

XIO - connectivity made easy for Upstream Oil & Gas Create optimal remote I/O expansion

The XIO sets a new standard for control, automation and measurement solutions dedicated to upstream Oil & Gas applications. This new solution provides remote expansion for both brownfield and greenfield flow computers and RTUs.

With features such as multiple serial ports, hot-swappable TFIO modules, and multidrop connectivity with auto-detection, the XIO-08 will seamlessly integrate with the RMC-100 and XSeries controllers. Minimal commissioning time and low installation cost are two of the main benefits of this new solution.

Other key features include connectivity via multiple independent ethernet, Wi-Fi, and Bluetooth for configuration. This connectivity facilitates configuration and allows interfacing with different platforms and field instrumentation. With the XIO, we are continuing to improve our offering for digital solutions, giving customers a path forward to the future.
