have added a “Data Source Manager” object and below it a “Data Source” object below your application in the device tree. The connection parameters are displayed in the data source editor of the “Communication” tab. You can modify it there.

The data source type and the current connection type are listed in the status bar. It is not possible to modify the data source type later.

See also

- § Chapter 6.4.1.10.6.2 “Initially Adding a Data Source” on page 1949
- § Chapter 6.4.1.21.2.6.4 “Tab ‘Communication’ via CODESYS Symbolic” on page 2417
- § Chapter 6.4.1.21.2.6.5 “Tab ‘Communication’ via CODESYS ApplicationV3” on page 2422

**Updating data interfaces**

The data source variables are updated cyclically in runtime mode. Only the data is updated that either is used in the current visualization or has the property “Update always”.

---

**Library**

**SnakeUtil**

---
You can define the time interval. Moreover, you can define variables whose data is transferred in each update interval, and therefore they are always update. To update variables that are not used in the application code, you can implement an update programmatically with the help of interface functions from the data source manager.

**NOTICE!**
If data traffic between the remote and local device is too high, then the update rate is reduced automatically. This can lead to an incomplete transfer.

See also
- Chapter 6.4.1.21.2.6.2 “Tab ‘Variables’” on page 2415

### Setting the update rate

1. Open the editor of the data source.
2. Click the “General and Diagnosis” tab.
3. Specify a value in the “Update rate” field.
   
   Example: 100
   
   The data from the remote device to the local device is transferred every 100 ms.

See also
- Chapter 6.4.1.21.2.6.7 “Tab ‘General and Diagnosis’” on page 2426

### Selecting the variable for ‘Update always’

**NOTICE!**
Avoid updating too many variables always. Each update produces additional data traffic at the connection between the remote and local devices. When data traffic is too high, the update rate is reduced automatically. This can lead to an incomplete transfer.

1. Open the editor of the data source.
2. Activate the option “Update always” for a variable.
   
   The data of the variables is transferred at each update cycle, even when the data has not changed.

See also
- Further information on page 2415

### Updating data programmatically

The data source manager provides interface functions in the Datasources library. If a data source manager is integrated in the application code, then the global variable `g_Datasources` is instantiated automatically. This provides access to the interface functions.

Then you can update individual variables that are not called in the active visualization.
The variable `ivar` is activated and deactivated by means of methods from the `Datasources` library so that its value is transferred. Furthermore, you can configure that the variable is updated only over a defined duration in order to save transfer capacity.

```c
//Synchronize with DatasourcesTask and block until access is possible
//Regard the feedback in ERR_OK or in ERR_DE_MULTITASKING_LOCKED
_`g_DataServer.UseData(ADR('RemoteDevice.Application.PLC_PRG.iVar'));`
// Activate variable
// Deactivate variable
//`g_DataServer.ReleaseData(ADR('RemoteDevice.Application.PLC_PRG.iVar'));`
_`g_DataServer.EndDataConfiguration();`
```

The data configuration is started with `BeginDataConfiguration(TRUE)`, thus initializing the synchronization of the task `DatasourceTask` with the application task. The value `TRUE` blocks the processing until the access to the variable is possible; `FALSE` repeats access attempts without blocking. The return values `ERR_OK` and `ERR_DS_MULTITASKING_LOCKED` provide feedback about the access attempts.

When synchronization is successful, the variable is activated by means of the `UseData` method. Then the data configuration is completed with the `EndDataConfiguration` method and the synchronization triggered again with the task `DatasourceTask`.

The `ReleaseData` method is used in the same way for deactivating the variable again at the desired processing time.

### Using remote data

The variables that are listed in the data source editor of the “Variables” tab (and declared in the “DataSources_Objects” folder) can be used in your application like IEC variables. For example, you can visualize the variables.

If multiple data sources are available and therefore conflicts occur regarding unique variable names, then you must specify the data source name as the prefix. If no conflicts occur, then this is not necessary and you can map the variables without a data source prefix.

```
<data source name>.<function block name>.<variable name>
```

### Displaying variable values from the remote device

You need to show the variable value `iTemp` of a remote device in a visualization element of a visualization in the local application (with the data source manager).

Initial situation: A data source `dsRemotePLC` is below the local data source manager where the connection to the remote device is configured. In addition, the variable `iTemp` is selected in the data source editor of the “Variables” tab.

1. Select the visualization element in the editor view. Select the properties “Text variables”-“Text variable” in the “Properties” view.
2. Select the `iTemp` variable.
   ⇒ The variable mapping is qualified. Example: `dsRemotePLC.PLC_PRG.iTemp`.
3. Select the “Text” property of the visualization element and type in the following:
   `Temperature: %s`
   ⇒ The value of the `iTemp` variable from the remote device `RemoteDevice` is displayed.
4. Download and start the remote application.
5. Download and start the local application.
   ⇒ The visualization starts and displays the actual value of `iTemp`. 
NOTICE!
The visualization integrated in CODESYS does not display actual values of variables that are transferred by means of a data source connection. The integrated visualization displays only the initialization values or the last otherwise delivered values because they do not establish a connection to the data sources.

NOTICE!
If variables are used that are not called in the visualization code, then the variables must be updated in the application code by means of functions from the data source interface.

Data Source OPC UA Client

Establishing the Connection of a Data Source OPC UA Client to an OPC UA Server

Requirement:
- An OPC UA Server is available. For a description of the OPC UA Server which is included in the standard installation CODESYS, see the chapter "OPC UA Server". 
  Chapter 6.3.6.2 “OPC UA server for AC500 V3 products” on page 1787
- You have installed the CODESYS Security Agent add-on in CODESYS.
- CODESYS is open.
- The “Allow anonymous login” option is selected for your controller in the “Change Communication Policy” dialog of the device editor (“Communication Settings” tab, “Change Communication Policy” command, “Device” menu). Or the user management has been explicitly disabled (for example, by switching to “Optional user management” in the “Change Communication Policy” dialog and then “Reset Origin”).

1. Start the OPC UA Server.
2. Create a new CODESYS project.
3. Add a “Data Source Manager” object to the application.
4. Add a “Data Source” “OPC UA-Client” to the “Data Source Manager”.
   The “Initialize Data Source” dialog opens.
5. In the “Initialize Data Source” dialog, configure the data source for communication in the following.

With the option “Read Connection Settings from IEC Variable” option, you can dynamically configure the connection settings instead of defining them here in the dialog. For more information, see: Using a Dynamic Connection to an OPC UA Server

- Chapter 6.4.1.21.2.6.6 “Tab ‘Communication’ via OPC UA Server” on page 2424
- Chapter 6.4.1.10.6.7.3 “Using a Dynamic Connection to an OPC UA Server” on page 1963

The settings from this dialog are reflected accordingly on the Communication tab of the data source manager:

- For “Where to find the server layout”, define how the information about the existing variables and types should be detected. When you select the “Browse Live Server” option, the OPC UA Client connects to the OPC UA Server for this purpose and reads the information there. When you select “From Information Model”, the client reads the same information from an installed information model and does not require a running OPC UA Server to do this.
- Click the [Show All Endpoints] button to open the “Available Endpoints” dialog.
- Select an endpoint which defines an “Encrypt & Sign” message security mode and a corresponding security strategy. After the dialog is closed, these settings are transferred to the “Security” section of the “Initialize Data Source” dialog.
- Choose a suitable “Client certificate” to access the server for browsing purposes. If a certificate is not available for selection yet, then you can have one generated immediately. To do this, click the button to open the “Generate self-signed certificate” dialog. Define a password for your private key and a file name for the certificate. When you click [OK], the certificate is generated and automatically entered into the certificate store. The *.cer and *.pfx certificate files are stored with the project file. As a result, you can "give" the certificate with the public key (*.cer) to the server so that it "knows" the certificate. You can also share the private key (*.pfx) to make the project usable on another machine (for browsing).

Note that this certificate can be used only for browsing the server for variables and data types. An additional certificate is required for data exchange in online mode. Its creation is described below.

6. Click “Next”. Now the client scans the OPC UA Server to find the variables and types of the OPC UA Server. The OPC UA Server has to be online to do this.

7. Now select one or more variables.

These variables can be exchanged later via encrypted communication between the OPC UA Client and the OPC UA Server. For the variables, components are created in the “Devices” view, in the “DataSources_Objects” folder. The variables can be used in the application.

8. In the next steps, you create a certificate for the encrypted communication from the OPC UA Client to the OPC UA Server.

9. Click “View ➔ Security Screen”.

10. Switch to the “Devices” tab.

11. In the view on the left, select the controller.

In the right view, all services of the controller are displayed which require a certificate.

12. Select the service “CmpOPCUAClient”.

13. Create a new certificate for the device. To do this, click the icon.

The “Certificate Settings” dialog opens.
14. Define the certificate parameters and click “OK” to close the dialog.
   ⇨ The certificate is created on the controller.

15. Click the button and save the certificate to the local file directory of the OPC UA Server, in the folder certs.
   ⇨ Now when you restart the OPC UA Server, it will recognize the client certificate. The server sends its certificate to the client. In the following steps, this certificate will be made "trusted" to the client.

16. To do this, in the “Security Screen” view, on the “Devices” tab, click the “Certificates in Quarantine” folder in the left area.
   ⇨ The certificate is displayed in the right area.

17. Drag this certificate to the “Trusted Certificates” folder.
   ⇨ Now the server certificate is "trusted" by the client.

18. Now when you connect to the controller and the application starts, the data source variables of the OPC UA Client can be exchanged with the OPC UA Server via the encrypted connection.

- ☉ Chapter 6.4.1.21.2.6.6 “Tab ‘Communication’ via OPC UA Server” on page 2424

Error Messages

Error 8448  
Message: Identity mismatch
Typical error cause: The application information on the target device and the HMI to not match.
Correction: A new download should be done on the HMI to update the application information.

Error 8449  
Message: Login failed
Typical error cause
- The communication settings are incorrect.
- The user name or password is not correct.
Correction: Check the communication settings for the target device. Make sure that the user name and password are correct.

Error 8450  
Message: Login necessary
Typical error cause: There is no connection to the controller.
Correction: Check the communication settings for the target device. Make sure that the user name and password are correct.

Error 8452  
Message: The device cannot be reached.
Typical error cause
- The device is switched off.
- The communication settings are incorrect.
- The network connection does not work.
Correction: Make sure that the target device is switched on. Check the communication settings and the network connection to the target device.
Using a Dynamic Connection to an OPC UA Server

The settings for the communication of an OPC UA Client data source to an OPC UA Server can be dynamically configured from the IEC code and can also be changed at runtime. For this purpose, a structure is available in the DatasourceOpcUAServer library.

When using this kind of "dynamic connection", at runtime, for example, the server URL can be changed again if the device is located in a different network than at the time of configuration. It can also be used to configure detailed settings on the OPC UA connection.

**Requirement**

- You have created an OPC UA Client data source in the CODESYS project. For more information, see: Establishing the Connection of a Data Source OPC UA Client to an OPC UA Server.

  © Chapter 6.4.1.10.6.7 “Data Source OPC UA Client” on page 1960

1. On the “Communication” tab of the data source, now select the “Read Connection Settings from IEC Variable” option.
2. In static memory (for example, in a GVL or in a program in your project), create a variable of type DatasourceOpcUaServer.UserConfigurationV1.

**Example:** config variable in the PLC_PRG program

```plaintext
PROGRAM PLC_PRG
VAR
  config : DatasourceOpcUaServer.UserConfigurationV1 := (  
    SessionName := 'MyCustomSession',
    EndpointUrl := 'opc.tcp://DevXY:4840',
    SecurityPolicyUri := DatasourceOpcUaServer.CmpOpcUaStack_Interfaces.OpcUa_SecurityPolicy_None);
  value : INT;
END_VAR
```

**Error 8453**

Message: The device name is not unique.

Typical error cause: Multiple devices with the same name were found in the target system.

Correction: Make sure that the target device has a unique name.

**Error 8454**

Message: No symbols available

Typical error cause: Either no application has been downloaded to the target device, or an application with another symbol configuration.

Correction: Make sure that the application is downloaded with the correct symbol configuration to the target device.

**Error 8457**

Message: The connection is denied due to no resources.

Typical error cause: All available communication channels of the target device are used.
3. In the input field below the “Read Connection Settings from IEC Variable” option, reference the variable created in step 2:

Example: PLC_PRG.config

Now at any time you can fill the fields of this UserConfigurationV1 structure with values. For example, this can be done when starting the controller, from a configuration file, or from a visualization dialog.

When filling the structure with setting values, the following applies:

- The EndpointUrl setting always has to be defined.
- All other settings can be assigned as desired. They allow, for example, the use of a different security mode than in the usual editor. Some settings, which are not available in the editor, can also be configured on the OPC-UA connection.

When all connection settings are configured, you can set the xValid parameter of the UserkonfigurationV1 to TRUE.

Example: In the implementation part of PLC_PRG:

```plaintext
config.SubscriptionPublishingInterval := config.SamplingInterval := TIME#2S;
config.xValid := TRUE;
```

Then the data source starts to establish the connection in the next cycle.

Changes to the settings while a connection is established have no effect and are only applied the next time a new connection is established.

When the xValid setting is set to FALSE, the data source automatically disconnects from the server and the settings can be changed again.

In the documentation view of the DatasourceOpcUAServer library, you can see an overview of the currently available setting parameters of the structure and their default values in the library manager. New versions of the data sources might provide new options.

---

6.4.1.10.7 Subordinate safety controller

If a safety controller is below the standard controller, then the communication with the development system and the data exchange run via the standard controller. The communication links of the safety controller can interrupted the execution of commands that affect the standard controller. You find a notice about this for each these command.

Possible interruptions

- Temporary interruption: During the execution of the command (for example: download), the connections with the safety controller are interrupted first and then are automatically available again afterwards. If the interruption time is too long, then safety-oriented reactions can occur in the output devices and connected network variable receiver safety controllers. Then in the safety controller, the corresponding communication errors must be acknowledged (if not done automatically) in order to end the safety-oriented reactions. This affects the connection to their field devices and network variable receiver connections to other sender safety controllers. In the case of a connected safety controller with network variable senders, the communication errors must be acknowledged in the other safety controllers.

- Permanent interruption: The execution of commands (for example: delete) leads to an interruption that is ended again by another action (for example: download). As a result of the interruption, safety-oriented reactions can occur in the output devices and connected network variable receiver safety controllers. After ending the interruption, the corresponding communication errors must be acknowledged in the safety controller (if not done automatically) in order to end the safety-oriented reactions.

For a subordinate safety controller, the routing runs via “<Name of SafetyApp>_Mapping”. In some cases, it can happen that the user can see this application in the device tree.
6.4.11 Downloading an Application to the PLC

6.4.11.1 General

The multi download tool can be used to update multiple PLCs with firmware or an application at the same time.

* Chapter 6.6.4 "Multi download tool" on page 4306

In order to transfer your application to the PLC, the program has to be compiled without any errors and the connection settings for the PLC have to be set.

* Chapter 6.4.11.4 “Handling of Device User Management” on page 1971
* Chapter 6.4.1.9.18 “Protecting an application” on page 1915

You can edit the basic security policy for communication with the device in a dialog on the “Communication Settings” tab of the device editor. See here:

* Chapter 6.4.1.11.3 “Encrypting Communication, Changing Security Settings” on page 1967

When these requirements are fulfilled, the application is downloaded to the PLC at login.

6.4.11.2 Configuring the Connection to the PLC

The connection to the controller is established by means of a gateway. This gateway can be your development computer or another network computer connected to the controller. The “Communication Settings” dialog is available for configuring the connection path. This dialog opens automatically when you attempt to log in, but the communication settings have not been configured yet.
If the communication with the controller is encrypted and secured by means of user management, then you need a corresponding certificate and credentials to establish the connection to the controller. In this case, see the relevant instructions on the "Encrypting communication and Changing Security Settings" help page.

Requirement: The project can be compiled without any errors. A programmable logic controller (PLC) is inserted in the device tree. The use of a user management is required for the device, but it is not enabled.

1. In the device tree, select the PLC and click “Project ➔ Edit Object”.
   – The PLC opens in the editor.
2. Click the “Communication Settings” tab.
3. On the menu bar, click “Scan Network”.
   – The “Select Device” dialog opens. All available devices in the network are shown on the left side.
4. Select the desired device and click “OK”.
   – A dialog prompt is displayed with the notice that a user management is required for the device, but it is not enabled yet. You are prompted to enable the user management if you want. The notice is displayed that in this case you have to create a new administrator account and then log in as this user.
5. Click “Yes” to close the dialog prompt.
   – The “Add Device User” dialog opens to create an initial device administrator.
6. Define the credentials (“Name” and “Password”) for the device administrator. Select the “Password can be changed by the user” option.
   
   **NOTICE!**
   
   Remember the seriousness of the password: From within the development system, there is no way to access the controller again if you forget the password.

   Click “OK” to close the dialog.
   – The “Device User Logon” dialog opens.
7. Enter the credentials for the device administrator which you defined in the previous step.
   – The connection path for the PLC is set.

You can reset the communication settings view to the original view in the CODESYS options of the device editor.

- % Chapter 6.4.1.21.4.14.7 “Dialog 'Options' - 'Device Editor'” on page 2786
6.4.1.11.3 Encrypting Communication, Changing Security Settings

![NOTICE! Recommendations for data protection](image)

In order to minimize the risk of data security violations, we recommend the following organizational and technical actions for the system where your applications are running. Whenever possible, avoid exposing the PLC and control networks to open networks and the Internet. Use additional data link layers for protection, such as a VPN for remote access. Install firewall mechanisms. Restrict access to authorized persons. Use high-strength passwords. Change any default passwords regularly before and after commissioning.

Use the security features supported by CODESYS and the respective controller, such as encryption of communication with the controller and intentionally restricted user access.

Communication with the device can be protected by means of encryption and user management on the device. You can change the current security preset on the “Communication Settings” tab of the device editor.

Establishing a connection to the controller, logging in, installing a trusted certificate for encrypted communication

- Requirement: Encrypted communication with the controller and user management are enforced on the controller. However, an individual password does not exist yet. A certificate has not been installed on your computer and the connection to the controller has not been configured yet.

1. In the device tree, double-click the controller.
   - The device editor opens.
2. Click the “Communication Settings” tab.
3. Click “Scan Network”.

---

2024/01/05 3ADR010583, 1, en_US 1967
4. Select a controller.
   ⇒ A dialog opens, informing you that the certificate of the device does not have a trusted signature for communication. You are prompted whether or not to install this certificate as trusted in the local "Controller Certificates" store on your computer, or accept a session only for this one.

   NOTICE!
   A controller certificate installed in this way is valid for only 30 days.
   This gives you time for the following long-term solutions:
   - Creation of an additional self-signed certificate with a longer term (for example, 365 days). You can do this on the security screen if you have installed the CODESYS Security Agent, even if a certificate already exists. Using the PLC shell of the device editor is not a convenient workaround. See below: "Configuring encrypted communication with a controller certificate with a more long-term validity period"
   - Importing a CA-signed certificate. This is currently only possible via the PLC shell commands of the runtime. Therefore, we recommend to use self-signed certificates first.

5. If you want to install the certificate, then select the first option and click "OK" to confirm the dialog prompt.
   ⇒ The certificate is listed as trusted. After accepting the self-signed certificate for the first time, you can establish an encrypted connection with the controller again and again without further prompts.
   A dialog prompt is displayed with the notice that a user management is required for the device, but it is not enabled yet. You are prompted to enable the user management if you want. The notice is displayed that in this case you have to create a new administrator account and then log in as this user.

6. Click "Yes" to close the dialog prompt.
   ⇒ The "Add Device User" dialog opens to create an initial device administrator.

7. Create a device user in order to edit the user management as this user. In this case, only the "Administrator" group is available. Specify a "Name" and "Password" for the user. The password strength is displayed. Note also the set options regarding a password change. By default, the password can be changed by the user at any time. Click "OK" to confirm.
   ⇒ The "Device User Logon" dialog opens.

8. Enter the credentials for the device administrator which you defined in the previous step.
   ⇒ You are logged in on the controller. On the "Users and Groups" tab, you can use the button to switch to synchronized mode. The device user management is displayed there and you can edit it.
   After you click "OK" to confirm, the device user management is displayed in the editor view. It contains the user of the "Administrator" group who you just defined. The name of this user is also displayed in the taskbar of the window as "Device User".

9. All saved controller certificates (from Step 5) are stored in the local Windows Certificate Store on your computer. You can access this memory by means of the "Execute", certmgr.msc command.
   ⇒ All registered certificates for encrypted communication with controllers are listed here in "Controller Certificates".

---

**Configuring a controller certificate with a more long-term validity period**

Requirement: The CODESYS Security Agent add-on product is installed. You want to replace the temporary certificate (as described above) acquired the first time you connected to the protected controller with a certificate with a longer validity period.
In this case, the “Security Screen” view provides an additional tab: “Devices”. This allows for the simple configuration of certificates for the encrypted communication with controllers. For operation, see the help for CODESYS Security Agent: “Encrypted Communication with Devices via Controller Certificates”.

Choose this less convenient method when the CODESYS Security Agent is unavailable to you. In this case, you can set up a certificate with a more long-term validity period for communication encryption on the “PLC Shell” tab of the device editor.

☑ Requirement: You are connected to the controller.

1. At first, you check if a qualified certificate is already on the controller. If no certificate is available, then you create a new certificate.

Open the device editor by double-clicking the controller in the device tree, and select the “PLC Shell” tab.

⇒ The tab appears with a blank display window. Below that is a command line.

2. Type the following command in the command line: cert-getapplist.

⇒ All used certificates are listed. The list includes information about the runtime component and whether or not the certificate is available.

3. If a certificate still does not exist for the component CmpSecureChannel, then type the following command in the input line:

   cert-genselfsigned <number of the component in the applist>

4. Click the “Log” tab and then the refresh button (✓).

⇒ The display shows whether or not the certificate was generated successfully.

5. Change back again to the “PLC Shell” tab and type the command cert-getapplist.

⇒ The new certificate for the component CmpSecureChannel is displayed.

6. In the next two steps, activate encrypted communication in the security screen of CODESYS.

7. Open the “Security Screen” by double-clicking 🛡️ in the status bar.

8. On the “User” tab, select the “Enforce encrypted communication” option in the “Security Level” group.

⇒ The communication to all controllers is encrypted. If there is not a certificate on a controller, then you cannot log in to it.

   The connecting line between the development system, the gateway, and the controller is displayed in yellow on the “Communication Settings” tab of the device editor of the controller.

9. As an alternative to the “Enforce encrypted communication” option which applies to all controllers, you can also define encrypted communication for specific controllers only. To do this, select the “Communication Settings” tab in the editor of the respective controller. Then click “Encrypted Communication” in the “Device” list box.

⇒ The communication with this controller is encrypted. If there is not a certificate on the controller, then you cannot log in to it.

   The connecting line between the development system, the gateway, and the controller is displayed in yellow on the “Communication Settings” tab of the device editor of the controller.
10. When you log in to the controller for the first time, a dialog opens with information that the certificate of the controller is not signed by a trustworthy authority. In addition, the dialog displays information about the certificate and prompts you to install it as a trustworthy certificate in the local store in the “Controller Certificates” folder. When you confirm the dialog, the certificate is installed in the local store and you are logged in to the controller. In the future, communication with the controller will be encrypted automatically with this control certificate.

11. To increase security for key exchange for controllers < V3.5 13.0, you can generate Diffie-Hellman parameters on the controller. To do this, type the command `cert-gendhparams` in the input line. This is no longer required for controllers >= V3.5.13.0.

**NOTICE!**

Caution: Generating the Diffie-Hellman parameters can last for several minutes or even several hours. However, this process must be executed only one time for each controller. The Diffie-Hellman parameters increase security for key exchange and for future attacks against encrypted data recording.

---

### Changing the communication policy (encryption, user management)

- **Requirement:** The connection to the device is established.
- **1.** In the device tree, double-click the controller.
  - The device editor opens.
- **2.** Click the “Communication Settings” tab.
- **3.** Open the “Device” menu in the header of the editor. Click “Change Communication Policy”.
  - The “Change Communication Policy” dialog opens.
- **4.** In the upper part of the dialog, you can toggle between the “Optional encryption”, “Enforced encryption”, and “No encryption” settings.
- **5.** In the lower part of the dialog, you can toggle between the “Optional user management” and “Enforced user management” settings.

### Enabling and disabling enforced encrypted communication

- **Requirement:** The device supports encrypted communication.
- **1.** In the device tree, double-click the controller.
  - The device editor opens.
- **2.** Click the “Communication Settings” tab.
3. Open the “Device” menu in the header of the editor. Click “Encrypted Communication”. The status toggles between enabled and disabled.

⇒ If the “Encrypted communication” option is selected, then the connection line between the development system, the gateway, and the device is highlighted in the editor in bold and in color in the graphical representation.

### 6.4.11.4 Handling of Device User Management

**NOTICE!**

**Recommendations for data protection**

In order to minimize the risk of data security violations, we recommend the following organizational and technical actions for the system where your applications are running. Whenever possible, avoid exposing the PLC and control networks to open networks and the Internet. Use additional data link layers for protection, such as a VPN for remote access. Install firewall mechanisms. Restrict access to authorized persons. Use high-strength passwords. Change any default passwords regularly before and after commissioning.

Use the security features supported by CODESYS and the respective controller, such as encryption of communication with the controller and intentionally restricted user access.

For devices that support a device user management, the device editor includes the “Users and Groups” tab and the “Access Rights”. When offered by the device, you can view the user management for the device here as well as edit it in synchronization mode (not in online mode). Here, you can grant or deny specific permissions on the controller to the defined user groups.

The device user management can already be set up in the device description.

**Note the commands in the “Online ➔ Security” menu. You can easily add, edit, or remove a user account on the controller where you are currently logged in.**

**In order for the “Access Rights” tab to be available in the device editor, the corresponding CODESYS option must be selected in the device editor and unlocked in the device description. If the device editor is not available, then contact the manufacturer of the controller.**

In order to grant access rights to a user group, first the users and user groups have to be configured on the “Users and Groups” tab of the device editor. User management first has to be set up on the controller before access rights can be configured on it. In case the user management of a device is not enabled yet, it can be enabled in the following way: Either by switching to the synchronized mode on the “Users and Groups” tab, or by adding a new user by means of the command “Online ➔ Security ➔ Add Device User”.
For the CODESYS Control devices, a user management is enforced by default.

Access rights can be granted to groups only, not individual users. Therefore every user has to be a member of a group.

Access rights can be granted for the following actions which are executed on the individual objects of the controller:

- Add/Remove
- Modify
- View
- Execute

An object on the controller is usually assigned to just one controller component.

Each object can use all of the listed actions, but usually only the permissions for the following actions are needed on an object:

- "View"
- "Modify"

The objects are organized in a tree structure. There are two root objects for the two kinds of objects:

- "Runtime objects ➔ Device": In these objects, all objects are managed that have online access in the controller and therefore have to control the access rights.
- "File system objects ➔ /": In these objects, the permissions can be granted to folders of the current execution directory of the controller.

The child objects inherit the access rights from the root object (also "Device" or "/"). If a permission of a user group is denied or explicitly granted to a parent object, then this affects all child objects.

A single permission can be explicitly granted or denied (green plus sign or red minus sign), or remain "neutral" (light gray character). Neutral means that the permission has been neither explicitly granted nor denied. In this case, the permission of the parent object applies.

If no permission has been explicitly granted or denied in the entire hierarchy of the object, then it is by definition denied. As a result, all permissions are initially denied (exception: the access right for the "View" action). Initially, this permission is explicitly granted for every user group both on the "Device" runtime object as well as on the "/" file system object. This allows read access to all objects, unless it is explicitly denied in child objects.

For an overview table for the objects, see the "Tab 'Access Rights'" chapter.

See the following instructions for handling the editor for the device user management:

1. Double-click the controller device object in the device tree.
   ➞ The device editor opens.

2. Click the "Users and Groups" tab.

3. Click 🏷️.
   ➞ A dialog opens prompting whether the device user management should be activated.

4. Click "Yes" to acknowledge the dialog prompt.
   ➞ The "Add Device User" dialog opens.
5. Now create a device user in order to edit the user management as this user. In this case, only the “Administrator” group is available. Specify a “Name” and “Password” for the user. The password strength is displayed. Note also the set options regarding a password change. By default, the password can be changed by the user at any time. Click “OK” to confirm.

⇒ The “Device User Logon” dialog opens.

6. Specify a “User name” and “Password” for the user who you just defined.

⇒ After you click “OK” to confirm, the device user management is displayed in the editor view. It contains the user of the administrator group who you just defined. The name of this user is also displayed in the taskbar of the window as “Device User”.

**Setting up a new user in the user management of the controller**

Requirement: The controller has a device user management. You have the corresponding access data.

1. Double-click the controller device object in the device tree.

⇒ The device editor opens.

2. Click the “Users and Groups” tab.

3. Click (Synchronization) to load the user management configuration from the controller to the editor. If you are not logged in to the device yet, then the “Device User Logon” dialog opens for entering the user name and password.

⇒ The user management configuration of the device is shown in the editor.

4. In the “Users” view, click “Add”.

⇒ The “Add User” dialog opens.

5. Specify the name of the new user and assign the user to a group. This counts as the user's minimum required default group. The user can be assigned to other groups later. Define and confirm a “Password” for the user. Define whether the user can change the password and whether the user has to change the password at the first login. Click “OK” to confirm.

⇒ The new user appears in the “Users” view as a new node and in the “Groups” view as a new subentry of the selected default group.

**Changing of access rights to controller objects in the user management of the controller**

Requirement: The controller has a device user management. You have the corresponding access data.

1. Double-click the controller device object in the device tree.

⇒ The device editor opens.

2. Click the “Access Rights” tab.
3. Click (Synchronization) to load the rights management configuration from the controller to the editor. If you are not logged in to the device yet, then the “Device User Logon” dialog opens for entering the access data.

⇒ The access rights management configuration of the device is shown in the editor.

4. Select the object whose access right you want to change to the left in the object tree.

⇒ In the “Rights” view, a table shows the access rights to this object for all configured user groups.

5. Double-click the right in the table that you want to change.

⇒ If the object has child objects, then a dialog prompts whether you want to modify the permissions for the child objects.

6. Click “Yes” or “No” to close the prompt.

⇒ The permissions are switched from "allowed" to "not allowed", or the other way around. The symbol in the table cell changes accordingly. Explicitly set permissions appear in the table as green or red symbols. Rights that are inherited from a parent object appear as gray symbols.

1. Double-click the controller device object in the device tree.

⇒ The device editor opens.

2. Click the “Users and Groups” tab.

3. Click （）.

⇒ The dialog for selecting a file from the local file system opens.

4. Select the file (*.dum2) with the desired user management from the local file system and click “Open” to confirm.

⇒ The “Enter Password” dialog opens.
5. Specify the password that was assigned when the user management file was exported (possible by means of the button).  
**CAUTION:** The import of a device user management by means of a *.dum2 file completely overwrites the existing user management on the device. In order to log in to the device again afterwards, you need authentication data from the recently imported user management.

⇒ When the password is entered correctly, the configuration from the downloaded user management file is now displayed in the editor view.

6. Edit the configuration however you like. For example, change the user password or add a new user.

⇒ Every change is downloaded immediately to the device.

- Chapter 6.4.1.21.2.8.14 “Tab 'Users and Groups’” on page 2450
- Chapter 6.4.1.8.2 “Configuring Devices and I/O Mapping” on page 1836
- Chapter 6.4.1.11.3 “Encrypting Communication, Changing Security Settings” on page 1967

**Configuring the password policy and login lock**

You can configure a password policy and login lock for the runtime system. Using these two mechanisms makes sure that the credentials configured for the controller are as secure as possible and that attackers cannot guess the credential by repeated attempts. By default, a password policy is not enabled. The login lock is enabled by default for the administrator user group because this user group needs to fulfill increased security criteria and should also be better protected. When the maximum number of login attempts has been exceeded, the user will be locked out for the configured amount of time (3600 seconds by default).

**Unlocking a locked user**

The following options are available for unlocking a user who has been locked for a specific period of time:

- An administrator or a member of a user group with write permission for the user group of the locked user assigns a new password for the user.
- The runtime system is restarted.

1. In the device tree, double-click the controller.

⇒ The device editor opens. The “Communication Settings” tab is displayed.

2. In the header, click the “Scan Network” button, and in the “Select Device” dialog, select the desired device. Then click “OK”.

⇒ The active path to the controller is set.

3. In the “Device” menu, select “Change Runtime System Password Policy”.

4. In the “Change Runtime System Password Policy” dialog, select the “Password policy is active” option.

⇒ The password policy with the displayed password settings is enabled.

⇒ The detailed default password settings can be found in the description of the dialog.

5. Change individual password settings as needed.

6. Click “OK” to confirm the changes made.

⇒ The configured password policy is immediately applied when creating a new user and when changing the password for an existing user. Only new passwords which fulfill the password policy can be created.
1. In the device tree, double-click the controller.
   ➔ The device editor opens. The “Communication Settings” tab is displayed.

2. In the header, click the “Scan Network” button, and in the “Select Device” dialog, select the desired device. Then click “OK”.
   ➔ The active path to the controller is set.

3. In the “Device” menu, select “Change Runtime System Password Policy”.

4. In the “Change Runtime System Password Policy” dialog, you can change the default settings for the login lock or disable the login lock.

5. Click “OK” to confirm the changes made.
   ➔ The configured login lock is immediately applied when logging in to the device user management for users of the user group selected in the “Scope”.
   ➔ When the number of login attempts specified in the “Maximal Retries” field is exceeded, the user will be locked out for the amount of time which is specified in the “Lock duration” field.

6.4.11.5 Generating Application Code

The application code is the machine code that a PLC executes when you start an application. CODESYS automatically generates the application code from the source code that was written in the development system. This is done automatically before downloading the application to the PLC. Before the application code is generated, a test is performed for checking the allocations, the data types, and the availability of libraries. Moreover, the memory addresses are allocated when the application code is generated.

You can click “Build ➔ Generate Code” to execute this command explicitly. This is useful for detecting any errors in your source code, even when the PLC is not connected yet. The errors are output in the message view in the “Build” category.

NOTICE!
If you have encrypted the application, then consider the following information: If a (new) boot application is generated on request after an online change, then the boot application is formed in the RAM with the current code that is not encrypted.

Explicitly generating the application code

Requirement: The application can be compiled without any errors.

➢ Click “Build ➔ Generate Code”.
   ➔ The application code is generated. Detailed information about memory allocation is output in the message view.

See also

● § Chapter 6.4.11.7 “Generating boot applications” on page 1978
● § Chapter 6.4.1.21.3.6.1 “Command ‘Generate Code’” on page 2618

Messages when generating the application code

When you generate the application code, CODESYS outputs information about memory allocation in the message view. Gaps form in the memory because reallocation is only for new and changed POUs and variables due to the incremental memory build. Online changes have the same effect. This fragmentation reduces the amount of available memory. However, you can completely reallocate the memory by clicking “Clean” and therefore increase the amount of free memory.
Syntax errors and bugs that CODESYS detects during the code generation and memory allocation are also output in the message view ("Build" category).

Output information about memory allocation:

- "Size of the generated code" (in bytes): Sum of all code segments
- "Size of global data" (in bytes): Total memory used by the global variables. Inputs and outputs are not included unless inputs or outputs are mapped in the area of the global variables.
- "Total allocated memory size for code and data" (in bytes): The total allocated memory is composed of the already used memory areas plus the reserved, not yet used memory for incremental builds and online changes. After the first build, the already used memory is approximately equal to the highest used address (see below). The largest contiguous memory gap (see below) still corresponds approximately to the difference to the total allocated memory. However, as the number of incremental builds and online changes increases, the number of memory gaps also increases, and the largest contiguous memory gap becomes smaller.
- "Memory area <n>": Contents of the individual reserved memory areas

Background: It depends on the PLC which data and code is stored in which memory areas. For example, code and data are located in the same area on the CODESYS Control Win V3. For the addresses %I, %M, and %Q, memory is always reserved, even when a variable is not assigned to an address. After cleaning the application, the memory is reallocated completely. In this case, small gaps could result from the predefined alignment (normally 8). Larger gaps result from changing a date without cleaning, for example by increasing an array area. In this case, only the affected POU's are recompiled. Furthermore, in the case of an online change, the memory is used only for new variables and new code. Memory that was previously reserved by deleted variables and code is made available again. As a result, memory fragmentation can occur after many incremental builds and online changes. This creates many small gaps that might not be usable at all in some cases. To clarify how much memory is safely available, the "largest contiguous memory gap" of the memory area is output during code generation.

- "highest used address" (Byte): This is the highest reserved address in the entire allocated memory area. During the first build after a "Clean" operation, the memory addresses are output to variables in ascending order, taking into consideration the alignment (usually 8 bytes). As a result, the highest address used at this time corresponds approximately to the amount of memory used. The rest of the allocated memory area is still completely available for incremental builds and online changes.

- "Largest contiguous memory gap" (in bytes): This is the memory size that is available for backup. Resulting gaps in the allocated memory are reused whenever possible for other changes. When, for example, a global variable of type Byte is added, it is placed in the first free byte of the memory. Even just a small gap is enough for this. However, an FB instance, a variable of the type structure or array, or the code for a POU has to be stored contiguously and therefore occupies more memory accordingly. As a result, they can be allocated only to the largest contiguous memory area. This is why during code generation the "largest contiguous memory gap" that is safely available is output (in bytes), as well as its percentage of the total memory.

Note the options for generating applications.

6.4.11.6 Downloading the application code, logging in, and starting the PLC

In order to download the source code of your application to the PLC, you must log in to the PLC with application. If there are several applications in the project, then you must switch explicitly to the correct application first.
When you download an application to the PLC, CODESYS performs the following checks:

The list of applications on the PLC is compared with the applications available in the project. If they do not match, then you are prompted to download the application that is not on the PLC yet or delete existing applications.

For "externally implemented" blocks in the application to be downloaded, CODESYS checks whether these are available on the PLC. If they are not available, then the message "unresolved reference(s)" is printed to a dialog prompt and to the message view. Then CODESYS compares the parameters (variables) of the blocks in the application to be downloaded and the parameters of the same-named blocks in the application that exists on the PLC (signature check). If there are any discrepancies, then the message "invalid signature(s)" is printed to a dialog prompt and to the message view.

If the "Download Application Info" check box is selected in the application properties, then additional information about the application contents are downloaded to the PLC.

If multiple applications exist for the same device, then notice that the "I/O Mapping" dialog contains the definition for which of the applications is used for the I/O mapping of the device.

- Chapter 6.4.1.21.2.2 “Object ´Application´” on page 2410

**Transferring an application and starting the program**

Requirement: The application contains no errors and the communication settings of the PLC are correct. The application does not exist yet on the PLC: The application and the communication with the controller are not encrypted.

1. Select the required application in the device tree. Skip to Step 3 if you have only one application.
2. Click “Set Active Application”.
   - The application name appears in bold typeface.
3. Click “Online ➔ Login”.
   - A dialog prompts you whether the application should be created on the PLC.
4. Click “Yes” to confirm.
   - The application is downloaded to the PLC.
5. Click “Debug ➔ Start” or press the [F5] key.
   - The application is running on the controller.

**6.4.11.7 Generating boot applications**

A boot application is the application that is started automatically when the controller is switched on or started. For this to happen, the application on the controller must exist as a file `<application name>.app`.

For each application that is running on the controller, a boot application can also be saved there.

By default, CODESYS generates the boot application automatically when an application is downloaded and transfers them to the PLC. The defaults for generating automatically are located in the “Boot application” category of the application “Properties”. When logging in with a changed application, you are still prompted whether or not to generate a new boot application.

In addition, you can create a (new) boot application at any time in online mode by clicking “Online ➔ Create boot application”.

You can create and save a local copy of a boot application in offline mode as well. Then, you can copy this application to the controller with external tools. In this way, you transfer an application to the controller, even when there is no connection to CODESYS.
Generating boot applications on the controller automatically and explicitly

Requirement: Offline mode; the application is compiled without errors. The connection to the controller is configured and the controller is running. The application is active. The following steps demonstrate the options:

1. Click “Online ➔ Login”.
   ⇒ The boot application file `application name`.app is created on the controller with the checksum of the boot application `application name`.crc.

2. Click “Online ➔ Create Boot Application” explicitly.
   ⇒ The files on the controller are replaced by new files.

3. Log out.

4. Change the application. Log back in to the controller.
   ⇒ You are prompted whether an online change should be performed. You see the “Update boot application” check box in the same dialog box. This is cleared by default, but this can be changed in the “Boot Application” category of the application “Properties”.

5. Keep the check box cleared and continue login.
   ⇒ A new boot application file is not created.

   ⇒ The boot application that was created above is running on the controller.

You can save the encrypted boot application on the controller. These settings are defined in the “Application Build Options” category of the application “Properties”.

- § Chapter 6.4.1.14.2 “Executing the online change” on page 2025
- § Chapter 6.4.1.21.3.7.4 “Command ‘Create Boot Application’” on page 2627

Creating boot applications in offline mode

Requirement: Offline mode; the application is compiled without errors. You want to generate a boot application for an application and save it in the file directory for copying it later to the controller by using external tools (without CODESYS).

1. Click “Online ➔ Create Boot Application”.
   ⇒ A dialog box opens for specifying a save location in the local file system.

2. Click a save path and then click “Save”.

3. If the application has changed since the last boot application was generated, then you are prompted to use a new code for the boot application. In this case, click “Yes”.
   ⇒ The “Save as” dialog box opens.

4. Select a directory and click “Save”.
   ⇒ The boot application file `application name`.app is created in the given path.

You are prompted whether or not the build information for the boot application is saved.
5. Click “Yes”.

⇒ The build information is saved to the project directory as a file named `<application name>.compileinfo`. It is a requirement for a possible online change the next time the application is updated. Please note: Clicking “Build ➔ Clean” deletes this file.

6.4.11.8 Downloading source code to and from the PLC

The source code of an AC500 V3 project can be downloaded to a V3 PLC memory. At a later point in time, this project can be uploaded and restored directly from the PLC without the engineering PC being required for this § Chapter 6.3.5.3 “Source download/upload” on page 1751.

6.4.12 Testing and Debugging

6.4.12.1 General

CODESYS provides various options for testing your application and detecting errors. You can start your application in simulation mode, even without connecting any hardware. Using breakpoints and stepping commands, you can examine specific parts of a program. By writing values to variables, you can influence the running program.

Commands are provided that reset your application in various different ways, from resetting only non-persistent variables to completely resetting the controller to factory settings.

See also

- § Chapter 6.4.1.12.3 “Using Breakpoints” on page 1981
- § Chapter 6.4.1.12.4 “Stepping Through a Program” on page 1985
- § Chapter 6.4.1.12.6 “Resetting applications” on page 1990

6.4.12.2 Testing in simulation mode

Use simulation mode for testing and debugging your program when you do not have a physical target device. In this mode, the application is started on a simulated device.

The command is available only when you are logged out.

Requirement: You program contains no errors (compiler error messages or compile errors) and you are not logged in.

1. Activate simulation mode as follows:

- Click “Online ➔ Simulation”, or
- Right-click the controller in the device tree and click “Simulation”.

⇒ The name of the controller in the device tree is displayed in italics. In the status line, “Simulation” appears highlighted in red. The “Simulation” command is selected in the main menu.

2. Click “Online ➔ Login”.

3. When logging in with the active application, you will be prompted whether the application "Sim.<device name>,<application name>" should be created and loaded. Click “Yes” to confirm.

⇒ The application is logged onto the PLC.

4. Now you can check and correct the program flow with the commands provided in the main menu in “Debug”.

5. Log out from the controller and end the simulation mode.
See also

- Chapter 6.4.1.21.3.7.23 “Command ‘Simulation’” on page 2640

Limitations

- The focus of the simulation mode is testing and debugging your program of the PLC. That means the functionality of the simulated PLC is limited. Keep in mind that some POUs have no function. They are not creating any compile or download errors, they will simply not work.
- Without an extra available “Virtual Commissioning” license the “Online mode” of the simulated PLC is limited to 2 hours. After 2 hours starting from the “Login”, the “Online mode” is automatically terminated and the PLC is logged out.
- It is not possible to create a “Boot Application” in the simulated PLC. Every “Login” starts with an empty simulated PLC and a download of the application is required.
- When logging in to a simulated PLC the first time a “Windows Security Alert” is displayed. Depending on the application, e.g. if any network communication is implemented, it might be necessary to allow the “Virtual AC500” to communicate on one or multiple network types.

6.4.12.3 Using Breakpoints

Breakpoints are commonly used for debugging programs. CODESYS supports breakpoints in all IEC editors.

You can set breakpoints at specific positions in the program to force an execution stop and to monitor variable values. You can set special data breakpoints to halt program execution when the value of a specific variable changes.

The halt at a breakpoint or data breakpoint can be linked to additional conditions. You can also redefine breakpoints and data breakpoints as execution points where specific code is executed instead of stopping the program.

The “Breakpoints” view provides an overview of all defined breakpoints. It also includes additional commands for processing batch changes to multiple breakpoints.

In the editor, the following symbols identify the status of a breakpoint or execution point:

- The breakpoint is enabled.
- The breakpoint is disabled.
- Breakpoint is set in another instance of the POU open in the editor.
- The program is halted at the breakpoint.
- The conditional breakpoint is enabled.
- The conditional breakpoint is disabled.
- The execution point is enabled.
- The execution point is disabled.
- The conditional execution point is enabled.
- The conditional execution point is disabled.
- The data breakpoint is enabled.
- The data breakpoint is disabled.
- Halt at data breakpoint
- The data execution point is enabled.
- The data execution point is disabled.
- Halt at data execution point
- The conditional data execution point is enabled.
- The conditional data breakpoint is enabled.

See also

- Chapter 6.4.1.21.3.4.12 “Command ‘Breakpoints’” on page 2586
The function of data breakpoints depends on the target system. Currently, data breakpoints are possible only with the CODESYS Control Win V3.

Program execution stops at a data breakpoint when the value of a particular variable or memory address changes. As with ordinary breakpoints, the halt can be linked to an additional condition, or specific code can be processed instead of the halt (converted to a data execution point).

You set a data breakpoint either by means of the “New Data Breakpoint” command in the “Debug” menu or by means of the “New” button in the “Breakpoints” view. You specify a qualified variable name or a memory address directly which is to be monitored for changes in its value.

In the following sample code, the memory of the variable iNumber is overwritten unintentionally. However, a data breakpoint at the variable iNumber will detect when its value changes. The processing then stops with a corresponding message at the array access, which overwrites the variable value: Idx = 7. See also below: “Setting a data breakpoint”.

```
PROGRAM PLC_PRG
VAR
  Idx : INT;
  Ary : ARRAY[0..3] OF BYTE;
  iNumber : INT := 55;
END_VAR
FOR idx := 0 TO 6 DO
  Ary[idx] := 0;
END_FOR
```

Basically, debugging is not possible for multiple tasks at the same time. While you are working on a task with breakpoints or stepping, breakpoints are ignored in other tasks.

If a POU containing a breakpoint is used by multiple tasks, then only the debug task is halted because it reaches the breakpoint first. All other tasks continue. The “Call Stack” dialog shows which task is currently halted.

If you need a breakpoint to affect only one specific task, then you can define this in the breakpoint properties.

Breakpoints operate separately for each application so that a "HALT ON BP" does not affect any other applications. This applies also to parent/child applications, even if the breakpoint is set in a block that is used by several applications and whose code is located only once on the PLC.

**NOTICE!**

The I/Os that are called by the debug task are not updated at a halt in the breakpoint, even if you select the "Refresh I/Os in Stop" check box in the PLC settings.

If the application stops at a breakpoint on the PLC, then an online change or download causes all tasks to halt which means the PLC will stop. In this case, CODESYS prompts you whether or not to continue with the login.

- Chapter 6.4.1.21.3.4.15 “Command ‘Call Stack’” on page 2590
Setting a single breakpoint (example in ST editor)

Requirement: The application is in online mode and running. The operating mode is “Debug”.

1. In the editor, open a POU programmed in structured text (ST).
2. Place the cursor in the line where a breakpoint will be set.
3. Click “Debug ➔ Toggle Breakpoint” or press [F9].
   ➔ The line is marked in red and identified by the “breakpoint enabled” symbol (●). If the program is halted at the breakpoint, then the line is marked by the “stop at breakpoint” symbol (●). The processing of the program is stopped. This is identified in the status line by the HALT ON BP status highlighted in red.
4. Click “Debug ➔ Start” or press [F5].
   ➔ The program continues.
5. Set more breakpoints and check the variable values at the break position.
6. Place the cursor in the line where a breakpoint should be removed.
7. Click “Debug ➔ Toggle Breakpoint” or press [F9].
   ➔ The marking disappears. The breakpoint is deleted.

See also
● Chapter 6.4.1.21.3.8.9 “Command ‘Toggle Breakpoint’” on page 2646

Defining a breakpoint condition (example in ST editor)

1. In the editor, open a POU programmed in structured text (ST).
2. Place the cursor in the line where a breakpoint will be set.
3. Click “Debug ➔ New Breakpoint”.
   ➔ The “Breakpoint Properties” dialog opens.
4. Click the “Condition” tab.
5. Click “Break when the hit count is a multiple of” in the “Hit Count” list box.
   Specify the value “5” in the field to the right.
6. In addition, you can define a Boolean condition for when the breakpoint should be active. Select the “Break, when true” check box. Specify a Boolean variable in the text field to the right.
7. Select the “Enable breakpoint immediately” check box.
8. Close the dialog.
   ➔ The line is marked red and identified by the “conditional breakpoint enabled” symbol (●)

Monitor the running program. As long as the Boolean variable for the condition is FALSE, the breakpoint condition is not fulfilled and the program continues to run. If you set the variable to TRUE, then the condition is fulfilled and the program halts at the breakpoint every 5th pass.

See also
● Chapter 6.4.1.21.4.6 “Dialog ‘Breakpoint Properties’” on page 2747
Defining an execution point (example in ST editor)

1. In the editor, open a POU programmed in structured text (ST).
2. Place the cursor at the position for an execution point.
3. Click “Debug ➤ New Breakpoint”.
   ➤ The “Breakpoint Properties” dialog opens.
4. Click the “Execution Point Settings” tab.
5. Select the “Execution point” option.
   In the “Execute the following code” field, type the following statement: iCounter := iCounter + 1;
   In the “Print a message in the device log” field, type the following text: Execution point reached {iCounter}
6. Close the dialog.

When the program reaches the execution point, it does not halt, but executes the code defined above. In addition, a message is issued to the device log.

See also
● Chapter 6.4.1.21.4.6 “Dialog ‘Breakpoint Properties’” on page 2747

Setting a data breakpoint

Requirement: The application is in online mode and running.

1. Click “View ➤ Breakpoints”.
2. Click “Debug ➤ New Data Breakpoint”.
3. Click the button in the “New breakpoint” dialog (“Data” tab).
4. In the “Input assistant” dialog (“Watch Variables” tab), select the variables for which the program should halt when changed.
   As an alternative, specify the qualified name of the variable on the “Data” tab directly in the input line. Example: PLC_PRG.iNumber. The exact number of bytes to be monitored is specified as the “Size”. A value that corresponds to the data type is set here automatically by default. You can also specify fewer bytes to be monitored.
5. In the “Breakpoints” view, select the line with the data breakpoint and click the button.
   ➤ The line is marked and identified by the “Data breakpoint enabled” symbol (●). When the program reaches the data breakpoint (meaning when the value of the selected variables changes), the program processing halts. In the implementation part of the POU, the next line is identified by an arrow ●. This is identified in the status line by the HALT ON BP status highlighted in red.
6. Click “Debug ➤ Start” or press [F5].
   ➤ The program continues running and halts again when the value of the variables changes again.

See also
● Chapter 6.4.1.21.4.6 “Dialog ‘Breakpoint Properties’” on page 2747
6.4.12.4 Stepping Through a Program

You can step through an application and navigate the code. This is useful to check the status of your code at runtime. You can examine the call process, track variable values, or locate errors.

Stepping commands are provided in the “Debug” menu for this purpose. The commands become available when you set breakpoints in online mode and then halt execution at a breakpoint: the application is in “HALT ON BP” state (debug mode). During debug mode, the current break position is highlighted in yellow and marked with the symbol in the text editors.

Switching to debug mode

1. Download your application to a controller.
   ➤ The application is highlighted in green. CODESYS and the editors of the POUs are in online mode.

2. In the POUs, set breakpoints at the locations in the code that you want to examine.
   ➤ All breakpoints are listed in the “Breakpoints” view.

3. Start the application.
   ➤ The application starts and the code is processed until the first breakpoint.

   Now the application is in debug mode. In the device tree, the application is labeled with “[halt on breakpoint]”. The status bar provides information about the operating state:

   ![Device Tree](image)

   The editor was opened at the current break position. The line of code with an active breakpoint where program execution was halted is highlighted in yellow and marked by the symbol. This statement highlighted in yellow has not been executed yet.

   ![Code Highlight](image)

   Now you can select the various stepping commands or display the call tree.
Alternatively, you can first start the application and then set a breakpoint.

Behavior of the stepping command in the 'Debug' menu

- Command “Step Over”
  The statement at the breakpoint position is executed. Program execution halts before the next statement in the POU.
  If the statement contains a call (from a program, function block instance, function, method, or action), then the subordinate POU is processed completely in one step.

- Command “Step Into”
  The statement at the breakpoint position is executed. Program execution halts before the next statement.
  If the statement contains a call (from a program, function block instance, function, method, or action), then the program execution jumps to this subordinate POU. The first statement there is executed and the program execution halts before the next statement. The new current breakpoint position is then in the called POU.

- Command “Step Out”
  The command executes the POU from the current breakpoint position to the end of the POU and then jumps back to the calling POU. Program execution halts at the calling position (in the line with the call).
  If the current breakpoint position is in the main program, then the POU is run through to the end. Then the program execution jumps back to the beginning (to the program start at the first line of code in the POU) and halts there.

- Command “Run to Cursor”
  First set the cursor at any line of code and then execute the command. The program is executed from the current breakpoint position and halts at the current cursor position without executing the code of this line.

- Command “Set Next Statement”
  First set the cursor at any line of code (also before the current breakpoint position) and then execute the command. The statement marked with the cursor is executed next. All statements in between are ignored and skipped.

- Command “Show Next Statement”
  If you do not see the current breakpoint position, then execute the command. Then the window with the current breakpoint position comes into focus and the breakpoint position is visible.

Click “View Call Stack” to completely show the previous call tree for the breakpoint position currently reached in the program processing.

The “Call Stack” view shows the location of the block in the call structure of the program at all times, even before compiling the application.

6.4.12.5 Forcing and Writing of Variables

CAUTION!
Unusual changes to variable values in an application currently running on the controller can lead to undesired behavior of the controlled machinery. Evaluate possible dangers before forcing variable values. Take the respective safety precautions. Depending on the controlled machinery, the result may lead to damage to machinery and equipment or injury to health and life of personnel.

In CODESYS, variable values in the PLC can be changed in online mode. Here we make a distinction between forcing and writing a previously prepared value.

Writing is done with the “Write Values” command ([Ctrl]+[F7]) and sets the variable to the prepared value one time. In this way, the value can be overwritten again by the program at any time.

Forcing is done with the “Force Values” command ([F7]) and sets the prepared value permanently. For more information, see below.

The preparation of a value for forcing or writing is possible at different places:
- Declaration part: “Prepared value” field
- Implementation part of the FBD/LD/IL editor: inline monitoring field
- Watch view: “Prepared value” field

For instructions about this, see below. In the case that you want to prepare a value again for an already forced value, the “Prepare Value” dialog opens with options for handling the current force value.

Functionality of forcing

The prepared value is set to the respective variable at the beginning and end of a task cycle (or of a processing loop in the case of other task types).

The processing order in each cycle of a task is as follows:
1. Read the inputs
2. Force: Before the first program call, all prepared values are written to the variables by the runtime system, regardless of whether or not they are used by the task.
3. Process the IEC code
4. Force: After the last program call, all prepared values are written to the variables by the runtime system, regardless of whether or not they are used by the task.
5. Write the outputs

Note: It is possible that a forced variable temporarily gets a different value in the cycle while the code is being processed because the IEC code performs an assignment. Then the variable receives the forced value again only at the end of the cycle. The variable value can also be overwritten by the write access of a client to symbols of the application in mid-cycle. For this case, see the “Access variables in sync with IEC tasks” option in the “Properties” of the device object, or the “Configure synchronization with IEC tasks” setting in the symbol configuration. In this way, a PLC handler-supported synchronization of the write accesses by clients can be enabled with the task cycle.
NOTICE!
Forced values are marked with the symbol. CODESYS does the forcing until the user lifts it explicitly by one of the following actions:

- Executing the “Cancel forcing for all values” command
- Lifting the force operation in the “Prepare Value” dialog
- Logging out of the application

If forced variables still exist when logging out, then a dialog opens, prompting whether or not forcing should be lifted for all variables. If you respond by clicking “No”, then the forced values are applied again at the next login.

See also
- Chapter 6.4.1.9.17 “Task Configuration” on page 1914
- Chapter 6.4.1.21.4.11.20 “Dialog ‘Properties’ - ‘Options’” on page 2765
- “Setting: Configure synchronization with IEC tasks” on page 2527

**Forcing in the declaration part**

Requirement: Your application includes a POU with declarations. The application is in online mode.

1. Open the POU in the editor by choosing the command “Project ➔ Edit Object”.
2. In the declaration part of the editor, double-click in column (1) “Prepared Value” of a variable.
   - The field can be edited and a value can be entered. When it is a Boolean value, you change the value by clicking in the field.

3. Perform Step 2 for other variables.
4. Click “Debug ➔ Force Values”.
   - The variable values are overwritten with the prepared values. The values are marked with the symbol.
Forcing in the implementation part

Requirement: The application is in online mode.

1. Open the POU in the editor by choosing the command “Project ➤ Edit Object”.
2. In the implementation part of the editor, double-click an inline monitoring field (1).
   ➤ The “Prepare Value” dialog opens.
3. Enter the new value in the field “Prepare a new value for the next write or force operation”.
   ➤ The prepared value appears in the inline monitoring field.
4. Click “Debug ➤ Force Values”.
   ➤ The value of the variables is overwritten with the prepared values. The values are marked with the symbol.

Viewing and editing all forced variables one list

Requirement: The application is in online mode. Multiple variables are forced.

1. Click “View ➤ Watch ➤ Watch all Forces”.
   ➤ The “Watch all Forces” view opens. It contains all currently forced variables of the application in the form of a watch list.
2. Select all lines in the list and click “Unforce ➤ Unforce and Keep All Selected Values” in the list box in the upper left part of the view.
   ➤ The variables are unforced and they get the values that they had before forcing.

Forcing a function block input in CFC

Requirement: An application has a CFC POU that contains a function block, and the application is in offline mode.

NOTICE!

This kind of forcing uses a data breakpoint internally and is therefore different from forcing with the “Force Values” command or [F7].

Values that were forced by the command “Force FB Input” do not respond to the commands “Show All Forces” or “Unforce Values.”
1. Open the editor of the CFC POU by double-clicking the object in the tree.
2. When using compiler version 3.5.11.x or 3.5.12.x, enable the "forceability" for the desired function block. Select the POU element in CFC and click "CFC ➔ Prepare Box for Forcing".
3. Log in to the application on the target device. In CFC, select the input of the POU and click "Force Function Block Input" in the context menu.
   ➔ The "Force Value" dialog opens.
4. Set a new value for the input. Example in the case of a TON POU: FALSE for the Boolean input IN, or t#4s for the PT input (TIME). Click "OK" to confirm.
   ➔ The set value is forced immediately. A green circle is displayed at the upper left of the POU element and the name of the input in the element is highlighted in green. In the case of a Boolean value, a small monitoring view with the value also opens at the input. In the monitoring views, the forced value is displayed, for example in the "Value" column, as in the declaration part.
5. To remove the forced value, click "Force Function Block Input" again. In the "Force Value" dialog, select the "Remove value" option.
   ➔ Forcing is canceled. The input gets the current value from the controller.

6.4.1.12.6 Resetting applications
Resetting the application stops the program and resets the variables to their initialization values. Depending on the type of reset, retain variables and persistent variables are also reset.

● Reset warm: All variables are reset, except RETAIN and PERSISTENT variables.
● Reset cold: All variables are reset, except PERSISTENT variables.
● Reset origin: All variables are reset.
● Reset origin device: All variables are reset and all applications are deleted.

The following sample program and statements clarify the functionality of the various resets.

See also
● “Lifespan of variables when calling online commands” on page 1922
Example
Declaration

VAR
  iVar: INT := 0;
END_VAR
VAR RETAIN
  iVarRetain: INT := 0;
END_VAR
VAR PERSISTENT
  iVarPersistent: INT := 0;
END_VAR

Implementation

iVar := 100;
iVarRetain := 200;
iVarPersistent := 300;

1. Insert the “Persistent Variables” object below the application and open it in the editor.
2. Click “Build ➔ Build”.
3. Click “Declare ➔ Add All Instance Paths”.
   ⇒ The instance path of the persistent variables is inserted.
4. Download the application to the controller.

Executing a "Reset warm", "Reset cold", and "Reset origin"

Requirement: The sample program runs on the controller.

1. Click “Online ➔ Login” to switch to online mode.
2. Monitor the variables iVar, iVarRetain, and iVarPersistent.
3. Click “Online ➔ Reset Warm”.
   ⇒ You are prompted whether you really want to execute the command.
4. Click “Yes” to confirm the dialog.
   ⇒ The application is reset. The iVar variable is set to the initialization value 0. Both of
   the other variables retain their values.
5. Click “Online ➔ Reset Cold”.
   ⇒ You are prompted whether you really want to execute the command.
6. Click “Yes” to confirm the dialog.
   ⇒ The application is reset. The iVar and iVarRetain variables are set to the initialization
   value 0. The iVarPersistent variable retains its value.
7. Click “Online ➔ Reset Origin”.
   ⇒ You are prompted whether you really want to execute the command.
8. Click “Yes” to confirm the dialog.
   ⇒ The application is reset. All variables are reset to their initialization values.
6.4.1.12.7 Flow Control

With flow control, you can monitor the processing of the application program. Flow control is provided for the ST, FBD, LD, and CFC language editors.

With an activated flow control, CODESYS displays the variable values and results from function calls and operations at the respective processing location and time. In this way, the exact lines of code and networks that process the current cycle are marked in colors. Compare this to standard monitoring, in which CODESYS delivers only the value that a variable has between two processing cycles.

Flow control works in all parts of the editor view that are currently visible. “Flow control enabled” is then displayed in the status line as long as the function is active and flow control positions (processed parts of code) are visible in an editor view.

You can write values in the declaration part and implementation part. Forcing is not possible.

**NOTICE!**

Values are written at the end of the current cycle.

**NOTICE!**

When you enable flow control, the cycle time of the application is prolonged.

When “Confirmed Online Mode” is selected in the communication settings, a dialog prompt appears when switching on the flow control to cancel the operation.

When flow control is enabled, it is not possible to use breakpoints or step through the program.

See also

- Chapter 6.4.1.21.2.8.3 “Tab ’Communication Settings’” on page 2427
- Chapter 6.4.1.21.3.8.22 “Command ’Flow Control’” on page 2652

By default, CODESYS displays the flow control positions of the processed parts of code as green fields. Unprocessed parts of code are displayed in white.

*Note that the displayed value of an unprocessed code position is an ordinary monitoring value. This is the value between two task cycles.*
In network editors, CODESYS marks the processed networks with bars on the left edge in the flow control color.

In LD, CODESYS displays the currently processed connecting lines in green and all others in gray. The actual value of the connection is also displayed: TRUE by a bold blue line, FALSE by a bold black line, and unknown or analog values by thin black lines. Combinations of these lines are displayed as dashed lines.

In IL, for each statement CODESYS uses two fields for the display of the actual values. One is located to the left of the operator with the current accumulator value, and one is located to the right of the operand with the operand value.
### 6.4.12.8 Determining the current processing position with the call stack

You can use the call stack for determining the current position of the program flow. This function is very useful when stepping into programs.

**Requirement:** The application is in online mode. The program is halted at a breakpoint or you are stepping into it.

- Open the call stack by clicking **View → Call Stack**.

  The call stack opens. The list shows the current location with the complete call path.

The call stack is also available in offline mode and normal online mode (without using debugging functions). In this case, it receives the last displayed location during a stepped execution, but it is displayed in gray.

**See also**

- Chapter 6.4.1.21.3.4.15 “Command ‘Call Stack’” on page 2590
- Chapter 6.4.1.12.4 “Stepping Through a Program” on page 1985

### 6.4.12.9 Checking the Task Deployment

The Tab **Task Deployment** of the device editor indicates in an overview the tasks that process the individual inputs and outputs of the I/O mapping of your application and the priority with which they do so. You can check here whether an unintentional overwriting of values is caused, which can lead to undefined values.
1. Generate code for the application: to do this select, for example, the command “Build ➔ Generate Code”.

2. Open the device editor by double-clicking on the device object in the device tree. Select the “Task Deployment” tab.

   ⇒ You obtain a display of the inputs and outputs of your application and the assignment of the tasks and their priorities. See the description of the “Task Deployment” tab for details.

6.4.1.13 Application at Runtime

6.4.1.13.1 General

When the application is running on the PLC, in the CODESYS Development System there are some features for monitoring and changing the values of the variables as well as for recording and storing the value charts.

Furthermore, you can poll some information from the PLC, you can have a look into the PLC-log, display a core dump and monitor the time behavior of the tasks.

Regard also the possibility to restrict the access on the running application in critical states of the machine via online commands provided by CODESYS Development System. For this purpose some system variables are available in a module of the ComponentManager library.

6.4.1.13.2 Monitoring of Values

General

In runtime mode, you can monitor the current variable values of a programming object at different places in a project. The following is what we refer to as monitoring:

- Online view of the programming editor of an object: inline monitoring
- Online view of the declaration editor of an object
- Object-independent, configurable watchlists

When you set the (attribute ‘monitoring’...) pragma, you can monitor the results from function calls and the current variable values in property-type objects.

More options for recording current variable values:

- Read and save recipes
- Record values on a timeline for displaying the history immediately or later: trace and trend features
See also
- Chapter 6.4.1.20.6.3.26 “Attribute ‘monitoring’” on page 2295
- Chapter 6.4.1.13.2.3 “Using watch lists” on page 2002
- Chapter 6.4.1.13.2.4 “Changing Values with Recipes” on page 2003
- Chapter 6.4.1.13.3 “Data Recording with Trace” on page 2007
- Chapter 6.4.1.13.4 “Data Recording with Trend” on page 2016

Calling of monitoring in programming objects

When an application is running on the controller, the actual values of variables are displayed in the editors of the POUs. This is how the values of variables are monitored.

- Requirement: The “Enable inline monitoring” option is activated in “Tools ➔ Options” in the “Text Editor” category on the “Monitoring” tab.

1. Download an application to the controller and start it.
2. Click “Debug ➔ Display Mode ➔ Decimal”.
   - The display format of the actual values is set.
3. Click a programming object in the “Devices” view or “POUs” view.
   - The respective editor opens. Actual values of the variables are refreshed continually for both the declaration and implementation.

Monitoring in the declaration editor

The actual value of an expression (1) is displayed in the “Value” column (3).
You can write and force a value in the “Prepared Value” (4) column. During the forcing, the actual value is decorated with a red symbol (📸).
The expression of an interface reference can be expanded. If the interface points to a global instance, then this global instance is displayed as the first entry below the reference. Afterwards, if the interface reference changes, then the displayed reference is collapsed.

Monitoring in the implementation (inline monitoring)

Inline monitoring is the display of the current variable value in the implementation.
Depending on the implementation language, the following displays are possible in the implementation part:
- Variables have a window with the current value displayed after their name: nResult2
  - If you have prepared values for variables for forcing or writing, then they are displayed in angle brackets in the inline monitoring view after the current value.
  - After forcing, the respective values are identified by the 📸 symbol.
- Network editors and the CFC editor:
  - Connecting lines are displayed in color according to their actual Boolean value (blue means TRUE, black means FALSE).
● LD editor:
The contact and coil elements are also marked.
For contacts and coils, a prepared value (TRUE or FALSE) is shown in a small view next to the element.

● SFC editor:
Transitions with the value TRUE are displayed in color according to their actual Boolean value (blue means TRUE, black means FALSE).
Active steps are displayed in blue.
Forced transition values are displayed in red in the implementation.

● IL tabular editor:
Current values are displayed in a separate column.
You can deactivate the inline monitoring function in “Tools ➔ Options”, in the “Text Editor” category on the “Monitoring” tab.

- % Chapter 6.4.1.20.1.7.5 “CFC Editor in Online Mode” on page 2103

Partial monitoring of an array

An expanded array shows the actual values for up to 1000 elements. However, this can be confusing. In addition, an array can contain more than 1000 elements. Then it is helpful to limit the range of displayed elements. You can do this in online mode in the following way.

☐ Requirement: An application is running. It contains a multidimensional array variable with more than 1000 elements. Example:

```
arrBig : ARRAY [0..100, -9..10, -19..20] OF INT;
```

1. Click in the field of the “Data Type” column for the `arrBig` variable.
   ➤ The “Monitoring Range” dialog opens.

2. Specify the value `[1, -9, -19]` for “Start”.

3. Specify the value `[1, 10, 20]` for “End”.
   ➤ The actual values of 800 array elements are displayed in the declaration editor. The range is limited to the elements of the index `[1, <i>, <j>]` with i from -9 to 10 and j from -19 to 20.

See also

- % Chapter 6.4.1.20.1.2 “Declaration Editor” on page 2047
- % Chapter 6.4.1.12.5 “Forcing and Writing of Variables” on page 1987
- % Chapter 6.4.1.21.4.10 “Dialog ‘Monitoring Range’” on page 2752

Limiting the monitoring range

Monitoring a function block

When you double-click the editor view of a function block in online mode, a dialog opens where you can choose between viewing the basic implementation or a specific instance.

If you select the basic implementation, then the code is displayed in the editor without current values. Now set a breakpoint in the basic implementation. If the execution halts there, then the current values of the instance that is processed first in the program flow are displayed. Now you can step successively through all instances.

If you select one of the instances, then the editor opens with the code of the function block instance. The current values are displayed in the declaration and, if applicable, in the implementation, and are updated continuously.

See also

- % Chapter 6.4.1.21.2.21.3 “Object ‘Function Block’” on page 2479
- % Chapter 6.4.1.12.3 “Using Breakpoints” on page 1981

Monitoring a property

You can monitor variables in a property object by setting a breakpoint in the function during online mode. When halted there, the current values are displayed.

In addition to your own values, the values of the variables of the superordinate instance are displayed automatically. In the declaration part of the property, the `THIS` pointer, which points to the superordinate instance, appears in the first line with the current data type information and values.
FUNCTION_BLOCK FB_BaseAlfa
VAR
  iBaseLocal : INT;
  sBaseLocal : STRING;
END_VAR
iBaseLocal := iBaseLocal + 1;
sBaseLocal := 'Testing Text';

FB_BaseAlfa.PorpBeta.Get
iBaseLocal := iBaseLocal + 1;
IF iBaseLocal > 0 THEN
  PropBeta := TRUE;
END_IF

FB_BaseAlfa.PorpBeta.Set
IF PropBeta = TRUE THEN
  iBaseLocal := 0;
  sBaseLocal := 'Tested IF';
END_IF

PROGRAM PLC_PRG
VAR
  fb_BaseAlfa : FB_BaseAlfa;
END_VAR

fb_BaseAlfa();

IF fb_BaseAlfa.PorpBeta = TRUE THEN
  xResult := TRUE;
END_IF
IF xReset THEN
  fb_BaseAlfa.PorpBeta := TRUE;
  xReset := FALSE;
END_IF

See also
- Chapter 6.4.1.21.2.21.9 “Object ’Property’” on page 2493
Monitoring of property access in the superordinate programming object

You can monitor the values of subordinate properties in a function block or program in addition to the variable values.

To do this, add either the pragma `{attribute 'monitoring' = 'variable'}` or `{attribute 'monitoring' = 'call'}` to the subordinate property object in the declaration. If you open the superordinate program instance or function block instance at runtime, then the current property values are displayed in the editor in addition to the current variable values.

See also

- Chapter 6.4.1.21.21.9 “Object ‘Property’” on page 2493
- Chapter 6.4.1.20.6.3.26 “Attribute ‘monitoring’” on page 2295

Monitoring a method

You can monitor variables in a method object by setting a breakpoint in the method during online mode. When halted there, the current values are displayed.

In addition to your own values, the values of the variables of the superordinate instance are displayed automatically. In the declaration part of the method, the `THIS` pointer, which points to the superordinate instance, appears in the first line with the current data type information and values.
FUNCTION_BLOCK FB_BaseAlfa
VAR
   iBaseLocal : INT;
   sBaseLocal : STRING;
END_VAR
iBaseLocal := iBaseLocal + 1;
sBaseLocal := 'Testing Text';

METHOD MethBaseAlfa : BOOL // Method of FB_BaseAlfa
VAR_INPUT
END_VAR
VAR
   iMethLocal : INT;
END_VAR
iMethLocal := iMethLocal + 1;

PROGRAM PLC_PRG
VAR
   fb_BaseAlfa : FB_BaseAlfa;
END_VAR
fb_BaseAlfa();
fb_BaseAlfa.MethBaseAlfa();

- Chapter 6.4.1.21.2.21.9 “Object ‘Property’” on page 2493
- Chapter 6.4.1.21.2.21.6 “Object ‘Method’” on page 2485

Monitoring a function
You can monitor variables in a function object by setting a breakpoint in the function during online mode. When halted there, the current values are displayed.

Monitoring the return value of a function call
In the ST editor of a POU, the current return value is displayed as inline monitoring at the position of the POU where a function is called.

The following conditions must be fulfilled:
- The value can be interpreted as a 4-byte numeric value. Example: INT, SINT, or LINT.
- The pragma (attribute 'monitoring' := 'call') is inserted into the function.
Using watch lists

What is a watch list?

A watch list is a user-defined list of project variables that are collected in one view for the purpose of monitoring their values. In online mode, you can write and force variable values in a watch list. Monitoring, writing, and forcing are handled the same way as the declaration editor in online mode. You can customize the format of the representation of floating-point values in the options for monitoring.

There are four, ready-to-use watch lists (Watch <n>) available in a project. Click “View ➔ Watch”.

Information:

If the expression is an interface reference, then it can be expanded. If the interface points to a global instance, then this global instance is displayed as the first entry below the reference. If the interface reference changes, then the displayed reference is collapsed.

Creating and editing a watch list (offline or online mode)

Requirement: The project is in either online or offline mode. It includes an application with declared variables that you want added to one of the four possible watch lists.

1. Click “View ➔ Watch ➔ Watch <n>”.
   ⇒ The Watch <n> view opens. It contains a blank table row.

2. Double-click the field in the “Expression” column and type a variable to monitor, either manually or with the input assistant.
   Syntax: <device name>.<application name>.<object name>.<variable name>
   Example: "Dev1.Appl.PLC_PRG.ivar"
   If you type the name of a structured variable, then the individual components are displayed automatically in other lines in online mode.

3. Define all successive variables that will be monitored with this list. You can change the order by using drag and drop operations.
   ⇒ The “Execution point”, “Type”, “Address”, “Comment” fields are filled in automatically according to the variables declaration. The symbol before the expression indicates the type of variable: input variable (✓), output variable (✓), or ordinary variable (✓).

In online mode, you can also create or edit watch lists by right-clicking and choosing the “Add Watch” command.

See also

● Chapter 6.4.1.20.1.2 “Declaration Editor” on page 2047
● Chapter 6.4.1.21.4.19 “Dialog ‘Options’ - ‘Monitoring” on page 2792
Requirement: A project is open and running. It includes an application with declared variables that you want added to a possible watch list.

1. Click “View ➔ Watch <n>” to open the watch list.
2. Place the cursor on a variable in the declaration or implementation part of a POU and right-click to choose the “Add Watch” command.
   ⇒ This adds an entry to the list for the selected variable.
3. You can add other variables in this way or by typing directly into the list in the “Expression” field as described above.
   ⇒ The watch lists are updated immediately.

If a watch list is not open when you click “Add Watch” for a variable, then it is added automatically to the “Watch 1” list.

Writing and forcing variable values is also possible in the watch lists. In online mode, the “Prepared value” column is also available.

- § Chapter 6.4.1.21.3.23.1 “Command ‘Add Watch’” on page 2743
- § Chapter 6.4.1.13.2.2 “Calling of monitoring in programming objects ” on page 1996
- § Chapter 6.4.1.12.5 “Forcing and Writing of Variables” on page 1987

Changing Values with Recipes

Use recipes to change or read recipes values for a specific set of variables (recipe definition) on the controller at the same time.

You define the basic settings for recipes, such as location and format, in the “Recipe Manager” object. Insert one or more recipe definitions below this object. A recipe definition is composed of one or more recipes for the contained variable. The recipe consists of specific variable values.

You can save a recipe to a file or write directly from files to the PLC.

Recipes can be loaded via the CODESYS development interface, the visualization element, or the application program.

Using recipes on remote devices

The variable values from recipes are transferred automatically to and from another controller when they are data source variables and a data source exchange is configured. Reading and writing occurs synchronously. Therefore, CODESYS updates all variables in a recipe at the same time. After reading or writing, you can use the call g_RecipeManager.LastError to check whether or not the transfer was successful (g_RecipeManager.LastError = 0).
Calling recipe commands in the CODESYS user interface

The development interface of CODESYS provides commands for generating recipes as well as reading/writing in online mode.

See also

- Chapter 6.4.1.21.3.20 “Menu ‘Recipes’” on page 2723

Calling recipe commands programmatically or in a visualization

At runtime, the recipe definition and the recipe commands can be called in the application program. To do this, you implement the process for writing, reading, or monitoring recipe definitions in your code by using the methods of the `RecipeManCommands` function block from the `RecipeManagement` library.

In the visualization, the call of the recipe commands is implemented by using the for a visualization element. By doing this, a visualization user can control the execution of recipe commands.

**During the initialization process, the recipe management reads the values of the variables that are defined in the recipe definition. This operation takes place at the end of the initialization phase of the application. At this point, all initial values of the application variables are set. This is done to initialize missing values from recipe files correctly.**

See also

- `RecipeManCommands`
- `Input Configuration`

Special functionality for floating-point numbers

For variables of type `REAL` or `LREAL`, a distinction is made whether or not the value is exactly convertible.

- If it is possible to convert the value exactly, then only the numerical value is saved in the recipe file.
- If exact conversion is not possible, then a hexadecimal encoded string is written in the recipe file next to the numeric value. This should have the effect that also a non-convertible floating-point number returns the same value.

This feature can be disabled with the `RECIPE_GENERATE_SIMPLE_STRINGREAL` compiler define.

**In the object properties of the parent application under “Build”, you can enter this `RECIPE_GENERATE_SIMPLE_STRINGREAL` compiler define in the “Compiler Defines” option. As a result, no hexadecimal encoded string is stored.**

For more information, see: Dialog: Properties: Build
Creating a recipe

1. In the device tree, select the “Application” object.
2. Click “Project → Add Object → Recipe Manager”.
   ⇒ The Recipe Manager is added to the device tree.
3. In the device tree, click the “Recipe Manager” object.
4. Click “Project → Add Object → Recipe Manager”.
   ⇒ The recipe definition is added below the Recipe Manager.
5. Open the editor of the recipe definition by double-clicking the object.
6. Double-click the blank field below “Variable”. Specify the name of a variable to define a recipe for. You can use the Input Assistant ()... button) for this.
7. Click “Recipes ➔ Add a New Recipe” and specify a name for the new recipe.
   ⇒ A column with the new recipe name appears in the editor.
8. Enter the variable value for this recipe in this field.
9. Insert additional fields as needed.
10. Select a variable value for the recipe and click “Recipes ➔ Save Recipe”. Select a location and file name.
   ⇒ The recipe is saved in the format which was defined in the Recipe Manager.

See also
- ☞ Chapter 6.4.1.21.2.25 “Object ‘Recipe Manager’” on page 2519
- ☞ Chapter 6.4.1.21.2.26 “Object ‘Recipe Definition’” on page 2522
- ☞ Chapter 6.4.1.21.3.20 “Menu ‘Recipes’” on page 2723

Loading a recipe from a file

Requirement: A Recipe Manager is available in the application. In a recipe definition, there is a “myRec” recipe with variable values. A myRec.txt recipe file is located on the file system and contains the entries for this recipe.

Example of the recipe file:
PLC_PRG.bVar:=0
PLC_PRG.iVar:=2
PLC_PRG.dwVar:=35232
PLC_PRG.stVar:='first'
PLC_PRG.wstVar:='12343245'

1. Double-click the “Recipe Definition” object in the device tree to open the tabular editor for the definition of the individual recipes.
   ⇒ You see the myRec column with the current values for this recipe.
2. Edit the myRec.txt file in an external text editor and replace the variable values with other values that you want to load into the recipe definition in CODESYS. Save the file.
3. In the recipe definition, click the “myRec” column and in the context menu click “Load Recipe”.
   ⇒ A dialog prompt notifies you about the possibly needing to perform an online change when logging in again. An online change is necessary when you change the current values of the recipe variables by loading the recipe.
4. Click “Yes” to close the dialog and continue. Select the myRec.txt file from the file explorer for loading.

If you want to overwrite only individual recipe variables with new values, then remove the values for the other variables before loading to the recipe file. Entries without value definitions are not read, and therefore updating leaves these variables unchanged on the controller and in the project.

For values of the data type REAL/LREAL, the hexadecimal value is also written to the recipe file in some cases. This is necessary so that the exactly identical value is restored when converting back. In this case, you change the decimal value and delete the hexadecimal value.

Recipe management on the controller; memory usage

When you clear the “Recipe management in the PLC” option, the Recipe Manager and recipe definitions will not use any memory on the PLC.

If you select this option, then code is generated for the Recipe Manager and all recipe definitions, and this code is stored on the PLC. The size of the used memory primarily depends on the number of recipes and their variables, as well as the data type of the variables. Whether or not the fields of the recipe definition are filled also has an effect. The memory usage of recipes cannot be calculated. It has to be determined by experimentation at the time it is needed. The following table merely provides some guiding principles.

<table>
<thead>
<tr>
<th>Recipe definition</th>
<th>Code Size (bytes)</th>
<th>Data Size (bytes)</th>
<th>Total (bytes)</th>
</tr>
</thead>
<tbody>
<tr>
<td>100 INT variables</td>

</tbody>
</table>

Loading recipe values from the controller

You can apply recipe values on the controller to recipe definitions in the project, even if these definitions have been modified in the project.

Requirement: The “Recipe management in the PLC” option is selected in the Recipe Manager.
1. Create a recipe definition RecDef1 in the project, containing the variables PLC_PRG.ivar and PLC_PRG.bvar. Insert a recipe "R1". value for PLC_PRG.ivar: 33; value for PLC_PRG.bvar: TRUE.

2. Log in to the controller and download the application.
   - The recipe file R1.RecDef1.txtrecipe is saved to the default directory of the controller ($PlcLogic$).

3. Logout and add another variable PLC_PRG.dwvar to the recipe definition in the project.

4. Edit the recipe definition file R1.RecDef1.txtrecipe on the device by changing the value for PLC_PRG.ivar from 33 to 34.
   - Moreover, add another recipe “R2” on the device. To do this, copy the R1.RecDef1.txtrecipe and rename it to R2.RecDef1.txtrecipe. Then edit this file and change the recipe values: PLC_PRG.ivar: 1, PLC_PRG.bvar: FALSE.
   - Now two recipes “R1” and “R2” are available on the device. In the project, there is only “R1”, and it also contains other values than “R1” on the device.

5. Log in to the controller by means of an online change.

6. Click “Load Recipes from Device” from the context menu.
   - A dialog prompt notifies you that executing the command at the next login may trigger an online change, and that the recipes on the runtime system will overwrite the recipes of the current recipe definition.

7. Confirm that you want to continue.
   - A dialog prompt notifies you that the recipe for PLC_PRG.dwvar loaded on the device cannot yield a value from the controller.

8. Confirm that you want to continue.
   - The value of PLC_PRG.ivar in recipe “R1” of the recipe definition in the project changes to 34. The recipe “R2” with the values 1 and FALSE is also listed in the recipe definition now. PLC_PRG.dwvar remains in the recipe definition.

### 6.4.1.13.3 Data Recording with Trace

#### General

You can use a "Trace" to follow the value history of variables on the controller in a similar way as a digital sampling oscilloscope. When the application is in runtime mode with trace, all statements are executed first within the task cycle. Then, data recording starts with value storage including time stamps. These time stamps are relative and refer to the start time of the data recording. The data yields a discrete time signal and CODESYS displays its course in the trace editor.

A sample (data record) is composed of the value and the time stamp. The runtime system writes the samples to a buffer with a definable size. CODESYS requests the data, saves it in the trace editor buffer, and displays it in the trace diagram as a function of time. You can monitor the value history of the configured variables continually because CODESYS displays the latest data.

You can trigger the data recording. When this happens, the application saves the data from the time of the trigger and CODESYS displays the data at the time of the trigger.

The configuration and the display of a trace are possible in the CODESYS project by means of trace objects in the trace editor. There are the following two object types:
“Trace”: Inserted below the IEC application in the device tree. This kind of object always contains a purely application-specific trace configuration. You can download this trace configuration to the controller and run it with the application.

“DeviceTrace”: Inserted below the device object in the device tree. If the PLC supports a trace manager, then you can use one or more “DeviceTrace” objects to access one or more traces that are running on the controller. These can be both application-specific or controller-specific traces. For example, a controller can support traces for recording the processor load. Menu commands allow for access from the CODESYS project to the trace manager in the device.

Access to the trace manager from IEC code is possible by means of the functions from the library CmpTraceMgr.library. For more information, refer to the library documentation.

**NOTICE!**

A running data recording with trace can lead to a significant increase in the cycle time of the IEC task.

**NOTICE!**

Data recording with trace also continues running after logging out of the device.

**Runtime system component CmpTraceMgr, ”Trace manager”**

The device description of a runtime system with trace manager includes the tracemanager entry in the TargetSettings section.

In this case, CODESYS transfers only the trace configuration when downloading the application to the PLC. When you start the trace, the application interprets the configuration on the RTS by means of the trace manager, executes the data recording, and buffers the data sets on the PLC.

The CmpTraceMgr runtime system component provides extended functionality, as compared to data recording with IEC code.

Data recording is therefore possible as follows:

- Parameters on the PLC (for example, the processor load (cpuload, plcload), or the temperature curve of a CPU or a battery). The measurement of the processor load per CPU core (cpuload) is interesting for multicore controllers.
- Device signals (for example, the current path of a drive)
- System variables of another runtime system component

You can configure parameters like IEC variables in the “Trace Configuration” dialog of the “Variable Settings”.

The display of traces that run on the controller is possible in the trace editor of a DeviceTrace object.

See also

- Chapter 6.4.1.21.2.7 “Object 'DeviceTrace’” on page 2426
- Chapter 6.4.1.21.4.16.2 “Dialog 'Trace Configuration’” on page 2804

**Data recording after triggering**

To monitor data that depends on an event or a condition, you can free the data recording that depends on a trigger. At runtime, the application checks whether the event has occurred or the condition is fulfilled, and then it buffers the data accordingly.

The trace configuration enables triggering by:

- a trigger variable that maps the event
- a condition as expression
- a combination of trigger variable and condition
**Saving samples to a file**  You can save samples from the development system to a file. The file can also include the trace configuration.

### Table 385: Possible file formats

<table>
<thead>
<tr>
<th>File Extension</th>
<th>File type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>*.trace</td>
<td>&quot;Trace file&quot;</td>
<td>Contains the samples and the trace configuration in XML format. You can execute the &quot;Load Trace&quot; command to load the file to the trace editor when offline and analyze the samples without a controller.</td>
</tr>
<tr>
<td>*.txt</td>
<td>&quot;Text File&quot;</td>
<td>Contains the samples in ASCII format. You can edit the file with an external tool.</td>
</tr>
<tr>
<td>*.trace.csv</td>
<td>&quot;Trace dump&quot;</td>
<td>File in CSV format includes the trace configuration and optional samples. You can create the file by clicking &quot;Export Symbolic Trace Config&quot;. You can transfer the file to the controller and load it to the application. Then you can execute the &quot;Load Trace&quot; command in CODESYS to display this in the trace editor. You can also click &quot;Trace ➜ Save Trace&quot; and select the *.trace.csv file format. You can transfer the file to the controller and load it with an HMI for analysis.</td>
</tr>
<tr>
<td>*.traceconfig</td>
<td>&quot;Symbolic trace configuration&quot;</td>
<td>Contains the trace configuration CSV format. You can create the file by clicking &quot;Export Symbolic Trace Config&quot;. The CmpTraceMgr runtime system component can read the file.</td>
</tr>
</tbody>
</table>

### Getting started

**Program**  PLC_PRG

```plaintext
PROGRAM PLC_PRG
VAR
  iVar : INT;
  rSin : REAL;
  rVar : REAL;
END_VAR
```

2024/01/05  3ADR010583, 1, en_US  2009
iVar := iVar + 1;
iVar := iVar MOD 33;

rVar := rVar + 0.1;
rSin := 30 * SIN(rVar);

☑ Requirement: The application is running the PLC_PRG program on the controller.

1. In the device tree, select the application and add a new trace object by clicking "Project ➔ Add Object".
   ➔ The respective trace editor opens with the commands available in the "Trace" menu.

2. Click "Trace ➔ Configuration".
   ➔ The "Trace Configuration" dialog box opens.

3. Select a task for running the trace feature. Normally this is the same task that is running in PLC_PRG.

4. Click "Add Variable" to add an entry to the tree view of the trace configuration and assign an IEC variable (for example, PLC_PRG.rSin).

5. Click "Trace ➔ Download Trace".
   ➔ CODESYS loads the trace configuration to the controller. The application starts recording data and transmits the data to CODESYS, where it is displayed in the trace diagram as a graph. Commands are provided for navigating through the samples and controlling the data recording.

Example

The PLC_PRG program is running on the controller. When you follow the instructions for "Getting Started", CODESYS displays the following trace diagram.

- (1) : "Configuration"
- (2) : "Add Variable"

See also

- ☑ Chapter 6.4.1.21.2.31 “Object ‘Trace’” on page 2541

Creating trace configuration

For a complete trace configuration, specify at least one task and one variable. In order to trigger the data recording, activate the trigger option and select a trigger variable or specify a recording condition.
Assigning a task

In this task, the data recording is executed in runtime mode. Usually the same task is selected where the variables are written.

1. Double-click the trace object.
   - The trace editor opens with the commands available in the “Trace” menu.
2. Click “Trace ➔ Configuration”.
   - The “Trace Configuration” dialog opens. In the tree view “Trace Record”, the top item is selected and the subdialog “Record Settings” is shown on the right.
3. Click the "arrow down" symbol (▼) in the “Task” drop-down list.
   - The drop-down list opens with all tasks that are available throughout the application.
4. Select a task for the trace.

Configuring a trace variable

1. Double-click the trace object.
   - The trace editor opens. The commands of the “Trace” menu are available.
2. Click “Add Variable”.
   - The “Trace Configuration” dialog opens. The subdialog “Variable Settings” is displayed on the right.
3. Click in the input field of the “Variable” setting and select a trace variable in the “Input Assistant” dialog.
   - The variable is configured for data recording. The trace record tree and the display tree were extended by the variable.
4. Click the “Add Variable” link.
   - The trace record tree and the display tree receive a new variable. The settings of the variables are available on the right.
5. Select a trace variable.
6. Click “OK” to close the dialog.
   - The variables are trace variables and are displayed in the trace variable list.

Deleting a trace variable

1. Double-click the trace object.
2. Click a variable in the trace record tree.
3. Click the “Delete Variable” command or press [Del].
4. Click “OK” to close the dialog.
   - The variable is removed from the trace variable list.
Tracing a parameter

1. Double-click the trace object.
2. Click “Add Variable”.
   ⇨ The “Trace Configuration” dialog opens. The subdialog “Variable Settings” is displayed on the right.
3. Click (right of the “Variable” setting, left of the input field).
4. Select the “Parameter” option in the drop-down list.
5. Click and select a parameter from the “Input Assistant” dialog.
6. Configure how the parameter is displayed.
7. Click “OK” to close the dialog.
   ⇨ The parameter will be traced and displayed in the trace variable list.

Configuring a trigger

1. Double-click the trace object.
   ⇨ The trace editor opens with the commands available in the “Trace” menu.
2. Click “Trace ➤ Configuration”.
   ⇨ The “Trace Configuration” dialog opens. The subdialog “Record Settings” is displayed on the right.
3. Select the “Enable trigger” check box.
4. Select the task in which the trend record is to be executed.
5. Select a variable from the “Trigger Variable” field.
6. Click “OK” to close the dialog.
   ⇨ The data recording will be triggered.

The trigger time is displayed as a black line in the diagram in runtime mode.

1. Download the application and start it.
2. Click “Trace ➤ Download Trace”.
   ⇨ The trace configuration is loaded. After triggering, the runtime system saves the value graph of the trace variables. The data is displayed in the trace editor. The trigger time is displayed as a black line in the diagram.

Configuring the display of the time axis

1. Double-click a trace object.
2. Click the “Configuration” link above the configuration tree.
   ⇨ The “Trace Configuration” dialog opens.
3. Select “Time axis” in the display tree (below “Presentation (Diagrams)”).
   ⇨ The display settings of the time axis are shown on the right.
4. Edit the presets and click the “Preview” link.
   ⇨ The changes are seen in the coordinate system preview.
5. Click “Y-axis” in the display tree. The “Y-axis” item is below every configured diagram. Therefore, the display of the value axis is set for each diagram.  
⇒ The subdialog “Display Settings” of the selected axis is displayed on the right.

6. Change the preset value.
⇒ The changes are applied in the coordinate system preview.

7. Click OK to close the “Trace Configuration” dialog.
⇒ The display changes are visible in the affected diagrams.

---

**Configuring the display of the trace variable**

1. Double-click a trace object.
2. Click the “Configuration” link.  
⇒ The “Trace Configuration” dialog opens.
3. Select a variable below “Trace Record”.
⇒ The subdialog “Variable Settings” of the selected variable is displayed on the right.
4. Change a setting, for example the “Line type”.
5. Click “OK” to close the dialog.  
⇒ The display changes are visible in the affected diagrams.

---

**Configuring the buffer for data on the runtime system**

1. Double-click a trace object.
2. Click “Trace ➔ Configuration”.  
⇒ The “Trace Configuration” dialog opens. The subdialog “Record Settings” is displayed on the right.
3. Click “Advanced”.
⇒ The “Advanced Trace Settings” dialog opens.
4. Change the setting “Measure in every n-th cycle” or “Recommended runtime buffer size (samples)”.  
5. Click “OK” to close the dialog.  
⇒ The buffer settings are reconfigured. It is applied after the trace configuration is loaded to the RTS the next time.

---

**Editing the trace configuration in runtime mode**

Requirement: The application is running on the controller and a trace configuration is loaded.

1. Double-click a variable in the trace record tree.  
⇒ The “Trace Configuration” dialog opens.
2. Change the color, for example.  
⇒ The variable is displayed in the new color in the affected diagrams without interrupting the execution of the application.
Operating the data recording

Use menu commands for controlling how data is recorded.

Requirement: The application is loaded on the runtime system and a trace is configured.

Menu commands

- “Trace ➔ Download Trace”
- “Trace ➔ Start Trace”
- “Trace ➔ Stop Trace”
- “Trace ➔ Reset Trigger”

See also

- Chapter 6.4.1.21.3.22.6 “Command ‘Download Trace’” on page 2734
- Chapter 6.4.1.21.3.22.16 “Command ‘Start Trace’” on page 2741
- Chapter 6.4.1.21.3.22.17 “Command ‘Stop Trace’” on page 2741
- Chapter 6.4.1.21.3.22.13 “Command ‘Reset Trigger’” on page 2740

Accessing All Traces on the Controller

If the controller supports the runtime system component CmpTraceMgr (Trace Manager), then you can access all traces from a CODESYS project which are running on the controller. In addition to application-related traces that capture the values of IEC variables, these can also be entirely controller-specific traces (for example, for recording device signal values or the CPU load).

For each trace running on the controller that you want to present in your project, you have to insert an individual “DeviceTrace” object in the device tree.

In order to show a trace from the device in this object, the connection to the PLC has to be configured correctly (“Communication Settings”). Then use one of the following menu commands:

- “Trace ➔ Upload Trace”: Establishes the connection to the PLC and opens the “Online List” dialog for selecting a trace from the controller.
- “Trace ➔ Online List”: Available in online mode only: Also opens the “Online List” dialog.

Now the trace uploaded from the controller can be started and traced in the editor of the DeviceTrace object. The configuration of the presentation (colors, labels, etc.) is the same as with traces for application variables configured in the project.

NOTICE!
Closing the DeviceTrace editor terminates the connection to the controller.

Please note that the connections to the controller is also terminated when the last open “DeviceTrace” editor is closed. In order for device traces to be displayed again in the project, you have to reload them into the “DeviceTrace” objects.

At this time, closing the editor is also the recommended procedure for deliberately terminating the connection to the controller. Logging out is not enough for this.
Requirement: The PLC device supports the Trace Manager. For the example described here, this is CODESYS Control Win V3. The device provides traces of the individual CPU loads (\textit{CpuLoad}), as well as traces of the CPU load caused by the runtime system (\textit{PlcLoad}). The possible display of the CPU load in the project can be helpful when using multicore functionality.

1. In the project, define the “\textit{Communication Settings}” for the controller.
2. Select the PLC entry in the device tree and add a “\textit{DeviceTrace}” object.
3. Rename “\textit{DeviceTrace}” to “\textit{Trace_PlcLoad}” (“\textit{Properties}”).
   - The connection to the controller is established and the “\textit{Online List}” dialog opens.
4. Set the focus in the trace editor and click “\textit{Trace \rightarrow Upload Trace}”.
   - The connection to the controller is established and the “\textit{Online List}” dialog opens.
5. Select the “\textit{PlcLoad}” entry in the dialog and click “\textit{Upload}”. Click OK to close the dialog.
   - Multiple trace views open in the trace editor to show the CPU load in the runtime system. There are the traces for the particular CPUs and one trace for the average value. The following text appears for each: “No samples have been recorded.”
6. Click “\textit{Trace \rightarrow Start Trace}”.
   - The trace recording for the four parameters is displayed.
7. If you also want to display the traces for the \textit{CpuLoad} per CPU with their average value in the project, then insert another “\textit{DeviceTrace}” object into the device tree. Name it “\textit{Trace_CpuLoad}” for example. Load and start the traces for “\textit{CpuLoad}” in the editor as described above.
   - Now you can monitor all traces in the project:

8. If you want to change the appearance of the presentation, then click “\textit{Configuration}” in the respective trace editor window to access the configuration dialogs. You can use these dialogs (except variable assignments) in the same way as for an IEC variable trace created in a project.
9. To disconnect from the controller, close all open DeviceTrace editor windows. If you are logged in to the device, then logging out is enough to terminate the connection.

Navigating into trace data

Use menu commands to navigate the data in the trace diagram.

Requirement: The application is in online mode.

Menu commands
- “\textit{Trace \rightarrow Cursor}”
- “\textit{Trace \rightarrow Mouse Zooming}”
Managing trace

Use menu commands to load and save traces in various formats.

Menu commands

- “Trace ➔ Reset View”
- “Trace ➔ AutoFit”
- “Trace ➔ Compress”
- “Trace ➔ Stretch”
- “Trace ➔ Convert to Single-Channel”
- “Trace ➔ Convert to Multi-Channel”

- § Chapter 6.4.1.21.3.22.7 “Command ‘Export Symbolic Trace Config’” on page 2735

Showing statistics

CODESYS evaluates and displays the recorded data with an option of saving the data to the clipboard. Click “Trace ➔ Statistics”.

See also

- § Chapter 6.4.1.21.3.22.20 “Command ‘Statistics’” on page 2742

6.4.13.4 Data Recording with Trend

General

When you want to monitor the development of data over a long period of time for the purpose of reading a trend, you can save the data with “Trend Recording”. You can configure any number of variables or parameters to save their values in a persistent database. This database is located on the PLC and is populated continually at runtime.
Trend recording comprises the following objects:

1. "Trend recording task" of type "Task"
2. Object of type "Trend Recording Manager"
3. Object of type "Trend Recording"

NOTICE!

Timeout for trend recording

During a trend recording, it can happen that the application task triggers a timeout that is caught with an exception when transitioning from "Running" to "Stop". Causes can be that file operations with the SQLite database are taking too long or that too many variables are being recorded. This usually happens on a target device with weak performance.

You can avoid the occurrence of an exception:

- Configure the trend recording with less memory demand so that the amount of data that is stored is adapted to the target system.
- Reduce the number of variables.

To display the collected data, you design a visualization with a "Trend" element. This kind of visualization accesses the database for visualizing the data.

See also

- Chapter 6.4.1.21.2.32 “Object ‘Trend Recording Manager’” on page 2545
- Chapter 6.4.1.21.2.33 “Object ‘Trend Recording’” on page 2545
- Chapter 6.4.1.21.2.34 “Object ‘Trend Recording Task’” on page 2548

Getting started with trend recording

To execute trend recording on a runtime system, you need an application with a "Trend Recording Manager" object that contains at least one "Trend Recording" object. Then you can configure a database on the runtime system and the data buffering.
1. Add a "Trend Recording Manager" object below your application.
2. Select the "Trend Recording Manager" object and click "Add Object ➔ Trend Recording". Type a name in the "Add Trend Recording" dialog box.
   ➞ CODESYS creates the object. The editor opens.
3. Type a task in "Record Settings".
4. Click "Add Variable".
   ➞ CODESYS adds another variables. The blank settings open in the "Variable Settings" to the right of the tree view.
5. Select a valid IEC variable from the "Variable" field.
   ➞ The IEC variable is configured for trend recording.
6. Build the application.
7. Download the application to the controller and click "Start".
   ➞ The application records data in runtime mode and saves it to a database.

See also
● ☰ Chapter 6.4.1.21.2.33 “Object 'Trend Recording’” on page 2545
● ☰ Chapter 6.4.5.13.2 “Getting Started with Trend Visualization” on page 2928

Configuring trend recording
You can configure a database on the runtime system and the data buffering.

NOTICE!
Timeout for trend recording

During a trend recording, it can happen that the application task triggers a timeout that is caught with an exception when transitioning from "Running" to "Stop". Causes can be that file operations with the SQLite database are taking too long or that too many variables are being recorded. This usually happens on a target device with weak performance.

You can avoid the occurrence of an exception:
– Configure the trend recording with less memory demand so that the amount of data that is stored is adapted to the target system.
– Reduce the number of variables.

Assigning tasks
In this task, the runtime system records the trend.

In general, trend recording runs in the same task as the main program (for example, PLC_PRG).

1. Double-click a “Trend Recording” object in the device tree.
   ➞ The respective editor opens. In the tree view of the trend configuration, the top entry is selected, and on the right you see the current configuration in "Record Settings".
2. Click the "arrow down" symbol (▼) in the “Task” drop-down list.
   ➞ The drop-down list opens with all tasks that are available throughout the application.
3. Select a task for trend recording.
Adding IEC variables

NOTICE!
The number of variables is limited for trend recording. You can change this number in the “Trend storage” dialog.

1. Double-click a “Trend Recording” object in the device tree.
   ⇒ The respective editor opens. In the tree view of the trend configuration, the top entry is selected, and on the right you see the current configuration in “Record Settings”.
2. Right-click an entry in the tree view.
3. Click “Add Variable”.
   ⇒ CODESYS adds another variable. The blank settings open in the “Variable Settings” to the right of the tree view.
4. Select a valid IEC variable from the “Variable” field.
   ⇒ The IEC variable is configured for trend recording.
5. Configure how the variable is displayed in the trend diagram.
6. Configure how the alert color is displayed in the trend diagram.

See also
● ° Chapter 6.4.1.21.2.33 “Object ‘Trend Recording’” on page 2545

Removing variables from the configuration

1. Double-click a “Trend Recording” object in the device tree.
2. Click a variable in the tree view of the configuration.
3. Click “Delete Variable” or press [Del].

Starting conditional trend recording

You can configure conditional trend recording for execution. Configuration is not possible when depending on triggering. For that you need a “Trace” object.

1. Double-click a “Trend Recording” object in the device tree.
2. Click the top node in the tree view of the trend configuration.
   ⇒ The name of the trend configuration is selected and on the right you see the current configuration in “Record Settings”.
3. Assign a Boolean variable, an access to a bit, or a property to the “Record condition” field.
   ⇒ When the application is in runtime mode, data is recorded only if the value is TRUE.

See also
● ° Chapter 6.4.1.13.3 “Data Recording with Trace” on page 2007
Adding parameter

1. Double-click a “Trend Recording” object in the device tree.
   ⇒ The respective editor opens. In the tree view of the trend configuration, the top entry is selected, and on the right you see the current configuration in “Record Settings”.

2. Right-click an entry in the tree view.

3. Click “Add Variable”.
   ⇒ CODESYS inserts a new variable. The blank settings open in the “Variable Settings” to the right of the tree view.

4. Click the “down” symbol (▼) to the right of the “Variable” label.

5. Select “Parameter” from the drop-down list.

6. Click and select a parameter from the “Input Assistant” dialog.

7. Configure how the parameter is displayed in the trend diagram.

8. Configure how the alert color is displayed in the trend diagram.

See also
● Chapter 6.4.1.21.2.33 “Object 'Trend Recording'” on page 2545

Configuring data buffering on the RTS

1. Double-click a “Trend Recording” object in the device tree.
   ⇒ The respective editor opens. In the tree view of the trend configuration, the top entry is selected, and on the right you see the current configuration in “Record Settings”.

2. Click “Trend Storage”.
   ⇒ The “Trend Storage” dialog opens.

3. Now you can change the settings.

See also
● Chapter 6.4.1.21.4.17 “Dialog Box 'Trend storage'” on page 2809

Configuring additional buffering

1. Double-click a “Trend Recording” object in the device tree.
   ⇒ The respective editor opens. In the tree view of the trend configuration, the top entry is selected, and on the right you see the current configuration in “Record Settings”.

2. Click “Advanced”.
   ⇒ The “Advanced Trace Settings” dialog opens.

3. Now you can change the settings.

See also
● Chapter 6.4.1.21.4.18 “Dialog Box 'Advanced Trend Settings'” on page 2810
6.4.13.5 Monitoring tasks

In online mode, you can display some statistical values of the tasks in the runtime system. This information is very useful for testing clock cycles or solving problems in the runtime performance.

1. Switch to online mode.
2. Select the “Task Configuration” object in the device tree.
   - Click “Project ➔ Edit Object”.
   - The task configuration opens in the editor.
3. Click the “Monitor” tab.

See also
- Chapter 6.4.1.3.3 “Creating trace configuration” on page 2010

6.4.13.6 Reading the PLC log

CODESYS provides the capability to display the events and error messages logged in the controller.

See also
- Chapter 6.4.1.21.2.8.9 “Tab 'Log'” on page 2437

Reading the log

Requirement: The controller is running.

1. Select the controller in the device tree.
2. Choose the command “Project ➔ Edit Object”.
   - The device editor opens.
3. Choose the tab “Log”.
4. Click on  to update the view.
   - A connection to the controller is established. The controller in the device tree is highlighted in green.
   - All controller log information are displayed.
5. Click on  to delete the current list.
6. Filter the view by clicking on the desired category (for example "Information").
7. Save the log entries. Click on  and choose a file name.

See also
- Chapter 6.4.1.21.2.8.9 “Tab 'Log'” on page 2437
6.4.1.13.7 Using PLC shell for requesting information

The "PLC shell" in CODESYS is a text-based control monitor (terminal) on a tab of the device editor. There you can enter commands for the request of specific information from the controller, as well as execute actions like starting, stopping or downloading applications. Also a description on the meaning and syntax of the possible commands you can get directly via the PLC shell.

Requesting information about the application on the controller

Requirement: Your project is connected with a controller; Example: CODESYS Control Win V3, on which an application App1 is running.

1. Open the device editor double-clicking on the object CODESYS Control Win V3 in the device tree, and activate tab "PLC Shell".
   ⇒ The tab shows an empty output data window. Below there is an entry field for a command.
2. Click button ...
   ⇒ The "Insert Standard Command" dialog appears with a list of commands.
3. Choose command "?” and click button “Execute”.
   ⇒ The dialog closes and in the output data window you see a list of the supported commands and their possible parameters. Each the syntax for how to enter the command is displayed.
4. Click again [ ] and choose command “pid”. In the input assistant supplement the command as follows: pid App1. Press the Enter key.
   ⇒ In the output data window the following gets displayed (the GUIDs are just examples):
   
   pid App1  
   Project Identification  
   Application: App1  
   Code GUID:0x08a893c0  
   Data GUID:0x762d0e90  
5. Click button ▼ in the command line.
   ⇒ Command pid App1 is added to the history of already entered commands.

6.4.1.13.8 PLC operation control via system variables

CAUTION!
You are responsible for runtime system services being enabled under safe application conditions and disabled only under critical conditions.

At runtime, the state of an application or facility can become sensitive and disruptive actions can endanger the entire machine or facility. However, in this state you can suppress certain commands and prevent dangerous actions. The "PlcOperationControl" function block and "Component Manager" library are provided for this purpose.
Examples of CODESYS commands that can suppress operations when executed:

- “Online Change”, “Download”
- “Enable Breakpoint”
- “Reset Application”, “Stop Application”
- “Transmit Data”
- “Force Values”, “Write Values”

In order that a backup solution is always in place, you are not permitted to suppress the “Reset origin” and “Delete” commands.

CODESYS will notify you if a currently disabled runtime system service is required when the application is in runtime mode. Then, you can respond with an appropriate countermeasure.

**Function block PlcOperationControl for operation control**

This function block is used for enabling and disabling operations.

<td>TRUE: Forcing variables is suppressed.</td>
</tr>
<tr>
<td>xDisableApplicationReset</td>
<td>BOOL</td>
<td>FALSE</td>
<td>TRUE: Resetting the application (not &quot;Reset origin&quot;) is suppressed.</td>
</tr>
<tr>
<td>xDisableAll</td>
<td>BOOL</td>
<td>FALSE</td>
<td>TRUE: All operations are suppressed.</td>
</tr>
</tbody>
</table>

**Implementing operation control**

**Requirement**

- Compiler version >= 3.4.3.0
- In the device description, the PLC operation control is enabled by system variables.

1. Declare an instance of the PlcOperationControl function block (for example, PlcOpCtrl_Inst).
    
    ```
    PlcOpCtrl_Inst : PlcOperationControl;
    ```

2. Suppress a command by assigning the respective TRUE property (for example, "Stop Application").
    
    ```
    PlcOpCtrl_Inst.xDisableApplicationStop := TRUE;
    ```
6.4.1.13.9 Backup and restore

CODESYS and the CODESYS standard runtime systems (with version 3.5.8.0 and later) support backing up application-specific files on the PLC. You can execute the required actions in the “Backup and Restore” tab of the generic device editor.

A backup consists of creating and saving a file in zip archive that contains the application-related files and an information file `meta.info`. This backup file has the extension `TBF` ("Target Backup File") and can be saved in the local file system or on the PLC.

The following applies when restoring the software status from the backup file:

- A dialog opens with a list of affected files on the PLC, and you can deactivate optional components.
- We highly recommend to set the application to STOP mode for backup or restore. A dialog prompt will open to warn you about this.
- The user interface is blocked when restoring to the PLC.
- Existing files are overwritten without warning.
- Existing boot applications are deactivated as soon as at least one new boot application is part of the restore.

See also

- Chapter 6.4.1.21.3.7.6 “Command ‘Online Change’” on page 2629
- Chapter 6.4.1.21.3.8.16 “Command ’Force Values’” on page 2649
- Chapter 6.4.1.12.5 “Forcing and Writing of Variables” on page 1987

Creating backup files

Requirement: A project is open with an application that is running on the required device. In addition, for this example an external file `myExternalFile.txt` is inserted as an object below the application. This file is downloaded to the PLC implicitly when downloading the application.

1. Open the device editor by double-clicking the device entry in the device tree. Click the “Backup and Restore” tab.
   - The tab opens with a menu bar including the “Backup” and “Restore” menus.
2. In the “Backup” menu, select the “Read Backup Information from Device” item.
   - If the PLC is not connected at the moment, then CODESYS opens a temporary connection to the device and reads the relevant files from the `$PlcLogic$/Application/Application.app`, `$PlcLogic$/Application/Application.crc`, and `$PlcLogic$/Application/myExternalFile.txt`. In addition, other external, project-dependent files are listed, which have been inserted below the application in the device tree. Furthermore, the source code archive file `$PlcLogic$/Archive.prj` is listed if you have set the project setting for this (“Implicitly at program download and online change”) as the loading time.
3. In the table, clear the check box for the `$PlcLogic$/Application//myExternalFile.txt` file in the “Active” column.
4. Select “Save Backup File to Device” in the “Backup” menu.
   - The “Save as” dialog opens. The file type is predefine as “Backup files (*.tbf)”.
5. Select a location for the backup file and click “Save”.

See also

- Chapter 6.4.1.21.2.8.6 “Tab ’Backup and Restore’” on page 2435
- Chapter 6.4.1.21.4.12.6 “Dialog ’Project Settings’ – ’Source Download’” on page 2770
Restoring from backup files

Requirement: A project is open with a PLC device connected. A backup file is saved to the local file system as described above.

1. Open the device editor by double-clicking the device entry in the device tree. Click the "Backup and Restore" tab.
   - Click “Restore ➔ Load Backup File from Disc”.
   - The default prompt opens for selecting a backup file tbf in the local file system.
2. Select the backup file and click “Open”.
   - The files are read from the backup file and shown in the table of the dialog below.
   - The file $PlcLogic$/Application/myExternalFile.txt that was excluded in the backup is missing.
3. Click “Restore ➔ Restore Backup to Device”.
   - A dialog prompt opens with information about the actions when restoring.
4. Click “OK” to start restoring the files to the PLC file system.
   - When restore is complete, you are prompted to restart the PLC in order to activate the loaded application.

6.4.1.14 Updating an Application on the PLC

6.4.1.14.1 General

CODESYS basically provides two options to transfer a modified application to the controller: download and online change.

A download results in a recompilation of the application. In that time, a syntax check is performed and application code is also created and downloaded to the controller. This leads to the running program being stopped. A download is the recommended method of data transfer because a defined starting state is always created due to the program stop and the reinitialization.

In the case of an online change, only the modified parts are downloaded again to the controller. A running program is not stopped for this. You should perform an online change only in the case of minor changes to the application. For extensive changes, the behavior of a program cannot be safely predicted. For more information, read the notes in the description of the “Online Change” command.

See also
- “Chapter 6.4.1.14.2 “Executing the online change” on page 2025
- “Chapter 6.4.1.14.3 “Execution of a download” on page 2026
- “Chapter 6.4.1.21.3.7.5 “Command 'Load'” on page 2628
- “Chapter 6.4.1.21.3.7.6 “Command 'Online Change'” on page 2629

6.4.1.14.2 Executing the online change

CODESYS automatically offers you an online change if you log in with an application that is already present on the controller, but has been changed since the last download in the programming system. With this procedure only the modified parts are reloaded to the controller. A running program on the controller is not stopped during the online change.

In the view “Memory reserve for online change”, you can configure memory reserves for the online change for function blocks of a project. In this way, instance variables do not have to be moved to the memory after changes are made to a function block for an online change.

NOTICE!

When carrying out the online change, pay attention to the notes in the description of the “Online Change” command.
See also
- Chapter 6.4.1.21.3.7.6 “Command ‘Online Change’” on page 2629
- Chapter 6.4.1.21.3.7.2 “Command ‘Login’” on page 2624
- Chapter 6.4.1.11.5 “Generating Application Code” on page 1976

Executing the online change when logging in

Requirement: The connection settings of the controller are correctly set. The applications in the project and on the controller are identical. The project on the controller is running. The application is logged out.

1. Change your application.
2. Click “Online ➔ Login”.
   - A dialog appears with the information that the application has been changed since the last download.
3. Click the “Details…” button
4. Check the details in the “Application information” tab.
   - If you have not generated any code since the last change, the command “Application is not up to date. Generate code now?” appears at the bottom edge of the dialog. In this case click this command.
   - You are shown a comparison view of the objects (objects marked red are different).
5. Close the dialog.
6. Select the option “Login with Online Change” and click “OK”.
   - The change is loaded to the controller. The running program on the controller is not stopped while doing this. The application is logged in.

See also
- “View ‘Project Comparison’ - ‘Differences’” on page 2607

Execute online change in the logged-in state (online operation)

Requirement: The connection settings of the controller are correctly set. The applications in the project and on the controller are identical. The project on the controller is running. The application is logged in.

1. Select an object in the device tree. It is best to select a POU or a GVL here.
2. Click “Project ➔ Edit Object (Offline)”.
   - The object opens in the editor.
3. Change the object. For example, you can declare a new variable or change a value assignment here.
4. Click “Online ➔ Online Change”.
   - A query will appear, asking whether you really want to execute the online change.
5. Click “Yes” to confirm the dialog.
   - The change is loaded to the controller.

6.4.1.14.3 Execution of a download

A download of the application causes a compilation of the active application. In the process, a syntax check is performed and application code is also created and loaded to the controller. A program running on the controller is stopped during the download.
NOTICE!
During the download, pay attention to the notes in the description of the "Download" command.

See also
- ▶️ Chapter 6.4.1.21.3.7.5 “Command ‘Load’” on page 2628
- ▶️ Chapter 6.4.1.21.3.7.2 “Command ‘Login’” on page 2624
- ▶️ Chapter 6.4.1.11.5 “Generating Application Code” on page 1976

### Downloading when logging in

Requirement: the connection settings of the controller are correctly set. The applications in the project and on the controller are identical. The project on the controller is running. The application is logged out.

1. Change your application.
2. Select the command “Online ➔ Login”
   
   ➔ A dialog box appears with the information that the application has been changed since the last download.
3. Select the option “Login with download” and click on “OK”.
   
   ➔ The running program on the controller is stopped and the change is loaded to the controller. The application is logged in.

### Downloading in the logged-in state (online mode)

Requirement: the connection settings of the controller are correctly set. The applications in the project and on the controller are identical. The project on the controller is running. The application is logged in.

1. Select an object in the device tree. It is best to select a POU or a GVL here.
2. Select the command “Project ➔ Edit Object (Offline)”
   
   ➔ The object opens in the editor.
3. Change the object. For example, you can declare a new variable or change a value assignment here.
4. Select the command “Online ➔ Download”.
   
   ➔ A query will appear, asking whether you really want to execute the download.
5. Confirm the dialog box with “Yes”.
   
   ➔ The running program on the controller is stopped and the change is loaded to the controller.

### 6.4.1.15 Copying files to/from PLC

In the generic “Files” tab of the device editor, you can copy files to and from the local file system and the controller.

Requirement: The vendor has unlocked the tab. In the device tree, the connection to the controller is configured. The device is running.

1. Double-click the PLC device object in the device tree to open the device editor.
2. Click the “Files” tab.
3. In “Host” | “Location” on the left part of the view, set the path in the local file system where files will be copied to and from. Example: D:\FileTransferWithPLC. If necessary, create a new directory by clicking the folder symbol ( ).
   ➔ The files and directories are shown like in a file manager. Click the refresh symbol ( ) to update the display.

4. In “Runtime” on the right side of the view, set the required directory for the data transfer in the same way.
   ➔ CODESYS shows the files on the controller.

5. Select the required files from the file system tree for the file transfer (multiple selection is possible). You can also select a directory for transferring all files in a folder.

6. Click the left and right arrow symbols ( ), ( ) between the two parts of the view.
   ➔ CODESYS copies the selected files to the other file system immediately. If a file is not already available in the target directory, then it is created. If it is already available and not write-protected, then it is overwritten. Otherwise a message is shown.

6.4.16 Using the Command-Line Interface

You can start the command line with the following options and arguments.

Syntax:

(folder)Automation Builder.exe --<option>

Paths or option parameters must be written inside straight quotation marks when they contain spaces, dashes, or slash marks.

Option --culture (language of the user interface)
CodeSYS is started in the specified language.

Syntax:

--culture=<culture>

<Culture>: Typical language codes are as follows: de, en, fr, it, es, zh-CHS.

Example

Starting CodeSYS with the user interface in English:
Automation Builder.exe --culture=en

See also

Option --profile (CODESYS profile)
CODESYS is started directly with the specified profile. When you start CODESYS without this option, the “Select Profile” opens.

Syntax:

--profile="<profile name>"

<profile name>: You have to specify the profile name exactly as it is displayed in the “Help ➔ About” splash screen of the development system or in the start menu on your computer.
After CODESYS is started, the comparison of two CODESYS projects is begun immediately. Type the path of the project file as arguments after the option and then the path of the reference project. CODESYS starts and opens the "Project Comparison - Differences" view.

Syntax:
```
--compare="<path of project file>" "<path of reference project file>"
```

Example
```
Automation Builder.exe --compare "D:\proj\project1.project" "D:\proj\project2.project"
```

See also
- § Chapter 6.4.1.21.3.5.21 “Command ‘Compare’” on page 2607

CODESYS is started and the specified project is opened.

Syntax:
```
--project="<path of project file>"
```

Example
```
Open the test project:
Automation Builder.exe --culture=de --
project="D:\projects\test.project"
```

See also
- § Chapter 6.4.1.21.3.2.2 “Command ‘Open Project’” on page 2553

CODESYS is started, the specified project archive is extracted, and the project is opened.

Syntax:
```
--projectarchive="<path of project archive file>"
```

Example
```
Extract the test.projectarchive and open the project in the development system:
Automation Builder.exe --
projectarchive="D:\projects\test.projectarchive"
```

See also
- § Chapter 6.4.1.21.3.2.9 “Command ‘Extract Archive’” on page 2558
The specified script file is run by CODESYS.

**Option --runscript (run script)**

**Table 387: Command-line options for --runscript**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>--runscript=&quot;&lt;scriptfile&gt;.py&quot;</td>
<td>CODESYS runs the <code>&lt;scriptfile&gt;.py</code> script file at startup. You have to provide the complete path of the script file.</td>
</tr>
<tr>
<td>--scriptargs:'&lt;arg1&gt; &lt;arg2&gt; ... &lt;argn&gt;'</td>
<td>Use this option with the --runscript option. As a result, the arguments <code>&lt;arg1&gt; ... </code>&lt;argn&gt;<code>are passed to the script. The arguments are passed to the Python variable</code>sys.argv`.</td>
</tr>
<tr>
<td>--noUI</td>
<td>Use this option with the --runscript option. The CODESYS user interface is not opened. CODESYS prints all errors, warnings, compiler reports, and command-line messages generated from the script. The script messages (1: Severity Text) can be separated from other messages (2: Severity FatalError, Error, Warning, Information) with the &quot;&gt;&quot; operator.</td>
</tr>
<tr>
<td>--enablescripttracing</td>
<td>Use this option with the --runscript option. As a result, each command of the script file is shown in the output.</td>
</tr>
<tr>
<td>--textPrompts</td>
<td>Use this option with the --noUI option. As a result, message service methods and default dialogs are output in the command line for user input. If you do not specify --textPrompts, then all message service prompts are confirmed automatically with default values.</td>
</tr>
<tr>
<td>scriptdebugger {=&quot;&lt;debugger&gt;&quot;}</td>
<td>Use this option with the --runscript option. It sets IronPython in debug mode so that external debuggers can be used to debug Python scripts. The following values are defined for <code>&lt;debugger&gt;</code> (uppercase/lowercase is irrelevant).</td>
</tr>
<tr>
<td></td>
<td><strong>auto</strong>: Automatically detects if a debugger is included in every script for the current process. At this time, only .NET-based debuggers can be detected automatically. A detected debugger overwrites the --enablescripttracing flag.</td>
</tr>
<tr>
<td></td>
<td><strong>.NET</strong>: Activates debugging for .NET-based debuggers, such as &quot;Python Tools for Visual Studio&quot; (PTVS) and SharpDevelop. With this option, a debugger can also be included in running scripts, as opposed to &quot;auto&quot;. Note: This is currently the default value when --scriptdebugger is used without providing a value.</td>
</tr>
<tr>
<td></td>
<td><strong>disabled</strong>: Deactivates debugging and automatic detection.</td>
</tr>
<tr>
<td></td>
<td><strong>script</strong>: Switches the IronPython script engine to debug mode for activating the debugging for set-trace debuggers. The script itself must connect to and disconnect from the debugger.</td>
</tr>
<tr>
<td></td>
<td><strong>tracing</strong>: Activates the simple integrated script tracing mode and deactivates the automatic detection (same as the option --scripttracing).</td>
</tr>
<tr>
<td></td>
<td>$absolute_path.py$**: Absolute path to a Python script that initiates the connection to a Python-based debugger. The IronPython script engine is switched to debug mode for allowing the debugging for set-trace debuggers. This script is run one time during the initialization and should define the following non-parameterized functions:</td>
</tr>
<tr>
<td></td>
<td>scriptdebuggersetup is run immediately before running the user script to establish the connection to the debugger.</td>
</tr>
<tr>
<td></td>
<td>scriptdebuggershutdown is called immediately after running the user script or when the script engine is downloaded and should close the connection to the debugger.</td>
</tr>
</tbody>
</table>
Examples of using transfer parameters in script files with 'sys.argv'

```
start /b /wait Automation Builder.exe
--runscript="D:\Script\ArgvAnd__main__Test.py"
--scriptargs:'username password 3.14 "path="C:\temp\"

Script file: ArgvAnd__main__Test.py

from __future__ import print_function
import sys
print("sys.argv: ", len(sys.argv), " elements:")
for arg in sys.argv:
    print(" - ", arg)
print() print("__name__: ", __name__)
```

Output result: stdout:
sys.argv: 6 elements:
- D:\TestScripts\ArgvAnd__main__Test.py
- username
- password
- 3.14
- path= "C:temp"
__name__: __main__

For more information about the __name__ global variable, see the Python documentation.

Examples of the message output

```
start /b /wait Automation Builder.exe --runscript="D:\Script\AmpelTest.py" --noUI 1>ScriptMessages.txt

CODESYS passes all messages that are generated by the script to the ScriptMessages.txt file. Other messages are printed to the command line.

start /b /wait Automation Builder.exe --runscript="D:\Script\AmpelTest.py" --noUI 2>NUL

CODESYS suppresses all messages, except for script messages. The script messages are printed to the command line.
The following initdebug.py script was tested successfully with pydevd-based debuggers, such as PyDev / LiClipse and PyCharm. To use this script, start CODESYS with the following command line:

```
--profile="Fanta Development Build" --scriptdebugger="D:\test\charmdebug\initdebug.py"
```

File: initdebug.py:

```python
from _future_ import print_function
from _future_ import unicode_literals
import sys
sys.path.append(r"D:\test\Env2\Lib\site-packages\pycharm-debug.egg")
import pydevd
def scriptdebuggersetup():
    pydevd.settrace('localhost', port=51234, stdoutToServer=True, stderrToServer=True)
def scriptdebuggershutdown():
    pydevd.stoptrace()
```

See also
- [http://docs.python.org/tutorial/modules.html](http://docs.python.org/tutorial/modules.html)

Option --ignorewhitespace (ignore whitespace in project comparison)

If you add this option after the option `--compare <project1> <project2>`, then whitespace is ignored in the project comparison. Note that semantically relevant spaces, for example in STRING literals, are still taken into account.

Syntax:

```
--compare="<path of project file>" "<path of reference project file>" --ignorewhitespace="true"|"false"
```

Example

```
Automation Builder.exe --compare "D:\proj\project1.project" "D:\proj\project2.project" --ignorewhitespace="true"
```

See also
- [Chapter 6.4.1.21.3.5.21 “Command ‘Compare’” on page 2607](#)

Option --ignorecomments (ignore comments in project comparison)

If you add this option after the option `--compare <project1> <project2>`, then comments are ignored in the project comparison.

Syntax:

```
--compare="<path of project file>" "<path of reference project file>" --ignorecomments="true"|"false"
```

Example

```
Automation Builder.exe --compare "D:\proj\project1.project" "D:\proj\project2.project" --ignorecomments="true"
```

See also
- [Chapter 6.4.1.21.3.5.21 “Command ‘Compare’” on page 2607](#)
If you add this option after the option `--compare <project1> <project2>`, then object properties (permissions, compile settings, directories, bitmaps, etc.) are ignored in the project comparison.

Syntax:

```
--compare="<path of project file>" "<path of reference project file>"
--ignoreproperties="true"|"false"
```

Example

```
Automation Builder.exe --compare "D:\proj\project1.project"
"D:\proj\project2.project" --ignoreproperties="true"
```

See also

- § Chapter 6.4.1.21.3.5.21 “Command ‘Compare’” on page 2607

CODESYS is started. In this case, the query as to whether unlicensed components should still be loaded is skipped. If so, then CODESYS does not load these components by implication.

Example

```
Automation Builder.exe --skipunlicensedplugins
```

If you add this option after the option `--project="<path of project file>"`, then the project is opened and the thumbprint of the certificate for signing compiled libraries is passed.

Syntax:

```
--signaturethumbprint="<thumbprint of digital signature>"
```

Example

```
Automation Builder.exe --project="D:\projects\test.project"
signaturethumbprint="3E96C9B61010CBDC31B6021A1CAA64946DDCAAF3"
```

See also

- § Chapter 6.4.1.21.3.4.18 “Command ‘Security Screen’” on page 2592

If you add this option after the option `--project="<path of project file>"`, then the “Enforce signing of compiled libraries” option is enabled in the project in the “Security Screen” on the “User” tab.

```
NOTICE!
When the “Security Screen” is opened and closed, the current settings are applied in the user options, even when no active changes have been made.
```

Syntax:

```
--enforcesignedcompiledlibraries="true"|"false"
```
Option --timestampingserverurl (set the time stamp server address)

If you add this option after the option --project="<path of project file>", then the Internet address of the RFC-3161 time stamp server ("Timestamping server") is set in the project in the “Security Screen” on the “User” tab.

**NOTICE!**

When the “Security Screen” is opened and closed, the current settings are applied in the user options, even when no active changes have been made.

Syntax:

--timestampingserverurl="<URL of RFC-3161 timestamping server>"

Example

Automation Builder.exe --timestampingserverurl="http://timestamp.comodoca.com/rfc3161"

6.4.1.17 Using Libraries

6.4.1.17.1 Library repository

The library repository is the storage location on the development system for libraries and associated metadata. You can link any installed the libraries into your project by means of a library manager. Moreover, the libraries are installed with version management for easy library updates.

You can create and edit more repositories in addition to the preinstalled System repository.

§ Chapter 6.4.1.21.3.9.5 “Command ‘Library Repository’” on page 2657

6.4.1.17.2 Library Manager

In order to be able to use POU’s, which are provided in a library POU, in the application, the library has to be integrated in the Library Manager in the project. The requirement for this is the installation of the library in the library repository.

The Library Manager displays all integrated libraries according to their library type and the respective properties. In the Library Manager, you can add more libraries from the library repository, remove libraries, and edit library properties.
The Library Manager can be inserted into the “POUs” view or the “Devices” view. As a result, a project can have a Library Manager for each application, as well as a Library Manager in the “POUs” view for use across all applications. The library POUs of the integrated libraries in the “POUs” view can be called regardless of the application. The library POUs of the integrated libraries in the “Devices” view can be called in the respective application code only. Furthermore, placeholder libraries behave differently when downloading depending on their positions.

Libraries that are integrated to a specific version in the project also have a placeholder for that version (placeholder library). You can define special placeholder resolutions. You can also use the placeholder resolution that is defined for a device in the device description or that is stored in the library repository for a library. The Library Manager notifies you about the actual placeholder resolution and shows the version that will be loaded when an application is downloaded (effective version).

When a Library Manager in the “POUs” view is integrated across all applications, you can access its contents globally. If placeholder libraries are integrated, then only the placeholder resolutions in the device description or library repository are checked.

A Library Manager is usually integrated in the “Devices” view. Then only the application code below it calls library POUs from it. Moreover, the special placeholder resolutions are checked first for placeholder libraries. Only after that are the placeholder resolutions checked that are in the device description or that originate from the library repository.

In order to avoid consistency problems and to adequately support the user, be sure to adhere to certain rules for the creation, referencing, encryption, protection, and documentation of libraries. The following description provides only an overview of the library development possibilities. For a more detailed description of these topics, see the “LibDev-Summary” guidelines for library development.

See also
- Chapter 6.4.1.21.2.16 “Object 'Library Manager’” on page 2469
- Chapter 6.4.1.9.9 “Using Library POUs” on page 1890

6.4.17.3 Information for Library Developers

In order to avoid consistency problems and to adequately support the user, be sure to adhere to certain rules for the creation, referencing, encryption, protection, and documentation of libraries.

The following description provides only an overview of the library development possibilities. For a more detailed description of these topics, see the “LibDev-Summary” guidelines for library development.

See also
- Chapter 6.4.1.17 “Using Libraries” on page 2034

General
- You can define categories for libraries. The libraries are then displayed in the library repository below these categories.
- You can define a namespace for a library in order to enable unambiguous access to the integrated objects. The access becomes unambiguous by adding the namespace in front of the POU name:
  <namespace>.<variable name>
- Example: AC.Module
- You can open the POUs of unencrypted libraries (*.library) by double-clicking the respective entry in the Library Manager.
You can create the following library types:
- *.library: Implementation library (source code of the library)
- *.compiled-library, *.compiled-library-v3: Protected library; source code no longer accessible.
- *_Itfs.library: Interface library; contains only objects that are used for the interface definition of a component (for example, constants, structures, or interfaces) and do not generate any code.
- *_Cnt.library: Container library; does not contain any POUs; instead contains exclusively other libraries; therefore used to conveniently integrate an entire set of libraries whose POUs are published on the top level of the container library.

You can integrate external libraries into the application. External libraries are programmed outside of CODESYS in a different programming language, for example C.

Protection of libraries
- Source code protection:
  When a library is prepared in "compiled-library" format, the source code of the library POUs is no longer visible after the library is integrated into a project.
- Signing:
  In CODESYS V3 SP15 and higher, a certificate is always used for the signing of library projects (*.compiled-library-v3). The signing can be enforced by means of a setting in the security screen. Then for generating a compiled library, you need a certificate suitable for code signing in your user profile.
  For library projects that have to be compatible with CODESYS < V3 SP15 (*.compiled-library), only the less safe signing is possible with a private key and a corresponding token. These deprecated methods should only be used for reasons of compatibility. Settings are configured in the "Project Information" on the "Signing" tab.
  Note: For signing libraries, you should use compiler version 3.5.15.0 or higher because a better storage format is used.
- Licensing:
  You can protect libraries by means of a license (dongle or soft container). License-protected libraries can be installed in the library repository. However, for use in the project, the valid license has to exist on the computer. Licenses are managed in the License Manager.

Library versions
- You can have several versions of a library installed on the system at the same time.
- You can have several versions of a library integrated into your project at the same time. However, we do not recommend doing this. In this case, each of the libraries must be assigned a unique namespace and access to the symbols must be qualified. Examples: V1.SendBlob, V2.SendBlob

Referenced libraries
- You can integrate a library into other libraries (referenced libraries). The nesting can be of any depth.
- You can define whether referenced libraries should be visible in the Library Manager.
- You can integrate referenced libraries via library placeholders. This way you avoid the problems that could occur due to version dependencies or the necessity to use vendor-specific libraries.

- Chapter 6.4.1.3.4.2 “Retrieving and Editing Project Information” on page 1813

Adding a Library to the Application
The following instructions describe how to integrate for example the library Util into your application in order to use its library POUs.
6.4.1.17.5 Adding a library to the repository

The following instructions describe how to install a library in the library repository.

1. Select the command “Tools ➤ Library Repository”.
   ⇒ The dialog box “Library Repository” opens.
2. Click on the “Install” button.
3. Select the library that you wish to install. You can set a file filter here. Click on “Open”.
   ⇒ The library is added to the repository. The library can now be added in the Library Manager.

See also
- Chapter 6.4.1.17.4 “Adding a Library to the Application” on page 2036

6.4.1.17.6 Exporting library files

You can export a library from the library manager of a project or from the library repository and then save it as a file to the hard disk.

Export from the library manager

1. Open a library manager of an application in a project.
2. Select a library in the library manager.
3. Click the export command in the context menu.
   ⇒ The “Export Library” dialog box opens.
4. If the selected library is linked in the project not only as a compiled library, but also in source format, then both file types are in the drop-down list for “File type”. Otherwise, the filter automatically shows the available type: “*.library” or “*.compiled-library”.
5. Select the file type and storage location and click “Save”.

Export from the library manager

1. Open the CODESYS library repository (“Tools” menu).
2. Select a library version in the window of the installed libraries.
3. Click the "Export" button.
   ⇒ The “Export Library” dialog box opens.

4. As step 4 and 5 for "Export from the library manager”.

See also
- Chapter 6.4.1.21.2.16 “Object 'Library Manager'” on page 2469
- Chapter 6.4.1.21.3.9.5 “Command 'Library Repository'” on page 2657

6.4.1.18 Managing devices
6.4.1.18.1 General
CODESYS manages the installed devices in the device repository. A device repository is a defined location in the file system. In the default CODESYS installation, it is defined with an absolute path as the system repository. You install or uninstall devices in the “Device Repository” dialog. The system installs a device by reading the device description file. The properties of a device are defined in these files regarding configurability, programmability, and possible connections to other devices.
You can use the devices provided in the device repository by adding them to the device tree of your project.

See also
- Chapter 6.4.1.21.3.9.8 “Command 'Device Repository’” on page 2663
- Chapter 6.4.1.18.2 “Installing devices” on page 2038

6.4.1.18.2 Installing devices
Install a device in the device repository in order to include it in your project.
1. Click “Tools ➔ Device Repository”.
   ⇒ The “Device Repository” dialog box opens.
2. Select the install location. “System Repository” is set by default.
3. Click “Install”.
   ⇒ The “Install Device Description” dialog box opens.
4. Select the file path of the device description.
5. Select the file type filter of the required device description.
   ⇒ All device descriptions of the selected file type are listed.
6. Select the required device description and click “Open”.
   ⇒ CODESYS adds the device description to the matching category of your device repository.
   If errors occur during installation (for example, missing files that are referenced by the device description), then CODESYS displays them in the lower part of the device repository dialog box.

6.4.1.19 Security

6.4.1.19.1 General

Due to the increased networking of controllers and plants, potential threats are also quickly rising. Therefore, you should carefully consider all possible security measures.

Security measures are absolutely necessary to protect data and communication channels from unauthorized access.

On the following help pages, you can learn more about the safety functions of CODESYS and the controller.

6.4.1.19.2 General Information

The following provides some general information about safety functions (security measures). This information applies regardless of the usage in CODESYS or one with a connection controller.

Access protection with user management

As a means of protecting against unauthorized access to data, it is necessary to configure user accounts with specific access rights. Only a user with the credentials has access to the data or functions.

Creating passwords according to the general recommendations for achieving a high password strength is a tremendous contribution to security.

The following types of user management are roughly distinguished as follows:

- Simple user management:
  To access data, only a password or the valid combination of user name and password has to be entered. This means that access can only be granted or denied. Graduated permissions cannot be configured.

- Group-based user management:
  The access rights are assigned to user groups. Users who belong to a group can access the data or functions after entering the credentials with precisely these assigned and different permissions.

Encryption, signature

Encryption:

Encryption of data means the following: Data is converted into an unreadable form and can only be made readable again with a matching key. In the simplest case, the key is a password or a key pair.

There are two types of encryption methods:
Symmetric method: (the only type of encryption until the mid-1970s)

- Characteristic: Use of a secret key
- Advantages: Fast, simple encoding
- Disadvantages: The key has to be shared secretly.

Asymmetric method:

- Characteristic: Use of a key pair (private/secret key and public key)
- Advantages: The public key can be made accessible to anyone, and authentication possible with it.
- Disadvantages: Slow (approx. 1,000 to 10,000 times slower than symmetric methods); complex encoding; long key lengths

Key exchange is usually performed by asymmetric methods; encryption and decryption by symmetric methods.

Signature:

In order for the irrefutable ownership and integrity of a message to be verifiable, it should be provided with a signature. These are usually the steps involved:

- Sender: Determines a unique hash value over the data (H)
- Sender: Encrypts the hash value with private key (He)
- Recipient: Also calculates the hash value and decrypts the He with the public key and compares the two values. This allows the sender to be identified uniquely and verifies that the sender owns the private key.

In the case of asymmetric encryption, a public key contained in a certificate is first exchanged between the sender and the recipient. In addition, each participant needs a private key with which they can decrypt the data if they have the certificate. So if you want to access a certificate, you need a certificate AND a private key.

Hash methods are necessary for this:

- Hash method:
  - Characteristic: Unique thumbprint of the data (for example, checksum of the data)
  - As low a collision as possible (it is very difficult to find / construct two different data for a single hash value)

Certificates

In order to assign the public key to an identity, it is usually embedded in a certificate.

In certificate-based systems, each user receives a digital certificate. The certificate is used for digital identification. It contains information about the identity and the public key of the user.

Each certificate is authenticated by an issuing authority, which in turn may be authenticated by higher authorities. The trust system of this PKI (Public Key Infrastructure) is strictly hierarchical. The common trust anchor is a root certificate.

Contents of a certificate:

- Version
- Serial number
- Algorithm ID
- Issuer (authority or company)
- Validity from (not before) to (not after)
- Certificate owner (subject)
- Certificate owner key information (subject public key)
  - Public key algorithm
  - Public key of the certificate owner
- Unique ID of the issuer (optional)
- Unique ID of the owner (optional) The owner possess a private key matching the public key.
- Extensions
  - Purpose (extended key usage)
  - ...

The certificate consists of 2 parts/files:
• Public X.509 certificate (can be issued to anyone)
• Private key that matches the certificate or its public key only (has to be kept secret).

To manage the certificates in your local "Windows Certificate Store", see the following help page:

• Chapter 6.4.1.6 "Protecting and Saving Projects" on page 1819

6.4.1.19.3 Security for the development system

In CODESYS, you can apply access protection to projects, libraries, as well as individual applications. In addition to a simple write protection for a project, a user management (credentials, access rights) and encryption using certificates should be used.

See current help:

• Chapter 6.4.1.6 "Protecting and Saving Projects" on page 1819
• Chapter 6.4.1.9.18 "Protecting an application" on page 1915

6.4.1.19.4 Security for the Runtime/PLC

Communication with the controller connected in the CODESYS project should be protected against unauthorized access in the following ways:

• Enabling user management: simple or group-based
• Certificate-based encryption of communication with the controller

Enabling the security features

First switch the communication to encryption so that you do not reveal any credentials to other participants in the network when transferring the user management.

Enforcing encrypted communication

• On the controller:
  – Runtime version >= 3.5 SP14: Encryption can be enabled for “Communication Policy” and enforced for all clients.

• In CODESYS:
  – Encrypted communication can be selected as an option in the device editor on the “Communication Settings” tab (command or “Change Communication Policy” dialog) or in the “Security Screen” view.

    See the current help regarding this:
    • Chapter 6.4.11.3 “Encrypting Communication, Changing Security Settings” on page 1967

    If the CODESYS Security Agent is installed, then see the help for CODESYS Security Agent.

Enforcing a user management

• On the controller:
  – Runtime version >= 3.5 SP17: User management is enforced by default for “Communication Policy”.

    Note: For enabling the user management, at least a CODESYS development system V3.5 SP16 is necessary. This means that, in the case of enforced user management which has not been enabled yet, you cannot connect to an older development system.

• In CODESYS:
  – See the current help regarding this:
    • Chapter 6.4.11.3 “Encrypting Communication, Changing Security Settings” on page 1967
    • Chapter 6.4.11.4 “Handling of Device User Management” on page 1971
6.4.19.5 Security for CODESYS WebVisu

Protect the connection between the web server of the controller and the visualization client with the following measures against unwanted access:

- Configure an HTTPS connection (encryption with SSL/TSL) between the visualization client and the web server.
- Restrict access to the visualization and configure a visualization user management.

Configure an encrypted connection.

An HTTPS connection between the web server and the visualization client requires authentication of the web server by means of a certificate. You can create a self-signed certificate in the "Security Screen".

1. Click “View ➔ Security Screen”.
2. Create a certificate for the web server on your controller.
   - The certificate data for the web server is displayed.
3. Stop your controller.
4. Restart the controller.
   - The new certificate is active.
5. Download your application to the controller.
6. Open your browser and specify the URL address of your web server.
   - The URL of a secure connection corresponds to the following format:
     https://<IP address/URL>:443/<name of HTM file>.htm

   - The HTML file name has to match the configured name as it is set in the "Visualization Manager" object below the WebVisu variant. You will find the IP address of the controller in the device editor when a connection is active.
   - Example: https://localhost:443/webvisu.htm
     - The browser establishes a connection. If the certificate is not rated as trusted, then a security notice appears.
7. Confirm that you know the risk and want to proceed.
   - You have created self-signed certificate and confirmed it as trusted.
   - Now start the web application with the visualization. The lock symbol in the browser indicates secure communication.

See the chapter "Run as CODESYS WebVisu", which describes in detail how you use certificates in the security screen.

6.4.19.6 FAQ

6.4.19.6.1 Certificate expired

If the certificate from the controller for encrypted communication has expired (valid from "not before" until "not after"), you get a prompt with a corresponding message in CODESYS when you attempt to access the controller. For example, to renew the expired certificate, you can accept the expired certificate and connect to the controller.

You will see this message again every time you try to login until a valid certificate is installed on the controller.

If you have created or imported a new certificate on the controller, then this new certificate will be available for you to accept the next time you login.

See also

- Chapter 6.4.11.3 “Encrypting Communication, Changing Security Settings” on page 1967

6.4.19.6.2 New certificate (while the current one is still valid)

A new certificate can be issued before the existing certificate expires. This makes it possible for the encrypted communication to continue seamlessly. As soon as a new certificate is available on the controller parallel to the one currently used, the new certificate will be offered by the controller at the next login attempt. All you have to do is accept it.

See also

- “Installing a controller certificate for encrypted communication via the PLC shell of the device editor” on page 1969

6.4.19.6.3 Client does not support security feature

User management

The following CODESYS clients do not support user management yet:

- WebServer < V3.5.14.0

In order for these clients to be able to establish a connection to the controller, the user management must not be enabled.

Encrypted communication

The following CODESYS clients do not support encrypted communication yet:
Data servers with compiler version =< V3.5.9.0
- WebVisu < V3.5.14.0 or in the case of enabled file transfer
- WebServer < V3.5.14.0
- Remote TargetVisu
- Data source ApplicationV3
- OPC Server V3
- PLCHandler < V3.5.14.0

In order for these clients to be able to establish a connection to the controller, the encrypted communication can be set as optional. Therefore clients can establish either an encrypted or an unencrypted connection.

Do not use the same user or password for encrypted and unencrypted communication.

See also
- Chapter 6.4.1.11.3 “Encrypting Communication, Changing Security Settings” on page 1967

CA-signed certificates preferred (PLC shell)

Using CA-signed certificates is not conveniently supported yet in CODESYS. However, you can still request and use these types of certificates. In the device editor, on the “PLC Shell” tab, you export the required CSR files to the file system and import from there the CER files sent from the certification authority.

Requesting and providing a CA-signed certificate

1. You are connected to the controller.
2. First you generate certificate signing requests (CSR) of all server certificates.
   For this purpose, click the “PLC Shell” tab of the controller and type the command `cert-createcsr` in the input line.
3. Click the “Log” tab and then the refresh button (⟳).
   ⇒ In the log entries, you can see that the CSR files were generated.
4. Click the “Files” tab and open the file path `cert/export` in the right side of the “Runtime” dialog.
   ⇒ The export folder contains the generated CSR files, for example `0_CmpsecureChannel.csr, 1_CmpApp.csr, 2_CmpWebServer.csr`.
5. Select a file path where you wish to insert the CSR files in the left side of the “Host” dialog,
   mark the CSR files in the right side of the dialog, and click `<<`.
   ⇒ The CSR files are copied to the required folder.
6. These requests can be signed for certification signing by a certificate authority (CA), and then you receive a signed certificate from the certification authority.
6. In the steps that follow, you import these signed server certificates to your controller.

**NOTICE!**

Caution: Self-signed certificates of the server must be deleted before importing the CA-signed certificates.

7. Select the “Path” cert/import in the right side of the “Runtime” dialog.

8. In the left side of the “Host” dialog, select the path in the file system where you saved the signed certificates and selected the certificates.

9. Click ➤ .

   ➤ The certificates are copied to the cert/import folder.

10. Click the “PLC Shell” tab.

11. Type the command `cert-import own <file name of the certificate.cer>` in the input line of the tab and press the [Enter] key.

    ➤ The signed certificates are available to the runtime system servers.

**See also**

- +% Chapter 6.4.1.21.2.8.11 “Tab 'PLC Shell'” on page 2441
- +% Chapter 6.4.1.21.2.8.9 “Tab 'Log'” on page 2437
- +% Chapter 6.4.1.21.2.8.8 “Tab 'Files'” on page 2437

**Problems at login**

If you have entered an incorrect password when logging in to the user management of the controller, then the login dialog reappears immediately afterwards. After three incorrect attempts, the controller is locked for a defined period of time. However, stricter policies on the controller can lead to the user being locked out and only authorized again by an administrator.

**See also**

- +% Chapter 6.4.1.21.3.7.2 “Command 'Login'” on page 2624

**Disabling User Management**

**NOTICE!**

After disabling the user management, your controller is accessible again for everyone in the network of the controller. Therefore, you should only do this in justified exceptional cases or if the clients used do not support any user management.

For enabling the user management, at least a CODESYS development system V3.5 SP16 is necessary. This means that, in the case of enforced user management which has not been enabled yet, you cannot connect to an older development system.
1. If the security policy for device user management is set to "Enforced", first set it back to "Optional".

2. Execute the "Reset Origin Device" command. This deletes the user management and you can then reconnect to the controller without having to enter user credentials. Note: In CODESYS Version 3.5 SP16 Patch 20 and higher, you can exclude the boot application from the delete operation when you execute "Reset Origin Device".

See also
- "Changing the communication policy (encryption, user management)" on page 1970
- Chapter 6.4.1.21.3.7.13 "Command 'Reset Origin Device'" on page 2636
- Chapter 6.4.1.11.4 "Handling of Device User Management" on page 1971
- Chapter 6.4.1.6 "Protecting and Saving Projects" on page 1819

Permitting encrypted communication again

Remember that not every controller supports the deactivation of encrypted communication.

NOTICE!
We strongly advise against disabling encrypted communication. Especially in connection with an enabled user management, encrypted communication should be enabled so that credentials do not fall into the wrong hands.

To disable encrypted communication with the controller again, proceed as follows:

1. If the communication policy for encrypted communication is set to "Enforced", first set it back to "Optional".

2. In the device editor, on the "Communication Settings" tab in the "Device" menu, disable "Encrypted communication". If you have installed the CODESYS Security Agent, then you can also change the setting in the "Security Screen".

   CODESYS establishes unencrypted communication again with the controller. Other clients can also communicate again without encryption.

### 6.4.1.20 Programming Languages and Editors

- **6.4.1.20.1 Introduction**
- **6.4.1.20.2 Declaration Editor**
- **6.4.1.20.3 Common functions in graphical editors**
- **6.4.1.20.4 Structured Text and Extended Structured Text (ExST)**
- **6.4.1.20.5 Sequential Function Chart (SFC)**
- **6.4.1.20.6 Function Block Diagram / Ladder Diagram / Instruction List (FBD/LD/IL)**
- **6.4.1.20.7 Continuous Function Chart (CFC) and Page-Oriented CFC**

## Introduction

You program a POU in each case in the editor for the implementation language that you selected when creating the POU. CODESYS offers a text editor for ST and graphic editors for SFC, FBD/LD/IL and CFC.

The editor opens with a double-click on the POU in the device tree or in the “POUs” view.

Each of the programming language editors consists of two sub-windows:

- In the upper part you make declarations in the “declaration editor”, in text or tabular form depending on the setting.
- In the lower part you insert the implementation code in the respective language.

You can configure the display and the behavior of each editor project-wide on the associated tab of the CODESYS options.

## Declaration Editor

In the declaration editor, you declare variables in variable lists and POUs.

If the declaration editor is used with an implementation language editor, then it opens in a view above the implementation language editor.

The declaration editor offers two possible views: textual and tabular. In the “Tools > Options > Declaration Editor” dialog, you define whether only the textual view or only the tabular view is available, or whether you can switch between both views by means of the buttons on the right side of the editor view.

A rectangle selection is possible in the textual view of the declaration editor. The key combinations for the rectangle selection are located on the help page for the ST editor.

See also

- § Chapter 6.4.1.9.4.2 “Using the declaration editor” on page 1851
- § Chapter 6.4.1.9.4 “Declaration of Variables” on page 1847
In online mode, you see the tabular view of the editor. The header always contains the current object path: `<device name>..<application name>..<object name>`. In contrast to offline mode, the table also contains the "Value" and "Prepared Value" columns.

The "Value" column shows the actual value on the PLC, offering monitoring functionality. If the expression is an array with more than 1,000 elements, then you can define the range of the array indices to monitor. To do this, double-click in the "Data Type" column to open the "Monitoring Area" dialog. In this dialog, the declared array range is specified as the "Valid area" for monitoring. A maximum of 20,000 elements can be monitored per array. You define the range of the array indices to be monitored by specifying the "Start" and "End" indices. In order to move this area more easily while maintaining the same size, the available scrollbars can be used coupled. To toggle between coupled and not coupled, click the symbol on the right of the bar. In non-coupled state, you can increase or decrease the size of the area to be monitored as desired.

The "Prepared Value" column contains the value that you prepared for forcing or writing. If you double-click a "Prepared value" field, then you can specify a value explicitly for writing or forcing. In the case of enumerations, a combo box opens from which you can select a value. In the case of a Boolean variable you can toggle the prepared value with the help of the [Enter] key or the [Space] bar. If an expression (variable) is of a structured data type, for example the instance of a function block or an array variable, then a plus or a minus sign is placed in front. You can customize the format of the representation of floating-point values in the options for monitoring.

Common functions in graphical editors

The implementation part of the graphical editors for FBD, LD, CFC, and SFC contains a toolbar in the lower right corner.

- Return to normal editing mode: The mouse pointer changes back to the shape of the default arrow. You can select and edit elements in the editor view.

- Panning tool: The mouse pointer changes to the shape of two crossed arrows. You can click and drag anywhere in the editor view to move the visible area of the FBD/LD/IL editor or also pivot a CFC chart.

- Magnification tool: A magnified window opens in the lower right corner of the editor view and the mouse pointer changes to the shape of a cross. As you move the mouse pointer over your diagram, the magnification tool shows the area of the diagram under the cross at 100% magnification. Note: If you click in the view, then the magnification tool closes and the part of the diagram that the tool contained is displayed at 100% magnification. If you want to retain the set zoom factor, then you should use the default arrow ( ) for returning to the default editing mode.

- Zooming tool: This opens a drop-down list with a selection of zoom factors. Clicking more selections ( . . . ) will open the “Zoom” dialog for typing other values. The current zoom factor is always shown to the left of the symbol.
Zooming with the scroll wheel: By holding down the [Ctrl] key and moving the scroll wheel, you can change the zoom factor in steps of 10%.

Every graphical editor has its own “ToolBox” view that is located on the right of the editor view by default. The toolbox contains elements that you can drag to insertion points in the editor view. CODESYS highlights the insertion points with gray position flags in the shape of diamonds, triangles, or arrows. These flags are green when you move the mouse pointer over them. When you release the mouse button, CODESYS inserts the element at the selected position.

It is also possible to use the mouse for moving elements in the editor.

You can drag function block declarations in the FBD, LD, and CFC graphical editors to the editor view. To do this, select the full declaration (variable name and data type) and drag it to a suitable position in the editor view. In the ladder diagram, you can also drag Boolean declarations to the editor and insert them as contacts.

Structured Text and Extended Structured Text (ExST)

6.4.1.20.1.4.1 ST Editor........................................................................................................... 2049
6.4.1.20.1.4.2 ST editor in online mode.................................................................................. 2050
6.4.1.20.1.4.3 ST expressions................................................................................................ 2050
6.4.1.20.1.4.4 Assignments ................................................................................................. 2051
6.4.1.20.1.4.5 Statements.................................................................................................... 2055

ST Editor

The ST editor is a textual editor used for the implementation of code in Structured Text (ST) and Extended Structured Text (ExST).

The line numbering is displayed on the left side of the editor. When inputing programming elements, the "List components" functionality (activated in the CODESYS options, “SmartCoding” category) and the Input Assistant [F2] are also useful. When the cursor is placed over a variable, CODESYS shows a tooltip with information for declaring variables.

The box selection can be made with the following key combinations:
- [Shift]+[Alt]+[Arrow Right]: The selected area is extended one position to the right.
- [Shift]+[Alt]+[Arrow Left]: The selected area is extended one position to the left.
- [Shift]+[Alt]+[Arrow Up]: The selected area is extended one position up.
- [Shift]+[Alt]+[Arrow Down]: The selected area is extended one position down.

The behavior (for example parentheses, mouse actions, tabs) and appearance of the editor are configured in the CODESYS options in the “Text Editor” category.

For an incremental search for strings in the editor, open an input field at the bottom edge of the editor by means of the key combination [Ctrl]+[Shift]+[i]. As soon as you start typing in characters, the corresponding search locations are highlighted in color in the editor. The number of found matches is shown to the right of the input field. You can set the cursor at the search location by using the arrow keys or the key combinations [Alt]+[Page Up] or [Alt]+[Page Down].

When you place the cursor on a symbol name, all occurrence locations of the symbol within the editor are highlighted in color. The search locations correspond to the hits in the cross-reference list. For very large projects, this can cause input delays. In this case, you can disable the function in the options of the text editor.

CODESYS identifies syntax errors already when inputing in the editor and shows the corresponding messages in the message view (“Precompile” category). If the corresponding option is selected in the CODESYS options (“SmartCoding” category), then the error locations in the text are also underlined with a wavy red line.
The “Format Document” command provides an automatic formatting of syntactically correct ST code.

ST editor in online mode

In online mode CODESYS displays the variables and expressions in the ST editor. The writing and forcing of the variables and expressions as well as debugging functions (breakpoints, single step execution) are also possible.

If you use assignments as expressions in ST programming, no further breakpoint positions are created within a line.

ST expressions

An expression is a construct that returns a value following its evaluation.

Expressions are composed of operators and operands. In Extended Structured Text (ExST) you can also use assignments as expressions. An operand can be a constant, a variable, a function call or a further expression.

<table>
<thead>
<tr>
<th>Examples</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>2014</td>
<td>(* Constant *)</td>
</tr>
<tr>
<td>iVar</td>
<td>(* Variable *)</td>

</tr>
<tr>
<td>(x*y)/z</td>
<td>(* Expression *)</td>
</tr>
<tr>
<td>real_var2 := int.var;</td>
<td>(* in ExST: Assignment *) *</td>
</tr>
</tbody>
</table>

See also

- “ExST - Extended structured text” on page 1879

Evaluation of expressions

The evaluation of an expression takes place by processing the operators according to certain rules of binding. CODESYS processes the operator with the strongest binding first. Operators with the same binding strength are processed from left to right.
<table>
<thead>

6.4.1.20.1.4.4.3  ExST assignment ‘S=’……………………………………………………… 2052
6.4.1.20.1.4.4.4  ExST assignment ‘R=’……………………………………………………… 2053
6.4.1.20.1.4.4.5  ExST – Assignment as expression………………………………………. 2054
6.4.1.20.1.4.4.6  Assignment Operator ‘REF=’………………………………………….. 2054

ST assignment operator

Syntax:

<operand> := <expression>

This assignment operator executes the same function as the MOVE operator.

See also
- Chapter 6.4.1.20.3.7 “Operator MOVE” on page 2137
ST assignment operator for outputs

The assignment operator => assigns the output of a function, a function block, or a method to a variable. The position on the right side of the operator can also be blank.

Syntax

<output> => <variable>

Example

FBcomp_Output1 => bVar1;
FBcomp_Output2 => ;

FBcom_Output1 and FB_Output2 are outputs of a function block. The value of FBcom_Output1 is assigned to the variable bVar1.

ExST assignment 'S='

When the operand of the Set assignment switches to TRUE, then TRUE is assigned to the variable to the left of the operator. The variable is set.

<variable name> S= <operand name> ;

The variables and the operand have the data type BOOL.

Example

PROGRAM PLC_PRG
VAR
  xOperand: BOOL := FALSE;
  xSetVariable: BOOL := FALSE;
END_VAR

  xSetVariable S= xOperand;

When the operand xOperand switches from FALSE to TRUE, then TRUE is also assigned to the variable xSetVariable. But then the variable keeps this state, even if the operand continues to change its state.

Multiple assignments

NOTICE!

In the case of multiple assignments within a code line, the individual assignments are not processed from right to left, but all assignments refer to the operands at the end of the code line.
FUNCTION funCompute : BOOL
VAR_INPUT
  xIn : BOOL;
END_VAR
IF xIn = TRUE THEN
  funCompute := TRUE;
RETURN;
END_IF

PROGRAM PLC_PRG
VAR
  xSetVariable: BOOL;
  xResetVariable: BOOL := TRUE;
  xVar: BOOL;
END_VAR
xSetVariable S= xResetVariable R= funCompute(xIn := xVar);
xResetVariable gets the R= assignment of the return value of funCompute.
xSetVariable gets the S= assignment of ht return value of funCompute, but not from xResetVariable.

See also
- “ExST - Extended structured text” on page 1879
- Chapter 6.4.1.20.1.4.4.4 “ExST assignment 'R='” on page 2053

ExST assignment 'R='
When the operand of the Reset assignment switches to TRUE, then FALSE is assigned to the variable to the left of the operator. The variable is reset.
<variable name> R= <operand name> ;
The variables and the operand have the data type BOOL.

Example

VAR
  xOperand: BOOL := FALSE;
  xResetVariable: BOOL := TRUE;
END_VAR
xResetVariable R= xOperand;

When the operand xOperand switches from FALSE to TRUE, then FALSE is also assigned to the variable xResetVariable. But then the variable keeps its state, even if the operand continues to change its state.

Multiple assignments

NOTICE!
In the case of multiple assignments within a code line, the individual assignments are not processed from right to left, but all assignments refer to the operands at the end of the code line.
Example

```plaintext
FUNCTION funCompute : BOOL
VAR_INPUT
  xIn : BOOL;
END_VAR
IF xIn = TRUE THEN
  funCompute := TRUE;
RETURN;
END_IF

PROGRAM PLC_PRG
VAR
  xSetVariable: BOOL;
  xResetVariable: BOOL := TRUE;
  xVar: BOOL;
END_VAR
xSetVariable := xResetVariable R= funCompute(xIn := xVar);
```

ExST – Assignment as expression

In ExST, as an extension to the IEC 61131-3 standard, CODESYS permits the use of assignments as expressions.

<table>
<thead>
<tr>
<th>Examples</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>int_var1 := int_var2 := int_var3 + 9;</code></td>
<td>(‘int_var1 and int_var2 receive the value of int_var3 + 9 ’)</td>
</tr>
<tr>
<td><code>real_var1 := real_var2 := int_var;</code></td>
<td>(‘real_var1 and real_var2 receive the value of int_var ’)</td>
</tr>
<tr>
<td><code>int_var := real_var1 := int_var;</code></td>
<td>(‘incorrect assignment, the data types do not correspond! ’)</td>
</tr>
<tr>
<td>IF b := (i = 1) THEN i := i + 1; END_IF</td>
<td></td>
</tr>
</tbody>
</table>

- “ExST - Extended structured text” on page 1879

Assignment Operator ‘REF=’

The operator generates a reference (pointer) to a value.

Syntax:

```
<variable name> REF= <variable name>;  
```
**Example**

```plaintext
refA : REFERENCE TO DUT;
B : DUT;
C : DUT;

A REF= B; // corresponds to A := ADR(B);
A := C; // corresponds to A^ := C;
```

- 6.4.1.20.1.4.5.11 ST – Comments.................................................................... 2061

**ST statement 'IF'**

The **IF** statement is used for checking a condition and, depending on this condition, for executing the subsequent statements.

A condition is coded as an expression that returns a Boolean value. If the expression returns **TRUE**, then the condition is fulfilled and the corresponding statements after **THEN** are executed. If the expression returns **FALSE**, then the following conditions, which are identified with **ELSIF**, are evaluated. If an **ELSIF** condition returns **TRUE**, then the statements are executed after the corresponding **THEN**. If all conditions return **FALSE**, then the statements after **ELSE** are executed.

Therefore, at most one branch of the **IF** statement is executed. **ELSIF** branches and the **ELSE** branch are optional.

**Syntax**

```plaintext
IF <condition> THEN
 <statements>
 ( ELSIF <condition> THEN
   <statements> )* 
 ( ELSE
   <statements> )?
END_IF;
// // { ... }* None, once or several times
// // { ... }? Optional
```
Example

PROGRAM PLC_PRG
VAR
  iTemp: INT;
  xHeatingOn: BOOL;
  xOpenWindow: BOOL;
END_VAR

IF iTemp < 17 THEN
  xHeatingOn := TRUE;
ELSIF iTemp > 25 THEN
  xOpenWindow := TRUE;
ELSE
  xHeatingOn := FALSE;
END_IF;

The program is run as follows at runtime:
For the evaluation of the expression iTemp < 17 = TRUE, the subsequent statement is executed and the heating is switched on. For the evaluation of the expression iTemp < 17 = FALSE, the subsequent ELSIF condition iTemp > 25 is evaluated. If this is true, then the statements in ELSIF are executed and the view is opened. If all conditions are FALSE, then the statement in ELSE is executed and the heating is switched off.

See also
- Chapter 6.4.1.20.1.4.3 “ST expressions” on page 2050

ST instruction ‘FOR’

The FOR loop is used to execute instructions with a certain number of repetitions.

Syntax:
FOR <counter> := <start value> TO <end value> {BY <increment>} DO <instructions>
END_FOR;

The section inside the curly parentheses {} is optional.
CODESYS executes the <instructions> as long as the <counter> is not greater, or - in case of negative increment - is not smaller than the <end value>. This is checked before the execution of the <instructions>.

Every time the instructions <instructions> have been executed, the counter <counter> is automatically increased by the increment <increment>. The increment <increment> can have any integral value. If you do not specify an increment, the standard increment is 1.

Example

FOR iCounter := 1 TO 5 BY 1 DO
  iVar1 := iVar1*2;
END_FOR;

Erg := iVar1;

If you have pre-configured iVar1 with 1, iVar1 has the value 32 after the FOR loop.
CAUTION!
The end value <end value> may not attain the same value as the upper limit of the data type of the counter.

If the end value of the counter is equal to the upper limit of the data type of the counter, an endless loop results. For example, an endless loop results in the above example if iCounter is of the data type SINT and the <end value> equals 127, since the data type SINT has the upper limit 127.

As an extension to the IEC 61131-3 standard you can use the CONTINUE instruction within the FOR loop.

See also
- § Chapter 6.4.1.20.5.3 “Integer data types” on page 2235
- § Chapter 6.4.1.20.1.4.5.9 "EXST Statement 'CONTINUE'" on page 2060

ST instruction 'CASE'

Use this dialog box for pooling several conditional instructions containing the same condition variable into a construct.

Syntax:
CASE <Var1> OF
<value1>:<instruction1>
<value2>:<instruction2>
<value3, value4, value5>:<instruction3>
<value6 ... value10>:<instruction4>
...
<value n>:<instruction n>
{ELSE <ELSE-instruction>}
END_CASE;

The section within the curly brackets {} is optional.

Processing scheme of a CASE instruction.

- If the value of the variable <Var1> is <value i>, then the instruction <insturction i> is executed.
- If the variable <Var1> has non of the given values, then the <ELSE-instruction> is executed.
- If the same instruction is executed for several values of the variable, then you can write the values in sequence, separated by commas.

Example
CASE iVar OF
1, 5: bVar1 := TRUE;
   bVar3 := FALSE;
2: bVar2 := FALSE;
   bVar3 := TRUE;
10..20: bVar1 := TRUE;
   bVar3 := TRUE;
ELSE
   bVar1 := NOT bVar1;
   bVar2 := bVar1 OR bVar2;
END_CASE;
ST instruction 'WHILE'

The WHILE loop is used like the FOR loop in order to execute instructions several times until the abort condition occurs. The abort condition of a WHILE loop is a boolean expression.

Syntax:

```
WHILE <boolean expression> DO
    <instructions>
END_WHILE;
```

CODESYS repeatedly executes the <instructions> for as long as the <boolean expression> returns TRUE. If the boolean expression is already FALSE at the first evaluation, then CODESYS never executes the instructions. If the boolean expression never adopts the value FALSE, then the instructions are repeated endlessly, as a result of which a runtime error results.

Example

```
WHILE iCounter <> 0 DO
    Var1 := Var1*2
    iCounter := iCounter-1;
END_WHILE;
```

NOTICE!

You must ensure by programming means that no endless loops are caused.

In a certain sense the WHILE and REPEAT loops are more powerful than the FOR loop, since you don’t need to already know the number of executions of the loop before its execution. In some cases it is thus only possible to work with these two kinds of loop. If the number of executions of the loop is clear, however, then a FOR loop is preferable in order to avoid endless loops.

As an extension to the IEC 61131-3 standard you can use the CONTINUE instruction within the WHILE loop.

See also

- Chapter 6.4.1.20.1.4.5.2 “ST instruction ‘FOR’” on page 2056
- Chapter 6.4.1.20.1.4.5.9 “EXST Statement ‘CONTINUE’” on page 2060

ST Statement 'REPEAT'

The REPEAT loop is used like the WHILE loop, but with the difference that CODESYS only checks the abort condition after the execution of the loop. The consequence of this behavior is that the REPEAT loop is executed at least once, regardless of the abort condition.

Syntax:

```
REPEAT
    <instructions>
UNTIL <boolean expression>
END_REPEAT;
```

CODESYS executes the <instructions> until the <boolean expression> returns TRUE. If the boolean expression already returns TRUE at the first evaluation, CODESYS executes the instructions precisely once. If the boolean expression never adopts the value TRUE, then the instructions are repeated endlessly, as a result of which a runtime error results.
**Example**

```plaintext
REPEAT
  Var1 := Var1 * 2;
  iCounter := iCounter - 1;
UNTIL
  iCounter = 0
END_REPEAT;
```

In a certain sense the **WHILE** and **REPEAT** loops are more powerful than the **FOR** loop, since the number of executions of the loop doesn’t already need to be known before its execution. In some cases you can only work with these two kinds of loop. If the number of executions of the loop is clear, however, then a **FOR** loop is preferable in order to avoid endless loops.

As an extension to the IEC 61131-3 standard you can use the **CONTINUE** instruction within the **WHILE** loop.

See also
- § Chapter 6.4.1.20.1.4.5.4 “ST instruction ‘WHILE’” on page 2058
- § Chapter 6.4.1.20.1.4.5.2 “ST instruction ‘FOR’” on page 2056
- § Chapter 6.4.1.20.1.4.5.9 “EXST Statement ‘CONTINUE’” on page 2060

**ST statement ‘RETURN’**

Use the **RETURN** statement in order to exit from a function block. You can make this dependent on a condition, for example.

**Example**

```plaintext
IF xIsDone = TRUE THEN
  RETURN;
END_IF;

  iCounter := iCounter + 1;
```

If the value of **xIsDone** is equal to **TRUE**, then the function block is exited immediately and the statement **iCounter := iCounter + 1;** is not executed.

See also
- § Chapter 6.4.1.20.1.4.5.1 “ST statement ‘IF’” on page 2055

**ST instruction ‘JMP’**

The **JMP** instruction is used to execute an unconditional jump to a program line that is marked by a jump label.

**Syntax:**

```plaintext
<label>: <instructions>
JMP <label>;
```

The jump label **<label>** is any unique identifier that you place at the beginning of a program line. On reaching the **JMP** instruction, a return to the program line with the **<label>** takes place.
Example
iVar1 := 0;
_label1: iVar1 := iVar1+1;
(* instructions *)
IF (iVar1 < 10) THEN
  JMP _label1;
END_IF;

NOTICE!
You must ensure by programming means that no endless loops are caused. For example, you can make the jump conditional.

ST instruction 'EXIT'
The EXIT instruction is used in a FOR, WHILE or REPEAT loop in order to end the loop regardless of other abort conditions.
See also
- % Chapter 6.4.1.20.1.4.5.2 “ST instruction ‘FOR’” on page 2056
- % Chapter 6.4.1.20.1.4.5.4 “ST instruction ‘WHILE’” on page 2058
- % Chapter 6.4.1.20.1.4.5.5 “ST Statement ‘REPEAT’” on page 2058

EXST Statement 'CONTINUE'
CONTINUE is an instruction of the Extended Structured Text (ExST).
The instruction is used inside FOR, WHILE and REPEAT loops in order to jump to the beginning of the next execution of the loop.

Example
FOR Counter:=1 TO 5 BY 1 DO
  INT1:=INT1/2;
  IF INT1=0 THEN
    CONTINUE; (* to avoid a division by zero *)
    END_IF
  Var1:=Var1/INT1; (* executed, if INT1 is not 0 *)
  END_FOR;
  Erg:=Var1;

See also
- % Chapter 6.4.1.20.1.4.5.2 “ST instruction ‘FOR’” on page 2056
- % Chapter 6.4.1.20.1.4.5.4 “ST instruction ‘WHILE’” on page 2058
- % Chapter 6.4.1.20.1.4.5.5 “ST Statement ‘REPEAT’” on page 2058

ST function block call
Syntax
<FB-instance>(<FB input variable>:=<value or address>, <other FB input variables>);
Example

TMR:TON;

TMR (IN:=%Ox5, PT:=T#300ms);
varA:=TMR.Q;

The timer function block TON is instanced in TMR:TON and called with assignments for the parameters IN and PT.

The output Q is addressed with TMR.Q and assigned to the variable varA.

ST – Comments

<table>
<thead>
<tr>
<th>Comment</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Single-line</td>
<td>There are two ways of marking:</td>
<td>/// This is a comment.</td>
</tr>
<tr>
<td></td>
<td>• Starts with // and ends at the end of the line</td>
<td>/// This is a comment.</td>
</tr>
<tr>
<td></td>
<td>• Starts with ///// and ends at the end of the line</td>
<td></td>
</tr>
<tr>
<td></td>
<td>In CODESYS, these comments are handled the same way.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>However, if library documentation is created using the LibDoc Scripting Collection, the following applies:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• When the property LibDocContent = DocsOnly is entered in the project information, only comments marked with /// are processed into library documentation. See the example for this below the table.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• When LibDocContent = CommentsAndDocs (default setting) is defined, all comments are processed into library documentation.</td>
<td></td>
</tr>
<tr>
<td>Multiline</td>
<td>Starts with (* and ends with *).</td>
<td>(* This is a multiline comment *)</td>
</tr>
<tr>
<td>Nested</td>
<td>Starts with (* and ends with <em>). Additional comments (</em>,....*) can be contained within this comment.</td>
<td>(* a:=inst.out; (* comment 1 <em>) b:=b+1; (</em> comment 2 *) *)</td>
</tr>
</tbody>
</table>
Comments for tooltips and POU documentation

A tooltip in the header of a POU is defined by the following comment:
// tooltip text – line 1
// tooltip text – line 2
// tooltip text – line 3

Afterwards the documentation is defined as follows:
/// reStructuredText

Note: It is not recommended to mix the different comment types because this can cause unwanted side-effects when the documentation is generated.

6.4.1.20.1.5.8  Elements................................................................................. 2073

SFC editor

The SFC editor is graphical editor. A new SFC POU includes an Init step and a subsequent transition.

In the SFC editor, you can insert individual elements into the diagram by means of commands in the “SFC” menu, the context menu, or the “ToolBox” view.

When inserting by means of a menu command, the elements that can be inserted at the currently selected position are available.

Before inserting branches parallel to multiple actions and transitions, you must highlight these actions and transitions in a multiple selection.

You can also drag SFC elements from the “ToolBox” view to the diagram. When you drag an element over the editor, CODESYS marks all possible insertion points with gray boxes. If you move the mouse over a gray box, then the color of the box changes to green. When you release the mouse button, the object is inserted at that location.

If you drag a branch into the diagram, then you must set the beginning and the end of the branch using the mouse pointer. You set the beginning of the branch by releasing the mouse button at an insertion point. The color of the box then changes to red. You set the end of the branch by clicking the second insertion point. Then CODESYS inserts a branch around the objects between the beginning and end markers.

For copying step and transition elements that call action objects or transition objects, two different duplication modes can be set. Either the references are copied at the same time, or the referenced objects are embedded and duplicated when copying.

You define the look and feel of the editor in the CODESYS options ("SFC Editor").

See also

●  § Chapter 6.4.1.20.1.3 “Common functions in graphical editors” on page 2048
●  § Chapter 6.4.1.20.1.5 “Sequential Function Chart (SFC)” on page 2062
SFC Editor in Online Mode

In the SFC editor, the variables and expressions in use on the controller can be displayed at runtime. You can also write and force variables and expressions. Debugging functions, such as breakpoints and step-by-step execution, are not available yet.

In the SFC editor options, you can set the online representation of the SFC elements and attributes.

In the case that you have declared SFC flags explicitly, then they are displayed in the declaration part in online mode. They are not displayed in offline mode.

Note the processing order of elements in an SFC diagram.

In online mode, CODESYS displays active steps in blue.

See also

- Chapter 6.4.1.20.1.5.5 “Implicit variables” on page 2066
- Chapter 6.4.1.9.4.2 “Using the declaration editor” on page 1851
- Chapter 6.4.1.20.1.5.3 “Processing order in SFC” on page 2064
- Chapter 6.4.1.21.4.14.23 “Dialog ‘Options’ - ‘SFC Editor’” on page 2795
Processing order in SFC

Basic element behavior

- Active step: An active step includes actions currently being executed. In online mode, CODESYS displays active steps in blue.
- Initial step: In the first cycle after calling a POU in SFC, the initial step is activated automatically and the step action is executed.
- CODESYS executes IEC actions at least two times: the first time is when the step is activated, and the second time when the step is deactivated (but not until the next cycle).
- Alternative branches: If the step before the branch is active, then CODESYS passes the first transition of each alternative branch line from left to right. CODESYS activates the subsequent step in the first branch line with a transition yielding TRUE.
- Parallel branches: If the step before the branch (horizontal double line) is active and the transition before the branch yields TRUE, then CODESYS activates the first steps in every branch line. The branch lines are then processed at the same time. The step after the end of the branch is activated when every last step in each branch line is active and the transition after the double line yields TRUE.

Processing order

1. Reset IEC actions
   CODESYS resets the internal action control flags of the action qualifiers (N, R, S, L, D, P, SD, DS, SL). These flags control IEC actions. However, flags are not reset when they are called within actions.

2. Execute exit actions
   CODESYS verifies whether all steps fulfill the condition for executing the exit action for each step. The order of verification follows the layout in the SFC diagram, from top to bottom and from left to right.
   CODESYS executes an exit action when the step is deactivated (after any entry and step actions have been executed in the preceding cycle and the condition for the subsequent step yields TRUE).

3. Execute entry actions
   CODESYS verifies whether all steps fulfill the condition for executing the entry action for each step. The order of verification follows the layout in the SFC diagram, from top to bottom and from left to right. If the conditions are fulfilled, then CODESYS executes the entry actions.
   CODESYS executes an entry action as soon as the transition of the preceding step has been processed and yields TRUE, thus indicating that the step has been activated.

4. Time check / Execute step actions
   CODESYS performs the following check for each step in the order of the SFC layout:
   - CODESYS copies the elapsed time of the active step to the respective implicit step variable <step name>.t. (not yet implemented)
   - If a timeout occurs, then CODESYS sets the respective error flags. (not yet implemented)
   - For non-IEC steps: CODESYS executes the step action.

5. Execute IEC actions
   CODESYS executes the IEC actions in alphabetical order, passing through the list of actions two times. In the first pass, CODESYS executes the IEC actions for each step that was deactivated in the preceding cycle. In the second pass, the IEC actions are executed for each active step.

6. Transition check / Activate next steps
   The transitions are passed as follows: If a step is active in the current cycle and the subsequent transition yields TRUE and any defined minimum time of the step has elapsed, then the subsequent step is activated.
NOTICE!

Please note when executing actions:

An action can be executed multiple times within the same cycle if you use it in multiple SFC diagrams. For example, if a sequential function chart includes two IEC actions A and B, both of which are programmed in SFC and call an IEC action C, then the IEC action C is called two times.

If you use the same IEC action at the same time in different levels of an SFC diagram, then this can lead to unpredictable results when processing. For this reason, CODESYS issues a corresponding error message. This error message can appear for projects that have been created in an earlier version of the development system.

Please note: It is possible to use implicit variables to monitor the processing status of steps and actions and to control processing.

See also
- Chapter 6.4.1.20.1.5.5 “Implicit variables” on page 2066
- Chapter 6.4.1.20.1.5.4 “Qualifiers for Actions in SFC” on page 2065

Qualifiers for Actions in SFC

You assign qualifiers to IEC steps. Qualifiers describe how a step action is processed.

Qualifiers are processed by the SFCActionControl function block in the library IecSfc.library. The library is automatically integrated into the project by the SFC plug-in.

<table>
<thead>
<tr>
<th>Qualifier</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>N</td>
<td>Non-stored</td>
</tr>
<tr>
<td>R</td>
<td>Overriding Reset</td>
</tr>
<tr>
<td>S</td>
<td>Set (Stored)</td>
</tr>
<tr>
<td>L</td>
<td>Time Limited</td>
</tr>
<tr>
<td>D</td>
<td>Time Delayed</td>
</tr>
<tr>
<td>P</td>
<td>Pulse</td>
</tr>
<tr>
<td>SD</td>
<td>Stored and Time Delayed</td>
</tr>
<tr>
<td>DS</td>
<td>Delayed and Stored</td>
</tr>
<tr>
<td>SL</td>
<td>Stored and Time Limited</td>
</tr>
</tbody>
</table>

You have to specify the times for the L, D, SD, DS, and SL qualifiers in the format of a TIME constant.
When an IEC action is deactivated, it is executed one more time. This means that CODESYS executes this kind of action at least two times. This also applies to actions with the \( P \) qualifier.

See also

- Chapter 6.4.1.9.5.5.2 “Programming in SFC” on page 1880

Implicit variables

Every SFC object supplies implicit variables for you to monitor the status of steps and IEC actions at runtime. These implicit variables are declared automatically by CODESYS for each step and each IEC action.

The implicit variables are structure instances of the type \( SFCStepType \) for steps and type \( SFCActionType \) for actions. The variables have the same names as their elements, for example "step1" variable name for "step1" step name. The structure members describe the status of a step or action or the currently elapsed time in an active step.

In the element properties, you can define whether CODESYS should export a symbol definition for this flag to the symbol configuration.

See also

- Chapter 6.4.1.20.1.5.8.6 “SFC element properties” on page 2080

**Step and action status**

Syntax for the implicit variable declaration:

- \(<\text{step name}>:\text{SFCStepType};\)
- \(_<\text{action name}>:\text{SFCActionType};\)

**Table 389: The following implicit variables are available for step or IEC action status:**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>(&lt;\text{step name}&gt;.x)</td>
<td>Shows the activation status in the current cycle. When (&lt;\text{step name}&gt;.x = \text{TRUE}), CODESYS processes the step in the current cycle.</td>
</tr>
<tr>
<td>(&lt;\text{step name}&gt;._x)</td>
<td>Shows the activation status for the next cycle. When (&lt;\text{step name}&gt;._x = \text{TRUE} \text{ and } &lt;\text{step name}&gt;.x = \text{FALSE}), CODESYS processes the step in the next cycle. This means that (&lt;\text{step name}&gt;._x) is copied to (&lt;\text{step name}&gt;.x) at the beginning of a cycle.</td>
</tr>
<tr>
<td>(&lt;\text{step name}&gt;.t)</td>
<td>The flag ( t ) yields the current elapsed time since the step was activated. This applies only to steps, regardless of whether a minimum time has been defined or not in the step properties. Also see SFC flag ( \text{SFCError} ).</td>
</tr>
<tr>
<td>(&lt;\text{step name}&gt;._t)</td>
<td>For internal use only</td>
</tr>
<tr>
<td>(_&lt;\text{action name}&gt;.x)</td>
<td>\text{TRUE} when the action is being executed.</td>
</tr>
<tr>
<td>(_&lt;\text{action name}&gt;._x)</td>
<td>\text{TRUE} when the action is active.</td>
</tr>
</tbody>
</table>
NOTICE!
You can use the above variables to force a specific status value to a step (activate a step). However, note that this can cause an unstable status in the SFC.

See also
● § Chapter 6.4.1.20.1.5.6 “SFC Flags” on page 2067

Access to implicit variables
Syntax for access:
Assign the implicit variable directly in the POU: <variable name>:=<step name>.<implicit variable> or <variable name>:=_<action name>.<implicit variable>

Example
status:=step1._x;

From another POU, with the POU name: <variable name>:=<POU name>.<step name>.<implicit variable> or <variable name>:=<POU name>._<action name>.<implicit variable>

Example
status:=SFC_prog.step1._x;

Symbol generation
In the element properties of a step or action, you define whether CODESYS should add a symbol definition for the step or action flag. In the “Properties” view, you have to select the necessary access rights in the “Symbol” column.

See also
● § Chapter 6.4.1.20.1.5.8.6 “SFC element properties” on page 2080

SFC Flags
SFC flags are implicitly generated variables with predefined names. You can use them to influence the processing of an SFC diagram. You can use these flags, for example, to display timeouts or reset step step chains. In addition, you can activate jogging mode specifically to activate transitions. You have to declare and activate these variables in order to have access to them.

SFC flags

<table>
<thead>
<tr>
<th>Name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SFCInit</td>
<td>Bool</td>
<td>TRUE: CODESYS resets the sequence to the initial step. The other SFC flags are also reset (initialization). While the variable is TRUE, the initial step remains set (active), but its actions are not executed. Only when you set SFCInit again to FALSE is the POU further processed normally.</td>
</tr>
<tr>
<td>SFCReset</td>
<td>Bool</td>
<td>This function behaves similar to SFCInit. However, CODESYS continues processing after the initialization of the initial step. For example, in the initial step, you could immediately reset the SFCReset flag to FALSE.</td>
</tr>
<tr>
<td>SFCError</td>
<td>Bool</td>
<td>TRUE if a timeout occurs in an SFC diagram. If second timeout occurs in the program, it is not registered unless you previously reset the variable SFCError. The declaration of SFCError is a requirement for other flag variables to function for controlling the chronological sequence (“SFCErrorStep”, SFCErrorPOU, SFCQuitError).</td>
</tr>
<tr>
<td>Name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>-----------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>SFCEnableLimit</td>
<td>Bool</td>
<td>Used specifically for activating (TRUE) and deactivating (FALSE) the timeout control in steps using SFCError. If you declare and activate this variable (SFC settings), you must set it to TRUE for SFCerror to work. If you do not, then the timeouts are ignored. The is useful, for example, at start-up or in manual operation. If you do not declare the variable, then SFCError will work automatically. The requirement is the declaration of SFCError.</td>
</tr>
<tr>
<td>SFCErrorStep</td>
<td>String</td>
<td>Stores the name of the step that caused a timeout, which was registered by SFCError. The name is kept until the registered step error is reset by means of SFCQuitError (FALSE -&gt; TRUE). The requirement is the declaration of SFCError.</td>
</tr>
<tr>
<td>SFCErrorPOU</td>
<td>String</td>
<td>Stores the name of the block in which a timeout occurred and was registered by SFCError. The name is saved until the timeout is reset by SFCQuitError. The requirement is the declaration of SFCError.</td>
</tr>
<tr>
<td>SFCQuitError</td>
<td>Bool</td>
<td>As long as this Boolean variable is TRUE, CODESYS pauses the processing of the SFC diagram and any timeout, saved in the variable SFCError, is reset. If you reset the variable to FALSE, then all previous times in the active steps are reset. The requirement is the declaration of SFCError.</td>
</tr>
<tr>
<td>SFCPause</td>
<td>Bool</td>
<td>As long as this variable is TRUE, CODESYS pauses the processing of the SFC diagram.</td>
</tr>
<tr>
<td>SFCTrans</td>
<td>Bool</td>
<td>TRUE if a transition is active.</td>
</tr>
<tr>
<td>SFCCurrentStep</td>
<td>String</td>
<td>Shows the name of the active step, regardless of the time monitoring. In parallel branches, the name of the step of the rightmost branch line is always stored.</td>
</tr>
<tr>
<td>SFCTip, SFCTipMode</td>
<td>Bool</td>
<td>Controls the jogging mode of the SFC block. If you enable this flag with SFCTipMode=TRUE, then you can activate the next step only by setting SFCTip to TRUE. While SFCTipMode is set to FALSE, transitions can also be used to continue activation.</td>
</tr>
<tr>
<td>SFCErrorAnalyzation</td>
<td></td>
<td>Contains as string all variables that contribute to the total value TRUE of SFCError (timeout in one step). SFCError needs to be activated for this. SFCErrorAnalyzation implicitly uses the function of the POU AnalyzeExpression of the library Analyzation.</td>
</tr>
<tr>
<td>SFCErrorAnalyzationTable</td>
<td></td>
<td>Contains in a table all variables that contribute to the total value TRUE of SFCError (timeout in one step). SFCError needs to be activated for this. SFCErrorAnalyzationTable implicitly uses the function of the POU AnalyzeExpressionTable of the library Analyzation.</td>
</tr>
</tbody>
</table>

**Implicit generation of SFC flags**

CODESYS declares SFC flags automatically when you activate the respective options. You can set this option in the “SFC Settings” tab of the properties dialog for each POU, or in the “SFC” project settings dialog for each SFC POU in the project.

*The SFC settings for the SFC flags of individual POUs are effective only if you have not selected the "Use defaults" option. When you select this option, the settings apply that were defined in the project settings.*
SFC flags that you declare in the SFC settings dialog are visible only in the online view of the SFC block.

See also

- “Flag” on page 2763

**Explicit generation of SFC flags**

Manual declaration, which was necessary in CoDeSys V2.3, is now only required to enable write access from another block. In this case, you should note that when you declare the flag in a global variable list, you must deactivate its “Declare” setting in the SFC settings dialog. If you do not do this, then a local SFC flag is implicitly declared that CODESYS uses instead of the global variable.
You have created an SFC block named `sfc1`, which contains the `s1` step. You have defined timeouts in the step properties. (See "Online view of SFC block `sfc1`" below.)

If for any reason the `s1` step remains active longer than its time properties have permitted (timeout), then CODESYS sets the `SFCError` flag to permit access by the application.

To permit access, you have to declare and activate the SFC flag in the SFC settings. If you have only declared it, then the SFC flag is only displayed in the online view of `sfc1` in the declaration part, but it has no function.

Now the SFC flag can be referenced within the POU, for example in an action (2) or outside of the block (1).

Online view of the SFC block `sfc1`
SFCErr is TRUE as soon as a timeout occurs within sfc2.

Note that you can use the flags SFCErrorAnalyzation and SFCErrorAnalyzationTable to determine the components of the expression that contributes to the value TRUE of the SFCErr.

See also
- § Chapter 6.4.1.20.1.5.7 “Library “Analyzation”” on page 2072

### Access to the flags

Syntax for access:
You assign the flag directly within the POU: `<variable name>:=<SFC flag>`

**Example**
```
checkerror:=SFCErr;
```

From another POU with POU name: `<variable name>:=<POU name>..<SFC flag>`

**Example:**
```
checkerror:=SFC_prog.SFCErr;
```

If you need write access from another block, then you also have to declare the SFC flag explicitly as a VAR_INPUT variable in the SFC block or globally in a GVL.
Example
Local declaration:

```plaintext
PROGRAM SFC_prog
VAR_INPUT
  SFCinit:BOOL;
END_VAR
```

Global declaration in a global variable list:

```plaintext
VAR_GLOBAL
  SFCinit:BOOL;
END_VAR
```

```plaintext
PROGRAM PLC_PRG
VAR
  setinit: BOOL;
END_VAR
SFC_prog.SFCinit:=setinit;  // write access to SFCinit in SFC_prog
```

See also

- § Chapter 6.4.1.20.1.5.7 “Library "Analyzation"” on page 2072

Library "Analyzation"

This library contains POU:s for the analysis of expressions. When a composite expression has the total value of FALSE, those of its components that contribute to this result can be determined. In the SFC editor, the flags SFCErrorAnalyzation and SFCErrorAnalyzationTable use these functions implicitly to examine the transition expressions. Then the flags provide the identifiers of the variables that contributed to a timeout error. They keep this information until they are reset explicitly by means of the SFC flag SFCQuitError.

An analysis POU cannot be called by means of a pointer. This kind of call is ignored. Call the POU as a single instance.

For a description of the library POU:s and an example of how the SFC flags display the analysis results in CODESYS, see the documentation for the library (online help or directly in the Library Manager).

SFC elements 'Step' and 'Transition'

Step symbol 🔄; Transition symbol ➡

As a rule, CODESYS inserts steps and transitions as combinations. Inserting a step without a transition or a transition without a step causes an error when compiling. You can modify this by double-clicking the name.

**NOTICE!**

Step names must be unique within the scope of the parent block. Consider this especially when using actions that were also programmed in SFC.

Please note that you can convert a step into an initial step by clicking “Init step” or by setting the respective property in the SFC properties.

All steps are defined by the step properties, which you can display and edit in the “Properties” view, depending on the set options.

You have to add those actions to the step which are to be executed when the step is active. A distinction is made between IEC actions and step actions. Details for this are found in the chapter about the SFC element "Action".

A transition must include the condition for the subsequent step to be active as soon as the value of the condition yields **TRUE**. Therefore, a transition condition must yield **TRUE** or **FALSE**. It can be defined in one of two ways:

1. Inline condition (direct): You replace the default transition name with either the name of a Boolean variable, a Boolean address, a Boolean constant, or a statement with a Boolean result, for example *(i<100) AND b*. You cannot specify programs, function blocks, or assignments here.
2. Multi-use condition (separate transition or property object): You replace the default transition name with the name of a transition or property object *(condition_xy)*. You create these objects by clicking “Project ➔ Add Object”. This allows multiple use of transitions, for example “condition_xy” in the figures below. Like an inline condition, the object can contain a Boolean variable, Boolean address, Boolean constant, or an statement with a Boolean result. In addition, it can also contain multiple statements with any code.
NOTICE!
The user is responsible for assigning the required expression to a transition variable if the transition includes multiple instructions.

Transitions that reference a transition or property object are marked with a small triangle in the upper right corner of the transition box.

As opposed to CoDeSys V2.3, now CODESYS treats a transition condition like a method call. The entry has the following syntax:

\(<\text{transition name}>:=<\text{transition condition}>\)
(for example \texttt{trans1:= a=100})

or only

\texttt{<transition condition>}

(for example \texttt{a=100})

You will find an example (condition\_xy) in the figure above.

\end{itemize}

\textbf{SFC Element ‘Action’}

Symbol: \includegraphics[width=1cm]{symbol_action}

An action includes one or more statements in one of the valid implementation languages. You can assign an action to a step.

Actions that you use in SFC steps have to be created as POUs in the project.

Exception: In the case of IEC actions, which you add to a step as action association, you can also specify a Boolean variable instead of an action object. The value of these variables is switched between FALSE and TRUE each time the action is executed.

\begin{center}
\textbf{NOTICE!}
\end{center}

You have to define unique step names within the scope of the parent block. An action written in SFC must not contain a step with a name identical to the step to which the action is assigned.

A distinction is made between IEC actions and step actions:

1. \textbf{IEC actions}

IEC actions comply with the IEC 61131-3 standard. They are executed according to their qualifiers.

IEC actions are executed two times: first when the step is activated and second when the step is deactivated. If you assign multiple actions to one step, then the action list is processed from top to bottom.

Each action box includes the qualifier in the first column and the action name in the second column. Both can be edited directly.
**NOTICE!**
When the same global Boolean variable is associated as an IEC action in different SFC POUs, unwanted overwriting can result.

In contrast to step actions, you can use different qualifiers for IEC actions. Moreover, each IEC action is provided with a control flag. This directs CODESYS to execute an action only one time at any moment, even if the action is called by another step at the same time. This cannot be guaranteed for step actions.

You assign IEC actions to steps by clicking “SFC ➔ Insert Action Association”.

See also
- Chapter 6.4.1.21.3.12.14 “Command ‘Insert Action Association’” on page 2680
- Chapter 6.4.1.20.1.5.4 “Qualifiers for Actions in SFC” on page 2065

### 2. Step actions
These are actions that you can use to extend the IEC standard.
- **Entry action:**
  CODESYS executes this action after the step is activated and before the main action is executed.
  You reference a new action, or an action created below the SFC object, from a step by means of the “Entry action” element property (2). You can also add a new action to the step by means of the “Add Entry Action” command. The entry action is marked with an E in the lower left corner of the step box.

- **Main action:**
  CODESYS executes this action when the step is active and any entry actions have already been processed. However, in contrast to IEC actions (see above), these step actions are not executed a second time when the step is deactivated. Moreover, you cannot use qualifiers here.
  You add an existing action to a step by means of the “Main action” element property (1). You can create and add a new action by clicking the step element. A main action is marked with a filled triangle in the upper right corner of the step box.

- **Exit action:**
  CODESYS executes this action one time when the step is deactivated. However, note that an exit action is not executed in the same cycle, but at the beginning of the next cycle.
  You reference a new action, or an action created below the SFC object, from a step by means of the “Exit action” element property (3). You can also add a new action to the step by means of the “Insert Exit Action” command. The exit action is marked with an X in the lower right corner of the step box.
The main difference between step actions and IEC actions with a qualifier N is that an IEC action is always executed two times: when the step is activated and when the step is deactivated. See the following example:

You have attached the `Action_AS1` action to the `AS1` step as a step action (left) and as an IEC action with qualifier N (right). Because two transitions are activated in each case, the time to reach the initial step again is two PLC cycles. This is true as long as the `iCounter` counter variable was initialized at 0 and then incremented in the `Action_AS1` action. After the `Init` step is reactivated, `iCounter` returns a value of 1 in the example on the left. In the example on the right, a value of 2 is returned because the IEC action is executed a second time due to the deactivation of `AS1`.

Another difference: Step actions can be pseudo-embedded. In this case, they can be called only from the related step. If you copy this step, CODESYS creates new action objects automatically and copies the respective implementation code. You define whether or not a step action is embedded, either when the first action is inserted into the step, or later in the "Duplicate when copying" element property. In general, this behavior can also be preset in the SFC options.

Moreover, for IEC actions, a Boolean variable can be specified instead of an action object. This is not possible for step actions.
SFC element 'Branch'

Symbol ▼

Use branches to program parallel or alternative sequences in the sequential function chart.

For alternative branches, CODESYS processes just one of the branch lines at a time, depending on the preceding transition condition. Parallel branches are processed at the same time.

See also
- Chapter 6.4.1.20.1.5.3 “Processing order in SFC” on page 2064
- Chapter 6.4.1.9.5.5.2 “Programming in SFC” on page 1880
- Chapter 6.4.1.21.3.12.13 “Command ‘Insert Branch Right’” on page 2679

Parallel branch

For parallel branches, the branch lines must begin and end with steps. Parallel branch lines can contain additional branches.

The horizontal lines before and after the branch are double lines.

Processing in online mode: If the preceding transition (t2 in the example) yields TRUE, then the first steps in all parallel branch lines are active (Step11 and Step21). CODESYS processes the individual branch lines at the same time and the subsequent transition is passed afterwards (t3).

The "Branch<n>" jump marker is added automatically to the horizontal line that indicates the beginning of a branch. You can define this marker as the jump destination.

Please note that you can convert a parallel branch into an alternative branch by clicking “Alternative”.

See also
- Chapter 6.4.1.21.3.12.11 “Command ‘Alternative’” on page 2679

Alternative branch

The horizontal line before and after the branch is a single line.

In an alternative branch, the branch lines must begin and end with transitions. The branch lines can contain additional branches.
If the step before the branch is active, then CODESYS passes the first transition of each alternative branch line from left to right. For the first transition that yields TRUE, the associated branch line opens, thus activating the step following the transition.

Please note that you can convert an alternative branch into a parallel branch by clicking "Parallel".

See also

- Chapter 6.4.1.21.3.12.10 “Command ’Parallel’” on page 2678

SFC element 'Jump'

Symbol ₋

Use a jump to define which actions in a step should be executed next as soon as the transition preceding the jump is TRUE. Jumps may become necessary, as execution paths cannot cross or lead upwards.

Excluding the required jump at the end of a diagram, you can generally insert jumps only at the end of a branch.

The destination of a jump is defined by the added text string, which you can edit directly. The jump destination can be a step name or the marker for a parallel branch.

See also

- Chapter 6.4.1.9.5.5.2 “Programming in SFC” on page 1880
- Chapter 6.4.1.21.3.12.16 “Command ’Insert Jump’” on page 2681

SFC element 'Macro'

Symbol ₋
A macro includes part of the SFC diagram, but it is not displayed in detail in the main view of the editor.

Using macros does not influence the processing flow. Macros are used for hiding specific parts of the diagram, for example to increase overall clarity.

You open the macro editor by double-clicking the macro box or by clicking “SFC → Zoom Into Macro”. You can program here just like in the main view of the SFC editor. To close the macro editor, click “SFC → Zoom Out of Macro”.

Macros can also include other macros. The caption of the macro editor always shows the path of the open macro within the diagram, for example:

```
Macro1 → Macro2
```

See also
- Chapter 6.4.1.9.5.5.2 “Programming in SFC” on page 1880

- Chapter 6.4.1.21.3.12.21 “Command ‘Zoom Out of Macro’” on page 2682

### SFC element properties

You edit the properties of an SFC element in the “Properties” view. Click “View → Element Properties” to open this view. The properties to be displayed depend on the currently selected element.
The properties that are displayed in the SFC diagram next to the element depend on the settings in the "View" tab of the SFC editor options.

### General

<th>Value description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Init step&quot;</td>
<td>✅: This option is activated only for the defined initial step. By default, this is the first step in an SFC diagram. Note: If you activate this property for another step, then it must be deactivated in the previous step to prevent compilation errors.</td>
</tr>
<tr>
<td>&quot;Duplicate when copying&quot;</td>
<td>This option is available for steps that contain a step action (entry action, main action, or exit action), and for transitions that are linked to a transition object.</td>
</tr>
<tr>
<td></td>
<td>✅: When copying the step or transition, a new object is created for each called action or transition. It contains a copy of the implementation code of the copied object.</td>
</tr>
<tr>
<td></td>
<td>⬜: When copying a step or transition, the link to the called object is retained for the respective action or transition. No new objects are generated. The source and the copies of the step or transition call the same action or transition.</td>
</tr>
</tbody>
</table>
### Property Value description

<table>
<thead>
<tr>
<th>Property</th>
<th>Value description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Times”</td>
<td>Minimum time that the step is active, even when the subsequent transition is TRUE. Maximum time that the step can be active. If this time is exceeded, then CODESYS sets the SFCError implicit variable to TRUE. Times according to IEC syntax (for example t#8s) or the TIME variable; default: t#0s.</td>
</tr>
<tr>
<td>“Actions”</td>
<td>“Entry action”: CODESYS executes these actions after activating the step. “Step action”: CODESYS executes this action when the step is active and any entry actions have already been processed. “Exit action”: CODESYS executes this action in the subsequent cycle when the step is deactivated.</td>
</tr>
</tbody>
</table>

Please note the processing sequence.

When using the respective implicit SFC variables and flags, you receive information about the status of a step or an action or about timeouts.

### FBD/LD/IL Editor

The FBD/LD/IL editor is a combined editor of the programming languages FBD, LD and IL.

If necessary, IL can be activated in the CODESYS options.

There is a common set of commands and elements and CODESYS automatically converts the 3 programming languages into one another internally.

The code in the implementation part is structured in all three languages with the aid of networks.

The “FBD/LD/IL” menu provides the commands for working in the editor.

In offline and online modes, you can switch editors at any time by using the menu command in “View”.

The behavior of the FBD/LD/IL editor is defined by the settings in “Tools ➔ Options” (category “FBD, LD and IL”).

---

Configuration and programming
Programming with CODESYS > CODESYS Development System
NOTICE!
There are some special elements that CODESYS cannot convert and thus it displays only in the applicable language. There are also constructs that are not clearly convertible between IL and FBD and are therefore 'normalized', i.e. nullified, when converted back to FBD. This concerns: negation of expressions and explicit/implicit assignment of function block inputs and outputs.

An error-free conversion between the languages requires syntactically correct code. Otherwise parts of the implementation can be lost.

FBD and LD editor

Inserting and arranging elements

You can drag elements with the mouse from the view “Tools” (toolbox) into the implementation part of the editor. Alternatively you can use the commands of the context menu or the “FBD/LD/IL” menu.

Settings for the display and interface are defined in the CODESYS options, category "FBD/LD/IL".

If you drag an element with the mouse over a network in the editor, all possible insertion positions are displayed with gray diamond-shaped, triangular or arrow-shaped position marks. As soon as the mouse pointer is located over one of these marks, the mark turns green. If the mouse button is now released, CODESYS inserts the element at this position.

Example

If you drag a function block or an operator from the toolbox or a network at the left-hand side of the network onto one of the two arrows, then CODESYS automatically creates a new network and inserts the element there.

In order to replace an element, drag a suitable other element onto its position with the mouse. Elements that you can replace by the new element are marked by CODESYS in the editor with text fields, for example “Replace”, “Attach input”.

You can use the usual commands in the menu “Edit” for cutting, copying, pasting and deleting elements. Copying also works with drag-and-drop by holding down the [Ctrl] key.

NOTICE!
The operators with EN/ENO functionality can only be inserted in the FBD and IL editors.

Selecting elements

A box or a connecting line in the editor is selected by clicking on it with the mouse so that it has the focus. Multiple selection is possible by keeping the [Ctrl] key pressed. A selected element is shaded red.

Tooltip
If the cursor points to certain elements, for example to a variable or to an input, a tooltip appears showing information about this element.

In the case of elements underlined with a wavy red line, the tooltip shows the pre-compile error message of the error that occurs with this element.

**Navigating in the editor**

**Table 390: Navigating in the editor**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[←]</td>
<td>Change to the neighboring cursor position, along the signal flow, i.e. from left to right and vice versa.</td>
</tr>
<tr>
<td>[→]</td>
<td>Change to the next cursor position above or below the current position, if this neighboring position belongs to the same logical group. For example, all connections of a box form a logical group. If such a logical group does not exist: change to the first cursor position in the next higher or lower neighboring element. In the case of parallel-connected elements, navigation takes place along the first branch.</td>
</tr>
<tr>
<td>[Ctrl] + [Home]</td>
<td>Change to the first network; this will be selected.</td>
</tr>
<tr>
<td>[Ctrl] + [End]</td>
<td>Change to the last network; this will be selected.</td>
</tr>
<tr>
<td>[Page Up]</td>
<td>Scroll upwards by one page; the highest network on this page is selected.</td>
</tr>
<tr>
<td>[Page Down]</td>
<td>Scroll downwards by one page; the lowest network on this page is selected.</td>
</tr>
<tr>
<td>Command “Go to…”</td>
<td>Change to a certain network.</td>
</tr>
</tbody>
</table>

Opening function blocks

If a function block is inserted in the editor, then you can open its implementation by a double-click or with the context menu command “Browse for symbol ➔ Go to Definition”.

**IL editor**

**Inserting and arranging elements:**

You can insert elements with the help of the commands of the menu “FBD/LD/IL” in the context menu. You can also drag a new network from the tool box into the implementation part of the editor by drag-and-drop.

You can use the usual commands in the menu “Edit” for cutting, copying, pasting and deleting elements. Copying also works with drag-and-drop by holding down the [Ctrl] key.

**NOTICE!**

Please note that operators with EN/ENO functionality can only be inserted in the FBD and IL editors.
Each program line is entered in a table row.

**Table 391: Structure of networks in the IL editor**

FBD/LD/IL editor in online mode

In online mode the current value of each variable is displayed behind the variable in the editor. Writing/forcing and the setting of breakpoints is possible.

If the variable is presently forced, this is indicated directly in front of the forced value by ☑. If a value has been prepared for writing or forcing, this value is displayed directly behind the current value in square brackets <value>.

Example

Forced variable:

![BVar1 TRUE](image)

Prepared value

![iVar1 0<12>](image)

In the online view of a ladder diagram (LD) the connecting lines are marked in color: connections with the value TRUE are displayed as a thick blue line, connections with the value FALSE as a thick black line. Conversely, connections with an unknown or analog value are displayed normally (thin black line).

NOTICE!

Note that values of the connections are calculated from the monitored variables.

This is not a genuine flow control.

Breakpoints
Possible positions for breakpoints are in principle the positions at which values of variables can change (instructions), at which the program branches or at which another box is called.

Possible breakpoint positions:

- On the entire network: causes the breakpoint to be set at the first possible position in the network.
- On a box, if the box contains an assignment. Not possible with operator boxes, for example ADD, DIV.
- On assignments.
- At the end of the box at the position of the return to the calling box. In online mode an empty network automatically appears here; it is marked by 'RET' in place of a network number.

**NOTICE!**

At present you cannot directly set a breakpoint on the first box in the network. However, if you set a breakpoint on the entire network, this breakpoint marking is transferred automatically to the first box in online mode.

**NOTICE!**

Breakpoints in methods: CODESYS automatically sets a breakpoint in all methods that can be called. Therefore, if a method managed by an interface is called, breakpoints are set in all methods that occur in function blocks that implement this interface as well as in all derived function blocks that use the method. If a method is called by a pointer to a function block, CODESYS sets the breakpoints in the method of the function block and in all derived function blocks that use the method.

</tr>
<tr>
<td>ADD</td>
</tr>
<tr>
<td>ADD</td>
</tr>
<tr>
<td>ADD</td>
</tr>
<tr>
<td>ST</td>
</tr>
</tbody>
</table>

### Complex operands

For a complex operand, you enter the opening parenthesis in the first column. You enter the closing parenthesis in the first column in a separate row following the operand entries of the following rows.

A string is rotated by a character each cycle:

```plaintext
LD   stRotate
RIGHT ( stRotate
LEN   SUB   1
)    )
CONCRT ( stRotate
LEFT   1
)    )
ST   stRotate
```

FBD/LD/IL element 'Network'

Symbol [Network]

A network is the base unit of an FBD or LD program. In the FBD/LD/IL editor, the networks are arranged in a list. Each network is provided with a sequential network number on the left side and can include: logical and arithmetic expressions, program/function/function block calls, jumps, or return statements.

An IL program consists of at least one network. This network can include all IL statements of the program.

You can provide each network with a title, comment, or label. In the CODESYS options (category "FBD, LD, and IL", you can define whether network title, comment, and separator between individual networks are displayed in the editor.

Click the first line of the network to enter a network title. Click the second line of the network to enter a network comment.
FBD/LD/IL element 'Box'

Symbol: 

A box and its call can represent additional functions, for example IEC function blocks, IEC functions, library function blocks, operators.

A box can have any number of inputs and outputs.

If the box also provides an image file, the box icon is displayed inside the box. The requirement is that the option “Show box symbol” is activated in the CODESYS options, category “FBD, LD and IL”.

If you have changed the box interfaces, you can update the box parameters with the command “FBD/LD/IL Update Parameters” without having to re-insert the box.

See also

- Chapter 6.4.1.21.3.14.5 “Command ’Insert Box”’ on page 2701
- Chapter 6.4.1.21.4.14.10 “Dialog ’Options’ - ’FBD, LD, and IL’” on page 2787
- Chapter 6.4.1.21.3.14.38 “Command ’Update Parameters”’ on page 2710

FBD/LD/IL element 'Assignment'

Symbol: 

The FBD editor shows a newly inserted assignment as a line with 3 question marks after it. The LD editor shows a newly inserted assignment as a coil with 3 question marks located above it.

After insertion you can replace the placeholder ??? by the name of the variable to which the signal coming from the left is to be assigned. The input assistant is available to you for this.

In IL an assignment is programmed via the operators LD and ST.

See also

- Chapter 6.4.1.20.1.6.1 “FBD/LD/IL Editor” on page 2082
- Chapter 6.4.1.21.3.14.4 “Command ’Insert Assignment”’ on page 2701

FBD/LD/IL element 'Box with EN/ENO'

Symbol: 

The element is available only in the FBD and LD editors.

The box generally corresponds to the FBD/LD/IL element “Box”; however, this box additionally contains an EN input and an ENO output. EN and ENO have the data type BOOL.

Function of the EN input and ENO output: if the input EN has the value FALSE at the time of the calling the box, the operations defined in the box are not executed. Otherwise, i.e. if EN has the value TRUE, these operations are executed. The ENO output has the same value as the EN input.

See also

- Chapter 6.4.1.21.3.14.6 “Command ’Insert Box with EN/ENO”’ on page 2702
- Chapter 6.4.1.20.1.6.4.2 “FBD/LD/IL element ’Box”’ on page 2092
FBD/LD/IL element 'Input'

Symbol: %

The maximum number of inputs depends on the type of box.

A newly added input is first marked with ???. You can replace the string ?? by a variable or a
constant.

See also

- % Chapter 6.4.1.21.3.14.13 “Command 'Insert Input'” on page 2703
- % Chapter 6.4.1.20.1.6.1 “FBD/LD/IL Editor” on page 2082

FBD/LD/IL element 'Label'

The label is an optional identifier for a network in FBD and LD, which you can specify as a
destination for a jump.

If you insert a jump label in a network, it will be added as an editable field “Label:” in the
network.

See also

- % Chapter 6.4.1.20.1.6.1 “FBD/LD/IL Editor” on page 2082
- % Chapter 6.4.1.21.3.14.11 “Command 'Insert Label'” on page 2703

FBD/LD/IL element 'Jump'

Symbol →

In FBD or LD a jump is inserted either directly before an input, directly after an output or at the
end of the network, depending on the current cursor position.

You enter a jump label as the jump destination directly behind the jump element.

In IL you program a jump with the instruction JMP.

See also

- % Chapter 6.4.1.20.1.6.1 “FBD/LD/IL Editor” on page 2082
- % Chapter 6.4.1.21.3.14.10 “Command 'Insert Jump'” on page 2703
- % Chapter 6.4.1.20.1.6.4.6 “FBD/LD/IL element 'Label'” on page 2093

FBD/LD/IL element 'Return'

This element immediately interrupts the execution of the box if the input of the RETURN element
goes TRUE.

In an FBD or LD network you can place the Return instruction parallel to or after the preceding
elements.

In IL the RET instruction is available to you for this purpose.

See also

- % Chapter 6.4.1.21.3.14.12 “Command 'Insert Return'” on page 2703
- % Chapter 6.4.1.20.1.6.3 “Modifiers and operators in IL” on page 2087

FBD/LD/IL element 'Branch'

Symbol: ➕
The element is available in the LD and FBD editor and represents an open line branch. A line
branch splits the processing line from the current cursor position onwards into 2 subnetworks,
which are executed in succession from top to bottom. You can branch each subnetwork further,
as a result of which multiple branches are created within a network.

Each subnetwork is given a marker symbol (rectangle) at the branch point, which you can select
in order to execute further commands.

The commands “Copy”, “Cut” and “Paste” are not available for subnetworks.

In order to delete a subnetwork, you must first delete all elements of the network and then the
marker symbol of the subnetwork.

- § Chapter 6.4.1.21.3.14.35 “Command 'Insert Branch Below'” on page 2709

**FBD/LD/IL element 'Execute'**

Symbol: 

The element is a box that enables you to directly enter ST code in the FBD and LD editors.
You can drag the “Execute” element with the mouse from the “Tools” view into the implementa-
tion part of your POU. If you click on “Enter ST code here…”, an input field opens where you can
input multiple-line ST code.

- § Chapter 6.4.1.20.1.6.1 “FBD/LD/IL Editor” on page 2082

**LD element 'Contact'**

Symbol: 

The element is available only in the LD editor.
A contact passes on the signal \texttt{TRUE} (ON) or \texttt{FALSE} (OFF) from left to right until the signal finally reaches a coil in the right-hand part of the network. For this purpose a boolean variable containing the signal is assigned to the contact. To do this, replace the placeholder ??? above the contact with the name of a boolean variable.

You can arrange several contacts both in series and in parallel. In the case of two parallel contacts, only one needs to obtain the value \texttt{TRUE} in order for ON to be passed on to the right. If contacts are connected in series, all of them must obtain the value \texttt{TRUE} in order for ON to be passed on to the right by the last contact in the series. Hence, you can program electrical parallel and series connections with LD.

A negated contact forwards the signal \texttt{TRUE} if the variable value is \texttt{FALSE}. You can negate an inserted contact with the help of the command \texttt{"FBD/LD/IL \rightarrow Negation"} or insert a negated contact from the \texttt{"Tools"} view.

If you place the mouse pointer on a contact with the left mouse button pressed and with a network selected, the button \texttt{"Convert to coil"} appears in the network. If you now move the mouse pointer onto this button, still with the mouse button pressed, and then release the mouse button over this button, CODESYS converts the contact into a coil.

\section*{LD element 'Coil' }

Symbol: \texttt{\langle \rangle}, in the editor \texttt{\langle \rangle }

The element is available only in the LD editor.

A coil adopts the value supplied from the left and saves it in the boolean variable assigned to the coil. Its input can have the value \texttt{TRUE} (ON) or \texttt{FALSE} (OFF).

Several coils in a network can only be arranged in parallel.

In a negated coil \texttt{\langle \rangle } the negated value of the incoming signal is stored in the boolean variable that is assigned to the coil.

\subsection*{Set coil, Reset coil}

Symbol: \texttt{\langle \rangle \langle \rangle \langle \rangle \langle \rangle}, in the editor: \texttt{\langle \rangle \langle \rangle \langle \rangle \langle \rangle}

Set coil: If the value \texttt{TRUE} arrives at a set coil, the coil retains the value \texttt{TRUE}. As long as the application is running, the value can no longer be overwritten here.

Reset coil: If the value \texttt{TRUE} arrives at a reset coil, the coil retains the value \texttt{FALSE}. As long as the application is running, the value can no longer be overwritten here.

You can define an inserted coil as a set or reset coil with the help of the command \texttt{"FBD/LD/IL \rightarrow Set/Reset"} or insert it as an element “Set Coil” and “Reset Coil” from the “Tools” view.

See also

- Chapter 6.4.1.21.3.14.14 “Command 'Insert Coil'” on page 2704

- Chapter 6.4.1.21.3.14.31 “Command 'Set/Reset’’ on page 2708

\section*{LD element 'Branch Start/End' }

Symbol: \texttt{\langle \rangle}
The element serves the closed line branch.

See also

-  Chapter 6.4.1.20.1.6.4.14 “Closed branch” on page 2096
-  Chapter 6.4.1.20.1.6.1 “FBD/LD/IL Editor” on page 2082
-  Chapter 6.4.1.21.3.14.36 “Command ‘Set Branch Start Point’” on page 2709
-  Chapter 6.4.1.21.3.14.37 “Command ‘Set Branch End Point’” on page 2710

Closed branch

A closed branch is available in LD only, and it contains a starting point and an end point. It is used for implementing parallel analyses of logical elements.

Inserting a closed branch

- Command “FBD/LD/IL ➔ Insert Contact Parallel (Below) ”
- Command “FBD/LD/IL ➔ Insert Contact Parallel (Above) ”
- Command “FBD/LD/IL ➔ Set Branch Start/End Point”

Closed branch at a contact

When you select one or more contacts and then execute the command “Insert Contact in Parallel”, a parallel branch is added with a single vertical line. For this kind of branching, the signal flow passes through both branches. This is an OR construct of both branches.

Closed branch at a block, OR evaluation, or short-circuit evaluation

New: When you select a box and execute the command “Insert Contact in Parallel”, a parallel branch is inserted with a double vertical line. This indicates that a short-circuit evaluation (SCE) is implemented. SCE allows for the execution of a function block with a Boolean output to be bypassed if a specific condition is TRUE. The condition can be displayed in the LD editor as a branch connected parallel to the function block branch. The short circuit condition is defined by one or more contacts in this branch that are interconnected parallel or sequentially.

Functional principle:

The branches that do not include the function block are processed first. If CODESYS detects the value TRUE for one of these branches, then the function block is not called in the parallel branch. In this case, the value at the input of the function block is sent directly to the output. If CODESYS determines FALSE for the SCE condition, then the box will be called and the Boolean result of its processing is passed on. If all branches contain function blocks, they are analyzed from top to bottom and their outputs are logically ORed. If there are no branches with function blocks, normal OR operations are performed.
The function block instance \( x_1 \) (TON) has a Boolean input and a Boolean output. The execution of \( x_1 \) is skipped if \( \text{TRUE} \) is determined for the condition in the parallel line branch. The condition value results from the OR and AND operations that connect contacts \( \text{cond1}, \text{cond2} \) and \( \text{cond3} \).

\( x_1 \) is executed if the condition value from the connection of the contacts \( \text{cond1}, \text{cond2} \) and \( \text{cond3} \) is \( \text{FALSE} \).

(1) Indicates from the double vertical connections that it is a construct subject to an SCE.

(2) Indicates from the single vertical connections that it is an OR construct.

The given LD example is shown below as ST code. \( \text{P_IN} \) and \( \text{P_OUT} \) are the Boolean values at the input (split point) and output (reunification point) of the parallel line branch.

\[
\text{P_IN} := \text{b1 AND b2};
\]

\[
\text{IF} \ ((\text{P_IN AND cond1}) \ AND \ (\text{cond2 OR cond3})) \ \text{THEN} \ \\
\quad \text{P_OUT} := \text{P_IN};
\]

\[
\text{ELSE} \ \\
\quad x1(\text{IN} := \text{P_IN}, \text{PT} := \{\text{p 10}\}\text{t#2s}); \\
\quad t\text{Elapsed} := x1.\text{ET}; \\
\quad \text{P_OUT} := x1.\text{Q}; \\
\quad \text{END IF}
\]

\[
\text{bRes} := \text{P_OUT AND b3};
\]

General

From an external point of view, a Function Block Diagrams consists of inputs and outputs, with data being processed between them. From an internal point of view, a Function Block Diagrams consists of POUs and their connections which represent data (signals) and act as assignment operators in ST. The overall behavior is composed of the behavior of the inserted POUs which call other POUs or library POUs.

Code in the “Continuous Function Chart (CFC)” implementation language mainly illustrates the data flow through the system. Therefore, a continuous function chart is also referred to as a “signal flow chart”.

In the page-oriented CFC editor, you can wire POUs to each other and create well-structured Function Block Diagrams distributed over multiple pages. The page-oriented editor behaves like the CFC editor, but provides the following functionality:

The page-oriented editor behaves like the CFC editor, but provides additional functionality.

The editor supports you with the following functions:
- Creating pages
- Setting the page size
- Copying and inserting pages in the page navigator
- Copying the implementation of a POU in the CFC implementation language and inserting into a page
- Well-structured and space-saving arranging of inputs, outputs, and connection marks in the border areas
- Connection over pages with connection marks

CFC Editor

Configuring the editor

You can configure the appearance, behavior, and printing for the entire project in the CODESYS options in the “CFC Editor” category. For example, on the “View” tab, you can configure the color of the connecting lines depending on the data type.

Editing

<table>
<thead>
<tr>
<th>Cursor symbol:</th>
<th>Requirement: “Pointer” is selected in the “Toolbox” view.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>The symbol indicates that you can edit in the editor. Select elements or connections to move them or to execute commands.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Cursor symbol:</th>
<th>Requirement: An element is selected in the “Toolbox” view.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Clicking in the editor inserts the selected element. You can also drag an element to the editor.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Dragging a function block instance from the declaration to the editor</th>
<th>Requirement: A line is selected in the declaration of the CFC.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>The instance is inserted as a box with name, type, and all pins.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Dragging a variable from the declaration to a box pin to the editor</th>
<th>The variable is inserted as an input or output with a connection to the box pin in focus.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Hint: The cursor indicates when your focused location is valid for a variable:</td>
</tr>
</tbody>
</table>

```plaintext
                        ADD
                        +
```
| Dragging a variable from the declaration part to the editor | Requirement: The respective element is selected in the declaration.  
- Function block instance: A POU with the corresponding data type is created.  
- Declaration of **VAR_INPUT** or **CONSTANT**: An input element is inserted.  
- Declaration of **VAR_OUTPUT**: An output element is inserted.  
- Declaration of **VAR**, **VAR_GLOBAL**: A window opens at the insert location, where you can select whether an input element or output element should be inserted.  
When a variable is dragged from the declaration part to an existing replaceable element, the existing element is replaced. |
|---------------------------------------------------------------|
| Dragging a function block or POU to the editor from the “Devices” view, “POUs” view, or from the Library Manager. | A box element with the corresponding type is inserted.  
- When a box is dragged to an existing connecting line and both the input and output of the box are compatible with the data type of the line, the box is inserted in the line. Here its first matching input and output are connected to the elements that were previously connected by the connecting line.  
- When a box is dragged to an existing box, the existing box is replaced. |
| Resorting the order of inputs and outputs within a function block by means of drag&drop | Requirement: The text field of the input or output, which should be resorted to another location, is selected. |
| **[Ctrl]** + click in the programing area | Requirement: An element is selected in the “Toolbox” view.  
As long as you hold down the **[Ctrl]** key, a selected element is created each time you click in the programming area. |
| **[Ctrl]**+[Right Arrow] | Requirement: In the CFC program, **exactly** one output pin is selected for an element.  
The selection is moved so that the input pin at the end of the connecting line is selected. In the case of multiple pins, all are selected. |
Requirement: In the CFC program, exactly one input pin is selected for an element.
The selection is moved so that the output pin at the beginning of the connecting line is selected. In the case of multiple pins, all are selected.

Example:

![Diagram of CFC program with selected input and output pins.]

See also

- § Chapter 6.4.1.20.1.3 “Common functions in graphical editors” on page 2048

Connecting

You can insert connecting lines between element connections. Connecting lines are inserted by means of auto-routing so that connecting lines are automatically optimal and as short as possible. The connecting lines are checked for collisions.

<table>
<thead>
<tr>
<th>Dragging a pin to another</th>
<th>A connecting line is inserted between the two element pins.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dragging a pin to a function block</td>
<td>Dropping can be done on a pin or on the text field of a pin. In the case of extendable operators (example: ADD), dropping can also be done within the box. The following behavior applies for this: If there are still unconnected input pins, then the top free pin is connected. If there are no more unconnected input pins, then a new pin is automatically inserted below.</td>
</tr>
<tr>
<td>Command “Connect Selected Pins”</td>
<td>Requirement: Multiple pins are selected. The pins are marked in red.</td>
</tr>
<tr>
<td>Move an inserted element so that it touches the pin of another element.</td>
<td>Requirement: The “Enable AutoConnect” option is selected. The touching pins are connected automatically.</td>
</tr>
<tr>
<td>![Connection icon]</td>
<td>The connection icon is located in the upper right corner of the editor. A green icon indicates collision-free connections. A red icon indicates collisions. Clicking the icon opens a menu with commands for collision processing, for example the “Show Next Collision” command.</td>
</tr>
<tr>
<td>![Connection mark]</td>
<td>Requirement: A connection is selected and the “Connection Mark” command is executed. Instead of a long connecting line, a connection is represented by connection marks.</td>
</tr>
</tbody>
</table>

See also

- § Chapter 6.4.1.21.3.13.22 “Command ’Show Next Collision’” on page 2694
- § Chapter 6.4.1.21.3.13 “Menu ’CFC’” on page 2685
CFC editor, page-oriented

POUs generated in the “Continuous Function Chart (CFC) - page-oriented” cannot be converted into “Continuous Function Chart (CFC)” POUs or back.

- (1) Page navigator
- (2) Page header with name and description
- (3) Left border area reserved for inputs and sink connection marks
- (4) Program area
- (5) Right border area reserved for outputs and source connection marks

Editing

You can drag a “Page” element from the “ToolBox” view to the page navigation. Then an additional page is inserted.

You can select existing pages in the page navigation and duplicated them by clicking “Edit ➔ Copy” and “Edit ➔ Paste”.

The size of the page is changed by means of the “Edit Page Size” command.

Connections over multiple pages are established by means of the “Connection Mark - Source” and “Connection Mark - Sink” elements. When you drag a connecting line from an input pin or an output pin to the border area, a new connection mark is created automatically. The advantage is that the "List components" input assistance provides all previously defined connection mark sources.

If you have selected an element in the editor, then you can use the arrow keys to move the selection from one element to the next to navigate through the circuit. If you then select a connection mark and press another arrow key, even the corresponding connection mark of the next/previous page will be selected.

- Chapter 6.4.1.21.3.13 “Menu ‘CFC’” on page 2685
- Chapter 6.4.1.21.4.11.14 “Dialog ‘Properties’ - ‘CFC Execution Order’” on page 2761
You can transfer networks from a CFC POU to the program area of a page-oriented CFC by clicking “Edit ➔ Copy” and “Edit ➔ Paste” (from the clipboard). You can also use drag&drop.

**Execution order**

The execution order is determined automatically according to the order of the pages as they are sorted in the page navigator of the editor. Within a page, a page-oriented CFC object behaves like a CFC object. Therefore, you can switch between “Auto Data Flow Mode” and “Explicit Execution Order Mode”.

**Additional commands in “CFC page-oriented”**

CFC Editor in Online Mode

In online mode, you can monitor and change variable values of the controller. In addition, debugging features are provided such as breakpoints and stepping.

Monitoring

As usual, you can monitor values in the declaration part as well as in the implementation part (with inline monitoring).

Inline monitoring of a function block is possible only when an instance of the function block is open. No values are displayed in the basic implementation view.

Monitoring a Boolean variable

The connections between Boolean variables are displayed in color according to their actual value: TRUE in blue and FALSE in black. The element pins are decorated with the actual value.
An application contains a CFC POU. An internal Boolean variable is switched there. With each cycle, the variable `iToggle` switches its state from `TRUE` to `FALSE`.

Example

Monitoring a scalar variable

In the case of scalar variables, the element pins are decorated with the actual values.
In online mode in the declaration editor, you can prepare a value for forcing or writing a monitored variable.

When you select the "Prepare values in implementation part" check box in the "CFC Editor" category of the CODESYS options, you can also prepare values in the implementation part.

To do this, open the "Prepare Value" dialog by double-clicking an element or the monitoring box next to an element. No dialog appears for Boolean variables. However, with each mouse click on the value displayed next to the variable, the values TRUE and FALSE are toggled.

Prepared values are displayed in angle brackets. After executing a write or a force, a red "F" is shown in the monitoring box.

You can write input parameters of function block instances of type VAR_INPUT CONSTANT in online mode and modify the parameters in this way. After logging out, you save these parameters by clicking "Save Prepared Parameters to Project".
Requirement: A CFC editor is active. An instantiated function block has VAR_INPUT CONSTANT variables in its declaration.

1. In the editor, open the POU by calling the function block instance.

   ```
   FUNCTION_BLOCK FB_DoIt
   VAR_INPUT
   iAlfa : INT;
   iBravo : INT;
   sCharlie : STRING := 'Charlie';
   xItem : BOOL;
   iDelta : INT;
   END_VAR
   VAR_INPUT CONSTANT
   MAXIMUM : INT := 12;
   END_VAR
   VAR_OUTPUT
   iResult : INT;
   sResult : STRING;
   xResult : BOOL;
   END_VAR
   
   The declaration of FB_DoIt has been supplemented by the constant MAXIMUM.
   ```

2. Login to the controller.
3. Click the "Parameters" button of the function block instance.
   ⇒ The "Edit Parameters" dialog opens.
4. Click the "Value" column in an inline monitoring field of a parameter.
   ⇒ The "Prepare Value" dialog opens.
5. Type 20 in the "Prepare a new value for the next write or force operation" field.
6. Click "OK" to confirm the entry.
   ⇒ The prepared value is shown in angle brackets next to the current value (for example, <20>).
7. Click “Debug ➔ Write Values”.

- The prepared value is written. The parameter is changed and displayed in the project in brackets after the value.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Value</th>
<th>Initial value</th>
<th>Min</th>
<th>Max</th>
<th>Unit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>[20]</td>
<td>20</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The difference between both values is shown by a red cross next to the parameter field of the function block instance.

8. Click “Edit Parameters” to close the dialog. Logout.

9. Click “CFC ➔ Save Prepared Parameters to Project”.

- The change parameter values are saved to the project. The asterisk next to the parameter field disappears.

Breakpoint locations

- Possible position of a breakpoint
  - Element “Output”
    - Variables are described.
  - Element “Box”
    - POU’s are called.
  - Element “RETURN”
    - The program flow is branched.
  - Element “Selector”
    - Structure elements are described.

Click “Debug ➔ Toggle Breakpoint” to set a new breakpoint or delete an existing breakpoint. A red circle in the block diagram represents an active breakpoint.
NOTICE!

A breakpoint is set automatically in all methods that can be called.

Therefore, if a method is called that is defined over an interface, then breakpoints are set in all methods of function blocks that implement this interface. This also applies to all inherited function blocks that define methods.

You can process a POU in steps in debug mode. A called POU is supplemented internally by a `RETURN` at the beginning before the element with the number 0 and at the end after the last element. When stepping, these are started automatically.

**Stepping into a POU**

**Commands in online mode**

CFC element 'Page'
Symbol: ☐

The element inserts a new page into the editor. It is available only in the page-oriented CFC editor. The number of the page is automatically assigned in accordance with its position. You can enter the name and the description of the page into the orange header. The page size is adapted with the “Edit Page Size” command.

See also
● § Chapter 6.4.1.21.3.13.2 “Command ‘Edit Page Size’” on page 2686

CFC element 'Control Point'
Symbol: ▲

Use a control point in order to fix points of a connection before you adapt the line routing. To do this, drag the element to the desired position on a connecting line. Connecting lines with control points are no longer routed automatically.

See also
● § Chapter 6.4.1.9.5.3.3 “Programming in the CFC editor” on page 1871
● § Chapter 6.4.1.21.3.13.30 “Command ‘Create Control Point’” on page 2696
● § Chapter 6.4.1.21.3.13.29 “Command ‘Remove Control Point’” on page 2695

CFC Element 'Input'
Symbol: ➡

Keyboard shortcuts for inserting the element: [Ctrl]+[Q]

By default, CODESYS inserts an input element with the text "???. You can edit this input field directly by clicking it and typing in a constant value or a variable name. Alternatively, you could click [.] to open the Input Assistant to select a variable.

CFC Element 'Output'
Symbol: ➢

Keyboard shortcuts for inserting the element: [Ctrl]+[A]
By default, CODESYS inserts an output element with the text "???. You can edit this input field directly by clicking it and typing in a constant value or a variable name. Alternatively, you could click ... to open the Input Assistant to select a variable.

CFC Element 'Box'

Symbol: ⧭

Keyboard shortcuts for inserting the element

- [Ctrl]+[B]: Empty box
- [Ctrl]+[Shift]+[B]: Box with EN/ENO

You use the element in order to insert an operator, a function, a function block, or a program. By default, CODESYS inserts the element with the name "???. You can edit this field directly by clicking it and typing in a function block name. Alternatively, you could click ... to open the Input Assistant and select a function block.

In the case of a function block, CODESYS also displays an input field ("???) above the function block symbol. You have to replace this name with the name of the function block instance. If you instantiate a function block with constant input parameters, then the function block element displays the "Parameter..." field in the bottom left corner. You click on this field to edit the parameters.

In order to replace an existing box, you replace only the currently inserted identifier with the new desired name. When you do this, note that CODESYS adapts the number of input and output pins according to the definition of the POU and that existing assignments may be deleted as a result.

**NOTICE!**

Because feedback is allowed in CFC, implicit variables with the data type of the input variable are created at the output of a box (in the example: temp_USINT). If the result of the operation of a function block is a value which exceeds the number range of the data type of the input variable, then the overflow is written to the implicit variable. The actual output variable gets the value of the implicit variable, thus the overflow and not the actual result of the operation (see example).

**Example**

Implicitly generated variables at the box output:

![Diagram](image)

Implicitly generated code:

```plaintext
temp_USINT := USINT1 * temp_USINT;
UDINT1 := temp_USINT;
```

See also

- Section 6.4.1.2.3.13.18 "Command 'Edit Parameters'" on page 2692

**CFC element 'Jump'

Symbol: ⫸
You use the element in order to define a position at which program execution is to continue. You must define this target position by a label. To do this, enter the name of the mark in the input field “???”. If you have already inserted the corresponding label, you can also select it via the input assistant (↵). See also

- Chapter 6.4.1.20.1.7.6.7 “CFC element 'Label'” on page 2111

**CFC element 'Label'**

Symbol: 

A label defines a position to which program execution jumps with the help of a jump element. In online mode CODESYS automatically inserts a RETURN flag at the end of a CFC function block.

See also

- Chapter 6.4.1.20.1.7.6.6 “CFC element 'Jump'” on page 2110

**CFC element 'Return'**

Symbol: ➡

Use the element in order to exit the function block.

Please note that in online mode in the CFC editor a return element is automatically inserted before the first line and after the last element. In single-step execution CODESYS automatically jumps to the return element at the end before exiting the function block.

**CFC element 'Composer'**

Symbol: 

The composer element is for handling structural components. The individual components of a structure are made available to you as an input. For this purpose you must name the composer element like the structure concerned (replace the “???”).

The composer element is the counterpart to the selector element.

See also

- Chapter 6.4.1.20.1.7.6.10 “CFC element 'Selector'” on page 2111

**CFC element 'Selector'**

Symbol: 

The selector element is for handling structural components. The individual components of a structure are made available to you as an output. For this purpose you must name the selector element like the structure concerned (replace the “???”).

The selector element is the counterpart to the composer element.

See also

- Chapter 6.4.1.20.1.7.6.9 “CFC element 'Composer'” on page 2111

**CFC element 'Comment'**

Symbol: 

128x765 2024/01/05 3ADR010583, 1, en_US 2111
With this element you input a comment in the CFC editor. Replace the placeholder text in the element by the comment text. A line break can be inserted with the aid of the shortcut [Ctrl] + [Enter].

**CFC element 'Connection Mark - Source/Sink'**

Symbol: ➔, ➙

You can use connection marks instead of a connecting line between elements. That helps you to display complex diagrams more clearly.

For a valid connection you must connect an element “Connection Mark - Source” with the output of an element and an element “Connection Mark - Sink” with the input of another element. Both marks must bear the same name. The names are not case-sensitive.

Notes on naming

- The standard name for connection marks is C-<nr>. <nr> is a sequential number starting with 1.
- You can rename the standard name. In doing so, you must make sure that the connection mark - source and connection mark - sink have the same name.
- If you change the name of the connection mark - source, the destination name is automatically renamed.
- If you change the name of the connection mark - sink, the source name is retained.

Observe the command “Connection Mark” for the automatic transformation of an existing connection.

- Chapter 6.4.1.21.3.13.31 “Command ‘Connection Mark’” on page 2696
- Chapter 6.4.1.20.1.7.2 “CFC Editor” on page 2098

**CFC element 'Input Pin'**

Symbol: ⬃

Depending on the type of function block you can add further inputs to an inserted function block element. To do this you must select the function block element and drag the function block input element onto the body of the function block.

Please note: You can drag an input or output connection to another position on the function block with the [Ctrl] key pressed.

See also

- Chapter 6.4.1.20.1.7.6.14 “CFC element 'Output Pin’” on page 2112

**CFC element 'Output Pin'**

Symbol: ⬄

Depending on the type of function block you can add further outputs to an inserted function block element. To do this you must select the function block element and drag the function block output element onto the body of the function block.

Please note: You can drag an input or output connection to another position on the function block with the [Ctrl] key pressed.

#### General

The scope of a variable defines how and where you can use a variable. You define the scope in the variable declaration.

#### Local variables - VAR

Local variables are declared between the keywords **VAR** and **END_VAR** in the declaration part of programming objects.

You have read-only access to local variables by using the instance path.

You can extend local variables with an attribute keyword.

##### Example

```plaintext
VAR
  iVar1 : INT;
END_VAR
```

See also

- Chapter 6.4.1.9.19 “Data Persistence” on page 1920

#### Input variables - VAR_INPUT

Input variables are used at the inputs of function blocks.

**VAR_INPUT** variables are declared between the keywords **VAR_INPUT** and **END_VAR** in the declaration part of programming objects.

You can extend input variables with an attribute keyword.
Output variables - VAR_OUTPUT

Output variables are used at the outputs of function blocks. VAR_OUTPUT variables are declared between the keywords VAR_OUTPUT and END_VAR in the declaration part of programming objects. CODESYS returns the values of this variable to the calling POU. There you can retrieve the values and continue using them.

You can extend output variables with an attribute keyword.

Example

```
VAR_OUTPUT
   iOut1 : INT; (* 1st output variable *)
END_VAR
```

See also

- § Chapter 6.4.1.9.19 “Data Persistence” on page 1920

Output variables in functions and methods

According to the IEC 61131-3 standard, functions and methods have additional outputs. You have to assign these additional outputs when calling the function, as shown below.

Example

```
fun(iIn1 := 1, iIn2 := 2, iOut1 => iLoc1, iOut2 => iLoc2);
```

Input/Output Variable (VAR_IN_OUT)

A VAR_IN_OUT variable is an input/output variable, which is part of a POU interface and serves as a formal pass-by-reference parameter.

Syntax declaration

```
<keyword> <POU name>
VAR_IN_OUT
   <variable name> : <data type> ( := <initialization value> )? ;
END_VAR
<keyword> : FUNCTION | FUNCTION_BLOCK | METHOD | PRG
```

You can declare an input/output variable in the VAR_IN_OUT declaration section in the POU's PRG, FUNCTION_BLOCK, METHOD, or FUNCTION. As an option, a constant of the declared data type can be assigned as an initialization value. The VAR_IN_OUT variable can be read and written.
Usage

- **Call**: When a POU is called, the formal `VAR_IN_OUT` variable receives the actual variable (pass-by-reference variable) as the argument. At runtime, no copies are generated when parameters are passed. Instead, the formal variable receives a reference to the actual variable passed remotely. The referential variables contain a memory address internally as a value to the actual value (pass as pointer, call-by reference). It is not possible to specify a constant (literal) or a bit variable directly as an argument.

- **Read/write access within the POU**: If the variable is written to within the POU, then this affects the passed variable. When the POU is exited, any performed changes are retained. This means that a POU uses its `VAR_IN_OUT` variables just like the calling POU uses its variables. Read access is always permitted.

- **Read/write access remotely**: `VAR_IN_OUT` variables cannot be directly read or written remotely via `<function block instance name>..<variable name>`. This works only for `VAR_INPUT` and `VAR_OUTPUT` variables.

- **Passing string variables**: If a string variable is passed as an argument, then the actual variable and the formal variable should have the same length. Otherwise the passed string can be manipulated unintentionally. This problem does not occur in the case of `VAR_OUTPUT CONSTANT` parameters.

- **Passing bit variables**: A bit variable cannot be passed directly to a `VAR_IN_OUT` variable because it needs an intermediate variable.

- **Passing properties**: Not permitted.

---

| If a string is passed as a variable or a constant to a formal `VAR_IN_OUT CONSTANT` variable, then the string is automatically passed completely. You do not have to check the string length. |

---

See also

- Chapter “Transfer variable `VAR_IN_OUT CONSTANT`” on page 2117
Example

Passing arrays

```
TYPE DUT_A :
  STRUCT
    xA: BOOL;
    iB: INT;
  END_STRUCT
END_TYPE

FUNCTION_BLOCK FB_SetArray
  VAR_IN_OUT
    aData_A : ARRAY[0..1] OF DUT_A; // Formal variable
  END_VAR

  aData_A[0].xA := TRUE;
  aData_A[0].iB := 100;

PROGRAM PLC_PRG
  VAR
    fbSetA : FB_SetArray;
    aSpecialData : ARRAY[0..1] OF DUT_A; // Actual variable
  END_VAR

  fbSetA(aData_A := aSpecialData);
```

Passing strings

```
{attribute 'qualified_only'}
  VAR_GLOBAL
    g_sDEV_STATUS : STRING(25) := 'Device_A';
  END_VAR

  FUNCTION_BLOCK FB_SetStatus
    VAR_IN_OUT
      sDeviceStatus : STRING(25); // Formal parameter
    END_VAR

    sDeviceStatus := CONCAT(sDeviceStatus, ' Activ');

  PROGRAM PLC_PRG
    VAR
      fbDoB : FB_SetStatus;
    END_VAR

    fbDoB(sDeviceStatus := GVL.g_sDEV_STATUS); // Call with actual parameter

The variable sDeviceStatus is part of the POU interface of FB_B. When calling fbDoB, first a device name is assigned to the string and then the string is manipulated.
```

Passing bit variables

```
  VAR_GLOBAL
    xBit0 AT %MX0.1 : BOOL;
    xTemp : BOOL;
  END_VAR

  FUNCTION_BLOCK FB_DoSomething
    VAR_INPUT

```

{attribute 'qualified_only'}

PROGRAM PLC_PRG

VAR
  xIn : BOOL;
  DoSomething_1 : FB_DoSomething;
  DoSomething_2 : FB_DoSomething;
END_VAR

// The following line of code causes a compiler error:
// C0201: Typ 'BIT' is not equal to type 'BOOL' of VAR_IN_OUT 'xInOut'
DoSomething_1(xIn := xIn, xInOut := xBit0);

// Workaround
xTemp := xBit0;
DoSomething_2(xIn := xIn, xInOut := xTemp);
xBit0 := xTemp;

The program calls the function block instances DoSomething_1 and DoSomething_2. As a result of the direct assignment of the bit variable xBit0 to the VAR_IN_OUT input, a compiler error is generated when the DoSomething_1 instance is called. In contrast, calling the DoSomething_2 instance with the assignment of an intermediate variable is correct code.
**Example**

**Passing parameters of string constants and string variables**

```plaintext
FUNCTION funManipulate : BOOL
VAR_IN_OUT
  sReadWrite : STRING(16); (* Can be read or written here in POU *)
  dwVarReadWrite : DWORD; (* Can be read or written here in POU *)
END_VAR

VAR_IN_OUT CONSTANT
  c_sReadOnly : STRING(16); (* Constant string variable can only be read here in POU *)
END_VAR

sReadWrite := 'String_from_POU';
dwVarReadWrite := STRING_TO_DWORD(c_sReadOnly);

PROGRAM PRG_A
VAR
  sVarFits : STRING(16);
  sValFits : STRING(16) := '1234567890123456';
  dwVar : DWORD;
END_VAR

// The following line of code causes the compiler error C0417:
// C0417: VAR_IN_OUT parameter 'sReadWrite' needs a variable with write access as input.
funManipulate(sReadWrite:='1234567890123456',
c_sReadOnly:='1234567890123456',
dwVarReadWrite := dwVar);

// Correct code
funManipulate(sReadWrite := sValFits,
c_sReadOnly := '23',
dwVarReadWrite := dwVar);

funManipulate(sReadWrite := sVarFits,
c_sReadOnly := sValFits,
dwVarReadWrite := dwVar);
```

In the code, strings are passed to the `funManipulate` function via different `VAR_IN_OUT` variables. When passing a string literal, a compiler error is output to a `VAR_IN_OUT` variable. When passing a constant variable to a `VAR_IN_OUT` CONSTANT variable, correct code is generated even for passing string variables.

---

**Global variables - VAR_GLOBAL**

Global variables are ordinary variables, constants, external or remanent variables that are recognized within the entire project. You declare global variables in global variable lists or in the declaration section of programming objects between the keywords `VAR_GLOBAL` and `END_VAR`. 
The system recognizes a global variable when you prepend the variable name with a dot (for example,.iGlobVar1).

NOTICE!
If a local variable that is declared in a block has the same name as a global variable, then it has precedence within the block.

NOTICE!
For compiler version 3.2.0.0 and later, CODESYS always initializes global variables before the local POU variables.

Example

```plaintext
VAR_GLOBAL
   iVarGlob1 : INT;
END_VAR
```

See also
- Chapter 6.4.1.21.2.12 “Object ‘GVL’ - Global Variable List” on page 2465
- Chapter 6.4.1.20.3.70 “Operator - Global namespace” on page 2216

Temporary variable - VAR_TEMP

This function is an extension of the IEC 61131-3 standard.
You declare temporary variables locally between the keywords VAR_TEMP and END_VAR.

VAR_TEMP declarations are possible only in program blocks and function blocks.
CODESYS initializes temporary variables each time the block is called.
The application can access the temporary variables only in the implementation section of a program block or a function block.

Example

```plaintext
VAR_TEMP
   iVarTmp1 : INT; (*1st temporary variable *)
END_VAR
```

Static variables - VAR_STAT

This function is an extension of the IEC 61131-3 standard.
You declare static variables locally between the keywords VAR_STAT and END_VAR. CODESYS initializes static variables the first time each block is called.
You can access static variables only from within the namespace where the variables are declared (like static variables in C). But static variables retain their values when the application leaves the block. For example, you can use static variables as counters for function calls.
You can extend static variables with an attribute keyword.
Example

```plaintext
VAR_STAT
   iVarStat1 : INT;
END_VAR
```

See also

- Chapter 6.4.1.9.19 “Data Persistence” on page 1920

External variables - **VAR_EXTERNAL**

External variables are global variables that are imported into a block.

You declare these variables between the keywords **VAR_EXTERNAL** and **END_VAR**. If the global variable does not exist, then an error message is printed.

**NOTICE!**

CODESYS does not require you to declare a global variable as external in order to use it in a POU. The keyword exists only for maintaining compliance with IEC 61131-3.

Syntax

```
<POU keyword> <POU name>
VAR_EXTERNAL
    <variable name> : <data type>;
END_VAR
```

Initialization is not permitted.

Example

```plaintext
FUNCTION_BLOCK FB_DoSomething
VAR_EXTERNAL
   iVarExt1 : INT; (* 1st external variable *)
END_VAR
```

See also

- Chapter 6.4.1.21.2.12 “Object ‘GVL’ - Global Variable List” on page 2465

Instance variables - **VAR_INST**

CODESYS does not save a **VAR_INST** method variable in a method stack, but in the stack of the function block instance. This means that the **VAR_INST** variable functions like other Variables of the function block instance, and it is not reinitialized each time the method is called.

**VAR_INST** variables are permitted in methods only and you can access these variables only within the method. The variable values of instance variables are monitored in the declaration section of the method.

You can extend instance variable with an attribute keyword.
Example

```plaintext
METHOD meth_last : INT
VAR_INPUT
  iVar : INT;
END_VAR
VAR_INST
  iLast : INT := 0;
END_VAR
meth_last := iLast;
iLast := iVar;
```

Configuration variables - VAR_CONFIG

Use configuration variables for assigning complete addresses to variables that are declared in function blocks with incomplete addresses and will be mapped on device I/Os.

Declare the variables in a global variables list between VAR_CONFIG and END_VAR. The global variables list is termed "variables configuration", where you type the configuration variables with a complete instance path and the correct address.

Example

Declaration of the variable `xLocIn` with incomplete address `%I*` in a function block:

```plaintext
FUNCTION_BLOCK locio
VAR
  xLocIn AT %I* : BOOL := TRUE;
END_VAR
```

The `locio` function block is used in the `PLC_PRG` program:

```plaintext
PROGRAM PLC_PRG
VAR
  locioVar1 : locio;
END_VAR
```

The correct variables configuration in the global variable list is as follows:

```plaintext
VAR_CONFIG
  PLC_PRG.locioVar1.xLocIn AT %IX1.0 : BOOL;
END_VAR
```

See also

- Chapter 6.4.1.9.12.2 “Variables configuration - VAR_CONFIG” on page 1901

Constant Variables - 'CONSTANT'

Constant variables are declared in global variable lists or in the declaration part of programming objects. In implementations, constant variables can be accessed as read-only via the instance path.
CONSTANT

<identifier> : <data type> := <initial value> ;
END_VAR

VAR : VAR | VAR_INPUT | VAR_STAT | VAR_GLOBAL
<data type>: <elementary data type> | <user defined data type> |
<function block>
<initial value> : <literal value> | <identifier> | <expression>

Always assign an initialization value when declaring a constant variable. Then the constant cannot be written any more.

Example

Declaration

VAR CONSTANT
  c_rTAXFACTOR : REAL := 1.19;
END_VAR

Call

rPrice := rValue * c_rTAXFACTOR;

You have read-only access to constant variables in an implementation. Constant variables are located to the right of the assignment operator.

See also

- % Chapter 6.4.1.20.2.5 “Input/Output Variable (VAR_IN_OUT)” on page 2114
- % “Constants and literals” on page 2219

Persistent Variable - PERSISTENT

Persistent variables are declared in the declaration section VAR_GLOBAL RETAIN PERSISTENT in the persistent global variable list. For variables that are marked with the PERSISTENT keyword outside of the persistence editor, instance paths are added there.

As of CODESYS version 3.3.0.1, a variable declaration with PERSISTENT RETAIN has the same effect as with RETAIN PERSISTENT or PERSISTENT.

Syntax of the declaration in the global persistent variable list PersistentVars:

VAR_GLOBAL PERSISTENT RETAIN
  <identifier> : <data type> (:= <initialization>)?;
  <instance path to POU variable>
END_VAR

Syntax of the declaration in POU:

<scope> PERSISTENT RETAIN
  <identifier> : <data type> ( := <initialization> )?; // ( ... )? : Optional
  END_VAR
<scope> : VAR | VAR_INPUT | VAR_OUTPUT | VAR_IN_OUT | VAR_STAT | VAR_GLOBAL

An assignment of inputs, outputs, or memory addresses with the AT keyword is not permitted.

Never use the POINTER TO data type in persistent variable lists. If the application is downloaded again, their addresses could change. The corresponding compiler warnings are shown in the message window.
If you frequently change the names or data types of remanent variables, then it is better to declare them as retain variables with the `RETAIN` keyword only.

**NOTICE!**
Avoid inserting instance paths because in this case twice as much memory is used and a higher cycle time can occur. Instead, declare variables in the list of persistent variables.

**Example**

**Declaration in the persistent variable list**

```
{attribute 'qualified_only'}
VAR_GLOBAL PERSISTENT RETAIN
  g_iCounter : INT;
  // Generated instance path of persistent variable
  PLC_PRG.fb_A.iPersistentCounter_A: INT;
END_VAR
```

**Declaration in the function block FB_A:**

```
FUNCTION_BLOCK FB_A
  VAR_INPUT
  END_VAR
  VAR_OUTPUT
  END_VAR
  VAR PERSISTENT
    iPersistentCounter_A : INT;
  END_VAR
  VAR
    fb_A1 : FB_A;
  END_VAR
```

**Declaration in the program PLC_PRG:**

```
VAR
  fb_A1 : FB_A;
END_VAR
```

### Possible declaration locations

<table>
<thead>
<tr>
<th>Directly in the persistent global variable list</th>
<th>The variable is persistent and lies in the protected memory area.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Locally in a program with an instance path in the persistent variable list</td>
<td>The variable is persistent and located in the protected memory area and in the memory (double allocation).</td>
</tr>
<tr>
<td>Locally in a function block with an instance path in the persistent variable list</td>
<td></td>
</tr>
<tr>
<td>Only locally in a program</td>
<td>This variable is not persistent. A warning is shown in the message window.</td>
</tr>
<tr>
<td>Only locally in a function block</td>
<td>Hint: Click &quot;Declarations ➔ Add All Instance Paths&quot; to import the variables into the persistent variable list.</td>
</tr>
<tr>
<td>Locally in a function</td>
<td>This declaration does not have any effect. The variable is not persistent.</td>
</tr>
</tbody>
</table>
In the persistence editor, click “Declarations ➔ Add All Instance Paths” if local variables are marked with `PERSISTENT`.

Whenever possible, avoid marking variables, which are declared in a function block, with `PERSISTENT`. This is because the function block instance is stored entirely in remanent memory and not just the marked variable.

See also
- § Chapter 6.4.1.9.19 “Data Persistence” on page 1920
- § Chapter 6.4.1.21.3.18.4 “Command ‘Add all instance paths’” on page 2720

**Retain Variable - RETAIN**

Retain variables are declared by the keyword `RETAIN` is added in programming objects in the scope `VAR`, `VAR_INPUT`, `VAR_OUTPUT`, `VAR_IN_OUT`, `VAR_STAT`, or `VAR_GLOBAL`.

**Syntax for the declaration**

```
<scope> RETAIN
   <identifier>: <data type> ( := <initialization> )? // ( ... )? :
Optional
END_VAR
```

```
<scope> : VAR | VAR_INPUT | VAR_OUTPUT | VAR_IN_OUT | VAR_STAT | VAR_GLOBAL
```

An assignment of inputs, outputs, or memory addresses with the `AT` keyword is not permitted.

**Example**

**In a POU:**

```
VAR RETAIN
   iVarRetain: INT;
END_VAR
```

**In a GVL:**

```
VAR_GLOBAL RETAIN
   g_iVarRetain: INT;
END_VAR
```

**Possible declaration locations**

<table>
<thead>
<tr>
<th>Locally in a program</th>
<th>Only the variable is located in the retain memory area.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Info: When using redundancy, the entire program with all of its data is located in the retain memory area.</td>
</tr>
<tr>
<td>Globally in a global variable list</td>
<td>Only the variable is located in the retain memory area.</td>
</tr>
<tr>
<td></td>
<td>Info: When using redundancy, the entire global variable list with all of its data is located in the retain memory area.</td>
</tr>
<tr>
<td>Locally in a function block</td>
<td>The entire instance of the function block with all of its data is located in the retain memory area. Only the declared retain variable is protected.</td>
</tr>
<tr>
<td>Locally in a function</td>
<td>The variable is not located in the retain memory area. This declaration does not have any effect.</td>
</tr>
<tr>
<td>-----------------------</td>
<td>--------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Locally and persistently in a function</td>
<td>The variable is not located in the retain memory area. This declaration does not have any effect.</td>
</tr>
</tbody>
</table>

Whenever possible, avoid using `retain` to mark the variables of a function block.

See also
- [Chapter 6.4.1.9.19 “Data Persistence” on page 1920](#)
- [Chapter 6.4.1.21.3.18.4 “Command ‘Add all instance paths’” on page 2720](#)

**SUPER**

`SUPER` is a special variable and is used for object-oriented programming.

`SUPER` is the pointer of a function block to the basic function block instance from which the function block was generated. The `SUPER` pointer thus also permits access to the implementation of the methods of the basic function block (basic class). A `SUPER` pointer is automatically available for each function block.

You can use `SUPER` only in methods and in the associated function block implementations.

Dereferencing of the pointer: `SUPER^`

Use of the `SUPER` pointer: with the help of the keyword `SUPER` you call a method that is valid in the instance of the basic class or parent class.

**Examples**

ST:

```
SUPER^.METH_DoIt();
```

FBD/CFC/LD

![Diagram](image)

**THIS** is not yet implemented for the instruction list (IL).
Examples

Use of SUPER and THIS pointers

```plaintext
FUNCTION_BLOCK FB_Base
  VAR_OUTPUT
    iCnt : INT;
  END_VAR

  METHOD METH_DoIt : BOOL
    iCnt := -1;
  END_METHOD

  METHOD METH_DoAlso : BOOL
    METH_DoAlso := TRUE;
  END_METHOD

FUNCTION_BLOCK FB_1 EXTENDS FB_Base
  VAR_OUTPUT
    iBase : INT;
  END_VAR

  THIS^.METH_DoIt();  //Call of the methods of FB_1
  THIS^.METH_DoAlso();

  SUPER^.METH_DoIt();   //Call of the methods of FB_Base
  SUPER^.METH_DoAlso();
  iBase := SUPER^.iCnt;

  METHOD METH_DoIt : BOOL
    iCnt := 1111;
    METH_DoIt := TRUE;
  END_METHOD

PROGRAM PLC_PRG
  VAR
    myBase : FB_Base;
    myFB_1 : FB_1;
    iTHIS : INT;
    iBase : INT;
  END_VAR

  myBase();
  iBase := myBase.iCnt;
  myFB_1();
  iTHIS := myFB_1.iCnt;
```

See also
- Chapter 6.4.1.20.5 “Data Types” on page 2234
- Chapter 6.4.1.20.2.16 “THIS” on page 2126

THIS

THIS is a special variable and is used for object-oriented programming. THIS is the pointer of a function block to its own function block instance. A THIS pointer is automatically available for each function block.

You can use THIS only in methods and in function blocks. THIS is available for the implementation in the input assistant in the category “Keywords”.

Dereferencing of the pointer: THIS^
Use of the **THIS** pointer

- If a local variable obscures a function block variable in a method, you can set the function block variable with the **THIS** pointer. See example below (1)
- If the pointer to the function block's own function block instance is referenced for use in a function. (See example below (2))

**Examples**

**ST:**

```
THIS^.METH_DoIt();
```

**FBD/CFC/LD:**

![Diagram]

**THIS** is not yet implemented for the instruction list (IL).
Examples

(1) The local variable iVarB obscures the function block variable iVarB.

```plaintext
FUNCTION_BLOCK fbA
  VAR_INPUT
  iVarA: INT;
  END_VAR
  iVarA := 1;

FUNCTION_BLOCK fbB EXTENDS fbA
  VAR_INPUT
  iVarB: INT := 0;
  END_VAR
  iVarA := 11;
  iVarB := 2;

METHOD DoIt : BOOL
  VAR_INPUT
  END_VAR
  iVarB: INT;
  END_VAR
  iVarB := 22;    // The local variable iVarB is set.
  THIS^.iVarB := 222;    // The function block variable iVarB is set even though iVarB is obscured.

PROGRAM PLC_PRG
  VAR
    MyfbB: fbB;
  END_VAR
  MyfbB(iVarA:=0, iVarB:= 0);
  MyfbB.DoIt();
```

(2) A function call requires the reference to its own instance.

```plaintext
FUNCTION funA
  VAR_INPUT
  pFB: fbA;
  END_VAR
  ...;

FUNCTION_BLOCK fbA
  VAR_INPUT
  iVarA: INT;
  END_VAR
  ...;

FUNCTION_BLOCK fbB EXTENDS fbA
  VAR_INPUT
  iVarB: INT := 0;
  END_VAR
  iVarA := 11;
  iVarB := 2;

METHOD DoIt : BOOL
  VAR_INPUT
  END_VAR
  iVarB: INT;
  END_VAR
  iVarB := 22;    // The local variable iVarB is set.
  funA(pFB := THIS^);    // funA is called via THIS^.

PROGRAM PLC_PRG
```
VAR
  MyfbB: fbB;
END_VAR
MyfbB(iVarA:=0 , iVarB:= 0);
MyfbB.DoIt();

6.4.1.20.3 Operators

General

CODESYS V3 supports all IEC-61131-3 operators. These operators are recognized implicitly throughout the project. In addition to these IEC operators, CODESYS also supports some non-IEC 61131-3 operators.

Operators are used in blocks, such as functions.

> For information about the processing order (binding strength) of the ST operators, please refer to the section on ST expressions.

> CAUTION!
For operations with floating-point data types, the computational result depends on the applied target system hardware.

> CAUTION!
For operations with overflow or underflow in the data type, the computational result depends on the applied target system hardware.

Overflow/underflow in the data type

The CODESYS compiler generates code for the target device and computes temporary results always with the native size that is defined by the target device. For example, computation is performed at least with 32-bit temporary values on x86 and ARM systems and always with 64-bit temporary values on x64 systems. This provides considerable advantages in the computation speed and often also produces the desired result. But this also means that an overflow or underflow in the data type is not truncated in some cases.
**Examples**

**Example 1**
The result of this addition is not truncated and the result in `dwVar` is 65536.

```plaintext
VAR
wVar : WORD;
dwVar: DWORD;
END_VAR

wVar := 65535;
dwVar := wVar + 1;
```

**Example 2**
The overflow and underflow in the data type is not truncated and the results (`bVar1`, `bVar2`) of both comparisons are `FALSE` on 32-bit and 64-bit hardware.

```plaintext
VAR
wVar1 : WORD;
wVar2 : WORD;
bVar1 : BOOL;
bVar2 : BOOL;
END_VAR

wVar1 := 65535;
wVar2 := 0;
bVar1 := (wVar1 + 1) = wVar2;
bVar2 := (wVar2 - 1) = wVar1;
```

**Example 3**
By the assignment to `wVar3`, the value is truncated to the target data type `WORD` and the result `bVar1` is `TRUE`.

```plaintext
VAR
wVar1 : WORD;
wVar2 : WORD;
wVar3 : WORD;
bVar1 : BOOL;
END_VAR

wVar1 := 65535;
wVar2 := 0;
wVar3 := (wVar1 + 1);
bVar1 := wVar3 = wVar2;
```

**Example 4**
In order to force the compiler to truncate the temporary results, a conversion can be inserted. The type conversion makes sure that both comparisons are 16-bit only and the results (`bVar1`, `bVar2`) of both comparisons are each `TRUE`.

```plaintext
VAR
wVar1 : WORD;
wVar2 : WORD;
bVar1 : BOOL;
bVar2 : BOOL;
END_VAR

wVar1 := 65535;
wVar2 := 0;
bVar1 := TO_WORD(wVar1 + 1) = wVar2;
bVar2 := TO_WORD(wVar2 - 1) = wVar1;
```

- Chapter 6.4.1.20.3.24 “Operator ‘LIMIT’” on page 2147
- Chapter 6.4.1.20.3.25 “Operator ‘MUX’” on page 2147

### Comparison operators
A comparison operator is a Boolean that compares two inputs (first and second operand).
- Chapter 6.4.1.20.3.26 “Operator ‘GT’” on page 2148
- Chapter 6.4.1.20.3.27 “Operator ‘LT’” on page 2148
- Chapter 6.4.1.20.3.28 “Operator ‘LE’” on page 2148
- Chapter 6.4.1.20.3.29 “Operator ‘GE’” on page 2149
- Chapter 6.4.1.20.3.30 “Operator ‘EQ’” on page 2149
- Chapter 6.4.1.20.3.31 “Operator ‘NE’” on page 2149

### Address operators
- Chapter 6.4.1.20.3.32 “Operator ‘ADR’” on page 2150
- Chapter 6.4.1.20.3.33 “Operator ‘Content Operator’” on page 2151
- Chapter 6.4.1.20.3.34 “Operator ‘BITADR’” on page 2151

### Call operators
- Chapter 6.4.1.20.3.35 “Operator ‘CAL’” on page 2152
You can explicitly call type conversion operators. The type conversion operators described below are available for typed conversions from one elementary type to another elementary type, as well as for overloading. Conversions from a larger type to a smaller type are also implicitly possible (for example, from `INT` to `BYTE` or from `DINT` to `WORD`).

**Typed conversion**: `<elementary data type> _TO_ <another elementary data type>`

**Overloaded conversion**: `TO_ <elementary data type>`

**Elementary data types:**

- `<elementary data type> =
  - UXINT | XINT | _XWORD | BIT | BOOL | BYTE | DATE | DATE_AND_TIME |
  - DINT | DT | DWORD | INT | LDATE | LDATE_AND_TIME | LDT | LINT |
  - LREAL | LTIME | LTOD | LWORD | REAL | SINT | TIME | TOD | UDINT |
  - UINT | ULINT | USINT | WORD`

The keywords `T`, `TIME_OF_DAY` and `DATE_AND_TIME` are alternative forms for the data types `TIME`, `TOD`, and `DT`. `T`, `TIME_OF_DAY` and `DATE_AND_TIME` are not represented as a type conversion command.

**NOTICE!**

If the operand value for a type conversion operator is outside of the value range of the target data type, then the result output depends on the processor type and is therefore undefined. This is the case, for example, when a negative operand value is converted from `LREAL` to the target data type `UINT`.

Information can be lost when converting from larger data types to smaller data types.

**NOTICE!**

String manipulation when converting to STRING or WSTRING

When converting the type to STRING or WSTRING, the typed value is left-aligned as a character string and truncated if it is too long. Therefore, declare the return variable for the type conversion operators `<>_TO_STRING` and `<>_TO_WSTRING` long enough that the character string has enough space without any manipulation.

- Chapter 6.4.1.20.3.52 “Operator ‘COS’” on page 2196
Namespace operators

Namespaces operators are extended from IEC 61131-3 operators. They make it possible for you to provide unique access to variables and modules, even when you use the same name multiple times for variables or modules in a project.

- Chapter 6.4.1.20.3.70 “Operator - Global namespace” on page 2216
- Chapter 6.4.1.20.3.71 “Operator - Namespace for global variables lists” on page 2216
- Chapter 6.4.1.20.3.73 “Operator - Enumeration namespace” on page 2217
- Chapter 6.4.1.20.3.72 “Operator - Library namespace” on page 2217
- Chapter 6.4.1.20.3.74 “Operator '__POOL''” on page 2217

Multicore operators

Working with different tasks requires the synchronization of these tasks. This is especially true when working on multicore platforms. Some special operators are provided in CODESYS to support this synchronization.

These operators are extensions of IEC-61131-3. The operators TEST_AND_SET and __COMPARE_AND_SWAP are used for similar tasks.

- Chapter 6.4.1.20.3.69 “Operator 'TEST_AND_SET'” on page 2215
- Chapter 6.4.1.20.3.65 “Operator '__COMPARE_AND_SWAP” on page 2212
- Chapter 6.4.1.20.3.66 “Operator '__XADD''” on page 2213

Other operators

- Chapter 6.4.1.20.3.57 “Operator 'DEL__ELE''” on page 2198
- Chapter 6.4.1.20.3.58 “Operator '__ISVALIDREF’'' on page 2201
- Chapter 6.4.1.20.3.59 “Operator '__NEW’” on page 2201
- Chapter 6.4.1.20.3.60 “Operator '__QUERYINTERFACE’’ on page 2204
- Chapter 6.4.1.20.3.61 “Operator '__QUERYPOINTER’’ on page 2205
- Chapter 6.4.1.20.3.75 “Operator '__POINTER’’ on page 2218
- Chapter 6.4.1.20.3.62 “Operators '__TRY', '__CATCH', '__FINALLY', '__ENDTRY’’ on page 2206
- Chapter 6.4.1.20.3.67 “Operator '__POSITION’’ on page 2214
- Chapter 6.4.1.20.3.68 “Operator '__POUNAME’’ on page 2214

Operator 'ADD'

The IEC operator adds variables.

Permitted data types: __UXINT | __XINT | __XWORD | BYTE | DATE | DATE_AND_TIME | DINT | DT | DWORD | INT | LDATE | LDATE_AND_TIME | LDT | LINT | LREAL | LTOD | LWORD | REAL | SINT | TIME | TIME_OF_DAY | TOD | UDINT | UINT | USINT | WORD

Possible combinations for time data types:

- TIME + TIME = TIME
- TIME + LTIME = LTIME
- LTIME + LTIME = LTIME
Possible combinations for date and time data types:

- TOD + TIME = TOD
- DT + TIME = DT
- TOD + LTIME = LTOD
- DT + LTIME = LDT
- LTOD + TIME = LTOD
- LDT + LTIME = LDT
- LTOD + LTIME = LTOD
- LDT + LTIME = LDT

Feature in the FBD/LD editor: You can extend the **ADD** operator to function block inputs. The number of additional function block inputs is limited.

**Examples**

**ST:**

```plaintext
var1 := 7+2+4+7;
```

**FBD:**

![FBD diagram showing variable addition]

**Operator 'MUL'**

This IEC operator is used for multiplying variables.

**Permitted data types:** BYTE, WORD, DWORD, LWORD, SINT, USINT, INT, UINT, DINT, UDINT, LINT, ULINT, REAL, LREAL, TIME

Feature in the FBD/LD editor: You can extend the **MUL** operator to additional function block inputs. The number of additional function block inputs is limited.
Examples

\[
\text{ST:} \\
\text{var1 := 7*2*4*7;}
\]

\[
\text{FBD:}
\]

Operator 'SUB'

The IEC operator subtracts variables.

Permitted data types: BYTE, WORD, DWORD, LWORD, SINT, USINT, INT, UINT, DINT, UDINT, LINT, ULINT, REAL, LREAL, TIME, LTIME, TIME_OF_DAY (TOD), LTIME_OF_DAY (LTOD), DATE, LDATE, DATE_AND_TIME (DT), LDATE_AND_TIME (LDT)

Possible combinations for time data types:
- TIME - TIME = TIME
- LTIME - LTIME = LTIME

Possible combinations for date and time data types:
- DATE - DATE = TIME
- LDATE - LDATE = LTIME
- TOD - TIME = TOD
- LTOD - LTIME = LTOD
- TOD - TOD = TIME
- LTOD - LTOD = LTIME
- DT - TIME = DT
- LDT - LTIME = LDT
- DT - DT = TIME
- LDT - LDT = LTIME

Negative TIME/LTIME values are undefined.
Examples

**ST:**

```plaintext
var1 := 7-2;
```

**FBD:**

```
7 SUB Var1
```

---

**Operator 'DIV'**

This IEC operator is used for dividing variables.

**Permitted data types:** BYTE, WORD, DWORD, LWORD, SINT, USINT, INT, UINT, DINT, UDINT, LINT, ULINT, REAL, LREAL, TIME

---

**NOTICE!**

Division by zero may have different results depending on the target system.

---

Examples

**ST:**

```plaintext
var1 := 8/2;
```

**FBD:**

1. Series of DIV blocks, 2. Single DIV block, 3. DIV blocks with EN/ENO parameters

---

```
var1 66 DIV 66 var3 1
```

```
var1 66 DIV 66 var3 1
```

```
var1 66 DIV 66 var3 1
```

```
start TRUE 66 DIV 66 var3 1 end TRUE
```

---

*Please note that it is possible to monitor division by zero at runtime by using the implicit monitoring functions CheckDivInt, CheckDivLInt, CheckDivReal, and CheckDivLReal.*

---

**See also**

- ☞ Chapter 6.4.1.21.2.22.3 “POU 'CheckDivInt'” on page 2505
- ☞ Chapter 6.4.1.21.2.22.4 “POU 'CheckDivLInt'” on page 2505
- ☞ Chapter 6.4.1.21.2.22.5 “POU 'CheckDivReal'” on page 2506
- ☞ Chapter 6.4.1.21.2.22.6 “POU 'CheckDivLReal'” on page 2507
Operator 'MOD'

This IEC operator is used for modulo division.
The result of the function is the integer remainder of division.
Permitted data types: BYTE, WORD, DWORD, LWORD, SINT, USINT, INT, UINT, DINT, UDINT, LINT, ULINT

```
NOTICE!
Division by zero may have different results depending on the target system.
```

### Examples

Result in Var1: 1

**ST:**

```
var1 := 9 MOD 2;
```

**FBD:**

![MOD block diagram]

Operator 'MOVE'

This IEC operator is used for assigning a variable to another variable of a corresponding type.
Because the MOVE block is available in the CFC, FBD, and LD editors, you can also use the EN/ENO functionality for variable assignment.

**CFC with EN/ENO function:**

CODESYS assigns the value of var1 to var2 only if "en_i" yields TRUE.

```
ST:
ivar2 := MOVE(ivar1);
```

This corresponds to:
```
ivar2 := ivar1;
```

Operator 'INDEXOF'

This operator is an extension of the IEC 61131-3 standard.
Instead of the INDEXOF operator, the ADR operator is provided in CODESYS V3 for obtaining a pointer at the index of a block.

See also
- Chapter 6.4.1.20.3.32 “Operator ‘ADR’” on page 2150
Operator ‘SIZEOF’

The operator is an extension of the IEC 61131-3 standard.

The operator is used for defining the number of bytes that are required by the variable \(x\). The operator \(\text{SIZEOF}\) always yields an unsigned value. The type of return variable adapts to the detected size of the variable \(x\).

In compiler version 3.5.16.0 and higher, the operator \(\text{XSIZEOF}\) should be used instead of this operator.

<table>
<thead>
<tr>
<th>Return value of (\text{SIZEOF}(x))</th>
<th>Data type of the constant which CODESYS uses implicitly for the detected size.</th>
</tr>
</thead>
<tbody>
<tr>
<td>(0 \leq \text{size of } x &lt; 256)</td>
<td>(\text{USINT})</td>
</tr>
<tr>
<td>(256 \leq \text{size of } x &lt; 65536)</td>
<td>(\text{UINT})</td>
</tr>
<tr>
<td>(65536 \leq \text{size of } x &lt; 4294967296)</td>
<td>(\text{UDINT})</td>
</tr>
<tr>
<td>(4294967296 \leq \text{size of } x)</td>
<td>(\text{ULINT})</td>
</tr>
</tbody>
</table>

Examples

Result in \(\text{var1} : 10\).

\[
\text{ST:}
\[
\begin{align*}
\text{arr1} & : \text{ARRAY}[0..4] \text{ OF INT;} \\
\text{var1} & : \text{INT;} \\
\text{var1} & := \text{SIZEOF(arr1); (}\ast \text{ var1} := \text{USINT#10; }\ast
\end{align*}
\]

See also

- Chapter 6.4.1.20.3.10 “Operator ‘XSIZEOF’” on page 2138

Operator ‘XSIZEOF’

The operator is an extension of the IEC 61131-3 standard.

The operator is used for defining the number of bytes that are required by the variable \(x\). The data type of the return value is \(\text{ULINT}\) on 64-bit platforms and \(\text{UDINT}\) on all other platforms.

The operator \(\text{XSIZEOF}\) should be used instead of the operator \(\text{SIZEOF}\). Because the data type of the return value is fixed, problems do not occur for \(\text{XSIZEOF}\), which do occur in the case of the operator \(\text{SIZEOF}\).

Example

Variable \(\text{udiVarX}\) is

\[
\text{ST:}
\[
\begin{align*}
\text{udiVarX} & : \text{UDINT;} (\ast \text{ Data type for 64-bit platforms: ULINT }\ast) \\
\text{udiVarX} & := \text{XSIZEOF(<variable>)};
\end{align*}
\]

The variable \(\text{udiVarX}\) contains the number of bytes that the variable \(<\text{variable}>\) requires.

See also

- Chapter 6.4.1.20.3.9 “Operator ‘SIZEOF’” on page 2138
Operator 'NOT'

This IEC operator is used for the bitwise NOT of a bit operand. When the respective input bit yields 0, the output bit also yields 1, and vice-versa.

Permitted data types: BOOL, BYTE, WORD, DWORD, LWORD

Examples

Result in var1: 2#0110_1100

ST:
var1 := NOT 2#1001_0011;

FBD:

Operator 'AND'

This IEC operator is used for the bitwise AND of bit operands. When the input bits all yield 1, the output bit also yields 1; otherwise 0.

Permitted data types: BOOL, BYTE, WORD, DWORD, LWORD

Examples

Result in var1: 2#1000_0010

ST:
var1 := 2#1001_0011 AND 2#1000_1010;

FBD:

Operator 'OR'

This IEC operator is used for the bitwise OR of bit operands. When at least one of the input bits yields 1, the output bit also yields 1; otherwise 0.

Permitted data types: BOOL, BYTE, WORD, DWORD, LWORD

Examples

Result in Var1: 2#1001_1011

ST:
Var1 := 2#1001_0011 OR 2#1000_1010;

FBD:
Operator 'XOR'

This IEC operator is used for the bitwise XOR of bit operands.

When only one of the two input bits yields 1, the output bit also yields 1. When both inputs yield 1 or 0, then the output yields 0.

Permitted data types: BOOL, BYTE, WORD, DWORD, LWORD

NOTICE!

Please note the following behavior of the XOR block in extended form (more than two inputs): CODESYS compares the inputs in pairs and then the corresponding results (according to the standard, but not necessarily according to expectations).

Example:

Result in var1: 2#0001_1001

ST:

var1 := 2#1001_0011 XOR 2#1000_1010;

FBD:

Operator 'AND_THEN'

This operator is an extension of the IEC 61131-3 standard.

The AND_THEN operator is permitted only for programming in structured text with the AND operation of BOOL and BIT operands with short-circuit evaluation. This means that:

When all operands yield TRUE, the result of the operands also yield TRUE; otherwise FALSE.

However, CODESYS also executes the expressions on other operands only if the first operand of the AND_THEN operator is TRUE. This can prevent problems with null pointers, for example in conditions such as IF (ptr <> 0 AND_THEN ptr^ = 99) THEN....

In contrast, CODESYS always evaluates all operands when using the AND IEC operator.

See also

● Chapter 6.4.1.20.3.12 “Operator ‘AND’” on page 2139

Operator 'OR_ELSE'

This operator is an extension of the IEC 61131-3 standard.

The OR_ELSE operator is permitted only for programming in structured text: OR operation of BOOL and BIT operands; with short-circuit evaluation. This means:

When at least one of the operands yields TRUE, the result of the operation also yields TRUE; otherwise FALSE.

In contrast to using the OR IEC operator, for OR_ELSE the expressions on all other operators are not evaluated as soon as one of the operands is evaluated as TRUE.
Example

VAR
   bEver: BOOL;
   bX: BOOL;
   dw: DWORD := 16#000000FF;
END_VAR
bEver := FALSE;
bX := dw.8 OR_ELSE dw.1 OR_ELSE dw.1 OR_ELSE (bEver := TRUE);

\textit{dw.8} is FALSE and \textit{dw.1} is TRUE; therefore \textit{bX} is the result of the operation TRUE. However, the expression at the third input is not executed, and \textit{bEver} remains FALSE. On the other hand, if the standard OR operation was used, \textit{bEver} would be set to TRUE.

See also

- Chapter 6.4.1.20.3.13 “Operator ‘OR’” on page 2139

Operator ‘SHL’

This IEC operator is used for bitwise shift of an operand to the left.

\[ \text{erg} := \text{SHL} \left( \text{in}, \ n \right) \]

\textit{in}: Operand that is shifted to the left
\textit{n}: Number of bits to shift \textit{in} to the left

\begin{itemize}
\item \textbf{NOTICE!}
\begin{itemize}
\item If \textit{n} overwrites the data type width, then it depends on the target system how the \texttt{BYTE}, \texttt{WORD}, \texttt{DWORD}, and \texttt{LWORD} operands are padded. The target systems cause padding with zeros or \textit{n} MOD \texttt{<tab width>}
\end{itemize}
\end{itemize}

\begin{itemize}
\item \textbf{NOTICE!}
\begin{itemize}
\item Please note the number of bits that CODESYS uses for this operation as defined by the data type of the input variable \textit{in}.
\end{itemize}
\end{itemize}
The results for \texttt{erg\_byte} and \texttt{erg\_word} are different, although the values of the \texttt{in\_byte} and \texttt{in\_word} input variables are the same and the data types of the input variables are different.

\textbf{ST:}

\begin{verbatim}
PROGRAM shl_st
VAR
  in\_byte : BYTE := 16#45; (* 2#01000101 *)
  in\_word : WORD := 16#0045; (* 2#0000000001000101 *)
  erg\_byte : BYTE;
  erg\_word : WORD;
  n: BYTE := 2;
END_VAR

  erg\_byte := SHL(in\_byte,n); (* Result is 16#14, 2#00010100 *)
  erg\_word := SHL(in\_word,n); (* Result is 16#0114, 2#0000000100010100 *)
\end{verbatim}

\textbf{FBD:}

\begin{center}
\includegraphics[width=0.3\textwidth]{shl.png}
\end{center}

\textbf{Operator 'SHR'
}

This IEC operator is used for bitwise shift of an operand to the right.

\begin{verbatim}
  erg := SHR (in, n)
\end{verbatim}

\texttt{in}: Operand that is shifted to the right

\texttt{n}: Number of bits for shifting \texttt{in} to the right

\begin{center}
\begin{tabular}{|c|}
\hline
\textbf{NOTICE!} \\
If \texttt{n} overwrites the data type width, then it depends on the target system how the \texttt{BYTE}, \texttt{WORD}, \texttt{DWORD}, and \texttt{LWORD} operands are padded. The target systems cause padding with zeros or \texttt{n MOD <tab width>}. \\
\hline
\end{tabular}
\end{center}
**Examples**

```plaintext
PROGRAM shr_st
VAR
  in_byte : BYTE := 16#45; (* 2#01000101 *)
  in_word : WORD := 16#0045; (* 2#0000000001000101 *)
  erg_byte : BYTE;
  erg_word : WORD;
  n: BYTE := 2;
END_VAR

  erg_byte := SHR(in_byte, n); (* Result is 16#11, 2#00010001 *)
  erg_word := SHR(in_word, n); (* Result is 16#0011, 2#00000000010001 *)

FBD:
```

**Operator 'ROL'**

This IEC operator is used for bitwise rotation of an operand to the left.

**Permitted data types:** BYTE, WORD, DWORD, LWORD

```plaintext
erg := ROL (in, n)
```

CODESYS moves `in` `n`-times one bit to the left and adds the bit to the leftmost position from the right.

**NOTICE!**

Please note the number of bits that CODESYS uses for this operation as defined by the data type of the input variable `in`. If this is a constant, then CODESYS uses the smallest possible data type. The data type of the output variables still does not influence this operation.
The results for erg_byte and erg_word are different depending on the data type of the input variables, although the values of the in_byte and in_word input variables are the same.

**ST:**

```plaintext
PROGRAM rol_st

VAR
  in_byte : BYTE := 16#45;
  in_word : WORD := 16#45;
  erg_byte : BYTE;
  erg_word : WORD;
  n: BYTE := 2;
END_VAR

  erg_byte := ROL(in_byte,n); (* Result: 16#15 *)
  erg_word := ROL(in_word,n); (* Result: 16#0114 *)
```

**FBD:**

```
FBD:
```

**IL:**

```
IL:
LD in_byte
ROL n
ST erg_byte
```

---

**Examples**

**Operator 'ROR'**

This IEC operator is used for bitwise rotation of an operand to the right.

Permitted data types: BYTE, WORD, DWORD, LWORD

```plaintext
erg := ROR(in,n)
```

CODESYS moves in n-times one bit to the right and adds the bit to the rightmost position from the left.

Please note the number of bits that CODESYS uses for this operation as defined by the data type of the input variable in. If this is a constant, then CODESYS uses the smallest possible data type. The data type of the output variables still does not influence this operation.
The results for `erg_byte` and `erg_word` are different depending on the data type of the input variables, although the values of the `in_byte` and `in_word` input variables are the same.

**ST:**

```plaintext
PROGRAM ror_st

VAR
    in_byte : BYTE := 16#45;
    in_word : WORD := 16#45;
    erg_byte : BYTE;
    erg_word : WORD;
    n: BYTE := 2;
END_VAR

erg_byte := ROR(in_byte,n); (* Result: 16#51 *)
erg_word := ROR(in_word,n); (* Result: 16#4011 *)
```

**FBD:**

The IEC operator is used for bitwise selection.

```plaintext
OUT := SEL(G, IN0, IN1)
```

**NOTICE!**

When `G` is TRUE, CODESYS does not compute an expression that precedes `IN0`. When `G` is FALSE, CODESYS does not compute an expression that precedes `IN1`.

Caution: In the case of graphical programming languages, the expressions at `IN0` and `IN1` are computed independently of the `G` input when a “Box”, “Jump”, “Return”, “Line Branch”, or “Edge Detection” precedes.

Permitted data types:

- `IN0`, ..., `INn` and `OUT`: Any identical data type. Make sure that variables of the identical type are used at all three positions, especially when using user-defined data types. The compiler checks for type identity and returns any compile errors. The assignment of function block instances to interface variables is specifically not supported.

```plaintext
G: BOOL
```
Examples

ST:
Var1 := SEL(TRUE, 3, 4); (* Result: 4 *)

FBD:

Operator 'MAX'
This IEC operator is used for the maximum function. It yields the largest value of two values.

OUT := MAX(IN0, IN1)

Permitted data types: all

Examples

ST:
Result: 90
Var1 := MAX(30, 40);
Var1 := MAX(40, MAX(90, 30));

FBD:
Result: 90

Operator 'MIN'
This IEC operator is used for the minimum function. It yields the smallest value of two values.

OUT := MIN(IN0, IN1)

Permitted data types: all
Examples

Result: 30

ST:
Var1 := MIN(90, 30);
Var1 := MIN(MIN(90, 30), 40);

FBD:

![FBD Diagram]

Operator 'LIMIT'

This IEC selection operator is used for limiting.

\[
\text{OUT} := \text{LIMIT} (\text{Min}, \text{IN}, \text{Max})
\]

**Means:**
\[
\text{OUT} := \text{MIN} \left( \text{MAX} \left( \text{IN}, \text{Min} \right), \text{Max} \right)
\]

Max is the upper limit and Min is the lower limit for the result. If the IN value is above the Max upper limit, then LIMIT yields Max. If the value of IN is below the Min lower limit, then the result is Min.

Permitted data types for IN and OUT: all

Examples

Result in Var1 is 80

ST:
Var1 := LIMIT(30, 90, 80);

Operator 'MUX'

This IEC operator is used as a multiplexer.

\[
\text{OUT} := \text{MUX} (\text{K}, \text{IN0}, ..., \text{INn})
\]

**Means:**
\[
\text{OUT} = \text{IN}_K
\]

Permitted data type for K: BYTE, WORD, DWORD, LWORD, SINT, USINT, INT, UINT, DINT, LINT, ULINT, UDINT.

IN0, ..., INn, and OUT: Any identical data type. Make sure that variables of the identical type are used at all three positions, especially when using user-defined data types. The compiler checks for type identity and returns any compile errors. The assignment of function block instances to interface variables is specifically not supported.

MUX selects the K-th value from a set of values. The first value is K=0. If K is greater than the number of other inputs (n), then CODESYS passes on the last value (INn).

**NOTICE!**

For runtime optimization, CODESYS computes only the expression that precedes \text{IN}_K. However, CODESYS computes all branches in simulation mode.
**Examples**

Result in Var1 is 30.

**ST:**

```
Var1 := MUX(0, 30, 50, 60, 70, 80);
```

---

**Operator 'GT'**

This IEC operator is used for the "greater than" function.
Permitted data types of the operands: any basic data type.
If the first operand is greater than the second operand, then the operator yields the result **TRUE**; otherwise **FALSE**.

**Examples**

Result: FALSE

**ST:**

```
VAR1 := 20 > 30;
```

**FBD:**

---

**Operator 'LT'**

This IEC operator is used for the "less than" function.
Permitted data types of the operands: any basic data type.
If the first operand is less than the second operand, then the operator yields the result **TRUE**; otherwise **FALSE**.

**Examples**

Result: TRUE

**ST:**

```
Var1 := 20 < 30;
```

---

**Operator 'LE'**

This IEC operator is used for the "less than or equal to" function.
Permitted data types of the operands: any basic data type.
If the first operand is less than or equal to the second operand, then the operator yields the result **TRUE**; otherwise **FALSE**.
Examples

Result in `Var1`: TRUE

**ST:**

\[ Var1 := 20 \leq 30; \]

---

**Operator 'GE'**

This IEC operator is used for the "greater than or equal to" function.

Permitted data types of the operands: any basic data type.

If the first operand is greater than or equal to the second operand, then the operator yields the result TRUE; otherwise FALSE.

Examples

Result: TRUE

**ST:**

\[ VAR1 := 60 \geq 40; \]

**FBD:**

---

**Operator 'EQ'**

This IEC operator is used for the "equals" function.

Permitted data types of the operands: any basic data type, depending on target system and compiler version: structure data type.

If the operands are equal, then then the operator yields the result TRUE, otherwise FALSE.

Examples

Result: TRUE

**ST:**

\[ VAR1 := 40 = 40; \]

**FBD:**

---

**Operator 'NE'**

This IEC operator is used for the "does not equal" function.

Permitted data types of the operands: any basic data type, depending on target system and compiler version: structure data type.
If the operands are not equal, then the operator yields the result \texttt{TRUE}; otherwise \texttt{FALSE}.
If the target system supports the data type, then as from compiler version $\geq 3.5.7.0$ also operands of type \texttt{STRUCT} (structure) can be compared. Example: \texttt{IF (stStruct1 := stStruct2) THEN...}.

**Examples**

Result in \texttt{Var1} is \texttt{FALSE}

**ST:**

\texttt{Var1 := 40 <> 40;}

**FBD:**

\begin{figure}[h]
\centering
\includegraphics[width=0.3\textwidth]{ne.png}
\caption{Example of \texttt{NE} in FBD}
\end{figure}

**Operator \texttt{`ADR`}**

The operator is an extension of the IEC 61131-3 standard. \texttt{ADR} yields the 32-bit address (or the 64-bit address, if possible) of its argument. You can pass this address to the manufacturer functions or assign them to a pointer in the project.

**Syntax**

\begin{verbatim}
VAR <address name> : DWORD | LWORD | POINTER TO < basis data type>
END_VAR

<address name> := ADR( <variable name> );
\end{verbatim}

**Example**

\begin{verbatim}
FUNCTION_BLOCK FB_Address
VAR
   piAddress1: POINTER TO INT;
   iNumber1: INT := 5;
   lwAddress2
   iNumber2: INT := 10;
END_VAR

piAddress1 := ADR(iNumber1); // piNumber is assigned to address of iNumber1
lwAddress2 := ADR(iNumber2); // 64 bit runtime system
\end{verbatim}

**NOTICE!**

In contrast to CoDeSys V2.3, you can use the \texttt{ADR} operator with function names, program names, function block names, and method names. Therefore, \texttt{ADR} replaces the \texttt{INDEXOF} operator.

When using function pointers, note that you can pass a function pointer to external libraries, but it is not possible to call a function pointer from within CODESYS. To enable a system call (runtime system), you must set the respective object property ("Build" tab) for the function object.
CAUTION!
When you use an online change, the contents of addresses can shift. As a result, POINTER TO variables could point to an invalid memory area. To avoid problems, you should make sure that the value of pointers is updated in every cycle.

CAUTION!
Do not return Pointer-TO variables of functions and methods to the caller or assign them to global variables.

See also
● § Chapter 6.4.1.20.5.13 “Pointers” on page 2243

Operator 'Content Operator'

This operator is an extension of the IEC 61131-3 standard.

You can use this operator to dereference pointers by appending the operator as ^ to the pointer identifier.

CAUTION!
When using pointers to addresses, please note that applying an online change can shift address contents.

Example

ST:

pt : POINTER TO INT;
var_int1 : INT;
var_int2 : INT;
pt := ADR(var_int1);
var_int2 := pt^;

Operator 'BITADR'

The operator is an extension of the IEC 61131-3 standard.

BITADR yields the bit offset within a segment in a DWORD.

NOTICE!
The offset depends on whether the "Byte addressing" option is selected or cleared in the target system settings.

The highest value nibble (4 bits) in this DWORD defines the memory range:

Marker M: 16#40000000
Input I: 16#80000000
Output Q: 16#C0000000
CAUTION!
When using pointers to addresses, note that applying an online change can shift the contents of addresses.

Example

ST implementation language:

VAR
  xVar AT %IX2.3 : BOOL;
  dwBitoffset : DWORD;
END_VAR

dwBitoffset := BITADR(xVar); (* If byte addressing = TRUE, result = 16#80000013; if byte addressing = FALSE, result = 16#80000023 *)

Operator 'CAL'

This IEC operator is used for calling function blocks.
In IL, CAL calls the instance of a function block.

CAL <function block> (<input variable1> := <value>, <input variableN> := <value>)

Example

Call of the Inst instance of a function block with assignment of the input variables Par1 and Par2 with 0 or TRUE.

CAL Inst(Par1 := 0, Par2 := TRUE);

Overloading

NOTICE!
If the operand value for a type conversion operator is outside of the value range of the target data type, then the result output depends on the processor type and is therefore undefined. This is the case, for example, when a negative operand value is converted from IREAL to the target data type UINT.

Information can be lost when converting from larger data types to smaller data types.

NOTICE!
The rounding logic for borderline cases depends on the target system or the FPU (Floating Point Unit) of the target system. For example, a value of -1.5 can be converted differently on different controllers.

Catch value ranges overflows across the application to program code-independent from the target system.
The IEC61131-3 specification does not provide for overloaded functions.

If you want to program strictly according to IEC61131-3, then you should use the operators of the syntax `<type> _TO_ <another type>` as described in the following sections.

The rules for typed conversions also apply here for overloading.

The operators convert values into other data types, explicitly specifying only a target data type and no initial data type (data type of the operands) ("overloaded conversion"). Overloading is not part of the IEC 61131-3 specification.

### Call syntax

<variable name> := <TO operator> ( <operand> )
<operand> = <variable name> | <literal>

### Operators

- TO__UXINT
- TO__XINT
- TO__XWORD
- TO_BIT
- TO_BYTE
- TO_BOOL
- TO_DATE
- TO_DIINT
- TO_DT
- TO_DWORD
- TO_INT
- TO_LDATE
- TO_LDT
- TO_LINT
- TO_LREAL
- TO_LTIME
- TO_LTOD
- TO_LWORD
- TO_REAL
- TO_SINT
- TO_STRING
- TO_TIME
- TO_TOD
- TO_UDINT
- TO_UINT
- TO_ULINT
- TO_USINT
- TO_WORD
- TO_WSTRING
Examples

ST implementation language:

VAR
  iNumber_1 : INT;
  rNumber_2 : REAL := 123.456;
  iNumber_2 : INT;
  xIsTrue : BOOL;
  sOutputText : STRING;
  sText : STRING := 'Hello World!';
  wsText : WSTRING;
  dateEvent : DATE := D#2019-9-3;
  uiEvent : UINT;
  uxiData : __UXINT;
END_VAR

iNumber_1 := TO_INT(4.22); (* Result: 4 *)
iNumber_2 := TO_INT(rNumber_2); (* Result: 123 *)
xIsTrue := TO_BOOL(1); (* Result: TRUE *)
sOutputText := TO_STRING(342); (* Result: '342' *)
wsText := TO_WSTRING(sText); (* Result: "Hello World!" *)
uiEvent := TO_UINT(dateEvent); (* Result: 44288 *)
uxiData := TO___UXINT(iNumber_2); (* Result: 123 *)

Boolean Conversion

**NOTICE!**

String manipulation when converting to STRING or WSTRING

When converting the type to STRING or WSTRING, the typed value is left-aligned as a character string and truncated if it is too long. Therefore, declare the return variable for the type conversion operators <> TO_STRING and <> TO WSTRING long enough that the character string has enough space without any manipulation.

The operators convert a Boolean value into the specified data types and return a type-converted value.

Call syntax

<variable name> := <BOOL to operator> ( <operand> );
<operand> = <variable name> | <literal>
Operators

BOOL_TO___UXINT
BOOL_TO___XINT
BOOL_TO___XWORD
BOOL_TO_BIT
BOOL_TO_BYTE
BOOL_TO_DATE
BOOL_TO_DINT
BOOL_TO_DT
BOOL_TO_DWORD
BOOL_TO_INT
BOOL_TO_LDATE
BOOL_TO_LDT
BOOL_TO_LINT
BOOL_TO_LREAL
BOOL_TO_LTIME
BOOL_TO_LTOD
BOOL_TO_LWORD
BOOL_TO_REAL
BOOL_TO_SINT
BOOL_TO_STRING
BOOL_TO_TIME
BOOL_TO_TOD
BOOL_TO_UDINT
BOOL_TO_UINT
BOOL_TO_ULINT
BOOL_TO_USINT
BOOL_TO_WORD
BOOL_TO_WSTRING

When the operand value is **TRUE**, the following typed values are returned:

- **BOOL_TO_DATE**: D#1970-1-1 // The zeroth bit is set, but does not effect the display.
- **BOOL_TO_DT**: DT#1970-01-01-0:0:0:1
- **BOOL_TO_LTIME**: LTIME#1NS
- **BOOL_TO_REAL**: '1'
- **BOOL_TO_STRING**: 'TRUE'
- **BOOL_TO_TOD**: TOD#0:0:0.001
- **BOOL_TO_TIME**: T#1MS
- **BOOL_TO_WSTRING**: "TRUE"

When the operand value is **FALSE**, the following typed values are returned:

- **BOOL_TO_DATE**: D#1970-1-1
- **BOOL_TO_DT**: DT#1970-01-01-00:00:00
- **BOOL_TO_LTIME**: LTIME#0NS
- **BOOL_TO_REAL**: '0.0'
- **BOOL_TO_STRING**: 'FALSE'
- **BOOL_TO_TOD**: TOD#0:0:0
- **BOOL_TO_TIME**: T#0MS
- **BOOL_TO_WSTRING**: "FALSE"

Integer Conversion

**NOTICE!**

If the operand value for a type conversion operator is outside of the value range of the target data type, then the result output depends on the processor type and is therefore undefined. This is the case, for example, when a negative operand value is converted from `LREAL` to the target data type `UINT`.

Information can be lost when converting from larger data types to smaller data types.

The operators convert an integer value into the specified data types and return this type-converted value. If the number to be converted exceeds the range limit, then the first bytes of the number are ignored.

**Call syntax**

```plaintext
<variable name> := <integer conversion type operator> ( <integer operand> );

<integer conversion type operator> = <integer data type> _TO_ <data type>
<integer operand> = <variable name> | <literal>

<integer data type> =
  __UXINT | __XINT | __XWORD | BIT | BYTE | DINT | DWORD | INT | LINT |
  LWORD | SINT | UDINT | UINT | UINT | USINT | WORD
```

**NOTICE!**

String manipulation when converting to `STRING` or `WSTRING`

When converting the type to `STRING` or `WSTRING`, the typed value is left-aligned as a character string and truncated if it is too long. Therefore, declare the return variable for the type conversion operators `<>_TO_STRING` and `<>_TO_WSTRING` long enough that the character string has enough space without any manipulation.

The operators that convert a value into a character string of type `STRING` or `WSTRING` require an operand that matches the target data type.
When a larger data type is converted to a smaller data type, the more high-order (front) bytes are truncated. When a smaller data type is converted to a larger data type, the more high-order bytes filled with zeros.

Floating-Point Number Conversion

NOTICE!
If the operand value for a type conversion operator is outside of the value range of the target data type, then the result output depends on the processor type and is therefore undefined. This is the case, for example, when a negative operand value is converted from LREAL to the target data type UINT.

Information can be lost when converting from larger data types to smaller data types.

NOTICE!
If the floating-point number is within the value range of the target data type, then the conversion operates the same way on all systems.

NOTICE!
If the floating-point number to be converted exceeds the range limit, then the first bytes of the number are ignored.

The operators convert a floating-point number into the specified data types and return a type-converted value. If applicable, the conversion is rounded.

Call Syntax

<variable name> := <floating-point conversion operator> ( <floating-point operand> );

<floating-point operand> = <variable name> | <literal>

<floating-point type> =
REAL | LREAL

**Rounding**

When converting to an integer, the operand is rounded up or down to an integer value. For 1 to 4 after the decimal point, the number is rounded down. For 5 to 9, the number is rounded up. Then the rounded number is converted to the specified integer type. If the rounded value is outside of the integer value range, then an undefined, target system-dependent value is returned. An exception error is also possible then.

**NOTICE!**
The rounding logic for borderline cases depends on the target system or the FPU (Floating Point Unit) of the target system. For example, a value of \(-1.5\) can be converted differently on different controllers.

To program target system-independent code, you have to catch value range overflows across the application.

**Converting to a string**

**NOTICE!**

String manipulation when converting to STRING or WSTRING

When converting the type to STRING or WSTRING, the typed value is left-aligned as a character string and truncated if it is too long. Therefore, declare the return variable for the type conversion operators <>_TO_STRING and <>_TO_WSTRING long enough that the character string has enough space without any manipulation.
For a floating-point number conversion to a string, the number of decimal places of the mantissa is limited to 6. If the number is $< 1$, then the mantissa is $1 \leq m < 10$. If the mantissa has more digits after the comma, then it is rounded to the 6th digit and then converted.

The string variable may also be declared too short for the return value. In this case, the return string is truncated on the right.
Examples

ST implementation language

String Conversion

**NOTICE!**

If the operand value for a type conversion operator is outside of the value range of the target data type, then the result output depends on the processor type and is therefore undefined. This is the case, for example, when a negative operand value is converted from \( \text{LREAL} \) to the target data type \( \text{UINT} \).

Information can be lost when converting from larger data types to smaller data types.
The operators convert a character string (STRING or WSTRING) into the specified target data type and return a type-converted value.

A conversion with a meaningful result is only possible when the operand matches the target data type according to the IEC 61131-3 standard. This is the case if the value of the operand corresponds to a valid constant (literal) of the target data type.

Convertible strings contain:

- Number with type prefix (example: '16#FFFFFFFF')
- Number with grouping characters (example: '2#1111_1111')
  
  Note: The international weight and measure grouping character (thin space) is not accepted. Only the underscore is accepted.
- Floating-point number, also in exponential notation (example: '9.876' or '1.2E-34')
  
  Note: Floating-point numbers are not convertible. The comma is treated and truncated like a following character.
- Time, time of day, and date specification with prefix and size (example: 'T#2h', 'DT#2019-9-9-12:30:30.9')
- Infinite values (example: '1.7E+400')
- Additional character after a number (example: '2m' or '3.14'). These are truncated.
- Additional characters before a number are not permitted.
- Spaces before (example: ' 3.14')

**Call syntax**

```plaintext
<variable name> := <string to operator> ( <operand> );
<operand> = <variable name> | <literal>
```

FBD implementation language
Time Conversion

NOTICE!

If the operand value for a type conversion operator is outside of the value range of the target data type, then the result output depends on the processor type and is therefore undefined. This is the case, for example, when a negative operand value is converted from `LREAL` to the target data type `UINT`.

Information can be lost when converting from larger data types to smaller data types.

The operators convert time values (`TIME` or `LIME`) into the specified data types and return this type-converted value.

Call syntax

```
<variable name> := <time conversion operator> ( <operand> );
<operand> = <variable name> | <literal>
```

Operators

```
TIME_TO__UXINT
TIME_TO___XINT
TIME_TO___XWORD
TIME_TO_BIT
TIME_TO_BOOL
TIME_TO_BYTE
TIME_TO_DATE
TIME_TO_DINT
TIME_TO_DT
TIME_TO_DWORD
TIME_TO_INT
TIME_TO_LDATE
TIME_TO_LDINT
TIME_TO_LINT
TIME_TO_LREAL
TIME_TO_LTIME
TIME_TO_LTOD
TIME_TO_LWORD
TIME_TO_REAL
TIME_TO_SINT
TIME_TO_STRING
TIME_TO_TOD
TIME_TO_UDINT
TIME_TO_UINT
TIME_TO_ULINT
TIME_TO_USINT
TIME_TO_WORD
TIME_TO_WSTRING
```
The operator returns **FALSE** if and only if the operand value can be interpreted as "0".

### Converting to Boolean values

<table>
<thead>
<tr>
<th>Expression</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>xTime := TIME_TO_BOOL(T#0MS);</code></td>
<td><code>xTime = FALSE</code></td>
</tr>
<tr>
<td><code>xLongTime := TIME_TO_BOOL(T#0NS);</code></td>
<td><code>xLongTime = FALSE</code></td>
</tr>
<tr>
<td><code>xTime := TIME_TO_BOOL(T#1MS);</code></td>
<td><code>xDate = TRUE</code></td>
</tr>
<tr>
<td><code>xLongTime := TIME_TO_BOOL(T#1NS);</code></td>
<td><code>xLongTime = TRUE</code></td>
</tr>
</tbody>
</table>

### Converting to a string

**NOTICE!**

String manipulation when converting to STRING or WSTRING

When converting the type to **STRING** or **WSTRING**, the typed value is left-aligned as a character string and truncated if it is too long. Therefore, declare the return variable for the type conversion operators `<>` TO STRING and `<>` TO WSTRING long enough that the character string has enough space without any manipulation.

<table>

Date and Time Conversion

**NOTICE!**

If the operand value for a type conversion operator is outside of the value range of the target data type, then the result output depends on the processor type and is therefore undefined. This is the case, for example, when a negative operand value is converted from LREAL to the target data type UINT.

Information can be lost when converting from larger data types to smaller data types.

The operators convert a date and time value into the specified data type and return a type-converted value.

Call syntax

<variable name> := <date and time conversion operator> ( <operand> )
<operand> = <variable name> | <literal>

The data types DATE and DT use the same memory format internally and are stored as DWORD. The resolution for DATE is 1 day. The resolution for DT is 1 second. Both begin at January 1, 1970. TOD is stored as DWORD with a resolution of 1 millisecond.

</tr>
</tbody>
</table>
**NOTICE!**

String manipulation when converting to STRING or WSTRING

When converting the type to STRING or WSTRING, the typed value is left-aligned as a character string and truncated if it is too long. Therefore, declare the return variable for the type conversion operators `<>_TO_STRING` and `<>_TO_WSTRING` long enough that the character string has enough space without any manipulation.

---

The operands of type `DATE`, `DATE_AND_TIME`, `TIME_OF_DAY`, `DT`, or `TOD`, which are passed to an operator for a data and time conversion, are converted to their constant syntax (literal syntax). The generated string contains the keyword `D#`, `DT#` or `TOD#` and then the size with its data and time unit, as indicated in the IEC 61131-3 specification.

### Examples

```plaintext
DEVICE_APP_ConvertToWStrings.PLC_PRG.Device.App_ConvertToWStrings
```

Operator 'TRUNC'

The IEC operator is used for converting the REAL data type into the DINT data type. CODESYS takes only the integer part of the number.

In CoDeSys V2.3, the TRUNC operator converts REAL into INT. If you import a V2.3 project, then CODESYS automatically replaces TRUNC with TRUNC_INT.

If CODESYS cannot represent the input value by a DINT or INT, then the result of this function is undefined. The behavior of such input values is platform-dependent.

```
NOTICE!

If the operand value for a type conversion operator is outside of the value range of the target data type, then the result output depends on the processor type and is therefore undefined. This is the case, for example, when a negative operand value is converted from LREAL to the target data type UINT.

Information can be lost when converting from larger data types to smaller data types.
```

Examples

Result in diVar: 1

```
ST

diVar := TRUNC(1.9); (* Result: 1 *)
d iVar := TRUNC(-1.4); (* Result: -1 *)
```

See also

- “Type conversion operators” on page 2132

Operator 'TRUNC_INT'

The IEC operator is used for converting the REAL data type into the INT data type. CODESYS takes only the integer part of the number.

TRUNC_INT corresponds to the TRUNC operator in CoDeSys V2.3, and it is used automatically at this point when importing V2.3 projects. Note the change function of TRUNC.

If CODESYS cannot represent the input value by a DINT or INT, then the result of this function is undefined. The behavior of such input values is platform-dependent.

```
NOTICE!

If the operand value for a type conversion operator is outside of the value range of the target data type, then the result output depends on the processor type and is therefore undefined. This is the case, for example, when a negative operand value is converted from LREAL to the target data type UINT.

Information can be lost when converting from larger data types to smaller data types.
```
**Operator 'ABS'**

This IEC operator yields the absolute value of a number.

Permitted data types for input and output variables and numeric constants: any numeric basic data type

```
Examples
Result in i: 2

ST:
i := ABS(-2);
```

**Operator 'SQRT'**

This IEC of course yields the square root of a number.

Permitted data types for input variables: any numeric basic data type
Permitted data types for output variables: REAL or LREAL

```
Examples
Result in q: 4

ST:
q := SQRT(16);
```

**Operator 'LN'**

This IEC operator yields the natural logarithm of a number.

Permitted data types for input variables: any numeric basic data type
Permitted data types for output variables: REAL and LREAL
**Examples**

Result: 3.80666

ST:

q := LN(45);

FBD:

![LN block](image)

---

**Operator 'LOG'**

This IEC operator yields the base-10 logarithm of a number.
The input variable can be any numeric basic data type, but the output variable must be the data type REAL or LREAL.

**Examples**

Result in q: 2.49762

ST:

q := LOG(314.5);

FBD:

![LOG block](image)

---

**Operator 'EXP'**

This IEC operator yields the exponential function.
Permitted data types for input variables: any numeric basic data type
Permitted data types for output variables: REAL and LREAL

**Examples**

Result in q: 7.389056099

ST:

q := EXP(2);

FBD:

![EXP block](image)

---

**Operator 'EXPT'**

This IEC operator raises a number to a higher power and returns the power of the base raised to the exponent: power = base^exponent. The input values (parameters) are the base and the exponent. The power function is undefined if the base is zero and the exponent is negative. However, the behavior depends on the platform in this case.

Syntax:

EXPT(<base>, <exponent>)
Permitted data types for the input values: Numeric base data types (SINT, USINT, INT, UINT, DINT, UDINT, LINT, ULINT, REAL, LREAL, BYTE, WORD, DWORD, and LWORD)

Permitted data types for the return value: Floating-point number types (REAL and LREAL)

Example
Power function with literals
Var1 := EXPT(7,2);
FBD:

Return value: Var1 = 49

Example
Power function with variables
PROGRAM PLC_PRG
VAR
  lrPow : LREAL;
  iBase : INT := 2;
  iExponent : INT := 7;
END_VAR

  lrPow := EXPT(iBase, iExponent);
Return value: lrPow = 128

Operator 'SIN'
The IEC operator yields the sine value of a number.
Permitted data types for input variables that measure the angle in radians: any numeric basic data type
Permitted data types for output variable: REAL and LREAL

The permitted range for the input value is -2^{63} to +2^{63}. On x86 and x64 systems:
If the input value is outside of the permitted range, the function returns the input value

Examples
Result in q: 0.479426
ST:
  q := SIN (0.5);
FBD:

Operator 'COS'
The IEC operator yields the cosine value of a number.
Permitted data types for input variables that measure the angle in radians: any numeric basic data type
Permitted data types for output variables: REAL and LREAL

The permitted range for the input value is \(-2^{63}\) to \(+2^{63}\). On x86 and x64 systems: If the input value is outside of the permitted range, the function returns the input value

### Examples

**Result in q: 0.877583**
```
ST:
q := COS(0.5);
```
```
FBD:
```

### Operator 'TAN'

This IEC operator yields the tangent value of a number.
Permitted data types for input variables that measure the angle in radians: any numeric basic data type
Permitted data types for output variables: REAL and LREAL

**Result in q: 0.546302**
```
ST:
q := TAN(0.5);
```
```
FBD:
```

### Operator 'ASIN'

This IEC operator yields the arcsine value of a number.
Permitted data types for input variables: any numeric basic data type
Permitted data types for output variables: REAL and LREAL

**Result in q: 0.523599**
```
ST:
q := ASIN(0.5);
```
```
FBD:
```
Operator 'ACOS'

This IEC operator yields the arccosine value of a number. The value is computed in radians.
Permitted data types for input variables that measure the angle in radians: any numeric basic data type
Permitted data types for output variables: REAL and LREAL

Examples
Result in q: 1.0472

ST:
q := ACOS(0.5);

FBD:

---

Operator 'ATAN'

This IEC operator yields the arctangent value of a number. The value is computed in radians.
Permitted data types for input variables that measure the angle in radians: any numeric basic data type
Permitted data types for output variables: REAL and LREAL

Examples
Result in q: 0.463648

ST:
q := ATAN(0.5);

FBD:

---

Operator '__DELETE'

This operator is an extension of the IEC 61131-3 standard.

NOTICE!
For compatibility, the compiler version must be >= 3.3.2.0.

The operator releases the memory of instances that the "__NEW" operator generated dynamically. The __DELETE operator does not have a return value and the operand is set to zero after this operation.

Requirement: In the properties dialog of the application, the “Use dynamic memory allocation” check box is selected in the “Application Build Options” tab.

__DELETE (<pointer>)
NOTICE!

Two tasks should not call __DELETE simultaneously. Either you use a semaphore (SysSemEnter) or comparable method to prevent any concurrent calling of __DELETE, or you use __DELETE in one tasks only (recommended).

You can use a semaphore (SysSemEnter) to prevent two tasks from allocating memory at the same time. As a consequence, the extensive use of __DELETE causes higher jitter.

If Pointer references a function block, then CODESYS calls the associated FB_EXIT method before the pointer is set to zero.
FUNCTION_BLOCK FBDynamic

VAR_INPUT
  in1, in2 : INT;
END_VAR

VAR_OUTPUT
  out : INT;
END_VAR

  pFB^.INC();
END_IF

IF (bDelete) THEN
  __DELETE(pFB);
END_IF

Operator '__ISVALIDREF'

This operator is an extension of the IEC 61131-3 standard.
The operator is used for checking whether a reference refers to a valid value. For a description of use and an example, refer to the description for the REFERENCE data type.

See also

● § Chapter 6.4.1.20.5.14 “Reference” on page 2245

Operator '__NEW'

The operator is an extension of the IEC 61131-3 standard.
The __NEW operator reserves dynamic memory to instantiate function blocks, user-defined data types, or arrays of standard types. The operator returns a matching typed pointer.

Requirement: In the properties dialog of the parent application, on the “Application Build Options” tab, the “Use dynamic memory allocation” option is selected.

Syntax

<pointer name> := __NEW( <type> ( , <size> )? );
__DELETE( <pointer name> );

<type>: <function block> | <data unit type> | <standard data type>

The operator generates an instance of the type <type> and returns a pointer to this instance. Then the initialization of the instance is called. If <type> is a scalar standard data type, then the optional operand <size> is also evaluated. Then the operator generates an array of type <standard data type> and size <size>. If the attempt to allocate memory fails, then __NEW returns the value 0.

Use the operator within the assignment ":=". Otherwise an error message is displayed.

A function block or a user-defined data type whose instance is created dynamically with __NEW uses a fixed memory area. Here it is required that you mark the objects with the pragma (attribute 'enable_dynamic_creation'). It is not required for function blocks that are part of a library.

If you change the data layout of the function block in online mode, then you cannot execute a login with an online change afterwards. This is because the memory area of the function block instance has been invalidated. You change the data layout when you add new variables to the function block, delete existing variables, or change the data types of variables.
PROGRAM PLC_PRG
VAR
  pdwScalar : POINTER TO DWORD; //Typed pointer
  xInit : BOOL := TRUE;
  xDelete : BOOL;
END_VAR

IF (xInit) THEN
  pdwScalar := __NEW(DWORD, 16); // Allocates memory (16 dwords)
  and assigns them to pointer pdwScalar
END_IF

IF (xDelete) THEN
  __DELETE(pdwScalar); // Frees memory of pointer
END_IF

FUNCTION_BLOCK FBComputeGamma
VAR_INPUT
  iAlpha : INT;
  iBeta : INT;
END_VAR
VAR_OUTPUT
  iGamma : INT;
END_VAR
VAR
END_VAR

iGamma := iAlpha + iBeta;

PROGRAM PLC_PRG
VAR
  pComputeGamma : POINTER TO FBComputeGamma; // Typed pointer
  xInit : BOOL := TRUE;
  xDelete : BOOL;
  iResult : INT;
END_VAR

IF (xInit) THEN
  pComputeGamma := __NEW(FBComputeGamma); // Allocates memory
  xInit := FALSE;
END_IF

pComputeGamma^.iAlpha := (pComputeGamma^.iAlpha + 1)MOD 100; // Sets first input of pComputeGamma
pComputeGamma^.iBeta := 10; // Sets second input of pComputeGamma
pComputeGamma^(); // Calls the FB pComputeGamma is pointing to
iResult := pComputeGamma^.iGamma; // Reads output of pComputeGamma
IF (xDelete) THEN
  __DELETE(pComputeGamma); // Frees memory
END_IF

TYPE ABCDATA :
  STRUCT
    iA, iB, iC, iD : INT;
  END_STRUCT
END_TYPE

PROGRAM PLC_PRG
VAR
  pABCDATA : POINTER TO ABCDATA; // Typed pointer
  xInit : BOOL := TRUE;
Array (BYTE):

PROGRAM PLC_PRG
VAR
   pbDataAlpha: POINTER TO BYTE;
   pbDataBeta: POINTER TO BYTE;
   xInit: BOOL := TRUE;
   xDelete: BOOL;
   usiCnt: USINT;
   bTestC: BYTE;
END_VAR

IF (xInit) THEN
   pbDataAlpha := __NEW(BYTE, 16); // Allocates 16 bytes for pbDataAlpha
   pbDataBeta := __NEW(BYTE); // Allocates memory for pbDataBeta
   xInit := FALSE;
   FOR usiCnt := 0 TO 15 DO
      pbDataAlpha[usiCnt] := usiCnt; // Writes to new array
   END_FOR
   pbDataBeta^:= 16#FF; // Writes to new data
END_IF

bTestC := pbDataAlpha[12]; // Reads new array by index access

IF (xDelete) THEN // Frees memory
   __DELETE(pbDataAlpha);
   __DELETE(pbDataBeta);
END_IF

NOTICE!
We do not recommend the simultaneous execution of two tasks that both call the __NEW operator. You use either a semaphore (SysSemEnter) or a comparable technique to prevent a concurrent call of __NEW. However, this results in a higher jitter when __NEW is applied extensively.

We recommend that you call __NEW operators in one task only.

**Operator '__QUERYINTERFACE'**

This operator is an extension of the IEC 61131-3 standard.

At runtime, the operator executes a type conversion of an interface reference into another type. The operator returns a `BOOL` result. `TRUE` means that CODESYS has performed the conversion successfully.

`__QUERYINTERFACE(<ITF_Source>,<ITF_Dest>);`

1. Operand: Interface reference or FB interface
2. Operand: Interface reference with required target type

The requirement for the explicit conversion is that both the ITF_Source and ITF_Dest are derived from `Interface __System.IQueryInterface`. This interface is implicitly available does not require a library.
Example

INTERFACE ItfBase EXTENDS __System.IQueryInterface
METHOD mbase : BOOL
END_METHOD

INTERFACE ItfDerived1 EXTENDS ItfBase
METHOD mderived1 : BOOL
END_METHOD

INTERFACE ItfDerived2 EXTENDS ItfBase
METHOD mderived2 : BOOL
END_METHOD

FUNCTION_BLOCK FB1 IMPLEMENTS ItfDerived1
METHOD mbase : BOOL
  mbase := TRUE;
END_METHOD
METHOD mderived1 : BOOL
  mderived1 := TRUE;
END_METHOD
END_FUNCTION_BLOCK

FUNCTION_BLOCK FB2 IMPLEMENTS ItfDerived2
METHOD mbase : BOOL
  mbase := FALSE;
END_METHOD
METHOD mderived2 : BOOL
  mderived2 := TRUE;
END_METHOD
END_FUNCTION_BLOCK

PROGRAMM POU
VAR
  inst1 : FB1;
  inst2 : FB2;
  itfbase1 : ItfBase := inst1;
  itfbase2 : ItfBase := inst2;
  itfderived1 : ItfDerived1 := 0;
  itfderived2 : ItfDerived2 := 0;
  xResult1, xResult2, xResult3, xResult4: BOOL;
END_VAR

xResult1 := __QUERYINTERFACE(itfbase1, itfderived1); // xResult = TRUE, itfderived1 <> 0  // references the instance inst1
xResult2 := __QUERYINTERFACE(itfbase1, itfderived2); // xResult = FALSE, itfderived2 = 0
xResult3 := __QUERYINTERFACE(itfbase2, itfderived1); // xResult = FALSE, itfderived1 = 0
xResult4 := __QUERYINTERFACE(itfbase2, itfderived2); // xResult = TRUE, itfderived2 <> 0  // references the instance inst2

Operator '__QUERYPOINTER'
This operator is an extension of the IEC 61131-3 standard.
At runtime, the operator makes it possible to convert the type of an interface reference of a function block to a pointer. The operator returns a BOOL result. TRUE means that CODESYS has performed the conversion successfully.

**NOTICE!**

For compatibility, the definition of the pointer to be converted must be an extension of the base interface "__SYSTEM.IQueryInterface".

```__QUERYPOINTER (<ITF_Source>, <Pointer_Dest>)```

The operator receives an interface reference or a FB instance with the required target types as the first operand and a pointer as the second operand. After processing `__QUERYPOINTER`, Pointer_Dest receives the pointer to the reference or instance of a function block that the ITF_Source interface reference currently refers to. Pointer_Dest is not typed and can be cast to any type. You have to make sure of the type. For example, the interface could offer a method that returns a type code.

### Operators '__TRY', '__CATCH', '__FINALLY', '__ENDTRY'

These operators are extended from the IEC 61131-3 standard and they are used for specific exception handling in IEC code.

**Syntax**

```__TRY
    <statements_try>
__CATCH(exec)
    <statements_catch>
__FINALLY
    <statements_finally>
__ENDTRY
    <statements_next>```

When a statement in the __Try operator throws an exception, the application does not stop. Instead, the application executes the statements in __Catch, starts the exception handling, and then executes the statements in __FINALLY. The exception handling ends with __ENDTRY, and the application executes the subsequent statements.

An IEC variable for an exception has the data type __System.ExceptionCode.
If the statement in \_TRY throws an exception, then program execution is not stopped. Instead, the statement in \_CATCH is executed. Therefore, in this example, the application executes the \texttt{exc} function, then the statement in \_FINALLY, and finally the statement in \_ENDTRY.

```plaintext
FUNCTION Tester : UDINT
VAR_INPUT
  count : UDINT;
END_VAR
VAR_OUTPUT
  strExceptionText : STRING;
END_VAR
VAR
  exc : __SYSTEM.ExceptionCode;
END_VAR
TRY
  Tester := tryFun(count := count, testcase := g_testcase);  // This statement is tested. If it throws an exception, then the statement in \_CATCH is executed first, and then the statement in \_FINALLY.
  \_CATCH(exc)
  HandleException(exc, strExceptionText => strExceptionText);
  \_FINALLY
  GVL.g_count := GVL.g_count + 2;
ENDTRY
```

) UDINT ;
END_TYPE

Operator '__VARINFO'

This operator is an extension of the IEC 61131-3 standard.

The operator yields information about a variable. You can save the information as data structure in a variable of data type __SYSTEM.VAR_INFO.

Syntax in the declaration:

<name of the info variable> : __SYSTEM.VAR_INFO; // Data structure for info variable

Syntax for the call:

<name of the info variable> := __VARINFO( <variable name> ); // Call of the operator
FUNCTION_BLOCK FB_Velocity
VAR_INPUT
  rVelocity: REAL := 1.2;
END_VAR
VAR_OUTPUT
END_VAR
VAR
  infoVelocity: __SYSTEM.VAR_INFO; // Info of Velocity
END_VAR

infoVelocity := __VARINFO(rVelocity); // Gets the info of Velocity locally

PROGRAM PLC_PRG
VAR
  iCounter : INT := 0; // Counts the calls
  infoCounter : __SYSTEM.VAR_INFO; // Info of Counter
  arrA : ARRAY [1..2, 1..2, 1..2] OF INT := [0, 1, 2, 3, 4, 5, 6, 7]; // Stores the A data
  infoA : __SYSTEM.VAR_INFO; // Info of A
  fbVel : FB_Velocity;
END_VAR

iCounter := iCounter + 1;
infoCounter := __VARINFO(iCounter);
infoA := __VARINFO(arrA);
fbVel();

The iCounter and arrA variables are recognized in the application code. The variable information is saved in the infoCounter and infoA variables. Moreover, the FB_Velocity function block is instantiated.

**Operator '__CURRENTTASK'**

This operator is an extension of the IEC 61131-3 standard.

In runtime mode, the operator provides information about the IEC task that is currently running.

*The operator is supported only on target systems in which the target system setting memory-layout\max-stack-size is set to a value > 0.*

The operator allows for access to a structure with two variables:

- TaskIndex: Zero-based index that identifies the task
- pTaskInfo: Detailed information about the currently running task. It can be assigned to a POINTER TO Task_Info2 from the library CmpIecTask.

The operator cannot be used in the declaration of a POU. This would result in an error message. If the current task cannot be determined, then the TaskIndex -1 and the pTaskInfo are zero.
**Example**

```plaintext
//Declaration
VAR
    idx : INT;
    pInfo : POINTER TO Task_Info2;
END_VAR

//Program code
idx := __CURRENTTASK.TaskIndex;
pInfo := __CURRENTTASK.pTaskInfo;
```

**Operator '__COMPARE_AND_SWAP'**

The multicore operator is an extension of the IEC 61131-3 standard.

The operator can be used for implementing a semaphore, for example to guarantee exclusive access to a variable written to by different tasks.

__COMPARE_AND_SWAP gets a pointer to a data type __XWORD variable, an old value, and a new value as its input (example: bMutex := __COMPARE_AND_SWAP(ADR(dwSynch), dwOld, dwNew);). The old and new values can also be data type __XWORD variables. The referenced __XWORD variable is compared with the old value and if both are equal, then the new value is written. The result of the function is TRUE when the new value could be written.

The compiler automatically replaces the data type __XWORD with DWORD on 32-bit systems and LWORD on 64-bit systems.

This operation is atomic, so it cannot be interrupted by another task, even on multicore platforms.
**Example**

The following example shows a typical usage. Exclusive access to a type STRING variable, which is addressed via the pstrOutput pointer, should be implemented.

The access to a string is not atomic. If multiple tasks write to the same string at the same time, then the contents may be inconsistent.

With this function, it is now possible to write the same STRING variable in different tasks.

```pascal
FUNCTION ExclusiveStringWrite : BOOL
VAR_INPUT
    strToWrite : STRING;
    pstrOutput : POINTER TO STRING;
END_VAR
VAR_STAT
    dwSynch : __XWORD;
END_VAR
VAR
    bMutex : BOOL;
END_VAR

bMutex := __COMPARE_AND_SWAP(ADR(dwSynch), 0, 1); (* compare with 0 and write 1 as atomic operation *)
IF bMutex THEN // bMutex is TRUE if write could be done
    pstrOutput^ := strToWrite; // Now you can write safely on the string
    dwSynch := 0; // The __XWORD variable must be reset.
    ExclusiveStringWrite := TRUE; // Writing was successful
ELSE
    ExclusiveStringWrite := FALSE; // Writing was not successful
END_IF
```

- ☼ “Multicore operators” on page 2133
- ☼ Chapter 6.4.1.20.3.69 “Operator ‘TEST_AND_SET’” on page 2215

**Operator '__XADD'**

The multicore operator is an extension of the IEC 61131-3 standard.

The operator can be used for implementing an atomic counter. If an integer variable is incremented by means of ordinary addition, for example iTest := iTest + 1;, then this operation is not executed atomically. Another access to the variable could take place between reading and writing the variable.

If the counter is incremented in multiple tasks, then the counter result can be less than the number of counting cycles. So if two tasks execute the above code one time and the variable previously had the value 0, then the variable can then have the value 1. This is especially problematic if arrays are being processed in multiple tasks and a unique index is required for the array in each processing cycle.

When the __XADD operator is called, it gets a pointer to a type DINT variable as the first summand and a type DINT value as the second summand. __XADD returns the old value of the first summand and in the same step adds the second summand to the first summand.

For example, the function call can look like this: diOld := __XADD(ADR(diVar), deAdd);
The following example shows a typical usage. An array should be populated from two tasks. In the process, all positions in the array should be used and no position should be overwritten.

With this function, multiple tasks can populate a Boolean array.

```plaintext
FUNCTION WriteToNextArrayPosition : BOOL
VAR_EXTERNAL
  g_diIndex : DINT;  // Index and array are globally defined and used by multiple tasks
  g_boolArray : ARRAY [0..1000] OF BOOL;
END_VAR
VAR_INPUT
  bToWrite : BOOL;
END_VAR
VAR
  diIndex : DWORD;
END_VAR

diIndex := __XADD(ADR(g_diIndex), 1);        // Returns a unique index
WriteToNextArrayPosition := FALSE;
IF (diIndex >= 0 AND diIndex <= 1000) THEN
  g_boolArray[diIndex] := bToWrite;         //Writes to unique index
  WriteToNextArrayPosition := TRUE;         // TRUE: Array was not full yet
END_IF
```

Example

See also

- "Multicore operators" on page 2133

Operator '__POSITION'

The operator is an extension of the IEC 61131-1 standard.

At runtime, the operator yields the position of a variable in the declaration part or in the implementation part of a POU. The operator has to be assigned the variables of type STRING in the declaration part or in the implementation part.

Result of __POSITION

- **Declaration part**: 'Line <line number> (Decl)'
- **Implementation part**: 'Line <line number>, Column <column number> (Impl)'

Example

```plaintext
PROGRAM PROG1
VAR
  strPOS : STRING := __POSITION();  //Yields the line number of this declaration
  strLocalPOS : STRING;
END_VAR

  strLocalPOS := __POSITION();  //Yields the line and column number of this assignment
```

Operator '__POUNAME'

The operator is an extension of the IEC 61131-1 standard.
At runtime, the operator yields the name of the POU that contains the operator `__POUNAME`. The result is of type `STRING`.

The result of `__POUNAME` depends where it is used:

- In a program: program name
- In a function name: function name
- In a function block: function block name
- In a method: the method name qualified with the FB name
- In a Get/Set accessor of a property: the property name + Get/Set qualified with the FB name
- In a GVL: GVL name
- In a structure: structure name
- In a data structure `UNION`: union name

### Example

```plaintext
PROGRAM PROG1
VAR
    strPOU : STRING := __POUNAME(); //Yields 'PROG1'
    strlocalPOU : STRING;
END_VAR
strlocalPOU := __POUNAME(); //Yields 'PROG1'
```

### Operator `TEST_AND_SET`

The multicore operator is an extension of the IEC 61131-3 standard.

The operator can be used for implementing a semaphore, for example to guarantee exclusive access to a variable written to by different tasks.

`TEST_AND_SET` gets a type `DWORD` variable as its input. Write access to this variable must be possible. The variable is set to `1` and the previous value is returned as the result.

The operation is atomic, which means that it cannot be interrupted by another task. This also applies to multicore platforms.

For example, the call in the program is `dwOldValue := TEST_AND_SET(dw);`, in which the variables `dwOldValue` and `dw` must be of data type `DWORD`. 
Example

The following example shows a typical usage. Exclusive access to a type STRING variable, which is addressed via the pstrOutput pointer, should be implemented. The access to a string is not atomic. If multiple tasks write to the same string at the same time, then the contents may be inconsistent. With the TEST_AND_SET function, it is now possible to write the same STRING variable in different tasks.

```plaintext
FUNCTION ExclusiveStringWrite : BOOL
VAR_INPUT
    strToWrite : STRING;
    pstrOutput : POINTER TO STRING;
END_VAR
VAR_STAT
    dwSynch : DWORD;
END_VAR
VAR
    dwOldValue: DWORD;
END_VAR

dwOldValue := TEST_AND_SET(dwSynch);  // Write the 1 and read the old value at the same time
IF dwOldValue = 0 THEN                // 0 means: no other task is currently writing
    pstrOutput^ := strToWrite;         // Now you can write safely on the string
    dwSynch := 0;                      // The DWORD must be reset
    ExclusiveStringWrite := TRUE;      // Writing was successful
ELSE
    ExclusiveStringWrite := FALSE;     // Writing was not successful
```

Operator - Global namespace

This operator is an extension of the IEC 61131-3 standard.

An instance path that begins with a dot (.) always opens a global namespace. If there is a local variable that has the same name <varname> as a global variable, then you refer to the global variable as .<varname>.

Operator - Namespace for global variables lists

This operator is an extension of the IEC 61131-3 standard.

You can use the name of a global variables list (GVL) as a namespace identifier for the variables that are defined in the list. This makes it possible to use variables with the same name in different global variables lists and still access specific variables uniquely. You use a dot (.) to prepend the name of the global variables list to the variable name.

<global variable list name>.<variable>

Example

```plaintext
globlist1.varx := globlist2.varx;
```

The globlist1 and globlist2 global variables lists each contain a varx variable. CODESYS copies the varx global variable from the globlist2 list to varx in the globlist1 list.
If you reference a variable that is declared in several global variables lists without referencing the prepended list name, then an error message is printed.

**Operator - Library namespace**

This operator is an extension of the IEC 61131-3 standard.

**Syntax:** `<library namespace>..<library identifier>`

**Example:** `LIB_A.FB_A`

A library module identifier is appended with the library namespace (as a prefix separated by a dot) for unique and qualified access to the library module. The namespace usually coincides with the library name.

**Example**

A library is included in a project and contains the module `FB_A`. However, the function block with the same name is already available locally in the project. Identify the library module as `LIB_A.FB_A` in order to access the library module, not the local function block.

```plaintext
var1 := FB_A(in := 12); // Call of the project function FB_A
var2 := LIB_A.FB_A(in := 22); // Call of the library function FB_A
```

You can define another identifier for the namespace. To do this, specify a namespace in the project information (library developers: when creating a library project). As an alternative, you can specify a specific namespace for a library in the library manager in the "Properties" dialog box (application developers: when creating an application).

**See also**

- Chapter 6.4.1.21.3.15.4 “Command 'Placeholders’” on page 2716
- Chapter 6.4.1.21.2.16 “Object 'Library Manager’” on page 2469

**Operator - Enumeration namespace**

This operator is an extension of the IEC 61131-3 standard.

You can use the TYPE name of an enumeration for unique access to an enumeration constant. In this way, you can use the same constant names in different enumerations.

The enumeration name is prepended to the constant name with a dot (.)

```plaintext
<enumeration name>..<constant name>
```

**Example**

The constant `Blue` is a component of both the enumeration `Colors` and the enumeration `Feelings`.

```plaintext
color := Colors.Blue; // Access to component blue in enumeration Colors
feeling := Feelings.Blue; // Access to component blue in enumeration Feelings
```

**Operator '__POOL'**

The operator is an extension of the IEC 61131-3 standard.

The operator is used to reference objects which are managed in the global POU pool (in the “POUs” view). The operator directly accesses objects in the “POUs” view.
Example

PROGRAM PLC_PRG
VAR
    svar_pou : STRING;
END_VAR
    svar_pou := __POOL.POU();

See also

- % Chapter 6.4.1.20.8 “Shadowing Rules” on page 2333

Operator 'INI'

The INI operator is a CoDeSys V2.3 operator. In CODESYS V3, the FB_init method replaces the INI operator. You can still use this operator in projects that are imported from CoDeSys V2.3.

The INI operator is used for initializing retain variables of a function block instance used in a POU.

Assign the operator to a Boolean variable.

Syntax:

<Boolean variable name> := INI <FB instance name> , <Boolean value> );
<Boolean value> : TRUE | FALSE

If the second parameter of the operator yields TRUE, then CODESYS initializes all retain variables that are defined in the function block <FB instance name>.

Examples

fbinst is the instance of the function block fb1, where the retain variable retvar is defined.

ST:

Declaration in the block:

VAR
    fbinst : fb1;
    b : BOOL;
END_VAR

Program part:

b := INI(fbinst, TRUE);
ivar := fbinst.retvar; (* => retvar is initialized *)

FBD

6.4.1.20.4 Operands

General

Constants and literals

Constants are identifiers for unchangeable values. You can declare constants locally within a POU or globally within a global variable list. The declaration segment is extended with the keyword CONSTANT.

Constants are also character strings that represent the value of a base type, such as integers or floating-point numbers (for example, 16#FFFF_FFFF, T#5s, -1.234 E-5). To distinguish between them, these constants are also called literals, literal constants, or unnamed constants.

There are logical (TRUE, FALSE) or numeric literals (3.1415, T#5s), but also character string literals ('Hello world!', "black").

Syntax declaration

```
<scope> CONSTANT
    <identifier> : <data type> := <initial value> ;
END_VAR
```

```
<scope> : VAR | VAR_INPUT | VAR_STAT | VAR_GLOBAL
<data type>: <elementary data type | user defined data type | function block >
<initial value> : literal value | identifier | expression
```

Allowed initial values:

- Literal (example: TRUE, FALSE, 16#FFFF_FFFF)
- Named constant that was declared at another location
- Simple expression composed of literals, also combined with simple operators, such as +-*

Inputs or function calls cannot be specified as an initial value.

Example

```
VAR_GLOBAL CONSTANT
    g_ciMAX_A : INT := 100;
    g_ciSPECIAL : INT := g_ciMAX_A - 10;
END_VAR
```

Constants are defined only for the declaration. The assignment of an initial value is required. Within an implementation, constants are only read and therefore always appear on the right of the assignment operator in a statement.

The constants are replaced with the initial value when the code is compiled. It also has to be possible to calculate the initial value at compile time.

Constants of structured or user-defined types are calculated not until runtime. Structured constants in programs or GVLs are calculated one time at program start. Structured constants in functions or methods are calculated every time the function or method is called. Therefore, the initialization of structured constants can depend on inputs or execute function calls.

Variables

You can declare variables as either local in the declaration part of a POU or in a global variable list. The allowed location of a variable depends on its data type.

- § Chapter 6.4.1.20.2.12 “Constant Variables - ‘CONSTANT’” on page 2121
- § Chapter 6.4.1.20.1.4.3 “ST expressions” on page 2050

### BOOL constants

BOOL constants are the truth values TRUE (1) and FALSE (0).

See also

- § Chapter 6.4.1.20.5.2 “Data type ‘BOOL’” on page 2235

### Numeric constants

Numeric values can be binary, octal, decimal, and hexadecimal numbers. If an integer value is not a decimal number, then you must write its base followed by the number sign (#) before the integer constant. You enter the hexadecimal digit values for the numbers 10 to 15 as usual with the letters A-F.

You can use an underscore within a numeric value.

<table>
<thead>
<tr>
<th>Examples:</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>14</td>
<td>decimal number</td>
</tr>
<tr>
<td>#1001_0011</td>
<td>binary number</td>
</tr>
<tr>
<td>8#67</td>
<td>octal number</td>
</tr>
<tr>
<td>16#A</td>
<td>hexadecimal number</td>
</tr>
<tr>
<td>DINT#16#A1</td>
<td>typed data type DINT# and base 16# combined</td>
</tr>
</tbody>
</table>

This type of numeric value can be BYTE, WORD, DWORD, SINT, USINT, INT, UINT, DINT, UDINT, REAL, or LREAL.

Implicit conversions from “larger” to “smaller” types are not permitted. You cannot simply use a DINT variable as an INT variable. For this, you have to use a type conversion function.

See also

- § Chapter 6.4.1.20.3 “Operators” on page 2129
- § Chapter 6.4.1.20.4.9 “Typed literals” on page 2228
As number constants basically are treated as integers, in divisions you must enter a constant in the format of a floating-point number in order not to loose the remainder. For example: Division \( \frac{1}{10} \) results in 0, division \( \frac{1.0}{10} \) results in 0.1.

REAL/LREAL constants

You can specify floating-point numbers as REAL and LREAL constants either in decimal notation or exponential notation with mantissa and exponent. The decimal point serves as the decimal separator according to the International System of Units (English).

Syntax of exponential notation

\[
\text{<significand>} \ e \ | \ E \ \text{<exponent>}
\]

exponent : -44..38 // REAL
exponent : -324..308 // LREAL

Example

<table>
<thead>
<tr>
<th>Table 395: REAL literal</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.4</td>
</tr>
<tr>
<td>1/3.0</td>
</tr>
<tr>
<td>Note: In the case of division of integer types, the result remains an integer type. In this case, the value is rounded. For example, ( \frac{1}{3} ) yields 0 as the result.</td>
</tr>
<tr>
<td>1.64e+009</td>
</tr>
<tr>
<td>-3.402823e+38</td>
</tr>
<tr>
<td>-1E-44</td>
</tr>
<tr>
<td>1.0E-44</td>
</tr>
<tr>
<td>3.402823e+38</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Table 396: LREAL literal</th>
</tr>
</thead>
<tbody>
<tr>
<td>-1.7976931348623157E+308</td>
</tr>
<tr>

</tr>
<tr>
<td>4.94065645841247E-324</td>
</tr>
<tr>
<td>1.7976931348623157E+308</td>
</tr>
</tbody>
</table>

See also

- Chapter 6.4.1.20.5.4 “Data type ‘REAL’ / ‘LREAL’” on page 2236

String Constants

A string constant is a character string enclosed in single straight quotation marks. The characters are coded according to the character set specified in ISO/IEC 8859-1. Therefore, a string constant can include spaces and accented characters, as these belong to this character set. This is also referred to as a string literal, or simply a string.
Example: 'Hello world!'

When a dollar sign ($) is in a string constant, the following two characters are interpreted as a hexadecimal code according to the coding in ISO/IEC 8859-1. The code also corresponds to ASCII code. In addition, please note the special cases.

**Table 397: Hexadecimal code**

<table>
<thead>
<tr>
<th>String with $ code</th>
<th>Interpretation</th>
</tr>
</thead>
<tbody>
<tr>
<td>'$&lt;8-bit code&gt;'</td>
<td>8-bit code: Two-digit hexadecimal number that is interpreted according to ISO/IEC 8859-1.</td>
</tr>
<tr>
<td>'$41'</td>
<td>A</td>
</tr>
<tr>
<td>'$A9'</td>
<td>©</td>
</tr>
<tr>
<td>'$40'</td>
<td>@</td>
</tr>
<tr>
<td>'$0D'</td>
<td>Control character: Line break (corresponds to '$R')</td>
</tr>
<tr>
<td>'$0A'</td>
<td>Control character: New line (corresponds to '$L' and '$N')</td>
</tr>
</tbody>
</table>

**Table 398: Special cases**

<table>
<thead>
<tr>
<th>String with $ code</th>
<th>Interpretation</th>
</tr>
</thead>
<tbody>
<tr>
<td>'$L', '$l'</td>
<td>Control character: Line feed (corresponds to '$0A')</td>
</tr>
<tr>
<td>'$N', '$n'</td>
<td>Control character: New line (corresponds to '$0A')</td>
</tr>
<tr>
<td>'$P', '$p'</td>
<td>Control character: Form feed</td>
</tr>
<tr>
<td>'$R', '$r'</td>
<td>Control character: Line break (corresponds to '$0D')</td>
</tr>
<tr>
<td>'$T', '$t'</td>
<td>Control character: Tab</td>
</tr>
<tr>
<td>'$S'</td>
<td>Dollar sign: $</td>
</tr>
<tr>
<td>'$'</td>
<td>Single straight quotation mark: '</td>
</tr>
</tbody>
</table>

**Example**

```pascal
VAR CONSTANT
    constA : STRING := 'Hello world';
    constB : STRING := 'Hello world $21'; // Hello world!
END_VAR
```

**Constant: UTF8# String**

With compiler version >= 3.5.18.0, UTF-8 encoded string literals are possible as a single-byte string with base “STRING”.

**Syntax:**

UTF8# '<string literal> '

**Constant declaration**

```pascal
VAR CONSTANT
    constA : STRING := UTF8#'ääöüü';
    constB : STRING := UTF8#'Hello Allgäu $21'; // Hello Allgäu!
END_VAR
```
To ensure correct monitoring, the 'monitoring_encoding' := 'UTF-8' attribute can be added.

NOTICE!
UTF-8 encoding only for project-wide configuration

A UTF-8 encoding is used if the project-wide compile option UTF8 encoding for STRING is enabled. Library functions and add-ons are then also oriented according to this setting.

If you use single UTF-8 encoded strings, then you have to make sure that they are interpreted correctly wherever they are used. For example, a string variable in the OPC server will be converted to UTF-8 before being transferred to a client if the setting is not selected. Values such as UTF8#äöü would then be misinterpreted. Similar problems can arise when outputting strings in the visualization.

TIME/LTIME Constant

You can use TIME constants to operate the standard timer modules. The constant has a size of 32 bits and a resolution in milliseconds.

In addition, the time constant LTIME is available as a time basis for high-resolution timers. The LTIME constant has a dimension of 64 bits and a resolution in nanoseconds.

TIME constant

Syntax

<time keyword> # <length of time>

<time keyword> : TIME | time | T | t
<length of time> : ( <number of days>d )? ( <number of hours>h )? ( <number of minutes>m )? ( <number of seconds>s )? <number of milliseconds>ms)? // ( ...)? Optional

The order of time units must not be changed. However, it is not required to specify all units. It is permitted to specify the units in uppercase.

Time units

- D | d: Days
- H | h: Hours
- M | m: Minutes
- s | s: Seconds
- MS | ms: Milliseconds
Examples
Correct time constants of an ST assignment

VAR
timLength : TIME := T#14ms;
timLength1 : TIME := T#100s12ms; // Overflow in the highest unit is allowed.
timLength2 : TIME := T#12h34m15s;
timCompare : TIME;
xIsOK: BOOL;

timLongest := T#49D17H2M47S295MS; // 4294967295
END_VAR

IF timLength < T#15MS THEN
  IF timCompare < timLength1 THEN
    xIsOK := TRUE;
  END_IF;
END_IF

Table 399: Incorrect usage:

| timIncorrect := t#5m68s; | Overflow at a lower position |
| timIncorrect1 := 15ms;   | Time marker T# missing      |
| timIncorrect2 := t#4ms13d; | Incorrect order of time units |

LTIME constant

Syntax

<long time keyword> # <length of high resolution time>

<long time keyword> : LTIME | ltime
<length of high resolution time> : <length of time> ( <number of microseconds>us )? ( <number of nanoseconds>ns )? // ( ...)? Optional

You can use the same units for LTIME constants as for TIME constants. You can also specify microseconds and nanoseconds because the specified time is calculated in higher time resolution. LTIME literals are treated internally as data type LWORD and therefore the value resolved in nanoseconds.

Additional time units

- US | us: Microseconds
- NS | ns: Nanoseconds

Examples of correct usage of an ST assignment:

PROGRAM PLC_PRG
VAR
  ltimLength := LTIME#1000d15h23m12s34ms2us44ns;
  ltimLength1 := LTIME#345343m3424732874823ns;
END_VAR

- Chapter 6.4.1.20.4.8 “Date and Time Constants” on page 2225

Date and Time Constants

32-bit date specifications ‘DATE’

Use the keyword DATE (D) to specify a date.

Syntax

```
<date keyword>#<year>-<month>-<day>
```

```
<date keyword> : DATE | date | D | d
<year> : 1970-2106
<month> : 1-12
<day> : 1-31
```

DATE literals are treated internally as data type DWORD, which corresponds to an upper limit of DATE#2106-2-7.

Example

```
PROGRAM PRG_Date
VAR
    dateStart : DATE := DATE#2018-8-8;
    dateEnd : DATE := D#2018-8-31;
    dateCompare : DATE := date#1996-05-06;
    xIsDuringTheTime: BOOL;
    dateEarliest : DATE := d#1970-1-1; // = 0
    dateLatest : DATE := DATE#2106-2-7; // = 4294967295
END_VAR

IF dateStart < dateCompare THEN
    IF dateCompare < dateEnd THEN
        xIsDuringTheTime := TRUE;
    END_IF;
END_IF
```

64-bit date specifications ‘LDATE’

Use the keyword LDATE (LD) to specify a date.

Syntax

```
<date keyword>#<year>-<month>-<day>
```

```
<date keyword> : LDATE | ldate | LD | ld
<year> : 1970-2262
<month> : 1-12
<day> : 1-31
```

LDATE literals are treated internally as data type LWORD, which corresponds to an upper limit of DATE#2554-7-21.
PROGRAM PRG_Ldate
VAR
  ldateStart : LDATE := LDATE#2018-8-8;
  ldateEnd : LDATE := ldate#2018-8-31;
  ldateCompare : LDATE := LD#1996-05-06;
  xIsDuringTheTime : BOOL;
  ldateEarliest : LDATE := ld#1970-1-1; // = 0
  ldateLatest : LDATE := LDATE#2262-4-10; // = 16#7FFF63888C620000
  lwValue : LWORD;
END_VAR

IF ldateStart < ldateCompare THEN
  IF ldateCompare < ldateEnd THEN
    xIsDuringTheTime := TRUE;
  END_IF;
END_IF
lwValue := LDATE_TO_LWORD(ldateCompare);

Example

PROGRAM PRG_Ldate
VAR
  ldateStart : LDATE := LDATE#2018-8-8;
  ldateEnd : LDATE := ldate#2018-8-31;
  ldateCompare : LDATE := LD#1996-05-06;
  xIsDuringTheTime : BOOL;
  ldateEarliest : LDATE := ld#1970-1-1; // = 0
  ldateLatest : LDATE := LDATE#2262-4-10; // = 16#7FFF63888C620000
  lwValue : LWORD;
END_VAR

IF ldateStart < ldateCompare THEN
  IF ldateCompare < ldateEnd THEN
    xIsDuringTheTime := TRUE;
  END_IF;
END_IF
lwValue := LDATE_TO_LWORD(ldateCompare);

32-bit date and time specifications

Use the keyword DATE_AND_TIME (DT) to specify a date and time.

Syntax

<date and time keyword>#:<date and time value>

<date and time keyword> : DATE_AND_TIME | date_and_time | DT | dt
<date and time value> : <year>-<month>-<day>-<hour>:<minute>:<second>
<year> : 1970-2106
<month> : 1-12
<day> : 1-31
<hour> : 0-24
<minute> : 0-59
<second> : 0-59

DATE_AND_TIME literals are treated internally as data type DWORD. The time is processed in seconds and as a result can take on values from January 1, 1970 00:00:00 to February 7, 2106 06:28:15.

Example

PROGRAM PLC_PRG
VAR
  dtDate : DATE_AND_TIME := DATE_AND_TIME#1996-05-06-15:36:30;
  dtDate1: DATE_AND_TIME := DT#1972-03-29-00:00:00;
  dtDate2: DATE_AND_TIME := DT#2018-08-08-13:33:20.5;
  dtEarliest : DATE_AND_TIME :=
    DATE_AND_TIME#1979-1-1-00:00:00; // 0
  dtLatest : DATE_AND_TIME := DATE_AND_TIME#2106-2-7-6:28:15; // 4294967295
END_VAR
Use the keyword `LDATE_AND_TIME` (LDT) to specify a date and time.

Syntax

```
<date and time keyword>#<long date and time value>
```

```
<date and time keyword> : LDATE_AND_TIME | ldate_and_time | LDT | ldt
<date and time value> : <year>-<month>-<day>-<hour>:<minute>:<second>
<year> : 1970-2106
<month> : 1-12
<day> : 1-31
<hour> : 0-24
<minute> : 0-59
<second> : 0-59 LDATE_AND_TIME#2262-4-10-23:59:59.999999999
```

`DATE_AND_TIME` literals are treated internally as data type LWORD. The time is processed in seconds and as a result can take on values from January 1, 1970 00:00 to July 21, 2554 23:59:59.999999999.

Example

```
PROGRAM PLC_PRG
VAR
  ldtDate : LDATE_AND_TIME := LDATE_AND_TIME#1996-05-06-15:36:30;
  ldtDate1: LDATE_AND_TIME := LDT#1972-01-29-00:00:00;
  ldtDate2: LDATE_AND_TIME := LDT#2018-08-08-13:33:20.5;
  dtEarliest : LDT := LDT#1979-1-1-00:00:00; // 0
  dtLatest : LDT := LDT#2266-4-10-23:59:59; // = 16#7FFF63888C620000
END_VAR
```

Use the keyword `TIME_OF_DAY` (TOD) to specify a time.

Syntax

```
<time keyword>#<time value>
```

```
<time keyword> : TIME_OF_DAY | time_of_day | TOD | tod
<time value> : <hour>:<minute>:<second>
<hour> : 0-23
<minute> : 0-59
<second> : 0.000-59.999
```

You can also specify fractions of a second. `TIME_OF_DAY` literals are treated internally as DWORD and the value is resolved in milliseconds.

Examples

```
PROGRAM POU
VAR
  todClockTime : TIME_OF_DAY := TIME_OF_DAY#15:36:30.123;
  todEarliest : TIME_OF_DAY := TIME_OF_DAY#0:0:0.000;
  todLatest : TOD := TOD#23:59:59.999;
END_VAR
```
Use the keyword LTIME_OF_DAY (LTOD) to specify a time.

**'LTIME_OF_DAY'**

**Syntax**

```
<time keyword>#:<time value>
```

- `<time keyword>`: LTIME_OF_DAY | ltime_of_day | LTOD | ltod
- `<time value>`: <hour>:<minute>:<second>
- `<hour>`: 0-23
- `<minute>`: 0-59
- `<second>`: 0.000-59.999999999

You can also specify fractions of a second. LTIME_OF_DAY literals are treated internally as LWORD and the value is resolved in nanoseconds.

**Examples**

```plaintext
PROGRAM POU
VAR
  ltodClockTime : LTIME_OF_DAY := TIME_OF_DAY#15:36:30.123456789;
  todEarliest : TIME_OF_DAY := TIME_OF_DAY#0:0:0;
  todLatest : TOD := TOD#23:59:59.999999999;
END_VAR
```

- Chapter 6.4.1.20.5.8 “Date and Time Data Types” on page 2238

**Typed literals**

With the exception of REAL/LREAL constants (LREAL is always used here), CODESYS uses the smallest possible data type when calculating with IEC constants. If you want to use another data type, then you can use typed literals without having to declare the constants explicitly. When doing this, provide the constants with a prefix that indicates the type.

**Syntax:**

```
<type>#<literal>
```

- `<type>` defines the desired data type; possible values: BOOL, SINT, USINT, BYTE, INT, UINT, WORD, DINT, UDINT, DWORD, REAL, LREAL. You must capitalize the entire type name.
- `<literal>` defines the constants. The entry must match the data type defined in `<Type>`.

**Example:**

```
var1 := DINT#34;
```

If CODESYS cannot convert the constant into the target type without data loss, then an error message is issued.

You can use typed constants wherever you can use normal constants.

**Access to Variables in Arrays, Structures, and Blocks**

**Syntax for access to**

- Two-dimensional array component: `<array name> [ <1st dimension> , <2nd dimension> ]`
- Structural variable: `<structure name> . <component name>`
- Function block and program variable: `<function block name> | <program name> . <variable name>`
Bit Access in Variables

NOTICE!
Implement concurrent bit access by two tasks only if the processor can execute bit access directly on the memory. All x86 and x64 systems have commands for bit access in memory. Systems such as ARM and PPC cannot access bits directly in the memory.

If two tasks execute bit access simultaneously, even though the processor cannot perform bit access directly in the memory, then proceed as follows. Use a semaphore (SysSemEnter) or a similar technique to prevent competing bit access. However, it is best to execute the bit access within a task.

With index access, individual bits can be addressed in integer variables. Using a structure variable or a function block instance, individual bits can be addressed symbolically.

Index access to bits integer variables
You can address individual bits in integer variables. To do this, append the variable with a dot and the index of the addressed bit. The bit-index can be given by any constant. Indexing is 0-based.

Syntax
<integer variable name> . <index>
<integer data type> = BYTE | WORD | DWORD | LWORD | SINT | USINT | INT | UINT | DINT | UDINT | LINT | ULINT

Example
In the program, the third bit of the variable wA is set to the value of variable xB. The constant c_usiENABLE acts as an index to access the third bit of the variable iX.

Index access
PROGRAM PLC_PRG
VAR
   wA : WORD := 16#FFFF;
   xB : BOOL := 0;
END_VAR

   // Index access in an integer variable
   wA.2 := xB;

Result: wA = 2#1111_1111_1111_1011 = 16#FFFB

Constant as index
   // GVL declaration
   VAR_GLOBAL CONSTANT
c_usiENABLE : USINT := 2;
   END_VAR

PROGRAM PLC_PRG
VAR
   iX : INT := 0;
END_VAR

   // Constant as index
   iX.gc_usiENABLE := TRUE;   // Third bit in iX is set TRUE

Result: iX = 4
**Symbolic bit access in structure variables**

With the **BIT** data type, you can combine individual bits into a structure and then access them individually. Then the bit is addressed with the component name.

**Example**

**Type declaration of the structure:**

```plaintext
TYPE S_CONTROLLER :
  STRUCT
    bitOperationEnabled : BIT;
    bitSwitchOnActive : BIT;
    bitEnableOperation : BIT;
    bitError : BIT;
    bitVoltageEnabled : BIT;
    bitQuickStop : BIT;
    bitSwitchOnLocked : BIT;
    bitWarning : BIT;
  END_STRUCT
END_TYPE
```

**Declaration and write access to a bit:**

```plaintext
PROGRAM PLC_PRG
VAR
  ControlDriveA : S_CONTROLLER;
END_VAR

// Symbolic bit access to bitEnableOperation
ControlDriveA.bitEnableOperation := TRUE;
```

**Symbolic bit access in function block instances**

In function blocks, you can declare variables for individual bits.

**Example**

```plaintext
FUNCTION_BLOCK FB_Controller
  VAR_INPUT
    bitSwitchOnActive : BIT;
    bitEnableOperation : BIT;
    bitVoltageEnabled : BIT;
    bitQuickStop : BIT;
    bitSwitchOnLocked : BIT;
  END_VAR
  VAR_OUTPUT
    bitOperationEnabled : BIT;
    bitError : BIT;
    bitWarning : BIT;
  END_VAR
END_FUNCTION_BLOCK

PROGRAM PLC_PRG
VAR
  fbController : FB_Controller;
END_VAR

// Symbolic bit access to bitSwitchOnActive
fbController(bitSwitchOnActive := TRUE);
```
 Addresses

**CAUTION!**
If you use pointers to addresses, then the contents of addresses can be moved during an online change. If you use absolute addresses, then the contents of addresses does not change during an online change.

Syntax:

```
%<memory area prefix> ( <size prefix> )? <memory position>
```

- `<memory area prefix>`: I | Q | M
- `<size prefix>`: X | B | W | D
- `<memory position>`: <number> ( .<number> )* // Depends on the target system

When defining an address, you use specific character strings to express memory position and size. An address is marked with the percent sign (%), followed by the memory range prefix, the optional size prefix, and the memory range position. The numbering that you use for addressing the memory position depends on the target system.

<table>
<thead>
<tr>
<th>Memory Range Prefix</th>
<th>Memory Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>I</td>
<td>Input memory range for &quot;Inputs&quot;</td>
</tr>
<tr>
<td></td>
<td>For physical inputs via input drivers, &quot;Sensors&quot;</td>
</tr>
<tr>
<td>Q</td>
<td>Output memory range for &quot;Outputs&quot;</td>
</tr>
<tr>
<td></td>
<td>For physical outputs via output drivers, &quot;Actuators&quot;</td>
</tr>
<tr>
<td>M</td>
<td>Flag memory range</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Size Prefix</th>

<td>Variable declaration with address information of an input word</td>
</tr>
<tr>
<td>VAR xActuator AT %QW0 : BOOL; END_VAR</td>
<td>Boolean variable declaration</td>
</tr>
<tr>
<td>VAR xSensor AT IX7.5 : BOOL; END_VAR</td>
<td>Boolean variable declaration with explicit specification of a single bit address. On access, only the input bit 7.5 is read.</td>
</tr>
</tbody>
</table>

Memory position

Make sure that the address is valid as follows:

To map a valid address in an application, you must know the required position (applicable memory range) in the process image: input memory range (I), output memory range (Q), and flag memory range (M) — see above. Furthermore, you have to specify the required size prefix: bit, BYTE, WORD, DWord (see above: X, B, W, D).

The current device configuration and device settings (hardware structure, device description, I/O settings) play a decisive part. Note specifically the differences in the interpretation of bit addresses for devices with "byte addressing mode" and devices with "word-oriented IEC addressing mode". For example, in a byte addressing device, the number before the point of bit address %IX5.5 addresses byte 5. On the other hand, in a word-addressed device, it addresses word 5. In contrast, addressing with a word or byte address is independent of the device type: with %IW5 always word 5 is addressed and with byte address %IB5 always byte 5. Regardless of size and addressing mode, you can address different memory cells therefore with the same address information.

The following table shows the comparison of byte addressing and word-oriented IEC addressing for bits, bytes, words, and double words. It also shows the overlapping memory ranges that are present in the case of byte addressing (see also the example below the table).

Regarding syntax, note that the IEC addressing mode is always word-oriented. In this case, the word number is located before the point and the bit number after the point.
### Functions

In ST, you can use a function call as an operand.

**Example:**

```
Result := Fct(7) + 3;
```

### TIME() function

This function yields the time (in milliseconds) that has elapsed since system boot. The data type is TIME.

**Example in ST:**

```
systime := TIME();
```

6.4.1.20.5  Data Types

General

In the programming, a variable is identified by its name and has an address in the memory of the target system. Accordingly, variable names are identifiers under which the allocated memory is addressed. The size of the variable is determined by its data type. This determines how much memory is reserved for the variable and how the values in memory are to be interpreted. The data type also determines which operators are allowed.

In CODESYS, there is also the capability of instantiating function blocks. Function block instances then use memory like variables do. The memory requirement is determined by the function block.

The following groups of data types are available.

Standard data types

A standard data type (or standard data type) is an elementary data type or a string data type.

<standard data type> : __UXINT | __XINT | __XWORD | BIT | BOOL | BYTE | DATE | DATE_AND_TIME | DINT | DT | DWORD | INT | LDATE | LDATE_AND_TIME | LDT | LINT | LREAL | LTOD | LWORD | REAL | SINT | STRING | TIME | TOD | TIME_OF_DAY | UDINT | UINT | ULINT | USINT | WORD | WSTRING

User-defined data types

You can declare your own data types which are based on the default predefined data types or existing data types.

These kinds of data types are called user-defined or user-specific. The data types are either organized as its own DUT object or declared within the declaration part of a programming object. Moreover, they are differentiated according to their purpose and syntax.

<table>

### Integer data types

CODESYS provides the following integer data types.

<table>
<thead>
<tr>
<th>Data Type</th>
<th>Lower Limit</th>
<th>Upper Limit</th>
<th>Memory</th>
</tr>
</thead>
<tbody>
<tr>
<td>BYTE</td>
<td>0</td>
<td>255</td>
<td>8 bit</td>
</tr>
<tr>
<td>WORD</td>
<td>0</td>
<td>65535</td>
<td>16 bit</td>
</tr>
<tr>
<td>DWORD</td>
<td>0</td>
<td>4294967295</td>
<td>32 bit</td>
</tr>
<tr>
<td>LWORD</td>
<td>0</td>
<td>$2^{64}-1$</td>
<td>64 bit</td>
</tr>
<tr>
<td>SINT</td>
<td>-128</td>
<td>127</td>
<td>8 bit</td>
</tr>
<tr>
<td>USINT</td>
<td>0</td>
<td>255</td>
<td>8 bit</td>
</tr>
<tr>
<td>INT</td>
<td>-32768</td>
<td>32767</td>
<td>16 bit</td>
</tr>
<tr>
<td>UINT</td>
<td>0</td>
<td>65535</td>
<td>16 bit</td>
</tr>
<tr>
<td>DINT</td>
<td>-2147483648</td>
<td>2147483647</td>
<td>32 bit</td>
</tr>
<tr>
<td>UDINT</td>
<td>0</td>
<td>4294967295</td>
<td>32 bit</td>
</tr>
</tbody>
</table>
Data Type | Lower Limit | Upper Limit | Memory
---|---|---|---
LINT | $-2^{63}$ | $2^{63}-1$ | 64 bit
ULINT | 0 | $2^{64}-1$ | 64 bit

**NOTICE!**
Information can be lost when converting from larger to smaller types.

- ☰ Chapter 6.4.1.20.4.3 “Numeric constants” on page 2220

**Data type 'REAL' / 'LREAL'**
The data types REAL and LREAL are floating-point types according to IEEE 754. They are necessary when using decimal numbers and floating-point numbers in decimal notation or exponential notation.

**Example**

```
PROGRAM PLC_PRG
VAR
    rMax: REAL := 3.402823E+38; // Largest number
    rPosMin : REAL := 1.0E-44; // Smallest positive number
    rNegMax: REAL := -1.0E-44; // Largest negative number
    rMin: REAL := -3.402823E+38; // Smallest number
    lrMax: LREAL := 1.7976931348623157E+308; // Largest number
    lrPosMin : LREAL := 4.94065645841247E-324; // Smallest positive number
    lrNegMax: LREAL := -4.94065645841247E-324; // Largest negative number
    lrMin: LREAL := -1.7976931348623157E+308; // Smallest number
END_VAR
```

**NOTICE!**
Support for the LREAL data type depends on the target device in use. Refer to the respective documentation as to whether or not the 64-bit type LREAL is converted to REAL or remains as LREAL when compiling the application. Conversion may result in the loss of information.

**NOTICE!**
If the value of the REAL/LREAL number is outside of the value range of the integer, then an undefined result is yielded from a data type conversion from REAL or LREAL to SINT, USINT, INT, UINT, DINT, UDINT, LINT, or ULINT. The result depends on the target system. An exception error is also possible. To get code that is independent of the target system, the application must catch value range violations.

If the REAL/LREAL number is within the value range of the integer data type, then the conversion operates the same way on all systems.
Data Type 'STRING'

A variable of data type STRING can have contain any character string. The amount of memory that is reserved during a declaration refers to characters and is shown in parentheses or brackets. If a size is not defined, then CODESYS allocates 80 characters by default.

As a rule, CODESYS does not limit the string length. However, the string function processes lengths of 1–255 only. If a variable is initialized with a string that is too long for the data type, then CODESYS truncates the string accordingly from the right.

**NOTICE!**
The memory required for a STRING variable is always one byte per character plus one additional byte (for example, 81 bytes for a "STRING(80)" declaration).

**Example of a string declaration with 35 characters:**

```plaintext
str : STRING(35):= 'This is a String';
```

- § Chapter 6.4.1.20.5.10 “Data type 'WSTRING’” on page 2242

Data Type 'TIME'

The data type is treated internally as DWORD. TIME is resolved in milliseconds.

<table>
<thead>
<tr>
<th>Data type</th>
<th>Lower limit</th>
<th>Upper limit</th>
<th>Storage space</th>
<th>Resolution</th>
</tr>
</thead>
<tbody>
<tr>
<td>TIME</td>
<td>T#0d0h0m0s0ms</td>
<td>T#49d17h2m47s29</td>
<td>32 bit</td>
<td>Milliseconds</td>
</tr>
</tbody>
</table>

**See also**

- § Chapter 6.4.1.20.5.7 “Data Type 'LTIME’” on page 2237
- § Chapter 6.4.1.20.4.7 “TIME/LTIME Constant” on page 2223
- § Chapter 6.4.1.20.4.8 “Date and Time Constants” on page 2225

Data Type 'LTIME'

You can use the data type LTIME as a time base for high-resolution timer. A high-resolution timer has a resolution in nanoseconds.

<table>
<thead>
<tr>
<th>Data Type</th>
<th>Lower Limit</th>
<th>Upper Limit</th>
<th>Memory</th>
</tr>
</thead>
<tbody>
<tr>
<td>LTIME</td>
<td>LTIME#0NS</td>
<td>LTIME#213503D23H34M3 3S709MS551US615NS</td>
<td>64 bits</td>
</tr>
</tbody>
</table>

**Syntax:**
LTIME\#<long time declaration>

The time declaration can include units of time that apply for the TIME constant as well as:

- "US": microseconds
- "NS": nanoseconds

Example: 
LTIME1 := LTIME\#1000D15H23M12S34MS2US44NS

Date and Time Data Types

The data types DATE, DATE_AND_TIME (DT), and TIME_OF_DAY (TOD) are handled internally like a DWORD (32-bit value).

The data types LDATE, LDATE_AND_TIME (LDT), and LTIME_OF_DAY (LTOD) are treated internally like an LWORD (64-bit value).

The values of these data types are measured in seconds, milliseconds, and nanoseconds since 01/01/1970.

Data Type 'ANY' and 'ANY_<type>'

The data types ANY or ANY_<type> are used in interfaces of functions, function blocks, or methods in order to type input parameters whose type is unknown or unspecified: The input variables (VAR_INPUT) have a generic data type.

The compiler replaces the type of input variable internally with the data structure described below, whereby the value is not passed directly. Instead, a pointer is passed to the actual value so only a variable can be passed. Therefore, the data type is only specified when it is called. As a result, calls of such POUs can be made using arguments which each have different data types.

Literal, replaced constants, and results of function calls or expressions cannot be passed to input variables (VAR_IN_OUT).

Internal data structure for 'ANY' and 'ANY_<type>'

When code is compiled, the input variables are typed internally with ANY data type by the following structure. When the POU is called (at runtime), the argument is passed to a reference parameter.

2024/01/05  3ADR010583, 1, en_US  2239
TYPE AnyType :
STRUCT
  // the type of the actual parameter
  typeclass : __SYSTEM.TYPE_CLASS;
  // the pointer to the actual parameter
  pvalue : POINTER TO BYTE;
  // the size of the data, to which the pointer points
  diSize : DINT;
END_STRUCT
END_TYPE

You can access the input variable within the POU via this structure by means of this structure, and for example query the passed value.

Example
This compares whether or not two input variables have the same type and the same value.

FUNCTION funGenericCompare : BOOL
VAR_INPUT
  any1 : ANY;
  any2 : ANY;
END_VAR
VAR
  pTest : POINTER TO ARRAY [0..100] OF POINTER TO DWORD;
  diCount: DINT;
END_VAR

  pTest := ADR(any1);
  Generic_Compare := FALSE;
  IF any1.typeclass <> any2.typeclass THEN
    RETURN;
  END_IF
  IF any1.diSize <> any2.diSize THEN
    RETURN;
  END_IF
  // Byte comparison
  FOR iCount := 0 TO any1.diSize-1 DO
    IF any1.pvalue[iCount] <> any2.pvalue[iCount] THEN
      RETURN;
    END_IF
  END_FOR
  Generic_Compare := TRUE;
  RETURN;
END_FUNCTION

Declaration
The syntax descriptions refer to a POU with exactly one parameter (an input variable).

Syntax
FUNCTION | FUNCTION_BLOCK | METHOD <POU name> ( : <return data type> )?
VAR_INPUT
  <input variable name> : <generic data type>;
END_VAR

<generic data type> = ANY | ANY_BIT | ANY_DATE | ANY_NUM | ANY_REAL | ANY_INT | ANY_STRING
**Example**

```plaintext
FUNCTION funComputeAny : BOOL
VAR_INPUT
    anyInput1 : ANY; // valid data type see table
END_VAR
// END_FUNCTION

FUNCTION_BLOCK FB_ComputeAny
VAR_INPUT
    anyInput1 : ANY;
END_VAR
// END_FUNCTION_BLOCK

FUNCTION_BLOCK FB_ComputeMethod
METHOD methComputeAny : BOOL
VAR_INPUT
    anyInput1 : ANY_INT; // valid data types are SINT, INT, DINT,
    LINT, USINT, UINT, UDINT, ULINT
END_VAR
//END_METHOD
```

*With compiler versions > 3.5.1.0, the generic IEC data types in the table are supported.*

The table represents the hierarchy of the generic data types and provides information as to which generic data type of the formal parameter (declaration) allows which elementary data types of the argument (call).

<table>
<thead>
<tr>
<th>Generic data type in the case of a formal parameter</th>
<th>Permitted elementary data type in the case of an actual parameter (argument)</th>
</tr>
</thead>
<tbody>
<tr>
<td>ANY</td>
<td>ANY_BIT</td>
</tr>
<tr>
<td>ANY_DATE</td>
<td>DATE, DATE_AND_TIME, DT, TIME_OF_DAY, TOD, LDATE, LDATE_AND_TIME, LDT, LTIME_OF_DAY, LTOD</td>
</tr>
<tr>
<td>ANY_NUM</td>
<td>ANY_REAL, REAL, LREAL</td>
</tr>
<tr>
<td>ANY_INT</td>
<td>USINT, UINT, UDINT, ULINT, SINT, INT, DINT, LINT</td>
</tr>
<tr>
<td>ANY_STRING</td>
<td>STRING, WSTRING</td>
</tr>
</tbody>
</table>

**Call**

The syntax descriptions refer to a POU with exactly one parameter, to which an argument is passed. As a result, the data type of the argument specifies the generic data type of the input variable. For example, arguments of the type BYTE, WORD, DWORD, LWORD can be passed to a type ANY_BIT input variable.
Syntax of function call
<variable name> := <function name> ( <argument name> );
<argument name> : variable with valid data type

Syntax of function block call
<function block name> ( <input variable name> := <argument name> );

Syntax of method call
<function block name> . <method name> ( <input variable name> := <argument name> );

Example

PROGRAM PLC_PRG
VAR
byValue : BYTE := 16#AB;
iValue : INT := -1234;
xResultByte : BOOL;
xResultInt : BOOL;

fbComputeAnyByte : FB_ComputeAny;
fbComputeAnyInt : FB_ComputeAny;

fbComputeM1 : FB_ComputeMethod;
fbComputeM2 : FB_ComputeMethod;

byN : BYTE := 1;
wBitField1 : WORD := 16#FFFF;
wBitField2 : WORD := 16#0001;
xInit : BOOL;
xResult : BOOL;
END_VAR

xResultByte := funComputeAny(byValue);
xResultInt := funComputeAny(iValue);

xResult := funGenericCompare(wBitField1, wBitField2);

fbComputeAnyByte(anyInput1 := byValue);
fbComputeAnyInt(anyInput1 := iValue);

fbComputeM1.methComputeAny(byValue);
fbComputeM2.methComputeAny(iValue);
// END_PRG

Data type 'WSTRING'
The data type WSTRING is interpreted in Unicode format as opposed to the data type STRING (ASCII). As a result of this coding, the number of displayed characters for WSTRING depends on the characters. A length of 10 for WSTRING means that the length of the WSTRING can take a maximum of 10 WORDS. However, for some characters in Unicode, multiple WORDS are required for coding a character so that the number of characters do not have to correspond to the length of the WSTRING (10 in this case). The data type requires 1 WORD of memory per character plus 1 WORD of extra memory. Each STRING requires only 1 byte. The data type WSTRING is terminated with a 0.

Example:

wstr : WSTRING := "This is a WString";

- Chapter 6.4.1.20.5.5 “Data Type "STRING"” on page 2237
- Chapter 6.4.1.20.4.5 “String Constants” on page 2221
Data Type 'BIT'

The data type **BIT** is valid only in structures for the declaration of structure members or in a function block for the declaration of variables. A **BIT** variable can have the values **TRUE** (1) and **FALSE** (0). In this case, the variable requires exactly one bit of memory.

As a result, you can symbolically address individual bits by a name. **BIT** variables that are declared in succession are bundled in bytes. In this way, you can optimize memory use as opposed to **BOOL** types, which reserve 8 bits each. On the other hand, bit access is significantly more time-consuming. Therefore, you should use the **BIT** data type only when you need to define data in a predefined format.

Special Data Types '__UXINT', '__XINT', and '__XWORD'

Variables with these data types are converted to a platform-compliant data type, depending on the target system.

CODESYS supports systems with address registers of 32-bit and 64-bit widths. For making the IEC code as independent from the target system as possible, you use the pseudo data types __UXINT, __XINT, and __XWORD. The compiler checks which target system types are current and then converts these data types into the appropriate standard data types.

Moreover, type conversion operators are provided for variables of these data types.

<table>
<thead>
<tr>
<th>__UXINT</th>
<th>Type conversion on 64-bit platforms</th>
<th>Type conversion on 32-bit platforms</th>
</tr>
</thead>
<tbody>
<tr>
<td>__XINT</td>
<td>ULINT</td>
<td>UDINT</td>
</tr>
<tr>
<td>__XWORD</td>
<td>LWORD</td>
<td>DWORD</td>
</tr>
</tbody>
</table>

- Chapter 6.4.1.20.3.36 “Overloading” on page 2152

Pointers

A pointer stores the memory address of objects, such as variables or function block instances, at runtime.

**Syntax of the pointer declaration:**

<pointer name>: POINTER TO <data type | data unit type | function block>;
**Example**

FUNCTION_BLOCK FB_Point
VAR
    piNumber: POINTER TO INT;
    iNumber1: INT := 5;
    iNumber2: INT;
END_VAR

piNumber := ADR(iNumber1); // piNumber is assigned to address of iNumber1
iNumber2 := piNumber^; // value 5 of iNumber1 is assigned to variable iNumber2 by dereferencing of pointer piNumber

Dereferencing a pointer means obtaining the value to which the pointer points. A pointer is dereferenced by appending the content operator ^ to the pointer identifier (for example, piNumber^ in the example above). To assign the address of an object to a pointer, the address operator ADR is applied to the object: ADR(iNumber1).

In online mode, you can click “Edit ➔ Browse ➔ Go to Reference” to jump from a pointer to the declaration location of the referenced variable.

**NOTICE!**

When a pointer points to an I/O input, write access applies. This leads to the compiler warning “’<pointer name>’ is not a valid assignment target” when the code is generated. Example: pwInput := ADR(wInput);

If you require a construct of this kind, you have to first copy the input value (wInput) to a variable with write access.

**Index access to pointers**

CODESYS permits the index access [ ] to variables of type POINTER TO, as well as to the data types STRING or WSTRING.

The data, which the pointer points to, can also be accessed by appending the bracket operator [ ] to the pointer identifier(for example, piData[i]). The base data type of the pointer determines the data type and the size of the indexed component. In this case, the index access to the pointer is done arithmetically by adding the index dependent offset i * SIZEOF( <base type> ) to the address of the pointer. The pointer is dereferenced implicitly at the same time.

**Calculation:** piData[i] := (piData + i * SIZEOF(INT))^;

This is not: piData[i] != (piData + i)^.

**Index access STRING**

When you use the index access with a variable of the type STRING, you get the character at the offset of the index expression. The result is of type BYTE. For example, sData[i] returns the i-th character of the character string sData as SINT (ASCII).

**Index access WSTRING**

When you use the index access with a variable of the type WSTRING, you get the character at the offset of the index expression. The result is of type WORD. For example, wsData[i] returns the i-th character of the character string as INT (Unicode).

**Subtracting pointers**

The result of the difference between two pointers is a value of type DWORD, even on 64-bit platforms when the pointers are 64-bit pointers.
Using references provides the advantage of guaranteeing type safety. That is not the case with pointers.

The memory access of pointers can be checked at runtime by the implicit monitoring function `CheckPointer`.

- § Chapter 6.4.1.20.3.33 “Operator ‘Content Operator’” on page 2151
- § Chapter 6.4.1.20.3.32 “Operator ‘ADR’” on page 2150
- § Chapter 6.4.1.21.2.22.11 “POU ‘CheckPointer’” on page 2513

Reference

A reference implicitly refers to another object. When accessed, the reference is implicitly dereferenced, and therefore does not need a special content operator ^ such as a pointer.

Syntax

```
<identifier> : REFERENCE TO <data type> ;
<data type>: base type of the reference
```

Example

```plaintext
PROGRAM PLC_PRG
VAR
    rspeA : REFERENCE TO DUT_SPECIAL;
    pspeA : POINTER TO DUT_SPECIAL;
    speB : DUT_SPECIAL;
END_VAR
rspeA REF= speB; // Reference rspeA is alias for speB. The code corresponds to pspeA := ADR(speB);
rspeA := speD; // The code corresponds to pspeA^ := speB;
```

The readability of a program is made difficult when the same memory cell is accessed simultaneously by means of an identifier and its alias (for example, `speB` and `rspeA`).

NOTICE!

With compiler version >= V3.3.0.0, references are initialized (at 0).
NOTICE!

If a reference refers to a device input, then the access (for example, rInput REF= Input;) is applies as write access. This leads to a compiler warning when the code is generated: "...invalid assignment target".

If you require a construct of this kind, you have to first copy the input value (rInput) to a variable with write access.

**Invalid declarations**

ariTest : ARRAY[0..9] OF REFERENCE TO INT;
priTest : POINTER TO REFERENCE TO INT;
rrrTest : REFERENCE TO REFERENCE TO INT;
rbitTest : REFERENCE TO BIT;

A reference type must not be used as the base type of an array, pointer, or reference. Furthermore, a reference must not refer to a bit variable. These kinds of constructs generate compiler errors.

**Comparison of reference and pointer**

A reference has the following advantages over a pointer:

- Easier to use:
  A reference can access the contents of the referenced object directly and without dereferencing.

- Finer and simpler syntax when passing values:
  Call of a function block which passes a reference without an address operator instead of a pointer
  - Example: fbDoIt(riInput:=iValue);
  - Instead of: fbDoIt_1(piInput:=ADR(iValue));

- Type safety:
  When assigning two references, the compiler checks whether their base types match. This is not checked in the case of pointers.

**Testing the validity of a reference**

You can use the operator __ISVALIDREF to check whether or not a reference points to a valid value (meaning a value not equal to 0).

```plaintext
<Boolean variable name> := __ISVALIDREF( <reference name> );
<reference name>: Identifier declared with REFERENCE TO
```

The Boolean variable is TRUE when the reference points to a valid value. Otherwise it is FALSE.
Example

PROGRAM PLC_PRG
VAR
iAlfa : INT;
riBravo : REFERENCE TO INT;
riCharlie : REFERENCE TO INT;
bIsRef_Bravo : BOOL := FALSE;
bIsRef_Charlie : BOOL := FALSE;
END_VAR

iAlfa := iAlfa + 1;
riBravo REF= iAlfa;
riCharlie REF= 0;
bIsRef_Bravo := __ISVALIDREF(riBravo); (* becomes TRUE, because riBravo references to iAlfa, which is non-zero *)
bIsRef_Charlie := __ISVALIDREF(riCharlie); (* becomes FALSE, because riCharlie is set to 0 *)

In compiler version 3.5.7.40 and later, the implicit monitoring function “CheckPointer” acts on variables of type REFERENCE TO in the same way as for pointer variables.

See also
- % Chapter 6.4.1.20.1.4.4.6 “Assignment Operator ‘REF=’” on page 2054

Data Type ‘ARRAY’

An array is a collection of data elements of the same data type. CODESYS supports one- and multi-dimensional arrays of fixed or variable length.

As of Automation Builder 2.6.0 array initializations within type definitions are no longer allowed.

Array of fixed length
Syntax of the declaration of a one-dimensional array

<variable name> : ARRAY[ <dimension> ] OF <data type> ( := <initialization> )? ;

<dimension> : <lower index bound>..<upper index bound>
<data type> : elementary data types | user defined data types | function block types
// (...)? : Optional

Syntax of the declaration of a multi-dimensional array

<variable name> : ARRAY[ <1st dimension> ( , <next dimension> )+ ] OF <data type> ( := <initialization> )? ;

<1st dimension> : <1st lower index bound>..<1st upper index bound>
<next dimension> : <next lower index bound>..<next upper index bound>  
<data type> : elementary data types | user defined data types |  
function block types  
// (...)+ : One or more further dimensions  
// (...)? : Optional

The index limits are integers; maximum of the data type DINT.

Syntax for data access

```
<variable name>[ <index of 1st dimension> ( , <index of next dimension> )* ]  
// (....)* : 0, one or more further dimensions
```

Example

### One-dimensional array of 10 integer elements

```
VAR  
  aiCounter : ARRAY[0..9] OF INT;  
END_VAR  
```

Lower index limit: 0
Upper index limit: 9

#### Initialization

```
aiCounter : ARRAY[0..9] OF INT := [0, 10, 20, 30, 40, 50, 60, 70, 80, 90];
```

#### Data access

```
iLocalVariable := aiCounter[2];  
The value 20 is assigned to the local variable.
```

### 2-dimensional array

```
VAR  
  aiCardGame : ARRAY[1..2, 3..4] OF INT;  
END_VAR  
```

1st dimension: 1 to 2  
2nd dimension: 3 to 4

#### Initialization

```
```

#### Data access

```
iLocal_1 := aiCardGame[1, 3]; // Assignment of 10  
iLocal_2 := aiCardGame[2, 4]; // Assignment of 20
```

Note the capability of using the implicit monitoring function CheckBounds() to monitor the maintenance of the index limits at runtime.
Example

3-dimensional array

VAR
  aiCardGame : ARRAY[1..2, 3..4, 5..6] OF INT;
END_VAR

1st dimension: 1 to 2
2nd dimension: 3 to 4
3rd dimension: 5 to 6
2 * 2 * 2 = 8 array elements

Initialization

aiCardGame : ARRAY[1..2, 3..4, 5..6] OF INT := [10, 20, 30, 40, 50, 60, 70, 80];

Data access

iLocal_1 := aiCardGame[1, 3, 5]; // Assignment of 10
iLocal_2 := aiCardGame[2, 3, 5]; // Assignment of 20
iLocal_3 := aiCardGame[1, 4, 5]; // Assignment of 30
iLocal_4 := aiCardGame[2, 4, 5]; // Assignment of 40
iLocal_5 := aiCardGame[1, 3, 6]; // Assignment of 50
iLocal_6 := aiCardGame[2, 3, 6]; // Assignment of 60
iLocal_7 := aiCardGame[1, 4, 6]; // Assignment of 70
iLocal_8 := aiCardGame[2, 4, 6]; // Assignment of 80

Initialization

aiCardGame : ARRAY[1..2, 3..4, 5..6] OF INT := [2(10), 2(20), 2(30), 2(40)]; // Short notation for [10, 10, 20, 20, 30, 30, 40, 40]

Data access

iLocal_1 := aiCardGame[1, 3, 5]; // Assignment of 10
iLocal_2 := aiCardGame[2, 3, 5]; // Assignment of 10
iLocal_3 := aiCardGame[1, 4, 5]; // Assignment of 20
iLocal_4 := aiCardGame[2, 4, 5]; // Assignment of 20
iLocal_5 := aiCardGame[1, 3, 6]; // Assignment of 30
iLocal_6 := aiCardGame[2, 3, 6]; // Assignment of 30
iLocal_7 := aiCardGame[1, 4, 6]; // Assignment of 40
iLocal_8 := aiCardGame[2, 4, 6]; // Assignment of 40
**Example**

### 3-dimensional arrays of a user-defined structure

```plaintext
TYPE DATA_A
STRUCT
  iA_1 : INT;
  iA_2 : INT;
  dwA_3 : DWORD;
END_STRUCT
END_TYPE

PROGRAM PLC_PRG
VAR
  aData_A : ARRAY[1..3, 1..3, 1..10] OF DATA_A;
END_VAR

The array aData_A consists of a total of 3 * 3 * 10 = 90 array elements of data type DATA_A.

### Initialize partially

```plaintext
aData_A : ARRAY[1..3, 1..3, 1..10] OF DATA_A := [(iA_1 := 1, iA_2 := 10, dwA_3 := 16#00FF),
  (iA_1 := 2, iA_2 := 20, dwA_3 := 16#FF00),
  (iA_1 := 3, iA_2 := 30, dwA_3 := 16#FFFF)];
```

In the example, only the first 3 elements are initialized explicitly. Elements to which no initialization value is assigned explicitly are initialized internally with the default value of the basic data type. This initializes the structure components at 0 starting with the element aData_A[2, 1, 1].

### Data access

```plaintext
iLocal_1 := aData_A[1,1,1].iA_1; // Assignment of 1
dwLocal_2 := aData_A[3,1,1].dwA_3; // Assignment of 16#FFFF
```

---

**Example**

### Array of a function block

```plaintext
FUNCTION BLOCK FObject_A
VAR
  iCounter : INT;
END_VAR
...

PROGRAM PLC_PRG
VAR
  aObject_A : ARRAY[1..4] OF FObject_A;
END_VAR

The array aObject_A consists of 4 elements. Each element instantiates a FObject_A function block.

### Function call

```plaintext
aObject_A[2]();
```
The function block FB_Something has a method FB_Init that requires 2 parameters.

The declaration of an "array of arrays" is an alternative syntax for multidimensional arrays. A collection of elements is nested instead of dimensioning the elements. The nesting depth is unlimited.

Syntax for declaration

```
<variable name> : ARRAY[<first>] ( OF ARRAY[<next>] )+ OF <data type> ( := <initialization> )? ;
```

Syntax for data access

```
<variable name>[<index of first array>] ( [<index of next array>] )+ ;
```

// (...) : One or more further arrays
// (...) : Optional
Example

PROGRAM PLC_PRG
VAR
    aiPoints : ARRAY[1..2,1..3] OF INT := [1,2,3,4,5,6];
    ai2Boxes : ARRAY[1..2] OF ARRAY[1..3] OF INT := [ [1,2,3], [4,5,6] ];
        [ [ [1,2,3,4], [5,6,7,8] ], [9,10,11,12] ], [ [13,14,15,16], [17,18,19,20], [21,22,23,24] ] ];
        ARRAY[1..5] OF INT;
END_VAR
aiPoints[1, 2] := 1200;
ai2Boxes[1][2] := 1200;

The variables aiPoints and ai2Boxes collect the same data elements, however the syntax for the declaration differs from that of the data access.

Array of variable length

In function blocks, functions, or methods, you can declare arrays of variable length in the VAR_IN_OUT declaration section.

The LOWER_BOUND and UPPER_BOUND operators are provided for determining the index limits of the actual used array at runtime.

Only statically declared arrays (not arrays generated by means of the operator __NEW) may be passed to an array with variable length.
Syntax of the declaration of a one-dimensional array of variable length

```plaintext
<variable name> :  ARRAY[*] OF <data type> ( := <initialization> )? ;
```

Syntax of the declaration of a multi-dimensional array of variable length

```plaintext
<variable name> :  ARRAY[* ( , * )+ ] OF <data type> ( := <initialization> )? ;
```

Syntax of the operators for calculating the limit index

```plaintext
LOWER_BOUND( <variable name> , <dimension number> )
UPPER_BOUND( <variable name> , <dimension number> )
```

Example

The `SUM` function adds the integer values of the array elements and returns the calculated sum as a result. The sum is calculated across all array elements available at runtime. As the actual number of array elements will only be known at runtime, the local variable is declared as a one-dimensional array of variable length.

```plaintext
FUNCTION SUM: INT;
VAR_IN_OUT
    aiData : ARRAY[*] OF INT;
END_VAR
VAR
    diCounter : DINT;
    iResult : INT;
END_VAR

iResult := 0;
FOR diCounter := LOWER_BOUND(aiData, 1) TO UPPER_BOUND(aiData, 1) DO // Calculates the length of the current array
    iResult := iResult + aiData[diCounter];
END_FOR;
SUM := iResult;
```

Data Type '_VECTOR'

Vector operations are supported natively only on 64-bit processors and offer a performance advantage only on these processors. The data sheet of the controller provides information about the processor used on the controller. Currently, vector operations on the x86/64-bit platforms with SSE2 and ARM64 with NEON are supported natively. On all other platforms, vector operations are translated into individual statements. For example, vector addition is then executed with multiple single addition operations.
The command set extensions of the processors are SIMD extensions. SIMD (Single Instruction, Multiple Data) describes a computer architecture in which multiple data sets of the same type are processed simultaneously in parallel and therefore faster with one command call. In vector operations, for example, 4 pairs of numbers can then be added at the same time.

Syntax

<variable name> : __VECTOR[ <vector size> ] OF <element type> ( := <initialization> )? ;

<vector size> : 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8
<element type> : REAL | LREAL

// (...)? : Optional

A vector data type is an array of floating-point numbers with a maximum of 8 elements. The operators __vc<operator name> are available for this data type. You can use these to implement vector operations without additional function calls.

Syntax for index access

<variable name>[ <index> ]

<index> : 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7

When indexing a vector variable, you can access a single element of the vector. The index starts at 0 and goes until <vector size> - 1.

Example

```plaintext
PROGRAM PLC_PRG
VAR
   vcA : __VECTOR[3] OF REAL;
END_VAR

vcA[0] := 1.1;
vcA[1] := 2.2;
vcA[2] := 3.3;
```

Determining the optimal vector size

Use the optimal vector size depending on your target system as the vector size in order to program the most efficient code possible.

For target systems whose computer architecture is generally suitable for vector processing, we do not recommend using vectors of arbitrary size. There is an optimal vector size depending on the type of data processing of the processor. Vectors that are declared with this array size are processed as quickly as possible. Vectors that are declared as a larger array do not have an advantage in speed. Vectors that are declared as smaller arrays do not take full advantage of the processor's capabilities.

You can query the optimal size at runtime. You can find the information in the constants Constants.vcOptimalREAL (for vectors with REAL elements) and Constants.vcOptimalLREAL (for vectors with LREAL elements). The constants have the LREAL data type. If a constant returns the value 1 as the optimal value, then this means that accelerated vector processing is not available for the target system.
Example

PROGRAM PLC_PRG
VAR
  iOVS_REAL : INT; // Optimal vector size for REAL elements
  iOVS_LREAL : INT; // Optimal vector size for LREAL elements
END_VAR

iOVS_REAL := Constants.vcOptimalREAL;
'iOVS_LREAL := Constants.vcOptimalLREAL;

An application that is loaded on the CODESYS Control Win V3 x64 target system returns the following values at runtime:

![Table showing values](image)

Operator __VCADD
Syntax

<vector variable> := <1st vector operand> __VCADD <2nd vector operand>;

Example of addition

FUNCTION_BLOCK FB_ADD
VAR
  vcA : __VECTOR[3] OF REAL := __VCSET_REAL(3, 3, 3);
  vcB : __VECTOR[3] OF REAL := __VCSET_REAL(1, 2, 3);
  vcResult : __VECTOR[3] OF REAL;
END_VAR

vcResult := vcA __VCADD vcB;

Operator __VCSUB
Syntax

<vector variable> := <vector minuend> __VCSUB <vector subtrahend>;

The operator calculates the sum of two vectors.

The operator calculates the difference between two vectors.
Example of subtraction

```plaintext
FUNCTION_BLOCK FB_SUB
VAR
  vcA : __VECTOR[3] OF REAL := __VCSET_REAL(3, 3, 3);
  vcB : __VECTOR[3] OF REAL := __VCSET_REAL(1, 2, 3);
  vcResult0 : __VECTOR[3] OF REAL;
  vcResult1 : __VECTOR[3] OF REAL;
END_VAR

vcResult0 := vcA __VCSUB vcB;
vcResult1 := vcB __VCSUB vcA;
```

Operator __VCMUL

The operator calculates the product of two vectors or a scalar (floating-point number) and a vector.

Syntax

```plaintext
<vector variable> := <1st vector operand> __VCMUL <2nd vector operand> | <scalar operand> __VCMUL <vector operand> | <vector operand> __VCMUL <scalar operand> ;
```

Example of multiplication

```plaintext
FUNCTION_BLOCK FB_MUL
VAR
  rScalar : REAL := 1.1;
  vcA : __VECTOR[3] OF REAL;
  vcB : __VECTOR[3] OF REAL;
  vcResult0 : __VECTOR[3] OF REAL;
  vcResult1 : __VECTOR[3] OF REAL;
END_VAR

vcResult0 := vcA __VCMUL vcB;
vcResult1 := rScalar __VCMUL vcB;
vcResult2 := vcA __VCMUL 3.3;
```

Operator __VCDIV

The operator calculates the quotient of two vectors or a vector and a scalar.

Syntax

```plaintext
<vector variable> := <vector dividend> __VCDIV <vector divisor> | <vector dividend> __VCMUL <scalar divisor> ;
```
Example of division

FUNCTION_BLOCK FB_DIV
VAR
  iScalar : INT := 3;
  rScalar : REAL := 1.5;
  vcA : __VECTOR[3] OF REAL := __VCSET_REAL(3, 3, 3);
  vcB : __VECTOR[3] OF REAL := __VCSET_REAL(1, 2, 3);
  vcResult0 : __VECTOR[3] OF REAL;
  vcResult1 : __VECTOR[3] OF REAL;
END_VAR
vcResult0 := vcA __VCDIV vcB;
// ERROR CODE vcResult1 := rScalar __VCDIV vcB;
// ERROR CODE vcResult1 := iScalar __VCDIV vcB;
// ERROR CODE vcResult1 := 3.3 __VCDIV vcB;
vcResult2 := vcA __VCDIV 1.5;
vcResult2 := vcA __VCDIV iScalar;
vcResult2 := vcA __VCDIV rScalar;

Operator __VCDOT

Syntax

<scalar variable> := <1st vector operand> __VCDOT <2nd vector operand> ;

Example of a dot product

FUNCTION_BLOCK FB_DOT
VAR
  rResult : REAL;
  vcA : __VECTOR[3] OF REAL := __VCSET_REAL(3, 3, 3);
  vcB : __VECTOR[3] OF REAL := __VCSET_REAL(1, 2, 3);
END_VAR
rResult := vcA __VCDOT vcB; // = 18

Operator __VCSQRT

Syntax

<vector variable> := __VCSQRT( <vector operand> );

Example of a square root

FUNCTION_BLOCK FB_SQRT
VAR
  vcA : __VECTOR[3] OF REAL := __VCSET_REAL(4, 9, 16);
END_VAR
vcResult0 := __VCSQRT(vcA);
The operator calculates the maximum vector of two vectors. The maximum is determined element by element.

**Syntax**

\[ <\text{vector variable}> := \text{__VCMAX}( <\text{1st vector operand}>, <\text{2nd vector operand}>); \]

**Example of a maximum vector**

```plaintext
FUNCTION_BLOCK FB_MAX
VAR
  vcA : __VECTOR[3] OF REAL := __VCSET_REAL(3, 3, 3);
  vcB : __VECTOR[3] OF REAL := __VCSET_REAL(1, 2, 6);
  vcResult0 : __VECTOR[3] OF REAL;
END_VAR
vcResult0 := __VCMAX(vcA, vcB);
```

The operator calculates the minimum vector of two vectors. The minimum is determined element by element.

**Syntax**

\[ <\text{vector variable}> := \text{__VCMIN}( <\text{1st vector operand}>, <\text{2nd vector operand}>); \]

**Example of a minimum vector**

```plaintext
FUNCTION_BLOCK FB_MIN
VAR
  vcA : __VECTOR[3] OF REAL := __VCSET_REAL(3, 3, 3);
  vcB : __VECTOR[3] OF REAL := __VCSET_REAL(1, 2, 6);
  vcResult0 : __VECTOR[3] OF REAL;
END_VAR
vcResult0 := __VCMIN(vcA, vcB);
```

The operator sets all elements of a vector in a statement. The elements have the REAL data type.

**Syntax**

\[ <\text{vector variable}> := \text{__VCSET_REAL}( <\text{first literal}>, ( <\text{next literal}>)^+) ; ( ... )^+ // number of elements have to match \]

**Example**

```plaintext
FUNCTION_BLOCK FB_SET
VAR
  vcA : __VECTOR[3] OF REAL := __VCSET_REAL(3, 3, 3);
  vcB : __VECTOR[3] OF REAL := __VCSET_REAL(1, 2, 3);
END_VAR
vcA := __VCSET_REAL(4, 4, 4);
vcB := __VCSET_REAL(1.1, 2.2, 3.3);
```
The operator sets all elements of a vector at once in a statement. The elements have the \texttt{LREAL} data type.

They can be used wherever variables are valid, such as in assignments in implementations or as parameters in function calls.

\texttt{<vector variable>} := \texttt{\_VCSET\_LREAL( <first literal>, ( <next literal> )+ )};
\texttt{(...)+} // number of elements have to match

**Example**

\begin{verbatim}
FUNCTION_BLOCK FB_SET
VAR
  vc1A : __VECTOR[3] OF LREAL := __VCSET\_LREAL(3, 3, 3);
  vc1B : __VECTOR[3] OF LREAL := __VCSET\_LREAL(1, 2, 3);
END_VAR
vc1A := __VCSET\_LREAL(-1.7976931348623158E+308, 0.0, 1.7976931348623158E+308);
vc1B := __VCSET\_LREAL(-1.7976931348623158E+308, 0.0, 1.7976931348623158E+308);
\end{verbatim}

The operator interprets any arbitrary memory area as a vector. This is helpful for connecting vector variables to existing code. The operator requires 2 parameters. The first parameter indicates the number of vector elements. The second parameter is a pointer to the \texttt{REAL} data.

\texttt{<vector variable>} := \texttt{\_VCLOAD\_REAL( <vector size>, <pointer to data of type REAL> )};

\begin{verbatim}
VECTOR size : 2 | 3 | 4 | 5 | 6 | 7 | 8
\end{verbatim}

**Example of vectorization**

\begin{verbatim}
FUNCTION_BLOCK FB_LOAD
VAR_INPUT
  rData0 : REAL := 1.234;
  rData1 : REAL := 5.678;
  rData2 : REAL := 9.123;
  pData : POINTER TO REAL := ADR(rData0);
VAR_OUTPUT
  vcA : __VECTOR[3] OF REAL := __VCSET\_REAL(3, 3, 3);
END_VAR
vcA := __VCLOAD\_REAL(3, pData);
\end{verbatim}

The operator interprets any arbitrary memory area as a vector. This is helpful for connecting vector variables to existing code. The operator requires 2 parameters. The first parameter indicates the number of vector elements. The second parameter is a pointer to the \texttt{LREAL} data.

\texttt{<vector variable>} := \texttt{\_VCLOAD\_LREAL( <vector size>, <pointer to data of type LREAL> )};

\begin{verbatim}
NUMBER OF VECTOR ELEMENTS : 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8
\end{verbatim}
Example of vectorization

```plaintext
FUNCTION_BLOCK FB_LOAD
VAR_INPUT
END_VAR
VAR_OUTPUT
END_VAR
VAR
  lrData0 : LREAL := -1.7976931348623158E+308;
  lrData1 : LREAL := 1.6E+308;
  lrData2 : LREAL := 1.7E+308;
  lrData3 : LREAL := -1.6E+308;
  plData: POINTER TO LREAL := ADR(lrData0);
  vclA : __VECTOR[4] OF LREAL := __VCSET_LREAL(4, 4, 4, 4);
END_VAR
vclA := __VCLOAD_LREAL(4, plData);
```

Example of storage

```plaintext
FUNCTION_BLOCK FB_STORE
VAR_INPUT
END_VAR
VAR_OUTPUT
END_VAR
VAR
  rData0 : REAL := 3;
  rData1: REAL := 3;
  rData2 : REAL := 3;
  pData: POINTER TO REAL := ADR(rData0);

  lrData0 : LREAL := 4;
  lrData1: LREAL := 4;
  lrData2 : LREAL := 4;
  lrData3 : LREAL := 4;
  plData: POINTER TO LREAL := ADR(lrData0);

  vcA : __VECTOR[3] OF REAL := __VCSET_REAL( 1.234, 5.678, 9.123);
  vclA : __VECTOR[4] OF LREAL :=
    __VCSET_LREAL(-1.7976931348623158E+308, 1.6E+308, 1.7E+308,
    -1.6E+308);
END_VAR
__VCSTORE(pData, vcA);
__VCSTORE(plData, vclA);
```

Structure

A structure is a user-defined data type, which combines multiple variables of any data type into a logical unit. The variables declared within a structure are called members.

You make the type declaration of a structure in a “DUT” object which you create in the “Project ➔ Add Object ➔ DUT” menu or in the context menu of an application.

Syntax

```
TYPE <structure name> :
  STRUCT
    ( <variable declaration optional with initialization> )+
  END_STRUCT
END_TYPE
```

<structure name> is an identifier which is valid in the entire project so that you can use it like a standard data type. Moreover, you can declare any number of variables (at least one) which are supplemented optionally by an initialization.

Structures can also be nested. This means that you declare a structure member with an existing structure type. Then the only restriction is that you must not assign any address to the variable (structure member). (The AT declaration is not permitted here.)

Example

Type declaration

```
TYPE S_POLYGONLINE :
  STRUCT
    aiStart : ARRAY[1..2] OF INT := [-99, -99];
    aiPoint1 : ARRAY[1..2] OF INT;
    aiPoint2 : ARRAY[1..2] OF INT;
    aiPoint3 : ARRAY[1..2] OF INT;
    aiPoint4 : ARRAY[1..2] OF INT;
    aiEnd : ARRAY[1..2] OF INT := [99, 99];
  END_STRUCT
END_TYPE
```

Extension of a type declaration

An additional structure is declared from an existing structure. In addition to its own members, the extended structure also has the same structure members as the base structure.

Syntax

```
TYPE <structure name> EXTENDS <basis structure> :
  STRUCT
    ( <variable declaration optional with initialization> )+
  END_STRUCT
END_TYPE
```

Example

Type declaration

```
TYPE S_PENTAGON EXTENDS S_POLYGONLINE :
  STRUCT
    aiPoint5 : ARRAY[1..2] OF INT;
  END_STRUCT
END_TYPE
```
### Declaration and initialization of structure variables

**Example**

```plaintext
PROGRAM progLine
VAR
  sPolygon : S_POLYGONLINE := (aiStart:=\[1,1\], aiPoint1:=\[5,2\],
  aiPoint2:=\[7,3\], aiPoint3:=\[8,5\], aiPoint4:=\[5,7\], aiEnd:=\[1,1\]);
  sPentagon : S_PENTAGON := (aiStart:=\[0,0\], aiPoint1:=\[1,1\],
  aiPoint2:=\[2,2\], aiPoint3:=\[3,3\], aiPoint4:=\[4,4\], aiPoint5:=\[5,5\],
  aiEnd:=\[0,0\]);
END_VAR
```

You must not permitted to use initializations with variables. For an example of initializing an array of a structure, see the help page for the data type `ARRAY`.

**Access to a structure member**

You access structure members with the following syntax:

```
<variable name> . <component name>
```

**Example**

```plaintext
PROGRAM prog_Polygon
VAR
  sPolygon : S_POLYGONLINE := (aiStart:=\[1,1\], aiPoint1:=\[5,2\],
  aiPoint2:=\[7,3\], aiPoint3:=\[8,5\], aiPoint4:=\[5,7\], aiEnd:=\[1,1\]);
  iPoint: INT;
  END_VAR

// Assigns 5 to aiPoint
iPoint := sPolygon.aiPoint1[1];

Result: iPoint = 5
```

### Symbolic bit access in structure variables

You can declare a structure with variables of data type `BIT` to combine individual bits into a logical unit. Then you can symbolically address individual bits by a name (instead of by a bit index).

**Syntax declaration**

```plaintext
TYPE <structure name> :
  STRUCT
    ( <bit name> : BIT; )+
  END_STRUCT
END_TYPE
```

**Syntax of bit access**

```
<structure name> . <bit name>
```
**Example**

**Type declaration**

```
TYPE S_CONTROL :
STRUCT
  bitOperationEnabled : BIT;
  bitSwitchOnActive : BIT;
  bitEnableOperation : BIT;
  bitError : BIT;
  bitVoltageEnabled : BIT;
  bitQuickStop : BIT;
  bitSwitchOnLocked : BIT;
  bitWarning : BIT;
END_STRUCT
END_TYPE
```

**Bit access**

```
FUNCTION_BLOCK FB_Controller
VAR_INPUT
  xStart : BOOL;
END_VAR
VAR_OUTPUT
END_VAR
VAR
  ControlDriveA : S_CONTROL;
END_VAR
IF xStart = TRUE THEN
  // Symbolic bit access
  ControlDriveA.bitEnableOperation := TRUE;
END_IF
```

---

References and pointers to **BIT** variables are **invalid** declarations, as well as array elements with base type **BIT**.

- § Chapter 6.4.1.21.2.9 “Object ‘DUT’” on page 2461

---

**Enumerations**

An enumeration is a user-defined data type composed of a series of comma-separated components (enumeration values) for declaring user-defined variables. Moreover, you can use the enumeration components like constants whose identifier `<enumeration name>.<component name>` is recognized globally in the project.
You declare an enumeration in a DUT object, which you have already created in the project by clicking “Add Object”.

Declaration

Syntax

```plaintext
( {attribute 'strict'} )? // Pragma optional but recommended
TYPE <enumeration name> :
{
    <first component declaration>,
    ( <component declaration> ,|) +
    <last component declaration>
}( <basic data type> )? ( := <default variable initialization> )? ;
END_TYPE

( ... )? : Optional
<component declaration> : <component name> ( := <component initialization> )?
<basic data type> : INT | UINT | SINT | USINT | DINT | UDINT | LINT |
ULINT | BYTE | WORD | DWORD | LWORD
<variable initialization> : <one of the component names>
```

In an enumeration declaration, at least 2 components are usually declared. However, you can declare as many as you want. Every single component can be assigned its own initialization. Enumerations automatically have the basic data type INT, but you can specify another basic data type. Moreover, you can specify a component in the declaration with which an enumeration variable is then initialized.

The pragma {attribute 'strict'} causes a strict type test to be performed as described below.

Example

```plaintext
{attribute 'qualified_only'}
{attribute 'strict'}
TYPE COLOR_BASIC :
{
    yellow,
    green,
    blue,
    black
} // Basic data type is INT, default initialization for all COLOR_BASIC variables is yellow
END_TYPE
```

Enumeration with explicit basic data type

Extensions to the IEC 61131-3 standard

The basic data type for an enumeration declaration is INT by default. However, you can also declare enumerations that are based explicitly on another integer data type.

```plaintext
<basic data type> : INT | UINT | SINT | USINT | DINT | UDINT | LINT |
ULINT | BYTE | WORD | DWORD | LWORD
```
Example

Enumeration with basic data type DWORD

```
TYPE COLOR :
{
  white := 16#FFFFFF00,
  yellow := 16#FFFFFF00,
  green := 16#FF00FF00,
  blue := 16#FF0000FF,
  black := 16#88000000
} DWORD := black; // Basic data type is DWORD, default initialization for all COLOR variables is black
END_TYPE
```

Strict programming rules

**NOTICE!**
In CODESYS V3.5 SP7 and later, the pragma `attribute 'strict'` is added automatically in the first line when declaring an enumeration.

The strict programming rules are activated when adding the pragma `attribute 'strict'`.

The following code is considered a compiler error:

- Arithmetic operations with enumeration components
  For example, an enumeration variable cannot be used as a counter variable in a `FOR` loop.
- Assignment of a constant value, which does not correspond to an enumeration value, to an enumeration component
- Assignment of a non-constant variable, which has another data type as the enumeration, to an enumeration component

Arithmetic operations can lead to undeclared values being assigned to enumeration components. A better programming style is to use `SWITCH/CASE` statements for processing component values.

Declaration and initialization of enumeration variables

**Syntax**

```
<variable name> : <enumeration name> ( := <initialization> )? ;
```

For a declaration of an enumeration variable with user-defined data type `<enumeration name>`, this can be initialized with an enumeration component.

Example

```
PROGRAM PLC_PRG
VAR
  colorCar : COLOR;
  colorTaxi : COLOR := COLOR.yellow;
END_VAR

The variable `colorCar` is initialized with `COLOR.black`. That is the default initialization for all enumeration variables of type `COLOR` and defined this way in the type declaration. The variable `colorTaxi` has its own initialization.

If no initializations are specified, then the initialization value is 0.
```
The variable `cbFlower` is initialized with `COLOR_BASIC.yellow`. That is the default initialization for all enumeration variables of type `COLOR_BASIC`. Because the enumeration declaration does not specify a component for initialization, the system automatically initializes with the component that has the value 0. This is usually the first of the enumeration components. However, it can also be another component that is not in the first position but explicitly initialized with 0.

The variable `cbTree` has an explicit initialization.

If no value is specified for both the type and the variable, then the following rule applies: If an enumeration contains a value for 0, then this value is the default initialization, and if not, then the first component in the list.

The variable `e` is initialized with `ENUM.e2`.

The variable `e2` is initialized with `ENUM.e1`.

Extensions to the IEC 61131-3 standard

The enumeration components can also be used as constant variables with the identifier `<enumeration name>.<component name>`. Enumeration components are recognized globally in the project and access to them is unique. Therefore, a component name can be used in different enumerations.
PROGRAM PLC_PRG
VAR
  cbFlower : COLOR_BASIC;
  colorCar : COLOR;
END_VAR

(* unambiguous identifiers although the component names are identical *)
cbFlower := COLOR_BASIC.blue;
colorCar := COLOR.blue;

(* invalid code *)
cbFlower := blue;
colorCar := blue;

Alias

An alias is a user-defined data type with which an alternative name for a basic type, data type, or function block is generated.

You make the type declaration of an alias in a “DUT” object which you create in the “Project ➔ Add Object ➔ DUT” menu or in the context menu of an application.

Syntax

```plaintext
TYPE <DUT name> : <basic type> | <data type> | <function block name> ;
END_TYPE
```

Example

```plaintext
FUNCTION_BLOCK FB_Machine
VAR_INPUT
END_VAR
VAR_OUTPUT
END_VAR
VAR
  iCounter : INT;
END_VAR
iCounter := iCounter + 1;

// Alias for FB_Machine
TYPE A_ROBOT : FB_Machine;
END_TYPE

PROGRAM prog_Robot
VAR
  fbRobot : A_ROBOT;
END_VAR
fbRobot();
```
Data type 'UNION'

A UNION is a data structure that usually contains different data types.

In a union, all components have the same offset and therefore the same amount of memory. In the following declaration example of a union, an assignment to name.a will also affect name.b.

Example

```plaintext
TYPE name:
  UNION
      a : LREAL;
      b : LINT;
  END_UNION
END_TYPE
```

Subrange types

A subrange type is a data type whose value range is a subset of a base type.

Syntax for the declaration:

```
<name> : <int type> (<lower limit>..<upper limit>);
```

<table>
<thead>
<tr>
<th>&lt;name&gt;</th>
<th>valid IEC identifier</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;int type&gt;</td>
<td>data type of the subrange</td>
</tr>
<tr>
<td></td>
<td>(SINT, USINT, INT, UINT, DINT, UDINT, BYTE, WORD, DWORD, LINT, ULINT, LWORD).</td>
</tr>
<tr>
<td>&lt;lower limit&gt;</td>
<td>Lower limit of the range: constants that have to be compatible with the basic data type. The lower limit is also included in this range.</td>
</tr>
<tr>
<td>&lt;upper limit&gt;</td>
<td>Upper limit of the range: constants that have to be compatible with the base data type. The upper limit is also included in this range.</td>
</tr>
</tbody>
</table>

Examples:

```plaintext
VAR
  i : INT (-4095..4095);
  ui : UINT (0..10000);
END_VAR
```

If you assign a value to a subrange type in the declaration or implementation section that is not within this range (example: i:=5000), then CODESYS issues an error message.

Please note: In runtime mode, it is possible to monitor the range limits of a subrange type by using the implicit monitoring functions CheckRangeSigned and CheckRangeUnsigned.

### Pragmas

<table>
<thead>
<tr>
<th>Section</th>
<th>Topic</th>
<th>Page</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.4.1.20.6</td>
<td>General</td>
<td>2269</td>
</tr>
<tr>
<td>6.4.1.20.6.2</td>
<td>Message Pragmas</td>
<td>2269</td>
</tr>
<tr>
<td>6.4.1.20.6.3</td>
<td>Attribute Pragmas</td>
<td>2271</td>
</tr>
<tr>
<td>6.4.1.20.6.4</td>
<td>Conditional Pragmas</td>
<td>2318</td>
</tr>
<tr>
<td>6.4.1.20.6.5</td>
<td>Region Pragma</td>
<td>2327</td>
</tr>
</tbody>
</table>

#### General

Pragma instructions affect the properties of one or more variables with regard to the compilation or pre-compilation process. Various categories of pragmas are available to you for this.

Pragma are special statements that influence the behavior of an AC500 V3 project during compilation (build) and precompilation. The basic functionalities and use cases for AC500 V3 PLCs are described in the application note *AC500 V3 Using Pragmas*.

#### Message Pragmas

Message pragmas serve to force the display of messages in the Message window during the compilation process.

Insertion position: separate or already existing line in the text editor of a POU.

**Table 400: 4 types of message pragmas**

<table>
<thead>
<tr>
<th>Pragma</th>
<th>Message type</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>{text '&lt;textstring&gt;'}</code></td>
<td>&quot;Text&quot; : display of &lt;textstring&gt;.</td>
</tr>
<tr>
<td><code>{info '&lt;textstring&gt;'}</code></td>
<td>&quot;Information&quot; : display of &lt;textstring&gt;.</td>
</tr>
<tr>
<td><code>{warning '&lt;textstring&gt;'}</code></td>
<td>&quot;Warning&quot; : display of &lt;textstring&gt;.</td>
</tr>
<tr>
<td><code>{error '&lt;textstring&gt;'}</code></td>
<td>&quot;Error&quot; : display of &lt;textstring&gt;.</td>
</tr>
</tbody>
</table>

In the CODESYS Message window you can jump with the help of the commands “Next Message” and “Previous Message” from a message of the category “Information”, “Warning” and “Error” to the source position of the message. This means you jump to the position where the pragma is added in the source code.
Example

VAR
    var : INT; {info 'TODO: should get another name'}
    bvar : BOOL;
    arrTest : ARRAY [0..10] OF INT;
    i:INT;
END_VAR

arrTest[i] := arrTest[i]+1;
ivar:=ivar+1;

{warning 'This is a warning'}
{text 'Part xy has been compiled completely'}

Display in the Message window:

<table>
<thead>
<tr>
<th>Description</th>
<th>Project</th>
<th>Object</th>
<th>Position</th>
</tr>
</thead>
<tbody>
<tr>
<td>------ Build started: Application: Res.App2 ------</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>typedef code ...</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Compile time before typification: 6 ms</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Compile time after typification: 15 ms</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>TODO: should get another name!</td>
<td>TS pragma NewPOU</td>
<td>Line 3 (Decl)</td>
<td></td>
</tr>
<tr>
<td>This is a warning</td>
<td>TS pragma NewPOU</td>
<td>Line 7 (Impl)</td>
<td></td>
</tr>
<tr>
<td>Part xy has been compiled completely</td>
<td>TS pragma NewPOU</td>
<td>Line 10 (Impl)</td>
<td></td>
</tr>
<tr>
<td>Compile complete -- 1 errors, 2 warnings</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### General

Attribute pragmas affect the compilation and the pre-compilation.
CODESYS supports a series of pre-defined attribute pragmas. In addition you can use user-defined pragmas, which you can query with the help of conditional pragmas before the compilation of the project.

Attributes are defined within the declaration part. Exception: For the objects Action and Transition, which have no own declaration part, you can define the attributes at the beginning of the implementation part.

When you define own attributes, please make them unambiguous. Uniqueness can be reached for example by adding a prefix to the attribute name. OEMs can use the vendor prefix for this purpose.

User-defined attributes

User-defined attributes are any application-defined or user-defined attributes that you can apply to POUs, actions, data type definitions and variables. You can query a user-defined attribute with the help of conditional pragmas before the compilation of the application.

You can query user-defined attributes with conditional pragmas with the operator hasattribute.

More detailed information and examples can be found in the chapter 'Conditional pragmas'.

Syntax:

\{attribute 'attribute'\}

Example for POUs and actions

Attribute 'vision' for function “fun1”

```plaintext
{attribute 'vision'}
FUNCTION fun1 : INT
VAR_INPUT
  i : INT;
END_VAR
```

Example for variables

Attribute 'DoCount' for variable ivar:

```plaintext
PROGRAM PLC_PRG
VAR
  {attribute 'DoCount'};
  ivar:INT;
  bvar:BOOL;
END_VAR
```
Example for data types

Attribute 'aType' for data type DUT_1:

```cpp
{attribute 'aType'}
TYPE DUT_1 :
  STRUCT
    a:INT;
    b:BOOL;
  END_STRUCT
END_TYPE
```

See also

- Chapter 6.4.1.20.6.4 “Conditional Pragmas” on page 2318

Attribute 'call_after_global_init_slot'

**NOTICE!**

VAR_INPUT declarations in functions or methods that use the attribute lead to compile errors. Reason: Input variables are unknown in this case at the time of the call, which occurs implicitly during the online change.

The effect of this pragma is that all functions and programs containing this attribute are called after the global initialization. You define the order of calling by means of the attribute value.

Syntax:

```cpp
{attribute 'call_after_global_init_slot' := '<slot>'}
```

<slot>: Integer value that defines the ranking in the order of the calls; the lower the value, the earlier the call takes place. If several function blocks have the same ranking for the attribute, then the order of their calls remains indefinite.

Insert location: First line above the declaration part of functions and programs

If a method possesses the attribute, CODESYS determines all instances of the corresponding function block and calls all instances in the specified slot. In this case you have no influence on the order of the instances among themselves.

See also

- Chapter 6.4.1.20.10 “Methods 'FB_Init', 'FB_Reinit', and 'FB.Exit'” on page 2336

Attribute 'call_after_init'

**NOTICE!**

VAR_INPUT declarations in functions or methods that use the attribute lead to compile errors. Reason: Input variables are unknown in this case at the time of the call, which occurs implicitly during the online change.

The effect of this pragma is that a method is called implicitly after the initialization of a function block instance. For reasons of performance you must add the attribute both to the function block and to the method in its own first line above the declaration part.
Syntax:

{attribute 'call_after_init'}

Call: First line above the declaration part of the method and the function block.
CODESYS calls the method after the method FB_init and after the variable values of an initialization expression in the instance declaration have become valid.
This functionality is supported from compiler version 3.4.1.0.

Example

Definition:

{attribute 'call_after_init'}
FUNCTION_BLOCK FB
... <function block definition>

{attribute 'call_after_init'}
METHOD FB_AfterInit
... <method definition>

The definition implements, for example, the following declaration in the subsequent code processing:

inst : FB := (in1 := 99);

Code processing:

inst.FB_Init();
inst.in1 := 99;
inst.FB_AfterInit();

This allows a reaction to the user-defined initialization in FB_AfterInit.

See also

● ☞ Chapter 6.4.1.20.10 “Methods 'FB_Init', 'FB_Reinit', and 'FB_Exit'” on page 2336

Attribute 'call_after_online_change_slot'

NOTICE!

VAR_INPUT declarations in functions or methods that use the attribute lead to compile errors. Reason: Input variables are unknown in this case at the time of the call, which occurs implicitly during the online change.

The effect of this pragma is that all functions and programs containing this attribute are called after an online change. You define the order of calling by means of the attribute <slot>.

Syntax:

{attribute 'call_after_online_change_slot' := '<slot>'}

<slot>: Integer value that defines the ranking in the order of the calls; the lower the value, the earlier the call takes place. If several function blocks have the same ranking for the attribute, then the order of their calls remains indefinite.

Call: First line above the declaration part of functions and programs.
If a method possesses the attribute, then CODESYS determines all instances of the function block concerned. CODESYS calls all instances in the specified slot. In this case you have no influence on the order of the instances among themselves.
NOTICE!
Since the application cannot run during the online change, each code executed in this situation can lead to a jitter. Therefore, keep the extent of the executive code as small as possible.

See also
● § Chapter 6.4.1.21.3.7.6 “Command 'Online Change’” on page 2629

Attribute 'call_before_global_exit_slot'

NOTICE!
VAR_INPUT declarations in functions or methods that use the attribute lead to compile errors. Reason: Input variables are unknown in this case at the time of the call, which occurs implicitly during the online change.

The effect of this pragma is that all functions and programs containing this attribute in a dedicated first line of their declaration are called before the GlobalExit. The GlobalExit takes place before a new download or a reset. Function blocks provided with an FB_Exit method are affected. The order of calling is defined by means of the attribute value.

Syntax:
{attribute 'call_before_global_exit_slot' := '<slot>'}

Insert location: First line above the declaration part of functions and programs.

<slot>: Integer value that defines the ranking in the order of the calls; the lower the value, the earlier the call takes place. If several function blocks have the same ranking for the attribute, then the order of their calls remains indefinite.

If a method possesses the attribute, then the method is called for all instances of the function block concerned. CODESYS calls all instances in the specified slot. In this case you have no influence on the order of the instances among themselves.

See also
● § Chapter 6.4.1.20.10 “Methods 'FB_Init', 'FB_Reinit', and 'FB_Exit’” on page 2336

Attribute 'call_on_type_change'

With this pragma, you can mark a method of a function block A that should be called when the data type changes for one or more function blocks B, C, etc. that are referenced by A. The referencing can be defined by a pointer variable or a REFERENCE variable.

Syntax:
{attribute 'call_on_type_change' := '<name of the first referenced function block>|<name of the second referenced function block>|<name of the ... referenced function block>'}

Insert location: Line above the first line in the method declaration.
Example

Function blocks with references

FUNCTION_BLOCK FB_A
...
VAR
    var_pt: POINTER TO FB_B;
    var_ref: REFERENCE TO FB_C;
END_VAR
...

{attribute 'call_on_type_change' := 'FB_B, FB_C'}
METHOD METH_react_on_type_change : INT
VAR_INPUT
...

Method for reaction to a type change in the references FB_B and FB_C

Attribute 'conditionalshow'

The pragma has the effect that the identifiers of an integrated compiled library <library name>.compiled-library, which are decorated with the pragma, are hidden before programming an application. The POUs can be called but the variables are invisible in the CODESYS user interface.

Affected features

- Library management
- Debugging
- Input Assistant
- Function "List components"
- Monitoring
- Symbol configuration

This is useful when you develop libraries. As the library developer, you decorate function blocks or variables with the pragma. As a result, you determine which identifiers are hidden in an application after integration. If you want to show the hidden identifiers later, for example for debugging or further development of the library, you can reactivate its visibility.

Syntax

{attribute 'conditionalshow' ( := ' <some text> ' )? }

<some text>: Optional string literal to control the visibility of the identifiers decorated with this kind of pragma by means of a command-line command and this literal. When the pragma is specified without a literal, the variables in the CODESYS development environment are always hidden, regardless of how CODESYS was started. For more help about this, see the document "Library Development Summary".

Insert location: Top line in the declaration part of a function block, above a variable
## Example

**Hiding a variable**

For more examples, see the document "Library Development Summary".

```plaintext
FUNCTION_BLOCK FB_DataManager
VAR
    {attribute 'conditionalshow' := 'Library_Developer'}
    iLocal : INT;
    iCounter : INT;
END_VAR

The variable iLocal is invisible.
```

**Hiding a function block**

```plaintext
FUNCTION_BLOCK FB_DataManager
VAR
    iLocal : INT;
    iCounter : INT;
END_VAR

The identifiers FB_DataManager, iLocal, and iCounter are invisible.
```

## Visibility in case of existing source code file

When the source code file `<library name> .library` from an integrated library also exists at the same memory location (repository), the identifiers are visible despite the pragmas. That is regardless of whether or not an attribute value has been specified in the declaration.

## Command-line call to activate visibility

You can also enable the visibility of the hidden variable without a source code file by starting CODESYS with the command-line option `conditionalshowsymbols`. To enable the visibility, specify the attribute values of the pragma which are separated by commas.

### Syntax

```
codesys.exe --conditionalshowsymbols=" <some text> (,<next text>)*
"  
```

**Example**

```
codesys.exe --conditionalshowsymbols="Library_Developer"

codesys.exe --conditionalshowsymbols="Group_A,Group_B"
```

## See also

- § Chapter 6.4.1.16 “Using the Command-Line Interface” on page 2028
- § Chapter 6.4.1.20.6.3.17 “Attribute ‘hide’” on page 2286
- § Chapter 6.4.1.20.6.3.9 “Attribute ‘conditionalshow_all_locals’” on page 2277
- "Library Development Summary", "Visibility Control" Chapter

## Attribute 'conditionalshow_all_locals'

The pragma has the effect that all local variables of a library POU decorated with the pragma are hidden from application programmers. The POUs of an integrated compiled library `<library name> .compiled-library` can be called, but the variables are invisible in the CODESYS user interface.

### Affects features:

- Library management
- Debugging
- Input Assistant
- Function "List components"
- Monitoring
- Symbol configuration
This is useful when you develop libraries. As the library developer, you decorate function blocks with the pragma. As a result, you determine that their identifiers are hidden in an application after integration. If you want to show these identifiers later, for example for debugging or further development of the library, you can re-activate its visibility.

Syntax

```plaintext
{attribute 'conditionalshow_all_locals' ( := ' <some text> ' )? }
```

<some text>: Optional string literal to control the visibility of the identifiers decorated with this kind of pragma by means of a command-line command and this literal. When the pragma is specified without a literal, the variables in the CODESYS development environment are always hidden, regardless of how CODESYS was started. For more help about this, see the document "Library Development Summary".

Insert location: Top line in the declaration part of the function block.

### Example

**Hiding all local variables**

```plaintext
{attribute 'conditionalshow_all_locals' := 'Library_Developer'}
FUNCTION_BLOCK FB_DataManager
VAR
  iLocal : INT;
  iCounter : INT;
END_VAR
```

For more examples, see the document "Library Development Summary".

### Visibility in case of existing source code file

When the source code file `<library name>.library` from an integrated library also exists at the same memory location (repository), the library POU variables are visible despite the pragmas. That is regardless of whether or not an attribute value has been specified in the declaration.

### Command-line call to activate visibility

You can also enable the visibility of the hidden variable without a source code file by starting CODESYS with the command-line option `conditionalshowsymbols`. To enable the visibility, specify the attribute values of the pragma which are separated by commas.

```plaintext
codesys.exe --conditionalshowsymbols=" <some text> ( ,<next text> )* "
```

**Example**

```plaintext
codesys.exe --conditionalshowsymbols="Library_Developer"
codesys.exe --conditionalshowsymbols="Group_A,Group_B"
```

- "Library Development Summary", chapter "Visibility Control"

### Attribute 'const_replaced', Attribute 'const_non_replaced'

The attribute 'const_replaced' has the effect that the constant is replaced in the code, independently of the setting of the “Replace constants” compiler option. The attribute has an effect for variables of scalar types only, but not for compound types like arrays and structures.

You insert the pragma `{attribute 'const_non_replaced'}` accordingly in order to explicitly deactivate the “Replace constants” compiler option. This has the effect, for example in the symbol configuration, that the constant is available and can be exported despite the compiler option.
The “Replace constants” option in the “Compile Options” category of the “Project Settings” dialog is preset for the entire project, because replacing constants generally leads to faster code and less memory usage.

**Syntax:**

{attribute 'const_replaced'}
{attribute 'const_non_replaced'}

Insert location: Line above the declaration line of the global variables.

---

**Example**

The constants `iTestCon` and `xTestCon` are available in the symbol configuration because the “Replace constants” option deactivated.

```plaintext
{attribute 'qualified_only'}
VAR_GLOBAL CONSTANT
    {attribute 'const_non_replaced'}
iTestCon : INT := 12;
{xattribute 'const_non_replaced'}
xTestCon : BOOL := TRUE;
rTestCon : REAL := 1.5;
END_VAR

VAR_GLOBAL
    iTestVar : INT := 12;
{xattribute 'const_non_replaced'}
xTestVar : BOOL := TRUE;
END_VAR
```

---

**Attribute 'dataflow'**

With this pragma you control the data flow in the processing of function blocks in the FBD/LD/IL editor. The attribute defines the input or output of a function block to which the continuing connection to the next or previous function block is connected.

You may provide only 1 input and 1 output with the attribute in the declaration of a function block.

**Syntax:**

{attribute 'dataflow'}

Insertion position: line above the line with the declaration of the corresponding variables.

In the case of function blocks without the attribute `dataflow`, CODESYS determines the data flow as follows: first of all the connection is placed between an output and an input of same data type. The highest input or output variable of the function blocks is always taken. If there are no variables of a corresponding data type, CODESYS connects the highest output with the highest input of the neighboring function blocks.

---
The connection between FB and the preceding function block is established via the input variable i1. The connection between FB and the following function block is established via the output variable outRes1.

```
FUNCTION_BLOCK FB
VAR_INPUT
  r1 : REAL;
  {attribute 'dataflow'}
  i1 : INT;
  i2 : INT;
  r2 : REAL;
END_VAR

VAR_OUTPUT
  {attribute 'dataflow'}
  outRes1 : REAL;
  out1 : INT;
  g1 : INT;
  g2 : REAL;
END_VAR
```

See also

- Chapter 6.4.1.9.5.2.2 “Programming function block diagrams (FBD)” on page 1862

**Attribute 'displaymode'**

With this pragma you define the display mode of an individual variable. This definition overwrites the global setting for the display of the monitoring variable, which takes place via the commands in the menu “Debug ➔ Display Mode”.

**Syntax:**

```
{attribute 'displaymode':=<displaymode>}
```

The following definitions are possible

- **Binary format**
  - {attribute 'displaymode':='bin'}
  - {attribute 'displaymode':='binary'}

- **Decimal format**
  - attribute 'displaymode':='dec'}
  - {attribute 'displaymode':='decimal'}

- **Hexadecimal format**
  - {attribute 'displaymode':='hex'}
  - attribute 'displaymode':='hexadecimal'}

Insertion position: line above the line with the declaration of the corresponding variables.

```
VAR
  {attribute 'displaymode':='hex'}
  dwVar1: DWORD;
END_VAR
```

See also

Attribute 'enable_dynamic_creation'

The pragma `enable_dynamic_creation` is needed for using the `__NEW` operator for function blocks.

**Syntax:**
```
{attribute 'enable_dynamic_creation'}
```

Insert location: First line in the declaration of the function block.

See also
- chapter 6.4.1.20.3.59 “Operator ‘__NEW’” on page 2201

Attribute 'estimated-stack-usage'

The pragma provides an estimated value for the stack size requirement.

Methods with recursive calls cannot pass a stack check because stack usage cannot be determined. As a result, a warning is issued. To prevent this warning, you can give the method an estimated value (in bytes) for the stack size requirement. Then the method passes the stack check successfully.

**Syntax**
```
{attribute 'estimated-stack-usage' := '<estimated stack size in bytes>'}
```

**Example**
```
{attribute 'estimated-stack-usage' := '127'} // 127 bytes
METHOD PUBLIC DoIt : BOOL
  VAR_INPUT
  END_VAR
```

Insert location: First line above the declaration part of the method.

The section "Method call" includes an example that uses this pragma.

**Recursive method call**

Within its implementation, a method can call itself, either directly by means of the `THIS` pointer, or by means of a local variable for the assigned function block.

- Use recursions mainly for processing recursive data types such as linked lists.
- In general, we recommend to be careful when using recursion, as unexpectedly deep recursions can cause stack overflow and machine downtime.
The following program PLC_PRG calculates the factorial of a number in the FB_Factorial function block in a different way, each in its own method.

- Method m_Iterative: Iterative
- Method m_Pragmaed: Recursive with warning suppression
- Method m_Recursive: Recursive
- Method m_Temp: Temporary with warning suppression

A warning is issued for the m_Recursive method only.

```
// Contains the data of the factorial calculation of uiNumber
TYPE FACTORIAL_RESULT :
  STRUCT
    uiNumber : UINT;
    udiIterative : UDINT;
    udiRecursive : UDINT;
    udiPragmaed : UDINT;
    udiTemp : UDINT;
  END_STRUCT
END_TYPE

PROGRAM PLC_PRG
VAR
  fb_Factorial_A : FB_Factorial;
  factorial_A : FACTORIAL_RESULT := (uiNumber := 9,
    udiIterative := 0, udiRecursive := 0, udiPragmaed := 0);
END_VAR
fb_Factorial_A.p_Number := factorial_A.uiNumber;
factorial_A.udiIterative := fb_Factorial_A.m_Iterative();
factorial_A.udiRecursive := fb_Factorial_A.m_Recursive(uiN :=
    factorial_A.uiNumber);
factorial_A.udiPragmaed := fb_Factorial_A.m_Pragmaed(uiN :=
    factorial_A.uiNumber);
factorial_A.udiTemp := fb_Factorial_A.m_Temp(uiN :=
    factorial_A.uiNumber);
```
FUNCTION_BLOCK FB_Factorial
VAR_INPUT
END_VAR
VAR_OUTPUT
END_VAR
VAR
uiN : UINT;
udiIterative : UDINT;
udiPragmaed : UDINT;
udiRecursive : UDINT;
END_VAR

// Iterative calculation
METHOD PUBLIC m_Iterative : UDINT
VAR
uiCnt : UINT;
END_VAR
m_Iterative := 1;
IF    uiN > 1 THEN
    FOR uiCnt := 1 TO uiN DO
        m_Iterative := m_Iterative * uiCnt;
    END_FOR;
    RETURN;
ELSE
    RETURN;
END_IF;

// Recursive calculation with suppressed warning
{attribute 'estimated-stack-usage' := '99'}
METHOD PUBLIC m_Pragmaed : UDINT
VAR_INPUT
uiN : UINT;
END_VAR
VAR
END_VAR

IF    uiN > 1 THEN
    m_Pragmaed := uiN * THIS^.m_Pragmaed(uiN := (uiN - 1));
    RETURN;
ELSE
    RETURN;
END_IF;

METHOD PUBLIC m_Recursive : UDINT
VAR_INPUT
uiN : UINT;
END_VAR
VAR
END_VAR
m_Recursive := 1;
IF    uiN > 1 THEN
    m_Recursive := uiN * THIS^.m_Recursive(uiN := (uiN - 1) );
    RETURN;
ELSE
    RETURN;
END_IF;

// Called by temporary FB instance
{attribute 'estimated-stack-usage' := '99'}
METHOD PUBLIC m_Temp : UDINT
VAR_INPUT
uiN : UINT;
END_VAR
VAR
  fb_Temp : FB_Factorial;
END_VAR
m_Temp := 1;
IF uiN > 1 THEN
  m_Temp := uiN * fb_Temp.m_Temp(uiN := (uiN - 1));
  RETURN;
ELSE
  RETURN;
END_IF;

PROPERTY p_Number : UINT
uiN := p_Number; //Setter method

Only the m_Recursive issues a warning when the program is executed.

- Chapter 6.4.1.21.2.21.9 “Object ‘Property’” on page 2493

Attribute 'ExpandFully'
The effect of this pragma is that the components of an array used as an input variable for referenced visualizations are made visible in the Properties dialog box of the visualization.

Syntax:
(attribute 'ExpandFully')

Insertion position: the line above the line with the declaration of the array.
The visualization "visu" is to be inserted into a frame inside the visualization "visu_main". `arr` is defined as an input variable in the interface editor of "visu" and will thus be available later for assignments in the Properties dialog box of the frames in "visu_main". In order to also make the individual components of `arr` available in this Properties dialog box, you must insert the attribute 'ExpandFully' directly before `arr` in the interface editor of visu. Declaration in the interface editor of "visu":

```
VAR_INPUT
{attribute 'ExpandFully')
  arr : ARRAY[0..5] OF INT;
END_VAR
```

Example

The visualization "visu" is to be inserted into a frame inside the visualization "visu_main". `arr` is defined as an input variable in the interface editor of "visu" and will thus be available later for assignments in the Properties dialog box of the frames in "visu_main". In order to also make the individual components of `arr` available in this Properties dialog box, you must insert the attribute 'ExpandFully' directly before `arr` in the interface editor of visu. Declaration in the interface editor of "visu":

```
VAR_INPUT
{attribute 'ExpandFully')
  arr : ARRAY[0..5] OF INT;
END_VAR
```

Attribute 'global_init_slot'

The pragma defines the initialization order of programming blocks and global variable lists. Variables in a list (GVL or POU) are initialized from top to bottom.

If there are several global variable lists, then the initialization order is not defined.

The initialization does not apply for the initialization of literal values, for example 1, 'hello', 3.6, or constants of base data types. However, you must define the initialization order yourself if there are dependencies between the lists. You can assign a defined initialization slot to a GVL or POU with the 'global_init_slot' attribute.

Constants are initialized before the variables and in the same order as the variables. During initialization, the POUs are sorted according to the value for `<slot>`. Then the code for initializing the constants is generated and afterwards the code for initializing the variables.

Syntax:

```
{attribute 'global_init_slot' := '<slot>'}
```

`<slot>`: Integer value that defines the position in the call order. The default value for a POU (program, function block) is 50000. The default value for a GVL is 49990. A lower value means an earlier initialization. Caution: If several blocks or GVLs receive the same value for the 'global_init_slot' attribute, then the initialization order remains undefined.
The pragma always affects the entire GVL or POU and therefore it must be located above the VAR_GLOBAL or POU declaration.

If several programming blocks have got assigned the same value for the attribute 'global_init_slot', the order of their initialization remains undefined.

Example

The program includes two global variable lists GVL_1 and GVL_2, as well as a PLC_PRG program that uses variables from both lists. GVL_1 uses the variable B for initializing a variable A, which is initialized in GVL_2 with a value of 1000.

GVL_1

VAR_GLOBAL //49990
A : INT := GVL_2.B*100;
END_VAR

GVL_2

VAR_GLOBAL //49990
B : INT := 1000;
C : INT := 10;
END_VAR

PLC_PRG

PROGRAM PLC_PRG //50000
VAR
ivar: INT := GVL_1.A;
ivar2: INT;
END_VAR

ivar:=ivar+1;
ivar2:=GVL_2.C;

In this case, the compiler prints an error because GVL_2.B is used for initializing GVL_1.A before GVL_2 has been initialized. You can prevent this by using the global_init_slot attribute to position GVL_2 before GVL_1 in the initialization sequence.

In this example, GVL_1 must have at least one slot value of 49989 in order to achieve the earliest initialization within the program. Every lower value has the same effect:

GVL_2

{attribute 'global_init_slot' := '100'}

VAR_GLOBAL
B : INT := 1000;
END_VAR

Using GVL_2.C in the implementation part of PLC_PRG is also not critical even without using a pragma because both GVLs are initialized before the program in either case.

Attribute 'hide'

Using the pragma {attribute 'hide'} to hide variables and POUs does not have the desired effect in most cases. Instead, you should use the pragma {attribute 'conditionalshow'}.

The pragma prevents the variables and POUs defined with it from being shown in the CODESYS user interface. As a result, you can intentionally hide these identifiers without restricting the access. This can be useful when you develop libraries.

Affected features:

- Library management
- Debugging
- Input Assistant
- Function "List components"
The variables or POUs defined with the pragma are neither visible in the Library Manager nor are they suggested in the Input Assistant or in the "List components" function. The pragma prevents those marked variables from being displayed in the symbol configuration. As a result, you cannot export these kinds of variables as symbols. The variables are also invisible in online mode, and therefore their values cannot be monitored. Moreover, you cannot use any debugging functionalities and you do not have any support when checking for bugs.

**Syntax:**

{attribute 'hide'}

Insert location: For variables, above the line with the declaration of the variables. For POUs, in the first line.

If you, the application developer, know the exact instance path of the hidden POUs and variables, then you can access them in the code.

---

**Example of hidden variable**

The function block `FB_MyA` contains the attribute pragma `{attribute 'hide'}` to hide the local variable `xInvisibleIn`.

```
FUNCTION_BLOCK FB_MyA
VAR_INPUT
   iInA : INT;
   {attribute 'hide'}
   xInvisibleIn : BOOL;
   xInit: BOOL;
END_VAR
VAR_OUTPUT
   iOutA : INT;
END_VAR
VAR
   iCounter : INT;
END_VAR
```

Two instances of the function block `FB_MyA` are defined in the main program.

```
PROGRAM PLC_PRG
VAR
   fbMyA1, fbMyA2 : FB_MyA;
   xVar2 : BOOL;
   iVar1 : INT;
   iVar2 : INT;
END_VAR
fbMyA1(iInA := 1, xInit := TRUE, xInvisibleIn := TRUE, iOutA => iVar1);
fbMyA2(iInA := 1, xInit := TRUE, iOutA => iVar2);
```

When the input value for `fbMyA1` is implemented, the "List components" function, which opens when you type `fbMyA1` (in the implementation part of `PLC_PRG`), displays the variables `iInA, xInit, and iOutA, but not the hidden variable `xInvisibleIn`.
FB_A is a function block of the library HiddenFunctionality with the default namespace HIDDEN. To hide the identifier and the POU code from application developers, begin the declaration of the POU with the attribute pragma {attribute 'hide'}. To hide the subordinate POUs (actions, methods, properties, and transitions) in the same way, also begin their declarations with {attribute 'hide'}.

```plaintext
{attribute 'hide'}
FUNCTION_BLOCK FB_A
VAR_INPUT
END_VAR
VAR_OUTPUT
END_VAR
VAR
iA : INT;
iCount : INT;
iInvisible : INT;
END_VAR

{attribute 'hide'}
METHOD METH_Count : INT
VAR_INPUT
END_VAR
iCount := iCount + 1;

{attribute 'hide'}
METHOD METH_Invisible : BOOL
VAR_INPUT
END_VAR
iInvisible := iInvisible + 1;

{attribute 'hide'}
PROPERTY PUBLIC prop_iA : INT
```

For you as the application developer, all POUs are invisible. You can use them only if you know the instance path.

```plaintext
PROGRAM PLC_PRG
VAR
   fbHidden : HIDDEN.FB_A; // Hidden function block from library
   iCounter : INT;
END_VAR
fbHidden.METH_Invisible();
iCounter := fbHidden.iInvisible;
```

In online mode, no monitoring is performed.
With the pragma `hide_all_locals` you can hide all local variables of a POU.

See also
- Chapter 6.4.1.20.6.3.18 “Attribute 'hide_all_locals'” on page 2289
- Chapter 6.4.1.20.6.3.8 “Attribute 'conditionalshow'” on page 2276
- Chapter 6.4.1.20.6.3.9 “Attribute 'conditionalshow_all_locals'” on page 2277

**Attribute 'hide_alllocals'**

The pragma prevents all local variables of a signature from being visible in the display of the 'List components' function, in the Input Assistant or in the declaration part in online mode. Moreover, these variables are hidden in the symbol configuration and therefore cannot be exported as symbols. The pragma is especially useful in library POUs to hide POU variables from users.

**Affected features**
- Library management
- Debugging
- Input Assistant
- Function "List components"
- Monitoring
- Symbol configuration

**Syntax:**

```
{attribute 'hide_all_locals'}
```

Insert location: First line above the declaration part of the POU
Example

The function block `FB_MyB` uses the attribute:

```plaintext
{attribute 'hide_all_locals'}
FUNCTION_BLOCK FB_MyB
VAR_INPUT
  iInB : INT;
  {attribute 'hide'}
  xInvisibleIn : BOOL;
  xInit: BOOL;
END_VAR
VAR_OUTPUT
  iOutB : INT;
END_VAR
VAR
  iCounter : INT;
  xVar : BOOL;
END_VAR
```

Two instances of the function block `FB_MyB` are defined in the main program.

```plaintext
PROGRAM PLC_PRG
VAR
  fbMyB1, fbMyB2: FB_MyB;
  iVar3: INT;
  iVar4: INT;
END_VAR
fbMyB1(iInB := 2, xInvisibleIn := TRUE, iOutB => iVar3);
fbMyB2(iInB := 2, iOutB => iVar4);
IF fbMyB2.iCounter > 100 THEN
  fbMyB2.xInit := TRUE;
END_IF
```

Now when you download the program to the controller, start it, and switch to online mode, the variables `iInB`, `xInit`, `iOutB`, and `xReset` are displayed in the declaration editor. However, the hidden local variables `iCounter` and `xVar` are not displayed.

See also

- Chapter 6.4.1.20.6.3.17 “Attribute ‘hide’” on page 2286

Attribute 'initialize_on_call'

The pragma causes input variables of a function block to be initialized on each call of the function block. If an input variable is affected which expects a pointer and this pointer has been removed during an online change, then the variable is initialized to zero.

Syntax:

```plaintext
{attribute 'initialize_on_call'}
```

Insert location: Always in the first line of the declaration part for the entire function block, and also in a line above the declaration of the individual input variable.
**Example**

```plaintext
{attribute 'initialize_on_call'}
FUNCTION_BLOCK fb
VAR_INPUT
    {attribute 'initialize_on_call'}
pInt : POINTER TO INT := 0;
    {attribute 'initialize_on_call'}
iVal : INT := 0;
END_VAR
```

**Attribute 'init_namespace'**

The effect of this pragma is that a variable of the type `STRING` or `WSTRING`, which is declared in a library function block with this pragma, is initialized when used in the project with the current namespace of the library.

**Syntax**

```plaintext
{attribute 'init_namespace'}
```

Insertion position: the line above the line with the declaration of the variables in a library function block.

**Example**

The function block “POU” is provided with the necessary attributes:

```plaintext
FUNCTION_BLOCK POU
VAR_OUTPUT
    {attribute 'init_namespace'}
myStr: STRING;
END_VAR
```

An instance `fb` of the function block POU is defined within the main program PLC_PRG:

```plaintext
PROGRAM PLC_PRG
VAR
    fb:POU;
    newString: STRING;
END_VAR
newString := fb.myStr;
```

The variable `myStr` is initialized with the current namespace, for example `MyLib`. This value is assigned to `newString` in the main program.

**See also**
- [Chapter 6.4.1.21.2.16 “Object 'Library Manager’” on page 2469](#)
NOTICE!

For compiler version 3.5.0.0 and later, a fast online change is performed for minor changes. In this case, only the modified blocks are compiled and downloaded. In particular, no initialization code is generated. This means that also no code is generated when variables with the `init_on_onlchange` attribute are initialized. As a rule, this has no effect because the attribute is used primarily for initializing variables with addresses. However, it cannot happen that a variable changes its address during an online change.

To secure the effect of the `init_on_onlchange` attribute in the entire application code, you must deactivate the fast online change in general for the application by using the compiler definition `no_fast_online_change`. To do this, insert the definition in the application “Properties” (“Build” tab).

Syntax:

```
{attribute 'init_on_onlchange' }
```

Insert location: The line above the line with the declaration of the variables.

See also

- § Chapter 6.4.1.21.4.11.5 “Dialog ‘Properties’ - ‘Build’” on page 2755

Attribute 'instance-path'

This pragma can be applied to a local STRING variable and causes this local STRING variable to be initialized in sequence with the device tree path of the POU to which it belongs. This can be useful for error messages. The application of the pragma requires the application of the attribute 'reflection' to the associated POU, as well as the application of the additional attribute 'noinit' to the STRING variable.

Syntax:

```
{attribute 'instance-path'}
```

Insertion position: the line above the line with the declaration of the STRING variable.

Example

The following function block contains the attributes 'reflection', 'instance-path' and 'noinit'.

```
{attribute 'reflection'}
FUNCTION_BLOCK POU
VAR
 {attribute 'instance-path'}
{attribute 'noinit'}
str: STRING;
END_VAR
```

An instance “myPOU” of the function block “POU” is defined within the main program “PLC_PRG”:

```
PROGRAM PLC_PRG
VAR
 myPOU:POU;
 myString: STRING;
END_VAR
myPOU();
myString:=myPOU.str;
```

Following the initialization of the instance myPOU, the path of the instance myPOU is assigned to the string variable str, in the example PLCWinNT.Application.PLCS_PRG.myPOU. This path is assigned in the main program to the variable myString.
NOTICE!
You can define the length of a string to be whatever you like (even >255), but you must consider that the string will be truncated at the end if it is assigned to a variable whose data type is too small for it.

See also
- % Chapter 6.4.1.20.6.3.41 “Attribute ‘reflection’” on page 2313
- % Chapter 6.4.1.20.6.3.32 “Attribute ‘noinit’” on page 2299

Attribute 'io_function_block', 'io_function_block_mapping'

With the 'io_function_block' attribute, you mark a function block in order to prepare it for the assignment to a channel in the I/O mapping of the device configuration. Then it is shown in the “Select function block” dialog.

With the 'io_function_block_mapping' attribute, you mark a parameter that should be used when mapping the FB to a device channel in this kind of function block. You can provide the attribute to multiple parameters of the function block. For I/O mapping, the first one is used automatically whose type matches the channel (input, output, data type).

Syntax:

```
{attribute 'io_function_block'}
{attribute 'io_function_block_mapping'}
```

Insert location: The line above the first line in the declaration of the function block, or the line above the parameter declaration.

Example

```
{attribute 'io_function_block'}
FUNCTION_BLOCK Scale_Output_Int
VAR_INPUT
  iInput : INT;
  iNumerator : INT;
  iDenominator : INT := 1;
  iOffset : INT := 0;
END_VAR
VAR_OUTPUT
  {attribute 'io_function_block_mapping'}
  iOutput : INT;
END_VAR
```

See also
- % Chapter 6.4.1.21.4.4 “Dialog ‘Select Function Block’” on page 2746
- % “Linking a device with a function block instance” on page 1840

Attribute 'is_connected'

You use the pragma 'is_connected' to mark a Boolean function block variable which, when a function module instance is called, provides information about whether the associated input of the POU has an assignment.

The use of the pragma requires the use of the attribute 'reflection' on the affected function block.

Syntax:
```
{attribute 'is_connected' := '<input variable>'}
```
In the function block FB, a local variable is declared for each input variable (in1 and in2) and the attribute 'is connected' is prepended to it each time with the name of the input variable. The func itself gets the pragma attribute 'reflection'.

When an instance of the function block is called, the local variable is True in the case that the input assigned to it has received an assignment.

```
{attribute 'reflection'}
FUNCTION_BLOCK FB
VAR_INPUT
  in1: INT;
  in2: INT;
END_VAR
VAR
  {attribute 'is_connected' := 'in1'}
  in1_connection_info: BOOL;
  {attribute 'is_connected' := 'in2'}
  in2_connection_info: BOOL;
END_VAR
```

Assumption: When the function block instance is called, in1 receives an external assignment and in 2 does not receive an assignment. This results in the following code:

```
in1_connection_info := TRUE;
in2_connection_info := FALSE;
```

See also
- Chapter 6.4.1.20.6.3.41 “Attribute ‘reflection’” on page 2313
- Chapter 6.4.1.21.2.21.3 “Object ‘Function Block’” on page 2479

**Attribute 'linkalways'

The pragma {attribute 'linkalways'} instructs the compiler to always include a POU or a library POU in the compile information. During the build, the POU is compiled and is part of the application code. During the download, the POU is downloaded to the PLC.

**Syntax:**

```
{attribute 'linkalways'}
```

**Insertion location:** The first line in the declaration part of the POU or library POU

The POU may be valid throughout the project (saved in the “POUs” view) or throughout the application (saved in the “Devices” view).

You can also select the “Link always” option in the “Build” tab of a POU’s object properties.
The “MoreSymbols” GVL contains the pragma `{attribute 'linkalways'}`. The variables declared there are also part of the application code, regardless of any access.

```c
VAR_GLOBAL
  g_iAlpha: INT;
  g_iBravo: INT;
  g_iCharlie: INT;
END_VAR
```

The symbol configuration also accesses the compile information. As a result, the variables of the `MoreSymbols` GVL are always provided for selection in the “Symbol Configuration” editor.

Attribute 'monitoring'

The effect of this pragma is that you can monitor values of properties or function calls in the online view of the IEC editor or in a watch list. There are two possible attribute values for this: 'variable' and 'call'

Syntax

```c
{attribute 'monitoring' := 'variable'}
{attribute 'monitoring' := 'call'}
```

Monitoring of programming objects and their properties

In the online view of a function block or program, you can monitor the subordinate properties in addition to the local variables. This allows you to monitor the values of the Get and Set methods.

Insert either the pragma `{attribute 'monitoring' := 'variable'} or `{attribute 'monitoring' := 'call'}` in the declaration of the property block. The current values of the property are then displayed automatically in the IEC editor or in a watch list.
In online mode, the PLC_PRG object shows the value of the Minutes property at the call location inline in the ST editor. This is because the pragma \{attribute 'monitoring':='variable'} is located in the declaration of the Minutes property.

Example

Check carefully for each application which attribute pragma is suitable for displaying the desired value. This depends on whether further operations with the variables are implemented within the property.

1.Pragma \{attribute 'monitoring':='variable'}:

An implicit variable is created for the property, which is then always given the current property value when the application calls the Set or Get method. The value stored last in this variable is displayed in the monitoring.

2.Pragma \{attribute 'monitoring':='call'}:

You can use this attribute only for properties that return simple data types or pointers, but not for structured types. The value to be monitored is read or written by calling the property directly. This means that the monitoring service of the runtime executes the Get or Set method of the property.

---

**NOTICE!**

When you insert the pragma \{attribute 'monitoring':='call'} for monitoring, you have to pay attention to possible side effects. These kinds of side effects can occur if additional operations are implemented in the property.

**NOTICE!**

The pragma \{attribute 'monitoring'} is also evaluated for the symbol configuration. Only read access is possible for the value 'variable'.

---

*With the context menu command “Add Watch”, a variable on which the cursor is currently positioned is applied directly into the monitoring list in online mode.*
The forcing or writing of functions is not supported. However, you can implicitly implement forcing by adding an additional input parameter for the respective function, which serves as an internal force flag.

Function monitoring is not possible in the compact runtime.

See also

- Chapter 6.4.1.21.21.9 “Object ‘Property’” on page 2493

Attribute 'monitoring_encoding'

The attribute pragma is allowed for string variables and aliases. The attribute has the effect that the values of the variables are marked with it to be decoded in UTF-8 format during monitoring.

Syntax

{attribute 'monitoring_encoding' := 'UTF8'}

Example

PROGRAM PLC_PRG
VAR

{attribute 'monitoring.encoding' := 'UTF8'}
strDat : STRING := 'abc';
attribute 'monitoring_encoding' := 'UTF-8'
strVarUtf8 : STRING := UTF8#'你好,世界!ÜüÄäÖö';
{attribute 'monitoring_encoding' := 'UTF-8'}
str1: STRING := UTF8#'AÄyyy';
{attribute 'monitoring_encoding' := 'UTF-8'}
str2: STRING := UTF8#'AÄxxxÜÜÜ';

strVarUtf8_1: STRING := '#你好,世界!ÜüÄäÖö';
str1_1: STRING := '#AÄyyy';
str2_1: STRING := '#AÄxxxÜÜÜ';
END_VAR

Example Syntax

Configuration and programming
Programming with CODESYS > CODESYS Development System
Attribute 'no_assign', Attribute 'no_assign_warning'

The pragma 'no_assign' results in compiler errors being displayed if an instance of the function block is assigned to another instance of the same function block. Such assignments are often to be avoided if the function block contains pointers and pointers lead to problems, because they are copied as well during the value assignment.

The pragma 'no_assign_warning' results in the same as for the pragma 'no_assign' with compiler warnings instead of compiler errors.

**Syntax:**

```plaintext
{attribute 'no_assign'}
```

Insert location: First line in the declaration part of a function block.

---

**Example**

Assignment of function block instances containing pointers.

In this example the value assignment of the function block instances will lead to problems during the execution of `fb_exit`:

```plaintext
VAR_GLOBAL
    inst1 : TestFB;
    awsBufferLogFile : ARRAY [0..9] OF WSTRING(66);(* Area: 0, Offset: 0x1304 (4868)*)
    LogFile : SEDL.LogRecord := (sFileName := 'LogFile.log', pBuffer := ADR(awsBufferLogFile), udiMaxEntriesFile := UDINT#10000, udiMaxBuffered := UDINT#10, uiLineSize := UINT#64, wsSep := " ", xCircular := TRUE, siDateFormat := SINT#0, siTimeFormat := SINT#0);
END_VAR

PROGRAM PLC_PRG
VAR
    inst2 : TestFB := inst1;
    LogFileNew
END_VAR

In this case `LogFile` manages a list of pointers, for which various actions are executed in the case of `fb_exit`. Problems result due to the assignment, because `fb_exit` will be executed twice. You should prevent this by adding the attribute 'no_assign' in the declaration of the function block "TestFB":

```plaintext
{attribute 'no_assign'}

FUNCTION_BLOCK TestFB
VAR_INPUT
...

The following compiler errors are then displayed:

C0328: Assignment not allowed for type TestFB
C0328: Assignment not allowed for type LogRecord

If the pragma no_assign_warning is used instead of the pragma no_assign for the function block "TestFB", then the C0328 message is issued as compiler warning, not as a compiler error.

---

Attribute 'no_check'

This pragma prevents the check function being called for the POU (POUs for implicit checks). Since the check functions can affect the processing speed of the program, it can be useful to apply the attribute to function blocks that have already been checked or are frequently called.

You add the pragma to the declaration of a POU.

**Syntax:**

```plaintext
{attribute 'no_check'}
```

Insertion position: first line in the declaration part of the POU.
Attribute 'no_copy'

In general an online change requires a re-allocation of instances, for example of a POU. In the process, the value of the variable contained in the instance is copied.

The pragma prevents the value of the variable contained in the instance from being copied in the course of an online change; instead, the variable is re-initialized in the course of an online change. This can be useful for a local pointer variable that points to a variable that has just been shifted by the online change and thus has a changed address.

You insert the attribute in the declaration part above the line of the declaration of the variables concerned.

Syntax:

{attribute 'no_copy'}

Attribute 'no-exit'

This attribute suppresses the call of the FB_exit method of a function block for a certain one of its instances. To do this you insert the attribute in the line before the declaration of the function block instance.

Syntax:

{attribute 'no-exit'}

Example

The method “FB_exit” is added to the function block “POU_ex”. Two instances of the function block “POU_ex” are created in the main program “PLC_PRG”.

```
PROGRAM PLC_PRG
VAR
  POU1 : POU_ex;
  {attribute 'no-exit'}
  POU2 : POU_ex;
END_VAR
```

POU1 is called, POU2 is not called.

See also

- Chapter 6.4.1.20.10 “Methods ‘FB_Init’, ‘FB_Reinit’, and ‘FBExit’” on page 2336

Attribute 'noinit'

This pragma is applied to variables that should not be implicitly initialized.

Syntax:

{attribute 'no_init'}
{attribute 'no-init'}
{attribute 'noinit'}

Insertion position: line above the declaration line of the variables concerned in the declaration part.
Example

PROGRAM PLC_PRG
VAR
  A : INT;
  {attribute 'no_init'}
  B : INT;
END_VAR

When the associated application is reset, the integer variable A is implicitly re-initialized with 0, whereas the variable B retains its current value.

Attribute 'no_instance_in_retain'

You can use this pragma to prevent the instance of a function block from being stored in the retain memory.

Syntax:
{attribute 'no_instance_in_retain'}

Insert location:
Lines above the FUNCTION_BLOCK declaration in the declaration part of the function block.

Now when you declare an instance declaration of the function block as a RETAIN variable, an error message is issued.

See also
- Chapter 6.4.1.9.19 “Data Persistence” on page 1920

Attribute 'no_virtual_actions'

The pragma is used for function blocks that are derived from a function block implemented in SFC and use the fundamental SFC sequence of this base class. The actions called from it exhibit the same virtual behavior as methods. This means that the implementations of the actions in the base class can be replaced by the derived class with its own specific implementations.

If you apply the pragma to the base class, then its actions are protected against overloading.

Syntax:
{attribute 'no_virtual_actions'}

Insert location: Top line in the declaration part of the function block
The function block POU_SFC is the base class for the derived function block POU_child. The derived class POU_child calls the sequence of the base class written in SFC with the special variable SUPER.

The exemplary implementation of this sequence is limited to the initial step, followed by a single step with a linked step action ActiveAction. This step with a linked step action takes care of the configuration of the output variables.

```plaintext
an_int:=an_int+1; // Counting the action calls
test_act:='father_action';
METH(); // Call of the method METH in order to set the string variable test_meth
```

In the case of the derived class POU_child the step action is replaced by a special implementation of ActiveAction. Active Action differs from the original only by the assignment of the string 'child_action' in place of 'father_action' at the variable test_act.

Likewise, the method METH, which assigns the string 'father_method' to the variable test_meth in the base class, is overwritten so that test_meth now gets the value 'child_method'. The main program PLC_PRG calls an instance of the function block POU_child, named Child. As expected, the value of the strings reflects the call of the action and method of the derived class:
Now, however, you place the pragma `{attribute 'no_virtual_actions'}` in front of
the base class:

```plaintext
{attribute 'no_virtual_actions'}

FUNCTION_BLOCK POU_SFC...
```

This changes the behavior: While the implementation of the derived class is still used
for the method `METH`, the call of the step action now results in a call of the action `ActiveAction`
of the base class. Therefore `test_act` is now given the value `'father_action'`:

```
<table>
<thead>
<tr>
<th>Expression</th>
<th>Type</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Child</td>
<td>POU_child</td>
<td></td>
</tr>
<tr>
<td>test_meth</td>
<td>STRING</td>
<td>'child_method'</td>
</tr>
<tr>
<td>test_act</td>
<td>STRING</td>
<td>'child_action'</td>
</tr>
<tr>
<td>an_int</td>
<td>INT</td>
<td>33</td>
</tr>
</tbody>
</table>
```

**Attribute 'pingroup'**

The effect of this pragma is that the input pins or output pins (parameters) are grouped in the
declaration of a function block. In the FBD/LD editor a pin group defined in this way can be
displayed as an enlarged or reduced unit on the inserted function block. Several groups are
possible and are distinguished by their names. CODESYS saves the respective state (reduced)
per function block box with the project options.

**Syntax:**

```plaintext
{attribute 'pingroup' := '<group name>'}
```

Insertion position: line above the declaration of the input or output variables concerned in the
declaration part of a function block.
Two groups are defined: general (i1, out1) and group1 (i2, g1). r1, r2, outRes1 and g2 are always displayed.

FUNCTION_BLOCK FB
VAR_INPUT
  r1 : REAL;
  {attribute 'pingroup' := 'general'}
  i1 : INT;
  {attribute 'pingroup' := 'group1'}
  i2 : INT;
  r2 : REAL;
END_VAR

VAR_OUTPUT
  outRes1 : REAL;
  {attribute 'pingroup' := 'general'}
  out1 : INT;
  {attribute 'pingroup' := 'group1'}
  g1 : INT;
  g2 : REAL;
END_VAR

Example

Attribute 'pin_presentation_order_inputs/outputs'

The pragmas are evaluated in the CFC, FBD, and LD graphical editors, causing the order of inputs/outputs of the affected function block to be displayed as specified. You program the order by assigning the names of the inputs/outputs to the attribute in the desired order.

Syntax

{attribute 'pin_presentation_order_inputs' := '<First/Input_Name>,
  (<Next/Input_Name>,)* ( *, )? (<Next/Input_Name>,)*
  <Last/Input_Name>}'
{attribute 'pin_presentation_order_outputs' := '<First/Output_Name>,
  (<Next/Output_Name>,)* ( *, )? (<Next/Output_Name>,)*
  <Last/Output_Name>'}

- *
  The terminal character serves as a wildcard for all inputs/outputs that are not specified in the display order. If the terminal character is missing, then the missing inputs/outputs are appended at the end.

- ( ... )?
  The contents of the parentheses are optional.

- ( ... )*
  The contents of the parentheses are optional again and can therefore occur not at all, one time, or several times.

- Insert location: First line in the declaration part of a function block.

NOTICE!

This pragma is not evaluated when pragma {attribute 'pingroup' := '
  '<Group_Name>'} is used.
In the representation of function module instance pouBase_A, the pragmas result in the following arrangement of input and output pins:

![Diagram of function module instance](image)

- Chapter 6.4.1.20.6.3.35 “Attribute ‘pingroup’” on page 2302

**Attribute ‘obsolete’**

The effect of this pragma is that a defined warning is displayed for a data type definition during compilation if the data type (structure, function block, etc.) is used in the project. This enables you, for example, to draw attention to the fact that a data type is no longer valid because, for example, an interface has changed and this should also be implemented in the project.

In contrast to a message pragma this warning is defined centrally for all instances of a data type.

**Syntax:**

```
{attribute 'obsolete' := 'user defined text'}
```

Insertion position: line of the data type definition or in a line above it.
The pragma is inserted in the definition function block `fb1`:

```plaintext
{attribute 'Obsolete' := 'datatype fb1 not valid!'}
FUNCTION_BLOCK fb1
  VAR_INPUT
  i:INT;
  END_VAR
If you use fb1 as a data type, for example in `fbinst:fb1`, the following warning will be displayed when compiling the project: "datatype fb1 not valid".
```

- [Chapter 6.4.1.20.6.2 "Message Pragmas" on page 2269](#)

**Attribute 'pack_mode'**

The pragma defines how a data structure is packed during the allocation. The attribute has to be inserted above the data structure and affects the packing of the entire structure.

**Syntax:**

```plaintext
{attribute 'pack_mode' := ' <pack mode value>' }
```

Insert location: above the declaration of the data structure

**Table 401: Possible values for `<value>`:**

<table>
<thead>
<tr>
<th><code>&lt;pack mode value&gt;</code></th>
<th>Associated packing method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>

</tr>
</tbody>
</table>
### Table: Associated Packing Method

<table>
<thead>
<tr>
<th>&lt;pack mode value&gt;</th>
<th>Associated packing method</th>
<th>Description</th>
</tr>
</thead>
</table>
| 4                 | 4-byte-aligned            | There are:
|                   |                           | - 1-byte variables at byte addresses |
|                   |                           | - 2-byte variables at addresses divisible by 2. A maximum gap of 1 byte results. |
|                   |                           | - 4-byte variables at addresses divisible by 4. A maximum gap of 3 byte results. |
|                   |                           | - 8-byte variables at addresses divisible by 4. A maximum gap of 3 byte results. |
|                   |                           | - Strings always at byte addresses. No gaps result. |
| 8                 | 8-byte-aligned            | There are:
|                   |                           | - 1-byte variables at byte addresses |
|                   |                           | - 2-byte variables at addresses divisible by 2. A maximum gap of 1 byte results. |
|                   |                           | - 4-byte variables at addresses divisible by 4. A maximum gap of 3 byte results. |
|                   |                           | - 8-byte variables at addresses divisible by 8. A maximum gap of 7 byte results. |
|                   |                           | - Strings always at byte addresses. No gaps result. |

#### Notice

Depending on the structure, there may be no difference in the memory mapping of the individual modes. Therefore, the memory allocation of a structure with <pack mode value> = 4 can correspond to that of <pack mode value> = 8.

Arrays of structures: If the structures are combined in arrays, then bytes are added at the end of the structure so that the next structure is aligned.

#### Notice!

If the “Compatibility layout” option is selected in the symbol configuration and at the same time the attribute ‘pack_mode’ is used in the code, then problems can occur due to unintentional memory misalignment.

- § Chapter 6.4.1.21.2.27 “Object ‘Symbol Configuration’” on page 2523
Example 1

Example

{attribute 'pack_mode' := '1'}

TYPE myStruct:
  STRUCT
    Enable: BOOL;
    Counter: INT;
    MaxSize: BOOL;
    MaxSizeReached: BOOL;
  END_STRUCT
END_TYPE

The memory range for a variable of the data type myStruct is allocated 'aligned'. If the storage address of its component Enable is 0x0100, for example, then the component Counter follows at the address 0x0101, MaxSize at address 0x0103 and MaxSizeReached at address 0x0104. In the case of 'pack_mode':=2, Counter would be at 0x0102, MaxSize at 0x0104 and MaxSizeReached at 0x0106.
### Example 2

**Example**

```plaintext

</tbody>
</table>
If pack mode is not used, then the compiler typically uses pack mode 4 or 8, depending on the device description. In each case, a pack mode which is particularly beneficial for the processor is used so that memory access can be performed. This is also called natural alignment or a natural alignment of data.

Unaligned memory access can be the result of using the attribute 'pack_mode'. This means, for example, that a data type with a size of 4 bytes is then located at an address which is not divisible by 4. Normally, on a 32-bit system a 32-bit data type can be read and written with a single memory access. On some platforms, for example on ARM platforms, this is possible only when this value is aligned in the memory. On other platforms, it can be that the access is possible but it is performed much more slowly.

Example

```plaintext
{attribute 'pack_mode':=1}

TYPE DUT
STRUCT
    by1 : BYTE;
    dw1 : DWORD;
END_STRUCT
END_TYPE
```

On an ARM platform, the value dw1 cannot be read with a single access. When an attempt is made to access this element directly, the ARM processor will throw an exception.

Assumption: The following read access is performed: `dwTest := dut1.dw1;`

For this access to the DWORD dw1, four memory accesses are required because each byte is read, shifted, and disjuncted individually. The flow is somewhat the same as in the following example in which a DWORD is generated from an array of four bytes:

```plaintext
dwHelp := bytes[0];
dwResult := dwHelp;
dwHelp := bytes[1];
dwHelp := SHL(dwHelp, 8);
dwResult := dwResult OR dwHelp;
dwHelp := bytes[2];
dwHelp := SHL(dwHelp, 16);
dwResult := dwResult OR dwHelp;
dwHelp := bytes[3];
dwHelp := SHL(dwHelp, 24);
dwResult := dwResult OR dwHelp;
```

Obviously, this kind of access is much slower than access to a DWORD, which is aligned appropriately in the memory.

```plaintext
pdw := ADR(dut1.dw1);
dwTest := pdw^;
```
However, the compiler will not generate the access of the example when this kind of member is accessed by means of a pointer. This means that the following code results in an exception on an ARM platform.

```pascal
pdw := ADR(dut1.dw1);
dwTest := pdw^;
```

For performance reasons, you should therefore avoid working with structures which are not naturally aligned.

A packed structure must not contain an unpacked structure.

---

**Attribute 'ProcessValue'**

With the 'ProcessValue' attribute, you mark a component of a structure. In the CFC editor, you can then use the command “Use attributed member as input” in order to connect this structure to an input of scalar type.

**Syntax:**

```pascal
{attribute 'ProcessValue'}
```

**Insert location:** Line above the affected structure variable.

**Example**

```pascal
TYPE QINT :
  STRUCT
    Status : STRING;
    {attribute 'ProcessValue'}
    Value1 : INT;
    Value2 : INT;
  END_STRUCT
END_TYPE
```

**See also**

- Chapter 6.4.1.21.3.13.36 “Command 'Use Attributed Member as Input’” on page 2698

---

**Attribute 'qualified_only'**

The effect of this pragma is that variables of a global variable list are only addressed by specifying the global variable name, for example `gvl.g_var`. This also applies to variables of the type Enumeration and can be helpful in avoiding being mistaken for local variables.

**Syntax:**

```pascal
{attribute 'qualified_only'}
```

**Insertion position:** line above `VAR_GLOBAL` in a GVL
Example

Global Variable List “GVL”:

{attribute 'qualified_only'}
VAR_GLOBAL
  iVar:INT;
END_VAR

Within a POU, for example “PLC_PRG”, the global variable iVar can only be addressed using the prefix GVL:

GVL.iVar:=5;

Conversely, the following incomplete call of the variable will create an error:

iVar:=5;

Attribute 'reflection'

The pragma is used to identify POUs in which some variables require special treatment and are tagged with a specific attribute for this purpose. Currently, this applies to the attributes 'instance-path' and 'is-connected' for function block variables. The compiler searches only blocks marked with 'reflection' for variables with these attributes and therefore needs less time.

Syntax:

{attribute 'reflection'}

For examples, see the description of the attributes 'instance-path' and 'is-connected'.

See also

- Chapter 6.4.1.20.6.3.22 “Attribute 'instance-path’” on page 2292
- Chapter 6.4.1.20.6.3.24 “Attribute 'is_connected’” on page 2293

Attribute 'subsequent'

The pragma is used to allocate consecutive variables in memory. When the list changes, the entire variable list is allocated to a new memory area. This pragma is used in programs and global variable lists.

Syntax:

{attribute 'subsequent'}

NOTICE!

VAR_TEMP in a program with attribute 'subsequent' leads to a compiler error.

When a variable in the list is qualified with RETAIN, all variables of the declaration part are stored in the memory area for RETAIN.
**Attribute 'symbol'**

The pragma `{attribute 'symbol'}` defines which variables of a program or a global variable list are to be adopted into the symbol configuration. This means that the variables are exported as symbols to a symbol list. This symbol list is then available for external access both as an XML file in the project directory and as a file that is invisible to the user on the target system. For example, the symbol list is then available for access by an OPC server. The variables thus equipped with a symbol are loaded by CODESYS to the controller, even if they are not explicitly configured or visible in the editor of the symbol configuration.

In any case, however, an object “Symbol configuration” must be created below the application concerned in the device tree.

**Syntax:**

```
{attribute 'symbol' := '<access possibilities>'}
```

- `<access possibilities>`: `none`, `read`, `write`, `readwrite`. The default value `readwrite` applies if no parameter is specified.

**Insertion position:**
- In order to affect only an individual variable, you must place the pragma in the line before the variable declaration.
- In order to be effective for all variables in the declaration part of a program, you must place the pragma in the first line of the declaration editor. In this case, too, you can still set instructions for individual variables explicitly in the respective line.

**Example**

With the following configuration the variables A and B are exported with read and write permission. Variable C is exported with read permission.

```
{attribute 'symbol' := 'readwrite'}
PROGRAM PLC_PRG
VAR
  A : INT;
  B : INT;
  {attribute 'symbol' := 'none'}
  C : INT;
  {attribute 'symbol' := 'read'}
  D : INT;
END_VAR
```

**See also**

- § Chapter 6.4.1.9.8 “Using Pragmas” on page 1888
- § Chapter 6.4.1.10.3 “Symbol Configuration” on page 1941

**Attribute 'to_string'**

The pragma affects how the result of converting an enumeration component with the `TO_STRING` operator is output. If the enumeration declaration has the pragma, then the name of the enumeration component appears as a string instead of the numeric value.

**Syntax:**

```
{attribute 'to_string'}
```

Insert location: First line above the declaration part of the enumeration.
Declaration of the enumeration color:

```plaintext
{attribute 'to_string'}
TYPE color :
{
    red := 0,
    blue := 1,
    green := 2
};
END_TYPE
```

Conversion with TO_STRING:

```plaintext
PROGRAM PLC_PRG
VAR
    i_color: Color;
    s_show_color: STRING;
END_VAR
i_color := 1;
s_show_color := TO_STRING(i_color);
```

In this case, `s_show_color` gets the value 'blue' instead of '1' as the conversion result.

See also
- Chapter 6.4.1.20.5.18 “Enumerations” on page 2263

Attribute 'warning disable', attribute 'warning restore'

This pragma causes certain warnings to be suppressed. The `warning restore` pragma causes a suppressed message to be reactivated.

**Syntax:**

```plaintext
{warning disable <compiler ID>}
{warning restore <compiler ID>}
```

`<compiler ID>`: ID located at the beginning of an error or a warning message.

**Example**

Compiler message:

```plaintext
typify code ...
C0196: Implicit conversion from unsigned Type 'UINT' to signed Type 'INT': possible change of sign
```

Apply the pragma to a variable declaration:

```plaintext
VAR
    {warning disable C0195}
    test1 : UINT := -1;
    {warning restore C0195}
    test2 : UINT := -1;
END_VAR
```

`test1` does not generate an error message, `test2` generates an error message.

**Effects of Pragmas on Symbols**

POUs and variables can change their behavior with respect to the symbol configuration as a result of pragmas. A detailed description can be found on the help page of each pragma.

### Conditional Pragmas

The purpose of conditional pragmas is to influence the generation of code in the pre-compilation process or the compilation process. The ST implementation language supports these pragmas.
NOTICE!
They use conditional pragmas in the implementations of POUs. CODESYS does not evaluate these conditional pragmas if you use them in the declaration part.

With conditional pragmas you affect whether implementation code is taken into account for the compilation. For example, you can make this dependent on whether a certain variable is declared, whether a certain function block exists, etc.

<table>
<thead>
<tr>
<th>Pragma</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>{define &lt;identifier&gt; &lt;string&gt;}</td>
<td>The value can be queried and compared later with hasvalue.</td>
</tr>
<tr>
<td>{undefine &lt;identifier&gt;}</td>
<td>The {define} statement of the identifier &lt;identifier&gt; is canceled, and the identifier is 'undefined' again from now on. The pragma is ignored if the specified identifier is not defined at all.</td>
</tr>
<tr>
<td>{IF &lt;expr&gt;}...</td>
<td>These are pragmas for the conditional compilation.</td>
</tr>
<tr>
<td>{ELSIF &lt;expr&gt;}...</td>
<td>The specified expressions &lt;expr&gt; must be constant at the time of compilation; they are evaluated in the order in which they appear here until one of the expressions indicates a non-zero value. The text linked to the instruction is compiled; the other lines are ignored. The order of the sections is fixed. The ELSIF and ELSE sections are optional. The ELSIF-segments may occur any number of times. You can use several conditional compilation operators within the constants &lt;expr&gt;.</td>
</tr>
<tr>
<td>{ELSE}...</td>
<td>You can use one or more operators within the constant expression &lt;expr&gt; within the conditional compilation pragma {IF} or {ELSIF}.</td>
</tr>
</tbody>
</table>

You can enter expressions and define definitions as “compiler definitions” in the “Build” tab in the Properties dialog of POUs. If you enter define definitions in the properties dialog, you must omit the term {define}, contrary to the definition in the implementation code. In addition, you can specify several define definitions in the properties dialog, separated by commas.

This operator causes the expression to be given the value TRUE. The requirement is that the identifier <identifier> was defined with the help of a {define} instruction and not undefined again afterwards with an {undefine} instruction; otherwise FALSE is returned.

**Example**

Requirement: The applications App1 and App2 exist. The variable pdef1 is defined by a {define} statement in App1, but not in App2.

```plaintext
{IF defined (pdef1)}
(* This code is processed in App1 *)
{info 'pdef1 defined'}
    hugo := hugo + SINT#1;
{ELSE}
(* the following code is only processed in App2 *)
{info 'pdef1 not defined'}
    hugo := hugo - SINT#1;
{END_IF}
```

This also contains an example of a message pragma: Only the message pdef1 defined is displayed in the message view when the application is compiled, because pdef1 is actually defined. The message pdef1 not defined is displayed if pdef1 is not defined.
This operator causes the expression to be given the value TRUE if the variable \(<variable\_name>\) is declared within the current scope; otherwise FALSE is returned.

**Example**

Requirement: The two applications App1 and App2 exist. The variable \(g\_bTest\) is declared in App1, but not in App2.

```plaintext
{IF defined (variable: g_bTest)}
(* the following code is only processed in App2*)
  g_bTest := x > 300;
{END_IF}
```

The operator causes the expression to be given the value TRUE if a data type is declared with the identifier \(<identifier>\); otherwise FALSE is returned.

**Example**

Requirement: The two applications App1 and App2 exist. The data type \(DUT\) is declared in App1, but not in App2.

```plaintext
{IF defined (type: DUT)}
(* the following code is only processed in App1*)
  bDutDefined := TRUE;
{END_IF}
```

The operator causes the expression to be given the value TRUE if a function block or an action with name \(<pou\_name>\) exists; otherwise FALSE is returned.

**Example**

Requirement: The two applications App1 and App2 exist. The function block \(CheckBounds\) exists in App1, but not in App2.

```plaintext
{IF defined (pou: CheckBounds)}
(* the following code is only processed in App1 *)
  arrTest[CheckBounds(0,i,10)] := arrTest[CheckBounds(0,i,10)] + 1;
{ELSE}
(* the following code is only processed in App2 *)
  arrTest[i] := arrTest[i]+1;
{END_IF}
```

Not yet implemented!

The operator causes the expression to be given the value TRUE if a task is defined with the name \(<task\_name>\); otherwise FALSE is returned.

**Example**

```plaintext
{IF | ELSIF defined (task: <task name> )
```
Example

Requirement: The two applications App1 and App2 exist. The task PLC_PRG_Task is defined in App1, but not in App2.

```plaintext
{END_IF}
{IF defined (task: PLC_PRG_Task)}
(* the following code is only processed in App1 *)
  erg := plc_prg.x;
{ELSE}
(* the following code is only processed in App2 *)
  erg := prog.x;
{END_IF}
```

Not yet implemented!

The operator causes the expression to be given the value TRUE if a resource object with the name <identifier> exists for the application; otherwise FALSE is returned.

Example

Requirement: The two applications App1 and App2 exist. A resource object glob_var1 of the global variable list exists for App1, but not for App2.

```plaintext
{IF defined (resource:glob_var1)}
(* the following code is only processed in App1 *)
  gvar_x := gvar_x + ivar;
{ELSE}
(* the following code is only processed in App2 *)
  x := x + ivar;
{END_IF}
```

Operator defined (resource: <identifier>)

The operator causes the expression to be given the value TRUE if a resource object with the name <identifier> exists for the application; otherwise FALSE is returned.

Operator defined (IsSimulation Mode)

The operator causes the expression to be given the value TRUE if the application runs on a simulated device, i.e. in simulation mode.

See also

- Chapter 6.4.1.12.2 “Testing in simulation mode” on page 1980

Operator defined (IsLittleEndian)

The operator causes the expression to be given the value FALSE, if the CPU memory is organized in Big Endian (Motorola byte order).

Operator defined (IsFPUSupported)

If the expression returns the value TRUE, then the code generator produces an FPU code (for the floating-point unit processor) when calculating with REAL values. Otherwise CODESYS emulates FPU operations, which is much slower.

Operator hasattribute (pou: <pou name>, '<attribute>' )

This operator causes the expression to be given the value TRUE if the attribute <attribute> is specified in the first line of the declaration part of the function block <pou name>; otherwise FALSE is returned.
Example

Requirement: The two applications App1 and App2 exist. The function fun1 is declared in App1 and App2. However, in App1 it is also provided with the pragma \{attribute 'vision'\}.

In App1:

\[
\begin{align*}
\{\text{attribute 'vision'}\} \\
\text{FUNCTION fun1 : INT} \\
\text{VAR_INPUT} \\
\quad i : \text{INT;} \\
\text{END_VAR} \\
\text{VAR} \\
\text{END_VAR}
\end{align*}
\]

In App2:

\[
\begin{align*}
\text{FUNCTION fun1 : INT} \\
\text{VAR_INPUT} \\
\quad i : \text{INT;} \\
\text{END_VAR} \\
\text{VAR} \\
\text{END_VAR}
\end{align*}
\]

Pragma instruction:

\[
\{\text{IF hasattribute (pou: fun1, 'vision')}\} \\
\{\text{END_IF}\}
\]

Example

Declaration of \texttt{g\_globalInt} in App1

\[
\begin{align*}
\text{VAR_GLOBAL} \\
\quad \{\text{attribute 'DoCount'}\} \\
\quad \text{g\_globalInt : INT;} \\
\quad \text{g\_multiType : STRING;} \\
\text{END_VAR}
\end{align*}
\]

Pragma instruction:

\[
\{\text{IF hasattribute (variable: g\_globalInt, 'DoCount')}\} \\
\{\text{END_IF}\}
\]

See also

- § Chapter 6.4.1.20.6.3.2 “User-defined attributes” on page 2272

Operator \texttt{hasattribute} (\texttt{variable:\ <variable>, '<attribute>'})

This operator causes the expression to be given the value \texttt{TRUE} if the pragma \{attribute '<attribute>'\} is assigned to the variable in the line before the variable declaration; otherwise \texttt{FALSE} is returned.

Requirement: The two applications App1 and App2 exist. The variable \texttt{g\_globalInt} is used in App1 and App2, but in App1 the attribute 'DoCount' is assigned to it in addition.

Declaration of \texttt{g\_GlobalInt} in App1

\[
\begin{align*}
\text{VAR_GLOBAL} \\
\quad \{\text{attribute 'DoCount'}\} \\
\quad \text{g\_globalInt : INT;} \\
\quad \text{g\_multiType : STRING;} \\
\text{END_VAR}
\end{align*}
\]

Declaration of \texttt{g\_GlobalInt} in App2:

\[
\begin{align*}
\text{VAR_GLOBAL} \\
\quad \text{g\_globalInt : INT;} \\
\quad \text{g\_multiType : STRING;} \\
\text{END_VAR}
\end{align*}
\]

Pragma instruction:

\[
\{\text{IF hasattribute (variable: g\_globalInt, 'DoCount')}\} \\
\{\text{END_IF}\}
\]
The operator checks whether or not the constant, which is identified with <constant name>, has been replaced. The second parameter (Boolean value) controls what is checked:

- TRUE: Checks if the constant has been replaced
- FALSE: Checks if the constant has not been replaced

When the respective case occurs, the operator returns TRUE.

**Syntax**

```plaintext
{ IF hasconstanttype( <constant name> , <boolean literal> ) }
{ ELIF hasconstanttype( <constant name> , <boolean literal> ) }
```

**Example**

```plaintext
{IF hasconstanttype(PLC_PRG.aConst, TRUE)}
```

The automatic replacement of constants in principle depends on the following:

- Compile option
- Replace constants
- Constant type (For example, STRING types are never replaced.)
- Usage of the attribute `{attribute 'const_non_replaced'}`
- Usage of the attribute `{attribute 'const_replaced'}`

**Example**

```plaintext
VAR
  iCntMAXIsReplaced: INT;
  xErrorOccured : BOOL;
END_VAR
VAR CONSTANT
  c_iMAX: INT := 99;
END_VAR

{IF hasconstanttype(c_iMAX, TRUE)}
iCntMAXIsReplaced := iCntMAXIsReplaced + 1;
{ELSE}
xErrorOccured := FALSE;
{END_IF}
```

The operator compares the value of the constant, which is identified with <constant name>, with the value of the second parameter. The second parameter can be specified either as a literal <literal> or as a variable <variable name>.

**Comparison operators <comparison operator>:**

- Greater than (>)
- Greater than or equal to (>=)
- Equal to (=)
- Not equal to (<>)
- Less than or equal to (<=)
- Less than (<)
Syntax

(IF hasconstantvalue(<constant name>, <variable name>, <comparison operator>)
(IF hasconstantvalue(<constant name>, <literal>, <comparison operator>)
(ELSIF hasconstantvalue(<constant name>, <variable name>, <comparison operator>)
(ELSIF hasconstantvalue(<constant name>, <literal>, <comparison operator>)

Example

(IF hasconstantvalue(PLC_PRG.aConst, 99, >))
(ELSIF hasconstantvalue(PLC_PRG.aConst, GVL.intconst99, =))

Example

PROGRAM PRG_ConditionConstantValue
VAR
  iCntMAX: INT;
  iCntGlobalMAX: INT;
  iCntABC: INT;
  iCntGlobalABC: INT;
  xErrorOccured: BOOL;
END_VAR
VAR CONSTANT
  c_iMAX: INT := 999;
  c_sABC: STRING := 'ABC';
  c_iNonReplaceable: INT := 888;
END_VAR
(IF hasconstantvalue(c_iMAX, 999, =))
  iCntMAX := iCntMAX + 1;
(ELSE)
  xErrorOccured := FALSE;
(END_IF)
(IF hasconstantvalue(c_iMAX, GVL.gc_iMAX, =))
  iCntGlobalMAX := iCntGlobalMAX + 1;
(ELSE)
  xErrorOccured := FALSE;
(END_IF)
(IF hasconstantvalue(c_sABC, 'ABC', =))
  iCntABC := iCntMAX + 1;
(ELSE)
  xErrorOccured := FALSE;
(END_IF)
(IF hasconstantvalue(c_sABC, GVL.gc_sABC, =))
  iCntGlobalABC := iCntMAX + 1;
(ELSE)
  xErrorOccured := FALSE;
(END_IF)
This operator causes the expression to be given the value TRUE if the variable `<variable>` is of the data type `<type-spec>`; otherwise FALSE is returned.

Possible data types for `<type-spec>`:
- BOOL
- BYTE
- DATE
- DATE_AND_TIME (DT)
- DINT
- DWORD
- INT
- LDATE
- LDATE_AND_TIME (LDT)
- LINT
- LREAL
- LTIME
- LTIME_OF_DAY (LTOD)
- LWORD
- REAL
- SINT
- STRING
- TIME
- TIME_OF_DAY (TOD)
- ULINT
- UDINT
- UINT
- USINT
- WORD
- WSTRING

**Example**

Requirement: The two applications App1 and App2 exist. The variable `g_multitype` is declared in App1 with data type LREAL, in App2 with data type STRING.

```plaintext
{IF (hastype (variable: g_multitype, LREAL))
 (* the following code is only processed in App1 *)
 g_multitype := (0.9 + g_multitype) * 1.1;
{ELSIF (hastype (variable: g_multitype, STRING))}
 (* the following code is only processed in App2 *)
 g_multitype := 'this is a multitalent';
{END_IF}
```

**Operator**

`hastype (variable: <variable>, <type-spec>)`

The checked pack mode depends on the device description, not on the pragma that can be specified for individual DUTs.

**Operator**

`hasvalue (PackMode, '<pack mode value>')`

**Operator**

`hasvalue (RegisterSize, '<register size>')`

`<register size>`: Size of a CPU register (in bits) The operator causes the expression to return the value TRUE when the size of a CPU register is equal to `<register size>`.

Possible values for `<register size>`
- 16 for C16x
- 64 for X86-64 bit
- 32 for X86-32 bit
Operator \texttt{hasvalue} (\texttt{<define-ident>, '<char-string>'})

This operator causes the expression to be given the value \texttt{TRUE} if a variable is defined with the identifier \texttt{<define-ident>} and has the value \texttt{<char-string>}; otherwise \texttt{FALSE} is returned.

\textbf{Example}

Requirement: The two applications \texttt{App1} and \texttt{App2} exist. The variable \texttt{test} is used in the applications \texttt{App1} and \texttt{App2}; in \texttt{App1} it is given the value \texttt{1}, in \texttt{App2} the value \texttt{2}.

\begin{verbatim}
{IF hasvalue(test,'1')}
(* the following code is only processed in App1 *)
x := x + 1;
{ELSIF hasvalue(test,'2')}
(* the following code is only processed in App2 *)
x := x + 2;
{END_IF}
\end{verbatim}

Operator \texttt{NOT} \texttt{<operator>}

The expression is given the value \texttt{TRUE} if the reverse value of \texttt{<operator>} returns the value \texttt{TRUE}. \texttt{<operator>} can be one of the operators described in this chapter.

\textbf{Example}

Requirement: The two applications \texttt{App1} and \texttt{App2} exist. \texttt{PLC_PRG1} exists in \texttt{App1} and \texttt{App2}, and the POU \texttt{CheckBounds} exists only in \texttt{App1}.

\begin{verbatim}
{IF defined (pou: PLC_PRG1) AND NOT (defined (pou: CheckBounds))}
(* the following code is only processed in App2 *)
bANDNotTest := TRUE;
{END_IF}
\end{verbatim}

Operator \texttt{<operator>} \texttt{AND} \texttt{<operator>}

The expression is given the value \texttt{TRUE} if the two specified operators return \texttt{TRUE}. \texttt{<operator>} can be one of the operators described in this chapter.

\textbf{Example}

Requirement: The applications \texttt{App1} and \texttt{App2} exist. \texttt{PLC_PRG1} exists in \texttt{App1} and \texttt{App2}, the POU \texttt{CheckBounds} only in \texttt{App1}.

\begin{verbatim}
{IF defined (pou: PLC_PRG1) AND (defined (pou: CheckBounds))}
(* the following code is only processed in App1 *)
bANDTest := TRUE;
{END_IF}
\end{verbatim}

Operator \texttt{<operator>} \texttt{OR} \texttt{<operator>}

The expression returns \texttt{TRUE} if one of the two specified operators returns \texttt{TRUE}. \texttt{<operator>} can be one of the operators described in this chapter.

\textbf{Example}

Requirement: The two applications \texttt{App1} and \texttt{App2} exist. The POU \texttt{PLC_PRG1} exists in \texttt{App1} and \texttt{App2}, and the POU \texttt{CheckBounds} exists only in \texttt{App1}.

\begin{verbatim}
{IF defined (pou: PLC_PRG1) OR (defined (pou: CheckBounds))}
(* the following code is only processed in App1 and in App2 *)
bORTTest := TRUE;
{END_IF}
\end{verbatim}
Operator

\(<\text{operator}>\)

() parenthesizes the operators.

Region Pragma

This pragma is used for grouping several lines into one block in a text editor. The block can be named. Region pragmas can also be nested.

Code with region pragma: Expanded and collapsed views

![Region Pragma Example](image)

The pragma can be used in the ST editor and all declaration editors. Syntax highlighting can be customized in the options.

6.4.1.20.7 Identifiers

Rules for identifier designation

- An identifier must not contain spaces or special characters.
- Capitalization is ignored. For example, VAR1 and var1 refer to the same variable.
- The underscore is recognized. For example, A_BCD and AB_CD are treated as two different identifiers. Multiple consecutive underscores are not permitted.
- The length of an identifier is unrestricted.

Rules for multiple use of identifiers (namespaces)

- An identifier must not be declared two times locally.
- An identifier can be used more than one time globally. If a local variable has the same name as a global variable, then the local variable has priority within the POU.
- An identifier must not be identical to a keyword, such as the scope VAR_Global.
- A variable that is declared in a global variable list can have the same name as a variable defined in another GVL. CODESYS provides features that extend the standard for the namespace or scope of variables:
  - Global namespace operator:
    An instance path that begins with a dot always opens a global namespace. If there is a local variable (for example, `ivar`) that has the same name as a global variable, then you refer to the global variable as `.ivar`.
  - The name of a global variable list can define the namespace uniquely for the include variables. Therefore, you can declare variables with the same name in different global variables list and still uniquely reference by prepending the list name.
    
    For example, `globlist1.ivar := globlist2.ivar; (* ivar from GVL globlist2 is copied to ivar in GVL globlist1 *)`.
  - Variables that are defined in the global variable list of a library included in the project can be addressed uniquely according to the following syntax:
    `<name scope library>..< GVL name>..<variable name>`
    
    For example, `globlist1.ivar := lib1.globlist1.ivar (* ivar from GVL globlist1 in library lib1 is copied to ivar in GVL globlist1 *)`.

- When inserting a library, you also use the Library Manager to define a namespace. In this way, you can make unique references to a library block or library variable by `<namespace library>..<block name|variable name>`. Note that when libraries are nested, you have to reference the namespaces of all libraries in succession.
  
  Example: If `Lib1` is referenced by `Lib0`, then the POU `func` in `Lib1` is addressed by `Lib0.Lib1.fun:ivar := Lib0.Lib1.func(4, 5); (* return value from func is copied to variable ivar in the project *)`

We recommend that you apply the following rules in addition to the items that you have to consider specifically for variables declaration. By doing this, you get the best possible harmonization when assigning names.

**Recommendations for variable names**
Whenever possible, you should name variables in Hungarian notation in applications and libraries. Find a meaningful, short, English name for each variable as a base name, which can consist of several words. Write the first letter of each word in uppercase, the remaining letters in lowercase. In front of the base name, append a prefix in lowercase to indicate the data type of the variable.

**Example:** `iFileSize : INT;`

<table>

**Example**

```plaintext
VAR
    bySubIndex: BYTE;
    xFlag: BOOL;
    udiCounter: UDINT;
END_VAR
```
### Nested declaration
Prefixes are attached successively in the order of declaration.

**Example**
```
pabyTelegramData: POINTER TO ARRAY [0..7] OF BYTE;
```

### Function block instance
Prefix: Abbreviation for the name of the function block or data type

**Example**
```
cansdoReceivedTelegram: CAN_SDOTelegram;
TYPE CAN_SDOTelegram : (* prefix: sdo *)
  STRUCT
    wIndex: WORD;
    bySubIndex:BYTE;
    byLen:BYTE;
    aby: ARRAY [0..3] OF BYTE;
  END_STRUCT
END_TYPE
```

### Local constant
Prefix: `c_`, followed by the type prefix and the variable name

**Example**
```
VAR CONSTANT
c_uiSyncID: UINT := 16#80;
END_VAR
```

### Global variable
An additional prefix is appended to the library prefix.

**Example**
```
VAR_GLOBAL
can_g_iTest: INT;
END_VAR
```

### Global constants
An additional prefix is appended to the library prefix.

**Example**
```
VAR_GLOBAL CONSTANT
can_gc_dwExample: DWORD;
END_VAR
```

### Recommendations for variable names

### Recommendations for identifiers for POUs, functions, function blocks, programs

<table>
<thead>
<tr>
<th>Identifier for</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>POUs: Functions, function blocks, programs</td>
<td>Library prefix followed by an underscore and a short, informative POU name. Like for variables, the first letter of each word is uppercase and all other letters are lowercase. We recommend that you compose the POU name from a verb and a noun. For function blocks, the associated prefix for created instances should follow the name as a comment.</td>
<td>FUNCTION_BLOCK CAN_SendTelegram (* prefix: canst *)</td>
</tr>
<tr>
<td>Actions</td>
<td>Only actions that the block itself calls, beginning with prv_. Otherwise, actions do not have a prefix.</td>
<td></td>
</tr>
</tbody>
</table>

---

### Recommendations for identifiers for POUs in CODESYS V3 libraries
6.4.1.20.8 Shadowing Rules

In CODESYS, you are generally allowed to use the same identifier for different elements. For example, a POU and a variable can be named the same. However, you should avoid this practice in order to prevent confusion.

Negative example: In the following code snippet, a local function block instance has the same name as a function:

Example

```plaintext
FUNCTION YYY : INT
;
END_FUNCTION

FUNCTION_BLOCK XXX
;
END_FUNCTION_BLOCK

PROGRAM PLC_PRG
VAR
    YYY : XXX;
END_VAR
    YYY();
END_PROGRAM
```

In such a case as this, it is unclear whether the instance or the function is called in the program.

To make sure that names are always unique, you should follow naming conventions, such as certain prefixes for variables. Rules for assigning identifiers can be found in the "Identifiers" chapter of the help.

Naming conventions can be checked automatically using the static code analysis of CODESYS. Static code analysis could also detect the duplicate use of the name YYY and report it as an error.
The consistent use of the attribute `qualified_only` for enumerations and global variable lists and the use of qualified libraries can also prevent ambiguous situations.

To make sure that a POU of the same name in the "Devices" view is not called when a POU in the "POUs" view is called, the operator `__POOL` should be prepended (for example, `svar_pou := __POOL.POU();`) when the name of the POU is called.

**Shadowing:** The compiler does not report any errors or warnings if the same identifier is used for different elements. Instead, the compiler searches the code in a specific order for the declaration of the identifier. If a declaration is found, then the compiler does not search for any other declarations elsewhere. If other declarations do exist, then they are "shadowed" for the compiler. The following section describes the shadowing rules (that is, the search order that the compiler uses when searching for the declaration for identifiers). The section "Ambiguous access and qualified access" provides ways to prevent ambiguous access and bypass shadowing rules.

### Search order in the application

When the compiler encounters a single identifier in the code of an application, it searches for the corresponding declaration in the following order:

1. Local variables of a method
2. Local variables in the function block, program, or function, and in any base function blocks
3. Local methods of the POU
4. Global variables in the application, if the `qualified_only` attribute is not set in the variable list where the global variables are declared
5. Global variables in a parent application, if the `qualified_only` attribute is not set in the variable list where the global variables are declared
6. Global variables in referred libraries when neither the library nor the variable list requires qualified access
7. POU or type names from the application (that is, names of global variable lists, function blocks, and so on)
8. POU or type names from a parent application
9. POU or type names from a library
10. Namespaces of locally referred libraries and libraries that are published by libraries
11. Global variables in the "POUs" view, unless the `qualified_only` attribute is set in the variable list where they are declared
12. POU or type names from the "POUs" view (that is, names of global variable lists, function blocks, and so on)

### Search order in the library

When the compiler encounters a single identifier in the code of a library, it searches for the corresponding declaration in the following order:

1. Local variables of a method
2. Local variables in the function block, program, or function, and in any base function blocks
3. Local methods of the POU
4. Global variables in the local library, if the `qualified_only` attribute is not set in the variable list where the global variables are declared
5. Global variables in referred libraries when neither the library nor the variable list requires qualified access

---

*Libraries that are inserted in the Library Manager of the “POUs” view are mirrored in the Library Manager in all applications in the project with the appropriate placeholder resolution. These libraries then form a common namespace with the libraries in the application. Therefore, there is no shadowing of libraries in the pool by libraries in the application.*
6. POU or type names from the local library (that is, names of global variable lists, function blocks, and so on)

7. POU or type names from a referred library

8. Namespaces of locally referred libraries and libraries that are published by locally refereed libraries

**Ambiguous access and qualified access**

Despite these search orders, ambiguous access can still occur. For example, this is the case when a variable with the same name exists in two global variable lists that do not require qualified access. Such a case is reported by the compiler as an error (for example: **ambiguous use of the name XXX**).

This kind of ambiguous usage can be made unique by means of qualified access, for example by accessing via the name of the global variable list (example: **GVL.XXX**).

Qualified access can also always be used to avoid shadowing rules.

- The name of the global variable list can be used to uniquely access a variable in the list.
- The name of a library can be used to uniquely access elements in the library.
- The **THIS** pointer be used to uniquely access variables in a function block, even if a local variable with the same name exists in a method of the function block.

To find the declaration location of an identifier at any time, use the command "**Edit ➔ Browse ➔ Go to Definition**". This can be especially helpful if the compiler produces an apparently obscure error message.

**Searching in instance paths**

The search orders described above do not apply to identifiers that exist as components in an instance path or to identifiers that are used as inputs in calls.

For access of the following type **yy.component**, it depends on the entity described by **yy** where the declaration of **component** is searched for.

If **yy** denotes a variable with a structured data type (that is, type **STRUCT** or **UNION**), then **component** is searched for in the following order:

- Local variables of the function block
- Local variables of the base function block
- Methods of the function block
- Methods of the base function block

If **yy** denotes a global variable list or a program, then **component** is searched for in this list only.

If **yy** denotes a namespace of a library, then **component** is searched for in this library exactly as described in the section above "Search order in the library".

Only in the second instance does the compiler decide whether access to the found element is granted (that is, whether the variable is only locally accessible, or whether a method is private). If access is not allowed, an error is issued.

**6.4.1.20.9 Keywords**

In all editors, you must capitalize keywords that for example denote scopes, data types, or operators.

Keywords cannot be used as variable names.
### Examples

```plaintext
VAR
END_VAR
BOOL_TO_INT
IF
THEN
ELSE
LTIME
MUL
XOR
PERSISTENT
PROGRAM
```

CODESYS checks the correct use of keywords automatically and highlights errors immediately during input with a wavy underline.

When CODESYS creates implicit code, variables and functions are generally given a name that is prepended with two underscores (_). The use of double underscores in the implementation code is prevented automatically. This eliminates conflicts between internal system identifiers and identifiers assigned by the programmer.

The following keywords are used in the CODESYS export format. Therefore, you may not use them as identifiers:

- ACTION
- END_ACTION
- END_FUNCTION
- END_FUNCTION_BLOCK
- END_PROGRAM

Other valid keywords:

- VAR_ACCESS
- READ_ONLY
- READ_WRITE
- PARAMS

### 6.4.1.20.10 Methods 'FB_Init', 'FB_Reinit', and 'FB_Exit'

You can declare the methods explicitly in order to influence the initialization of function block variables, as well as the behavior when exiting function blocks.

The type of the return value for the implicit methods is `BOOL`. The value is not evaluated by the system, but the type should not be changed.

`FB_Init` is always available implicitly and it is used primarily for initialization. For a specific influence, you can also declare the methods explicitly and provide additional code there with the standard initialization code.

`FB_Reinit` must be implemented explicitly. If this method exists, then it is called after the instance of the affected function block is **copied**. That happens during an online change after changes to the function block declaration (signature change) in order to reinitialize the new instance module. To reinitialize the basic implementation of the function block, you must call `FB_Reinit` explicitly.
FB.Exit must be implemented explicitly. If there is an implementation, then the method is called before the controller removes the code of the function block instance (implicit call).

The following shows some use cases of these methods for different operating conditions.

**Operating condition "First download"**

When downloading an application to a PLC with factory settings, the memory of all variables must be offset to the required initial state. In this way, the data areas of function block instances are assigned the required values. By the explicit implementation of FB_Init for function blocks, you can react specifically to this situation in the application code. By evaluating the method parameters bInCopyCode(FALSE) and bInitRetains(TRUE), you can detect this operating condition clearly. (See "Operating condition "Online Change"" and "Operating condition "Re-download"".)

**Operating condition "Online Change"**

Within the scope of the online change, you can influence the initialization of function block instances by means of the methods FB.Exit, FB_Init, and FB_Reinit. During the online change, the changes to the application that were made in offline mode are applied in the running PLC. This is the reason that the old instances of the function blocks are replaced by new instances as much as possible without incident. If no changes were made to the declaration part of a function block in the application before login, but in the implementation only, then the data areas are not replaced. Only code blocks are replaced. Then the methods FB.Exit, FB_Init, and FB_Reinit are not called.

If you have made changes to the declaration of a function block that lead to the copying operation described above, then you receive a message during the online change about possible unintended effects. In the “Details” of the message view, you see a list of all instances to be copied.

In the code of the FB_Init method, the parameter bInCopyCode(TRUE) can be evaluated to detect whether or not an online change is being executed.

The following calls occur in succession during an online change:

1. **FB.Exit**
   ```
   old_inst.FB.Exit(bInCopyCode := TRUE);
   ```
   You can call FB.Exit when exiting the old instance in order to trigger specific cleanup tasks before the copy operation. In this way, you can prepare the data for the following copy operation and influence the state of the new instance. You can notify other parts of the application about the pending change in location in the memory. Pay special attention to the variables of type POINTER and REFERENCE. These may no longer refer to the required memory locations after the online change. Interface variables (INTERFACE) are handled separately by the compiler and they are adapted accordingly during the online change. External resources such as sockets, files, or other handles can be applied by the new instance, in some case unchanged. Often they do not have to be treated specially during an online change. (See "Operating condition "Re-download""

2. **FB_Init**
   ```
   new_inst.FB_Init(bInitRetains := FALSE, bInCopyCode := TRUE);
   ```
   FB_Init is called before the copy operation and can be used in order to execute specific operations for the online change. For example, you can initialize variables accordingly at the new location in the memory, or notify other parts of the application about the new location of specific variables in the memory.

3. **Copy operation:**
   ```
   copy(
   old_inst, new_inst);
   ```
   Existing values remain unchanged. For this purpose, they are copied from the old instance into the new instance.
4. FB_Reinit
   new_inst.FB_Reinit();

   This method is called after the copy operation and should set defined values for the
   variables of the instance. For example, you can initialize variables accordingly at the new
   location in the memory, or notify other parts of the application about the new location of
   specific variables in the memory. Design the implementation independent of the online
   change. The method can also be called from the application at any time in order to reset a
   function block instance to its original state.

   With the {attribute 'no_copy'} attribute, you can prevent that this is
   copied during the online change for a single variable of the function block. It
   always retains the initial value.

See also
- Chapter 6.4.1.21.3.4.19 “Command 'Settings of Memory Reserve for Online Change' ”
on page 2595

Operating condition "New download"
When downloading an application, an existing application may be replaced on the PLC. There-
fore, the provision of memory for the present function blocks must be regulated. You can use
the FB_Exit method for implementing the required steps for this. For example, you can offset
external resources (with socket and file handles) in a defined state.

   You can detect this operating condition by checking whether or not the parameter
   bInCopyCode = FALSE for the FB_Exit method.

Operating condition "Start of application"
The initial assignments are processed before the first cycle of the application tasks.

Example
   T1 : TON := (PT:=t#500ms);

   These kinds of assignments are executed only after calling FB_Init. In order to control the
   effects of these assignments, you can provide a function block or a method of a function
   block with the {attribute 'call_after_init'} attribute. You must add the attribute
   above the declaration part of the function block body and above the declaration part of
   the corresponding method. A POU that extends another POU which uses the {attribute
   'call_after_init'} attribute must also have the attribute. For the benefit of clarity, we
   recommend that the corresponding methods are overwritten with the same name, the same
   signature, and the same attribute. This requires calling SUPER^.MyInit. The name of the
   method can be chosen without restriction. (Exceptions: FB_Init, FB_Reinit, and FB_Exit).
   The method is called after processing the initial assignments and before starting the application
   tasks. Therefore, the method can react to user input.

   When using FB_Init or {attribute 'call_after_init'}, remember that detecting
   errors in the FB_Init method or in methods decorated with the {attribute
   'call_after_init'} attribute is tedious, because the setting of breakpoints may not have
   the expected effect.

   NOTICE!
   If the explicitly defined initialization code is reached during execution, then the
   function block instance is already completely initialized via the implicit initialization
   code. Therefore, there must not be a SUPER^.FB_Init call.
NOTICE!

FB_Init replaces the INI operator used in CoDeSys V2.3. The methods cannot be compared to the design of a constructor, such as in C#, C++, or Java. This has consequences for function blocks that extend other function blocks. (See below: "Derived function blocks")

**Interface of method FB_Init**

METHOD FB_Init : BOOL
VAR_INPUT
  bInitRetains : BOOL; // TRUE: the retain variables are initialized (reset warm / reset cold)
  bInCopyCode : BOOL; // TRUE: the instance will be copied to the copy code afterward (online change)
END_VAR

You can declare additional function block inputs in an FB_init method. Then you have to set these inputs in the declaration of the function block instance.

**Example**

**Method FB_Init for the serialdevice function block**

METHOD PUBLIC FB_Init : BOOL
VAR_INPUT
  bInitRetains : BOOL; // initializing of retain variable
  bInCopyCode : BOOL; // instance is copied to copy code
  iCOMnum : INT; // additional input: number of the COM interface, that is to be observed
END_VAR

Instantiation of the serialdevice function block:

com1: serialdevice(iCOMnum:=1);
com0: serialdevice(iCOMnum:=0);

**Interface of method FB_Reinit**

METHOD FB_Reinit : BOOL

There is the mandatory parameter bInCopyCode.

**Interface of method FB_Exit**

METHOD FB_Exit : BOOL
VAR_INPUT
  bInCopyCode : BOOL; // TRUE: the exit method is called in order to leave the instance which will be copied afterwards (online change).
END_VAR
Behavior for derived function blocks

If a function block is derived from another function block, then the FB_Init method of the derived function block must define the same parameters as the FB_Init method of the basic function block. However, you can add further parameters in order to set up a special initialization for the instance.

Example

The function blocks MainFB, SubFB, and SubSubFB are derived from each other. Therefore, SubFB EXTENDS MainFB and SubSubFB EXTENDS SubFB apply.

Calling order of methods FB_Init and FB_Init:

1. fbSubSubFb.FB_Init(...);
2. fbSubFb.FB_Init(...);
3. fbMainFb.FB_Init(...);
4. fbMainFb.FB_Init(...);
5. fbSubFb.FB_Init(...);
6. fbSubSubFb.FB_Init(...);

Compiler error C0001

**Message:** Constant '<constant value>' too large for type '<data type>'

**Possible error cause:** A typed constant is too large for the given data type or a constant is too large for each possible data type.

**Error correction:** Use smaller constants or an appropriate data type for a typed constant.

**Example of the error:**

```plaintext
PROGRAM PLC_PRG
VAR
    test1: INT;
    test2: INT;
    test3: LREAL;
END_VAR

    test1 := 1234567891234556699192393292939911;
    test2 := INT#123456;
    test3 := 10E500;

--> C0001: Constant '1234567891234556699192393292939911' too large for type 'ANY_INT'
--> C0001: Constant 'INT#123456' too large for type 'INT'
--> C0001: Constant '10E500' too large for type 'ANY_REAL'
```
**Possible error cause:** Attempted access to a bit that is outside of the range for a data type.

**Error correction:** Use a bit value for the bit access that is lower than the number of bits in the data type of the variable.

---

**Example of the error:**

```plaintext
PROGRAM PLC_PRG
VAR
    test1: WORD;
    test2: BOOL;
END_VAR

    test1 := test2.17;
--> C0003: '17' is not a valid bit number for 'w'
```

---

**Compiler Error C0004**

**Message:** `<variable>` is not a component of `<structure>`

**Possible error cause:** Component access with `.` to a variable that is not a structured value or does not exist as a component of the structure.

**Error correction:** Access a defined component, or change the definition of the component in the data type. The input assistance "List components" provides all valid access to this position.

---

**Example of the error:**

```plaintext
TYPE DUT:
STRUCT
    x, y : INT;
END_STRUCT
END_TYPE

PROGRAM PLC_PRG
VAR
    test1: DUT;
    test2: INT;
END_VAR

    test2 := test1.z;
--> C0032: Type 'Unknown type: 'test1.z'' cannot be converted to type 'INT'
--> C0004: 'z' is to a component of 'DUT'
```

---

**Compiler error C0005**

**Message:** Constant overflow in address `<address>`

**Possible error cause:** At least one component in the address does not fit into a 32-bit integer value.

**Error correction:** Use a valid address expression.

---

**Example of the error:**

```plaintext
PROGRAM PLC_PRG
VAR
    X: BYTE;
END_VAR

    X := %QB5555555555;
--> C0005: Constant overflow in address '%??'
```
Compiler error C0006

**Message:** '<operator>' expected instead of '<token>'

**Possible error cause:** Syntax error

**Error correction:** Use the correct syntax.

**Example of the error:**

```plaintext
PROGRAM PLC_PRG
VAR
    x: INT;
    bTest : BOOL;
END_VAR

IF bTest
    x := 9;
END_IF

--> C0006: 'THEN' expected instead of 'x'
```

Compiler error C0007

**Message:** Expression expected instead of '<token>'

**Possible error cause:** Syntax error

**Error correction:** Use the correct syntax.

**Example of the error:**

```plaintext
PROGRAM PLC_PRG
VAR
    x: INT;
    bTest : BOOL;
END_VAR

IF THEN
    x := 9;
END_IF

--> C0007: Expression expected instead of 'THEN'
```

Compiler error C0008

**Message:** Unexpected end-of-file found: '<operator 1>', '<operator 2>', or '<operator 3>'

**Possible error cause:** Syntax error

**Error correction:** Use the correct syntax.

**Example of the error:**

```plaintext
PROGRAM PLC_PRG
VAR
    x: INT;
    bTest : BOOL;
END_VAR

IF bTest THEN
    x := 9;

--> C0008: Unexpected end-of-file found: 'ELSIF', 'ELSE' or 'END_IF' expected
```
Compiler error C0009
  Message: Unexpected token '<token>' found
  Possible error cause: Syntax error
  Error correction: Use the correct syntax.

Example of the error:
PROGRAM PLC_PRG
VAR
END_VAR
END_FOR;

--> C0009: Unexpected token 'END_FOR' found

Compiler error C0010
  Message: Unexpected end-of-file found: '<token>' expected
  Possible error cause: Syntax error
  Error correction: Use the correct syntax.

Example of the error:
PROGRAM PLC_PRG
VAR
  i: INT;
END_VAR
FOR i := 0 TO 2 DO
  END_FOR;

--> C0010: Unexpected end-of-file 'END_FOR' found

Compiler error C0011
  Message: No 'CASE' label found
  Possible error cause: Syntax error in a CASE statement. A statement in a CASE statement is not assigned to a CASE label.
  Error correction: Add a CASE label.

Example of the error:
PROGRAM PLC_PRG
VAR
  i: INT;
  x: INT;
END_VAR
CASE i OF
  x := 9;
END_CASE

--> C0011: No 'CASE' label found

Error correction:
CASE i OF
  0: x := 9;
END_CASE
Compiler error C0013

**Message:** At least one statement is expected.

**Possible error cause:** At least one statement is expected at some positions in the code. For example, in the THEN and ELSE part of an IF statement, or in the body of a FOR loop.

**Error correction:** Add at least one statement at the selected position. It is enough to write a blank statement ";".

**Example of the error:**

```
PROGRAM PLC_PRG
VAR
  bTest: BOOL;
END_VAR

IF bTest THEN
END_IF

--> C0013: At least one statement is expected
```

Compiler error C0016

**Message:** Counter initialization expected

**Possible error cause:** Syntax error in a FOR loop. The counter variable is not initialized correctly.

**Error correction:** Pay attention to the correct syntax of the FOR loop.

```
FOR i := 0 TO 10 DO
  ;
END_FOR
```

**Example of the error:**

```
PROGRAM PLC_PRG
VAR
  i: INT;
END_VAR

FOR i TO 10 DO
  ;
END_FOR

--> C0015: Counter initialization expected
```

Compiler error C0018

**Message:** <expression> is not a valid assignment target

**Possible error cause:** An expression with no write permission is on the left side of an assignment. Example: a constant.

**Error correction:** Assign only to variables that have write access.

**Example of the error:**

```
PROGRAM PLC_PRG
VAR
  i: INT;
END_VAR
VAR CONSTANT
```

Example of the error:

```
PROGRAM PLC_PRG
VAR
  i: INT;
END_VAR
VAR CONSTANT
```
j: INT := 0;
END_VAR
j := i;

--> C0018: 'j' is not a valid assignment target

Compiler error C0020
Message: '<statement>' is no valid statement
Possible error cause: Syntax error (for example, too few or too many characters)
Error correction: Make sure that the syntax is correct.

Example of the error:
PROGRAM PLC_PRG
VAR
  x : INT;
END_VAR
x = 2;

--> C0020: '(x = 2); ' is no valid statement
Error correction: Example:
  x := 2;

Compiler error C0022
Message: '<operator>' needs exactly '<number of operands>' operands
Possible error cause: Too many or too few operands are assigned to an operator.
Error correction: Assign the required number of operands to the operator.

Example of the error:
PROGRAM PLC_PRG
VAR
  i : INT;
  pt: POINTER TO INT;
END_VAR
pt := ADR(i,1);

--> C0022: 'ADR' needs exactly '1' operands
Error correction: Example:
  pt := ADR(i);

Compiler error C0023
Message: '<operator>' needs at least '<number of operands>' operands
Possible error cause: Too few operands are assigned to an operator.
Error correction: Assign the required number of operands to the operator.
Example of the error:

```plaintext
PROGRAM PLC_PRG
VAR
    i : INT;
END_VAR

i := MUX(30,40);
```

--> C0023: 'MUX' needs at least '3' operands

Error correction:

```plaintext
Example:
i := MUX(30,40,50);
```

Compiler error C0026

Message: Identifier expected instead of '<invalid identifier>'

Possible error cause: An invalid identifier is passed to a method.

Error correction: Use valid identifiers.

Example of the error:

```plaintext
METHOD 123
VAR_INPUT
END_VAR
```

--> C0243: The name used in the signature is not identical to the object name

--> C0026: Identifier expected instead of '123'

Error correction:

```plaintext
Example:
METHOD METH123
```

Compiler error C0027

Message: size of string expected after '('

Possible error cause: The length of the string is not specified.

Error correction: Specify a string length between the parentheses.

Example of the error:

```plaintext
PROGRAM PLC_PRG
VAR
    str : STRING();
END_VAR
```

--> C0027: size of string expected after '('

--> C0006: ';, :=, REF=, ( or ['] expected instead of ')'

Error correction:

```plaintext
Example:
str : STRING(100);
```

Compiler error C0030

Message: Direct Address expected after 'AT' instead of '<identifier>'

Possible error cause: Either an invalid address or no address is assigned after 'AT'.

Error correction: Specify a valid address.
Example of the error:
PROGRAM PLC_PRG
VAR
    i AT ABC : INT;
END_VAR

--> C0030: Direct Address expected after 'AT' instead of 'ABC'

Error correction:
Example:
    i AT %IW0 : INT;

Compiler error C0031

Message: Type definition expected instead of '<no data type>'
Possible error cause: An invalid type definition is assigned to the identifier.
Error correction: Specify a valid type definition.

Example of the error:
PROGRAM PLC_PRG
VAR
    i : 0;
END_VAR

--> C0031: Type definition expected instead of '0'

Error correction:
Example:
    i : INT;

Compiler error C0032

Message: Type '<type 1>' can not be converted to type '<type 2>'
Possible error cause: A variable is assigned to another variable with an incompatible type.
Error correction: Use a type conversion.

Example of the error:
PROGRAM PLC_PRG
VAR
    test1: INT;
    test2: STRING;
END_VAR

    test1 := test2;

--> C0032: Type 'STRING' cannot be converted to type 'INT'

Error correction:
Example:
    test1 := TO_INT(test2);

Compiler Error C0033

Message: Type '<pointer type>' possibly not convertible to type '<data type>'
Possible error cause: This error occurs only when checking pool objects. An attempt was made to convert a pointer to an integer. Because the size of pointers in a library is unknown, errors may occur when using the library.
Error correction: Use the type __UXINT or __XWORD for platform-independent calculations with pointers.
Example of the error:

```
PROGRAM PLC_PRG
VAR
  ptr : POINTER TO INT;
  dw : DWORD;
END_VAR
  dw := ptr;

--> C0033: Type 'POINTER TO INT' possibly not convertible to type 'DWORD'.
```

Compiler error C0035

**Message:** Program name, function or function block instance expected instead of '<invalid function>'

**Possible error cause:** A function is called that does not exist.

**Error correction:** Make sure that only program names, functions, and function Block Instances that exist are called.

Example of the error:

```
PROGRAM PLC_PRG
VAR
  end_var
  PLC_PRG.METH1();
METHOD METH
VAR_INPUT
END_VAR

--> C0004: 'METH1' is no component of 'PLC_PRG'
--> C0035: Program name, function or function block instance expected instead of 'PLC_PRG.METH1'
```

**Error correction:** Example:

```
PLC_PRG.METH();
```

Compiler Error C0036

**Message:** Cannot call object of type <type>

**Possible error cause:** An attempt has been made to call an object that does not support any calls.

**Error correction:** Only functions, function blocks, programs, methods, and actions can be called.

Example of the error:

```
VAR_GLOBAL GVL
  value : INT;
END_VAR
PRGGRAM PLC_PRG
GVL();

--> C0036: Cannot call object of type 'VAR_GLOBAL'.
```

Compiler error C0037

**Message:** '<invalid input>' is no input of '<function name>'
Possible error cause: A local variable is defined in a function call.

Error correction: Declare the variable as an input parameter.

Example of the error:

```plaintext
PROGRAM PLC_PRG
VAR
  i : INT;
END_VAR
i := TEST(iVar := 1);

FUNCTION TEST : INT
VAR
  iVar : INT;
END_VAR

--> C0037: 'iVar' is no input of 'TEST'
```

Error correction:

```plaintext
Example:
VAR_INPUT
  iVar : INT;
END_VAR
```

Compiler error C0038

Message: '<invalid output>' is no output of '<function name>'

Possible error cause: A local variable is handled as an output in a function call.

Error correction: Declare the variable as an output parameter.

Example of the error:

```plaintext
PROGRAM PLC_PRG
VAR
  i : INT;
  x : INT;
END_VAR
i := TEST(iVar => x);

FUNCTION TEST : INT
VAR
  iVar : INT;
END_VAR

--> C0038: 'iVar' is no output of 'TEST'
```

Error correction:

```plaintext
Example:
VAR_OUTPUT
  iVar : INT;
END_VAR
```

Compiler error C0039

Message: VAR_IN_OUT '<invalid variable>' must be assigned in call of '<function block name>'

Possible error cause: An IN_OUT variable is not passed to a function block that requires an IN_OUT variable.

Error correction: Assign the IN_OUT variable.
Example of the error:

```plaintext
PROGRAM PLC_PRG
VAR
  inst : FB;
END_VAR
inst();

FUNCTION_BLOCK FB
VAR_IN_OUT
  inout : INT;
END_VAR

--> C0039: VAR_IN_OUT 'inout' must be assigned in call of 'FB'

Error correction:
Example:
inst(inout := i);
```

Compiler error C0040

- **Message:** Function '<function name>' requires exactly '<number of inputs>' input
- **Possible error cause:** Too many or too few parameters are passed to the called function.
- **Error correction:** Pass exactly as many parameters to the function as are expected.

Example of the error:

```plaintext
PROGRAM PLC_PRG
VAR
  i : INT;
END_VAR
i := TEST(1,2);

FUNCTION TEST : INT
VAR_INPUT
  IN: INT;
END_VAR

--> C0040: Function 'TEST' requires exactly '1' inputs

Error correction:
Example:
i := Test(1);
```

Compiler error C0041

- **Message:** VAR_IN_OUT parameter '<parameter name>' of '<function name>' needs variable with write access as input
- **Possible error cause:** The passed parameter is not a variable with write access (but a constant for example).
- **Error correction:** Pass a VAR_IN_OUT parameter with write access to the function.

Example of the error:

```plaintext
PROGRAM PLC_PRG
VAR
  i : INT;
  x : INT;
END_VAR
i := Test(31415);

FUNCTION TEST : INT
  Example of the error:
  PROGRAM PLC_PRG
  VAR
    i : INT;
    x : INT;
  END_VAR
  i := Test(31415);

  FUNCTION TEST : INT
    Example of the error:
    PROGRAM PLC_PRG
    VAR
      i : INT;
      x : INT;
    END_VAR
    i := Test(31415);

    FUNCTION TEST : INT
```
VAR_IN_OUT
    in_out: INT;
END_VAR

--> C0041: VAR_IN_OUT' parameter 'in_out' of 'TEST' needs variable with write access as input

Error correction: Example:
i := Test(x);

Compiler Error C0042 (Compiler Version <= 3.4.10)

Message: Either all or none formal parameter have to be denoted in function call
Possible error cause: The parameters are explicitly assigned to the function in the wrong order.
Error correction: Use uniform formal parameters or implicit parameters.

Example of the error:
PROGRAM PLC_PRG
VAR
    i : INT;
END_VAR
    i := Test(iPar1:=2, 5);

FUNCTION Test : INT
VAR_INPUT
    iPar1 : INT;
    iPar2 : INT;
END_VAR

--> Either all or none formal parameter have to be denoted in function call

Compiler error C0043

Message: Wrong formal parameter: '<parameter name>' expected in this place
Possible error cause: The parameters are assigned to the function explicitly in the wrong order.
Error correction: Specify the parameters in the correct order.

Example of the error:
PROGRAM PLC_PRG
VAR
    i : INT;
END_VAR
    i := Test(iPar2 := 2, 5);

FUNCTION Test : INT
VAR_INPUT
    iPar1 : INT;
    iPar2 : INT;
END_VAR

--> C0043: Wrong formal parameter: 'iPar1' expected in this place
--> C0412: Multiple input assignments for parameter ''
Error correction:  
Example:  
i := Test(5, iPar2 := 2);

Compiler error C0044  

Message: Assignment to input missing for parameter '<input variable name>' in call of '<function block name>'

Possible error cause: A parameter is passed although an input variable is not declared.

Error correction: Declare an input variable.

Example of the error:  
PROGRAM PLC_PRG  
VAR  
    inst : FB;  
END_VAR  
    inst(1);  

FUNCTION_BLOCK FB  
VAR_INPUT  
END_VAR  

--> C0044: Assignment to input missing for parameter '1' in call of 'FB'

Error correction:  
Example:  
VAR_INPUT  
    in: INT;  
END_VAR

Compiler error C0045  

Message: Use of 'THIS' is not allowed in this context

Possible error cause: In order to be assigned to the current instance, THIS can be used only in a method, action, transition, or in the body of a function block. This error message appears for all other positions.

Error correction: Use THIS in an allowed context only.

Example of the error:  
PROGRAM PLC_PRG  
VAR  
    test1: INT;  
END_VAR  
    THIS^.test1 := 19;  

--> C0018: 'THIS^.test1' is not a valid assignment target  
--> C0062: 'THIS^' is not a structure variable  
--> C0045: Use of 'THIS' is not allowed in this context

Compiler error C0046  

Message: Identifier '<identifier name>' not defined

Possible error cause: An identifier is used that is not declared.
**Error correction:** Declare the variables that you want to use.

**Example of the error:**

```plaintext
PROGRAM PLC_PRG
VAR
  i := i;
END_VAR

--> C0018: 'i' is no valid assignment target
--> C0046: Identifier 'i' not defined
```

**Error correction:**

```plaintext
Example:
VAR
  i : INT;
END_VAR
```

**Compiler error C0047**

**Message:** Cannot apply indexing with '[]' to an expression of type '<data type>'

**Possible error cause:** A data type that is not an array is indexed with '[]'.

**Error correction:** Index data types with '[]' only if they are declared as arrays.

**Example of the error:**

```plaintext
PROGRAM PLC_PRG
VAR
  i : INT;
END_VAR
i[1];

--> C0047: Cannot apply indexing with '[]' to an expression of type 'INT'
```

**Example of the error:**

```plaintext
PROGRAM PLC_PRG
VAR
  arr1 : ARRAY[1..2,1..3] OF INT;
END_VAR
arr1[1] := 5;
```

**Compiler error C0048**

**Message:** Array requires exactly '<number>' indexes

**Possible error cause:** Too many or too few indexes are specified when using an array.

**Error correction:** Specify as many indexes as there are dimensions assigned to the array.

**Example of the error:**

```plaintext
PROGRAM PLC_PRG
VAR
  arr1 : ARRAY[1..2,1..3] OF INT;
END_VAR
arr1[1] := 5;
```

**Error correction:**

```plaintext
Example:
arr1[1,2] := 5;
```
Compiler error C0049

Message: The constant index 'index value' is not within the range from 'start index' to 'end index'.

Possible error cause: An index is specified that is outside the size of the array.

Error correction: Use only indexes that are within the size of the array.

Example of the error:

```plaintext
PROGRAM PLC_PRG
VAR
  arr1 : ARRAY[1..2] OF INT;
END_VAR
arr1[3] := 1;
```

--> C0049: The constant index '3' is not within the range from '1' to '2'

Error correction:

Example:

```plaintext
arr1[2] := 1;
```

Compiler error C0050

Message: Bitaccess requires literal or symbolic integer constant

Possible error cause: No literal or an integer constant is specified in a bit access.

Error correction: Use a literal or an integer constant.

Example of the error:

```plaintext
PROGRAM PLC_PRG
VAR
  i : INT;
  x : INT;
END_VAR
i.x := FALSE;
```

--> C0018: 'i.x' is no valid assignment target
--> C0050: Bitaccess requires literal or symbolic integer constant

Error correction:

Example:

```plaintext
i := Test(x);
```

Compiler Error C0051

Message: Single byte string expected for an attribute value instead of '<value>'.

Possible error cause: A character string does not appear at the displayed location as expected.

Error correction: Replace the current value with a string.

Example of the error:

```plaintext
PROGRAM PLC_PRG
{IF hasattribute(pou: MyPOU, MyAttribute)}
{END_IF}
```

--> C0051: Single byte string expected for an attribute value instead of 'MyAttribute'.

Example:

```plaintext
{IF hasattribute(pou: MyPOU, 'MyAttribute')} {END_IF}
```
Error correction:  
PROGRAM PLC_PRG
(IF hasattribute(pou: MyPOU, 'MyAttribute'))
(END_IF)

Compiler Error C0053  
**Message:** Compiler version <version> has been withdrawn. Please use a higher compiler version instead.  
**Possible error cause:** The current compiler version cannot be used.  
**Error correction:** Adapt the current compiler version in the project (Project Environment, Project Settings).

Compiler error C0061  
**Message:** Bitaccess on function call is not allowed  
**Possible error cause:** Bit access is performed on a function.  
**Error correction:** Use bit access only for supported data types.

Example of the error:  
PROGRAM PLC_PRG  
VAR  
END_VAR  
Test().2;  
FUNCTION Test : INT  
VAR_INPUT  
END_VAR  
--> C0061: Bitaccess on function call is not allowed

Compiler error C0062  
**Message:** `<variable name>` is no structured variable  
**Possible error cause:** A variable that is not a structure variable is treated like a structure variable.  
**Error correction:** Make sure that the variable is a structure variable.

Example of the error:  
PROGRAM PLC_PRG  
VAR  
  pt : PUNKT;  
  i : INT;  
END_VAR  
i.x := 1024;  
  TYPE Punkt :  
    STRUCT  
      x : REAL;  
      y : REAL;  
    END_STRUCT
--- C0018: 'i.x' is no valid assignment target
--- C0062: 'Variable' is no structured variable

Example:
pt.x := 1024;

Compiler error C0064
Message: Dereferencing requires a pointer
Possible error cause: A variable that is not a pointer variable is dereferenced.
Error correction: Dereference only variables that are pointer variables.

Example of the error:
PROGRAM PLC_PRG
VAR
  i : INT;
  pi : POINTER TO INT;
END_VAR
i^:=1;

--- C0018: 'i^' not a valid assignment target
--- C0064: Dereferencing requires a pointer

Error correction:
Example:
pi := ADR(i);
pi^ := 1;

Compiler Error C0065
Message: There is no global definition for '<name>'.
Possible error cause: The value searched for is not a global variable, global POU, or other value that can be accessed globally.
Error correction: Declare '<name>' as a global variable.

Example of the error:
PROGRAM PLC_PRG
.someValue := 5;

--- C0065: There is no global definition for 'someValue'

Error correction:
Example:
VAR_GLOBAL
  someValue : INT;
END_VAR

Compiler error C0066
Message: Cannot compare type '<data type>' with type '<data type>'
Possible error cause: Two data types are compared which cannot be compared with each other.
Error correction: Compare only data types that can be compared with each other.
Example of the error:

PROGRAM PLC_PRG
VAR
    i : INT;
    re : REAL;
    str: STRING;
    b : BOOL;
END_VAR

b := i > str;

--> C0066: Cannot compare type 'INT' with type 'STRING'

Error correction:

Example:

b := i > re;

Compiler error C0068

Message: Compare not possible on objects of type '<data type>'
Possible error cause: Objects are being compared in which a comparison is not possible.
Error correction: Compare only data types in which a comparison is possible (INT, REAL, etc.).

Example of the error:

PROGRAM PLC_PRG
VAR
    b : BOOL;
    arr1 : ARRAY [1..2] OF INT;
    arr2 : ARRAY [1..2] OF INT;
END_VAR

b := arr1 > arr2;

--> C0068: Compare not possible on objects of type 'ARRAY [1..2]'

Compiler error C0069

Message: Compare not possible on objects of type '<data type>' or '<data type>'
Possible error cause: Two different objects are being compared in which a comparison is not possible.
Error correction: Compare only data types in which a comparison is possible (INT, REAL, etc.).

Example of the error:

PROGRAM PLC_PRG
VAR
    b : BOOL;
    arr1 : ARRAY [1..2] OF INT;
    arr2 : ARRAY [1..3] OF INT;
END_VAR

b := arr1 > arr2;

--> C0069: Compare not possible on objects of type 'ARRAY [1..2]' or 'ARRAY [1..3]'
Compiler error C0070

**Message:** 'INI' operator needs function block instance or data unit type instance

**Possible error cause:** Neither a function block instance nor a DUT instance is applied to the INI operator.

**Error correction:** Pass only function block instances or DUT instances to the INI operator.

**Example of the error:**

```plaintext
PROGRAM PLC_PRG
VAR
  b : BOOL;
  inst : FB;
END_VAR

b := INI(b, TRUE);

FUNCTION_BLOCK FB
VAR
END_VAR

--> C0070: 'INI' operator needs function block instance or data unit type instance

Example:
  b := INI(inst, TRUE);
```

Compiler error C0072

**Message:** Operator '<operator name>' is not possible on type '<data type>'

**Possible error cause:** An operator is applied to an incompatible type.

**Error correction:** Apply operators only on compatible types.

**Example of the error:**

```plaintext
PROGRAM PLC_PRG
VAR
  i : INT;
  str : STRING;
END_VAR

str := ABS(str);

--> C0072: Operator 'Abs' is not possible on type 'STRING'

Example:
  i := ABS(i);
```

Compiler error C0074

**Message:** Unexpected array initialisation

**Possible error cause:** Syntax error in the array initialization

**Error correction:** Correct the syntax
Example of the error:

```plaintext
PROGRAM PLC_PRG
VAR
  arr1 : INT := [1,2,3,4,5,6];
END_VAR
```

--> C0074: Unexpected array initialisation
--> C0032: Cannot convert type 'Unknown type: [1,2,3,4,5,6]' to type 'INT'

Error correction:

Example:

```plaintext
arr1 : ARRAY [1..6] OF INT := [1,2,3,4,5,6];
```

Compiler error C0075

Message: Too many initializers for array
Possible error cause: Too many values are specified for the size of the array.
Error correction: The number of assigned values must correspond to the size of the array.

Example of the error:

```plaintext
PROGRAM PLC_PRG
VAR
  arr1 : ARRAY [1..5] OF INT := [1,2,3,4,5,6];
END_VAR
```

--> C0075: Unexpected array initialisation

Error correction:

Example:

```plaintext
arr1 : ARRAY [1..6] OF INT := [1,2,3,4,5,6];
```

Compiler error C0076

Message: Unexpected structure initialisation
Possible error cause: Syntax error in the structure initialization
Error correction: Make sure that the syntax is correct.

Example of the error:

```plaintext
PROGRAM PLC_PRG
VAR
  st1 : INT := (p1 := 1);
END_VAR
```

--> C0076: Unexpected structure initialisation
--> C0032: Cannot convert type 'STRUCT(p1:=1)' to type 'INT'
--> C0046: Identifier 'p1' not defined
--> C0018: 'p1' is no valid assignment target

Error correction:

Example:

```plaintext
st1 : STRUCT1 := (p1:=1,p2:=10);
```

Compiler error C0077

Message: Unknown type: '<data type>'
Possible error cause: Invalid data type in the declaration (maybe a syntax error)
Error correction: Specify valid data types only.
Example of the error:

```plaintext
PROGRAM PLC_PRG
VAR
  i : INTEGER;
END_VAR

--> C0077: Unknown type: 'INTEGER'
```

Error correction:

```plaintext
Example:
arr1 : ARRAY[1..2] OF STRUCT1 := (p1:=1,p2:=10);
```

Compiler Error C0078

Message: Unsupported type: '<data type>'

Possible error cause: The used type is not supported by the current device and therefore cannot be used.

Error correction: If possible, use a different type. For example, REAL instead of LREAL.

Example of the error:

```plaintext
PROGRAM PLC_PRG
VAR
  value : LREAL;
END_VAR

--> C0078: Unsupported type: 'LREAL'
```

Error correction:

```plaintext
Example:
PROGRAM PLC_PRG
VAR
  value : REAL;
END_VAR
```

Compiler error C0080

Message: Functionblock '<function block name>' must be instantiated to be accessed

Possible error cause: Missing function Block Instantiation

Error correction: Instantiate the function block.

Example of the error:

```plaintext
PROGRAM PLC_PRG
VAR
END_VAR

FB();

FUNCTION_BLOCK FB
VAR
END_VAR

--> C0080: Functionblock 'FB' must be instantiated to be accessed
```

Error correction:

```plaintext
Example:
VAR
  inst : FB;
END_VAR
inst();
```
Compiler error C0081

Message: Unexpected Pragma: '<pragma name>' found without matching 'if'

Possible error cause: The IF condition is missing when using the pragma.

Error correction: Complete the IF condition of the pragma.

Example of the error:

PROGRAM PLC_PRG
VAR
  i : INT;
END_VAR

i := 5;
{END_IF}

--> C0081: Unexpected Pragma: 'END_IF' found without matching 'if'

Error correction:
Example:
{IF <expression>}
i := 5;
{END_IF}

Compiler error C0082

Message: '<invalid pragma>' is no valid condition for pragma

Possible error cause: When using a pragma, an invalid expression is used in the IF condition.

Error correction: Use valid pragma conditions.

Example of the error:

PROGRAM PLC_PRG
VAR
  i : INT;
END_VAR

{IF abc}
i := 5;
{END_IF}

--> C0082: '!!!ERROR!!!' is no valid condition for pragma

Error correction:
Example:
{IF defined (abc)}

Compiler error C0084

Message: '<pragma operand>' is no valid operand for pragma

Possible error cause: Syntax error

Error correction: Use valid pragma operands.
Example of the error:

```plaintext
PROGRAM PLC_PRG
VAR
END_VAR

{IF defined(0)}
{END_IF}

--> C0084: 'defined(null)' is no valid operand for pragma
```

Error correction:

```plaintext
Example:
{IF defined (abc)}
```

Compiler Error C0085

**Message:** Define value expected instead of '<value>'.

**Possible error cause:** A string is expected instead of the current value at the displayed location of the pragma.

**Error correction:** Replace the current value with a string.

Example of the error:

```plaintext
PROGRAM PLC_PRG
{IF hasvalue(define, defineValue)}
{END_IF}

--> C0086: C:0085: Define value expected instead of 'defineValue'
```

Error correction:

```plaintext
Example:
PROGRAM PLC_PRG

{IF hasvalue(define, '120')} {END_IF}
```

Compiler error C0086

**Message:** No definition found for interface '<interface name>'

**Possible error cause:** An undefined interface is used.

**Error correction:** Define the interface.

Example of the error:

```plaintext
PROGRAM PLC_PRG
VAR
  inst : FB;
END_VAR

FUNCTION_BLOCK FB IMPLEMENTS XY
VAR
END_VAR

--> C0086: No definition found for interface 'XY'
```

Error correction:

```plaintext
Example:
INTERFACE XY
```
Compiler error C0087

**Message:** There is no implementation for method '<method name>' defined in interface '<interface name>'.

**Possible error cause:** One of the methods specified by the interface has not be provided by the implemented function block.

**Error correction:** Implement all methods that are specified by the interface.

Example of the error:

```plaintext
PROGRAM PLC_PRG
VAR
  inst : FB;
END_VAR

INTERFACE XY
METHOD METH1
VAR_INPUT
END_VAR

FUNCTION_BLOCK FB IMPLEMENTS XY
VAR
END_VAR
METHOD METH2
VAR_INPUT
END_VAR

--> C0087: There is no implementation for method 'METH1' defined in interface 'XY'
```

Compiler error C0089

**Message:** Interface of overridden method '{0}' of interface '{1}' does not match declaration

**Possible error cause:** The signature of the implemented method does not match the signature of the method in the interface.

**Error correction:** Make sure that the same return types and parameters are declared.

Example of the error:

```plaintext
PROGRAM PLC_PRG
VAR
  inst : FB;
END_VAR

INTERFACE XY
METHOD METH1
VAR_INPUT
  iPar : INT;
END_VAR

FUNCTION_BLOCK FB IMPLEMENTS XY
VAR
END_VAR
METHOD METH1
VAR_INPUT
```
Compiler error C0090

Message: No definition found for base class '<function name>'
Possible error cause: The function block specified as the base does not exist or is not a function block.
Error correction: Use a function block as the base.

Example of the error:

PROGRAM PLC_PRG
VAR
  inst : FB;
END_VAR

FUNCTION_BLOCK FB EXTENDS POU
VAR
END_VAR

FUNCTION POU
VAR
END_VAR

--> C0090: No definition found for base class 'POU'

Compiler error C0091

Message: Recursion in base function block list: <function name>
Possible error cause: A base function block is extended by itself.
Error correction: Recursion in base function block lists is not possible.

Example of the error:

PROGRAM PLC_PRG
VAR
  inst : FB;
END_VAR

FUNCTION_BLOCK FB EXTENDS FB
VAR
END_VAR

--> C0091: Recursion in base function block list: FB -> FB

Compiler error C0094

Message: Interface of overridden method '<method name>' of interface '<function block name>' doesn't match declaration
Possible error cause: The signature of the method of the first interface does not match the signature of the method in the second interface, which is extended by the first.
Error correction: Align the signatures.

Example of the error:

```plaintext
PROGRAM PLC_PRG
VAR
    xyz : XY2;
END_VAR

FUNCTION_BLOCK XY
METHOD METH1
VAR_INPUT
END_VAR

FUNCTION_BLOCK XY2 EXTENDS XY
METHOD METH1
VAR_INPUT
    _iPar : BOOL;
END_VAR

--> C00094: Interface of the overridden method METH1 of interface XY
doesn't match declaration
```

Compiler error C0096

Message: Only one base function block may be defined in EXTENDS-list.
Possible error cause: Two or more base function blocks are defined in the EXTENDS list.
Error correction: Define only one base function block in the EXTENDS list.

Example of the error:

```plaintext
PROGRAM PLC_PRG
VAR
    fb : FB;
END_VAR

FUNCTION_BLOCK FB EXTENDS FB2, FB3
VAR
END_VAR

FUNCTION_BLOCK FB2
VAR
END_VAR

FUNCTION_BLOCK FB3
VAR
END_VAR

--> C00096: Only one base function block may be defined in EXTENDS-list
```

Compiler error C0097

Message: Duplicate definition of variable '<variable name>' in function block '<function block name>' and in base '<base function block name>'
Possible error cause: A variable is declared with the same name in a function block and its base.
Error correction: Use different variable names.
Example of the error:

```plaintext
PROGRAM PLC_PRG
VAR
    fb : FB;
END_VAR

FUNCTION_BLOCK FB EXTENDS FB2
VAR
    i : INT;
END_VAR

FUNCTION_BLOCK FB2
VAR
    i : INT;
END_VAR

--> C00097: Duplicate definition of variable 'i' in function block 'FB' and in base 'FB2'
```

Compiler error C0098

**Message:** The keyword "FUNCTIONBLOCK" is no longer supported. Use "FUNCTION_BLOCK" instead.

**Possible cause of error:** Syntax error

**Error correction:** Use the keyword "FUNCTION_BLOCK".

Example of the error:

```plaintext
PROGRAM PLC_PRG
VAR
    inst : FB;
END_VAR

FUNCTIONBLOCK FB
VAR
END_VAR

--> C00098: The keyword "FUNCTIONBLOCK" is no longer supported. Use "FUNCTION_BLOCK" instead. Use "FUNCTION_BLOCK" instead.
```

Compiler Error C0099 (Compiler Version < 3.5.7.0)

**Message:** Local defined enumeration are no longer supported. Use datatype definition instead.

**Possible error cause:** A local enumeration declaration was used together with a compiler version that does not support this.

**Error correction:** Use a later compiler version, or define the enumeration in a DUT.

Example of the error:

```plaintext
PROGRAM PLC_PRG
VAR
    localEnumVar : (RED, GREEN, BLUE) := RED;
END_VAR

--> C0099: Local defined enumeration are no longer supported. Use datatype definition instead.
```
Compiler error C0101

Message: Data Recursion: '<recursion>'
Possible error cause: Recursive data initialization over two function blocks
Error correction: Avoid recursions for data initialization.

Example of the error:

PROGRAM PLC_PRG
VAR
  inst0 : FB1;
END_VAR

FUNCTION_BLOCK FB1
VAR
  inst1 : FB2;
END_VAR

FUNCTION_BLOCK FB2
VAR
  inst2 : FB1;
END_VAR

--> C0101: Data Recursion: FB1->FB2->FB1

Compiler error C0102

Message: Out of retain memory: Variable '<variable name>', <byte size> bytes.
Possible error cause: More retain memory is used than is available on the PLC. It is also possible that the retain memory is too fragmented due to incremental builds.
Error correction: Use the "Clean" for fragmenting the memory. This will force the reallocation of all data at the next build.

Compiler error C0104

Message: 'Out of global data memory: Variable '<variable name>', <byte size> bytes.
Possible error cause: More memory for data is used than is available on the PLC. It is also possible that the memory is too fragmented due to incremental builds.
Error correction: Use the "Clean" for fragmenting the memory. This will force the reallocation of all data at the next build.

Compiler error C0114

Message: Invalid destination <jump label> for 'JMP'
Possible error cause: Syntax error or typographical error in the JMP destination
Error correction: Correct the typographical or syntax error.

Example of the error:

PROGRAM PLC_PRG
VAR
END_VAR
JMP 0;

--> C0114: Invalid destination 0 for 'JMP'
Compiler Error C0115

**Message:** The second parameter of a conditional call (?? ALWAYS CALC????) has to be a valid call statement.

**Error correction:** Specify the call of a function, method, or function block in the second parameter of the conditional ????CALC??? call.

**Example of the error:**

```plaintext
PROGRAM PLC_PRG
VAR
  condition : BOOL;
END_VAR
CALC(condition, 1+2);

--> C0115: The second parameter of a conditional call has to be a valid call statement.
```

**Error correction:**

```plaintext
Example:
CALC(condition, MyFunction(1,2))
```

Compiler error C0116

**Message:** The label '<jump label>' is a duplicate

**Possible error cause:** A label is defined multiple times.

**Error correction:** Define each label one time only.

**Example of the error:**

```plaintext
PROGRAM PLC_PRG
VAR
END_VAR
JMP label;
label:
label:

--> C0116: The label 'LABEL' is a duplicate
```

Compiler error C0117

**Message:** No such label '<jump label>' within the scope of the 'JMP' statement

**Possible error cause:** A jump is made to a label that does not exist.

**Error correction:** Define the label that you specify as the destination.

**Example of the error:**

```plaintext
PROGRAM PLC_PRG
VAR
END_VAR
JMP A;

--> C0117: No such label 'A' within the scope of the 'JMP' statement
```

Compiler error C0118

**Message:** The label '<jump label>' has not been referenced.
Possible error cause: A jump label is defined that is not referenced.
Error correction: Remove the unused jump labels.

Example of the error:

```plaintext
PROGRAM PLC_PRG
VAR
END_VAR
LABEL:

--> C0118: The label 'LABEL' has not been referenced
```

Compiler error C0119

Message: An 'FB_init'-Method of a functionblock or struct needs two inputs 'bInitRetains' and 'bInCopyCode' of type BOOL

Possible error cause: One or both of the inputs 'bInitRetains' and 'bInCopyCode' of type BOOL is missing.

Error correction: Define the missing inputs.

Example of the error:

```plaintext
PROGRAM PLC_PRG
VAR
    inst : FB;
END_VAR

FUNCTION_BLOCK FB
METHOD FB_init
VAR_INPUT
    END_VAR

--> C0119: An 'FB_init'-Method of a functionblock or struct needs two inputs 'bInitRetains' and 'bInCopyCode' of type BOOL

Error correction:

    METHOD FB_init
    VAR_INPUT
        bInitRetains : BOOL;
        bInCopyCode : BOOL;
    END_VAR
```

Compiler error C0120

Message: An 'FB_Exit'-Method of a functionblock or struct needs an input 'bInCopyCode' of type BOOL.

Possible error cause: The input 'bInCopyCode' of type BOOL is missing.

Error correction: Define the input.

Example of the error:

```plaintext
PROGRAM PLC_PRG
VAR
    inst : FB;
END_VAR

FUNCTION_BLOCK FB
```
METHOD FB_exit
VAR_INPUT
END_VAR

--> C0120: An 'FB_Exit'-Method of a functionblock or struct needs an input 'bInCopyCode' of type BOOL.

Error correction:
Example:
METHOD FB_exit
VAR_INPUT
  bInCopyCode : BOOL;
END_VAR

Compiler error C0122

Message: Expression 'SUPER' is not allowed in this context
Possible error cause: "SUPER^" is used outside of derived function blocks.
Error correction: Use "SUPER^" in function blocks only.

Example of the error:
PROGRAM PLC_PRG
VAR
END_VAR

SUPER^.METH(TRUE, TRUE);

--> C0122: Expression 'SUPER' is not allowed in this context

Compiler error C0124

Message: 'Initialization' is no valid initialization for an enumeration
Possible error cause: A data type that is not ANY_INT is used for the enum initialization.
Error correction: Use only ANY_INT for enum initializations.

Example of the error:
PROGRAM PLC_PRG
VAR
  inst : DUT;
END_VAR

TYPE DUT :
  (enum_member := 1.5)
) DWORD;
END_TYPE

--> C0032: Cannot convert type 'LREAL' to type 'DUT'
--> C0124: 'Initialization' is no valid initialization for an enumeration

Compiler error C0125

Message: The constant <constant value> is assigned to more than one enumeration.
Possible error cause: The same value is assigned to two or more enumerations.
**Error correction:** Assign different values to the enumerations.

**Example of the error:**

```plaintext
PROGRAM PLC_PRG
VAR
  inst : DUT;
END_VAR

TYPE DUT :
  (  
    enum_member := 0,
    enum_member2 := 0
  );
END_TYPE

--> C0125: The constant 0 is assigned to more than one enumeration
```

**Compiler error C0126**

**Message:** Variable of type `<data type>` requires exactly 1 index

**Possible error cause:** Multiple indexes are assigned to a variable with one index.

**Error correction:** Assign only one index.

**Example of the error:**

```plaintext
PROGRAM PLC_PRG
VAR
  pi : POINTER TO INT;
END_VAR

pi[0,1] := 0;

--> C0126: Variable of type 'POINTER TO INT' requires exactly 1 Index
```

**Error correction:**

Example:

```plaintext
pi[0] := 0;
```

**Compiler error C0130**

**Message:** `<object> `<object name>` referenced without parentheses `()'`

**Possible error cause:** A method is referenced without parentheses.

**Error correction:** Always reference methods by means of parentheses.

**Example of the error:**

```plaintext
PROGRAM PLC_PRG
VAR
  inst : FB;
END_VAR

inst.METH1

--> C0130: METHOD 'METH1' referenced without parentheses '()'`

**Error correction:**

Example:

```plaintext
inst.METH1();
```
Compiler error C0131

Message: '<value>' is not allowed as operand for 'ADR'
Possible error cause: A constant is passed as an operand to the operator ADR.
Error correction: Use only valid operands for ADR.

Example of the error:

```plaintext
PROGRAM PLC_PRG
VAR
   i : INT;
   pt : POINTER TO INT;
END_VAR

pt := ADR(1);

---> C0131: '1' is not allowed as operand for 'ADR'
```

Error correction:

```plaintext
Example:
pt := ADR(i);
```

Compiler error C0132

Message: No enclosing loop of which to EXIT
Possible error cause: EXIT is used outside of a loop.
Error correction: Use EXIT inside of a loop only.

Example of the error:

```plaintext
PROGRAM PLC_PRG
VAR
END_VAR

EXIT ;

---> C0132: No enclosing loop of which to EXIT
```

Compiler error C0136

Message: ambiguous use of name '<variable name>'
Possible error cause: A variable is declared in multiple GVLs.
Error correction: Qualify the variable with the desired GVL.

Example of the error:

```plaintext
PROGRAM PLC_PRG
VAR
   j : INT := g_i;
END_VAR

GVL1:
VAR_GLOBAL
   g_i : INT;
END_VAR

GVL2:
```
VAR_GLOBAL
    _g_i : INT;
END_VAR

--> C0136: ambiguous use of name 'g_i'

Example:
    j : INT := GVL1.g_i;

Compiler Error C0138

Message: No matching 'FB_Init' method found for instantiation of POU.
Possible error cause: No FB_Init method exists that accepts the passed parameters.
Error correction: Check which arguments FB_Init has to receive and adjust the passed arguments.

Example of the error:
PROGRAM PLC_PRG
VAR
    myPOU : POU(arg1 := 1, arg2 := 2);
END_VAR

--> C0138: No matching 'FB_Init' method found for instantiation of POU.

Compiler error C0139

Message: The code <code> has no effect. Is this the intent?
Possible error cause: The written code is syntactically correct but does not do anything.
Error correction: Write code that has a purpose.

Example of the error:
PROGRAM PLC_PRG
VAR
    i : INT;
END_VAR
    i;

--> C0139: The code 'i;' has no effect. Is this the intent?

Compiler error C0140

Message: Reference assign is only allowed to variables of Reference type
Possible error cause: An attempt is made to assign a reference value to a variable not defined as a reference type.
Error correction: Define the variable as a reference type.

Example of the error:
PROGRAM PLC_PRG
VAR
    i : INT;
    I_r : INT;
END_VAR
I_r REF= i;

--> C0140: Reference assign is only allowed to variables of Reference type

Example:
I_r : REFERENCE TO INT;

Compiler error C0141

Message: Reference assign needs variable with write access

Possible error cause: A constant is assigned to the reference assignment.

Error correction: Assign a writable variable.

Example of the error:

PROGRAM PLC_PRG
VAR
  i : INT;
  I_r : REFERENCE TO INT;
END_VAR

I_r REF= 314;

--> C0141: Reference assign needs variable with write access

Example correction:
I_r REF= i;

Compiler error C0142

Message: A local variable named '<variable name>' is already defined in '<pou name>'

Possible error cause: The same variable name is used two times.

Error correction: Use different variable names.

Example of the error:

PROGRAM PLC_PRG
VAR
  i : INT;
  i : INT;
END_VAR

--> C0142: A local variable named 'i' is already defined in 'PLC_PRG'

Compiler error C0143

Message: The property '<property name>' cannot be used in this context because it lacks the get accessor

Possible error cause: The property does not have Get access.

Error correction: Make sure that the property has a Get access definition.
Example of the error:

```plaintext
PROGRAM PLC_PRG
VAR
  i : INT;
  inst: FB;
END_VAR

i := inst.Prop;

FUNCTION_BLOCK FB
VAR
END_VAR

PROPERTY Prop : INT
Set;

--> C0143: The property 'Prop' cannot be used in this context because it lacks the get accessor
```

Compiler error C0144

**Message:** Inheritance only allowed in Functionblocks, Interfaces and Structures

**Possible error cause:** An attempt is made to use inheritance in an object that does not permit inheritance.

**Error correction:** Use `EXTENDS` in function blocks, interfaces, and structures only.

Example of the error:

```plaintext
PROGRAM PLC_PRG
VAR
  inst : DUT_1;
END_VAR

TYPE DUT:
  enum_member := 0
END_TYPE

TYPE DUT_1 EXTENDS DUT:
  enum_memberX := 0
END_TYPE

--> C0144: Inheritance only allowed in Functionblocks, Interfaces and Structures
```

Compiler error C0145

**Message:** Interfaces can only be implemented by Functionblocks

**Possible error cause:** An attempt is made to implement an interface outside of a function block.

**Error correction:** Implement interfaces only in function blocks.
Example of the error:

```
PROGRAM PLC_PRG
VAR
END_VAR

POU();

FUNCTION POU IMPLEMENTS ITF
VAR
END_VAR

--> C0145: Interfaces can only be implemented by Functionblocks
```

Compiler error C0149

**Message:** Variable declarations are not allowed in interfaces

**Possible error cause:** An attempt is made to define a variable in an interface.

**Error correction:** Do not define variables in interfaces.

Example of the error:

```
PROGRAM PLC_PRG
VAR
  inst : ITF;
END_VAR

INTERFACE ITF
VAR_INPUT
  i : INT;
END_VAR

--> C0149: Variable declarations are not allowed in interfaces
```

Compiler error C0161

**Message:** Border <array bound> of array is no constant value

**Possible error cause:** A variable is specified as an array bound.

**Error correction:** Use constants for the array bounds.

Example of the error:

```
PROGRAM PLC_PRG
VAR
  i : INT := 3;
  arr1 : ARRAY[1..i] OF INT;
END_VAR

--> C0161: Border 'i' of array is no constant value
```

**Error correction:**

Example:

```
arr1 : ARRAY[1..3] OF INT;
```

Compiler error C0162

**Message:** Number <number of array values> of array initialisations is no constant value

**Possible error cause:** The initialization [Wert1, AnzahlWert2(Wert2)] works only with a constant for AnzahlWert2.

**Error correction:** Use constants only.
Example of the error:

PROGRAM PLC_PRG
VAR
  i : INT := 3;
  arr1 : ARRAY[1..4] OF INT := [1,i(7)];
END_VAR

--- C0162: Number 'i' of array initialisations is no constant value

Example:
arr1 : ARRAY[1..4] OF INT := [1,3(7)];

Compiler Error C0164

Message: POU <name> writes to output <name> and is called in several tasks.

Possible error cause: The device setting codegenerator\check-multiple-task-output-write is set and multiple tasks access the same output.

Error correction: Do not call a program that changes outputs in multiple tasks.

Example of the error:

PROGRAM PLC_PRG
VAR
  Output AT %QB7 : BYTE
END_VAR

Output := 0;

--- C0164: POU 'PLC_PRG' writes to output 'QB7' and is called in several tasks

Compiler Error C0165

Message: Variable '<variable name>', which is mapped on address '<address>' is written in different tasks.

Possible error cause: The device setting codegenerator\check-multiple-task-output-write is set and multiple tasks access the same output.

Error correction: Write an output in one fixed task only. If multiple tasks need to calculate data for one output, then you should try to transfer this information by means of global variables to one fixed task, which then writes the data to one output.
Example of the error:

PROGRAM PLC_PRG_1
VAR
  Output AT %QB7 : BYTE;
END_VAR
Output := 0;

PROGRAM PLC_PRG_2
VAR
  Output AT %QB7 : BYTE;
END_VAR
Output := 1;

--> C0165: Variable 'Output', which is mapped on address 'QB7' is written in different tasks.

Compiler error C0168

Message: 'VAR_CONFIG' declaration only allowed in VAR_CONFIG - list
Possible error cause: 'VAR_CONFIG' is used outside of a VAR_CONFIG list.
Error correction: Use 'VAR_CONFIG' only in VAR_CONFIG lists.

Example of the error:

PROGRAM PLC_PRG
VAR_CONFIG
  i : INT;
END_VAR

--> C0168: 'VAR_CONFIG' declaration only allowed in VAR_CONFIG - list

Compiler error C0169

Message: 'VAR_GLOBAL' declaration only allowed in Global variable list
Possible error cause: 'VAR_GLOBAL' is used outside of global variable lists.
Error correction: Use 'VAR_GLOBAL' in global variable lists only.

Example of the error:

PROGRAM PLC_PRG
VAR_GLOBAL
  i : INT;
END_VAR

--> C0169: 'VAR_GLOBAL' declaration only allowed in Global variable list
Compiler Error C0173

**Message:** '<keyword>' not allowed in this place

**Possible error cause:** A declaration keyword (example: VAR_INPUT, VAR_OUTPUT, or VAR) is not allowed at this location.

**Error correction:** Correct the declaration: Inputs and outputs are not useful or necessary in type definitions or global variable lists.

```
TYPE DUT :
  STRUCT
    member : INT;
  END_STRUCT
END_TYPE
```

---

**Example of the error:**

```
TYPE DUT :
  STRUCT
    VAR_INPUT
      member : INT;
    END_VAR
  END_STRUCT
END_TYPE
```

--> C0173: 'VAR_INPUT' not allowed in this place.

**Error correction**

Example:

```
TYPE DUT :
  STRUCT
    member : INT;
  END_STRUCT
END_TYPE
```

---

Compiler error C0174

**Message:** 'VAR_TEMP' declaration not allowed in this place

**Possible error cause:** 'VAR_TEMP' is used outside of a program or function block.

**Error correction:** Use 'VAR_TEMP' inside of programs and function blocks only.

---

**Example of the error:**

```
PROGRAM PLC_PRG
VAR
END_VAR

FUN();

FUNCTION FUN
VAR_TEMP
END_VAR

--> C0174: 'VAR_TEMP' declaration not allowed in this place
```

---

Compiler error C0175

**Message:** 'RETAIN' or 'PERSISTENT' not allowed in this place

**Possible error cause:** 'RETAIN' or 'PERSISTENT' is used in a function.

**Error correction:** Use 'RETAIN' or 'PERSISTENT' at the intended locations.
Example of the error:

```plaintext
PROGRAM PLC_PRG
VAR
END_VAR

POU_1();

FUNCTION POU_1
VAR RETAIN
END_VAR

--> C0175: 'RETAIN' or 'PERSISTENT' not allowed in this place

See also
- Chapter 6.4.1.20.2.14 “Retain Variable - RETAIN” on page 2124
- Chapter 6.4.1.20.2.14 “Retain Variable - RETAIN” on page 2124
```

Compiler error C0177

**Message:** ‘<object>’ is of type ‘type’ and cannot be instantiated

**Possible error cause:** An attempt is made to instantiate a function.

**Error correction:** Instantiate only objects that can be instantiated.

```plaintext
Example of the error:

```plaintext
PROGRAM PLC_PRG
VAR
  inst : POU;
END_VAR

FUNCTION POU
VAR
END_VAR

--> C0177: 'POU' is of type 'FUNCTION' and cannot be instantiated
```

Compiler error C0178

**Message:** No external access to 'VAR_IN_OUT' parameter '<parameter name>' of '<object name>'

**Possible error cause:** An attempt is made to remotely access a 'VAR_IN_OUT' parameter.

**Error correction:** Do not remotely access 'VAR_IN_OUT' parameters.

```plaintext
Example of the error:

```plaintext
PROGRAM PLC_PRG
VAR
  inst : FB;
  i : INT;
END_VAR
  i := inst.in_out;

FUNCTION_BLOCK FB
VAR_IN_OUT
  in_out : INT;
END_VAR

--> C0178: No external access to 'VAR_IN_OUT' parameter 'in_out' of 'FB'
```
Compiler Error C0179

**Message:** '<identifier>' is no output of 'Function block'

**Possible error cause:** The initialization of a function block instance must not contain VAR_IN_OUT variables.

**Error correction:** Use VAR_IN_OUT variables in function block calls only. When initializing a function block instance, only assign the inputs of a function block.

**Example of the error:**

```plaintext
FUNCTION_BLOCK MyFB
  VAR_IN_OUT
    inOut : INT;
  END_VAR

PROGRAM PLC_PRG
  VAR
    iValue : INT;
    fb : MyFB := (inOut := iValue);
  END_VAR

--> C0179: 'inOut' is no output of 'MyFB'
```

Compiler Error C0180

**Message:** Ambiguous namespace '<library 1>' defined by library '<library 2>'

**Possible error cause:** The namespace of the library <library 1> is not unique. It is already used for <library 2>.

**Error correction:** Change the namespace of the library accordingly ("Properties" button in the Library Manager).

**Example of the error:**

```plaintext
--> C0180: Ambiguous namespace 'STANDARD' defined by library 'Standard, 3.5.15.0 (System)'
```

Compiler error C0182

**Message:** Return type is only possible for POUs of Type FUNCTION and METHOD

**Possible error cause:** An attempt is made to define a return value in a program.

**Error correction:** Define a return value only in methods and functions.

**Example of the error:**

```plaintext
PROGRAM PLC_PRG : BOOL
  VAR
  END_VAR

--> C0182: Return type is only possible for POUs of Type FUNCTION and METHOD
```
Compiler Error C0183

**Message:** Global scope operation '.' is not valid on expression '<expression>'

**Possible error cause:** The '.' operator is used to access a global variable. However, at this location it is not followed by a valid IEC identifier, but for example a character such as ';' or a reserved identifier such as FUNCTION, or an operator such as TO_STRING.

**Error correction:** Use a valid IEC identifier for a global variable.

**Example of the error:**

```plaintext
PROGRAM PLC_PRG
  iVar := .FUNCTION; // ERROR: C0183 because ; is not a valid identifier
  strVar := .TO_STRING;
  --> C0183: Global scope operation '.' is not valid on expression '<expression>'
```

**Error correction:**

```plaintext
Example: globalValue is declared in a GVL.
PROGRAM PLC_PRG
  iVar := .globalValue;
```

Compiler error C0185

**Message:** It is not possible to perform component access '.', index access '[]' or call '()' on result of function call. Assign result to help variable first.

**Possible error cause:** Component or index access to the result of a function call is performed.

**Error correction:** Assign the result to a variable in order to access.

**Example of the error:**

```plaintext
PROGRAM PLC_PRG
  VAR
    it : ITF;
  END_VAR
  POU_1()[0].METH1();
  FUNCTION POU_1 : ARRAY[0..0] OF ITF
  INTERFACE ITF
  METHOD METH1
  --> C0185: It is not possible to perform component access '.', index access '[]' or call '()' on result of function call. Assign result to help variable first.
```

Compiler Error C0186

**Message:** It is not possible to compare interface that is return value of call. Assign to variable first.

**Possible error cause:** A comparison operation is applied to an interface that is returned by a function.

**Error correction:** First assign the result of the function call to a variable and then compare the value of the variable. This will also reduce the number of function calls that are required.
Example of the error:

```plaintext
INTERFACE MyInterface

FUNCTION GetInterface : MyInterface

PROGRAM PLC_PRG
IF GetInterface() <> 0 THEN
   // ...
END_IF

--> C0186: It is not possible to compare interface that is return value of call. Assign to variable first.
```

Error correction:

```plaintext
Example:
PROGRAM PLC_PRG
VAR_TEMP
   tempInterface : MyInterface;
END_VAR
tempInterface := GetInterface();
IF tempInterface <> 0 THEN
   // ...
END_IF
```

Compiler Error C0188

**Message:** Device not installed to the system. No code generation possible.

**Possible error cause:** The desired device is not installed.

**Error correction:** Install the missing device in the device repository, or replace the existing device already inserted in the device tree with another existing device ("Update Device").

Compiler error C0189

**Message:** `;` expected instead of '<token>'

**Possible error cause:** Syntax error

**Error correction:** Make sure that the syntax is correct.
Example of the error:

```plaintext
PROGRAM PLC_PRG
VAR
  INT
END_VAR

--> C0009: Unexpected Token '<Token>' found
--> C0189: ';' expected instead of 'INT'
```

Compiler error C0190

**Message:** ';' expected instead of end of POU

**Possible error cause:** Syntax error in the POU

**Error correction:** Make sure that the syntax is correct.

Example of the error:

```plaintext
PROGRAM PLC_PRG
VAR
  i : INT;
END_VAR
  i := 5

--> C0190: ';' expected instead of end of POU
```

Compiler error C0191

**Message:** The operator 'INDEXOF' is no longer supported. Use ADR instead. ADR on a POU-Name returns a Pointer to a Pointer to the function code.

**Possible error cause:** The outdated operator 'INDEXOF' is used.

**Error correction:** Use the operator 'ADR'.

Compiler error C0195

**Message:** Implicit conversion from signed Type '<data type 1>' to unsigned Type '<data type 2>' : possible change of sign

**Possible error cause:** A sign conflict may have been missed in the implicit conversion.

**Error correction:** Convert only data types with the same sign implicitly.

Example of the error:

```plaintext
PROGRAM PLC_PRG
VAR
  i : INT;
  b : UINT;
END_VAR
  b := i;

--> C0195: Implicit conversion from signed Type 'INT' to unsigned Type 'UINT' : possible change of sign
```

Compiler error C0196

**Message:** Implicit conversion from unsigned Type '<data type 1>' to signed type '<data type 2>' : possible change of sign
Possible error cause: A sign conflict may have been missed in the implicit conversion.

Error correction: Use explicit conversions.

Example of the error:

```
PROGRAM PLC_PRG
VAR
  i : INT;
  b : UINT;
END_VAR

i := b;

--> C0196: Implicit conversion from unsigned Type 'UINT' to signed type 'INT' : possible change of sign
```

Compiler error C0197

Message: Implicit conversion from '<data type 1>' to '<data type 2>': possible loss of information

Possible error cause: An attempt is made to convert a variable from data type DINT or LINT to data type REAL.

Error correction: For DINT, use the data type LREAL, and when converting from LINT to LREAL make sure that the value of LINT does not exceed the capacity of LREAL.

Example of the error:

```
PROGRAM PLC_PRG
VAR
  i : DINT;
  b : REAL;
END_VAR

b := i;

--> C0197: Implicit conversion from 'DINT' to 'REAL': possible loss of information
```

Compiler error C0198

Message: String constant '<string value>' too long for destination type '<data type>'

Possible error cause: The string constant has too many characters.

Error correction: Use shorter string constants or declare larger strings.

Example of the error:

```
PROGRAM PLC_PRG
VAR
  str : STRING(4) := '12345';
END_VAR

--> C0198: String constant '12345' too long for destination type 'STRING(4)'
```

Compiler error C0199

Message: Interface '<interface name>' must be instantiated to be accessed

Possible error cause: An attempt is made to access an interface method without the interface being instantiated.
**Error correction:** Instantiate the interface.

**Example of the error:**

```plaintext
PROGRAM PLC_PRG
VAR
END_VAR

ITF.METH();

INTERFACE ITF

METHOD METH
VAR_INPUT
END_VAR

--> C0199: Interface 'ITF' must be instantiated to be accessed

```

**Error correction:**

Example:

```plaintext
itest: ITF;
```

**Compiler error C0201**

**Message:** Type '<data type 1>' is not equal to type '<data type 2>' of VAR_IN_OUT 'Variable'

**Possible error cause:** The data type that is passed to the function as a VAR_IN_OUT parameter does not match the data type defined in it.

**Error correction:** Pass a variable with the correct data type.

**Example of the error:**

```plaintext
PROGRAM PLC_PRG
VAR
    Inst: POU;
    b : BOOL;
END_VAR

inst(in_out := b);

FUNCTION_BLOCK POU
VAR_IN_OUT
    in_out : INT;
END_VAR

--> C0201: Type 'BOOL' is not equal to type 'INT' of VAR_IN_OUT 'Variable'
```

**Compiler error C0203**

**Message:** Only Structures and Function Blocks can contain variables of type BIT.

**Possible error cause:** An attempt is made to declare a variable of type BIT outside of structures and function blocks.

**Error correction:** Declare variables of type BIT only in structures and function blocks.

**Example of the error:**

```plaintext
PROGRAM PLC_PRG
VAR
    b : BIT;
END_VAR

--> C0203: Only Structures and Function Blocks can contain variables of type BIT.
```
Compiler error C0204

**Message**: Variables of type BIT must be declared within a VAR_INPUT-, VAR_OUTPUT or VAR-block

**Possible error cause**: An attempt is made to define a variable of type BIT or as a VAR_IN_OUT parameter.

**Error correction**: Define variables of type BIT only within a VAR_INPUT, VAR_OUTPUT or VAR block.

**Example of the error**:

```plaintext
PROGRAM PLC_PRG
  VAR
    inst : FB;
  END_VAR

  FUNCTION_BLOCK FB
    VAR_IN_OUT
      b : BIT;
    END_VAR
  --> C0204: Variables of type BIT must be declared within a VAR_INPUT-, VAR_OUTPUT or VAR-block
```

Compiler error C0205

**Message**: POINTER TO BIT is not allowed

**Possible error cause**: An attempt is made to declare a POINTER TO BIT.

**Error correction**: Do not declare POINTER TO BIT.

**Example of the error**:

```plaintext
PROGRAM PLC_PRG
  VAR
    pt : POINTER TO BIT;
  END_VAR
  --> C0205: POINTER TO BIT is not allowed
```

Compiler error C0206

**Message**: BIT is not allowed as base type of an array

**Possible error cause**: An attempt is made to declare a BIT array.

**Error correction**: Do not declare BIT arrays.

**Example of the error**:

```plaintext
PROGRAM PLC_PRG
  VAR
    arr : ARRAY[1..2] OF BIT;
  END_VAR
  --> C0206: BIT is not allowed as base type of an array
```

Compiler Error C0207

**Message**: There is no system definition for '<identifier>'
**Possible error cause:** An attempt was made to access a variable in __SYSTEM that does not exist.

**Error correction:** Check and correct the specified identifier of the respective variable.

**Example of the error:**

```plaintext
PROGRAM PLC_PRG
VAR
  Value : INT;
END_VAR
Value := __SYSTEM.UnknownVariable;

--> C0207: There is no system definition for 'UnknownVariable'
```

**Compiler error C0208**

**Message:** 'MOD' is not defined for 'REAL'

**Possible error cause:** An attempt is made to perform a modulo operation with a variable of type REAL.

**Error correction:** Modulo operations are only possible with variables of type ANY_INT.

**Example of the error:**

```plaintext
PROGRAM PLC_PRG
VAR
  r1 : REAL;
END_VAR
r1 := r1 MOD 2;

--> C0208: 'MOD' is not defined for 'REAL'
```

**Compiler Error C0209**

**Message:** You have defined '<number>' applications for device '<device name>'. The maximum number is '<number>'. So you will not be able to download all applications.

**Possible error cause:** Some devices only support a specific number of applications (device description). If a project contains more applications, then not all will be downloaded to the device.

**Error correction:** Remove applications from your project or use another device.

**Compiler error C0211**

**Message:** Variable declaration expected instead of <expression>

**Possible error cause:** Syntax error

**Error correction:** Make sure that the syntax is correct.

**Example of the error:**

```plaintext
PROGRAM PLC_PRG
VAR
  VAR
    END_VAR
END_VAR

--> C0211: Variable declaration expected instead of VAR END_VAR
```
Compiler error C0212

**Message:** VAR, VAR_INPUT, VAR_OUTPUT or VAR_INOUT expected instead of <expression>

**Possible error cause:** Syntax error

**Error correction:** Make sure that the syntax is correct.

**Example of the error:**

```c
PROGRAM PLC_PRG
  i : INT;
  --> C0212: VAR, VAR_INPUT, VAR_OUTPUT or VAR_INOUT expected instead of i : INT;
```

Compiler Error C0215

**Message:** Direct address declaration is not possible in persistent list

**Possible error cause:** Persistent variables are not allowed to have a direct address.

**Error correction:** Remove the direct address assignment in the persistent variable list.

**Example of the error:**

```c
VAR_GLOBAL PERSISTENT RETAIN
directAddressVar AT %QB7 : BYTE;
END_VAR
  --> C0215: Direct address declaration is not possible in persistent list.
```

Compiler error C0216

**Message:** Case label duplicate

**Possible error cause:** A CASE label is used multiple times.

**Error correction:** Use each CASE label only one time.

**Example of the error:**

```c
PROGRAM PLC_PRG
  VAR
  i : INT;
  END_VAR
  CASE i OF
    1: i := i+1;
    1: i := i+2;
    ELSE
    i := i+10;
    END_CASE;
  --> C0216: Case label duplicate
```

Compiler error C0217

**Message:** Case label <case label> also contained in range <case range begin> .. <case range end>

**Possible error cause:** A CASE label is part of the range of another CASE label.

**Error correction:** Make sure that there is no intersecting.
Example of the error:

```plaintext
PROGRAM PLC_PRG
VAR
  i : INT;
END_VAR
CASE i OF
  3..5: i := i+2;
  4: i := i+2;
ELSE
  i := i+10;
END_CASE;

--> C0217: Case label 4 also contained in range 3 .. 5
```

Compiler error C0218

**Message:** Case label requires literal or symbolic integer constant

**Possible error cause:** An attempt is made to use a variable as a CASE label.

**Error correction:** Use only literals and symbolic integer constants.

Example of the error:

```plaintext
PROGRAM PLC_PRG
VAR
  i : INT;
  a : INT := 2;
END_VAR
CASE i OF
  1: i := i+1;
  a: i := i+2;
ELSE
  i := i+10;
END_CASE;

--> C0218: Case label requires literal or symbolic integer constant
```

Compiler error C0219

**Message:** Case contains overlapping range <case range 1 begin> .. <case range 1 end> and <case range 2 begin> .. <case range 2 end>

**Possible error cause:** Two branches of CASE markers have the same elements or subsets.

**Error correction:** Make sure that there is no intersecting.

Example of the error:

```plaintext
PROGRAM PLC_PRG
VAR
  i : INT;
END_VAR
CASE i OF
  3..5: i := i+2;
  1..4: i := i+2;
ELSE
  i := i+10;
END_CASE;

--> C0219: Case contains overlapping range 1 .. 4 and 3 .. 5
```
**Compiler error C0221**

**Message:** Direct Address '<address>' malformed

**Possible error cause:** An address is not displayed completely.

**Error correction:** Make sure that the address is displayed correctly.

**Example of the error:**

```plaintext
PROGRAM PLC_PRG
VAR
  xVar : BOOL;
END_VAR;

xVar := %IX0;

--> C0221: Direct Address '%IX0' malformed
```

**Error correction:**

```plaintext
Example:

xVar := %IX0.2;
```

**Compiler error C0222**

**Message:** Outputs can't be of type 'REFERENCE TO'

**Possible error cause:** An attempt is made to define 'REFERENCE TO' as an output parameter.

**Error correction:** Do not use 'REFERENCE TO' as an output parameter.

**Example of the error:**

```plaintext
PROGRAM PLC_PRG
VAR
  inst : FB;
END_VAR

FUNCTION_BLOCK FB
VAR_OUTPUT
  re : REFERENCE TO INT;
END_VAR

--> C0222: Outputs can't be of type 'REFERENCE TO'
```

**Compiler error C0224**

**Message:** Call Recursion: <recursion>

**Possible error cause:** A function calls itself.

**Error correction:** Make sure that functions are not recursive.

**Example of the error:**

```plaintext
PROGRAM PLC_PRG
VAR
END_VAR

POU();

FUNCTION POU
VAR
END_VAR

POU();

--> C0224: Call Recursion: POU -> POU
```
Compiler Error C0225

**Message:** '<name>' is not an instance of '<name>'

**Possible error cause:** A function block in a graphical programming language has been assigned with an explicitly specified type that does not match the declared type.

**Error correction:** Replace the explicit type with the one used in the declaration part, or remove the specification of the explicit type from the POU.

**Example of the error:**

```plaintext
PROGRAM PLC_PRG
VAR
  fbVar : MyFB;
END_VAR

--> C0225: 'fbVar' is not an instance of 'MyFB2'

Error correction:
```

Compiler error C0227

**Message:** Initialisation of constant variable <constant name> not constant

**Possible error cause:** A constant is initialized with a variable.

**Error correction:** Initialize constants only with constant values.

**Example of the error:**

```plaintext
PROGRAM PLC_PRG
VAR
  i : INT;
END_VAR
VAR CONSTANT
  k : INT := i;
END_VAR

--> C0227: Initialisation of constant variable 'k' not constant
```
Compiler error C0228

**Message:** No initial value for constant variable '<constant name>''

**Possible error cause:** A constant is not initialized.

**Error correction:** Initialize the constants.

**Example of the error:**

```
PROGRAM PLC_PRG
VAR
END_VAR
VAR CONSTANT
  k : INT;
END_VAR

--> C0228: No initial value for constant variable 'k'
```

**Error correction:**

```
k : INT := 1;
```

Compiler Error C0230

**Message:** Type name '<data type>' not expected in this place

**Possible error cause:** The data type name of an enumeration is used at an invalid position.

**Error correction:** Check whether the data type name is used correctly at this location. Maybe there is a spelling error.

**Example of the error:**

```
TYPE MyEnum :
  (enum_member := 0);
END_TYPE

PROGRAM PLC_PRG
VAR
  value : INT;
END_VAR
value := MyEnum;
MyEnum := value;

--> For PLC_PRG, the error message is issued 2x:
C0230: Type name 'MyEnum' not expected in this place
```

**Error correction:**

```
value := MyEnum.enum_member;
MyEnum.enum_member := value;
```

Compiler Error C0232

**Message:** Array initialisation expected

**Possible error cause:** An array of arrays is initialized, but the initialization values are not nested.

**Error correction:** Use a nested array initialization as shown in the example below.
Example of the error:

PROGRAM PLC_PRG
VAR
  value : ARRAY[0..2] OF ARRAY[0..2] OF INT := [1,2,3];
END_VAR

--> C0232: Array initialisation expected

Error correction:

Example:
value : ARRAY[0..2] OF ARRAY[0..2] OF INT := [ [1,2,3], [4,5,6], [7,8,9] ];

Compiler Error C0233

Message: Initialisation list for {0} <data type> expected
Possible error cause: An array of the type of a structure is initialized with elements that are not structure initializations or variables.
Error correction: As shown in the example below, use structure initializations or existing variables to initialize arrays of structures.

Example of the error:

PROGRAM PLC_PRG
VAR
  values : ARRAY[0..2] OF COLOR := [1,2,3];
END_VAR

--> C0233: Initialisation list for COLOR expected

Error correction:

Example:
PROGRAM PLC_PRG
VAR
  colorVariable : COLOR := (red:=0, green:=0, blue:=255);
  value : ARRAY[0..2] OF COLOR := [ colorVariable,
    (red:=255, green:=0, blue:=0),
    (red:=0, green:=255, blue:=0) ];
END_VAR

Compiler error C0234

Message: First Operand of __QueryInterface must be an interface reference or the instance of a function block
Possible error cause: Incorrect operands are passed to the operator __QueryInterface.
Error correction: Pass an interface reference or the instance of a function block.

Example of the error:

PROGRAM PLC_PRG
VAR
  a : INT;
  ITFRef, ITFRef2 : ITF;
  ITFRef2 : ITF2;
END_VAR

__QueryInterface(a ,ITFRef);
INTERFACE ITF EXTENDS __SYSTEM.IQueryInterface
INTERFACE ITF2 EXTENDS ITF

--> C0234: First Operand of __QueryInterface must be an interface reference or the instance of a function block

Example:
__QueryInterface(ITFref2, ITFref);

Error correction:

Compiler error C0235

Message: Second Operand of __QueryInterface must be an interface reference

Possible error cause: Incorrect operands are passed to the operator __QueryInterface.

Error correction: Pass an interface reference.

Example of the error:
PROGRAM PLC_PRG
VAR
   a : INT;
   ITFref, ITFref2 : ITF;
   ITFref2 : ITF2;
END_VAR
__QueryInterface(ITFref2, a);

INTERFACE ITF EXTENDS __SYSTEM.IQueryInterface
INTERFACE ITF2 EXTENDS ITF

--> C0235: Second Operand of __QueryInterface must be an interface reference

Example:
__QueryInterface(ITFref2, ITFref);

Error correction:

Compiler error C0236

Message: Wrong type definition for VAR_EXTERNAL <variable name>

Possible error cause: The variable is declared in VAR_GLOBAL / VAR_EXTERNAL as different types.

Error correction: Use the same type definition in VAR_GLOBAL and VAR_EXTERNAL.

Example of the error:
PROGRAM PLC_PRG
VAR_EXTERNAL
   _ig : STRING;
END_VAR

VAR_GLOBAL
   _ig : INT;
END_VAR

--> C0236: Wrong type definition for VAR_EXTERNAL ig

Compiler error C0237

Message: No global definition found for VAR_EXTERNAL '<variable name>'
Possible error cause: An attempt is made to declare a variable in VAR_EXTERNAL which does not exist in VAR_GLOBAL.

Error correction: Make sure that the identifiers match.

**Example of the error:**

```plaintext
PROGRAM PLC_PRG
VAR_EXTERNAL
  i : INT;
END_VAR

VAR_GLOBAL
  ig : INT;
END_VAR

--> C0237: No global definition found for VAR_EXTERNAL 'i'
```

**Compiler error C0238**

**Message:** No initial value allowed for VAR_EXTERNAL <variable name>

**Possible error cause:** An attempt is made to initialize a variable in VAR_EXTERNAL.

**Error correction:** Do not initialize variables in VAR_EXTERNAL.

**Example of the error:**

```plaintext
PROGRAM PLC_PRG
VAR_EXTERNAL
  ig : INT := 2;
END_VAR

VAR_GLOBAL
  ig : INT;
END_VAR

--> C0238: No initial value allowed for VAR_EXTERNAL ig
```

**Compiler error C0239**

**Message:** Interface <interface name 1> does not extend <interface name 2>

**Possible error cause:** The used interface does not extend another interface.

**Error correction:** Extend the interface.

**Example of the error:**

```plaintext
PROGRAM PLC_PRG
VAR
  ITFref : ITF;
  ITFref2 : ITF2;
END_VAR

__QueryInterface(ITFref2, ITFref);

INTERFACE ITF
INTERFACE ITF2 EXTENDS ITF

--> C0239: Interface ITF__Union does not extend __System.IQueryInterface
```

**Error correction:**

```plaintext
Example:
INTERFACE ITF EXTENDS __System.IQueryInterface
```
Compiler error C0240

Message: First Operand of __QueryPointer must be an interface reference or the instance of a function block
Possible error cause: Incorrect operands are passed to the operator __QueryPointer.
Error correction: Pass an interface reference or the instance of a function block.

Example of the error:
PROGRAM PLC_PRG
VAR
  a : INT;
  ITFref : ITF;
  pt : POINTER TO FB;
END_VAR
__QueryPointer(a,pt);

Compiler error C0241

Message: Second Operand of __QueryPointer must be pointer
Possible error cause: Incorrect operands are passed to the operator __QueryPointer.
Error correction: Pass a pointer.

Example of the error:
PROGRAM PLC_PRG
VAR
  b : INT;
  ITFref : ITF;
  pt : POINTER TO FB;
END_VAR
__QueryPointer(ITFref,b);

Compiler error C0242

Message: Operand of __DELETE must be pointer
Possible error cause: An incorrect operand is passed to the operator __DELETE.
Error correction: Pass a pointer.
**Example of the error:**

```plaintext
PROGRAM PLC_PRG
VAR
  a : INT;
  pt : POINTER TO INT;
END_VAR

__DELETE(a);

--> C0242: Operand of __DELETE must be pointer
```

**Error correction:**

```plaintext
__DELETE (pt);
```

---

**Compiler error C0243**

**Message:** The name used in the signature is not identical to the object name

**Possible error cause:** The object name differs from the name used in the code.

**Error correction:** make sure that the names are the same.

---

**Compiler Error C0380**

**Message:** The Operators LOWER_BOUND and UPPER_BOUND are only supported for arrays of variable length.

**Possible error cause:** One of the two operators LOWER_BOUND or UPPER_BOUND is not used for an array of variable length.

**Error correction:** Use the operators LOWER_BOUND and UPPER_BOUND only for an array of variable length.

```
For compiler version 3.5.14.0 and higher, the operators can also be used for static arrays. As a result, the error C0380 occurs only in the case of earlier compiler versions.
```

**Example of the error:**

```plaintext
FUNCTION_BLOCK POU
VAR_IN_OUT
  arrin : ARRAY [*] OF INT;
END_VAR
VAR
  arrtest : ARRAY [0..5] OF INT;
  test1: DINT;
  test2: DINT;
```
END_VAR

test1 := UPPER_BOUND(arrin, 1);
test2 := UPPER_BOUND(arrest, 1);

--> C0380: The operators LOWER_BOUND and UPPER_BOUND are supported only for arrays with variable length.

Compiler error C0509

Message: Multiple assignments for operator '__New' not allowed

Possible error cause: In one line of code, the assignment operator "=" is called a multiple number of times with the __New operator.

Error correction: Program the memory allocation with the __New operator in a separate line of code for each pointer that points to dynamically allocated memory.

Example of the error:

PROGRAM PLC_PRG
VAR
  pbAlpha : POINTER TO BYTE; // Typed pointer to Alpha
  pbBeta: POINTER TO BYTE;    // Typed pointer to Beta
  xInit : BOOL := TRUE;
  xDelete : BOOL;
END_VAR

IF (xInit) THEN
  pbBeta := pbAlpha := __NEW(BYTE); // Incorrect code for memory allocation
END_IF

pbBeta := pbAlpha := 16#01;

IF (xDelete) THEN
  __DELETE(pbAlpha); // Frees memory of pointer
END_IF

--> C0509: Multiple assignments for operator '__New' not allowed

Error correction:

PROGRAM PLC_PRG
VAR
  pbAlpha : POINTER TO BYTE; // Pointer to Alpha
  pbBeta: POINTER TO BYTE;    // Pointer to Beta
  xInit : BOOL := TRUE;
  xDelete : BOOL;
END_VAR

IF (xInit) THEN
  pbAlpha := __NEW(BYTE); // Allocates memory for Alpha
  pbBeta := __NEW(BYTE); // Allocates memory for Beta
END_IF

pbBeta := pbAlpha := 16#01; // Multiple assignment

IF (xDelete) THEN
  __DELETE(pbAlpha); // Frees memory of pointer
END_IF
Compiler error C0511

**Message:** The function block '<function block name>' is ABSTRACT and cannot be used as a target for an assignment.

**Possible error cause:** A value was assigned to an abstract function block. The concrete function blocks may have different types and therefore cannot be copied.

**Error correction:** In order to copy the data of the function block, concrete function blocks have to be used.

**Example of the error:**

```
PROGRAM PLC_PRG
VAR
  refAbstract1 : REFERENCE TO AbstractPOU;
  refAbstract2 : REFERENCE TO AbstractPOU;
END_VAR

refAbstract1 := refAbstract2;
--> C0511: The function block 'refAbstract1' is ABSTRACT and cannot be used as a target for an assignment.

Error correction:
Use the reference assignment REF= to assign the reference refAbstract1 to the same function block as refAbstract2.
```

Compiler Error C0542

**Message:** Inheritance is not intended for the data type "UNION" <data type name>.

**Possible error cause:** A structured data type (DUT) is derived from a UNION by extending with EXTENDS, or a UNION is derived from a DUT. This kind of derivation is not permitted. However, for reasons of compatibility only a warning is issued.

**Example of the error:**

```
TYPE U_StringExt EXTENDS U_StringBase :
  UNION
    str10 : STRING(10);
  END_UNION
END_TYPE TYPE U_StringBase :
  UNION
    str20 : STRING(20);
  END_UNION
END_TYPE

PROGRAM PLC_PRG
VAR
  uStringExt : U_StringExt;
END_VAR

uStringExt.str20 := 'a234567890b234567890'; --> C0542
```
Compiler Error C0543

Message: The name <keyword> is a reserved keyword in the IEC 1131-3 standard. An error will be issued in future versions.

Possible error cause: A reserved keyword was assigned as the name of a variable.

Error correction: Rename the variable.

Example of the error:

```
PROGRAM PLC_PRG
VAR
  char : BYTE;
END_VAR
```

--> C0543: The name 'char' is a reserved keyword in the IEC 1131-3 standard. An error will be issued in future versions.

Note: For violations in compiled libraries, only a text message (information) will be issued instead of a warning.

The following keywords are reserved:

- CHAR
- WCHAR
- ANY DERIVED
- ANY ELEMENTARY
- ANY MAGNITUDE
- ANY SIGNED
- ANY DURATION
- ANY CHAR
- ANY CHAR
- CHAR TO
- TO CHAR
- WCHAR TO
- TO WCHAR
- ATAN2
- USING
- CLASS
