Advanced Circular Chart Recorder C1300

The Company

We are an established world force in the design and manufacture of instrumentation for industrial process control, flow measurement, gas and liquid analysis and environmental applications.

As a part of ABB, a world leader in process automation technology, we offer customers application expertise, service and support worldwide.

We are committed to teamwork, high quality manufacturing, advanced technology and unrivalled service and support.

The quality, accuracy and performance of the Company's products result from over 100 years experience, combined with a continuous program of innovative design and development to incorporate the latest technology.

The UKAS Calibration Laboratory No. 0255 is just one of the ten flow calibration plants operated by the Company and is indicative of our dedication to quality and accuracy.

EN ISO 9001:2000

Lenno, Italy - Cert. No. 9/90A

Stonehouse, U.K.

Electrical Safety

This equipment complies with the requirements of CEI/IEC 61010-1:2001-2 'Safety Requirements for Electrical Equipment for Measurement, Control and Laboratory Use'. If the equipment is used in a manner NOT specified by the Company, the protection provided by the equipment may be impaired.

Symbols

One or more of the following symbols may appear on the equipment labelling:

Â	Warning – Refer to the manual for instructions	===	Direct current supply only
Â	Caution – Risk of electric shock	\sim	Alternating current supply only
	Protective earth (ground) terminal	$\left \right\rangle$	Both direct and alternating current supply
<u> </u>	Earth (ground) terminal		The equipment is protected through double insulation

Information in this manual is intended only to assist our customers in the efficient operation of our equipment. Use of this manual for any other purpose is specifically prohibited and its contents are not to be reproduced in full or part without prior approval of the Technical Publications Department.

Health and Safety

To ensure that our products are safe and without risk to health, the following points must be noted:

- 1. The relevant sections of these instructions must be read carefully before proceeding.
- 2. Warning labels on containers and packages must be observed.
- 3. Installation, operation, maintenance and servicing must only be carried out by suitably trained personnel and in accordance with the information given.
- 4. Normal safety precautions must be taken to avoid the possibility of an accident occurring when operating in conditions of high pressure and/or temperature.
- 5. Chemicals must be stored away from heat, protected from temperature extremes and powders kept dry. Normal safe handling procedures must be used.
- 6. When disposing of chemicals ensure that no two chemicals are mixed.

Safety advice concerning the use of the equipment described in this manual or any relevant hazard data sheets (where applicable) may be obtained from the Company address on the back cover, together with servicing and spares information.

1 Preparation

1.1 Preparing the Recorder for First Use - Figs. 1.1 and 1.2

Prepare the recorder for first use as follows:

- 1. Install the recorder see Section 4, page 59.
- 2. Connect the recorder see Section 5, page 63.

Warning. Ensure all connections are made correctly, especially to the earth (ground) stud – see Section 5.4, page 70.

3. Switch on the power supply to the recorder.

Note. On power-up, the pen arm(s) is (are) moved to an off-chart position for automatic referencing. Pen chatter may occur on the pen(s) nearest the reference position. This is a normal function of the recorder.

4. Fit the pen capsule(s) - see Fig. 1.1.

Note.

- Ensure the correct colored capsule is fitted to the appropriate pen arm. Each pen arm is identified by a colored band – see Fig. 1.1.
- If the violet, true-time line event option is fitted, the pen records on the same time line as the red pen, but on the outer edge of the chart.
- 5. Fit a chart see Fig. 1.2 on page 3.

Fig. 1.1 Fitting the Pen Capsule(s)

Fig. 1.2 Fitting a Chart

1.2 Powering up the Recorder - Fig. 1.3

To power up the recorder:

- 1. Switch on the supply to the recorder, any power-operated control circuits and the input signals. Wait for the pens to settle.
- 2. The start-up self-test sequence shown in Fig. 1.3 is shown on display screen 1 when the power supply is first switched on.

Fig. 1.3 Recorder Start-up Self-test Sequence

1.2.1 Recorder Status and Error Page – Fig. 1.4

If any of the start-up self-tests (see Fig. 1.3) fail, the error message 'Fail' is displayed. Refer to Fig. 1.4 for possible cause and remedial action information.

Fig. 1.4 Start-up Error Messages

2 Operation

2.1 Display Screens and Operator Keys - Fig. 2.1

Up to two faceplates are fitted to the front of the recorder, each comprising a display screen and associated operator keys - see Fig. 2.1.

Each high resolution, dot matrix display screen shows the operating and programming information for up to two input channels in a variety of formats.

Alarm states are indicated by icons in the lower left corner of the display screen(s) - see Fig. 2.3 on page 7.

Fig. 2.1 Display Screen and Operator Keys

The recorder has dedicated *Operating Pages* in the **Operating Level** – see Sections 2.3 to 2.6. These pages display the process measurements and are not affected by the security system which inhibits access to the **Configuration Pages** – see Section 3.3, page 19.

2.2 Input Error Messages and Alarm Icons - Figs. 2.2 and 2.3

Fig. 2.2 Input Error Messages Displayed in the Operating Page

Fig. 2.3 Alarm Icons

2.3 Operating Pages

Overview.

- The following information is displayed in the Operating Pages:
 - Input (pen) channel readings
 - Data logging status (if data logging option is enabled by installation of the appropriate hardware)
 - System time/date (if any one of the Totalizer, Math or Timers software options are enabled by installation of the appropriate software key)
 - Totalizer readings (if the totalizer software option is enabled by installation of the appropriate software key)
 - Totalizer log (if the totalizer software option is enabled by installation of the appropriate software key)
 - Totalizer control (if the totalizer software option is enabled and Totalizer Reset is set to YES see Section 3.4, page 20.)
 - Alarm set points (if Alarm Adjust is set to Yes see Section 3.4, page 20.)
- The Input (pen) channel and totalizer displays are configured separately (see Pen Ch Display and Totals Display in Section 3.4) and each can be displayed in one of several ways. Input channel information can be displayed without totalizer information and vice-versa.
- Input channel 1 and 2 information and system time/date is shown on display screen 1.
- If the recorder is fitted with the optional second faceplate:
 - Input channel 3 and 4 information, together with system time/date is shown on display screen 2
 - Totalizer logs, totalizer control and alarm set point adjustment for pens 3 and 4 and associated totalizers are accessed from the menu shown on display screen 2 when the 🗐 key is pressed on faceplate 2.
- Totalizer information is shown on the same display screen as the pen to which the totalizer is assigned.
- All channel and totalizer configuration is done using faceplate 1.

2.3.1 Accessing the Operating Pages

Input 1

. 90

99

Autoscroll

When **Autoscroll** is set to **On**, each *Operating Page* screen is displayed in turn for a period of time determined by the rate selected:

Slow Rate - each screen is displayed in turn for 10 seconds

Fast Rate - each screen is displayed in turn for 5 seconds

Press the () key from any *Operating Page* screen to initiate Autoscroll in Slow Rate mode.

Press the $\hfill \bigtriangleup$ key again to switch to Fast Rate mode.

When in Fast Rate mode, press the \bigcirc key to switch to Slow Rate mode.

When in Slow Rate mode, press the 💌 key to switch Autoscroll off.

Press the p key at any time to switch Autoscroll off.

2.3.3 Input (Pen) Channel Display - Separate

The following screens are displayed only if **Pen Ch Display** is set to **Separate** – see Section 3.4, page 20.

2.3.4 Input (Pen) Channel Display – Dual The following screens are displayed only if **Pen Ch Display** is set to **Dual** – see Section 3.4, page 20.

Turnut 1	Input Channels 1 and 2 (Pens 1 and 2)
0.0 1/s	Channel tag.
	Measured value and units.
	Note. If Pen X Source (where X is the pen number) is set to None (Section 3.14), only a measured value of 0 is displayed for that channel.
0.00 u/s 0.0000 au/s	Totalizer, Math or Timers software options not enabled by installation of the appropriate software key and optional Data Logging hardware not installed – return to top of page.
Totalizer 1 000000000	Totalizer software option enabled by installation of the appropriate software key and Totals Display not set to Off (Section 3.4) – see Sections 2.3.6 to 2.3.10.
	Optional Data Logging hardware installed – see Section 2.3.11, page 15.
System Time Tuesday 25th May 2004 14:33:48	Optional Data Logging hardware not installed and Totalizer software option enabled by installation of the appropriate software key and Totals Display set to Off (Section 3.4) – see Section 2.3.3, page 10.

2.3.5 Input (Pen) Channel Display - Separate and Dual

The following screens are displayed only if **Pen Ch Display** is set to **Separate & Dual** – see Section 3.4, page 20.

2.3.6 Totalizer Display - Separate

The following screens are displayed only if **Totals Display** is set to **Separate** (Section 3.4) *and* **Tot X Source** (where **X** is the totalizer number) is set to anything other than **None** – see Section 3.7, page 35.

2.3.7 Totalizer Display - Rate with Total

The following screens are displayed only if **Totals Display** is set to **Rate with Total** (Section 3.4) *and* **Tot X Source** (where **X** is the totalizer number) is set to anything other than **None** – see Section 3.7, page 35.

2.3.8 Totalizer Display - Total with Rate

The following screens are displayed only if **Totals Display** is set to **Total with Rate** (Section 3.4) *and* **Tot X Source** (where **X** is the totalizer number) is set to anything other than **None** – see Section 3.7, page 35.

2.3.9 Totalizer Display - Dual Total

The following screen is displayed only if **Totals Display** is set to **Dual Total** (Section 3.4) *and* **Tot X Source** (where **X** is the totalizer number) is set to anything other than **None** – see Section 3.7, page 35.

2.3.10 Totalizer Display - Dual + Flow Rate

The following screen is displayed only if **Totals Display** is set to **Dual + Flow Rate** (Section 3.4) *and* **Tot X Source** (where **X** is the totalizer number) is set to anything other than **None** – see Section 3.7, page 35.

2.3.11 Data Logging

Data Logging Status

Provides information on current data logging status.

Press the 💌 key to place data logging off-line.

When data logging is off-line, the Compact Flash card can be removed safely.

If the card is not removed within 1 minute, data logging is placed on-line automatically. A timer indicates the number of seconds remaining before data logging resumes.

This screen is displayed when a Compact Flash card is not inserted.

Data logging starts automatically when a Compact Flash card is inserted.

see Section 2.3.3, page 10.

2.4 Totalizer Log

Note.

- The totalizer log is available only if the totalizer software option is enabled by installation of the appropriate software key.
- The recorder can store up to 21 log entries for each enabled totalizer. When the maximum number of entries has been reached, the oldest data is overwritten by the newest.
- A new log entry is created for each totalizer at the interval selected in the Tot X Log Enable parameter (where X is the totalizer number) see Section 3.7, page 35.

2.5 Totalizer Control

Note. Totalizer control is available only if the totalizer software option is enabled by installation of the appropriate software key *and* Totalizer Reset is set to YES – see Section 3.4, page 20.

2.6 Alarm Set Point Adjustment

Note. Alarm set point adjustment is available only if Alarm Adjust is set to YES – see Section 3.4, page 20.

3 Configuration

3.1 Introduction

The configuration procedures are used to make changes to the operating parameter values and for scale adjustment. Configuration of all channels is performed from faceplate 1.

The configuration settings can be backed up to a PC and restored to the recorder as required – see Section 3.16, page 57.

An overview of the Configuration Pages is on the rear cover fold-out.

When changing the input type, it may be necessary to reposition the input selector links accordingly - see Section 5.2.1, page 66.

3.2 Preparation for Configuration

Note.

- Isolate any external alarm/control circuits if inadvertent operation during configuration is undesirable.
- The recorder responds instantly to parameter changes. These are saved automatically when either the pressed.
- The display screen of faceplate 2 (if fitted) shows **Configuration Mode** when the configuration pages are accessed by scrolling past **Security Code** in the Main Menu on the display screen of faceplate 1.

3.3 Configuration Level Security

Unauthorized access to the configuration pages is prevented by the use of a security code.

The security code, set to '0' when the recorder is despatched, can be set to any value from 0 to 9999 – see **Configure Password** in Section 3.4 on pgae 20. When set to anything other than '0', access to all configuration menus (i.e. all menus below **Security Code**) is prevented. Enter the correct code to enable access to the configuration menus.

3.4 Common Configuration

Line Rejection 50 Hz	Line Rejection Select the frequency of the mains supply to ensure maximum noise rejection on analog inputs.			
Pen Ch Display	Pen Channel Display			
	Select the style of input (p to 2.3.5.	ben) channel display required in the Operating Page – see Sections 2.3.3		
Separate	Off	- input channel information is not displayed in the Operating Page		
	Separate	 input channel information for channels 1 and 2 is shown separately on display screen 1. Input channel information for channels 3 and 4 (3 and 4 pen recorders only) is shown separately on display screen 2 see Section 2.3.3, page 10 		
	Dual	- input channel information for channels 1 and 2 is shown simultaneously on display screen 1. Input channel information for channels 3 and 4 (3 and 4 pen recorders only) is shown simultaneously on display screen 2 – see Section 2.3.4, page 11		
	Separate & Dual	 input channel information for channels 1 and 2 is first shown separately, then simultaneously on display screen 1. Input channel information for channels 3 and 4 (3 and 4 pen recorders only) is first shown separately, then simultaneously on display screen 2 – see Section 2.3.5, page 12 		
Totals Display Separate	Continued on next page.			

3.5 Channels Configuration

Overview.

- Universal inputs mV, mA, V, THC, RTD and resistance.
- Internal cold junction compensation.
- Linearization enables use of non-linearizing temperature transmitters or any electrical input.
- Programmable fault levels and actions.
- Digital filter reduces the effect of noise on inputs.

Example A – setting up:

- a current input of 4 to 20mA
- displaying a range of 0 to 200psi
- a fault detection level 10% above 200psi (engineering/display range) and 10% below 0psi (engineering/display range)
- in the event of a fault being detected and/or the fault detection level being exceeded, the process variable is driven downscale.

Example B - setting up:

- a Type K thermocouple
- displaying temperature in °F
- displaying a range of 0 to 2000°F
- a fault detection level 10% above 2000°F (engineering/display range) and 10% below 0°F (engineering/display range)
- in the event of a fault being detected and/or the fault detection level being exceeded, the process variable is driven upscale.

3.6 Alarms Configuration

Overview.

- **Four alarms per channel** identified A1 to D1 (for channel 1) up to A4 to D4 (for channel 4).
- High/Low process alarms.
- Fast/Slow rate alarms.
- Adjustable hysteresis value prevents oscillation of alarm state.
- Time hysteresis enables delayed triggering of alarms.

Fig. 3.1 High and Low Process Alarm with Hysteresis

Fig. 3.2 Time Hysteresis Alarm

Fig. 3.3 Fast Rate Alarms with Hysteresis

Fig. 3.4 Slow Rate Alarms with Hysteresis

3.7 Totalizer Configuration

Overview.

- Up to four, 9-digit totalizers assignable to any pen, analog input or math block (if math software option enabled by installation of the appropriate software key).
- Count up or count down.
- Automatic count rate calculation wherever possible, the recorder calculates the count rate automatically according to source units, totalizer units and engineering range, from 0.0001 to 99.9999 counts/second.
- External counter pulse can be used to energize relays or digital outputs (a maximum of 4 pulses per second are generated).
- Wrap function with external wrap pulse used to energize relays or digital outputs.
- Programmable preset and predetermined count values for (batch) flow total.
- Adjustable cut-off values.
- Operator level reset and stop/go.
- Digital signal reset and stop/go.

When enabled by installation of the appropriate software key, the totalizer software provides indication and recording of flow rates from input signals with linear, square law or power law characteristics. Totalization is available for each channel and can be switched on or off as required.

The flow total for any channel can be viewed on the same display screen as the input (pen) channel to which it is assigned. The flow total can also be reset using the control keys on the associated faceplate. An additional internal 'Secure' total is also provided that can be reset only in the Totalizer Configuration level.

External counters with their own power supplies can be driven using 4 relay and digital output module options.

Count Rate

Totalizers are normally used in flow applications and their purpose is to summate the volume of process fluid passing the point of measurement. Totalizers have no relationship to time and continue to count up or down (dependant on setting) until instructed to reset. A trip meter on a typical family car is an example of a basic totalizer – the meter counts and displays the distance travelled by the vehicle until reset by the driver. In this example, the speedometer and trip meter read in the same unit of distance.

Flow totalization is more complex than that of a trip meter. In flow totalization, the flow recorder typically measures the instantaneous value in one flow unit whilst the totalizer counts in a larger flow unit. When configuring a totalizer, a count rate must be calculated and entered to compensate for the difference between the totalized measurement unit and the instantaneous measurement unit.

Where possible, the recorder calculates automatically the count rate for the most popular measurement units, e.g. gallons, cubic feet, liters and cubic meters. When configuring a totalizer, first ensure that the unit of measurement (**Channel Units**) selected for the channel to which the totalizer is assigned is a volumetric unit (i.e. quantity per unit of time, for example gallons per hour) – see Section 3.5, page 24. Finally, enter the required Totalizer unit of measurement. If the recorder holds the relationship data between the selected measurement and totalizer units, '**Automatic**' is displayed under the count rate to indicate that it has been set automatically. If the relationship data is not in the recorder's look-up table, '**Manual**' is displayed and the count rate must be set manually – see next page.

Calculating The Count Rate Manually

The count rate determines how many units the totalizer increments per second when the flow input signal is at 100%. To calculate this parameter manually, follow the procedure below:

1. Calculate the volume relationship

Typically the unit of measure used by the totalizer is larger than that used for displaying the instantaneous flow-rate. Use standard conversion tables to calculate how many times the flow units used for the input will fit into the desired totalizer unit.

Example: Measurement channel units is set to gallons/minute. Instantaneous process flow-rate (engineering range) is 0-300 imperial gallons/minute, totalizer is required to increment in cubic feet. From standard conversion tables, 1 cubic foot = 6.229 imperial gallons.

2. Calculate the unit time

Ensuring that the time-base of the instantaneous flow-rate is used, the following equation determines how many seconds it will take at full scale flow for a single totalizer unit to pass the measurement point:

```
\frac{\text{Volume relationship}}{\text{Full scale flow}} \times \text{number of seconds in time-base} = \text{Seconds to pass one totalizer unit}
```

Example:

 $\frac{6.229 \text{ (imperial gallons in 1ft}^3)}{300 \text{ (imperial gallons max. flow rate)}} \times 60 \text{ (seconds in 1 minute)} = 1.2458 \text{ seconds to pass 1ft}^3$

3. Calculate the count rate

The totalizer count rate is the reciprocal of the result of the calculation above:

 $\frac{1}{\text{Seconds to pass 1 totalizer unit}} = \text{Totalizer count rate}$

Example:

 $\frac{1}{1.2458} = 0.803$

Note. Totalizer configuration is available only if the totalizer software option is enabled by installation of the appropriate software key.

Tot 1 Tag	Totalizer Tag
Totalizer 1	Press the 🖘 key to open the Edit screen.
	Use the \blacktriangle , \bigtriangledown and \blacklozenge keys to enter the totalizer tag required – see Fig. 2.1 on page 6.

3.8 Relay Configuration

Overview.

- Relays can be energized by alarms, logic equation results (math software option enabled by installation of the appropriate software key), digital inputs, real time events (timer software option enabled by installation of the appropriate software key) and totalizer wrap signal (totalizer software option enabled by installation of the appropriate software key)
- External totalizer count function external counter can be driven only by Module Type 3 (4-relay module) fitted in module positions 4, 5 or 6 (see Section 5.2, page 65).
- Polarity allows fail-safe settings

3.9 Digital Input and Output Configuration

Overview.

- The Digital I/O menu selection is displayed only if a digital input/output module is fitted see Section 5.3.3, page 69.
- Up to 24 digital outputs available depending on the module types fitted.
- Digital outputs can be energized by alarms, logic equation results (math software option enabled by installation of the appropriate software key), digital inputs, real time events (timer software option enabled by installation of the appropriate software key) and totalizer wrap signal (totalizer software option enabled by installation of the appropriate software key).
- External Totalizer count function external counter can be driven only by Module Type 5 (8-digital output module) fitted in module positions 4, 5 or 6 (see Section 5.2, page 65).
- **Polarity** inverts the effect of the selected source on the output state.

3.10 Analog Output Configuration

Overview.

- Fitted analog outputs assignable to retransmit any process variable
- Selectable analog output range allows maximum resolution on range of interest
- Adjustable output range for non-standard and reversed outputs

The example below shows analog output 1 programmed to retransmit part of process variable 1's engineering range (250 to 750°C) as a 4.0 to 20.0 mA current output.

3.11 Logic Equation Configuration

Overview.

- 8 logic equations
- Up to 4 operands and 3 operators per equation
- OR/AND/XOR/NAND/NOR/NOT operators
- Can combine internal and external digital signals i.e. alarms, digital inputs, other logic equation results and real-time events (if timer software option enabled by installation of the appropriate software key)

For each equation, the logic elements 1 to 7 are arranged sequentially, as shown below. Odd numbered elements are used for logic inputs (operands) and even numbered elements for logic gates (operators).

Logic inputs must be set to one of the digital sources in Appendix A on page 77.

Logic inputs may be inverted (set to NOT)

Logic gates must be set to AND, OR, XOR, NAND, NOR or END. Setting an element to END terminates the equation.

Note. The elements of each equation are calculated sequentially, i.e. elements 1, 2 and 3 are evaluated first and the result combined with elements 4 and 5. This result is then combined with elements 6 and 7 to give the logic equation result.

Example - Reservoir level monitoring using:

- process variable 1 with an engineering range of 0 to 100 feet
- logic equation 1 result assigned to relay 1.1 that is used to operate the control valve.

3.12 Data Logging Configuration

Trend pen channel data values and the contents of the totalizer log (if the totalizer option is enabled by installation of the appropriate software key) can be saved to a Compact Flash card if the optional data logging hardware is installed and data logging is on-line. Logged data is compatible with the Company's DataManager data analysis software package. DataManager is a Microsoft® Excel add-in that enables the analysis and validation of the recorder's pen channel data values and log files on a PC.

Note.

- The recorder is not equipped with an internal memory therefore recorded pen channel data values are lost if a Compact Flash card with sufficient available free space is not inserted.
- Logging starts automatically when a card is inserted and continues until either the card is removed or becomes full.
- The content of the totalizer log (if the totalizer option is enabled by installation of the appropriate software key) is saved automatically to the Compact Flash card when data logging is on-line.
- Event pen data is not logged.

File Types

Files created by the recorder are given filenames automatically. Each type of file is given a different filename extension as shown in Table 3.3.

Туре	Extension	Contents
Pen channel data files	*.D00	Digital recording channel data
Totalizer log files	*.TE0	The historical record of all totalizer and associated statistical values relating to a particular pen channel

Table 3.3 File Types

Filenames

Filenames are formatted as shown in Table 3.4.

Туре	Format
Pen channel data files	<start hh_mm="" time=""> Start Date ddmmmyy><instrument tag="">.D00</instrument></start>
Totalizer log files	<start hh_mm="" time=""> Start Date ddmmmyy><instrument tag="">.T00</instrument></start>

Table 3.4 Filenames

Data Verification and Integrity

Each block of data in the pen channel data files has its own data integrity check. This enables the integrity of the data stored on the Compact Flash card to be verified when it is viewed using the DataManager software.

Totalizer log files also contain built-in integrity checks enabling the integrity of the data to be verified by the DataManager software.

3.13 System Clock Configuration

Note. The System Clock is available only if any of the Totalizer, Math or Timers software options are enabled by installation of the appropriate software key, or the optional Data Logging hardware is installed.

3.14 Pen Function Overview.

Trend Pens – the chart range is configured independently of the engineering range (see Section 3.5, page 24) to enable a selected part of the engineering range to be used for display thus giving extra detail on the chart.

Event Pens – assigned to digital inputs, alarms, logic equation results and real-time events (if timer software option enabled by installation of the appropriate software key).

5 Electrical Installation

Warning.

- To comply with Underwriter Laboratories (UL) and Canadian Standards Association (CSA) certification, route signal leads and power cables in earthed (grounded), flexible metal conduit.
- Recorders not fitted with the optional internal on/off switch and fuse must have an external fuse and disconnecting device such as a switch or circuit breaker conforming to local safety standards fitted to the final installation. They must be fitted in close proximity to the recorder within easy reach of the operator and must be marked clearly as the disconnection device for the recorder.
- Remove all power from supply, relay and any powered control circuits and high common mode voltages before accessing or making any connections.
- Use cable appropriate for the load currents. The terminals accept cables up to 14AWG (2.5mm2).
- The power supply and all inputs and outputs conform to Insulation Category II, Pollution Degree II.
- All connections to secondary circuits must have basic insulation.
- After installation, there must be no access to live parts e.g. terminals.
- Terminals for external circuits are for use only with equipment with no accessible live parts.
- If the recorder is used in a manner not specified by the Company, the protection provided by the equipment may be impaired.
- All equipment connected to the recorder's terminals must comply with local safety standards (IEC 60950, EN601010-1).

Note.

- Always route signal leads and power cables separately.
- Use screened cable for signal inputs and relay connections. Connect the screen to the earth (ground) stud see Fig. 5.9 on page 70.
- The terminal blocks can be removed from the main PCB when making connections see Fig. 5.1 on page 64. Before removing a module, note its position.
- If wall- or pipe-mounting to NEMA 4X hosedown standard is required, suitable cable glands must be used to prevent water ingress.
- The optional Software Key (if fitted), part number C1900/0463, contains a non-replaceable 3.0V lithium cell.

Fig. 5.1 Removing Terminal Block Assembly

5.1 Identifying the Input/Output Modules - Fig. 5.1

To gain access to the modules, open the door and chassis – see Fig. 5.1 on page 64. There are five module positions (2 to 6) as shown in Fig. 5.2.

5.2 Channel Connections

Channel 1 connections are made directly to the terminal block mounted on the motherboard.

Other Channel connections are made to standard I/O modules, fitted in positions 2, 3 or 4 – see Fig. 5.2.

Warning. The maximum channel to channel voltage (between any 2 channels) must not exceed 500V DC.

Fig. 5.2 Module Positions and Functions

Note.

- Module positions 2 and 3 can also be used for additional I/O modules (module types 1 and 2) for use with math functions.
- The module type is marked on the component side of the PCB.

5.2.1 Selecting the Analog Input Type(s) – Figs. 5.3 and 5.4

Plug-in links are used to select the input type:

Note. Input impedances:

Low voltage (mV)	$>10M\Omega$
Voltage	$>10M\Omega$
Current (mA)	100Ω

5.2.3 2-wire Transmitter Input – Fig. 5.5 (D)

Power for the transmitter is supplied by terminal 6.

Note. The voltage across terminals 4 and 6 is 20V (nominal). This is due to internal voltage drops across a shunt resistor and measurement circuitry.

5.2.4 Thermocouple - Fig. 5.5 (E)

Use the correct compensating cable between the thermocouple and the terminals – see Table 5.1 on page 67.

An automatic cold junction (ACJC) is incorporated but an independent cold (reference) junction may be used.

5.2.5 Resistance Thermometer (RTD) - Fig. 5.5 (G and H)

If long leads are necessary it is preferable to use a 3-lead resistance thermometer.

If 2-lead resistance thermometers are used each input must be calibrated to take account of the lead resistance.

5.2.6 Logic Inputs - Fig. 5.5 (A)

The two logic inputs accept either volt-free (switch) or TTL (5V) input types and can be used for remote switching of many recorder functions, e.g. chart stop/go, alarm acknowledgment, totalizer reset etc. – see Section 3.11, page 47.

5.2.7 Analog Output - Fig. 5.5 (A)

```
5.2.8 Relay Output - Fig. 5.5 (A)
```

Note. Relay specification:

Туре	single pole changeover	
Voltage	250V AC	250V DC
Current	5A AC	5A DC
Loading (non inductive)	1250VA	50W
Isolation, contacts to earth	2kV RMS	

Fig. 5.5 Channel Connections

5.3 Module Connections

5.3.1 Standard I/O or Analog + Relay

(Module Types 1, 2 and 7) - Fig. 5.5

The connections are the same as Channel connections to the main board. Refer to Section 5.2.

Fig. 5.6 Four Relay Module Connections (Module Type 3)

5.3.3 Eight Digital Inputs or Outputs

(Module Types 4 and 5 respectively) – Figs. 5.7 and 5.8 A plug-in link is used to select the board's function; digital inputs or digital outputs – see Fig. 5.7. The maximum current drain from each TTL output must not exceed 5mA.

Fig. 5.8 Eight Digital Inputs or Outputs Connections (Module Types 4 and 5)

5.4 Power Supply Selection and AC Connections – Fig. 5.9

Fig. 5.9 Power Supply Selection and AC Connections
6 Fault Diagnosis

Symptom	Possible Cause	Action	
Recorder does not power up	a) Internal fuse (if fitted) is blown	a) Check wiring, rectify fault and replace fuse	
	b) Internal power switch (if fitted) is OFF	b) Turn power switch ON	
	c) Power supply connections are incorrect	c) Check connections	
Chart does not appear to move	a) Very slow chart duration selected – see Section 3.4, page 20	a) Select required chart duration in Common Configuration – see Section 3.4, page 20	
	b) Stop Chart Source selected – see Section 3.4, page 20	b) Set Stop Chart Source to None – see Section 3.4, page 20	
Pens in recording position but do not drop onto paper	Stop Chart Source selected – see Section 3.4, page 20	Set Stop Chart Source to None – see Section 3.4, page 20	
Red pen does not move beyond 94% position on chart	When real-time event pen is fitted the red pen cannot go beyond 94% to prevent pens clashing	Use chart range that prevents the need to go beyond 94% of maximum on chart	
Pen lift key on front panel does not work	Pen lift key is disabled	Set Pen Lift Enable to YES – see Section 3.4, page 20	
Pens do not remain lifted when pen lift key is used	Auto pen drop feature is enabled	Set Auto Pen Drop to NO – see Section 3.4, page 20	
Analog inputs are slow to respond	A large filter time has been set	Set Pen X Filter to a value that gives the required response – see Section 3.5, page 24	
Time or date incorrect	Not set for correct local time	Set correct time and date – see Section 3.12, page 50	
Totalizers cannot be reset by the Operator	Totalizer reset function is not enabled	Set Totalizer Reset to YES – see Section 3.4, page 20	
External relays connected to relays in instrument fail to de-energize	Arc suppression capacitors are provided across the relay contacts and capacitor leakage current may be sufficient to prevent an external relay from de-energizing	Remove the arc suppression components: R13 and R14 on mainboard R1 and R7 on standard I/O and analog relay module IC3 to IC10 on 4 relay module	

Table 6.1 Fault Diagnosis

7 Spares and Accessories

Item

Fuses

100 to 240V

*True time line event option only.

Fig. 7.1 Accessories

Construction

Size	15.23 in. (h) x 15.04 in. (w) x 5.57 in. (d) (386.8 x 382.0 x 135mm)
Weight	18lb (8.2kg)
Case material	Glassfiber-filled reinforced polyester
Window material	Polycarbonate or glass
Door latch	High-compression with optional lock

Environmental

Operational temperature range	0° to 55°C (32° to 130°F)
Operational humidity range	5 to 95%RH (non-condensing) 5 to 80%RH (chart only)
Case sealing	NEMA 3 (IP54) NEMA 4X (IP66) (optional)

Installation

Mounting options	Panel, wall or pipe
Terminal type	Screw
Wire size (max)	14 AWG (I/O), 12 AWG (power)

Operation and Configuration

Programming method	Via front panel keys
Security	Password-protected menus

Safety

General safety	EN61010
Installation category	II
Pollution degree	2
Dielectric	500V DC (channel/channel) 2kV DC (channel/ground)
Memory protection	Nonvolatile FRAM
Approvals	CE CSA General Safety (option) UL General Safety (option)

Power Supply

Voltage	100 to 240V AC ±10% (90V min. to 264V AC max.), 50/60Hz
Consumption	<30 VA (typical for full spec. unit)
Line interruption	Up to 60ms

Process Inputs and Outputs General

	Noise Rejection	Common mode >120dB at 50/60Hz Normal (series) mode >60dB at 50/60Hz
	CJC rejection ratio	<0.05°C/°C (0.1°F/°F)
	Sensor break protection	Upscale or downscale drive
	Out of range detection	0 to 100% of engineering span
	Temperature stability	<0.02% of reading/°C (0.04% of reading/°F) or 1µV/°C
	Long-term drift	${<}0.01\%$ of reading or $10\mu V$ annually
	Input impedance	>10MW (mV and V inputs) 39W (mA input)
An	alog Inputs	
	Signal types	mV, V, mA, W
	Thermocouple types	B, E, J, K, N, R, S, T
	Resistance thermometer	Pt 100
	Other linearizations	x ^{1/2} , x ^{3/2} , x ^{5/2} , linear
	Sample interval	250ms per channel
	Dielectric	500V DC channel/channel
	Digital Filter	0 to 60s (programmable)

Туре	Range Low	Range High	Minimum Span	Accuracy
mV	0	150	5	±0.1% reading or 10µV
V	0	5	0.1	±0.1% reading or 20mV
mA	0	50	1	±0.2% reading or 0.2µA
Ohms (low)	0	750	20	±0.2% reading or 0.1W
Ohms (high)	0	10k	400	$\pm 0.5\%$ reading or 10Ω

PRODUCTS & CUSTOMER SUPPORT

Products

Automation Systems

- for the following industries:
 - Chemical & Pharmaceutical
 - Food & Beverage
 - Manufacturing
 - Metals and Minerals
 - Oil, Gas & Petrochemical
 - Pulp and Paper

Drives and Motors

- AC and DC Drives, AC and DC Machines, AC Motors to 1kV
- Drive Systems
- Force Measurement
- Servo Drives

Controllers & Recorders

- Single and Multi-loop Controllers
- Circular Chart and Strip Chart Recorders
- Paperless Recorders
- Process Indicators

Flexible Automation

Industrial Robots and Robot Systems

Flow Measurement

- Electromagnetic Flowmeters
- Mass Flowmeters
- Turbine Flowmeters
- Wedge Flow Elements

Marine Systems & Turbochargers

- Electrical Systems
- Marine Equipment
- Offshore Retrofit and Refurbishment

Process Analytics

- Process Gas Analysis
- Systems Integration

Transmitters

- Pressure
- Temperature
- Level
- Interface Modules

Valves, Actuators and Positioners

- Control Valves
- Actuators
- Positioners

Water, Gas & Industrial Analytics Instrumentation

- pH, Conductivity and Dissolved Oxygen Transmitters and Sensors
- Ammonia, Nitrate, Phosphate, Silica, Sodium, Chloride, Fluoride, Dissolved Oxygen and Hydrazine Analyzers
- Zirconia Oxygen Analyzers, Katharometers, Hydrogen Purity and Purge-gas Monitors, Thermal Conductivity

Customer Support

We provide a comprehensive after sales service via a Worldwide Service Organization. Contact one of the following offices for details on your nearest Service and Repair Centre.

United Kingdom

ABB Limited Tel: +44 (0)1480 475321 Fax: +44 (0)1480 217948

United States of America

ABB Inc. Tel: +1 215 674 6000 Fax: +1 215 674 7183

Client Warranty

Prior to installation, the equipment referred to in this manual must be stored in a clean, dry environment, in accordance with the Company's published specification.

Periodic checks must be made on the equipment's condition. In the event of a failure under warranty, the following documentation must be provided as substantiation:

- 1. A listing evidencing process operation and alarm logs at time of failure.
- 2. Copies of all storage, installation, operating and maintenance records relating to the alleged faulty unit.
